No active DTCs set (prevents monitor from running)		P0101, P0102, P0103, P0107, P0108, P0111, P0112, P0113, P0116, P0117, P0118, P0122, P0123, P0133, P0134, P0135, P0153, P0154, P0155, P0171, P0172, P0174, P0175, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0351, P0352, P0353, P0354, P0355, P0356, P0401, P0404, P0406, P0443, P0496, P0497, P0506, P0507, P060A, P0722, P1077, P1078, P1116, P1128, P1129, P1172, P1174, P145C, P1659, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2195, P2197, P2227, P2228, P2229, P2237, P2238, P2240, P2241, P2243, P2245, P2247, P2249, P2251, P2252, P2254, P2255, P2279, P2413, P2646, P2647, P2648, P2649, P2A00, P2A03	
Other		Without excessive load change	

MALFUNCTION THRESHOLD

The air/fuel ratio (A/F) sensor response parameter according to the opening and closing of the EGR valve is 15,565 (LT80A) or less.

DRIVING PATTERN

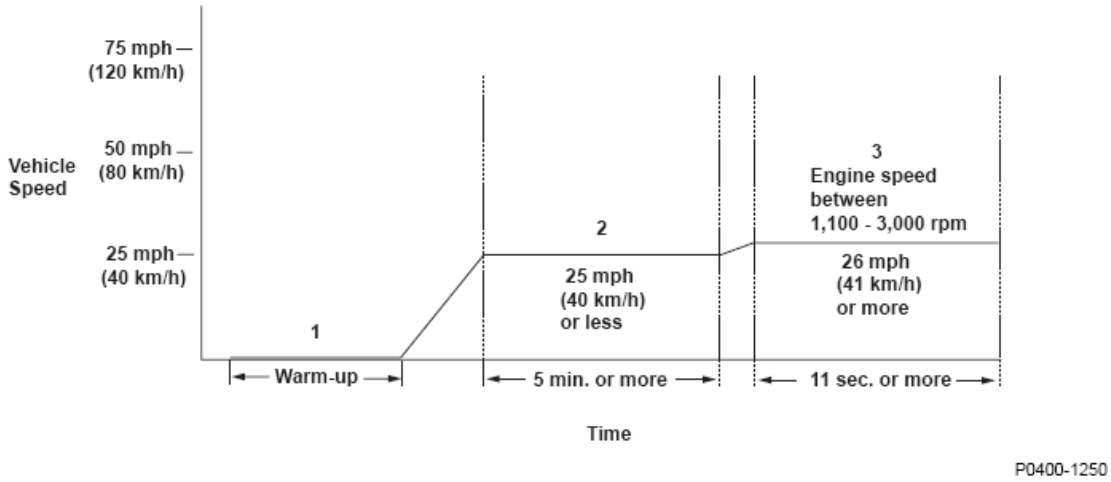

Fig. 75: Vehicle Speed Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in P or N) until the radiator fan comes on.
2. Drive the vehicle at a steady speed of 25 mph (40 km/h) or less, for at least 5 minutes.
3. Drive immediately at a steady speed 26 mph (41 km/h) or more and engine speed between 1,100 - 3,000 rpm for at least 11 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0400: EXHAUST GAS RECIRCULATION (EGR) SYSTEM LEAK DETECTED (ENGINE TYPE: J37A4)

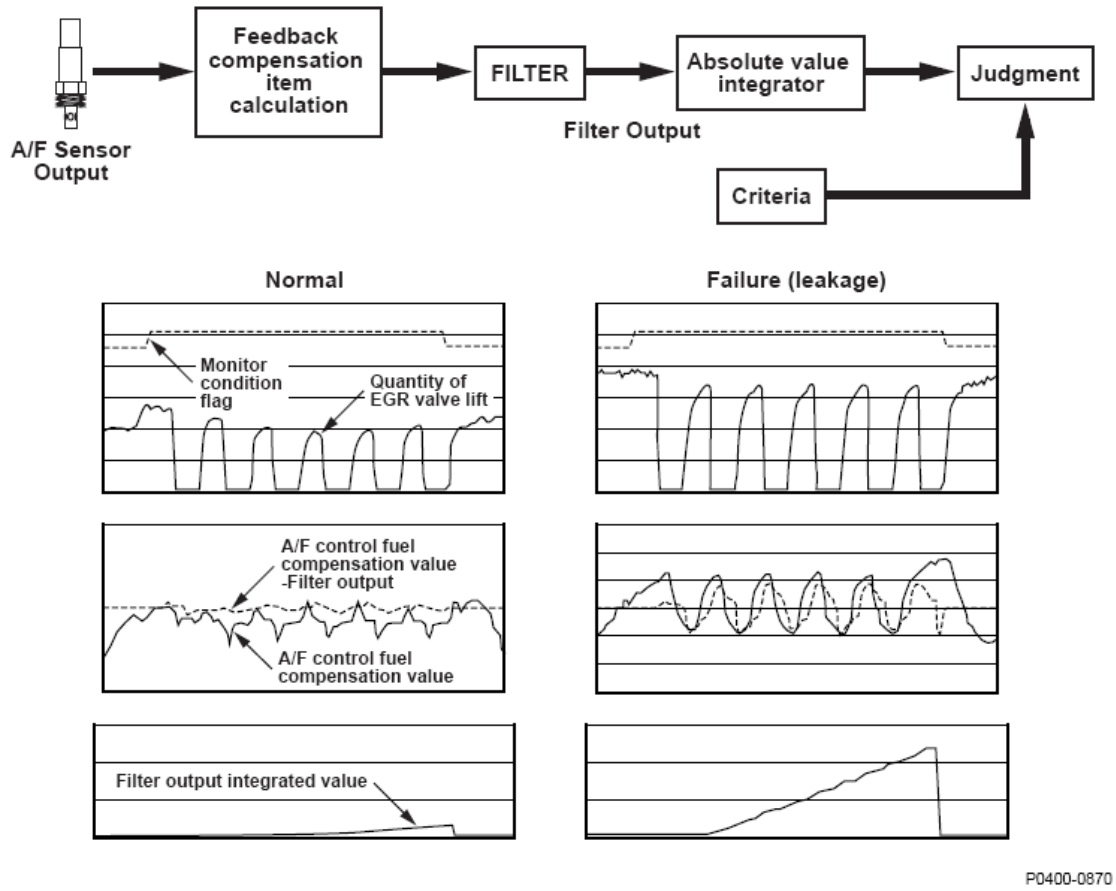

Fig. 76: Exhaust Gas Recirculation System Characteristics Curve (Normal And Failure)

GENERAL DESCRIPTION

The exhaust gas recirculation (EGR) system failure conditions include a sticking lift sensor, restricted passages, and leakage from the external piping. At any specific EGR lift value there is a corresponding air/fuel ratio compensation value. If the air/fuel ratio compensation value is greater than the corresponding EGR lift value, the engine control module (ECM)/powertrain control module (PCM) detects a malfunction and stores a DTC.

(1) A/T model

(2) M/T model

MALFUNCTION THRESHOLD

The air/fuel ratio (A/F) sensor response parameter according to the opening and closing of the EGR valve is 19,661 (LT80A) or less.

DRIVING PATTERN

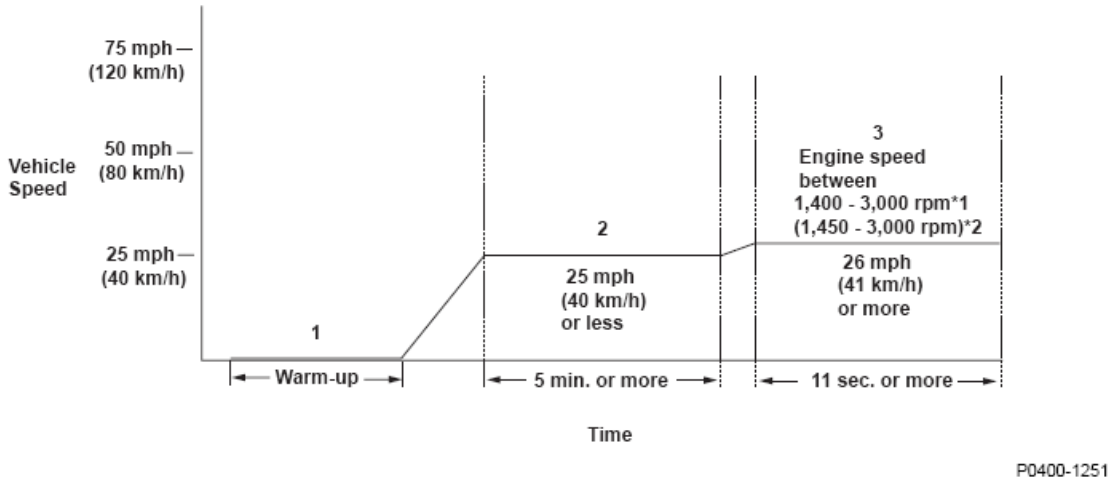

Fig. 77: Vehicle Speed Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Drive the vehicle at a steady speed of 25 mph (40 km/h) or less, for at least 5 minutes.
3. Drive immediately at a steady speed 26 mph (41 km/h) or more and engine speed between 1,400 - 3,000 rpm*1 (1,450 - 3,000 rpm)*2 for at least 11 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0401: EXHAUST GAS RECIRCULATION (EGR) INSUFFICIENT FLOW (ENGINE TYPE: J35Z6)

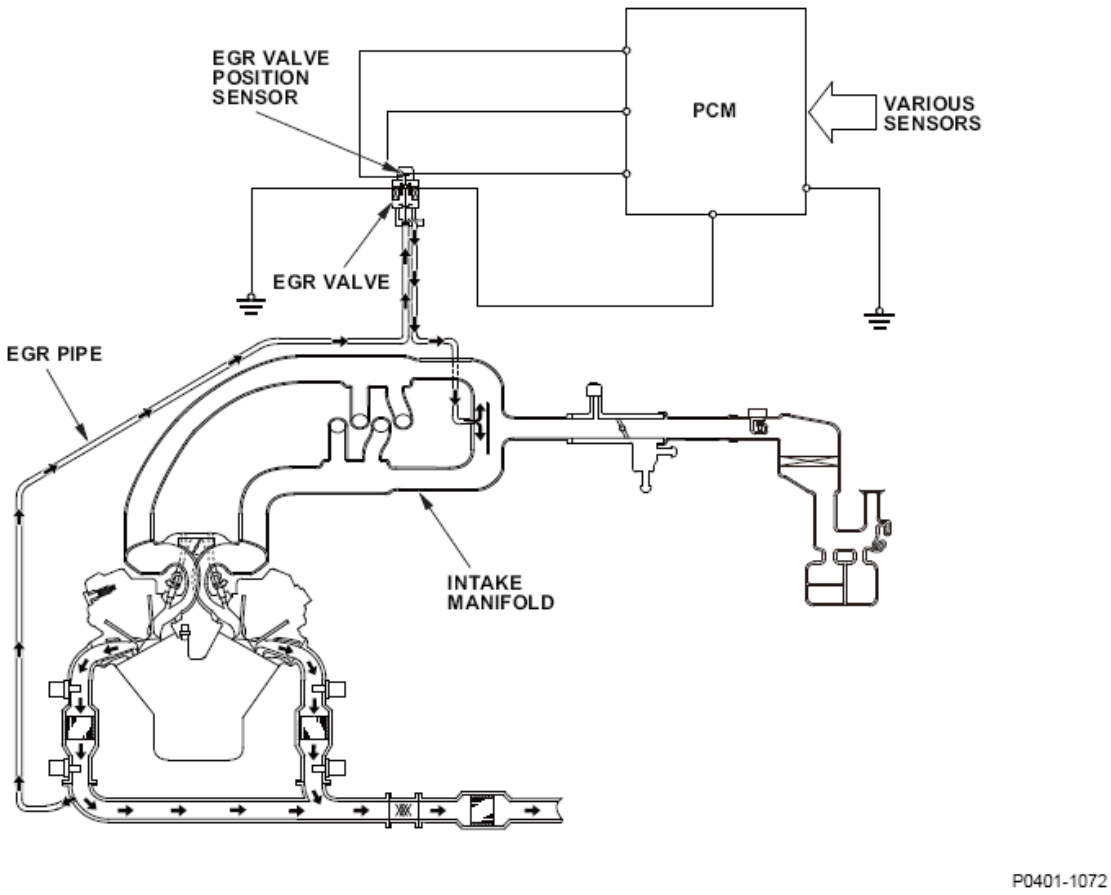

Fig. 78: Exhaust Gas Recirculation System Operation Diagram

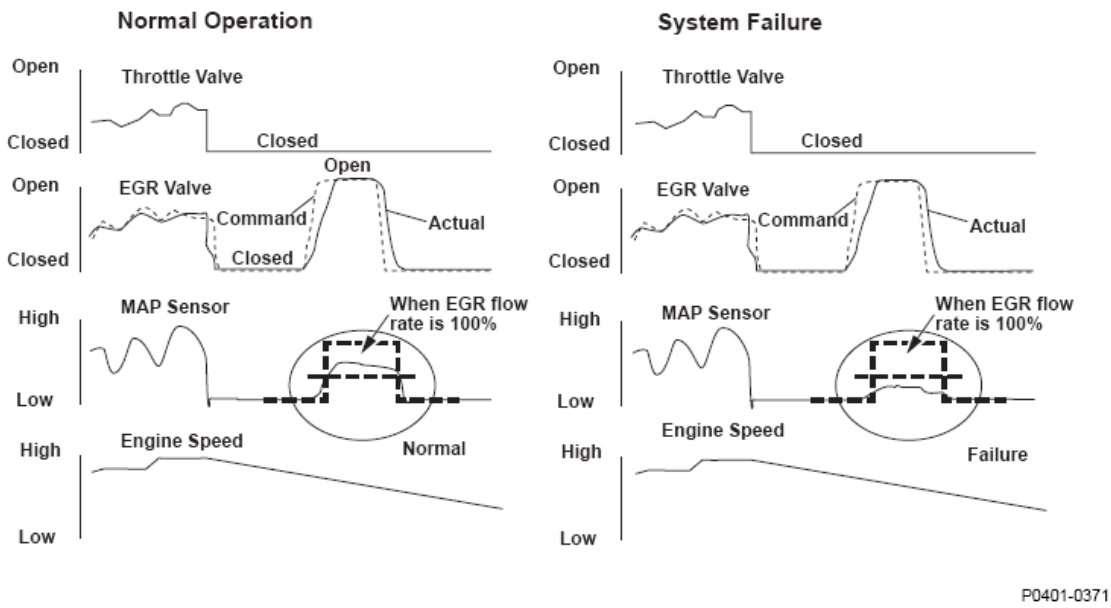

Fig. 79: Exhaust Gas Recirculation System Characteristics Curve (Normal And Failure)

GENERAL DESCRIPTION

The exhaust gas recirculation (EGR) valve, which is controlled by the powertrain control module (PCM), is opened and the exhaust gas flows through the EGR valve, the intake manifold, and the EGR passage. The exhaust gas is circulated into the air/fuel mixture to lower combustion temperatures, thus reducing oxides of nitrogen (NOx) emissions. The EGR flow is inspected as follows. The EGR valve is closed during deceleration with the throttle valve fully closed. Then the PCM fully opens the EGR valve. After a set time, the PCM computes the ratio of the present EGR flow to the normal EGR flow by monitoring the fluctuation of the intake manifold pressure between when the EGR valve is fully opened and when it is fully closed. If the EGR flow rate is lower than normal, the PCM detects a malfunction and stores a DTC.

MALFUNCTION THRESHOLD

The ratio of the current EGR flow to the normal EGR flow is 15 % or less for at least 3.0 seconds.

The ratio is derived from the actual and estimated MAP values before and after the EGR value was opened.

The estimated MAP difference value is shown in the table.

Engine speed	Barometric pressure	
	52 kPa (15.4 inHg, 390 mmHg)	102 kPa (30.0 inHg, 760 mmHg)
1,200 rpm	10 kPa (2.8 inHg, 70 mmHg)	15 kPa (4.3 inHg, 109 mmHg)
2,000 rpm	5 kPa (4 inHg, 34 mmHg)	9 kPa (2.6 inHg, 64 mmHg)

DRIVING PATTERN

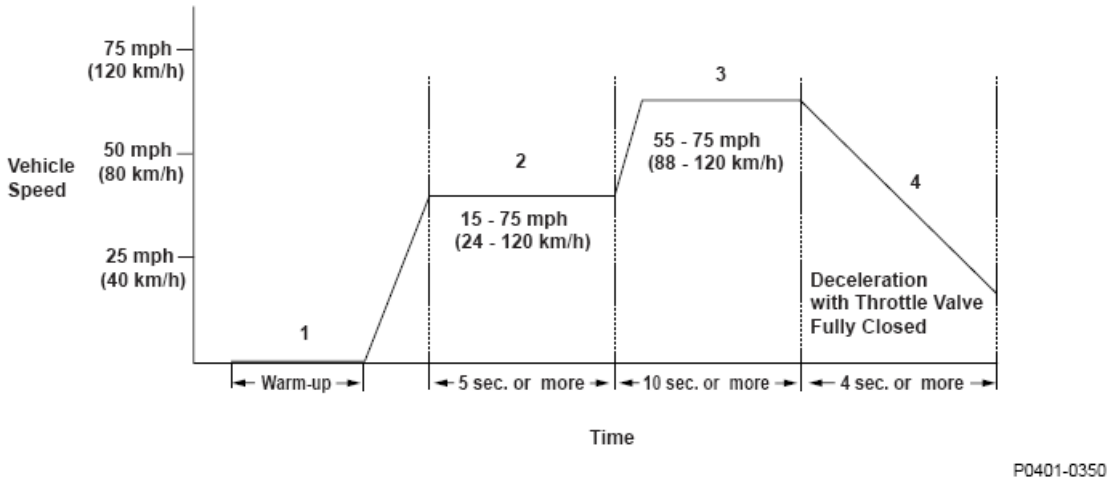

Fig. 80: Vehicle Speed Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in P or N) until the radiator fan comes on.
2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 5 seconds.
3. Drive at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
4. Decelerate with the throttle valve fully closed for at least 4 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0401: EXHAUST GAS RECIRCULATION (EGR) INSUFFICIENT FLOW

(ENGINE TYPE: J37A4)

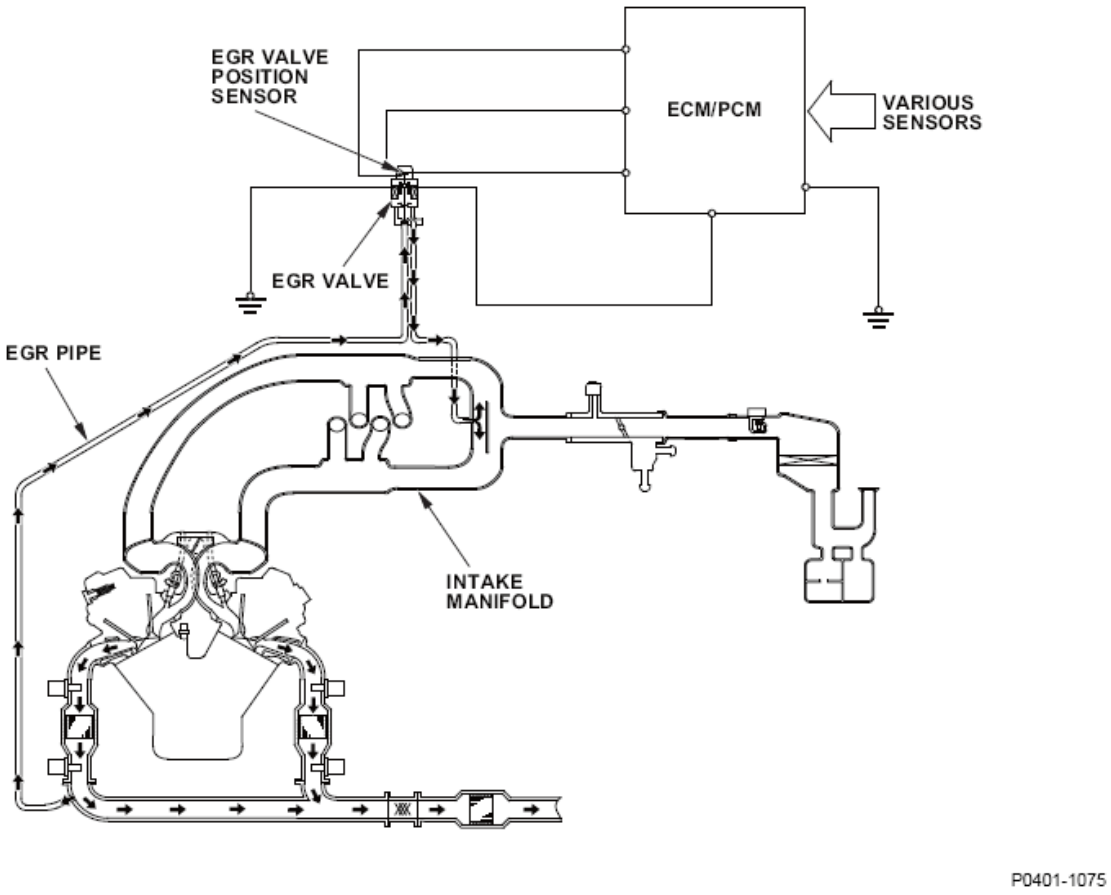

Fig. 81: Exhaust Gas Recirculation System Operation Diagram

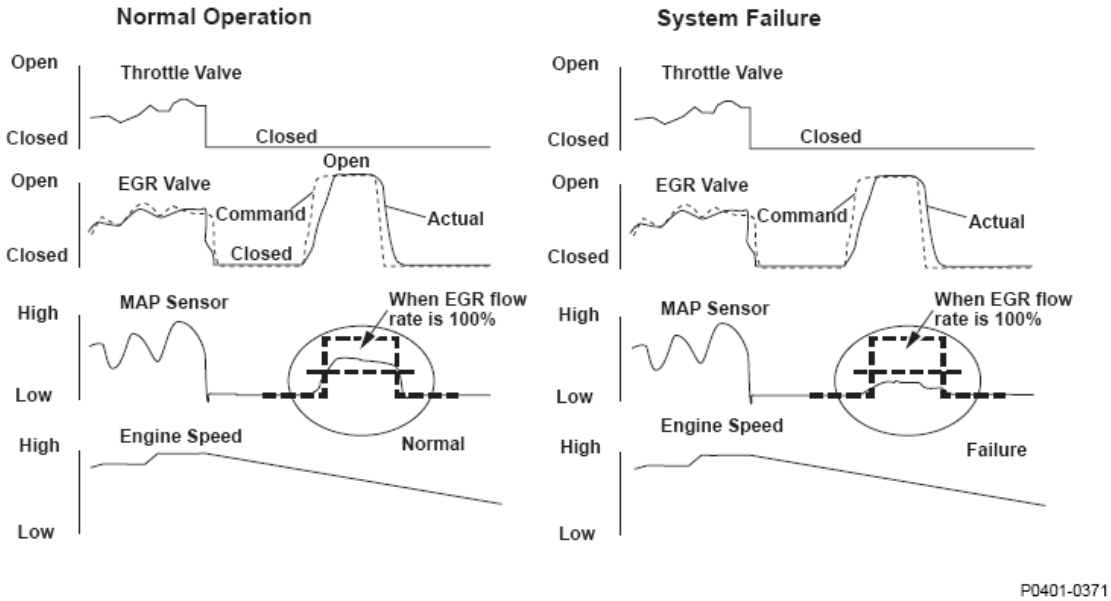

Fig. 82: Exhaust Gas Recirculation System Characteristics Curve (Normal And Failure)

GENERAL DESCRIPTION

The exhaust gas recirculation (EGR) valve, which is controlled by the engine control module (ECM)/powertrain control module (PCM), is opened and the exhaust gas flows through the EGR valve, the intake manifold, and the EGR passage. The exhaust gas is circulated into the air/fuel mixture to lower combustion temperatures, thus reducing oxides of nitrogen (NOx) emissions. The EGR flow is inspected as follows. The EGR valve is closed during deceleration with the throttle valve fully closed. Then the ECM/PCM fully opens the EGR valve. After a set time, the ECM/PCM computes the ratio of the present EGR flow to the normal EGR flow by monitoring the fluctuation of the intake manifold pressure between when the EGR valve is fully opened and when it is fully closed. If the EGR flow rate is lower than normal, the ECM/PCM detects a malfunction and stores a DTC.

