LIFT AND SUPPORT POINTS

NOTE: **If you are going to remove heavy components such as suspension or the fuel tank from the rear of the vehicle, first support the front of the vehicle with tall**

safety stands. When substantial weight is removed from the rear of the vehicle, the center of gravity can change, causing the vehicle to tip forward on the lift.

VEHICLE LIFT

1. Position the lift pads (A) under the vehicle's front support points (B) and rear support points (C).

NOTE: Be sure the lift pads are properly placed to avoid damaging the vehicle.

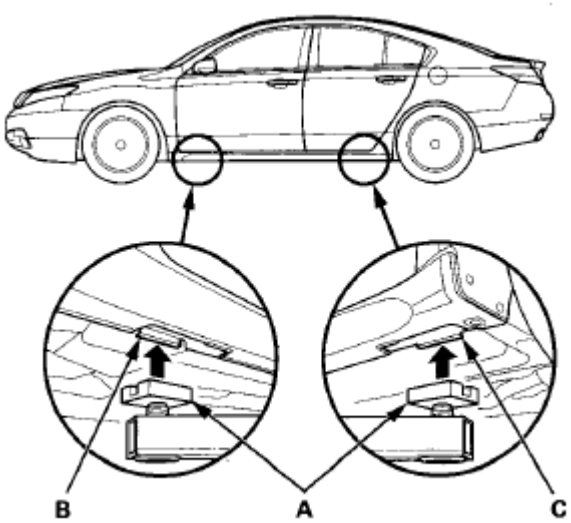

Fig. 16: Identifying Lift Pads, Vehicle's Front Support Points And Rear Support Points
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Raise the lift a few inches, and rock the vehicle gently to be sure it is firmly supported.
3. Raise the lift to its full height, and inspect the vehicle support points for solid contact with the lift pads.

SAFETY STANDS

To support the vehicle on safety stands, use the same support points as for a vehicle lift. Always use safety stands when working on or under any vehicle that is supported only by a jack.

FLOOR JACK

1. When lifting the front of the vehicle, set the parking brake. When lifting the rear of the vehicle, put the shift lever in reverse for manual transmission, or in P for automatic transmission.
2. Block the wheels that are not being lifted.
3. Position the floor jack under the front jacking bracket (A) or the rear jacking bracket (B). Center the jacking bracket on the jack lift platform (C), and jack up the vehicle high enough to fit the safety stands under it.

NOTE: Be sure the floor jack is properly placed to avoid damaging the vehicle.

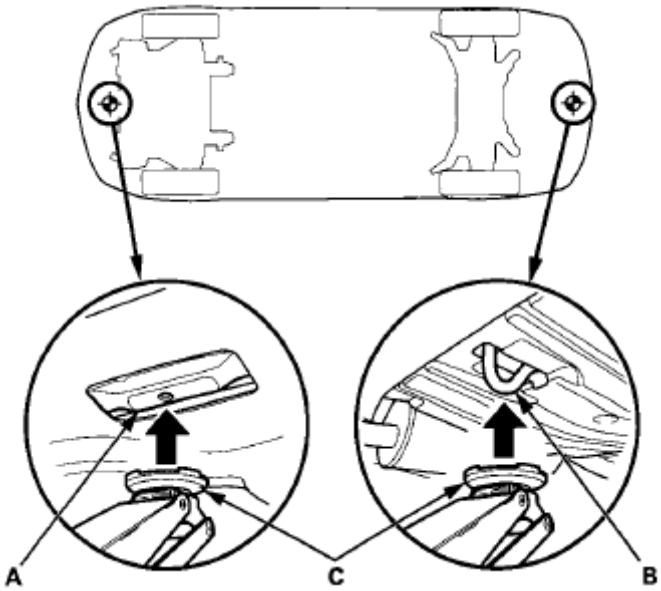

Fig. 17: Identifying Front Jacking Bracket, Rear Jacking Bracket And Center Jacking Bracket On Jack Lift Platform
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Position the safety stands under the support points, and adjust them so the vehicle is level side-to-side.
5. Lower the vehicle onto the stands.

TOWING

If the vehicle needs to be towed, call a professional towing service. Never tow the vehicle behind another vehicle with just a rope or chain. It is very dangerous.

EMERGENCY TOWING

There are three popular methods of towing a vehicle.

FLAT-BED TOW TRUCK EQUIPMENT

The operator loads the vehicle on the back of a flat-bed tow truck. **This is the only way of transporting the vehicle.**

To accommodate the flat-bed tow truck equipment, the vehicle is equipped with a detachable front towing hook (A), front tie down hook slots (B), a rear towing hook (C), and rear tie down hook slots (D).

The towing hooks can be used with a winch to pull the vehicle onto the flat-bed tow truck, and the tie down hook slots can be used to secure the vehicle to the flat-bed tow truck.

NOTE: The front and rear tie down hook slots have rubber plugs (E) over the openings. Be sure to reinstall the plugs after use.

FRONT

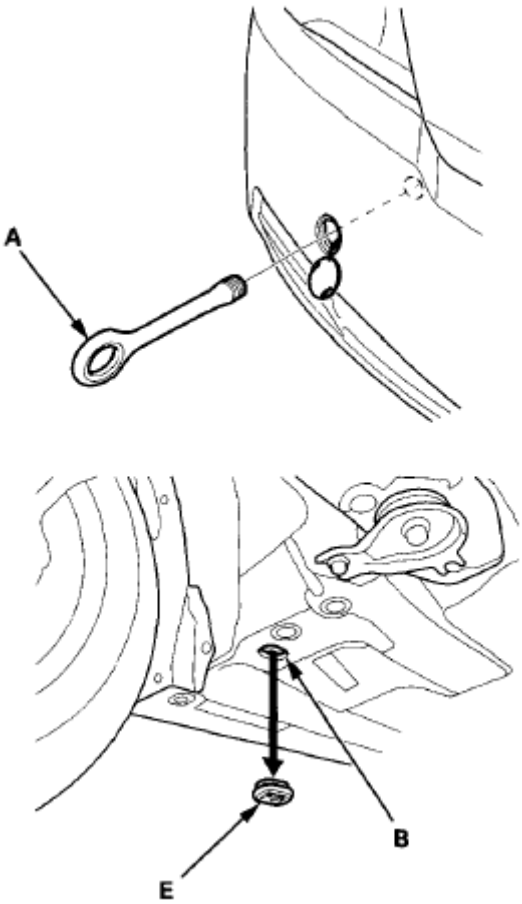

Fig. 18: Identifying Front Towing Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

REAR

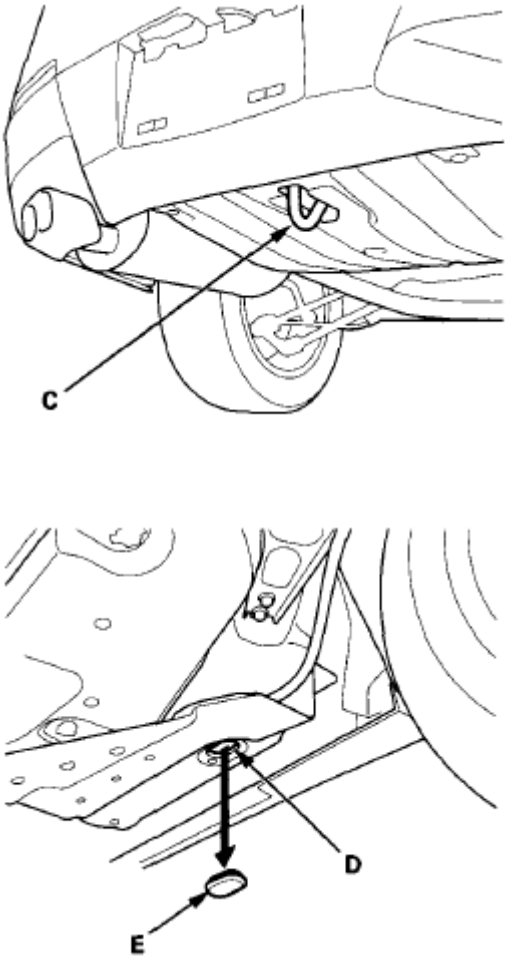

Fig. 19: Identifying Rear Towing Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

FRONT TOWING HOOK INSTALLATION

The detachable front towing hook is for towing very short distances, such as freeing the vehicle. The hook attaches to the anchor in the front bumper.

NOTE:

- **To avoid damage to the vehicle, use the towing hook for straight flat ground towing only. Do not tow on an angle.**
- **Do not use the detachable tow hook as a tie down for securing the vehicle on a flat-bed tow truck. To secure the vehicle on a flat-bed tow truck, use the tie down hook slots provided.**

1. Remove the cover (A) from the front bumper.

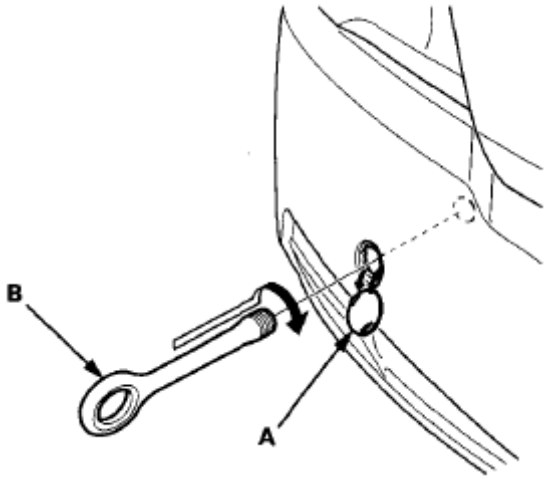

Fig. 20: Screw In Detachable Towing Hook
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the detachable towing hook from the tool kit in the trunk.
3. Screw in the detachable towing hook (B), and tighten it securely by hand.

WHEEL LIFT EQUIPMENT

SH-AWD models

The tow truck uses two pivoting arms that go under the tires (front or rear) and lifts them off the ground. The other two wheels remain on the ground. **Never tow the vehicle with wheel lift equipment.**

Except SH-AWD models

The tow truck uses two pivoting arms that go under the front tires and lifts them off the ground. The rear wheels remain on the ground. **This is an acceptable way of towing the vehicle.**

Sling-type Equipment

The tow truck uses metal cables with hooks on the ends. These hooks go around parts of the frame or suspension, and the cables lift that end of the vehicle off the ground. The Vehicle's suspension and body can be seriously damaged if this method of towing is attempted. **This method of towing the vehicle is unacceptable.**

The only recommended way of towing the SH-AWD models is on a flat-bed tow truck.

NOTE:

- **Towing the SH-AWD models with only two wheels on the ground will damage parts of the SH-AWD system. If the vehicle is damaged, it must be transported on a flat-bed tow truck or trailer.**
- **Improper towing preparation will damage the transmission. Follow the above procedure exactly.**
- **Trying to lift or tow the vehicle by the bumpers will cause serious damage.**

The bumpers are not designed to support the Vehicle's weight.

For the vehicle equipped with the engine start/stop button:

- If the battery is discharged, the ACC mode cannot be selected by pushing the engine start/stop button. Charge or replace the battery to unlock the steering wheel before towing.
- If the ACC mode cannot be selected because of in an electrical problem other than a discharged battery, the vehicle must be transported on a flat-bed tow truck.

PARTS MARKING

To deter vehicle theft, certain major components are marked with the vehicle identification number (VIN). Original parts have self-adhesive labels. Replacement body parts have generic self-adhesive labels. These labels should not be removed. The original engine or transmission VIN plates are not transferable to the replacement engine or transmission.

NOTE: Be careful not to damage the parts marking labels during body repair. Mask the labels before repairing the part.

PRECAUTIONS FOR SUPER HANDLING ALL-WHEEL DRIVE™ (SH-AWD®) SYSTEM

This vehicle is equipped with the Super Handling All Wheel Drive™ (SH-AWD®) system. The SH-AWD system distributes driving torque between the front and rear wheels when accelerating and when wheel spin occurs.

The SH-AWD system does not have a manual switch to disable the AWD system. Whenever service work requires spinning the front or rear wheels with the engine, always lift and support the vehicle so all four wheels are off the ground.

2010-12 COMMON SPECS & PROCEDURES

TL

SPECIFICATIONS INDEX

TL SPECIFICATIONS INDEX

System	Specification/Procedure
Air Conditioning	
Service	**AIR CONDITIONING**
Torque	See applicable component in **HEATING, VENTILATION, AND AIR CONDITIONING** .

2009-12 DTC INDEX

TL

ACURALINK DTCS

NOTE: Retrieval of some diagnostic codes may require the use of special OEM tester or flash method using instrument cluster indicator. For procedures/testing of codes not shown below, refer to appropriate system article.

ACURALINK DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B2240	XM Antenna line failure
DTC U0100	F-CAN Lost communication with ECM/PCM
DTC U0155	F-CAN Lost communication with Gauge Control Module
DTC U128D	Lost Communication with Gauge Control Module

AUTOMATIC TRANSMISSION DTCS

AUTOMATIC TRANSMISSION DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC P0705	Short in Transmission Range Switch Circuit (Multiple Shift-Position Input)
DTC P0706	Open in Transmission Range Switch Circuit
DTC P0711	Problem in ATF Temperature Sensor Circuit
DTC P0712	Short in ATF Temperature Sensor Circuit
DTC P0713	Open in ATF Temperature Sensor Circuit
DTC P0714	ATF Temperature Sensor Intermittent Failure
DTC P0716	Problem in Input Shaft (Mainshaft) Speed Sensor Circuit
DTC P0721	Problem in Output Shaft (Countershaft) Speed Sensor Circuit
DTC P0717	Problem in Input Shaft (Mainshaft) Speed Sensor Circuit (No Signal Input)
DTC P0718	Input Shaft (Mainshaft) Speed Sensor Intermittent Failure
DTC P0722	Problem in Output Shaft (Countershaft) Speed Sensor Circuit (No Signal Input)
DTC P0723	Output Shaft (Countershaft) Speed Sensor Intermittent Failure
DTC P0729	Problem in 6th Clutch and 6th Clutch Hydraulic Circuit

DTC P0731	Problem in 1st Clutch and 1st Clutch Hydraulic Circuit
DTC P0732	Problem in 2nd Clutch and 2nd Clutch Hydraulic Circuit
DTC P0733	Problem in 3rd Clutch and 3rd Clutch Hydraulic Circuit
DTC P0734	Problem in 4th Clutch and 4th Clutch Hydraulic Circuit
DTC P0735	Problem in 5th Clutch and 5th Clutch Hydraulic Circuit
DTC P0741	Torque Converter Clutch Hydraulic Circuit Stuck OFF
DTC P0746	A/T Clutch Pressure Control Solenoid Valve A Stuck OFF
DTC P0747	A/T Clutch Pressure Control Solenoid Valve A Stuck ON
DTC P0751	Shift Solenoid Valve A Stuck OFF
DTC P0752	Shift Solenoid Valve A Stuck ON
DTC P0756	Shift Solenoid Valve B Stuck OFF
DTC P0757	Shift Solenoid Valve B Stuck ON
DTC P0761	Shift Solenoid Valve C Stuck OFF
DTC P0762	Shift Solenoid Valve C Stuck ON
DTC P0776	A/T Clutch Pressure Control Solenoid Valve B Stuck OFF
DTC P0777	A/T Clutch Pressure Control Solenoid Valve B Stuck ON
DTC P0796	A/T Clutch Pressure Control Solenoid Valve C Stuck OFF
DTC P0797	A/T Clutch Pressure Control Solenoid Valve C Stuck ON
DTC P0812	Open in Transmission Range Switch ATPR Switch Circuit
DTC P0842	Short in Transmission Fluid Pressure Switch A (2nd Clutch) Circuit, or Transmission Fluid Pressure Switch A (2nd Clutch) Stuck ON
DTC P0843	Open in Transmission Fluid Pressure Switch A (2nd Clutch) Circuit, or Transmission Fluid Pressure Switch A (2nd Clutch) Stuck OFF
DTC P0847	Short in Transmission Fluid Pressure Switch B (3rd Clutch) Circuit, or Transmission Fluid Pressure Switch B (3rd Clutch) Stuck ON
DTC P0848	Open in Transmission Fluid Pressure Switch B (3rd Clutch) Circuit, or Transmission Fluid Pressure Switch B (3rd Clutch) Stuck OFF

DTC P084C	Short in Line Pressure Switch Circuit, or Line Pressure Switch Stuck ON
DTC P0872	Short in Transmission Fluid Pressure Switch C (4th Clutch) Circuit, or Transmission Fluid Pressure Switch C (4th Clutch) Stuck ON
DTC P0873	Open in Transmission Fluid Pressure Switch C (4th Clutch) Circuit, or Transmission Fluid Pressure Switch C (4th Clutch) Stuck OFF
DTC P0877	Short in Transmission Fluid Pressure Switch D (5th Clutch) Circuit, or Transmission Fluid Pressure Switch D (5th Clutch) Stuck ON
DTC P0878	Open in Transmission Fluid Pressure Switch D (5th Clutch) Circuit, or Transmission Fluid Pressure Switch D (5th Clutch) Stuck OFF
DTC P0962	Problem in A/T Clutch Pressure Control Solenoid Valve A Circuit
DTC P0963	Problem in A/T Clutch Pressure Control Solenoid Valve A
DTC P0966	Problem in A/T Clutch Pressure Control Solenoid Valve B Circuit
DTC P0967	Problem in A/T Clutch Pressure Control Solenoid Valve B
DTC P0970	Problem in A/T Clutch Pressure Control Solenoid Valve C Circuit
DTC P0971	Problem in A/T Clutch Pressure Control Solenoid Valve C
DTC P0973	Short in Shift Solenoid Valve A Circuit
DTC P0974	Open in Shift Solenoid Valve A Circuit
DTC P0976	Short in Shift Solenoid Valve B Circuit
DTC P0977	Open in Shift Solenoid Valve B Circuit
DTC P0979	Short in Shift Solenoid Valve C Circuit
DTC P0980	Open in Shift Solenoid Valve C Circuit
DTC P0989	Short in Transmission Fluid Pressure Switch E (6th Clutch) Circuit, or Transmission Fluid Pressure Switch E (6th Clutch) Stuck ON
DTC P0990	Open in Transmission Fluid Pressure Switch E (6th Clutch) Circuit, or Transmission Fluid Pressure Switch E (6th Clutch) Stuck OFF
DTC P1717	Open in Transmission Range Switch ATPRVS Switch Circuit
DTC P177A	Line Pressure Solenoid Valve A Stuck OFF, or Line Pressure Switch Stuck OFF
DTC P2714	A/T Clutch Pressure Control Solenoid Valve D Stuck OFF

DTC P2720	Problem in A/T Clutch Pressure Control Solenoid Valve D Circuit
DTC P2721	Problem in A/T Clutch Pressure Control Solenoid Valve D
DTC P2821	Line Pressure Solenoid Valve A Stuck ON
DTC P2826	Short in Line Pressure Solenoid Valve A Circuit
DTC P2827	Open in Line Pressure Solenoid Valve A Circuit

CATALYTIC CONVERTER DTCS

CATALYTIC CONVERTER DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC P0420	Rear Bank Catalyst System Efficiency Below Threshold (Bank 1)
DTC P0430	Front Bank Catalyst System Efficiency Below Threshold (Bank 2)

CLIMATE CONTROL DTCS

CLIMATE CONTROL DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC U0155	Lost Communication with Gauge Control Module (Climate Control Unit)
DTC B1215	An Open or Short in the Recirculation Control Motor Circuit
DTC B1225	An Open in the In-Car Temperature Sensor Circuit
DTC B1226	A Short in the In-Car Temperature Sensor Circuit
DTC B1227	An Open in the Outside Air Temperature Sensor Circuit
DTC B1228	A Short in the Outside Air Temperature Sensor Circuit
DTC B1229	An Open in the Sunlight Sensor Circuit
DTC B1230	A Short in the Sunlight Sensor Circuit
DTC B1231	An Open in the Evaporator Temperature Sensor Circuit
DTC B1232	A Short in the Evaporator Temperature Sensor Circuit
DTC B1233	An Open in the Air Mix Control Motor Circuit (Driver's)
DTC B1234	A Short in the Air Mix Control Motor Circuit (Driver's)
DTC B1235	A Problem in the Air Mix Control Motor Circuit, Linkage, Door, or Motor (Driver's)

DTC B1236	An Open in the Passenger's Air Mix Control Motor Circuit
DTC B1237	A Short in the Passenger's Air Mix Control Motor Circuit
DTC B1238	A Problem in the Passenger's Air Mix Control Motor Circuit, Linkage, Door, or Motor
DTC B1239	An Open or Short in the Mode Control Motor Circuit (Driver's)
DTC B1240	A Problem in the Mode Control Motor Circuit, Linkage, Doors, or Motor (Driver's)
DTC B1241	A Problem in the Blower Motor Circuit
DTC B1242	An Open or Short in the Passenger's Mode Control Motor Circuit
DTC B1243	A Problem in the Passenger's Mode Control Motor Circuit, Linkage, Doors, or Motor
DTC B2967	An Open in the Humidity Sensor Circuit
DTC B2968	A Short in the Humidity Sensor Circuit
DTC B2969	Climate Control Unit Lost Communication with Driver's MICU (WIPSW message)
DTC B2979	An Open in the A/C Pressure Sensor Circuit
DTC B2980	A short in the A/C Pressure Sensor Circuit
DTC B2983	A Problem in the Recirculation Control Motor Circuit, Linkage, Door, or Motor

DRIVER POSITION MEMORY

DRIVER POSITION MEMORY DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B1802	Power Seat Control Unit Failure
DTC B1825	Power Seat Slide Motor Pulse Error
DTC B1826	Power Seat Front Up-Down Motor Pulse Error
DTC B1827	Power Seat Rear Up-Down Motor Pulse Error
DTC B1828	Power Seat Recline Motor Pulse Error
DTC B1829	A/T-P Signal and VSP Signal Mismatch
DTC B1830	Left Mirror Position Sensor Open
DTC B1832	Right Mirror Position Sensor Open
DTC B1836	Power Seat Position Sensor Circuit Short
DTC B1837	Memory Position Calling Timeout
DTC B1843	UART Communication Error
DTC B1844	Power Seat Slide Switch Circuit Malfunction
DTC B1845	Power Seat Recline Switch Circuit Malfunction
DTC B1846	Power Seat Front Up-Down Switch Circuit Malfunction

DTC B1847	Power Seat Rear Up-Down Switch Circuit Malfunction
DTC U0155	Power Seat Control Unit Lost Communication With Gauge Control Module
DTC U0199	Power Seat Control Unit Lost Communication With Door Multiplex Control Unit
DTC U1282	Power Seat Control Unit Lost Communication With Driver's MICU

EGR DTCS

EGR DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC P0400	EGR System Leak Detected
DTC P0401	EGR Insufficient Flow
DTC P0404	EGR Circuit Range/Performance Problem
DTC P0406	EGR Valve Position Sensor Circuit High Voltage
DTC P2413	EGR System Malfunction

ELECTRONIC THROTTLE CONTROL SYSTEM DTCS

ELECTRONIC THROTTLE CONTROL DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC P0122	TP Sensor A Circuit Low Voltage
DTC P0123	TP Sensor A Circuit High Voltage
DTC P0222	TP Sensor B Circuit Low Voltage
DTC P0223	TP Sensor B Circuit High Voltage
DTC P1658	ETCS Control Relay ON Malfunction
DTC P1659	ETCS Control Relay OFF Malfunction
DTC P1683	Throttle Valve Default Position Spring Performance Problem
DTC P1684	Throttle Valve Return Spring Performance Problem
DTC P2101	ETCS Malfunction
DTC P2118	Throttle Actuator Current Range/Performance Problem
DTC P2122	APP Sensor A (TP Sensor D) Circuit Low Voltage
DTC P2123	APP Sensor A (TP Sensor D) Circuit High Voltage
DTC P2127	APP Sensor B (TP Sensor E) Circuit Low Voltage
DTC P2128	APP Sensor B (TP Sensor E) Circuit High Voltage
DTC P2135	TP Sensor A/B Incorrect Voltage Correlation
DTC P2138	APP Sensor A/B (TP Sensor D/E) Incorrect Voltage Correlation

DTC P2176	Throttle Actuator Control System Idle Position Not Learned

EVAP DTCS

EVAP DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC P0443	EVAP Canister Purge Valve Circuit Malfunction
DTC P0451	FTP Sensor Circuit Range/Performance Problem
DTC P0452	FTP Sensor Circuit Low Voltage
DTC P0453	FTP Sensor Circuit High Voltage
DTC P0455	EVAP System Large Leak Detected
DTC P0456	EVAP System Very Small Leak Detected
DTC P0457	EVAP System Leak Detected/Fuel Fill Cap Loose or Missing
DTC P0496	EVAP System High Purge Flow Detected
DTC P0497	EVAP System Low Purge Flow Detected (Without SH-AWD)
DTC P0497	EVAP System Low Purge Flow Detected (With SH-AWD)
DTC P0498	EVAP Canister Vent Shut Valve Circuit Low Voltage
DTC P0499	EVAP Canister Vent Shut Valve Circuit High Voltage
DTC P1454	FTP Sensor Circuit Range/Performance Problem
DTC P2422	EVAP Canister Vent Shut Valve Stuck Closed Malfunction
DTC P1458	FTP Sensor Circuit Range/Performance Problem
DTC P145C	EVAP System Purge Flow Malfunction

EXTERIOR LIGHTING DTCS

EXTERIOR LIGHTING DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B10CF	Left Daytime Running Lights Circuit Malfunction
DTC B11CF	Right Daytime Running Lights Circuit Malfunction
DTC B1275	Headlight Switch OFF Position Circuit Malfunction
DTC B1276	Headlight Switch PARKING Position Circuit Malfunction
DTC B1277	Headlight AUTO Position Circuit Malfunction
DTC B1278	Headlight ON Position Circuit Malfunction
DTC B1279	Dimmer Switch Circuit Malfunction
DTC B1575	Auto Lighting Sensor Malfunction

FUEL SUPPLY SYSTEM DTCS

FUEL SUPPLY DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC P0461	Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Range/Performance Problem
DTC P0462	Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Low Voltage (Without SH-AWD)
DTC P0462	Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Low Voltage (With SH-AWD)
DTC P0463	Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit High Voltage (Without SH-AWD)
DTC P0463	Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit High Voltage (With SH-AWD)

GAUGES DTCS

GAUGES DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B1152	Gauge Control Module Internal (EEPROM) Error
DTC B1175	Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Malfunction
DTC B1176	Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Short
DTC B1192	Gauge Control Module Lost Communication With the Battery Sensor (UART LINE)
DTC U0029	F-CAN Communication Line Error (BUS OFF)
DTC U0100	Gauge Control Module Lost Communication With ECM/PCM
DTC U0122	Gauge Control Module Lost Communication With VSA Modulator-Control Unit (VSA Message)
DTC U0127	Gauge Control Module Lost Communication With the TPMS Control Unit (TPMS Message)
DTC U0131	Gauge Control Module Lost Communication With EPS Control Unit (EPS Message)
DTC U0151	Gauge Control Module Lost Communication With SRS Unit (SRS Message)
DTC U0164	Gauge Control Module Lost Communication With Climate Control Unit
DTC U0199	Gauge Control Module Lost Communication With Door Multiplex Control Unit
DTC U1282	Gauge Control Module Lost Communication With Driver's MICU
DTC U1283	Gauge Control Module Lost Communication With

	Passenger's MICU
DTC U1286	Gauge Control Module Lost Communication With Keyless Access Control Unit
DTC U1289	Gauge Control Module Lost Communication With Remote Slot Control Unit
DTC U128B	Gauge Control Module Lost Communication With Power Control Unit
DTC U128F	Gauge Control Module Lost Communication With BSI Control Unit (BSI Message)

HANDSFREELINK DTCS

HANDSFREELINK DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B1775	Microphone input/output shorted to power or open (with navigation)
DTC B1775	Microphone input/output shorted to power or open (without navigation)
DTC B1776	Microphone input/output shorted to ground (with navigation)
DTC B1776	Microphone input/output shorted to ground (without navigation)
DTC B1779	HandsFreeLink steering wheel switch failure (with navigation)
DTC B1779	HandsFreeLink steering wheel switch failure (without navigation)
DTC B1780	HandsFreeLink steering wheel switch line short (with navigation)
DTC B1780	HandsFreeLink steering wheel switch line short (without navigation)
DTC B1792	HandsFreeLink control module error (with navigation)
DTC B1792	Hands Free Link control module error (without navigation)

IDLE CONTROL SYSTEM DTCS

IDLE CONTROL DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC P0506	Idle Control System RPM Lower Than Expected
DTC P0507	Idle Control System RPM Higher Than Expected

IMMOBILIZER SYSTEM DTCS

IMMOBILIZER DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC U0155	Immobilizer-Keyless Control Unit Lost Communication With Gauge Control Module
DTC U0199	Immobilizer-Keyless Control Unit Lost Communication With Door Multiplex Control Unit
DTC U1282	Immobilizer-Keyless Control Unit Lost Communication With Driver's MICU

INTAKE AIR SYSTEM DTCS

INTAKE AIR DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC P1077	IMT Valve Stuck in High RPM Position
DTC P1078	IMT Valve Stuck in Low RPM Position

KEYLESS ACCESS SYSTEM DTCS

KEYLESS ACCESS DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B12A1	Power Control Unit Internal (CPU) Error
DTC B12C5	Engine Start/Stop Switch Failure
DTC B12C6	Electric Steering Lock Switch C/D Monitor Circuit Failure
DTC B12C7	Electric Steering Lock Motor Circuit Failure
DTC B12D0	Power Control Unit IG1A Circuit Error
DTC B12D1	Power Control Unit IG1B Circuit Error
DTC B12D2	Power Control Unit IG2 Circuit Error
DTC B12D3	Power Control Unit IG Latch Circuit Error
DTC B12E0	Electric Steering Lock Switch Internal Error
DTC B12E1	Electric Steering Lock Motor Internal Error
DTC B12E2	Electric Steering Lock Low Level Failure of MTRCUT1
DTC B12E3	Electric Steering Lock High Level Failure of MTRCUT1
DTC B12E4	Electric Steering Lock High Level Failure of MTRCUT2
DTC B12F0	Power Control Unit Lost Communication With Electric Steering Lock
DTC B12F1	Power Control Unit Lost Communication With Remote Slot Control Unit
DTC B12F2	Power Control Unit Lost Communication With Keyless Access Control Unit

DTC U0155	Power Control Unit Lost Communication With Gauge Control Module
DTC U0199	Power Control Unit Lost Communication With Door Multiplex Control Unit
DTC B1601	Keyless Access Control Unit Internal (CPU) Error
DTC B1602	Keyless Access Control Unit Internal (EEPROM) Error
DTC B1927	MTR CONT Signal Error
DTC B1640	RF Unit Not Connected
DTC B1646	Driver's Door LF Antenna Circuit Open or Short
DTC B1648	Passenger's Door LF Antenna Circuit Open or Short
DTC B1658	Rear Bumper LF Antenna Circuit Open or Short
DTC B1660	Front Interior LF Antenna Circuit Open or Short
DTC B1664	Rear Interior LF Antenna Circuit Open or Short
DTC B1668	Rear Shelf LF Antenna Circuit Open or Short

GENERAL TROUBLESHOOTING INFORMATION

HOW TO CHECK FOR DTCS WITH THE HDS

NOTE: Check the vehicle battery condition first (see BATTERY TEST).

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

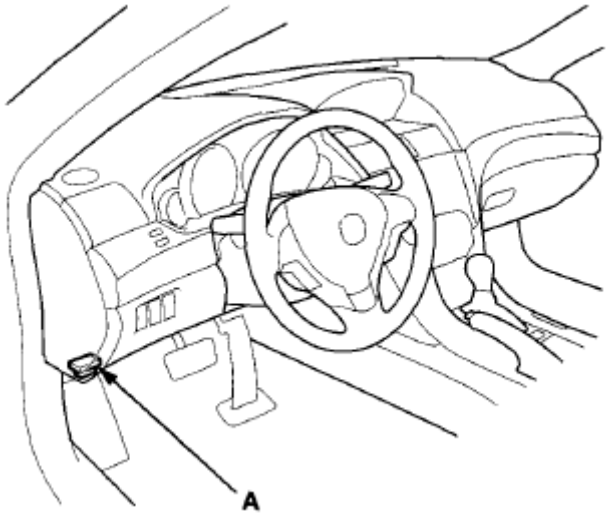

Fig. 2: Locating Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Make sure the HDS communicates with the vehicle and the AcuraLink® control unit (XM receiver). If it does not, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
5. Select XM/HIP in the BODY ELECTRICAL menu.
6. Select DTCs in the XM/HIP menu.
7. Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated **DTC TROUBLESHOOTING**. If no DTCs are indicated, refer to **SYMPTOM TROUBLESHOOTING**.

NOTE:

- **After troubleshooting, clear the DTCs with the HDS.**
- **For specific operations, refer to the user's manual that came with the HDS.**

LEVER-LOCKED CONNECTOR

Disconnecting

To disconnect the connector, pull the lever (A) while pushing the lock tab (B) down, then pull the connector (C).

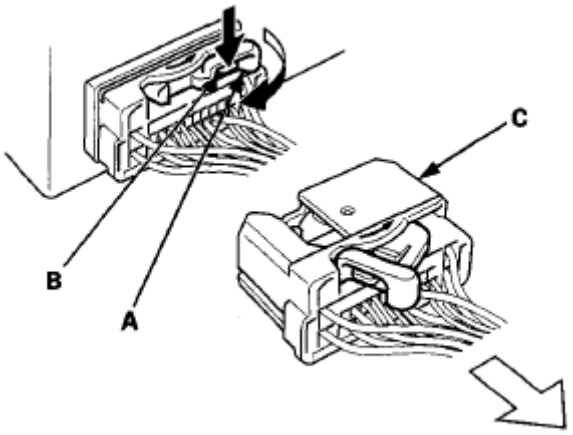

Fig. 3: Disconnecting Lever-Locked Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connecting

To connect the connector, push the connector into the connector sleeve (A). As the connector is pressed in, the lever (B) moves to the locked position.

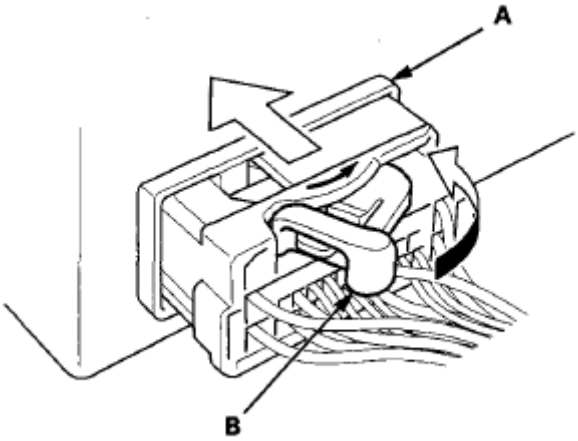

Fig. 4: Connecting Lever-Locked Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DTC TROUBLESHOOTING INDEX

AcuraLink® CONTROL UNIT

DTC	Description	DTC Type
B2240	XM Antenna line failure	Internal error
U0100	F-CAN Lost communication with ECM/PCM	Loss of communication
U0155	F-CAN Lost communication with Gauge Control Module	Loss of communication

U1280	Communication bus line error (BUS-OFF)	Loss of communication
U128D	Lost Communication with Gauge Control Module	Loss of communication

SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic Procedure	Also Check for
AcuraLink® services do not work	Symptom Troubleshooting (see **AcuraLink® SERVICES DO NOT WORK**)	• Blown fuse No. 15(10 A) in the under-hood fuse/relay box and No. 12 (7.5 A), No. 18 (7.5 A) in the driver's under-dash fuse/relay box • Poor ground at G501
AcuraLink® services do not work after replacing the AcuraLink® control unit (XM receiver)		• Call Acura Client Services and request an activation. • Call XM customer service and register the replacement AcuraLink® control unit (XM receiver).
AcuraLink® messages cannot be heard or are weak	Symptom Troubleshooting (see **AcuraLink® MESSAGES CANNOT BE HEARD OR ARE WEAK**)	
Traffic or Weather information is not shown on map screen	Navigation System Symptom Troubleshooting (see **TRAFFIC OR WEATHER INFORMATION IS NOT SHOWN ON MAP SCREEN**)	
AcuraLink® messages cannot be deleted	How to Delete Stored AcuraLink® Messages (see **MESSAGE DELETE PROCEDURE (CLIENT)**)	

SYSTEM DESCRIPTION

AcuraLink® Satellite Communication System uses the client's cell phone or XM radio to transmit and receive information about the vehicle. In addition, the AcuraLink® system is also able to initiate voice or data calls with the HandsFreeLink control unit.

The AcuraLink® control unit (XM receiver) is very similar in design to an XM receiver, but it has additional communication features. The main functions include:

- Receiving and playing XM stations. Displaying station, song title and other information on the audio-HVAC subdisplay using the GA-Net bus.
- Receiving XM traffic channel data.

- Gives Feature Guide tips.
- Receiving AcuraLink® messages and displaying them in the navigation display.
- Processing DTC (diagnostic trouble code) error messages from the ECM/PCM, the SRS, and other systems, and displaying them on the navigation display.
- Sending DTC information to the AcuraLink® servers using the client's cell phone (only if the client has set up and enabled this option).
- Receiving weather data.

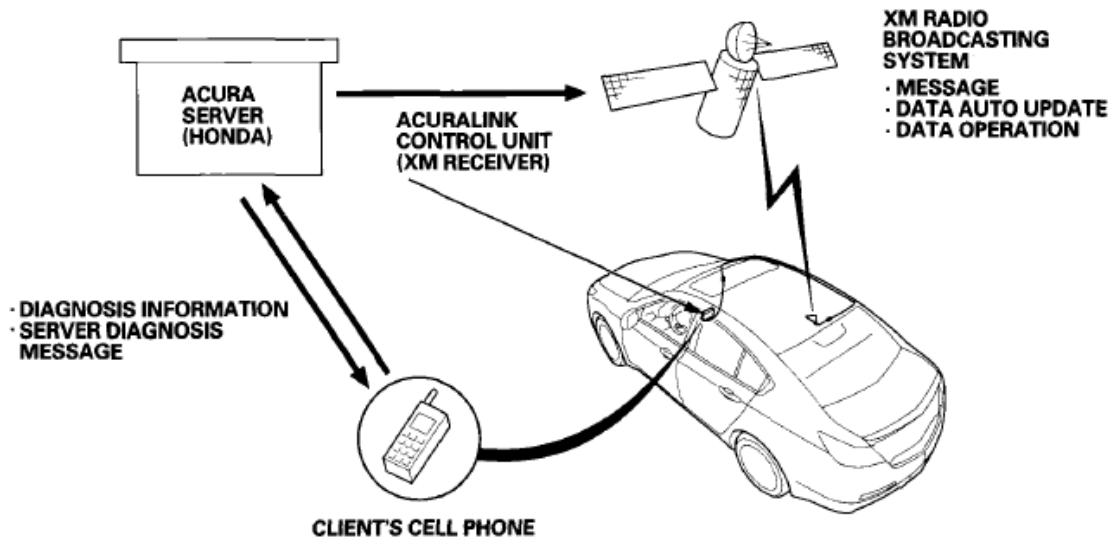

Fig. 5: Identifying AcuraLink® Satellite Communication System Operation
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Service Application

- Malfunction indicator lamp (MIL) explanation (from server message and vehicle message)
- Service information message
- Recall Information
- Quick tips
- Place to provide feedback/view cautions that were not available when vehicle was initially sold
- Correction of address and full name that is registered
- Real time traffic information
- Maintenance information message
- Feature guide (90 days)
- Weather information

HOW TO DELETE STORED ACURALINK® MESSAGES

The AcuraLink® Satellite Communication System stores and displays these types of messages on the navigation system display screen:

- Feature Guide info
- System malfunction info
- Driver warnings
- DTCs
- Quick tips

NOTE:

- **To delete any stored AcuraLink® messages, follow these procedures. The first procedure is for your client. It lets them delete certain types of messages. The second procedure is for technicians. It lets you delete all stored messages.**
- **The diagnostic menu includes a DATA RESET function. Select this only at TQI and when the vehicle changes ownership. It deletes all AcuraLink® messages, log data, and AcuraLink® registration. If you select DATA RESET during the 45-days activation period, the AcuraLink® Feature Guide repeats the first message. AcuraLink® messages related to a repair should be deleted after that repair is done. If you don't delete these messages, they stay in your client's AcuraLink® message log.**

MESSAGE DELETE PROCEDURE (CLIENT)

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Touch OK on the disclaimer screen.
3. Press the INFO button to bring up the Information screen.
4. Use the interface dial to select #1 All Messages.
5. Select the item number you want to delete, then select Delete (if you do not see Delete on the display screen, you cannot remove this message).
6. Select Yes to confirm your choice.

MESSAGE DELETE PROCEDURE (SERVICE TECH)

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Touch OK on the disclaimer screen.
3. Press and hold the DEST/ROUTE, the MAP/GUIDE, and the CANCEL buttons at the same time for 3 seconds more, and the system diagnostic mode begins.

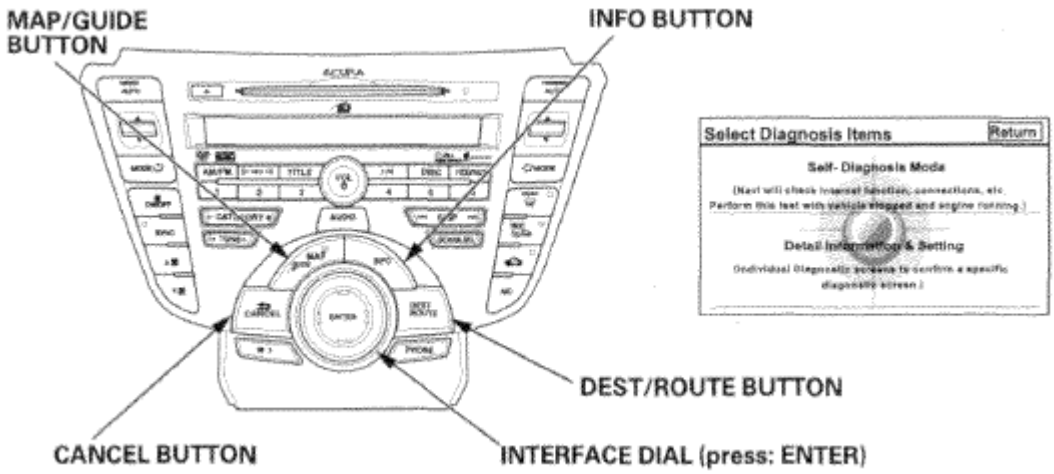

Fig. 6: Identifying Message Delete Procedure Buttons
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Using the interface dial, spinet the XM (HIP) from the Detail Information & Setting, and press the ENTER. Select XM (HIP) Diag (A) front the XM (HIP) System Link.

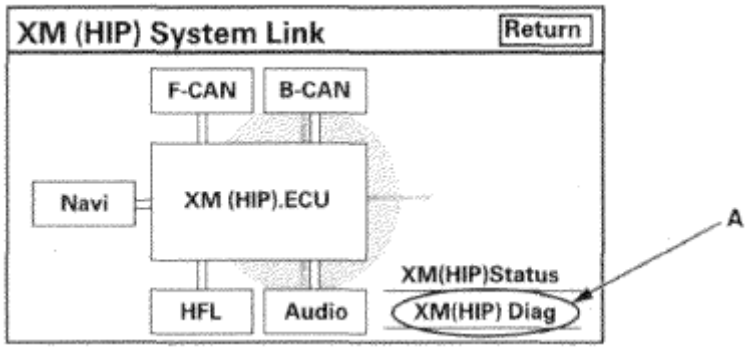

Fig. 7: Identifying XM (HIP) System Link Block Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Select Diagnostic Info.
6. Select the item you want to delete. After the message and date come up, select Delete.
7. Select Yes to confirm your choice.
8. Repeat step 6 and 7 for each message you want to delete.

SELF-DIAGNOSTIC FUNCTION

NOTE: Only select DATA RESET from the XM (HIP) ECU screen when instructed. Selecting DATA RESET will clear the AcuraLink® registration, and the AcuraLink® service resets to the factory default, if the vehicle was already registered for the AcuraLink® service, it will have to be reactivated by calling Acura Client Services before all features are available.

The AcuraLink® control unit (XM receiver) has a self-diagnostic function. To run the self-diagnostic function, do the following:

HOW TO ENTER THE SELF-DIAGNOSTIC FUNCTION

NOTE: Always check for and repair any CAN DTCs before troubleshooting the AcuraLink® system.

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Touch OK on the disclaimer screen.
3. Press and hold the DEST/ROUTE, the MAP/GUIDE, and the CANCEL buttons at the same time for 3 seconds more, and the system diagnostic mode begins.

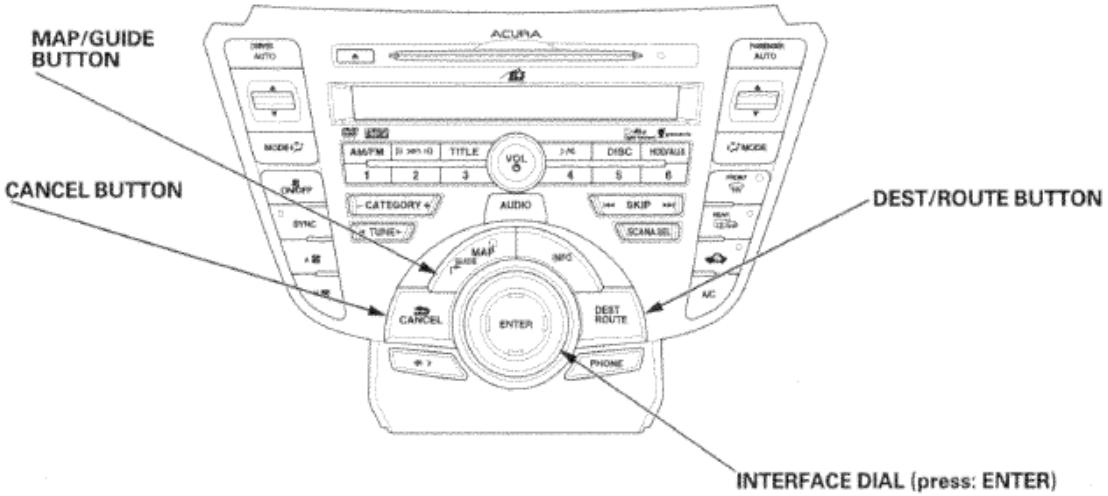

Fig. 15: Identifying Self-Diagnostic Function Buttons
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Using the interface dial, select the Select Diagnosis Items from the Detail Information & Setting, and press the ENTER.

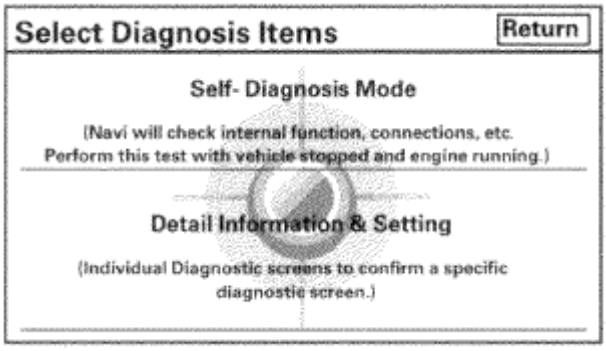

Fig. 16: Screen Display - Select Diagnosis Items (1 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Using the interface dial, select the XM (HIP) from the Detail Information & Setting menu, and press the ENTER.

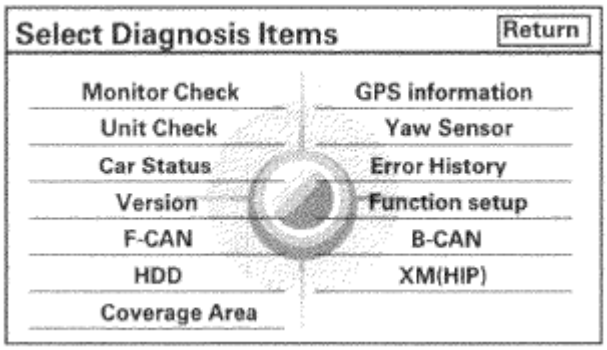

Fig. 17: Screen Display - Select Diagnosis Items (2 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. The display shows the XM (HIP) System Link, and does an AcuraLink® connection check for each device. If a connection is faulty, the place where it is faulty is indicated with NG (red color).

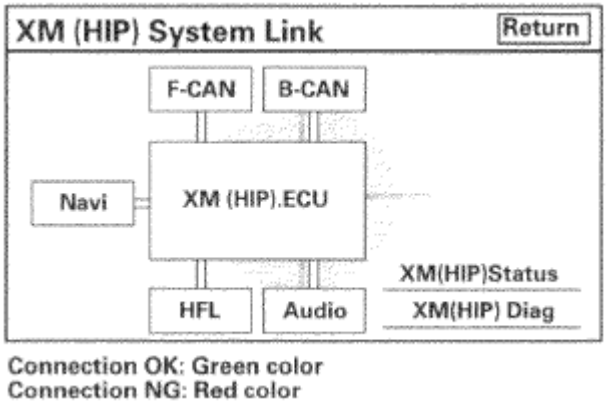

Fig. 18: Screen Display - XM (HIP) System Link Block Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. When red (NG) is indicated, check the continuity between the AcuraLink® control unit (XM receiver) and the device indicated in red.

An open in the wire
	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 6 and EPS control unit connector D (28P) terminal No. 15: There should be continuity.	An open in the wire
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • SH-AWD control unit connector A (20P)'	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 7 and SH-AWD control unit connector A (20P) terminal No. 10: There should be continuity.	An open in the wire
	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 6 and SH-AWD control unit connector A (20P) terminal No. 20: There should be continuity.	An open in the wire
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Steering angle sensor 5P connector(1)	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 7 and steering angle sensor 5P connector terminal No. 10: There should be continuity.	An open in the wire
	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 6 and steering angle sensor 5P connector terminal No. 2: There should be continuity.	An open in the wire

Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Power control unit connector C (36P)	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 7 and power control unit connector C (36P) terminal No. 34: There should be continuity.	An open in the wire
	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 6 and power control unit connector C (36P) terminal No. 35: There should be continuity.	An open in the wire
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • VSA modulator-control unit 47P connector	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 7 and VSA modulator-control unit 47P connector terminal No. 12: There should be continuity.	An open in the wire
	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 6 and VSA modulator-control unit 47P connector terminal No. 13: There should be continuity.	An open in the wire
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • SRS unit connector A (39P)	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 7 and SRS unit connector A (39P) terminal No. 17: There should be continuity.	An open in the wire
	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 6 and SRS unit connector A (39P) terminal No. 16: There should be continuity.	An open in the wire
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Yaw rate-lateral acceleration sensor 4P connector(3) • Yaw rate-lateral/longitudinal	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 6 and No. 7 individually: There should be no continuity.	A short in the wire

acceleration sensor 4P connector(2) • ECM/PCM connector A (49P) • Gauge control module 32P connector • Power control unit connector C (36P) • TPMS control unit 20P connector • VSA modulator-control unit 47P connector • SRS unit connector A (39P) • EPS control unit connector D (28P) • SH-AWD control unit connector A (20P)(2) • Steering angle sensor 5P connector(2) • Audio-navigation unit connector H (28P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 1 and No. 7 individually: There should be no continuity.	A short to power in the wire
	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 1 and No. 6 individually: There should be no continuity.	A short to power in the wire
Disconnect these items: • Yaw rate-lateral acceleration sensor 4P connector(3) • Yaw rate-lateral/longitudinal acceleration sensor 4P connector(2) • ECM/PCM connector A (49P) • Gauge control module 32P connector • Power control unit connector C (36P) • TPMS control unit 20P connector • VSA modulator-control unit 47P	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 6 and No. 7 individually: There should be no continuity.	A short in the AcuraLink® control unit (XM receiver)

connector • SRS unit connector A (39P) • EPS control unit connector D (28P) • SH-AWD control unit connector A (20P)(2) • Steering angle sensor 5P connector(2) • Audio-navigation unit connector H (28P)		
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • ECM/PCM connector A (49P) • Gauge control module 32P connector • Power control unit connector C (36P) • TPMS control unit 20P connector • VSA modulator-control unit 47P connector • SRS unit connector A (39P) • EPS control unit connector D (28P) • SH-AWD control unit connector A (20P)(2) • Steering angle sensor 5P connector(2) • Audio-navigation unit connector H (28P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 6 and No. 7 individually: There should be no continuity.	A short in the yaw rate-lateral acceleration sensor(3) or yaw rate-lateral/longitudinal acceleration sensor(2)
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P)		

	• Yaw rate-lateral acceleration sensor 4P connector(3) • Yaw rate-lateral/longitudinal acceleration sensor 4P connector(3) • Gauge control module 32P connector • Power control unit connector C (36P) • TPMS control unit 20P connector • VSA modulator-control unit 47P connector • SRS unit connector A (39P) • EPS control unit connector D(28P) • SH-AWD control unit connector A (20P)(2) • Steering angle sensor 5P connector(2) • Audio-navigation unit connector H (28P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 6 and No. 7 individually: There should be no continuity.	A short in the ECM/PCM
	Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Yaw rate-lateral acceleration sensor 4P connector(3) • Yaw rate-lateral/longitudinal acceleration sensor 4P connector(2) • ECM/PCM connector A (49P) • Gauge control module 32P connector	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P)	A short in EPS control

• Power control unit connector C (36P) • TPMS control unit 20P connector • VSA modulator-control unit 47P connector • SRS unit connector A (39P) • SH-AWD control unit connector A (20P)(2) • Steering angle sensor 5P connector(2) • Audio-navigation unit connector H (28P)	terminals No. 6 and No. 7 individually: There should be no continuity.	unit
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Yaw rate-lateral acceleration sensor 4P connector(3) • Yaw rate-lateral/longitudinal acceleration sensor 4P connector(2) • ECM/PCM connector A (49P) • Power control unit connector C (36P) • TPMS control unit 20P connector • VSA modulator-control unit 47P connector • SRS unit connector A (39P) • EPS control unit connector D (28P) • SH-AWD control unit connector A (20P)(2)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 6 and No. 7 individually: There should be no continuity.	A short in the gauge control module

• Steering angle sensor 5P connector(2) • Audio-navigation unit connector H (28P)		
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Yaw rate-lateral acceleration sensor 4P connector(3) • Yaw rate-lateral/longitudinal acceleration sensor 4P connector(2) • ECM/PCM connector A (49P) • Gauge control module 32P connector • Power control unit connector C (36P) • VSA modulator-control unit 47P connector • SRS unit connector A (39P) • EPS control unit connector D (28P) • SH-AWD control unit connector A (20P)(2) • Steering angle sensor 5P connector(2) • Audio-navigation unit connector H 28P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 6 and No. 7 individually: There should be no continuity.	A short in the TPMS control unit
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Yaw rate-lateral acceleration sensor 4P		

connector(3) • Yaw rate-lateral/longitudinal acceleration sensor 4P connector(2) • ECM/PCM connector A (49P) • Gauge control module 32P connector • Power control unit connector C (36P) • TPMS control unit 20P connector • SRS unit connector A (39P) • EPS control unit connector D (28P) • SH-AWD control unit connector A (20P)(2) • Steering angle sensor 5P connector(2) • Audio-navigation unit connector H (28P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 6 and No. 7 individually: There should be no continuity.	A short in the VSA modulator-control unit
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Yaw rate-lateral acceleration sensor 4P connector(3) • Yaw rate-lateral/longitudinal acceleration sensor 4P connector(2) • ECM/PCM connector A (49P) • Gauge control module 32P connector • Power control unit connector C (36P) • TPMS control unit	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 6 and No. 7 individually: There should be no continuity.	A short in the SRS unit

	20P connector • VSA modulator-control unit 47P connector • EPS control unit connector D (28P) • SH-AWD control unit connector A (20P)(2) • Steering angle sensor 5P connector(2) • Audio-navigation unit connector H (28P)		
F-CAN	Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Yaw rate-lateral acceleration sensor 4P connector(3) • Yaw rate-lateral/longitudinal acceleration sensor 4P connector(2) • ECM/PCM connector A (49P) • Gauge control module 32P connector • Power control unit connector C (36P) • TPMS control unit 20P connector • VSA modulator-control unit 47P connector • SRS unit connector A (39P) • EPS control unit connector D (28P) • SH-AWD control unit connector A (20P)(2) • Steering angle sensor	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 6 and No. 7 individually: There should be no continuity.	A short in the audio-navigation unit

5P connector(2)		
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Yaw rate-lateral acceleration sensor 4P connector(3) • Yaw rate-lateral/longitudinal acceleration sensor 4P connector(2) • ECM/PCM connector A (49P) • Gauge control module 32P connector • Power control unit connector C (36P) • TPMS control unit 20P connector • VSA modulator-control unit 47P connector • SRS unit connector A (39P) • EPS control unit connector D (28P) • Steering angle sensor 5P connector(2) • Audio-navigation unit connector H (28P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 6 and No. 7 individually: There should be no continuity.	A short in the SH-AWD control unit(2)
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Yaw rate-lateral acceleration sensor 4P connector(3) • Yaw rate-lateral/longitudinal acceleration sensor 4P		

connector(2) • ECM/PCM connector A (49P) • Gauge control module 32P connector • Power control unit connector C (36P) • TPMS control unit 20P connector • VSA modulator-control unit 47P connector • SRS unit connector A (39P) • EPS control unit connector D (28P) • SH-AWD control unit connector A (20P)(2) • Audio-navigation unit connector H (28P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 6 and No. 7 individually: There should be no continuity.	A short in the steering angle sensor(2)
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Yaw rate-lateral acceleration sensor 4P connector(3) • Yaw rate-lateral/longitudinal acceleration sensor 4P connector(2) • ECM/PCM connector A (49P) • Gauge control module 32P connector • TPMS control unit 20P connector • VSA modulator-control unit 47P connector • SRS unit connector A	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 6 and No. 7 individually: There should be no continuity.	A short in the power control unit

	(39P) • EPS control unit connector D (28P) • SH-AWD control unit connector A (20P)(2) • Steering angle sensor 5P connector(2) • Audio-navigation unit connector H (28P)		
	Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Driver's under-dash fuse/relay box connector P (20P)	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 9 and driver's under-dash fuse/relay box connector P (20P) terminal No. 6: There should be continuity.	An open in the wire
		Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 8 and driver's under-dash fuse/relay box connector P (20P) terminal No. 5: There should be continuity.	An open in the wire
	Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Passenger's under-dash fuse/relay box connector A (38P)	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 9 and passenger's under-dash fuse/relay box connector A (38P) terminal No. 6: There should be continuity.	An open in the wire

Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Power control unit connector A (36P)	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 9 and power control unit connector C (36P) terminal No. 16: There should be continuity.	An open in the wire
	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 8 and power control unit connector C (36P) terminal No. 17: There should be continuity.	An open in the wire
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Remote slot control unit 40P connector	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 9 and remote slot control unit 40P connector terminal No. 3: There should be continuity.	An open in the wire
	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 8 and remote slot control unit 40P connector terminal No. 23: There should be continuity.	An open in the wire
Disconnect these items: • AcuraLink® control unit (XM receiver)	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 9 and keyless access control unit connector B (32P) terminal No. 8: There should be continuity.	An open in the wire

connector A (32P) • Keyless access control unit connector B (32P)	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 8 and keyless access control unit connector B (32P) terminal No. 7: There should be continuity.	An open in the wire
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Driver's under-dash fuse/relay box connector P (20P) • Passenger's under-dash fuse/relay box connector A (38P) • Power window master switch 37P connector • Gauge control module 32P connector • BSI control unit 16P connector • Power seat control unit connector A (40P) • Climate control unit connector C (20P) • Audio-navigation unit connector D (36P) • Power control unit connector C (36P) • Remote slot control unit 40P connector • Keyless access control unit connector B (32P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 8 and No. 9 individually: There should be no continuity.	A short in the wire
	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 1 and No. 8 individually: There should be no continuity.	A short to power in the wire
	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 1 and No. 9 individually: There should be no continuity.	A short to power in the wire
Disconnect these items: • Driver's under-dash fuse/relay box connector P (20P) • Passenger's under-dash fuse/relay box		

connector A (38P) • Power window master switch 37P connector • Gauge control module 32P connector • BSI control unit 16P connector • Power seat control unit connector A (40P) • Climate control unit connector C (20P) • Audio-navigation unit connector D (36P) • Power control unit connector C (36P) • Remote slot control unit 40P connector • Keyless access control unit connector B (32P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 8 and No. 9 individually: There should be no continuity.	A short in the AcuraLink® control unit (XM receiver)
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Passenger's under-dash fuse/relay box connector A (38P) • Power window master switch 37P connector • Gauge control module 32P connector • BSI control unit 16P connector • Power seat control unit connector A (40P) • Climate control unit connector C (20P) • Audio-navigation unit connector D (36P) • Power control unit	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 8 and No. 9 individually: There should be no continuity.	A short in the driver's under-dash fuse/relay box

connector C (36P) • Remote slot control unit 40P connector • Keyless access control unit connector B (32P)		
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Driver's under-dash fuse/relay box connector P (20P) • Power window master switch 37P connector • Gauge control module 32P connector • BSI control unit 16P connector • Power seat control unit connector A (40P) • Climate control unit connector C (20P) • Audio-navigation unit connector D (36P) • Power control unit connector C (36P) • Remote slot control unit 40P connector • Keyless access control unit connector B (32P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 8 and No. 9 individually: There should be no continuity.	A short in the passenger's under-dash fuse/relay box
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Driver's under-dash fuse/relay box connector P (20P) • Passenger's under-dash fuse/relay box		

connector A (38P) • Gauge control module 32P connector • BSI control unit 16P connector • Power seat control unit connector A (40P) • Climate control unit connector C (20P) • Audio-navigation unit connector D (36P) • Power control unit connector C (36P) • Remote slot control unit 40P connector • Keyless access control unit connector B (32P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 8 and No. 9 individually: There should be no continuity.	A short in the door multiplex control unit (built into the power window master switch)
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Driver's under-dash fuse/relay box connector P (20P) • Passenger's under-dash fuse/relay box connector A (38P) • Power window master switch 37P connector • BSI control unit 16P connector • Power seat control unit connector A (40P) • Climate control unit connector C (20P) • Audio-navigation unit connector D (36P) • Power control unit connector C (36P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 8 and No. 9 individually: There should be no continuity.	A short in the gauge control module

• Remote slot control unit 40P connector • Keyless access control unit connector B (32P)		
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Driver's under-dash fuse/relay box connector P (20P) • Passenger's under-dash fuse/relay box connector A (38P) • Power window master switch 37P connector • Gauge control module 32P connector • Power seat control unit connector A (40P) • Climate control unit connector C (20P) • Audio-navigation unit connector D (36P) • Power control unit connector C (36P) • Remote slot control unit 40P connector • Keyless access control unit connector B (32P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 8 and No. 9 individually: There should be no continuity.	A short in the BSI control unit
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Driver's under-dash fuse/relay box connector P (20P) • Passenger's under-dash fuse/relay box		

connector A (38P) • Power window master switch 37P connector • Gauge control module 32P connector • BSI control unit 16P connector • Climate control unit connector C (20P) • Audio-navigation unit connector D (36P) • Power control unit connector C (36P) • Remote slot control unit 40P connector • Keyless access control unit connector B (32P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 8 and No. 9 individually: There should be no continuity.	A short in the power seat control unit
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Driver's under-dash fuse/relay box connector P (20P) • Passenger's under-dash fuse/relay box connector A (38P) • Power window master switch 37P connector • Gauge control module 32P connector • BSI control unit 16P connector • Power seat control unit connector A (40P) • Audio-navigation unit connector D (36P) • Power control unit connector C (36P) • Remote slot control	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 8 and No. 9 individually: There should be no continuity.	A short in the climate control unit

unit 40P connector • Keyless access control unit connector B (32P)		
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Driver's under-dash fuse/relay box connector P (20P) • Passenger's under-dash fuse/relay box connector A (38P) • Power window master switch 37P connector • Gauge control module 32P connector • BSI control unit 16P connector • Power seat control unit connector A (40P) • Climate control unit connector C (20P) • Power control unit connector C (36P) • Remote slot control unit 40P connector • Keyless access control unit connector B (32P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 8 and No. 9 individually: There should be no continuity.	A short in the audio-navigation unit
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Driver's under-dash fuse/relay box connector P (20P) • Passenger's under-dash fuse/relay box connector A (38P)		

• Power window master switch 37P connector • Gauge control module 32P connector • BSI control unit 16P connector • Power seat control unit connector A (40P) • Climate control unit connector C (20P) • Audio-navigation unit connector D (36P) • Remote slot control unit 40P connector • Keyless access control unit connector B (32P)	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 8 and No. 9 individually: There should be no continuity.	A short in the power control unit
Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Driver's under-dash fuse/relay box connector P (20P) • Passenger's under-dash fuse/relay box connector A (38P) • Power window master switch 37P connector • Gauge control module 32P connector • BSI control unit 16P connector • Power seat control unit connector A (40P) • Climate control unit connector C (20P) • Audio-navigation unit connector D (36P) • Power control unit	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 8 and No. 9 individually: There should be no continuity.	A short in the remote slot control unit

	connector C (36P) • Keyless access control unit connector B (32P)		
B-CAN	Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Driver's under-dash fuse/relay box connector P (20P) • Passenger's under-dash fuse/relay box connector A (38P) • Power window master switch 37P connector • Gauge control module 32P connector • BSI control unit 16P connector • Power seat control unit connector A (40P) • Climate control unit connector C (20P) • Audio-navigation unit connector D (36P) • Power control unit connector C (36P) • Remote slot control unit 40P connector	Check for continuity between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 8 and No. 9 individually: There should be no continuity.	A short in the keyless access control unit
		Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 19 and audio-navigation unit connector H (28P) terminal No. 22: There should be continuity.	An open in the wire
		Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 20 and audio-navigation unit connector H (28P) terminal No. 9: There should be continuity.	An open in the wire

Disconnect these items: • AcuraLink® control unit (XM receiver) connector A (32P) • Audio-navigation unit connector H (28P)	Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 17 and audio-navigation unit connector H (28P) terminal No. 23: There should be continuity. (1) With SH-AWD

(2) With SH-AWD

(3) Without SH-AWD

NOTE:

If the XM antenna connection condition is faulty, XM ANTENNA is indicated on the audio-navigation switch panel display.

8. If the indication does not go away, confirm DTCs, and refer to the relevant system troubleshooting and input tests.

Canceling the Self-Diagnostic Function

Use the interface dial, select the Exit Diag. Press the interface dial to cancel the self-diagnostic function.

DTC TROUBLESHOOTING

DTC B2240: XM ANTENNA LINE FAILURE

1. Connect the HDS to the DLC (see **HOW TO CHECK FOR DTCS WITH THE HDS**).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and then back to ON (II), or the ON mode and wait 30 seconds or more.
4. Check for DTC with the HDS.

   Is DTC B2240 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the XM antenna is OK at this time. Check for poor connections or loose terminals at the AcuraLink® control unit (XM receiver) and the XM antenna.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check for poor connections or loose terminals at AcuraLink® control unit (XM receiver) connector B (2P) and the XM antenna 2P connector.

   Are the connections or terminals OK?

   YES -Go to step 7.

   NO -Repair poor connections or loose terminals, and recheck the DTC.

7. Substitute a known-good XM antenna (see **XM ANTENNA REPLACEMENT**).
8. Clear the DTC with the HDS.
9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and then back to ON (II), or the ON mode and wait 30 seconds or more.
10. Check for DTC with the HDS.

    Is DTC B2240 indicated?

    YES -Update the AcuraLink® control unit (see **AcuraLink® CONTROL UNIT UPDATE**) if it does not have the latest software. If the software is the latest, replace the original AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT (XM RECEIVER)**

REMOVAL/INSTALLATION).

NO -Replace the original XM antenna (see **XM ANTENNA REPLACEMENT**).

DTC U0100: F-CAN LOST COMMUNICATION WITH ECM/PCM

1. Connect the HDS to the DLC (see **HOW TO CHECK FOR DTCS WITH THE HDS**).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and then back to ON (II), or the ON mode.
4. Check for DTC with the HDS.

   Is DTC U0100 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the F-CAN communication line is OK at this time. Check for poor connections or loose terminals at the AcuraLink® control unit (XM receiver).

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect AcuraLink® control unit (XM receiver) connector A (32P).
7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector A (49P).
9. Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 6 and No. 7 and ECM/PCM connector A (49P) terminals No. 49 and No. 48 respectively.

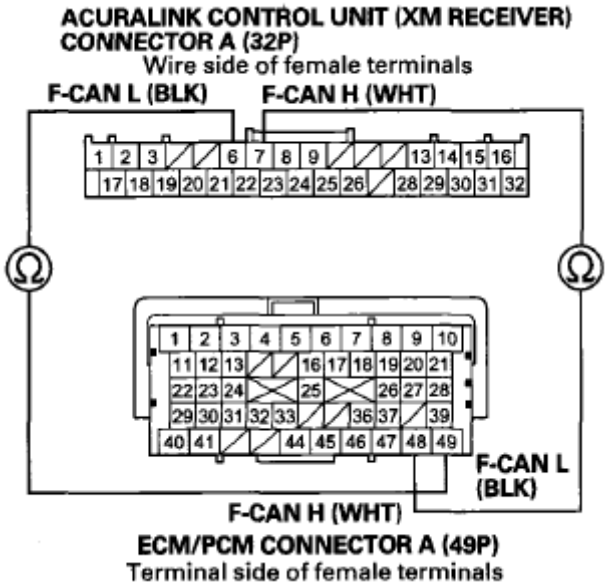

Fig. 19: Checking For Continuity Between AcuraLink® Control Unit (XM Receiver) & ECM With 32P & 49P Connector End Views

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Check for poor connections or loose terminals at the AcuraLink® control unit (XM receiver). If OK, Update the AcuraLink® control unit (see **AcuraLink® CONTROL UNIT UPDATE**) if it does not have the latest software. If the software is the latest, replace the AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT UPDATE**).

NO -Repair an open in the wire between the AcuraLink® control unit (XM receiver) and the ECM/PCM.

DTC U0155: F-CAN LOST COMMUNICATION WITH GAUGE CONTROL MODULE

1. Connect the HDS to the DLC (see **HOW TO CHECK FOR DTCS WITH THE HDS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Check for DTCs with the HDS and DTC log data in the navigation system diagnostic mode (see **SELF-DIAGNOSTIC FUNCTION**).

   Is DTC U0155 indicated with HDS and on the navigation display?

   YES -Go to step 4.

   NO -Intermittent failure, the F-CAN communication line is OK at this time. Check for poor connections or loose terminals at the AcuraLink® control unit (XM receiver).

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect AcuraLink® control unit (XM receiver) connector A (32P) and the gauge control module 32P connector.
6. Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 6 and No. 7 and gauge control module 32P connector terminals No. 13 and No. 14 respectively.

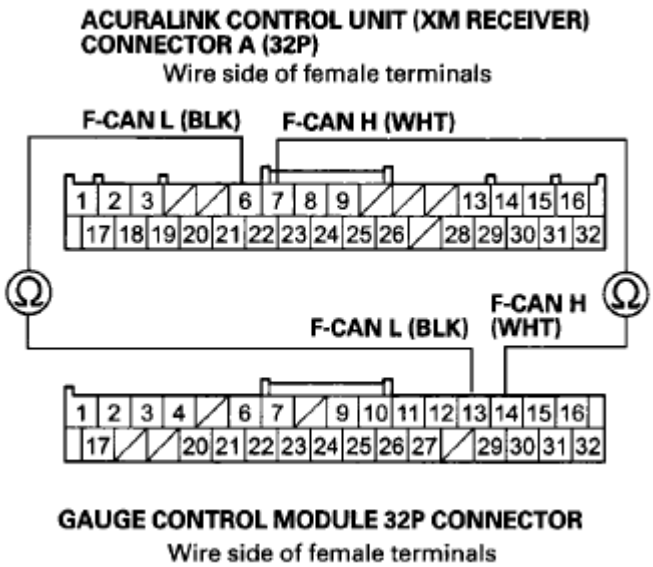

Fig. 20: Checking For Continuity Between AcuraLink® Control Unit (XM Receiver) & Gauge Control Module
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Check for poor connections or loose terminals at the AcuraLink® control unit (XM receiver). If OK, Update the AcuraLink® control unit (see **AcuraLink® CONTROL UNIT UPDATE**) if it does not have the latest software. If the software is the latest, replace the AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT UPDATE**).

NO -Repair an open in the wire between the AcuraLink® control unit (XM receiver) and the gauge control module.

DTC U128D: LOST COMMUNICATION WITH GAUGE CONTROL MODULE

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN system diagnosis test mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Connect the HDS to the DLC (see **HOW TO CHECK FOR DTCS WITH THE HDS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Check for DTCs with the HDS and DTC log data in the navigation system diagnostic mode (see **SELF-DIAGNOSTIC FUNCTION**).

Is DTC U128D indicated with HDS and on the navigation display?

YES -Go to step 4.

NO -Intermittent failure, the B-CAN communication line is OK at this time. Check for poor connections

or loose terminals at the AcuraLink® control unit (XM receiver).

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect AcuraLink® control unit (XM receiver) connector A (32P) and the gauge control module 32P connector.
6. Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 8 and No. 9 and gauge control module 32P connector terminals No. 29 and No. 30 respectively.

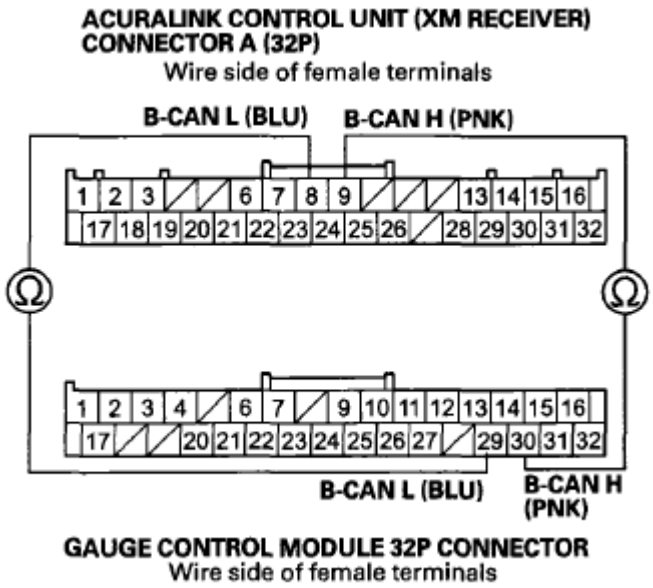

Fig. 21: Checking For Continuity Between AcuraLink® Control Unit (XM Receiver) & Gauge Control Module
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Check for poor connections or loose terminals at the AcuraLink® control unit (XM receiver). If OK, Update the AcuraLink® control unit (see **AcuraLink® CONTROL UNIT UPDATE**) if it does not have the latest software. If the software is the latest, replace the AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT UPDATE**).

NO -Repair an open in the wire between the AcuraLink® control unit (XM receiver) and the gauge control module.

SYMPTOM TROUBLESHOOTING

ACURALINK® SERVICES DO NOT WORK

NOTE:

- **In order for the AcuraLink® service to work, the client must have an activated account with XM (receives at least channels, 000, 001, 174, and 247).**

- **Verify the client account status by calling XM Radio at 800-852-9696.**

1. Check the No. 15 (10 A) fuse in the under-hood fuse/relay box and the No. 12 (7.5 A) fuse and the No. 18 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Are the fuses OK?

   YES -Go to step 2.

   NO -Replace the fuse(s), and recheck. If the fuse(s) blows again, check for a short in the No. 15 (10 A) fuse and/or the No. 12 (7.5 A) fuse and/or the No. 18 (7.5 A) fuse circuits.

2. Turn the ignition switch to ACCESSORY (I), or press the engine start/stop button to select the ACC mode.
3. Measure the voltage between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 3 and body ground.

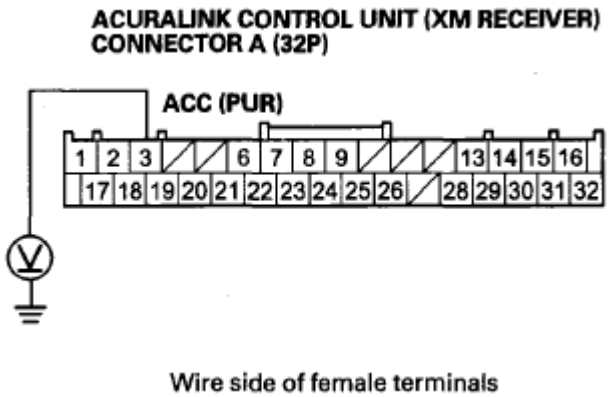

Fig. 22: Measuring Voltage Of AcuraLink® Control Unit (XM Receiver) Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES -Go to step 4.

   NO -Repair an open in the wire(s) between the AcuraLink® control unit (XM receiver) and the No. 18 (7.5 A) fuse in the driver's under-dash fuse/relay box.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Measure the voltage between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 2 and body ground.

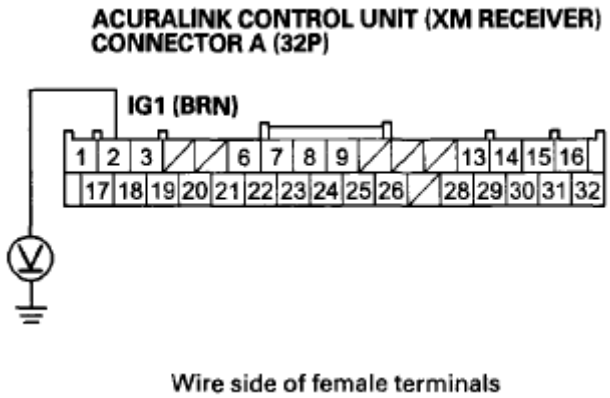

Fig. 23: Measuring Voltage Of AcuraLink® Control Unit (XM Receiver) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 6.

NO -Repair an open in the wire(s) between the AcuraLink® control unit (XM receiver) and the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box.

6. Measure the voltage between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 28 and body ground.

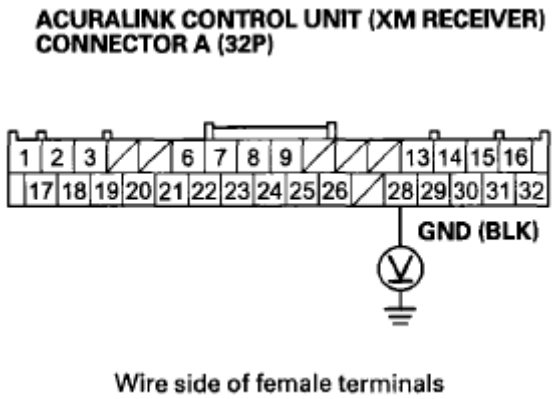

Fig. 24: Measuring Voltage Of AcuraLink® Control Unit (XM Receiver) Terminal No. 28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Check for poor connections or loose terminals at the AcuraLink® control unit (XM receiver). If OK, Update the AcuraLink® control unit (see **AcuraLink® CONTROL UNIT UPDATE**) if it does not have the latest software. If the software is the latest, replace the AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT UPDATE**).

NO -Repair an open or high resistance in the wire between the AcuraLink® control unit (XM receiver) and body ground (G501) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

ACURALINK® MESSAGES CANNOT BE HEARD OR ARE WEAK

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check that the audio system is operating normally and the speaker sound levels are normal from different audio sources (AM/FM, XM, CD/DVDs, navigation, etc.).

   Does the audio system work normally and is the audio output from the speaker normal when playing various audio sources?

   YES -Go to step 3.

   NO -Refer to the audio system **SYMPTOM TROUBLESHOOTING**.

3. Check the audio system when AcuraLink® messages are played.

   Does the audio system mute when AcuraLink® messages are being played?

   YES -If audio system mutes and plays the messages at a normal volume, the system is OK at this time. If the messages are weaker than normal, go to step 4.

   NO -Check for B-CAN codes. Repair any B-CAN codes, then recheck. If there are no B-CAN codes, substitute a known-good AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect AcuraLink® control unit (XM receiver) connector A (32P) and audio-navigation unit connector H (28P).
6. Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) and audio-navigation unit connector H (28P) according to the table.

AcuraLink® control unit (XM receiver) connector	Audio-navigation unit connector	Wire color
A17	H23	WHT
A18	H10	RED
A19	H22	GRN
A20	H9	BLK

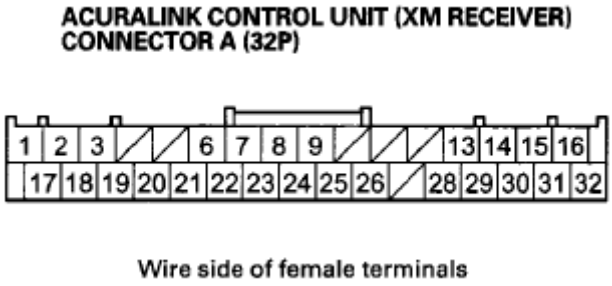

Fig. 25: AcuraLink® Control Unit (XM Receiver) 32P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

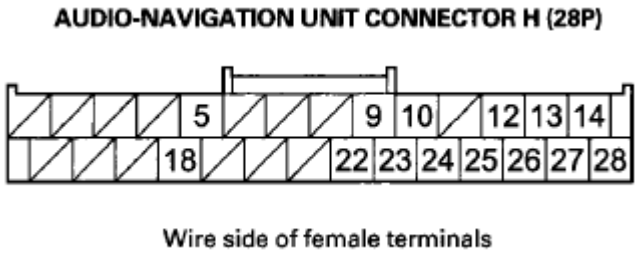

Fig. 26: Audio-Navigation Unit 28P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 7.

NO -There is an open in the wire(s) between the AcuraLink® control unit (XM receiver) and the audio-navigation unit. Replace the affected shielded harness.

7. Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) and body ground according to the table.

AcuraLink® control unit (XM receiver) connector	Wire color
A17	WHT
A18	RED
A19	GRN
A20	BLK

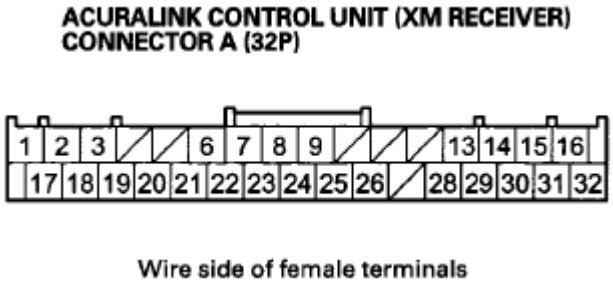

Fig. 27: AcuraLink® Control Unit (XM Receiver) 32P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is short to body ground in the wire(s) between the AcuraLink® control unit (XM receiver) and the audio-navigation unit. Replace the affected shielded harness.

NO -Go to step 8.

8. Check for continuity between the terminal of AcuraLink® control unit (XM receiver) connector A (32P) according to the table.

From terminal	To terminals
A17 (WHT)	A18 (RED), A19 (GRN), A20 (BLK), A21 (GRY)
A18 (RED)	A19 (GRN), A20 (BLK), A21 (GRY)
A19 (GRN)	A20 (BLK), A21 (GRY)
A20 (BLK)	A21 (GRY)

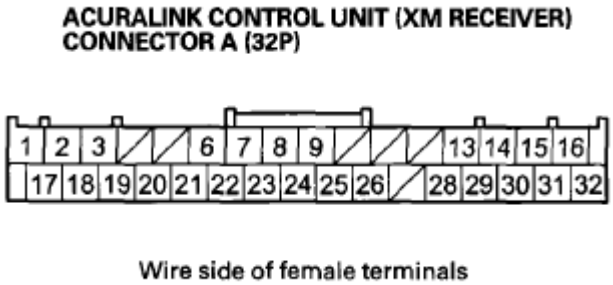

Fig. 28: AcuraLink® Control Unit (XM Receiver) 32P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wires between the AcuraLink® control unit (XM receiver) and the audio-navigation unit. Replace the affected shielded harness.

NO -Go to step 9.

9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Measure the voltage between AcuraLink® control unit (XM receiver) connector A (32P) and body ground according to the table.

AcuraLink® control unit (XM receiver) connector	Wire color
A17	WHT
A18	RED
A19	GRN
A20	BLK

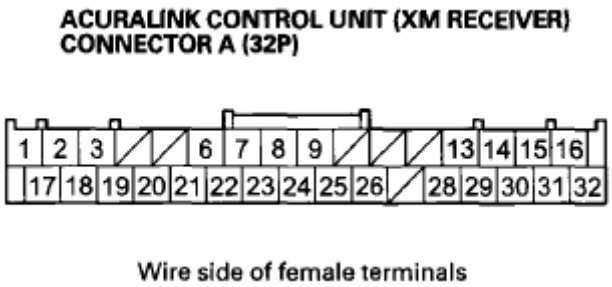

Fig. 29: AcuraLink® Control Unit (XM Receiver) 32P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 11.

NO -There is a short to power in the wire(s) between the AcuraLink® control unit (XM receiver) and the audio-navigation unit. Replace the affected shielded harness.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Reconnect audio-navigation unit connector H (28P).
13. Substitute a known-good AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

Does the problem go away?

YES -Update the AcuraLink® control unit (see **AcuraLink® CONTROL UNIT UPDATE**) if it does not have the latest software. If the software is the latest, replace the AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT UPDATE**).

NO -Replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

ACURALINK® CONTROL UNIT UPDATE

Special Tools Required

- GNA600 and an in workstation with HDS and CM update software
- 256MB PCMCIA Memory Card
- AcuraLink® Reprogramming Cable

NOTE:

- **Before you update an AcuraLink® control unit, read the procedure. The order of connecting and disconnecting connectors is critical, and some steps must be done within a specified period of time. If the steps are not followed exactly, you may have to repeat the procedure from the start, and in some cases, you may damage the GNA600 or the AcuraLink® control unit.**
- **Whenever you install a new AcuraLink® control unit, you must update the AcuraLink® control unit with the latest software.**
- **The GNA600 is the only tool currently available to update the AcuraLink® control unit.**
- **If you are updating a AcuraLink® control unit in a new vehicle, make sure all the fuses are installed.**
- **Make sure the in workstation has the latest HDS software installed (The AcuraLink® update software is contained in the HDS update CD.).**
- **The update may take up to 60 minutes.**
- **You cannot update an AcuraLink® control unit with its current or previous software versions. It will only accept a new software version.**
- **Before you update the AcuraLink® control unit, test the vehicle battery (see BATTERY TEST), and only proceed if the results are good. Make sure the battery is connected to a battery booster (not a battery charger) while updating the AcuraLink® control unit. If the battery is not in good condition, or it dies during the updating procedure, you may damage the AcuraLink® control unit.**
- **If you encounter errors in the software, follow the on-screen instructions, or if necessary, reboot the in workstation, and try again.**
- **There are five process involved in updating the AcuraLink® control unit:**
  - **Setting up the GNA600**
  - **Capturing the current program ID from the AcuraLink® control unit**
  - **Download the new software to the GNA600**
  - **Update the software in the vehicle's AcuraLink® control unit**
  - **Confirm the AcuraLink® self-diagnosis**
- **While updating the AcuraLink® control unit, do not turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.**
- **To prevent damage to the AcuraLink® control unit, do not operate anything electrical (brakes, head lights, etc.) during the update.**
- **Check any official Honda service website for more service information**

about updating the AcuraLink® control unit.

- **To update the AcuraLink® control unit, you must connect the GNA600 to the AcuraLink® connector (A), not the DLC.**

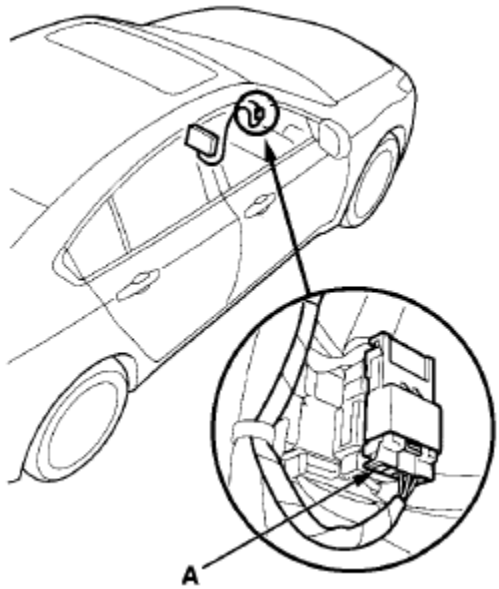

Fig. 30: Identifying AcuraLink® Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

1. Make sure the ignition switch is in LOCK (0), or engine start/stop button is in the OFF mode.
2. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
3. Launch the AcuraLink® Update program, and follow the on-screen instructions to complete the update.

NOTE:

- **If the software in the AcuraLink® control unit is the latest, disconnect the update tool from the AcuraLink® connector.**
- **If the update is part of a troubleshooting or a repair procedure, return to that procedure and continue troubleshooting or repairing the vehicle.**

GENERAL TROUBLESHOOTING INFORMATION

LEVER-LOCKED CONNECTOR

Disconnecting

To disconnect the connector, pull the lever (A) while pushing the lock tab (B) down, then pull the connector (C).

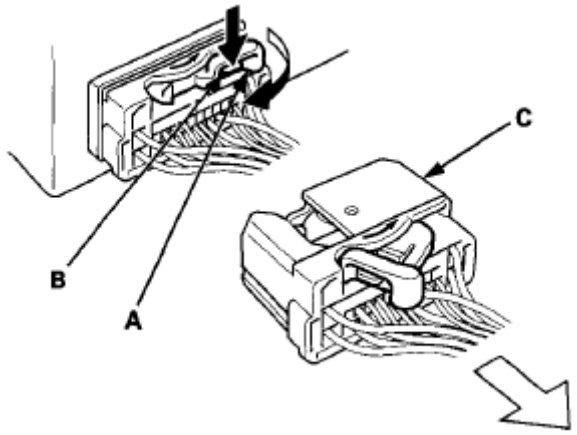

Fig. 3: Disconnecting Lever-Locked Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connecting

To connect the connector, push the connector into the connector sleeve (A). As the connector is pressed in, the lever (B) moves to the locked position.

Bluetooth cell phone audio function SKIP and PAUSE/RESUME do not work (without navigation)	HFL Symptom Troubleshooting (see **BLUETOOTH CELL PHONE AUDIO FUNCTION SKIP AND PAUSE/RESUME DO NOT WORK (WITHOUT NAVIGATION)**)	(For further information, please contact cell phone carrier or the cell phone manufacturer.) Bluetooth phone (Some Bluetooth phones do not support the function.)

SYSTEM DESCRIPTION

OVERVIEW

The audio unit acts as the processor for all audio functions. Select audio functions from the audio unit buttons or the audio remote switch (on the steering wheel). The center display provides the current audio status.

The audio unit has a built-in EEPROM (electrically erasable programmable read-only memory). This memory

holds the audio presets (AM/FM radio frequency, sound settings, etc.) even when the battery is disconnected.

A security signal is daisy-chained between the audio and vehicle components for integration into the vehicle's security system.

There are two audio systems available for the TL:

- The ELS audio system is available on vehicles with navigation. It includes surround sound with 10 speakers.
- The premium audio system is on vehicles without navigation. It includes 8 speakers.

Disc Playback Types	ELS Audio System	Premium Audio System
CD (CD-DA)	o	o
CD-R/RW (uncompressed)	o	o
CD-R/RW (MP3/WMA)	o	o
DVD-Audio	o	X
DVD-Video	X	X
DVD-R/RW (uncompressed)	o	X
DTS CD	o	X
o: Available X: Not available		

HDD Recording (with navigation)

The navigation system uses a HDD (hard disc drive) and can store music. To record music to the HDD, you must use an original CD or uncompressed CD-R files. The music must be loaded on a CD using the CD player. You cannot load music through the USB adapter or auxiliary jack.

Song By Voice™ (with navigation)

You can use the voice control to operate the audio system, including the Song By Voice™ feature. See the Navigation Owner's Manual for more information.

Speed-Sensitive Volume Compensation (SVC)

All audio systems are equipped with speed-sensitive volume compensation (SVC). The audio-navigation unit or the audio unit receives the vehicle speed pulse (VSP) from the ECM/PCM. The system processes the speed input and increases the navigation or the audio system volume level as the vehicle speed increases to compensate for the interior noise that occurs at higher speeds. When the vehicle slows down, the volume returns to its normal level. The SVC has four settings: SVC OFF, SVC LOW, SVC MID, and SVC HIGH that can be adjusted using the audio-navigation unit or the audio unit. The factory default setting is SVC MID.

Telematics Muting Logic

The navigation system provides voice control for the audio, the XM, the USB, the Bluetooth audio, and the CD/DVD player functions. Voice control commands are communicated through the GA-Net (audio unit). When

using the TALK/BACK buttons or route guidance (RG), the center speaker is muted and you hear the navigation instructions through the front speakers. When using the HFL/AcuraLink®, the center speaker, the rear speakers, and the subwoofer are muted and the front speakers give the telephone sound. When using the HFL/AcuraLink® and the RG (Route Guidance) or the TALK/BACK buttons, the rear speakers are muted and you hear the telephone sound and navigation instructions through the front speakers. Muting commands are passed on the GA-Net bus. For more information, see the navigation information. The outline of the audio interruption function is shown in the following table.

Contents	Audio Output				
	Center CH	Left Front CH	Right Front CH	Right Rear CH	Left Rear CH
Pressing TALK/BACK buttons	Navigation output	MUTE	MUTE	MUTE	MUTE
Route Guidance (RG)	Navigation output and audio	Audio	Audio	Audio	Audio
HFL/AcuraLink®	MUTE	Telephone sound	Telephone sound	MUTE	MUTE
HFL/AcuraLink® and RG	Navigation output	Telephone sound	Telephone sound	MUTE	MUTE

Bluetooth Audio

Bluetooth audio allows approved Bluetooth cell phones equipped with music function to play music via a car audio system using Bluetooth technology. You can control the phone's music player remotely using the wireless connection.

- You can play music stored in your cell phone using the wireless connection*1 .
- You can choose next song, previous song and resume/pause via wireless*2 .

*1: Call phone must support AVRCP 1.0, A2DP 1.0 for Bluetooth technology, and also be on the Acura approved HFL list at www.acura.com/handsfreelink.

*2: Not all phones support the Bluetooth audio function.

Supported Devices

- Bluetooth music phones that support AVRCP 1.0/A2DP 1.0.
- Bluetooth adapters for portable music devices including iPod are not supported.

NOTE:

- **Availability of the functions depends on the connected device.**
- **The latest support information is updated through the website www.acura.com/handsfreelink.**

Pairing a Cell Phone

To pair a cell phone, refer to pairing a cell phone in the HandsFreeLink system (see **NAVIGATION THROUGH HFL MENUS**). Once a cell phone is paired, the process does not have to be repeated for the phone.

HOW TO PLAY THE BLUETOOTH AUDIO

Procedure

1. Press the HDD/AUX button (A) or the AUX button (B) to select Bluetooth Audio source.

NOTE:

- **If you press the HDD/AUX button or the AUX button when no cell phone is connected, NO CONNECT is displayed.**
- **If you see NO CONNECT when you are using the cell phone music function, check that the device is properly paired. If it is paired, the cell phone may not be compatible. See www.acura.com/handsfreelink for more information.**
- **Music titles and artist names are not displayed.**

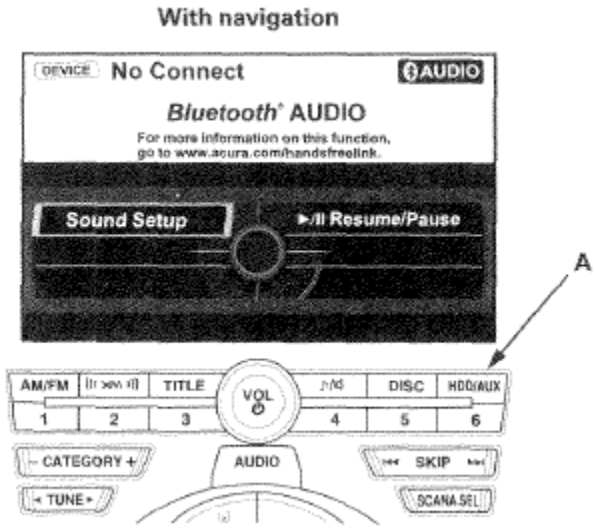

Fig. 5: Screen Display - Bluetooth (With Navigation And No Connection)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

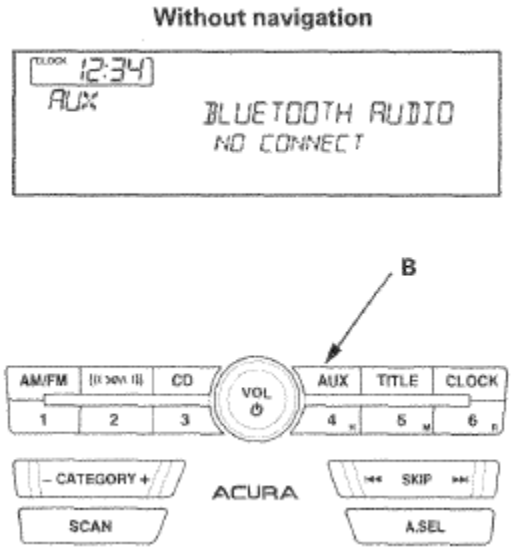

Fig. 6: Screen Display - Bluetooth (Without Navigation And No Connection)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Start playing the music in the paired cell phone.

NOTE: Depending on the cell phone, the music may start automatically, or the user may need to select headset as an audio output.

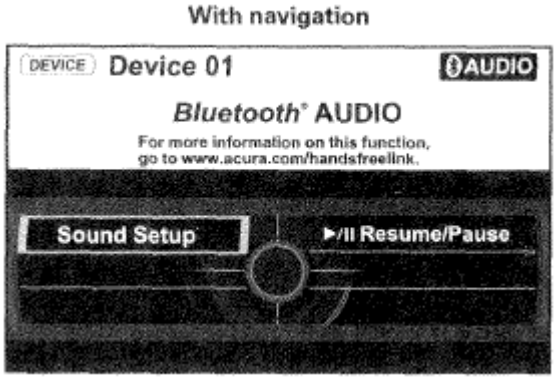

Fig. 7: Screen Display - Bluetooth (With Navigation And Connection)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

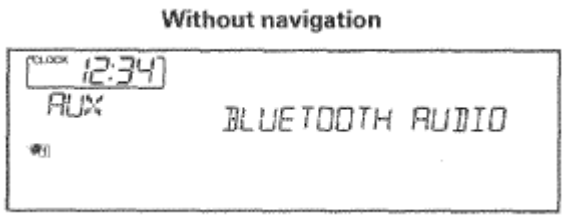

Fig. 8: Screen Display - Bluetooth (Without Navigation And Connection)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. A user can select the next song or the previous song using the SKIP button (A).

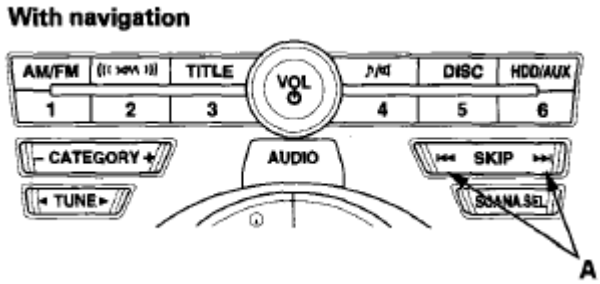

Fig. 9: Identifying Skip Button (With Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

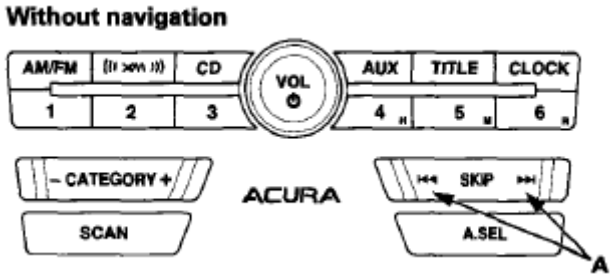

Fig. 10: Identifying Skip Button (Without Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. With navigation, using the interface dial (A) to select [Sound Setup] or [RESUME/PAUSE].

   Without navigation, using the Setup button (B) to select audio settings (RESUME/PAUSE and sound settings).

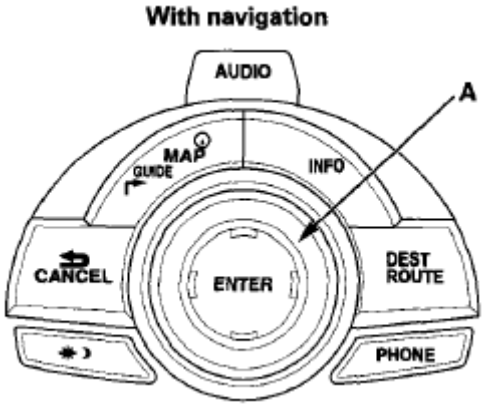

Fig. 11: Identifying Interface Dial
Courtesy of AMERICAN HONDA MOTOR CO., INC.

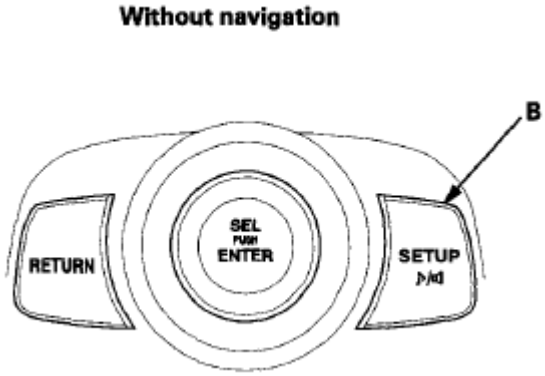

Fig. 12: Identifying Setup Button
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. To turn the Bluetooth audio mode off, select another audio mode (AM/FM, XM, CD/DVD, or USB).

Disc Handing and Cleaning

To avoid damaging or leaving fingerprints on a disc (CD, DVD, DVD-A, etc.), always handle it by the edges and place it in a jewel case whenever it is outside the audio or the audio-navigation unit. Deep scratches or fingerprints on the back of the disc can cause loading problems, poor sound quality, skipping, or other errors.

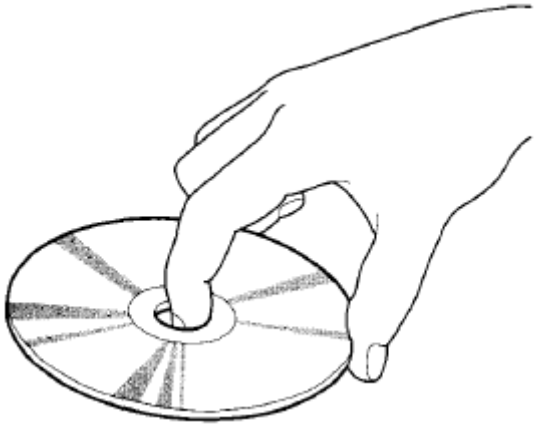

Fig. 13: Handling Disc By Hand
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Smudges and fingerprints can be carefully removed using a mild cleaner and tissues designed to clean eyeglasses. To clean a disc, use a clean soft cloth. Very gently wipe across the disc from the center to the outside edge, never in a circular motion.

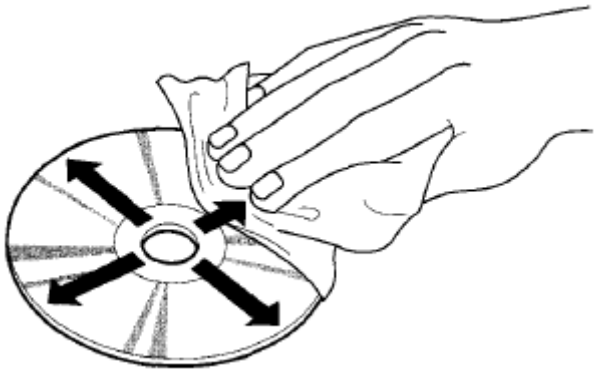

Fig. 14: Cleaning Disc Using Soft Cloth
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Do not place stabilizer rings or labels on the disc.

With Navigation

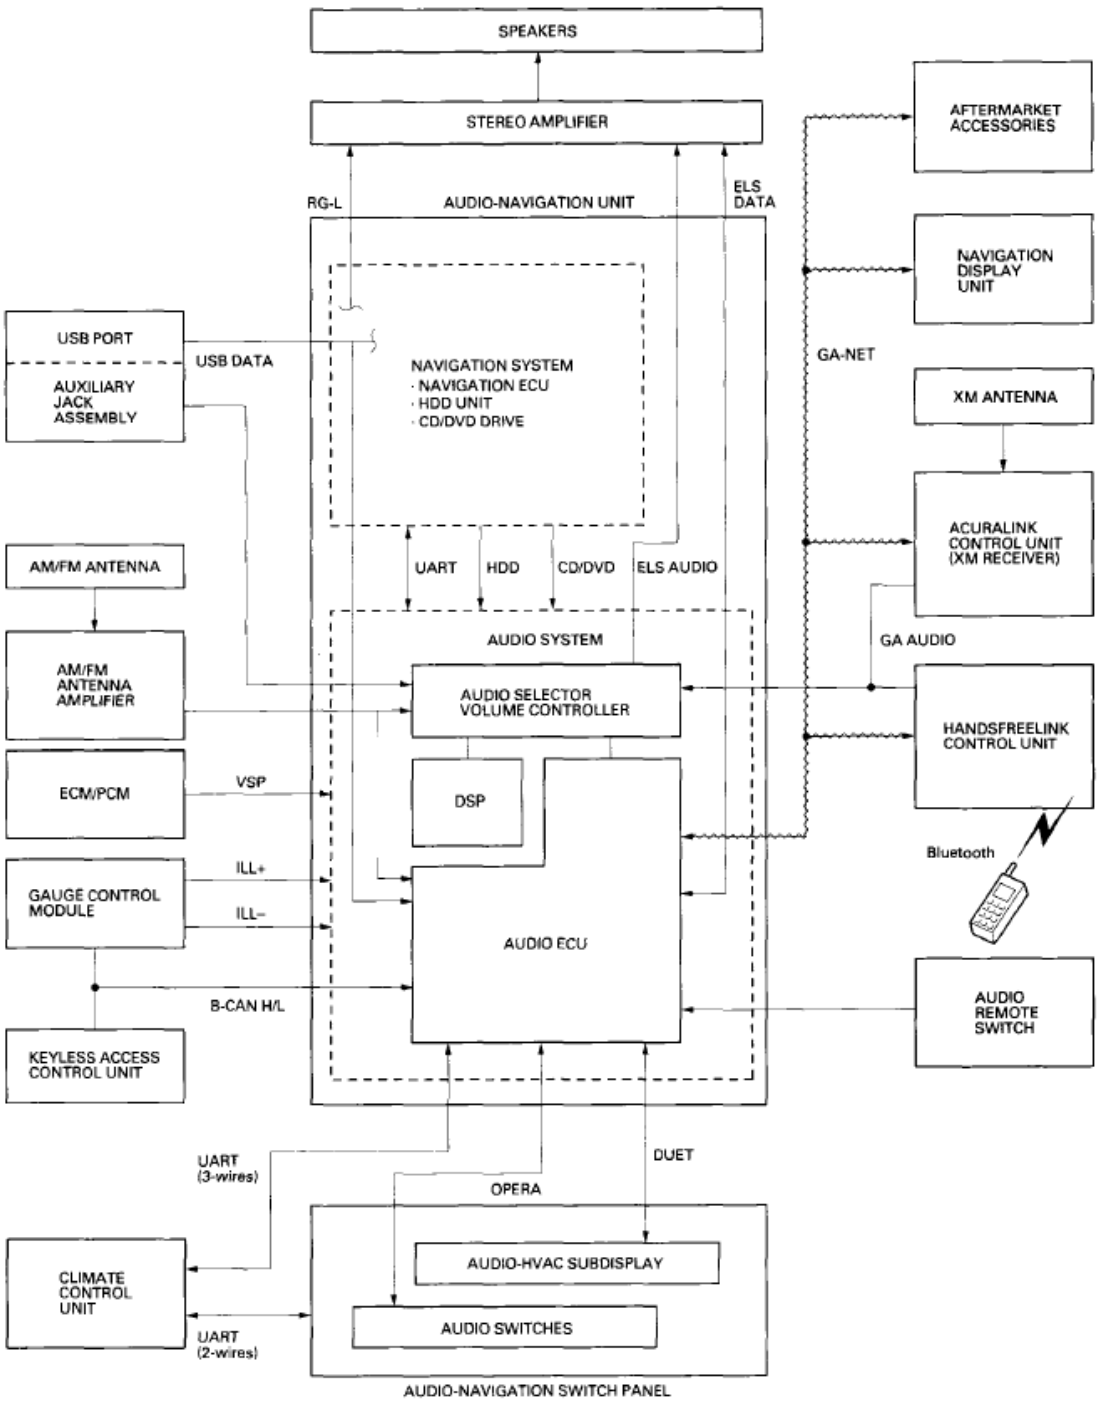

Fig. 15: Audio System Circuit Diagram (1 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Without Navigation

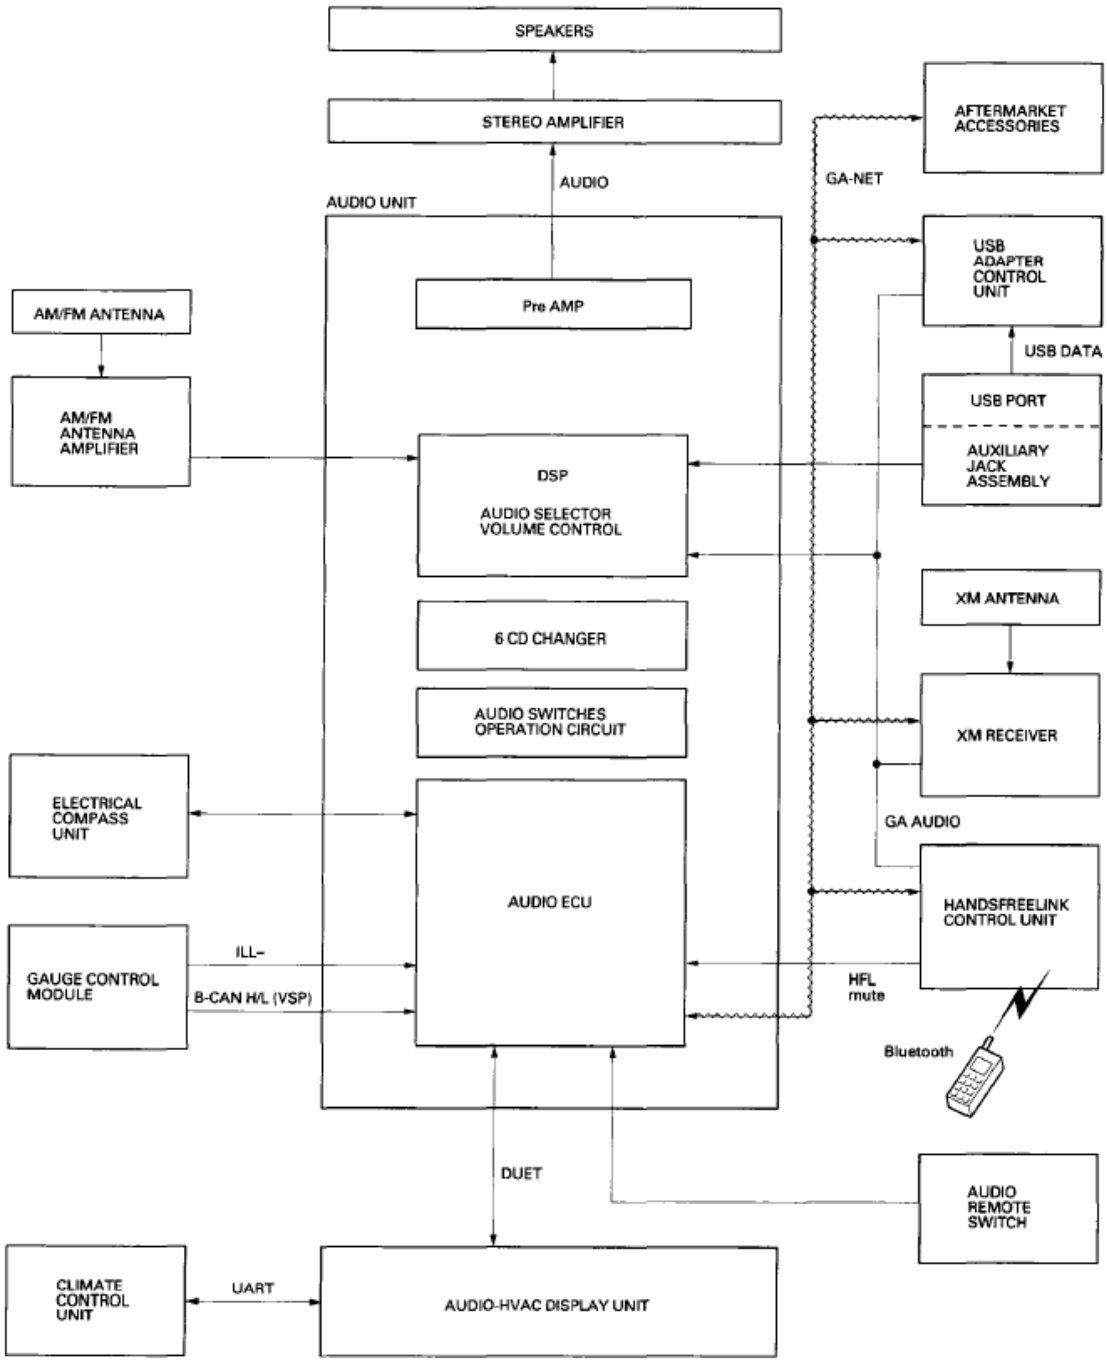

Fig. 16: Audio System Circuit Diagram (2 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Audio Glossary

NOTE: All items may not apply to this vehicle. See the Owner's Manual for more information.

Item	Definition
Active noise cancellation	The active noise cancellation system cancels some of the vehicle noise. This occurs in the 1, 500-2, 400 RPM range. Microphones detect the low frequency sound, and the system outputs a canceling sound from the audio speaker.
Active sound control	The next generation of sound control that reduces unwanted sound in the passenger compartment.
AcuraLink®	This device receives information from the XM satellites and passes XM audio information to the audio system. In addition, traffic and weather information is sent to the navigation system.
AM (Amplitude Modulation)	The type of transmission used in the standard radio broadcast band from 530 to 1, 710 kHz.
Amplifier	A device that increases the level of a signal by increasing the current or voltage.
Antenna	A device used to send or receive electromagnetic waves through the air.
ATA (PC Card)	A type of card that has been tested for use in playing WMA and MP3 music files in the PC card slot.
Audio remote switch	The switches on the steering wheel that control the audio system.
Auxiliary jack	Allows the client to use a portable audio device to input audio recordings.
Balance	A control that changes the relative volume of the left and right channels.
Band	A range of frequencies between two definite limits. Bands are assigned by the Federal Communications Commission for specific uses.
Bass	An adjustment for the low frequency sounds of around 160 Hz and below.
Bluetooth Audio	Allows the client to play audio recordings stored on their cell phone through the audio system.
Byte	A unit of storage for computer files and memory. A CD holds approximately 700 million bytes.
Cassette	Audio or video magnetic tape container having two reels. Customer can insert it for play back.
Compact flash	A standard for small-size (3x4 cm), memory cards used in mobile computers, PDAs, and digital cameras. Compact flash memory cards are available in size of 32 MB up to 4 GB or more and can be played in the audio PC slot. Sizes above 1 GB have not been tested.
CD (Compact Disc)	A 4.5-inch plastic disc containing digital audio recording that is played optically on a laser equipped player. Never use discs with a paper label. In a hot vehicle, labels can curl up and jam the unit.
CD (audio disc) changer	CD player that can store and play more than one CD. Two types are available. Some units accept CDs fed into the changer one at a time, and others accept a magazine (with CDs stacked in a container).
CD player	A component designed to play compact disc recordings using a laser optical pickup. The signal from a CD player usually requires amplification.
CSF (Cold Start Fix) screens	These screens are displayed if the system requires a GPS initialization. The vehicle should be moved outside into an open area away from buildings/power lines.
dB (Decibels)	A method of measuring sound or radio signal strength received by the audio unit antenna.
Distortion	Inexact reproduction of an audio signal caused by playing music at levels the audio

	system cannot handle, you will typically hear this as static, pops, or crackles.
Dolby (noise reduction)	A processing system developed by Dolby Laboratories that reduces the background noise on recording media. The result is a cleaner playback from the audio system.
DUET	A serial data communication line used for sub display.
DVD (Digital Versatile Disc)	A 4.5-inch CD-like format used for storing movies with digital audio and video features. The DVD-A format is a DVD format designed for DVD audio systems. Some vehicles can play DVD and DVD-A formats.
Equalizer	A device that changes the relative volume of individual frequency bands to suit personal tastes of the listener.
Fader	The control that adjusts the relative volume levels of front and rear speakers in a four-speaker system.
Format	To prepare a PC card to receive files this function is done on a PC. Always choose either FAT or FAT32, as the NTFS format is not accepted by the system. Pick the default sectors for the format method selected.
FM (Frequency Modulation)	The form of modulation used for radio and television sound transmission in most of the world. Less prone to interference than AM. The FM broadcast band in North America covers roughly 87.7 to 107.9 MHz.
GA-Net	The GA-Net allows the audio unit to communicate with all the audio and navigation components in a vehicle. If there is an open in the GA-Net or components, the entire audio and navigation system may appear inoperative.
GB (Gigabyte)	A unit of memory or disc storage equal to one billion bytes (1, 000 million bytes).
HDD	Hard disc drive. The navigation does not use a DVD, but uses a hard drive to contain the navigation software. Can be updated with a CD or DVD that is inserted into the audio disc slot.
Hertz (Hz)	The unit of frequency equal to one cycle per second (cps). One kilohertz (kHz) equals 1, 000 cps; one megahertz (MHz) equals 1 million cps.
Integrated amplifier	A component that combines a pre amp and a power amp into a single unit. A receiver combines an integrated amp and a tuner into a single unit.
Jewel case	The hard plastic case that contains a compact disc or DVD. Always use a jewel case to prevent scratches on the underside of a CD or DVD.
LCD (Liquid Crystal Display)	A type of digital display that changes reflectance or transmittance when an electrical field is applied to it.
Memory	Circuitry or devices that hold information in electrical or magnetic form, such as the AM/FM radio presets.
MB (Megabyte)	One million bytes. Written as 1 MB. Megabytes are used as a measure of digital storage space. For example, a CD can hold 650 MB.
Mic	An abbreviation for microphone. For vehicles with navigation, the microphone accepts navigation voice commands to control audio and navigation functions.
MP3 music files	MP3 is an audio coding format. MP3 is a popular audio compression format on the Internet and computers. CDs and PC cards with these files can be played on some vehicle's audio system.
Mute	When the navigation gives guidance, the front speakers are muted (no music). When you use the voice control system, all of the speakers are muted.
Noise	Unwanted random sounds like buzzing, hiss, pops, static, whine, etc.

PC card	The slot used for playing MP3 and WMA music files. The PC card is usually a combination of a small flash card in a PCMCIA adaptor that slides into the slot. The ATA, SD, and compact flash types of cards have been tested up to 1 GB.
PCMCIA	A computer standard for the slot that the PC card slides into. Another term for the PC card slot.
Processor	The part of an audio device that performs tasks/calculations. In the audio unit, the processor handles muting to allow the navigation system to speak its voice commands, and the decoding/playback of the sound files, etc.
Radio	A head unit that combines a tuner, a preamplifier, and often a power-amplifier.
Route guidance (RG)	Spoken voice used for turn-by-turn navigation from the audio speakers.
Stereo	A recording of at least two channels where you can hear sound or music from the left or right side.
SD (Secure Digital) card	This compact type of memory card allows for fast data transfer and has built-in security functions. SD cards have a small write-protection switch on the side.
Shield	A metallic foil or braided wire layer surrounding conductors which are designed to prevent electrostatic or electromagnetic interference (noise) from external sources which you hear as buzzing or popping sounds which you hear on the speakers.
Speaker (Loudspeaker)	A device that converts electrical energy into acoustical energy (sound).
Speed-sensitive volume compensation (SVC)	The SVC increases the audio volume to compensate for increased interior noise when the vehicle is driven at freeway speeds.
Subwoofer	A loudspeaker made to reproduce the lowest audio frequencies, from about 25 Hz to 125 Hz.
Track	A sound recording on a CD, tape, or PC card.
Treble	An adjustment to control the volume of the high frequency sounds.
Tuner	A component (or part of a component) that receives radio signals and selects one broadcast from many.
Tweeter	A speaker designed to reproduce the higher frequencies (treble) only.
USB	Universal serial bus. The USB is used for playing audio files (MP3, WMA, AAC, etc.) on the external device through the audio unit.
USB port	Allows the clients to play data such as input audio recording from portable audio devices (such as iPod) or data from USB flash memory.
Voice coil	A coil of wire wrapped around a tube and then attached to the speaker cone or diaphragm. When an audio signal is applied, the coil becomes an electromagnet and interacts with the permanent magnet causing the cone or diaphragm to vibrate. We interpret these vibrations as sound.
Volume control	Allows you to control the loudness of the music.
WMA music file	Windows Media Audio Pile. This is an accepted format for music files to be played on either a CD-R, a CD-RW, or a PC card.
Woofer	A speaker that is designed to reproduce low (bass) frequencies only.
XM radio	Satellite based radio transmission, which also uses a ground based repeater network to ensure seamless reception. The channels originate from XM's broadcast center, in Washington DC, and uplink to two satellites. These satellites transmit the

	signal across the entire continental United States.
XM receiver	The external component that receives and processes the XM signals from the XM satellites, and terrestrial (land) stations. The audio unit communicates to the XM receiver over the GA-Net bus.

AUDIO UNIT CONNECTOR FOR INPUTS AND OUTPUTS (WITH NAVIGATION)

Audio-navigation unit

NOTE: Refer to the navigation system information for audio-navigation unit connector G, H, and J inputs and outputs (see NAVIGATION UNIT CONNECTOR FOR INPUTS AND OUTPUTS).

SELF-DIAGNOSTIC FUNCTION

HOW TO OBTAIN THE AUDIO UNIT SERIAL NUMBER

NOTE: This procedure can only be done after the power has been disconnected and reconnected to the audio unit, and the audio unit displays CODE when the audio unit is turned on.

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

2. Make sure the audio system is turned off.
3. Push and hold the preset No. 1 and No. 6 buttons.
4. While holding the buttons, push the VOLUME/POWER knob to on.
5. Release the buttons, and the self-diagnosis begins.

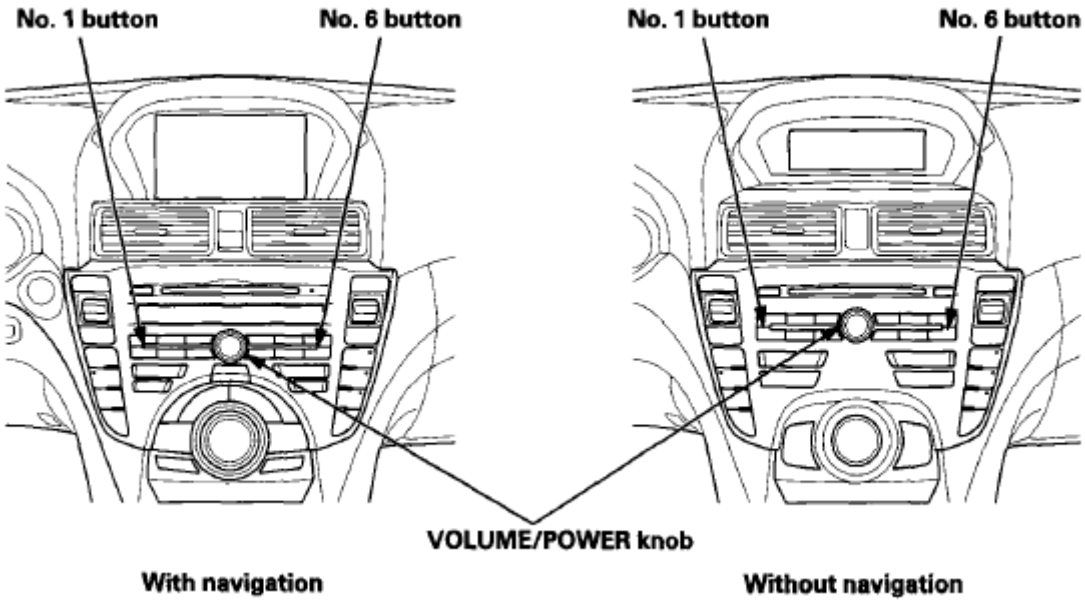

Fig. 59: Identifying Audio Unit Serial Number Button Procedure (With Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. The display shows an 8 digit serial number.

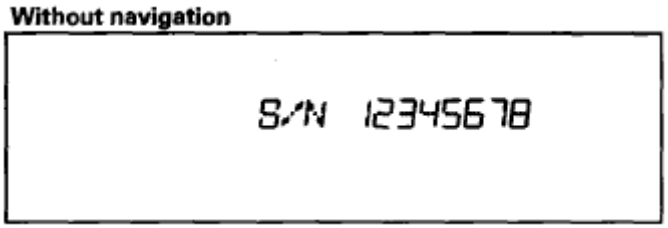

Fig. 61: Screen Display - Audio Unit Serial Number (With Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Use all 8 numbers as the serial number when using the Interactive Network (iN) to retrieve the 5 digit anti-theft code.

8. To end the self-diagnostic function, turn the audio system off, or turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

HOW TO CHECK THE AUDIO SYSTEM CONDITION

The audio system has a self-diagnostic function to help find problems with the audio system. To run the self-diagnostic function, do the following:

NOTE:

- **Not all self-diagnostic functions appear on all models.**
- **There may be other self-diagnostic functions that are for factory use only.**
- **The self-diagnostic function does not find every problem with the audio system. Check any official Honda service website for more information about the audio system.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Make sure the audio system is turned off.
3. Push and hold the preset No. 1 and No. 6 buttons.
4. While holding the buttons, push the VOLUME/POWER knob to on.
5. Release the buttons, and the self-diagnosis begins.

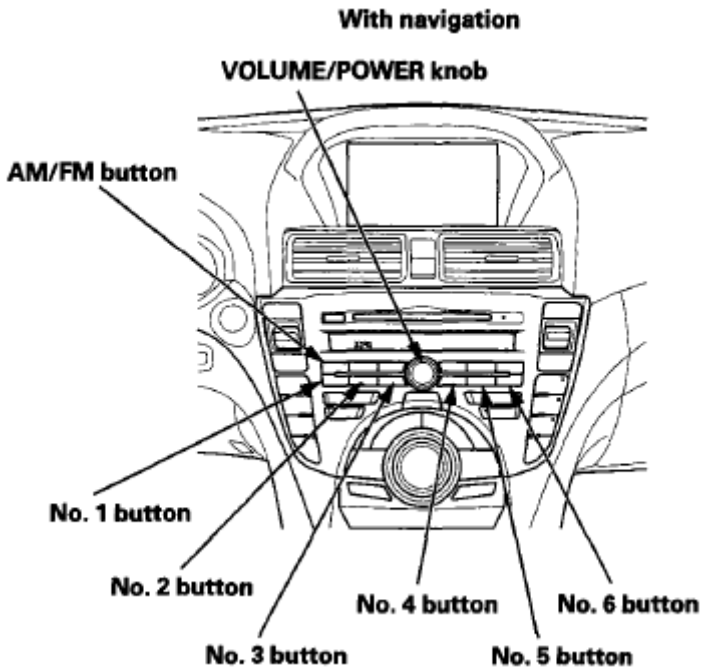

Fig. 62: Identifying Audio System Buttons (With Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

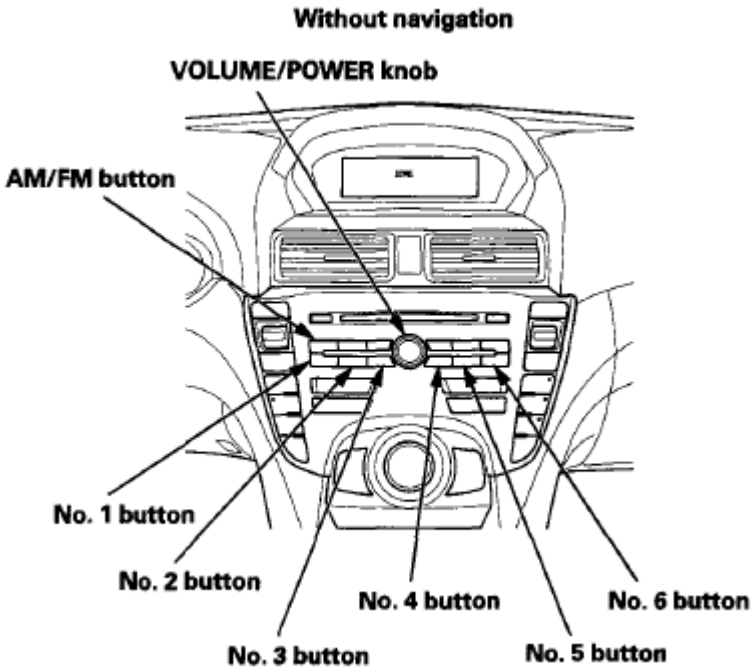

Fig. 63: Identifying Audio System Buttons (Without Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. When you are in the self-diagnostic mode, pressing a preset button starts the diagnostic mode that is assigned to that preset button.

NOTE: Any other diagnostic screens shown are for factory use only.

No. 2 button

Audio button, knob, and audio remote switch detection: Allows individual manual selection of all audio panel knobs, buttons, and remote switches to verify if they are functional. When properly detected, the selected knob, button, or audio remote switch name and/or value is displayed. To exit this mode, go to step 7. Once you exit this test, you must start again at step 1.

No. 3 button

Entire LCD lighting/light-out mode: Turns on/off the entire LCD to show the presence (LCD stuck on) or absence (LCD dead) of an LCD segment.

No. 4 button

Duty indication mode (for the Illumination dim): Indicates the duty for the Illumination dim when the dash lights are on.

No. 5 button

Vehicle speed pulse (VSP) indication mode: Indicates the vehicle speed pulse.

AM/FM button (press and hold 5 sec)

Reception level indication mode: Indicates the reception level (dB). The A.SEL button is used to change the antenna amplifier on/off.

7. To end the self-diagnostic function, turn the audio system off, or turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

DISPLAY SPECIFICATIONS

NOTE: Any other diagnostic screens shown are for audio manufacturer's use only.

Entire LCD lighting/lights-outs mode (press No. 3 button)

This diagnostic screen checks for segments that may be dead (off) or stuck on.

All the segments in the display must appear. If there are dead segments, replace the audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**), or the audio-HVAC display unit (see **AUDIO-HVAC DISPLAY UNIT REMOVAL/INSTALLATION**).

When the display segments are all on, press the No. 3 button. The entire display must turn black. If any segments are stuck on, replace the audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**), or the audio-HVAC display unit (see **AUDIO-HVAC DISPLAY UNIT REMOVAL/INSTALLATION**).

With navigation

Fig. 64: Screen Display - Audio System (With Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Without navigation

Fig. 65: Screen Display - Audio System (Without Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Illumination level (for the gauge illumination) indication (press No. 4 button)

This diagnostic screen checks the gauge illumination input.

With the headlights on, you should see a values between 1 (max low) and 11 (with navigation) or 22 (without navigation) (max high).

When you dim and brighten the gauge with the dimmer knob, you should see this value change accordingly.

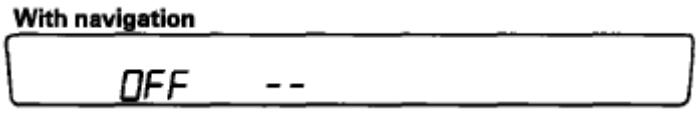

Fig. 66: Screen Display - Illumination Level (With Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

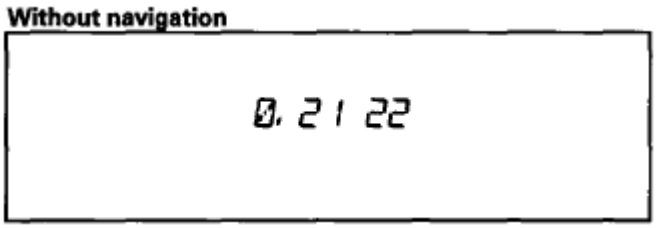

Fig. 67: Screen Display - Illumination Level (Without Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Vehicle speed pulse indication (press No. 5 button)

This diagnostic screen checks that the audio-navigation unit or the audio unit is receiving the VSP indication.

When you drive the vehicle, the VSP indicates the vehicle speed in km/h.

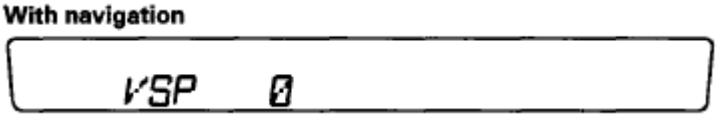

Fig. 68: Screen Display - Vehicle Speed Pulse Indication (With Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

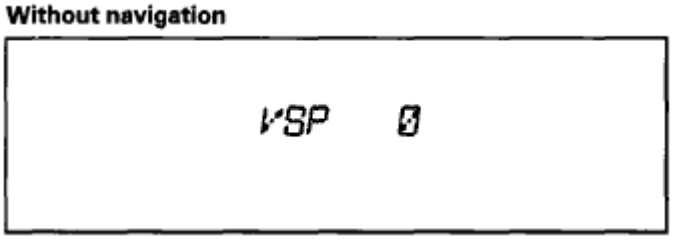

Fig. 69: Screen Display - Vehicle Speed Pulse Indication (Without Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Reception level indication (press and hold 5 sec AM/FM button)

This diagnostic screen checks the radio reception level. This level then can used in the diagnosis of radio reception quality. The reception level is displayed in decibels (dB).

Preperation:

- Park the vehicle outdoors a location with good radio reception.
- Tune to a powerful local FM radio station, then write down the radio station number.
- Tune to a powerful local AM radio station, then write down the radio station number.

1. Enter the reception level indication mode in the self-diagnostic function. The AM/FM antenna amplifier is on and the character (A) is not displayed in the audio-HVAC display.

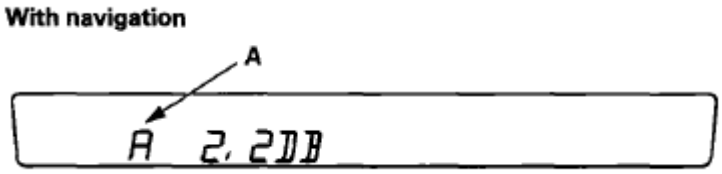

Fig. 70: Screen Display - Reception Level Indication (With Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

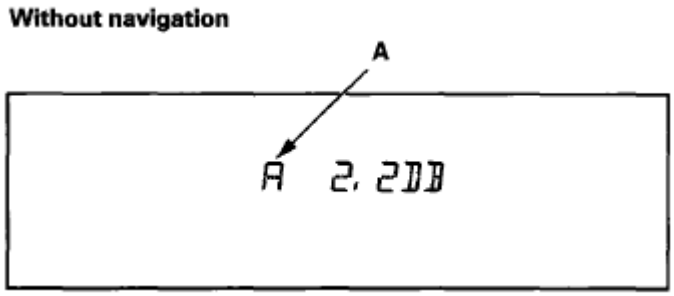

Fig. 71: Screen Display - Reception Level Indication (Without Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Tune to the FM radio station you wrote down in preparation using the TUNE button (with navigation) or selector knob (without navigation), and note the decibel level of that station.
3. Press and release the A.SEL button to turn the AM/FM antenna amplifier off (A is now displayed in the audio-HVAC display).
4. Note the decibel level of that station.
5. Press and release the A.SEL button to turn the AM/FM antenna amplifier back on (A is not displayed in the audio-HVAC display).
6. Press and hold the AM/FM button for more than 5 seconds to enter the AM reception mode.
7. Tune to the AM radio station you wrote down in preparation using the TUNE button (with navigation) or selector knob (without navigation), and note the decibel level of that station.
8. Press and release the A.SEL button to turn the antenna amplifier off (A is now displayed in the audio-HVAC display).

9. Note the decibel level of that station.
10. Press and release the A.SEL button to turn the AM/FM antenna amplifier back on (A is not displayed in the audio-HVAC display).
11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, or audio system off to exit the test mode.
12. Compare your results to a known-good vehicle, (make sure it is the same year and trim level) in the same location and direction, and under the same environmental conditions.

Speaker Check Mode

NOTE:

- **Not all self-diagnostic functions appear on all models.**
- **There may be other self-diagnostic functions that are for factory use only.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Make sure the audio system is turned off.
3. Push and hold the preset No. 1 and No. 3 buttons.
4. While holding the buttons, push the VOLUME/POWER knob to on.
5. Release the buttons and the speaker check mode begins. A tone should sound from one speaker.
6. Each time you press the SKIP button, the test moves to the next speaker in the order listed in the table.

NOTE: Adjust the volume level to a comfortable level.

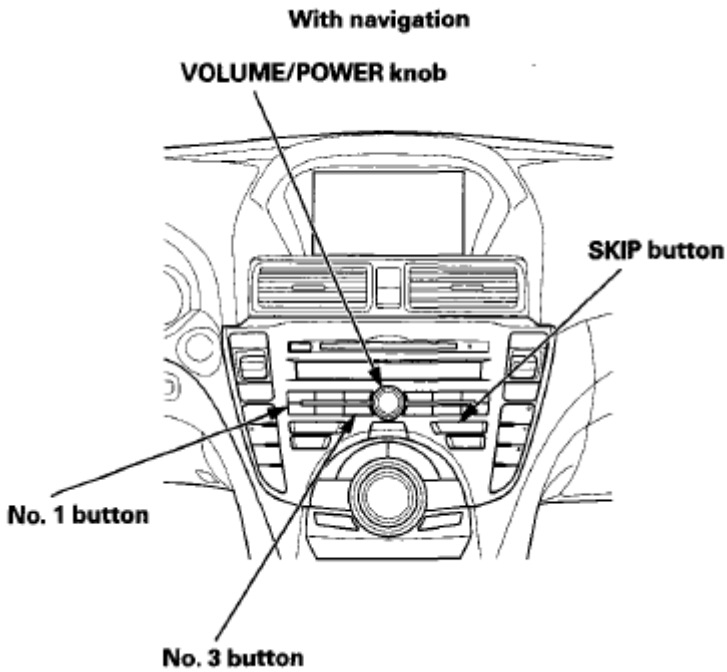

Fig. 72: Identifying Audio System Speaker Test Buttons (With Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

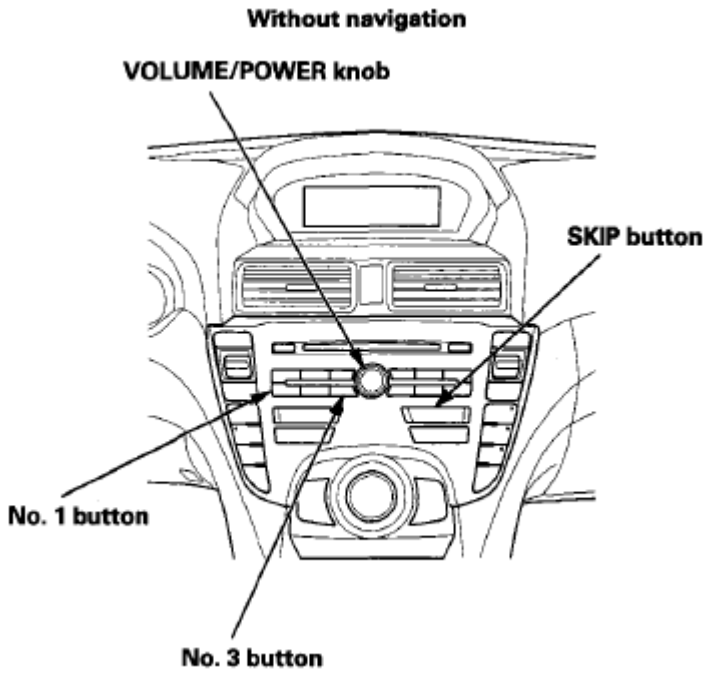

Fig. 73: Identifying Audio System Speaker Test Buttons (Without Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Display Specifications

(Skip +) is pressed: (1)-->(2)-->(3)-->(4)-->(5)-->(6)-->(7)

(Skip -) is pressed: (1)-->(7)-->(6)-->(5)-->(4)-->(3)-->(2)

	Speaker	Displayed Segments	Remarks
(1)	Driver's door speaker and left tweeter	SPK FR-L	You should hear a tone corresponding to the speaker
(2)	Front center speaker	SPK CNT	You should hear a tone corresponding to the speaker
(3)	Front passenger's door speaker and right tweeter	SPK FR-R	You should hear a tone corresponding to the speaker
(4)	Right rear door speaker(1) and right rear speaker	SPK RR-R	You should hear a tone corresponding to the speaker
(5)	Subwoofer	SPK SUBW	You should hear a tone corresponding to the speaker
(6)	Left rear door speaker(1) and left rear speaker	SPK RR-L	You should hear a tone corresponding to the speaker
(7)	All speakers	SPK ALL	• You should hear a tone corresponding to the speaker • The subwoofer does not sound a tone

(1) With navigation

7. The speaker check mode ends when you turn the audio system off or turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

XM SELF-DIAGNOSIS

NOTE: This diagnostic screen checks the audio unit's XM radio reception level. To check the XM reception, do the following:

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Select XM1 mode.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Push and hold the preset No. 3 and No. 6 buttons.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. While holding the buttons for 5 seconds, then release the buttons.
7. Press and release preset No. 1 button to read the error code.

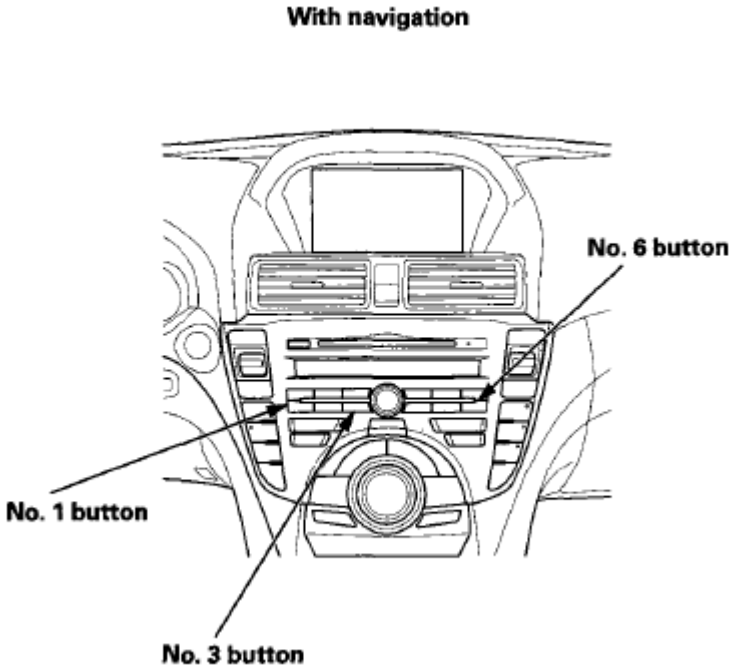

Fig. 74: Identifying XM Self Diagnosis Buttons (With Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

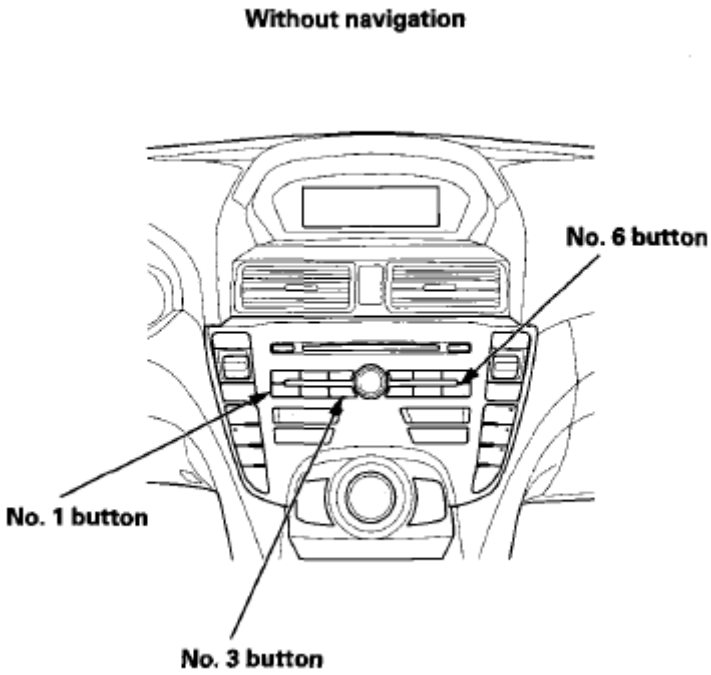

Fig. 75: Identifying XM Self Diagnosis Buttons (Without Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Error Code No. Displayed	Error Code Title Displayed	Solution
ERROR 00	NO ERROR	System is normal
ERROR 04	NO SIGNAL	Move the vehicle to an open area, and recheck.
ERROR 05	NO XM ACTIVATION	Contact XM Radio at 800-852-9696
ERROR 06	NO XM AUTHORIZATION	Contact XM Radio at 800-852-9696
ERROR 14	ANTENNA NOT CONNECTED/NO SIGNAL	Refer to Error code: XM ANTENNA is displayed; • With AcuraLink® (see **ERROR CODE: XM ANTENNA OR XM LOADING IS DISPLAYED (WITH AcuraLink®)**) • Without AcuraLink® (see **ERROR CODE: XM ANTENNA OR XM LOADING IS DISPLAYED (WITHOUT AcuraLink®)**)
ERROR 24	ANTENNA SHORTED/NO SIGNAL	Refer to Error code: XM ANTENNA is displayed; • With AcuraLink® (see **ERROR CODE: XM ANTENNA OR XM LOADING IS DISPLAYED (WITH AcuraLink®)**) • Without AcuraLink® (see **ERROR CODE: XM ANTENNA OR XM LOADING IS DISPLAYED**

		(WITHOUT AcuraLink®))
ERROR 55	HARDWARE FAILURE (CONDITIONAL ACCESS FAILURE)	Replace the AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**) or the XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**).
ERROR 65	HARDWARE FAILURE (CONDITIONAL ACCESS FAILURE)	Replace the AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**) or the XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**).

8. To end the XM self-diagnosis, turn the audio system off, or turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

XM SIGNAL RECEPTION LEVEL INDICATION MODE

NOTE: When you receive any XM complaint, do the XM self-diagnosis to check for any XM error codes. To get the XM error codes, do the following:

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Select XM2 mode.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Push and hold the preset No. 3 and No. 6 buttons.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. While holding the buttons for 5 seconds, then release the buttons.
7. Press and release preset No. 1 button to read the error code.

Error Code Displayed	Solution
SG NOSIG	Move the vehicle to an open area, and recheck. If the signal does not improve, substitute a known-good XM antenna (see **XM ANTENNA REPLACEMENT**), and recheck.
SG GOOD	The XM signal is OK.
SG MARG	The XM signal is OK.
SG WEAK	Move the vehicle to an open area, and recheck. If the signal does not improve, substitute a known-good XM antenna (see **XM ANTENNA REPLACEMENT**), and recheck.
SG VWEAK	Move the vehicle to an open area, and recheck. If the signal does not improve, substitute a known-good XM antenna (see **XM ANTENNA REPLACEMENT**), and recheck.

8. To end the XM self-diagnosis, turn the audio system off, or turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

ERROR CODES

The audio system can display a few error codes when some problems are detected with the audio disc player, the audio disc, the XM radio, the USB, or the anti-theft code. This is not a complete list of audio error codes.

Refer to **SYMPTOM TROUBLESHOOTING**, or go to any official Honda service website for more service information.

CD ERROR CODES

Error Code Displayed	Possible Cause	Solution
BAD DISC>PLEASE CHECK> OWNER'S MANUAL>PUSH EJECT	There is a problem with the disc player. A common problem is paper disc labels coming off the disc while in the player.	Try to eject the disc and try another one. If there is still a problem, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), or the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).
HEAT ERROR	Disc player is hot. This can happen if the vehicle is parked out in the hot sun all day.	Park the vehicle in a cooler place for a while and try the disc player again. If the error code is still present, try another disc. If the error code is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), or the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).
UNPLAYABLE FILE	Track/File format not supported.	Current track is skipped. The next supported track or file plays automatically. • Verify that CD file names end in CD-DA. • Verify that CD-R or CD-RW with compressed music formats end in MP3 or WMA. • Other file formats like iTunes (AAC) or Ogg are not recognized. • WMA files may have (DRM) copy protection and cannot be read.
MECH ERROR	• CD label jammed in the mechanism. • CD eject mechanism or motor is inoperative. • CD spindle motor won't spin up the CD.	Press the EJECT button and hold it for 5 seconds. If the CD does not eject, try again. If the CD still won't eject, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), or the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

USB ERROR CODES

Error Code Displayed	Possible Cause	Solution
FILE ERROR	The audio unit cannot read the file(s).	Check the files in the USB device. There is a possibility that the files have been damaged or are not supported.

MEDIA ERROR UNSUPPORTED	Unsupported USB device is connected.	Connect the applicable USB device (see Owner's Manual).
USB LOADING	Data is being loaded from the USB device.	Check the files in the USB device. There is a possibility that the files have been damaged, or are not supported.
USB NO SONG	There are no files or files that are not supported on the USB device.	Check the files in the USB device. There is a possibility that the files have been damaged, or are not supported.
USB NO DATA	USB device is not connected.	If the code appears when the USB devices is connected, go to USB device does not function troubleshooting: • With navigation (see **USB DEVICE DOES NOT FUNCTION (WITH NAVIGATION)**) • Without navigation (see **USB DEVICE DOES NOT FUNCTION (WITHOUT NAVIGATION)**)

AUDIO UNIT ERROR CODES

Error Code Displayed	Possible Cause	Solution
CODE ERROR 1	Anti-theft code mismatch (1st try).	Enter the correct anti-theft code.
CODE ERROR E	Anti-theft code mismatch (10th try).	Remove the No. 15 (10 A) fuse in the under-hood fuse/relay box, then reinsert it. You will have 10 more tries to enter the correct anti-theft code.

XM ERROR CODES

Error Code Displayed	Possible Cause	Solution
LOADING	XM radio is acquiring audio or program information.	Wait until the radio receives the information.
OFF AIR	XM channel not in service.	Try another XM channel.
NO SIGNAL	Loss of signal.	Both terrestrial and satellite antennas have lost the signal. Park the vehicle outside with a clear view of the southern horizon.
UPDATING	XM radio is receiving information update from the network.	This message disappears once the update finishes.
CHECK ANTENNA	XM antenna error.	Repair an open or a short in the satellite antenna. Substitute a known-good XM antenna (see **XM ANTENNA REPLACEMENT**), and recheck. If the error is gone, replace the original XM antenna. If the error is still present, replace the
ANTENNA		

ERROR		antenna lead.
--	No signal from XM.	Check a known-good vehicle with XM radio. If the known-good vehicle has the same symptoms, contact XM Radio at 800-852-9696.

NOTE: Do these checks with the vehicle parked outside with a clear view of the southern horizon.

SYMPTOM TROUBLESHOOTING

POOR AM OR FM RADIO RECEPTION OR INTERFERENCE (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Check for aftermarket accessories including cell phones and chargers plugged into the vehicle accessory power sockets.**
- **Check the radio reception in an open area. Poor reception/interference can be caused by any of these conditions:**
  - **The radio station is far away**
  - **Atmospheric conditions are unfavorable**
  - **Aftermarket metallic window tint**
  - **A tall building, mountains, or high-voltage power lines are nearby**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Do the Seek Stop Test (see **SEEK STOP TEST**) and the reception level indication in the Self-Diagnostic Function (see **RECEPTION LEVEL INDICATION (PRESS AND HOLD 5 SEC AM/FM BUTTON)**).

   Is the test vehicle within 10 % of the known-good vehicle?

   YES -Multipath interference or weak station. Operation is normal.

   NO -Go to step 3.

3. Check the reception/interference is the same in several locations.

   Is the reception/interference the same?

   YES -Go to step 4.

   NO -Multipath interference or weak station. Operation is normal.

4. Check the reception/interference while the engine is running.

Is there noise (static or whine) only with the engine running?

YES -Check the antenna and radio grounds. If OK, check the charging system and the ignition system.

NO -Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Remove the right C-pillar trim (see **C-PILLAR TRIM**).
7. Check for poor connections or loose terminals at the AM/FM antenna amplifier to the window antenna.

   Are the connections or terminals OK?

   YES -Go to step 8.

   NO -Repair poor connections or loose terminals, and recheck. If the symptom/indication is still present, replace the **AM/FM ANTENNA AMPLIFIER**.

8. With the help of an assistant inside the vehicle, have the assistant shine a strong flashlight (A) along each antenna wire (B). Check from the outside of the vehicle for any breaks or openings in the antenna wires (the light shines through any breaks or cuts).

   NOTE: It is easier to see the breaks if you do this test in a dark or shaded area.

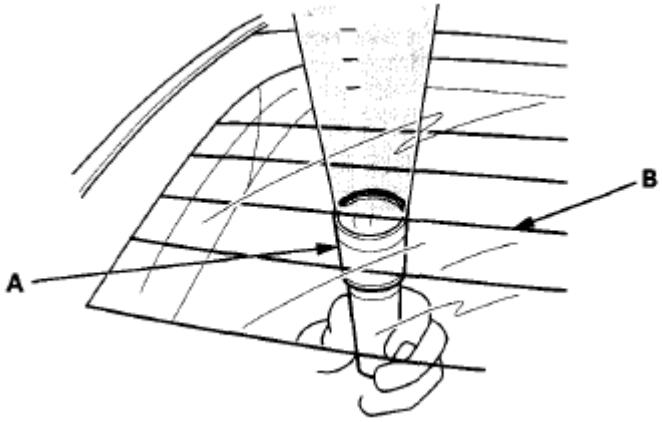

Fig. 76: Identifying Flashlight And Antenna Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Are there any breaks or cuts in the antenna?

   YES -Repair the window antenna. Go to **AM/FM ANTENNA REPAIR**, or replace the rear window (see **REAR WINDOW REPLACEMENT**) if the damaged section is too long.

   NO -Go to step 9.

9. Disconnect the AM/FM antenna amplifier 3P connector.

10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Measure the voltage between AM/FM antenna amplifier 3P connector terminal No. 3 and body ground.

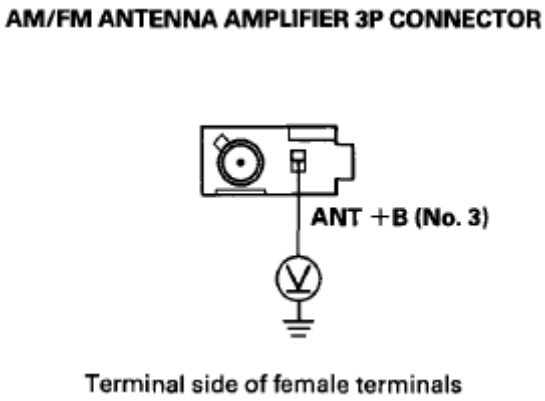

Fig. 77: Measuring Voltage Of AM/FM Antenna Amplifier Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 16.

NO -Go to step 12.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect audio-navigation unit connector E (5P).
14. Check for continuity between audio-navigation unit connector E (5P) terminal No. 3 and AM/FM antenna amplifier 3P connector terminal No. 3.

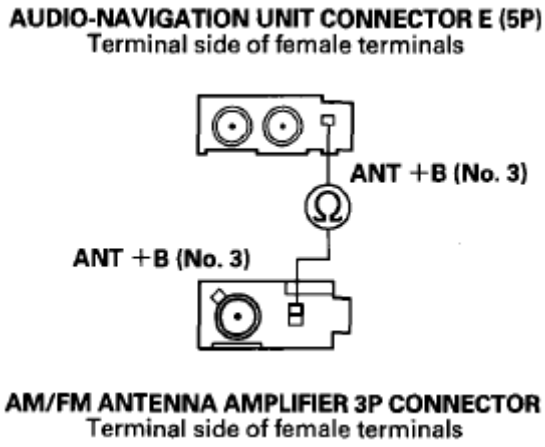

Fig. 78: Checking Continuity Of Audio-Navigation Unit 5P Terminal No. 3 & 3P Terminal No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 15.

NO -Repair an open in the wire between the audio-navigation unit and the AM/FM antenna amplifier. Also check the AM/FM antenna lead/sublead connector.

15. Check for continuity between audio-navigation unit connector E (5P) terminal No. 3 and body ground.

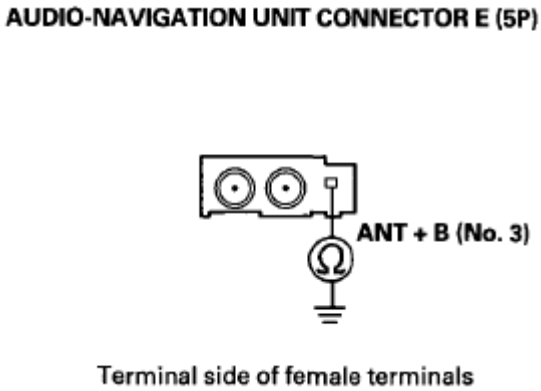

Fig. 79: Checking Continuity Of Audio-Navigation Unit Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire between the audio-navigation unit and the AM/FM antenna amplifier.

NO -Replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Disconnect audio-navigation unit connector E (5P).
18. Check for continuity between audio-navigation unit connector E (5P) terminal No. 1 and AM/FM antenna amplifier 3P connector terminal No. 1.

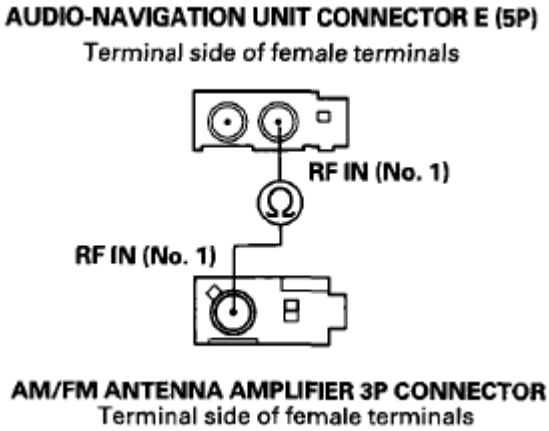

Fig. 80: Checking Continuity Between Audio-Navigation Unit Connector E (5P) Terminal No. 1 & 3P Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 19.

NO -Replace the AM/FM antenna lead and/or the sublead.

19. Check for continuity between audio-navigation unit connector E (5P) terminal No. 1 and body ground.

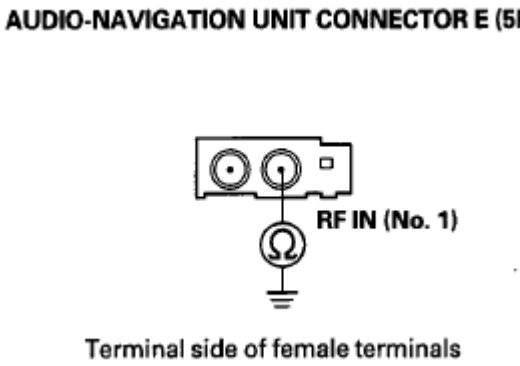

Fig. 81: Checking Continuity Of Audio-Navigation Unit Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the AM/FM antenna lead and/or the sublead.

NO -Go to step 20.

20. Check for continuity between audio-navigation unit connector E (5P) terminal No. 2 and AM/FM antenna amplifier 3P connector terminal No. 2.

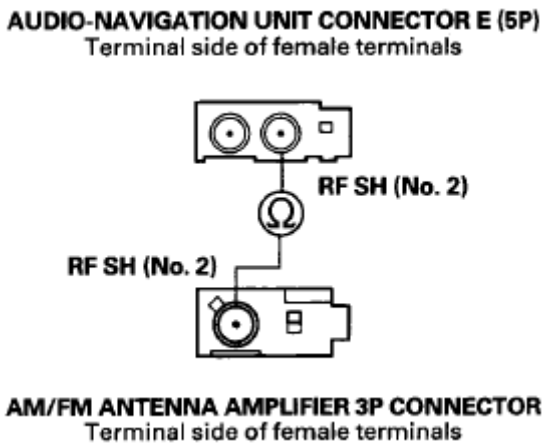

Fig. 82: Checking Continuity Between Audio-Navigation Unit Connector E (5P) Terminal No. 2 & 3P Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 21.

NO -Replace the AM/FM antenna lead and/or the sublead.

21. Check for continuity between audio-navigation unit connector E (5P) terminals No. 1 and No. 2.

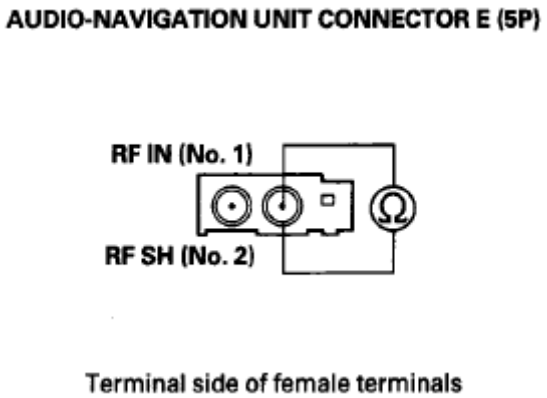

Fig. 83: Checking Continuity Between Audio-Navigation Unit Connector E (5P) Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the AM/FM antenna lead and/or the sublead.

NO -Replace the AM/FM antenna amplifier (see **AM/FM ANTENNA AMPLIFIER REPLACEMENT**), and recheck. If the reception is still poor, replace the audio-navigation unit (see

AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION).

POOR AM OR FM RADIO RECEPTION OR INTERFERENCE (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Check for aftermarket accessories including cell phones and chargers plugged into the vehicle accessory power sockets.**
- **Check the radio reception in an open area. Poor reception/interference can be caused by any of these conditions:**
  - **The radio station is far away**
  - **Atmospheric conditions are unfavorable**
  - **Aftermarket metallic window tint**
  - **A tall building, mountains, or high-voltage power lines are nearby**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Do the Seek Stop Test (see **SEEK STOP TEST**) and the reception level indication in the Self-Diagnostic Function (see **RECEPTION LEVEL INDICATION (PRESS AND HOLD 5 SEC AM/FM BUTTON)**).

   Is the test vehicle within 10 % of the known-good vehicle?

   YES -Multipath interference or weak station. Operation is normal.

   NO -Go to step 3.

3. Check the reception/interference is the same in several locations.

   Is the reception/interference the same?

   YES -Go to step 4.

   NO -Multipath interference or weak station. Operation is normal.

4. Check the reception/interference while the engine is running.

   Is there noise (static or whine) only with the engine running?

   YES -Check the antenna and radio grounds. If OK, check the charging system and the ignition system.

   NO -Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Remove the right C-pillar trim (see **C-PILLAR TRIM**).

7. Check for poor connections or loose terminals at the AM/FM antenna amplifier to the window antenna.

   Are the connections or terminals OK?

   YES -Go to step 8.

   NO -Repair poor connections or loose terminals, and recheck. If the symptom/indication is still present, replace the AM/FM antenna amplifier (see **AM/FM ANTENNA AMPLIFIER REPLACEMENT**).

8. With the help of an assistant inside the vehicle, have the assistant shine a strong flashlight (A) along each antenna wire (B). Check from the outside of the vehicle for any breaks or openings in the antenna wires (the light shines through any breaks or cuts).

   NOTE: It is easier to see the breaks if you do this test in a dark or shaded area.

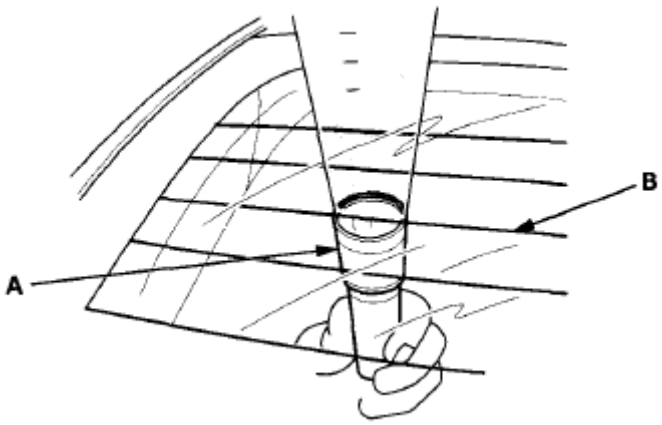

Fig. 84: Identifying Flashlight And Antenna Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Are there any breaks or cuts in the antenna?

   YES -Repair the window antenna. Go to **AM/FM ANTENNA REPAIR**, or replace the rear window (see **REAR WINDOW REPLACEMENT**) if the damaged section is too long.

   NO -Go to step 9.

9. Disconnect the AM/FM antenna amplifier 3P connector.
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Measure the voltage between AM/FM antenna amplifier 3P connector terminal No. 3 and body ground.

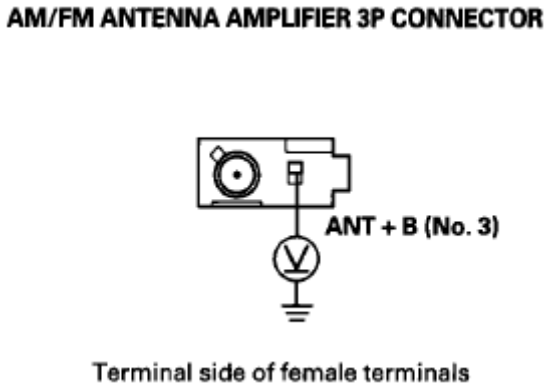

Fig. 85: Measuring Voltage Of AM/FM Antenna Amplifier Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 16.

NO -Go to step 12.

12. Turn the ignition switch to LOCK (0), press the engine start/stop button to select the OFF mode.
13. Disconnect audio unit connector E (3P).
14. Check for continuity between audio unit connector E (3P) terminal No. 3 and AM/FM antenna amplifier 3P connector terminal No. 3.

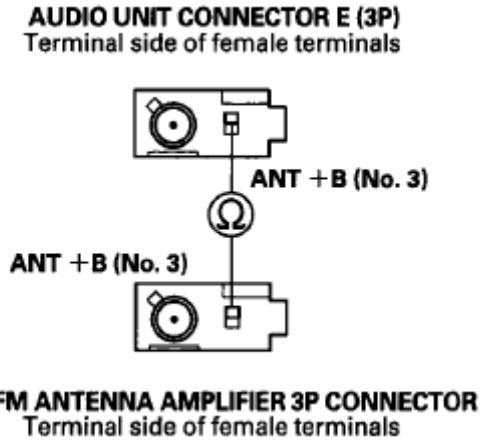

Fig. 86: Checking Continuity Between Audio Unit Connector E (3P) And AM/FM Antenna Amplifier 3P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 15.

NO -Repair an open in the wire between the audio unit and the AM/FM antenna amplifier. Also check the AM/FM antenna lead/sublead connector.

15. Check for continuity between audio unit connector E (3P) terminal No. 3 and body ground.

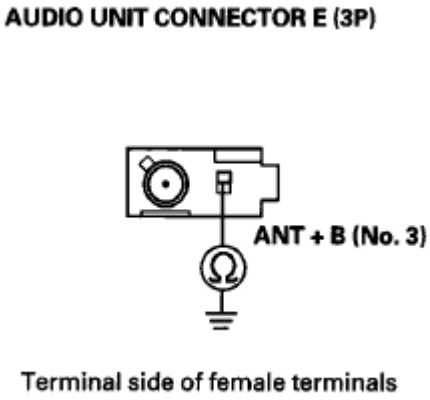

Fig. 87: Checking Continuity Between Audio Unit Connector E (3P) Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire between the audio unit and the AM/FM antenna amplifier.

NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

16. Turn the ignition switch to LOCK (0), press the engine start/stop button to select the OFF mode.
17. Disconnect audio unit connector E (3P).
18. Check for continuity between audio unit connector E (3P) terminal No. 1 and AM/FM antenna amplifier 3P connector terminal No. 1.

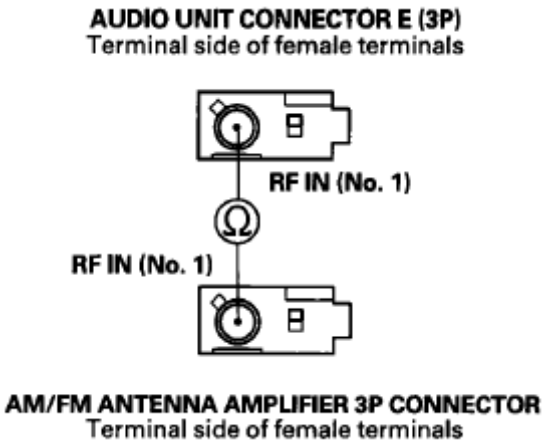

Fig. 88: Checking Continuity Between Audio Unit Connector E (3P) And AM/FM Antenna

Amplifier 3P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 19.

NO -Replace the AM/FM antenna lead and/or the sublead.

19. Check for continuity between audio unit connector E (3P) terminal No. 1 and body ground.

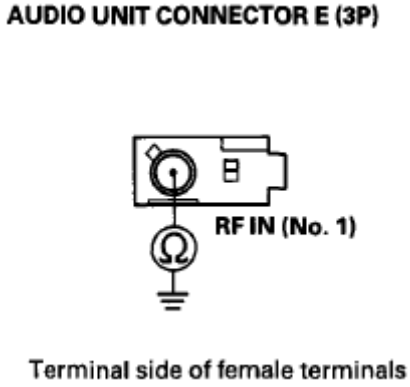

Fig. 89: Checking Continuity Between Audio Unit Connector E (3P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the AM/FM antenna lead and/or the sublead.

NO -Go to step 20.

20. Check for continuity between audio unit connector E (3P) terminal No. 2 and AM/FM antenna amplifier 3P connector terminal No. 2.

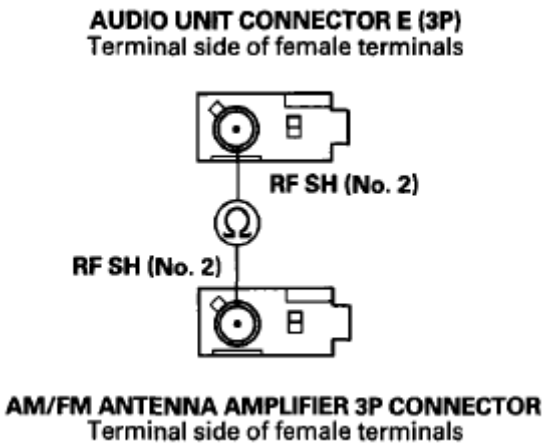

Fig. 90: Checking Continuity Between Audio Unit Connector E (3P) And AM/FM Antenna Amplifier 3P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 21.

NO -Replace the AM/FM antenna lead and/or the sublead.

21. Check for continuity between audio unit connector E (3P) terminals No. 1 and No. 2.

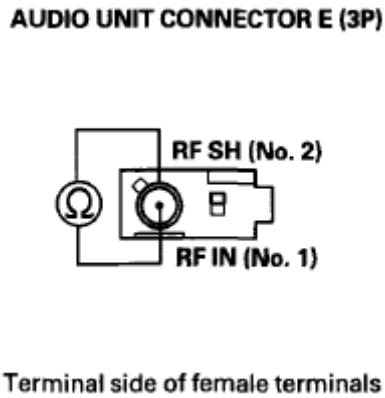

Fig. 91: Checking Continuity Between Audio Unit Connector E (3P) Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the AM/FM antenna lead and/or the sublead.

NO -Replace the AM/FM antenna amplifier (see **AM/FM ANTENNA AMPLIFIER REPLACEMENT**), and recheck. If the reception is still poor, replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

AUDIO UNIT POWER SWITCH WILL NOT TURN ON (NO INFORMATION DISPLAY AND NO SOUND) (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Press the VOLUME/POWER knob on to see if the audio system turns on.

   Does the audio display operate properly, and does the audio-navigation unit sound normal?

   YES -Intermittent failure, the system is OK at this time.

   NO -Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Check the No. 15(10 A) fuse in the under-hood fuse/relay box and the No. 18 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Are the fuses OK?

   YES -Go to step 5.

   NO -Replace the fuse(s), and recheck. If the fuse(s) blows again, check for a short in the No. 15(10 A) fuse and/or the No. 18 (7.5 A) fuse circuits.

5. Check for poor connections or loose terminals at audio-navigation unit connectors.

   Are the connections or terminals OK?

   YES -Go to step 6.

   NO -Repair poor connections or loose terminals, and recheck.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Measure the voltage between body ground and audio-navigation unit connector A (24P) terminals No. 14 and No. 24 individually.

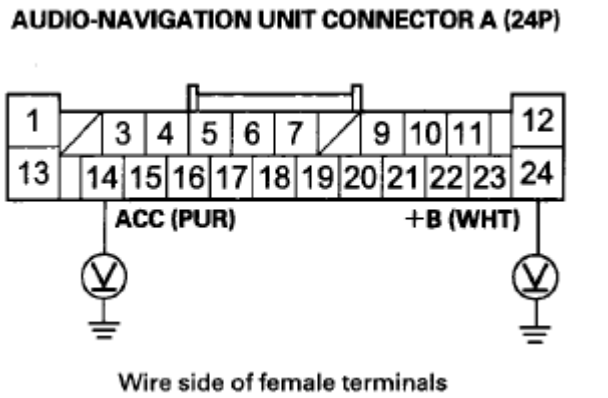

Fig. 92: Measuring Voltage Between Body Ground And Audio-Navigation Unit Connector A (24P) Terminals No. 14 And No. 24
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 8.

NO -If the +B wire does not have voltage, repair an open in the wire between the No. 15(10 A) fuse in the under-hood fuse/relay box and the audio-navigation unit. If the ACC wire does not have voltage, repair an open in the wire between the No. 18 (7.5 A) fuse in the driver's under-dash fuse/relay box and the audio-navigation unit.

8. Measure the voltage between audio-navigation unit connector A (24P) terminal No. 12 and body ground.

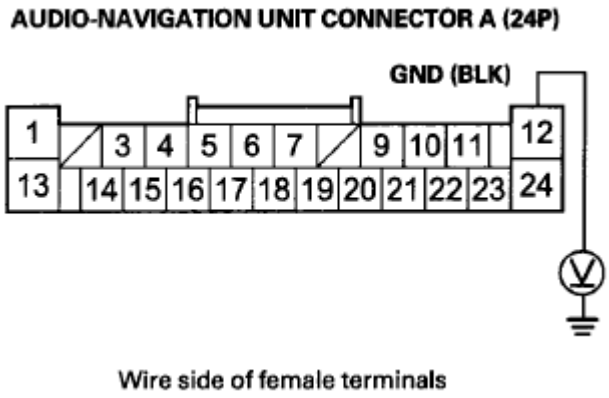

Fig. 93: Measuring Voltage Between Audio-Navigation Unit Connector A (24P) Terminal No. 12 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 9.

NO -Repair an open or high resistance in the wire between the audio-navigation unit and body ground

(G502) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

9. Measure the voltage between audio-navigation switch panel 24P connector terminal No. 22 and body ground.

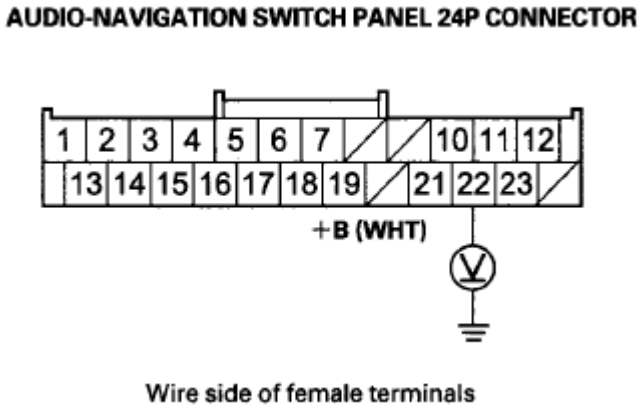

Fig. 94: Measuring Voltage Between Audio-Navigation Switch Panel 24P Connector Terminal No. 22 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 10.

NO -Repair an open in the wire(s) between the No. 15 (10 A) fuse in the under-hood fuse/relay box and the audio-navigation switch panel.

10. Measure the voltage between audio-navigation switch panel 24P connector terminal No. 10 and body ground.

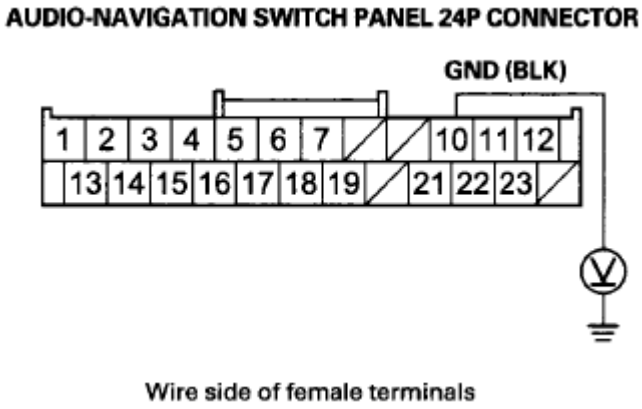

Fig. 95: Measuring Voltage Between Audio-Navigation Switch Panel 24P Connector Terminal No. 10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 11.

NO -Repair an open or high resistance in the wire between the audio-navigation switch panel and body ground (G501) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

11. Measure the voltage between audio-navigation switch panel 24P connector terminal No. 17 and body ground.

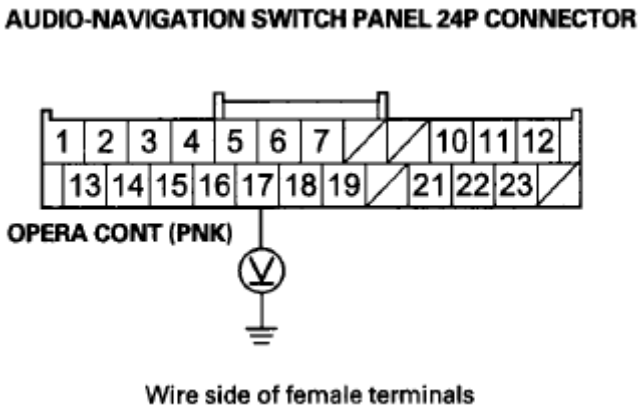

Fig. 96: Measuring Voltage Between Audio-Navigation Switch Panel 24P Connector Terminal No. 17 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 12.

NO -Repair an open or a short in the wire between the audio-navigation switch panel and the audio-navigation unit.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect audio-navigation unit connector D (36P) and the audio-navigation switch panel 24P connector.
14. Check for continuity between audio-navigation switch panel 24P connector terminal No. 14 and body ground.

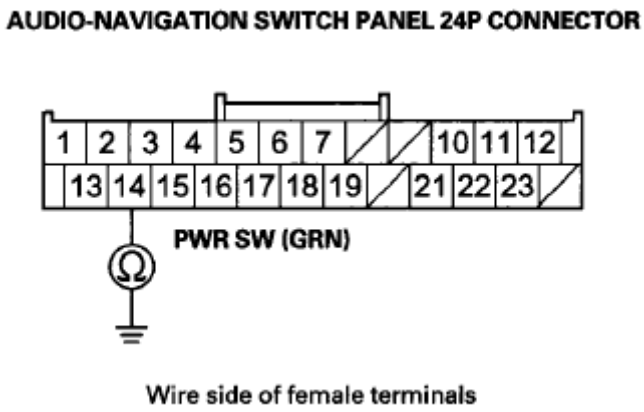

Fig. 97: Checking Continuity Between Audio-Navigation Switch Panel 24P Connector Terminal No. 14 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire between the audio-navigation switch panel and the audio-navigation unit.

NO -Go to step 15.

15. Check for continuity between audio-navigation unit connector D (36P) terminal No. 24 and audio-navigation switch panel 24P connector terminal No. 14.

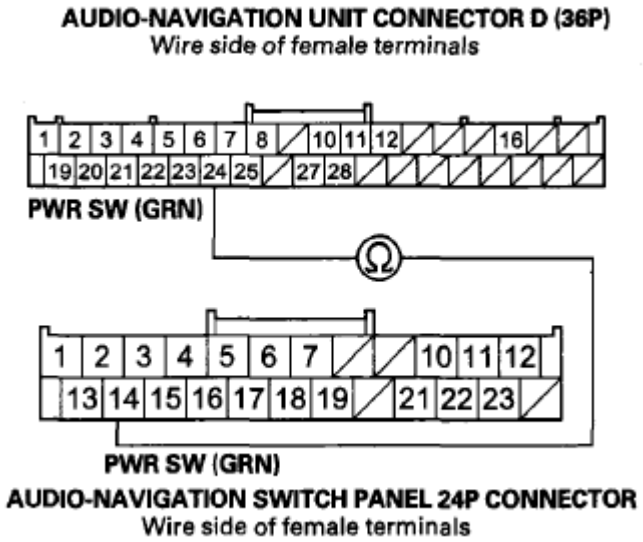

Fig. 98: Checking Continuity Between Audio-Navigation Unit Connector D (36P) And Audio-Navigation Switch Panel 24P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 16.

NO -Repair an open in the wire between the audio-navigation switch panel and the audio-navigation unit.

16. Reconnect the audio-navigation switch panel 24P connector.
17. Check for continuity between audio-navigation switch panel 24P connector terminal No. 14 and body ground.

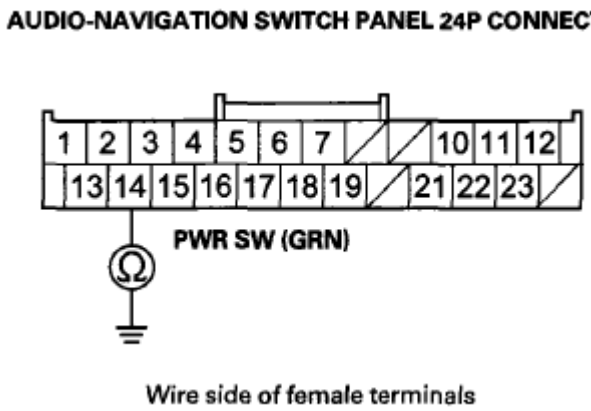

Fig. 99: Checking Continuity Between Audio-Navigation Switch Panel 24P Connector Terminal No. 14 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**).

NO -Go to step 18.

18. While press and holding the VOLUME/POWER knob, check for continuity between audio-navigation switch panel 24P connector terminal No. 14 and body ground.

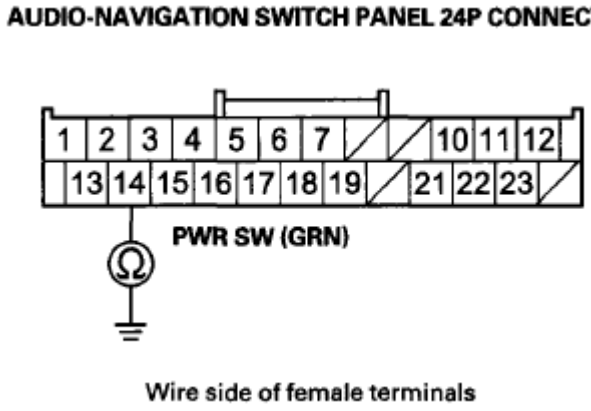

Fig. 100: Checking Continuity Between Audio-Navigation Switch Panel 24P Connector Terminal

No. 14 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 19.

NO -Replace the audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**).

19. Disconnect the audio-navigation switch panel 24P connector.
20. Check for continuity between audio-navigation unit connector D (36P) and the audio-navigation switch panel 24P connector according to the table.

Audio-navigation unit connector	Audio-navigation switch panel connector	Wire color
D1	15	YEL
D19	16	BRN
D20	3	BLU

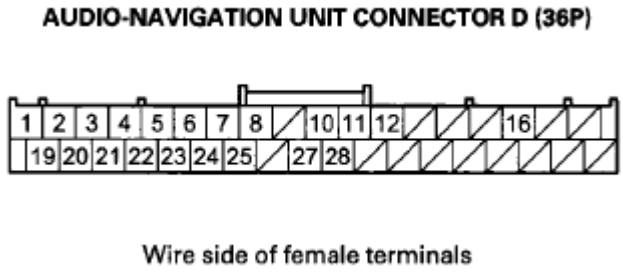

Fig. 101: Checking Continuity Between Audio-Navigation Unit Connector D (36P) And Audio-Navigation Switch Panel 24P Connector (Audio-Navigation Unit Connector)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

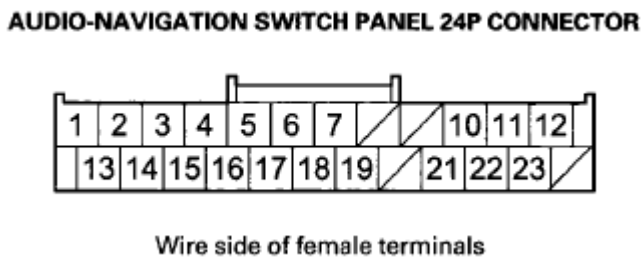

Fig. 102: Checking Continuity Between Audio-Navigation Unit Connector D (36P) And Audio-Navigation Switch Panel 24P Connector (Audio-Navigation Switch Panel Connector)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 21.

NO -There is an open in the wire(s) between the audio-navigation unit and the audio-navigation switch panel. Repair or replace the affected harness.

21. Check for continuity between the audio-navigation switch panel 24P connector and body ground according to the table.

Audio-navigation switch panel connector	Wire color
3	BLU
15	YEL
16	BRN

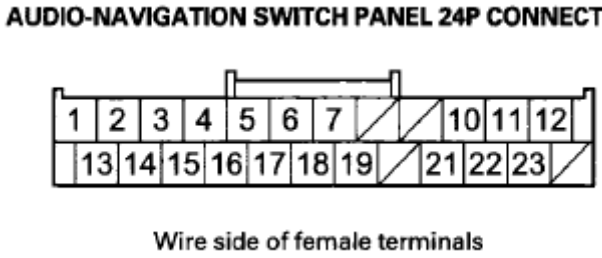

Fig. 103: Checking Continuity Between Audio-Navigation Switch Panel 24P Connector And Body Ground According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short in the wire(s) between the audio-navigation unit and the audio-navigation switch panel. Repair or replace the affected harness.

NO -Go to step 22.

22. Check for continuity between the terminals of the audio-navigation switch panel 24P connector according to the table.

From terminal	To terminals
4 (GRY)	15 (YEL), 16 (BRN)
15 (YEL)	16 (BRN)

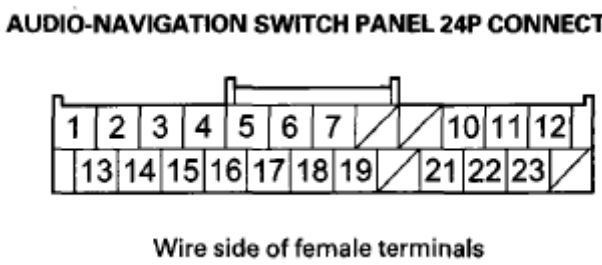

Fig. 104: Checking Continuity Between Terminals Of Audio-Navigation Switch Panel 24P Connector According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wires between the audio-navigation unit and the audio-navigation switch panel. Replace the affected shielded harness.

NO -Substitute a known-good audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**), then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**). If the symptom/indication is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

AUDIO UNIT POWER SWITCH WILL NOT TURN ON (NO INFORMATION DISPLAY AND NO SOUND) (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Push the VOLUME/POWER knob on to see if the audio unit turns on.

   Does the audio unit display operate properly, and does the audio unit sound normal?

   YES -Intermittent failure, the system is OK at this time.

   NO -Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Check the No. 15 (10 A) fuse in the under-hood fuse/relay box and the No. 18 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Are the fuses OK?

   YES -Go to step 5.

   NO -Replace the fuse(s), and recheck. If the fuse(s) blows again, check for a short in the No. 15 (10 A) fuse and/or the No. 18 (7.5 A) fuse circuits.

5. Check for poor connections or loose terminals at audio unit connectors

   Are the connections or terminals OK?

YES -Go to step 6.

NO -Repair poor connections or loose terminals, and recheck.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Measure the voltage between body ground and audio unit connector A (24P) terminals No. 14 and No. 24 individually.

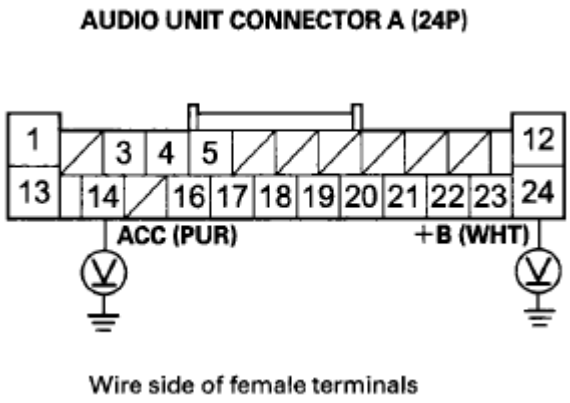

Fig. 105: Measuring Voltage Between Body Ground And Audio Unit Connector A (24P) Terminals No. 14 And No. 24
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 8.

NO -If the +B wire does not have voltage, repair an open in the wire between the No. 15 (10 A) fuse in the under-hood fuse/relay box and the audio unit. If the ACC wire does not have voltage, repair an open in the wire between the No. 18 (7.5 A) fuse in the driver's under-dash fuse/relay box and the audio unit.

8. Measure the voltage between audio unit connector A (24P) terminal No. 12 and body ground.

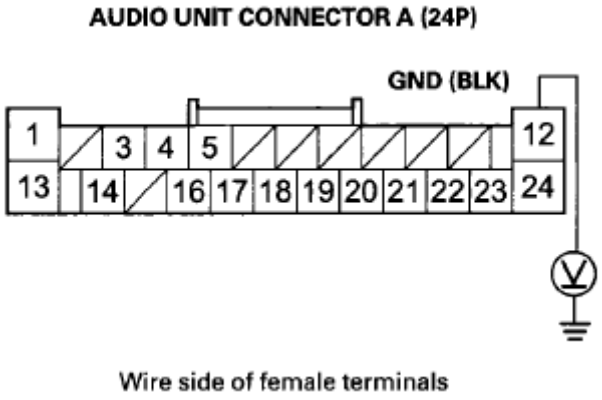

Fig. 106: Measuring Voltage Between Audio Unit Connector A (24P) Terminal No. 12 And Body

Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Substitute a known-good audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

NO -Repair an open or high resistance in the wire between the audio unit and body ground (G502) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

AUDIO UNIT POWER SWITCH WILL NOT TURN OFF (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Check for aftermarket accessories plugged info the vehicle's accessory power sockets.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Push the VOLUME/POWER knob off to see if the audio system turns off.

   Does the audio system turn off?

   YES -Operation is normal.

   NO -Go to step 3

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

   Does the audio-navigation unit turn off?

   YES -Go to step 5.

   NO -Go to step 4.

4. Measure the voltage between audio-navigation unit connector A (24P) terminal No. 14 and body ground.

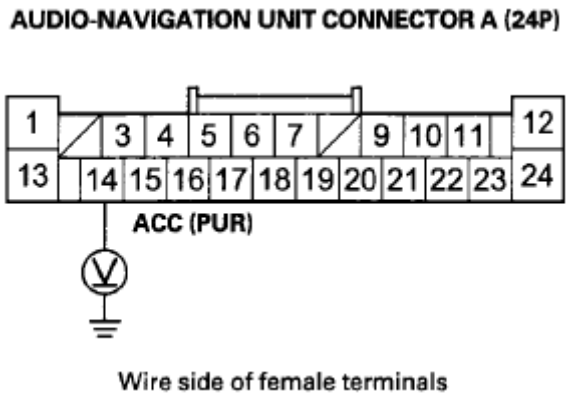

Fig. 107: Measuring Voltage Between Audio-Navigation Unit Connector A (24P) Terminal No. 14 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Check for a short to power on the PUR wire.

NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

5. Disconnect audio-navigation unit connector D (36P) and the audio-navigation switch panel 24P connector.
6. Check for continuity between audio-navigation switch panel 24P connector terminal No. 14 and body ground.

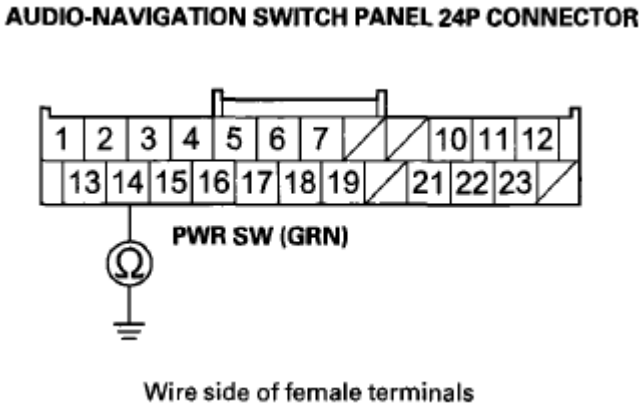

Fig. 108: Checking Continuity Between Audio-Navigation Switch Panel 24P Connector Terminal No. 14 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire between the audio-navigation switch panel and the audio-navigation unit.

NO -Go to step 7.

7. Check for continuity between audio-navigation unit connector D (36P) terminal No. 24 and audio-navigation switch panel 24P connector terminal No. 14.

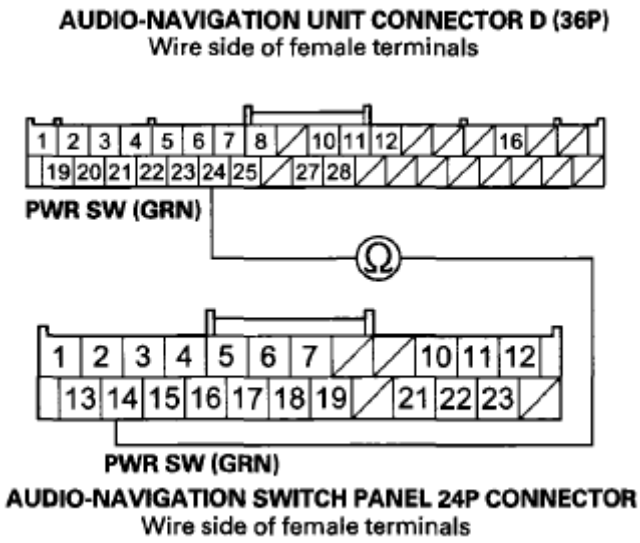

Fig. 109: Checking Continuity Between Audio-Navigation Unit Connector D (36P) And Audio-Navigation Switch Panel 24P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 8.

NO -Repair an open in the wire between the audio-navigation switch panel and the audio-navigation unit.

8. Reconnect the audio-navigation switch panel 24P connector.
9. Check for continuity between audio-navigation switch panel 24P connector terminal No. 14 and body ground.

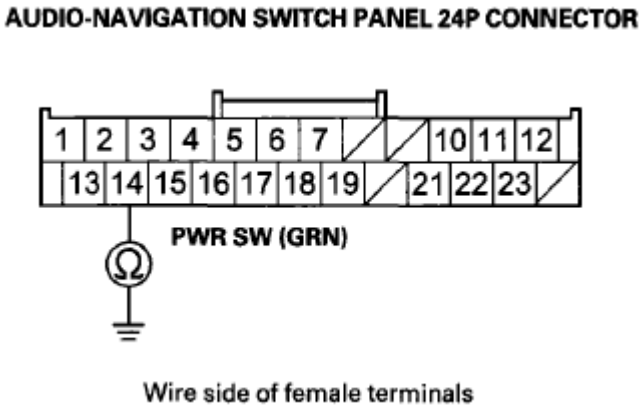

Fig. 110: Checking Continuity Between Audio-Navigation Switch Panel 24P Connector Terminal No. 14 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**).

NO -Go to step 10.

10. While press and holding the VOLUME/POWER knob, check for continuity between audio-navigation switch panel 24P connector terminal No. 14 and body ground.

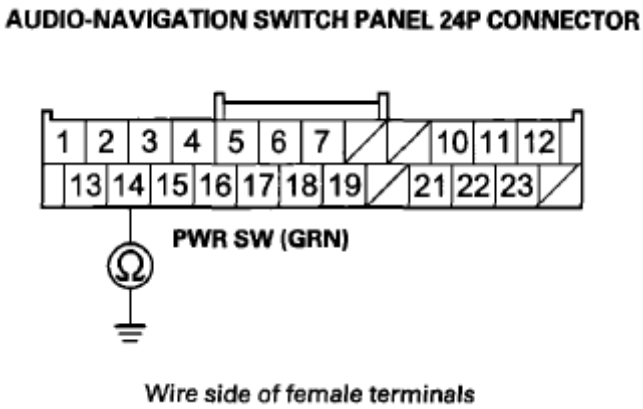

Fig. 111: Checking Continuity Between Audio-Navigation Switch Panel 24P Connector Terminal No. 14 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

NO -Replace the audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**).

AUDIO UNIT POWER SWITCH WILL NOT TURN OFF (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Check for aftermarket accessories plugged info the vehicle's accessory power sockets.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Push the VOLUME/POWER knob off to see if the audio unit turns off.

   Does the audio unit turn off?

   YES -Go to step 3.

   NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

   Does the audio unit turn off?

   YES -Operation is normal.

   NO -Go to step 4

4. Measure the voltage between audio unit connector A (24P) terminal No. 14 and body ground.

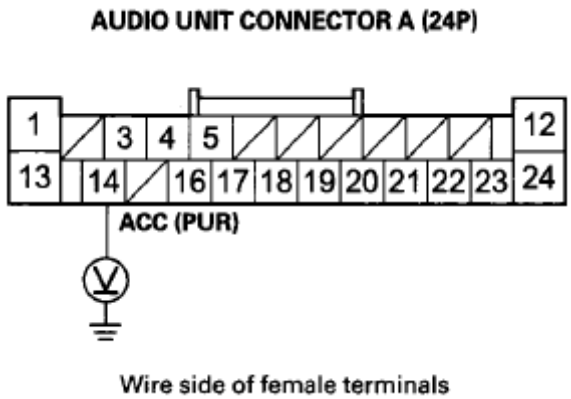

Fig. 112: Measuring Voltage Between Audio Unit Connector A (24P) Terminal No. 14 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Check for short to power on the PUR wire.

NO -Substitute a known-good audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

NO SOUND IS HEARD FROM THE SPEAKER(S) (DISPLAY IS NORMAL) (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Set the fader and balance positions to the center.**
- **Before doing the troubleshooting, do the Audio unit power switch will not turn on (No information display and no sound) troubleshooting (see AUDIO UNIT POWER SWITCH WILL NOT TURN ON (NO INFORMATION DISPLAY AND NO SOUND) (WITH NAVIGATION)).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio-navigation unit, and make sure the volume button is not set to the MIN level.

   Is it at the MIN level?

   YES -Raise the volume level, and recheck the function.

   NO -Go to step 3.

3. Check for sound in each mode (AM/FM, XM, USB, and CD or DVD).

   Is the sound OK in each mode?

   YES -Intermittent failure. The system is OK at this time. Check for loose connections at the audio-navigation unit and speaker(s).

   NO -

   - If there is no sound in all modes, go to step 4.
   - If there is no sound in AM/FM mode, go to **AM OR FM RADIO RECEPTION INTERFERENCE TROUBLESHOOTING**.
   - If the sound quality is poor only with XM radio, or the XM radio does not function, go to **POOR OR NO SOUND WITH XM RADIO (AUDIO UNIT DOES DISPLAY XM CHANNELS) TROUBLESHOOTING; WITH AcuraLink®** (see), **WITHOUT AcuraLink®** .
   - If sound quality is poor only with USB mode, go to **USB INPUT SOUND IS LOW OR CANNOT BE HEARD TROUBLESHOOTING** .
   - If there is no sound in CD or DVD mode, do the Audio disc does not play troubleshooting (see **AUDIO DISC DOES NOT PLAY (WITH NAVIGATION)**).

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
6. Disconnect the HandsFreeLink control unit 32P connector (see **HANDSFREELINK CONTROL UNIT REMOVAL/INSTALLATION**).
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and recheck the audio system for sound.

   Did the sound return?

   YES -Replace the HandsFreeLink control unit (see **HFL SWITCH TEST**).

   NO -Go to step 8.

8. Do the Speaker Check Mode with the Self-Diagnostic Function (see **SPEAKER CHECK MODE**).

   Do all speakers produce a tone?

   YES -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

   NO -Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Check the No. 15 (20 A) fuse in the passenger's under-dash fuse/relay box.

    Is the fuse OK?

    YES -Go to step 11.

    NO -Replace the fuse, and recheck. If the fuse blows again, check for a short in the No. 15 (20 A) fuse circuit.

11. Measure the voltage between stereo amplifier connector A (18P) terminal No. 18 and body ground.

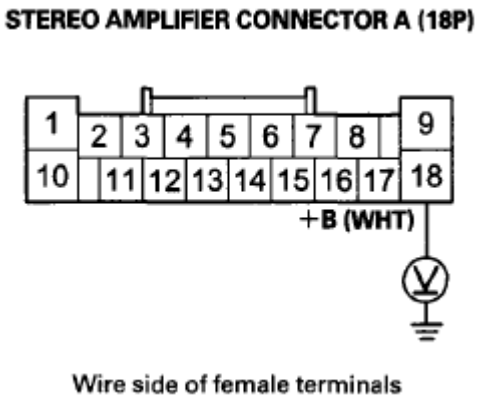

Fig. 113: Measuring Voltage Between Stereo Amplifier Connector A (18P) Terminal No. 18 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 12.

NO -Repair an open in the wire between the No. 15 (20 A) fuse in the passenger's under-dash fuse/relay box and the stereo amplifier.

12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Measure the voltage between stereo amplifier connector B (28P) terminal No. 3 and body ground.

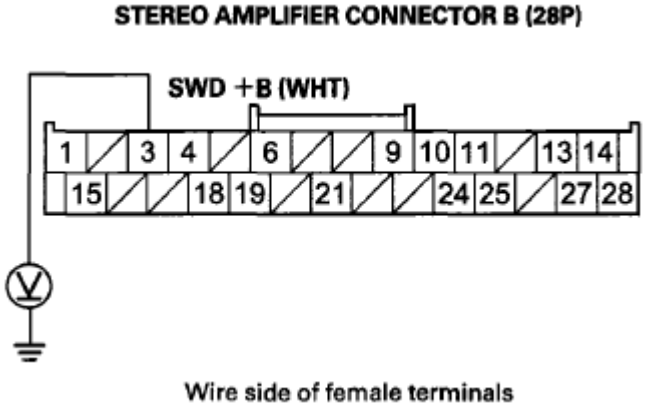

Fig. 114: Measuring Voltage Between Stereo Amplifier Connector B (28P) Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 15.

NO -Go to step 14.

14. Measure the voltage between audio-navigation unit connector A (24P) terminal No. 17 and body ground.

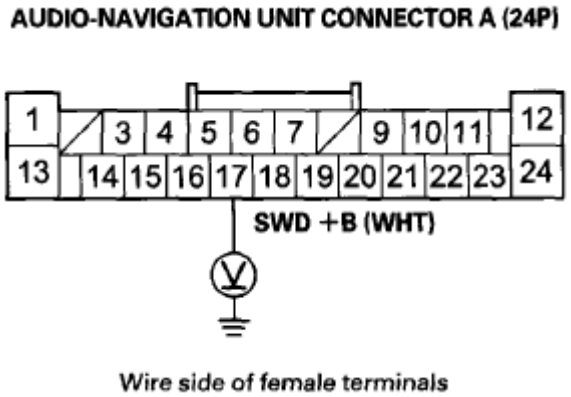

Fig. 115: Measuring Voltage Between Audio-Navigation Unit Connector A (24P) Terminal No. 17 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair an open in the wire between the stereo amplifier and the audio-navigation unit.

NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

15. Measure the voltage between body ground and stereo amplifier connector A (18P) terminal No. 9.

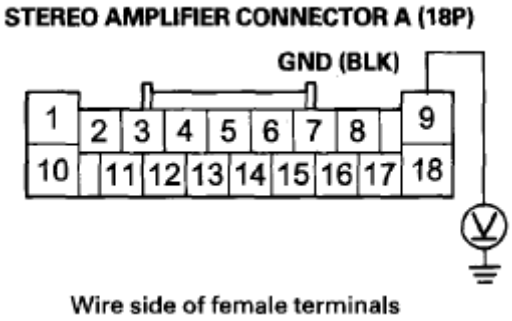

Fig. 116: Measuring Voltage Between Body Ground And Stereo Amplifier Connector A (18P) Terminal No. 9
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 16.

NO -Repair an open or high resistance in the wire between the stereo amplifier and body ground (G653);

with SH-AWD (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), without SH-AWD (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Check the faulty speaker(s) for damage.

    Is there any damage?

    YES -Replace the speaker (see **SPEAKER TEST/REPLACEMENT**), and recheck.

    NO -Go to step 18.

18. Remove the speaker(s) with no sound (see **SPEAKER TEST/REPLACEMENT**), and disconnect its connector.
19. Check for poor connections or loose terminals at speaker 2P connectors.

    Are the connections or terminals OK?

    YES -Go to step 20.

    NO -Repair poor connections or loose terminals, and recheck.

20. Test the speaker(s) (see **SPEAKER TEST/REPLACEMENT**).

    Is the speaker(s) OK?

    YES -Go to step 21.

    NO -Replace the speaker(s) (see **SPEAKER TEST/REPLACEMENT**).

21. Reconnect the speaker connector(s).
22. Disconnect stereo amplifier connector A (18P).
23. Check for continuity between body ground and stereo amplifier connector A (18P) according to the table.

Speaker	Stereo amplifier connector	Wire color
Driver's door speaker, left tweeter	A16	LT GRN
	A7	BLU
Front passenger's door speaker, right tweeter	A15	GRY
	A6	BRN
Front center speaker	A11	BRN
	A2	YEL
Left rear door speaker	A13	RED
	A4	GRN
Right rear door speaker	A12	BRN

	A3	GRY
Left rear speaker	A17	YEL
	A8	BLU
Right rear speaker	A14	BLU
	A5	YEL
Subwoofer	A10	GRY
	A1	LT BLU

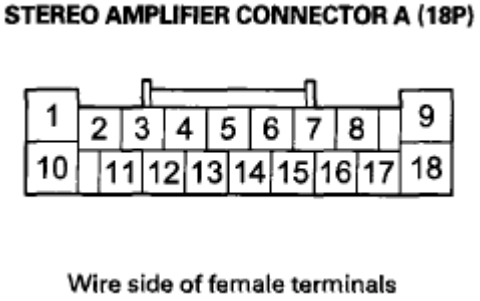

Fig. 117: Checking Continuity Between Body Ground And Stereo Amplifier Connector A (18P) According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire(s) between the stereo amplifier and the speaker(s).

NO -Go to step 24.

24. Disconnect the left tweeter 2P connector and the right tweeter 2P connector.
25. Measure the resistance between each pair of speaker terminals at stereo amplifier connector A (18P) according to the table.

Speaker	Stereo amplifier connector	Wire color	Resistance
Driver's door speaker	A16	LT GRN	About 2 ohms
	A7	BLU	
Front passenger's door speaker	A15	GRY	About 2 ohms
	A6	BRN	
Front center speaker	A11	BRN	About 2 ohms
	A2	YEL	
Left rear door speaker	A13	RED	About 2 ohms
	A4	GRN	
Right rear door speaker	A12	BRN	About 2 ohms
	A3	GRY	
Left rear speaker	A17	YEL	About 2 ohms
	A8	BLU	

Right rear speaker	A14	BLU	About 2 ohms
	A5	YEL	
Subwoofer	A10	GRY	About 2 ohms
	A1	LT BLU	

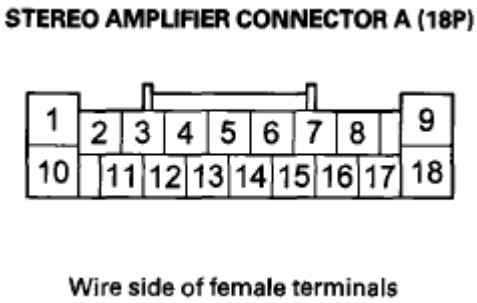

Fig. 118: Measuring Resistance Between Each Pair Of Speaker Terminals At Stereo Amplifier Connector A (18P) According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there resistance OK?

YES -Go to step 26.

NO -Repair an open or a short in the wire between the stereo amplifier and the speaker(s).

26. Connect stereo amplifier connector A (18P) terminals No. 6 and No. 15 with a jumper wire, and terminals No. 7 and No. 16 with a jumper wire.

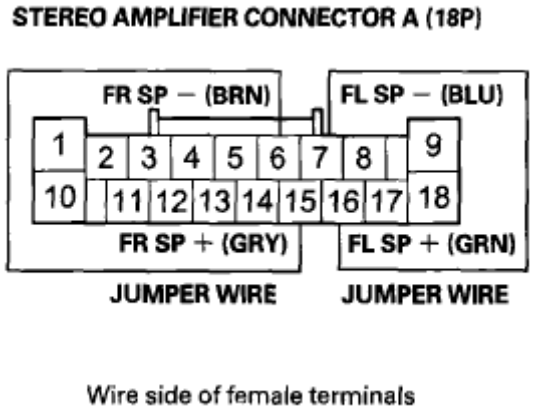

Fig. 119: Connecting Stereo Amplifier Connector A (18P) Terminals No. 6 And No. 15 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

27. Check for continuity between the tweeter 2P connector according to the table.

Speaker	Terminal	Wire color

Left tweeter	1	LT GRN
	2	BLU
Right tweeter	1	GRY
	2	BRN

Fig. 120: Checking Continuity Of Tweeter With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 28.

NO -Repair an open in the wire between the stereo amplifier and the tweeter.

28. Disconnect the jumper wires.
29. Disconnect stereo amplifier connector B (28P).
30. Disconnect audio unit connector D (36P).
31. Check for continuity between body ground and audio-navigation unit connector D (36P) terminals No. 7 and No. 8 individually.

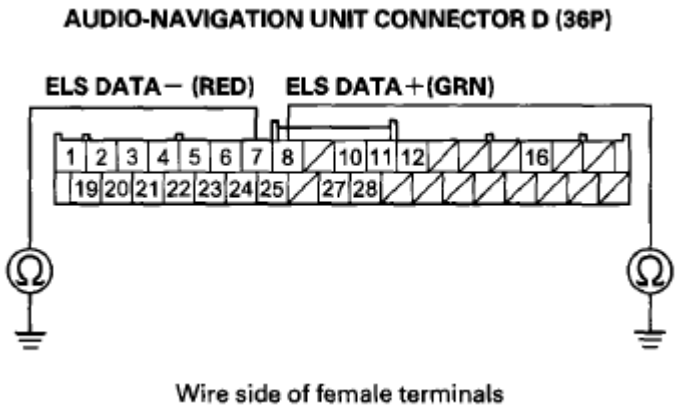

Fig. 121: Checking Continuity Between Body Ground And Audio-Navigation Unit Connector D (36P) Terminals No. 7 And No. 8
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the audio-navigation unit and the stereo amplifier. Replace the affected shielded harness.

NO -Go to step 32.

32. Check for continuity between the terminals of audio-navigation unit connector D (36P) according to the table.

From terminal	To terminals
D7 (RED)	D8 (GRN), D25 (GRY)
D8 (GRN)	D25 (GRY)

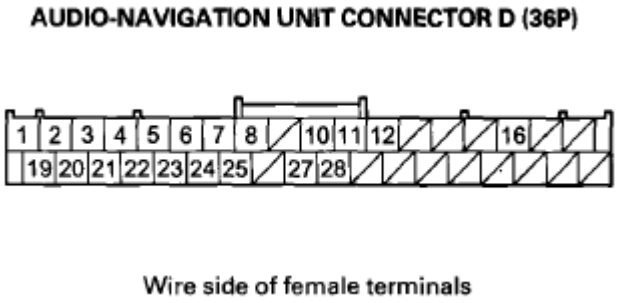

Fig. 122: Checking Continuity Between Terminals Of Audio-Navigation Unit Connector D (36P) According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wires between the audio-navigation unit and the stereo amplifier. Replace the affected shielded harness.

NO -Go to step 33.

33. Check for continuity between audio-navigation unit connector D (36P) and stereo amplifier connector B (28P) according to the table.

Audio-navigation unit connector	Stereo amplifier connector	Wire color
D7	B1	RED
D8	B15	GRN

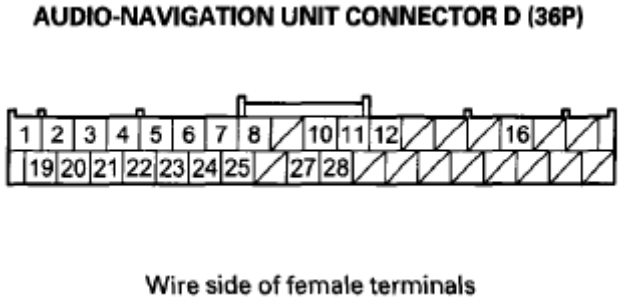

Fig. 123: Checking Continuity Between Audio-Navigation Unit Connector D (36P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

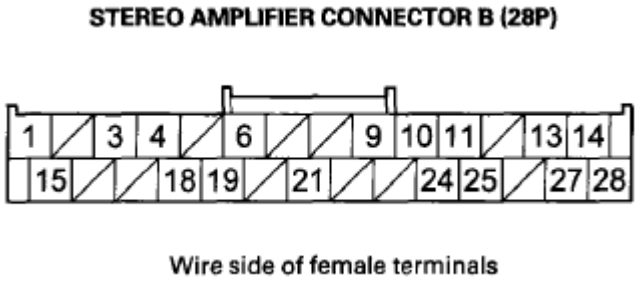

Fig. 124: Checking Continuity Between Terminals Stereo Amplifier Connector B (28P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 34.

NO -There is an open in the wire(s) between the audio-navigation unit and the stereo amplifier. Replace the affected shielded harness.

34. Disconnect audio-navigation unit connector A (24P) and connector B (24P).

NOTE: Eject all the disc(s) before disconnecting the audio-navigation unit to prevent damaging the CD/DVD player's load mechanism.

35. Check for continuity between audio-navigation unit connector A (24P), connector B (24P), and stereo amplifier connector B (28P) according to the table.

Audio-navigation unit connector	Stereo amplifier connector
A6 (WHT)	B28 (WHT)
A7 (BLK)	B14 (BLK)
A10 (RED)	B27 (RED)
AH (GRN)	B13 (GRN)
A18 (RED)	B25 (RED)
A19 (GRN)	B11 (GRN)

A22 (RED)	B24 (RED)
A23 (GRN)	B10 (GRN)
B9 (WHT)	B18 (WHT)
B10 (BLK)	B4 (BLK)
B12 (GRN)	B6 (GRN)
B24 (RED)	B19 (RED)

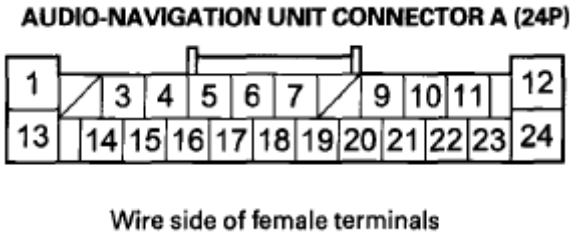

Fig. 125: Checking Continuity Between Audio-Navigation Unit Connector A (24P) Terminals

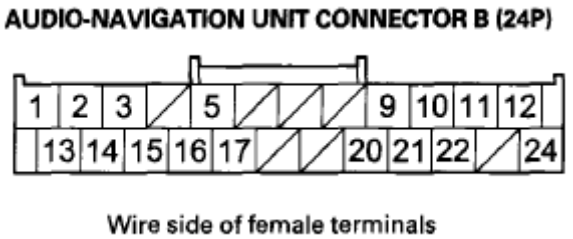

Fig. 126: Checking Continuity Between Audio-Navigation Unit Connector B (24P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

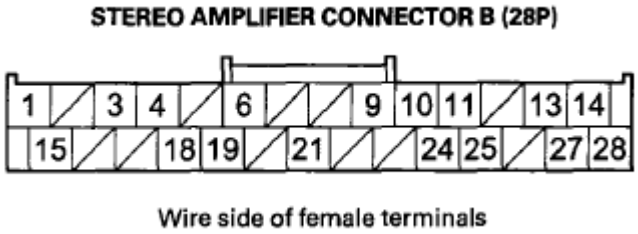

Fig. 127: Checking Continuity Between Stereo Amplifier Connector B (28P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 36.

NO -There is an open in the wire(s) between the stereo amplifier and the audio-navigation unit. Replace the affected shielded harness.

36. Check for continuity between body ground and audio-navigation unit connector A (24P) and connector B

(24P) according to the table.

Audio-navigation unit connector	Wire color
A6	WHT
A7	BLK
A9	GRY
A10	RED
AH	GRN
A18	RED
A19	GRN
A20	GRY
A21	GRY
A22	RED
A23	GRN
B9	WHT
B10	BLK
B11	GRY
B12	GRN
B24	RED

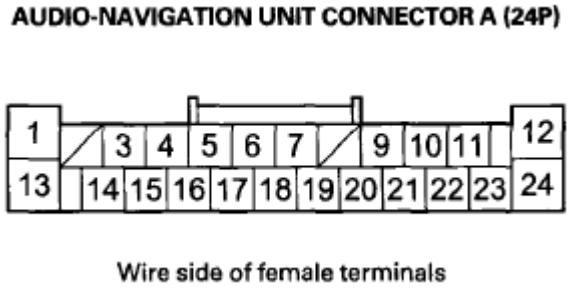

Fig. 128: Checking Continuity Between Body Ground And Audio-Navigation Unit Connector A (24P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

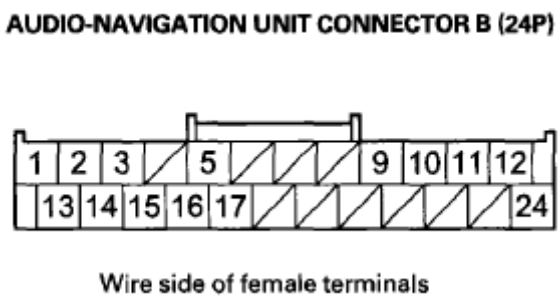

Fig. 129: Checking Continuity Between Body Ground And Audio-Navigation Unit Connector B (24P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the stereo amplifier and the audio-navigation unit. Replace the affected shielded harness.

NO -Go to step 37.

37. Check for continuity between the terminals of stereo amplifier connector B (28P) and audio-navigation unit connector A (24P) and connector B (24P) according to the table.

From terminals	To terminals	
Audio-navigation unit connector	Stereo amplifier connector	Audio-navigation unit connector
A20 (GRY)	B25 (RED)	A18 (GRN)
	B11 (GRN)	A19 (GRN)
A21 (GRY)	B10 (RED)	A22 (RED)
	B24 (GRN)	A23 (GRN)
A9 (GRY)	B28 (RED)	A6 (WHT)
	B14 (GRN)	A7 (BLK)
	B27 (RED)	A10 (RED)
	B13 (GRN)	A11 (GRN)
B11 (GRY)	B18 (RED)	A9 (WHT)
	B4 (GRN)	A10 (BLK)
	B6 (GRN)	A12 (GRN)
	B19 (RED)	A24 (RED)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

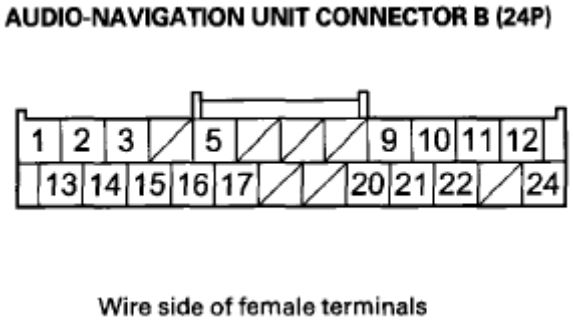

Fig. 131: Checking Continuity Between Terminals Of Audio-Navigation Connector B (24P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

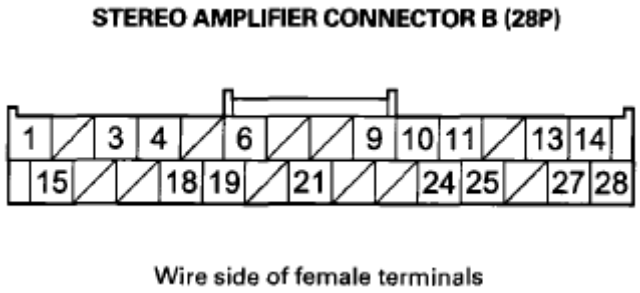

Fig. 132: Checking Continuity Between Terminals Of Stereo Amplifier Connector B (28P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is short in the wires between the audio-navigation unit and the stereo amplifier. Replace the affected shielded harness.

NO -Substitute a known-good stereo amplifier (see **STEREO AMPLIFIER REMOVAL/INSTALLATION**), then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original stereo amplifier (see **STEREO AMPLIFIER REMOVAL/INSTALLATION**). If the symptom/indication is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

NO SOUND IS HEARD FROM THE SPEAKER(S) (DISPLAY IS NORMAL) (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Set the fader and balance positions to the center.**
- **Before doing the troubleshooting, do the Audio unit power switch will not turn on (No information display and no sound) troubleshooting (see AUDIO UNIT POWER SWITCH WILL NOT TURN ON (NO INFORMATION DISPLAY AND NO SOUND) (WITHOUT NAVIGATION)).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio unit and make sure the volume button is not set to the MIN level.

   Is it at the MIN level?

   YES -Raise the volume level, and recheck the function.

   NO -Go to step 3.

3. Check for sound in each mode (AM/FM, XM, USB, and CD).

   Is the sound OK in each mode?

   YES -Intermittent failure. The system is OK at this time. Check for loose connections at the audio-navigation unit and speaker(s).

   NO -

   - If there is no sound in all modes, go to step 4.
   - If there is no sound in AM/FM mode, go to **AM OR FM RADIO RECEPTION INTERFERENCE TROUBLESHOOTING** .
   - If the sound quality is poor only with XM radio, or the XM radio does not function, go to **POOR OR NO SOUND WITH XM RADIO (AUDIO UNIT DOES DISPLAY XM CHANNELS) TROUBLESHOOTING** .
   - If sound quality is poor only with USB mode, go to **USB INPUT SOUND IS LOW OR CANNOT BE HEARD TROUBLESHOOTING** .
   - If there is no sound in CD mode, go to **AUDIO DISC DOES NOT PLAY TROUBLESHOOTING** .
4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
6. Disconnect the HandsFreeLink control unit 28P connector (see **HANDSFREELINK CONTROL UNIT REMOVAL/INSTALLATION**).
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and recheck the audio system for sound.

   Did the audio system sound return?

   YES -Replace the HandsFreeLink control unit (see **HFL SWITCH TEST**).

   NO -Go to step 8.

8. Do the Speaker Check Mode with the Self-Diagnostic Function (see **SPEAKER CHECK MODE**).

   Do all speakers produce a tone?

YES -Substitute a known-good audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

NO -Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Check the No. 15 (20 A) fuse in the passenger's under-dash fuse/relay box.

Is the fuse OK?

YES -Go to step 11.

NO -Replace the fuse, and recheck. If the fuse blows again, check for a short in the No. 15 (20 A) fuse circuit.

11. Measure the voltage between stereo amplifier connector A (18P) terminal No. 18 and body ground.

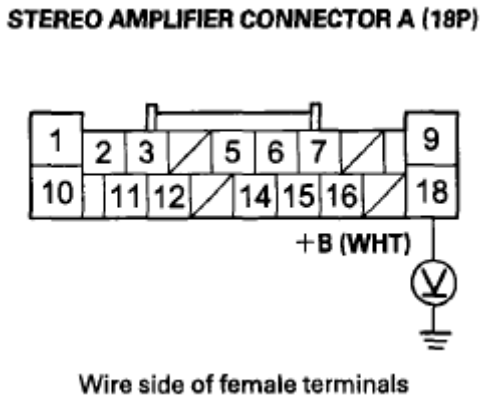

Fig. 133: Measuring Voltage Between Stereo Amplifier Connector A (18P) Terminal No. 18 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 12.

NO -Repair an open in the wire between the No. 15 (20 A) fuse in the passenger's under-dash fuse/relay box and the stereo amplifier.

12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Measure the voltage between stereo amplifier connector B (20P) terminal No. 1 and body ground.

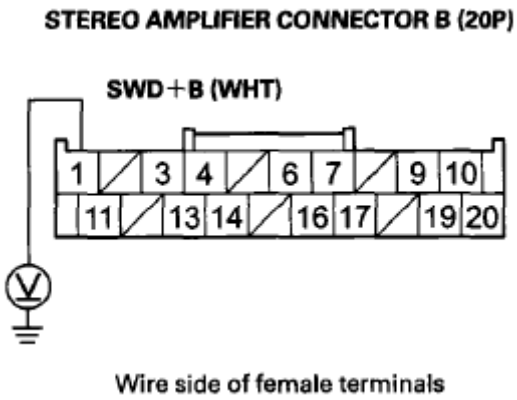

Fig. 134: Measuring Voltage Between Stereo Amplifier Connector B (20P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 15.

NO -Go to step 14.

14. Measure the voltage between audio unit connector A (24P) terminal No. 17 and body ground.

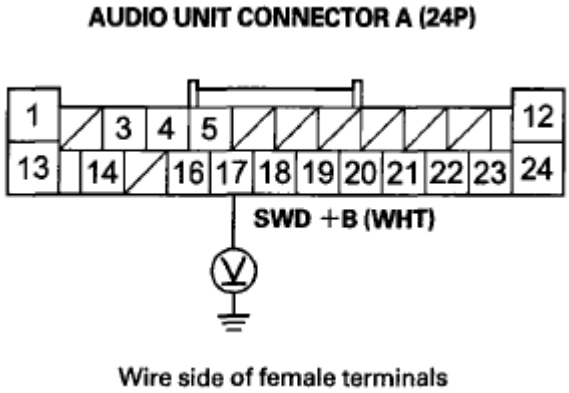

Fig. 135: Measuring Voltage Between Audio Unit Connector A (24P) Terminal No. 17 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair an open in the wire between the stereo amplifier and the audio unit.

NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

15. Measure the voltage between body ground and stereo amplifier connector A (18P) terminal No. 9.

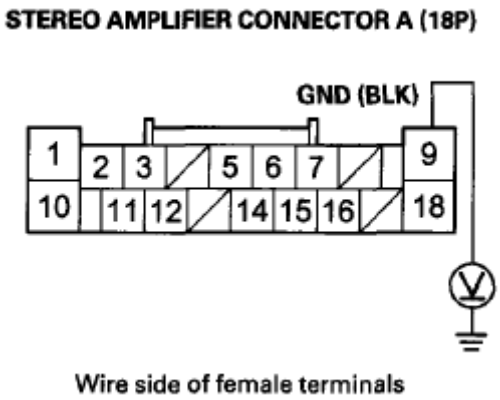

Fig. 136: Measuring Voltage Between Body Ground And Stereo Amplifier Connector A (18P) Terminal No. 9
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 16.

NO -Repair an open or high resistance in the wire between the stereo amplifier and body ground (G653); with SH-AWD (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), without SH-AWD (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Check the faulty speaker(s) for damage.

    Is there any damage?

    YES -Replace the speaker (see **SPEAKER TEST/REPLACEMENT**), and recheck.

    NO -Go to step 18.

18. Remove the speaker(s) with no sound (see **SPEAKER TEST/REPLACEMENT**), and disconnect its connector.
19. Check for poor connections or loose terminals at speaker 2P connectors.

    Are the connections or terminals OK?

    YES -Go to step 20.

    NO -Repair poor connections or loose terminals, and recheck.

20. Test the speaker(s) (see **SPEAKER TEST/REPLACEMENT**).

    Is the speaker OK?

YES -Go to step 21.

NO -Replace the speaker(s) (see **SPEAKER TEST/REPLACEMENT**).

21. Reconnect the speaker connector(s).
22. Disconnect stereo amplifier connector A (18P).
23. Check for continuity between stereo amplifier connector A (18P) and body ground according to the table.

Speaker	Stereo amplifier connector	Wire color
Driver's door speaker, left tweeter	A11 (+)	LT GRN
	A2 (-)	BLU
Front passenger's door speaker, right tweeter	A15 (+)	GRY
	A6 (-)	BRN
Front center speaker	A16 (+)	BRN
	A7 (-)	YEL
Left rear speaker	A10 (+)	YEL
	A1 (-)	BLU
Right rear speaker	A14 (+)	BLU
	A5 (-)	YEL
Subwoofer	A12 (+)	GRY
	A3 (-)	LT BLU

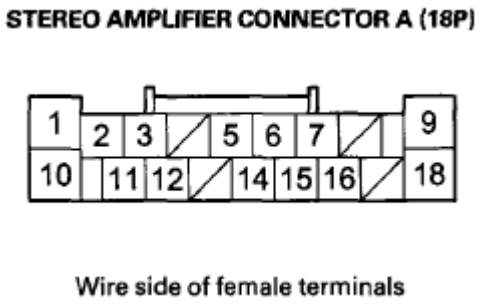

Fig. 137: Checking Continuity Between Stereo Amplifier Connector A (18P) And Body Ground According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire(s) between the stereo amplifier and the speaker(s).

NO -Go to step 24.

24. Disconnect the left tweeter 2P connector and the right tweeter 2P connector.
25. Measure the resistance between each pair of speaker terminals at stereo amplifier connector A (18P) according to the table.

Speaker	Stereo amplifier connector	Wire color	Resistance
Driver's door speaker	A11	LT GRN	About 4 ohms
	A2	BLU	
Front passenger's door speaker	A15	GRY	About 4 ohms
	A6	BRN	
Front center speaker	A16	BRN	About 2 ohms
	A7	YEL	
Left rear speaker	A10	YEL	About 4 ohms
	A1	BLU	
Right rear speaker	A14	BLU	About 4 ohms
	A5	YEL	
Subwoofer	A12	GRY	About 2 ohms
	A3	LT BLU	

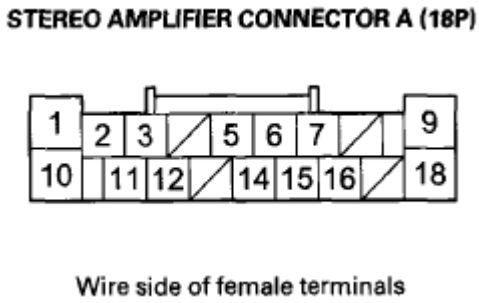

Fig. 138: Measuring Resistance Between Speaker Terminals At Stereo Amplifier Connector A (18P) According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there resistance OK?

YES -Go to step 26.

NO -Repair an open or a short in the wire between the stereo amplifier and the speaker(s).

26. Connect stereo amplifier connector A (18P) terminals No. 2 and No. 11 with a jumper wire, and terminals No. 6 and No. 15 with a jumper wire.

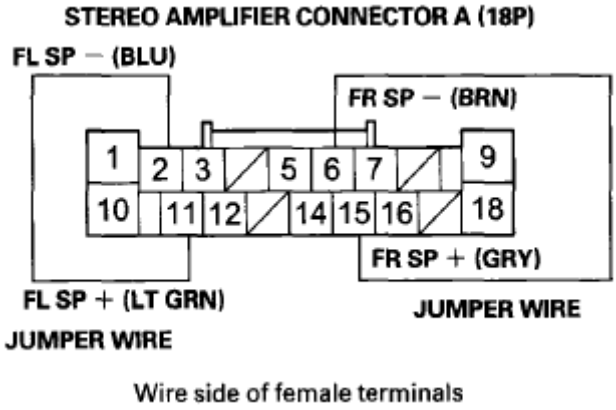

Fig. 139: Connecting Stereo Amplifier Connector A (18P) Terminals No. 2 And No. 11 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

27. Check for continuity between the tweeter 2P connector according to the table.

Speaker	Terminal	Wire color
Left tweeter	1	LT GRN
	2	BLU
Right tweeter	1	GRY
	2	BRN

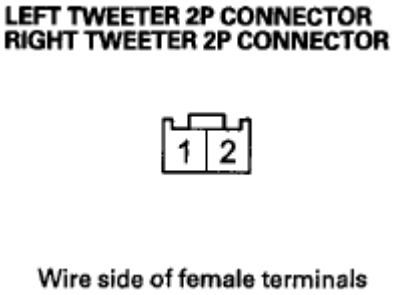

Fig. 140: Checking Continuity Between Tweeter 2P Connector According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 28.

NO -Repair an open in the wire between the stereo amplifier and the tweeter.

28. Disconnect the jumper wires.
29. Disconnect stereo amplifier connector B (20P).
30. Disconnect audio unit connector A (24P) and connector B (14P).

NOTE: Eject all the CDs before disconnecting the audio unit to prevent damaging the CD player's load mechanism.

31. Check for continuity between audio unit connector A (24P), connector B (14P), and stereo amplifier connector B (20P) according to the table.

Audio unit connector	Stereo amplifier connector
A18 (RED)	B17 (RED)
A19 (GRN)	B7 (GRN)
A22 (RED)	B16 (RED)
A23 (GRN)	B6 (GRN)
B1 (RED)	B14 (RED)
B2 (WHT)	B13 (WHT)
B3 (BLK)	B3 (BLK)
B4 (RED)	B19 (RED)
B5 (WHT)	B20 (WHT)
B8 (GRN)	B4 (GRN)
B11 (GRN)	B9 (GRN)
B12 (BLK)	B10 (BLK)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

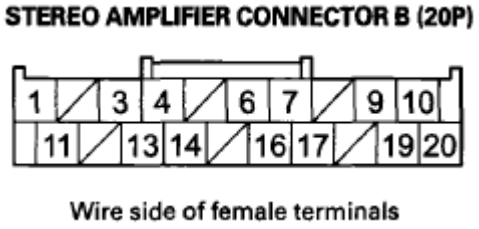

Fig. 143: Checking Continuity Between Stereo Amplifier Connector B (20P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 32.

NO -There is an open in the wire(s) between the stereo amplifier and the audio unit. Replace the affected shielded harness.

32. Check for continuity between body ground and audio unit connector A (24P) and connector B (14P) according to the table.

Audio unit connector	Wire color
A18	RED
A19	GRN
A20	GRY
A21	GRY
A22	RED
A23	GRN
B1	RED
B2	WHT

Courtesy of AMERICAN HONDA MOTOR CO., INC.

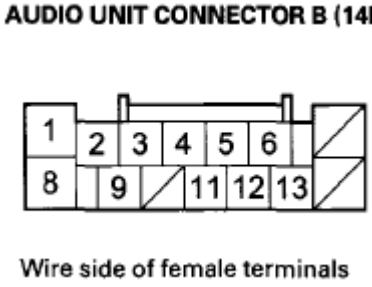

Fig. 145: Checking Continuity Between Body Ground And Audio Unit Connector Identifying B (14P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the stereo amplifier and the audio unit. Replace the affected shielded harness.

NO -Go to step 33.

33. Check for continuity between the terminals of stereo amplifier connector B (20P) and audio unit connector A (24P) and connector B (14P) according to the table.

From terminals	To terminals	
Audio unit connector	Stereo amplifier connector	Audio unit connector
A20 (GRY)	B17 (RED)	A18 (RED)
	B7 (GRN)	A19 (GRN)
A21 (GRY)	B16 (RED)	A22 (RED)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

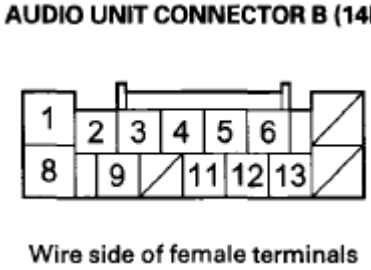

Fig. 147: Checking Continuity Between Terminals Of Audio-Unit Connector B (14P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

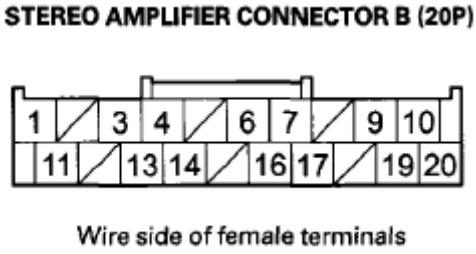

Fig. 148: Checking Continuity Between Terminals Of Stereo Amplifier Connector B (20P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wires between the stereo amplifier and the audio unit. Replace the affected shielded harness.

NO -Substitute a known-good stereo amplifier (see **STEREO AMPLIFIER REMOVAL/INSTALLATION**), then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original stereo amplifier (see **STEREO AMPLIFIER REMOVAL/INSTALLATION**). If the symptom/indication is still present, replace the audio unit (see

AUDIO UNIT REMOVAL/INSTALLATION).

AUXILIARY INPUT SOUND IS LOW OR CANNOT BE HEARD (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Use auxiliary stereo cables with 3.5 mm ends only.**
- **Auxiliary accessories may be played on the audio-navigation unit using the auxiliary input.**
- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system, and connect an auxiliary accessory to the auxiliary input jack.
3. Check the volume operation.

   Is the sound normal?

   YES -Intermittent failure, the system is OK at this time.

   NO -Go to step 4.

4. Make sure the auxiliary accessory volume is set to high.

   Is the volume set to high?

   YES -Go to step 5.

   NO -Raise the auxiliary accessory volume to high. Make sure the audio-navigation unit volume is turned down before retesting.

5. Substitute a known-good auxiliary audio accessory and/or auxiliary stereo cable, and recheck.

   Does the auxiliary audio accessory operate properly?

   YES -Original auxiliary audio accessory or auxiliary stereo cable is faulty.

   NO -Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Remove the USB adapter holder/auxiliary jack assembly (see **USB ADAPTER HOLDER/AUXILIARY JACK ASSEMBLY REPLACEMENT**), and check for poor connection or loose terminals at the auxiliary jack assembly 5P connector.

   Are the connection or terminals OK?

   YES -Go to step 8.

NO -Repair poor connection or loose terminals, and recheck.

8. Disconnect the auxiliary jack assembly 5P connector.
9. Disconnect audio-navigation unit connector B (24P).
10. Check for continuity between audio-navigation unit connector B (24P) and body ground according to the table.

Audio-navigation unit connector	Wire color
B1	RED
B2	BLK
B3	ORN
B13	WHT

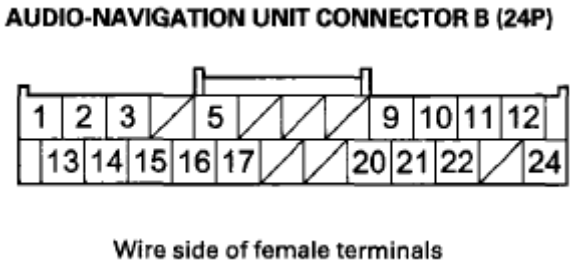

Fig. 149: Checking Continuity Between Audio-Navigation Unit Connector B (24P) And Body Ground According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the audio-navigation unit and the auxiliary jack assembly. Repair or replace the affected harness.

NO -Go to step 11.

11. Check for continuity between the terminals of audio-navigation unit connector B (24P) according to the table.

From terminal	To terminals
B1 (RED)	B2 (BLK), B13 (WHT), B15 (GRY)
B2 (BLK)	B13 (WHT), B15 (GRY)
B13 (WHT)	B15 (GRY)

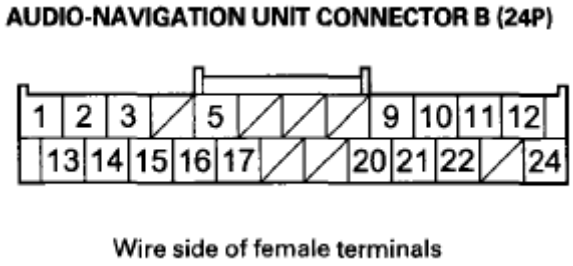

Fig. 150: Checking Continuity Between Terminals Of Audio-Navigation Unit Connector B (24P) According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wire(s) between the audio-navigation unit and the auxiliary jack assembly. Replace the affected shielded harness.

NO -Go to step 12.

12. Check for continuity between audio-navigation unit connector B (24P) and the auxiliary jack assembly 5P connector according to the table.

Audio-navigation unit connector	Auxiliary jack assembly connector	Wire color
B1	4	RED
B2	3	BLK
B3	1	ORN
B13	5	WHT
B14	2	YEL

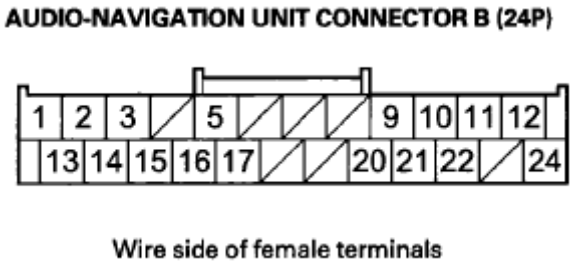

Fig. 151: Checking Continuity Between Audio-Navigation Unit Connector B (24P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

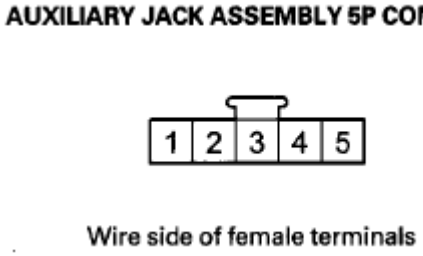

Fig. 152: Checking Continuity Between Auxiliary Jack Assembly 5P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good USB adapter holder/auxiliary jack assembly (see **USB ADAPTER HOLDER/AUXILIARY JACK ASSEMBLY REPLACEMENT**), then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original USB adapter holder/auxiliary jack assembly (see **USB ADAPTER HOLDER/AUXILIARY JACK ASSEMBLY REPLACEMENT**). If the symptom/indication is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

NO -There is an open in the wire(s) between the audio-navigation unit and the auxiliary jack assembly. Repair or replace the affected harness.

AUXILIARY INPUT SOUND IS LOW OR CANNOT BE HEARD (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Use auxiliary stereo cables with 3.5 mm ends only.**
- **Auxiliary accessories may be played on the audio unit using the auxiliary input.**
- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system, and connect an auxiliary accessory to the auxiliary input jack.
3. Check the volume operation.

   Is the sound normal?

   YES -Intermittent failure, the system is OK at this time.

   NO -Go to step 4.

4. Make sure the auxiliary accessory volume is set to high.

   Is the volume set to high?

YES -Go to step 5.

NO -Raise the auxiliary accessory volume to high. Make sure the audio unit volume is turned down before retesting.

5. Substitute a known-good auxiliary audio accessory and/or auxiliary stereo cable, and recheck.

   Does the auxiliary audio accessory operate properly?

   YES -Original auxiliary audio accessory or auxiliary stereo cable is faulty.

   NO -Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Remove the USB adapter holder/auxiliary jack assembly (see **USB ADAPTER HOLDER/AUXILIARY JACK ASSEMBLY REPLACEMENT**), and check for poor connection or loose terminals at the auxiliary jack assembly 5P connector.

   Are the connection or terminals OK?

   YES -Go to step 8.

   NO -Repair poor connection or loose terminals, and recheck.

8. Disconnect the auxiliary jack assembly 5P connector.
9. Disconnect audio unit connector D (20P).
10. Check for continuity between audio unit connector D (20P) and body ground according to the table.

Audio unit connector	Wire color
D3	BLK
D13	RED
D14	WHT
D15	ORN

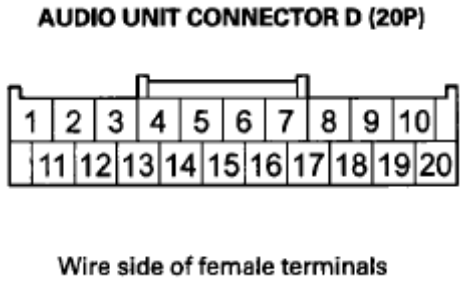

Fig. 153: Checking Continuity Between Audio Unit Connector D (20P) And Body Ground According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the audio unit and the auxiliary jack assembly. Repair or replace the affected harness.

NO -Go to step 11.

11. Check for continuity between the terminals of audio unit connector D (20P) according to the table.

From terminal	To terminals
D3 (BLK)	D4 (GRY), D13 (RED), D14 (WHT)
D4 (GRY)	D13 (RED), D14 (WHT)
D13 (RED)	D14 (WHT)

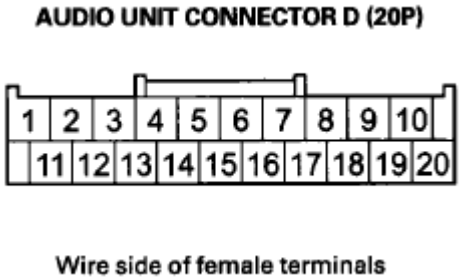

Fig. 154: Checking Continuity Between Terminals Of Audio Unit Connector D (20P) According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wire(s) between the audio unit and the auxiliary jack assembly. Replace the affected shielded harness.

NO -Go to step 12.

12. Check for continuity between audio unit connector D (20P) and the auxiliary jack assembly 5P connector according to the table.

Audio unit connector	Auxiliary jack assembly connector	Wire color
D3	3	BLK
D5	2	YEL
D13	4	RED
D14	5	WHT
D15	1	ORN

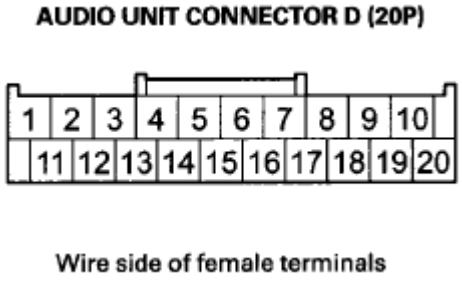

Fig. 155: Checking Continuity Between Audio Unit Connector D (20P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

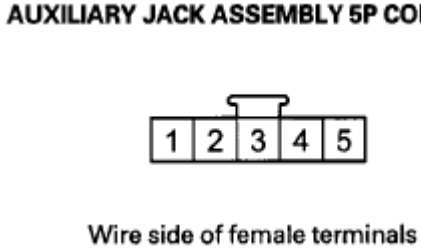

Fig. 156: Checking Continuity Between Auxiliary Jack Assembly 5P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good USB adapter holder/auxiliary jack assembly (see **USB ADAPTER HOLDER/AUXILIARY JACK ASSEMBLY REPLACEMENT**), then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original USB adapter holder/auxiliary jack assembly (see **USB ADAPTER HOLDER/AUXILIARY JACK ASSEMBLY REPLACEMENT**). If the symptom/indication is still present, replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

NO -There is an open in the wire(s) between the audio unit and the auxiliary jack assembly. Repair or replace the affected harness.

AUDIO SYSTEM SOUND IS WEAK OR DISTORTED (DISPLAY IS NORMAL) (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio-navigation unit, and check for sound in each mode (AM/FM and CD or DVD).

Is there sound from the speakers, and is the sound quality normal in each mode?

YES -Intermittent failure, the system is OK at this time. Check for loose connections at the audio unit, the

stereo amplifier, and each speaker.

NO -Speakers all work, sound quality is poor:

- If the sound quality is poor only with AM or FM, go to **POOR AM OR FM RADIO RECEPTION OR INTERFERENCE TROUBLESHOOTING** .
- If there is no sound in CD or DVD mode, go to **AUDIO DISC DOES NOT PLAY TROUBLESHOOTING** .
- If the sound is poor in all modes, go to **SOUND QUALITY DIAGNOSIS** .

AUDIO SYSTEM SOUND IS WEAK OR DISTORTED (DISPLAY IS NORMAL) (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio unit, and check for sound in each mode (AM/FM and CD).

Is there sound from the speakers, and is the sound quality normal in each mode?

YES -Intermittent failure. The system is OK at this time. Check for loose connections at the audio unit, the stereo amplifier, and each speaker.

NO -Speakers all work, sound quality is poor:

- If the sound quality is poor only with AM or FM, go to **POOR AM OR FM RADIO RECEPTION OR INTERFERENCE TROUBLESHOOTING** .
- If there is no sound in CD or DVD mode, go to **AUDIO DISC DOES NOT PLAY TROUBLESHOOTING** .
- If the sound is poor in all modes, go to **SOUND QUALITY DIAGNOSIS** .

RADIO PRESET MEMORY IS LOST (WITH NAVIGATION)

NOTE: **If only XM stations are lost, go to XM RADIO PRESET MEMORY IS LOST TROUBLESHOOTING; WITH AcuraLink® (see), WITHOUT AcuraLink® .**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system, and set each of the radio station preset buttons.

Do each of the buttons set properly?

YES -Go to step 3.

NO -Substitute a known-good audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**). If the symptom/indication is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode for 1 minute, then back to ON (II), or the ON mode.
4. Test the preset buttons for proper recall operation.

   Do the preset buttons recall the set radio stations?

   YES -Intermittent failure, the system is OK at this time. Check connections at the audio-navigation unit and the audio-navigation switch panel.

   NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit.

RADIO PRESET MEMORY IS LOST (WITHOUT NAVIGATION)

NOTE: **If only XM stations are lost, go to XM RADIO PRESET MEMORY IS LOST TROUBLESHOOTING .**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio unit, and set each of the radio station preset buttons.

   Do each of the buttons set properly?

   YES -Go to step 3.

   NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode for 1 minute, then turn it back to ON (II), or the ON mode.
4. Test the preset buttons for proper recall operation.

   Do the preset buttons recall the set radio stations?

   YES -Intermittent failure, the system is OK at this time. Check connections at the audio unit.

   NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

VOLUME DOES NOT CHANGE (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**

- **Check the connectors for poor connections or loose terminals.**
- **Set the fader and balance positions to the center.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system, and check for sound in each mode (AM/FM and CD or DVD).

   Is the sound normal?

   YES -Go to step 3.

   NO -Go to **SOUND QUALITY DIAGNOSIS** (see) or **NO SOUND IS HEARD FROM THE SPEAKER(S) (DISPLAY IS NORMAL) TROUBLESHOOTING** .

3. Operate the volume knob to see if the volume changes.

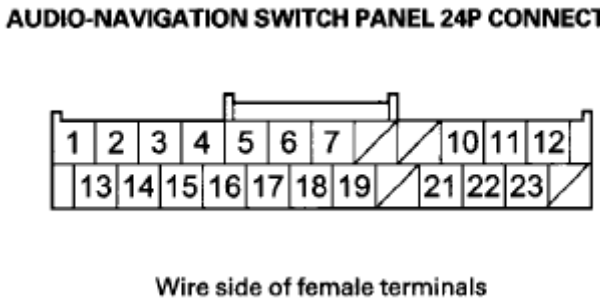
   Does the volume change?

   YES -Intermittent failure, the system is OK at this time.

   NO -Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the audio-navigation switch panel 24P connector.
6. Disconnect audio-navigation unit connector D (36P).
7. Check for continuity between the audio-navigation switch panel 24P connector and audio-navigation unit connector D (36P) according to the table.

Audio-navigation switch panel connector	Audio-navigation unit connector	Wire color
1	D5	BLU
13	D23	PNK



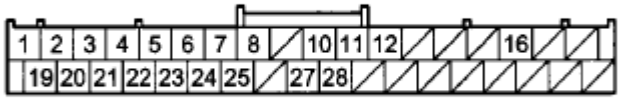


Fig. 157: Checking Continuity Between Audio-Navigation Switch Panel 24P Connector Terminals
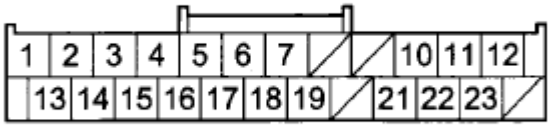
Courtesy of AMERICAN HONDA MOTOR CO., INC.

AUDIO-NAVIGATION UNIT CONNECTOR D (36P)

Wire side of female terminals

Fig. 158: Checking Continuity Between Audio-Navigation Unit Connector D (36P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?



YES -Go to step 8.

NO -There is an open in the wire(s) between the audio-navigation switch panel and the audio-navigation unit. Replace the affected shielded harness.

8. Check for continuity between the audio-navigation switch panel 24P connector and body ground according to the table.

Audio-navigation switch panel connector	Wire color
1	BLU
13	PNK

AUDIO-NAVIGATION SWITCH PANEL 24P CONNECTOR

Wire side of female terminals

Fig. 159: Checking Continuity Between Audio-Navigation Switch Panel 24P Connector And Body Ground According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the audio-navigation unit and the audio-navigation switch panel. Replace the affected shielded harness.

NO -Go to step 9.

9. Check for continuity between the terminals of the audio-navigation switch panel 24P connector according to the table.

From terminal	To terminals
1 (BLU	2 (GRY), 13(PNK)
2 (GRY)	13 (PNK)

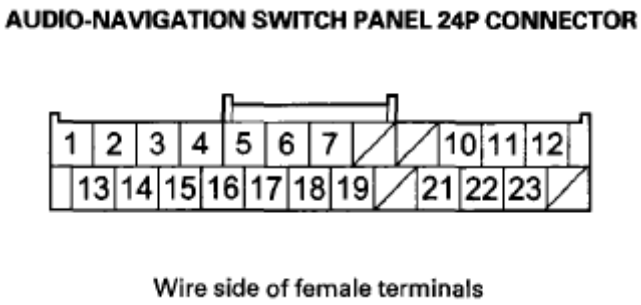


Fig. 160: Checking Continuity Between Terminals Of Audio-Navigation Switch Panel 24P Connector According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wires between the audio-navigation switch panel and the audio-navigation unit. Replace the affected shielded harness.

NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**). If the symptom/indication is still present, replace the audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**).

VOLUME DOES NOT CHANGE (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Set the fader and balance positions to the center.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio unit, and check for sound in each mode (AM/FM and CD).

Is the sound normal?

YES -Go to step 3.

NO -Go to **SOUND QUALITY DIAGNOSIS** (see) or **NO SOUND IS HEARD FROM THE SPEAKER(S) (DISPLAY IS NORMAL) TROUBLESHOOTING** .

3. Operate the volume knob to see if the volume changes.

   Does the volume change?

   YES -Operation is normal.

   NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

VOLUME DOES NOT INCREASE WITH SPEED (WITH NAVIGATION)

NOTE:
- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Test-drive the vehicle at highway speeds, and monitor if the volume increases.

   Does the volume increase?

   YES -Intermittent failure, the system is OK at this time.

   NO -Go to step 2.

2. Verify SVC mode setting in audio-navigation unit sound adjustment set-up.

   Is the SVC set to off?

   YES -Change setting to SVC MID, and recheck.

   NO -Go to step 3.

3. Do the Self-Diagnostic Function for the vehicle speed pulse indication (see **HOW TO CHECK THE AUDIO SYSTEM CONDITION**).
4. With the help of an assistant test-drive the vehicle, and watch the VSP signal.

   Does self-diagnostic function indicate a VSP signal?

   YES -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

   NO -Go to navigation DTC 1306 (Vehicle Speed Pulse) troubleshooting (see **DTC 1305: GYRO ERROR 2**).

VOLUME DOES NOT INCREASE WITH SPEED (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Test-drive the vehicle at highway speeds, and monitor if the volume increases.

   Does the volume increase?

   YES -Intermittent failure, the system is OK at this time.

   NO -Go to step 2.

2. Verify SVC mode setting in audio unit sound adjustment set-up.

   Is the SVC set to off?

   YES -Change setting to SVC MID, and recheck.

   NO -Go to step 3.

3. Do the Self-Diagnostic Function for the vehicle speed pulse indication (see **HOW TO CHECK THE AUDIO SYSTEM CONDITION**).
4. With the help of an assistant, test-drive the vehicle and watch the VSP signal.

   Does self-diagnostic function indicate a VSP signal?

   YES -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

   NO -Check for B-CAN DTCs (communication BUS Line Error) with the HDS and go to the indicated DTC's troubleshooting. If no B-CAN DTCs or communication bus line errors are found, substitute a known-good audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

VOLUME IS TOO HIGH OR TOO LOW WHEN DRIVING AT FREEWAY SPEEDS (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Test-drive the vehicle at highway speeds, and monitor volume level.

   Is the volume level too high, or too low?

   YES -Go to step 2.

NO -Intermittent failure, the system is OK at this time.

2. Change SVC mode setting in sound adjustment set-up to SVC MID, and recheck.

   Is the volume level still too high or too low?

   YES -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

   NO -Improper SVC setting for client's sound taste.

VOLUME IS TOO HIGH OR TOO LOW WHEN DRIVING AT FREEWAY SPEEDS (WITHOUT NAVIGATION)

NOTE:
- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Test-drive the vehicle at highway speeds, and monitor volume level.

   Is the volume level too high, or too low?

   YES -Go to step 2.

   NO -Intermittent failure, the system is OK at this time.

2. Change SVC mode setting in sound adjustment set-up to SVC MID, and recheck.

   Is the volume level still too high or too low?

   YES -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

   NO -Improper SVC setting for client's sound taste.

RADIO TUNER DOES NOT CHANGE STATIONS (WITH NAVIGATION)

NOTE:
- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connection or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system, and check the audio information on the audio-navigation switch panel display.

   Does the audio information display properly?

   YES -Go to step 3.

NO -Go to **AUDIO UNIT POWER SWITCH WILL NOT TURN ON (NO INFORMATION DISPLAY AND NO SOUND) TROUBLESHOOTING** .

3. Operate the TUNE button to see if the radio station changes.

   Does the radio station change?

   YES -Intermittent failure, the system is OK at this time.

   NO -Go to step 4.

4. Do the Self-Diagnostic Function for the audio button detection (see **HOW TO CHECK THE AUDIO SYSTEM CONDITION**).

   Does the TUNE button respond?

   YES -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

   NO -Substitute a known-good audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**).

RADIO TUNER DOES NOT CHANGE STATIONS (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connection or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio unit, and check the audio information on the audio-HVAC display.

   Does the audio information display properly?

   YES -Go to step 3.

   NO -Go to **AUDIO UNIT POWER SWITCH WILL NOT TURN ON (NO INFORMATION DISPLAY AND NO SOUND) TROUBLESHOOTING** .

3. Operate the tuning knob to see if the radio station changes.

   Does the radio station change?

   YES -Intermittent failure, the system is OK at this time.

NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

AUDIO SYSTEM INFORMATION DOES NOT DISPLAY ON THE AUDIO-NAVIGATION SWITCH PANEL DISPLAY (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Check for poor connections or loose terminals at the audio-navigation switch panel 24P connector and audio-navigation unit connector D (36P).

   Are the connections or terminals OK?

   YES -Go to step 2.

   NO -Repair poor connections or loose terminals, and recheck.

2. Measure the voltage between audio-navigation switch panel 24P connector terminal No. 22 and body ground.

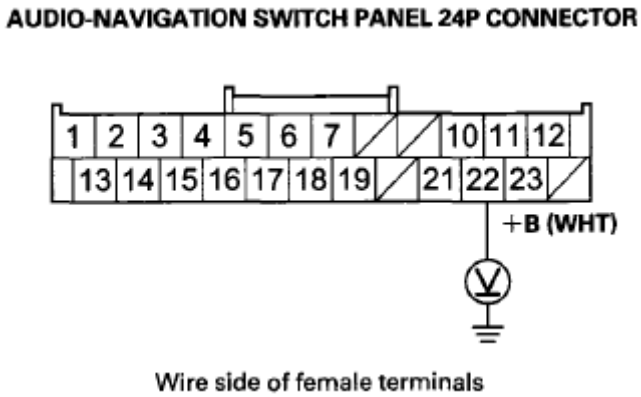

Fig. 161: Measuring Voltage Between Audio-Navigation Switch Panel 24P Connector Terminal No. 22 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES -Go to step 4.

   NO -Repair an open in the wire between the No. 15 (10 A) fuse in the under-hood fuse/relay box and the audio-navigation switch panel.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Measure the voltage between audio-navigation switch panel 24P connector terminal No. 10 and body ground.

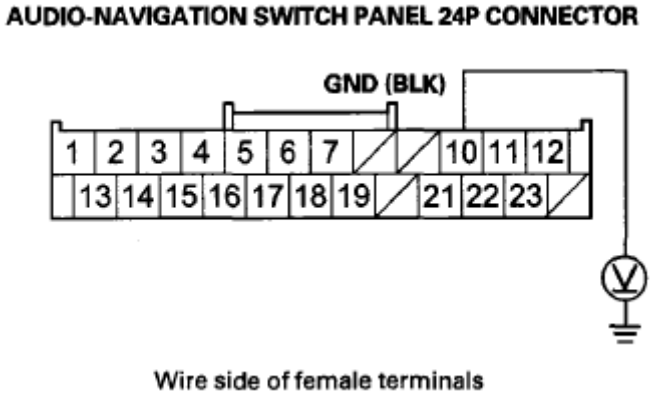

Fig. 162: Measuring Voltage Between Audio-Navigation Switch Panel 24P Connector Terminal No. 10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 5.

NO -Repair an open or high resistance in the wire between the audio-navigation switch panel and body ground (G501) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the audio-navigation switch panel 24P connector.
7. Disconnect audio-navigation unit connector D (36P).
8. Check for continuity between the audio-navigation switch panel 24P connector and audio-navigation unit connector D (36P) according to the table.

Audio-navigation switch panel connector	Audio-navigation unit connector	Wire color
3	D20	BLU
15	D1	YEL
16	D19	BRN

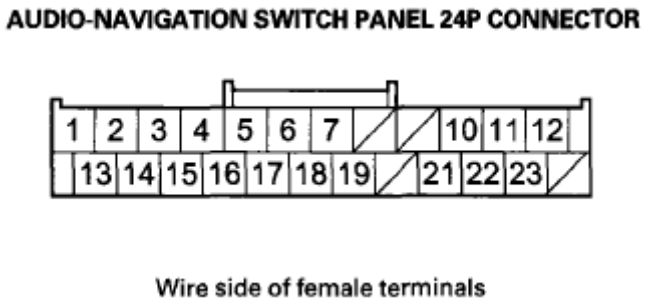

Fig. 163: Checking Continuity Between Audio-Navigation Switch Panel 24P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

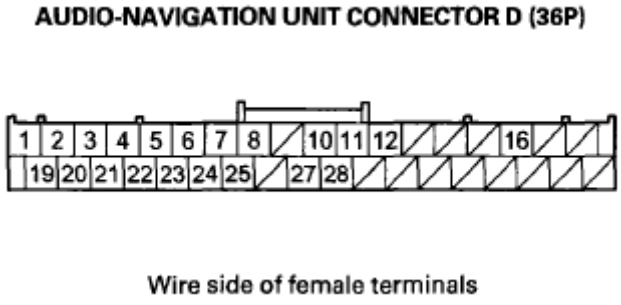

Fig. 164: Checking Continuity Between Audio-Navigation Connector D (36P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 9.

NO -There is an open in the wire(s) between the audio-navigation switch panel and the audio-navigation unit. Repair or replace the affected shielded harness.

9. Check for continuity between the audio-navigation switch panel 24P connector and body ground according to the table.

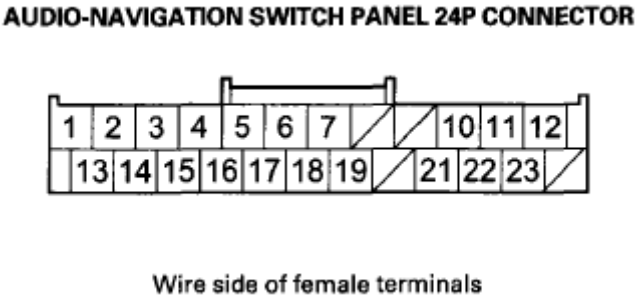

Fig. 165: Checking Continuity Between Audio-Navigation Switch Panel 24P Connector And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short in the wire(s) between the audio-navigation switch panel and the audio-navigation unit. Repair or replace the affected shielded harness.

NO -Go to step 10.

10. Check for continuity between the terminals of the audio-navigation switch panel 24P connector according to the table.

From terminal	To terminals

4 (GRY)	15 (YEL), 16(BRN)
15 (YEL)	16 (BRN)

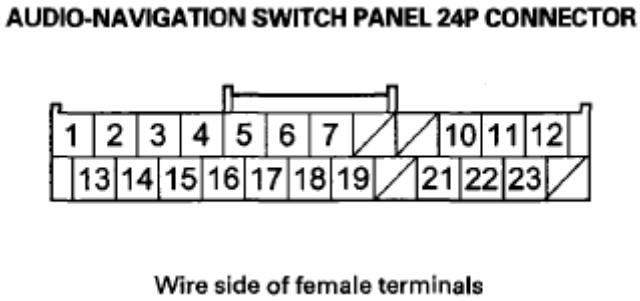

Fig. 166: Checking Continuity Between Terminals Of Audio-Navigation Switch Panel 24P Connector According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wires between the audio-navigation switch panel and the audio-navigation unit. Replace the affected shielded harness.

NO -Substitute a known-good audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**), then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**). If the symptom/indication is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

AUDIO SYSTEM INFORMATION DOES NOT DISPLAY ON THE AUDIO-HVAC DISPLAY UNIT (WITHOUT NAVIGATION)

NOTE:
- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Check for poor connections or loose terminals at the audio-HVAC display unit 12P connector and audio unit connector D (20P).

   Are the connections or terminals OK?

   YES -Go to step 3.

   NO -Repair poor connections or loose terminals, and recheck.

2. Measure the voltage between audio-HVAC display unit 12P connector terminal No. 6 and body ground.

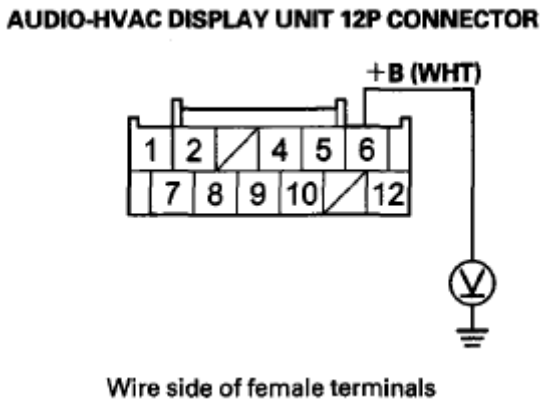

Fig. 167: Measuring Voltage Between Audio-HVAC Display Unit 12P Connector Terminal No. 6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 4.

NO -Repair an open in the wire between the No. 15 (10 A) fuse in the under-hood fuse/relay box and the audio-HVAC display unit.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Measure the voltage between audio-HVAC display unit 12P connector terminal No. 9 and body ground.

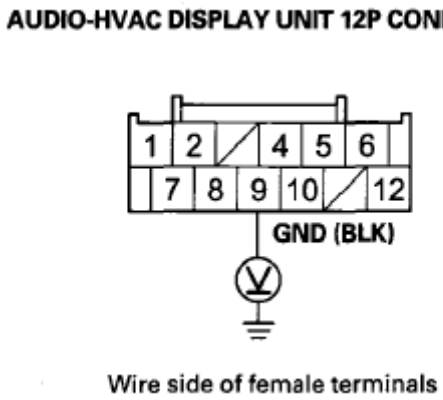

Fig. 168: Measuring Voltage Between Audio-HVAC Display Unit 12P Connector Terminal No. 9 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 5.

NO -Repair an open or high resistance in the wire between the audio-HVAC display unit and body

ground (G501) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the audio-HVAC display unit 12P connector.
7. Disconnect audio unit connector D (20P).
8. Check for continuity between audio unit connector D (20P) and the audio-HVAC display unit 12P connector according to the table.

Audio unit connector	Audio-HVAC display unit connector	Wire color
D6	2	BRN
D7	1	YEL
D17	4	BLU

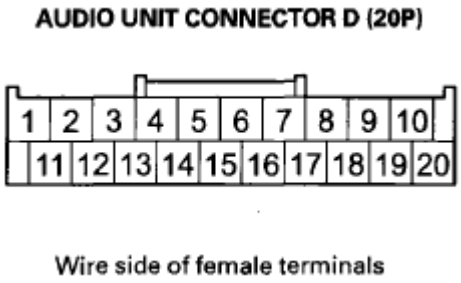

Fig. 169: Checking Continuity Between Audio Unit Connector D (20P) Terminals According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

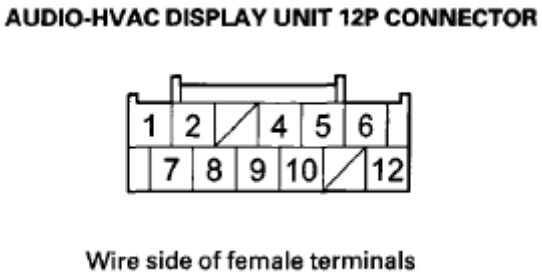

Fig. 170: Checking Continuity Between Audio-HVAC Display Unit 12P Connector Terminals According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 9.

NO -There is an open in the wire(s) between the audio unit and the audio-HVAC display unit. Repair or replace the affected shielded harness.

9. Check for continuity between the audio unit connector D (20P) and body ground according to the table.

Audio unit connector	Wire color
06	BRN
D7	YEL
D17	BLU

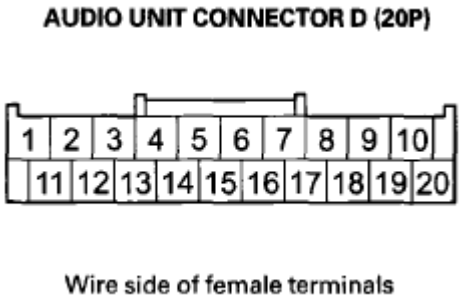

Fig. 171: Checking Continuity Between Audio Unit Connector D (20P) And Body Ground According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the audio unit and the audio-HVAC display unit. Repair or replace the affected shielded harness.

NO -Go to step 10.

10. Check for continuity between the terminals of audio unit connector D (20P) according to the table.

From terminal	To terminals
D6 (BRN)	D7 (YEL), D16(GRY)
D7 (YEL)	D16 (GRY)

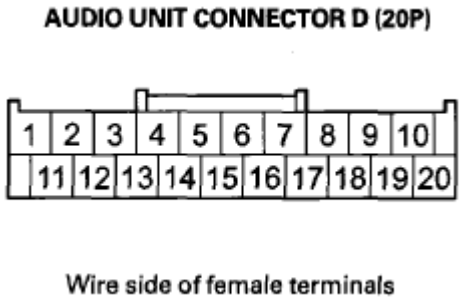

Fig. 172: Checking Continuity Between Terminals Of Audio Unit Connector D (20P) According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wires between the audio unit and the audio-HVAC display unit. Replace the affected shielded harness.

NO -Substitute a known-good audio-HVAC display unit (see **AUDIO-HVAC DISPLAY UNIT REMOVAL/INSTALLATION**), then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original audio-HVAC display unit (see **AUDIO-HVAC DISPLAY UNIT REMOVAL/INSTALLATION**). If the symptom/indication is still present, replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

AUDIO-NAVIGATION SWITCH PANEL BUTTON ILLUMINATION DOES NOT WORK (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn the combination lighting switch to the parking light position.
3. Check the illumination of the audio-navigation switch panel buttons.

   Are the buttons illuminated?

   YES -Intermittent failure, the system is OK at this time. Check for loose or poor connections at the audio-navigation switch panel 24P connector.

   NO -Go to step 4.

4. Check the illumination of several other buttons not related to the audio system.

   Are the buttons illuminated?

   YES -Go to step 6.

   NO -Troubleshoot the interior lights. Start by checking the No. 6 (7.5 A) fuse in the passenger's under-dash fuse/relay box. If the fuse is OK, check for an open in the wire between passenger's under-dash fuse/relay box and the audio-navigation switch panel.

5. Turn the combination lighting switch to the off position.
6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Disconnect the audio-navigation switch panel 24P connector.
8. Disconnect the gauge control module 32P connector.
9. Check for continuity between audio-navigation switch panel 24P connector terminals No. 11 and No. 12 and gauge control module 32P connector terminals No. 21 and No. 20 respectively.

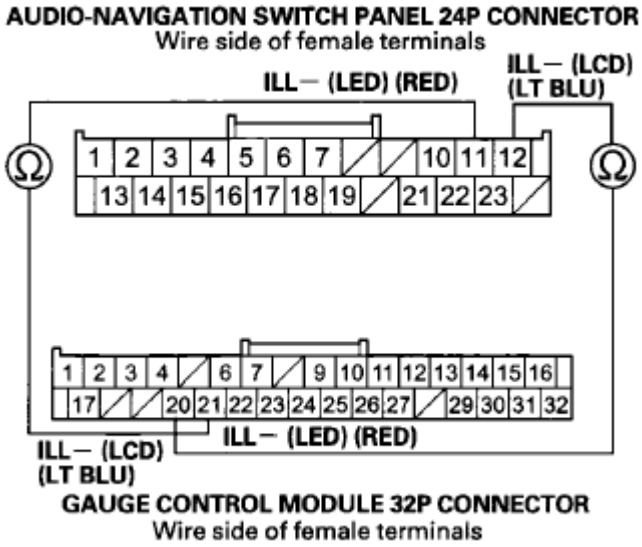

Fig. 173: Checking Continuity Between Audio-Navigation Switch Panel 24P Connector Terminals No. 11 And No. 12
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 10.

NO -Repair an open in the wire between the audio-navigation switch panel and the gauge control module.

10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. With the combination lighting switch to the parking light position, measure the voltage between audio-navigation switch panel 24P connector terminal No. 23 and body ground.

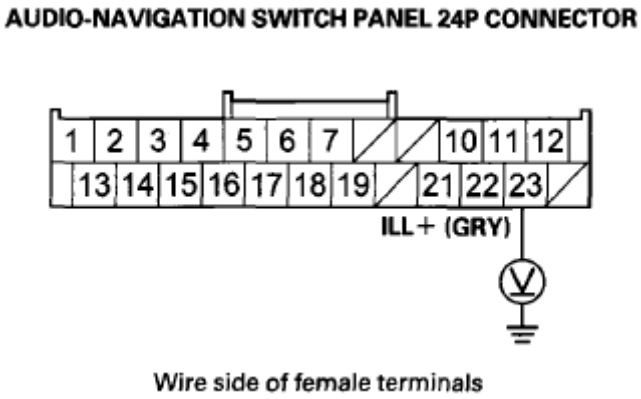

Fig. 174: Measuring Voltage Between Audio-Navigation Switch Panel 24P Connector Terminal No. 23 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Substitute a known-good audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**), and recheck. If the symptom/indicated goes away, replace the original audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**).

NO -Repair an open in the wire between the passenger's under-dash fuse/relay box and the audio-navigation switch panel.

AUDIO SWITCH PANEL BUTTON ILLUMINATION DOES NOT WORK (WITHOUT NAVIGATION)

NOTE:
- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn the combination lighting switch to the parking light position.
3. Check the illumination of the audio unit buttons.

   Are the buttons illuminated?

   YES -Intermittent failure, the system is OK at this time. Check for loose or poor connections at audio unit connector A (24P).

   NO -Go to step 4.

4. Check the illumination of several other buttons not related to the audio system.

   Are the buttons Illuminated?

   YES -Go to step 6.

   NO -Troubleshoot the interior lights. Start by checking the No. 6 (7.5 A) fuse in the passenger's under-dash fuse/relay box. If the fuse is OK, check for an open in the wire between the passenger's under-dash fuse/relay box and the audio unit.

5. Turn the combination lighting switch to the off position.
6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Disconnect audio unit connector A (24P).

   NOTE: Eject all the CDs before disconnecting the audio unit to prevent damaging the CD player's load mechanism.

8. Disconnect the gauge control module 32P connector.
9. Check for continuity between audio unit connector A (24P) terminal No. 1 and gauge control module 32P connector terminal No. 21.

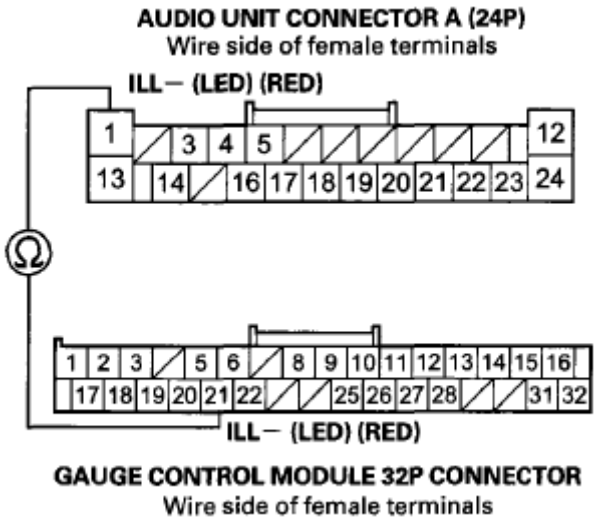

Fig. 175: Checking Continuity Between Audio Unit Connector A (24P) And Gauge Control Module 32P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 10.

NO -Repair an open in the wire between the audio unit and the gauge control module.

10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. With the combination lighting switch to the parking light position, measure the voltage between audio unit connector A (24P) terminal No. 13 and body ground.

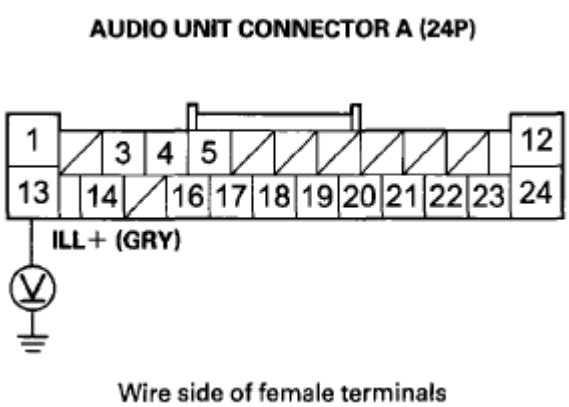

Fig. 176: Measuring Voltage Between Audio Unit Connector A (24P) Terminal No. 13 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

NO -Repair an open in the wire between the passenger's under-dash fuse/relay box and the audio unit.

AUDIO REMOTE SWITCH DOES NOT WORK PROPERLY (WITH NAVIGATION)

NOTE:
- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio-navigation unit, and check the audio remote switch operation (volume up, volume down, CH (UP), CH (DOWN), MODE).

   Is the audio system operation OK?

   YES -Intermittent failure, the system is OK at this time.

   NO -Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Do the Audio Remote Switch Test (see **AUDIO REMOTE SWITCH TEST**).

   Is the audio remote switch OK?

   YES -Go to step 5.

   NO -Replace the audio remote, HFL-navigation voice control switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**).

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Reconnect the audio remote, HFL-navigation voice control switch 12P connector.
7. Disconnect audio-navigation unit connector A (24P).

   NOTE: Eject all the disc(s) before disconnecting the audio-navigation unit to prevent damaging the CD/DVD player's load mechanism.

8. Measure the resistance between audio-navigation unit connector A (24P) terminals No. 5 and No. 16 as specified in the table.

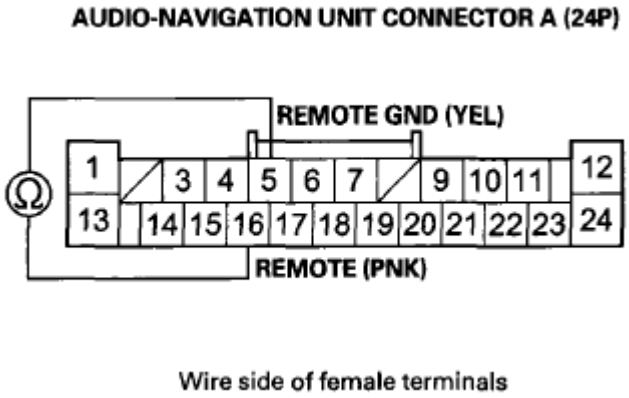

Fig. 177: Measuring Resistance Between Audio-Navigation Unit Connector A (24P) Terminals No. 5 And No. 16
Courtesy of AMERICAN HONDA MOTOR CO., INC.

AUDIO REMOTE SWITCH TABLE

Button held down	VOL DOWN	VOL UP	CH(-)	CH(+)	MODE	No button pressed
Resistance	about 100 ohms	about 357 ohms	about 775 ohms	about 1.7 kohms	about 3.7 kohms	about 10 kohms

Is the resistance OK?

YES -Go to step 9.

NO -Repair a short or high resistance in the wires between the audio-navigation unit and the audio remote switch. If the wires are OK, replace the cable reel (see **CABLE REEL REPLACEMENT**).

9. Disconnect the audio remote, HFL-navigation voice control switch 12P connector.
10. Check for continuity between body ground and audio-navigation unit connector A (24P) terminals No. 5 and No. 16 individually.

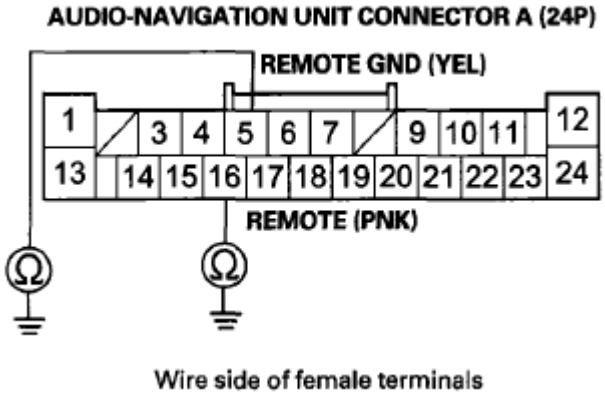

Fig. 178: Checking Continuity Between Body Ground And Audio-Navigation Unit Connector A (24P) Terminals No. 5 And No. 16

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire(s) between the audio-navigation unit and the audio remote switch. If the wires are OK, replace the cable reel (see **CABLE REEL REPLACEMENT**).

NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

AUDIO REMOTE SWITCH DOES NOT WORK PROPERLY (WITHOUT NAVIGATION)

NOTE:
- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio unit, and check the audio remote switch operation (volume up, volume down, CH (UP), CH (DOWN), MODE).

   Is the audio system operation OK?

   YES -Intermittent failure, the system is OK at this time.

   NO -Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Do the Audio Remote Switch Test (see **AUDIO REMOTE SWITCH TEST**).

   Is the audio remote switch OK?

   YES -Go to step 5.

   NO -Replace the audio remote-HFL switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**).

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Reconnect the audio remote-HFL switch 12P connector.
7. Disconnect audio unit connector A (24P).

   NOTE: Eject all the CDs before disconnecting the audio unit to prevent damaging the CD player's load mechanism.

8. Measure the resistance between audio unit connector A (24P) terminals No. 5 and No. 16 as specified in

the table.

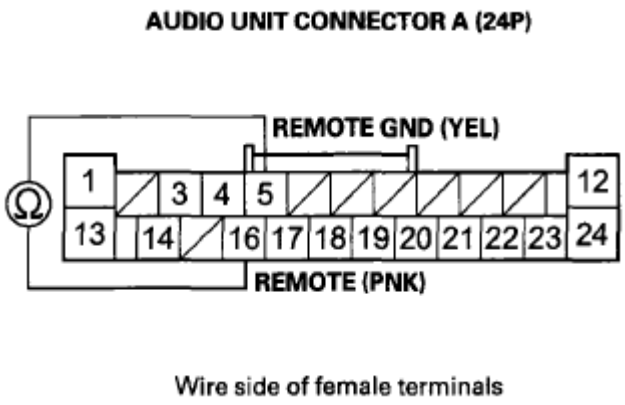

Fig. 179: Measuring Resistance Between Audio Unit Connector A (24P) Terminals No. 5 And No. 16
Courtesy of AMERICAN HONDA MOTOR CO., INC.

AUDIO REMOTE SWITCH TABLE

Button held down	VOL DOWN	VOL UP	CH(-)	CH(+)	MODE	No button pressed
Resistance	about 100 ohms	about 357 ohms	about 775 ohms	about 1.7 kohms	about 3.7 kohms	about 10 kohms

Is the resistance OK?

YES -Go to step 9.

NO -Repair a short or high resistance in the wires between the audio unit and the audio remote switch. If the wires are OK, replace the cable reel (see **CABLE REEL REPLACEMENT**).

9. Disconnect the audio remote-HFL switch 12P connector.
10. Check for continuity between body ground and audio unit connector A (24P) terminals No. 5 and No. 16 individually.

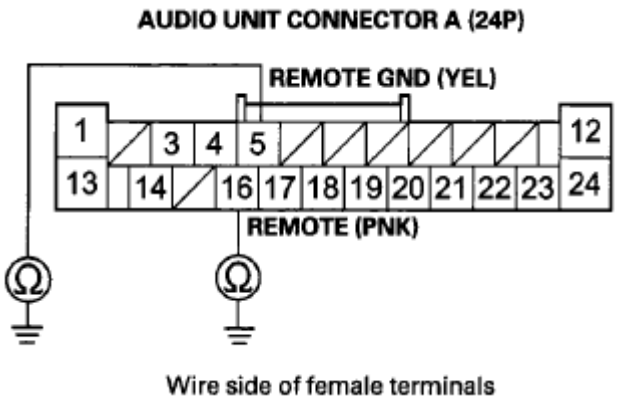

Fig. 180: Checking Continuity Between Body Ground And Audio Unit Connector A (24P) Terminals No. 5 And No. 16
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire(s) between the audio unit and the audio remote switch. If the wires are OK, replace the cable reel (see **CABLE REEL REPLACEMENT**).

NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

AUDIO DISC DOES NOT LOAD (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Disc labels should not be used in the audio-navigation unit. They may jam and damage the player mechanism.**
- **Make sure the audio disc is compatible with the system (see the Owner's Manual for more information).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Insert a known-good disc to see if the symptom can be duplicated.

   Does the disc load?

   YES -Operation is normal. If the disc loads normally, but will not play, go to **AUDIO DISC DOES NOT PLAY TROUBLESHOOTING** (see).

   NO -Go to step 3.

3. Insert another disc.

   Does the disc load?

   YES -The original disc is faulty.

   NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

AUDIO DISC DOES NOT LOAD (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

- **Disc labels should not be used in the audio unit. They may jam and damage the player mechanism.**
- **Make sure the audio disc is compatible with the system (see the Owner's Manual for more information).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Insert a known-good disc to see if the symptom can be duplicated.

   Does the disc load?

   YES -Operation is normal. If the disc loads normally, but will not play, go to **AUDIO DISC DOES NOT PLAY TROUBLESHOOTING** (see).

   NO -Go to step 3.

3. Insert another disc.

   Does the disc load?

   YES -The original disc is faulty.

   NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

AUDIO DISC DOES NOT EJECT (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Disc labels should not be used in the audio-navigation unit. They may jam and damage the player mechanism.**
- **Check the connectors for poor connections or loose terminals**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system.

   Does the system turn on?

   YES -Go to step 3.

   NO -Go to **AUDIO UNIT POWER SWITCH WILL NOT TURN ON (NO INFORMATION DISPLAY AND NO SOUND) TROUBLESHOOTING** (see).

3. Check to see if the disc ejects correctly with no binding when you push the EJECT button.

   Does the disc eject properly?

   YES -Operation is normal.

NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

AUDIO DISC DOES NOT EJECT (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Disc labels should not be used in the audio unit. They may jam and damage the player mechanism.**
- **Check the connectors for poor connections or loose terminals**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio unit.

   Does the audio unit turn on?

   YES -Go to step 3.

   NO -Go to **AUDIO UNIT POWER SWITCH WILL NOT TURN ON (NO INFORMATION DISPLAY AND NO SOUND) TROUBLESHOOTING** .

3. Check to see if the disc ejects correctly with no binding when you push the EJECT button.

   Does the disc eject properly?

   YES -Operation is normal.

   NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

AUDIO DISC CHANGER DOES NOT LOAD ALL SIX DISCS (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Disc labels should not be used in the audio unit. They may jam and damage the player mechanism.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Try loading six discs into the audio unit (in-dash disc changer).

   Does the audio unit accept all six discs?

   YES -Intermittent failure, the audio unit is OK at this time.

   NO -Go to step 3.

3. Try loading the disc player with six known-good discs.

   Does the audio unit (in-dash disc changer) accept all six discs?

   YES -At least one of the original discs is faulty.

   NO -Replace the audio unit (in-dash disc changer) (see **AUDIO UNIT REMOVAL/INSTALLATION**).

AUDIO DISC CHANGER DOES NOT MOVE BETWEEN DISCS (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Disc labels should not be used in the audio unit. They may jam and damage the player mechanism.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Insert six discs into the audio unit (in-dash disc changer), and see if the changer moves between discs.

   Does the changer operate normally?

   YES -Intermittent failure, the disc changer is OK at this time.

   NO -Go to step 3.

3. Insert six known-good discs into the audio unit.

   Does the changer operate normally?

   YES -At least one of the original discs is faulty.

   NO -Replace the audio unit (in-dash disc changer) (see **AUDIO UNIT REMOVAL/INSTALLATION**).

   Special Tools Required

   Diagnostic CD 07AAZ-SDBA100

AUDIO DISC DOES NOT PLAY (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Disc labels should not be used in the audio-navigation unit. They may jam and damage the player mechanism.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Insert a disc into the audio-navigation unit.

   Does the disc load?

   YES -Go to step 3.

   NO -Go to **AUDIO DISC DOES NOT LOAD TROUBLESHOOTING** .

3. Insert a known-good disc to see if the symptom can be duplicated.

   Does the disc play?

   YES -Operation is normal.

   NO -Go to step 4

4. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio-navigation unit.

   Does the disc play?

   YES -The original disc is faulty or has an unreadable format.

   NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

   Special Tools Required

   Diagnostic CD 07AAZ-SDBA100

AUDIO DISC DOES NOT PLAY (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Disc labels should not be used in the audio unit. They may jam and damage the player mechanism.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Insert a disc into the audio unit.

   Does the disc load?

   YES -Go to step 3.

NO -Go to **AUDIO DISC DOES NOT LOAD TROUBLESHOOTING** .

3. Insert a known-good disc to see if the symptom can be duplicated.

   Does the disc play?

   YES -Operation is normal.

   NO -Go to step 4.

4. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.

   Does the disc play?

   YES -The original disc is faulty or has an unreadable format.

   NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

   Special Tools Required

   - Diagnostic CD 07AAZ-SDBA100
   - Skip Test CD 07AAZ-SDBA200
   - Skip Test CD 07AAZ-SDBA300

AUDIO DISC SKIPS (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Disc labels should not be used in the audio-navigation unit. They may jam and damage the player mechanism.**

1. Confirm the vehicles tires are properly inflated.
2. Check the client's disc for scratches and fingerprints.

   NOTE: The following test should be done with the audio system bass and treble set to the client's listening settings. When comparing to known-good vehicles, do the comparison on the same model and trim level.

3. Test-drive the vehicle to identify when the client's disc skips. The audio diagnostic CD (T/N 07AAZ-SDBA100) can be used if the client's disc is not available; use tracks 10-12.

   Does the disc skip?

   YES -Go to step 4.

NO -Operation is normal.

4. Compare the client's disc that skips to a known-good vehicle under the same conditions.

   Does the disc skip in the known-good vehicle under the same conditions?

   YES -The disc player operation is normal, the problem is with the client's disc.

   NO -Go to step 5.

   NOTE: Do the following test with vehicle parked and the engine running.

5. Insert the diagnostic skip test CD (T/N 07AAZ-SDBA300). Play tracks 2-11, and note on which track number(s) the disc starts skipping. Do the same test on a known-good vehicle.

   Does the disc skip on the same track(s) as the known-good vehicle?

   YES -Operation is normal.

   NO -Go to step 6

6. Insert the diagnostic skip test CD (T/N 07AAZ-SDBA200). Play tracks 7-11 and tracks 13-15, and note on which track number(s) the disc starts skipping. Do the same test on a known-good vehicle.

   Does the disc skip on the same track number(s) as the known-good vehicle?

   YES -Operation is normal.

   NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

   Special Tools Required

   - Diagnostic CD 07AAZ-SDBA100
   - Skip Test CD 07AAZ-SDBA200
   - Skip Test CD 07AAZ-SDBA300

AUDIO DISC SKIPS (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Disc labels should not be used in the audio unit. They may jam and damage the player mechanism.**

1. Confirm the vehicles tires are properly inflated.
2. Check the client's disc for scratches and fingerprints.

NOTE: The following test should be done with the audio system bass and treble set to the client's listening settings. When comparing to known-good vehicles, do the comparison on the same model and trim level.

3. Test-drive the vehicle to identify when the client's disc skips. The audio diagnostic CD (T/N 07AAZ-SDBA100) can be used if the client's CD is not available; use tracks 10-12.

   Does the disc skip?

   YES -Go to step 4.

   NO -Operation is normal.

4. Compare the client's CD that skips to a known-good vehicle under the same conditions.

   Does the disc skip in the known-good vehicle under the same conditions?

   YES -The disc player operation is normal, the problem is with the client's disc.

   NO -Go to step 5.

NOTE: Do the following test with vehicle parked and the engine running.

5. Insert the diagnostic skip test CD (T/N 07AAZ-SDBA300). Play tracks 2-11, and note on which track number(s) the disc starts skipping. Do the same test on a known-good vehicle.

   Does the disc skip on the same track(s) as the known-good vehicle?

   YES -Operation is normal.

   NO -Go to step 6

6. Insert the diagnostic skip test CD (T/N 07AAZ-SDBA200). Play tracks 7-11 and tracks 13-15, and note on which track number(s) the disc starts skipping. Do the same test on a known-good vehicle.

   Does the disc skip on the same track number(s) as the known-good vehicle?

   YES -Operation is normal.

   NO -Substitute a known-good audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

AUDIO UNIT BUTTON DOES NOT WORK (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Press the VOLUME/POWER knob on.

   Does the audio system turn on?

   YES -Go to step 3.

   NO -Go to **AUDIO UNIT POWER SWITCH WILL NOT TURN ON (NO INFORMATION DISPLAY AND NO SOUND) TROUBLESHOOTING** .

3. Rotate the VOLUME/POWER knob to see if the volume changes.

   Does the volume change?

   YES -Go to step 4.

   NO -Go to **VOLUME DOES NOT CHANGE TROUBLESHOOTING** .

4. Operate all buttons in the appropriate switch list.

   Switch list

   AM/FM, XM, TITLE, *Musical Note / Speaker Symbol* , DISC, HDD/AUX, Preset 1-6, CATEGORY +/-, SKIP, TUNE, SCAN, A.SEL

   Do all the items in the appropriate switch list work properly?

   YES -Intermittent failure, the system is OK at this time.

   NO -If the all buttons do not respond, go to step 5. If not, substitute a known-good audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**). If the symptom/indication is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the audio-navigation switch panel 24P connector.
7. Disconnect audio-navigation unit connector D (36P).
8. Check for continuity between the audio-navigation switch panel 24P connector and audio-navigation unit

connector D (36P) according to the table.

Audio-navigation switch panel connector	Audio-navigation unit connector	Wire color
6	D21	LT BLU
18	D3	PUR

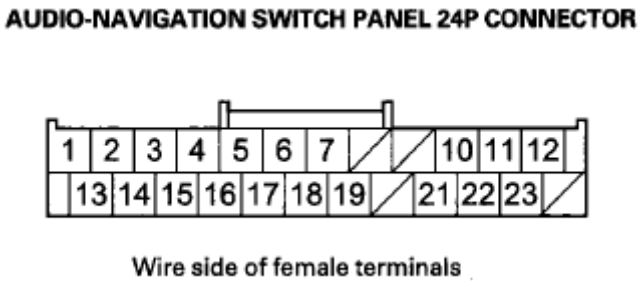

Fig. 181: Checking Continuity Between Audio-Navigation Switch Panel 24P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

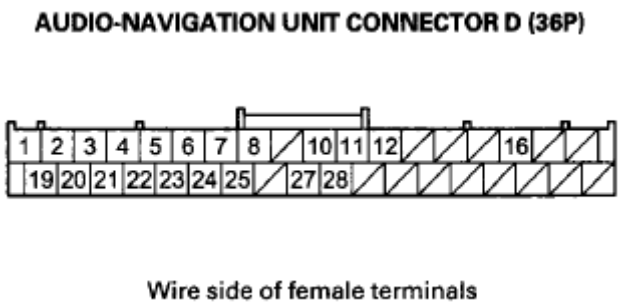

Fig. 182: Checking Continuity Between Audio-Navigation Unit Connector D (36P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 9.

NO -There is an open in the wire(s) between the audio-navigation switch panel and the audio-navigation unit. Replace the affected shielded harness.

9. Check for continuity between the audio-navigation switch panel 24P connector and body ground according to the table.

Audio-navigation switch panel connector	Wire color
6	LT BLU
18	PUR

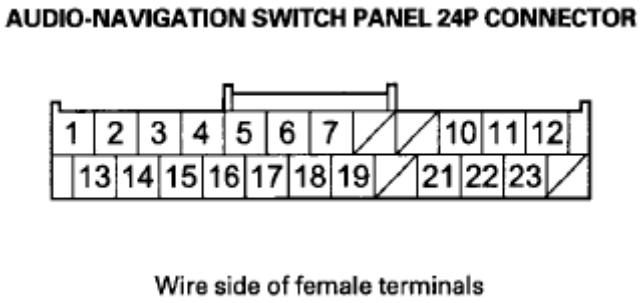

Fig. 183: Checking Continuity Between Audio-Navigation Switch Panel 24P Connector And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the audio-navigation switch panel and the audio-navigation unit. Replace the affected shielded harness.

NO -Go to step 10.

10. Check for continuity between the terminals of the audio-navigation switch panel 24P connector according to the table.

From terminal	To terminals
5 (GRY)	6 (LT BLU), 18 (PUR)
6 (LT BLU)	18 (PUR)

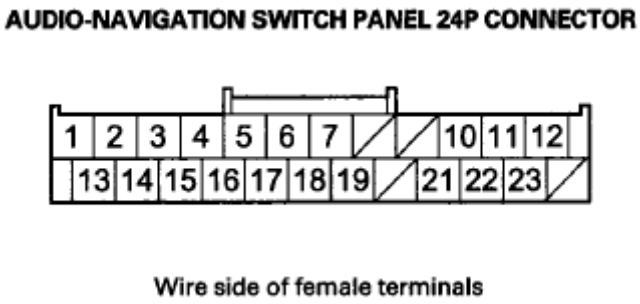

Fig. 184: Checking Continuity Between Terminals Of Audio-Navigation Switch Panel 24P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wires between the audio-navigation switch panel and the audio-navigation unit. Replace the affected shielded harness.

NO -Substitute a known-good audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH**

PANEL REMOVAL/INSTALLATION), and recheck. If the symptom/indication goes away, replace the original audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**). If the symptom/indication is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

AUDIO UNIT BUTTON DOES NOT WORK (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Press the VOLUME/POWER knob on.

   Does the audio unit turn on?

   YES -Go to step 3.

   NO -Go to **AUDIO UNIT POWER SWITCH WILL NOT TURN ON (NO INFORMATION DISPLAY AND NO SOUND) TROUBLESHOOTING** .

3. Operate all buttons in the appropriate switch list.

   Switch list

   AM/FM, XM, CD, AUX, TITLE, CLOCK, Preset 1-6, CATEGORY +/-, SKIP, SCAN, A.SEL, RETURN, SETUP, *Musical Note / Speaker Symbol* , SEL, VOL

   Do all the items in the appropriate switch list work properly?

   YES -Intermittent failure, the system is OK at this time.

   NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

AUDIO UNIT DISC INDICATOR DOES NOT WORK (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Discs with labels should not be used in the audio-navigation unit. They may jam and damage the player mechanism.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system.
3. Insert a known-good disc or press the EJECT button.

Is the DISC indicator (LED) indicated?

YES -Intermittent failure, the system is OK at this time. Check for loose or poor connections at the audio-navigation unit and the audio-navigation switch panel.

NO -Substitute a known-good audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**). If the symptom/indication is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

AUDIO UNIT DISC INDICATOR DOES NOT WORK (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Discs with labels should not be used in the audio unit. They may jam and damage the player mechanism.**

1. Turn on the audio unit.
2. Insert a known-good disc or press the EJECT button.

Is the DISC indicator (LED) indicated?

YES -Intermittent failure, the system is OK at this time.

NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

USB DEVICE DOES NOT FUNCTION (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Check the USB device requirement:**
  - **Mass-storage class ready digital audio player with USB 2.0 port**
  - **More than 256 MB of RAM**
  - **Support MP3, WMA, and AAC (encoded with the iTunes) files, DRM files are not supported**
- **Not all players and player functions work with the USB adapter. Please see the Owner's Manual for more information. Always test the clients USB device in a known-good vehicle of the same year and trim (if possible). Technologies change and are updated frequently which may result that USB devices may work in newer vehicles, but not in order vehicles of the same model.**
- **If UNSUPPORTED appears on the display, the vehicle is OK, there is a software problem with the USB device.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system.
3. Press the HDD/AUX button, and check if it changes to USB mode.

   NOTE: Do not connect the USB device.

   Is USB NO DATA displayed in the audio display?

   YES -Go to step 5.

   NO -Go to step 4.

4. Go into the System Diagnostic Mode (see **SYSTEM DIAGNOSTIC MODE**), and check the System Link (see **SYSTEM LINK**).

   Is the USB icon green?

   YES -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

   NO -Go to step 11.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Connect the client's USB device to a known-good vehicle (same year/trim) that is equipped with a USB adapter, and check the USB device operation.

   Is the USB device working properly in the known-good vehicle?

   YES -Go to step 7.

   NO -If the audio display displays UNSUPPORTED or MEDIA ERROR, the USB device may not be supported or is defective. If the audio display displays USB NO MUSIC, the USB device may have no music files or wrong type music files are on the device. See the Owner's Manual for details on USB device requirements and approved file types.

7. On the client's vehicle, connect the client's USB device to the USB port.
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Turn on the audio system.
10. Check the USB device operation in the client's vehicle.

    Does the USB device work properly in the client's vehicle?

    YES -Intermittent failure, the system is OK at this time. Inspect the connectors of the USB device, USB port and USB adapter for wear.

NO -Check the navigation system hard error code (see **HOW TO CHECK ERROR HISTORY (NAVIGATION DTCS)**).

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Disconnect audio-navigation unit connector F (7P).
13. Check for continuity between audio-navigation unit connector F (7P) terminals No. 6 and No. 7.

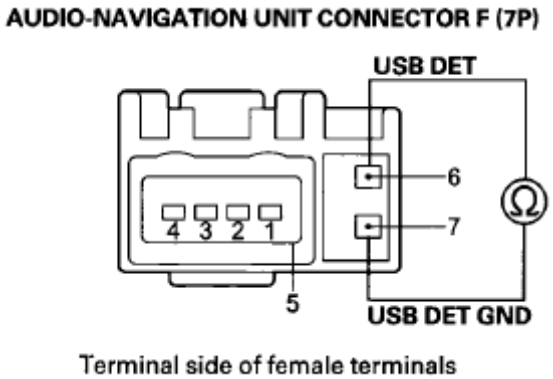

Fig. 185: Checking Continuity Between Audio-Navigation Unit Connector F (7P) Terminals No. 6 And No. 7
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

NO -Replace the USB main harness, then recheck.

USB DEVICE DOES NOT FUNCTION (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Check the USB device requirement:**
  - **Mass-storage class ready digital audio player with USB 2.0 port**
  - **More than 256 MB of RAM**
  - **Support MP3, WMA, and AAC (encoded with the iTunes) files, DRM files are not supported**
- **Not all players and player functions work with the USB adapter. Please see the Owner's Manual for more information. Always test the clients USB device in a known-good vehicle of the same year and trim (if possible). Technologies change and are updated frequently which may result that USB devices may work in newer vehicles, but not in order vehicles of the**

same model.

- **If UNSUPPORTED appears on the display, the vehicle is OK, there is a software problem with the USB device.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio unit.
3. Press the AUX button to select USB mode.

NOTE: Do not connect the USB device.

Is USB NO DATA displayed in the audio display?

YES -Go to step 4.

NO -Go to step 16.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Connect the client's USB device to a known-good vehicle (same year/trim) that is equipped with a USB adapter, and check the USB device operation.

Is the USB device working properly in the known-good vehicle?

YES -Go to step 6.

NO -If the audio display displays UNSUPPORTED or MEDIA ERROR, the USB device may not be unsupported or is defective. If the audio display displays USB NO MUSIC, the USB device may have no music files or wrong type music files are on the device. See the Owner's Manual for details on USB device requirements and approved file types.

6. On the client's vehicle, connect the client's USB device to the USB port.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Turn on the audio unit.
9. Check the USB device operation in the client's vehicle.

Does the USB device work properly in the client's vehicle?

YES -Intermittent failure, the system is OK at this time. Inspect the connectors of the USB device, USB port and USB adapter for wear.

NO -Go to step 10.

10. Turn the ignition switch to LOCK(0), or press the engine start/stop button to select the OFF mode.
11. On the client's vehicle, remove the USB device.
12. Disconnect USB adapter control unit connector B (5P).

13. Check for continuity between USB adapter control unit connector B (5P) and the USB port 5P connector according to the table.

USB adapter control unit connector	USB port connector
B1	4
B2	3
B3	2
B4	1
B5	5

Fig. 186: Checking Continuity Between USB Adapter Control Unit Connector B (5P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

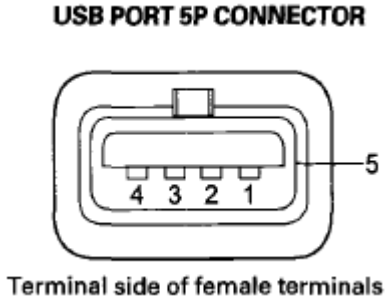

Fig. 187: Checking Continuity Between USB Port 5P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the USB adapter control unit (see **USB ADAPTER CONTROL UNIT REPLACEMENT**), then recheck.

NO -Go to step 14.

14. Disconnect the USB adapter 5P connector.
15. Check for continuity between the USB adapter 5P connector and the USB port 5P connector according to the table.

USB adapter connector	USB port connector
1	4
2	3
3	2
4	1
5	5

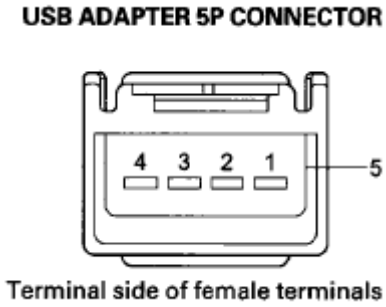

Fig. 188: Checking Continuity Between USB Adapter 5P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

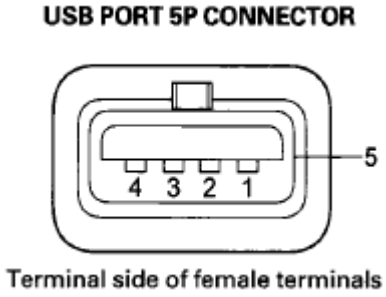

Fig. 189: Checking Continuity Between USB Port 5P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is an open in the wire(s) between the USB adapter control unit and the USB adapter. Replace the affected shielded harness.

NO -Replace the USB adapter, then recheck.

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Measure the voltage between USB adapter control unit connector A (14P) terminal No. 1 and body ground.

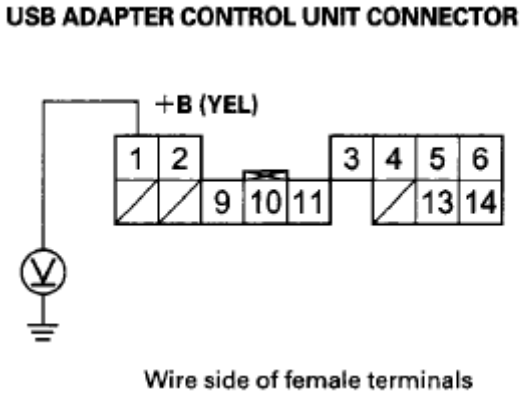

Fig. 190: Measuring Voltage Between USB Adapter Control Unit Connector A (14P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 19.

NO -Go to step 18.

18. Measure the voltage between audio unit connector C (14P) terminal No. 1 and body ground.

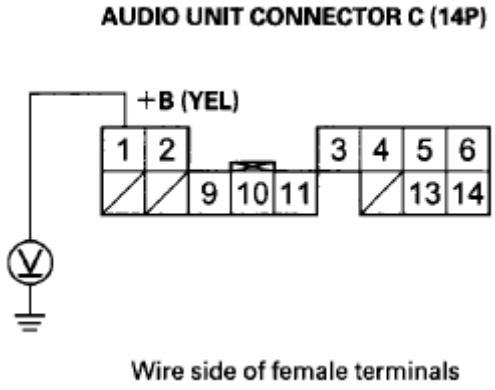

Fig. 191: Measuring Voltage Between Audio Unit Connector C (14P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair an open or high resistance in the wire between the USB adapter control unit and the audio unit.

NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

20. Measure the voltage between USB adapter control unit connector A (14P) terminal No. 11 and body ground.

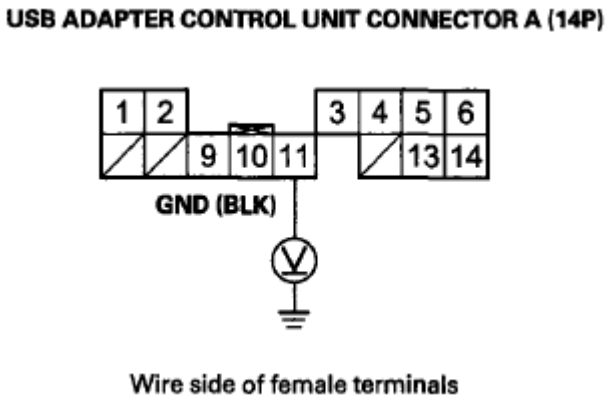

Fig. 192: Measuring Voltage Between USB Adapter Control Unit Connector A (14P) Terminal No. 11 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 21.

NO -Repair an open or high resistance in the wire between the USB adapter control unit and the audio unit.

21. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
22. Disconnect these items:
    - Audio unit connector C (14P)
    - USB adapter control unit connector A (14P)
    - XM receiver connector A (14P)
23. Check for continuity between USB adapter control unit connector A (14P) terminal No. 2 and body ground.

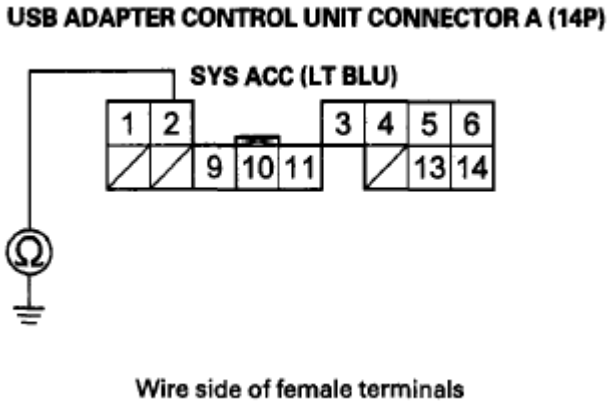

Fig. 193: Checking Continuity Between USB Adapter Control Unit Connector A (14P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire between the USB adapter control unit and the audio unit.

NO -Go to step 24.

24. Check for continuity between audio unit connector C (14P) terminal No. 2 and USB adapter control unit connector A (14P) terminal No. 2.

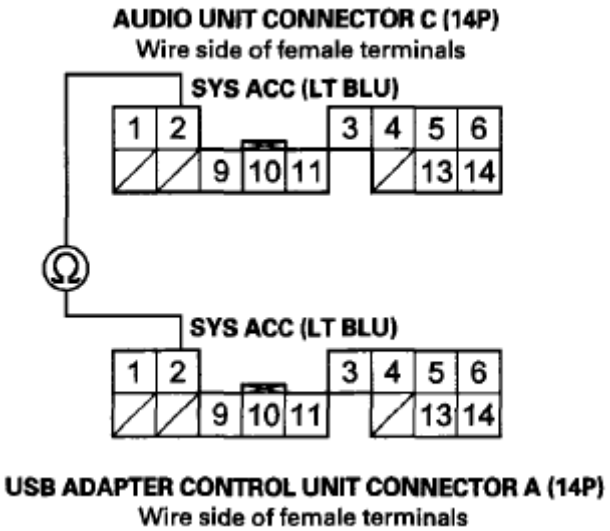

Fig. 194: Checking Continuity Between Audio Unit Connector C (14P) And USB Adapter Control Unit Connector A (14P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 25.

NO -Repair an open in the wire between the audio unit and the USB adapter control unit.

25. Check for continuity between USB adapter control unit connector A (14P) and audio unit connector C (14P) according to the table.

USB adapter control unit connector	Audio unit connector	Wire color
A9	C9	PNK
A10	C10	BLU

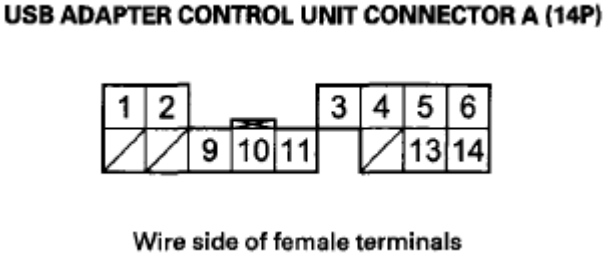

Fig. 195: Checking Continuity Between USB Adapter Control Unit Connector A (14P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

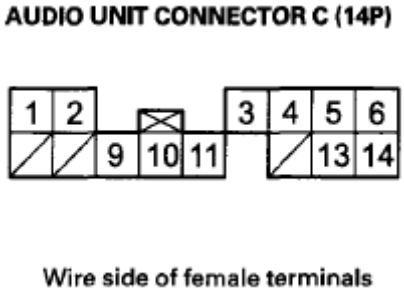

Fig. 196: Checking Continuity Between USB Adapter Control Unit Connector C (14P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 26.

NO -There is an open in the wire(s) between the audio unit and the USB adapter control unit. Replace the affected shielded harness.

26. Disconnect the HandsFreeLink control unit 28P connector.
27. Check for continuity between body ground and audio unit connector C (14P) according to the table.

Audio unit connector	Wire color
C9	PNK

C10	BLU

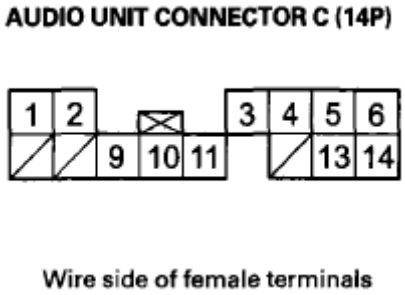

Fig. 197: Checking Continuity Between Body Ground And Audio Unit Connector C (14P) According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the audio unit and the USB adapter control unit. Replace the affected shielded harness.

NO -Go to step 28.

28. Check for continuity between the terminals of audio unit connector C (14P) according to the table.

From terminal	To terminals
C3 (GRY)	C9 (PNK), C10 (BLU)
C9 (PNK)	C10 (BLU)

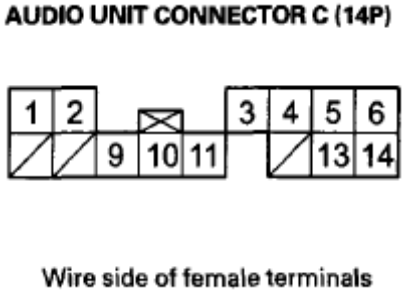

Fig. 198: Checking Continuity Between Terminals Of Audio Unit Connector C (14P) According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wires between the audio unit and the USB adapter control unit. Replace the affected shielded harness.

NO -Go to step 29.

29. Reconnect these items:
    - Audio unit connector C (14P)
    - HandsFreeLink control unit 28P connector
    - XM receiver connector A (14P)
30. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
31. Turn on the audio unit.
32. Press the AUX button several times.

    Is the display changed to other mode?

    YES -Replace the USB adapter control unit (see **USB ADAPTER CONTROL UNIT REPLACEMENT**).

    NO -Go to step 33.

33. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
34. Disconnect XM receiver connector A (14P).
35. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
36. Turn on the audio unit.
37. Press the AUX button several times.

    Is the display changed to other mode?

    YES -Replace the XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**).

    NO -Go to step 38.

38. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
39. Reconnect XM receiver connector A (14P).
40. Disconnect the HandsFreeLink control unit 28P connector.
41. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
42. Turn on the audio unit.
43. Press the AUX button several times.

    Is the display changed to other mode?

    YES -Replace the HandsFreeLink control unit (see **HFL SWITCH TEST**).

    NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

USB INPUT SOUND IS LOW OR CANNOT BE HEARD (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Not all players and player functions work with the USB adapter. Please see the Owner's Manual for more information. Always test the clients USB device in a known-good vehicle of the same year and trim (if possible). Technologies change and are updated frequently which may result in that USB devices may work in newer vehicles, but not in older vehicles of the same model.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Do the Speaker Check Mode with the Self-Diagnostic Function (see **SPEAKER CHECK MODE**).

   Do all speakers make a sound?

   YES -Go to step 3.

   NO -Go to **NO SOUND IS HEARD FROM THE SPEAKER(S) (DISPLAY IS NORMAL) TROUBLESHOOTING** .

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. On the client's vehicle, connect the client's USB device to the USB port.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Turn on the audio system.
7. Press the HDD/AUX button until USB appears on the audio display.
8. Check if the USB device can be operated with the audio-navigation unit (Folders or Files UP/DOWN, etc.) (see **HOW TO PLAY THE BLUETOOTH AUDIO**).

   Can you operate the USB device, but there is no sound heard?

   YES -Go to step 9.

   NO -If the sound is normal, the USB device is OK at this time. If the USB device cannot be operated, go to **USB DEVICE DOES NOT FUNCTION TROUBLESHOOTING** .

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Connect the client's USB device to a known-good vehicle (same year/trim) that is equipped with a USB adapter, and check the USB device operation.

    Is the USB device working properly in the known-good vehicle?

    YES -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

NO -USB device is faulty or not compatible. Also check the USB adapter and USB adapter connector condition.

USB INPUT SOUND IS LOW OR CANNOT BE HEARD (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Not all players and player functions work with the USB adapter. Please see the Owner's Manual for more information.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Do the Speaker Check Mode with the Self-Diagnostic Function (see **SPEAKER CHECK MODE**).

   Do all speakers make a sound?

   YES -Go to step 3.

   NO -Go to **NO SOUND IS HEARD FROM THE SPEAKER(S) (DISPLAY IS NORMAL) TROUBLESHOOTING** .

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. On the client's vehicle, connect the client's USB device to the USB port.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Turn on the audio unit.
7. Press the AUX button until USB appears on the audio display.
8. Check if the USB device can be operated with the audio unit (Folders or Files UP/DOWN, etc.) (see **HOW TO PLAY THE BLUETOOTH AUDIO**).

   Can you operate the USB device, but there is no sound heard?

   YES -Go to step 9.

   NO -If the sound is normal, the USB device is OK at this time. If the USB device cannot be operated, go to **USB DEVICE DOES NOT FUNCTION TROUBLESHOOTING** .

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Connect the client's USB device to a known-good vehicle (same year/trim) that is equipped with a USB adapter, and check the USB device operation.

    Is the USB device working properly in the known-good vehicle?

    YES -Go to step 11.

    NO -USB device is faulty. Also check the USB adapter and USB adapter connector condition.

11. Return to the client's vehicle.
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Turn on the audio unit, and check for sound in each mode (XM or Bluetooth audio).

    Is the sound normal?

    YES -Go to step 14.

    NO -Go to **POOR OR NO SOUND WITH XM RADIO (AUDIO UNIT DOES DISPLAY XM CHANNELS)**, or No sound when Bluetooth audio is used troubleshooting (see **NO SOUND WHEN BLUETOOTH AUDIO IS USED (WITHOUT NAVIGATION)**).

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Measure the voltage between USB adapter control unit connector A (14P) terminal No. 1 and body ground.

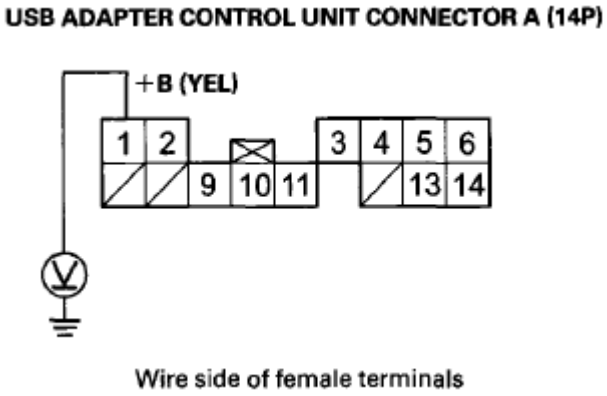

Fig. 199: Measuring Voltage Between USB Adapter Control Unit Connector A (14P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 17.

NO -Go to step 16.

16. Measure the voltage between audio unit connector C (14P) terminal No. 1 and body ground.

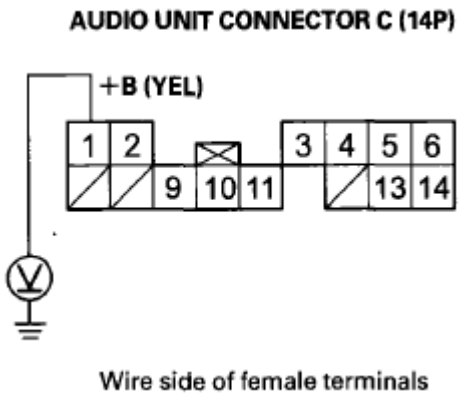

Fig. 200: Measuring Voltage Between Audio Unit Connector C (14P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair an open or high resistance in the wire between the USB adapter control unit and the audio unit.

NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

17. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
18. Measure the voltage between USB adapter control unit connector A (14P) terminal No. 11 and body ground.

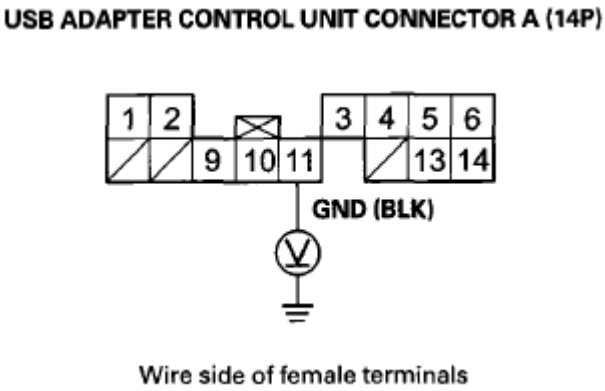

Fig. 201: Measuring Voltage Between USB Adapter Control Unit Connector A (14P) Terminal No. 11 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 19.

NO -Repair an open or high resistance in the wire between the USB adapter control unit and the audio

unit.

19. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
20. Disconnect these items:
    - Audio unit connector C (14P)
    - USB adapter control unit connector A (14P)
    - XM receiver connector A (14P)
21. Check for continuity between USB adapter control unit connector A (14P) terminal No. 2 and body ground.

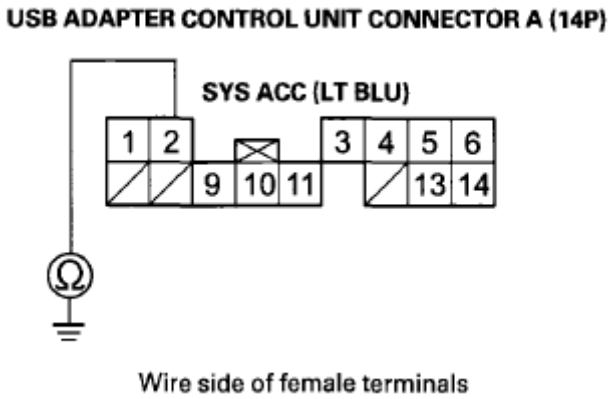

Fig. 202: Checking Continuity Between USB Adapter Control Unit Connector A (14P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire between the USB adapter control unit and the audio unit.

NO -Go to step 22.

22. Check for continuity between audio unit connector C (14P) terminal No. 2 and USB adapter control unit connector A (14P) terminal No. 2.

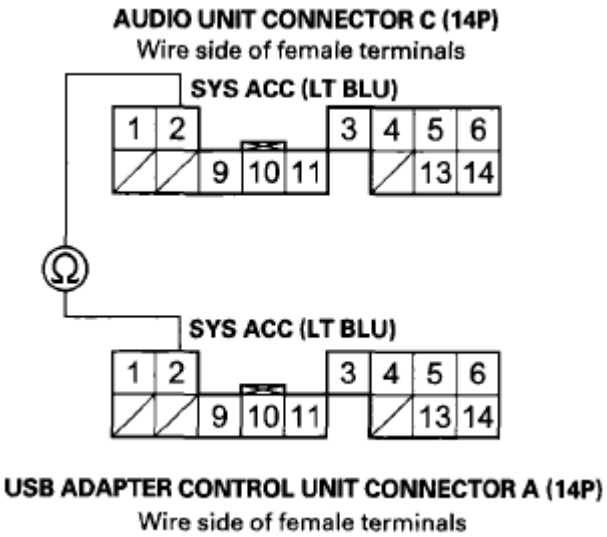

Fig. 203: Checking Continuity Between Audio Unit Connector C (14P) And USB Adapter Control Unit Connector A (14P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

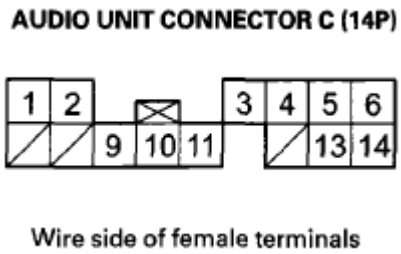
Is there continuity?

YES -Go to step 23.

NO -Repair an open in the wire between the audio unit and the USB adapter control unit.

23. Check for continuity between audio unit connector C (14P)and USB adapter control unit connector A (14P) according to the table.

Audio unit connector	USB adapter control unit connector	Wire color
C5	A5	GRN
C6	A6	BLK
C13	A13	WHT
C14	A14	RED



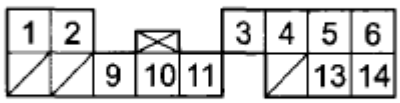


Fig. 204: Checking Continuity Between Audio Unit Connector C (14P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

USB ADAPTER CONTROL UNIT CONNECTOR A (14P)

Wire side of female terminals

Fig. 205: Checking Continuity Between USB Adapter Control Unit Connector A (14P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good USB adapter control unit (see **USB ADAPTER CONTROL UNIT REPLACEMENT**), then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original USB adapter control unit (see **USB ADAPTER CONTROL UNIT REPLACEMENT**). If the symptom/indication is still present, replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

NO -There is an open in the wire(s) between the audio unit and the USB adapter control unit. Replace the affected shielded harness.

ERROR CODE: XM NO SIGNAL OR XM LOADING IS DISPLAYED (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connection or loose terminals.**
- **Check XM radio reception in an open area. Poor reception/interference can be caused by tall buildings, mountains, or high-voltage power lines.**

1. Park the vehicle outside with a clear view of the southern horizon.
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Do the XM Self-Diagnosis (see **XM SELF-DIAGNOSIS**).

   Are there other XM error codes displayed?

   YES -Refer to **SOLUTION FOR TROUBLESHOOTING** .

   NO -Go to step 4.

4. Turn on the audio system, and press the XM button to select the XM radio.

   Does the XM radio receive a signal?

   YES -Reception interference, the system is OK at this time.

NO -Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check for poor connections or loose terminals at the XM antenna 2P connector and AcuraLink® control unit (XM receiver) connector B (2P) or XM receiver connector B (2P).

   Are the connections or terminals OK?

   YES -Go to step 7.

   NO -Repair poor connections or loose terminals, and recheck the XM radio operation. If the signal is restored, the system is OK. If the signal is not restored, go to step 7.

7. Substitute a known-good XM antenna (see **XM ANTENNA REPLACEMENT**), and recheck.

   Does the XM radio receive a signal?

   YES -Replace the original XM antenna (see **XM ANTENNA REPLACEMENT**).

   NO -

   - USA models: Substitute a known-good XM antenna lead, and recheck. If the XM radio receives a signal, replace the original XM antenna lead. If the XM radio does not receive a signal, replace the AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).
   - Canada models: Substitute a known-good XM antenna lead, and recheck. If the XM radio receives a signal, replace the original XM antenna lead. If the XM radio does not receive a signal, replace the XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**).

ERROR CODE: XM NO SIGNAL OR XM LOADING IS DISPLAYED (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connection or loose terminals.**
- **Check XM radio reception in an open area. Poor reception/interference can be caused by tall buildings, mountains, or high-voltage power lines.**

1. Park the vehicle outside with a clear view of the southern horizon.
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Do the XM Self-Diagnosis (see **XM SELF-DIAGNOSIS**).

   Are there other XM error codes displayed?

   YES -Refer to **SOLUTION FOR TROUBLESHOOTING** .

   NO -Go to step 4.

4. Turn on the audio unit, and select XM radio.

   Does the XM radio receive a signal?

   YES -Reception interference, the system is OK at this time.

   NO -Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check for poor connections or loose terminals at the XM antenna 2P connector and XM receiver connector B (2P).

   Are the connections or terminals OK?

   YES -Go to step 7.

   NO -Repair poor connections or loose terminals, and recheck the XM radio operation. If the signal is restored, the system is OK. If the signal is not restored, go to step 7.

7. Substitute a known-good XM antenna (see **XM ANTENNA REPLACEMENT**), and recheck.

   Does the XM radio receive a signal?

   YES -Replace the original XM antenna (see **XM ANTENNA REPLACEMENT**).

   NO -Substitute a known-good XM antenna lead, and recheck. If the XM radio receives a signal, replace the original XM antenna lead. If the XM radio does not receive a signal, replace the XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**).

ERROR CODE: XM ANTENNA OR XM LOADING IS DISPLAYED (WITH ACURALINK®)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connection or loose terminals.**
- **If you replace the AcuraLink® control unit (XM receiver), the AcuraLink® must be reactivated by Acura Client Services.**
- **Check XM radio reception in an open area. Poor reception/interference can be caused by tall buildings, mountains, or high-voltage power lines.**

1. Park the vehicle outside with a clear view of the southern horizon.
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Do the XM Self-Diagnosis (see **XM SELF-DIAGNOSIS**).

   Are there other XM error codes displayed?

   YES -Refer to **SOLUTION FOR TROUBLESHOOTING**. If ERROR 14 or ERROR 24 is displayed,

go to step 4.

NO -Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Check if the AcuraLink® control unit (XM receiver) connectors are properly connected.

   Are the connectors connected properly?

   YES -Go to step 6.

   NO -Reconnect the connector(s), and recheck. If the error message does not go away, go to step 6.

6. Check if the XM antenna 2P connector is properly connected.

   Is the connector properly connected?

   YES -Go to step 7.

   NO -Reconnect the connector, and recheck. If the error message does not go away, go to step 7.

7. Substitute a known-good XM antenna (see **XM ANTENNA REPLACEMENT**), and recheck.

   Is the error message gone?

   YES -Replace the original XM antenna (see **XM ANTENNA REPLACEMENT**).

   NO -Go to step 8.

8. Substitute a known-good AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**), and recheck.

   Is the error message gone?

   YES -Update the AcuraLink® control unit (see **AcuraLink® CONTROL UNIT UPDATE**) if it does not have the latest software. If the software is the latest, replace the original AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

   NO -Replace the XM antenna lead.

ERROR CODE: XM ANTENNA OR XM LOADING IS DISPLAYED (WITHOUT ACURALINK®)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connection or loose terminals.**
- **Check XM radio reception in an open area. Poor reception/interference can**

be caused by tall buildings, mountains, or high-voltage power lines.

1. Park the vehicle outside with a clear view of the southern horizon.
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Do the XM Self-Diagnosis (see **XM SELF-DIAGNOSIS**).

   Are there other XM error codes displayed?

   YES -Refer to **SOLUTION FOR TROUBLESHOOTING**. If ERROR 14 or ERROR 24 is displayed, go to step 4.

   NO -Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Check if the XM receiver connectors are properly connected.

   Is the connector connected properly?

   YES -Go to step 6.

   NO -Reconnect the connector, and recheck. If the error message does not go away, go to step 6.

6. Check if the XM antenna 2P connector is properly connected.

   Is the connector connected properly?

   YES -Go to step 7.

   NO -Reconnect the connector, and recheck. If the error message does not go away, go to step 7.

7. Substitute a known-good XM antenna (see **XM ANTENNA REPLACEMENT**), and recheck.

   Is the error message gone?

   YES -Replace the original XM antenna (see **XM ANTENNA REPLACEMENT**).

   NO -Go to step 8.

8. Substitute a known-good XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**), and recheck.

   Is the error message gone?

   YES -Replace the original XM receiver (see **WITHOUT NAVIGATION**).

   NO -Replace the XM antenna lead.

XM RADIO DISPLAY IS BLANK AND NO STATION INFORMATION IS DISPLAYED (USA MODELS WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **If you replace the XM receiver, the AcuraLink® must be reactivated by Acura Client Services.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check for the audio-navigation unit hard error code.

   Is DTC 2601 (Display Diag: Connect) indicated?

   YES -Do the DTC 2601 troubleshooting (see **DTC 2601: DISPLAY DIAG: CONNECT**).

   NO -Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Measure the voltage between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 1 and body ground.

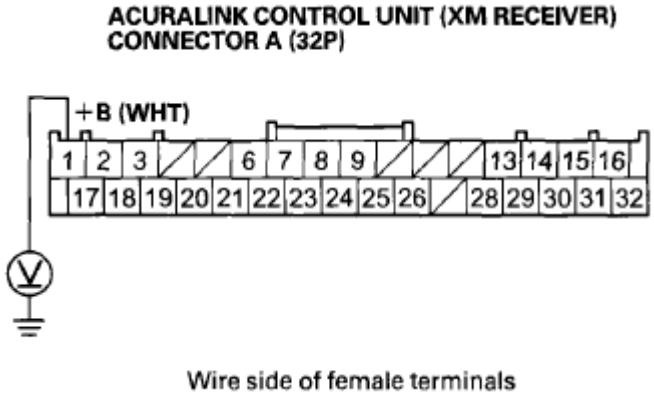

Fig. 206: Measuring Voltage Between AcuraLink® Control Unit (XM Receiver) Connector A (32P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 5.

NO -Repair an open in the wire between No. 15 (10 A) fuse in the under-hood fuse/relay box and the AcuraLink® control unit (XM receiver).

5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Measure the voltage between body ground and AcuraLink® control unit (XM receiver) connector A

(32P) terminals No. 2 and No. 3 individually.

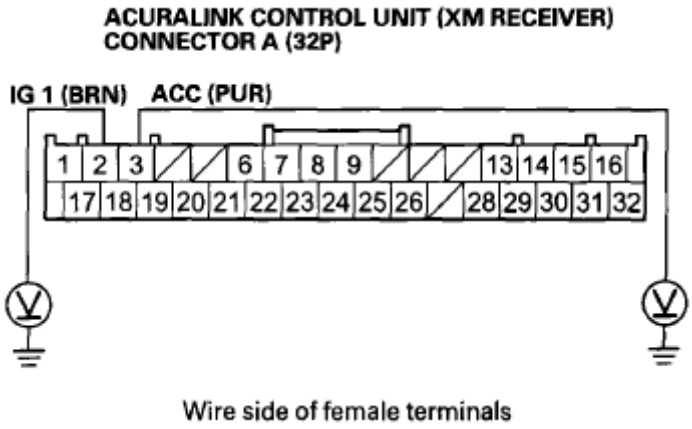

Fig. 207: Measuring Voltage Between Body Ground And AcuraLink® Control Unit (XM Receiver) Connector A (32P) Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 7.

NO -If the IG 1 wire does not have voltage, repair an open in the wire between the No. 5 (7.5 A) fuse in the driver's under-dash fuse/relay box and the AcuraLink® control unit (XM receiver). If the ACC wire does not have voltage, repair an open in the wire between the No. 18 (7.5 A) fuse in the driver's under-dash fuse/relay box and the AcuraLink® control unit (XM receiver).

7. Measure the voltage between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 28 and body ground.

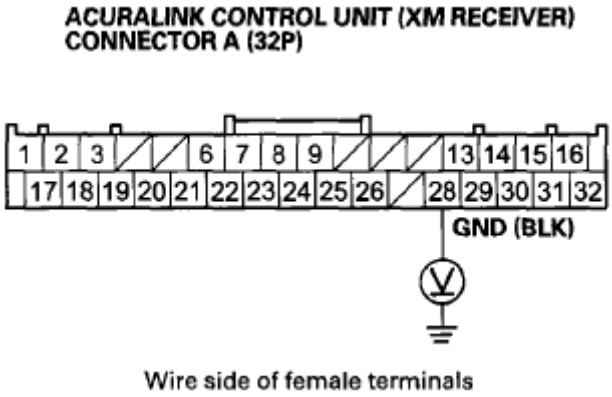

Fig. 208: Measuring Voltage Between AcuraLink® Control Unit (XM Receiver) Connector A (32P) Terminal No. 28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 8.

NO -Repair an open or high resistance in the wire between the AcuraLink® control unit (XM receiver) and body ground (G501) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Disconnect audio-navigation unit connector C (14P).
10. Disconnect AcuraLink® control unit (XM receiver) connector A (32P).
11. Check for continuity between AcuraLink® control unit (XM receiver) connector A (32P) and audio-navigation unit connector C (14P) according to the table.

AcuraLink® control unit (XM receiver) connector	Audio-navigation unit connector	Wire color
A30	C9	PNK
A31	C10	BLU

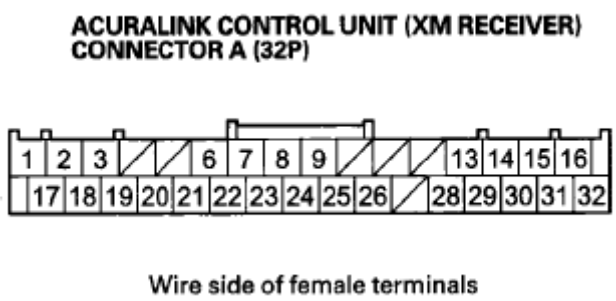

Fig. 209: Checking Continuity Between AcuraLink® Control Unit (XM Receiver) Connector A (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

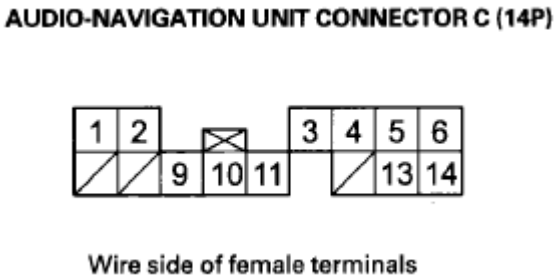

Fig. 210: Checking Continuity Between Audio-Navigation Unit Connector C (14P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 12.

NO -There is an open in the wire(s) between the audio-navigation unit and the AcuraLink® control unit (XM receiver). Replace the affected shielded harness.

12. Reconnect audio-navigation unit connector C (14P).
13. Substitute a known-good AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**), and recheck.

    Is the symptom/indication go away?

    YES -Update the AcuraLink® control unit (see **AcuraLink® CONTROL UNIT UPDATE**) if it does not have the latest software. If the software is the latest, replace the original AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

    NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

XM RADIO DISPLAY IS BLANK AND NO STATION INFORMATION IS DISPLAYED (CANADA MODELS WITH NAVIGATION)

NOTE:
- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check for the audio-navigation unit hard error code.

   Is DTC 2601 (Display Diag: Connect) indicated?

   YES -Do the DTC 2601 troubleshooting (see **DTC 2601: DISPLAY DIAG: CONNECT**).

   NO -Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Measure the voltage between XM receiver connector A (14P) terminal No. 1 and body ground.

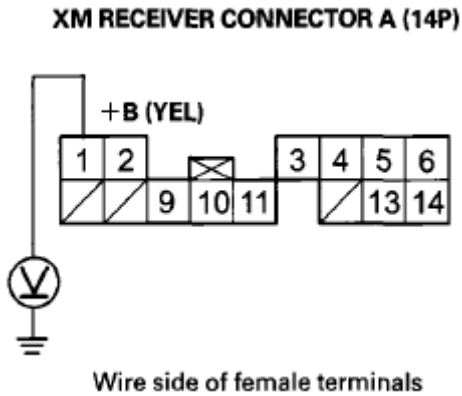

Fig. 211: Measuring Voltage Between XM Receiver Connector A (14P) Terminal No. 1 And Body

Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 6.

NO -Go to step 5.

5. Measure the voltage between audio-navigation unit connector C (14P) terminal No. 1 and body ground.

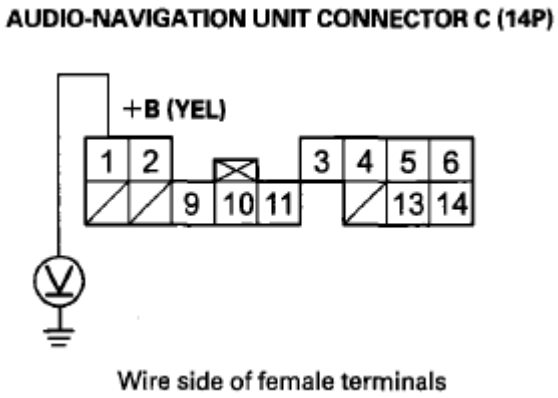

Fig. 212: Measuring Voltage Between Audio-Navigation Unit Connector C (14P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair an open or high resistance in the wire between the audio-navigation unit and the XM receiver.

NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Measure the voltage between XM receiver connector A (14P) terminal No. 11 and body ground.

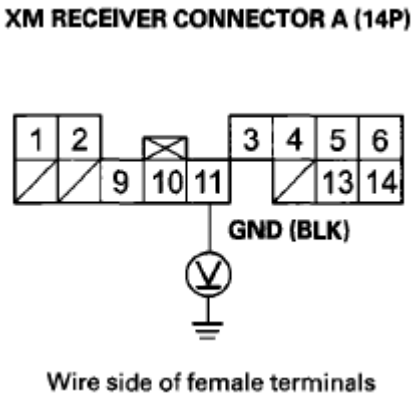

Fig. 213: Measuring Voltage Between XM Receiver Connector A (14P) Terminal No. 11 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 8.

NO -Repair an open or high resistance in the wire between the XM receiver and the audio-navigation unit.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Disconnect audio-navigation unit connector C (14P) and XM receiver connector A (14P).
10. Check for continuity between XM receiver connector A (14P) terminal No. 2 and body ground.

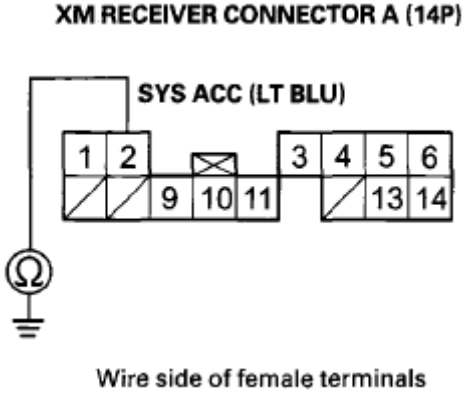

Fig. 214: Checking Continuity Between XM Receiver Connector A (14P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a shot to body ground in the wire between the XM receiver and the audio-navigation unit.

NO -Go to step 11.

11. Check for continuity between audio-navigation unit connector C (14P) terminal No. 2 and XM receiver connector A (14P) terminal No. 2.

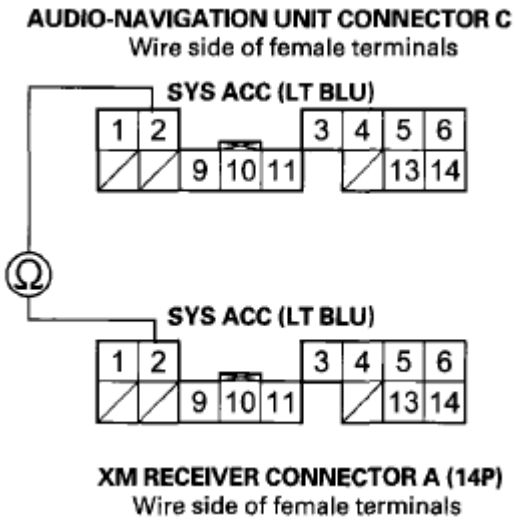

Fig. 215: Checking Continuity Between Audio-Navigation Unit Connector C (14P) Terminal No. 2 And XM Receiver Connector A (14P) Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 12.

NO -Repair an open in the wire between the audio-navigation unit and the XM receiver.

12. Check for continuity between XM receiver connector A (14P) and audio-navigation unit connector C (14P) according to the table.

XM receiver connector	Audio-navigation unit connector	Wire color
A9	C9	PNK
A10	C10	BLU

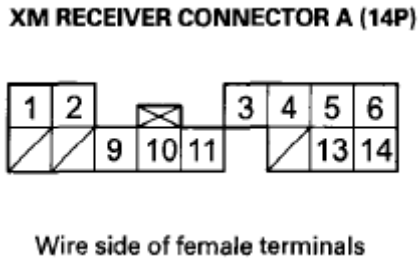

Fig. 216: Checking Continuity Between XM Receiver Connector A (14P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

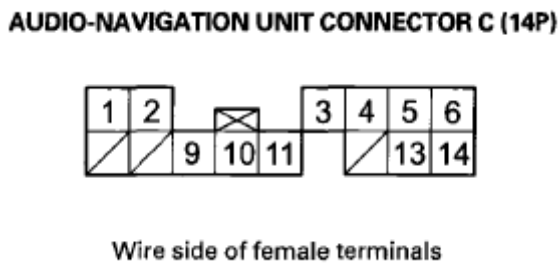

Fig. 217: Checking Continuity Between Audio-Navigation Unit Connector C (14P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**), then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**). If the symptom/indication is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

NO -There is an open in the wire(s) between the audio-navigation unit and the XM receiver. Replace the affected shielded harness.

XM RADIO DISPLAY IS BLANK AND NO STATION INFORMATION IS DISPLAYED (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**

1. Measure the voltage between XM receiver connector A (14P) terminal No. 1 and body ground.

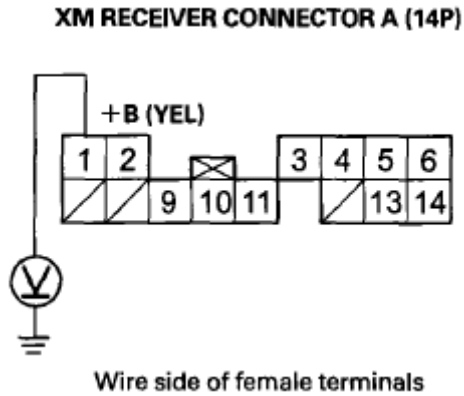

Fig. 218: Measuring Voltage Between XM Receiver Connector A (14P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 3.

NO -Go to step 2.

2. Measure the voltage between audio unit connector C (14P) terminal No. 1 and body ground.

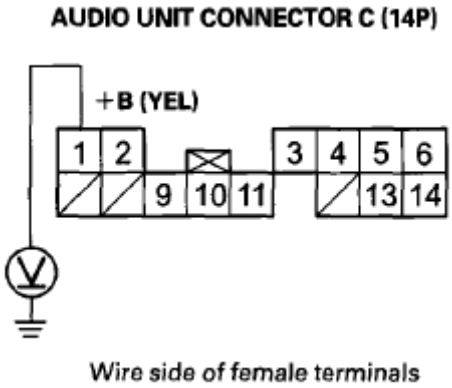

Fig. 219: Measuring Voltage Between Audio Unit Connector C (14P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair an open or high resistance in the wire between the audio unit and the XM receiver.

NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Measure the voltage between XM receiver connector A (14P) terminal No. 11 and body ground.

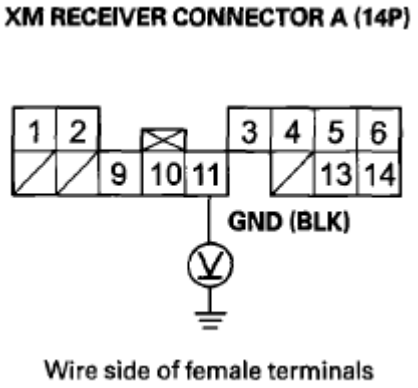

Fig. 220: Measuring Voltage Between XM Receiver Connector A (14P) Terminal No. 11 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 5.

NO -Repair an open or high resistance in the wire between the XM receiver and the audio unit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect these items:
   - Audio unit connector C (14P)
   - USB adapter control unit connector A (14P)
   - XM receiver connector A (14P)
7. Check for continuity between XM receiver connector A (14P) terminal No. 2 and body ground.

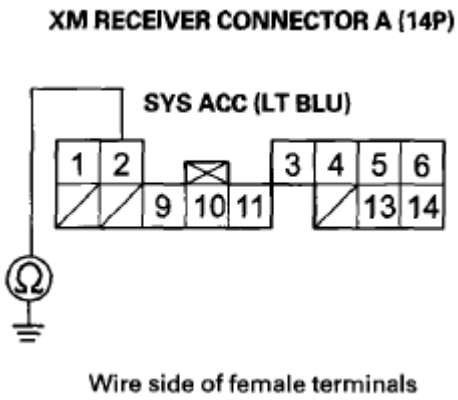

Fig. 221: Checking Continuity Between XM Receiver Connector A (14P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire between the XM receiver and the audio unit.

NO -Go to step 8.

8. Check for continuity between audio unit connector C (14P) terminal No. 2 and XM receiver connector A (14P) terminal No. 2.

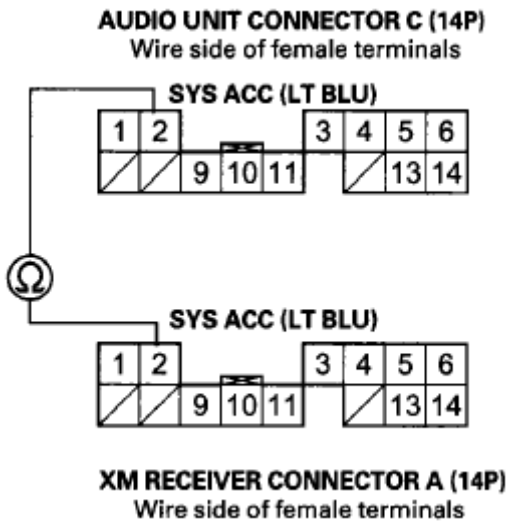

Fig. 222: Checking Continuity Between Audio Unit Connector C (14P) Terminal No. 2 And XM Receiver Connector A (14P) Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 9.

NO -Repair an open in the wire between the audio unit and the XM receiver.

9. Check for continuity between XM receiver connector A (14P) and audio unit connector C (14P) according to the table.

XM receiver connector	Audio unit connector	Wire color
A9	C9	PNK
A10	C10	BLU

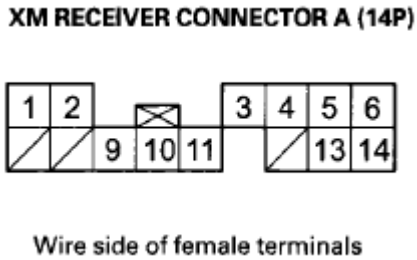

Fig. 223: Checking Continuity Between XM Receiver Connector A (14P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

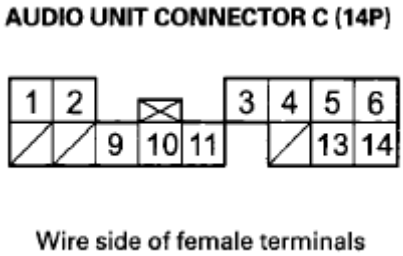

Fig. 224: Checking Continuity Between Audio Unit Connector C (14P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 10.

NO -There is an open in the wire(s) between the XM receiver and the audio unit. Replace the affected shielded harness.

10. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
11. Disconnect the HandsFreeLink control unit 28P connector.
12. Check for continuity between body ground and audio unit connector C (14P) according to the table.

Audio unit connector	Wire color
C9	PNK
C10	BLU

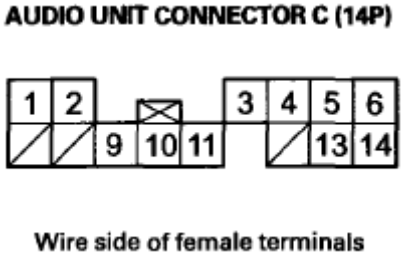

Fig. 225: Checking Continuity Between Body Ground And Audio Unit Connector C (14P) Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the audio unit and the XM receiver. Replace the affected shielded harness.

NO -Go to step 13.

13. Check for continuity between the terminals of audio unit connector C (14P) according to the table.

From terminal	To terminals
C3 (GRY)	C9 (PNK), C10 (BLU)
C9 (PNK)	C10 (BLU)

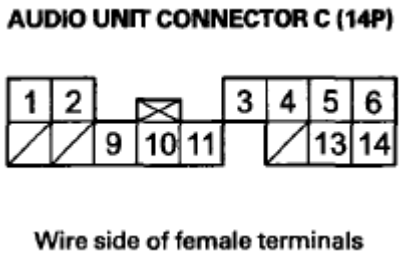

Fig. 226: Checking Continuity Between Terminals Of Audio Unit Connector C (14P) According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wires between the audio unit and the XM receiver. Replace the affected shielded harness.

NO -Go to step 14.

14. Reconnect these items:
    - Audio unit connector C (14P)
    - HandsFreeLink control unit 28P connector
    - USB adapter control unit connector A (14P)
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Turn on the audio unit.
17. Press the AUX button several times.

Is the display changed to other mode?

YES -Replace the XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**).

NO -Go to step 18

18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
19. Disconnect USB adapter control unit connector A (14P).
20. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
21. Turn on the audio unit.
22. Press the AUX button several times.

Is the display changed to other mode?

YES -Replace the USB adapter control unit (see **USB ADAPTER CONTROL UNIT REPLACEMENT**).

NO -Go to step 23.

23. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
24. Reconnect USB adapter control unit connector A (14P).
25. Disconnect the HandsFreeLink control unit 28P connector.
26. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
27. Turn on the audio unit.
28. Press the AUX button several times.

Is the display changed to other mode?

YES -Replace the HandsFreeLink control unit (see **HFL SWITCH TEST**).

NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

XM RADIO PRESET MEMORY IS LOST (USA MODELS WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Make sure the remotes are linked.**
- **Check the connectors for poor connections or loose terminals.**
- **If you replace the AcuraLink® control unit (XM receiver), the AcuraLink® must be reactivated by Acura Client Services.**
- **If you can only tune to channel 000, 001, 174, and 247, make sure the audio-navigation unit is set to channel mode (see Owner's Manual), if it is set to channel mode, call XM Radio client support, and check the account activation status.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system, and set each of the XM radio channel preset buttons.

Do each of the XM radio channel preset buttons set properly?

YES -Go to step 3.

NO -Go to step 5.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode for 1 minute, then back to ON (II), or the ON mode.
4. Test all of the XM radio channel preset buttons for proper recall operation.

Do the preset buttons recall the set radio stations?

YES -Intermittent failure, the system is OK at this time. Check connections at the audio-navigation unit.

NO -Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Measure the voltage between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 1 and body ground.

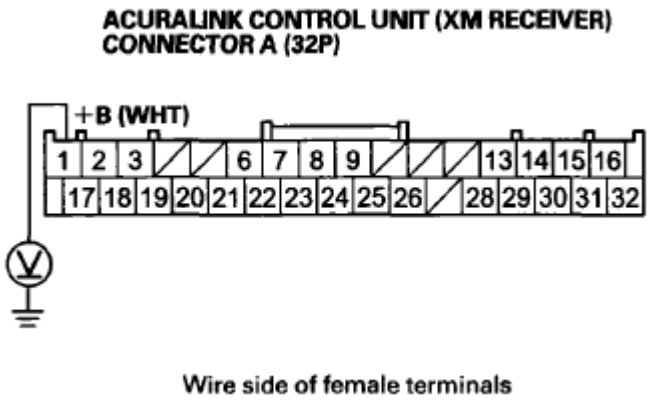

Fig. 227: Measuring Voltage Between AcuraLink® Control Unit (XM Receiver) Connector A (32P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 7.

NO -Repair an open in the wire between No. 15 (10 A) fuse in the under-hood fuse/relay box and the AcuraLink® control unit (XM receiver).

7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Measure the voltage between body ground and AcuraLink® control unit (XM receiver) connector A (32P) terminals No. 2 and No. 3 individually.

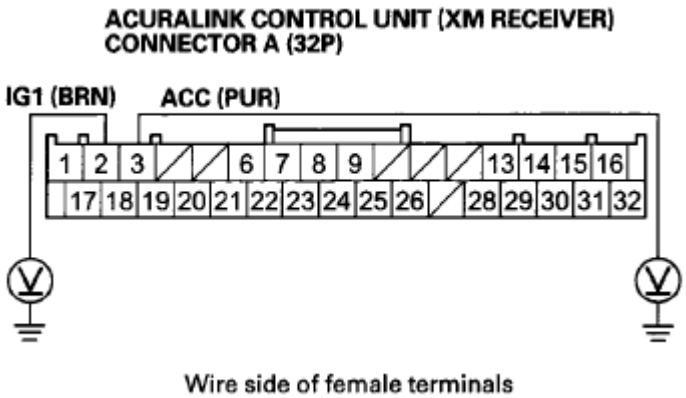

Fig. 228: Measuring Voltage Between Body Ground And AcuraLink® Control Unit (XM Receiver) Connector A (32P) Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 9.

NO -If the IG 1 wire does not have voltage, repair an open in the wire between the No. 5 (7.5 A) fuse in the driver's under-dash fuse/relay box and the AcuraLink® control unit (XM receiver). If the ACC wire does not have voltage, repair an open in the wire between the No. 18 (7.5 A) fuse in the driver's under-dash fuse/relay box and the AcuraLink® control unit (XM receiver).

9. Measure the voltage between AcuraLink® control unit (XM receiver) connector A (32P) terminal No. 28 and body ground.

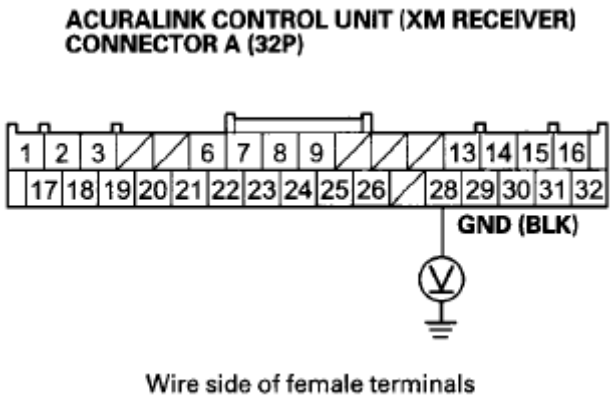

Fig. 229: Measuring Voltage Between AcuraLink® Control Unit (XM Receiver) Connector A (32P) Terminal No. 28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Replace the AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

NO -Repair an open or high resistance in the wire between the AcuraLink® control unit (XM receiver) and body ground (G501) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

XM RADIO PRESET MEMORY IS LOST (CANADA MODELS WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Make sure the remotes are linked.**
- **Check the connectors for poor connections or loose terminals.**
- **If you can only tune to channel 000, 001, 174, and 247, make sure the**

audio-navigation unit is set to channel mode (see Owner's Manual), if it is set to channel mode, call XM Radio client support, and check the account activation status.

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system, and set each of the XM radio channel preset buttons.

   Do each of the XM radio channel preset buttons set properly?

   YES -Go to step 3.

   NO -Go to step 5.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode for 1 minute, then back to ON (II), or the ON mode.
4. Test all of the XM radio channel preset buttons for proper recall operation.

   Do the preset buttons recall the set radio stations?

   YES -Intermittent failure, the system is OK at this time. Check connections at the audio-navigation unit.

   NO -Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Measure the voltage between XM receiver connector A (14P) terminal No. 1 and body ground.

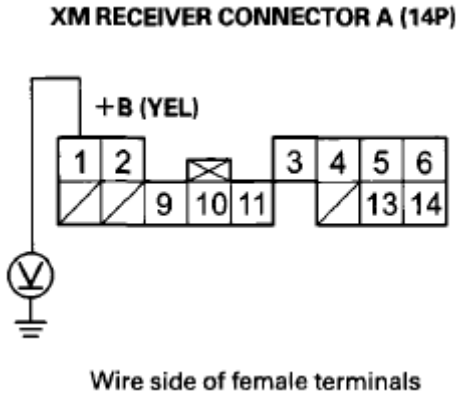

Fig. 230: Measuring Voltage Between XM Receiver Connector A (14P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 8.

NO -Go to step 7.

7. Measure the voltage between audio-navigation unit connector C(14P) terminal No. 1 and body ground.

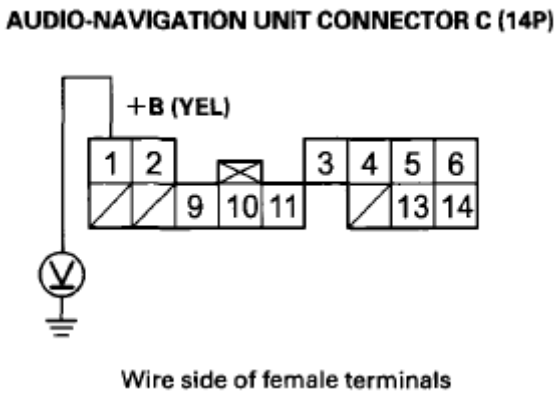

Fig. 231: Measuring Voltage Between Audio-Navigation Unit Connector C(14P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair an open or high resistance in the wire between the audio-navigation unit and the XM receiver.

NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Measure the voltage between XM receiver connector A (14P) terminal No. 11 and body ground.

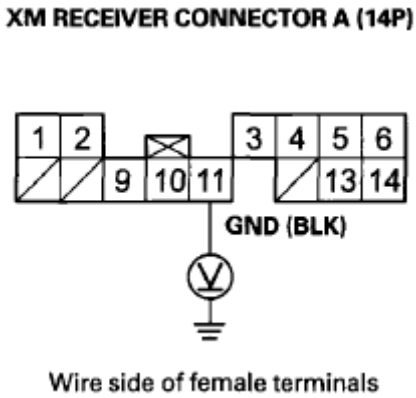

Fig. 232: Measuring Voltage Between XM Receiver Connector A (14P) Terminal No. 11 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Replace the XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**).

NO -Repair an open or high resistance in the wire between the XM receiver and the audio-navigation unit.

XM RADIO PRESET MEMORY IS LOST (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Make sure the remotes are linked.**
- **Check the connectors for poor connections or loose terminals.**
- **If you can only tune to channel 000, 001, 174, and 247, make sure the audio unit is set to channel mode (see Owner's Manual), if it is set to channel mode, call XM Radio client support, and check the account activation status.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system, and set each of the XM radio channel preset buttons.

   Do each of the XM radio channel preset buttons set properly?

   YES -Go to step 3.

   NO -Go to step 5.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode for 1 minute, then back to ON (II), or the ON mode.
4. Test all of the XM radio channel preset buttons for proper recall operation.

   Do the preset buttons recall the set radio stations?

   YES -Intermittent failure, the system is OK at this time. Check connections at the audio unit.

   NO -Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Measure the voltage between XM receiver connector A (14P) terminal No. 1 and body ground.

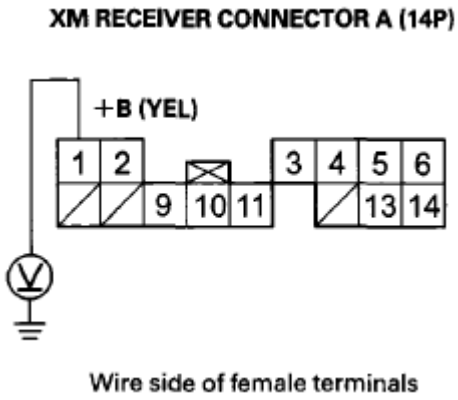

Fig. 233: Measuring Voltage Between XM Receiver Connector A (14P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 8.

NO -Go to step 7.

7. Measure the voltage between audio unit connector C (14P) terminal No. 1 and body ground.

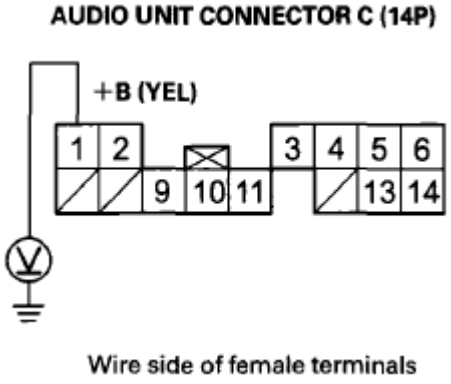

Fig. 234: Measuring Voltage Between Audio Unit Connector C (14P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair an open or high resistance in the wire between the audio unit and the XM receiver.

NO -Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Measure the voltage between XM receiver connector A (14P) terminal No. 11 and body ground.

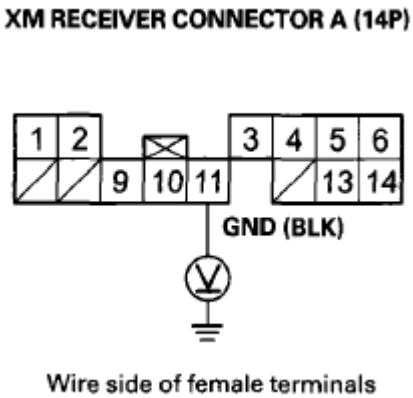

Fig. 235: Measuring Voltage Between XM Receiver Connector A (14P) Terminal No. 11 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Replace the XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**).

NO -Repair an open or high resistance in the wire between the XM receiver and the audio unit.

POOR OR NO SOUND WITH XM RADIO (AUDIO UNIT DOES DISPLAY XM CHANNELS) (USA MODELS WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connector for poor connections or loose terminals.**
- **Check the radio reception in an open area. Poor reception/interference can be caused by tall buildings, mountains, or high-voltage power lines are nearby.**
- **If you can only tune to channel 000, 001, 174, and 247, make sure the audio-navigation unit is set to channel mode (see Owner's Manual), if it is set to channel mode, call XM Radio client support, and check the account activation status.**
- **If you replace the XM receiver, the AcuraLink® must be reactivated by Acura Client Services.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system and select XM radio.
3. Check for an error message on the display.

Are there any messages displayed?

YES -Go to **ERROR CODES** .

NO -Go to step 4

4. Disconnect these items:
   - Audio-navigation unit connector C (14P)
   - HandsFreeLink control unit 32P connector
   - AcuraLink® control unit (XM receiver) connector A (32P)
5. Check for continuity between audio-navigation unit connector C (14P) and body ground according to the table.

Audio-navigation unit connector	Wire color
C5	GRN
C6	BLK
C13	WHT
C14	RED

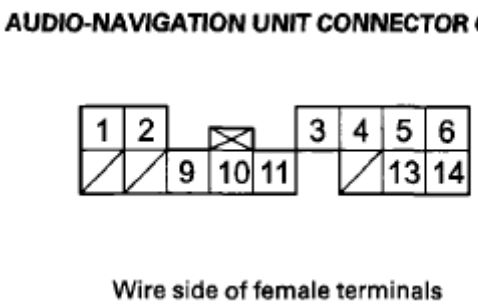

Fig. 236: Checking Continuity Between Audio-Navigation Unit Connector C (14P) And Body Ground According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the audio-navigation unit and the AcuraLink® control unit (XM receiver). Replace the affected shielded harness.

NO -Go to step 6.

6. Check for continuity between the terminals of audio-navigation unit connector C (14P) according to the table.

From terminal	To terminals
C4 (GRY)	C5 (GRN), C6 (BLK), C13 (WHT), C14 (RED)

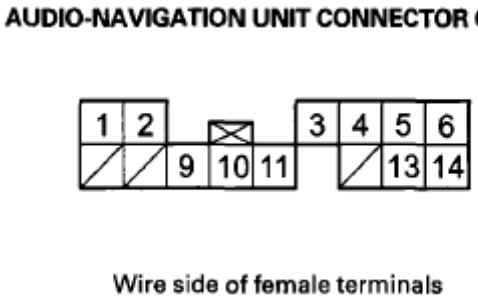

Fig. 237: Checking Continuity Between Terminals Of Audio-Navigation Unit Connector C (14P) According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wires between the audio-navigation unit and the AcuraLink® control unit (XM receiver). Replace the affected shielded harness.

NO -Go to step 7.

7. Check for continuity between audio-navigation unit connector C (14P) and AcuraLink® control unit (XM receiver) connector A (32P) according to the table.

Audio-navigation unit connector	AcuraLink® control unit (XM receiver) connector	Wire color
C5	A13	GRN
C6	A15	BLK
C13	A14	WHT
C14	A16	RED

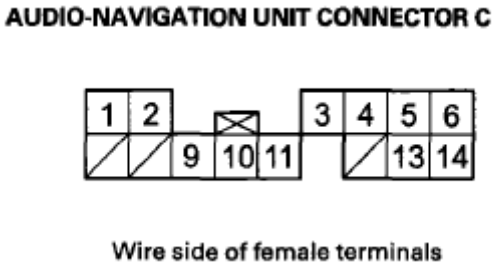

Fig. 238: Checking Continuity Between Audio-Navigation Unit Connector C (14P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

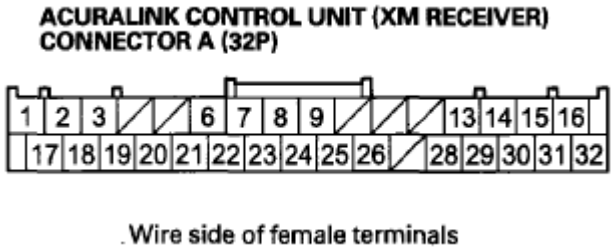

Fig. 239: Checking Continuity Between AcuraLink® Control Unit (XM Receiver) Connector A (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 8.

NO -There is an open in the wire(s) between the audio-navigation unit and the AcuraLink® control unit (XM receiver). Replace the affected shielded harness.

8. Reconnect audio-navigation unit connector C (14P).
9. Substitute a known-good AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**), and recheck.

Is the symptom/indication go away?

YES -Update the AcuraLink® control unit (see **AcuraLink® CONTROL UNIT UPDATE**) if it does not have the latest software. If the software is the latest, replace the original AcuraLink® control unit (XM receiver) (see **AcuraLink® CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

POOR OR NO SOUND WITH XM RADIO (AUDIO UNIT DOES DISPLAY XM CHANNELS) (CANADA MODELS WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connector for poor connections or loose terminals.**
- **Check the radio reception in an open area. Poor reception/interference can be caused by tall buildings, mountains, or high-voltage power lines are nearby.**
- **If you can only tune to channel 000, 001, 174, and 247, make sure the audio-navigation unit is set to channel mode (see Owner's Manual), if it is set to channel mode, call XM Radio client support, and check the account activation status.**

- **If you replace the XM receiver, the AcuraLink® must be reactivated by Acura Client Services.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system and select XM radio.
3. Check for an error message on the display.

   Are there any messages displayed?

   YES -Go to **ERROR CODES** .

   NO -Go to step 4.

4. Disconnect these items:
   - Audio-navigation unit connector C (14P)
   - HandsFreeLink control unit 32P connector
   - XM receiver connector A (14P)
5. Check for continuity between audio-navigation unit connector C (14P) and body ground according to the table.

Audio-navigation unit connector	Wire color
C5	GRN
C6	BLK
C13	WHT
C14	RED

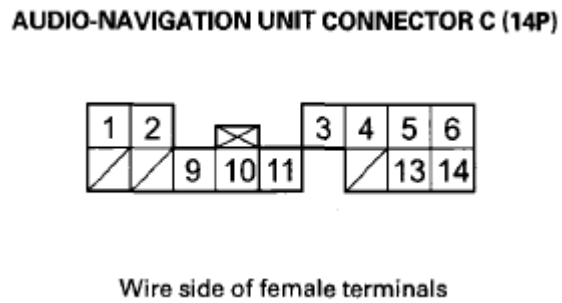

Fig. 240: Checking Continuity Between Audio-Navigation Unit Connector C (14P) And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the audio-navigation unit and the XM receiver. Replace the affected shielded harness.

NO -Go to step 6.

6. Check for continuity between the terminals of audio-navigation unit connector C (14P) according to the table.

From terminal	To terminals
C4 (GRY)	C5 (GRN), C6 (BLK), C13 (WHT), C14 (RED)

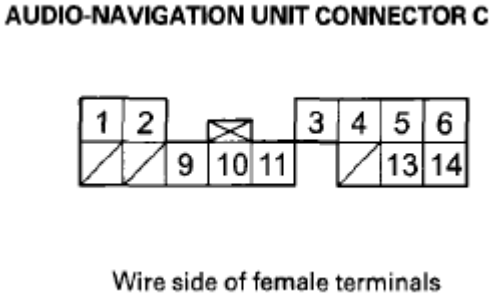

Fig. 241: Checking Continuity Between Terminals Of Audio-Navigation Unit Connector C (14P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wires between the audio-navigation unit and the XM receiver. Replace the affected shielded harness.

NO -Go to step 7.

7. Check for continuity between audio-navigation unit connector C (14P) and XM receiver connector A (14P) according to the table.

Audio-navigation unit connector	XM receiver connector	Wire color
C5	A4	GRN
C6	A16	BLK
C13	A13	WHT
C14	A5	RED

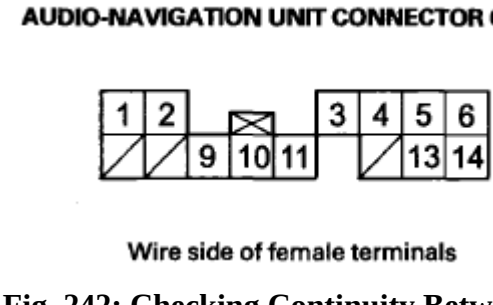

Fig. 242: Checking Continuity Between Audio-Navigation Unit Connector C (14P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

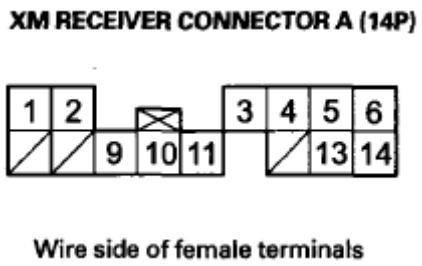

Fig. 243: Checking Continuity Between XM Receiver Connector A (14P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**), then reconnect all connectors, and recheck. If the symptom/indication goes away, replace the original XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**). If the symptom/indication is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

NO -There is an open in the wire(s) between the audio-navigation unit and the XM receiver. Replace the affected shielded harness.

POOR OR NO SOUND WITH XM RADIO (AUDIO UNIT DOES DISPLAY XM CHANNELS) (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connector for poor connections or loose terminals.**
- **Check the radio reception in an open area. Poor reception/interference can be caused by tall buildings, mountains, or high-voltage power lines are nearby.**
- **If you can only tune to channel 000, 001, 174, and 247, make sure the audio unit is set to channel mode (see Owner's Manual), if it is set to channel mode, call XM Radio client support, and check the account activation status.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system and select XM radio.
3. Check for an error message on the display.

Are there any messages displayed?

YES -Go to **ERROR CODES** .

NO -Go to step 4

4. Disconnect these items:
   - Audio unit connector C(14P)
   - HandsFreeLink control unit 28P connector
   - XM receiver connector A (14P)
   - USB adapter control unit connector A (14P)
5. Check for continuity between audio unit connector C (14P) and body ground.

Audio unit connector	Wire color
C5	GRN
C6	BLK
C13	WHT
C14	RED

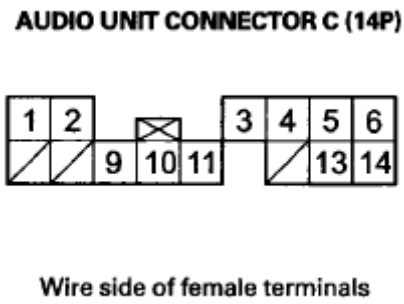

Fig. 244: Checking Continuity Between Audio Unit Connector C (14P) And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the audio unit and the XM receiver. Replace the affected shielded harness.

NO -Go to step 6.

6. Check for continuity between the terminals of audio unit connector C (14P) according to the table.

From terminal	To terminals
C4 (GRY)	C5 (GRN), C6 (BLK), C13 (WHT), C14 (RED)

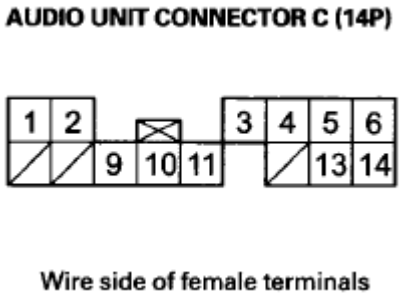

Fig. 245: Checking Continuity Between Terminals Of Audio Unit Connector C (14P) According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wires between the audio unit and the XM receiver. Replace the affected shielded harness.

NO -Go to step 7.

7. Check for continuity between audio unit connector C (14P) and XM receiver connector A (14P) according to the table.

Audio unit connector	XM receiver connector	Wire color
C5	A14	GRN
C6	A6	BLK
C13	A13	WHT
C14	A5	RED

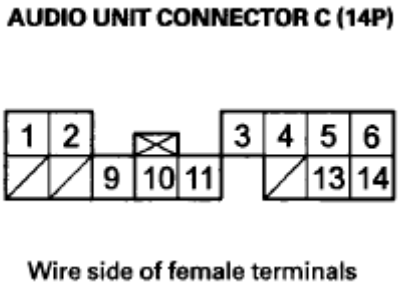

Fig. 246: Checking Continuity Between Audio Unit Connector C (14P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

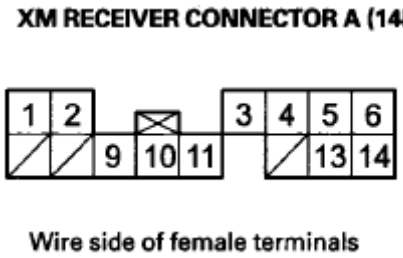

Fig. 247: Checking Continuity Between XM Receiver Connector A (14P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**), then reconnect all connectors, and recheck. If the symptom/indication goes away, replace the original XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**). If the symptom/indication is still present, replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

NO -There is an open in the wire(s) between the audio unit and the XM receiver. Replace the affected shielded harness.

SOUND QUALITY DIAGNOSIS

Special Tools Required

Diagnostic CD 07AAZ-SDBA100

Use the following tests to check sound quality.

NOTE: Before beginning the following tests, write down the client's bass, treble, fader and balance settings, then set them to their center positions for the testing.

LEFT/RIGHT CHANNEL ID

Do this test to confirm proper channel routing.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
2. Play track No. 1 (left, both, right channel ID) at a normal, or slightly higher than normal, volume level.
3. The voice should be audible only from the channel or channels when indicated.
    - If the channel ID is correct for each side, go to **PHASE TEST**.
    - If the channel ID is not correct, check for:
        - Shorted speaker wire
        - Faulty stereo amplifier
        - Faulty audio unit

PHASE TEST

Do this test to confirm proper speaker phasing.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
2. Play track No. 2 (phase) at a normal, or slightly higher than normal, volume level.
3. The voice should sound centered and focused when it is in-phase.
4. The voice should sound diffused, and have less bass when it is out of phase.
    - If the voice changes from in-phase to out of phase as indicated by the prompt, the phasing is correct. Go to **ELECTRICAL NOISE TEST**.
    - If the voice always sounds out of phase, phasing is not correct. Check for:
        - Crossed speaker wire
        - Faulty stereo amplifier
        - Faulty audio unit

ELECTRICAL NOISE TEST

Do this test to check for electrical noise being induced into the audio system.

NOTE: Electrical noise may be caused by outside sources that cannot be handled by the audio system. Make sure you remove any cell phones and/or turn off any aftermarket devices before beginning this test.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
2. Play track No. 4 (digital zero) at a normal, or slightly higher than normal, volume level.
3. Operate any electrical device that may create electrical noise in the audio system, including starting the engine.
4. Play track No. 5 (near digital zero) at a normal, or slightly higher than normal, volume level.
5. Operate any electrical device that may create electrical noise in the audio system, including starting the engine.
6. Play track No. 6 (SNR) at a normal, or slightly higher than normal, volume level.
7. Operate any electrical device that may create electrical noise in the audio system, including starting the engine.
    - If no abnormal noise is heard, go to **INDIVIDUAL SPEAKER TEST**.
    - If the noise is present only during the SNR track, replace the audio unit.
    - If the noise is heard during the digital zero or near digital zero track, check for:
        - Poor ground at the audio unit, stereo amplifier, engine, or battery cable
        - Pinched or shorted speaker or stereo amplifier wire
        - Faulty stereo amplifier
        - Faulty audio unit
        - Other faulty components causing excessive electrical noise (ignition coils, alternator, door

lock actuators, etc.). Disconnect any suspect components, and then replay the tracks that were originally noisy. If the noise is gone, check the component's circuit and the component.

INDIVIDUAL SPEAKER TEST

Do this test to identify a faulty speaker.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
2. Play track No. 30 (steady 300 Hz tone) at a normal, or slightly higher than normal, volume level.
3. Listen to each speaker for poor sound compared to the other channels. Use the audio unit's fader and balance settings to help isolate the channel with the problem.
    - If the sound quality produced by a specific speaker is poor, substitute it with a known-good speaker. If the poor sound quality continues, go to Sound Balance Test.
    - If the sound quality is OK, go to Sound Balance Test.

SOUND BALANCE TEST

Do this test to identify a faulty channel or speaker.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
2. Confirm the bass and treble are set to the center positions.
3. Play track No. 3 (pink noise) at a normal, or slightly higher than normal, volume level.
4. A static type sound should be heard through all speakers.
5. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit of a known-good vehicle.
6. Set the bass and treble to the center positions.
7. Play track No. 3 (pink noise) all the same level as was played in step 3.
8. Compare the sounds made by the two vehicles.
    - If the sound does not have as much bass, check the subwoofer and circuit.
    - If the sound does not have enough hiss, check the tweeters and their circuits.

FREQUENCY SWEEP

Do this test to find rattles or reverberations that may cause a perception of poor sound quality.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
2. Play track No. 13 (sweep from 500 Hz to 35 Hz) at a normal, or slightly higher than normal, volume level.
3. Listen to each speaker for poor sound quality or reverberations caused by specific frequencies. Use the voice-over to estimate the frequency that causes the vibration. Use the audio unit's fader and balance settings to help isolate the channel with the problem.
    - If vibrations or poor sound quality are heard, go to step 4.
    - If no vibrations or poor sound quality are heard, go to Sound Judging.
4. Choose the appropriate track from No. 14 to 25 (small range frequency sweep) or 26 to 53 (single

frequencies) to recreate the frequency that caused the poor sound quality or vibration witnessed in step 3; this aids in diagnosis of the cause.

NOTE: When you get to the track that recreates the problem, select the repeat function on the audio unit, this will help you isolate the cause.

5. Replace or insulate the source of the vibration or, if the speaker is the source of the poor sound quality, replace it.

SOUND JUDGING

Do this test to compare overall sound quality, imaging, and dynamics between the client's vehicle and a known-good vehicle. Only use a vehicle of the same model and trim level for this test.

1. In the client's vehicle, set the bass, treble, fader, and balance settings to the client's normal settings that were written down before beginning the test.
2. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
3. Play tracks No. 7 to 12 (sound quality, midland, dynamics, and imaging demonstration tracks) at a normal, or slightly higher than normal, volume level. Write down the volume setting being used.
4. Listen to areas of the track that stand out as being either very clear or poorer than other areas of the track.
5. In a known-good vehicle, insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
6. Play the tracks at the same volume level and the same bass, treble, balance, and fader settings as used in step 3 in the client's vehicle.
7. Listen to the same area of the track that stood out as being either very clear or poorer than other areas of the track.
8. Compare the client's vehicle's sound quality results the known-good vehicle's results.
    - If the sound quality in the client's vehicle is comparable to the sound quality in the known-good vehicle, then the client's vehicle is operating as designed.
    - If the sound quality is not comparable, check these items in order:
        - Loose or improperly installed speakers or other hardware that may create interference from the vibrations generated by the speakers
        - Poor power or ground to the stereo amplifier
        - Damaged speaker(s)
        - Faulty stereo amplifier
        - Faulty audio unit

SEEK STOP TEST

Do this test to check the performance of the audio unit's AM and FM reception. Refer to **SYMPTOM TROUBLESHOOTING: AUDIO SOUND WEAK OR DISTORTED (DISPLAY IS NORMAL); WITH NAVIGATION** (see), **WITHOUT NAVIGATION** (see), or **NO SOUND IS HEARD FROM THE SPEAKER(S) (DISPLAY IS NORMAL); WITH NAVIGATION** (see), **WITHOUT NAVIGATION** before continuing with this test.

NOTE:

- **Window tint, aftermarket theft-recovery devices and other aftermarket devices may affect reception.**
- **Changes in cloud cover and other atmospheric conditions will affect the ability of the audio unit to receive radio signals.**

1. Park the client's vehicle in an open area away from buildings or other obstructions.
2. Park a known-good vehicle (same year, model, and trim level) next to the client's vehicle, facing the same direction.
3. Start the engine in the client's vehicle, and turn on the radio.
4. Set the FM receiver to 87.7 MHz.
5. Press the Seek + button, and record the first station that the audio unit locks onto.
6. Press the Seek + button repeatedly, and write down each station that the audio unit locks onto until the station recorded in step 5 is reached again.
7. Set the AM receiver to 530 kHz.
8. Press the Seek + button, and record the first station that the audio unit locks onto.
9. Press the Seek + button repeatedly, and write down each station that the audio unit locks onto until the station recorded in step 8 is reached again.
10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Start the engine in the known-good vehicle, and then do steps 4 thru 10 on the known-good vehicle.
12. Compare the number of stations received in steps 6 and 9 in the client's vehicle with the number of stations received in the known-good vehicle.
    - If the number of stations received is the same, or within 10%, the audio unit's tuner performance is OK. The problem may be atmospheric conditions, multi-path interference, or other obstructions to the radio signal.
    - If the client's vehicle receives fewer stations by at least 10%, go to step 2 of Poor AM or FM radio reception or interference troubleshooting; with navigation (see **POOR AM OR FM RADIO RECEPTION OR INTERFERENCE (WITH NAVIGATION)**), without navigation (see **POOR AM OR FM RADIO RECEPTION OR INTERFERENCE (WITHOUT NAVIGATION)**).

AUDIO UNIT REMOVAL/INSTALLATION

WITHOUT NAVIGATION

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the dashboard and related parts.**
- **Lay a shop towel under the parts when working on them to protect the face panel from scratches or other damage.**
- **Eject all the discs before removing the audio unit to prevent damaging the CD player's load mechanism.**
- **If you are replacing the audio unit, write down the audio presets (if**

possible), then enter them into the new audio unit.

1. Make sure you have the anti-theft codes for the audio system.
2. Remove the dashboard center trim (see **DASHBOARD CENTER TRIM REMOVAL/INSTALLATION**).
3. Remove the dashboard center vent (see **DASHBOARD CENTER VENT REMOVAL/INSTALLATION**).
4. Carefully remove the bolts (A) and (B), then pull the audio unit (C) out.

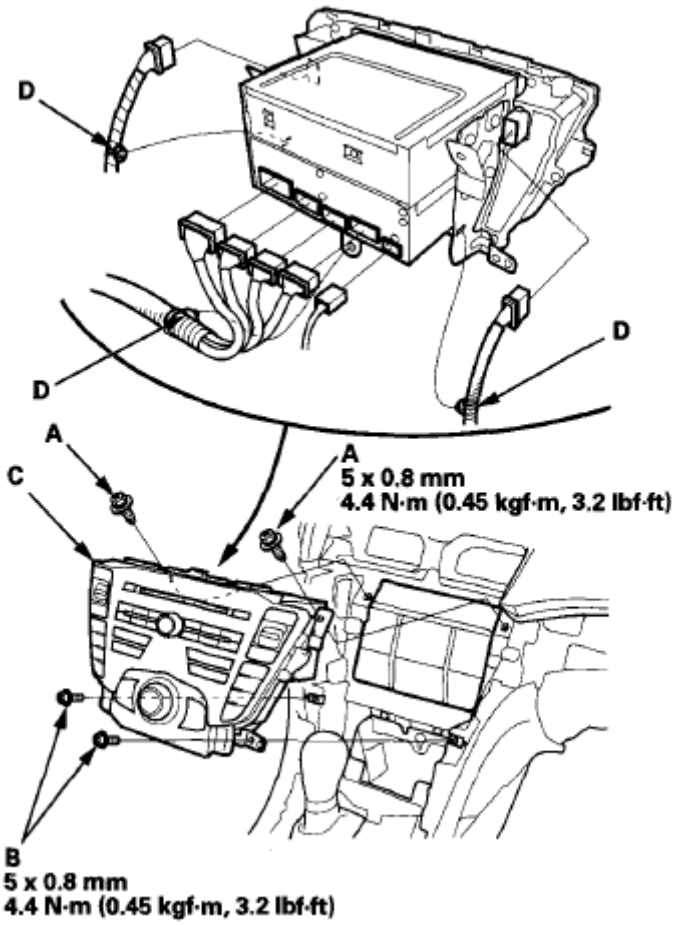

Fig. 248: Identifying Bolts And Audio Unit With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Disconnect the connectors, and detach the clips (D).
6. Remove the climate control switches (see **CLIMATE CONTROL SWITCH REMOVAL/INSTALLATION**).
7. Remove the bolts (A) and stays (B).

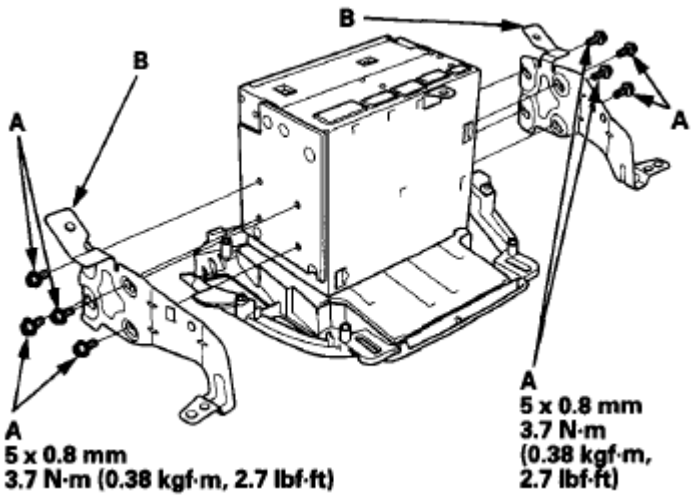

Fig. 249: Identifying Bolts And Stays With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the audio unit in the reverse order of removal, and note these items:
   - Make sure all the connectors and the antenna lead are secure.
   - Enter the anti-theft codes for the audio system.
9. Give the new anti-theft codes to the client if the audio unit is replaced.

AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION

WITH NAVIGATION

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the dashboard and related parts.**
- **Lay a shop towel under the parts when working on them to protect the face panel from scratches or other damage.**
- **Eject all the discs before removing the audio-navigation unit to prevent damaging the CD/DVD player's load mechanism.**
- **Discharge static electricity from your body before and during the work.**

1. Remove the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).
2. Remove the interface dial (see **INTERFACE DIAL REMOVAL/INSTALLATION**).

Do not touch the terminal connector (A) of the audio-navigation switch panel with your bare hands (if you have touched it, wipe it off thoroughly).

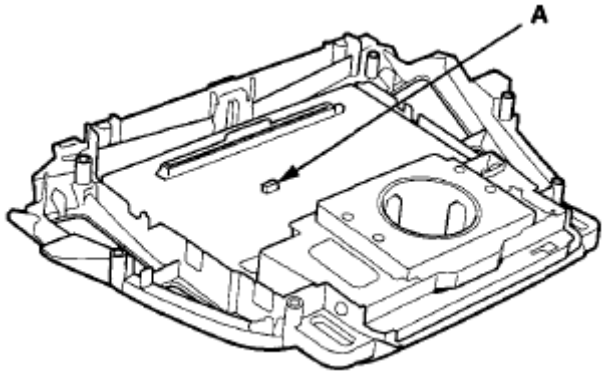

Fig. 250: Identifying Terminal Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the audio-navigation switch panel in the reverse order of removal.

AUDIO-HVAC DISPLAY UNIT REMOVAL/INSTALLATION

WITHOUT NAVIGATION

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the dashboard and related parts.**
- **Lay a shop towel under the parts when working on them to protect the face panel from scratches or other damage.**

1. Remove the dashboard center vent (see **DASHBOARD CENTER VENT REMOVAL/INSTALLATION**).
2. Carefully remove the screws from the audio-HVAC display unit (A).

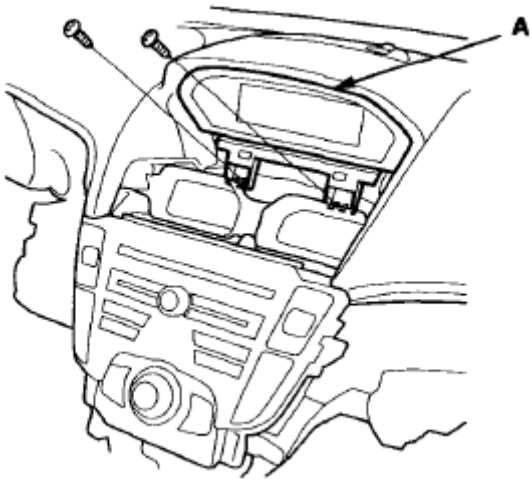

Fig. 251: Identifying Audio-HVAC Display Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Pull out the audio-HVAC display unit. Then disconnect the connector (A) from the audio-HVAC display unit.

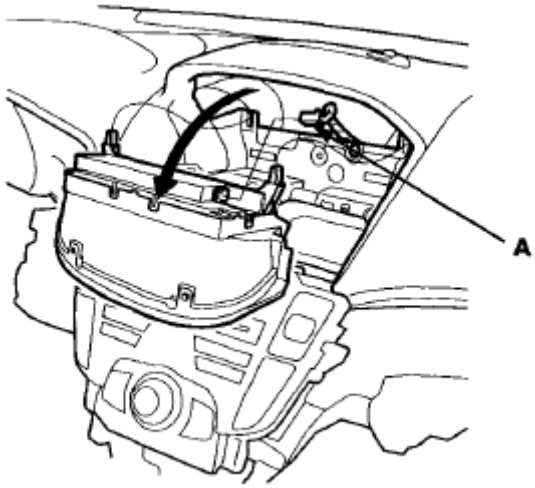

Fig. 252: Identifying Connector Of Audio-HVAC Display Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the audio-HVAC display unit in the reverse order of removal.

STEREO AMPLIFIER REMOVAL/INSTALLATION

1. Remove the right trunk side trim panel (see **TRIM REMOVAL/INSTALLATION - TRUNK AREA**).
2. Loosen the mounting bolts (A), then detach the clip (B) and pull out the stereo amplifier (C).

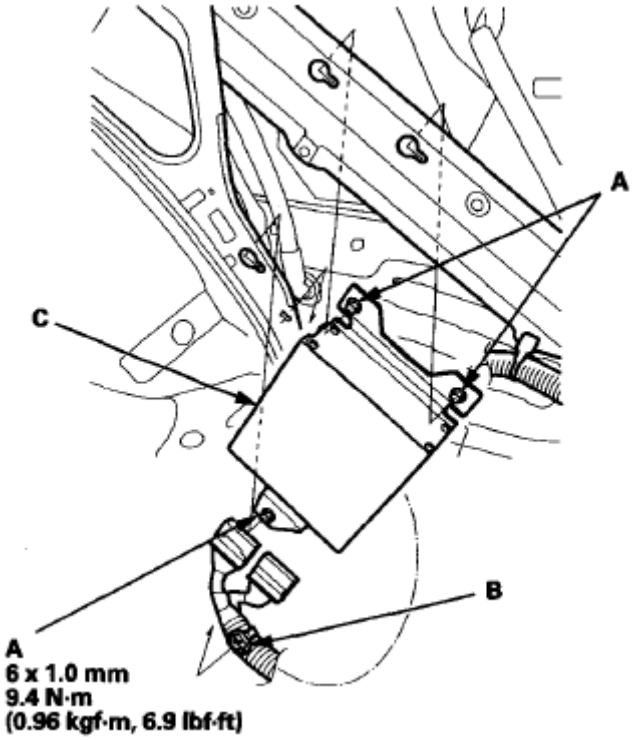

Fig. 253: Identifying Mounting Bolts, Clip And Stereo Amplifier With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the connectors from the stereo amplifier, and remove it.
4. Install the stereo amplifier in the reverse order of removal.

ACURALINK® CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION

WITH ACURALINK®

1. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
2. Remove the HandsFreeLink control unit (see **HFL SWITCH TEST**).
3. Remove the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).
4. Remove the bolts (A), and loosen the bolt (B).

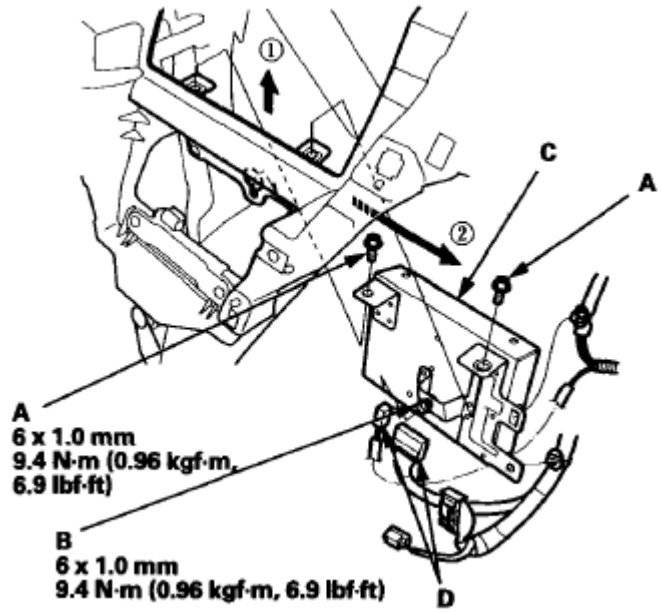

Fig. 254: Identifying Bolts, Connectors And AcuraLink® Control Unit With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Pull the AcuraLink® control unit (XM receiver) (C) out, then disconnect the connectors (D) from the AcuraLink® control unit (XM receiver), and detach the clips.
6. Install the AcuraLink® control unit (XM receiver) in the reverse order of removal.

NOTE: If you replaced the AcuraLink® control unit (XM receiver) make sure it has the latest software (see AcuraLink® CONTROL UNIT UPDATE).

7. Call XM Radio to update the client's account with the new XM/HIP serial number. Also call Acura Client Services to reactivate the AcuraLink®.

XM RECEIVER REMOVAL/INSTALLATION

WITHOUT ACURALINK®

1. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
2. Remove the HandsFreeLink control unit (see **HFL SWITCH TEST**).
3. Without navigation, remove the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). Canada models with navigation, remove the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).
4. Remove the bolt (A), and loosen the bolt (B).

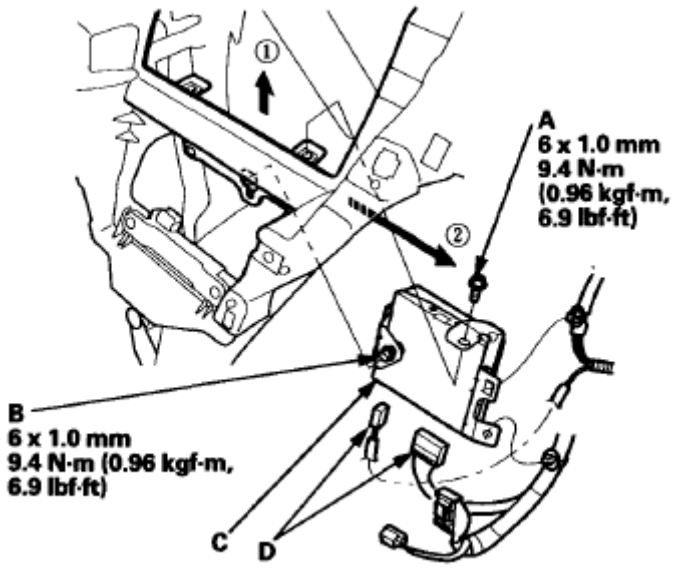

Fig. 255: Identifying Bolts, XM Receiver And Connectors With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Pull the XM receiver (C) out, then disconnect the connectors (D) from the XM receiver, and detach the clips.
6. Install the XM receiver in the reverse order of removal.

NOTE: If you are replacing the XM receiver, register the new XM receiver I.D. number with XM Radio by calling 800-852-9696.

USB ADAPTER CONTROL UNIT REPLACEMENT

WITHOUT NAVIGATION

1. Remove the center console panel (see **CENTER CONSOLE PANEL DISASSEMBLY/REASSEMBLY**).
2. Disconnect the connectors from the USB adapter control unit (A), then remove the screws and the USB adapter control unit.

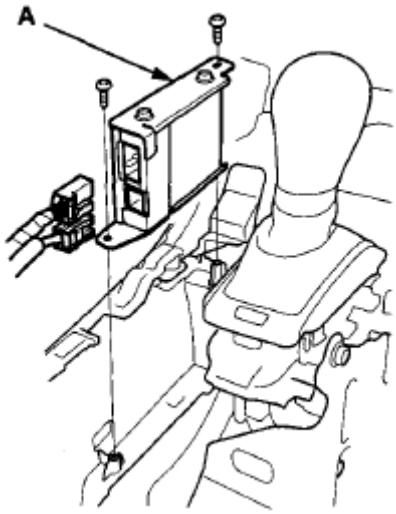

Fig. 256: Identifying USB Adapter Control Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the USB adapter control unit in the reverse order of removal.

SPEAKER TEST/REPLACEMENT

FRONT DOOR SPEAKER

1. Remove the front door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
2. Remove the bolt (A). Then lift the speaker (B) straight up to release the lower clips (C).

NOTE: If you pull the speaker out too far from the door, you will damage the lower clips.

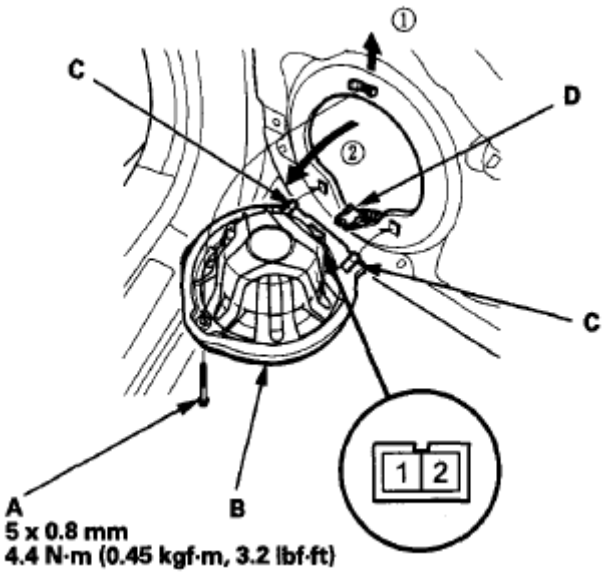

Fig. 257: Identifying Bolt, Speaker And Lower Clips With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the 2P connector (D), and remove the speaker.
4. Measure the resistance between terminals No. 1 and No. 2:
   - With navigation, there should be 2 ohms.
   - Without navigation, there should be 4 ohms.
5. If the resistance is not as specified, replace the door speaker.

FRONT CENTER SPEAKER

1. With navigation, remove the navigation display unit (see **NAVIGATION DISPLAY UNIT REMOVAL/INSTALLATION**). Without navigation, remove the audio-HVAC display unit (see **AUDIO-HVAC DISPLAY UNIT REMOVAL/INSTALLATION**).
2. Push out the speaker lid (A) from inside the dashboard, and disconnect the connectors.

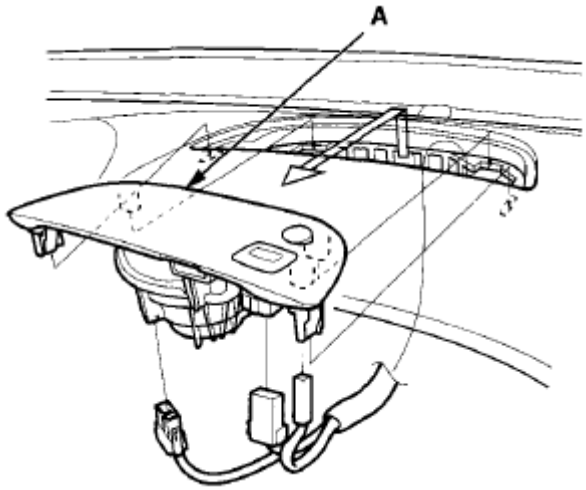

Fig. 258: Identifying Speaker Lid
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the screws and the front center speaker (A).

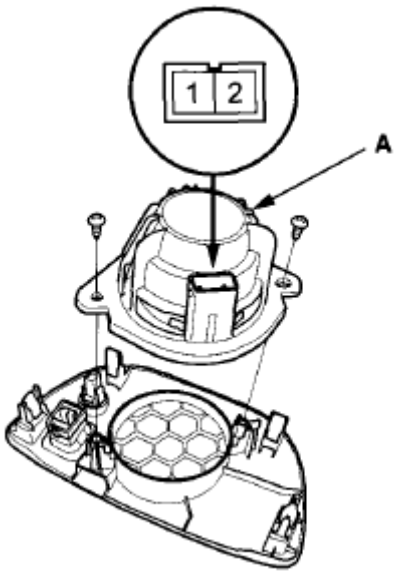

Fig. 259: Identifying Front Center Speaker
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the resistance between terminals No. 1 and No. 2. There should be about 2 ohms.
5. If the resistance is not as specified, replace the front center speaker.

TWEETER

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**), and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repairs or service.

1. Remove the A-pillar trim (see **TRIM REMOVAL/INSTALLATION - PILLAR AREAS**).
2. Release the hooks, and remove the tweeter (A).

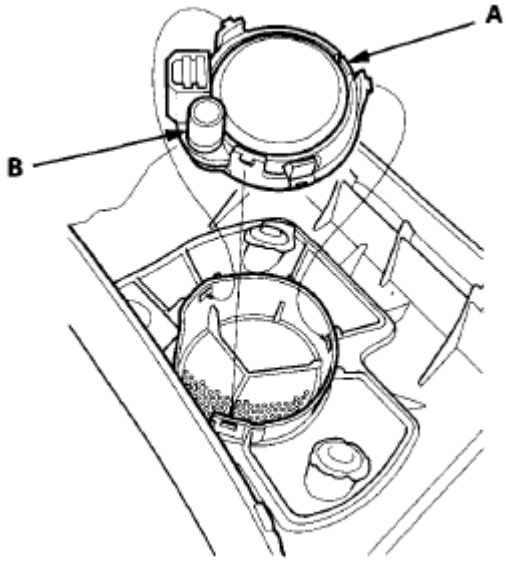

Fig. 260: Identifying Tweeter And Capacitor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check the capacitor (B) condition. If any malfunction is found, replace the tweeter.
4. Measure the resistance between the tweeter (A) terminal No. 2 and the outside terminal of the capacitor. There should be about 6 ohms.

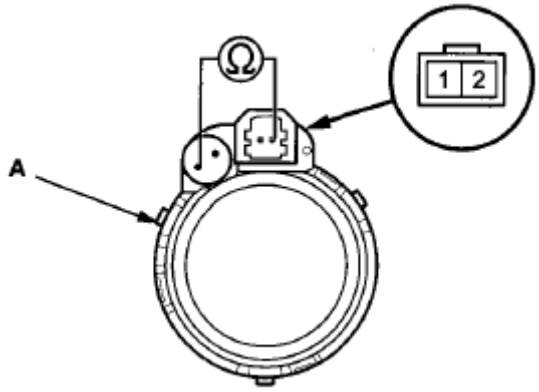

Fig. 261: Identifying Tweeter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the resistance is not as specified, replace the tweeter.

REAR SPEAKER

1. Remove the rear shelf (see **TRIM REMOVAL/INSTALLATION - REAR SHELF AREA**).
2. Remove the mounting bolt (A), then tilt the speaker (B) forward to release the clips (C).

NOTE: If you pull the speaker out too far from the rear bulkhead, you will damage

the clips.

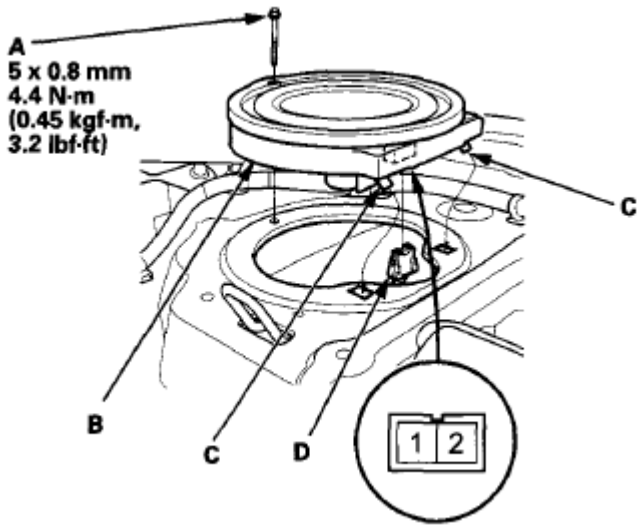

Fig. 262: Identifying Mounting Bolt, 2P Connector, Speaker And Clips With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the 2P connector (D), and remove the rear speaker.
4. Measure the resistance between the terminals No. 1 and No. 2:
   - With navigation, there should be 2 ohms.
   - Without navigation, there should be 4 ohms.
5. If the resistance is not as specified, replace the rear speaker.

REAR DOOR SPEAKER (WITH ELS AUDIO)

1. Remove the rear door panel (see **REAR DOOR PANEL REMOVAL/INSTALLATION**).
2. Remove the bolts (A), disconnect the 2P connector (B), and remove the speaker (C).

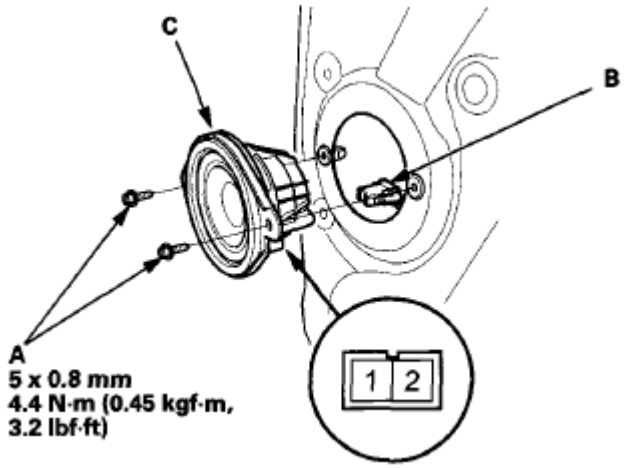

Fig. 263: Identifying Bolts, 2P Connector And Speaker With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the resistance between terminals No. 1 and No. 2. There should be about 2 ohms.
4. If the resistance is not as specified, replace the rear door speaker.

SUBWOOFER

1. Remove the rear shelf (see **TRIM REMOVAL/INSTALLATION - REAR SHELF AREA**).
2. Remove the four mounting bolts (A) from the subwoofer (B).

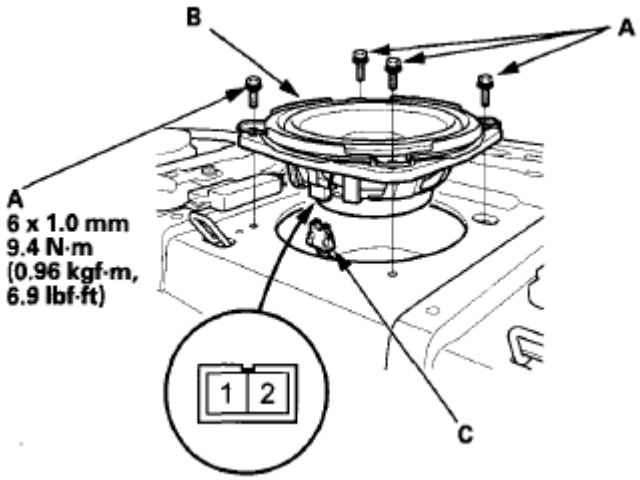

Fig. 264: Identifying Mounting Bolts, 2P Connector And Subwoofer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the 2P connector (C), and remove the subwoofer.
4. Measure the resistance between the terminals No. 1 and No. 2. There should be about 2 ohms.
5. If the resistance is not as specified, replace the subwoofer.

AUDIO REMOTE SWITCH TEST

1. Remove the audio remote, HFL-navigation voice control switch or the audio remote-HFL switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**).
2. Measure the resistance between terminals No. 11 and No. 12 in each switch position according to the table.

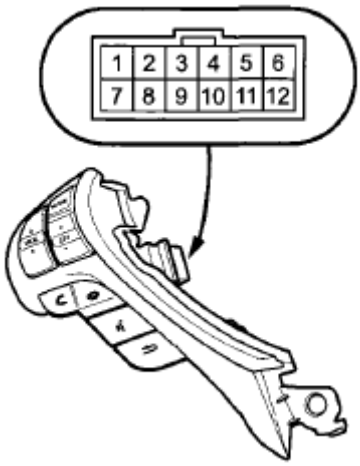

Fig. 265: Measuring Resistance Between Terminals No. 11 And No. 12 In Switch Position According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Position	Resistance
No button pressed	About 10 kohms
MODE	About 3.7 kohms
CH (+)	About 1.7 kohms
CH (-)	About 775 ohms
^ (VOL. UP)	About 357 ohms
(VOL. DOWN)	About 100 ohms

3. If the resistance is not as specified, replace the switch.

AM/FM ANTENNA AMPLIFIER REPLACEMENT

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**), and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repairs or service.

1. Remove the C-pillar trim (see **C-PILLAR TRIM**).
2. Disconnect the connectors (A) from the AM/FM antenna and connector (B) from the AM/FM antenna amplifier (C).

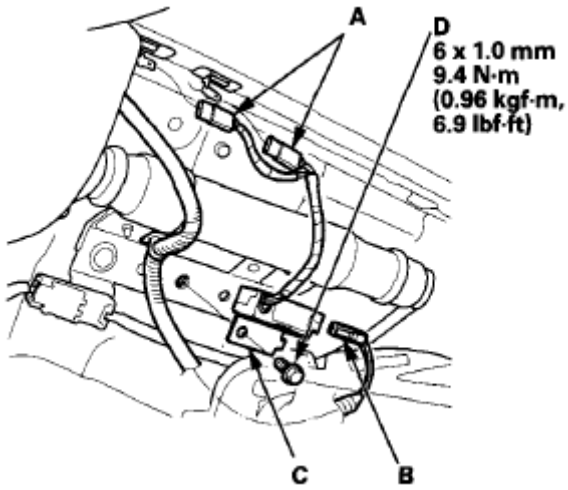

Fig. 266: Identifying Connectors, AM/FM Antenna And Connector, Bolts And Amplifier With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the bolt (D) and the AM/FM antenna amplifier.
4. Install the AM/FM antenna amplifier in the reverse order of removal.

AM/FM ANTENNA REPAIR

NOTE: To make an effective repair, the broken section must be no longer than one inch.

1. Lightly rub the area around the broken section (A) with fine steel wool, then clean it with isopropyl alcohol.

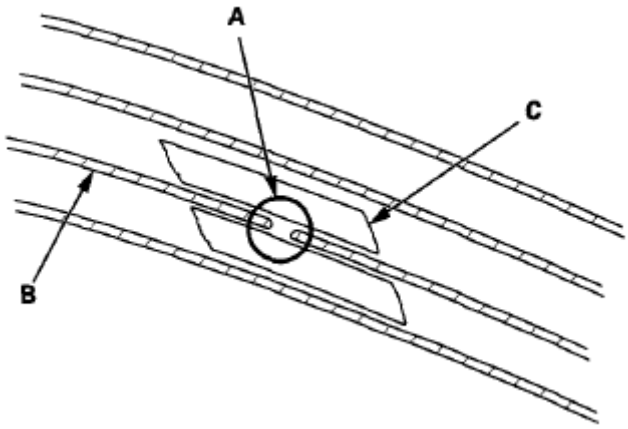

Fig. 267: Identifying Broken Section, Antenna Wire And Cellophane Tape
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Carefully mask above and below the broken portion of the window antenna wire (B) with cellophane tape

(C).

3. Using a commercially available rear window defogger repair kit, apply a heavy coat of paint (A) extending about 1/8" on both sides of the break. Allow 30 minutes to dry.

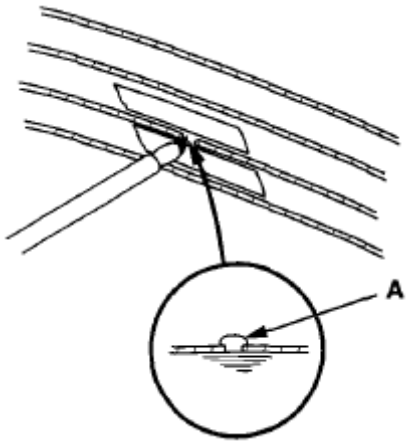

Fig. 268: Identifying Heavy Coat Of Paint
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Check for continuity in the repaired wire.
5. Apply a second coat of paint in the same way. Let it dry 3 hours before removing the tape.

XM ANTENNA REPLACEMENT

1. Pull down the rear portion of the headliner (see **HEADLINER REMOVAL/INSTALLATION**). Take care not to damage the headliner.
2. Disconnect the XM antenna connector (A).

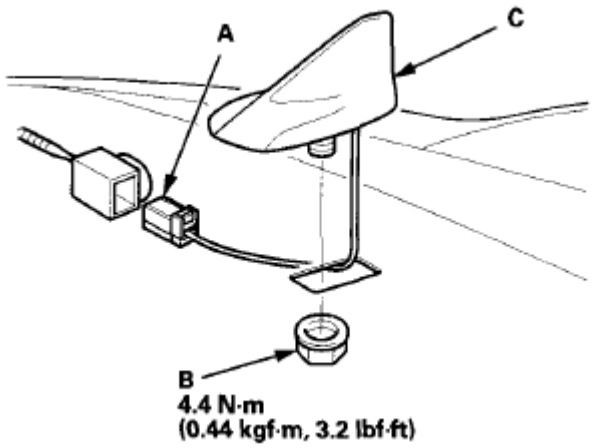

Fig. 269: Identifying XM Antenna Connector, Nut And XM Antenna With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the nut (B) from the XM antenna (C), and remove it.

4. Install the XM antenna in the reverse order of removal.

USB ADAPTER HOLDER/AUXILIARY JACK ASSEMBLY REPLACEMENT

1. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
2. Detach the connector (A) from the clip. Remove the cover (B) and disconnect the USB adapter connector (C).

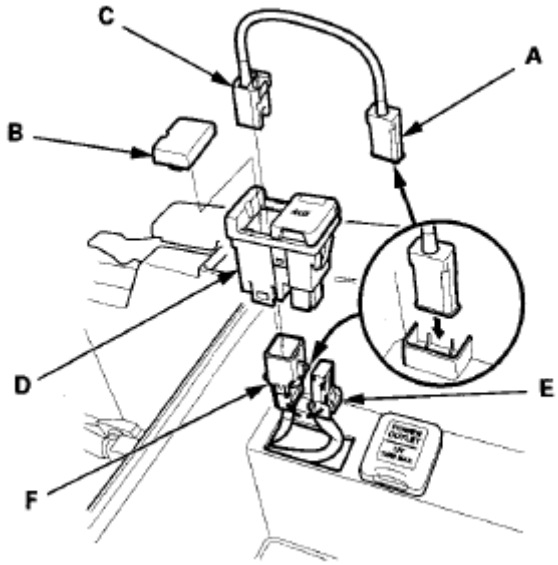

Fig. 270: Identifying Connector, Cover And USB Adapter Connector
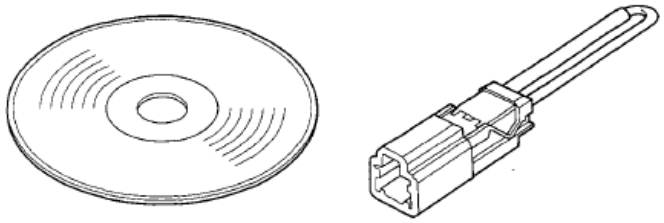
Courtesy of AMERICAN HONDA MOTOR CO., INC.



3. Carefully pull out the USB adapter holder/auxiliary jack assembly (D) from the center console box, then disconnect the 5P connector (E) and remove the USB adapter connector (F).
4. Install the USB adapter holder/auxiliary jack assembly in the reverse order of removal.

Automatic Dimming Inside Mirror - TL

CIRCUIT DIAGRAM

WITHOUT KEYLESS ACCESS SYSTEM

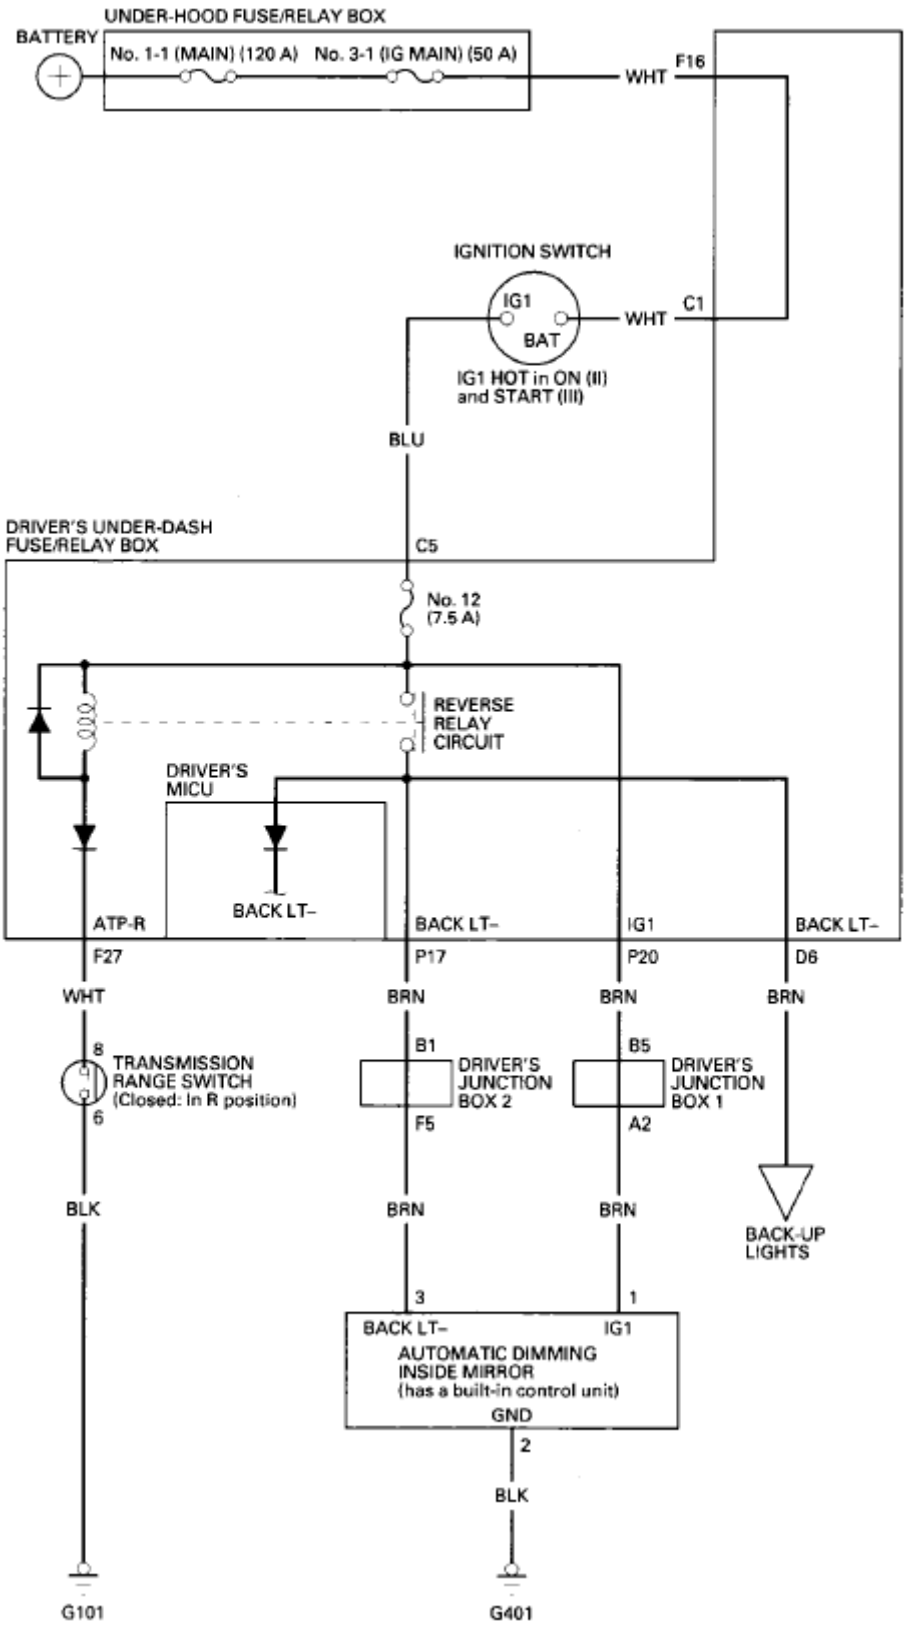

Fig. 1: Automatic Dimming Inside Mirror Circuit Wiring Diagram (1 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

WITH KEYLESS ACCESS SYSTEM

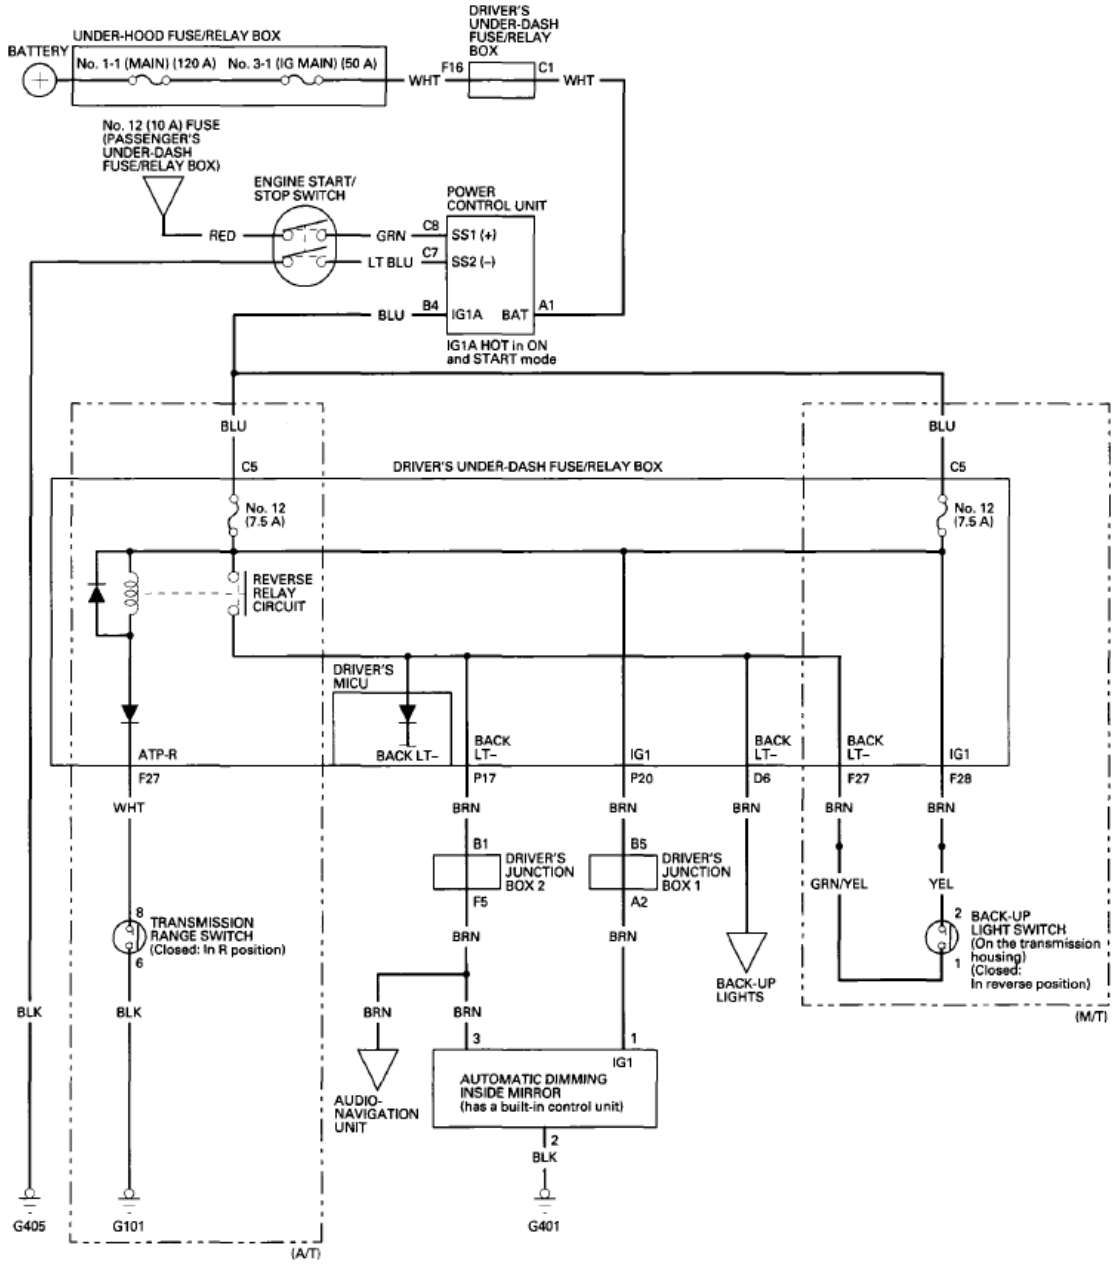

Fig. 2: Automatic Dimming Inside Mirror Circuit Wiring Diagram (2 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SYSTEM DESCRIPTION

The automatic dimming inside mirror has a front-facing lux level sensor (A), rear-facing lux level sensors (B), and a control unit. The control unit receives signals from each sensor. Based on the difference between the two lux levels (the light outside the vehicle and the light from the headlights of the other vehicle, etc.), the control unit controls the electro-chromic gel to reduce glare. This dimming function is canceled when the transmission is in reverse, or when the automatic dimming off switch (C) is turned OFF.

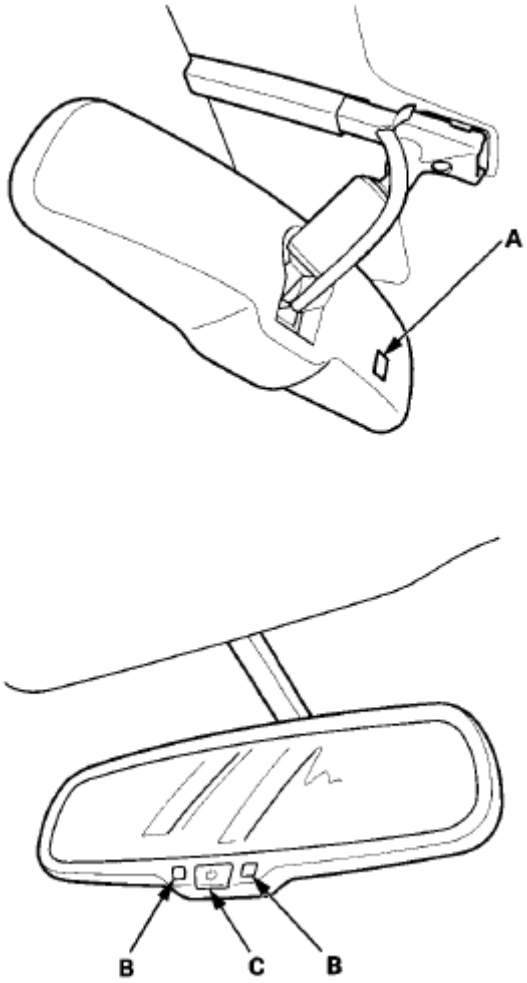

Fig. 3: Identifying Front-Facing Lux Level Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TEST/REPLACEMENT

1. Check for obstructions (parking stickers, labels, etc.) over the front-facing lux level sensor (A).

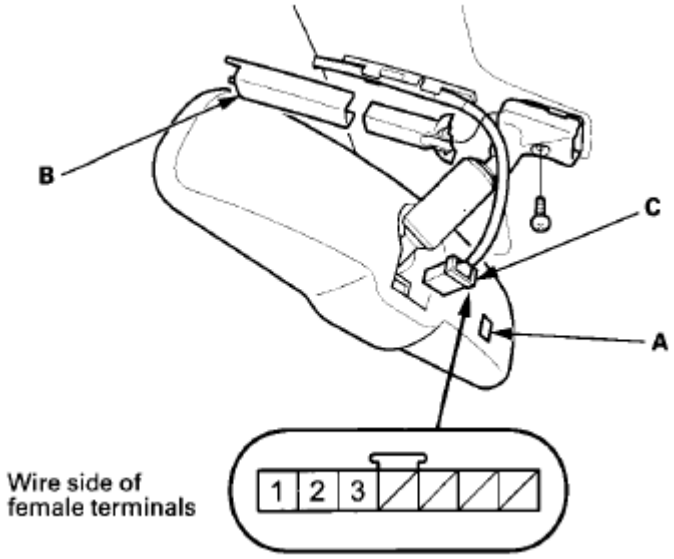

Fig. 4: Identifying Front-Facing Lux Level Sensor, Cover And 7P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the cover (B), then disconnect 7P connector (C).
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Measure the voltage between terminal No. 2 and body ground.
    - If there is less than 0.2 V, go to step 5.
    - If there is more than 0.2 V, check for:
        - An open or high resistance in the wire.
        - Poor ground (G401).
5. Measure the voltage between terminal No. 1 and body ground.
    - If there is battery voltage, go to step 6.
    - If there is no voltage, check for:
        - Blown No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box.
        - An open or high resistance in the wire.
6. Measure the voltage between terminal No. 3 and body ground with the shift lever in Ft (or reverse) position.

- If there is battery voltage, replace the mirror assembly.
- If there is no voltage, check for:
    - An open or high resistance in the wire.
    - Faulty driver's under-dash fuse/relay box.
    - Faulty transmission range switch (A/T).
    - Faulty back-up light switch (M/T).

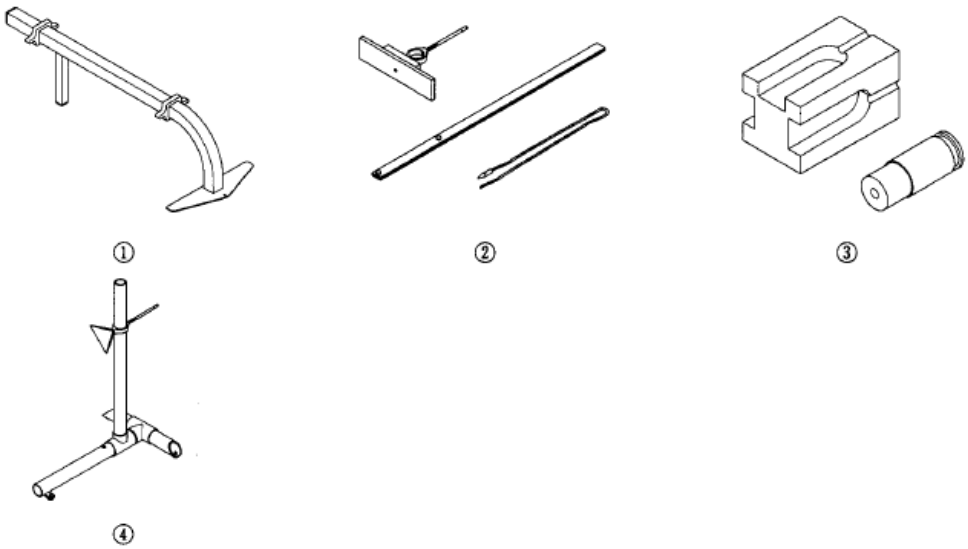

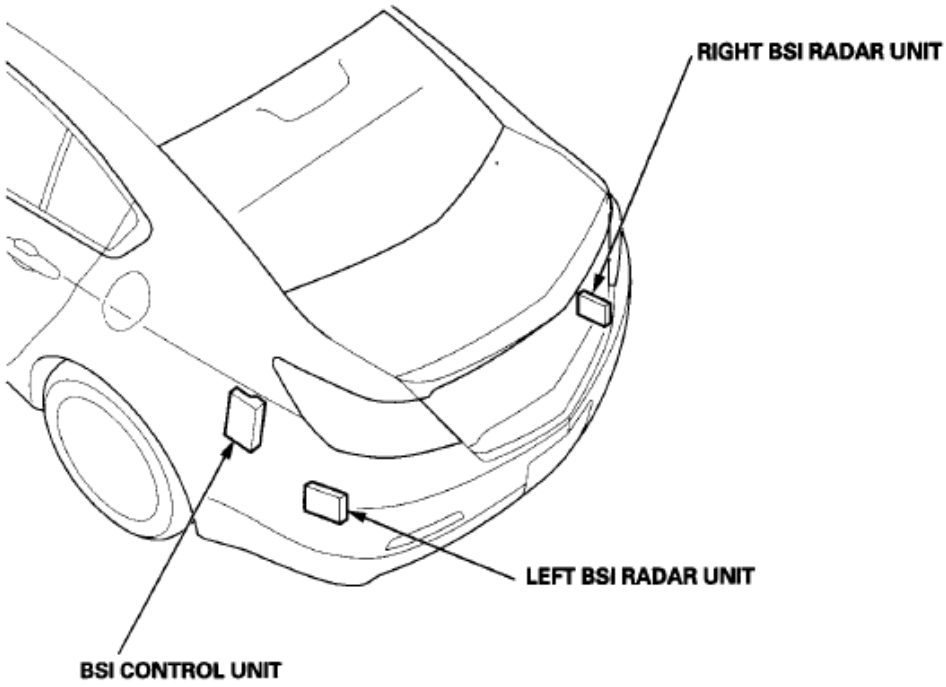

Fig. 1: Blind Spot Information System Special Tools
Courtesy of AMERICAN HONDA MOTOR CO., INC.

COMPONENT LOCATION INDEX

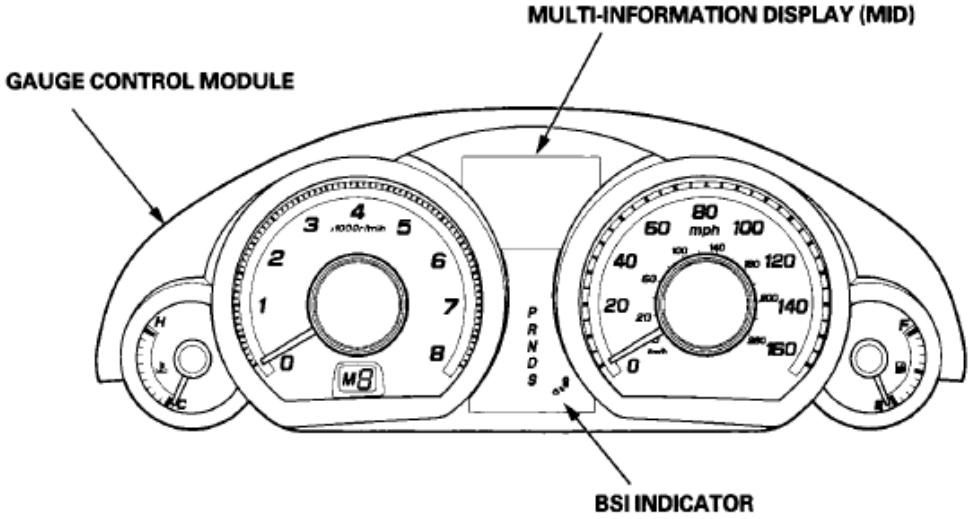

Fig. 2: Blind Spot Information System Components Location (1 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

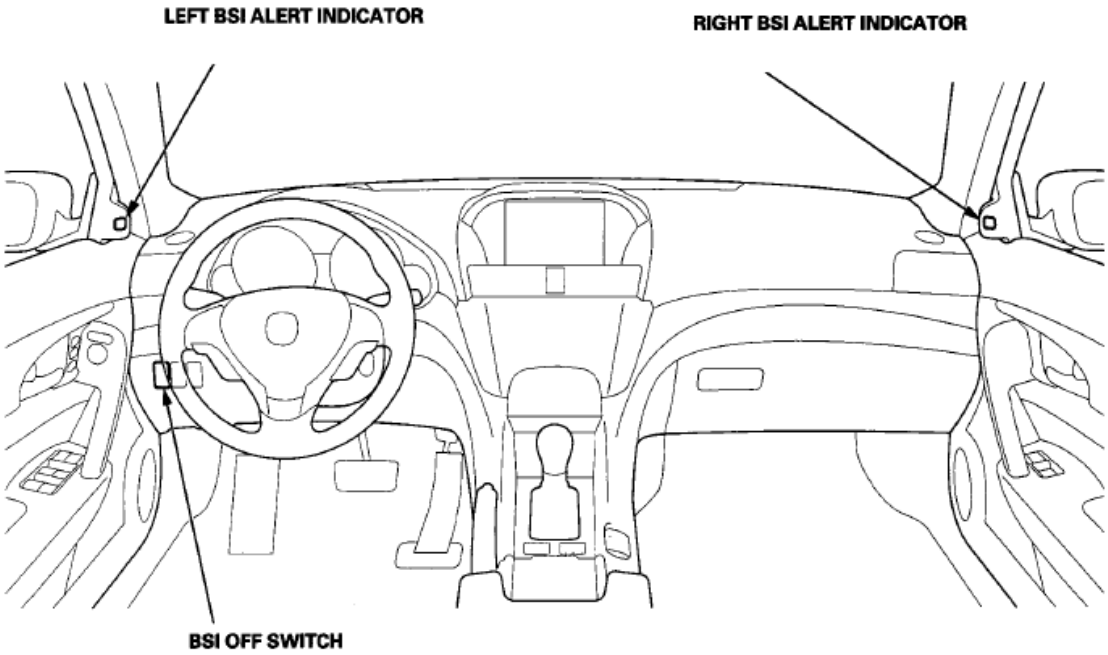

Fig. 3: Blind Spot Information System Components Location (2 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

GENERAL TROUBLESHOOTING INFORMATION

BLIND SPOT INFORMATION SYSTEM (BSI) INDICATOR

When the BSI system Is OK, the BSI indicator (A) comes on for about 3 seconds after pressing the engine start/stop button to select the ON mode.

When the BSI system detects a problem while in operation, the BSI system stops control. The BSI indicator comes on, and the BSI system indicates "CHECK BLIND SPOT SYSTEM" in the MID.

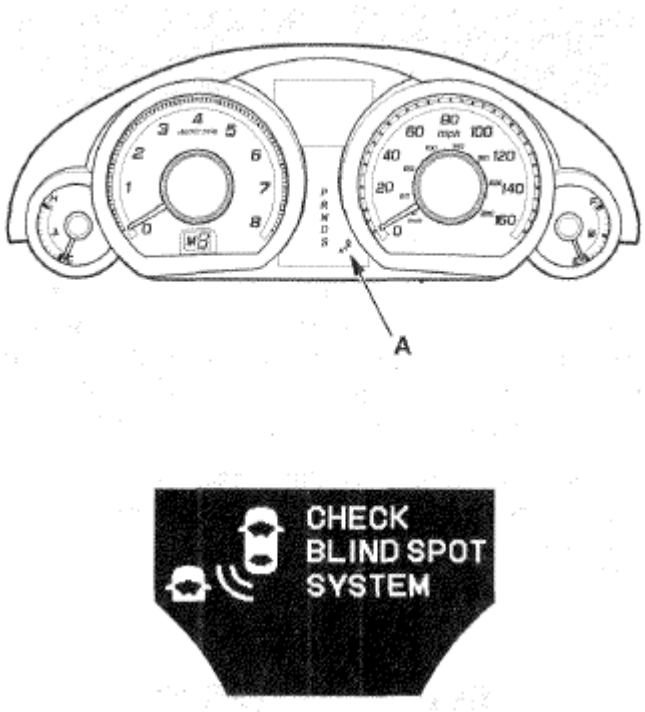

Fig. 4: Identifying Blind Spot Information System Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

BLIND SPOT INFORMATION SYSTEM (BSD) ALERT INDICATOR

While the BSI system is working, the system turns on/blinks* the BSI alert indicator (A) when it detects another vehicle on either side toward the rear.

*: When the driver moves the turn signal lever toward the side with the BSI alert indicator on, the alert indicator blinks to alert the driver.

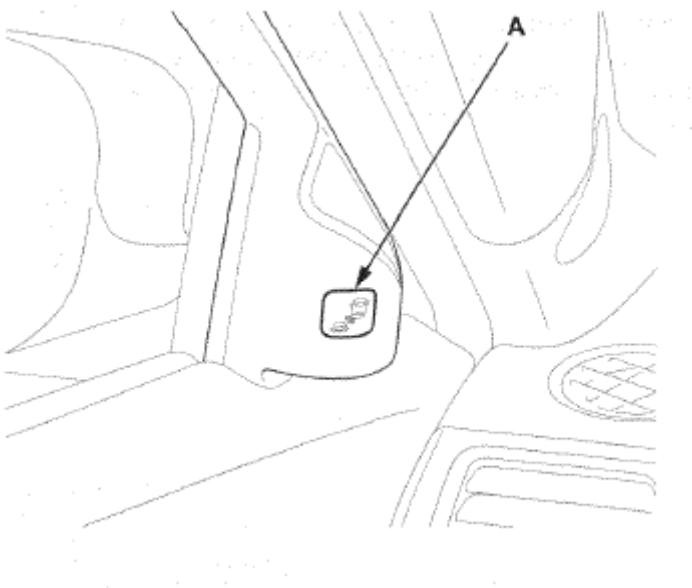

Fig. 5: Identifying BSI Alert Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

BSI OFF SWITCH

Pressing and holding the button on the BSI OFF switch (A) for at least 0.5 second turns the BSI system on or off.

To turn on the BSI system, press the engine start/stop button to select the ON mode, then press the BSI OFF button. The BSI indicator in the gauge control module goes off, and the BSI system indicates that it is turned on in the multi-information display (MID).

To turn off the BSI system, press the button on the BSI OFF switch again. The BSI indicator in the gauge control module comes on, and the BSI system indicates that it is turned off in the MID.

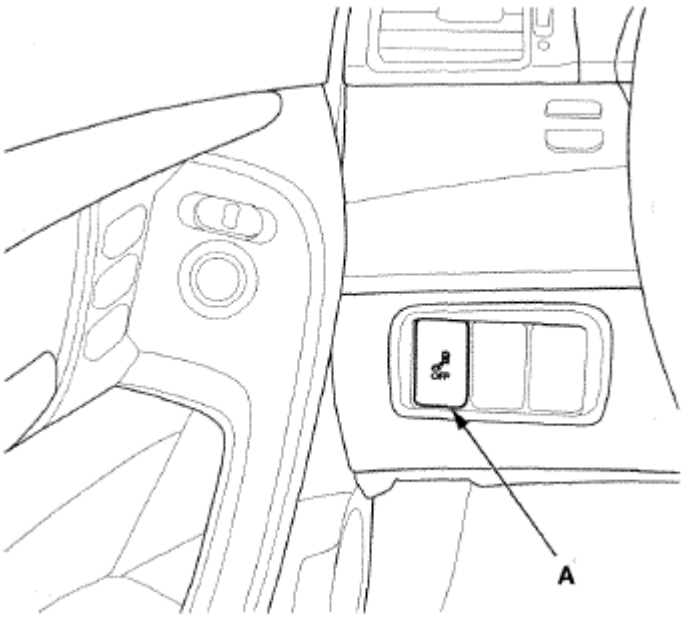

Fig. 6: Identifying BSI OFF Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MULTI-INFORMATION DISPLAY (MID) INDICATION

The BSI system indicates its operation status on the multi-information display (MID) (A) in the gauge control module as below.

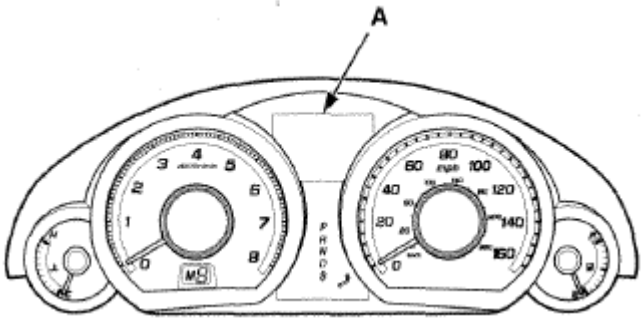

Fig. 7: Identifying Multi-Information Display (MID)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

BSI OFF/BSI ON

The BSI system indicates its condition for only 5 seconds when the system is turned on or off with the BSI OFF switch.

Fig. 8: Display BSI OFF/BSI ON
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CLEAN THE BSI RADAR UNITS

When mud, dirt, wet snow, leaves, or other foreign material sticks to the side of the rear bumper, the BSI system stops control and indicates in the MID that the BSI radar units must be cleaned. It also turns on the BSI indicator at the same time, and stores the DTC(s).

When the obstruction or contamination is removed, the indicator in MID goes off and the BSI system automatically returns to ON.

Fig. 9: Identifying Display Blind Spot Signal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SELF-DIAGNOSTIC FUNCTION

The BSI system has a self-diagnostic function. If the self-diagnostic function detects a malfunction, the BSI system stops control, turns on the BSI indicator, and stores DTCs.

BLIND SPOT INFORMATION SYSTEM (BSI) CONTROL UNIT

The BSI control unit uses input from the BSI radar units. The BSI radar units also detects its own errors, and it signals the BSI control unit if an error is detected.

BLIND SPOT INFORMATION SYSTEM (BSI) RADAR UNITS

The BSI radar units are installed in the rear bumper on both sides of the vehicle. They detect other vehicles as they approach your vehicle from the rear sides, and they send this information to the BSI control unit.

CAN COMMUNICATION

B-CAN

The BSI control unit is on the B-CAN, and it communicates with other units (AcuraLink™, Gauge control module, MICU) via the B-CAN.

If the BSI control unit detects a communication error or a malfunction in another connected unit, the BSI system will not operate even though it is OK.

In this case, both BSI indicator and related unit indicator will come on and stay on.

BSI-CAN

BSI-CAN is used as a network connecting the BSI control unit and the BSI radar units.

When the BSI control unit does not properly receive information from the BSI-CAN, the BSI system stops control and turns on the BSI indicator.

HOW TO TROUBLESHOOT DTCS

Check the DTCs with the HDS.

Before troubleshooting, check and note these items:

- Ask the client about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.
- If the symptom does not appear and the BSI indicator does not come on during the test-drive, but troubleshooting is done based on the DTC, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure the BSI indicator does not come on.
- The BSI system sometimes stops control because of the environment (weather, road conditions, driving conditions, etc.). A DTC may be stored in these cases.

Some DTCs may be stored even when the system is OK. For example, the BSI indicator may come on with one or more of these DTCs:

B18A5: Left BSI Radar Unit Temperature High

B18A6: Right BSI Radar Unit Temperature High

B18A7: Left BSI Radar Unit Voltage Input Low

B18A8: Right BSI Radar Unit Voltage Input Low

B18A9: Left BSI Radar Unit Voltage Input High

B18AA: Right BSI Radar Unit Voltage Input High

B18B4: Left BSI Radar Unit Dirty

B18B5: Right BSI Radar Unit Dirty

B18BD: BSI Control Unit Voltage Input High

B18BE: BSI Control Unit Voltage Input Low

HOW TO RETRIEVE DTCS

NOTE: Make sure the battery is fully charged before you begin.

1. Press the engine start/stop button to select the OFF mode.
2. Connect the HDS (Honda Diagnostic System) to the data link connector (DLC) (A) located under the driver's side of the dashboard.

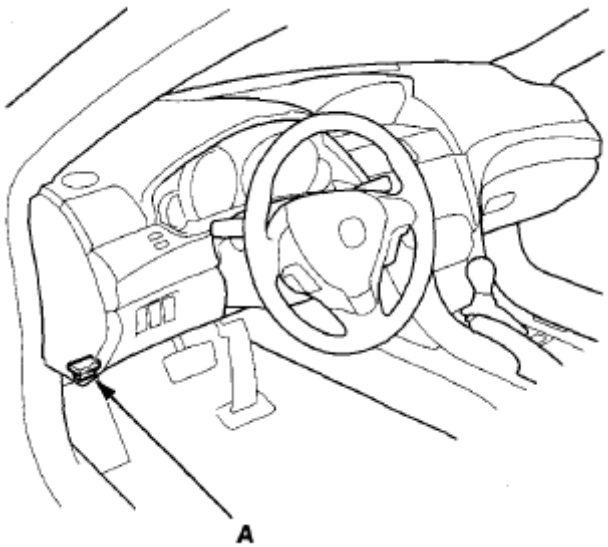

Fig. 10: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Press the engine start/stop button to select the ON mode.
4. Make sure the HDS communicates with the vehicle and the BSI control unit. If it does not communicate, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
5. Use the HDS to check for BSI DTCs.
6. Read and record the DTC.
7. Press the engine start/stop button to select the OFF mode, then wait for 10 seconds.
8. Disconnect the HDS from the DLC.
9. Do the troubleshooting procedure for the DTC.

HOW TO CLEAR DTCS

NOTE: Make sure the battery is fully charged before you begin.

1. Press the engine start/stop button to select the OFF mode.
2. Connect the HDS (Honda Diagnostic System) to the data link connector (DLC) (A) located under the driver's side of the dashboard.

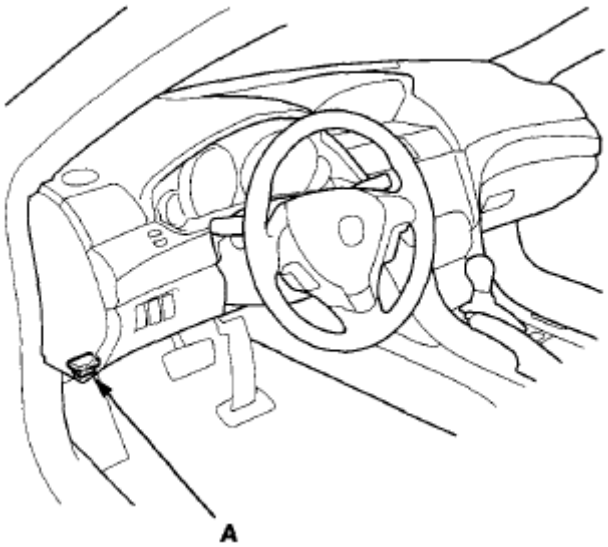

Fig. 11: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Press the engine start/stop button to select the ON mode.
4. Make sure the HDS communicates with the vehicle and the BSI control unit. If it does not communicate, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
5. In the DRIVING SUPPORT MENU of the HDS, select BSI, then choose the Clear DTCs icon, and follow the prompts.
6. Press the engine start/stop button to select the OFF mode, then wait for 10 seconds.
7. Disconnect the HDS from the DLC.

DTC TROUBLESHOOTING INDEX

DTC	Detection Item	BSI Indicator
B18A1	BSI control unit internal circuit error	ON
B18A5	Left BSI radar unit temperature high	ON
B18A6	Right BSI radar unit temperature high	ON
B18A7	Left BSI radar unit voltage input low	ON
B18A8	Right BSI radar unit voltage input low	ON
B18A9	Left BSI radar unit voltage input high	ON
B18AA	Right BSI radar unit voltage input	ON

	high	
B18AF	Left BSI radar unit internal circuit error	ON
B18B1	Right BSI radar unit internal circuit error	ON
B18B4	Left BSI radar unit dirty	ON
B18B5	Right BSI radar unit dirty	ON
B18B6	Lost communication with left BSI radar unit	ON
B18B7	Lost communication with right BSI radar unit	ON
B18B8	Left BSI radar unit azimuth off alignment	ON
B18B9	Right BSI radar unit azimuth off alignment	ON
B18BA	Left BSI radar unit version incorrect	ON
B18BB	Right BSI radar unit version incorrect	ON
B18BC	BSI radar units communication error	ON
B18BD	BSI control unit voltage input high	ON
B18BE	BSI control unit voltage input low	ON
B18C2	Left BSI alert indicator output error	ON
B18CF	Right BSI alert indicator output error	ON
U0155	Lost communication with the gauge control module	ON
U0423	Invalid data received from PCM (vehicle speed data)	ON
U1280	Communication bus line error (BUS-OFF)	ON

SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure	Also Check for
The BSI alert indicator comes on when no other vehicle is in the detectable area (Wrong indication)	Symptom Troubleshooting (see **THE BSI ALERT INDICATOR COMES ON WHEN NO OTHER VEHICLE IS IN THE DETECTABLE AREA (WRONG INDICATION)**)	
The BSI does not come on when other vehicles are in the detectable area (No indication)	Symptom Troubleshooting (see **THE BSI DOES NOT COME ON WHEN OTHER VEHICLES ARE IN THE DETECTABLE AREA (NO INDICATION)**)	
The BSI OFF switch does not work	Symptom Troubleshooting (see **THE BSI OFF SWITCH DOES NOT WORK**)	
	Symptom Troubleshooting (see **THE BSI**	

The BSI indicator does not go off, or does not come on	**INDICATOR DOES NOT GO OFF, OR DOES NOT COME ON**)	
The MID beeper does not sound when the BSI OFF switch is pushed	Symptom Troubleshooting (see **THE MID BEEPER DOES NOT SOUND WHEN THE BSI OFF SWITCH IS PUSHED**)	
The HDS does not communicate with the BSI	Symptom Troubleshooting (see **THE HDS DOES NOT COMMUNICATE WITH THE BSI**)	Incorrect HDS software
The HDS does not communicate with the PCM or the vehicle	Symptom Troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**)	• Incorrect HDS software • Shorted reference voltage

SYSTEM DESCRIPTION

BLIND SPOT INFORMATION SYSTEM (BSI)

The BSI system turns on the BSI alert indicators (A) on the front door sash inner trims when another vehicle in the next lane enters the "blind" area where the driver cannot see the vehicle with his peripheral vision or with the inside and outside rearview mirrors.

NOTE: The BSI system does not ensure the safety of the vehicle occupants, nor does it help in low visibility situations such as bad weather.

The BSI system turns on/blinks* the BSI alert indicator in the following situations.

*: When moving the turn signal lever toward the side with the BSI alert indicator on, the alert indicator blinks to alert driver.

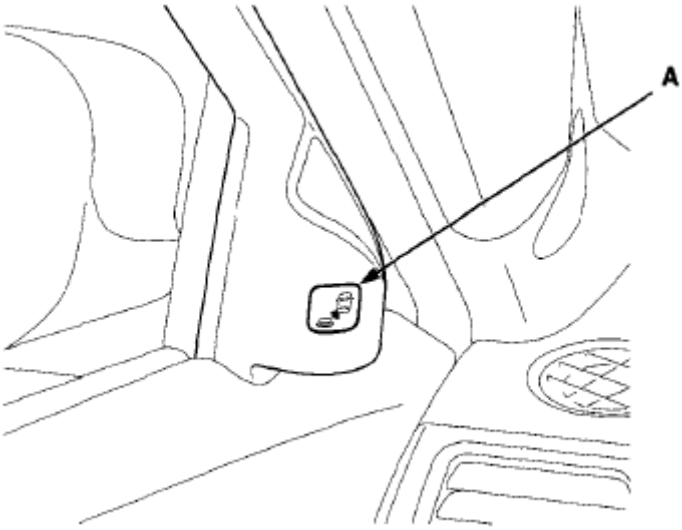

Fig. 12: Identifying BSI Alert Indicators
Courtesy of AMERICAN HONDA MOTOR CO., INC.

1. Pass from rear
    - Vehicle operation speed: 6-99 mph (10-160 km/h)

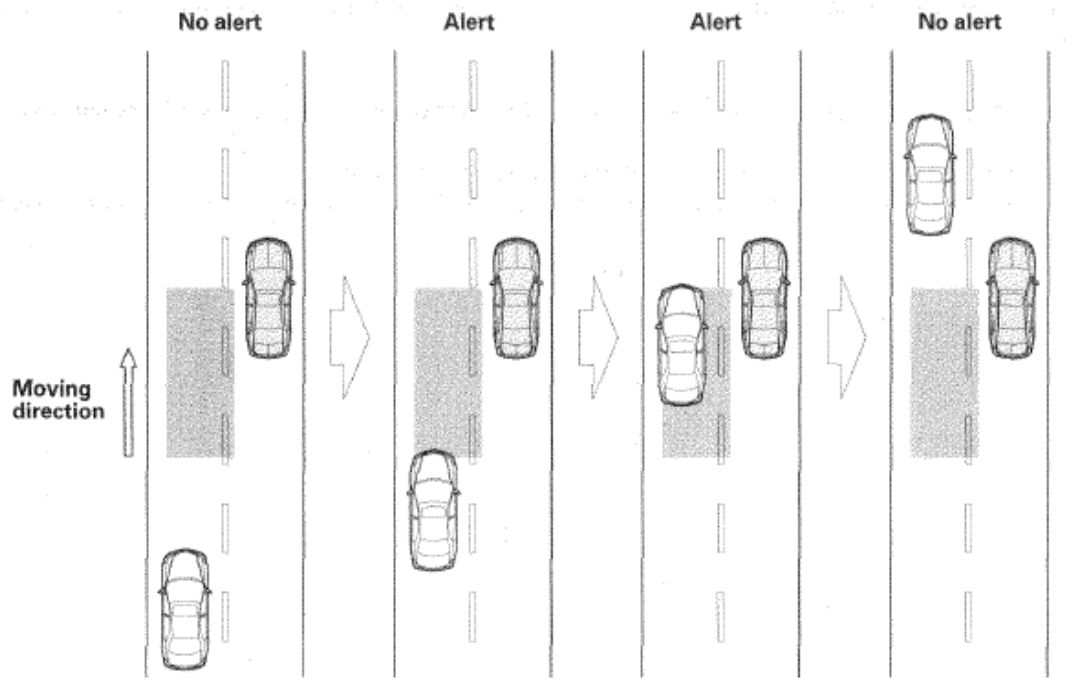

Fig. 13: Identifying Display - Vehicle Operation Speed Limits (Pass From Rear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Lane changes
    - Vehicle operation speed: 6-93 mph (10-160 km/h)
    - Relative speed: About 12 mph (20km/h)

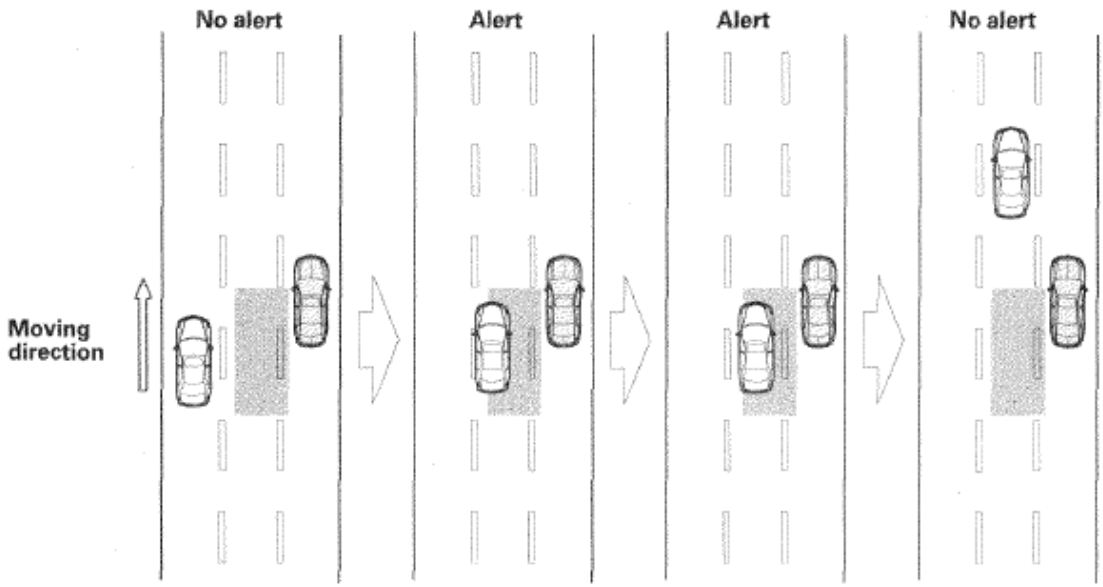

Fig. 14: Identifying Display - Vehicle Operation Speed Limits (Lane Changes)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Passing
    - Vehicle operation speed: 6-99 mph (10-160 km/h)
    - Relative speed: About 12 mph (20km/h)

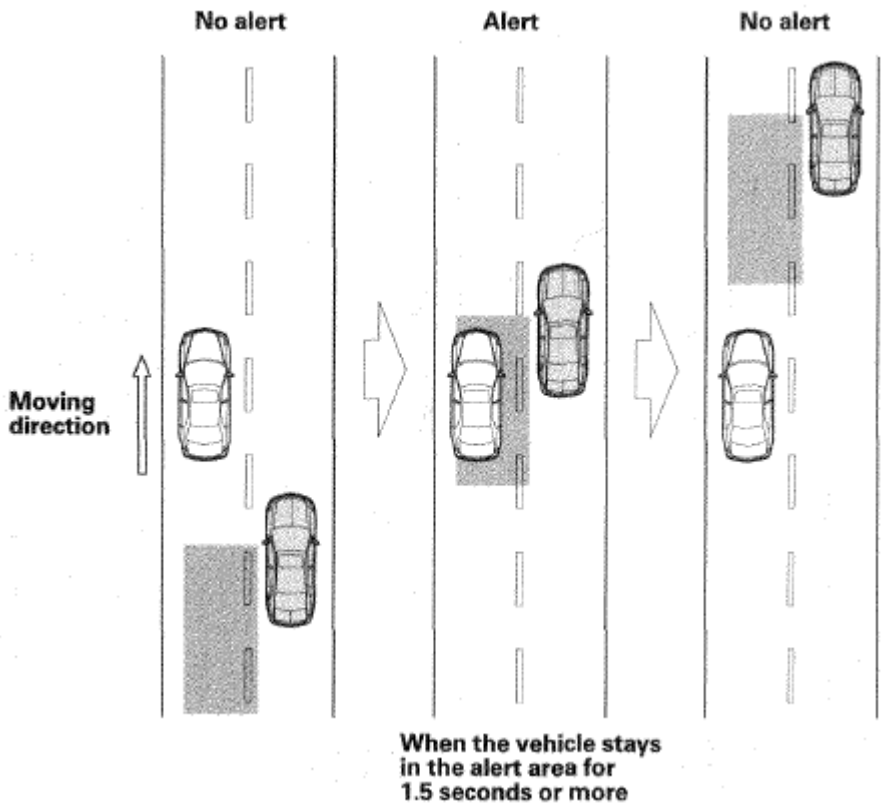

Fig. 15: Identifying Display - Vehicle Operation Speed Limits (Passing)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Starting
    - Vehicle operation speed: 6-99 mph (10-160 km/h)

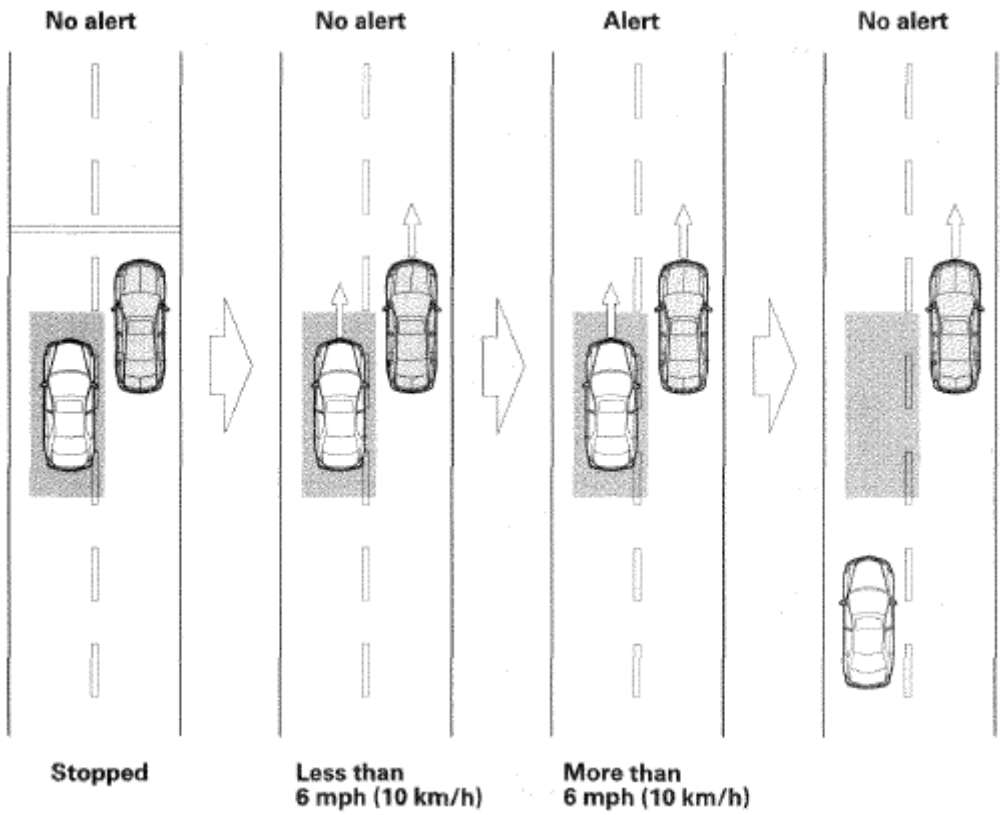

Fig. 16: Identifying Display - Vehicle Operation Speed Limits (Starting)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. One or more lanes apart
    - Vehicle operation speed: 6-99 mph (10-160 km/h)

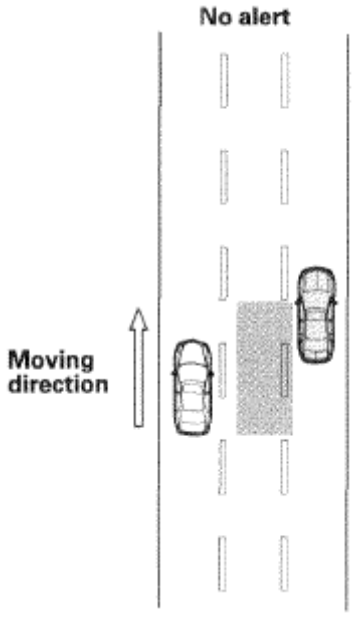

Fig. 17: Identifying Display - Vehicle Operation Speed Limits (One Or More Lanes Apart)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Oncoming vehicle
    - Vehicle operation speed: 6-99 mph (10-160 km/h)

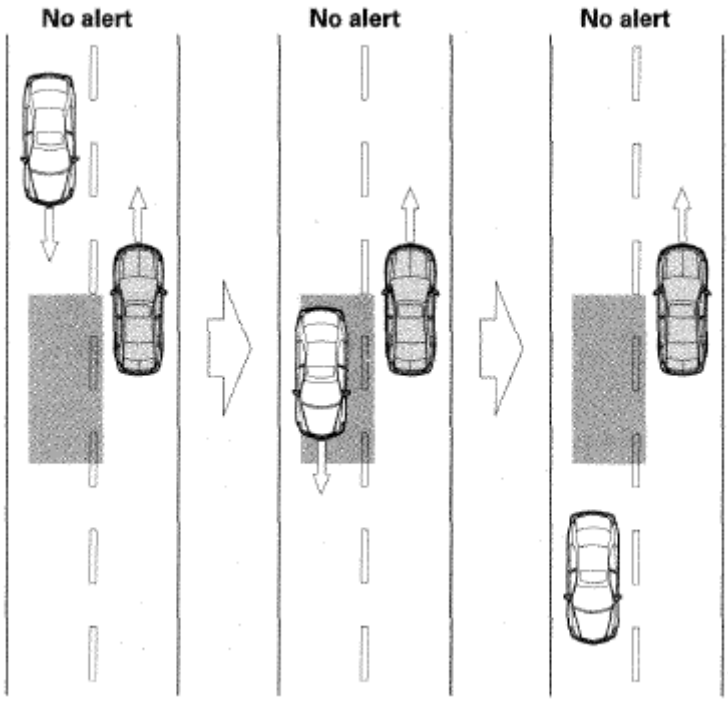

Fig. 18: Identifying Display - Vehicle Operation Speed Limits (Oncoming Vehicle)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Static objects
    - Vehicle operation speed; 6-99 mph (10-160 km/h)

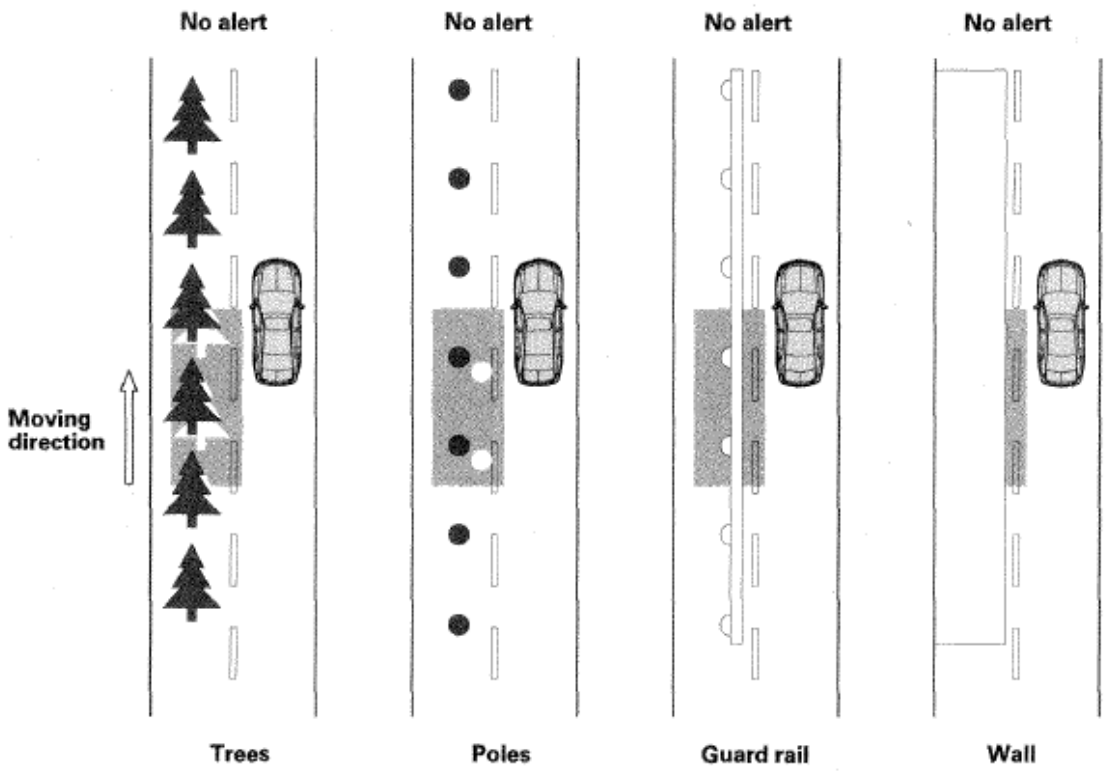

Fig. 19: Identifying Display - Vehicle Operation Speed Limits (Static Objects)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

BLIND SPOT INFORMATION SYSTEM (BSI) CONTROL UNIT

The BSI control unit obtains information from external sensors and switches that are connected to their respective control units.

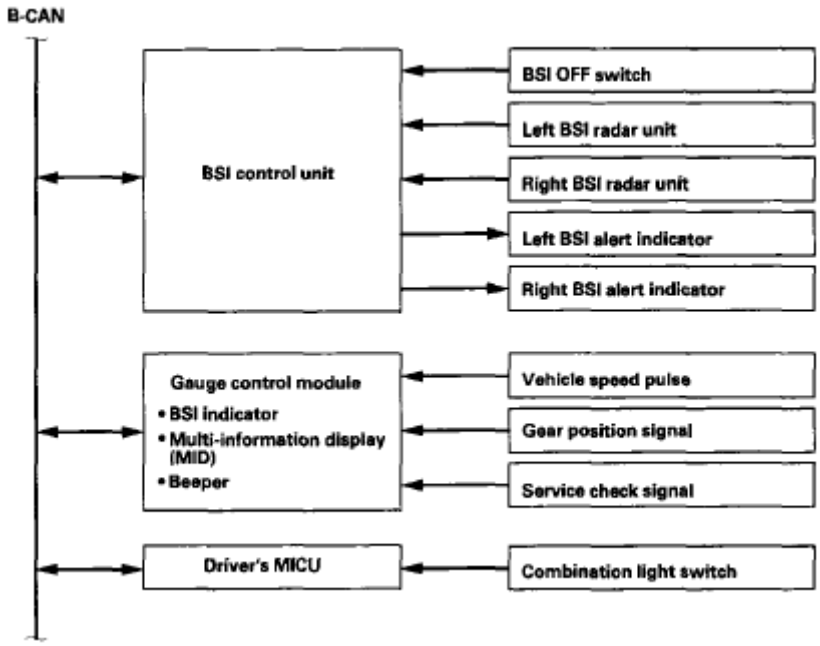

Fig. 20: Blind Spot Information System Control Unit Block Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

BLIND SPOT INFORMATION SYSTEM (BSI) RADAR UNITS

The BSI radar units are installed in the rear bumper on both sides.

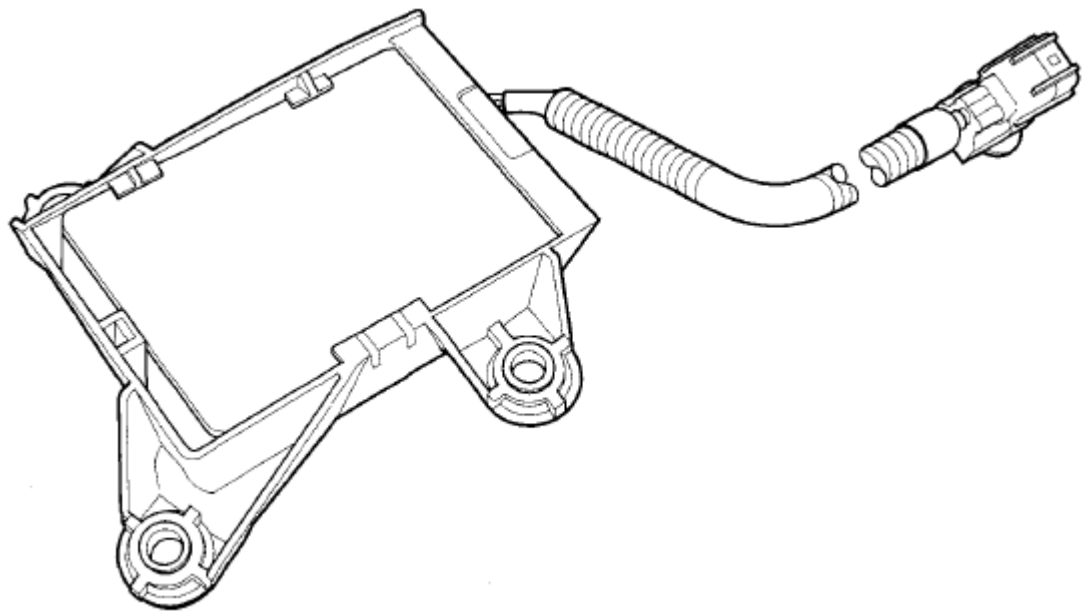

Fig. 21: Identifying Blind Spot Information System Radar Units
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Basic distance function

The BSI radar unit radiates 24 GHz radar waves within the range of 3 m (9.84 ft) toward the rear and 3 m (9.84 ft) on both sides horizontally and 20 degrees on both sides toward the rear. It receives the reflected radar waves when another vehicle enters in this alert area.

Aiming function

The BSI radar unit has a small amount of auto-aiming capability. Straighten the body when auto-aiming is not possible.

Self-Diagnostic function

The BSI radar units have a self-diagnostic function that displays the self-diagnosis information in the MID when the system turns on after pressing the engine start/stop button to select the ON mode.

Sensitivity-Lowering detection function

When the detecting ability of the BSI radar units are hampered by dirt or other contaminants around the rear bumper that covers BSI radar units, the BSI radar units outputs this condition to the BSI control unit until the function recovers.

DTC TROUBLESHOOTING

DTC B18A1: BSI CONTROL UNIT INTERNAL CIRCUIT ERROR

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC B18A1 indicated?

YES -Replace the BSI control unit (see **BSI CONTROL UNIT REMOVAL/INSTALLATION**).

NO -Intermittent failure, the system is OK at this time.

DTC B18A5: LEFT BSI RADAR UNIT TEMPERATURE HIGH

NOTE: It is usually difficult to duplicate this DTC.

1. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC B18A5 indicated?

   YES -Go to step 2.

   NO -Intermittent failure, the system is OK at this time.

2. Check the exhaust system and heat shields for modifications or damage.

   Are all parts OK?

   YES -Intermittent failure due to temporary high temperature around the BSI radar unit, the system is OK at this time. Clear the DTCs.

   NO -Repair or replace the faulty part.

DTC B18A6: RIGHT BSI RADAR UNIT TEMPERATURE HIGH

NOTE: It is usually difficult to duplicate this DTC.

1. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC B18A6 indicated?

   YES -Go to step 2.

   NO -Intermittent failure, the system is OK at this time.

2. Check the exhaust system and heat shields for modifications or damage.

   Are all parts OK?

   YES -Intermittent failure due to temporary high temperature around the BSI radar unit, the system is OK at this time. Clear the DTCs.

   NO -Repair or replace the faulty part.

DTC B18A7: LEFT BSI RADAR UNIT VOLTAGE INPUT LOW

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Test-drive the vehicle at 12 mph (20 km/h) for 60 seconds or more.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC B18A7 indicated?

   YES -Go to step 4.

   NO -Intermittent failure, the system is OK at this time.

4. Press the engine start/stop button to select the OFF mode.
5. Check the connection at the left BSI radar unit 6P connector.

   Is the connection OK?

   YES -Go to step 6.

   NO -Repair the poor connection, and retest.

6. Disconnect the left BSI radar unit 6P connector.
7. Press the engine start/stop button to select the ON mode.
8. Measure the voltage between left BSI radar unit 6P connector terminals No. 2 and No. 5. There should be battery voltage.

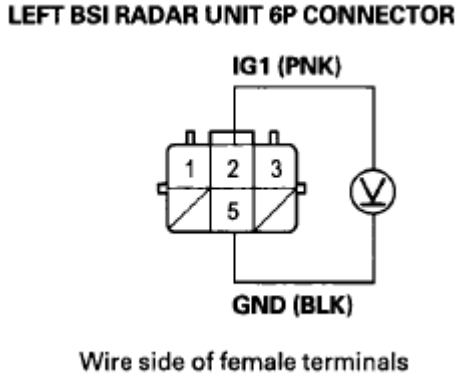

Fig. 27: Measuring Voltage Between Left BSI Radar Unit 6P Connector Terminals No. 2 And No. 5
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Replace the left BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

NO -Go to step 9.

9. Measure the voltage between left BSI radar unit 6P connector terminal No. 2 and body ground. There should be battery voltage.

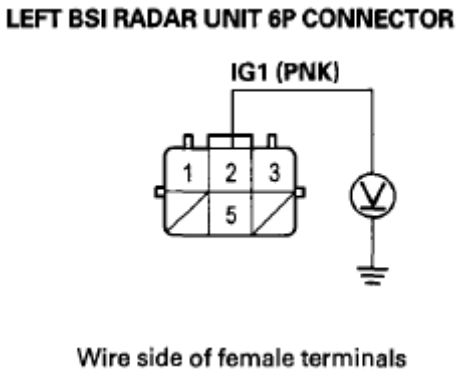

Fig. 28: Measuring Voltage Between Left BSI Radar Unit 6P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair an open in the wire between the left BSI radar unit 6P connector and body ground (G603).

NO -Repair an open in the wire between the driver's under-dash fuse/relay box and the left BSI radar unit.

DTC B18A8: RIGHT BSI RADAR UNIT VOLTAGE INPUT LOW

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Test-drive the vehicle at 12 mph (20 km/h) for 60 seconds or more.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC B18A8 indicated?

YES -Go to step 4.

NO -Intermittent failure, the system is OK at this time.

4. Press the engine start/stop button to select the OFF mode.
5. Check the connection at the right BSI radar unit 6P connector.

Is the connection OK?

YES -Go to step 6.

NO -Repair the poor connection, and retest.

6. Disconnect the right BSI radar unit 6P connector.

7. Press the engine start/stop button to select the ON mode.
8. Measure the voltage between right BSI radar unit 6P connector terminals No. 2 and No. 5. There should be battery voltage.

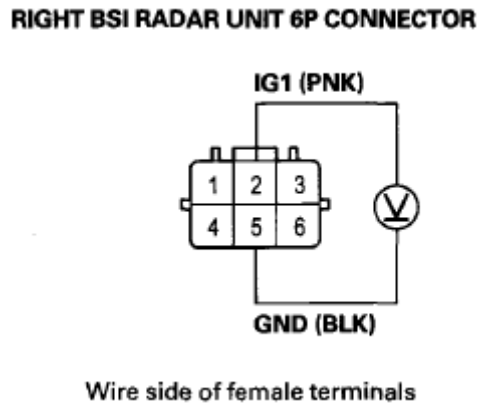

Fig. 29: Measuring Voltage Between Right BSI Radar Unit 6P Connector Terminals No. 2 And No. 5
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Replace the right BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

NO -Go to step 9.

9. Measure the voltage between right BSI radar unit 6P connector terminals No. 2 and body ground. There should be battery voltage.

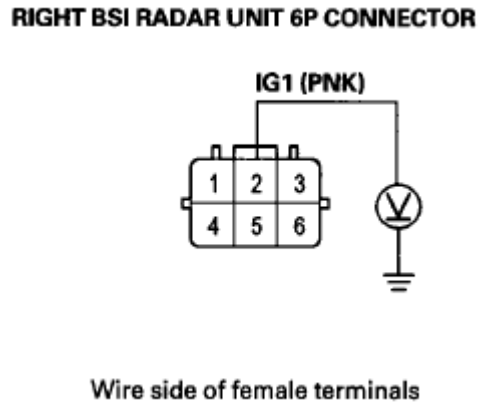

Fig. 30: Measuring Voltage Between Right BSI Radar Unit 6P Connector Terminals No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair an open in the wire between the right BSI radar unit 6P connector and body ground (G603).

NO -Repair an open in the wire between the driver's under-dash fuse/relay box and the right BSI radar unit.

DTC B18A9: LEFT BSI RADAR UNIT VOLTAGE INPUT HIGH

NOTE:

- **This DTC could be detected after jump-starting the vehicle with a booster battery or other power source.**
- **This DTC may be indicated due to a faulty charging system, including the battery.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Start the engine, then wait for 20 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC B18A9 indicated?

YES -Go to step 4.

NO -Intermittent failure, the system is OK at this time.

4. Press the engine start/stop button to select the OFF mode.
5. Test the battery (see **BATTERY TEST**).

Is the battery OK?

YES -Replace the left BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

NO -Replace the battery (see **BATTERY REMOVAL AND INSTALLATION**).

DTC B18AA: RIGHT BSI RADAR UNIT VOLTAGE INPUT HIGH

NOTE:

- **This DTC could be detected after jump-starting the vehicle with a booster battery or other power source.**
- **This DTC may be indicated due to a faulty charging system, including the battery.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Start the engine, then wait for 20 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC B18AA indicated?

YES -Go to step 4.

NO -Intermittent failure, the system is OK at this time.

4. Press the engine start/stop button to select the OFF mode.
5. Test the battery (see **BATTERY TEST**).

Is the battery OK?

YES -Replace the right BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

NO -Replace the battery (see **BATTERY REMOVAL AND INSTALLATION**).

DTC B18AF: LEFT BSI RADAR UNIT INTERNAL CIRCUIT ERROR

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Press the engine start/stop button to select the ON mode, then wait for 30 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC B18AF indicated?

YES -Replace the left BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

NO -Intermittent failure, the system is OK at this time.

DTC B18B1: RIGHT BSI RADAR UNIT INTERNAL CIRCUIT ERROR

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Press the engine start/stop button to select the ON mode, then wait for 30 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC B18B1 indicated?

YES -Replace the right BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

NO -Intermittent failure, the system is OK at this time.

DTC B18B4: LEFT BSI RADAR UNIT DIRTY

1. Check the outside of rear bumper for snow, ice, dirt, contaminants, or stickers.
2. From the left rear wheel arch, remove the screws securing the rear bumper (see **LOWER FRONT BUMPER GRILLE REPLACEMENT**).
3. Gently pull on the rear bumper (A) at the left rear wheel arch area to release it from the hooks (B) on the side spacer (C). Do not pull the rear bumper forcibly.

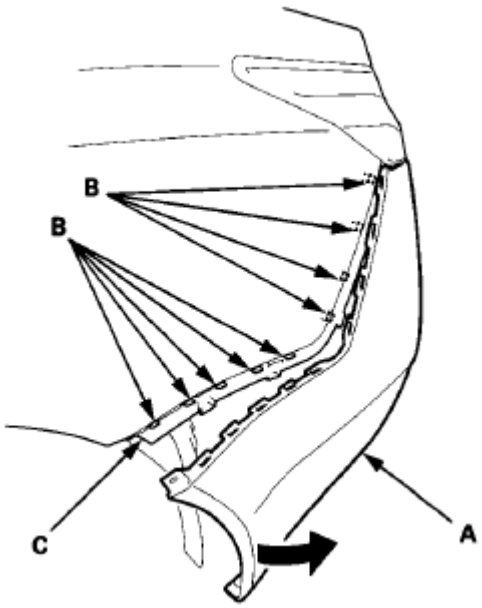

Fig. 31: Pulling On Rear Bumper At Left Rear Wheel Arch Area
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Check the inside of the rear bumper for snow, ice, dirt, or contaminants. Also, check the left BSI radar unit surface for dirt or contaminants.

   Is it OK?

   YES -Intermittent failure due to temporary contamination around the rear bumper, the system is OK at this time. Clear the DTCs.

   NO -Go to step 5.

5. Remove the rear bumper (see **LOWER FRONT BUMPER GRILLE REPLACEMENT**), and wipe off the dirt or contaminants.
6. Check the BSI radar unit bracket for proper installation (see step 4).

   Is it OK?

   YES -Intermittent failure due to temporary contamination around the rear bumper, the system is OK at this time. Clear the DTCs.

   NO -Install the BSI radar unit bracket properly. If damaged, replace the left BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

DTC B18B5: RIGHT BSI RADAR UNIT DIRTY

1. Check the outside of rear bumper for snow, ice, dirt, contaminants, or stickers.
2. From the right rear wheel arch, remove the screws securing the rear bumper (see **LOWER FRONT**

BUMPER GRILLE REPLACEMENT).

3. Gently pull on the rear bumper (A) at the right rear wheel arch area to release it from the hooks (B) on the side spacer (C). Do not pull the rear bumper forcibly.

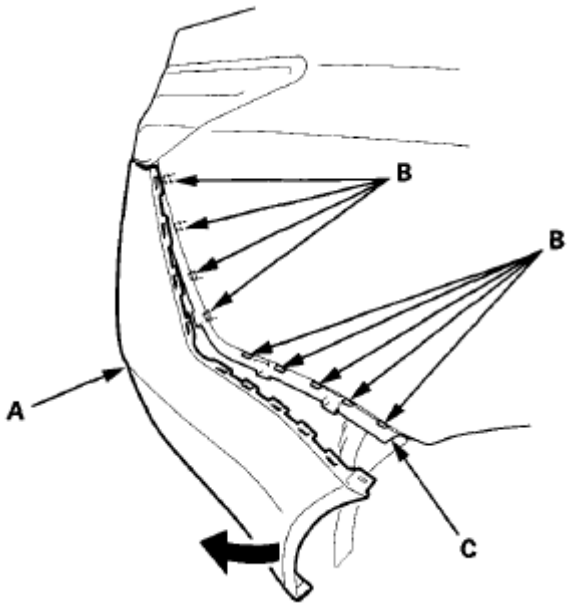

Fig. 32: Pulling On Rear Bumper At Right Rear Wheel Arch Area
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Check the inside of the rear bumper for snow, ice, dirt, or contaminants. Also, check the right BSI radar unit surface for dirt or contaminants.

   Is it OK?

   YES -Intermittent failure due to temporary contamination around the rear bumper, the system is OK at this time. Clear the DTCs.

   NO -Go to step 5.

5. Remove the rear bumper (see **LOWER FRONT BUMPER GRILLE REPLACEMENT**), and wipe off the dirt or contaminants.
6. Check the BSI radar unit bracket for proper installation (see step 4).

   Is it OK?

   YES -Intermittent failure due to temporary contamination around the rear bumper, the system is OK at this time. Clear the DTCs.

   NO -Install the BSI radar unit bracket properly. If damaged, replace the left BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

DTC B18B6: LOST COMMUNICATION WITH LEFT BSI RADAR UNIT; DTC B18B7: LOST COMMUNICATION WITH RIGHT BSI RADAR UNIT

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Press the engine start/stop button to select the ON mode, then wait for 60 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC B18B6 or B18B7 indicated?

   YES -Go to step 4.

   NO -Intermittent failure, the system is OK at this time.

4. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Are DTC B18B6 and B18B7 indicated?

   YES -Go to step 5.

   NO -

   - If only DTC B18B6 indicated, go to step 24.
   - If only DTC B18B7 indicated, go to step 32.
5. Press the engine start/stop button to select the OFF mode.
6. Disconnect the left BSI radar unit 6P connector.
7. Press the engine start/stop button to select the ON mode.
8. Measure the voltage between left BSI radar unit 6P connector terminals No. 2 and No. 5. There should be battery voltage.

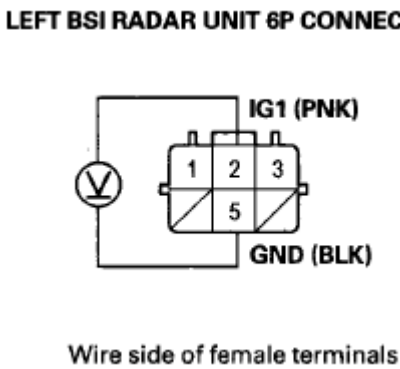

Fig. 33: Measuring Voltage Between Left BSI Radar Unit 6P Connector Terminals No. 2 And No. 5
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 10.

NO -Go to step 9.

9. Measure the voltage between left BSI radar unit 6P connector terminal No. 2 and body ground. There should be battery voltage.

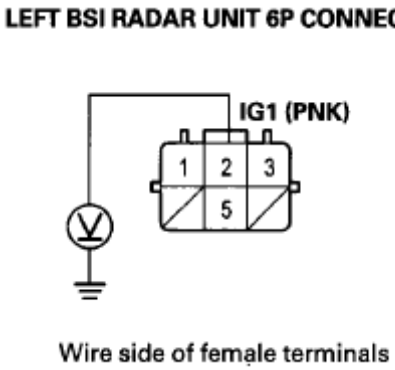

Fig. 34: Measuring Voltage Between Left BSI Radar Unit 6P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair an open in the wire or poor body ground (G603).

NO -Repair an open in the wire between the BSI control unit and the branch of the IG1 line.

10. Press the engine start/stop button to select the OFF mode.
11. Disconnect the right BSI radar unit 6P connector.
12. Disconnect the BSI control unit 16P connector.
13. Check for continuity between BSI control unit 16P connector terminal No. 2 and body ground.

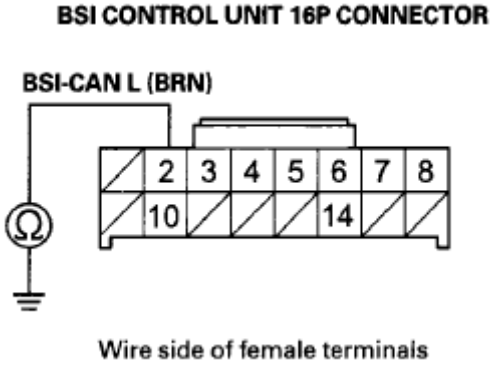

Fig. 35: Checking Continuity Between BSI Control Unit 16P Connector Terminal No. 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire between the BSI control unit and the branch of the BSI-CAN line (BSI-CAN L)M

NO -Go to step 14.

14. Press the engine start/stop button to select the ON mode.
15. Measure the voltage between BSI control unit 16P connector terminal No. 3 and body ground. There should be less than 0.2 V.

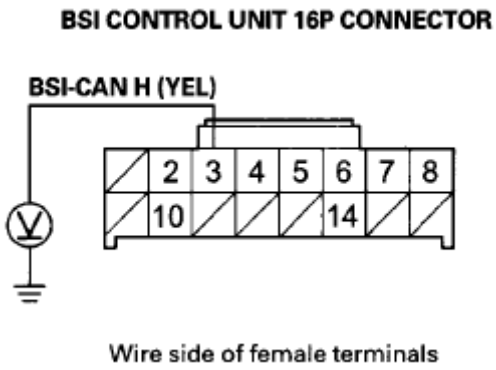

Fig. 36: Measuring Voltage Between BSI Control Unit 16P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES -Go to step 16.

NO -Repair a short to power in the wire between the BSI control unit and the branch of the BSI-CAN line (BSI-CAN H).

16. Press the engine start/stop button to select the OFF mode.
17. Check for continuity between BSI control unit 16P connector terminal No. 3 and left BSI radar unit 6P connector terminal No. 3, and between BSI control unit 16P connector terminal No. 2 and left BSI radar unit 6P connector terminal No. 1.

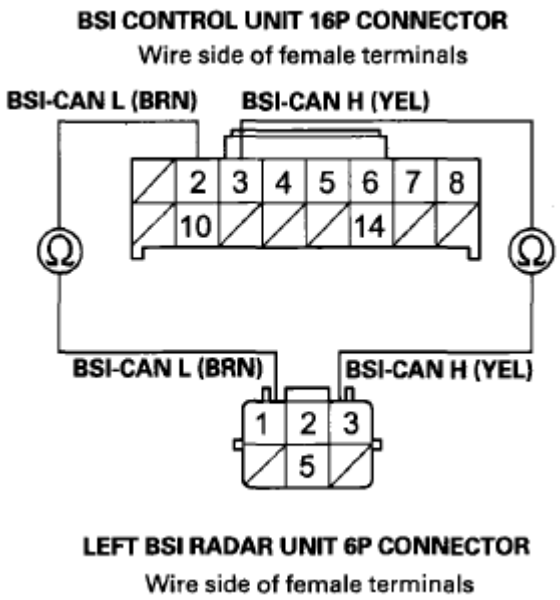

Fig. 37: Checking Continuity Between BSI Control Unit 16P Connector Terminal And Left BSI Radar Unit 6P Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 18.

NO -Repair an open in the wire between the BSI control unit and the branch of the BSI-CAN line (BSI-CAN H, BSI-CAN L)M

18. Reconnect the left BSI radar unit 6P connector.
19. Reconnect the BSI control unit 16P connector.
20. Press the engine start/stop button to select the ON mode.
21. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
22. Press the engine start/stop button to select the ON mode, then wait for 60 seconds.
23. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Are DTC B18B6 and B18B7 indicated?

YES -Replace the right BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

NO -Replace the left BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

24. Press the engine start/stop button to select the OFF mode.
25. Disconnect the left BSI radar unit 6P connector.
26. Press the engine start/stop button to select the ON mode.
27. Measure the voltage between left BSI radar unit 6P connector terminals No. 2 and No. 5. There should be

battery voltage.

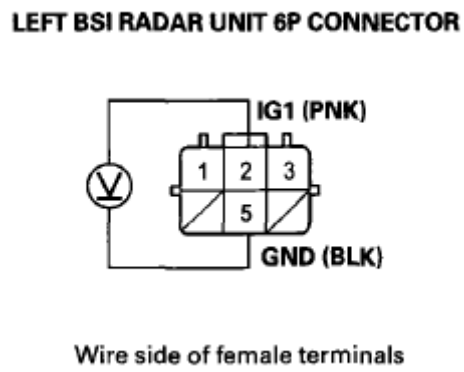

Fig. 38: Measuring Voltage Between Left BSI Radar Unit 6P Connector Terminals No. 2 And No. 5
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 28.

NO -Go to step 31.

28. Press the engine start/stop button to select the OFF mode.
29. Disconnect the BSI control unit 16P connector.
30. Check for continuity between BSI control unit 16P connector terminal No. 3 and left BSI radar unit 6P connector terminal No. 3, and between BSI control unit 16P connector terminal No. 2 and left BSI radar unit 6P connector terminal No. 1.

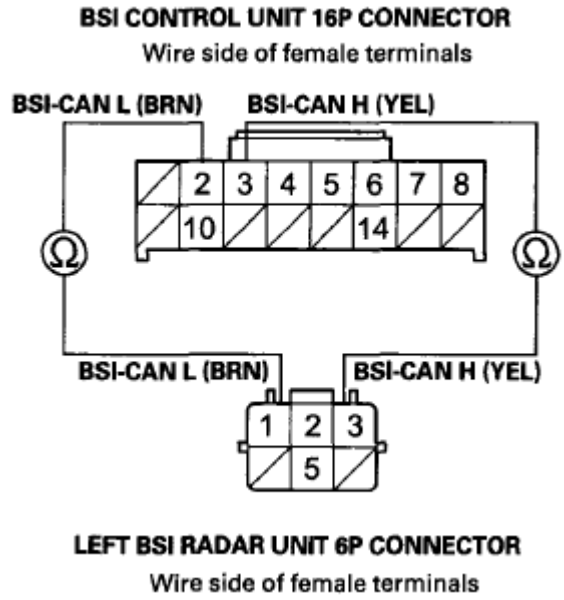

Fig. 39: Checking Continuity Between BSI Control Unit 16P Connector Terminal And Left BSI

Radar Unit 6P Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the left BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

NO -Repair an open in the wire between the BSI control unit and the left BSI radar unit.

31. Measure the voltage between left BSI radar unit 6P connector terminal No. 2 and body ground. There should be battery voltage.

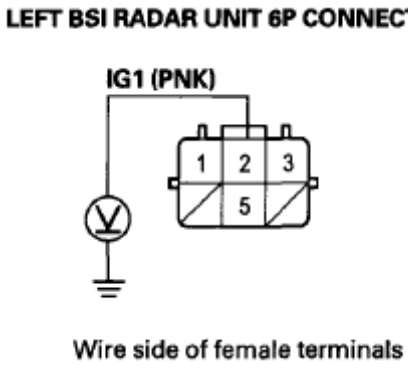

Fig. 40: Measuring Voltage Between Left BSI Radar Unit 6P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair an open in the wire between the left BSI radar unit and body ground (G603).

NO -Repair an open in the wire between the driver's under-dash fuse/relay box and the left BSI radar unit.

32. Press the engine start/stop button to select the OFF mode.
33. Disconnect the right BSI radar unit 6P connector.
34. Press the engine start/stop button to select the ON mode.
35. Measure the voltage between right BSI radar unit 6P connector terminals No. 2 and No. 5. There should be battery voltage.

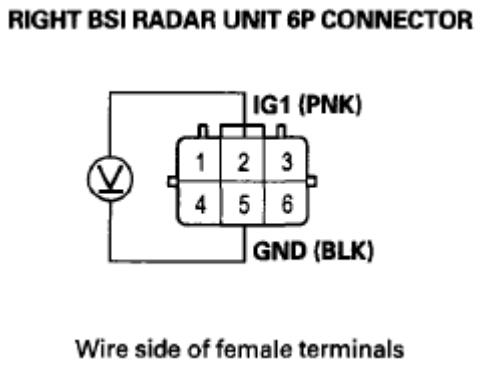

Fig. 41: Measuring Voltage Between Right BSI Radar Unit 6P Connector Terminals No. 2 And No. 5
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 36.

NO -Go to step 40.

36. Press the engine start/stop button to select the OFF mode.
37. Measure the resistance between body ground and right BSI radar unit 6P connector terminals No. 4 and No. 6 individually. There should be less than 1.0 ohms.

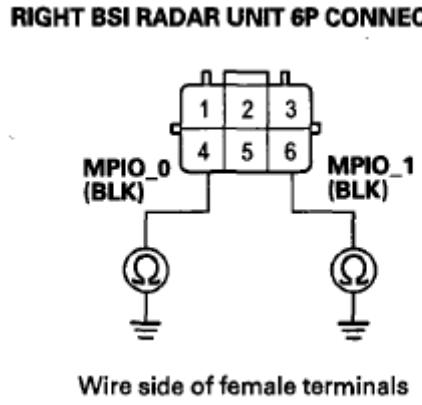

Fig. 42: Measuring Resistance Between Body Ground And Right BSI Radar Unit 6P Connector Terminals No. 4 And No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES -Go to step 38.

NO -Repair an open in the wire between the right BSI radar unit and body ground (G603).

38. Disconnect the BSI control unit 16P connector.
39. Check for continuity between BSI control unit 16P connector terminal No. 3 and right BSI radar unit 6P connector terminal No. 3, and between BSI control unit 16P connector terminal No. 2 and right BSI radar unit 6P connector terminal No. 1.

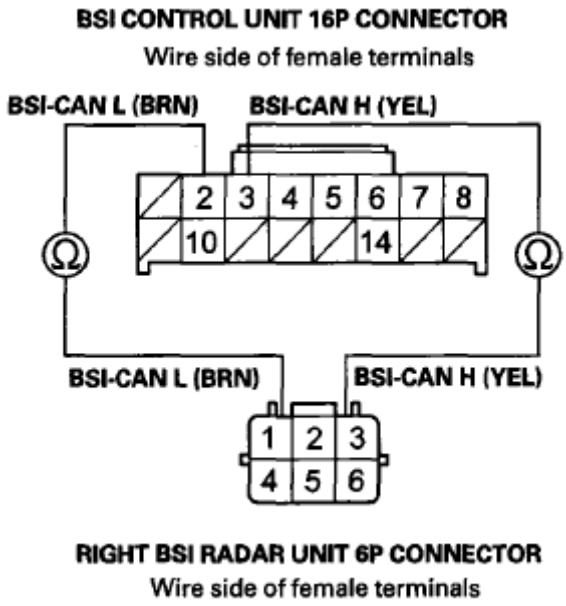

Fig. 43: Checking Continuity Between BSI Control Unit 16P Connector Terminal And Right BSI Radar Unit 6P Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the right BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

NO -Repair an open in the wire between the BSI control unit and the right BSI radar unit.

40. Measure the voltage between right BSI radar unit 6P connector terminal No. 2 and body ground. There should be battery voltage.

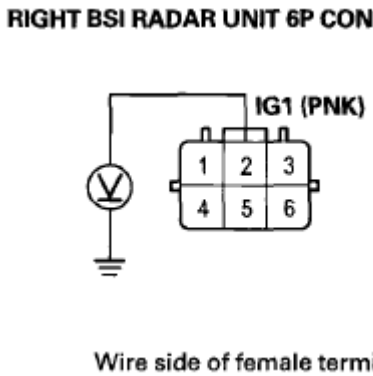

Fig. 44: Measuring Voltage Between Right BSI Radar Unit 6P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair an open in the wire between the right BSI radar unit and body ground (G603).

NO -Repair an open in the wire between the driver's under-dash fuse/relay box and the right BSI radar unit.

DTC B18B8: LEFT BSI RADAR UNIT AZIMUTH OFF ALIGNMENT; DTC B18B9: RIGHT BSI RADAR UNIT AZIMUTH OFF ALIGNMENT

1. Check the installation of the BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

   Is it OK?

   YES -Check the vehicle condition:

   - Make sure the vehicle does not have aftermarket suspension.
   - Make sure all the tires are the correct size.
   - Set the tire pressures to the specifications shown on the doorjamb label.

   If the problem is still present, do the BSI radar unit mounting area check (see **BSI RADAR UNIT MOUNTING AREA CHECK**).

   NO -Replace the BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

DTC B18BA: LEFT BSI RADAR UNIT VERSION INCORRECT; DTC B18BB: RIGHT BSI RADAR UNIT VERSION INCORRECT

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Are DTC B18BA and/or B18BB indicated?

   YES -Go to step 4.

   NO -Intermittent failure, the system is OK at this time.

4. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Are DTC B18BA and/or B18BB indicated?

YES -Go to step 5.

NO -An incorrect BSI radar unit is installed. Replace the BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**) with the proper part.

5. Check the part number of BSI control unit.

   Does the part number of BSI control unit correspond to this vehicle?

   YES -Both BSI radar units are incorrect. Replace both BSI radar units (see **BSI RADAR UNIT REMOVAL/INSTALLATION**) with the proper parts.

   NO -An incorrect BSI control unit is installed. Replace the BSI control unit (see **BSI CONTROL UNIT REMOVAL/INSTALLATION**) with the proper part.

DTC B18BC: BSI RADAR UNITS COMMUNICATION ERROR

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Press the engine start/stop button to select the ON mode, then wait for 60 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC B18BC indicated?

   YES -Go to step 4.

   NO -Intermittent failure, the system is OK at this time.

4. Press the engine start/stop button to select the OFF mode.
5. Disconnect the left BSI radar unit 6P connector.
6. Disconnect the right BSI radar unit 6P connector.
7. Disconnect the BSI control unit 16P connector.
8. Check for continuity between BSI control unit 16P connector terminal No. 3 and body ground.

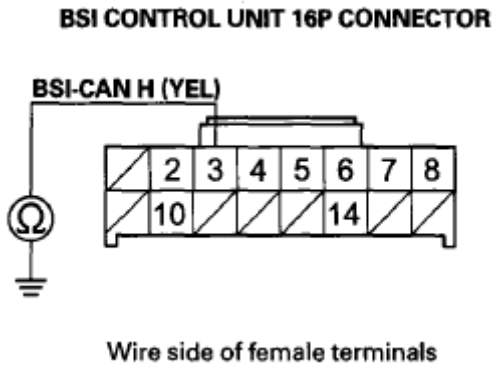

Fig. 45: Checking Continuity Between BSI Control Unit 16P Connector Terminal No. 3 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire between the BSI control unit and the branch of the BSI-CAN line (BSI-CAN H).

NO -Go to step 9.

9. Check for continuity between BSI control unit 16P connector terminals No. 2 and No. 3.

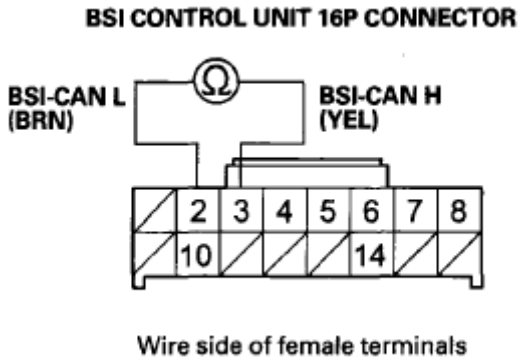

Fig. 46: Checking Continuity Between BSI Control Unit 16P Connector Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short in the wires between the BSI-CAN H line and the BSI-CAN L line.

NO -Go to step 10.

10. Press the engine start/stop button to select the ON mode.
11. Measure the voltage between BSI control unit 16P connector terminal No. 2 and body ground. There should be less than 0.2 V.

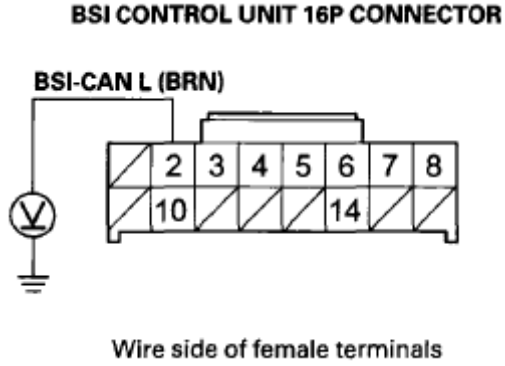

Fig. 47: Measuring Voltage Between BSI Control Unit 16P Connector Terminal No. 2 And Body

Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES -Go to step 12.

NO -Repair a short to power in the wire between the BSI control unit and the branch of the BSI-CAN line (BSI-CAN).

12. Press the engine start/stop button to select the OFF mode.
13. Reconnect the BSI control unit 16P connector.
14. Measure the resistance between BSI control unit 16P connector terminals No. 2 and No. 3. There should be an open circuit or at least 1 Mohms.

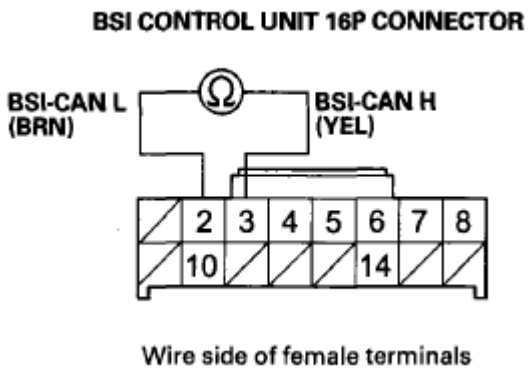

Fig. 48: Measuring Resistance Between BSI Control Unit 16P Connector Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES -Go to step 15.

NO -Replace the BSI control unit (see **BSI CONTROL UNIT REMOVAL/INSTALLATION**).

15. Reconnect the right BSI radar unit 6P connector.
16. Press the engine start/stop button to select the ON mode.
17. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
18. Press the engine start/stop button to select the ON mode, then wait for 60 seconds.
19. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC B18BC indicated?

YES -Replace the right BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

NO -Replace the left BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

DTC B18BD: BSI CONTROL UNIT VOLTAGE INPUT HIGH

NOTE: This DTC may be indicated due to a faulty charging system including the battery.

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Press the engine start/stop button to select the ON mode, then wait for 20 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC B18BD indicated?

YES -Go to step 4.

NO -Intermittent failure, the system is OK at this time.

4. Press the engine start/stop button to select the OFF mode.
5. Test the battery (see **BATTERY TEST**).

Is the battery OK?

YES -Replace the BSI control unit (see **BSI CONTROL UNIT REMOVAL/INSTALLATION**).

NO -Replace the battery (see **BATTERY REMOVAL AND INSTALLATION**).

DTC B18BE: BSI CONTROL UNIT VOLTAGE INPUT LOW

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Start the engine, then wait for 30 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC B18BE indicated?

YES -Check the connection between the BSI connector and the BSI control unit. If the connection is OK, check the battery (see **BATTERY TEST**).

NO -Intermittent failure, the system is OK at this time.

DTC B18C2: LEFT BSI ALERT INDICATOR OUTPUT ERROR

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC B18C2 indicated?

YES -Go to step 4.

NO -Intermittent failure, the system is OK at this time.

4. Press the engine start/stop button to select the OFF mode.
5. Remove the front door sash inner trim (see **FRONT DOOR SASH INNER TRIM REPLACEMENT**).
6. Measure the resistance between left BSI alert indicator 2P connector terminal No. 1 and body ground. There should be less than 1.0 ohms.

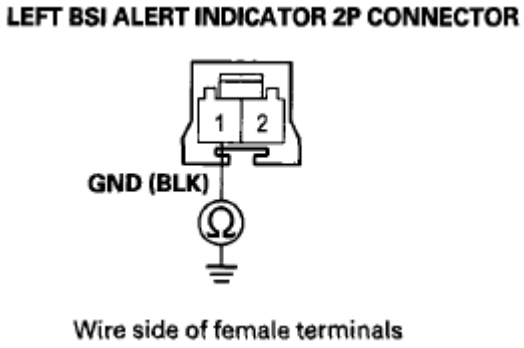

Fig. 49: Measuring Resistance Between Left BSI Alert Indicator 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES -Go to step 7.

NO -Repair an open in the wire between the left BSI alert indicator and body ground (G402).

7. Press the engine start/stop button to select the ON mode, and within 3 seconds measure the voltage between left BSI alert indicator 2P connector terminals No. 1 and No. 2.

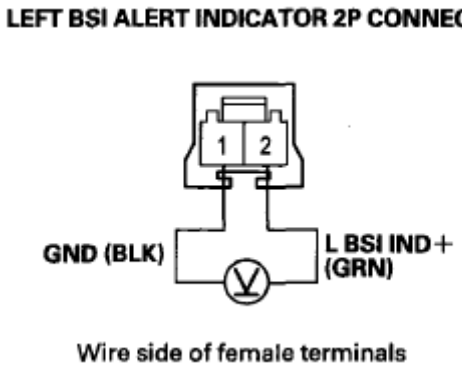

Fig. 50: Measuring Voltage Between Left BSI Alert Indicator 2P Connector Terminals No. 1 And

No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the voltage remain between 12 V and 1 V for 3 seconds after pressing the engine start/stop button to select the ON mode, then go down to 0 V?

YES -Replace the left BSI alert indicator (see **BSI ALERT INDICATOR REMOVAL/INSTALLATION**).

NO -Go to step 8.

8. Press the engine start/stop button to select the OFF mode.
9. Disconnect the BSI control unit 16P connector.
10. Measure the resistance between left BSI alert indicator 2P connector terminal No. 2 and body ground. There should be an open circuit or at least 1 Mohms.

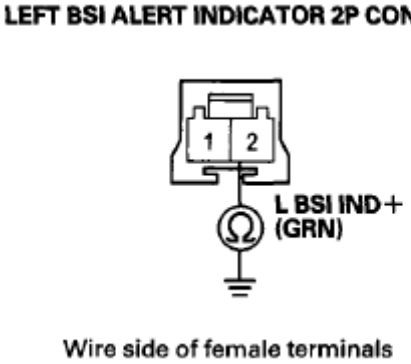

Fig. 51: Measuring Resistance Between Left BSI Alert Indicator 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES -Go to step 11.

NO -Repair a short to ground in the wire between the BSI control unit and the left BSI alert indicator.

11. Measure the resistance between BSI control unit 16P connector terminal No. 4 and left BSI alert indicator 2P connector terminal No. 2. There should be less than 1.0 ohms.

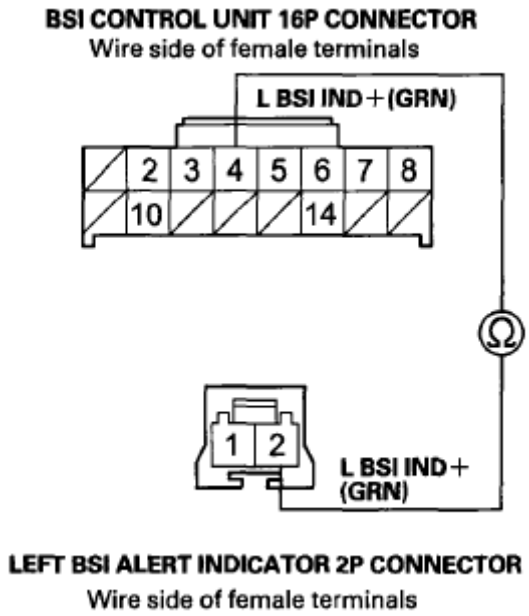

Fig. 52: Measuring Resistance Between BSI Control Unit 16P Connector Terminal No. 4 And Left BSI Alert Indicator 2P Connector Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES -Go to step 12.

NO -Repair an open in the wire between the BSI control unit and the left BSI alert indicator.

12. Press the engine start/stop button to select the ON mode.
13. Measure the voltage between left BSI alert indicator 2P connector terminal No. 2 and body ground. There should be less than 0.2 V.

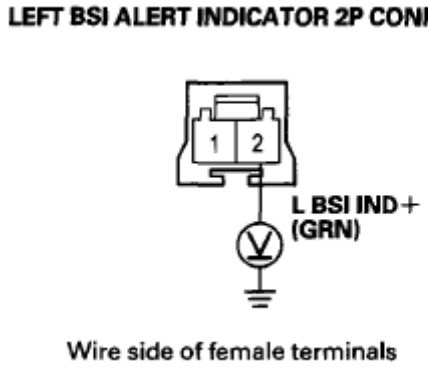

Fig. 53: Measuring Voltage Between Left BSI Alert Indicator 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES -Replace the BSI control unit (see **BSI CONTROL UNIT REMOVAL/INSTALLATION**).

NO -Repair a short to power in the wire between the BSI control unit and the left BSI alert indicator. If the problem is still present, replace the left BSI alert indicator (see **BSI ALERT INDICATOR REMOVAL/INSTALLATION**).

DTC B18CF: RIGHT BSI ALERT INDICATOR OUTPUT ERROR

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC B18CF indicated?

YES -Go to step 4.

NO -Intermittent failure, the system is OK at this time.

4. Press the engine start/stop button to select the OFF mode.
5. Remove the front door sash inner trim (see **FRONT DOOR SASH INNER TRIM REPLACEMENT**).
6. Measure the resistance between right BSI alert indicator 2P connector terminal No. 1 and body ground. There should be less than 1.0 ohms.

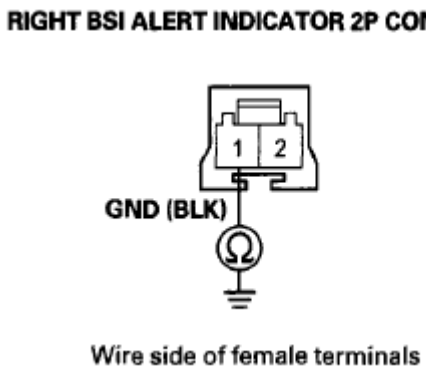

Fig. 54: Measuring Resistance Between Right BSI Alert Indicator 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES -Go to step 7.

NO -Repair an open in the wire between the right BSI alert indicator and body ground (G405).

7. Press the engine start/stop button to select the ON mode, and within 3 seconds measure the voltage between right BSI alert indicator 2P connector terminals No. 1 and No. 2.

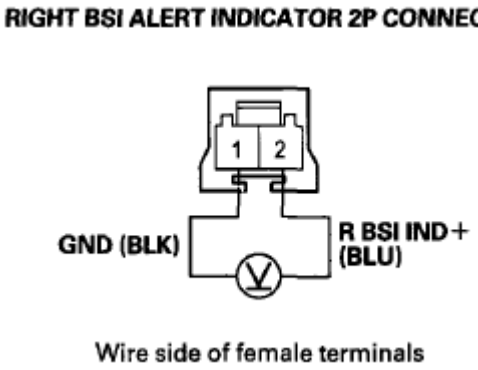

Fig. 55: Measuring Voltage Between Right BSI Alert Indicator 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the voltage remain between 12 V and 1 V for 3 seconds after pressing the engine start/stop button to select the ON mode, then go down to 0 V?

YES -Replace the right BSI alert indicator (see **BSI ALERT INDICATOR REMOVAL/INSTALLATION**).

NO -Go to step 8.

8. Press the engine start/stop button to select the OFF mode.
9. Disconnect the BSI control unit 16P connector.
10. Measure the resistance between right BSI alert indicator 2P connector terminal No. 2 and body ground. There should be an open circuit or at least 1 Mohms.

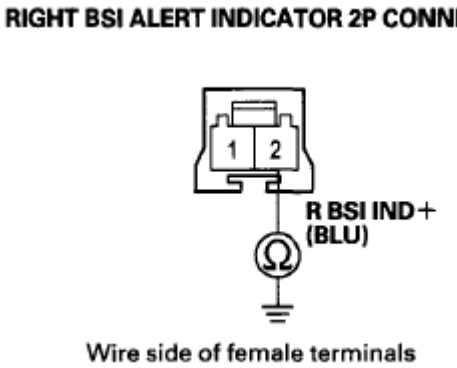

Fig. 56: Measuring Resistance Between Right BSI Alert Indicator 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES -Go to step 11.

NO -Repair a short to ground in the wire between the BSI control unit and the right BSI alert indicator.

11. Measure the resistance between BSI control unit 16P connector terminal No. 14 and right BSI alert indicator 2P connector terminal No. 2. There should be less than 1.0 ohms.

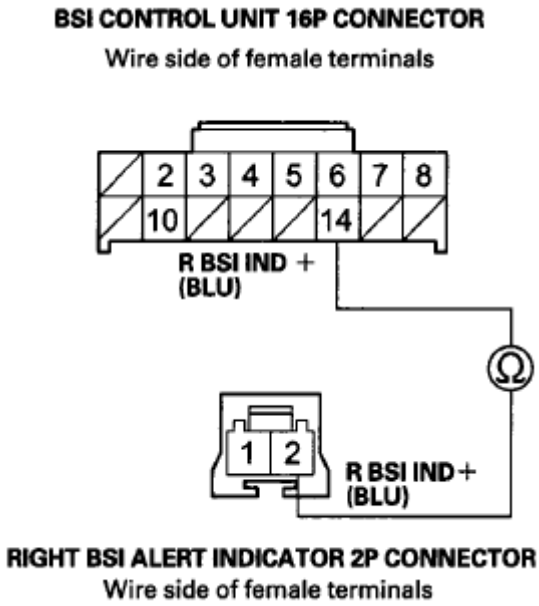

Fig. 57: Measuring Resistance Between BSI Control Unit 16P Connector Terminal No. 14 And Right BSI Alert Indicator 2P Connector Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES -Go to step 12.

NO -Repair an open in the wire between the BSI control unit and the right BSI alert indicator.

12. Press the engine start/stop button to select the ON mode.
13. Measure the voltage between right BSI alert indicator 2P connector terminal No. 2 and body ground. There should be less than 0.2 V.

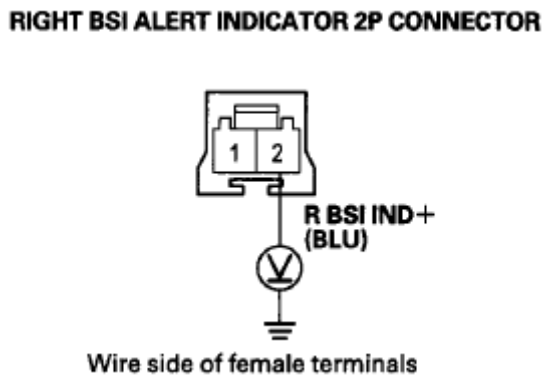

Fig. 58: Measuring Voltage Between Right BSI Alert Indicator 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES -Replace the BSI control unit (see **BSI CONTROL UNIT REMOVAL/INSTALLATION**).

NO -Repair a short to power in the wire between the BSI control unit and the right BSI alert indicator. If the problem is still present, replace the right BSI alert indicator (see **BSI ALERT INDICATOR REMOVAL/INSTALLATION**).

DTC U0155: LOST COMMUNICATION WITH THE GAUGE CONTROL MODULE

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC U0155 indicated?

   YES -Go to step 4.

   NO -Intermittent failure, the system is OK at this time.

4. Check for any DTCs with the HDS.

   Are there any other gauge control module DTCs indicated?

   YES -Troubleshoot the indicated gauge control module DTC(s). After troubleshooting, clear the DTC.

   NO -Go to step 5.

5. Press the engine start/stop button to select the OFF mode.
6. Disconnect the BSI control unit 16P connector.
7. Disconnect gauge control module 32P connector.

8. Check for continuity between gauge control module 32P connector terminal No. 30 and BSI control unit 16P connector terminal No. 6, and between gauge control module 32P connector terminal No. 29 and BSI control unit 16P connector terminal No 5.

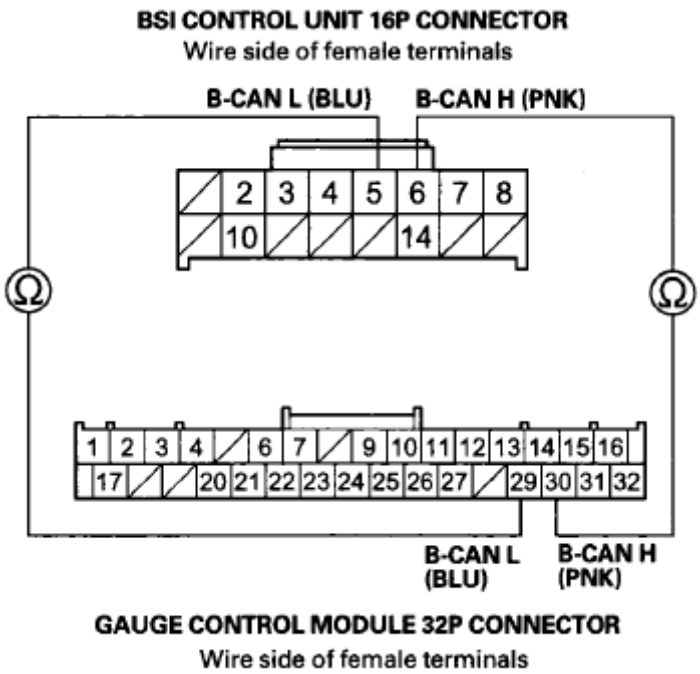

Fig. 59: Checking Continuity Between Gauge Control Module 32P Connector Terminal And BSI Control Unit 16P Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the BSI control unit (see **BSI CONTROL UNIT REMOVAL/INSTALLATION**).

NO -Repair an open in the wire between the gauge control module and the BSI control unit.

DTC U0423: INVALID DATA RECEIVED FROM PCM (VEHICLE SPEED DATA)

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Start the engine, then wait at least 3 seconds.
3. Test-drive the vehicle at 6 mph (10 km/h) or more.
4. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC U0423 indicated?

YES -Troubleshoot the indicated PGM-FI system DTC(s). After troubleshooting, clear the DTC.

NO -Intermittent failure, the system is OK at this time.

DTC U1280: COMMUNICATION BUS LINE ERROR (BUS-OFF)

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC U1280 indicated?

   YES -Replace the BSI control unit (see **BSI CONTROL UNIT REMOVAL/INSTALLATION**).

   NO -Intermittent failure, the system is OK at this time.

SYMPTOM TROUBLESHOOTING

THE BSI ALERT INDICATOR COMES ON WHEN NO OTHER VEHICLE IS IN THE DETECTABLE AREA (WRONG INDICATION)

NOTE:
- **If the system malfunctions, always check for DTCs with the HDS.**
- **If a DTC is stored, troubleshoot the DTC first.**

1. Check BSI OFF switch, and make sure the BSI system is ON.

   Is the BSI system ON?

   YES -Go to step 2.

   NO -Cancel the OFF status by operating BSI OFF switch.

2. Interview the client about when the symptom occurred to determine if an inspection is needed.

   NOTE: The BSI system cannot work properly in the following driving situations:

   - In rainy, snowy, or foggy weather.
   - When receiving a jamming signal from outside.
   - When followed by other vehicles at a curve in a road.
   - When another vehicle is getting close to yours when turning right or left.
   - When the rear bumper is deformed.
   - When the sensor is out of place.
   - In places where there is a guardrail, pole, or tree.
   - When an area of bumper around the installed sensor is soiled.

   Is an inspection required?

YES -Go to step 3.

NO -The system is OK at this time. Check the rear bumper for dirt contamination. If everything looks OK, explain BSI system precautions to the client.

3. Make sure that the rear bumper is correctly installed, and check the rear bumper for alteration or deformation.

   Is the rear bumper OK?

   YES -Go to step 4.

   NO -If the rear bumper is incorrectly installed, reinstall it correctly. If it is damaged or deformed, replace it. If it is modified, explain to the client that modifying rear bumper may lead to improper BSI system operation.

4. Remove the rear bumper (see **LOWER FRONT BUMPER GRILLE REPLACEMENT**).
5. Check the inside and outside of the rear bumper for dirt, contaminants, or stickers. Also, check the BSI radar unit surface for dirt or contaminants.

   Are the rear bumper and the BSI radar unit OK?

   YES -Go to step 6.

   NO -Completely wipe off any dirt or contaminants from the BSI radar unit or rear bumper.

6. Check the body surface where the BSI radar unit is mounted for deformation.

   Is the body surface OK?

   YES -Go to step 7.

   NO -Do the BSI radar unit mounting area check (see **BSI RADAR UNIT MOUNTING AREA CHECK**).

7. Check the BSI radar unit for damage.

   Is it OK?

   YES -Do the BSI radar unit aiming inspection (see **BSI RADAR UNIT AIMING INSPECTION**).

   NO -Replace the BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

THE BSI DOES NOT COME ON WHEN OTHER VEHICLES ARE IN THE DETECTABLE AREA (NO INDICATION)

NOTE:

- **If the system malfunctions, always check for DTCs with the HDS.**
- **If a DTC is stored, troubleshoot the DTC first.**

1. Check BSI OFF switch, and make sure the BSI system is ON.

   Is the BSI system ON?

   YES -Go to step 2.

   NO -Cancel the OFF status by operating BSI OFF switch.

2. Interview the client about when the symptom occurred to determine if an inspection is needed.

   NOTE: The BSI system cannot work properly in the following driving situations:

   - In rainy, snowy, or foggy weather.
   - When small targets in the detectable area cannot reflect radar; for example, a motor bike.
   - When there is ice, snow, or dirt is stuck to the rear bumper.
   - When driving in a traffic lane divided with road marking ramps.
   - When a vehicle comes over in the lane next to yours from a far lane.
   - When the temperature around the sensor is high.
   - When the rear bumper is deformed.
   - When the sensor is out of place.
   - When an area of bumper around the installed sensor is soiled.

   Is an inspection required?

   YES -Go to step 3.

   NO -The system is OK at this time. Check the rear bumper for dirt contamination. If everything looks OK, explain BSI system precautions to the client.

3. Make sure that the rear bumper is correctly installed, and check the rear bumper for alteration or deformation.

   Is the rear bumper OK?

   YES -Go to step 4.

   NO -If the rear bumper is incorrectly installed, reinstall it correctly. If it is damaged or deformed, replace it. If it is modified, explain to the client that modifying rear bumper may lead to improper BSI system operation.

4. Remove the rear bumper (see **LOWER FRONT BUMPER GRILLE REPLACEMENT**).

5. Check the inside and outside of the rear bumper for dirt, contaminants, or stickers. Also, check the BSI radar unit surface for dirt or contaminants.

   Are the rear bumper and the BSI radar unit OK?

   YES -Go to step 6.

   NO -Completely wipe off any dirt or contaminants from the BSI radar unit or rear bumper.

6. Check the body surface where the BSI radar unit is mounted for deformation.

   Is the body surface OK?

   YES -Go to step 7.

   NO -Do the BSI radar unit mounting area check (see **BSI RADAR UNIT MOUNTING AREA CHECK**).

7. Check the BSI radar unit for damage.

   Is it OK?

   YES -Do the BSI radar unit aiming Inspection (see **BSI RADAR UNIT AIMING INSPECTION**).

   NO -Replace the BSI radar unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

THE BSI OFF SWITCH DOES NOT WORK

NOTE:

- **If the system malfunctions, always check for DTCs with the HDS.**
- **If a DTC is stored, troubleshoot the DTC first.**
- **Check the BSI OFF switch by pressing and holding it for 1 second.**

1. Connect the HDS to the data link connector.
2. Press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Select HISTORY DATA CLEAR in the BSI MENU, and clear the operating history with the HDS.
4. Press and hold the BSI OFF switch for at least 1 second, release the switch, then press and hold the BSI OFF switch again for at least 1 second.
5. Select the Data List in the BSI MENU, and check the operating history in the Off to On history of the BSI OFF switch and the On to Off history of the BSI OFF switch with the HDS.

   Are both ON?

   YES -The BSI OFF switch is OK.

   NO -Go to step 6.

6. Press the engine start/stop button to select the OFF mode.
7. Disconnect the BSI OFF switch 5P connector.
8. Check the BSI OFF switch (see **BSI OFF SWITCH TEST/REMOVAL/INSTALLATION**).

   Is it OK?

   YES -Go to step 9.

   NO -Replace the BSI OFF switch (see **BSI OFF SWITCH TEST/REMOVAL/INSTALLATION**).

9. Press the engine start/stop button to select the ON mode.
10. Measure the voltage between BSI OFF switch 5P connector terminals No. 1 and No. 2. There should be battery voltage.

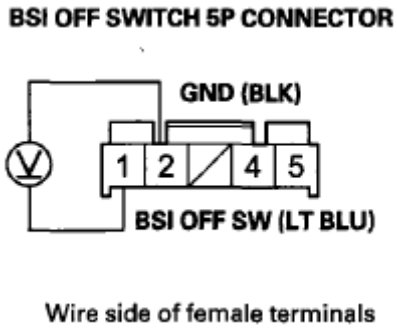

Fig. 60: Measuring Voltage Between BSI OFF Switch 5P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES -Go to step 11.

NO -Go to step 13.

11. Press the engine start/stop button to select the OFF mode.
12. Measure the voltage between BSI OFF switch 5P connector terminals No. 1 and No. 2. There should be less than 0.2 V.

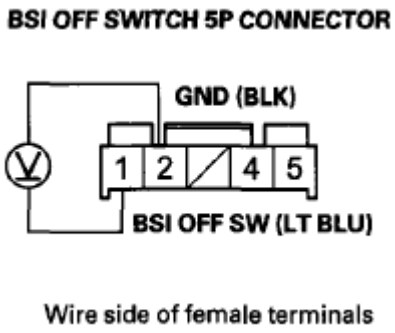

Fig. 61: Measuring Voltage Between BSI OFF Switch 5P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES -Replace the BSI control unit (see **BSI CONTROL UNIT REMOVAL/INSTALLATION**).

NO -Repair a short to power in the wire between the BSI control unit and the BSI OFF switch.

13. Press the engine start/stop button to select the OFF mode.
14. Measure the resistance between BSI OFF switch 5P connector terminal No. 2 and body ground. There should be less than 1.0 ohms.

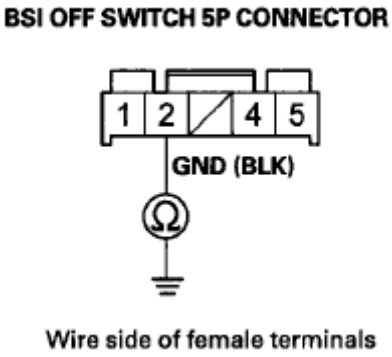

Fig. 62: Measuring Resistance Between BSI OFF Switch 5P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES -Go to step 15.

NO -Repair an open in the wire between the BSI OFF switch and body ground (G402).

15. Disconnect the BSI control unit 16P connector.
16. Measure the resistance between BSI control unit 16P connector terminal No. 8 and body ground. There should be an open circuit or at least 1 Mohms.

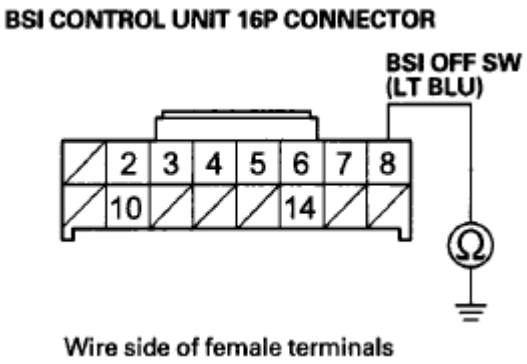

Fig. 63: Measuring Resistance Between BSI Control Unit 16P Connector Terminal No. 8 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES -Go to step 17.

NO -Repair a short to ground in the wire between the BSI control unit and the BSI OFF switch.

17. Measure the resistance between BSI control unit 16P connector terminal No. 8 and BSI OFF switch 5P connector terminal No. 1. There should be less than 1.0 ohms.

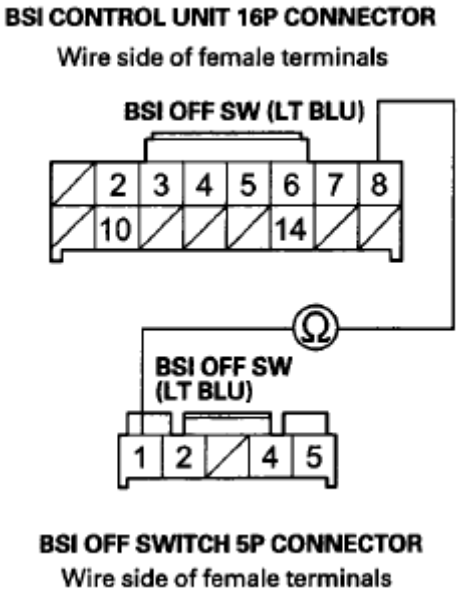

Fig. 64: Measuring Resistance Between BSI Control Unit 16P Connector Terminal No. 8 And BSI OFF Switch 5P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES -Replace the BSI control unit (see **BSI CONTROL UNIT REMOVAL/INSTALLATION**).

NO -Repair an open in the wire between the BSI control unit and the BSI OFF switch.

THE BSI INDICATOR DOES NOT GO OFF, OR DOES NOT COME ON

NOTE:
- **If the system malfunctions, always check for DTCs with the HDS.**
- **If a DTC is stored, troubleshoot the DTC first.**

1. Press the engine start/stop button to select the ON mode, then wait for 10 seconds.
2. Check that the BSI indicator comes on for about 2 seconds and then goes off.

   Does the BSI indicator go off?

   YES -The system is OK.

   NO -Go to step 3.

3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Are any DTCs indicated?

   YES -Troubleshoot the indicated DTC(s).

   NO -Go to step 4.

4. Do the gauge control module self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

   Does the side BSI indicator blink?

   YES -Replace the BSI control unit (see **BSI CONTROL UNIT REMOVAL/INSTALLATION**).

   NO -Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), and recheck.

THE MID BEEPER DOES NOT SOUND WHEN THE BSI OFF SWITCH IS PUSHED

NOTE:
- **If the system malfunctions, always check for DTCs with the HDS.**
- **If a DTC is stored, troubleshoot the DTC first.**

1. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Are any DTCs indicated?

   YES -Troubleshoot the indicated DTC(s).

NO -Go to step 2.

2. Do the gauge control module self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

   Does the beeper sound?

   YES -Replace the BSI control unit (see **BSI CONTROL UNIT REMOVAL/INSTALLATION**).

   NO -Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), and recheck.

THE HDS DOES NOT COMMUNICATE WITH THE BSI

NOTE:
- **If the system malfunctions, always check for DTCs with the HDS.**
- **If a DTC is stored, troubleshoot the DTC first.**

1. Test the battery (see **BATTERY TEST**).

   Is the battery OK?

   YES -Go to step 2.

   NO -Charge or replace the battery (see **BATTERY REMOVAL AND INSTALLATION**) as needed, then recheck.

2. Connect the HDS to the data link connector.
3. Press the engine start/stop button to select the ON mode, then wait for 10 seconds.
4. Make sure the HDS can communicate with the body electrical system.

   Is communication possible?

   YES -Go to step 5.

   NO -Do the MICU unit input test (see **MICU INPUT TEST**).

5. Check for body electrical system DTCs with the HDS (see **WIRE COLOR CODES**).

   Are any DTCs indicated?

   YES -Troubleshoot the indicated body electrical system DTC(s), and retest.

   NO -Go to step 6.

6. Press the engine start/stop button to select the OFF mode.
7. Check the connection at the BSI control unit 16P connector.

Is the connection OK?

YES -Go to step 8.

NO -Repair the poor connection, and recheck.

8. Disconnect the BSI control unit 16P connector.
9. Press the engine start/stop button to select the ON mode.
10. Measure the voltage between BSI control unit 16P connector terminals No. 7 and No. 10. There should be battery voltage.

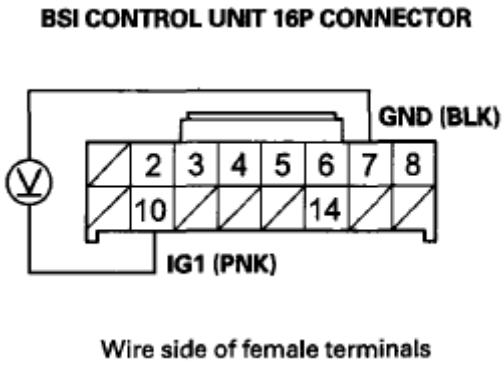

Fig. 65: Measuring Voltage Between BSI Control Unit 16P Connector Terminals No. 7 And No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 12.

NO -Go to step 11.

11. Measure the voltage between BSI control unit 16P connector terminal No. 10 and body ground. There should be battery voltage.

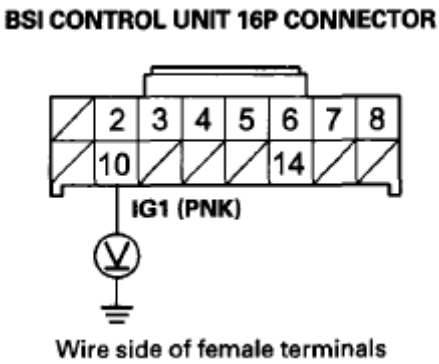

Fig. 66: Measuring Voltage Between BSI Control Unit 16P Connector Terminal No. 10 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Repair an open in the wire between the BSI control unit and body ground (G603).

NO -Repair an open or short to ground in the wire between the driver's under-dash fuse/relay box and the BSI control unit.

12. Press the engine start/stop button to select the OFF mode.
13. Disconnect driver's under-dash fuse/relay box connector P (20P).
14. Check for continuity between driver's under-dash fuse/relay box connector P (20P) terminal No. 6 and BSI control unit 16P connector terminal No. 6, and between driver's under-dash fuse/relay box connector P (20P) terminal No. 5 and BSI control unit 16P connector terminal No. 5.

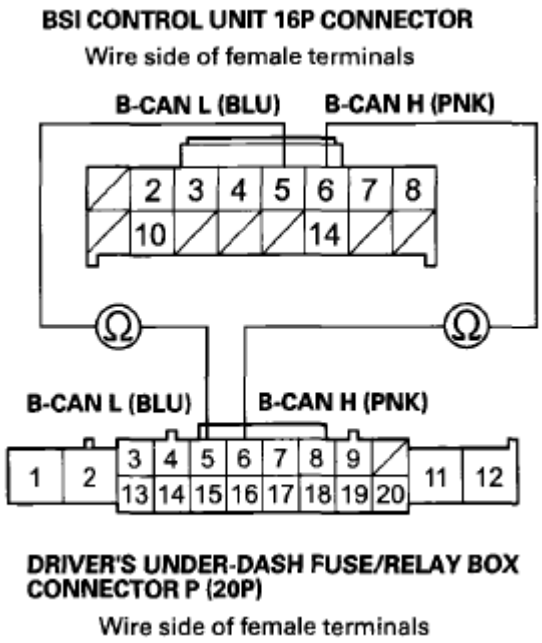

Fig. 67: Checking Continuity Between Driver's Under-Dash Fuse/Relay Box Connector P (20P) Terminal No. 6 And BSI Control Unit 16P Connector Terminal No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 15.

NO -Repair an open in the wire between the driver's under-dash fuse/relay box and the BSI control unit.

15. Reconnect driver's under-dash fuse/relay box connector P (20P).
16. Reconnect the BSI control unit 16P connector.
17. Press the engine start/stop button to select the ON mode, then wait for 10 seconds.

18. Check that the HDS can communicate with the BSI system.

    Is communication possible?

    YES -Intermittent failure, the system is OK at this time.

    NO -Replace the BSI control unit (see **BSI CONTROL UNIT REMOVAL/INSTALLATION**).

BSI RADAR UNIT REMOVAL/INSTALLATION

1. Remove the rear bumper (see **LOWER FRONT BUMPER GRILLE REPLACEMENT**).
2. Remove the BSI radar unit (A).
    1. Disconnect the 6P connector (B), and detach the harness clip (C).
    2. Remove the bolts.

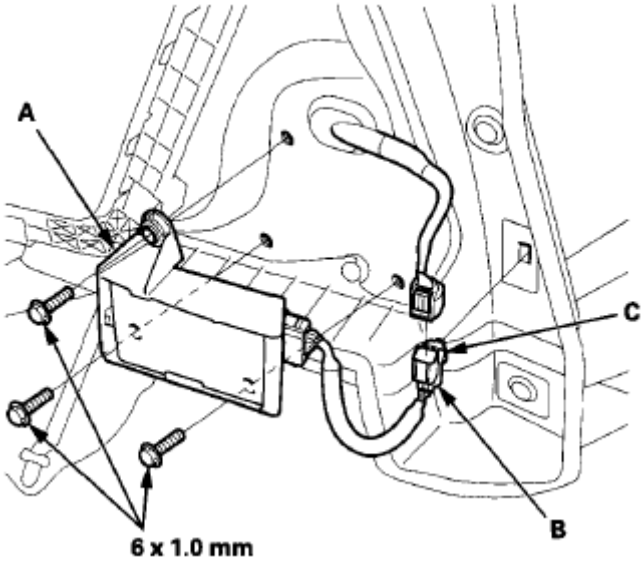

Fig. 68: Identifying BSI Radar Unit, 6P Connector, And Harness Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Clean the surface of the BSI radar unit.
4. Install the BSI radar unit (A).
    1. Tighten the bolts.
    2. Connect the 6P connector (B), and attach the harness clip (C).

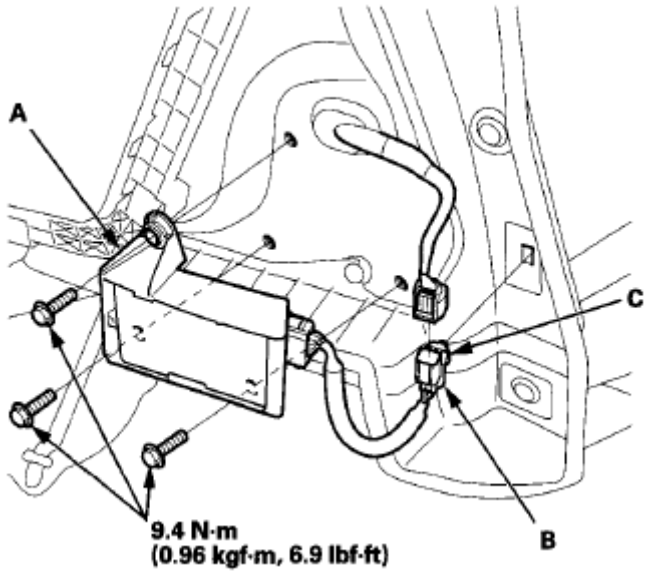

Fig. 69: Identifying BSI Radar Unit, 6P Connector, And Harness Clip With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Do the BSI radar unit aiming inspection (see **BSI RADAR UNIT AIMING INSPECTION**).

BSI CONTROL UNIT REMOVAL/INSTALLATION

1. Remove the left trunk side trim panel (see **TRIM REMOVAL/INSTALLATION - TRUNK AREA**).
2. Remove the BSI control unit (A).
   1. Disconnect the BSI control unit 16P connector (B).
   2. Loosen the bolts.

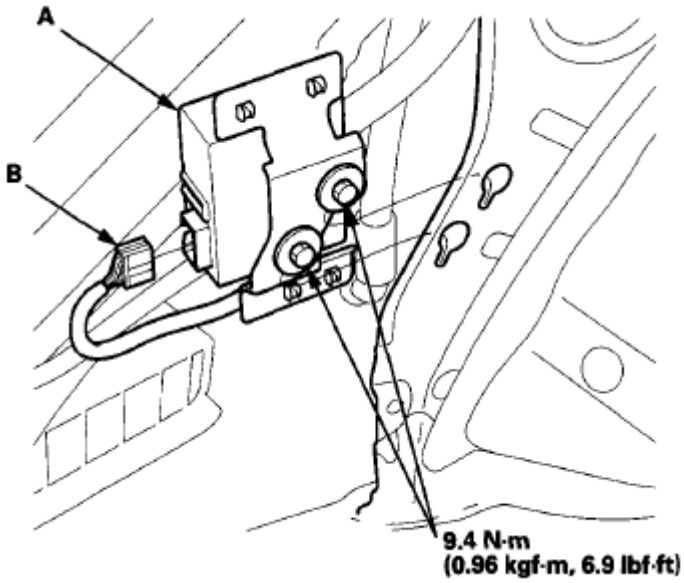

Fig. 70: Identifying BSI Control Unit And 16P Connector With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the BSI control unit in the reverse order of removal.

BSI ALERT INDICATOR REMOVAL/INSTALLATION

1. Remove the front door sash inner trim (see **FRONT DOOR SASH INNER TRIM REPLACEMENT**).
2. Remove the screws and the BSI alert indicator (A).

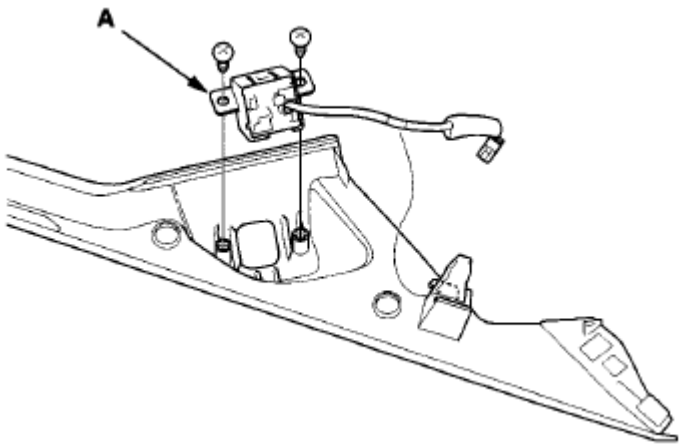

Fig. 71: Identifying BSI Alert Indicator & Fasteners
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the BSI alert indicator in the reverse order of removal.

BSI OFF SWITCH TEST/REMOVAL/INSTALLATION

1. Remove the driver's switch panel (see **DRIVER'S SWITCH PANEL REMOVAL/INSTALLATION**).
2. Remove the BSI OFF switch (A) from the driver's dashboard lower panel (B).

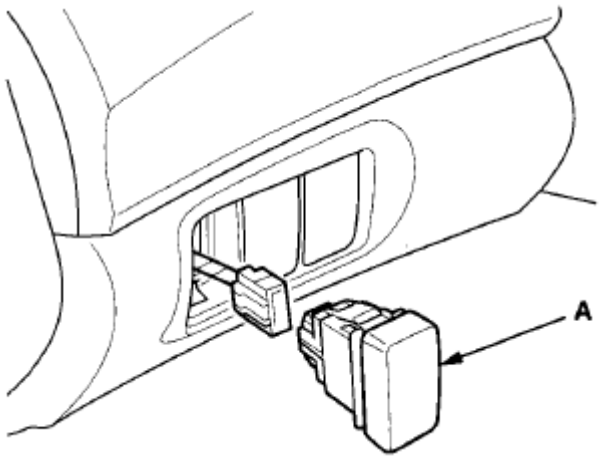

Fig. 72: Identifying BSI OFF Switch And Driver's Dashboard Lower Panel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. On the switch side, check for continuity between the BSI OFF switch 5P connector terminal in each switch position according to the table.

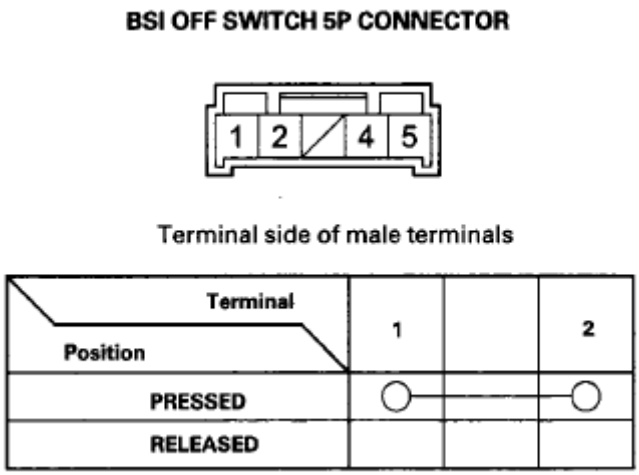

Fig. 73: Identifying Continuity Chart With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the continuity is not as specified, remove the BSI OFF switch.

BSI RADAR UNIT AIMING INSPECTION

Special Tools Required

- Rim Frame 07AAJ-TK8A150
- Target Set 07AAJ-STKA160
- Angle Gauge 07AAJ-STKA170
- Stand Set 07AAJ-STKA220

Required Materials:

- Masking tape
- Fine-tip felt marking pen

Inspect the BSI radar unit aiming in these instances:

- After replacing or removing and reinstalling one or both of the BSI radar units.
- After repairing the body panel(s) where the BSI radar unit(s) mount.
- For any of the following aiming axis DTCs:
  - B18B8: Left BSI Radar Unit Azimuth Off Alignment

- B18B9: Right BSI Radar Unit Azimuth Off Alignment

Before Inspection:

- Clean the surface of the BSI radar unit.
- Make sure the vehicle does not have aftermarket suspension.
- Make sure all the tires are the correct size, and set their pressures to the specifications shown on the doorjamb label.
- Make sure the fuel tank is full.
- Remove all cargo from the vehicle except the spare tire and tool kit.
- Park the vehicle on level ground (within 1 degree) with at least 4 m (13.1 ft) of space on both sides and behind the vehicle. Do not do this procedure with the vehicle on a lift or with the tires on steel plates or rollers.
- Make sure the steering wheel is pointed straight ahead, and do not turn it after parking the vehicle.
- Shift the transmission into P, and apply the parking brake.

1. Remove the rear bumper (see **LOWER FRONT BUMPER GRILLE REPLACEMENT**).
2. Set the target (A) on the stand set (B).

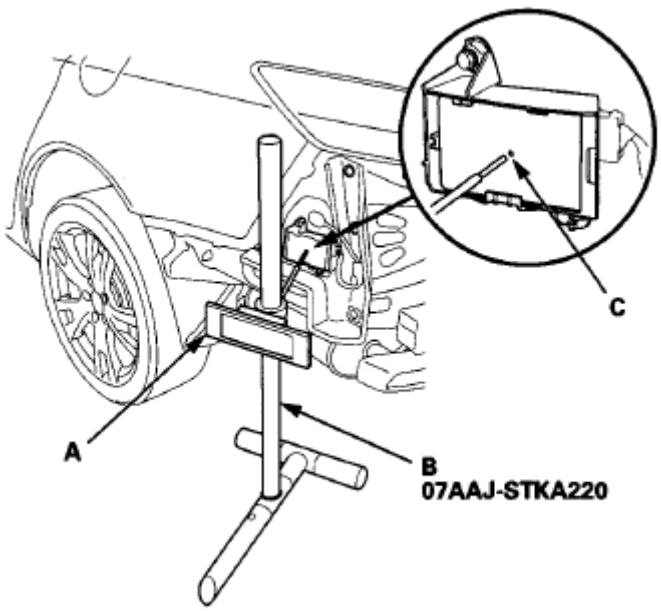

Fig. 74: Measuring Height Of Dot From Floor Using Target And Stand Set
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Set the target height by adjusting the rod to the same height as the dot (C) in the center of the BSI radar unit. Measure and note the height of the dot from the floor.
4. Hold the plumb line against the dot (A) on the radar unit, and lower the plumb bob until it touches the floor. Mark the floor at that point (B).

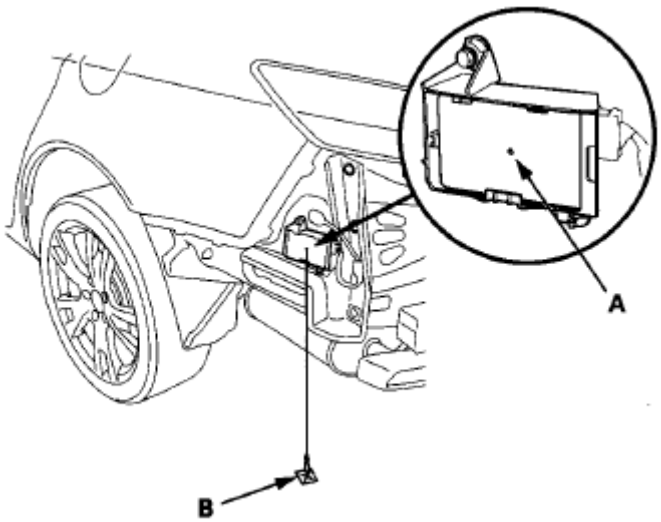

Fig. 75: Identifying Dot On Radar Unit And Mark On Floor At That Point
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Place the rim frame (A) by the rear wheel on the side of the vehicle you are aiming. Adjust the spacers (B, C) to fit against the wheel rim to make the rim frame parallel with the wheel.

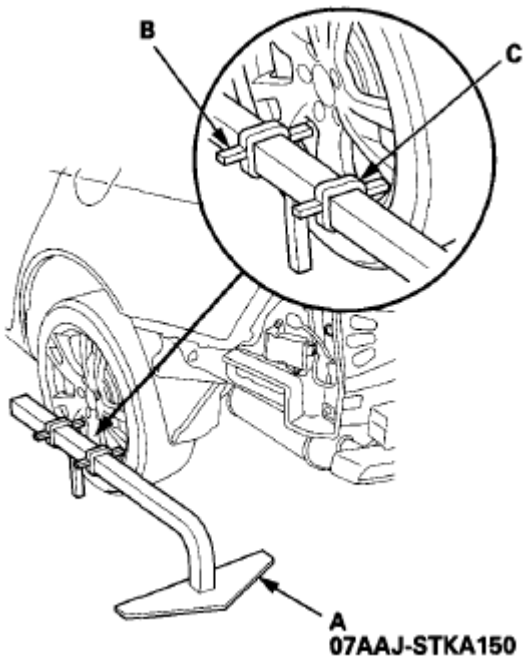

Fig. 76: Adjusting Spacers (B, C) To Fit Wheel Rim Frame Parallel With Wheel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Assemble the two sections of the straightedge, then place the hole in the end of the straightedge over the mark on the ground that you made in step 4. Slide the rim frame rearward until the base of the rim frame and the straightedge meet as shown.

NOTE:

- **Make sure the spacers are still touching the wheel rim.**
- **Set the straightedge according to the arrow (A).**

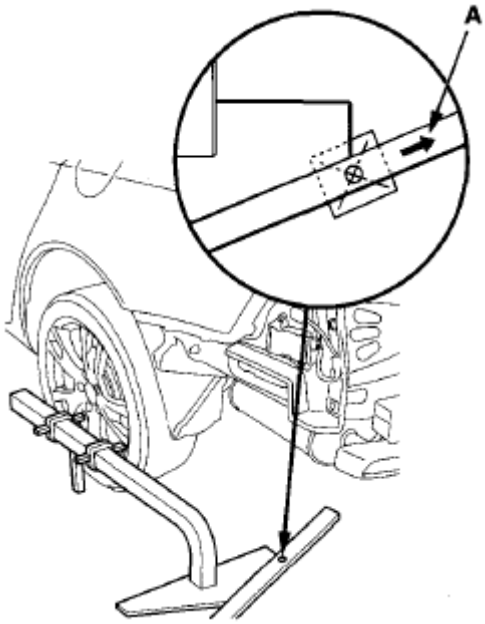

Fig. 77: Sliding Rim Frame Rearward Of Rim Frame And Straightedge Meet
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Place the target over the other end of the straightedge, and align the hole (A) in the base if the target with the hole in the end of the straightedge as shown.

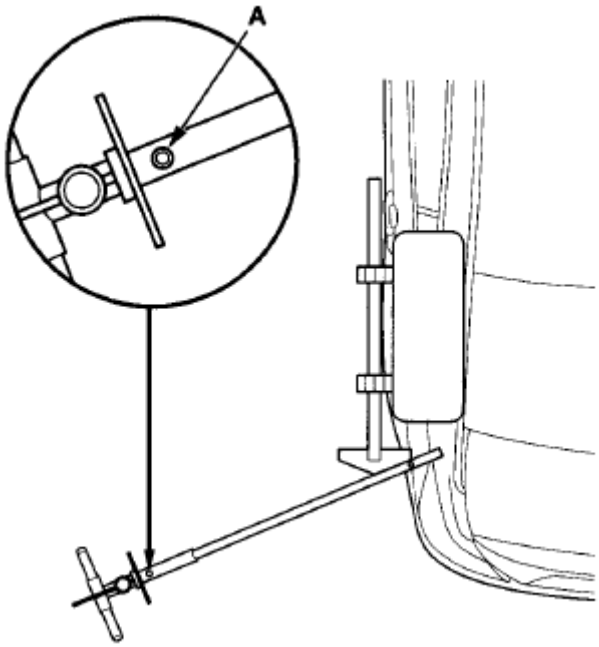

Fig. 78: Aligning Hole In Base And Straightedge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Compare the radar unit height you measured in step 3 with the table to determine which degree setting to use on the angle gauge (A).

   500 to 599 mm (19.69 to 23.58 in) = 2 degrees

   600 to 699 mm (23.62 to 27.52 in) = 1 degree

   700 to 800 mm (27.56 to 31.50 in) = 0 degree

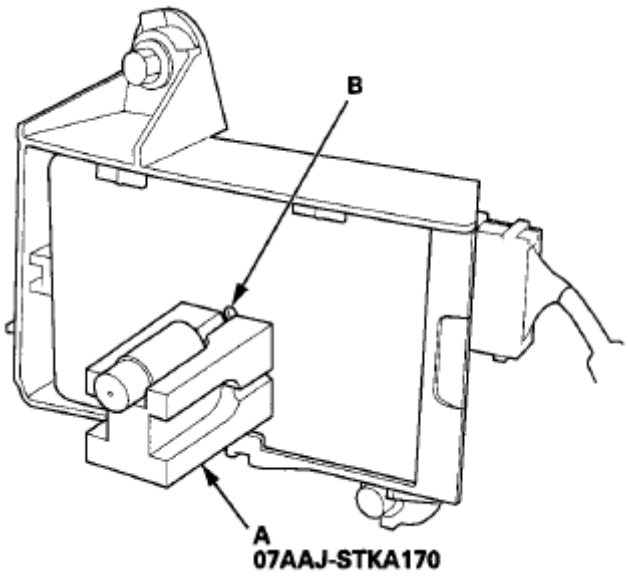

Fig. 79: Measuring Degree Setting By Using Angle Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. With the appropriate degree setting on the angle gauge up, set the angle gauge against the radar unit. Align the cutout in the angle gauge with the dot (B) on the radar unit.
10. Turn on the laser pointer (A), and set it on the angle gauge so that the beam shines on the target (8).

CAUTION: Do not aim the laser beam at anyone's eyes.

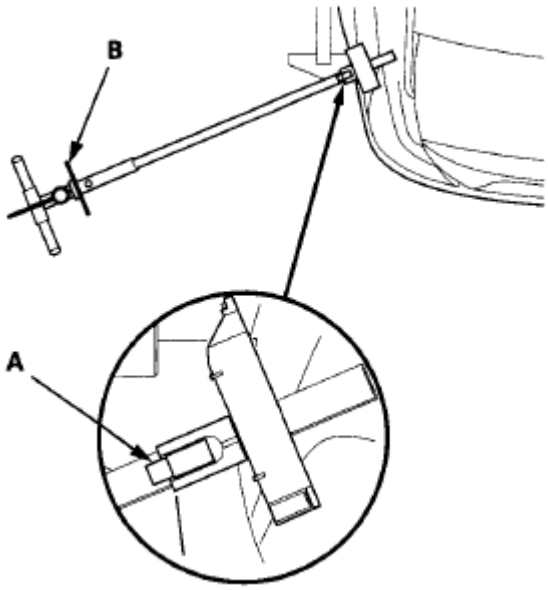

Fig. 80: Setting Beam Shines On Target Using Angle Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check the point (A) where the laser beam hits the target (B):
    - If the laser beam is within the target, the BSI radar unit is aimed properly, go to step 12.
    - If the laser beam is out of the target range, check the BSI radar unit mounting area (see **BSI RADAR UNIT MOUNTING AREA CHECK**).

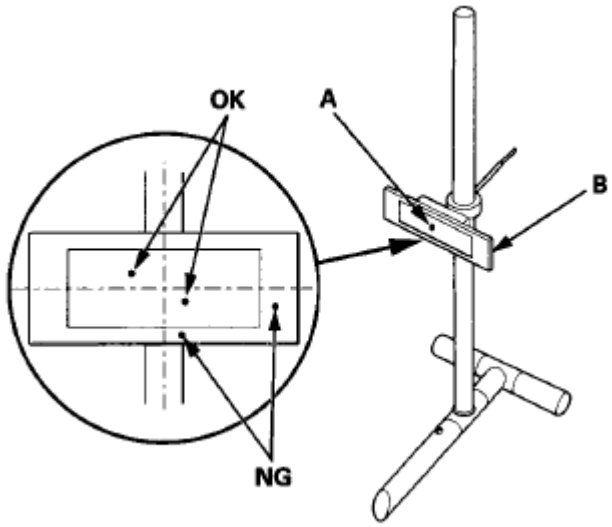

Fig. 81: Checking Laser Beam Hits Target Point
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Install the rear bumper (see **LOWER FRONT BUMPER GRILLE REPLACEMENT**).

BSI RADAR UNIT MOUNTING AREA CHECK

Required Materials:

- Masking tape
- Plumb line
- Scale

Before checking:

- Make sure the vehicle does not have aftermarket suspension.
- Make sure all the tires are the correct size, and set their pressures to the specifications shown on the doorjamb label.
- Make sure the fuel tank is full.
- Remove all cargo from the vehicle except the spare tire and tool kit.
- Park the vehicle on level ground (within 1 degree). Do not do this procedure with the vehicle on a lift or with the tires on steel plates or rollers.
- Make sure the steering wheel is pointed straight ahead, and do not turn it after parking the vehicle.
- Shift the transmission into P, and apply the parking brake.

1. Remove the rear bumper (see **LOWER FRONT BUMPER GRILLE REPLACEMENT**).
2. Remove the BSI radar unit(s) (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

NOTE: Make sure to remove the BSI radar unit when repairing the body.

3. Remove the screw, and detach the hooks (A), then remove the side spacer (B).

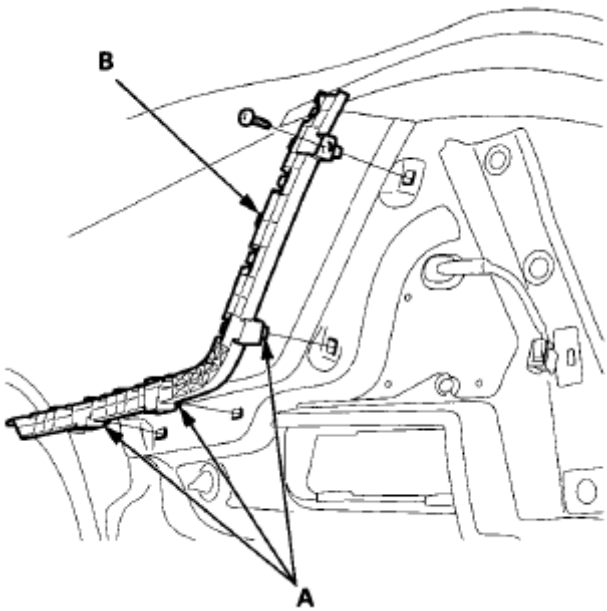

Fig. 82: Identifying Side Spacer, Hooks And Screw
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Detach and the clips, then remove the BSI radar dust cover (A).

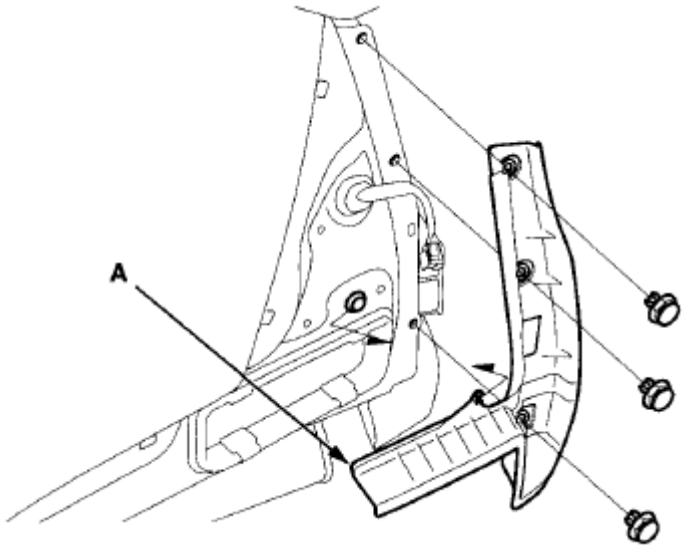

Fig. 83: Identifying BSI Radar Dust Cover & Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the appropriate length 6 mm bolts for each of the BSI radar unit mounting holes.

   HOLE A: 30-35 mm (1.18-1.38 in)

   HOLE B: 45-50 mm (1.77-1.97 in)

6. Hold or tape the plumb line against the quarter panel directly above mounting hole A, and thread the bolt in or out until the head of the bolt just touches the plumb line.
7. Measure the distance from the head to the end of the threaded insert in the quarter panel. If needed, have a body shop adjust the body panel.

   HOLE A: 11.0 ± 3.0 mm (0.433 ± 0.118 in)

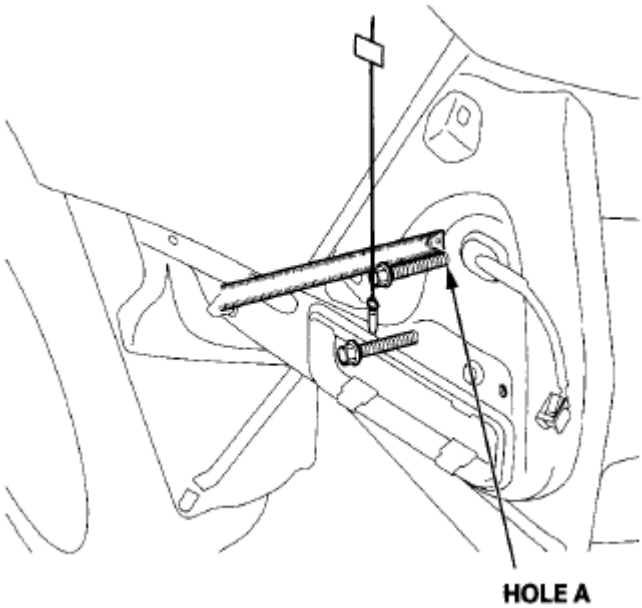

Fig. 84: Measuring Distance From Head To End Of Threaded Insert In Quarter Panel (Hole A)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: The illustration shows the left side.

8. Hold or tape the plumb line against the rear quarter panel directly above mounting hole B, and thread the bolt in or out until the head of the bolt just touches the plumb line.
9. Measure the distance from the head to the end of the threaded insert in the quarter panel. If needed, have a body shop adjust the body panel.

HOLE B: HOLE A + 8.4±2.0 mm (0.331±0.079 in)

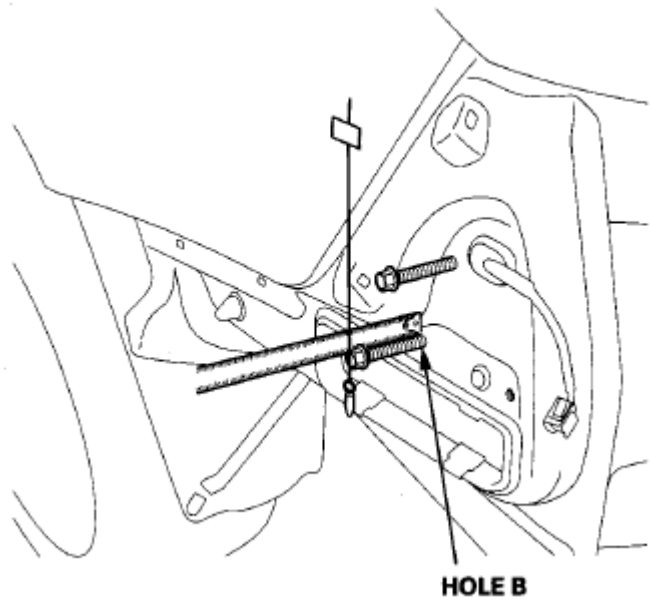

Fig. 85: Measuring Distance From Head To End Of Threaded Insert In Quarter Panel (Hole B)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: The illustration shows the left side.

10. Loosely install the BSI radar unit with the two front mounting bolts (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).
11. Make sure there is no gap (A) between the BSI radar unit (B) and the quarter panel at the rear mounting bolt location. Also make sure the bracket hole and the bolt hole are properly aligned. If needed, have a body shop adjust the body panel.

NOTE: When repairing the body panel, remove the BSI radar unit.

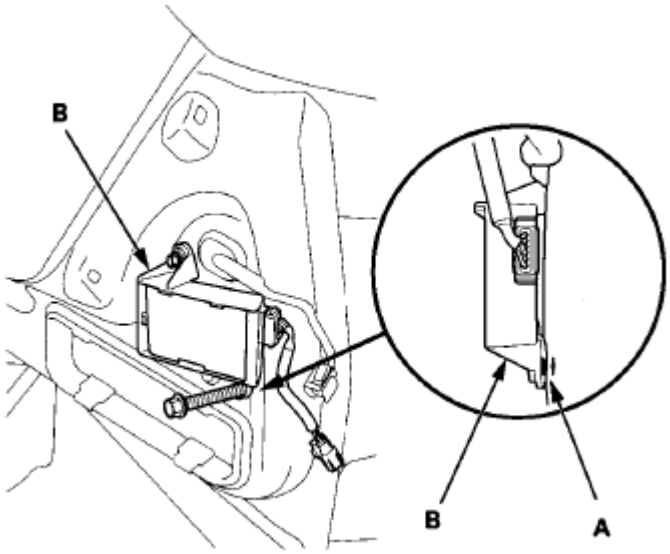

Fig. 86: Identifying Gap Between BSI Radar Unit And Quarter Panel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: The illustration shows the left side.

12. Install BSI radar unit, and do the BSI radar unit aiming inspection (see **BSI RADAR UNIT AIMING INSPECTION**).
13. Reinstall the remaining parts.

2012 ACCESSORIES & EQUIPMENT

Consoles - TL

CENTER CONSOLE PANEL REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the front seat, the dashboard, or the related parts.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when Identifying components.**
- **When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.**

1. Remove the dashboard center trims both sides (see **DASHBOARD CENTER TRIM REMOVAL/INSTALLATION**).
2. Remove the screws securing the center console panel (A).

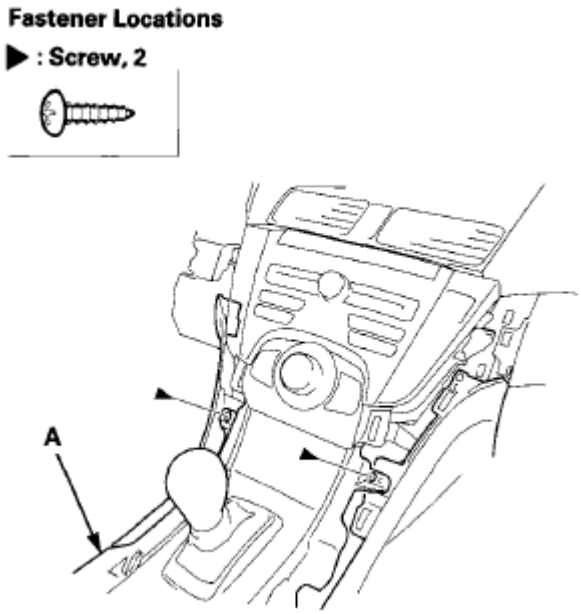

Fig. 1: Identifying Center Console Panel And Fastener Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. A/T: Apply the protective tape (A) to the A/T shift panel (B) along the side edge of the shift lever boot

base (C). Pry upon the edge of the shift lever trim with a flat-tipped screwdriver to release the hooks (D).

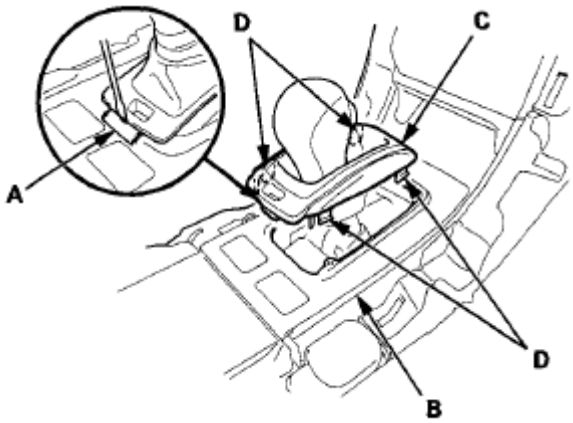

Fig. 2: Identifying Protective Tape, A/T Shift Panel, Shift Lever Boot Base And Hooks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. M/T: Lower the shift lever boot (A) to release the hooks (B) from the boot, then remove the shift knob (C).

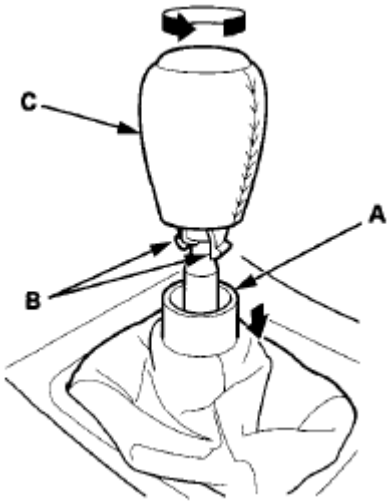

Fig. 3: Lowering Shift Lever Boot To Release Hooks From Boot
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Detach the clips by pulling up the A/T shift panel (A). Disconnect the seat heater switch connectors or seat ventilation switch connectors (B) and the A/T gear shift position indicator light connector (C) (A/T).

NOTE: A/T is shown; M/T is similar.

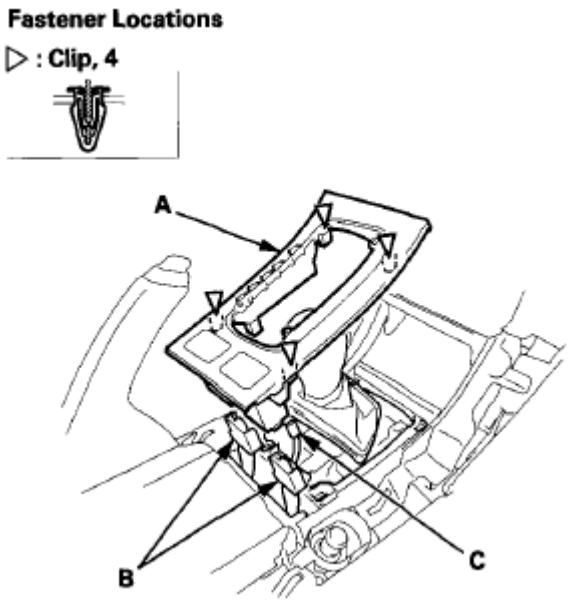

Fig. 4: Identifying A/T Shift Panel, Ventilation Switch Connectors And Light Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Detach the clips by pulling up the center console panel (A). Disconnect the accessory power socket connector (B), then remove the console panel.

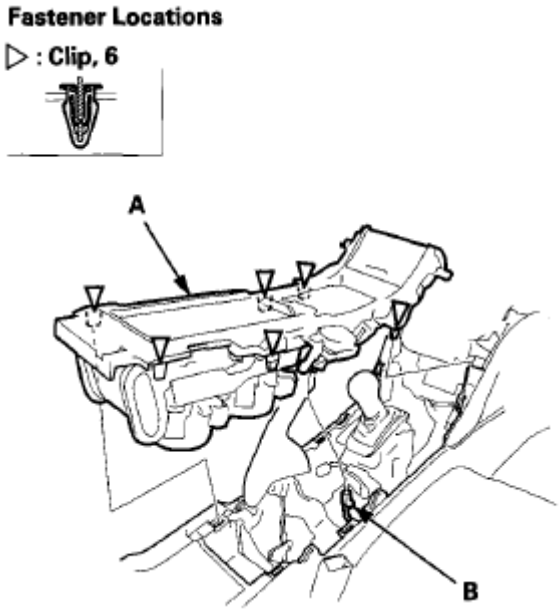

Fig. 5: Identifying Center Console Panel And Power Socket Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the console panel in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Make sure each connector is plugged in properly.

- Push the clips and the hooks into place securely.

CENTER CONSOLE REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the front seat, the dashboard, or the related parts.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when Identifying components.**
- **When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.**

1. Remove these items:
   - Dashboard center trims, both sides (see **DASHBOARD CENTER TRIM REMOVAL/INSTALLATION**)
   - **CENTER CONSOLE PANEL**.
   - Center **CONSOLE REAR TRIM**.
   - Passenger's dashboard undercover (see **GLOVE BOX DAMPER REPLACEMENT**)
   - Console carpet trims, both sides (see step 2).
2. Disconnect the center console RF unit connector (A). Remove the center console RF unit mounting bolts, then remove the center console RF unit (B).

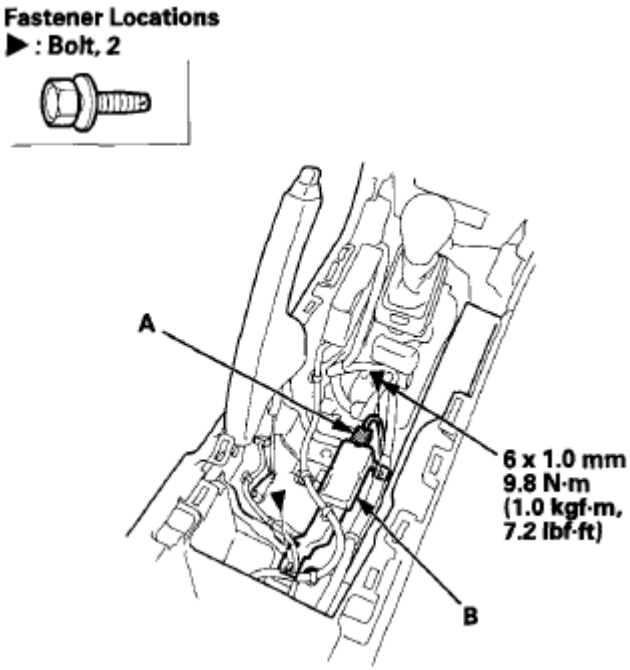

Fig. 6: Identifying RF Unit Connector And Center Console RF Unit With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Loosen the parking brake lever mounting bolts.

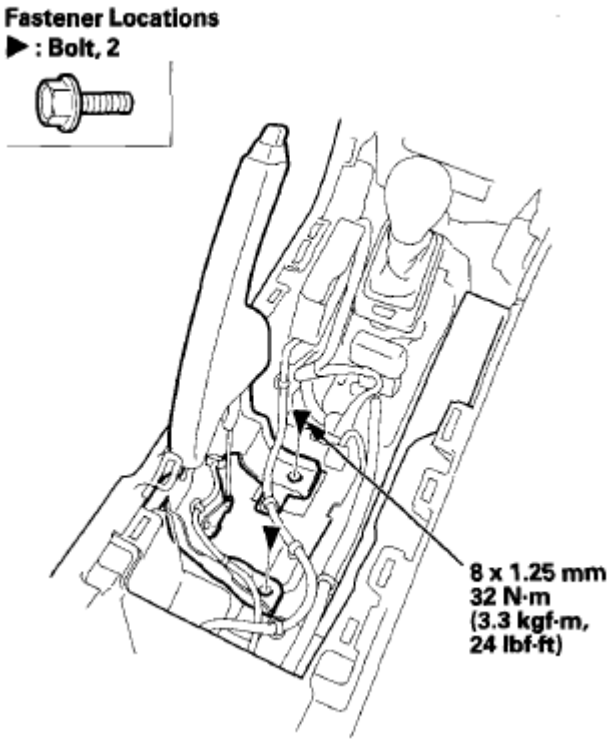

Fig. 7: Loosening Parking Brake Lever Mounting Bolts With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the center console subharness connector (A), the parking brake switch connector (B), the USB adapter unit connector (C), and the seat ventilation control unit connector (D), then detach the harness clips (E).