2,300 rpm*2	5 kPa (1.3 inHg, 31 mmHg)	7 kPa (1.9 inHg, 48 mmHg)

DRIVING PATTERN

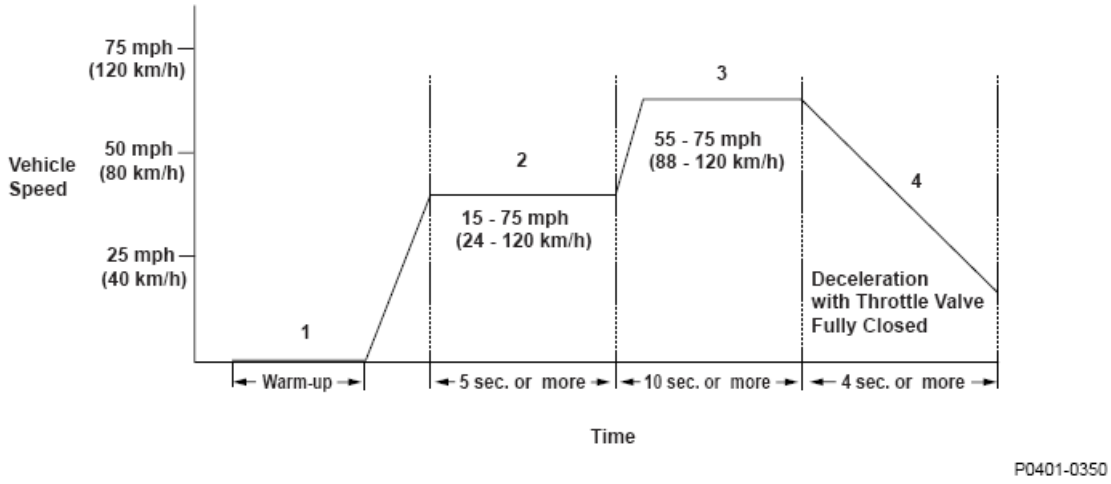

Fig. 83: Vehicle Speed Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 5 seconds.
3. Drive at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
4. Decelerate with the throttle valve fully closed for at least 4 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the

freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0404: EXHAUST GAS RECIRCULATION (EGR) VALVE CIRCUIT RANGE/PERFORMANCE PROBLEM

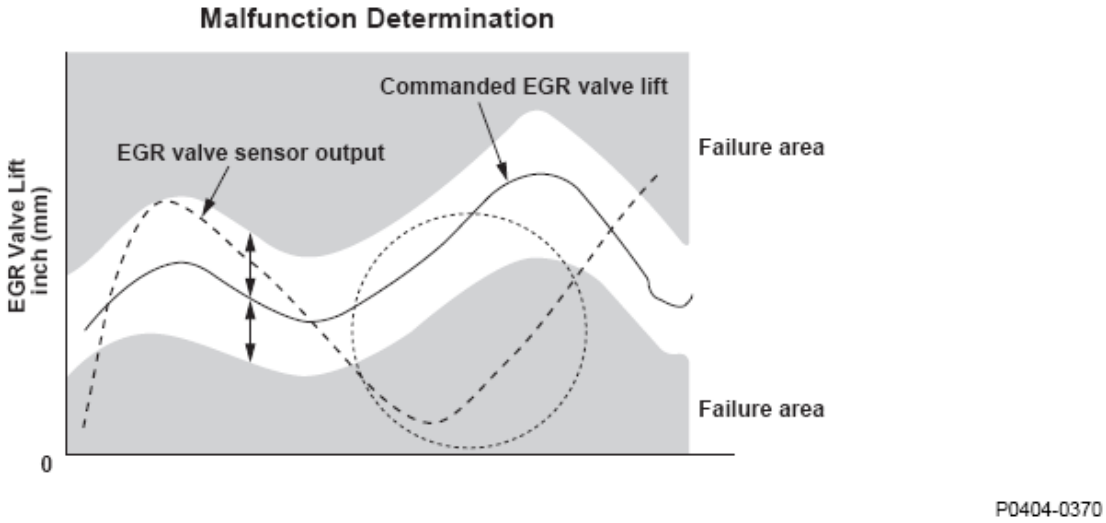

Fig. 84: Exhaust Gas Recirculation Valve Malfunction Determination Areas

GENERAL DESCRIPTION

The exhaust gas recirculation (EGR) valve, which is controlled by the engine control module (ECM)/powertrain control module (PCM), is opened and the exhaust gas flows through the EGR valve, the intake manifold, and the EGR passage. The exhaust gas is circulated into the air/fuel mixture and the mixture is drawn into the combustion chamber to lower combustion temperatures, thus reducing oxides of nitrogen (NOx) emissions. A sensor (lift sensor) is built into the EGR valve and detects the amount of valve lift. The command value for the target valve lift is stored in the ECM/PCM so that exhaust gas recirculation can be optimized according to driving conditions. Comparing this command value with the lift sensor output signal value, the ECM/PCM controls the EGR valve to make the amount of actual valve lift equal to the command value. If the difference between the value of commanded EGR valve lift and actual EGR valve lift is a specified value or more, an abnormality in the EGR valve or the lift sensor output is determined, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None

Duration	5.0 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	-	4,600 rpm
Commanded EGR valve lift	0.012 in (0.30 mm)	-
Battery voltage	10.5 V	-
No active DTCs set (prevents monitor from running)	P0101, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0134, P0135, P0154, P0155, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0351, P0352, P0353, P0354, P0355, P0356, P0400, P0401, P0406, P1128, P1129, P1172, P1174, P2195, P2197, P2237, P2238, P2240, P2241, P2243, P2245, P2247, P2249, P2251, P2252, P2254, P2255, P2279	

MALFUNCTION THRESHOLD

The difference between the command value of the amount of EGR valve lift in the ECM/PCM and the actual amount of valve lift is 0.041 in (1.02 mm) or more for at least 5.0 seconds.

CONFIRMATION PROCEDURE WITH THE HDS

Do the EGR TEST in the INSPECTION MENU with the HDS.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 5 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0406: EXHAUST GAS RECIRCULATION (EGR) VALVE POSITION SENSOR CIRCUIT HIGH VOLTAGE

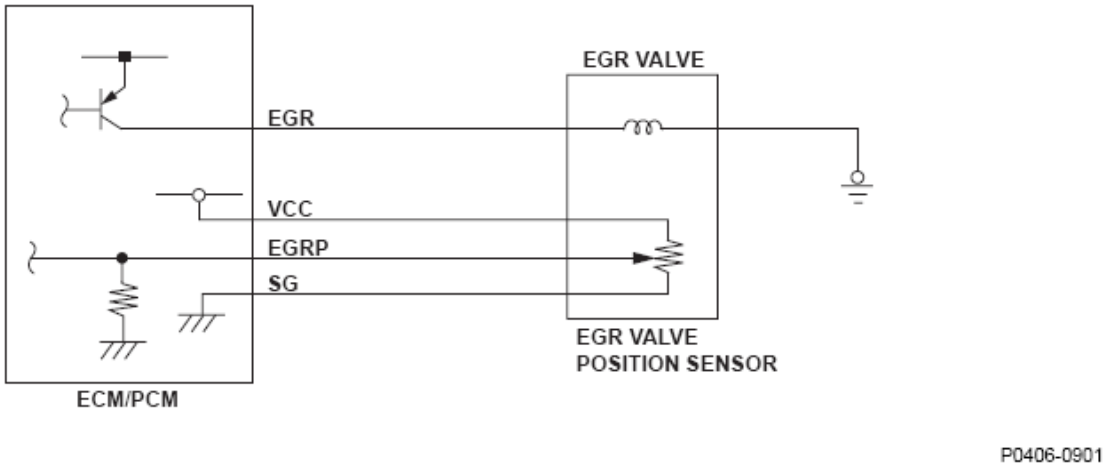

Fig. 85: Exhaust Gas Recirculation Valve Position Sensor - Circuit Diagram

GENERAL DESCRIPTION

The exhaust gas recirculation (EGR) system reduces oxides of nitrogen (NOx). NOx is generated by high combustion temperatures. The EGR system lowers peak combustion temperature by recirculating inert exhaust gas into the air/fuel mixture, thus reducing NOx emissions. To determine the optimal amount of recirculating exhaust gas, depending on driving conditions, a command value (the amount of valve lift) is stored in the engine control module (ECM)/powertrain control module (PCM). The EGR valve position sensor indicates the amount of valve lift, and the ECM/PCM controls the EGR valve so that the amount of actual valve lift equals the command value by comparing the command value and the actual amount of valve lift. If EGR valve position sensor output voltage is not within a specified value, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
State of the engine	Running

MALFUNCTION THRESHOLD

The EGR valve position sensor output voltage is 4.89 V or more for at least 2 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0420: REAR BANK CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 1)

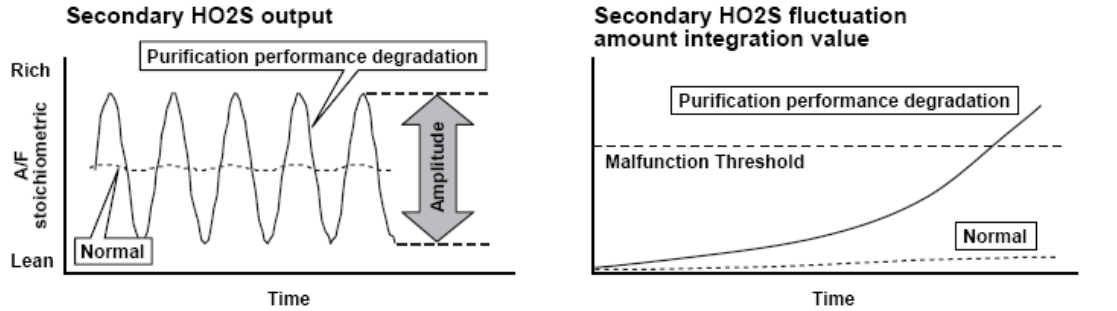

Fig. 86: Secondary HO2S Output Characteristics Curve

GENERAL DESCRIPTION

The rear warm up three way catalytic converter (WU-TWC) (bank 1) converts hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx) in the exhaust gas to water vapor, carbon dioxide (CO_2), and dinitrogen (N_2). The engine control module (ECM)/powertrain control module (PCM) fluctuates the air/fuel ratio temporarily to detect the performance of the rear WU-TWC and measures the degree of fluctuation in the rear secondary heated oxygen sensor (secondary HO2S (bank 1, sensor 2)) output. If the accumulated value for a set time is too great, deterioration of the performance of the catalyst is detected, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None

Duration	7.5 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	Minimum	Maximum

Other	Has record of deceleration at least once	
	Cruise load or more	

MALFUNCTION THRESHOLD

The rear secondary HO2S fluctuation integration value is 3.0 V or more for at least 7.5 seconds.

DRIVING PATTERN

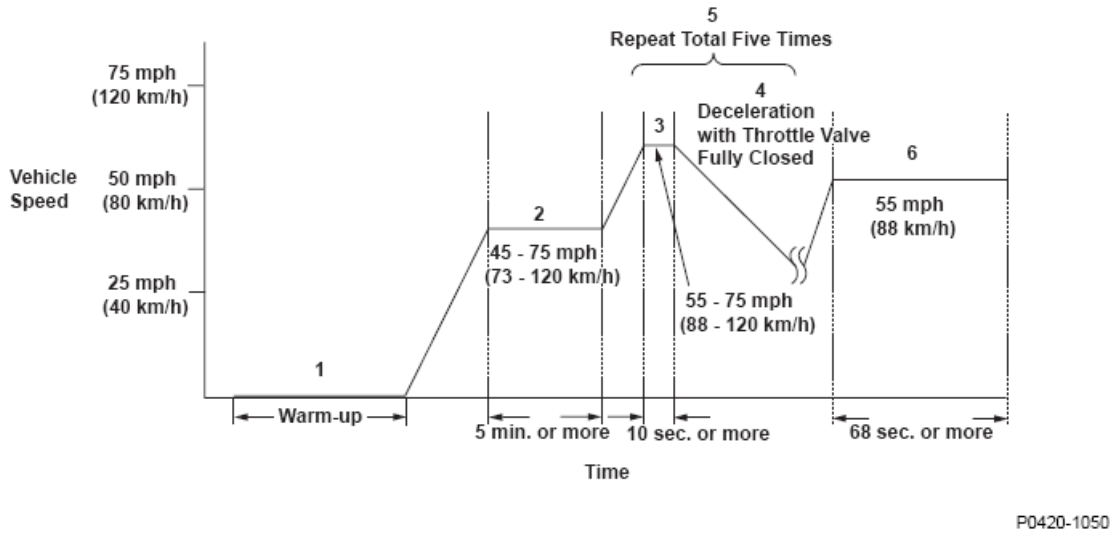

Fig. 87: Vehicle Speed Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 45 - 75 mph (73 - 120 km/h) for at least 5 minutes, to warm up the TWC.
3. Drive at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
4. Decelerate with the throttle valve fully closed.
5. Repeat Driving Pattern steps 3 through 4, four times.
6. Set a vehicle speed of 55 mph (88 km/h) on the cruise control or equivalent, and drive for at least 68 seconds.
    - After disconnecting the battery, extend Driving Pattern step 6 to 4 minutes or longer.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0430: FRONT BANK CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 2) (ENGINE TYPE: J35Z6)

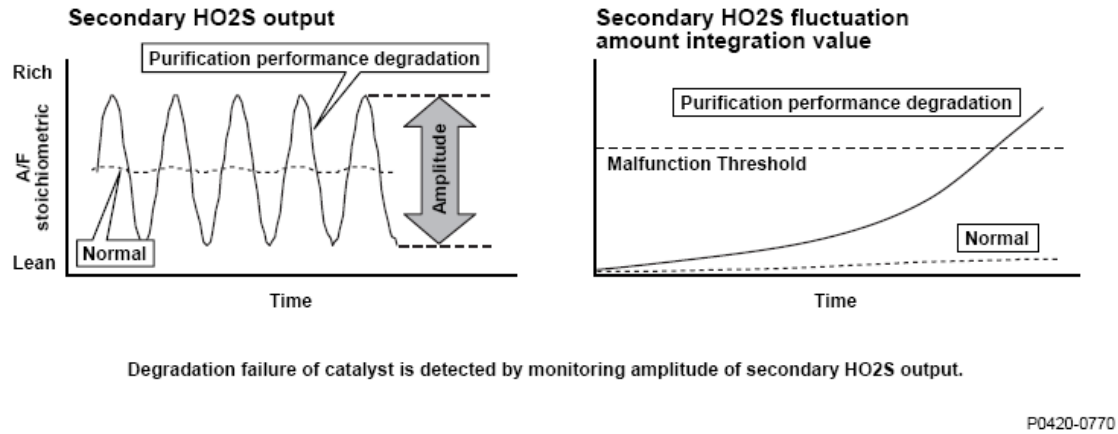

Fig. 88: Secondary HO2S Output Characteristics Curve

GENERAL DESCRIPTION

The front warm up three way catalytic converter (WU-TWC) (bank 2) converts hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx) in the exhaust gas to water vapor, carbon dioxide (CO_2), and dinitrogen (N_2). The powertrain control module (PCM) fluctuates the air/fuel ratio temporarily to detect the performance of the front WU-TWC and measures the degree of fluctuation in the front secondary heated oxygen sensor (secondary HO2S (bank 2, sensor 2)) output. If the accumulated value for a set time is too great, deterioration of the performance of the catalyst is detected, the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	7.5 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time that secondary HO2S activity is not monitored after starting the engine	20 seconds	-
Engine coolant temperature	156 °F (69 °C)	-
Intake air temperature	-13 °F (-25 °C)	-
Estimated TWC	1,202 °F (650 °C)	-

temperature		
Vehicle speed	26 mph (41 km/h)	-
Fuel trim	0.73	1.47
Fuel feedback	Closed loop at stoichiometric	
Monitoring priority	P0133, P0153	
No active DTCs set (prevents monitor from running)	P0101, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0133, P0134, P0135, P0141, P0157, P0158, P0159, P0171, P0172, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0351, P0352, P0353, P0354, P0355, P0356, P0400, P0401, P0404, P0443, P0496, P0497, P060A, P0722, P1077, P1078, P1128, P1129, P1172, P145C, P1659, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2195, P2227, P2228, P2229, P2237, P2238, P2243, P2245, P2251, P2252, P2272, P2279, P2413, P2646, P2647, P2648, P2649, P2A00	
Other	Has record of deceleration at least once	
	Cruise load or more	

MALFUNCTION THRESHOLD

The front secondary HO2S fluctuation integration value is 3.0 V or more for at least 7.5 seconds.

DRIVING PATTERN

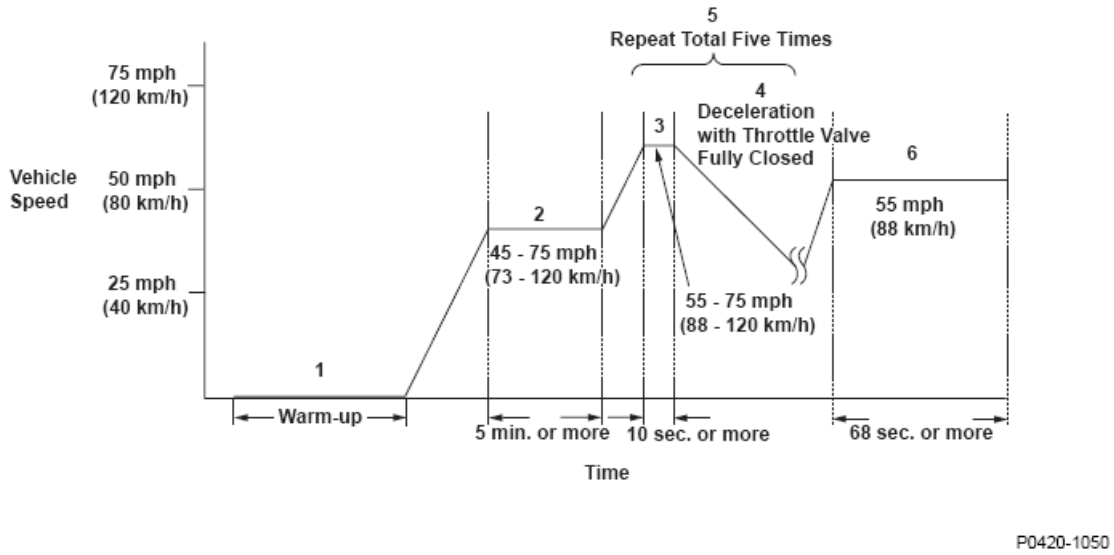

Fig. 89: Vehicle Speed Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in P or N) until the radiator fan comes on.
2. Drive the vehicle at a speed between 45 - 75 mph (73 - 120 km/h) for at least 5 minutes, to warm up the TWC.
3. Drive at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.

4. Decelerate with the throttle valve fully closed.
5. Repeat Driving Pattern steps 3 through 4, four times.
6. Set a vehicle speed of 55 mph (88 km/h) on the cruise control or equivalent, and drive for at least 68 seconds.
    - After disconnecting the battery, extend Driving Pattern step 6 to 4 minutes or longer.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0430: FRONT BANK CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 2) (ENGINE TYPE: J37A4)

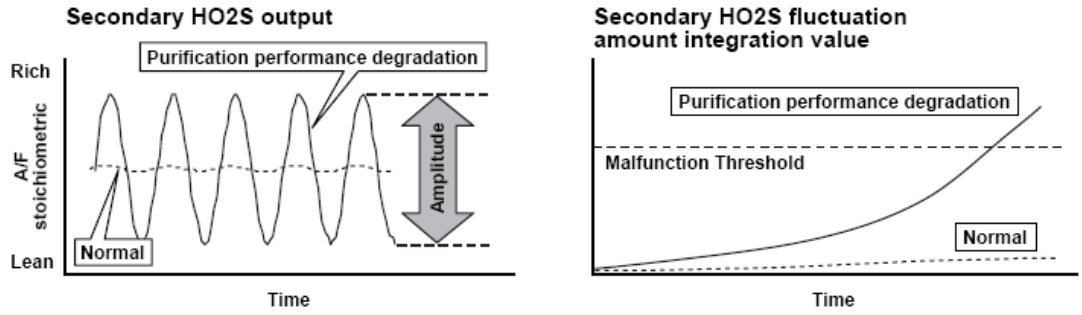

Fig. 90: Secondary HO2S Output Characteristics Curve

GENERAL DESCRIPTION

The front warm up three way catalytic converter (WU-TWC) (bank 2) converts hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx) in the exhaust gas to water vapor, carbon dioxide (CO_2), and dinitrogen (N_2). The engine control module (ECM)/powertrain control module (PCM) fluctuates the air/fuel ratio temporarily to detect the performance of the front WU-TWC and measures the degree of fluctuation in the front secondary heated oxygen sensor (secondary HO2S (bank 2, sensor 2)) output. If the accumulated value for

a set time is too great, deterioration of the performance of the catalyst is detected, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	7.5 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	Minimum	Maximum

Other	Has record of deceleration at least once	
	Cruise load or more	

MALFUNCTION THRESHOLD

The front secondary HO2S fluctuation integration value is 3.0 V or more for at least 7.5 seconds.