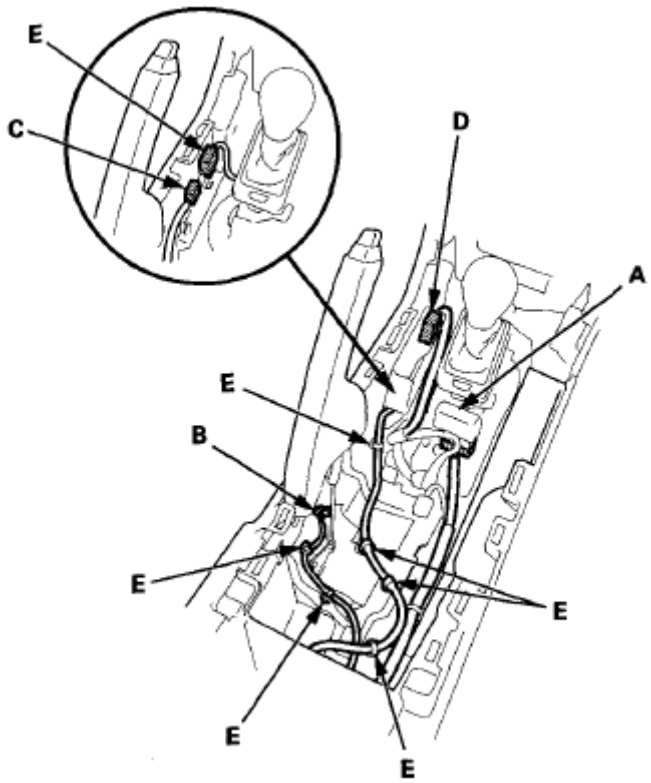

Fig. 8: Identifying Subharness Connector, Parking Brake Switch Connector, USB Adapter Unit Connector, Control Unit Connector And Harness Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the screws securing the center console (A).

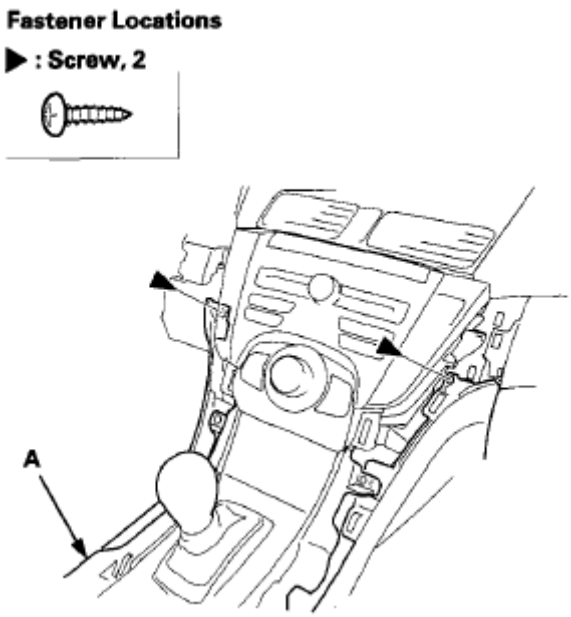

Fig. 9: Identifying Screws Securing Center Console
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the bolts securing the center console (A).

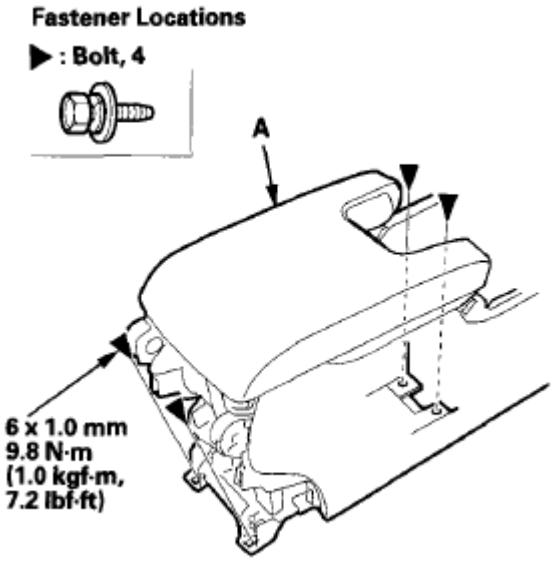

Fig. 10: Identifying Bolts Securing Center Console With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the center console (A).
    1. Detach the clips (B) securing the passenger's front console cover (C).
    2. Detach the clips (D) by pulling out the console from both sides, and pull up the console to release the guide pin (E).

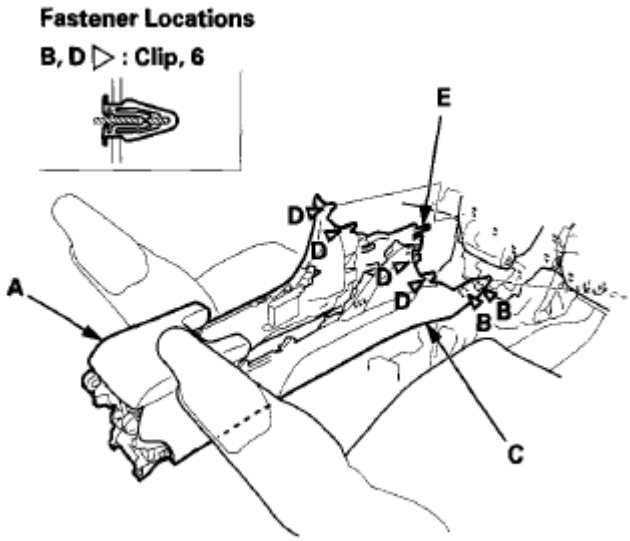

Fig. 11: Identifying Center Console, Clips, Front Console Cover, Clips And Guide Pin
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the console in the reverse order of removal, and note these items:
   - If the clips are damaged, replace them with new ones.
   - Make sure each connector is plugged in properly.
   - Push the clips and the hooks into place securely.

CENTER CONSOLE REAR TRIM REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Take care not to scratch the center console or the related parts.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when Identifying components.**

1. Gently pull out the center console rear trim (A) to detach the clips, then remove the trim.

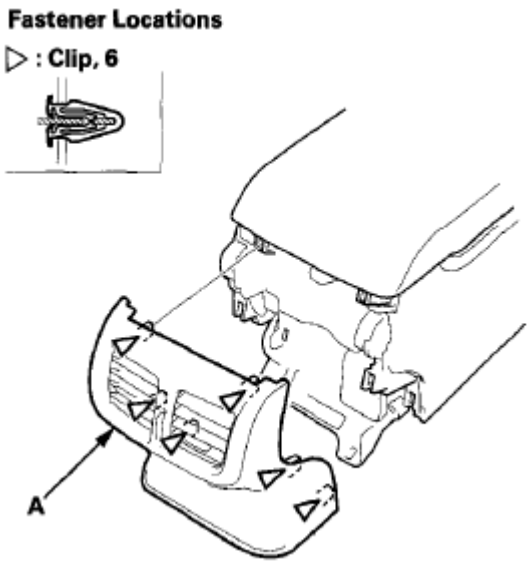

Fig. 12: Identifying Center Console Rear Trim
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the trim in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Push the clips into place securely.

CENTER CONSOLE ARMREST REPLACEMENT

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:
- **Take care not to scratch the center console or the related parts.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when Identifying components.**

1. Remove the **center console rear trim**.
2. Gently pull out the console upper trims (A) to detach the clips, and remove the trims. Remove the screws securing the center console (B).

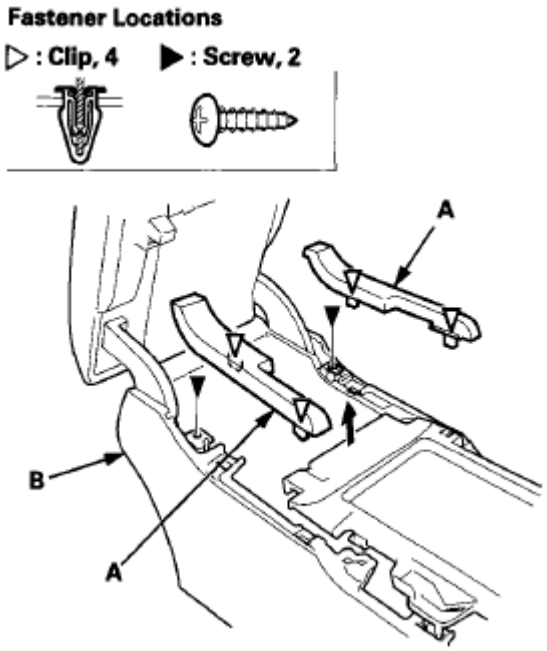

Fig. 13: Identifying Console Upper Trims And Center Console
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the center console light socket (A) 45 ° counterclockwise to remove the socket from the housing. Remove the screws securing the center console armrest (B).

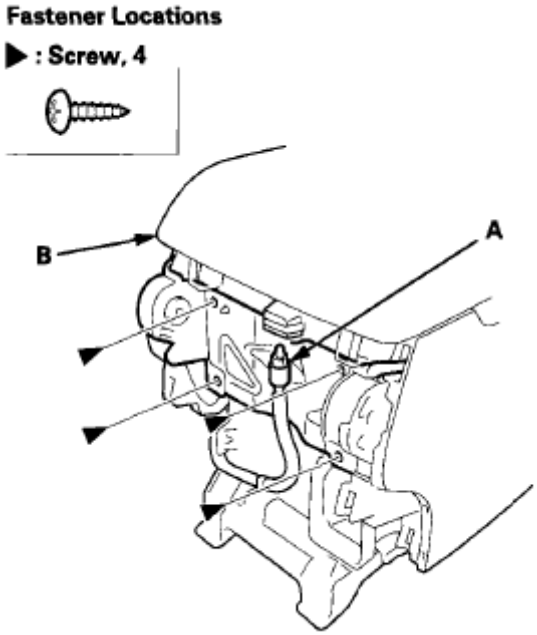

Fig. 14: Identifying Center Console Light Socket And Center Console Armrest
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Pull up the center console armrest (A) and remove it.

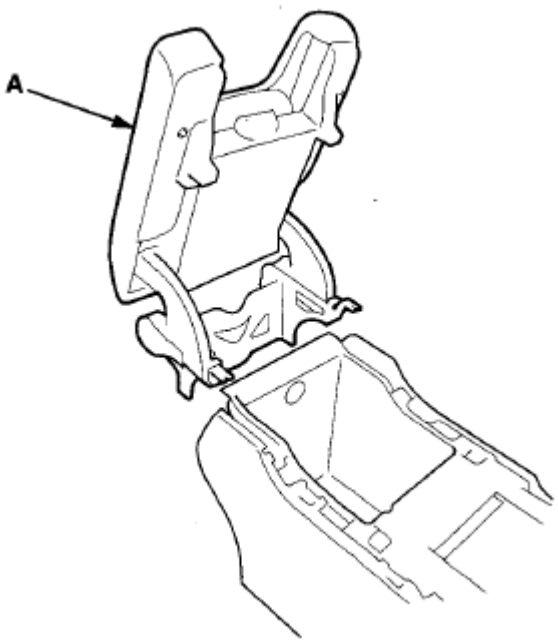

Fig. 15: Identifying Center Console Armrest
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the armrest in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Push the clips into place securely.

CENTER CONSOLE PANEL DISASSEMBLY/REASSEMBLY

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Take care not to scratch the center console or the related parts.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when Identifying components.**

1. Remove the **CENTER CONSOLE PANEL**.
2. Remove the screws from the back or the center console panel (A), then remove the panel from the center console pocket assembly (B) and the beverage holder assembly (C).

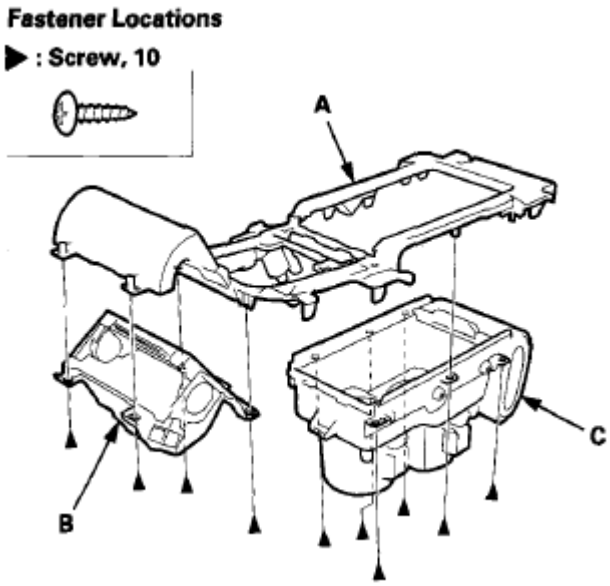

Fig. 16: Identifying Center Console Panel, Center Console Pocket Assembly And Beverage Holder Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the screws from both sides of the beverage holder (A), then remove the driver's side shutter rail (B), the passenger's side shutter rail (C), and the console shutter (D).

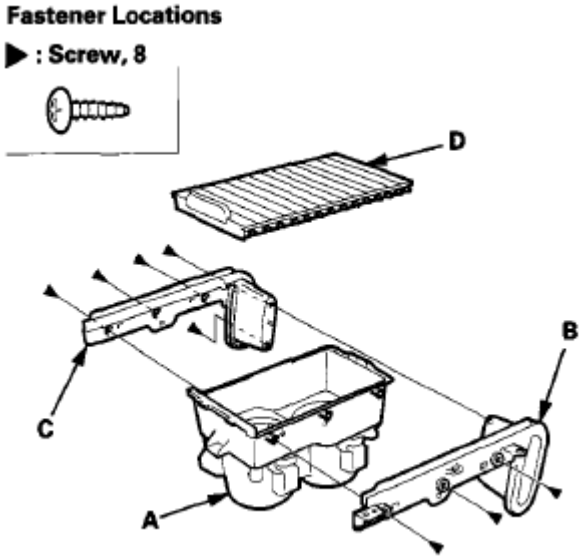

Fig. 17: Identifying Beverage Holder, Driver Side And Passenger Side Shutter Rails And Console Shutter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Reassemble the center console panel in the reverse order of disassembly.

CENTER CONSOLE DISASSEMBLY/REASSEMBLY

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Take care not to scratch the center console or the related parts.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when Identifying components.**

1. Remove the **CENTER CONSOLE**.
2. Pry out the rear edge of the console carpet trim (A, B) with the appropriate trim tool to detach the clips and to release the hooks (C) from the center console (D).

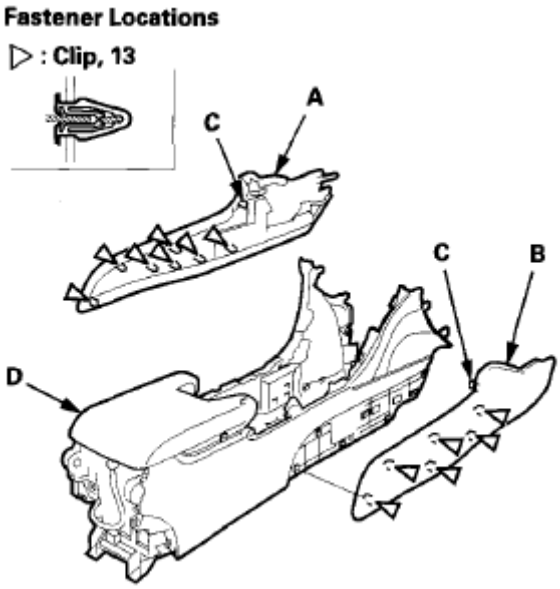

Fig. 18: Identifying Console Carpet Trim, Hooks And Center Console
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the screws from both sides of the center console (A), then remove the console side pockets (B).

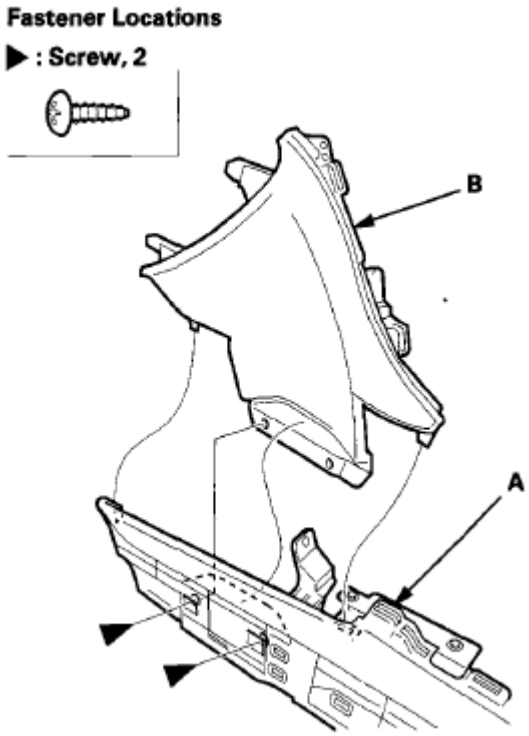

Fig. 19: Identifying Center Console And Side Pockets
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Reassemble the center console in the reverse order of disassembly and note these items:
    - If the clips are damaged or stress-whitened, replace them with new ones.
    - Push the clips and the hooks into place securely.

2012 ACCESSORIES & EQUIPMENT

Cruise Control - TL

COMPONENT LOCATION INDEX

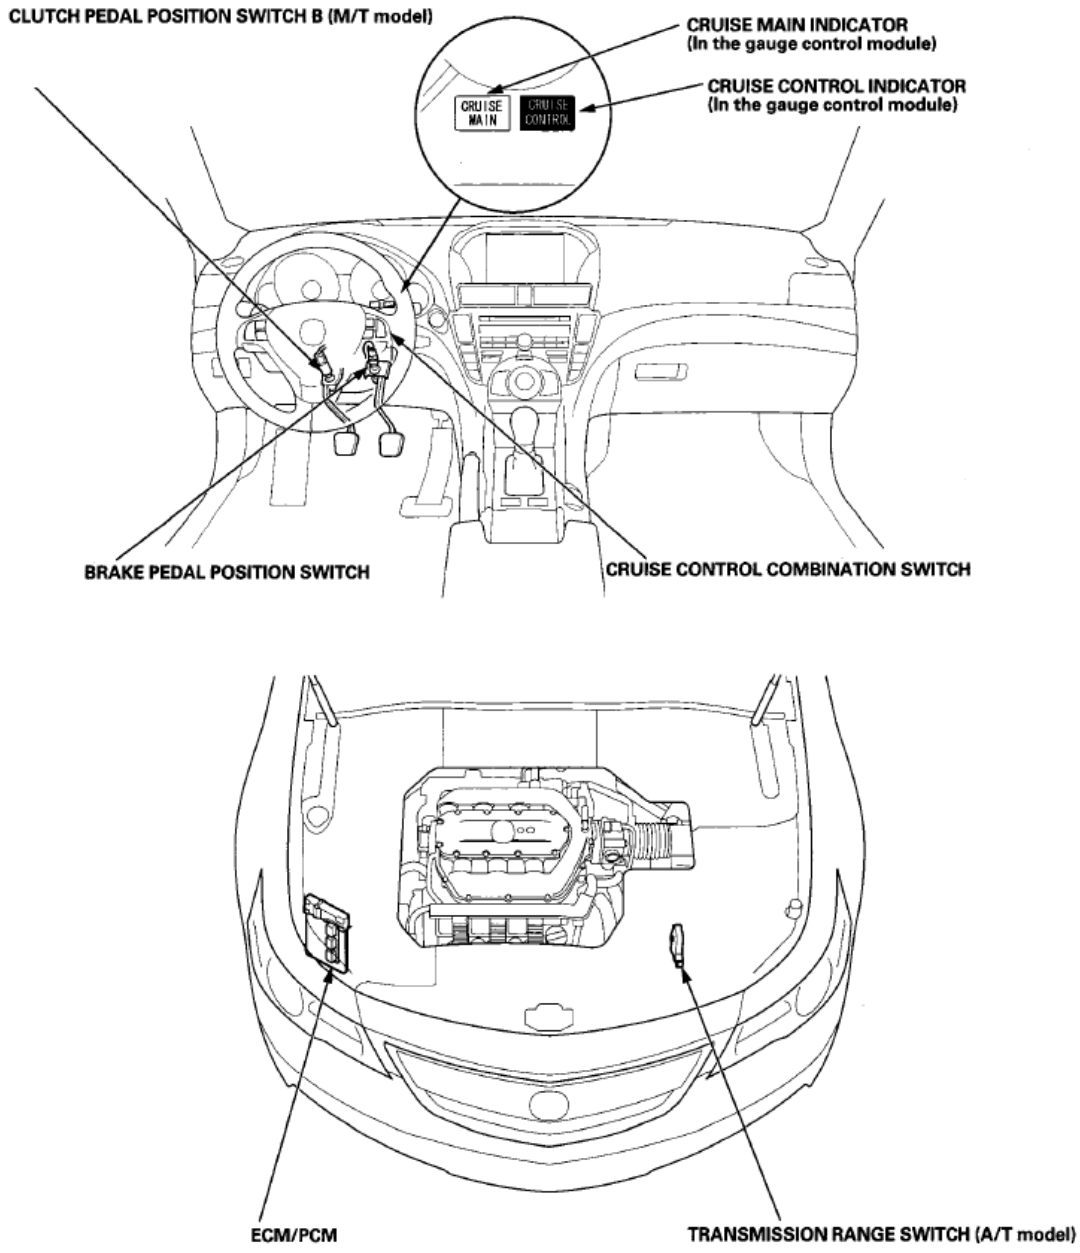

Fig. 1: Cruise Control System Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure	Also check for
Cruise control cannot be set	1. Check for PGM-FI DTCs (see **GENERAL TROUBLESHOOTING INFORMATION**). 2. Check the No. 10 (20 A) fuse in the under-hood fuse/relay box, and the No. 13 (15 A) fuse in the driver's under-dash fuse/relay box. 3. Do the cruise control combination switch test (see **CRUISE CONTROL COMBINATION SWITCH TEST/REPLACEMENT**). 4. Do the cruise control input test (see **CRUISE CONTROL INPUT TEST**).	Poor ground G301 (M/T model) or G101 (A/T model)
Cruise control can be set, but the cruise main indicator does not come on	1. Do the gauge control module self-diagnostic function procedure (see **SELF-DIAGNOSTIC FUNCTION**). 2. Do the cruise control input test (see **CRUISE CONTROL INPUT TEST**). Test the cruise control main switch signal input. 3. Check for PGM-FI DTCs (see **GENERAL TROUBLESHOOTING INFORMATION**).	Faulty gauge control module
Cruise control can be set, but the cruise control indicator does not come on	1. Do the gauge control module self-diagnostic function procedure (see **SELF-DIAGNOSTIC FUNCTION**). 2. Do the cruise control input test (see **CRUISE CONTROL INPUT TEST**). Test the cruise control indicator signal input. 3. Check for PGM-FI DTCs (see **GENERAL TROUBLESHOOTING INFORMATION**).	Faulty gauge control module
Vehicle does not accelerate accordingly when the resume/accel button is pressed	1. Do the cruise control combination switch test (see **CRUISE CONTROL COMBINATION SWITCH TEST/REPLACEMENT**). 2. Do the cruise control input test (see **CRUISE CONTROL INPUT TEST**). Test the resume/accel switch signal input. 3. Check for PGM-FI DTCs (see **GENERAL TROUBLESHOOTING**	Open circuit, loose or disconnected terminals: ORN or GRY wire

	INFORMATION).	
Set speed does not cancel when the brake pedal is pressed	1. Do the brake pedal position switch test (see **BRAKE PEDAL POSITION SWITCH TEST**). 2. Do the cruise control input test (see **CRUISE CONTROL INPUT TEST**). Test the brake pedal position switch signal input. 3. Check for PGM-FI DTCs (see **GENERAL TROUBLESHOOTING INFORMATION**).	• Short to power on the ORN wire • Faulty brake pedal position switch
Set speed does not cancel (engine RPM stays high) when the clutch pedal is pressed (M/T model)	1. Do the clutch pedal position switch B test (see **CLUTCH PEDAL POSITION SWITCH B TEST**). 2. Do the cruise control input test (see **CRUISE CONTROL INPUT TEST**). Test the clutch pedal position switch B signal input. 3. Check for PGM-FI DTCs (see **GENERAL TROUBLESHOOTING INFORMATION**).	Short to ground in the BRN wire
Set speed does not cancel when the cruise control main button is pressed	1. Do the cruise control combination switch test (see **CRUISE CONTROL COMBINATION SWITCH TEST/REPLACEMENT**). 2. Do the cruise control input test (see **CRUISE CONTROL INPUT TEST**). Test the cruise control main switch signal input. 3. Check for PGM-FI DTCs (see **GENERAL TROUBLESHOOTING INFORMATION**).	Short to ground in the YEL wire
Set speed does not cancel when the cancel button is pressed	1. Do the cruise control combination switch test (see **CRUISE CONTROL COMBINATION SWITCH TEST/REPLACEMENT**). 2. Do the cruise control input test (see **CRUISE CONTROL INPUT TEST**). Test the cancel switch signal input. 3. Check for PGM-FI DTCs (see **GENERAL TROUBLESHOOTING INFORMATION**).	Open circuit, loose or disconnected terminals: LT GRN, ORN or GRY wire
	1. Do the cruise control combination switch	

Set speed does not resume when the resume/accel button is pressed (with the cruise control main switch turned on, and set speed temporarily canceled by pressing the brake pedal)	test (see **CRUISE CONTROL COMBINATION SWITCH TEST/REPLACEMENT**). 2. Do the cruise control input test (see **CRUISE CONTROL INPUT TEST**). Test the resume/accel switch signal input. 3. Check for PGM-FI DTCs (see **GENERAL TROUBLESHOOTING INFORMATION**).	Open circuit, loose or disconnected terminals: ORN or GRY wire
Set speed does not resume when the resume/accel button is pressed (with the cruise control main switch turned on, and set speed temporarily canceled by pressing the clutch pedal) (M/T model)	1. Do the cruise control combination switch test (see **CRUISE CONTROL COMBINATION SWITCH TEST/REPLACEMENT**). 2. Do the cruise control input test (see **CRUISE CONTROL INPUT TEST**). Test the resume/accel switch signal input. 3. Check for PGM-FI DTCs (see **GENERAL TROUBLESHOOTING INFORMATION**).	Open circuit loose or disconnected terminal: LT BLU or GRY wire
Light switch turned on, the cruise control combination switch illumination does not come on	1. Check the No. 6 (7.5 A) fuse in the passenger's under-dash fuse/relay box. 2. Do the cruise control combination switch test (see **CRUISE CONTROL COMBINATION SWITCH TEST/REPLACEMENT**).	Open circuit, loose or disconnected terminals: GRY or RED wires

CIRCUIT DIAGRAM

WITHOUT KEYLESS ACCESS SYSTEM

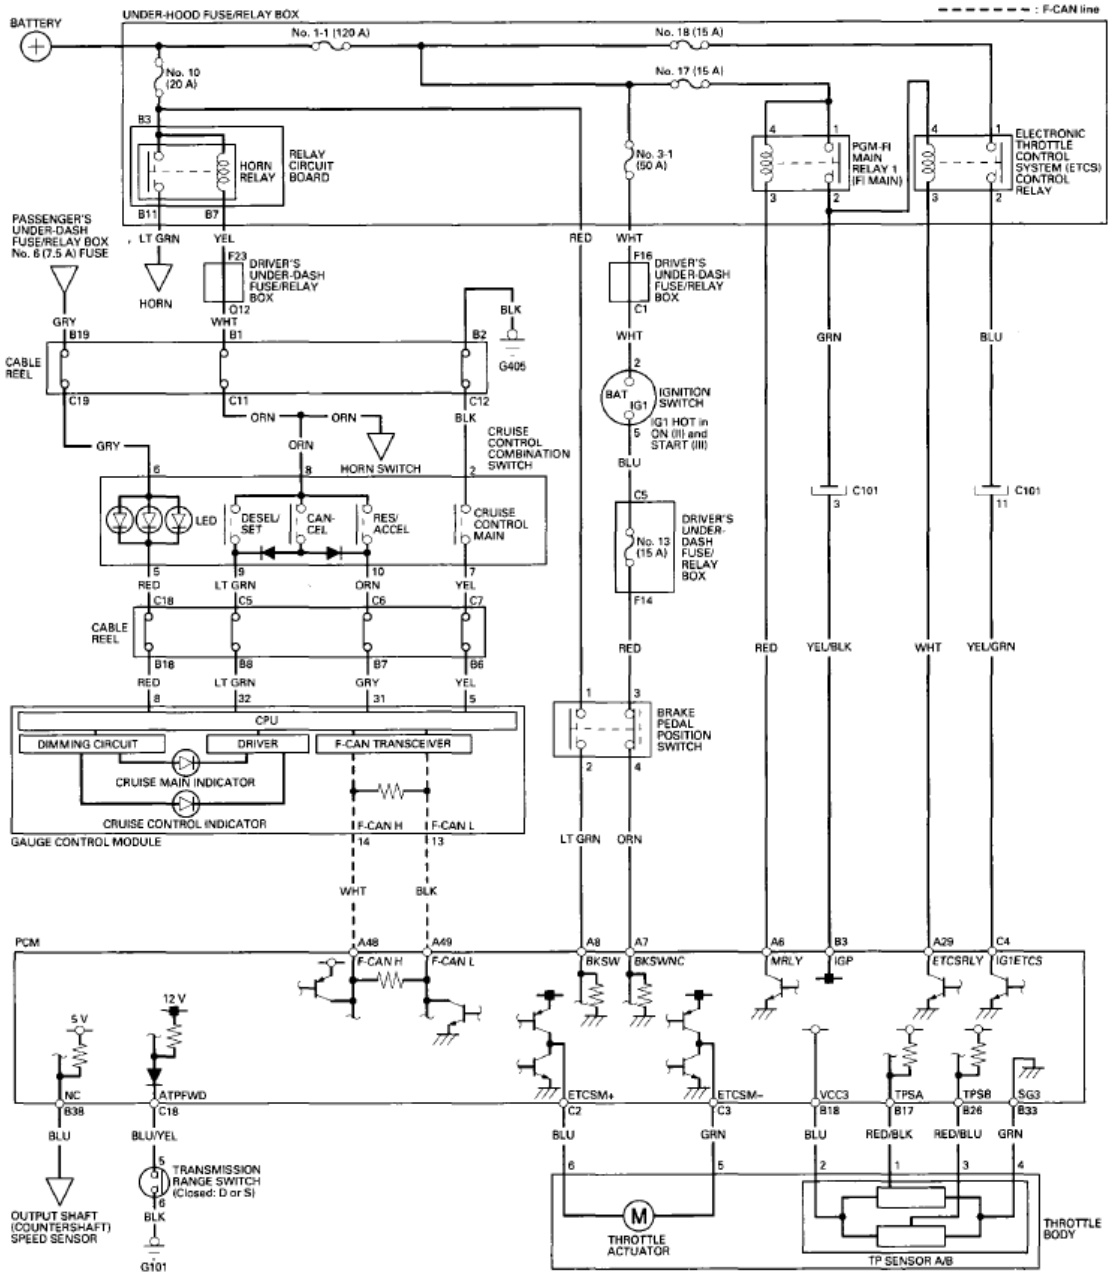

Fig. 2: Cruise Control System Circuit Diagram (Without Keyless Access System)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

WITH KEYLESS ACCESS SYSTEM

CRUISE CONTROL INPUT TEST

NOTE: Always make sure that you have the latest HDS software.

1. Connect the Honda HDS to the DLC (see **HOW TO USE THE HDS (HONDA DIAGNOSTIC SYSTEM)**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

3. Make sure the HDS communicates with the vehicle and the ECM/PCM. If it does not communicate, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Check for and troubleshoot any DTCs (see **GENERAL TROUBLESHOOTING INFORMATION**).
5. Do the following tests while monitoring parameters in the PGM-FI DATA LIST with the HDS.
6. If the input tests prove OK, replace the ECM/PCM (see **ECM/PCM REPLACEMENT**).

NOTE: Intermittent failures are often caused by loose circuit connections. While monitoring cruise control inputs, flex the circuit wires, and note if any of the test results change.

Signal to be tested	Test condition	Parameter: Desired result	Possible cause if result is not obtained
Brake pedal position switch signal	Brake pedal pressed, then released	CRUISE BRAKE SW/IDLE STOP SW should indicate OPEN when the brake pedal is pressed and CLOSE when the brake pedal is released.	• Faulty brake pedal position switch • Blown No. 13 (15 A) fuse in the driver's under-dash fuse/relay box • An open in the wire between the ECM/PCM and the brake pedal position switch • A wire shorted to ground or power between the ECM/PCM and the brake pedal position switch
Clutch pedal position switch B signal (M/T model)	Clutch pedal pressed, then released	SHIFT/CLUTCH SW should indicate ON when the clutch pedal is pressed and OFF when the clutch pedal is released.	• Faulty clutch pedal position switch B • An open in the wire between the ECM and clutch pedal position switch B • A wire shorted to ground between the ECM and clutch pedal position switch B • Poor ground G301
			• Faulty cruise control combination switch

Cruise control main switch signal	Cruise control main button pressed and released	CRUISE MASTER (MAIN) SW should indicate ON when the cruise control main button is pressed and OFF when the cruise control main button is released.	• An open in the wire between the gauge control module and the cruise control combination switch • A wire shorted to ground between the gauge control module and the cruise control combination switch • An open in the wire between the cruise control combination switch and ground G405
Set switch signal	Decel/set button pressed and released	CRUISE SET SW should indicate ON when the decel/set button is pressed and OFF when the decel/set button is released.	• Faulty cruise control combination switch • An open in the wire between the gauge control module and the cruise control combination switch • A wire shorted to ground between the gauge control module and the cruise control combination switch
Resume switch signal	Resume/accel button pressed and released	CRUISE RESUME SW should indicate ON when the resume/accel button is pressed and OFF when the resume/accel button is released.	• Faulty cruise control combination switch • An open in the wire between the gauge control module and the cruise control combination switch • A wire shorted to ground between the gauge control module and the cruise control combination switch
		CRUISE CANCEL SW should	• Faulty cruise control combination switch • An open in the wire between the gauge control module and

Cancel switch signal	Cancel button pressed and released	indicate ON when the cancel button is pressed and OFF when the cancel button is released.	the cruise control combination switch • A wire shorted to ground between the gauge control module and the cruise control combination switch
Cruise control indicator signal	Start the engine, press the cruise control main button on and drive the vehicle above 25 mph (40 km/h) with the cruise control set and cancel the cruise control	CRUISE INDICATOR should indicate ON when the cruise control is set and OFF when the cruise control is cancelled.	• Faulty gauge control module • Faulty cruise control combination switch • An open in the wire between the gauge control module and the cruise control combination switch • A wire shorted to ground between the gauge control module and the cruise control combination switch

CRUISE CONTROL COMBINATION SWITCH TEST/REPLACEMENT

There are SRS components located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**), and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**), in the SRS before doing repairs or service.

1. Remove the steering wheel (see **STEERING WHEEL REMOVAL**).
2. Remove the steering wheel rear cover (see **STEERING WHEEL REMOVAL**).
3. Disconnect the cable reel subharness connector (A), then remove the steering wheel trim/cruise control combination switch (B).

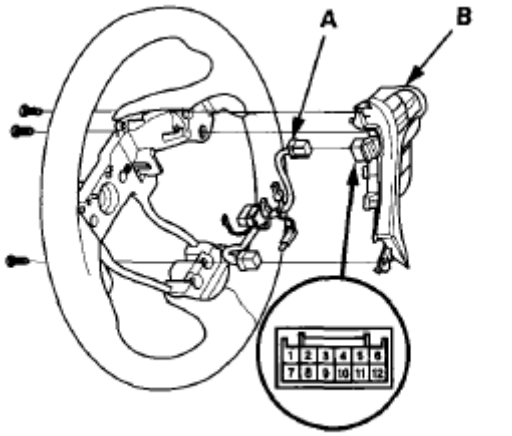

Fig. 4: Identifying Cable Reel Subharness Connector And Steering Wheel Trim/Cruise Control Combination Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Check for continuity between the terminals in each cruise control combination switch position according to the table:
   - If there is continuity, and it matches the table, but the cruise control combination switch failure occurred on the cruise control input test, check and repair the wire harness on the switch circuit.
   - If there is no continuity in one or both positions, replace the steering wheel trim/cruise control combination switch.

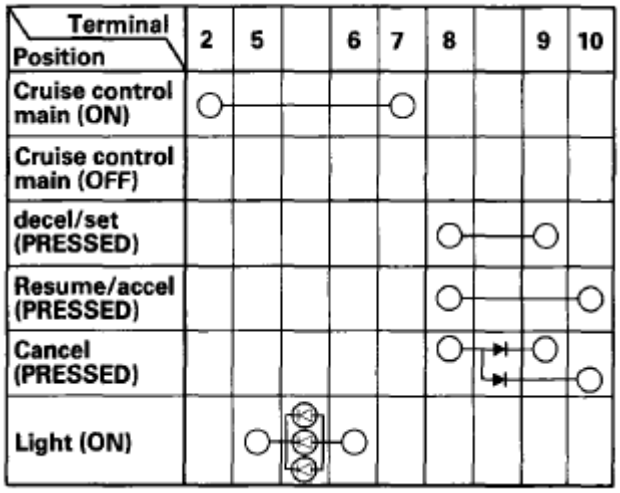

Fig. 5: Identifying Continuity Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the cruise control combination switch in the reverse order of removal.

CLUTCH PEDAL POSITION SWITCH B TEST

M/T MODEL

1. Disconnect the clutch pedal position switch B connector (A).

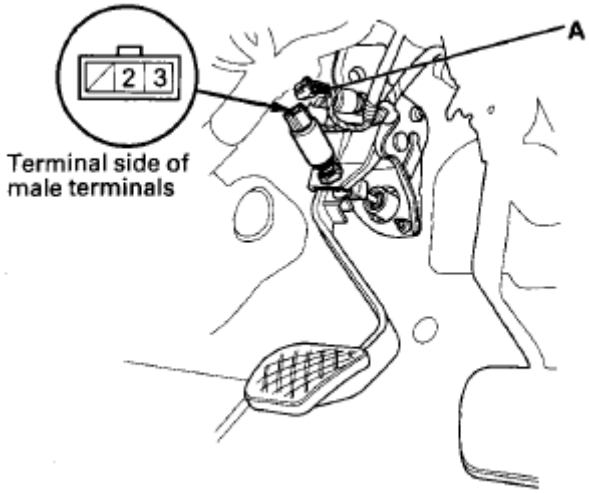

Fig. 6: Identifying Clutch Pedal Position Switch And Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Check for continuity between the terminals according to the table:
   - If the continuity is not as specified, replace the clutch pedal position switch B (see **CLUTCH PEDAL POSITION SWITCH B REPLACEMENT**) and adjust the pedal height (see **CLUTCH PEDAL, CLUTCH PEDAL POSITION SWITCH A, AND CLUTCH PEDAL POSITION SWITCH B ADJUSTMENT**).
   - If OK, connect the clutch pedal position switch B connector.

Terminal / Clutch Pedal	1	2	3
RELEASED		○—○	
PRESSED			

Fig. 7: Identifying Continuity Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CLUTCH PEDAL POSITION SWITCH B REPLACEMENT

M/T MODEL

1. Disconnect the clutch pedal position switch B connector (A).

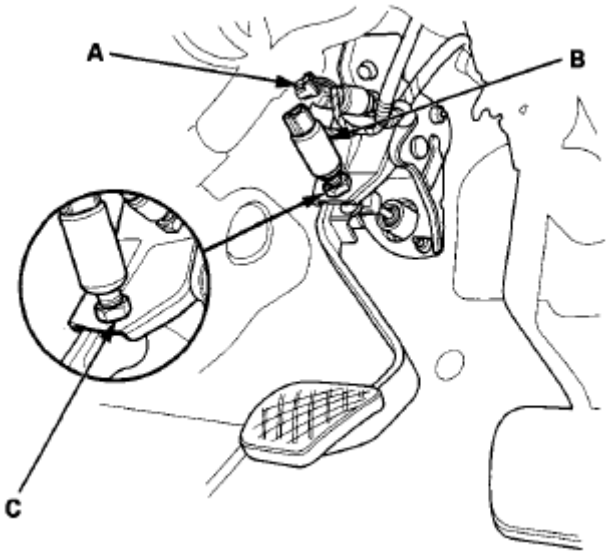

Fig. 8: Identifying Locknut, Clutch Pedal Position Switch, Connector And Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Loosen the locknut (C), then remove clutch pedal position switch B.
3. Install clutch pedal position switch B, and adjust the pedal height (see **CLUTCH PEDAL, CLUTCH PEDAL POSITION SWITCH A, AND CLUTCH PEDAL POSITION SWITCH B ADJUSTMENT**).

2012 ACCESSORIES & EQUIPMENT

Dashboard - TL

COMPONENT LOCATION INDEX

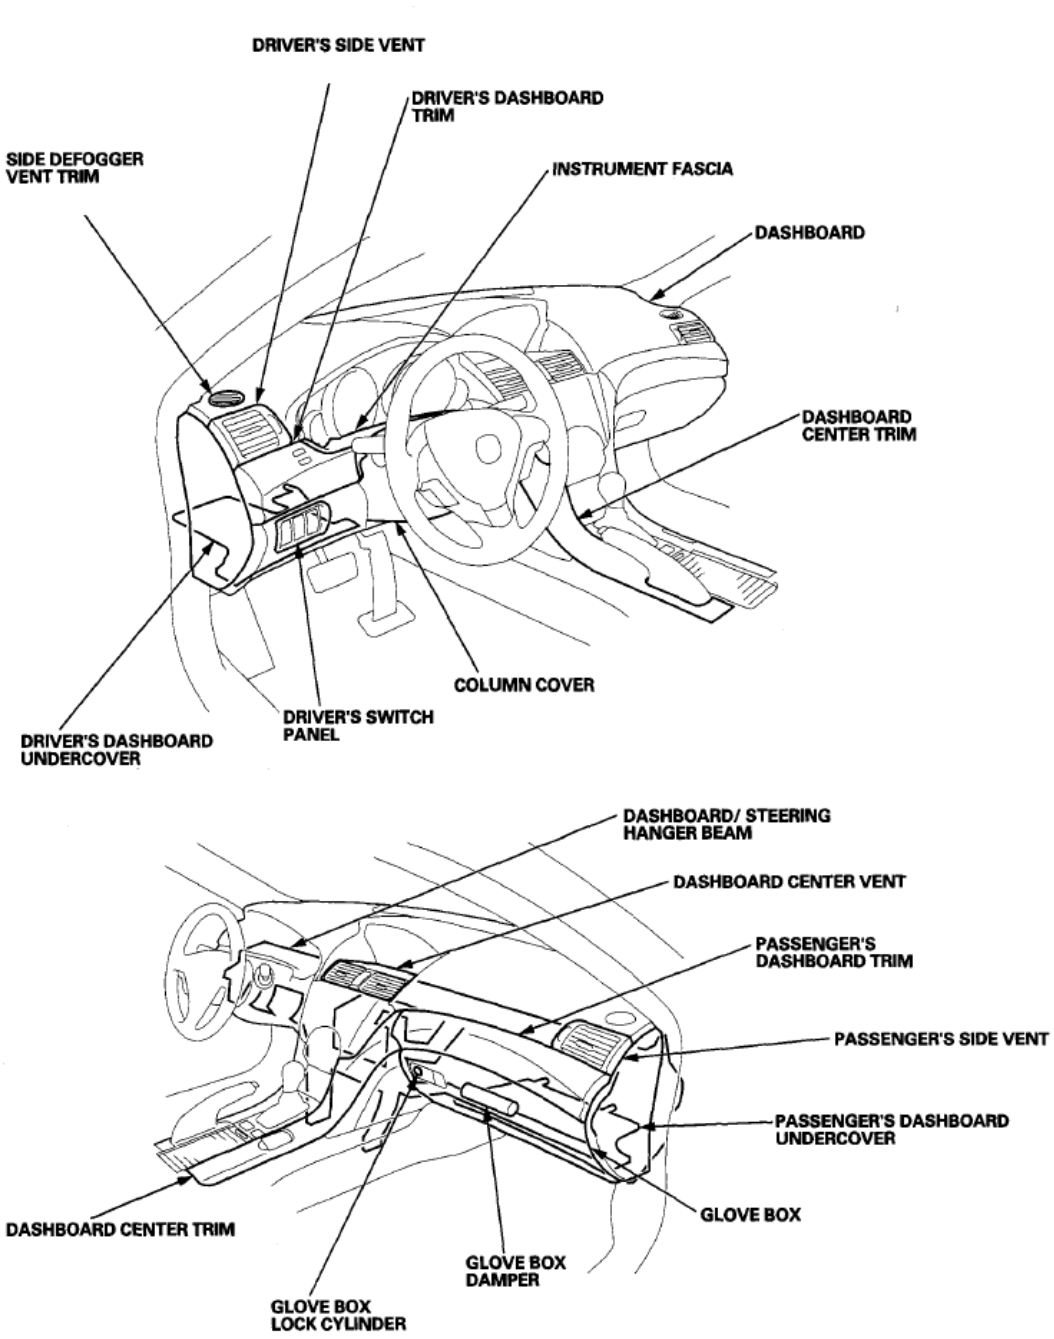

Fig. 1: Dashboard Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DRIVER'S DASHBOARD TRIM REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Take care not to scratch the dashboard or the related parts.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**

1. Remove the driver's dashboard side panel (A).
    1. Open the front door.
    2. Gently pry the bottom edge of the panel with the appropriate trim tool to detach the clips and to release the hooks (B).

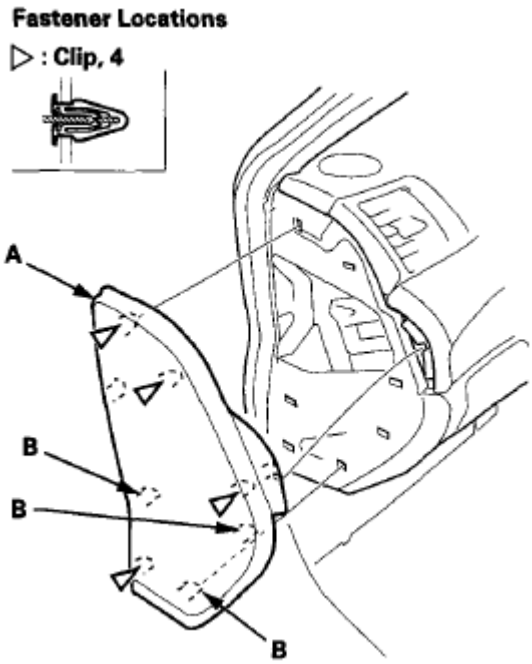

Fig. 2: Identifying Driver's Dashboard Side Panel And Hooks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the driver's dashboard trim (A).
    1. Pry up the edge of the trim at the driver's dashboard side panel opening.
    2. Detach the clips.
    3. While holding the trim, disconnect the dashlights brightness controller connector (B).

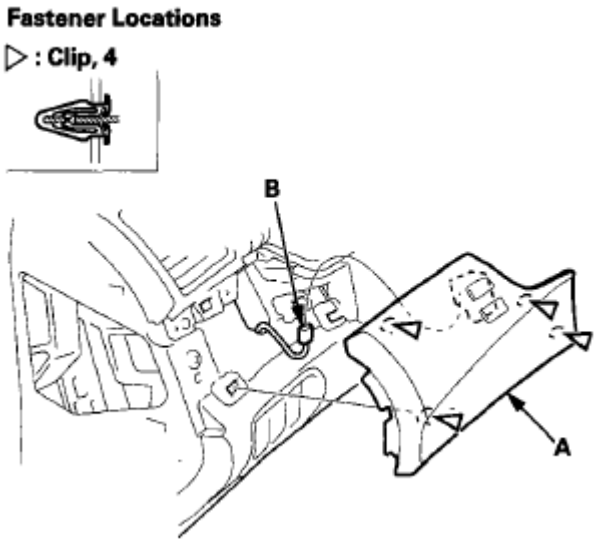

Fig. 3: Identifying Driver's Dashboard Trim And Controller Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the trim in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Make sure the connector is plugged in properly.
   - Push the clips and the hooks into place securely.

DRIVER'S SWITCH PANEL REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Take care not to scratch the trim or the panels.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**
- **When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.**

1. Remove the driver's switch panel (A).
   1. Apply the protective tape (B) to the dashboard under the edge of the panel.
   2. Pry up on the edge of the panel with a flat-tip screwdriver to release the hooks (C).
   3. Disconnect the following connectors:
      - Connector (D):
        - VSA OFF switch connector

    - BSI OFF switch connector
    - Headlight washer switch connector
- Connector (E):
    - VSA OFF switch connector
    - BSI OFF switch connector
- Connector (F): VSA OFF switch connector

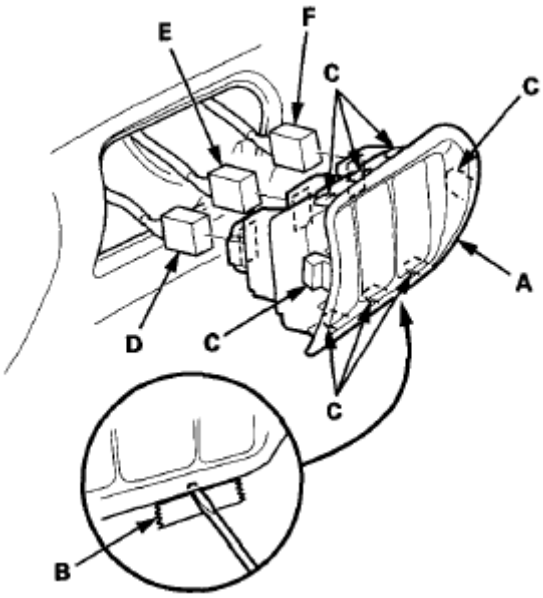

Fig. 4: Identifying Driver's Switch Panel Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the panel in the reverse order of removal, and note these items:
    - Make sure each connector is plugged in properly.
    - Push the hooks into place securely.

INSTRUMENT FASCIA REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Take care not to scratch the trim or the panels.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**

1. Remove these items:

- Driver's dashboard trim (see **DRIVER'S DASHBOARD TRIM REMOVAL/INSTALLATION**)
- Dashboard center trim, driver's side (see **DASHBOARD CENTER TRIM REMOVAL/INSTALLATION**)

2. Adjust the steering column to the full tilt down position and to the full telescopic out position.
3. Detach the clips and release the hooks (A) fastening the instrument fascia (B) from the upper column cover (C).

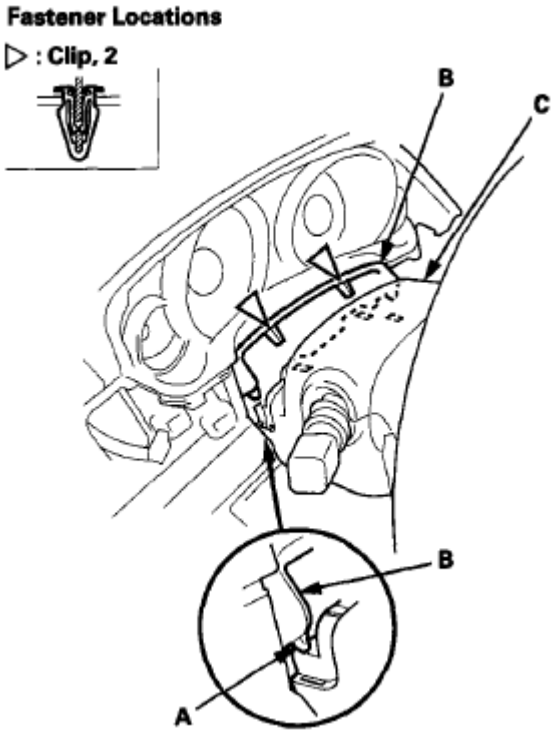

Fig. 5: Identifying Hooks, Instrument Fascia And Upper Column Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Gently pull out the instrument fascia (A) to detach the clips, then remove it.

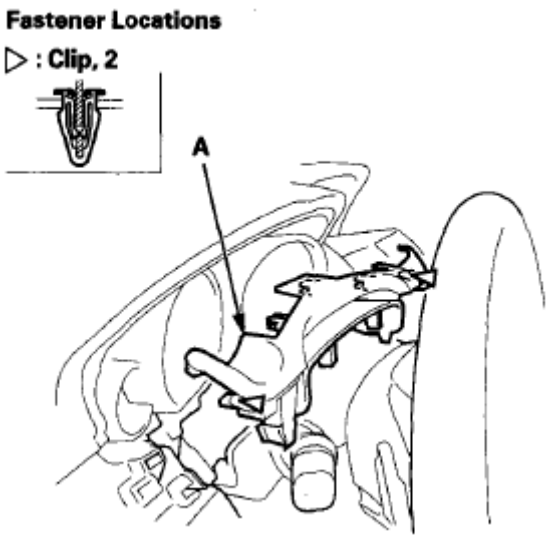

Fig. 6: Identifying Instrument Fascia
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. install the instrument fascia in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Push the clips and the hooks into place securely.

DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Take care not to scratch the dashboard or the related parts.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**

1. Remove the driver's dashboard undercover (A).
   1. Turn the lock knob (B) 90 °.
   2. Gently pull down the rear edge of the undercover to detach the clip.
   3. Disconnect the footwell light connector (C), and detach the harness clip (D).
   4. Pull the undercover rearward to release the pins (E) from the brackets (F).

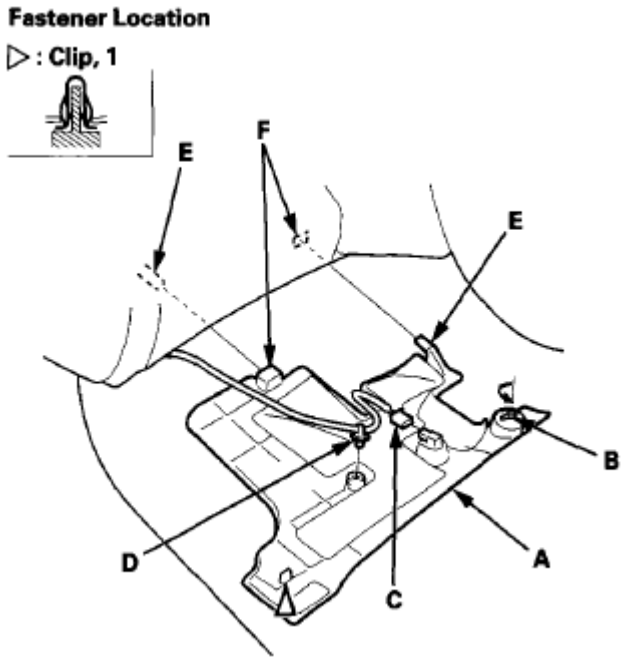

Fig. 7: Identifying Driver's Dashboard Undercover Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the undercover in the reverse order of removal, and note these items:
   - If the clip is damaged or stress-whitened, replace it with a new one.
   - Make sure the connector is plugged in properly.
   - Make sure the pins are installed securely in the brackets.
   - Push the clip into place securely.

DASHBOARD CENTER TRIM REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

* Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Take care not to scratch the trim or the panels.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**

1. Remove the dashboard center trims (A, B).
   1. Gently pull up the lower area of the trim to detach the clips from the edge of the center console (C).
   2. Disconnect the engine start/stop switch connector (D) (for some models).

Driver's side

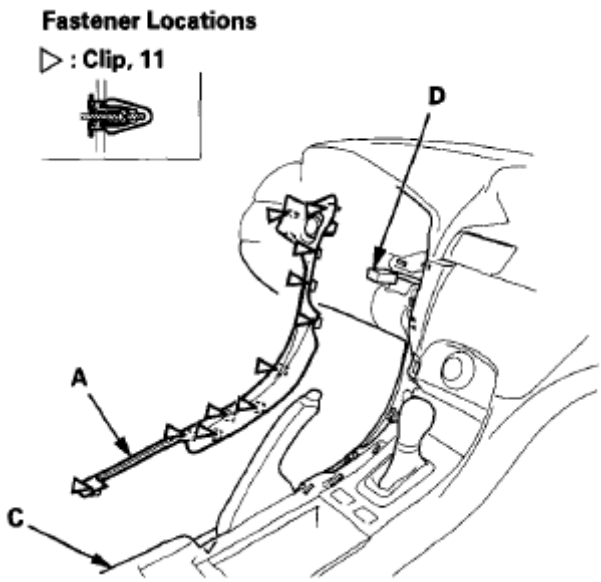

Fig. 8: Identifying Center Trims, Center Console And Start/Switch Connector (Driver'S Side)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Passenger's side

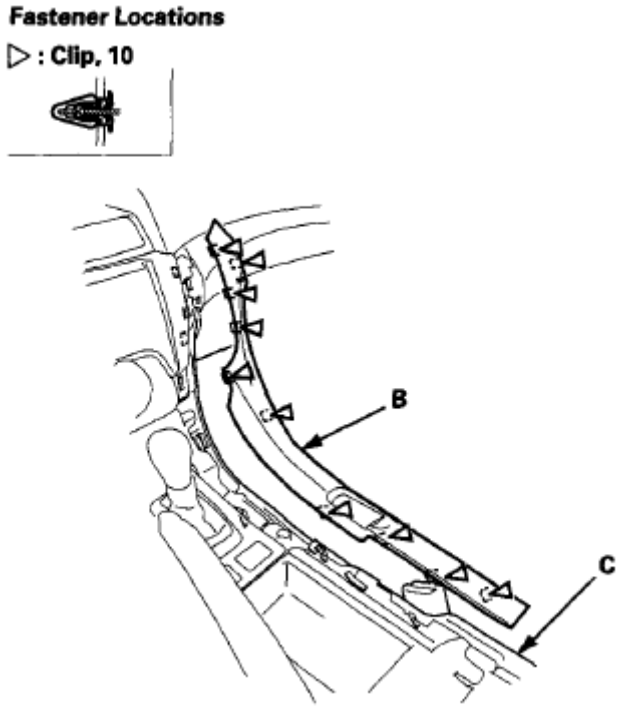

Fig. 9: Identifying Center Trims, Center Console And Start/Switch Connector (Passenger'S Side)
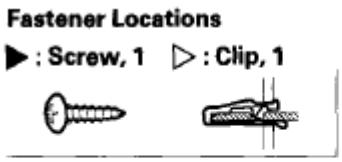
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the trim in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Make sure the engine start/stop switch connector is plugged in properly (for some models).
   - Push the clips into place securely.

DRIVER'S SIDE VENT REMOVAL/INSTALLATION

Special Tools Required



KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Take care not to scratch the dashboard or the panels.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**

1. Remove the driver's dashboard trim (see **DRIVER'S DASHBOARD TRIM REMOVAL/INSTALLATION**).
2. Remove the screw, and detach the clip, then remove the driver's side vent (A).

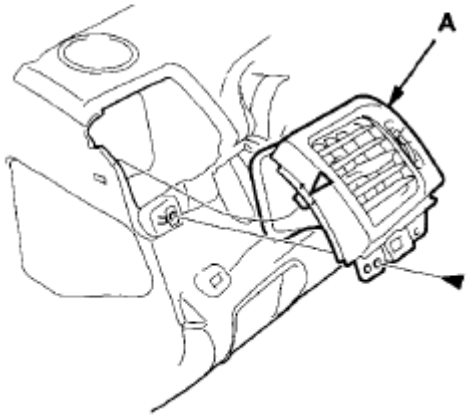


Fig. 10: Identifying Driver's Side Vent
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the vent in the reverse order of removal, and note these items:
   - If the clip is damaged or stress-whitened, replace it with a new one.

- Push the clip into place securely.

PASSENGER'S SIDE VENT REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Take care not to scratch the dashboard or the panels.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**

1. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
2. Remove the screw (A) securing the duct (B) from the glove box opening. Remove the screws (C) securing the passenger's side vent (D).

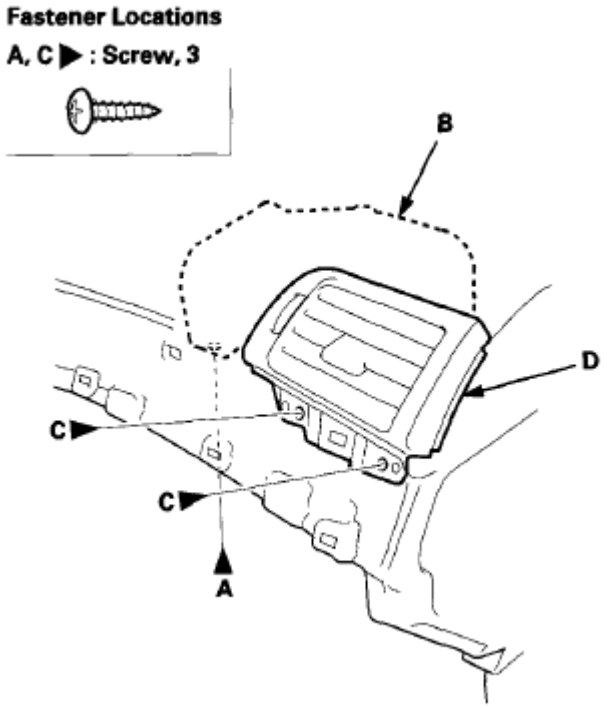

Fig. 11: Identifying Screw, Duct And Passenger's Side Vent
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Pull out the passenger's side vent (A) to detach the clip, then remove it.

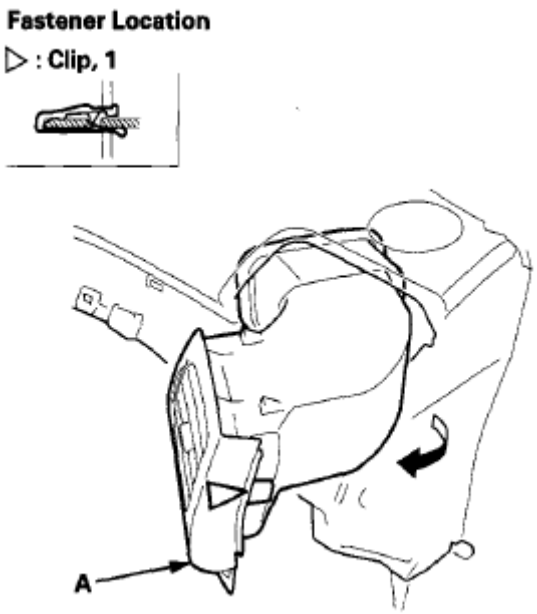

Fig. 12: Pulling Out Passenger's Side Vent To Detach Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the vent in the reverse order of removal, and note these items:
   - If the clip is damaged or stress-whitened, replace it with a new one.
   - Push the clip into place securely.

DASHBOARD CENTER VENT REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:
- **Take care not to scratch the dashboard or the panels.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**

1. Remove the dashboard center vent (A).
   1. Insert a hook-shaped tool into one side of the center vent until it hooks to the back edge of the duct (B).
   2. Carefully pull out one side of the dashboard center vent partially to release the clips (C, D) and the hooks (E), then do the same on the other side.
   3. Disconnect the hazard warning switch/passenger's airbag cutoff indicator connector (F).

NOTE: Do not pull on the vent louvers or the edge of the vent, or you may

damage them.

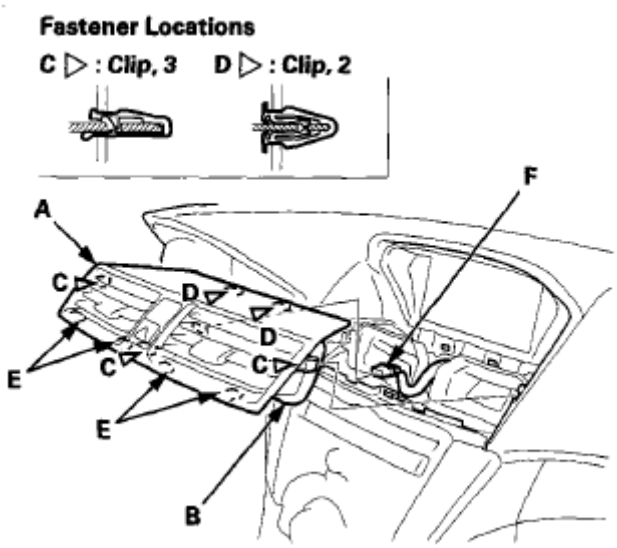

Fig. 13: Identifying Dashboard Center Vent, Duct, Cutoff Indicator Connector, Clips And Hooks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the vent in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Make sure the connector is plugged in properly.
   - Push the clips and the hooks into place securely.

PASSENGER'S DASHBOARD TRIM REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Take care not to scratch the dashboard or the panels.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**

1. Remove the passenger's dashboard side panel (A).
   1. Open the front door.
   2. Gently pry the bottom edge of the panel with the appropriate trim tool to detach the clips and to release the hooks (B).

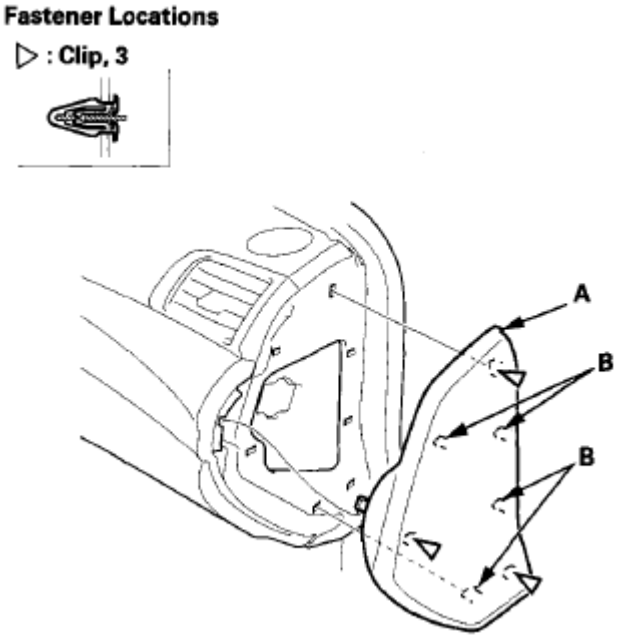

Fig. 14: Identifying Passenger's Dashboard Panel And Hooks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the dashboard center trim, passenger's side (see **DASHBOARD CENTER TRIM REMOVAL/INSTALLATION**).
3. Remove the passenger's dashboard trim (A).
    1. Pry up the edge of the trim at the passenger's dashboard side panel opening.
    2. Detach the clips along the trim.

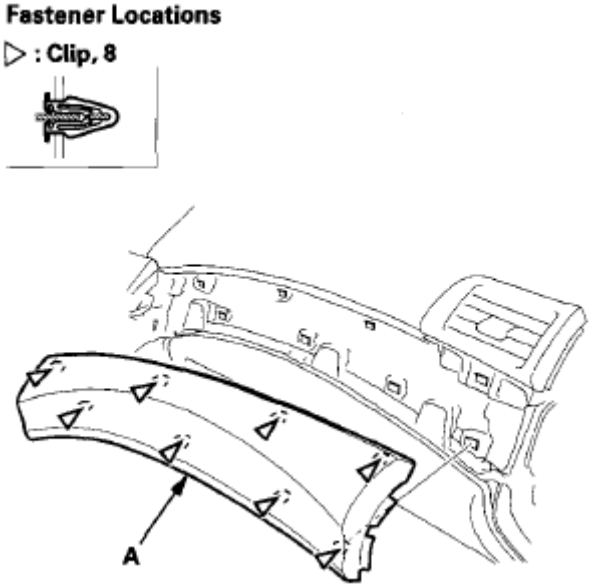

Fig. 15: Identifying Passenger's Dashboard Trim
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the trim in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Push the clips and the hooks into place securely.

GLOVE BOX REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

* Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Take care not to scratch the dashboard or the panels.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**

1. Remove these items:
   - Passenger's dashboard trim (see **PASSENGER'S DASHBOARD TRIM REMOVAL/INSTALLATION**)
   - Passenger's dashboard undercover (see **PASSENGER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**)
2. Remove the bolts (A) and the screws (B).

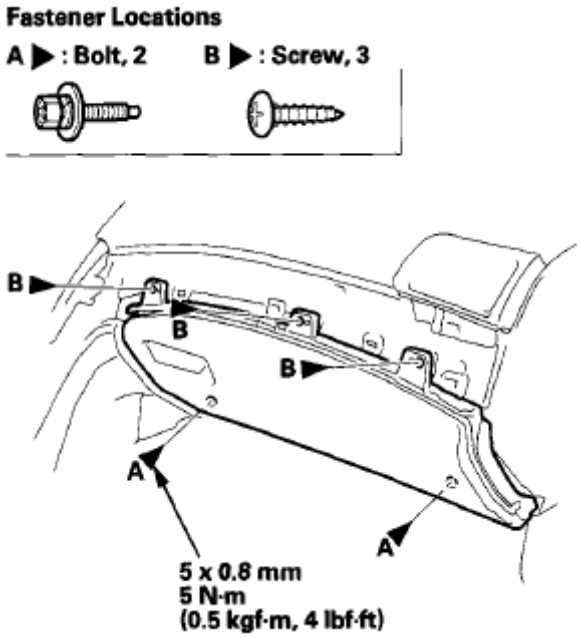

Fig. 16: Identifying Bolts And Screws With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the glove box (A).
    1. Pull out the glove box by hand to detach the clips.
    2. While holding the glove box, disconnect the glove box light bulb (B), the trunk lid opener main switch connector (C), and the keyless access system mode switch connector (D) (for some models).

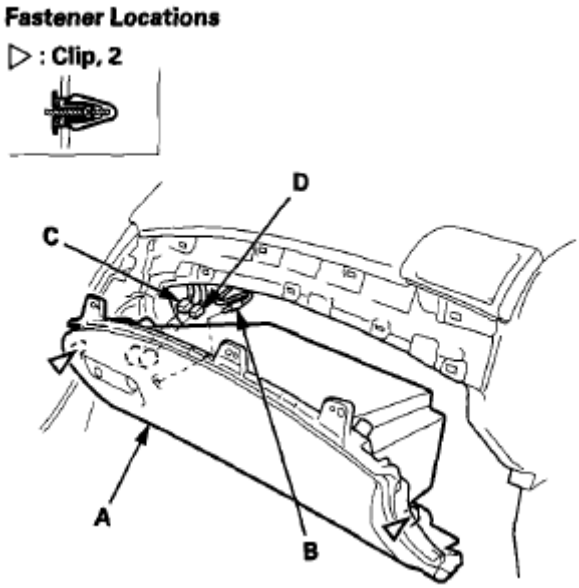

Fig. 17: Identifying Glove Box, Light Bulb, Main Switch Connector And Switch Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the glove box in the reverse order of removal, and note these items:
    - If the clips are damaged or stress-whitened, replace them with new ones.
    - Make sure each connector is plugged in properly.
    - Push the clips into place securely.

GLOVE BOX LOCK CYLINDER REPLACEMENT

NOTE: Take care not to scratch the glove box.

1. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
2. While lifting the glove box handle (A), pull out one end of the retainer (B) with a hook-shaped tool of its slot.

NOTE: Do not remove the retainer entirely. Leave one end of the retainer in its original position when removing the lock cylinder.

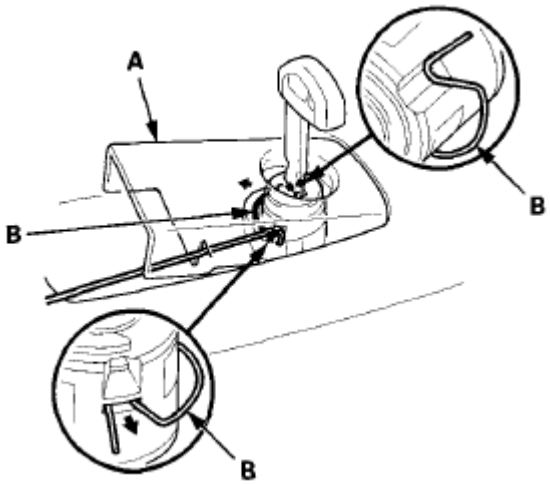

Fig. 18: Identifying Glove Box Handle And Retainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the glove box lock cylinder (A).

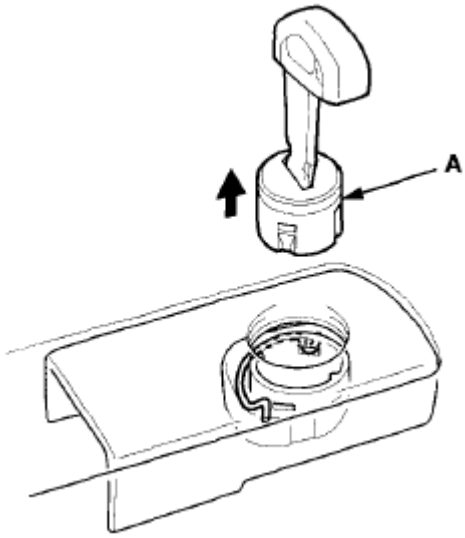

Fig. 19: Identifying Glove Box Lock Cylinder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Reinstall the end of the retainer (A) in its slot, then install the glove box lock cylinder (B). Push the cylinder into place securely until the retainer snaps into place.

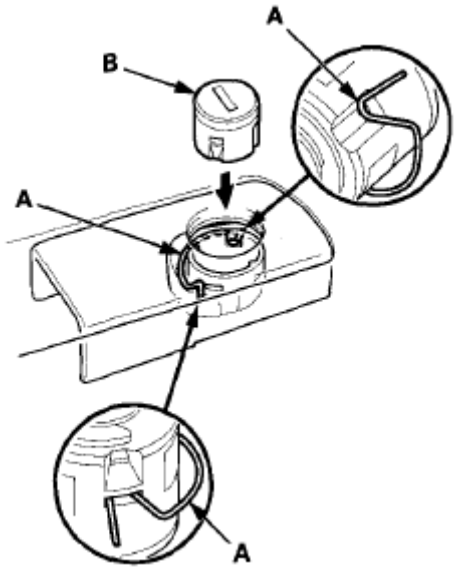

Fig. 20: Identifying Retainer And Glove Box Lock Cylinder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

GLOVE BOX DAMPER REPLACEMENT

NOTE: Take care not to scratch the glove box.

1. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
2. Release the glove box damper string (A), and remove the screws, then remove glove box damper (B).

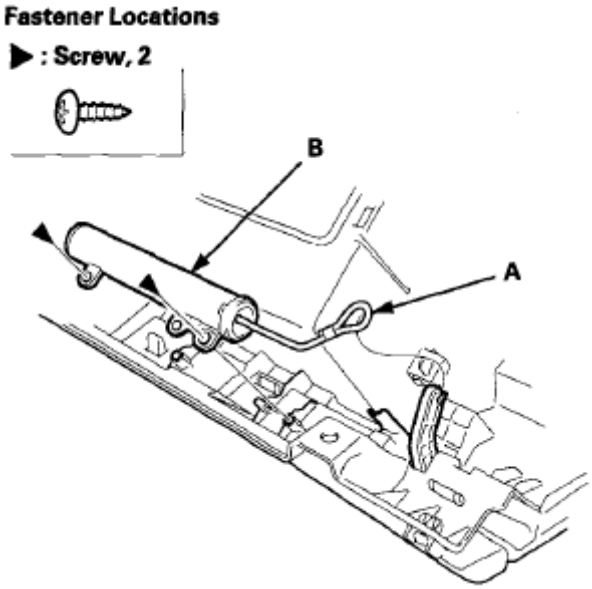

Fig. 21: Identifying Glove Box Damper String And Glove Box Damper
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the damper in the reverse order of removal.

PASSENGER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

* Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Take care not to scratch the dashboard or the related parts.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**

1. Remove the passenger's dashboard undercover (A).
    1. Gently pull down the rear edge of the undercover to detach the clips.
    2. Disconnect the front passenger's footwell light connector (B).
    3. Pull out the undercover to release the pins (C) from the brackets (D).

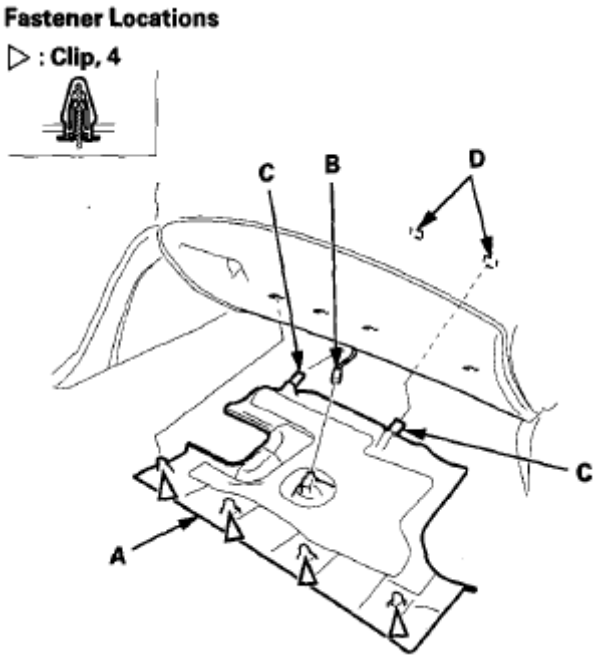

Fig. 22: Identifying Front Passenger's Footwell Light Connector, Passenger's Dashboard Undercover, Pins And Brackets
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the undercover in the reverse order of removal, and note these items:
    - If the clips are damaged or stress-whitened, replace them with new ones.

- Make sure the connector is plugged in properly.
- Make sure the pins are installed securely in the brackets.
- Push the clips into place securely.

SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Take care not to scratch the dashboard or the panels.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**
- **The left side defogger vent trim is shown; the right side defogger vent trim is similar.**

1. Insert the appropriate trim tool into a gap between the side defogger vent trim (A) and the dashboard, and pry on the hooks (B), then remove the trim.

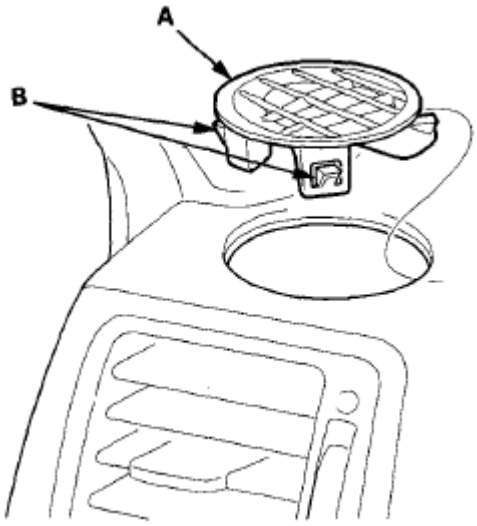

Fig. 23: Identifying Defogger Vent Trim And Hooks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the trim in the reverse order of removal, and push the hooks into place securely.

COLUMN COVER REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

* Available through the Acura Tool and Equipment Program; call 888-424-6857

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the dashboard or the panels.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**
- **Do not pry the column cover surface with any tools.**

1. Remove the instrument fascia (see **INSTRUMENT FASCIA REMOVAL/INSTALLATION**).
2. Turn the steering wheel to access the mounting screws, then remove the screws from the front side of the column cover (A).

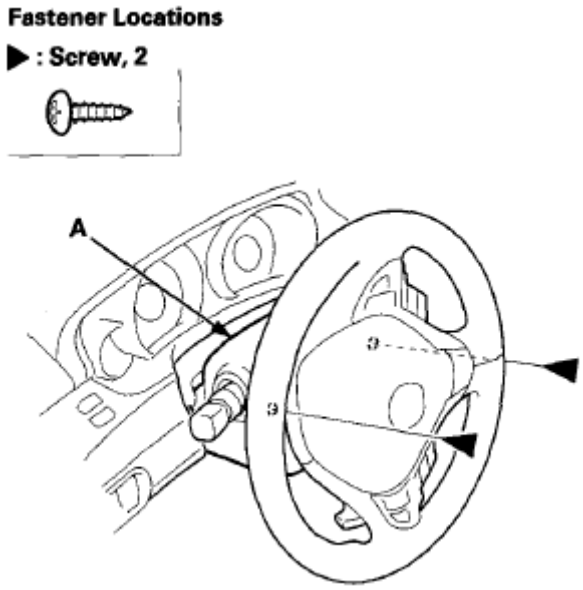

Fig. 24: Turning Steering Wheel To Access Mounting Screws From Column Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Insert a suitable sized screwdriver or equivalent tool into the holes (A) in the lower column cover (B). Gently push to release the hooks (C), and pull up the upper column cover (D) to remove it.

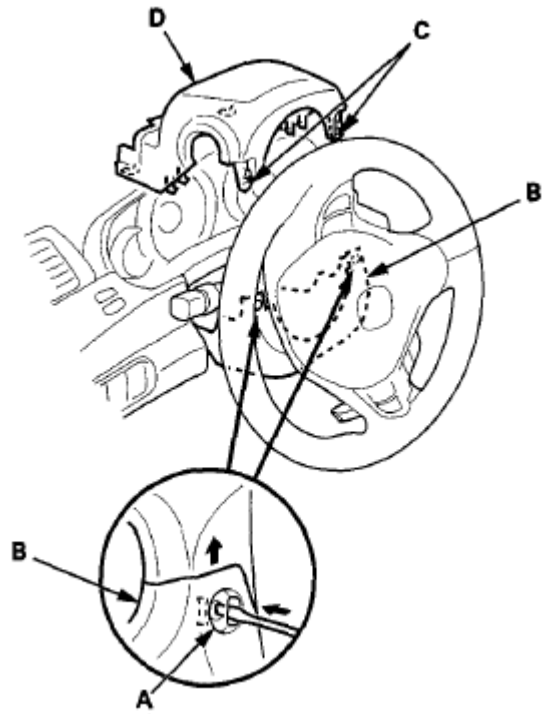

Fig. 25: Pulling Up Upper Column Cover To Remove It
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the screws (A, B), then remove the lower column cover (C).

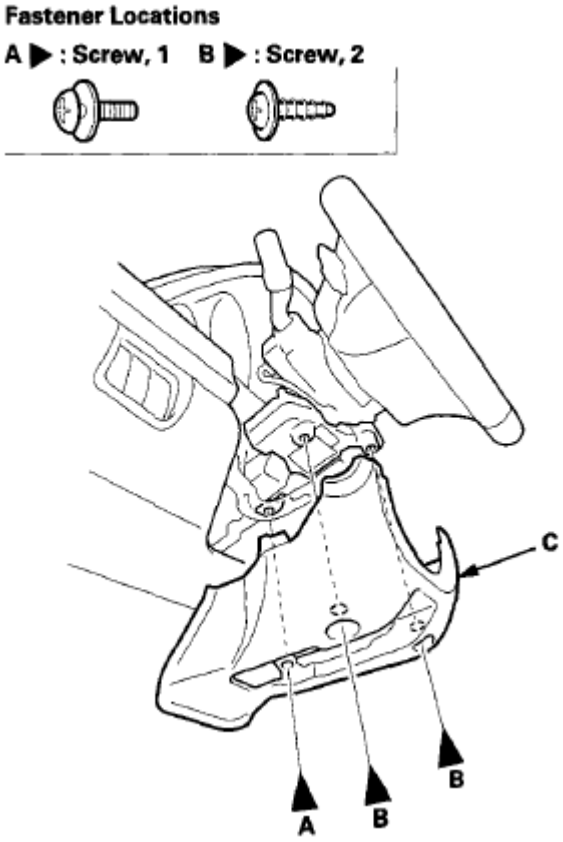

Fig. 26: Identifying Screws And Lower Column Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the upper and lower column covers in the reverse order of removal, and note these items:
   - Make sure the wire harnesses are not pinched before tightening the screws.
   - Push the hooks into place securely.

DASHBOARD REPLACEMENT

Special Tools Required

KTC Trim Tool Set SOJATP2014*

* Available through the Acura Tool and Equipment Program; call 888-424-6857

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repairs or service.

NOTE:

- **Have an assistant help you when removing and installing the dashboard.**
- **Put on gloves to protect your hands.**

- **Take care not to scratch the dashboard, the body, or the related parts.**
- **Take care not to bend the brackets.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before beginning work.
2. Remove these items from the dashboard area:
   - A-pillar trims, both sides (see **TRIM REMOVAL/INSTALLATION - PILLAR AREAS**)
   - Instrument fascia (see **INSTRUMENT FASCIA REMOVAL/INSTALLATION**)
   - Driver's switch panel (see **DRIVER'S SWITCH PANEL REMOVAL/INSTALLATION**)
   - Driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**)
   - Hood release handle (see **HOOD RELEASE HANDLE REPLACEMENT**)
   - Dashboard center vent (see **DASHBOARD CENTER VENT REMOVAL/INSTALLATION**)
   - Center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**)
   - Glove box (see **GLOVE BOX REMOVAL/INSTALLATION**)
   - Driver's side vent (see **DRIVER'S SIDE VENT REMOVAL/INSTALLATION**)
   - Passenger's side vent (see **PASSENGER'S SIDE VENT REMOVAL/INSTALLATION**)
   - Side defogger vent trims, both sides (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**)
   - Gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**)
   - Center speaker (see **FRONT CENTER SPEAKER**)
   - Without navigation: Audio-HVAC display unit (see **AUDIO-HVAC DISPLAY UNIT REMOVAL/INSTALLATION**)
   - With navigation: Navigation display unit (see **NAVIGATION DISPLAY UNIT REMOVAL/INSTALLATION**)
   - Without navigation: Audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**)
   - With navigation: Audio-Navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**)
   - Steering column (see **STEERING COLUMN REMOVAL AND INSTALLATION**)
   - Humidity/In-car temperature sensor (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR REPLACEMENT**)
   - Sunlight sensor (see **OUTSIDE AIR TEMPERATURE SENSOR REPLACEMENT**)
   - With navigation: GPS antenna (see **GPS ANTENNA REMOVAL/INSTALLATION**)
   - Front passenger's airbag (see **FRONT PASSENGER'S AIRBAG REPLACEMENT**)
   - With keyless access system: Front interior LF antenna (see **RF UNIT REPLACEMENT**)
   - With keyless access system: Remote slot (see **REMOTE SLOT TEST/REPLACEMENT**)

Driver's Side

3. Detach the harness clip (A) from between the A-pillar (B) and the dashboard (C).

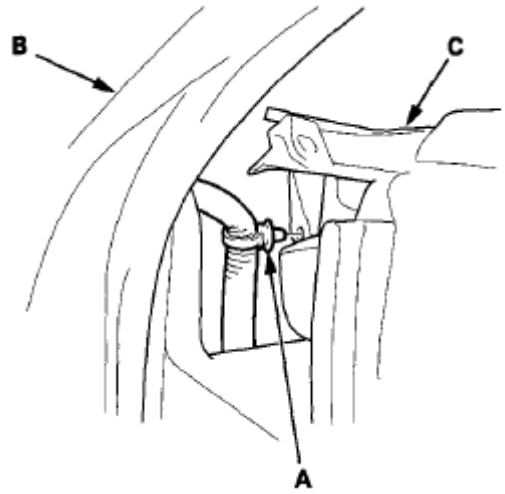

Fig. 27: Identifying Harness Clip, A-Pillar And Dashboard
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Center Area

4. Detach the clip, then remove the center joint duct (A).

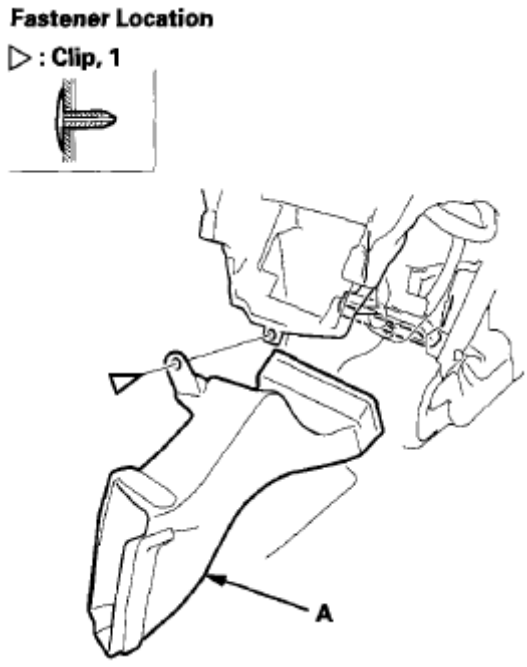

Fig. 28: Identifying Center Joint Duct
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Detach the harness clips (A, B) from below the display unit opening.

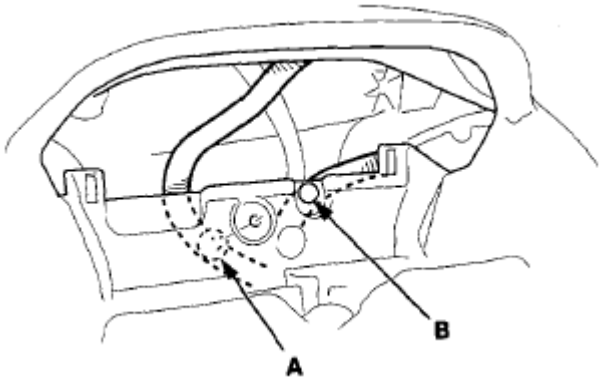

Fig. 29: Identifying Harness Clips Below Display Unit Opening
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Passenger's Side

6. Detach the harness clip (A) from between the A-pillar (B) and the dashboard (C).

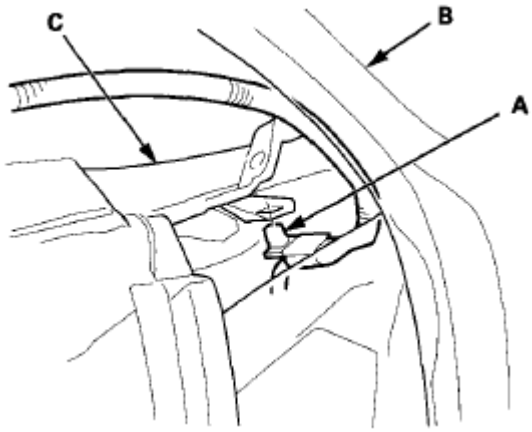

Fig. 30: Identifying Harness Clip, A-Pillar And Dashboard
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the bolts securing the dashboard (A).

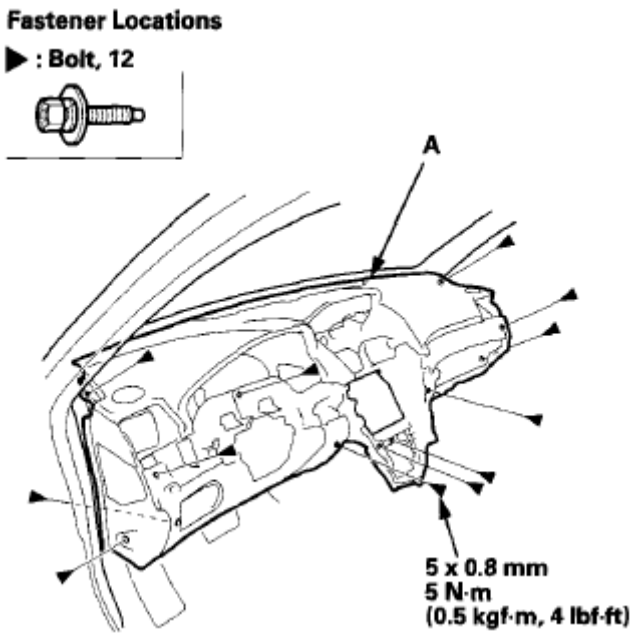

Fig. 31: Identifying Bolts To Secure Dashboard With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Lift up on the dashboard (A) to release it from the guide pins (B), then carefully remove the dashboard through the front door opening.

NOTE: Do not rest the dashboard on its lower console opening, or it may be damaged. Lay it on its front or back.

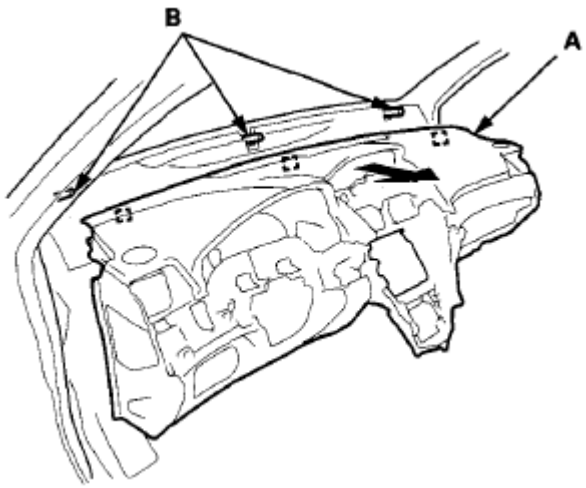

Fig. 32: Identifying Dashboard And Guide Pins
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the dashboard in the reverse order of removal, and note these items:
   - Make sure the dashboard fits onto the guide pins correctly.

- Make sure the wire harnesses are not pinched before tightening the bolts.
- Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
- Check for any DTCs that may have been set during repairs, and clear them.

DASHBOARD/STEERING HANGER BEAM REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repairs or service.

NOTE:

- **Have an assistant help you when removing and installing the dashboard.**
- **Put on gloves to protect your hands.**
- **Take care not to scratch the dashboard, the body, or the related parts.**
- **Take care not to bend the brackets.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before beginning work.
2. Remove these items from the dashboard:
   - A-pillar trims, both sides (see **TRIM REMOVAL/INSTALLATION - PILLAR AREAS**)
   - Driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**)
   - Kick panels, both sides (see **TRIM REMOVAL/INSTALLATION - DOOR AREAS**)
   - Hood release handle (see **HOOD RELEASE HANDLE REPLACEMENT**)
   - Instrument fascia (see **INSTRUMENT FASCIA REMOVAL/INSTALLATION**)
   - Steering column (see **STEERING COLUMN REMOVAL AND INSTALLATION**)
   - Center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**)
   - Passenger's dashboard undercover (see **PASSENGER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**)

Driver's Side

3. Disconnect the roof wire harness connector (A).

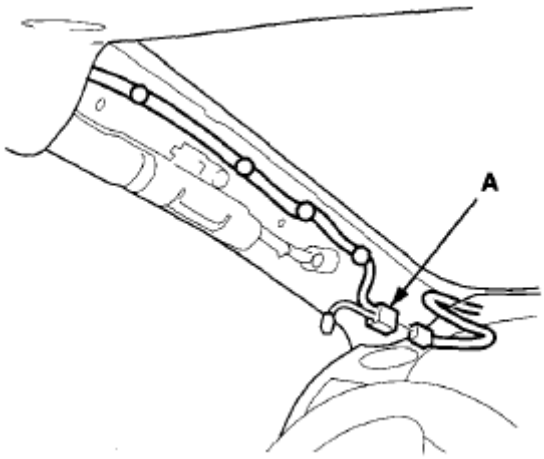

Fig. 33: Identifying Roof Wire Harness Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the left side wire harness connectors (A), the left engine compartment wire harness connectors (B), and the driver's door wire harness connector (C) from the driver's under-dash fuse/relay box (D).

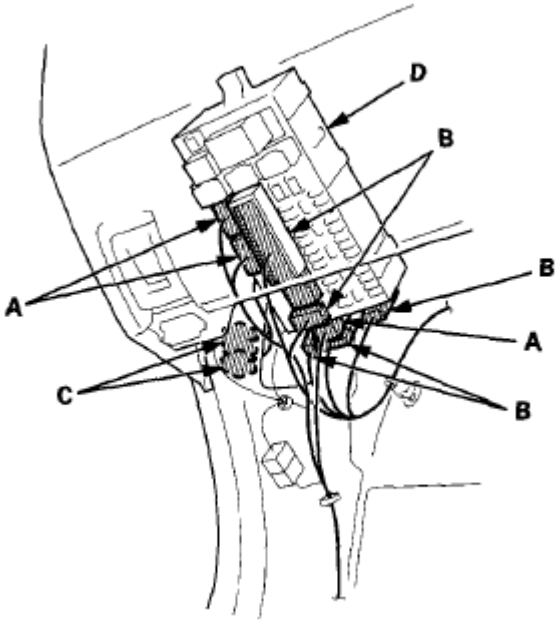

Fig. 34: Identifying Left Side, Left Engine And Driver's Door Wire Harness Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Detach the harness clip (A) fastening the relay (B) from the brake pedal support member (C). Remove the bolts (D, E), then remove the member, and disconnect the TPMS control unit connector (F).

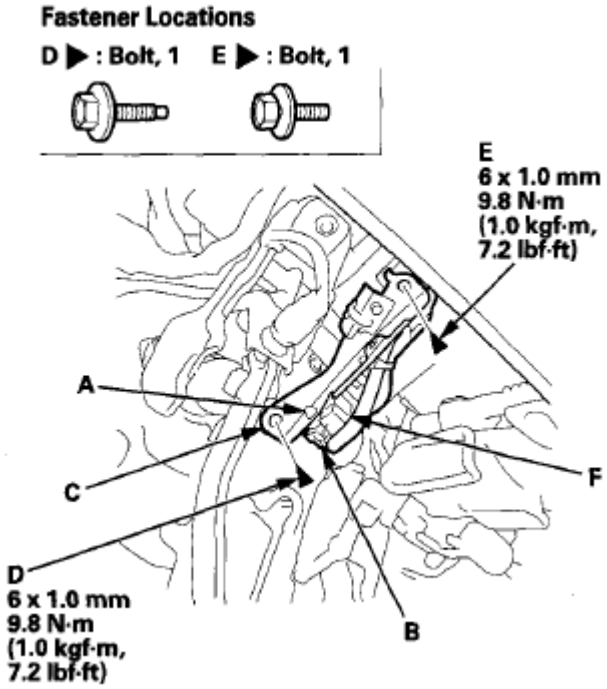

Fig. 35: Identifying Harness Clips, Relay, Brake Pedal Support Member, TPMS Control Unit Connector And Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Center Dashboard/Console

6. Detach the clip, then remove the center joint duct (A).

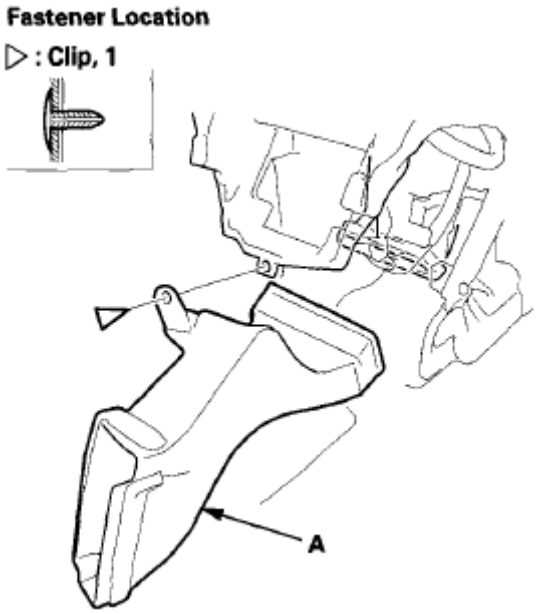

Fig. 36: Identifying Center Joint Duct

Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Detach the clip securing the center side duct (B). Disconnect SRS unit connector A, the A/C wire harness connector (C), and the yaw rate-lateral/(longitudinal) acceleration sensor connector (D), the A/T shift solenoid /park-pin switch connector (E), the center console subharness connector (F), then detach the wire harness clips (G). Remove the TORX ground bolt (H) with a TORX T30 bit.

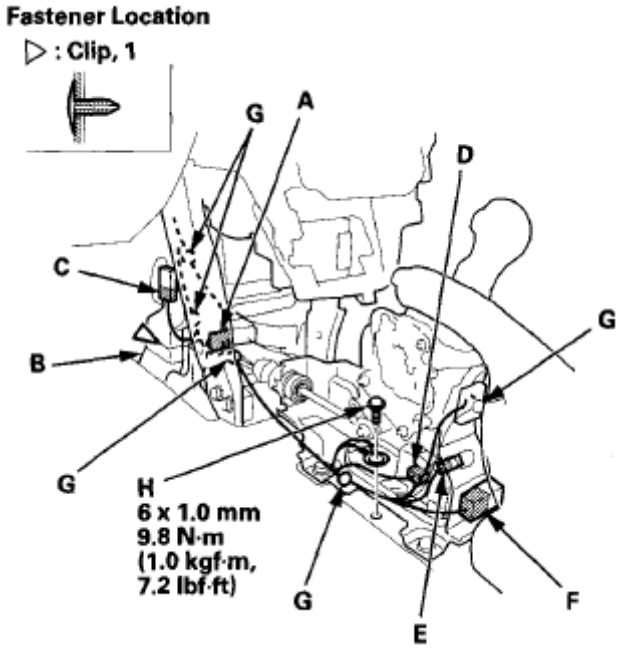

Fig. 37: Identifying Center Side Duct, A/C Wire Harness Connector, Acceleration Sensor Connector, Switch Connector, Connector And Clips With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Center Dashboard (Passenger's Side)

8. Disconnect the A/C wire harness connector (A), and detach the clip securing the center side duct (B).

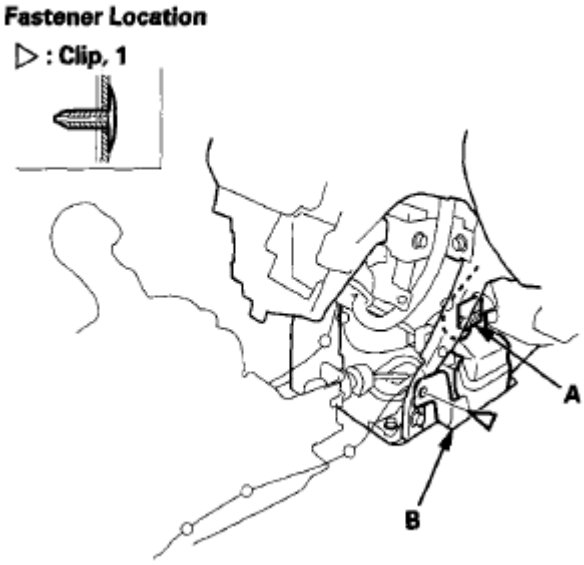

Fig. 38: Identifying A/C Wire Harness Connector And Center Side Duct
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Passenger's Side

9. Disconnect the antenna lead connectors (A).

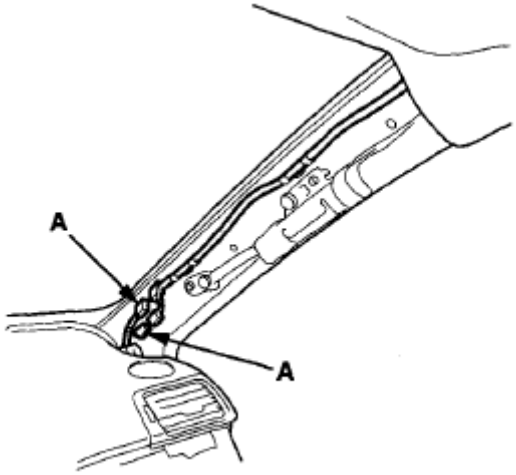

Fig. 39: Identifying Antenna Lead Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Disconnect the passenger's door wire harness connector (A), the right side wire harness connectors (B), and the right engine compartment wire harness connectors (C). Disconnect the dashboard wire harness connector (D) and the audio wire harness connectors (E) from the passenger's under-dash fuse/relay box (F). Detach the harness clip (G).

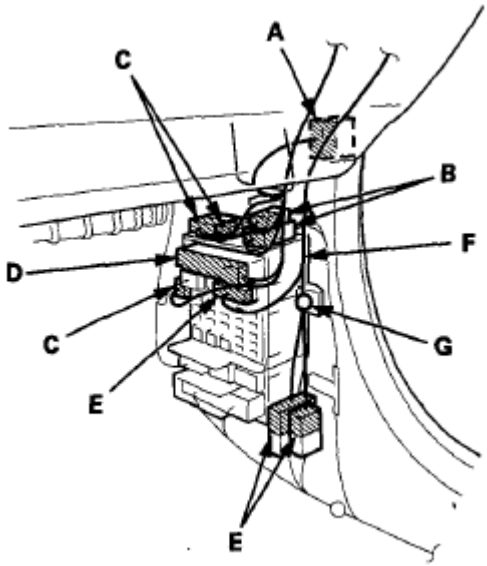

Fig. 40: Identifying Different Types Of Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Remove the center frame mounting bolt (A) and the center joint bracket mounting bolts (B).

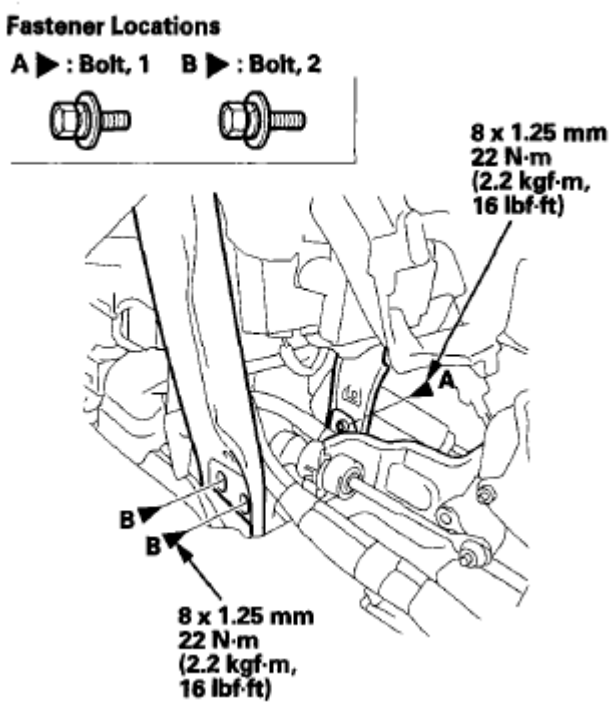

Fig. 41: Identifying Center Frame Mounting Bolt And Center Joint Bracket Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the cowl cover (see **FRONT BULKHEAD BRACE COVER REPLACEMENT**).

13. Remove the bolt securing the steering hanger beam.

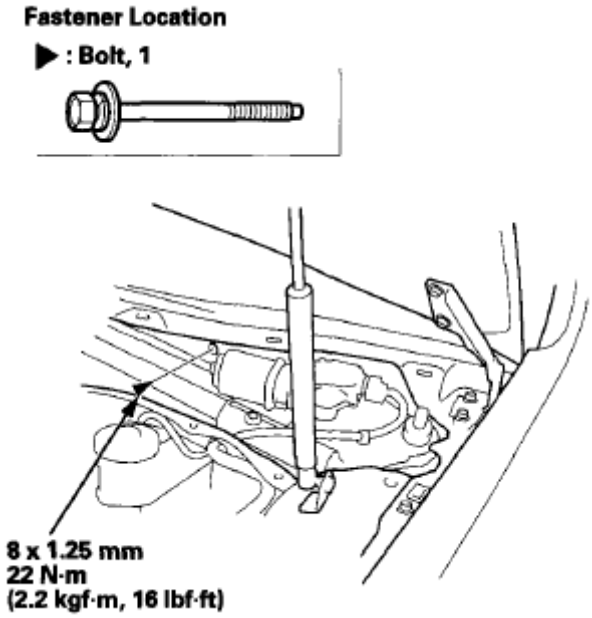

Fig. 42: Identifying Bolt Securing Steering Hanger Beam With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Remove the special bolts (A) from outside the passenger's door.
    1. Remove the caps (B).
    2. Loosen the special bolts until they disengage from the threads on the hanger beam side bracket (C), and engage the inside threads of the collar bolts (D). The thread lock on the special bolts makes the special bolts and the collar bolts turn together.
    3. Continue loosening the special bolts to turn the collar bolts into the fixed space adjusters (E) until the collar bolts engage the stops (F). This creates a gap (G) between the collar bolts and the body.
    4. Loosen the special bolts to disengage them from the collar bolts, then remove them.

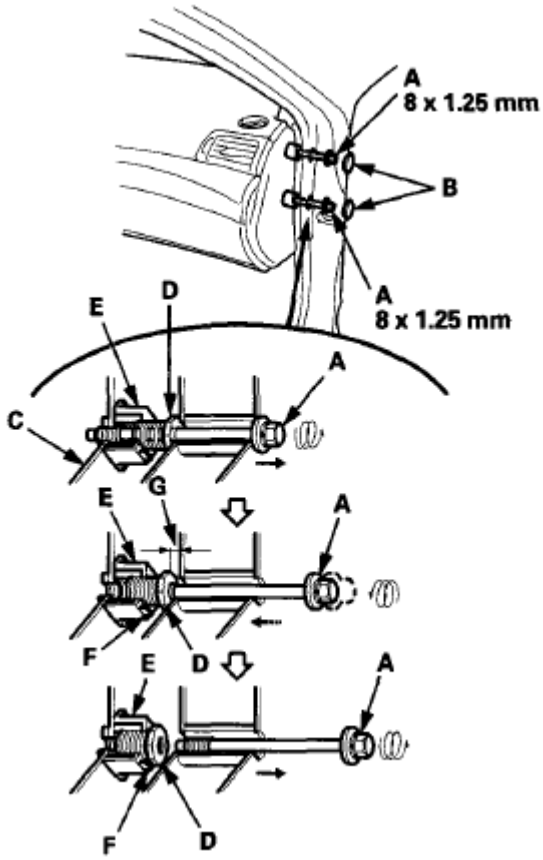

Fig. 43: Identifying Bolts, Side Bracket, Collar Bolts, Space Adjusters, Stops And Gap
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Check that the collar bolts (A) are seated in the space adjusters (B).
    1. Insert an 8 mm hex wrench in the collar bolt.
    2. Gently turn the wrench counterclockwise.
    3. If the wrench turns easily, continue turning until the collar bolt seats and engages the stop (C).
    4. If the wrench does not turn easily, the collar bolt is seated.

NOTE: If either collar bolt was not seated, replace the special bolts.

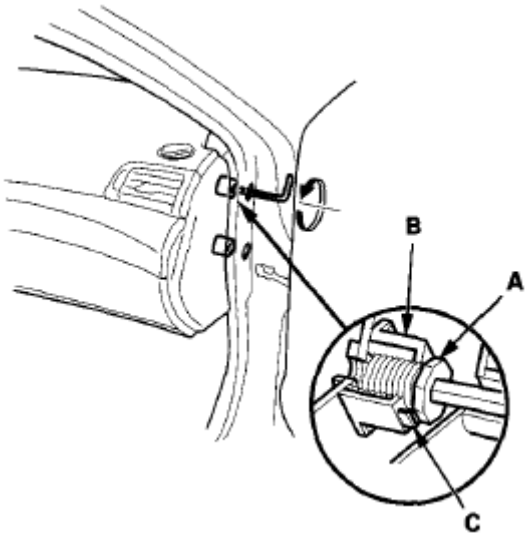

Fig. 44: Identifying Collar Bolts, Space Adjusters And Stop
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. From outside the driver's door, remove the caps (A), then remove the driver's side bracket bolts from outside the driver's door.

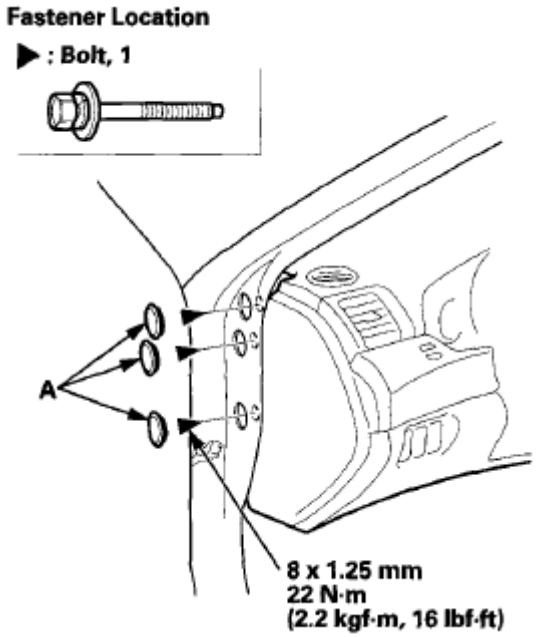

Fig. 45: Identifying Caps From Outside Driver's Door With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Lift up on the dashboard (A) to release it from the guide pins (B) on the body. Carefully remove the dashboard through the front door opening.

NOTE:

- **Take care not to scratch the body with the collar bolts on the passenger's side.**
- **Do not rest the dashboard on its lower center cover opening, or it may be damaged. Lay it on its front or back.**

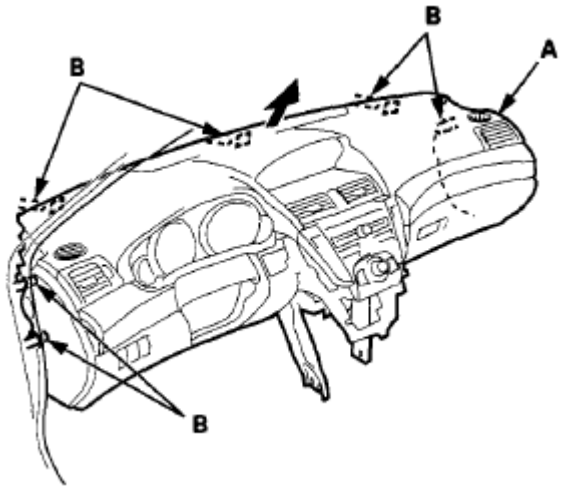

Fig. 46: Lifting Up On Dashboard To Release It From Guide Pins On Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Install the dashboard in the reverse order of removal, and note these items:
    - If the clips are damaged or stress-whitened, replace them with new ones.
    - Make sure the dashboard fits onto the guide pins correctly.
    - Before tightening the bolts, make sure the wire harnesses are not pinched.
    - Make sure each connector is plugged in properly.
    - Push the clips and the hooks into place securely.
    - Make sure the collar bolts (A) turn easily by hand in the fixed space adjusters (B). Tighten the collar bolts by hand until they engage the stops (C) before reinstalling the dashboard.
    - Before reinstalling the dashboard, screw the special bolts (D) into the collar bolts, and check that they turn together. If they do not turn together, replace the special bolts.
    - After setting the dashboard in the body, reinstall all of the mounting bolts but do not tighten them. First tighten the driver's side bracket bolts to the specified torque. Next, tighten the special bolts. As you tighten the bolts, the collar bolts screw out of the fixed space adjuster until they contact the body. Continue tightening the special bolts to the specified torque.
    - Apply medium strength liquid thread lock to the bolts securing the center joint bracket and the dashboard before reinstallation.
    - After tightening the dashboard mounting bolts, tighten the center joint bracket mounting bolts, and then tighten the center frame mounting bolts.
    - Tighten all remaining mounting bolts to the specified torque.
    - Do the battery terminal reconnection procedure (see **BATTERY TERMINAL**

DISCONNECTION AND RECONNECTION).

- Check for any DTCs that may have been set during repairs, and clear them.

Special bolt tightening on passenger's side

2012 ACCESSORIES & EQUIPMENT

Dashlights Brightness Controller - TL

CIRCUIT DIAGRAM

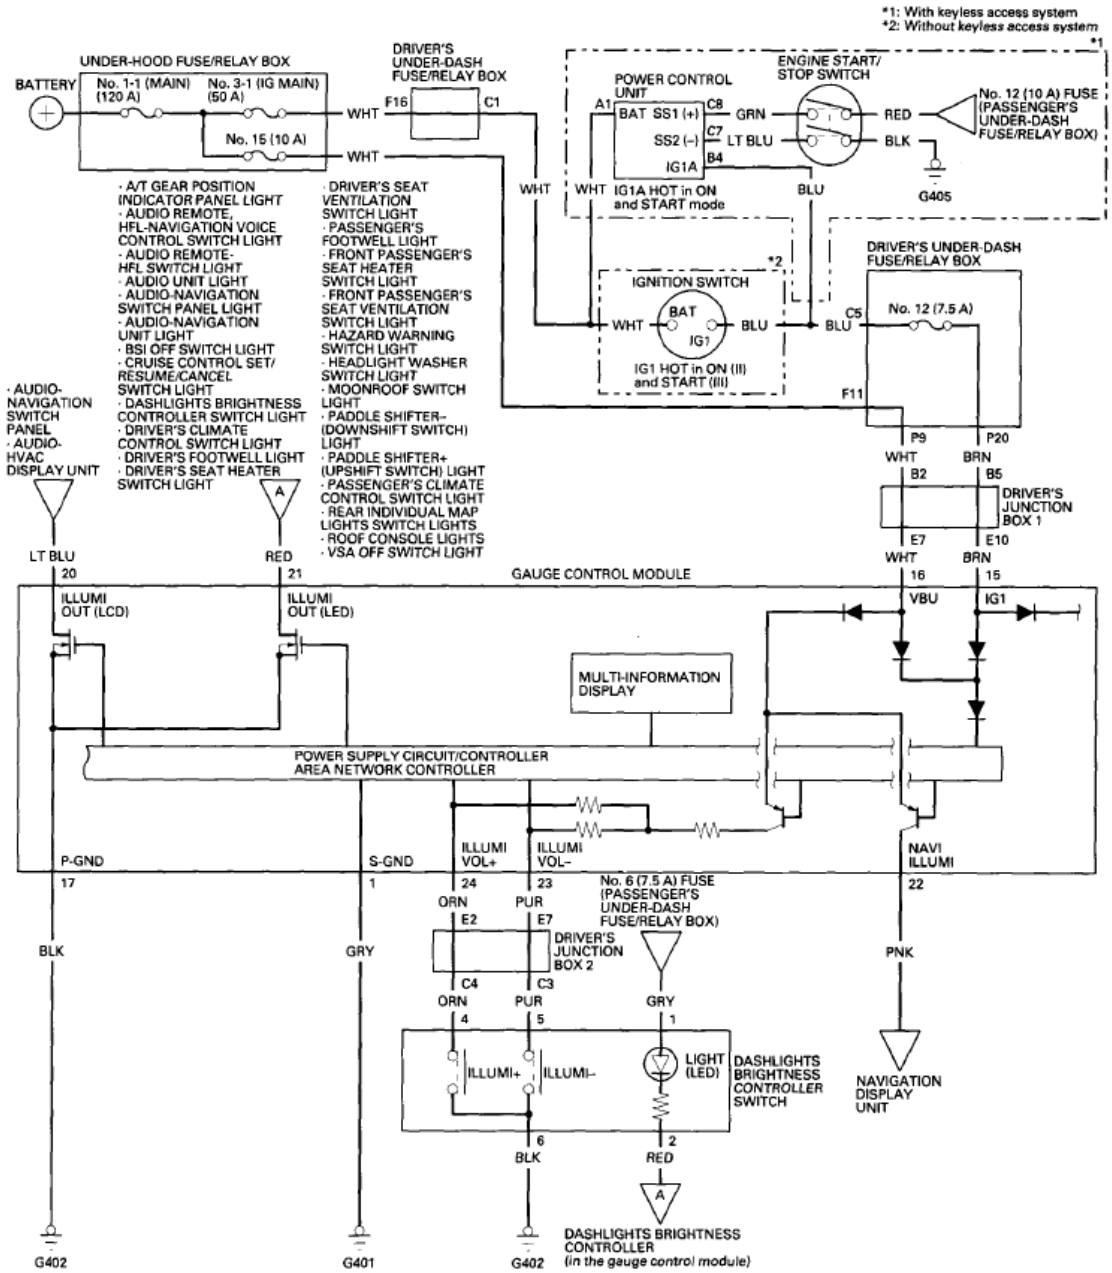

Fig. 1: Dashlights Brightness Controller Circuit Wiring Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DASHLIGHTS BRIGHTNESS CONTROLLER SWITCH TEST/REPLACEMENT

1. Remove the driver's dashboard trim. (See **DRIVER'S DASHBOARD TRIM REMOVAL/INSTALLATION**).
2. Remove the two screws and dashlights brightness controller switch (A) from the driver's dashboard trim (B).

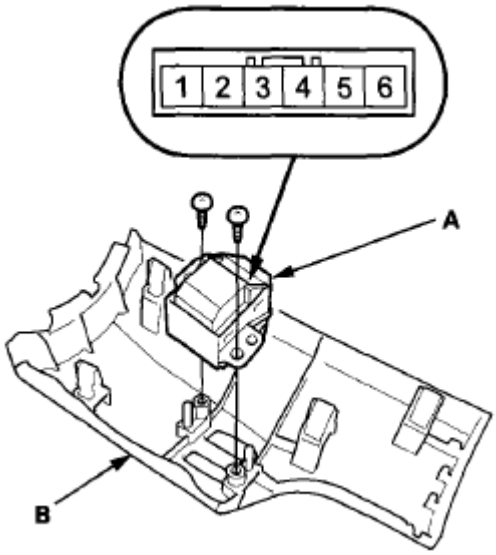

Fig. 2: Identifying Dashlights Brightness Controller Switch & Trim With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between the terminals in each switch position according to the table.

NOTE:

- **Make sure the correct test lead (+ or -) is placed on the terminal.**
- **When checking for continuity across the diode, use the diode setting on the digital volt/ohm meter to check the diode bias.**
- **Be careful of this characteristic; a diode is one that conducts fully in one direction (forward) and not at all in the opposite direction (reverse).**

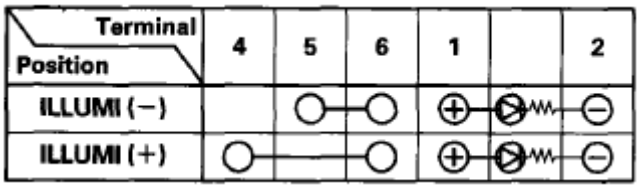

Fig. 3: View Of Continuity Between Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the continuity is not as specified or LED does not turn on, replace the switch.

2012 ACCESSORIES & EQUIPMENT

Driver Position Memory System - TL

COMPONENT LOCATION INDEX

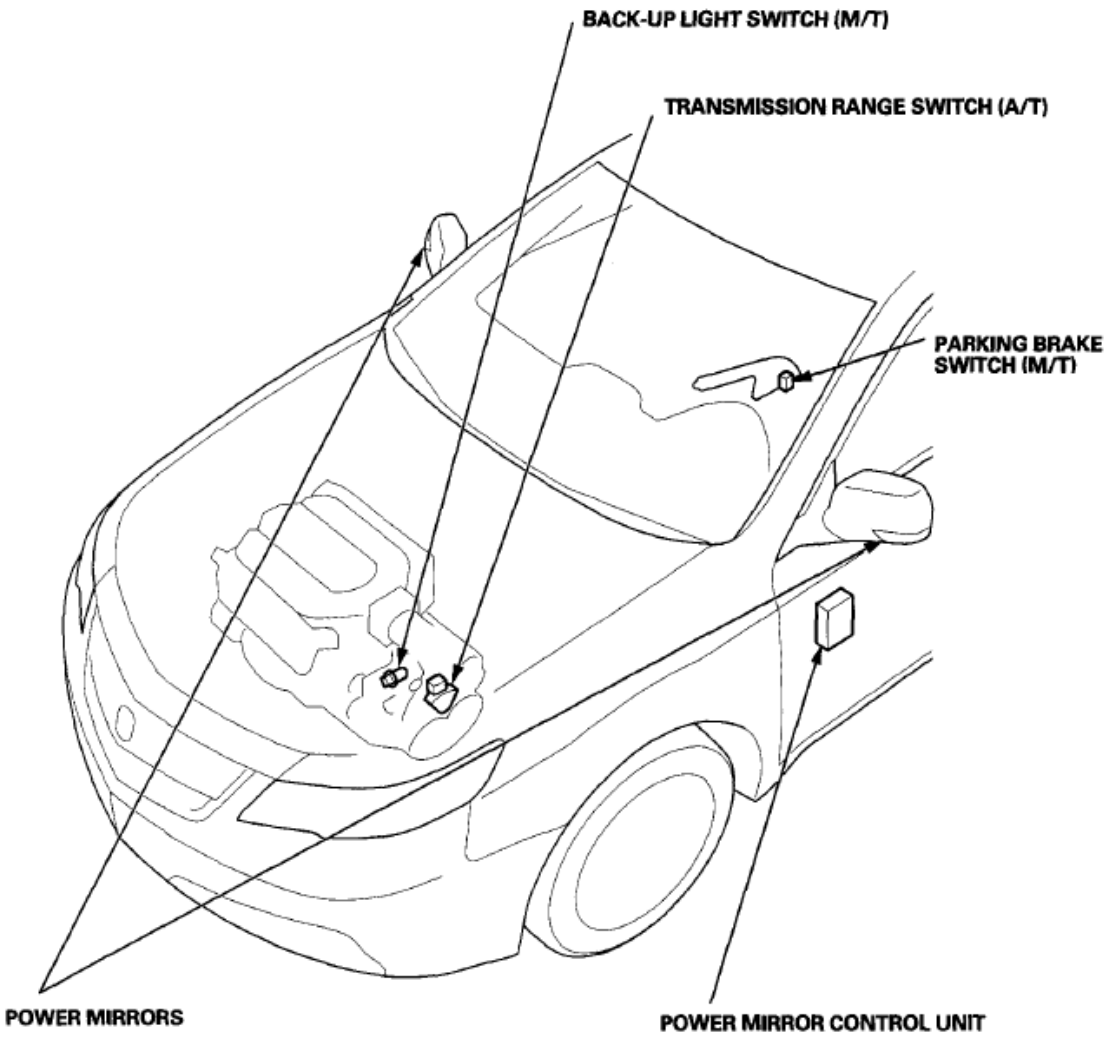

Fig. 1: Driver Position Memory System Components Location (1 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

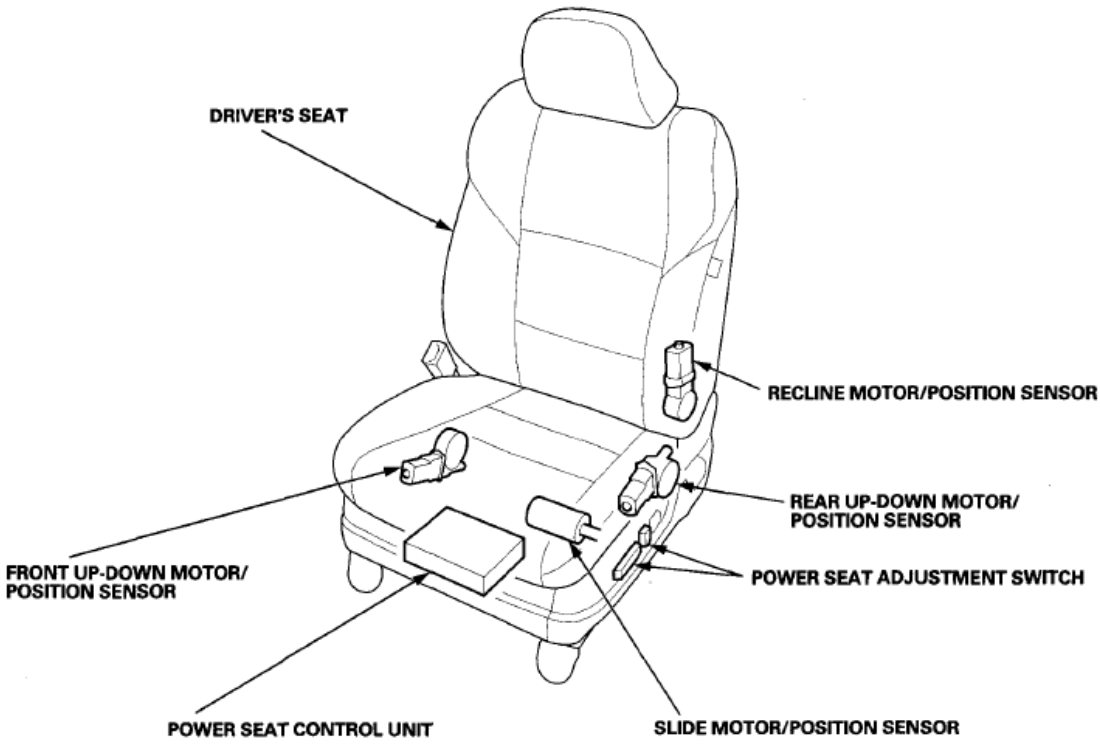

Fig. 2: Driver Position Memory System Components Location (2 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

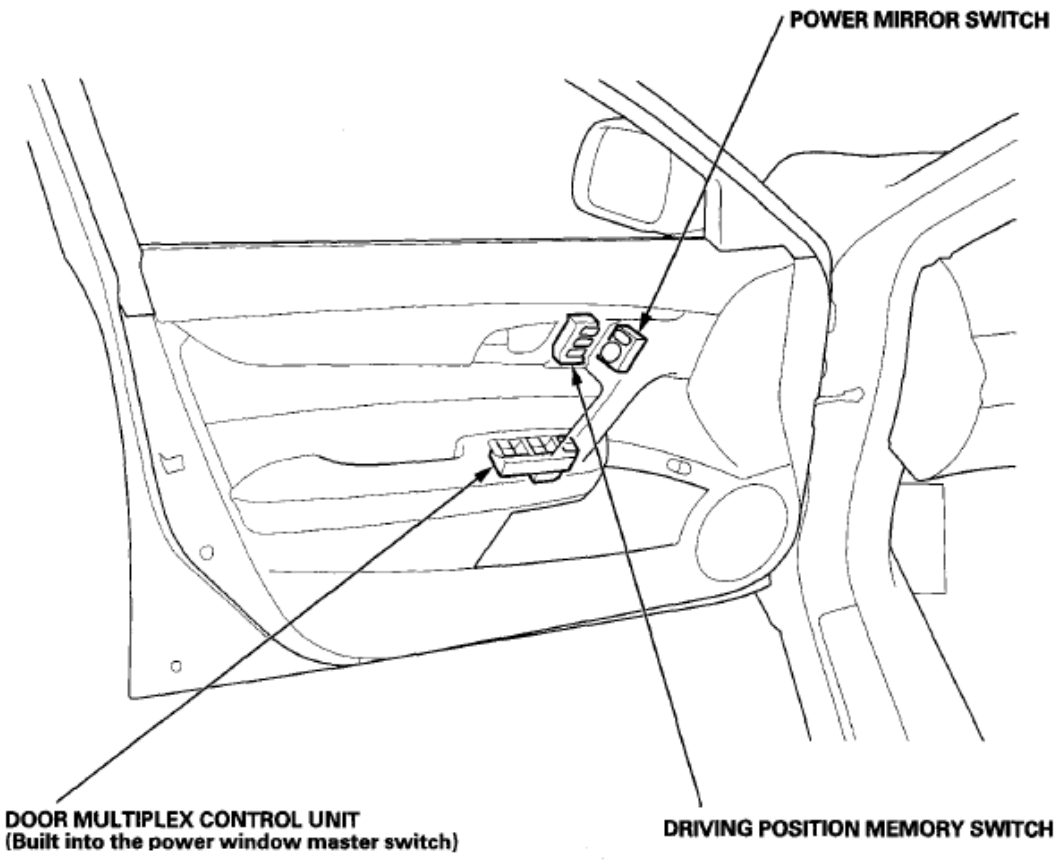

Fig. 3: Driver Position Memory System Components Location (3 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SYSTEM DESCRIPTION

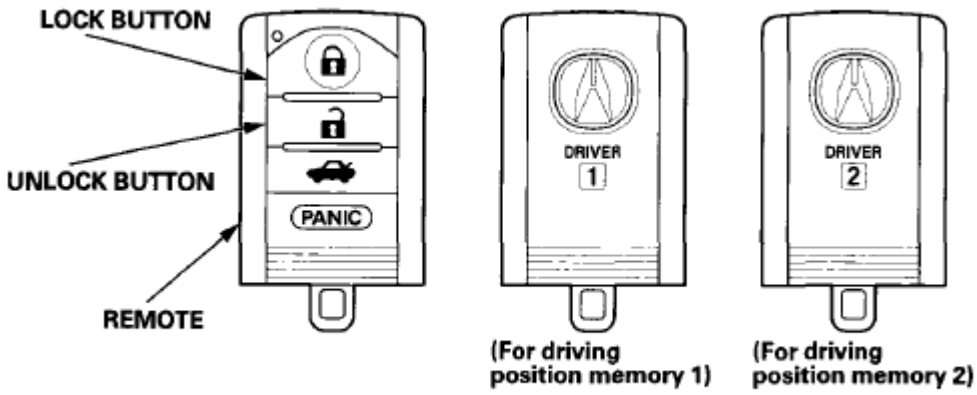
The driver's seat and the power mirrors have a memory feature. All the adjustments can be memorized by pressing the SET button on the driving position memory switch, and then pressing one of two position buttons within 5 seconds. Pressing the appropriate position button will move the seat and the mirrors to the memorized positions.

Along with the seat and mirror settings, the power door lock settings can also be memorized based on which remote (Driver 1 or Driver 2) is used.

This system is integrated with the multiplex integrated control system, and has 9 wake-up and sleep modes. All digital signals are sent via shared B-CAN and UART communication lines. For more information about communication line and wake-up/sleep mode, refer to the Multiplex Integrated Control System Description (see **SYSTEM DESCRIPTION**).

Disconnecting the battery erases the memorized positions.

MEMORIZING A SEAT AND MIRROR POSITION



Move the seat and the mirrors to the desired position. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

Press and hold the SET button on the driver's position memory switch. A single beep is heard and both of the green LEDs begin to flash. Press No. 1 or No. 2 to match the remote that is to be used. There are two more beeps confirming that the seat and the mirror are memorized. The green LED remains lit, unless the seat and the mirrors are moved from the memorized position.

MEMORIZED POSITION RECALL WITH THE REMOTES

After the seat and the mirror positions are memorized, the seat and mirror move to the position when the appropriate remote UNLOCK button is pressed and the driver's door is opened. When the seat and the mirrors move to the memorized position, the green LED corresponding with that remote stays lit until the position is changed or the key is turned to LOCK (0), or engine start/stop button is pressed to select the OFF mode.

Without Keyless Access System

View of the remote when the door key is removed.

POWER SEAT POSITION SENSORS

Each motor has a sensor that detects motor rotation and sends a pulse to the power seat control unit when the motor rotates. The control unit stores the number of pulses in its memory, and the seat position is memorized.

POWER MIRROR POSITION SENSORS

Using of a tilt position sensor and a swing position sensor, the power mirror control circuit in the power mirror control unit detects the voltage changes created by the mirrors moving. These voltage changes are stored in memory, and the power mirror positions are memorized for each stored driving position.

REVERSE MIRROR CONTROL

When the vehicle is shifted to R or reverse (shift lever in R or reverse) with the power mirror selector switch in the Left (or the Right) position, the driver's (or the passenger's) side mirror tilts down automatically to help the driver's view. The mirror returns to the previous position when the shift lever is shifted out of R or reverse. The reverse mirror control is cancelled if the power mirror selector switch is in the center position.

DTC TROUBLESHOOTING

DTC B1802: POWER SEAT CONTROL UNIT FAILURE

NOTE: **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN**

SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC B1802 indicated?

YES -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

NO -Intermittent failure, the system is OK at this time.

DTC B1825: POWER SEAT SLIDE MOTOR PULSE ERROR

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Operate the power seat adjustment switch for several seconds in each direction.

NOTE: DTC B1825 is stored when the slide switch is operated more than 1 second after the seat moves to the most forward or backward position, even when the system is OK.

4. Check for DTCs with the HDS.

Is DTC B1825 indicated?

YES -Go to step 5.

NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Clear the DTCs with the HDS.

Is DTC B1836 also indicated?

YES -Go to the **DTC B1836 TROUBLESHOOTING**).

NO -Go to step 6.

6. Clear the DTCs with the HDS.

   Are DTCs B1826, B1827, and/or B1828 also indicated?

   YES -Go to step 17.

   NO -Go to step 7.

7. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
8. Operate the slide switch for 2 seconds, and check the slide motor operation.

   Does the slide motor run smoothly?

   YES -Go to step 9.

   NO -Go to step 24.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect power seat control unit connector B (40P).
11. Disconnect the slide motor/position sensor 5P connector.
12. Check for continuity between power seat control unit connector B (40P) terminals No. 29 and No. 11 and slide motor/position sensor 5P connector terminals No. 3 and No. 4 respectively.

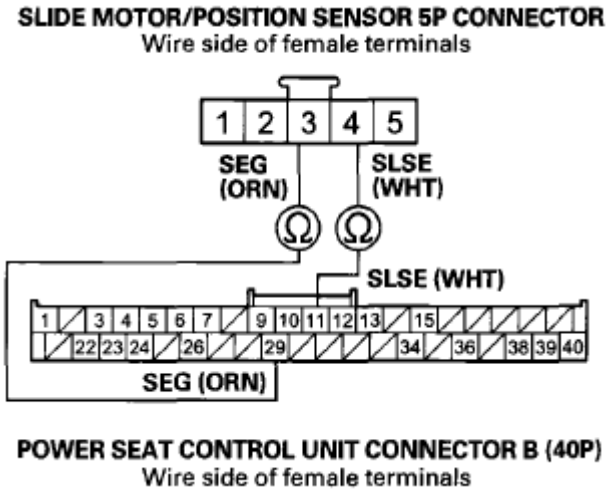

Fig. 13: Checking Continuity Between Power Seat Control Unit Connector B (40P) Terminals No. 29 And No. 11
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 13.

NO -Repair an open or high resistance in the wire.

13. Check for continuity between body ground and power seat control unit connector B (40P) terminal No. 11.

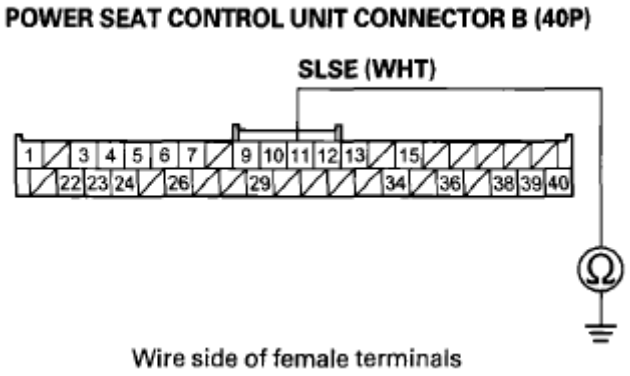

Fig. 14: Checking Continuity Between Body Ground And Power Seat Control Unit Connector B (40P) Terminal No. 11
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 14.

14. Reconnect power seat control unit connector B (40P).
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Measure the voltage between slide motor/position sensor 5P connector terminals No. 4 (+) and No. 3 (-).

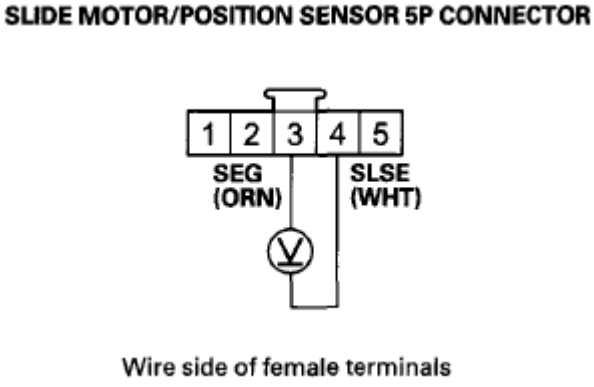

Fig. 15: Measuring Voltage Between Slide Motor/Position Sensor 5P Connector Terminals No. 4 (+) And No. 3 (-)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Replace the slide motor/position sensor (see **FRONT SEAT SLIDE MOTOR REPLACEMENT**).

NO -If there is no voltage, replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**). If there is battery voltage, repair a short in the wire (sensor line).

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Disconnect power seat control unit connector B (40P).
19. Disconnect the slide motor/position sensor 5P connector.
20. Check for continuity between power seat control unit connector B (40P) terminals No. 15 and No. 29 and slide motor/position sensor 5P connector terminals No. 2 and No. 3 respectively.

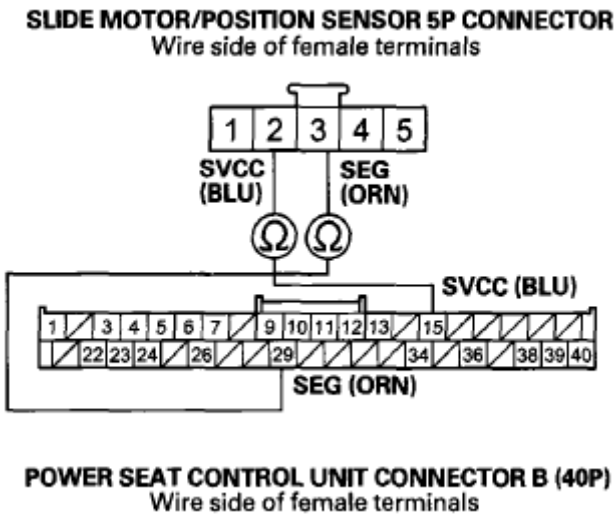

Fig. 16: Checking Continuity Between Power Seat Control Unit Connector B (40P) Terminals No. 15 And No. 29
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 21.

NO -Repair an open or high resistance in the wire.

21. Reconnect power seat control unit connector B (40P).
22. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
23. Measure the voltage between power seat control unit connector B (40P) terminals No. 15 and No. 29.

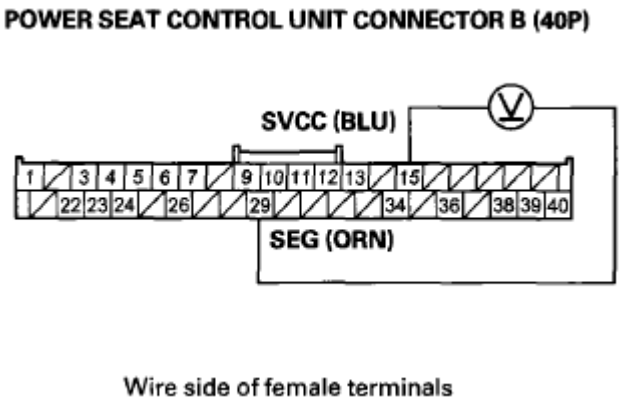

Fig. 17: Measuring Voltage Between Power Seat Control Unit Connector B (40P) Terminals No. 15 And No. 29
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage when the slide switch is operated?

YES -Replace the slide motor/position sensor (see **FRONT SEAT SLIDE MOTOR REPLACEMENT**).

NO -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

24. Check the No. 19 (20 A) fuse in the driver's under-dash fuse/relay box.

    Is the fuse OK?

    YES -Go to step 25.

    NO -Replace the fuse. If the fuse blows again, repair the short to ground on the No. 19 (20 A) fuse circuit.

25. Measure the voltage between body ground and power seat control unit connector A (18P) terminal No. 8.

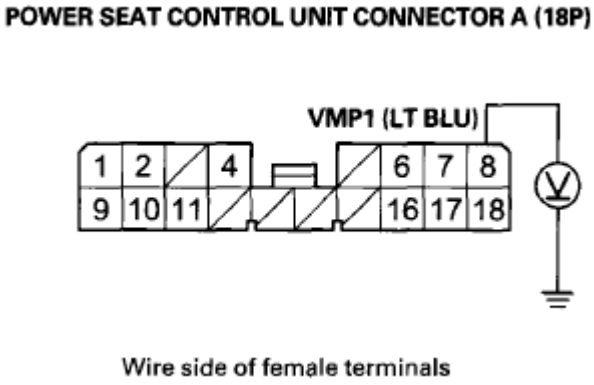

Fig. 18: Measuring Voltage Between Body Ground And Power Seat Control Unit Connector A

(18P) Terminal No. 8
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 26.

NO -Repair an open or high resistance in the wire between the driver's under-dash fuse/relay box and the power seat control unit.

26. Measure the voltage between body ground at power seat control unit connector A (18P) terminal No. 18 when operating the slide switch.

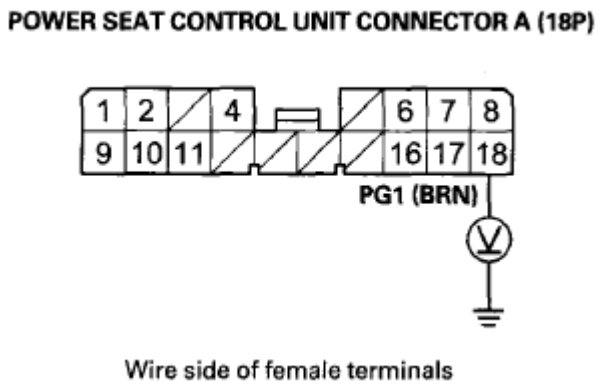

Fig. 19: Measuring Voltage Between Body Ground At Power Seat Control Unit Connector A (18P) Terminal No. 18
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 0.2 V or more?

YES -Repair an open or high resistance in the wire between the power seat control unit and body ground (G701).

NO -Go to step 27.

27. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
28. Disconnect power seat control unit connector A (18P).
29. Disconnect the slide motor/position sensor 5P connector.
30. Check for continuity between power seat control unit connector A (18P) terminals No. 17 and No. 7 and slide motor/position sensor 5P connector terminals No. 1 and No. 5 respectively.

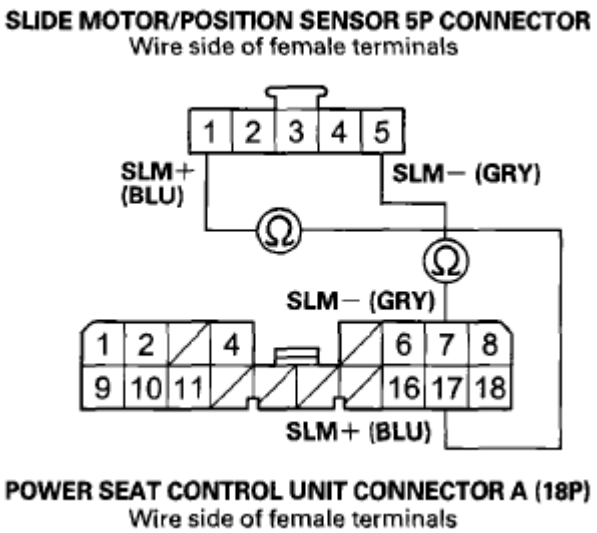

Fig. 20: Checking Continuity Between Power Seat Control Unit Connector A (18P) Terminals No. 17 And No. 7
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 31.

NO -Repair an open or high resistance in the wire.

31. Check for continuity between body ground and slide motor/position sensor 5P connector terminals No. 1 and No. 5 individually.

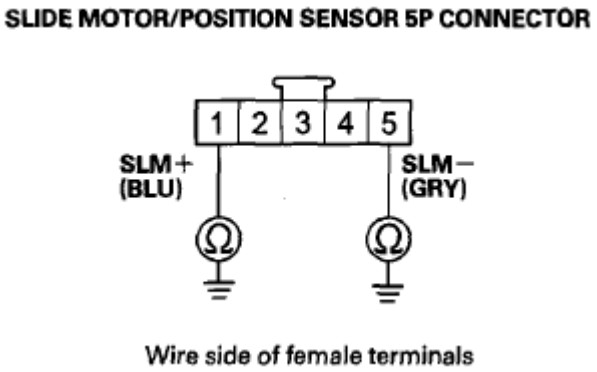

Fig. 21: Checking Continuity Between Body Ground And Slide Motor/Position Sensor 5P Connector Terminals No. 1 And No. 5
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 32.

32. Test the slide motor (see **DRIVER'S POWER SEAT MOTOR TEST**).

    Is the motor OK?

    YES -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

    NO -Replace the slide motor/position sensor (see **FRONT SEAT SLIDE MOTOR REPLACEMENT**).

DTC B1826: POWER SEAT FRONT UP-DOWN MOTOR PULSE ERROR

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Operate the power seat adjustment switch for several seconds in each direction.

   NOTE: DTC B1826 is stored when the front up-down switch is operated more than 1 second after the seat moves to the most up or down position, even when the system is OK.

4. Check for DTCs with the HDS.

   Is DTC B1826 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Clear the DTCs with the HDS.

   Is DTC B1836 also indicated?

   YES -Go to the **DTC B1836 TROUBLESHOOTING**).

   NO -Go to step 6.

6. Clear the DTCs with the HDS.

   Are DTCs B1825, B1827, and/or B1828 also indicated?

YES -Go to step 17.

NO -Go to step 7.

7. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
8. Operate the front up-down switch for 2 seconds, and check the front up-down motor operation.

   Does the front up-down motor run smoothly?

   YES -Go to step 9.

   NO -Go to step 24.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect power seat control unit connector B (40P).
11. Disconnect the front up-down motor/position sensor 5P connector.
12. Check for continuity between power seat control unit connector B (40P) terminals No. 12 and No. 29 and front up-down motor/position sensor 5P connector terminals No. 5 and No. 4 respectively.

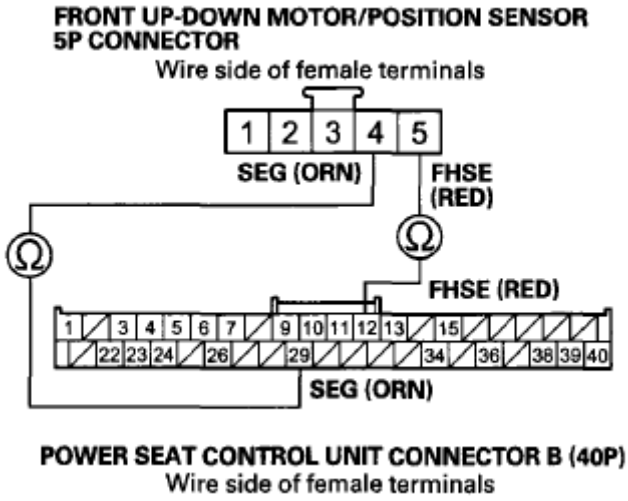

Fig. 22: Checking Continuity Between Power Seat Control Unit Connector B (40P) Terminals No. 12 And No. 29
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 13.

NO -Repair an open or high resistance in the wire.

13. Check for continuity between body ground and power seat control unit connector B (40P) terminal No. 12.

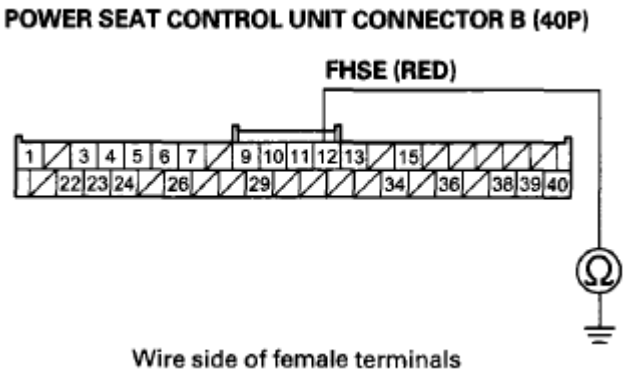

Fig. 23: Checking Continuity Between Body Ground And Power Seat Control Unit Connector B (40P) Terminal No. 12
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 14.

14. Reconnect power seat control unit connector B (40P).
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Measure the voltage between front up-down motor/position sensor 5P connector terminals No. 5 (+) and No. 4 (-).

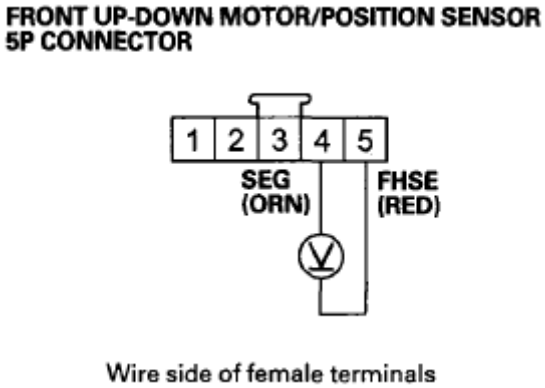

Fig. 24: Measuring Voltage Between Front Up-Down Motor/Position Sensor 5P Connector Terminals No. 5 (+) And No. 4 (-)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Faulty front up-down motor/position sensor; replace the seat frame assembly (see **FRONT SEAT FRAME REPLACEMENT**).

NO -If there is no voltage, replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**). If there is battery voltage, repair a short in the wire (sensor line).

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Disconnect power seat control unit connector B (40P).
19. Disconnect the front up-down motor/position sensor 5P connector.
20. Check for continuity between power seat control unit connector B (40P) terminals No. 15 and No. 29 and front up-down motor/position sensor 5P connector terminals No. 3 and No. 4 respectively.

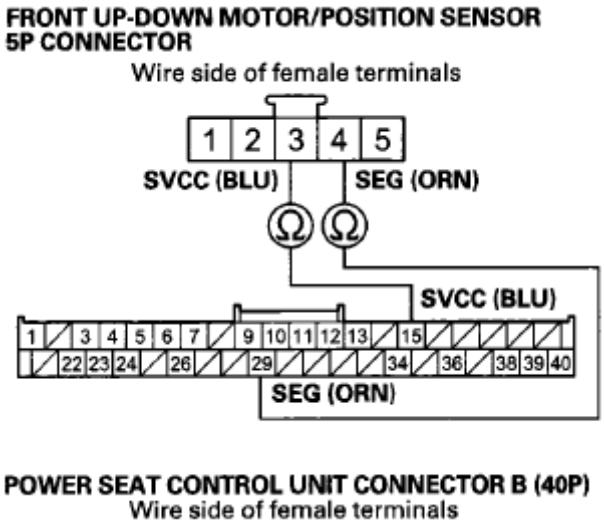

Fig. 25: Checking Continuity Between Power Seat Control Unit Connector B (40P) Terminals No. 15 And No. 29
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 21.

NO -Repair an open or high resistance in the wire.

21. Reconnect power seat control unit connector B (40P).
22. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
23. Measure the voltage between power seat control unit connector B (40P) terminals No. 15 and No. 29.

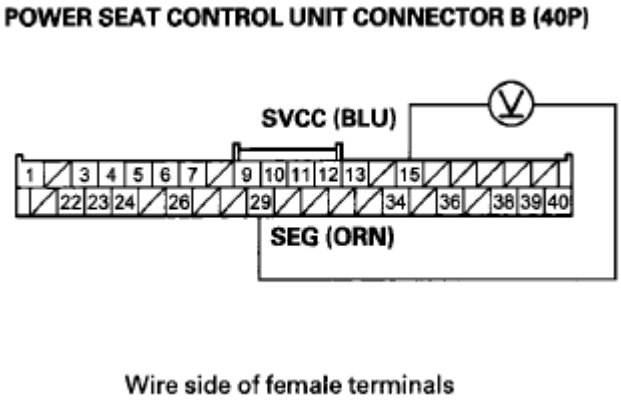

Fig. 26: Measuring Voltage Between Power Seat Control Unit Connector B (40P) Terminals No. 15 And No. 29
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage when the front up-down switch is operated?

YES -Faulty front up-down motor/position sensor; replace the seat frame assembly (see **FRONT SEAT FRAME REPLACEMENT**).

NO -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

24. Check the No. 19 (20 A) fuse in the driver's under-dash fuse/relay box.

    Is the fuse OK?

    YES -Go to step 25.

    NO -Replace the fuse. If the fuse blows again, repair the short to ground on the No. 19 (20 A) fuse circuit.

25. Measure the voltage between body ground and power seat control unit connector A (18P) terminal No. 8.

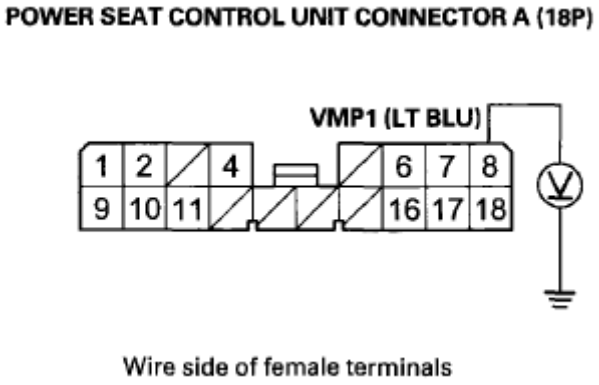

Fig. 27: Measuring Voltage Between Body Ground And Power Seat Control Unit Connector A

(18P) Terminal No. 8
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 26.

NO -Repair an open or high resistance in the wire between the driver's under-dash fuse/relay box and the power seat control unit.

26. Measure the voltage between body ground at power seat control unit connector A (18P) terminal No. 18 when operating the front up-down switch.

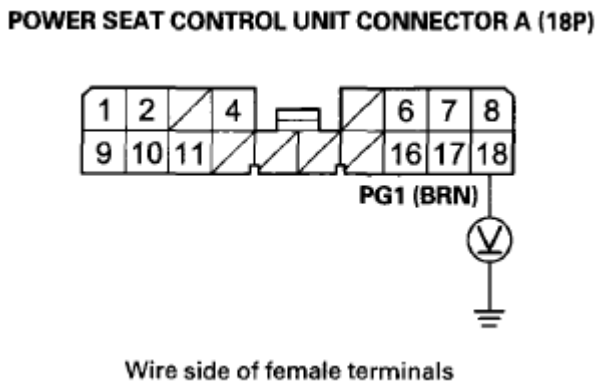

Fig. 28: Measuring Voltage Between Body Ground At Power Seat Control Unit Connector A (18P) Terminal No. 18
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 0.2 V or more?

YES -Repair an open or high resistance in the wire between the power seat control unit and body ground (G701).

NO -Go to step 27.

27. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
28. Disconnect power seat control unit connector A (18P).
29. Disconnect the front up-down motor/position sensor 5P connector.
30. Check for continuity between power seat control unit connector A (18P) terminals No. 6 and No. 16 and front up-down motor/position sensor 5P connector terminals No. 2 and No. 1 respectively.

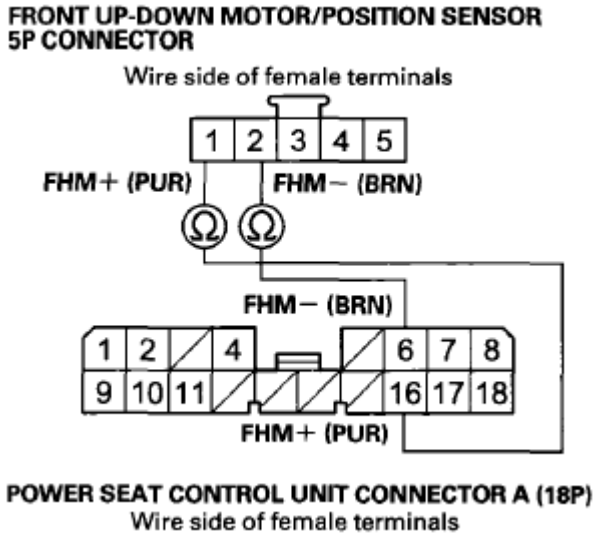

Fig. 29: Checking Continuity Between Power Seat Control Unit Connector A (18P) Terminals No. 6 And No. 16
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 31.

NO -Repair an open or high resistance in the wire.

31. Check for continuity between body ground and front up-down motor/position sensor 5P connector terminals No. 1 and No. 2 individually.

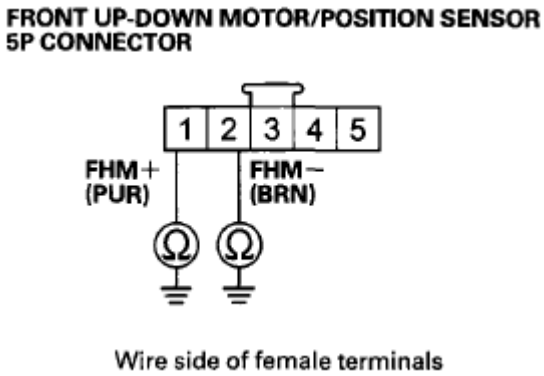

Fig. 30: Checking Continuity Between Body Ground And Front Up-Down Motor/Position Sensor 5P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 32.

32. Test the front up-down motor (see **DRIVER'S POWER SEAT MOTOR TEST**).

    Is the motor OK?

    YES -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

    NO -Faulty front up-down motor/position sensor; replace the seat frame assembly (see **FRONT SEAT FRAME REPLACEMENT**).

DTC B1827: POWER SEAT REAR UP-DOWN MOTOR PULSE ERROR

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Operate the power seat adjustment switch for several seconds in each direction.

   NOTE: DTC B1827 is stored when the rear up-down switch is operated more than 1 second after the seat moves to the most up or down position, even when the system is OK.

4. Check for DTCs with the HDS.

   Is DTC B1827 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Clear the DTCs with the HDS.

   Is DTC B1836 also indicated?

   YES -Go to the **DTC B1836 TROUBLESHOOTING**).

   NO -Go to step 6.

6. Clear the DTCs with the HDS.

   Are DTCs B1825, B1826, and/or B1828 also indicated?

YES -Go to step 17.

NO -Go to step 7.

7. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
8. Operate the rear up-down switch for 2 seconds, and check the rear up-down motor operation.

   Does the rear up-down motor run smoothly?

   YES -Go to step 9.

   NO -Go to step 24.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect power seat control unit connector B (40P).
11. Disconnect the rear up-down motor/position sensor 5P connector.
12. Check for continuity between power seat control unit connector B (40P) terminals No. 13 and No. 29 and rear up-down motor/position sensor 5P connector terminals No. 5 and No. 4 respectively.

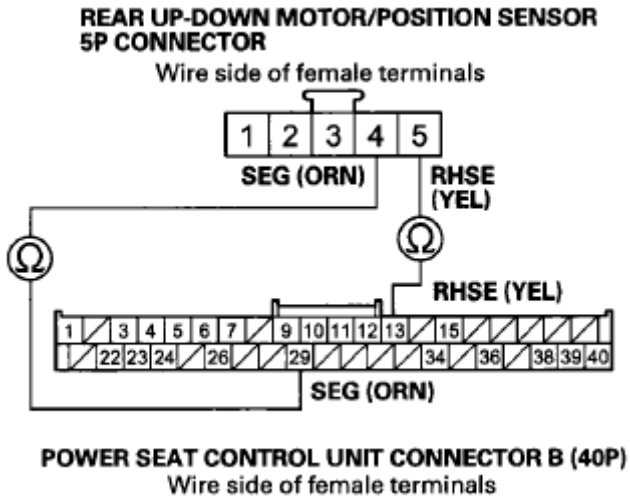

Fig. 31: Checking Continuity Between Power Seat Control Unit Connector B (40P) Terminals No. 13 And No. 29
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 13.

NO -Repair an open or high resistance in the wire.

13. Check for continuity between body ground and power seat control unit connector B (40P) terminal No. 13.

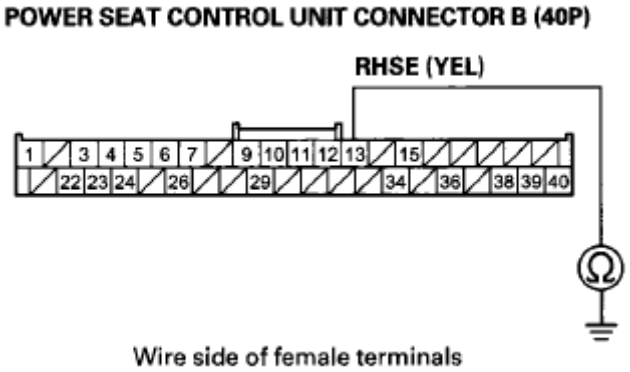

Fig. 32: Checking Continuity Between Body Ground And Power Seat Control Unit Connector B (40P) Terminal No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 14.

14. Reconnect power seat control unit connector B (40P).
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Measure the voltage between rear up-down motor/position sensor 5P connector terminals No. 5 (+) and No. 4 (-).

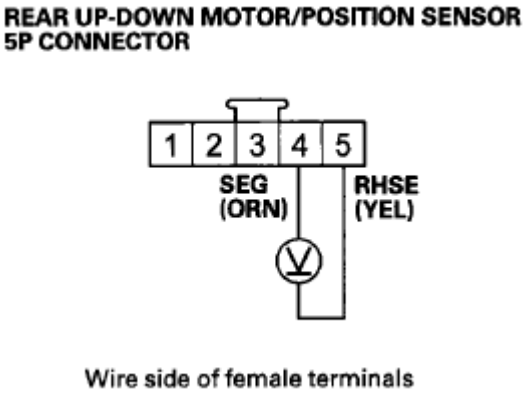

Fig. 33: Measuring Voltage Between Rear Up-Down Motor/Position Sensor 5P Connector Terminals No. 5 (+) And No. 4 (-)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Faulty rear up-down motor/position sensor; replace the seat frame assembly (see **FRONT SEAT FRAME REPLACEMENT**).

NO -If there is no voltage, replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**). If there is battery voltage, repair a short in the wire (sensor line).

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Disconnect power seat control unit connector B (40P).
19. Disconnect the rear up-down motor/position sensor 5P connector.
20. Check for continuity between power seat control unit connector B (40P) terminals No. 15 and No. 29 and rear up-down motor/position sensor 5P connector terminals No. 3 and No. 4 respectively.

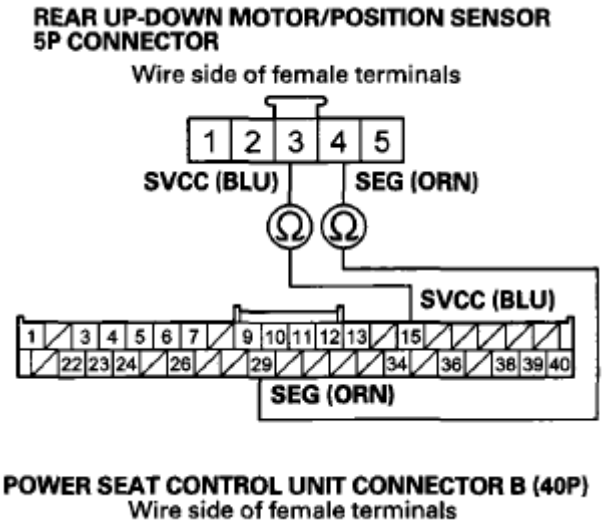

Fig. 34: Checking Continuity Between Power Seat Control Unit Connector B (40P) Terminals No. 15 And No. 29
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 21.

NO -Repair an open or high resistance in the wire.

21. Reconnect power seat control unit connector B (40P).
22. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
23. Measure the voltage between power seat control unit connector B (40P) terminals No. 15 and No. 29.

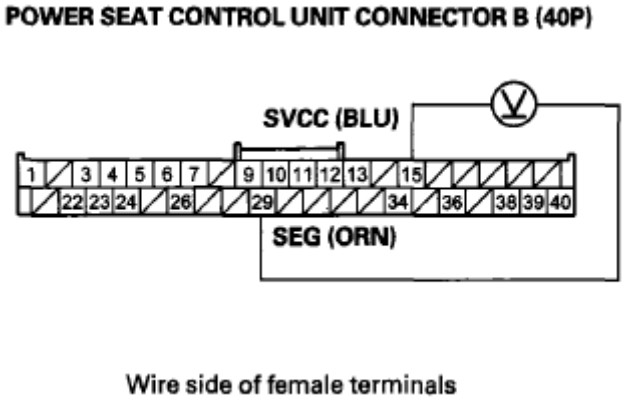

Fig. 35: Measuring Voltage Between Power Seat Control Unit Connector B (40P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage when the rear up-down switch is operated?

YES -Faulty rear up-down motor/position sensor; replace the seat frame assembly (see **FRONT SEAT FRAME REPLACEMENT**).

NO -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

24. Check the No. 21 (20 A) fuse in the driver's under-dash fuse/relay box.

    Is the fuse OK?

    YES -Go to step 25.

    NO -Replace the fuse. If the fuse blows again, repair the short to ground on the No. 21 (20 A) fuse circuit.

25. Measure the voltage between body ground and power seat control unit connector A (18P) terminal No. 1.

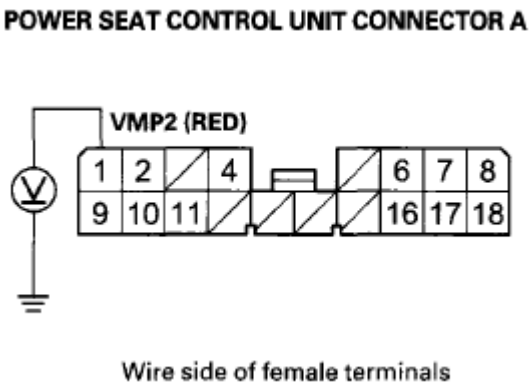

Fig. 36: Measuring Voltage Between Body Ground And Power Seat Control Unit Connector A (18P) Terminal No. 1

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 26.

NO -Repair an open or high resistance in the wire between the driver's under-dash fuse/relay box and the power seat control unit.

26. Measure the voltage between body ground at power seat control unit connector A (18P) terminal No. 4 when operating the rear up-down switch.

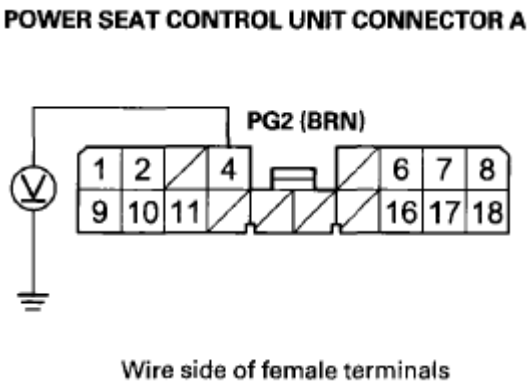

Fig. 37: Measuring Voltage Between Body Ground At Power Seat Control Unit Connector A (18P) Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 0.2 V or more?

YES -Repair an open or high resistance in the wire between the power seat control unit and body ground (G701).

NO -Go to step 27.

27. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
28. Disconnect power seat control unit connector A (18P).
29. Disconnect the rear up-down motor/position sensor 5P connector.
30. Check for continuity between power seat control unit connector A (18P) terminals No. 2 and No. 10 and rear up-down motor/position sensor 5P connector terminals No. 2 and No. 1 respectively.

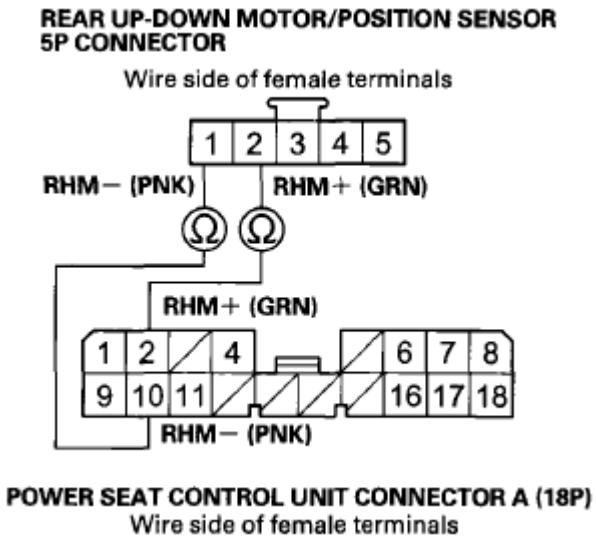

Fig. 38: Checking Continuity Between Power Seat Control Unit Connector A (18P) Terminals No. 2 And No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 31.

NO -Repair an open or high resistance in the wire.

31. Check for continuity between body ground and rear up-down motor/position sensor 5P connector terminals No. 1 and No. 2 individually.

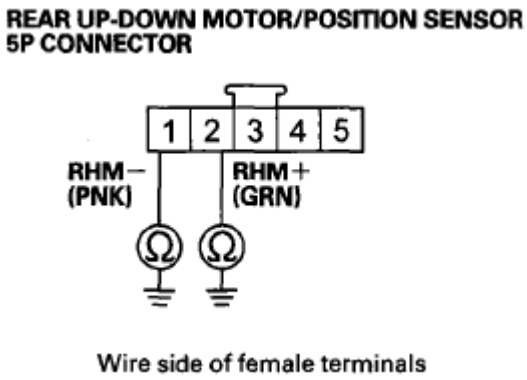

Fig. 39: Checking Continuity Between Body Ground And Rear Up-Down Motor/Position Sensor 5P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 32.

32. Test the rear up-down motor (see **DRIVER'S POWER SEAT MOTOR TEST**).

    Is the motor OK?

    YES -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

    NO -Faulty rear up-down motor/position sensor; replace the seat frame assembly (see **FRONT SEAT FRAME REPLACEMENT**).

DTC B1828: POWER SEAT RECLINE MOTOR PULSE ERROR

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Operate the power seat adjustment switch for several seconds in each direction.

   NOTE: DTC B1828 is stored when the recline switch is operated more than 1 second after the seat moves to the most forward or backward position, even when the system is OK.

4. Check for DTCs with the HDS.

   Is DTC B1828 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Clear the DTCs with the HDS.

   Is DTC B1836 also indicated?

   YES -Go to the **DTC B1836 TROUBLESHOOTING**.

   NO -Go to step 6.

6. Clear the DTCs with the HDS.

   Are DTCs B1825, B1826, and/or B1827 also indicated?

YES -Go to step 18.

NO -Go to step 7.

7. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
8. Operate the recline switch for 2 seconds, and check the recline motor operation.

   Does the recline motor run smoothly?

   YES -Go to step 9.

   NO -Go to step 24.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect power seat control unit connector B (40P).
11. Disconnect the recline motor/position sensor 5P connector.
12. Check for continuity between power seat control unit connector B (40P) terminals No. 10 and No. 29 and recline motor/position sensor 5P connector terminals No. 5 and No. 4 respectively.

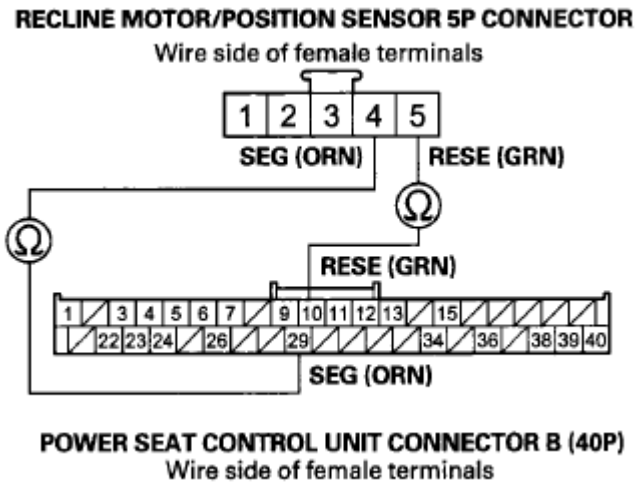

Fig. 40: Checking Continuity Between Power Seat Control Unit Connector B (40P) Terminals No. 10 And No. 29
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 13.

NO -Repair an open or high resistance in the wire.

13. Check for continuity between body ground and power seat control unit connector B (40P) terminal No. 10.

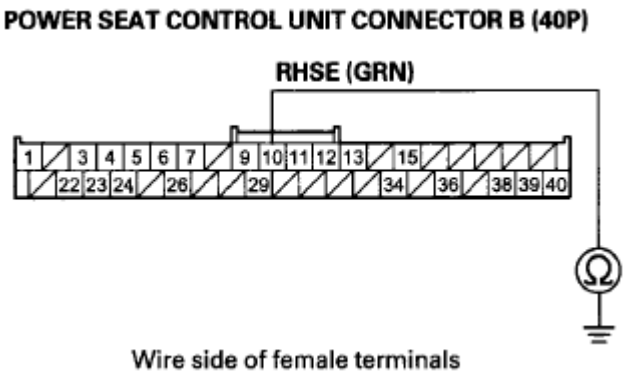

Fig. 41: Checking Continuity Between Body Ground And Power Seat Control Unit Connector B (40P) Terminal No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 14.

14. Reconnect power seat control unit connector B (40P).
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Measure the voltage between recline motor/position sensor 5P connector terminals No. 5(+) and No. 4 (-).

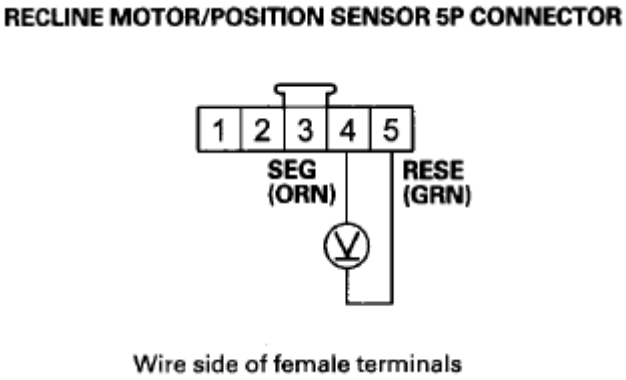

Fig. 42: Measuring Voltage Between Recline Motor/Position Sensor 5P Connector Terminals No. 5 (+) And No. 4 (-)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Replace the recline motor/position sensor (see **FRONT SEAT RECLINE MOTOR REPLACEMENT**).

NO -If there is no voltage, replace the power seat control unit (see **POWER SEAT CONTROL UNIT**

INPUT TEST/REPLACEMENT). If there is battery voltage, repair a short in the wire (sensor line).

17. Disconnect power seat control unit connector B (40P).
18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
19. Disconnect the recline motor/position sensor 5P connector.
20. Check for continuity between power seat control unit connector B (40P) terminals No. 15 and No. 29 and recline motor/position sensor 5P connector terminals No. 3 and No. 4 respectively.

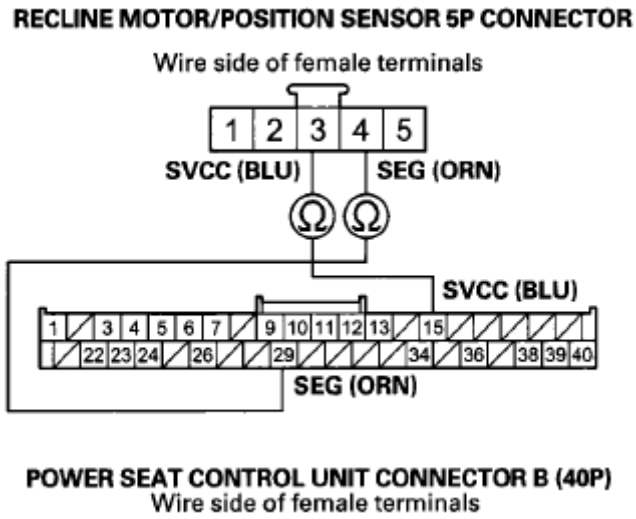

Fig. 43: Checking Continuity Between Power Seat Control Unit Connector B (40P) Terminals No. 15 And No. 29
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 21.

NO -Repair an open or high resistance in the wire.

21. Reconnect power seat control unit connector B (40P).
22. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
23. Measure the voltage between power seat control unit connector B (40P) terminals No. 15 and No. 29.

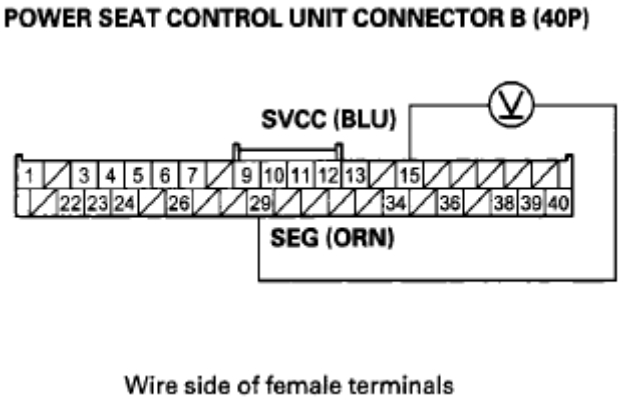

Fig. 44: Measuring Voltage Between Power Seat Control Unit Connector B (40P) Terminals No. 15 And No. 29
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage when the recline switch is operated?

YES -Replace the recline motor/position sensor (see **FRONT SEAT RECLINE MOTOR REPLACEMENT**).

NO -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

24. Check the No. 21 (20 A) fuse in the driver's under-dash fuse/relay box.

    Is the fuse OK?

    YES -Go to step 25.

    NO -Replace the fuse. If the fuse blows again, repair the short to ground on the No. 21 (20 A) fuse circuit.

25. Measure the voltage between body ground and power seat control unit connector A (18P) terminal No. 1.

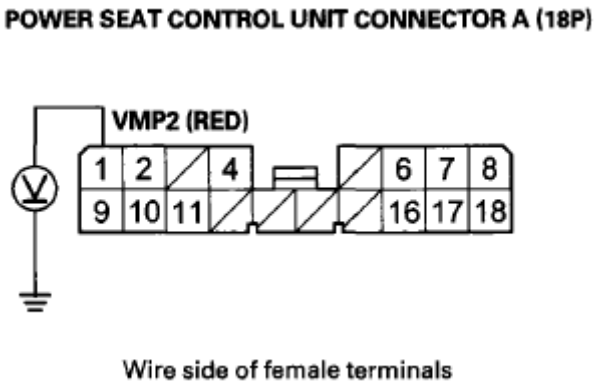

Fig. 45: Measuring Voltage Between Body Ground And Power Seat Control Unit Connector A

(18P) Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 26.

NO -Repair an open or high resistance in the wire between the driver's under-dash fuse/relay box and the power seat control unit.

26. Measure the voltage between body ground at power seat control unit connector A (18P) terminal No. 4 when operating the rear up-down switch.

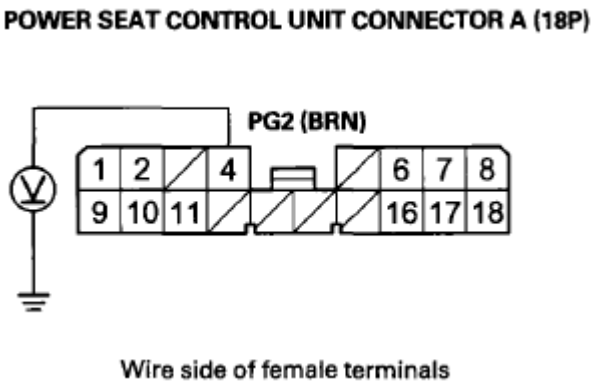

Fig. 46: Measuring Voltage Between Body Ground At Power Seat Control Unit Connector A (18P) Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 0.2 V or more?

YES -Repair an open or high resistance in the wire between the power seat control unit and body ground (G701).

NO -Go to step 27.

27. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
28. Disconnect power seat control unit connector A (18P).
29. Disconnect the recline motor/position sensor 5P connector.
30. Check for continuity between power seat control unit connector A (18P) terminals No. 9 and No. 11 and recline motor/position sensor 5P connector terminals No. 1 and No. 2 respectively.

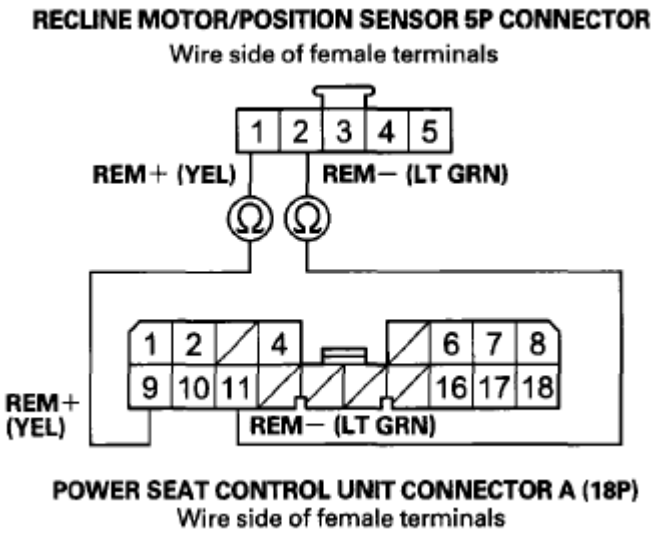

Fig. 47: Checking Continuity Between Power Seat Control Unit Connector A (18P) Terminals No. 9 And No. 11
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 31.

NO -Repair an open or high resistance in the wire.

31. Check for continuity between body ground and recline motor/position sensor 5P connector terminals No. 1 and No. 2 individually.

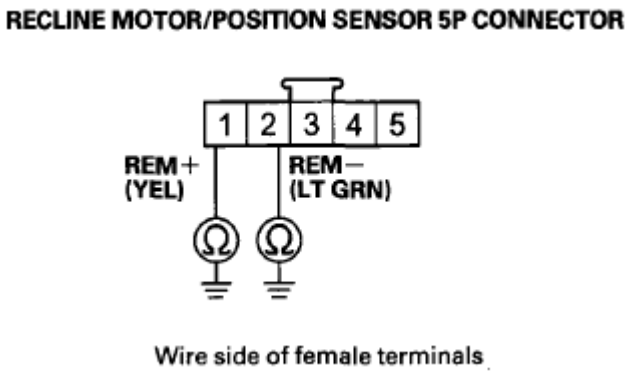

Fig. 48: Checking Continuity Between Body Ground And Recline Motor/Position Sensor 5P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 32.

32. Test the recline motor (see **DRIVER'S POWER SEAT MOTOR TEST**).

    Is the motor OK?

    YES -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

    NO -Replace the recline motor/position sensor (see **FRONT SEAT RECLINE MOTOR REPLACEMENT**).

DTC B1829: A/T-P SIGNAL AND VSP SIGNAL MISMATCH

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Start the engine.
3. Test drive at 6 mph (10 km/h) for 10 seconds.
4. Check for DTCs with the HDS.

   Is DTC B1829 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Check the P shift position indicator and the MIL.

   Does the P indicator and MIL come on?

   YES -Troubleshoot the automatic transmission system.

   NO -Go to step 6.

6. Check for the gauge control module DTCs with the HDS.

   Are any DTCs indicated?

   YES -Go to the indicated **DTCS TROUBLESHOOTING**.

   NO -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

DTC B1830: LEFT MIRROR POSITION SENSOR OPEN

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Operate the left power mirror in each direction with the power mirror switch.
4. Check for DTCs with the HDS.

   Is DTC B1830 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Remove the driver's door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
7. Disconnect the power mirror control unit 24P connector.
8. Disconnect the left power mirror 16P connector.
9. Check for continuity between body ground and left power mirror 16P connector terminal No. 6.

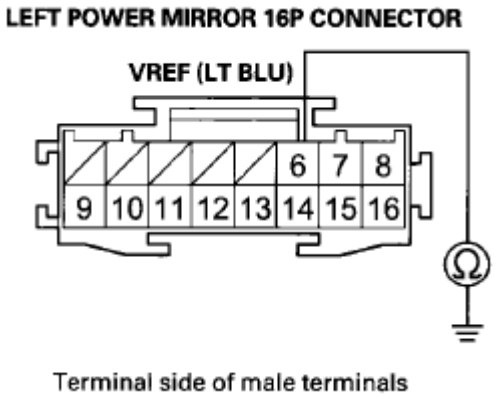

Fig. 49: Checking Continuity Between Body Ground And Left Power Mirror 16P Connector Terminal No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 10.

10. Connect power mirror control unit 24P connector terminal No. 7 to body ground with a jumper wire.

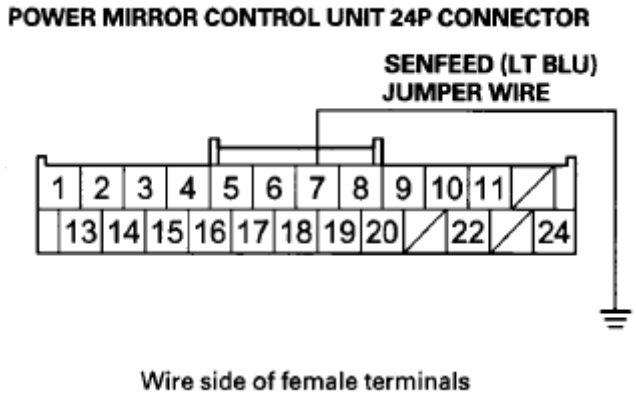

Fig. 50: Connecting Power Mirror Control Unit 24P Connector Terminal No. 7 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check for continuity between body ground and left power mirror 16P connector terminal No. 6.

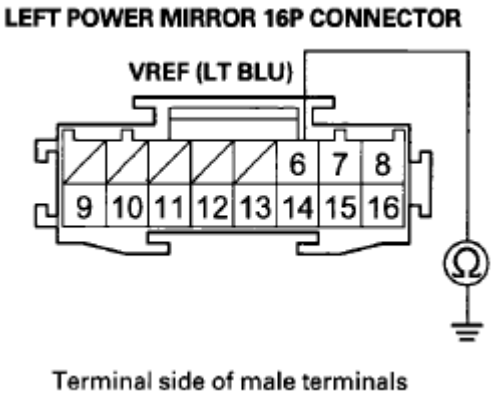

Fig. 51: Checking Continuity Between Body Ground And Left Power Mirror 16P Connector Terminal No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 12.

NO -Repair an open or high resistance in the wire.

12. Check for continuity between body ground and left power mirror 16P connector terminals No. 8 and No. 13 individually.

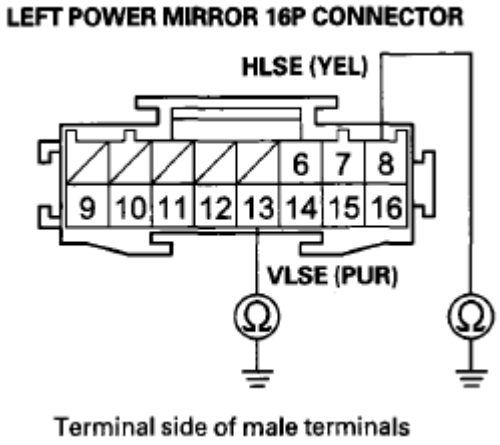

Fig. 52: Checking Continuity Between Body Ground And Left Power Mirror 16P Connector Terminals No. 8 And No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 13.

13. Connect power mirror control unit 24P connector terminals No. 4 and No. 5 to body ground with jumper wires.

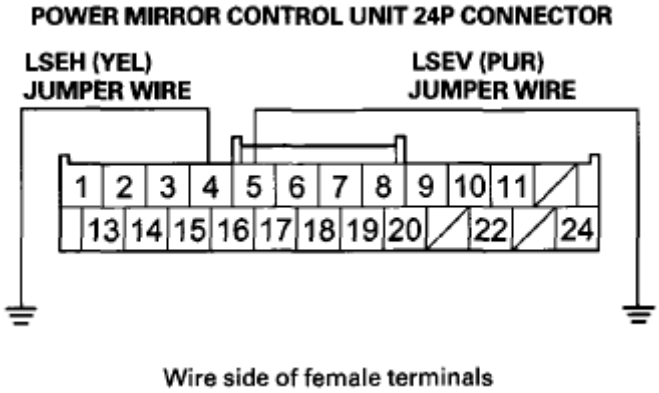

Fig. 53: Connecting Power Mirror Control Unit 24P Connector Terminals No. 4 And No. 5 To Body Ground With Jumper Wires
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Check for continuity between body ground and left power mirror 16P connector terminals No. 8 and No. 13 individually.

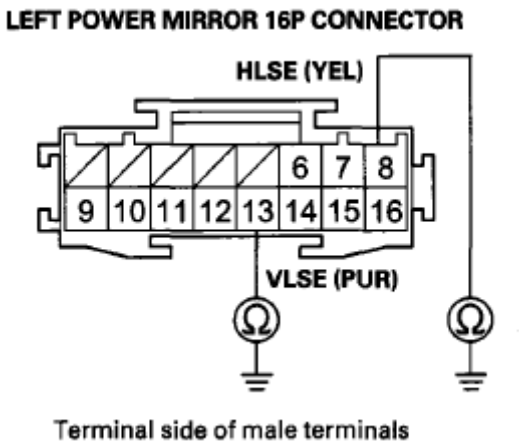

Fig. 54: Checking Continuity Between Body Ground And Left Power Mirror 16P Connector Terminals No. 8 And No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 15.

NO -Repair an open or high resistance in the wire.

15. Check for continuity between body ground and power mirror control unit 24P connector terminal No. 6.

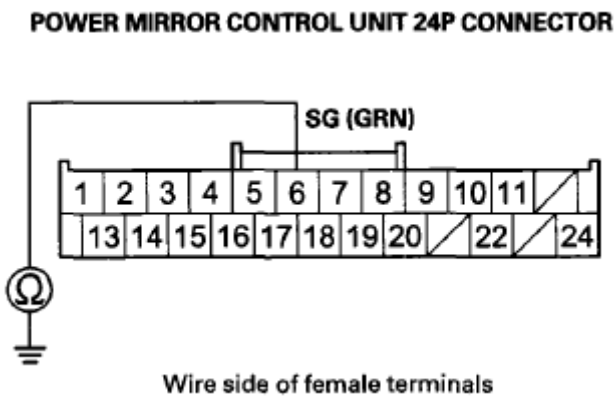

Fig. 55: Checking Continuity Between Body Ground And Power Mirror Control Unit 24P Connector Terminal No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 16.

16. Connect power mirror control unit 24P connector terminal No. 6 to body ground with a jumper wire.

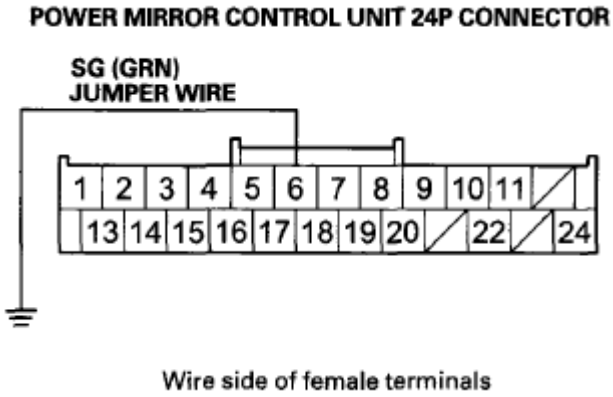

Fig. 56: Connecting Power Mirror Control Unit 24P Connector Terminal No. 6 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Check for continuity between body ground and left power mirror 16P connector terminal No. 7.

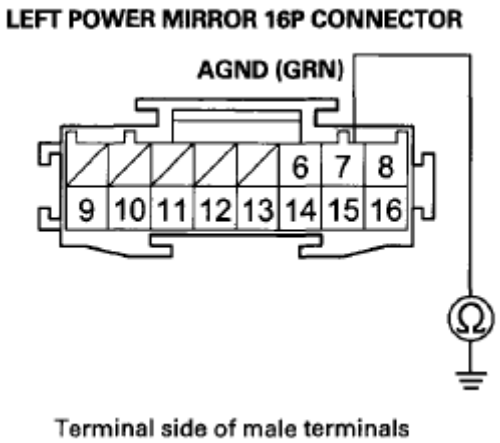

Fig. 57: Checking Continuity Between Body Ground And Left Power Mirror 16P Connector Terminal No. 7
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 18.

NO -Repair an open or high resistance in the wire.

18. Reconnect the power mirror control unit 24P connector.
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Measure the voltage between power mirror control unit 24P connector terminals No. 6 and No. 7.

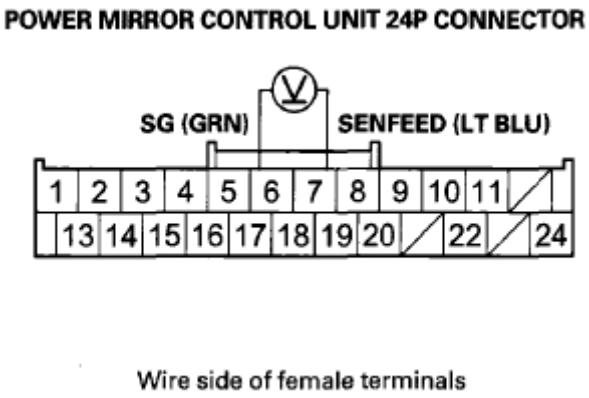

Fig. 58: Measuring Voltage Between Power Mirror Control Unit 24P Connector Terminals No. 6 And No. 7
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Faulty left power mirror position sensor; replace the power mirror actuator (see **POWER MIRROR ACTUATOR REPLACEMENT**).

NO -Substitute a known-good power mirror control unit, and recheck. If DTC is gone, the original power mirror control unit is faulty; replace it (see **POWER MIRROR CONTROL UNIT INPUT TEST/REPLACEMENT**).

DTC B1832: RIGHT MIRROR POSITION SENSOR OPEN

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Operate the right power mirror in each direction with the power mirror switch.
4. Check for DTCs with the HDS.

   Is DTC B1832 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Remove the front passenger's door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).

7. Disconnect the power mirror control unit 24P connector.
8. Disconnect the right power mirror 16P connector.
9. Check for continuity between body ground and right power mirror 16P connector terminal No. 6.

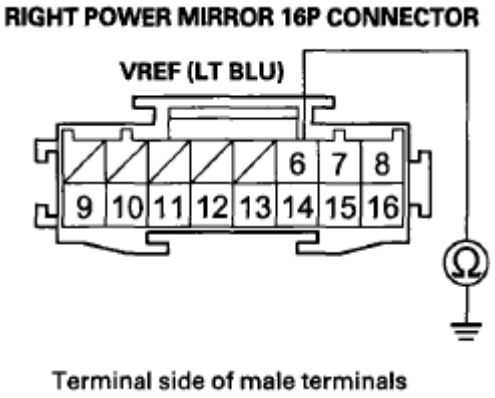

Fig. 59: Checking Continuity Between Body Ground And Right Power Mirror 16P Connector Terminal No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 10.

10. Connect power mirror control unit 24P connector terminal No. 7 to body ground with a jumper wire.

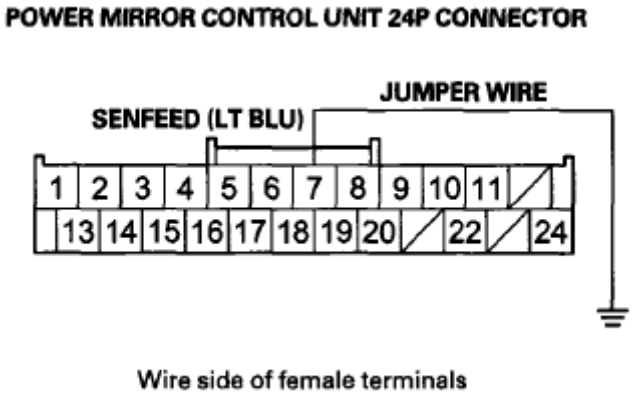

Fig. 60: Connecting Power Mirror Control Unit 24P Connector Terminal No. 7 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check for continuity between body ground and right power mirror 16P connector terminal No. 6.

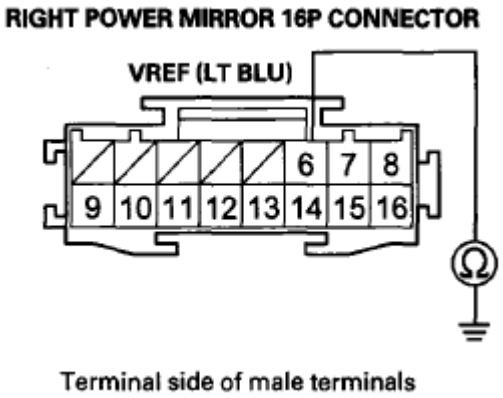

Fig. 61: Checking Continuity Between Body Ground And Right Power Mirror 16P Connector Terminal No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 12.

NO -Repair an open or high resistance in the wire.

12. Check for continuity between body ground and right power mirror 16P connector terminals No. 8 and No. 13 individually.

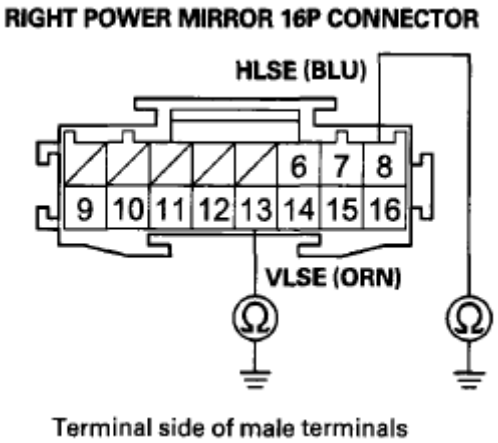

Fig. 62: Checking Continuity Between Body Ground And Right Power Mirror 16P Connector Terminals No. 8 And No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 13.

13. Connect power mirror control unit 24P connector terminals No. 19 and No. 20 to body ground with jumper wires.

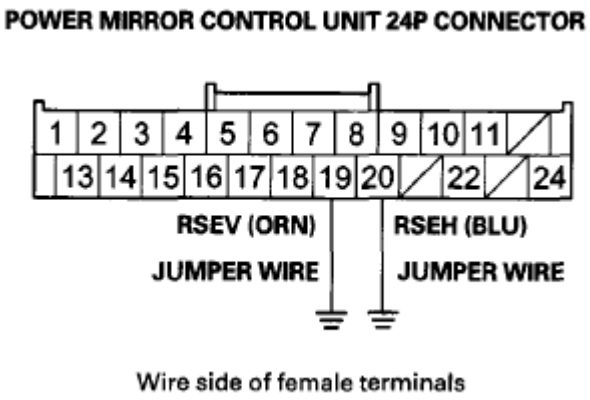

Fig. 63: Connecting Power Mirror Control Unit 24P Connector Terminals No. 19 And No. 20 To Body Ground With Jumper Wires
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Check for continuity between body ground and right power mirror 16P connector terminals No. 8 and No. 13 individually.

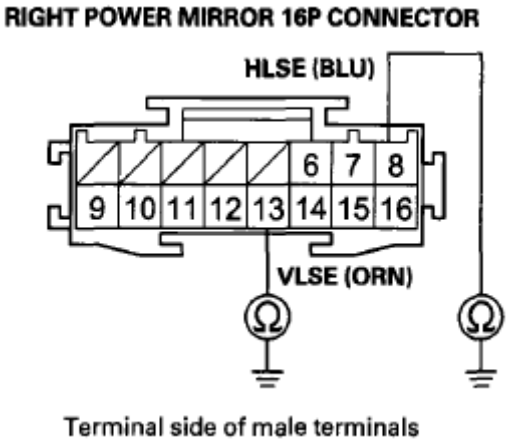

Fig. 64: Checking Continuity Between Body Ground And Right Power Mirror 16P Connector Terminals No. 8 And No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 15.

NO -Repair an open or high resistance in the wire.

15. Check for continuity between power mirror control unit 24P connector terminal No. 6 and body ground.

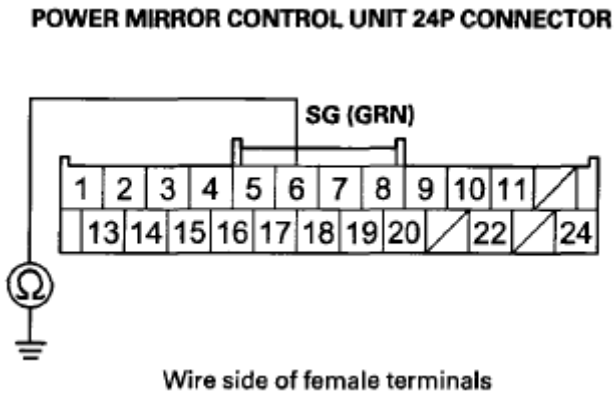

Fig. 65: Checking Continuity Between Power Mirror Control Unit 24P Connector Terminal No. 6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 16.

16. Connect power mirror control unit 24P connector terminal No. 6 to body ground with a jumper wire.

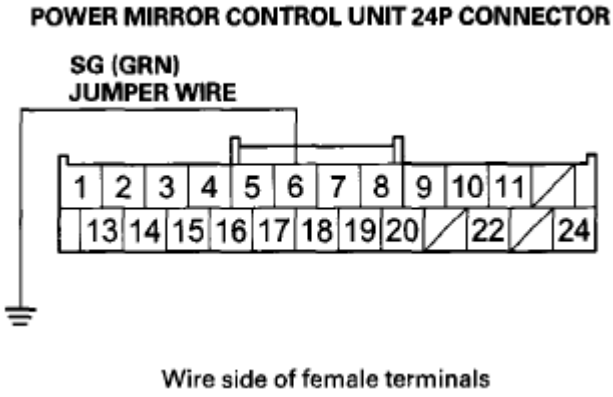

Fig. 66: Connecting Power Mirror Control Unit 24P Connector Terminal No. 6 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Check for continuity between body ground and right power mirror 16P connector terminal No. 7.

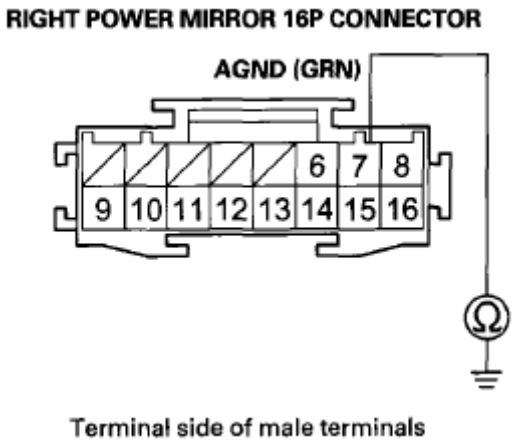

Fig. 67: Checking Continuity Between Body Ground And Right Power Mirror 16P Connector Terminal No. 7
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 18.

NO -Repair an open or high resistance in the wire.

18. Reconnect the power mirror control unit 24P connector.
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Measure the voltage between power mirror control unit 24P connector terminals No. 6 and No. 7.

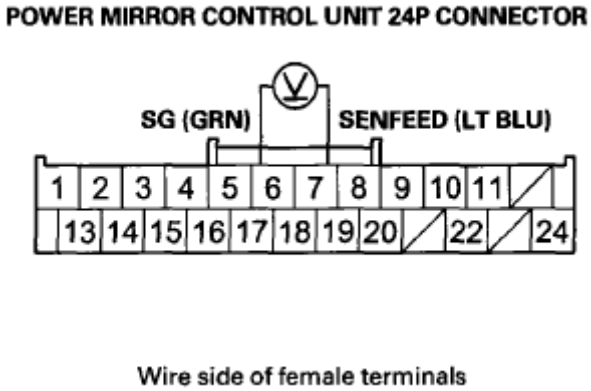

Fig. 68: Measuring Voltage Between Power Mirror Control Unit 24P Connector Terminals No. 6 And No. 7
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Faulty right power mirror position sensor; replace the power mirror actuator (see **POWER MIRROR ACTUATOR REPLACEMENT**).

NO -Substitute a known-good power mirror control unit, and recheck. If DTC is gone, the original power mirror control unit is faulty; replace it (see **POWER MIRROR CONTROL UNIT INPUT TEST/REPLACEMENT**).

DTC B1836: POWER SEAT POSITION SENSOR CIRCUIT SHORT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Operate the power seat adjustment switch in all directions for more than 1 second each.
4. Check for DTCs with the HDS.

Is DTC B1836 indicated?

YES -Go to step 5.

NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect power seat control unit connector B (40P).
7. Disconnect the 5P connector from each motor.
8. Check for continuity between body ground and power seat control unit connector B (40P) terminal No. 15.

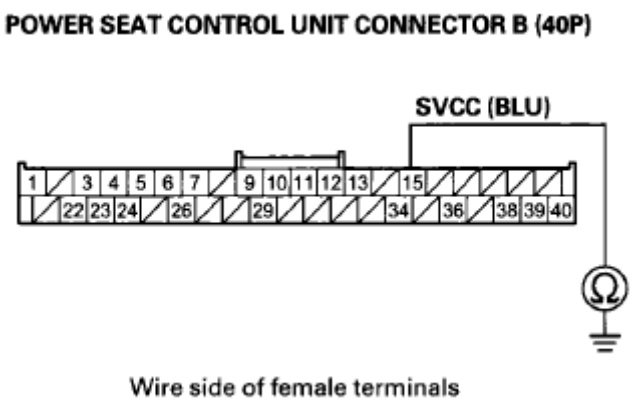

Fig. 69: Checking Continuity Between Body Ground And Power Seat Control Unit Connector B (40P) Terminal No. 15
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 9.

9. Check for continuity between slide motor/position sensor terminal No. 2 and the motor body.

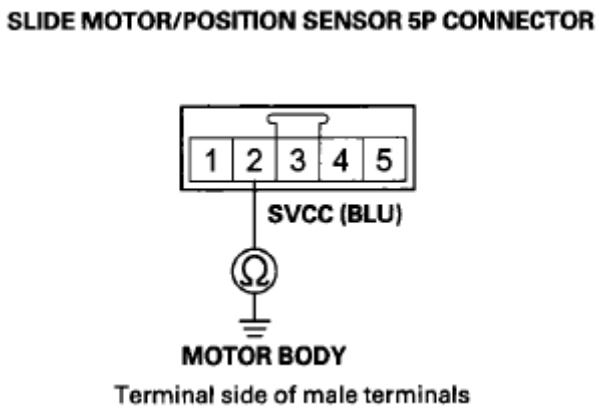

Fig. 70: Checking Continuity Between Slide Motor/Position Sensor Terminal No. 2 And Motor Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the slide motor/position sensor (see **FRONT SEAT SLIDE MOTOR REPLACEMENT**).

NO -Go to step 10.

10. Check for continuity between front up-down motor/position sensor, rear up-down motor/position sensor, and recline motor/position sensor terminal No. 3 and motor body.

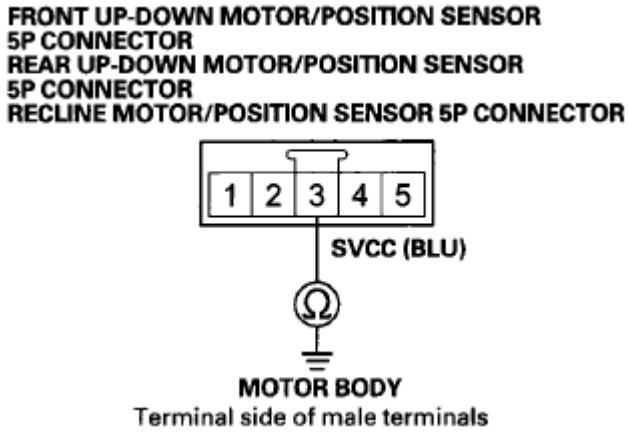

Fig. 71: Checking Continuity Between Front And Rear Up-Down Motor/Position Sensor And Recline Motor/Position Sensor And Motor Body

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -If the front or rear up-down motor/position sensor is faulty, replace the seat frame assembly (see **FRONT SEAT FRAME REPLACEMENT**). If the recline motor/position sensor is faulty, replace the recline motor/position sensor (see **FRONT SEAT RECLINE MOTOR REPLACEMENT**).

NO -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

DTC B1837: MEMORY POSITION CALLING TIMEOUT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Move both power mirrors to the full up and full left positions with the power mirror switch.
4. Move the power seat to the full front up and full rear up positions, then slide the seat all the way back and completely recline the seat-back backward with the power seat adjustment switch.
5. Set the seating position into memory by pressing either the Driver 1 or the Driver 2 position memory switch.
6. Using the power seat switches, move the seat away from the position just memorized.
7. Recall the memory position with the driving position memory switch.
8. Wait for 2 minutes.
9. Check for DTCs with the HDS.

   Are any DTCs indicated?

   YES -Go to step 10.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

10. Check for DTCs with the HDS.

    Are any DTCs other than B1837 indicated?

    YES -Go to the indicated **DTCS TROUBLESHOOTING**.

    NO -Go to step 11.

11. Clear the DTCs with the HDS.

12. Wait for 6 seconds.
13. Move each power seat motor one at a time, and check the operation time.

    Does any motor fail to run smoothly?

    YES -Go to the **POWER SEAT MOTOR TEST** (see). If the motor is OK, check the engagement of the motor gear.

    NO -Go to the **POWER SEAT CONTROL UNIT INPUT TEST** (see).

DTC B1843: UART COMMUNICATION ERROR

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Operate the power seat with the driving position memory switch.
4. Check for DTCs with the HDS.

   Is DTC B1843 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the power seat control unit connectors and power mirror control unit 24P connector.
7. Check for continuity between power seat control unit connector B (40P) terminal No. 38 and power mirror control unit 24P connector terminal No. 13.

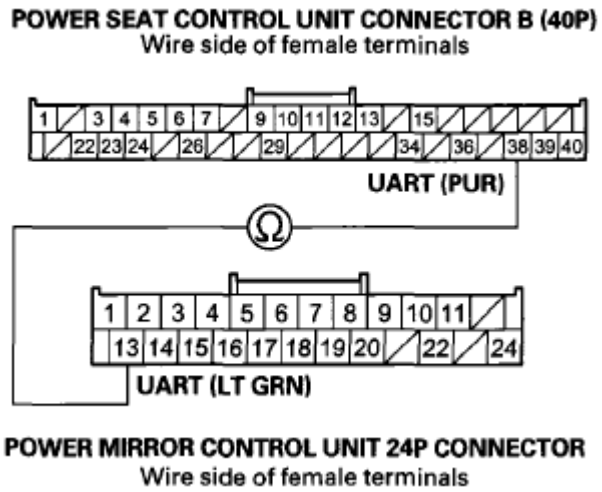

Fig. 72: Checking Continuity Between Power Seat Control Unit Connector B (40P) And Power Mirror Control Unit 24P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 8.

NO -Repair an open in the wire between the power mirror control unit and power seat control unit.

8. Check for continuity between body ground and power seat control unit connector B (40P) terminal No. 38.

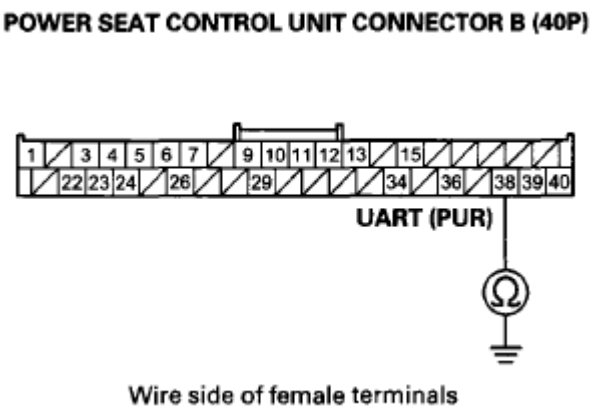

Fig. 73: Checking Continuity Between Body Ground And Power Seat Control Unit Connector B (40P) Terminal No. 38
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 9.

9. Reconnect the power mirror control unit 24P connector.
10. Measure the voltage between body ground and power mirror control unit 24P connector terminal No. 24.

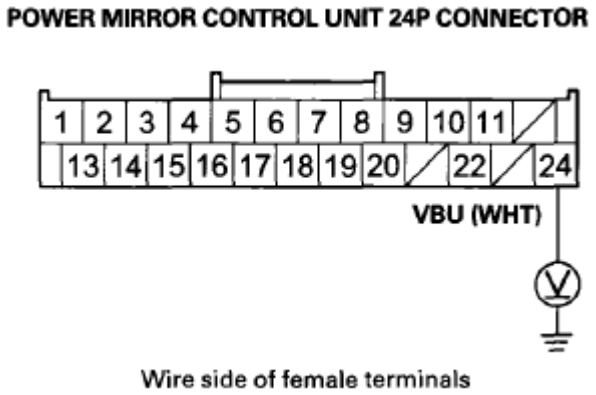

Fig. 74: Measuring Voltage Between Body Ground And Power Mirror Control Unit 24P Connector Terminal No. 24
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 11.

NO -Check No. 15 (10 A) fuse in the under-hood fuse/relay box. If the fuse is OK, repair an open in or high resistance the wire.

11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
12. Measure the voltage between body ground and power mirror control unit 24P connector terminal No. 22.

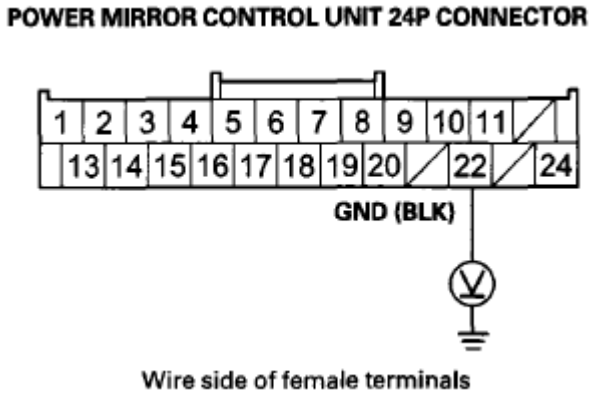

Fig. 75: Measuring Voltage Between Body Ground And Power Mirror Control Unit 24P Connector Terminal No. 22
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Replace the power mirror control unit (see **POWER MIRROR CONTROL UNIT INPUT TEST/REPLACEMENT**).

NO -Repair an open or high resistance in the wire between the power mirror control unit and body ground (G401). If the wire is OK, repair G401.

DTC B1844: POWER SEAT SLIDE SWITCH CIRCUIT MALFUNCTION

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Operate the slide switch in each direction for more than 1 second.
4. Check for DTCs with the HDS.

Is DTC B1844 indicated?

YES -Go to step 5.

NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect power seat control unit connector B (40P).
7. Disconnect the power seat adjustment switch 12P connector.
8. Check for continuity between body ground and power seat control unit connector B (40P) terminals No. 1, No. 7, and No. 24 individually.

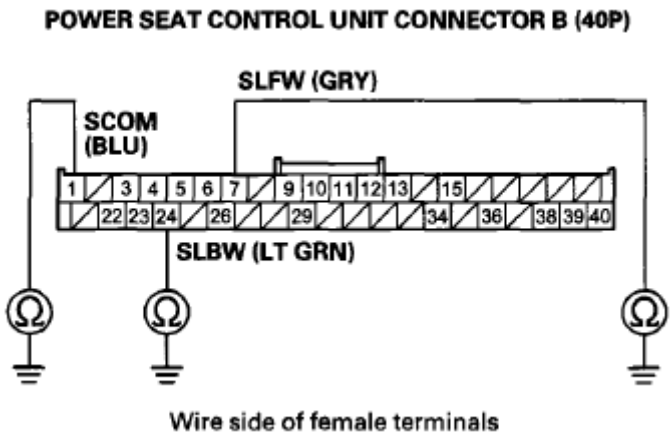

Fig. 76: Checking Continuity Between Body Ground And Power Seat Control Unit Connector B

(40P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 9.

9. Check for continuity between these power seat control unit connector B (40P) terminals:
   - No. 1 and No. 7
   - No. 1 and No. 24
   - No. 7 and No. 24

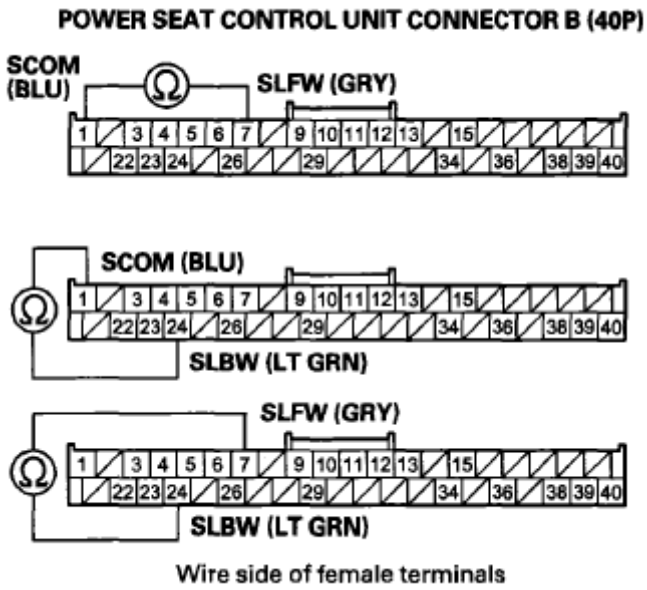

Fig. 77: Checking Continuity Between These Power Seat Control Unit Connector B (40P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short in the wire(s).

NO -Go to step 10.

10. Test the power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**).

Is the switch OK?

YES -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

NO -Replace the power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**).

DTC B1845: POWER SEAT RECLINE SWITCH CIRCUIT MALFUNCTION

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Operate the recline switch in each direction for more than 1 second.
4. Check for DTCs with the HDS.

   Is DTC B1845 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect power seat control unit connector B (40P).
7. Disconnect the power seat adjustment switch 12P connector.
8. Check for continuity between body ground and power seat control unit connector B (40P) terminals No. 1, No. 6, and No. 23 individually.

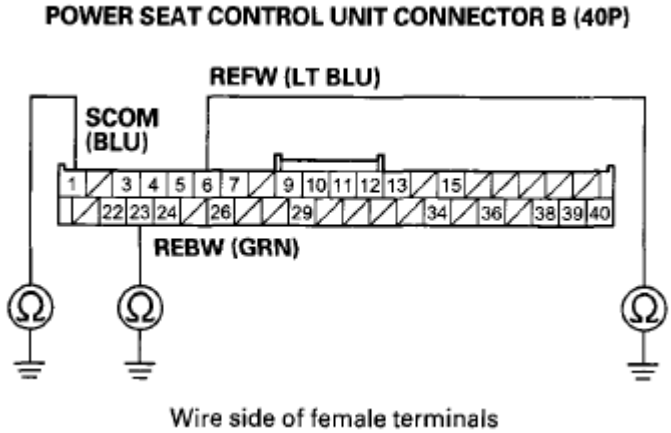

Fig. 78: Checking Continuity Between Body Ground And Power Seat Control Unit Connector B (40P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 9.

9. Check for continuity between these power seat control unit connector B (40P) terminals:
   - No. 1 and No. 6
   - No. 1 and No. 23
   - No. 6 and No. 23

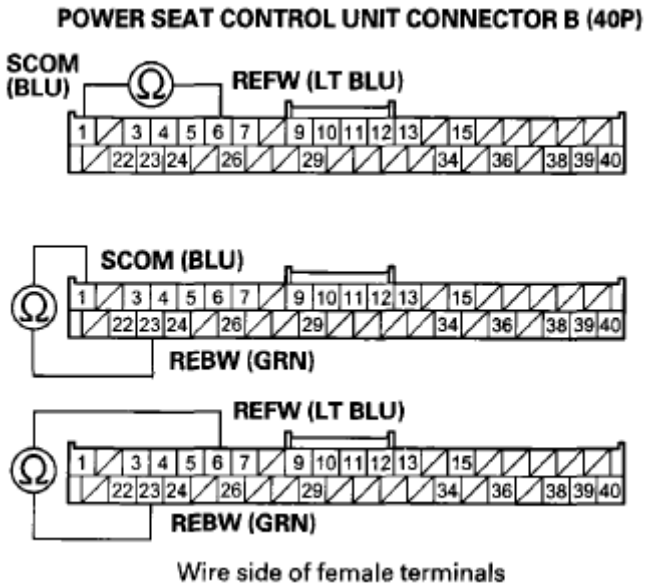

Fig. 79: Checking Continuity Between These Power Seat Control Unit Connector B (40P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short in the wire(s).

NO -Go to step 10.

10. Test the power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**).

Is the switch OK?

YES -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

NO -Replace the power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**).

DTC B1846: POWER SEAT FRONT UP-DOWN SWITCH CIRCUIT MALFUNCTION

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Operate the front up-down switch in each direction for more than 1 second.
4. Check for DTCs with the HDS.

   Is DTC B1846 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect power seat control unit connector B (40P).
7. Disconnect the power seat adjustment switch 12P connector.
8. Check for continuity between body ground and power seat control unit connector B (40P) terminals No. 1, No. 4, and No. 5 individually.

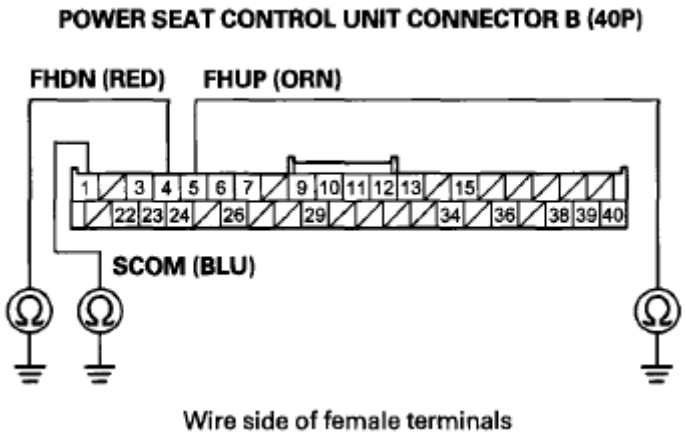

Fig. 80: Checking Continuity Between Body Ground And Power Seat Control Unit Connector B (40P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 9.

9. Check for continuity between these power seat control unit connector B (40P) terminals:
   - No. 1 and No. 4
   - No. 1 and No. 5
   - No. 4 and No. 5

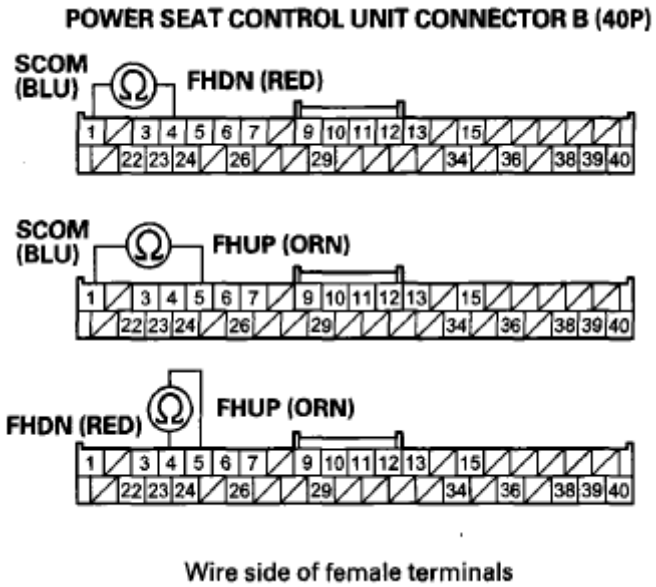

Fig. 81: Checking Continuity Between These Power Seat Control Unit Connector B (40P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short in the wire(s).

NO -Go to step 10.

10. Test the power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**).

Is the switch OK?

YES -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

NO -Replace the power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**).

DTC B1847: POWER SEAT REAR UP-DOWN SWITCH CIRCUIT MALFUNCTION

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Operate the rear up-down switch in each direction for more than 1 second.
4. Check for DTCs with the HDS.

   Is DTC B1847 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect power seat control unit connector B (40P).
7. Disconnect the power seat adjustment switch 12P connector.
8. Check for continuity between body ground and power seat control unit connector B (40P) terminals No. 1, No. 3, and No. 22 individually.

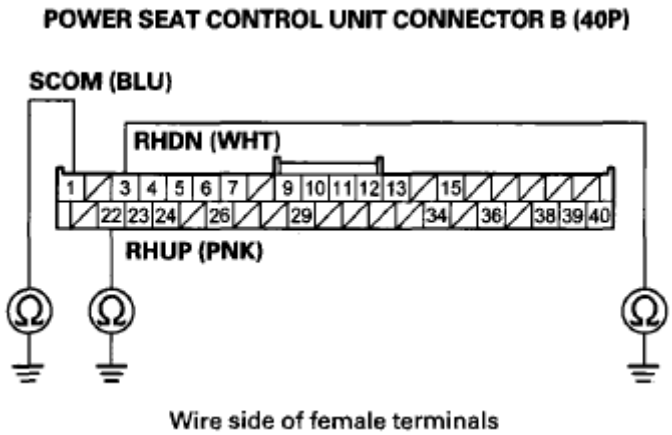

Fig. 82: Checking Continuity Between Body Ground And Power Seat Control Unit Connector B (40P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 9.

9. Check for continuity between these power seat control unit connector B (40P) terminals:
   - No. 1 and No. 3
   - No. 1 and No. 22
   - No. 3 and No. 22

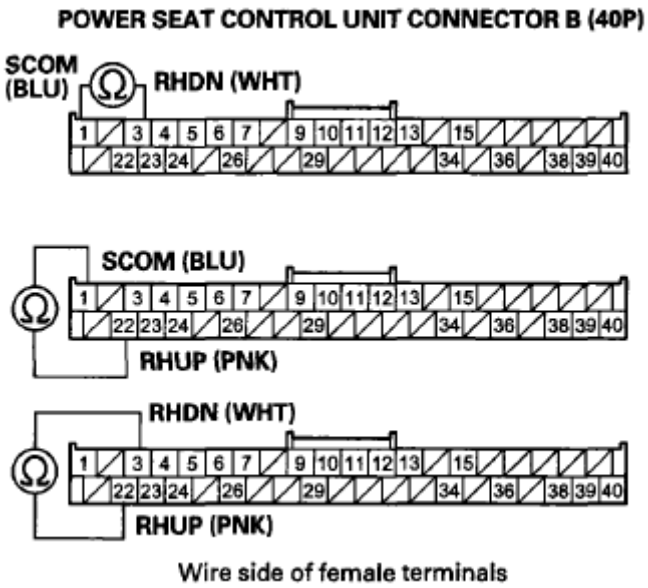

Fig. 83: Checking Continuity Between These Power Seat Control Unit Connector B (40P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short in the wire(s).

NO -Go to step 10.

10. Test the power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**).

    Is the switch OK?

    YES -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

    NO -Replace the power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**).

DTC U0155: POWER SEAT CONTROL UNIT LOST COMMUNICATION WITH GAUGE CONTROL MODULE

NOTE: **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U0155 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the power seat control unit and the gauge control module.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the gauge control module detected?

   YES -Go to step 9.

   NO -Go to step 6.

6. Measure the voltage between body ground and gauge control module 32P connector terminals No. 15 and No. 16 individually.

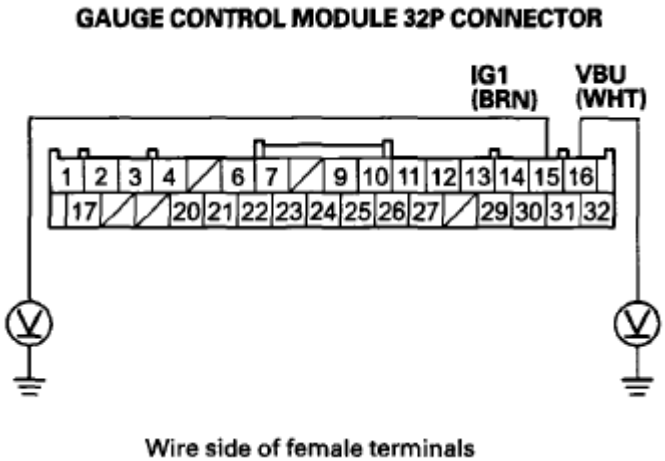

Fig. 84: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 15 And No. 16
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 8.

NO -Go to step 7.

7. Check the No. 15 (10 A) fuse in the under-hood fuse/relay box and the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Are the fuses OK?

   YES -Repair an open or high resistance in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

   NO -Replace the fuse(s). If the fuse blows again, repair a short to ground in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

8. Measure the voltage between body ground and gauge control module 32P connector terminals No. 1 and No. 17 individually.

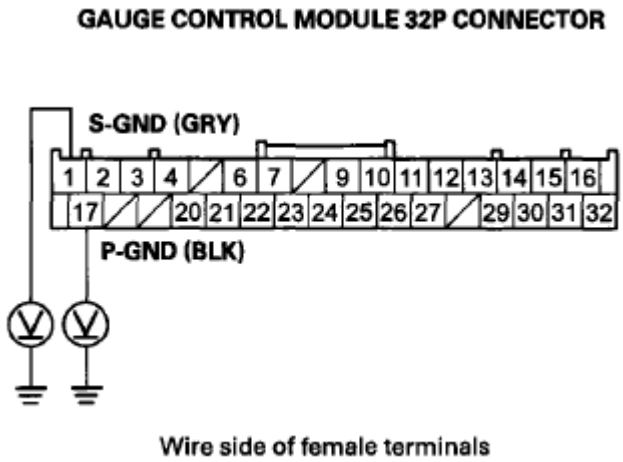

Fig. 85: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 1 And No. 17
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there less than 0.2 V?

   YES -Go to step 9.

   NO -Repair an open or high resistance in the ground wire or poor ground (G401) and/or (G402).

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect power seat control unit connector A (40P).
11. Disconnect the gauge control module 32P connector.
12. Check for continuity between gauge control module 32P connector terminals No. 29 and No. 30 and

power seat control unit connector A (40P) terminals No. 39 and No. 40 respectively.

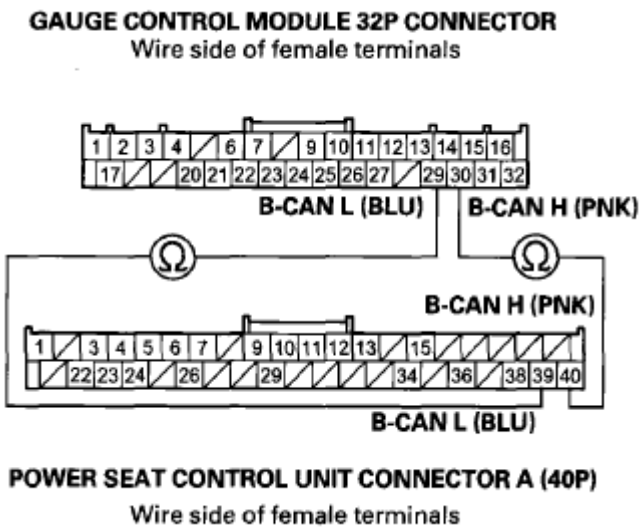

Fig. 86: Checking Continuity Between Gauge Control Module 32P Connector Terminals No. 29 And No. 30
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO -Repair an open or poor connection in the B-CAN wire between the power seat control unit and the gauge control module.

DTC U0199: POWER SEAT CONTROL UNIT LOST COMMUNICATION WITH DOOR MULTIPLEX CONTROL UNIT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U0199 indicated?

YES -Go to step 5.

NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the

power seat control unit and the door multiplex control unit.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the power window unit detected?

   YES -Go to step 9.

   NO -Go to step 6.

6. Measure the voltage between body ground and power window master switch 37P connector terminal No. 13.

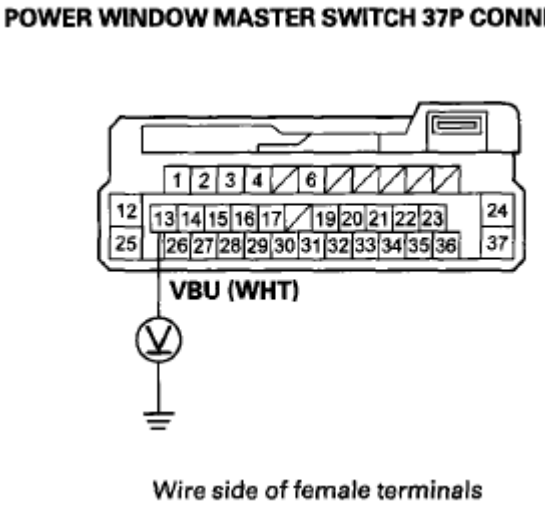

Fig. 87: Measuring Voltage Between Body Ground And Power Window Master Switch 37P Connector Terminal No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES -Go to step 8.

   NO -Go to step 7.

7. Check the No. 15(10 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES -Repair an open or high resistance in the No. 15 (10 A) fuse circuit.

   NO -Replace the fuse. If the fuse blows again, repair a short to ground in the No. 15 (10 A) fuse circuit.

8. Measure the voltage between body ground and power window master switch 37P connector terminals No. 32 and No. 37 individually.

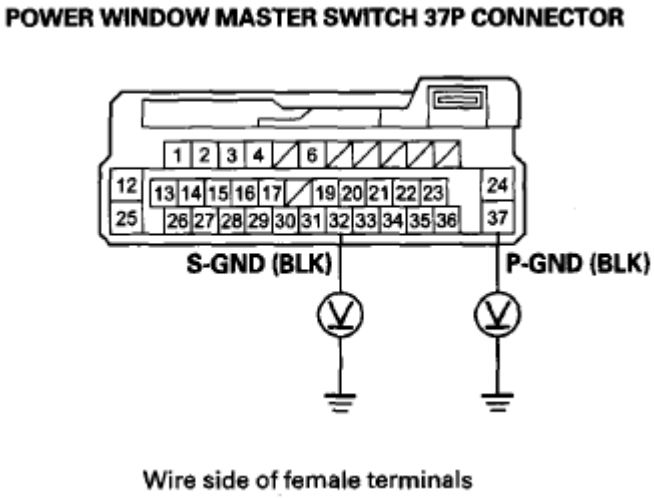

Fig. 88: Measuring Voltage Between Body Ground And Power Window Master Switch 37P Connector Terminals No. And No. 37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 9.

NO -Repair an open or high resistance in the ground wire or poor ground (G401) and/or (G402).

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect power seat control unit connector A (40P).
11. Disconnect the power window master switch 37P connector.
12. Check for continuity between power window master switch 37P connector terminals No. 33 and No. 35 and power seat control unit connector A (40P) terminals No. 39 and No. 40 respectively.

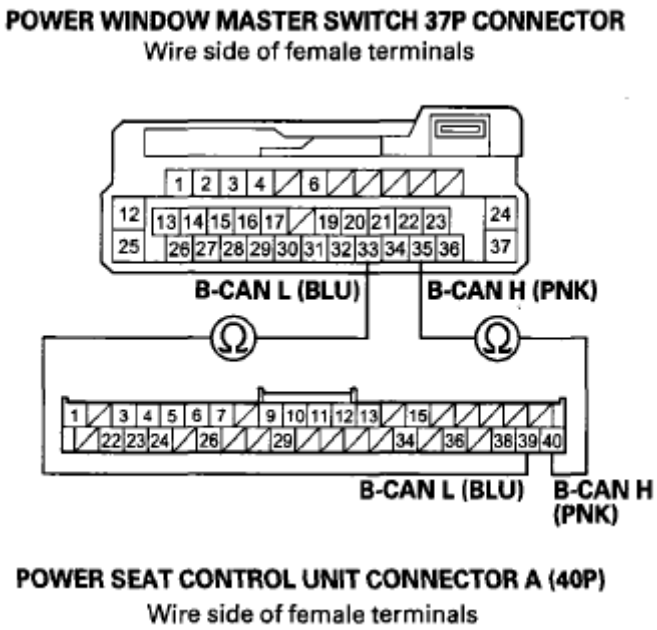

Fig. 89: Checking Continuity Between Power Window Master Switch 37P Connector Terminals No. 33 And No. 35[]
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

NO -Repair an open or poor connection in the B-CAN wire between the power seat control unit and the door multiplex control unit.

DTC U1282: POWER SEAT CONTROL UNIT LOST COMMUNICATION WITH DRIVER'S MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U1282 indicated?

YES -Replace the power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**).

NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the power seat control unit and the driver's MICU.

SYSTEM INPUT TEST AND FUNCTION TEST

1. Connect the HDS to the data link connector (DLC).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. From the BODY ELECTRICAL SYSTEM SELECT menu, select POWER SEAT/POWER MIRROR, then DTCs.
   - If DTCs are found, troubleshoot the DTCs using B-CAN System Diagnosis Test Mode A (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A**).
   - If no DTCs are found, go to step 4.
4. Exit the DTC mode, and select DATA LIST from the POWER SEAT TEST MODE MENU.
5. Test each input and monitor each output under the condition shown below:
   - If the data list indication is correct, continue to the next switch. If all switches are OK, go to step 6.
   - If the data list indication is not correct, do the appropriate test at the control unit and terminal indicated in the table.
     - Voltage drop tests should be done with the ignition switch in ON (II) or the vehicle ignition in the ON mode, and all connectors connected and the meter negative test lead attached to a good body ground, unless specified otherwise.
     - Continuity tests should be done with the ignition switch in LOCK (0) or the vehicle ignition in the OFF mode, and indicated terminals disconnected.

Data List Input/Command	Condition: Data List Indication	Control Unit/Terminal Number/Test (If applicable)	Possible cause if desired result is not obtained
Slide Switch Forward	Slide switch forward: ON Switch released: OFF	Power seat control unit/B1, B7 Slide switch forward: 0 V Switch released: 5 V	• Faulty driver's power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**) • Faulty power seat control unit • An open or high resistance in the wire • A short to ground in the wire
Slide Switch Backward	Slide switch backward: ON Switch released: OFF	Power seat control unit/B1, B24 Slide switch backward: 0 V Switch released: 5 V	• Faulty driver's power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**) • Faulty power seat control unit • An open or high resistance in the

			wire • A short to ground in the wire
Recline Switch Forward	Recline switch forward: ON Switch released: OFF	Power seat control unit/B1, B6 Recline switch forward: 0 V Switch released: 5 V	• Faulty driver's power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**) • Faulty power seat control unit • An open or high resistance in the wire • A short to ground in the wire
Recline Switch Backward	Recline switch backward: ON Switch released: OFF	Power seat control unit/B1, B23 Recline switch backward: 0 V Switch released: 5 V	• Faulty driver's power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**) • Faulty power seat control unit • An open or high resistance in the wire • A short to ground in the wire
Front Up-Down Switch Up	Front up-down switch up: ON Switch released: OFF	Power seat control unit/B1, B5 Front up-down switch up: 0 V Switch released: 5 V	• Faulty driver's power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**) • Faulty power seat control unit • An open or high resistance in the wire • A short to ground in the wire
Front Up-Down Switch Down	Front up-down switch down: ON Switch released: OFF	Power seat control unit/B1, B4 Front up-down switch down: 0 V Switch released: 5 V	• Faulty driver's power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**) • Faulty power seat control unit • An open or high resistance in the wire • A short to ground in the wire
	Rear up-down	Power seat control unit/B1, B22	• Faulty driver's power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH**

Rear Up-Down Switch Up	switch up: ON Switch released: OFF	Rear up-down switch up: 0 V Switch released: 5 V	**TEST/REPLACEMENT**) • Faulty power seat control unit • An open or high resistance in the wire • A short to ground in the wire
Rear Up-Down Switch Down	Rear up-down switch down: ON Switch released: OFF	Power seat control unit/B1, B3 Rear up-down switch down: 0 V Switch released: 5 V	• Faulty driver's power seat adjustment switch (see **POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT**) • Faulty power seat control unit • An open or high resistance in the wire • A short to ground in the wire
Ignition Switch for Power Seat Control	Ignition switch ON (II) or vehicle ignition ON mode: ON Ignition switch LOCK (0) or vehicle ignition OFF mode: OFF	Power seat control unit/B34 Ignition switch ON (II): 12 V	• Blown No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box • Faulty under-dash fuse/relay box • Faulty power seat control unit • An open or high resistance in the wire
PBK Switch (M/T)	Parking brake lever pulled: ON Parking brake switch: ON	Power seat control unit/B26 Parking brake switch ON: 0 V	• Faulty parking brake switch • Faulty power seat control unit • An open or high resistance in the wire
ATP Switch (A/T)	Transmission range switch P position: ON Any other position than P: OFF	Power seat control unit/B26 Transmission range switch P: 0 V	• Faulty transmission range switch • Faulty power seat control unit • An open or high resistance in the wire
Slide Sensor	Seat moving forward or backward: ON Seat not moving: OFF	Power seat control unit/B11 Pulses as seat moves: 2.5 V average	• Faulty slide position sensor • Faulty power seat control unit • An open or high resistance in the wire
Front Up-Down Sensor	Seat front moving up/down: ON Seat not moving: OFF	Power seat control unit/B12 Pulses as seat moves: 2.5 V average	• Faulty front up-down position sensor • Faulty power seat control unit • An open or high resistance in the wire
	Seat back		

Recline Sensor	moving forward or backward: ON Seat not moving: OFF	Power seat control unit/B10 Pulses as seat moves: 2.5 V average	• Faulty recline position sensor • Faulty power seat control unit • An open or high resistance in the wire
Rear Up-Down	Sensor Seat rear moving up/down: ON Seat not moving: OFF	Power seat control unit/B13 Pulses as seat moves: 2.5 V average	• Faulty rear up-down sensor • Faulty power seat control unit • An open or high resistance in the wire
DPMS SET Switch	Driving position memory switch SET button pushed: ON Switch released: OFF	Door multiplex control unit/19 Driving position memory switch SET button pushed: 19 (less than 0.2 V) SET button released: 19 (at least 5 V)	• Faulty driving position memory switch • Faulty door multiplex control unit • An open or high resistance in the wire • A short to ground in the wire
DPMS POSITION 1 Switch	Driving position memory switch POSITION 1 button pushed: ON Switch released: OFF	Door multiplex control unit/17 Driving position memory switch POSITION 1 button pushed: 17 (more than 0.2 V) POSITION 1 button released: 17 (at least 5 V)	• Faulty driving position memory switch • Faulty door multiplex control unit • An open or high resistance in the wire • A short to ground in the wire
DPMS POSITION 2 Switch	Driving position memory switch POSITION 2 button pushed: ON Switch released: OFF	Door multiplex control unit/16 Driving position memory switch POSITION 2 button pushed: 16 (more than 0.2 V) POSITION 2 button released: 16 (at least 5 V)	• Faulty driving position memory switch • Faulty door multiplex control unit • An open or high resistance in the wire • A short to ground in the wire

6. Exit the DATA LIST and select FUNCTION TEST.
7. Do each of the function tests listed in the table shown. The appropriate output should occur.
    - If the function operates normally, go to the next function test. If all function tests operate normally, the system is OK.
    - If the function does not occur, do the appropriate test at the control unit and terminal indicated in the table.
        - Voltage drop tests should be done with the ignition switch in ON (II) or the vehicle ignition in the ON mode, and all connectors connected.
        - Continuity tests should be done with the ignition switch in LOCK (0) or the vehicle ignition in the OFF mode, and indicated terminals disconnected.
        - Jumper tests should be done according to the instructions indicated.

- If the test indicates that the component operates normally, but the function will not operate by doing the function test or the normal use of the component, the control unit that operates that function must be faulty; replace it.
- If the test indicates that the component does not operate normally, check for an open or short in the harnesses between the component and the control unit. If the harness is OK, replace the component.

Function Test	Component and Operation	Control Unit/Terminal Number/Test (If applicable)	Possible cause if desired result is not obtained
Power Seat: Slide Motor-Full Forward	Seat slides forward	Power seat control unit/ A8, A18, A7, A17 Disconnect power seat control unit connector A. Connect A8 to A17 and A7 to A18; driver's seat should slide forward.	• Faulty slide motor • An open or high resistance in the wire • A short to ground in the wire
Power Seat: Slide Motor-Full Backward	Seat slides backward	Power seat control unit/ A8, A18, A7, A17 Disconnect power seat control unit connector A. Connect A8 to A7 and A17 to A18; driver's seat should slide backward.	• Faulty slide motor • An open or high resistance in the wire • A short to ground in the wire
Power Seat: Front Up-Down Motor-Full Up	Front of seat moves up	Power seat control unit/ A8, A18, A6, A16 Disconnect power seat control unit connector A. Connect A8 to A16 and A6 to A18; front of driver's seat should move up.	• Faulty front up-down motor • An open or high resistance in the wire • A short to ground in the wire
Power Seat: Front Up-Down Motor-Full Down	Front of seat moves down	Power seat control unit/ A8, A18, A6, A16 Disconnect power seat control unit connector A. Connect A8 to A6 and A16 to A18; front of driver's seat should move down.	• Faulty front up-down motor • An open or high resistance in the wire • A short to ground in the wire
Power Seat: Rear Up-Down Motor-Full Up	Rear of seat moves up	Power seat control unit/ A1, A4, A2, A10 Disconnect power seat control unit connector A. Connect A1 to A2 and A10 to A4; rear of driver's seat should move up.	• Faulty rear up-down motor • An open or high resistance in the wire • A short to ground in the wire
		Power seat control unit/ A1, A4,	• Faulty rear up-down

Power Seat: Rear Up-Down Motor-Full Down	Rear of seat moves down	A2, A10 Disconnect power seat control unit connector A. Connect A1 to A10 and A2 to A4; rear of driver's seat should move down.	motor • An open or high resistance in the wire • A short to ground in the wire
Power Seat: Recline Motor-Full Forward	Seat back moves forward	Power seat control unit/ A1, A4, A11, A9 Disconnect power seat control unit connector A. Connect A1 to A9 and A11 to A4; driver's seat back should move forward.	• Faulty recline motor • An open or high resistance in the wire • A short to ground in the wire
Power Seat: Recline Motor-Full Backward	Seat back moves backward	Power seat control unit/ A1, A4, A11, A9 Disconnect power seat control unit connector A. Connect A1 to A11 and A9 to A4; driver's seat back should move backward.	• Faulty recline motor • An open or high resistance in the wire • A short to ground in the wire

POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT

NOTE:

- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Remove the driver's seat (see **FRONT SEAT REMOVAL/INSTALLATION**).

   NOTE: Be careful not to scratch the interior trim.

3. Disconnect the 18P connector (A) and 40P connector (B) from the power seat control unit (C).

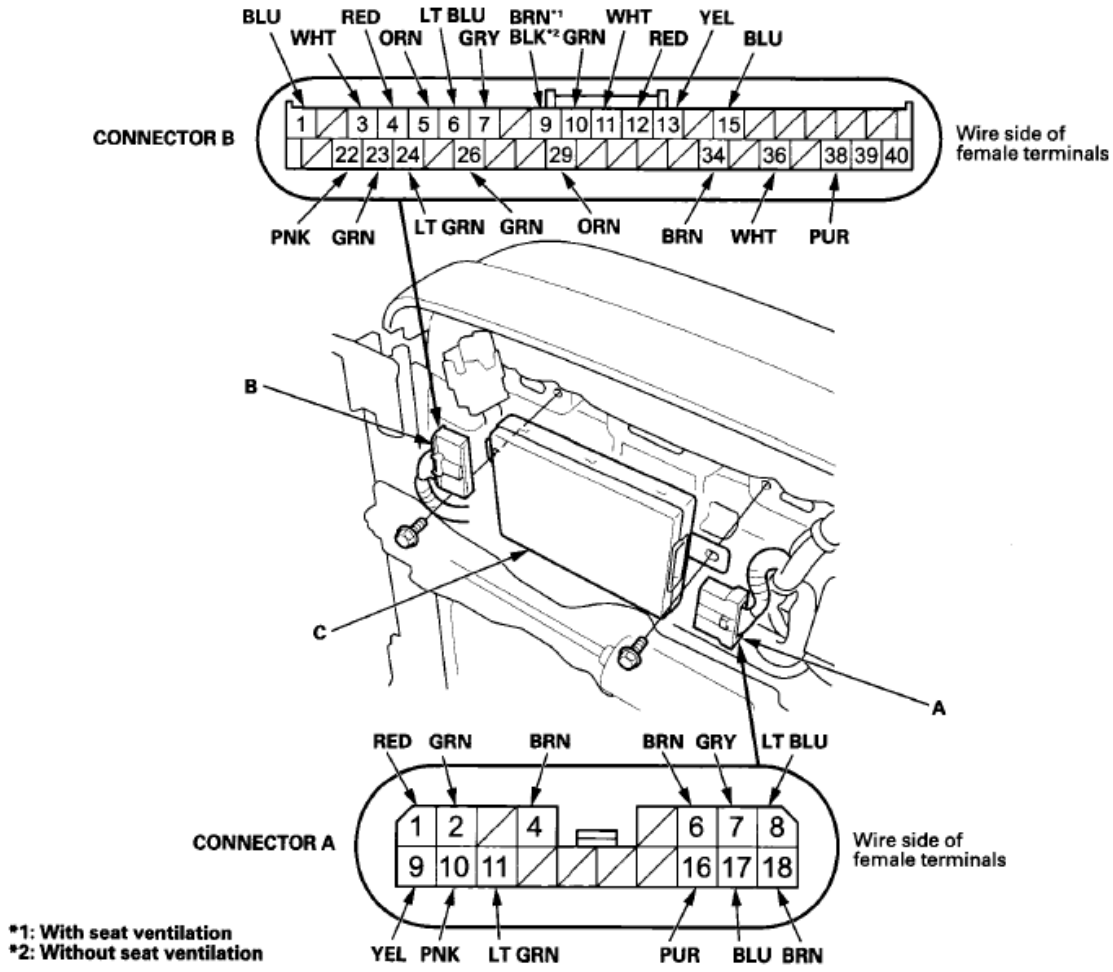

Fig. 90: Identifying 18P Connector, 40P Connector And Power Seat Control Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.
5. Reconnect the connectors to the power seat control unit, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 6.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
B34	BRN	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box • An open or high resistance in the wire

B36	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15(10 A) fuse in the under-hood fuse/relay box • An open or high resistance in the wire
A1	RED	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 3-4 (DR F/B STD) (60 A) fuse in the under-hood fuse/relay box • Blown No. 21 (20 A) fuse in the driver's under-dash fuse/relay box • An open or high resistance in the wire
A8	LT BLU	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 3-4 (DR F/B STD) (60 A) fuse in the under-hood fuse/relay box • Blown No. 19 (20 A) fuse in the driver's under-dash fuse/relay box • An open or high resistance in the wire
B9(1)	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G701) • An open or high resistance in the ground wire
B9(2)	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G701) • An open or high resistance in the ground wire
A4	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G701) • An open or high resistance in the ground wire
A18	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G701) • An open or high resistance in the ground wire
B26 (A/T)	GRN	Shift lever in P position	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty transmission range switch • Poor ground (G101) • An open or high resistance in the wire
			Measure the voltage to	• Faulty transmission range

		Shift lever in any other position than P	ground: There should be about 5 V.	switch • A short to ground in the wire
B26 (A/T)	GRN	Ignition switch ON (II), or power mode ON, parking brake lever pulled	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty parking brake switch • An open or high resistance in the wire
		Ignition switch ON (II), or power mode ON, parking brake lever released	Measure the voltage to ground: There should be about 5 V.	• Faulty parking brake switch • A short to ground in the wire
B15	BLU	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be at least about 10 V.	• Faulty position sensor • A short to ground in the wire
B10 • B29	GRN • ORN	Run the recline motor	Measure the voltage between terminals B10 (+) and B29(-): There should be about 2.5 V average.	• Faulty position sensor • An open or high resistance in the wire • A short to ground in the wire
B11 • B29	WHT • ORN	Run the slide motor	Measure the voltage between terminals B11 (+) and B29(-): There should be about 2.5 V average.	• Faulty position sensor • An open or high resistance in the wire • A short to ground in the wire
B12 • B29	RED • ORN	Run the front up-down motor	Measure the voltage between terminals B12 (+) and B29(-): There should be about 2.5 V average.	• Faulty position sensor • An open or high resistance in the wire • A short to ground in the wire
B13 • B29	YEL • ORN	Run the rear up-down motor	Measure the voltage between terminals B13 (+) and B29(-): There should be about 2.5 V average.	• Faulty position sensor • An open or high resistance in the wire • A short to ground in the wire
B1 • B7	BLU • GRY	Slide switch in FORWARD position	Measure the voltage between the terminals: There should be less then 0.2 V.	• Faulty driver's power seat adjustment switch • An open or high resistance in the wire
B1 • B24	BLU • LT GRN	Slide switch in BACKWARD position	Measure the voltage between the terminals: There should be less then 0.2 V.	• Faulty driver's power seat adjustment switch • An open or high resistance in the wire
B1	BLU •	Recline switch in	Measure the voltage between the terminals:	• Faulty driver's power seat adjustment switch

• B6	LT BLU	FORWARD position	There should be less then 0.2 V.	• An open or high resistance in the wire
B1 • B23	BLU • GRN	Recline switch in BACKWARD position	Measure the voltage between the terminals: There should be less then 0.2 V.	• Faulty driver's power seat adjustment switch • An open or high resistance in the wire
B1 • B5	BLU • ORN	Front up-down switch in UP position	Measure the voltage between the terminals: There should be less then 0.2 V.	• Faulty driver's power seat adjustment switch • An open or high resistance in the wire
B1 • B4	BLU • RED	Front up-down switch in DOWN position	Measure the voltage between the terminals: There should be less then 0.2 V.	• Faulty driver's power seat adjustment switch • An open or high resistance in the wire
B1 • B22	BLU • PNK	Rear up-down switch in UP position	Measure the voltage between the terminals: There should be less then 0.2 V.	• Faulty driver's power seat adjustment switch • An open or high resistance in the wire
B1 • B3	BLU • WHT	Rear up-down switch in DOWN position	Measure the voltage between the terminals: There should be less then 0.2 V.	• Faulty driver's power seat adjustment switch • An open or high resistance in the wire
(1) With seat ventilation (2) Without seat ventilation				

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then disconnect the connectors from the power seat control unit, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the control unit must be faulty; replace it.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
B38	PUR	Disconnect the power mirror control unit 24P connector	Check for continuity between terminal B38 and power mirror control unit 24P connector terminal No. 13: There should be continuity.	An open in the UART wire
A7 • A17	GRY • BLU	Under all conditions	Connect terminals A1 and A7, and terminals A17 and A4: The seat should slide backward.	• Faulty slide motor • An open or high resistance in the wire
			Connect terminals A1 and A17, and terminals A7 and A4:	

			The seat should slide forward.	
A9 • A11	YEL • LT GRN	Under all conditions	Connect terminals A1 and A9, and terminals A11 and A4: The seat should recline forward. Connect terminals A1 and A11, and terminals A9 and A4: The seat should recline backward.	• Faulty recline motor • An open or high resistance in the wire
A6 • A16	BRN • PUR	Under all conditions	Connect terminals A1 and A6, and terminals A16 and A4: The front of seat should move down. Connect terminals A1 and A16, and terminals A6 and A4: The front of seat should move up.	• Faulty front up-down motor • An open or high resistance in the wire
A2 • A10	GRN • PNK	Under all conditions	Connect terminals A1 and A2, and terminals A10 and A4: The rear of seat should move up. Connect terminals A1 and A10, and terminals A2 and A4: The rear of seat should move down.	• Faulty rear up-down motor • An open or high resistance in the wire

POWER MIRROR CONTROL UNIT INPUT TEST/REPLACEMENT

NOTE: Before troubleshooting the DPMS, troubleshoot the multiplex integrated control system first using B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Remove the driver's door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
3. Disconnect the 24P connector (A) from the power mirror control unit (B).

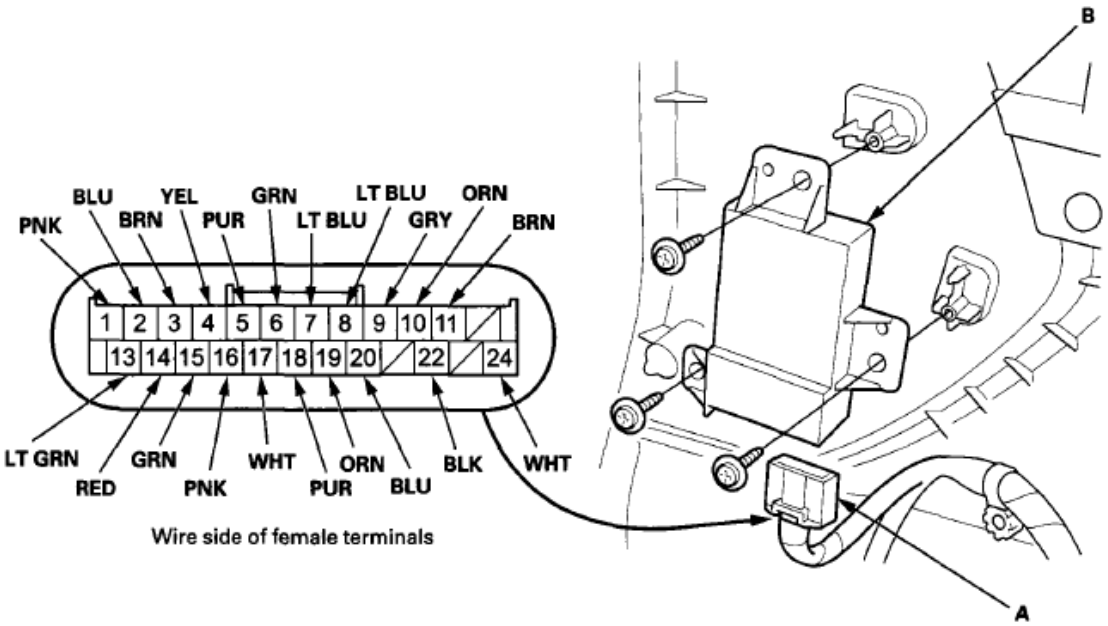

Fig. 91: Identifying 24P Connector And Power Mirror Control Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.
5. Reconnect the connector to the power mirror control unit, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 6.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
11	BRN	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box • An open or high resistance in the wire
24	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • An open or high resistance in the wire
22	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than	• Poor ground (G401) • An open or high resistance in the

			0.2 V.	ground wire
1 • 2	PNK • BLU	Ignition switch ON (II), or power mode ON, and mirror select switch in LEFT, then mirror down switch pressed	Measure the voltage to ground: There should be battery voltage.	• Blown No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box • Faulty power mirror switch • An open or high resistance in the wire
8 • 9	LT • BLU GRY	Ignition switch ON (II), or power mode ON, and mirror select switch in RIGHT, then mirror down switch pressed	Measure the voltage to ground: There should be battery voltage.	• Blown No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box • Faulty power mirror switch • An open or high resistance in the wire
10	ORN	Ignition switch ON (II), or power mode ON, and mirror select switch in LEFT or RIGHT, then mirror up switch pressed	Measure the voltage to ground: There should be battery voltage.	• Blown No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box • Faulty power mirror switch • An open or high resistance in the wire
7	LT BLU	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be about 5 V.	• Faulty mirror position sensor • A short to ground in the wire
4 • 6	YEL • GRN	Swing the left mirror from full left to full right	Measure the voltage between terminals No. 4 and No. 6: There should be about 0.5 V to 4.5 V (average about 2.5 V when the mirror moves).	• Faulty left mirror position sensor • An open or high resistance in the wire • A short to ground in the wire
5 • 6	PUR • GRN	Move the left mirror from full up to full down	Measure the voltage between terminals No. 5 and No. 6: There should be about 0.5 V to 4.5 V (average about 2.5 V when the mirror moves).	• Faulty left mirror position sensor • An open or high resistance in the wire • A short to ground in the wire
			Measure the voltage	

20 • 6	BLU • GRN	Swing the right mirror from full left to full right	between terminals No. 20 and No. 6: There should be about 0.5 V to 4.5 V (average about 2.5 V when the mirror moves).	• Faulty right mirror position sensor • An open or high resistance in the wire • A short to ground in the wire
19 • 6	ORN • GRN	Move the right mirror from full up to full down	Measure the voltage between terminals No. 19 and No. 6: There should be about 0.5 V to 4.5 V (average about 2.5 V when the mirror moves).	• Faulty right mirror position sensor • An open or high resistance in the wire • A short to ground in the wire

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then disconnect the connectors from the power mirror control unit, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the control unit must be faulty; replace it.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
13	LT GRN	Disconnect power seat control unit B (40P) connector	Check for continuity between terminal No. 13 and power seat control unit B (40P) connector terminal No. 38: There should be continuity.	An open in the UART wire

DOOR MULTIPLEX CONTROL UNIT INPUT TEST

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Remove the driver's door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
3. Disconnect the 37P connector (A) from the power window master switch (B).

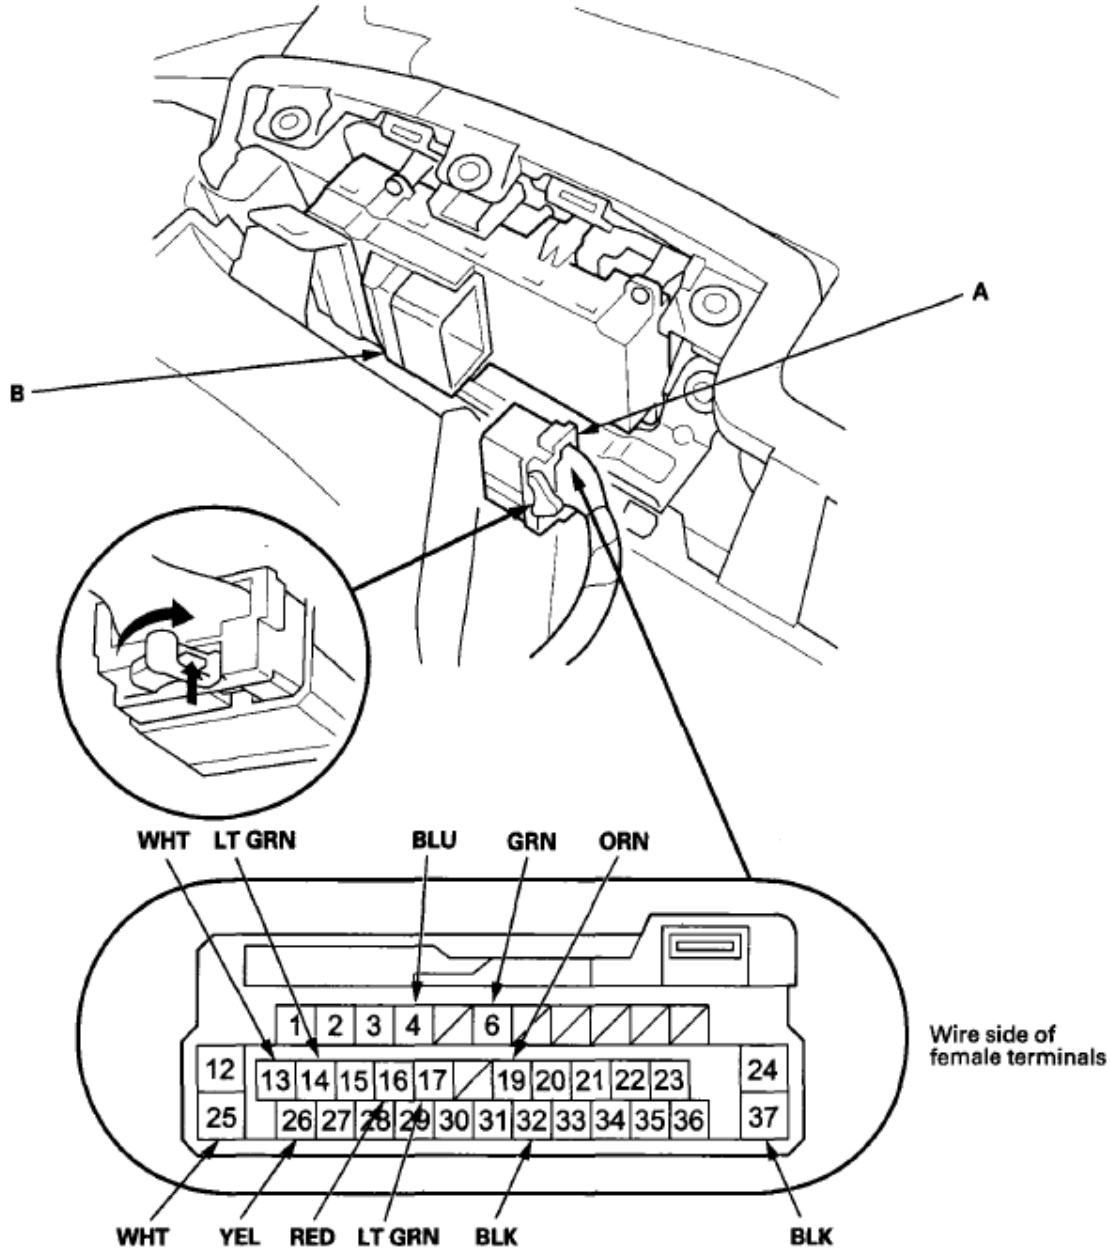

Fig. 92: Identifying 37P Connector And Power Window Master Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.
5. Reconnect the connector to the power window master switch, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 6.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
13	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • An open or high resistance in the wire
14	LT GRN	Ignition switch ON (II), or ignition mode ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box • An open or high resistance in the wire
25	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 3-4 (DR F/B STD) (60 A) fuse in the under-hood fuse/relay box • Blown No. 24 (20 A) fuse in the driver's under-dash fuse/relay box • An open or high resistance in the wire
32	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G401) • An open or high resistance in the ground wire
37	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G402) • An open or high resistance in the ground wire
		Ignition switch ON (II), or ignition mode ON, position 2	Measure the voltage to ground:	• Faulty driving position memory switch • Poor ground (G401) or an open

		switch pressed	There should be less than 0.2 V.	in the ground wire • An open or high resistance in the wire
16	RED	Ignition switch ON (II), or ignition mode ON, position 2 switch released	Measure the voltage to ground: There should be about 5 V.	• Faulty driving position memory switch • A short to ground in the wire
17	LT GRN	Ignition switch ON (II), or ignition mode ON, position 1 switch pressed	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driving position memory switch • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Ignition switch ON (II), or ignition mode ON, position 1 switch released	Measure the voltage to ground: There should be about 5 V.	• Faulty driving position memory switch • A short to ground in the wire
19	ORN	Ignition switch ON (II), or ignition mode ON, SET switch pressed	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driving position memory switch • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Ignition switch ON (II), or ignition mode ON, SET switch released	Measure the voltage to ground: There should be about 5 V.	• Faulty driving position memory switch • A short to ground in the wire

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then disconnect the connector from the power window master switch, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the door multiplex control unit must be faulty; replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

NOTE: After replacing the power window master switch, reset the power window control unit (see RESETTING THE POWER WINDOW CONTROL UNIT).

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
				• Faulty driving position

				memory switch • Faulty LED • Poor ground(G401) or an open in the ground wire • An open or high resistance in the wire
4	BLU	Under all conditions	Connect terminals No. 13 and No. 4: The driving position memory switch indicator 2 should come on.	
6	GRN	Under all conditions	Connect terminals No. 13 and No. 6: The driving position memory switch indicator 1 should come on.	• Faulty driving position memory switch • Faulty LED • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
26	YEL	Under all conditions	Connect terminals No. 13 and No. 26: The driving position memory switch lights should come on.	• Faulty driving position memory switch • Faulty LED • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire

DRIVING POSITION MEMORY SWITCH TEST/REPLACEMENT

1. Remove the driver's door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
2. Disconnect the 7P connector (A) from the driver's position memory switch (B).

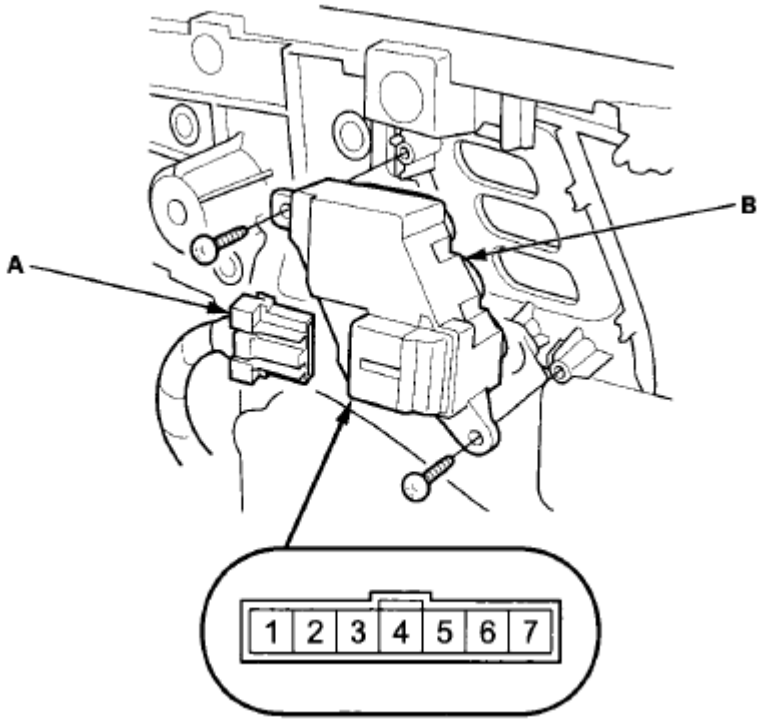

Fig. 93: Identifying 7P Connector And Driver'S Position Memory Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the two screws, then remove the switch from the door panel.
4. Check for continuity between the terminals in each switch position according to the table.

NOTE:

- **Make sure the correct test lead (+ or -) is placed on the terminal.**
- **When checking for continuity across the diode, use the diode setting on the digital volt/ohm meter to check the diode bias.**
- **Be careful of this characteristic; a diode is one that conducts fully in one direction (forward) and not at all in the opposite direction (reverse).**

Position \ Terminal		1	2	3	4	5		6	7

5. If the continuity is not as specified, replace the switch.

POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Remove the driver's seat (see **FRONT SEAT REMOVAL/INSTALLATION**).
2. Remove the power seat adjustment switch knobs (A) and the recline cover from the driver's seat (see **FRONT SEAT RECLINE COVER REMOVAL/INSTALLATION**), then remove the two screws and the power seat adjustment switch (B).

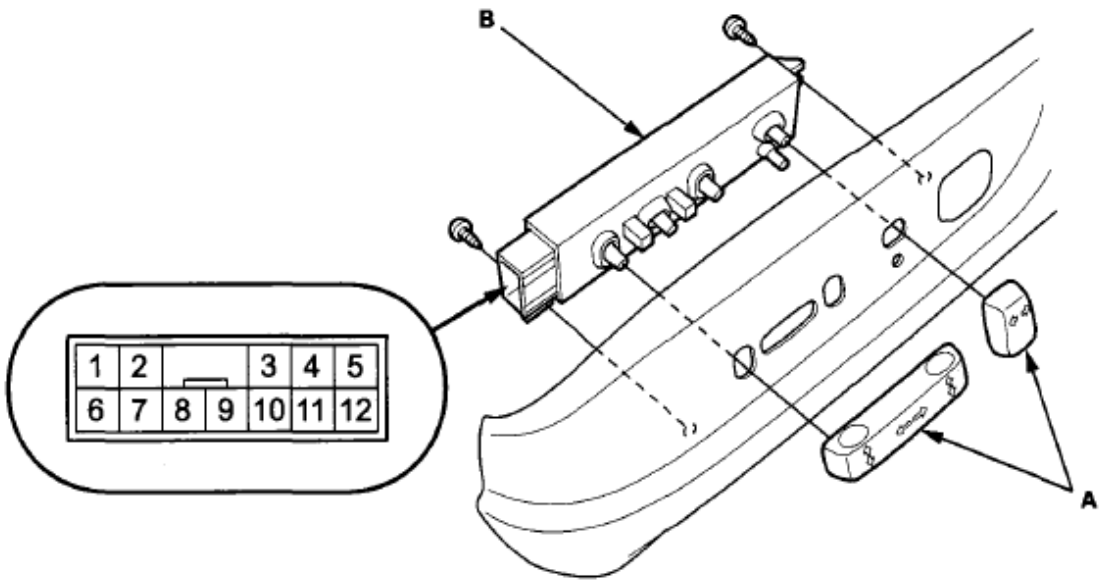

Fig. 95: Identifying Power Seat Adjustment Switch Knobs And Power Seat Adjustment Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the 12P connector from the power seat adjustment switch.
4. Reinstall the adjustment switch knobs to the switch.
5. Check for continuity between the terminals in each position according to the table.

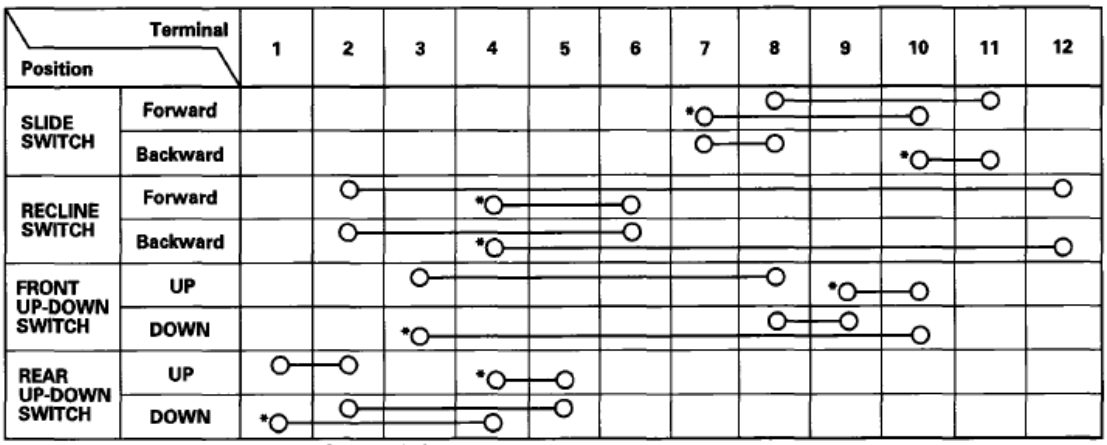

Fig. 96: Checking Continuity Between Terminals In Position According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the continuity is not as specified, replace the switch.

DRIVER'S POWER SEAT MOTOR TEST

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Remove the driver's seat (see **FRONT SEAT REMOVAL/INSTALLATION**).
2. Disconnect the connector from each power seat motor.

NOTE:

- **For the recline motor, remove the seat-back cover (see FRONT SEAT-BACK COVER REPLACEMENT).**
- **All connectors are terminal side of male terminals.**

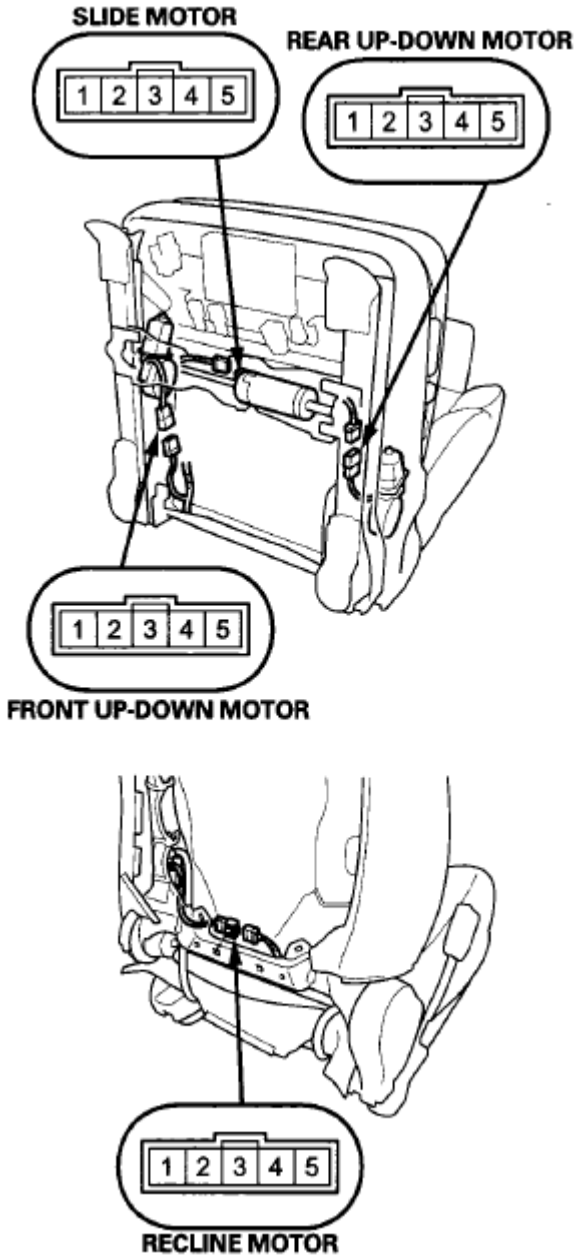

Fig. 97: Identifying Slide, Rear And Front Up-Down And Recline Motors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Test each motor by connecting power and ground according to the table. When the motor stops running, disconnect battery power immediately.

Self-test has failed (flashing the CAL and NW)	**Electrical Compass Troubleshooting**.	Reboot the electrical compass unit

SYSTEM DESCRIPTION

OVERVIEW

The electrical compass sends the azimuth (direction) information in the 8-directions (N, NE, E, SE, S, SW, W, NW) to the audio-HVAC display unit via the audio unit.

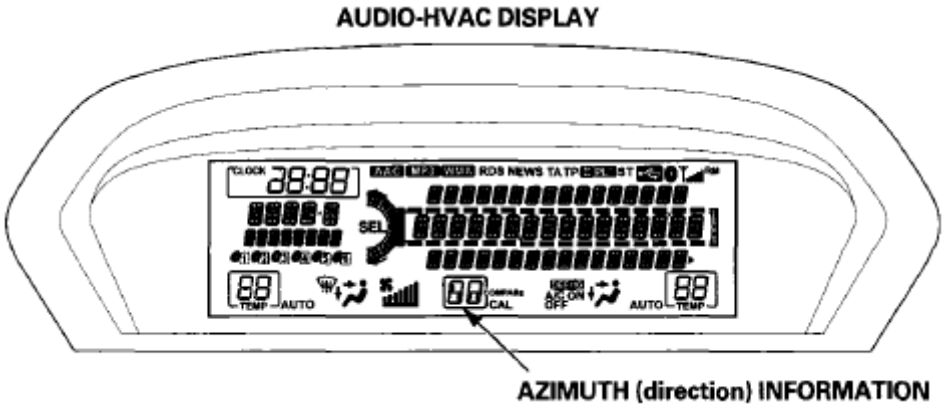

Fig. 2: Identifying Electrical Compass Azimuth Display
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Starting Operation

When the ignition switch is turned to ACCESSORY (I), the electrical compass unit begins to communicate with the audio unit. Then turn the ignition switch to ON (II), the self-test mode begins automatically.

The self-test function checks for the current voltage, non-volatile memory (NVM), and ROM status in the electrical compass unit. If the unit detects a malfunction while in the self-test, it indicates a malfunction by flashing compass information segments (CAL and NW) in the audio-HVAC display unit.

The electrical compass unit send the azimuth (direction) information to the audio unit. The electrical compass unit receive the VSP signal from the gauge control module via the audio unit. The azimuth information is fixed while parked. The electrical compass unit also receives following signals via the audio unit:

- RR DEF (on/off) signal from the climate control unit. The electrical compass unit compensates for magnetic anomalies when the rear window defogger is on.
- INTR LT signal from the driver's MICU. The electrical compass unit not compensates for magnetic anomalies when the rear window defogger is on and the rear door or the trunk lid is opening.

Self-Calibration

The electrical compass unit has a self-calibration function. It detects and compensates for magnetic anomalies caused by bridges, subways and large steel structures. When the vehicle leaves an area with a strong magnetic interference field (2, 400 mG or more), the electrical compass unit automatically begins calibrating. If needed, you can manually **calibrate the compass**.

Zone Selection

Zone selection is required to compensate for the difference between magnetic North and geographic North. This deviation is referred to as declination, the compass compensates for declination when you select the zone where the vehicle is located.

1	BRN	IG1	No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box
2	BLK	GND	Body ground to G651
3	LT BLU	COMPASS 1	Audio unit
4	PNK	COMPASS 2	Audio unit
5	ORN	COMPASS 3	Audio unit
6	RED	COMPASS 4	Audio unit

CIRCUIT DIAGRAM

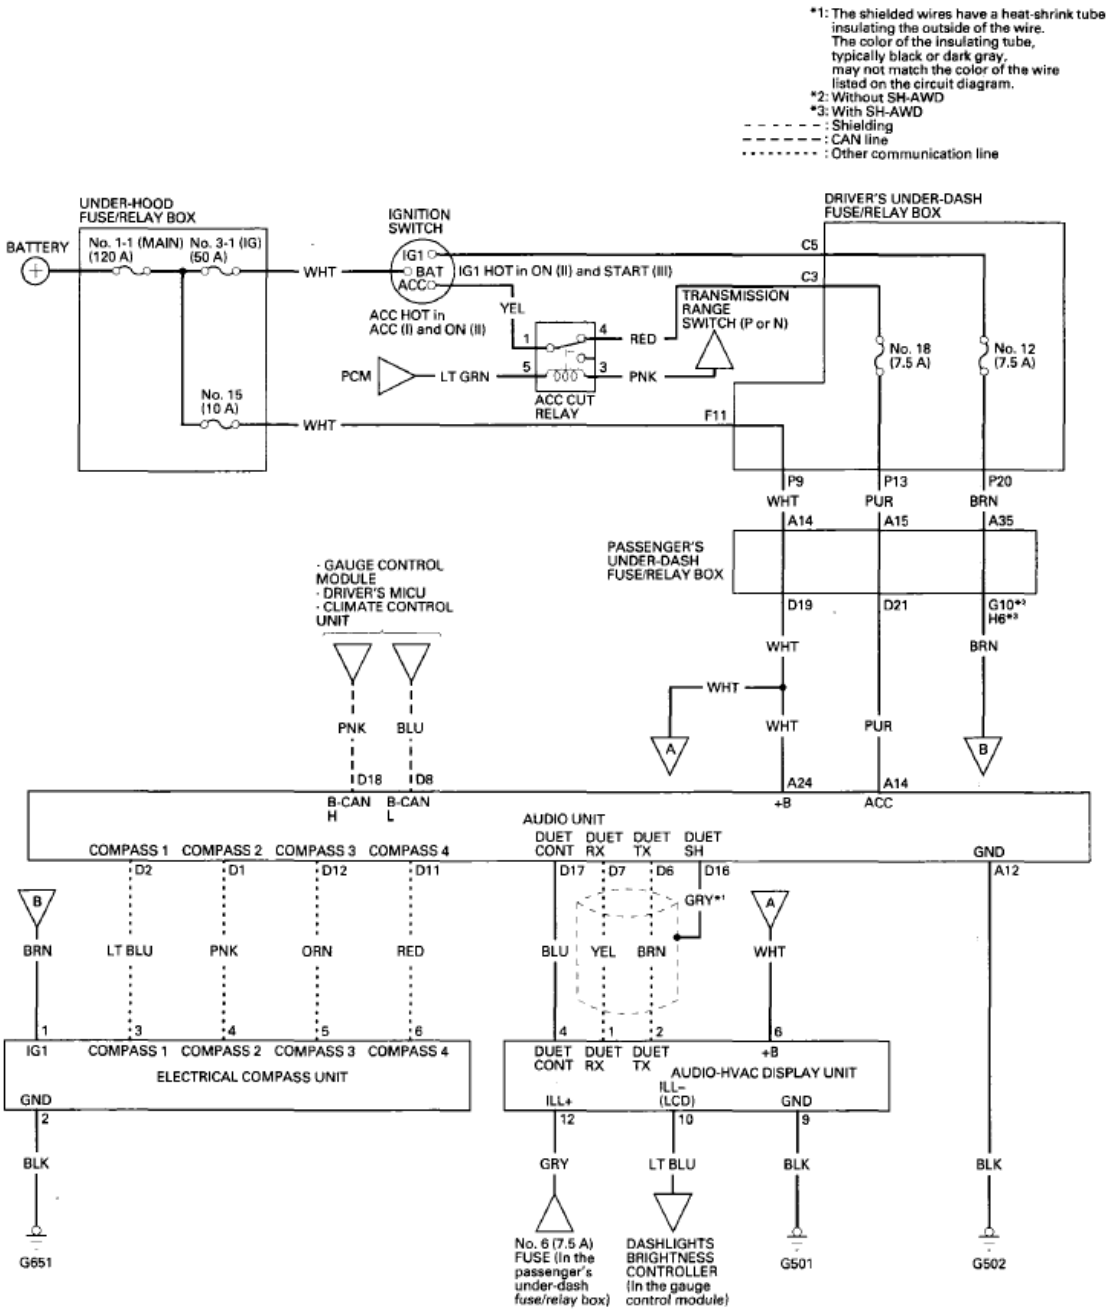

Fig. 6: Electrical Compass Circuit Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ELECTRICAL COMPASS TROUBLESHOOTING

NOTE: Check the vehicle battery condition first (see BATTERY TEST).

1. Check the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

YES -Go to step 2.

NO -Replace the fuse, and recheck. If the fuse blows again, check for a short in the No. 12 (7.5 A) fuse circuit. •

2. Check if the electrical compass unit 6P connector is properly connected.

   Is the connector properly connected?

   YES -Go to step 3.

   NO -Reconnect the connector, and recheck. •

3. Turn the ignition switch to ON (II).
4. Measure the voltage between electrical compass unit 6P connector terminal No. 1 and body ground.

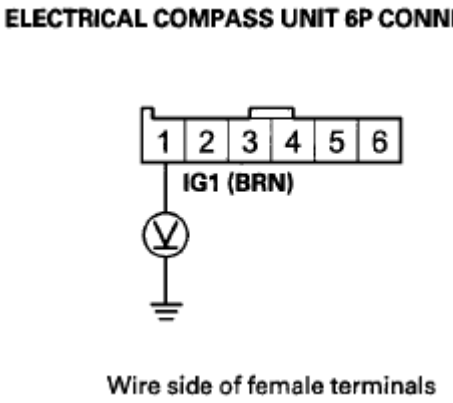

Fig. 7: Measuring Voltage Between Electrical Compass Unit 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 5.

NO -Repair an open or high resistance in the wire between electrical compass unit 6P connector terminal No. 1 and the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box. •

5. Measure the voltage between electrical compass unit 6P connector terminal No. 2 and body ground.

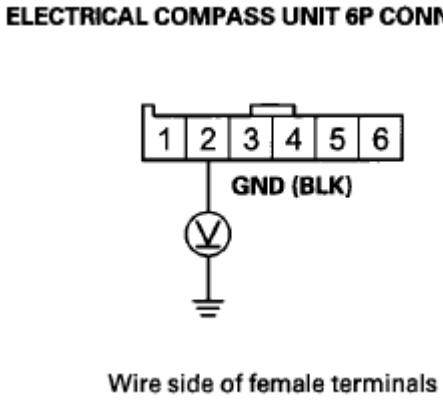

Fig. 8: Measuring Voltage Between Electrical Compass Unit 6P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 6.

NO -Repair an open or high resistance in the wire between electrical compass unit 6P connector terminal No. 2 and body ground (G651); with SH-AWD (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), without SH-AWD (see **CONNECTOR TO FUSE/RELAY BOX INDEX**). •

6. Turn the ignition switch to LOCK (0).
7. Disconnect the electrical compass unit 6P connector and audio unit connector D (20P).
8. Check for continuity between the electrical compass unit 6P connector and body ground according to the table.

Electrical compass unit connector	Wire color
3	LT BLU
4	PNK
5	ORN
6	RED

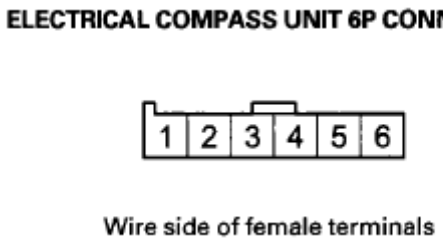

Fig. 9: Electrical Compass Unit 6P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire(s) between the electrical compass unit and the audio unit. •

NO -Go to step 9.

9. Check for continuity between the electrical compass unit 6P connector and audio unit connector D (20P) according to the table.

Electrical compass unit connector	Audio unit connector	Wire color
3	D2	LT BLU
4	D1	PNK
5	D12	ORN
6	D11	RED

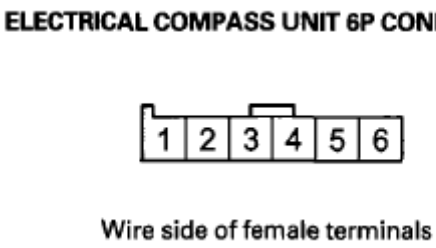

Fig. 10: Electrical Compass Unit 6P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

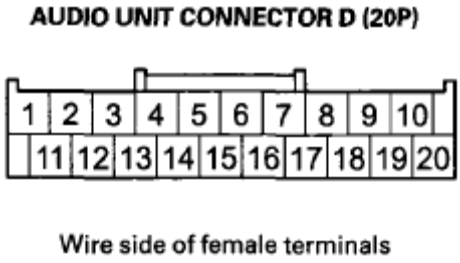

Fig. 11: Audio Unit Connector D (20P) Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair an open in the wire(s) between the electrical compass unit and the audio unit. •

NO -Substitute a known-good **electrical compass unit** (see), and recheck. If the symptom/indication goes away, replace the original **electrical compass unit**. If the symptom/indication is still present, replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). •

ELECTRICAL COMPASS ZONE SELECTION AND CALIBRATION

SET THE COMPASS ZONE

NOTE:

- **Do this procedure any time the electrical compass unit is replaced.**
- **Do this procedure in an open area away from buildings, power lines, and other vehicles.**
- **If you see "-- --" in the compass display and the CAL indicator is shown in the display, the compass is self-calibrating.**
- **The compass may need to be manually calibrated after exposure to a strong magnetic field. If the compass seems to be continually showing the wrong direction and is not self-calibrating, do the following procedure.**
- **In most areas, there is a variation between magnetic north and true north. The compass zone needs to be set to your geographic zone to compensate for this variation.**

1. Check the No. 15(10 A) fuse in the under-hood fuse/relay box and the No. 12 (7.5 A) and the No. 18 (7.5 A) fuses in the driver's under-dash fuse/relay box.
2. Turn the ignition switch to ON (II), then press and hold the SETUP button (A) on the audio panel for about 5 seconds until you hear a beep. The display shows the compass setting menu items.

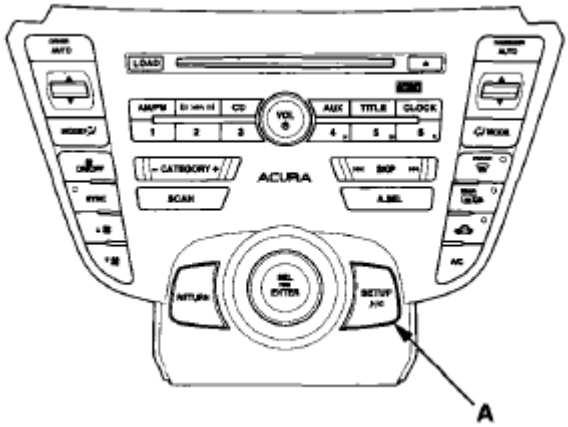

Fig. 12: Identifying Setup Button On Audio Panel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Find your zone number in the map shown.

Fig. 13: Identifying Zone Numbers Map
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Turn the selector knob (A) to select ZONE, then press the knob to enter the selection. The display shows the currently selected zone number.

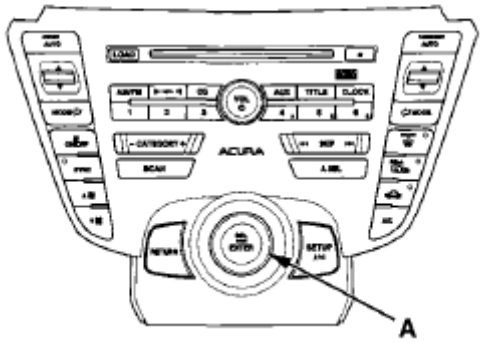

Fig. 14: Identifying Selector Knob
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Turn the selector knob to enter your zone, then press the knob, The display returns to its normal display mode.

NOTE: If necessary, press the RETURN button (A) to return to the previous display. Pressing the SETUP button (B) cancels the compass setting mode.