DRIVING PATTERN

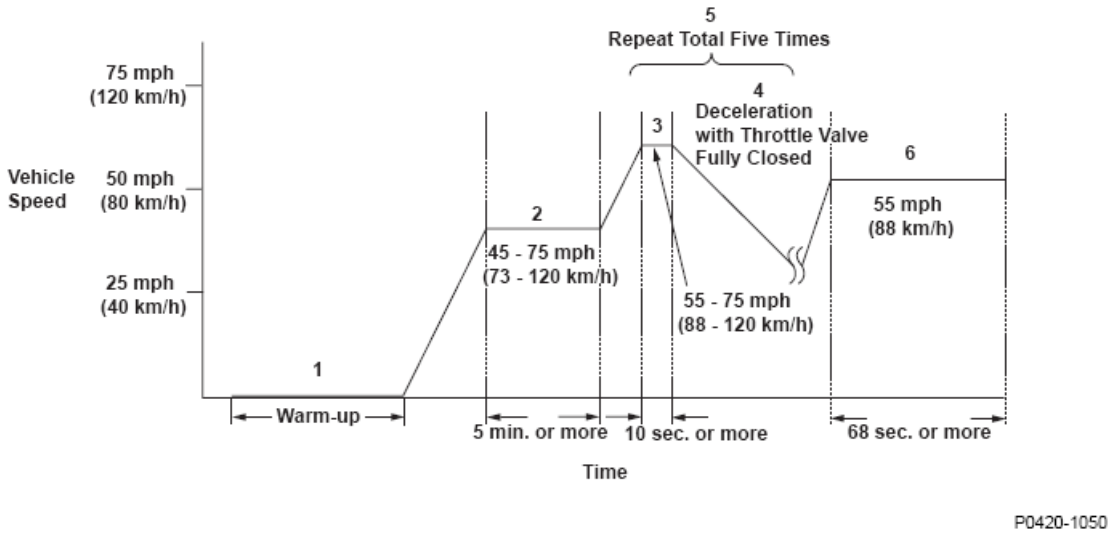

Fig. 91: Vehicle Speed Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 45 - 75 mph (73 - 120 km/h) for at least 5 minutes, to warm up the TWC.
3. Drive at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
4. Decelerate with the throttle valve fully closed.
5. Repeat Driving Pattern steps 3 through 4, four times.
6. Set a vehicle speed of 55 mph (88 km/h) on the cruise control or equivalent, and drive for at least 68 seconds.
    - After disconnecting the battery, extend Driving Pattern step 6 to 4 minutes or longer.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0443: EVAPORATIVE EMISSION (EVAP) CANISTER PURGE VALVE CIRCUIT MALFUNCTION

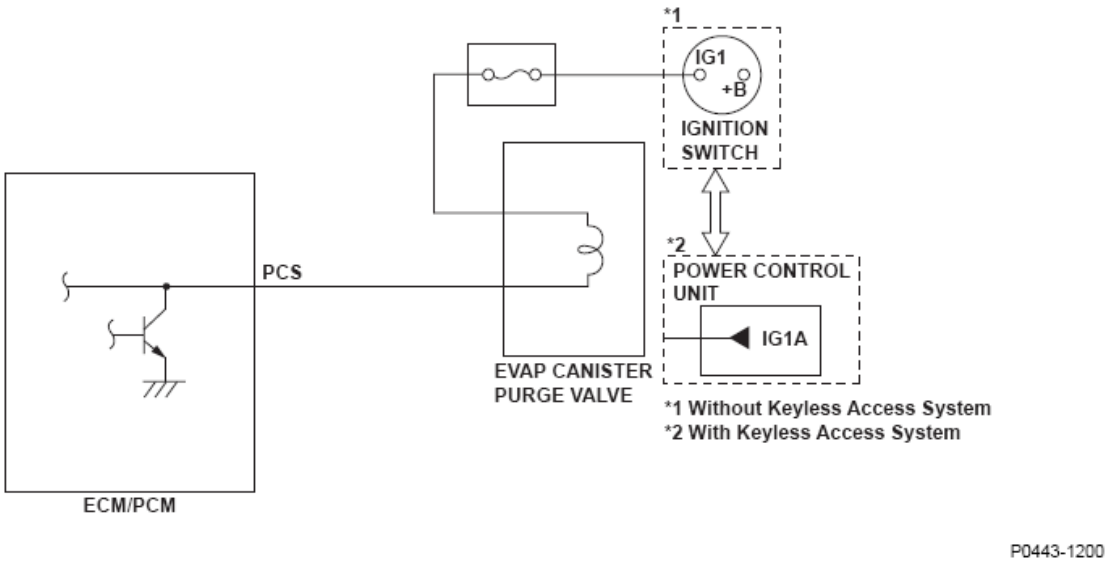

Fig. 92: Evaporative Emission Canister Purge Valve - Circuit Diagram

GENERAL DESCRIPTION

The evaporative emission (EVAP) canister purge valve is attached to the vacuum port between the intake manifold and the EVAP canister. The engine control module (ECM)/powertrain control module (PCM) does not turn on the EVAP canister purge valve when the engine coolant temperature is less than a specified value. The ECM/PCM adjusts the amount of fuel vapor sent to the engine by controlling the EVAP canister purge valve duty cycle. When the return signal does not change according to the EVAP canister purge valve output for a set time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
EVAP canister purge valve output duty	2 %	98 %
State of the engine	Running	

MALFUNCTION THRESHOLD

The return signal does not change according to the EVAP canister purge valve output for at least 5 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0451: FUEL TANK PRESSURE (FTP) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

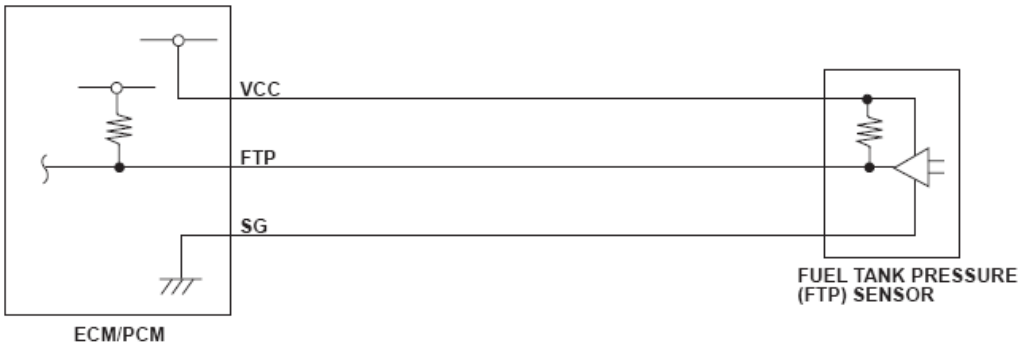

Fig. 93: Fuel Tank Pressure Sensor - Circuit Diagram

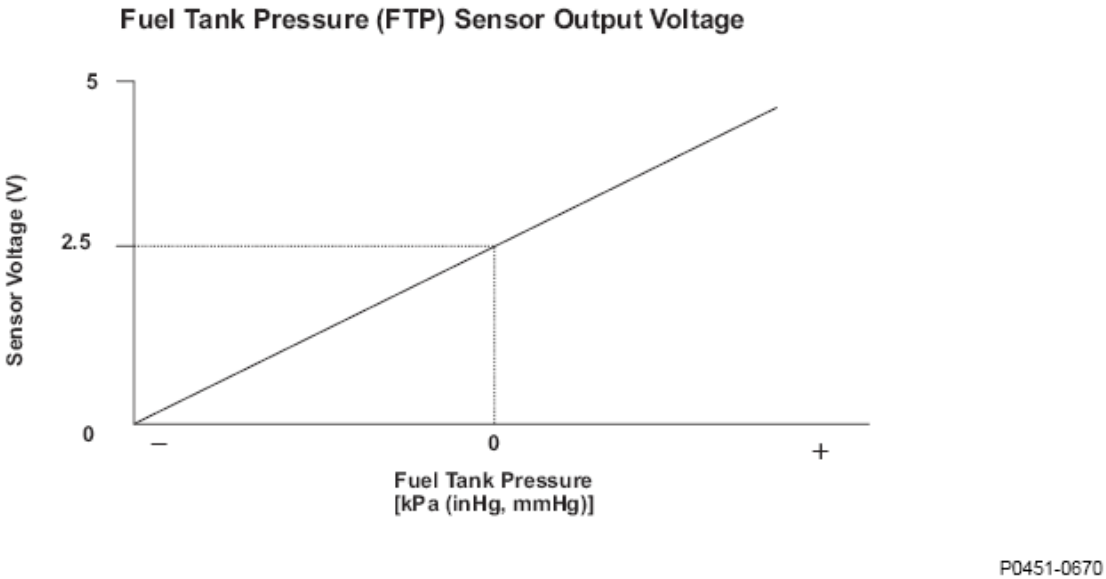

Fig. 94: Fuel Tank Pressure Sensor Output Voltage Graph

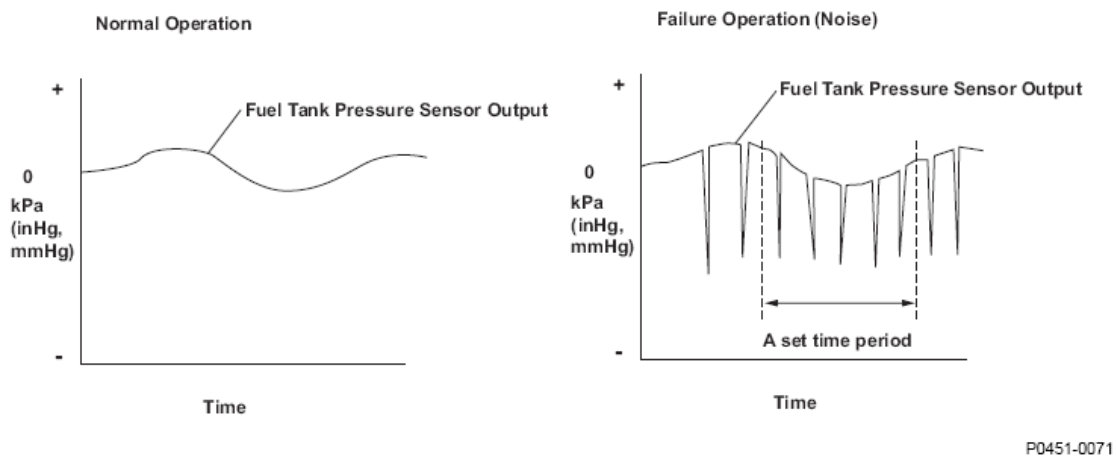

Fig. 95: Fuel Tank Pressure Sensor Output Characteristics Curve (Normal And Failure)

GENERAL DESCRIPTION

The fuel tank pressure (FTP) sensor is installed on the evaporative emission (EVAP) canister. The FTP sensor is used to detect leaks in the EVAP system. The engine control module (ECM)/powertrain control module (PCM) monitors the FTP sensor output voltage. The FTP sensor output voltage rises as the fuel tank pressure increases. Conversely, the FTP sensor output voltage drops as the fuel tank pressure decreases. Rapid changes in the FTP sensor output voltage due to electrical noise or an intermittent open during the EVAP leak detection may cause incorrect leak detection, so abnormal output is monitored. If the FTP sensor output voltage change occurs for specified ratio within a set time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	32 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time after starting the engine	10 seconds	-
Engine coolant temperature	140 °F (60 °C)	-
Battery voltage	10.5 V	-
EVAP canister purge valve duty	Other than 0 %	
Fuel feedback	During deceleration	
No active DTCs set (prevents monitor from running)	P0452, P0453	
Other	Other than purge-cut operation	

MALFUNCTION THRESHOLD

The FTP sensor output voltage fluctuation occurs for more than 30 % within the set time at least 32 seconds.

DRIVING PATTERN

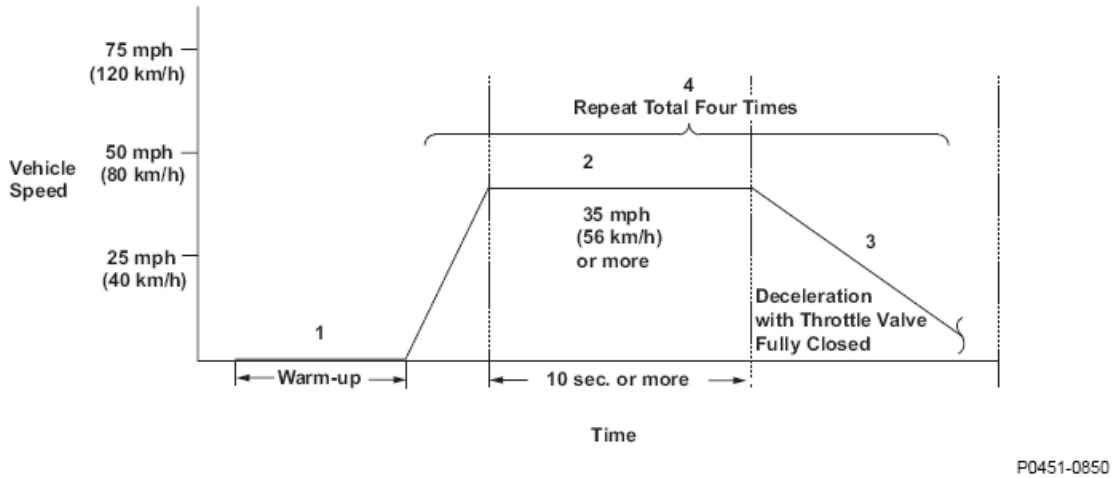

Fig. 96: Vehicle Speed Driving Pattern

1. Start the engine, and let it idle until the radiator fan comes on.
2. Drive the vehicle at a steady speed 35 mph (56 km/h) or more for at least 10 seconds.
3. Decelerate with the throttle valve fully closed.
4. Repeat Driving Pattern steps 2 through 3, three times.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0452: FUEL TANK PRESSURE (FTP) SENSOR CIRCUIT LOW VOLTAGE

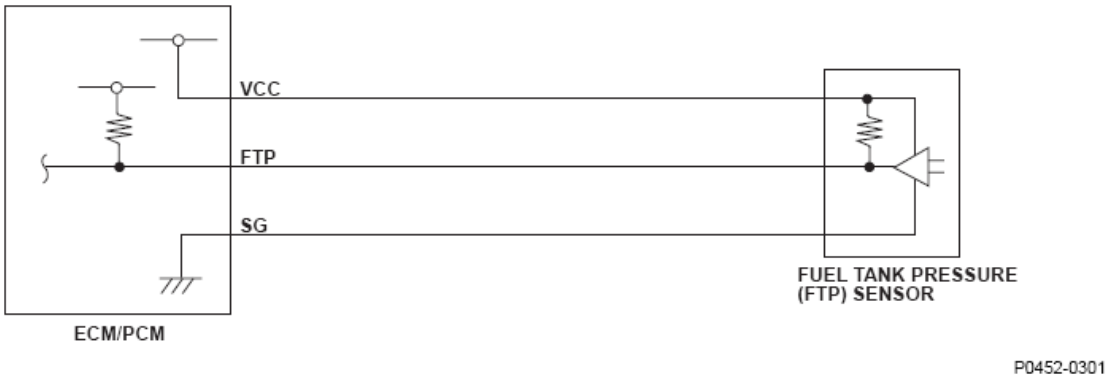

Fig. 97: Fuel Tank Pressure Sensor - Circuit Diagram

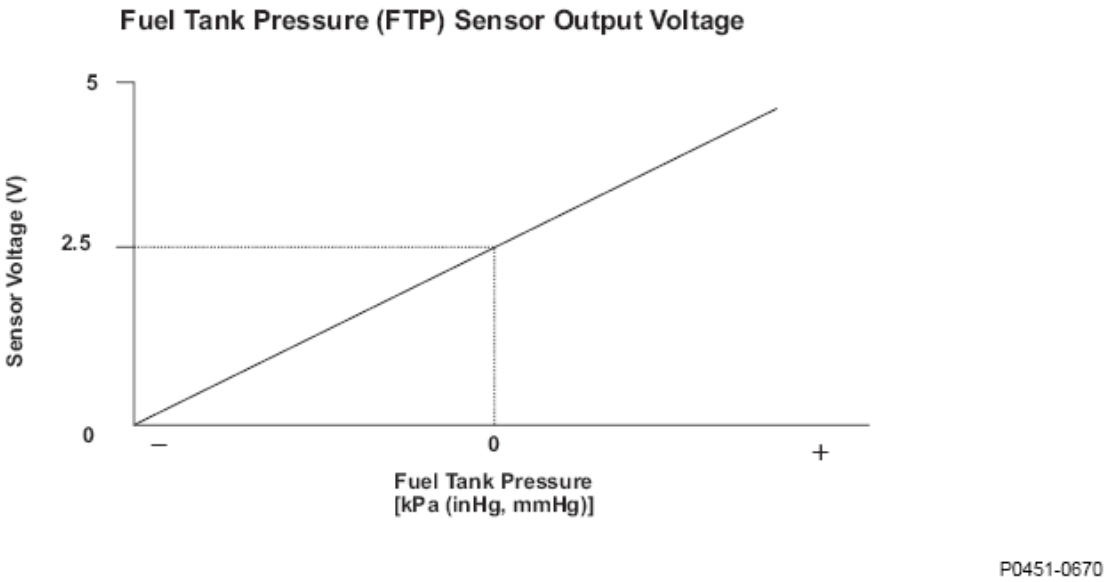

Fig. 98: Fuel Tank Pressure Sensor Output Voltage Graph

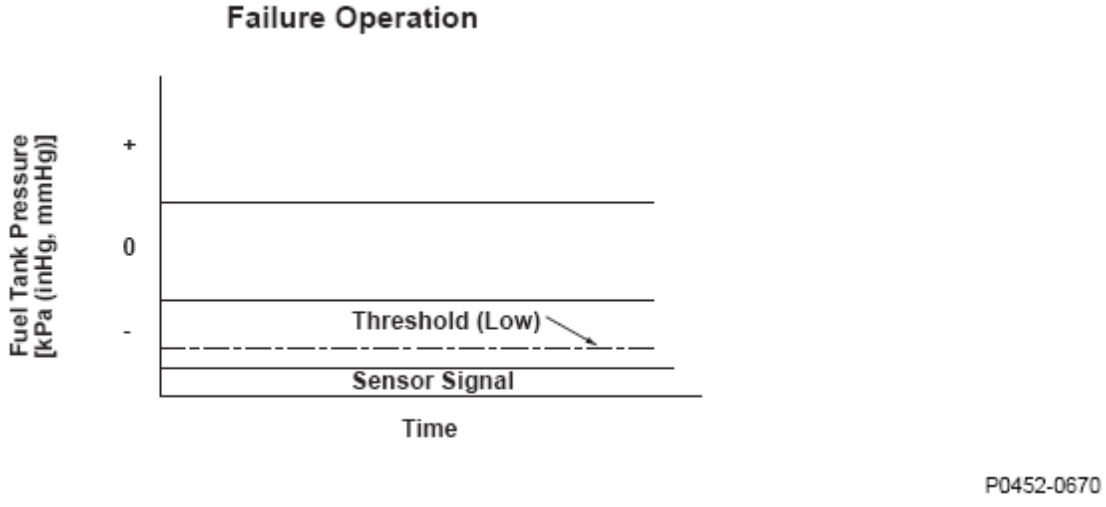

Fig. 99: Fuel Tank Pressure Versus Time Graph (Failure Operation)

GENERAL DESCRIPTION

The fuel tank pressure (FTP) sensor is installed on the evaporative emission (EVAP) canister and detects the fuel tank pressure. The FTP sensor is used to detect leaks in the EVAP system. The engine control module (ECM)/powertrain control module (PCM) monitors the FTP sensor output voltage. The FTP sensor output voltage rises as the fuel tank pressure increases. Conversely, the FTP sensor output voltage drops as the fuel tank pressure decreases. If the FTP sensor output voltage does not reach a target value for a set time after starting the engine in a cold condition, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	3.0 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time after engine start	2.0 seconds	-
Other	At idle	

MALFUNCTION THRESHOLD

The output from the FTP sensor is less than -7 kPa (-2.1 inHg, -55 mmHg) for at least 3.0 seconds.