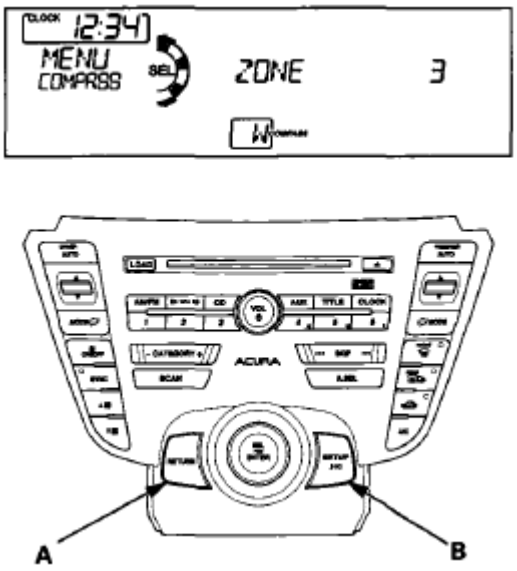

Fig. 15: Identifying Return Button And Setup Button
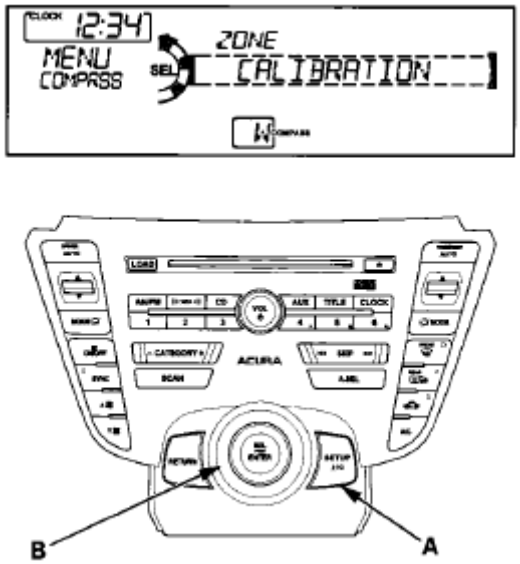
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CHECK THE COMPASS CALIBRATION

Although the compass is self calibrating, it may need to be manually calibrated after exposure to a strong magnetic field. If the compass is blinking and CAL is shown on the display, do this to calibrate the compass:

1. Turn the ignition switch to ON (II).
2. Press and hold the SETUP button (A) for about 5 seconds until you hear a beep. The display shows you the compass setting menu items.



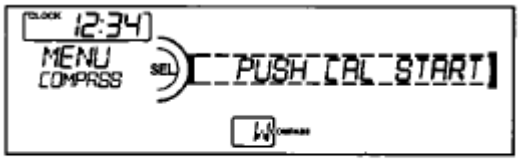


Fig. 16: Identifying Setup Button And Selector Knob
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the selector knob (B) to select CALIBRATION, then press the knob.
4. When the display shows PUSH CAL START, press the selector knob (A). The compass display blinks and the CAL indicator comes on.

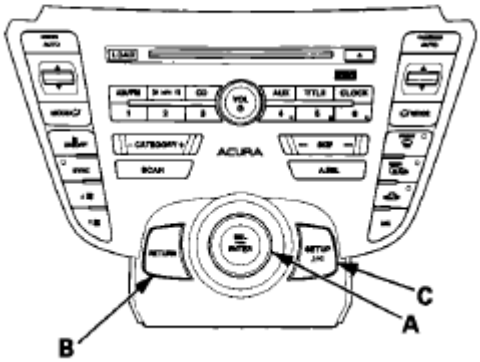

Fig. 17: Identifying Selector Knob, Return Button And Setup Button
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Drive the vehicle slowly in three complete circles (20 seconds or more per a circle). When the calibration is successfully completed, the compass display stops blinking and the CAL indicator goes off.

NOTE:

- **When you are in the setting mode, pressing the RETURN button (B) returns to the previous display. Pressing the SETUP button (C) cancels the compass setting mode.**
- **The audio system is not related to the electrical compass system. Even if the electrical compass system is calibrating, the display returns to the normal display which was last selected.**
- **If the calibration is failure, change the place (an open area away from buildings, power lines, other vehicles, and any other sources of strong magnetic fields) and do the calibration procedure over again.**

ELECTRICAL COMPASS UNIT REMOVAL/INSTALLATION

1. Remove the rear shelf (see **TRIM REMOVAL/INSTALLATION - REAR SHELF AREA**).
2. Remove the bolts (A), then disconnect the 6P connector (B) from the electrical compass unit (C), and remove it.

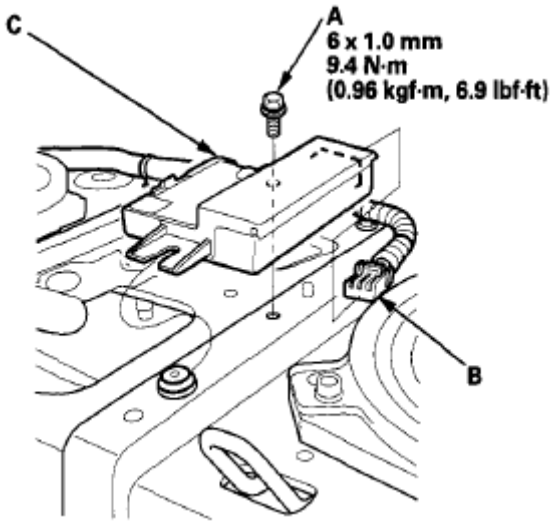

Fig. 18: Identifying Bolts, 6P Connector And Electrical Compass Unit With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the electrical compass unit in the reverse order of removal.

NOTE: If you replaced the electrical compass unit, set the compass zone.

FUEL FILL DOOR OPENER SOLENOID TEST

1. Open the trunk lid, and remove the left trunk side trim panel. (See **TRIM REMOVAL/INSTALLATION - TRUNK AREA**).
2. Disconnect the 2P connector (A) from the fuel fill door opener solenoid (B).

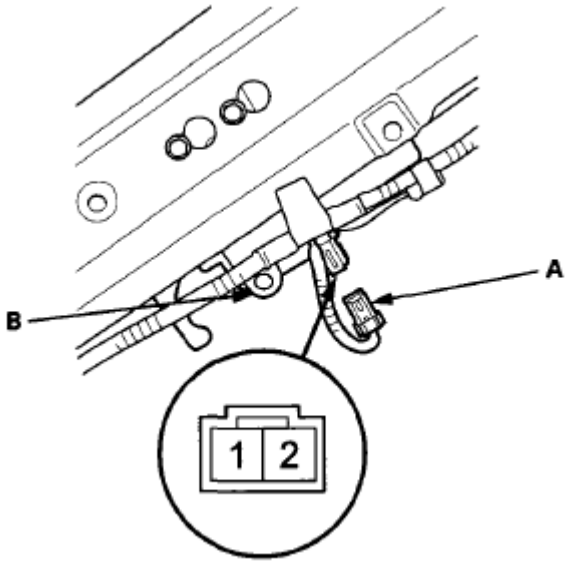

Fig. 3: Identifying Fuel Fill Door Opener Solenoid & 2P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check solenoid operation by connecting power to terminal No. 1 and ground terminal No. 2 momentarily.

NOTE: To prevent damage to the solenoid only apply battery voltage momentarily.

4. If the solenoid does not actuate, replace it.

FUEL FILL DOOR OPENER SWITCH TEST/REPLACEMENT

1. Remove the driver's door panel. (See **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
2. Disconnect the 6P connector (A) from the fuel fill door opener switch (B).

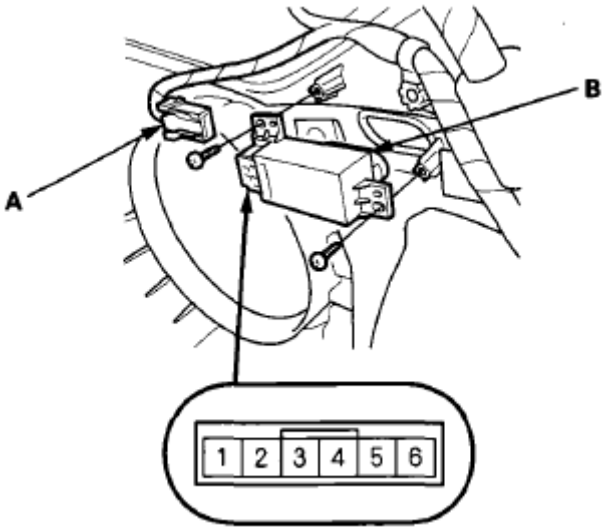

Fig. 4: Fuel Fill Door Opener Switch Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between the terminals in each switch position according to the table.

Terminal / Position	1	2
Pushed	○—○	
Released		

Fig. 5: Checking Continuity Between Terminals In Switch Position According To Table

Gauges - TL

COMPONENT LOCATION INDEX

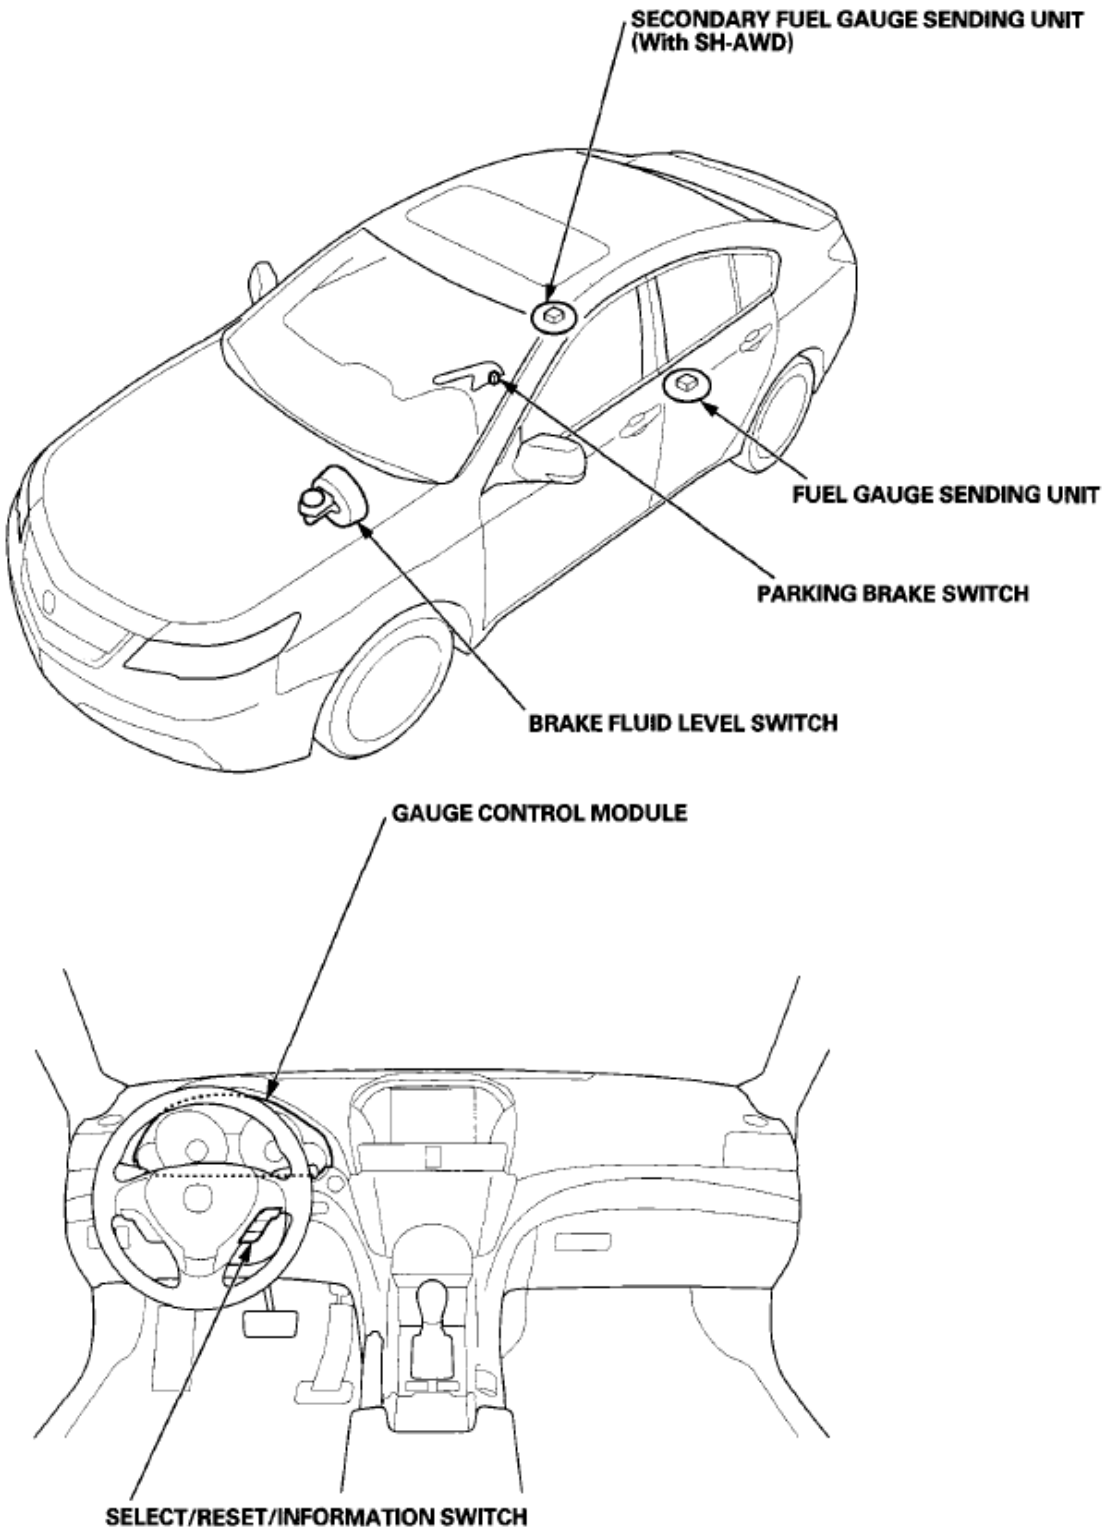

Fig. 1: Gauges Components Location (1 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

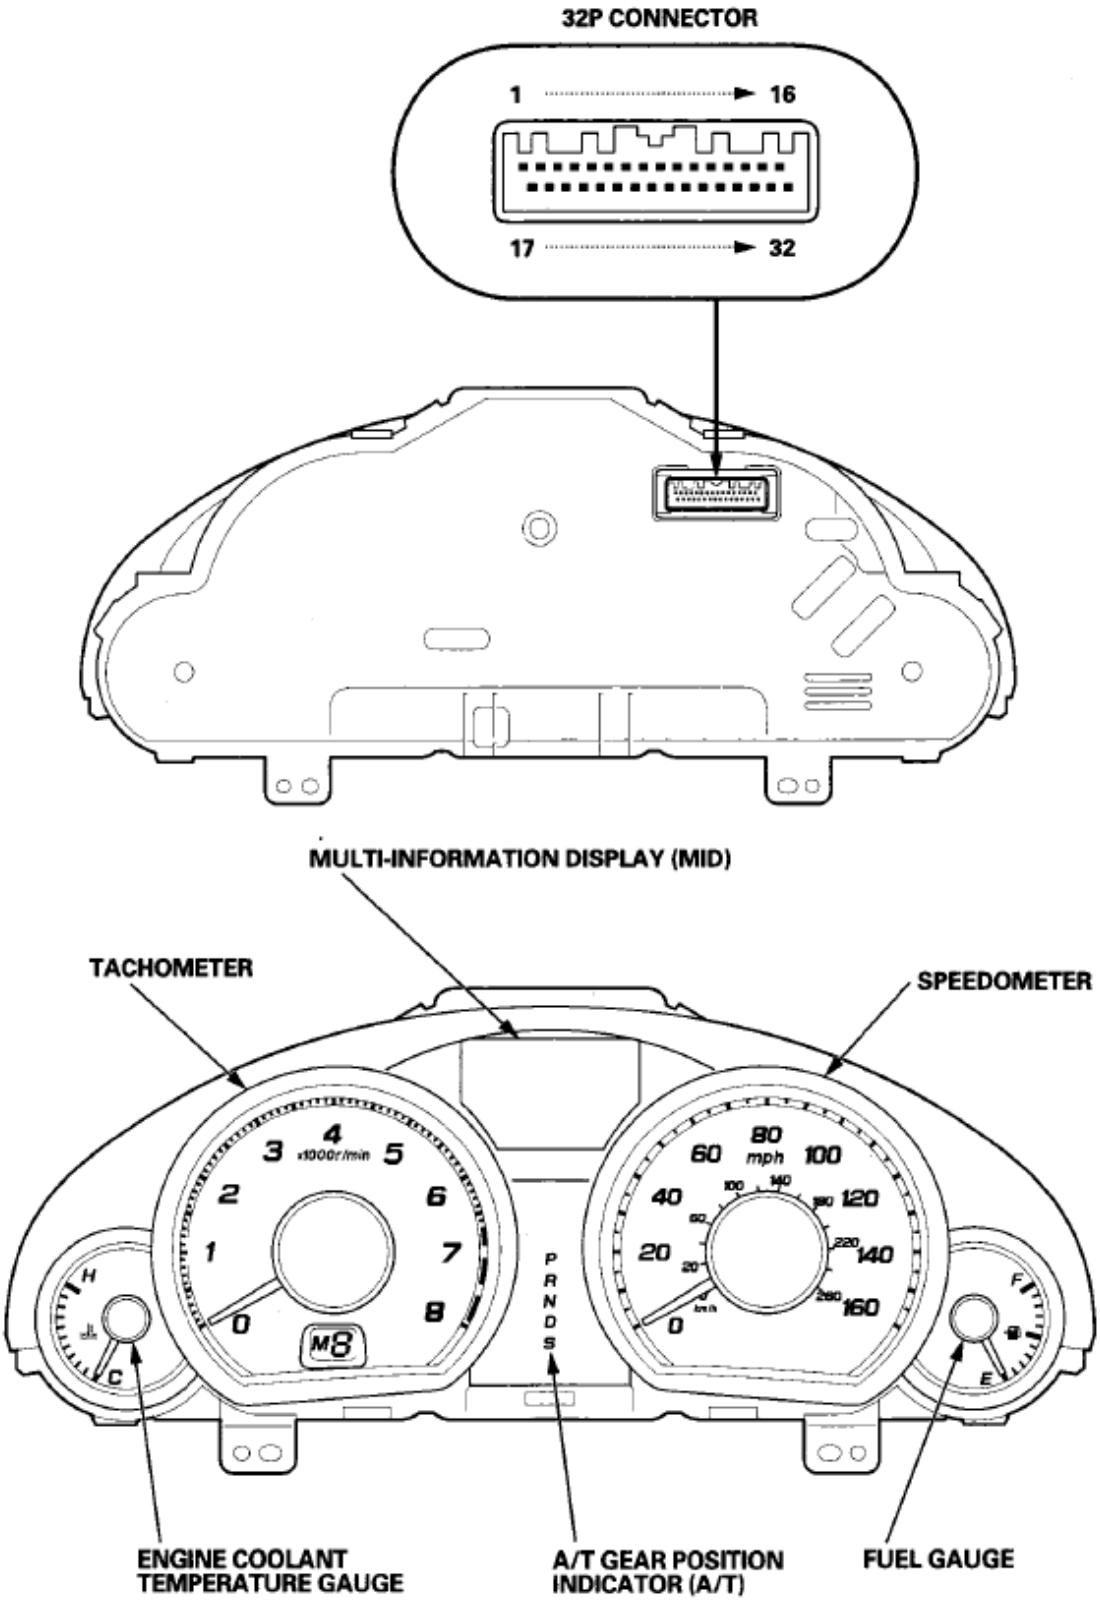

Fig. 2: Gauges Components Location (2 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SELF-DIAGNOSTIC FUNCTION

NOTE: Before testing, troubleshoot the multiplex integrated control unit first, using B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

The gauge control module has a self-diagnostic function which consists of the following checks:

- The beeper drive circuit check.
- The indicator drive circuit check.
- The switch input test.
- The LCD/MID segments check.
- The gauges drive circuit check (Tachometer, Fuel gauge, Speedometer, Engine coolant temperature gauge).
- The communication line check (of the body-controller area network (B-CAN) communication line and the fast-controller area network (F-CAN) communication line between the gauges).

NOTE: Indicators are also controlled via the communication lines.

ENTERING THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS

Using the HDS, select BODY ELECTRICAL, GAUGES, then FUNCTION TESTS and do the SELF-DIAGNOSTIC FUNCTION.

ENTERING THE SELF-DIAGNOSTIC FUNCTION (MANUAL METHOD)

Before doing the self-diagnostic function, make sure the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box and the No. 15 (10 A) fuse in the under-hood fuse/relay box are OK.

1. Push and hold the SEL/RESET button.
2. Turn the combination light switch ON.
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Within 5 sec, turn the combination light switch OFF, then ON and OFF again.
5. Within 5 sec, release the SEL/RESET button, and then repeatedly push and release the button three times.

NOTE:

- **While in the self-diagnostic mode, the dashlights brightness controller operates normally.**
- **While in the self-diagnostic mode, the SEL/RESET switch is used to start the Beeper Drive Circuit Test and the Gauge Drive Circuit Check.**
- **If the vehicle speed exceeds 1 mph (2 km/h) or the ignition switch is turned to LOCK (0), or the vehicle is in OFF mode, the self-diagnostic mode ends.**

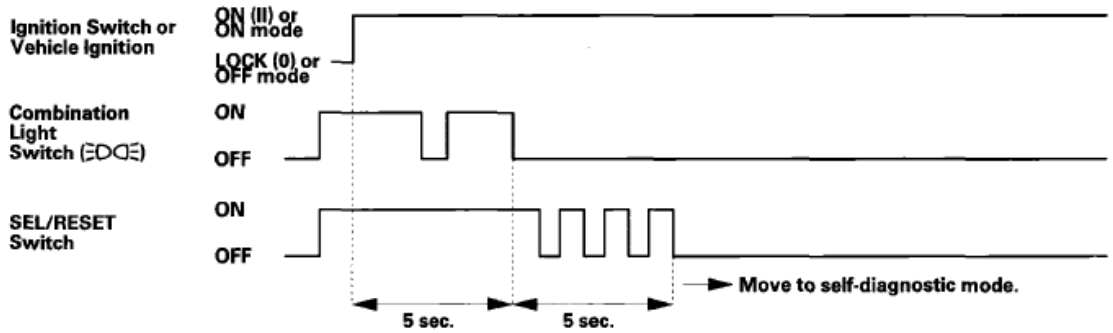

Fig. 3: Identifying Digital Patterns Of Switches
Courtesy of AMERICAN HONDA MOTOR CO., INC.

THE INDICATOR DRIVE CIRCUIT CHECK

When entering the self-diagnostic mode, the following indicators (if equipped) blink:

A/T gear position indicator, ABS indicator, BSI indicator, brake system indicator, charging system indicator, cruise control indicator, cruise main indicator, door indicator, EPS indicator, high beam indicator, fog light indicator, immobilizer indicator, lights-on indicator, keyless access indicator, low oil pressure indicator, low fuel indicator, malfunction indicator lamp (MIL), message indicator, seat belt reminder indicator, security indicator, SH-AWD indicator, side airbag cutoff indicator, SRS indicator, TPMS indicator, VSA indicator, and VSA OFF indicator.

SWITCH INPUT CHECK

At the initial stage of the self-diagnostic function, the beeper sounds intermittently. The beeper sounds continuously when any of the following switch inputs are switched from OFF to ON:

Cruise control main, SET/DECEL, RES/ACCEL, CANCEL switches, SEL/RESET switch, parking brake switch, PREVIOUS, NEXT switch, and VSA OFF switch.

THE BEEPER DRIVE CIRCUIT CHECK

When entering the self-diagnostic mode, the beeper sounds 5 times.

THE LCD/MID SEGMENT CHECK

When entering the self-diagnostic mode, the words "CHECKING NOW" show on the MID, and blink 5 times.

THE GAUGE DRIVE CIRCUIT CHECK

When entering the self-diagnostic mode, the speedometer, the tachometer, the fuel gauge, and the engine coolant temperature gauge needles sweep from the minimum position to maximum position, then return to the minimum position.

NOTE: After the beeper stops sounding and the gauge needles return to the minimum

position, pushing the SEL/RESET button starts the Beeper Drive Circuit Check (one beep) and the Gauge Drive Circuit Check again. The check cannot be started again until the gauge needles return to the minimum position.

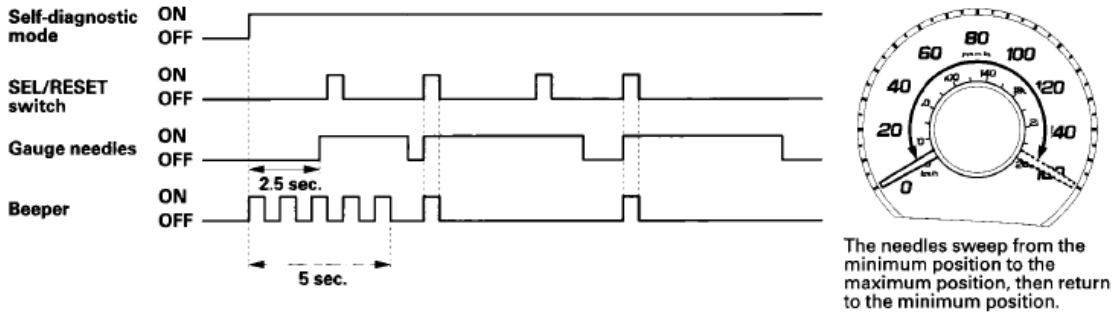

Fig. 4: View Of Digital Patterns Of Switches And Gauge Drive
Courtesy of AMERICAN HONDA MOTOR CO., INC.

If the needles fail to sweep, or the beeper does not sound, replace the gauge control module.

THE COMMUNICATION LINE CHECK

While in the self-diagnostic mode, the Communication Line Check starts after the LCD/MID Segments Check.

Fig. 5: Display Checking Now
Courtesy of AMERICAN HONDA MOTOR CO., INC.

If the communication line is OK, the word "OK" will be indicated on the multi-information display (MID). If there is a communication line error, the word "ERROR" will be indicated on the MID.

Indication pattern

There is a malfunction in the communication line between the F-CAN and the gauge control module. The B-CAN is OK at this time. Check for DTCs in the ECM/PCM and troubleshoot any DTCs found.

Fig. 6: Display Communication Check, B-Can.....Ok And F-Can....Error (1 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

There is a malfunction in the communication line between the B-CAN and the gauge control module. The F-CAN line is OK at this time.

Fig. 7: Display Communication Check, B-Can.....Ok And F-Can....Error (2 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

There is a malfunction in the communication line between the gauge control module and the F-CAN and the B-CAN. Check for DTCs in the ECM/PCM and troubleshoot any DTCs found.

Fig. 8: Display Communication Check, B-Can.....Ok And F-Can....Error (3 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ENDING THE SELF-DIAGNOSTIC FUNCTION

Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

NOTE: If the vehicle speed exceeds 1 mph (2 km/h), the self-diagnostic function ends.

DTC TROUBLESHOOTING

DTC B1152: GAUGE CONTROL MODULE INTERNAL (EEPROM) ERROR

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to

select the OFF mode and then the ON mode.

3. Check for DTCs with the HDS.

   Is DTC B1152 indicated?

   YES -Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

   NO -Intermittent failure, the system is OK at this time.

DTC B1175: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT MALFUNCTION

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait at least than 30 seconds.
4. Check for DTCs with the HDS.

   Is DTCs B1175 indicated?

   YES -

   - Without SH-AWD: Go to step 5.
   - With SH-AWD: Go to step 10.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the fuel gauge sending unit 4P connector.
7. Disconnect the gauge control module 32P connector.
8. Check for continuity between gauge control module 32P connector terminals No. 2 and No. 4 and fuel gauge sending unit 4P connector terminals No. 3 and No. 1 respectively.

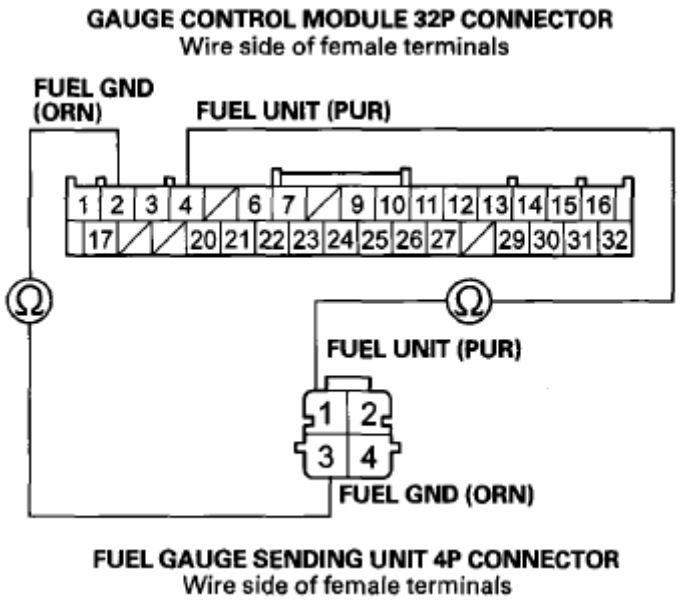

Fig. 13: Checking Continuity Between Gauge Control Module 32P Connector And Fuel Gauge Sending Unit 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 9.

NO -Repair an open or high resistance in the wire.

9. Do the fuel gauge sending unit test (see **FUEL GAUGE SENDING UNIT TEST**).

   Is the fuel gauge sending unit OK?

   YES -Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

   NO -Replace fuel gauge sending unit (see **FUEL PUMP/FUEL GAUGE SENDING UNIT REPLACEMENT**).

10. Disconnect the fuel gauge sending 4P connector.
11. Disconnect the secondary fuel gauge sending unit 4P connector.
12. Check for continuity between fuel gauge sending unit 4P connector terminal No. 3 and secondary fuel gauge sending unit 4P connector terminal No. 1.

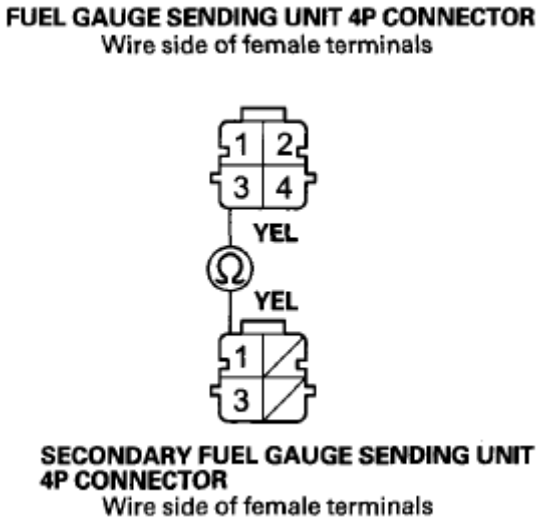

Fig. 14: Checking Continuity Between Fuel Gauge Sending Unit 4P Connector Terminal No. 3 And Secondary Fuel Gauge Sending Unit 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 13.

NO -Repair an open or high resistance in the wire.

13. Disconnect the gauge control module 32P connector.
14. Check for continuity between gauge control module 32P connector terminal No. 2 and fuel gauge sending unit 4P connector terminal No. 3.

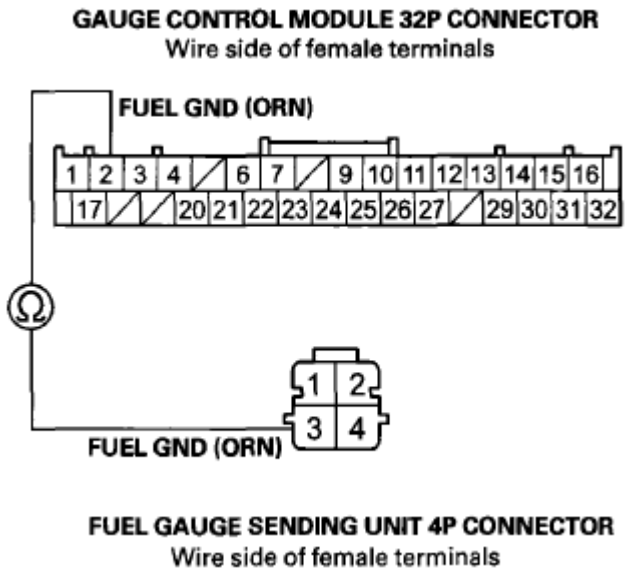

Fig. 15: Checking Continuity Between Gauge Control Module 32P Connector And Fuel Gauge

Sending Unit 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 15.

NO -Repair an open or high resistance in the wire.

15. Check for continuity between gauge control module 32P connector terminal No. 4 and secondary fuel gauge sending unit 4P connector terminal No. 1.

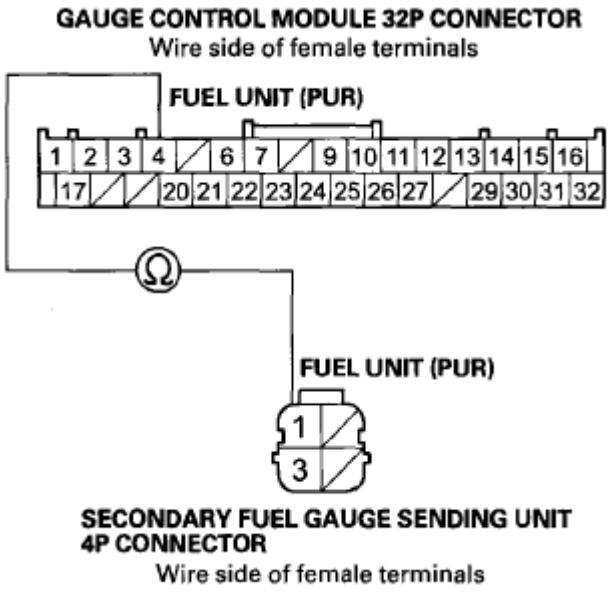

Fig. 16: Checking Continuity Between Gauge Control Module 32P Connector And Secondary Fuel Gauge Sending Unit 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 16.

NO -Repair an open or high resistance in the wire.

16. Do the fuel gauge sending unit test (see **FUEL GAUGE SENDING UNIT TEST**).

Is the fuel tank unit OK?

YES -Go to step 17.

NO -Replace fuel gauge sending unit (see **FUEL PUMP/FUEL GAUGE SENDING UNIT REPLACEMENT**).

17. Do the secondary fuel gauge sending unit test (see **SECONDARY FUEL GAUGE SENDING UNIT TEST**).

    Is the secondary fuel gauge sending unit OK?

    YES -Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

    NO -Replace the secondary gauge sending unit (see **SECONDARY FUEL GAUGE SENDING UNIT REMOVAL/INSTALLATION**).

DTC B1176: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT SHORT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 30 seconds.
4. Check for DTCs with the HDS.

   Is DTC B1176 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the fuel level sensor circuit is OK at this time. Check for worn/missing insulation or an internal short in the wire.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the fuel gauge sending unit 4P connector.
7. Clear the DTCs with the HDS.
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Wait for at least 30 seconds.
10. Check for DTCs with the HDS.

    Is DTC B1176 indicated?

    YES -Go to step 11.

    NO -Replace the fuel gauge sending unit (see **FUEL PUMP/FUEL GAUGE SENDING UNIT REPLACEMENT**).

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

12. Disconnect the gauge control module 32P connector.
13. Check for continuity between gauge control module 32P connector terminal No. 4 and body ground.

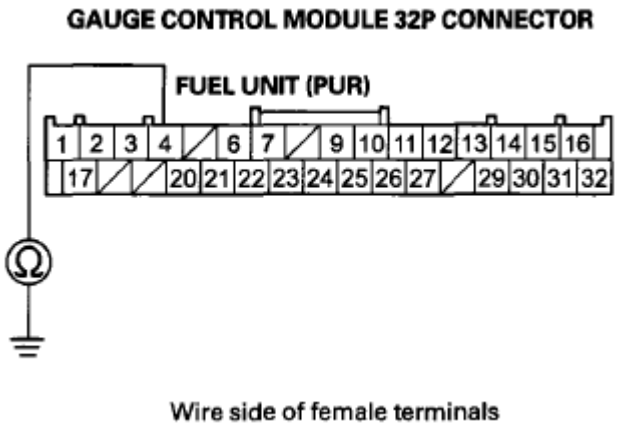

Fig. 17: Checking Continuity Between Gauge Control Module 32P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire between the gauge control module and the fuel gauge sending unit.

NO -

- Without SH-AWD: Go to step 14.
- With SH-AWD: Go to step 15.

14. Check for continuity between gauge control module 32P connector terminals No. 2 and No. 4.

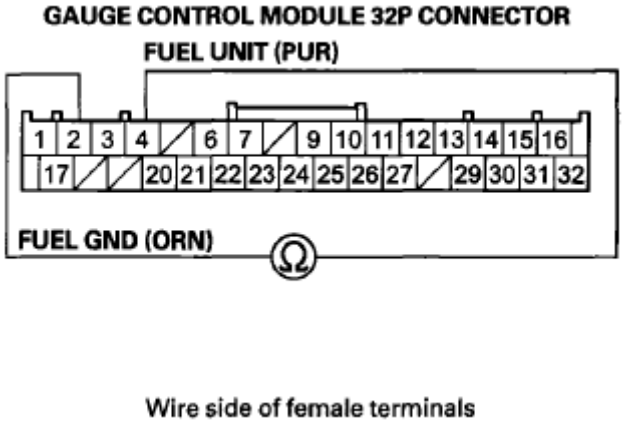

Fig. 18: Checking Continuity Between Gauge Control Module 32P Connector Terminals No. 2 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire between the gauge control module and the fuel gauge sending unit.

NO -Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

15. Disconnect the secondary fuel gauge sending unit 4P connector.
16. Check for continuity between fuel gauge sending unit 4P connector terminals No. 1 and No. 3.

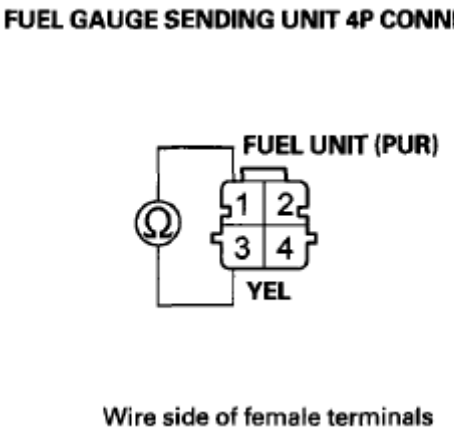

Fig. 19: Checking Continuity Between Fuel Gauge Sending Unit 4P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short in the wire.

NO -Go to step 17.

17. Reconnect the fuel gauge sending unit 4P connector.
18. Reconnect the gauge control module 32P connector.
19. Clear the DTCs with the HDS.
20. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
21. Wait for at least 30 seconds.
22. Check for DTCs with the HDS.

Is DTC B1176 indicated?

YES -Go to step 23.

NO -Replace the secondary fuel gauge sending unit (see **SECONDARY FUEL GAUGE SENDING UNIT REMOVAL/INSTALLATION**).

23. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
24. Disconnect the fuel gauge sending unit 4P connector.
25. Check for continuity between secondary fuel gauge sending unit 4P connector terminal No. 1 and body ground.

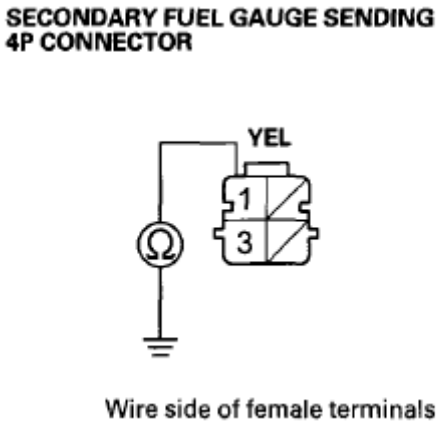

Fig. 20: Checking Continuity Between Secondary Fuel Gauge Sending Unit 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire between the fuel gauge sending unit and the secondary fuel gauge sending unit.

NO -Go to step 27.

26. Disconnect the gauge control module 32P connector.
27. Check for continuity between secondary fuel gauge sending unit 4P connector terminals No. 1 and No. 3.

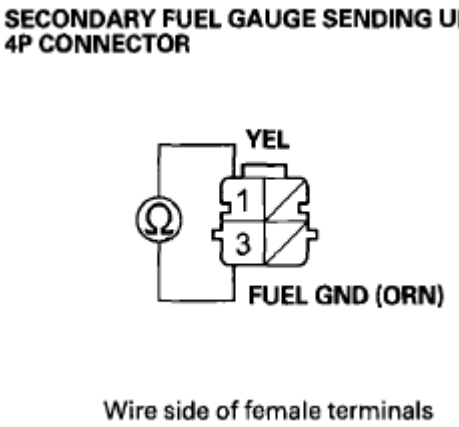

Fig. 21: Checking Continuity Between Secondary Fuel Gauge Sending Unit 4P Connector Terminals No. 1 And No. 3

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short in the wire.

NO -Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

DTC B1192: GAUGE CONTROL MODULE LOST COMMUNICATION WITH THE BATTERY SENSOR (UART LINE)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Wait for at least 15 seconds.
3. Check for DTCs with the HDS.

   Is DTC B1192 indicated?

   YES -Go to step 4.

   NO -Intermittent failure, the battery sensor is OK at this time. Check for loose or poor connections between the battery sensor arid the gauge control module.

4. Check the No. 12 (7.5 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES -Go to step 5.

   NO -Replace the fuse. If the fuse blows again, repair a short to ground on the No. 12 (7.5 A) fuse circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the battery sensor 2P connector.
7. Measure the voltage between battery sensor 2P connector terminal No. 2 and body ground.

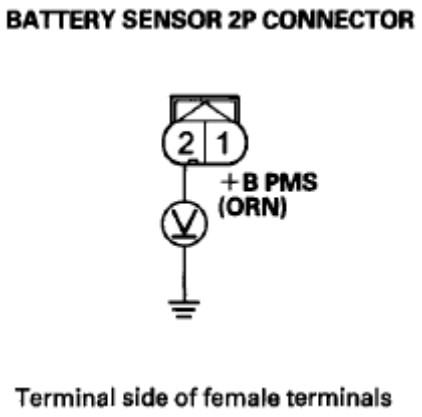

Fig. 22: Measuring Voltage Between Battery Sensor 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 8.

NO -Repair an open or high resistance in the wire between the under-hood fuse/relay box and the battery sensor.

8. Disconnect the gauge control module 32P connector.
9. Measure the voltage between battery sensor 2P connector terminal No. 1 and body ground.

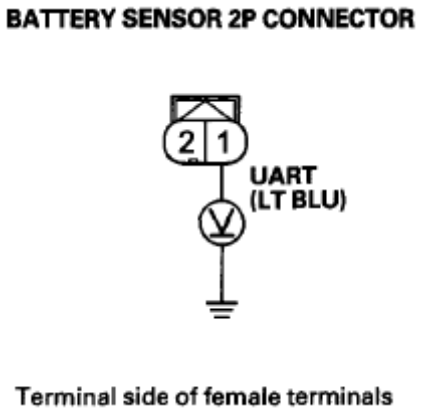

Fig. 23: Measuring Voltage Between Battery Sensor 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES -Repair a short to power in the wire between the gauge control module and the battery sensor.

NO -Go to step 10.

10. Check for continuity between battery sensor 2P connector terminal No. 1 and body ground.

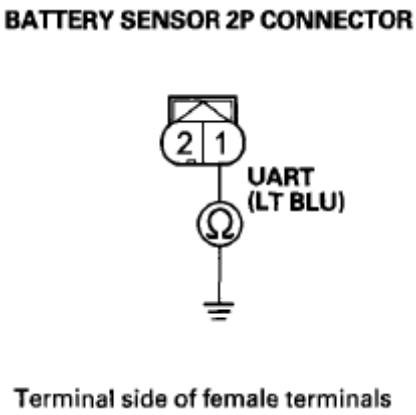

Fig. 24: Checking Continuity Between Battery Sensor 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire between the battery sensor and the gauge control module.

NO -Go to step 11.

11. Check for continuity between battery sensor 2P connector terminal No. 1 and gauge control module 32P connector terminal No. 12.

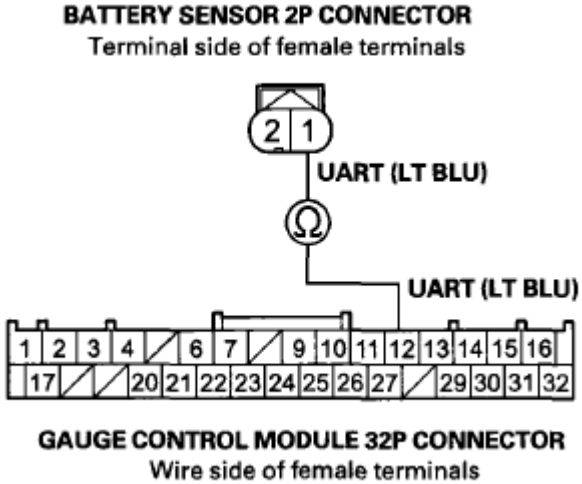

Fig. 25: Checking Continuity Between Battery Sensor 2P Connector Terminal No. 1 And Gauge Control Module 32P Connector Terminal No. 12
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO -Repair an open in the wire between the gauge control module and the battery sensor.

DTC U0029: F-CAN COMMUNICATION LINE ERROR (BUS OFF)

NOTE:

- **Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it does not, go to DLC Circuit Troubleshooting (see DLC CIRCUIT TROUBLESHOOTING).**
- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U0029 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections, or worn/shorted wires. If the connections are good, check the battery condition (see **BATTERY TEST**) and the charging system.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the appropriate connector at each control unit in the table one at a time. Clear the DTC, then recheck for DTCs after each unit is disconnected.

Control Unit	Connector
Gauge control module	32P connector
ECM/PCM	Connector A (49P)
VSA modulator-control unit	47P connector
SRS unit	Connector A (39P)
Audio-navigation unit(1)	Connector H (28P)
TPMS control unit	20P connector
EPS control unit	28P connector
Yaw rate-lateral acceleration sensor(2) Yaw rate-lateral longitudinal/acceleration sensor(3)	4P connector
Steering angle sensor	5P connector
SH-AWD control unit	Connector A (20P)

AcuraLink control unit(4)	Connector A (32P)
(1) With navigation (2) Without SH-AWD (3) With SH-AWD (4) USA models with navigation	

Is DTC U0029 indicated after each individual unit was disconnected?

YES -Go to step 7.

NO -Replace the control unit that was disconnected when DTC U0029 did not set.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect all the control units connectors in the following table.

Control Unit	Connector
Gauge control module	32P connector
ECM/PCM	Connector A (49P)
VSA modulator-control unit	47P connector
SRS unit	Connector A (39P)
Audio-navigation unit(1)	Connector H (28P)
TPMS control unit	20P connector
EPS control unit	28P connector
Yaw rate-lateral acceleration sensor(2) Yaw rate-lateral longitudinal/acceleration sensor(3)	4P connector
Steering angle sensor(3)	5P connector
SH-AWD control unit(3)	Connector A (20P)
AcuraLink control unit(4)	Connector A (32P)
(1) With navigation (2) Without SH-AWD (3) With SH-AWD (4) USA models with navigation	

9. Disconnect the HDS from the data link connector (DLC).
10. Check for continuity between body ground and gauge control module 32P connector terminals No. 13 and No. 14 individually.

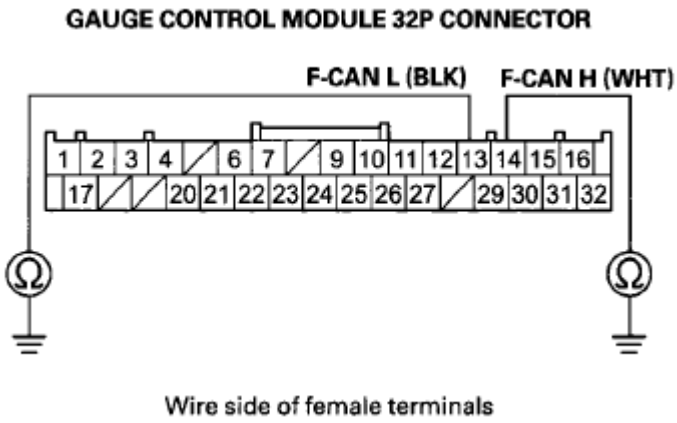

Fig. 26: Checking Continuity Between Body Ground And Gauge Control Module 32P Connector Terminals No. 13 And No. 14
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Go to step 11.

11. Check for continuity between gauge control module 32P connector terminals No. 13 and No. 14.

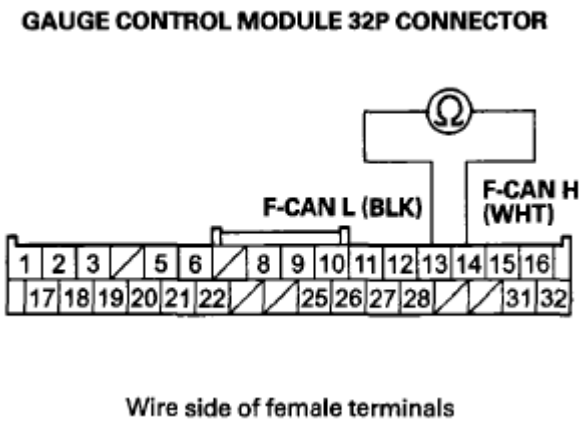

Fig. 27: Checking Continuity Between Gauge Control Module 32P Connector Terminals No. 13 And No. 14
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short in the F-CAN wires.

NO -Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

DTC U0100: GAUGE CONTROL MODULE LOST COMMUNICATION WITH ECM/PCM

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Start and run the engine for at least 5 seconds, then turn the engine off.
4. Check for DTCs with the HDS.

   Is DTC U0100 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the F-CAN communication line is OK at this time. Check for DTCs in the ECM/PCM with the HDS. If F-CAN DTCs are present, check for loose or poor connections at the gauge control module and the ECM/PCM. If the connections are good, check the battery condition and the charging system, then clear all DTCs.

5. Check for DTCs in the ECM/PCM with the HDS.

   Are any DTCs indicated?

   YES -Go to the ECM/PCM indicated **DTCS TROUBLESHOOTING**, then recheck.

   NO -Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Short the SCS line with the HDS.
8. Disconnect ECM/PCM connector A (49P).
9. Check for continuity between gauge control module 32P connector terminals No. 13 and No. 14 and ECM/PCM connector A (49P) terminals No. 49 and No. 48 respectively.

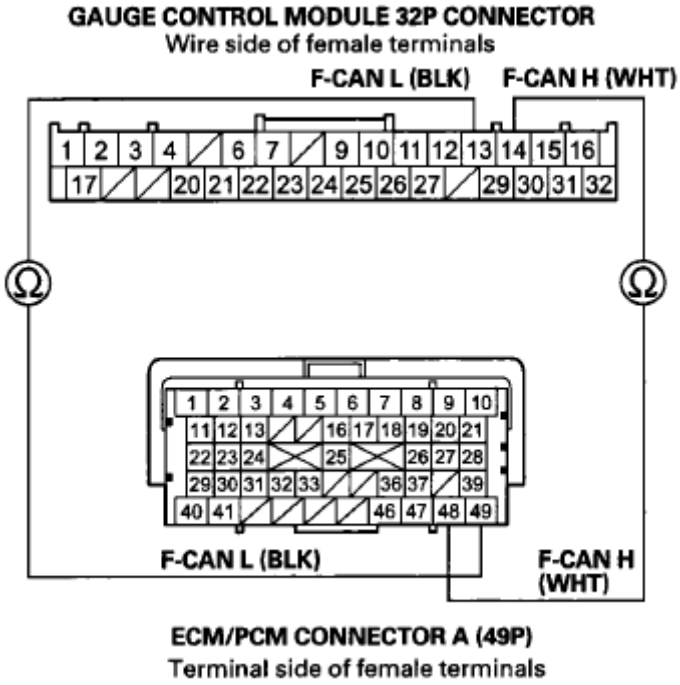

Fig. 28: Checking Continuity Between Gauge Control Module 32P Connector And ECM/PCM Connector A (49P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), and recheck. If the indication goes away, replace the original ECM/PCM. If the DTC is still present, replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO -Repair an open or poor connection in the wire between the ECM/PCM and the gauge control module.

DTC U0122: GAUGE CONTROL MODULE LOST COMMUNICATION WITH VSA MODULATOR-CONTROL UNIT (VSA MESSAGE)

NOTE:

- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **If the HDS does not communicate with the VSA modulator-control unit, the VSA indicator stays on, and no VSA DTCs are stored, go to symptom troubleshooting for ABS indicator, brake system indicator, and VSA indicator do not go off, and no DTCs are stored (see ABS INDICATOR, BRAKE SYSTEM INDICATOR, AND VSA INDICATOR DO NOT GO OFF).**

1. Clear the DTCs with the HDS.

2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U0122 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the F-CAN communication line is OK at this time. Check for DTCs in the ECM/PCM and the VSA modulator-control unit with the HDS. If F-CAN DTCs are present, check for a loose VSA ground or poor connections at the VSA modulator-control unit or gauge control module. If the connections are good, check the battery condition and the charging system, then clear all DTCs.

5. Check for DTCs in the ECM/PCM or VSA with the HDS.

   Are any DTCs indicated?

   YES -Go to the ECM/PCM or VSA indicated **DTCS TROUBLESHOOTING**, then recheck.

   NO -Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Disconnect the VSA modulator-control unit 47P connector.
8. Check for continuity between gauge control module 32P connector terminals No. 13 and No. 14 and VSA modulator-control unit 47P connector terminals No. 13 and No. 12 respectively.

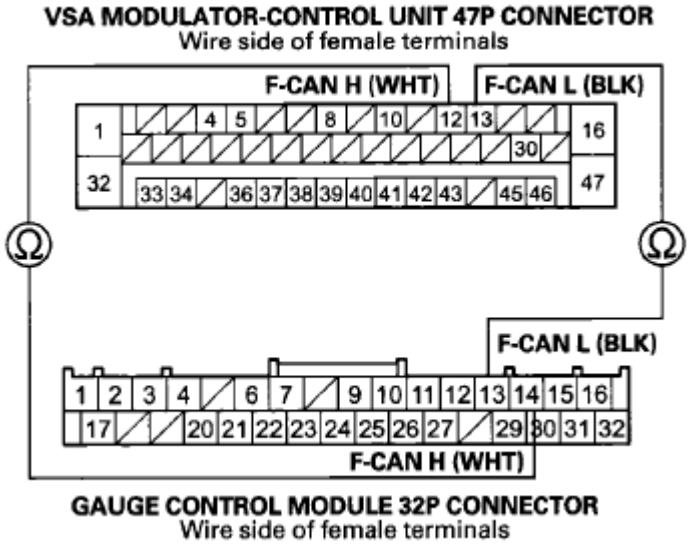

Fig. 29: Checking Continuity Between Gauge Control Module 32P Connector And VSA Modulator-Control Unit 47P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**), and recheck. If the indication goes away, replace the original VSA modulator-control unit. If the DTC is still present, replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO -Repair an open or poor connection in the wire between the VSA modulator-control unit and the gauge control module.

DTC U0127: GAUGE CONTROL MODULE LOST COMMUNICATION WITH THE TPMS CONTROL UNIT (TPMS MESSAGE)

NOTE:

- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **If the HDS does not communicate with the TPMS control unit, the TPMS indicator stays on, and no TPMS DTCs are stored, go to symptom troubleshooting for TPMS indicator does not go off, and no DTCs are stored (see TPMS INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED).**

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U0127 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the gauge control module and the TPMS control unit.

5. Check for TPMS DTCs with the HDS.

   Are any DTCs indicated?

   YES -Go to the TPMS indicated **DTCS TROUBLESHOOTING**, then recheck.

   NO -Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Disconnect the gauge control module 32P connector.

8. Disconnect the TPMS control unit 20P connector.
9. Check for continuity between the gauge control module 32P connector terminals No. 13 and No. 14 and TPMS control unit 20P connector terminals No. 11 and No. 2 respectively.

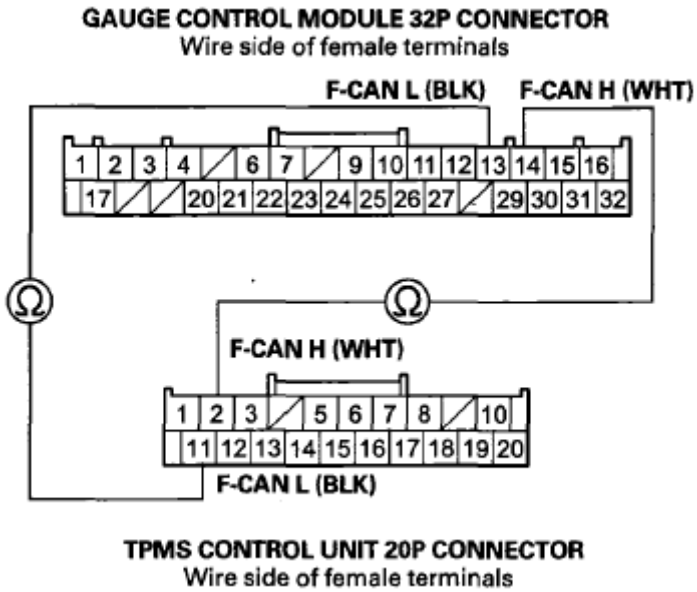

Fig. 30: Checking Continuity Between Gauge Control Module 32P Connector And TPMS Control Unit 20P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**), and recheck. If the indication goes away, replace the original TPMS control unit. If the DTC is still present, replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO -Repair an open or poor connection in the wire between the TPMS control unit and the gauge control module.

DTC U0131: GAUGE CONTROL MODULE LOST COMMUNICATION WITH EPS CONTROL UNIT (EPS MESSAGE)

NOTE:

- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **If the HDS does not communicate with the EPS control unit, the EPS indicator stays on, and no EPS DTCs are stored, go to symptom troubleshooting for EPS indicator does not go off, and no DTCs are stored (see EPS INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED).**

1. Clear the DTCs with the HDS.

2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U0131 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the gauge control module and the EPS control unit.

5. Check for EPS DTCs with the HDS.

   Are any DTCs indicated?

   YES -Go to the EPS indicated **DTCS TROUBLESHOOTING**, then recheck.

   NO -Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Disconnect the gauge control module 32P connector.
8. Disconnect EPS control unit connector D (28P).
9. Check for continuity between the gauge control module 32P connector terminals No. 13 and No. 14 and EPS control unit connector D (28P) terminals No. 15 and No. 1 respectively.

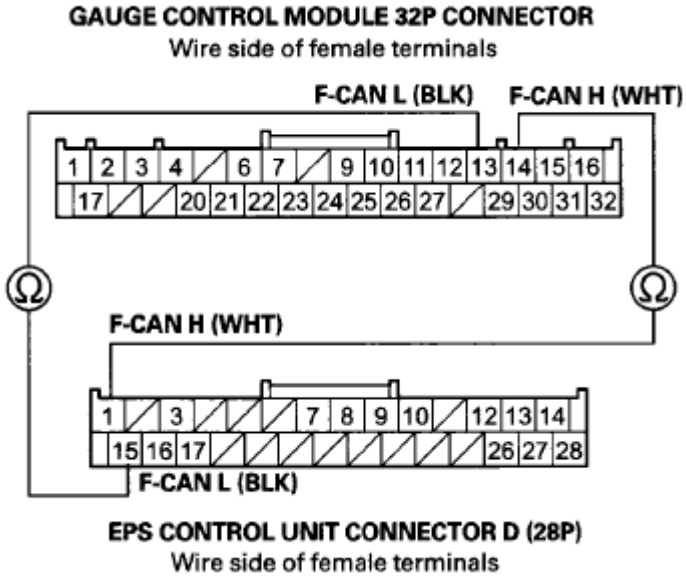

Fig. 31: Checking Continuity Between Gauge Control Module 32P Connector And EPS Control Unit Connector D (28P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good EPS control unit (see **RACK GUIDE REMOVAL/INSTALLATION**), and recheck. If the indication goes away, replace the original EPS control unit. If the DTC is still present, replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO -Repair an open or poor connection in the wire between the EPS control unit and the gauge control module.

DTC U0151: GAUGE CONTROL MODULE LOST COMMUNICATION WITH SRS UNIT (SRS MESSAGE)

NOTE:

- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **If the HDS does not communicate with the SRS unit, the SRS indicator stays on, go to symptom troubleshooting for SRS indicator does not go off, but no DTCs are stored, or cannot be read (see SYMPTOM TROUBLESHOOTING).**

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U0151 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the gauge control module and the SRS unit.

5. Check for SRS DTCs with the HDS.

   Are any DTCs indicated?

   YES -Go to the SRS indicated **DTCS TROUBLESHOOTING**, then recheck.

   NO -Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes.
8. Disconnect the gauge control module 32P connector.

9. Disconnect SRS unit connector A (39P).
10. Check for continuity between gauge control module 32P connector terminals No. 13 and No. 14 and SRS unit connector A (39P) terminals No. 17 and No. 16 respectively.

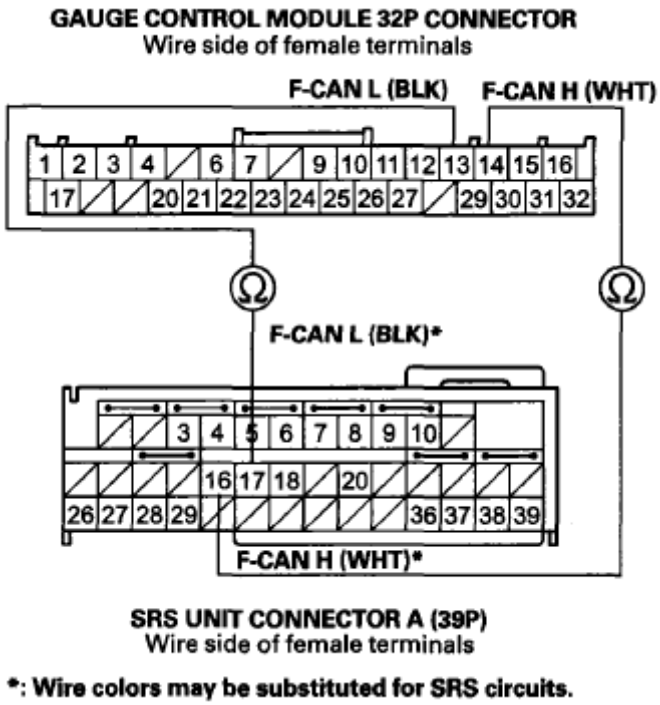

Fig. 32: Checking Continuity Between Gauge Control Module 32P Connector And SRS Unit Connector A (39P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good SRS unit (see **SRS UNIT REPLACEMENT**), and recheck. If the indication goes away, replace the original SRS unit. If the DTC is still present, replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO -Repair an open or poor connection in the wire between the SRS unit and the gauge control module.

DTC U0164: GAUGE CONTROL MODULE LOST COMMUNICATION WITH CLIMATE CONTROL UNIT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.

3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U0155 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the gauge control module and the climate control unit.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the climate control unit detected?

   YES -Go to step 9.

   NO -Go to step 6.

6. Measure the voltage between body ground and climate control unit connector A (32P) terminal No. 15.

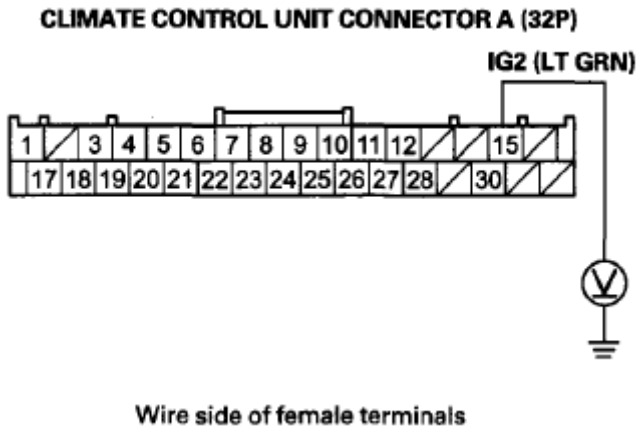

Fig. 33: Measuring Voltage Between Body Ground And Climate Control Unit Connector A (32P) Terminal No. 15
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES -Go to step 8.

   NO -Go to step 7.

7. Check the No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

YES -Repair an open or high resistance in the No. 16 (7.5 A) fuse circuit.

NO -Replace the fuse. If the fuse blows again, repair a short to ground in the No. 16 (7.5 A) fuse circuit.

8. Measure the voltage between body ground and climate control unit connector A (32P) terminal No. 1.

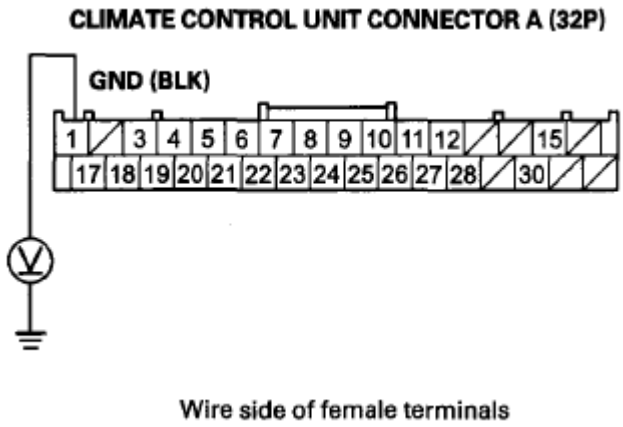

Fig. 34: Measuring Voltage Between Body Ground And Climate Control Unit Connector A (32P) Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 9.

NO -Repair an open or high resistance in the ground wire or poor ground (G403).

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect climate control unit connector A (28P).
11. Disconnect the gauge control module 32P connector.
12. Check for continuity between climate control unit connector C (20P) terminals No. 7 and No. 8 and gauge control module connector terminals No. 29 and No. 30 respectively.

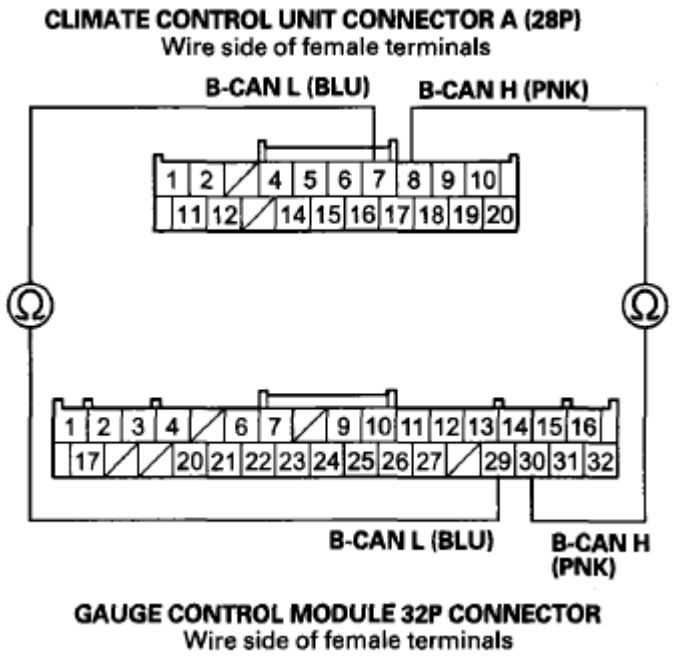

Fig. 35: Checking Continuity Between Climate Control Unit Connector C (20P) Terminals No. 7 And No. 8 And Gauge Control Module Connector Terminals No. 29 And No. 30
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the climate control unit (see **EVAPORATOR TEMPERATURE SENSOR REPLACEMENT**).

NO -Repair an open or poor connection in the B-CAN wire between the gauge control module and the climate control unit.

DTC U0199: GAUGE CONTROL MODULE LOST COMMUNICATION WITH DOOR MULTIPLEX CONTROL UNIT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U0199 indicated?

YES -Go to step 5.

NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the gauge control module and the door multiplex control unit.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the power window unit detected?

   YES -Go to step 9.

   NO -Go to step 6.

6. Measure the voltage between body ground and power window master switch 37P connector terminal No. 13.

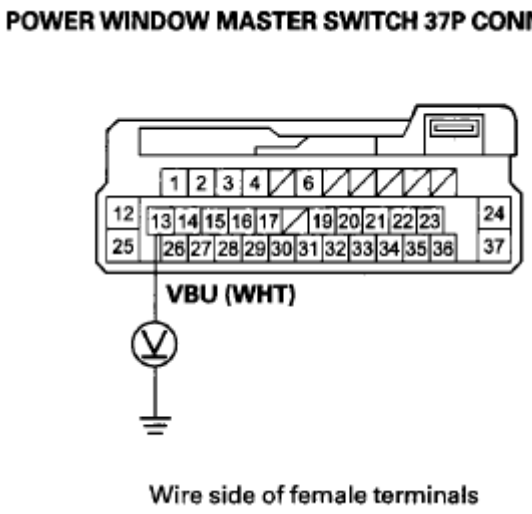

Fig. 36: Measuring Voltage Between Body Ground And Power Window Master Switch 37P Connector Terminal No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES -Go to step 8.

   NO -Go to step 7.

7. Check the No. 15 (10 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES -Repair an open or high resistance in the No. 15 (10 A) fuse circuit.

NO -Replace the fuse. If the fuse blows again, repair a short to ground in the No. 15(10 A) fuse circuit.

8. Measure the voltage between body ground and power window master switch 37P connector terminals No. 32 and No. 37 individually.

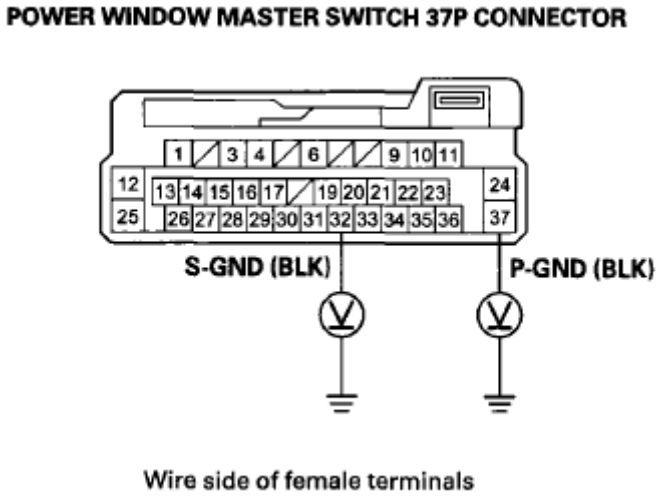

Fig. 37: Measuring Voltage Between Body Ground And Power Window Master Switch 37P Connector Terminals No. 32 And No. 37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 9.

NO -Repair an open or high resistance in the ground wire or poor ground (G401) and/or (G402).

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect the gauge control module 32P connector.
11. Disconnect the power window master switch 37P connector.
12. Check for continuity between power window master switch 37P connector terminals No. 33 and No. 35 and the gauge control module 32P connector terminals No. 29 and No. 30 respectively.

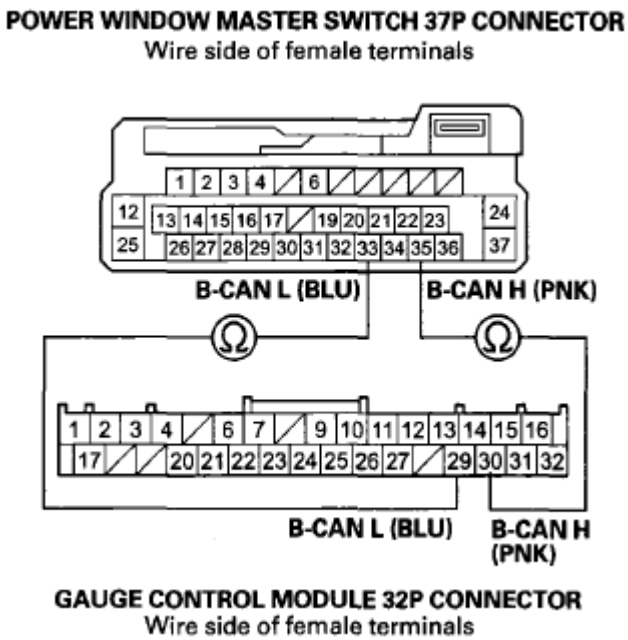

Fig. 38: Checking Continuity Between Power Window Master Switch 37P Connector And No. 35 And Gauge Control Module 32P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Faulty door multiplex control unit; replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

NO -Repair an open or poor connection in the B-CAN wire between the gauge control module and the door multiplex control unit.

DTC U1282: GAUGE CONTROL MODULE LOST COMMUNICATION WITH DRIVER'S MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U1282 indicated?

YES -Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the gauge control module and the driver's MICU.

DTC U1283: GAUGE CONTROL MODULE LOST COMMUNICATION WITH PASSENGER'S MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U01283 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the gauge control module and the passenger's MICU.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the passenger's MICU detected?

   YES -Go to step 9.

   NO -Go to step 6.

6. Measure the voltage between body ground and passenger's under-dash fuse/relay box connector A (38P) terminals No. 14 and No. 35 individually.

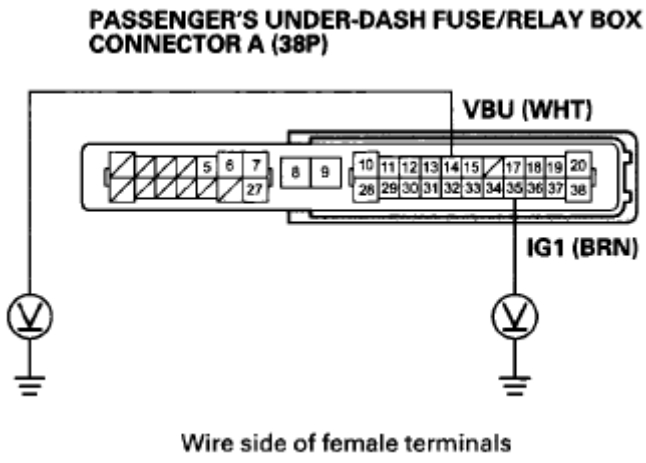

Fig. 39: Measuring Voltage Between Body Ground And Passenger's Under-Dash Fuse/Relay Box Connector A (38P) Terminals No. 14 And No. 35
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 8.

NO -Go to step 7.

7. Check the No. 15(10 A) fuse in the under-hood fuse/relay box and the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Are the fuses OK?

   YES -Repair an open or high resistance in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

   NO -Replace the fuse(s). If the fuse blows again, repair a short to ground in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

8. Measure the voltage between body ground and passenger's under-dash fuse/relay box connector A (38P) and E (18P) terminals as shown.

Passenger's under-dash fuse/relay box connector	
A36	Body ground
A37	
E15

Courtesy of AMERICAN HONDA MOTOR CO., INC.

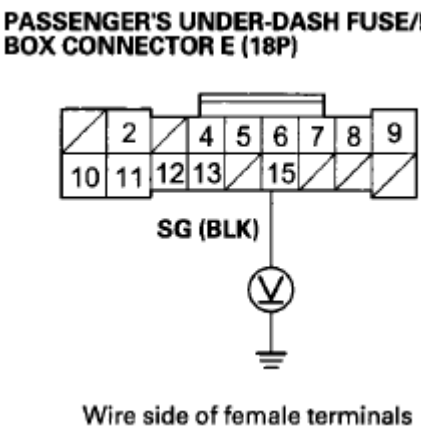

Fig. 41: Measuring Voltage Between Body Ground And Passenger's Under-Dash Fuse/Relay Box Connector E (18P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 9.

NO -Repair an open or high resistance in the ground wire or poor ground (G203), (G401), and/or (G405).

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect passenger's under-dash fuse/relay box connector A (38P).
11. Disconnect the gauge control module 32P connector.
12. Check for continuity between passenger's under-dash fuse/relay box connector A (38P) terminals No. 11 and No. 29 and gauge control module 32P connector terminals No. 30 and No. 29 respectively.

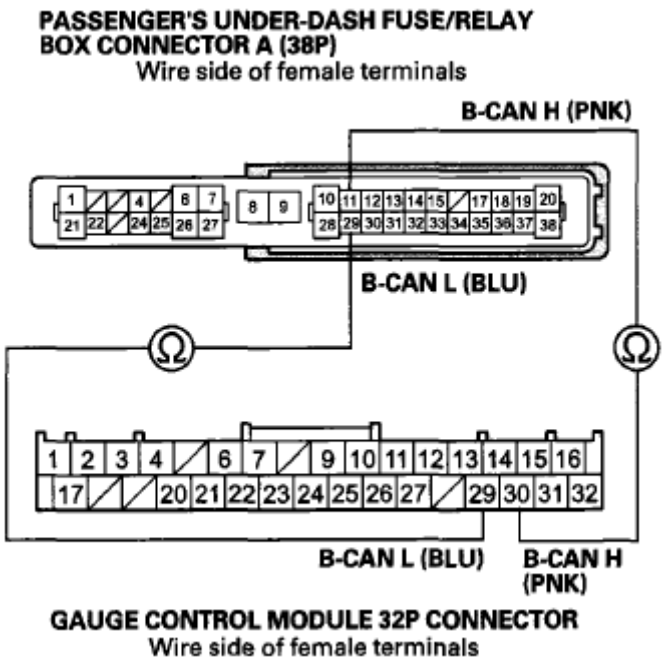

Fig. 42: Checking Continuity Between Passenger's Under-Dash Fuse/Relay Box Connector A (38P) Terminals And Gauge Control Module 32P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO -Repair an open or poor connection in the B-CAN wire between the gauge control module and the passenger's MICU.

DTC U1286: GAUGE CONTROL MODULE LOST COMMUNICATION WITH KEYLESS ACCESS CONTROL UNIT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U1286 indicated?

YES -Go to step 5.

NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the gauge control module and the keyless access control unit.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the keyless access control unit detected?

   YES -Go to step 9.

   NO -Go to step 6.

6. Measure the voltage between body ground and keyless access control unit connector B (32) terminals No. 1 and No. 17 individually.

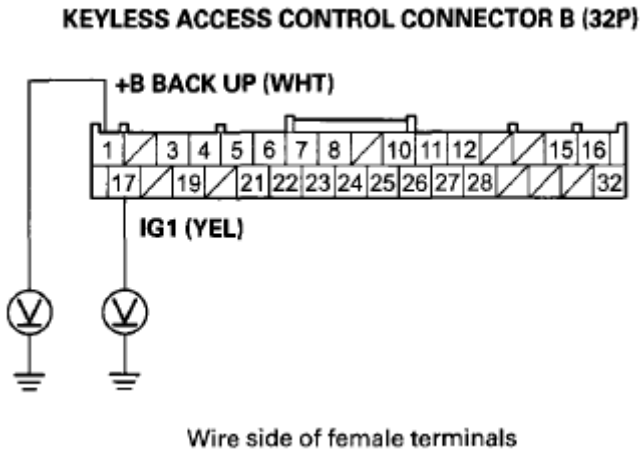

Fig. 43: Measuring Voltage Between Body Ground And Keyless Access Control Unit Connector B (32) Terminals No. 1 And No. 17
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES -Go to step 8.

   NO -Go to step 7.

7. Check the No. 15 (10 A) fuse in the under-hood fuse/relay box and the No. 9 (20 A) fuse in the driver's under-dash fuse/relay box.

   Are the fuses OK?

   YES -Repair an open or high resistance in the No. 15 (10 A) and/or No. 9 (20 A) fuse circuit.

   NO -Replace the fuse(s). If the fuse blows again, repair a short to ground in the No. 15 (10 A) and/or No. 9 (20 A) fuse circuit.

8. Measure the voltage between body ground and keyless access control unit connector A (36P) and B (32P) terminals as shown.

Keyless access control unit connector	
A36	Body ground
B32	

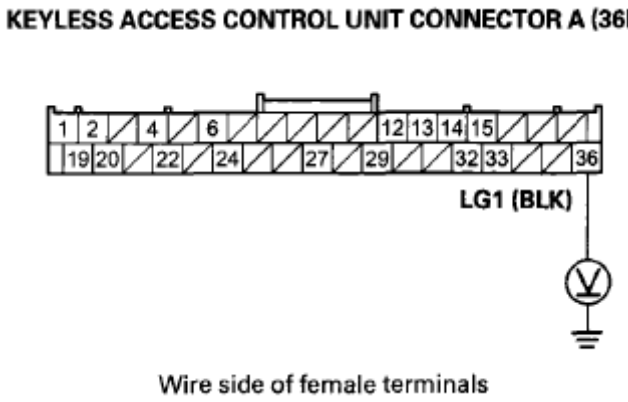

Fig. 44: Measuring Voltage Between Body Ground And Keyless Access Control Unit Connector A (36P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

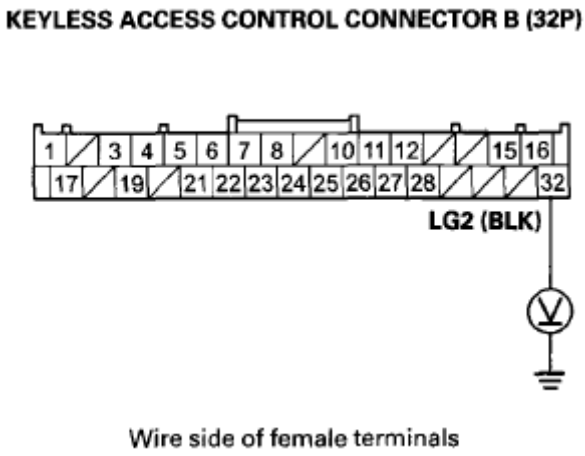

Fig. 45: Measuring Voltage Between Body Ground And Keyless Access Control Unit Connector B (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 9.

NO -Repair an open or high resistance in the ground wire or poor ground (G402).

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect keyless access control unit connector B (32P).
11. Disconnect the gauge control module 32P connector.
12. Check for continuity between keyless access control unit connector B (32P) terminals No. 7 and No. 8 and gauge control module 32P connector terminals No. 29 and No. 30 respectively.

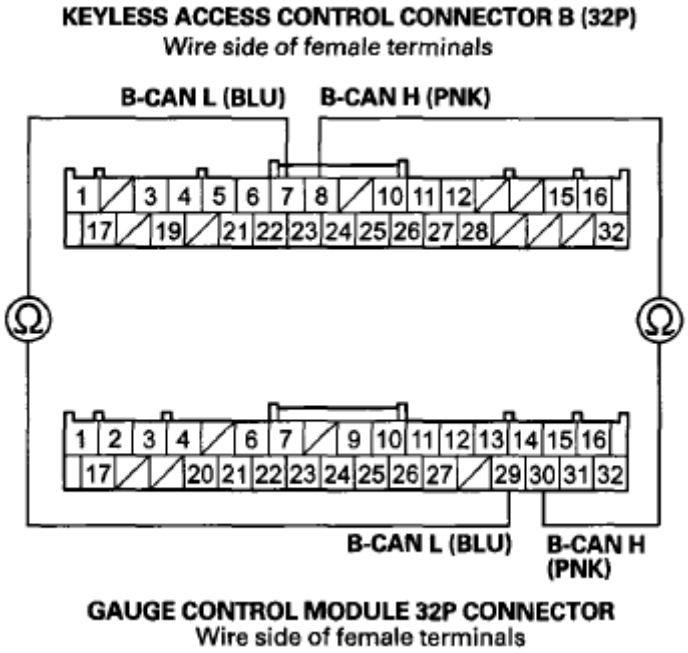

Fig. 46: Checking Continuity Between Keyless Access Control Unit Connector B (32P) And Gauge Control Module 32P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO -Repair an open or poor connection in the B-CAN wire between the gauge control module and keyless access control unit.

DTC U1289: GAUGE CONTROL MODULE LOST COMMUNICATION WITH REMOTE SLOT CONTROL UNIT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.

3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U1289 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the remote slot control unit and the gauge control module.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the remote slot control unit detected?

   YES -Go to step 9.

   NO -Go to step 6.

6. Measure the voltage between body ground and remote slot control unit 40P connector terminals No. 1 and No. 21 individually.

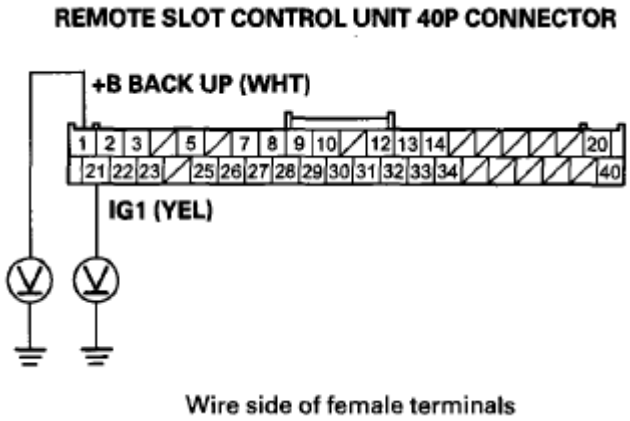

Fig. 47: Measuring Voltage Between Body Ground And Remote Slot Control Unit 40P Connector Terminals No. 1 And No. 21
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES -Go to step 7.

   NO -Go to step 8.

7. Check the No. 15 (10 A) fuse in the under-hood fuse/relay box and the No. 9 (20 A) fuse in the driver's under-dash fuse/relay box.

Are the fuses OK?

YES -Repair an open or high resistance in the No. 15 (10 A) and/or No. 9 (20 A) fuse circuit.

NO -Replace the fuse(s). If the fuse blows again, repair a short to ground in the No. 15(10 A) and/or No. 9 (20 A) fuse circuit.

8. Measure the voltage between body ground and remote slot control unit 40P connector terminals No. 20 and No. 40 individually.

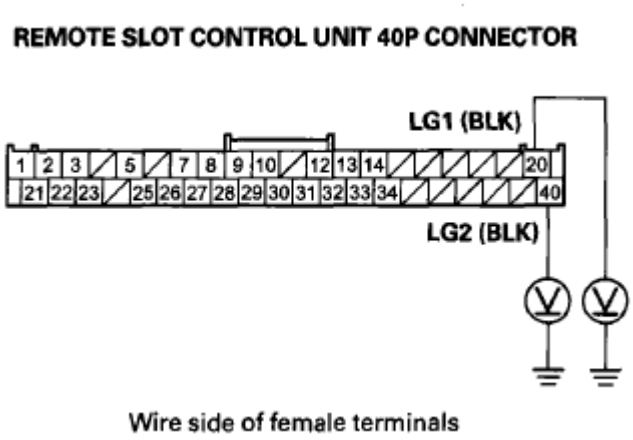

Fig. 48: Measuring Voltage Between Body Ground And Remote Slot Control Unit 40P Connector Terminals No. 20 And No. 40
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 9.

NO -Repair an open or high resistance in the ground wire or poor ground (G405).

9. Turn the ignition switch to LOCK (0) or press the engine start/stop button to select the OFF mode.
10. Disconnect the remote slot control unit 40P connector.
11. Disconnect the gauge control module 32P connector.
12. Check for continuity between gauge control module 32P connector terminals No. 29 and No. 30 and remote slot control unit 40P connector terminals No. 23 and No. 3 respectively.

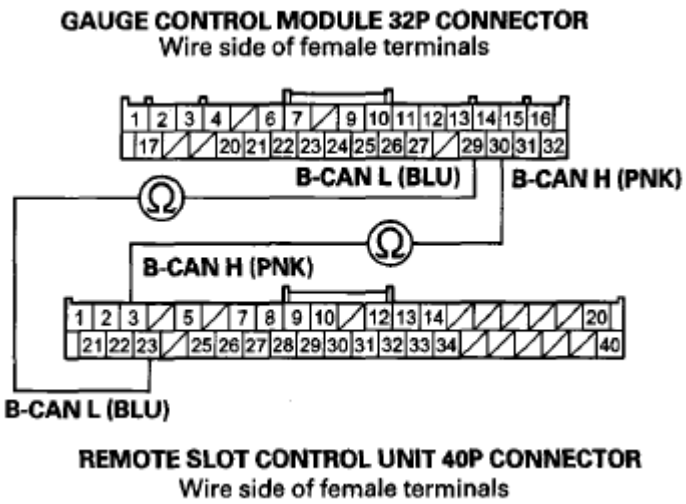

Fig. 49: Checking Continuity Between Gauge Control Module 32P Connector Terminals And Remote Slot Control Unit 40P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the remote slot control unit (see **RF UNIT REPLACEMENT**).

NO -Repair an open or poor connection in the B-CAN wire between the remote slot control unit and the gauge control module.

DTC U128B: GAUGE CONTROL MODULE LOST COMMUNICATION WITH POWER CONTROL UNIT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U128B indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the power control unit and the gauge control module.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS

INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

Is the power control unit detected?

YES -Go to step 9.

NO -Go to step 6.

6. Measure the voltage between body ground and power control unit connector C (36P) terminal No. 1.

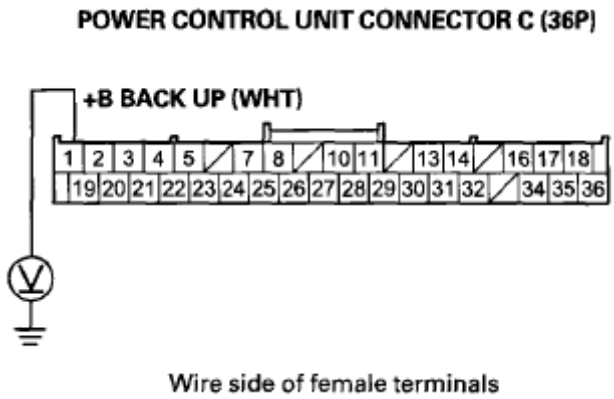

Fig. 50: Measuring Voltage Between Body Ground And Power Control Unit Connector C (36P) Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 8.

NO -Go to step 7.

7. Check the No. 15(10 A) fuse in the under-hood fuse/relay box.

Is the fuse OK?

YES -Repair an open or high resistance in the No. 15 (10A) fuse circuit.

NO -Replace the fuse. If the fuse blows again, repair a short to ground in the No. 15 (10 A) fuse circuit.

8. Measure the voltage between body ground and power control unit connector C(36P) terminals No. 18 and No. 36 individually.

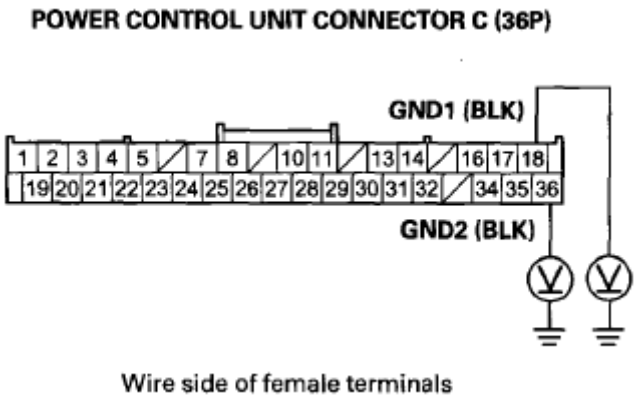

Fig. 51: Measuring Voltage Between Body Ground And Power Control Unit Connector C(36P) Terminals No. 18 And No. 36
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 9.

NO -Repair an open or high resistance in the ground wire or poor ground (G402).

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect power control unit connector C (36P).
11. Disconnect the gauge control module 32P connector.
12. Check for continuity between gauge control module 32P connector terminals No. 29 and No. 30 and power control unit connector C (36P) terminals No. 17 and No. 16 respectively.

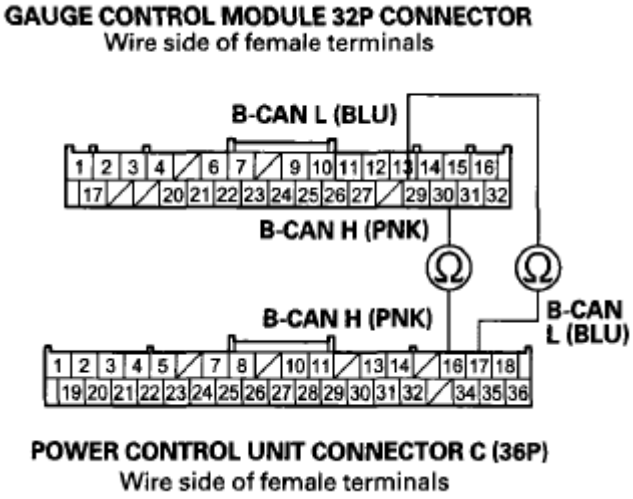

Fig. 52: Checking Continuity Between Gauge Control Module 32P Connector And Power Control Unit Connector C (36P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the power control unit (see **RF UNIT REPLACEMENT**).

NO -Repair an open or poor connection in the B-CAN wire between the power control unit and the gauge control module.

DTC U128F: GAUGE CONTROL MODULE LOST COMMUNICATION WITH BSI CONTROL UNIT (BSI MESSAGE)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U128F indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the gauge control module and the BSI control unit.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the BSI control unit detected?

   YES -Go to step 9.

   NO -Go to step 6.

6. Measure the voltage between body ground and BSI control unit 16P connector terminal No. 10.

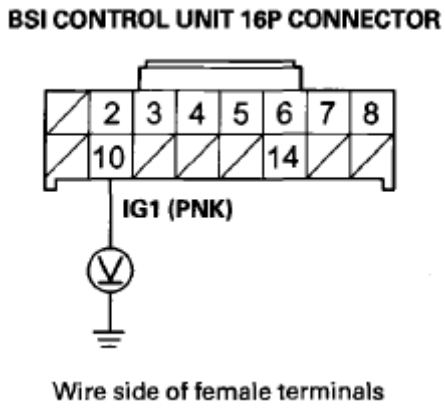

Fig. 53: Measuring Voltage Between Body Ground And BSI Control Unit 16P Connector Terminal No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 8.

NO -Go to step 7.

7. Check the No. 1 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

   YES -Repair an open or high resistance in the No. 1 (7.5 A) fuse circuit.

   NO -Replace the fuse. If the fuse blows again, repair a short to ground in the No. 1 (7.5 A) fuse circuit.

8. Measure the voltage between body ground and BSI control unit 16P connector terminal No. 7.

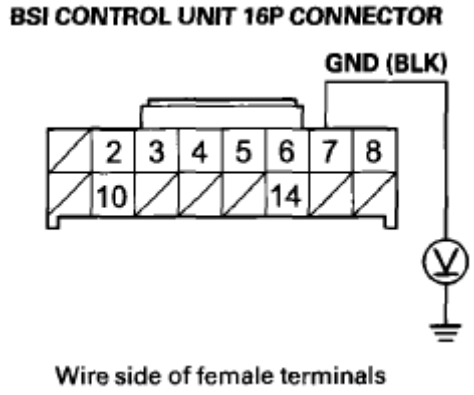

Fig. 54: Measuring Voltage Between Body Ground And BSI Control Unit 16P Connector Terminal No. 7
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 9.

NO -Repair an open or high resistance in the ground wire or poor ground (G603).

9. Turn the ignition switch to LOCK (0) or press the engine start/stop button to select the OFF mode.
10. Disconnect the BSI control unit 16P connector.
11. Disconnect the gauge control module 32P connector.
12. Check for continuity between gauge control module 32P connector terminals No. 29 and No. 30 and BSI control unit 16P connector terminals No. 6 and No. 5 respectively.

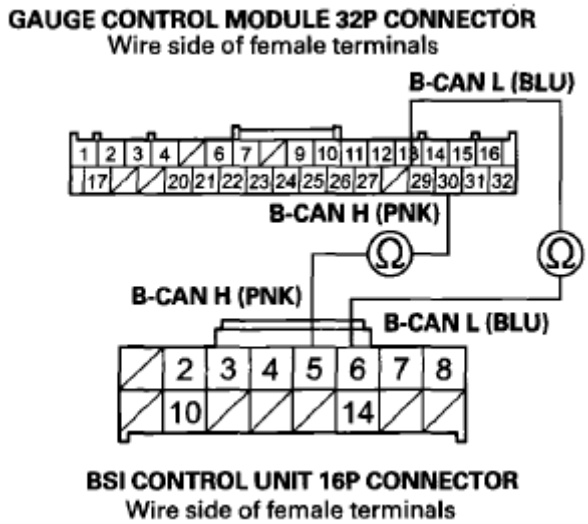

Fig. 55: Checking Continuity Between Gauge Control Module 32P Connector Terminals No. 29 And No. 30 And BSI Control Unit 16P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the BSI control unit (see **BSI RADAR UNIT REMOVAL/INSTALLATION**).

NO -Repair an open or poor connection in the B-CAN wire between the BSI control unit and the gauge control module.

GAUGE CONTROL MODULE INPUT TEST

NOTE: Before testing, do the gauge control module self-diagnostic function (see SELF-DIAGNOSTIC FUNCTION), and make sure the B-CAN communication lines are OK.

1. Remove the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), and disconnect the 32P connector (A) from it.

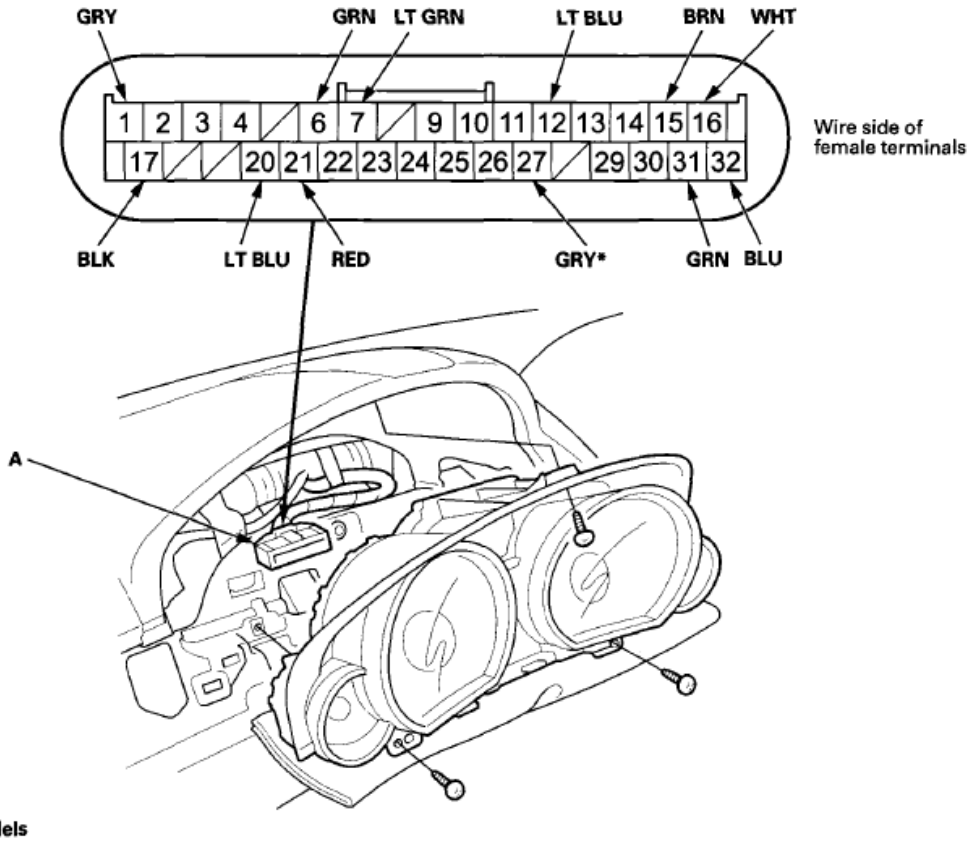

Fig. 56: Gauge Control Module 32P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals are OK, go to step 3.
3. With the connector still disconnected, do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 4.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
12	LT BLU	Battery sensor 2P connector disconnected	Check for continuity between terminal No. 12 and battery sensor 2P connector terminal No. 1: There should be continuity.	An open in the UART wire
20	LT BLU	Combination light switch ON	Connect to ground with a jumper wire: Dashlights should come on full bright.	• Faulty LEDs • Faulty bulbs • An open or high resistance in the wire

21	RED	Combination light switch ON	Connect to ground with a jumper wire: Dashlights should come on full bright.	• Faulty LEDs • An open or high resistance in the wire
31	GRN	Ignition switch ON (II), or power mode ON, turn signal switch in RIGHT	Measure the voltage to ground: There should be battery voltage when the lights are flashing.	• Faulty driver's MICU • Faulty combination light switch • An open or high resistance in the wire
32	BLU	Ignition switch ON (II), or power mode ON, turn signal switch in LEFT	Measure the voltage to ground: There should be battery voltage when the lights are flashing.	• Faulty driver's MICU • Faulty combination light switch • An open or high resistance in the wire

4. Reconnect the 32P connector to the gauge control module, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the gauge control module must be faulty; replace it (see **GAUGE CONTROL MODULE REPLACEMENT**).

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
16	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • An open or high resistance in the wire
15	BRN	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box • An open or high resistance in the wire
1	GRY	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G401) • An open or high resistance in the ground wire
		In all ignition switch positions or	Measure the voltage to	• Poor ground(G402)

17	BLK	all power modes	ground: There should be less than 0.2 V.	• An open or high resistance in the ground wire
27(1)	GRY	Ignition switch ON (II), or power mode ON, washer fluid level is full in the washer reservoir	Measure the voltage to ground: There should be about 5 V.	• Faulty washer fluid level switch • A short to ground in the wire
		Ignition switch ON (II), or power mode ON washer fluid level is low in the washer reservoir	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty washer fluid level switch • Poor ground (G203) or an open in the ground wire • An open or high resistance in the wire
6	GRN	Ignition switch ON (II), or power mode ON, brake fluid level is full in the reservoir	Measure the voltage to ground: There should be battery voltage.	• Faulty brake fluid level switch • A short to ground in the wire
		Ignition switch ON (II), or power mode ON, brake fluid level is low in the reservoir	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty brake fluid level switch • Poor ground (G302) or an open in the ground wire • An open or high resistance in the wire
7	LT GRN	Ignition switch ON (II), or power mode ON, parking brake lever pulled	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty parking brake switch • Faulty parking brake switch ground • An open or high resistance in the wire
		Ignition switch ON (II), or power mode ON, parking brake lever released	Measure the voltage to ground: There should be battery voltage.	• Faulty parking brake switch • A short to ground in the wire
(1) Canada models				

REWRITING THE ODO DATA AND TRANSFERRING THE MAINTENANCE MINDER™ DATA TO A NEW GAUGE CONTROL MODULE

NOTE:

- **Obtain a new gauge control module before starting the rewriting process. Only new gauges can be rewritten.**

- **Rewriting is not possible on a gauge control module that will not communicate with the HDS.**
- **Make sure that the HDS shows the correct VIN for the vehicle you are working on.**
- **Once you have started this procedure, you must complete it before removing the HDS from the DLC.**
- **Connect a jumper battery (do not connect a battery charger) to ensure that correct battery voltage is maintained.**
- **Check any official Honda service website for more service information about the odometer.**

1. Before replacing the gauge control module, connect the HDS.
2. Select GAUGES from the BODY ELECTRICAL SYSTEM SELECT menu with the HDS.
3. Select GAUGE CONTROL MODULE REPLACEMENT (ODO Rewrite) from the ADJUSTMENT menu, and select READ OUT DATA and save ODO value and smart maintenance data into the HDS.
4. Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).
5. Select WRITE DATA and follow the instructions on the HDS display, and install the ODO value and smart maintenance data into the replacement gauge control module. If the data transfer fails, refer to the instructions to release the locked ODO value.

HOW TO RELEASE LOCKED ODOMETER MILEAGE TO THE ORIGINAL GAUGE CONTROL MODULE

If, after you attempt to transfer mileage to a new gauge control module, the odometer display has dashes (- - -), is garbled, or shows an incorrect value, the original gauge control module can be unlocked and restored to its original state. In this way, it can be used again for additional attempts to transfer the mileage:

1. Confirm that you have the latest HDS version of software.
2. Make sure that the HDS shows the correct VIN for the vehicle you are working on.
3. With the ignition switch is in LOCK (0), or the vehicle ignition is in the OFF mode, reconnect the original gauge control module.
4. Completely re-boot the HDS.
5. Clear any stored DTCs.
6. Navigate to BODY ELECTRIC/GAUGES/GAUGE CONTROL MODULE REPLACEMENT (ODO REWRITE, etc.).
7. Select 3. RELEASING LOCKED ODO VALUE.
8. Follow the prompts and the odometer mileage is restored.
9. Start over and make sure the screen prompts are followed.

GAUGE CONTROL MODULE REPLACEMENT

NOTE: Before replacing the gauge control module, retrieve the ODO data and

transferring Maintenance Minder information from the gauge control module with the HDS (see REWRITING THE ODO DATA AND TRANSFERRING THE MAINTENANCE MINDER™ DATA TO A NEW GAUGE CONTROL MODULE).

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Adjust the steering column to full tilt down position and to the full telescopic pull position, then remove the instrument fascia (see **DRIVER'S SWITCH PANEL REMOVAL/INSTALLATION**).
3. Remove the three screws from gauge control module (A), then pull the gauge control module out carefully.

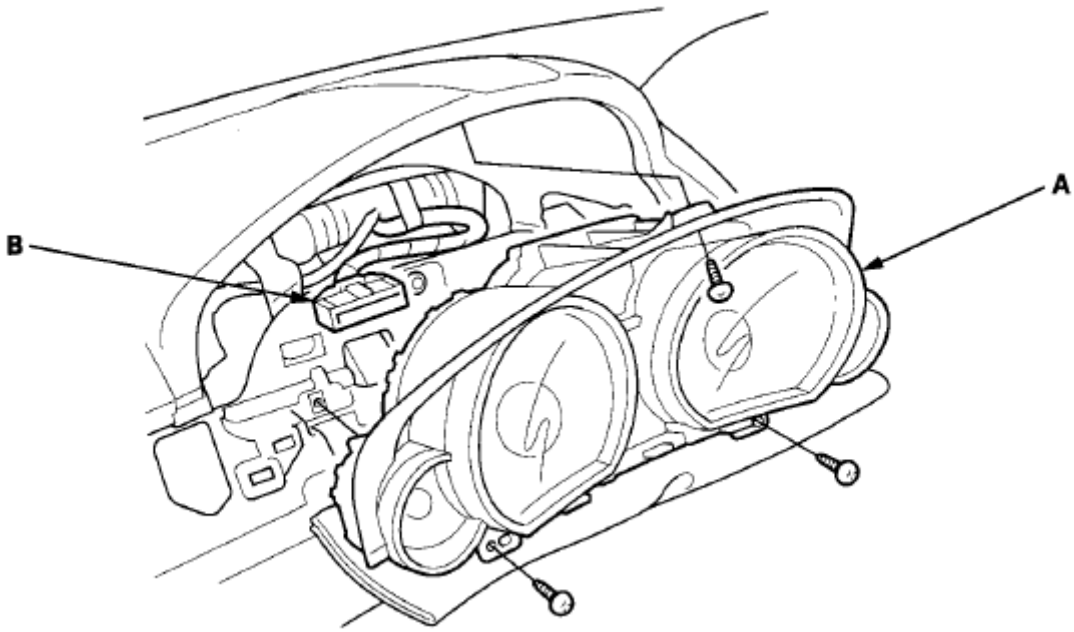

Fig. 57: Identifying Gauge Control Module
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the 32P connector (B) from the gauge control module.
5. Install the gauge control module in the reverse order of removal.
6. Do rewriting the ODO data and transferring the Maintenance Minder data to a new gauge control module (see **REWRITING THE ODO DATA AND TRANSFERRING THE MAINTENANCE MINDER™ DATA TO A NEW GAUGE CONTROL MODULE**).

NOTE: Check the official Honda website for more information on how to write odometer information to a gauge control module that will not communicate with the HDS.

OUTSIDE AIR TEMPERATURE INDICATOR CALIBRATION

NOTE: To test the outside air temperature sensor (see OUTSIDE AIR TEMPERATURE SENSOR TEST).

DESCRIPTION

The outside air temperature sensor is located behind the center of the front bumper. The gauge control module uses measurements from this sensor, along with data provided by the climate control unit via the B-CAN communication line, to display the outside air temperature.

Because of the location of the sensor, it may be affected by heat reflection from the road, engine and radiator heat, or hot exhaust from surrounding traffic.

These conditions can heat soak the outside air temperature sensor and cause inaccurate readings. Logic has been written into the gauge control module to help prevent abnormal or fluctuating outside air temperature indicator readings.

OUTSIDE AIR TEMPERATURE INDICATOR LOGIC

Engine coolant temperature is 140 °F (60 °C) or higher:

If the engine coolant temperature is 140 °F (60 °C) or higher when the ignition switch is turned to ON (II), or the engine start/stop button is pressed to select the ON mode, the outside air temperature when the last time the key was turned off is displayed regardless of the current temperature measured by the outside air temperature sensor.

Engine coolant temperature is less than 140 °F (60 °C):

If the engine coolant temperature is less than 140 °F (60 °C) or lower when the ignition switch is turned to ON (II), or the engine start/stop button is pressed to select the ON mode, the current temperature measured by the outside air temperature sensor is indicated.

INFORMATION UPDATE TO THE OUTSIDE AIR TEMPERATURE INDICATOR WHILE DRIVING

Engine coolant temperature is 140 °F (60 °C) or higher:

If the temperature measured by the outside air temperature sensor is greater than the temperature on the outside air temperature indicator, the outside air temperature indicator increases by 1 °F (1 °C) per minute after the vehicle speed is greater than 19 mph (30 km/h) for more than 1 minute and 30 seconds. It continues to increase until the current outside air temperature is indicated. So, the first change to the outside air temperature indicator is 1 minute and 30 seconds after the vehicle speed is greater than 19 mph (30 km/h). If the vehicle speed drops below 19 mph (30 km/h), the indicator does not update again until the vehicle speed has increased to 19 mph (30 km/h) or more for more than 1 minute and 30 seconds again.

Engine coolant temperature is less than 140 °F (60 °C):

If the outside air temperature is less than the indicated temperature, the temperature decreases 1 °F(1 °C) every 2 seconds until the current outside air temperature is indicated regardless of vehicle speed.

TROUBLESHOOTING

If the indicator displays "- - -" for more than 2 seconds after selecting the outside air temperature display mode, the gauge is not receiving the outside temperature data from the climate control unit over the B-CAN. Check the climate control system or multiplex integrated control system for DTCs (see B-CAN System Diagnosis Test Mode A) (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A**).

CALIBRATION PROCEDURE

The outside air temperature indicator's displayed temperature can be recalibrated ±5 °F (or ±3 °C) to meet the client's expectations.

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Push and hold the INFORMATION button for at least 3 seconds to enter the customizing mode.
3. While in the customizing mode, select "CHG SETTING", and enter "METER SETUP". Then select "ADJUST OUTSIDE TEMP. DISPLAY", and calibrate the value with the SEL/RESET switch and the INFORMATION switch.

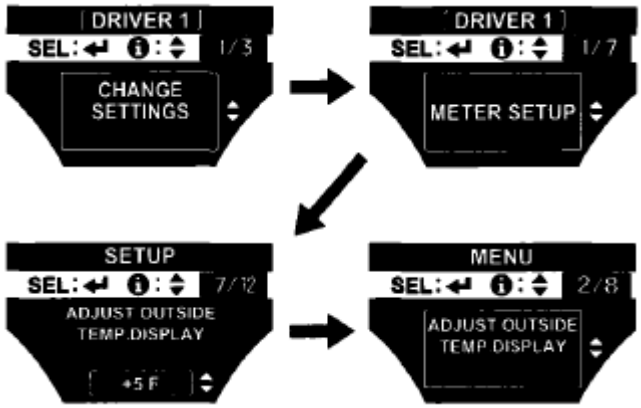

Fig. 58: Display Outside Air Temperature Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. When the desired correction value appears on the display, release the button, and the recalibrated outside air temperature will be displayed.

NOTE: The recalibration temperature is not the value the sensor sees. Therefore the temperature can only be adjusted ±5 ° from the sensors reading.

Example:

Incorrect value = 68°F (20°C)

Desired correction value = +2°F (+ 1 °C)

Correct value = 70 °F (21 °C)

Desired correction value = -2 °F (-1 °C)

Correct value = 66 °F (19 °C)

NOTE: To recalibrate the display to the true temperature, remove the outside air temperature sensor (A), but leave it connected. Submerge the sensor and a thermometer (B) in a container of ice water (C). Select the calibration mode as described above, then recalibrate the display to the true temperature.

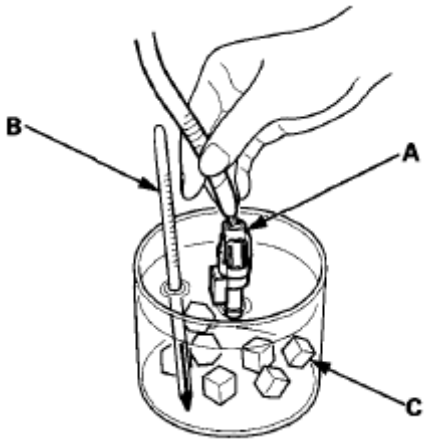

Fig. 59: Calibrating Outside Air Temperature
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. The snow mark is displayed when the temperature is 37 °F (3 °C) or less the first time you turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

Fig. 60: Display Low Outside Air Temperature
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SELECT/RESET/INFORMATION SWITCH TEST/REPLACEMENT

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Remove the steering wheel (see **STEERING WHEEL REMOVAL**).
2. Remove the paddle shifter (+) (upshift switch) (see **PADDLE SHIFTER REPLACEMENT**).

3. Disconnect the 12P connector (A) from the select/reset/information switch (B).

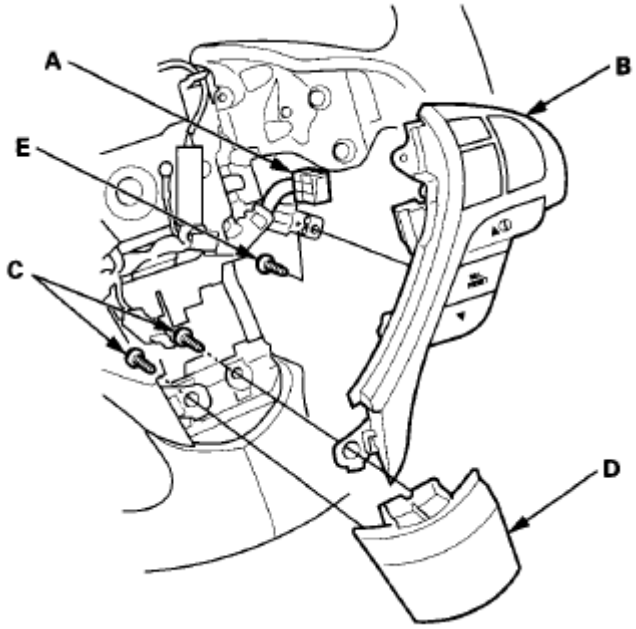

Fig. 61: Identifying 12P Connector, Select/Reset/Information Switch, Center Trim & Fasteners
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the screws (C), then pull out the center trim (D) from the steering wheel.
5. Remove the screw (E), then pull the select/reset/information switch from the steering wheel.
6. Measure the resistance between select/reset/information switch 12P connector terminals No. 4 and No. 11 in each switch position according to the table.

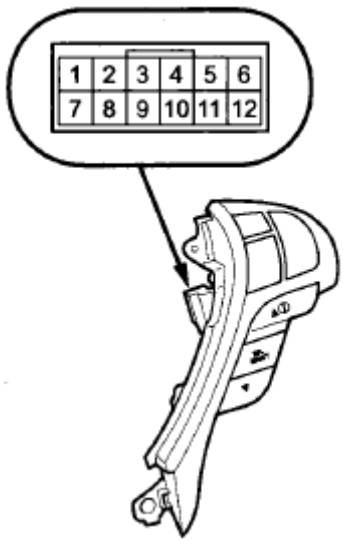

Fig. 62: Select/Reset/Information Switch 12P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Position	Resistance
^	About 1, 043 ohms
SEL/RESET	About 33 ohms
ˇ	About 363 ohms

7. If the resistance is not as specified, replace the switch.
8. If the switch is OK, but there is a problem with the switch function, check the cable reel subharness and cable reel.

2012 ACCESSORIES & EQUIPMENT

Glass - TL

COMPONENT LOCATION INDEX

FRONT

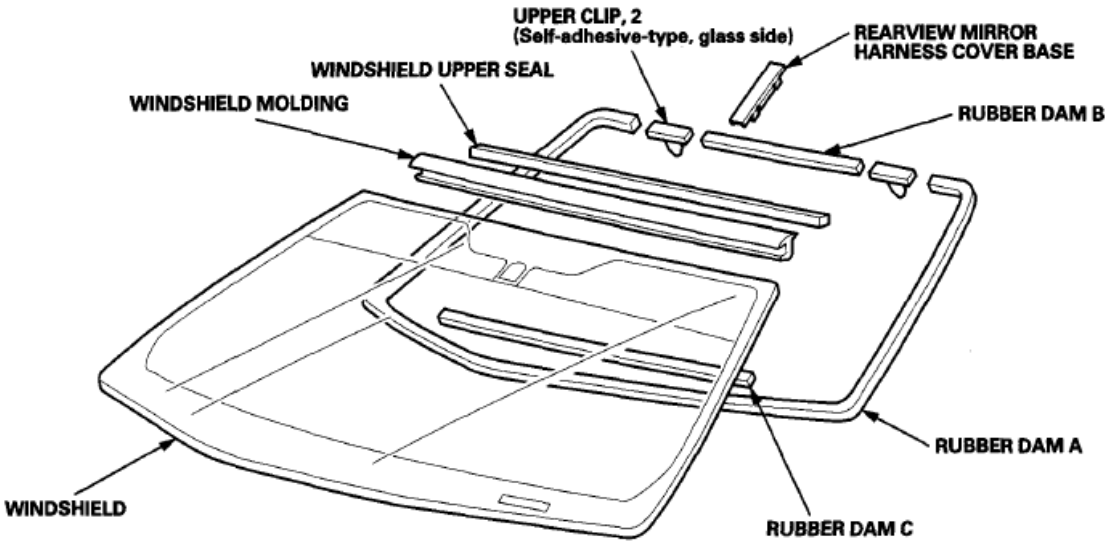

Fig. 1: Front Glass Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

REAR

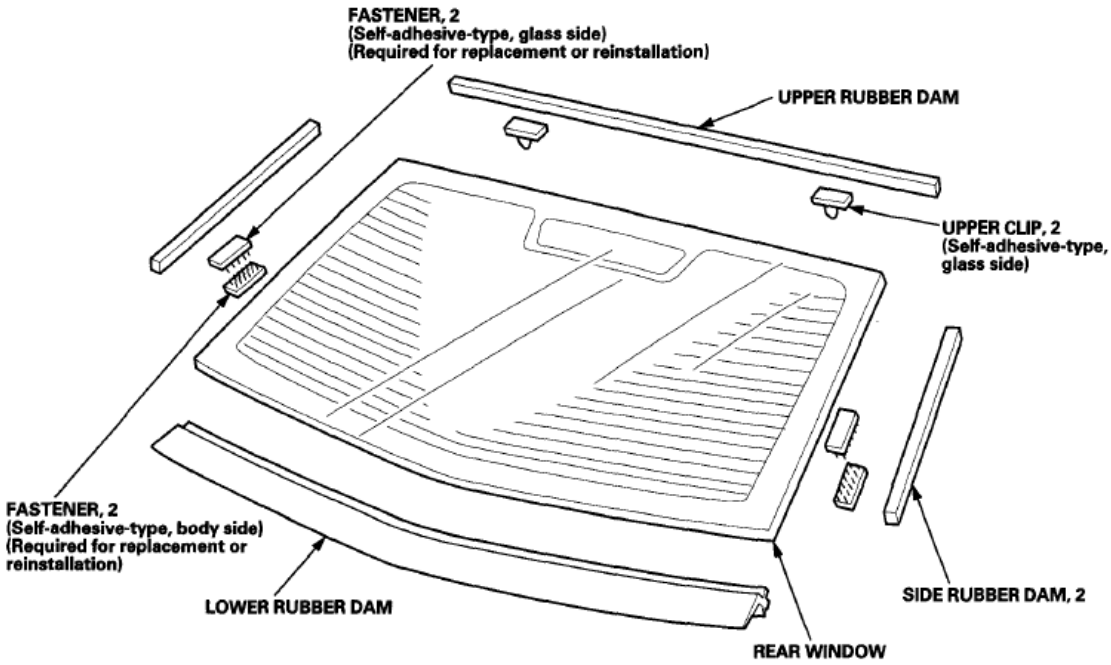

Fig. 2: Rear Glass Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

WINDSHIELD REPLACEMENT

NOTE:

- **Wear eye protection while cutting the glass adhesive with a piano wire.**
- **Put on gloves to protect your hands.**
- **Use seat covers to avoid damaging any surfaces.**
- **Glass adhesive can be efficiently cut with a commercially available auto glass tool. See the tool manufacturer's instructions for details.**

1. Remove these items:
   - Cowl cover (see **FRONT BULKHEAD BRACE COVER REPLACEMENT**)
   - Rearview mirror (see **REARVIEW MIRROR REPLACEMENT**)
   - A-pillar trims, both sides (see **TRIM REMOVAL/INSTALLATION - PILLAR AREAS**)
   - Roof moldings, both sides (see **ROOF MOLDING REPLACEMENT**)
2. Remove the windshield molding (A) from the upper edge of the windshield (B). If necessary, cut the windshield molding with a utility knife.

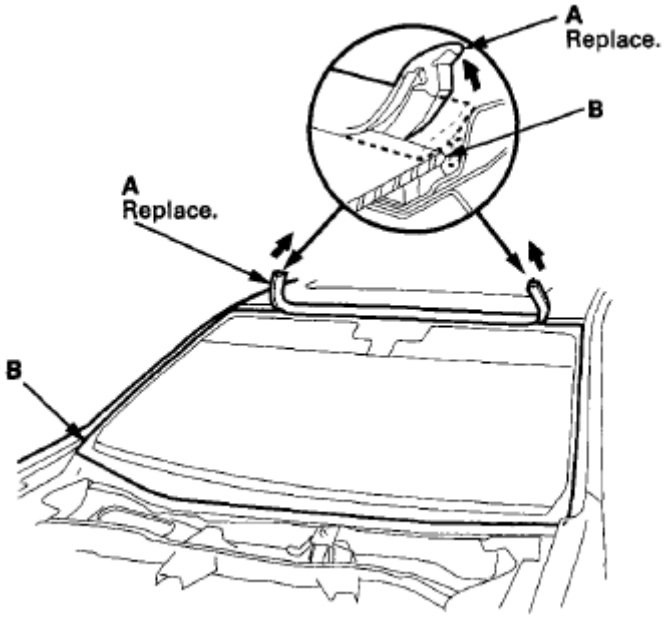

Fig. 3: Identifying Windshield & Molding
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the original windshield will be reinstalled, make alignment marks across the windshield and the body with a grease pencil.
4. Pull down the front area of the headliner (see **HEADLINER REMOVAL/INSTALLATION**).

NOTE: Take care not to bend the headliner excessively, or you may crease or break it.

5. Apply protective tape along the edge of the dashboard and the body. Make a hole with an awl through the rubber dam and the adhesive from inside the vehicle at a corner of the windshield. Push a piece of piano wire through the hole, and wrap each end around a piece of wood.
6. With a helper on the outside, pull the piano wire (A) back and forth in a sawing motion. Hold the piano wire as close to the windshield (B) as possible to prevent damage to the body and the dashboard. Carefully cut through the rubber dam and the adhesive (C) around the entire windshield.

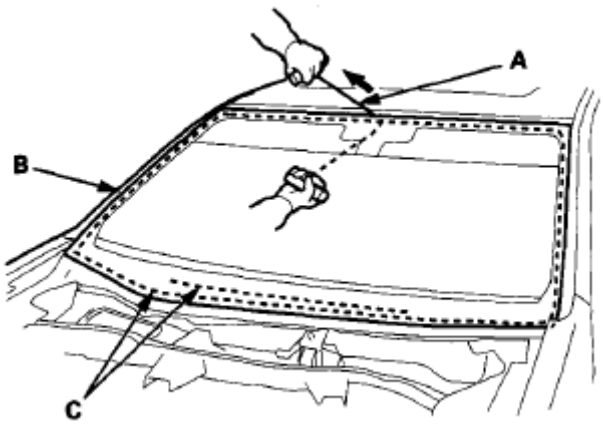

Fig. 4: Identifying Windshield, Piano Wire & Rubber Dam
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Cutting positions

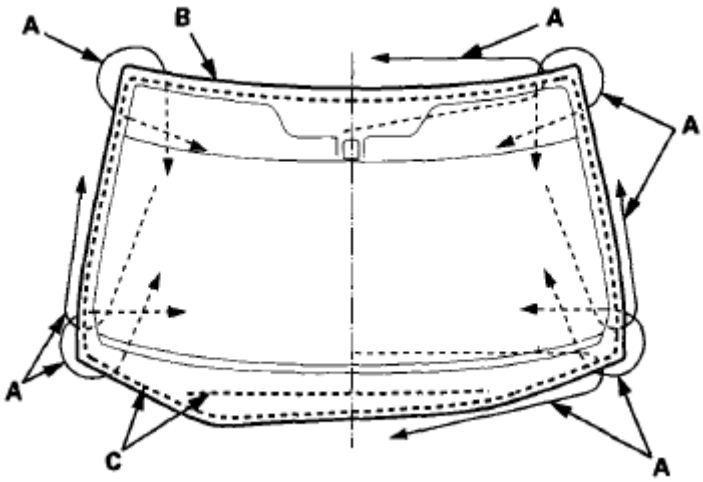

Fig. 5: Identifying Cutting Positions
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Carefully remove the windshield.
8. Scrape smooth the original adhesive with a knife until there is a thickness of about 2 mm (0.08 in) on the bonding surface around the entire windshield opening flange:
   - Do not scrape down to the painted surface of the body; damaged paint will interfere with proper bonding.
   - Remove the rubber dams from the body.
9. Clean the body bonding surface with a shop towel dampened with isopropyl alcohol. After cleaning, keep oil, grease, and water from getting on the clean surface.
10. If you are reinstalling the original windshield, scrape off the original adhesive, the upper clips, and the rubber dams with a putty knife from the windshield. Clean the bonding surfaces on the inside face and the edge of the windshield with isopropyl alcohol. Make sure the bonding surface is kept free of water, oil,

and grease.

11. Before installing a new windshield, attach a new rearview mirror harness cover base to the inside face of the windshield (see **REARVIEW MIRROR HARNESS COVER BASE REPLACEMENT**).
12. Apply glass primer to the upper clip mounting areas on the windshield (C), and let it dry. Remove the adhesive backing and attach the rubber dam A, B and the upper clips (D) to the inside of the windshield as shown:
    - Make sure the rubber dams and the upper clips line up with the alignment marks (E).
    - Make sure the index tabs (F) on the clips face the left side.
    - Be careful not to touch the windshield where the adhesive will be applied.

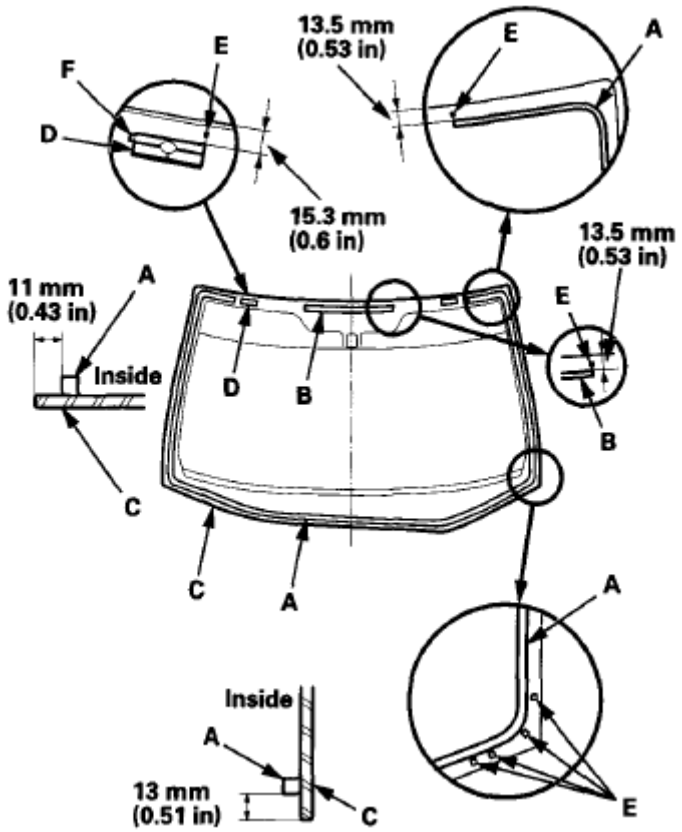

Fig. 6: Identifying Windshield & Fasteners
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Attach rubber dam C with adhesive tape to the inside surface of the windshield (A) as shown, using the edge of the black ceramic-coated area (B) as a guide:
    - Make sure the rubber dam lines up with the alignment marks (D).
    - Be careful not to touch the windshield where the adhesive will be applied.

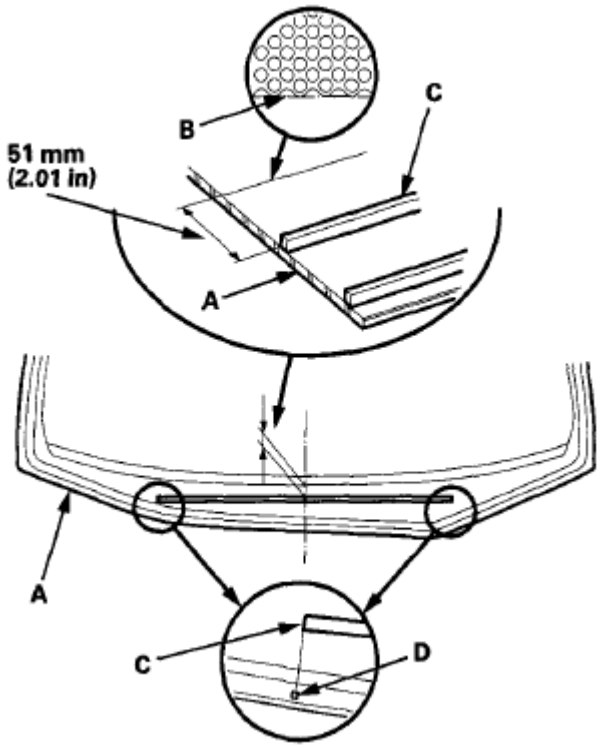

Fig. 7: Identifying Windshield, Black Ceramic-Coated Area And Alignment Marks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Attach the windshield molding (A) with adhesive tape (B) to the upper edge of the windshield (C). Be careful not to touch the windshield where the adhesive will be applied.

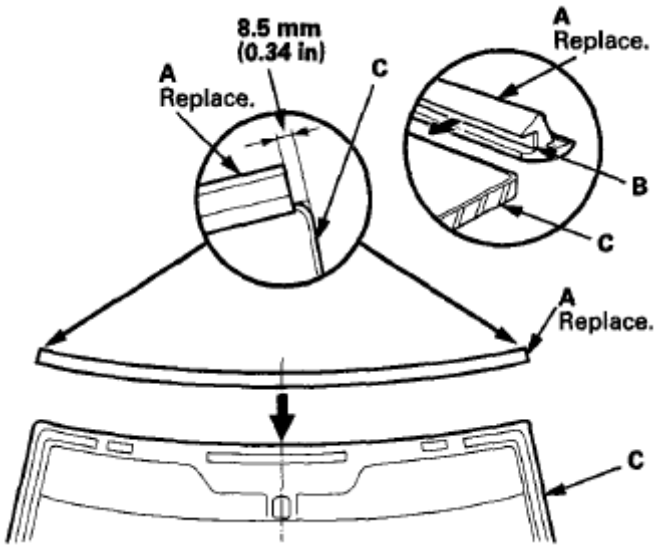

Fig. 8: Identifying Windshield, Tape & Molding
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Attach the molding upper seal (A) with adhesive tape to the inside surface of the windshield molding (B)

as shown.

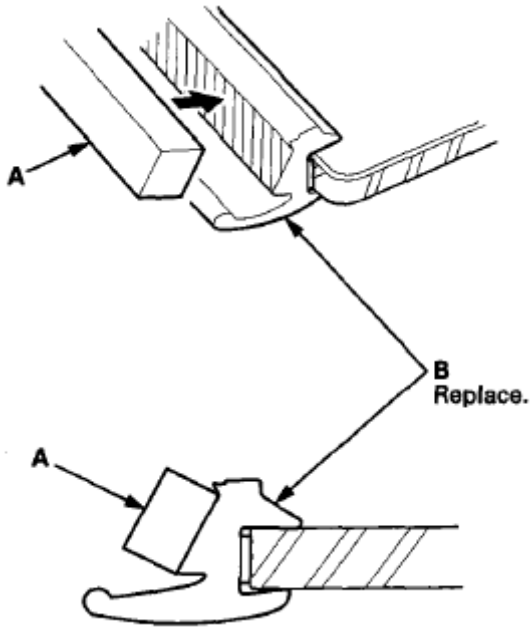

Fig. 9: Identifying Molding Upper Seal, Adhesive Tape & Windshield Molding
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Set the windshield in the opening, and center it. Make alignment marks (A) across the windshield and the body with a grease pencil at the four points shown:
    - Make sure the pins (B) of both upper clips (C) contact with the edge of the body holes.
    - Be careful not to touch the windshield where the adhesive will be applied.

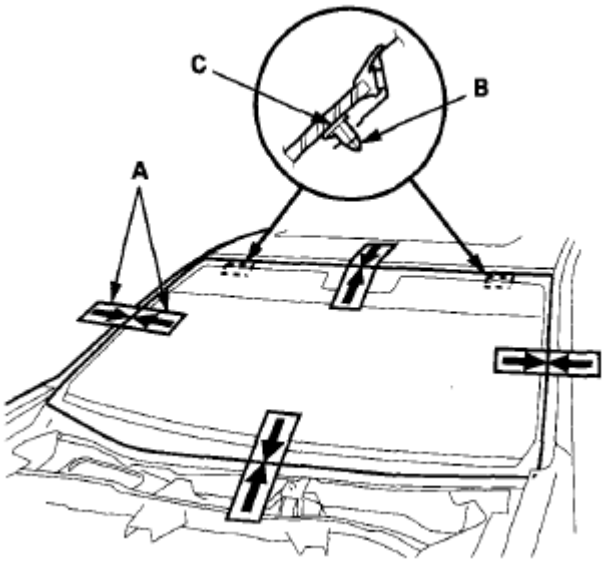

Fig. 10: Identifying Alignment Marks, Pins And Upper Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Remove the windshield.
18. Apply a light coat of glass primer to the windshield (A) along the edge of the windshield molding (B) and the rubber dams (C) as shown, then lightly wipe it off with a gauze or a cheesecloth:
    - Apply glass primer to the molding.
    - Do not apply body primer to the windshield, and do not mix up the body and glass primer applicators.
    - Never touch the primed surfaces with your hands. If you do, the adhesive may not bond to the windshield properly, causing a leak after the windshield is installed.
    - Keep water, dust, and abrasive materials away from the primed surfaces.

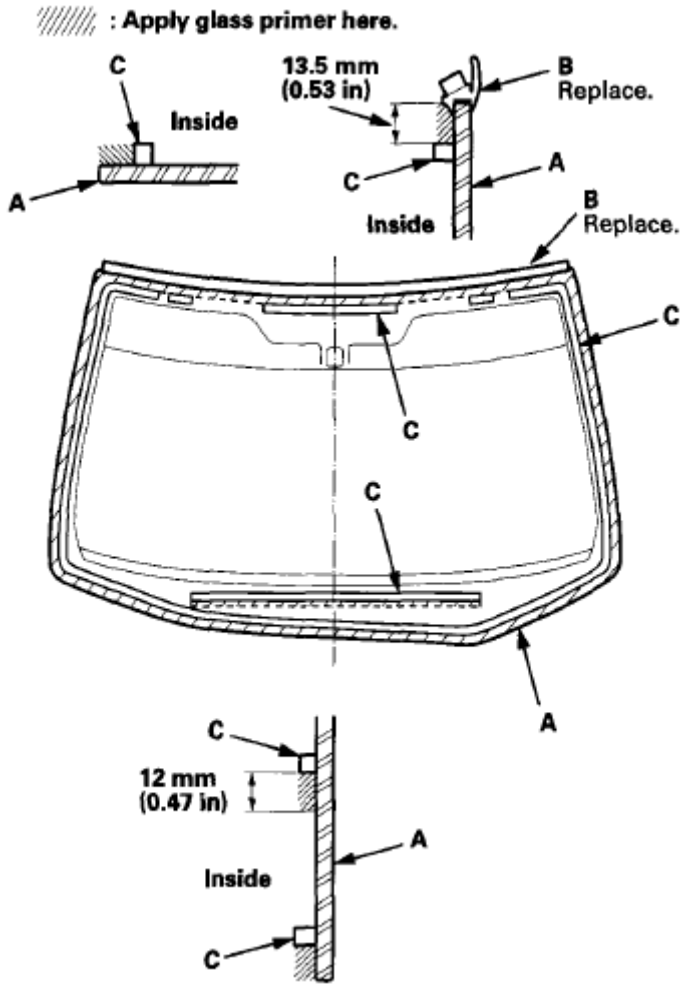

Fig. 11: Identifying Windshield Primer Application Areas, Rubber Dams & Windshield Molding
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Carefully apply a light coat of body primer to any exposed paint or metal around the flange where new adhesive will be applied. Let the body primer dry for at least 10 minutes:
    - Do not apply body primer to any original adhesive on the flange.

- Cover on the dashboard before applying the primer.
- Be careful not to mix up the body and glass primer applicators.
- Never touch the primed surfaces with your hands.

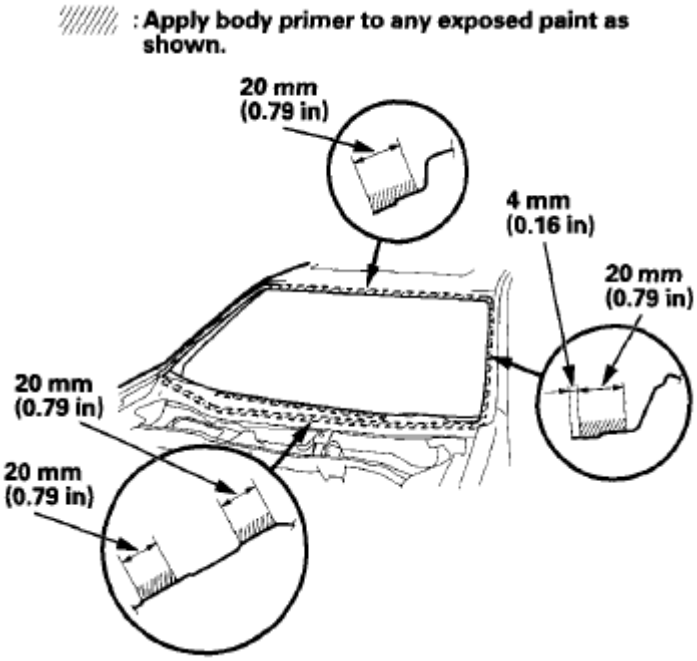

Fig. 12: Identifying Primer Application Areas
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Cut a "V" in the end of the nozzle (A) on the adhesive cartridge as shown.

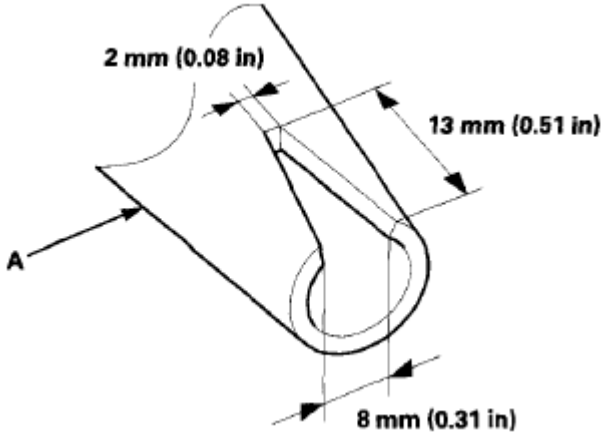

Fig. 13: Identifying Dimensions Of Nozzle On Adhesive Cartridge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Put the cartridge in a caulking gun, and run a continuous bead of the adhesive (A) on the windshield (B) along the edge of the windshield molding (C) and the rubber dams (D) as shown:

- Apply the adhesive within 30 minutes after applying the glass primer.
- Make a slightly thicker bead at each corner.

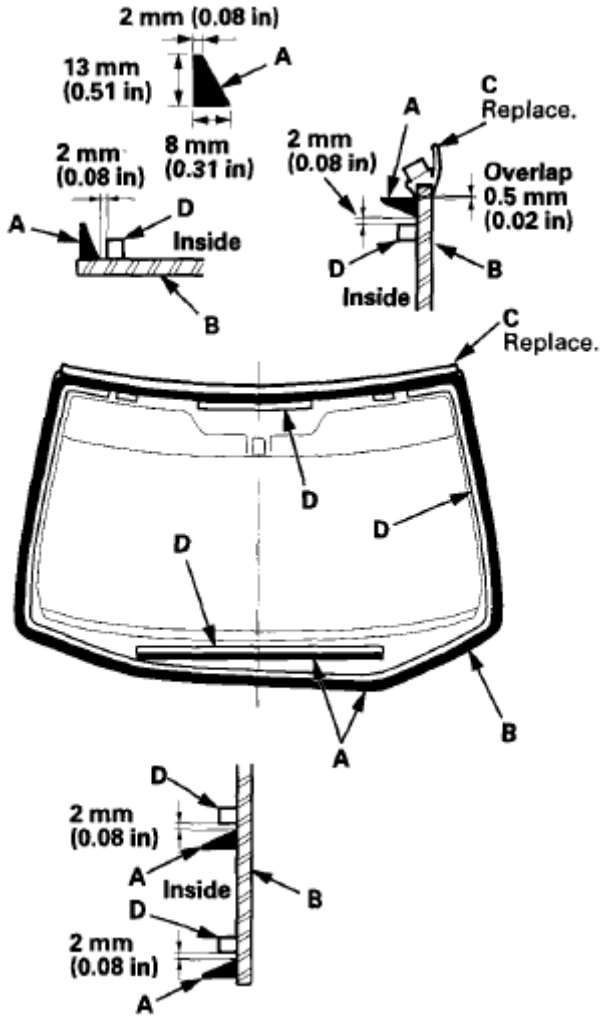

Fig. 14: Identifying Adhesive Application Areas
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Hold the windshield over the opening with suction cups, align it with the alignment marks you made in step 16, and set it down on the adhesive. Lightly push on the windshield until its edges are fully seated on the adhesive all the way around.

NOTE: Do not open or close any of the doors for about an hour until the adhesive is dry.

23. Remove the excess adhesive with a putty knife or a shop towel dampened with isopropyl alcohol.
24. Wait at least an hour for the adhesive to dry, then spray water over the windshield and check for leaks. Mark leaking areas, and let the windshield dry, then seal with sealant. Let the vehicle stand for at least 4 hours after windshield installation. If the vehicle has to be used within the first 4 hours, it must be driven

slowly.

25. Reinstall all remaining removed parts.

NOTE: Advise the customer not to do the following things for 2 to 3 days:

- Slam the doors with all the windows rolled up.
- Twist the body excessively (such as when going in and out of driveways at an angle or driving over rough, uneven roads).

REARVIEW MIRROR HARNESS COVER BASE REPLACEMENT

NOTE:

- **Wear eye protection while cutting the glass adhesive with a piano wire.**
- **Put on gloves to protect your hands.**

1. Remove the rearview mirror (see **REARVIEW MIRROR REPLACEMENT**).
2. Carefully cut through the adhesive tape under the rearview mirror harness cover base with a piano wire, then remove the base.
3. Scrape off all of the original the adhesive tape with a putty knife from the windshield. Clean the bonding surface on the inside face of the windshield with isopropyl alcohol. Make sure the bonding surface is kept free of water, oil and grease.
4. If you are reinstalling the original rearview mirror harness cover base (A), scrape off all of the original adhesive tape with a putty knife from the base. Clean the base surface with isopropyl alcohol. Apply primer to the base as shown, and attach the adhesive tape (B) to the base.

   Adhesive tape: Thickness 0.8 mm (0.031 in) Width 7 mm (0.28 in)

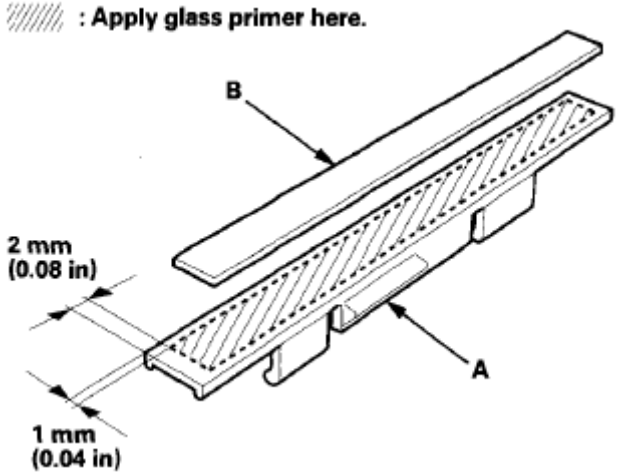

Fig. 15: Identifying Rearview Mirror Harness Cover Base And Adhesive Tape
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Before installing the rearview mirror harness cover base, apply primer to the area where the harness cover

base will be applied to the inside face of the windshield. Let the primer dry at least 10 minutes, then attach it to the windshield within 12 hours.

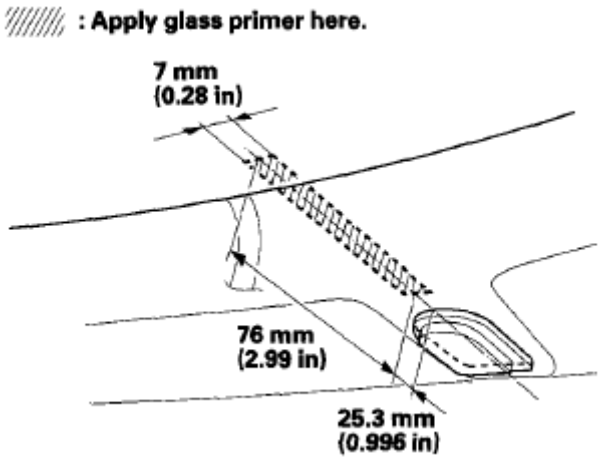

Fig. 16: Identifying Glass Primer Application Area
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Attach the rearview mirror harness cover base (A) with adhesive tape (B) to the inside face of the windshield as shown, then press the adhesive areas into place securely.

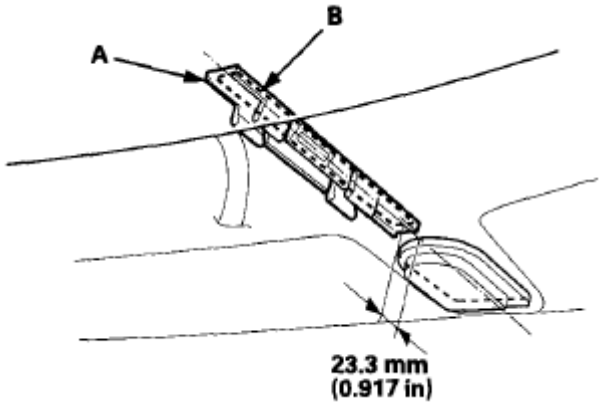

Fig. 17: Identifying Rearview Mirror Harness Cover Base And Adhesive Tape
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Reinstall all remaining removed parts.

REAR WINDOW REPLACEMENT

NOTE:

- **Wear eye protection while cutting the glass adhesive with a piano wire.**
- **Put on gloves to protect your hands.**
- **Use seat covers to avoid damaging any surfaces.**
- **Do not damage the rear window defogger grid lines, the window antenna**

grid lines, or the terminals.

1. Remove these items:
   - Trunk lid
   - Rear door opening seal, as needed (see **TRIM REMOVAL/INSTALLATION - DOOR AREAS**).
   - Rear center seat belt lower anchor (see **REAR CENTER SEAT BELT AND REAR SEAT BELT BUCKLES**)
   - Rear window molding (see **REAR WINDOW MOLDING REPLACEMENT**)
2. Disconnect the window antenna connectors (A) and the rear window defogger terminals (B).

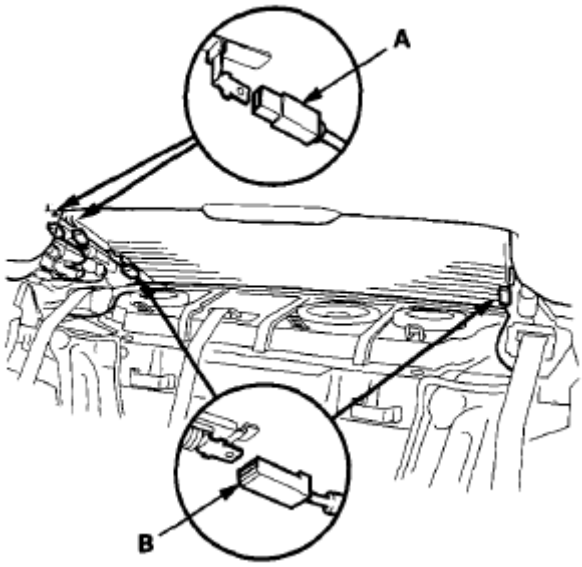

Fig. 18: Identifying Window Antenna Connectors And Rear Window Defogger Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the original rear window will be reinstalled, make alignment marks across the rear window and the body with a grease pencil.
4. Pull down the rear area of the headliner (A) by detaching the clips.

NOTE: Take care not to bend the headliner excessively, or you may crease or break it.

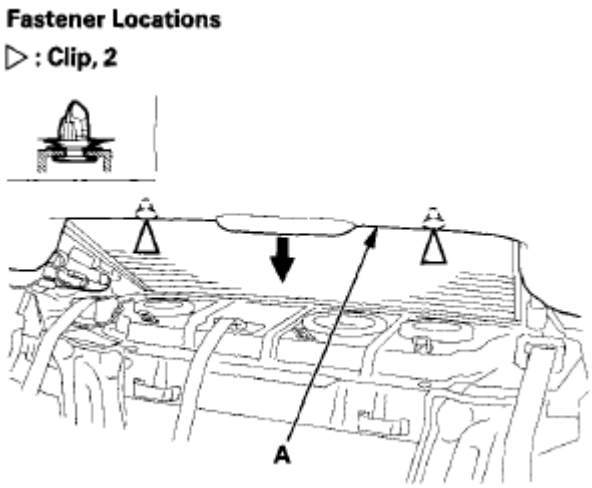

Fig. 19: Identifying Headliner & Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Apply protective tape along the inside and outside edges of the body. Make a hole with an awl through the adhesive from inside the vehicle at a corner of the rear window. Push a piece of piano wire through the hole, and wrap each end around a piece of wood.
6. Remove the lower rubber dam (A) from the lower edge of the rear window (B). If necessary cut the rubber dam with a utility knife.

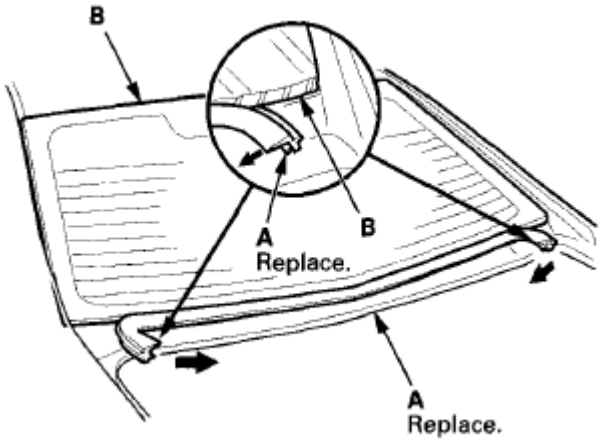

Fig. 20: Removing Lower Rubber Dam From Lower Edge Of Rear Window
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. With a helper on the outside, pull the piano wire (A) back and forth in a sawing motion. Hold the piano wire as close to the rear window (B) as possible to prevent damage to the body, and carefully cut through the adhesive (C) around the entire rear window.

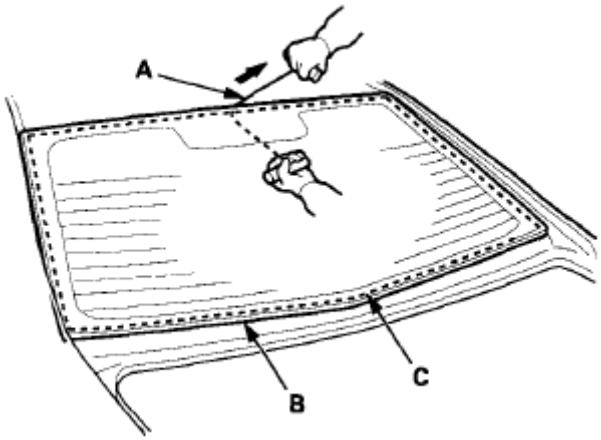

Fig. 21: Pulling Piano Wire Back And Forth In Sawing Motion
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Cutting positions

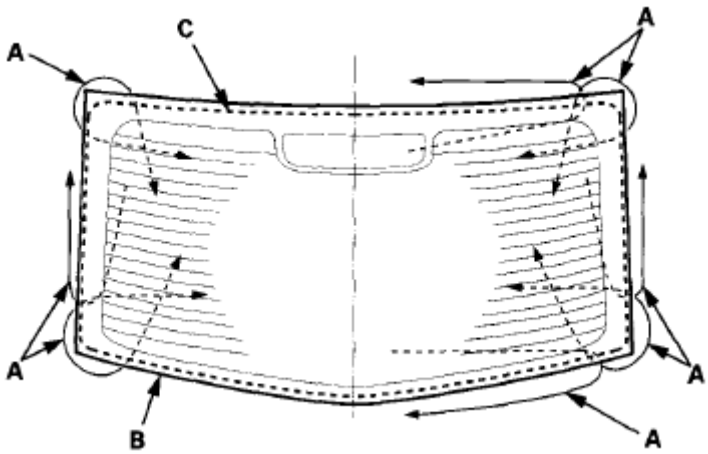

Fig. 22: Cutting Positions Rear Window
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Carefully remove the rear window.
9. Scrape smooth the original adhesive with a knife until there is a thickness of about 2 mm (0.08 in) on the bonding surface around the entire rear window opening flange:
    - Do not scrape down to the painted surface of the body; damaged paint will interfere with proper bonding.
    - Remove the fasteners from the body.
10. Clean the body bonding surface with a shop towel dampened with isopropyl alcohol. After cleaning, keep oil, grease, and water from getting on the surface.
11. If you are reinstalling the original windshield, scrape off all of the original adhesive, the fasteners, and the rubber dams with a putty knife from the rear window. Clean the bonding surfaces on inside face and the edge of the rear window with isopropyl alcohol. Make sure the bonding surface is kept free of water, oil, and grease.

12. Apply glass primer to the edge of the rear window (A) where the lower rubber dam (B) will be attached as shown. Attach the lower rubber dam with adhesive tape (C) to the lower edge of the rear window:
    - After installing the rubber dam, cut the ends (D) of the rubber dam as shown.
    - Be careful not to touch the windshield where the adhesive will be applied.

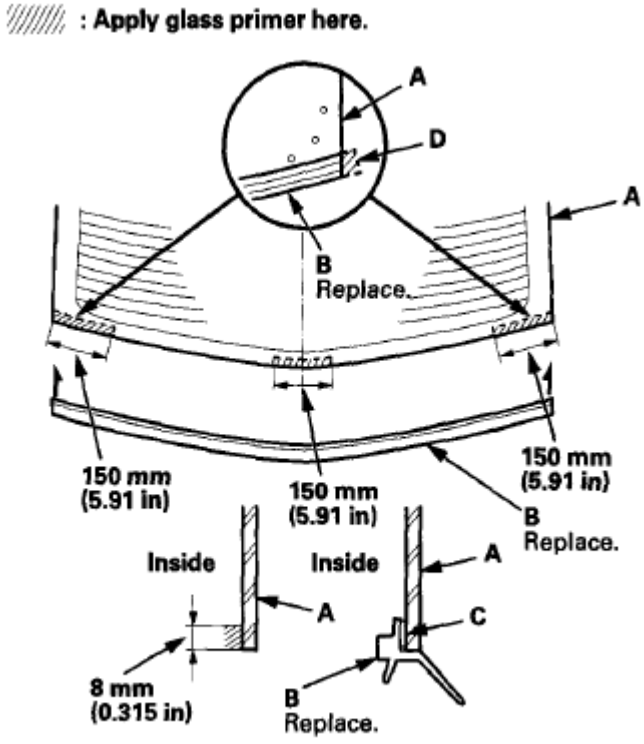

Fig. 23: Applying Glass Primer At Indicated Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Apply glass primer to the upper clip mounting areas on the rear window, and let it dry. Attach the upper rubber dam (A), the side rubber dams (B), the upper clips (C), and the fasteners (D) with the adhesive tape to the inside face of the rear window (E) as shown:
    - Make sure the upper rubber dam, the side rubber dams, the upper clips, and the fasteners line up with the alignment marks (F). If necessary, cut the excess rubber dams.
    - Make sure the index tabs (G) on the clips face the right side.
    - Be careful not to touch the rear window where the adhesive will be applied.

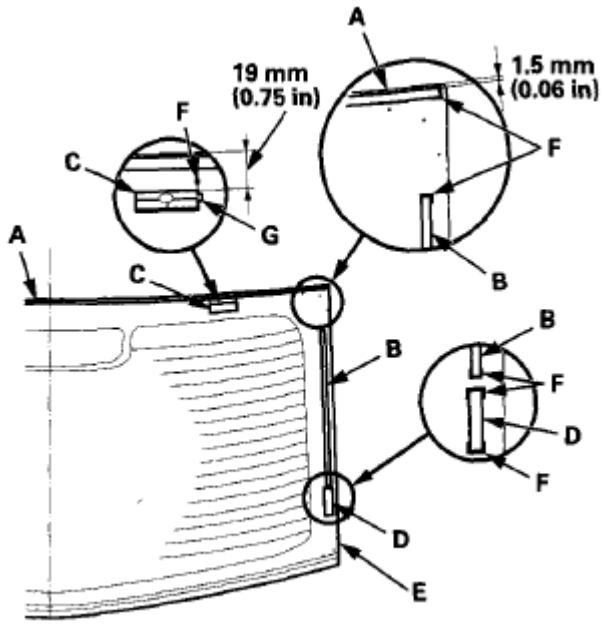

Fig. 24: Identifying Upper Rubber Dam, Rubber Dams, Upper Clips, Fasteners, Rear Window, Alignment Marks And Index Tabs
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Attach the fasteners with the adhesive tape to the rear window opening flange (A) of the body on both sides.

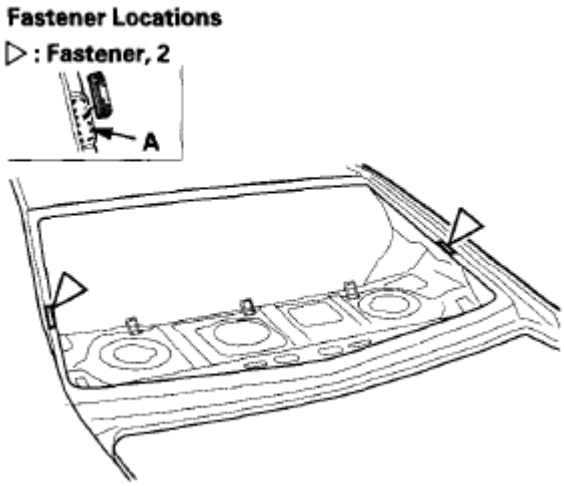

Fig. 25: Attaching Fasteners With Adhesive Tape To Rear Window Opening Flange Of Body On Sides
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Set the rear window in the opening, and center it. Make alignment marks (A) across the rear window and the body with a grease pencil at the four points shown:
    - Make sure the pins (B) of both upper clips (C) contact with the edge of the body holes.

- Be careful not to touch the rear window where the adhesive will be applied.

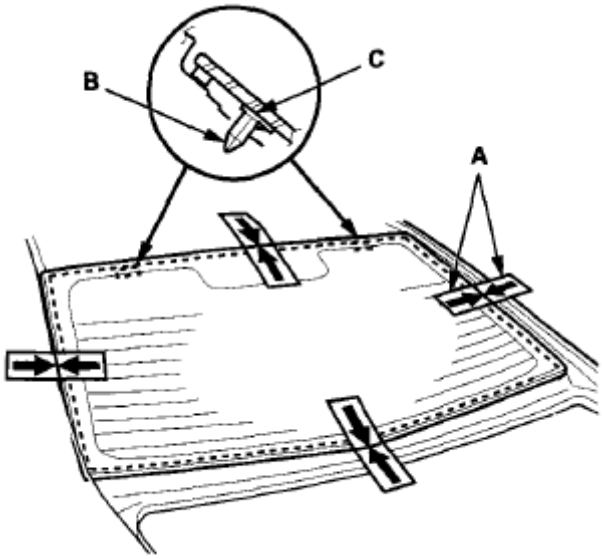

Fig. 26: Identifying Alignments Marks, Pins And Upper Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Remove the rear window.
17. Apply a light coat of glass primer to the rear window (A) along the edge of the rubber dams (B) as shown, then lightly wipe it off with gauze or cheesecloth:
    - Apply the glass primer to the corner areas of the rear window using the printed dots (C) on the rear window as a guide.
    - Do not apply body primer to the rear window, and do not mix up the body and glass primer applicators.
    - Never touch the primed surfaces with your hands. If you do, the adhesive may not bond to the rear window properly, causing a leak after the rear window is installed.
    - Keep water, dust, and abrasive materials away from the primed surfaces.

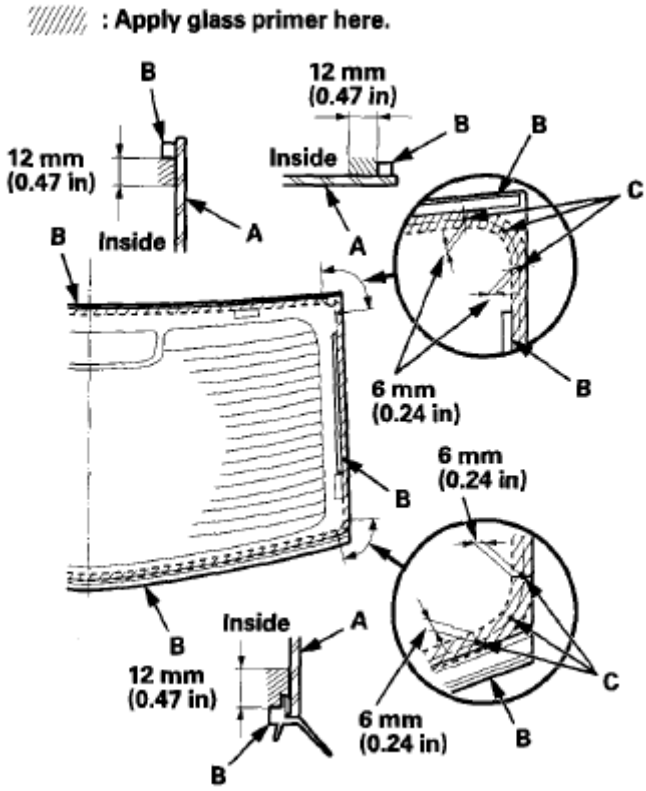

Fig. 27: Identifying Glass Primer Application Areas
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Carefully apply a light coat of body primer to any exposed paint or metal around the flange where the new adhesive will be applied. Let the body primer dry for at least 10 minutes:
    - Do not apply body primer to any original adhesive on the flange.
    - Be careful not to mix up the body and glass primer applicators.
    - Never touch the primed surfaces with your hands.

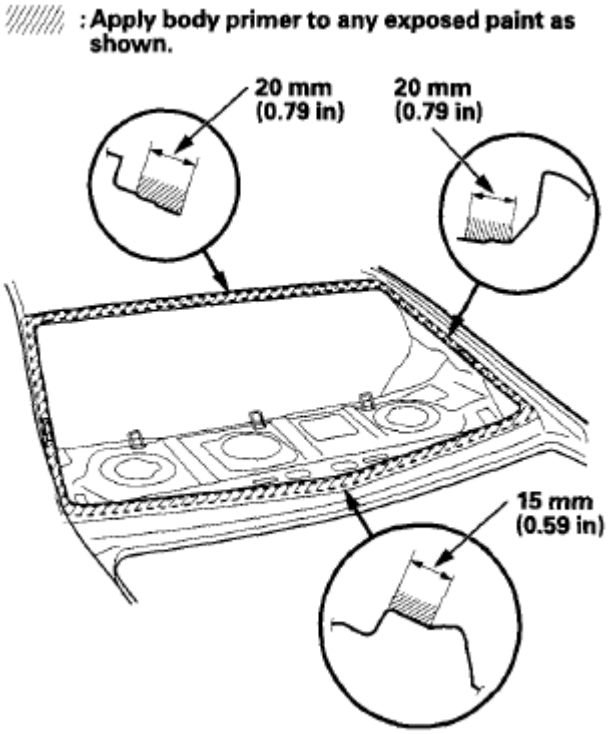

Fig. 28: Applying Body Primer To Exposed Paint As Indicated
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Cut a "V" in the end of the nozzle (A) on the adhesive cartridge as shown.

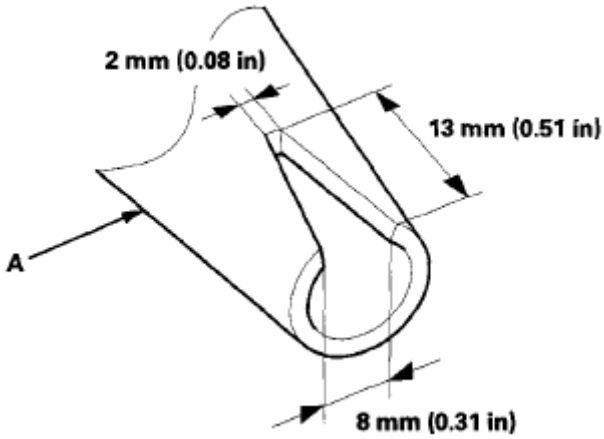

Fig. 29: Identifying Dimensions Of Nozzle On Adhesive Cartridge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Put the cartridge in a caulking gun, and run a continuous bead of the adhesive (A) to the rear window (B) along the edge of the rubber dams (C) as shown:
    - Use the printed dots (D) as a guide when you apply the adhesive to the corners of the rear window.
    - Apply the adhesive within 30 minutes after applying the glass primer.

- Make a slightly thicker bead at each corner.

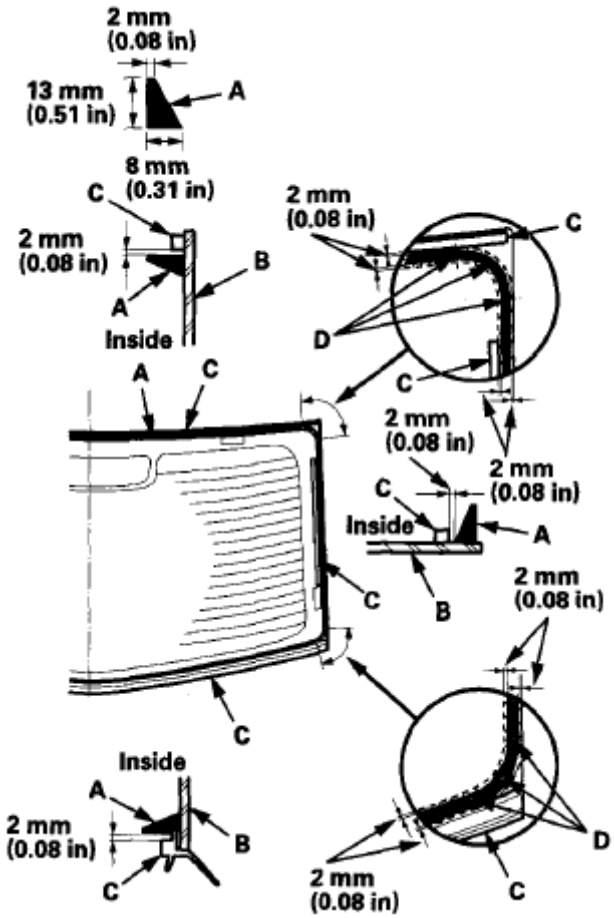

Fig. 30: Identifying Adhesive, Rear Window, Edge Of Rubber Dams And Printed Dots
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Hold the rear window over the opening with suction cups, align it with the alignment marks you made in step 15, and set it down on the adhesive. Lightly push on the rear window until its edges are fully seated on the adhesive all the way around.

NOTE: Do not open or close any of the doors for about an hour until the adhesive is dry.

22. Remove the excess adhesive with a putty knife or a shop towel dampened with isopropyl alcohol.
23. Wait at least an hour for the adhesive to dry, then spray water over the rear window and check for leaks. Mark the leaking areas, let the rear window dry, then seal with sealant. Let the vehicle stand for at least 4 hours after rear window installation. If the vehicle has to be used within the first 4 hours, it must be driven slowly.
24. Reinstall all remaining removed parts.

NOTE: Advise the client not to do the following things for 2 to 3 days:

- **Slam the doors with all the windows rolled up.**
- **Twist the body excessively (such as when going in and out of driveways at an angle or driving over rough, uneven roads).**

Courtesy of AMERICAN HONDA MOTOR CO., INC.

GENERAL TROUBLESHOOTING INFORMATION

HOW TO CHECK FOR DTCS WITH THE HDS (WITHOUT NAVIGATION)

NOTE: Check the vehicle battery condition first (see BATTERY TEST).

1. Make sure the ignition switch is in LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

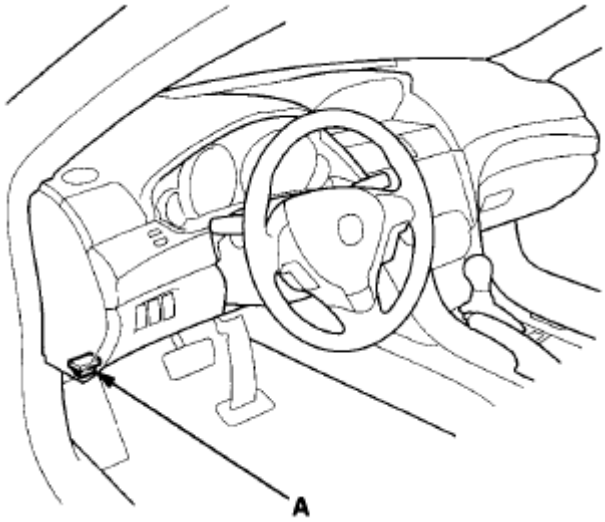

Fig. 3: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Make sure the HDS communicates with the vehicle and the HandsFreeLink Control Unit. If it does not, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
5. Select HandsFreeLink in the BODY ELECTRICAL menu.
6. Select DTCs in the HandsFreeLink menu.
7. Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troubleshooting. If no DTCs are indicated, refer to **Symptom Troubleshooting Index** symptom troubleshooting.

NOTE:

- **After troubleshooting, clear the DTCs with the HDS.**
- **For specific operations, refer to HOW TO USE THE HDS (HONDA DIAGNOSTIC SYSTEM) .**

LEVER-LOCKED CONNECTOR

Disconnecting

To disconnect the connector, pull the lever (A) while pushing the lock tab (B) down, then pull the connector (C).

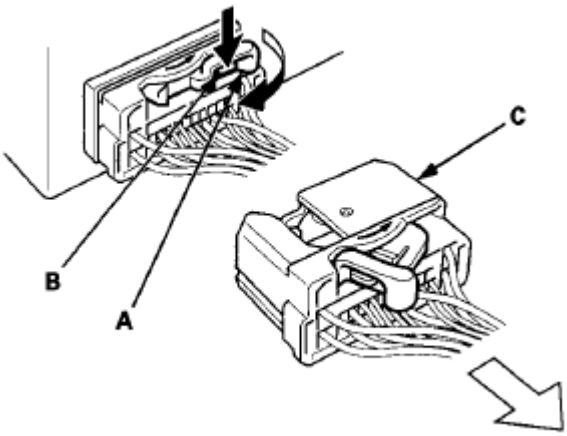

Fig. 4: Disconnecting Lever-Locked Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connecting

To connect the connector, push the connector into the connector sleeve (A). As the connector is pressed in, the lever (B) moves to the locked position.

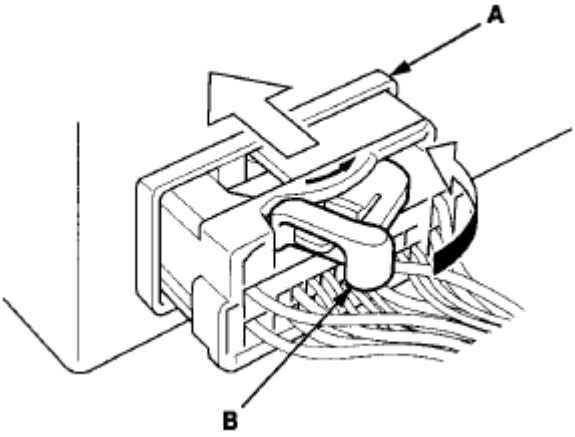

Fig. 5: Connecting Lever-Locked Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INTRODUCTION

The HFL system works only with Acura approved Bluetooth®-enabled cell phones with a hands-free profile. If you are not sure if your cell phone is compatible with the HFL system, Acura has a dedicated call center at 888-528-7876 and web site www.acura.com/handsfreelink, to answer your questions.

The HFL system allows you to make and receive hands-free calls. It cannot control the phone's performance (call quality and signal strength). For more information about performance and performance problems, refer to Dropped Calls.

Always call the HFL call center first, not Tech Line because the HFL call center has the latest information about

cell phone software versions, settings and other issues.

Most HFL complaints are due to pairing, configuration, or compatibility issues. Contact the Acura call center before replacing the HandsFreeLink Control Unit.

The call center is open Monday thru Friday from 6:00 a. m. to 6:00 p.m. CST; Saturday from 7:00 a.m. to 6:00 p.m. CST; and Sunday from 8:00 a.m. to 6:00 p.m. CST.

CHECKING CELL PHONE COMPATIBILITY

The most important step in troubleshooting HFL issues is to identify the client's phone model, the software version, and the cellular carrier that experiences the HFL problem. Not all phones with the Bluetooth feature and a hands-free profile are compatible with the Acura HFL system.

Go to www.acura.com/handsfreelink or call Acura's dedicated call center at 888-528-7876, and check if the client's phone is approved to work with the Acura HFL system.

NOTE:

- **These approved, archived, and currently testing phone model lists are constantly changing, so make sure you view them frequently.**
- **Phones are added as they are approved.**
- **Phones can be removed from the approved list if a software bug is discovered that makes the phone incompatible. There phones can be added back to the approved list if the phone manufacturer corrects the bug.**
- **If the software bug is corrected, a new software version is created and may be listed in the Supported Features section of the phone. If you have trouble finding the phone's software version, you can call the HFL call center at 888-528-7876.**
- **The Acura web site now includes the software versions that are tested and approved. When software versions are listed, you need to know which version is loaded on the phone to help you troubleshoot the client's complaint. If you cannot access the Acura web site, call the HFL call center at 888-528-7876 for further assistance.**

VOICE CONTROL TIPS AND IMPROVING VOICE RECOGNITION

With navigation, HFL voice control and voice recognition is not supported. The HFL system stores a simple voice tag for the Speed Dial. But HFL is controlled by using the navigation voice recognition system.

To give a voice command to the HFL system, press and release the HFL TALK button (A). Always wait for the beep, then give your command in a clear, natural voice. The HFL microphone is on the ceiling by the map lights.

If the HFL system does not recognize your voice command, you'll hear "Pardon? Press the HFL TALK button and say a command. For a list of commands, say HandsFreeHelp." If your command is not recognized a second time, you'll hear "Bluetooth HandsFreeLink main menu. Available calling options are call, dial, redial, and

transfer. Available setup options are phone setup, phone book, and system setup. For more detailed help, say HandsFreeHelp." If your command is not recognized a third time, the HFL system sends you to its Help menu.

To hear a list of available options at any time, press the HFL TALK button, and say "help."

The HFL system may have problems recognizing some voices. To improve voice recognition:

- Close the windows and moonroof.
- Set the fan speed to low (1 or 2) or off.
- Adjust the airflow from the center vents down, so that it's not blowing against the microphone on the ceiling.
- Speak in a clear and natural voice. If the system cannot recognize your command, try speaking louder, slower in a deeper tone.
- If the background noise is too loud, you may need to speak louder.
- If you speak with something in your mouth, or your voice is too high, the system may not interpret your command correctly.
- Find out if the problem is with one person or with everyone who uses the system. If the system has a problem with only one person's voice, this is a system limitation.

Many issues result from the client not using the system properly. When the HFL TALK button is pressed, the client hears one audible tone. When the HFL BACK button is pressed, the client hears two audible tones. Make sure to press the HFL BACK button to exit out of the HFL main menu after completing a call and before giving any navigation commands.

The HFL system may experience a number recognition issue, such as when a client rattles off a set of numbers in a group unrecognized by the system. The HFL system understands phone numbers in specific blocks of 3, 4, 7, 10, and 11 numbers. For example, the system understands:

1234567890

123-456-7890

The system may become confused if numbers are stated in other blocks like these:

1234-567-890

12-34-56-78-90

12345-67890

123-4567-890

1-2-3-4-5-6-7-8-9-0

Without navigation

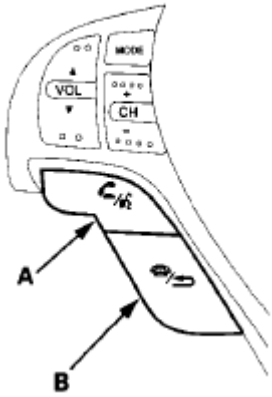

Fig. 6: Identifying HFL System Button (Without Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NAVIGATION THROUGH HFL MENUS

With navigation, HFL voice control and voice recognition is not supported. The HFL system stores a simple voice tag for the Speed Dial. But HFL is controlled by using the navigation voice recognition system.

To skip a voice prompt, press and release the HFL TALK button (A) while the HFL system is speaking. The system beings listening for your next voice command.

To go back a step in a voice command sequence, press and release the HFL BACK button (B), or press the HFL TALK button and say "Go back." If you do not say anything while the HFL system is listening for your voice command, it times out and stops voice recognition. The next time you press and release the HFL TALK button, the HFL system begins listening from the point it timed out.

If you've finished or want to stop a voice command sequence at anytime, press and release the HFL BACK button, or press and release the HFL TALK button, wait for the beep, and say "Cancel." The next time you press and release the HFL TALK button, the HFL system begins from its main menu. To avoid keeping the audio system muted, press and release the HFL BACK button when you are finished.

Without navigation

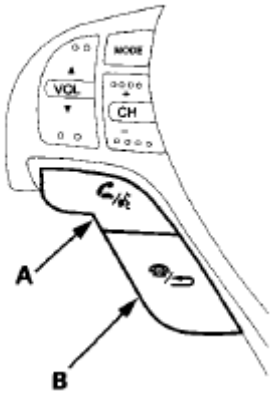

Fig. 7: Identifying HFL System Button (With Navigation)

PAIRING A CELL PHONE

You must pair an approved Bluetooth-compatible phone to the HFL system before you can make and receive calls. For a current list of approved phones and specific phone pairing instructions for each phone, see Checking Cell Phone Compatibility, go to www.acura.com/handsfreelink, or call 888-528-7876.

The following procedure works for most Acura approved phones. If you cannot pair your phone to the HFL system with this procedure, refer to your phone's operating manual, vehicle's Owner's Manual, visit www.acura.com/handsfreelink, or call 888-528-7876.

NOTE:

- **You cannot pair a phone while the vehicle is moving.**
- **Your phone must be in its Discovery mode.**
- **A maximum of six approved Bluetooth-compatible phones can be paired to the system.**

WITH NAVIGATION

The commands for pairing the phone can either be selected using the interface dial or by using the navigation voice recognition system (TALK and BACK buttons).

NOTE: **The navigation system can pair up to six approved phones. If you try to pair a seventh phone, a message appears that prompts you to delete one of your existing phones.**

1. Turn the ignition switch to ACCESSORY (I), or press the engine start/stop button to select the ACC mode and make sure the phone you are pairing is on and in its discovery mode.
2. Press the INFO button, and turn the interface dial to select Cellular Phone, then press ENTER.
3. Move the interface dial down to select Phone Setup.
4. Select Connection, then press Enter.
5. Select Add New Phone, then press Enter.
6. When a four-digit pass key number appears on the screen, wait until prompted by the phone, then enter the pass key into your cellphone.
7. Once the phone is successfully paired, the screen displays "The pairing was successful."

WITHOUT NAVIGATION

1. With your approved phone on and the ignition switch in ACCESSORY (I) or ON (II), or press the engine start/stop button to select the ACC or ON mode, press and release the HFL TALK button. After the beep, say "Phone setup." The HFL responds, "Phone setup options are pair, edit, delete, list, status, next phone, set pairing code."
2. Press and release the HFL TALK button. After the beep, say "Pair." The HFL responds, "The pairing

process requires operation of your mobile phone. For safety, only perform this function while the vehicle is stopped. For proper system function a compatible Bluetooth phone is required. Please visit www.acura.com/handsfreelink for a list of approved phones and other system information. HandsFreeLink is waiting to pair with a Bluetooth phone. From your phone, search for Bluetooth devices, and select HandsFreeLink. When prompted by your mobile phone enter the pairing code 0000."

3. When prompted by your mobile phone, enter the pairing code 0000. Refer to your cell phone user guide for more information about searching for a Bluetooth device.
4. Once the phone is recognized by the HFL system, it responds, "HandsFreeLink has connected to a new phone. A name is needed to identify this phone. Press the talk button and say a name. For example, John's phone."
5. Press and release the HFL TALK button. After the beep, say the name you want to use. For example, say "Tom's phone." The HFL responds, "Tom's phone has been successfully paired."

PAIRING TROUBLESHOOTING

Many pairing issues are resolved by altering the client's phone settings.

If you cannot get an approved HFL phone to pair, contact Acura's dedicated call center at 888-528-7876, or go online to www.acura.com/handsfreelink.

DROPPED CALLS

Clients may perceive dropped calls as being an HFL system fault, but most dropped calls are resultant from cell phone and cell phone carrier issues. The HFL system does not directly handle the cell phone signal. It allows the cell phones to transmit the cell phone audio over the vehicle's audio system.

Many dropped calls issues can be resolved by changing the client's phone settings. For help on approved HFL settings, contact Acura's dedicated call center at 888-528-7876, or go online to www.acura.com/handsfreelink.

Always confirm with the client if the number of dropped calls is higher while using the HFL system as opposed to using the cell phone only. Clients often confuse problems with their phone or carrier as a problem with the HFL system. The HFL system cannot control or determine:

- Cellular connection quality
- Signal strength
- Cellular coverage
- Ambient weather conditions that affect cellular signals

When a client complains about dropped calls, ask questions about when or where the calls are dropped, such as:

- Do you drive the same route on a regular basis?
- Does the call drop in the same location?
- Where do you keep your cell phone?
- Have you compared the number of dropped calls using the HFL versus making calls from the handset?
- Does your phone have an antenna that needs to be extended?

Many reasons for a dropped call are not related to the HFL system. Here are some causes for dropped calls:

- If the quantity of dropped calls is about the same when the client uses the HFL system versus the handset, the issue is likely due to the cellular phone or carrier.
- If the phone is equipped with a retractable antenna, it needs to be extended to maximize signal strength.
- If a client also notices that the calls tend to drop in the same areas, the HFL system may be operating normally, but something about the area diminishes cellular coverage to a point where the call drops.
- Hills or mountains can block or interfere with cellular signals.
- High-rise buildings, bridges, or other large structures may block or interfere with cellular signals.
- Placing the cell phone in a purse, in a metal briefcase, under the seat, in the glove box, or in the trunk can all affect signal reception.
- There are coverage gaps in the cellular service. When driving, a call is typically passed from one tower to another. If the client drives through an area where there is a coverage gap between towers, the call drops.
- Electrical storms, heavy rain, or overcast conditions interfere with signal strength.
- The cell phone battery's state of change can affect signal reception. A low battery may reduce the phone's ability to boost the antenna's power and function properly, especially in low signal strength areas. Some phone manufacturers trade off signal transmission and reception strength for battery life. As the battery weakens, the signal strength may also weaken. Some cell phones may operate more effectively than others in low signal strength areas, especially with a partially charged battery, and depending on whether or not the retractable antenna is fully extended (if applicable). On these models, make sure the antenna is always extended to maximize signal strength and extend battery life.

PHONE WILL NOT AUTOMATICALLY CONNECT THE HFL

If a client complains that their cell phone is not automatically connecting to the HFL system when they enter the vehicle, do this:

1. Make sure the Bluetooth feature is turned on in the cell phone.
2. Make sure the cell phone is properly paired to the HFL system.
3. Do a soft reset to the cell phone.
4. Check if the phone has an Authorized Connection or Trusted option.
5. Check the battery and signal strength on the cell phone. Pairing a phone requires optimal signal strength and a nearly full battery.

INCOMING CALLS

Call the HFL call center at 888-528-7876 after you have duplicated the problem.

If a client complains that they cannot receive incoming calls through the HFL system, see if the call is routing to the cell phone instead of the HFL system. An easy way to know if the call is routed to the cell phone is when the client says, "I can't hear the caller, but they can hear me."

1. Make sure the Bluetooth feature is turned on in the cell phone.
2. Make sure the cell phone is paired to the HFL system and linked.

3. Make sure the answer settings in the cell phone are set to multi-key or any-key answer. If the phone is set to flip-open to answer, recommend changing the setting to Any Key or leaving the phone flipped open when using the HFL system.
4. Make sure the Auto Answer feature is turned off in the cell phone.
5. Do a soft reset to the phone.
6. Make sure the battery is fully charged and there is adequate signal strength.
7. Ask the client if they have set specific ring tones or ringer IDs to specific contacts. If they have, recommend returning them to a standard ring tone for all calls.
8. Make sure the client is pressing the PICK-UP button (A) or the HFL TALK button (B) and not the HANG-UP button (C), the HFL BACK button (D), the TALK button (E), or the BACK button (F).

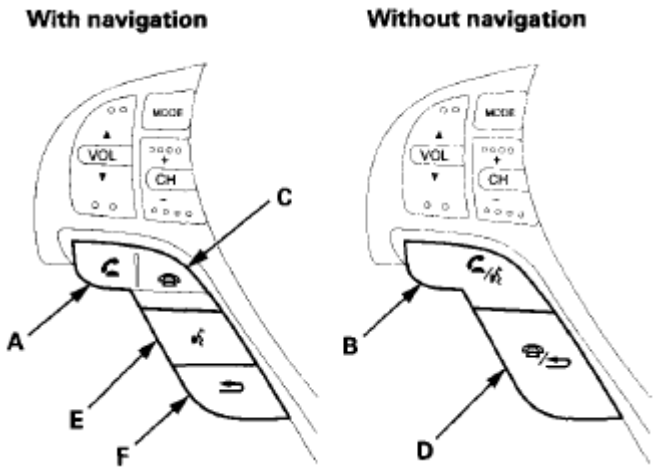

Fig. 8: Identifying HFL Talk Buttons
Courtesy of AMERICAN HONDA MOTOR CO., INC.

OUTGOING CALLS

Call the HFL call center at 888-528-7876 after you have duplicated the problem.

If a client says that they cannot place a call using the HFL system, ask if the call was initiated through the HFL system or the cell phone itself.

If the call is placed by the HFL system:

1. Make sure the Bluetooth feature is turned on in the cell phone.
2. Make sure the cell phone is paired to the HFL system and linked.
3. Make sure the client is pressing the TALK button (A) or the HFL TALK button (B) before each command and going through the calling process correctly.

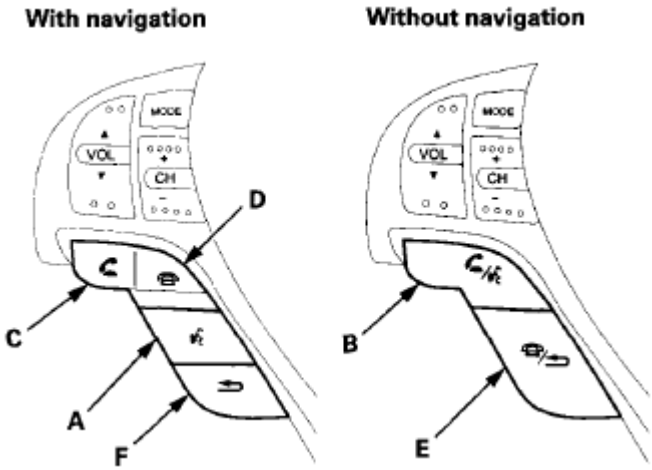

Fig. 9: Identifying HFL Talk Buttons
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Make sure the client is pressing the PICK-UP button (C) or the HFL TALK button and not the HANG-UP button (D), the HFL BACK button (E), the TALK button, or the BACK button (F).
5. Check if the cell phone has an Authorized Connections or Trusted option.
6. Do a soft reset to the cell phone.

If the call is placed by the cell phone:

The call will remain on the handset until you transfer it over to the HFL system. To continue the call on the HFL system, you must use the Transfer command by pressing and releasing the TALK button or the HFL TALK button during an active call and saying "Transfer." The client can now continue the call using the HFL system.

CLEARING THE HFL SYSTEM

With Navigation

The commands for deleting a phone can either be selected using the interface dial or by using the navigation voice recognition system (use the TALK and BACK buttons).

NOTE:

- **All the phones paired to the HFL cannot be deleted at once. You must delete one phone at a time.**
- **If the system is locked and the pass code is lost or forgotten, see symptom troubleshooting.**

1. Turn the ignition switch to ACCESSORY (I), or press the engine start/stop button to select the ACC mode.
2. Press the INFO button, and turn the interface dial to select Cellular Phone, then press ENTER.
3. Move the interface dial down to select Phone Setup.

4. Select Edit User, and press ENTER.
5. Select Delete, then select the phone you want to delete from the list. Press ENTER to select the phone, then press ENTER again to confirm.
6. Repeat steps 4-5 for each phone you want to delete.

Without Navigation

NOTE:

- **This operation clears the HFL system of all passcode(s), any paired phones, and all names in the HFL phonebook.**
- **Clearing the HFL system is recommend before selling the vehicle.**
- **If the system is locked and the pass code is lost or forgotten, see the symptom troubleshooting.**

1. Press and release the HFL TALK button. After the beep, say "System setup clear" and the HFL system responds, "This process will clear all paired phones, clear all entries in the phonebook, clear the security passcode and restore all defaults in the system setup. Is this what you would like to do?."
2. Press and release the HFL TALK button. After the beep, say "Yes" and the HFL system responds, "Preparing to clear the system, which may take up to 2 minutes to complete."
3. Press and release the HFL TALK button. After the beep, say "Continue" to proceed, or say "Go back" or "Cancel."
4. If you said "Continue" the HFL responds, "Please wait until the system is cleared". After a short period of time (up to two minutes) the HFL responds, "The system has been cleared."

GLOSSARY OF TERMS

Auto Answer

This cell phone setting forces incoming calls to automatically be answered by the handset. Disable this feature on the phone when using the HFL system, as it may interfere with the HFL system answering incoming calls. Set the phone setting to:

- Send Only
- Any Key
- Multi-Key answer

Answer Options

These cell phone settings allow you to select how you would like to answer an incoming call on the handset. The answer option in the phone can affect inbound calls on the HFL system.

Authorized Connection

This cell phone setting allows the phone to connect automatically with the HFL system without prompting the client for permission to connect. In some instances, it can affect the ability of the phone to properly route sound to the HFL system.

Bluetooth Power

This cell phone function enables or disables the Bluetooth application. When using a hands-free device such as HFL, the Bluetooth application needs to be enabled.

Discovery Mode

You need to have the cell phone in Discovery Mode to allow other devices with Bluetooth capabilities (such as the HFL system) to find the phone during the pairing process.

HFL Button

- TALK button (A) or the HFL TALK button (B): This button activates the voice control system and is used for all voice commends. Press and release it, wait for a beep, and give a voice command.
- BACK button (C) or the HFL BACK button (D): This button has the same function as the CANCEL button. When you press and release it, the current voice command is canceled and the display returns to the previous screen.
- PICK-UP button (E) or the HFL TALK button: This button is used to answer incoming calls or to make outgoing calls. You can also go directly to the Cellular Phone screen by pressing this button.
- HANG-UP button (F) or the HFL BACK button: This button is used to end a call.

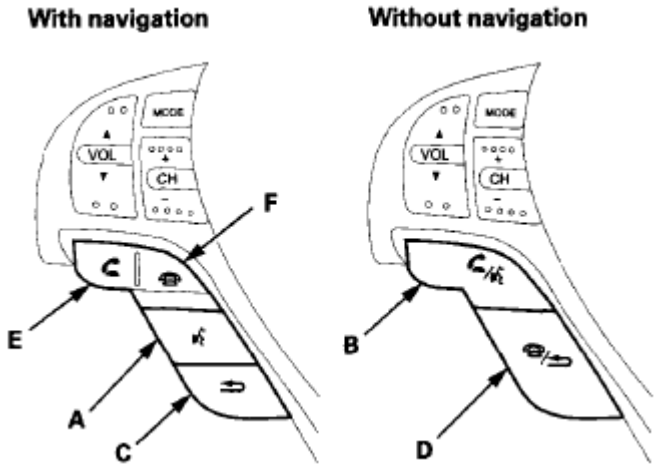

Fig. 10: Identifying HFL Buttons
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Hard Reset (cellular phone)

Hard resets clear the saved settings in the cell phone and restores it to the factory defaults. A hard reset should be done only as a last resort (see the cell phone owner's manual for more information).

Linking

This is when your paired phone is actively ready to use the HFL system. You can pair up to six phones to the HFL system, but only one phone can be linked at a time. If two paired phones are in the vehicle, only the phone

that is linked can use the HFL system and functions. The second phone must be used as a normal handset.

Pairing

A description for linking two Bluetooth devices together. In this case, you are linking a cell phone with the HFL system. After the pairing process is complete, the devices are able to recognize each other and communicate wirelessly via Bluetooth.

Soft Reset (cellular phone)

This helps to restore the basic functions of the phone. To do a soft reset, turn the phone power off, remove and reinsert the cell phone battery, then turn the phone back on. See the cell phone user manual for more information.

Software Version

This refers to the software version loaded in the cell phone. The software version that was tested and determined to be compatible with the HFL system may be listed on the HFL website. Not all software versions are compatible with the HFL system.

DTC TROUBLESHOOTING INDEX

SELF-DIAGNOSTIC FUNCTION

HOW TO CHECK THE HANDSFREELINK SYSTEM CONDITION

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Make sure the audio system or the navigation system anti-theft code is entered.**
- **The self-diagnostic function can only be initiated while the HFL is in its idle state.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

2. Press and hold the HANG-UP button (A) or the HFL BACK button (B) for more than 5 seconds.

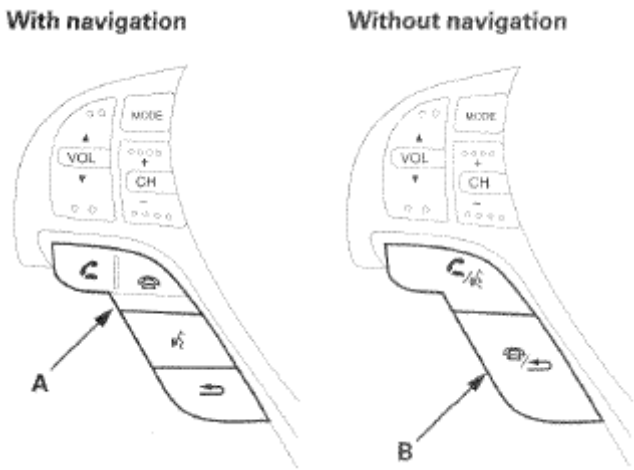

Fig. 23: Identifying Hang-Up Button And HFL Back Button
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. The HFL system starts the self-diagnosis, the following will occurs:
   - If the HFL system is OK, and there are no HFL DTCs, the HFL system says, "The HFT is OK."
   - If there are any HFL DTCs stored, the HFL system says, "The HFT is NG."

The self-diagnosis ends if the HFL system returns to its idle state.

HOW TO CHECK THE HFL DTCS (WITH NAVIGATION)

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Press and hold the DEST/ROUTE, the MAP/GUIDE, and the CANCEL buttons for 3 seconds or more, and the navigation system diagnostic mode begins.

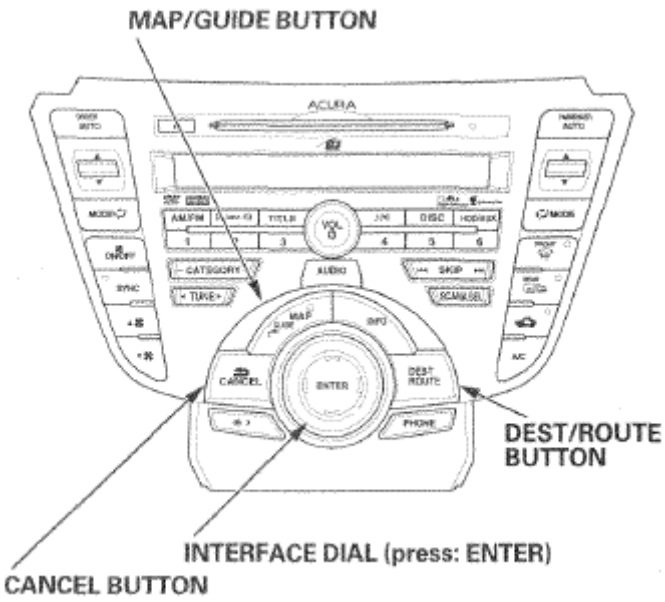

Fig. 24: Identifying Dest/Route, Map/Guide, And Cancel Buttons
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Using the interface dial, select the Detail Information & Setting, then press the ENTER button.

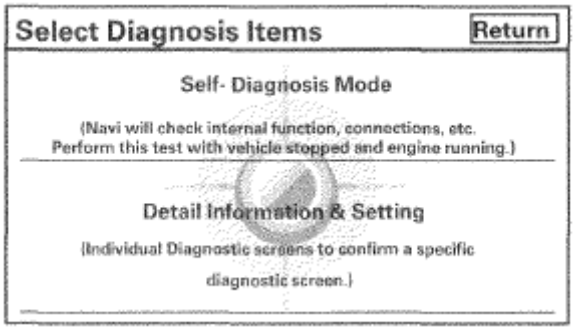

Fig. 25: View Of Interface Dial, Detail Information & Setting
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Select the Unit Check from the Detail Information & Setting menu, then press the ENTER button.

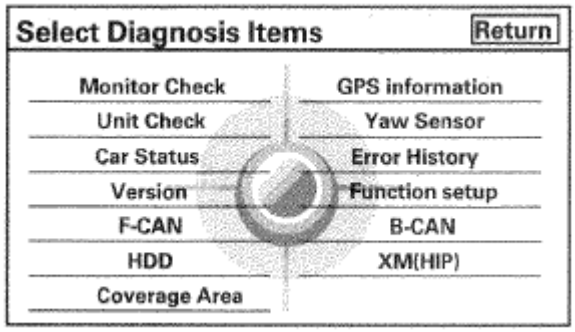

Fig. 26: View Of Detail Information & Setting Menu
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Select the HFT from the Unit Check menu, then press the ENTER button.

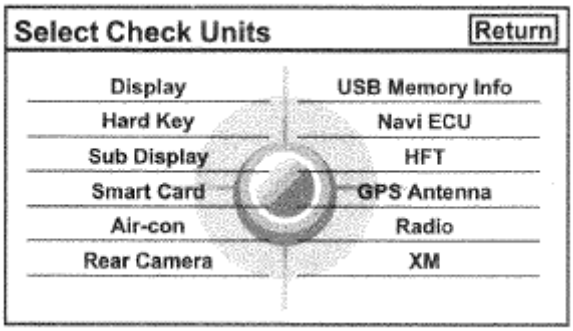

Fig. 27: View Of Unit Check Menu
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Check the GA-NET and the DESIP status in the HFT diagnosis.

NOTE: If HFL Part Number and HFL S/W Version are not shown, go to HandsFreeLink Control Unit Input Test.

- If OK, go to step 7.
- If GA-NET is NG, go to HandsFreeLink **Control Unit Input Test**.
- If DESIP (USA models) is NG, go to navigation DTC 2705 (HFL Diag) troubleshooting (see **DTC 2705: HFL DIAG**).

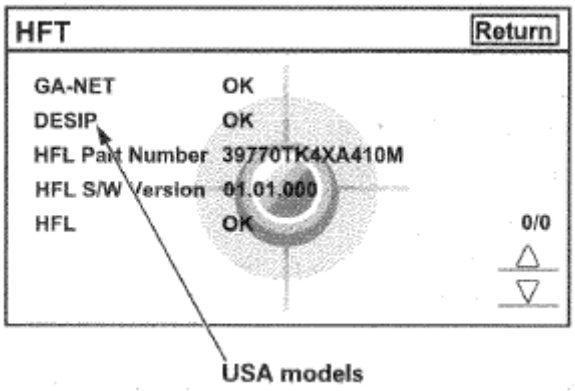

Fig. 28: Identifying DESIP (USA Models)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Check the HFL status in the HFT diagnosis:
   - If OK, the system is OK at this time, go to step 8.
   - If NG and any DTC are displayed, go to indicated HandsFreeLink DTC troubleshooting.

8. To end the self-diagnostic function, select the Return, or turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

HFL SYSTEM TROUBLESHOOTING

NOTE:

- **Before doing this troubleshooting, refer to General Troubleshooting Information to make sure the phone is compatible and configured correctly.**
- **Make sure the phone is Acura approved and configured correctly. Online, go to www.acura.com/handsfreelink, or call the HFL call center at 888-528-7876.**
- **You must be able to duplicate the client's concern to successfully diagnose the problem.**
- **Always use the client's phone to successfully diagnose the problem.**

1. Make sure the phone is approved by checking www.acura.com/handsfreelink, or call the HFL call center at 888-528-7876.

   Is the Bluetooth phone approved?

   YES -Go to step 2.

   NO -Explain to the client that the cell phone is not approved. Recommend they get a phone that does appear on the www.acura.com/handsfreelink. •

2. Check if the cell phone has any special requirements (software version, configuration, etc.). Call the HFL call center at 888-528-7876 for help.

   Is the correct software version loaded and is the phone properly configured?

   YES -Go to step 3.

   NO -Explain to your client that the cell phone software needs to be updated or the cell phone needs to be configured properly. If the HFL call center is able to help you configure the phone, explain the proper settings, otherwise direct your client to contact their cell phone manufacturer or carrier. •

3. Check the features of the approved phone at www.acura.com/handsfreelink, or call the HFL call center at 888-528-7876.

   Are all the features approved?

   YES -Go to step 4.

   NO -Check and see if the feature that is not approved is the same as the customer complaint. If the complaint is about the feature that is not approved, the vehicle is OK. Explain to the customer that the

feature is not approved to work with the HFL. If the complaint is an approved feature, go to step 4.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Press and hold the HANG-UP button or the **HFL BACK button** for more than 5 seconds.

   Do you hear the message "The HFT is OK"?

   YES -Go to step 6.

   NO -Check for **HFL DTCs with the System Diagnostic Mode** or the **HDS**. •

6. Try to duplicate the problem or have the client demonstrate the problem.

   Can you duplicate the problem?

   YES -Go to step 7.

   NO -The system is OK at this time. •

7. Pair the phone to a known-good vehicle (same model, year, and trim), and try duplicate the problem.

   Does the phone have the same problem on the known-good vehicle?

   YES -Call the HFL call center at 888-528-7876 to make sure the phone is configured correctly and has the correct software. If the phone is configured correctly, it is either a characteristic of the HFL system, or a characteristic of the particular approved phone being used. Explain to your client that this is a system characteristic. Another phone from the approved phone list may give more favorable results. •

   NO -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the problem goes away, replace the **Original HandsFreeLink Control Unit**. •

DTC TROUBLESHOOTING

DTC B1775: MICROPHONE INPUT/OUTPUT SHORTED TO POWER OR OPEN (WITH NAVIGATION)

NOTE: Check the vehicle battery condition first (see BATTERY TEST).

1. Do the HFL **Self-Diagnostic Function**, and check for HFL DTCs.

   Is DTC B1775 indicated?

   YES -Go to step 2.

   NO -Intermittent failure, the system is OK at this time. •

2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
3. Check for poor connection or loose terminals at the HFL-navigation microphone 7P connector.

   Are the connection or terminals OK?

   YES -Go to step 4.

   NO -Repair poor connections or loose terminals, and recheck. •

4. Disconnect the HFL-navigation microphone 7P connector.
5. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
6. Disconnect the HandsFreeLink Control Unit 32P connector (see step 2.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Measure the voltage between HandsFreeLink Control Unit 32P connector terminal No. 15 and body ground.

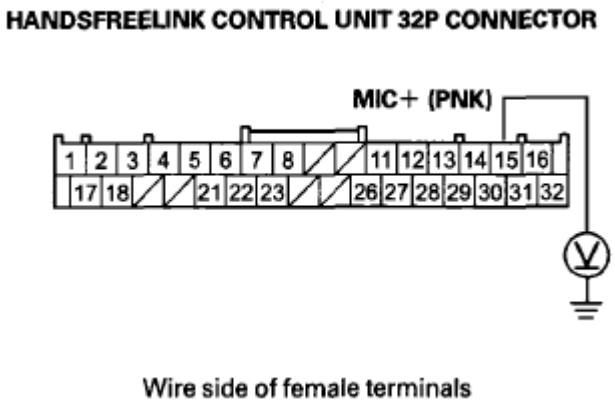

Fig. 29: Measuring Voltage Between HandsFreeLink Control Unit 32P Connector Terminal No. 15 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there voltage?

   YES -There is a short to power in the wire between the HandsFreeLink Control Unit and the HFL-navigation microphone. Replace the affected shielded harness. •

   NO -Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Check for continuity between HandsFreeLink Control Unit 32P connector terminals No. 15 and No. 16 and HFL-navigation microphone 7P connector terminals No. 3 and No. 2 respectively.

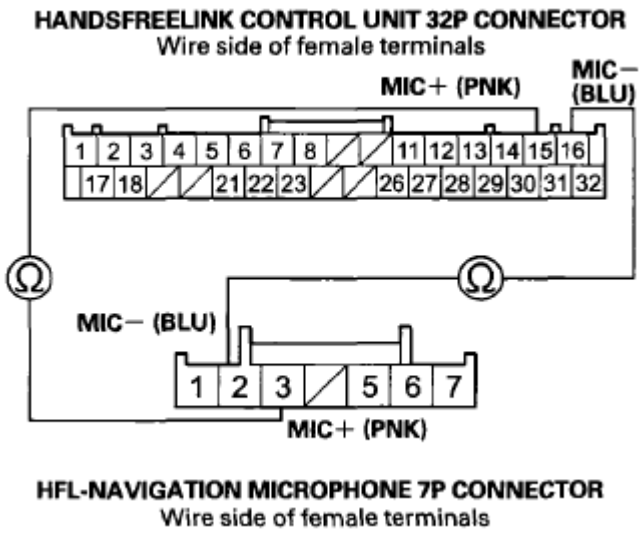

Fig. 30: Checking For Continuity Between HandsFreeLink Control Unit 32P Connector And HFL-Navigation Microphone 7P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 11.

NO -There is an open in the wire between the HandsFreeLink Control Unit and the HFL-navigation microphone. Replace the affected shielded harness. •

11. Disconnect audio-navigation unit connector H (28P).
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Measure the voltage between HandsFreeLink Control Unit 32P connector terminal No. 31 and body ground.

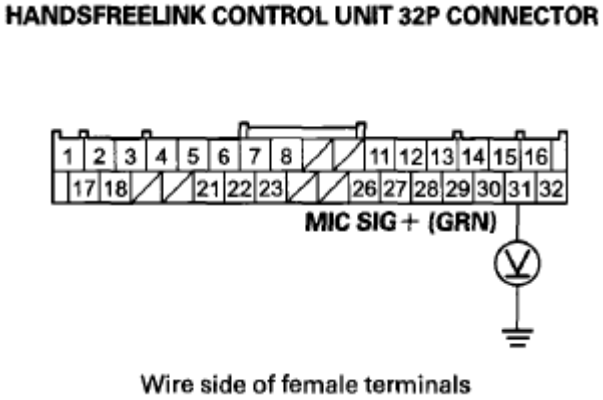

Fig. 31: Measuring Voltage Between HandsFreeLink Control Unit 32P Connector Terminal No. 31 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES -There is a short to power in the wire between the HandsFreeLink Control Unit and the audio-navigation unit. Replace the affected shielded harness. •

NO -Go to step 14.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Substitute a known-good HFL-navigation microphone (see **NAVIGATION DISPLAY VISOR REMOVAL/INSTALLATION**).
16. Reconnect the HandsFreeLink Control Unit 32P connector and audio-navigation unit connector H (28P).
17. Do the HFL **Self-Diagnostic Function**, and check for HFL DTCs.

Is DTC B1775 indicated?

YES -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. If the symptom/indication is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**). •

NO -Replace the original HFL-navigation microphone (see **NAVIGATION DISPLAY VISOR REMOVAL/INSTALLATION**). •

DTC B1775: MICROPHONE INPUT/OUTPUT SHORTED TO POWER OR OPEN (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN system diagnosis test mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**

1. Connect the **HDS** to the DLC.
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode
4. Check for DTCs with the HDS.

Is DTC B1775 indicated?

YES -Go to step 5.

NO -Intermittent failure, the system is OK at this time. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check for poor connection or loose terminals at the roof console 20P connector.

Are the connection or terminals OK?

YES -Go to step 7.

NO -Repair poor connections or loose terminals, and recheck. •

7. Disconnect the roof console 20P connector.
8. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
9. Disconnect the HandsFreeLink Control Unit 28P connector (see step 2).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Measure the voltage between HandsFreeLink Control Unit 28P connector terminal No. 13 and body ground.

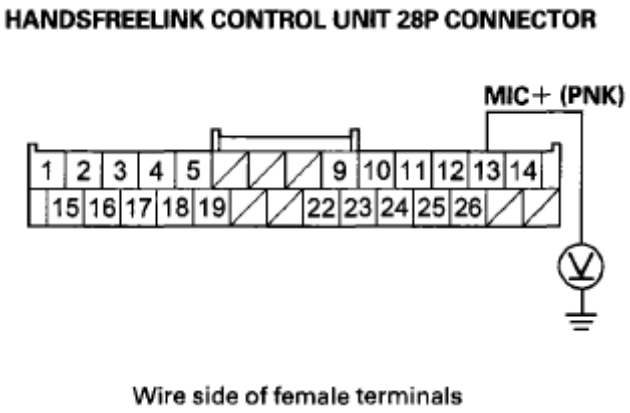

Fig. 32: Measuring Voltage Between HandsFreeLink Control Unit 28P Connector Terminal No. 13 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES -There is a short to power in the wires between the HandsFreeLink Control Unit and the HFL microphone. Replace the affected shielded harness. •

NO -Go to step 12.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Check for continuity between HandsFreeLink Control Unit 28P connector terminals No. 13 and No. 14 and roof console 20P connector terminals No. 20 and No. 19 respectively.

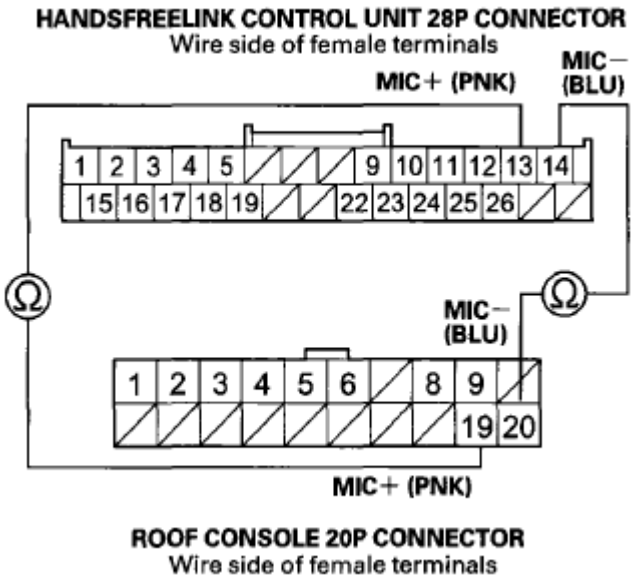

Fig. 33: Checking For Continuity Between HandsFreeLink Control Unit 28P Connector And Roof Console 20P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good **HFL microphone**, and recheck. If the symptom/indication goes away, replace the original **HFL microphone**. If the symptom/indication is still present, replace the **HandsFreeLink Control Unit**. •

NO -There is an open in the wire between the HandsFreeLink Control Unit and the HFL microphone. Replace the affected shielded harness. •

DTC B1776: MICROPHONE INPUT/OUTPUT SHORTED TO GROUND (WITH NAVIGATION)

NOTE: Check the vehicle battery condition first (see BATTERY TEST).

1. Do the HFL **Self-Diagnostic Function**, and check for HFL DTCs.

   Is DTC B1776 indicated?

   YES -Go to step 2.

   NO -Intermittent failure, the system is OK at this time. •

2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
3. Disconnect the HFL-navigation microphone 7P connector.
4. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).

5. Disconnect the HandsFreeLink Control Unit 32P connector (see step 2).
6. Check for continuity between HandsFreeLink Control Unit 32P connector terminals No. 14 and No. 15.

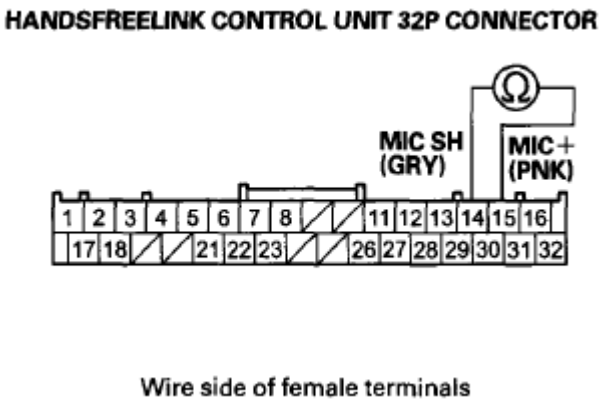

Fig. 34: Checking For Continuity Between HandsFreeLink Control Unit 32P Connector Terminals No. 14 And No. 15
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short in the wires between the HandsFreeLink Control Unit and the HFL-navigation microphone. Replace the affected shielded harness. •

NO -Go to step 7.

7. Check for continuity between HandsFreeLink Control Unit 32P connector terminal No. 15 and body ground.

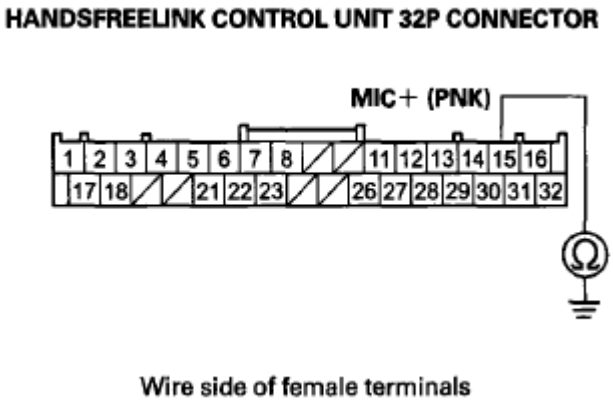

Fig. 35: Checking For Continuity Between HandsFreeLink Control Unit 32P Connector Terminal No. 15 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire between the HandsFreeLink Control Unit and the HFL-navigation microphone. Replace the affected shielded harness. •

NO -Go to step 8.

8. Disconnect audio-navigation unit connector H (28P).
9. Check for continuity between HandsFreeLink Control Unit 32P connector terminal No. 31 and body ground.

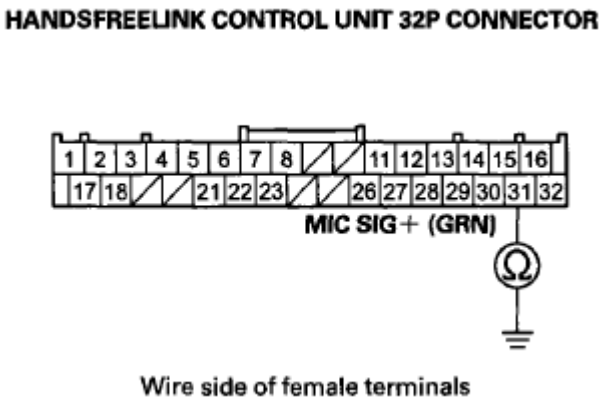

Fig. 36: Checking For Continuity Between HandsFreeLink Control Unit 32P Connector Terminal No. 31 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire between the HandsFreeLink Control Unit and the audio-navigation unit. Replace the affected shielded harness. •

NO -Go to step 10.

10. Check for continuity between audio-navigation unit connector H (28P) terminals No. 14 and No. 28.

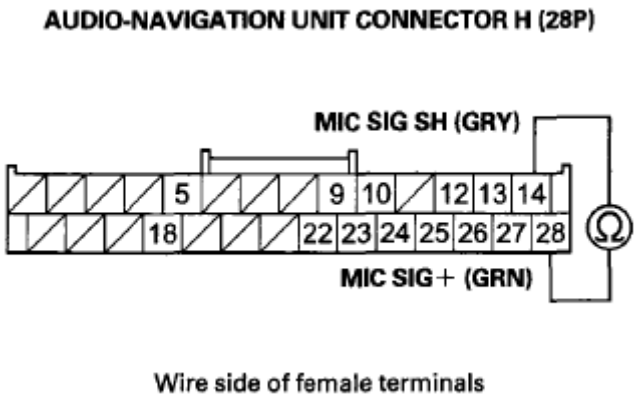

Fig. 37: Checking For Continuity Between Audio-Navigation Unit Connector H (28P) Terminals

No. 14 And No. 28
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short in the wires between the audio-navigation unit and the HandsFreeLink Control Unit. Replace the affected shielded harness. •

NO -Go to step 11.

11. Substitute a known-good HFL-navigation microphone (see **NAVIGATION DISPLAY VISOR REMOVAL/INSTALLATION**).
12. Reconnect the HandsFreeLink Control Unit 32P connector and audio-navigation unit connector H (28P).
13. Do the HFL **Self-Diagnostic Function**, and check for HFL DTCs.

Is DTC B1776 indicated?

YES -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. If the symptom/indication is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**). •

NO -Replace the original HFL-navigation microphone (see **NAVIGATION DISPLAY VISOR REMOVAL/INSTALLATION**). •

DTC B1776: MICROPHONE INPUT/OUTPUT SHORTED TO GROUND (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN system diagnosis test mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**

1. Connect the **HDS** to the DLC.
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
4. Check for DTCs with the HDS.

Is DTC B1776 indicated?

YES -Go to step 5.

NO -Intermittent failure, the system is OK at this time. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

6. Disconnect the roof console 20P connector.
7. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
8. Disconnect the HandsFreeLink Control Unit 28P connector (see step 2).
9. Check for continuity between HandsFreeLink Control Unit 28P connector terminals No. 12 and No. 13.

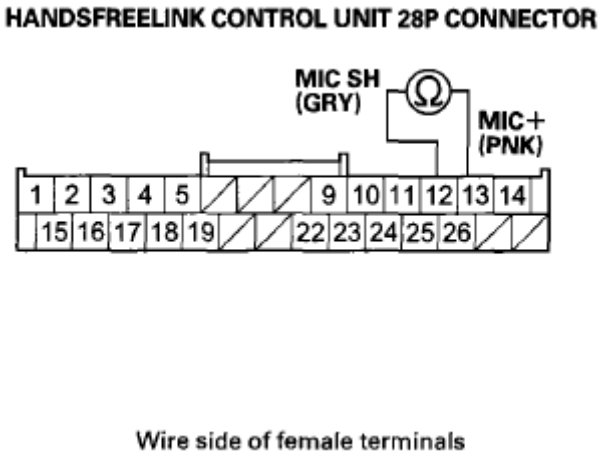

Fig. 38: Checking For Continuity Between HandsFreeLink Control Unit 28P Connector Terminals No. 12 And No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short in the wires between the HandsFreeLink Control Unit and the HFL microphone. Replace the affected shielded harness. •

NO -Go to step 10.

10. Check for continuity between HandsFreeLink Control Unit 28P connector terminal No. 13 and body ground.

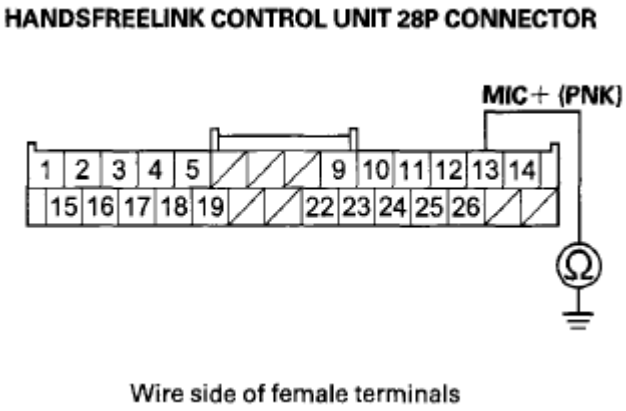

Fig. 39: Checking For Continuity Between HandsFreeLink Control Unit 28P Connector Terminal

No. 13 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire between the HandsFreeLink Control Unit and the HFL microphone. Replace the affected shielded harness. •

NO -Substitute a known-good **HFL microphone**, and recheck. If the symptom/indication goes away, replace the original **HFL microphone**. If the symptom/indication is still present, replace the **HandsFreeLink Control Unit**. •

DTC B1779: HANDSFREELINK STEERING WHEEL SWITCH FAILURE (WITH NAVIGATION)

NOTE: Check the vehicle battery condition first (see BATTERY TEST).

1. Start the vehicle, and turn the steering wheel left and right several times.
2. Do the HFL **Self-Diagnostic Function**, and check for HFL DTCs.

   Is DTC B1779 indicated?

   YES -Go to step 3.

   NO -Intermittent failure, the system is OK at this time. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Do the **HFL Switch Test**.

   Is the switch OK?

   YES -Go to step 5.

   NO -Replace the audio remote, HFL-navigation voice control switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**). •

5. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
6. Disconnect the HandsFreeLink Control Unit 32P connector (see step 2).
7. Disconnect the audio remote, HFL-navigation voice control switch 12P connector, and connect the cable reel connectors.
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Measure the voltage between audio remote, HFL-navigation voice control switch 12P connector terminal No. 9 and body ground.

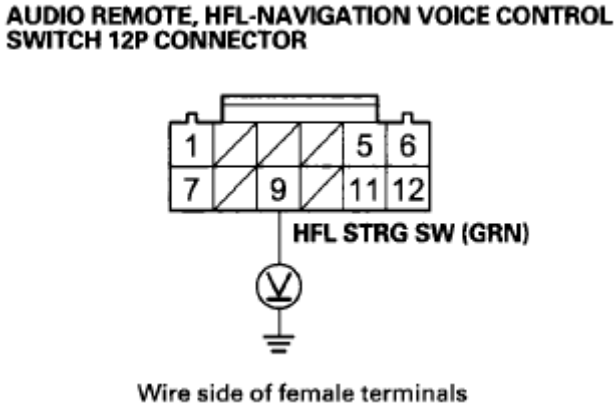

Fig. 40: Measuring Voltage Between Audio Remote, HFL-Navigation Voice Control Switch 12P Connector Terminal No. 9 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES -Go to step 13.

NO -Go to step 10.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Check for continuity between HandsFreeLink Control Unit 32P connector terminal No. 2 and audio remote, HFL-navigation voice control switch 12P connector terminal No. 9.

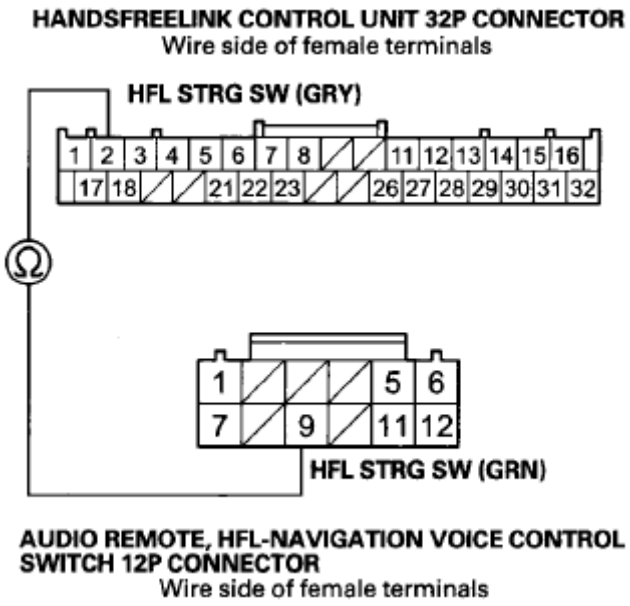

Fig. 41: Checking For Continuity Between HandsFreeLink Control Unit 32P Connector And Audio Remote, HFL-Navigation Voice Control Switch 12P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 16.

NO -Repair an open in the wire between the switch, the cable reel, and the HandsFreeLink Control Unit. •

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect cable reel connector A (20P).
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Measure the voltage between HandsFreeLink Control Unit 32P connector terminal No. 2 and body ground.

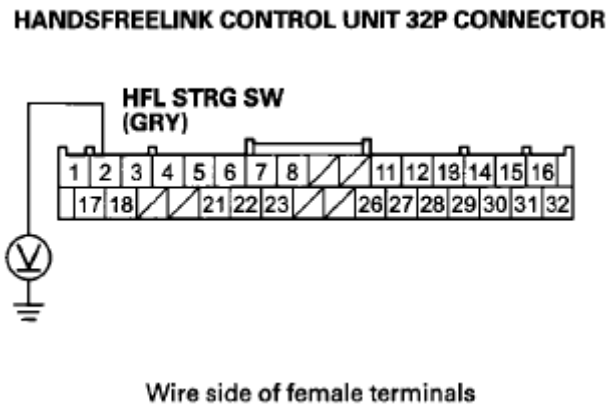

Fig. 42: Measuring Voltage Between HandsFreeLink Control Unit 32P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES -Repair a short to power in the wire between the HandsFreeLink Control Unit and the cable reel. •

NO -Replace the cable reel (see **CABLE REEL REPLACEMENT**). •

16. Disconnect audio-navigation unit connector A (24P).

NOTE: Eject all the discs before disconnecting the audio-navigation unit to prevent damaging the CD/DVD player's load mechanism.

17. Check for continuity between audio remote, HFL-navigation voice control switch 12P connector terminal No. 11 and audio-navigation unit connector A (24P) terminal No. 5.

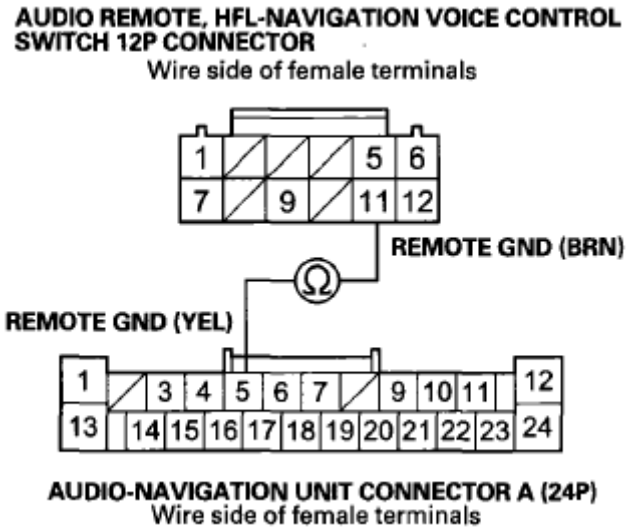

Fig. 43: Checking For Continuity Between Audio Remote, HFL-Navigation Voice Control Switch 12P Connector And Audio-Navigation Unit Connector (24P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the **HandsFreeLink Control Unit**. •

NO -Repair an open in the wire between the switch, the cable reel, and the audio-navigation unit. •

DTC B1779: HANDSFREELINK STEERING WHEEL SWITCH FAILURE (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN system diagnosis test mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**

1. Connect the **HDS** to the DLC.
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then start the vehicle and turn the steering wheel back and forth several times.
4. Check for DTCs with the HDS.

Is DTC B1779 indicated?

YES -Go to step 5.

NO -Intermittent failure, the system is OK at this time. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Do the **HFL Switch Test**.

   Is the switch OK?

   YES -Go to step 7.

   NO -Replace the audio remote-HFL switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**). •

7. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
8. Disconnect the HandsFreeLink Control Unit 28P connector (see step 2).
9. Disconnect the audio remote-HFL switch 12P connector, and connect the cable reel connectors.
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Measure the voltage between audio remote-HFL switch 12P connector terminal No. 9 and body ground.

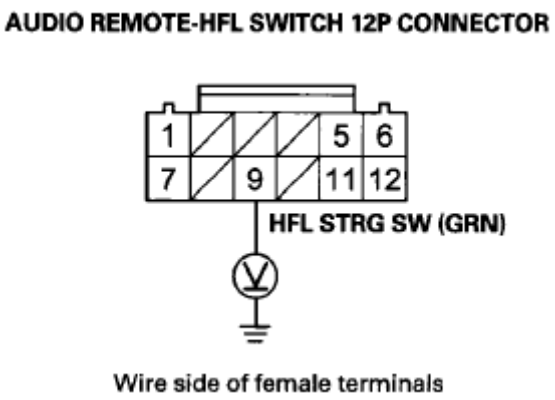

Fig. 44: Measuring Voltage Between Audio Remote-HFL Switch 12P Connector Terminal No. 9 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES -Go to step 14.

NO -Go to step 12.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Check for continuity between HandsFreeLink Control Unit 28P connector terminal No. 2 and audio remote-HFL switch 12P connector terminal No. 9.

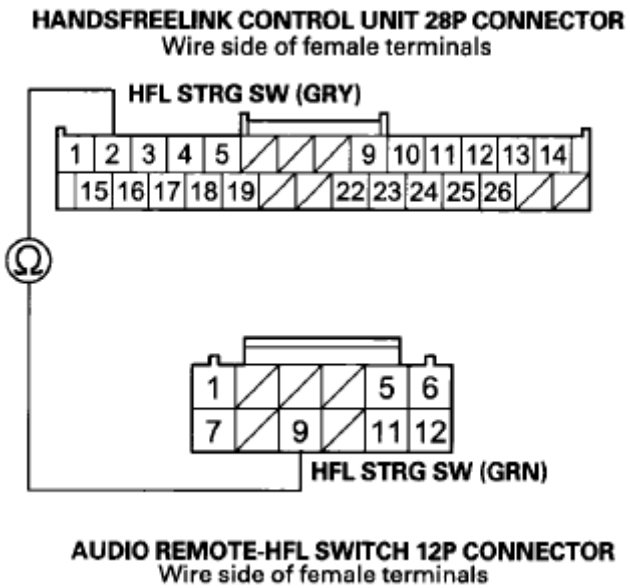

Fig. 45: Checking For Continuity Between HandsFreeLink Control Unit 28P Connector And Audio Remote-HFL Switch 12P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 18.

NO -Repair an open in the wire between the switch, the cable reel, and the HandsFreeLink Control Unit. •

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Disconnect cable reel connector A (20P).
16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
17. Measure the voltage between HandsFreeLink Control Unit 28P connector terminal No. 2 and body ground.

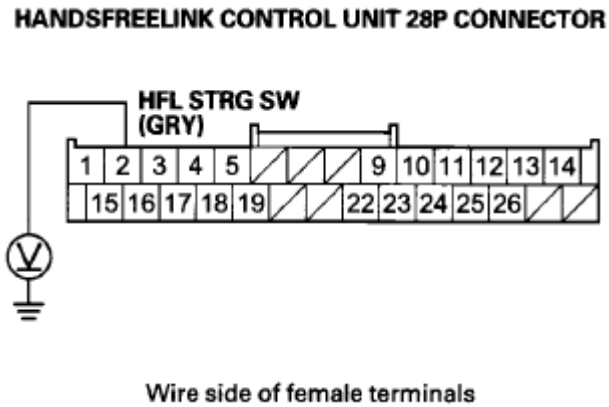

Fig. 46: Measuring Voltage Between HandsFreeLink Control Unit 28P Connector Terminal No. 2

And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES -Repair a short to power in the wire between the HandsFreeLink Control Unit and the audio remote-HFL switch. •

NO -Replace the cable reel (see **CABLE REEL REPLACEMENT**). •

18. Disconnect audio-navigation unit connector A (24P).

NOTE: Eject all the discs before disconnecting the audio unit to prevent damaging the CD player's load mechanism.

19. Check for continuity between audio remote-HFL switch 12P connector terminal No. 11 and audio unit connector A (24P) terminal No. 5.

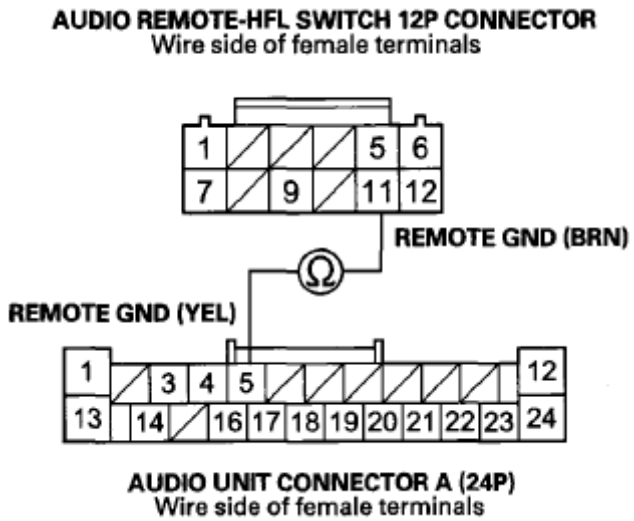

Fig. 47: Checking For Continuity Between Audio Remote-HFL Switch 12P Connector Terminal No. 11 And Audio Unit Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the **HandsFreeLink Control Unit**. •

NO -Repair an open in the wire between the switch, the cable reel, and the audio unit. •

DTC B1780: HANDSFREELINK STEERING WHEEL SWITCH LINE SHORT (WITH NAVIGATION)

NOTE: Check the vehicle battery condition first (see BATTERY TEST).

1. Start the vehicle, and turn the steering wheel left and right several times.
2. Do the HFL **Self-Diagnostic Function**, and check for HFL DTCs.

   Is DTC B1780 indicated?

   YES -Go to step 3.

   NO -Intermittent failure, the system is OK at this time. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Do the **HFL Switch Test**.

   Is the switch OK?

   YES -Go to step 5.

   NO -Replace the audio remote, HFL-navigation voice control switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**). •

5. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
6. Disconnect the HandsFreeLink Control Unit 32P connector (see step 2).
7. Disconnect the audio remote, HFL-navigation voice control switch 12P connector, and connect the cable reel connectors.
8. Check for continuity between HandsFreeLink Control Unit 32P connector terminal No. 2 and body ground.

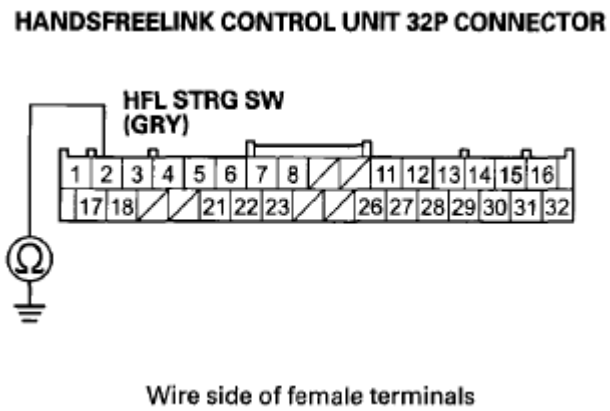

Fig. 48: Checking For Continuity Between HandsFreeLink Control Unit 32P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire between the switch, the cable reel, and the HandsFreeLink Control Unit. •

NO -Replace the **HandsFreeLink Control Unit**. •

DTC B1780: HANDSFREELINK STEERING WHEEL SWITCH LINE SHORT (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN system diagnosis test mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**

1. Connect the HDS to the DLC.
2. Clear the DTCs with the **HDS**.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then start the vehicle and turn the steering wheel back and forth several times.
4. Check for DTCs with the HDS.

   Is DTC B1780 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Do the **HFL Switch Test**.

   Is the switch OK?

   YES -Go to step 7.

   NO -Replace the audio remote-HFL switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**). •

7. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
8. Disconnect the HandsFreeLink Control Unit 28P connector (see step 2).
9. Disconnect the audio remote-HFL switch 12P connector, and connect the cable reel connectors.
10. Check for continuity between HandsFreeLink Control Unit 28P connector terminal No. 2 and body ground.

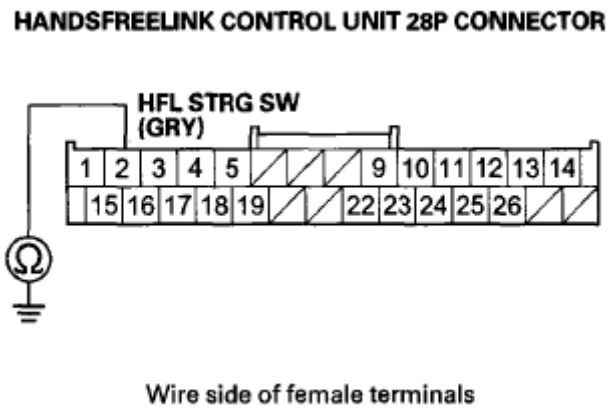

Fig. 49: Checking For Continuity Between HandsFreeLink Control Unit 28P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire between the switch, the cable reel, and the HandsFreeLink Control Unit. •

NO -Replace the **HandsFreeLink Control Unit**. •

DTC B1792: HANDSFREELINK CONTROL MODULE ERROR (WITH NAVIGATION)

NOTE: Check the vehicle battery condition first (see BATTERY TEST).

1. Do the HFL **Self-Diagnostic Function**, and check for HFL DTCs.

   Is DTC B1792 indicated?

   YES -Replace the **HandsFreeLink Control Unit**. •

   NO -Intermittent failure, the system is OK at this time. •

DTC B1792: HANDS FREE LINK CONTROL MODULE ERROR (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN system diagnosis test mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**

1. Connect the **HDS** to the DLC.
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to

select the OFF mode and then the ON mode.

4. Check for DTCs with the HDS.

   Is DTC B1792 indicated?

   YES -Replace the **HandsFreeLink Control Unit**. •

   NO -Intermittent failure, the system is OK at this time. •

SYMPTOM TROUBLESHOOTING

THE MID DISPLAYS AND HFL MESSAGE DO NOT GO AWAY AFTER PRESSING THE HFL BACK BUTTON (WITHOUT NAVIGATION)

1. Connect the **HDS** to the DLC.
2. Clear the DTCs with the **HDS**.
3. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
4. Check for DTCs with the HDS.

   Are there any DTCs indicated?

   YES -Repair the indicated DTCs. •

   NO -Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Substitute a known-good **HandsFreeLink Control Unit**, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and recheck the multi-information display (MID).

   Are the HFL digits cleared?

   YES -Replace the original **HandsFreeLink Control Unit**. •

   NO -Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**). •

THE HFL SYSTEM DOES NOT RECOGNIZE ALL VOICE COMMANDS (WITHOUT NAVIGATION)

NOTE: Make sure the client's phone is compatible with Acura approved. See www.acura.com/handsfreelink for more information.

1. Connect the **HDS** to the DLC.
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to

select the OFF mode and then the ON mode.

4. Check for DTCs.

   Are there any DTCs indicated?

   YES -Repair the indicated DTCs. •

   NO -Go to step 5.

5. Check if client's concern is duplicated.

   Can the client's problem be duplicated?

   YES -Go to step 6.

   NO -The system is OK at this time. Ask the client to demonstrate the concern. •

6. Pair the client's phone to a known-good vehicle, and try to duplicate the concern.

   Can you duplicate the concern?

   YES -Call the HFL call center at 888-528-7876, and inquire if there are any known issues for the concern. If there are no known issues, explain to the client this is a system characteristic and cannot be improved at this time. •

   NO -Substitute a known-good **HFL Microphone**, and recheck. If the symptom/indication goes away, replace the original **HFL Microphone**. If the symptom/indication is still present, replace the **HandsFreeLink Control Unit**. •

THE HFL SYSTEM IS LOCKED AND THE PASS CODE HAS BEEN LOST OR FORGOTTEN (WITHOUT NAVIGATION)

1. Connect the **HDS** to the DLC.
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. From the Body Electrical menu, select HandsFreeLink.
4. Select Miscellaneous Tests, then select Pass code reset.
5. Follow the HDS prompts to reset the pass code.

THE HFL MESSAGES CANNOT BE HEARD OR ARE WEAK (WITH NAVIGATION)

NOTE: Check the vehicle battery condition first (see BATTERY TEST).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check that the audio system is operating normally and the speaker sound levels from different audio sources (AM/FM, XM, CD, navigation, etc.).

Does the audio system work normally and is the audio output from the speaker normal when playing various audio sources?

YES -Go to step 3.

NO -Refer to the audio system symptom troubleshooting. •

3. Press and hold the HANG-UP button for more than 5 seconds.

   Do you hear the message "The HFT is OK"?

   YES -Intermittent failure, the system is OK at this time. •

   NO -Go to step 4.

4. Do the HFL **Self-Diagnostic Function**, and check for HFL DTCs.

   Are there any DTCs indicated?

   YES -Repair the indicated DTCs. •

   NO -Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Do the **HFL Switch Test**.

   Is the switch OK?

   YES -Go to step 7.

   NO -Replace the audio remote, HFL-navigation voice control switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**). •

7. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
8. Disconnect the HandsFreeLink Control Unit 32P connector (see step 2.
9. Disconnect audio-navigation unit connector B (24P).
10. Check for continuity between HandsFreeLink Control Unit 32P connector terminals No. 13 and No. 29 and audio-navigation unit connector B (24P) terminals No. 5 and No. 16 respectively.

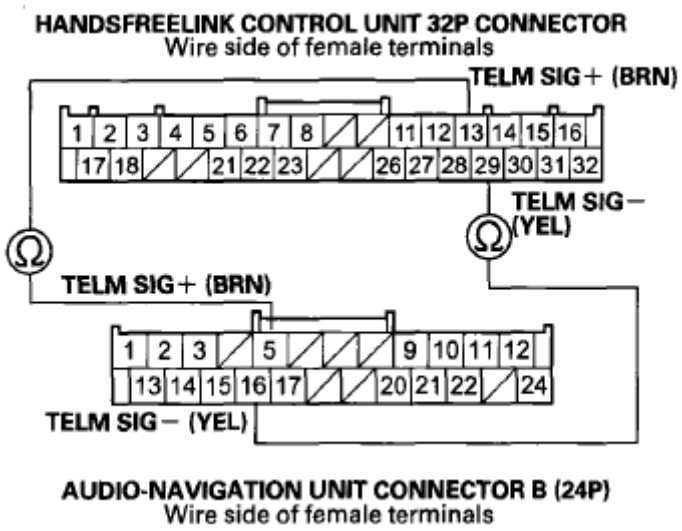

Fig. 50: Checking For Continuity Between HandsFreeLink Control Unit 32P Connector And Audio-Navigation Unit Connector (24P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 11.

NO -There is an open in the wire(s) between the HandsFreeLink Control Unit and the audio-navigation unit. Replace the affected shielded harness. •

11. Check for continuity between body ground and audio-navigation unit connector B (24P) terminals No. 5 and No. 16 individually.

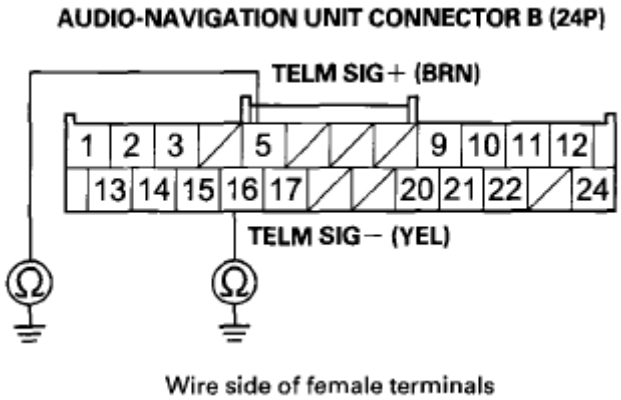

Fig. 51: Checking For Continuity Between Body Ground And Audio-Navigation Unit Connector (24P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the HandsFreeLink Control Unit and the audio-navigation unit. Replace the affected shielded harness. •

NO -Go to step 12.

12. Check for continuity between the terminals of audio-navigation unit connector B (24P) according to the table.

From terminal	To terminals
B5 (BRN)	B16 (YEL), B17 (GRY)
B16 (YEL)	B17 (GRY)

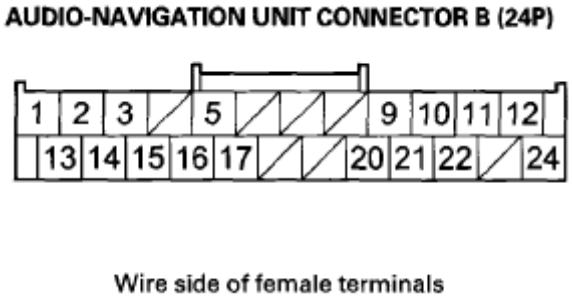

Fig. 52: Audio-Navigation Unit (24P) Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wire(s) between the HandsFreeLink Control Unit and the audio-navigation unit. Replace the affected shielded harness. •

NO -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. If the symptom/indication is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**). •

THE HFL MESSAGES CANNOT BE HEARD OR ARE WEAK (WITHOUT NAVIGATION)

NOTE: Check the vehicle battery condition first (see BATTERY TEST).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check that the audio system is operating normally and the speaker sound levels from different audio sources (AM/FM, XM, CD, navigation, etc.).

Does the audio system work normally and is the audio output from the speaker normal when playing various audio sources?

YES -Go to step 3.

NO -Refer to the audio system symptom troubleshooting. •

3. Press and hold the HFL BACK button for more than 5 seconds.

   Do you hear the message "The HFT is OK"?

   YES -Go to step 4.

   NO -Go to step 5.

4. Turn on the audio unit, and press and hold the HFL BACK button for more than 5 seconds.

   Does the audio system mute when the message "The HFT is OK" is played?

   YES -Intermittent failure, the system is OK at this time. •

   NO -Go to step 18.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Connect the **HDS** to the DLC.
7. Clear the DTCs with the HDS.
8. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
9. Check for DTCs.

   Are there any DTCs indicated?

   YES -Repair the indicated DTCs. •

   NO -Go to step 10.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Do the **HFL Switch Test**.

    Is the switch OK?

    YES -Go to step 12.

    NO -Replace the audio remote-HFL switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**). •

12. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
13. Disconnect the HandsFreeLink Control Unit 28P connector (see step 2).
14. Disconnect audio unit connector D (20P).

15. Check for continuity between HandsFreeLink Control Unit 28P connector terminals No. 11 and No. 25 and audio unit connector D (20P) terminals No. 19 and No. 9 respectively.

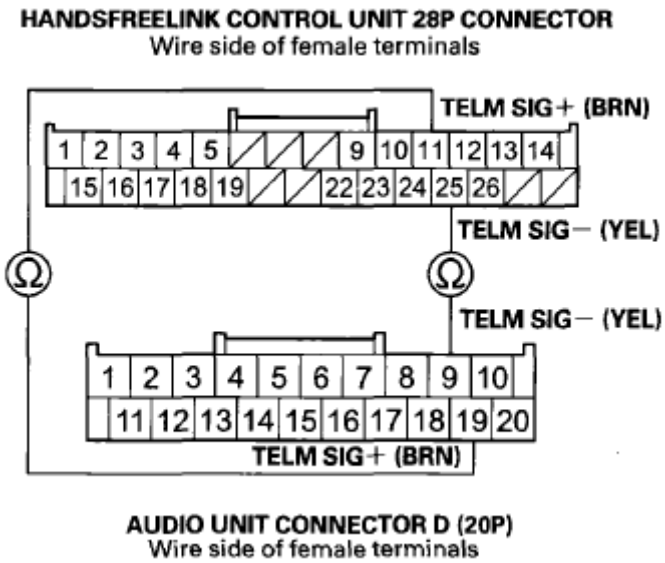

Fig. 53: Checking For Continuity Between HandsFreeLink Control Unit 28P Connector And Audio Unit Connector D (20P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 16.

NO -There is an open in the wire(s) between the HandsFreeLink Control Unit and the audio unit. Replace the affected shielded harness. •

16. Check for continuity between body ground and audio unit connector D (20P) terminals No. 9 and No. 19 individually.

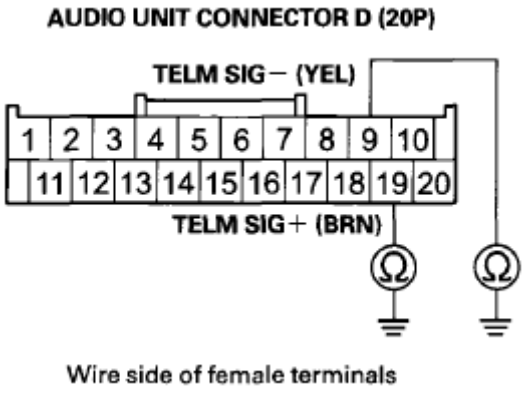

Fig. 54: Checking For Continuity Between Body Ground And Audio Unit Connector D (20P) Terminals No. 9 And No. 19

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the HandsFreeLink Control Unit and the audio unit. Replace the affected shielded harness. •

NO -Go to step 17.

17. Check for continuity between the terminals of audio unit connector D (20P) according to the table.

From terminal	To terminals
D9 (BRN)	D10 (GRY), D19 (YEL)
D10 (GRY)	D19 (YEL)

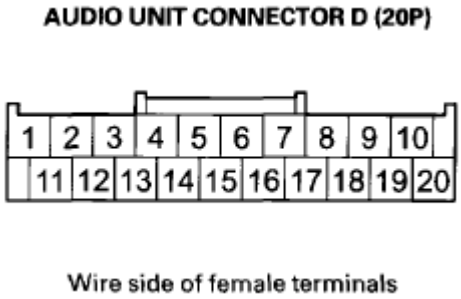

Fig. 55: Audio Unit (20P) Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES -There is a short in the wire(s) between the HandsFreeLink Control Unit and the audio unit. Replace the affected shielded harness. •

NO -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. If the symptom/indication is still present, replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). •

18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
19. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
20. Disconnect the HandsFreeLink Control Unit 28P connector (see step 2).
21. Disconnect audio unit connector D (20P).
22. Check for continuity between HandsFreeLink Control Unit 28P connector terminal No. 3 and audio unit connector D (20P) terminal No. 20.

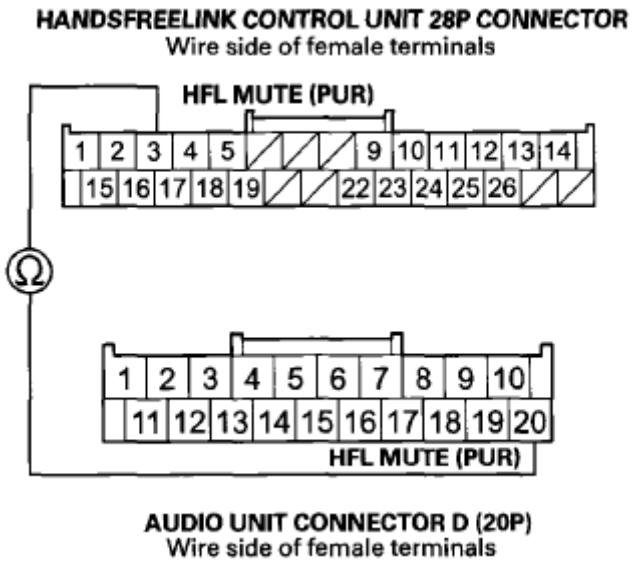

Fig. 56: Checking For Continuity Between HandsFreeLink Control Unit 28P Connector And Audio Unit Connector D (20P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 23.

NO -Repair an open in the wire between the HandsFreeLink Control Unit and the audio unit. •

23. Check for continuity between body ground and HandsFreeLink Control Unit 28P connector terminal No. 3.

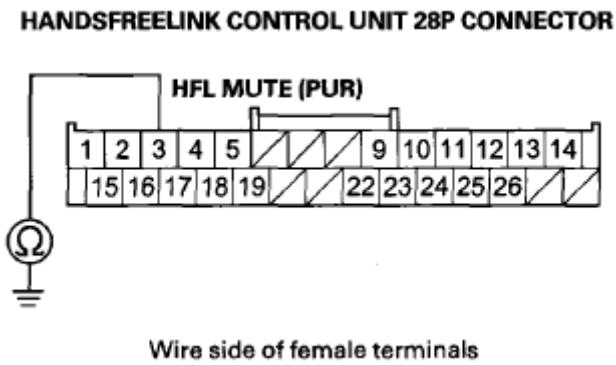

Fig. 57: Checking For Continuity Between Body Ground And HandsFreeLink Control Unit 28P Connector Terminal No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire between the HandsFreeLink Control Unit and the audio

unit. •

NO -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original the **HandsFreeLink Control Unit**. If the symptom/indication is still present, replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). •

NO SOUND WHEN BLUETOOTH AUDIO IS USED (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Set the fader and balance positions to the center.**
- **Check if the cell phone with Bluetooth audio functions normally.**
- **Make sure the cell phone is properly paired.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio system, and check for sound in each mode (AM/FM and CD).

   Is the sound is normal?

   YES -Go to step 3.

   NO -Go to Sound Quality Diagnosis (see **SOUND QUALITY DIAGNOSIS**) or No sound is heard from the speaker(s) (display is normal) troubleshooting (see **AUDIO UNIT POWER SWITCH WILL NOT TURN OFF (WITHOUT NAVIGATION)**). •

3. Press the HDD/AUX button, and check if it changes to Bluetooth audio source.

   Does it change to Bluetooth audio source?

   YES -Go to step 4.

   NO -Go to **Bluetooth audio does not work troubleshooting**. •

4. Check if it is connected when switching to Bluetooth audio screen by pressing the HDD/AUX button.

   Is NO CONNECTION displayed?

   YES -Go to **Bluetooth cell phone cannot be paired troubleshooting**. •

   NO -Go to step 5.

5. Check if the Bluetooth audio device can be played.

   Does the Bluetooth audio play?

YES -Intermittent failure, the audio-navigation unit is OK at this time. •

NO -Go to step 6.

6. Turn on the audio system, and check for XM radio sound.

   Is the sound normal?

   YES -Go to step 7.

   NO -Go to step 12.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
9. Disconnect the HandsFreeLink Control Unit 32P connector (see step 2).
10. Disconnect audio-navigation unit connector C (14P).
11. Check for continuity between audio unit connector C (14P) and the HandsFreeLink Control Unit 32P connector according to the table.

	Audio-navigation unit connector	HandsFreeLink Control Unit connector	Wire color
AUDIO R+	C5	11	GRN
AUDIO R-	C13	27	WHT
AUDIO L+	C6	12	BLK
AUDIO L-	C14	28	RED

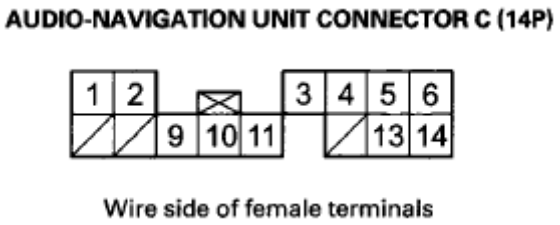

Fig. 58: Audio-Navigation Unit (14P) Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

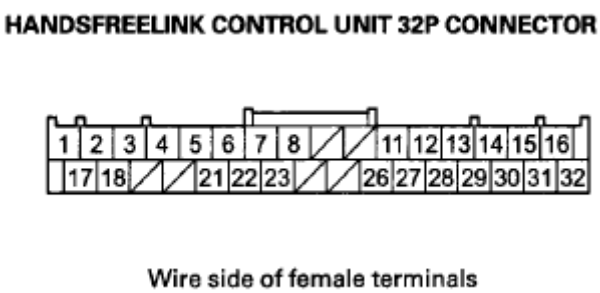

Fig. 59: HandsFreeLink Control Unit (32P) Connector End View

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. If the symptom/indication is still present, replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**). •

NO -There is an open in the wire(s) between the audio-navigation unit and the HandsFreeLink Control Unit. Replace the affected shielded harness. •

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
14. Disconnect these items:
    - Audio-navigation unit connector C(14P)
    - AcuraLink control unit(XM receiver) connector A (32P) (USA models)
    - XM receiver connector A (14P) (Canada models)
    - HandsFreeLink Control Unit 32P connector
15. Check for continuity between the HandsFreeLink Control Unit 32P connector and body ground according to the table.

	HandsFreeLink Control Unit connector	Wire color
AUDIO R+	11	GRN
AUDIO R-	27	WHT
AUDIO L+	12	BLK
AUDIO L-	28	RED

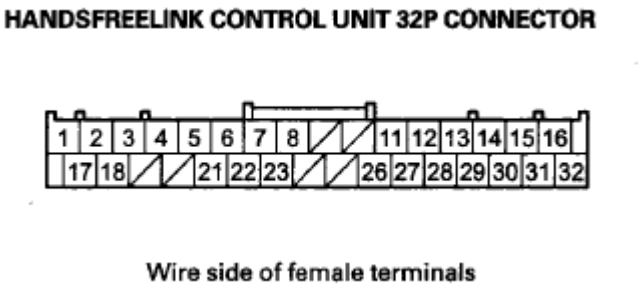

Fig. 60: HandsFreeLink Control Unit 32P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the audio-navigation unit, then AcuraLink control unit (XM receiver) or XM receiver, and the HandsFreeLink Control Unit. Replace the affected

shielded harness. •

NO -Go to step 16.

16. Check for continuity between audio-navigation unit connector C (14P) and the HandsFreeLink Control Unit 32P connector according to the table.

	Audio-navigation unit connector	HandsFreeLink Control Unit connector	Wire color
AUDIO R+	C5	11	GRN
AUDIO R-	C13	27	WHT
AUDIO L+	C6	12	BLK
AUDIO L-	C14	28	RED

Courtesy of AMERICAN HONDA MOTOR CO., INC.

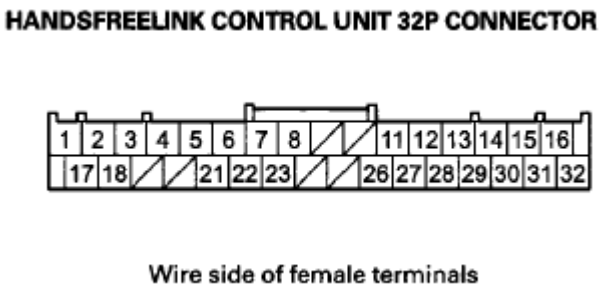

Fig. 62: HandsFreeLink Control Unit 32P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 17.

NO -There is an open in the wire(s) between the audio-navigation unit and the HandsFreeLink Control Unit. Replace the affected shielded harness. •

17. Check for continuity between the terminals of the HandsFreeLink Control Unit 32P connector according to the table.

From terminal	To terminals

26 (GRY)	11 (GRN), 12 (BLK), 27 (WHT), 28 (RED)

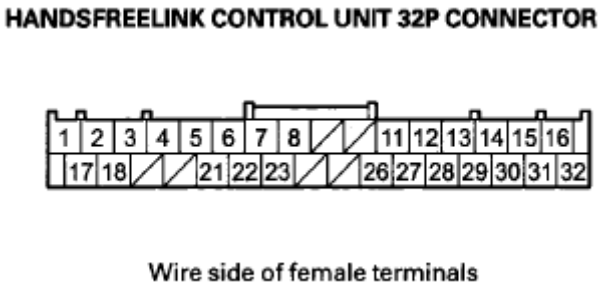

Fig. 63: HandsFreeLink Control Unit 32P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short in the wires between the audio-navigation unit and the HandsFreeLink Control Unit. Replace the affected shielded harness. •

NO -Go to step 18.

18. Reconnect audio-navigation unit connector C (14P) and the HandsFreeLink Control Unit 32P connector.
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Check if the Bluetooth audio device can be played.

Does the Bluetooth audio play?

YES -There is an internal malfunction where the connector for either the AcuraLink control unit (XM receiver) (USA models) or the XM receiver (Canada models) is connected. •

NO -Go to step 21.

21. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
22. Disconnect the HandsFreeLink Control Unit 32P connector.
23. Reconnect AcuraLink control unit (XM receiver) connector A (32P) (USA models) or XM receiver connector A (14P) (Canada models).
24. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
25. Check if the XM radio can be played.

Is the sound normal?

YES -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. •

NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the

original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**). •

NO SOUND WHEN BLUETOOTH AUDIO IS USED (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Set the fader and balance positions to the center.**
- **Check if the cell phone with Bluetooth audio functions normally.**
- **Make sure the cell phone is properly paired.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio unit, and check for sound in each mode (AM/FM and CD).

   Is the sound is normal?

   YES -Go to step 3.

   NO -Go to Sound Quality Diagnosis (see **SOUND QUALITY DIAGNOSIS**) or No sound is heard from the speaker(s) (display is normal) troubleshooting (see **NO SOUND IS HEARD FROM THE SPEAKER(S) (DISPLAY IS NORMAL) (WITHOUT NAVIGATION)**). •

3. Press the AUX button, and check if it changes to Bluetooth audio source.

   Does it change to Bluetooth audio source?

   YES -Go to step 4.

   NO -Go to **Bluetooth audio does not work troubleshooting**. •

4. Check if it is connected when switching to Bluetooth audio screen by pressing the AUX button.

   Is NO CONNECTION displayed?

   YES -Go to **Bluetooth cell phone cannot be paired troubleshooting**. •

   NO -Go to step 5.

5. Check if the Bluetooth audio device can be played.

   Does the Bluetooth audio play?

   YES -Intermittent failure, the audio unit is OK at this time. •

   NO -Go to step 6.

6. Turn on the audio unit, and check for sound in each mode (XM and USB).

   Is the sound normal?

   YES -Go to step 7.

   NO -Go to step 12.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
9. Disconnect the HandsFreeLink Control Unit 28P connector (see step 2).
10. Disconnect audio unit connector C (14P).
11. Check for continuity between audio unit connector C (14P) and the HandsFreeLink Control Unit 28P connector according to the table.

	Audio unit connector	HandsFreeLink Control Unit connector	Wire color
AUDIO R +	C5	9	GRN
AUDIO R-	C13	23	WHT
AUDIO L+	C6	10	BLK
AUDIO L-	C14	24	RED

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short in the wires between the audio unit and the HandsFreeLink Control Unit. Replace the affected shielded harness. •

NO -Go to step 18.

18. Reconnect the audio unit connector C(14P) and the HandsFreeLink Control Unit 28P connector.
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Check if the Bluetooth audio device can be played.

Does the Bluetooth audio play?

YES -There is an internal malfunction where the connector for either the XM receiver or the USB adapter control unit is connected. •

NO -Go to step 21.

21. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
22. Disconnect the HandsFreeLink Control Unit 28P connector.
23. Reconnect XM receiver connector A (14P) and the USB adapter control unit connector A (14P).
24. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
25. Turn on the audio unit, and check for sound in each mode (XM and USB).

Is the sound normal?

YES -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. •

NO -Substitute a known-good audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). •

BLUETOOTH AUDIO DOES NOT WORK (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Check if the cell phone with Bluetooth audio functions normally.**
- **Make sure the cell phone is properly paired.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio unit, and press HDD/AUX button to select Bluetooth audio source.

   Does it change to Bluetooth audio source?

   YES -Go to step 5.

   NO -Go to step 3.

3. Check if the Bluetooth audio device can be played.

   Does the Bluetooth audio play?

   YES -Intermittent failure, the audio-navigation unit is OK at this time. •

   NO -Go to step 4.

4. Pair and check the Bluetooth device function on a known-good vehicle equipped with Bluetooth audio.

   Is the Bluetooth device normal?

   YES -Check online at www.acura.com/handsfreelink or call the HFL call center at 888-528-7876 to make sure the Bluetooth audio device is compatible with the HFL system and that there are no known issues. •

   NO -Defective Bluetooth device or is not compatible. •

5. Check for the navigation system hard error codes (see **HOW TO CHECK ERROR HISTORY (NAVIGATION DTCS)**).

   Are there any DTC's related to the Display or XM systems?

   YES -Go to step 6.

   NO -Go to step 11.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
8. Disconnect the HandsFreeLink Control Unit 32P connector (see step 2).
9. Disconnect audio-navigation unit connector C (14P).

10. Check for continuity between audio-navigation unit connector C (14P) and the HandsFreeLink Control Unit 32P connector according to the table.

	Audio-navigation unit connector	HandsFreeLink Control Unit connector	Wire color
GA-NET BUS+	C9	4	PNK
GA-NET BUS-	C10	5	BLU

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. •

NO -There is an open in the wire(s) between the audio-navigation unit and the HandsFreeLink Control Unit. Replace the affected shielded harness. •

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
13. Disconnect these items:
    - Audio-navigation unit connector C(14P)
    - AcuraLink control unit (XM receiver) connector A (32P) (USA models)
    - XM receiver connector A (14P) (Canada models)

- Navigation display unit 36P connector
- HandsFreeLink Control Unit 32P connector

14. Check for continuity between the HandsFreeLink Control Unit 32P connector and body ground according to the table.

	HandsFreeLink Control Unit connector	Wire color
GA-NET BUS+	4	PNK
GA-NET BUS-	5	BLU

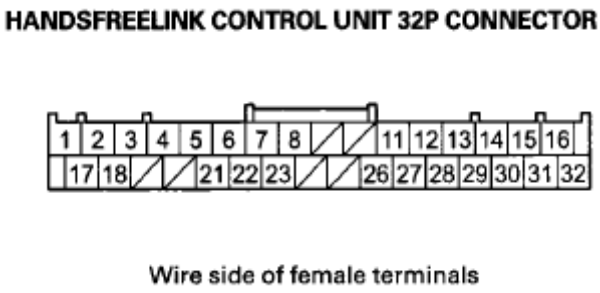

Fig. 72: View Of HandsFreeLink Control Unit Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the HandsFreeLink Control Unit and the audio-navigation unit. Replace the affected shielded harness. •

NO -Go to step 15.

15. Check for continuity between audio-navigation unit connector C (14P) and the HandsFreeLink Control Unit 32P connector according to the table.

	Audio-navigation unit connector	HandsFreeLink Control Unit connector	Wire color
GA-NET BUS+	C9	4	PNK

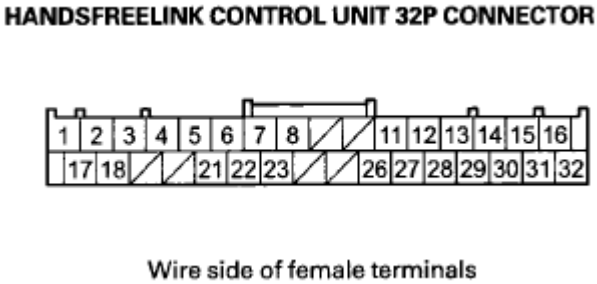

Fig. 74: View Of HandsFreeLink Control Unit 32P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 16.

NO -There is an open in the wire(s) between the audio-navigation unit and the HandsFreeLink Control Unit. Replace the affected shielded harness. •

16. Check for continuity between the terminals of the HandsFreeLink Control Unit 32P connector according to the table.

From terminal	To terminals
4 (PNK)	5 (BLU), 21 (GRY)
5 (BLU)	21 (GRY)

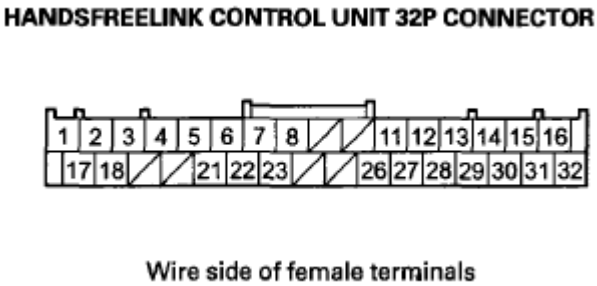

Fig. 75: View Of HandsFreeLink Control Unit 32P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short in the wires between the audio-navigation unit and the HandsFreeLink Control Unit. Replace the affected shield harness. •

NO -Go to step 17.

17. Reconnect audio-navigation unit connector C (14P) and the HandsFreeLink Control Unit 32P connector.
18. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

19. Check if the Bluetooth device can be played.

    Does the Bluetooth audio play?

    YES -Intermittent failure, the system is OK at this time. Check for loose or poor connections at the AcuraLink control unit (XM receiver), the XM receiver, or the navigation display unit. •

    NO -Go to step 20.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Disconnect the HandsFreeLink Control Unit 32P connector.
22. Reconnect AcuraLink control unit (XM receiver) connector A (32P) or XM receiver connector A (14P), and the navigation display unit 36P connector.
23. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
24. Check if the XM radio plays.

    Is the sound normal?

    YES -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. •

    NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**). •

BLUETOOTH AUDIO DOES NOT WORK (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Check if the cell phone with Bluetooth audio functions normally.**
- **Make sure the cell phone is properly paired.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio unit, and press AUX button to select Bluetooth audio source.

   Does it change to Bluetooth audio source?

   YES -Go to step 5.

   NO -Go to step 3.

3. Check if the Bluetooth device can be played.

   Does the Bluetooth audio play?

YES -Intermittent failure, the audio unit is OK at this time. •

NO -Go to step 4.

4. Register and check the Bluetooth audio device function on a known-good vehicle equipped with Bluetooth audio.

   Is the Bluetooth device normal?

   YES -Check online at www.acura.com/handsfreelink or call the HFL call center at 888-528-7876 to make sure the Bluetooth audio device is compatible with the HFL system and that there are no known issues. •

   NO -Defective Bluetooth device. •

5. Turn on the audio unit, and check for sound in each mode (XM and USB).

   Is the sound is normal?

   YES -Go to step 6.

   NO -Go to step 11.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
8. Disconnect the HandsFreeLink Control Unit 28P connector (see step 2).
9. Disconnect audio unit connector C (14P).
10. Check for continuity between audio unit connector C (14P) and the HandsFreeLink Control Unit 28P connector according to the table.

	Audio unit connector	HandsFreeLink Control Unit connector	Wire color
GA-NET BUS+	C9	4	PNK
GA-NET BUS-	C10	5	BLU

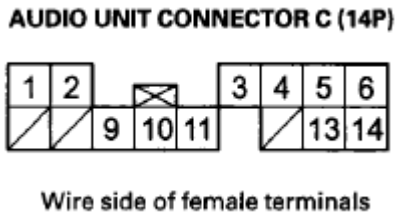

Fig. 76: View Of Audio Unit Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

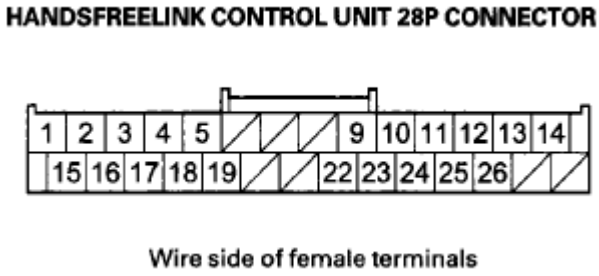

Fig. 77: View Of HandsFreeLink Control Unit Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. •

NO -There is an open in the wire(s) between the audio unit and the HandsFreeLink Control Unit. Replace the affected shielded harness. •

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
13. Disconnect these items:
    - Audio unit connector C (14P)
    - XM receiver connector A (14P)
    - USB adapter control unit connector A (14P)
    - HandsFreeLink Control Unit 28P connector
14. Check for continuity between the HandsFreeLink Control Unit 28P connector and body ground according to the table.

	HandsFreeLink Control Unit connector	Wire color
GA-NET BUS+	4	PNK
GA-NET BUS-	5	BLU

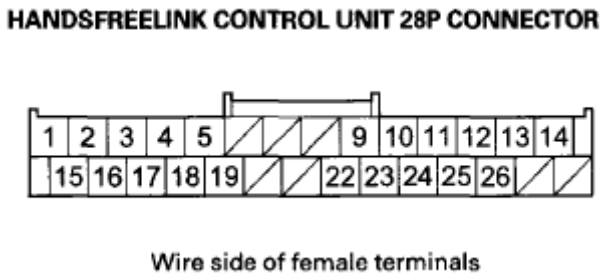

Fig. 78: View Of HandsFreeLink Control Unit 28P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short to body ground in the wire(s) between the HandsFreeLink Control Unit and the audio unit. Replace the affected shielded harness. •

NO -Go to step 15.

15. Check for continuity between audio unit connector C (14P) and the HandsFreeLink Control Unit 28P connector according to the table.

	Audio unit connector	HandsFreeLink Control Unit connector	Wire color
GA-NET BUS +	C9	4	PNK
GA-NET BUS-	C10	5	BLU

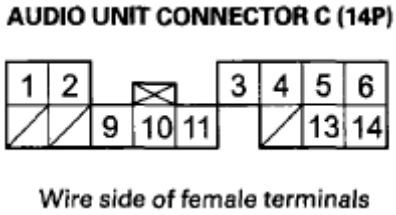

Fig. 79: View Of Audio Unit Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

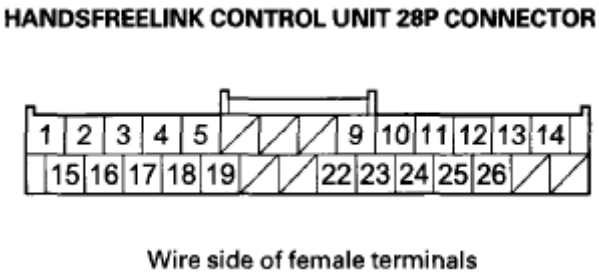

Fig. 80: View Of HandsFreeLink Control Unit Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 16.

NO -There is an open in the wire(s) between the audio unit and the HandsFreeLink Control Unit. Replace the affected shielded harness. •

16. Check for continuity between the terminals of the HandsFreeLink Control Unit 28P connector according to the table.

From terminal	To terminals

4 (PNK)	5 (BLU), 19 (GRY)
5 (BLU)	19 (GRY)

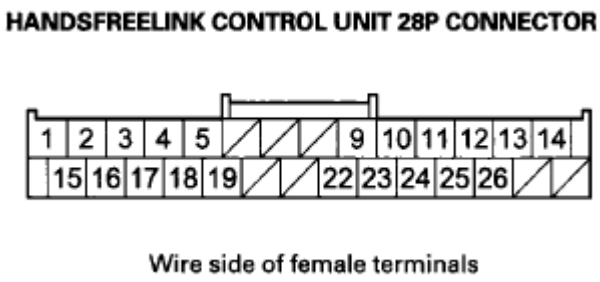

Fig. 81: View Of HandsFreeLink Control Unit 28P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -There is a short in the wires between the audio unit and the HandsFreeLink Control Unit. Replace the affected shield harness. •

NO -Go to step 17.

17. Reconnect audio unit connector C (14P) and the HandsFreeLink Control Unit 28P connector.
18. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
19. Check if the Bluetooth device can be played.

Does the Bluetooth audio play?

YES -Intermittent failure, the system is OK at this time. Check for loose or poor connections at the XM receiver or the USB adapter control unit. •

NO -Go to step 20.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Disconnect the HandsFreeLink Control Unit 28P connector.
22. Reconnect XM receiver connector A (14P) and USB adapter control unit connector A (14P).
23. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
24. Turn on the audio unit, and check for sound in each mode (XM and USB).

Is the sound normal?

YES -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. •

NO -Substitute a known-good audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**) and recheck. If the symptom/indication goes away, replace the original audio unit (see **AUDIO UNIT**

REMOVAL/INSTALLATION). •

BLUETOOTH CELL PHONE CANNOT BE PAIRED (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **When six Bluetooth phones are already paired, delete a device before pairing another one.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Press the PICK-UP button.

   Does a beep sound?

   YES -

   - If you have the client's Bluetooth phone, go to step 4.
   - If you have not the client's Bluetooth phone, go to step 3.

   NO -Go to The HFL messages cannot be heard or are weak troubleshooting. •

3. Pair a known-good Bluetooth phone to the client's vehicle.

   Can you pair the Bluetooth phone, and does it operate normally?

   YES -The client's Bluetooth phone is defective or not compatible. •

   NO -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. •

4. Check online at www.acura.com/handsfreelink or call the HFL call center at 888-528-7876 to make sure the client's Bluetooth phone is compatible with the HFL system and that there are no known issues.
5. Pair the client's Bluetooth phone to a known-good vehicle.

   Can you pair the Bluetooth phone, and does it operate normally?

   YES -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. •

   NO -The client's Bluetooth phone is defective or not compatible. •

BLUETOOTH CELL PHONE CANNOT BE PAIRED (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**

- **Check the connectors for poor connections or loose terminals.**
- **When six Bluetooth phones are already paired, delete a device before pairing another one.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Press the HFL TALK button.

   Does a beep sound?

   YES -

   - If you have the client's Bluetooth phone, go to step 4.
   - If you have not the client's Bluetooth phone, go to step 3.

   NO -Go to **The HFL messages cannot be heard or are weak troubleshooting**. •

3. Pair a known-good Bluetooth phone to the client's vehicle.

   Can you pair the Bluetooth phone, and does it operate normally?

   YES -The client's Bluetooth phone is defective or not compatible. •

   NO -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. •

4. Check online at www.acura.com/handsfreelink or call the HFL call center at 888-528-7876 to make sure the client's Bluetooth phone is compatible with the HFL system and that there are no known issues.
5. Pair the client's Bluetooth phone to a known-good vehicle.

   Can you pair the Bluetooth phone, and does it operate normally?

   YES -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. •

   NO -The client's Bluetooth phone is defective or not compatible. •

THE COMMUNICATION WITH CELL PHONE IS INTERRUPTED OR CHANGES

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Check if the audio system functions normally.**
- **The connected device may not function properly when it is in the trunk or in a metallic case.**
- **Check online at www.acura.com/handsfreelink or call the HFL call center**

at 888-528-7876 to make sure the Bluetooth phone is compatible with the HFL system and that there are no known issues.

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio-navigation unit, and check for sound in each mode (AM/FM, XM, and CD) while pairing the Bluetooth audio device.

   Does the symptom occur?

   YES -Go to **bluetooth Audio Does Not Work Troubleshooting; WITH NAVIGATION**, or **bluetooth Audio Does Not Work Troubleshooting; WITHOUT NAVIGATION**. •

   NO -Go to step 3.

3. Check the communication abnormality of connected Bluetooth audio device.

   Does the symptom occur in a specific place or under an specific condition?

   YES -Intermittent failure. Bluetooth audio is OK at this time. Influence or electric wave interference. •

   NO -

   - If you have the client's Bluetooth phone, go to step 5.
   - If you have not the client's Bluetooth phone, go to step 4.

4. Pair a known-good Bluetooth phone to the client's vehicle.

   Can you pair the Bluetooth phone, and does it operate normally?

   YES -The client's Bluetooth phone is defective or not compatible. •

   NO -Go to No sound when Bluetooth audio is used troubleshooting; **WITH NAVIGATION**, or **WITHOUT NAVIGATION**. •

5. Pair the client's Bluetooth phone to a known-good vehicle.

   Can you pair the Bluetooth phone, and does it operate normally?

   YES -Go to No sound when Bluetooth audio is used troubleshooting; **WITH NAVIGATION**, or **WITHOUT NAVIGATION**. •

   NO -The client's Bluetooth phone is defective or not compatible. •

BLUETOOTH CELL PHONE AUDIO FUNCTION SKIP AND PAUSE/RESUME DO NOT WORK (WITH NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Check if the audio system functions normally.**
- **Check if it functioned normally at the time of initial pairing.**
- **Some mobile phones do not support the function.**
- **Check online at www.acura.com/handsfreelink or call the HFL call center at 888-528-7876 to make sure the Bluetooth phone is compatible with the HFL system and that there are no known issues.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio-navigation unit, and check that MENU, SKIP, and TITLE button function normally with the audio-navigation unit.

   Is the audio-navigation unit operation OK?

   YES -Go to step 3.

   NO -Substitute a known-good audio-navigation unit (including the HDD) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**). •

3. Check that music plays with the Bluetooth device.

   Is the system normal?

   YES -

   - If you have the client's Bluetooth phone, go to step 5.
   - If you have not the client's Bluetooth phone, go to step 4.

   NO -Go to **No sound when Bluetooth audio is used troubleshooting**. •

4. Pair a known-good cell phone to the client's vehicle.

   Can you pair the Bluetooth phone, and does it operate normally?

   YES -The client's Bluetooth phone is defective or not compatible. •

   NO -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. •

5. Pair the client's phone to a known-good vehicle.

   Can you pair the Bluetooth phone, and does it operate normally?

YES -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. •

NO -The client's Bluetooth phone is defective or not compatible. •

BLUETOOTH CELL PHONE AUDIO FUNCTION SKIP AND PAUSE/RESUME DO NOT WORK (WITHOUT NAVIGATION)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Check if the audio system functions normally.**
- **Check if it functioned normally at the time of initial pairing.**
- **Some mobile phones do not support the function.**
- **Check online at www.acura.com/handsfreelink or call the HFL call center at 888-528-7876 to make sure the Bluetooth phone is compatible with the HFL system and that there are no known issues.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Turn on the audio unit, and check that SET UP, SKIP, and TITLE button function normally with the audio unit.

   Is the audio unit operation OK?

   YES -Go to step 3.

   NO -Substitute a known-good audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**), and recheck. If the symptom/indication goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). •

3. Check that music plays with the Bluetooth device.

   Is the system normal?

   YES -

   - If you have the client's Bluetooth phone, go to step 5.
   - If you have not the client's Bluetooth phone, go to step 4.

   NO -Go to **No sound when Bluetooth audio is used troubleshooting**. •

4. Pair a known-good cell phone to the client's vehicle.

   Can you pair the Bluetooth phone, and does it operate normally?

   YES -The client's Bluetooth phone is defective or not compatible. •

NO -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. •

5. Pair the client's phone to a known-good vehicle.

   Can you pair the Bluetooth phone, and does it operate normally?

   YES -Substitute a known-good **HandsFreeLink Control Unit**, and recheck. If the symptom/indication goes away, replace the original **HandsFreeLink Control Unit**. •

   NO -The client's Bluetooth phone is defective or not compatible. •

HFL SWITCH TEST

1. Remove the audio remote, HFL-navigation voice control switch or the audio remote-HFL switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**).

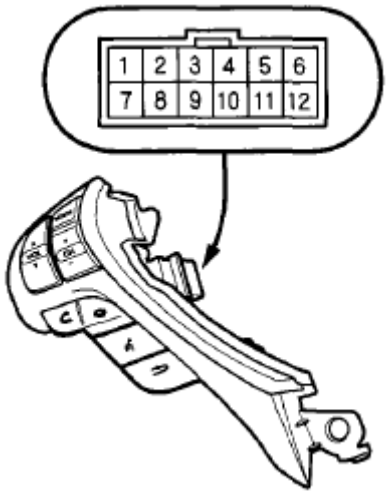

Fig. 82: Identifying Audio Remote, HFL-Navigation Voice Control Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the resistance between terminals No. 9 and No. 11 in each switch position according to the table.

HFL Switch (with navigation)

Position	Resistance
No button pressed	About 10 kohms
PICK-UP button pressed	About 47 ohms
HANG-UP button pressed	About 222 ohms

HFL Switch (without navigation)

Position	Resistance
No button pressed	About 1 kohms
HFL TALK button pressed	About 45 ohms
HFL BACK button pressed	About 185 ohms

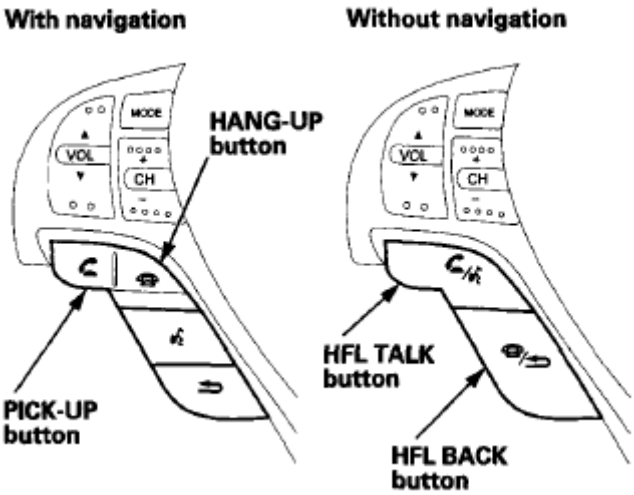

Fig. 83: Identifying HFL Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

HANDSFREELINK CONTROL UNIT REMOVAL/INSTALLATION

NOTE: Tell the client they need to write down all phone numbers as there is no way to transfer the information in the original HandsFreeLink Control Unit to a new HandsFreeLink Control Unit.

1. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
2. Disconnect the connector (A).

NOTE: With keyless access: Disconnect the LF antenna 2P connector (B).

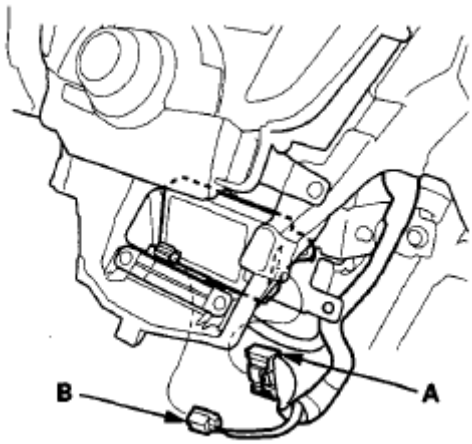

Fig. 84: Identifying Connector And LF Antenna 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the screws (A) and HandsFreeLink Control Unit(B).

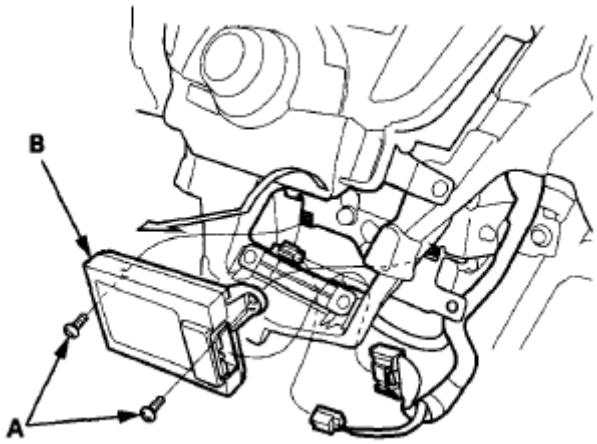

Fig. 85: Identifying Screws And HandsFreeLink Control Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the HandsFreeLink Control Unit in the reverse order of removal.

   After replacing the HandsFreeLink Control Unit, tell the client:

   - They need to pair their phones to the system.
   - They need to set up their system preferences.

HFL MICROPHONE REMOVAL/INSTALLATION

WITHOUT NAVIGATION

1. Remove the roof console (see **HEADLINER REMOVAL/INSTALLATION**).

2. Remove the screws and bracket (A).

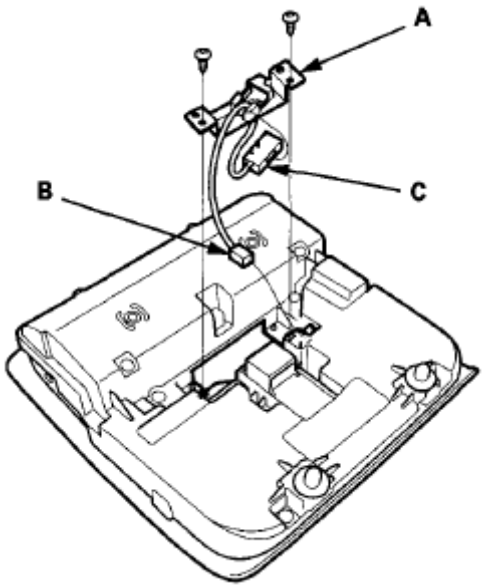

Fig. 86: Identifying Screws And Bracket, Connector And HFL Microphone
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the connector (B) and remove the HFL microphone (C).
4. Install the HFL microphone in the reverse order of removal.

CONTROL UNIT INPUT TEST

WITH NAVIGATION

1. Remove the **HandsFreeLink Control Unit**.
2. Inspect the connector (A) and socket (B) terminals for a good pinfit to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 3.

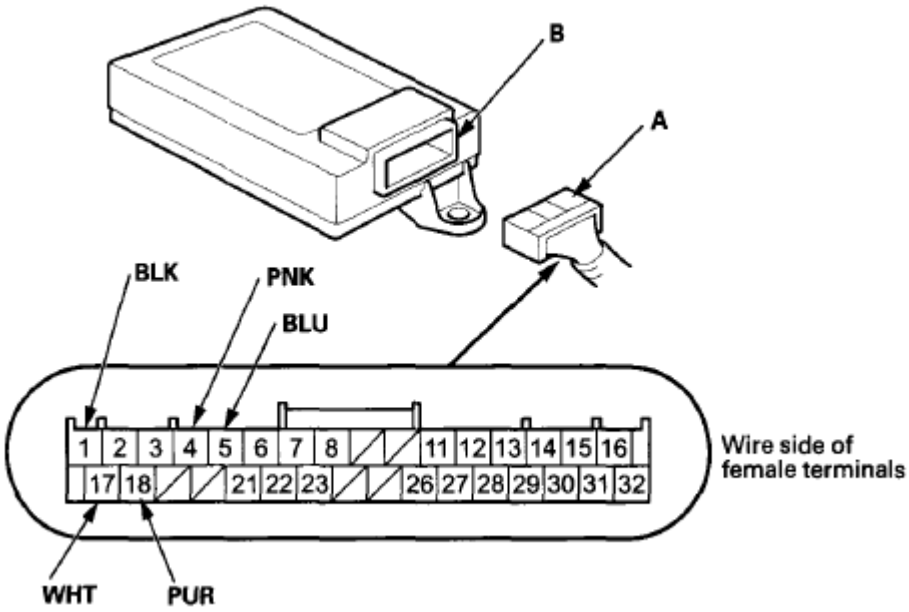

Fig. 87: Identifying Connector And Socket Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Reconnect the connector, and make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 4.

Cavity	Wire Color	Test Condition	Test: Desired Result	Possible Cause if Desired Result is not Obtained
1	BLK	Ignition switch in ACCESSORY (I) or ON (II), or the engine start/stop button to ACC mode or ON mode	Measure the voltage to body ground: There should be less than 0.2 V.	• Poor ground (G501) • An open or high resistance in the wire
17	WHT	Under all conditions	Measure the voltage to body ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • An open in the wire
18	PUR	Ignition switch in ACCESSORY (I) or ON (II), or the engine start/stop button to ACC mode or ON mode	Measure the voltage to body ground: There should be battery voltage.	• Blown No. 18 (7.5 A) fuse in the driver's under-dash fuse/relay box • An open in the wire

4. Disconnect the 32P connector again, and make this input test at the connector. If the input test proves OK, the HandsFreeLink Control Unit is faulty, replace it.

Cavity	Wire Color	Test Condition	Test: Desired Result	Possible Cause if Desired Result is not Obtained
4	PNK	Audio-navigation unit connector C(14P) disconnected	Check for continuity between terminal No. 4 and audio-navigation unit connector C (14P) terminal No. 9 : There should be continuity.	An open in the wire
		Disconnect these items: • Audio-navigation unit connector C (14P) • Navigation display unit 36P connector • AcuraLink control unit connector A (32P)(1) • XM receiver connector A (32P)(2)	Check for continuity to body ground: There should be no continuity.	Short to body ground in the wire
			Check for continuity between terminal No. 4 and No. 3: There should be no continuity.	Short in the wire
			Check for continuity between terminal No. 4 and No. 5: There should be no continuity.	Short in the wire
5	BLU	Audio-navigation unit connector C (14P) disconnected	Check for continuity between terminal No. 5 and audio-navigation unit connector C (14P) terminal No. 10: There should be continuity.	An open in the wire
		Disconnect these items: • Audio-navigation unit connector C (14P) • Navigation display unit 36P connector • AcuraLink control unit connector A (32P)(1) • XM receiver connector A (32P)(2)	Check for continuity to body ground: There should be no continuity.	Short to body ground in the wire
			Check for continuity between terminal No. 5 and No. 3: There should be no continuity.	Short in the wire

(1) USA models

(2) Canada models

WITHOUT NAVIGATION

1. Remove the **HandsFreeLink Control Unit**.
2. Inspect the connector (A) and socket (B) terminals for a good pinfit to be sure they are all making good contact.

- If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
- If the terminals look OK, go to step 3.

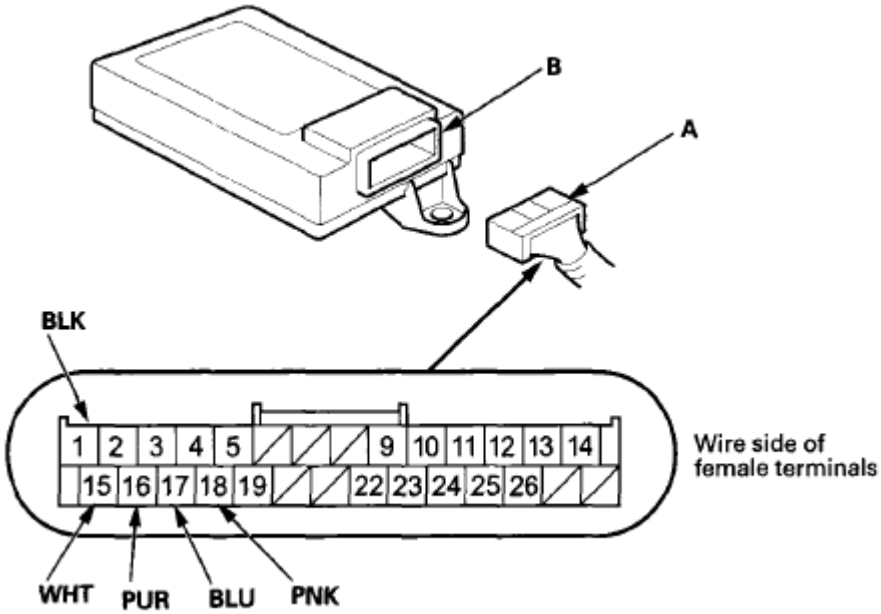

Fig. 88: Identifying Connector And Socket Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Reconnect the connector, and make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 4.