DRIVING PATTERN

Start the engine in a cold condition, and let it idle until the radiator fan comes on.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0453: FUEL TANK PRESSURE (FTP) SENSOR CIRCUIT HIGH

VOLTAGE

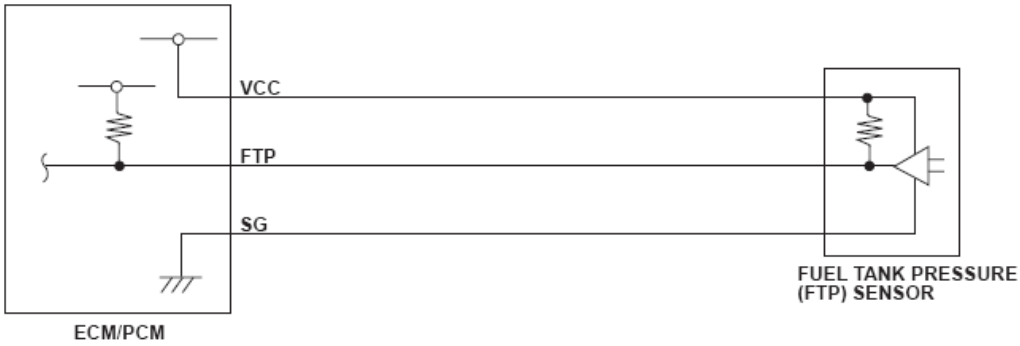

Fig. 100: Fuel Tank Pressure Sensor - Circuit Diagram

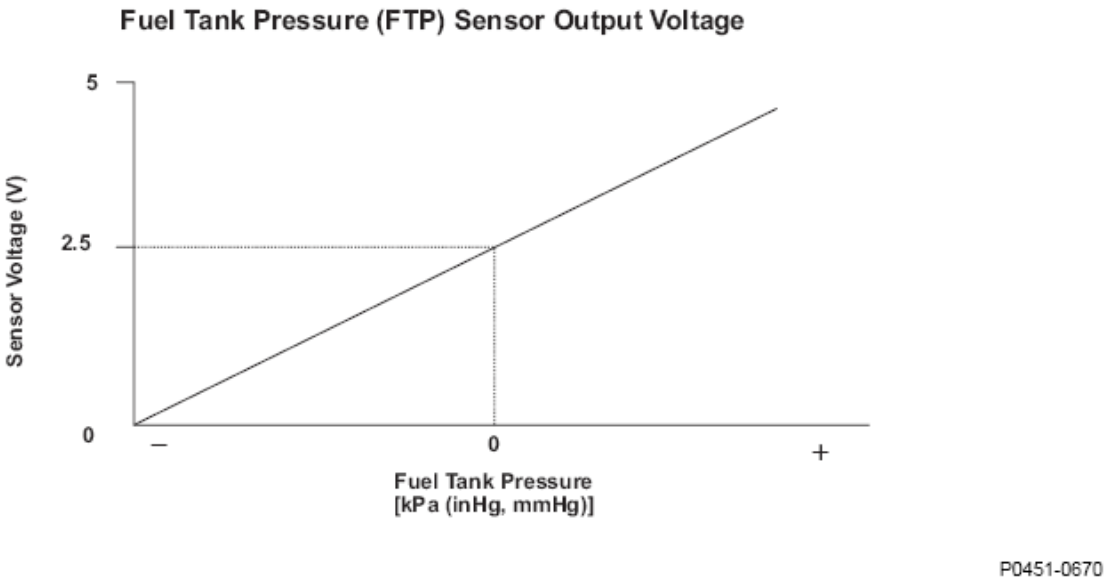

Fig. 101: Fuel Tank Pressure Sensor Output Voltage Graph

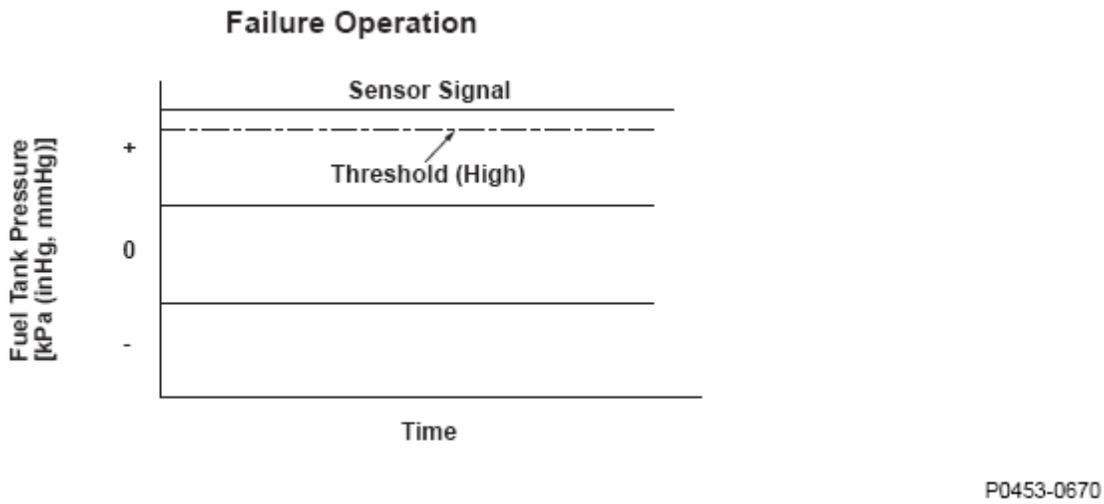

Fig. 102: Fuel Tank Pressure Versus Time Graph (Failure Operation)

GENERAL DESCRIPTION

The fuel tank pressure (FTP) sensor is installed on the evaporative emission (EVAP) canister and detects the fuel tank pressure. The FTP sensor is used to detect leaks in the EVAP system. The engine control module (ECM)/powertrain control module (PCM) monitors the FTP sensor output voltage. The FTP sensor output voltage rises as the fuel tank pressure increases. Conversely, the FTP sensor output voltage drops as the fuel tank pressure decreases. If the FTP sensor output voltage is higher than a target value for a set time after starting the engine in a cold condition, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	3.0 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time after engine start	2 seconds	-
Other	At idle	

MALFUNCTION THRESHOLD

The output from the FTP sensor is more than 7 kPa (2.1 inHg, 55 mmHg) for at least 3.0 seconds.

DRIVING PATTERN

Start the engine in a cold condition, and let it idle until the radiator fan comes on.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0455: EVAPORATIVE EMISSION (EVAP) SYSTEM LARGE LEAK DETECTED

GENERAL DESCRIPTION

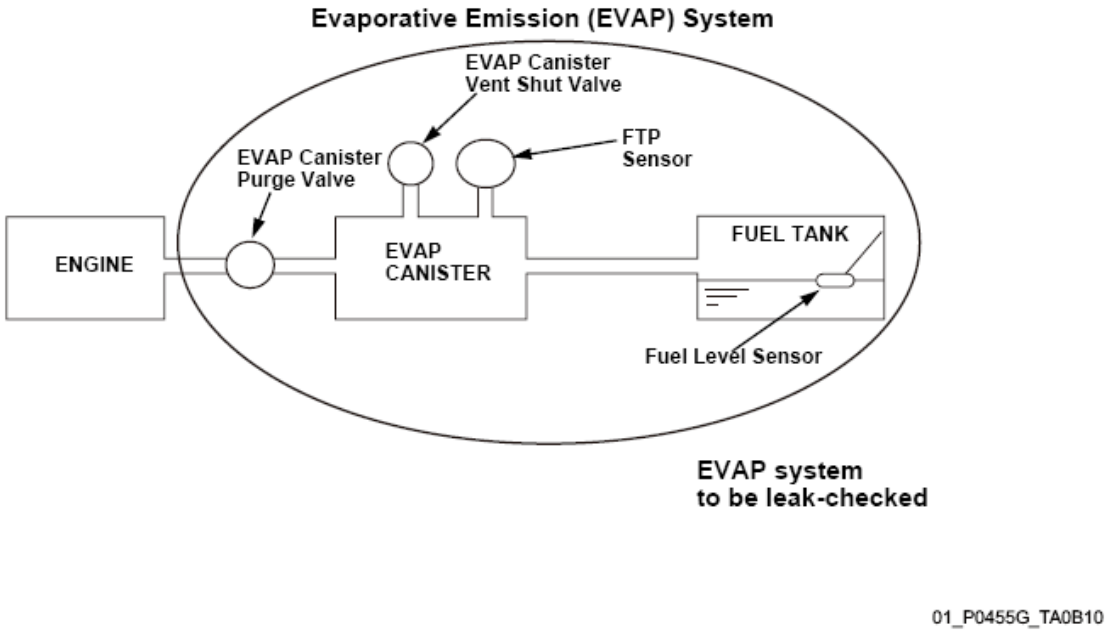

Fig. 103: Evaporative Emission - System Diagram

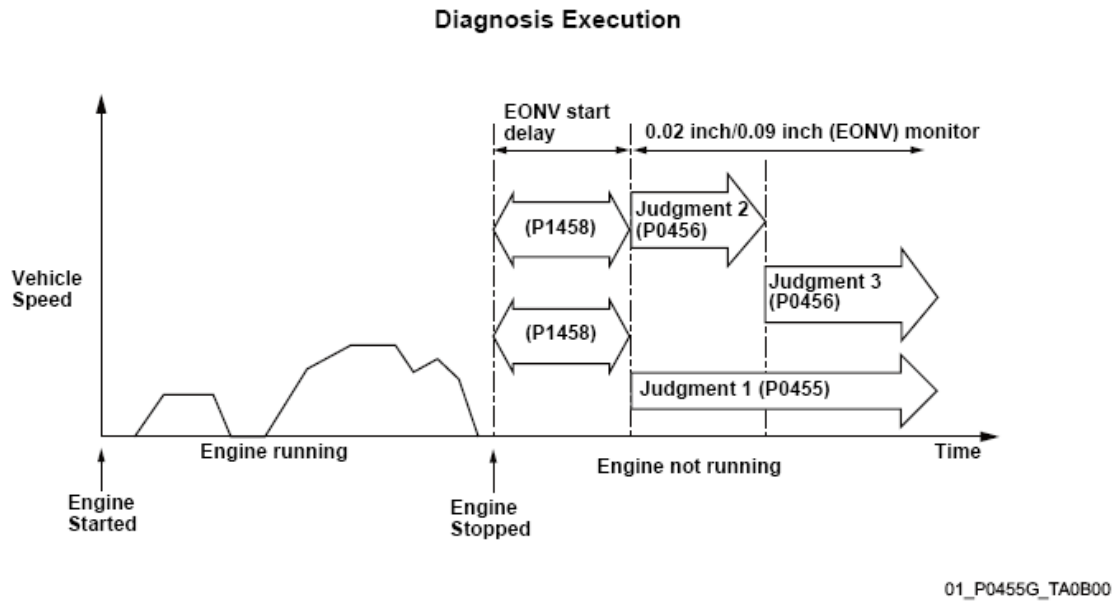

Fig. 104: Evaporative Emission System Diagnosis Execution Graph

The evaporative emission (EVAP) leak detection system uses an engine off natural vacuum (EONV) method. The EONV method detects leakage from the change in fuel tank pressure via the fuel tank pressure (FTP) sensor with the engine off.

Here is an overview of the malfunction detection for the EONV method:

Judgment 1: Judgment of detection of 0.09 inch leak as normal operation

Judgment 2: Judgment of detection of 0.02 inch leak as normal operation

Judgment 3: Detection of 0.02 inch leak

< Judgments 1, 2, and 3 happen at the same time. >

Judgment 1:

After the engine has stopped, the engine control module (ECM)/powertrain control module (PCM) monitors the variation of the FTP sensor output to detect "no 0.09 inch leak" depending on the variation of the pressure inside the fuel tank.

- If the variation of the pressure is a specified value and continues for a specified duration, it is identified as a "0.09 inch leak" and the diagnosis completes.
- If the variation of the pressure is a specified value before a specified duration has passed, it is defined as "no 0.09 inch leak", the judgment of detection of a 0.09 inch leak is completed, and it goes to 0.02 inch leak monitor.

Judgment 2:

After the engine has stopped, the ECM/PCM monitors the variation of the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the increasing pressure inside the fuel tank.

- If "no 0.02 inch leak" is detected, it is identified as normal; the diagnosis is complete.
- If the pressure inside the fuel tank does not increase a specified value within a specified duration, it goes to Judgment 3.

Judgment 3:

The ECM/PCM continues to monitor the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the decreasing pressure inside the fuel tank until the detection completes.

- If a "0.02 inch leak" is detected, it is identified as a malfunction; the diagnosis is complete.
- If "no leakage" is detected, it is identified as normal; the diagnosis is complete.
- If the pressure is not atmospheric pressure or less when the detection is completed, that data is stored and the diagnosis is complete.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	At least 11 minutes, 37 seconds but not more than 36 minutes, 37 seconds
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time before starting the engine	6 hours	-
Initial condition A(1)	-	36 °F (20 °C)
Initial condition B(2)	-	18 °F (10 °C)
Initial engine coolant temperature	40 °F (5 °C)	95 °F (35 °C)
Initial intake air temperature	40 °F (5 °C)	95 °F (35 °C)
Barometric pressure	76 kPa (22.5 inHg, 569 mmHg)	-
Battery voltage	10.5 V	-
No active DTCs set (prevents monitor from running)	P0111, P0112, P0113, P0116, P0117, P0118, P0125, P0443, P0451, P0452, P0453, P0496, P0497, P0498, P0499, P0685, P0720, P0722, P1116, P1454, P1458, P145C, P2227, P2228, P2229, P2422, P2610	
Other	Avoid abrupt acceleration, deceleration, and turns	
	Test-drive on a flat road to avoid misdetection	

	No refueling is required
	Vehicle stopped
(1) The initial intake air temperature minus the current intake air temperature	
(2) The initial engine coolant temperature minus the initial intake air temperature	

MALFUNCTION THRESHOLD

The variation of pressure inside the fuel tank is 0.03 kPa (0.009 inHg, 0.24 mmHg) or less.

CONFIRMATION PROCEDURE

With the HDS

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

With the Driving Pattern

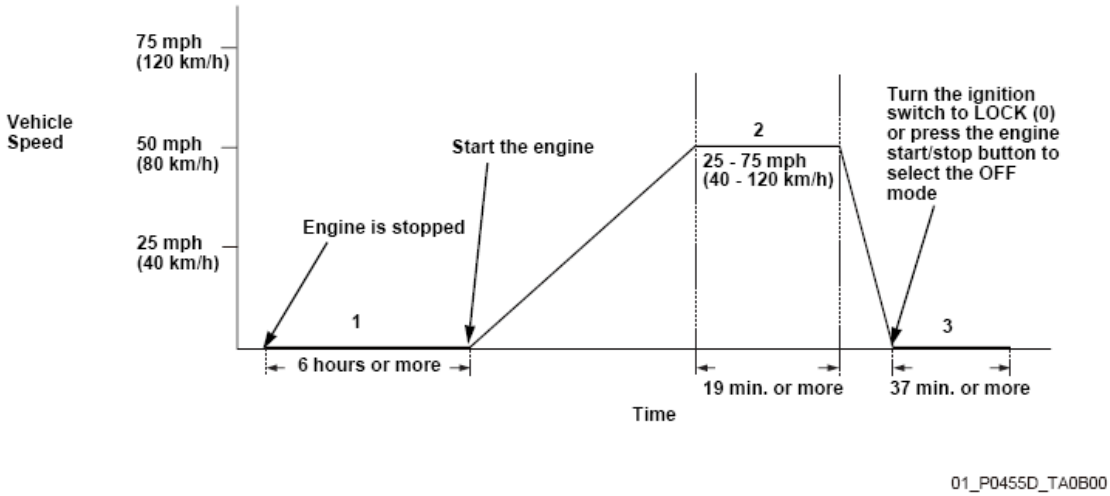

Fig. 105: Vehicle Speed Driving Pattern

1. After the vehicle has been left for an appropriate amount of time as specified, with the engine coolant temperature and intake air temperature within the specified range, start the engine.
2. Drive the vehicle immediately at a speed between 25 - 75 mph (40 - 120 km/h) for at least 19 minutes.
3. After stopping the vehicle, turn the ignition switch to LOCK (0) or press the engine start/stop button to select the OFF mode, and leave the vehicle in this condition for at least 37 minutes (EONV executes).
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air

temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0456: EVAPORATIVE EMISSION (EVAP) SYSTEM VERY SMALL LEAK DETECTED

GENERAL DESCRIPTION

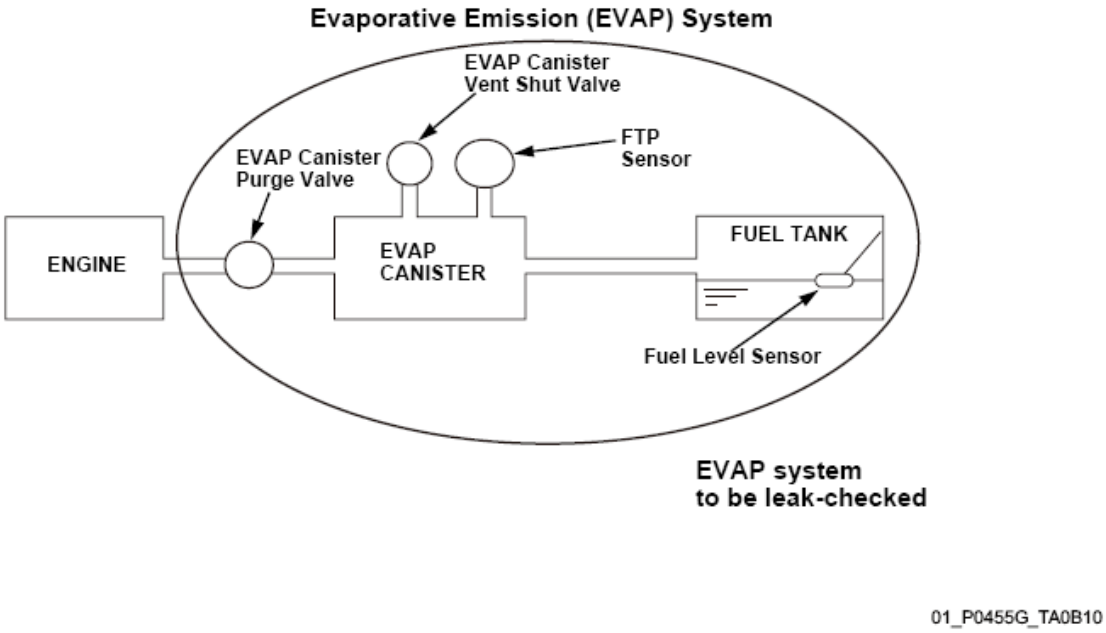

Fig. 106: Evaporative Emission - System Diagram

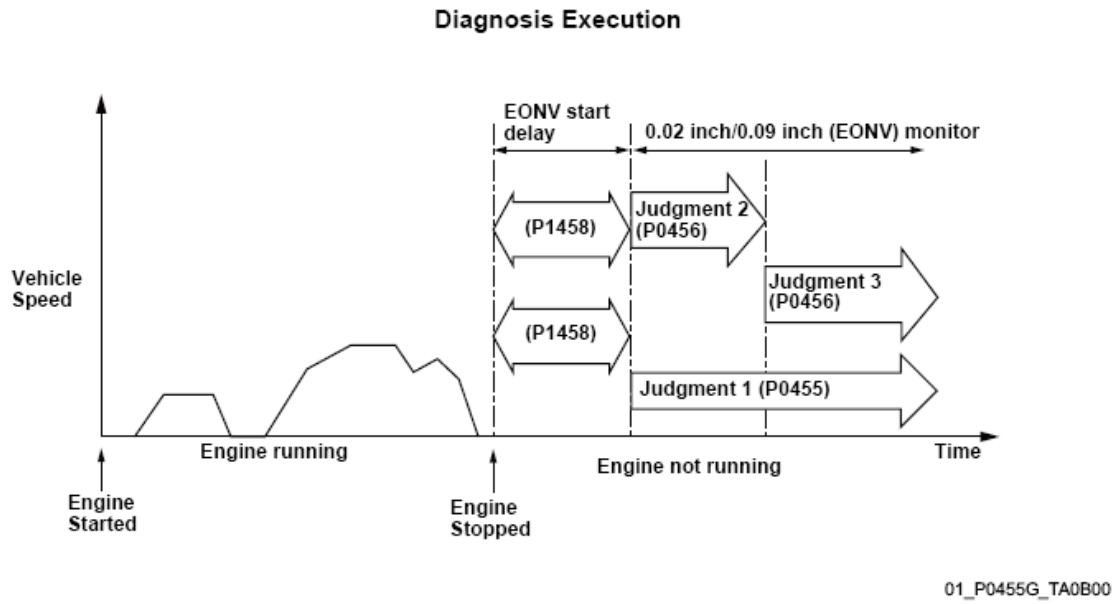

Fig. 107: Evaporative Emission System Diagnosis Execution Graph

The evaporative emission (EVAP) leak detection system uses an engine off natural vacuum (EONV) method. The EONV method detects leakage from the change in fuel tank pressure via the fuel tank pressure (FTP) sensor with the engine off.

Here is an overview of the malfunction detection for the EONV method:

Judgment 1: Judgment of detection of 0.09 inch leak as normal operation

Judgment 2: Judgment of detection of 0.02 inch leak as normal operation

Judgment 3: Detection of 0.02 inch leak

< Judgments 1, 2, and 3 happen at the same time. >

Judgment 1:

After the engine has stopped, the engine control module (ECM)/powertrain control module (PCM) monitors the variation of the FTP sensor output to detect "no 0.09 inch leak" depending on the variation of the pressure inside the fuel tank.

- If the variation of the pressure is a specified value and continues for a specified duration, it is identified as a "0.09 inch leak" and the diagnosis completes.
- If the variation of the pressure is a specified value before a specified duration has passed, it is defined as "no 0.09 inch leak", the judgment of detection of a 0.09 inch leak is completed, and it goes to 0.02 inch leak monitor.

Judgment 2:

After the engine has stopped, the ECM/PCM monitors the variation of the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the increasing pressure inside the fuel tank.

- If "no 0.02 inch leak" is detected, it is identified as normal; the diagnosis is complete.
- If the pressure inside the fuel tank does not increase a specified value within a specified duration, it goes to Judgment 3.

Judgment 3:

The ECM/PCM continues to monitor the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the decreasing pressure inside the fuel tank until the detection completes.

- If a "0.02 inch leak" is detected, it is identified as a malfunction; the diagnosis is complete.
- If "no leakage" is detected, it is identified as normal; the diagnosis is complete.
- If the pressure is not atmospheric pressure or less when the detection is completed, that data is stored and the diagnosis is complete.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	P0455 is judged as OK
Duration	At least 11 minutes, 37 seconds but not more than 36 minutes, 37 seconds
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time before starting the engine	6 hours	-
Initial condition A(1)	-	36 °F (20 °C)
Initial condition B(2)	-	18 °F (10 °C)
Initial engine coolant temperature	40 °F (5 °C)	95 °F (35 °C)
Initial intake air temperature	40 °F (5 °C)	95 °F (35 °C)
Barometric pressure	76 kPa (22.5 inHg, 569 mmHg)	-
Battery voltage	10.5 V	-
No active DTCs set (prevents monitor from running)	P0111, P0112, P0113, P0116, P0117, P0118, P0125, P0443, P0451, P0452, P0453, P0496, P0497, P0498, P0499, P0685, P0720, P0722, P1116, P1454, P1458, P145C, P2227, P2228, P2229, P2422, P2610	
Other	Avoid abrupt acceleration, deceleration, and turns	
	Test-drive on a flat road to avoid misdetection	

	No refueling is required
	Vehicle stopped
(1) The initial intake air temperature minus the current intake air temperature	
(2) The initial engine coolant temperature minus the initial intake air temperature	

MALFUNCTION THRESHOLD

- The change rate of the pressure rise slope inside the fuel tank is 4.0 or more.
- The change rate of the pressure descending slope inside the fuel tank is 0.8 or more.
- The barometric pressure is stable for at least 30 minutes.

CONFIRMATION PROCEDURE

With the HDS

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

With the Driving Pattern

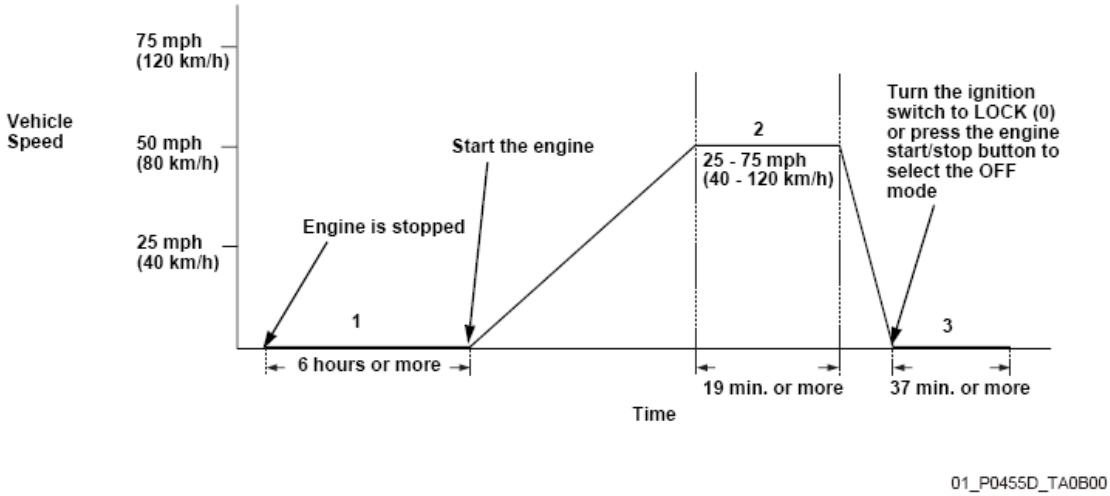

Fig. 108: Vehicle Speed Driving Pattern

1. After the vehicle has been left for an appropriate amount of time as specified, with the engine coolant temperature and intake air temperature within the specified range, start the engine.
2. Drive the vehicle immediately at a speed between 25 - 75 mph (40 - 120 km/h) for at least 19 minutes.
3. After stopping the vehicle, turn the ignition switch to LOCK (0) or press the engine start/stop button to select the OFF mode, and leave the vehicle in this condition for at least 37 minutes (EONV executes).
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0457: EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTED/FUEL FILL CAP LOOSE OR MISSING

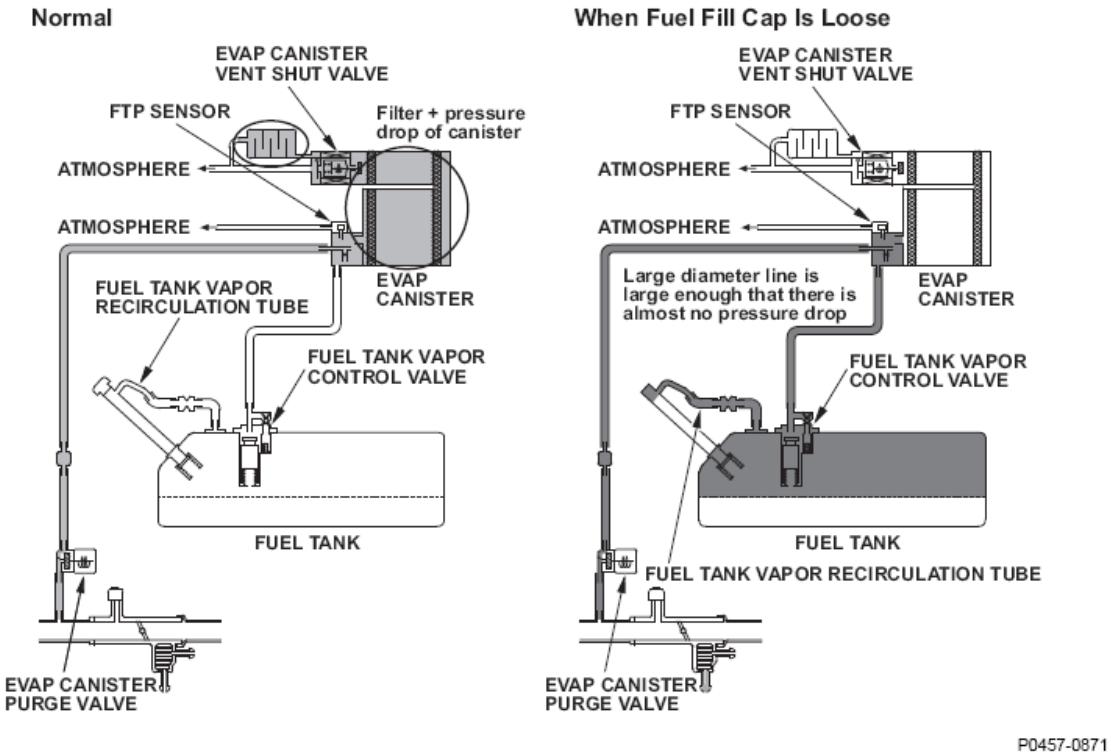

Fig. 109: Evaporative Emission - System Diagram

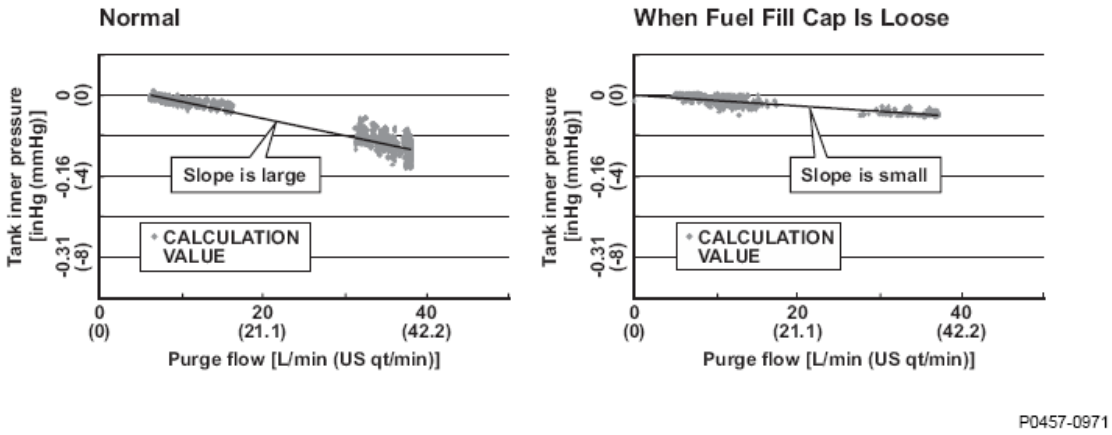

Fig. 110: Evaporative Emission System Characteristics Curve

GENERAL DESCRIPTION

When the fuel fill cap is installed properly, purge flow occurs due to the airflow resistance of the canister, and tank pressure will be reduced. When the fuel fill cap is loosened, the fuel tank pressure will not decrease even when the airflow resistance decreases and purge flow occurs, because air is being vented from the tank to the atmosphere. By checking the fuel tank pressure with various purge flows, and using the above characteristics, a loose fuel fill cap is detected. The engine control module (ECM)/powertrain control module (PCM) calculates the relationship of the purge flow and fuel tank pressure (FTP) sensor, and when the slope of the decreasing fuel tank pressure to the purge flow increase is small, the ECM/PCM detects a loose fuel fill cap and stores a DTC. The failure detection is normally done during purge.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	P0455 or P0456 are judged as NG
Duration	12 seconds or more
DTC Type	One drive cycle, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine coolant temperature before EVAP purge control starts	140 °F (60 °C)	-
Barometric pressure	76 kPa (22.5 inHg, 569 mmHg)	-
Vehicle speed	2 mph (2 km/h)	-
Battery voltage	10.5 V	-

Fuel trim	0.73	1.47
Low purge flow side detection	5 L/min (5.3 US qt/min, 4.4 lmp qt/min)	10 L/min (10.5 US qt/min, 8.7 lmp qt/min)
High purge flow side detection	61 L/min (64.5 US qt/min, 53.7 lmp qt/min)	-
Fuel feedback	Closed loop at stoichiometric	
No active DTCs set (prevents monitor from running)	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0134, P0135, P0154, P0155, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0351, P0352, P0353, P0354, P0355, P0356, P0443, P0451, P0452, P0453, P0496, P0497, P0498, P0499, P0720, P0722, P1128, P1129, P1172, P1174, P1454, P145C, P2195, P2197, P2227, P2228, P2229, P2237, P2238, P2240, P2241, P2243, P2245, P2247, P2249, P2251, P2252, P2254, P2255, P2279, P2422, U0029, U0155	
Other	No refueling is required	

MALFUNCTION THRESHOLD

The output from the fuel cap monitor is 0.065 or less for at least 12 seconds (when there is no NG judgment history in this drive cycle).

CONFIRMATION PROCEDURE WITH THE HDS

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

DRIVING PATTERN

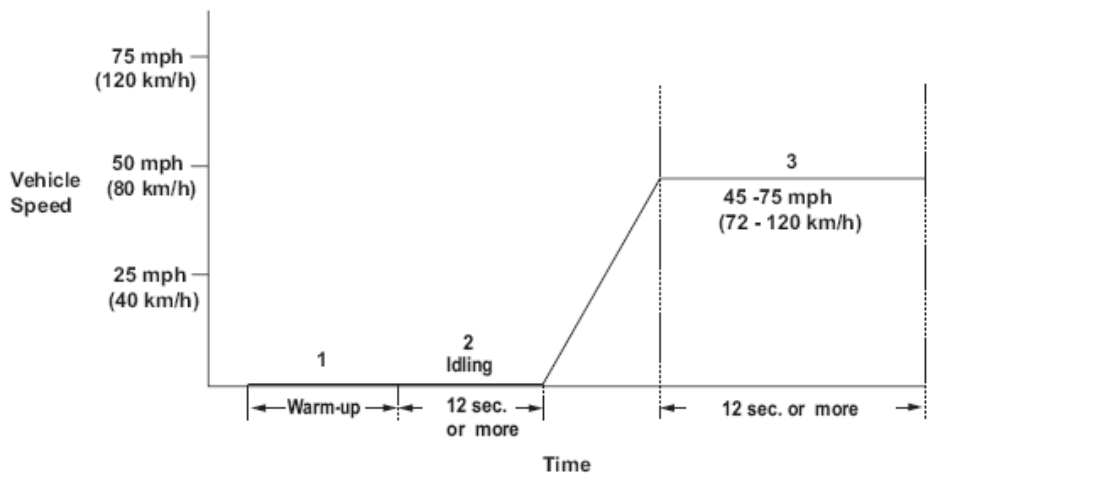

Fig. 111: Vehicle Speed Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Let the engine idle for at least 12 seconds.
3. Drive the vehicle immediately at a speed between 45 - 75 mph (72 - 120 km/h) for at least 12 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for illuminating the fuel fill cap caution

1. When a loose fuel fill cap is judged by this detection, the fuel fill cap caution is displayed. At this time, a DTC is not stored.
2. When the first drive cycle leak judgment (Pending DTC stored) is detected at a 0.02 inch leak or a 0.09 inch leak, the fuel fill cap caution is displayed the next time the ignition switch is turned to ON (II) or the engine start/stop button is pressed to select the ON mode.

Conditions for clearing the fuel fill cap caution

1. When the fuel fill cap caution is displayed by the first drive cycle leak judgment (Pending DTC stored) at a 0.02 inch leak or a 0.09 inch leak, the fuel fill cap caution goes out when the next failure occurs (second drive cycle) and P0457 is stored. (MIL illuminates)
2. When no leak is judged by a 0.02 inch leak or a 0.09 inch leak after the fuel fill cap caution is displayed, the fuel fill cap caution goes out the next time the ignition switch is turned to ON (II) or the engine start/stop button is pressed to select the ON mode. (P0457 is not stored at this time)
3. When driven three times without this failure detected and a 0.02 inch leak or a 0.09 inch leak detection is not done after the fuel fill cap caution is displayed, the fuel fill cap caution goes out. (P0457 is not stored at this time)
4. Use the Clear command of scan tool to erase the caution. The caution is erased when the MIL is illuminated.

DTC P0461: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT RANGE/PERFORMANCE PROBLEM

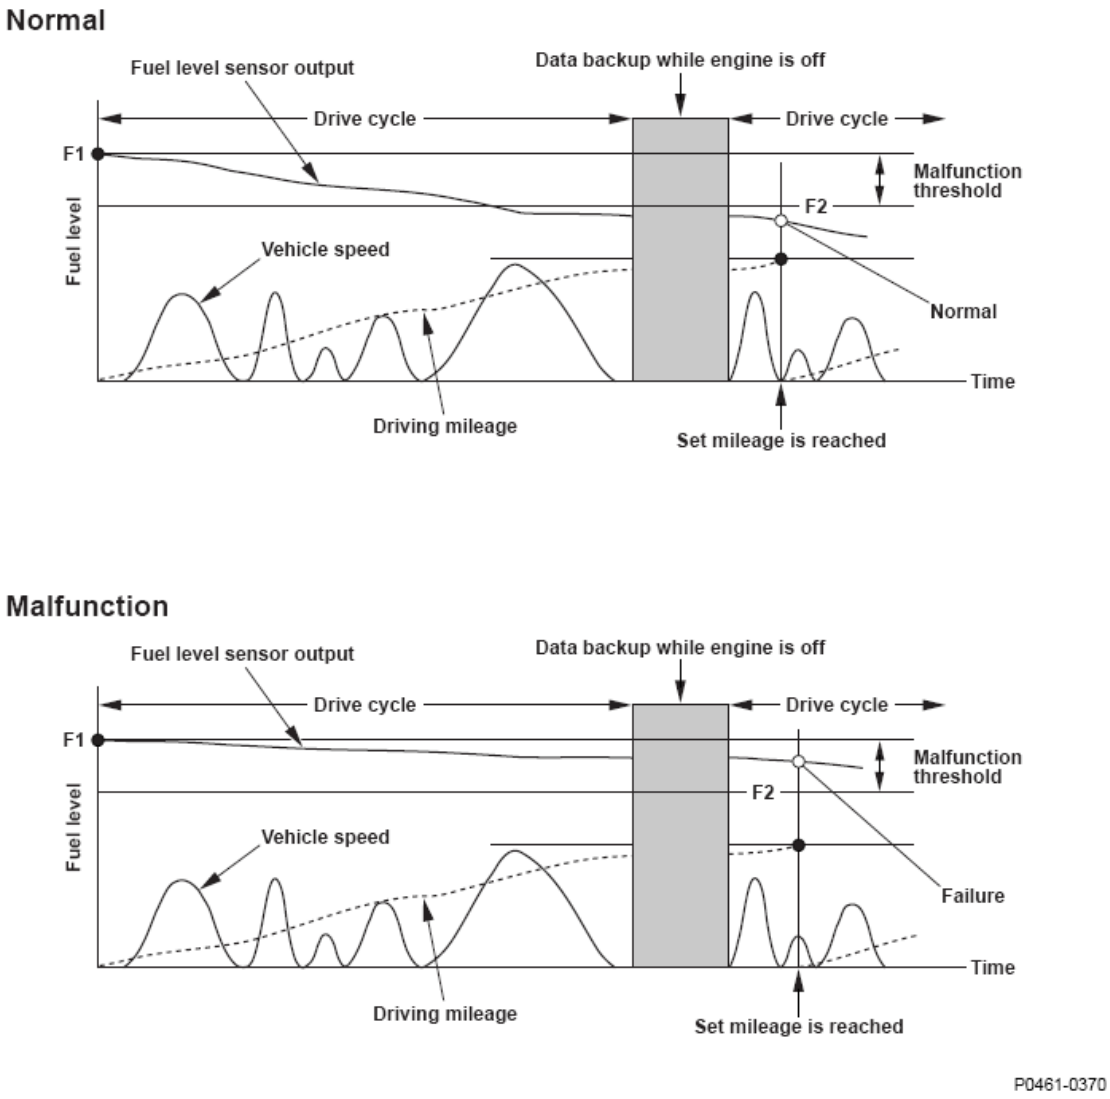

Fig. 112: Fuel Level Sensor Characteristics Curve (Normal And Malfunction)

GENERAL DESCRIPTION

The fuel level sensor is incorporated with the fuel pump and installed in the fuel tank. Using a built-in potentiometer and float, it converts the movement of the float into electrical signals that correspond to the fuel level, and it indicates the amount of fuel in the fuel tank. If the engine control module (ECM)/powertrain control module (PCM) receives no change in the fuel level sensor output after driving for a specified number of miles, it detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Every 125 miles (200 km)
Sequence	P0455 or P0456 is judged as NG
Duration	-
DTC Type	One drive cycle, MIL off

OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Mileage	125 miles (200 km)	-
No active DTCs set (prevents monitor from running)	P0462, P0463, P0720, P0722, U0029, U0155	
Other	Avoid driving and stopping on a steep road	

MALFUNCTION THRESHOLD

The change in the fuel level sensor output is 3.5 % or less.

DRIVING PATTERN

Drive for 125 miles (200 km) or more under Enable Conditions (see "Other") without refueling (turning the ignition switch to LOCK (0) or pressing the engine start/stop button to select the OFF mode is acceptable).

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected in a certain drive cycle and a malfunction of 0.02 inch leak is detected in the same drive cycle, and DTC P0456 is stored, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, Confirmed DTC and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0462: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT LOW VOLTAGE

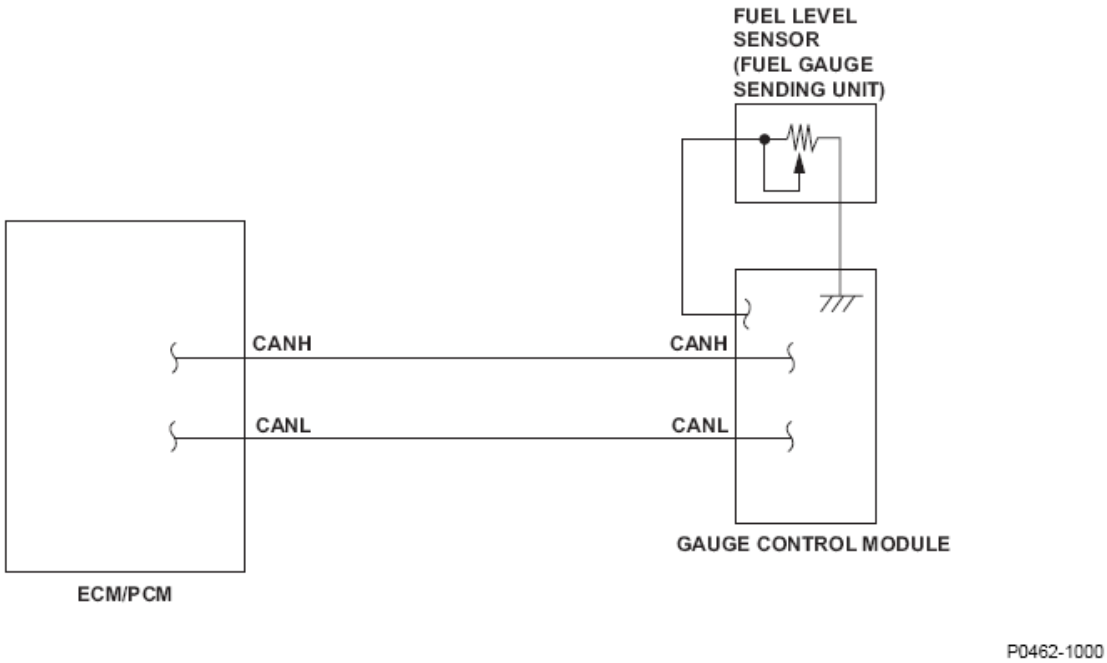

Fig. 113: Fuel Level Sensor - Circuit Diagram

GENERAL DESCRIPTION

The fuel level sensor (fuel gauge sending unit) is incorporated into the fuel pump and installed in the fuel tank. Using a built-in potentiometer and float, it converts the movement of the float to electrical signals as an output that corresponds to fuel level variations in the fuel tank. The fuel level, which is indicated by the gauge control module, is sent to the engine control module (ECM)/powertrain control module (PCM) via the controller area network (CAN). If the ECM/PCM detects a signal from the fuel level sensor (fuel gauge sending unit) below a predetermined value for a set time, it detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
Ignition switch(1)	ON (II)	
Engine start/stop button(2)	ON mode	
No active DTCs set (prevents monitor from running)	P0463, U0029, U0155	

(1) Without keyless access system

(2) With keyless access system

MALFUNCTION THRESHOLD

The fuel level sensor (fuel gauge sending unit) output voltage is 0.10 V or less for at least 5 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0463: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT HIGH VOLTAGE