Cavity	Wire Color	Test Condition	Test: Desired Result	Possible Cause if Desired Result is not Obtained
1	BLK	Ignition switch in ACCESSORY (I) or ON (II), or the engine start/stop button to ACC mode or ON mode	Measure the voltage to body ground: There should be less than 0.2 V.	• Poor ground (G501) • An open or high resistance in the wire
15	WHT	Under all conditions	Measure the voltage to body ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • An open in the wire
16	PUR	Ignition switch in ACCESSORY (I) or ON (II), or the engine start/stop button to ACC mode or ON mode	Measure the voltage to body ground: There should be battery voltage.	• Blown No. 18 (7.5 A) fuse in the driver's under-dash fuse/relay box • An open in the wire

4. Disconnect the 28P connector again, and make this input test at the connector.
   - If the test indicates a problem, find and correct the cause and check for B-CAN related DTCs, then recheck the system.
   - If the input test proves OK, the HandsFreeLink Control Unit is faulty, replace it.

Cavity	Wire Color	Test Condition	Test: Desired Result	Possible Cause if Desired Result is not Obtained
17	BLU	Passenger's under-dash fuse/relay box connector D (28P) disconnected	Check for continuity between terminal No. 17 and passenger's under-dash fuse/relay box connector D (28P) terminal No. 8: There should be continuity.	An open in the wire
18	PNK	Passenger's under-dash fuse/relay box connector D (28P) disconnected	Check for continuity between terminal No. 18 and passenger's under-dash fuse/relay box connector D(28P) terminal No. 7: There should be continuity.	An open in the wire

2012 ACCESSORIES & EQUIPMENT

HomeLink Remote Control System - TL

CIRCUIT DIAGRAM

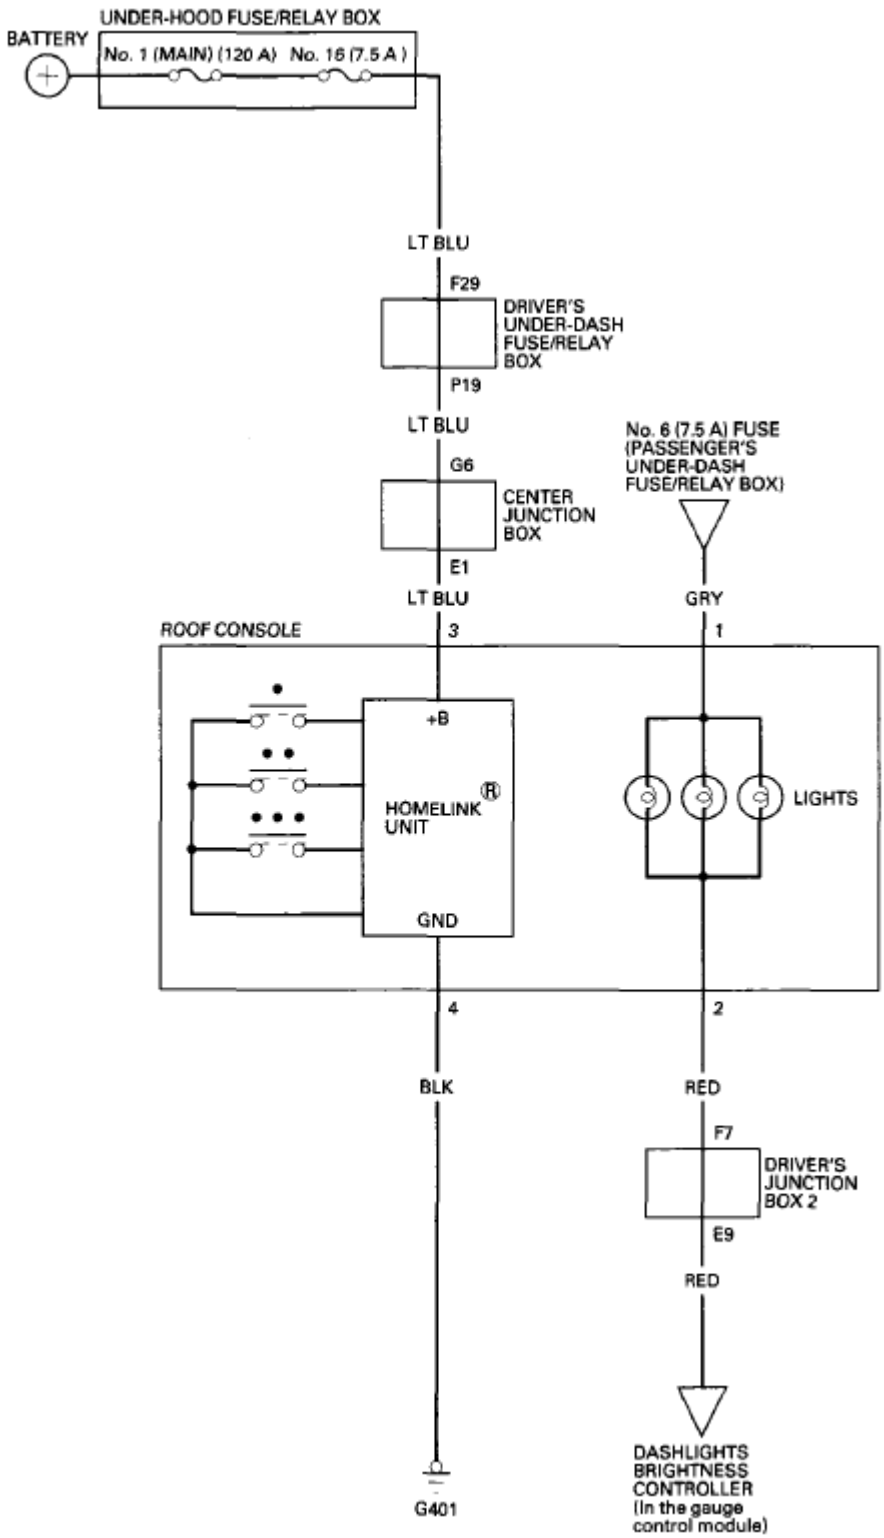

Fig. 1: HomeLink Remote Control System Circuit Wiring Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TEST

NOTE:

- **Explain to the client that garage door remote transmitters come in two types: Fixed code and rolling code. Each type has its own programming method, and each method is covered in the owner's manual. If the client has concerns about the HomeLink unit, have the client contact the HomeLink assistance desk at 800-355-3515.**
- **If HomeLink will not open the client's garage, do the following procedures.**

1. Press any of the buttons on the HomeLink unit.
   - If the red indicator comes on, go to step 4.
   - If the red indicator does not come on, go to step 2.
2. Remove the roof console (see **ROOF CONSOLE INPUT TEST/REPLACEMENT**).
3. Measure the voltage between terminals No. 3 (+) and No. 4 (-) of the roof console 20P connector. There should be battery voltage.
   - If the voltage is not as specified, check for these problems:
     - Blown No. 16 (7.5 A) fuse in the under-hood fuse/relay box.
     - Faulty under-dash fuse/relay box.
     - An open or high resistance in the wire.
     - Poor ground (G401).
   - If the voltage is specified, go to step 4.

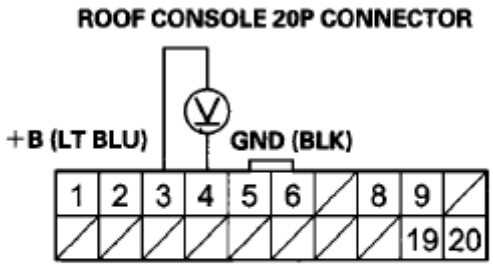

Fig. 2: Measuring Voltage Between Roof Console 20P Connector Terminal No. 3 And 4 With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Make sure the genie remote transmitter (test remote) has fresh batteries.
5. Clear any previously learned codes by pressing and holding the two outside buttons (A) on the HomeLink unit (B) for until (about 20 seconds) the red indicator (C) on the unit starts blinking, release the buttons.

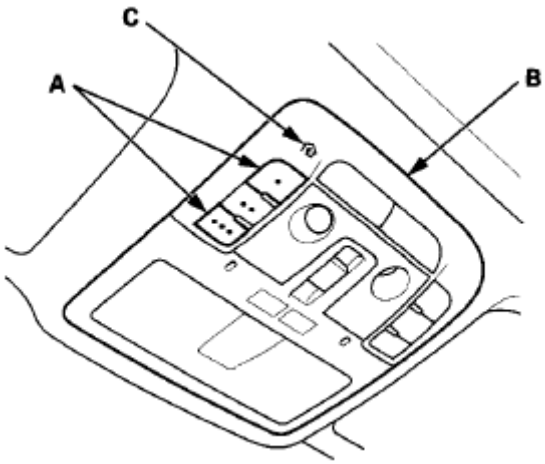

Fig. 3: Identifying Outside Buttons, Homelink Unit And Red Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Point the test remote transmitter (A) straight up exactly 101.6 mm (4.0 in) away from the HomeLink unit (B).

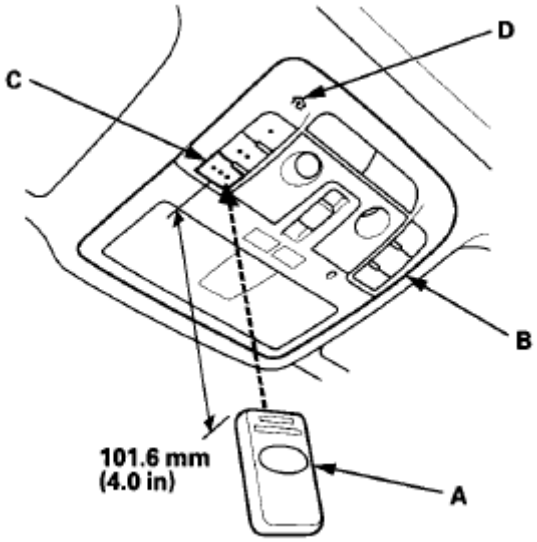

Fig. 4: Identifying Remote Transistor And Homelink Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Press and hold the test transmitter button and one of the HomeLink unit buttons (C) at the same time.
8. Wait for about 20 seconds while watching the red indicator (D) on the HomeLink unit.
   - If the red indicator starts out blinking slowly and then blinks faster, the unit is OK. Release the buttons, then clear the learned code (see step 1). For more information, go online to www.homelink.com.
   - If the red indicator does not blink, the HomeLink unit is faulty; replace the roof console (see **ROOF CONSOLE INPUT TEST/REPLACEMENT**).

Horns - TL

COMPONENT LOCATION INDEX

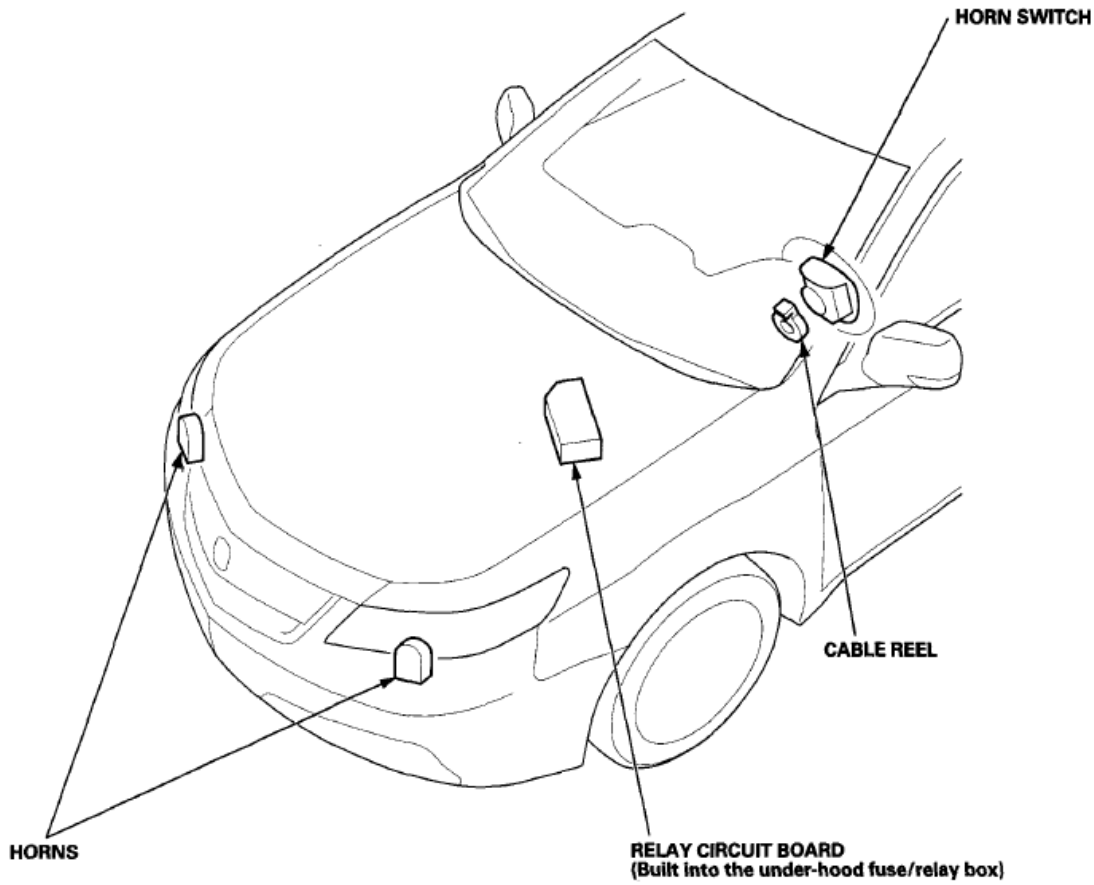

Fig. 1: Horns Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CIRCUIT DIAGRAM

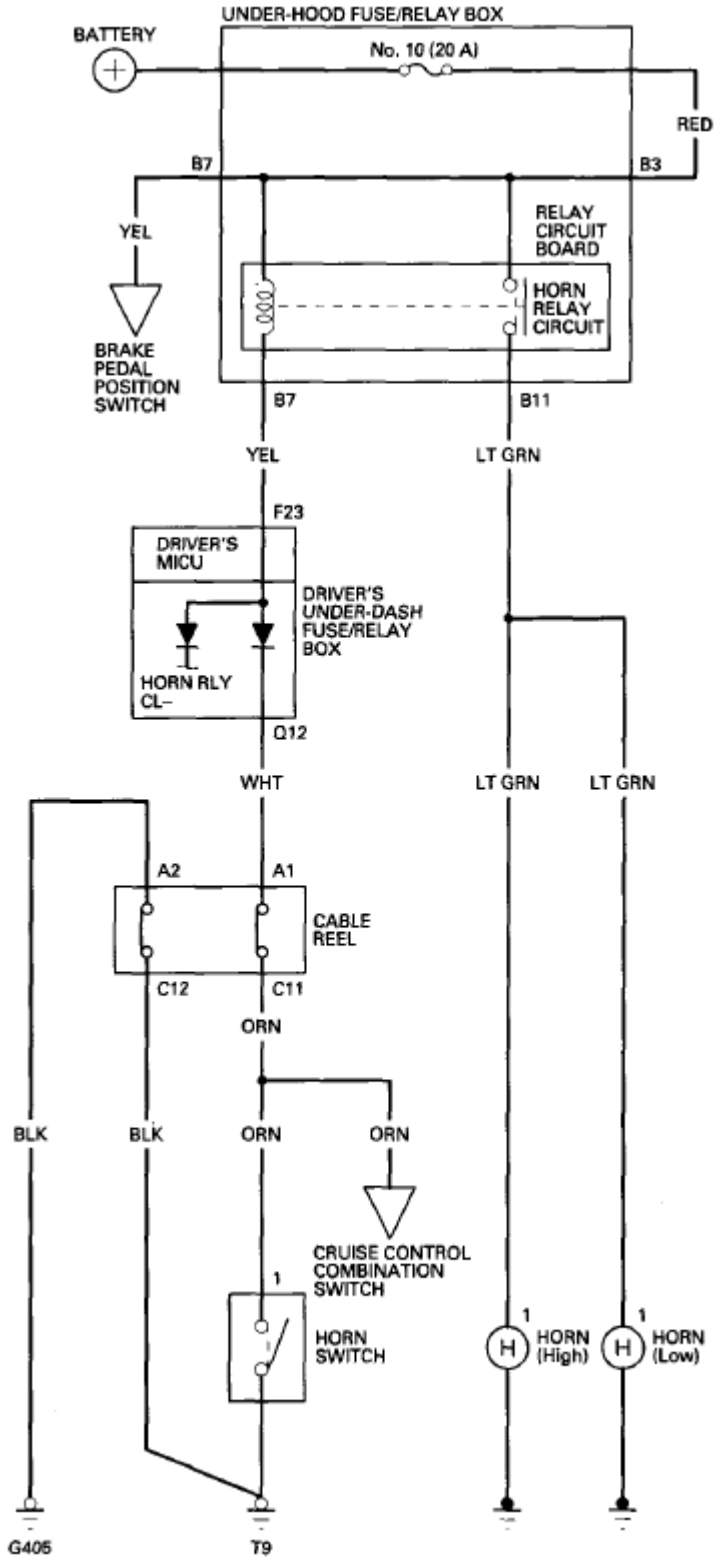

Fig. 2: Horns Circuit Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

HORN TEST/REPLACEMENT

1. Remove the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**).
2. Disconnect the 1P connector (A) from each horn (B), then remove the bolt.

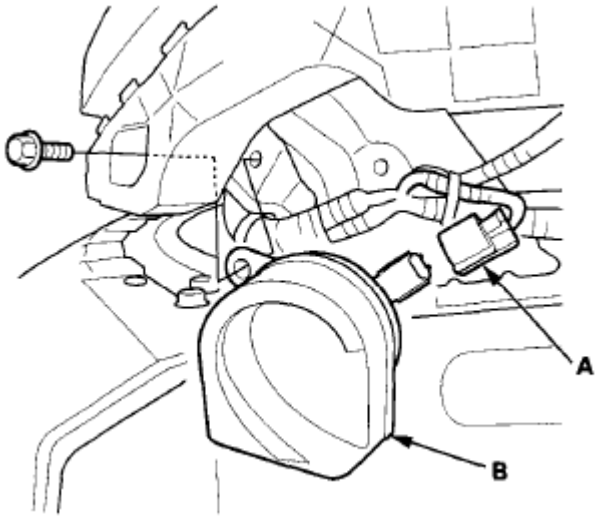

Fig. 3: Identifying 1P Connector And Horn
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Test the horn by momentarily connecting battery power to the terminal (A) and grounding the bracket (B). The horn should sound.

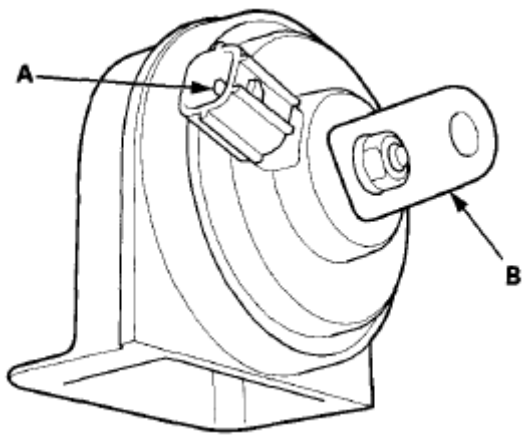

Fig. 4: Identifying Terminal And Grounding Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If it fails to sound, replace it.

HORN SWITCH TEST

NOTE:

- **SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.**
- **Check for a blown No. 10(20A) fuse in the under-hood fuse/relay box. If it is blown, check for a faulty horn relay (built in the relay circuit board) (see POWER RELAY TEST).**

1. Remove the steering column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
2. Disconnect cable reel connector A (20P) (A) from the cable reel (B).

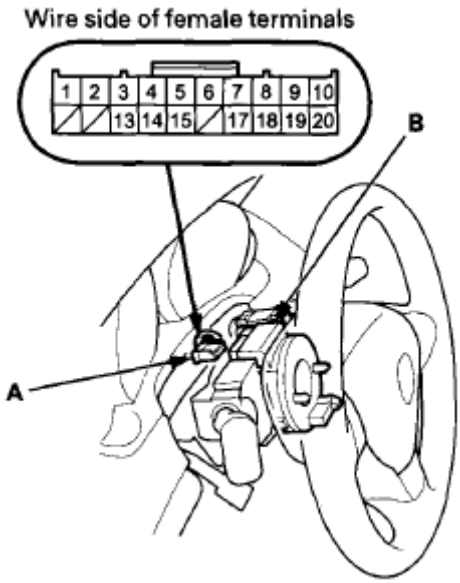

Fig. 5: Cable Reel With A (20P) Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Connect cable reel connector A (20P) terminals No. 1 and No. 2 with a jumper wire. The horns should sound.
   - If the horns sound, go to step 7.
   - If the horns do not sound, go to step 4.
4. Remove the jumper wire from cable reel connector A (20P).
5. Check for continuity between cable reel connector A (20P) terminal No. 2 and body ground. There should continuity.
   - If there is continuity, go to step 6.
   - If there is no continuity, repair an open or high resistance in the wire, or poor ground (G405).
6. Measure the voltage between cable reel connector A (20P) terminal No. 1 and body ground. There should be battery voltage.
   - If there is battery voltage, replace the horns.

- If there is no voltage, repair an open in the wire, or faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

7. Reconnect cable reel connector A (20P) to the cable reel, then remove the driver's airbag assembly (see **DRIVER'S AIRBAG REPLACEMENT**).
8. Connect cable reel connector C (20P) terminals No. 11 and No. 12 with a jumper wire. The horns should sound.
   - If the horns sound, go to step 9.
   - If the horns do not sound, repair open in the wire, or replace the cable reel (see **CABLE REEL REPLACEMENT**).
9. Disconnect the cable reel connector C (20P) (A).

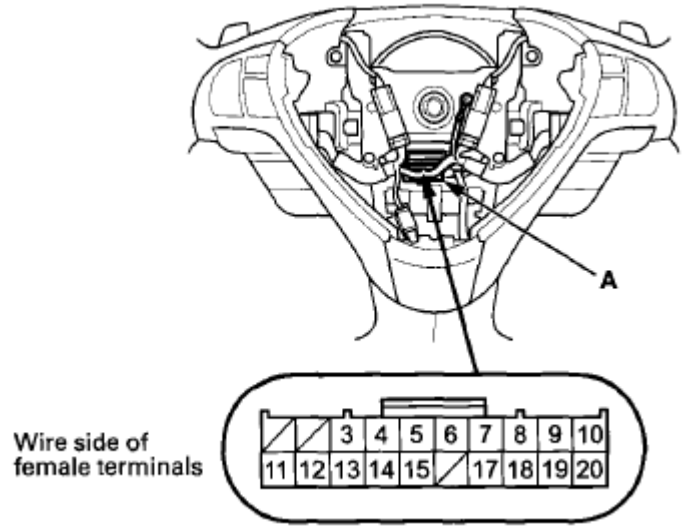

Fig. 6: Cable Reel C (20P) Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Check for continuity between terminal (T9) and cable reel connector C (20P) terminal No. 12. There should be continuity.
    - If there is continuity, go to step 11
    - If there is no continuity.
      - An open in the wire, replace the cable reel subharness.
      - Poor terminal (T9).

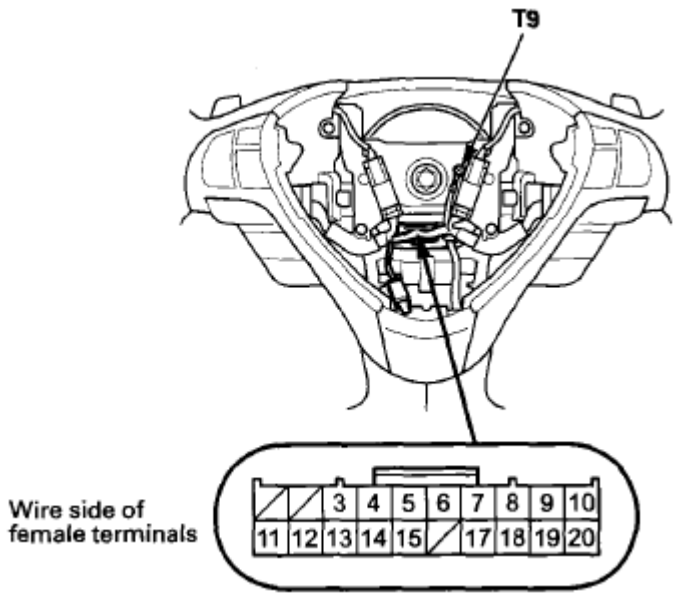

Fig. 7: Checking Cable Reel Connector C (20P) Terminal And Terminal (T9) For Continuity
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check for continuity between cable reel connector C (20P) terminal No. 11 and horn switch positive terminal 1P. There should be continuity.

- If there is continuity, check or adjust the installation of the driver's airbag assembly and the horn switch plate or, replace the driver's airbag assembly.
- If there is no continuity, repair open in the wire, or replace the cable reel subharness.

2012 ACCESSORIES & EQUIPMENT

Ignition Switch - TL

COMPONENT LOCATION INDEX

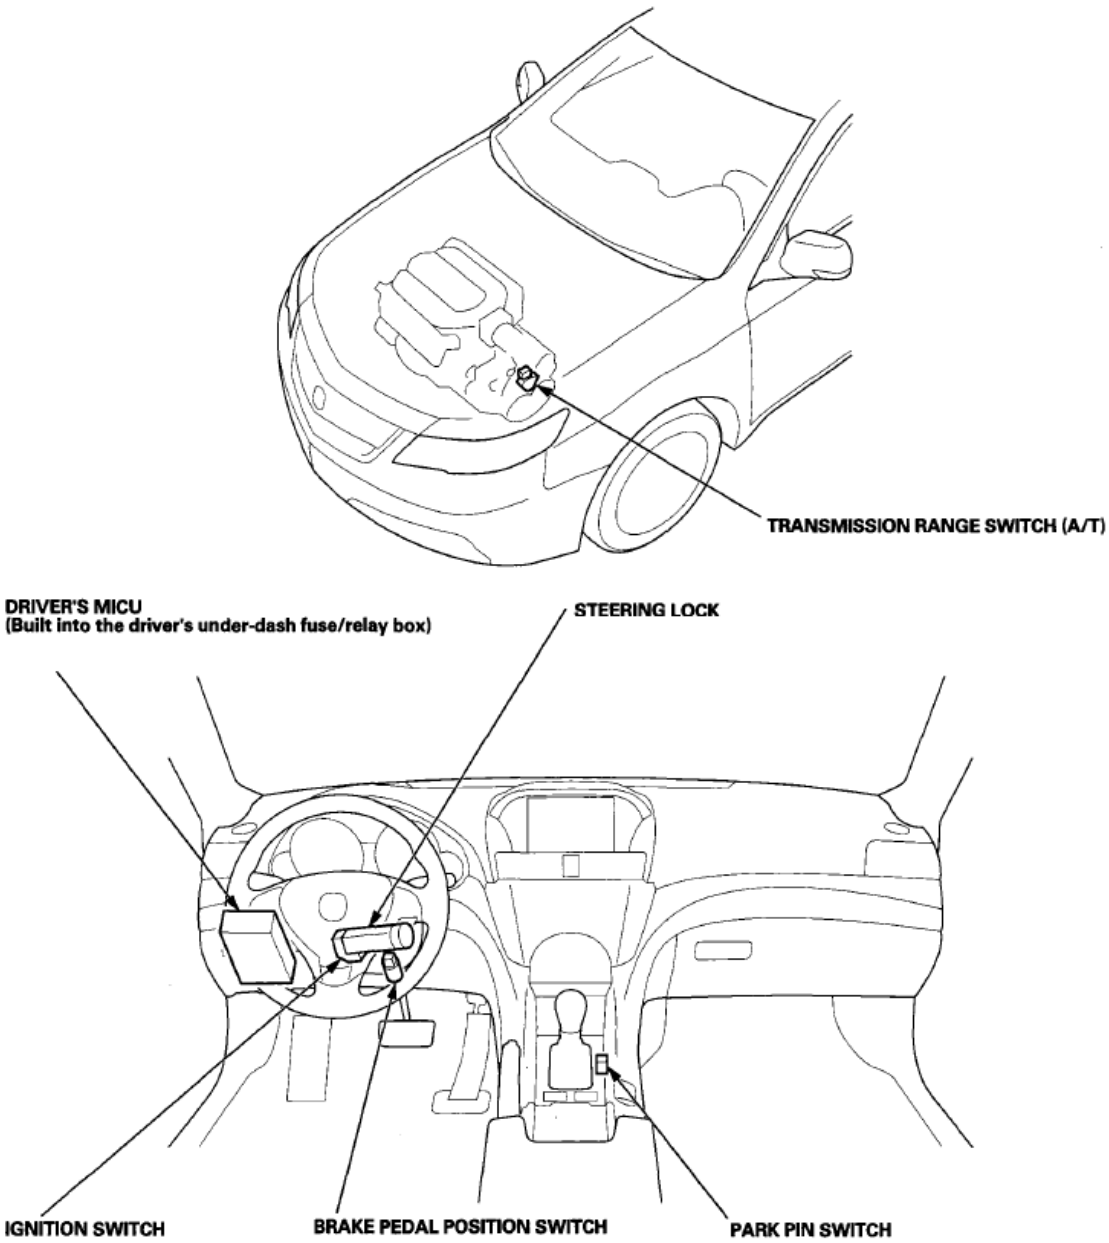

Fig. 1: Ignition Switch Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CIRCUIT DIAGRAM - WITHOUT KEYLESS ACCESS SYSTEM

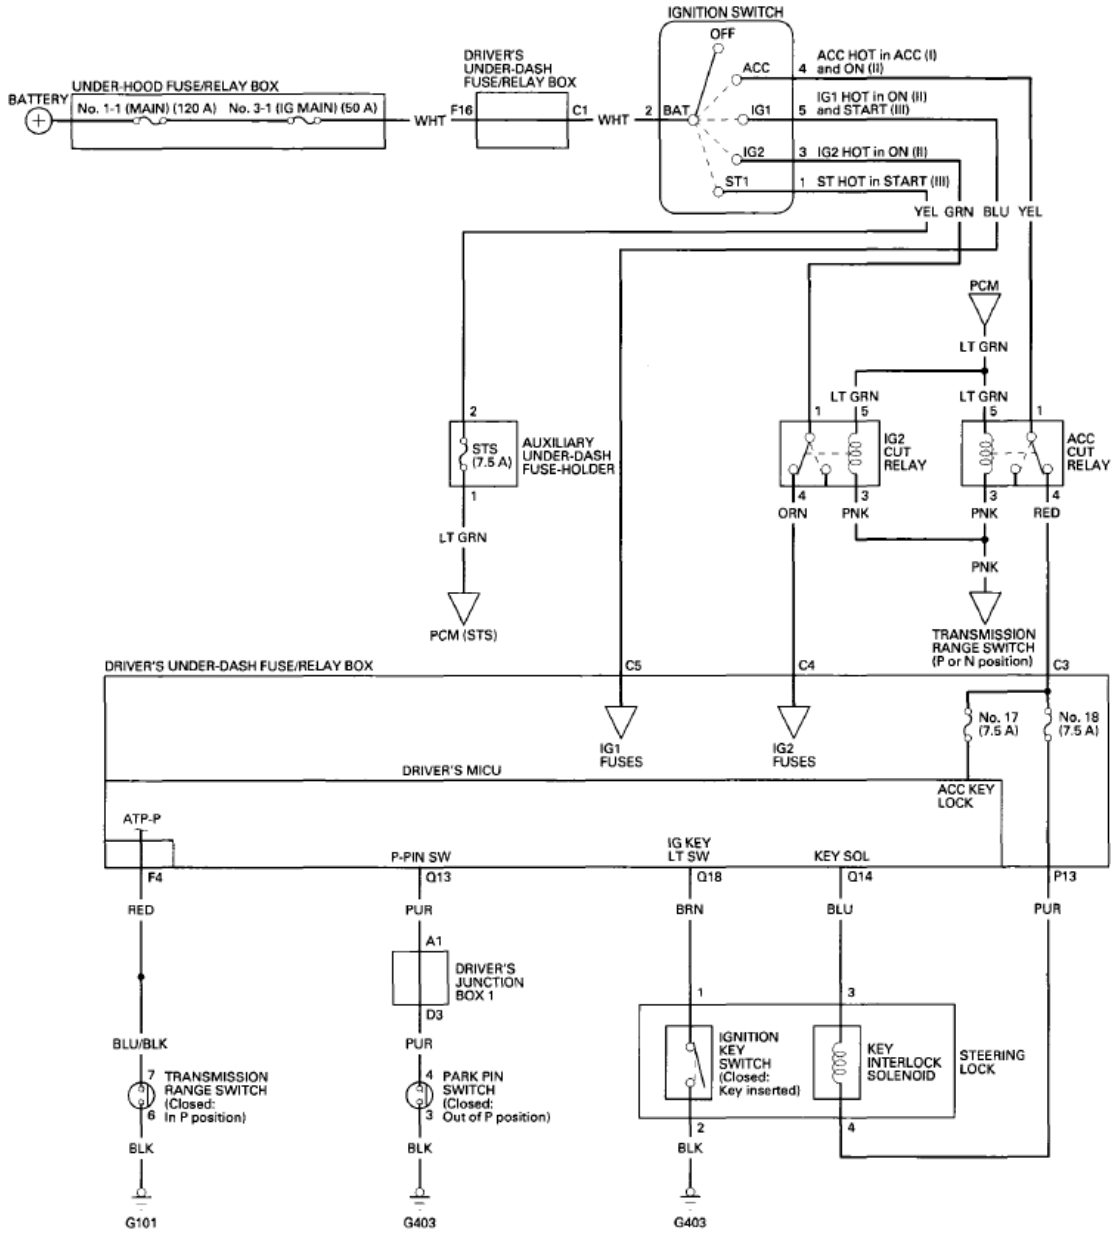

Fig. 2: Ignition Switch Circuit Diagram (w/o Keyless Access System)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

KEY INTERLOCK SYSTEM CIRCUIT TROUBLESHOOTING

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Check the A/T system DTCs with the HDS.

   Are DTCs P0705 and/or P0706 indicated?

YES -Go to DTC troubleshooting P0705 (see **DTC TROUBLESHOOTING**), P0706 (see **DTC P0706: OPEN IN TRANSMISSION RANGE SWITCH CIRCUIT**).

NO -Go to step 2.

2. Move the shift lever to P and set the parking brake.
3. Remove the column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
4. Disconnect the steering lock 6P connector.
5. Turn the ignition switch to ACCESSORY (I).
6. Check if the ignition switch can be turned to LOCK (0).

   Can the ignition switch be turned to LOCK (0)?

   YES -Go to step 7.

   NO -Replace the ignition key cylinder/steering lock (see **STEERING LOCK REPLACEMENT**).

7. Check the No. 18 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

   YES -Go to step 8.

   NO -Replace the fuse. If the fuse blows again, repair a short to ground in the No. 18 (7.5 A) fuse circuit.

8. Make sure the ignition switch is turned to LOCK (0).
9. Disconnect driver's under-dash fuse/relay box connector Q (20P).
10. Check for continuity between steering lock 6P connector terminal No. 3 and body ground.

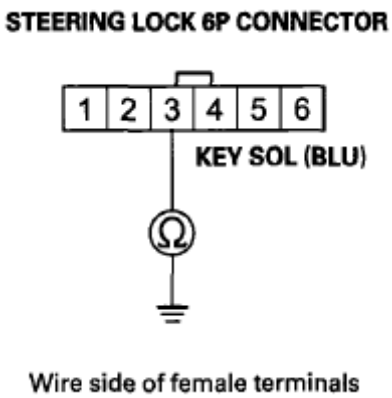

Fig. 3: Checking Continuity Between Steering Lock 6P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire between the key interlock solenoid and the driver's MICU.

NO -Go to step 11.

11. Check for continuity between driver's under-dash fuse/relay box connector Q (20P) terminal No. 14 and steering lock 6P connector terminal No. 3.

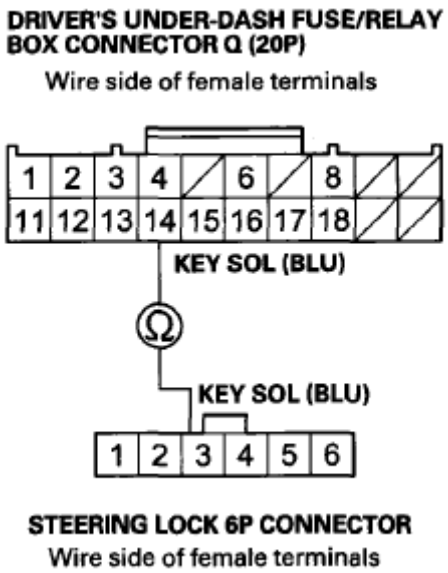

Fig. 4: Checking Continuity Between Driver's Under-Dash Fuse/Relay Box Connector Q (20P) Terminal No. 14 And Steering Lock 6P Connector Terminal No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 12.

NO -Repair an open or high resistance in the wire between the key interlock solenoid and the driver's MICU.

12. Move the shift lever to P.
13. Remove the center console (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
14. Disconnect the shift lever 12P connector.
15. Do the park pin switch test (see **PARK PIN SWITCH TEST**).

Is the switch OK?

YES -Go to step 16.

NO -Check the park pin switch installation. If the switch installation is OK, the park pin switch is faulty; replace the park pin switch (see **PARK PIN SWITCH TEST**), and retest.

16. Check for continuity between A/T shift lock solenoid/park pin switch 4P connector terminal No. 4 and body ground.

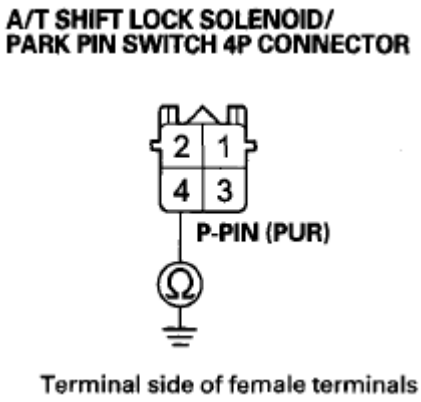

Fig. 5: Checking Continuity Between A/T Shift Lock Solenoid/Park Pin Switch 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to body ground in the wire between A/T shift lock solenoid/park pin switch 4P connector terminal No. 4 and the driver's MICU.

NO -Go to step 17.

17. Check for continuity between A/T shift lock solenoid/park pin switch 4P connector terminal No. 3 and body ground.

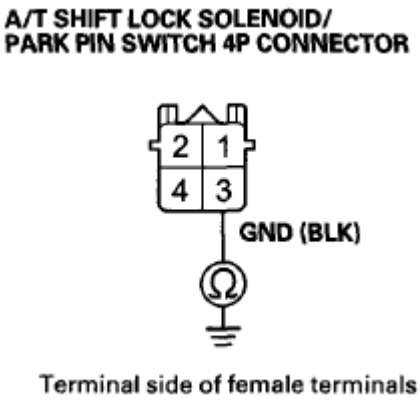

Fig. 6: Checking Continuity Between A/T Shift Lock Solenoid/Park Pin Switch 4P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 18.

NO -Repair an open or high resistance in the between A/T shift lock solenoid/park pin switch and body ground (G403).

18. Check the A/T system Data List with the HDS.

    Is the transmission range switch indicated ON when the shift lever is in P, and is the transmission range switch indicated OFF when the shift lever is shifted to any position other than P?

    YES -Go to step 20.

    NO -Go to step 19.

19. Do the transmission range switch test (see **TRANSMISSION RANGE SWITCH TEST**).

    Is the switch OK?

    YES -Go to step 20.

    NO -Check the transmission range switch installation. If the switch installation is OK, replace the transmission range switch (see **TRANSMISSION RANGE SWITCH TEST**), and retest.

20. Disconnect the transmission range switch connector.
21. Check for continuity between driver's under-dash fuse/relay box connector F (33P) terminal No. 4 and transmission range switch connector terminal No. 7.

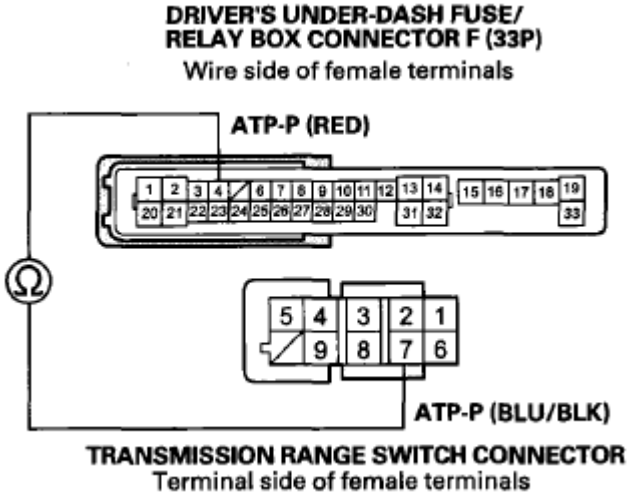

Fig. 7: Checking Continuity Between Driver's Under-Dash Fuse/Relay Box Connector F (33P) Terminal No. 4 And Transmission Range Switch Connector Terminal No. 7
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 22.

NO -Repair an open or high resistance in the wire between the driver's under-dash fuse/relay box and the transmission range switch.

22. Check for continuity between transmission range switch connector terminal No. 6 and body ground.

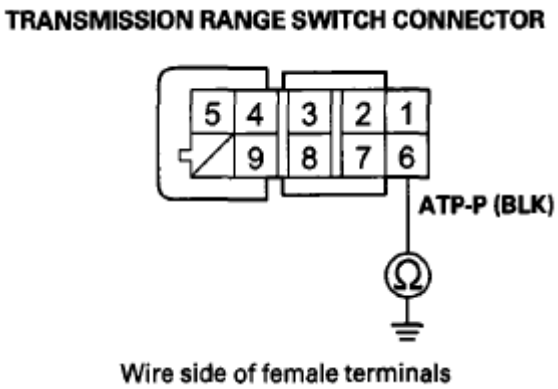

Fig. 8: Checking Continuity Between Transmission Range Switch Connector Terminal No. 6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO -Repair an open or high resistance in the ground wire or poor ground (G101).

KEY INTERLOCK SOLENOID TEST

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Remove the steering column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
2. Disconnect the steering lock 6P connector (A).

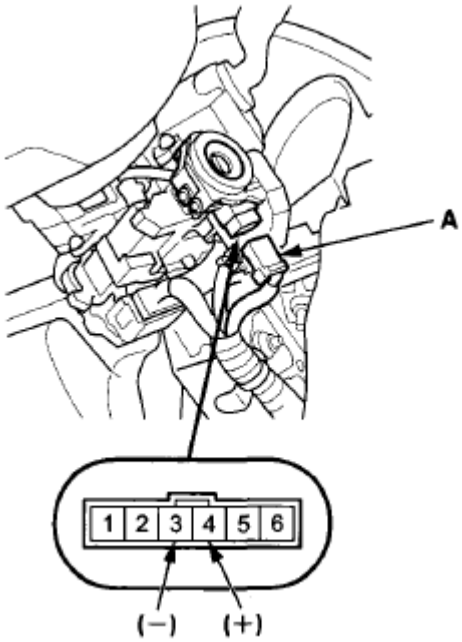

Fig. 9: Steering Lock 6P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Insert the ignition key in the key cylinder, then turn the ignition key to ACCESSORY (I).
4. Connect the positive battery terminal to steering lock assembly connector terminal No. 4, and connect the negative battery terminal to terminal No. 3. Check that the ignition key cannot be turned to LOCK (0). Release the battery terminals, and check that the key can be turned to the LOCK (0) position and removed from the cylinder.
5. If the key interlock solenoid works improperly, replace the ignition key cylinder/steering lock (see **STEERING LOCK REPLACEMENT**).

PARK PIN SWITCH TEST

1. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
2. Disconnect the A/T shift lock solenoid/park pin switch 4P connector (A) from the park pin switch (B).

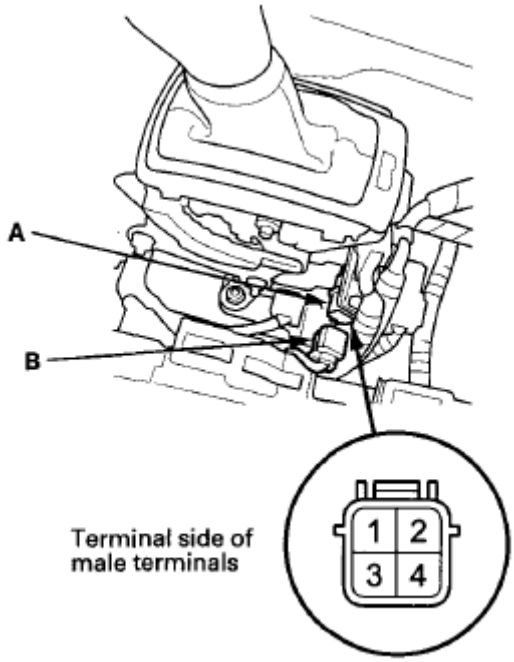

Fig. 10: Identifying A/T Shift Lock Solenoid/Park Pin Switch 4P Connector And Park Pin Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between terminals No. 3 and No. 4.
   - There should be continuity when the shift lever button is pressed or the shift lever is moved out of P.
   - There should be no continuity when the shift the shift lever is moved to P and the shift lever button is released.
4. If the continuity is not as specified, check the shift cable adjustment (see **SHIFT CABLE ADJUSTMENT**). If the cable adjustment is OK, go to step 5.

   If the park pin switch fails the test, replace the park pin switch (see **PARK PIN SWITCH REPLACEMENT**).

5. Install the parts in the reverse order of removal (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).

IGNITION SWITCH TEST

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
2. Remove the steering column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).

3. Disconnect the 5P connector (A) from the ignition switch (B).

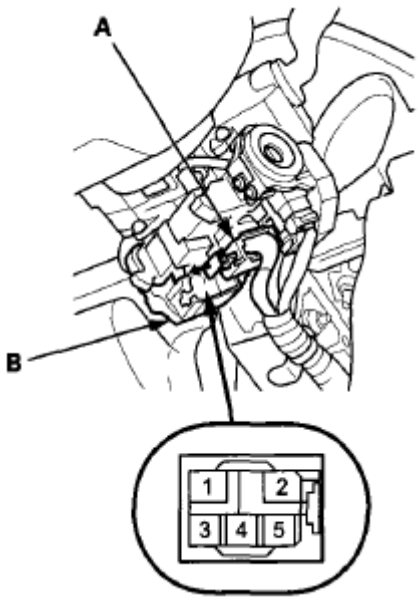

Fig. 11: Identifying Ignition Switch & 5P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Check for continuity between the terminals in each switch position according to the table.

Terminal / Position	4 (ACC)	2 (BAT)	5 (IG1)	3 (IG2)	1 (ST1)
0 (LOCK)					
I (ACC)	○——	——○			
II (ON)	○——	——○	——○	——○	
III (START)		——○	——○		——○

Fig. 12: Continuity Reference Chart
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the continuity is not as specified, replace the ignition switch (see **IGNITION SWITCH REPLACEMENT**).
6. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

IGNITION SWITCH REPLACEMENT

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see

PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
2. Remove the steering column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
3. Disconnect the 5P connector (A) from the ignition switch (B).

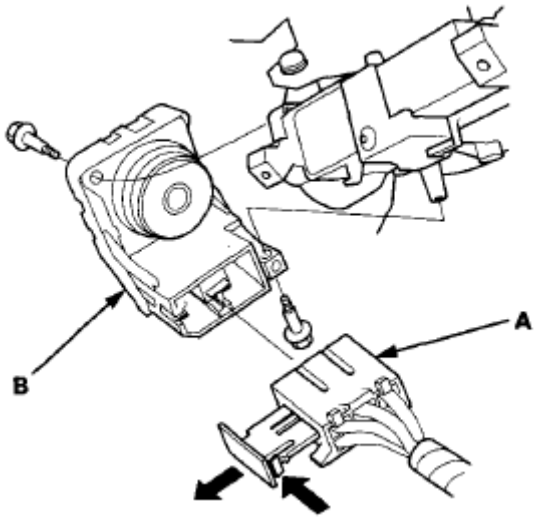

Fig. 13: Identifying 5P Connector & Ignition Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the two screws and the ignition switch.
5. Install the parts in the reverse order of removal.
6. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

2012 ACCESSORIES & EQUIPMENT

Immobilizer System - TL

COMPONENT LOCATION INDEX

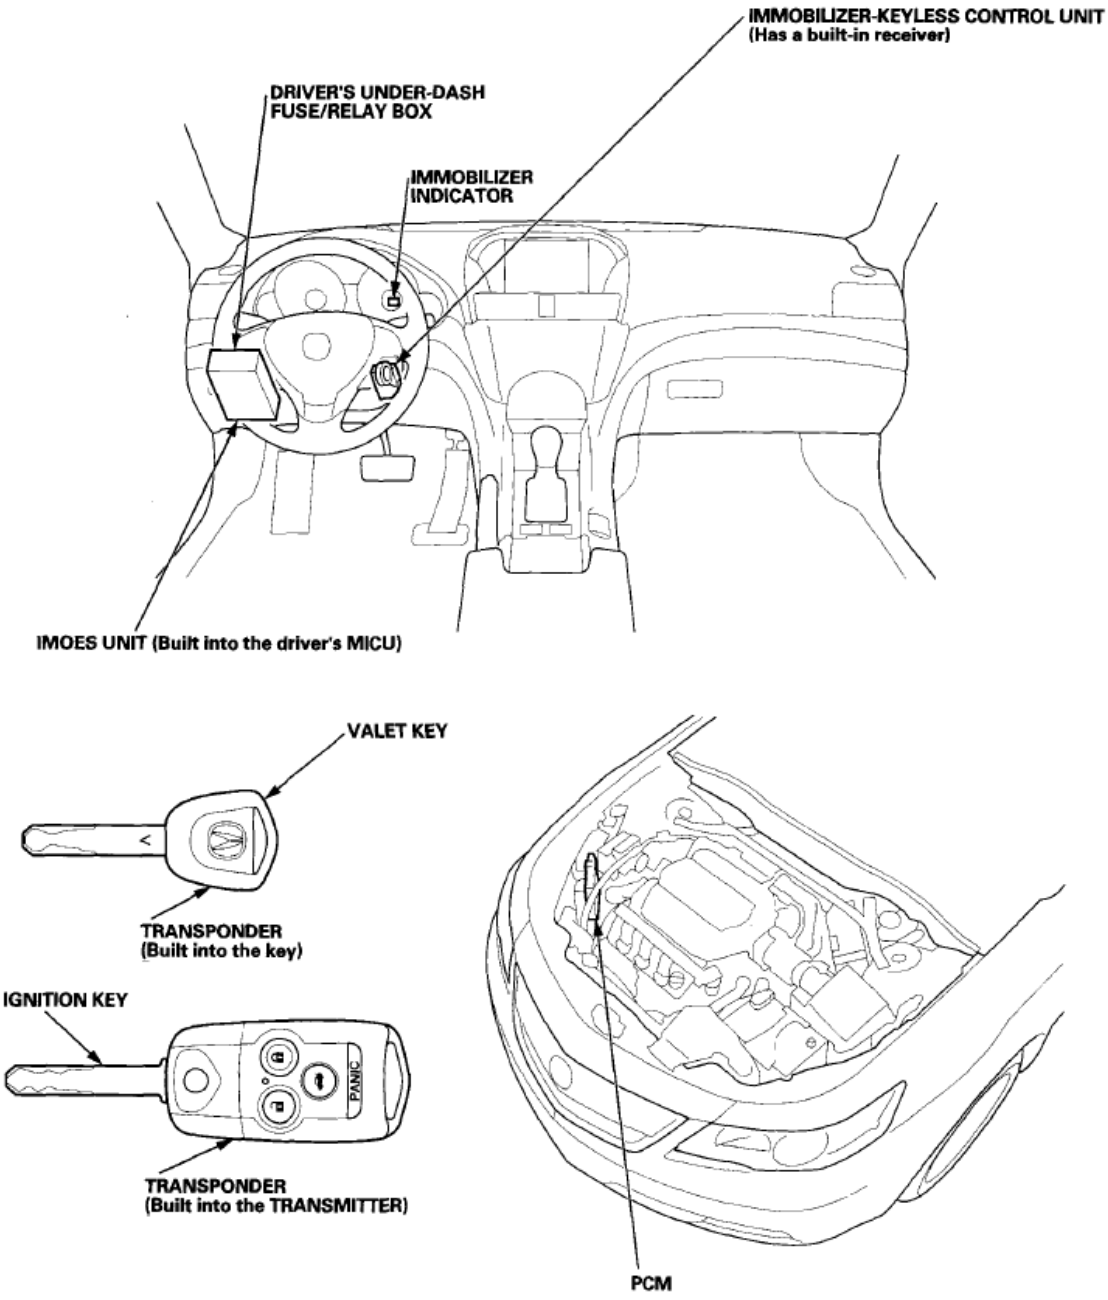

Fig. 1: Immobilizer System Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SYSTEM DESCRIPTION

The vehicle is equipped with a Type VII (GEN 5) immobilizer system that disables the vehicle unless a programmed ignition key is used.

This system consists of a transponder built into the ignition key, an immobilizer-keyless control unit (has a built-in receiver), the driver's MICU (has a built-in imoes unit), an immobilizer indicator, and the PCM.

When the immobilizer key (programmed by the HDS) is inserted into the ignition switch and turned to ON (II), the immobilizer-keyless control unit sends power to the transponder. The transponder then sends a coded signal back to the immobilizer-keyless control unit, which then sends a coded signal to the PCM and the driver's MICU (imoes unit). The PCM and driver's MICU (imoes unit) identify this coded signal, then voltage is supplied to the fuel pump.

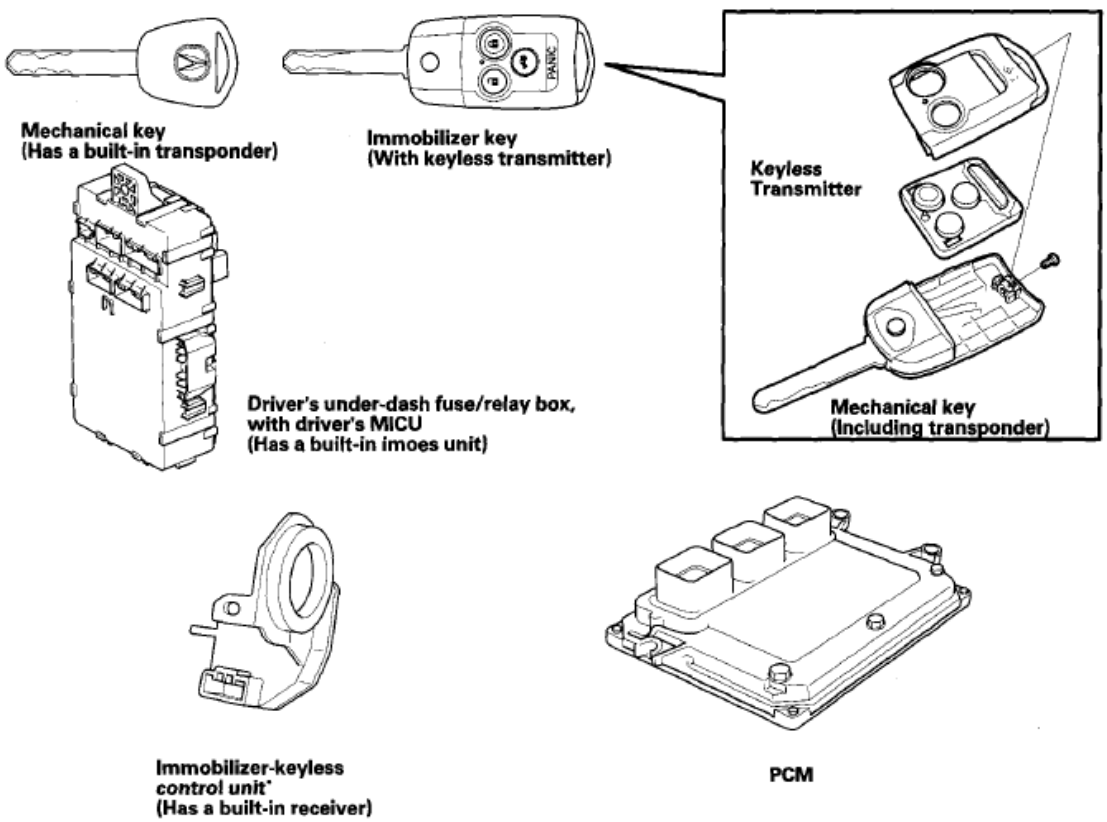

Fig. 2: Identifying Immobilizer System Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

***: The immobilizer-keyless control unit can store up to 6 immobilizer keys per vehicle; the original 2 keys that came with the vehicle, and up to four more keys can be added.**

If the wrong key is used or the code was not received or recognized, the indicator flashes once, then it blinks until the ignition switch is turned to LOCK (0). When the ignition switch is turned to the LOCK (0) position, the indicator blinks ten times to signal that unit has reset correctly, then the indicator goes off.

CIRCUIT DIAGRAM

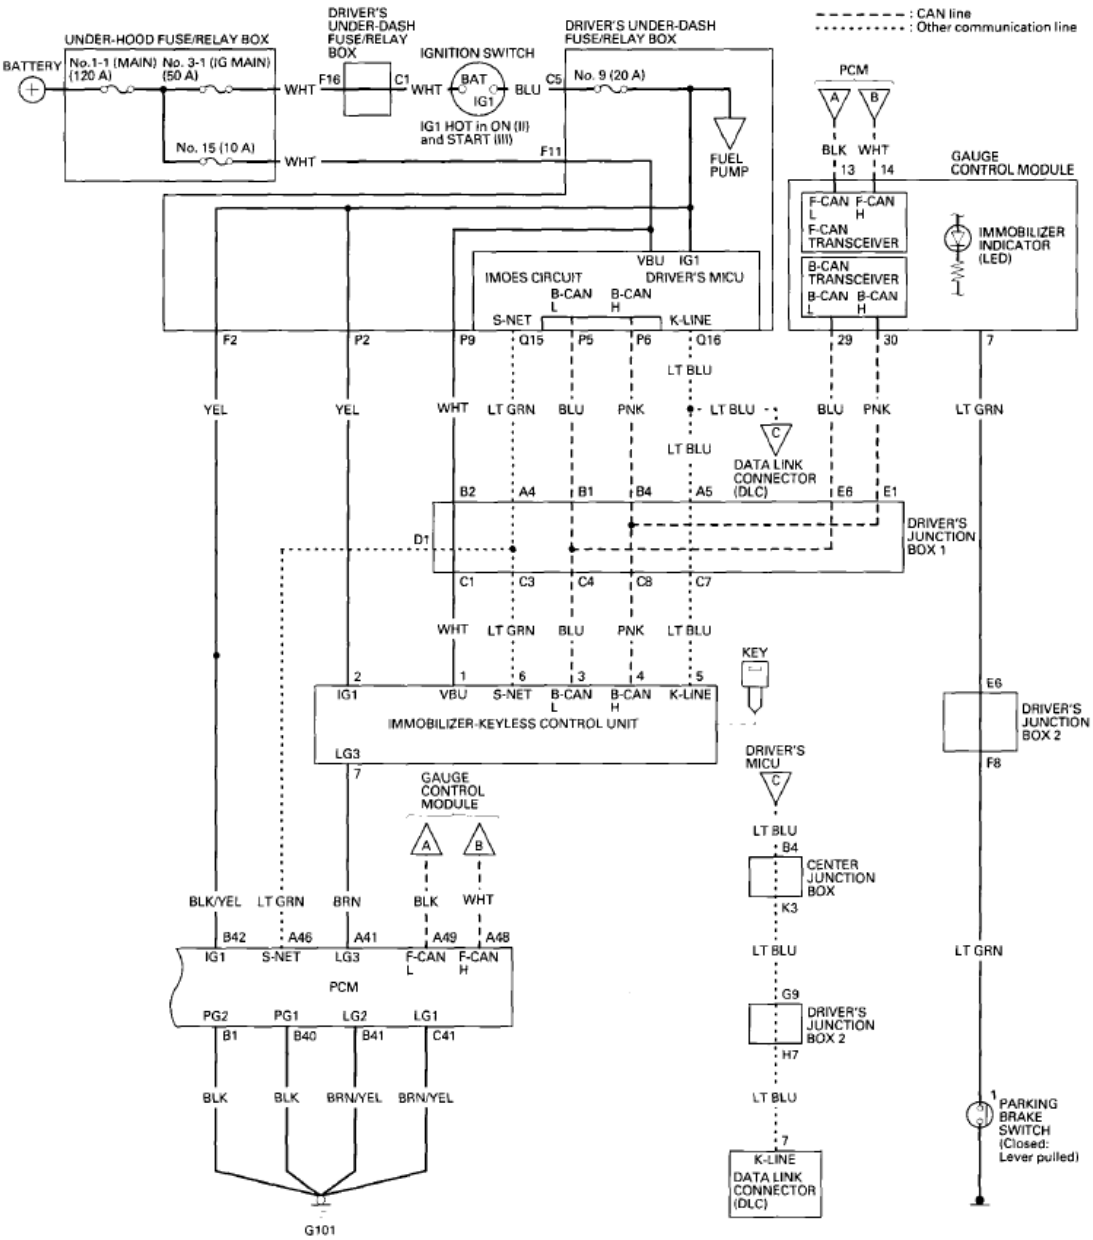

Fig. 3: Immobilizer System Circuit Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DTC TROUBLESHOOTING

DTC U0155: IMMOBILIZER-KEYLESS CONTROL UNIT LOST COMMUNICATION WITH GAUGE CONTROL MODULE

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U0155 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the immobilizer-keyless control unit and the gauge control module.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the gauge control module detected?

   YES -Go to step 9.

   NO -Go to step 6.

6. Measure the voltage between body ground and gauge control module 32P connector terminals No. 15 and No. 16 individually.

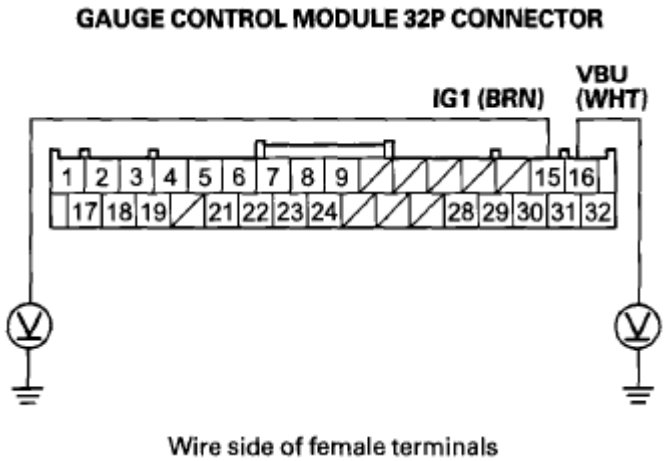

Fig. 4: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 15 And No. 16
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 8.

NO -Go to step 7.

7. Check the No. 15 (10 A) fuse in the under-hood fuse/relay box and the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Are the fuses OK?

   YES -Repair an open or high resistance in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

   NO -Replace the fuse(s). If the fuse blows again, repair a short to ground in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

8. Measure the voltage between body ground and gauge control module 32P connector terminals No. 1 and No. 17 individually.

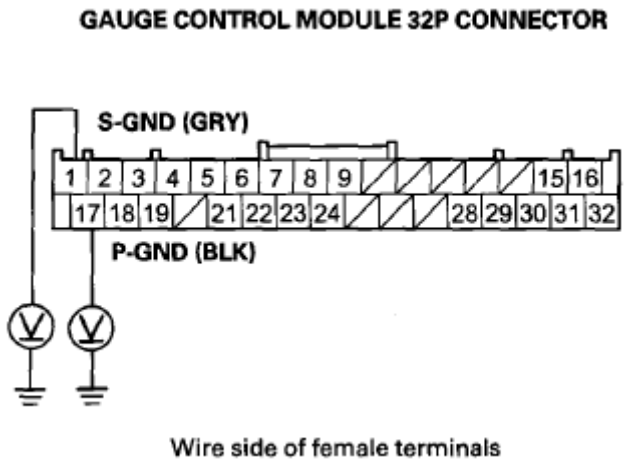

Fig. 5: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 1 And No. 17
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there less than 0.2 V?

   YES -Go to step 9.

   NO -Repair an open or high resistance in the ground wire or poor ground (G401) and/or (G402).

9. Turn the ignition switch to LOCK (0).
10. Disconnect the immobilizer-keyless control unit 7P connector.
11. Disconnect the gauge control module 32P connector.
12. Check for continuity between gauge control module 32P connector terminals No. 29 and No. 30 and

immobilizer-keyless control unit 7P connector terminals No. 3 and No. 4 respectively.

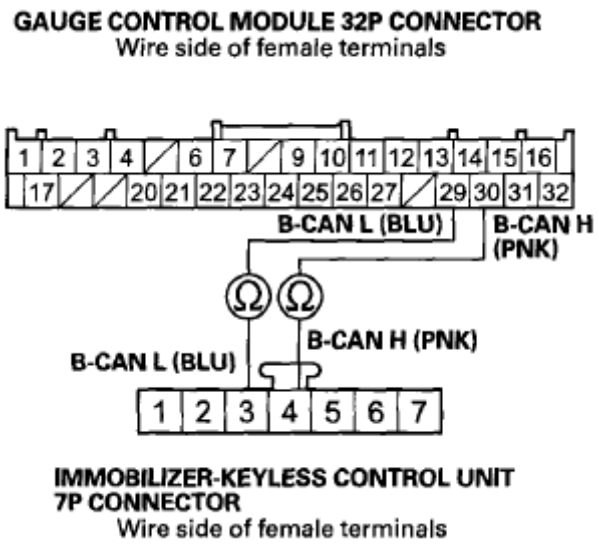

Fig. 6: Checking Continuity Between Gauge Control Module 32P Connector Terminals No. 29 And No. 30
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO -Repair an open or poor connection in the B-CAN wire between the immobilizer-keyless control unit and the gauge control module.

DTC U0199: IMMOBILIZER-KEYLESS CONTROL UNIT LOST COMMUNICATION WITH DOOR MULTIPLEX CONTROL UNIT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U0199 indicated?

YES -Go to step 5.

NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the

immobilizer-keyless control unit and the door multiplex control unit.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the power window unit detected?

   YES -Go to step 9.

   NO -Go to step 6.

6. Measure the voltage between body ground and power window master switch 37P connector terminal No. 13.

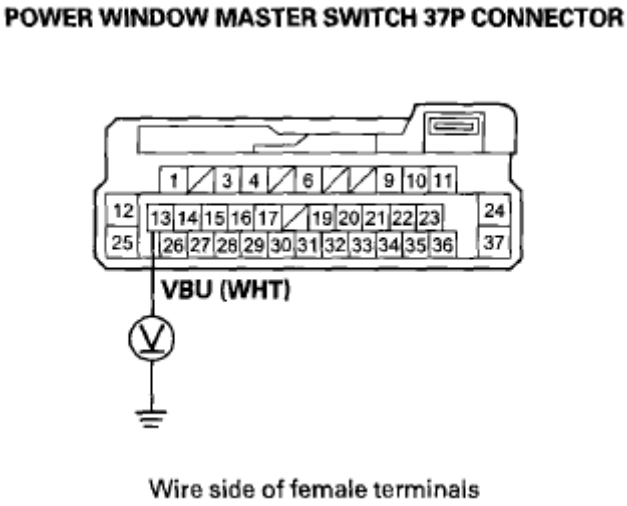

Fig. 7: Measuring Voltage Between Body Ground And Power Window Master Switch 37P Connector Terminal No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES -Go to step 8.

   NO -Go to step 7.

7. Check the No. 15 (10 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES -Repair an open or high resistance in the No. 15 (10 A) fuse circuit.

   NO -Replace the fuse. If the fuse blows again, repair a short to ground in the No. 15 (10 A) fuse circuit.

8. Measure the voltage between body ground and power window master switch 37P connector terminals No. 32 and No. 37 individually.

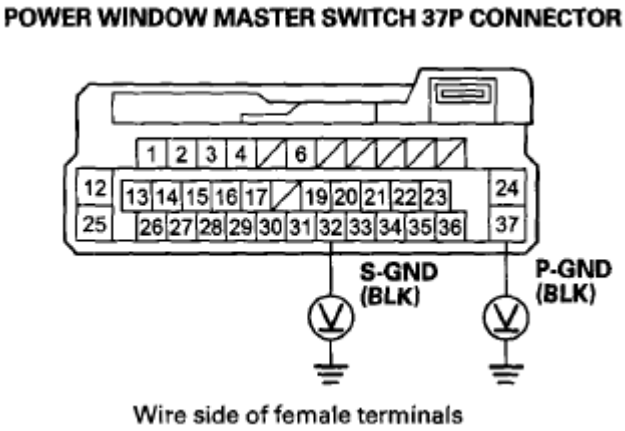

Fig. 8: Measuring Voltage Between Body Ground And Power Window Master Switch 37P Connector Terminals No. 32 And No. 37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Go to step 9.

NO -Repair an open or high resistance in the ground wire or poor ground (G401) and/or (G402).

9. Turn the ignition switch to LOCK (0).
10. Disconnect the immobilizer-keyless control unit 7P connector.
11. Disconnect the power window master switch 37P connector.
12. Check for continuity between power window master switch 37P connector terminals No. 33 and No. 35 and immobilizer-keyless control unit 7P connector terminals No. 3 and No. 4 respectively.

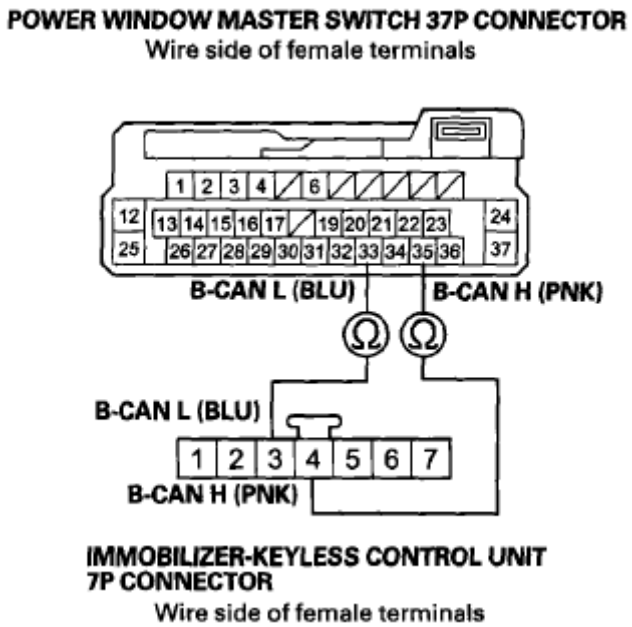

Fig. 9: Checking Continuity Between Power Window Master Switch 37P Connector Terminals No. 33 And No. 35
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

NO -Repair an open or poor connection in the B-CAN wire between the immobilizer-keyless control unit and the door multiplex control unit.

DTC U1282: IMMOBILIZER-KEYLESS CONTROL UNIT LOST COMMUNICATION WITH DRIVER'S MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U1282 indicated?

YES -Go to the driver's MICU input test, and do all power, ground, and communication input tests (see **MICU INPUT TEST**). If the tests prove OK, replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**). If

the DTC is still present, replace the immobilizer-keyless control unit (see **IMMOBILIZER-KEYLESS CONTROL UNIT REPLACEMENT**).

NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections between the immobilizer-keyless control unit and the driver's MICU.

SYMPTOM TROUBLESHOOTING INFORMATION

GENERAL CHECK BEFORE TROUBLESHOOTING

Before troubleshooting the immobilizer system, check the following general items and solve any if applicable:

- The battery is low; charge the battery fully, then troubleshoot the immobilizer system.
- The ignition key is not a genuine Acura part; use an Acura-approved key blank, register the key, then troubleshoot the immobilizer system.
- A key ring, keys, or a key case is used; remove the key from it, and troubleshoot the immobilizer system with the key only.
- An aftermarket electrical part is installed; remove it, then troubleshoot the immobilizer system.

SYMPTOM TROUBLESHOOTING USING THE IMMOBILIZER INDICATOR LIGHTING PATTERN

The pattern of the immobilizer indicator can help troubleshoot the condition of the immobilizer system. Here are descriptions of the four possible patterns:

Normal operation

If the immobilizer code is identified, the immobilizer indicator quickly flashes once when the ignition switch is turned to ON (II).

The immobilizer indicator does not come on when the ignition switch is turned to LOCK (0).

Immobilizer code is not identified

If the immobilizer code is not identified, the immobilizer indicator quickly flashes once, then blinks until the ignition switch is turned to LOCK (0). When the ignition switch is turned to LOCK (0), the indicator blinks ten times, then goes OFF to show the system is correctly reset.

The state of the immobilizer key registration and the S-NET line can be checked by doing a SYSTEM CHECK (see **SYSTEM CHECK**) and STATUS LOG CHECK (see **STATUS LOG**) with the HDS.

Immobilizer indicator does not come on

If the immobilizer indicator does not come on after turning the ignition switch to ON (II), there is an open or short in the F-CAN lines between the PCM and the gauge control module. Watch the malfunction indicator lamp (MIL). If the MIL stays on, go to the PGM-FI system troubleshooting (see **GENERAL TROUBLESHOOTING INFORMATION**).

Immobilizer indicator does not go off

If the immobilizer indicator does not go off after turning the ignition switch to ON (II), do the gauge control module self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**). If the indicator drive circuit is OK, do the SYSTEM CHECK and STATUS LOG CHECK with the HDS.

SYMPTOM TROUBLESHOOTING USING MALFUNCTIONING CIRCUIT FUNCTIONS

If a malfunction occurs in the immobilizer circuit, use the table to cross-reference the malfunction criteria to the line(s) that should be checked in the table:

Function / Line Error		Immobilizer Indicator	Engine Start	Key Registration	Tester Communication	Keyless Operation
Terminal No. (Wire color)	Cause of Malfunction					
1 (WHT)	VBU line open or short	Comes on, then goes off.	Possible	Impossible	Possible	Impossible
2 (YEL)	IG1 line open or short	Blinking	Impossible	Impossible	Impossible	Possible
3 (BLU)	B-CAN L line open or short	Comes on, then goes off.	Possible	Possible	Immobilizer: Possible Keyless: Impossible	Impossible
4 (PNK)	B-CAN H line open or short	Comes on, then goes off.	Possible	Possible	Immobilizer: Possible Keyless: Impossible	Impossible
5 (LT BLU)	K-LINE line open or short	Comes on, then goes off.	Possible	Impossible	Impossible	Possible
6 (LT GRN)	S-NET line open or short	Blinking	Impossible	Impossible	Impossible	Possible
7 (BRN)	GND (LG3) line open	Blinking	Impossible	Impossible	Impossible	Impossible

Fig. 10: Identifying Malfunctioning Circuit Functions Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SYSTEM CHECK AND STATUS LOG

NOTE: The HDS can be used to:

- **Check the state of the immobilizer key registration and the S-NET line by doing a SYSTEM CHECK.**
- **Check the number of times the immobilizer-keyless control unit did not permit the engine to run by checking the STATUS LOG (see STATUS LOG).**

1. Connect the HDS to the data link connector (DLC), then turn the ignition switch to ON (II) and follow the prompts to the SYSTEM SELECTION MENU.

NOTE: If the HDS does not communicate with the vehicle, go to the DLC circuit

troubleshooting (see DLC CIRCUIT TROUBLESHOOTING).

2. At SYSTEM SELECTION MENU, enter IMMOBI, then select IMMOBILIZER SETUP.
3. Do the SYSTEM CHECK. If there is a system check number, do the troubleshooting for the item indicated (see **SYSTEM CHECK**).
4. Check the STATUS LOG using the HDS (see **STATUS LOG**). Troubleshoot the line with the highest counts first. If all the lines are 0 (zero), the problem may not be caused by the immobilizer system; check for ignition or fuel problems.

NOTE: Once repaired, clear the status log by removing the No. 15 (10 A) fuse in the under-hood fuse/relay box or disconnecting the battery.

SYMPTOM TROUBLESHOOTING INDEX

1. Troubleshoot the immobilizer system in the order shown:

Order of Priority	Symptom	Possible cause
1	Immobilizer indicator blinks.	Symptom troubleshooting (see **IMMOBILIZER INDICATOR BLINKS**).
2	Engine does not start with the immobilizer key.	Symptom troubleshooting (see **ENGINE DOES NOT START WITH THE IMMOBILIZER KEY**).
3	Immobilizer indicator does not come on.	Check the MIL indication. If the MIL comes on, go to the PGM-FI System MIL circuit troubleshooting (see **MIL CIRCUIT TROUBLESHOOTING**).
4	Immobilizer indicator does not go off.	Symptom troubleshooting (see **IMMOBILIZER INDICATOR DOES NOT GO OFF**).

SYMPTOM TROUBLESHOOTING

IMMOBILIZER INDICATOR BLINKS

NOTE: Before troubleshooting, check the items listed in General Check before Troubleshooting (see GENERAL CHECK BEFORE TROUBLESHOOTING).

1. Turn the ignition switch to LOCK (0).
2. Connect the HDS, then turn the ignition switch to ON (II).
3. From the SYSTEM SELECTION MENU, enter IMMOBI, select IMMOBILIZER SETUP, then select SYSTEM CHECK, NUMBER OF KEYS, and STATUS LOG.
4. Select the SYSTEM CHECK.

Is SYSTEM CHECK indicated?

YES -Troubleshoot the immobilizer system according to the result of the SYSTEM CHECK (see

SYSTEM CHECK) and STATUS LOG (see **STATUS LOG**).

NO -Go to step 5.

5. Turn the ignition switch to LOCK (0).
6. Enter the vehicle, and remove the ignition key from the ignition switch, then close all doors.
7. Operate the keyless transmitter LOCK and UNLOCK several times in the vehicle.

Do the door lock actuators work normally?

YES -Go to step 8.

NO -Check for a poor ground through PCM to G101 and/or an open or high resistance in the wire between immobilizer-keyless control unit 7P connector terminal No. 7 and PCM connector A (49P) terminal No. 41.

8. Turn the ignition switch to ON (II).
9. Back-probe and measure the voltage between immobilizer-keyless control unit 7P connector terminal No. 2 and body ground.

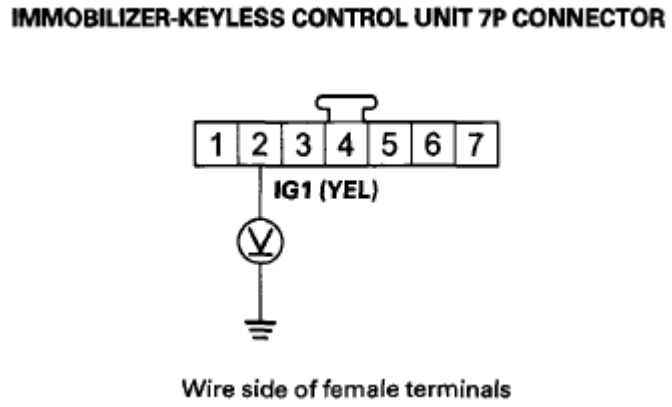

Fig. 11: Measuring Voltage Between Immobilizer-Keyless Control Unit 7P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Replace the immobilizer-keyless control unit (see **IMMOBILIZER-KEYLESS CONTROL UNIT REPLACEMENT**).

NO -Check for a blown No. 9 (20 A) fuse in the driver's under-dash fuse/relay box. If the fuse is OK, repair an open in the YEL wire between the driver's under-dash fuse/relay box and the immobilizer-keyless control unit.

ENGINE DOES NOT START WITH THE IMMOBILIZER KEY

NOTE: Before troubleshooting, check the items listed in General Check before Troubleshooting (see GENERAL CHECK BEFORE TROUBLESHOOTING).

1. Try to start the engine.

   Does the engine start?

   YES -Intermittent failure, the vehicle is OK at this time. Check STATUS LOG (see **STATUS LOG**) and check the line indicated in the table.

   NO -Go to step 2.

2. Turn the ignition switch to LOCK (0).
3. Turn the ignition switch to ON (II), and check the immobilizer indicator.

   Does the indicator blink once, then stay off?

   YES -Go to step 4.

   NO -Go to the **IMMOBILIZER INDICATOR BLINKS TROUBLESHOOTING** (see).

4. Turn the ignition switch to START (III).

   Does the starter motor run?

   YES -Go to step 5.

   NO -Go to Starting System, and check the starter motor (see **STARTER PERFORMANCE TEST**).

5. Try to start the engine with the immobilizer key.

   Does the engine start?

   YES -Go to step 6.

   NO -Go to the PGM-FI System Symptom Troubleshooting (see **GENERAL TROUBLESHOOTING INFORMATION**).

6. Wait for a few minutes with the engine running.

   Does the engine stop?

   YES -Go to the PGM-FI System Symptom Troubleshooting (see **GENERAL TROUBLESHOOTING INFORMATION**).

   NO -The system is OK at this time.

IMMOBILIZER INDICATOR DOES NOT GO OFF

1. Turn the ignition switch to LOCK (0).
2. Connect the HDS to the data link connector (DLC).
3. Turn the ignition switch to ON (II).
4. From the SYSTEM SELECTION MENU, enter IMMOBI, then select IMMOBILIZER SETUP, then select SYSTEM CHECK, NUMBER OF KEYS, and STATUS LOG.

   NOTE: If the HDS does not communicate with the immobilizer-keyless control unit, check the power, ground, and K-line connectors.

5. Do the SYSTEM CHECK with the HDS.

   Is N-1 OK indicated?

   YES -Do the indicator drive circuit check (see **THE INDICATOR DRIVE CIRCUIT CHECK**). If the indicator does not go off; replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

   NO -Substitute a known-good immobilizer-keyless control unit, then register it and recheck. If the symptom goes away, replace the original immobilizer-keyless control units (see **IMMOBILIZER-KEYLESS CONTROL UNIT REPLACEMENT**).

SYSTEM CHECK

1. Connect the HDS to the data link connector (DLC).
2. Turn the ignition switch to ON (II).
3. Monitor the SYSTEM CHECK in the IMMOBILIZER INFO with the HDS.

   NOTE: If the HDS does not communicate with the immobilizer keyless control unit, check the power, ground, and K-line connectors.

4. If the HDS displays NORMAL N-1, the immobilizer system is OK at this time, refer to the **STATUS LOG**. If the HDS displays any other messages, check as follows:

System Check No.	System Check	Possible Cause
A-1	The key is not registered	• This key is not registered in the immobilizer-keyless control unit. Try to register keys using the HDS. • No communication between the antenna and the immobilizer key because of interference from metal such as key chains/key rings/other keys.

		• Low battery voltage.
A-2	Communication error between the key and immobilizer-keyless control unit	• Intermittent interruption between transponder and immobilizer-keyless control unit. • The immobilizer key type is incorrect non-Acura key. • Key failure (transponder failure) • No communication between the antenna and the immobilizer key because of interference from metal such as key chains/key rings/other keys. • Low battery voltage.
A-3	No communication between the key and immobilizer-keyless control unit	• The ignition switch was turned to ON (II) with a non-immobilizer key. • The immobilizer key type is incorrect non-Acura key. • Key failure (transponder failure) • No communication between the antenna and the immobilizer key because of interference from metal such as key chains/key rings/other keys. • Low battery voltage. • Immobilizer-keyless control unit failure
B-1	The PCM is not registered	• The PCM was not registered. Try to register the PCM using the HDS. • No communication between the PCM and the immobilizer-keyless control unit because of low battery voltage. • No communication between the immobilizer-keyless control unit and the PCM because of electrical interference. • Open in the IG1 line
B-2	Error of communication format in PCM	• The PCM was not registered. Try to register the PCM using the HDS. • No communication between the PCM and the immobilizer-keyless control unit because of low battery voltage. • No communication between the immobilizer-keyless control unit and the PCM because of electrical interference.
C-1	The imoes unit is not registered	• Imoes unit was not registered. • No communication between the imoes unit and the immobilizer-keyless control unit because of low battery voltage.

		• No communication between the imoes unit and the immobilizer-keyless control unit because of electrical interference. • Try to register the imoes unit with the HDS.
C-2	Error of communication format in imoes unit	• Imoes unit was not registered. • No communication between the imoes unit and the immobilizer-keyless control unit because of low battery voltage. • No communication between the imoes unit and the immobilizer-keyless control unit because of electrical interference. • Try to register the imoes unit with the HDS.
D-1	S-NET line short	• S-NET line short from the PCM to the imoes or immobilizer-keyless control unit. (S-NET line short) • No communication between the PCM and the immobilizer-keyless control unit because of low battery voltage. • No communication between the immobilizer-keyless control unit and the PCM because of electrical interference. • Immobilizer-keyless control unit failure • PCM failure
D-2	No communication between imoes unit and immobilizer-keyless control unit (S-NET line)	• Blown fuse • S-NET line open from the imoes unit to the immobilizer-keyless control unit. (S-NET line open) • No communication between the imoes unit and the immobilizer-keyless control unit because of low battery voltage. • No communication between the imoes unit and the immobilizer-keyless control unit because of electrical interference. • Immobilizer-keyless control unit failure • Imoes unit failure
D-3	No communication between PCM and immobilizer-keyless control unit (S-NET line)	• Blown fuse • S-NET line open from the PCM to the immobilizer-keyless control unit. • No communication between the PCM and the immobilizer-keyless control unit because of low battery voltage.

		• No communication between the immobilizer-keyless control unit and the PCM because of electrical interference. • Immobilizer-keyless control unit failure • PCM failure
E-1	Initial registration of immobilizer-keyless control unit is not completed	The immobilizer-keyless control unit is not registered. Try to register the immobilizer-keyless control unit using the HDS.

STATUS LOG

If you suspect there is an immobilizer system problem, check the status log in the HDS.

1. Connect the HDS to the data link connector (DLC).
2. Turn the ignition switch to ON (II).
3. On the HDS screen, at SYSTEM SELECTION MENU, enter IMMOBI, then select IMMOBILIZER SETUP, select SYSTEM CHECK, NUMBER OF KEYS, and STATUS LOG, then select STATUS LOG.
4. Check the STATUS LOG count. Troubleshoot the status with the highest count first. If no counts are listed, the immobilizer system is OK. Continue with normal symptom troubleshooting.

Status Log No.	Detected Item	Probable Cause
A-1	KEY CODE MISMATCH(1) (Code format correct, but code data does not match)	• The key was not registered • Interference from metal such as key chains • Low battery voltage
A-2	KEY CODE MISMATCH(2) (Incorrect code format)	• Ignition switch was turned to ON (II) with another type of immobilizer key or aftermarket key • Interference from metal such as key chains • Low battery voltage
A-3	KEY CODE MISMATCH(3) (No	• Ignition switch was turned to ON (II) with another type of immobilizer key or aftermarket key • Interference from metal such as key chains

	transponder detected)	• Low battery voltage • Key failure • Immobilizer-keyless control unit failure
B-1	PCM CODE MISMATCH(1) (Code format correct, but code data does not match)	• PCM was not registered correctly • Low battery voltage • Poor or loose terminal connections at the immobilizer-keyless control unit • Communication line electrical noise
B-2	PCM MISMATCH(2) (Incorrect code format)	• PCM was not registered correctly • Low battery voltage • Poor or loose terminal connections at the immobilizer-keyless control unit • Communication line electrical noise
C-1	IMOES UNIT MISMATCH(1) (Code format correct, but data does not match)	• Imoes unit was not registered • The communication was not good between imoes unit and immobilizer-keyless control unit by battery voltage low • The communication was not good between imoes unit and immobilizer-keyless control unit by influence of some noise
C-2	IMOES UNIT MISMATCH(2) (Incorrect code format)	• Imoes unit was not registered correctly • The communication was not good between imoes unit and immobilizer-keyless control unit by battery voltage low • The communication was not good between imoes unit and immobilizer-keyless control unit by influence of some noise
D-1	S-NET LINE PROBLEM(1) (Short to ground)	• Low battery voltage • Poor or loose terminal connections at the immobilizer-keyless control unit and the PCM • Communication line electrical noise
D-2	S-NET LINE PROBLEM(2) (No communication)	• Blown fuse • Harness open from imoes unit to immobilizer-keyless control unit • The communication was not good between imoes unit and immobilizer-keyless control unit by battery voltage low • The communication was not good between imoes unit and immobilizer-keyless control unit by influence of some noise

		• Imoes unit failure • Immobilizer-keyless control unit failure
D-3	S-NET LINE PROBLEM(3) (Open line or PCM failure)	• Open or short in the harness from the PCM to the immobilizer-keyless control unit • Low battery voltage • Poor or loose terminal connections at the immobilizer-keyless control unit and the PCM • Communication line electrical noise • Poor S-NET data communication due to electrical interference

IMMOBILIZER-KEYLESS CONTROL UNIT INPUT TEST

NOTE:

- **SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.**
- **Before testing, troubleshoot the multiplex integrated control unit first, using B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**

1. Remove the steering column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
2. Disconnect the 7P connector (A) from the immobilizer-keyless control unit (B).

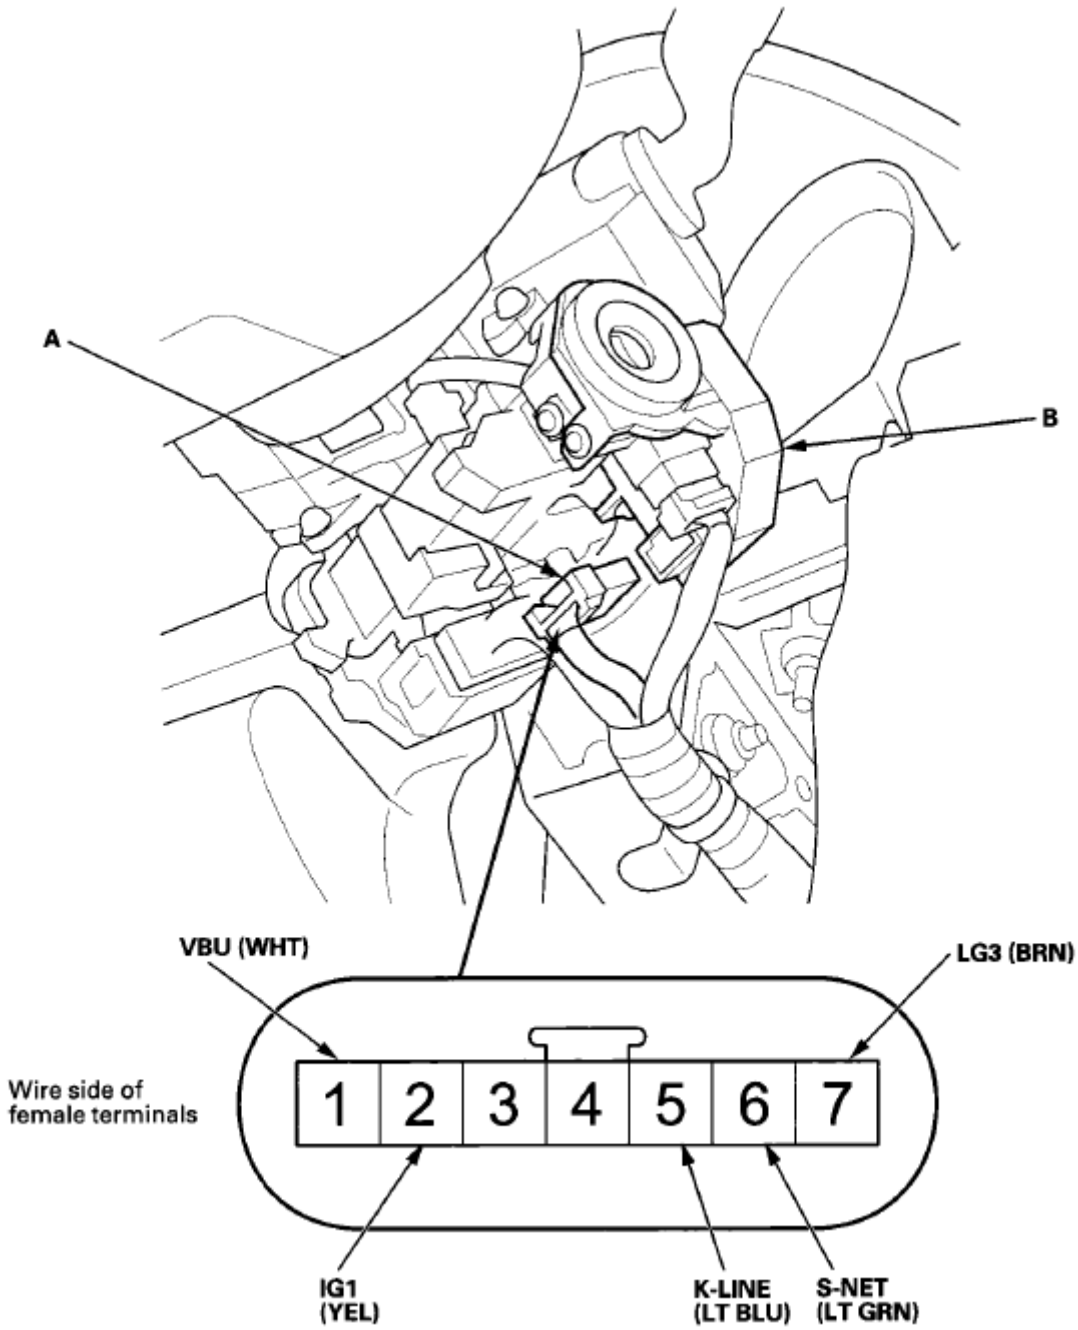

Fig. 12: Identifying Immobilizer-Keyless Control Unit With 7P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 4.
4. With the connector still disconnected, do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.

- If all the input tests prove OK, go to step 5.

Cavity	Wire	Terminal name	Test condition	Test: Desired result	Possible cause if desired result is not obtained
6	LT GRN	S-NET	Disconnect PCM connector A (49P) (see **ECM/PCM REPLACEMENT**)	Measure the voltage to ground: There should be about 5 V.	• A short to ground in the wire • An open in the wire • Faulty imoes unit (built into the MICU) • Faulty driver's under-dash fuse/relay box • An open in the S-NET wire
			Disconnect the battery negative terminal	Measure the resistance between terminal and body ground: There should be more than 50 k ohms.	
			Disconnect PCM connector A (49P) (see **ECM/PCM REPLACEMENT**)	Check for continuity between terminal and PCM connector A (49P) terminal No. 46: There should be continuity.	An open in the wire

5. Reconnect the connector to the immobilizer-keyless control unit, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, replace the immobilizer-keyless control unit (see **IMMOBILIZER-KEYLESS CONTROL UNIT REPLACEMENT**).

NOTE: If you replace the immobilizer-keyless control unit, do the immobilizer registration (see IMMOBILIZER KEY REGISTRATION).

Cavity	Wire	Terminal name	Test condition	Test: Desired result	Possible cause if desired result is not obtained
1	WHT	VBU	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • An open or high resistance in the wire
2	YEL	IG1	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 9 (20 A) fuse in the driver's under-dash fuse/relay box • An open or high resistance in the wire

7	BRN	LG3	Under all conditions	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty PCM • Poor ground(G101) or an open in the ground wire • An open or high resistance in the wire
5	LT BLU	K-LINE	Ignition switch ON (II)	Measure the voltage to ground: There should be 9-12 V.	• Faulty control unit on the K-LINE • K-LINE short to ground

IMMOBILIZER KEY REGISTRATION

NOTE:

- **The HDS is required for registration of the immobilizer keys.**
- **Programming the immobilizer also programs the keyless transmitter.**
- **Check for aftermarket electrical equipment that can cause problems with transponder operation.**
- **The immobilizer-keyless control unit can store up to six immobilizer keys.**

ADD ONE NEW KEY/KEYLESS TRANSMITTER

1. Have a registered key, a new immobilizer key, and the first password from the iN system.
2. Connect the HDS to the data link connector (DLC).
3. Turn the ignition switch to ON (II).
4. Select IMMOBI from the SYSTEM SELECTION MENU, then select IMMOBILIZER SETUP.
5. Select ADD AND DELETE KEYS, then ADD 1 KEY.
6. Do the registration according to the instructions on the HDS screen.
7. Check if the engine can be started with the newly registered key.
8. When prompted by the HDS, do the keyless transmitter programming.
9. Make sure the keyless remote operation works properly.

ADD AND DELETE KEYS/KEYLESS TRANSMITTERS, THEN SELECT DELETE OR ADD KEYS

1. Have all registered keys, all new keys, and the first password from the iN system.
2. Connect the HDS to the data link connector (DLC).
3. Turn the ignition switch to ON (II).
4. Select IMMOBI from the SYSTEM SELECTION MENU, then select IMMOBILIZER SETUP.
5. Select ADD AND DELETE KEYS, or DELETE OR ADD MULTIPLE KEYS.
6. Do the registration according to the instructions on the HDS screen.
7. Check if the engine can be started with all the registered keys.
8. When prompted by the HDS, do the keyless transmitter programming.

9. Make sure the keyless remote operation works properly.

ALL KEYS ARE LOST

1. Prepare all new keys and have the immobilizer PCM code.
2. Connect the HDS to the data link connector (DLC).
3. Turn the ignition switch to ON (II).
4. Select IMMOBI from the SYSTEM SELECTION MENU, then select IMMOBILIZER SETUP.
5. Select ADD AND DELETE KEYS, then ALL KEYS LOST.
6. Do the registration according to the instructions on the HDS screen.
7. Check if the engine can be started using all the registered keys.
8. When prompted by the HDS, do the keyless transmitter programming.
9. Make sure the keyless remote operation works properly.

IMMOBILIZER-KEYLESS CONTROL UNIT REGISTRATION

1. Have all registered keys and the PCM code.
2. Connect the HDS to the data link connector (DLC).
3. Turn the ignition switch to ON (II).
4. Select IMMOBI from the SYSTEM SELECTION MENU, then select IMMOBILIZER SETUP.
5. Select REPLACE IMMOBILIZER RECEIVER/CONTROL UNIT.
6. Do the registration according to the instructions on the HDS screen.
7. Check that the engine can be started with all registered keys, and check that the door locks operate using the Immobilizer key transmitter.

IMMOBILIZER-KEYLESS CONTROL UNIT REPLACEMENT

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Remove the steering column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
2. Disconnect the 7P connector (A) from the immobilizer-keyless control unit (B).

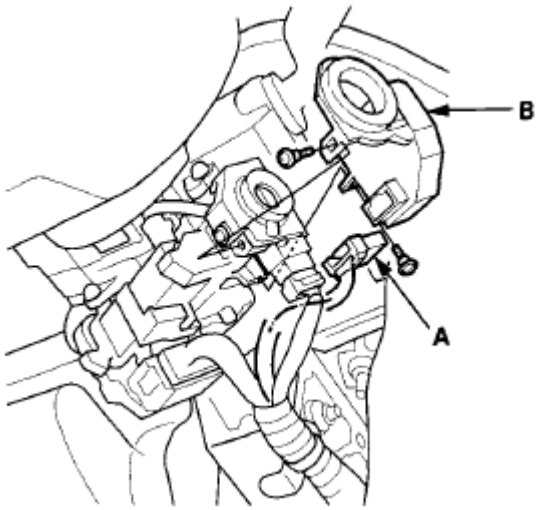

Fig. 13: Identifying Immobolizer-Keyless Control Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the two screws and the immobilizer-keyless control unit.
4. Install the immobilizer-keyless control unit in the reverse order of removal.
5. After replacement, register the immobilizer-keyless control unit (see **IMMOBILIZER KEY REGISTRATION**), and make sure the immobilizer system works properly.
6. Program all of the client's keys/keyless transmitters (see **ADD AND DELETE KEYS/KEYLESS TRANSMITTERS, THEN SELECT DELETE OR ADD KEYS**).

SYSTEM DESCRIPTION

SECURITY ALARM

The security alarm system automatically arms after the doors, hood, and trunk lid are closed and locked. For the system to arm, the ignition switch must be in the LOCK (0), or the vehicle ignition in the OFF mode, with the key removed from the ignition switch, or the remote removed from the remote slot, and the driver's and passenger's MICUs must receive signals that the doors, hood, and trunk lid are closed and locked. The alarm can be disarmed at any time by unlocking the driver door with the key or pressing the UNLOCK button on the transmitter, or by grabbing either the driver's or front passenger's door handle with the keyless access remote in range.

When everything is closed and locked, the only inputs that are grounded, and have 0 V, are the driver's door lock knob switch (LOCK position) and the audio unit or audio-navigation unit (if equipped). In other words, all of the other switches are open, and have about 10 to 12 V, including the key cylinder switches. A beep sounds and the parking lights flash to confirm the security alarm system is armed if the LOCK button is pressed a second time within 5 seconds. The security indicator in the gauge control module begins to flash immediately after the vehicle is completely closed and locked, and 15 seconds later, the security system arms. If the security indicator does not flash, the system is not arming.

If one of the switches is misadjusted or shorted internally, or there is a short in one of the keyless/power door lock/security circuits, the security system will not arm. As long as the control unit continues to receive a ground signal (0 V) except for the driver's door lock/unlock knob switch input, it senses that the vehicle is not closed

and locked, and the system will not arm. A switch that is slightly misadjusted can cause the alarm to sound for no apparent reason. In this case, a significant change in outside air temperature, the vibration of a passing truck, or someone bumping into the vehicle could cause the alarm to sound.

NOTE: There is no glass breakage or motion detection feature.

If anything is opened or improperly unlocked after the system is armed, the control unit receives a ground signal from that switch, and the 10 to 12 V reference drops to 0 V. If the audio unit or audio-navigation unit (if equipped) is disconnected, the input loses its ground, and the input voltage goes from 0 V to 10 to 12 V. The system sounds the alarm when any of these occur:

- A door or the trunk lid is forced open.
- A door is unlocked without using the key or the transmitter.
- The hood is opened.
- The audio unit or audio-navigation unit (if equipped) is disconnected.
- The transmitter PANIC button is pressed.

When the system sounds the alarm, the horn sounds and the exterior lights flash for 2 minutes. The alarm can be stopped at any time by unlocking the driver's door by pressing any button on the transmitter.

NOTE: The security system can be customized in the multi-information display (MID) to suit the client's needs. For more information about keyless/security system options, refer to the Owner's manual.

KEYLESS ENTRY SYSTEM

The keyless entry system is integrated with the multiplex integrated control system. The multiplex integrated control unit (MICU) receives LOCK, UNLOCK, and PANIC signals from the immobilizer-keyless control unit (keyless receiver).

The keyless entry system allows you to lock and unlock the vehicle with the transmitter. When you press the LOCK button, all doors lock. When you press the UNLOCK button once, only the driver's door unlocks. The other doors will unlock when you press the button a second time. The doors will not lock with the transmitter if a door is not fully closed, or if the key is in the ignition switch.

When the switch for the front individual map lights and rear individual map lights are in the DOOR position, it comes on when the UNLOCK button is pressed. If a door is not opened, the light goes off and the doors relock in about 30 seconds. If the doors are locked with the transmitter within 30 seconds, the light goes off immediately.

NOTE: The keyless entry system can be customized in the multi-information display (MID) to suit the client's needs. For more information about keyless/security system options, refer to the Owner's manual.

PANIC MODE

The panic mode sounds the alarm in order to attract attention. When the PANIC button on the transmitter is pressed and held for 2 seconds, the horns sound and the exterior lights flash for about 20 seconds.

The panic mode can be cancelled at anytime by pressing any button on the transmitter or by turning the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. The panic mode will not function if the ignition switch is in ON (II), or the vehicle ignition in the ON mode.

DTC TROUBLESHOOTING

DTC B1127: DRIVER'S DOOR KEY CYLINDER SWITCH MALFUNCTION

NOTE:

- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-**

CAN SYSTEM DIAGNOSIS TEST MODE A).

- **For vehicles without keyless access, you will need two keys to do this troubleshooting.**
- **For vehicles with keyless access, use the key inside the keyless remote.**

1. Clear the DTCs with the HDS.
2. With one ignition key, turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Insert the second ignition key or remote into the driver's door key cylinder switch, and turn the key to the LOCK and UNLOCK positions 10 times.
4. Check for DTCs with the HDS.

   Is DTC B1127 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the driver's door key cylinder switch system is OK at this time. Check for loose or poor connections.

5. With the driver's door key cylinder in the neutral position, select KEYLESS TRANSMITTER with the HDS, and enter DATA LIST.
6. Check the ON/OFF information of the DRIVER'S DOOR KEY CYLINDER SWITCH (LOCK) and DRIVER'S DOOR KEY CYLINDER SWITCH (UNLOCK) in the DATA LIST.

   Are both information indicators OFF?

   YES - Go to step 12.

   NO - Go to step 7.

7. Disconnect the driver's door lock actuator 10P connector.
8. Check the ON/OFF information of the DRIVER'S DOOR KEY CYLINDER SWITCH (LOCK) and DRIVER'S DOOR KEY CYLINDER SWITCH (UNLOCK) in the DATA LIST.

   Are both information indicators OFF?

   YES - Faulty driver's door key cylinder switch; replace the driver's door latch (see **FRONT DOOR LATCH REPLACEMENT**).

   NO - Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect the power window master switch 37P connector.
11. Check for continuity between body ground and power window master switch 37P connector terminals No. 28 and No. 29 individually.

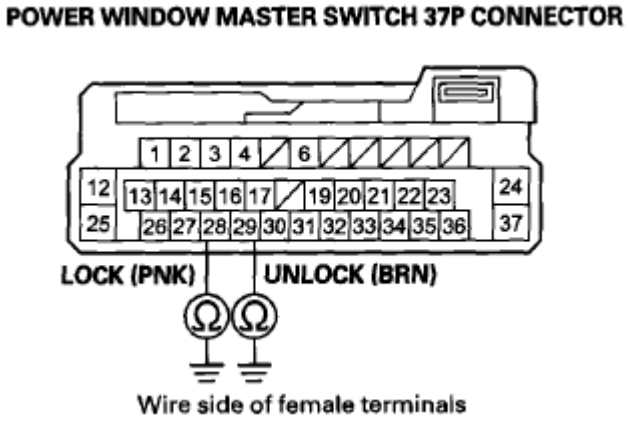

Fig. 8: Checking Continuity Between Body Ground And Power Window Master Switch 37P Connector Terminals No. 28 And No. 29 Individually With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the LOCK or UNLOCK wire.

NO - Replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the driver's door lock actuator 10P connector.
14. Disconnect the power window master switch 37P connector.
15. Check for continuity between power window master switch 37P connector terminals No. 28 and No. 29.

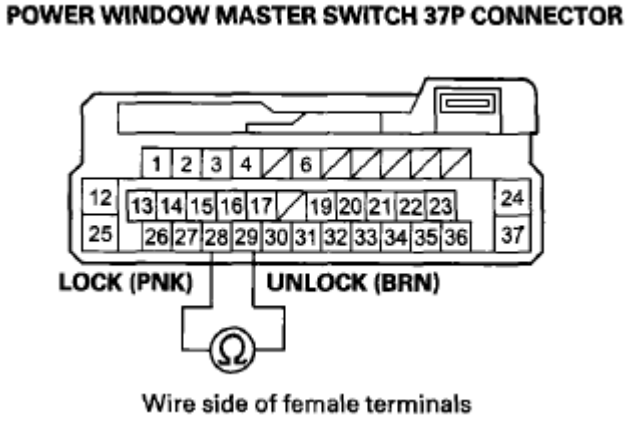

Fig. 9: Checking Continuity Between Power Window Master Switch 37P Connector Terminals No. 28 And No. 29
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short between the LOCK and UNLOCK wires.

NO - Substitute a known-good power window master switch. If the symptom goes away, replace the original power window master switch (see **REAR POWER WINDOW SWITCH TEST**). If not, driver's door key cylinder switch is faulty; replace the driver's door latch (see **FRONT DOOR LATCH REPLACEMENT**).

DTC B1128: DRIVER'S DOOR LOCK SWITCH MALFUNCTION

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Lock and unlock the driver's door with the driver's door lock switch.
3. Check for DTCs with the HDS.

Is DTC B1128 indicated?

YES - Replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

NO - Intermittent failure, the system is OK at this time. Check for a loose or poor connection.

DTC B1129: DRIVER'S DOOR LOCK KNOB SWITCH MALFUNCTION

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Operate the driver's door lock knob switch several times.
4. Check for DTCs with the HDS.

Is DTC B1129 indicated?

YES - Go to step 5.

NO - Intermittent failure, the driver's door lock knob switch system is OK at this time. Check for loose or poor connections.

5. Select KEYLESS TRANSMITTER from the BODY ELECTRICAL SYSTEM SELECT menu, and enter DATA LIST.
6. Check the ON/OFF information of the DRIVER'S DOOR LOCK KNOB SWITCH (LOCK) and the DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK).

Is the DRIVER'S DOOR LOCK KNOB SWITCH (LOCK) information indicator ON and the DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK) information indicator OFF with the driver's door lock knob switch in LOCK position, and is the DRIVER'S DOOR LOCK KNOB SWITCH (LOCK) information indicator OFF and the DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK) information indicator ON with the driver's door lock knob switch in UNLOCK position?

YES - Replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

NO - Go to step 7.

7. Disconnect the driver's door lock actuator 10P connector.
8. Check the ON/OFF information of the DRIVER'S DOOR LOCK KNOB SWITCH (LOCK) and DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

   Are both information indicators OFF?

   YES - Go to step 12.

   NO - Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect the power window master switch 37P connector.
11. Check for continuity between body ground and power window master switch 37P connector terminals No. 30 and No. 31 individually.

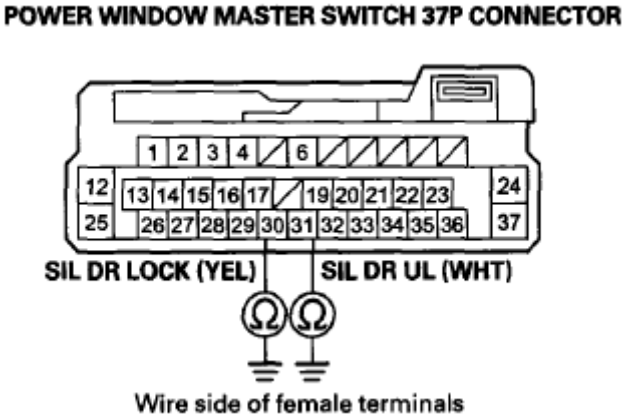

Fig. 10: Checking Continuity Between Body Ground And Power Window Master Switch 37P Connector Terminals No. 30 And No. 31 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the LOCK or UNLOCK wire.

NO - Replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the power window master switch 37P connector.
14. Check for continuity between power window master switch 37P connector terminals No. 30 and No. 31.

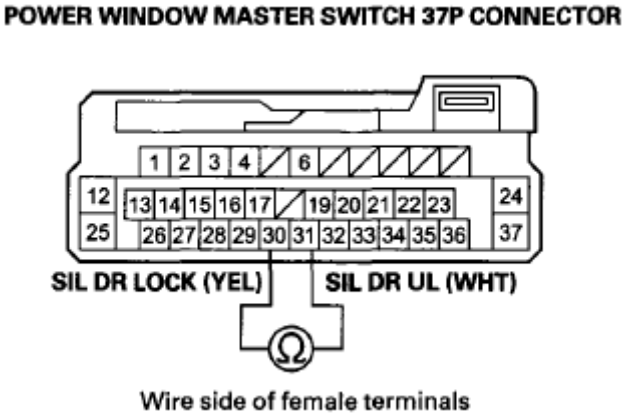

Fig. 11: Checking Continuity Between Power Window Master Switch 37P Connector Terminals No. 30 And No. 31
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short between the LOCK and UNLOCK wires.

NO - Check for an open or high resistance in the driver's door lock knob switch (LOCK) wire or the driver's door lock knob switch (UNLOCK) wire between the door multiplex control unit and the driver's door lock knob switch. If the wires are OK, the driver's door lock knob switch is faulty; replace the driver's door latch (see **FRONT DOOR LATCH REPLACEMENT**).

SYMPTOM TROUBLESHOOTING INDEX

1. Check for B-CAN DTCs. If any B-CAN DTCs are indicated, troubleshoot and resolve them first.
2. If the door lock system and the keyless operation do not work, troubleshoot the door locks first.

NOTE: The system does not function when the ignition switch is ON (II), or the vehicle ignition is in the ON mode.

Symptom	Check Items	Also check for
	• Poor ground (G203, G401, G402, G405, G601, G651) • Driver's door key cylinder switch test (see **DOOR KEY CYLINDER SWITCH TEST**) • Door switch test (check the door switch ON/OFF information with the HDS)	

All the doors will not lock or unlock with driver's door key cylinder or door lock switch or keyless transmitter	• Door lock switch test (check the door switch ON/OFF information with the HDS) • Door lock actuator test (see **DOOR LOCK ACTUATOR TEST**) • Driver's MICU input test (see **CONTROL UNIT INPUT TEST**) • Passenger's MICU input test (see **CONTROL UNIT INPUT TEST**) • Check the UART line ○ An open in the wire ○ A short to ground wire ○ A short to power wire	
Driver's and left rear doors will not lock or unlock with driver's door key cylinder or door lock switch or keyless transmitter	• Poor ground (G401, G402, G601) • Blown No. 24 (20 A) fuse in the driver's under-dash fuse/relay box • Blown No. 25 (15 A) fuse in the driver's under-dash fuse/relay box • Driver's MICU input test (see **CONTROL UNIT INPUT TEST**) • Door multiplex control unit input test (see **CONTROL UNIT INPUT TEST**)	
Front passenger's and right rear doors will not lock or unlock with driver's door key cylinder or door lock switch or keyless transmitter	• Poor ground (G203, G401, G405, G651) • Blown No. 1-2 (AS F/B STD) (40 A) fuse in the under-hood fuse/relay box • Blown No. 10 (10 A) fuse in the passenger's under-dash fuse/relay box • Blown No. 13 (20 A) fuse in the passenger's under-dash fuse/relay box • Passenger's MICU input test (see **CONTROL UNIT INPUT TEST**) • Door multiplex control unit input test (see **CONTROL UNIT INPUT TEST**)	
Keyless operation does not work (LOCK, UNLOCK, PANIC)	Symptom troubleshooting (see **KEYLESS OPERATION DOES NOT WORK (LOCK, UNLOCK, PANIC)**)	Customized settings in the multi-information display (MID), see Owner's manual for details
Doors will not unlock (or lock) with the transmitter, but will unlock (or lock) with the door lock switch	• Symptom troubleshooting (see **DOORS WILL NOT UNLOCK (OR LOCK) WITH THE TRANSMITTER, BUT WILL UNLOCK (OR LOCK) WITH THE DOOR LOCK SWITCH AND THE DOOR KEY**	

and the door key cylinder switch	**CYLINDER SWITCH**) • Door lock switch test (check the door switch ON/OFF information with the HDS)	
Doors automatically relock 30 seconds after being unlocked with the transmitter even though a door has been opened	• Symptom troubleshooting (see **DOORS AUTOMATICALLY RELOCK 30 SECONDS AFTER BEING UNLOCKED WITH THE TRANSMITTER EVEN THOUGH A DOOR HAS BEEN OPENED**) • Door switch test (check the door switch ON/OFF information with the HDS)	
Only driver's door will unlock or door locks relock immediately after unlocking with the remote	Driver's door lock knob switch test (see **DOOR LOCK KNOB SWITCH TEST**)	
Trunk lid release actuator will not work when the trunk lid outer handle switch is pressed	• Lock knob switch is faulty • Open lock knob switch unlock input wire • Door lock actuator is faulty	
The horn does not sound and/or the headlights do not flash when the PANIC button on the transmitter is pressed	Symptom troubleshooting (see **THE HORN DOES NOT SOUND AND/OR THE HEADLIGHTS DO NOT FLASH WHEN THE PANIC BUTTON ON THE TRANSMITTER IS PRESSED**)	Customized settings in the multi-information display (MID), see Owner's manual for details
Keyless operation will work even though the ignition key is in the ignition switch	Ignition key switch test (see **IGNITION KEY SWITCH TEST**)	
Security alarm system will not arm	Symptom troubleshooting (see **SECURITY ALARM SYSTEM WILL NOT ARM**)	

SYMPTOM TROUBLESHOOTING

THE HORN DOES NOT SOUND AND/OR THE HEADLIGHTS DO NOT FLASH WHEN THE PANIC BUTTON ON THE TRANSMITTER IS PRESSED

NOTE: Before troubleshooting, check the B-CAN DTCs. If any DTC is indicated, refer to the B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A), and troubleshoot the indicated DTCs first.

1. Press the PANIC button.

   Do the horns sound?

   YES - Go to step 3.

NO - Go to step 2.

2. Press the horn button.

   Do the horns sound?

   YES - Go to step 3.

   NO - Check the horn relay circuit (see **CIRCUIT DIAGRAM**).

3. Turn the headlight switch ON.

   Do the headlights come on?

   YES - Go to step 4.

   NO - Check the lighting circuit. Do the MICU input test (see **MICU INPUT TEST**).

4. Do the transmitter test (see **TRANSMITTER TEST**).

   Is the transmitter OK?

   YES - Substitute a known-good immobilizer-keyless control unit, and recheck. If there is still a problem, substitute a known-good driver's under-dash fuse/relay box, and recheck. If the problem goes away, replace the original immobilizer-keyless control unit (see **IMMOBILIZER-KEYLESS CONTROL UNIT REGISTRATION**) or the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

   NO - Replace the transmitter.

DOORS AUTOMATICALLY RELOCK 30 SECONDS AFTER BEING UNLOCKED WITH THE TRANSMITTER EVEN THOUGH A DOOR HAS BEEN OPENED

NOTE:

- **Opening the trunk does not cancel this function; only an open door signal cancels the automatic relock.**
- **Before troubleshooting, check the B-CAN DTCs. If any DTC is indicated, refer to the B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A), and troubleshoot the indicated DTCs first.**
- **The driver's door switch and the left rear door switch are connected to the driver's MICU, and the front passenger's door switch and the right rear door switch are connected to the passenger's MICU.**

1. Move the interior light switch to the DOOR position.
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Watch the front individual map light and the multi-information display on the gauge control module.

Does the front individual map light and multi-information display come on when each door is opened, and go off when each door is closed?

YES - Substitute a known-good driver's (or passenger's) under-dash fuse/relay box, and recheck. If the symptom goes away, replace the original under-dash fuse/relay box.

NO - Repair an open or high resistance in the wire between the driver's (or passenger's) MICU (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**) and each door switch, or a bad door switch.

KEYLESS OPERATION DOES NOT WORK (LOCK, UNLOCK, PANIC)

NOTE:

- **Before troubleshooting, check the B-CAN DTCs. If any DTC is indicated, refer to the B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A), and troubleshoot the indicated DTCs first.**
- **If the LOCK and UNLOCK buttons work OK, but the PANIC button does not, see the troubleshooting for the horn does not sound and/or the headlights do not flash when the PANIC button on the transmitter is pressed (see THE HORN DOES NOT SOUND AND/OR THE HEADLIGHTS DO NOT FLASH WHEN THE PANIC BUTTON ON THE TRANSMITTER IS PRESSED).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Try to start the engine.

   Does the engine start?

   YES - The immobilizer system is OK, go to step 3.

   NO - Go to the immobilizer symptom troubleshooting (see **SYMPTOM TROUBLESHOOTING INDEX**).

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Do the transmitter test.
   - Without keyless access system (see **WITHOUT KEYLESS ACCESS SYSTEM**)
   - With keyless access system (see **KEYLESS ACCESS SYSTEM MODE SWITCH TEST/REPLACEMENT**)

   Is the transmitter OK?

   YES - Replace the immobilizer-keyless control unit (see **IMMOBILIZER-KEYLESS CONTROL UNIT REGISTRATION**).

   NO - Replace the transmitter.

DOORS WILL NOT UNLOCK (OR LOCK) WITH THE TRANSMITTER, BUT WILL UNLOCK (OR LOCK) WITH THE DOOR LOCK SWITCH AND THE DOOR KEY CYLINDER SWITCH

NOTE: Before troubleshooting, check the B-CAN DTCs. If any DTC is indicated, refer to the B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A), and troubleshoot the indicated DTCs first.

1. Turn the ignition switch to LOCK (0).
2. Remove the ignition key from the ignition switch.
3. Close and lock the doors.
4. Try to lock/unlock the doors with the keyless transmitter.

   Do the door lock actuators work normally?

   YES - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

   NO - Go to step 5.

5. Open the driver's door.

   Does the key-in reminder chime sound?

   YES - Faulty ignition key switch, or short to ground on the wire related to the ignition switch. Repair the wire as needed.

   NO - Go to step 6.

6. Do the transmitter test (see **TRANSMITTER TEST**).

   Is the transmitter OK?

   YES - Substitute a known-good driver's under-dash fuse/relay box, and recheck. If there is still a problem, substitute a known-good immobilizer-keyless control unit, and recheck. If the problem goes away, replace the original immobilizer-keyless control unit (see **IMMOBILIZER-KEYLESS CONTROL UNIT REGISTRATION**).

   NO - Replace the transmitter.

SECURITY ALARM SYSTEM WILL NOT ARM

NOTE: Before troubleshooting, check the B-CAN DTCs. If any DTC is indicated, refer to the B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A), and troubleshoot the indicated DTCs first.

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Select SECURITY from the BODY ELECTRICAL menu, and enter the DATA LIST with the HDS.
3. Check the ON/OFF information in the DATA LIST when each switch is operating.
   - TRUNK LID/TAILGATE SWITCH
   - SECURITY HOOD SWITCH
   - DRIVER'S DOOR LOCK KNOB SWITCH (LOCK)
   - DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK)
   - FRONT PASSENGER'S DOOR LOCK KNOB SW (UNLOCK)
   - DRIVER'S DOOR SWITCH
   - FRONT PASSENGER'S DOOR SWITCH
   - DRIVER'S DOOR KEY CYLINDER SWITCH (LOCK)
   - DRIVER'S DOOR KEY CYLINDER SWITCH (UNLOCK)
   - DRIVER'S REAR DOOR KNOB SWITCH (UNLOCK)
   - PASSENGER'S REAR DOOR KNOB SW. (UNLOCK)
   - DRIVER'S REAR DOOR SWITCH
   - PASSENGER'S REAR DOOR SWITCH

   Is each switch information OK?

   YES - Intermittent failure, the system is OK at this time.

   NO - Troubleshoot the indicated circuit.

   - Trunk lid latch switch circuit troubleshooting (see **TRUNK LID LATCH SWITCH CIRCUIT TROUBLESHOOTING**)
   - Security hood switch circuit troubleshooting (see **SECURITY HOOD SWITCH CIRCUIT TROUBLESHOOTING**)
   - Driver's door lock knob switch circuit troubleshooting (see **DRIVER'S DOOR LOCK KNOB SWITCH CIRCUIT TROUBLESHOOTING**)
   - Front passenger's door lock knob switch circuit troubleshooting (see **FRONT PASSENGER'S DOOR LOCK KNOB SWITCH CIRCUIT TROUBLESHOOTING**)
   - Driver's door switch circuit troubleshooting (see **DRIVER'S DOOR SWITCH CIRCUIT TROUBLESHOOTING**)
   - Front passenger's door switch circuit troubleshooting (see **FRONT PASSENGER'S DOOR SWITCH CIRCUIT TROUBLESHOOTING**)
   - Driver's door key cylinder switch circuit troubleshooting (see **DRIVER'S DOOR KEY CYLINDER SWITCH CIRCUIT TROUBLESHOOTING**)
   - Left rear door lock knob switch circuit troubleshooting (see **LEFT REAR DOOR LOCK KNOB SWITCH CIRCUIT TROUBLESHOOTING**)
   - Right rear door lock knob switch circuit troubleshooting (see **RIGHT REAR DOOR LOCK KNOB SWITCH CIRCUIT TROUBLESHOOTING**)

- Left rear door switch circuit troubleshooting (see **LEFT REAR DOOR SWITCH CIRCUIT TROUBLESHOOTING**)
- Right rear door switch circuit troubleshooting (see **RIGHT REAR DOOR SWITCH CIRCUIT TROUBLESHOOTING**)

TRUNK LID LATCH SWITCH CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. With the trunk lid closed, select SECURITY with the HDS, and enter the DATA LIST.
3. Check the ON/OFF information of the TRUNK LID/TAILGATE SWITCH in the DATA LIST.

   Is information indicator ON?

   YES - Go to step 4.

   NO - Go to step 8.

4. Disconnect the trunk lid latch 3P connector.
5. Check the ON/OFF information of the TRUNK LID/TAILGATE SWITCH in the DATA LIST.

   Is information indicator OFF?

   YES - Faulty trunk lid latch switch; replace the trunk lid latch (see **TRUNK LID LATCH REPLACEMENT**).

   NO - Go to step 6.

6. Disconnect driver's under-dash fuse/relay box connector D(16P).
7. Check for continuity between driver's under-dash fuse/relay box connector D (16P) terminal No. 5 and body ground.

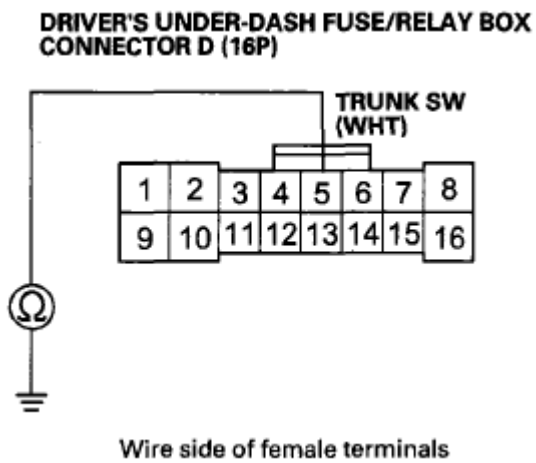

Fig. 12: Checking Continuity Between Driver's Under-Dash Fuse/Relay Box Connector D (16P)

Terminal No. 5 And Body Ground With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

8. Disconnect the trunk lid latch 3P connector.
9. Connect trunk lid latch 3P connector terminal No. 1 and body ground with a jumper wire.

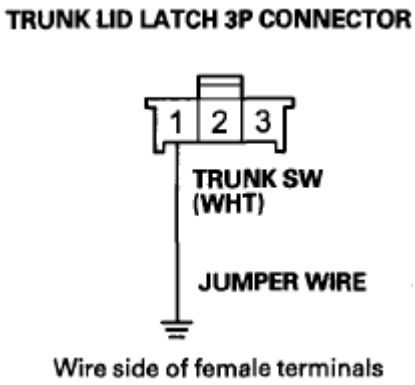

Fig. 13: Connecting Trunk Lid Latch 3P Connector Terminal No. 1 And Body Ground With Jumper Wire With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Check the ON/OFF information of the TRUNK LID/TAILGATE SWITCH in the DATA LIST.

    Is information indicator ON?

    YES - Go to step 11.

    NO - Go to step 12.

11. Check for continuity between trunk lid latch 3P connector terminal No. 2 and body ground.

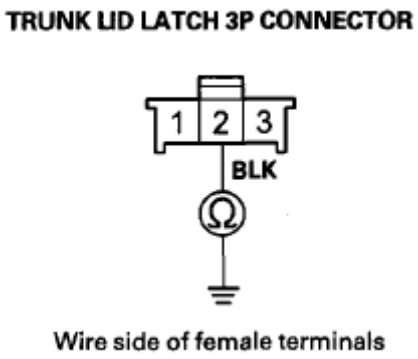

Fig. 14: Checking Continuity Between Trunk Lid Latch 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty trunk lid latch switch; replace the trunk lid latch (see **TRUNK LID LATCH REPLACEMENT**).

NO - Repair an open or high resistance in the ground wire or poor ground (G603).

12. Connect driver's under-dash fuse/relay box connector D (16P) terminal No. 5 and body ground with a jumper

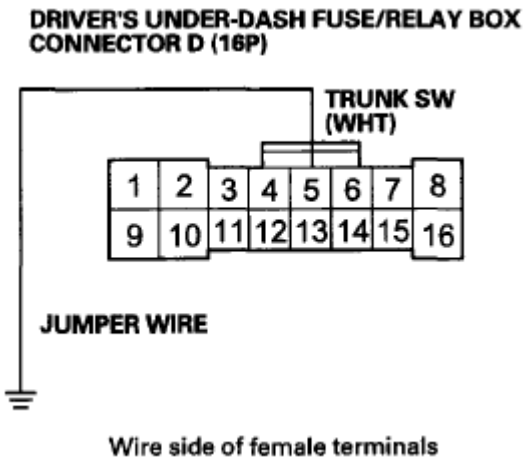

Fig. 15: Connecting Driver's Under-Dash Fuse/Relay Box Connector D (16P) Terminal No. 5 And Body Ground With Jumper
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check the ON/OFF information of the TRUNK LID/TAILGATE SWITCH in the DATA LIST.

Is information indicator ON?

YES - Repair an open or high resistance in the wire.

NO - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

SECURITY HOOD SWITCH CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. With the hood closed, select SECURITY with the HDS, and enter the DATA LIST.
3. Check the ON/OFF information of the SECURITY HOOD SWITCH in the DATA LIST.

   Is information indicator ON?

   YES - Go to step 4.

   NO - Go to step 8.

4. Disconnect the security hood switch 2P connector.
5. Check the ON/OFF information of the SECURITY HOOD SWITCH in the DATA LIST.

   Is information indicator OFF?

   YES - Faulty security hood switch; replace the hood latch (see **HOOD LATCH REPLACEMENT**).

   NO - Go to step 6.

6. Disconnect driver's under-dash fuse/relay box connector G (13P).
7. Check for continuity between driver's under-dash fuse/relay box connector G (13P) terminal No. 3 and body ground.

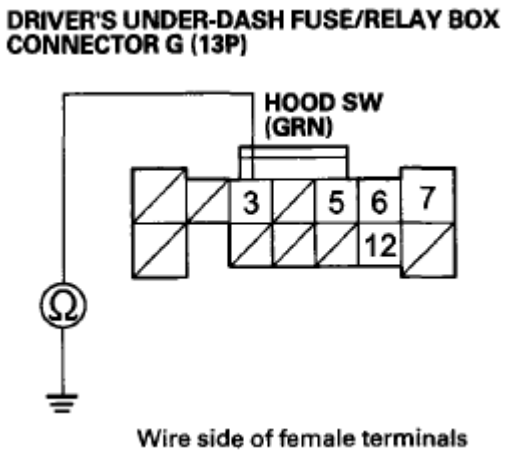

Fig. 16: Checking Continuity Between Driver's Under-Dash Fuse/Relay Box Connector G (13P) Terminal No. 3 And Body Ground With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

8. Disconnect the security hood switch 2P connector.
9. Connect security hood switch 2P connector terminal No. 2 and body ground with a jumper wire.

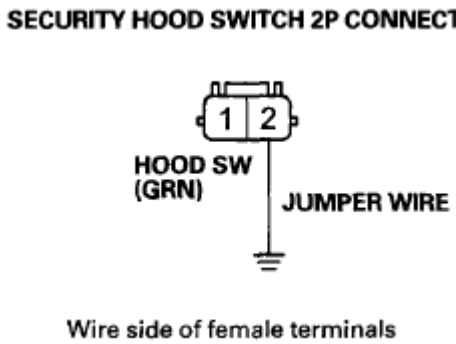

Fig. 17: Connecting Security Hood Switch 2P Connector Terminal No. 2 And Body Ground With Jumper Wire With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Check the ON/OFF information of the SECURITY HOOD SWITCH in the DATA LIST.

Is information indicator ON?

YES - Go to step 11.

NO - Go to step 12.

11. Check for continuity between security hood switch 2P connector terminal No. 1 and body ground.

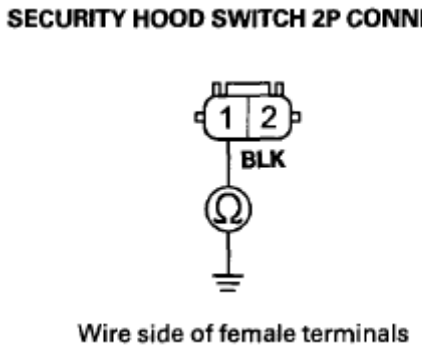

Fig. 18: Checking Continuity Between Security Hood Switch 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty security hood switch; replace the hood latch (see **HOOD LATCH REPLACEMENT**).

NO - Repair an open or high resistance in the ground wire or poor ground (G302).

12. Connect driver's under-dash fuse/relay box connector G (13P) terminal No. 3 and body ground with a jumper

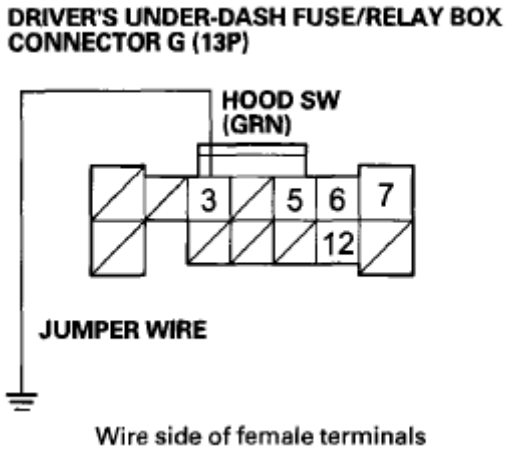

Fig. 19: Connecting Driver's Under-Dash Fuse/Relay Box Connector G (13P) Terminal No. 3 And Body Ground With Jumper
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check the ON/OFF information of the SECURITY HOOD SWITCH in the DATA LIST.

Is information indicator ON?

YES - Repair an open or high resistance in the wire.

NO - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

DRIVER'S DOOR LOCK KNOB SWITCH CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. With the driver's door lock knob switch in LOCK position, select SECURITY with the HDS, and enter the DATA LIST.
3. Check the ON/OFF information of the DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

Is Information indicator ON?

YES - Go to step 4.

NO - Go to step 8.

4. Disconnect the driver's door latch 10P connector.
5. Check the ON/OFF information of the DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

   Is information indicator OFF?

   YES - Faulty driver's door lock knob switch; replace the driver's door latch (see **FRONT DOOR LATCH REPLACEMENT**).

   NO - Go to step 6.

6. Disconnect the power window master switch 37P connector.
7. Check for continuity between power window master switch 37P connector terminal No. 32 and body ground.

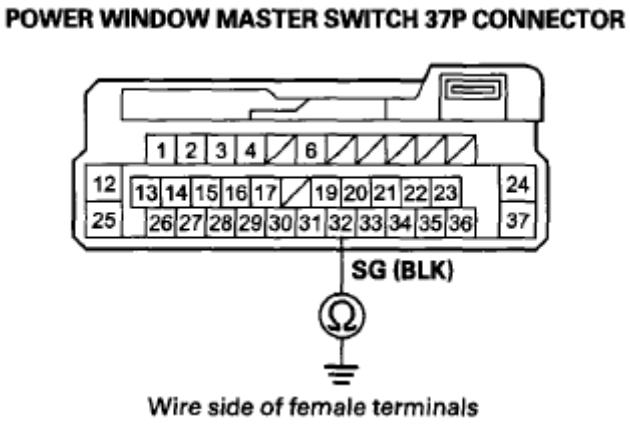

Fig. 20: Checking Continuity Between Power Window Master Switch 37P Connector Terminal No. 32 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Faulty door multiplex control unit; replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

8. Disconnect the driver's door latch 10P connector.
9. Connect driver's door latch 10P connector terminal No. 7 and body ground with a jumper wire.

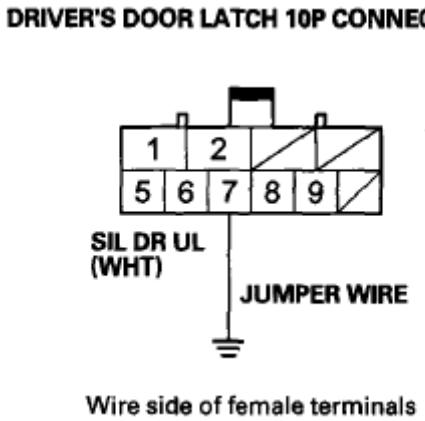

Fig. 21: Connecting Driver's Door Latch 10P Connector Terminal No. 7 And Body Ground With Jumper Wire With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Check the ON/OFF information of the DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

    Is information indicator ON?

    YES - Go to step 11.

    NO - Go to step 12.

11. Check for continuity between driver's door latch 10P connector terminal No. 5 and body ground.

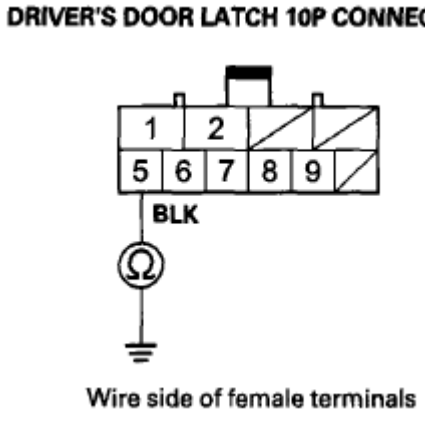

Fig. 22: Checking Continuity Between Driver's Door Latch 10P Connector Terminal No. 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty driver's door lock knob switch; replace the driver's door latch (see **FRONT DOOR**

LATCH REPLACEMENT).

NO - Repair an open or high resistance in the ground wire or poor ground (G401).

12. Connect power window master switch 37P connector terminal No. 31 and body ground with a jumper wire.

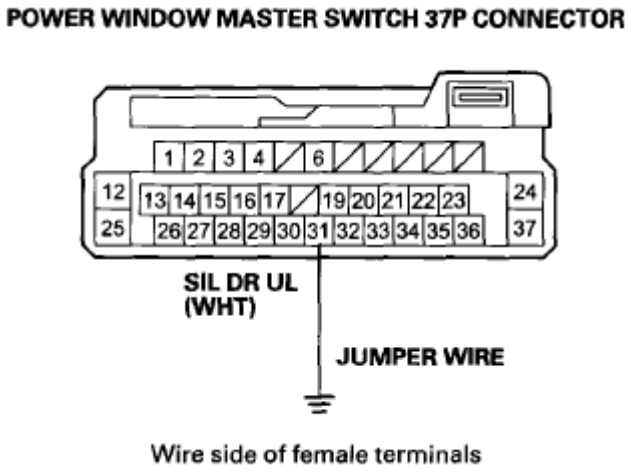

Fig. 23: Connecting Power Window Master Switch 37P Connector Terminal No. 31 And Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check the ON/OFF information of the DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

Is information indicator ON?

YES - Repair an open or high resistance in the wire.

NO - Faulty door multiplex control unit; replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

FRONT PASSENGER'S DOOR LOCK KNOB SWITCH CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. With the front passenger's door lock knob switch in LOCK position, select SECURITY with the HDS, and enter the DATA LIST.
3. Check the ON/OFF information of the FRONT PASSENGER'S DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

Is information indicator ON?

YES - Go to step 4.

NO - Go to step 8.

4. Disconnect the front passenger's door latch 10P connector.
5. Check the ON/OFF information of the FRONT PASSENGER'S DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

   Is information indicator OFF?

   YES - Faulty front passenger's door lock knob switch; replace the front passenger's door latch (see **FRONT DOOR LATCH REPLACEMENT**).

   NO - Go to step 6.

6. Disconnect the front passenger's power window switch 37P connector.
7. Check for continuity between front passenger's power window switch 37P connector terminal No. 34 and body ground.

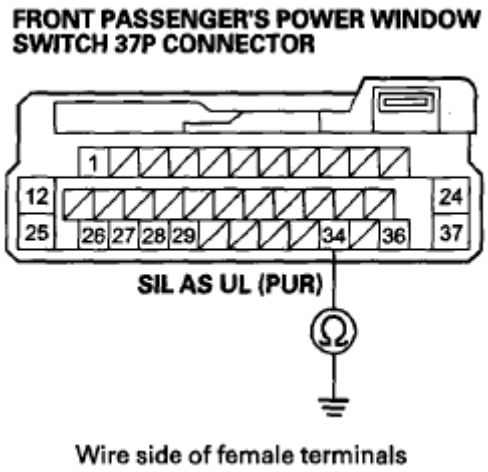

Fig. 24: Checking Continuity Between Front Passenger'S Power Window Switch 37P Connector Terminal No. 34 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Replace the front passenger's power window switch (see **FRONT PASSENGER'S POWER WINDOW SWITCH REPLACEMENT**).

8. Disconnect the front passenger's door latch 10P connector.
9. Connect front passenger's door latch 10P connector terminal No. 8 and body ground with a jumper wire.

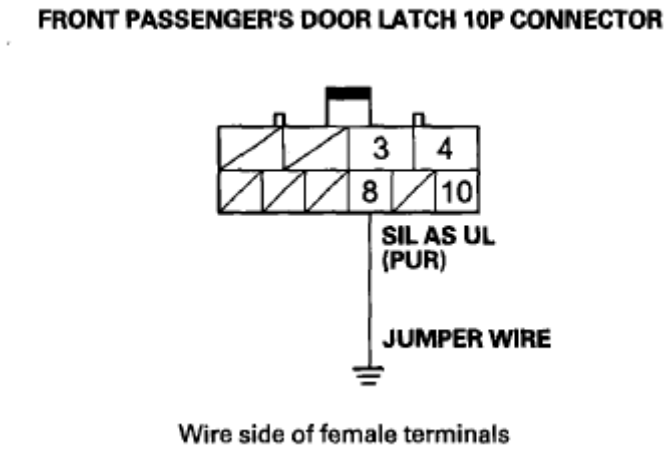

Fig. 25: Connecting Front Passenger's Door Latch 10P Connector Terminal No. 8 And Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Check the ON/OFF information of the FRONT PASSENGER'S DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

    Is information indicator ON?

    YES - Go to step 11.

    NO - Go to step 12.

11. Check for continuity between front passenger's door latch 10P connector terminal No. 10 and body ground.

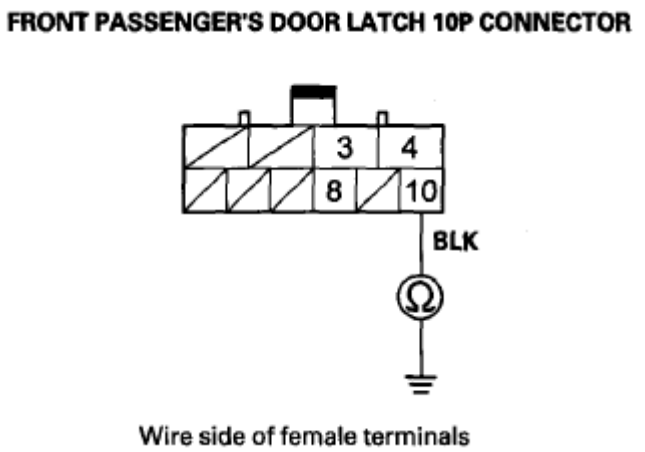

Fig. 26: Checking Continuity Between Front Passenger's Door Latch 10P Connector Terminal No. 10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty front passenger's door lock knob switch (UNLOCK); replace the front passenger's door latch (see **FRONT DOOR LATCH REPLACEMENT**).

NO - Repair an open or high resistance in the ground wire or poor ground (G405).

12. Connect front passenger's power window switch 37P connector terminal No. 34 and body ground with a jumper wire.

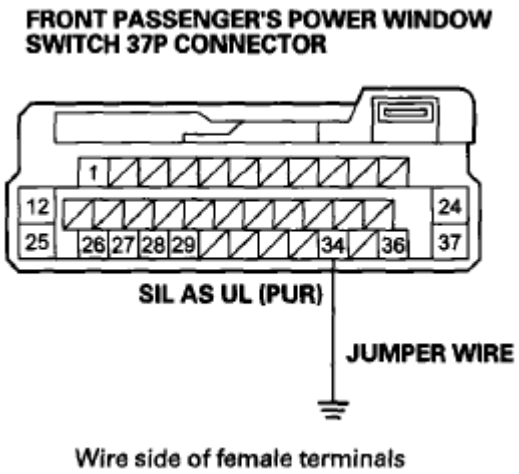

Fig. 27: Connecting Front Passenger's Power Window Switch 37P Connector Terminal No. 34 And Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check the ON/OFF information of the FRONT PASSENGER'S DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

Is information indicator ON?

YES - Repair an open or high resistance in the wire.

NO - Replace the front passenger's power window switch (see **FRONT PASSENGER'S POWER WINDOW SWITCH REPLACEMENT**).

DRIVER'S DOOR SWITCH CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. With the driver's door closed, select SECURITY with the HDS, and enter the DATA LIST.
3. Check the ON/OFF information of the DRIVER'S DOOR SWITCH in the DATA LIST.

Is information indicator ON?

YES - Go to step 4.

NO - Go to step 9.

4. Remove the driver's door switch.
5. Disconnect the driver's door switch 1P connector.
6. Check for continuity between the driver's door switch 1P connector and switch ground.

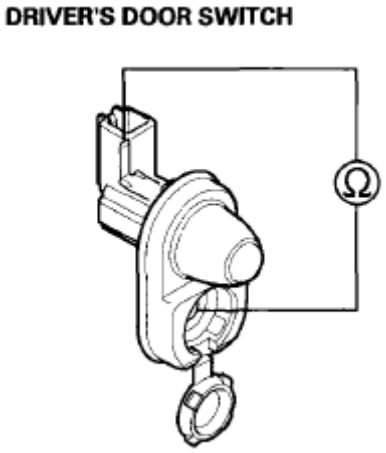

Fig. 28: Checking Continuity Between Driver's Door Switch 1P Connector And Switch Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there no continuity when the switch is pushed, and is there continuity when the switch is released?

YES - Go to step 7.

NO - Replace the driver's door switch.

7. Disconnect driver's under-dash fuse/relay box connector D(16P).
8. Check for continuity between driver's under-dash fuse/relay box connector D (16P) terminal No. 12 and body ground.

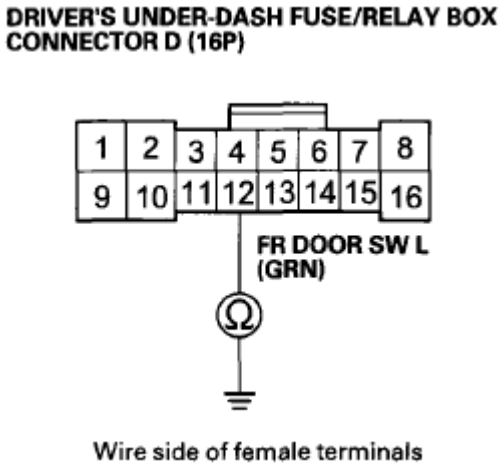

Fig. 29: Checking Continuity Between Driver's Under-Dash Fuse/Relay Box Connector D (16P) Terminal No. 12 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

9. Remove the driver's door switch.
10. Disconnect the driver's door switch 1P connector.
11. Check for continuity between driver's door switch 1P connector and switch ground.

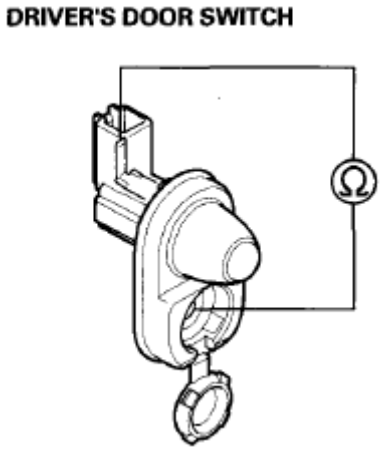

Fig. 30: Checking Continuity Between Driver's Door Switch 1P Connector And Switch Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there no continuity when the switch is pushed, and is there continuity when the switch is released?

YES - Go to step 12.

NO - Replace the driver's door switch.

12. Connect driver's under-dash fuse/relay box connector D (16P) terminal No. 12 and body ground with a jumper wire.

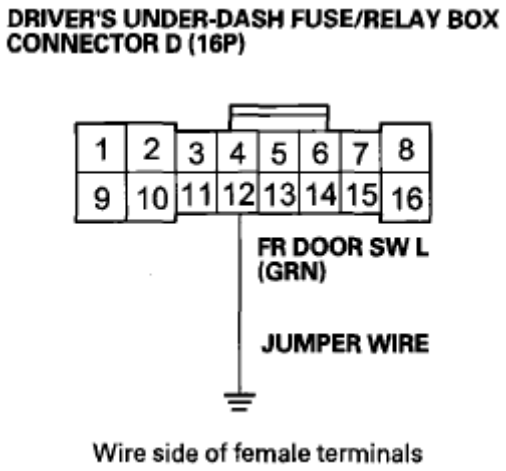

Fig. 31: Connecting Driver's Under-Dash Fuse/Relay Box Connector D (16P) Terminal No. 12 And Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check the ON/OFF information of the DRIVER'S DOOR SWITCH in the DATA LIST.

    Is information indicator ON?

    YES - Repair an open or high resistance in the wire.

    NO - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

FRONT PASSENGER'S DOOR SWITCH CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. With the front passenger's door closed, select SECURITY with the HDS, and enter the DATA LIST.
3. Check the ON/OFF information of the FRONT PASSENGER'S DOOR SWITCH in the DATA LIST.

   Is information indicator ON?

   YES - Go to step 4.

   NO - Go to step 9.

4. Remove the front passenger's door switch.
5. Disconnect the front passenger's door switch 1P connector.
6. Check for continuity between front passenger's door switch 1P connector and switch ground.

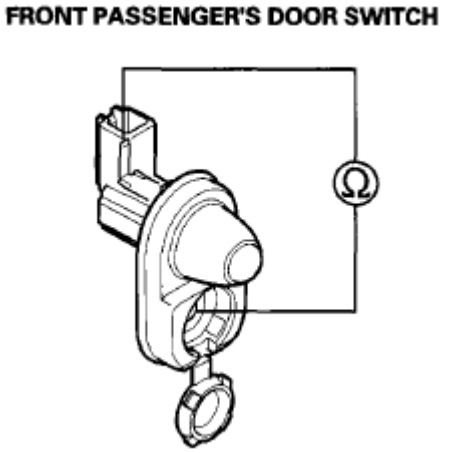

Fig. 32: Checking Continuity Between Front Passenger's Door Switch 1P Connector And Switch Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there no continuity when the switch is pushed, and is there continuity when the switch is released?

YES - Go to step 7.

NO - Replace the front passenger's door switch.

7. With SH-AWD: Disconnect passenger's under-dash fuse/relay box connector H (38P).

   Without SH-AWD: Disconnect passenger's under-dash fuse/relay box connector G (16P).

8. With SH-AWD: Check for continuity between passenger's under-dash fuse/relay box connector H (38P) terminal No. 3 and body ground.

   Without SH-AWD: Check for continuity between passenger's under-dash fuse/relay box connector G (16P) terminal No. 15 and body ground.

   With SH-AWD

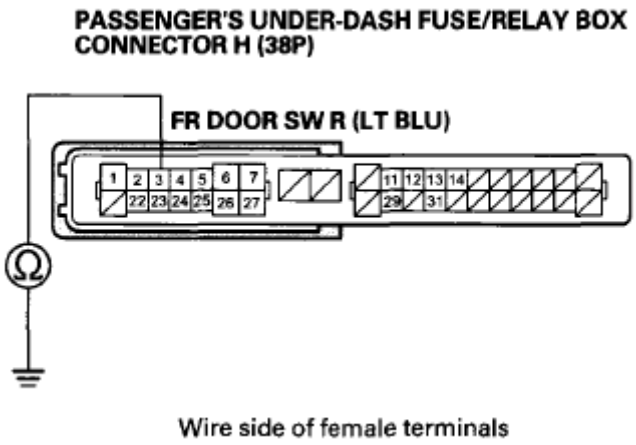

Fig. 33: Checking Continuity Between Passenger's Under-Dash Fuse/Relay Box Connector H (38P) Terminal No. 3 And Body Ground - With SH-AWD With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Without SH-AWD

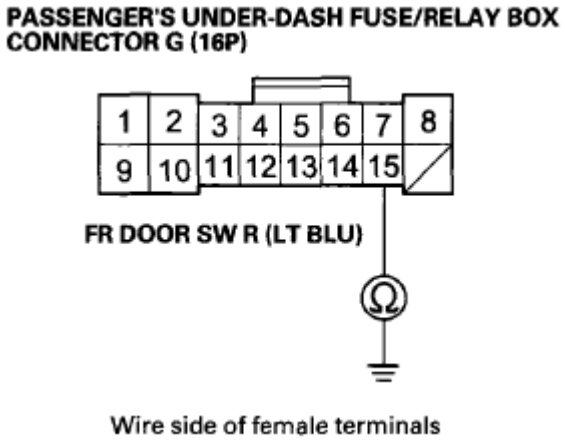

Fig. 34: Checking Continuity Between Passenger'S Under-Dash Fuse/Relay Box Connector G (16P) Terminal No. 15 And Body Ground - Without SH-AWD With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Faulty passenger's MICU; replace the passenger's under-dash fuse/relay box (see **PASSENGER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

9. Remove the front passenger's door switch.
10. Disconnect the front passenger's door switch 1P connector.
11. Check for continuity between front passenger's door switch 1P connector and switch ground.

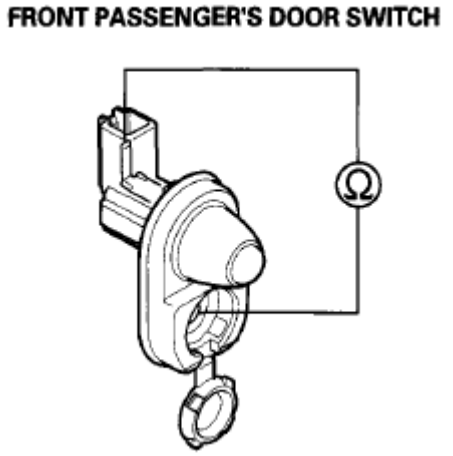

Fig. 35: Checking Continuity Between Front Passenger's Door Switch 1P Connector And Switch Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there no continuity when the switch is pushed, and is there continuity when the switch is released?

YES - Go to step 12.

NO - Replace the front passenger's door switch.

12. With SH-AWD: Connect passenger's under-dash fuse/relay box connector H (38P) terminal No. 3 and body ground with a jumper wire. Without SH-AWD: Connect passenger's under-dash fuse/relay box connector G (16P) terminal No. 15 and body ground with a jumper wire.

With SH-AWD

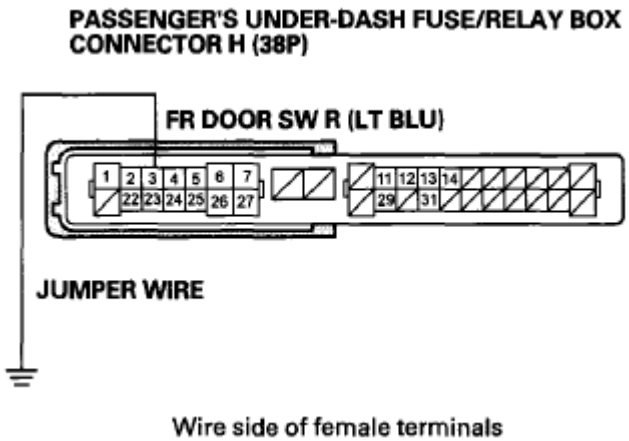

Fig. 36: Connecting Passenger's Under-Dash Fuse/Relay Box Connector H (38P) Terminal No. 3 And Body Ground With Jumper Wire - With SH-AWD
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Without SH-AWD

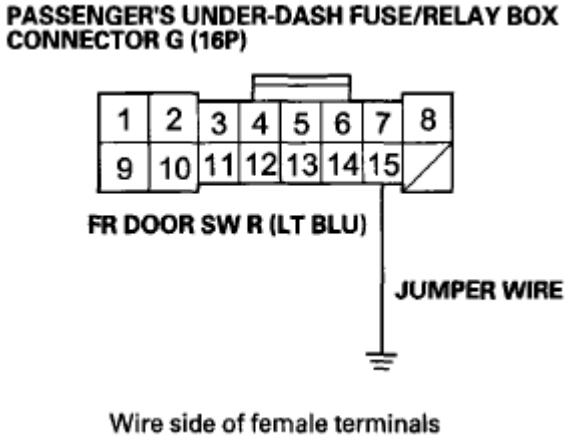

Fig. 37: Connecting Passenger's Under-Dash Fuse/Relay Box Connector G (16P) Terminal No. 15 And Body Ground With Jumper Wire - Without SH-AWD
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check the ON/OFF information of the FRONT PASSENGER'S DOOR SWITCH in the DATA LIST.

    Is information indicator ON?

    YES - Repair an open or high resistance in the wire.

    NO - Faulty passenger's MICU; replace the passenger's under-dash fuse/relay box (see **PASSENGER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

DRIVER'S DOOR KEY CYLINDER SWITCH CIRCUIT TROUBLESHOOTING

NOTE: Before troubleshooting, check the B-CAN DTCs. If any DTC is indicated, refer to the B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A), and troubleshoot the indicated DTCs first.

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Disconnect the driver's door latch 10P connector.
3. Connect driver's door latch 10P connector terminal No. 9 and body ground with a jumper wire.

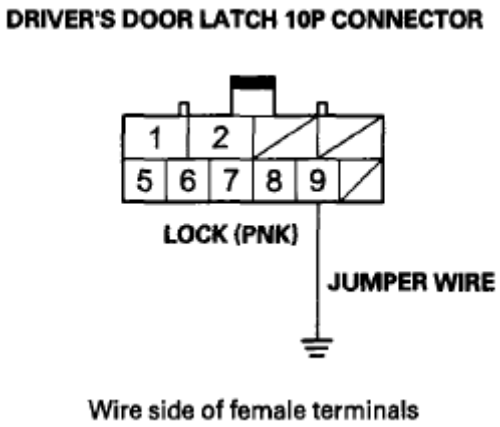

Fig. 38: Connecting Driver's Door Latch 10P Connector Terminal No. 9 And Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Select SECURITY with the HDS, and enter the DATA LIST.
5. Check the ON/OFF information of the DRIVER'S DOOR KEY CYLINDER SWITCH (LOCK) in the DATA LIST.

   Is information indicator ON?

   YES - Go to step 6.

   NO - Go to step 8.

6. Test the driver's door key cylinder switch (see **DOOR KEY CYLINDER SWITCH TEST**).

   Is the switch OK?

   YES - Go to step 7.

   NO - Faulty driver's door key cylinder switch; replace the driver's door latch (see **FRONT DOOR LATCH REPLACEMENT**).

7. Check for continuity between driver's door latch 10P connector terminal No. 5 and body ground.

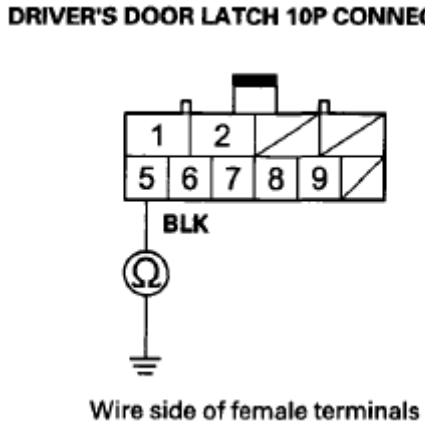

Fig. 39: Checking Continuity Between Driver's Door Latch 10P Connector Terminal No. 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty door multiplex control unit; replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

NO - Repair an open or high resistance in the wire or poor ground (G401).

8. Connect power window master switch 37P connector terminal No. 28 and body ground with a jumper wire.

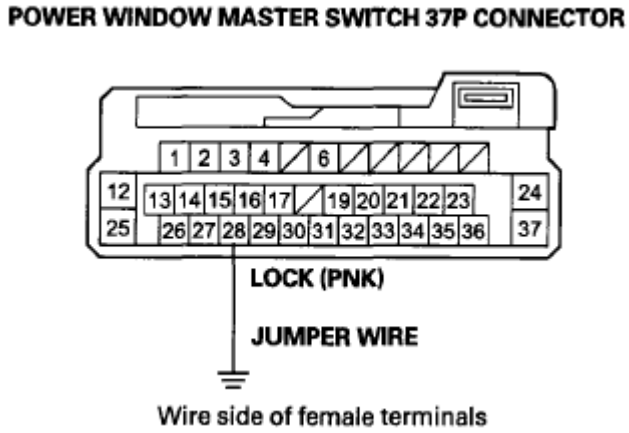

Fig. 40: Connecting Power Window Master Switch 37P Connector Terminal No. 28 And Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Check the ON/OFF information of the DRIVER'S DOOR KEY CYLINDER SWITCH (LOCK) in the DATA LIST.

Is information indicator ON?

YES - Repair an open or high resistance in the wire.

NO - Faulty door multiplex control unit; replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

LEFT REAR DOOR LOCK KNOB SWITCH CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. With the left rear door lock knob switch in LOCK position, select SECURITY with the HDS, and enter the DATA LIST.
3. Check the ON/OFF information of the DRIVER'S REAR DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

   Is information indicator ON?

   YES - Go to step 4.

   NO - Go to step 8.

4. Disconnect the left rear door latch 10P connector.
5. Check the ON/OFF information of the DRIVER'S REAR DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

   Is information indicator OFF?

   YES - Faulty left rear door lock knob switch; replace the left rear door latch (see **REAR DOOR LATCH REPLACEMENT**).

   NO - Go to step 6.

6. Disconnect driver's under-dash fuse/relay box connector D(16P).
7. Check the ON/OFF information of the DRIVER'S REAR DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

   Is information indicator OFF?

   YES - Repair a short to ground in the wire.

   NO - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

8. Disconnect the left rear door latch 10P connector.
9. Connect left rear door latch 10P connector terminal No. 7 and body ground with a jumper wire.

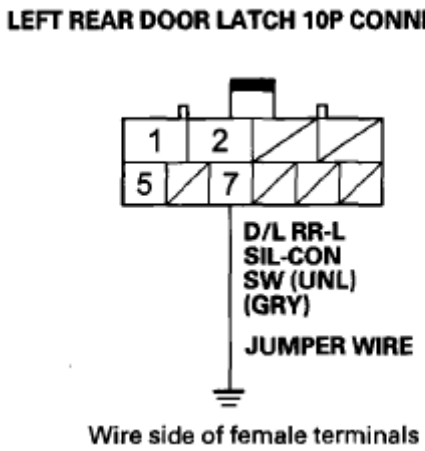

Fig. 41: Connecting Left Rear Door Latch 10P Connector Terminal No. 7 And Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Check the ON/OFF information of the DRIVER'S REAR DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

    Is information indicator ON?

    YES - Go to step 11.

    NO - Go to step 12.

11. Check for continuity between left rear door latch 10P connector terminal No. 5 and body ground.

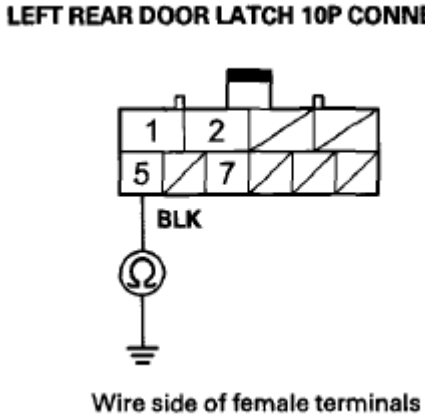

Fig. 42: Checking Continuity Between Left Rear Door Latch 10P Connector Terminal No. 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty left rear door lock knob switch; replace the left rear door latch (see **REAR DOOR LATCH**

REPLACEMENT).

NO - Repair an open or high resistance in the ground wire or poor ground (G601).

12. Connect driver's under-dash fuse/relay box connector D (16P) terminal No. 15 and body ground with a jumper wire.

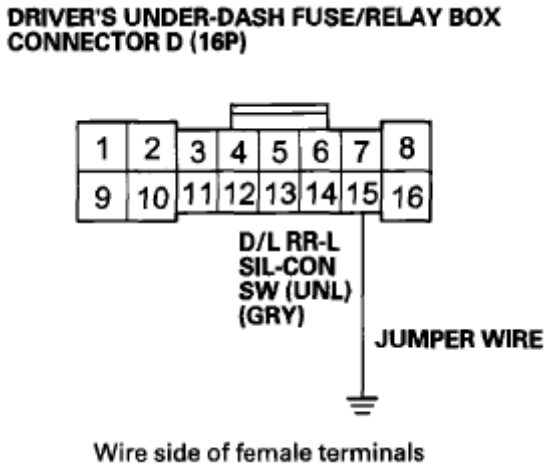

Fig. 43: Connecting Driver's Under-Dash Fuse/Relay Box Connector D (16P) Terminal No. 15 And Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check the ON/OFF information of the DRIVER'S REAR DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

Is information indicator ON?

YES - Repair an open or high resistance in the wire.

NO - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

RIGHT REAR DOOR LOCK KNOB SWITCH CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. With the right rear door lock knob switch in LOCK position, select SECURITY with the HDS, and enter the DATA LIST.
3. Check the ON/OFF information of the PASSENGER'S REAR DOOR LOCK KNOB SW. (UNLOCK) in the DATA LIST.

Is information indicator ON?

YES - Go to step 4.

NO - Go to step 8.

4. Disconnect the right rear door latch 10P connector.
5. Check the ON/OFF information of the PASSENGER'S REAR DOOR LOCK KNOB SW. (UNLOCK) in the DATA LIST.

   Is information indicator OFF?

   YES - Faulty right rear door lock knob switch; replace the right rear door latch (see **REAR DOOR LATCH REPLACEMENT**).

   NO - Go to step 6.

6. With SH-AWD: Disconnect the passenger's under-dash fuse/relay box connector H (38P). Without SH-AWD: Disconnect the passenger's under-dash fuse/relay box connector G (16P).
7. With SH-AWD: Check for continuity between passenger's under-dash fuse/relay box connector H (38P) terminal No. 22 and body ground. Without SH-AWD: Check for continuity between passenger's under-dash fuse/relay box connector G (16P) terminal No. 6 and body ground.

   With SH-AWD

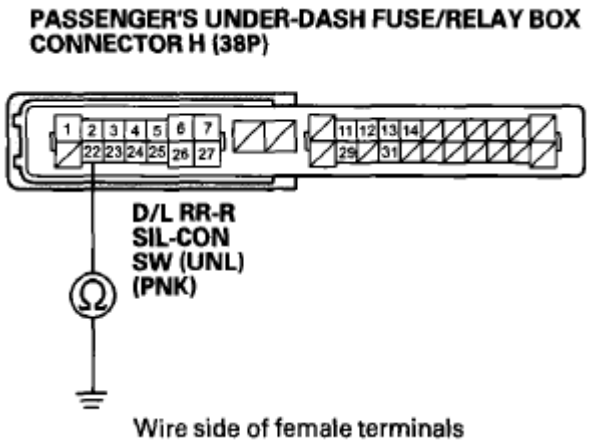

Fig. 44: Checking Continuity Between Passenger's Under-Dash Fuse/Relay Box Connector H (38P) Terminal No. 22 And Body Ground - With SH-AWD
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Without SH-AWD

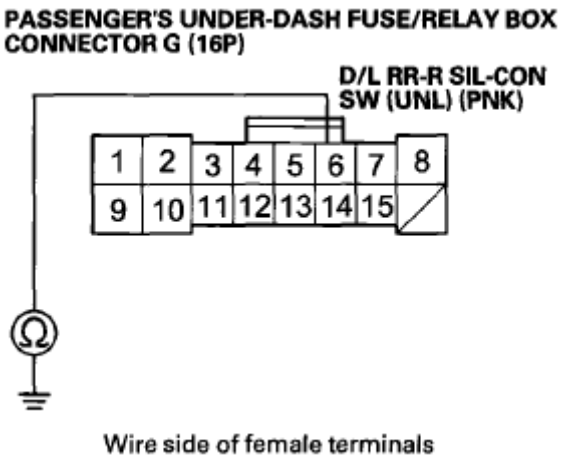

Fig. 45: Checking Continuity Between Passenger's Under-Dash Fuse/Relay Box Connector G (16P) Terminal No. 6 And Body Ground - Without SH-AWD
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Faulty passenger's MICU; replace the passenger's under-dash fuse/relay box (see **PASSENGER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

8. Disconnect the right rear door latch 10P connector.
9. Connect right rear door latch 10P connector terminal No. 8 and body ground with a jumper wire.

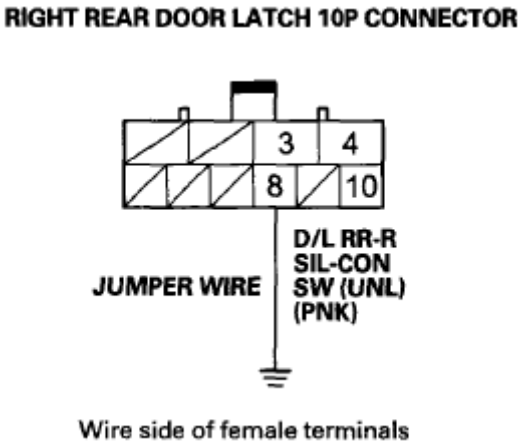

Fig. 46: Connecting Right Rear Door Latch 10P Connector Terminal No. 8 And Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Check the ON/OFF information of the PASSENGER'S REAR DOOR LOCK KNOB SW. (UNLOCK) in the DATA LIST.

Is information indicator ON?

YES - Go to step 11.

NO - Go to step 12.

11. Check for continuity between right rear door latch 10P connector terminal No. 10 and body ground.

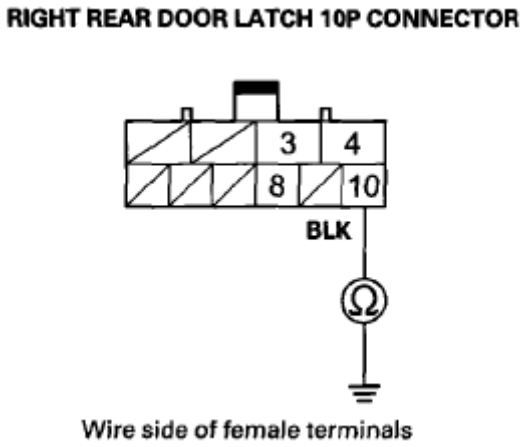

Fig. 47: Checking Continuity Between Right Rear Door Latch 10P Connector Terminal No. 10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty right rear door lock knob switch (UNLOCK); replace the right rear door latch (see **REAR DOOR LATCH REPLACEMENT**).

NO - Repair an open or high resistance in the ground wire or poor ground (G651).

12. With SH-AWD: Connect passenger's under-dash fuse/relay box connector H (38P) terminal No. 22 and body ground with a jumper wire. Without SH-AWD: Connect passenger's under-dash fuse/relay box connector G (16P) terminal No. 6 and body ground with a jumper wire.

With SH-AWD

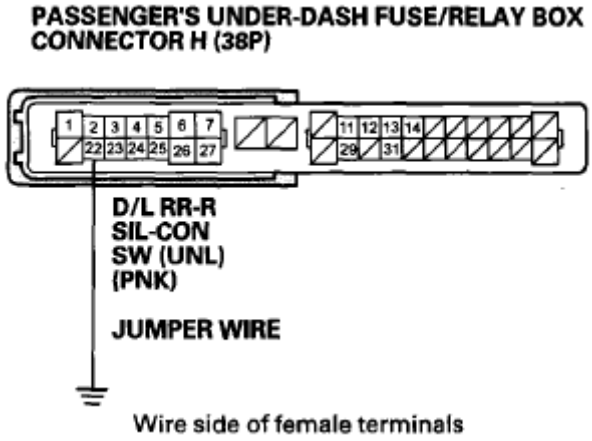

Fig. 48: Connecting Passenger's Under-Dash Fuse/Relay Box Connector H (38P) Terminal No. 22 And Body Ground With Jumper Wire - With SH-AWD
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Without SH-AWD

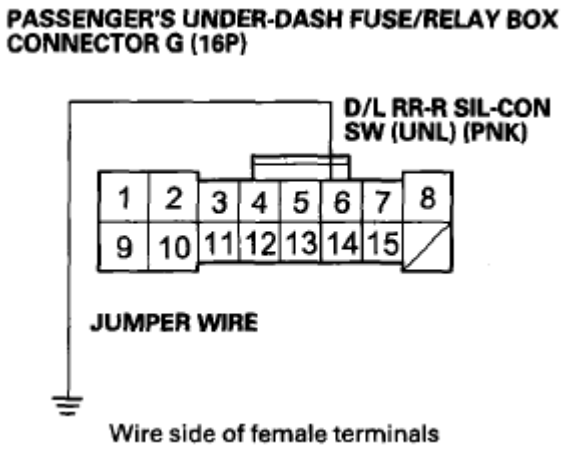

Fig. 49: Connecting Passenger's Under-Dash Fuse/Relay Box Connector G (16P) Terminal No. 6 And Body Ground With Jumper Wire - Without SH-AWD
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check the ON/OFF information of the PASSENGER'S REAR DOOR LOCK KNOB SW. (UNLOCK) in the DATA LIST.

    Is information indicator ON?

    YES - Repair an open or high resistance in the wire.

    NO - Faulty passenger's MICU; replace the passenger's under-dash fuse/relay box (see **PASSENGER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

LEFT REAR DOOR SWITCH CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. With the left rear door closed, select SECURITY with the HDS, and enter the DATA LIST.
3. Check the ON/OFF information of the DRIVER'S REAR DOOR SWITCH in the DATA LIST.

   Is information indicator ON?

   YES - Go to step 4.

   NO - Go to step 9.

4. Remove the left rear door switch.
5. Disconnect the left rear door switch 1P connector.
6. Check for continuity between the left rear door switch 1P connector and switch ground.

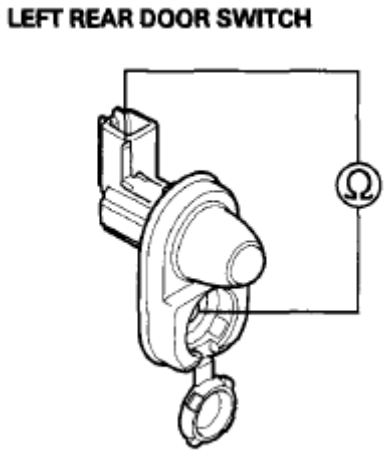

Fig. 50: Checking Continuity Between Left Rear Door Switch 1P Connector And Switch Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there no continuity when the switch is pushed, and is there continuity when the switch is released?

YES - Go to step 7.

NO - Replace the left rear door switch.

7. Disconnect driver's under-dash fuse/relay box connector D(16P).
8. Check for continuity between driver's under-dash fuse/relay box connector D (16P) terminal No. 4 and body ground.

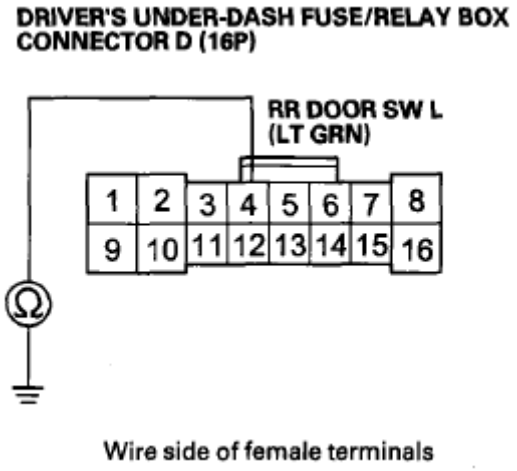

Fig. 51: Checking Continuity Between Driver's Under-Dash Fuse/Relay Box Connector D (16P) Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

9. Remove the left rear door switch.
10. Disconnect the left rear door switch 1P connector.
11. Check for continuity between left rear door switch 1P connector and switch ground.

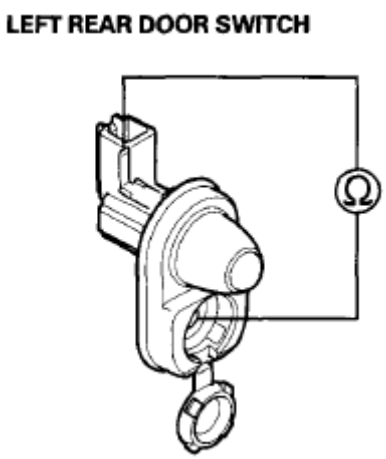

Fig. 52: Checking Continuity Between Left Rear Door Switch 1P Connector And Switch Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there no continuity when the switch is pushed, and is there continuity when the switch is released?

YES - Go to step 12.

NO - Replace the left rear door switch.

12. Connect driver's under-dash fuse/relay box connector D (16P) terminal No. 4 and body ground with a jumper wire.

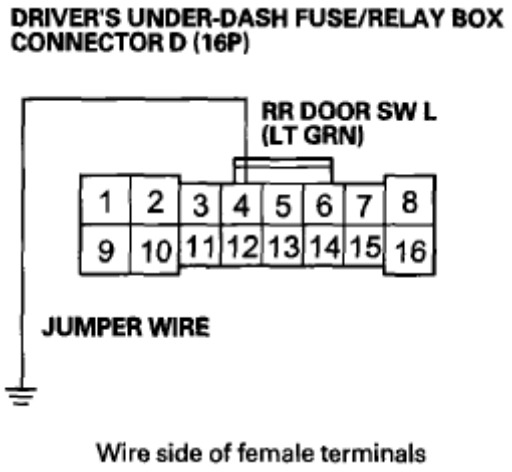

Fig. 53: Connecting Driver's Under-Dash Fuse/Relay Box Connector D (16P) Terminal No. 4 And Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check the ON/OFF information of the DRIVER'S REAR DOOR SWITCH in the DATA LIST.

Is information indicator ON?

YES - Repair an open or high resistance in the wire.

NO - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

RIGHT REAR DOOR SWITCH CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. With closed the right rear door closed, select SECURITY with the HDS, and enter the DATA LIST.
3. Check the ON/OFF information of the PASSENGER'S REAR DOOR SWITCH in the DATA LIST.

Is information indicator ON?

YES - Go to step 4.

NO - Go to step 9.

4. Remove the right rear door switch.

5. Disconnect the right rear door switch 1P connector.
6. Check for continuity between right rear door switch 1P connector and switch ground.

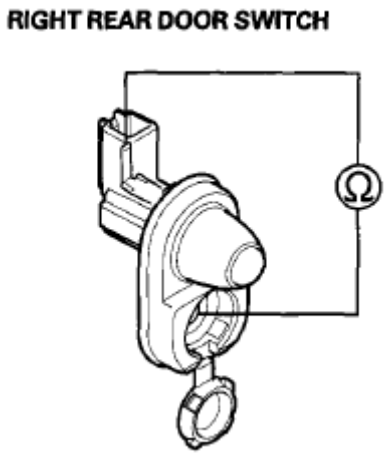

Fig. 54: Checking Continuity Between Right Rear Door Switch 1P Connector And Switch Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there no continuity when the switch is pushed, and is there continuity when the switch is released?

YES - Go to step 7.

NO - Replace the right rear door switch.

7. With SH-AWD: Disconnect passenger's under-dash fuse/relay box connector H (38P).

   Without SH-AWD: Disconnect passenger's under-dash fuse/relay box connector G (16P).

8. With SH-AWD: Check for continuity between passenger's under-dash fuse/relay box connector H (38P) terminal No. 25 and body ground.

   Without SH-AWD: Check for continuity between passenger's under-dash fuse/relay box connector G (16P) terminal No. 14 and body ground.

   With SH-AWD

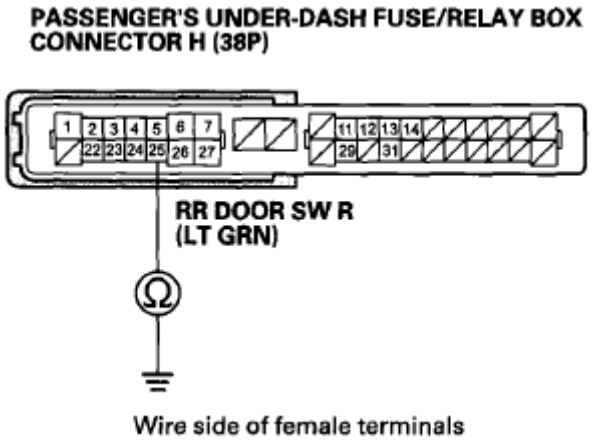

Fig. 55: Checking Continuity Between Passenger's Under-Dash Fuse/Relay Box Connector H (38P) Terminal No. 25 And Body Ground - With SH-AWD
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Without SH-AWD

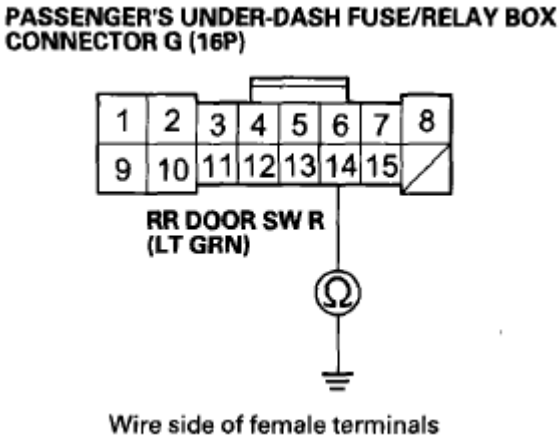

Fig. 56: Checking Continuity Between Passenger's Under-Dash Fuse/Relay Box Connector G (16P) Terminal No. 14 And Body Ground - Without SH-AWD
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Faulty passenger's MICU; replace the passenger's under-dash fuse/relay box (see **PASSENGER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

9. Remove the right rear door switch.
10. Disconnect the right rear door switch 1P connector.
11. Check for continuity between right rear door switch 1P connector and switch ground.

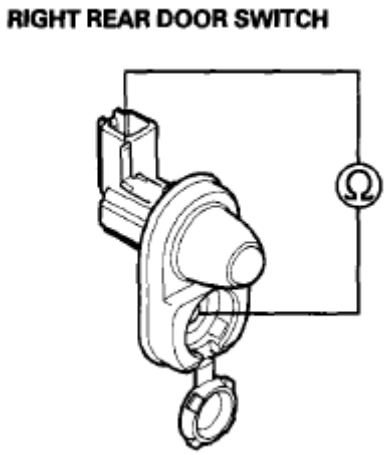

Fig. 57: Checking Continuity Between Right Rear Door Switch 1P Connector And Switch Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there no continuity when the switch is pushed, and is there continuity when the switch is released?

YES - Go to step 12.

NO - Replace the right rear door switch.

12. With SH-AWD: Connect passenger's under-dash fuse/relay box connector H (38P) terminal No. 25 and body ground with a jumper wire. Without SH-AWD: Connect passenger's under-dash fuse/relay box connector G (16P) terminal No. 14 and body ground.

With SH-AWD

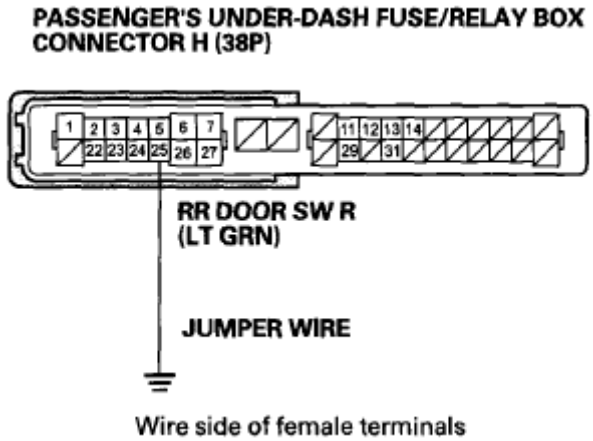

Fig. 58: Connecting Passenger's Under-Dash Fuse/Relay Box Connector H (38P) Terminal No. 25 And Body Ground With Jumper Wire - With SH-AWD
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Without SH-AWD

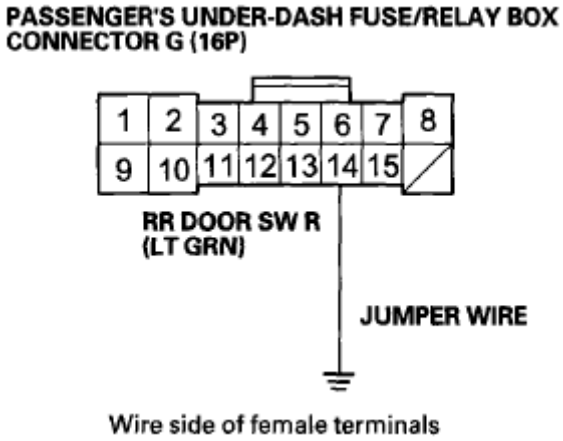

Fig. 59: Connecting Passenger's Under-Dash Fuse/Relay Box Connector G (16P) Terminal No. 14 And Body Ground - Without SH-AWD
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check the ON/OFF information of the PASSENGER'S REAR DOOR SWITCH in the DATA LIST.

    Is information indicator ON?

    YES - Repair an open or high resistance in the wire.

    NO - Faulty passenger's MICU; replace the passenger's under-dash fuse/relay box (see **PASSENGER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

CONTROL UNIT INPUT TEST

NOTE: Before testing, troubleshoot the multiplex integrated control system first, using B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A), and make sure the lighting system works properly.

Driver's MICU

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
3. Disconnect driver's under-dash fuse/relay box connectors D, F, G, N, Q, and R.

NOTE: All connector views are wire side of female terminals.

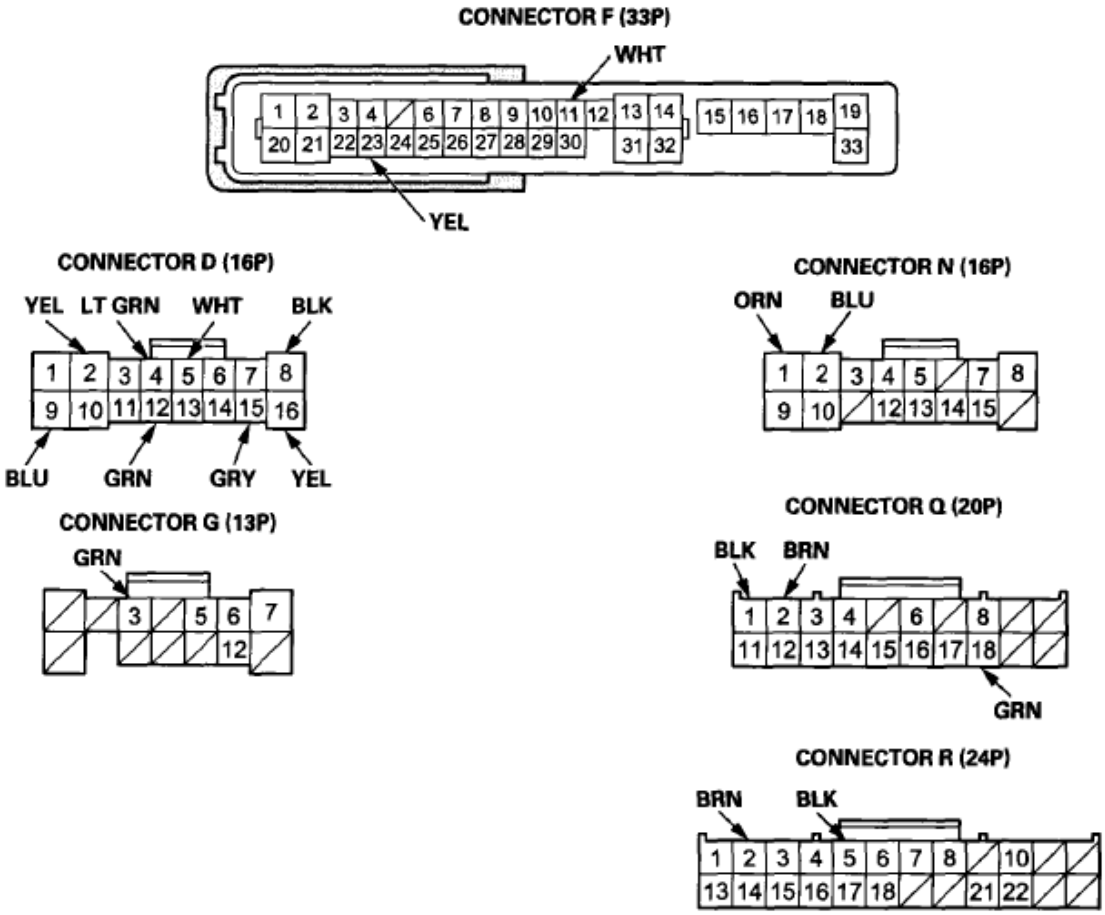

Fig. 60: Identifying Driver's MICU F (33P), D (16P), N (16P), G (13P), Q (20P) & R (24P) Connector End Views
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.
5. With the connectors still disconnected, do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 6.

NOTE: Before testing, make sure the No. 15 (10 A) fuse in the under-hood fuse/relay box is OK.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
D2	YEL	Connect terminal F11 to terminal D2 (or D9), and terminal D9 (or D2) to body	Check actuator operation: The left rear door lock actuator	• Faulty left rear door lock actuator • An open or high

D9	BLU	ground.	should UNLOCK (or LOCK).	resistance in the wire
D16	YEL	Connect terminal F11 to terminal D16 momentarily	Check actuator operation: The trunk lid release actuator should work.	• Faulty trunk lid release actuator • Poor ground (G603) or an open in the ground wire • An open or high resistance in the wire
F11	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • An open or high resistance in the wire
F23	YEL	Under all conditions	Connect to ground with a jumper wire: The horns should sound.	• Blown No. 10 (20 A) fuse in the under-hood fuse/relay box • Faulty horn relay circuit • Faulty horn • An open or high resistance in the wire
D8	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G601) • An open or high resistance in the ground wire
N1	ORN	Connect terminal F11 to terminal N1 (or N2), and terminal N2 (or N1) to body ground.	Check actuator operation: The driver's door lock actuator should UNLOCK (or LOCK).	• Faulty driver's door lock actuator • An open or high resistance in the wire
N2	BLU			

6. Reconnect the connectors to the driver's under-dash fuse/relay box, and do the following input tests:
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 8.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
Q1	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G402) • An open or high resistance in the ground wire

Q2	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G401) • An open or high resistance in the ground wire
R2	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G401) • An open or high resistance in the ground wire
R5	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G402) • An open or high resistance in the ground wire
D4	LT GRN	Left rear door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty left rear door switch • Faulty left rear door switch ground • An open or high resistance in the wire
		Left rear door closed	Measure the voltage to ground: There should be about 5 V.	• Faulty left rear door switch • A short to ground in the wire
D5	WHT	Trunk lid open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty trunk lid latch switch • Poor ground (G603) or an open in the ground wire • An open or high resistance in the wire
		Trunk lid closed	Measure the voltage to ground: There should be about 5 V.	• Faulty trunk lid latch switch • A short to ground in the wire
D12	GRN	Driver's door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driver's door switch • Faulty driver's door switch ground • An open or high resistance in the wire
			Measure the voltage to	• Faulty driver's door switch

		Driver's door closed	ground: There should be about 5 V.	• A short to ground in the wire
D15	GRY	Left rear door lock knob switch in UNLOCK	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty left rear door lock knob switch • Poor ground (G601) or an open in the ground wire • An open or high resistance in the wire
		Left rear door lock knob switch in LOCK	Measure the voltage to ground: There should be about 5 V.	• Faulty left rear door lock knob switch • A short to ground in the wire
G3	GRN	Hood open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty security hood switch • Poor ground (G302) or an open in the ground wire • An open or high resistance in the wire
		Hood closed	Measure the voltage to ground: There should be about 5 V.	• Faulty security hood switch • A short to ground in the wire
Q18(1)	BRN	Ignition key inserted into the ignition switch	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty ignition key switch • Poor ground (G403) or an open in the ground wire • An open or high resistance in the wire
		Ignition switch LOCK (0), and the ignition key removed from the ignition switch	Measure the voltage to ground: There should be about 5 V.	• Faulty ignition key switch • A short to ground in the wire
Q18(2)	BRN	Keyless access remote inserted into the remote slot	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty power control unit • Poor ground (G402) or an open in the ground wire • An open or high

				resistance in the wire
		Keyless access remote removed from the remote slot	Measure the voltage to ground: There should be about 5 V.	• Faulty power control unit • A short to ground in the wire
(1) Without keyless access system (2) With keyless access system				

Passenger's MICU

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Remove the passenger's kick panel (see **TRIM REMOVAL/INSTALLATION - DOOR AREAS**).
10. Disconnect passenger's under-dash fuse/relay box connectors A, E, G*1 , (or H*2).

*1: Without SH-AWD

*2: With SH-AWD

NOTE: All connector views are wire side of female terminals.

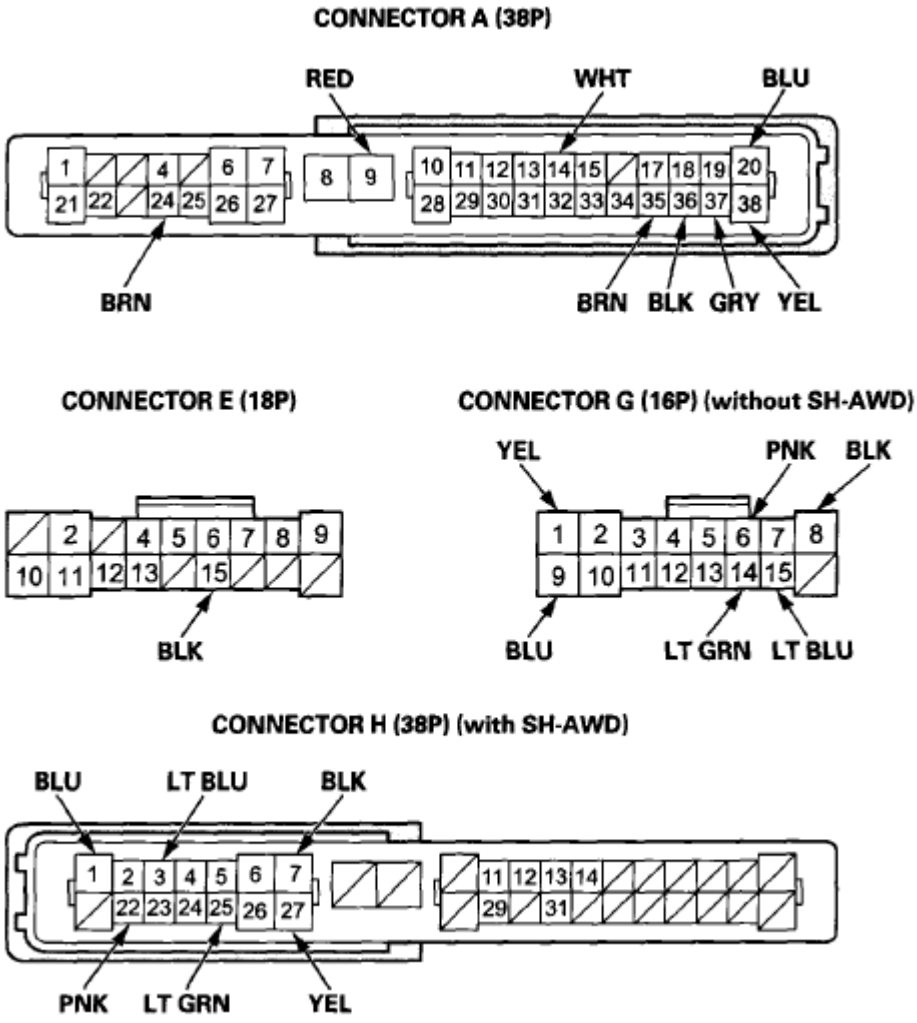

Fig. 61: Identifying Passenger's MICU A (38P), E (18P), G (16P) (w/o SH-AWD) & H (38P) (w/ SH-AWD) Connector End Views
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Inspect the connector and socket terminals to be sure they are all making good contact.
    - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
    - If the terminals look OK, go to step 12.
12. With the connectors still disconnected, do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 13.

NOTE: Before testing, make sure the No. 15(10 A) fuse in the under-hood fuse/relay box is OK.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained

G8[1] or H7[2]	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground(G651) • An open or high resistance in the ground wire
A20	BLU	Connect terminal A14 to terminal A20 (or A38), and terminal A38 (or A20) to body ground.	Check actuator operation: The front passenger's door lock actuator should UNLOCK (or LOCK).	• Faulty front passenger's door lock actuator • An open or high resistance in the wire
A38	YEL			
G1[1]	YEL	Connect terminal A14 to terminal G1 (or G9), and terminal G9 (or G1)to body ground.	Check actuator operation: The right rear door lock actuator should LOCK (or UNLOCK).	• Faulty right rear door lock actuator • An open or high resistance in the wire
G9[1]	BLU			
H27[2]	YEL	Connect terminal A14 to terminal H27 (or H1), and terminal H1 (or H27) to body ground.	Check actuator operation: The right rear door lock actuator should LOCK (or UNLOCK).	• Faulty right rear door lock actuator • An open or high resistance in the wire
H1[2]	BLU			
(1) Without SH-AWD (2) With SH-AWD				

13. Reconnect the connectors to the passenger's under-dash fuse/relay box, and do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 14.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
A9	RED	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 1-2 (AS F/B STD) (40 A) fuse in the under-hood fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
A14	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in

				the wire
A35	BRN	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 12(7.5 A) fuse in the driver's under-dash fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
A36	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G405) • An open or high resistance in the ground wire
A37	GRY	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G401) • An open or high resistance in the ground wire
E15	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G203) • An open or high resistance in the ground wire
G14(1) or H25(2)	LT GRN	Right rear door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty right rear door switch • Faulty right rear door switch ground • An open or high resistance in the wire
		Right rear door closed	Measure the voltage to ground: There should be about 5 V.	• Faulty right rear door switch • A short to ground in the wire
G15(1) or H3(2)	LT BLU	Front passenger's door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty front passenger's door switch • Faulty front passenger's door switch ground • An open or high resistance in the wire
		Front passenger's door closed	Measure the voltage to ground: There should be about 5 V.	• Faulty front passenger's door switch • A short to ground in the wire
G6(1) or H22*3	PNK	Right rear door lock knob switch in UNLOCK	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty right rear door lock knob switch • Poor ground (G651) or an open in the ground wire • An open or high resistance in the wire

		Right rear door lock knob switch in LOCK	Measure the voltage to ground: There should be about 5 V.	• Faulty right rear door lock knob switch • A short to ground in the wire
(1) Without SH-AWD (2) With SH-AWD				

Door Multiplex Control Unit

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Remove the driver's door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
16. Disconnect the 37P connector from the power window master switch.

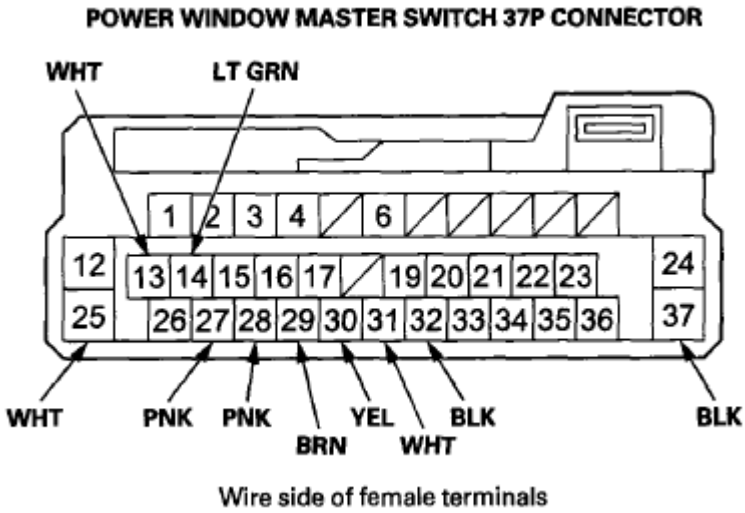

Fig. 62: Identifying Door Multiplex Control Unit Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Inspect the connector and socket terminals to be sure they are all making good contact.
    - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
    - If all the terminals look OK, go to step 18.
18. Reconnect the driver's door harness to driver's door subharness.
19. With the connector still disconnected, do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input test proves OK, go to step 20.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
			Check for continuity between power	

27	PNK	Disconnect the front passenger's power window switch 37P connector and moonroof control unit/motor 14P connector	window master switch 37P connector terminal No. 27 and front passenger's power window switch 37P connector terminal No. 29: There should be continuity.	An open in the UART wire
			Check for continuity to ground: There should be no continuity.	A short to ground in the wire

20. Reconnect the 37P connector to the power window master switch, and do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 21.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
13	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
14	LT GRN	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
25	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 24 (20 A) fuse in the driver's under-dash fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
32	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G401) • An open or high resistance in the ground wire
37	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G402) • An open or high resistance in the ground wire

28	PNK	Driver's door key cylinder switch in LOCK	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driver's door key cylinder switch • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Driver's door key cylinder switch in neutral or UNLOCK	Measure the voltage to ground: There should be about 5 V.	• Faulty driver's door key cylinder switch • A short to ground in the wire
29	BRN	Driver's door key cylinder switch in UNLOCK	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driver's door key cylinder switch • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Driver's door key cylinder switch in neutral or LOCK	Measure the voltage to ground: There should be about 5 V.	• Faulty driver's door key cylinder switch • A short to ground in the wire
30	YEL	Driver's door lock knob switch in LOCK	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driver's door lock knob switch • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Driver's door lock knob switch in neutral or UNLOCK	Measure the voltage to ground: There should be about 5 V.	• Faulty driver's door lock knob switch • A short to ground in the wire
31	WHT	Driver's door lock knob switch in UNLOCK	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driver's door lock knob switch • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Driver's door lock knob switch in neutral or LOCK	Measure the voltage to ground: There should be about 5 V.	• Faulty driver's door lock knob switch • A short to ground in the wire

Front Passenger's Power Window Switch

21. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
22. Remove the front passenger's door panel (see **FRONT DOOR PANEL**

REMOVAL/INSTALLATION).

23. Disconnect the 37P connector from the front passenger's power window switch.

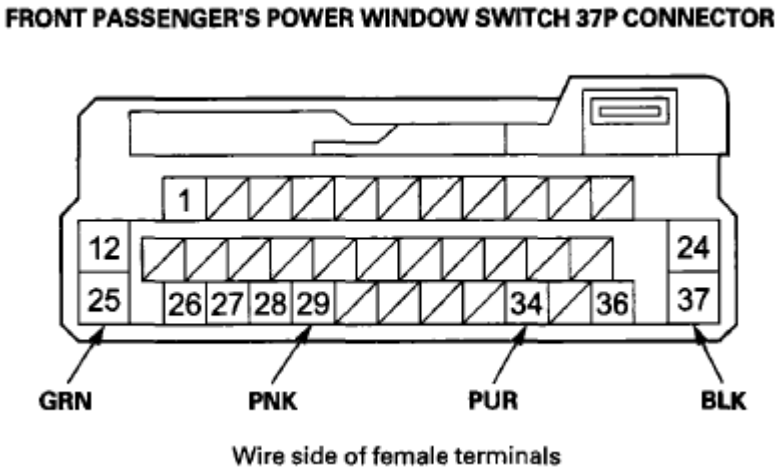

Fig. 63: Identifying Front Passenger's Power Window Switch Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Inspect the connector and socket terminals to be sure they are all making good contact.
    - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
    - If the terminals look OK, go to step 25.
25. With the connector still disconnected, do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input test proves OK, go to step 26.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
29	PNK	Disconnect the front passenger's power window switch 37P connector	Check for continuity between power window master switch 37P connector terminal No. 27 and front passenger's power window switch 37P connector terminal No. 29: There should be continuity.	An open in the UART wire
			Check for continuity to ground: There should be no continuity.	A short to ground in the UART wire

26. Reconnect the 37P connector to the front passenger's power window switch, and do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 27.

				Possible cause if desired result is

Cavity	Wire	Test condition	Test: Desired result	not obtained
25	GRN	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 13 (20 A) fuse in the passenger's under-dash fuse/relay box • An open or high resistance in the wire
37	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G405) • An open or high resistance in the ground wire
34	PUR	Front passenger's door lock knob switch in UNLOCK	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty front passenger's door lock knob switch • Poor ground (G405) or an open in the ground wire • An open or high resistance in the wire
		Front passenger's door lock knob switch in LOCK	Measure the voltage to ground: There should be about 5 V.	• Faulty front passenger's door lock knob switch • A short to ground in the wire

27. If multiple failures are found on more than one control unit, replace the driver's under-dash fuse/relay box (includes the driver's MICU) (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**). If input failures are related to a particular control unit, replace the control unit.

DOOR LOCK ACTUATOR TEST

DRIVER'S DOOR AND LEFT REAR DOOR

1. Remove the door panel:
   - Driver's door (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**)
   - Left rear door (see **REAR DOOR PANEL REMOVAL/INSTALLATION**)
2. Disconnect the 10P connector (A) from the actuator (B).

NOTE: The illustration shows the driver's door.

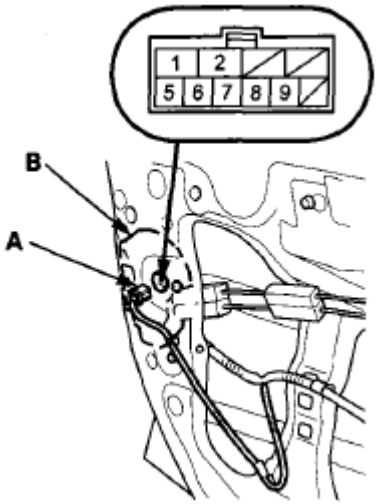

Fig. 64: Identifying 10P Connector And Actuator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check the actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Position \ Terminal	1	2
LOCK	⊕	⊖
UNLOCK	⊖	⊕

Fig. 65: Actuator Operation Reference Chart
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the actuator does not operate as specified, the actuator is faulty; replace the door latch:
   - Driver's door (see **FRONT DOOR LATCH REPLACEMENT**)
   - Left rear door (see **REAR DOOR LATCH REPLACEMENT**)

FRONT PASSENGER'S DOOR AND RIGHT REAR DOOR

1. Remove the door panel:
   - Front passenger's door (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**)
   - Right rear door (see **REAR DOOR PANEL REMOVAL/INSTALLATION**)
2. Disconnect the 10P connector (A) from the actuator (B).

NOTE: The illustration shows the front passenger's door.

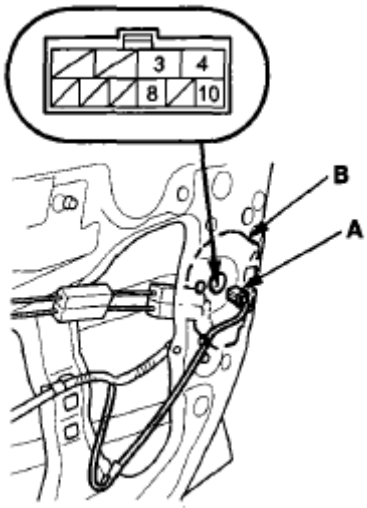

Fig. 66: Identifying 10P Connector And Actuator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check the actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Terminal / Position	3	4
LOCK	⊕	⊖
UNLOCK	⊖	⊕

Fig. 67: Actuator Operation Reference Chart
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the actuator does not operate as specified, the actuator is faulty; replace the door latch:
   - Front passenger's door (see **FRONT DOOR LATCH REPLACEMENT**)
   - Right rear door (see **REAR DOOR LATCH REPLACEMENT**)

DOOR LOCK KNOB SWITCH TEST

DRIVER'S DOOR

1. Remove the driver's door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
2. Disconnect the 10P connector (A) from the door lock actuator (6).

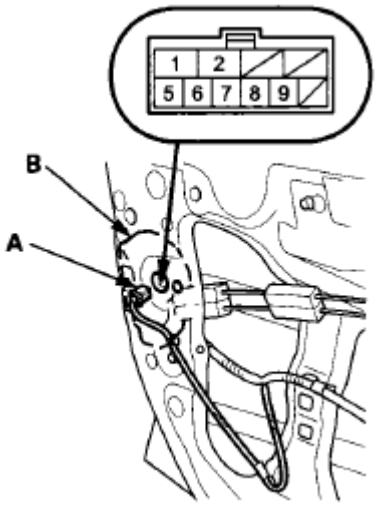

Fig. 68: Identifying 10P Connector And Door Lock Actuator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between the terminals.
   - There should be continuity between terminals No. 6 and No. 5 when the door lock knob switch is in the LOCK position and no continuity when the switch is in the UNLOCK position.
   - There should be continuity between terminals No. 7 and No. 5 when the door lock knob switch is in the UNLOCK position and no continuity when the switch is in the LOCK position.
   - Check for continuity between terminals No. 6 and No. 7 of door lock knob switch. There should be no continuity in either LOCK or UNLOCK positions.
4. If the continuity is not as specified, the switch is faulty; replace the driver's door latch (see **FRONT DOOR LATCH REPLACEMENT**).

PASSENGER'S DOORS

1. Remove the passenger's door panel:
   - Front passenger's door (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**)
   - Left and right rear door (see **REAR DOOR PANEL REMOVAL/INSTALLATION**)
2. Disconnect the 10P connector (A) from the door lock actuator (B).

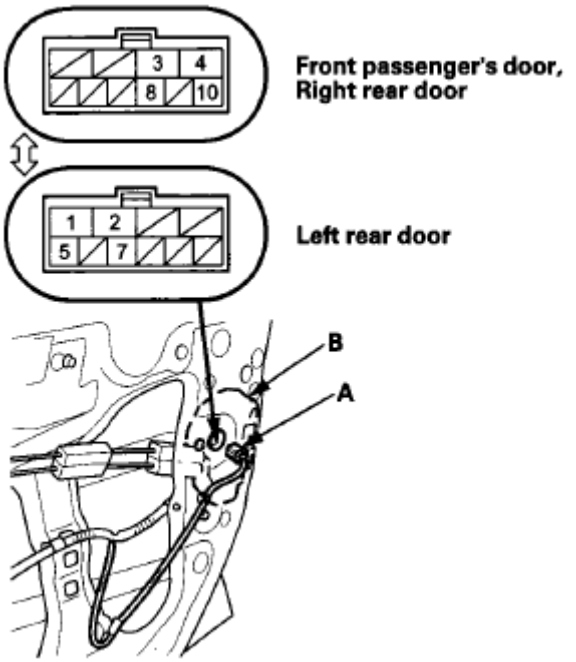

Fig. 69: Identifying 10P Connector And Door Lock Actuator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between the terminals.

   There should be continuity between terminals No. 8 [No. 7] and No. 10 [No. 5] when the door lock knob switch in the UNLOCK position and no continuity when the switch is in the LOCK position.

   [] : Left rear door

4. If the continuity is not as specified, the switch is faulty; replace the door latch:
   - Front passenger's door (see **FRONT DOOR LATCH REPLACEMENT**)
   - Left and right rear door (see **REAR DOOR LATCH REPLACEMENT**)

DOOR KEY CYLINDER SWITCH TEST

1. Remove the driver's door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
2. Disconnect the 10P connector (A) from the door lock actuator (key cylinder switch) (B).

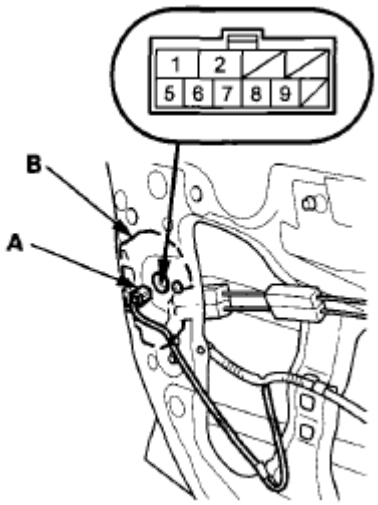

Fig. 70: Identifying 10P Connector And Door Lock Actuator (Key Cylinder Switch)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between the terminals.
   - There should be continuity between terminals No. 9 and No. 5 when the door key cylinder switch is in LOCK position.
   - There should be no continuity between terminals No. 9 and No. 5 when the door key cylinder switch is in the neutral or UNLOCK position.
   - There should be continuity between terminals No. 8 and No. 5 when the door key cylinder switch is in UNLOCK position.
   - There should be no continuity between terminals No. 8 and No. 5 when the door key cylinder switch is in the neutral or LOCK position.
   - There should be no continuity between terminals No. 8 and No. 9 when the key is in the neutral position.
4. If the continuity is not as specified, the switch is faulty; replace the driver's door latch (see **FRONT DOOR LATCH REPLACEMENT**).

SECURITY HOOD SWITCH TEST

1. Open the hood then remove the bulkhead cover (see **ENGINE COMPARTMENT COVER REPLACEMENT**).
2. Disconnect the 2P connector (A) from the security hood switch.

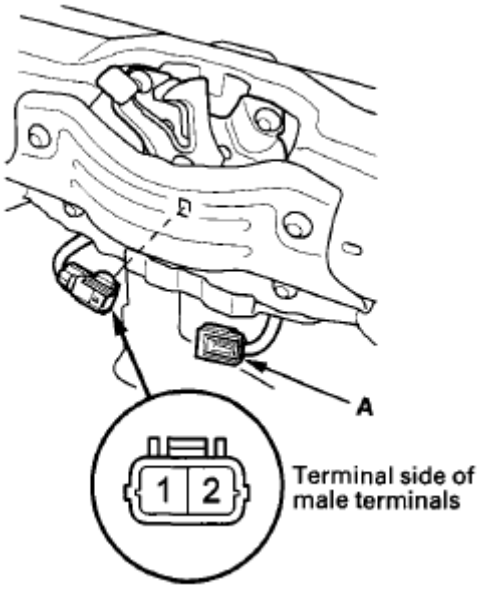

Fig. 71: Identifying 2P Connector & Security Hood Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between the terminals.
   - There should be continuity between terminals No. 1 and No. 2 when the hood is opened (latch released).
   - There should be no continuity between terminals No. 1 and No. 2 when the hood is closed (latch pushed down).
4. If the continuity is not as specified, the switch is faulty; replace the hood latch (see **HOOD LATCH REPLACEMENT**).

TRUNK LID RELEASE ACTUATOR TEST

1. Open the trunk lid, and remove the trunk lid trim (see **TRIM REMOVAL/INSTALLATION - TRUNK LID**).
2. Disconnect the 3P connector (A) from the trunk lid latch switch/trunk release actuator (B).

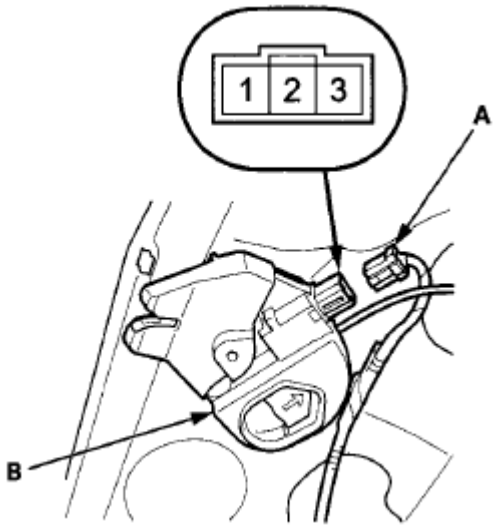

Fig. 72: Identifying 3P Connector And Trunk Lid Latch Switch/Trunk Release Actuator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check actuator operation by connecting power to the terminal No. 3 and ground to terminal No. 2 momentarily to prevent damage to the actuator. The actuator should work.
4. If the actuator does not work, the trunk lid release actuator is faulty; replace the trunk lid latch (see **TRUNK LID LATCH REPLACEMENT**).

KEYLESS BUZZER REPLACEMENT

1. Remove the rear bumper (see **LOWER FRONT BUMPER GRILLE REPLACEMENT**).
2. Disconnect the 2P connector (A) from the keyless buzzer (B).

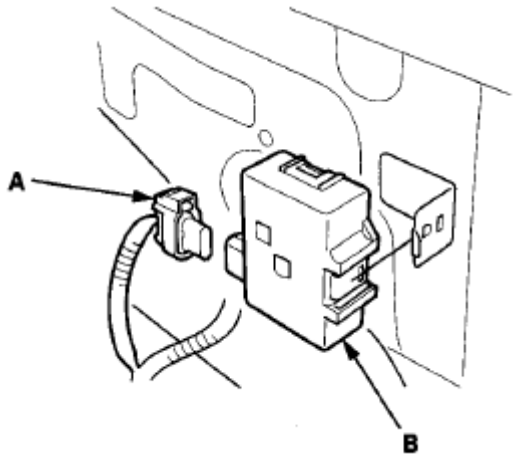

Fig. 73: Identifying 2P Connector And Keyless Buzzer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the buzzer from the bracket.

4. Install the buzzer in the reverse order of removal.

TRANSMITTER TEST

WITHOUT KEYLESS ACCESS SYSTEM

NOTE:

- **If the doors unlock or lock with the transmitter, but the LED on the transmitter does not come on, the LED is faulty; replace the transmitter.**
- **If any door is open, you cannot lock the doors with the transmitter.**
- **If you unlocked the doors with the transmitter, but do not open any of the doors within 30 seconds, the doors relock automatically. Opening the trunk does not cancel this function; only an open door signal cancels the automatic relock.**
- **The doors do not lock or unlock with the transmitter if the ignition key is inserted in the ignition switch.**

WITH HDS

1. Press the transmitter lock or unlock button at least 10 times to reset the transmitter.
   - If the locks work, the transmitter is OK.
   - If any of the transmitter buttons do not work, replace the transmitter, then register the new transmitter (see **IMMOBILIZER KEY REGISTRATION**).
   - If the locks do not work, go to step 2.
2. Connect the HDS to the data link connector (DLC).
3. Select KEYLESS TRANSMITTER from the BODY ELECTRICAL SYSTEM SELECT menu, next select inspection then select INSPECTION, then KEYLESS CHECK.
4. Follow the screen prompts to change to check each button operation.

   NOTE: The door lock actuators may or may not cycle when receiving input from the transmitter.

   - If KEYLESS ENTRY TRANSMITTER CODE WAS RECEIVED is indicated, the transmitter is OK.
   - If DIFFERENT KEYLESS ENTRY TRANSMITTER CODE WAS RECEIVED is indicated, the transmitter is not registered to the vehicle. If necessary, register the transmitter (see **IMMOBILIZER KEY REGISTRATION**).
   - If KEYLESS ENTRY TRANSMITTER CODE WAS NOT RECEIVED is indicated, go to step 5.
5. Open the transmitter, and check for water damage.
   - If you find any water damage, replace the transmitter, then register the new transmitter (see **IMMOBILIZER KEY REGISTRATION**).
   - If there is no water damage, go to step 6.

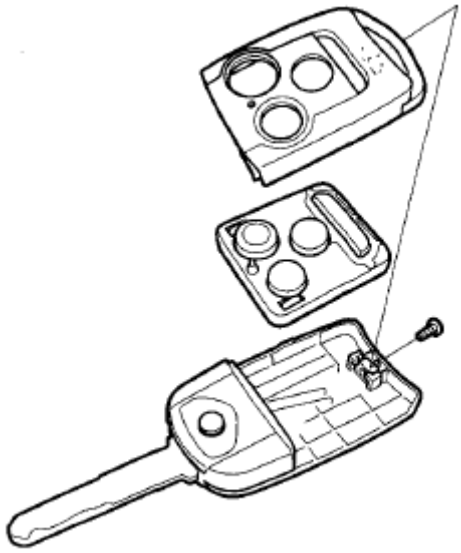

Fig. 74: Identifying Keyless Entry Transmitter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Replace the transmitter battery (A) with a new one, and press the lock or unlock button and check the response on the screen of the HDS.
   - If KEYLESS ENTRY TRANSMITTER CODE WAS RECEIVED is indicated, the transmitter is OK.
   - If KEYLESS ENTRY TRANSMITTER CODE WAS NOT RECEIVED is indicated, go to step 7.

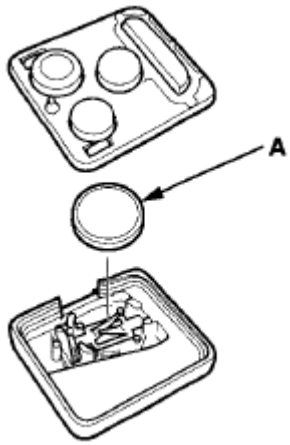

Fig. 75: Identifying Transmitter Battery
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Use a different known-good keyless transmitter assembly and repeat steps 3 and 4.

NOTE: The keyless transmitter does not need to be programmed to the vehicle for this test.

- If DIFFERENT KEYLESS ENTRY TRANSMITTER CODE WAS RECEIVED is indicated, replace the keyless transmitter and do the immobilizer system registration (see **IMMOBILIZER KEY REGISTRATION**).
- If KEYLESS ENTRY TRANSMITTER CODE WAS NOT RECEIVED is indicated, the immobilizer-keyless control unit is faulty, replace it and do the immobilizer system registration (see **IMMOBILIZER KEY REGISTRATION**).

NOTE: The keyless transmitter is combined with the immobilizer transponder, so when the transponder is registered by the HDS, the keyless transmitter programming is completed automatically.

WITHOUT HDS

1. Start the engine.
   - If the engine does not start, go to the immobilizer system troubleshooting (see **SYMPTOM TROUBLESHOOTING INDEX**).
   - If the engine starts, go to step 2.
2. Press the transmitter lock or unlock button at least 10 times to reset the transmitter.
   - If the locks work, the transmitter is OK.
   - If the locks do not work, go to step 3.
3. Open the transmitter, and check for water damage.
   - If you find any water damage, replace the transmitter and register the new transmitter (see **IMMOBILIZER KEY REGISTRATION**).
   - If there is no water damage, go to step 4.

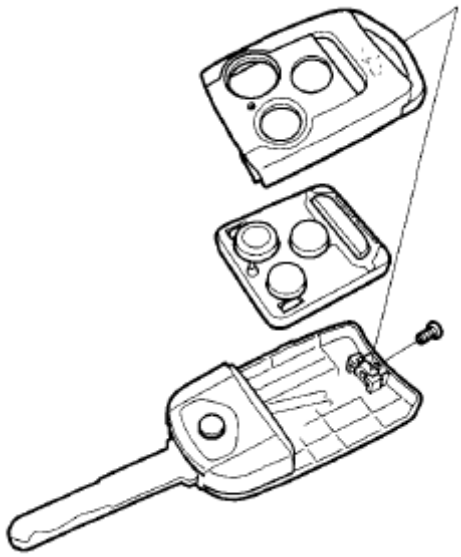

Fig. 76: Exploded View Of Keyless Entry Transmitter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Replace the transmitter battery (A) with a new one (CR 1616), and try to lock and unlock the doors with the transmitter by pressing the lock or unlock button five or six times.
    - If the doors lock and unlock, the transmitter is OK.
    - If the doors do not lock and unlock, go to step 5.

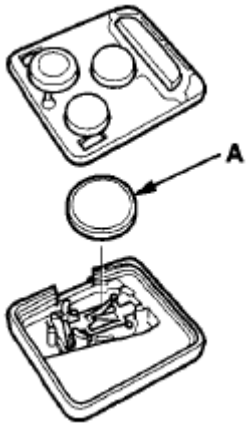

Fig. 77: Identifying Transmitter Battery
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Reprogram and register the transmitter (see **IMMOBILIZER KEY REGISTRATION**), then try to lock and unlock the doors.
    - If the doors lock and unlock, the transmitter is OK.
    - If the doors do not lock and unlock, substitute a known-good transmitter, register it and recheck (see **IMMOBILIZER KEY REGISTRATION**). If still not operating, replace the immobilizer-keyless control unit (see **IMMOBILIZER-KEYLESS CONTROL UNIT REGISTRATION**).

TRIPPED SENSOR HISTORY

The security system stores information on the last tripped sensor if the security system had been actuated. The information can be retrieved using the HDS.

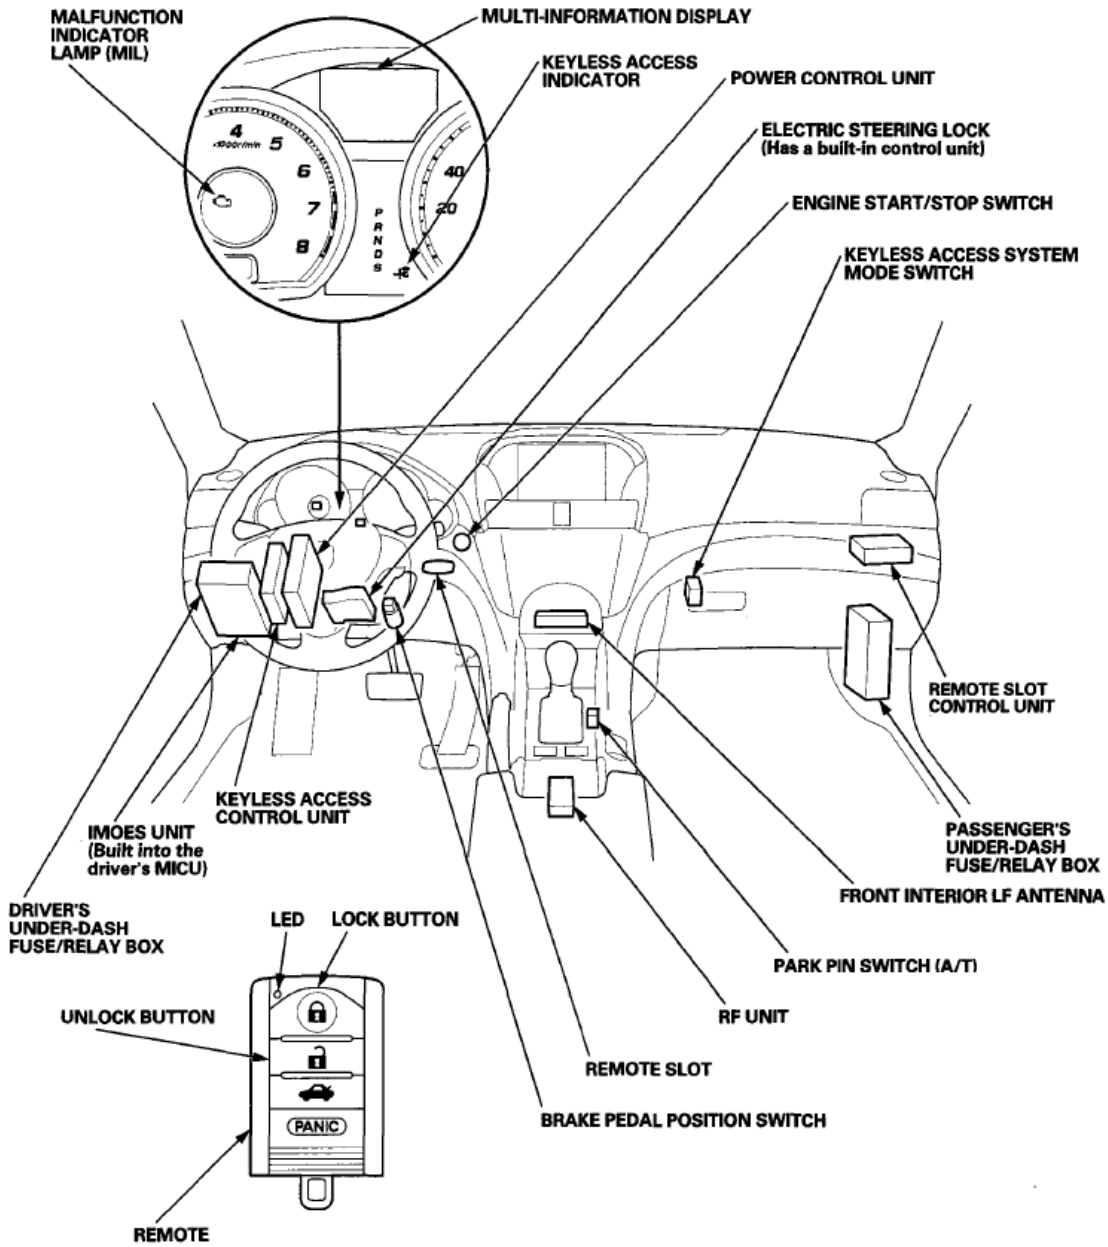
To retrieve the last tripped sensor data:

1. Select HISTORY DATA from the SECURITY MODE MENU.
2. Scroll through the data list.
    - Sensors that were actuated will indicate DETECT.
    - Sensors that were not actuated will indicate NONE.
3. Inspect the DETECT circuit for:
    - Misadjusted or damaged switch.
    - Loose or corroded connections.
    - Intermittent short to ground.

2012 ACCESSORIES & EQUIPMENT

Keyless Access System - TL

COMPONENT LOCATION INDEX



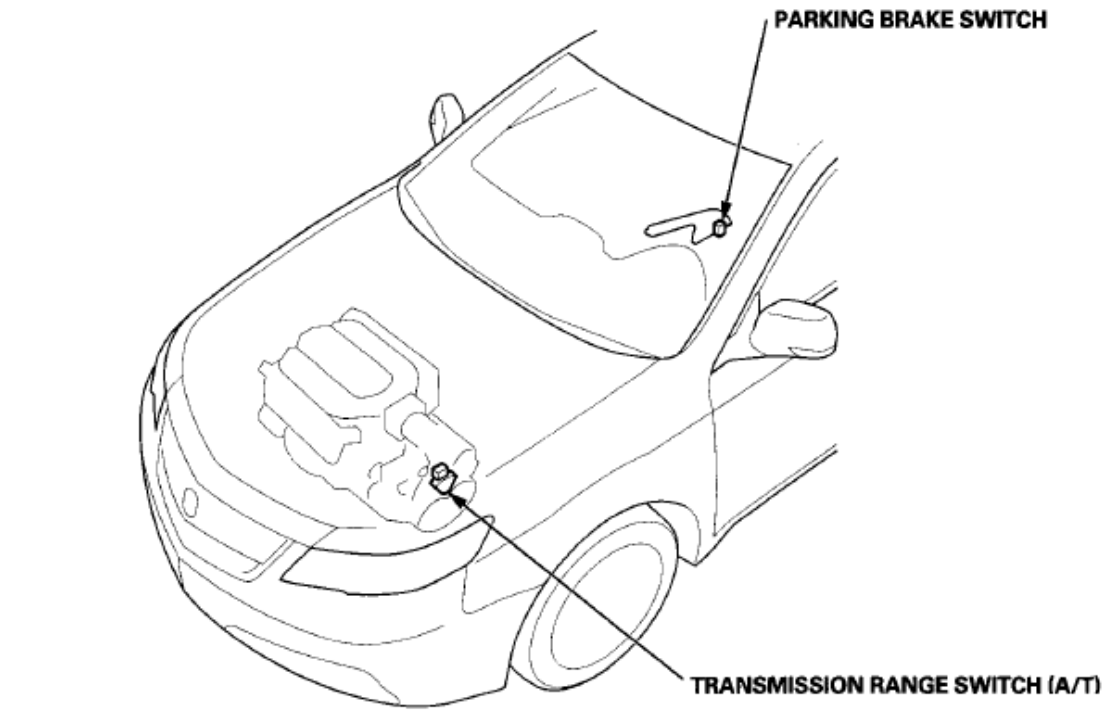


Fig. 1: Keyless Access System Components Location (1 Of 4)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

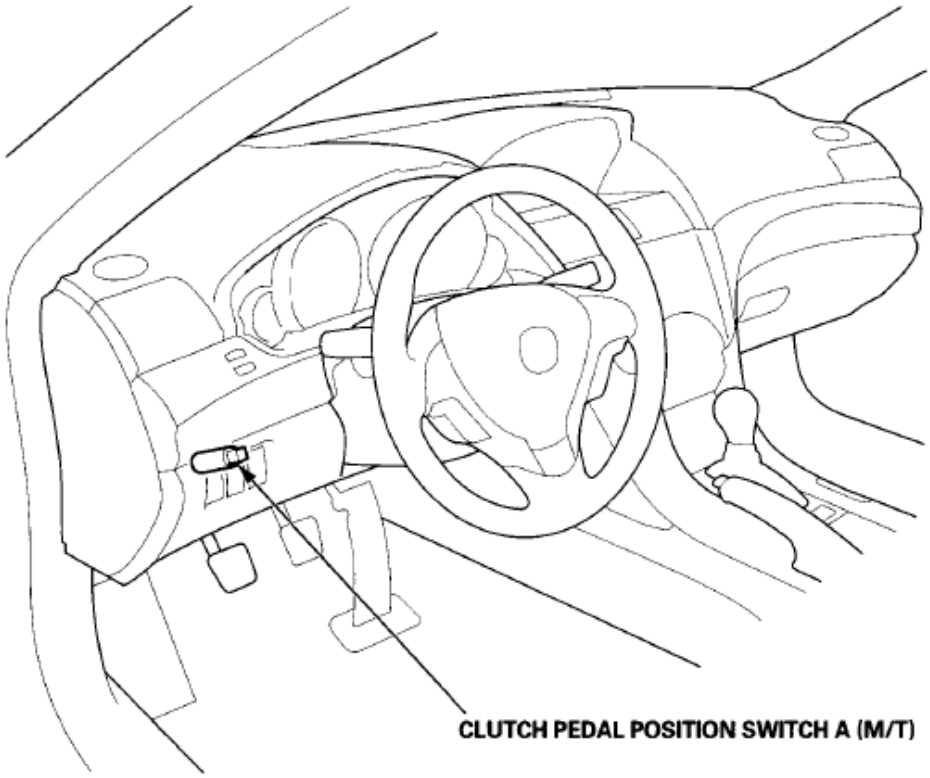

Fig. 2: Keyless Access System Components Location (2 Of 4)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

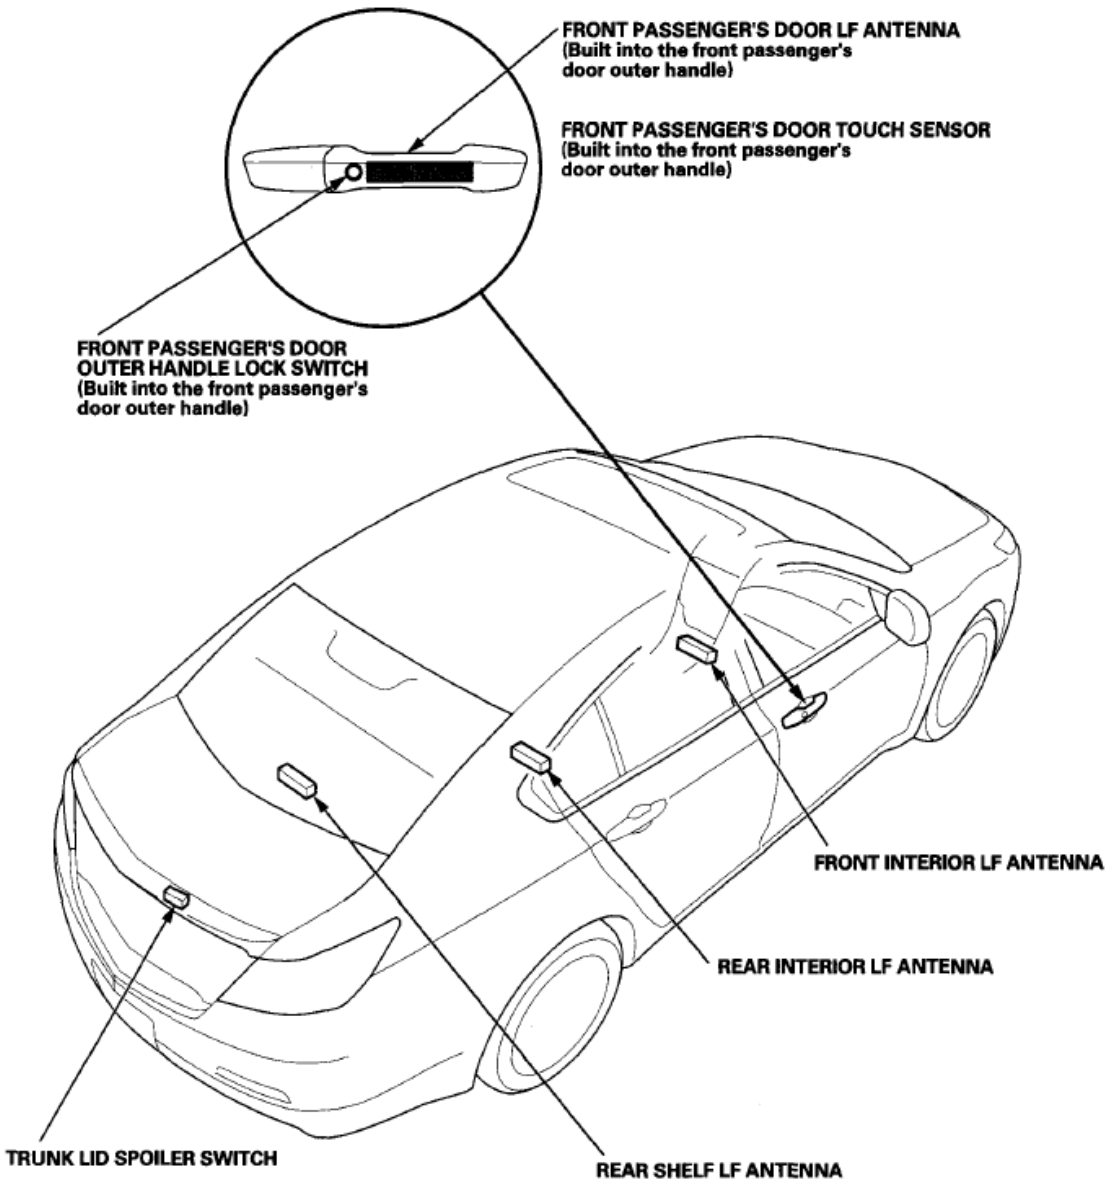

Fig. 3: Keyless Access System Components Location (3 Of 4)
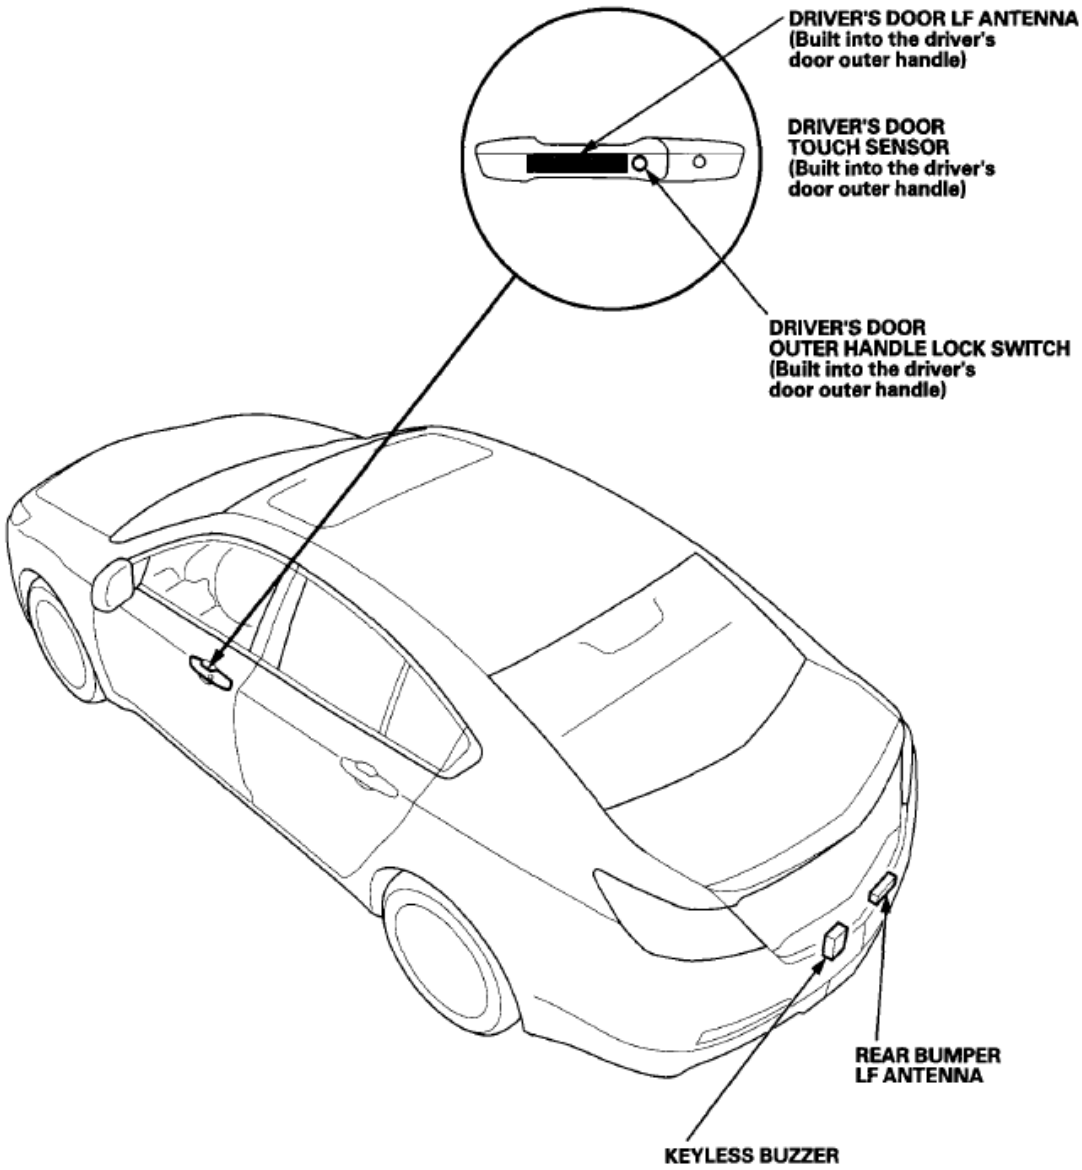
Courtesy of AMERICAN HONDA MOTOR CO., INC.



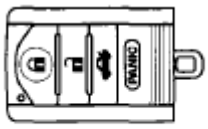


Fig. 4: Keyless Access System Components Location (4 Of 4)
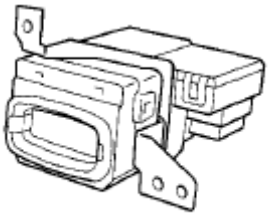
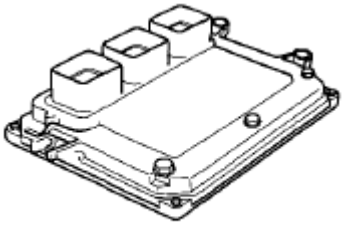
Courtesy of AMERICAN HONDA MOTOR CO., INC.



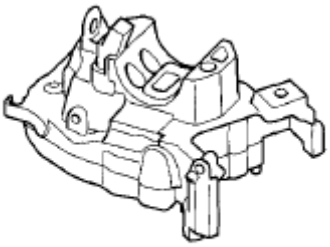
SYSTEM DESCRIPTION

The keyless access system consists of the keyless access control unit, the power control unit, the engine start/stop switch, the remote slot control unit, the electric steering lock, the remote slot, the door outer handle touch sensors/door lock switches, the LF (low frequency) antennas, the RF (radio frequency) unit, the keyless access indicator, the keyless buzzer, the keyless access system mode switch, and the remote. The function of the system is to allow the driver keyless entry into the vehicle along with starting the engine without an ignition key.



Remote
(Has a built-in transponder)

Fig. 5: Identifying Remote
Courtesy of AMERICAN HONDA MOTOR CO., INC.



Remote slot

Fig. 6: Identifying Remote Slot

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Fig. 11: Identifying Keyless Access Control Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

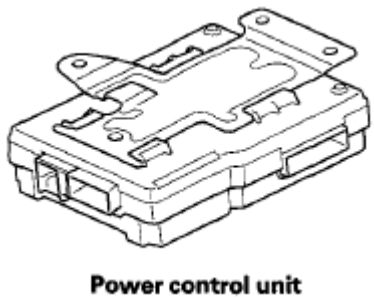

Fig. 12: Identifying Power Control Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

POWER CONTROL UNIT

The power control unit is located under left side of dash. The power control unit controls the power modes based upon signal from the engine start/stop switch, transmission range switch (A/T), park pin switch (A/T), brake pedal position switch (A/T), clutch pedal position switch A (M/T), and B- CAN.

KEYLESS ACCESS CONTROL UNIT

The keyless access control unit is located under left side of dash. The control unit detects the remotes which allows access using the touch sensors in the outer door handles, and also allows the vehicle to operate using the one push start.

TOUCH SENSORS AND LOCK SWITCHES

The touch sensors and lock switches are built into the driver's and front passenger's door outer handles. To operate the door locks without the built- in key while carrying the remote, grip the door outer handle to unlock the doors and press the lock switch on the door outer handle to lock the doors.

RF (RADIO FREQUENCY) UNIT

RF unit is located under the center console.

LF (LOW FREQUENCY) ANTENNAS

The front interior, rear interior and rear shelf LF antennas send the signals to the remote placed in the interior. The driver's door, front passenger's door, and rear bumper LF antennas send the signals to the keyless remote outside of the vehicle.

ENGINE START/STOP SWITCH

The engine start/stop switch is located on the left side of dash. The power modes of the power control unit can be changed by pressing the engine start/stop button.

KEYLESS ACCESS SYSTEM MODE SWITCH

The keyless access system mode switch is installed in a glove box, and turns the keyless access function ON and OFF.

REMOTE SLOT

The remote slot is located on the left side of dash. Insert the remote into the remote slot when the remote battery is dead, or the keyless access system mode switch is OFF. The remote cannot be removed until the power mode is OFF.

REMOTE SLOT CONTROL UNIT

The remote slot control unit is installed behind the glove box, and it controls the remote slot lock.

Built- in immobilizer function operates when the keyless access function is off.

ELECTRIC STEERING LOCK

The electric steering lock control unit is built into the electric steering lock, and it controls the steering lock motor. When the remote code is identified, the electric steering lock control unit unlocks the steering lock by controlling the steering lock motor.

FAIL- SAFE FUNCTION

The system has a fail- safe function. If any malfunction occurs, the keyless access system indicator and the malfunction indicator lamp (MIL) in the gauge come on.

SELF- DIAGNOSTIC FUNCTION

The system also has a self- diagnostic function.

POWER MODE CONTROL FUNCTION

The keyless access system has four power modes: OFF, ACC, ON, and START. The power modes can be changed by pressing the engine start/stop button. The power mode changes to START mode any time the engine start/stop button is pressed while also pressing the brake pedal (A/T) or clutch pedal (M/T).

- OFF and START mode: Indicator (A) in the engine start/stop button is off.
- ACC mode: Indicator in the engine start/stop button comes on green.
- ON mode: Indicator in the engine start/stop button remains green when the engine is not running (If the engine is running, the indicator goes off).

NOTE: If the keyless access system mode switch is OFF, Insert the remote into the remote slot, and press the engine start/stop button to select the mode.

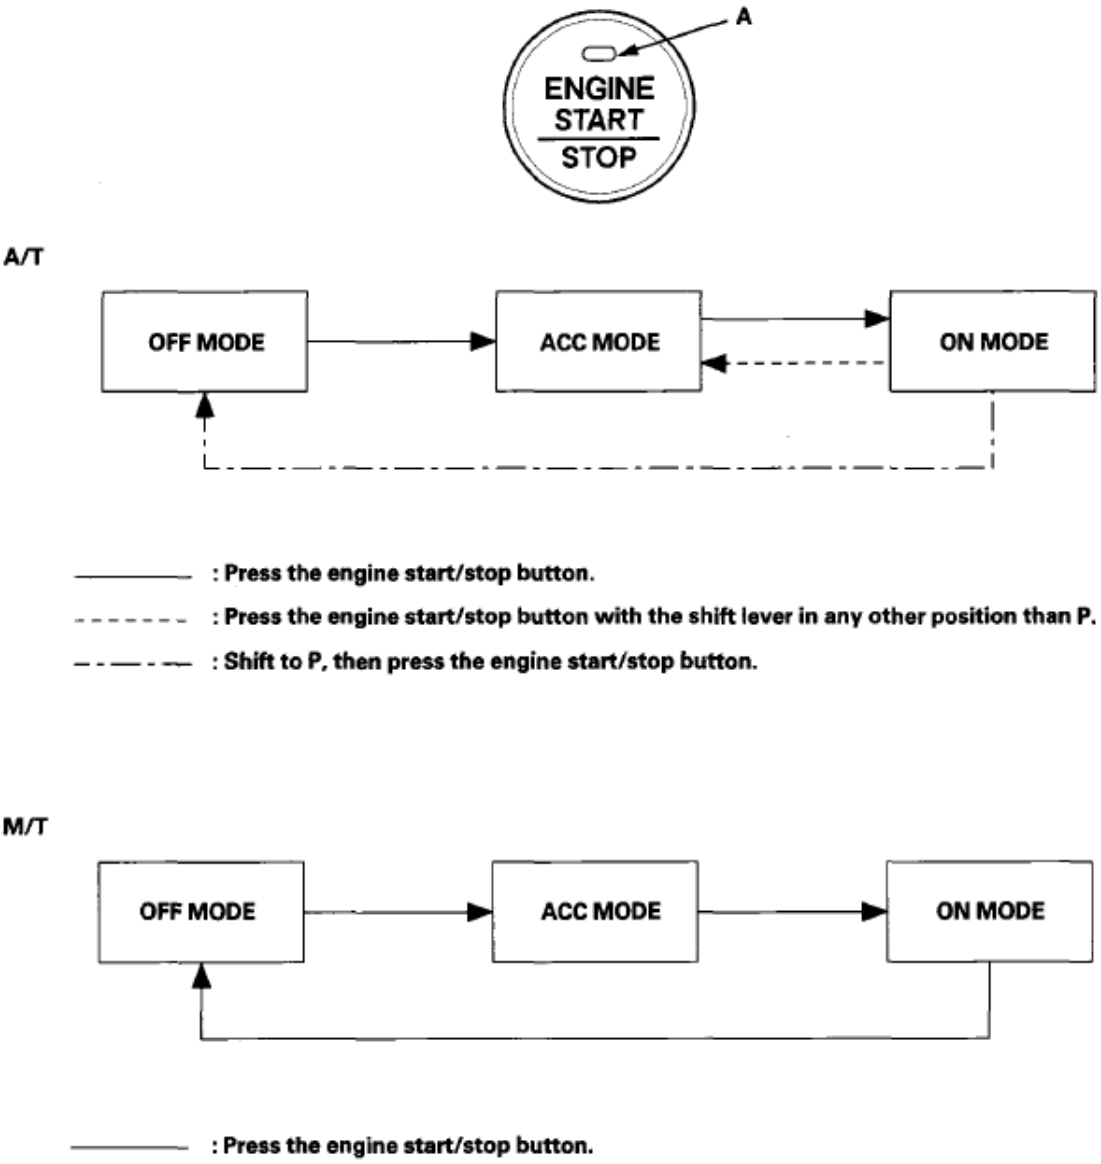

Fig. 13: Power Mode Control Function Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MULTI- INFORMATION DISPLAY INDICATION PATTERN

NOTE: Some examples of indication patterns are shown.

When the door is opened and the power mode is OFF, the display alternates every 3 seconds.

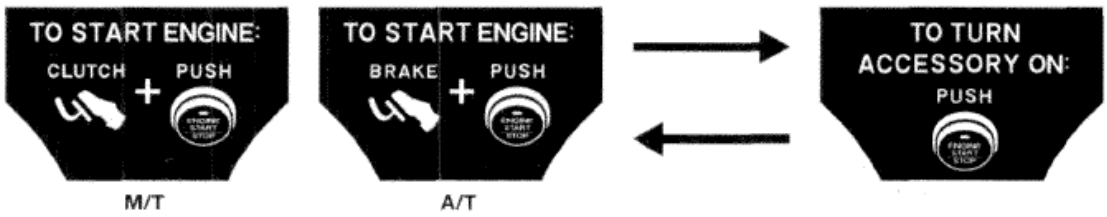

Fig. 14: Multi- Information Display Indication Pattern - Power Mode OFF
Courtesy of AMERICAN HONDA MOTOR CO., INC.

When the power mode is ACC, the display alternates in 3 seconds.

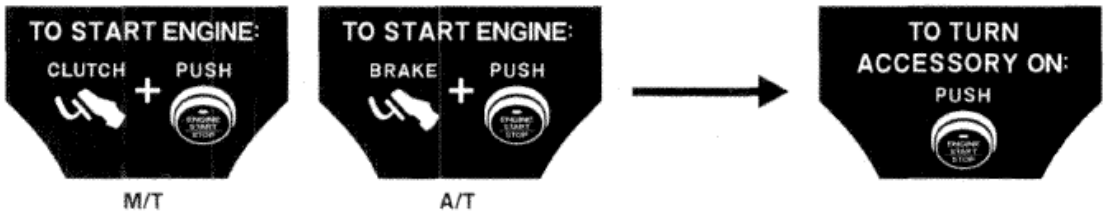

Fig. 15: Multi- Information Display Indication Pattern - Power Mode ACC
Courtesy of AMERICAN HONDA MOTOR CO., INC.

When the power mode is ON.

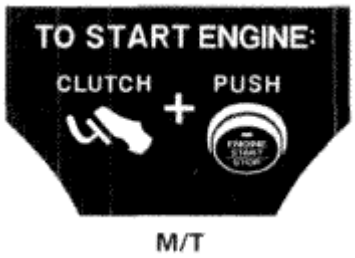

Fig. 16: Multi- Information Display Indication Pattern - Power Mode ON For M/T
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Fig. 17: Multi- Information Display Indication Pattern - Power Mode ON For A/T
Courtesy of AMERICAN HONDA MOTOR CO., INC.

EMERGENCY ENGINE STOP FUNCTION

If you must stop the engine while driving in a serious emergency condition, do either of the following operations:

- Press and hold the engine start/stop button.
- Press the engine start/stop button three times continuously.

IMMOBILIZER FUNCTION

The vehicle is equipped with a Type VII (GEN 5) immobilizer system that disables the vehicle unless a programmed remote is used.

This system consists of a transponder built into the remote, a remote slot control unit, the driver's MICU (has a built- in imoes unit), an immobilizer indicator, and the ECM/PCM.

When the remote (programmed by the HDS) is inserted into the remote slot and the engine start/stop switch is pressed to select the ON mode, the remote slot control unit sends power to the transponder. The transponder then sends a coded signal back to the remote slot control unit, which then sends a coded signal to the ECM/PCM and the driver's MICU (imoes unit). The ECM/PCM and driver's MICU (imoes unit) identify this coded signal, then voltage is supplied to the fuel pump.

If the wrong remote is used or the code was not received or recognized by the units, the Indicator flashes once, then it blinks until the OFF mode is selected by pressing the engine start/stop button. When the OFF mode is selected by pressing the engine start/stop button, the indicator blinks ten times to signal that unit has reset correctly, then the indicator goes off.

GENERAL TROUBLESHOOTING INFORMATION

SELF- DIAGNOSTIC FUNCTION

The keyless access system has a self- diagnostic function. If any malfunction is stored in the keyless access control unit, the DTC codes can be determined by the keyless access indicator blinking pattern.

Short the SCS line with the HDS, then press the engine start/stop button to select the ON mode. The keyless

access indicator starts to show the DTCs if any DTCs are stored.

The DTC is cleared when the battery terminal is disconnected, or by removing the No. 15 (10 A) fuse from the under- hood fuse/relay box.

DTC	Keyless access indicator		Description
B1601	1	o	Keyless access control unit internal (CPU) error
B1602	2	o	Keyless access control unit internal (EEPROM) error
B1640	40	o	RF unit not connected
B1646	46	o	Driver's door LF antenna circuit open or short
B1648	48	o	Passenger's door LF antenna circuit open or short
B1658	58	o	Rear bumper LF antenna circuit open or short
B1660	60	o	Front interior LF antenna circuit open or short
B1664	64	o	Rear interior LF antenna circuit open or short
B1668	68	o	Rear shelf LF antenna circuit open or short
U0155	10	o	Keyless access control unit lost communication with gauge control module
U0199	7	o	Keyless access control unit lost communication with door multiplex control unit
U1280	100	o	Communication bus line error (BUS- OFF) (see **DTC U1280: COMMUNICATION BUS LINE ERROR (BUS- OFF)**)
U1282	5	o	Keyless access control unit lost communication with driver's MICU
U1283	16	o	Keyless access control unit lost communication with passenger's MICU
NOTE: **When the engine start/stop button is pressed and the mode changes to ON, the keyless access indicator comes on when any malfunction is detected.**			

DTC TROUBLESHOOTING

DTC B12A1: POWER CONTROL UNIT INTERNAL (CPU) ERROR

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Do the battery terminal disconnect procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
2. Wait for at least 10 seconds to clear the DTCs.
3. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
4. Press and hold the engine start/stop button.
5. Wait for at least 10 seconds.
6. Check for DTCs with the HDS.

Is DTC B12A1 indicated?

YES - Replace the power control unit (see **CONTROL UNIT INPUT TEST**).

NO - Intermittent failure, the system is OK at this time.

DTC B12C5: ENGINE START/STOP SWITCH FAILURE

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

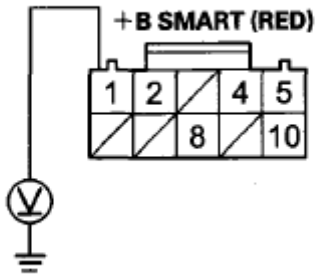
1. Clear the DTCs with the HDS.
2. Press the engine start/stop button at least 20 times, then wait for at least 20 seconds.
3. Check for DTCs with the HDS.

Is DTC B12C5 indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

4. Do the engine start/stop switch test (see **ENGINE START/STOP SWITCH TEST/REPLACEMENT**).



Is the engine start/stop switch OK?

YES - Go to step 5.

NO - Replace the engine start/stop switch (see **ENGINE START/STOP SWITCH TEST/REPLACEMENT**).

5. Reconnect the engine start/stop switch 10P connector.
6. Measure the voltage between body ground and engine start/stop switch 10P connector terminal No. 1.

ENGINE START/STOP SWITCH 10P CONNECTOR

Wire side of female terminals

Fig. 25: Measuring Voltage Between Body Ground And Engine Start/Stop Switch 10P Connector Terminal No. 1 With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 7.

NO - Check the No. 12 (10 A) fuse in the passenger's under- dash fuse/relay box. If the fuse is OK, check for an open in the wire.

7. Press and hold the engine start/stop button.
8. Measure the voltage between body ground and engine start/stop switch 10P connector terminal No. 4.

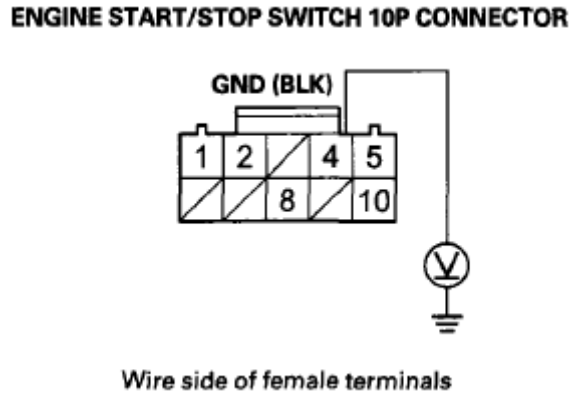


Fig. 26: Measuring Voltage Between Body Ground And Engine Start/Stop Switch 10P Connector Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 9.

NO - Repair an open or high resistance in the wire or poor ground (G405).

9. Disconnect the engine start/stop switch 10P connector.
10. Disconnect power control unit connector C (36P).
11. Check for continuity between engine start/stop switch 10P connector terminals No. 2 and No. 5, and power control unit connector C (36P) terminals No. 8 and No. 7 respectively.

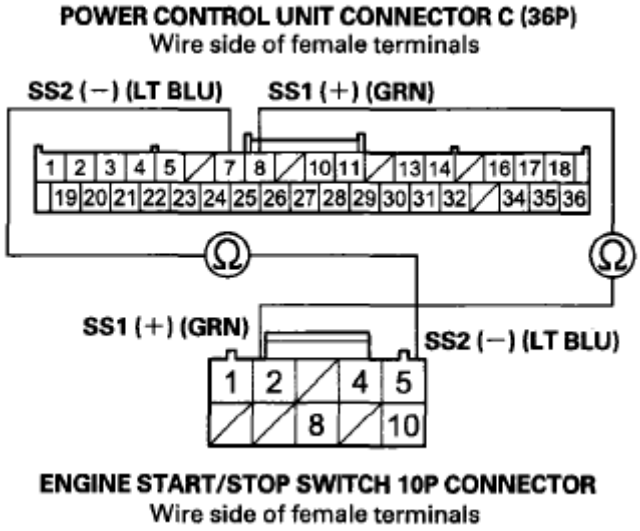

Fig. 27: Checking Continuity Between Engine Start/Stop Switch 10P Connector Terminals And Power Control Unit Connector C (36P) Terminals With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the power control unit (see **CONTROL UNIT INPUT TEST**).

NO - Repair an open or high resistance in the wire.

DTC B12C6: ELECTRIC STEERING LOCK SWITCH C/D MONITOR CIRCUIT FAILURE

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Press the engine start/stop button at least 10 times.
3. Check for DTCs with the HDS.

   Is DTC B12C6 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

4. Measure the voltage between body ground and electric steering lock 12P connector terminal No. 12.

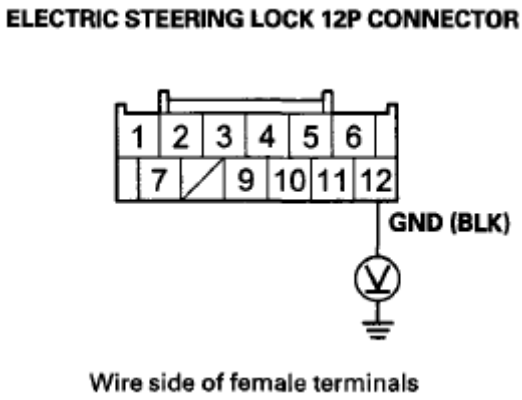

Fig. 28: Measuring Voltage Between Body Ground And Electric Steering Lock 12P Connector Terminal No. 12 With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 5.

NO - Repair an open or high resistance in the wire or poor ground (G405).

5. Disconnect the electric steering lock 12P connector.
6. Disconnect power control unit connector C (36P).
7. Check for continuity between body ground and electric steering lock 12P connector terminals No. 9 and No. 10 individually.

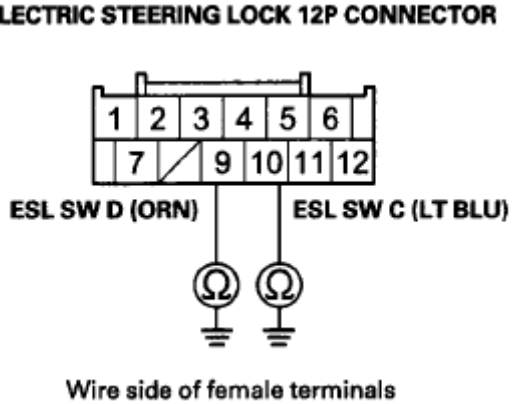

Fig. 29: Checking Continuity Between Body Ground And Electric Steering Lock 12P Connector Terminals No. 9 And No. 10 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 8.

8. Check for continuity between power control unit connector C (36P) terminals No. 29 and No. 30, and electric steering lock 12P connector terminals No. 10 and No. 9 respectively.

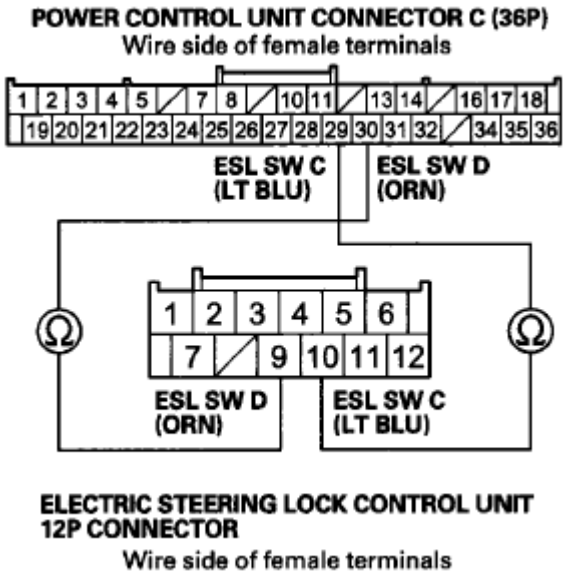

Fig. 30: Checking Continuity Between Power Control Unit Connector C (36P) Terminals And Electric Steering Lock 12P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Repair an open or high resistance in the wire.

9. Reconnect power control unit connector C (36P).
10. Select PCU from the ONE-PUSH START system select menu with the HDS, and enter DATA LIST.
11. Check each PCU value with the DATA LIST menu.
12. Connect the jumper wires to body ground and to electric steering control unit 12P connector terminals No. 10 and No. 9.

Data List	Value
ESL SWITCH C	ON
ESL SWITCH D	ON

Are all data list values correct?

YES - Replace the electric steering lock (see **STEERING LOCK REPLACEMENT**).

NO - Replace the power control unit (see **CONTROL UNIT INPUT TEST**).

DTC B12C7: ELECTRIC STEERING LOCK MOTOR CIRCUIT FAILURE

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Do this procedure 10 times: Press the engine start/stop button to select the OFF, ACC, ON, and OFF mode.
3. Check for DTCs with the HDS.

   Is DTC B12C7 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

4. Disconnect the engine start/stop switch 10P connector.
5. Check for continuity between body ground and electric steering lock 12P connector terminal No. 12.

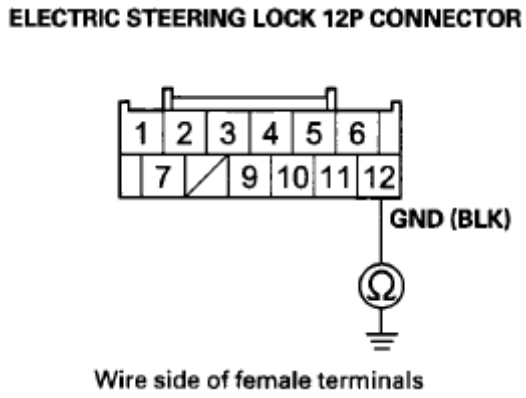

Fig. 31: Checking Continuity Between Body Ground And Electric Steering Lock 12P Connector Terminal No. 12
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there continuity?

   YES - Go to step 6.

   NO - Repair an open or high resistance in the wire or poor ground (G405).

6. Disconnect the electric steering lock 12P connector.
7. Disconnect power control unit connector C (36P).

8. Check for continuity between body ground and electric steering lock 12P connector terminals No. 3 and No. 5 individually.

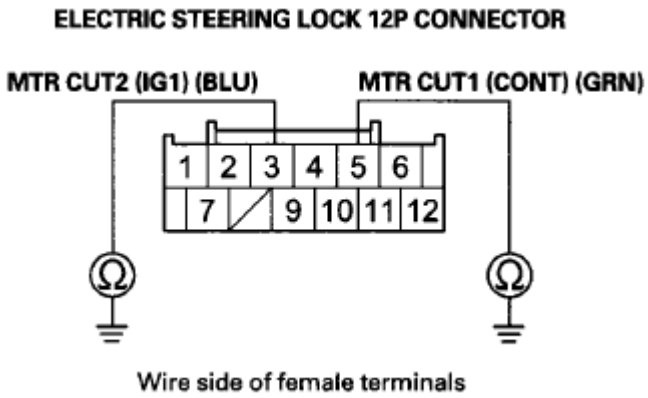

Fig. 32: Checking Continuity Between Body Ground And Electric Steering Lock 12P Connector Terminals No. 3 And No. 5 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 9.

9. Check for continuity between power control unit connector C (36P) terminals No. 31 and No. 32, and electric steering lock 12P connector terminals No. 5 and No. 3 respectively.

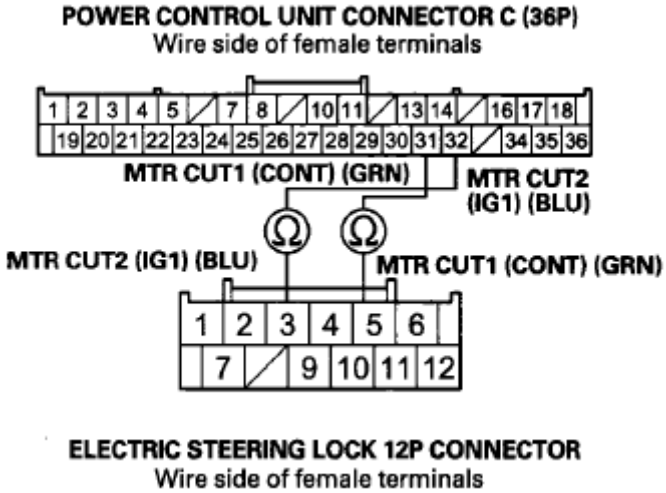

Fig. 33: Checking Continuity Between Power Control Unit Connector C (36P) Terminals And Electric Steering Lock 12P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Substitute a known- good power control unit. If the symptom goes away, replace the original power control unit (see **CONTROL UNIT INPUT TEST**). If not, replace the electric steering lock (see **STEERING LOCK REPLACEMENT**).

NO - Repair an open or high resistance in the wire.

DTC B12D0: POWER CONTROL UNIT IG1A CIRCUIT ERROR; DTC B12D1: POWER CONTROL UNIT IG1B CIRCUIT ERROR; DTC B12D2: POWER CONTROL UNIT IG2 CIRCUIT ERROR; DTC B12D3: POWER CONTROL UNIT IG LATCH CIRCUIT ERROR

NOTE:
- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B- CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **Make sure aftermarket accessories are not installed.**

1. Clear the DTCs with the HDS.
2. Do this procedure 5 times:
   - Press the engine start/stop button to select the OFF mode
   - Wait 10 seconds
   - Select the ACC mode
   - Wait 10 seconds
   - Select the ON mode
   - Wait 10 seconds before repeating this procedure
3. Check for DTCs with the HDS.

   Are DTCs B12D0, B12D1, B12D2, and/or B12D3 indicated?

   YES - Replace the power control unit (see **CONTROL UNIT INPUT TEST**).

   NO - Intermittent failure, the system is OK at this time.

DTC B12E0: ELECTRIC STEERING LOCK SWITCH INTERNAL ERROR

NOTE: **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B- CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).**

1. Clear the DTCs with the HDS.
2. Do this procedure at least 10 times: Press the engine start/stop button to select the OFF, ACC, ON, and OFF mode.
3. Check for DTCs with the HDS.

   Is DTC B12E0 indicated?

YES - Replace the electric steering lock (see **STEERING LOCK REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time.

DTC B12E1: ELECTRIC STEERING LOCK MOTOR INTERNAL ERROR; DTC B12E2: ELECTRIC STEERING LOCK LOW LEVEL FAILURE OF MTRCUT1; DTC B12E3: ELECTRIC STEERING LOCK HIGH LEVEL FAILURE OF MTRCUT1; DTC B12E4: ELECTRIC STEERING LOCK HIGH LEVEL FAILURE OF MTRCUT2

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Do this procedure 11 times: Press the engine start/stop button to select the OFF, ACC, ON, and OFF mode.
3. Check for DTCs with the HDS.

Are DTCs B12E1, B12E2, B12E3, and/or B12E4 indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

4. Disconnect the electric steering lock 12P connector.
5. Measure the voltage between body ground and electric steering lock 12P connector terminal No. 4.

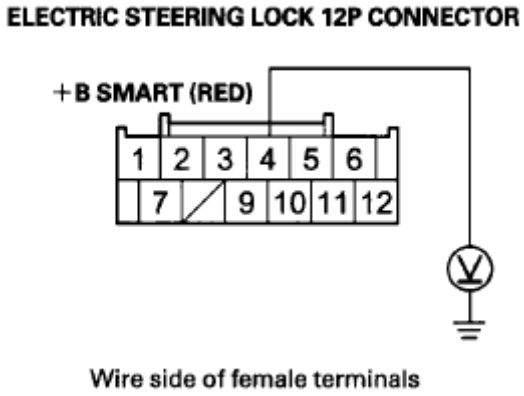

Fig. 34: Measuring Voltage Between Body Ground And Electric Steering Lock 12P Connector Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 6.

NO - Blown No. 12 (10 A) fuse in the passenger's under- dash fuse/relay box, repair an open or high resistance in the wire.

6. Reconnect the electric steering lock 12P connector.
7. Measure the voltage between body ground and electric steering lock 12P connector terminal No. 12.

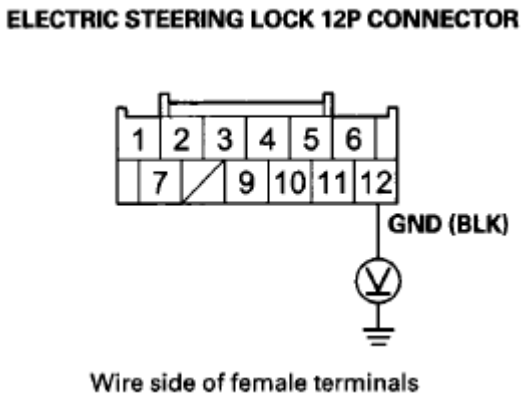

Fig. 35: Measuring Voltage Between Body Ground And Electric Steering Lock 12P Connector Terminal No. 12
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 8.

NO - Repair an open or high resistance in the wire or poor ground (G405).

8. Press the engine start/stop button to select the ON mode.
9. Measure the voltage between body ground and electric steering lock 12P connector terminal No. 7.

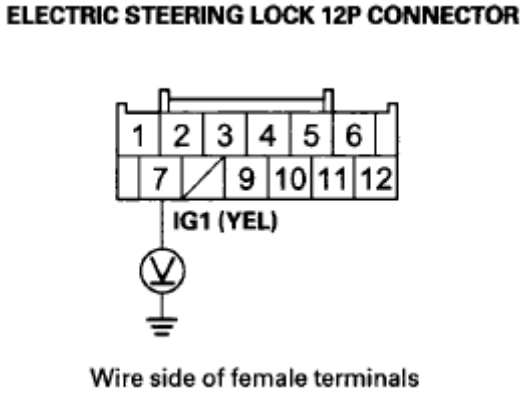

Fig. 36: Measuring Voltage Between Body Ground And Electric Steering Lock 12P Connector Terminal No. 7
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Repair an open or high resistance in the wire or blown No. 9 (20 A) fuse in the driver's under- dash fuse/relay box.

10. Press the engine start/stop button to select the OFF mode.
11. Disconnect the remote slot control unit 40P connector.
12. Disconnect keyless access control unit connector A (36P).
13. Check for continuity between electric steering lock 12P connector terminal No. 6 and remote slot control unit 40P connector terminal No. 12.

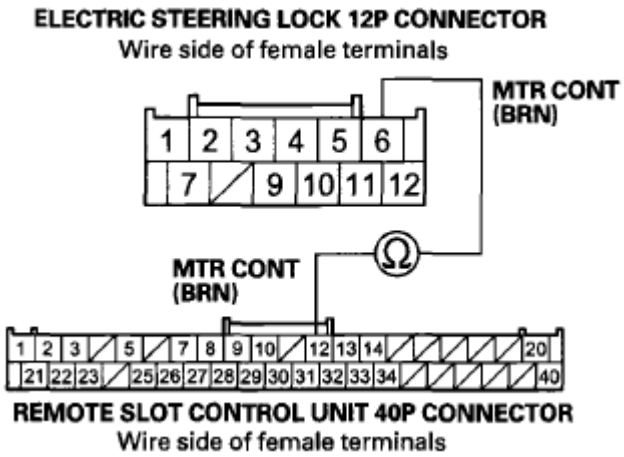

Fig. 37: Checking Continuity Between Electric Steering Lock 12P Connector Terminal No. 6 And Remote Slot Control Unit 40P Connector Terminal No. 12
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 14.

NO - Repair an open or high resistance in the wire.

14. Check for continuity between electric steering lock 12P connector terminal No. 6 and keyless access control unit connector A (36P) terminal No. 27.

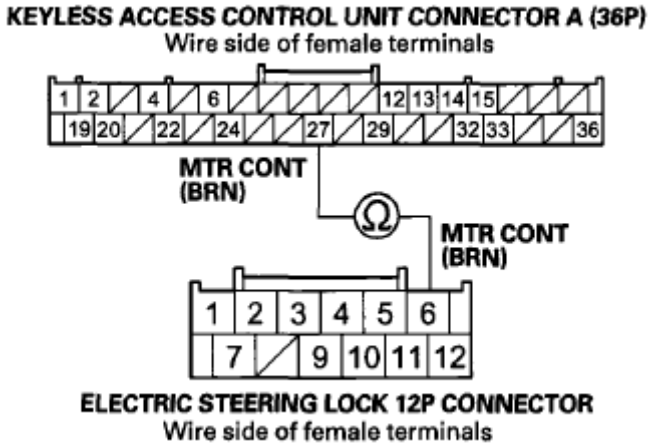

Fig. 38: Checking Continuity Between Electric Steering Lock 12P Connector Terminal No. 6 And Keyless Access Control Unit Connector A (36P) Terminal No. 27
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 15.

NO - Repair an open or high resistance in the wire.

15. Disconnect power control unit connector C (36P).
16. Check for continuity between electric steering lock 12P connector terminals No. 5 and No. 3 and power control unit connector C (36P) terminals No. 31 and No. 32 respectively.

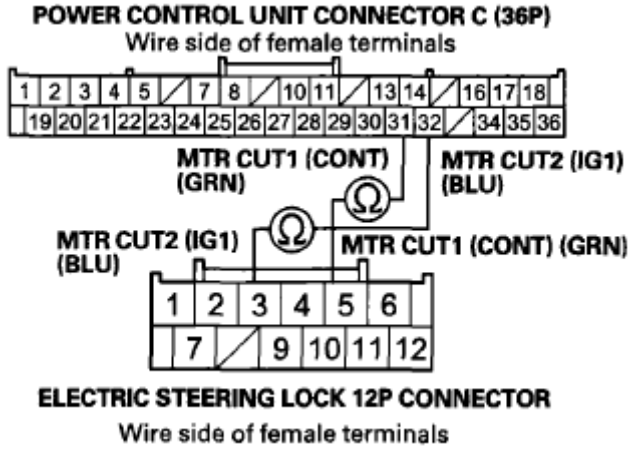

Fig. 39: Checking Continuity Between Electric Steering Lock 12P Connector Terminals And Power Control Unit Connector C (36P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Substitute a known- good electric steering lock. If the symptom goes away, replace the original electric steering lock (see **STEERING LOCK REPLACEMENT**). If not, replace the remote slot control unit (see **CONTROL UNIT INPUT TEST**).

NO - Repair an open or high resistance in the wire.

DTC B12F0: POWER CONTROL UNIT LOST COMMUNICATION WITH ELECTRIC STEERING LOCK

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Do this procedure 10 times: Press the engine start/stop button to select the OFF, ACC, ON, and OFF mode.
3. Check for DTCs with the HDS.

   Is DTC B12F0 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

4. Measure the voltage between body ground and electric steering lock 12P connector terminal No. 4.

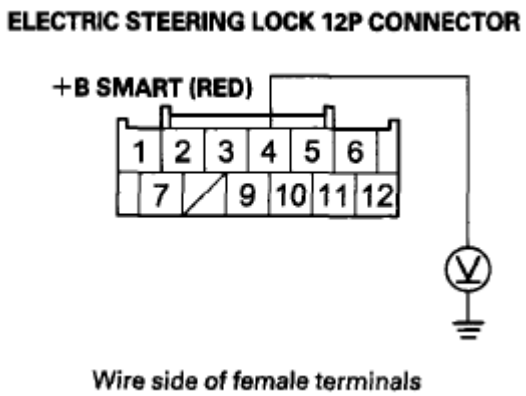

Fig. 40: Measuring Voltage Between Body Ground And Electric Steering Lock 12P Connector Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 5.

NO - Blown No. 12 (10 A) fuse in the passenger's under- dash fuse/relay box, repair an open or high

resistance in the wire.

5. Measure the voltage between body ground and electric steering lock 12P connector terminal No. 12.

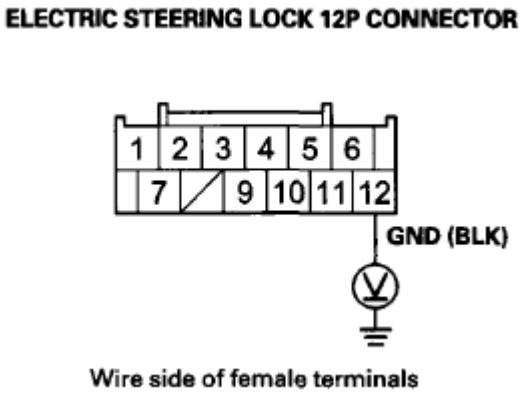

Fig. 41: Measuring Voltage Between Body Ground And Electric Steering Lock 12P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 6.

NO - Repair an open or high resistance in the wire or poor ground (G405).

6. Press the engine start/stop button to select the OFF mode.
7. Disconnect these items:
   - Electric steering lock 12P connector
   - Power control unit connector C (36P)
   - Remote slot control unit 40P connector
   - Keyless access control unit connector B (32P)
8. Check for continuity between body ground and electric steering lock 12P connector terminal No. 1.

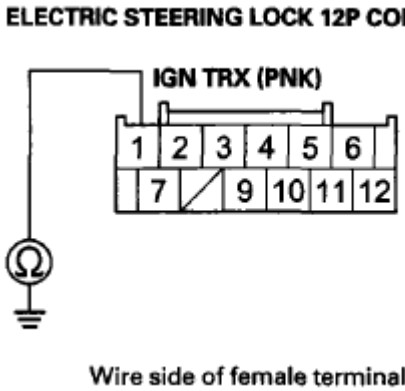

Fig. 42: Checking Continuity Between Body Ground And Electric Steering Lock 12P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 9.

9. Check for continuity between electric steering lock 12P connector terminal No. 1 and power control unit connector C (36P) terminal No. 2.

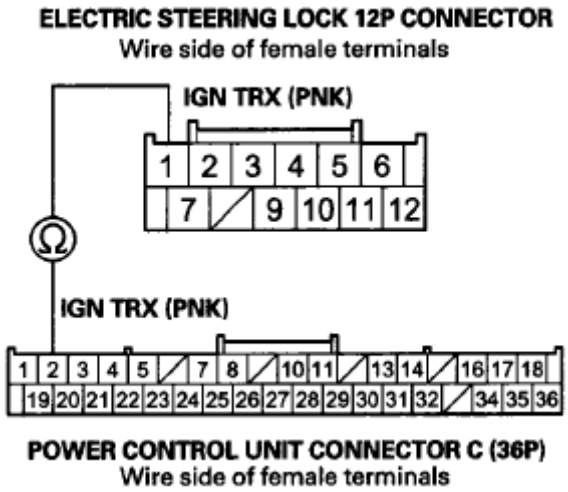

Fig. 43: Checking Continuity Between Electric Steering Lock 12P Connector Terminal No. 1 And Power Control Unit Connector C (36P) Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open or high resistance in the wire.

10. Reconnect these items:
    - Electric steering lock 12P connector
    - Power control unit connector C (36P)
    - Remote slot control unit 40P connector
    - Keyless access control unit connector B (32P)
11. Do the battery terminal disconnect procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
12. Wait for at least 10 seconds to clear the DTCs.

13. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
14. Turn the keyless access system mode switch ON.
15. If necessary, remove the remote from the remote slot.
16. Press the engine start/stop button to select the ON mode, then select the OFF mode.
17. Insert the remote into the remote slot.
18. Press and hold the engine start/stop button to select the ON mode.

    Does the mode change to ON?

    YES - Go to step 19.

    NO - Go to step 22.

19. Clear the DTCs with the HDS.
20. Do this procedure 10 times: Press the engine start/stop button to select the OFF, ACC, ON, and OFF mode.
21. Check for DTCs with the HDS.

    Is DTC B12F0 indicated?

    YES - Replace the electric steering lock (see **STEERING LOCK REPLACEMENT**).

    NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

22. Connect the HDS to the data link connector (DLC).
23. Select COMMUNICATION STATUS in the INSPECTION MENU with the HDS.
24. Check the value of STATUS with ESL, STATUS with KEYLESS ACCESS CONTROL UNIT, and STATUS with SLOT with the HDS.

	HDS Description	Value
Status with ESL	MTR CUT1 (Cont) Status	1
	MTR CUT2 (IG) Status	1
	IG1 Input State of ESL	1
	MTRCONT Status of ESL	1
	ESL Motor Status	1
	Switch D detection for Unlock Status	1
	Switch C detection for Unlock Status	1
	Switch B detection for Unlock Status	1
Status with KEYLESS ACCESS CONTROL UNIT	FOR KEY Authentication Result	1
Status with SLOT	FOR KEY Authentication Result	1

Are only values of status with ESL 1?

YES - Replace the electric steering lock (see **STEERING LOCK REPLACEMENT**).

NO - Replace the power control unit (see **CONTROL UNIT INPUT TEST**).

DTC B12F1: POWER CONTROL UNIT LOST COMMUNICATION WITH REMOTE SLOT CONTROL UNIT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Insert the remote into the remote slot.
2. Clear the DTCs with the HDS.
3. Do this procedure 10 times: Press the engine start/stop button to select the OFF, ACC, ON, and OFF mode.
4. Check for DTCs with the HDS.

   Is DTC B12F1 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Select ONE-PUSH START from the SYSTEM SELECTION MENU with the HDS.
6. Select the REMOTE SLOT CONTROL UNIT and check for DTCs with the HDS.

   Are any DTCs indicated?

   YES - Go to the indicated **DTCS TROUBLESHOOTING**.

   NO - Go to step 7.

7. Press the engine start/stop button to select the OFF mode.
8. Disconnect these items:
   - Power control unit connector C (36P)
   - Remote slot control unit 40P connector
   - Electric steering lock 12P connector
   - Keyless access control unit connector B (32P)
9. Check for continuity between body ground and power control unit connector C (36P) terminal No. 2.

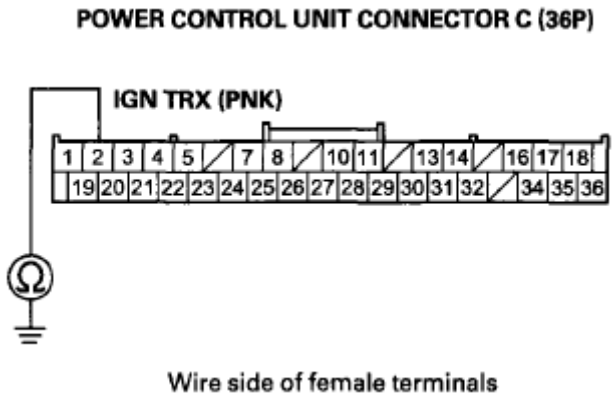

Fig. 44: Checking Continuity Between Body Ground And Power Control Unit Connector C (36P) Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 10.

10. Check for continuity between remote slot control unit 40P connector terminal No. 32 and power control unit connector C (36P) terminal No. 2.

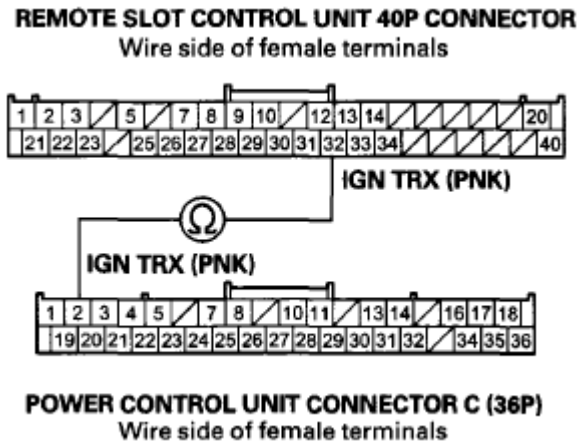

Fig. 45: Checking Continuity Between Remote Slot Control Unit 40P Connector Terminal No. 32 And Power Control Unit Connector C (36P) Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair an open or high resistance in the wire.

11. Reconnect these items:
    - Power control unit connector C (36P)
    - Remote slot control unit 40P connector
    - Electric steering lock 12P connector
    - Keyless access control unit connector B (32P)
12. Do the battery terminal disconnect procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
13. Wait for at least 10 seconds to clear the DTCs.
14. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
15. Turn the keyless access system mode switch ON.
16. If necessary, remove the remote from the remote slot.
17. Press the engine start/stop button to select the ON mode, then select the OFF mode.
18. Insert the remote into the remote slot.
19. Press and hold the engine start/stop button to select the ON mode.

    Does the mode change to ON?

    YES - Go to step 20.

    NO - Go to step 23.

20. Clear the DTCs with the HDS.
21. Do this procedure 10 times: Press the engine start/stop button to select the OFF, ACC, ON, and OFF mode.
22. Check for DTCs with the HDS.

    Is DTC B12F1 indicated?

    YES - Replace the remote slot control unit (see **CONTROL UNIT INPUT TEST**).

    NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

23. Connect the HDS to the data link connector (DLC).
24. Select COMMUNICATION STATUS in the INSPECTION MENU with the HDS.
25. Check the value of STATUS with ESL, STATUS with KEYLESS ACCESS CONTROL UNIT, and STATUS with SLOT with the HDS.

HDS Description		Value
	MTR CUT1 (Cont) Status	1
	MTR CUT2 (IG) Status	1
	IG1 Input State of ESL	1

Status with ESL	MTRCONT Status of ESL	1
	ESL Motor Status	1
	Switch D detection for Unlock Status	1
	Switch C detection for Unlock Status	1
	Switch B detection for Unlock Status	1
Status with KEYLESS ACCESS CONTROL UNIT	FOR KEY Authentication Result	1
Status with SLOT	FOR KEY Authentication Result	1

Are only values of status with SLOT 1?

YES - Replace the remote slot control unit (see **CONTROL UNIT INPUT TEST**).

NO - Replace the power control unit (see **CONTROL UNIT INPUT TEST**).

DTC B12F2: POWER CONTROL UNIT LOST COMMUNICATION WITH KEYLESS ACCESS CONTROL UNIT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Make sure the remote is not in the remote slot.
2. Clear the DTCs with the HDS.
3. Do this procedure 10 times: Press the engine start/stop button to select the OFF, ACC, ON, and OFF mode.
4. Check for DTCs with the HDS.

   Is DTC B12F2 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Select ONE-PUSH START from the SYSTEM SELECTION MENU with the HDS.
6. Select the KEYLESS ACCESS CONTROL UNIT and check for DTCs with the HDS.

   Are any DTCs indicated?

   YES - Go to the indicated **DTCS TROUBLESHOOTING**.

   NO - Go to step 7.

7. Press the engine start/stop button to select the OFF mode.
8. Disconnect these items:

- Power control unit connector C (36P)
- Remote slot control unit 40P connector
- Electric steering lock 12P connector
- Keyless access control unit connector B (32P)

9. Check for continuity between body ground and power control unit connector C (36P) terminal No. 2.

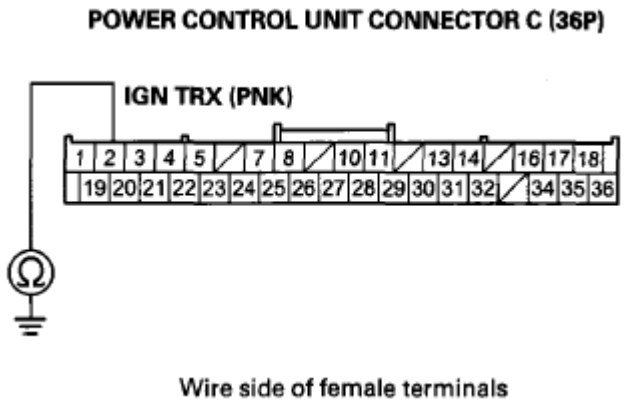

Fig. 46: Checking Continuity Between Body Ground And Power Control Unit Connector C (36P) Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 10.

10. Check for continuity between keyless access control unit connector B (32P) terminal No. 6 and power control unit connector C (36P) terminal No. 2.

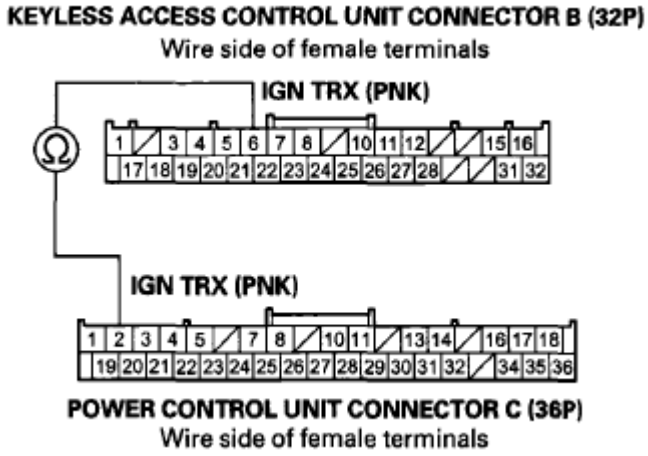

Fig. 47: Checking Continuity Between Keyless Access Control Unit Connector B (32P) Terminal No. 6 And Power Control Unit Connector C (36P) Terminal No. 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair an open or high resistance in the wire.

11. Reconnect these items:
    - Power control unit connector C (36P)
    - Remote slot control unit 40P connector
    - Electric steering lock 12P connector
    - Keyless access control unit connector B (32P)
12. Do the battery terminal disconnect procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
13. Wait for at least 10 seconds to clear the DTCs.
14. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
15. Turn the keyless access system mode switch ON.
16. If necessary, remove the remote from the remote slot.
17. Press the engine start/stop button to select the ON mode, then select the OFF mode.
18. Insert the remote into the remote slot.
19. Press and hold the engine start/stop button to select the ON mode.

    Does the mode change to ON?

    YES - Go to step 20.

    NO - Go to step 23.

20. Clear the DTCs with the HDS.
21. Press the engine start/stop button to select the OFF.
22. Check for DTCs with the HDS.

    Is DTC B12F2 indicated?

    YES - Replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

    NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

23. Connect the HDS to the data link connector (DLC).
24. Select COMMUNICATION STATUS in the INSPECTION MENU with the HDS.
25. Check the value of STATUS with ESL, STATUS with KEYLESS ACCESS CONTROL UNIT, and

STATUS with SLOT with the HDS.

HDS Description		Value
Status with ESL	MTR CUT1 (Cont) Status	1
	MTR CUT2 (IG) Status	1
	IG1 Input State of ESL	1
	MTRCONT Status of ESL	1
	ESL Motor Status	1
	Switch D detection for Unlock Status	1
	Switch C detection for Unlock Status	1
	Switch B detection for Unlock Status	1
Status with KEYLESS ACCESS CONTROL UNIT	FOR KEY Authentication Result	1
Status with SLOT	FOR KEY Authentication Result	1

Are only values of status with KEYLESS ACCESS CONTROL UNIT 1?

YES - Replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

NO - Replace the power control unit (see **CONTROL UNIT INPUT TEST**).

DTC U0155: POWER CONTROL UNIT LOST COMMUNICATION WITH GAUGE CONTROL MODULE

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Press the engine start/stop button to select the OFF, ACC, and ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U0155 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the power control unit and the gauge control module.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B- CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the gauge control module detected?

   YES - Go to step 9.

NO - Go to step 6.

6. Measure the voltage between body ground and gauge control module 32P connector terminals No. 15 and No. 16 individually.

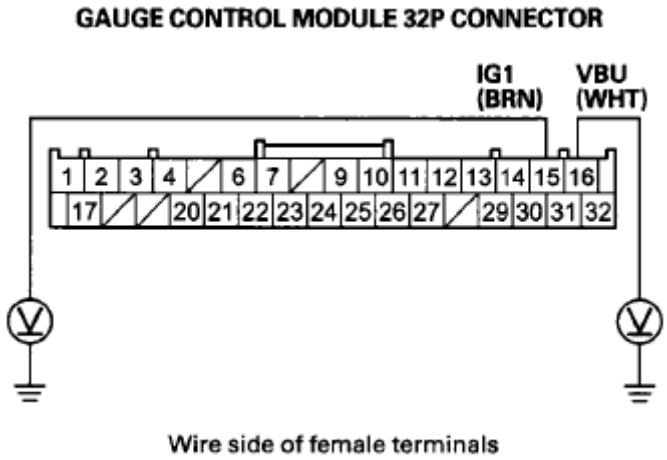

Fig. 48: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 15 And No. 16 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 9.

NO - Go to step 7.

7. Check the No. 15(10 A) fuse in the under- hood fuse/relay box and the No. 12 (7.5 A) fuse in the driver's under- dash fuse/relay box.

Are the fuses OK?

YES - Repair an open or high resistance in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

NO - Replace the fuse(s). If the fuse blows again, repair a short to ground in the No. 15(10 A) and/or No. 12 (7.5 A) fuse circuit.

8. Measure the voltage between body ground and gauge control module 32P connector terminals No. 1 and No. 17 individually.

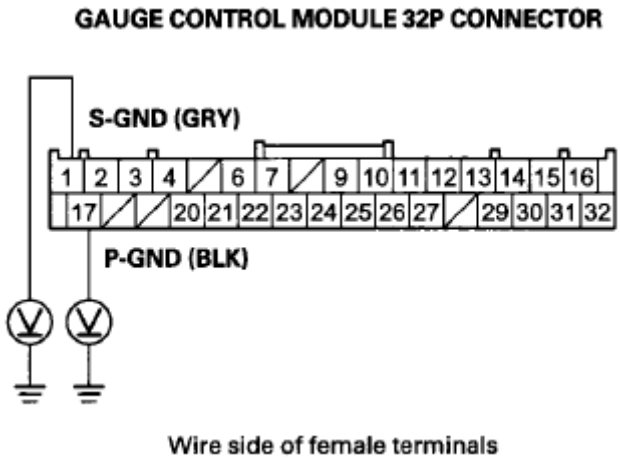

Fig. 49: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 1 And No. 17 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 9.

NO - Repair an open or high resistance in the ground wire or poor ground (G401) and/or (G402).

9. Press the engine start/stop button to select the OFF mode.
10. Disconnect power control unit connector C (36P).
11. Disconnect the gauge control module 32P connector.
12. Check for continuity between gauge control module 32P connector terminals No. 29 and No. 30 and power control unit connector C (36P) terminals No. 17 and No. 16 respectively.

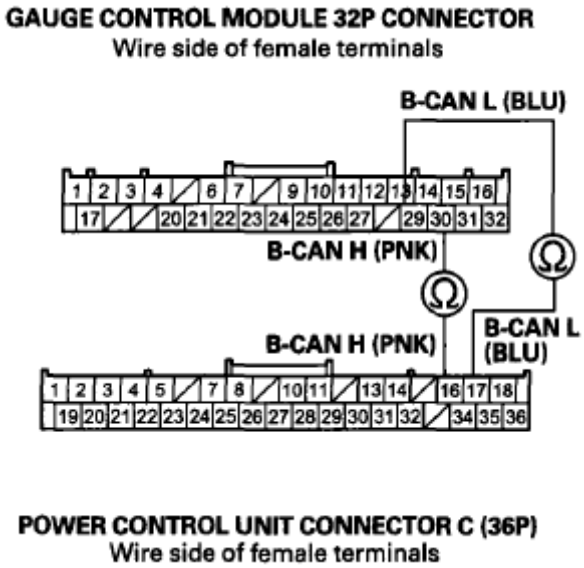

Fig. 50: Checking Continuity Between Gauge Control Module 32P Connector Terminals And Power Control Unit Connector C (36P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO - Repair an open or poor connection in the B- CAN wire between the power control unit and the gauge control module.

DTC U0199: POWER CONTROL UNIT LOST COMMUNICATION WITH DOOR MULTIPLEX CONTROL UNIT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Press the engine start/stop button to select the OFF, ACC, and ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U0199 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the power control unit and the door multiplex control unit.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B- CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the power window unit detected?

   YES - Go to step 9.

   NO - Go to step 6.

6. Measure the voltage between body ground and power window master switch 37P connector terminal No. 13.

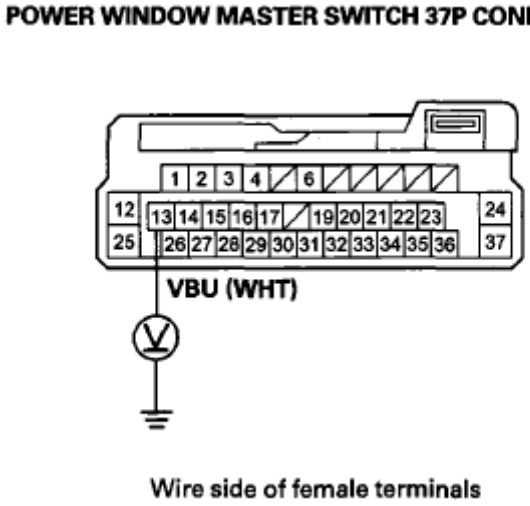

Fig. 51: Measuring Voltage Between Body Ground And Power Window Master Switch 37P Connector Terminal No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 8.

NO - Go to step 7.

7. Check the No. 15 (10 A) fuse in the under- hood fuse/relay box.

   Is the fuse OK?

   YES - Repair an open or high resistance in the No. 15 (10 A) fuse circuit.

   NO - Replace the fuse. If the fuse blows again, repair a short to ground in the No. 15(10 A) fuse circuit.

8. Measure the voltage between body ground and power window master switch 37P connector terminals No. 32 and No. 37 individually.

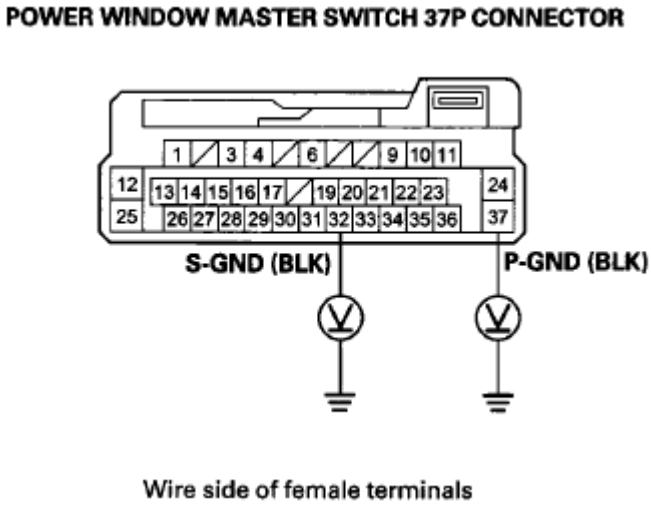

Fig. 52: Measuring Voltage Between Body Ground And Power Window Master Switch 37P Connector Terminals No. 32 And No. 37 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 9.

NO - Repair an open or high resistance in the ground wire or poor ground (G401) and/or (G402).

9. Press the engine start/stop button to select the OFF mode.
10. Disconnect the power window master switch 37P connector.
11. Disconnect power control unit connector C (36P).
12. Check for continuity between power window master switch 37P connector terminals No. 33 and No. 35 and power control unit connector C(36P) terminals No. 17 and No. 16 respectively.

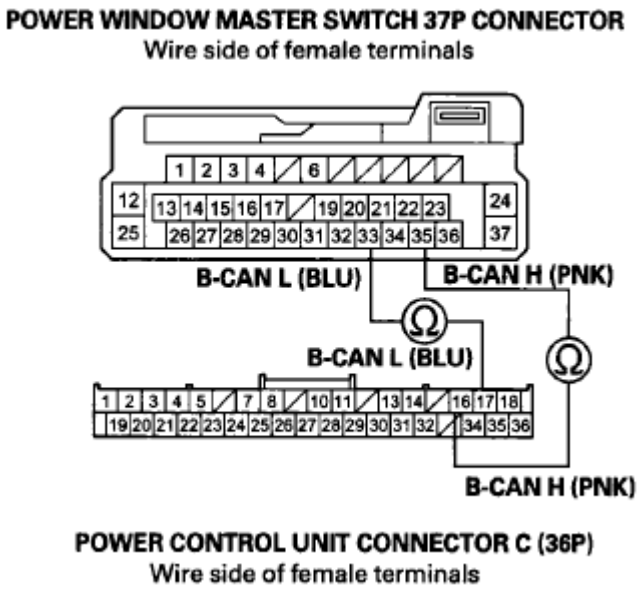

Fig. 53: Checking Continuity Between Power Window Master Switch 37P Connector Terminals And Power Control Unit Connector C(36P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

NO - Repair an open or poor connection in the B- CAN wire between the power control unit and the door multiplex control unit.

DTC B1601: KEYLESS ACCESS CONTROL UNIT INTERNAL (CPU) ERROR; DTC B1602: KEYLESS ACCESS CONTROL UNIT INTERNAL (EEPROM) ERROR

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
2. Wait for at least 10 seconds to clear the DTCs.
3. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
4. Push the door outer handle door lock button to lock the door.
5. Touch the door outer handle touch sensor to unlock the door.
6. Connect the HDS to the data link connector (DLC).
7. Press the engine start/stop button to select the ON mode according to the instructions on the HDS screen.
8. Check for DTCs with the HDS.

Are DTCs B1601 and/or B1602 indicated?

YES - Replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

NO - Intermittent failure, the system is OK at this time.

DTC B1927: MTR CONT SIGNAL ERROR

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Press the engine start/stop button to select the OFF mode.
2. Disconnect the electric steering lock 12P connector.
3. Measure the voltage between body ground and electric steering lock 12P connector terminal No. 6.

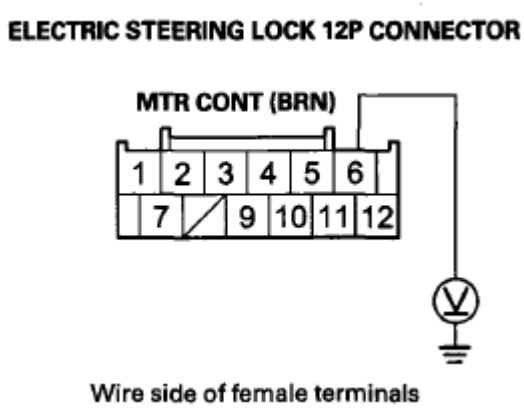

Fig. 54: Measuring Voltage Between Body Ground And Electric Steering Lock 12P Connector Terminal No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 4.

NO - Go to step 8.

4. Disconnect keyless access control unit connector A (36P).
5. Measure the voltage between body ground and keyless access control unit connector A (36P) terminal No. 27.

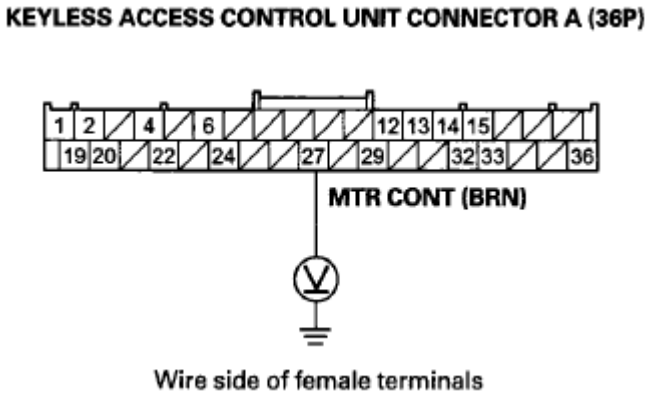

Fig. 55: Measuring Voltage Between Body Ground And Keyless Access Control Unit Connector A (36P) Terminal No
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 6.

NO - Replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

6. Disconnect the remote slot control unit 40P connector.
7. Measure the voltage between body ground and remote slot control unit 40P connector terminal No. 12.

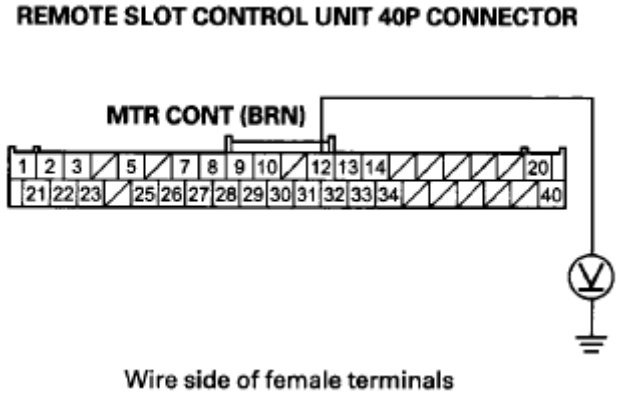

Fig. 56: Measuring Voltage Between Body Ground And Remote Slot Control Unit 40P Connector Terminal No. 12
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair a short to power in the wire.

NO - Replace the remote slot control unit (see **CONTROL UNIT INPUT TEST**).

8. Reconnect the electric steering lock 12P connector.
9. Disconnect keyless access control unit connector A (36P).
10. Measure the voltage between body ground and keyless access control unit connector A (36P) terminal No. 27.

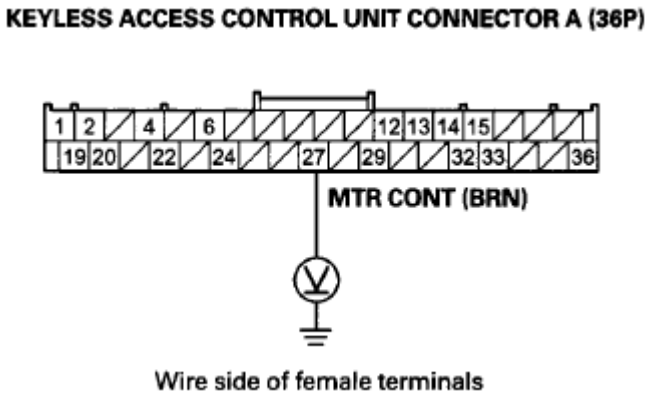

Fig. 57: Measuring Voltage Between Body Ground And Keyless Access Control Unit Connector A (36P) Terminal No. 27
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Replace the electric steering lock (see **STEERING LOCK REPLACEMENT**).

NO - Go to step 11.

11. Reconnect keyless access control unit connector A (36P).
12. Clear the DTCs with the HDS.
13. Do this procedure 10 times: Press the engine start/stop button to select the OFF, ACC, ON, and OFF mode.
14. Check for DTCs with the HDS.

Is DTC B1927 indicated?

YES - Substitute a known- good remote slot control unit. If the symptom goes away, replace the original remote slot control unit (see **CONTROL UNIT INPUT TEST**). If not, substitute a known- good keyless access control unit. If the symptom goes away, replace the original keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**). If not, replace the electric steering lock (see **STEERING LOCK REPLACEMENT**).

NO - Go to step 15.

15. Insert the remote into the remote slot.
16. Do this procedure 10 times: Press the engine start/stop button to select the OFF, ACC, ON, and OFF mode.

17. Check for DTCs with the HDS.

    Is DTC B1927 indicated?

    YES - Substitute a known- good remote slot control unit. If the symptom goes away, replace the original remote slot control unit (see **CONTROL UNIT INPUT TEST**). If not, substitute a known- good keyless access control unit. If the symptom goes away, replace the original keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**). If not, replace the electric steering lock (see **STEERING LOCK REPLACEMENT**).

    NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1640: RF UNIT NOT CONNECTED

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Select the MODE MENU from the HDS, then enter the SELF CHECK.
3. Do the SELF CHECK.
4. Check for DTCs with the HDS.

   Is DTC B1640 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Press the engine start/stop button to select the OFF mode.
6. Disconnect the RF unit 3P connector.
7. Disconnect keyless access control unit connector B (32P).
8. Check for continuity between the following RF unit 3P connector terminals and keyless access control unit connector B (32P) terminals.

RF UNIT	KEYLESS ACCESS CONTROL UNIT CONNECTOR B (32P)
No. 1	No. 3
No. 2	No. 5
No. 3	No. 15

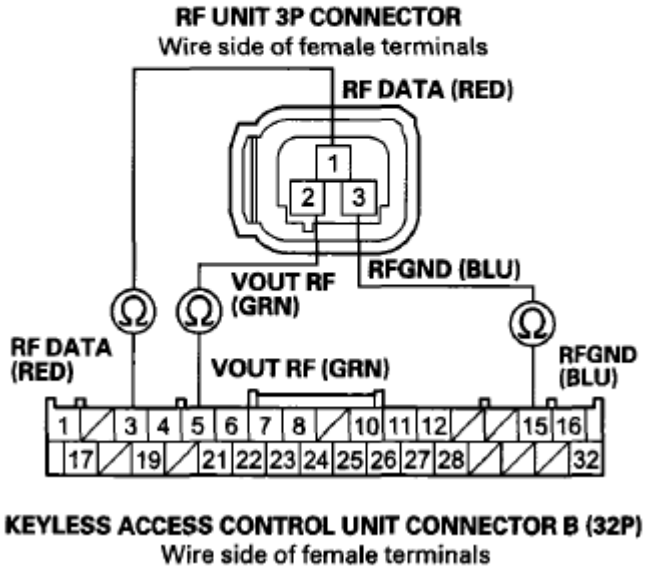

Fig. 58: Checking Continuity Between Following RF Unit 3P Connector Terminals And Keyless Access Control Unit Connector B (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Repair an open or high resistance in the wire.

9. Check for continuity between body ground and RF unit 3P connector terminals No. 1, No. 2, and No. 3 individually.

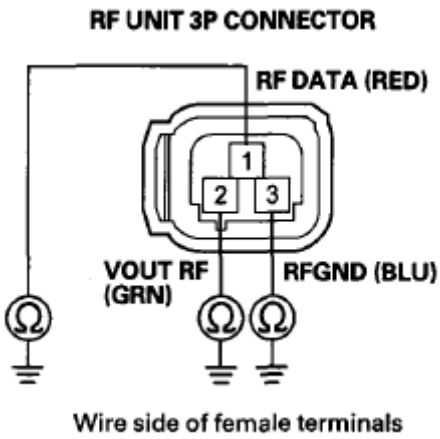

Fig. 59: Checking Continuity Between Body Ground And RF Unit 3P Connector Terminals No. 1, No. 2, And No. 3 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Substitute a known- good RF unit. If the symptom goes away, replace the original RF unit (see **RF UNIT REPLACEMENT**). If not, replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

DTC B1646: DRIVER'S DOOR LF ANTENNA CIRCUIT OPEN OR SHORT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Select the MODE MENU from the HDS, then enter the SELF CHECK.
3. Do the SELF CHECK.
4. Check for DTCs with the HDS.

   Is DTC B1646 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Press the engine start/stop button to select the OFF mode.
6. Disconnect keyless access control unit connector A (36P).
7. Disconnect the driver's door LF antenna 8P connector.

8. Check for continuity between body ground and keyless access control unit connector A (36P) terminals No. 4 and No. 22 individually.

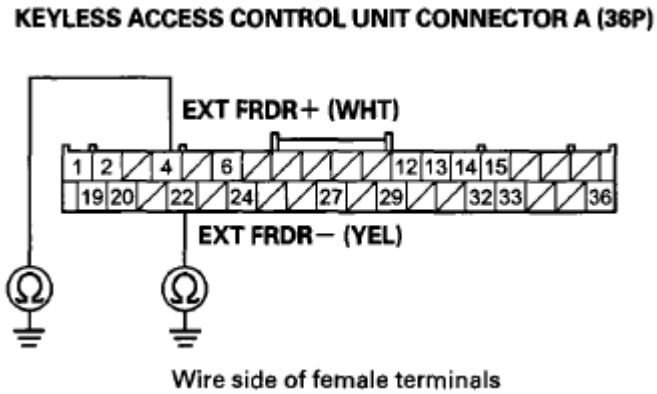

Fig. 60: Checking Continuity Between Body Ground And Keyless Access Control Unit Connector A (36P) Terminals No. 4 And No. 22 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 9.

9. Check for continuity between keyless access control unit connector A (36P) terminals No. 4 and No. 22 and driver's door LF antenna 8P connector terminals No. 3 and No. 7 respectively.

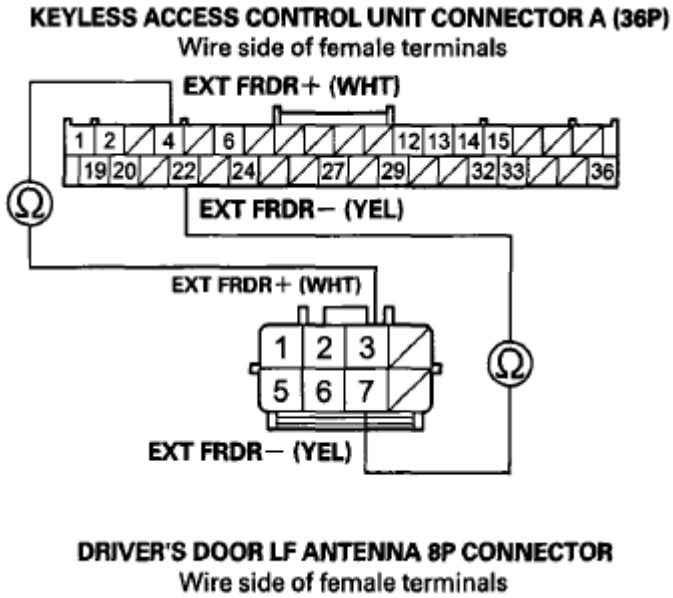

Fig. 61: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminals And Driver's Door LF Antenna 8P Connector Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open or high resistance in the wire.

10. Check for continuity between keyless access control unit connector A (36P) terminals No. 4 and No. 22.

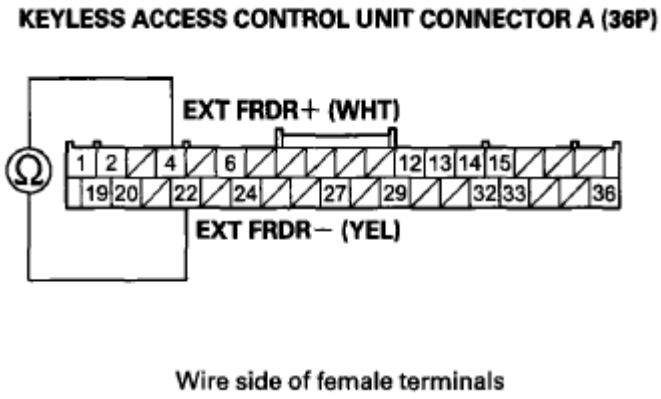

Fig. 62: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminals No. 4 And No. 22
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short between the wires.

NO - Go to step 11.

11. Reconnect the driver's door LF antenna 8P connector.
12. Measure the resistance between keyless access control unit connector A (36P) terminals No. 4 and No. 22.

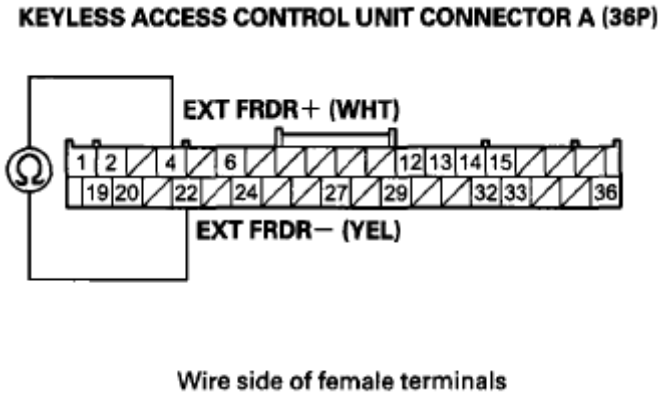

Fig. 63: Measuring Resistance Between Keyless Access Control Unit Connector A (36P) Terminals No. 4 And No. 22
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 1- 5 ohms?

YES - Replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

NO - Replace the driver's door LF antenna (see **FRONT DOOR OUTER HANDLE REPLACEMENT**).

DTC B1648: PASSENGER'S DOOR LF ANTENNA CIRCUIT OPEN OR SHORT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Select the MODE MENU from the HDS, then enter the SELF CHECK.
3. Do the SELF CHECK.
4. Check for DTCs with the HDS.

Is DTC B1648 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Press the engine start/stop button to select the OFF mode.
6. Disconnect keyless access control unit connector A (36P).
7. Disconnect the passenger's door LF antenna 8P connector.
8. Check for continuity between body ground and keyless access control unit connector A (36P) terminals No. 2 and No. 20 individually.

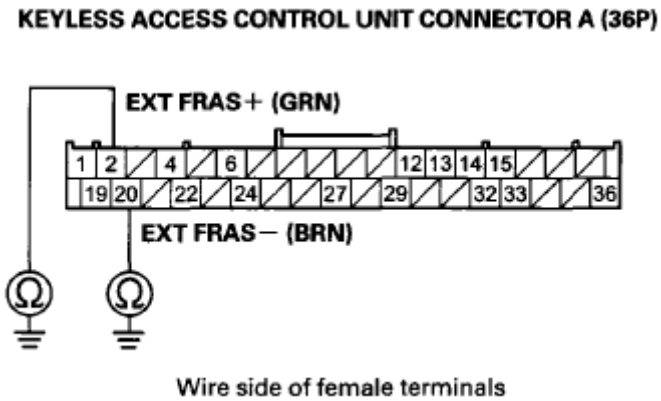

Fig. 64: Checking Continuity Between Body Ground And Keyless Access Control Unit Connector A (36P) Terminals No. 2 And No. 20 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 9.

9. Check for continuity between keyless access control unit connector A (36P) terminals No. 2 and No. 20 and passenger's door LF antenna 8P connector terminals No. 3 and No. 7 respectively.

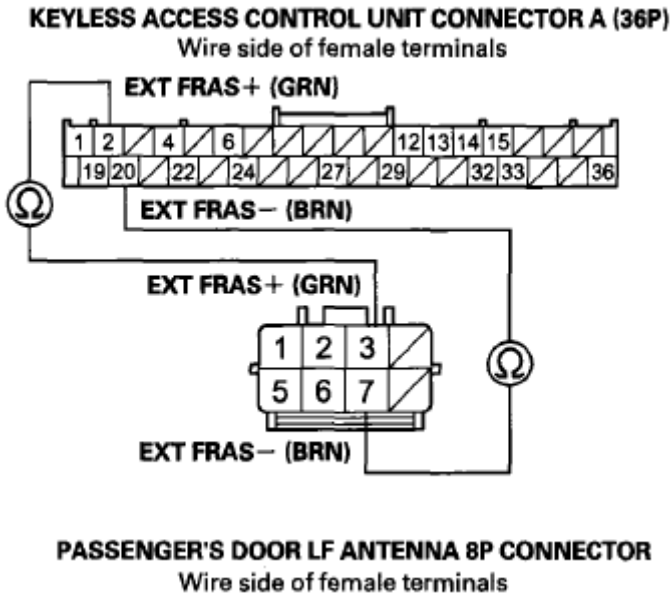

Fig. 65: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminals And Passenger's Door LF Antenna 8P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open or high resistance in the wire.

10. Check for continuity between keyless access control unit connector A (36P) terminals No. 2 and No. 20.

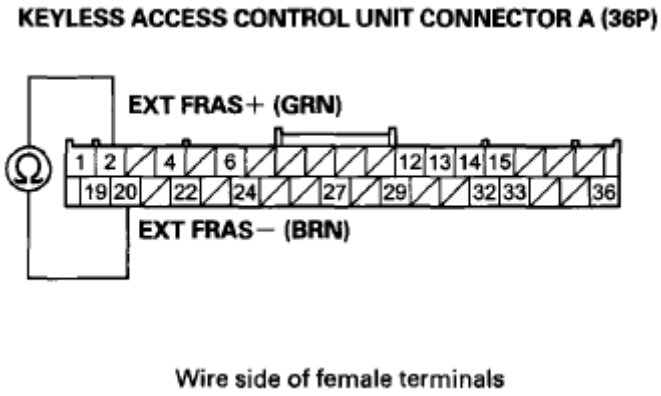

Fig. 66: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminals No. 2 And No. 20
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short between the wires.

NO - Go to step 11.

11. Reconnect the passenger's door LF antenna 8P connector.
12. Measure the resistance between keyless access control unit connector A (36P) terminals No. 2 and No. 20.

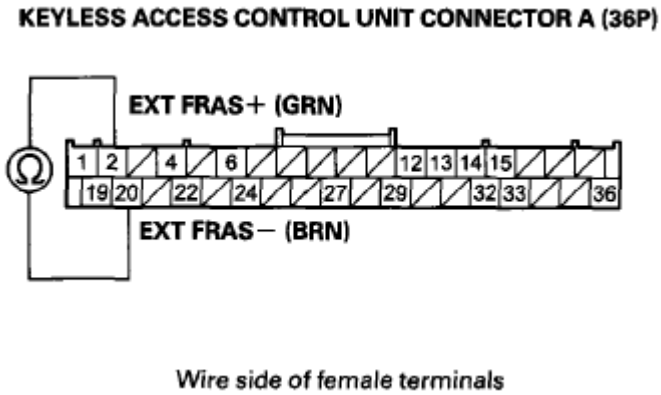

Fig. 67: Measuring Resistance Between Keyless Access Control Unit Connector A (36P) Terminals No. 2 And No. 20
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 1- 5 ohms?

YES - Replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

NO - Replace the passenger's door LF antenna (see **FRONT DOOR OUTER HANDLE REPLACEMENT**).

DTC B1658: REAR BUMPER LF ANTENNA CIRCUIT OPEN OR SHORT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Select the MODE MENU from the HDS, then enter the SELF CHECK.
3. Do the SELF CHECK.
4. Check for DTCs with the HDS.

   Is DTC B1658 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Press the engine start/stop button to select the OFF mode.
6. Disconnect keyless access control unit connector A (36P).
7. Disconnect the rear bumper LF antenna 2P connector.
8. Check for continuity between body ground and keyless access control unit connector A (36P) terminals No. 1 and No. 19 individually.

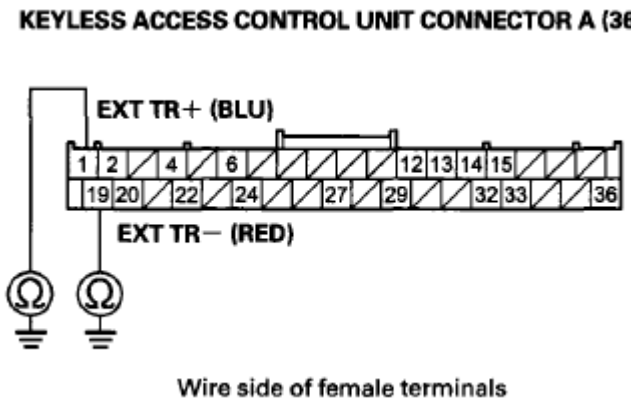

Fig. 68: Checking Continuity Between Body Ground And Keyless Access Control Unit Connector A (36P) Terminals No. 1 And No. 19 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 9.

9. Check for continuity between keyless access control unit connector A (36P) terminals No. 1 and No. 19 and rear bumper LF antenna 2P connector terminals No. 1 and No. 2 respectively.

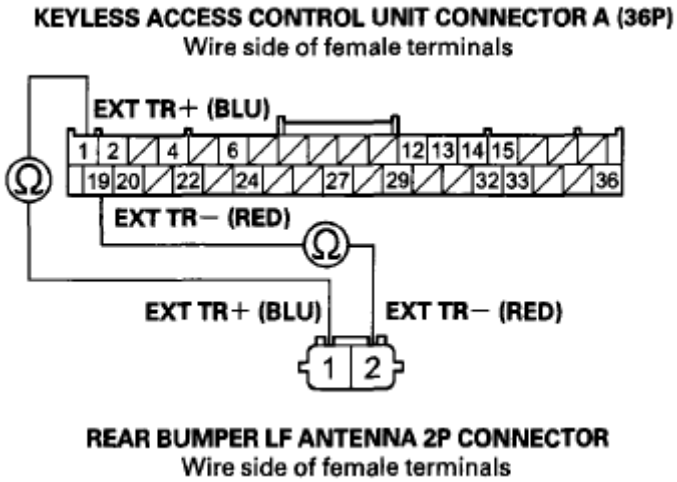

Fig. 69: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminals And Rear Bumper LF Antenna 2P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open or high resistance in the wire.

10. Check for continuity between keyless access control unit connector A (36P) terminals No. 1 and No. 19.

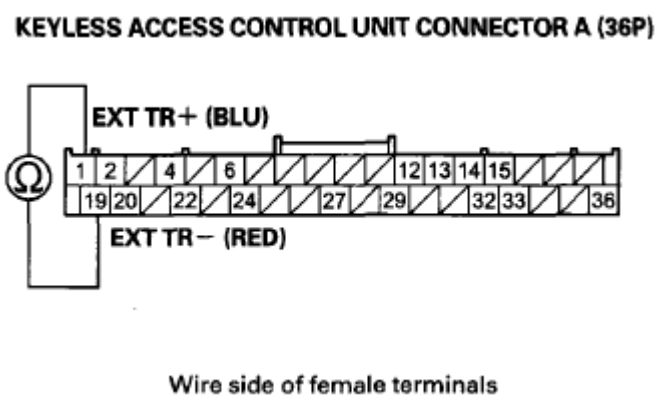

Fig. 70: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminals No. 1 And No. 19
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short between the wires.

NO - Go to step 11.

11. Reconnect the rear bumper LF antenna 2P connector.
12. Measure the resistance between keyless access control unit connector A (36P) terminals No. 1 and No. 19.

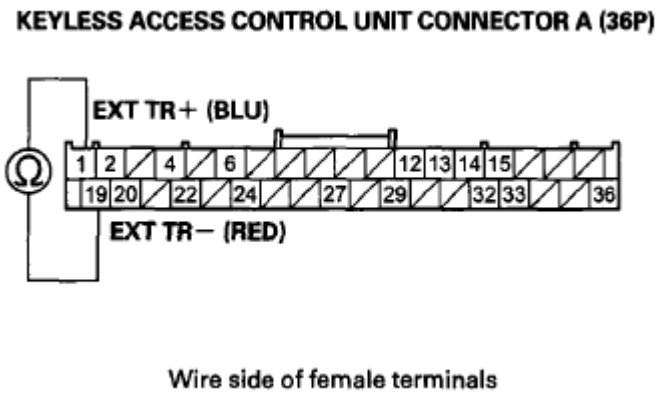

Fig. 71: Measuring Resistance Between Keyless Access Control Unit Connector A (36P) Terminals No. 1 And No. 19
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 1- 5 ohms?

YES - Replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

NO - Replace the rear bumper LF antenna (see **REAR BUMPER LF ANTENNA REPLACEMENT**).

DTC B1660: FRONT INTERIOR LF ANTENNA CIRCUIT OPEN OR SHORT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Select the MODE MENU from the HDS, then enter the SELF CHECK.
3. Do the SELF CHECK.
4. Check for DTCs with the HDS.

Is DTC B1660 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Press the engine start/stop button to select the OFF mode.
6. Disconnect keyless access control unit connector A (36P).
7. Disconnect the front interior LF antenna 2P connector.
8. Check for continuity between body ground and keyless access control unit connector A (36P) terminals No. 14 and No. 15 individually.

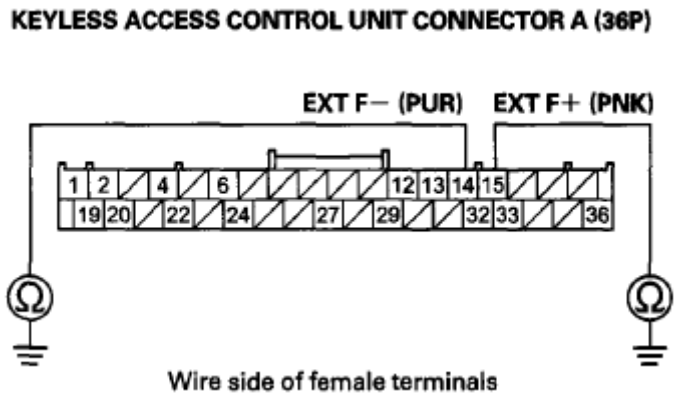

Fig. 72: Checking Continuity Between Body Ground And Keyless Access Control Unit Connector A (36P) Terminals No. 14 And No. 15 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 9.

9. Check for continuity between keyless access control unit connector A (36P) terminals No. 14 and No. 15 and front interior LF antenna 2P connector terminals No. 2 and No. 1 respectively.

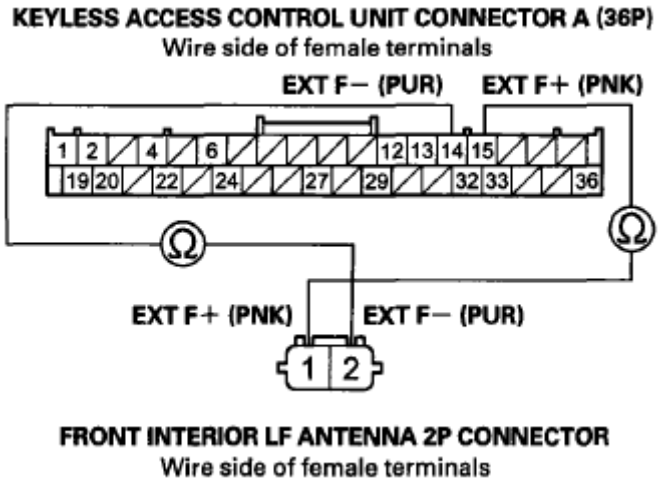

Fig. 73: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminals

And Front Interior LF Antenna 2P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open or high resistance in the wire.

10. Check for continuity between keyless access control unit connector A (36P) terminals No. 14 and No. 15.

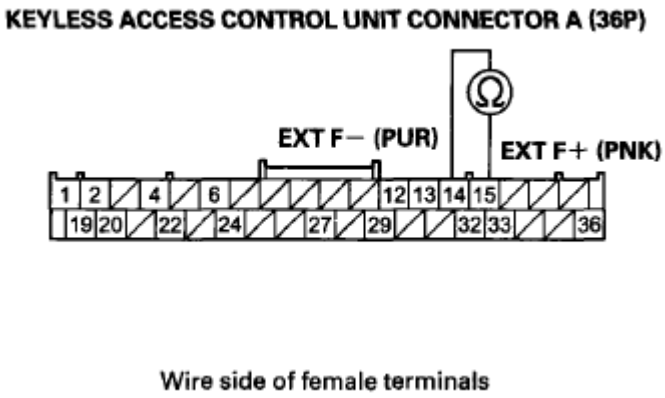

Fig. 74: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminals No. 14 And No. 15
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short between the wires.

NO - Go to step 11.

11. Reconnect the front interior LF antenna 2P connector.
12. Measure the resistance between keyless access control unit connector A (36P) terminals No. 14 and No. 15.

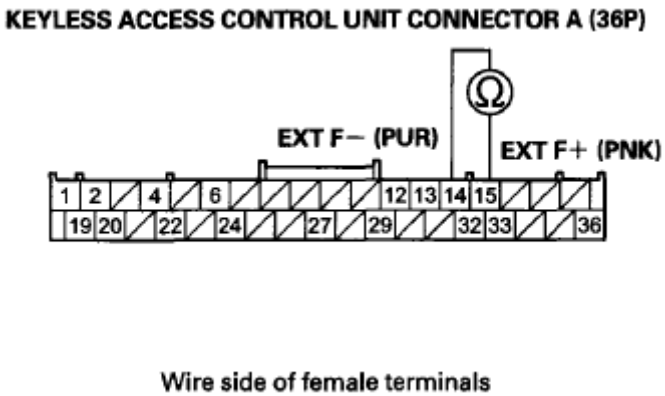

Fig. 75: Measuring Resistance Between Keyless Access Control Unit Connector A (36P) Terminals No. 14 And No. 15
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 1- 5 ohms?

YES - Replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

NO - Replace the front interior LF antenna (see **FRONT INTERIOR LF ANTENNA REPLACEMENT**).

DTC B1664: REAR INTERIOR LF ANTENNA CIRCUIT OPEN OR SHORT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Select the MODE MENU from the HDS, then enter the SELF CHECK.
3. Do the SELF CHECK.
4. Check for DTCs with the HDS.

   Is DTC B1664 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Press the engine start/stop button to select the OFF mode.
6. Disconnect keyless access control unit connector A (36P).
7. Disconnect the rear interior LF antenna 2P connector.
8. Check for continuity between body ground and keyless access control unit connector A (36P) terminals No. 12 and No. 13 individually.

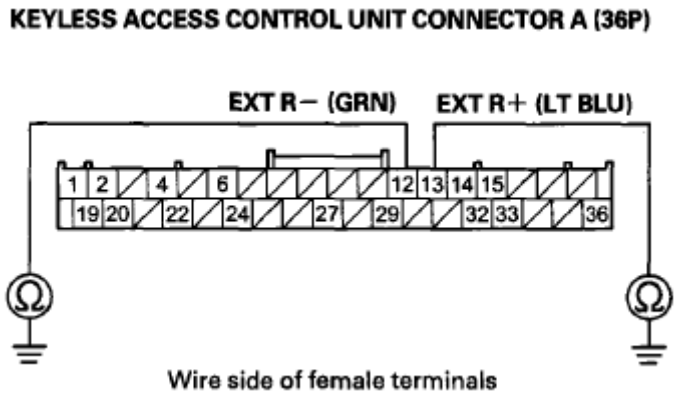

Fig. 76: Checking Continuity Between Body Ground And Keyless Access Control Unit Connector A (36P) Terminals No. 12 And No. 13 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 9.

9. Check for continuity between keyless access control unit connector A (36P) terminals No. 12 and No. 13 and rear interior LF antenna 2P connector terminals No. 2 and No. 1 respectively.

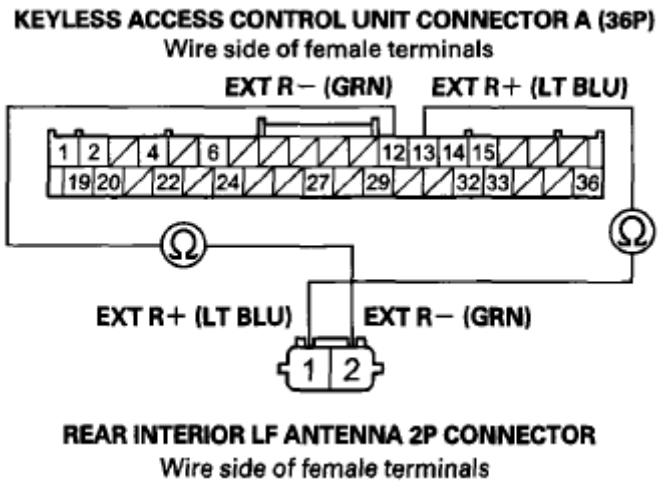

Fig. 77: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminals And Rear Interior LF Antenna 2P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open or high resistance in the wire.

10. Check for continuity between keyless access control unit connector A (36P) terminals No. 12 and No. 13.

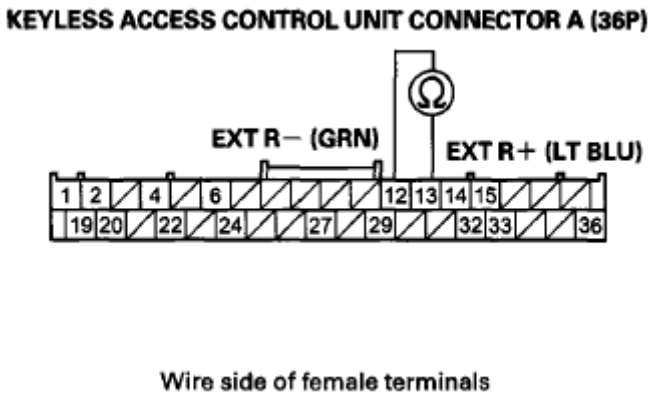

Fig. 78: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminals No. 12 And No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short between the wires.

NO - Go to step 11.

11. Reconnect the rear interior LF antenna 2P connector.
12. Measure the resistance between keyless access control unit connector A (36P) terminals No. 12 and No. 13.

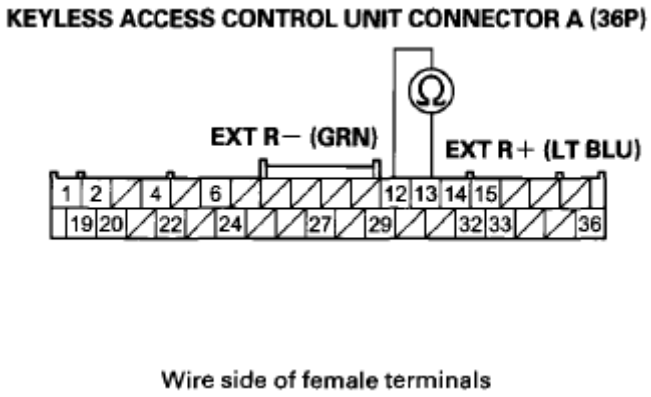

Fig. 79: Measuring Resistance Between Keyless Access Control Unit Connector A (36P) Terminals No. 12 And No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 1- 5 ohms?

YES - Replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

NO - Replace the rear interior LF antenna (see **REAR INTERIOR LF ANTENNA REPLACEMENT**).

DTC B1668: REAR SHELF LF ANTENNA CIRCUIT OPEN OR SHORT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Select the MODE MENU from the HDS, then enter the SELF CHECK.
3. Do the SELF CHECK.
4. Check for DTCs with the HDS.

   Is DTC B1668 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Press the engine start/stop button to select the OFF mode.
6. Disconnect keyless access control unit connector A (36P).
7. Disconnect the rear shelf LF antenna 2P connector.
8. Check for continuity between body ground and keyless access control unit connector A (36P) terminals No. 6 and No. 24 individually.

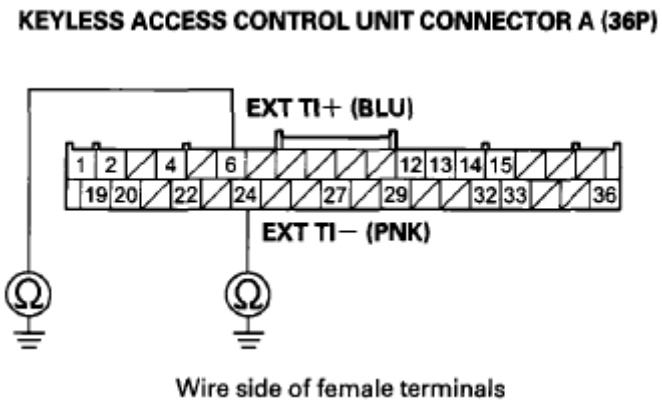

Fig. 80: Checking Continuity Between Body Ground And Keyless Access Control Unit Connector A (36P) Terminals No. 6 And No. 24 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 9.

9. Check for continuity between keyless access control unit connector A (36P) terminals No. 6 and No. 24 and rear shelf LF antenna 2P connector terminals No. 1 and No. 2 respectively.

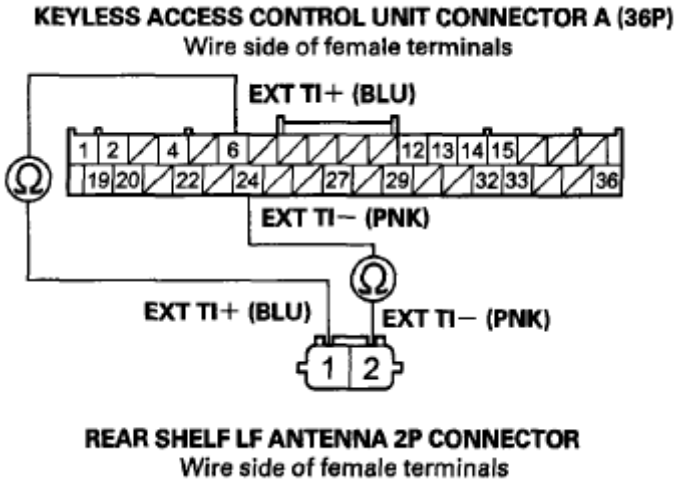

Fig. 81: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminals And Rear Shelf LF Antenna 2P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open or high resistance in the wire.

10. Check for continuity between keyless access control unit connector A (36P) terminals No. 6 and No. 24.

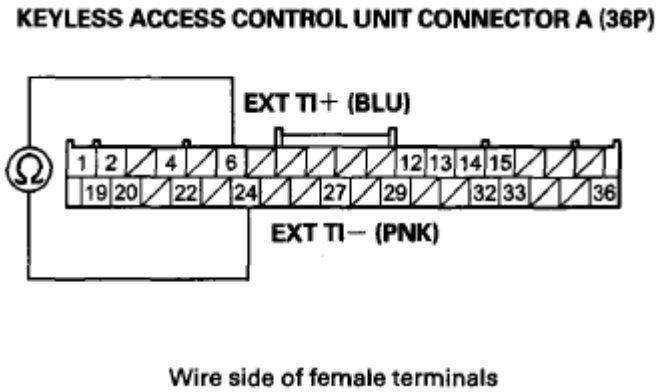

Fig. 82: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminals No. 6 And No. 24

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short between the wires.

NO - Go to step 11.

11. Reconnect the rear shelf LF antenna 2P connector.
12. Measure the resistance between keyless access control unit connector A (36P) terminals No. 6 and No. 24.

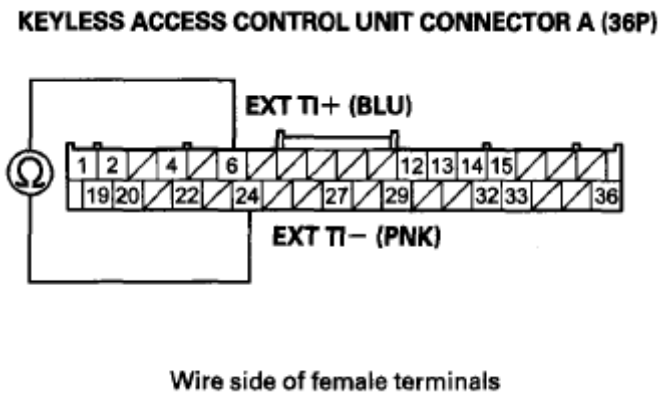

Fig. 83: Measuring Resistance Between Keyless Access Control Unit Connector A (36P) Terminals No. 6 And No. 24
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 1- 5 ohms?

YES - Replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

NO - Replace the rear shelf LF antenna (see **REAR SHELF LF ANTENNA REPLACEMENT**).

DTC U0155: KEYLESS ACCESS CONTROL UNIT LOST COMMUNICATION WITH GAUGE CONTROL MODULE

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Press the engine start/stop button to select the OFF, ACC, and ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U0155 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the keyless access control unit and the gauge control module.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B- CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the gauge control module detected?

   YES - Go to step 9.

   NO - Go to step 6.

6. Measure the voltage between body ground and gauge control module 32P connector terminals No. 15 and No. 16 individually.

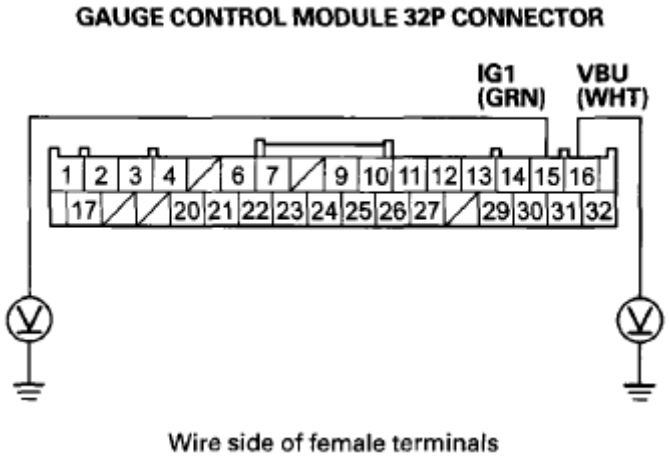

Fig. 84: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 15 And No. 16 Individually With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES - Go to step 8.

   NO - Go to step 7.

7. Check the No. 15(10 A) fuse in the under- hood fuse/relay box and the No. 12 (7.5 A) fuse in the driver's under- dash fuse/relay box.

   Are the fuses OK?

YES - Repair an open or high resistance in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

NO - Replace the fuse(s). If the fuse blows again, repair a short to ground in the No. 15(10 A) and/or No. 12 (7.5 A) fuse circuit.

8. Measure the voltage between body ground and gauge control module 32P connector terminals No. 1 and No. 17 individually.

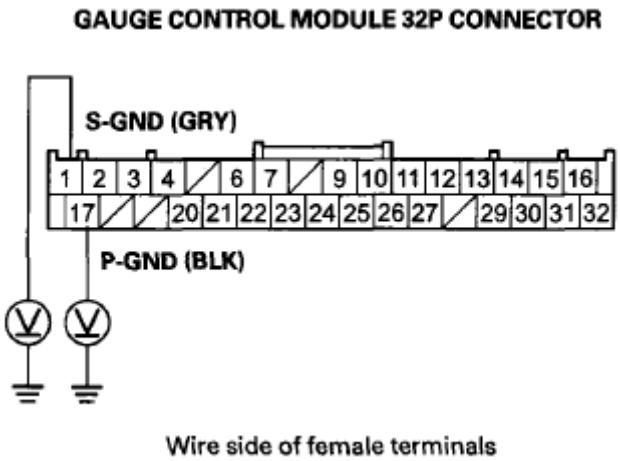

Fig. 85: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 1 And No. 17 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 9.

NO - Repair an open or high resistance in the ground wire or poor ground (G401) and/or (G402).

9. Press the engine start/stop button to select the OFF mode.
10. Disconnect keyless access control unit connector B (32P).
11. Disconnect the gauge control module 32P connector.
12. Check for continuity between gauge control module 32P connector terminals No. 29 and No. 30 and keyless access control unit connector B (32P) terminals No. 7 and No. 8 respectively.

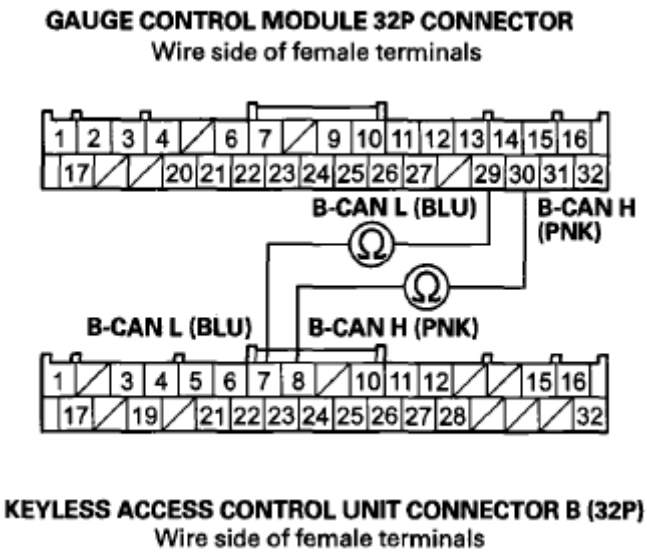

Fig. 86: Checking Continuity Between Gauge Control Module 32P Connector Terminals And Keyless Access Control Unit Connector B (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO - Repair an open or poor connection in the B- CAN wire between the keyless access control unit and the gauge control module.

DTC U0199: KEYLESS ACCESS CONTROL UNIT LOST COMMUNICATION WITH DOOR MULTIPLEX CONTROL UNIT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Press the engine start/stop button to select the OFF, ACC, and ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U0199 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the keyless access control unit and the door multiplex control unit.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B- CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the power window unit detected?

   YES - Go to step 9.

   NO - Go to step 6.

6. Measure the voltage between body ground and power window master switch 37P connector terminal No. 13.

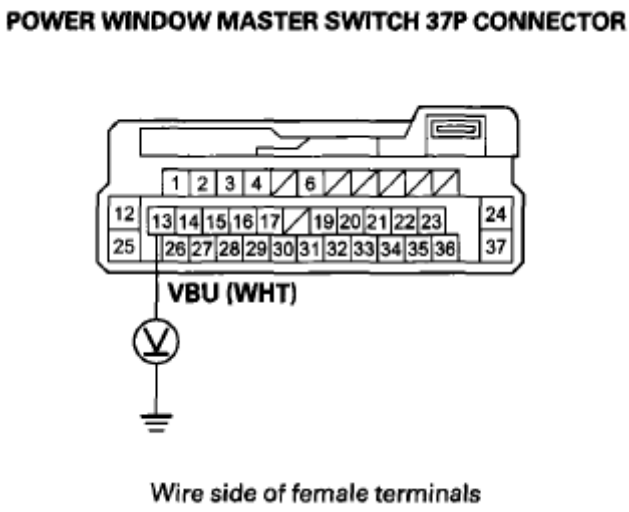

Fig. 87: Measuring Voltage Between Body Ground And Power Window Master Switch 37P Connector Terminal No. 13 With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES - Go to step 8.

   NO - Go to step 7.

7. Check the No. 15(10 A) fuse in the under- hood fuse/relay box.

   Is the fuse OK?

   YES - Repair an open or high resistance in the No. 15 (10 A) fuse circuit.

   NO - Replace the fuse. If the fuse blows again, repair a short to ground in the No. 15 (10 A) fuse circuit.

8. Measure the voltage between body ground and power window master switch 37P connector terminals No. 32 and No. 37 individually.

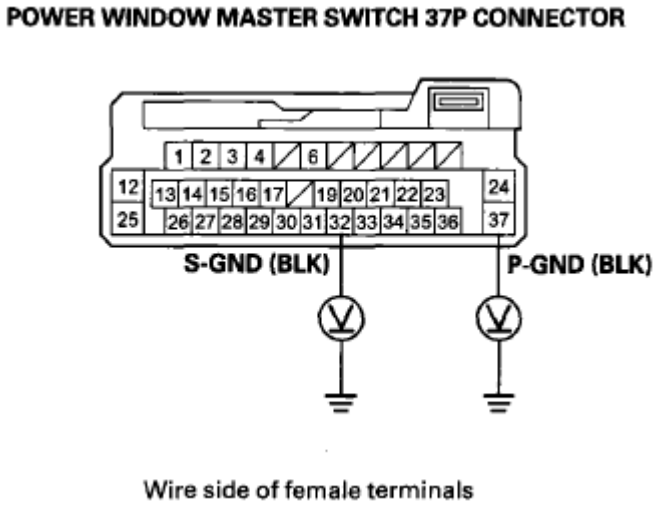

Fig. 88: Measuring Voltage Between Body Ground And Power Window Master Switch 37P Connector Terminals No. 32 And No. 37 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 9.

NO - Repair an open or high resistance in the ground wire or poor ground (G401) and/or (G402).

9. Press the engine start/stop button to select the OFF mode.
10. Disconnect the power window master switch 37P connector.
11. Disconnect power tailgate control unit connector B (32P).
12. Check for continuity between power window master switch 37P connector terminals No. 33 and No. 35 and keyless access control unit connector B (32P) terminals No. 7 and No. 6 respectively.

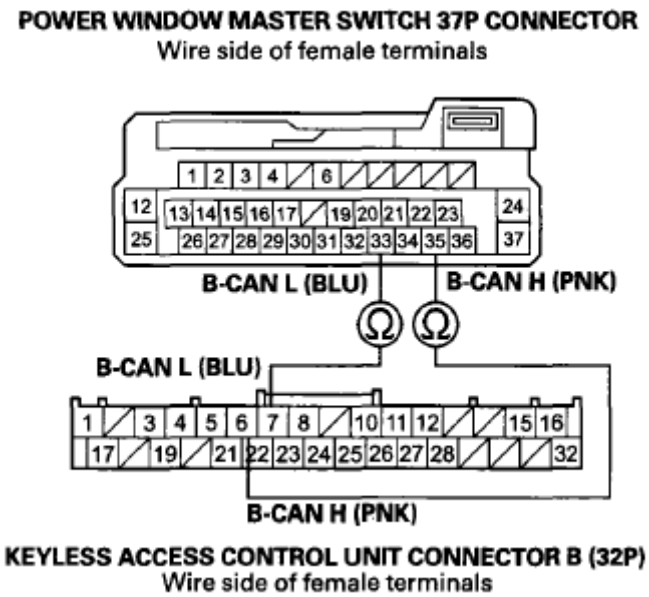

Fig. 89: Checking Continuity Between Power Window Master Switch 37P Connector Terminals And Keyless Access Control Unit Connector B (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

NO - Repair an open or poor connection in the B- CAN wire between the keyless access control unit and the door multiplex control unit.

DTC U1282: KEYLESS ACCESS CONTROL UNIT LOST COMMUNICATION WITH DRIVER'S MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Press the engine start/stop button to select the OFF, ACC, and ON mode.
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

Is DTC U1282 indicated?

YES - Go to the driver's MICU input test, and do all power, ground, and communication input tests (see **MICU INPUT TEST**). If the tests prove OK, replace the driver's under- dash fuse/relay box (see **DRIVER'S UNDER- DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**). If the DTC is still present, replace the keyless access control unit (see **KEYLESS ACCESS CONTROL**

UNIT).

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the keyless access control unit and the driver's MICU.

DTC U1283: KEYLESS ACCESS CONTROL UNIT LOST COMMUNICATION WITH PASSENGER'S MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Press the engine start/stop button to select the OFF, ACC, and ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U01283 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the keyless access control unit and the passenger's MICU.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B- CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the passenger's MICU detected?

   YES - Go to step 9.

   NO - Go to step 6.

6. Measure the voltage between body ground and passenger's under- dash fuse/relay box connector A (38P) terminals No. 14 and No. 35 individually.

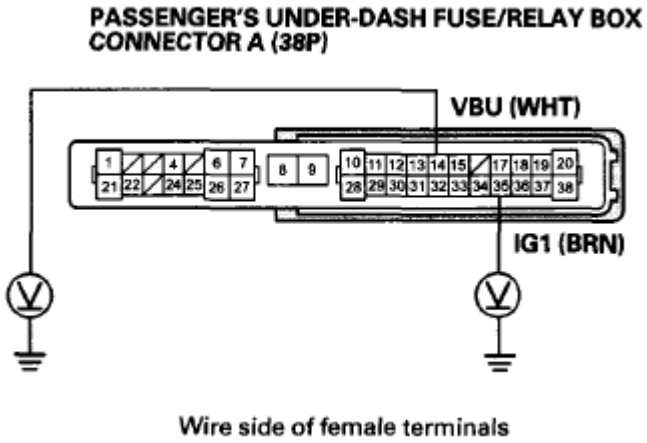

Fig. 90: Measuring Voltage Between Body Ground And Passenger's Under- Dash Fuse/Relay Box Connector A (38P) Terminals No. 14 And No. 35 Individually With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 8.

NO - Go to step 7.

7. Check the No. 15 (10 A) fuse in the under- hood fuse/relay box and the No. 12 (7.5 A) fuse in the driver's under- dash fuse/relay box.

   Are the fuses OK?

   YES - Repair an open or high resistance in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

   NO - Replace the fuse(s). If the fuse blows again, repair a short to ground in the No. 15(10 A) and/or No. 12 (7.5 A) fuse circuit.

8. Measure the voltage between body ground and passenger's under- dash fuse/relay box connector A (38P) and E (18P) terminals as shown.

Passenger's under- dash fuse/relay box connector	
A36	Body ground
A37	
E15

Courtesy of AMERICAN HONDA MOTOR CO., INC.

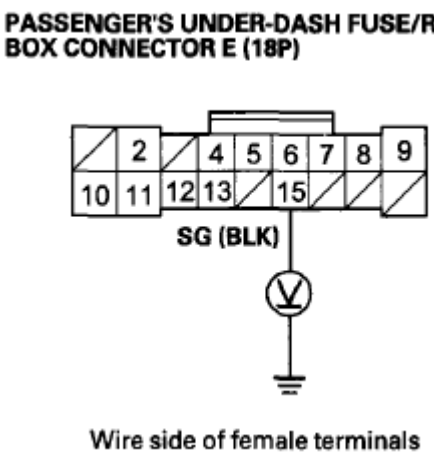

Fig. 92: Measuring Voltage Between Body Ground And Passenger's Under- Dash Fuse/Relay Box Connector And E (18P) Terminals With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 9.

NO - Repair an open or high resistance in the ground wire or poor ground (G203), (G401) and/or (G405).

9. Press the engine start/stop button to select the OFF mode.
10. Disconnect keyless access control unit connector B (32P).
11. Disconnect passenger's under- dash fuse/relay box connector A (38P).
12. Check for continuity between passenger's under- dash fuse/relay box connector A (38P) terminals No. 11 and No. 29 and keyless access control unit connector B (32P) terminals No. 8 and No. 7 respectively.

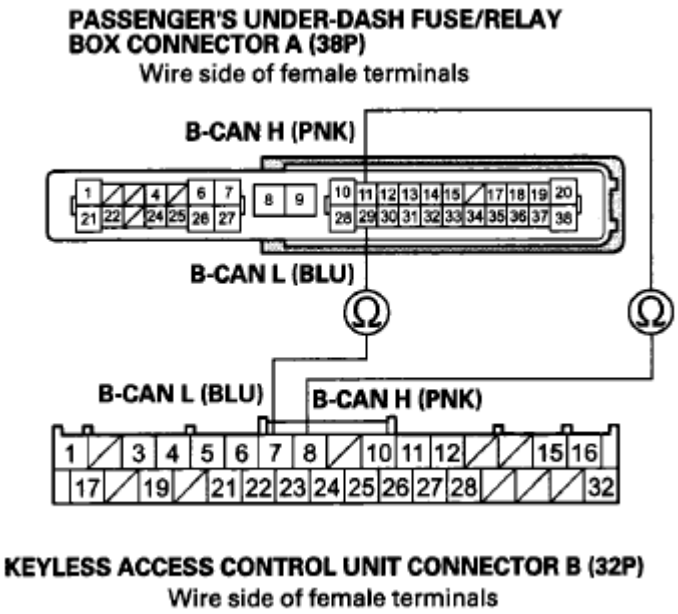

Fig. 93: Checking Continuity Between Passenger's Under- Dash Fuse/Relay Box Connector A (38P) Terminals And Keyless Access Control Unit Connector B (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

NO - An open or poor connection in the B- CAN wire between the keyless access control unit and the passenger's MICU.

DTC B1902: REMOTE SLOT CONTROL UNIT INTERNAL ERROR (EEPROM ERROR)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Do the battery terminal disconnect procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
2. Wait for at least 10 seconds to clear the DTCs.
3. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
4. Push the door outer handle lock button to lock the door.
5. Touch the door outer handle touch sensor to unlock the door.
6. Connect the HDS to the data link connector (DLC).
7. Press the engine start/stop button to select the ON mode according to the instructions on the HDS screen.
8. Check for DTCs with the HDS.

Is DTC B1902 indicated?

YES - Replace the remote slot control unit (see **CONTROL UNIT INPUT TEST**).

NO - Intermittent failure, the system is OK at this time.

DTC B1926: REMOTE SLOT ANTENNA OPEN OR SHORT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Insert the remote into the remote slot.
3. Do the procedure 10 times: Press the engine start/stop button to select the OFF, ACC, ON, and OFF mode.
4. Select the ONE-PUSH START from the SYSTEM SELECTION MENU with the HDS.
5. Select the SLOT UNIT and check for DTCs with the HDS.

Is DTC B1926 indicated?

YES - Replace the remote slot (see **REMOTE SLOT TEST/REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B1930: REMOTE SLOT CONTROL UNIT LOCK/ UNLOCK ERROR

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the keyless access system mode switch OFF.
3. Insert the remote into the remote slot.
4. Do the procedure 10 times: Press the engine start/stop button to select the OFF, ACC, ON, and OFF mode.
5. Select the ONE-PUSH START from the SYSTEM SELECTION MENU with the HDS.
6. Select the SLOT UNIT and check for DTCs with the HDS.

Is DTC B1930 indicated?

YES - Go to step 7.

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

7. Press the engine start/stop button to select the OFF mode.
8. Disconnect the remote slot control unit 40P connector.
9. Disconnect the remote slot 16P connector.
10. Check for continuity between body ground and remote slot control unit 40P connector terminals No. 5 and No. 25 individually.

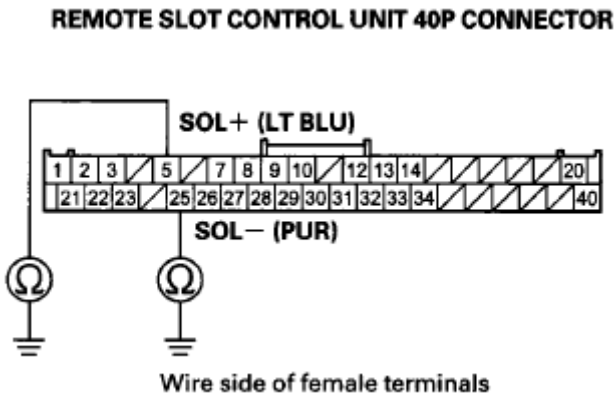

Fig. 94: Checking Continuity Between Body Ground And Remote Slot Control Unit 40P Connector Terminals No. 5 And No. 25 Individually With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 11.

11. Check for continuity between remote slot control unit 40P connector terminals No. 5 and No. 25 and remote slot 16P connector terminals No. 16 and No. 8 respectively.

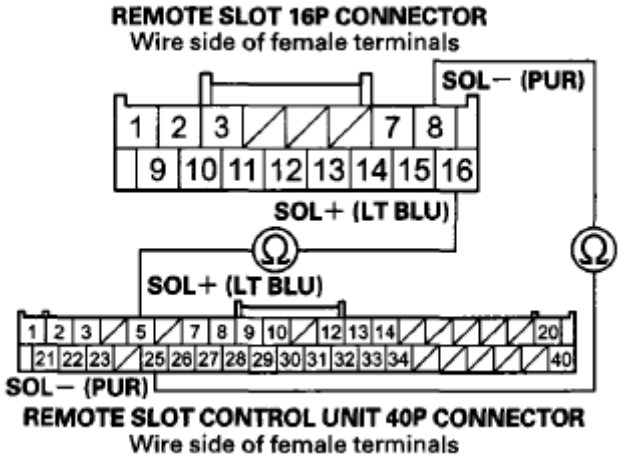

Fig. 95: Checking Continuity Between Remote Slot Control Unit 40P Connector Terminals And Remote Slot 16P Connector Terminals With Connector End View

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 12.

NO - Repair an open or high resistance in the wire.

12. Check for continuity between body ground and remote slot 16P connector terminal No. 13.

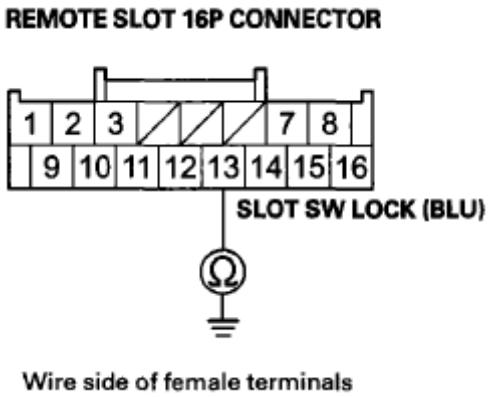

Fig. 96: Checking Continuity Between Body Ground And Remote Slot 16P Connector Terminal No. 13 With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 13.

13. Check for continuity between remote slot control unit 40P connector terminal No. 8 and remote slot 16P connector terminal No. 13.

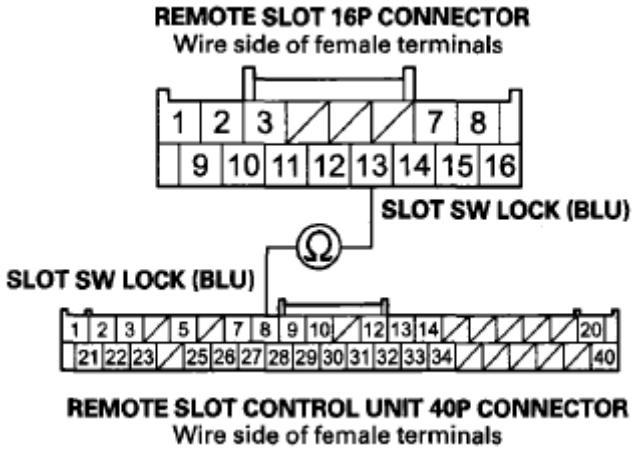

Fig. 97: Checking Continuity Between Remote Slot Control Unit 40P Connector Terminal No. 8 And Remote Slot 16P Connector Terminal No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 14.

NO - Repair an open or high resistance in the wire.

14. Check for continuity between body ground and remote slot 16P connector terminals No. 7 and No. 15 individually.

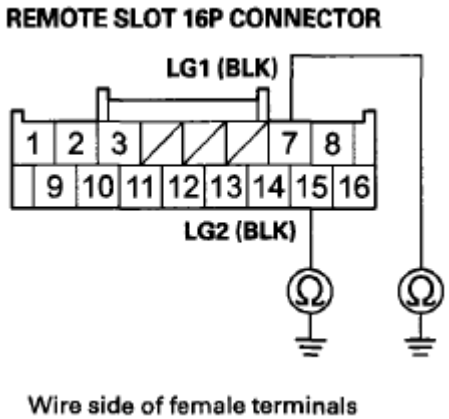

Fig. 98: Checking Continuity Between Body Ground And Remote Slot 16P Connector Terminals No. 7 And No. 15 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for loose or poor connections at the remote slot control unit and the remote slot. If the connections are OK, substitute a known- good remote slot. If the symptom goes away, replace the

original remote slot (see **REMOTE SLOT TEST/REPLACEMENT**). If not, replace the remote slot control unit (see **CONTROL UNIT INPUT TEST**).

NO - Repair an open or high resistance in the wire or poor ground (G403).

DTC B1931: REMOTE SLOT CONTROL UNIT NO RESPONSE

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the keyless access system mode switch OFF.
3. Insert the remote into the remote slot.
4. Do the procedure 10 times: Press the engine start/stop button to select the OFF, ACC, ON, and OFF mode.
5. Select the ONE-PUSH START from the SYSTEM SELECTION MENU with the HDS.
6. Select the SLOT UNIT and check for DTCs with the HDS.

   Is DTC B1931 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

7. Press the engine start/stop button to select the OFF mode.
8. Check for loose connections in the remote slot 16P connector.

   Is the connections OK?

   YES - Go to step 9.

   NO - Replace the faulty connections, and then recheck the system.

9. Measure the voltage between body ground and the remote slot 16P connector terminal No. 1.

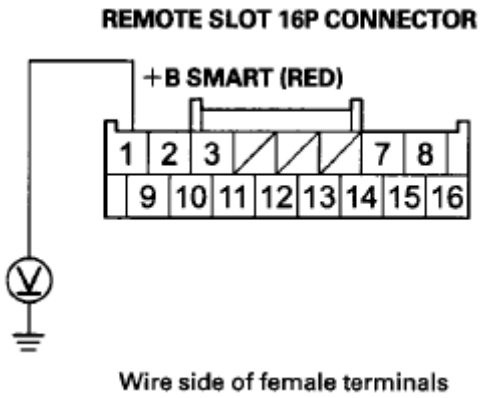

Fig. 99: Measuring Voltage Between Body Ground And Remote Slot 16P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Check for blown No. 12 (10 A) fuse in the passenger's under- dash fuse/relay box and an open or a short to ground in the wire. If the fuse and wire are OK, replace the remote slot (see **REMOTE SLOT TEST/REPLACEMENT**).

10. Disconnect the remote slot 16P connector.
11. Check for continuity between body ground and remote slot 16P connector terminals No. 7 and No. 15 individually.

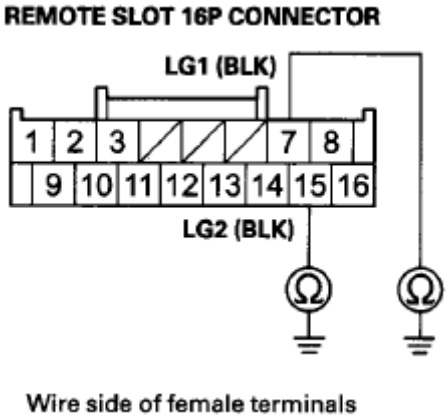

Fig. 100: Checking Continuity Between Body Ground And Remote Slot 16P Connector Terminals No. 7 And No. 15 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 12.

NO - Repair an open or high resistance in the wire or poor ground (G403).

12. Reconnect the remote slot 16P connector.
13. Press the engine start/stop button to select the ON mode.
14. Measure the voltage between body ground and remote slot 16P connector terminal No. 11.

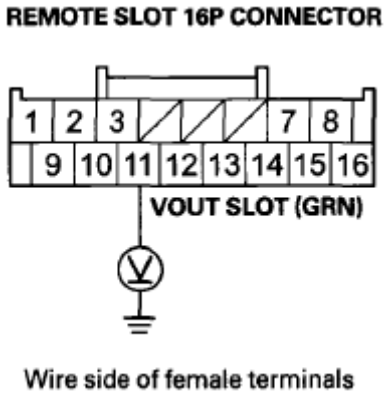

Fig. 101: Measuring Voltage Between Body Ground And Remote Slot 16P Connector Terminal No. 11
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 18.

NO - Go to step 15.

15. Press the engine start/stop button to select the OFF mode.
16. Disconnect the remote slot control unit 40P connector.
17. Check for continuity between body ground and remote slot 16P connector terminal No. 11.

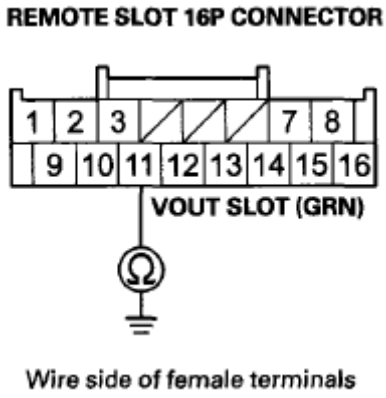

Fig. 102: Checking Continuity Between Body Ground And Remote Slot 16P Connector Terminal No. 11
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Substitute a known- good remote slot. If the symptom goes away, replace the original remote slot (see **REMOTE SLOT TEST/REPLACEMENT**). If not, replace the remote slot control unit (see **CONTROL UNIT INPUT TEST**).

18. Press the engine start/stop button to select the OFF mode.
19. Disconnect the remote slot control unit 40P connector.
20. Disconnect the remote slot 16P connector.
21. Check for continuity between body ground and remote slot 16P connector terminals No. 2 and No. 9 individually.

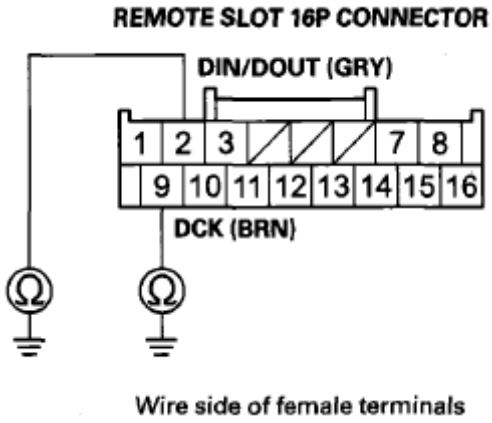

Fig. 103: Checking Continuity Between Body Ground And Remote Slot 16P Connector Terminals No. 2 And No. 9 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 22.

22. Check for continuity between remote slot control unit 40P connector terminals No. 9, No. 29, arid No. 28, and remote slot 16P connector terminals No. 2, No. 9, and No. 11 respectively.

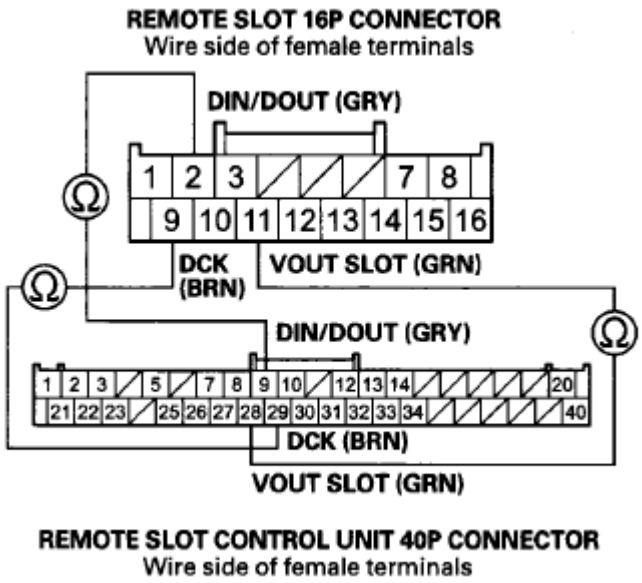

Fig. 104: Checking Continuity Between Remote Slot Control Unit 40P Connector Terminals And Remote Slot 16P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Substitute a known- good remote slot. If the symptom goes away, replace the original remote slot (see **REMOTE SLOT TEST/REPLACEMENT**). If not, replace the remote slot control unit (see **CONTROL UNIT INPUT TEST**).

NO - Repair an open or high resistance in the wire.

DTC U0155: REMOTE SLOT CONTROL UNIT LOST COMMUNICATION WITH GAUGE CONTROL MODULE

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Press the engine start/stop button to select the OFF, ACC, and ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U0155 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the

remote slot control unit and the gauge control module.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B- CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the gauge control module detected?

   YES - Go to step 9.

   NO - Go to step 6.

6. Measure the voltage between body ground and gauge control module 32P connector terminals No. 15 and No. 16 individually.

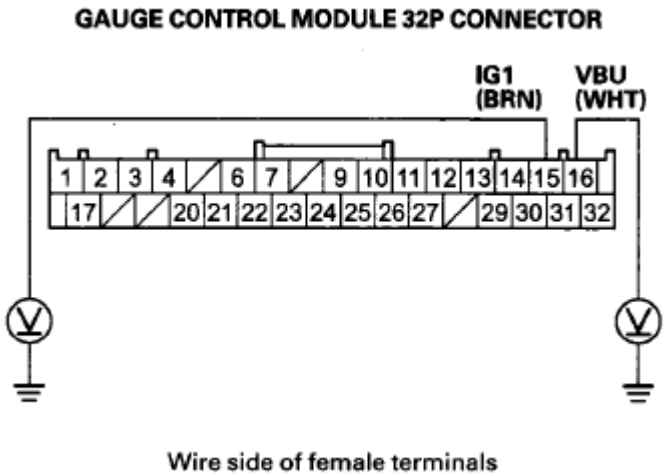

Fig. 105: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 15 And No. 16 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES - Go to step 8.

   NO - Go to step 7.

7. Check the No. 15 (10 A) fuse in the under- hood fuse/relay box and the No. 12 (7.5 A) fuse in the driver's under- dash fuse/relay box.

   Are the fuses OK?

   YES - Repair an open or high resistance in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

   NO - Replace the fuse(s). If the fuse blows again, repair a short to ground in the No. 15(10 A) and/or No. 12 (7.5 A) fuse circuit.

8. Measure the voltage between body ground and gauge control module 32P connector terminals No. 1 and No. 17 individually.

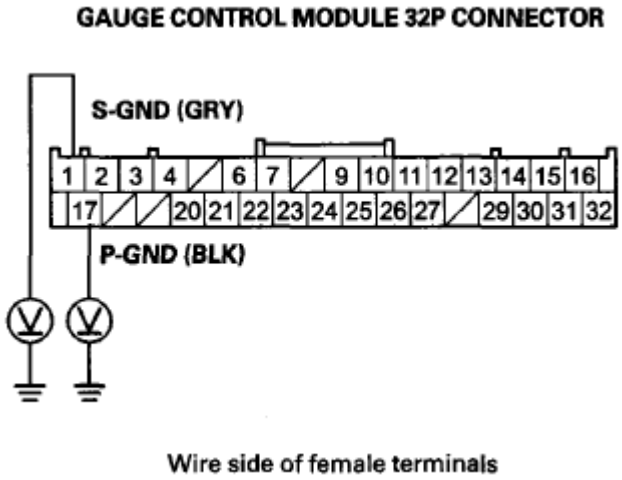

Fig. 106: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 1 And No. 17 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 9.

NO - Repair an open or high resistance in the ground wire or poor ground (G401) and/or (G402).

9. Press the engine start/stop button to select the OFF mode.
10. Disconnect the remote slot control unit 40P connector.
11. Disconnect the gauge control module 32P connector.
12. Check for continuity between gauge control module 32P connector terminals No. 29 and No. 30 and remote slot control unit 40P connector terminals No. 23 and No. 3 respectively.

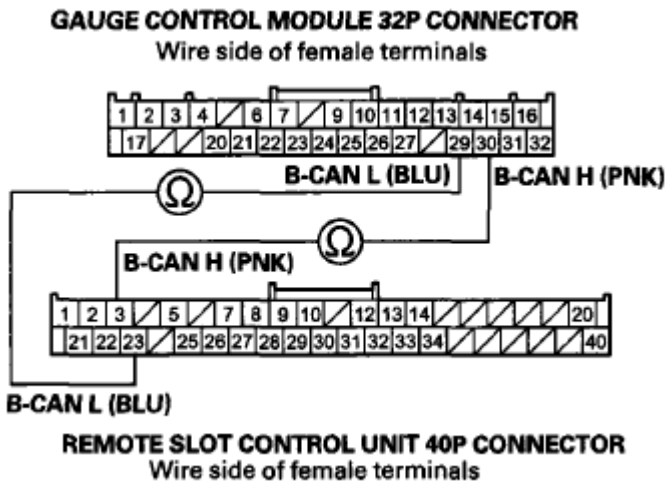

Fig. 107: Checking Continuity Between Gauge Control Module 32P Connector Terminals And Remote Slot Control Unit 40P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO - Repair an open or poor connection in the B- CAN wire between the remote slot control unit and the gauge control module.

SYMPTOM TROUBLESHOOTING INFORMATION

1. Symptom troubleshooting by the immobilizer indicator.

   The immobilizer and keyless access system condition can be checked by the immobilizer indicator lighting pattern.

   Normal operation:

   When pressing the engine start/stop button to select the ON mode and the immobilizer code is identified, the immobilizer indicator quickly flashes once.

   Immobilizer code is not identified:

   When pressing the engine start/stop button to select the ON mode when the immobilizer code has not been identified, the immobilizer indicator will come on for 2 seconds, then blinks until the OFF mode is selected. The state of the keyless registration and the S- NET line can be checked by doing a system check and status log checks with the HDS.

   When in the OFF mode, the immobilizer indicator will blink 10 times to signal that until has reset correctly, the immobilizer indicator will remain off.

Immobilizer indicator does not come on:

If the immobilizer indicator does not come on after pressing the engine start/stop button to select the ON mode, there is an open or short in the F- CAN lines between the ECM/PCM and the gauge control module. Watch the malfunction indicator lamp (MIL). If the MIL stays on, go to the PGM- FI system troubleshooting (see **MIL CIRCUIT TROUBLESHOOTING**).

Immobilizer indicator does not go off:

If the immobilizer indicator does not go off after pressing the engine start/stop button to select the ON mode, do the gauge control module self- diagnostic function procedures (see **SELF- DIAGNOSTIC FUNCTION**). If the indicator drive circuit is OK, do the SYSTEM CHECK and STATUS LOG CHECK procedures with the HDS.

2. General check before troubleshooting.

   Before troubleshooting the keyless access system, check the following items and solve any applicable issues.

   - Check the No. 3- 1 (IG MAIN) (50 A) fuse and the No. 15 (10 A) fuse in the under- hood fuse/relay box.
   - Check the No. 9 (20 A) fuse in the driver's under- dash fuse/relay box.
   - Check for poor connection at the power control unit and the keyless access control unit.
   - Check for DTCs with the HDS, if there is a DTC indicated, troubleshoot the DTC first.
   - Before testing, troubleshoot the keyless access system first using SELF CHECK, and if any malfunction is found, troubleshoot it first.
   - Make sure the remote is not in a purse with coins, wrapped with any metallic material, placed near a mobile phone or computer.
   - Make sure the vehicle battery is fully charged.
   - Make sure the remote batteries are not low; if they are, replace the battery.
   - Make sure a different remote is not being used; only use an Acura- approved remote.
   - Make sure the remote is not attached to a key ring or key case, if it is, remove the key from it.
   - Make sure aftermarket accessories are not installed; remove any aftermarket accessories.
   - Make sure aftermarket accessories are not connected to the S- NET line: disconnect any aftermarket accessories from the S- NET line.
   - Make sure there is no electrical interference nearby: avoid areas with electrical interference.

3. System Checks.

   If a System Check 1 or 2 result is indicated on the display of the HDS, troubleshoot the items based on these Check tables.

SYSTEM CHECK 1 (KEYLESS ACCESS CONTROL UNIT)

System Check No.	Possible cause	Check items

A- 1 A- 2 A- 3 G- 4	• Remote is mismatched • RF unit failure • LF interior antenna failure • Remote is not registered	• Remote test • RF unit test • LF interior antenna test • Register the remote
B- 1 B- 2 G- 1	• ECM/PCM is replaced • No communication between Keyless Access Control Unit and ECM/PCM • Open in the IG1 line • Keyless Access Control Unit is replaced	• Register the ECM/PCM • Check ECM/PCM • Check harness • Register the Keyless Access Control Unit
C- 1 C- 2 G- 2	• MICU (Imoes unit) is replaced • Communication error between Keyless Access Control Unit and MICU • Open in the IG1 line • Keyless Access Control Unit is replaced • Remote Slot Control Unit is replaced	• Register the Keyless Access Control Unit • Check MICU • Check harness
G- 5	• Power Control Unit is replaced • Electric Steering Lock is replaced • Keyless Access Control Unit is replaced	• Register the Power Control Unit • Check for an open or short in the wire IGN TRX lines

SYSTEM CHECK 2 (KEYLESS ACCESS CONTROL UNIT)

System Check No.	Possible cause	Check items
C- 3 C- 4	• Power Control Unit is replaced • Electric Steering Lock is replaced • Keyless Access Control Unit is replaced	• Register the Power Control Unit • Check for an open or short in the wire IGN TRX lines
D- 1 D- 2 D- 3	• S- NET line is short • No communication between Keyless Access Control Unit and MICU (Imoes unit) • No communication between Keyless Access Control Unit and ECM/PCM	• Check harness • Check MICU • Check ECM/PCM
D- 4 D- 5	IGN TRX line trouble	Check IGN TRX line
E- 1 E- 2 E- 3 E- 4 E- 5	Remote Slot Control Unit is not registered	Register the Remote Slot Control Unit
F- 1		

F- 2 F- 3 F- 4 F- 5	Special Mode	Press the engine start/stop button to select the ON mode and then select the OFF mode with a registered remote

SYSTEM CHECK (REMOTE SLOT CONTROL UNIT)

System Check No.	Possible cause	Check items
A- 1 A- 2 A- 3	• Remote is mismatched • Remote Slot failure • Remote is not registered	• Register the remote • Check Remote Slot
B- 1 B- 2	• ECM/PCM is replaced • Communication error between Remote Slot Control Unit and ECM/PCM	• Register the ECM/PCM • Check ECM/PCM
C- 1 C- 2	• MICU is replaced • Communication error between Remote Slot Control Unit and MICU • Open in the IG1 line	• Register the Remote Slot Control Unit • Check MICU • Check harness
D- 1 D- 2 D- 3	• S- NET line short • No communication between Remote Slot Control Unit and MICU • No communication between Remote Slot Control Unit and ECM/PCM	• Check harness • Check MICU • Check ECM/PCM

4. Status Log.

If the symptom does not occur again during the symptom check, check the Status Log with the HDS, and troubleshoot the items based on this table:

Check the status log count. Troubleshoot the status log number with the highest count first. If no counts are listed, the keyless access system is OK. Continue with normal symptom troubleshooting.

STATUS LOG (KEYLESS ACCESS CONTROL UNIT)

Status Log No.	Possible cause
B- 1 B- 2	• ECM/PCM was not registered correctly. • Keyless Access Control Unit was registered correctly • Poor connections or loose terminals between Keyless Access Control Unit and ECM/PCM • Poor connections or loose terminals in the IG1 line • Low Battery voltage

	• Electrical noise
C- 1 C- 2	• Communication error between Keyless Access Control Unit and MICU • Poor connections or loose terminals in the IG1 line • Keyless Access Control Unit was not registered • Low Battery voltage • Electrical noise
D- 1 D- 2 D- 3	• Poor connections or loose terminals between Keyless Access Control Unit and MICU (Imoes unit) • Poor connections or loose terminals between Keyless Access Control Unit and ECM/PCM • Low Battery voltage • Electrical noise • Blown fuse

STATUS LOG (REMOTE SLOT CONTROL UNIT)

Status Log No.	Possible cause
A- 1 A- 2 A- 3	• Remote was not registered correctly • Remote Slot failure
B- 1 B- 2	• ECM/PCM was not registered correctly • Communication error between Remote Slot Control Unit and ECM/PCM • Low Battery voltage • Electrical noise
C- 1 C- 2	• Remote Slot Control Unit was not registered correctly • Communication error between Remote Slot Control Unit and MICU • Poor connections or loose terminals in the IG1 line • Low Battery voltage • Electrical noise
D- 1 D- 2 D- 3	• Poor connections or loose terminals between Remote Slot Control Unit and MICU (Imoes unit) • Poor connections or loose terminals between Remote Slot Control Unit and ECM/PCM • S- NET line short • Low Battery voltage • Electrical noise • Blown fuse

SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure	Also check for
Cannot select ON mode with keyless access or with the remote in the remote slot	Symptom Troubleshooting (see **SYMPTOM TROUBLESHOOTING**)	• No. 3- 1 (IG MAIN) (50 A) and No. 15(10 A) fuses in the under- hood fuse/relay box • No. 9 (20 A) fuse in the driver's under- dash fuse/relay box • Poor connections at the power control unit • Gauge control module • Power control unit • Electric steering lock • Engine start/stop switch • SS1 (+) line open/power short/ground short • SS2 (-) line open/short • B- CAN communication line • F- CAN communication line • ESL SW B, C, D lines open/short • MTRCONT line open/short • IGN TRX line open/short • Not registered • Harness/connections
Cannot select ON mode with keyless access, but can select ON mode with the remote in the remote slot	Symptom Troubleshooting (see **CANNOT SELECT ON MODE WITH KEYLESS ACCESS, BUT CAN SELECT ON MODE WITH THE REMOTE IN THE REMOTE SLOT**)	• Keyless access control unit • Keyless access system mode switch • Remote slot • RF unit • LF antenna • Remote • Low or weak remote battery • MTR CONT line open/short • IGN TRX line open/short

		• ESLID mismatch • Not registered • Harness/connections
Cannot select ON mode with the remote in the remote slot, but can select ON mode with the remote removed	Symptom Troubleshooting (see **CANNOT SELECT ON MODE WITH THE REMOTE IN THE REMOTE SLOT, BUT CAN SELECT ON MODE WITH THE REMOTE REMOVED**)	• Keyless access control unit • Remote slot control unit • Remote slot • MTR CONT line power short • ESLID mismatch • Not registered • Harness/connections
The engine cranks but will not start with keyless access or with the remote in the remote slot	Symptom Troubleshooting (see **THE ENGINE CRANKS BUT WILL NOT START WITH KEYLESS ACCESS OR WITH THE REMOTE IN THE REMOTE SLOT**)	• No power to ECM/PCM • No power to driver's MICU • ESL SW B line open • Electric steering lock • Harness/fuses
The engine cranks but will not start with keyless access	Symptom Troubleshooting (see **THE ENGINE CRANKS BUT WILL NOT START WITH KEYLESS ACCESS**)	• S- net line open/short • ESL SW B line open • IMOCD mismatch • IMOES mismatch
The engine cranks but will not start with the remote in the remote slot	Symptom Troubleshooting (see **THE ENGINE CRANKS BUT WILL NOT START WITH THE REMOTE IN THE REMOTE SLOT**)	• S- net line open/short • ESL SW B line open • IMOCD mismatch • IMOES mismatch
All the doors and the trunk will not lock and unlock	Symptom Troubleshooting (see **ALL THE DOORS AND THE TRUNK WILL NOT LOCK AND UNLOCK**)	• Keyless access control unit • RF unit • LF antenna • Keyless access system mode switch • Driver's door lock knob switch • Door outer handle touch sensor/lock switch • Door lock actuators • Remote

		• Low or weak remote battery • Not registered
The doors will not unlock (lock is normal) with keyless access or with the remote buttons, or the doors will not lock (unlock is normal) with keyless access or with the remote buttons	Symptom Troubleshooting (see **THE DOORS WILL NOT UNLOCK (LOCK IS NORMAL) WITH KEYLESS ACCESS OR WITH THE REMOTE BUTTONS, OR THE DOORS WILL NOT LOCK (UNLOCK IS NORMAL) WITH KEYLESS ACCESS OR WITH THE REMOTE BUTTONS**)	• Driver's MICU • Remote • Door outer handle touch sensor/lock switch • Door switches
Keyless access indicator does not go off or does not come on	Symptom Troubleshooting (see **KEYLESS ACCESS INDICATOR DOES NOT GO OFF OR DOES NOT COME ON**)	• Gauge control module • Keyless access control unit • Power control unit • Remote slot control unit
Immobilizer indicator does not go off or does not come on	Symptom Troubleshooting (see **IMMOBILIZER INDICATOR DOES NOT GO OFF OR DOES NOT COME ON**)	• Gauge control module • Keyless access control unit • ECM/PCM
The key- in reminder does not sound	Symptom Troubleshooting (see **THE KEY- IN REMINDER DOES NOT SOUND**)	• Gauge control module • Driver's door switch • Keyless access control unit • Driver's MICU • PCUKEY line open • Harness
The key- in reminder sounds when the remote is removed from the remote slot and door is open	Symptom Troubleshooting (see **THE KEY- IN REMINDER SOUNDS WHEN THE REMOTE IS REMOVED FROM THE REMOTE SLOT AND DOOR IS OPEN**)	• Remote slot • Driver's MICU • Power control unit • Engine start/stop switch • Harness
Engine does not crank (power supply is normal)	• Check the brake pedal position switch (A/T) (see **BRAKE PEDAL POSITION SWITCH TEST**) • Check the clutch pedal position switch A (M/T) (see **CLUTCH PEDAL POSITION SWITCH A TEST**) • Check the power control unit (see	• Power control unit • STS line open/short • Brake pedal position switch (A/T) • Brake light line open/short (A/T) • Clutch pedal position switch A (M/T)

	CONTROL UNIT INPUT TEST)	• CLUTCH line open/short (M/T)
Engine start/stop switch does not work	Check for DTCs. If any DTC is indicated, go to the **DTC TROUBLESHOOTING**	• Power control unit • Engine start/stop switch • SS1 (+) line open/short • SS2 (-) line open/short • Harness
The mode changes between ACC and ON, but it does not change to OFF (A/T)	• Check the transmission range switch (see **TRANSMISSION RANGE SWITCH TEST**) • Check the power control unit (see **CONTROL UNIT INPUT TEST**)	• AT- P line short • Transmission range switch • Power control unit • Park Pin Switch
The mode changes between ACC and ON, but it is difficult to change to OFF	• Check the power control unit (see **CONTROL UNIT INPUT TEST**) • Check the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**) • Check the remote slot control unit (see **CONTROL UNIT INPUT TEST**) • Check the gauge control module (see **GAUGE CONTROL MODULE INPUT TEST**)	• Gauge control module • Keyless access control unit • Remote slot control unit • Power control unit • ECM/PCM • B- CAN communication line open/short • F- CAN communication line open/short • Speed signal line open
Remote cannot be removed from the remote slot	Check the park pin switch (A/T) (see **KEY INTERLOCK SOLENOID TEST**)	• Remote slot • Park pin switch (A/T) • P- PIN line short (A/T)
Remote will not go into the remote slot	Symptom Troubleshooting (see **REMOTE WILL NOT GO INTO THE REMOTE SLOT**)	Damaged remote casing
The doors will not unlock or lock with the remote, but will unlock	Symptom Troubleshooting (see **THE DOORS WILL NOT UNLOCK OR LOCK WITH THE REMOTE, BUT WILL UNLOCK OR**	• Remote battery dead • Remote • Driver's MICU • RF unit • Remote slot • Power control unit • SLOT SW HALF/FULL/FULL2 lines short • PCUKEY line short

or lock with the door outer handles	**LOCK WITH THE DOOR OUTER HANDLES**)	• SS1 (+) line short • SS2 (-) line short • IG1A line short • ACC line short • B- CAN communication line open/short • Not registered • Harness/fuses
The doors will not unlock or lock with the door outer handle touch sensor or lock switch, but will unlock or lock with the remote	Symptom Troubleshooting (see **THE DOORS WILL NOT UNLOCK OR LOCK WITH THE DOOR OUTER HANDLE TOUCH SENSOR OR LOCK SWITCH, BUT WILL UNLOCK OR LOCK WITH THE REMOTE**)	• Door outer handles • Keyless access system mode switch • Keyless access control unit • Remote • LF antenna • Driver's MICU • RF unit • Not registered • Harness/fuses

SYMPTOM TROUBLESHOOTING

CANNOT SELECT ON MODE WITH KEYLESS ACCESS OR WITH THE REMOTE IN THE REMOTE SLOT

1. Check the following fuses:
   - No. 3- 1 (IG MAIN) (50 A) and No. 15 (10 A) in the under- hood fuse/relay box
   - No. 9 (20 A) in the driver's under- dash fuse relay/box
   - No. 12 (10 A) in the passenger's under- dash fuse/relay box

   Are the fuses OK?

   YES - Go to step 2.

   NO - Replace the fuse(s). If the fuse blows again, repair the short to ground on the fuse circuit(s).

2. Turn the keyless access system mode switch ON.
3. Insert the remote into the remote slot.
4. Press the engine start/stop button to select the ON mode while turning the steering wheel to the left and to the right.

Does the system change to ON mode?

YES - The system is OK at this time.

NO - Go to step 5.

5. Repeat step 4 at least 10 times.

   Does the system change to ON mode?

   YES - The system is OK at this time.

   NO - Go to step 6.

6. Remove the remote from the remote slot.
7. Press the engine start/stop button to select the ON mode while turning the steering wheel to the left and to the right.

   Does the system change to ON mode?

   YES - The system is OK at this time.

   NO - Go to step 8.

8. Repeat step 7 at least 10 times.

   Does the system change to ON mode?

   YES - The system is OK at this time.

   NO - Go to step 9.

9. Connect the HDS to the data link connector (DLC), and boot the HDS.
10. Select model on the HDS screen.
11. When prompted by the HDS, select YES when asked if the vehicle has keyless access system, then press and hold the engine start/stop button for 120 seconds. This selects the forced ON mode.

    Does the system change to forced ON mode?

    YES - Go to step 12.

    NO - If the screen displays a DTC is stored, go to step 46. If the screen displays "Cannot detect ENGINE START/STOP button signal," go to step 18.

12. Check for PCU DTCs with the HDS.

Are any DTCs indicated?

YES - Troubleshoot the PCU DTCs.

NO - Go to step 13.

13. Check for KEYLESS ACCESS CONTROL UNIT communication with the HDS.

    Is there communication?

    YES - Go to step 14.

    NO - Do the keyless access control unit input test (see **KEYLESS ACCESS CONTROL UNIT**).

14. Check for KEYLESS ACCESS CONTROL UNIT DTCs with the HDS.

    Are any DTCs indicated?

    YES - Troubleshoot the KEYLESS ACCESS CONTROL UNIT DTCs.

    NO - Go to step 15.

15. Check for REMOTE SLOT CONTROL UNIT communication with the HDS.

    Is there communication?

    YES - Go to step 16.

    NO - Do the remote slot control unit input test (see **CONTROL UNIT INPUT TEST**).

16. Check for REMOTE SLOT CONTROL UNIT DTCs with the HDS.

    Are any DTCs indicated?

    YES - Troubleshoot the REMOTE SLOT CONTROL UNIT DTCs.

    NO - Go to step 17.

17. Do the remote test (see **REMOTE TEST**).

    Is the remote OK?

    YES - Go to step 47.

    NO - Substitute a known- good remote and recheck. If the symptom goes away, replace the original remote, then register all the remotes (see **WHEN REPLACING THE REMOTE SLOT CONTROL UNIT/KEYLESS ACCESS CONTROL UNIT/ECM/PCM/DRIVER'S MICU OR**

REGISTRATION OF THE REMOTE(S)).

18. Check for loose or poor connections at the power control unit.

    Are the connections OK?

    YES - Go to step 19.

    NO - Repair the connections, and retest.

19. Do the engine start/stop switch test (see **ENGINE START/STOP SWITCH TEST/REPLACEMENT**).

    Is the engine start/stop switch OK?

    YES - Go to step 20.

    NO - Replace the engine start/stop switch (see **ENGINE START/STOP SWITCH TEST/REPLACEMENT**).

20. Disconnect the engine start/stop switch 10P connector.
21. Disconnect power control unit connector C (36P).
22. Check for continuity between engine start/stop switch 10P connector terminals No. 2 and No. 5, and power control unit connector C (36P) terminals No. 8 and No. 7 respectively.

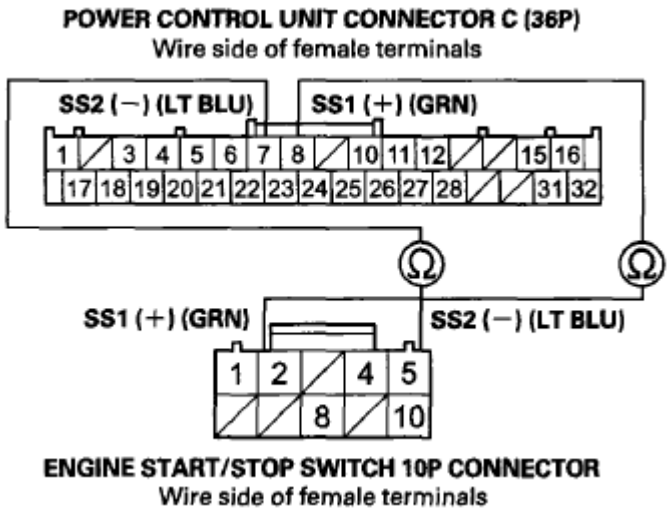

Fig. 108: Checking Continuity Between Engine Start/Stop Switch 10P Connector Terminals And Power Control Unit Connector C (36P) Terminals With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair an open or high resistance in the wire.

23. Measure the voltage between body ground and engine start/stop switch 10P connector terminal No. 1.

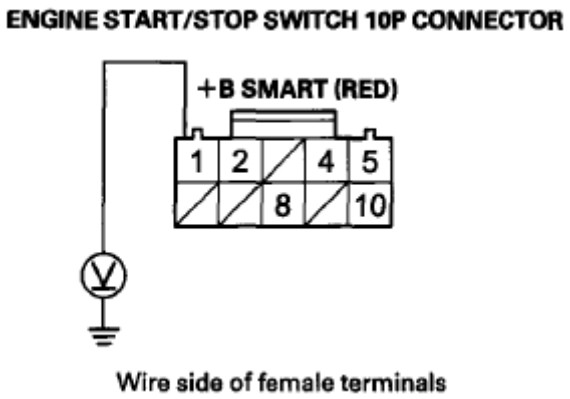

Fig. 109: Measuring Voltage Between Body Ground And Engine Start/Stop Switch 10P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 24.

NO - Repair an open or high resistance in the wire.

24. Check for continuity between body ground and engine start/stop switch 10P connector terminal No. 4.

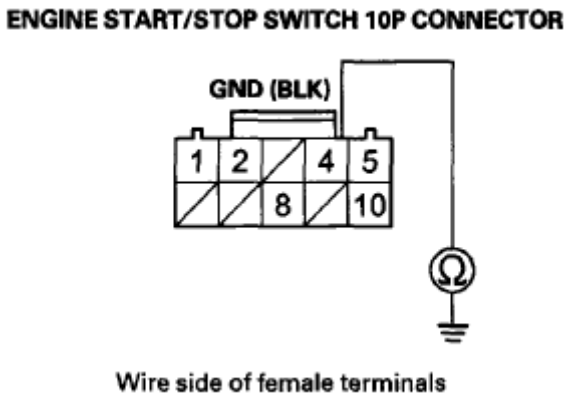

Fig. 110: Checking Continuity Between Body Ground And Engine Start/Stop Switch 10P Connector Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair an open or high resistance in the wire or poor ground (G405).

25. Disconnect power control unit connector A (1P).
26. Measure the voltage between body ground and power control unit connector A (1P) and C (36P) terminals as shown.

Power control unit connector	
A1	Body ground
C1	
C20

Courtesy of AMERICAN HONDA MOTOR CO., INC.

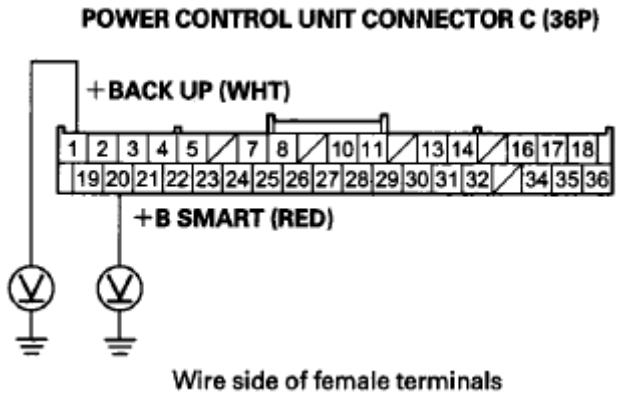

Fig. 112: Measuring Voltage Between Body Ground And Power Control Unit Connector And C (36P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 27.

NO - Repair an open or high resistance in the wire.

27. Check for continuity between body ground and power control unit connector C (36P) terminals No. 18 and No. 36 individually.

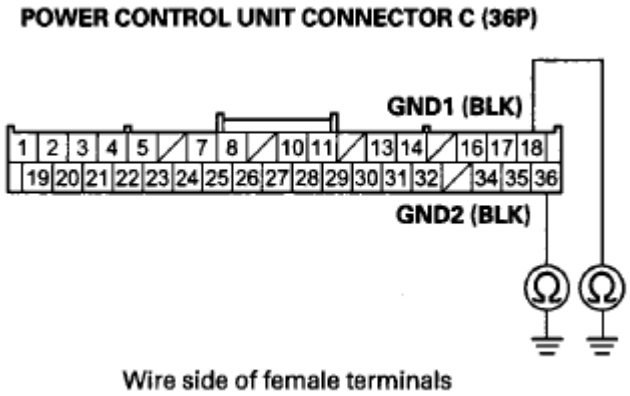

Fig. 113: Checking Continuity Between Body Ground And Power Control Unit Connector C (36P) Terminals No. 18 And No. 36 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 28.

NO - Repair an open or high resistance in the wire or poor ground (G402).

28. Disconnect the electric steering lock 12P connector.
29. Check for continuity between electric steering lock 12P connector terminals and power control unit connector C (36P) terminals as shown.

Power control unit connector C (36P)	Electric steering lock 12P connector
2 (PNK)	1 (PNK)
13 (PUR)	2 (PUR)
29 (LT BLU)	10 (LT BLU)
30 (ORN)	9 (ORN)

32 (BLU)	3 (BLU)

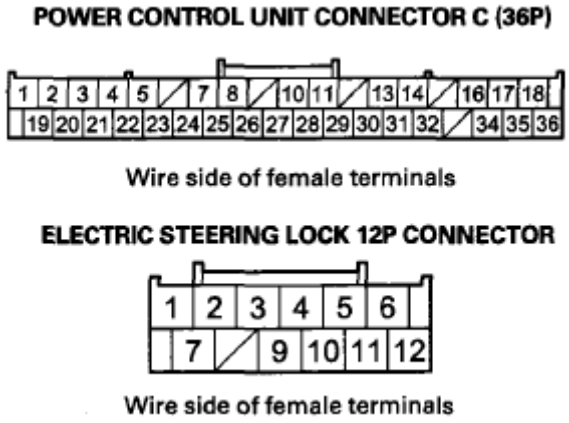

Fig. 114: Checking Continuity Between Electric Steering Lock 12P Connector Terminals And Power Control Unit Connector C (36P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Repair an open or high resistance in the wire.

30. Disconnect keyless access control unit connector B (32P).
31. Disconnect the remote slot control unit 40P connector.
32. Check for continuity between body ground and electric steering lock 12P connector terminals as shown.

Electric steering lock 12P connector	
1	Body ground
2	
3	
5	
9	
10	

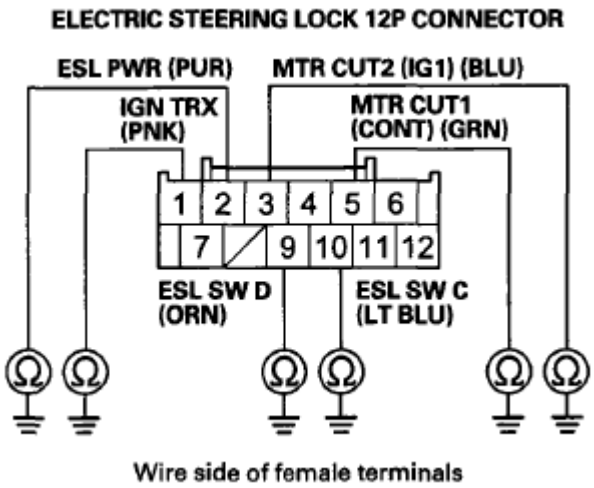

Fig. 115: Checking Continuity Between Body Ground And Electric Steering Lock 12P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 33.

33. Measure the voltage between body ground and electric steering lock 12P connector terminal No. 4.

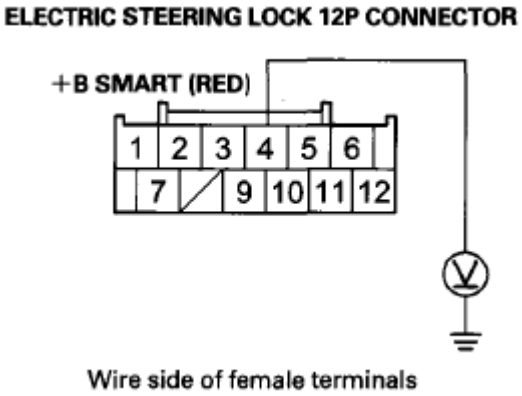

Fig. 116: Measuring Voltage Between Body Ground And Electric Steering Lock 12P Connector Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 34.

NO - Repair an open or high resistance in the wire.

34. Check for continuity between body ground and electric steering lock 12P connector terminal No. 12.

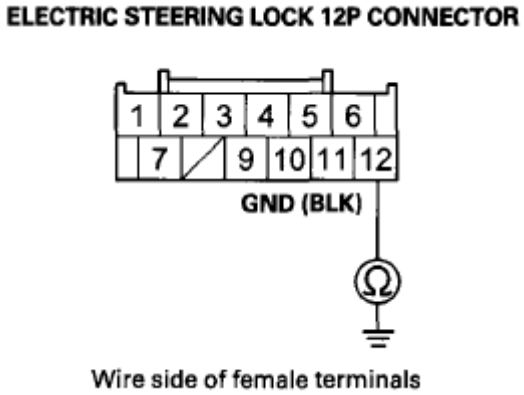

Fig. 117: Checking Continuity Between Body Ground And Electric Steering Lock 12P Connector Terminal No. 12
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 35.

NO - Repair an open or high resistance in the wire or poor ground (G405).

35. Disconnect keyless access control unit connector A (36P).
36. Check for continuity between keyless access control unit connector A (36P) and B (32P) terminals and electric steering lock 12P connector terminals as shown.

Keyless access control unit connector	Electric steering lock 12P connector
B6	1
A27	6

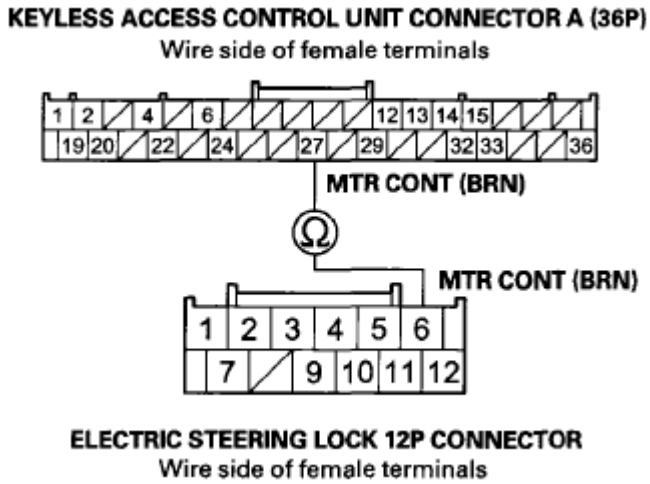

Fig. 119: Checking Continuity Between Keyless Access Control Unit Connector A (36P) And Electric Steering Lock 12P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 37.

NO - Repair an open or high resistance in the wire.

37. Check for continuity between body ground and electric steering lock 12P connector terminal No. 6.

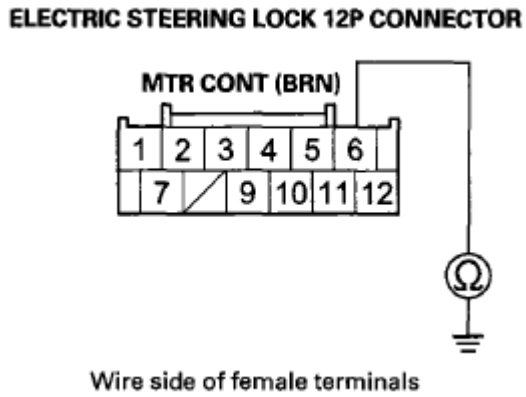

Fig. 120: Checking Continuity Between Body Ground And Electric Steering Lock 12P Connector Terminal No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 38.

38. Check for continuity between electric steering lock 12P connector terminals No. 1 and No. 6 and remote slot control unit 40P connector terminals No. 32 and No. 12 respectively.

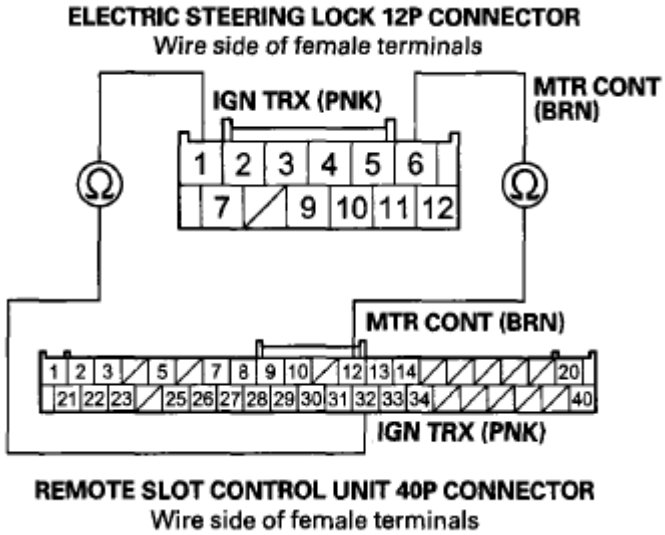

Fig. 121: Checking Continuity Between Electric Steering Lock 12P Connector Terminals And Remote Slot Control Unit 40P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 39.

NO - Repair an open or high resistance in the wire.

39. Measure the voltage between body ground and remote slot control unit 40P connector terminals No. 1 and No. 2 individually.

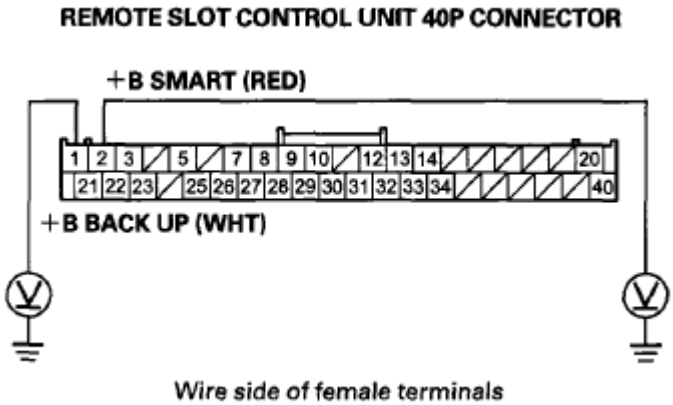

Fig. 122: Measuring Voltage Between Body Ground And Remote Slot Control Unit 40P Connector Terminals No. 1 And No. 2 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 40.

NO - Repair an open or high resistance in the wire.

40. Check for continuity between body ground and remote slot control unit 40P connector terminals No. 20 and No. 40 individually.

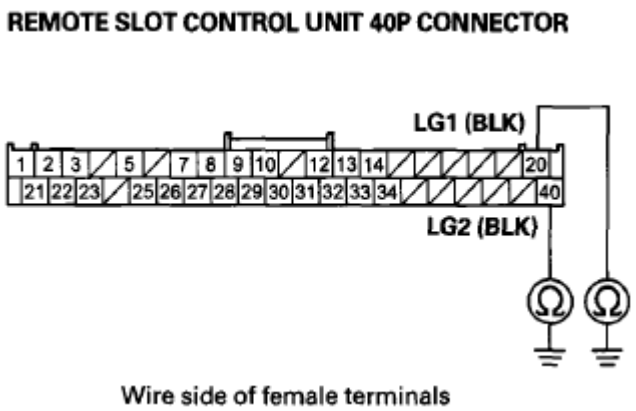

Fig. 123: Checking Continuity Between Body Ground And Remote Slot Control Unit 40P Connector Terminals No. 20 And No. 40 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 41.

NO - Repair an open or high resistance in the wire or poor ground (G405).

41. Check for continuity between remote slot control unit 40P connector terminals No. 10 and No. 13 and engine start/stop switch 10P connector terminals No. 2 and No. 5 respectively.

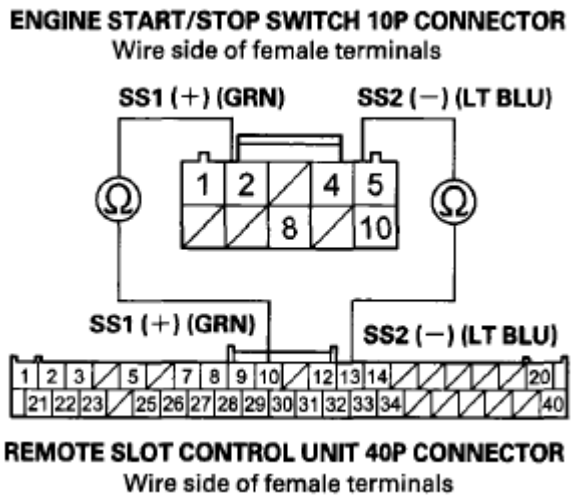

Fig. 124: Checking Continuity Between Remote Slot Control Unit 40P Connector Terminals And Engine Start/Stop Switch 10P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 42.

NO - Repair an open or high resistance in the wire.

42. Measure the voltage between body ground and keyless access control unit connector B (32P) terminal No. 1.

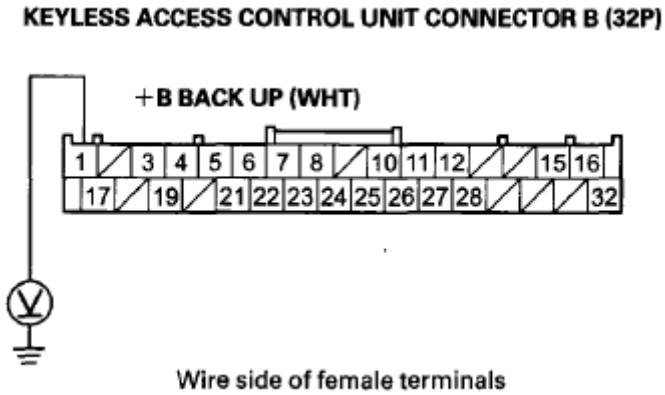

Fig. 125: Measuring Voltage Between Body Ground And Keyless Access Control Unit Connector B (32P) Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 43.

NO - Repair an open or high resistance in the wire.

43. Check for continuity between body ground and keyless access control unit connectors A (36P) and B (32P) terminals as shown.

Keyless access control unit connector	
A36	Body ground
B32	

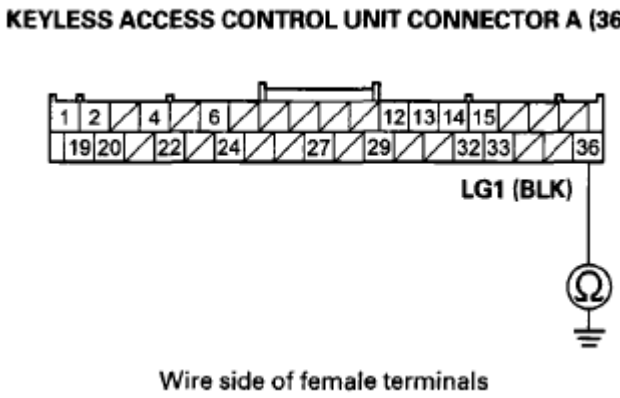

Fig. 126: Checking Continuity Between Body Ground And Keyless Access Control Unit Connectors A (36P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

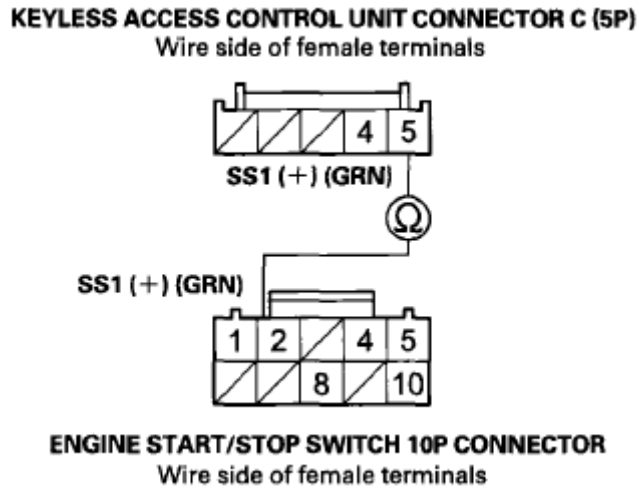

Fig. 129: Checking Continuity Between Keyless Access Control Unit Connectors And C (5P) Terminals And Engine Start/Stop Switch 10P Connector Terminals With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Substitute a known- good power control unit. If the symptom goes away, replace the original power control unit (see **CONTROL UNIT INPUT TEST**). If not, replace the electric steering lock (see **STEERING LOCK REPLACEMENT**).

NO - Repair an open or high resistance in the wire.

46. Select DTC from the INSPECTION MODE MENU with the HDS, then check for PCU DTCs with the HDS.

    Are any DTCs indicated?

    YES - Troubleshoot the PCU DTCs.

    NO - Go to step 25.

47. Press the engine start/stop button to select the OFF mode.
48. Remove all the remotes from inside the vehicle. Place the remotes more than 5 feet away from the vehicle.
49. Disconnect the electric steering lock 12P connector.
50. Reboot the HDS without pressing the engine start/stop button.
51. Select REGISTRATION from the ONE-PUSH START system select menu with the HDS, then select REPLACE PCU.
52. Reconnect the electric steering lock 12P connector.
53. Do the registration of PCU according to the instructions on the HDS screen.
54. Take the remote into the vehicle, and clear the PCU DTCs with the HDS.
55. Recheck the system.

    Is a system normal?

    YES - System is OK at this time.

    NO - Repeat steps 47 to 55, and recheck the system.

CANNOT SELECT ON MODE WITH KEYLESS ACCESS, BUT CAN SELECT ON MODE WITH THE REMOTE IN THE REMOTE SLOT

1. Turn the keyless access system mode switch ON.
2. Remove the remote from the remote slot.
3. Push the LOCK and the UNLOCK buttons of the remote, and check if the LED on the remote comes on.

   Does the LED come on?

   YES - Go to step 4.

   NO - Replace the remote battery and recheck the system. If the symptom does not go away, replace the

remote.

4. Press the engine start/stop button to select the ON mode while turning the steering wheel to the left and to the right.

   Does the system change to ON mode?

   YES - The system is OK at this time.

   NO - Go to step 5.

5. Repeat step 4 at least 10 times.

   Does the system change to ON mode?

   YES - The system is OK at this time.

   NO - Go to step 6.

6. Insert the remote into the remote slot.
7. Press the engine start/stop button to select the ON mode while turning the steering wheel to the left and to the right.
8. Connect the HDS to the data link connector (DLC).
9. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter SELF CHECK.

   Does the system communicate with the HDS?

   YES - Go to step 10.

   NO - Do the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**), and recheck the system. If the symptom does not go away, do the keyless access control unit input test (see **KEYLESS ACCESS CONTROL UNIT**).

10. Check for KEYLESS ACCESS CONTROL UNIT DTCs with the HDS.

    Are any DTCs indicated?

    YES - Troubleshoot the KEYLESS ACCESS CONTROL UNIT DTCs.

    NO - Go to step 11.

11. Check for PCU DTCs with the HDS

    Are any DTCs indicated?

YES - Troubleshoot the PCU DTCs.

NO - Go to step 12.

12. Check for REMOTE SLOT CONTROL UNIT DTCs with the HDS.

    Are any DTCs indicated?

    YES - Troubleshoot the REMOTE SLOT CONTROL UNIT DTCs.

    NO - Go to step 13.

13. Select HISTORY CLEAR from the KEYLESS ACCESS CONTROL UNIT MODE MENU with the HDS.
14. Press the engine start/stop button to select the OFF mode.
15. Remove the remote from the remote slot, then insert the remote into the remote slot.
16. Turn the keyless access system mode switch OFF, then turn the keyless access system mode switch ON.
17. Press the engine start/stop button to select the ON mode.
18. Select HISTORY DATA from the KEYLESS ACCESS CONTROL UNIT mode menu with the HDS.

    HISTORY DATA

ENGINE START/STOP SWITCH 1 (+)	ON
ENGINE START/STOP SWITCH 2 (-)	ON
Keyless access system mode SW	ON
SLOT SWITCH FULL	ON
SLOT SWITCH HALF	ON
SLOT SWITCH FULL2	ON

    Is all the information ON?

    YES - Go to step 19.

    NO - Go to the **KEYLESS ACCESS CONTROL UNIT INPUT TEST** (see).

19. Turn the keyless access system mode switch OFF.
20. Press the engine start/stop button to select the OFF mode.
21. Remove the remote from the remote slot.
22. Disconnect the electric steering lock 12P connector.
23. Reboot the HDS.
24. Press the engine start/stop button to enter PCU inspection menu according to the instruction on the HDS screen.
25. Reconnect the electric steering lock 12P connector.
26. Select PCU from the ONE-PUSH START system select menu with the HDS, and enter DATA LIST.

27. Check each keyless access system mode switch and remote slot value with the DATA LIST menu.

NOTE: When the keyless access system mode switch is OFF, the HDS value is ON; this is normal.

PRESS AND HOLD ENGINE START/STOP BUTTON

Data List	Value
KEYLESS ACCESS SYSTEM MODE SW	ON
SLOT SWITCH FULL2	OFF
SLOT SWITCH HALF	OFF

Are all data list values correct?

YES - Go to step 28.

NO - Go to the **POWER CONTROL UNIT INPUT TEST** (see).

28. Insert the remote into the remote slot.
29. Turn the keyless access system mode switch ON.
30. Press the engine start/stop button to select the ON mode.
31. Check each remote slot and keyless access system mode switch value with the DATA LIST menu.

NOTE: When the keyless access system mode switch is ON, the HDS value is OFF; this is normal.

Data List	Value
KEYLESS ACCESS SYSTEM MODE SW	OFF
SLOT SWITCH FULL2	ON
SLOT SWITCH HALF	ON

Are all data list values correct?

YES - Go to step 32.

NO - Go to the **POWER CONTROL UNIT INPUT TEST** (see).

32. Reboot the HDS.
33. Select KEYLESS TRANSMITTER from the BODY ELECTRICAL SYSTEM SELECT menu, then select INSPECTION, then KEYLESS CHECK.
34. Do the KEYLESS CHECK with the HDS using the remote.

Is KEYLESS ENTRY TRANSMITTER CODE IS RECEIVED indicated?

YES - Go to step 35.

NO - Go to step 45.

35. Do the KEYLESS CHECK with the HDS using the remote.

    Is DIFFERENT KEYLESS ENTRY TRANSMITTER CODE RECEIVED indicated?

    YES - Register all the remotes, and recheck.

    NO - Go to step 36.

36. Press the engine start/stop button to select the OFF mode.
37. Disconnect keyless access control unit connector B (32P).
38. Disconnect power control unit connector C (36P).
39. Check for continuity between keyless access control unit connector B (32P) terminal No. 6 and power control unit connector C (36P) terminal No. 2.

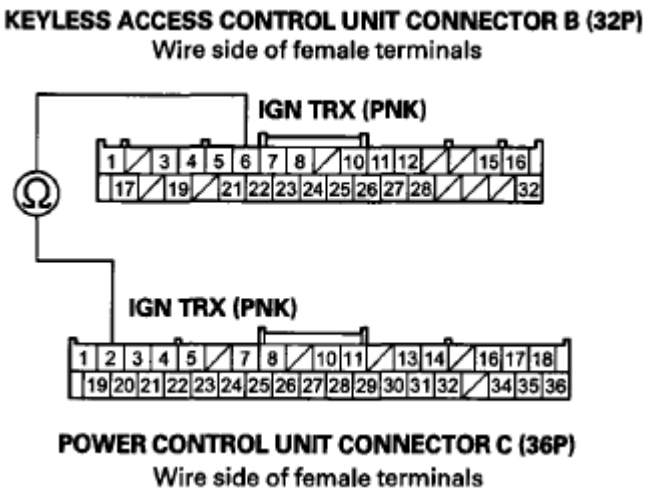

Fig. 130: Checking Continuity Between Keyless Access Control Unit Connector B (32P) Terminal No. 6 And Power Control Unit Connector C (36P) Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 40.

NO - Repair an open or high resistance in the wire, and recheck the system.

40. Disconnect the electric steering lock 12P connector.
41. Disconnect keyless access control unit connector A (36P).
42. Check for continuity between keyless access control unit connector A (36P) terminal No. 27 and electric steering lock 12P connector terminal No. 6.

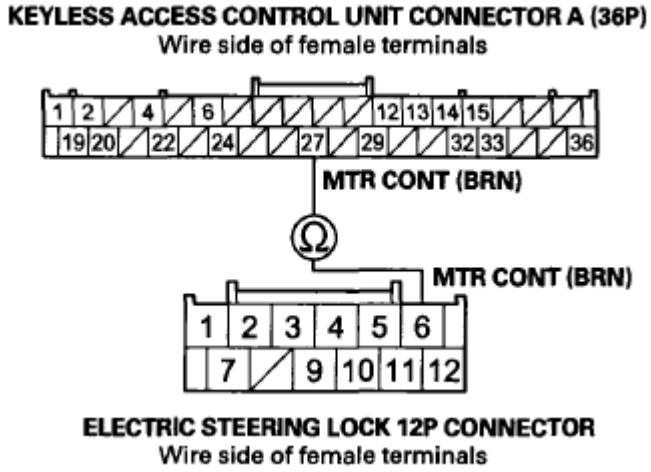

Fig. 131: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminal No. 27 And Electric Steering Lock 12P Connector Terminal No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 43.

NO - Repair an open or high resistance in the wire.

43. Measure the voltage between body ground and keyless access control unit connector B (32P) terminal No. 17.

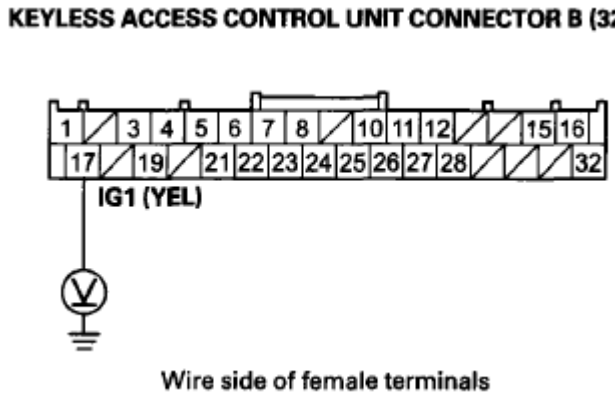

Fig. 132: Measuring Voltage Between Body Ground And Keyless Access Control Unit Connector B (32P) Terminal No. 17
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES - Repair a short to power in the wire.

NO - Go to step 44.

44. Substitute a known- good remote, then recheck the system.

    Did the symptom go away?

    YES - Replace the original remote.

    NO - Substitute a known- good keyless access control unit. If the symptom goes away, replace the original keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**). If not, replace the RF unit (see **RF UNIT REPLACEMENT**).

45. Substitute a known- good RF unit (see **RF UNIT REPLACEMENT**), then recheck the system.

    Did the symptom go away?

    YES - Replace the original RF unit (see **RF UNIT REPLACEMENT**).

    NO - Substitute a known- good remote. If the symptom goes away, replace the original remote. If not, replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

CANNOT SELECT ON MODE WITH THE REMOTE IN THE REMOTE SLOT, BUT CAN SELECT ON MODE WITH THE REMOTE REMOVED

1. Turn the keyless access system mode switch OFF.
2. Insert the remote into the remote slot.
3. Press the engine start/stop button to select the ON mode while turning the steering wheel to the left and to the right.

   Does the system change to ON mode?

   YES - The system is OK at this time.

   NO - Go to step 4.

4. Repeat step 3 at least 10 times.

   Does the system change to ON mode?

   YES - The system is OK at this time.

   NO - Go to step 5.

5. Remove the remote from the remote slot.
6. Turn the keyless access system mode switch ON.
7. Press the engine start/stop button to select the ON mode.
8. Connect the HDS to the data link connector (DLC).

9. Select REMOTE SLOT CONTROL UNIT from the ONE-PUSH START system select menu.

   Does the system communicate with the HDS?

   YES - Go to step 10.

   NO - Do the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**), and recheck the system. If the symptom does not go away, do the remote slot control unit input test (see **CONTROL UNIT INPUT TEST**).

10. Check for REMOTE SLOT CONTROL UNIT DTCs with the HDS.

    Are any DTCs indicated?

    YES - Troubleshoot the REMOTE SLOT CONTROL UNIT DTCs.

    NO - Go to step 11.

11. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu, and enter the SELF CHECK.
12. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu, and check for KEYLESS ACCESS CONTROL UNIT DTCs with the HDS.

    Are any DTCs indicated?

    YES - Troubleshoot the KEYLESS ACCESS CONTROL UNIT DTCs.

    NO - Go to step 13.

13. Check for PCU DTCs with the HDS.

    Are any DTCs indicated?

    YES - Troubleshoot the PCU DTCs.

    NO - Go to step 14.

14. Select REMOTE SLOT CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter DATA LIST.
15. Check each REMOTE SLOT CONTROL UNIT value with the DATA LIST menu.

Data List	Value
ENGINE START/STOP SWITCH 1 (+)	OFF
ENGINE START/STOP SWITCH 2 (-)	OFF
SLOT SWITCH FULL	OFF

SLOT SWITCH HALF	OFF
SLOT SWITCH FULL2	OFF

Are all data list values correct?

YES - Go to step 16.

NO - Go to the **REMOTE SLOT CONTROL UNIT INPUT TEST** (see).

16. Insert the remote into the remote slot.
17. Check each REMOTE SLOT CONTROL UNIT value with the DATA LIST menu.

Data List	Value
SLOT SWITCH FULL	ON
SLOT SWITCH HALF	ON
SLOT SWITCH FULL2	ON
+ B SMART	ON
+ B BACKUP	ON

Are all data list values correct?

YES - Go to step 18.

NO - Do the remote slot control unit input test (see **CONTROL UNIT INPUT TEST**).

18. Press the engine start/stop button to select the OFF mode.
19. Disconnect the remote slot control unit 40P connector.
20. Disconnect the engine start/stop switch 10P connector.
21. Check for continuity between engine start/stop switch 10P connector terminals No. 2 and No. 5, and remote slot control unit connector 40P terminals No. 10 and No. 13 respectively.

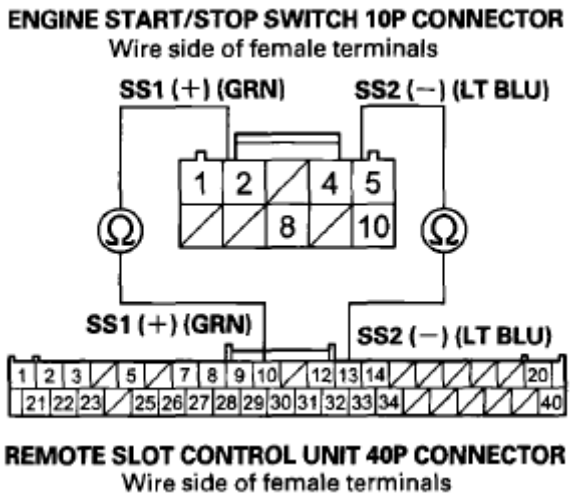

Fig. 133: Checking Continuity Between Engine Start/Stop Switch 10P Connector Terminals And Remote Slot Control Unit Connector 40P Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 22.

NO - Repair an open or high resistance in the wire.

22. Disconnect the electric steering lock 12P connector.
23. Check for continuity between electric steering lock 12P connector terminals No. 1 and No. 6, and remote slot control unit 40P connector terminals No. 32 and No. 12 respectively.

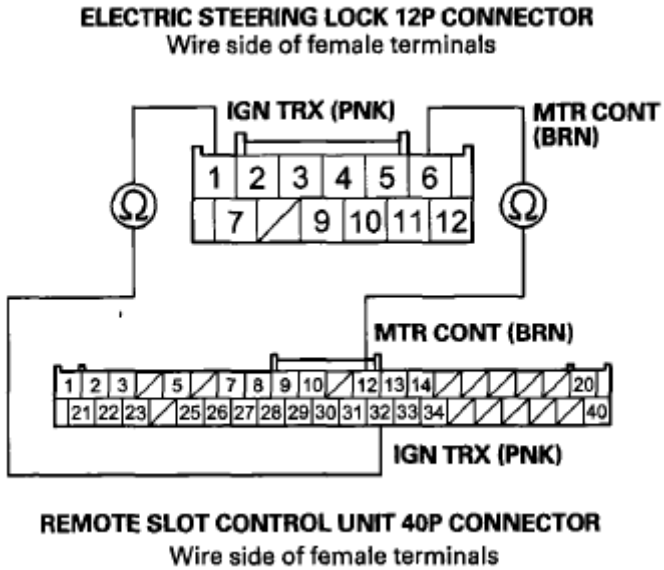

Fig. 134: Checking Continuity Between Electric Steering Lock 12P Connector Terminals And Remote Slot Control Unit 40P Connector Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 24.

NO - Repair an open or high resistance in the wire.

24. Disconnect the remote slot 16P connector.
25. Check for continuity between remote slot control unit 40P connector terminals and remote slot 16P connector terminals as shown.

Remote slot control unit 40P connector	Remote slot 16P connector
9 (GRY)	2 (GRY)
28(GRN)	11 (GRN)
29 (BRN)	9 (BRN)

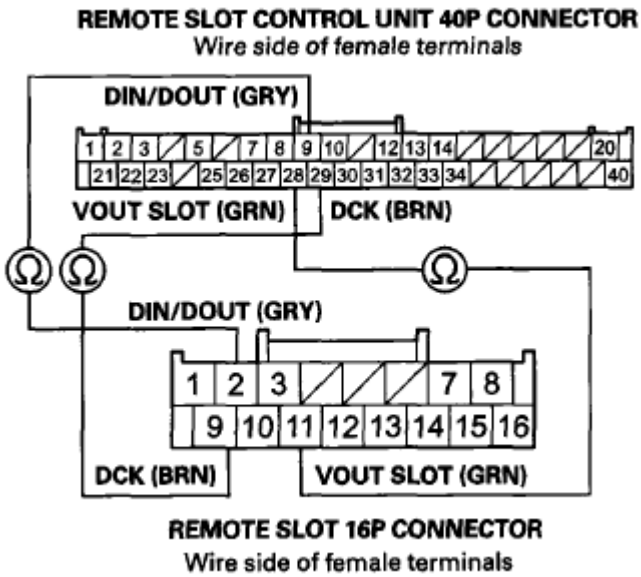

Fig. 135: Checking Continuity Between Remote Slot Control Unit 40P Connector Terminals And Remote Slot 16P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 26.

NO - Repair an open or high resistance in the wire.

26. Measure the voltage between body ground and remote slot 16P connector terminal No. 1.

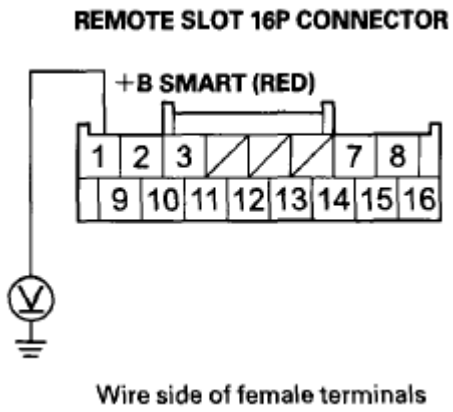

Fig. 136: Measuring Voltage Between Body Ground And Remote Slot 16P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 27.

NO - Repair No. 12 (10 A) fuse in the passenger's under- dash fuse/relay box, or repair an open or high resistance in the wire.

27. Check for continuity between body ground and remote slot 16P connector terminals No. 7 and No. 15 individually.

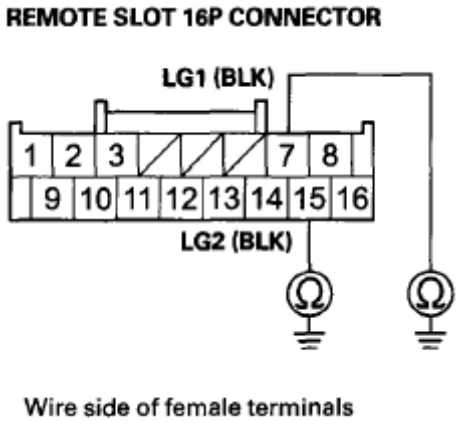

Fig. 137: Checking Continuity Between Body Ground And Remote Slot 16P Connector Terminals No. 7 And No. 15 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 28.

NO - Repair an open or high resistance in the wire or poor ground (G403).

28. Reconnect these items:
    - Remote slot control unit 40P connector
    - Engine start/stop switch 10P connector
    - Electric steering lock 12P connector
    - Remote slot 16P connector
29. Remove the remote from the remote slot.
30. Connect the HDS to the data link connector (DLC).
31. Press the engine start/stop button to select the ON mode.
32. Select PCU from the ONE-PUSH START system select menu with the HDS, and enter DATA LIST.
33. Wait for at least 10 seconds.
34. Check each PCU value with the DATA LIST menu.

Data List	Value
SLOT SWITCH FULL	OFF
SLOT SWITCH HALF	OFF

Are all data list values correct?

YES - Go to step 35.

NO - Go to the **POWER CONTROL UNIT INPUT TEST** (see).

35. Insert the remote into the remote slot.
36. Wait for at least 10 seconds.
37. Check each PCU value with the DATA LIST menu.

Data List	Value
SLOT SWITCH FULL	ON
SLOT SWITCH HALF	ON

Are all data list values correct?

YES - Go to step 38.

NO - Go to the **POWER CONTROL UNIT INPUT TEST** (see).

38. Press the engine start/stop button to select the OFF mode.
39. Remove all the remotes from inside the vehicle. Place the remotes more than 5 feet away from the vehicle.
40. Disconnect the electric steering lock 12P connector.
41. Reboot the HDS without pressing the engine start/stop button.
42. Select REGISTRATION from the ONE-PUSH START system select menu with the HDS, and enter

REPLACE PCU.

43. Reconnect the electric steering lock 12P connector.
44. Do the registration of PCU according to the instructions on the HDS screen.
45. Take the remote into the vehicle, and press the engine start/stop button to select the ON mode.
46. Clear the PCU DTCs with the HDS.
47. Press the engine start/stop button to select the OFF mode.
48. Insert the remote into the remote slot.
49. Press the engine start/stop button to select the ON mode.
50. Recheck the system.

    Is the system normal?

    YES - System is OK at this time.

    NO - Go to step 51.

51. Substitute a known- good remote slot (see **REMOTE SLOT TEST/REPLACEMENT**), then recheck the system.

    Did the symptom go away?

    YES - Replace the original remote slot (see **REMOTE SLOT TEST/REPLACEMENT**).

    NO - Substitute a known- good remote. If the symptom goes away, replace the original remote. If not, replace the remote slot control unit (see **CONTROL UNIT INPUT TEST**).

THE ENGINE CRANKS BUT WILL NOT START WITH KEYLESS ACCESS OR WITH THE REMOTE IN THE REMOTE SLOT

1. Turn the keyless access system mode switch OFF.
2. Insert the remote into the remote slot.
3. Press the engine start/stop button to select the ON mode.
4. Check the immobilizer indicator.

   Is the immobilizer indicator blinking?

   YES - Go to step 5.

   NO - Go to step 20.

5. Connect the HDS to the data link connector (DLC).
6. Select REMOTE SLOT CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter SYSTEM INFORMATION.
7. Do the SYSTEM CHECK with the HDS.

Is N- 1 OK indicated?

YES - Go to step 8.

NO - Troubleshooting the keyless access system according to the result of the SYSTEM CHECK (see **SYMPTOM TROUBLESHOOTING INFORMATION**).

8. Select REMOTE SLOT CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter DATA LIST.
9. Check the ESL SW B in the DATA LIST.

Is the information indicator ON?

YES - Go to step 10.

NO - Go to step 23.

10. Press the engine start/stop button to select the OFF mode.
11. Remove the remote from the remote slot.
12. Turn the keyless access system mode switch ON.
13. Press the engine start/stop button to select the ON mode.
14. Check the immobilizer indicator.

Is the immobilizer indicator blinking?

YES - Go to step 15.

NO - Go to step 20.

15. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter KEYLESS ACCESS CONTROL INFORMATION.
16. Do the SYSTEM CHECK 1 with the HDS.

Is N- 1 OK indicated?

YES - Go to step 17.

NO - Troubleshoot the keyless access system according to the result of the SYSTEM CHECK 1 (see **SYMPTOM TROUBLESHOOTING INFORMATION**).

17. Do the SYSTEM CHECK 2 with the HDS.

Is N- 2 OK indicated?

YES - Go to step 18.

NO - Troubleshoot the keyless access system according to the result of the SYSTEM CHECK 2 (see **SYMPTOM TROUBLESHOOTING INFORMATION**).

18. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter DATA LIST.
19. Check the ESL SW B in the DATA LIST.

    Is the indicator ON?

    YES - Go to the PGM- FI system symptom troubleshooting (see **SYMPTOM TROUBLESHOOTING INDEX**).

    NO - Go to step 29.

20. Check the immobilizer indicator.

    Does the indicator come on?

    YES - Go to the PGM- FI system symptom troubleshooting (see **SYMPTOM TROUBLESHOOTING INDEX**).

    NO - Go to step 21.

21. Select GAUGES from the BODY ELECTRICAL SYSTEM SELECT menu with the HDS.
22. Select FUNCTIONAL TESTS from the TEST MODE menu with the HDS, and enter SELF TEST.

    Does the immobilizer indicator come on?

    YES - Go to the PGM- FI system symptom troubleshooting (see **SYMPTOM TROUBLESHOOTING INDEX**).

    NO - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

23. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter DATA LIST.
24. Check the ESL SW B in the DATA LIST.

    Is the indicator ON?

    YES - Go to step 25.

    NO - Go to step 33.

25. Press the engine start/stop button to select the OFF mode.
26. Disconnect the remote slot control unit 40P connector.
27. Disconnect the electric steering lock 12P connector.

28. Check for continuity between electric steering lock 12P connector terminal No. 11 and remote slot control unit 40P connector terminal No. 30.

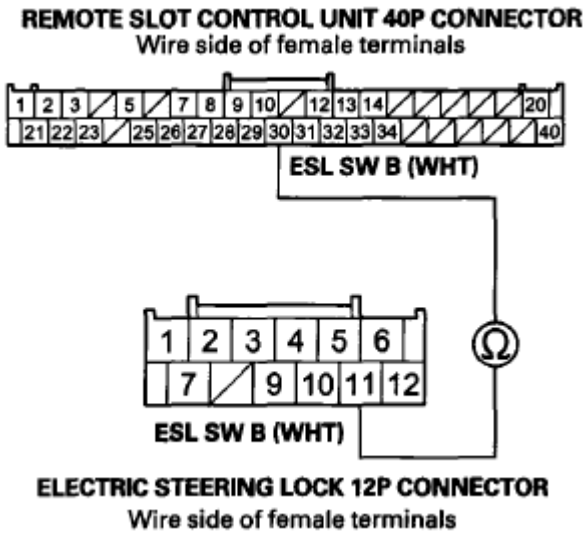

Fig. 138: Checking Continuity Between Electric Steering Lock 12P Connector Terminal No. 11 And Remote Slot Control Unit 40P Connector Terminal No. 30
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the remote slot control unit (see **CONTROL UNIT INPUT TEST**).

NO - Repair an open or high resistance in the wire.

29. Press the engine start/stop button to select the OFF mode.
30. Disconnect keyless access control unit connector C (5P).
31. Disconnect the electric steering lock 12P connector.
32. Check for continuity between electric steering lock 12P connector terminal No. 11 and keyless access control unit connector C (5P) terminal No. 4.

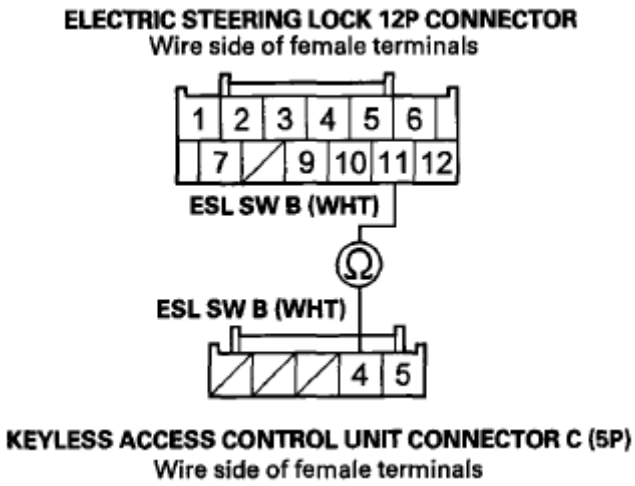

Fig. 139: Checking Continuity Between Electric Steering Lock 12P Connector Terminal No. 11 And Keyless Access Control Unit Connector C (5P) Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

NO - Repair an open or high resistance in the wire.

33. Press the engine start/stop button to select the OFF mode.
34. Disconnect the remote slot control unit 40P connector.
35. Disconnect the electric steering lock 12P connector.
36. Check for continuity between electric steering lock 12P connector terminal No. 11 and remote slot control unit 40P connector terminal No. 30.

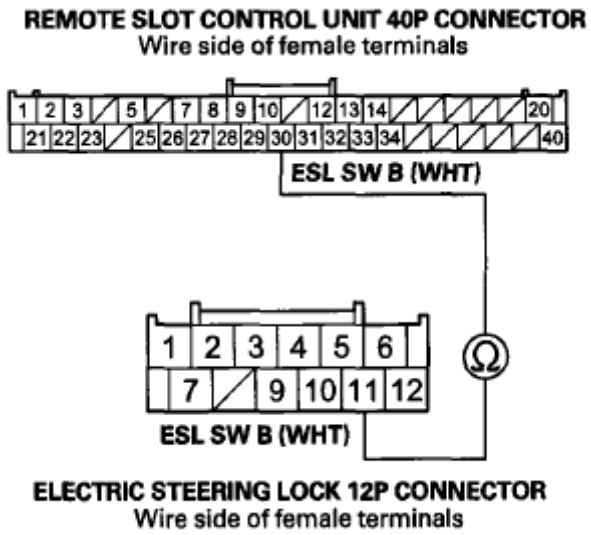

Fig. 140: Checking Continuity Between Electric Steering Lock 12P Connector Terminal No. 11 And

Remote Slot Control Unit 40P Connector Terminal No. 30
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the remote slot control unit (see **CONTROL UNIT INPUT TEST**).

NO - Repair an open or high resistance in the wire.

THE ENGINE CRANKS BUT WILL NOT START WITH KEYLESS ACCESS

1. Turn the keyless access system mode switch ON.
2. Remove the remote from the remote slot.
3. Press the engine start/stop button to select the ON mode.
4. Check the immobilizer indicator.

   Is the immobilizer indicator blinking?

   YES - Go to step 5.

   NO - Go to step 15.

5. Connect the HDS to the data link connector (DLC).
6. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter SYSTEM INFORMATION.
7. Do the SYSTEM CHECK 1 with the HDS.

   Is N- 1 OK indicated?

   YES - Go to step 8.

   NO - Troubleshooting the keyless access system according to the result of the SYSTEM CHECK 1 (see **SYMPTOM TROUBLESHOOTING INFORMATION**).

8. Do the SYSTEM CHECK 2 with the HDS.

   Is N- 2 OK indicated?

   YES - Go to step 9.

   NO - Troubleshoot the keyless access system according to the result of the SYSTEM CHECK 2 (see **SYMPTOM TROUBLESHOOTING INFORMATION**).

9. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter DATA LIST.
10. Check the ESL SW B in the DATA LIST.

Is the indicator ON?

YES - Substitute a known- good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**) and recheck. If the symptom goes away, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If not, replace the keyless access control unit (see **KEYLESS ACCESS CONTROL UNIT**).

NO - Go to step 11.

11. Press the engine start/stop button to select the OFF mode.
12. Disconnect keyless access control unit connector C (5P).
13. Disconnect the electric steering lock 12P connector.
14. Check for continuity between electric steering lock 12P connector terminal No. 11 and keyless access control unit connector C (5P) terminal No. 4.

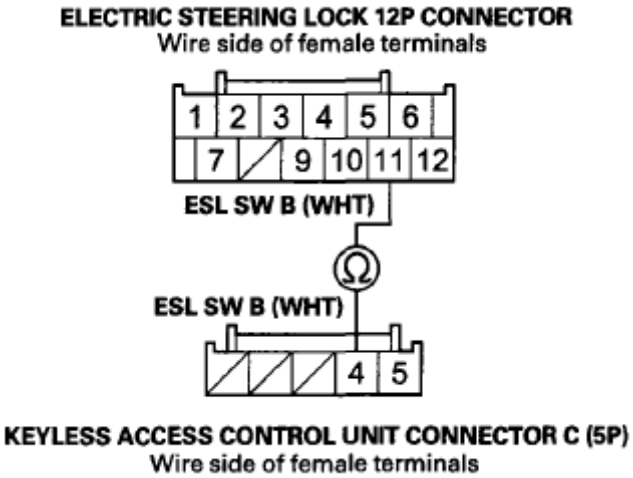

Fig. 141: Checking Continuity Between Electric Steering Lock 12P Connector Terminal No. 11 And Keyless Access Control Unit Connector C (5P) Terminal No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the keyless access control unit (see **CONTROL UNIT INPUT TEST**).

NO - Repair an open or high resistance in the wire.

15. Check the immobilizer indicator.

Does the indicator come on?

YES - Go to the PGM- FI system symptom troubleshooting (see **SYMPTOM TROUBLESHOOTING INDEX**).

NO - Go to step 16.

16. Select GAUGES from the BODY ELECTRICAL SYSTEM SELECT menu with the HDS.
17. Select FUNCTIONAL TESTS from the TEST MODE menu with the HDS, and enter SELF TEST.

    Does the immobilizer indicator come on?

    YES - Go to the PGM- FI system symptom troubleshooting (see **SYMPTOM TROUBLESHOOTING INDEX**).

    NO - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

THE ENGINE CRANKS BUT WILL NOT START WITH THE REMOTE IN THE REMOTE SLOT

1. Turn the keyless access system mode switch OFF.
2. Insert the remote into the remote slot.
3. Press the engine start/stop button to select the ON mode.
4. Check the immobilizer indicator.

   Does the indicator blink once, then stay off?

   YES - Go to the PGM- FI system symptom troubleshooting (see **SYMPTOM TROUBLESHOOTING INDEX**).

   NO - Go to step 5.

5. Check the immobilizer indicator.

   Is the immobilizer indicator blinking?

   YES - Go to step 6.

   NO - Go to step 15.

6. Connect the HDS to the data link connector (DLC).
7. Select REMOTE SLOT CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter SYSTEM INFORMATION.
8. Do the SYSTEM CHECK with the HDS.

   Is N- 1 OK indicated?

   YES - Go to step 9.

   NO - Troubleshooting the keyless access system according to the result of the SYSTEM CHECK (see **SYMPTOM TROUBLESHOOTING INFORMATION**).

9. Select REMOTE SLOT CONTROL UNIT from the ONE-PUSH START system select menu with the

HDS, and enter DATA LIST.

10. Check the ESL SW B in the DATA LIST.

    Is the indicator ON?

    YES - Substitute a known- good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**) and recheck. If the symptom goes away, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If not, replace the remote slot control unit (see **CONTROL UNIT INPUT TEST**).

    NO - Go to step 11.

11. Press the engine start/stop button to select the OFF mode.
12. Disconnect the remote slot control unit 40P connector.
13. Disconnect the electric steering lock 12P connector.
14. Check for continuity between electric steering lock 12P connector terminal No. 11 and remote slot control unit 40P connector terminal No. 30.

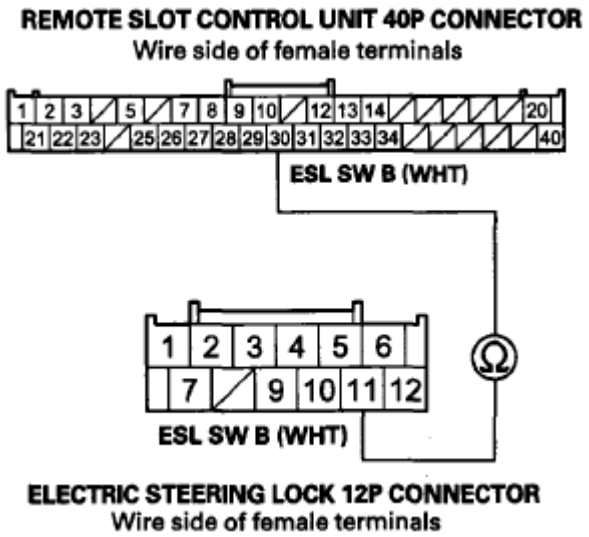

Fig. 142: Checking Continuity Between Electric Steering Lock 12P Connector Terminal No. 11 And Remote Slot Control Unit 40P Connector Terminal No. 30
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the remote slot control unit (see **CONTROL UNIT INPUT TEST**).

NO - Repair an open or high resistance in the wire.

15. Select GAUGES from the BODY ELECTRICAL SYSTEM SELECT menu with the HDS.
16. Select FUNCTIONAL TESTS from the TEST MODE menu with the HDS, and enter SELF TEST.

Does the immobilizer indicator come on?

YES - Go to the PGM- FI system symptom troubleshooting (see **SYMPTOM TROUBLESHOOTING INDEX**).

NO - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), and recheck.

ALL THE DOORS AND THE TRUNK WILL NOT LOCK AND UNLOCK

1. Insert the remote into the remote slot.

   Does the remote go in?

   YES - Go to step 2.

   NO - Go to keyless access symptom troubleshooting "**REMOTE WILL NOT GO INTO THE REMOTE SLOT**" (see).

2. Remove the remote from the remote slot, and close all doors.
3. Push the LOCK and the UNLOCK buttons of the remote, and check if the LED on the remote comes on.

   Does the LED come on?

   YES - Go to step 4.

   NO - Replace the remote battery and recheck the system. If the symptom does not go away, replace the remote.

4. Lock and unlock the driver's door with the driver's door lock switch.

   Do the door lock actuators work normally?

   YES - Go to step 5.

   NO - Check the B- CAN system DTCs. If not, check the door lock system.

5. Lock and unlock the front passenger's door with the front passenger's door lock switch.

   Do the door lock actuators work normally?

   YES - Go to step 6.

   NO - Check the B- CAN system DTCs. If not, check the door lock system.

6. Push the UNLOCK button of the remote at least 10 times.

Do the actuators operate?

YES - Intermittent failure, the system is OK at this time.

NO - Go to step 7.

7. Open the driver's door.

   Does the key- in reminder sound?

   YES - Go to the keyless access system symptom troubleshooting "**THE KEY- IN REMINDER SOUNDS WHEN THE REMOTE IS REMOVED FROM THE REMOTE SLOT AND DOOR IS OPEN**" (see).

   NO - Go to step 8.

8. Turn the keyless access system mode switch ON.
9. Press the engine start/stop button to select the ON mode.

   Does the system change to ON mode?

   YES - Go to step 12.

   NO - Go to step 10.

10. Insert the remote into the remote slot.
11. Press the engine start/stop button to select the ON mode.

    Does the system change to ON mode?

    YES - Go to the keyless access system symptom troubleshooting "**CANNOT SELECT ON MODE WITH KEYLESS ACCESS, BUT CAN SELECT ON MODE WITH THE REMOTE IN THE REMOTE SLOT**".

    NO - Go to the keyless access system symptom troubleshooting "**CANNOT SELECT ON MODE WITH KEYLESS ACCESS OR WITH THE REMOTE IN THE REMOTE SLOT**".

12. Connect the HDS to the data link connector (DLC).
13. Check for DTCs with the HDS.

    Are any DTCs indicated?

    YES - Go to the indicated **DTCS TROUBLESHOOTING**.

    NO - Go to step 14.

14. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter HISTORY CLEAR.
15. Select HISTORY DATA with the HDS.
16. Insert the remote into the remote slot, then check the HISTORY DATA.

HISTORY DATA

SLOT SWITCH FULL	OK
SLOT SWITCH HALF	OK
SLOT SWITCH FULL2	OK

Is all the information OK?

YES - Go to step 17.

NO - Go to step 19.

17. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, then enter SELF CHECK.
18. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu, and check for KEYLESS ACCESS CONTROL UNIT DTCs with the HDS.

Are any DTCs indicated?

YES - Troubleshoot the KEYLESS ACCESS CONTROL UNIT DTCs.

NO - Go to the driver's MICU input test, and do all power, ground, and communication input tests (see **MICU INPUT TEST**). If the tests prove OK, replace the driver's under- dash fuse/relay box (see **DRIVER'S UNDER- DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

19. Press the engine start/stop button to select the OFF mode.
20. Remove the remote from the remote slot.
21. Disconnect the remote slot 16P connector.
22. Close all doors.
23. Push the UNLOCK button of the remote.

Do the door lock actuators work normally?

YES - Replace the remote slot (see **REMOTE SLOT TEST/REPLACEMENT**).

NO - Replace the keyless access control unit (see **CONTROL UNIT INPUT TEST**).

THE DOORS WILL NOT UNLOCK OR LOCK WITH THE REMOTE, BUT WILL UNLOCK OR LOCK WITH THE DOOR OUTER HANDLES

1. Remove the remote from the remote slot, and close all doors.

2. Push the UNLOCK button of the remote, at least 10 times.

   Do the door lock actuators work normally?

   YES - Intermittent failure, the system is OK at this time.

   NO - Go to step 3.

3. Open the driver's door.

   Does the key- In reminder sound?

   YES - Go to keyless access symptom troubleshooting "**KEY- IN REMINDER SOUNDS IS REMOVED FROM THE REMOTE SLOT AND DOOR IS OPEN**".

   NO - Go to step 4.

4. Turn the keyless access system mode switch ON.
5. Press the engine start/stop button to select the ON mode.

   Does the system change to ON mode?

   YES - Go to step 8.

   NO - Go to step 6.

6. Insert the remote into the remote slot.
7. Press the engine start/stop button to select the ON mode.

   Does the system change to ON mode?

   YES - Go to the keyless access system symptom troubleshooting "**CANNOT SELECT ON MODE WITH KEYLESS ACCESS, BUT CAN SELECT ON MODE WITH THE REMOTE IN THE REMOTE SLOT**".

   NO - Go to the keyless access system symptom troubleshooting "**CANNOT SELECT ON MODE WITH KEYLESS ACCESS OR WITH THE REMOTE IN THE REMOTE SLOT**".

8. Connect the HDS to the data link connector (DLC).
9. Check for DTCs with the HDS.

   Are any DTCs indicated?

   YES - Go to the indicated **DTCS TROUBLESHOOTING**.

   NO - Go to step 10.

10. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter HISTORY CLEAR.
11. Select HISTORY DATA with the HDS.
12. Insert the remote into the remote slot, then check the HISTORY DATA.

HISTORY DATA

SLOT SWITCH FULL	OK
SLOT SWITCH HALF	OK
SLOT SWITCH FULL2	OK

Is all the information OK?

YES - Go to step 13.

NO - Go to step 20.

13. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, then enter SELF CHECK.
14. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu, and check for KEYLESS ACCESS CONTROL UNIT DTCs.

Are any DTCs indicated?

YES - Troubleshoot the KEYLESS ACCESS CONTROL UNIT DTCs.

NO - Go to step 15.

15. Select KEYLESS TRANSMITTER from the BODY ELECTRICAL SYSTEM SELECT menu, then select INSPECTION, then KEYLESS CHECK.
16. Do the KEYLESS CHECK with the HDS using the remote.

Is DIFFERENT KEYLESS ENTRY TRANSMITTER CODE RECEIVED indicated?

YES - Register all the remotes, and recheck.

NO - Go to step 17.

17. Do the KEYLESS CHECK with the HDS using the remote.

Is DIFFERENT KEYLESS ENTRY TRANSMITTER CODE RECEIVED indicated?

YES - Go to step 18.

NO - Register the remote, and recheck. If the symptom does not go away, replace the remote.

18. Press the engine start/stop button to select the OFF mode, and close all doors.
19. Lock and unlock the driver's door of the driver's door lock switch, and lock and unlock the front passenger's door of the front passenger's door lock switch.

    Do the door lock actuators work normally?

    YES - Go to the driver's MICU input test, and do all power, ground, and communication input tests (see **MICU INPUT TEST**). If the tests prove OK, replace the driver's under- dash fuse/relay box (see **DRIVER'S UNDER- DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

    NO - Check the B- CAN system DTCs. If not, check the door lock system.

20. Press the engine start/stop button to select the OFF mode.
21. Remove the remote from the remote slot.
22. Disconnect the remote slot 16P connector.
23. Close all doors, and push the UNLOCK button of the remote.

    Do the door lock actuators work normally?

    YES - Replace the remote slot (see **REMOTE SLOT TEST/REPLACEMENT**).

    NO - Replace the keyless access control unit (see **CONTROL UNIT INPUT TEST**).

THE DOORS WILL NOT UNLOCK OR LOCK WITH THE DOOR OUTER HANDLE TOUCH SENSOR OR LOCK SWITCH, BUT WILL UNLOCK OR LOCK WITH THE REMOTE

1. Turn the keyless access system mode switch ON.
2. Remove the remote from the remote slot.
3. Press the engine start/stop button to select the ON mode.

    Does the system change to ON mode?

    YES - Go to step 4.

    NO - Go to the keyless access system symptom troubleshooting "**CANNOT SELECT ON MODE WITH KEYLESS ACCESS, BUT CAN SELECT ON MODE WITH THE REMOTE IN THE REMOTE SLOT**".

4. Connect the HDS to the data link connector (DLC).
5. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, then enter SELF CHECK.
6. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu, and check for KEYLESS ACCESS CONTROL UNIT DTCs with the HDS.

    Are any DTCs indicated?

YES - Troubleshoot the KEYLESS ACCESS CONTROL UNIT DTCs.

NO - Go to step 7.

7. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter HISTORY CLEAR.
8. Select HISTORY DATA with the HDS.
9. Touch the driver's and the front passenger's door outer handle touch sensors, then check the HISTORY DATA.

HISTORY DATA

DRIVER DOOR UNLOCK SWITCH	OK
FRONT PASSENGER DOOR UNLOCK SWITCH	OK

Is all the information OK?

YES - Go to step 10.

NO - Go to step 13.

10. Push the driver's and the front passenger's door outer handle lock buttons, then check the HISTORY DATA.

HISTORY DATA

DRIVER DOOR UNLOCK SWITCH	OK
FRONT PASSENGER DOOR LOCK SWITCH	OK

Is all the information OK?

YES - Go to step 11.

NO - Go to step 18.

11. Press the engine start/stop button to select the OFF mode, and close all doors.
12. Lock and unlock the driver's door with the driver's door lock switch, and lock and unlock the front passenger's door with the front passenger's door lock switch.

Do the door lock actuators work normally?

YES - Go to the driver's MICU input test, and do all power, ground, and communication input tests (see **MICU INPUT TEST**). If the tests prove OK, replace the driver's under- dash fuse/relay box (see **DRIVER'S UNDER- DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO - Check the B- CAN system DTCs. If not, check the door lock system.

13. Disconnect the faulty door outer handle touch sensor 8P connector.

14. Measure the voltage between driver's (or front passenger's)* door outer handle touch sensor 8P connector terminals No. 1 and No. 5.

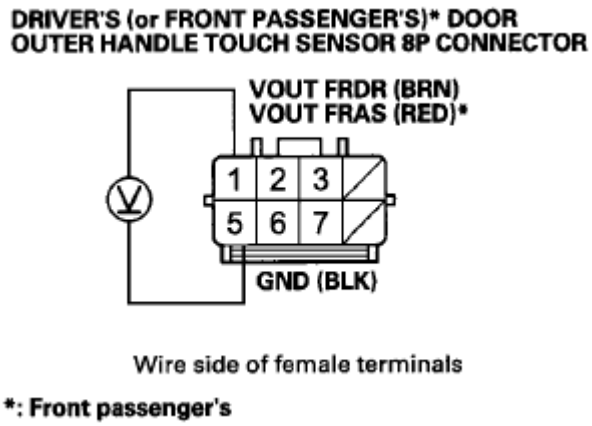

Fig. 143: Measuring Voltage Between Driver's (Or Front Passenger's) Door Outer Handle Touch Sensor 8P Connector Terminals No. 1 And No. 5 With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 15.

NO - Go to step 23.

15. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter HISTORY CLEAR.
16. Connect driver's (or front passenger's)* door outer handle touch sensor 8P connector terminals No. 6 to body ground with a jumper wire.

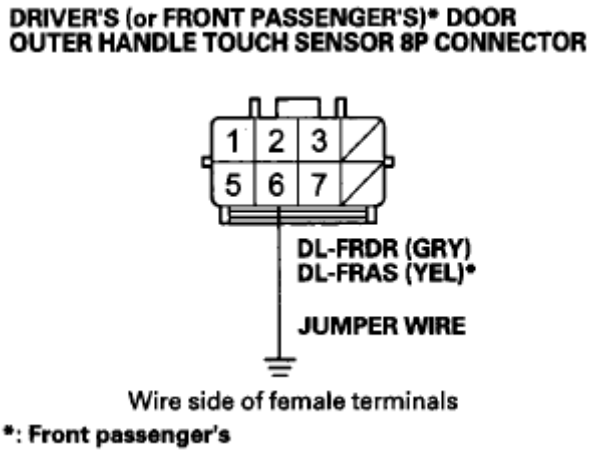

Fig. 144: Connecting Driver's (Or Front Passenger's) Door Outer Handle Touch Sensor 8P Connector Terminals No. 6 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Check the HISTORY DATA with the HDS.

HISTORY DATA

DRIVER DOOR UNLOCK SWITCH	OK
FRONT PASSENGER DOOR UNLOCK SWITCH	OK

Is all the information OK?

YES - Replace the faulty door outer handle (see **FRONT DOOR OUTER HANDLE REPLACEMENT**).

NO - Go to step 29.

18. Disconnect the faulty door outer handle touch sensor 8P connector.
19. Measure the voltage between driver's (or front passenger's)* door outer handle touch sensor 8P connector terminals No. 1 and No. 5.

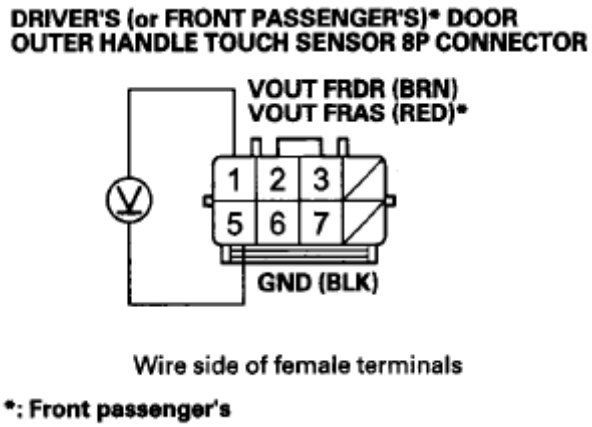

Fig. 145: Measuring Voltage Between Driver's (Or Front Passenger's) Door Outer Handle Touch Sensor 8P Connector Terminals No. 1 And No. 5
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 20.

NO - Go to step 23.

20. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter HISTORY CLEAR.
21. Connect driver's (or front passenger's)* door outer handle touch sensor 8P connector terminals No. 6 to body ground with a jumper wire.

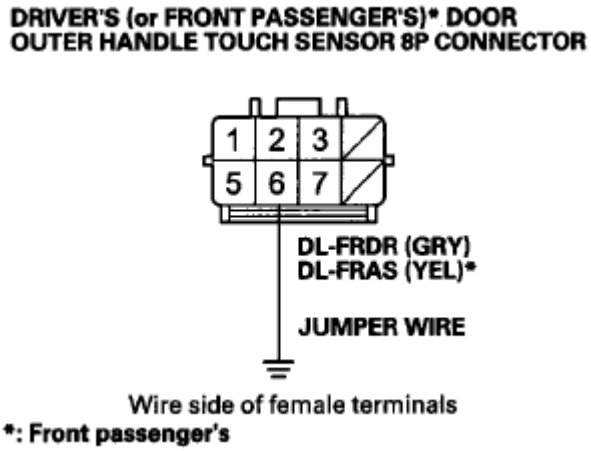

Fig. 146: Connecting Driver's (Or Front Passenger's) Door Outer Handle Touch Sensor 8P Connector Terminals No. 6 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Check the HISTORY DATA with the HDS.

HISTORY DATA

DRIVER DOOR LOCK SWITCH	OK
FRONT PASSENGER DOOR LOCK SWITCH	OK

Is all the information OK?

YES - Replace the faulty door outer handle (see **FRONT DOOR OUTER HANDLE REPLACEMENT**).

NO - Go to step 33.

23. Check for continuity between body ground and driver's (or front passenger's)* door outer handle touch sensor 8P connector terminal No. 5.

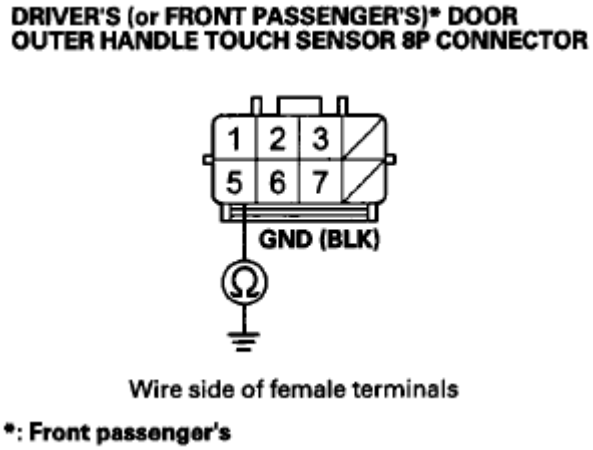

Fig. 147: Checking Continuity Between Body Ground And Driver's (Or Front Passenger's) Door Outer Handle Touch Sensor 8P Connector Terminal No. 5
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 24.

NO - Repair an open or high resistance in the wire or poor ground (G401: driver's, G405: front passenger's).

24. Disconnect keyless access control unit connector A (36P).
25. Check for continuity between keyless access control unit connector A (36P) terminals and driver's (or front passenger's)* door outer handle touch sensor 8P connector terminals as shown.

Keyless access control unit connector	Door outer handle touch sensor 8P connector
A32 (driver's)	1 (driver's)
A29 (front passenger's)	1 (front passenger's)

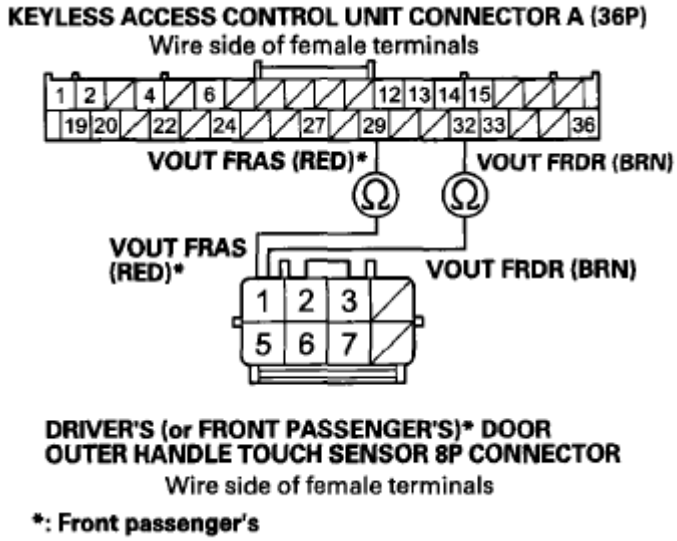

Fig. 148: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminals And Driver's (Or Front Passenger's) Door Outer Handle Touch Sensor 8P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 26.

NO - Repair an open or high resistance in the wire.

26. Check for continuity between body ground and driver's (or front passenger's)* door outer handle touch sensor 8P connector terminals No. 1 and No. 5.

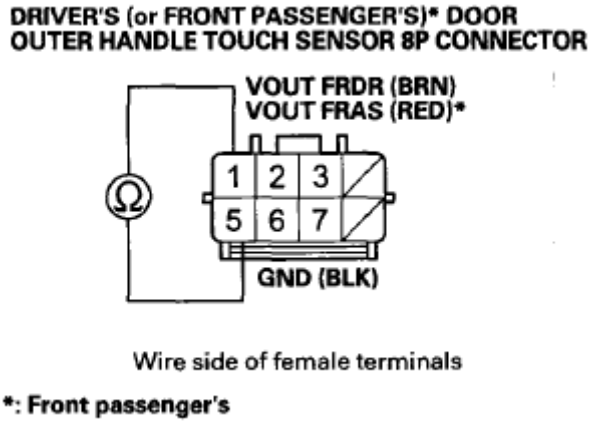

Fig. 149: Checking Continuity Between Body Ground And Driver's (Or Front Passenger's) Door Outer Handle Touch Sensor 8P Connector Terminals No. 1 And No. 5
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 27.

27. Disconnect keyless access control unit connector B (32P).
28. Measure the voltage between body ground and keyless access control unit connector B (32P) terminal No. 1.

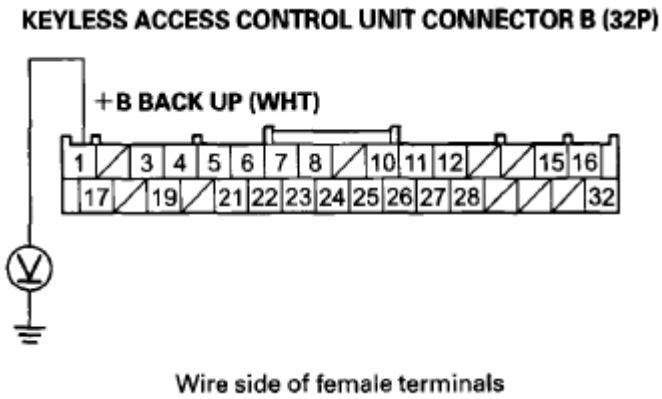

Fig. 150: Measuring Voltage Between Body Ground And Keyless Access Control Unit Connector B (32P) Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Replace the keyless access control unit (see **CONTROL UNIT INPUT TEST**).

NO - Check the No. 15 (10 A) fuse in the under- hood fuse/relay box. If the fuse is OK, repair an open or

high resistance in the wire.

29. Disconnect keyless access control unit connector B (32P).
30. Disconnect the faulty door outer handle touch sensor 8P connector.
31. Check for continuity between keyless access control unit connector B (32P) terminals and driver's (or front passenger's)* door outer handle touch sensor 8P connector terminals as shown.

Keyless access control unit connector	Door outer handle touch sensor 8P connector
B25 (driver's)	2 (driver's)
B22 (front passenger's)	2 (front passenger's)

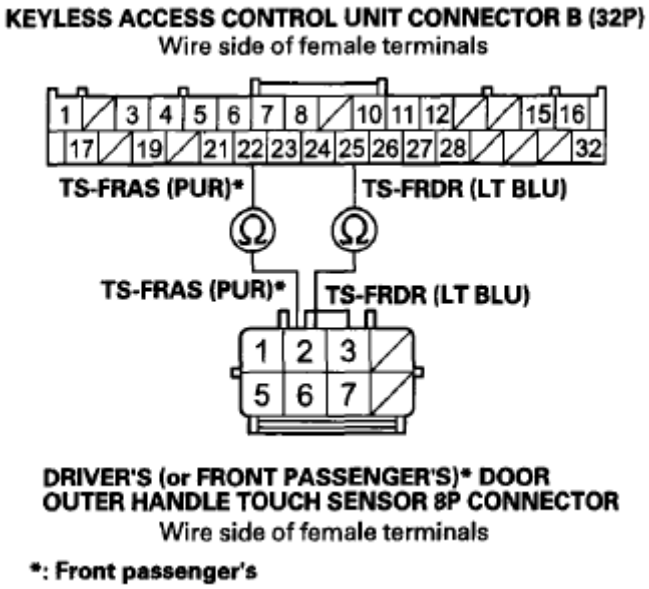

Fig. 151: Checking Continuity Between Keyless Access Control Unit Connector B (32P) Terminals And Driver's (Or Front Passenger's) Door Outer Handle Touch Sensor 8P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 32.

NO - Repair an open or high resistance in the wire.

32. Measure the voltage between body ground and keyless access control unit connector B (32P) terminal No. 1.

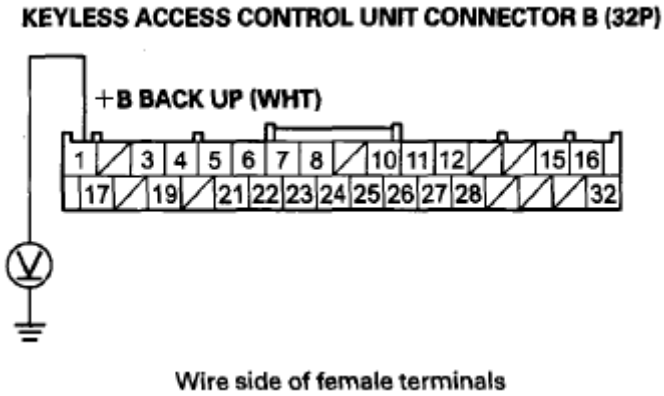

Fig. 152: Measuring Voltage Between Body Ground And Keyless Access Control Unit Connector B (32P) Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Replace the keyless access control unit (see **CONTROL UNIT INPUT TEST**).

NO - Check the No. 15 (10 A) fuse in the under- hood fuse/relay box. If the fuse is OK, repair an open or high resistance in the wire.

33. Remove the jumper wire from the touch sensor.
34. Disconnect keyless access control unit connector B (32P).
35. Check for continuity between keyless access control unit connector B (32P) terminals and driver's (or front passenger's)* door outer handle touch sensor 8P connector terminals as shown.

Keyless access control unit connector	Door outer handle touch sensor 8P connector
B26 (driver's)	6 (driver's)
B23 (front passenger's)	6 (front passenger's)

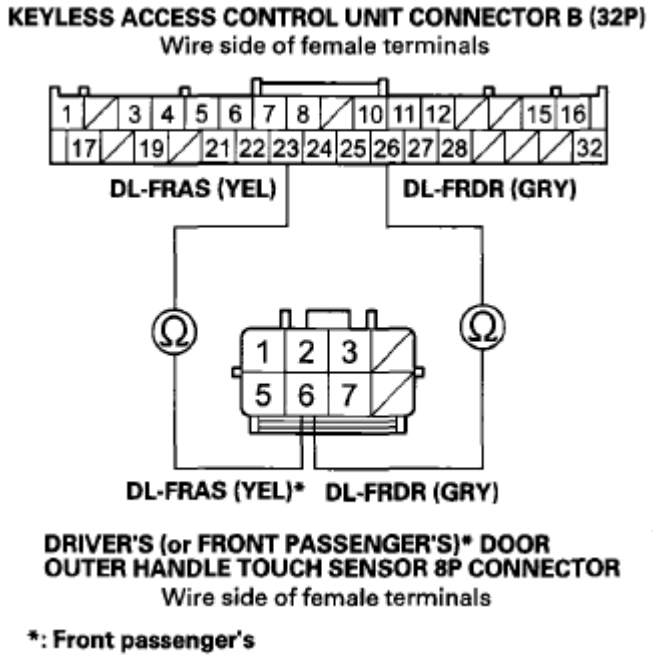

Fig. 153: Checking Continuity Between Keyless Access Control Unit Connector B (32P) Terminals And Driver's (Or Front Passenger's) Door Outer Handle Touch Sensor 8P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 36.

NO - Repair an open or high resistance in the wire.

36. Measure the voltage between body ground and keyless access control unit connector B (32P) terminal No. 1.

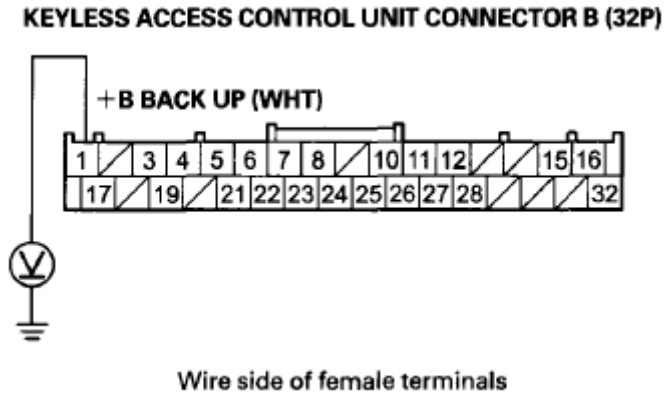

Fig. 154: Measuring Voltage Between Body Ground And Keyless Access Control Unit Connector B (32P) Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Replace the keyless access control unit (see **CONTROL UNIT INPUT TEST**).

NO - Check the No. 15 (10 A) fuse in the under- hood fuse/relay box. If the fuse is OK, repair an open or high resistance in the wire.

THE DOORS WILL NOT UNLOCK (LOCK IS NORMAL) WITH KEYLESS ACCESS OR WITH THE REMOTE BUTTONS, OR THE DOORS WILL NOT LOCK (UNLOCK IS NORMAL) WITH KEYLESS ACCESS OR WITH THE REMOTE BUTTONS

The doors will not unlock under the following conditions:

- When the remote is far from the vehicle.
- When the operation is made without the remote.
- When the remote is inserted into the remote slot.
- When the doors are already unlocked.
- When the vehicle speed signal is detected.

The doors will not lock under the following conditions:

- When the remote is far from the vehicle.
- When the operation is made without the remote.
- When the remote is inserted into the remote slot.
- When the doors are already open.
- When the vehicle is in ACC or ON modes.

1. Select HISTORY CLEAR from the ONE-PUSH START system select menu with the HDS.
2. Select HISTORY DATA from the ONE-PUSH START system select menu with the HDS.
3. Touch the each door outer handle touch sensor and push the lock button, then check the HISTORY DATA.

HISTORY DATA

DRIVER DOOR UNLOCK SWITCH	OK
DRIVER DOOR LOCK SWITCH	OK
FRONT PASSENGER DOOR UNLOCK SWITCH	OK
FRONT PASSENGER DOOR LOCK SWITCH	OK

Is all the information OK?

YES - Go to step 4.

NO - Go to the **TOUCH SENSOR CIRCUIT TROUBLESHOOTING**.

4. Remove the remote from the remote slot, get out of the vehicle with the remote, and close all doors.
5. Push the UNLOCK button of the remote at least 10 times.

   Do the door lock actuators work normally?

   YES - Go to step 6.

   NO - Go to step 10.

6. Push the LOCK button of the remote at least 10 times.

   Do the door lock actuators work normally?

   YES - Intermittent failure, the system is OK at this time.

   NO - Go to step 7.

7. Push the LOCK and the UNLOCK buttons of the remote, and check if the LED come on.

   Does the LED come on?

   YES - Go to step 8.

   NO - Replace the remote battery and recheck the system. If the symptom does not go away, replace the remote.

8. Select DOOR LOCKS from the BODY ELECTRICAL SYSTEM SELECT menu with the HDS.
9. Check each door switch value with the DATA LIST menu.

   WITH ALL DOORS CLOSED

Data List	Value
Driver's door switch	OFF
Front passenger's door switch	OFF
Left rear door switch	OFF
Right rear door switch	OFF

   Are all data list values correct?

   YES - Replace the driver's under- dash fuse/relay box (see **DRIVER'S UNDER- DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

   NO - Check the each door switch circuit and recheck.

10. Push the LOCK button of the remote at least 10 times.

Do the door lock actuators work normally?

YES - Go to step 11.

NO - Go to the keyless access system symptom troubleshooting "**ALL THE DOORS AND THE TRUNK WILL NOT LOCK AND UNLOCK**".

11. Push the LOCK and the UNLOCK buttons of the remote, and check if the LED come on.

    Does the LED come on?

    YES - Replace the keyless access control unit (see **CONTROL UNIT INPUT TEST**).

    NO - Replace the remote battery and recheck the system. If the symptom not goes away, replace the remote.

KEYLESS ACCESS INDICATOR DOES NOT GO OFF OR DOES NOT COME ON

1. Press the engine start/stop button to select the OFF mode.
2. Press the engine start/stop button to select the ON mode.
3. Check the keyless access indicator.

   Does the keyless access indicator come on for 2 seconds?

   YES - Go to step 4.

   NO - Go the indicator drive circuit check (see **SELF- DIAGNOSTIC FUNCTION**). If the indicator does not come on, replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

4. Check the immobilizer indicator.

   Does the indicator blink once, then stay off?

   YES - Intermittent failure, the system is OK at this time.

   NO - Go to step 5.

5. Check for DTCs in the PCU, SLOT UNIT and KEYLESS ACCESS CONTROL UNIT with the HDS.

   Are there any DTCs?

   YES - Go to the indicated **DTCS TROUBLESHOOTING**.

   NO - Go to step 6.

6. Press the engine start/stop button to select the OFF mode.

7. Disconnect keyless access control unit connector B (32P).
8. Wait for at least 30 seconds.
9. Press the engine start/stop button to select the ON mode.

Does the keyless access indicator go off?

YES - Go to step 10.

NO - Replace the keyless access control unit (see **CONTROL UNIT INPUT TEST**).

10. Press the engine start/stop button to select the OFF mode.
11. Reconnect keyless access control unit connector B (32P).
12. Disconnect the remote slot control unit 40P connector.
13. Wait for at least 30 seconds.
14. Press the engine start/stop button to select the ON mode.

Does the keyless access indicator go off?

YES - Go to step 15.

NO - Replace the remote slot control unit (see **CONTROL UNIT INPUT TEST**).

15. Press the engine start/stop button to select the OFF mode.
16. Reconnect the remote slot control unit 40P connector.
17. Disconnect power control unit connector C (36P).
18. Wait for at least 30 seconds.
19. Press the engine start/stop button to select the ON mode.

Does the keyless access indicator go off?

YES - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO - Replace the power control unit (see **CONTROL UNIT INPUT TEST**).

IMMOBILIZER INDICATOR DOES NOT GO OFF OR DOES NOT COME ON

1. Press the engine start/stop button to select the OFF mode.
2. Press the engine start/stop button to select the ON mode.
3. Check the immobilizer indicator.

Does the immobilizer indicator come on?

YES - Go to step 4.

NO - Go to step 9.

4. Check the immobilizer indicator.

   Does the indicator come on, then go off?

   YES - Go to step 5.

   NO - Go to step 10.

5. Press the engine start/stop button to select the OFF mode.
6. Insert the remote into the remote slot.
7. Press the engine start/stop button to select the ON mode.
8. Check the immobilizer indicator.

   Does the indicator blink once, then stay off?

   YES - Intermittent failure, the system is OK at this time.

   NO - Go to step 12.

9. Check the malfunction indicator lamp (MIL).

   Does the indicator come on?

   YES - Troubleshooting the ECM/PCM DTCs.

   NO - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

10. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with HDS, and enter KEYLESS ACCESS CONTROL UNIT INFORMATION.
11. Do the SYSTEM CHECK 1 and 2 with the HDS.

    Is N- 1 OK indicated?

    YES - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

    NO - Troubleshoot the keyless access system according to the result of the SYSTEM CHECK 1 and 2 (see **SYMPTOM TROUBLESHOOTING INFORMATION**).

12. Select REMOTE SLOT CONTROL UNIT from the ONE-PUSH START system select menu with HDS, and enter KEYLESS ACCESS CONTROL UNIT INFORMATION.
13. Do the SYSTEM CHECK with the HDS.

    Is N- 1 OK indicated?

YES - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO - Troubleshoot the keyless access system according to the result of the SYSTEM CHECK (see **SYMPTOM TROUBLESHOOTING INFORMATION**).

THE KEY- IN REMINDER DOES NOT SOUND

1. Turn the interior light switch to DOOR position.
2. Open the driver's door.

   Does the individual map lights come on?

   YES - Go to step 3.

   NO - Faulty driver's door switch and/or open in the wire.

3. Select GAUGES from the BODY ELECTRICAL SYSTEM SELECT menu with the HDS.
4. Select FUNCTIONAL TESTS from the TEST MODE menu with the HDS, and enter SELF TEST.

   Does the key- in reminder sound?

   YES - Go to step 5.

   NO - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

5. Open the driver's door.
6. Connect power control unit connector C (36P) terminal No. 14 to body ground with a jumper wire.

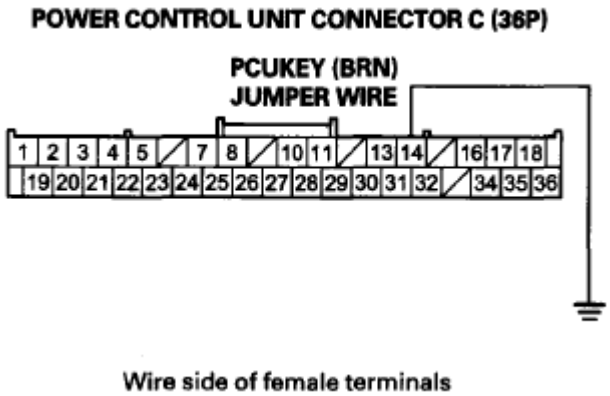

Fig. 155: Connecting Power Control Unit Connector C (36P) Terminal No. 14 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the key- in reminder sound?

YES - Replace the power control unit (see **CONTROL UNIT INPUT TEST**).

NO - Go to step 7.

7. Press the engine start/stop button to select the OFF mode.
8. Remove the jumper wire.
9. Disconnect power control unit connector C (36P).
10. Disconnect driver's under- dash fuse/relay box connector Q (20P).
11. Check for continuity between driver's under- dash fuse/relay box connector Q (20P) terminal No. 18 and power control unit connector C (36P) terminal No. 14.

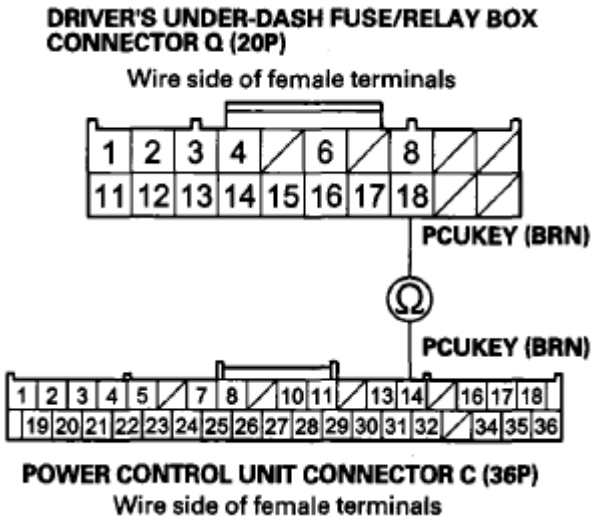

Fig. 156: Checking Continuity Between Driver's Under- Dash Fuse/Relay Box Connector Q (20P) Terminal No. 18 And Power Control Unit Connector C (36P) Terminal No. 14 With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty driver's MICU; replace the under- dash fuse/relay box (see **DRIVER'S UNDER- DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO - Repair an open or high resistance in the wire.

THE KEY- IN REMINDER SOUNDS WHEN THE REMOTE IS REMOVED FROM THE REMOTE SLOT AND DOOR IS OPEN

1. Insert the remote into the remote slot.

Does the remote go into the slot?

YES - Go to step 2.

NO - Go to symptom troubleshooting "**REMOTE WILL NOT GO INTO THE REMOTE SLOT**".

2. Select PCU from the ONE-PUSH START system select menu, and check for DTCs with HDS.

   Are there any DTCs?

   YES - Go to the indicated **DTCS TROUBLESHOOTING**.

   NO - Go to step 3.

3. Select PCU from the ONE-PUSH START system select menu with the HDS, and enter DATA LIST.
4. Check each remote slot value with the DATA LIST menu.

   WITH REMOTE IN REMOTE SLOT

Data List	Value
SLOT SWITCH HALF	OFF
SLOT SWITCH FULL	OFF
SLOT SWITCH FULL 2	OFF

   Are all data list values correct?

   YES - Go to step 5.

   NO - Go to step 22.

5. Press the engine start/stop button to select the OFF mode.
6. Disconnect power control unit connector C (36P).
7. Disconnect driver's under- dash fuse/relay box connector Q (20P).
8. Check for continuity between body ground and power control unit connector C (36P) terminal No. 14.

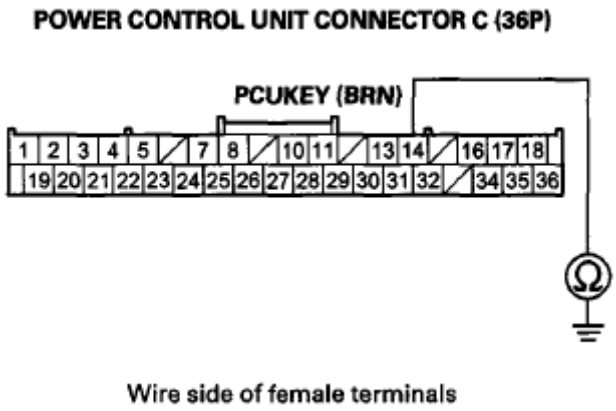

Fig. 157: Checking Continuity Between Body Ground And Power Control Unit Connector C (36P) Terminal No. 14
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 9.

9. Check for continuity between driver's under- dash fuse/relay box connector Q (20P) terminal No. 18 and power control unit connector C (36P) terminal No. 14.

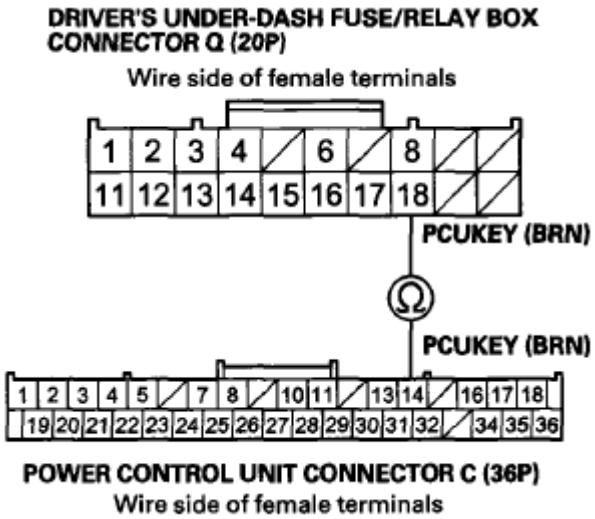

Fig. 158: Checking Continuity Between Driver's Under- Dash Fuse/Relay Box Connector Q (20P) Terminal No. 18 And Power Control Unit Connector C (36P) Terminal No. 14
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open or high resistance in the wire.

10. Reconnect driver's under- dash fuse/relay box connector Q(20P).
11. Measure the voltage between body ground and driver's under- dash fuse/relay box connector Q (20P) terminal No. 18.

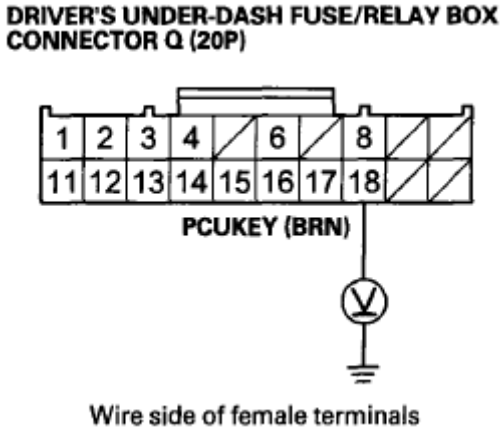

Fig. 159: Measuring Voltage Between Body Ground And Driver's Under- Dash Fuse/Relay Box Connector Q (20P) Terminal No. 18
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 12.

NO - Faulty driver's MICU; replace the driver's under- dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

12. Reconnect power control unit connector C (36P).
13. Press the engine start/stop button to select the ON mode.
14. Select PCU from the ONE-PUSH START system select menu with the HDS, and enter FUNCTION TESTS.
15. Connect the voltmeter to body ground and to power control unit connector C (36P) terminal No. 14.

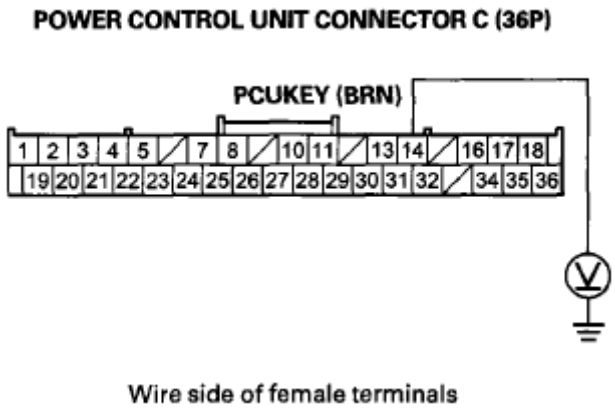

Fig. 160: Connecting Voltmeter To Body Ground And To Power Control Unit Connector C (36P) Terminal No. 14
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Select DRLOCKSWOUT with the HDS.

Does the voltage change from about 12 to 0 V?

YES - Go to step 16.

NO - Replace the power control unit (see **CONTROL UNIT INPUT TEST**).

17. Press the engine start/stop button to select the OFF mode.
18. Disconnect power control unit connector C (36P).
19. Measure the voltage between body ground and power control unit connector C (36P) terminal No. 8.

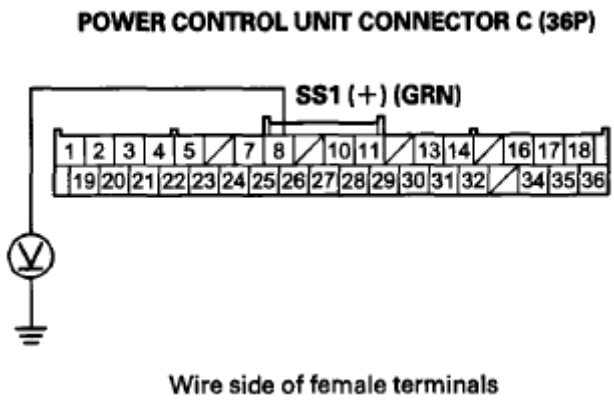

Fig. 161: Measuring Voltage Between Body Ground And Power Control Unit Connector C (36P) Terminal No. 8
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 0 V?

YES - Reconnect the connectors and recheck the system. If the symptom does not go away, replace the power control unit (see **CONTROL UNIT INPUT TEST**).

NO - Go to step 20.

20. Disconnect the engine start/stop switch 10P connector.
21. Do the engine start/stop switch test (see **ENGINE START/STOP SWITCH TEST/REPLACEMENT**).

Is the engine start/stop switch OK?

YES - Repair an open or high resistance in the wire.

NO - Replace the engine start/stop switch (see **ENGINE START/STOP SWITCH TEST/REPLACEMENT**).

22. Press the engine start/stop button to select the OFF mode.
23. Disconnect these items:

- Remote slot control unit 40P connector
- Remote slot 16P connector
- Power control unit connector C (36P)
- Keyless access control unit connectors A (36P) and B (32P)

24. Check for continuity between body ground and power control unit connector C (36P) terminals No. 26 and No. 27 individually.

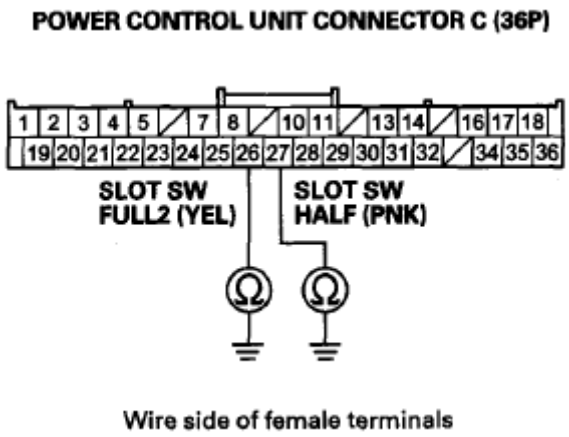

Fig. 162: Checking Continuity Between Body Ground And Power Control Unit Connector C (36P) Terminals No. 26 And No. 27 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 25.

25. Check for continuity between keyless access control unit connector A (36P) terminal, B (32P) terminals and the remote slot 16P connector terminals as shown.

Keyless access control unit connector	Remote slot 16P connector
A33	12
B16	3
B27	14

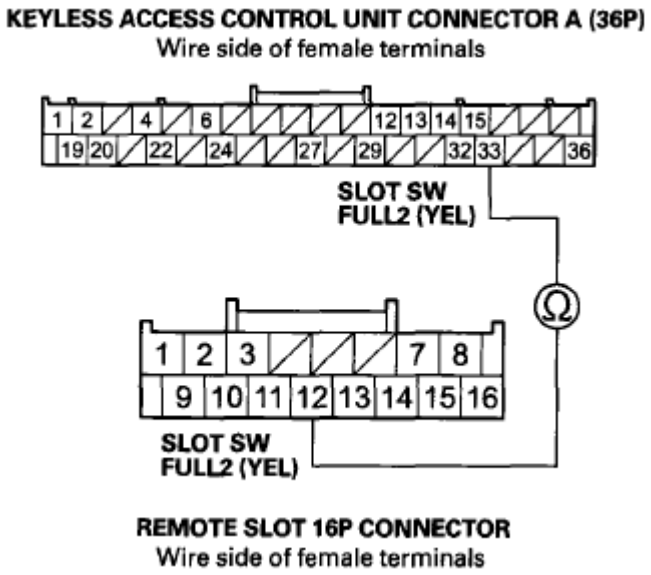

Fig. 163: Checking Continuity Between Keyless Access Control Unit Connector A (36P) Terminal And Remote Slot 16P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

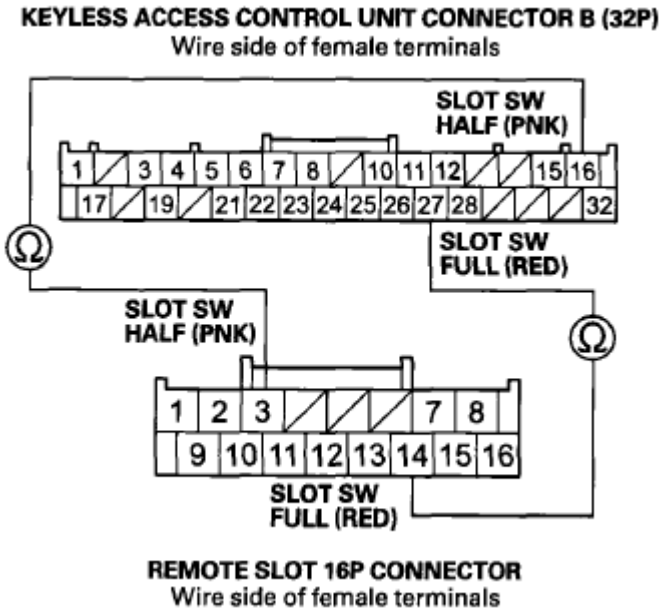

Fig. 164: Checking Continuity Between Keyless Access Control Unit Connector B (32P) Terminals And Remote Slot 16P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the remote slot (see **REMOTE SLOT TEST/REPLACEMENT**).

NO - Repair an open or high resistance in the wire.

REMOTE WILL NOT GO INTO THE REMOTE SLOT

NOTE: Take care not to scratch the remote slot.

1. Press the engine start/stop button to select the OFF mode.
2. Open the driver's door and check for the key- in reminder.
   - If the key- in reminder sounds, go to step 3.
   - If the key- in reminder does not sound, replace the remote slot (see **REMOTE SLOT TEST/REPLACEMENT**).
3. Press the unlock button on the remote to unlock the doors.
   - If the door lock actuators work, replace the remote slot (see **REMOTE SLOT TEST/REPLACEMENT**).
   - If the door lock actuators do not work, go to step 4.
4. Create a measuring gauge by placing a piece of masking tape about 45 mm (1.8 in) from the tip of a 6 inch long 1/4 inch drive extension. Make two lines on the tape; one at 32 mm (1.3 in) and one at 40 mm (1.6 in).

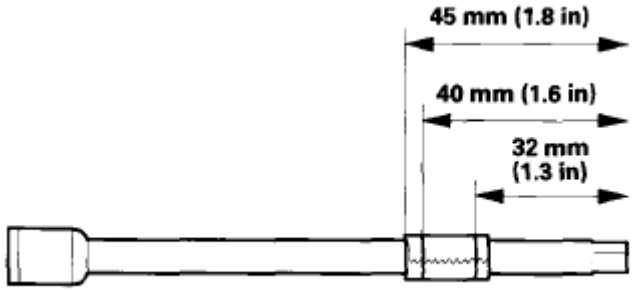

Fig. 165: Identifying Masking Tape, 6 Inch Drive Extension & Lines
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Check the position of the remote carriage in the remote slot. Lift up the flap (A) of the remote slot, then slide the gauge into the center of the remote slot, and note which line on the tape lines- up with the remote slot rim.
   - If the remote carriage is at the 40 mm (1.6 in) line, go to step 6.
   - If the remote carriage is at the 32 mm (1.3 in) line, replace the remote slot (see **REMOTE SLOT TEST/REPLACEMENT**).

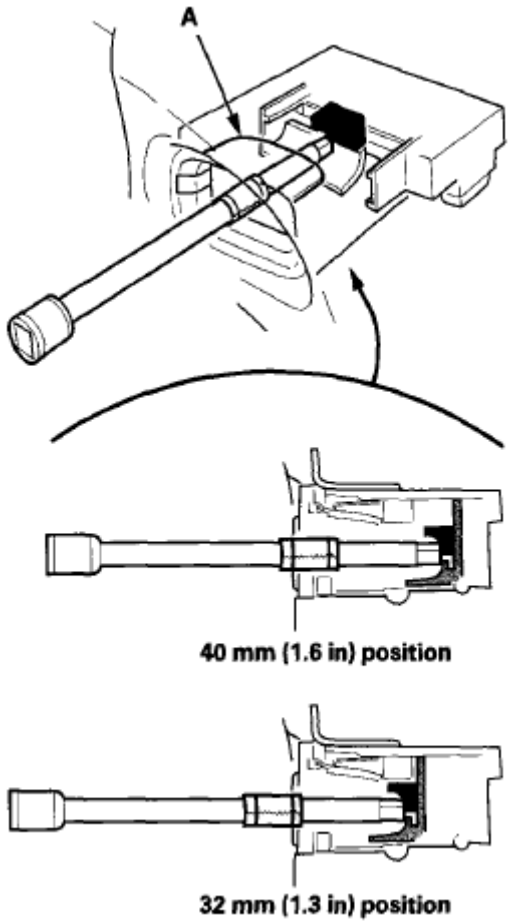

Fig. 166: Checking Position Of Remote Carriage In Remote Slot
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Wrap electrical tape (A) around the tips of a long nose locking pliers (Vise Grip tool number 4LN, or equivalent), then set the tips when closed to 15 mm (0.6 in).

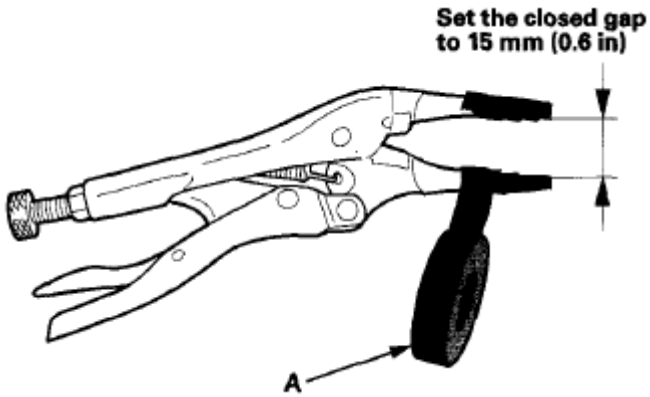

Fig. 167: Wrapping Electrical Tape Around Tips Of Long Nose Locking Pliers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Lift up the flap (A) of the remote slot, then carefully grasp the upper center section of the remote carriage (B) with the pliers, and gently pull to slide the carriage outward.

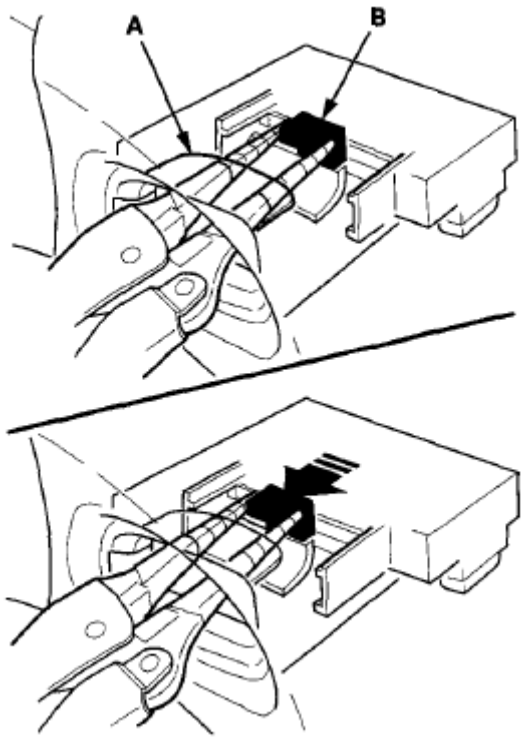

Fig. 168: Sliding Carriage Outward Using Pliers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Check the operation of the remote slot:
   - Insert the remote into the remote slot.
   - Press the engine start/stop button to select the ACC mode. The remote slot should click, locking the remote in place. If it does not click or lock the remote in place, replace the remote slot (see **REMOTE SLOT TEST/REPLACEMENT**).
   - Press the engine start/stop button to select the OFF mode. The remote slot should click again unlocking the remote. If it does not click or unlock the remote, replace the remote slot (see **REMOTE SLOT TEST/REPLACEMENT**).

KEYLESS BUZZER CIRCUIT TROUBLESHOOTING

1. Connect the HDS to the data link connector (DLC).
2. Press the engine start/stop button to select the ON mode.
3. Check the "CUSTOMIZE SETUP" information on the multi- information display.

Does the keyless buzzer (KEYLESS LOCK ACKNOWLEDGMENT) information indicate off?

YES - Change to ON.

NO - Go to step 4.

4. Press the engine start/stop button to select the OFF mode.
5. Disconnect the keyless buzzer 2P connector.
6. Check for continuity between body ground and keyless buzzer 2P connector terminal No. 1.

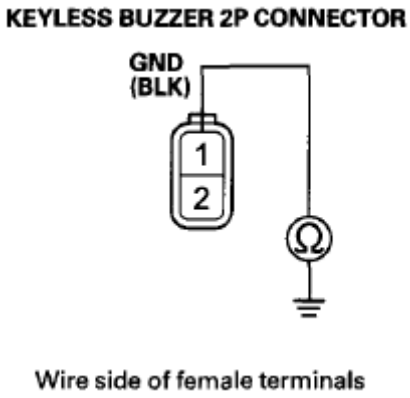

Fig. 169: Checking Continuity Between Body Ground And Keyless Buzzer 2P Connector Terminal No. 1 With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 7.

NO - Repair an open or high resistance in the wire or poor ground (G603).

7. Disconnect passenger's under- dash fuse/relay box connector A (38P).
8. Connect keyless buzzer 2P connector terminal No. 2 to body ground with a jumper wire.

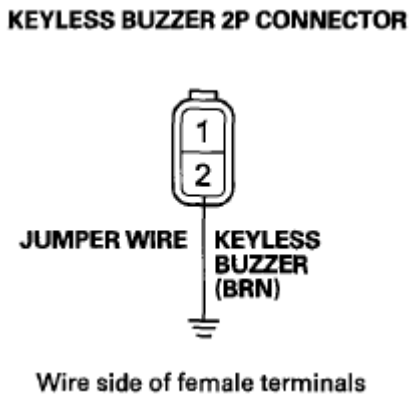

Fig. 170: Connecting Keyless Buzzer 2P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Check for continuity between body ground and passenger's under- dash fuse/relay box connector A (38P) terminal No. 24.

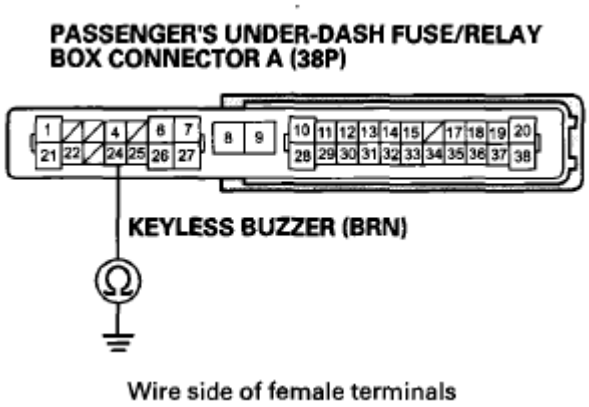

Fig. 171: Checking Continuity Between Body Ground And Passenger's Under- Dash Fuse/Relay Box Connector A (38P) Terminal No. 24
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open or high resistance in the wire.

10. Remove the jumper wire.
11. Check for continuity between body ground and passenger's under- dash fuse/relay box connector A (38P) terminal No. 24.

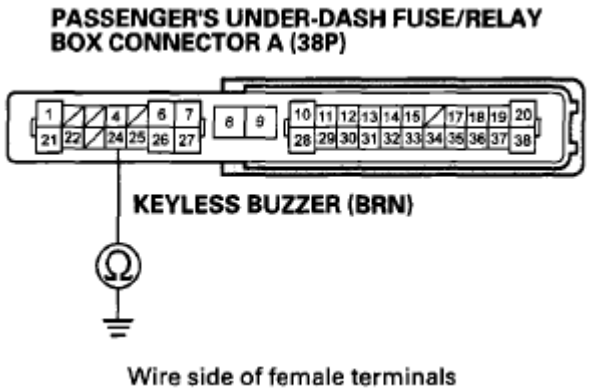

Fig. 172: Checking Continuity Between Body Ground And Passenger's Under- Dash Fuse/Relay Box Connector A (38P) Terminal No. 24
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Substitute a known- good keyless access control unit (see **CONTROL UNIT INPUT TEST**), and recheck. If there is still a malfunction, the passenger's MICU must be faulty, replace the passenger's under- dash fuse/relay box (see **PASSENGER'S UNDER- DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

TOUCH SENSOR CIRCUIT TROUBLESHOOTING

1. Connect the HDS to the data link connector (DLC).
2. Press the engine start/stop button to select the ON mode.
3. Clear the freeze data with the HDS.
4. Select the HISTORY DATA, and record the ON/OFF information for the following touch sensors:

   NOTE: When the freeze data is cleared, the information indicates "NOT CONFIRMED".

   - DRIVER DOOR UNLOCK SWITCH
   - DRIVER DOOR LOCK SWITCH
   - FRONT PASSENGER DOOR UNLOCK SWITCH
   - FRONT PASSENGER DOOR LOCK SWITCH
5. Press the engine start/stop button to select the OFF mode.
6. Get out of the vehicle with the remote, and press the driver's or front passenger's door outer handle touch sensor and lock switch.
7. Check the ON/OFF information.

   Is all the information changed from OFF to ON?

   YES - The system is OK at this time.

   NO - Go to step 8.

8. Disconnect the faulty outer handle touch sensor 8P connector.
9. Check for continuity between body ground and outer handle touch sensor 8P connector terminal No. 5.

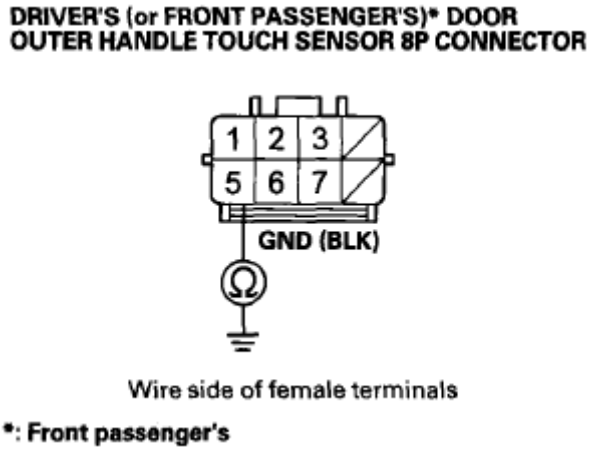

Fig. 173: Checking Continuity Between Body Ground And Outer Handle Touch Sensor 8P Connector Terminal No. 5
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open or high resistance in the wire or poor ground (G401: driver's, G405: passenger's).

10. Measure the voltage between body ground and outer handle touch sensor 8P connector terminal No, 1.

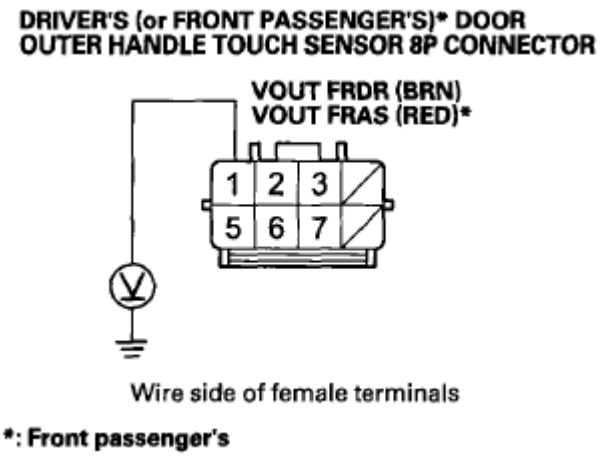

Fig. 174: Measuring Voltage Between Body Ground And Outer Handle Touch Sensor 8P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 11.

NO - Go to step 16.

11. Disconnect keyless access control unit connector B (32P).
12. Connect the driver's (or front passenger's)* door outer handle touch sensor 8P connector terminal No. 2 to body ground with a jumper wire.

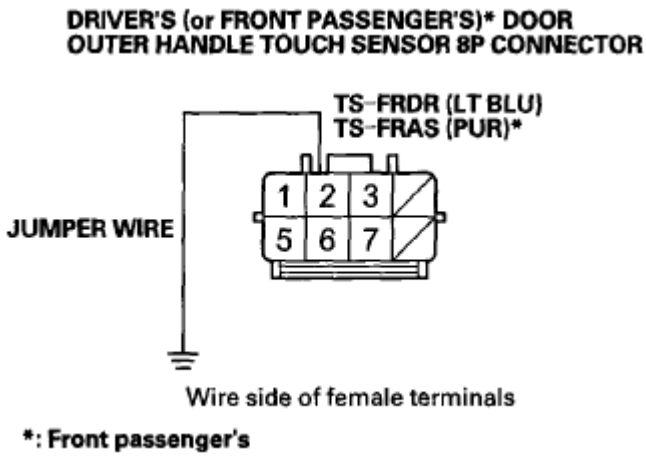

Fig. 175: Connecting Driver's (Or Front Passenger's) Door Outer Handle Touch Sensor 8P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check for continuity between keyless access control unit connector B (32P) terminal No. 22 and body ground (for front passenger's door touch sensor) or between keyless access control unit connector B (32P) terminal No. 25 and body ground (for driver's door touch sensor) individually.

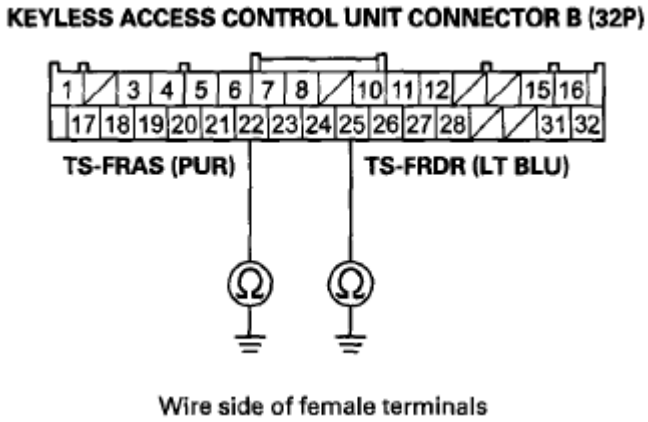

Fig. 176: Checking Continuity Between Keyless Access Control Unit Connector B (32P) Terminal No. 22, No. 25 And Body Ground Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 14.

NO - Repair an open or high resistance in the wire.

14. Remove the jumper wire.
15. Check for continuity between keyless access control unit connector B (32P) terminal No. 22 and body ground (for front passenger's door touch sensor), or between keyless access control unit connector B (32P) terminal No. 25 and body ground (for driver's door touch sensor) individually.

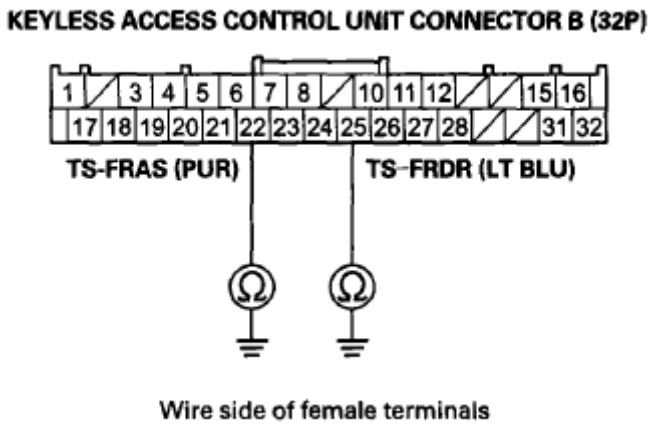

Fig. 177: Checking Continuity Between Keyless Access Control Unit Connector B (32P) Terminal No. 22, No. 25 And Body Ground Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Substitute a known- good touch sensor, and recheck. If there is still a malfunction, replace the keyless access control unit (see **CONTROL UNIT INPUT TEST**).

16. Measure the voltage between keyless access control unit connector A (36P) terminal No. 32 and body ground (for driver's door touch sensor), or between keyless access control unit connector A (36P) terminal No. 29 and body ground (for front passenger's door touch sensor) individually.

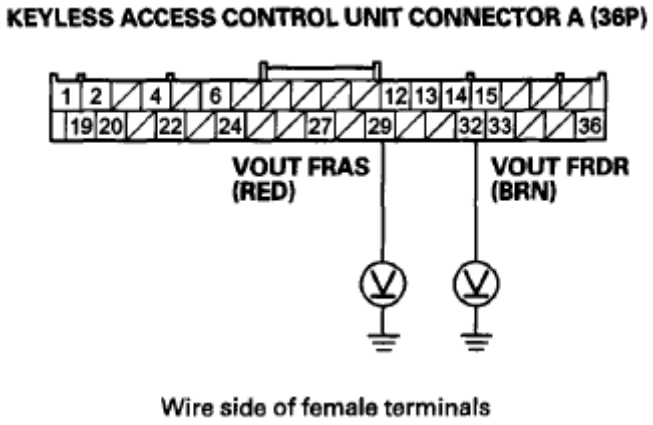

Fig. 178: Measuring Voltage Between Keyless Access Control Unit Connector A (36P) Terminal No. 32, No. 29 And Body Ground Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair an open or high resistance in the wire.

NO - Blown No. 15 (10 A) fuse in the under- hood fuse/relay box. If fuse is OK, do the keyless access control unit input test and power input tests (see **CONTROL UNIT INPUT TEST**).

DOOR AND TRUNK LF ANTENNA TEST

NOTE: Before testing, check for DTCs, If any DTCs are indicated, troubleshoot the indicated DTCs first.

1. Connect the HDS to the data link connector (DLC).
2. Press the engine start/stop button to select the ON mode.
3. Select the ONE-PUSH START from the SYSTEM SELECTION MENU with the HDS.
4. Select the SELF CHECK and if any malfunction is found, troubleshoot it first.
5. Select the FUNCTIONAL TESTS, and do the antenna driving test by checking the transmitting areas (A) between the LF antenna and the remote.

LF Antenna Location	HDS Indication (Function Test)
Driver's door LF antenna	Driver Antenna Driving
Front passenger's door LF antenna	Front Passenger Antenna Driving
Rear bumper LF antenna	Trunk/Tailgate Driver Antenna Driving

NOTE:

- **Check the LF antennas one at a time; function Test cannot operate at the same time.**
- **Test the transmitting area at about 30 cm (35, 4 in) height from the ground.**
- **The LED will blink when the remote is within the shaded areas.**

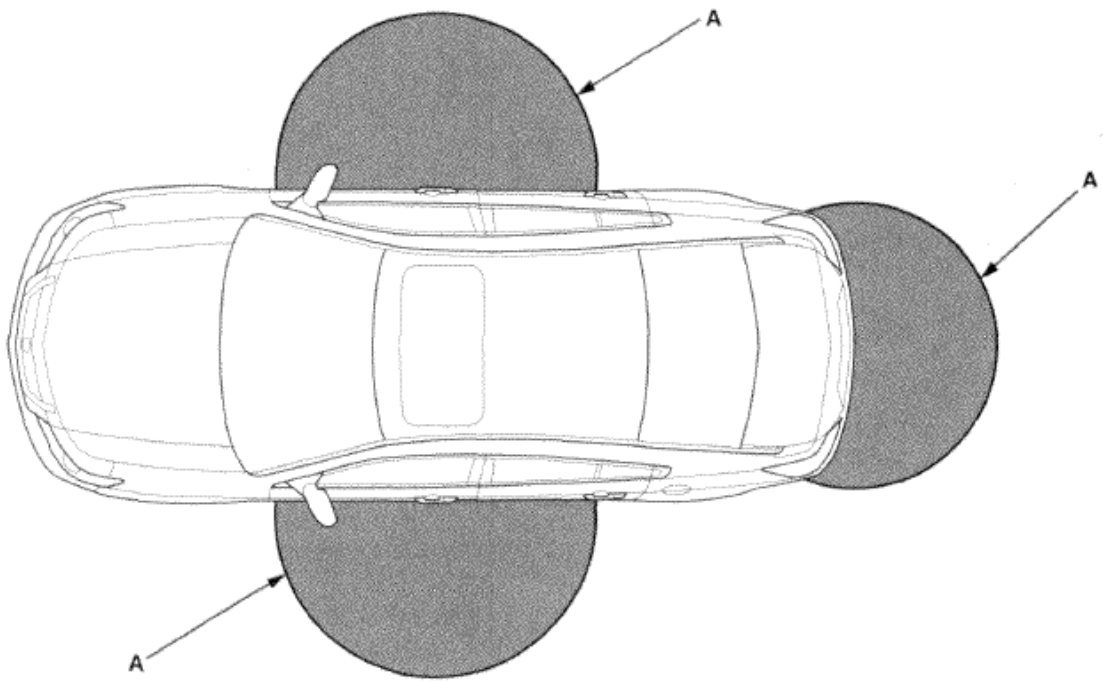

Fig. 179: Testing Door And Trunk LF Antenna
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INTERIOR LF ANTENNA TEST

NOTE: Before testing, check for DTCs, if any DTCs are indicated, troubleshoot the indicated DTCs first.

1. Connect the HDS to the data link connector (DLC).
2. Press the engine start/stop button to select the ON mode.
3. Select the ONE-PUSH START from the SYSTEM SELECTION MENU with the HDS.
4. Select the SELF CHECK and if any malfunction is found, troubleshoot it first.
5. Select the FUNCTIONAL TESTS, and do the antenna driving test by checking the transmitting area (A) between the LF antenna and the remote (except on the dashboard, in the glove box, door pockets, console box, and other enclosed areas).

LF Antenna Location	HDS Indication (Function Test)
Front Interior LF antenna	Front Interior Antenna Driving
Rear Interior LF antenna	Rear Interior Antenna Driving
Trunk interior/Rear shelf LF antenna	Trunk interior/Rear shelf LF Antenna Driving

NOTE: Check the LF antennas one at a time; function Test cannot operate at the same time.

CONTROL UNIT INPUT TEST

KEYLESS ACCESS CONTROL UNIT

NOTE:

- **Before doing the input tests, check the B- CAN DTCs. If any DTC is indicated, troubleshoot the indicated DTC first.**
- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B- CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**

1. Press the engine start/stop button to select the OFF mode.
2. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
3. Disconnect the connectors (A) from the keyless access control unit (B).

NOTE: All connector views are wire side of female terminals.

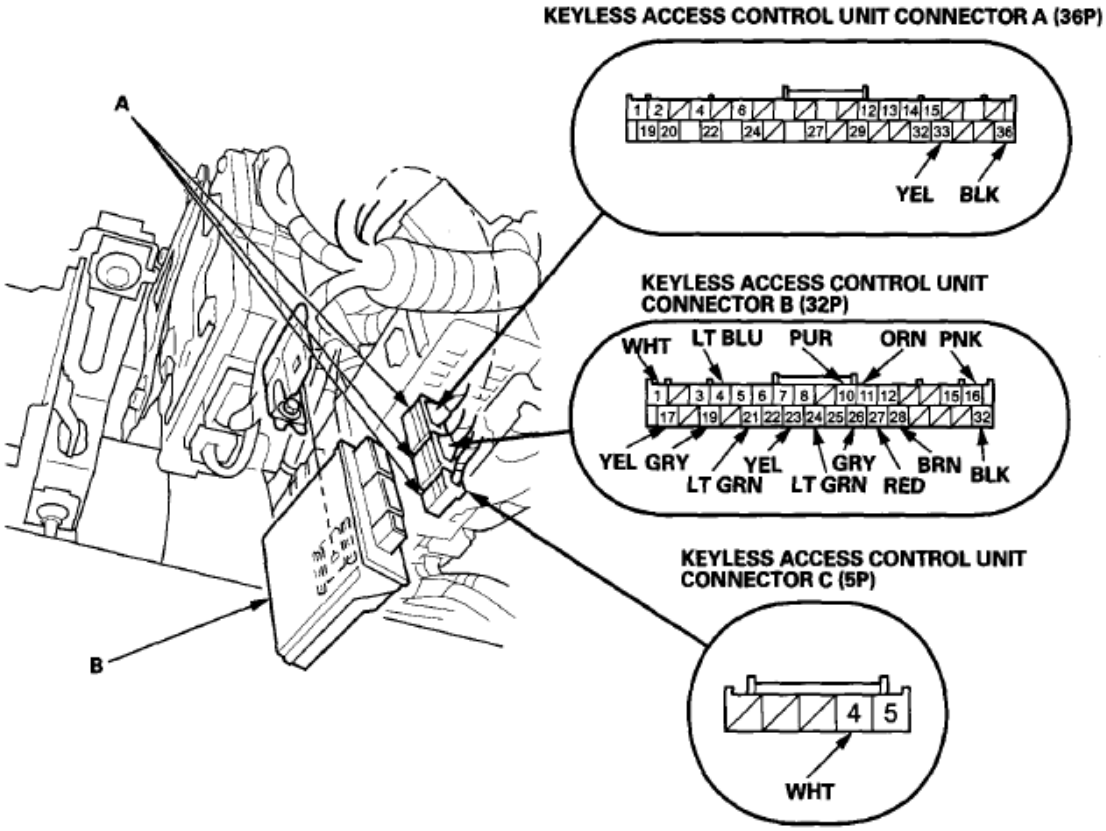

Fig. 181: Identifying Keyless Access Control Unit And Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.
5. With the connectors still disconnected, do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 6.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
B4	LT BLU	Under all conditions	Check for continuity between terminal B4 and data link connector (DLC) terminal No. 7: There should be continuity.	An open in the K- LINE wire
			Check for continuity between terminal B4 and body ground: There should be no continuity.	A short to ground in the wire
			Check for continuity between	

B11	ORN	Under all conditions	terminal B11 and data link connector (DLC) terminal No. 9: There should be continuity.	An open or high resistance in the wire
			Check for continuity between terminal B11 and body ground: There should be no continuity.	A short to ground in the wire
B21	LT GRN	Disconnect the remote slot control unit 40P connector and driver's under- dash fuse/relay box connector Q (20P). Jump the SCS line with the HDS, disconnect ECM/PCM connector A (49P)	Check for continuity between terminal B21 and remote slot control unit 40P connector terminal No. 14: There should be continuity.	An open in the S- NET wire
			Check for continuity between terminal B21 and driver's under- dash fuse/relay box connector Q (20P) terminal No. 15: There should be continuity.	
			Check for continuity between terminal B21 and ECM/PCM connector A (49P) terminal No. 46: There should be continuity.	
			Check for continuity between terminal B21 and body ground: There should be no continuity.	A short to ground in the wire
B27	RED	Disconnect the remote slot control unit 40P connector and the remote slot 16P connector	Check for continuity between terminal B27 and remote slot control unit 40P connector terminal No. 27: There should be continuity.	An open or high resistance in the wire
			Check for continuity between terminal B27 and remote slot 16P connector terminal No. 14: There should be continuity.	
			Check for continuity between terminal B27 and body ground: There should be no continuity.	A short to ground in the wire

6. Reconnect the connectors to the keyless access control unit, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 7.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
B1	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under- hood fuse/relay box • An open or high resistance in the wire
B10	PUR	Power mode ACC	Measure the voltage to ground: There should be battery voltage.	• Blown No. 18 (7.5 A) fuse in the driver's under- dash fuse/relay box • An open or high resistance in the wire
B17	YEL	Power mode ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 9 (20 A) fuse in the driver's under- dash fuse/relay box • An open or high resistance in the wire
A36	BLK	In all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G402) • An open or high resistance in the ground wire
B32	BLK	In all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G402) • An open or high resistance in the ground wire
C4	WHT	Electric steering lock (LOCK)	Measure the voltage to ground: There should be about 5 V.	• Faulty electric steering lock control unit • A short to ground in the wire
		Electric steering lock (UNLOCK)	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty electric steering lock control unit • An open or high resistance in the wire
B19	GRY	Keyless access system mode switch OFF	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty keyless access system mode switch • Poor ground (G501) or an open in the ground wire • An open or high resistance in the wire
		Keyless access system mode switch ON	Measure the voltage to ground: There should be battery voltage.	• Faulty keyless access system mode switch • A short to ground in the wire

B23	YEL	Front passenger's door outer handle lock switch pushed	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty front passenger's door outer handle • Poor ground (G405) or an open in the ground wire • An open or high resistance in the wire
		Front passenger's door outer handle lock switch released	Measure the voltage to ground: There should be battery voltage.	• Faulty front passenger's door outer handle • A short to ground in the wire
B26	GRY	Driver's door outer handle lock switch pushed	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driver's door outer handle • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Driver's door outer handle lock switch released	Measure the voltage to ground: There should be battery voltage.	• Faulty driver's door outer handle • A short to ground in the wire
B24	LT GRN	Power mode ON, parking brake lever pulled	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty parking brake switch • An open or high resistance in the wire
		Power mode ON, parking brake lever released	Measure the voltage to ground: There should be about 5 V.	• Faulty parking brake switch • A short to ground in the wire
B28	BRN	Trunk lid spoiler switch pushed	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driver's under- dash fuse/relay box • Faulty trunk lid spoiler switch • Poor ground (G603) or an open in the ground wire • An open or high resistance in the wire
		Trunk lid spoiler switch released	Measure the voltage to ground: There should be about 5 V.	• Faulty driver's under- dash fuse/relay box • Faulty trunk lid spoiler switch • A short to ground in the

				wire
A33	YEL	Insert the remote into the remote slot	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty remote slot • Poor ground (G403) or an open in the ground wire • An open or high resistance in the wire
B16	PNK	Insert the remote into the remote slot	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty remote slot • Poor ground (G403) or an open in the ground wire • An open or high resistance in the wire

Power Control Unit

7. Press the engine start/stop button to select the OFF mode.
8. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
9. Disconnect the connectors (A) from the power control unit (B).

NOTE: All connector views are wire side of female terminals.

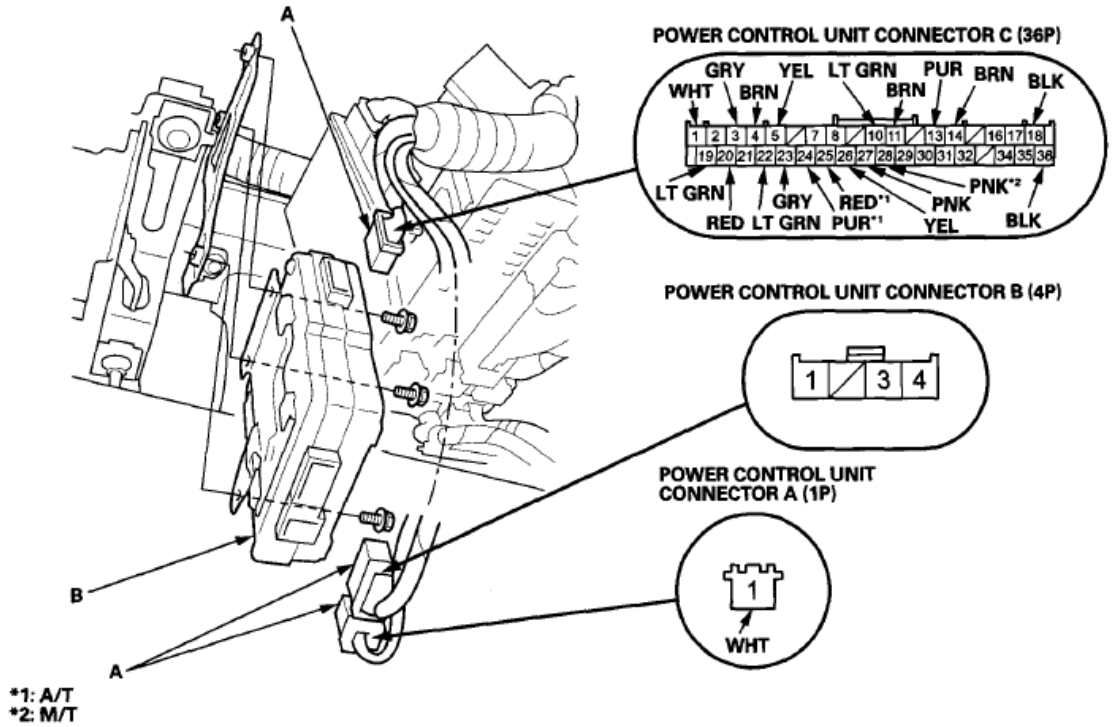

Fig. 182: Identifying Power Control Unit And Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Inspect the connector and the socket terminals to be sure they are all making good contact.
    - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
    - If the terminals look OK, go to step 11.
11. With the connectors still disconnected, do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 12.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
C3	GRY	Under all conditions	Check for continuity between terminal C3 and data link connector (DLC) terminal No. 1: There should be continuity.	An open in the DIAG-H wire
			Check for continuity between terminal C3 and body ground: There should be no continuity.	A short to ground in the wire

12. Reconnect the connectors to the power control unit, and do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 13.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
A1	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 3- 1 (IG MAIN) (50 A) fuse in the under- hood fuse/relay box • An open or high resistance in the wire
C1	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under- hood fuse/relay box • An open or high resistance in the wire
C20	RED	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 12 (10 A) fuse in the passenger's under-dash fuse/relay box • An open or high resistance in the wire
C18	BLK	In all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G402) • An open or high resistance in the ground wire
		In all power	Measure the voltage to	• Poor ground (G402)

C36	BLK	modes	ground: There should be less than 0.2 V.	• An open or high resistance in the ground wire
C11	BRN	Power mode ACC	Measure the voltage to ground: There should be battery voltage.	• Faulty power control unit • Faulty driver's under- dash fuse/relay box • A short to ground in the wire
C10	LT GRN	Power mode START	Measure the voltage to ground: There should be battery voltage.	• Faulty ECM/PCM • Faulty power control unit • A short to ground in the wire
C4	BRN	Under all conditions	Connect to ground with a jumper wire: The engine start/stop switch light should come on.	• Blown No. 12 (10 A) fuse in the passenger's under-dash fuse/relay box • Faulty engine start/stop switch • An open or high resistance in the wire
C5	YEL	Under all conditions	Connect to ground with a jumper wire: The engine start/stop switch indicator should come on.	• Blown No. 12 (10 A) fuse in the passenger's under-dash fuse/relay box • Faulty engine start/stop switch • An open or high resistance in the wire
C13	PUR	Power mode ON	Measure the voltage to ground: There should be battery voltage.	• Power control unit • A short to ground in the wire
C14	BRN	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Faulty driver's MICU • An open or high resistance in the wire • A short to ground in the wire
C19	LT GRN	Brake pedal pressed	Measure the voltage to ground: There should be battery voltage.	• Blown No. 10 (20 A) fuse in the under- hood fuse/relay box • Faulty brake pedal position switch • An open or high resistance in the wire • A short to ground in the

				wire
C22	LT GRN	Power mode ON, parking brake lever pulled	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty parking brake switch • An open or high resistance in the wire
		Power mode ON, parking brake lever released	Measure the voltage to ground: There should be about 5 V.	• Faulty parking brake switch • A short to ground in the wire
C23	GRY	Keyless access system mode switch OFF	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty keyless access system mode switch • Poor ground (G501) or an open in the ground wire • An open or high resistance in the wire
		Keyless access system mode switch ON	Measure the voltage to ground: There should be battery voltage.	• Faulty keyless access system mode switch • A short to ground in the wire
C24 (A/T)	PUR	Shift lever out of P position	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty park pin switch • Poor ground (G403) or an open in the ground wire • An open or high resistance in the wire
		Shift lever in P position	Measure the voltage to ground: There should be battery voltage.	• Faulty park pin switch • A short to ground in the wire
C25 (A/T)	RED	Shift lever in P position	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty transmission range switch • Poor ground (G101) or an open in the ground wire • An open or high resistance in the wire
		Shift lever out of P position	Measure the voltage to ground: There should be battery voltage.	• Faulty transmission range switch • A short to ground in the wire
C26	YEL	Insert the remote into the remote slot	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty remote slot • Poor ground (G403) or an open in the ground wire

				• An open or high resistance in the wire
C27	PNK	Insert the remote into the remote slot	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty remote slot • Poor ground (G403) or an open in the ground wire • An open or high resistance in the wire
C28 (M/T)	PNK	Power mode ON, clutch pedal pressed.	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty clutch pedal position switch A • Poor ground (G301) or an open in the ground wire • An open or high resistance in the wire
		Power mode ON, clutch pedal released.	Measure the voltage to ground: There should be battery voltage.	• Faulty clutch pedal position switch A • A short to ground in the wire

Electric Steering Lock

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

13. Press the engine start/stop button to select the OFF mode.
14. Remove the column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
15. Disconnect the connector (A) from the electric steering lock (B).

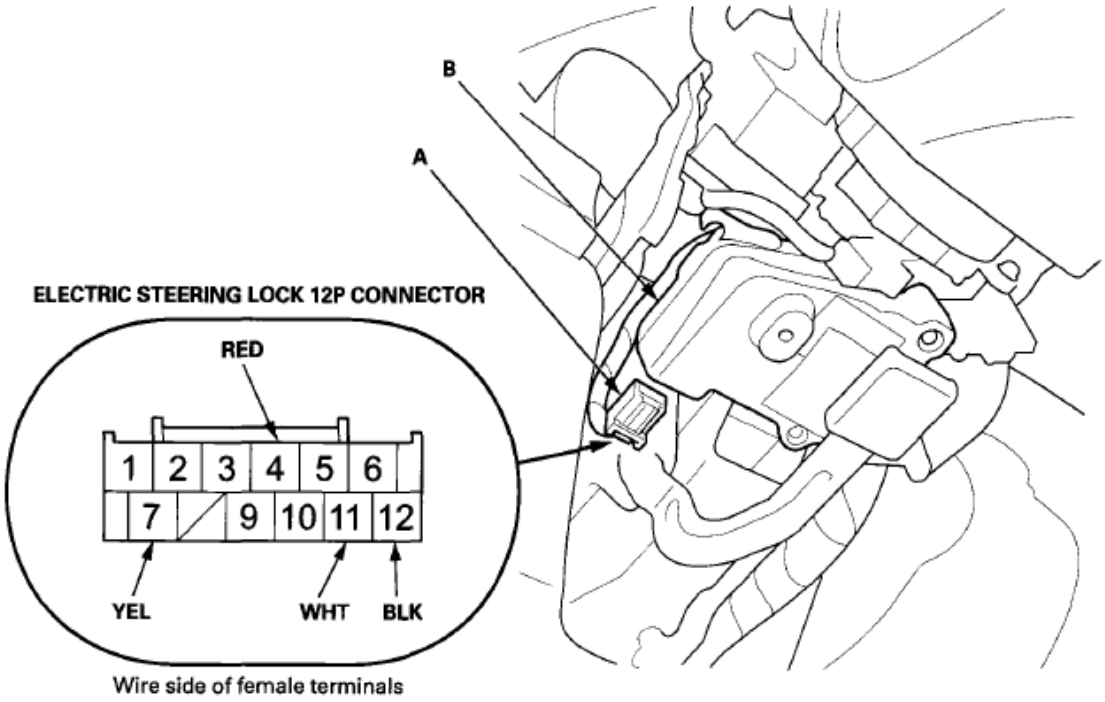

Fig. 183: Identifying Electric Steering Lock And Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Inspect the connector and socket terminals to be sure they are all making good contact.
    - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
    - If the terminals look OK, go to step 17.
17. Reconnect the connector to the electric steering lock, and do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 18.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
4	RED	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 12 (10 A) fuse in the passenger's under- dash fuse/relay box • An open or high resistance in the wire
7	YEL	Power mode ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 9 (20 A) fuse in the driver's under- dash fuse/relay box • An open or high resistance in the wire
12	BLK	In all power modes	Measure the voltage to ground: There should be	• Poor ground (G405) • An open or high resistance in

			less than 0.2 V.	the ground wire
11	WHT	Electric steering lock (LOCK) Electric steering lock (UNLOCK)	Measure the voltage to ground: There should be about 5 V. Measure the voltage to ground: There should be less than 0.2 V.	• Faulty electric steering lock control unit • A short to ground in the wire • Faulty electric steering lock control unit • An open or high resistance in the wire

Remote Slot Control Unit

18. Press the engine start/stop button to select the OFF mode.
19. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
20. Disconnect the connector (A) from the remote slot control unit (B).

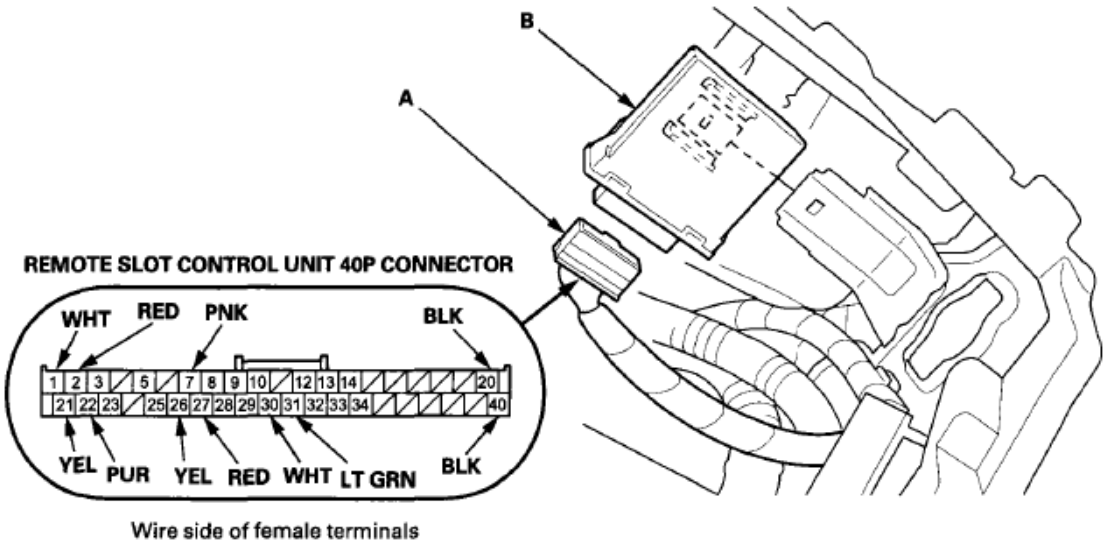

Fig. 184: Identifying Remote Slot Control Unit And Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Inspect the connector and the socket terminals to be sure they are all making good contact.
    - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
    - If the terminals look OK, go to step 22.
22. With the connector still disconnected, do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 23.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained

27	RED	Disconnect the remote slot 16P connector and keyless access control unit connector B (32P)	Check for continuity between terminal No. 27 and remote slot 16P connector terminal No. 14: There should be continuity.	An open or high resistance in the wire
			Check for continuity between terminal No. 27 and keyless access control unit connector B (32P) terminal No. 27: There should be continuity.	
			Check for continuity between terminal No. 27 and body ground: There should be no continuity.	A short to ground in the wire

23. Reconnect the connector to the remote slot control unit, and do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 24.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
1	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under- hood fuse/relay box • An open or high resistance in the wire
2	RED	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 12 (10 A) fuse in the passenger's under- dash fuse/relay box • An open or high resistance in the wire
21	YEL	Power mode ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 9 (20 A) fuse in the driver's under- dash fuse/relay box • An open or high resistance in the wire
22	PUR	Power mode ACC	Measure the voltage to ground: There should be battery voltage.	• Blown No. 18 (7.5 A) fuse in the driver's under- dash fuse/relay box • An open or high resistance in the wire
20	BLK	In all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G405) • An open or high resistance in the ground wire

40	BLK	In all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G405) • An open or high resistance in the ground wire
7	PNK	Insert the remote into the remote slot	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty remote slot • Poor ground (G403) or an open in the ground wire • An open or high resistance in the wire
26	YEL	Insert the remote into the remote slot	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty remote slot • Poor ground (G403) or an open in the ground wire • An open or high resistance in the wire
30	WHT	Electric steering lock (LOCK) Electric steering lock (UNLOCK)	Measure the voltage to ground: There should be about 5 V. Measure the voltage to ground: There should be less than 0.2 V.	• Faulty electric steering lock control unit • A short to ground in the wire • Faulty electric steering lock control unit • An open or high resistance in the wire
31	LT GRN	Power mode ON, parking brake lever pulled Power mode ON, parking brake lever released	Measure the voltage to ground: There should be less than 0.2 V. Measure the voltage to ground: There should be about 5 V.	• Faulty parking brake switch • An open or high resistance in the wire • Faulty parking brake switch • A short to ground in the wire

24. If multiple failures are found on more than one control unit, replace the keyless access control unit. If input failures are related to a particular control unit, replace the control unit.

RF UNIT REPLACEMENT

1. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
2. Disconnect the 3P connector (A) from RF unit (B) and remove the harness clip (C).

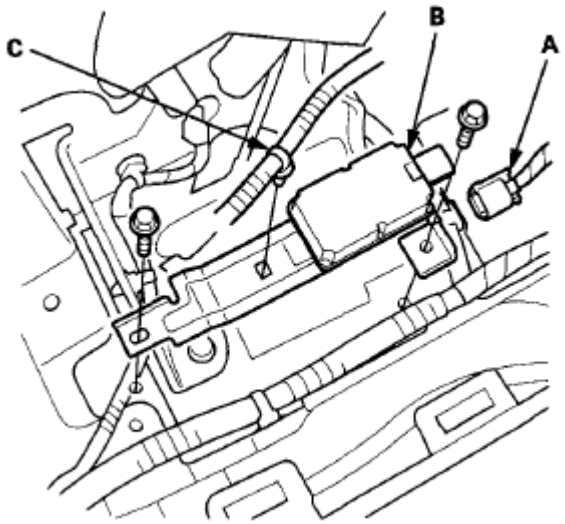

Fig. 185: Identifying 3P Connector, RF Unit And Harness Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the two bolts and RF unit.
4. Install the unit in the reverse order of removal.

FRONT INTERIOR LF ANTENNA REPLACEMENT

1. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
2. Disconnect the 2P connector (A) from the front interior LF antenna (B).

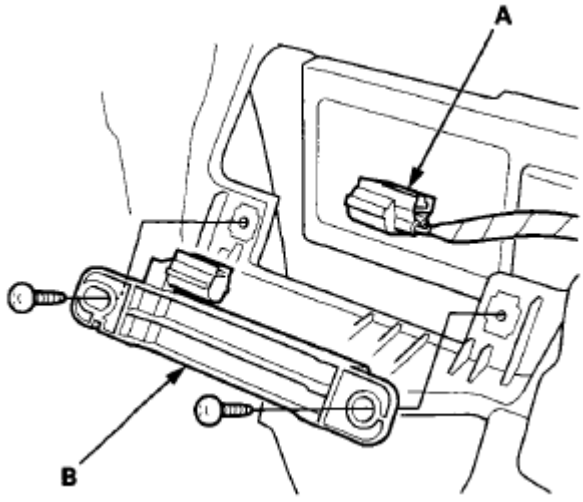

Fig. 186: Identifying 2P Connector And Front Interior LF Antenna
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the two screws from the front interior LF antenna.

4. Install the antenna in the reverse order of removal.

REAR INTERIOR LF ANTENNA REPLACEMENT

1. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
2. Pull out the carpet as needed.
3. Disconnect the 2P connector (A) from the rear interior LF antenna (B).

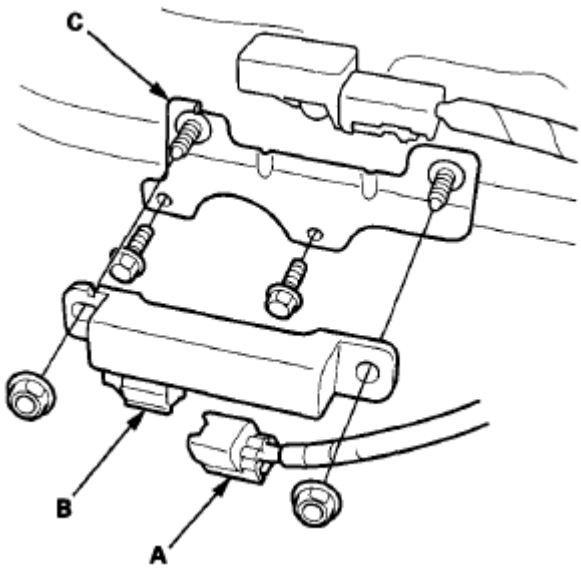

Fig. 187: Identifying 2P Connector And Rear Interior LF Antenna
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the two nuts and the rear interior LF antenna.
5. If necessary, remove the two bolts and replace the bracket (C).
6. Install the antenna in the reverse order of removal.

REAR SHELF LF ANTENNA REPLACEMENT

1. Remove the trunk upper trim panel (see **TRIM REMOVAL/INSTALLATION - TRUNK LID**).
2. Disconnect the 2P connector (A) from the rear shelf LF antenna (B).

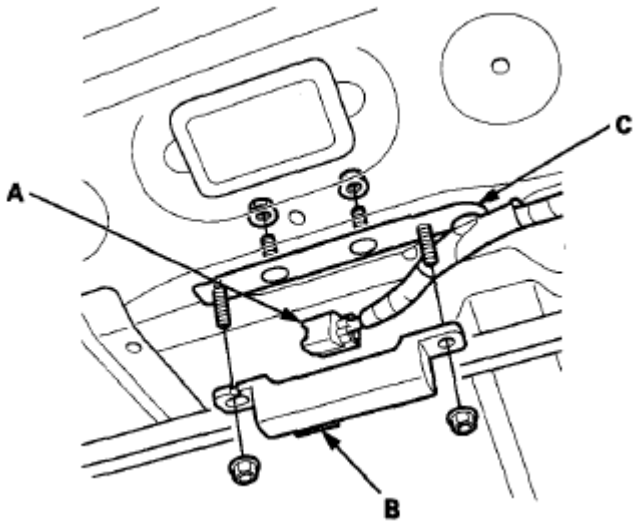

Fig. 188: Identifying 2P Connector And Rear Shelf LF Antenna And Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the two nuts and the rear shelf LF antenna.
4. If necessary, remove the rear shelf (see **TRIM REMOVAL/INSTALLATION - REAR SHELF AREA**).
5. If necessary, remove the two nuts and replace the bracket (C).
6. Install the antenna in the reverse order of removal.

REAR BUMPER LF ANTENNA REPLACEMENT

1. Remove the rear bumper (see **LOWER FRONT BUMPER GRILLE REPLACEMENT**).
2. Disconnect the 2P connector (A) from the rear bumper LF antenna (B) and remove the harness clip (C).

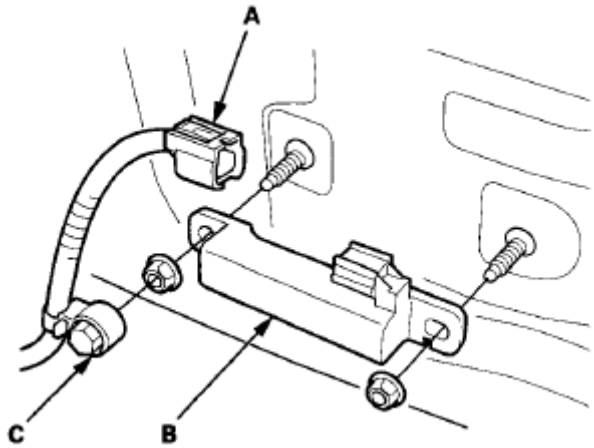

Fig. 189: Identifying 2P Connector, Rear Bumper LF Antenna And Harness Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the two nuts and the rear bumper LF antenna.
4. Install the antenna in the reverse order of removal.

ENGINE START/STOP SWITCH TEST/REPLACEMENT

1. Remove the driver's center trim (see **DASHBOARD CENTER TRIM REMOVAL/INSTALLATION**).
2. Disconnect the 10P connector (A) from the engine start/stop switch (B).

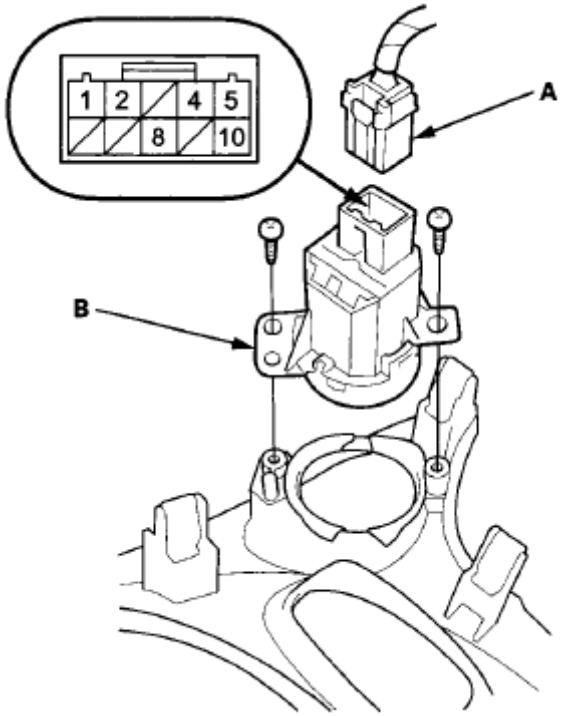

Fig. 190: Identifying 10P Connector And Engine Start/Stop Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the two screws, and the engine start/stop switch.
4. Check for continuity between the terminals in each switch position according to the table.

NOTE:

- **Make sure the correct test lead (+ or -) is placed on the terminal.**
- **When checking for continuity across the diode, use the diode setting on the digital volt/ohm meter to check the diode bias.**
- **Be careful of this characteristic; a diode is one that conducts fully in one direction (forward) and not at all in the opposite direction (reverse).**

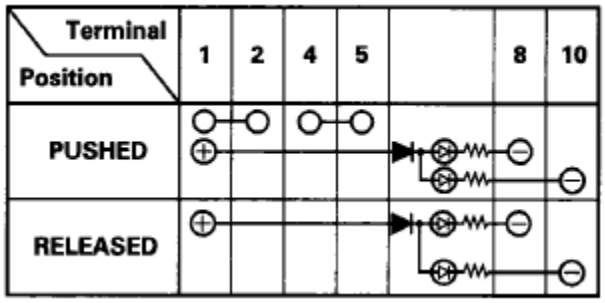

Fig. 191: Engine Start/Stop Switch Continuity Reference Chart
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the switch in the reverse order of removal.

REMOTE SLOT TEST/REPLACEMENT

1. Remove the column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
2. Remove the driver's center trim (see **DASHBOARD CENTER TRIM REMOVAL/INSTALLATION**).
3. Remove the two screws, then pull out the remote slot (A).

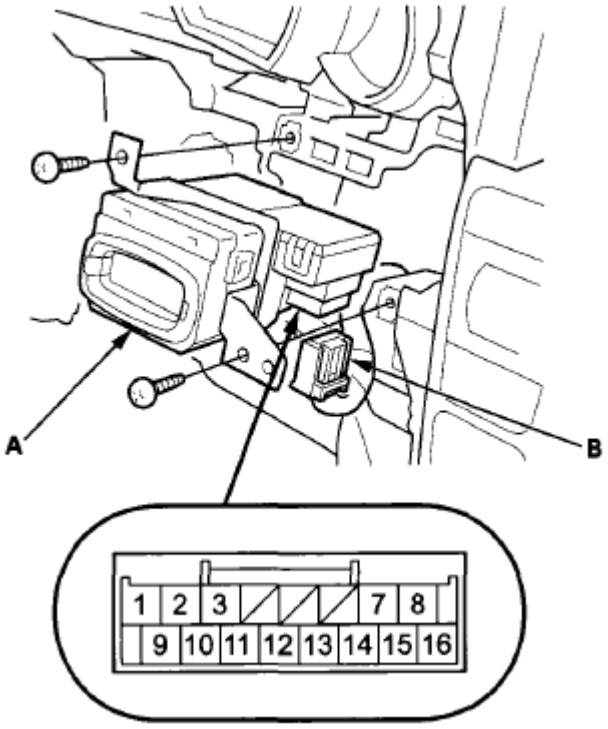

Fig. 192: Identifying Remote Slot And 16P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the 16P connector (B) from the remote slot.

5. Check for continuity between the terminals in each slot state according to the table.

NOTE:

- **Make sure the correct test lead (+ or -) is placed on the terminal.**
- **When checking for continuity across the diode, use the diode setting on the digital volt/ohm meter to check the diode bias.**
- **Be careful of this characteristic; a diode is one that conducts fully in one direction (forward) and not at all in the opposite direction (reverse).**

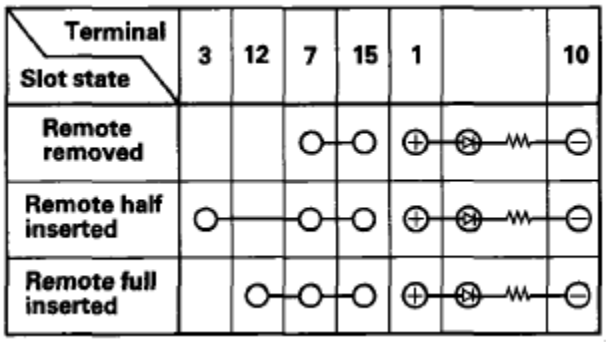

Fig. 193: Identifying Continuity Reference Chart For Terminals In Slot State
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the continuity is not as specified, replace the remote slot.
7. Insert the remote into the remote slot.
8. Connect the positive battery terminal to remote slot connector terminal No. 16, and the negative battery terminal to terminal No. 8. Check that the remote cannot be removed from the remote slot. Connect the positive battery terminal to remote slot connector terminal No. 8, and the negative battery terminal to terminal No. 16. Check that the remote can be removed from the remote slot.

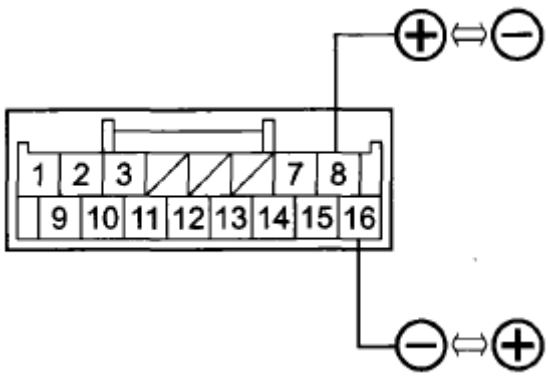

Fig. 194: Connecting Positive Battery Terminal To Remote Slot Connector Terminal No. 16 And Negative Battery Terminal To Terminal No. 8 And Vice- Versa
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. If the remote interlock solenoid works improperly, replace the remote slot.
10. Install the remote slot in the reverse order of removal.

KEYLESS ACCESS SYSTEM MODE SWITCH TEST/REPLACEMENT

1. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
2. Disconnect the 2P connector (A) from the keyless access system mode switch (B).

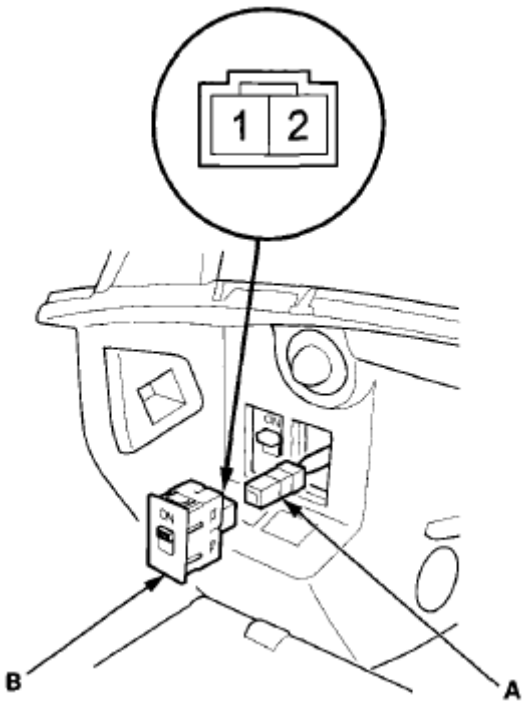

Fig. 195: Identifying 2P Connector And Keyless Access System Mode Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Push out the keyless access system mode switch from the glove box.
4. Check for continuity between the terminals in each switch position according to the table.

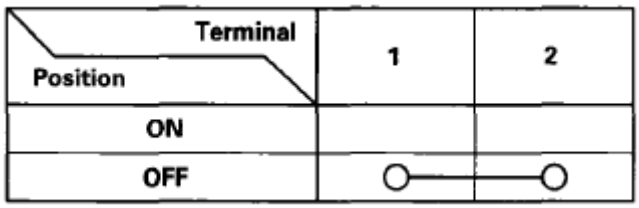

Fig. 196: Keyless Access System Mode Switch Continuity Reference Chart
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the continuity is not as specified, replace the switch.
6. Install the switch in the reverse order of removal.

REMOTE TEST

WITH KEYLESS ACCESS SYSTEM

NOTE:

- **If the doors unlock or lock with the remote, but the LED on the remote does not come on, the LED is faulty; replace the remote.**
- **If any door is open, you cannot lock the doors with the remote.**
- **If you unlocked the doors with the remote, but do not open any of the doors within 30 seconds, the doors relock automatically.**
- **The doors do not lock with the transmitter if the power mode is in ACC.**

WITH HDS

1. Press the lock or unlock button at least 10 times to reset the remote.
   - If the locks work, the remote is OK.
   - If any of the remote buttons do not work, replace the remote, then register the remote (see **WHEN REPLACING THE REMOTE SLOT CONTROL UNIT/KEYLESS ACCESS CONTROL UNIT/ECM/PCM/DRIVER'S MICU OR REGISTRATION OF THE REMOTE(S)**).
   - If the locks do not work, go to step 2.
2. Connect the HDS to the data link connector (DLC).
3. Select KEYLESS TRANSMITTER from the BODY ELECTRICAL SYSTEM SELECT menu, then select INSPECTION, then KEYLESS CHECK.
4. Press the lock, unlock, or panic button and check the response on the screen of the HDS.

   NOTE: The door lock actuators may or may not cycle when receiving input from the remote.

   - If KEYLESS ENTRY TRANSMITTER CODE IS RECEIVED is indicated, the remote is OK.
   - If DIFFERENT KEYLESS ENTRY TRANSMITTER CODE IS RECEIVED is indicated, the remote is not registered to the vehicle. If necessary, register the remote (see **WHEN REPLACING THE REMOTE SLOT CONTROL UNIT/KEYLESS ACCESS CONTROL UNIT/ECM/PCM/DRIVER'S MICU OR REGISTRATION OF THE REMOTE(S)**).
   - If KEYLESS ENTRY TRANSMITTER CODE IS NOT RECEIVED is indicated, go to step 5.
5. Open the remote, and check for water damage.
   - If you find any water damage, replace the remote, then register it (see **WHEN REPLACING THE REMOTE SLOT CONTROL UNIT/KEYLESS ACCESS CONTROL UNIT/ECM/PCM/DRIVER'S MICU OR REGISTRATION OF THE REMOTE(S)**).
   - If there is no water damage, go to step 6.
6. Replace the remote battery (A) with a new one (CR2032), and press the lock or unlock button and check the response on the screen of the HDS.
   - If KEYLESS ENTRY TRANSMITTER CODE IS RECEIVED is indicated, the remote is OK.
   - If KEYLESS ENTRY TRANSMITTER CODE IS NOT RECEIVED is indicated, go to step 7.

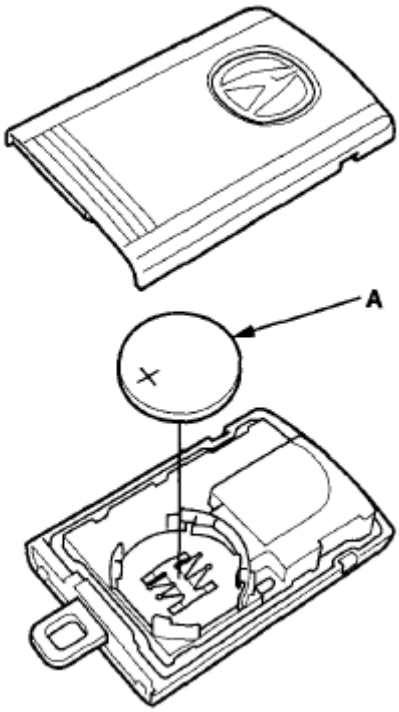

Fig. 197: Identifying Remote Battery
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Use a different known- good remote assembly and repeat steps 3 and 4.

NOTE: The remote does not need to be programmed to the vehicle for this test.

- If (DIFFERENT) KEYLESS ENTRY TRANSMITTER CODE IS RECEIVED is indicated, replace the remote and do the keyless access system registration (see **KEYLESS ACCESS SYSTEM REGISTRATION**).
- If KEYLESS ENTRY TRANSMITTER CODE IS NOT RECEIVED is indicated, the keyless access control unit is faulty, replace it and do the keyless access system registration (see **KEYLESS ACCESS SYSTEM REGISTRATION**).

NOTE: The remote is combined with the immobilizer transponder, so when the transponder is registered by the HDS, the remote programming is completed automatically.

WITHOUT HDS

1. Open the remote, and check for water damage.
   - If you find any water damage, replace the remote.
   - If there is no water damage, go to step 2.
2. Replace the remote battery (A) with a new one (CR2032), and try to lock and unlock the doors with the remote by pressing the lock or unlock button at least 10 times.

- If the doors lock and unlock, the remote is OK.
- If the doors do not lock and unlock, go to step 3.

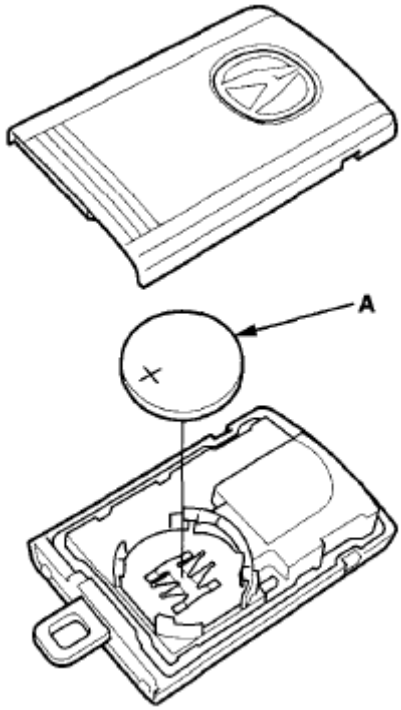

Fig. 198: Identifying Remote Battery
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Reprogram the remote with the HDS, then try to lock and unlock the doors.
   - If the doors lock and unlock, the remote is OK.
   - If the doors do not lock and unlock, try and program to another vehicle.
     - If the remote programs to another vehicle, go to B- CAN System Diagnosis Test Mode A (see **TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A**).
     - If the remote will not program to another vehicle, replace it.

KEYLESS ACCESS SYSTEM REGISTRATION

NOTE:

- **Check for aftermarket electrical equipment that can cause problems with keyless access operation.**
- **While doing the registration, keep the remote away from computers.**
- **While doing the registration, make sure the doors are closed.**
- **Programming the remote also programs the keyless transmitter.**
- **The keyless access control unit can store up to six remotes.**

WHEN REPLACING THE REMOTE SLOT CONTROL UNIT/KEYLESS ACCESS CONTROL

UNIT/ECM/PCM/DRIVER'S MICU OR REGISTRATION OF THE REMOTE(S)

1. When the replacing keyless access control unit, insert the remote into the remote slot.
2. Connect the HDS to the data link connector (DLC).
3. When all remotes are lost, select the ON mode according to the instructions on the HDS screen, then go to step 5.
4. Press the engine start/stop button to select the ON mode.
5. Select ONE-PUSH START from the SYSTEM SELECTION MENU, then enter REGISTRATION mode.
6. Select the appropriate unit or KEYS, and do the registration according to the instructions on the HDS screen.
7. Press the engine start/stop button to select the OFF mode, and verify that the system works normally with all remotes.

WHEN REPLACING THE POWER CONTROL UNIT OR THE ELECTRIC STEERING CONTROL UNIT

1. Connect the HDS to the data link connector (DLC).
2. Do the registration according to the instructions on the HDS screen.
3. After registration, verify that the system works normally with all remotes.

Mirrors - TL

COMPONENT LOCATION INDEX

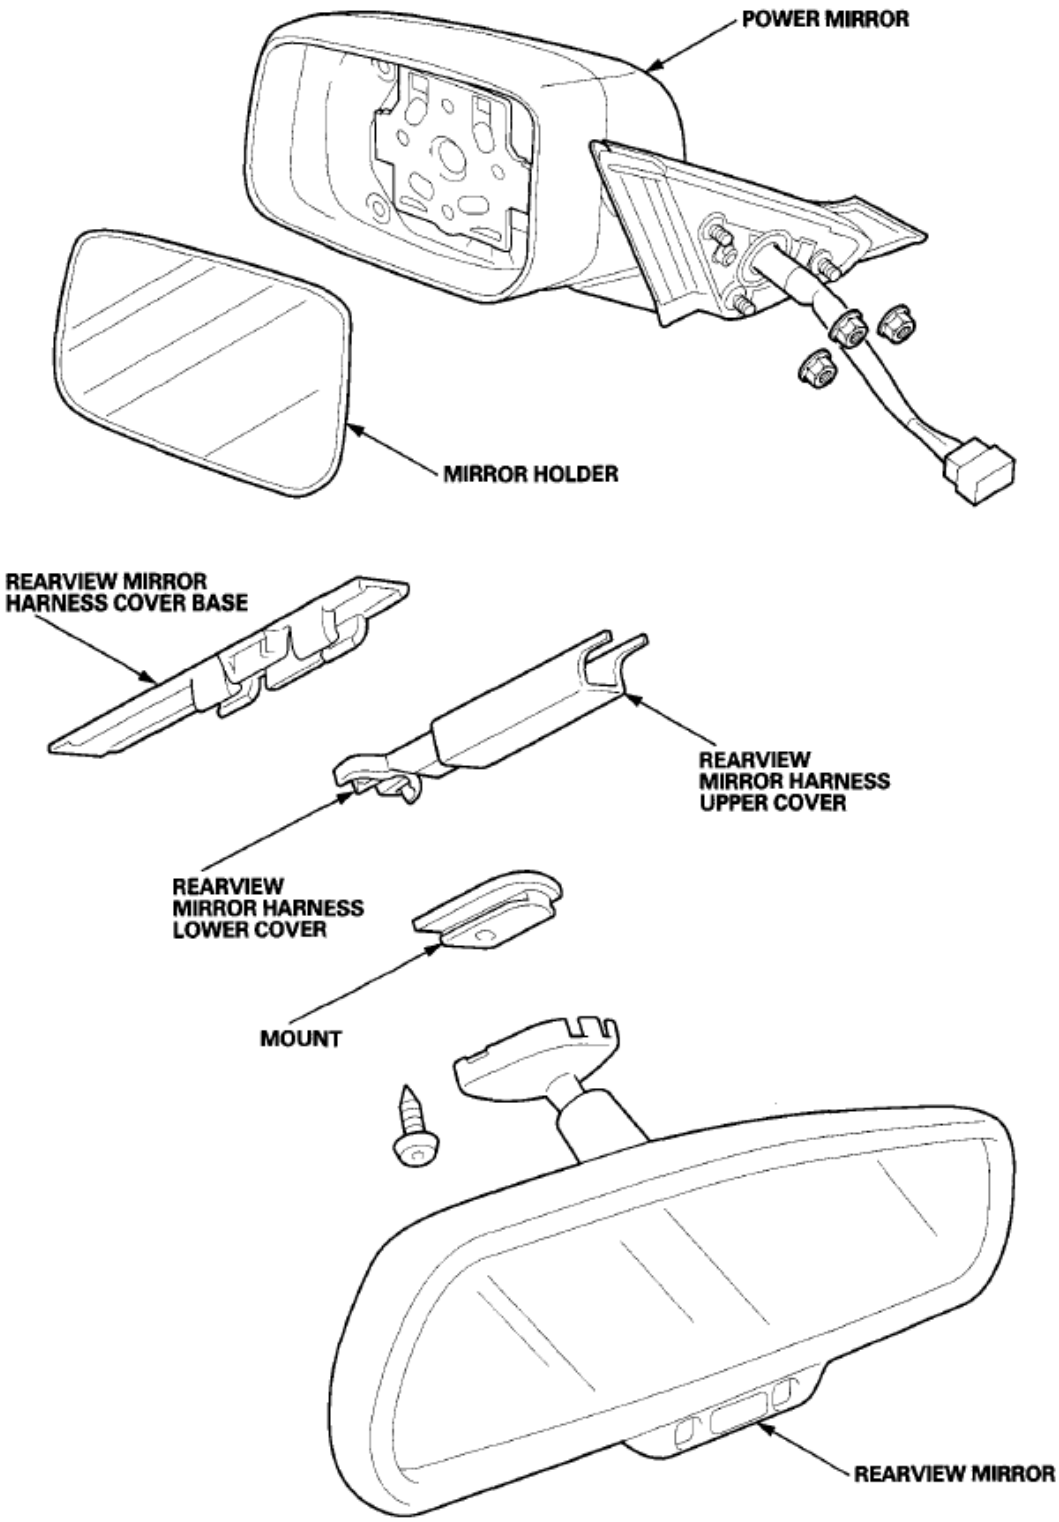

Fig. 1: Mirrors Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

POWER MIRROR REPLACEMENT

NOTE: Take care not to scratch the door.

1. Remove the front door sash inner trim (see **FRONT DOOR SASH INNER TRIM REPLACEMENT**).
2. Disconnect the power mirror connector (A).

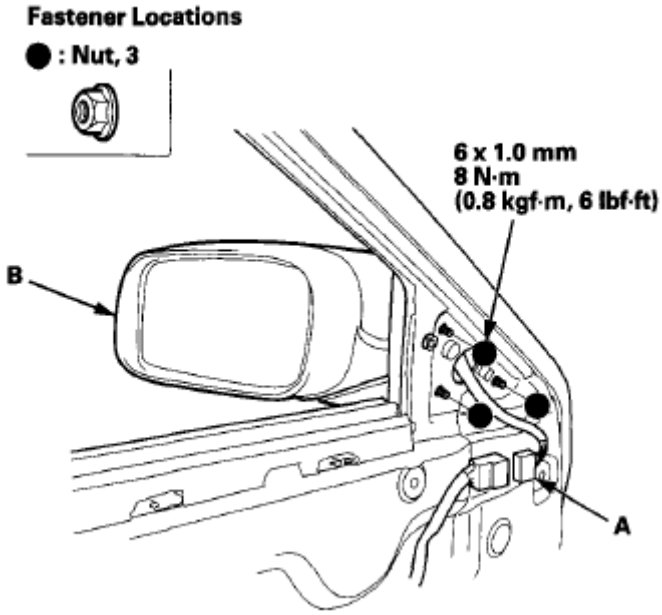

Fig. 2: Identifying Power Mirror And Power Mirror Connector With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. While holding the power mirror (B), remove the nuts securing the mirror.
4. Release the catch (A) from the hole in the door, then remove the power mirror (B).

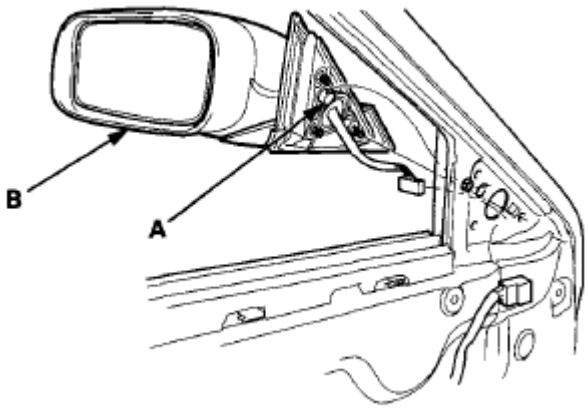

Fig. 3: Identifying Catch And Power Mirror
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the mirror in the reverse order of removal, and note these items:
   - Make sure the connector is plugged in properly.

- Make sure the power mirror operate properly.

MIRROR HOLDER REPLACEMENT

NOTE:

- **Put on gloves to protect your hands.**
- **When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.**

1. Carefully push on the top edge of the mirror holder (A) by hand.

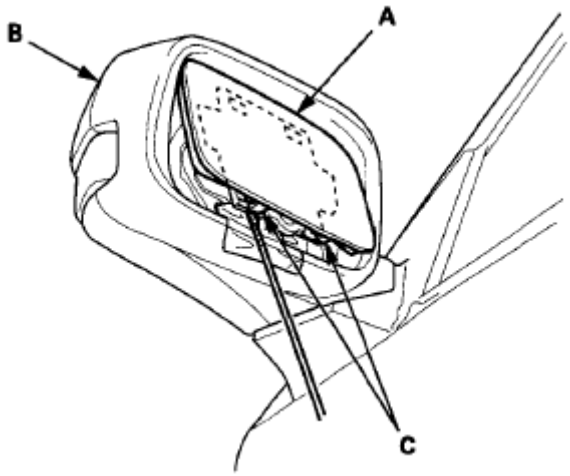

Fig. 4: Identifying Mirror Holder, Mirror Housing And Bottom Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Put a shop towel in the opening between the bottom edge of the mirror holder and the mirror housing (B) to prevent scratches. Insert a flat-tip screwdriver under the mirror holder, and detach the bottom clips (C).
3. Carefully pull out the bottom edge of the mirror holder (A) to separate the adhesive (B), and then release the side clips (C).

NOTE: In cold weather, gently warm the mirror holder to at least 68°F (20°C) before removing it.