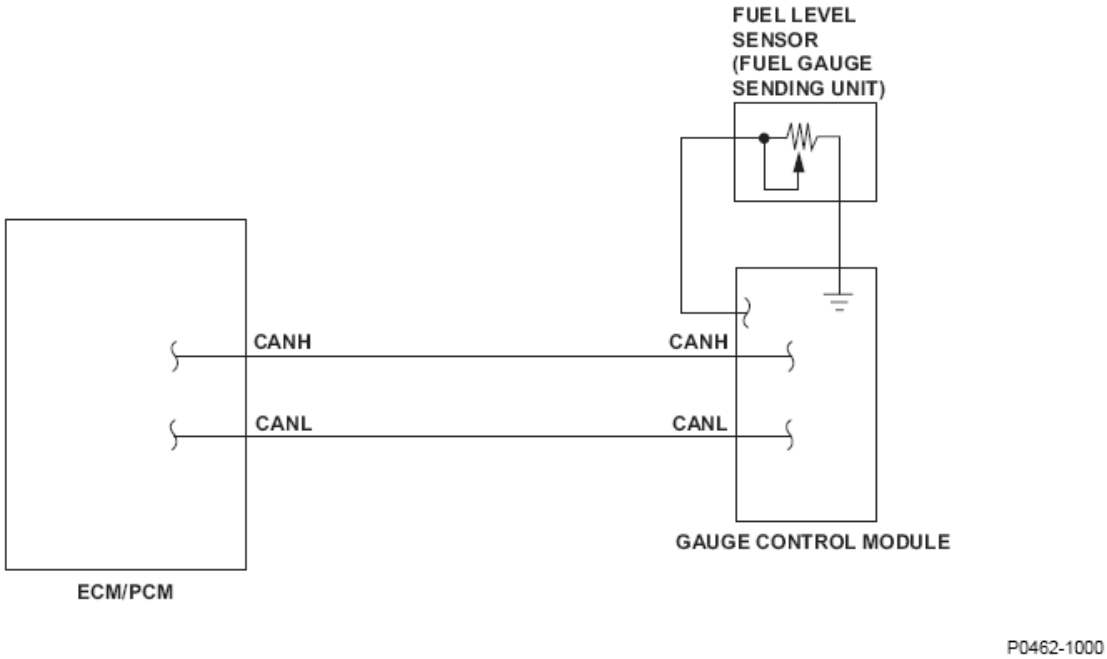

Fig. 114: Fuel Level Sensor - Circuit Diagram

GENERAL DESCRIPTION

The fuel level sensor (fuel gauge sending unit) is incorporated into the fuel pump and installed in the fuel tank. Using a built-in potentiometer and float, it converts the movement of the float to electrical signals as an output that corresponds to fuel level variations in the fuel tank. The fuel level, which is indicated by the gauge control module, is sent to the engine control module (ECM)/powertrain control module (PCM) via the controller area network (CAN). If the ECM/PCM detects a signal from the fuel level sensor (fuel gauge sending unit) above a predetermined value for a set time, it detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
Ignition switch(1)	ON (II)	
Engine start/stop button(2)	ON mode	
No active DTCs set (prevents monitor from running)	P0462, U0029, U0155	
(1) Without keyless access system (2) With keyless access system		

MALFUNCTION THRESHOLD

The fuel level sensor (fuel gauge sending unit) output voltage is 4.92 V or more for at least 5 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0496: EVAPORATIVE EMISSION (EVAP) SYSTEM HIGH PURGE FLOW DETECTED

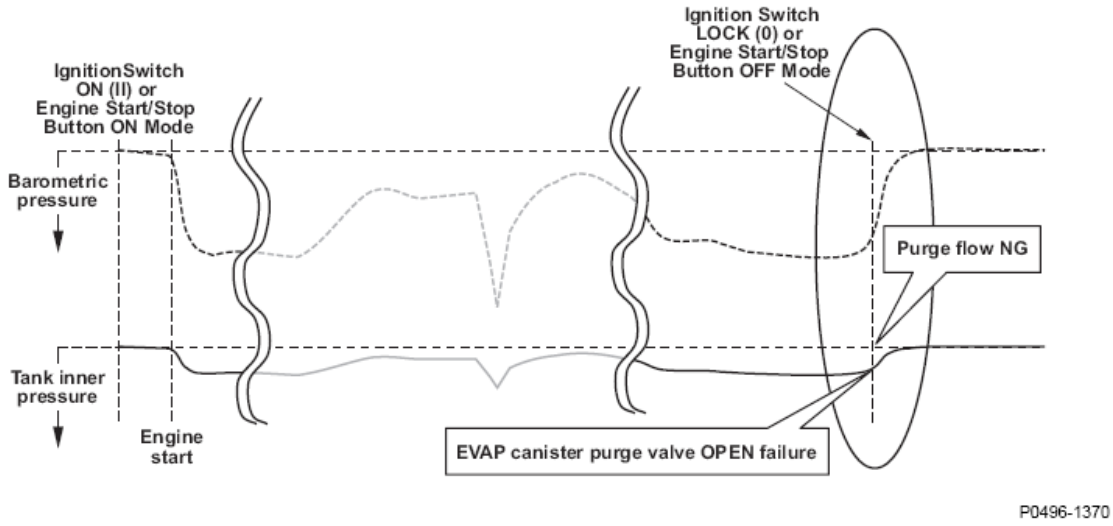

Fig. 115: Evaporative Emission System Characteristics Curve

GENERAL DESCRIPTION

The fuel vapor in the fuel tank is temporarily stored in the evaporative emission (EVAP) canister and drawn into the engine through the EVAP canister purge valve. The engine control module (ECM)/powertrain control module (PCM) controls the amount of vapor introduced into the engine by varying the duty cycle of the EVAP canister purge valve according to the condition of the engine.

< STEP 1 >

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve duty cycle is transmitted to the fuel tank pressure (FTP) sensor during purge flow (pulse method).

OK determination: Pulse exists (P145C OK)

- P0497 Purge flow OK
- P0496 EVAP canister purge valve stuck Open OK

NG determination: No pulse (P145C NG)

- Either purge flow P0497 abnormality or P0496 EVAP canister purge valve OPEN failure.
- In this case, classify the failed part according to < STEP 2 >.

< STEP 2 >

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve is stuck OPEN: When the FTP sensor fluctuates from negative pressure to atmospheric pressure after the ignition switch is turned to LOCK (0) or the engine start/stop button is pressed to select the OFF mode: P0496 EVAP canister purge valve stuck OPEN When there is no fluctuation of the FTP sensor: P0497 purge flow NG

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	P145C is judged as NG
Duration	-
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Low load duration time	10 seconds	-
Wait for stability after the ignition switch is turned to LOCK (0) or the engine start/stop button is pressed to select the OFF mode	10 seconds	-
Engine coolant temperature before EVAP purge control starts	140 °F (60 °C)	-
No active DTCs set (prevents monitor from running)	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0134, P0135, P0154, P0155, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0351, P0352, P0353, P0354, P0355, P0356, P0443, P0451, P0452, P0453, P0498, P0499, P0685, P1128, P1129, P1172, P1174, P1454, P2195, P2197, P2227, P2228, P2229, P2237, P2238, P2240, P2241, P2243, P2245, P2247, P2249, P2251, P2252, P2254, P2255, P2279, P2422	

MALFUNCTION THRESHOLD

The output from the FTP sensor is 0.3 kPa (0.08 inHg, 2 mmHg) or more for at least 10 seconds.

CONFIRMATION PROCEDURE WITH THE HDS

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Let the engine idle for at least 64 seconds.
3. Turn the ignition switch to LOCK (0) or press the engine start/stop button to select the OFF mode for at least 10 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0497: EVAPORATIVE EMISSION (EVAP) SYSTEM LOW PURGE FLOW DETECTED

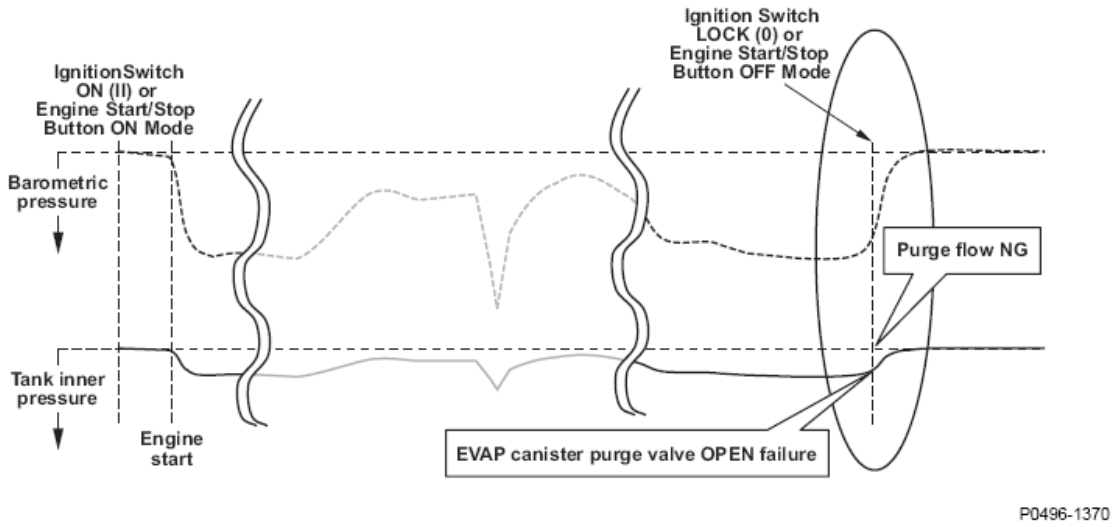

Fig. 116: Evaporative Emission System Characteristics Curve

GENERAL DESCRIPTION

The fuel vapor in the fuel tank is temporarily stored in the evaporative emission (EVAP) canister and drawn into the engine through the EVAP canister purge valve. The engine control module (ECM)/powertrain control module (PCM) controls the amount of vapor introduced into the engine by varying the duty cycle of the EVAP canister purge valve according to the condition of the engine.

< STEP 1 >

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve duty cycle is transmitted to the fuel tank pressure (FTP) sensor during purge flow (pulse method).

OK determination: Pulse exists (P145C OK)

- P0497 Purge flow OK
- P0496 EVAP canister purge valve stuck OPEN OK

NG determination: No pulse (P145C NG)

- Either purge flow P0497 abnormality or P0496 EVAP canister purge valve OPEN failure.
- In this case, classify the failed part according to < STEP 2 >.

< STEP 2 >

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve is stuck OPEN: When the FTP sensor fluctuates from negative pressure to atmospheric pressure after the ignition switch is turned to LOCK (0) or the engine start/stop button is pressed to select the OFF mode: P0496 EVAP canister purge valve stuck OPEN When there is no fluctuation of the FTP sensor: P0497 purge flow NG

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	P145C is judged as NG
Duration	-
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Low load duration time	10 seconds	-
Wait for stability after the ignition switch is turned to LOCK (0) or engine start/stop button is pressed to select the OFF mode	10 seconds	-
Engine coolant temperature before EVAP purge control start	140 °F (60 °C)	-
No active DTCs set (prevents monitor from running)	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0134, P0135, P0154, P0155, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0351, P0352, P0353, P0354, P0355, P0356, P0443, P0451, P0452, P0453, P0496, P0498, P0499, P0685, P1128, P1129, P1172, P1174, P1454, P2195, P2197, P2227, P2228, P2229, P2237, P2238, P2240, P2241, P2243, P2245, P2247, P2249, P2251, P2252, P2254, P2255, P2279, P2422	

MALFUNCTION THRESHOLD

The output from the FTP sensor is less than 0.2 kPa (0.07 inHg, 2 mmHg) for at least 10 seconds.

CONFIRMATION PROCEDURE WITH THE HDS

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Let the engine idle for at least 64 seconds.
3. Turn the ignition switch to LOCK (0) or press the engine start/stop button to select the OFF mode for at least 10 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0498: EVAPORATIVE EMISSION (EVAP) CANISTER VENT SHUT VALVE CIRCUIT LOW VOLTAGE

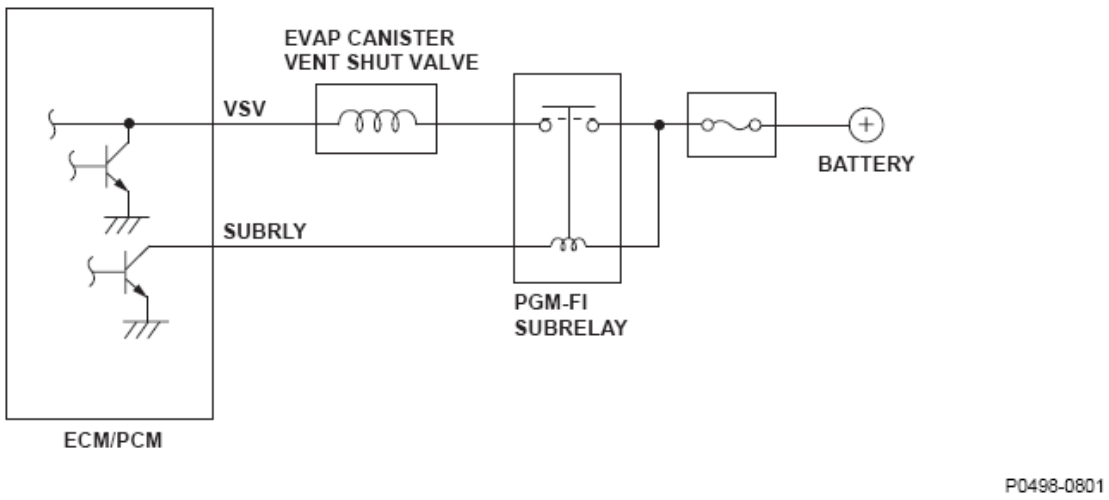

Fig. 117: Evaporative Emission Canister Vent Shut Valve - Circuit Diagram

GENERAL DESCRIPTION

The evaporative emission (EVAP) canister vent shut valve is attached to the EVAP canister to control the venting of the EVAP canister to atmosphere. The EVAP canister vent shut valve is open (open to atmosphere) when the VSV signal is OFF. If the return signal is "OFF" when the engine control module (ECM)/powertrain control module (PCM) outputs the "ON" signal to the EVAP canister vent shut valve, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
State of the engine	Running	
No active DTCs set (prevents monitor from running)	P0499	

MALFUNCTION THRESHOLD

The return signal is "OFF" for at least 5 seconds when the ECM/PCM outputs the "ON" signal to the EVAP canister vent shut valve.

CONFIRMATION PROCEDURE WITH THE HDS

Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0499: EVAPORATIVE EMISSION (EVAP) CANISTER VENT SHUT

VALVE CIRCUIT HIGH VOLTAGE

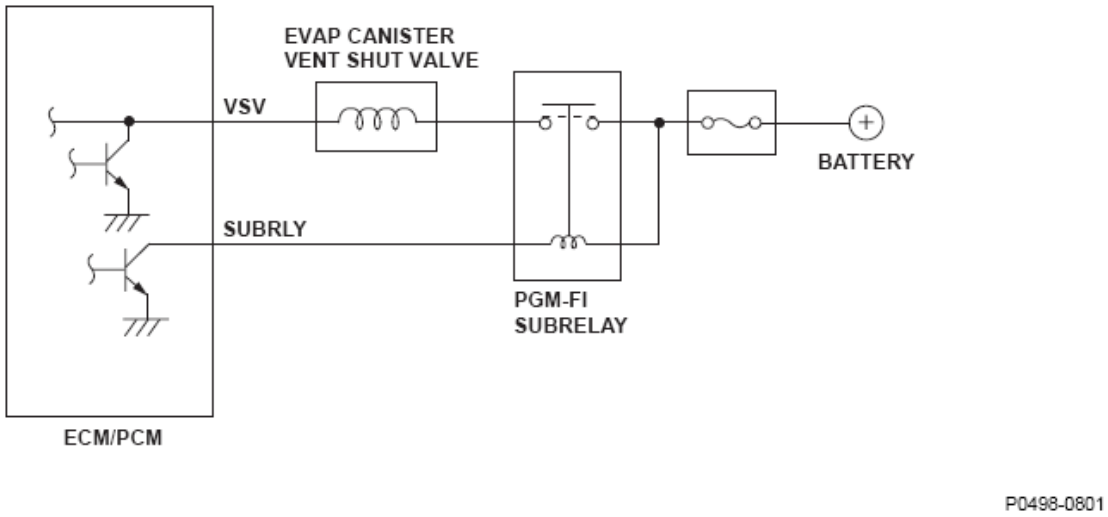

Fig. 118: Evaporative Emission Canister Vent Shut Valve - Circuit Diagram

GENERAL DESCRIPTION

The evaporative emission (EVAP) canister vent shut valve is attached to the EVAP canister to control the venting of the EVAP canister to atmosphere. The EVAP canister vent shut valve is open (open to atmosphere) when the VSV signal is OFF. If the return signal is "ON" when the engine control module (ECM)/powertrain control module (PCM) outputs the "OFF" signal to the EVAP canister vent shut valve, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
State of the engine	Running	
No active DTCs set (prevents monitor from running)	P0498	

MALFUNCTION THRESHOLD

The return signal is "ON" for at least 5 seconds when the ECM/PCM outputs the "OFF" signal to the EVAP

canister vent shut valve.

CONFIRMATION PROCEDURE WITH THE HDS

Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0506: IDLE CONTROL SYSTEM RPM LOWER THAN EXPECTED

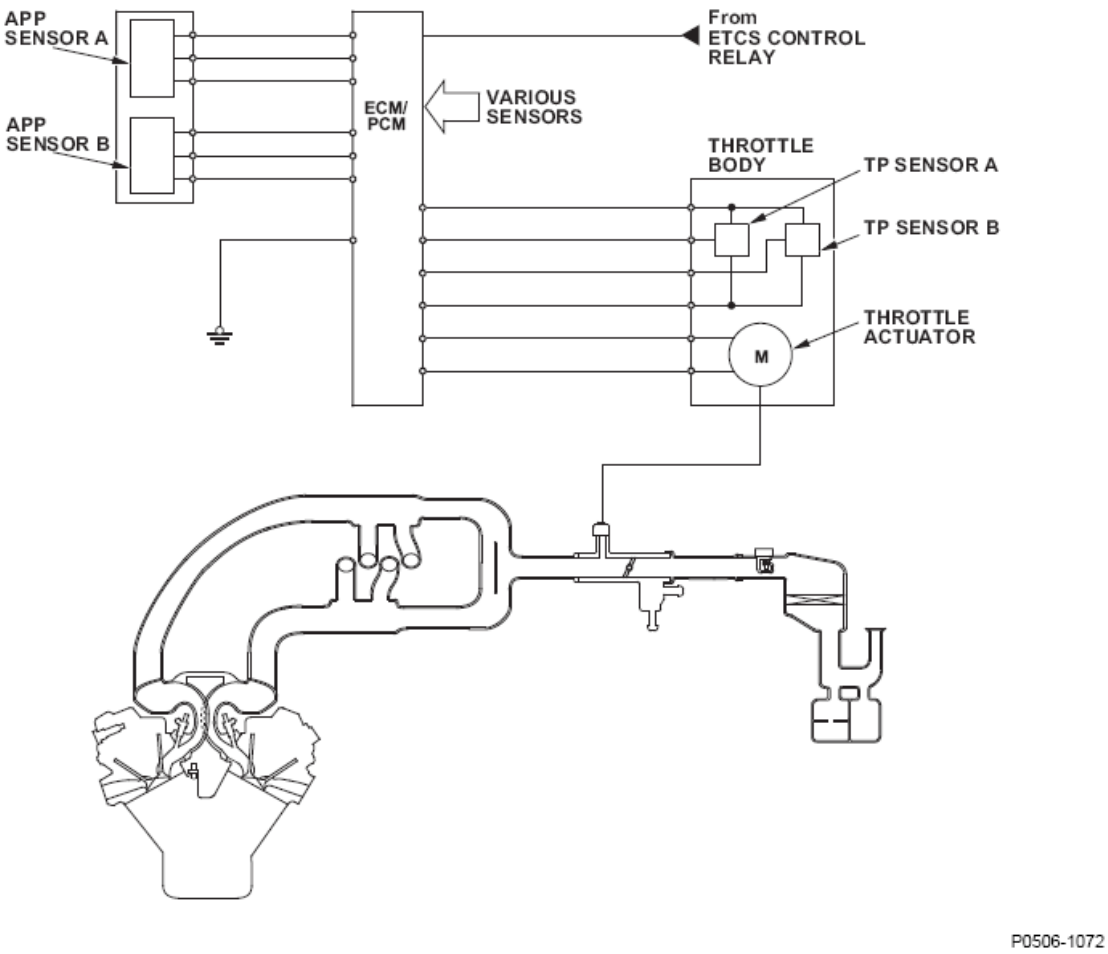

Fig. 119: Overview Of Idle Control System

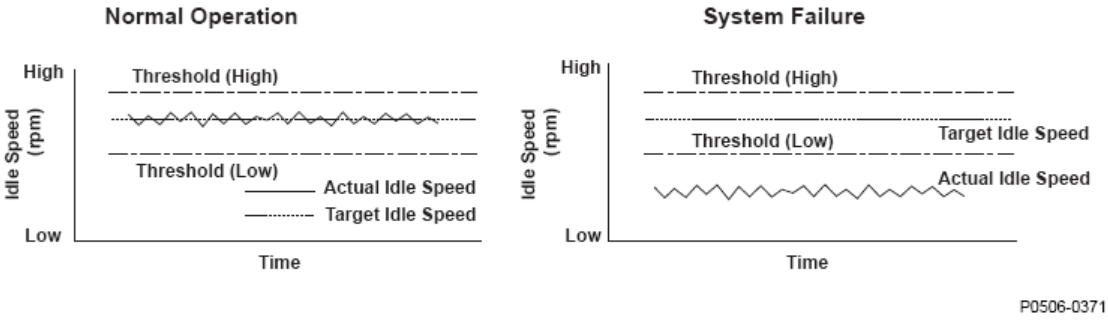

Fig. 120: Idle Control System Characteristics Curve (Normal And Failure)

GENERAL DESCRIPTION

A target idle speed that meets the engine operating conditions (coolant temperature, A/C ON or OFF, etc.) is stored in the engine control module (ECM)/powertrain control module (PCM). The ECM/PCM monitors and controls the idle speed so that the actual idle speed is equal to the target idle speed. If the actual idle speed varies beyond a specified value from the target speed over a certain period of time, the ECM/PCM detects a malfunction in the idle speed control system and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	20 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine coolant temperature	156 °F (69 °C)	-
Intake air temperature	19 °F (-7 °C)	-
Battery voltage	10.5 V	-
Fuel trim	0.73	1.47
Fuel feedback	Closed loop	
Throttle position	Fully closed	
No active DTCs set (prevents monitor from running)	P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0171, P0172, P0174, P0175, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0351, P0352, P0353, P0354, P0355, P0356, P0401, P0404, P0443, P0496, P0497, P0720, P0722, P1128, P1129, P145C, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2227, P2228, P2229, P2413, P2646, P2647, P2648, P2649	
Other	The engine is under no load	

MALFUNCTION THRESHOLD

The actual idle speed is 100 rpm less than the target idle speed for at least 20 seconds.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Let the engine idle for at least 20 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0507: IDLE CONTROL SYSTEM RPM HIGHER THAN EXPECTED

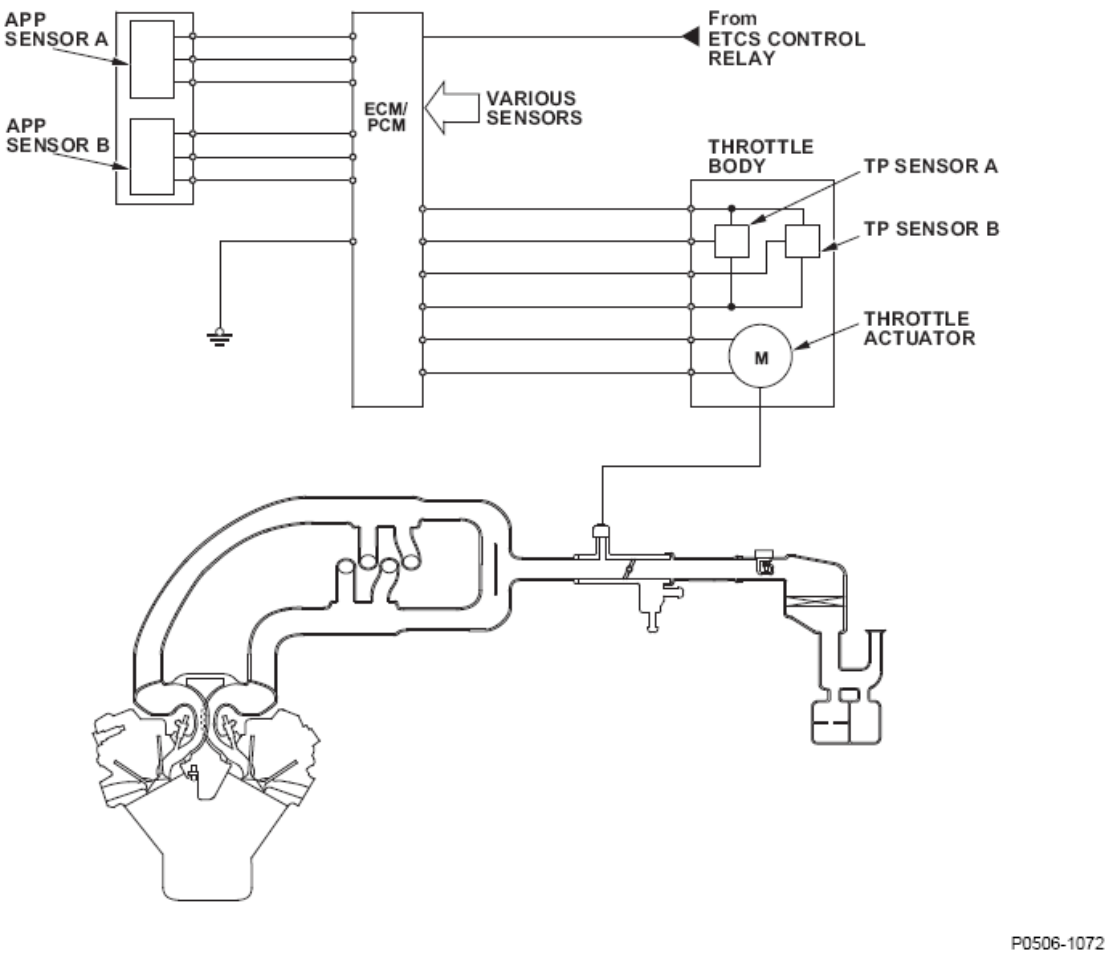

Fig. 121: Overview Of Idle Control System

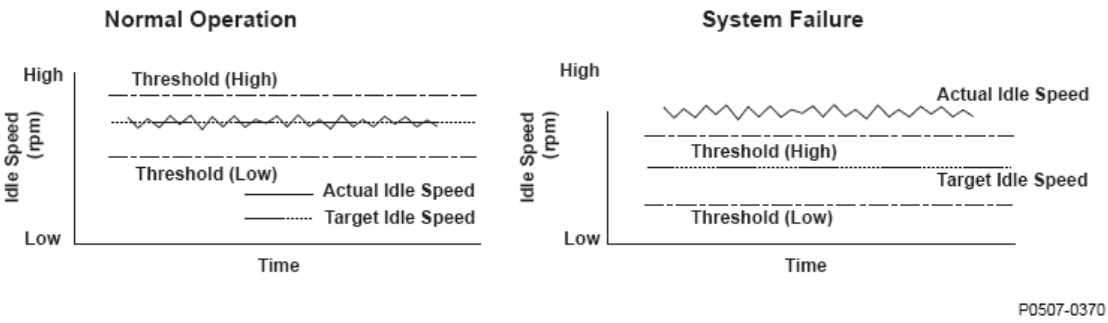

Fig. 122: Idle Control System Characteristics Curve (Normal And Failure)

GENERAL DESCRIPTION

A target idle speed that meets the engine operating conditions (coolant temperature, A/C ON or OFF, etc.) is stored in the engine control module (ECM)/powertrain control module (PCM). The ECM/PCM monitors and controls the idle speed so that the actual idle speed is equal to the target idle speed. If the actual idle speed varies beyond a specified value from the target speed over a certain period of time, the ECM/PCM detects a malfunction in the idle speed control system and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	20 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine coolant temperature	156 °F (69 °C)	-
Intake air temperature	19 °F (-7 °C)	-
Battery voltage	10.5 V	-
Fuel trim	0.73	1.47
Fuel feedback	Closed loop	
Throttle position	Fully closed	
No active DTCs set (prevents monitor from running)	P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0171, P0172, P0174, P0175, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0351, P0352, P0353, P0354, P0355, P0356, P0401, P0404, P0443, P0496, P0497, P0720, P0722, P1128, P1129, P145C, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2227, P2228, P2229, P2413, P2646, P2647, P2648, P2649	
Other	The engine is under no load	

MALFUNCTION THRESHOLD

The actual idle speed is 200 rpm greater than the target idle speed for at least 20 seconds.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Let the engine idle for at least 20 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P050A: COLD START IDLE AIR CONTROL SYSTEM PERFORMANCE PROBLEM

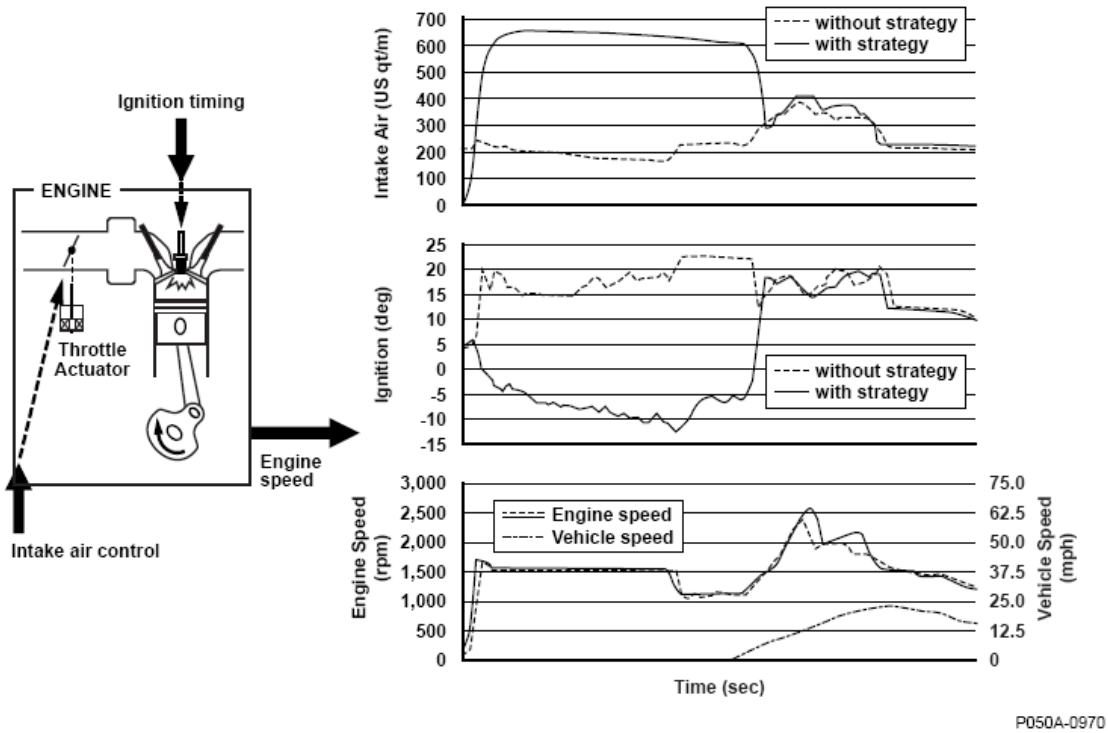

Fig. 123: Cold Start Idle Air Control System Characteristics Curve

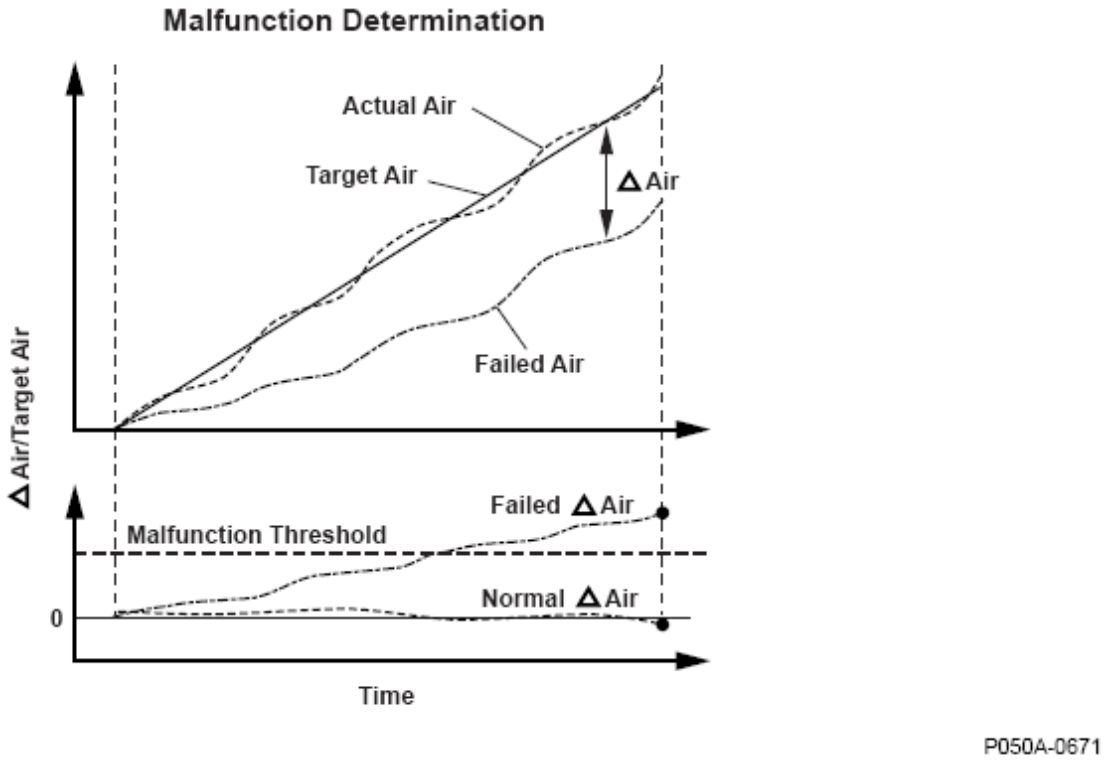

Fig. 124: Cold Start Idle Air Control System Malfunction Determination Graph

GENERAL DESCRIPTION

The quick warm-up system supplies additional air and retards the ignition timing when the engine is cold to activate the catalytic converter as quickly as possible. When the actual amount of air is less than the target amount, the engine control module (ECM)/powertrain control module (PCM) detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	Minimum	Maximum
Duration of quick warm-up system operation after engine start-up	-	35 seconds

Engine coolant temperature	41 °F (5 °C)	131 °F (55 °C)
Throttle position Fully closed No active DTCs set (prevents monitor from running)	P0101, P0102, P0103, P0107, P0108, P0111, P0112, P0113, P0116, P0117, P0118, P0122, P0123, P0125, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0351, P0352, P0353, P0354, P0355, P0356, P0404, P0406, P0506, P0507, P060A, P0720, P0722, P1116, P1128, P1129, P1659, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2227, P2228, P2229, P2279, P2413, P2646, P2647, P2648, P2649	
Other	Vehicle stopped	

MALFUNCTION THRESHOLD

The total airflow is decreased by a factor of 0.55 for at least 10 seconds.

DRIVING PATTERN

1. Allow the engine to cool to an engine coolant temperature of 131 °F (55 °C) or less.
2. Start the engine, and let it idle for at least 10 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P050B: COLD START IGNITION TIMING CONTROL SYSTEM PERFORMANCE PROBLEM

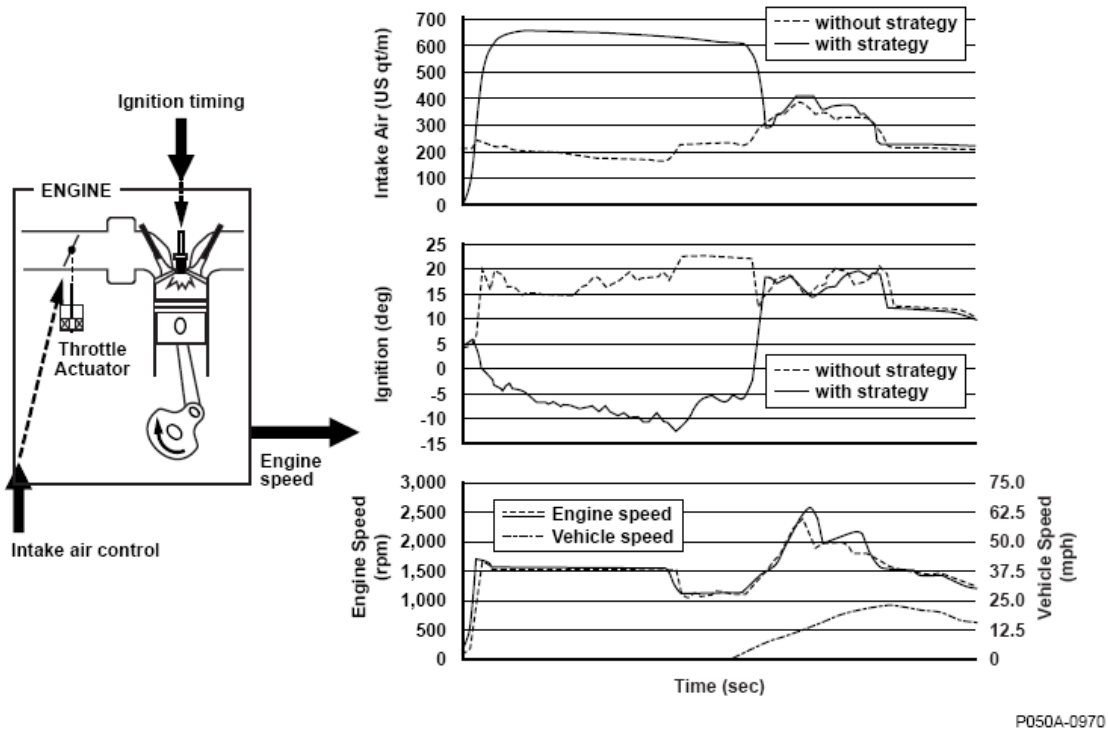

Fig. 125: Cold Start Idle Air Control System Characteristics Curve

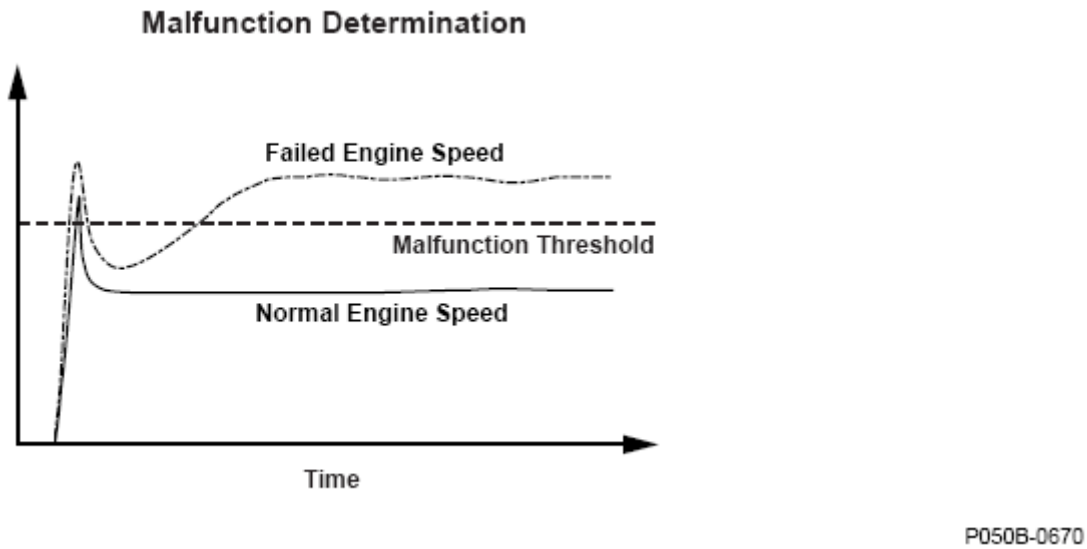

Fig. 126: Cold Start Idle Air Control System Malfunction Determination Graph

GENERAL DESCRIPTION

The quick warm-up system supplies additional air and retards the ignition timing when the engine is cold to activate the catalytic converter as quickly as possible. When the actual engine speed is a specified fast idle value, and it continues for a specified time, the engine control module (ECM)/powertrain control module (PCM) detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	3.5 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time after starting the engine	2.5 seconds	-
Duration of quick warm-up system operation after engine start-up	-	35 seconds
Engine coolant temperature	41 °F (5 °C)	131 °F (55 °C)
Throttle position	Fully closed	
No active DTCs set (prevents monitor from running)	P0101, P0102, P0103, P0107, P0108, P0116, P0117, P0118, P0122, P0123, P0125, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0351, P0352, P0353, P0354, P0355, P0356, P0404, P0406, P0506, P0507, P060A, P0720, P0722, P1116, P1128, P1129, P1659, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2227, P2228, P2229, P2279, P2413, P2646, P2647, P2648, P2649	
Other	Vehicle stopped	

MALFUNCTION THRESHOLD

The engine speed is 2,000 rpm or more for at least 3.5 seconds.