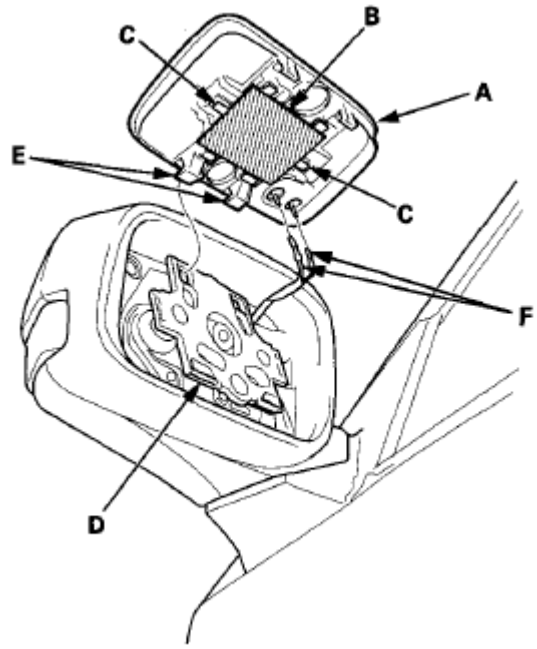

Fig. 5: Identifying Mirror Holder, Adhesive, Side Clips, Inner Holder, Hooks And Mirror Defogger Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Separate the mirror holder from the inner holder (D) on the actuator by releasing the hooks (E), and disconnect the mirror defogger connectors (F).
5. Before reinstalling the mirror holder to the inner holder (A) on the actuator, check the actuator rods (B) and the actuator boots (C).

NOTE: Make sure each actuator rod is inserted into the actuator securely, and each actuator boot is fully seated on the actuator.

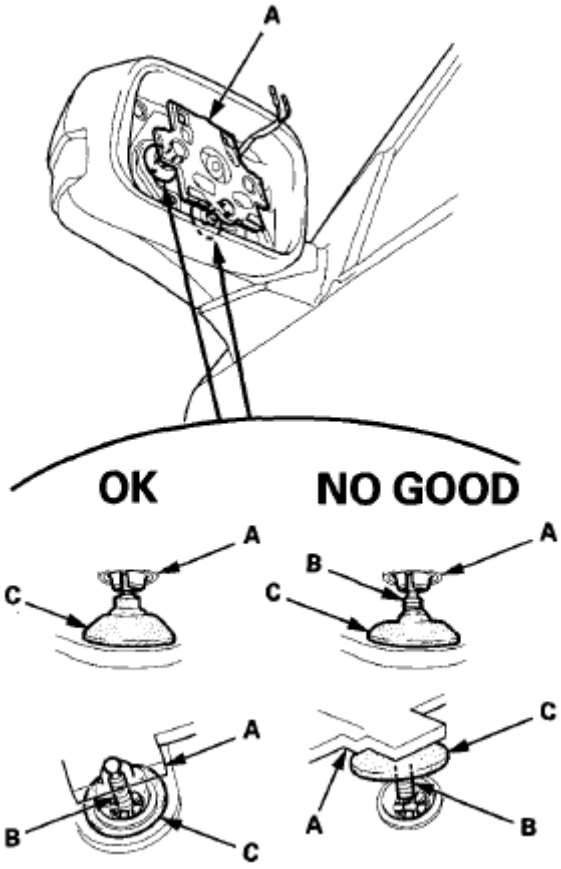

Fig. 6: Identifying Inner Holder, Actuator Rods And Actuator Boots
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Reconnect the mirror defogger connectors.
7. Reattach the hooks on the mirror holder to the actuator, then position the mirror holder on the actuator. Carefully push on the clip areas of the mirror holder until the mirror holder locks into place.
8. Check the actuator operation.

REARVIEW MIRROR REPLACEMENT

1. Slide the rearview mirror harness upper cover (A) forward to release it from the headliner (B). Pry out the rearview mirror harness lower cover (C) to release the hooks (D), then slide the lower cover rearward, and remove the lower cover by releasing the hooks (E) on the rearview mirror harness cover base (F).

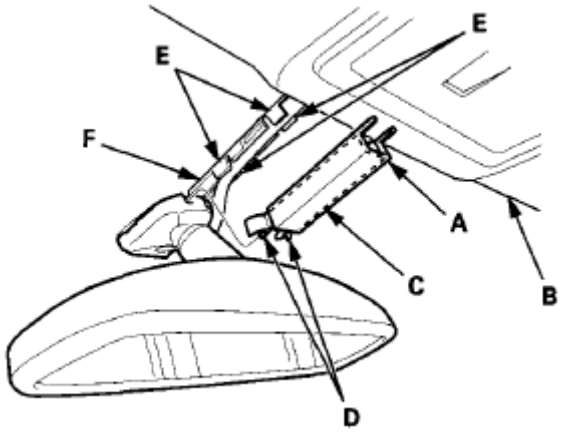

Fig. 7: Identifying Mirror Harness Lower And Upper Cover, Headliner, Hooks And Rearview Mirror Harness Cover Base
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Disconnect the rearview mirror connector (A).

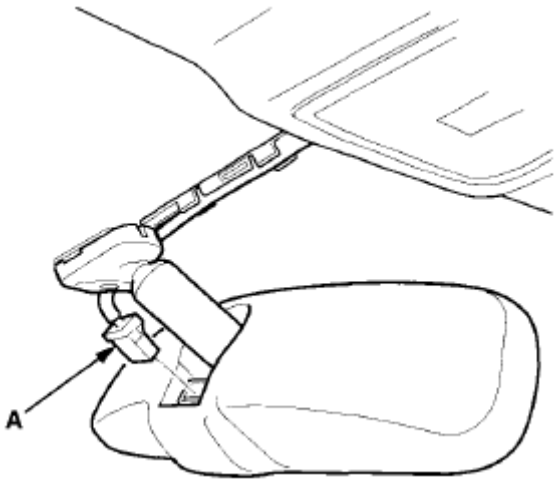

Fig. 8: Identifying Rearview Mirror Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Loosen the TORX screw with a TORX T20 bit, then slide the rearview mirror (A) rearward and off the mount (B).

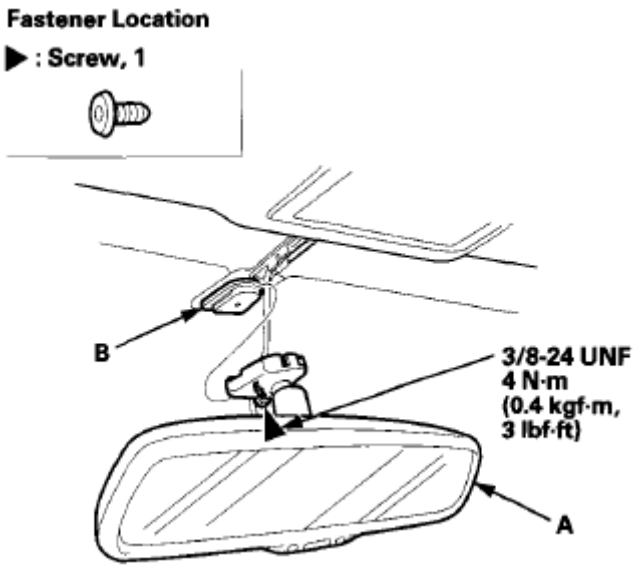

Fig. 9: Identifying Rearview Mirror And Mount With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the mirror in the reverse order of removal, and note these items:
   - Before installing the mirror, remove the TORX screw, and apply medium strength liquid thread lock to it.
   - Make sure the connector is plugged in properly.
   - Push the hooks into place securely.

GENERAL TROUBLESHOOTING INFORMATION

TROUBLESHOOTING CAN CIRCUIT RELATED PROBLEMS

NOTE: Check the ECM/PCM for DTCs and troubleshoot ECM/PCM (see GENERAL TROUBLESHOOTING INFORMATION) or F-CAN loss of communication errors first.

USING THE HDS (PREFERRED METHOD)

Connect the HDS to the Data Link Connector (DLC).

NOTE: There are two ways to read B-CAN code with the HDS.

First method; On the HDS, first select BODY ELECTRICAL, then select the subsystem that relates to the problem (for example: door locks, keyless, security, etc.), and then last, select the DTCs.

Second method; Ground the SCS circuit with the HDS, then read the DTCs displayed in the multi-information display (MID) in the gauge control module, then go to **B-CAN SYSTEM DIAGNOSIS TEST MODE A**.

USING THE B-CAN SYSTEM DIAGNOSIS TEST MODE 1 (USE ONLY IF THE HDS IS

UNAVAILABLE)

1. Check for communication circuit problems using the B-CAN System Diagnostic Test Mode 1 (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE 1 AND TEST MODE 2 (WITHOUT THE HDS)**).
2. Check for DTCs.
3. If multiple DTCs are stored, sort them, and then troubleshoot the DTCs in this order:
    1. Battery voltage DTCs
    2. Internal error DTCs
    3. Loss of communication DTCs

    NOTE: If DTC U1280 is stored, troubleshoot DTC U1280 first (see DTC U1280: COMMUNICATION BUS LINE ERROR (BUS-OFF)).

    4. Signal error DTCs
4. If no DTCs are retrieved, use the B-CAN System Diagnostic Test Mode 2 to check all inputs related to the failure (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE 1 AND TEST MODE 2 (WITHOUT THE HDS)**).

HOW TO DISPLAY DTCS ON THE MID OF THE GAUGE CONTROL MODULE

Enter the B-CAN System Diagnosis Test Mode 1 (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE 1 AND TEST MODE 2 (WITHOUT THE HDS)**). While in Test Mode 1, with normal communication between the MICU and gauge control module, the DTCs which have been detected and stored individually by various B-CAN (Body-Controller Area Network) units are shown one by one on the multi-information display. To scroll through the DTCs, press the SEL/RESET button.

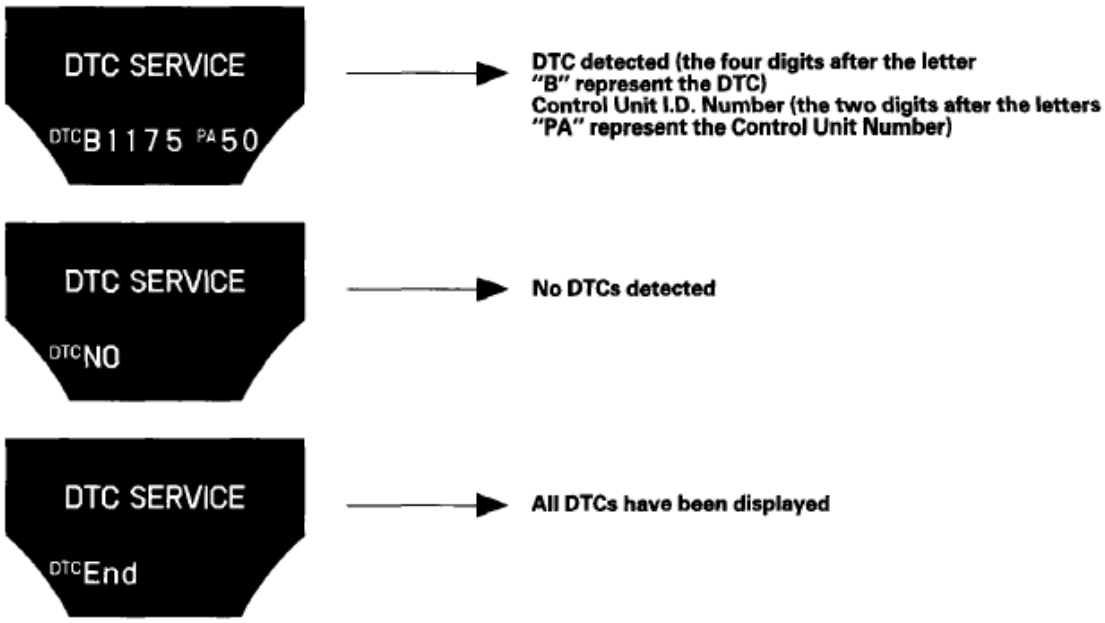

Fig. 5: Display DTCs On MID Of Gauge Control Module
Courtesy of AMERICAN HONDA MOTOR CO., INC.

The control unit that has stored the code can be identified by the number shown after the letters "PA" on the multi-information display (MID).

Control Unit	Control Unit I.D. Number
Driver's MICU	13
Passenger's MICU	14
Power control unit (With keyless access system)	15
Door multiplex control unit	30
Gauge control module	50
Climate control unit	51
Keyless access control unit (With keyless access system)	90
HandsFreeLink control unit (Without navigation)	94
Power seat control unit	95
Immobilizer-keyless control unit (Without keyless access system)	96
Remote slot control unit (With keyless access system)	96
AcuraLink control unit (XM receiver) (USA models with navigation)	97
BSI control unit (With BSI)	9F

HOW TO CLEAR DTCS

1. Enter the B-CAN System Diagnosis Test Mode 1 (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE 1 AND TEST MODE 2 (WITHOUT THE HDS)**).
2. While in Test Mode 1, press and hold down the SEL/RESET button for at least 10 seconds to clear the DTCs.

LOSS OF COMMUNICATION DTC CROSS-REFERENCE CHART

When an ECU on the CAN circuit is unable to communicate with the other ECUs on the B-CAN and F-CAN circuits, the other control units set loss of communication DTCs. Use this chart to find the control unit that is not communicating with the other control units on the CAN circuits.

1. Find the Transmitting Control Unit that is in the same row as all of the loss of communication DTCs retrieved.
2. Do the input test for the transmitting control unit.

BUS OFF AND INTERNAL ERROR CODES

DTC type	Related Unit

DTC TROUBLESHOOTING INDEX

NOTE: Record all DTCs, and sort them by DTC type using the following DTC troubleshooting indexes, then troubleshoot the DTC(s) in this order:

- Battery voltage DTCs
- Internal error DTCs
- Loss of communication DTCs
- Signal error DTCs

DRIVER'S MICU

DTC	Description	DTC Type
B1036	Driver's MICU IG1 line input error	Signal error
B1077	Wiper auto-stop (As) signal circuit malfunction	Signal error
B10A2	Driver's MICU internal (EEPROM) error	Internal error
B10CF	Left daytime running lights circuit malfunction	Signal error
B1275	Headlight switch OFF position circuit malfunction	Signal error
B1276	Headlight light switch PARKING position circuit malfunction	Signal error
B1277	Headlight AUTO position circuit malfunction	Signal error
B1278	Headlight ON position circuit malfunction	Signal error
B1279	Dimmer switch circuit malfunction	Signal error
B1280	Turn signal switch circuit malfunction	Signal error
B1281	Front wiper MIST position circuit malfunction	Signal error
B1282	Front wiper INT (AUTO) position circuit malfunction	Signal error
B1283	Front wiper LOW position circuit malfunction	Signal error
B1284	Front wiper HIGH position circuit malfunction	Signal error
U0155	Driver's MICU lost communication with gauge control module	Loss of communication
U0199	Driver's MICU lost communication with door multiplex control unit	Loss of communication
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1283	Driver's MICU lost communication with passenger's MICU	Loss of communication

PASSENGER'S MICU

DTC	Description	DTC Type
B11A2	Passenger's MICU internal (EEPROM) error	Internal error
B11C7	Passenger's MICU IG1 line input error	Signal error
B11CF	Right daytime running lights circuit malfunction	Signal error
B1575	Auto lighting sensor malfunction	Signal error
U0155	Passenger's MICU lost communication with gauge control module	Loss of communication
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1282	Passenger's MICU lost communication with driver's MICU	Loss of communication

DOOR MULTIPLEX CONTROL UNIT

DTC	Description	DTC Type
B1125	Driver's power window motor A pulse malfunction	Signal error
B1126	Driver's power window motor B pulse malfunction	Signal error
B1127	Driver's door key cylinder switch malfunction	Signal error
B1128	Driver's door lock switch malfunction	Signal error
B1129	Driver's door lock knob switch malfunction	Signal error
B1130	Front passenger's power window motor A-pulse malfunction	Signal error
B1131	Front passenger's power window motor B-pulse malfunction	Signal error
B1140	Driver's power window position detect circuit malfunction	Signal error
B1142	Door multiplex control unit lost communication with other unit (UART communication error)	Loss of communication
B1145	Front passenger's power window position detect circuit malfunction	Loss of communication
U0155	Door multiplex control unit lost communication with gauge control module	Loss of communication
U0164	Door multiplex control unit lost	Loss of communication

	communication with climate control unit	
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1282	Door multiplex control unit lost communication with driver's MICU	Loss of communication
U1283	Door multiplex control unit lost communication with passenger's MICU	Loss of communication

IMMOBILIZER-KEYLESS CONTROL UNIT

DTC	Description	DTC Type
U0155	Immobilizer-keyless control unit lost communication with gauge control module	Loss of communication
U0199	Immobilizer-keyless control unit lost communication with door multiplex control unit	Loss of communication
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1282	Immobilizer-keyless control unit lost communication with driver's MICU	Loss of communication

GAUGE CONTROL MODULE

DTC	Description	DTC Type
B1152	Gauge control module internal (EEPROM) error	Internal error
B1175	Fuel level sensor (Fuel gauge sending unit) circuit malfunction	Signal error
B1176	Fuel level sensor (Fuel gauge sending unit) circuit short	Signal error
B1192	Gauge control module lost communication with battery sensor (UART line)	Loss of communication
U0029	F-CAN communication line error (BUS OFF)	Loss of communication
U0100	Gauge control module lost communication with ECM/PCM	Loss of communication
U0122	Gauge control module lost communication with VSA modulator-control unit (VSA message)	Loss of communication
U0127	Gauge control module lost communication with the TPMS	Loss of communication

	control unit (TPMS message)	
U0131	Gauge control module lost communication with EPS control unit (EPS message)	Loss of communication
U0151	Gauge control module lost communication with SRS unit (SRS message)	Loss of communication
U0164	Gauge control module lost communication with climate control unit	Loss of communication
U0199	Gauge control module lost communication with door multiplex control unit	Loss of communication
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1282	Gauge control module lost communication with driver's MICU	Loss of communication
U1283	Gauge control module lost communication with passenger's MICU	Loss of communication
U1286	Gauge control module lost communication with keyless access control unit	Loss of communication
U1289	Gauge control module lost communication with remote slot control unit	Loss of communication
U128B	Gauge control module lost communication with power control unit	Loss of communication
U128F	Gauge control module lost communication with BSI control unit (BSI message)	Loss of communication

HANDSFREELINK CONTROL UNIT

DTC	Description	DTC Type
B1775	Microphone input/output shorted to power or open (with navigation)	Signal error
	Microphone input/output shorted to power or open (without navigation)	Signal error
B1776	Microphone input/output shorted to ground (with navigation)	Signal error
	Microphone input/output shorted to ground (without navigation)	Signal error
B1779	HandsFreeLink steering wheel switch failure (with navigation)	Signal error

	HandsFreeLink steering wheel switch failure (without navigation)	Signal error
B1780	HandsFreeLink steering wheel switch line short (with navigation)	Signal error
	HandsFreeLink steering wheel switch line short (without navigation)	Signal error
B1792	HandsFreeLink control unit error (with navigation)	Signal error
	HandsFreeLink control unit error (without navigation)	Signal error
U1280	Communication bus line error (BUS-OFF)	Loss of communication

CLIMATE CONTROL UNIT

DTC	Description	DTC Type
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U0155	Lost communication with gauge control module (climate control unit)	Loss of communication
B1215	An open or short in the recirculation control motor circuit	Signal error
B1225	An open in the in-car temperature sensor circuit	Signal error
B1226	A short in the in-car temperature sensor circuit	Signal error
B1227	An open in the outside air temperature sensor circuit	Signal error
B1228	A short in the outside air temperature sensor circuit	Signal error
B1229	An open in the sunlight sensor circuit	Signal error
B1230	A short in the sunlight sensor circuit	Signal error
B1231	An open in the evaporator temperature sensor circuit	Signal error
B1232	A short in the evaporator temperature sensor circuit	Signal error
B1233	An open in the air mix control motor circuit (driver's)	Signal error
B1234	A short in the air mix control motor circuit (driver's)	Signal error
B1235	A problem in the air mix control motor circuit, linkage, door, or	Signal error

	motor (driver's)	
B1236	An open in the passenger's air mix control motor circuit	Signal error
B1237	A short in the passenger's air mix control motor circuit	Signal error
B1238	A problem in the passenger's air mix control linkage, door, or motor	Signal error
B1239	An open or short in the mode control motor circuit (driver's)	Signal error
B1240	A problem in the mode control motor circuit, linkage, doors, or motor (driver's)	Signal error
B1241	A problem in the blower motor circuit	Signal error
B1242	An open or short in the passenger's mode control motor circuit	Signal error
B1243	A problem in the passenger's mode control motor circuit, linkage, doors, or motor	Signal error
B2967	An open in the humidity sensor circuit	Signal error
B2968	A short in the humidity sensor circuit	Signal error
B2969	Climate control unit lost communication with driver's MICU (WIPSW message)	Signal error
B2979	An open in the A/C pressure sensor circuit	Signal error
B2980	A short in the A/C pressure sensor circuit	Signal error
B2983	A problem in the recirculation control motor circuit, linkage, door, or motor	Signal error

ACURALINK CONTROL UNIT

DTC	Description	DTC Type
B2240	XM antenna error	Internal error
U0100	F-CAN lost communication with ECM/PCM	Loss of communication
U0155	Gauge control module lost F-CAN communication with AcuraLink control unit (XM receiver)	Loss of communication
U1280	Communication bus line error (BUS-OFF)	Loss of communication

U128D	AcuraLink control unit (XM receiver) lost B-CAN communication with gauge control module	Loss of communication

POWER SEAT CONTROL UNIT

DTC	Description	DTC Type
B1802	Power seat control unit failure	Internal error
B1825	Power seat slide motor pulse error	Signal error
B1826	Power seat front up-down motor pulse error	Signal error
B1827	Power seat rear up-down motor pulse error	Signal error
B1828	Power seat recline motor pulse error	Signal error
B1829	A/T-P signal and VSP signal mismatch	Signal error
B1830	Left mirror position sensor open	Signal error
B1832	Right mirror position sensor open	Signal error
B1836	Power seat position sensor circuit short	Signal error
B1837	Memory position calling timeout	Signal error
B1843	UART communication error	Signal error
B1844	Power seat slide switch circuit malfunction	Signal error
B1845	Power seat recline switch circuit malfunction	Signal error
B1846	Power seat front up-down switch circuit malfunction	Signal error
B1847	Power seat rear up-down switch circuit malfunction	Signal error
U0155	Power seat control unit lost communication with gauge control module	Loss of communication
U0199	Power seat control unit lost communication with door multiplex control unit	Loss of communication
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1282	Power seat control unit lost communication with driver's MICU	Loss of communication

POWER CONTROL UNIT

DTC	Description	DTC Type
B12A1	Power control unit internal (CPU)	Internal error

	error	
B12C5	Engine start/stop switch failure	Internal error
B12C6	Electric steering lock switch C/D monitor circuit failure	Internal error
B12C7	Electric steering lock motor circuit failure	Internal error
B12D0	Power control unit IG1A circuit error	Internal error
B12D1	Power control unit IG1B circuit error	Internal error
B12D2	Power control unit IG2 circuit error	Internal error
B12D3	Power control unit IG latch circuit error	Internal error
B12E0	Electric steering lock switch internal error	Internal error
B12E1	Electric steering lock motor internal error	Internal error
B12E2	Electric steering lock low level failure of MTRCUT1	Signal error
B12E3	Electric steering lock high level failure of MTRCUT1	Signal error
B12E4	Electric steering lock high level failure of MTRCUT2	Signal error
B12F0	Power control unit lost communication with electric steering lock	Loss of communication
B12F1	Power control unit lost communication with remote slot control unit	Loss of communication
B12F2	Power control unit lost communication with keyless access control unit	Loss of communication
U0155	Power control unit lost communication with gauge control module	Loss of communication
U0199	Power control unit lost communication with door multiplex control unit	Loss of communication
U1280	Communication bus line error (BUS-OFF)	Loss of communication

REMOTE SLOT CONTROL UNIT

DTC	Description	DTC Type
B1902	Remote slot control unit internal	Internal error

	error (EEPROM error)	
B1926	Remote slot antenna open or short	Internal error
B1927	MTRCONT signal error	Signal error
B1930	Remote slot control unit LOCK/UNLOCK error	Signal error
B1931	Remote slot control unit no response	Signal error
U0155	Remote slot control unit lost communication with gauge control module	Loss of communication
U1280	Communication bus line error (BUS-OFF)	Loss of communication

KEYLESS ACCESS CONTROL UNIT

DTC	Description	DTC Type
B1601	Keyless access control unit internal (CPU) error	Internal error
B1602	Keyless access control unit internal (EEPROM) error	Internal error
B1640	RF unit not connected	Signal error
B1646	Driver's door LF antenna circuit open or short	Signal error
B1648	Passenger's door LF antenna circuit open or short	Signal error
B1658	Rear bumper LF antenna circuit open or short	Signal error
B1660	Front interior LF antenna circuit open or short	Signal error
B1664	Rear interior LF antenna circuit open or short	Signal error
B1668	Rear shelf LF antenna circuit open or short	Signal error
U0155	Keyless access control unit lost communication with gauge control module	Loss of communication
U0199	Keyless access control unit lost communication with door multiplex control unit	Loss of communication
U1280	Communication bus line error (BUS-OFF)	Loss of communication
U1282	Keyless access control unit lost communication with driver's MICU	Loss of communication
U1283	Keyless access control unit lost communication with passenger's MICU	Loss of communication

BSI CONTROL UNIT

DTC	Description	DTC Type
B18A1	BSI control unit internal circuit error	Internal error
B18A5	Left BSI radar unit temperature high	Signal error
B18A6	Right BSI radar unit temperature high	Signal error
B18A7	Left BSI radar unit voltage input low	Signal error
B18A8	Right BSI radar unit voltage input low	Signal error
B18A9	Left BSI radar unit voltage input high	Signal error
B18AA	Right BSI radar unit voltage input high	Signal error
B18AF	Left BSI radar unit internal circuit error	Internal error
B18B1	Right BSI radar unit internal circuit error	Internal error
B18B4	Left BSI radar unit dirty	Signal error
B18B5	Right BSI radar unit dirty	Signal error
B18B6	Lost communication with left BSI radar unit	Loss of communication
B18B7	Lost communication with right BSI radar unit	Loss of communication
B18B8	Left BSI radar unit azimuth off alignment	Signal error
B18B9	Right BSI radar unit azimuth off alignment	Signal error
B18BA	Left BSI radar unit version incorrect	Signal error
B18BB	Right BSI radar unit version incorrect	Signal error
B18BC	BSI radar units communication error	Signal error
B18BD	BSI control unit voltage input high	Signal error
B18BE	BSI control unit voltage input low	Signal error
B18C2	Left BSI alert indicator output error	Signal error
B18CF	Right BSI alert indicator output error	Signal error
U0155	Lost communication with the gauge control module	Loss of communication
U0423	Invalid data received from PCM (vehicle speed data)	Loss of communication
U1280	Communication circuit error (BUS-	Loss of communication

	OFF)	

SYSTEM DESCRIPTION

BODY CONTROLLER AREA NETWORK (B-CAN) AND FAST CONTROLLER AREA NETWORK (F-CAN)

The body controller area network (B-CAN) and the fast controller area network (F-CAN) share information between multiple electronic control units (ECUs). B-CAN communication moves at a slower speed (125 kbps) for convenience related items and for other functions. F-CAN information moves at a faster speed (500 kbps) for "real time" functions such as fuel and emissions data. To allow both systems to share information, the gauge control module translates and relays the information from B-CAN to F-CAN and from F-CAN to B-CAN. This is called the Gateway Function.

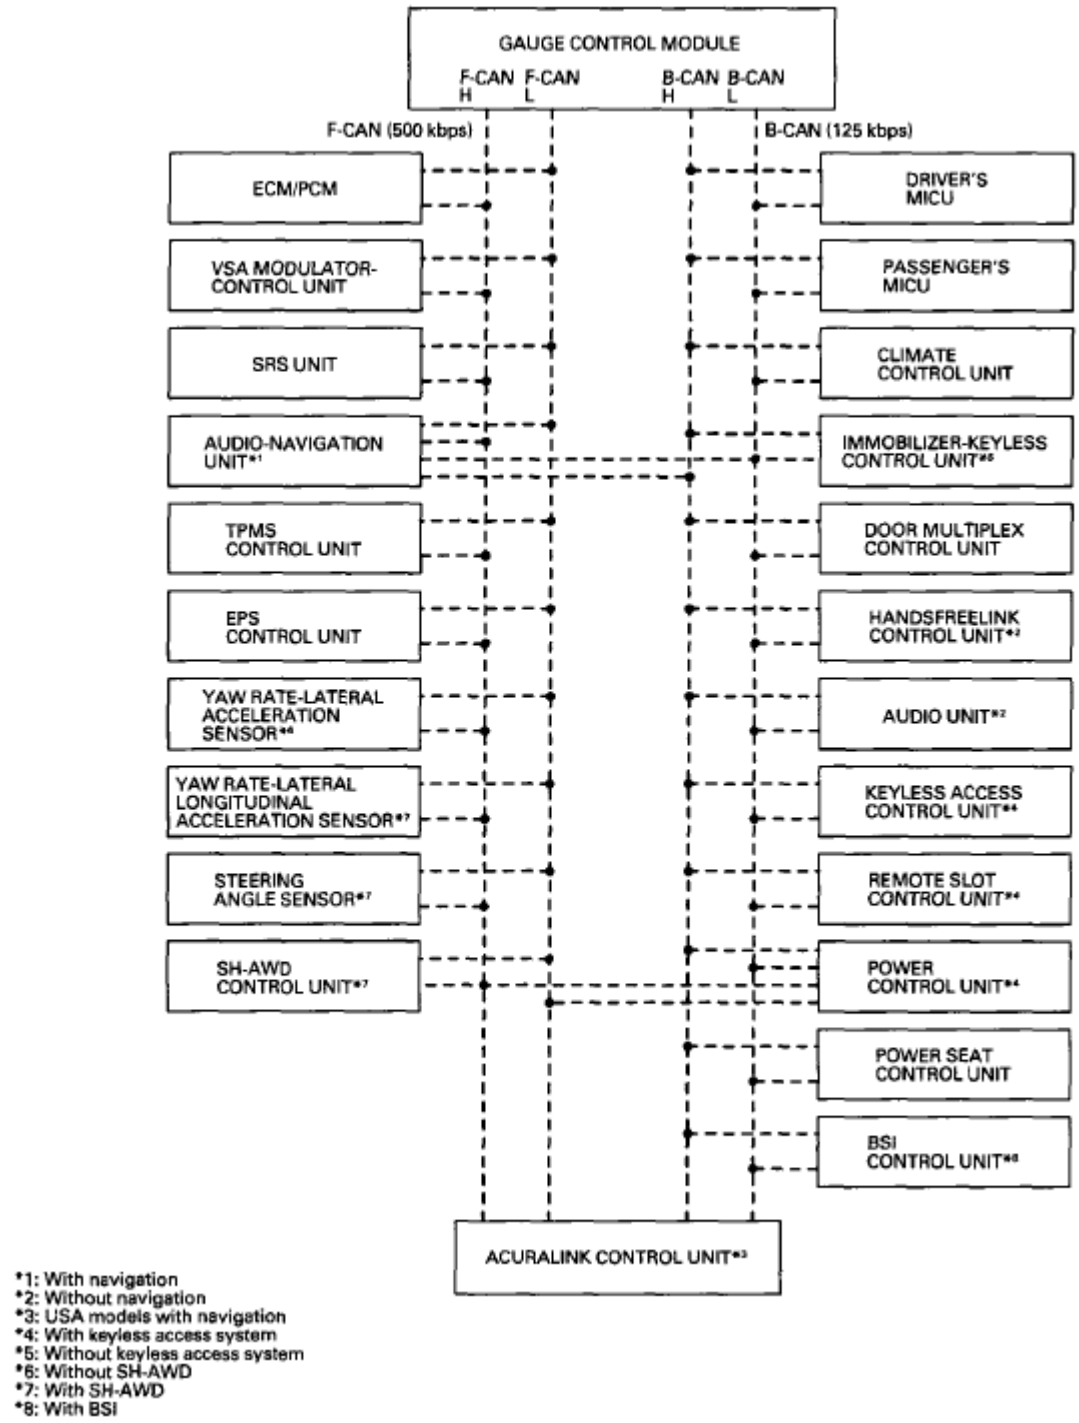

Fig. 6: Body Controller Area Network (B-CAN) And Fast Controller Area Network (F-CAN) System Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

GATEWAY FUNCTION

The gauge control module acts as a gateway to allow both systems to share information. The gauge control

module translates and relays the information from B-CAN to F-CAN and from F-CAN to B-CAN.

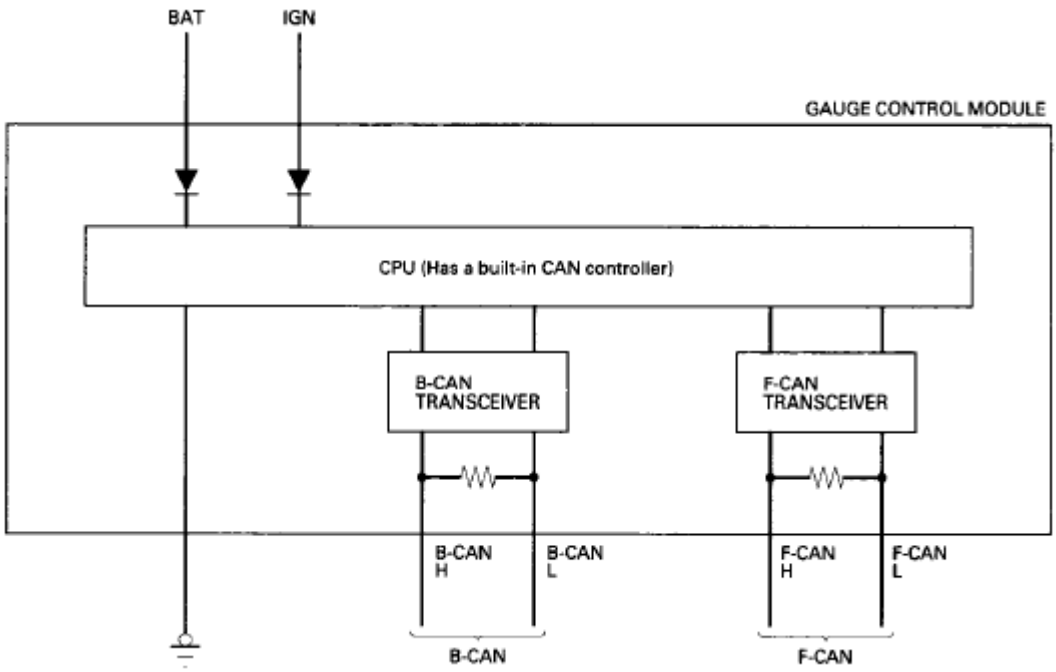

Fig. 7: Gateway Functioning Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NETWORK "LOSS OF COMMUNICATION" ERROR CHECKING FUNCTION

The ECUs on the CAN circuit send messages to each other. If there are any communication malfunctions on the network, the multi information display (MID) on the gauge control module can indicate the error messages by entering the gauge control module self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

Fig. 8: Display - Error Messages On Multi Information Display (MID)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SELF-DIAGNOSTIC FUNCTION (ON-BOARD DIAGNOSIS)

By connecting the HDS to the data link connector (DLC), the HDS can retrieve the diagnostic information from the driver's MICU via a diagnostic line called the K-LINE. The K-LINE is a separate communication line from the CAN lines, but it is connected to most of the CAN related ECUs. The driver's MICU is a gateway between the HDS and B-CAN related ECUs, and sends B-CAN diagnostic information to the HDS. When doing a function test with the HDS, the HDS sends an output signal through the K-LINE to the driver's MICU. The

driver's MICU either relays the request to another ECU, or commands the function itself.

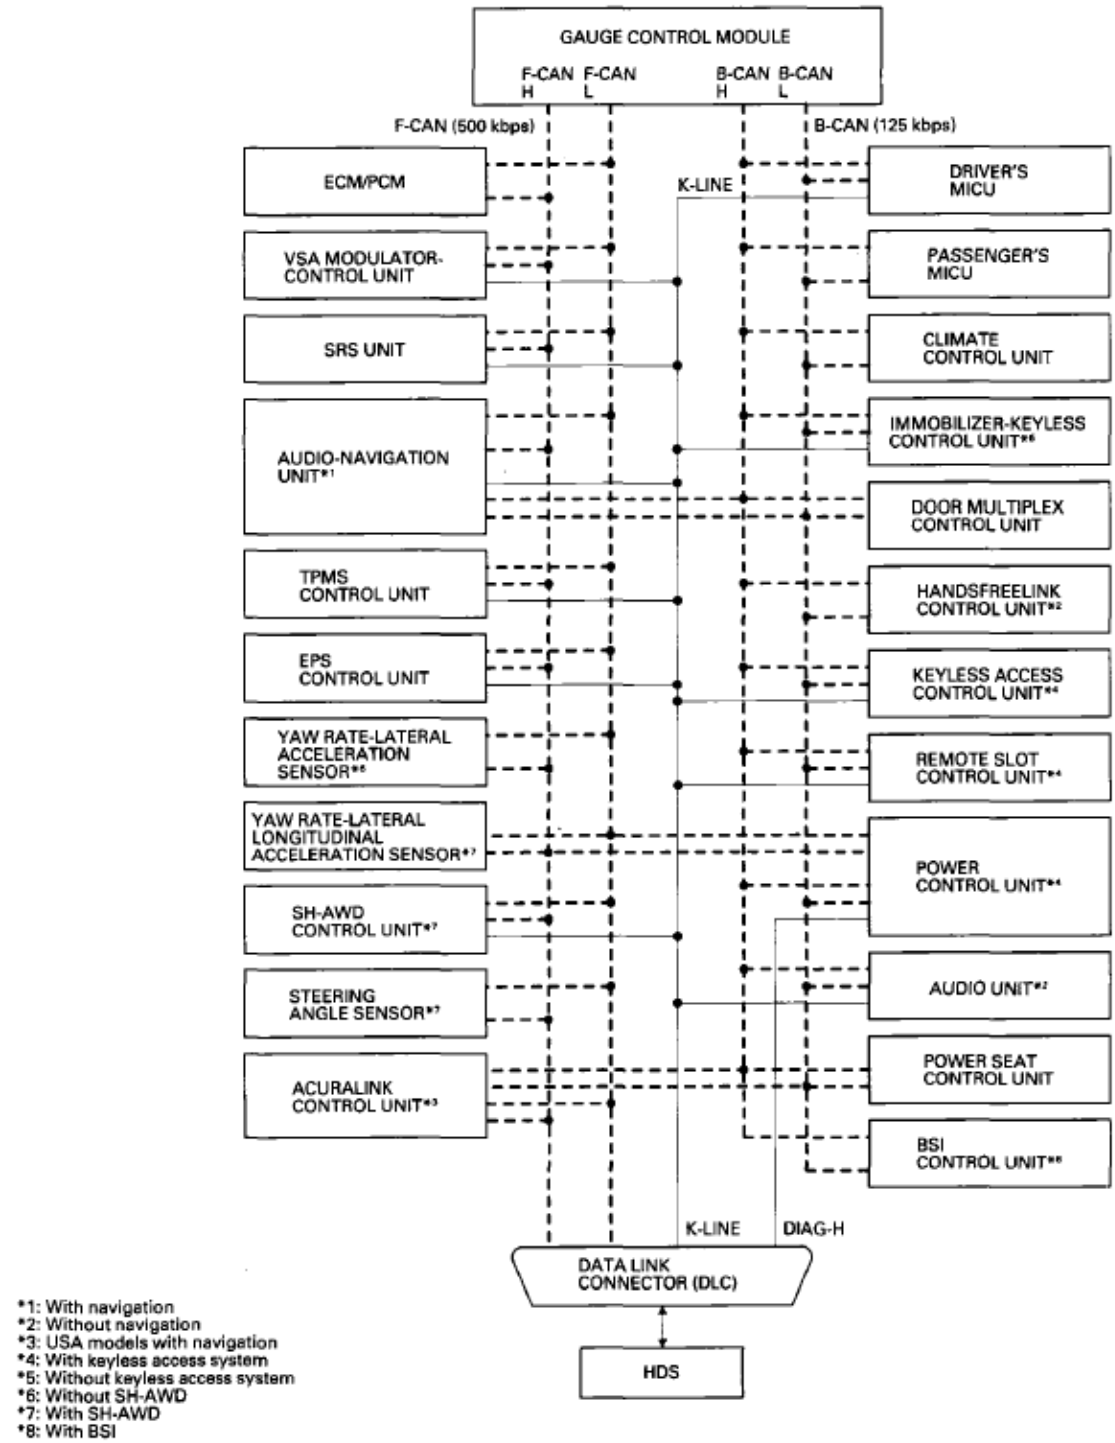

Fig. 9: Self-Diagnostic Functioning (On-Board Diagnosis) System Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

WAKE-UP AND SLEEP FUNCTION

The multiplex integrated control system has wake-up and sleep functions to decrease parasitic draw on the battery when the ignition switch is at LOCK (0), or the engine start/stop button has been pressed to select the OFF mode.

- In the sleep mode, the multiplex integrated control system stops functioning (communication and CPU control) when it is not necessary for the system to operate.
- As soon as any operation is requested (for example, a door is unlocked), the related control units in sleep mode immediately wake up and begin to function.
- When the ignition switch is turned to LOCK (0), or the engine start/stop button is pressed to select the OFF mode, and the driver's door is opened, then closed, there is a delay of about 40 seconds before the control unit goes from wake-up mode to sleep mode.
- The sleep mode function if any door is open or will not occur if a key is in the ignition switch.
- Electrical draw is reduced from 200 mA to less than 35 mA when in sleep mode.

NOTE: Sleep and Wake-Up Mode Test (see SLEEP AND WAKE-UP MODE TEST).

FAIL-SAFE FUNCTION

To prevent improper operation, the MICUs have a fail-safe function. In the fail-safe mode, the output signal is fixed when any part of the system malfunctions (for example, a faulty control unit or communication line).

Each control unit has a hardware fail-safe function that fixes the output signal when there is a CPU malfunction, and a software fail-safe function that ignores the signal from a malfunctioning control unit, which allows the system to continue operating normally.

HARDWARE FAIL-SAFE CONTROL

Fail-safe function

When a CPU problem or an abnormal power supply voltage is detected, the MICUs move to the hardware fail-safe mode, and each system output load is set to the pre-programmed fail-safe value.

SOFTWARE FAIL-SAFE CONTROL

When any of the data from the B-CAN circuit cannot be received within a specified time, or an unusual combination of data is recognized, the MICUs move to the software fail-safe mode. The data that was not received is forced to a pre-programmed value.

DRIVER'S MICU

Power Supply Voltage Monitoring Function

The driver's MICU monitors the power supply voltage (back-up voltage). If the voltage drops below 10 V, the driver's MICU does not store DTCs.

	Input	Output

Driver's MICU	Battery voltage (VBU)	
B-CAN		MICU (Under 10 V) message

Entry Lights Control System (Ceiling Lights, Map Lights, Ignition Key Light)*

The driver's MICU controls the interior lights and ignition key light ON/OFF based on input signals from each switch.

	Input	Output
Driver's MICU	IG1 power supply Ignition key switch Driver's door switch Left rear door switch	Interior lights Ignition key light
B-CAN	Keyless LOCK/UNLOCK signal Keyless access signal Right rear door switch Driver's door lock knob switch (LOCK/UNLOCK) Front passenger's door switch	

*: This system can be customized in the multi-information display (MID) to suit the client's needs. For more information about customizing system options, refer to the Owner's Manual.

Trunk Light

The driver's MICU controls the trunk light based on input from the trunk lid latch switch.

	Input	Output
Driver's MICU	IG1 power supply Trunk lid latch switch	Trunk light
B-CAN	Light cut signal	

Collision Detection Signal (CDS)

The driver's MICU controls the door lock actuators based on IG1 and SRS (CDS) inputs.

	Input	Output
Driver's MICU	IG1 power supply	Door lock actuators (UNLOCK)
B-CAN	CDS signal	Door lock actuators (UNLOCK)

Key Interlock (A/T)

The driver's MICU controls the key interlock solenoid based on ignition switch ACCESSORY (I) position, the transmission range switch P position, and the park pin switch inputs.

	Input	Output

Driver's MICU	Ignition switch (ACC) Transmission range switch (P) position Park pin switch	Key interlock solenoid

Rear Window Defogger Timer Operation

The driver's MICU controls the rear window defogger timer based on ignition switch and rear window defogger switch inputs.

	Input	Output
Driver's MICU	IG1 power supply	Rear window defogger relay
B-CAN	Rear window defogger switch	

Combination Light Switch

The driver's MICU controls the lighting system based on inputs from the combination light switch.

	Input	Output
Driver's MICU	Combination light switch (OFF) Combination light switch (ON) Combination light switch (AUTO) Combination light switch (PARKING) Combination light switch (PASSING) Combination light switch (DIMMER)	Parking light Headlight (high beam, low beam, passing) Taillights Headlight (AUTO)
B-CAN		Parking light Headlight (high beam, low beam, passing) Taillights Headlight (AUTO)

Daytime Running Lights

The driver's MICU controls the headlights as daytime running lights based on inputs from each switch.

	Input	Output
Driver's MICU	IG2 power supply	Left headlight (high beam)
B-CAN	Parking brake signal Auto headlight LO off signal IG1 meter signal	Headlight (high beam) DRL messages

Fog Lights

The driver's MICU controls fog lights based on inputs from the fog light switch.

	Input	Output
Driver's MICU	Fog light switch Combination light switch	Left fog light

B-CAN		Fog light signal

Headlight Auto OFF Function*

The driver's MICU controls the lighting system based on inputs from each switch.

	Input	Output
Driver's MICU	IG1 power supply Ignition key switch Driver's door switch	Left headlight (high beam, low beam) Taillights
B-CAN	Driver's door lock knob switch Keyless access signal Auto light off signals	Headlight off signal

*: This system can be customized in the multi-information display (MID) to suit the client's needs. For more information about customizing system options, refer to the Owner's Manual.

Turn Signal/Hazard Warning Lights

The driver's MICU controls the turn signal/hazard warning lights based on inputs from the turn signal switch and the hazard warning switch.

	Input	Output
Driver's MICU	IG1 power supply Turn signal switch (left) Turn signal switch (right) Hazard warning switch	Turn signal lights (left) Turn signal lights (right)
B-CAN		HAZARDSW message TURNLRLY message TURNRRLY message TURNRSW message TURNLSW message

Courtesy Light (Driver's Side)

The driver's MICU controls the driver's lights based on input from the driver's door switches.

	Input	Output
Driver's MICU	IG1 power supply Driver's door switch	Driver's door courtesy light
B-CAN	Light cut signal	

Wiper

The driver's MICU controls the wiper based on inputs from each switch.

	Input	Output
Driver's MICU	IG1 power supply Brake pedal position switch Transmission range switch P position (A/T) Wiper switch (INT & LO) Wiper switch (HI & LO) Wiper switch (MIST) Wiper switch (AS) Wiper switch intermittent dwell time controller	Windshield wiper intermittent relay Windshield wiper motor high/low relay
B-CAN	Parking brake signal (A/T) IG1 meter signal (A/T) Washer signal Keyless access signal Vehicle speed pulse signal	WIPSW messages

Driver's Power Window Relay

The driver's MICU controls the power windows based on inputs from each switch.

	Input	Output
Driver's MICU	IG1 power supply	Power window relay (left rear)
B-CAN	Power window relay signal (left rear) Power window timer signal	

Keyless Answer Back*

The driver's MICU controls the lighting system and horns based on keyless signals sent by B-CAN.

	Input	Output
Driver's MICU		Parking light Taillights Horns
B-CAN	KEYLESS DOOR LOCK signal	

*: This system can be customized in the multi-information display (MID) to suit the client's needs. For more information about customizing system options, refer to the Owner's Manual.

Security Answer Back*

The driver's MICU controls the lighting system and horns based on keyless signals sent by B-CAN.

	Input	Output
Driver's MICU		Parking light Taillights Horns
B-CAN	KEYLESS DOOR LOCK signal	Answer back buzzer message

*: This system can be customized in the multi-information display (MID) to suit the client's needs. For more information about customizing system options, refer to the Owner's Manual.

Answer Back Response Operation

The driver's MICU controls the lighting system and horns based on keyless signals sent by B-CAN.

	Input	Output
Driver's MICU		Parking light Taillights Horns
B-CAN	ANSWER BACK signal (HORN) ANSWER BACK signal (PARKING LIGHT) ANSWER BACK signal (H/L LO)	Taillight relay Horn relay

Power Door Locks*

The driver's MICU controls the door lock actuators based on the inputs from each switch.

	Input	Output
Driver's MICU	IG1 power supply Ignition key switch Driver's door switch Left rear door switch Trunk lid latch switch	Driver's door lock actuator (UNLOCK) Door lock actuators (LOCK) Door lock actuators (UNLOCK) Trunk lid release actuator Fuel lid actuator
B-CAN	Driver's door lock switch (LOCK/UNLOCK) Driver's door key cylinder switch (LOCK/UNLOCK) Driver's door lock knob switch (LOCK/UNLOCK) Front passenger's door lock switch (LOCK/UNLOCK) Front passenger's door switch Right rear door switch Keyless access signal	Door lock signal (LOCK) Door lock signal (UNLOCK)

*: This system can be customized in the multi-information display (MID) to suit the client's needs. For more information about customizing system options, refer to the Owner's Manual.

Door Lock Response Operation

The driver's MICU controls the door lock actuators LOCK, UNLOCK, DRIVER'S UNLOCK, TRUNK UNLOCK based on B-CAN door lock switch signals.

	Input	Output
		Driver's door lock actuator (UNLOCK)

Driver's MICU		Door lock actuators (LOCK) Door lock actuators (UNLOCK) Trunk lid release actuator
B-CAN	Door lock switch signals	

Keyless Entry System*

The driver's MICU controls the door lock actuators based on the input signals from each switch.

	Input	Output
Driver's MICU	IG1 power supply Ignition key switch Driver's door switch Left rear door switch Trunk lid opener main switch	Driver's door lock actuator (UNLOCK) Door lock actuators (LOCK) Door lock actuators (UNLOCK) Trunk lid release actuator
B-CAN	Front passenger's door switch Right rear door switch Driver's door lock knob switch (LOCK) Driver's door lock switch (LOCK/UNLOCK) Driver's door key cylinder switch (LOCK/UNLOCK) Front passenger's door lock switch (LOCK/UNLOCK) Keyless access signal Keyless LOCK/UNLOCK signal	Door lock signal (LOCK) Door lock signal (UNLOCK) Relock signal

*: This system can be customized in the multi-information display (MID) to suit the client's needs. For more information about customizing system options, refer to the Owner's Manual.

Keyless PANIC Operation

The driver's MICU controls the keyless PANIC operation based on keyless signals sent by B-CAN data.

	Input	Output
Driver's MICU		Headlight (low beam) Parking light Taillights Horns
B-CAN	PANIC signals	Headlight (low beam) signal Parking light signal Taillights signal

Auto Power Door Locks (LOCK Operation)*

The driver's MICU controls the door lock actuators based on inputs from each switch.

	Input	Output
Driver's MICU	IG1 power supply Transmission range switch (P position) Driver's door switch Left rear door switch Trunk lid latch switch Left rear door lock knob switch (LOCK) Brake pedal position switch	Door lock actuators (LOCK)
B-CAN	Front passenger's door switch Right rear door switch Driver's door lock knob switch (LOCK) Front passenger's door lock knob switch (LOCK) Right rear door lock knob switch (LOCK) Vehicle speed signal Engine speed signal	Door lock signal (LOCK)

*: This system can be customized in the multi-information display (MID) to suit the client's needs. For more information about customizing system options, refer to the Owner's Manual.

Auto Power Door Locks (UNLOCK Operation)*

The driver's MICU controls the door lock actuators based on inputs from each switch.

	Input	Output
Driver's MICU	IG1 power supply Transmission range switch (P position) Driver's door switch Left rear door switch Trunk lid latch switch Brake pedal position switch Left rear door lock knob switch (UNLOCK)	Driver's door lock actuators (UNLOCK) Door lock actuators (UNLOCK)
B-CAN	Front passenger's door switch Right rear door switch Driver's door lock knob switch (UNLOCK) Front passenger's door lock knob switch (UNLOCK) Right rear door lock knob switch (UNLOCK)	Door lock signal (UNLOCK) Door lock signal (LOCK)

*: This system can be customized in the multi-information display (MID) to suit the client's needs. For more information about customizing system options, refer to the Owner's Manual.

Security Alarm System

The driver's MICU controls the lighting system and horns based on inputs from each switch and B-CAN data.

	Input	Output
	IG1 power supply	

Driver's MICU	Ignition key switch Driver's door switch Left rear door switch Trunk lid latch switch Left rear door lock knob switch (UNLOCK) Security hood switch	Headlights (low beam) Parking light Taillights Horns
B-CAN	Audio switch Front passenger's door switch Right rear door switch Driver's door key cylinder switch (LOCK/UNLOCK) Driver's door lock knob switch (UNLOCK) Front passenger's door lock knob switch (UNLOCK) Right rear door lock knob switch (UNLOCK) Keyless LOCK/UNLOCK signal DOOR LOCK signal	Driver's MICU (SET 1) message Driver's MICU (SET 2) message ALARM (ACTION) message Headlight (low beam) signal Parking light signal Taillights signal

PASSENGER'S MICU

Power Supply Voltage Monitoring Function

The passenger's MICU monitors the power supply voltage (back-up voltage). If the voltage drops below 10 V, the passenger's MICU does not store DTCs.

	Input	Output
Passenger's MICU	Battery voltage (VBU)	

Courtesy Light (Passenger's Side)

The passenger's MICU controls the front passenger lights is based on input from the front passenger door switch.

	Input	Output
Passenger's MICU	IG1 power supply Front passenger's door switch	Front passenger's door courtesy light
B-CAN	Light cut signal	

Power Door Locks (LOCK)*

The passenger's MICU controls the front passenger's side door lock actuators based on inputs from the driver's MICU.

	Input	Output
Passenger's MICU		Door lock actuators (LOCK)
B-CAN	Door lock (LOCK) signal	

*: This system can be customized in the multi-information display (MID) to suit the client's needs. For more information about customizing system options, refer to the Owner's Manual.

Power Door Locks (UNLOCK)*

The passenger's MICU controls the front passenger's side door lock actuators based on inputs from the driver's MICU.

	Input	Output
Passenger's MICU		Door lock actuators (UNLOCK)
B-CAN	Door lock (UNLOCK) signal	

*: This system can be customized in the multi-information display (MID) to suit the client's needs. For more information about customizing system options, refer to the Owner's Manual.

Exterior Lights

The passenger's MICU controls the front passenger's side headlight, and parking lights based on inputs from the driver's MICU.

	Input	Output
Passenger's MICU		Parking light Headlight (high beam, low beam) Passenger's DRL (low beam) Passenger's fog light
B-CAN	Parking light signal Headlight (high beam, low beam passing) signal DRL signal Fog light signal	Passenger's DRL signal

Automatic Lighting*

The passenger's MICU controls the headlights and the parking lights based on inputs from the automatic lighting sensor.

	Input	Output
Passenger's MICU	IG1 power supply Automatic lighting sensor (SIO) signal	Headlight back-up signal
B-CAN	IG1 power supply signal Lighting switch signal Vehicle speed signal	AUTOLT signals

*: This system can be customized in the multi-information display (MID) to suit the client's needs. For more information about customizing system options, refer to the Owner's Manual.

Fog Lights

The passenger's MICU controls fog lights based on inputs from the fog light switch.

	Input	Output
Passenger's MICU		Right fog light
B-CAN	Fog light signal	

Washer Operation

The passenger's MICU controls the washer motor based on inputs from the wiper switch.

	Input	Output
Passenger's MICU	IG1 power supply Headlight washer switch (with headlight washer)	Windshield washer motor Headlight washer motor (with headlight washer)
B-CAN	Wiper switch signals	

Keyless Buzzer Operation

The passenger's MICU controls the keyless buzzer based on inputs from the answer back signals.

	Input	Output
Passenger's MICU		Keyless buzzer
B-CAN	Answer back signals	

HDS INPUTS AND FUNCTION TESTS

Certain inputs happen so quickly that the Data List on the HDS cannot update fast enough. Hold the switch that is being tested while monitoring the Data List. This should give the HDS time to update the signal on the Data List.

Because the HDS software is updated to support the release of newer vehicles, it is not uncommon to see system function tests that are not supported.

Make sure that the most current HDS software is loaded.

TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A

Check the ECM/PCM for DTCs and troubleshoot ECM/PCM (see **GENERAL TROUBLESHOOTING INFORMATION**) or F-CAN loss of communication errors first, then do this diagnosis if the symptom is related to the B-CAN system.

1. Compare the symptom with this list of B-CAN related systems:
    - Gauge control module

- Exterior lights
- Turn signals
- Entry light control
- Interior lights
- Safety indicators
- Horns (security and panic)
- Beepers (key-in, seat belt, lights-on, and parking brake)
- Power window/moonroof timer
- Wiper/washer
- Security
- Keyless entry
- Power door locks
- Key interlock
- Dashlights brightness
- Immobilizer
- Daytime running lights
- Driving position memory system
- XM radio
- AcuraLink
- HandsFreeLink
- Climate control
- Keyless access control
- BSI system

Is the symptom related to the B-CAN system?

YES - Go to step 2.

NO - Go to the system troubleshooting for the system with the symptom.

2. Connect the HDS to the data link connector (DLC) (A), then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

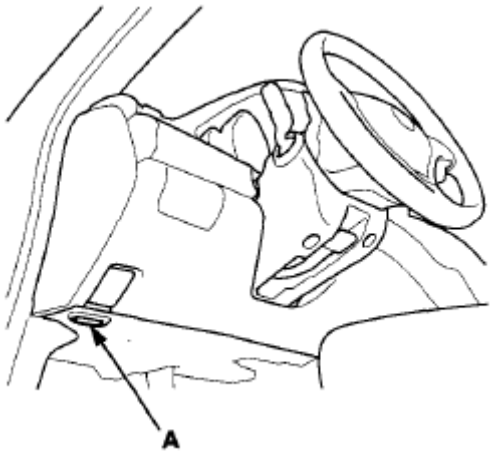

Fig. 10: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS listed to see if the following control units are communicating with the HDS.
   - Driver's MICU
   - Passenger's MICU
   - Door multiplex control unit (HDS name: Power Window Unit)
   - Gauge control module
   - Immobilizer-keyless control unit
   - Climate control unit
   - HandsFreeLink control unit
   - Power seat control unit (HDS name: Memory seat control unit)
   - AcuraLink control unit (XM receiver) (HDS name: HIP (Honda Information Platform) Unit)
   - Keyless access control unit (HDS name: Keyless access ECM)
   - BSI control unit

   NOTE:
   - **If a unit is communicating with the HDS, DETECT is displayed.**
   - **If a unit is not communicating or the vehicle is not equipped, "NOT AVAILABLE" is displayed.**
   - **The HDS only checks the status one time when BODY ELECTRICAL is selected. To recheck the status after repair, reboot the HDS.**

   Are all control units communicating with the HDS?

   YES - Go to step 4.

   NO - If any of the control units are not communicating, go to **B-CAN SYSTEM DIAGNOSIS TEST**

MODE B. If all units are not communicating or only the driver's MICU is communicating, go to **DTC U1280 TROUBLESHOOTING**.

4. Select the system that has the problem from the BODY ELECTRICAL SYSTEM SELECT menu, then select DTCs.

   Are any DTCs indicated?

   YES - Go to step 5.

   NO - If the problem is related to one of the following items, and the system that is malfunctioning does not stop or turn off, go to **B-CAN SYSTEM DIAGNOSIS TEST MODE C**. If the problem is related to one of the following items and the system that is malfunctioning does not run or turn on, go to **B-CAN SYSTEM DIAGNOSIS TEST MODE D**.

   - Exterior lights
   - Turn signals
   - Entry light control
   - Interior lights
   - Horns (security and panic)
   - Wiper/washer
   - Power window
   - Power door locks

   If the problem is related to one of the following items, go to the troubleshooting for that individual system.

   - Gauge control module
   - Safety indicators
   - Beepers (key-in, seat belt, lights-on, and parking brake)
   - Security
   - Keyless entry
   - Key interlock
   - Dashlights brightness
   - Navigation system (if equipped)
   - HandsFreeLink
   - Immobilizer
   - Driving position memory system
   - Rear window defogger (climate control)
   - Climate control
   - Keyless access control
   - BSI system

5. Record all DTCs, and sort them by DTC type.
6. Troubleshoot the DTC(s) in this order:
   - Battery voltage DTCs.
   - Internal error DTCs.
   - Loss of communication DTCs.
   - Signal error DTCs.

TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE B

Do this diagnosis if any of the control units are not communicating (NOT AVAILABLE is displayed on the HDS) as found by the B-CAN System Diagnosis Test Mode A (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A**).

1. Using the HDS, select the system that has the symptom from the BODY ELECTRICAL SYSTEM SELECT menu.
2. Select the DTCs, and then check for loss of communication DTCs.

   Are any loss of communication DTCs indicated?

   YES - Go to step 3.

   NO - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

3. Do the power, ground, and communication part of the input test for the unit(s) not communicating with the HDS.

Unit not communicating
Driver's MICU (see **MICU INPUT TEST**)
Gauge control module (see **GAUGE CONTROL MODULE INPUT TEST**)
Power control unit (see **RF UNIT REPLACEMENT**)
Keyless access control unit (see **CONTROL UNIT INPUT TEST**)
Remote slot control unit (see **RF UNIT REPLACEMENT**)
Immobilizer-keyless control unit (see **IMMOBILIZER-KEYLESS CONTROL UNIT INPUT TEST**)
Passenger's MICU (see **DTC U1283: DRIVER'S MICU LOST COMMUNICATION WITH PASSENGER'S MICU**)
Door multiplex control unit (see **POWER WINDOW MASTER SWITCH INPUT TEST**)
Climate control unit (see **CLIMATE CONTROL POWER AND GROUND CIRCUIT TROUBLESHOOTING**)
Audio-navigation unit (see **NAVIGATION UNIT CONNECTOR FOR INPUTS AND OUTPUTS**)
Power seat control unit (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**)
AcuraLink control unit (see **ACURALINK CONTROL UNIT (XM RECEIVER) CONNECTOR**

FOR INPUTS AND OUTPUTS)
HandsFreeLink control unit (see **CONTROL UNIT INPUT TEST**)
BSI control unit (see **BLIND SPOT INFORMATION SYSTEM (BSI) CONTROL UNIT INPUTS AND OUTPUTS**)

TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE C

Do this diagnosis if a component that is controlled by the B-CAN system does not stop or turn off.

NOTE:

- **If the component does not turn on, go to B-CAN SYSTEM DIAGNOSIS TEST MODE D.**
- **See the B-CAN system unit input/output index for a list of input and output devices and the control units that monitor the input and control the output devices (see HDS INPUTS AND FUNCTION TESTS).**

1. Check for DTCs by selecting the MODE MENU from the HDS.

   Are any DTCs indicated?

   YES - Go to **B-CAN SYSTEM DIAGNOSIS TEST MODE A** (see).

   NO - Go to step 2.

2. Turn off the switch that controls the malfunctioning component.
3. Select the applicable system from the system MODE MENU, then select DATA LIST, and check the input of the switch that controls the component.

   Does the HDS indicate the switch is OFF?

   YES - Go to step 4.

   NO - Go to step 6.

4. In the DATA LIST, check the output signal of the malfunctioning component.

   Is the output signal OFF?

   YES - Go to step 5.

   NO - Replace the control unit that controls the device that will not turn OFF.

5. Check the relay that does not stop or turn off, if applicable, then check for a short in the wire between the relay and the component, the relay and control unit, or the component and control unit.

   Are the relay and the wire harness OK?

YES - Replace the control unit that controls the component that will not stop or turn OFF.

NO - Replace the relay or repair/replace the wire harness.

6. Check the switch, then check for a short in the wire between the switch and the control unit that monitors the switch.

   Are the switch and wire harness OK?

   YES - Replace the control unit that monitors the switch.

   NO - Replace the switch, or repair/replace the wire harness.

TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE D

Do this diagnosis if a component that is controlled by the B-CAN system does not run or come on.

NOTE:

- **If the component does not turn off or stop, go to B-CAN SYSTEM DIAGNOSIS TEST MODE C.**
- **See the B-CAN system unit input/output index for a list of input and output devices and the control units that monitor the input and control the output devices (see HDS INPUTS AND FUNCTION TESTS).**

1. Check the fuse of the malfunctioning output device.

   Is the fuse OK?

   YES - Go to step 2.

   NO - Replace the fuse. If the fuse blows again, repair a short to ground on the fuse circuit of the malfunctioning device.

2. Check for DTCs by selecting the MODE MENU from the HDS.

   Are any DTCs indicated?

   YES - Go to **B-CAN SYSTEM DIAGNOSIS TEST MODE A**.

   NO - Go to step 3.

3. Turn ON the switch that controls the malfunctioning component.
4. Select the applicable system from the system MODE MENU, then select DATA LIST, and check output signal for the malfunctioning component.

   Is there an output signal?

YES - Go to step 5.

NO - Go to step 9.

5. Check the relay and ground, then check for an open or a short in the circuit for the malfunctioning component.

   Is the relay and the circuit OK?

   YES - Go to step 6.

   NO - Replace the relay or repair the wire circuit.

6. Do the function test for the malfunctioning component.

   Does the output device pass the function test?

   YES - Go to step 7.

   NO - Replace the component.

7. With the malfunctioning output device connected, connect a voltmeter between the malfunctioning output device and body ground on the wire that the control unit uses to control the output device circuit.
8. Select FUNCTIONAL TEST from the MODE MENU, and do the forced operation test of the malfunctioning component.

   Is there a change in voltage (12 V to 0 V or 0 V to 12 V)?

   YES - Inspect the ground for the component. If OK, replace the component.

   NO - Replace the control unit that controls the malfunctioning component.

9. Select DATA LIST from the system MODE MENU, and make sure the switch signal input for the malfunctioning system indicates a change when operated.

   Does the switch input indicate ON when the switch is ON?

   YES - Replace the control unit that controls the malfunctioning component.

   NO - Go to step 10.

10. Check the switch and its ground (if applicable), then check for an open or a short in the wire between the switch and the control unit that monitors it.

    Is the switch and the wire harness OK?

    YES - Replace the control unit that monitors the switch.

NO - Replace the switch, or repair/replace the wire harness.

TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE 1 AND TEST MODE 2 (WITHOUT THE HDS)

Special Tools Required

MPCS (MCIC) Service Connector 07WAZ-001010A

Test Mode 1

Check the ECM/PCM for DTCs and troubleshoot ECM/PCM (see **GENERAL TROUBLESHOOTING INFORMATION**) or F-CAN loss of communication errors first, then do this diagnosis if the HDS is not available.

1. Check the No. 15(10 A) fuse in the under-hood fuse/relay box and the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Are the fuses OK?

   YES - Go to step 2.

   NO - Replace the fuses. If the fuse blows again, repair the short to ground on the fuse circuit(s).

2. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and move the interior lights switch to the DOOR position.
4. Connect the MPCS service connector (A) to the MICU service check connector socket (B) in the driver's under-dash fuse/relay box.

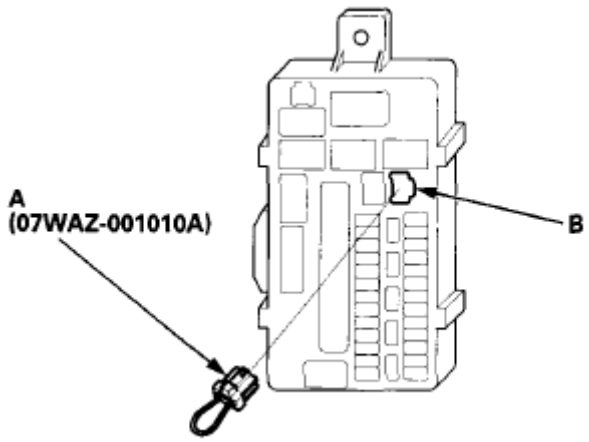

Fig. 11: Connecting MPCS Service Connector To MICU Service Check Connector Socket In Driver's Under-Dash Fuse/Relay Box

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Wait 5 seconds, and watch the front individual map lights and rear individual map lights. When the front individual map lights and rear individual map lights flash quickly once and then goes off, the system is in Test Mode 1.
6. Check for B-CAN DTCs indicated by the multi-information display (MID) on the gauge control module while still in Test Mode 1. Press the SEL/RESET button to display the next code. After you get to the last code, the display shows END. If no DTCs are stored, the display will read NO (see **HOW TO DISPLAY DTCS ON THE MID OF THE GAUGE CONTROL MODULE**).

NOTE: If the test times out, remove the MPCS service connector, turn the ignition switch to LOCK (0), and repeat steps 3 and 4.

Are any DTCs indicated?

YES - Go to step 7.

NO - Go to step 9.

7. Record all DTCs and troubleshoot them in this order:
   - Battery voltage DTCs
   - Internal error DTCs
   - Loss of communication DTCs
   - Signal error DTCs
8. Clear the DTCs by pressing and holding the SEL/RESET button for about 10 seconds.
9. You will hear a beep to confirm the codes have been cleared. Operate the devices that failed, and recheck for codes.

Test Mode 2

10. Remove the MPCS service connector from the driver's under-dash fuse/relay box MICU service check connector socket for 5-10 seconds, then re-insert it to enter Mode 2. When the system enters Mode 2, the front individual map lights and rear individual map lights flash two times quickly and then goes off.

NOTE: If the MPCS service connector is disconnected for too short or too long of a time, or if the ignition switch is turned to LOCK (0), or if the vehicle is in OFF mode, the systems returns to Test Mode 1.

11. The following tables list the circuits that can be checked in Test Mode 2. Operate the switch that is most closely related to the problem. If the circuit is OK, the front individual map lights and rear individual map lights blink once. If the circuit is faulty, there is no indication.

DRIVER'S MICU

Item

Brake pedal position switch (ON)
Driver's door switch
Left rear door switch
Trunk lid latch switch
Fog light switch
Left rear door lock knob switch (UNLOCK)
Wiper switch (HI/LO)
Wiper switch (INT/LO)
Wiper switch (MIST)
Washer switch
Wiper intermittent dwell time controller
Turn signal switch (LEFT)
Turn signal switch (RIGHT)
Hazard warning switch (ON)
Headlight switch (AUTO)
Headlight switch (ON)
Headlight switch (OFF)
Lighting switch (ON)
Dimmer switch (ON)
Passing switch (ON)
Trunk lid opener main switch
Trunk lid outer handle switch
Transmission range switch (P) (A/T)
Ignition key switch
Security hood switch
Windshield wiper motor park position (Auto stop)
Driver's seat heater switch (LO)
Driver's seat heater switch (HI)
Rear defogger switch

PASSENGER'S MICU

Item
Front passenger's door switch
Right rear door switch
Right rear door lock knob switch (UNLOCK)
Audio unit
Front passenger's seat heater switch (LO)
Front passenger's seat heater switch (HI)

DOOR MULTIPLEX CONTROL UNIT

Item

Driver's door lock switch (UNLOCK)
Driver's door lock switch (LOCK)
Driver's door lock knob switch (UNLOCK)
Driver's door lock knob switch (LOCK)
Driver's door key cylinder switch (UNLOCK)(1)
Driver's door key cylinder switch (LOCK)(1)
(1) A second key is necessary to check the key cylinder inputs. Be sure to rotate the key cylinder switch two times to each position (lock and lock, unlock and unlock) to ensure the door lock knob switch is in the appropriate position.

FRONT PASSENGER'S POWER WINDOW SWITCH

Item
Front passenger's door lock switch (UNLOCK)
Front passenger's door lock switch (LOCK)
Front passenger's door lock knob switch (UNLOCK)

POWER SEAT CONTROL UNIT

Item
Transmission range switch (P) (A/T)
Parking brake switch (M/T)
Slide switch (Forward)
Slide switch (Backward)
Recline switch (Forward)
Recline switch (Backward)
Front UP-DOWN switch (Up)
Front UP-DOWN switch (Down)
Rear UP-DOWN switch (Up)
Rear UP-DOWN switch (Down)

Do the front individual map lights and rear individual map lights work properly in all switch positions?

YES - Go to function and input test for the system related to the failure.

NO - Repair the open, or short, or replace the faulty switch.

SLEEP AND WAKE-UP MODE TEST

1. Shift to the sleep mode:

   Close all doors. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, remove the key without keyless access system, then open and close the driver's door. If the MICU receives no signals from the inputs listed below, it will go into sleep mode in less than 50 seconds.

- IG1 power supply
- IG2 power supply
- B-CAN data
- Trunk lid latch switch (Trunk lid closed) (OFF)
- Hazard warning switch (OFF)

2. Confirm the sleep mode:

NOTE: Check the official Honda service website for more service information about parasitic draw at the battery.

Check the parasitic draw at the battery while shifting into the sleep mode; amperage should change from about 200 mA to less than 35 mA in less than 50 seconds.

3. Shift to the wake-up mode:

When the ignition switch is turned to ON (II), or the vehicle is in ON mode. The driver's MICU, the passenger's MICU, the gauge control module, the immobilizer-keyless control unit, and the ECM/PCM wake-up at the same time without "talking" to each other through the communication lines. When any switch in the multiplex integrated control system is turned on, it wakes up its related control unit which, in turn, wakes up the other units. After confirming the sleep mode, look in the following table for the switch most related to the problem. Operate that switch and see if its control unit wakes up.

NOTE: If any control unit is faulty and does not wake up, several circuits in the system malfunction at the same time. Below is a list of the switches and input signals that wake them up.

- IG1 power supply
- IG2 power supply
- B-CAN data
- Driver's door switch (door open)
- Left rear door switch (door open)
- Trunk lid latch switch (Trunk lid open)
- Left rear door lock knob switch
- Security hood switch (hood open)
- Hazard warning switch (ON)
- Combination light switch (Parking, Headlight, Dimmer, Passing ON)
- Ignition key switch (key inserted)
- Trunk lid opener main switch (ON)
- Driver's door key cylinder switch (LOCK/UNLOCK)
- Passenger's rear door lock knob switch (UNLOCK)
- Front passenger's door lock knob switch (UNLOCK)

- Driver's door lock switch (LOCK/UNLOCK)
- Front passenger's door lock switch (LOCK/UNLOCK)
- Front passenger's door switch (door open)
- Passenger's rear door switch (door open)
- Trunk release switch (ON)

DTC TROUBLESHOOTING

DTC B10A2: DRIVER'S MICU INTERNAL (EEPROM) ERROR

NOTE: **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Check for DTCs with the HDS.

   Is DTC B10A2 indicated?

   YES - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

   NO - Intermittent failure, the system is OK at this time.

DTC B11A2: PASSENGER'S MICU INTERNAL (EEPROM) ERROR

NOTE: **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Check for DTCs with the HDS.

   Is DTC B11A2 indicated?

   YES - Faulty passenger's MICU; replace the passenger's under-dash fuse/relay box (see **PASSENGER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

   NO - Intermittent failure, the system is OK at this time.

DTC B1036: DRIVER'S MICU IG1 LINE INPUT ERROR

NOTE:

- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **Before troubleshooting, make sure the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box is OK.**

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to

select the OFF mode and then the ON mode.

3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC B1036 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections at the driver's under-dash fuse/relay box connector C (5P). If the connections are good, check the battery condition (see **BATTERY TEST**) and the charging system.

5. Measure the voltage between gauge control module 32P connector terminals No. 15 and body ground.

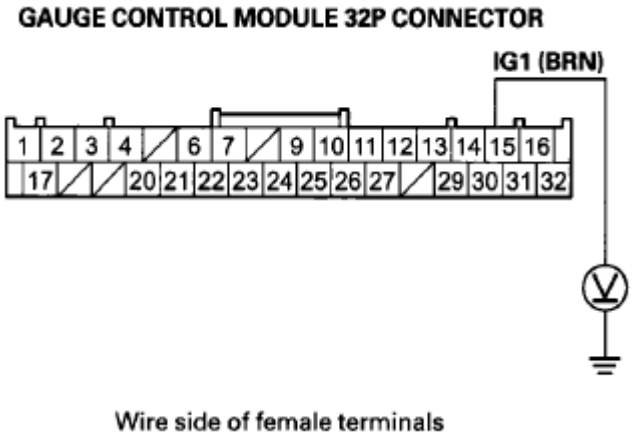

Fig. 16: Measuring Voltage Between Gauge Control Module 32P Connector Terminals No. 15 And Body Ground With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO - Repair an open or high resistance in the wire between the driver's under-dash fuse/relay box and the gauge control module.

DTC B11C7: PASSENGER'S MICU IG1 LINE INPUT ERROR

NOTE:

- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **Before troubleshooting, make sure the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box is OK.**

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC B11C7 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition (see **BATTERY TEST**) and the charging system.

5. Check the DTCs with the HDS.

   Is DTC B11C7 indicated with DTC U1282?

   YES - Go to **DTC U1282 TROUBLESHOOTING**.

   NO - Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Measure the voltage between the passenger's under-dash fuse/relay box connector A (38P) terminal No. 35 and body ground.

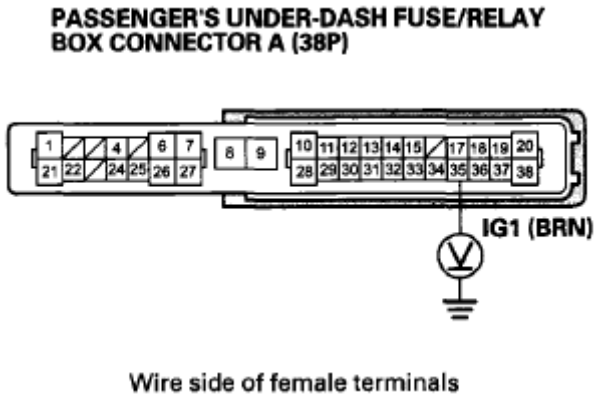

Fig. 17: Measuring Voltage Between Passenger's Under-Dash Fuse/Relay Box Connector A (38P) Terminal No. 35 And Body Ground With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Faulty passenger's MICU; replace passenger's under-dash fuse/relay box (see **PASSENGER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO - Repair an open or high resistance in the wire between the passenger's under-dash fuse/relay box and the driver's under-dash fuse/relay box.

DTC U0155: DRIVER'S MICU LOST COMMUNICATION WITH GAUGE CONTROL MODULE

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U0155 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the driver's MICU and the gauge control module.

5. Measure the voltage between body ground and gauge control module 32P connector terminals No. 15 and No. 16 individually.

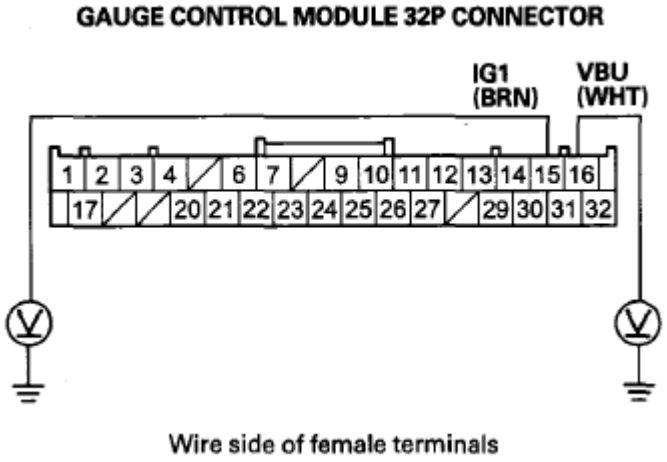

Fig. 18: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 15 And No. 16 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 7.

NO - Go to step 6.

6. Check the No. 15 (10 A) fuse in the under-hood fuse/relay box and the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Are the fuses OK?

   YES - Repair an open or high resistance in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

   NO - Replace the fuse(s). If the fuse blows again, repair a short to ground in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

7. Measure the voltage between body ground and gauge control module 32P connector terminals No. 1 and No. 17 individually.

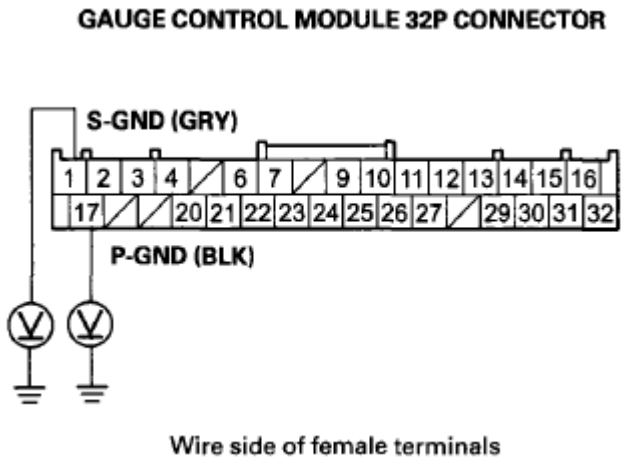

Fig. 19: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 1 And No. 17 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there less than 0.2 V?

   YES - Go to step 8.

   NO - Repair an open or high resistance in the ground wire or poor ground (G401) and/or (G402).

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Disconnect driver's under-dash fuse/relay box connector P (20P).
10. Disconnect the gauge control module 32P connector.
11. Check for continuity between gauge control module 32P connector terminals No. 29 and No. 30 and driver's under-dash fuse/relay box connector P (20P) terminals No. 5 and No. 6 respectively.

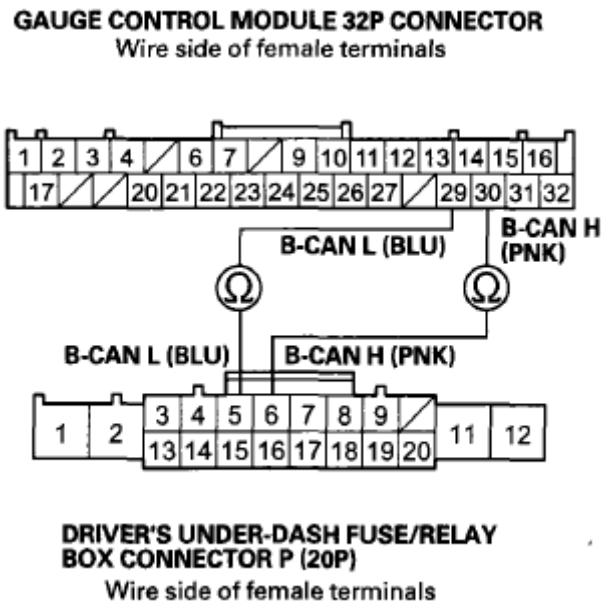

Fig. 20: Checking Continuity Between Gauge Control Module 32P Connector Terminals And Driver's Under-Dash Fuse/Relay Box Connector P (20P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO - Repair an open or poor connection in the B-CAN wire between the driver's MICU and the gauge control module.

DTC U0155: PASSENGER'S MICU LOST COMMUNICATION WITH GAUGE CONTROL MODULE

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U0155 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the passenger's MICU and the gauge control module.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the gauge control module detected?

   YES - Go to step 9.

   NO - Go to step 6.

6. Measure the voltage between body ground and gauge control module 32P connector terminals No. 15 and No. 16 individually.

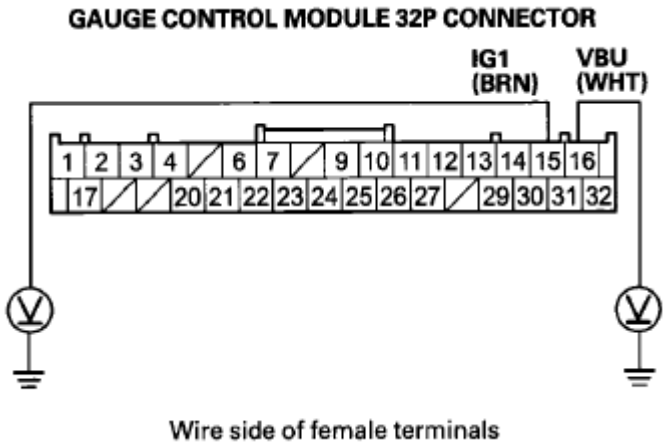

Fig. 21: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 15 And No. 16 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES - Go to step 8.

   NO - Go to step 7.

7. Check the No. 15 (10 A) fuse in the under-hood fuse/relay box and the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Are the fuses OK?

   YES - Repair an open or high resistance in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

   NO - Replace the fuse(s). If the fuse blows again, repair a short to ground in the No. 15(10 A) and/or No. 12 (7.5 A) fuse circuit.

8. Measure the voltage between body ground and gauge control module 32P connector terminals No. 1 and No. 17 individually.

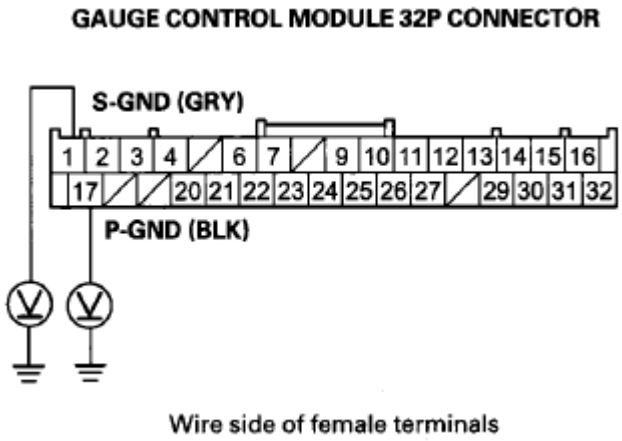

Fig. 22: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 1 And No. 17 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 9.

NO - Repair an open or high resistance in the ground wire or poor ground (G401) and/or (G402).

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect passenger's under-dash fuse/relay box connector A (38P).
11. Disconnect the gauge control module 32P connector.
12. Check for continuity between gauge control module 32P connector terminals No. 29 and No. 30 and passenger's under-dash fuse/relay box connector A (38P) terminals No. 29 and No. 11 respectively.

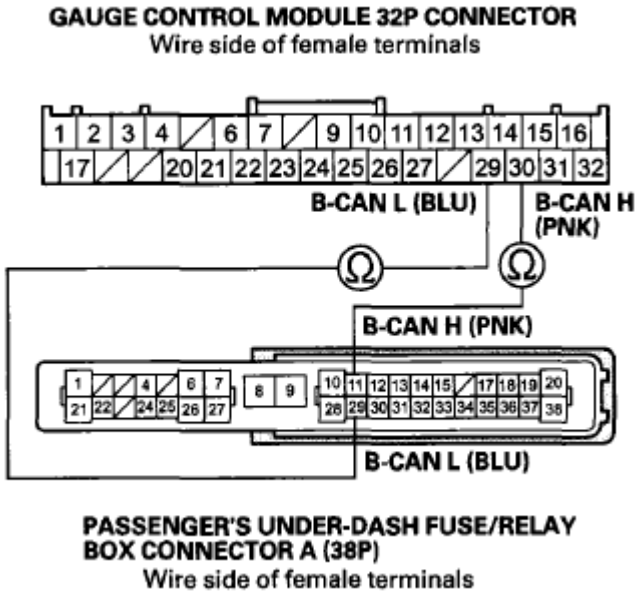

Fig. 23: Checking Continuity Between Gauge Control Module 32P Connector Terminals And Passenger'S Under-Dash Fuse/Relay Box Connector A (38P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO - Repair an open or poor connection in the B-CAN wire between the passenger's MICU and the gauge control module.

DTC U0199: DRIVER'S MICU LOST COMMUNICATION WITH DOOR MULTIPLEX CONTROL UNIT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U0199 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the driver's MICU and the door multiplex control unit.

5. Measure the voltage between body ground and power window master switch 37P connector terminal No. 13.

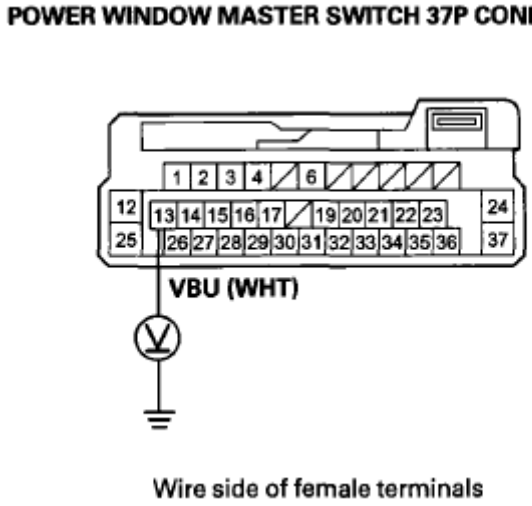

Fig. 24: Measuring Voltage Between Body Ground And Power Window Master Switch 37P Connector Terminal No. 13 With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 7.

NO - Go to step 6.

6. Check the No. 15(10 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES - Repair an open or high resistance in the No. 15 (10 A) fuse circuit.

   NO - Replace the fuse. If the fuse blows again, repair a short to ground in the No. 15(10 A) fuse circuit.

7. Measure the voltage between body ground and power window master switch 37P connector terminals No. 32 and No. 37 individually.

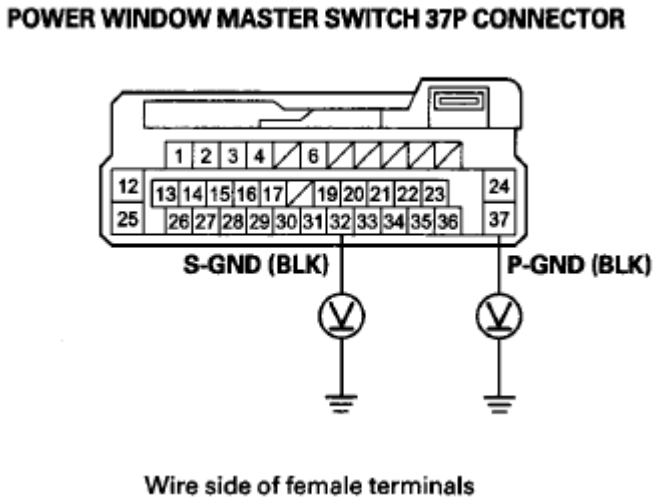

Fig. 25: Measuring Voltage Between Body Ground And Power Window Master Switch 37P Connector Terminals No. 32 And No. 37 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 8.

NO - Repair an open or high resistance in the ground wire or poor ground (G401) and/or (G402).

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Disconnect driver's under-dash fuse/relay box connector P (20P).
10. Disconnect the power window master switch 37P connector.
11. Check for continuity between power window master switch 37P connector terminals No. 33 and No. 35 and driver's under-dash fuse/relay box connector P (20P) terminals No. 5 and No. 6 respectively.

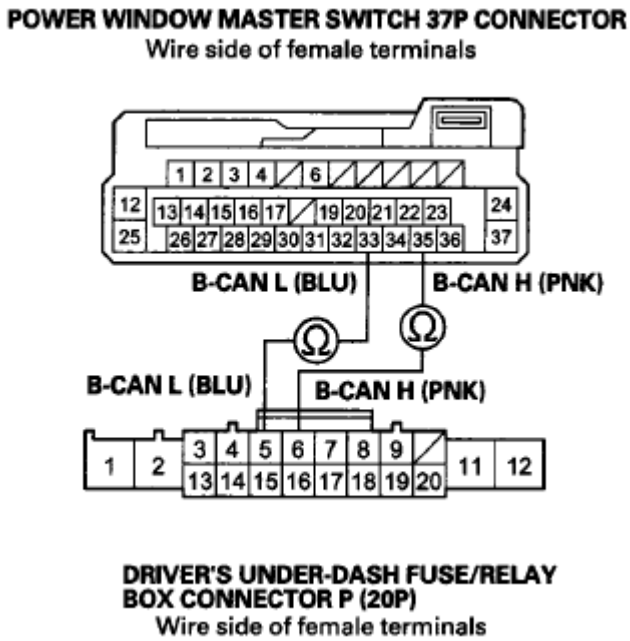

Fig. 26: Checking Continuity Between Power Window Master Switch 37P Connector Terminals And Driver's Under-Dash Fuse/Relay Box Connector P (20P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the power window master switch (see **REAR POWER WINDOW SWITCH TEST**).

NO - Repair an open or poor connection in the B-CAN wire between the driver's MICU and the door multiplex control unit.

DTC U1280: COMMUNICATION BUS LINE ERROR (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U1280 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections, or

worn/shorted wires. If the connections are good, check the battery condition (see **BATTERY TEST**) and the charging system.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the appropriate connector at each control unit in the table one at a time. Clear the DTC, then recheck for DTCs after each unit is disconnected.

Control Unit	Connector
Passenger's MICU	Passenger's under-dash fuse/relay box connector A (38P)
Door multiplex control unit	Power window master switch 37P connector
Gauge control module	32P connector
Immobilizer-keyless control unit(1)	7P connector
Power control unit(2)	Connector C (36P)
Keyless access control unit(2)	Connector B (32P)
Remote slot control unit(2)	40P connector
Audio-navigation control unit(4)	Connector D (20P)
Audio unit(3)	Connector D (20P)
Climate control unit	Connector C (20P)
Power seat control unit	Connector B (40P)
HandsFreeLink control unit(3)	28P connector
AcuraLink control unit(5)	Connector A (32P)
BSI control unit(6)	16P connector
(1) Without keyless access system (2) With keyless access system (3) Without navigation (4) With navigation (5) USA models with navigation (6) With BSI	

Is DTC U1280 indicated with each individual unit disconnected?

YES - Leave the connectors disconnected, and go to step 7.

NO - Go to the input test (or circuit troubleshooting) for the control unit that was disconnected when DTC U1280 did not reset, and perform all power and ground input tests. If the tests prove OK, replace that unit.

- Passenger's MICU input test (see **DTC U1283: DRIVER'S MICU LOST COMMUNICATION WITH PASSENGER'S MICU**)

- Door multiplex control unit (power window master switch) input test (see **POWER WINDOW MASTER SWITCH INPUT TEST**)
- Gauge control module input test (see **GAUGE CONTROL MODULE INPUT TEST**)
- Power control unit input test (see **RF UNIT REPLACEMENT**)
- Keyless access control unit input test (see **CONTROL UNIT INPUT TEST**)
- Remote slot control unit input test (see **RF UNIT REPLACEMENT**)
- Immobilizer-keyless control unit input test (see **IMMOBILIZER-KEYLESS CONTROL UNIT INPUT TEST**)
- Climate control unit power and ground circuit troubleshooting (see **CLIMATE CONTROL POWER AND GROUND CIRCUIT TROUBLESHOOTING**)
- Power seat control unit input test (see **POWER SEAT CONTROL UNIT INPUT TEST/REPLACEMENT**)
- HandsFreeLink control unit input test (see **CONTROL UNIT INPUT TEST**)
- AcuraLink control unit input test (see **ACURALINK CONTROL UNIT (XM RECEIVER) CONNECTOR FOR INPUTS AND OUTPUTS**)
- Audio unit input test (see **AUDIO UNIT CONNECTOR FOR INPUTS AND OUTPUTS (WITH NAVIGATION)**)
- Audio-navigation unit input test (see **NAVIGATION UNIT CONNECTOR FOR INPUTS AND OUTPUTS**)
- BSI control unit input test (see **BLIND SPOT INFORMATION SYSTEM (BSI) CONTROL UNIT INPUTS AND OUTPUTS**).

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
9. Disconnect driver's under-dash fuse/relay box connector P (20P).
10. Check for continuity between driver's under-dash fuse/relay box connector P (20P) terminals No. 5 and No. 6.

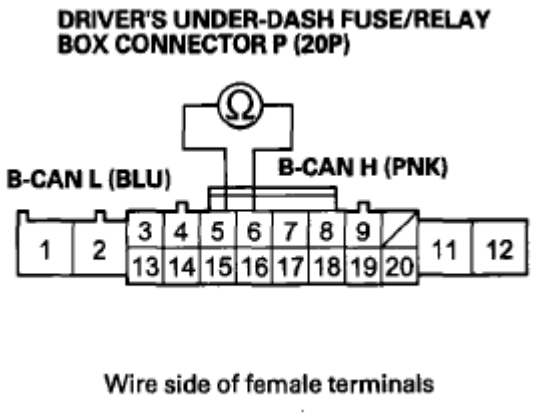

Fig. 27: Checking Continuity Between Driver's Under-Dash Fuse/Relay Box Connector P (20P) Terminals No. 5 And No. 6 With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short in the B-CAN wires.

NO - Go to step 11.

11. Check for continuity between body ground and driver's under-dash fuse/relay box connector P (20P) terminals No. 5 and No. 6 individually.

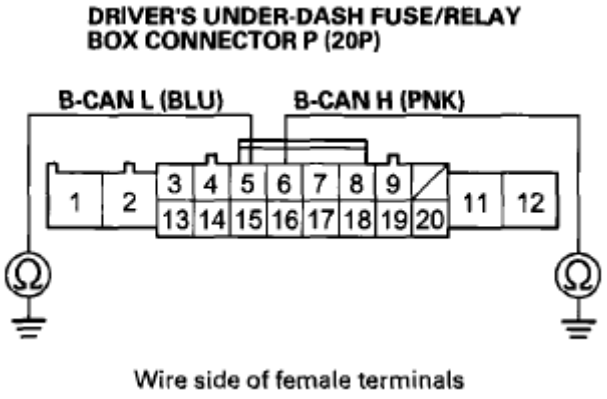

Fig. 28: Checking Continuity Between Body Ground And Driver's Under-Dash Fuse/Relay Box Connector P (20P) Terminals No. 5 And No. 6 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire(s).

NO - Go to step 12.

12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Measure the voltage between body ground and driver's under-dash fuse/relay box connector P (20P) terminals No. 5 and No. 6 individually.

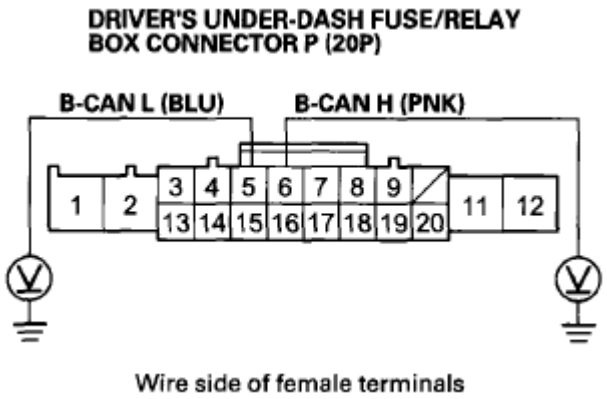

Fig. 29: Measuring Voltage Between Body Ground And Driver's Under-Dash Fuse/Relay Box Connector P (20P) Terminals No. 5 And No. 6 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES - Repair a short to power in the wire(s).

NO - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

DTC U1282: PASSENGER'S MICU LOST COMMUNICATION WITH DRIVER'S MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U1282 indicated?

YES - Faulty passenger's MICU; replace the passenger's under-dash fuse/relay box (see **PASSENGER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the Passenger's MICU and the driver's MICU.

DTC U1283: DRIVER'S MICU LOST COMMUNICATION WITH PASSENGER'S MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U1283 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the driver's MICU and the passenger's MICU.

5. Measure the voltage between body ground and passenger's under-dash fuse/relay box connector A (38P) terminals No. 14 and No. 35 individually.

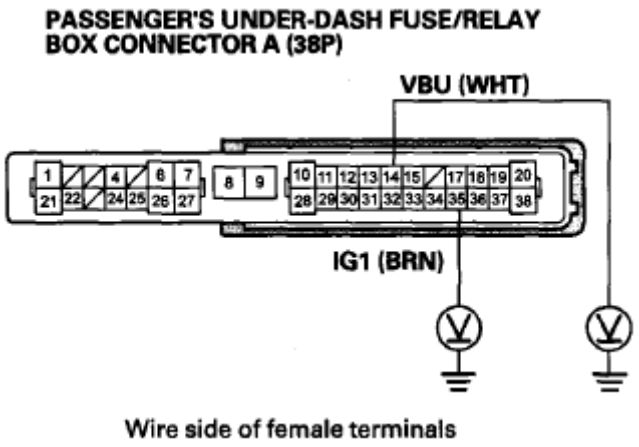

Fig. 30: Measuring Voltage Between Body Ground And Passenger's Under-Dash Fuse/Relay Box Connector A (38P) Terminals No. 14 And No. 35 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 7.

NO - Go to step 6.

6. Check the No. 15 (10 A) fuse in the under-hood fuse/relay box and the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box.

Are the fuses OK?

YES - Repair an open or high resistance in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

NO - Replace the fuse(s). If the fuse blows again, repair a short to ground in the No. 15(10 A) and/or No. 12 (7.5 A) fuse circuit.

7. Measure the voltage between body ground and passenger's under-dash fuse/relay box connector A (38P) and E (18P) terminals as shown.

Passenger's under-dash fuse/relay box connector	
A36	Body ground
A37	

E15

Courtesy of AMERICAN HONDA MOTOR CO., INC.

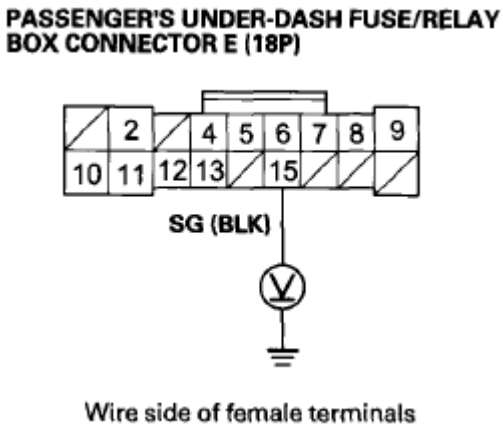

Fig. 32: Measuring Voltage Between Body Ground And Passenger's Under-Dash Fuse/Relay Box Connector And E (18P) Terminals With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 8.

NO - Repair an open or high resistance in the ground wire or poor ground (G203), (G401), and/or (G405).

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Disconnect passenger's under-dash fuse/relay box connector A (38P).
10. Disconnect the power window master switch 37P connector.
11. Check for continuity between passenger's under-dash fuse/relay box connector A (38P) terminals No. 11 and No. 29 and driver's under-dash fuse/relay box connector P (20P) terminals No. 6 and No. 5

respectively.

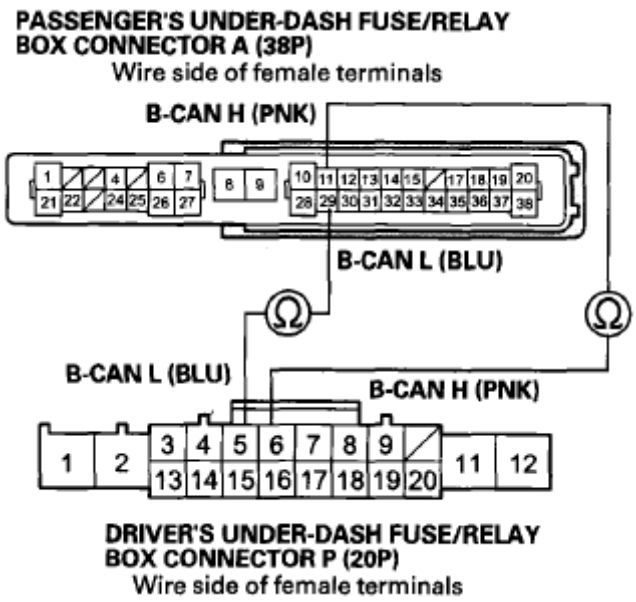

Fig. 33: Checking Continuity Between Passenger's Under-Dash Fuse/Relay Box Connector A (38P) Terminals And Driver's Under-Dash Fuse/Relay Box Connector P (20P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO - Repair an open or poor connection in the B-CAN wire between the driver's MICU and the passenger's MICU.

MICU INPUT TEST

NOTE: Before testing, troubleshoot the multiplex integrated control system first, using B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

Driver's MICU

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
3. Disconnect driver's under-dash fuse/relay box connectors F, N, P, Q, and R.

NOTE: All connector views are wire side of female terminals.

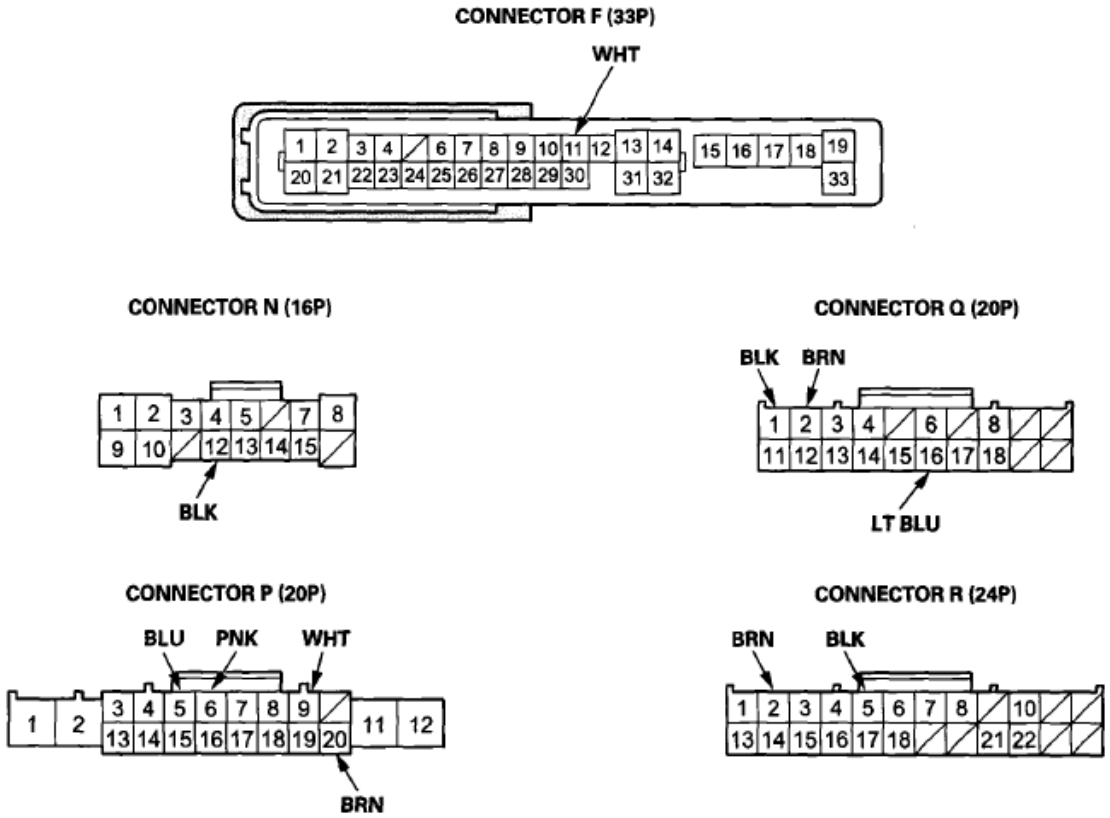

Fig. 34: Identifying Driver's MICU F (33P), N(16P), Q (20P), P (20P) & R (24P) Connector End Views
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.
5. With the connectors still disconnected, do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 6.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
P5(1)	BLU	Power control unit connector C (36P) disconnected	Check for continuity between terminal P5 and power control unit connector C (36P) terminal No. 17: There should be continuity.	An open in the B-CAN wire
P6(1)	PNK		Check for continuity between terminal P6 and power control unit connector C (36P) terminal No. 16: There should be continuity.	An open in the B-CAN wire

P5(1)	BLU	Keyless access control unit connector B (32P) disconnected	Check for continuity between terminal P5 and keyless access control unit connector B (32P) terminal No. 7: There should be continuity.	An open in the B-CAN wire
P6(1)	PNK		Check for continuity between terminal P6 and keyless access control unit connector B (32P) terminal No. 8: There should be continuity.	An open in the B-CAN wire
P5(1)	BLU	Remote slot control unit 40P connector disconnected	Check for continuity between terminal P5 and remote slot control unit 40P connector terminal No. 23: There should be continuity.	An open in the B-CAN wire
P6(1)	PNK		Check for continuity between terminal P6 and remote slot control unit 40P connector terminal No. 3: There should be continuity.	An open in the B-CAN wire
P5(2)	BLU	Immobilizer-keyless control unit 7P connector disconnected	Check for continuity between terminal P5 and immobilizer-keyless control unit 7P connector terminal No. 3: There should be continuity.	An open in the B-CAN wire
P6(2)	PNK		Check for continuity between terminal P6 and immobilizer-keyless control unit 7P connector terminal No. 4: There should be continuity.	An open in the B-CAN wire
P5	BLU	Gauge control module 32P connector disconnected	Check for continuity between terminal P5 and gauge control module 32P connector terminal No. 29: There should be continuity.	An open in the B-CAN wire
P6	PNK		Check for continuity between terminal P6 and gauge control module 32P connector terminal No. 30: There should be continuity.	An open in the B-CAN wire
P5	BLU	Power window master switch 37P connector disconnected	Check for continuity between terminal P5 and power window master switch 37P connector terminal No. 33: There should be continuity.	An open in the B-CAN wire
P6	PNK		Check for continuity between terminal P6 and power window master switch 37P connector terminal No. 35: There should be continuity.	An open in the B-CAN wire
P5	BLU	Passenger's under-dash fuse/relay box connector A (38P) disconnected	Check for continuity between terminal P5 and passenger's under-dash fuse/relay box connector A (38P) terminal No. 29: There should be continuity.	An open in the B-CAN wire
P6	PNK		Check for continuity between terminal P6 and passenger's under-dash fuse/relay	An open in the

			box connector A (38P) terminal No. 11 : There should be continuity.	B-CAN wire
P5	BLU	Climate control unit connector C (20P) disconnected	Check for continuity between terminal P5 and climate control unit connector C (20P) terminal No. 7: There should be continuity.	An open in the B-CAN wire
P6	PNK		Check for continuity between terminal P6 and climate control unit connector C (20P) terminal No. 8: There should be continuity.	An open in the B-CAN wire
P5(3)	BLU	Audio-navigation unit connector D (20P) disconnected	Check for continuity between terminal P5 and audio-navigation unit connector D (20P) terminal No. 28: There should be continuity.	An open in the B-CAN wire
P6(3)	PNK		Check for continuity between terminal P6 and audio-navigation unit connector D (20P) terminal No. 12: There should be continuity.	An open in the B-CAN wire
P5(4)	BLU	Audio unit connector D (20P) disconnected	Check for continuity between terminal P5 and audio unit connector D (20P) terminal No. 8: There should be continuity.	An open in the B-CAN wire
P6(4)	PNK		Check for continuity between terminal P6 and audio unit connector D (20P) terminal No. 18: There should be continuity.	An open in the B-CAN wire
P5	BLU	Power seat control unit connector B (40P) disconnected	Check for continuity between terminal P5 and power seat control unit connector B (40P) terminal No. 39: There should be continuity.	An open in the B-CAN wire
P6	PNK		Check for continuity between terminal P6 and power seat control unit connector B (40P) terminal No. 40: There should be continuity.	An open in the B-CAN wire
P5(4)	BLU	HandsFreeLink control unit 28P connector disconnected	Check for continuity between terminal P5 and HandsFreeLink control unit 28P connector terminal No. 17: There should be continuity.	An open in the B-CAN wire
P6(4)	PNK		Check for continuity between terminal P6 and HandsFreeLink control unit 28P connector terminal No. 18: There should be continuity.	An open in the B-CAN wire
P5(5)	BLU	AcuraLink control unit	Check for continuity between terminal P5 and AcuraLink control unit connector A (32P) terminal No. 8: There should be continuity.	An open in the B-CAN wire

P6(5)	PNK	connector A (32P) disconnected	Check for continuity between terminal P6 and AcuraLink control unit connector A (32P) terminal No. 9: There should be continuity.	An open in the B-CAN wire
P5(6)	BLU	BSI control unit 16P connector disconnected	Check for continuity between terminal P5 and BSI control unit 16P connector terminal No. 5: There should be continuity.	An open in the B-CAN wire
P6(6)	PNK		Check for continuity between terminal P6 and BSI control unit 16P connector terminal No. 6: There should be continuity.	An open in the B-CAN wire
Q16	LT BLU	Under all conditions	Check for continuity between terminal Q16 and data link connector (DLC) terminal No. 7: There should be continuity.	An open in the K-LINE wire

(4) Without navigation

(5) USA models with AcuraLink

(6) With BSI

6. Reconnect the connectors to the driver's under-dash fuse/relay box, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 7.

NOTE: These are power and ground tests for the multiplex integrated control unit.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
F11	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15(10 A) fuse in the under-hood fuse/relay box • An open or high resistance in the wire
P9	WHT	Under all conditions	Measure the voltage to ground: There should be	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • Faulty driver's under-dash

			battery voltage.	fuse/relay box • An open or high resistance in the wire
P20	BRN	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 12 (7.5 A) fuse in the driver's under- dash fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
N12	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G402) • An open or high resistance in the ground wire
Q1	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G402) • An open or high resistance in the ground wire
Q2	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
R2	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
R5	BLK	In all ignition switch positions or ail power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G402) • An open or high resistance in the ground wire

Passenger's MICU

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Remove the passenger's kick panel (see **TRIM REMOVAL/INSTALLATION - DOOR AREAS**).
9. Disconnect passenger's under-dash fuse/relay box connectors A and E.

NOTE: All connector views are wire side of female terminals.

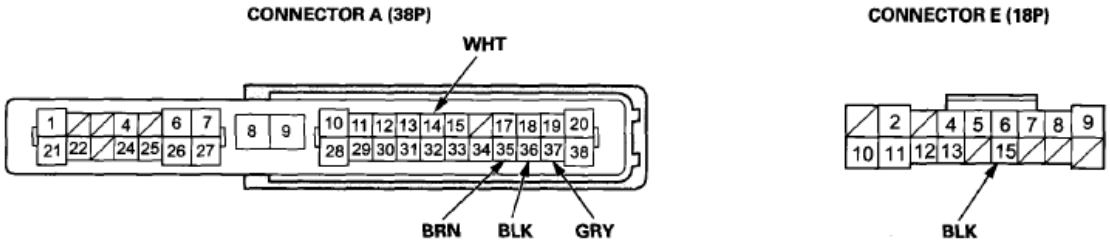

Fig. 35: Identifying Passenger's MICU A (38P) & E (18P) Connector End Views
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Inspect the connector and socket terminals to be sure they are all making good contact.
    - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
    - If the terminals look OK, go to step 11.
11. Reconnect the connectors to the passenger's under-dash fuse/relay box, turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 12.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
A14	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
A35	BRN	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
A36	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G405) • An open or high resistance in the ground wire
A37	GRY	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G401) • An open or high resistance in the ground wire
E15	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G203) • An open or high resistance in the ground wire

12. If multiple failures are found on more than one control unit, replace the driver's under-dash fuse/relay box (includes the driver's MICU) (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**). If input failures are related to a particular control unit, replace the control unit.

Courtesy of AMERICAN HONDA MOTOR CO., INC.

GENERAL TROUBLESHOOTING INFORMATION

GENERAL OPERATION

Refer to the Navigation Manual for the navigation system operating procedures.

ANTI-THEFT FEATURE

The navigation system has a coded theft protection circuit. Make sure you have the anti-theft security code before:

- Disconnecting the battery.
- Disconnecting the audio-navigation unit connector A (24P).
- Removing the No. 15(10 A) fuse from the under-hood fuse/relay box.

After service, reconnect power to the audio-navigation unit, and turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. Enter the 5-digit anti-theft security code.

If the code card is lost or unavailable, you can get the code from the iN using the navigation system serial number. The system serial number can easily be obtained without removing the audio-navigation unit. To get the serial number and the code, do the following:

- Press and hold the DEST/ROUTE, the MAP/GUIDE, and the CANCEL buttons at the same time.
- At the select diagnosis items screen, select Detail Information&Setting, select Unit Check, then Navi ECU. The system runs a brief diagnosis, then the audio-navigation unit serial number is displayed on the screen.
- Use the Anti-theft code inquiry option on the iN to look up the 5-digit anti-theft code. The iN may display more than one code for a given serial number. This is because serial numbers are not unique. You may have to try more than one 5-digit code. If no code is shown, or if the code(s) given do not work in the audio-navigation unit, contact the Automobile Warranty department.

Alternatively, you can find the serial number on the upper label which is located on the audio-navigation unit in the dash.

The HDD and audio-navigation unit are mated to each other and can only be mated to a new unit. If someone tried to put a stolen HDD in another audio-navigation unit, or insert their HDD in a stolen audio-navigation unit, the two components cannot mate and a HDD read error appears on the display.

When replacing the audio-navigation unit, be sure to give the client the new anti-theft security code.

SYMPTOM DIAGNOSIS

Certain circumstances and system limitations may result in occasional vehicle positioning errors. Some clients may think this indicates a problem with the navigation system when, in fact, the system is normal. Keep the following items in mind when interviewing clients about symptoms of the navigation system.

SELF-INERTIAL NAVIGATION LIMITATIONS

The limitations of the self-inertial portion of the navigation system (the yaw rate sensor and the vehicle speed pulse) can cause discrepancies between the vehicle's actual position and the indicated vehicle's position (GPS vehicle position).

The following circumstances may cause vehicle positioning errors:

- Moving the vehicle with the engine stopped and the vehicle stopped, such as by ferry or tow truck, or if the vehicle is spun on a turn table.
- Tire slippage, changes in tire rolling diameters, and some driving situations may cause discrepancies in travel distances. Examples of this include:
  - Continuous tire slippage on a slippery surface
  - Driving with snow chains mounted
  - Abnormal tire pressure
  - Incorrect tire size
  - Frequent lane changes across a wide highway
  - Continuous driving on a straight or gently curving highway
  - Very bumpy roads
- Tolerances in the system and map inaccuracies sometimes limit how precisely the vehicle's position is indicated. Examples of this include:
  - Driving on roads not shown on the map (map matching is not possible)
  - Driving on a road that winds in one direction, such as a loop bridge, an interchange, or a spiral parking garage
  - Driving on a road with a series of sharp hair-pin turns
  - Driving near a gradual highway exit or transition
  - Driving on one of two close parallel roads
  - Making many 90 degree turns

GLOBAL POSITIONING SYSTEM (GPS) LIMITATIONS

The GPS cannot detect the vehicle's position or elevation during the following instances:

- For the first 5 to 10 minutes after reconnecting the battery (this process can take as long as 45 minutes).
- When the satellite signals are blocked by tall buildings, mountains, tunnels, large trees, inside parking structures or large trucks.
- When the GPS antenna is blocked by metallic window tinting or by an object placed above it in the vehicle. The GPS antenna requires a clear unobstructed view of the sky.
- When there is no satellite signal output (signal output is sometimes stopped for satellite servicing).
- When the satellite signals are blocked by the operation of some electronic aftermarket accessories including, but not limited to non-OEM in-dash entertainment units (amp, CD players/changers, radar detectors, theft recovery systems, etc.) and cell phones placed near the navigation system.

The accuracy of the GPS is reduced during these instances:

- Metallic window tinting above the GPS antenna.
- When only three or less satellite signals are received (Four satellite signals are required for accurate positioning).
- When driving near high tension power lines.
- When the satellite signals are blocked by the operation of some electronic aftermarket accessories

including, but not limited to non-OEM in-dash entertainment units (amp, CD players/changers, radar detectors, theft recovery systems, etc.) and cell phones placed near the navigation system.

- When the satellite control centers are experiencing problems.

MUTING LOGIC

Whenever the navigation system is giving guidance, outputs of all the speakers except the center speaker are decreased. When the voice control system is being used, all of the speakers are muted. If the AcuraLink or HandsFreeLink is in use, the voice control system is unavailable and a message appears onscreen.

LCD UNIT LIMITATIONS

NOTE: The screen is not touch sensitive. Use the interface dial and buttons to select items on the screen.

- In cold temperatures, the display may stay dark for the first minute until it warms up.
- When the display is too hot because of direct summer sunlight, it will remain dark until the temperature drops (you may see an error message displayed stating this fact).
- When the humidity is high and the interior temperature is low, the display may appear cloudy. The display will clear up after some use.
- Fingerprints on the screen may be noticeable. Clean the screen with a soft, damp cloth. You may use a mild cleaner intended for eye glasses or computer screens. To avoid scratching the panel, do not rub too hard or use abrasive cleaners or shop towels.

SYMPTOM DUPLICATION

- When the symptom can be duplicated, verify that it is not a characteristic of the system. Review the Navigation System Manual and compare it to a known-good vehicle (with the same software and database), under the same conditions. If the symptom is not the same as the known-good vehicle, follow the self-diagnostic procedures and the appropriate troubleshooting procedures.
- When the symptom does not reappear or only reappears intermittently, ask the client about the conditions when the symptom occurred.
    - Always ask the client to demonstrate the problem
    - Try to establish possible user error or misunderstanding of the system
    - Try to establish if outside interference may have been the cause
    - Try to duplication the symptom under the same conditions the client experienced
    - Vibration, temperature extremes, and moisture (dew, humidity) are factors that are difficult to duplicate
    - Inspect the vehicle for after-market electronic devices (amp, CD players/changers, radar detectors, theft recovery systems, etc.) that may be hidden

NOTE: When troubleshooting navigation system problems, ensure that the known-good vehicle is the same software version year and model as the vehicle being serviced. Mixing incompatible navigation systems or other

system components can delay the troubleshooting process by creating symptoms or issues unrelated to the original problem.

AUDIO-NAVIGATION UNIT AND HDD SERVICE PRECAUTIONS

Contrary to previous generations of navigation units, the audio-navigation unit and the HDD cannot be substituted separately. You can substitute a combined audio-navigation unit and HDD with a known-good combined audio-navigation unit and HDD. When the audio-navigation unit and HDD are connected to a vehicle, and powered up for the first time, the audio-navigation unit and HDD go through a mating process where the HDD writes the audio-navigation unit's serial number to its memory. The audio-navigation unit and HDD are available separately.

When you get a replacement audio-navigation unit, the unit arrives able to mate one time to a HDD. When you connect the audio-navigation unit to the HDD and power it up for the first time, the two components are mated. Once the audio-navigation unit is mated, it does not accept an HDD that is already mated to another audio-navigation unit. It does accept a new HDD.

The HDD is removable from the audio-navigation unit. If the audio-navigation unit is replaced, install the original HDD into the new audio-navigation unit. When you transfer the HDD, all the client's settings, music, and photographs are transferred.

The HDD is able to mate more than once, allowing you to transfer the HDD with the client's information to a new audio-navigation unit. The HDD must mate to a new audio-navigation unit. It cannot mate to an audio-navigation unit that has been mated to another HDD.

If you need to replace the HDD, there is no way to transfer client data, music, or pictures to a new HDD. Explain to your client that their music and personal information is not transferable. The navigation system has the save users memory function available, but Acura does not recommend using it. If the HDD is OK, install it in the new audio-navigation unit and it will automatically transfer all the client's information and settings.

If you need to replace the HDD, you can try to back-up the navigation data (if possible) and transfer it to the new HDD. See **save users memory**. The save users memory function only copies client settings and phone information. There is no way to copy or transfer music and photographs that are saved on the HDD to a new HDD. Explain to your client that this information is not transferable and will be lost.

- When the battery is disconnected, the internal GPS clock resets to 0:00. The clock resets to the correct time after the system finishes GPS initialization.
- Before disconnecting the battery, make sure you have the anti-theft code for the navigation system. Also obtain any PGM-FI or A/T DTCs and freeze frame date (which are lost when the ECM/PCM loses power).
- After reconnecting the battery, you have to wait to get the initial signal from the satellite. It will take from 5 to 45 minutes.
- Adjust the setup clock settings (time zone and daylight savings) in the navigation system.
- Before returning the vehicle to the client, enter the anti-theft code for the navigation system.
- Install any discs that were removed.

SYSTEM INITIALIZATION

If the navigation system loses power (like the battery was disconnected), the navigation system requires initialization. Once completed, your system is ready to use.

This initialization requires the following:

- Entering the 5-digit anti-theft security code to unlock the system.
- GPS initialization (may not be needed depending of the length of time the system was without power).
- Map matching aligns the GPS to a location on the map.

ENTERING THE SECURITY CODE

Any time the navigation system loses power, you need to enter the 5-digit anti-theft code on the navigation system display. This 5-digit code is located on a small code card that was given to the client. Enter the 5-digit code.

If the anti-theft code is missing, get the serial number from the audio-navigation unit and use the iN to look it up. You do not need to remove the audio-navigation unit. See **Anti-Theft Feature**.

When replacing the audio-navigation unit, make sure you give the client the new anti-theft security code.

GPS INITIALIZATION

NOTE: You must park the vehicle outside with a clear view of the sky.

Depending on the length of time the battery was disconnected, your system may require GPS initialization. If it does, the CSF screen appears:

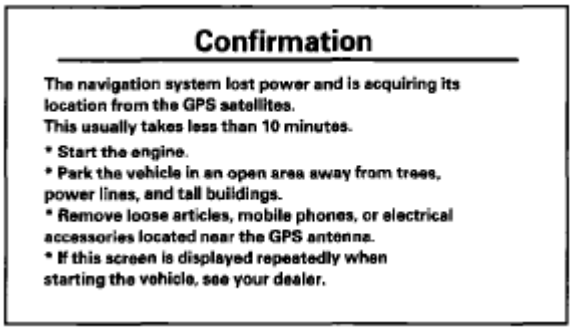

Fig. 3: Display - GPS Initialization Confirmation Message
Courtesy of AMERICAN HONDA MOTOR CO., INC.

If this procedure is not necessary, the system proceeds directly to the Disclaimer screen. During initialization, the system searches for all available GPS satellites, and obtains their orbital information. During this procedure the vehicle should be out in the open with a clear view of the sky.

If the navigation system finds the satellites properly, the CSF screen changes to the Disclaimer screen. If within 10 minutes the system fails to locate a sufficient number of satellites to locate your position, the confirmation screen appears.

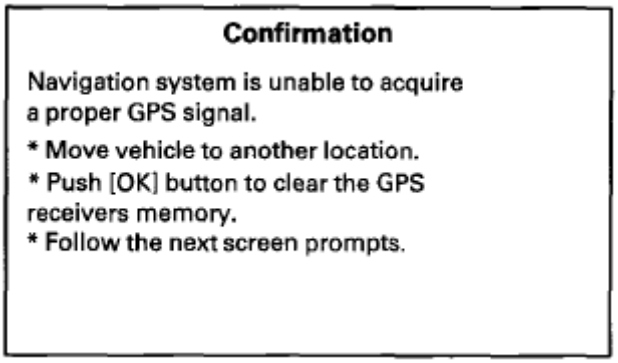

Fig. 4: Display - Navigation System Confirmation Message
Courtesy of AMERICAN HONDA MOTOR CO., INC.

If this screen appears, turn off the engine, then restart the vehicle and move it to a different location. If the Disclaimer screen appears, the GPS initialization is complete.

NOTE:

- **The average acquiring time is less than 10 minutes, but it can take as long as 45 minutes.**
- **If the system is still unable to acquire a signal, follow the instructions on the screen. If this screen appears again, go to GPS icon is white or not shown troubleshooting.**
- **Skip a CSF screen by pressing the DEST/ROUTE and the INFO buttons at the same time and can move to a System Link screen.**

MAP MATCHING

This part of the initialization matches the GPS coordinates with a road on the map screen. To do this part of the procedure, make sure that the navigation system displays a map, and drive the vehicle on a mapped road shown on the map screen. Do not enter a destination at this time. When the name of the current road you are driving on appears at the bottom of the screen, the entire procedure is complete. Your system is now ready to use.

ORDERING AN UPDATE NAVIGATION DVD

If the client wants to purchase a yearly update for their HDD, you have two ways to purchase one. You can either call 888-549-3798, or order on-line at www.acuranavi.com.

When clients order an update DVD, they need:

- VIN
- Device number (found on the INFO screen)
- Credit card

Update DVDs are available for purchase usually in the fall of each year. They may contain the following:

- Enhanced maps and points of interest (POI) coverage
- Fixes for minor software bugs
- Additional features

The update DVD is mailed to the client along with the password.

When the client receives the update DVD, insert the disc into the CD/DVD player. The client is prompted to enter the password that is shipped with the update DVD. The navigation system automatically updates the HDD.

NOTE: The update DVD is designed to update the vehicle with the submitted VIN. If a client has more than one vehicle that needs updating, they need to order a separate update DVD for that vehicle.

Acura tracks the map software version purchased for the VIN. If you need to replace the HDD, the new HDD comes with the latest map version that the client loaded on the HDD.

Never promise your client future free updates. There are no free programs for updating the navigation HDD. Update DVDs are generally available for purchase each fall. The online DVD order site provides information when an update is available.

LEVER-LOCKED CONNECTOR

Disconnecting

To disconnect the connector, pull the lever (A) while pushing the lock tab (B) down, then pull the connector (C).

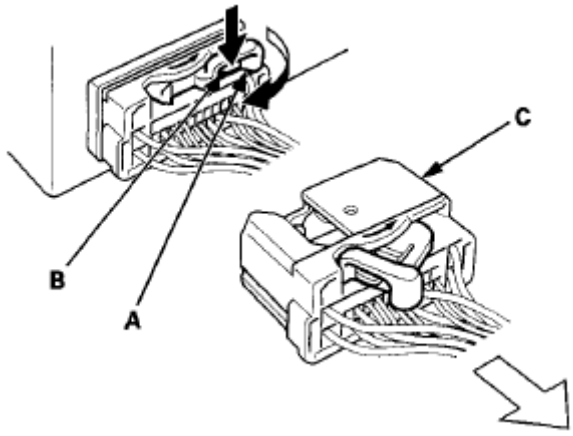

Fig. 5: Disconnecting Lever-Locked Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connecting

To connect the connector, push the connector into the connector sleeve (A). As the connector is pressed in, the lever (B) moves to the locked position.

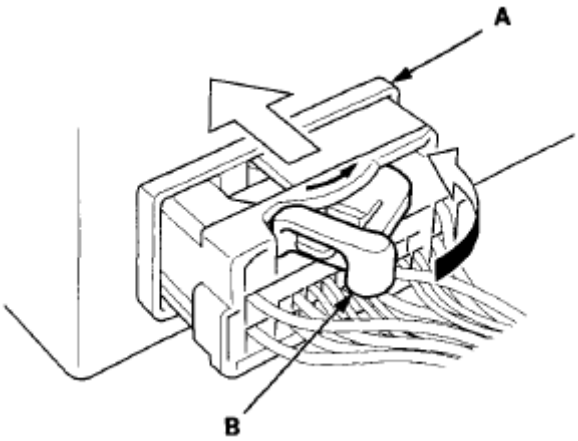

Fig. 6: Connecting Lever-Locked Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

HOW TO ANSWER CLIENT QUESTIONS ABOUT NAVIGATION COVERAGE

Some clients may ask questions regarding a city, address, or POI (point of interest) covered by the navigation system. It is better to verify a coverage question on an actual vehicle than to disappoint your client by promising coverage that may be incomplete or missing in their area. The following suggestions can be used to answer coverage inquiries from your client.

Is my address covered by the navigation system?

Using a current production vehicle (of the same model), and enter the client's address (street first) to see if their area is covered. Always enter the street first, because sometimes their city may be included in a neighboring township, or under some larger metropolitan city name. If the address is shown in a later year vehicle, but not your client's vehicle, you might recommend that your client purchase an update.

Is my city covered by the navigation system?

For general questions about whether a city is covered, view the map coverage link on the DVD order site. On the site, select a year, and select a model, then click on the Coverage link. You then select a state or province, and the cities are listed. This does not guarantee that the client's road or address is in the system. Verifying on an actual production vehicle is always the best guarantee that your information is accurate.

The gas station on my corner is now a restaurant, Why is it still Incorrect in the navigation system?

For POI-related client questions, explain that businesses are constantly moving, and there can be a considerable lag in updating the millions of POIs in the system. The database is updated annually, and the best way to the verify whether the POI is accurate is verify the inquiry on a current production vehicle.

Answers to these and other questions regarding coverage can be found in these locations;

- In the Frequently Asked Questions section of the Navigation Manual.
- At the online DVD order site, by clicking on the FAQs link.

How do I find the local address of a business that Is part of a national chain (for example, Starbucks)?

There are three ways to find the local address to businesses:

- If you know the phone number of the business, select Phone Number and enter the 10 digit phone number (area code plus seven digit number).
- Select Category, then Restaurant, Enter the keyword Star. The resulting list Includes all restaurants that have the letters Star anywhere in the name.
- Select Name and enter Starbucks, For more common business names, like McDonalds, you may have to search through a list that includes other businesses like McDonalds Welding, McDonalds Automotive, etc.

Why are some features different or missing compared to my previous Acura vehicle?

Hardware and software continually go through updates and improvements. Features may change or disappear overtime based on the navigation system development.

HOW TO CHECK ERROR HISTORY (NAVIGATION DTCS)

NOTE: The navigation DTCs cannot be retrieved with the HDS.

The Error History feature is to record intermittent navigation issues that occur while the client is using the system. Sometimes the client complaint cannot be duplicated. The error history may record the information needed to diagnose the problem. To check the error history.

1. Start the engine.
2. Press and hold the DEST/ROUTE, the MAP/GUIDE, and the CANCEL buttons for 3 seconds, or connect the SCS service connector to the navigation service check connector located by the **front passenger's kick panel**.
3. When the Select Diagnosis Items menu is displayed, select the Self-Diagnosis Mode.

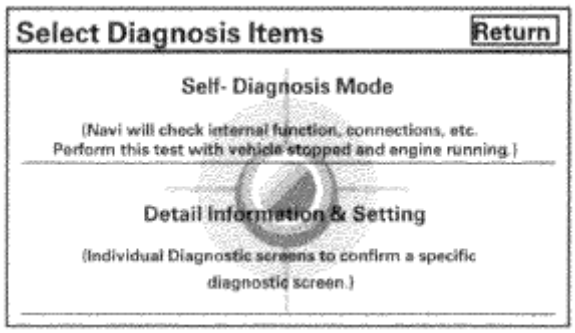

Fig. 7: Display - Self-Diagnosis Mode

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. When the audio-navigation unit has hard error codes, the Error History icon appears yellow when the Self-Diagnosis Mode (System Link) screen is displayed. When no hard error codes are stored, the icon appears gray. To view the errors with their navigation DTC, select the Error History icon.

USA models

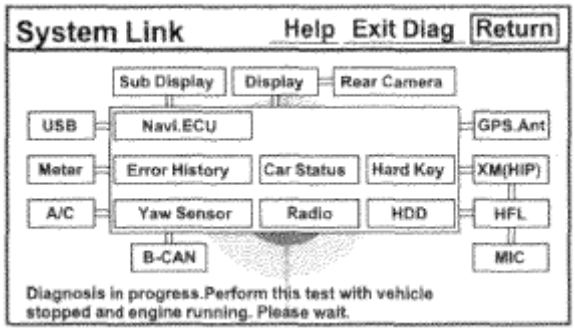

Fig. 8: Display - Self-Diagnosis Mode System Link (USA Models)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Canada models

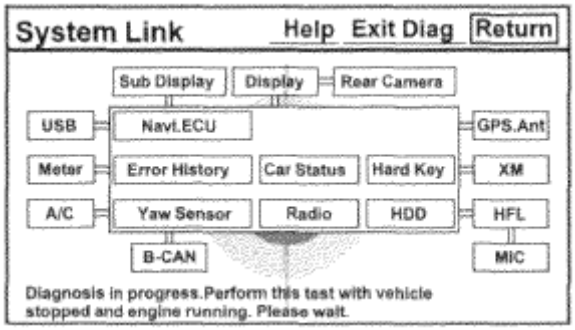

Fig. 9: Display - Self-Diagnosis Mode System Link (Canada Models)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Select Hard Error in the Error History main menu.

NOTE: Soft Error is for factory use only.

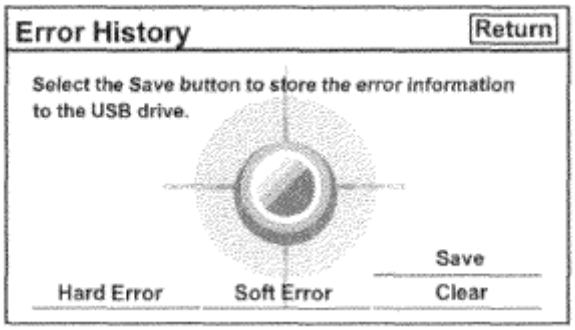

Fig. 10: Display - Error History Main Menu
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Hardware Error History

6. The Hard Error screen displays the following information for each error:
   - The navigation DTC for the error.
   - A brief description of the navigation DTC.
   - The date and time when the error occurred.

NOTE:

- **To see additional errors, use the interface dial to select UP or DOWN.**
- **Select Clear to delete the error history. The Save feature is for factory use only.**
- **Write down the navigation DTCs and error history before deleting.**

7. Use the navigation DTC Troubleshooting table to troubleshoot the error.

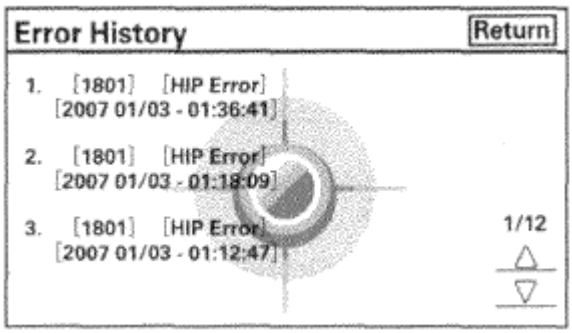

Fig. 11: Display - Error History
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Select Return to exit the Error History main menu.

Software Error (Soft error) History

Software errors are not available. They are for factory use only.

HOW TO CLEAR ERROR HISTORY

1. Do the steps in How to check Error History.
2. Select Clear in the Error History main menu.

NOTE:

- **By selecting Clear, all software and hardware errors stored in history are erased at the same time.**
- **Save is for factory use only.**
- **Write down the navigation DTCs and error history before deleting.**

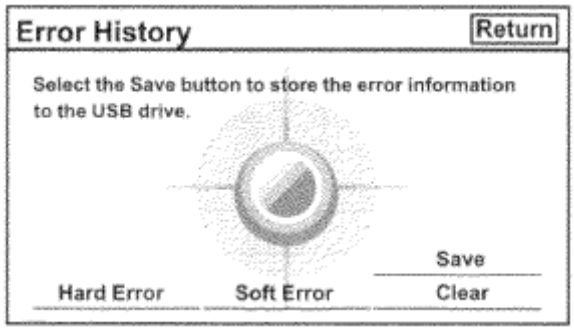

Fig. 12: Display - Error History
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. After selecting Clear, then selecting Yes on the confirmation screen.

Hard error history clear/Soft error history clear (Soft errors are for factory use only)

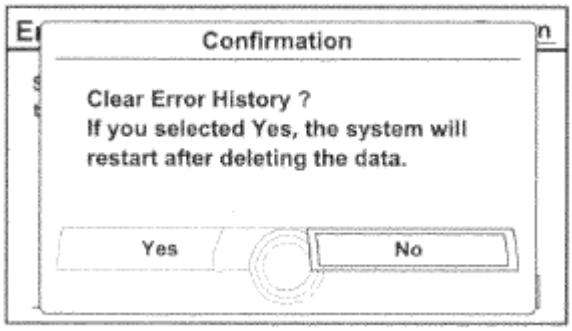

Fig. 13: Display - Clear Error History Confirmation Message
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. The notification screen appears and both Hard Error history and Soft Error history are cleared at the same time. The system returns to the Error History main menu automatically.

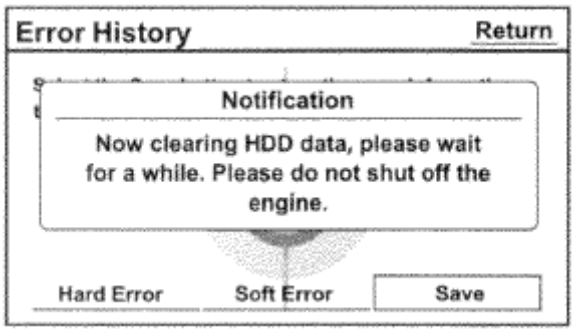

Fig. 14: Display - Clearing HDD Data Notification Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

AUDIO-NAVIGATION UNIT AND HDD REPLACEMENT TROUBLESHOOTING

To protect client information and data from theft, the audio-navigation unit and the HDD have a passcode that prevents the HDD from being accessed by any audio-navigation unit. When the HDD is first installed in an audio-navigation unit, and the ignition switch is turned to ON (II), or the engine start/stop button is pressed to select the ON mode, the HDD writes the passcode from the audio-navigation unit to its memory, which is also known as mating. Every time the ignition switch is turned to ON (II), or the engine start/stop button is pressed to select the ON mode, the audio-navigation unit and HDD confirm the passcode against the other component. If the audio-navigation unit has a different passcode than the HDD, the audio-navigation unit cannot access the HDD.

When you order a new audio-navigation unit, it arrives able to mate one time to a new or previously mated HDD. When you mate the two components, the new audio-navigation unit overwrites the HDD's original passcode with the new one. If you try to install the HDD back into the original audio-navigation unit, the passcode is different, and the audio-navigation unit cannot mate to the HDD.

When you order a new HDD, it arrives able to mate to a new or a previously mated audio-navigation unit. Once the HDD is mated, it then can only mate with a new audio-navigation unit.

For more information, refer to **audio-navigation unit and HDD service precautions**. The outline of the audio-navigation unit and the HDD replacement and substitution is shown in the following table.

NOTE:

- **Original units are known-good units that have been mated at least one time, and new units have never been mated.**
- **You can substitute a mated audio-navigation unit and HDD into another vehicle, but you cannot substitute known-good components individually.**

Audio-Navigation Unit	HDD	Result
New	New	OK
Original	New	OK
New	Original	OK
Original	An audio-navigation unit mated to a different HDD	NG

An audio-navigation unit mated to a different HDD	Original	NG

DTC TROUBLESHOOTING INDEX

DTC	Description	Circuit	Failure Detection	Also Check for
1102	**USB Diag**	USB	USB circuit malfunction.	Low or weak battery voltage
1203	**DVD Temp Error**	DVD drive	Audio-navigation unit temperature above the upper limit or below the limit. Failure in audio-navigation unit fan circuit.	• Low or weak battery voltage • High or Low dash temperature
1301	**GPS Antenna Error**	GPS Antenna	GPS antenna circuit malfunction.	Low or weak battery voltage
1302	**GPS Receiver Error 1**	GPS Receiver	GPS antenna circuit malfunction. Audio-navigation unit internal GPS receiver malfunction.	Low or weak battery voltage
1303	**GPS Receiver Error 2**	GPS Receiver	Audio-navigation unit internal GPS receiver malfunction.	Low or weak battery voltage
1304	**Gyro Error 1**	Gyro	Audio-navigation unit internal gyro malfunction.	Low or weak battery voltage
1305	**Gyro Error 2: ECU Temp XX °C**	Gyro	Audio-navigation unit internal gyro malfunction.	• Low or weak battery voltage • Excessively high or low passenger compartment temperature • Blocked audio-navigation unit cooling fan
1306	**Vehicle Speed Pulse**	Vehicle Speed Pulse	VSP circuit malfunction.	F-CAN DTCs
1402	**Audio Error 2**	CD	Mechanical malfunction in the audio disc changer.	Low or weak battery voltage
1403	**Audio Error 3 (Display Error)**	Display	Mechanical malfunction with navigation display unit.	Low or weak battery voltage

1404	**Audio Error 4 (DVD Error)**	DVD	Mechanical malfunction in the CD-DVD player (audio unit)	Low or weak battery voltage
1405	**Audio Error 5 (HDD Error)**	HDD	Mechanical malfunction in the HDD.	Low or weak battery voltage
1409	**Audio Error 9 (XM Error)**	XM	XM antenna/circuit malfunction.	Low or weak battery voltage
1501	**Aircon Error**	Aircon	Communication error between climate control unit and audio-navigation unit (open/short).	• Low or weak battery voltage • B-CAN DTCs • F-CAN DTCs
1701	**R-Camera Error**	Rear Camera	Communication error between rearview camera and navigation display unit (open/short).	Rearview camera connector disconnected
1801	**HIP Error**	HIP	HIP communication error, open the wire, or AcuraLink control unit (XM receiver) disconnected, or a AcuraLink control unit (XM receiver) malfunction.	B-CAN DTCs
2601	**Display Diag: Connect**	Display	GA-NET bus circuit malfunction (open/short).	
2602	**Display Diag: ROM**	Display	Navigation display unit internal malfunction.	
2603	**Display Diag: RAM**	Display	Navigation display unit internal malfunction.	
2607	**XM Diag**	XM	GA-NET bus circuit malfunction (open/short). XM antenna circuit malfunction.	
2608	**R-Camera Diag**	Rear Camera	Rearview camera internal malfunction.	
2610	**DRAM Diag**	ECU DRAM	Audio-navigation unit internal DRAM malfunction.	

2611	**HDD Diag**	HDD	HDD internal malfunction.	Low or weak battery voltage
2612	**Sub Display Diag**	Subdisplay	Subdisplay bus circuit malfunction (open/short).	Low or weak battery voltage
2701	**GPS Diag: Antenna**	GPS	GPS antenna malfunction.	
2702	**GPS Diag: Receiver in Navi ECU**	GPS	GPS antenna malfunction.	
2703	**Aircon Diag**	Aircon	Communication error between climate control unit and audio-navigation unit (open/short).	• Low or weak battery voltage • B-CAN DTCs • F-CAN DTCs
2704	**HIP Diag (AcuraLink)**	HIP	HIP/HFL COMM 1 thru HIP/HFL COMM 4 bus circuit malfunction (open/short).	B-CAN DTCs
2705	**HFL Diag**	HFL	HandsFreeLink control unit internal malfunction.	HFL DTCs
2706	**Gyro Diag: ECU Temp XX°C**	Gyro	Audio-navigation unit internal malfunction.	• Excessively high or low passenger compartment temperature • Blocked audio-navigation unit cooling fan
2707	**Mic Diag**	Mic	Mic circuit malfunction (open/short).	

SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic Procedure	Also Check for
Navigation system stays on the GPS initialization screen	**System Initialization**.	• Audio-navigation unit • Internal defect in GPS antenna • GPS antenna/cable is disconnected or damaged • Aftermarket metallic window tint

		• Software not up to date • Harness/fuses/switches
Vehicle position icon constantly leaves road, moves erratically, or is displayed very far from actual vehicle position	**Symptom Troubleshooting**.	• Audio-navigation unit • Internal defect in GPS antenna • GPS antenna/cable • Aftermarket metallic window tint • ECM/PCM (vehicle speed pulse) • Harness/fuses/switches
System always comes up in in-line diagnostic mode	**Factory diagnostic screen In Line Diag**.	
Navigation system does not accept security code	**Symptom Troubleshooting**.	Anti-theft code not matching
Navigation frequently asks for anti-theft code and/or needs GPS initialization	**Symptom Troubleshooting**.	• Loss of voltage or poor ground (G651) • Audio-navigation unit • Software not up to date • Low battery voltage • Harness/fuses/switches
GPS icon is white or not shown	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• Audio-navigation unit • Internal defect in GPS antenna • Aftermarket accessories connected to the system • GPS antenna/cable • Aftermarket metallic window tint • Harness/fuses/switches
Vehicle position icon wanders across the map when driving (does not follow a displayed road) or map vehicle ICON spins	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• Audio-navigation unit • GPS antenna/cable • Aftermarket metallic window tint • ECM/PCM (vehicle speed pulse) • Internal defect in GPS antenna
		• Software not up to date

No picture is displayed	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• Audio-navigation unit • Navigation display unit • Harness/fuses/switches
Picture has lines, rolls, or is blurry	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• Aftermarket accessories connected to the system • Audio-navigation unit • Navigation display unit • Harness/fuses/switches
Picture is missing a color or tone or is an odd color	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• Software not up to date • Audio-navigation unit • Navigation display unit • Aftermarket accessories connected to the system • Harness/fuses/switches
Traffic or Weather information is not shown on map screen	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• AcuraLink (XM) • Audio-navigation unit • Low or weak battery • Harness • Client account status • Area outage • Area not covered
Display day/night mode does not work or does not work properly	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• Audio-navigation unit • The gauge brightness level is set to High in day or night mode • Navigation display unit • Gauge control module (CAN) • The navigation display brightness is not set to Auto mode • Harness/fuses/switches
System locks up or freezes constantly	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• Audio-navigation unit • Software not up to date • Harness/fuses/switches
Voice guidance cannot be heard, is broken up,	Symptom Troubleshooting (see **Symptom**	• Volume or voice feedback setting (see Navigation Manual)

or there is static	**Troubleshooting**).	• Audio-navigation unit • Stereo amplifier • Harness/fuses/switches
Voice control does not work/respond	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• Audio-navigation unit • Microphone • Harness/switches • HandsFreeLink control unit
Navigation cannot control HVAC by voice command	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• Software not up to date • Harness/fuses/switches • Wrong audio-navigation unit (model code) • B-CAN DTCs
Navigation cannot control XM radio	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• Software not up to date • Audio-navigation unit • AcuraLink control unit (XM receiver) (USA models) or XM receiver (Canada models) • Harness
Navigation cannot control audio system	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• Audio-navigation unit • Harness • Software not up to date
Interface dial buttons do not work	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• Audio-navigation unit • Navigation display unit • Interface dial • Harness/fuses/switches
Today's Destinations button is dim and not selectable in the Enter destination by screen (grayed-out)	The client has not entered a group of locations for Today's Destinations. This is normal. The button is only selectable if the client is using this function	See Navigation Manual
Previous Destinations button is dim and not selectable in the Enter destination by screen (grayed-out)	The vehicle may be new, or the client deleted the destination. Without a stored previous destination, the system cannot route to a previous destination. Enter a destination, and allow the system to route to it. After the trip, the Previous Destinations button will be selectable	
Address cannot be found	• Verify proper operation and system limitations using the Navigation	• Database limitations (address

or system gives poor routing	Manual • See **How to Answer Client Questions about Navigation Coverage**.	not in database) • Software not up to date • Older database
Rearview camera image does not come on or work properly	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• Check software for latest up-dates • No backup signal • Wrong disc installed in navigation unit
The map will not display the Southern portion of the U.S. or the Northern parts of Canada	North American coverage is different for U.S./Canada markets. See the **Version diagnostic screen** for details on coverage differences	Software not up to date
Navigation display stays on with the ignition switch in LOCK (0), or in the OFF mode	Symptom Troubleshooting (see **Symptom Troubleshooting**).	• Harness/fuses/switches • Aftermarket accessories connected to the system
Navigation system will not go beyond the disclaimer screen and displays the OK button	Also see **Interface dial buttons do not work**	• Software not up to date • Audio-navigation unit
The navigation anti-theft code card is lost or missing	See **Anti-Theft Feature**.	
The vehicle icon lags behind when the vehicle turns	See **Self-Inertial Navigation Limitations**	• Aftermarket accessories connected to the system • GPS antenna/cable • Aftermarket metallic window tint
Navigation screen is darker than normal or takes time to brighten when it is cold	See **LCD Unit Limitations**	Compare to a known-good vehicle
The navigation clock is off by 1 to 3 hours after replacing the navigation unit	See **Service Precautions**	• Do **Map Matching**. • GPS antenna/cable • Aftermarket metallic window tint • Check and adjust the clock settings • Check the keyless remote linking
		• Software not up to date

Time is not correct	Reset Time Adjustment in set-up See **Service Precautions**.	• Reset Time Adjustment in set-up • A defective GPS receiver in the audio-navigation unit
A POI cannot be found	See **How to Answer Client Questions about Navigation Coverage**.	• Software not up to date • The database may be out of date. Confirm the POI exists in a current production vehicle
A specific city cannot be found	See **How to Answer Client Questions about Navigation Coverage**.	• Software not up to date • The database may be out of date. Confirm the address exists in a current production vehicle
Error messages are displayed	See **Error Message Table**.	• Software not up to date • The database may be out of date. Confirm the address exists in a current production vehicle

SYSTEM DESCRIPTION

OVERVIEW

The navigation system is a highly-sophisticated, hybrid locating system that uses satellites and a map database to show you where you are and to help guide you to a desired destination.

The navigation system receives signals from the global positioning system (GPS), a network of 24 satellites in orbit around the earth. By receiving signals from several of these satellites, the navigation system can determine the latitude, longitude, and elevation of the vehicle. In addition, signals from the system's yaw rate sensor and the ECM/PCM (vehicle speed pulse) enable the system to keep track of the vehicle's direction and speed of travel.

This hybrid system has advantages over a system that is either entirely self-contained or one that relies totally on the GPS. For example, the self-contained portion of the system can keep track of vehicle position even when satellite signals cannot be received. When the navigation system is on, the GPS can keep track of the vehicle position even when the vehicle is transported by ferry.

The navigation system applies all location, direction, and speed information to maps and calculates a route to the destination entered. As you drive to that destination, the system provides both visual and audio guidance.

This navigation system also has voice recognition that allows voice control of most of the navigation functions. The TALK and BACK buttons on the steering wheel activate the voice control. The voice control also allows control of the audio and climate functions.

The illumination signal (headlights ON) is used by the audio-navigation unit to automatically switch the display between Night and Day brightness modes. When the gauge control module brightness control is set to full brightness, the navigation system stays in the day mode, even with the headlights on.

The GA-Net II communication bus passes information back and forth between the navigation display, the audio-navigation unit, AcuraLink control unit (XM receiver), and the audio system. The information passed on this bus is audio settings directed by the audio-navigation unit.

For USA models, the Comm. Bus connects the HFL, XM (HIP) (AcuraLink), and audio-navigation units. This bus supports these functions:

- The audio-navigation unit receives traffic, weather, and AcuraLink message information from the AcuraLink Control unit (XM receiver).
- If a POI phone number is available, the audio-navigation unit sends the phone number (on the Calculate route to screen) to the HandsFreeLink control unit for dialing.
- If vehicle problems are detected, and the client's cellular contract includes data service (the vehicle must also have an approved blue tooth phone paired and configured correctly), then the AcuraLink control unit (XM receiver) can send vehicle data to the HandsFreeLink control unit for transmitting back to the AcuraLink servers.
- The AcuraLink server can pass additional problem details back through the HandsFreeLink control unit, to the AcuraLink control unit (XM receiver), and finally to the audio-navigation unit for display.

HDD NAVIGATION SYSTEM

The Acura TL uses a hard disc drive (HDD). The HDD system improves route calculation and POI searching time, as well as these additional functions:

- Ripping music to the HDD with on-board CD database (CDDB) information provided by Gracenote.
- Clients can save their personal pictures to the HDD and use the images as wallpaper when they are not using the navigation system.
- Seethe Owner's Manual or the Navigation Manual for more information.

HDD updates include the latest map info, POI DB, and CDDB information. The yearly update is available on DVD that is loaded onto the HDD. When you order a reman unit, the latest software is loaded onto the HDD.

If a client wants to order an update, see **ordering an update navigation DVD**.

The Gracenote CDDB is updated quarterly. Clients can visit www.acura.com and download the latest update.

The HDD shuts down to protect itself from damage:

- If the audio-navigation unit internal temperature is 183°F (84°C) or higher.
- If the atmospheric pressure below about 9 psi (62.29 kPa). The atmospheric pressure signal from ECM/PCM via F-CAN.

Warning of the temperature and the atmospheric pressure is displayed on the navigation screen as an error

message.

USB Adapter

The USB module is built into the audio-navigation unit. Clients can load images (which can be used as wallpaper), music, and the CDDB. Not all USB devices and devices functions work with the USB port. Please see the Owner's Manual for more information.

Rearview Camera

The rearview camera image now includes yellow guidelines to help give the client a way to estimate the distance behind the bumper.

NAVIGATION FUNCTION

The navigation system is composed of the audio-navigation unit, the ECM/PCM (vehicle speed pulse), the AcuraLink control unit (XM receiver) (traffic and weather information), the HandsFreeLink control unit (to send a POI phone number or place a call), the GPS antenna, the microphone, the voice control switch, the navigation display unit, and the interface dial.

Function Diagram

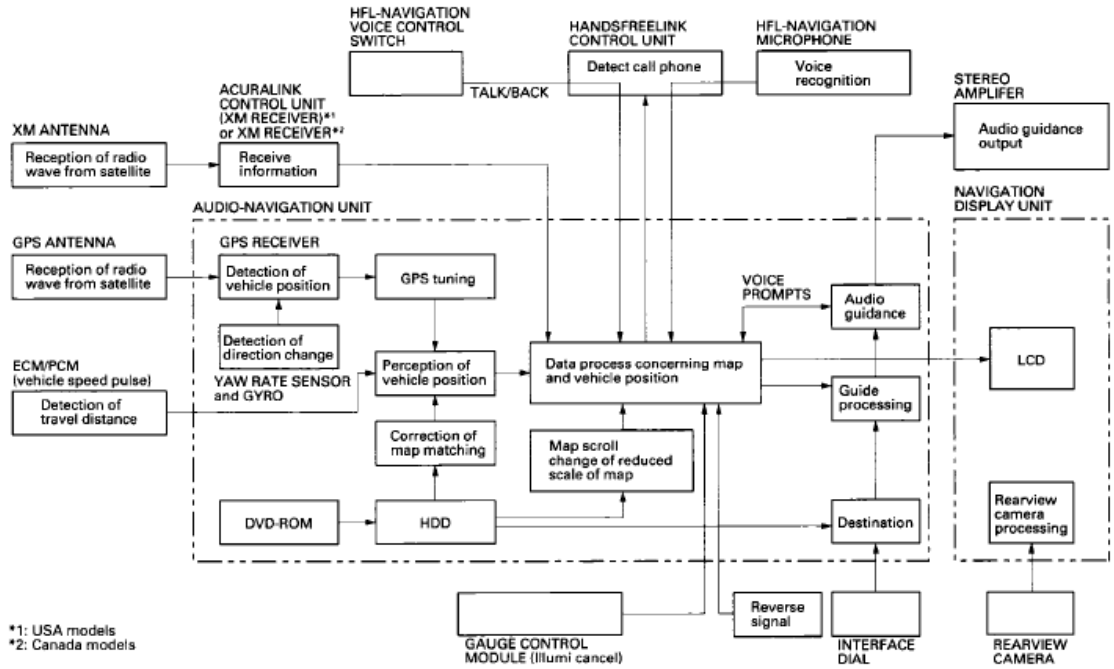

Fig. 18: Navigation Function Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

GA-Net Bus Configuration

The GA-Net bus passes audio and navigation commands throughout the navigation and audio components. These commands include navigation audio/XM/USB/Bluetooth audio selections by voice, and XM station and music title names. Because the entire bus is interconnected between components, an open or short in the GA-Net bus harness may cause any or all of these functions to become inoperative.

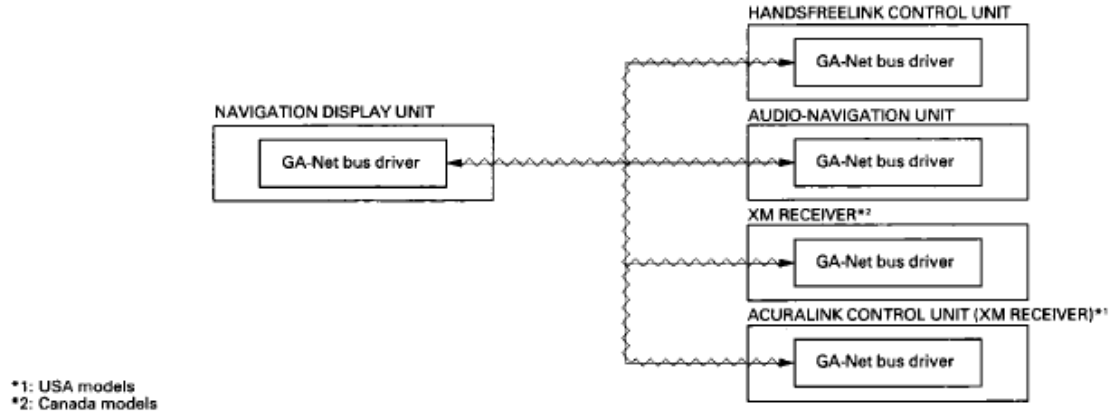

Fig. 19: GA-Net Bus Configuration Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Vehicle Speed Pulse

The vehicle speed pulse is sent by the ECM/PCM. The ECM/PCM receives a signal from the output shaft

(countershaft) speed sensor, then processes the signal and transmits it to the speedometer and other systems.

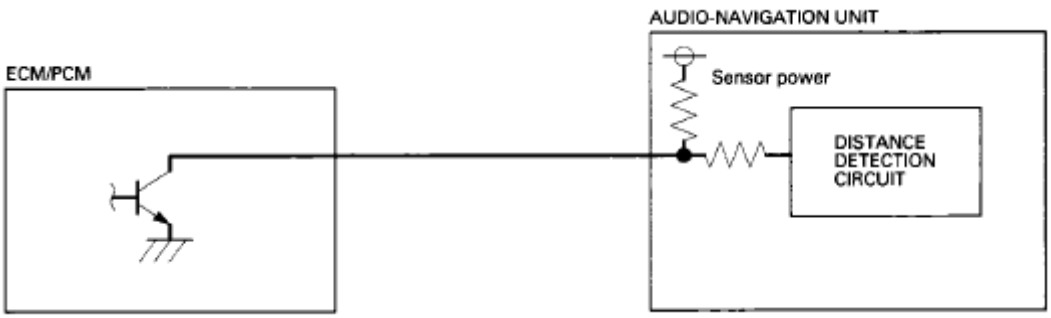

Fig. 20: Vehicle Speed Pulse Communication Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Yaw Rate Sensor

The yaw rate sensor (located in the audio-navigation unit) detects the direction change (angular speed) of the vehicle. The sensor is an oscillation gyro built into the audio-navigation unit.

Sensor Element Structure

The sensor element is shaped like a tuning fork, and it consists of the piezoelectric parts, the metal block, and the support pin. There are four piezoelectric parts: one to drive the oscillators, one to monitor and maintain the oscillation at a regular frequency, and two to detect angular velocity. The two oscillators, which have a 90-degree twist in the center, are connected at the bottom by the metal block and supported by the support pin. A detection piezoelectric part is attached to the top of each oscillator. The driving piezoelectric part is attached to the bottom of one oscillator, and the monitoring piezoelectric part is attached to the bottom of the other oscillator.

Oscillation Gyro Principles

The piezoelectric parts have electric/mechanical transfer characteristics. They bend vertically when voltage is applied to both sides of the parts, and voltage is generated between both sides of the piezoelectric parts when they are bent by an external force. The oscillation gyro functions by utilizing this characteristic of the piezoelectric parts and Coriolis force. (Coriolis force deflects moving objects as a result of the earth's rotation.) In the oscillation gyro, this force moves the sensor element when angular velocity is applied.

Operation

1. The driving piezoelectric part oscillates the oscillator by repeatedly bending and returning when an AC voltage of 6 kHz is applied to the part. The monitoring-side oscillator resonates because it is connected to the driving-side oscillator by the metal block.
2. The monitoring piezoelectric part bends in proportion to the oscillation and outputs voltage (the monitor signal). The navigation unit control circuit controls the drive signal to stabilize the monitor signal.
3. When the vehicle is stopped, the detecting piezoelectric parts oscillate right and left with the oscillators, but no signal is output because the parts are not bent (no angular force).
4. When the vehicle turns to the right, the sensor element moves in a circular motion with the right oscillator

bending forward and the left oscillator bending rearward. The amount of forward/rearward bend varies according to the angular velocity of the vehicle.

5. The detecting piezoelectric parts output voltage (the yaw rate signal) according to the amount of bend. The amount of vehicle direction change is determined by measuring this voltage.

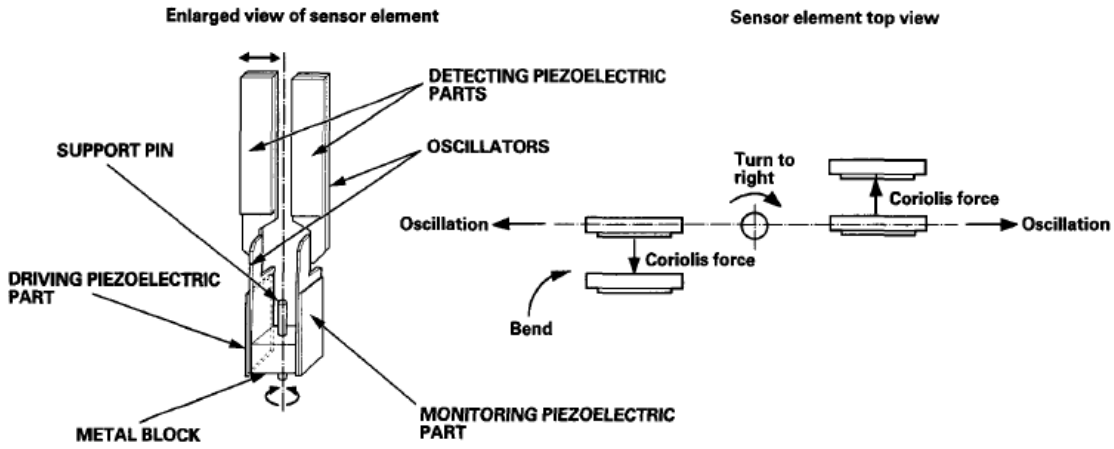

Fig. 21: Oscillation Gyro Operation Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Global Positioning System (GPS)

The global positioning system (GPS) enables the navigation system to determine the current position of the vehicle by using the signals transmitted from the satellites in orbit around the earth. The satellites transmit the satellite identification signal, orbit information, transmission time signal, and other information. When the GPS receiver receives a signal from four or more satellites simultaneously, it calculates the current position of the vehicle based on the distance to each satellite and the satellite's position in its respective orbit.

Position Detection Image with GPS Satellite

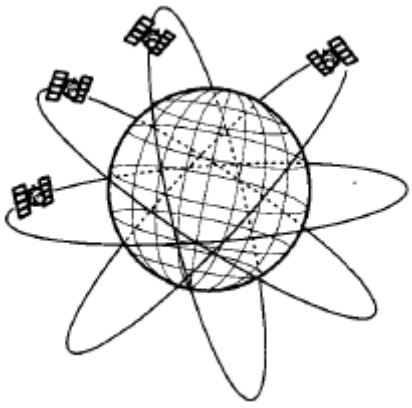

Fig. 22: Overview Of Global Positioning System (GPS) (1 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

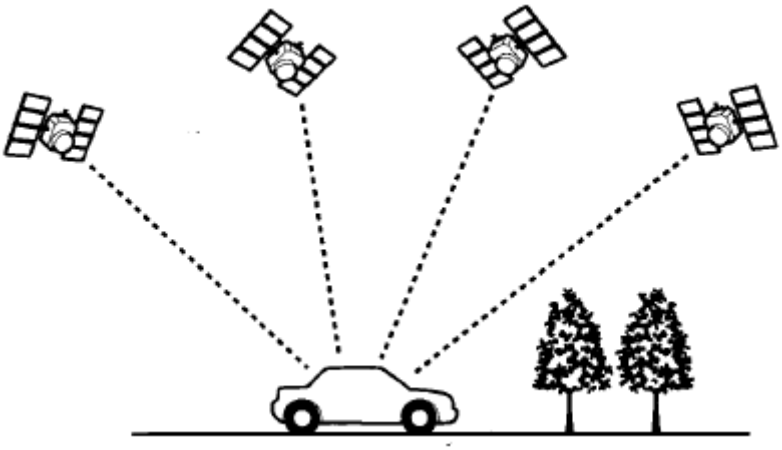

Fig. 23: Overview Of Global Positioning System (GPS) (2 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: Four satellites on each of 6 orbits.

Precision of GPS

The precision of the GPS varies according to the number of satellites from which signals are received and the view of the sky. The accuracy is indicated by the color of the GPS icon shown on the display.

GPS Icon Color	Number of Satellites	Condition	Description
No GPS icon	None	Faulty reception	The GPS can't be utilized due to a faulty GPS receiver, open in the wire, or other fault or interference.
	2 or less	Impossible to detect vehicle position	GPS function is normal. The satellite signals received by the GPS are too few to detect the vehicle position.
White GPS icon	3	Vehicle position detectable in 2 dimensions	The longitude and latitude of the vehicle position can be detected (less precise than detection in three dimensions).
Green GPS icon	4 or more	Vehicle position detectable in 3 dimensions (elevation displayed)	The longitude, latitude and the altitude of the vehicle position can be detected (more precise than detection in two dimensions).

GPS Antenna

The GPS antenna amplifies and transmits the signals received from the satellites to the GPS receiver.

GPS Receiver and Clock

The GPS receiver is built into the audio-navigation unit. It calculates the vehicle position by receiving the signal

from the GPS antenna. The current time, vehicle position and signal reception condition is transmitted from the GPS receiver to the audio-navigation unit to adjust vehicle position and the clock in the audio-navigation switch panel display.

Audio-Navigation Unit

The audio-navigation unit calculates the vehicle position and guides you to the destination. The unit performs map matching correction, GPS correction, and distance tuning. It also controls the menu functions and the HDD, and interprets voice commands. With control of all these items, the audio-navigation unit makes the navigation picture signal, then it transmits the signal to the navigation display unit.

Calculation of Vehicle Position

The audio-navigation unit calculates the vehicle position (the driving direction and the current position) by receiving the directional change signals from the yaw rate sensor and the travel distance signals from vehicle speed pulse (VSP) signal of the ECM/PCM.

Map Matching Tuning

The map matching tuning is accomplished by indicating the vehicle position on the roads on the map. The map data transmitted from the HDD is checked against the vehicle position data, and the vehicle position is indicated on the nearest road. Map matching tuning does not occur when the vehicle travels on a road not shown on the map, or when the vehicle position is far away from a road on the map.

GPS Tuning

The GPS tuning is accomplished by indicating the vehicle position as the GPS's vehicle position. The audio-navigation unit compares its calculated vehicle position data with the GPS vehicle position data. If there is large difference between the two, the indicated vehicle position is adjusted to the GPS vehicle position.

Distance Tuning

The distance tuning reduces the difference between the travel distance signal from the VSP and the distance data on the map. The audio-navigation unit compares its calculated vehicle position data with the GPS vehicle position data. The audio-navigation unit then decreases the tuning value when the vehicle position is always ahead of the GPS vehicle position, and it increases the tuning value when the vehicle position is always behind the GPS vehicle position.

Traffic Information

The Acura navigation system's real-time traffic feature helps you avoid traffic delays by providing up to the minute traffic information in many metropolitan areas across the contiguous USA. Color coded freeways appear on the navigation screen, displaying current traffic flow, and/or the locations of accidents and traffic conditions affected by construction and weather. Real-time traffic data services are offered on a subscription basis for a nominal fee following the 90-day free trial period.

Weather Information

The Acura navigation system's weather information option allows you to view the weather forecast, warning list, and warning map. The weather information is available in a subscription basis for a fee following the 90-day free trial period.

Dynamic Route Guidance

The audio-navigation unit can calculate different routes to a selected destination. You have five options:

- Direct Route- Calculate a route that is the most direct.
- Easy Route- Calculate a route that minimizes the number of turns needed.
- Minimize Freeways- Calculate a route that avoids freeway travel. If that is not possible, keep the amount of freeway travel to a minimum. This is not selectable (button grayed out) for trips greater than 100 miles.
- Minimize Toll Roads- Calculate a route that avoids, or minimizes travel on toll roads. This is not selectable (button grayed out) for trips greater than 100 miles.
- Maximize Freeways- Calculate a route that uses freeways as much as possible.

Audio Guidance

The audio-navigation unit transmits audio driving instructions before entering an intersection or passing a junction. The audio instructions come through the stereo amplifier to the front speakers.

NOTE: The front speakers are muted whenever the navigation system is giving guidance commands, and all of the speakers when the voice control system is being used.

Muting Signal Logic

The audio muting logic is orchestrated by the audio-navigation unit. The audio-navigation unit determines what audio source has priority to use the speakers.

The priority of the audio sources is as follows:

HFL has the highest priority, followed by navigation, and finally the radio/CD-DVD player. The priority is passed by HFL to the audio-navigation unit by dedicated mute wires. The navigation mute signal is passed to the stereo amplifier.

The audio-navigation unit temporarily disables the voice control buttons, but allows guidance to be heard. In addition, the audio-navigation unit suppresses the output from the audio system, the XM receiver, the disc player, or other audio accessories.

When the navigation system sends out a voice route guidance command, the audio front speaker is muted, and the navigation voice is heard in the front speakers.

When the navigation voice control system is in use, all of the speakers are muted, and the navigation voice prompts are heard from the front speakers.

Solar Angle

The climate control unit uses the sun's angle, along with the sunlight sensor to control the driver/passenger A/C airflow.

Off Road Tracking (bread-crumbs)

Off road tracking dots that can be followed on the map retrace your route back to a mapped (digitized) road.

Clock and Time Zone

The clock set up allows you to set daylight savings time, auto time zone and time adjustment.

Control Interface

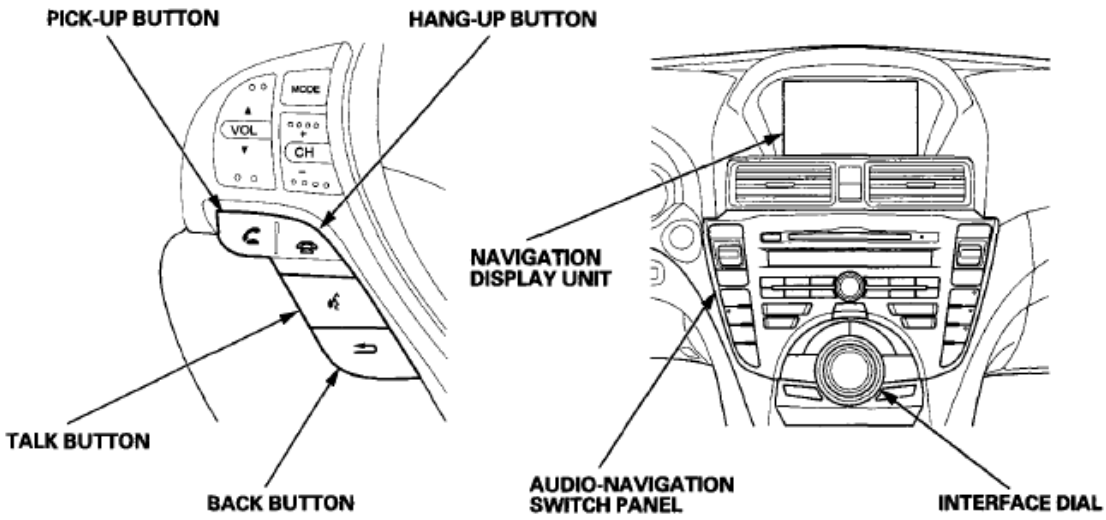

Fig. 24: Identifying Control Interface Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Navigation Display Unit

The display unit uses a liquid crystal display (LCD). The LCD is an 8-inch diagonal, thin film transistor (TFT), strip type with 336, 960 picture elements. The color film and fluorescent light are laid out on the back of the liquid crystal film.

NOTE: If the navigation volume and/or voice feedback is turned off, this feature is disabled.

TALK Button

Activates the voice control system in the audio-navigation unit to accept voice commands.

BACK Button

Returns the display to the previous screen (similar function as the CANCEL button).

Audio Remote, HFL-Navigation Voice Control Switch

The navigation voice control switch is combined with the audio remote switch and the HFL switch. Navigation TALK/BACK commands are sent to the audio-navigation unit via the HandsFreeLink control unit using the GA-net bus.

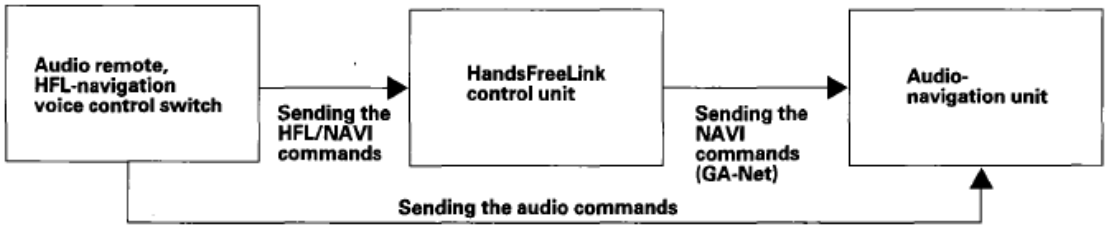

Fig. 25: Audio Remote, HFL-Navigation Voice Control Switch Communication Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Audio-Navigation Switch Panel

- The navigation hard buttons and interface dial are used to input commands.
- The display mode button switches the display between Day mode, Night mode, and off.

NOTE: When you activate this button, the navigation auto dimming is turned off until you turn the ignition switch to LOCK (0) or press the engine start/stop button to select OFF mode.

- The audio button displays the audio system information.

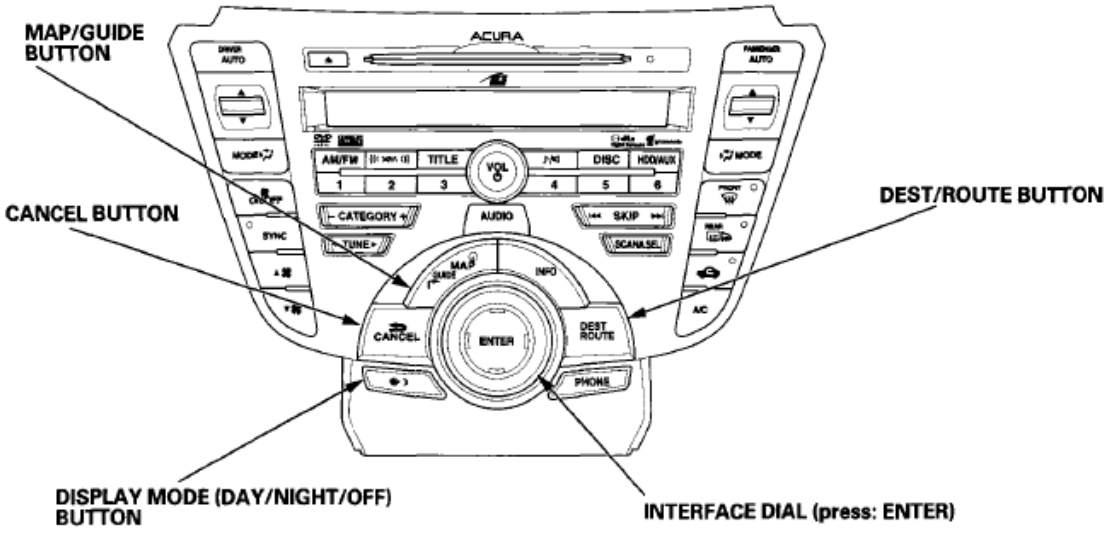

Fig. 26: Audio-Navigation Switch Panel Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Microphone (HFL-navigation)

Receives voice commands and transmits them to the audio-navigation unit or HandsFreeLink control unit. The microphone unit consist of two microphones. The microphones detects the driver's voice and passenger's voice separately.

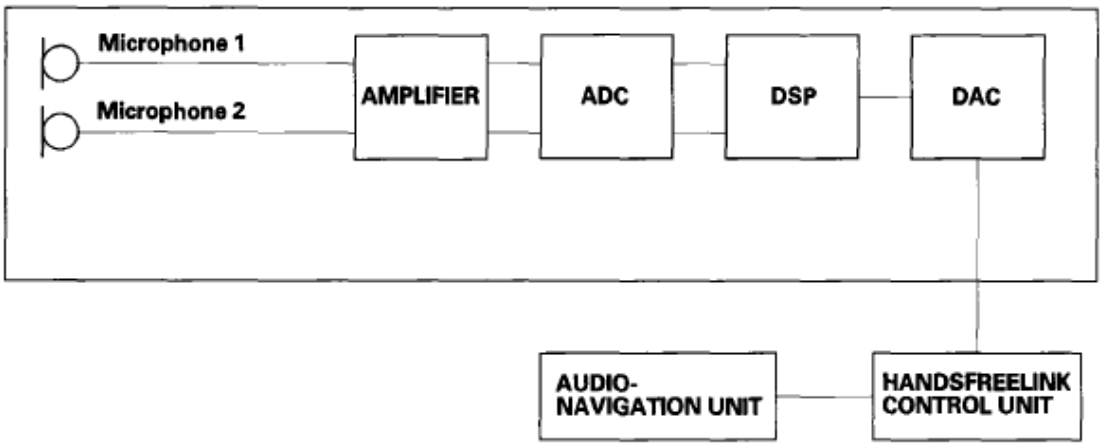

Fig. 27: Microphone (HFL-Navigation) Communication Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Glossary

The following is a glossary of terms pertaining to the navigation system.

NOTE: All items may not apply to this vehicle. See the Navigation Manual for more information.

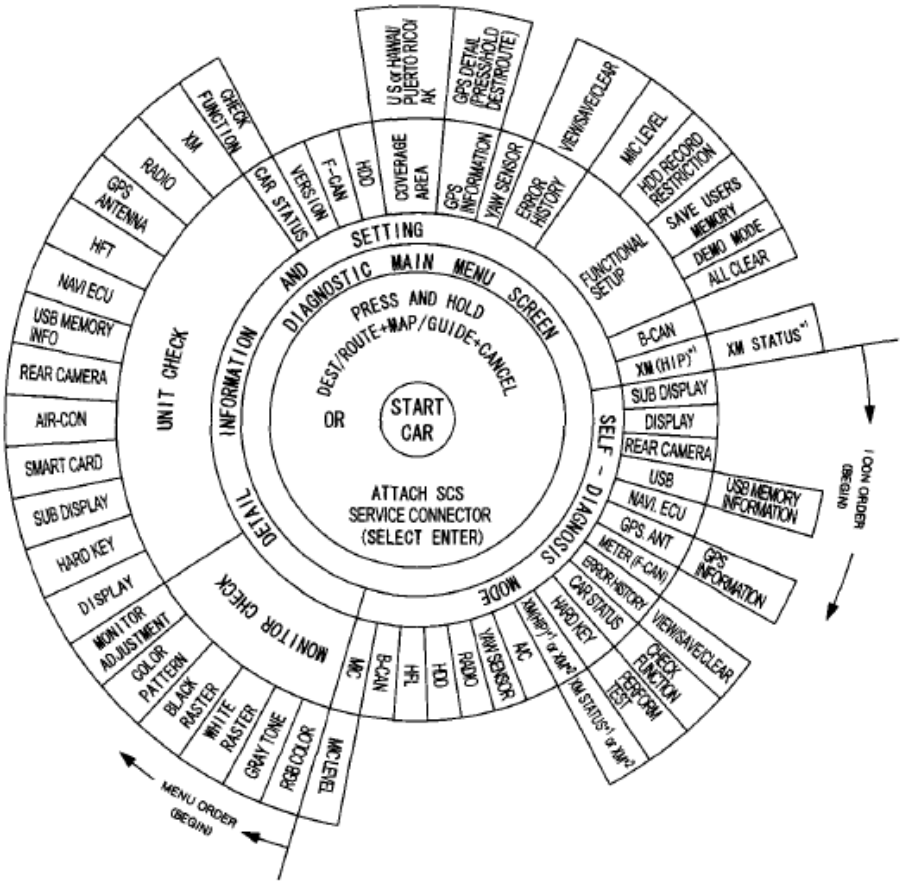
Item	Definition
AcuraLink	This device receives information from the XM satellites and passes XM audio information to the audio unit. In addition, traffic and weather information is sent to the navigation unit.
ANC (Active Noise Cancellation)	See audio information.
Address Book	The HFL system can import a copy of the phone book from and approved HFL compatible phone and display the imported phone book on the navigation screen as the address book. See the Navigation Manual for more information.
B-CAN	Body CAN Bus (see CAN)
Bluetooth	Bluetooth is a short-range wireless technology intended to replace cables connecting portable devices (like cell phones) to the audio system (Bluetooth audio) or the HFL (Hands free phone use).
Bluetooth audio	See audio information.
Bread-crumbs (White dots)	Off road tracking dots that can be followed on the map to retrace your route back to a mapped (digitized) road. This function can be turned on/off in Setup screen 1.
CAN	Controller Area Network. This communication network allows processors in the vehicle to send/receive information. The fuel pulses used by the MID trip computer are received from the ECM/PCM using the F-CAN (Fast Controller Area Network)

	bus.
CPU	Central Processing Unit. The main device within the navigation unit that coordinates the rest of the electronic functions.
CSS	Output shaft (Countershaft) Speed Sensor. This sensor reads the output shaft speed at the transmission and provides a speed pulse to the ECM/PCM.
Database	This consists of the Map data, and the POI (Points Of Interest) data stored on the HDD.
DBW	Drive By Wire. Allows electrical control of the throttle without the need of a mechanical linkage.
DCA	Detailed Coverage Area. Main metropolitan areas in the Lower 48 states, and Canada are mapped to this level. See the Navigation Manual for a list of these areas.
DTC	Diagnostic Trouble Codes. Use the HDS tablet to obtain, and troubleshoot the cause of these codes.
Dead Reckoning	The use of the speed signal, and yaw rate sensor to position the vehicle on the map even when tall buildings, or driving in a tunnel obscures the GPS signal.
Digitized Road	A road that appears on the navigation screen. The road name will appear at the bottom of the navigation screen. If the user drives off road the navigation system displays "Not on a digitized road", and after 1/2 mile, the breadcrumbs appear.
Disclaimer Screen	Screen containing cautionary information. It is meant to be read carefully, and acknowledged by the client when using the navigation system.
DVD or DVD-ROM	Digital Versatile Disc. The navigation program and database resides on this disc. See the Navigation Manual for information on how to order a replacement or an navigation update DVD.
Dynamic Route Guidance	Uses real-time traffic to change your driving route to help avoid extended traffic delays and incidents. Requires a data package subscription.
ECM	Engine Control Module. Typically referred to as the ECM.
FAQ	Frequently Asked Questions. See the Navigation Manual for a list of the client FAQs, and troubleshooting information.
F-CAN	Fast CAN Bus (see CAN)
GA-Net	The GA-Net allows the audio unit to communicate with all the audio and navigation components in a vehicle. If there is an open in the GA-Net, components or the entire audio and navigation system may appear inoperative.
GPS	Global Positioning System. A network of 24 satellites in orbit around the earth. The navigation system can simultaneously receive signals from up to 12 satellites to accurately position the vehicle on the map.
HDD	Hard disc drive. The navigation does not use a DVD, but uses a hard drive to contain the navigation software. Can be updated with a CD or DVD that is inserted into the audio disc slot.
HDS	Honda Diagnostic System. A hand held tablet PC used for in diagnosing vehicle problems. This device can be used to obtain DTC codes for diagnosis of the navigation system and CAN related problems.
HIP (AcuraLink)	This device receives information from the XM satellites and passes XM audio information to the audio unit. In addition, traffic and weather information is sent to the navigation unit.
	HandsFreeLink uses Bluetooth technology as a wireless link between it and an

HFL	approved Bluetooth compatible cell phone. See the vehicle Owner's Manual or Quick Start Guide for more information.
HFT	Hands Free Telephone-see HFL.
H/U	Head Unit. The navigation system display assembly in the dash.
Initialization	This refers to the period needed to re-acquire the GPS satellite orbital information whenever the navigation system power has been disconnected. This can take from 10 to 45 minutes.
Interface Dial	This control device consists of a rotating knob and the buttons surrounding it. This device allows control of the navigation, audio, and climate functions displayed on the screen.
Jog Dial	See interface dial.
LCD	Liquid Crystal Display (the navigation screen)
Map Matching	The received GPS information allows the navigation system to position the vehicle on the map. Map matching has occurred if the map screen displays the current street name in the bottom-shaded area.
Mated	The process where the audio-navigation unit electronically writes its passcode to the HDD.
Mic	Abbreviation for the microphone used for receiving voice commands. The active noise cancellation unit may also use it to check its tuning (if equipped). It is located near the map light in the ceiling.
MID	Multi-Information Display
MP3 music files	MP3 is an audio coding formal. MP3 is a popular audio compression format on the internet and computers. CDs and PC cards MP3 files can be played on some vehicle audio systems.
MW	Maneuver Window. While on-route to a destination, this window displays information about the next maneuver.
Navi	Abbreviation for the Navigation System.
Off-Road Tracking	See Breadcrumbs.
Off Route	This occurs when the user leaves mapped roads. Off road tracking dots (breadcrumbs) are displayed if the option is enabled in the setup menu. The user can use them to return to a mapped road. The bottom of the navigation screen displays "Not on a digitized road".
Outlying Areas	These are rural areas that typically have only their main roads mapped. All other roads are shown in light brown for reference only, since they have not been verified.
Paired	Linking your cell phone to the HFL.
PC Card Slot	The PC card (PCMCIA, type II) slot is for factory use only. Make sure that the sliding door is closed at all items, if opened, an error message is displayed on the screen (if equipped).
PCM	Powertrain Control Module. This unit supplies the navigation system speed signal, and charge signal via the F-CAN network. Also referred to as ECM.
PCMCIA	A computer industry defined term referring to the PC card slot standard.
PIN	Personal Identification Number, a random 4 digit number created by the client to protect personal information.
POI	Point Of Interest. These are the businesses, schools, etc. found under the places

	option on the main menu.
Polygon	Colored areas on the map screen denoting parks, schools, etc. Refer to the Navigation Manual "Driving to Your Destination" for a list of the assigned colors.
QWERTY	Keyboard layout resembling the typewriter keys. The keyboard layout can be changed to an alphabetical layout in the Setup mode.
SCS service connector	The service check signal 2-pin connector used to put the navigation system into the diagnostic mode.
Security Code	Code needed to activate the navigation system. You can get the security code from the iN by entering the navigation unit serial number. You can find the serial number on the diagnostic screens (Unit Check, Navi ECU) or on the underside of the navigation unit.
Touch Screen Buttons or Touch Sensor	Navigation display panel has 2 layers of clear film on the screen panel. If you touch the screen panel, the film layers engage and the display unit detects the touch point.
Tuning	A continual update of internal navigation system scaling factors. See the individual sensor tuning discussions under either System Description, or **System Diagnostic Mode**.
Unverified Streets	These streets have not been verified for turn restrictions, one-way, etc. They appear light brown on the map. You can enter address destinations in these areas, but depending on your Unverified Routing choice in setup, voice guidance may end at the last verified street closest to your destination.
USB adapter	Allows the client to play data such as input audio recording from portable audio devices (such as i-Pod) or data from USB flash memory.
Verified Streets	These streets consist of the detailed metropolitan coverage areas, and all other inter-town connection roads. These roads are shown in black on the map.
VP	Vehicle Position. When in map mode, this circular icon shows the vehicle position on the map. Touch this icon to show the latitude, longitude, and elevation of your current position.
VR	Voice Recognition. This allows voice control of many of the navigation functions. The hardware consists of the microphone, voice control switch (Talk/Back buttons), and the front speakers. See the overview for more information.
VSP	Vehicle Speed Pulse. This pulse signal coming from the ECM/PCM (via the CSS) is used to update the Vehicle position on the map. These pulses do not indicate direction (forward or backward). When in reverse, the navigation receives a signal and directs the VP to move backwards on the map.
Weather Information	The navigation system receives and displays weather information.
XM	This device receives information from the XM satellites and passes XM audio information to the audio unit. In addition, traffic and weather information is sent to the navigation unit (see AcuraLink).
Yaw Rate Sensor	This device is located in the navigation unit and senses the side-to-side twisting force generated when the vehicle turns. See a detailed description of how this sensor works.

Diagnostic System Diagram



This diagram below shows all of the navigation diagnostic features available for system troubleshooting. The diagram starts at the center, and works outward in layers.

Access to the diagnostic features begins by starting the vehicle. This is necessary so the system can check the other systems connected by various busses. After starting the vehicle you can enter the diagnostic mode either by pressing and holding the DEST/ROUTE, the MAP/GUIDE, and the CANCEL buttons, or by connecting the 2-PIN SCS service connector.

The main menu screen allows 2 checking modes - one automatic, and one manual:

- The automatic diagnostic check starts when you select SELF-DIAGNOSIS MODE. The system runs for several seconds, and reports any issues with Red icons. Rotate the interface dial and select the icon you wish obtain the problem details.
- The manual diagnostic check is selected from the main menu by selecting DETAIL INFORMATION AND SETTING. The traditional diagnostic menu is displayed. This allows you to obtain additional details as instructed in the troubleshooting procedures.

NOTE: Do not clear or change settings unless specified by either the troubleshooting procedures or by the factory.

AUDIO-NAVIGATION UNIT CONNECTOR A (24P)

Cavity	Wire Color	Terminal Name	Description	Voltage (about)	Symptom

A4	WHT	SCTY2	Security signal from navigation display unit	0 V	If open: The security system sets, and does not trip when screen is removed. If short to ground: The security system sets, and does not trip when screen is removed.
A12	BLK	GND (Ground)	Ground for audio-navigation unit (G502)	0 V	If open: No effect on system. If short to ground: No effect on system.
A13	PNK	NAVI ILL+ (Illumination positive)	Parking light on signal	Lights on: battery voltage, Lights off: 0 V	If open: When brightness=Auto, night mode for the display is inoperative when lights on. If short to ground: No effect on system.
A14	PUR	ACC (Accessory)	Power source for accessories	Battery voltage at ACCESSORY (I) or ACC mode	If open: Display picture goes out (display back light still on). If short to ground: Blows fuse No. 18 (7.5 A) in the driver's under-dash fuse/relay box.
A15	BLU	VSP (Vehicle speed pulse)	Vehicle speed pulse signal from ECM/PCM	0- 5 V pulses average 2.5 V (Depending on bus traffic)	If open: No vehicle speed pulse. Diagnostic screen Car Status, VSP=0. If short to ground: No vehicle speed pulses. Diagnostic screen Car Status, VSP=0.
A24	WHT	+ B (+ B Power source)	Continuous power source	Battery voltage	If open: Display picture goes out (display back light still on). **NOTE:** **System reboots to enter code screen. If short to ground: Blows fuse No. 15(10 A) in the under-hood fuse/relay box.**

AUDIO-NAVIGATION UNIT CONNECTOR B (24P)

NOTE: Refer to the audio system information for the terminals inputs and outputs not shown (see AUDIO-NAVIGATION UNIT CONNECTOR B (24P)).

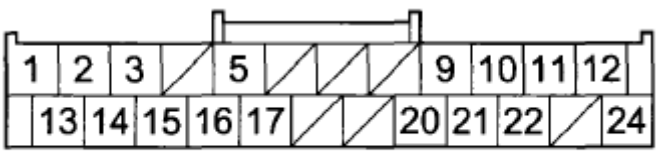

Fig. 31: Audio-Navigation Unit B (24P) Connector End View

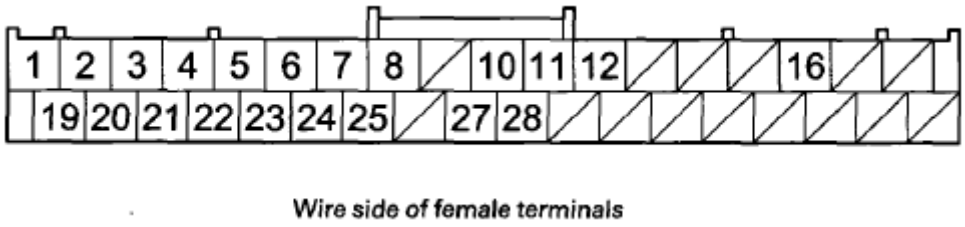
Courtesy of AMERICAN HONDA MOTOR CO., INC.



AUDIO-NAVIGATION UNIT CONNECTOR B (24P)

Cavity	Wire Color	Terminal Name	Description	Voltage (about)	Symptom
B20	WHT	RG L+(Route guidance positive)	Audio signal of voice guidance, and Voice Recognition (VR) prompts	Audio signal 0.004-0.04 V	If open: If voice activated, speakers buzz; if voice off, no effect. If short to ground: If voice activated, speakers buzz; if voice off, no effect.
B21	GRY(1)	RG L SH (Route guidance shield)	Shield for terminals No. 20 and No. 22	0 V	If open: No effect on voice output. If short to ground: No effect on voice output.
B22	BLK	RG L GND (Route guidance ground)	Ground for voice guidance, and Voice Recognition (VR) prompts	0 V	If open: If voice activated, speakers buzz; if voice off, no effect. If short to ground: If voice activated, speakers buzz; if voice off, no effect.

(1) The shielded wires have a heat-shrink tube insulating the outside of the wire. The color of the insulating tube, typically black or dark gray, may not match the color of the wire listed on the circuit diagram.

AUDIO-NAVIGATION UNIT CONNECTOR D (36P)

NOTE: Refer to the audio system information for the terminals inputs and outputs not shown (see AUDIO-NAVIGATION UNIT CONNECTOR D (36P)).

Wire side of female terminals

Fig. 32: Audio-Navigation Unit D (36P) Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

AUDIO-NAVIGATION UNIT CONNECTOR D (36P)

Cavity	Wire Color	Terminal Name	Description	Voltage (about)	Symptom
D10	ORN	NAVI SI (Air conditioner serial in)	Communication signal for climate control unit	- -	If open/short: HVAC will not respond to navigation commands.

D11	PUR	NAVI SO (Air conditioner serial out)	Communication signal for climate control unit	- -	If open/short: HVAC will not respond to navigation commands.
D16	PNK	NAVI ILL+ (Illumination positive)	Parking light on signal	Lights on: battery voltage, Lights off: 0 V	If open: When brightness=Auto, night mode for the display is inoperative when lights on. If short to ground: No effect on system.
D27	BRN	NAVI CLK (Air conditioner clock)	Check signal for climate control unit	- -	If open/short: HVAC will not respond to navigation commands.

Courtesy of AMERICAN HONDA MOTOR CO., INC.

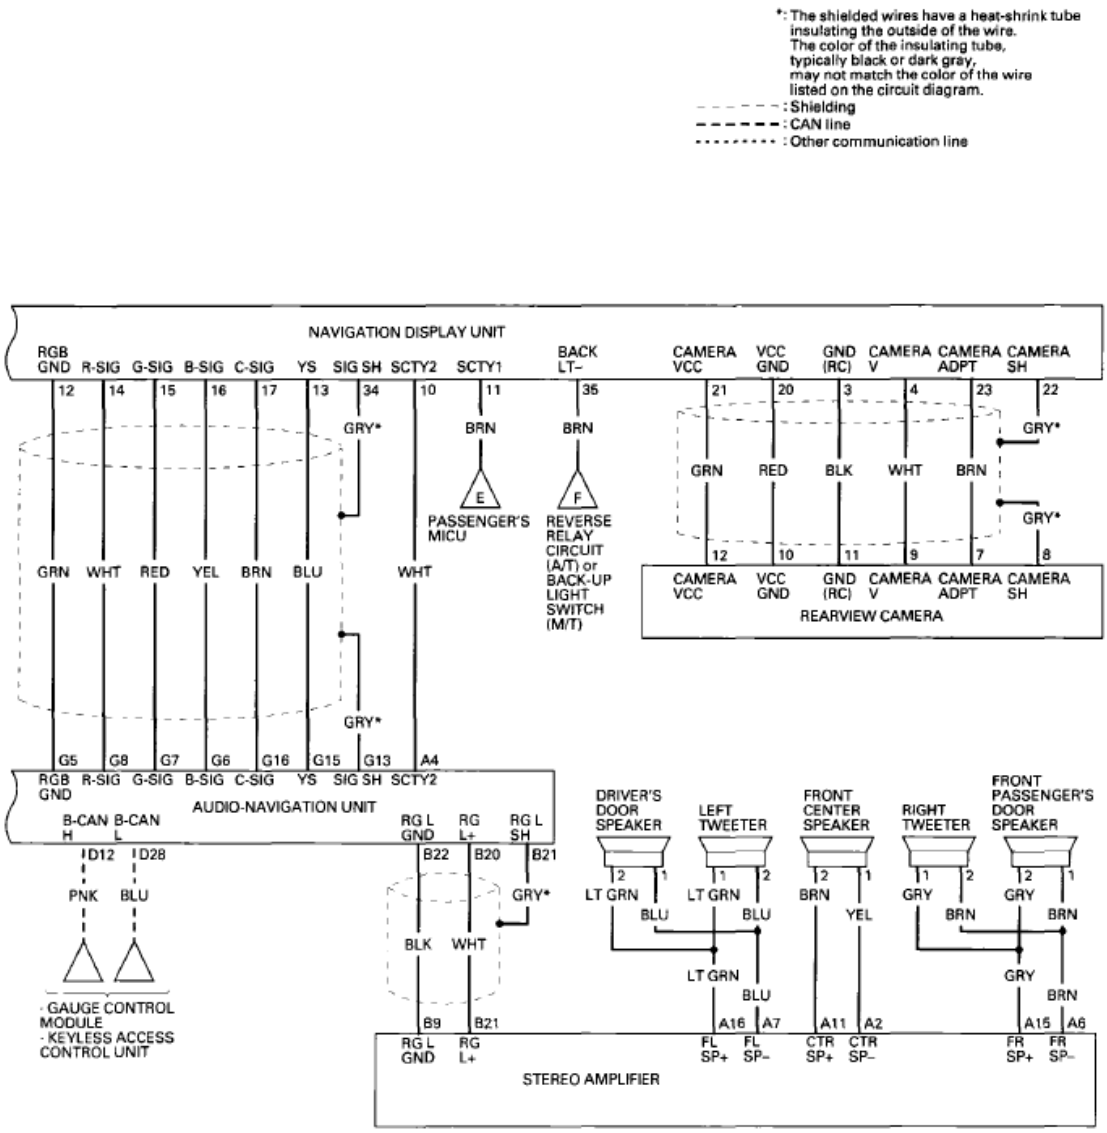

Fig. 49: Navigation System - Circuit Diagram (6 Of 6)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SYSTEM DIAGNOSTIC MODE

START-UP PROCEDURE AND DIAGNOSTIC MENU

There are two ways to enter the diagnostic mode:

Mode 1:

Start the vehicle, and at the disclaimer screen use the navigation display hard buttons:

Press and hold the DEST/ROUTE, the MAP/GUIDE, and the CANCEL buttons for about 3 seconds. The display screen goes directly to the Select Diagnosis Items menu shown.

- Self-Diagnosis Mode (runs the automatic diagnosis of the navigation system)
- Detail Information&Setting (Can help you to manually diagnose the navigation system)

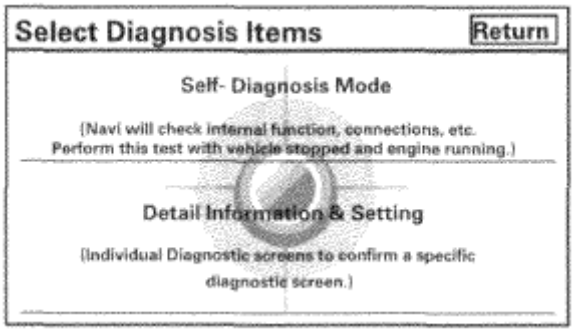

Fig. 50: Display - Detail Information And Setting Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Mode 2:

Start the vehicle. When the globe screen appears, connect the **SCS service connector** to the navigation service check connector located by passenger's Under-dash fuse/relay box. The screen changes to the System Link screen, and automatically begins running the self diagnosis. See the System Link information for more details.

NOTE: When finished troubleshooting, make sure to remove the SCS service connector.

USA models

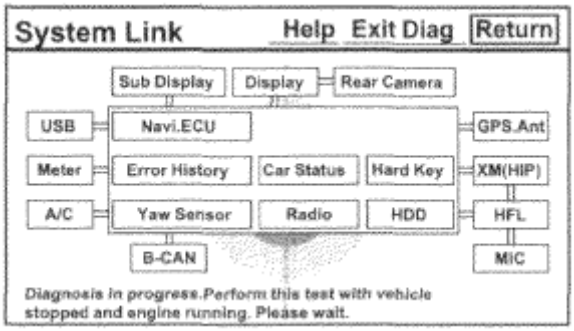

Fig. 51: Display - System Link Screen (USA Models)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Canada models

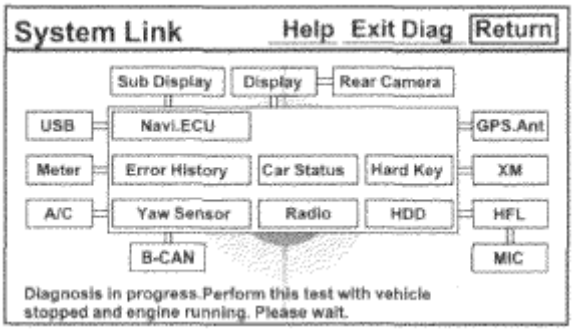

Fig. 52: Display - System Link Screen (Canada Models)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SYSTEM LINK

1. Enter this screen by connecting the SCS service connector or by selecting Self-Diagnosis Mode from the navigation screen main menu. The message at the bottom of the screen flashes indicating the diagnostic is running.

NOTE:

- **The system cannot complete a full diagnosis unless the engine is running.**
- **DTC 1801 can be stored when the ignition switch is in ACCESSORY (I), or press the engine start/stop button to select the ACC mode. With the ignition switch is in ACCESSORY (I), or press the engine start/stop button to select the ACC mode, the AcuraLink is turned off and the audio-navigation unit loses communication and stores DTCs. Therefore, there is a possibility that the system is normal even though DTC 1801 is stored. Check System Link with the engine running, and if it appears normal, the system is OK at this time.**

USA models

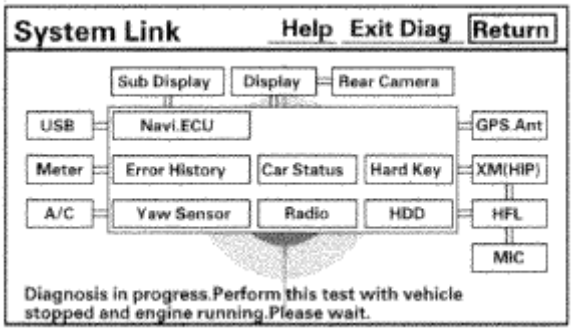

Fig. 53: Display - System Link Screen (USA Models)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Canada models

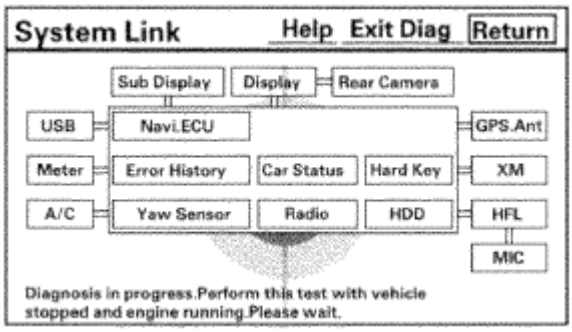

Fig. 54: Display - System Link Screen (Canada Models)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Rotate the interface dial to select the icon you want to diagnose. Push in the selector to see the details of that diagnostic function.

The System Link function runs automatically and displays a flashing message at the bottom of the screen reminding you to have the engine running for the test. The diagnostic tests the following:

- Most of the wires connecting the navigation components are shown in the block diagram.
- The results from the various components shown in the block diagram.
- The audio-navigation unit tests the microphone by listening to the bong sound produced by the audio-navigation unit from the speakers when the diagnosis is started. This requires that the audio system be operating normally.

When the diagnosis finishes, the icons turn different colors based on their test status. The color definitions are shown below and can also be seen by selecting Help on the System Link screen.

The indication on the screen may not change until you exit and reenter the Self-Diagnosis mode. In some cases, you may have to restart the engine for the indication to change. After you repair the affected component or harness, repeat this diagnosis.

Each icon color is explained in the table.

Icon Colors	Description
Green	The system ran a diagnosis and the results are OK.
Red	Errors that require replacement of hardware or harness. Examples are connection error or memory diagnosis errors. Troubleshoot for navigation DTCs.
Yellow	Errors that do not require hardware replacement, such as leaving the vehicle in ACCESSORY (1) or ACC mode, or because of a missing accessory.
White	The diagnosis is running. The screen functions are locked out while the diagnosis runs.
Gray	The system cannot automatically check this function. You have to select the diagnosis item and manually do additional testing, like checking the navigation buttons in the Hard Key test. When you complete the Hard Key test and return to the System Link menu, the gray icon turns green.

NOTE: By selecting the HELP icon, you can see a description for each color.

FACTORY DIAGNOSTIC SCREEN IN LINE DIAG

NOTE: If the vehicle left the factory in the factory diagnostic mode, or if the audio-navigation unit is replaced, you will see this screen every time you turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

When the audio-navigation unit is powered up for the first time at the factory or sometimes a remanufactured audio-navigation unit is installed, the factory diagnosis screen (In Line Diag) appears. Normally the factory does the steps necessary to verify proper operation and terminate the factory diagnostic. until the proper confirmation sequence is done, the screen appears every time the vehicle is started.

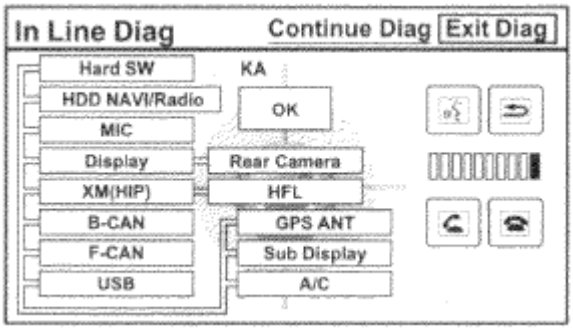

Fig. 55: Display - In Line Diag Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Follow the steps to prevent the screen from showing up in the future:

- Press and hold the DEST/ROUTE, the MAP/GUIDE, and the CANCEL buttons at the same time until the Select diagnosis menu screen comes up. Then release the buttons.
- Press and hold the MAP/GUIDE button until the In line Diag CSF Setting screen appears.
- Set the In Diag Setting to Complete, and make sure the CSF setting is ON, then select Return twice to exit the diagnostic mode.

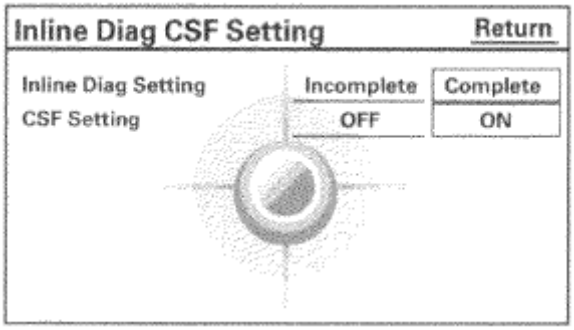

Fig. 56: Display - In Line Diag CSF Setting Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DETAILED INFORMATION & SETTING

These sections allow you to run a specific diagnosis and allows additional setting choices for some screens that are not shown when selecting an icon from the System Link screen.

When you select the Detail Information&Setting menu, the main diagnosis menu is displayed.

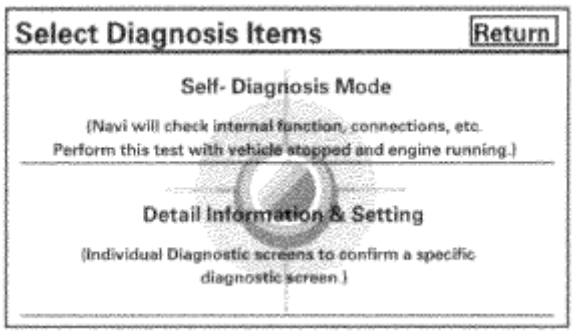

Fig. 57: Display - Select Diagnosis Items Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

After the display changes to the Diagnostic Menu, select the item you want to check, and the test begins. To return to the previous screen, select Return.

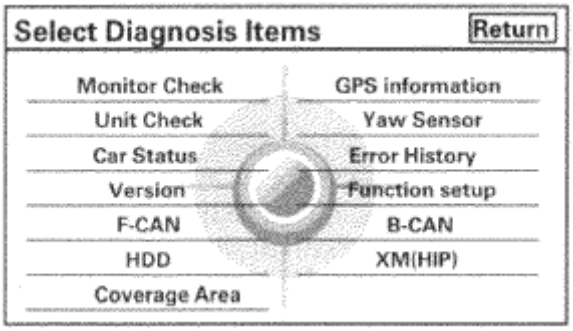

Fig. 58: Display - Diagnostic Menu Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MONITOR CHECK

Overview of navigation display unit

- The navigation display unit communicates with the audio-navigation unit over its own GA-Net bus. Information sent by the audio-navigation unit to the navigation display unit includes commands to control the LCD back light.
- The security system protects the navigation display unit by daisy-chaining the security signal through the components.

These screens allow you to troubleshoot the navigation display unit. Select the item you want to troubleshoot, and follow the diagnostic instructions.

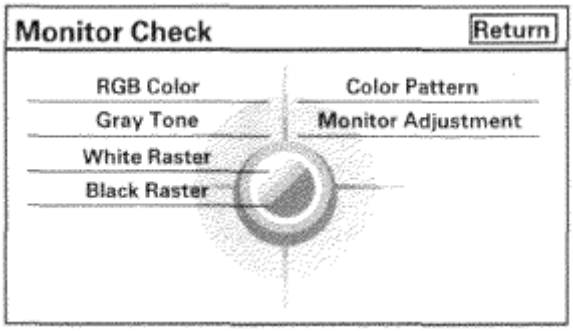

Fig. 59: Display - Monitor Check Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

RGB

This screen verifies that the display unit is receiving the video (R, G, B and Composite sync) signals properly. The three primary colors should all appear without distortion. The combination of all three should produce a central white section. If any of the **colors are missing, troubleshoot for the color signal**. If the picture has lines in it or scrolls horizontally, or vertically, troubleshoot for a **Composite sync problem**.

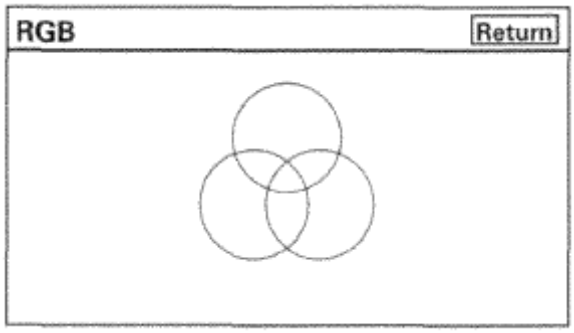

Fig. 60: Display - RGB Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Gray Tone

This screen checks problems with contrast. You should be able to see the changes from bar to bar across the scale. It is normal for the two bars on either side to appear the same. If you can't see changes from bar to bar, replace the **navigation display** unit.

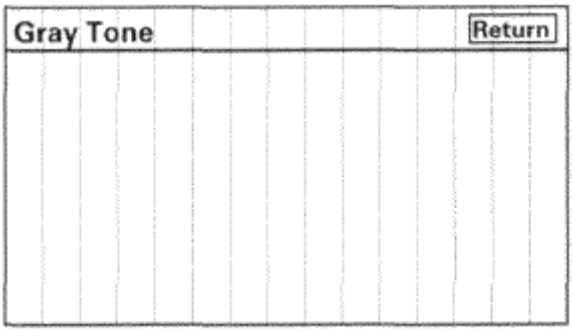

Fig. 61: Display - Gray Tone Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Black Raster

This screen checks for pixels that may be stuck on. The entire display must be black. If pixels are stuck on, replace the **navigation display unit**.

Fig. 62: Display - Black Raster Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Color Pattern

The screen shows the colors being used for the map and menu screens. This is for factory use only. To check the color signal, use the RGB Color diagnosis.

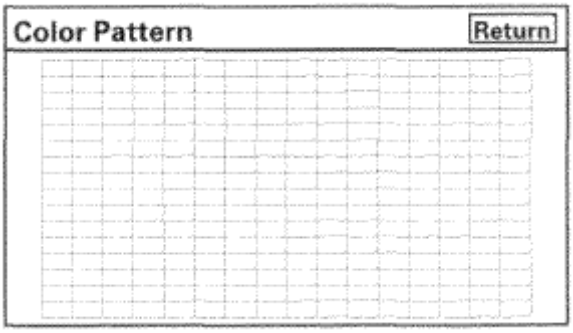

Fig. 63: Display - Color Pattern Screen

Courtesy of AMERICAN HONDA MOTOR CO., INC.

White Raster

This screen checks for pixels that may be dead (off). The entire display must be white. If there are dead pixels, replace the **navigation display unit**.

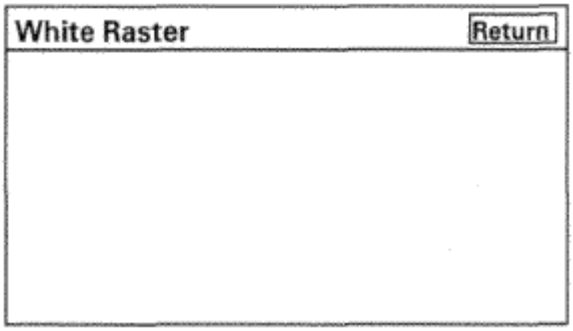

Fig. 64: Display - White Raster Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Monitor Adjustment

This screen allows you to adjust the navigation display or the rear view camera guide line. Select the item you want to adjust.

- Navi: This allows you to center the navigation display.
- Rear Camera: This allows you to adjust the rearview camera guide lines.

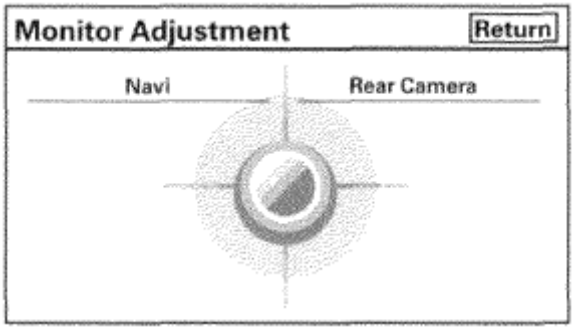

Fig. 65: Display - Monitor Adjustment Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Navi

If you selected the Navi, use the interface dial to move the picture up/down or left/right. Do not adjust the monitor position unless directed by a service bulletin. The Default button resets the display position to factory specifications.

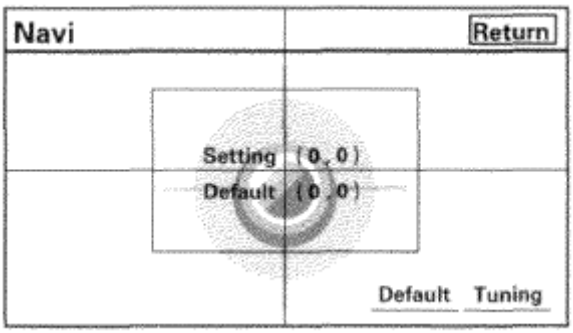

Fig. 66: Display - Navi Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Rear Camera

If you selected the rear camera, the rearview camera image appears. If you need to adjust the guide line, select Turning and adjust the guide line with the interface dial. The Default button resets the guide line position to factory specifications.

If the client starts the vehicle, and immediately shifts into R position, the camera Image appears within 1 second, but the guidelines may take up to 7 seconds to appear. This is normal.

The rearview camera is connected to the audio-navigation unit via the navigation display unit. The audio-navigation unit must boot up (7 seconds) before it can display the guidelines.

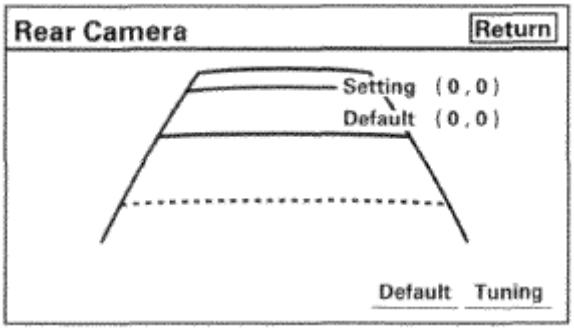

Fig. 67: Display - Rearview Camera Image
Courtesy of AMERICAN HONDA MOTOR CO., INC.

UNIT CHECK (QUICK CHECK)

Some of the tests and screens that are displayed under the Unit Check are different from the more detailed checks listed in other areas.

To start the test, select the item you want to check.

- Display
- Hard Key

- Sub Display
- Smart Card
- Air-con
- Rear Camera
- USB Memory Info
- Navi ECU
- HFT (HFL)
- GPS Antenna
- Radio
- XM

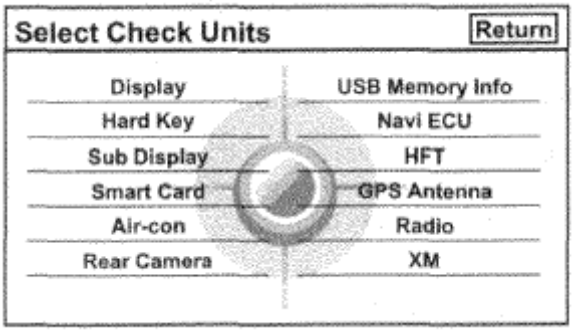

Fig. 68: Display - Unit Check Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Display

This diagnosis does additional checks on the GA-Net bus between the audio-navigation unit and the navigation display unit. This test also checks the internal electronic functions.

- When Connection is NG, first check for loose terminals at the audio-navigation unit and the navigation display unit connections. Next check for an open or short in the communication line between the audio-navigation unit and the navigation display unit If the line has an open or short, replace the affected shielded harness.
- If ROM or RAM is NG, replace the navigation display unit.
- The version represents the software version in the display.

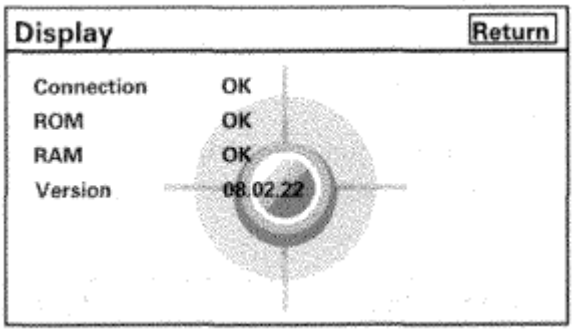

Fig. 69: Display - Display Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Hard Key

This diagnosis tests the interface dial, the navigation buttons that surround it, and the audio remote switch. For this model, the interface dial and buttons use the serial bus for communications.

To complete the test, touch each button on the vehicle's control panel, and move the interface dial to each indicated position. As each function is tested, the corresponding button on the display should highlight.

To exit, push in and hold the ENTER.

NOTE: You cannot use the onscreen return button to exit this function

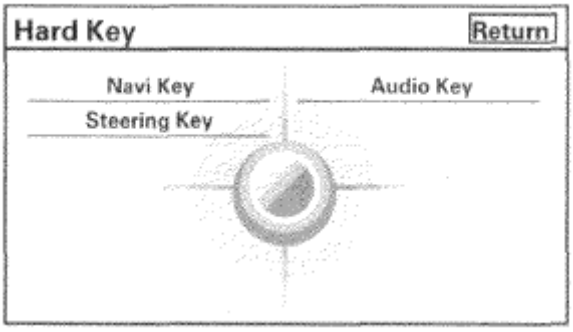

Fig. 70: Display - Hard Key Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Select Navi Key

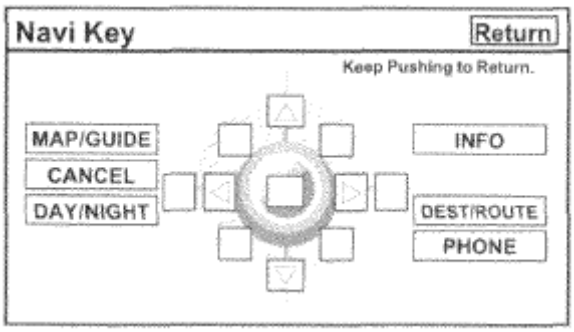

Fig. 71: Display - Navi Key Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Select AUDIO Key

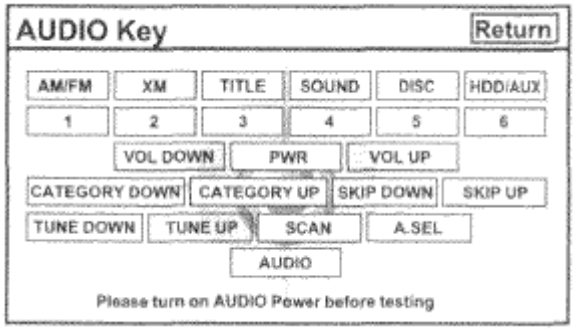

Fig. 72: Display - Audio Key Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Select Steering Key

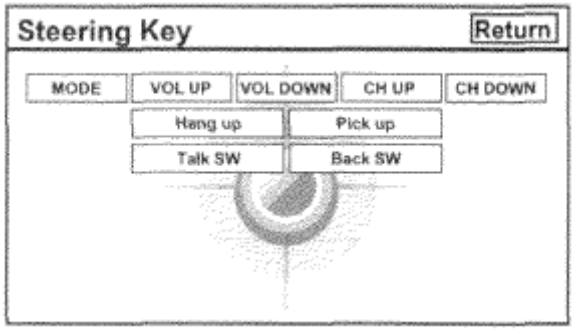

Fig. 73: Display - Steering Key Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Sub Display

This diagnosis tests the internal connection between the audio-navigation switch panel and the audio-HVAC subdisplay. If Connection is NG, check the serial bus line between the audio-navigation switch panel and the

audio-navigation unit.

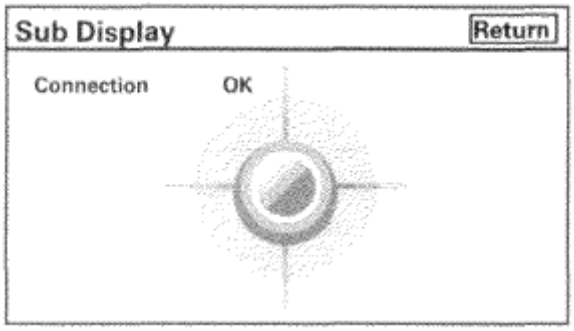

Fig. 74: Display - Sub Display Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

XM

- This diagnosis tests the GA-Net Bus line to the XM receiver.
- When Connection is NG, check the connection between the XM receiver and the audio-navigation unit.

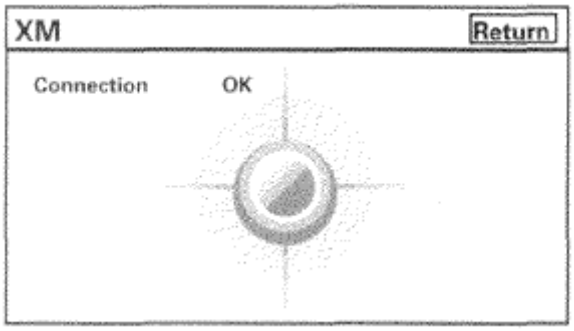

Fig. 75: Display - XM Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Aircon

This diagnosis tests the climate bus connection (AC-SI and AC-SO) between the audio-navigation unit and climate control unit. This test does not check the system components, only the connections. Make sure the engine is running for this test.

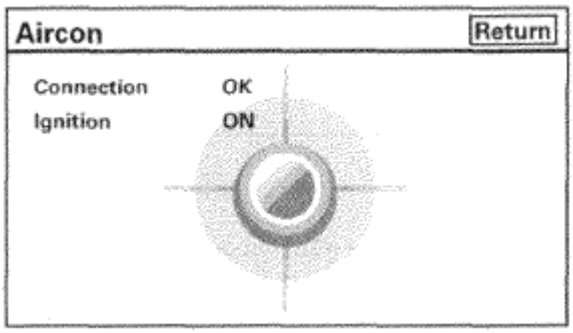

Fig. 76: Display - Aircon Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Rear Camera

- This diagnosis tests whether the rearview camera is connected to the navigation display unit.
- When Connection is NG, check the rearview camera signal line.

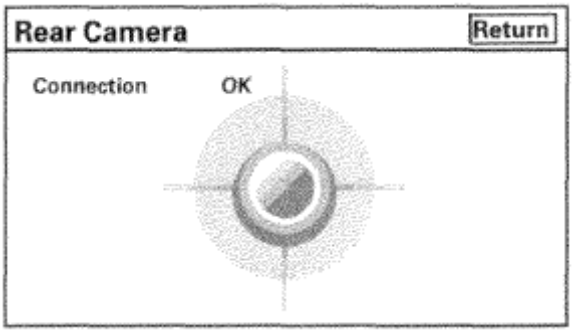

Fig. 77: Display - Rear Camera Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

USB Memory Information

If the USB memory is connected to the USB port, the screen displays the USB memory size, the Product ID, Vender ID, and connection status.

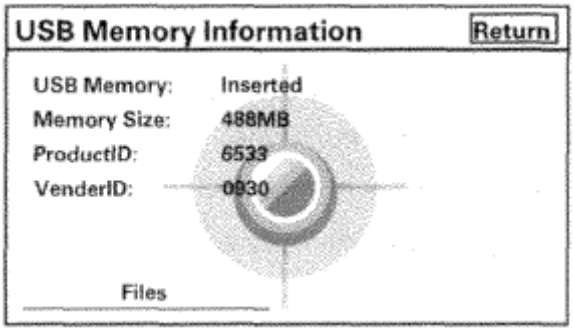

Fig. 78: Display - USB Memory Size

Courtesy of AMERICAN HONDA MOTOR CO., INC.

When you select files, the USB memory file information is displayed.

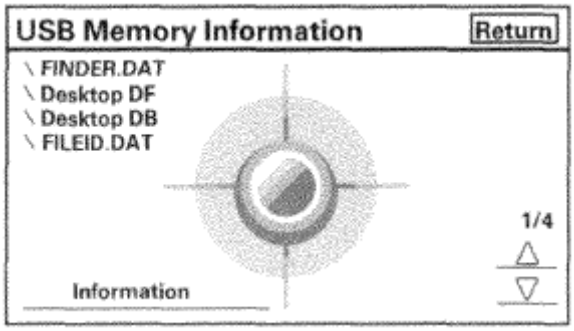

Fig. 79: Display - USB Memory Information Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Navi ECU

This screen looks for problems in the audio-navigation unit. When you initiate this diagnosis, the audio-navigation unit may delay up to a minute while the diagnosis runs.

- If D-RAM is NG, replace the audio-navigation unit.
- Program Version: if displayed, this value represents the version of the navigation software on the audio-navigation unit HDD.
- Serial No, should be the same as the serial number found on the underside of the audio-navigation unit. You need this number to obtain the security code from the iN system.
- If Flash is NG, replace the audio-navigation unit.

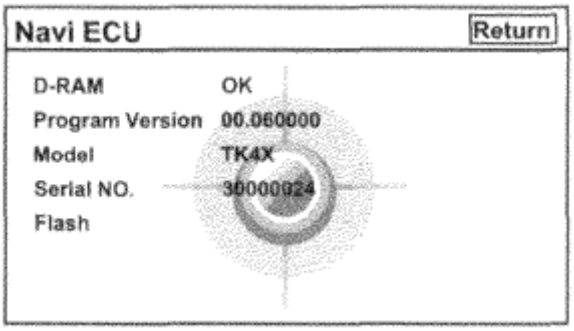

Fig. 80: Display - Navi ECU Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

HFT (HFL)

This diagnosis tests first whether the HandsFreeLink control unit is connecting to the audio-navigation unit.

- If GA-NET is NG, go to HandsFreeLink control unit Input Test (see **CONTROL UNIT INPUT TEST**).

- If HFL Part Number and HFL S/W Version are not shown, go to HandsFreeLink control unit Input Test (see **CONTROL UNIT INPUT TEST**).
- If DESIP (USA models) is NG, go to navigation **DTC 2705 (HFL Diag)** troubleshooting.

Then check the HandsFreeLink control unit status. If the HFL shows any DTC(s), go to the indicated HFL DTC troubleshooting.

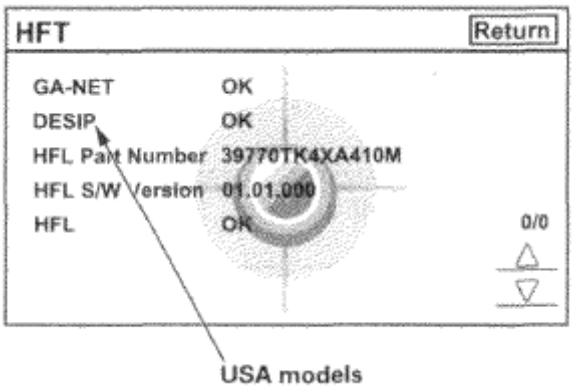

Fig. 81: Display - HFT Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

GPS

This diagnosis tests the GPS antenna connection and the GPS receiver condition.

- If Antenna is NG, then check the entire GPS antenna wire from the audio-navigation unit to the antenna, If the wire is crushed or damaged, try a known-good antenna. If this diagnostic reads OK, then order a new GPS antenna. If the diagnostic still reads NG (Antenna), then replace the audio-navigation unit.
- Select information to see the GPS satellite details.

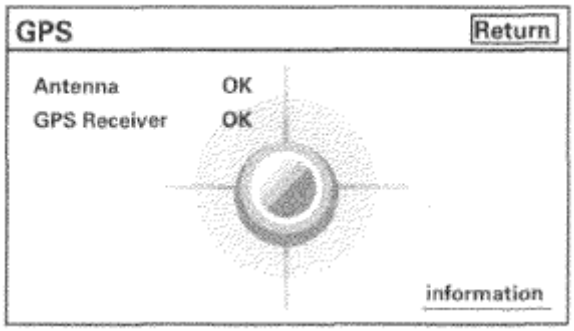

Fig. 82: Display - GPS Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Radio

This diagnosis tests the audio-navigation unit internal radio tuner and CD/DVD player. If Connection is NG,

replace the audio-navigation unit.

NOTE: If the XM link appears red, but the radio link appears green in the navigation system link, refer to audio system symptom troubleshooting.

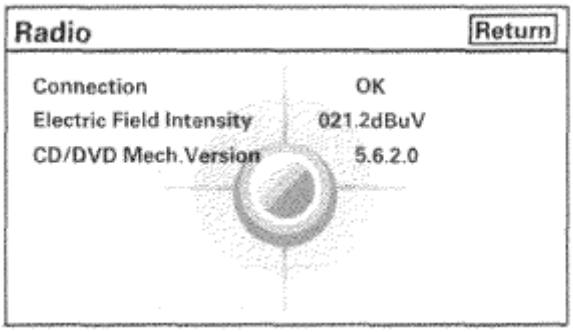

Fig. 83: Display - Radio Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Smart Card

If the remotes are linked to the vehicle, you can check the remote condition on this screen.

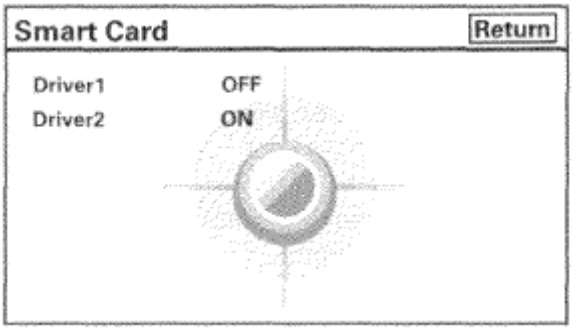

Fig. 84: Display - Smart Card Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CAR STATUS

Use this screen to confirm that the audio-navigation unit is properly receiving input signals. Signals equal to (0) are OFF, and signals equal to (1) are ON. If the value on the display does not match the actual vehicle status, check the wire carrying the signal.

- VSP-Vehicle Speed Pulse from ECM/PCM (Audio-navigation unit connector A (24P) terminal No. 15)
  a. OFF (0) when the vehicle is not moving
  b. ON (1) when the vehicle is moving

The VSP comes from the ECM/PCM as a dedicated signal. Internally, the audio-navigation unit compares the

actual VP on the map against street data to adjust the pulse to speed scaling factor. As this scaling factor becomes more accurate, the Level gradually increases from 0 to 10.

- BACK-Reverse indication front reverse relay circuit or back-up light switch (Audio-navigation unit connector G (16P) terminal No. 10)
  a. OFF (0) when the shift lever is in any position other than reverse
  b. ON (1) when the shift lever is in reverse

The Back signal is used by the audio-navigation unit to allow the map screen to show the VP moving backwards when in reverse. This signal is needed because the Speed Pulse has no direction indication.

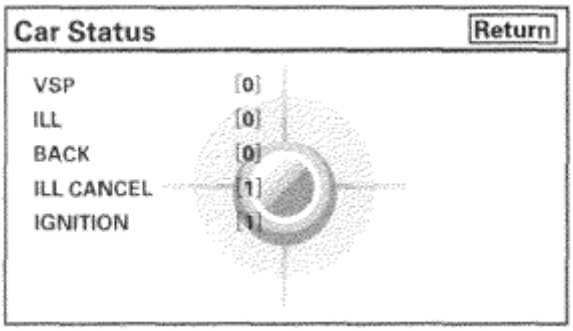

Fig. 85: Display - Car Status Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- IGNITION-Ignition switch position indication (Audio-navigation unit connector H (28P) terminals No. 12 and No. 15)

  Detects if the engine is running is running using information provided over the F-CAN bus.

  a. OFF (0) when the ignition switch is in ACCESSORY (I), or press the engine start/stop button to select the ACC mode.
  b. ON (1) when the ignition switch is in ON (II), or press the engine start/stop button to select the ON mode.

- ILL-Illumination Indication (Audio-navigation unit connector A (24P) terminal No. 13)
  a. OFF (0) when parking lights, or headlights are off
  b. ON (1) when parking lights, or headlights are on

The navigation uses the signal to determine whether to put the navigation screen into the Day or Night brightness mode. (Setup screen 1)

ILL CANCEL

This item detects whether the illumination cancel function is in use.

a. OFF (0) if illumination cancel is not selected

b. ON (1) if Illumination cancel is activated

The illumination cancel function is activated by increasing the dash brightness to MAX, This 'information is passed from the gauge control module to the audio-navigation unit.

NOTE: This setting is unaffected by the display mode button (see ERROR CODE: XM NO SIGNAL OR XM LOADING IS DISPLAYED (WITHOUT NAVIGATION)).

VERSION

This screen displays the current version information for the navigation system software. In addition, this screen allows the loading of updated software if directed by the factory, or instructed by a Service Bulletin, Software may be loaded from a DVD.

- System Version: Displays the version of the audio/navigation software.
- Model: For this model, the field should begin with TK4.
- Host uCom, Slave uCom, and Duet uCom are ail for factory use.
- Download: Do not touch unless instructed by the factory or any other official Honda service information (like a service bulletin).

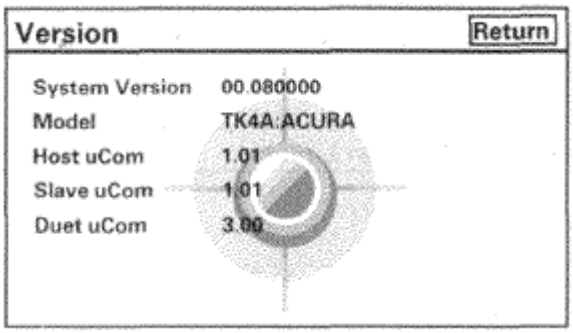

Fig. 86: Display - Version Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

F-CAN SYSTEM LINK

F-CAN (Fast Controller Area Network) passes information between processors on the network, for example, the F-CAN network passes trip computer information between the gauge and the audio-navigation unit for the trip computer function. The F-CAN network uses a communication protocol that transmits data at 500 Kbps.

- This diagnosis must have the engine running.
- if the F-CAN shows "ERROR ACTIVE", an error is not detected between F-CAN bus and the navigation unit If any error is detected, check for diagnostic trouble codes (DTCs) for the F-CAN with the HDS (Honda Diagnostic System), The data displayed in the ID boxes is for factory use only.
- For more details on troubleshooting the F-CAN, refer to the multiplex integrated control system and the PGM-FI system.

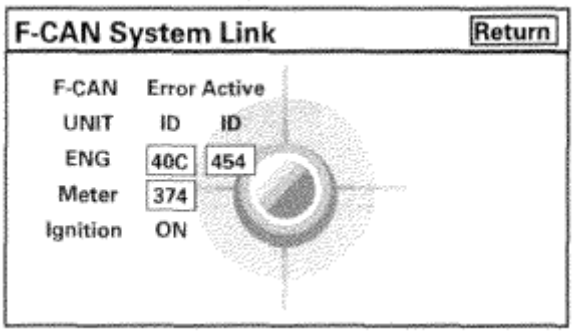

Fig. 87: Display - F-CAN System Link Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

HDD

This diagnosis tests for problems with the navigation HDD.

- If Error Detail is reading Low Temp, check the temperature around the audio-navigation unit.
- If Error Detail is reading Write Error, replace the HDD, If the symptom does not go away, replace the audio-navigation unit.

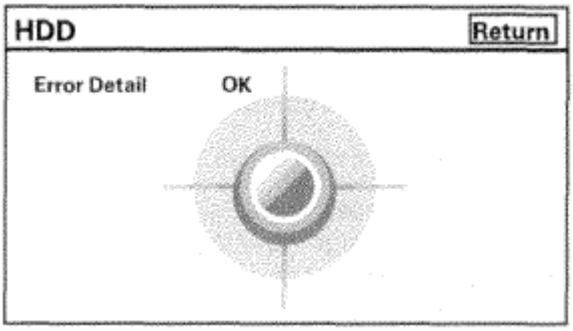

Fig. 88: Display - HDD Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

COVERAGE AREA

This screen allows the dealer to select the area that applies to the location of the vehicle. The choices are US (continental) or Hawaii/Puerto Rico/AK. The default is US. Select the choice (the system may reboot), exit the diagnostic mode, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and restart the vehicle.

NOTE: This function is designed to operate only when the vehicle is physically located in the coverage area you select.

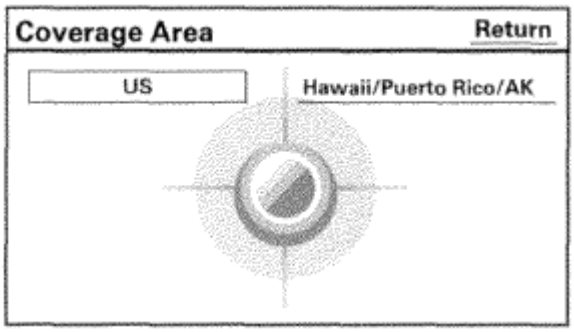

Fig. 89: Display - Coverage Area Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

GPS INFORMATION

This screen shows the current status of GPS reception. The circular diagram shows the current location of the GPS satellites (yellow numbers) as they would appear In the sky. The outer circle represents the horizon (0 degrees elevation). The middle and inner circles represents 30 and 60 degrees respectively. The very center of the diagram (90 degrees elevation) is directly overhead. Nearby obstructions, like tail buildings will block satellites in that direction. That is why it is necessary to be in an open area to effectively troubleshoot GPS reception issues. The satellite numbers shown on the diagram correspond to the PRN number in the GPS Details screen. There are always at least 24 active GPS satellites in orbit. Because satellites fail, and have to be removed from service, spares are always parked in orbit, ready to be activated. This is why the PRN (satellite ID number) can be greater than 24.

NOTE: When you use this screen for troubleshooting, park the vehicle outside, away from buildings, tail trees, and high-tension wires for at least 10 minutes with the engine running.

- The Number of Satellites box shows the number of acquired satellites (maximum of 12). It should contain three or more icons. If not, go to **GPS icon is white or not shown troubleshooting**.
- The Current Position shows latitude, longitude, and elevation (in feet). If there are less than four satellites, the elevation can be grossly inaccurate.
- The Date/Time field shows the current date, and also a time that includes daylight savings and other offsets entered by the client in Setup screen 2 Adjust Time Zone/Clock.

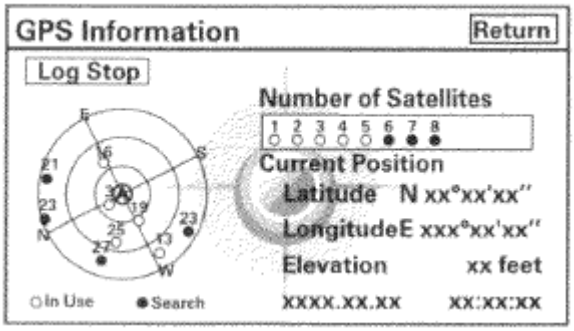

Fig. 90: Display - GPS Information Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: Pressing the MAP/GUIDE button displays the satellite number on each circle.

GPS DETAIL

By pressing and holding the DEST/ROUTE button for 2 seconds, a GPS Detail screen appears. This screen displays real time incoming satellite positional data when the vehicle is outside in the open. The information shown on this screen is for factory use.

NOTE: The data shown is an example only.

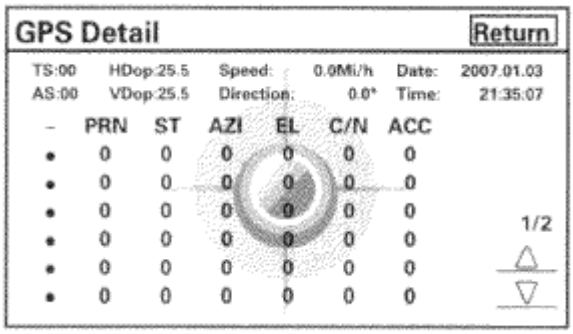

Fig. 91: Display - GPS Detail Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- The box TS/AS and H Dop (horizontal dilution of precision)/V Dop (vertical dilution of precision) is for factory use.
- The Speed and Direction information is updated in real time when driving.
- The Pate/Time Information is the same as in Setup screen 2 Adjust Time Zone/Clock.
- If the 3D icon is shown above the yellow dots, this implies that at least four satellites are available for map positioning, and the GPS Indicator on the map screen will be green. Seethe Global Positioning System detailed explanation in the System Description.
- If the row of data in the table below begins with a yellow clot, the AZI and EL fields can be used to locate each satellite on the circular GPS diagram (see prior screen).

The table of values shown define the terms at the top of the columns in the GPS Detail screen.

Column	Description	Problem Indication
3D	Active satellites (Yellow Dot)	If 3D or 2D is missing when the vehicle is parked outside, go to **GPS icon is white or not shown** troubleshooting.
PRN	The satellite ID number	
	The status: 0 = Cannot view or searching 2 = Tracking	

ST	4 = Acquiring (It is not being used for positioning) 8 = Acquiring (It is being used for positioning)	If all 0, go to **GPS icon is white or not shown** troubleshooting.
AZI	Azimuth, the angle (0 - 360) clockwise from north	
EL	Elevation from the horizon (90 deg is overhead)	
C/N	Receiver sensitivity	Normal signal: 49-52 No signal: 27-33
ACC	Satellite accuracy	
^ 1/2 or 2/2 ˇ	Shows view of all satellites in two screen views 1/2 or 2/2	

YAW SENSOR

This diagnosis gives a quick test of the yaw sensor functionality based on the two voltages Sensor and Offset.

- This diagnosis must be done while the vehicle is stopped.
- If ZeroPoint Output is reading NG, replace the **audio-navigation unit**.

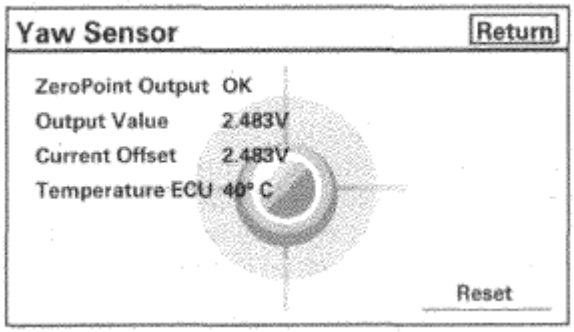

Fig. 92: Display - Yaw Sensor Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ERROR HISTORY

If you select Hard Error or Soft Error, you can see the error information. Refer to **How to Check for Error History** to use this diagnosis.

you can save the error history by connecting a USB device to the USB adapter, then select save to copy the information to the USB memory.

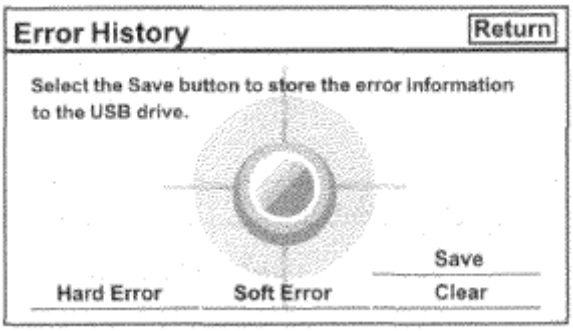

Fig. 93: Display - Error History Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

FUNCTIONAL SETUP

Select the item you want to check.

- Mic Level
- HDD Record Restriction
- Save Users Memory
- Demo Mode
- All Clear

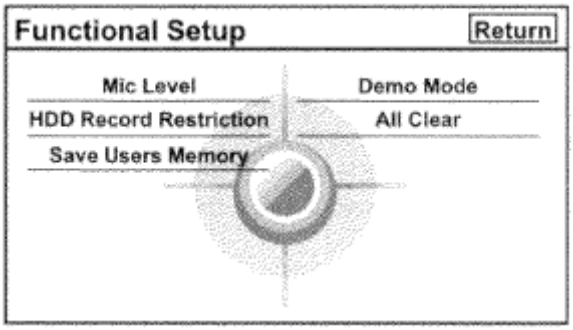

Fig. 94: Display - Functional Setup Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Mic Level

This diagnosis allows you to independently test the microphone and the TALK and BACK buttons. The TALK button is used to activate the voice control system. The microphone is located near the map light in the roof console. The microphones can now isolate the driver's voice even when there is noise or other conversations in the vehicle. To properly check the microphones, make sure you are sitting in the driver's seat.

- Press the TALK, button on the steering wheel, wait until you hear a beep, and in a normal voice say "testing". The TALK icon (A) on the screen should momentarily turn green, and the text Now Recording!! should appear. If the TALK icon does not turn green, check the wiring from the voice control

switch to the HandsFreeLink control unit, If there is no Mic Level (B) movement when you speak, then you should check the wiring from the microphone to the audio-navigation unit (via the HandsFreeLink control unit). If the wires are OK, the microphone must be faulty; replace the **microphone**.

- Press the BACK button on the steering wheel. The BACK icon (C) on the screen should momentarily turn green. If it does not briefly turn green, check the wiring from the steering wheel BACK button to the HandsFreeLink control unit.

NOTE: The mic level should reach the 6th bar.

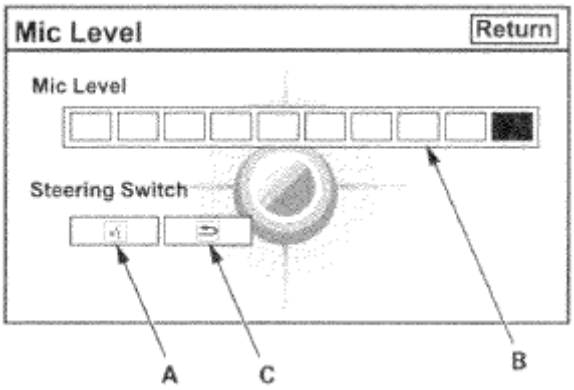

Fig. 95: Display - Mic Level Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

HDD Record Restriction

Setting ON OFF for recording the audio files to HDD, Refer to the Owner's Manual for more information about recording music to the HDD.

HDD Recording OFF

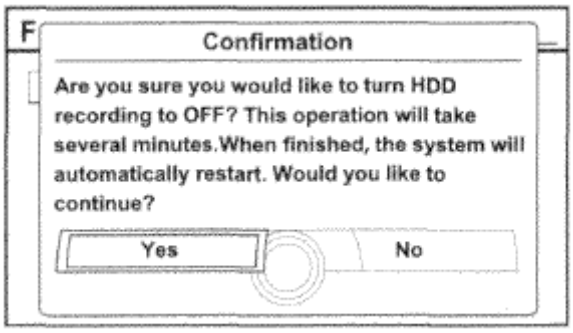

Fig. 96: Display - HDD Recording OFF Confirmation Message
Courtesy of AMERICAN HONDA MOTOR CO., INC.

HDD Recording ON

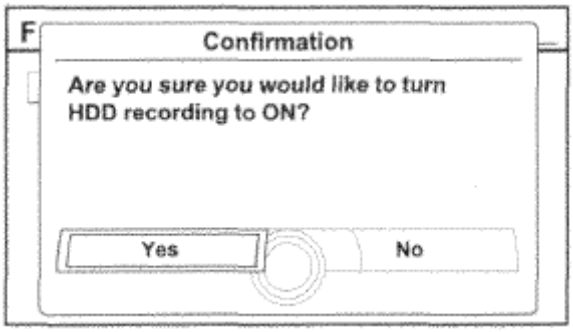

Fig. 97: Display - HDD Recording ON Confirmation Message
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Save Users Memory

NOTE: If the HDD is good, transfer it to the new audio-navigation unit. If the HDD is NG, try this procedure to see if you can recover some information can be recovered.

When replacing the audio-navigation unit, this function allows the dealer to transfer the client's personal data to the new audio-navigation unit The transferred information includes their Setup settings, and personal addresses. The dealer inserts a USB memory device into the USB adapter, and then selects the Save Users Memory function. The two functions In this diagnostic screen are EXPORT and IMPORT. EXPORT saves the client's data to the USB memory device, and IMPORT moves the USB memory device files to the new audio-navigation unit.

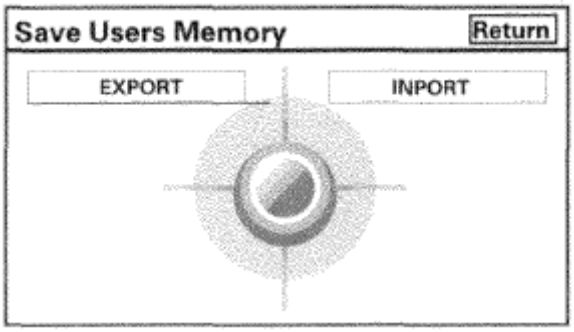

Fig. 98: Display - Save Users Memory Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

1. Select EXPORT button to move the client's data from the original audio-navigation unit to the USB memory. Select YES on the Export User Data Confirmation screen. The process takes only a couple of seconds. The system stores.DAT files on the USB memory.

NOTE: If the EXPORT button is grayed out, check the USB adaptor connector.

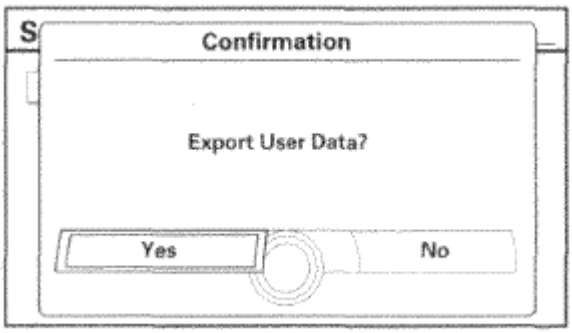

Fig. 99: Display - Export User Data Confirmation Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. After replacing the new audio-navigation unit, allow the system to boot up. Insert the USB memory device into the USB adapter and enter the Save Users Memory in the navigation system diagnostic mode.
3. Select the IMPORT button to move the two files stored by the Export process from the USB memory device to the new audio-navigation unit. Select YES on the Import User Data Confirmation screen, When the transfer is finished (a few seconds) the system automatically reboots. After the system reboots, remove the USB memory device from the USB adapter.

NOTE: If the IMPORT button is grayed out check if the Model and the Program Flash shown on the Version screen are the same.

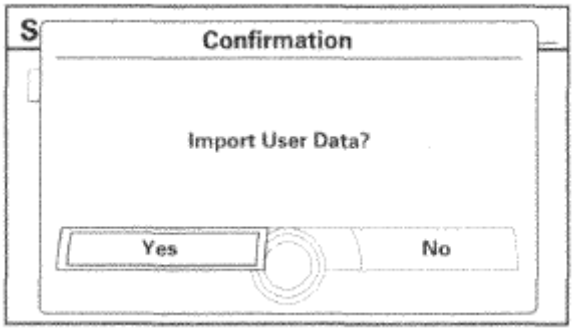

Fig. 100: Display - Import User Data Confirmation Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Demo Mode

This screen is for factory use only, and should always be set to OFF. Occasionally the Demo setting is turned ON when vehicles are used at Auto Shows or similar events. Turning this feature on allows the navigation system to automatically follow a route to a destination when the vehicle is stationary. The Speed changes the speed of the demo mode.

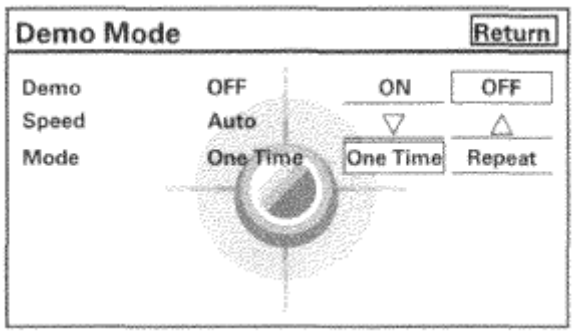

Fig. 101: Display - Demo Mode Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Clear All

The clear all function deletes all recorded music, images, cell phone information, previous destinations, and the phonebook from the HDD.

When Clear All is selected, the system restarts after performing the Clear All process. After the restart, a normal start-up process occurs and needs GPS initialization.

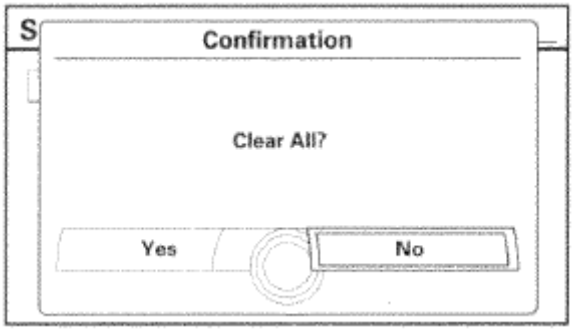

Fig. 102: Display - Clear All Confirmation Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

If you select YES, the second confirmation screen appears.

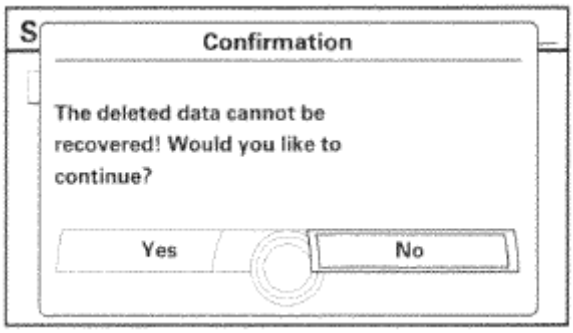

Fig. 103: Display - Clear All, Second Confirmation Screen

Courtesy of AMERICAN HONDA MOTOR CO., INC.

B-CAN SYSTEM LINK

This diagnosis tests whether the audio-navigation unit is receiving B-CAN data properly.

B-CAN (Body Controller Area Network) passes information between processors on the network. The B-CAN network uses a communication protocol that transmits data at 125 Kbps.

If any icons are red, check for B-CAN DTCs with the HDS.

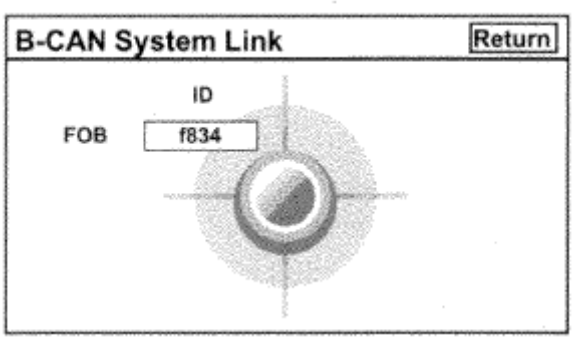

Fig. 104: Display - B-CAN System Link Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

XM (HIP) SYSTEM LINK

This diagnosis tests the connections between the AcuraLink control unit (XM receiver) and the communication lines. Refer to the AcuraLink Self-Diagnostic Function (see **DTC TROUBLESHOOTING**).

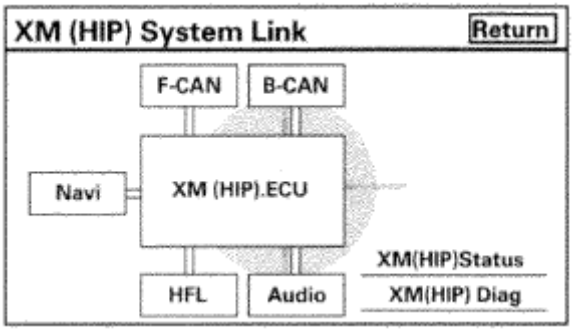

Fig. 105: Display - XM (HIP) System Link Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

KM STATUS

When you select XM (HIP) Status in the XM (HIP) System Link, the XM Status screen is displayed.

You can check the XM status in this screen.

Items	Condition Indicated
XM reception	• Receiving • Check Antenna • No Signal • Loading • Expired
Traffic Signal Reception	• Receiving • Check Antenna • No Signal • Loading • Expired
Traffic Indicator	• TRF (green icon): Traffic information is available. • TRF (white icon): Flow or incident data is not available. • TRF (red icon): No traffic available (flow and incident).
Traffic Data	• OK • Invalid
Traffic Last Update	Last update time and date indicated.
Weather Signal Reception	• Receiving • Check Antenna • No Signal • Loading • Expired
Weather Data	• OK • Invalid
Weather Last Update	Last update time and date indicated.

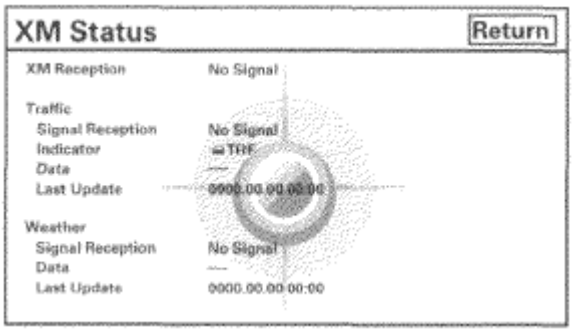

Fig. 106: Display - XM Status Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ERROR MESSAGE TABLE

Screen Error Message	Solution
Cannot access the HDD due to excessive heat. Please wait until the system cools down.	This message appears briefly when the audio-navigation unit temperature is too high, and then the display turns off until the temperature cools down. The system turns back on when the audio-navigation unit cools down.
Cannot write to the HDD due to the low temperature. Please wait until the system warms up.	The temperature is too low and the audio-navigation unit has difficulties reading the HDD. The system starts up when the temperature warms up.
Cannot access the HDD due to low atmospheric pressure. Navigation and HDD audio functions are disabled. The system will restart when atmospheric pressure is OK.	The atmospheric pressure is below 9 psi (62.29 kPa). This message appears, and after a few seconds, the system shuts down automatically. When the atmospheric pressure returns to a normal, the system reboots.
Cannot access HDD. Please contact your dealer.	This message appears when the system detects the HDD is not connected or there is a HDD connecting error. If the audio-navigation unit was replaced, make sure the HDD was transferred to the new unit. The HDD data management area (file system) is damaged or the password is incorrect. Check any official Honda service website for more service information about the navigation system.
The HDD is not connected. Please check the connection.	
There is no application program. Please visit your dealer when possible.	This message appears when the HDD generation and application program version are not interactive and an application program cannot start up. Check any official Honda service website for more service information about the navigation system.
The display temperature is too high! For protection, the display will shut down.	This message appears briefly when the display temperature is too high, and then the display turns off until the temperature cools down. The system turns back on when the display cools down.

DTC TROUBLESHOOTING

DTC 1102: USB DIAG

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when a problem is detected with the USB.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Connect the USB device to the USB port.
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Go into the System Diagnostic Mode, and use the **USB Memory** info to check the USB device status.

Is the USB device information displayed?

YES - Intermittent failure, the system is OK at this time. •

NO - Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the USB device, then reconnect it.
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Go into the System Diagnostic Mode, and use the **USB Memory info** to check the USB device status.

Is the USB device information displayed?

YES - Intermittent failure, the system is OK at this time. Check for loose or poor connection at USB device. •

NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Disconnect the USB device, then connect a known-good USB device to the USB port.
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Go into the System Diagnostic Mode, and use the **USB Memory info** to check the USB device status.

Is the USB device information displayed?

YES - Original USB device is faulty. •

NO - Go to step 12.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Make sure the USB device, the USB port, and audio-navigation unit connector F (7P) are properly connected.

Are the connectors properly connected?

YES - Go to step 14.

NO - Reconnect the connectors, and recheck. •

14. Disconnect the USB device.
15. Disconnect audio-navigation unit connector F (7P).
16. Check for continuity between audio-navigation unit connector F (7P) and the USB port 5P connector according to the table.

	Audio-navigation unit connector	USB port connector
USB VBUS	F1	4

USB DATA-	F2	3
USB DATA+	F3	2
USB GND	F4	1
USB SH	F5	5

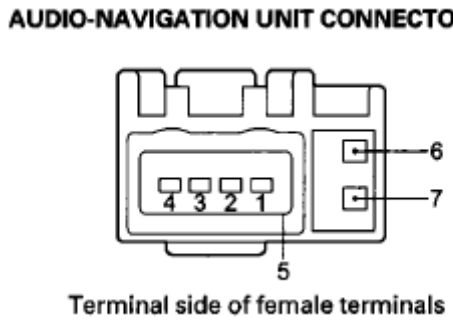

Fig. 107: Checking Continuity Between Audio-Navigation Unit Connector F (7P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

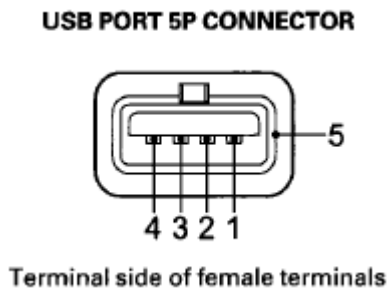

Fig. 108: Checking Continuity Between USB Port 5P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the **audio-navigation unit**. •

NO - There is an open in the wire(s) between the audio-navigation unit and the USB port. Replace the affected shielded harness. •

DTC 1203: DVD TEMP ERROR

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when the internal temperature of the ECU falls below - 4°F (- 20°C) or above 158°F (70°C). The unit is designed to shut down to protect the ECU. This is usually caused by exterior temperatures. Do the troubleshooting when the unit is within the allowable temperature range.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting**

Information.

1. Check that the temperature is between - 4°F (- 20°C), below 158°F (70°C) in dash.
2. Clear the **hard error code**.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or press the engine start/stop button to select the ON mode.
4. Check for the **hard error code**.

   Is DTC 1203 indicated?

   YES - Replace the **audio-navigation unit**. •

   NO - Go to step 5.

5. Check the audio-navigation unit cooling fan on the back of the audio-navigation unit to see if it is blocked.

   Is the fan blocked?

   YES - Clean or clear the audio-navigation unit cooling fan, and recheck. •

   NO - Intermittent failure, the system is OK at this time. If the vehicle repeatedly comes back with the navigation DTC, replace the **audio-navigation unit**. •

DTC 1301: GPS ANTENNA ERROR

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when there is poor connectors or loose terminals at the GPS antenna connector or an open in GPS antenna lead.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**
- **Make sure the vehicle is parked outside, away from buildings.**
- **Aftermarket metallic window tint or electronic devices located near the audio-navigation unit or the GPS antenna can potentially interfere with the operation of the navigation system.**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or press the engine start/stop button to select the ON mode.
3. Check for the **hard error code**.

   Is DTC 1301 indicated?

   YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. •

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Check for poor connections or loose terminals at the audio-navigation unit connector J (2P).
6. Clear the **hard error code**.
7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or press the engine start/stop button to select the ON mode.
8. Check for the **hard error code**.

Is DTC 1301 indicated?

YES - Replace the **GPS Antenna**, then recheck. If the DTC continues to set, replace the **audio-navigation unit**. •

NO - Intermittent failure, the system is OK at this time. If the vehicle repeatedly comes back with the navigation DTC, replace the **audio-navigation unit**. •

DTC 1302: GPS RECEIVER ERROR 1

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when there is an internal GPS receiver problem.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**
- **Make sure the vehicle is parked outside, away from buildings.**
- **Aftermarket metallic window tint or electronic devices located near the audio-navigation unit or GPS antenna can potentially interfere with the operation of the navigation system.**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or press the engine start/stop button to select the ON mode.
3. Check for the **hard error code**.

Is DTC 1302 indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. If the unit repeatedly comes back with the navigation DTC, replace the **audio-navigation unit**. •

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect and reconnect audio-navigation unit connector J (2P).
6. Clear the **hard error code**.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or press the engine start/stop button to select the ON mode.
8. Check for the **hard error code**.

   Is DTC 1302 indicated?

   YES - Replace the **GPS Antenna**, then recheck. If the navigation DTC continues to set, replace the **audio-navigation unit**. •

   NO - Intermittent failure, the system is OK at this time. If the vehicle repeatedly comes back with the navigation DTC, replace the **audio-navigation unit**. •

DTC 1303: GPS RECEIVER ERROR 2

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when there is an internal GPS receiver problem.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**
- **Make sure the vehicle is parked outside, away from buildings.**
- **Aftermarket metallic window tint or electronic devices located near the audio-navigation unit or GPS antenna can potentially interfere with the operation of the navigation system.**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
3. Check for the **hard error code**.

   Is DTC 1303 indicated?

   YES - Replace the **audio-navigation unit**. •

   NO - Intermittent failure, the system is OK at this time. If the vehicle repeatedly comes back with the navigation DTC, replace the **audio-navigation unit**. •

DTC 1304: GYRO ERROR 1

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when there is a problem with the internal yaw rate sensor.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**
- **Make sure the vehicle is parked outside, away from buildings.**

- **Aftermarket metallic window tint or electronic devices located near the audio-navigation unit or GPS antenna can potentially interfere with the operation of the navigation system.**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
3. Check for the **hard error code**.

Is DTC 1304 indicated?

YES - Replace the **audio-navigation unit**. •

NO - Intermittent failure, the system is OK at this time. If the vehicle repeatedly comes back with the navigation DTC, replace the **audio-navigation unit**. •

DTC 1305: GYRO ERROR 2

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when there is a problem with the internal yaw rate sensor.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Check that the passenger compartment temperature is between - 4°F (- 20°C) and 158°F (70°C).
2. Clear the **hard error code**.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
4. Check for the **hard error code**.

Is DTC 1305 Indicated?

YES - Replace the **audio-navigation unit**. •

NO - Intermittent failure, the system is OK at this time. If the vehicle repeatedly comes back with the navigation DTC, replace the **audio-navigation unit**. •

DTC 1306: VEHICLE SPEED PULSE

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when there is a problem with the VSP circuit.**
- **Check any official Honda service website for more service information about the navigation system.**

- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**
- **This navigation DTC may be caused by electrical interference. Check for aftermarket devices installed in the vehicle.**

1. Check the MIL on the gauge.

   Is the MIL on?

   YES - Go to the PGM-FI system's general troubleshooting information (see **GENERAL TROUBLESHOOTING INFORMATION**). •

   NO - Go to step 2.

2. Clear the **hard error code**.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then start the engine.
4. Check for the **hard error code**.

   Is DTC 1306 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. •

5. Go into the System Diagnostic Mode, and select the **Self-Diagnosis Mode**.
6. Select the **Car Status** in the System Link to check the vehicle speed pulse.
7. With the help of an assistant drive the vehicle and watch the VSP signal.

   Does the VSP signal change from [0] (stopped) to [1] (driving) as you drive?

   YES - Replace the **audio-navigation unit**. •

   NO - Go to step 8.

8. Raise the vehicle on a lift, and rotate the tires while measuring the voltage between audio-navigation unit connector A (24P) terminal No. 15 and body ground.

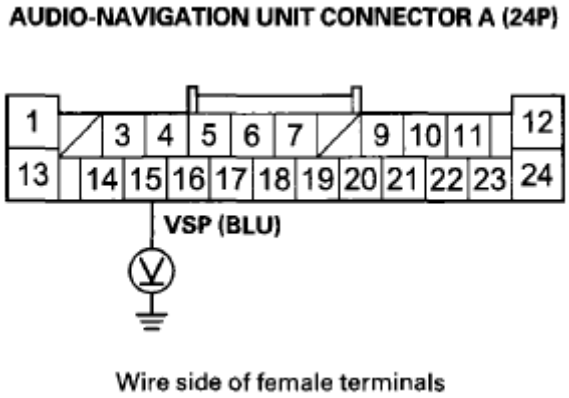

Fig. 109: Measuring Voltage Between Audio-Navigation Unit Connector A (24P) Terminal No. 15 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the voltage change from 0 V to 5 V?

YES - Replace the **audio-navigation unit**. •

NO - Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect audio-navigation unit connector A (24P).

NOTE: Eject all the disc(s) before disconnecting the audio-navigation unit to prevent damaging the CD/DVD player's load mechanism.

11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connector A (49P).
13. Check for continuity between audio-navigation unit connector A (24P) terminal No. 15 and body ground.

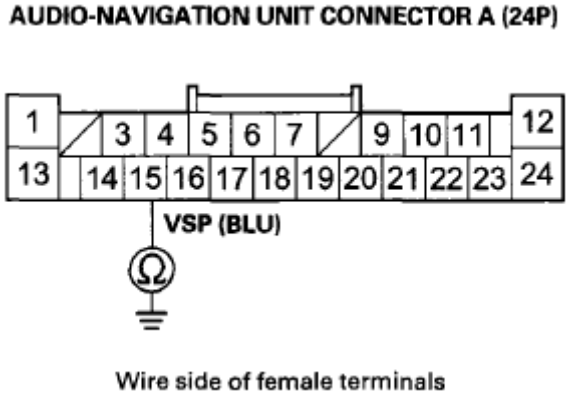

Fig. 110: Checking Continuity Between Audio-Navigation Unit Connector A (24P) Terminal No. 15 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the audio-navigation unit and the ECM/PCM, and recheck. •

NO - Go to step 14.

14. Check for continuity between audio-navigation unit connector A (24P) terminal No. 15 and ECM/PCM connector A (49P) terminal No. 30.

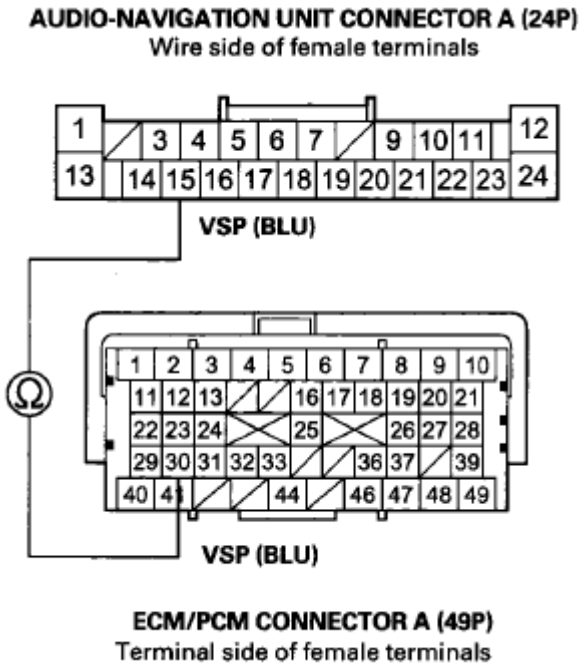

Fig. 111: Checking Continuity Between Audio-Navigation Unit Connector A (24P) Terminal No. 15 And ECM/PCM Connector A (49P) Terminal No. 30
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Update the ECM/PCM (see **ECM/PCM UPDATE**), if it does not have the latest software, or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). •

NO - Repair an open in the wire between the audio-navigation unit and the ECM/PCM, and recheck. •

DTC 1402: AUDIO ERROR 2

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when the audio-navigation unit detects a mechanical malfunction in the CD/DVD player.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
3. Check for the **hard error code**.

Is DTC 1402 indicated?

YES - Check if the audio system functions are working properly. If any problems are found, go to affected troubleshooting in audio information. •

NO - Intermittent failure, the system is OK at this time. •

DTC 1403: AUDIO ERROR 3 (DISPLAY ERROR)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when a mechanical malfunction in the navigation display is detected.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
3. Check for the **hard error code**.

Is DTC 1403 indicated?

YES - Replace the navigation display unit. •

NO - Intermittent failure, the system is OK at this time. •

DTC 1404: AUDIO ERROR 4 (DVD ERROR)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when there is a problem with the DVD player.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
3. Check for the **hard error code**.

Is DTC 1404 indicated?

YES - Replace the **audio-navigation unit**. •

NO - Intermittent failure, the system is OK at this time. •

DTC 1405: AUDIO ERROR 5 (HDD ERROR)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when the internal temperature of the HDD rises above 158°F (70°C). The unit is designed to shut down to protect the HDD. This could be caused by an inoperative audio-navigation unit cooling fan or if the vehicle cabin temperature exceeds the maximum. Do the troubleshooting when the audio-navigation unit is within the allowable temperature range.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
3. Check for the **hard error code**.

Is DTC 1405 indicated?

YES - Replace the **audio-navigation unit**. •

NO - Intermittent failure, the system is OK at this time. •

DTC 1409: AUDIO ERROR 9 (XM ERROR)

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when a problem is detected in the XM antenna connection.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Clear the **hard error code**.

2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
3. Check for the **hard error code**.

   Is DTC 1409 indicated?

   YES - Check for poor connections or loose terminals at the XM antenna, if they are OK, do the diagnosis for the XM antenna in the audio system. •

   NO - Intermittent failure, the system is OK at this time. •

DTC 1501: AIRCON ERROR; DTC 2703: AIRCON DIAG

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **These navigation DTCs sets when a communication error between the climate control unit and the audio-navigation unit (open or short) is detected.**
- **Check for B-CAN DTCs and resolve them before troubleshooting.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
2. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
3. Check the System Link.

   Is the Aircon icon red?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. •

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect audio-navigation unit connector D (36P).
6. Connect audio-navigation unit connector D (36P) terminals No. 10 and No. 11 with a jumper wire, then connect terminals No. 10 and No. 27 with a jumper wire.

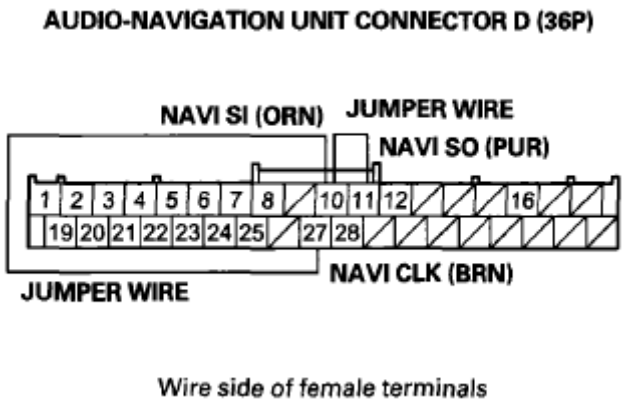

Fig. 112: Connecting Audio-Navigation Unit Connector D (36P) Terminals With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Press and hold the AUTO button, then press and hold the ON/OFF button.

   Are both HEAT/VENT indicators solid with the remaining icons blinking?

   YES - Replace the **audio-navigation unit**. •

   NO - Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then disconnect the jumper wires.
10. Disconnect the jumper wires.
11. Disconnect climate control unit connecter C (20P).
12. Connect climate control unit connector C (20P) terminals No. 4 and No. 5 with a jumper wire, then connect terminals No. 5 and No. 6 with a jumper wire.

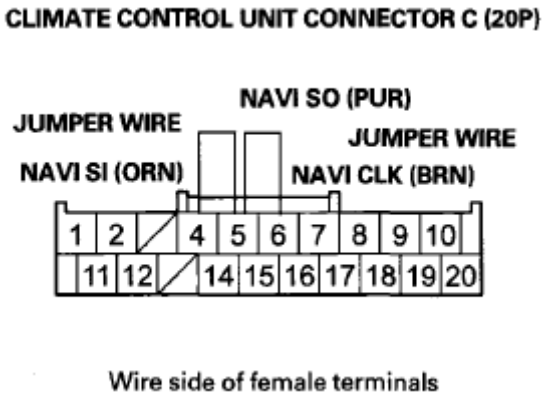

Fig. 113: Connecting Climate Control Unit Connector C (20P) Terminals With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check for continuity between audio-navigation unit connector D (36P) terminals No. 10 and No. 11, and

between terminals No. 10 and No. 27.

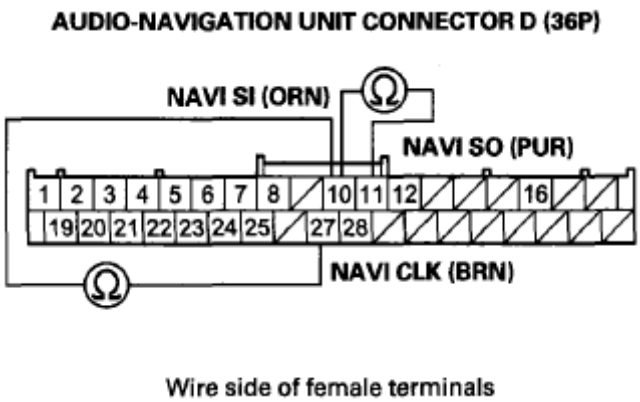

Fig. 114: Checking Continuity Between Audio-Navigation Unit Connector D (36P) Terminals And Between Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 14.

NO - Repair an open in the wire(s) between the audio-navigation unit and the climate control unit. •

14. Disconnect the jumper wires.
15. Check for continuity between body ground and audio-navigation unit connector D (36P) terminals No. 10, No. 11, and No. 27 individually.

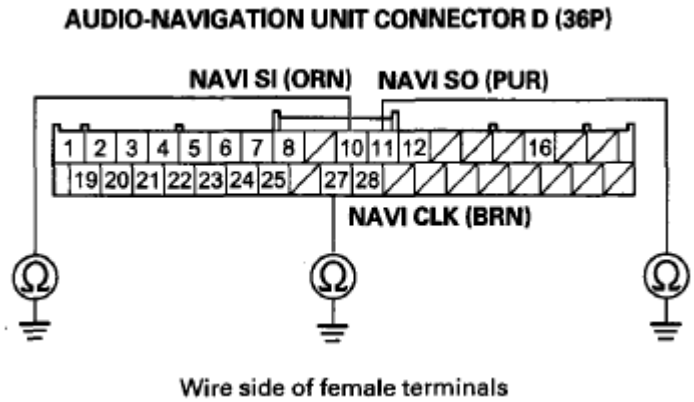

Fig. 115: Checking Continuity Between Body Ground And Audio-Navigation Unit Connector D (36P) Terminals Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Are there continuity?

YES - Repair a short to body ground in the wire(s) between the audio-navigation unit and the climate

control unit. •

NO - Go to step 16.

16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
17. Measure the voltage between body ground and audio-navigation unit connector D (36P) terminals No. 10, No. 11, and No. 27 individually.

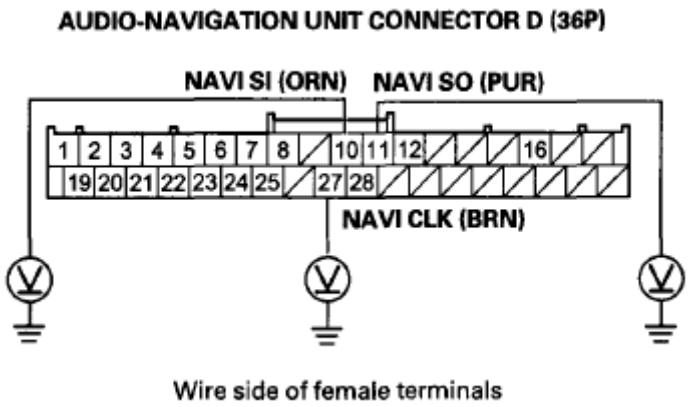

Fig. 116: Measuring Voltage Between Body Ground And Audio-Navigation Unit Connector D (36P) Terminals Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage above 0.2 V?

YES - Repair a short to power in the wire(s) between the audio-navigation unit and the climate control unit. •

NO - Replace the climate control unit (see **EVAPORATOR TEMPERATURE SENSOR REPLACEMENT**). •

DTC 1701: R- CAMERA ERROR; DTC 2608: R- CAMERA DIAG

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **These navigation DTCs sets when a mechanical malfunction in the navigation display is detected, or when a communication error between the rearview camera and the navigation display unit (open or short) is detected.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
2. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.

3. Check the System Link.

   Is the Rear- camera icon red?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. •

4. Check for poor connection or loose terminals at the rearview camera 12P connector.

   Are the connection or terminals OK?

   YES - Go to step 5.

   NO - Repair the poor connection or loose terminals, and recheck. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the rearview camera 12P connector.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Measure the voltage between rearview camera 12P connector terminal No. 7 and body ground.

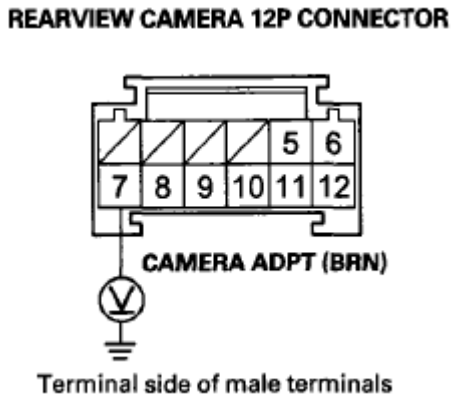

Fig. 117: Measuring Voltage Between Rearview Camera 12P Connector Terminal No. 7 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there about 3.0 V?

   YES - Replace the **rearview camera**. •

   NO - Go to step 9.

9. Measure the voltage between navigation display unit 36P connector terminal No. 23 and body ground.

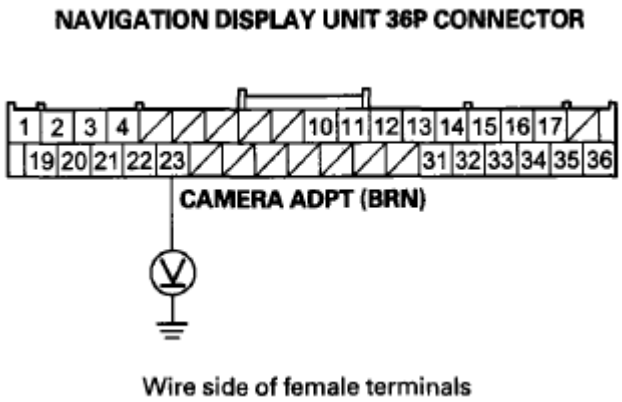

Fig. 118: Measuring Voltage Between Navigation Display Unit 36P Connector Terminal No. 23 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 3.0 V?

YES - Repair an open in the wire between the navigation display unit and the rearview camera. •

NO - Replace the **navigation display unit**. •

DTC 1801: HIP ERROR

USA models

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when a problem (open or short) is detected in the COMM BUS.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**
- **Check for and resolve any B-CAN DTCs before troubleshooting.**
- **Check any official Honda service website for any service information about the AcuraLink or software updates.**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
3. Check for the **hard error code**.

Is DTC 1801 indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. •

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Check for poor connections or loose terminals at AcuraLink control unit (XM receiver) connector A (32P), and audio-navigation unit connector H (28P).

   Are the connections or terminals OK?

   YES - Go to step 6.

   NO - Repair poor connections or loose terminals, and recheck. •

6. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Check for XM (HIP) communication with the HDS.

   Does the XM (HIP) communicate with the HDS?

   YES - Go to step 9.

   NO - Go to AcuraLink troubleshooting. •

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect AcuraLink control unit (XM receiver) connector A (32P) and audio-navigation unit connector H (28P).
11. Check for continuity between the terminals of AcuraLink control unit (XM receiver) connector A (32P) according to the table.

From terminal	To terminals
A21 (GRY)	A 17 (WHT), A 18 (RED), A 19 (GRN), A 20 (BLK)

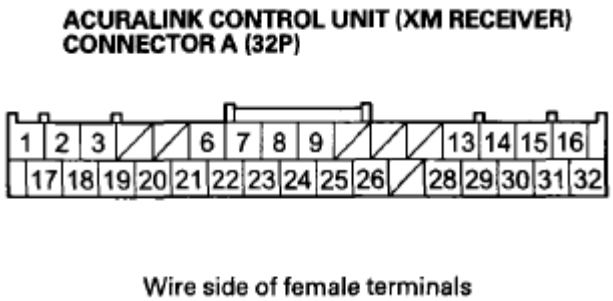

Fig. 119: Checking Continuity Between Terminals Of AcuraLink Control Unit (XM Receiver) Connector A (32P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of terminals?

YES - There is a short in the wires between the AcuraLink control unit (XM receiver) and the audio-

navigation unit. Replace the affected shielded harness. •

NO - Go to step 12.

12. Check for continuity between body ground and AcuraLink control unit (XM receiver) connector A (32P) terminals No. 17, No. 18, No. 19, and No. 20 individually.

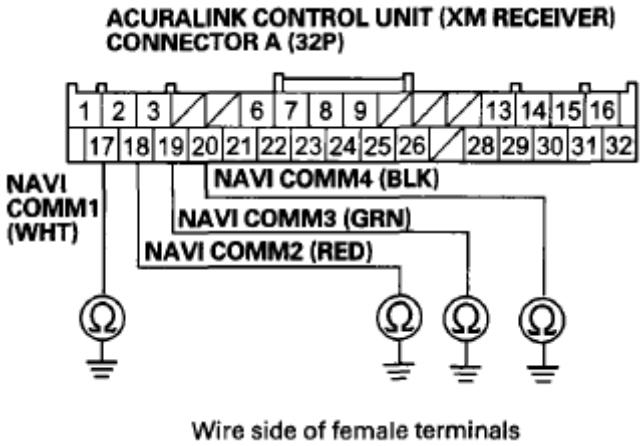

Fig. 120: Checking Continuity Between Body Ground And AcuraLink Control Unit (XM Receiver) Connector A (32P) Terminals Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - There is a short to body ground in the wire(s) between the AcuraLink control unit (XM receiver) and the audio-navigation unit. Replace the affected shielded harness. •

NO - Go to step 13.

13. Connect AcuraLink control unit (XM receiver) connector A (32P) terminals No. 17, No. 18, No. 19, and No. 20 to body ground with jumper wires.

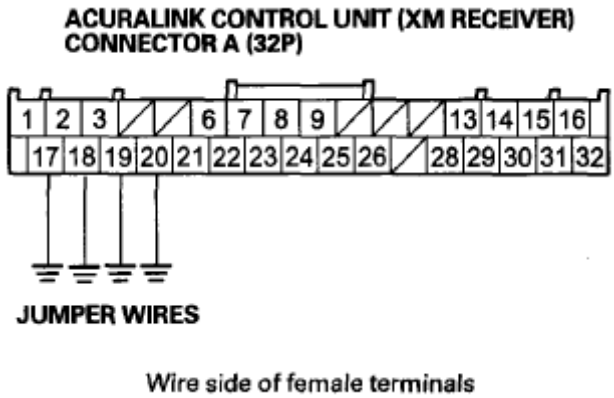

Fig. 121: Connecting AcuraLink Control Unit (XM Receiver) Connector A (32P) Terminals To

Body Ground With Jumper Wires
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Check for continuity between body ground and audio-navigation unit connector H (28P) terminals No. 9, No. 10, No. 22, and No. 23 individually.

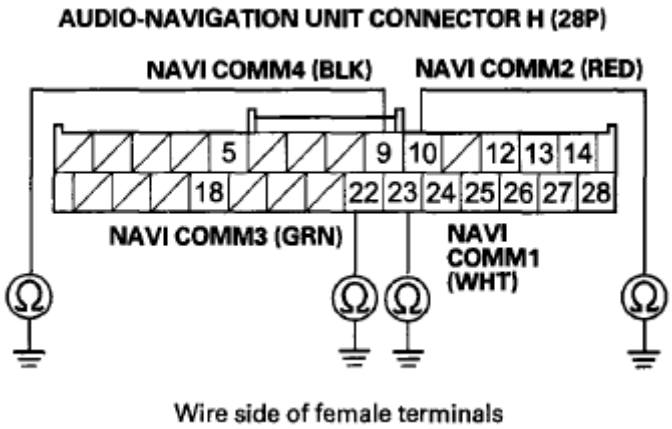

Fig. 122: Checking Continuity Between Body Ground And Audio-Navigation Unit Connector H (28P) Terminals Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the **audio-navigation unit**. •

NO - There is an open in the wire(s) between the AcuraLink control unit (XM receiver) and the audio-navigation unit. Replace the affected shielded harness. •

DTC 2601: DISPLAY DIAG: CONNECT

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when a mechanical malfunction in the navigation display unit is detected.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
3. Check the System Link.

Is the Display icon red?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. •

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Check for poor connections or loose terminals at these items:
   - Audio-navigation unit connector C(14P)
   - HandsFreeLink control unit 32P connector
   - AcuraLink control unit (XM receiver) connector A (32P) (USA models)
   - XM receiver connector A (14P) (Canada models)

   Are the connections OK?

   YES - Go to step 6.

   NO - Repair poor connections or loose terminals, and recheck. •

6. Disconnect audio-navigation unit connector C (14P) and the navigation display unit 36P connector.
7. Connect audio-navigation unit connector C (14P) terminals No. 9 and No. 10 with a jumper wire.

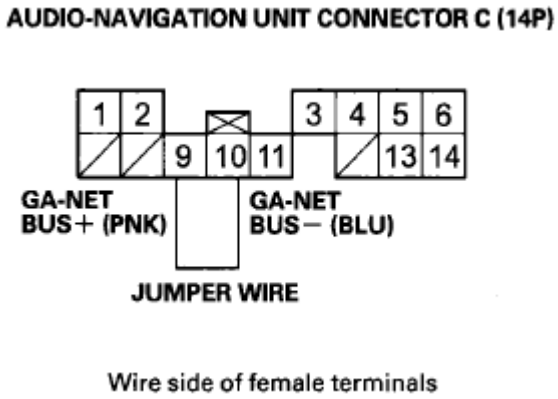

Fig. 123: Connecting Audio-Navigation Unit Connector C (14P) Terminals No. 9 And No. 10 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Check for continuity between navigation display unit 36P connector terminals No. 32 and No. 33.

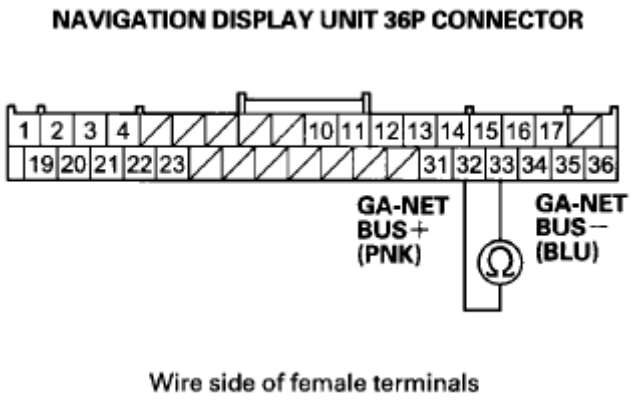

Fig. 124: Checking Continuity Between Navigation Display Unit 36P Connector Terminals No. 32 And No. 33
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - There is an open in the wire(s) between the navigation display unit and the audio-navigation unit. Replace the affected shielded harness. •

9. Disconnect the jumper wires.
10. Disconnect these items:
    - HandsFreeLink control unit 32P connector
    - AcuraLink control unit connector A (32P) (USA models)
    - XM receiver connector A (14P) (Canada models)
11. Check for continuity between navigation display unit 36P connector terminals No. 32 and No. 33.

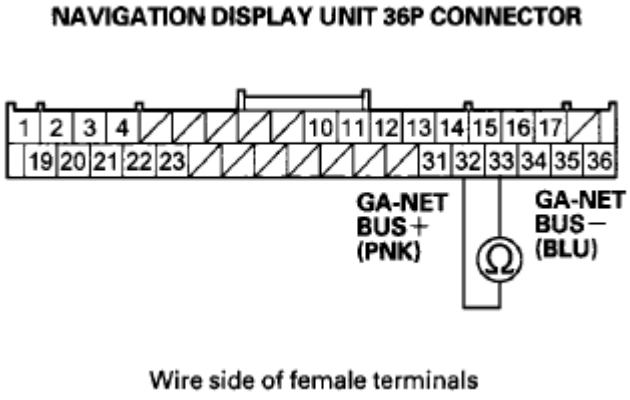

Fig. 125: Checking Continuity Between Navigation Display Unit 36P Connector Terminals No. 32 And No. 33
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - There is a short in the wires between the navigation display unit and the audio-navigation unit. Replace the affected shielded harness. •

NO - Go to step 12.

12. Check for continuity between body ground and navigation display unit 36P connector terminals No. 32 and No. 33 individually.

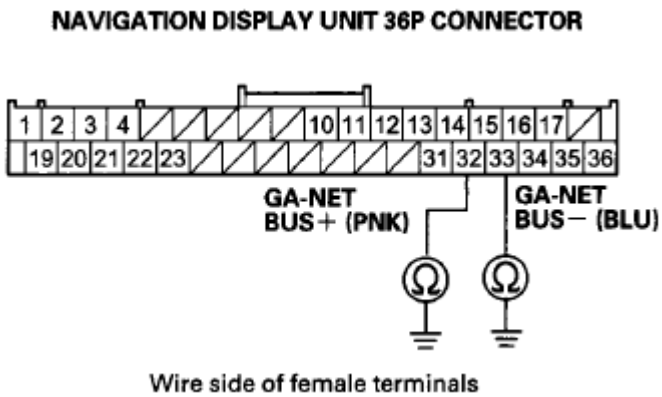

Fig. 126: Checking Continuity Between Body Ground And Navigation Display Unit 36P Connector Terminals No. 32 And No. 33 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - There is a short to body ground in the wire(s) between the navigation display unit and the audio-navigation unit. Replace the affected shielded harness. •

NO - Go to step 13.

13. Check for continuity between the terminals of the navigation display unit 36P connector according to the table.

From terminal	To terminals
31 (GRY)	32 (PNK), 33 (BLU)

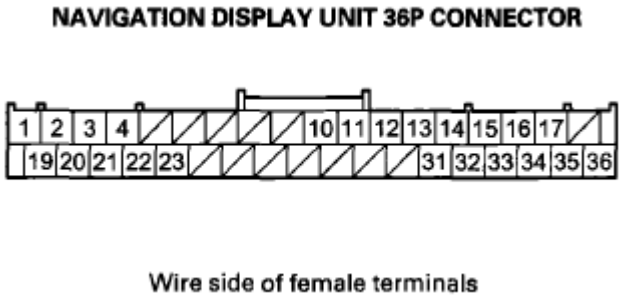

Fig. 127: Checking Continuity Between Terminals Of Navigation Display Unit 36P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - There is a short in wires between the navigation display unit and the audio-navigation unit. Replace the affected shielded harness. •

NO - Go to step 14.

14. Reconnect the all connectors, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
16. Check the System Link.

    Is the Display icon red?

    YES - Go to step 17.

    NO - Intermittent failure, the system is OK at this time. •

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Disconnect AcuraLink control unit (XM receiver connector A (32P) (USA models) or XM receiver connector A (14P) (Canada models).
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Go into the System Diagnostic Mode, and Select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
21. Check the System Link.

    Is the Display icon red?

    YES - Go to step 22.

    NO - Replace the AcuraLink control unit (XM receiver) (see **AcuraLink CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**) or the XM receiver (see **AcuraLink CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**). •

22. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
23. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
24. Disconnect the HandsFreeLink control unit 32P connector (see step 2 in **HANDSFREELINK CONTROL UNIT REMOVAL/INSTALLATION**).
25. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
26. Go into the System Diagnostic Mode, and Select the Self-Diagnosis Mode in the **Select Diagnosis Items Menu**.
27. Check the System Link.

    Is the Display icon red?

    YES - Go to step 28.

    NO - Replace the HandsFreeLink control unit (see **HFL SWITCH TEST**). •

28. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
29. Substitute a know-good navigation display unit.
30. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
31. Go into the System Diagnostic Mode, and Select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
32. Check the System Link.

    Is the Display icon red?

    YES - Replace the **audio-navigation unit**. •

    NO - Replace the original **navigation display unit**. •

DTC 2602: DISPLAY DIAG: ROM

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when a malfunction is detected in the navigation display unit.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
2. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
3. Select the Display in the System Link.

Is the ROM NG?

YES - Replace the **navigation display unit**. •

NO - Intermittent failure, the system is OK at this time. If the vehicle repeatedly comes back with the navigation DTC, replace the **navigation display unit**. •

DTC 2603: DISPLAY DIAG: RAM

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when a malfunction is detected in the navigation display unit.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
2. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
3. Select the Display in the System Link.

Is the RAM NG?

YES - Replace the **navigation display unit**. •

NO - Intermittent failure, the system is OK at this time. If the vehicle repeatedly comes back with the navigation DTC, replace the **navigation display unit**. •

DTC 2607: XM DIAG

USA models

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when a problem (open or short) is detected in the GA-Net BUS.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
3. Check for the **hard error code**.

Is DTC 2601 indicated?

YES - Do the DTC 2601 troubleshooting.

NO - Go to step 4.

4. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
5. Check the System Link.

   Is the XM (HIP) icon red?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. •

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Check for poor connections or loose terminals at these items:
   - Audio-navigation unit connector C (14P)
   - AcuraLink control unit (XM receiver) connector A (32P) and B (2P)

   Are the connections OK?

   YES - Go to step 8.

   NO - Repair poor connections or loose terminals. •

8. Disconnect these items:
   - Audio-navigation unit connector C (14P)
   - AcuraLink control unit (XM receiver) connector A (32P)
9. Connect AcuraLink control unit (XM receiver) connector A (32P) terminals No. 30 and No. 31 with a jumper wire.

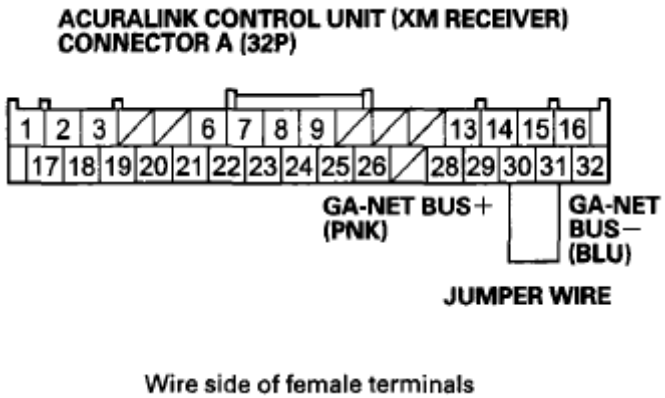

Fig. 128: Connecting AcuraLink Control Unit (XM Receiver) Connector A (32P) Terminals No. 30 And No. 31 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Check for continuity between audio-navigation unit connector C (14P) terminals No. 9 and No. 10.

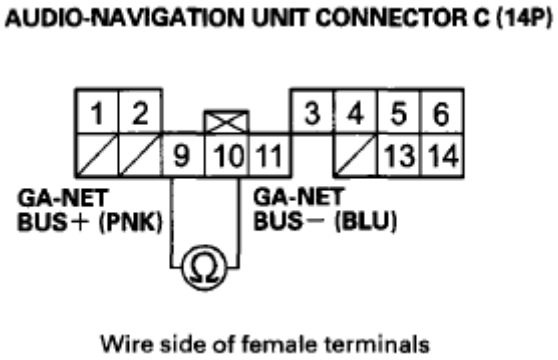

Fig. 129: Checking Continuity Between Audio-Navigation Unit Connector C (14P) Terminals No. 9 And No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the AcuraLink control unit (XM receiver) (see **AcuraLink CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**). •

NO - There is an open in the wire(s) between the AcuraLink control unit (XM receiver) and the audio-navigation unit. Replace the affected shielded harness. •

DTC 2607: XM DIAG

Canada models

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when a problem (open or short) is detected in the GA-Net BUS.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
3. Check for the **hard error code**.

Is DTC 2601 indicated?

YES - Do the DTC 2601 troubleshooting.

NO - Go to step 4.

4. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
5. Check the System Link.

   Is the XM icon red?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. •

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Check for poor connections or loose terminals at these items:
   - Audio-navigation unit connector C (14P)
   - XM receiver connector A (14P) and B (2P)

   Are the connections OK?

   YES - Go to step 8.

   NO - Repair poor connections or loose terminals. •

8. Disconnect these items:
   - Audio-navigation unit connector C (14P)
   - XM receiver connector A (14P)
9. Connect XM receiver connector A (14P) terminals No. 9 and No. 10 with a jumper wire.

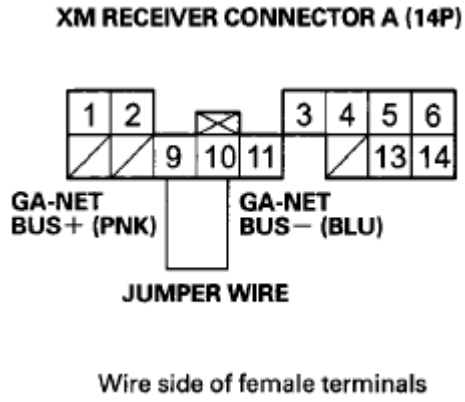

Fig. 130: Connecting XM Receiver Connector A (14P) Terminals No. 9 And No. 10 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Check for continuity between audio-navigation unit connector C (14P) terminals No. 9 and No. 10.

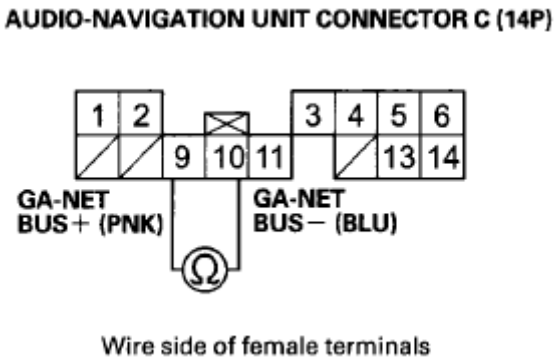

Fig. 131: Checking Continuity Between Audio-Navigation Unit Connector C (14P) Terminals No. 9 And No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the XM receiver (see **AcuraLink CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**). •

NO - There is an open in the wire(s) between the XM receiver and the audio-navigation unit. Replace the affected shielded harness. •

DTC 2610: DRAM DIAG

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when a problem with the audio-navigation unit internal DRAM is detected.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
2. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
3. Select the Navi ECU in the System Link.

Is D-RAM OK indicated?

YES - Intermittent failure, the system is OK at this time. If the vehicle repeatedly comes back with the navigation DTC, replace the **audio-navigation unit**. •

NO - Replace the **audio-navigation unit**. •

DTC 2611: HDD DIAG

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when there is a problem with the HDD.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Check that the passenger compartment temperature is between - 4°F (- 20°C) and 158°F (70°C).
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
3. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
4. Select the HDD in the System Link.

   Is HDD OK indicated?

   YES - Intermittent failure, the system is OK at this time. •

   NO - Go to step 5.

5. Check the HDD diagnosis.

   Is the Low Temp Indicated?

   YES - Replace the **HDD**, and recheck. If the vehicle repeatedly comes back with the navigation DTC, replace the **audio-navigation unit**. •

   NO - Replace the **audio-navigation unit**. •

DTC 2612: SUB DISPLAY DIAG

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when there is a problem with the audio-HVAC subdisplay.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II) or the ON mode.
2. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
3. Check the System Link.

   Is the Sub Display icon red?

   YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. •

4. Check that the audio system information is displaying properly.

   Is the audio information displayed?

   YES - Replace the **audio-navigation unit**. •

   NO - Go to Audio system information does not display on the audio-navigation switch panel display troubleshooting (see **AUDIO-NAVIGATION SWITCH PANEL BUTTON ILLUMINATION DOES NOT WORK (WITH NAVIGATION)**). •

DTC 2701: GPS DIAG: ANTENNA

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when a problem is detected in the GPS antenna.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**
- **Make sure the vehicle is parked outside, away from buildings.**
- **Check for electronic aftermarket accessories (possibly hidden) mounted near the GPS antenna or the audio-navigation unit.**
- **Check for aftermarket metallic window tint.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
2. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
3. Select the GPS Ant. in the System Link.

   Is Antenna OK indicated?

   YES - Intermittent failure, the system is OK at this time. •

   NO - Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Check for poor connections at audio-navigation unit connector J (2P).

   Is the connection OK?

   YES - Replace the GPS antenna. •

   NO - Repair poor connection. •

DTC 2702: GPS DIAG: RECEIVER IN NAVI ECU

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when a problem is detected in the GPS antenna.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**
- **Make sure the vehicle is parked outside, away from buildings.**
- **Check for electronic aftermarket accessories (possibly hidden) mounted near the GPS antenna or the audio-navigation unit.**
- **Check for aftermarket metallic window tint.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
2. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
3. Select the GPS Ant. in the System Link.

   Is Receiver in Navi ECU OK indicated?

   YES - Intermittent failure, the system is OK at this time. If the vehicle repeatedly comes back with the navigation DTC, replace the **audio-navigation unit**. •

   NO - Replace the **audio-navigation unit**. •

DTC 2704: HIP DIAG (ACURALINK)

USA models

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when a NG is indicated in the XM (HIP) diagnosis.**
- **Check for, and resolve any B-CAN DTCs before doing this troubleshooting.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
2. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
3. Check the System Link.

   Is the XM (HIP) icon red?

   YES - Do the AcuraLink Self-Diagnostic Function (see **SELF-DIAGNOSTIC FUNCTION**). •

NO - Do the **DTC 1801** troubleshooting. •

DTC 2705: HFL DIAG

USA models

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when NG is indicated in the HFT diagnosis.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
2. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
3. Check the System Link.

   Is the XM (HIP) icon red?

   YES - Go to **DTC 2704** Troubleshooting. •

   NO - Go to step 4.

4. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
5. Check the System Link.

   Is the HFL icon red?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. •

6. Select the HFT in the System Link, and check for HFL DTCs.

   Are there any HFL DTCs indicated?

   YES - Repair the indicated HFL DTC(s). •

   NO - Go to step 7.

7. Check the HFT diagnosis.

   Is DESIP NG indicated?

YES - Go to step 8.

NO - Replace the **audio-navigation unit**. •

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Remove the center console panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
10. Disconnect the HandsFreeLink control unit 32P connector, and AcuraLink control unit (XM receiver) connector A (32P).
11. Check for continuity between the terminals of HandsFreeLink control unit 32P connector according to the table.

From terminal	To terminals
8 (GRY)	6 (WHT), 7 (RED), 22 (BLK), 23 (GRN)

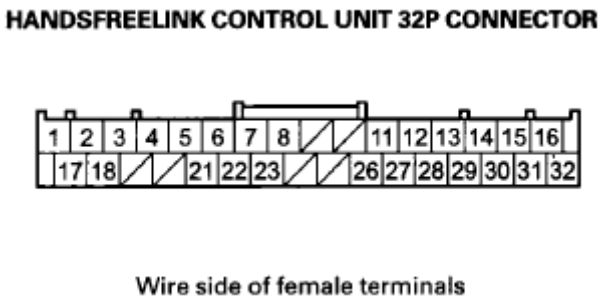

Fig. 132: Checking Continuity Between Terminals Of HandsFreeLink Control Unit 32P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - There is a short in the wires between the HandsFreeLink control unit and the audio-navigation unit. Replace the affected shielded harness. •

NO - Go to step 12.

12. Check for continuity between body ground and HandsFreeLink control unit 32P connector terminals No. 6, No. 7, No. 22, and No. 23 individually.

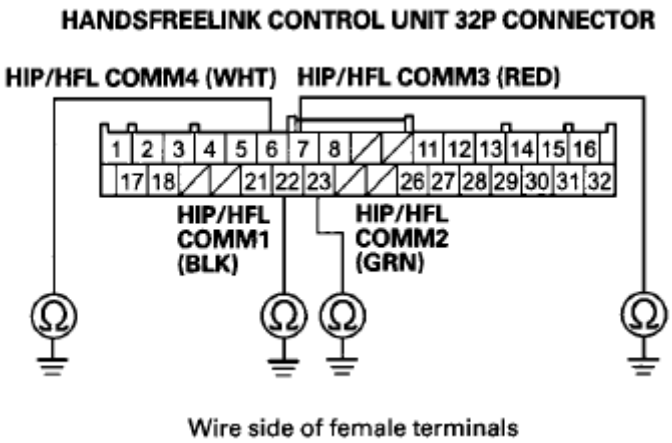

Fig. 133: Checking Continuity Between Body Ground And HandsFreeLink Control Unit 32P Connector Terminals Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - There is a short to body ground in the wire(s) between the HandsFreeLink control unit and the AcuraLink control unit (XM receiver). Replace the affected shielded harness. •

NO - Go to step 13.

13. Connect HandsFreeLink control unit 32P connector terminals No. 6, No. 7, No. 22, and No. 23 to body ground with jumper wires.

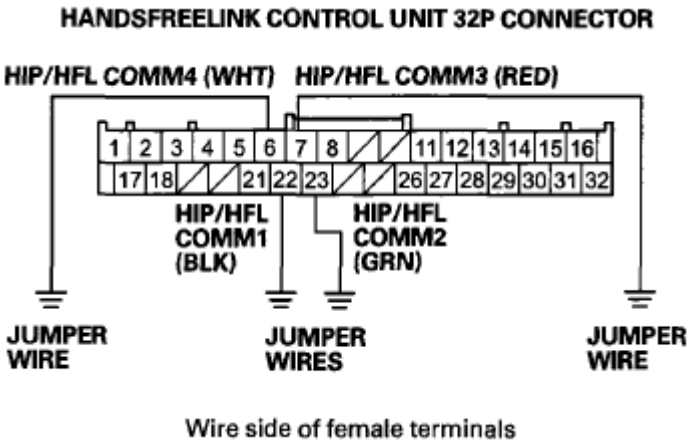

Fig. 134: Connecting HandsFreeLink Control Unit 32P Connector Terminals To Body Ground With Jumper Wires
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Check for continuity between body ground and AcuraLink control unit (XM receiver) connector A (32P) terminals No. 22, No. 23, No. 24, and No. 25 individually.

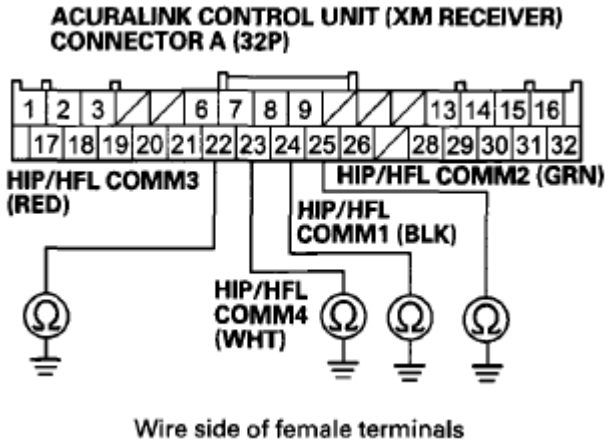

Fig. 135: Checking Continuity Between Body Ground And AcuraLink Control Unit (XM Receiver) Connector A (32P) Terminals Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the HandsFreeLink control unit (see **HFL SWITCH TEST**). •

NO - There is an open in the wire(s) between the HandsFreeLink control unit and the AcuraLink control unit (XM receiver). Replace the affected shielded harness. •

DTC 2705: HFL DIAG

Canada models

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when NG is indicated in the HFT diagnosis.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
2. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
3. Check the System Link.

Is the HFL icon red?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. •

4. Select the HFT in the System Link, and check for HFL DTCs.

   Are there any HFL DTCs indicated?

   YES - Repair the indicated HFL DTC(s). •

   NO - Replace the **audio-navigation unit**. •

DTC 2706: GYRO DIAG : ECU TEMP XX °C

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when the audio-navigation unit yaw rate sensor's temperature is out of its specified range.**
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**
- **Do this test only when the passenger compartment temperature is between - 4°F (- 20°C) and 158°F (70°C).**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
3. Check for the **hard error code**.

   Is DTC 2706 indicated?

   YES - Replace the **audio-navigation unit**. •

   NO - Go to step 4.

4. Check the audio-navigation unit cooling fan on the back of the audio-navigation unit to see if it is blocked.

   Is the fan blocked?

   YES - Clean or clear the audio-navigation unit cooling fan, and recheck. •

   NO - Intermittent failure, the system is OK at this time. If the vehicle repeatedly comes back with the navigation DTC, replace the **audio-navigation unit**. •

DTC 2707: MIC DIAG

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This navigation DTC sets when a problem is detected in the microphone circuit.**

- **Before you troubleshoot, make sure to follow the General Troubleshooting Information.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
2. Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode in the **Select Diagnosis Items menu**.
3. Select the System Link.

   Is the Mic icon red?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. •

4. Select the HFT in the System Link, and check for HFL DTCs.

   Are there any HFL DTCs indicated?

   YES - Repair the indicated HFL DTC(s). •

   NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check for poor connections or loose terminals at these items:
   - Audio-navigation unit connector H (28P)
   - HandsFreeLink control unit 32P connector
   - HFL-navigation microphone 7P connector

   Are the connections or terminals OK?

   YES - Go to step 7.

   NO - Repair poor connections or loose terminals, and recheck. •

7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Measure the voltage between body ground and HFL-navigation microphone 7P connector terminals No. 6 and No. 7 individually.

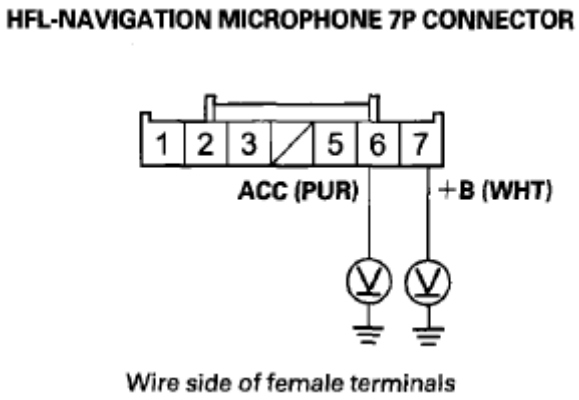

Fig. 136: Measuring Voltage Between Body Ground And HFL-Navigation Microphone 7P Connector Terminals No. 6 And No. 7 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 9.

NO - If the +B wire does not have voltage, repair an open in the wire between the No. 15 (10 A) fuse under-hood fuse/relay box and the HFL-navigation microphone. If the ACC wire does not have voltage, repair an open in the wire between the No. 18 (7.5 A) fuse in the driver's under-dash fuse/relay box and the HFL-navigation microphone. •

9. Measure the voltage between HFL-navigation microphone 7P connector terminal No. 1 and body ground.

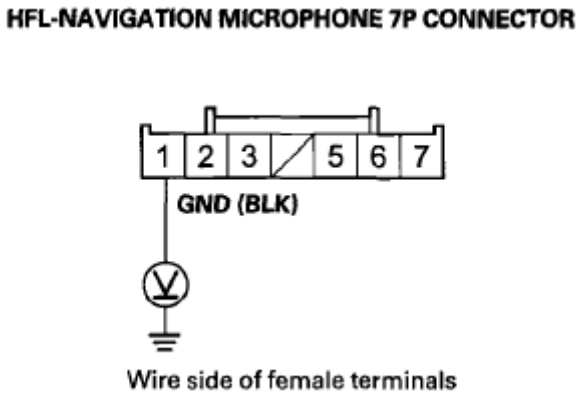

Fig. 137: Measuring Voltage Between HFL-Navigation Microphone 7P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Replace the HFL-navigation microphone. •

NO - Repair an open or high resistance in the wire between the HFL-navigation microphone and body

ground (G401) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**). •

SYMPTOM TROUBLESHOOTING

NO PICTURE IS DISPLAYED

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check if the Day/Night button has been pressed, and turned off the display (see Navigation Manual for more information).**
- **Check the connectors for poor connections or loose terminals.**
- **Before troubleshooting, make sure you have the anti-theft code.**
- **After troubleshooting, enter the anti-theft code.**
- **Make sure that the latest navigation software is installed.**
- **Check any official Honda service website for more service information about the navigation system.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check if the navigation display indicates any error message.

   Is error message displayed?

   YES - Refer to the **Error Message Table**. •

   NO - Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Check the No. 15 (10 A) fuse in the under-hood fuse/relay box and No. 18 (7.5 A) fuse in the driver's under-dash fuse/relay box, and reinstall the fuses if they are OK.

   Are the fuses OK?

   YES - Go to step 5.

   NO - Replace the fuse(s), and recheck. If the fuse(s) blows again, check for a short in the No. 15 (10 A) fuse and/or the No. 18 (7.5 A) fuse circuits. •

5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Do the **Forced Starting of the Audio-Navigation Unit**.

   Is the diagnosis menu of the picture diagnosis displayed?

   YES - Go to step 14.

   NO - Go to step 7.

7. Shield the navigation display unit from the sun with your hand, and check that the display is back lit (only the back light is on.)

   Can you see the back light?

   YES - Substitute a known-good **audio-navigation unit**, and recheck. If the symptom/indication goes away, replace the original **audio-navigation unit**. If the symptom/indication is still present, replace the **navigation display unit**. •

   NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Connect the HDS to the DLC.
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Clear the DTCs with the HDS.
12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
13. Check for DTCs with the HDS.

    Are there any DTCs?

    YES - Troubleshoot the indicated DTC, then recheck. •

    NO - Go to step 17.

14. Clear the **hard error code**.
15. Turn the ignition switch to LOCK(0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
16. Check for the **hard error code**.

    Is there a hard error code stored?

    YES - Refer to the hard error code troubleshooting. •

    NO - Substitute a known-good **audio-navigation unit**, and recheck. If the symptom/indication goes away, replace the original **audio-navigation unit**. If the symptom/indication is still present, replace the **navigation display unit**. •

17. Measure the voltage between body ground and audio-navigation unit connector A (24P) terminals No. 14 and No. 24 individually.

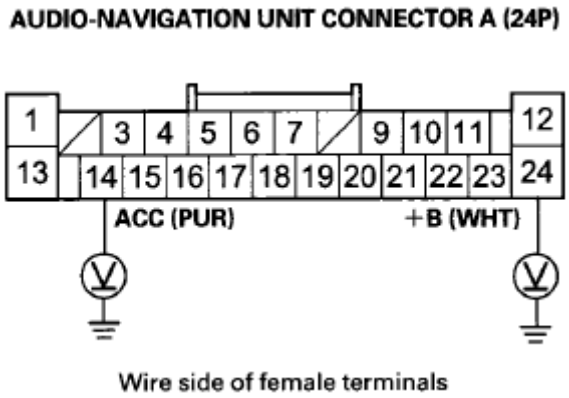

Fig. 138: Measuring Voltage Between Body Ground And Audio-Navigation Unit Connector A (24P) Terminals No. 14 And No. 24 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 18.

NO - If the +B wire does not have voltage, repair an open in the wire between the under-hood fuse/relay box and the audio-navigation unit. If the ACC wire does not have voltage, repair an open in the wire between the driver's under-dash fuse/relay box and the audio-navigation unit. •

18. Measure the voltage between audio-navigation unit connector A (24P) terminal No. 12 and body ground.

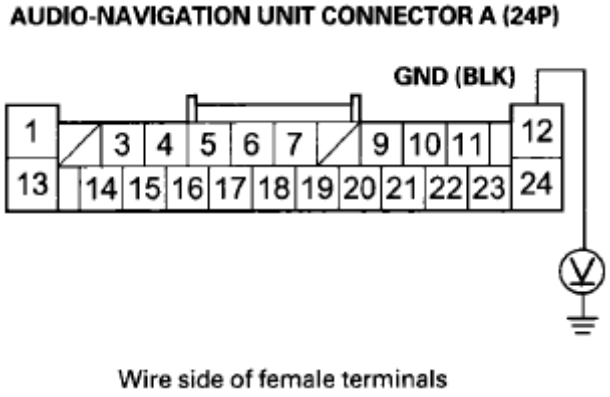

Fig. 139: Measuring Voltage Between Audio-Navigation Unit Connector A (24P) Terminal No. 12 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 19.

NO - Repair an open or high resistance in the wire between the audio-navigation unit and body ground (G502) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**). •

19. Measure the voltage between body ground and navigation display unit 36P connector terminals No. 1 and No. 2 individually.

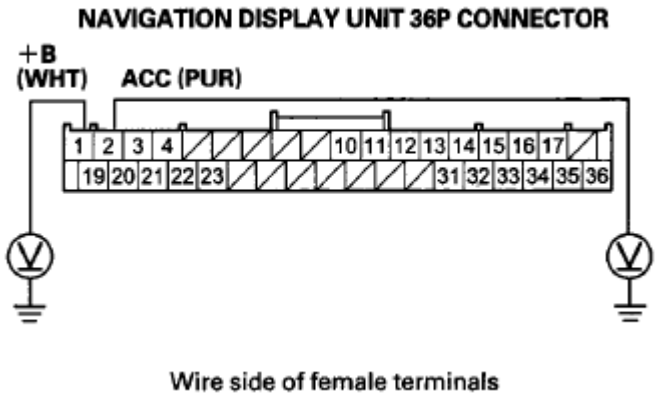

Fig. 140: Measuring Voltage Between Body Ground And Navigation Display Unit 36P Connector Terminals No. 1 And No. 2 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 20.

NO - If the +B wire does not have voltage, repair an open in the wire between the under-hood fuse/relay box and the navigation display unit. If the ACC wire does not have voltage, repair an open in the wire between the driver's under-dash fuse/relay box and the navigation display unit. •

20. Measure the voltage between navigation display unit 36P connector terminal No. 19 and body ground.

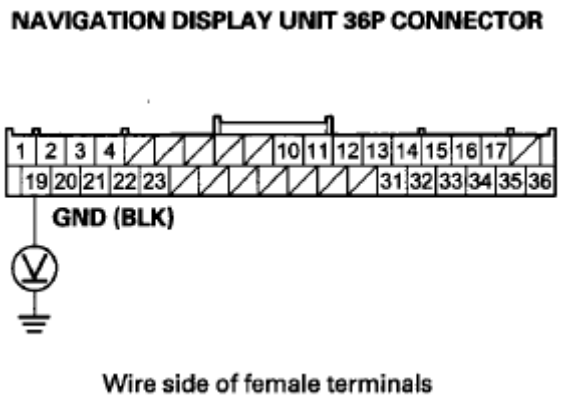

Fig. 141: Measuring Voltage Between Navigation Display Unit 36P Connector Terminal No. 19 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Substitute a known-good **navigation display unit**, and recheck. If the symptom/indication goes away, replace the original navigation display unit. If the symptom/indication is still present, replace the **audio-navigation unit**. •

NO - Repair an open or high resistance in the wire between the navigation display unit and body ground (G501) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**). •

VEHICLE POSITION ICON CONSTANTLY LEAVES ROAD, MOVES ERRATICALLY, OR IS DISPLAYED VERY FAR FROM ACTUAL VEHICLE POSITION

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check that the GPS antenna is plugged in.**
- **This is not the same condition as when driving off-road (or on a fire or logging road). This condition is caused by a loss of map matching from a bad sensor input. Check for aftermarket metallic window tinting or other objects that can block the GPS signal. Always do the Map Matching (see Map Matching) before proceeding with the troubleshooting.**
- **Make sure that the latest navigation software is installed.**
- **Check any official Honda service website for more service information about the navigation system.**
- **Check the GPS signal reception in an open area.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the GPS icon on the navigation screen.

   Is the GPS icon white?

   YES - Go to **GPS icon is white or not shown** troubleshooting. •

   NO - Go to step 3.

3. Go into the **System Diagnostic Mode**, and use the **Yaw Sensor test** to check the audio-navigation unit internal yaw rate sensor.

   Is the yaw rate sensor OK?

   YES - The condition may be normal. Check to see if the condition occurs in the same place in a known-good vehicle. If it does, the problem could be in the database. Go to step 4.

   NO - Replace the **audio-navigation unit**. •

4. Go into the System Diagnostic Mode, and use the **Car Status test** to check the VSP signal.
5. Drive the vehicle, and watch the VSP signal.

   Does the VSP signal change from [0] (stopped) to [1] (moving) as you drive?

YES - The condition may be normal. Check to see if the condition occurs in the same place in a known-good vehicle. If it does, the problem could be in the database. Go to step 6.

NO - Do the **DTC 1306 (Vehicle Speed Pulse)** troubleshooting. •

6. Substitute a known-good **audio-navigation unit**, and check to see if the problem occurs in the same place.

   Does the problem occur in the same location each time?

   YES - Try to replicate the problem in a known-good vehicle. If the problem can be duplicated, the problem is in the database. Report the problem according to the Navigation Manual under Reporting Errors. •

   NO - Replace the original **audio-navigation unit**. •

PICTURE IS MISSING A COLOR OR TONE OR IS AN ODD COLOR

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Make sure that the latest navigation software is installed.**
- **Check any official Honda service website for more service information about the navigation system.**
- **Check the navigation screen settings for brightness, contrast, and black level, and check the color screen for map color and menu color.**
- **Before troubleshooting, make sure you have the anti-theft code.**
- **After troubleshooting, enter the anti-theft code.**
- **Check for aftermarket accessories that may interfere with the navigation system.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Go into the **System Diagnostic Mode**, and use the RGB Color test under the **Monitor Check**.

   Are the red, green, and blue colored circles shown?

   YES - The system is OK at this time. •

   NO - Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect audio-navigation unit connector G (16P) and the navigation display unit 36P connector.
5. Check for poor connections or loose terminals at audio-navigation unit connector G (16P) and the navigation display unit 36P connector.

Are the connections or terminals OK?

YES - Go to step 6.

NO - Repair poor connections or loose terminals, and recheck. •

6. Check for continuity between the terminals of audio-navigation unit connector G (16P) according to the table.

From terminal	To terminals
G5 (GRN)	G6 (YEL), G7 (RED), G8 (WHT) G13 (GRY)
G6 (YEL)	G7 (RED), G8 (WHT) G13 (GRY)
G7 (RED)	G8 (WHT) G13 (GRY)
G8 (WHT)	G13 (GRY)

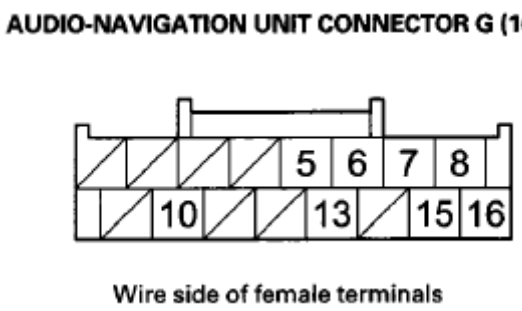

Fig. 142: Checking Continuity Between Terminals Of Audio-Navigation Unit Connector G (16P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - Go to step 7.

NO - There is a short in the wires between the audio-navigation unit and the navigation display unit. Replace the affected shielded harness. •

7. Check for continuity between audio-navigation unit connector G (16P) and body ground according to the table.

Audio-navigation unit connector	Wire color
G6	YEL
G7	RED
G8	WHT

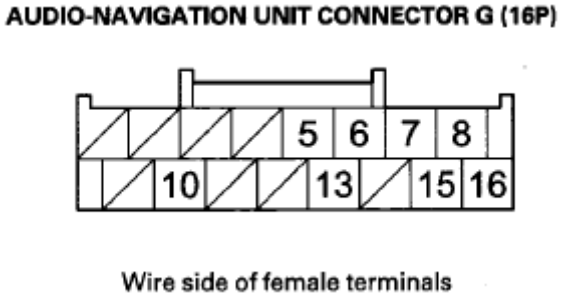

Fig. 143: Checking Continuity Between Audio-Navigation Unit Connector G (16P) And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - There is a short to body ground in the wires between the audio-navigation unit and the navigation display unit. Replace the affected shielded harness. •

NO - Go to step 8.

8. Check for continuity between the appropriate terminals of audio-navigation unit connector G (16P) and the navigation display unit 36P connector based on the missing color(s).

Missing color	Audio-navigation unit connector	Navigation display unit connector	Wire color
Blue	G6	16	YEL
Green	G7	15	RED
Red	G8	14	WHT

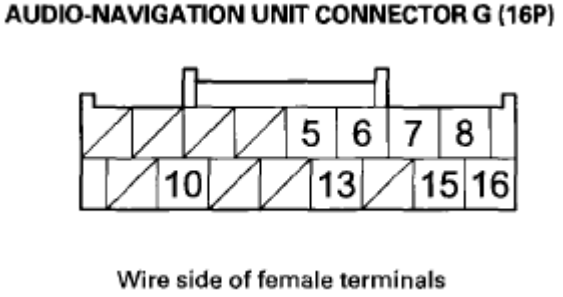

Fig. 144: Checking Continuity Between Appropriate Terminals Of Audio-Navigation Unit Connector G (16P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

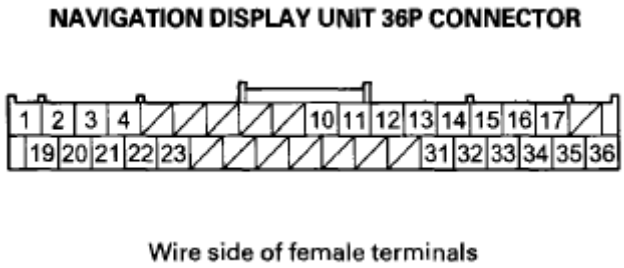

Fig. 145: Checking Continuity Between Appropriate Terminals Of Navigation Display Unit 36P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - There is an open in the wire(s) between the navigation display unit and the audio-navigation unit. Check for poor connections or loose terminals at the navigation display unit and the audio-navigation unit. If a poor connection or loose terminal is found, replace the affected shielded harness. •

NO - Substitute a known-good **navigation display unit**, then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original **navigation display unit**. If the symptom/indication is still present, replace the **audio-navigation unit**. •

PICTURE HAS LINES, ROLLS, OR IS BLURRY

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Always compare the screen image to a known-good vehicle. If the screen looks the same, inform the client that it is a characteristic of the system.**
- **Check the connectors for poor connections or loose terminals.**
- **Make sure that the latest navigation software is installed.**
- **Check any official Honda service website for more service information about the navigation system.**
- **Check the navigation screen settings for brightness, contrast, and black level, and check the color screen for map color and menu color.**
- **Before troubleshooting, make sure you have the anti-theft code.**
- **After troubleshooting, enter the anti-theft code.**

1. Check for electronic aftermarket accessories (possibly hidden) mounted near the navigation display unit or the audio-navigation unit.

   Are there any electronic accessories?

   YES - Disable the accessories, and recheck. •

   NO - Go to step 2.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and start up the navigation system (screen).

   Is the picture scrolling horizontally (left to right or right to left)?

   YES - Go to step 3.

   NO - Intermittent failure. The system is OK at this time. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect audio-navigation unit connector G (16P) and the navigation display unit 36P connector.
5. Check for continuity between audio-navigation unit connector G (16P) terminal No. 16 and body ground.

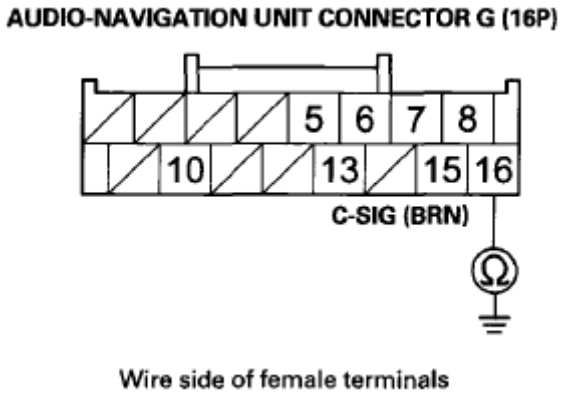

Fig. 146: Checking Continuity Between Audio-Navigation Unit Connector G (16P) Terminal No. 16 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there continuity?

   YES - There is a short to body ground in the wire between the audio-navigation unit and the navigation display unit. Replace the affected shielded harness. •

   NO - Go to step 6.

6. Check for continuity between the terminals of audio-navigation unit connector G (16P) according to the table.

From terminal	To terminals
G16 (BRN)	G5 (GRN), G6 (YEL), G7 (RED), G8 (WHT), G13 (GRY), G15 (BLU)

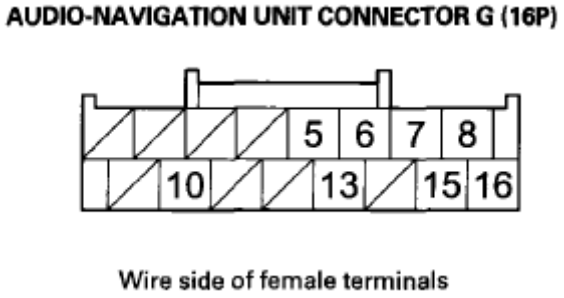

Fig. 147: Checking Continuity Between Terminals Of Audio-Navigation Unit Connector G (16P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - Go to step 7.

NO - There is a short in the wire(s) between the audio-navigation unit and the navigation display unit. Replace the affected shielded harness. •

7. Check for continuity between audio-navigation unit connector G (16P) terminal No. 16 and navigation display unit 36P connector terminal No. 17.

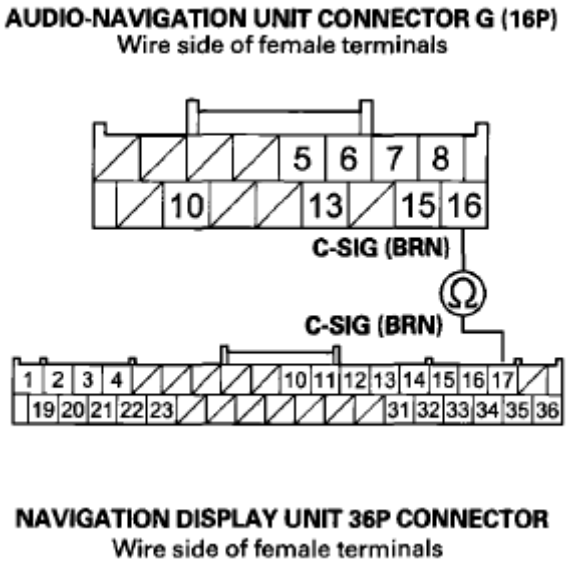

Fig. 148: Checking Continuity Between Audio-Navigation Unit Connector G (16P) Terminal No. 16 And Navigation Display Unit 36P Connector Terminal No. 17
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Substitute a known-good **navigation display unit**, then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original **navigation display unit**. If the symptom/indication is still present, replace the **audio-navigation unit**. •

NO - There is an open in the wire(s) between the audio-navigation unit and the navigation display unit. Replace the affected shielded harness. •

INTERFACE DIAL BUTTONS DO NOT WORK

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Check any official Honda service website for more service information about the navigation system.**
- **Before troubleshooting, make sure you have anti-theft code.**
- **After troubleshooting, enter the anti-theft code.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Go into the **System Diagnostic Mode**, and use the Hard Key test under the **Unit Check**.

   Do the interface dial buttons work properly?

   YES - The system is OK at this time. •

   NO - Go to step 3.

3. Measure the voltage between interface dial 5P connector terminal No. 4 and body ground.

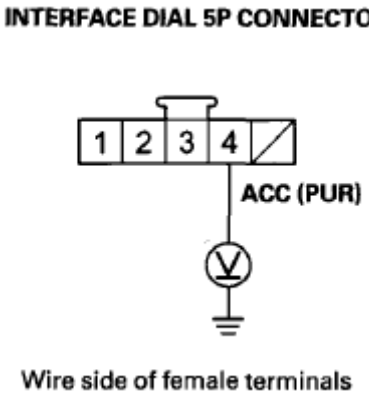

Fig. 149: Measuring Voltage Between Interface Dial 5P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES - Go to step 4.

   NO - Repair an open in the wire between the driver's under-dash fuse/relay box and the interface dial. •

4. Measure the voltage between interface dial 5P connector terminal No. 3 and body ground.

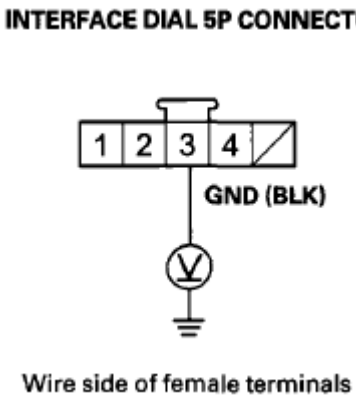

Fig. 150: Measuring Voltage Between Interface Dial 5P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 5.

NO - Repair an open or high resistance in the wire between the interface dial and body ground (G501) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**). •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect audio-navigation unit connector H (28P).
7. Disconnect the interface dial 5P connector.
8. Check for continuity between audio-navigation unit connector H (28P) terminal No. 26 and interface dial 5P connector terminal No. 1.

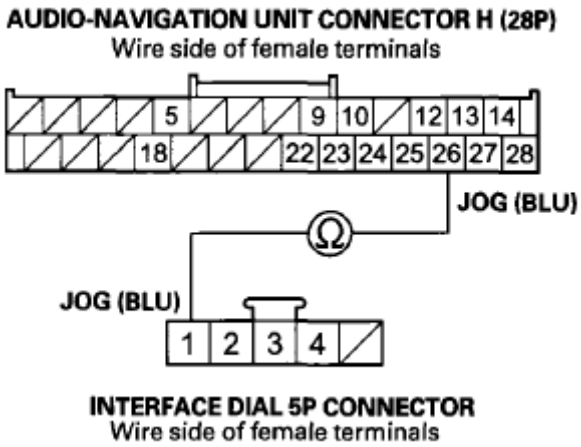

Fig. 151: Checking Continuity Between Audio-Navigation Unit Connector H (28P) Terminal No. 26 And Interface Dial 5P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - There is an open in the wire between the interface dial and the audio-navigation unit. Replace the affected shielded harness. •

9. Check for continuity between audio-navigation unit connector H (28P) terminals No. 13 and No. 26.

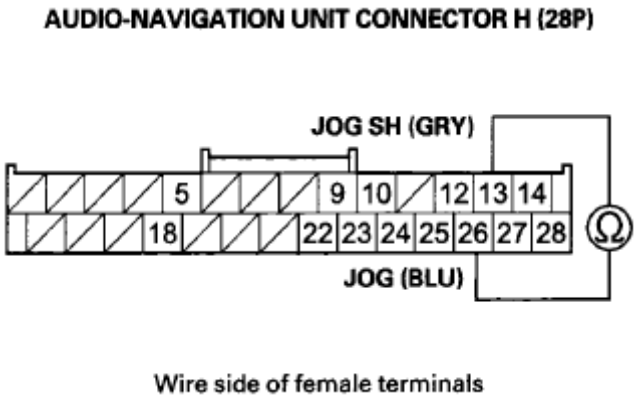

Fig. 152: Checking Continuity Between Audio-Navigation Unit Connector H (28P) Terminals No. 13 And No. 26
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - There is a short in the wires between the audio-navigation unit and the interface dial. Replace the affected shielded harness. •

NO - Substitute a known-good **interface dial**, then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original **interface dial**. If the symptom/indication is still present, replace the **audio-navigation unit**. •

GPS ICON IS WHITE OR NOT SHOWN

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **With good reception, the icon is normally green.**
- **Make sure the GPS antenna is plugged in.**
- **Check for any aftermarket accessories or metallic window tinting that may be interfering with the GPS signal.**
- **Make sure the vehicle is parked outside, away from buildings.**
- **Refer to GPS Information for real-time satellite reception display.**

1. Check for aftermarket metallic window tint on the front window and electronic aftermarket accessories (possibly hidden) mounted near the GPS antenna or the audio-navigation unit.

Is there aftermarket metallic window tint or electronic accessories?

YES - Remove tint or the accessories, and recheck. •

NO - Go to step 2.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Go into the **System Diagnostic Mode**, and use the System Link to check the GPS antenna.

   Is the GPS Ant icon red?

   YES - Check for a kinked, crushed, or disconnected GPS antenna wire. If icon is still red, replace the **GPS antenna**. •

   NO - Check that nothing is blocking the GPS antenna located under the package shelf, and recheck. Substitute a known-good **GPS antenna**, and recheck. If the symptom/indication goes away, replace the original **GPS antenna**. If the symptom/indication is still present, replace the **audio-navigation unit**. •

VOICE GUIDANCE CANNOT BE HEARD, IS BROKEN UP, OR THERE IS STATIC

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the navigation volume level (see Owner's Manual).**
- **Check the connectors for poor connections or loose terminals.**
- **If the hard error code stored, check the hard error code troubleshooting first.**
- **Make sure that the latest navigation software is installed.**
- **Before troubleshooting, make sure you have the anti-theft code.**
- **After troubleshooting, enter the anti-theft code.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Press the INFO button.
3. Check the volume and voice feedback setting for the navigation system in SETUP screen.

   Is either set to OFF?

   YES - Set the voice feedback to ON, and select an audible level for the volume. •

   NO - Go to step 4.

4. Check the audio system operation.

   Can you hear the audio system?

   YES - Go to step 5.

   NO - Troubleshoot the audio system. •

5. Clear the **hard error code**.
6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
7. Check for the **hard error code**.

   Are there any hard error codes stored?

   YES - Refer to the hard error code troubleshooting. •

   NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Disconnect audio-navigation unit connector B (24P).
10. Disconnect stereo amplifier connector B (28P).
11. Check for continuity between body ground and audio-navigation unit connector B (24P) terminals No. 20 and No. 22 individually.

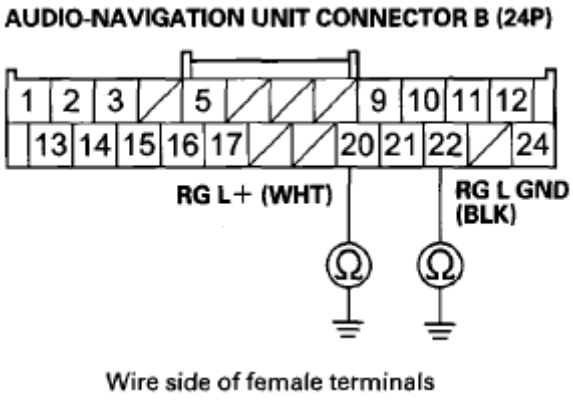

Fig. 153: Checking Continuity Between Body Ground And Audio-Navigation Unit Connector B (24P) Terminals No. 20 And No. 22 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - There is a short to body ground in the wire(s) between the audio-navigation unit and the stereo amplifier. Replace the affected shielded harness. •

NO - Go to step 12.

12. Check for continuity between the terminals of audio-navigation unit connector B (24P) according to the table.

From terminal	To terminals
B20 (WHT)	B21 (GRY), B22 (BLK)

B21 (GRY)	B22 (BLK)

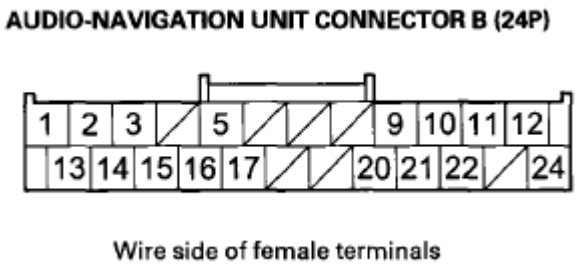

Fig. 154: Checking Continuity Between Terminals Of Audio-Navigation Unit Connector B (24P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - There is a short in the wires between the audio-navigation unit and the stereo amplifier. Replace the affected shielded harness. •

NO - Go to step 13.

13. Check for continuity between audio-navigation unit connector B (24P) terminals No. 20 and No. 22 and stereo amplifier connector B (28P) terminals No. 21 and No. 9 respectively.

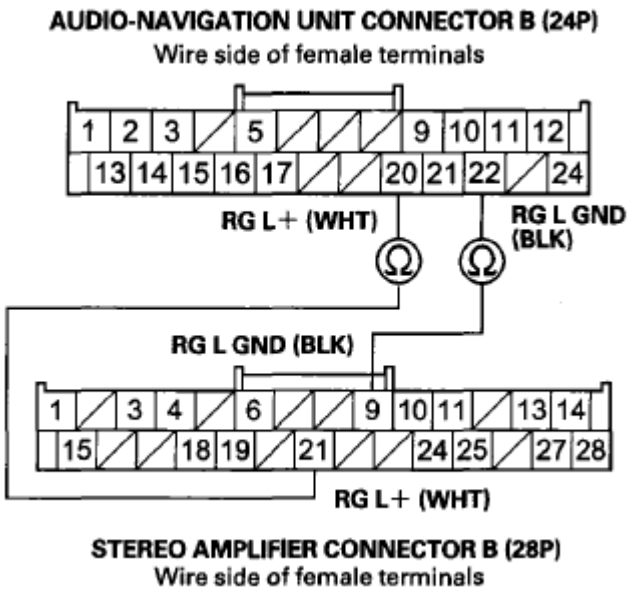

Fig. 155: Checking Continuity Between Audio-Navigation Unit Connector B (24P) Terminals And Stereo Amplifier Connector B (28P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Substitute a known-good stereo amplifier (see **AUDIO-HVAC DISPLAY UNIT**

REMOVAL/INSTALLATION), then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original stereo amplifier (see **AUDIO-HVAC DISPLAY UNIT REMOVAL/INSTALLATION**). If the symptom/indication is still present, replace the **audio-navigation unit**. •

NO - There is an open in the wire between the audio-navigation unit and the stereo amplifier. Replace the affected shielded harness. •

VOICE CONTROL DOES NOT WORK/RESPOND

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Make sure that the latest navigation software is installed.**
- **Check any official Honda service website for more service information about the navigation system.**
- **Before assuming that a voice complaint is hardware related, ensure that the voice control system is being operated correctly.**
  - **Make sure you are on the correct screen when trying to issue a voice command. For instance, the command "Find the nearest Italian Restaurant" only works on Map screen. (See the Navigation Manual for a complete list of allowed voice commands for the information being displayed)**
  - **Close the windows and moonroof**
  - **Set the fan speed to low (1 or 2)**
  - **Adjust the air flow from the air conditioning vents so that they do not blow against the microphone on the ceiling**
  - **Pause after pressing the navigation TALK button then give a voice command clearly in a natural speaking voice. If the system cannot recognize your command, speak louder**
  - **If you speak a command with something in your mouth, or your voice is too husky, or high pitched, the system may misunderstand your command**
- **Check the connectors for poor connections or loose terminals.**
- **Check for a loose roof console microphone; if it's loose, tighten it.**
- **Before troubleshooting, make sure you have the anti-theft code.**
- **After troubleshooting, enter the anti-theft code.**
- **Determine if the problem only happens to one person, or everyone who uses the system.**
- **If the system only has a problem with one person's voice, this should be considered a system limitation.**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.

3. Check for the **hard error code**.

   Is there a hard error code stored?

   YES - Refer to the hard error code troubleshooting. •

   NO - Go to step 4.

4. Do the **Voice Control Switch Test**.

   Is the switch OK?

   YES - Replace the **audio-navigation unit**. •

   NO - Replace the audio remote, HFL-navigation voice control switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**). •

NAVIGATION CANNOT CONTROL HVAC BY VOICE COMMAND

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Check for and resolve all CAN DTCs before troubleshooting the navigation system.**
- **If the hard error code stored, check the hard error code troubleshooting first.**
- **Before troubleshooting, make sure you have the anti-theft code.**
- **After troubleshooting, enter the anti-theft code.**
- **Verify that the correct audio-navigation unit is installed for this model. Go into the System Diagnostic Mode, and use Version.**
- **Make sure that the latest navigation software is installed.**
- **Check any official Honda service website for more service information about the navigation system.**

1. Connect the HDS to the DLC.
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Clear the DTCs with the HDS.
4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
5. Check for DTCs with the HDS.

   Are there any DTCs?

   YES - Troubleshoot the indicated DTC, then recheck. •

NO - Go to step 6.

6. Clear the **hard error code**.
7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
8. Check for the **hard error code**.

   Is there a hard error code stored?

   YES - Refer to the hard error code troubleshooting. •

   NO - Substitute and a known-good climate control unit (see **EVAPORATOR TEMPERATURE SENSOR REPLACEMENT**), then reconnect all connectors, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **EVAPORATOR TEMPERATURE SENSOR REPLACEMENT**). If the symptom/indication is still present, replace the **audio-navigation unit**. •

DISPLAY DAY/NIGHT MODE DOES NOT WORK OR DOES NOT WORK PROPERLY

- Turn the headlight on, and check that the dash brightness setting is not set to high.
- Check the connectors for poor connections or loose terminals.
- Always check for and resolve all CAN DTCs before troubleshooting the navigation system.
- Verify that the correct audio-navigation unit is installed for this model. Go into the System Diagnostic Mode, and use **Version**.
- Before troubleshooting, make sure you have the anti-theft code.
- After troubleshooting, enter the anti-theft code.
- Check any official Honda service website for more service information about the navigation system.

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Press the Day/Night button to see if the display changes to day and night modes.

   Does the display change today and night modes when pressing the Day/Night button?

   YES - Go to step 3.

   NO - Go to **Interface dial buttons do not work** properly troubleshooting. •

3. Turn the combination lighting switch to the parking light position, and adjust the dash brightness up and down, then to the middle range.

   Does the display change to day and night modes when turning the headlights on and off?

   YES - Intermittent failure. The system is OK at this time. •

   NO - Go to step 4.

4. Turn the combination lighting switch to the off position.
5. Clear the **hard error code**.
6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
7. Check for the **hard error code**.

   Are there hard error codes stored?

   YES - Refer to the hard error code troubleshooting. •

   NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Disconnect the navigation display unit 36P connector.
10. With the combination lighting switch to the parking light position, measure the voltage between navigation display unit 36P connector terminal No. 36 and body ground.

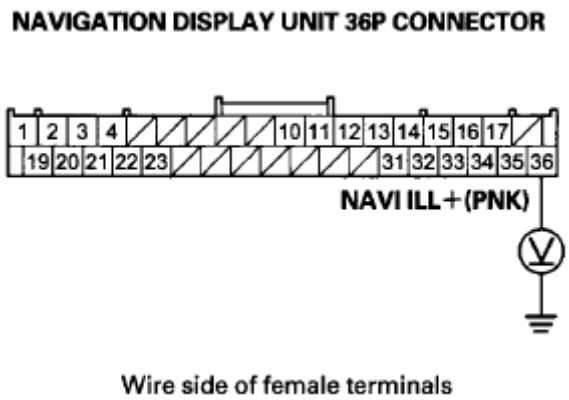

Fig. 156: Measuring Voltage Between Navigation Display Unit 36P Connector Terminal No. 36 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Substitute a known-good **navigation display unit**, then reconnect all of the connectors, and recheck. If the symptom/indication goes away, replace the original **navigation display unit**. If the symptom/indication is still present, replace the gauge control module **GAUGE CONTROL MODULE REPLACEMENT** . •

NO - Repair an open or short in the wire between the navigation display unit and the gauge control module. •

SYSTEM LOCKS UP OR FREEZES CONSTANTLY

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Always check for and resolve all CAN DTCs before troubleshooting the navigation system.**
- **Verify that the correct audio-navigation unit is installed for this model. Go into the System Diagnostic Mode, and use Version.**
- **Make sure that the latest navigation software is installed.**
- **Check any official Honda service website for more service information about the navigation system.**
- **Before troubleshooting, make sure you have the anti-theft code.**
- **After troubleshooting, enter the anti-theft code.**
- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

   Does the system reboot, lock up, or freeze?

   YES - Replace the **audio-navigation unit**. •

   NO - The system is OK at this time. Go into the **System Diagnostic Mode**, and use the **Unit Check diagnosis** to check the audio-navigation unit and the navigation display unit status. If any status are NG, replace the affected units. •

VEHICLE POSITION ICON WANDERS ACROSS THE MAP WHEN DRIVING (DOES NOT FOLLOW A DISPLAYED ROAD) OR MAP VEHICLE ICON SPINS

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **This is not the same condition as when driving off-road (or on a fire or logging road).**
- **This condition is caused by a loss of map matching from a bad sensor input. Check for aftermarket or other objects that can block the GPS signal. Always perform Map Matching before proceeding with the troubleshooting.**
- **Always check for and resolve all CAN DTCs before troubleshooting the navigation system.**
- **Verify that the correct audio-navigation unit is installed for this model. Go into the System Diagnostic Mode, and Go into the System Diagnostic Mode, and use Version.**
- **Check for aftermarket metallic window tinting.**
- **Check any official Honda service website for more service information about the navigation system.**
- **Before troubleshooting, make sure you have the anti-theft code.**
- **After troubleshooting, enter the anti-theft code.**

- **Check the connectors for poor connections or loose terminals.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the GPS icon on the navigation screen.

   Is the GPS icon white or missing?

   YES - Go to **GPS icon is white or not shown** troubleshooting. •

   NO - Go to step 3.

3. Go into the System Diagnostic mode, and use the **Yaw Sensor** diagnosis to check the yaw rate sensor.

   Is the yaw rate sensor OK?

   YES - Go to step 4.

   NO - Replace the **audio-navigation unit**. •

4. Go into the System Diagnostic Mode, and use the **Car Status diagnosis** to check the BACK signal.

   Does the BACK signal change from [0] to [1] when the shift lever position is changed from P or N to R?

   YES - Go to step 5.

   NO - Troubleshoot the back-up light. If OK, go to step 7.

5. Go into the System Diagnostic Mode, and use the **Car Status diagnosis** to check the VSP signal.
6. Drive the vehicle and watch the VSP signal.

   Does the VSP signal change from [0] to [1] as you drive?

   YES - Go to step 7.

   NO - Do the **DTC 1306 (Vehicle Speed Pulse)** troubleshooting. •

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect audio-navigation unit connector G (16P).
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Measure the voltage between audio-navigation unit connector G (16P) terminal No. 10 and body ground when the shift lever is in R position.

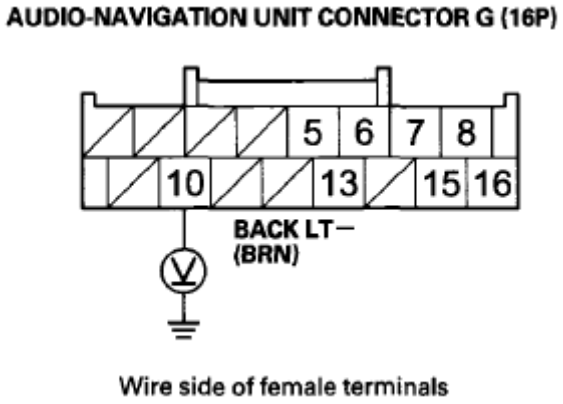

Fig. 157: Measuring Voltage Between Audio-Navigation Unit Connector G (16P) Terminal No. 10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Replace the **audio-navigation unit**. •

NO - Repair an open or high resistance in the wire between the audio-navigation unit and the driver's under-dash fuse/relay box. •

NAVIGATION SYSTEM DOES NOT ACCEPT SECURITY CODE

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **The system will not operate without the 5-digit security (anti-theft) code. Follow the this procedure (after 10 consecutive tries, you must cycle the key to continue trying).**
- **The Navigation System Diagnosis and Core Return Form is available on ISIS, under Job aids, and can be printed out for recording this information. This information will help the reman facility determine what caused the failure.**
- **Always check for and resolve all CAN DTCs before troubleshooting the navigation system.**
- **Check the connectors for poor connections or loose terminals.**
- **Before troubleshooting, make sure you have anti-theft code.**
- **Check any official Honda service website for more service information about the navigation system.**

1. Go into the **System Diagnostic Mode**, and use the Navi ECU under the **Unit Check diagnosis**. A brief diagnostic runs for 20 seconds, and the serial number is displayed.

   Is the serial number displayed?

YES - Go to step 4.

NO - Go to step 2.

2. Remove the **audio-navigation unit**.
3. Check the serial number on the label on the upper side of the audio-navigation unit.

   Is the serial number confirmed on the upper side of the audio-navigation unit?

   YES - Go to step 4.

   NO - Replace the **audio-navigation unit**. •

4. Using the serial number, look up the navigation security code in the Interactive Network (iN) (click: Service, Vehicle Information, Anti-Theft code Inquiry, and then select Navigation from the "product" dropdown box). Enter the serial number.

   Is a 5-digit code displayed on the screen?

   YES - Go to step 5.

   NO - Call the Warranty Department to obtain the code (the telephone number is in the PDI service bulletin). Then go to step 5.

5. Check that the obtained code works to bypass the code screen in the navigation system.

   Does the code work?

   YES - The system is OK at this time. Return the vehicle to the client and give them the anti-theft code. •

   NO - Replace the **audio-navigation unit**, and enter Won't take security code in the Problem description field of the core return form; (as proof, enclose the sticker that contains the Serial number and the Code). •

NAVIGATION DISPLAY STAYS ON WITH THE IGNITION SWITCH IN LOCK (0), OR IN THE OFF MODE

NOTE:

- **Check for aftermarket accessories that may interfere with the navigation system.**
- **Check the connectors for poor connections or loose terminals.**
- **Before troubleshooting, make sure you have the anti-theft code.**
- **After troubleshooting, enter the anti-theft code.**
- **The vehicle may have been used for a show event. Check for a short jumper harness in-line with the audio-navigation unit connector A (24P). If a jumper harness is present, remove it, and return it to Tech Line.**

1. Mare sure turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

   Does the navigation screen stay on?

   YES - Go to step 2.

   NO - The system is OK at this time. •

2. Measure the voltage between audio-navigation unit connector A (24P) terminal No. 14 and body ground.

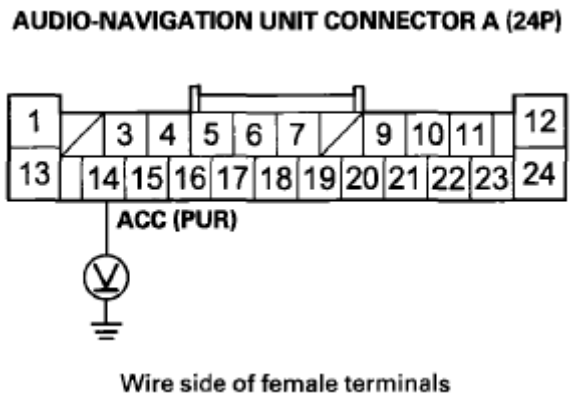

Fig. 158: Measuring Voltage Between Audio-Navigation Unit Connector A (24P) Terminal No. 14 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES - Troubleshoot a short to battery voltage on the ACC circuit. •

   NO - Replace the **audio-navigation unit**. •

NAVIGATION CANNOT CONTROL AUDIO SYSTEM

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check for and resolve all CAN DTCs before troubleshooting the navigation system.**
- **Verify that the correct navigation unit is installed for this model. Go into the System Diagnostic Mode, and use Version.**
- **Check the connectors for poor connections or loose terminals.**
- **Before troubleshooting, make sure you have the anti-theft code.**
- **After troubleshooting, enter the anti-theft code.**
- **Check any official Honda service website for more service information about the navigation system.**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
3. Check for the **hard error code**.

   Is there a hard error code stored?

   YES - Refer to the hard error code troubleshooting. •

   NO - Substitute a known-good **audio-navigation unit**, and recheck. If the symptom/indication goes away, replace the original **audio-navigation unit**. •

NAVIGATION CANNOT CONTROL XM RADIO

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check any official Honda service website for more service information about the navigation system.**

1. Clear the **hard error code**.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then back to ON (II), or the ON mode.
3. Check for the **hard error code**.

   Is there a hard error code stored?

   YES - Refer to the hard error code troubleshooting. •

   NO - Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Substitute a known-good Replace the AcuraLink control unit (XM receiver) (see **AcuraLink CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**) or XM receiver (see **AcuraLink CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

   Can the navigation system control XM radio functions?

   YES - Replace the original AcuraLink control unit (XM receiver) (see **AcuraLink CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**) or the XM receiver (see **AcuraLink CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**). •

   NO - Replace the **audio-navigation unit**. •

NAVIGATION FREQUENTLY ASKS FOR ANTI-THEFT CODE AND/OR NEEDS GPS INITIALIZATION

NOTE:

- **This is often caused by a loss of battery power, a low or poor battery condition, or a poor ground.**
- **Make sure that the latest navigation software is installed.**
- **Check any official Honda service website for more service information about the navigation system.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Check for poor connections or loose terminals at audio-navigation unit connector A (24P).

   Is the connection OK?

   YES - Repair poor connections or loose terminals, and recheck. •

   NO - Go to step 3.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Measure the voltage between body ground and audio-navigation unit connector A (24P) terminals No. 14 and No. 24 individually.

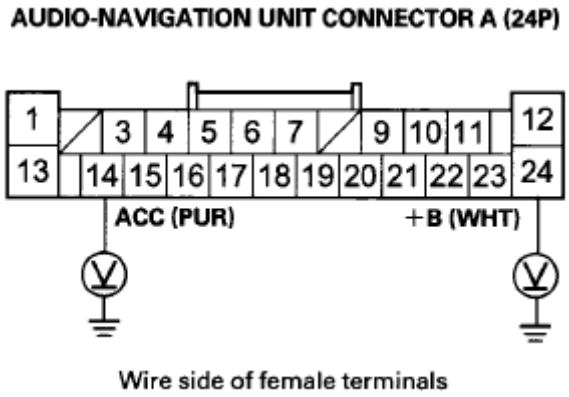

Fig. 159: Measuring Voltage Between Body Ground And Audio-Navigation Unit Connector A (24P) Terminals No. 14 And No. 24 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES - Go to step 5.

   NO - If the +B wire does not have voltage, repair an open in the wire between the under-hood fuse/relay box and audio-navigation unit. If the ACC wire does not have voltage, repair an open in the wire between the driver's under-dash fuse/relay box and audio-navigation unit. •

5. Measure the voltage between audio-navigation unit connector A (24P) terminal No. 12 and body ground.

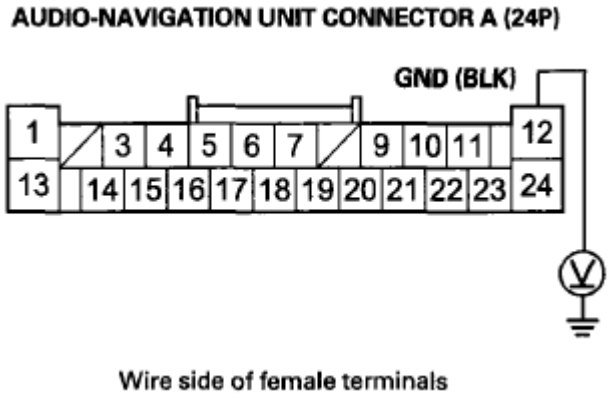

Fig. 160: Measuring Voltage Between Audio-Navigation Unit Connector A (24P) Terminal No. 12 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Replace the **audio-navigation unit**. •

NO - Repair an open or high resistance in the wire between audio-navigation unit and body ground (G502) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**). •

REARVIEW CAMERA IMAGE DOES NOT COME ON OR WORK PROPERLY

NOTE:

- **Check the vehicle battery condition first (see BATTERY TEST).**
- **Check the connectors for poor connections or loose terminals.**
- **Check any official Honda service website for more service information about the navigation system.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

   Does the Navigation screen come on and show an image when the vehicle is started?

   YES - Go to step 2.

   NO - Go to **No picture is displayed** troubleshooting. •

2. Go into the **System Diagnostic Mode**, and use the **System Link** diagnosis to check the connection between the navigation display unit and the rearview camera.

   Is the Rear camera link on the screen?

   YES - Go to step 3.

   NO - Replace the **audio-navigation unit**. •

3. Check the System Link.

   Is the Rear camera link red on the screen?

   YES - Do the **DTC 1701 (Rear Camera Error)** troubleshooting. •

   NO - Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the navigation display unit 36P connector.
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Measure the voltage between navigation display unit 36P connector terminal No. 35 and body ground when the shift lever is in R position.

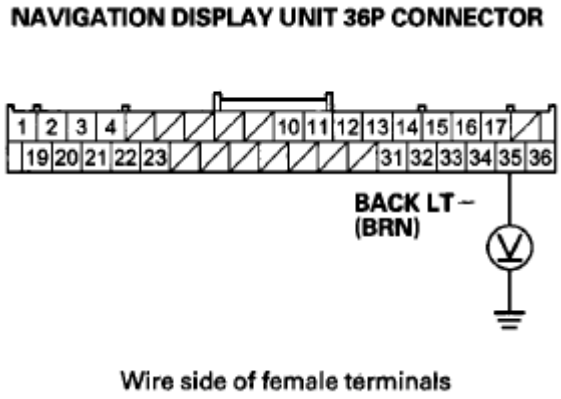

Fig. 161: Measuring Voltage Between Navigation Display Unit 36P Connector Terminal No. 35 & Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES - Go to step 8.

   NO - Repair an open or high resistance in the wire between the navigation display unit and the driver's under-dash fuse/relay box. •

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Disconnect the rearview camera 12P connector.
10. Check for continuity between the navigation display unit 36P connector and the rearview camera 12P connector according to the table.

Navigation display unit connector	Rearview camera connector	Wire color
3	11	BLK
4	9	WHT

20	10	RED
21	12	GRN
22	8	GRY

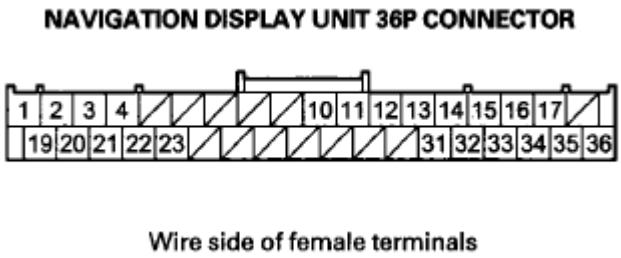

Fig. 162: Checking Continuity Between Navigation Display Unit 36P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

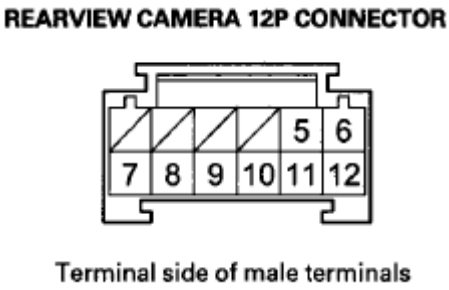

Fig. 163: Checking Continuity Between Rearview Camera 12P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - There is an open in the wire(s) between the navigation display unit and the rearview camera. Replace the affected shielded harness. •

11. Check for continuity between the terminals of the navigation display unit 36P connector according to the table.

From terminal	To terminals
3 (BLK)	4 (WHT), 20 (RED), 21 (GRN), 22 (GRY), 23 (BRN)
4 (WHT)	20 (RED), 21 (GRN), 22 (GRY), 23 (BRN)
20 (RED)	21 (GRN), 22 (GRY), 23 (BRN)
21 (GRN)	22 (GRY), 23 (BRN)
22 (GRY)	23 (BRN)

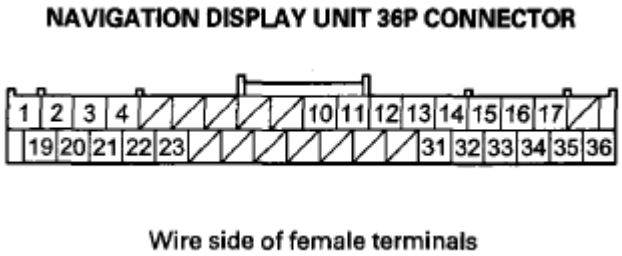

Fig. 164: Checking Continuity Between Terminals Of Navigation Display Unit 36P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - There is a short in the wires between the navigation display unit and the rearview camera. Replace the affected shielded harness. •

NO - Go to step 12.

12. Check for continuity between the navigation display unit 36P connector and body ground according to the table.

Navigation display unit connector	Wire color
3	BLK
4	WHT
20	RED
21	GRN
22	GRY

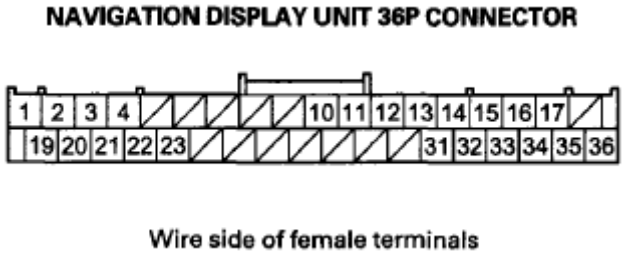

Fig. 165: Checking Continuity Between Navigation Display Unit 36P Connector & Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - There is a short to body ground in the wire(s) between the navigation display unit and the rearview camera. Replace the affected shielded harness. •

NO - Go to step 13.

13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Measure the voltage between the navigation display unit 36P connector and body ground according to the table.

Navigation display unit connector	Wire color
3	BLK
4	WHT
20	RED
21	GRN
22	GRY

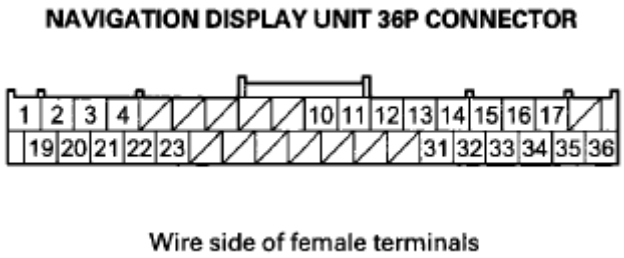

Fig. 166: Measuring Voltage Between Navigation Display Unit 36P Connector & Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 15.

NO - There is a short to power in the wires between the navigation display unit and the rearview camera. Replace the affected shielded harness. •

15. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
16. Reconnect the navigation display unit 36P connector.
17. Substitute a known-good rearview **camera**, and check the rearview camera image in R position.

Is the rearview image OK?

YES - Replace the original rearview **camera**. •

NO - Replace the **navigation display unit**. •

TRAFFIC OR WEATHER INFORMATION IS NOT SHOWN ON MAP SCREEN

If your client complains that traffic and/or weather is not displayed, it could be because a traffic and/or weather setting is not correct.

NOTE:

- **Always check for and resolve all CAN DTCs before troubleshooting the**

navigation system.

- **Check the connectors for poor connections or loose terminals.**
- **Before troubleshooting, get the anti-theft code.**
- **After troubleshooting, enter the anti-theft code.**
- **Check any official Honda service website for more service information about the navigation system.**
- **A marginal battery or poorly performing charging system may cause the AcuraLink control unit (XM receiver) to malfunction.**
- **The vehicle is equipped with an auto start feature that keeps the starter motor engaged, even when you release the ignition switch. Due to the ignition design, if a client releases the ignition switch before the engine starts, the AcuraLink control unit (XM receiver) may receive unusually low voltage. This may cause the XM/HIP to malfunction. When starting the vehicle, press and hold the engine start/stop button until the motor starts.**

1. Test the battery condition (see **BATTERY TEST**).

   Is the battery in good condition?

   YES - Go to step 2.

   NO - Troubleshoot the battery and/or charging system, and recheck. •

2. Park the vehicle outside where you have a clear view of the southern sky.
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Check to see if the vehicle is receiving an XM signal. Select Setup, then select more, then select Traffic/Weather.

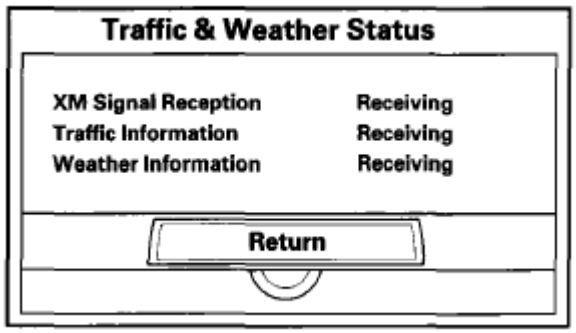

Fig. 167: Display - Traffic And Weather Status Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Make sure that you are receiving the applicable signal that you are troubleshooting. For example, if the client complains that they do not receive real-time traffic and account is Expired, you need to contact XM to confirm the account is active. Refer to the table below for the message status and action.

NOTE: This check confirms the client account, but does not check the XM signal reception. The XM radio continues to tune XM channels 000, 001, 174, or 247, even if the XM account is expired.

Message	Description	Action
Receiving	The system is receiving XM signal, Traffic information and/or weather information.	The system is OK. Go to step 7.
No signal	The signal is not being received.	Make sure you are outside with a clear view of the sky. Go into the **System Diagnostic Mode**, and check the **System Link**.
Expired	The account is expired.	Go to step 6.
Loading	The system is searching for the signal or receiving an update.	Give the system a few minutes to finish loading. If the loading message does not go away, go into the **System Diagnostic Mode**, and check the **System Link**.
Check antenna	There is a problem with the XM antenna.	Check the XM antenna for damage or loose connections, and go into the **System Diagnostic Mode**, check the **System Link**.

6. Make sure the client's XM NavTraffic and/or XM weather information account status is active. These accounts are separate from the regular XM radio subscription, and they have separate fees. For the 2012 Acura TL, real-time traffic and weather are free for the first 3 months.

   To check the XM NavTraffic and XM weather account status:

   - Call XM Radio at 800-852-9696.
   - Make sure you have:
     - The VIN
     - The XM radio ID (shown on channel 000)
   - From the automated phone menu, select tech support.
   - Tell the agent that you are working on an Acura vehicle, and ask them to check the XM NavTraffic and XM weather account(s) status. Have the agent confirm that the XM NavTraffic and XM weather subscription(s) applies to the vehicle VIN you are working on.

   NOTE: A client may own more than one vehicle capable of displaying real-time traffic and XM weather.

   Is the XM NavTraffic and XM weather account(s) status active?

   YES - Go to step 7.

   NO - If the free trial period is expired, return the vehicle to the client, and inform them how to renew their XM NavTraffic and XM weather subscription(s) by calling XM Radio at 800-852-9696. •

If the free trial period has not expired, call XM Radio at 800-852-9696 and reactivate the account for the remainder of the free trial period, then request rapid refresh. To do a rapid refresh:

- Park the vehicle outside, in a clear area, with the engine running.
- Turn the audio system on, and tune to an XM radio channel.
- Wait 30 minutes.

If the vehicle now receives real-time traffic information and/or XM weather, return it to the client, otherwise go to step 7.

7. Make sure the navigation map is set to any scale from 1/20 mile of a mile to 5 miles. If the scale is not set within this range, rotate the interface dial knob, or use the zoom in buttons to adjust the map to proper scale.

NOTE: XM weather is available on all scales.

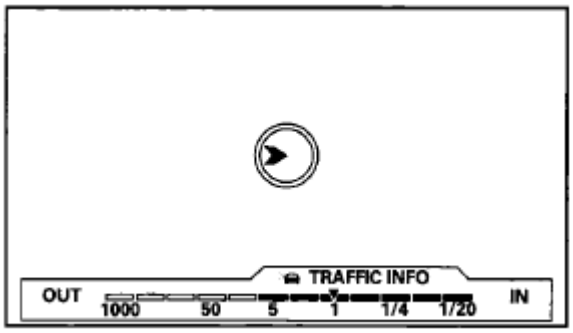

Fig. 168: Display - Traffic Info Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Do you see real-time traffic on the navigation display?

YES - Return the vehicle to the client, and explain the proper settings. •

NO - Go to step 8.

8. Make sure the real-time traffic settings are correct.
   - Press the map/guide button, then select the map menu by pressing in the selector button.
   - Select Show Icon on Map by turning the interface dial, then pressing in the selector button.
   - Select the Traffic icon (A) from the Icon selection bar at the bottom of the navigation display.
   - Select Icon Options (B) by pushing the selector to the right.
   - From the Select Category for Icon settings menu, select the Traffic.
   - Make sure both Traffic Speeds and Traffic Icons are solid blue. If they are not, select Traffic Speeds by pressing in the selector on the Select Traffic Info screen. It should turn solid blue. Turn the interface dial to select Traffic Icons, and press in the selector again. It should turn solid blue. Push the selector to the right (DONE) to complete the process.

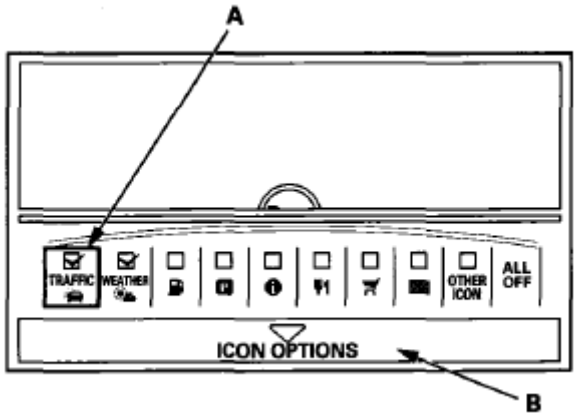

Fig. 169: Display - Icon Options Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

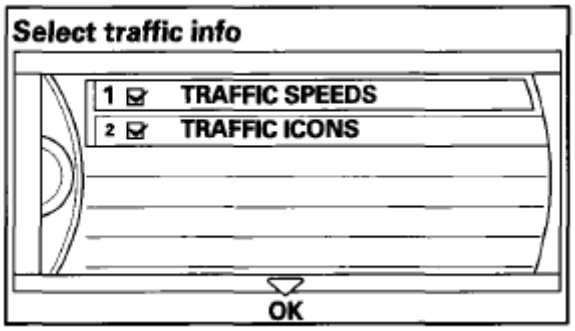

Fig. 170: Display - Traffic Info Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Do you see real-time traffic on the navigation display?

YES - Return the vehicle to the client, and explain the proper settings. •

NO - Go to step 9.

9. Make sure the XM weather settings are correct.
    - From the Show Icon on Map menu, select the Weather icon (A) from the Icon selection bar at the bottom of the navigation display.
    - Select Icon Options (B) by pushing the selector to the right.
    - From the Select Category for Icon settings menu, select the Weather.
    - Make sure both Weather Warning Icons and Weather Icons are solid blue. If they are not, select Weather Warning Icon by pressing in the selector on the Select Weather Info screen. It should turn solid blue. Turn the interface dial to select Weather Icons, and press in the selector again. It should turn solid blue. Push the selector to the right (DONE) to complete the process.

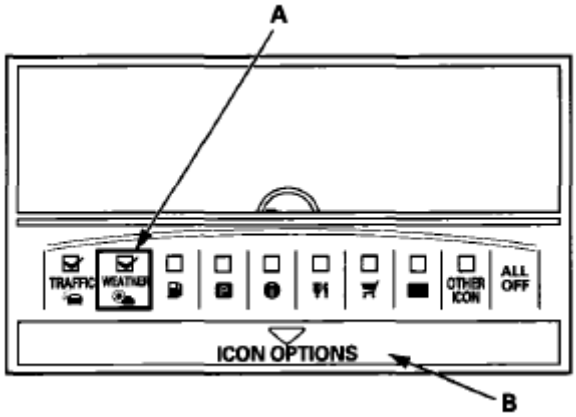

Fig. 171: Display - Icon Options Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

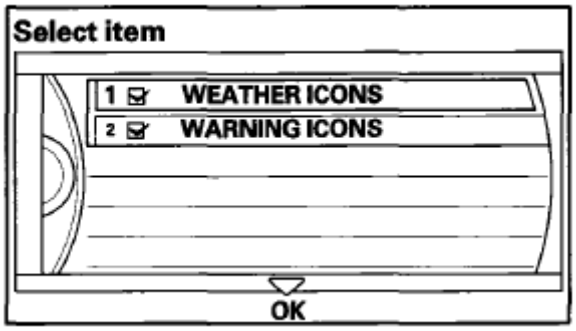

Fig. 172: Display - Weather Info Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Do you see XM weather on the navigation display?

YES - Return the vehicle to the client, and explain the proper settings. •

NO - Go to step 10.

10. Do the diagnostic mode checks:
    - Start the vehicle, and enter the System Diagnostic Mode by pressing and holding the DEST/ROUTE, the MAP/GUIDE, and the CANCEL buttons.
    - Go into the System Diagnostic Mode, and select the Self-Diagnosis Mode, and verify that all the icons are green. If any links/icons are red, refer to the appropriate Diagnostic or Service Information for repair information, then go to step 11.
    - Return to the Detail Information&Setting menu and select XM (HIP), then select XM (HIP) System Link, and verify that the links/icons are green. If any links/icons are red, refer to the appropriate Diagnostic or Service Information for repair information, then go to step 11.
11. Do a VIN status inquiry, updating the AcuraLink control unit software.

Are there any applicable product updates or service bulletins?

YES - Do the applicable product updates and service bulletins, then recheck the vehicle. If real-time traffic does not work, go to step 12.

NO - Go to step 12.

12. Reset the AcuraLink control unit.

NOTE: Make sure you have the anti-theft codes for the navigation system.

To reset the AcuraLink control unit:

- Disconnect AcuraLink control unit (XM receiver) connector B (2P) from the AcuraLink control unit.
- Enter the System Diagnostic Mode, select XM (HIP), then select XM (HIP) ECU.
- Select Data Reset to do the reset.
- When the reset is done, press cancel twice to return to the XM (HIP) diagnostic menu.
- Select Return to fully exit the diagnostic mode.
- Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
- Reconnect AcuraLink control unit (XM receiver) connector B (2P).
- Start the vehicle.
- Enter the anti-theft code.
- Let the navigation system boot, then select one of the traffic scales (5, 1, 1/4, 1/20 miles).
- Park the vehicle outside with a clear view of the southern sky, and verify you are receiving an XM radio signal (see step 4).

Do you see real-time traffic on the navigation display?

YES - Call Acura Client Services to ask for an AcuraLink reactivation. Return the vehicle to the client. •

NO - Go to step 13.

13. Substitute a known-good AcuraLink control unit (XM receiver) (see **AcuraLink CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**), and recheck the vehicle.

Park the vehicle outside with a clear view of the southern sky, and verify you are receiving an XM radio signal (see step 4).

Do you see real-time traffic on the navigation display?

YES - Replace the original AcuraLink control unit (XM receiver) (see **AcuraLink CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**). Register the new AcuraLink control unit with XM radio and Acura Client Services. Return the vehicle to the client. •

NO - Substitute a known-good **audio-navigation unit**, and recheck. If the symptom/indication goes

away, replace the original **audio-navigation unit**. •

FORCED STARTING OF THE AUDIO-NAVIGATION UNIT

Special Tools Required

SCS Service Connector 07PAZ-001010A

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Remove the right side kick panel (see **TRIM REMOVAL/INSTALLATION - DOOR AREAS**).
3. Connect the SCS service connector (A) to the navigation service check connector (B) located by the passenger's kick panel.

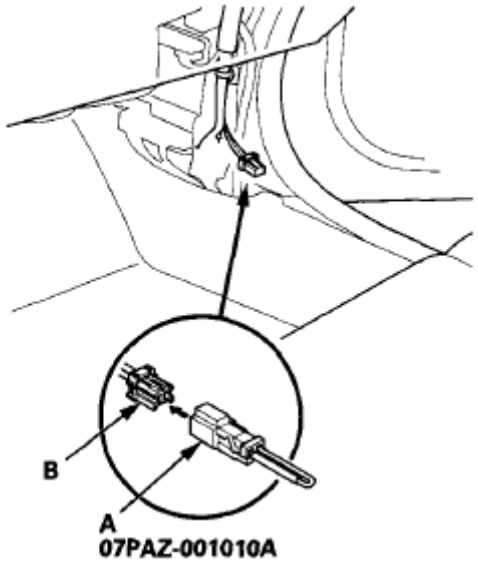

Fig. 173: Identifying SCS Service Connector And Navigation Service Check Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Check that the diagnosis menu for the picture diagnosis starts up, and then changes to the System Link menu.

NOTE: **If the display fails to display the System Link screen, refer to No Picture Is Displayed Troubleshooting.**

HDD REMOVAL/INSTALLATION

NOTE:

- **Check any official Honda service website for more service information about the navigation system.**
- **Static electricity can damage the HDD. Always follow proper handling**

procedures.

- **Always use the anti-static mat (ESD) and wrist strap when removing the HDD. Before you open the audio-navigation unit or handle the replacement HDD, attach the wrist strap around one of your wrists, and attach the alligator clip to the ESD mat.**
- **Make sure you use the screws in the same holes. The HDD can be damaged if the wrong screws are used.**
- **You do not have to peel off the plastic cover to remove the screws or the HDD.**
- **Do not force the HDD. If it does not slide in smoothly, check the alignment of the HDD and the pins. If the pins are bent, replace the HDD.**
- **Make sure the HDD screws are not loose. If they are, the HDD can be damaged.**
- **Handle the HDD by its edges. Do not touch the pins.**

1. Remove the **Audio-Navigation Unit**, and wait at least 1 minute.

NOTE: Disconnect all the connectors when removing the audio-navigation unit to prevent damaging the HDD.

2. Remove the screws (A).

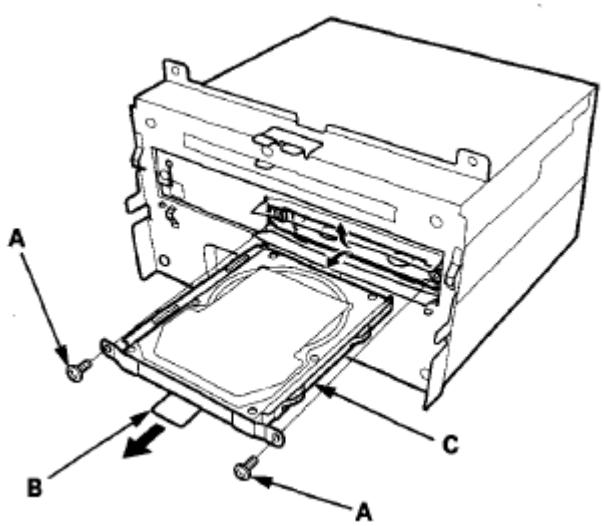

Fig. 174: Identifying Audio-Navigation Unit, HDD & Fasteners
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Lift the plastic tab (B), and use it to pull out the HDD (C).
4. Install the HDD in the reverse order of removal.

NOTE: Make sure the HDD is properly aligned when installing the HDD.

AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the dashboard and related parts.**
- **Lay a shop towel under the parts when working on them to protect the face panel from scratches or other damage.**
- **Eject the disc before removing the audio-navigation unit to prevent damaging the CD/DVD player's load mechanism.**
- **If you are replacing the audio-navigation unit, write down the audio presets (if possible), then enter them into the new audio-navigation unit.**
- **If the HDD is OK, transfer it to the new audio-navigation unit.**
- **If the audio-navigation unit is replaced or disconnected, a Map Matching must be done.**

1. Make sure you have the anti-theft code.
2. Remove the dashboard center trim (see **DASHBOARD CENTER TRIM REMOVAL/INSTALLATION**).
3. Remove the dashboard center vent (see **DASHBOARD CENTER VENT REMOVAL/INSTALLATION**).
4. Carefully remove the bolts (A) and bolts (B), then pull the audio-navigation switch panel (C) out.

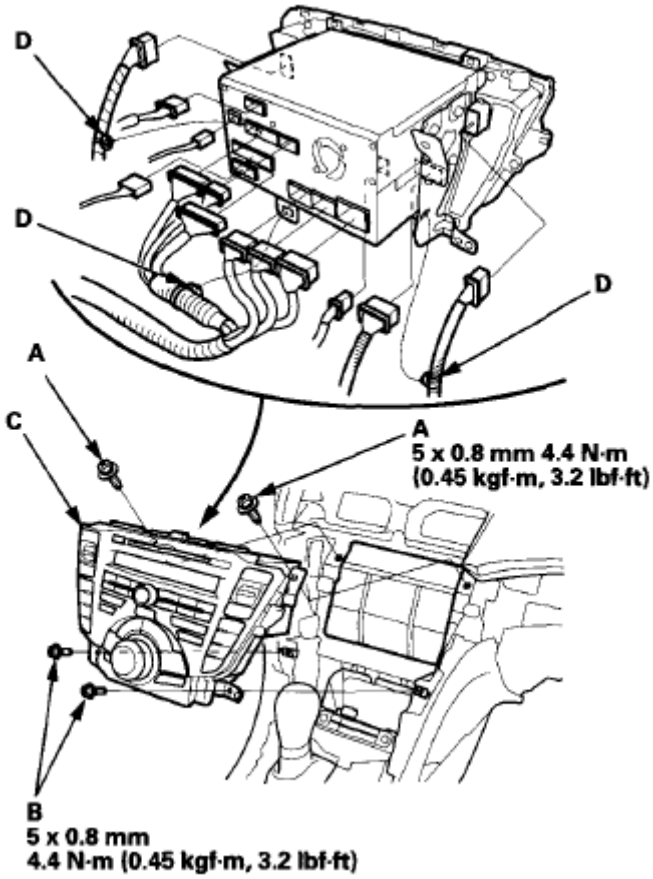

Fig. 175: Identifying Audio-Navigation Switch Panel, Clips And Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Disconnect the connectors, and detach the clips (D).
6. Remove the climate control switches (see **CLIMATE CONTROL SWITCH REMOVAL/INSTALLATION**).
7. Remove the bolts (A) and the stays (B).

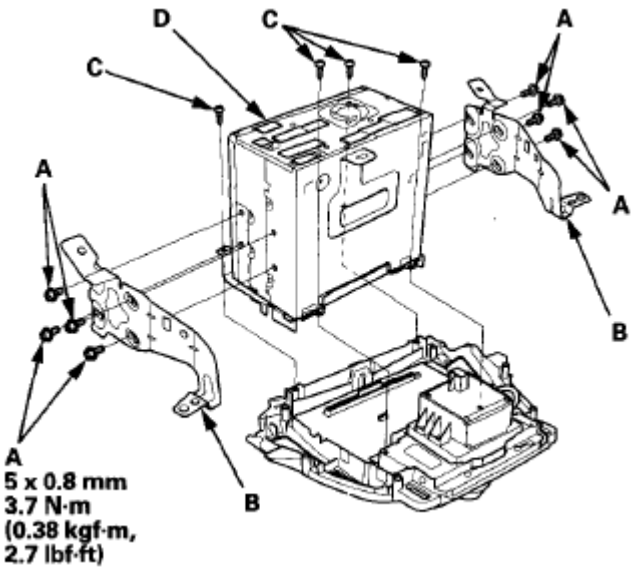

Fig. 176: Identifying Audio-Navigation Unit, Stays, Screws And Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the screws (C) and the audio-navigation unit (D).

NOTE: If you are replacing the audio-navigation unit, remove the HDD (see HDD Removal/Installation).

9. Install the audio-navigation unit in the reverse order of removal.

NOTE: Check any official Honda service website for more service information about patches for the navigation system. Apply any prescribed patches to the new audio-navigation unit.

10. Enter the new anti-theft code.
11. Park the vehicle outside, and do the **GPS Initialization**.
12. Give the new anti-theft code to the client.

NAVIGATION DISPLAY UNIT REMOVAL/INSTALLATION

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the dashboard and related parts.**
- **Lay a shop towel under the parts when working on them to protect the face panel from scratches or other damage.**
- **When prying components, use the handy remover set or equivalent.**

1. Remove the dashboard center vent (see **DASHBOARD CENTER VENT REMOVAL/INSTALLATION**).

2. Remove the screws and bolt (A) from the navigation display unit (B).

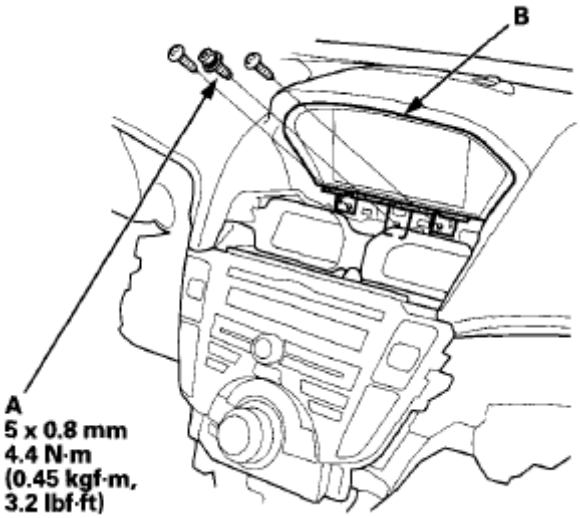

Fig. 177: Identifying Navigation Display Unit And Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Pull out the navigation display unit. Then disconnect the connector (A) from the navigation display unit.

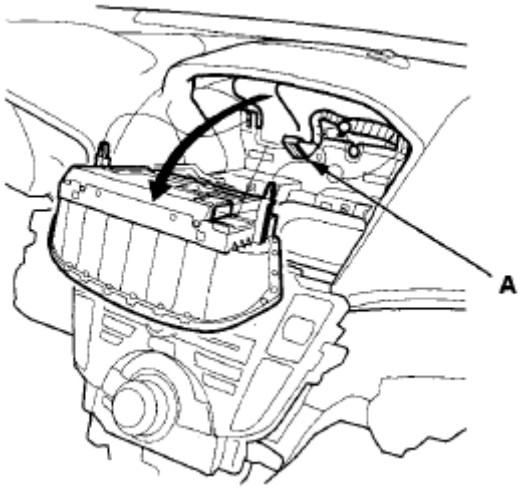

Fig. 178: Identifying Navigation Display Unit & Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the navigation display unit in the reverse order of removal.

NAVIGATION DISPLAY VISOR REMOVAL/INSTALLATION

NOTE:

- **Do this procedure in a clean place free from dirt.**
- **Wear latex or vinyl gloves when doing this procedure (Do not use fabric**

gloves).

- **When removing the navigation display visor, do not touch the LCD face.**
- **If there is dirt on the LCD face, clean it using compressed air.**
- **When installing the navigation display visor onto the LCD assembly, be careful not to touch the LCD face.**
- **Check that the navigation display visor and the LCD assembly are properly installed.**
- **Since the LCD assembly and the navigation display visor are installed at an angle, be sure that the screws are properly seated. If not properly seated, tighten the screws.**
- **Check that the navigation display unit assembly has no damage.**

1. Remove the **navigation display unit**.
2. Remove the screws (A) from the LCD assembly (B).

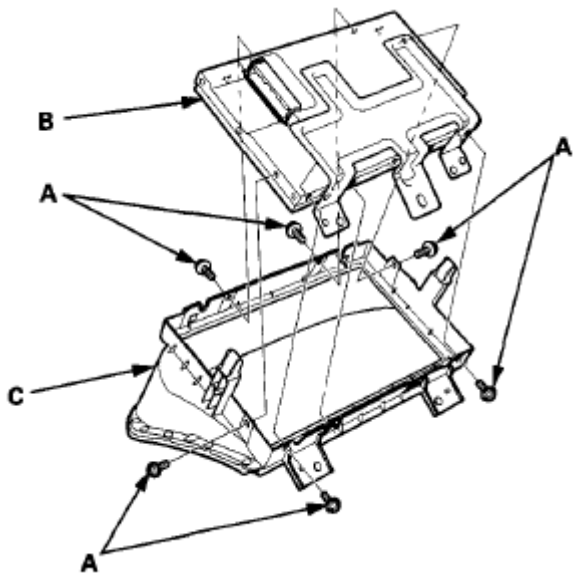

Fig. 179: Identifying LCD Assembly, Display Visor And Screws
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the display visor (C) from the LCD assembly.
4. Install the navigation display visor in the reverse order of removal.

HFL-NAVIGATION MICROPHONE REMOVAL/INSTALLATION

1. Remove the roof console (see **HEADLINER REMOVAL/INSTALLATION**).
2. Remove the screws and the HFL-navigation microphone (A).

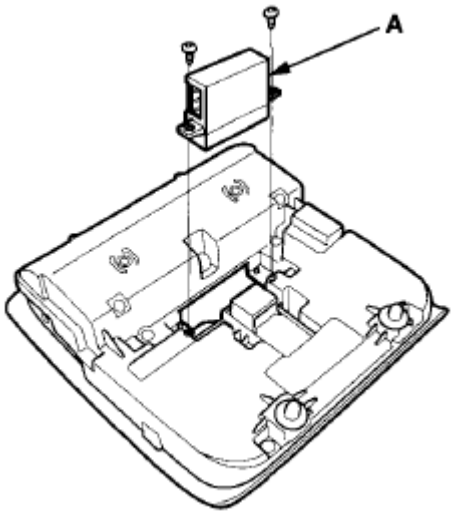

Fig. 180: Identifying HFL-Navigation Microphone
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the HFL-navigation microphone in the reverse order of removal.

INTERFACE DIAL REMOVAL/INSTALLATION

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the dashboard and related parts.**
- **Lay a shop towel under the parts when working on them to protect the face panel from scratches or other damage.**
- **Eject the disc before removing the audio-navigation unit to prevent damaging the CD/DVD player's load mechanism.**
- **If the audio-navigation unit is replaced or disconnected, a Map Matching must be done.**

1. Remove the audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**).
2. Remove the bolts (A) and the stays (B).

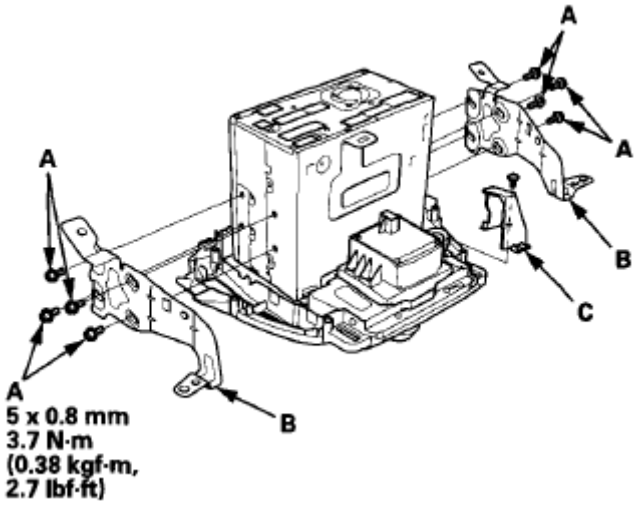

Fig. 181: Identifying Harness Cover, Stays And Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the screw and the harness cover (C).
4. Disconnect the interface dial 13P connector (A).

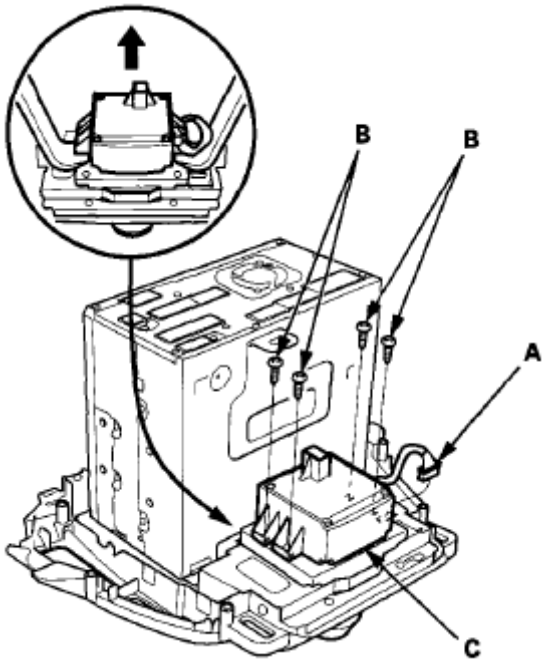

Fig. 182: Disconnecting Interface Dial 13P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the screws (B), then pry the interface dial (C) away from the audio-navigation switch panel with two KTC trim tools and applying even force as shown.

NOTE: Apply pressure slowly and steady until the knob and dial pops off.

6. Remove the interface dial (A), from the audio-navigation switch panel.

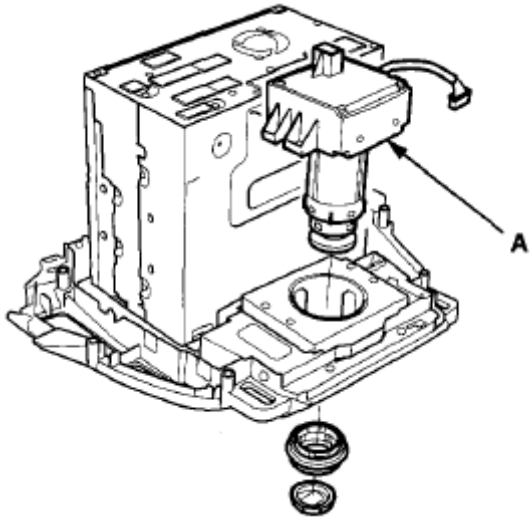

Fig. 183: Identifying Interface Dial
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the interface dial in the reverse order of removal.

NOTE: If the hard buttons do not work, but the jog dial does, recheck the interface dial connector connection.

GPS ANTENNA REMOVAL/INSTALLATION

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the dashboard and related parts.**
- **Lay a shop towel under the parts when working on them to protect the face panel from scratches or other damage.**

1. Remove the **navigation display unit**.
2. Remove the dashboard center trim (see **DASHBOARD CENTER TRIM REMOVAL/INSTALLATION**).
3. Pull out the audio-navigation unit (see step 4, and disconnect audio-navigation unit connector J (2P) (A).

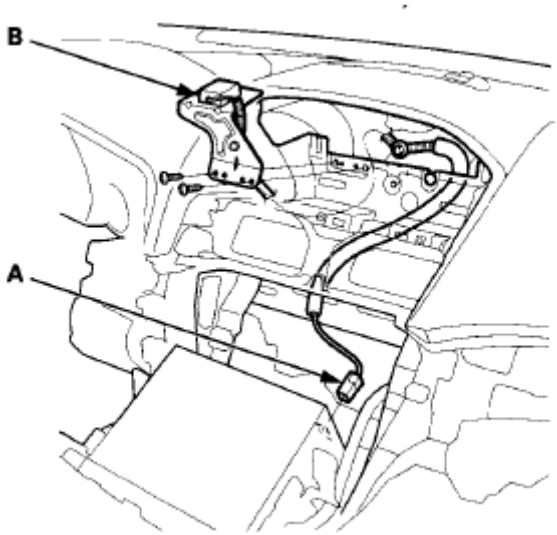

Fig. 184: Identifying GPS Antenna And Audio-Navigation Unit Connector J (2P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the screws and detach the clip, then remove the GPS antenna (B).
5. Install the GPS antenna in the reverse order of removal.

VOICE CONTROL SWITCH TEST

1. Remove the audio remote, HFL-navigation voice control switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**).
2. Measure the resistance between terminals No. 9 and No. 11 in each switch position according to the table.

VOICE CONTROL SWITCH

Position	Resistance
No button pressed	About 10 kohms
TALK button pressed	About 2.2 kohms
BACK button pressed	About 652 ohms

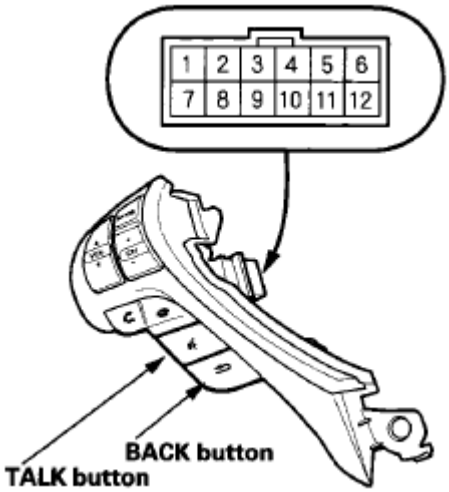

Fig. 185: Identifying Voice Control Switch, Talk & Back Button With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. In the resistance is not as specified, replace the switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**).

REARVIEW CAMERA REMOVAL/INSTALLATION

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the trunk lid and related parts.**

1. Remove the trunk lid trim panel (see **TRIM REMOVAL/INSTALLATION - TRUNK AREA**).
2. Disconnect the rearview camera 12P connector (A) and remove the nuts (B).

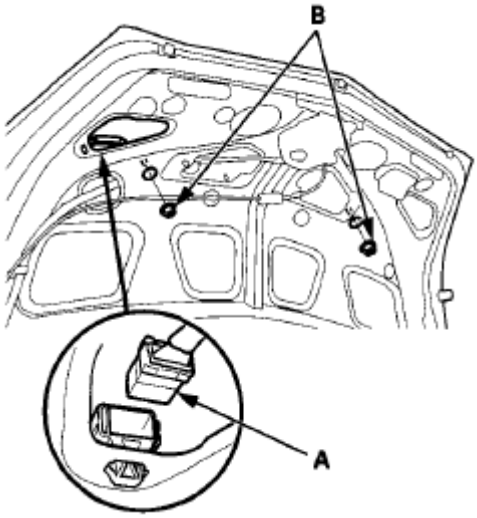

Fig. 186: Identifying Rearview Camera 12P Connector & Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Pull the rear license trim (A) away from the trunk lid, then remove the grommet (B) from the trunk lid, and carefully pull the connector through the hole in the trunk lid.

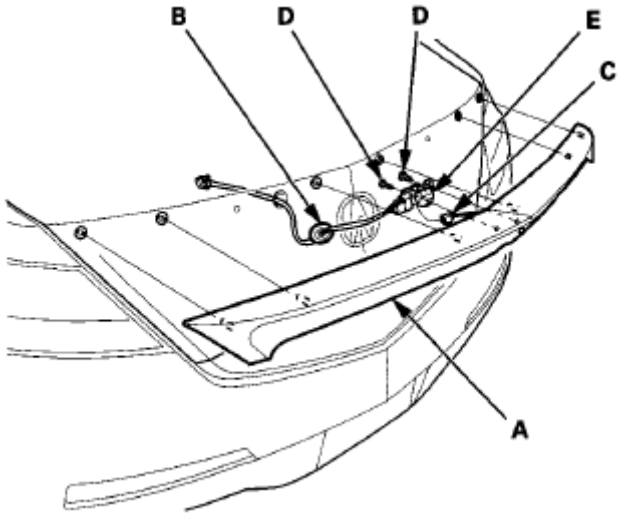

Fig. 187: Identifying Rearview Camera, Rear License Trim, Connector, Grommet And Screws
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the connector (C), remove the screws (D) and the rearview camera (E).
5. Install the rearview camera in the reverse order of removal.

2012 ACCESSORIES & EQUIPMENT

Power Lumbar Support - TL

COMPONENT LOCATION INDEX

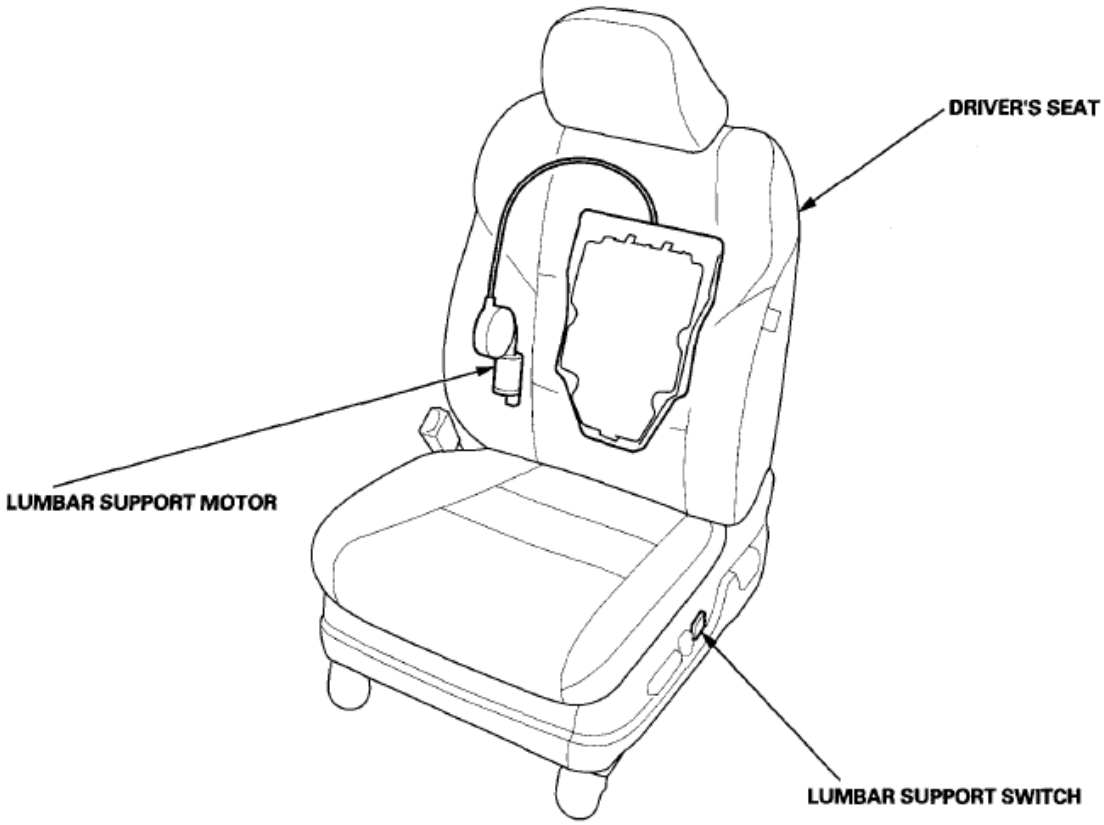

Fig. 1: Power Lumbar Support Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CIRCUIT DIAGRAM

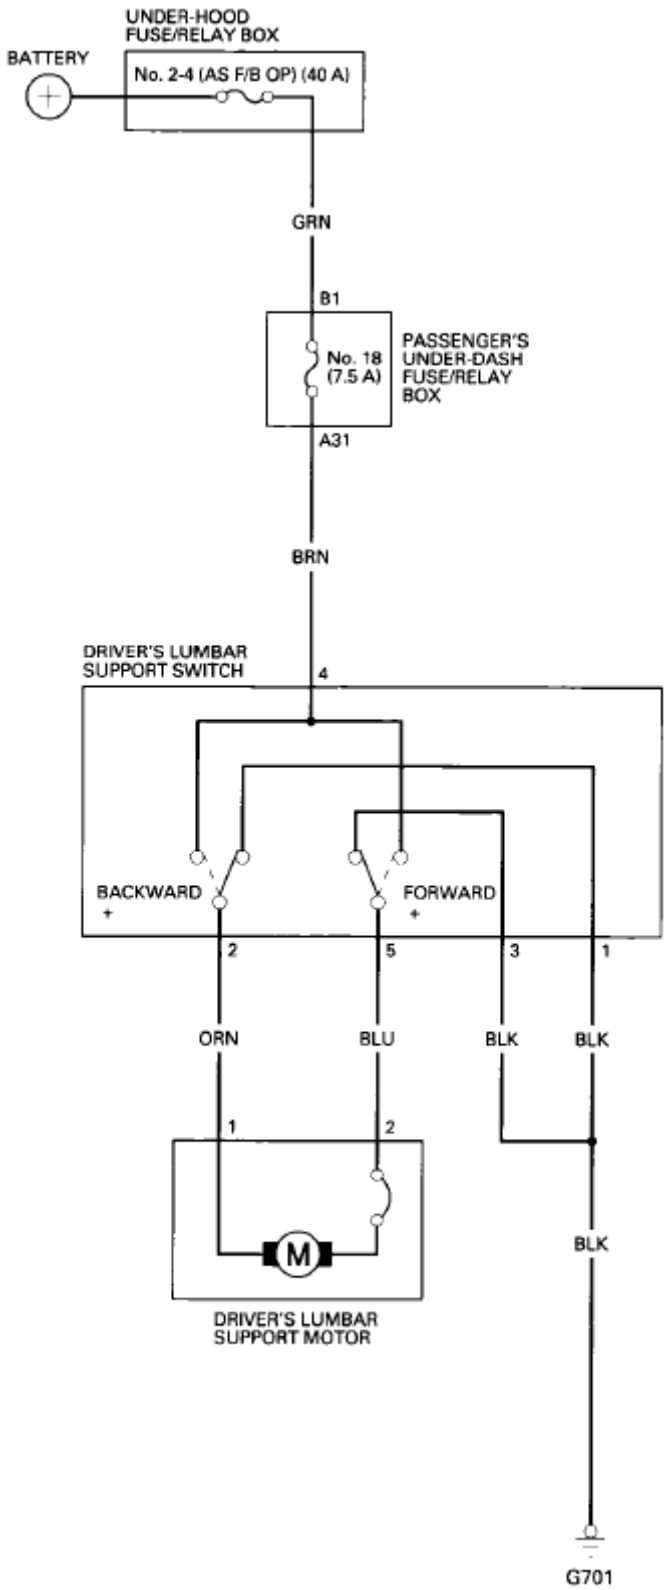

Fig. 2: Power Lumbar Support Circuit Wiring Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SWITCH TEST/REPLACEMENT

NOTE: SRS components are located in this area. Review the SRS component locations. (See COMPONENT LOCATION INDEX), and precautions and procedures. (See PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Separate the lumbar support switch cover (A) from the switch (B).

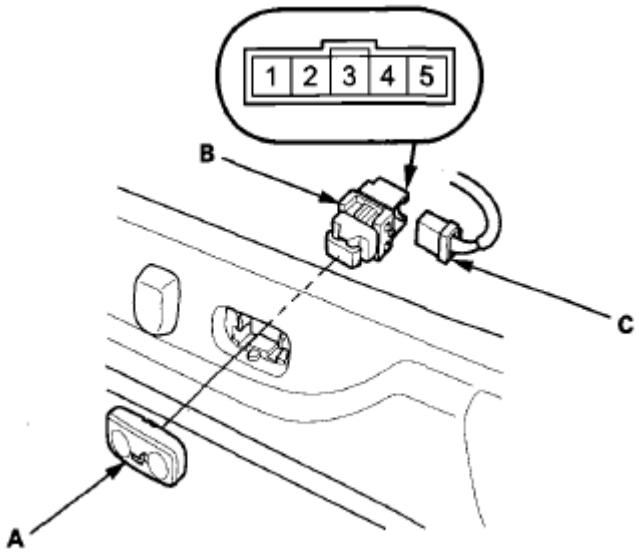

Fig. 3: Identifying Lumbar Support Switch Cover & Switch With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Disconnect the 5P connector (C) from the switch.
3. Check for continuity between the terminals in each switch position according to the table.

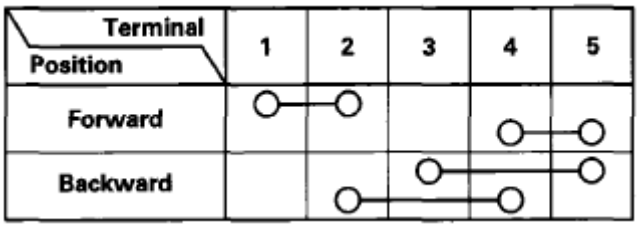

Fig. 4: Identifying Continuity Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the continuity is not as specified, replace the switch.

MOTOR TEST

NOTE: SRS components are located in this area. Review the SRS component locations.

(See COMPONENT LOCATION INDEX), and precautions and procedures. (See PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Turn over the driver's seat-back cover/pad as needed.
2. Remove the lumbar support motor cover (A).

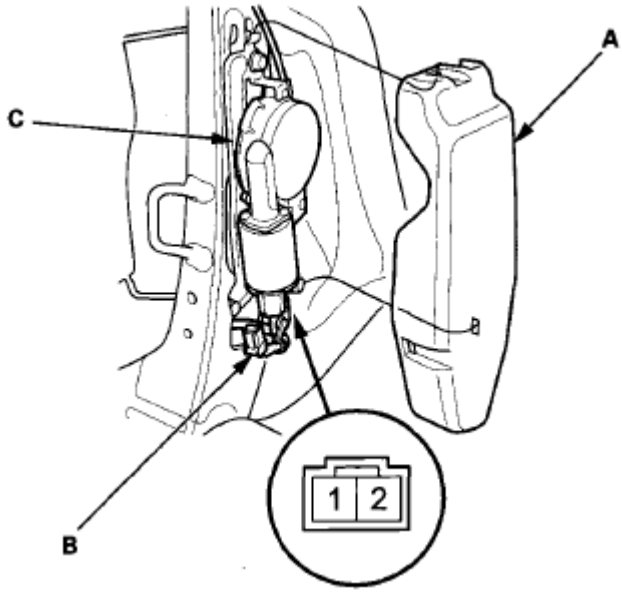

Fig. 5: Identifying Lumbar Support Motor Cover & Lumbar Support Motor With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the 2P connector (B) from the lumbar support motor (C).
4. Test the motor by applying battery power and body ground to the terminals.

Terminal / Position	1	2
Forward	⊖	⊕
Backward	⊕	⊖

Fig. 6: Testing Motor By Applying Battery Power And Body Ground To Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the motor does not run or fails to run smoothly, replace it. (See **FRONT SEAT LUMBAR SUPPORT REPLACEMENT**).

2012 ACCESSORIES & EQUIPMENT

Power Mirrors - TL

COMPONENT LOCATION INDEX

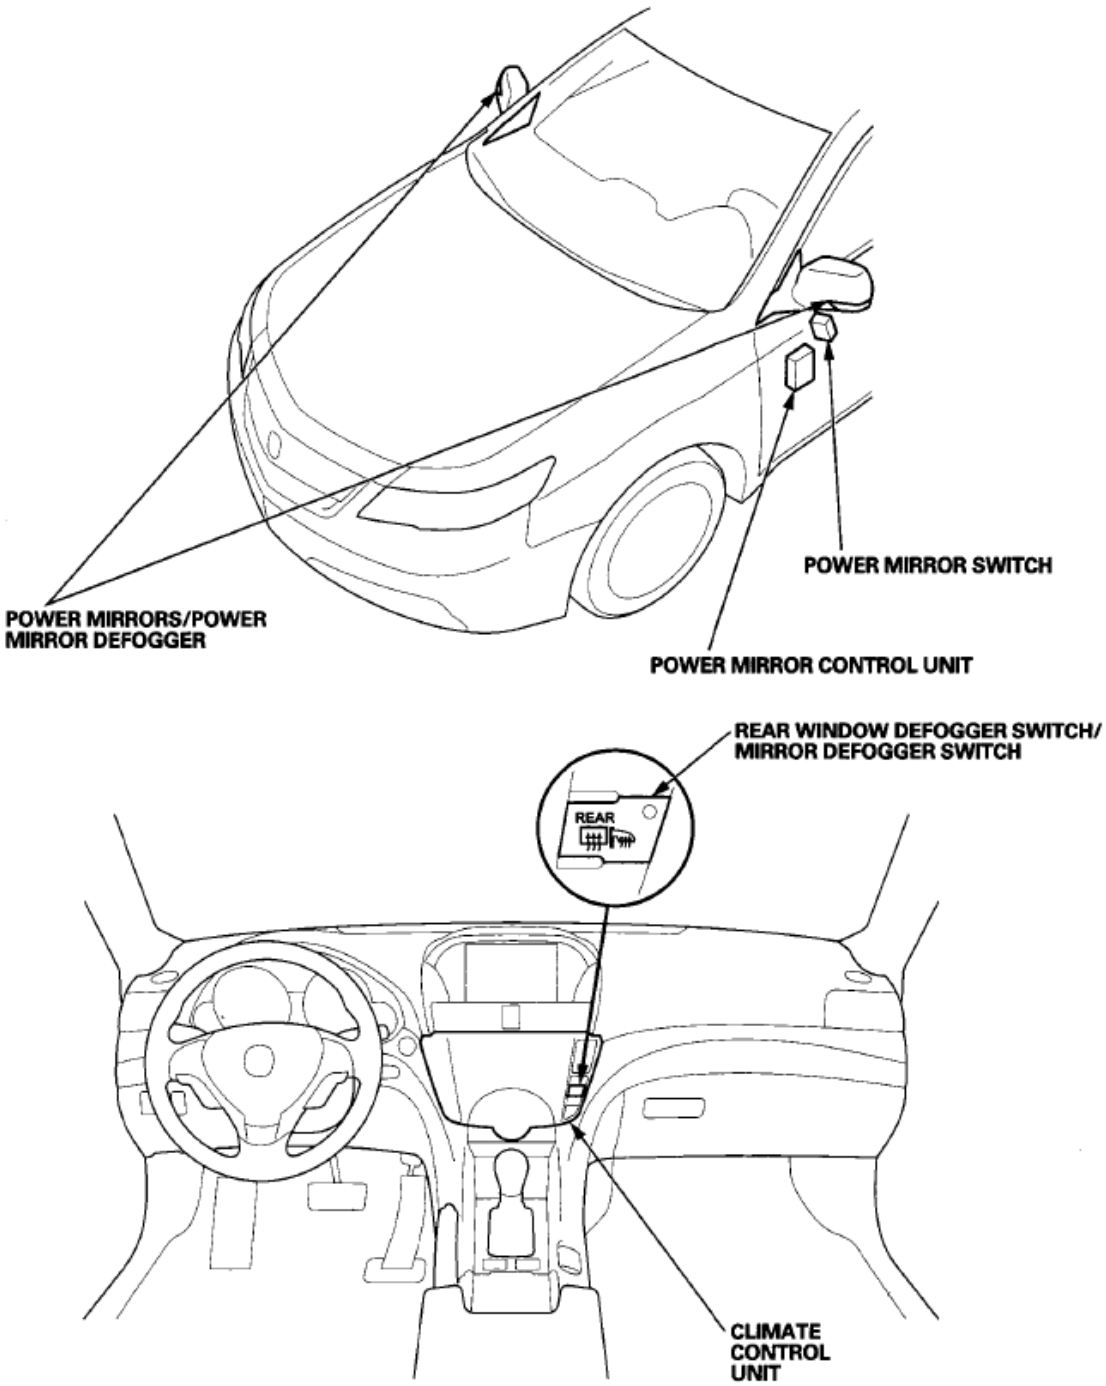

Fig. 1: Power Mirror Component Locations
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SYSTEM DESCRIPTION

POWER MIRROR DEFOGGER AUTO OPERATION FUNCTION

When the outside air temperature is 41°F (5°C) or below and the ignition switch is turned to ON (II) or the vehicle is in ON mode, the left and right power mirror defoggers automatically turn on. The power mirror defogger auto operation function is controlled by the door multiplex control unit.

- When the door multiplex control unit receives a signal that the outside air temperature is 41°F (5°C) or below from the climate control unit, the door multiplex control unit automatically turns on the left and right power mirror defoggers within ten seconds after the ignition switch is turned to ON (II) or the vehicle is in ON mode.
- Power mirror defogger output automatically stops in ten minutes as a result of its timer.
- If the door multiplex control unit receives a rear window defogger/power mirror defogger switch input signal from the climate control unit during power mirror defogger output, the door multiplex control unit shuts off the auto operation function immediately.
- While the power mirror defogger auto operation function is operating, the rear window defogger does not automatically operate.
- The power mirror defogger auto operation function stops temporarily when any power windows operate during power mirror defogger output.

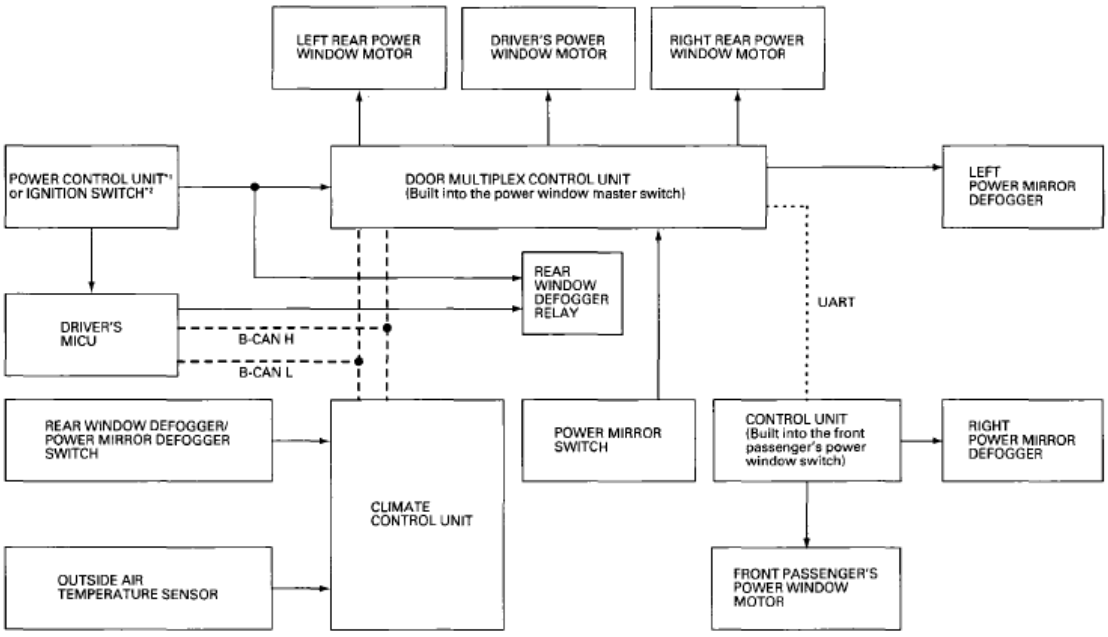

Fig. 2: Power Mirror Defogger - Chart
Courtesy of AMERICAN HONDA MOTOR CO., INC.

POWER MIRROR ACTUATOR TEST

1. Remove the door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
2. Disconnect the 16P connector (A) from the door harness (B).

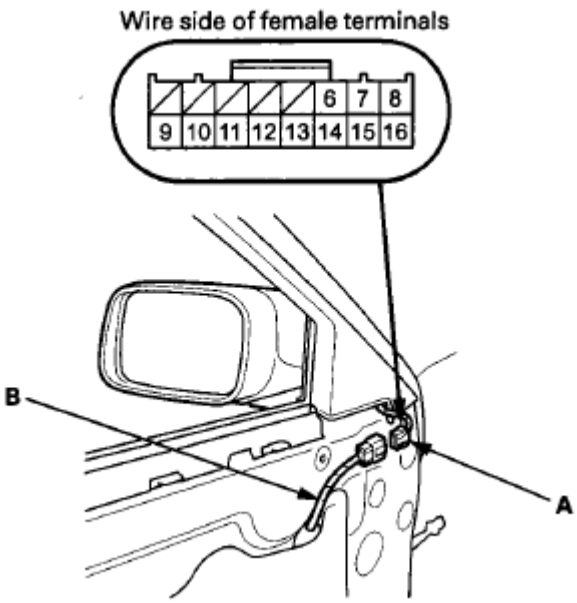

Fig. 3: Identifying 16P Connector End View And Door Harness
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. At the 16P connector, check the actuator operation by connecting power and ground according to the table.

Power mirror actuator

Terminal / Position	14	15	16
TILT UP		⊖	⊕
TILT DOWN		⊕	⊖
SWING LEFT	⊖	⊕	
SWING RIGHT	⊕	⊖	

Fig. 4: Power Mirror Actuator - Reference Chart
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the mirror fails to work properly, check for an open in the wire between the connector and the mirror holder. If the wire is OK, replace the mirror actuator (see **POWER MIRROR ACTUATOR REPLACEMENT**).

Defogger Test

5. Check for continuity between terminals No. 11 and No. 12 of the 16P connector. There should be continuity.

6. If there is no continuity, check for an open in the wire between the connector and the mirror holder. If the wire is OK, replace the mirror holder (see **POWER MIRROR REPLACEMENT**).

POWER MIRROR SWITCH TEST/REPLACEMENT

1. Remove the driver's door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
2. Remove the screws from the driver's door grip (A) and grip cover (B).

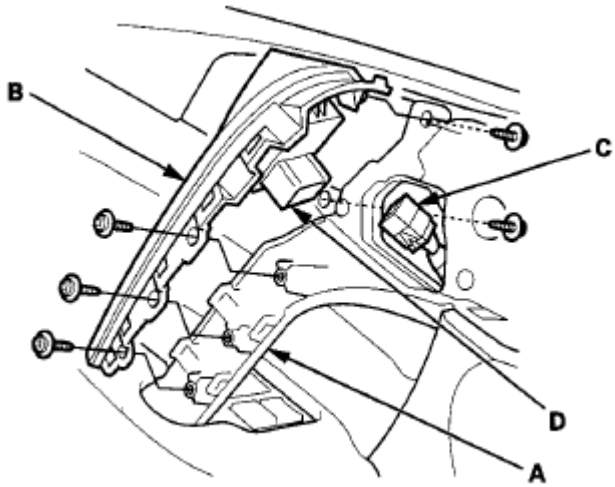

Fig. 5: Identifying Driver's Door Grip And Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Pull out the grip cover slightly from the door grip, then disconnect the 13P connector (C) from the power mirror switch (D).
4. Remove the two screws and the power mirror switch (A) from the grip trim (B).

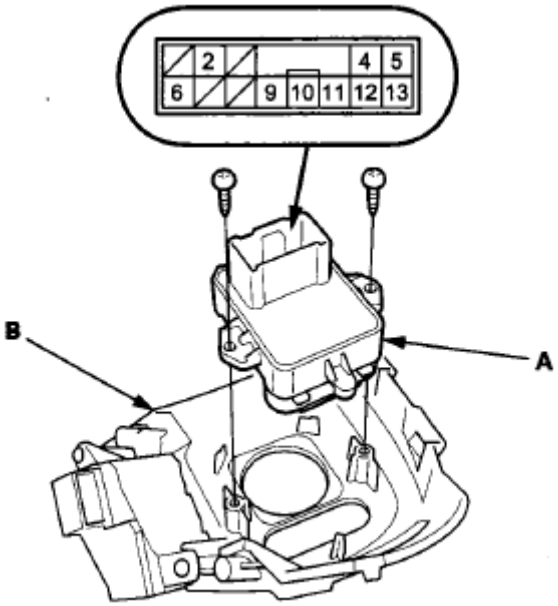

Fig. 6: Identifying Power Mirror Switch And Grip Trim With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Check for continuity between the terminals in each switch position according to the table.

Power mirror switch

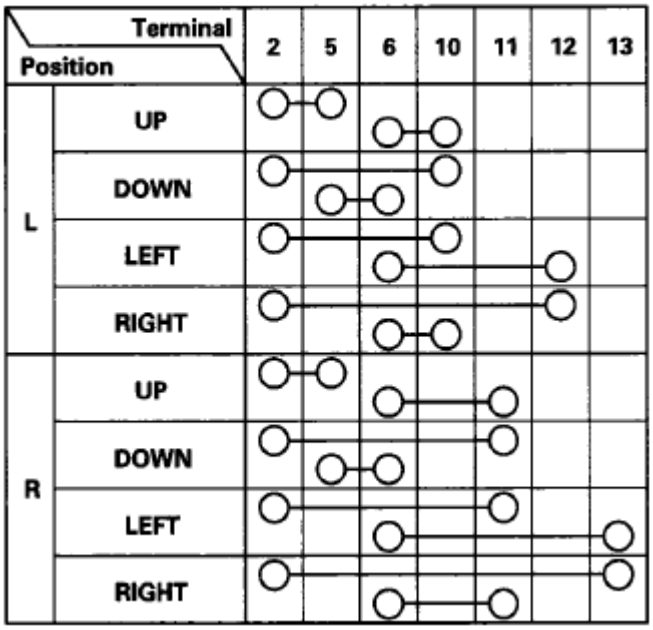

Fig. 7: Power Mirror Switch - Reference Chart
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the continuity is not as specified, replace the power mirror switch.

7. Install the switch in the reverse order of removal.

POWER MIRROR ACTUATOR REPLACEMENT

Removal

1. Remove these items:
   - Mirror holder (see **POWER MIRROR REPLACEMENT**)
   - Power mirror (see **POWER MIRROR REPLACEMENT**)
   - Side turn signal light (see **BULB REPLACEMENT**)
2. Disconnect the power mirror 16P connector from the door harness.
3. Remove the gaskets (A), then remove the screw and cord from the mirror bracket (B).

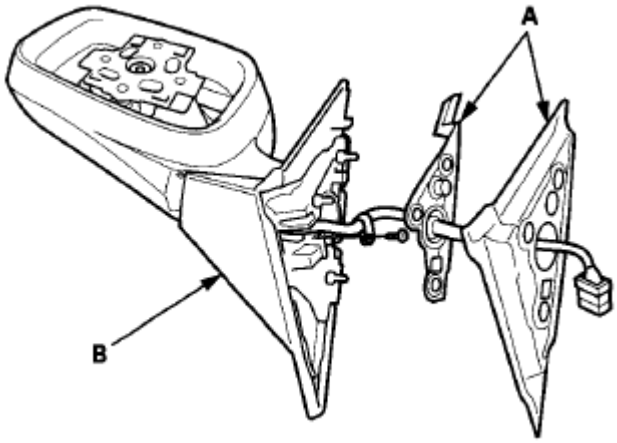

Fig. 8: Identifying Gaskets And Mirror Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Record the terminal location and wire colors, then cut the mirror actuator wires with the wire cutter.

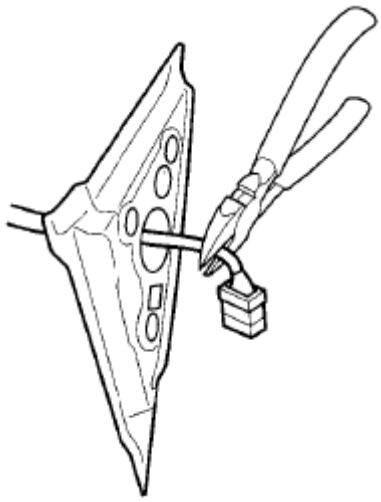

Fig. 9: Cutting Mirror Actuator Wires With Wire Cutter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the cover (A).

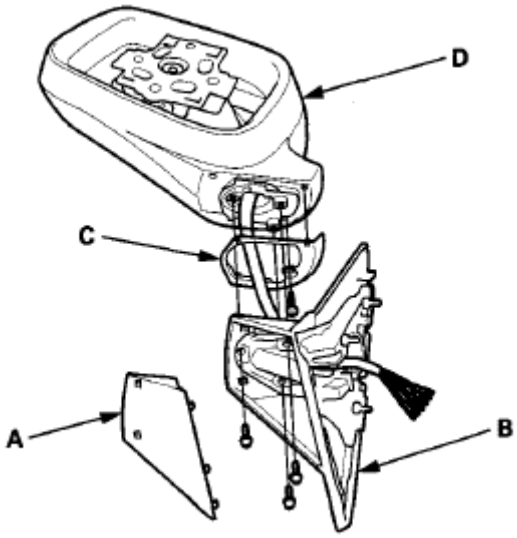

Fig. 10: Identifying Cover, Mirror Bracket, Seal And Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the three screws, separate the mirror bracket (B), then remove screw, separate the seal (C) from the housing (D).
7. Remove the two screws then remove the visor (A) and the actuator housing (B) from the housing (C).

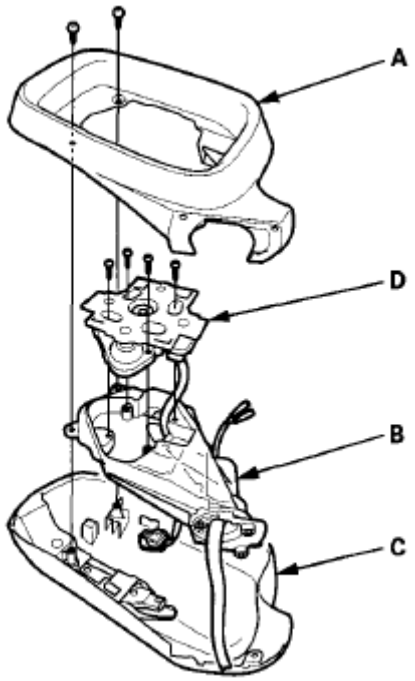

Fig. 11: Identifying Actuator, Housing, Actuator Housing And Visor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the four screws and the actuator (D) from the actuator housing.

Installation

9. Install new actuator to the housing and visor in the reverse order of step 7 and 8.
10. Route the wire harness (A) of a new actuator through the hole in the seal (B), then tighten a screw (C).

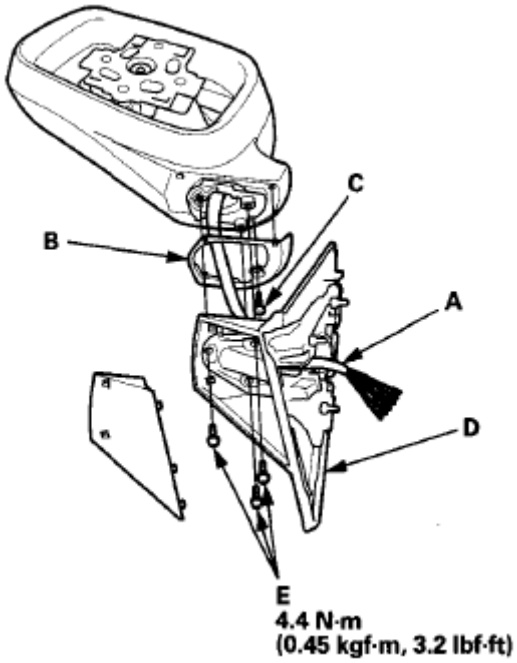

Fig. 12: Identifying Seal, Wire Harness, Bracket And Screw With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Route the wire harness of a new actuator through the hole in the bracket (D).
12. Reassemble the mirror in the reverse order of removal. Apply LOCTITE to the three screws (E) and tighten to 4.4 N.m (0.45 kgf.m, 3.2 lbf.ft).
13. Install the gasket in the reverse order of removal.
14. Insert the mirror actuator wires into the original terminal locations as noted in step 4.

NOTE: Be careful to insert the wires correctly because the wires cannot be removed from the coupler once they are inserted.

15. Reassemble in the reverse order of disassembly.

NOTE: Be careful not to break the mirror when reinstalling it to the actuator.

16. Reinstall the mirror assembly on the door.
17. Operate the power mirror to ensure smooth operation.

Power Seats - TL

COMPONENT LOCATION INDEX

For the driver's power seat, refer to the DRIVER POSITION MEMORY SYSTEM (DPMS)

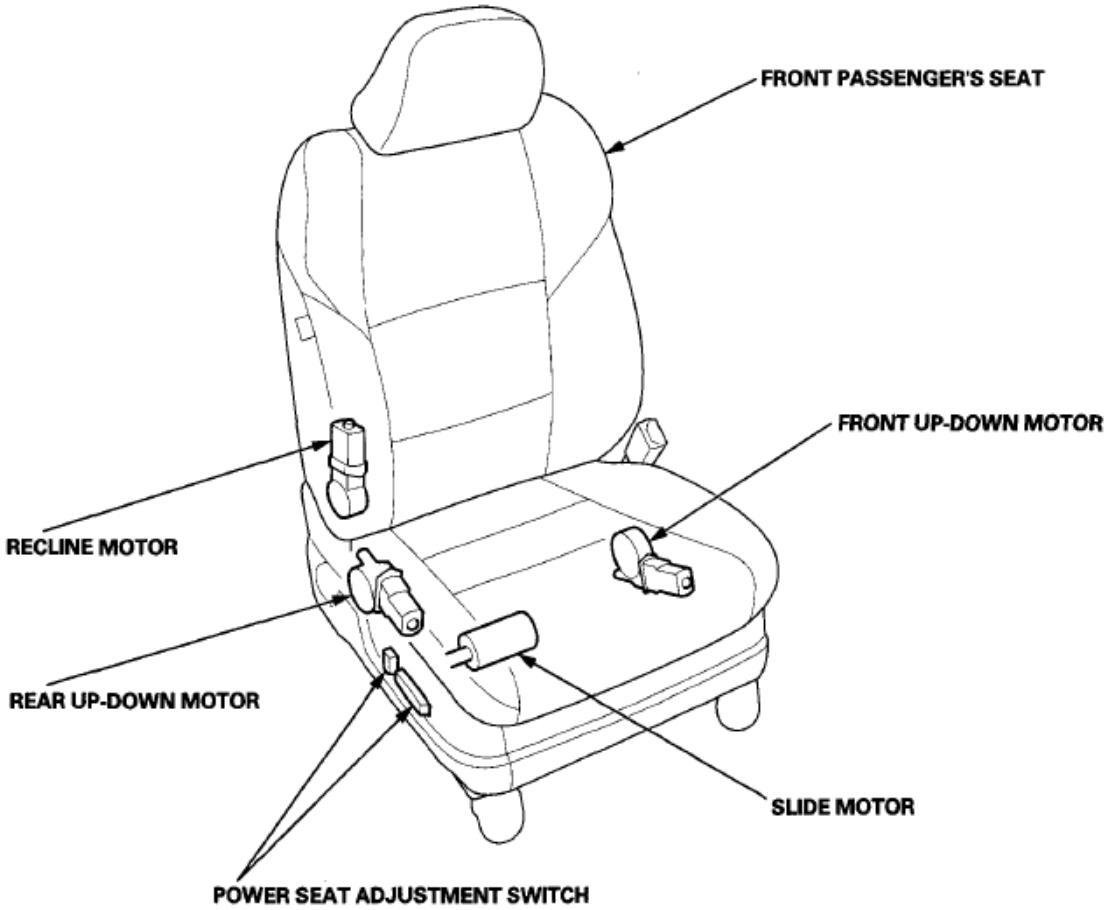

Fig. 1: Power Seats Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CIRCUIT DIAGRAM - FRONT PASSENGER'S POWER SEAT

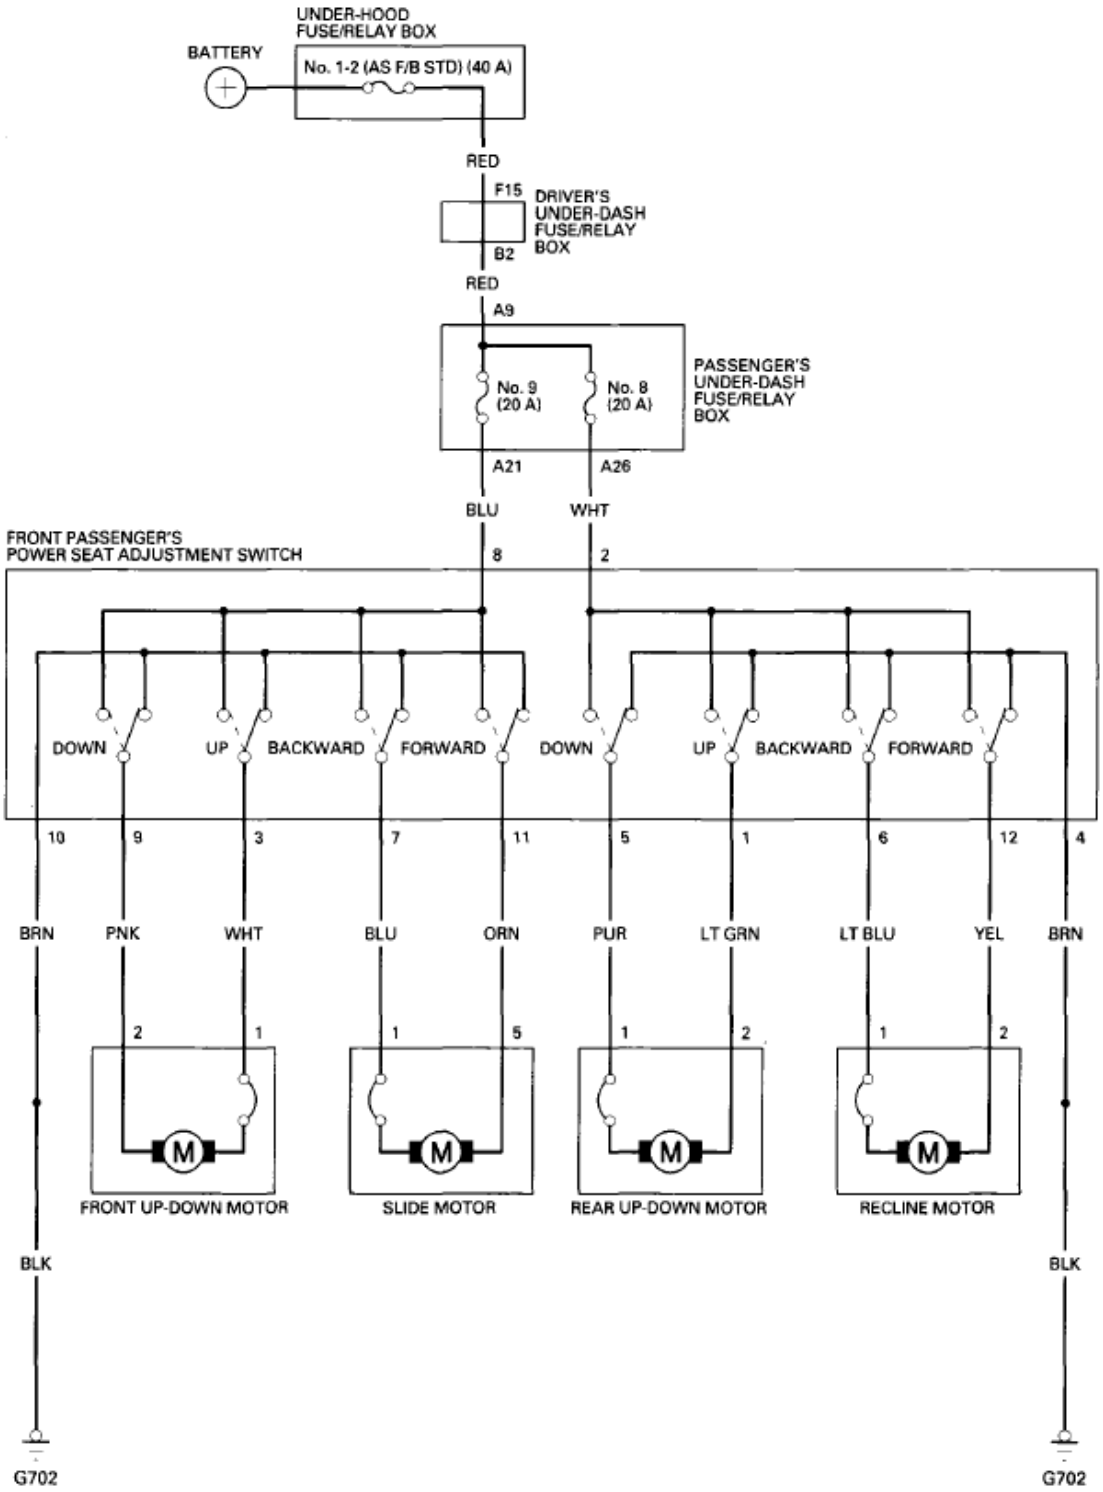

Fig. 2: Passenger's Power Seat - Circuit Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

POWER SEAT ADJUSTMENT SWITCH TEST/REPLACEMENT

FRONT PASSENGER'S SEAT

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Remove the front passenger's seat (see **FRONT SEAT REMOVAL/INSTALLATION**).
2. Remove the power seat adjustment switch knobs (A) and the recline cover from the front passenger's seat (see **FRONT SEAT RECLINE COVER REMOVAL/INSTALLATION**), then remove the two screws and the power seat adjustment switch (B).

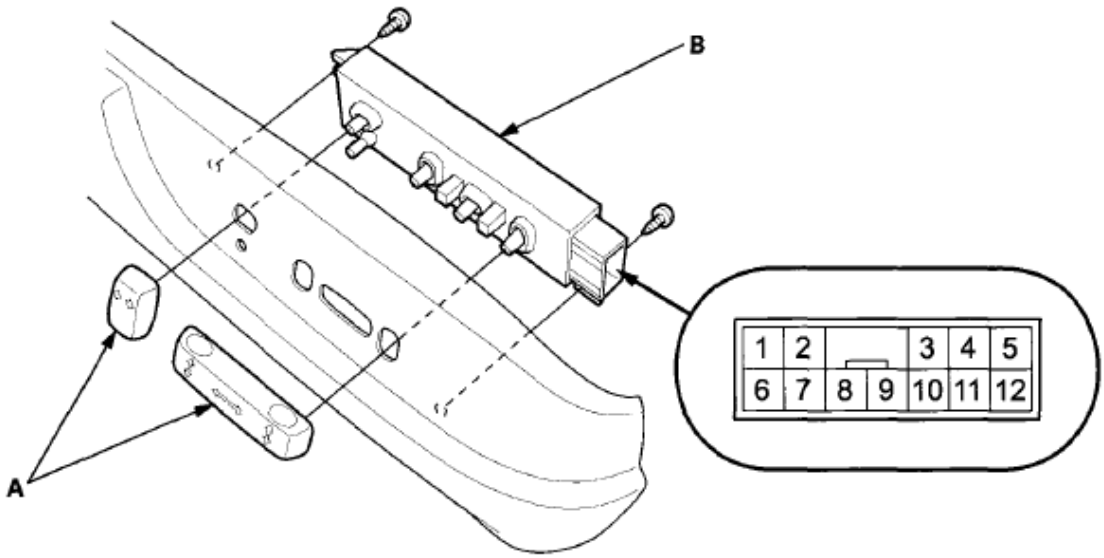

Fig. 3: Identifying Power Seat Adjustment Switch Knobs And Power Seat Adjustment Switch With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the 12P connector from the power seat adjustment switch.
4. Reinstall the adjustment switch knobs to the switch.
5. Check for continuity between the terminals in each switch position according to the table.

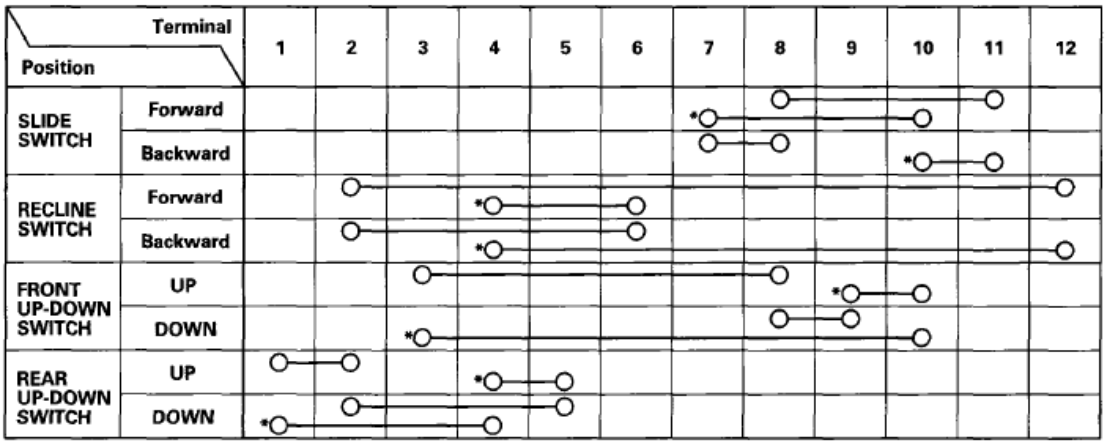

Fig. 4: Identifying Continuity Reference Chart
Courtesy of AMERICAN HONDA MOTOR CO., INC.

*: There is continuity without operating a switch.

6. If the continuity is not as specified, replace the switch.

FRONT PASSENGER'S POWER SEAT MOTOR TEST

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Remove the front passenger's seat (see **FRONT SEAT REMOVAL/INSTALLATION**).
2. Disconnect the connector from each power seat motor.

NOTE: All connectors are terminal side of male terminals.

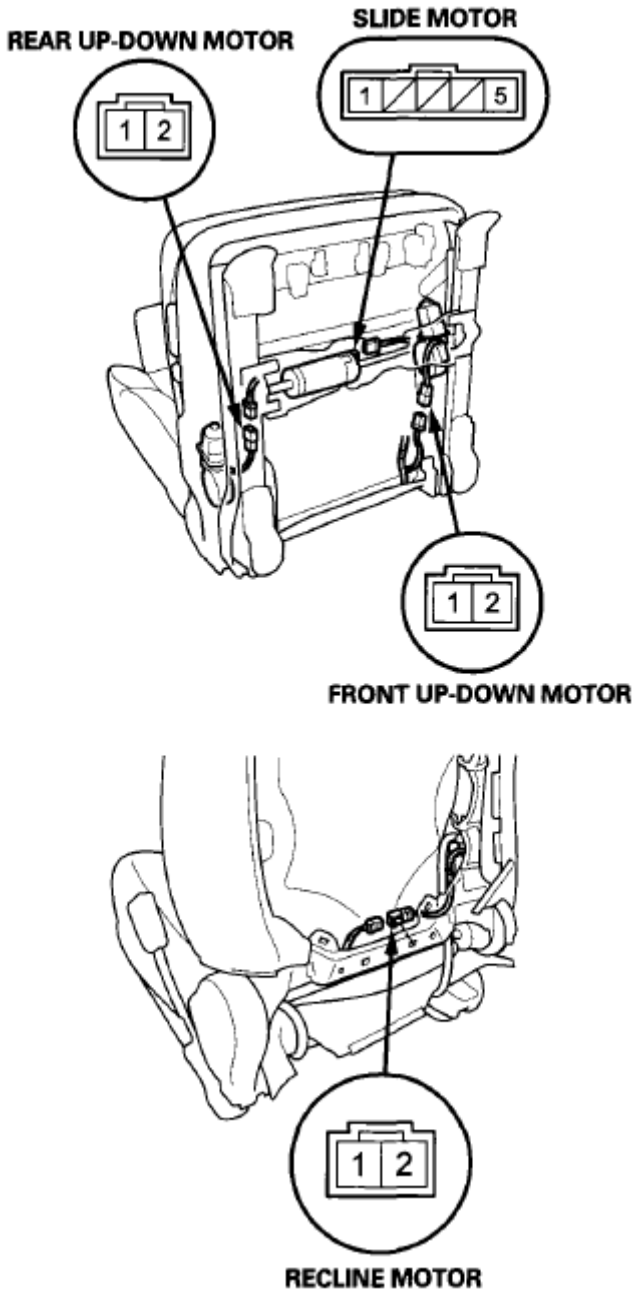

Fig. 5: Identifying Rear And Front Up-Down Motors Terminals, Slide Motor Terminals And Recline Motor With Connector End Views
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Test each motor by connecting power and ground according to the table. When the motor stops running, disconnect battery power immediately.

Position		Terminal 1	Terminal 5
SLIDE MOTOR	Forward	⊖	⊕
	Backward	⊕	⊖

Fig. 6: Testing Slide Motor By Connecting Power And Ground According To Table

Position		Terminal 1	Terminal 2
REAR UP-DOWN MOTOR	UP	⊖	⊕
	DOWN	⊕	⊖

Fig. 9: Testing Rear Up-Down Motor By Connecting Power And Ground According To Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the motor does not run or fails to run smoothly, replace:
   - Slide motor (see **FRONT SEAT SLIDE MOTOR REPLACEMENT**)
   - Front up-down motor/seat frame (see **FRONT SEAT FRAME REPLACEMENT**)
   - Rear up-down motor/seat frame (see **FRONT SEAT FRAME REPLACEMENT**)
   - Recline motor (see **FRONT SEAT RECLINE MOTOR REPLACEMENT**)

NOTE: **The front and rear up-down motors are part of the seat frame.**

Power Windows - TL

COMPONENT LOCATION INDEX

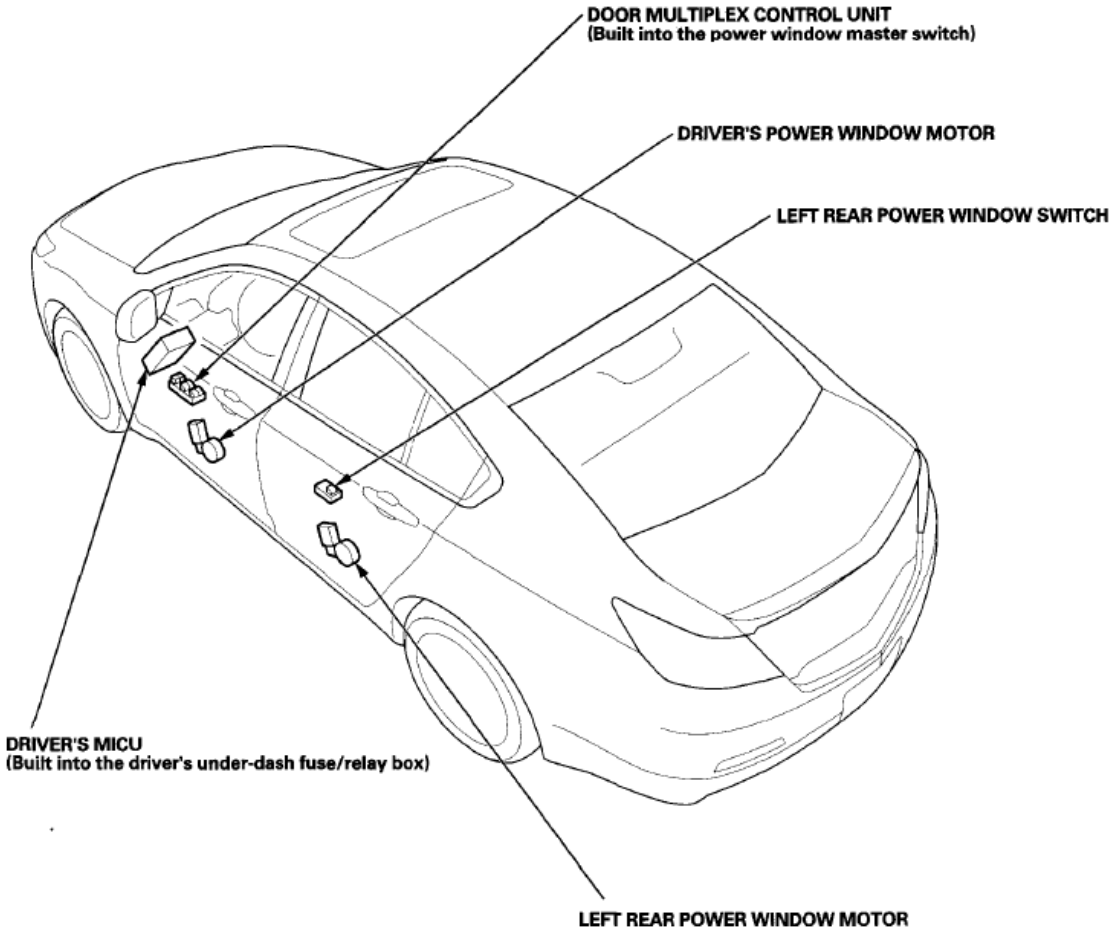

Fig. 1: Power Window Components Location (1 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

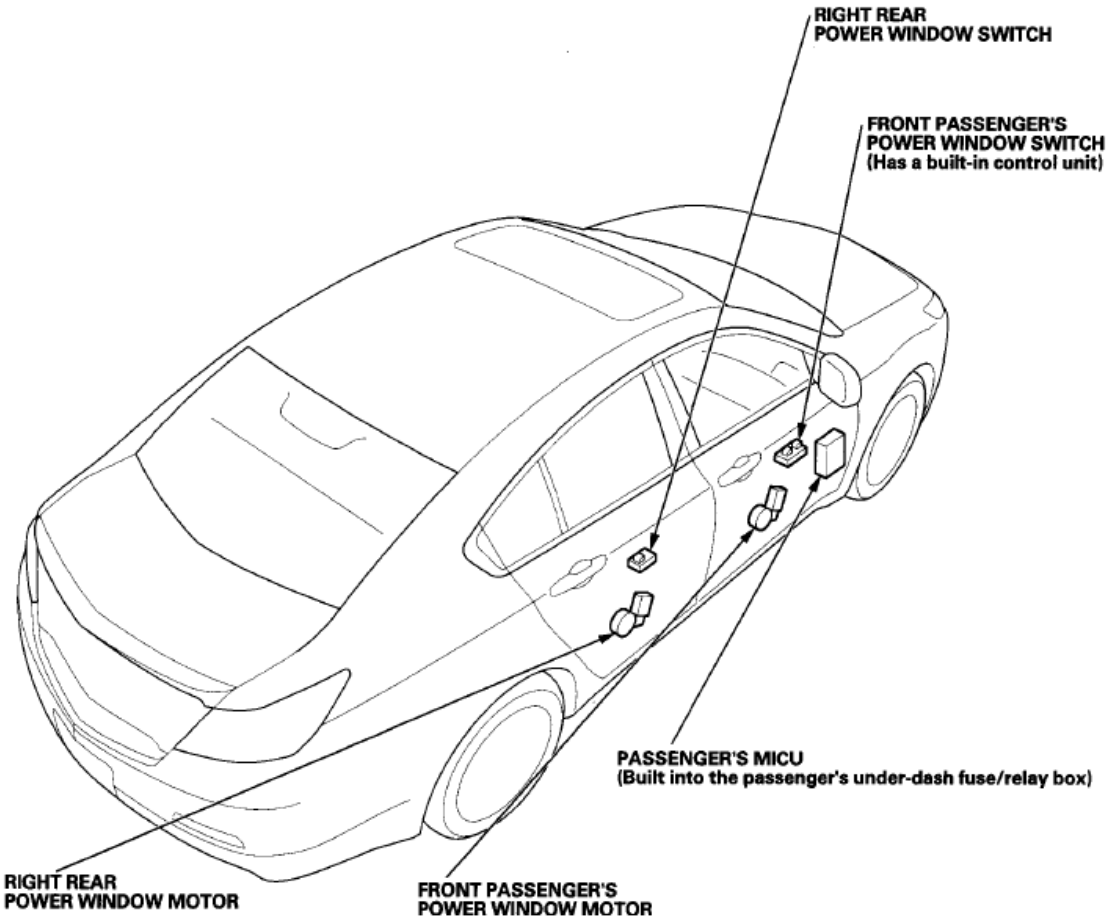

Fig. 2: Power Window Components Location (2 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SYSTEM DESCRIPTION

AUTO REVERSE POWER WINDOW OPERATION

The system is composed of the driver's MICU, the passenger's MICU unit, the door multiplex control unit (built into the power window master switch), the front passenger's power window control unit (built into the front passenger's switch), and the power window motors.

The driver's and front passenger's power window motors incorporate a Hall IC unit (pulser) which generates pulses during the motor's operation and sends pulses to the driver's and passenger's power window control units. As soon as the power window control units detect a change in the pulse frequency from the Hall IC unit (pulser), the power window control units make the power window motor stop and reverse. This prevents pinching your hand or fingers during auto-up operation. The auto reverse function does not work when the power window master switch is held in the closed position.

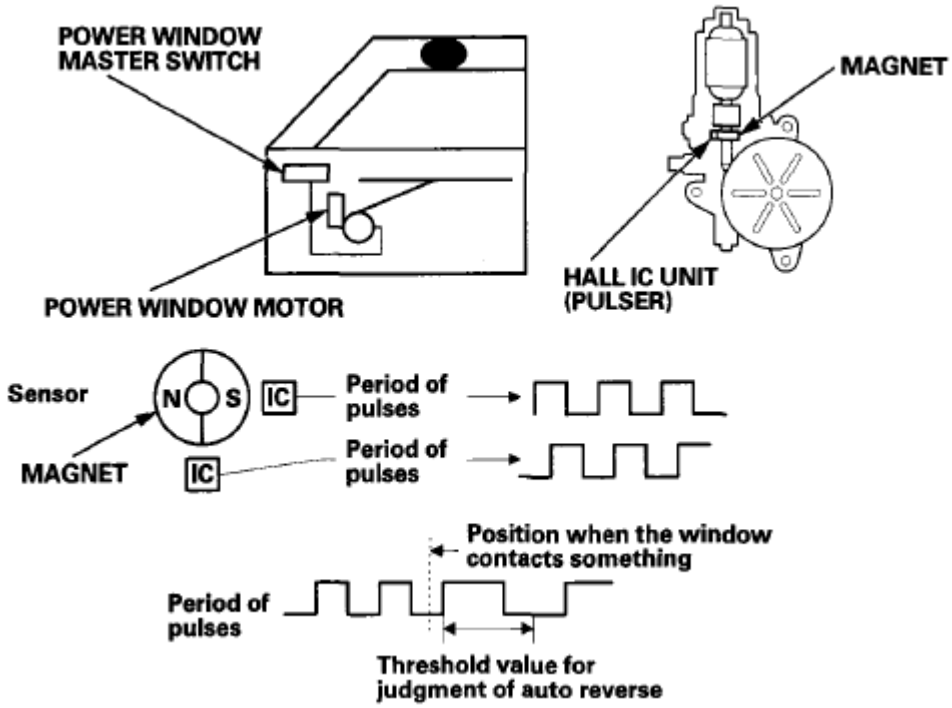

Fig. 3: View Of Auto Reverse Power Window Operation
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Key Cylinder Operation

With the key inserted in the driver's door key cylinder, turn the key twice within 15 seconds and hold it to operate the windows and moonroof (clockwise to open, counterclockwise to close). The windows and moonroof stop moving when the key is released. The auto reverse operation is not active when closing the windows and moonroof with the key cylinder.

Keyless Operation

By pressing and holding the UNLOCK button of the keyless transmitter, or remote twice within 15 seconds, the windows and moonroof open. The windows and moonroof stop moving when the UNLOCK button is released. The windows do not close with the LOCK button.

RESETTING THE POWER WINDOW CONTROL UNIT

Reset the power window control unit after doing any of the following:

- Power window regulator replacement, removal/installation, or repair.
- Power window motor replacement, removal/installation, or repair.
- Glass run channel replacement or removal/installation.
- Front passenger's power window switch replacement or removal/installation.
- Door glass replacement, removal/installation, or repair.
- Power is disconnected from the driver's power window master switch or front passenger's power window

switch while the power window timer is ON.

NOTE: If the front passenger's power window has lost power when the key off timer is ON, it cannot be operated from the driver's switch and must be reset from the front passenger's power window switch.

USING THE HDS

1. Connect the HDS to the data link connector (DLC).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then enter the vehicle's VIN and mileage at the prompts.
3. Select BODY ELECTRICAL from the SYSTEM SELECTION MENU.
4. From the BODY ELECTRICAL SYSTEM SELECT menu, select POWER WINDOWS.
5. From the MODE MENU, select ADJUSTMENT.
6. From the ADJUSTMENT MENU, select POWER WINDOW RESET FOR DRIVER SIDE (PASSENGER'S SIDE).
7. Follow the prompts on the screen.
8. Confirm that the power window control unit is reset by using the power window AUTO UP and AUTO DOWN function.

WITHOUT THE HDS

NOTE: Do the reset procedure from the power window switch of the affected window.

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Move the power window all the way down by using the power window DOWN switch.
3. Open the driver's or front passenger's door.
4. Do the following four times before going to step 5:

   NOTE: Do each bullet step within 5 seconds of each other.

   - Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
   - Push and hold the power window DOWN switch.
   - Turn the ignition switch to ON (II) or press the engine start/stop button to select the ON mode.
   - Release the power window DOWN switch.
5. Confirm that AUTO UP no longer works. If AUTO UP still works, repeat step 4, paying close attention to the 5 second time limit.
6. Move the power window all the way down using the power window DOWN switch.
7. Pull up and hold the power window UP switch until the power window is all the way up, then continue to hold the switch for several seconds.
8. Confirm that the power window control unit is reset by using the power window AUTO UP and AUTO DOWN function. If the power window still does not work in AUTO, repeat the procedure several times,

paying close attention to the 5 seconds time limit between each bulleted step. If the window still does not work, troubleshoot the power window circuit.

CIRCUIT DIAGRAM

DTC TROUBLESHOOTING

DTC B1125: DRIVER'S POWER WINDOW MOTOR A PULSE MALFUNCTION; DTC B1126: DRIVER'S POWER WINDOW MOTOR B PULSE MALFUNCTION

NOTE: **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Open and close the driver's power window by using the power window master switch manually.

   Does the window motor operate?

   YES - Go to step 4.

   NO - Test the driver's power window motor (see **DRIVER'S POWER WINDOW MOTOR TEST**). If the motor tests OK, go to step 4.

4. Check for DTCs with the HDS.

   Are DTCs B1125 and/or B1126 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Select the POWER WINDOWS from the BODY ELECTRICAL SYSTEM SELECT menu, and enter DATA LIST.
6. Check the DETECT/NONE information of the DRIVER'S P/W MOTOR PULSE A and PULSE B signal in the DATA LIST.

   Does the information indicator display DETECT while the window is moving, and display NONE when the window is stopped?

   YES - Replace the power window master switch (see **POWER WINDOW MASTER SWITCH REPLACEMENT**).

   NO - Go to step 7.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect the power window master switch 37P connector.
9. Disconnect the driver's power window motor 6P connector.
10. Check for continuity between power window master switch 37P terminals No. 3, No. 20, and No. 22 and driver's power window motor 6P connector terminals No. 5, No. 3, and No. 6 respectively.

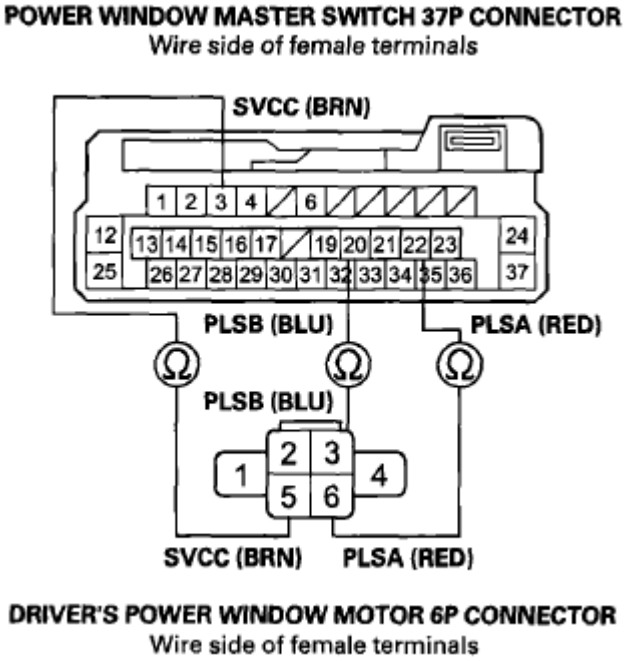

Fig. 7: Checking Continuity Between Power Window Master Switch 37P Connector And Driver's Power Window Motor 6P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair an open or high resistance in the wire between the door multiplex control unit and the driver's power window motor.

11. Check for continuity between driver's power window motor 6P connector terminals No. 3, No. 5, and No. 6 and body ground individually.

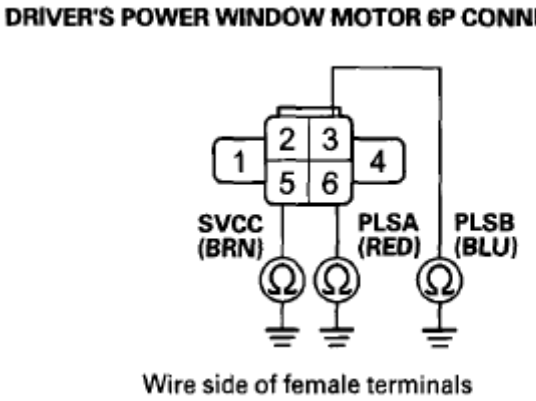

Fig. 8: Checking Continuity Between Driver's Power Window Motor 6P Connector Terminals No. 3, No. 5, And No. 6 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 12.

12. Test the driver's power window motor (see **DRIVER'S POWER WINDOW MOTOR TEST**).

    Is the motor OK?

    YES - Replace the power window master switch (see **POWER WINDOW MASTER SWITCH REPLACEMENT**).

    NO - Faulty the driver's power window motor; replace the driver's door regulator (see **FRONT DOOR GLASS AND REGULATOR REPLACEMENT**).

DTC B1130: FRONT PASSENGER'S POWER WINDOW MOTOR A-PULSE MALFUNCTION; DTC B1131: FRONT PASSENGER'S POWER WINDOW MOTOR B-PULSE MALFUNCTION

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Open and close the front passenger's power window by using the front passenger's power window switch manually.

   Does the window motor operate?

   YES - Go to step 4.

   NO - Test the front passenger's power window motor (see **FRONT PASSENGER'S POWER WINDOW MOTOR TEST**). If the motor tests OK, go to step 4.

4. Check for DTCs with the HDS.

   Are DTCs B1130 and/or B1131 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Select the POWER WINDOWS from the BODY ELECTRICAL SYSTEM SELECT menu, and enter DATA LIST.
6. Check the DETECT/NONE information of the PASSENGER'S POWER WINDOW MOTOR PULSE A and PULSE B signal in the DATA LIST.

   Does the information indicator display DETECT while the window is moving, and display NONE when the window is stopped?

   YES - Replace the front passenger's power window switch (see **FRONT PASSENGER'S POWER WINDOW SWITCH INPUT TEST**).

   NO - Go to step 7.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect the front passenger's power window switch 37P connector.
9. Disconnect the front passenger's power window motor 6P connector.

DTC B1140: DRIVER'S POWER WINDOW POSITION DETECT CIRCUIT MALFUNCTION

NOTE:

- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **Make sure you reset the power window control unit (see RESETTING THE POWER WINDOW CONTROL UNIT) whenever you replace or substitute any power window parts.**

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Open and close the driver's power window by using the driver's switch manually.
4. Check for DTCs with the HDS.

   Is DTC B1125 or B1126 indicated?

   YES - Troubleshoot DTC B1125 or B1126 (see **DTC B1125: DRIVER'S POWER WINDOW MOTOR A PULSE MALFUNCTION; DTC B1126: DRIVER'S POWER WINDOW MOTOR B PULSE MALFUNCTION**).

   NO - Go to step 5.

5. Reset the power window control unit (see **RESETTING THE POWER WINDOW CONTROL UNIT**).
6. Check for DTCs again with the HDS.

Is DTC B1140 indicated?

YES - Go to step 7.

NO - The system is OK at this time. Check for loose or poor connectors.

7. Substitute a known-good power window master switch.
8. Open and close the driver's power window by using the driver's switch manually.
9. Check for DTCs with the HDS.

Is DTC B1140 indicated?

YES - Faulty the driver's power window motor; replace the driver's door regulator (see **FRONT DOOR GLASS AND REGULATOR REPLACEMENT**).

NO - Faulty door multiplex control unit; replace the power window master switch (see **POWER WINDOW MASTER SWITCH REPLACEMENT**).

DTC B1142: DOOR MULTIPLEX CONTROL UNIT LOST COMMUNICATION WITH OTHER UNIT (UART COMMUNICATION ERROR)

NOTE:

- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **Before troubleshooting, make sure the No. 12 (7.5 A), No. 16 (7.5 A) and No. 24 (20 A) fuses in the driver's under-dash fuse/relay box are OK.**

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Open and close all power windows by using the power window master switch.
4. Check for DTCs with the HDS.

Is DTC B1142 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect these items:
   - Disconnect the power window master switch 37P connector.
   - Disconnect the front passenger's power window switch 37P connector.
   - Disconnect the moonroof control unit/motor 14P connector.

7. Check for continuity between power window master switch 37P connector terminal No. 27 and front passenger's power windows switch 37P connector terminal No. 29.

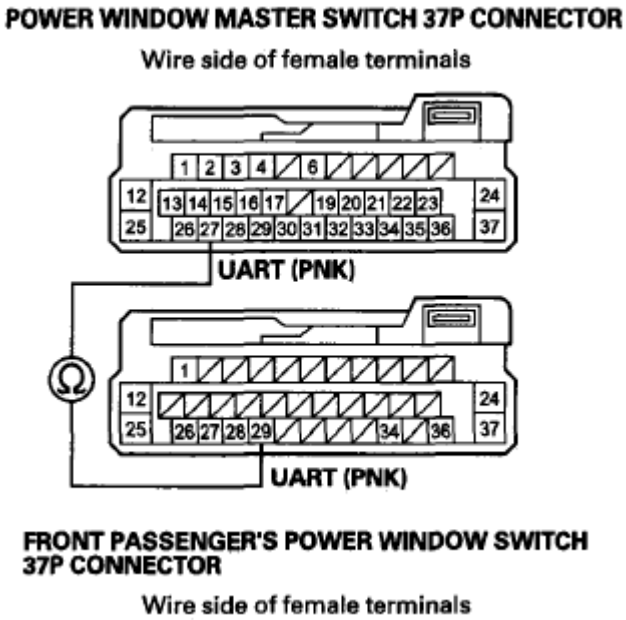

Fig. 9: Checking Continuity Between Power Window Master Switch 37P Connector And Front Passenger's Power Windows Switch 37P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 8.

NO - Repair an open or high resistance in the wire.

8. Check for continuity between power window master switch 37P connector terminal No. 27 and moonroof control unit 14P connector terminal No. 11.

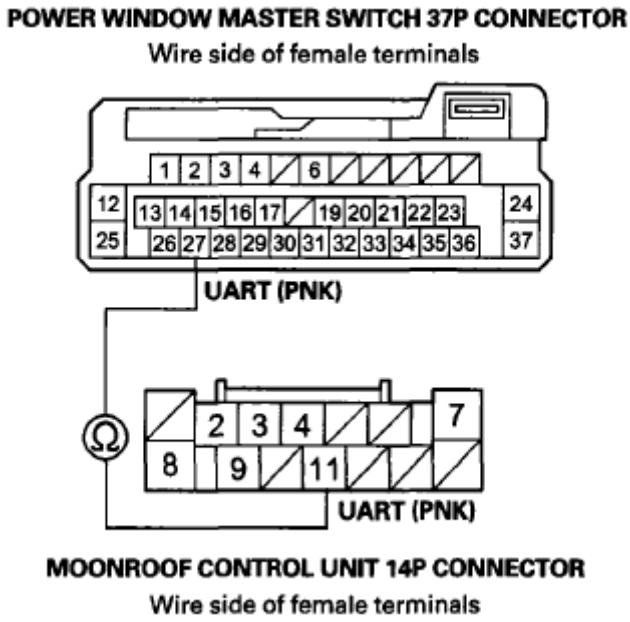

Fig. 10: Checking Continuity Between Power Window Master Switch 37P Connector And Moonroof Control Unit 14P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Repair an open or high resistance in the wire.

9. Check for continuity between power window master switch 37P connector terminal No. 27 and body ground.

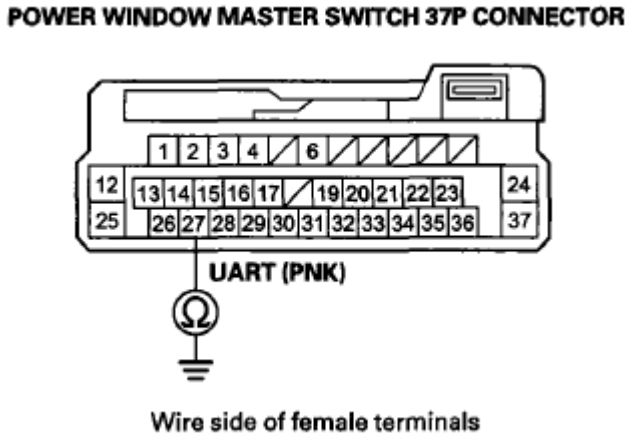

Fig. 11: Checking Continuity Between Power Window Master Switch 37P Connector Terminal No. 27 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 10.

10. Reconnect the power window master switch 37P connector.
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
12. Measure the voltage between power window master switch 37P connector terminal No. 27 and body ground.

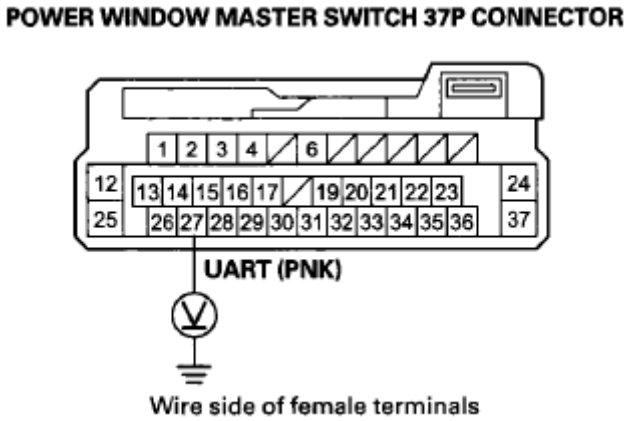

Fig. 12: Measuring Voltage Between Power Window Master Switch 37P Connector Terminal No. 27 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to the **FRONT PASSENGER'S POWER WINDOW SWITCH INPUT TEST**, and do the power and ground input tests (see **POWER WINDOW MASTER SWITCH INPUT TEST**). If the tests prove OK, substitute a known good front passenger's power window switch. If the DTC goes away, replace the original front passenger's power window switch (see **FRONT PASSENGER'S POWER WINDOW SWITCH REPLACEMENT**). If the DTC is still present, replace the power window master switch (see **POWER WINDOW MASTER SWITCH REPLACEMENT**).

NO - Repair a short to power in the wire.

DTC B1145: FRONT PASSENGER'S POWER WINDOW POSITION DETECT CIRCUIT MALFUNCTION

NOTE:

- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **Make sure you reset the power window control unit (see RESETTING THE POWER WINDOW CONTROL UNIT) whenever you replace or substitute**

any power window parts.

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Open and close the front passenger's power window by using the front passenger's switch manually.
4. Check for DTCs with the HDS.

   Is DTC B1130 or B1131 indicated?

   YES - Troubleshoot DTC B1130 or B1131 (see **DTC B1130: FRONT PASSENGER'S POWER WINDOW MOTOR A-PULSE MALFUNCTION; DTC B1131: FRONT PASSENGER'S POWER WINDOW MOTOR B-PULSE MALFUNCTION**).

   NO - Go to step 5.

5. Reset the power window control unit and the front passenger's power window control unit (see **RESETTING THE POWER WINDOW CONTROL UNIT**).
6. Check for DTCs again with the HDS.

   Is DTC B1145 indicated?

   YES - Go to step 7.

   NO - The system has recovered at this time.

7. Substitute a known-good passenger's power window switch.
8. Open and close the front passenger's power window by using the front passenger's switch manually.
9. Check for DTCs with the HDS.

   Is DTC B1145 indicated?

   YES - Faulty the front passenger's power window motor; replace the front passenger's door regulator (see **FRONT DOOR GLASS AND REGULATOR REPLACEMENT**).

   NO - Replace the front passenger's power window switch (see **FRONT PASSENGER'S POWER WINDOW SWITCH REPLACEMENT**).

DTC U0155: DOOR MULTIPLEX CONTROL UNIT LOST COMMUNICATION WITH GAUGE CONTROL MODULE

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U0155 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the door multiplex control unit and the gauge control module.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the gauge control module detected?

   YES - Go to step 9.

   NO - Go to step 6.

6. Measure the voltage between body ground and gauge control module 32P connector terminals No. 15 and No. 16 individually.

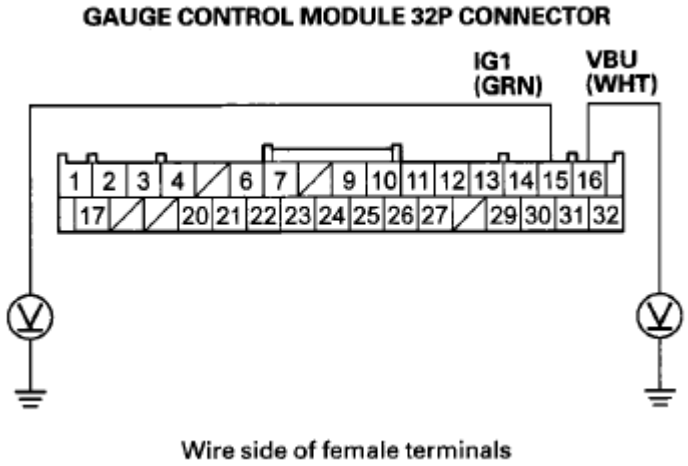

Fig. 13: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 15 And No. 16
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES - Go to step 8.

NO - Go to step 7.

7. Check the No. 15 (10 A) fuse in the under-hood fuse/relay box and the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Are the fuses OK?

   YES - Repair an open or high resistance in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

   NO - Replace the fuse(s). If the fuse blows again, repair a short to ground in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

8. Measure the voltage between body ground and gauge control module 32P connector terminals No. 1 and No. 17 individually.

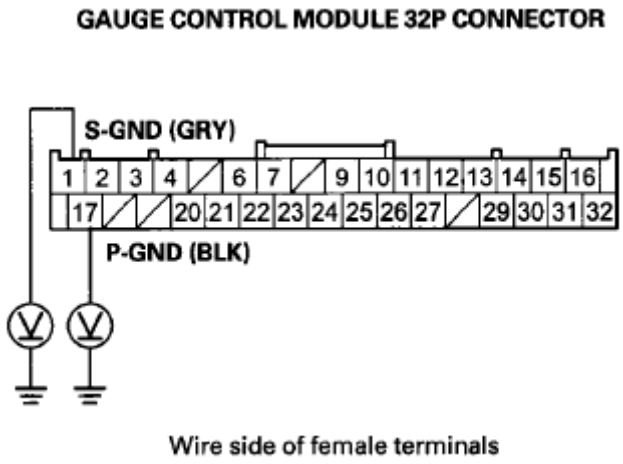

Fig. 14: Measuring Voltage Between Body Ground And Gauge Control Module 32P Connector Terminals No. 1 And No. 17
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there less than 0.2 V?

   YES - Go to step 9.

   NO - Repair an open or high resistance in the ground wire or poor ground (G401) and/or (G402).

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect the gauge control module 32P connector.
11. Disconnect the power window master switch 37P connector.
12. Check for continuity between gauge control module 32P connector terminals No. 29 and No. 30 and power window master switch 37P connector terminals No. 33 and No. 35 respectively.

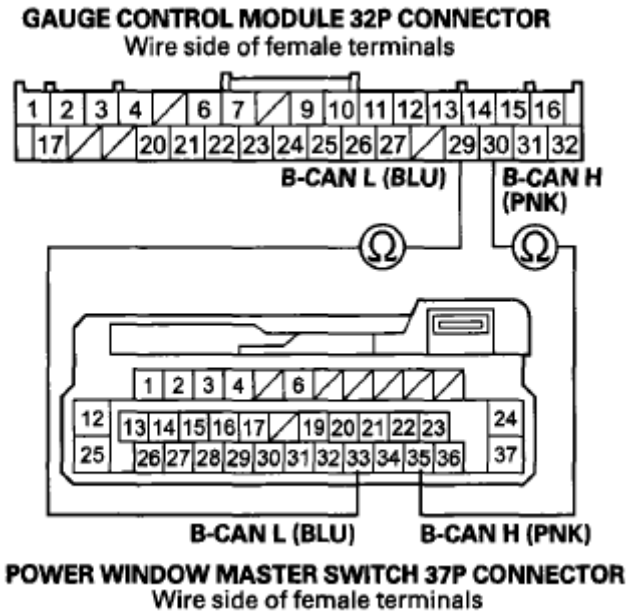

Fig. 15: Checking Continuity Between Gauge Control Module 32P Connector And Power Window Master Switch 37P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO - Repair an open or poor connection in the B-CAN wire between the door multiplex control unit and the gauge control module.

DTC U0164: DOOR MULTIPLEX CONTROL UNIT LOST COMMUNICATION WITH CLIMATE CONTROL UNIT

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U0155 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the door multiplex control unit and the climate control unit.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the climate control unit detected?

   YES - Go to step 9.

   NO - Go to step 6.

6. Measure the voltage between body ground and climate control unit connector A (32P) terminal No. 15.

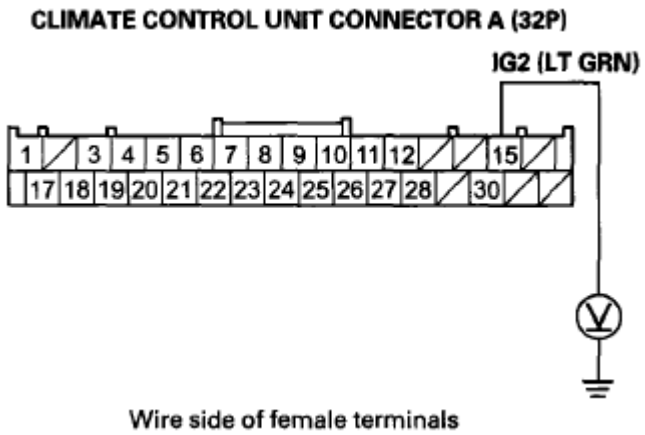

Fig. 16: Measuring Voltage Between Body Ground And Climate Control Unit Connector A (32P) Terminal No. 15
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES - Go to step 8.

   NO - Go to step 7.

7. Check the No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

   YES - Repair an open or high resistance in the No. 16 (7.5 A) fuse circuit.

   NO - Replace the fuse. If the fuse blows again, repair a short to ground in the No. 16(7.5 A) fuse circuit.

8. Measure the voltage between body ground and climate control unit connector A (32P) terminal No. 1.

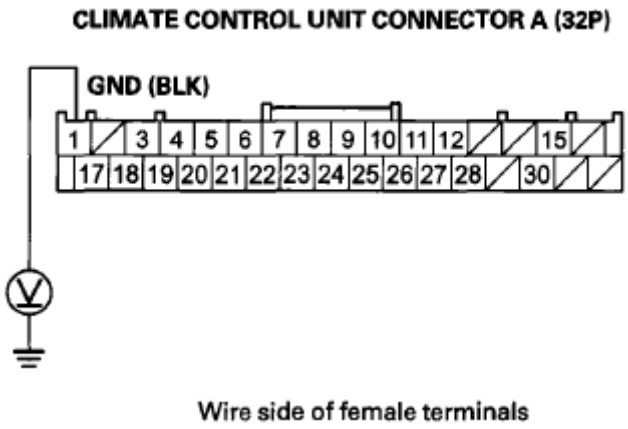

Fig. 17: Measuring Voltage Between Body Ground And Climate Control Unit Connector A (32P) Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 9.

NO - Repair an open or high resistance in the ground wire or poor ground (G403).

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect climate control unit connector A (32P).
11. Disconnect the power window master switch 37P connector.
12. Check for continuity between climate control unit connector A (32P) terminals No. 7 and No. 8 and power window master switch 37P connector terminals No. 33 and No. 35 respectively.

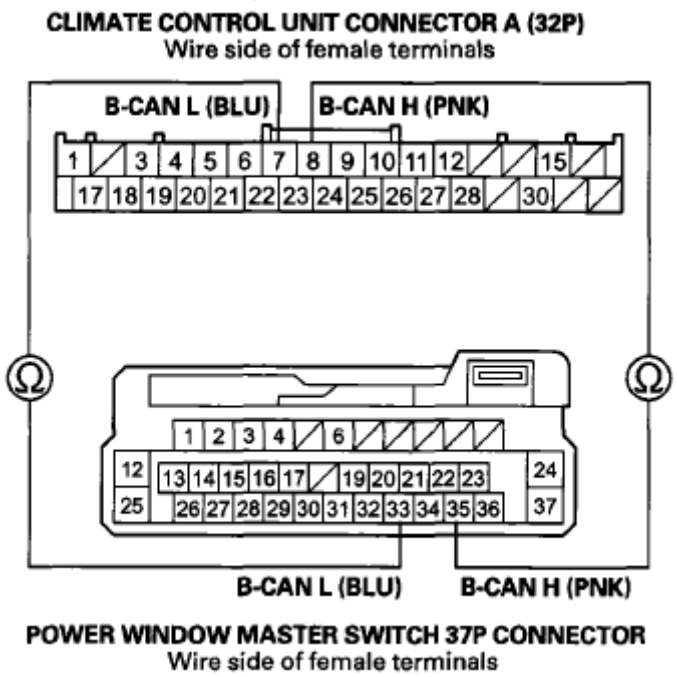

Fig. 18: Checking Continuity Between Climate Control Unit Connector A (32P) And Power Window Master Switch 37P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the climate control unit (see **EVAPORATOR TEMPERATURE SENSOR REPLACEMENT**).

NO - Repair an open or poor connection in the B-CAN wire between the door multiplex control unit and the climate control unit.

DTC U1282: DOOR MULTIPLEX CONTROL UNIT LOST COMMUNICATION WITH DRIVER'S MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC U1282 indicated?

YES - Replace the power window master switch (see **POWER WINDOW MASTER SWITCH REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the door multiplex control unit and the driver's MICU.

DTC U1283: DOOR MULTIPLEX CONTROL UNIT LOST COMMUNICATION WITH PASSENGER'S MICU

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for at least 6 seconds.
4. Check for DTCs with the HDS.

   Is DTC U0155 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the door multiplex control unit and the passenger's MICU.

5. From the BODY ELECTRICAL SYSTEM SELECT menu, select B-CAN CONTROL UNITS INFORMATION, and then select CHECK CONNECTED CONTROL UNITS.

   Is the passenger's MICU detected?

   YES - Go to step 9.

   NO - Go to step 6.

6. Measure the voltage between body ground and passenger's under-dash fuse/relay box connector A (38P) terminals No. 14 and No. 35 individually.

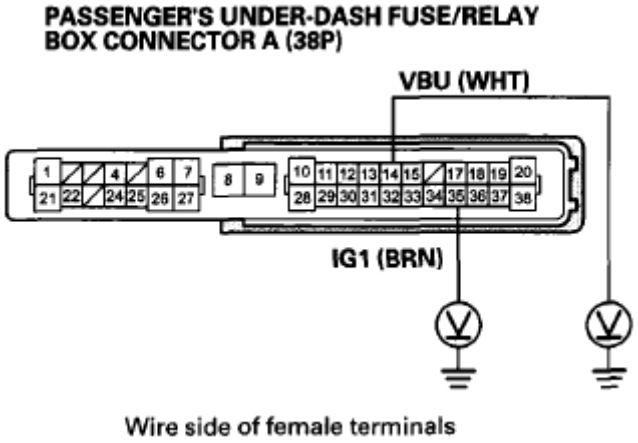

Fig. 19: Measuring Voltage Between Body Ground And Passenger's Under-Dash Fuse/Relay Box Connector A (38P) Terminals No. 14 And No. 35
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 8.

NO - Go to step 7.

7. Check the No. 15 (10 A) fuse in the under-hood fuse/relay box and the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Are the fuses OK?

   YES - Repair an open or high resistance in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

   NO - Replace the fuse(s). If the fuse blows again, repair a short to ground in the No. 15 (10 A) and/or No. 12 (7.5 A) fuse circuit.

8. Measure the voltage between body ground and passenger's under-dash fuse/relay box connector A (38P) and E (18P) terminals as shown.

Passenger's under-dash fuse/relay box connector	
A36	Body ground
A37	
E15	

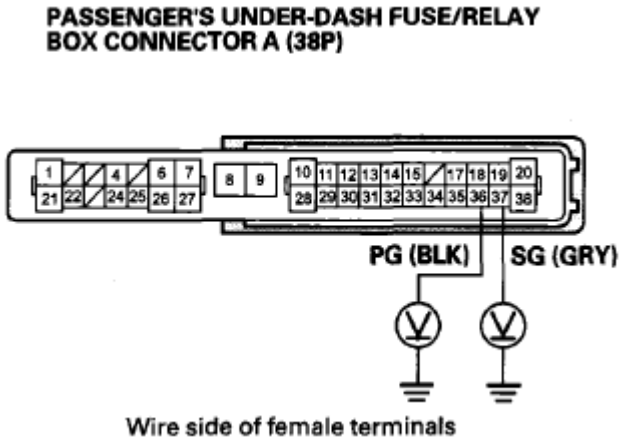

Fig. 20: Measuring Voltage Between Body Ground And Passenger's Under-Dash Fuse/Relay Box Connector A (38P) And E (18P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

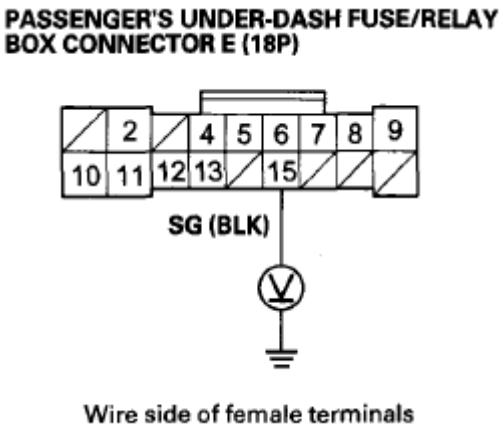

Fig. 21: Measuring Voltage Between Body Ground Passenger's Under-Dash Fuse/Relay Box Connector E (18P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES - Go to step 9.

NO - Repair an open or high resistance in the ground wire or poor ground (G203), (G401), and/or (G405).

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect passenger's under-dash fuse/relay box connector A (38P).
11. Disconnect the power window master switch 37P connector.
12. Check for continuity between passenger's under-dash fuse/relay box connector A (38P) terminals No. 11 and No. 29 and power window master switch 37P connector terminals No. 35 and No. 33 respectively.

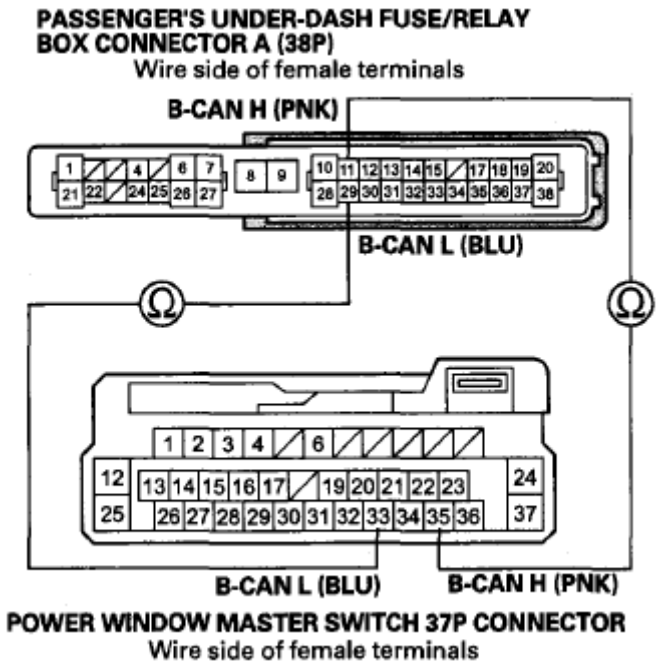

Fig. 22: Checking Continuity Between Passenger's Under-Dash Fuse/Relay Box Connector A (38P) And Power Window Master Switch 37P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the power window master switch (see **POWER WINDOW MASTER SWITCH REPLACEMENT**).

NO - Repair an open or poor connection in the B-CAN wire between the door multiplex control unit and the passenger's MICU.

POWER WINDOW MASTER SWITCH INPUT TEST

NOTE: Before testing, troubleshoot the multiplex integrated control unit first, using B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Open and close the driver's door, then remove the driver's door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
3. Disconnect the power window master switch 37P connector (A) from the power window master switch (B).

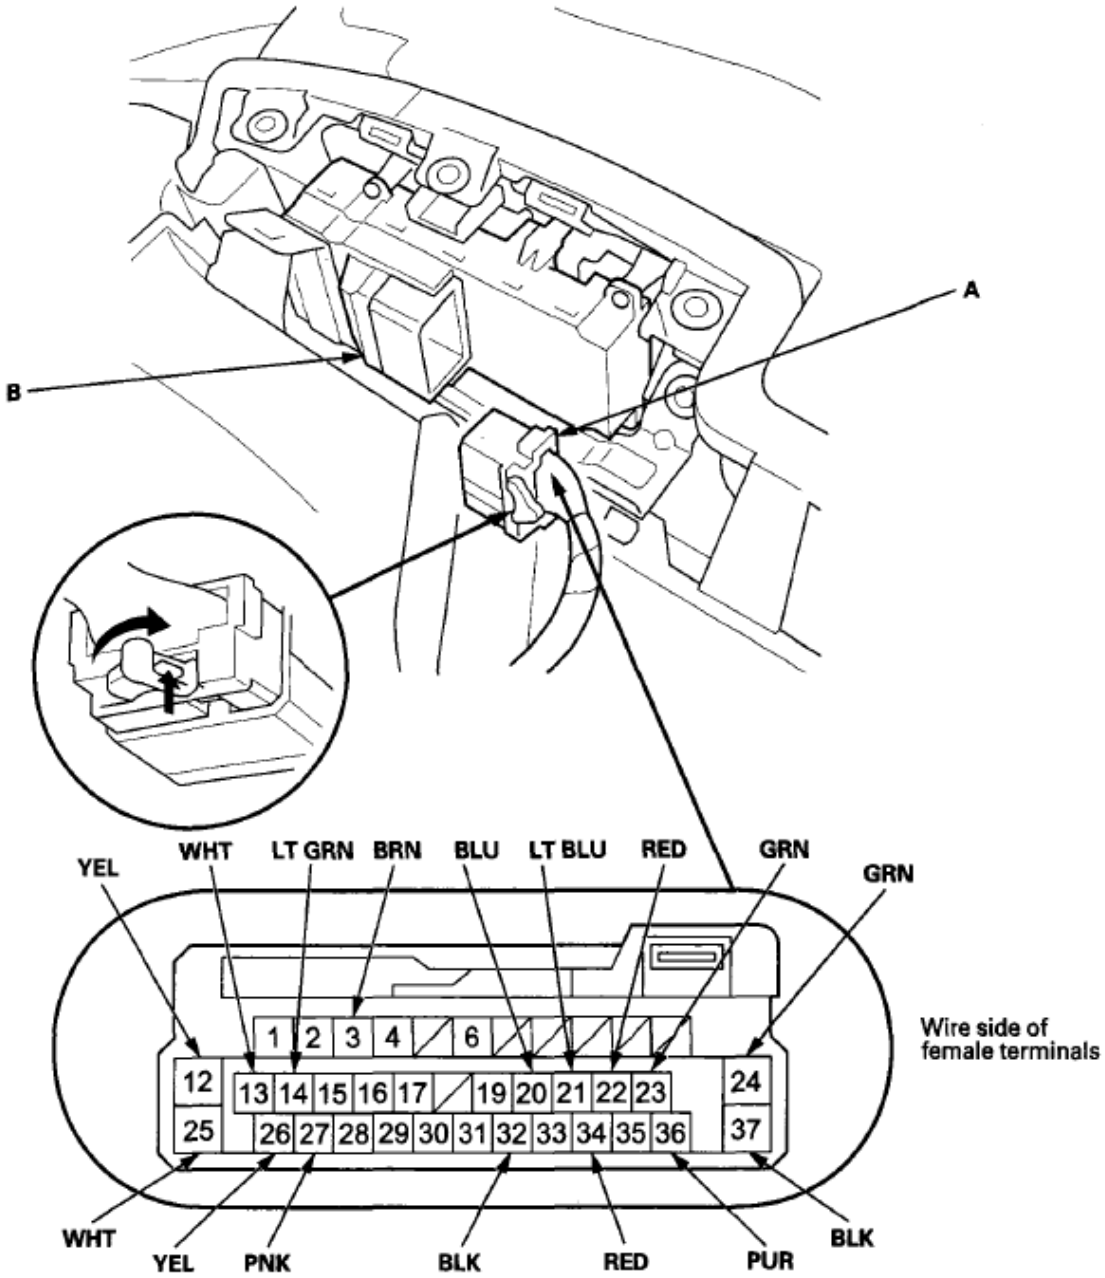

Fig. 23: Disconnecting Power Window Master Switch 37P Connector From Power Window Master Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.
5. Reconnect the driver's door harness to driver's door subharness.
6. With the power window master switch 37P connector still disconnected from the power window master switch, do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 7.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
12	YEL	Turn the ignition switch ON (II), or power mode ON connect terminals No. 25 and No. 24 (or No. 12), and terminals No. 12 (or No. 24) and No. 37 with jumper wires.	Check driver's power window motor operation: The driver's power window should open (or close).	• Faulty driver's power window motor • An open or high resistance in the wire
24	GRN			
23	GRN	Turn the ignition switch ON (II), or power mode ON connect terminals No. 25 and No. 36 (or No. 23).	Check left rear power window motor operation: The left rear power window should open (or close).	• Faulty left rear power window switch • Faulty left rear power window motor • Poor ground (G601)or an open in the ground wire • An open or high resistance in the wire
36	PUR			
21	LT BLU	Turn the ignition switch ON (II), or power mode ON connect terminals No. 25 and No. 34 (or No. 21).	Check right rear power window motor operation: The right rear power window should open (or close).	• Faulty passenger's under-dash fuse/relay box • Faulty right rear power window switch • Faulty right rear power window motor • Poor ground (G651) or an open in the ground wire • An open or high resistance in the wire
34	RED			
				• Blown No. 24

				(20 A) fuse in the driver's under-dash fuse/relay box • Faulty LED • Faulty left or right rear power window switch • Poor ground (G601 or G651) or an open in the ground wire • A short to ground in the wire • An open or high resistance in the wire
26	YEL	Turn the ignition switch ON (II), or power mode ON connect terminals No. 25 and No. 26 with a jumper wire.	Check left and right rear power window switch lights: The left and right rear power window switch lights should come on.	
27	PNK	Disconnect the front passenger's power window switch 37P connector and moonroof control unit/motor 14P connector	Check for continuity between power window master switch terminal No. 27 and front passenger's power window switch 37P connector terminal No. 29: There should be continuity. Check for continuity to ground: There should be no continuity.	An open in the UART wire A short to ground in the wire

7. Reconnect the connector to the power window master switch, turn the ignition switch, or press the engine start/stop button to select the ON mode, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the door multiplex control unit is faulty; replace the power window master switch (see **POWER WINDOW MASTER SWITCH REPLACEMENT**).

NOTE: After replacing the power window master switch, reset the power window control unit (see RESETTING THE POWER WINDOW CONTROL UNIT).

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
				• Blown No. 15 (10 A) fuse in the under-hood

				fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
13	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	
14	LT GRN	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
25	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 24 (20 A) fuse in the driver's under-dash fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
32	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
37	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G402) • An open or high resistance in the ground wire
3	BRN	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be at least about 10 V.	• Faulty power window master switch • A short to ground

				in the wire
20	BLU	Ignition switch ON (II), or power mode ON and driver's power window moving up or down	Measure the voltage between terminals No. 20 and No. 37: An analog meter should alternate between 0 V and about 5 V (a digital voltmeter should read about 2.5 V while the window moves).	• Faulty power window master switch • Faulty driver's power window motor • An open or high resistance in the wire • A short to ground in the wire
22	RED	Ignition switch ON (II), or power ON and driver's power window moving up or down	Measure the voltage between the terminals No. 22 and No. 37: An analog meter should alternate between 0 V and about 5 V (a digital voltmeter should read about 2.5 V while the window moves).	• Faulty power window master switch • Faulty driver's power window motor • An open or high resistance in the wire • A short to ground in the wire

FRONT PASSENGER'S POWER WINDOW SWITCH INPUT TEST

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Open and close the driver's door, then remove the front passenger's door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
3. Disconnect the front passenger's power window switch 37P connector (A) from the front passenger's power window switch (B).

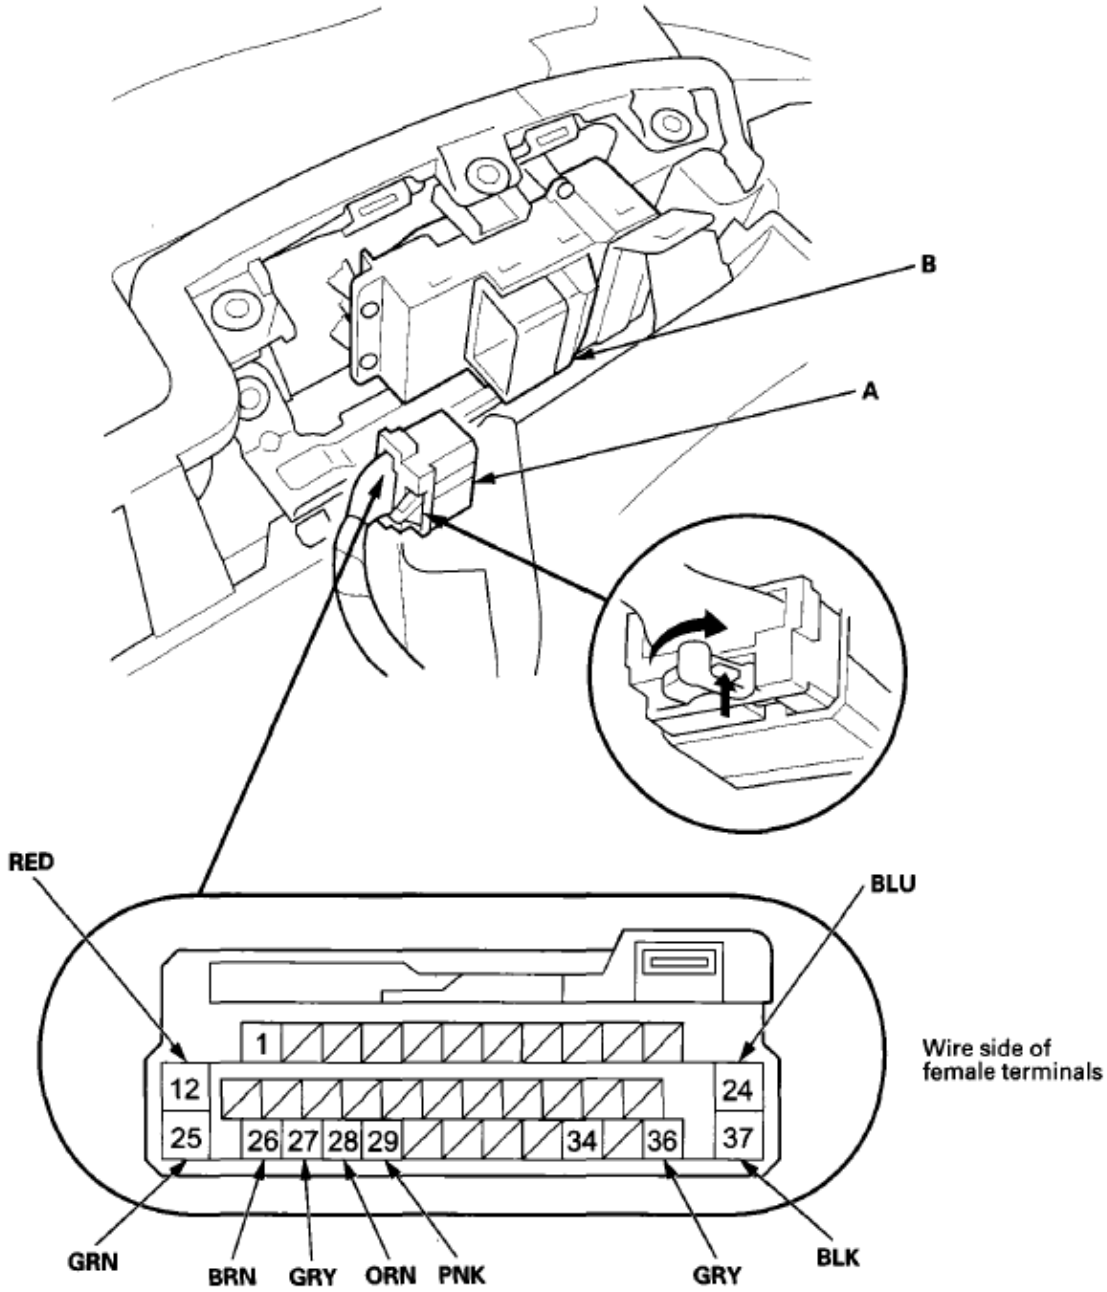

Fig. 24: Disconnecting Front Passenger's Power Window Switch 37P Connector From Front Passenger's Power Window Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.
5. With the connector still disconnected, do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.

- If all the input tests prove OK, go to step 6.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
12	RED	Under all conditions, connect terminals No. 25 and No. 24 (or No. 12), and terminals No. 12 (or No. 24) and No. 37 with jumper wires.	Check front passenger's power window motor operation: The front passenger's power window should open (or close).	• Faulty front passenger's power window motor • An open or high resistance in the wire
24	BLU			
25	GRN	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 13 (20 A) fuse in the passenger's under-dash fuse/relay box • Faulty driver's under-dash fuse/relay box • Faulty passenger's under-dash fuse/relay box • An open or high resistance in the wire
29	PNK	Under all conditions, disconnect the power window master switch 37P connector.	Check for continuity between front passenger's power window switch 37P connector terminal No. 29 and power window master switch 37P connector terminal No. 27: There should be continuity.	An open in the UART wire
36	GRY	Under all conditions, disconnect the front passenger's power window motor 6P connector.	Check for continuity to ground: There should be continuity. Check for continuity between front passenger's power window switch 37P connector terminal No. 36 and front passenger's power window motor 6P connector terminal No. 2: There should be continuity.	• Poor ground (G401) • An open or high resistance in the ground wire An open or high resistance in the ground wire

6. Reconnect the connector to the front passenger's power window switch, turn the ignition to ON(II), or press the engine start/stop button to select the ON mode, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, replace the front passenger's power window switch (see **FRONT PASSENGER'S POWER WINDOW SWITCH REPLACEMENT**).

NOTE: After replacing the front passenger's window switch, reset the power window control unit (see RESETTING THE POWER WINDOW CONTROL UNIT).

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
37	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G405) • An open or high resistance in the ground wire
26	BRN	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be at least about 10 V.	• Faulty front passenger's power window switch • A short to ground in the wire
27	GRY	Ignition switch ON (II), or power mode ON, and front passenger's power window switch moving up or down	Measure the voltage between terminals No. 27 and No. 37: An analog meter should alternate between 0 V and about 5 V (a digital voltmeter should read about 2.5 V while the window moves).	• Faulty front passenger's power window switch • Faulty front passenger's power window motor • An open or high resistance in the wire • A short to ground in the wire
				• Faulty front passenger's power window switch

28	ORN	Ignition switch ON (II), or power mode ON, and front passenger's power window switch moving up or down	Measure the voltage between terminals No. 28 and No. 37: An analog meter should alternate between 0 V and about 5 V (a digital voltmeter should read about 2.5 V while the window moves).	• Faulty front passenger's power window motor • An open or high resistance in the wire • A short to ground in the wire

DRIVER'S POWER WINDOW MOTOR TEST

Motor Test

1. Remove the driver's door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**), and disconnect the driver's door wire harness connectors (A) from the driver's door subharness.

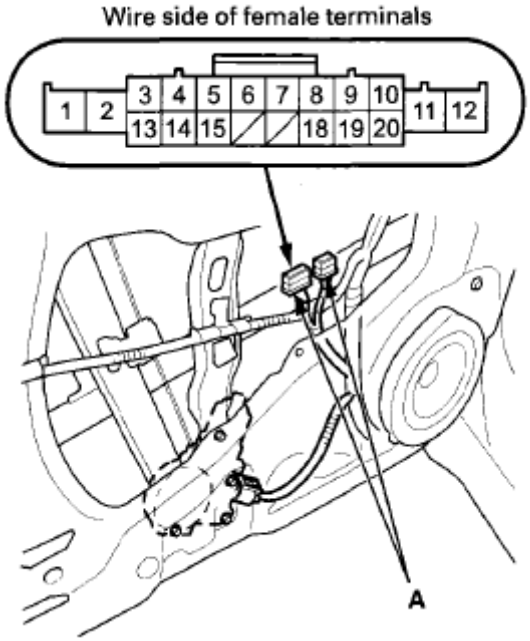

Fig. 25: Identifying Driver's Door Wire Harness Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. At the driver's door wire harness 20P connector, test the power window motor in each direction by connecting battery power and ground according to the table. When the motor stops running, disconnect one lead immediately.

Direction \ Terminal	2	12
UP	⊖	⊕
DOWN	⊕	⊖

Fig. 26: View Of Power Window Motor Condition
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the motor does not run or fails to run smoothly, go to step 4, if the motor runs smoothly, go to step 7.
4. Disconnect the 6P connector (A) from the driver's power window motor (B).

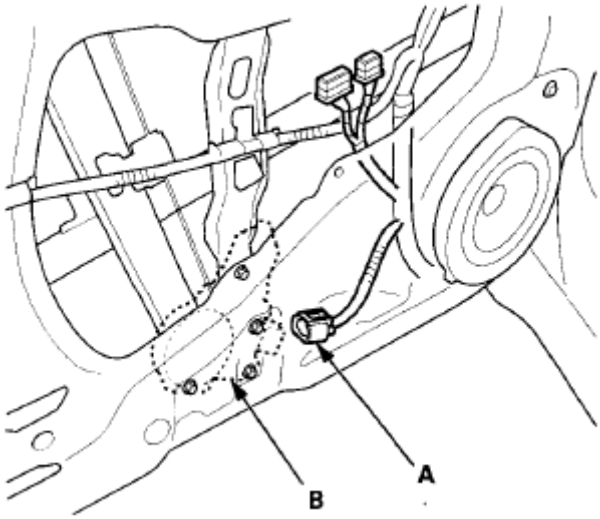

Fig. 27: Identifying 6P Connector And Driver's power Window Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Check for continuity between driver's door harness 28P connector terminals No. 2 and No. 12, and driver's power window motor 6P connector terminals No. 1 and No. 4 respectively. There should be continuity.

DRIVERS DOOR HARNESS 20P CONNECTOR

Terminal No. 1

Terminal No. 4

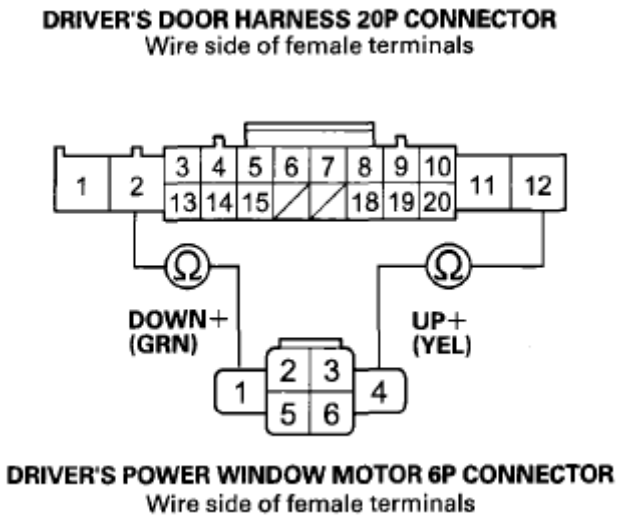

Fig. 28: Checking Continuity Between Driver's Door Harness 28P Connector Terminals And Driver's Power Window Motor 6P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If there is no continuity, repair an open or high resistance in the wires. If the wire harness is OK, the driver's power window motor is faulty; replace the driver's door regulator (see **FRONT DOOR GLASS AND REGULATOR REPLACEMENT**).

Pulser Test

7. Check for continuity between driver's power window motor 6P connector terminal No. 2 and body ground. There should be continuity.
   - If there is continuity, go to step 8.
   - If there is no continuity, check for an open in the BLK and/or GRY wire or poor ground (G401).

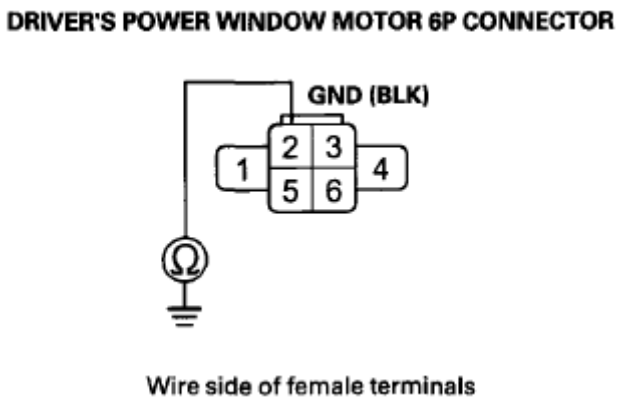

Fig. 29: Checking Open In BLK And/Or GRY Wire Or Poor Ground (Pulser Test)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Do the power window master switch input test terminals No. 3, No. 20, and No. 22 (see **POWER WINDOW MASTER SWITCH INPUT TEST**).

FRONT PASSENGER'S POWER WINDOW MOTOR TEST

Motor Test

1. Remove the front passenger's door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
2. Test the front passenger's power window motor in each direction by connecting battery power and ground to the front passenger's power window switch 37P connector (A) according to the table.

Direction \ Terminal	12	24
UP	⊕	⊖
DOWN	⊖	⊕

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If there is no continuity, repair an open in the wires. If the wire harness is OK, the front passenger's power window motor is faulty; replace the front passenger's door regulator (see **FRONT DOOR GLASS AND REGULATOR REPLACEMENT**).

Hall IC Unit (Pulser) Test

7. Check for continuity between front passenger's power window motor 6P connector terminal No. 2 and body ground. There should be continuity.
   - If there is continuity, go to step 8.
   - If there is no continuity, check for an open in the GRY wire or poor ground (G401).

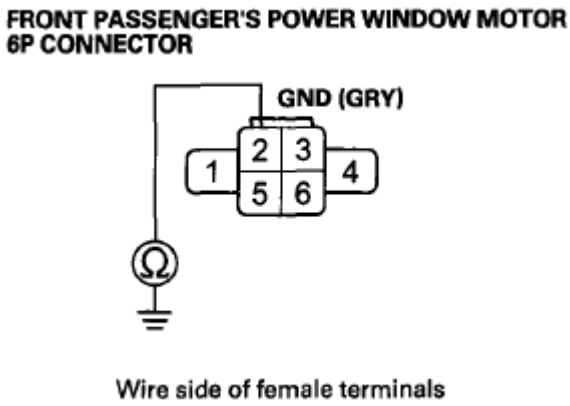

Fig. 33: Checking Continuity Between Front Passenger's Power Window Motor 6P

Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Do the front passenger's power window switch input test terminals No. 26, No. 27, and No. 28 (see **FRONT PASSENGER'S POWER WINDOW SWITCH INPUT TEST**).

REAR POWER WINDOW MOTOR TEST

1. Remove the rear door panel (see **REAR DOOR PANEL REMOVAL/INSTALLATION**).
2. Test the rear power window motor in each direction by connecting battery power and ground to the rear power window switch 14P connector (A) according to the table.

Direction \ Terminal	1	7
UP	⊖	⊕
DOWN	⊕	⊖

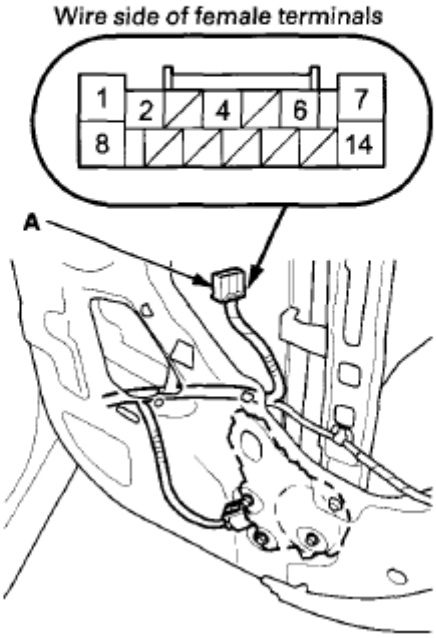

Fig. 34: Identifying Rear Power Window Switch 14P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the motor does not run or fails to run smoothly, go to step 4.
4. Disconnect the 2P connector (A) from the rear power window motor (B).

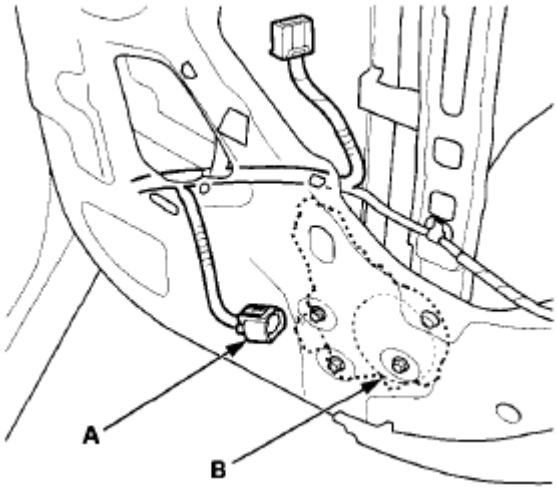

Fig. 35: Identifying 2P Connector And Rear Power Window Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Check for continuity between rear power window switch 14P connector terminals No. 1 and No. 7, and rear power window motor 2P connector terminals No. 1 and No. 2 respectively. There should be continuity.

REAR POWER WINDOW SWITCH 14P CONNECTOR

Terminal No. 1

Terminal No. 7

REAR POWER WINDOW MOTOR 2P CONNECTOR

Terminal No. 1

Terminal No. 2

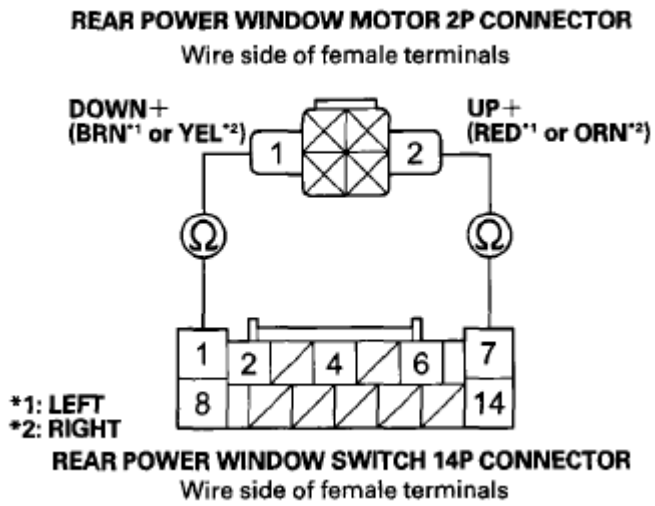

Fig. 36: Checking Continuity Between Rear Power Window Switch 14P Connector Terminals And Motor 2P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If there is no continuity, repair an open or high resistance in the wires. If the wire harness is OK, the rear power window motor is faulty; replace the rear door regulator (see **REAR DOOR GLASS AND REGULATOR REPLACEMENT**).

REAR POWER WINDOW SWITCH TEST

1. Remove the rear door panel (see **REAR DOOR PANEL REMOVAL/INSTALLATION**), and disconnect the 14P connector from the switch.
2. Check for continuity between the terminal in each position according to the table.
   - When the power is connected to terminal No. 2 and ground is connected to terminal No. 14. There should be continuity between terminals No. 8 and No. 7 [No. 1].
   - When the power is connected to terminal No. 6 and ground is connected to terminal No. 14. There should be continuity between terminals No. 8 and No. 1 [No. 7].
   - When the power is connected to terminal No. 8 and ground is connected to terminal No. 14, then push the rear power window switch to DOWN. There should be continuity between terminals No. 8 and No. 1.
   - When the power is connected to terminal No. 8 and ground is connected to terminal No. 14, then pull the rear power window switch to UP. There should be continuity between terminals No. 8 and No. 7.

   []: Right rear power window switch

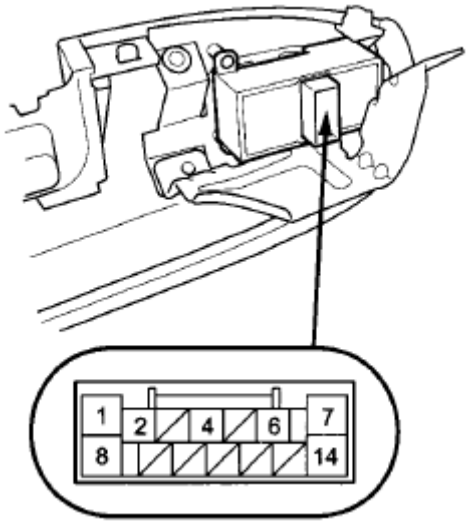

Fig. 37: Identifying Right Rear Power Window Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If continuity is not as specified, replace the switch (see **FRONT PASSENGER'S POWER WINDOW SWITCH REPLACEMENT**).

POWER WINDOW MASTER SWITCH REPLACEMENT

1. Remove the driver's door armrest (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
2. Remove the two screws (A), then remove the bracket (B) from the armrest assembly (C).

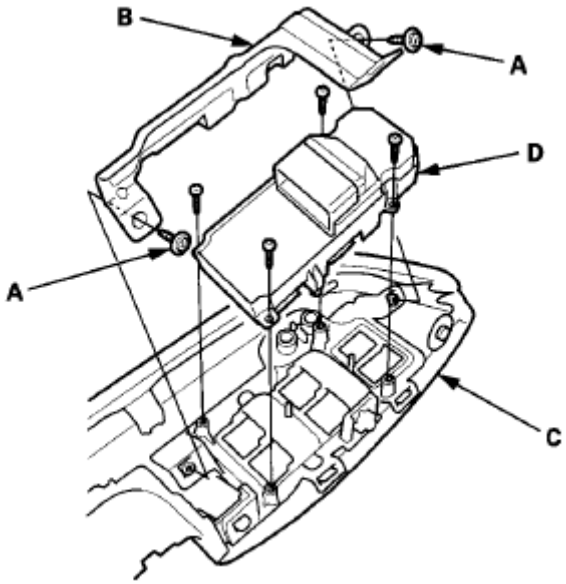

Fig. 38: Identifying Armrest Assembly, Bracket, Screws And Power Window Master Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the four screws and the power window master switch (D).
4. Install the switch in the reverse order of removal.
5. Resetting the power window control unit (see **RESETTING THE POWER WINDOW CONTROL UNIT**).

FRONT PASSENGER'S POWER WINDOW SWITCH REPLACEMENT

1. Remove the passenger's door armrest (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
2. Remove the two screws (A), then remove the bracket (B) from the armrest assembly (C).

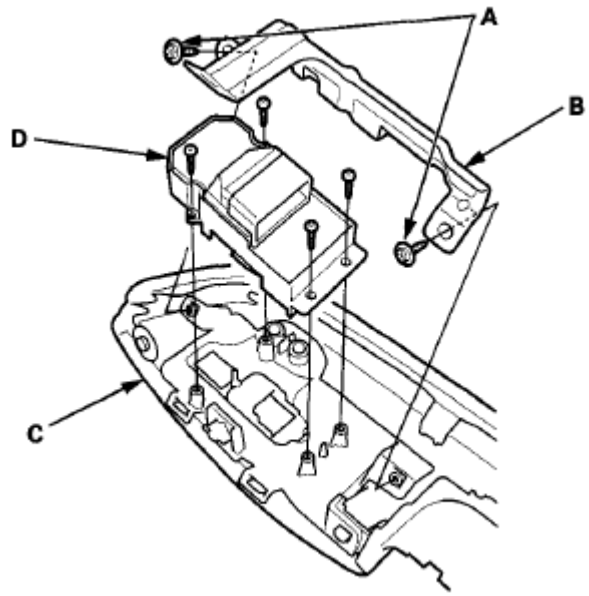

Fig. 39: Identifying Armrest Assembly, Bracket, Screws And Power Window Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the four screws and the front passenger's power window switch (D).
4. Install the switch in the reverse order or removal.
5. Resetting the power window control unit (see **RESETTING THE POWER WINDOW CONTROL UNIT**).

REAR POWER WINDOW SWITCH REPLACEMENT

1. Remove the rear door armrest (see **REAR DOOR PANEL REMOVAL/INSTALLATION**).
2. Remove the three screws and rear power window switch (A) from the armrest assembly (B).

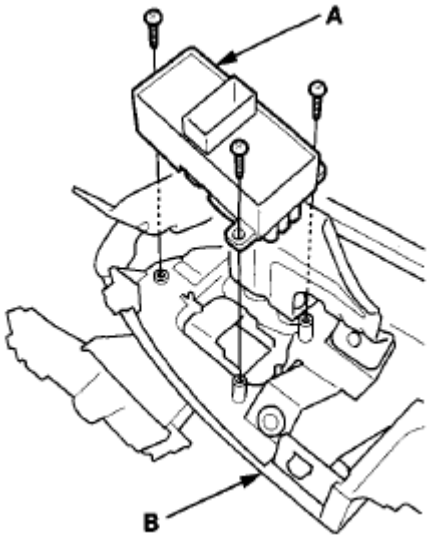

Fig. 40: Identifying Rear Power Window Switch And Armrest Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the switch in the reverse order of removal.

2012 ACCESSORIES & EQUIPMENT

Rear Window Defogger - TL

COMPONENT LOCATION INDEX

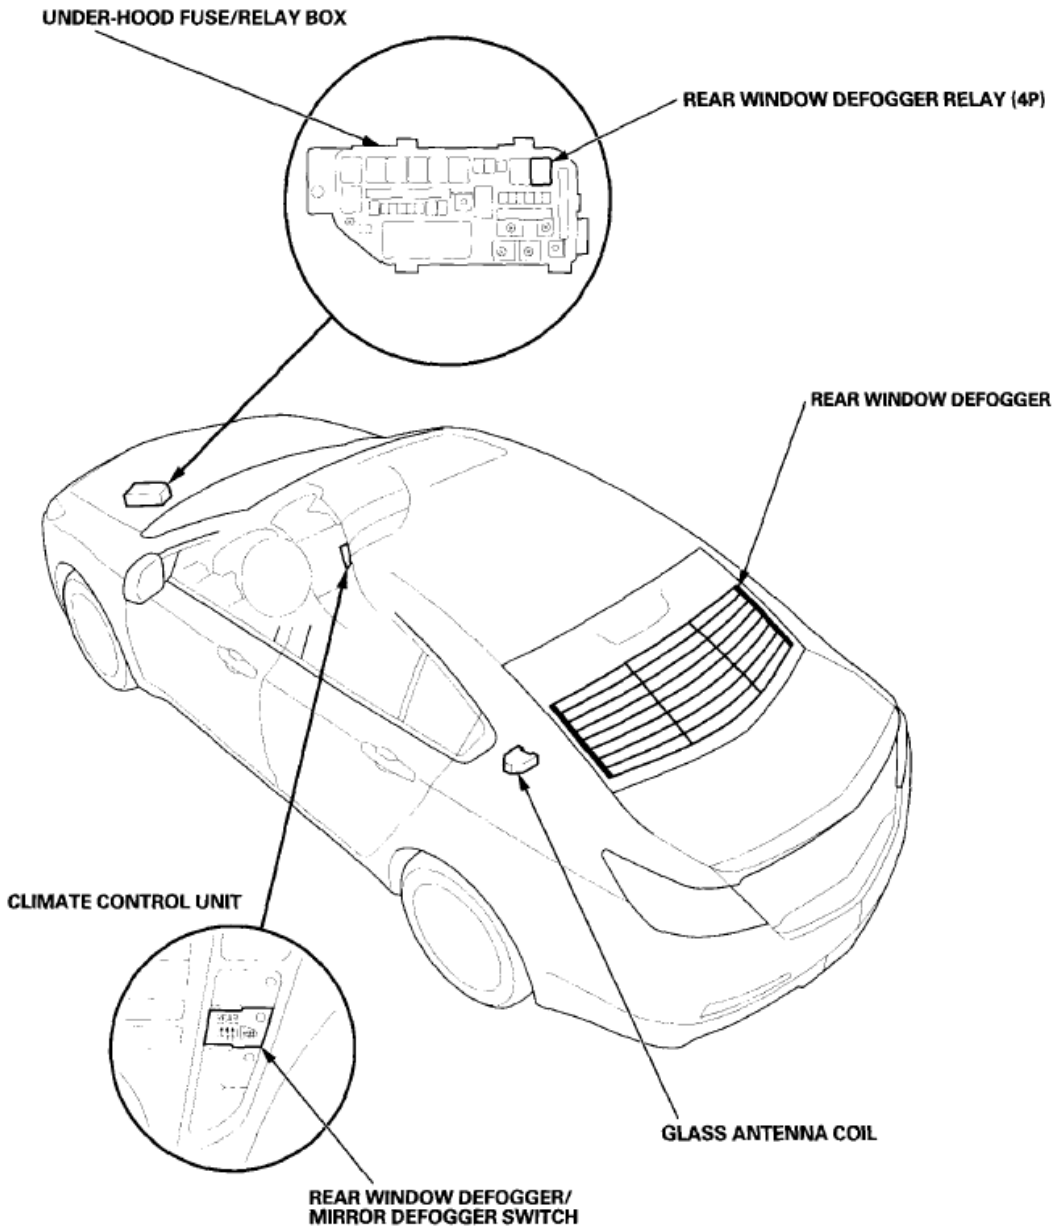

Fig. 1: Rear Window Defogger Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CIRCUIT DIAGRAM

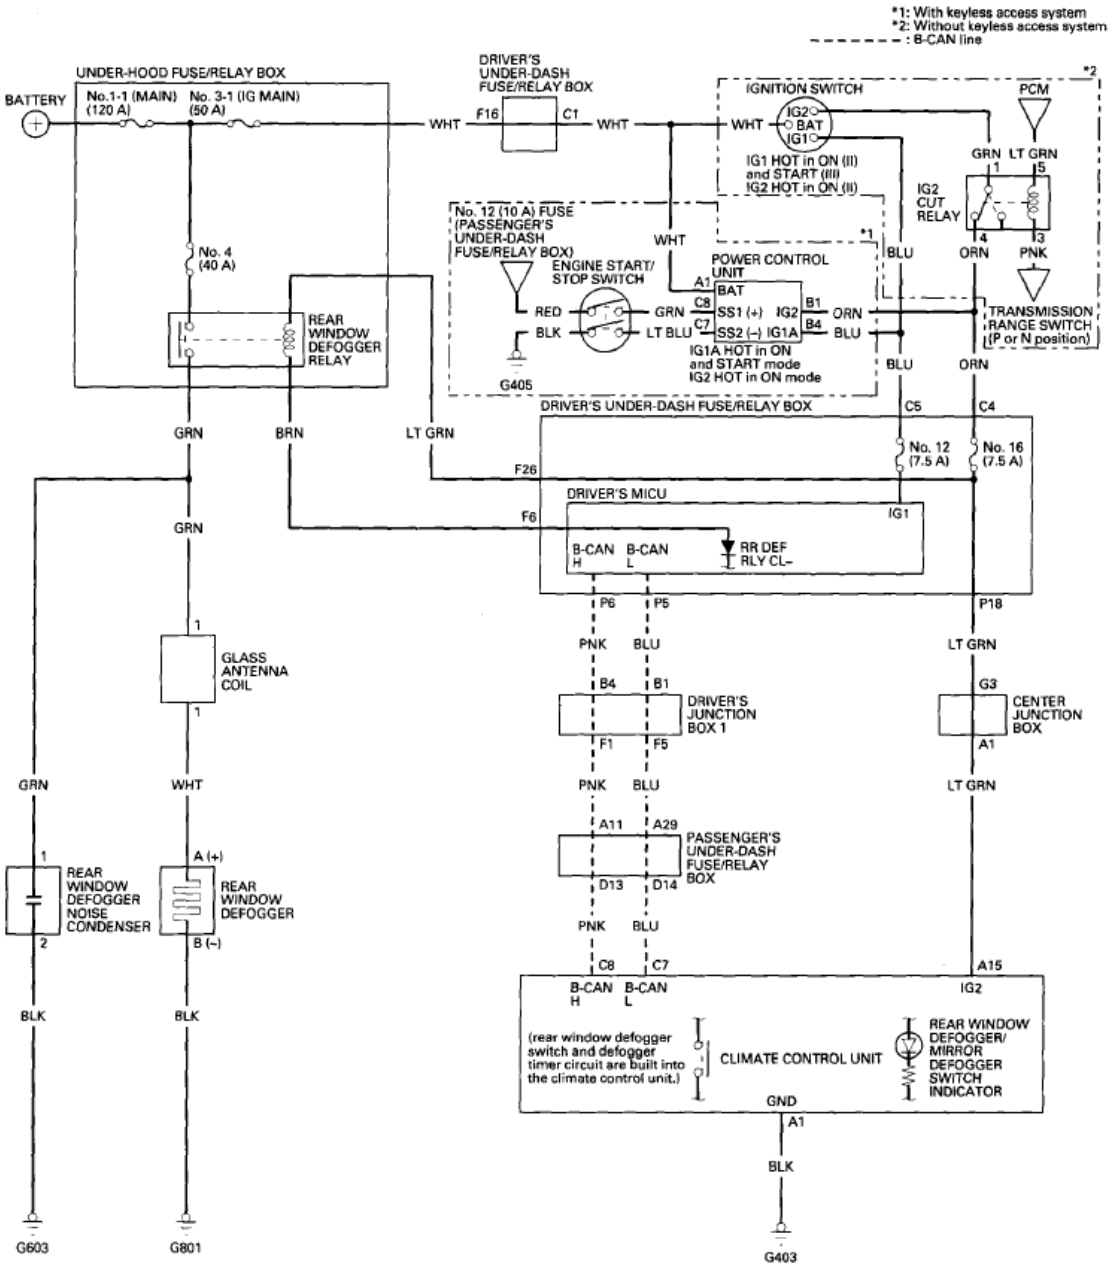

Fig. 2: Rear Window Defogger - Circuit Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

FUNCTION TEST

NOTE:

- **Before testing, make sure the No. 4 (40 A) fuse in the under-hood fuse/relay box and the No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box are OK.**
- **Aftermarket window tinting should be removed before testing.**
- **When testing the defogger, hold a cup of hot steaming water near the**

glass. The steam can help diagnose a broken or under-performing defogger grid.

- **Be careful not to scratch or damage the defogger wires with the tester probe.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then turn the rear window defogger switch ON.
2. Measure the voltage between rear window defogger A (1P) positive terminal and body ground. There should be battery voltage.
   - If there is no voltage, check for:
     - Faulty rear window defogger relay.
     - Faulty climate control switch.
     - Faulty gauge antenna coil.
     - An open or high resistance in the GRN or WHT wire to the positive terminal.
   - If there is battery voltage, go to step 3.

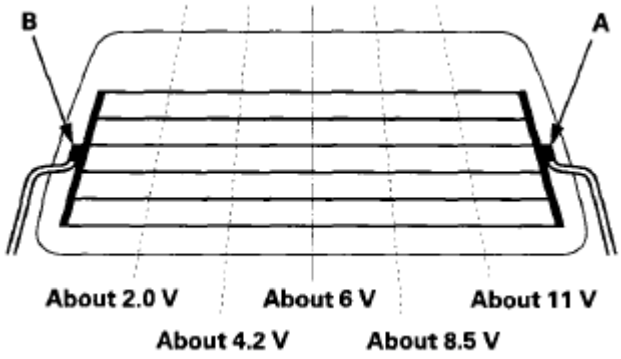

Fig. 3: Identifying Rear Window Defogger A (1P) Positive Terminal And Rear Window Defogger B (1P) Negative Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the voltage between rear window defogger B (1P) negative terminal and body ground. There should be less than 0.2 V.

   If there is greater than 0.2 V, check for an open in the ground (BLK) wire or poor ground (G801). If there is 0.2 V or less, go to step 4.

4. To avoid damaging the defogger grid, wrap a single strand of bare copper wire or aluminum foil around the voltmeter probe. Use the foil or wire as a contact brush when moving across the defogger grid.

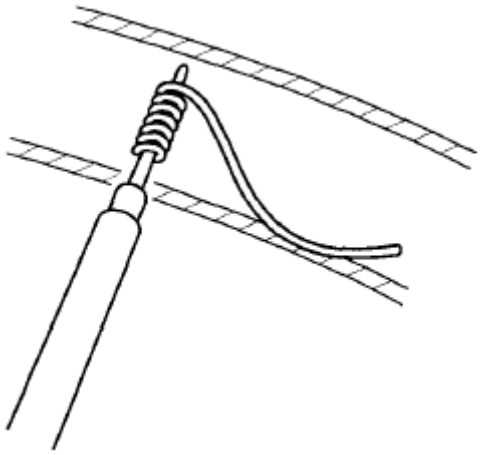

Fig. 4: Wrapping Single Strand Of Bare Copper Wire Or Aluminum Foil Around Voltmeter Probe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Touch the voltmeter positive probe along each defogger wire, and the negative probe to the negative terminal.

NOTE: Touch the copper wire or aluminum foil wrapped around the probe, not the probe, to avoid damaging the defogger wires.

- If the voltage is as specified, the defogger wire up to that point is OK.
- If the voltage is not as specified, repair the defogger wire.

- If voltage is more than specified at one of the points, there is a break or high resistance toward the negative half of the wire.
- If voltage is less than specified at one of the points, there is a break or high resistance toward the positive half of the wire.

DEFOGGER WIRE REPAIR

NOTE: To make an effective repair, the broken section must be no longer than 25 mm (1.0 in).

1. Lightly rub the area around the broken section (A) with fine steel wool, then clean it with isopropyl alcohol.

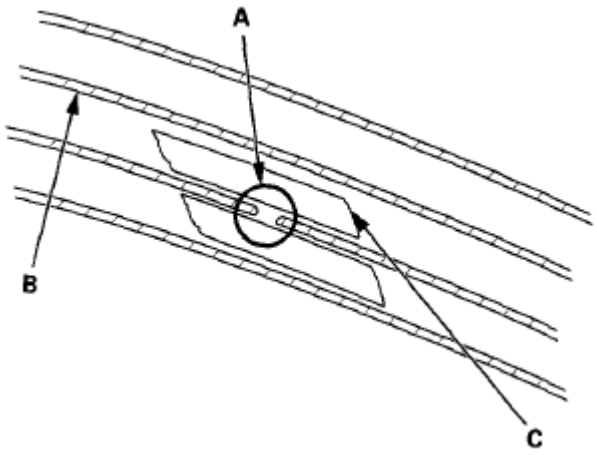

Fig. 5: Identifying Broken Section, Cellphone Tape And Defogger Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Carefully mask above and below the broken portion of the defogger wire (B) with cellophane tape (C).
3. Using a small brush, apply a heavy coat of silver conductive paint (commercially available) (A) extending about 1/8" on both sides of the break. Allow 25 minutes to dry.

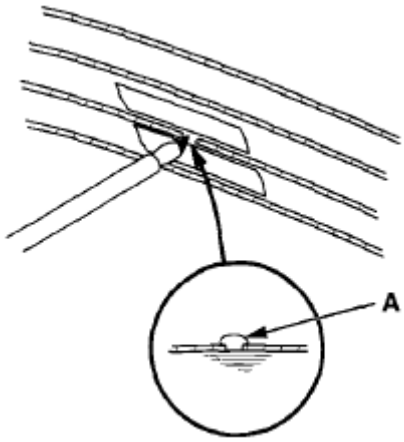

Fig. 6: Identifying Silver Conductive Paint
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Do the function test to confirm that the wire is repaired.
5. Apply a second coat of paint in the same way. Let it dry 3 hours before removing the tape.

GLASS ANTENNA COIL REPLACEMENT

1. Remove the rear shelf (see **TRIM REMOVAL/INSTALLATION - REAR SHELF AREA**).
2. Disconnect the 1P connectors (A) from the glass antenna coil (B).

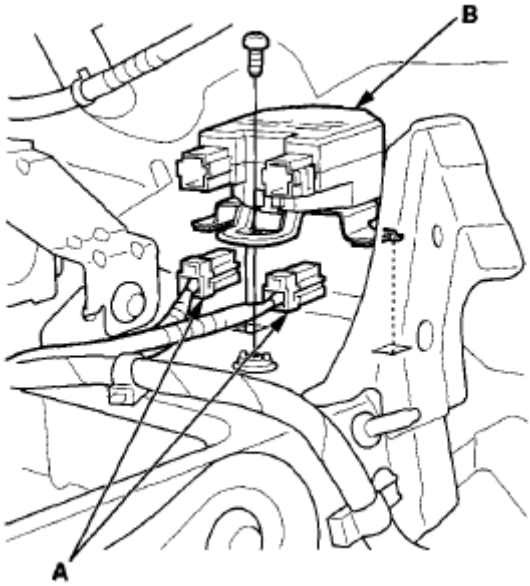

Fig. 7: Identifying 1P Connector And Glass Antenna Coil
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the mounting screw, then remove the glass antenna coil.
4. Install the glass antenna coil in the reverse order of removal.

CONTROL UNIT INPUT TEST

NOTE:

- **Before testing, troubleshoot the multiplex integrated control unit first, using B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **Before testing, do the gauge control module self-diagnostic function (see SELF-DIAGNOSTIC FUNCTION) to make sure the beeper and the**

indicators in the gauge control module work properly and the F-CAN line are OK.

- **Before doing the input tests, make sure the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box is OK.**

Driver's MICU

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
3. Disconnect driver's under-dash fuse/relay box connectors D, Q, and R.

NOTE: All connector views are wire side of female terminals.

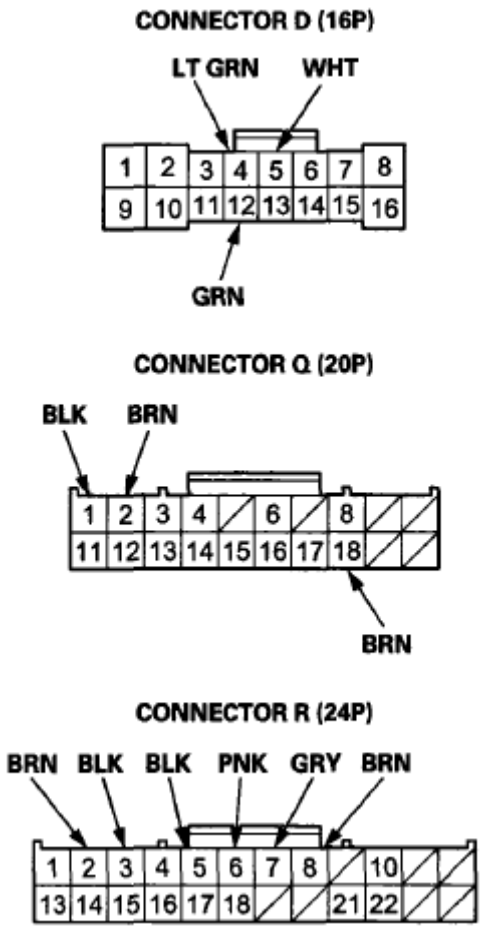

Fig. 5: Identifying Driver's Under-Dash Fuse/Relay Box D (16P), Q (20P) & R (24P) Connector End Views
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.

- If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
- If the terminals are OK, go to step 5.

5. Reconnect the connectors, turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 6.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
Q1	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G402) • An open or high resistance in the ground wire
Q2	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G401) • An open or high resistance in the ground wire
R2	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
R5	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G402) • An open or high resistance in the ground wire
D12	GRN	Driver's door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driver's door switch • Faulty driver's door switch ground • An open or high resistance in the wire
		Driver's door closed	Measure the voltage to ground: There should be about 5 V.	• Faulty driver's door switch • A short to ground in the wire
D4	LT GRN	Left rear door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty left rear door switch • Faulty left rear door switch ground • An open or high resistance in the wire

		Left rear door closed	Measure the voltage to ground: There should be about 5 V.	• Faulty left rear door switch • A short to ground in the wire
D5	WHT	Trunk lid open (Remove the trunk light bulb)	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty trunk lid latch switch • Poor ground (G603) or an open in the ground wire • An open or high resistance in the wire
		Trunk lid closed (Remove the trunk light bulb)	Measure the voltage to ground: There should be about 5 V.	• Faulty trunk lid latch switch • A short to ground in the wire
Q18(1)	BRN	Remote key inserted into the Remote slot	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty Remote slot • Faulty power control unit • Poor ground (G402) or an open in the ground wire • An open or high resistance in the wire
		Remote key removed from the Remote slot	Measure the voltage to ground: There should be about 5 V.	• Faulty Remote slot • Faulty power control unit • A short to ground in the wire
Q18(2)	BRN	Ignition key inserted into the ignition switch	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty ignition key switch • Poor ground (G403) or an open in the ground wire • An open or high resistance in the wire
		Ignition switch in LOCK (0) position and ignition key removed from the ignition switch	Measure the voltage to ground: There should be about 5 V.	• Faulty ignition key switch • A short to ground in the wire
		Combination light switch OFF	Measure the voltage between terminals R6 and	• Faulty combination light switch

R6 • R3	PNK • BLK	Combination light switch in any other position than OFF	R3: There should be less than 0.2 V.	• An open or high resistance in the wire
			Measure the voltage between terminals R6 and R3: There should be about 5 V.	• Faulty combination light switch • A short to ground in the wire
R7 • R3	GRY • BLK	Combination light switch (PARKING position) ON	Measure the voltage between terminals R7 and R3: There should be less than 0.2 V.	• Faulty combination light switch • An open or high resistance in the wire
		Combination light switch OFF	Measure the voltage between terminals R7 and R3: There should be about 5 V.	• Faulty combination light switch • A short to ground in the wire
R8 • R3	BRN • BLK	Combination light switch (Headlight position) ON	Measure the voltage between terminals R8 and R3: There should be less than 0.2 V.	• Faulty combination light switch • An open or high resistance in the wire
		Combination light switch OFF	Measure the voltage between terminals R8 and R3: There should be about 5 V.	• Faulty combination light switch • A short to ground in the wire
(1) With keyless access system (2) Without keyless access system				

Passenger's MICU

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Remove the passenger's side kick panel (see **TRIM REMOVAL/INSTALLATION - DOOR AREAS**).
8. Disconnect passenger's under-dash fuse/relay box connectors A, E, and G*1 (or H*2).

*1: With SH-AWD

*2: Without SH-AWD

NOTE: All connector views are wire side of female terminals.

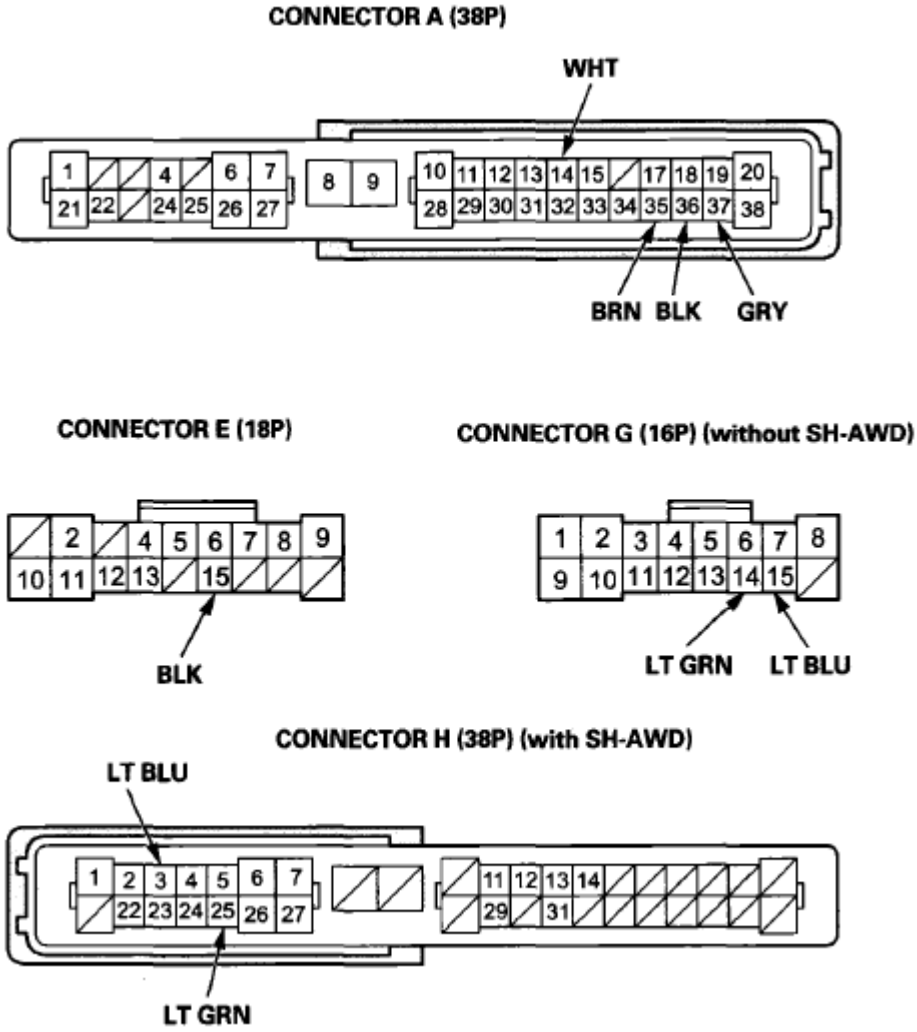

Fig. 6: Identifying Passenger's Under-Dash Fuse/Relay Box A (38P), E (18P), G (16P) (w/o SH-AWD) & H (38P) (w/ SH-AWD) Connector End Views
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 10.
10. Reconnect the connectors to the passenger's under-dash fuse/relay box, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 11.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
			Measure the voltage to	• Blown No. 15(10 A) fuse in the under-hood fuse/relay box

A14	WHT	Under all conditions	ground: There should be battery voltage.	• Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
A35	BRN	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be battery voltage.	• Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
A36	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G405) • An open or high resistance in the ground wire
A37	GRY	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
E15	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G203) • An open or high resistance in the ground wire
G15(1) or H3(2)	LT BLU	Front passenger's door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty front passenger's door switch • Faulty front passenger's door switch ground • An open or high resistance in the wire
		Front passenger's door closed	Measure the voltage to ground: There should be about 5 V.	• Faulty front passenger's door switch • A short to ground in the wire
G14(1) or H25(2)	LT GRN	Right rear door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty right rear door switch • Faulty right rear door switch ground • An open or high resistance in the wire
		Right rear door closed	Measure the voltage to ground: There should be about 5 V.	• Faulty right rear door switch • A short to ground in the wire

(1) Without SH-AWD

(2) With SH-AWD

Gauge Control Module

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Remove the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), and disconnect the 32P connector from it.

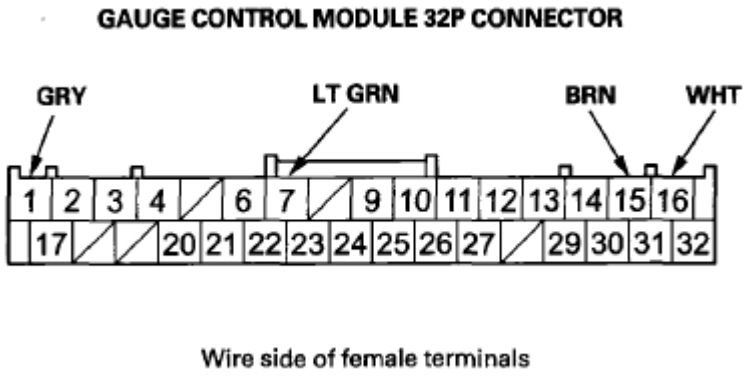

Fig. 7: Identifying Gauge Control Module 32P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Inspect the connector and socket terminals to be sure they are all making good contact.
    - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
    - If the terminals are OK, go to step 14.
14. Reconnect the connector to the gauge control module, turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 15.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
16	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
15	BRN	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be battery voltage.	• Faulty driver's under-dash fuse/relay box • Blown No. 12 (7.5 A) fuse in the under-dash fuse/relay box • An open or high resistance in the wire

1	GRY	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G401) • An open or high resistance in the ground wire
7	LT GRN	Parking brake lever pulled	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty parking brake switch • Faulty parking brake switch ground • An open or high resistance in the wire
		Parking brake lever released	Measure the voltage to ground: There should be battery voltage.	• Faulty parking brake switch • A short to ground in the wire

15. Do the Gauge Control Module Self-Diagnostic Function (see **SELF-DIAGNOSTIC FUNCTION**), and check the beeper and the seat belt reminder indicator.
    - If the beeper sounds and the seat belt reminder indicator flashes, go to step 16.
    - If the beeper does not sound or the seat belt reminder indicator does not flash, replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).
16. Substitute a known-good gauge control module, and recheck the system.
    - If the symptom is gone, the gauge control module is faulty; replace it (see **GAUGE CONTROL MODULE REPLACEMENT**).
    - If the symptom is still present, the driver's MICU is faulty; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

CONTROL UNIT INPUT TEST

NOTE:

- **Before testing, troubleshoot the multiplex integrated control unit first, using B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **Before testing, make sure the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box is OK.**

Driver's MICU

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
3. Disconnect driver's under-dash fuse/relay box connectors D, Q, and R.

NOTE: All connector views are wire side of female terminals.

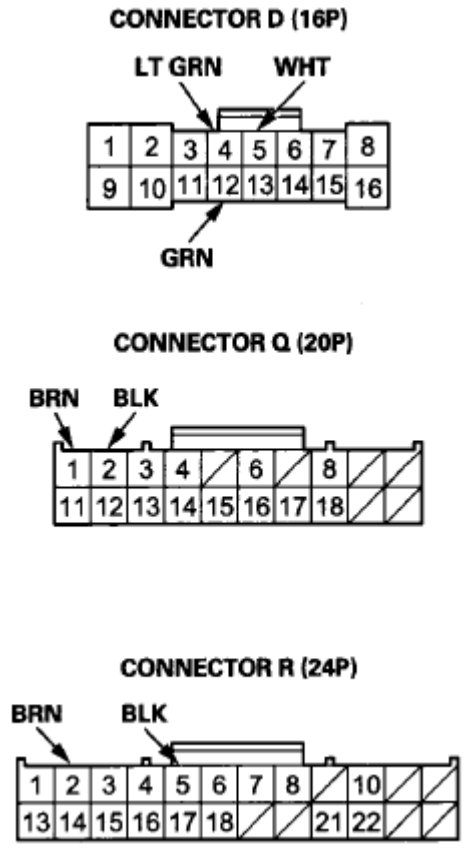

Fig. 4: Identifying Driver's Under-Dash Fuse/Relay Box D (16P), Q (20P), & R (24P) Connector End Views
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.
5. Reconnect the connectors to the driver's under-dash fuse/relay box, and do the following input tests:
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 7.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained

(1) Without SH-AWD (2) With SH-AWD				

Gauge Control Module

11. Remove the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), and disconnect the 32P connector from it.

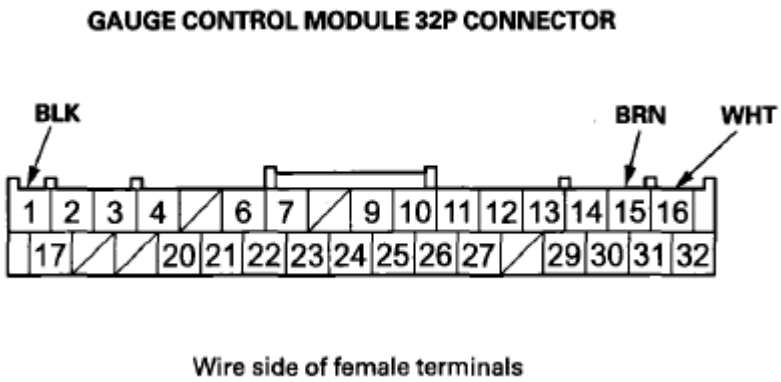

Fig. 6: Checking Condition Of Gauge Control Module Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Inspect the connector and socket terminals to be sure they are all making good contact.
    - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
    - If the terminals are OK, go to step 13.
13. Reconnect connector to the gauge control module, and do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 14.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
16	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • An open or high resistance in the wire
15	BRN	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
1	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire

14. If multiple failures are found on more than one control unit, replace the driver's under-dash fuse/relay box (includes the driver's MICU) (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**). If input failures are related to a particular control unit, replace the control unit.

SEAT HEATER TEST

DRIVER'S SEAT

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Remove the driver's seat (see **FRONT SEAT REMOVAL/INSTALLATION**).
2. Remove the seat-back cover (see **FRONT SEAT-BACK COVER REPLACEMENT**).
3. Lean the seat-back and disconnect the connector A (3P) and connector B (2P) from the seat heaters.

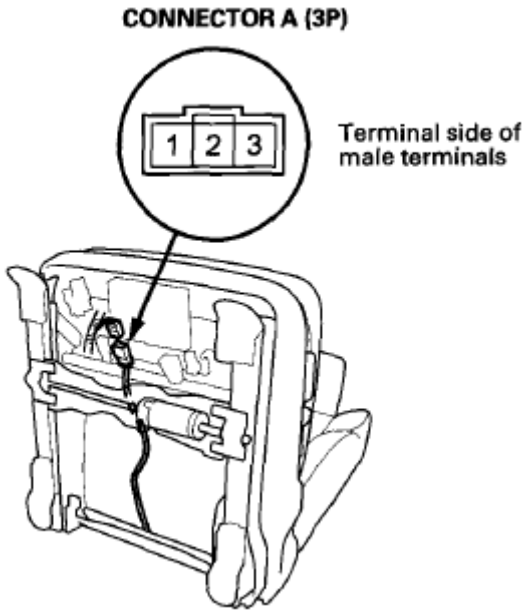

Fig. 6: Identifying A (3P) Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

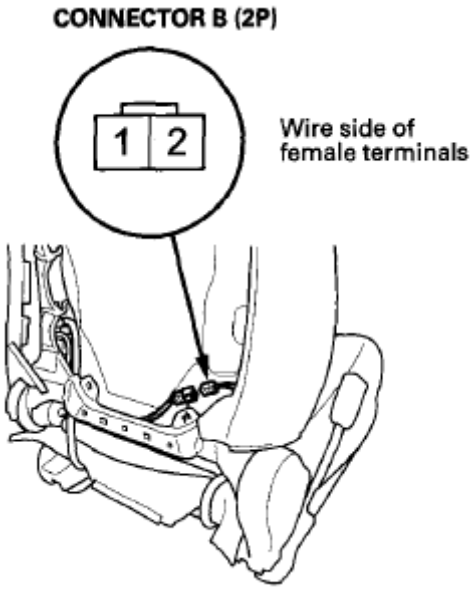

Fig. 7: Identifying B (2P) Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Check for continuity between seat heater connector A (3P) terminal No. 3, and seat heater connector B (2P) terminal No. 2. There should be continuity.
5. If there is no continuity, replace the seat wire harness.
6. Check for continuity between seat heater connector B (2P) terminals No. 1 and No. 2. There should be continuity.
7. If the continuity is not as specified, replace the seat-back heater (see **Seat-Back Heater**).
8. Check for continuity between seat heater connector A (3P) terminals No. 1 and No. 3, and between terminals No. 2 and No. 3. There should be continuity.
9. If there is no continuity, replace the seat cushion heater (see **Seat-Back Heater**).

FRONT PASSENGER'S SEAT

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Remove the front passenger's seat (see **FRONT SEAT REMOVAL/INSTALLATION**).
2. Disconnect the 4P connector from the seat heater.

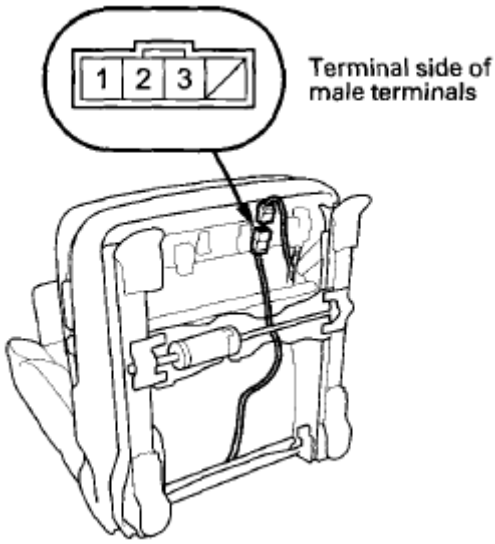

Fig. 8: Identifying 4P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between seat heater 4P connector terminals No. 1 and No. 3 and terminals No. 2 and No. 3. There should be continuity.
4. If the continuity is not as specified, replace the seat heater (see **Seat Heater Replacement**).

SWITCH TEST/REPLACEMENT

1. Remove the shift panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
2. Remove the seat heater switch from panel.

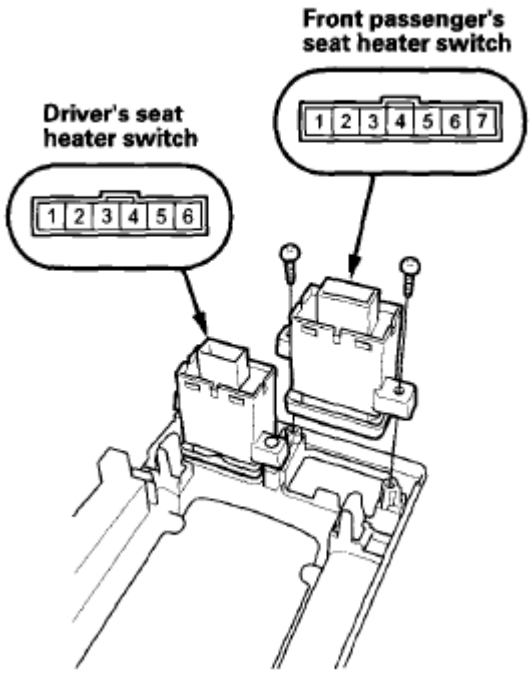

Fig. 9: Identifying Seat Heater Switches & Panel With Connector End Views
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between the terminals in each switch position according to the table.

NOTE:

- **Make sure the correct test lead (+ or -) is placed on the terminal.**
- **When checking for continuity across the diode, use the diode setting on the digital volt/ohm meter to check the diode bias.**
- **Be careful of this characteristic; a diode is one that conducts fully in one direction (forward) and not at all in the opposite direction (reverse).**

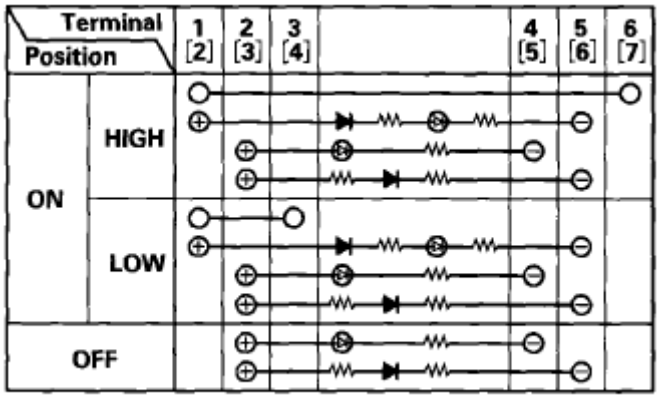

Fig. 10: Identifying Continuity Reference Chart
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the continuity is not as specified, replace the switch.
5. Install the parts in the reverse order of removal.

SEAT HEATER REPLACEMENT

SEAT CUSHION HEATER

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Remove the front seat cushion cover (see **FRONT SEAT CUSHION COVER REPLACEMENT**).
2. Carefully remove the seat cushion heater (A) from the seat cushion pad (B).

NOTE: The seat cushion heater is glued to the seat cushion pad. When removing it, take care not to damage the seat cushion pad.

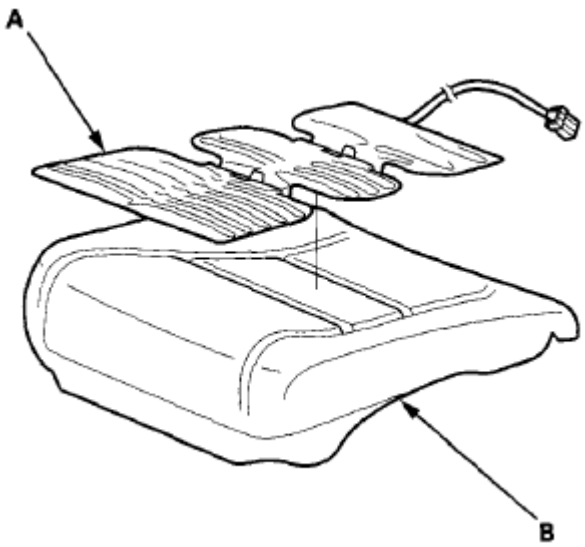

Fig. 11: Identifying Seat Cushion Pad And Seat Cushion Heater
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the removed parts in the reverse order of removal.

SEAT-BACK HEATER

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Remove the front seat-back cover (see **FRONT SEAT-BACK COVER REPLACEMENT**).
2. Carefully remove the seat-back heater (A) from the seat-back pad (B).

NOTE: The seat-back heater is glued to the seat-back pad. When removing it, take care not to damage the seat-back pad.

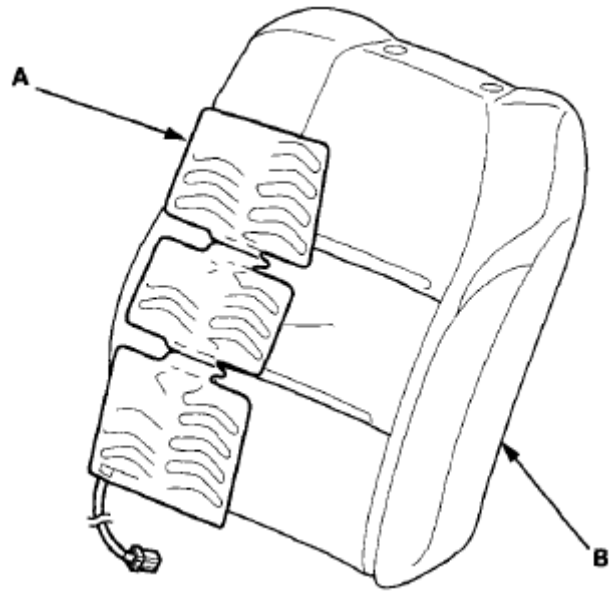

Fig. 12: Identifying Seat-Back Heater And Seat-Back Pad
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the removed parts in the reverse order of removal.

2012 ACCESSORIES & EQUIPMENT

Seats - TL

COMPONENT LOCATION INDEX

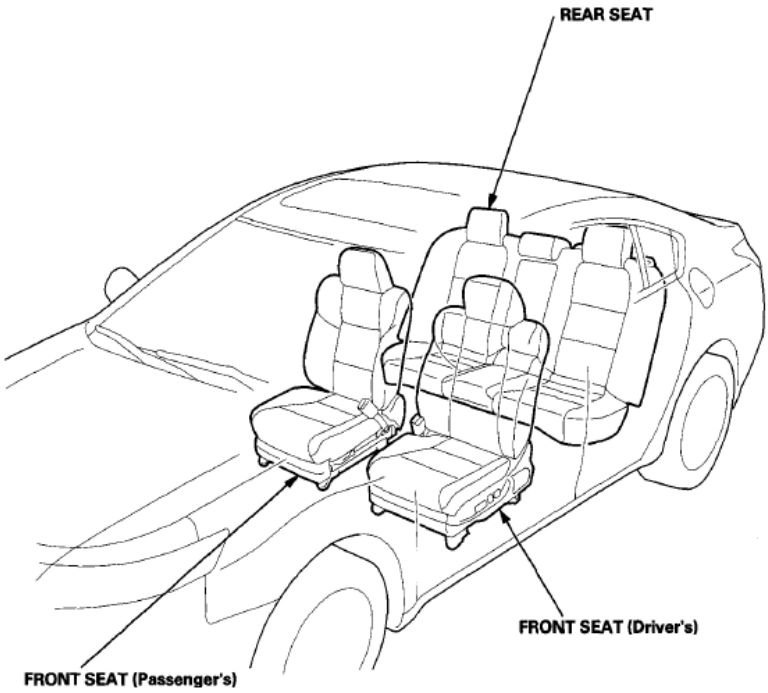

Fig. 1: Identifying Seats Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

FRONT SEAT ACTIVE HEAD RESTRAINT INSPECTION

NOTE: If the vehicle has been in a collision, always inspect the active head restraint, even if they appear reusable, by doing the following procedure.

1. Move the seat-back to the fully upright position. Raise the head restraint to the highest position.
2. Apply masking tape on the top of the head restraint.
3. Make the marks (A) on both sides at 300 mm (11.8 in) upward from the roots of the head restraint frame (B) along the back of the head restraint (C) surface. Use the center point (D) between the two marks for the measurements in step 4.

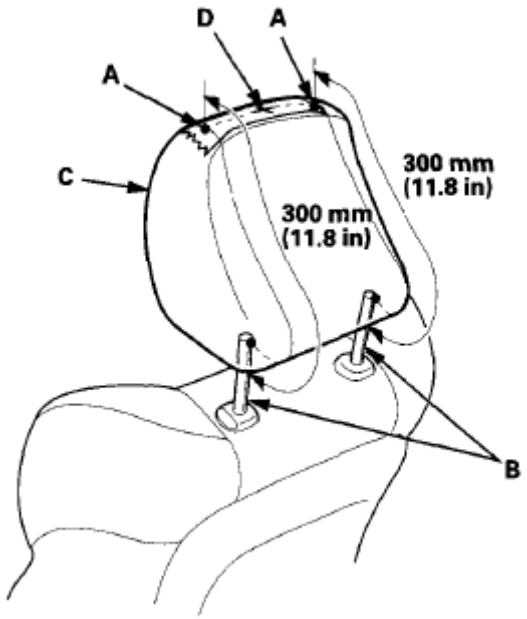

Fig. 2: Identifying Marks, Restraint Frame, Head Restraint And Center Point
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Push the head restraint (A) forward, and measure the horizontal head restraint movement. The head restraint should move more than 50 mm (2.0 in) without resistance. If it is less than 50 mm (2.0 in), or the head restraint does not move smoothly, replace the seat frame (see **FRONT SEAT FRAME REPLACEMENT**).

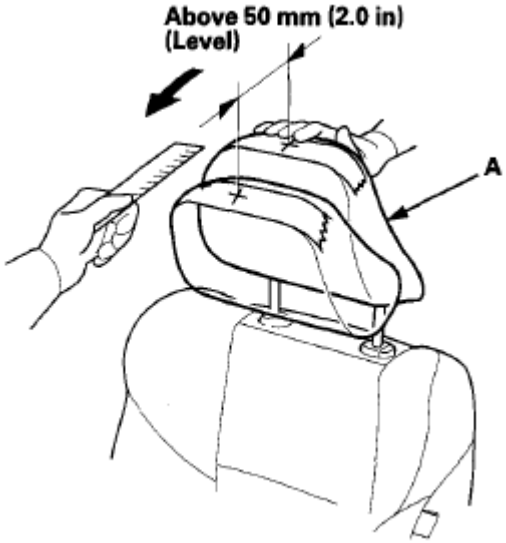

Fig. 3: Pushing Head Restraint Forward And Measure Horizontal Head Restraint Movement

FRONT SEAT REMOVAL/INSTALLATION

Special Tools Required

KTC Trim Tool Set SOJATP2014*

*Available through the Acura Tool and Equipment Program; call 888-424-6857

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repairs or service.

Do the ODS unit initialization (see **ODS UNIT INITIALIZATION**) after front passenger's seat replacement.

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the body or tear the seat covers.**
- **Use the appropriate tool from the KTC trim tool set to avoid damage when removing components.**
- **When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.**

1. Adjust the steering column to the full tilt up position and to the full telescopic in position.
2. Slide the front seat all the way forward. Carefully pry up on the bottom of the anchor cover (A) at the pry point (B) with the appropriate trim tool to release the hooks (C) and the tab (D), then remove the cover by pulling it upward. The driver's seat is shown; the passenger's seat is similar.

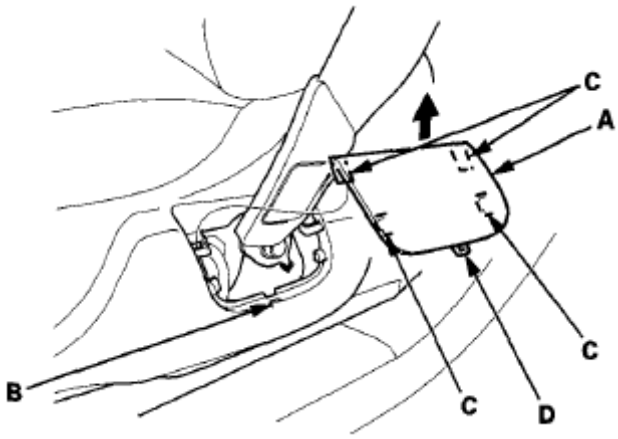

Fig. 4: Sliding Front Seat All Way Forward
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the lower anchor bolt (A).

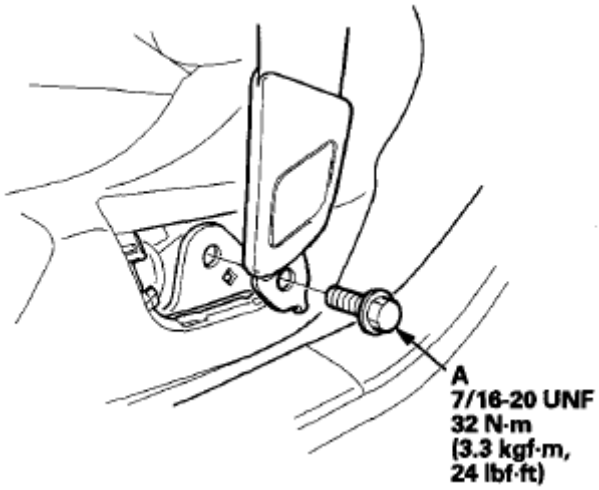

Fig. 5: Identifying Lower Anchor Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the seat track end covers (A) from the back of both seat tracks.

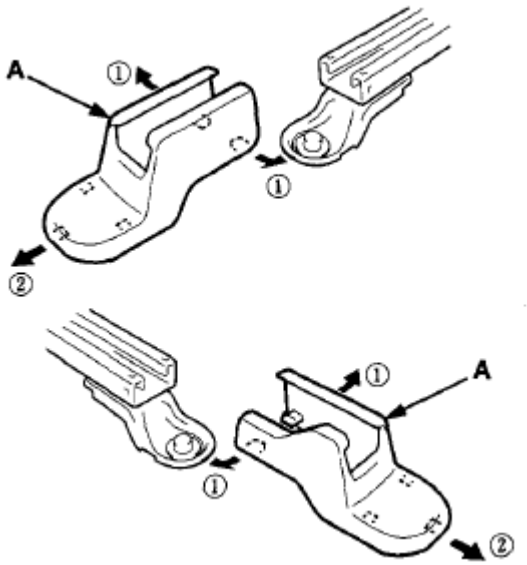

Fig. 6: Removing Seat Track End Covers From Back Of Both Seat Tracks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the seat mounting bolts from the rear side of the front seat.

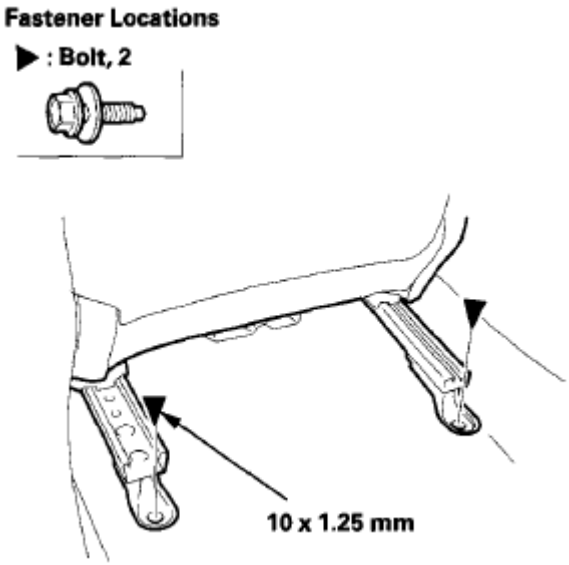

Fig. 7: Identifying Seat Mounting Bolts From Rear Side Of Front Seat
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Slide the front seat all the way back, and remove the seat mounting bolts.

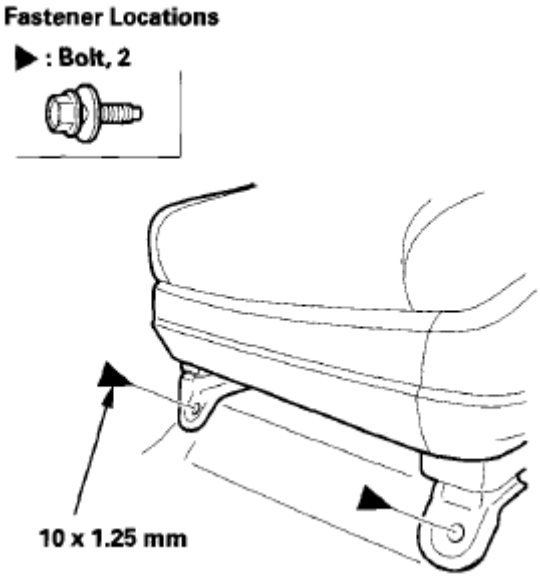

Fig. 8: Sliding Front Seat All Way Back
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before removing the seat.
8. Lift up the front seat, then detach the harness clip(s) (A). Disconnect the side airbag connector (B) and the seat wire harness connector (C).

Driver's seat (Without seat ventilation)

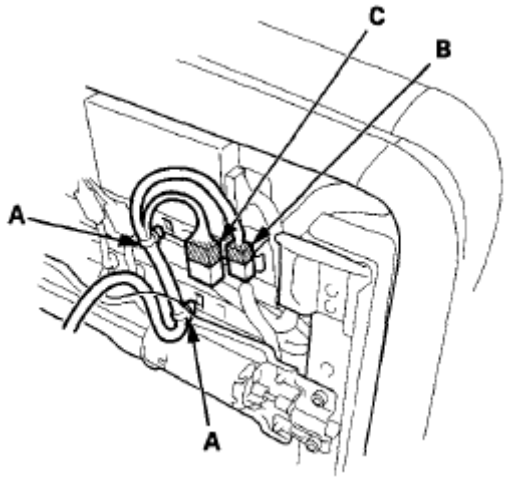

Fig. 9: Identifying Harness Clip, Side Airbag Connector And Seat Wire Harness Connector (Without Seat Ventilation)