DRIVING PATTERN

1. Allow the engine to cool to an engine coolant temperature of 131 °F (55 °C) or less.
2. Start the engine, and let it idle for at least 10 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes

on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0560: ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER SOURCE CIRCUIT UNEXPECTED VOLTAGE

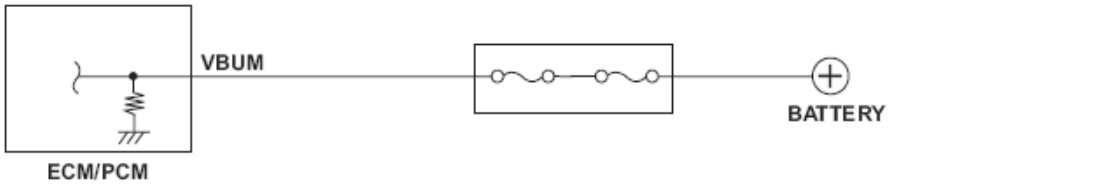

Fig. 127: Engine Control Module/Powertrain Control Module - Circuit Diagram

GENERAL DESCRIPTION

The engine control module (ECM)/powertrain control module (PCM) constantly draws power from VBUM to maintain the back-up ram. If the VBUM voltage is a set value for a specified time period, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

The back-up power supply voltage (at the VBUM terminal of the ECM/PCM) is 6.0 V or less for at least 5 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0562: CHARGING SYSTEM LOW VOLTAGE

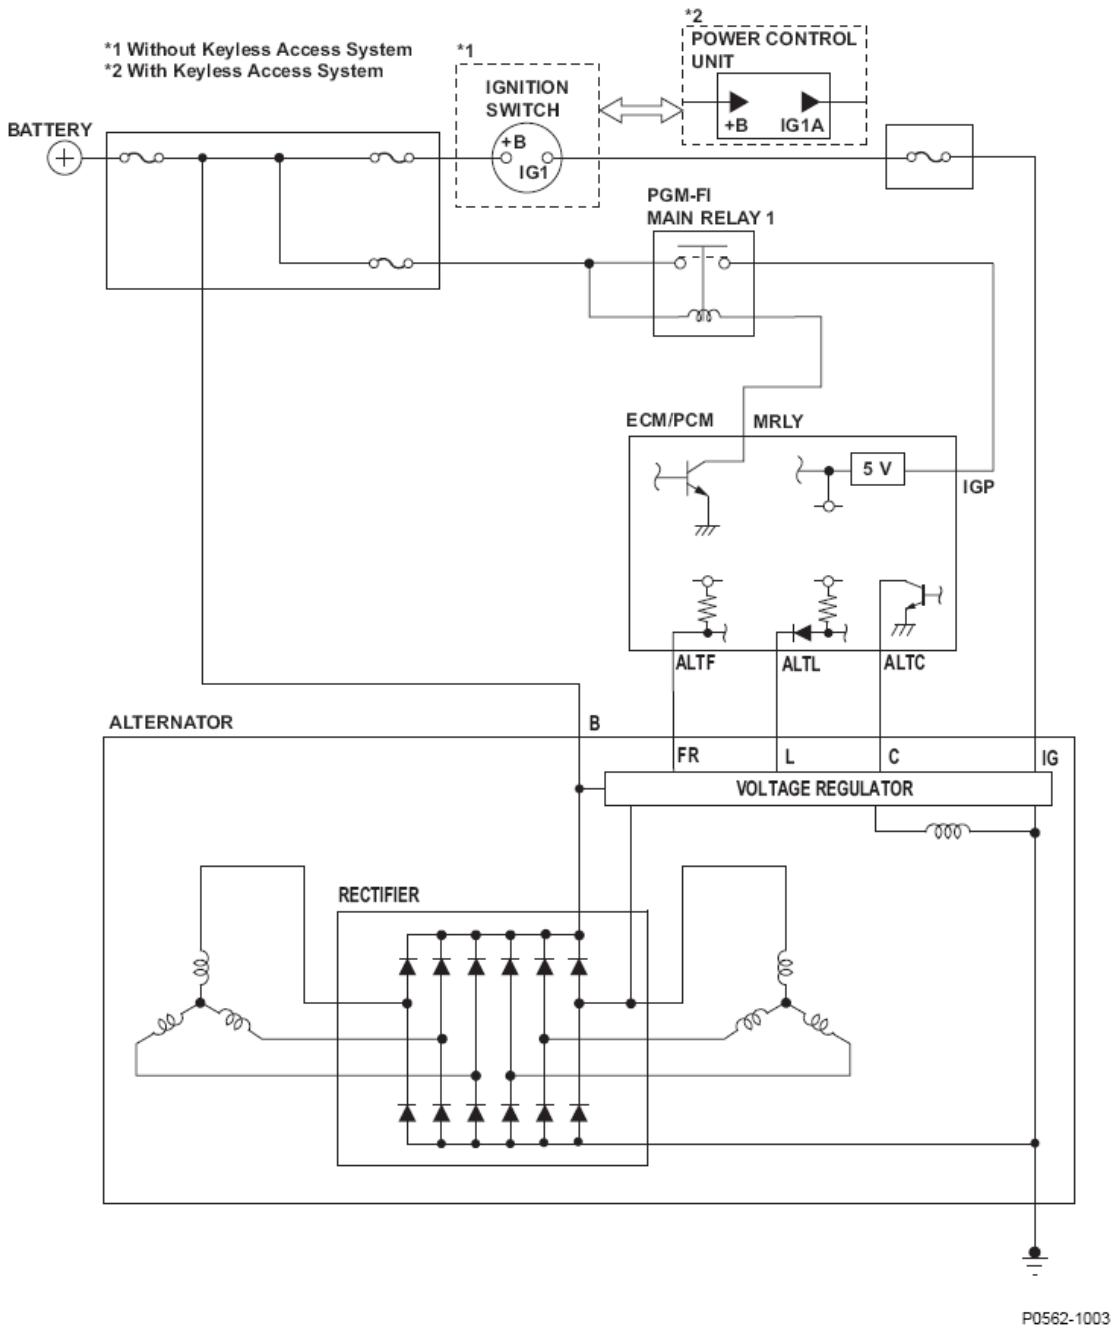

Fig. 128: Charging System - Circuit Diagram

GENERAL DESCRIPTION

The alternator is driven by the engine, and it generates electricity to supply power to the electrical system and to charge the battery. The alternator voltage target values of 14.5 V and 12.5 V are achieved by switching the alternator control mode (controlled by the engine control module (ECM)/powertrain control module (PCM)). The alternator output signal is sent to the ECM/PCM, and it varies according to the battery's state of charge, the electrical load, and the engine speed. When the IGP terminal voltage is a set value for a set time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	60 seconds or more
DTC Type	One drive cycle, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	500 rpm	-

MALFUNCTION THRESHOLD

The IGP terminal voltage is 11.0 V or less for at least 60 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0563: ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER SOURCE CIRCUIT UNEXPECTED VOLTAGE

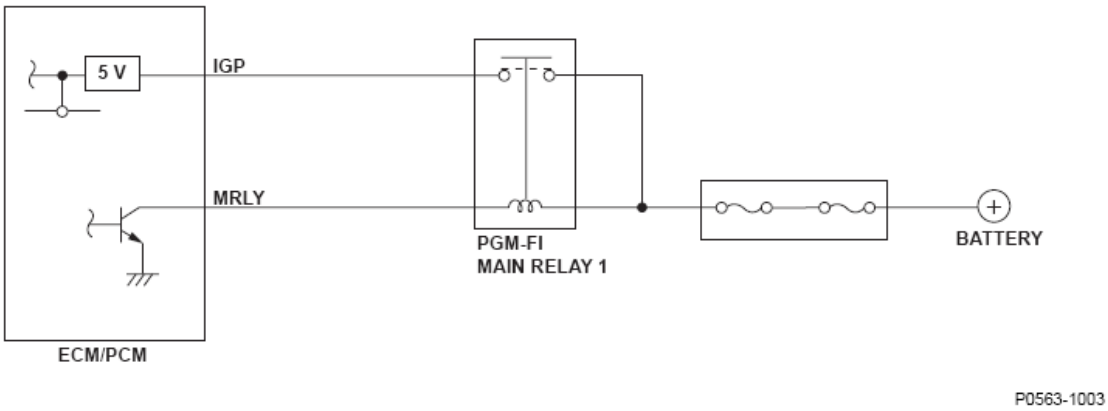

Fig. 129: Engine Control Module/Powertrain Control Module - Circuit Diagram

GENERAL DESCRIPTION

If there is a short to ground in the harness between the engine control module (ECM)/powertrain control module (PCM) and PGM-FI main relay 1, PGM-FI main relay 1 stays ON even if the ignition switch is turned to LOCK (0) or the engine start/stop button is pressed to select the OFF mode, and the ECM/PCM remains active. However, the engine is not running because power for the gauges, the ignition, and the fuel pump is turned OFF by the ignition switch. When the ECM/PCM operates for a set time after the ignition switch is turned to LOCK (0) or the engine start/stop button is pressed to select the OFF mode, it detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage (IGP terminal of ECM/PCM)	10.0 V	-

MALFUNCTION THRESHOLD

The ECM/PCM operates for at least 5 seconds after the ignition switch is turned to LOCK (0) or the engine start/stop button is pressed to select the OFF mode.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0602: ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) PROGRAMMING ERROR

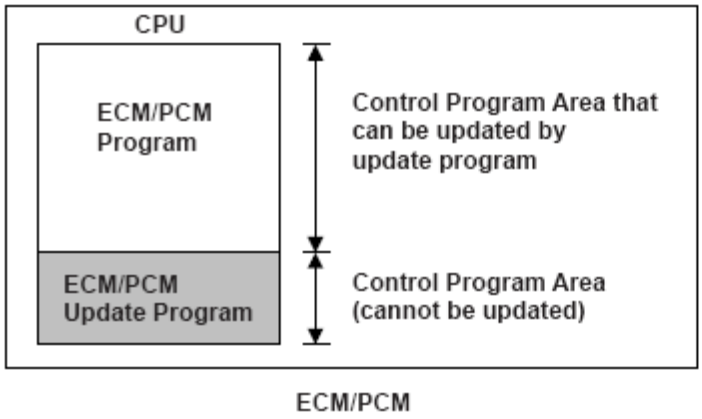

Fig. 130: Identifying ECM/PCM Control Program Area

GENERAL DESCRIPTION

The engine control module (ECM)/powertrain control module (PCM) is equipped with an update program to update its control program. The programs in the CPU of the ECM/PCM are classified as an ECM/PCM program (update-capable program) and a program for the update function (non-updatable program). The program update only updates the ECM/PCM program. When the ECM/PCM power is turned off during an update, the power for the update function is lost, and the update process stops. When the program update is stopped before it is completed, the ECM/PCM stores a DTC that indicates the update is not finished.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or less
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

The ECM/PCM program update stops 1second before it is finished.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When the ECM/PCM program is not written in the ECM/PCM, the MIL comes on, and a Pending DTC and a Confirmed DTC are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL, the Pending DTC, and the Confirmed DTC are cleared when the ECM/PCM program update is completed.

DTC P060A: ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) INTERNAL CONTROL MODULE MALFUNCTION

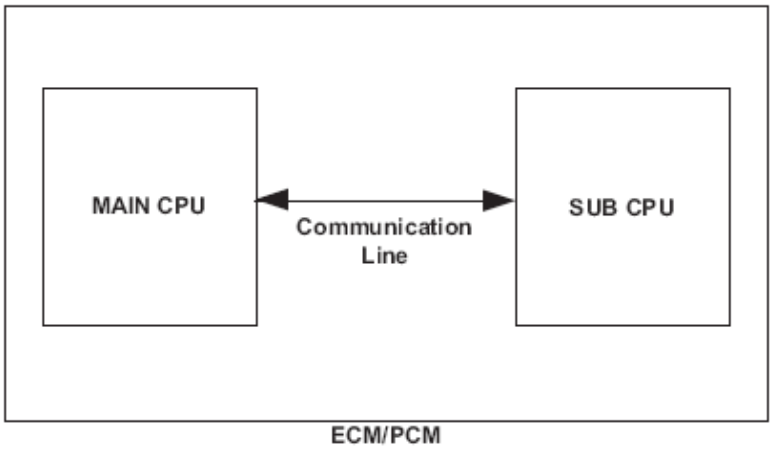

Fig. 131: ECM/PCM Communication Diagram

GENERAL DESCRIPTION

When a malfunction occurs in the communication line between the main CPU and the sub CPU in the engine control module (ECM)/powertrain control module (PCM), no monitor signals from the sub CPU are detected for a set time, or abnormal signals are detected for a set time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	0.5 second or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

One of these conditions is met for at least 0.5 second:

- No sub CPU monitor signals are detected.
- Sub CPU monitor signals are abnormal.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0615: STARTER CUT RELAY STRLD CIRCUIT MALFUNCTION

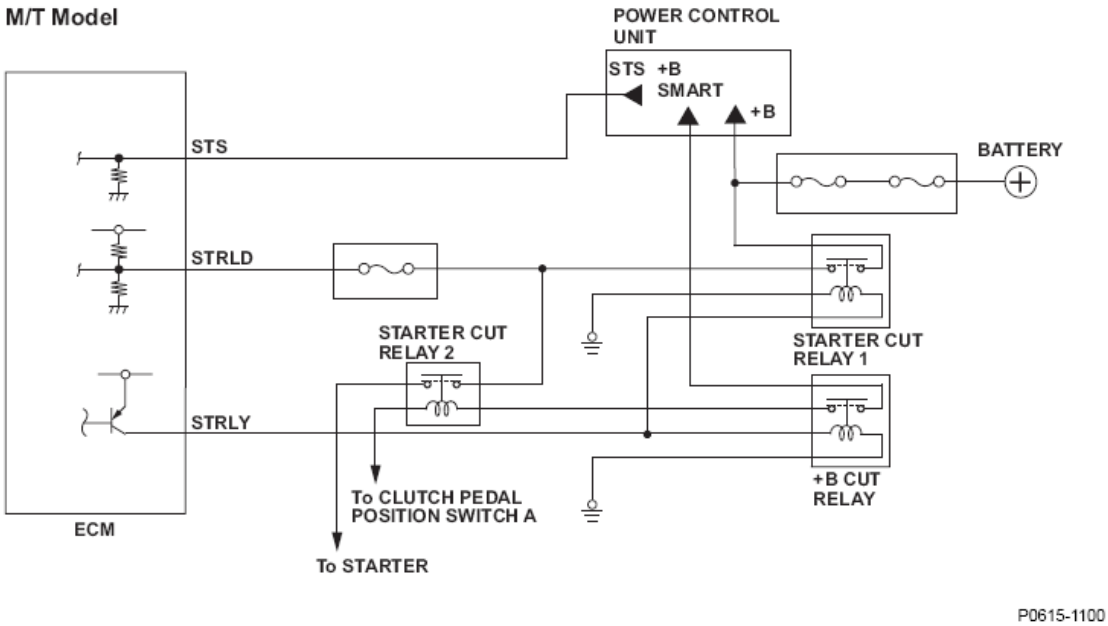

Fig. 132: Starter Cut Relay - Circuit Diagram (M/T Model)

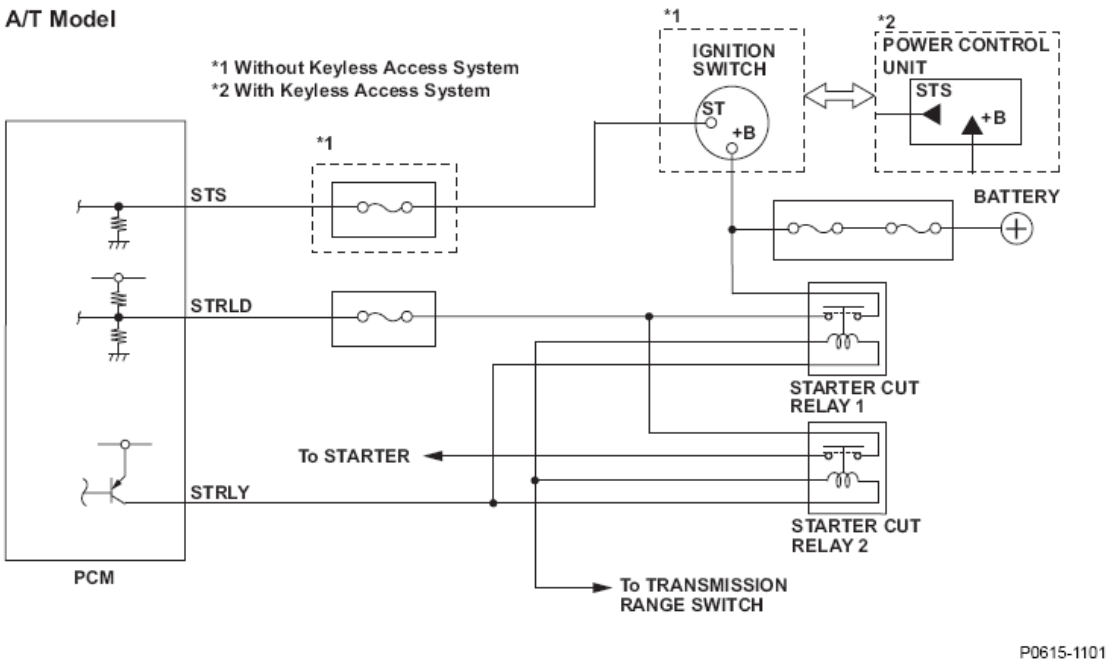

Fig. 133: Starter Cut Relay - Circuit Diagram (A/T Model)

GENERAL DESCRIPTION

A starter switch inhibit system prevents damaging the starter pinion gear by prohibiting starter activation while the engine is running. If the ignition switch is turned to START (III) or the engine start/stop button is pressed mistakenly while the engine is running, the engine control module (ECM)/powertrain control module (PCM) prevents the starter from working according to the engine speed information and the output (STRLY) signal of

the starter cut relay is switched to LOW. In this system, two starter cut relays are connected in series (starter cut relay 1, starter cut relay 2) to prevent the starter from continuing to run due to a starter cut relay malfunction. Also a diagnosis line (STRLD) is used to monitor voltage in the middle of starter cut relay 1 and starter cut relay 2. The PCM detects an OPEN malfunction of diagnosis line, an ON malfunction of starter cut relay 1, and an ON malfunction of starter cut relay 2. If the voltage on the diagnosis line (STRLD) input does not exceed upper and lower limits for a specified duration when the ignition switch is turned to START (III) or the engine start/stop button is pressed and the output of the starter cut relay (STRLY) is HIGH (starter ON), the ECM/PCM detects an OPEN malfunction of the diagnosis line and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	0.8 second or more
DTC Type	One drive cycle, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
Starter	On
No active DTCs set (prevents monitor from running)	P16BD, P16BE, P16E1(3)
(1) Without keyless access system (2) With keyless access system (3) M/T model	

MALFUNCTION THRESHOLD

The diagnosis line (STRLD) input voltage is between 2.4 V to 2.6 V for at least 0.8 second.

DRIVING PATTERN

Turn the ignition switch to START (III) or press the engine start/stop button to select the START mode for 1 second or more.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P062F: ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) INTERNAL CONTROL MODULE KEEP ALIVE MEMORY (KAM) ERROR

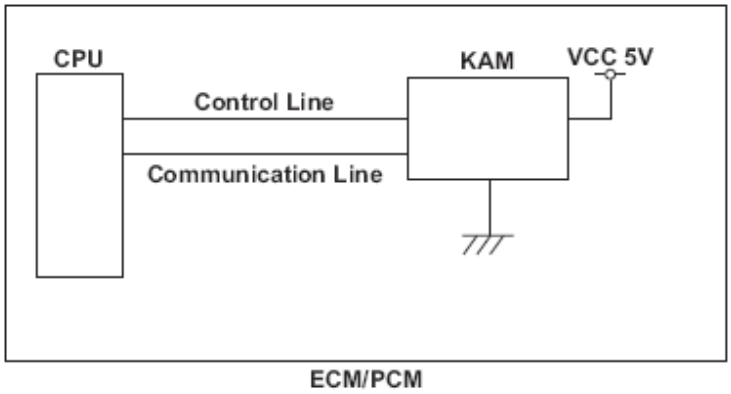

Fig. 134: ECM/PCM Communication Control Diagram

GENERAL DESCRIPTION

The engine control module (ECM)/powertrain control module (PCM) is equipped with a keep alive memory (KAM). The data (control learn data, etc.) for powertrain control and information (vehicle identification number (VIN), etc.) related to the vehicle control is stored in the KAM, so that it can be maintained even when power is not supplied to the ECM/PCM, such as when the battery is disconnected. When power is restored to the ECM/PCM, the CPU retrieves the stored information from the KAM, but when the data retrieval process is not finished normally, the ECM/PCM detects a malfunction and stores a DTC. The CPU writes data to the KAM from the CPU: Control related data is written when the ignition switch is turned to ON (II) or the engine start/stop button is pressed to select the ON mode, and vehicle information when commanded from the HDS. If the data writing process is not completed normally, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

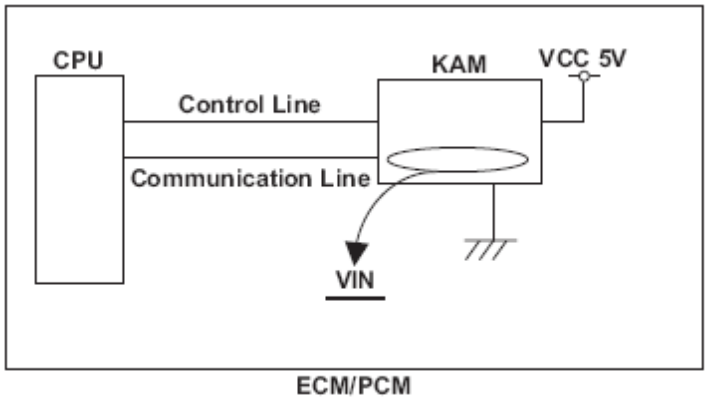
ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

A malfunction is detected whenever the keep alive data retrieval and writing process is not completed normally.

DIAGNOSIS DETAILS



Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0630: VIN NOT PROGRAMMED OR MISMATCH

P0630-1071

Fig. 135: ECM/PCM Communication Control Diagram (VIN Not Programmed Or Mismatch)

GENERAL DESCRIPTION

The engine control module (ECM)/powertrain control module (PCM) stores a vehicle identification number (VIN) in the keep alive memory (KAM) and outputs the VIN according to commands from the HDS. The VIN for each vehicle is registered to the ECM/PCM using the HDS. The registered VIN is read by the CPU from the

KAM after the ignition switch is turned to ON (II) or the engine start/stop button is pressed to select the ON mode, or after the Clear command is executed. If the VIN is not registered in the KAM when the ignition switch is turned to ON (II) or the engine start/stop button is pressed to select the ON mode, or when the Clear command is executed, the ECM/PCM detects a VIN unregistered condition and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or less
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

The VIN is not registered in the KAM in the ECM/PCM.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

When the VIN registration is completed, the MIL is cleared.

DTC P0641: SENSOR REFERENCE VOLTAGE A MALFUNCTION

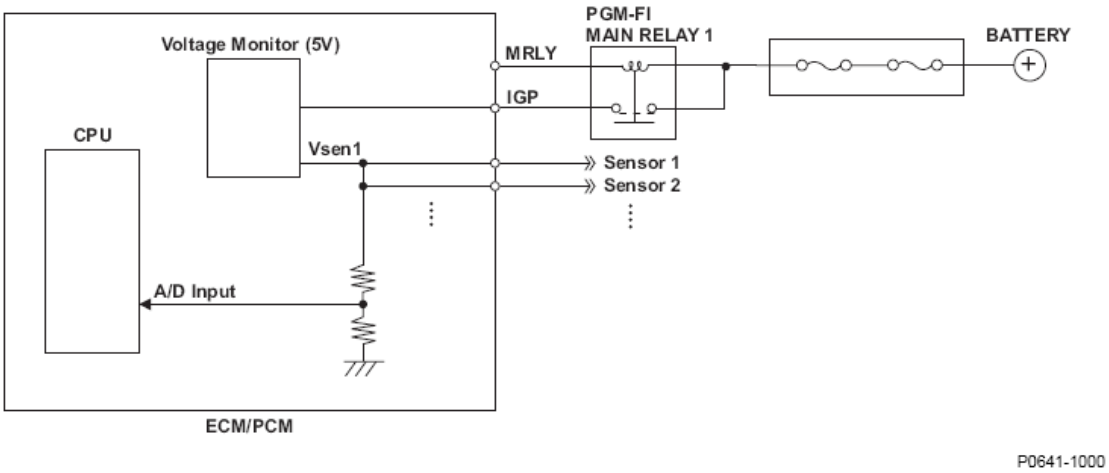


Fig. 136: ECM/PCM - Circuit Diagram (Sensor Reference Voltage A Malfunction)

GENERAL DESCRIPTION

The engine control module (ECM)/powertrain control module (PCM) is equipped with a voltage monitor (5 V power source) to supply a stable 5 V to each sensor as reference voltage. The correct voltage for the sensors are loaded in the CPU of the ECM/PCM (A/D input) and when the condition that sensor power voltage is a set value (high or low) continues for a certain time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

The sensor power voltage is 5.2 V or more, or 4.5 V or less, for at least 2.0 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0651: SENSOR REFERENCE VOLTAGE B MALFUNCTION

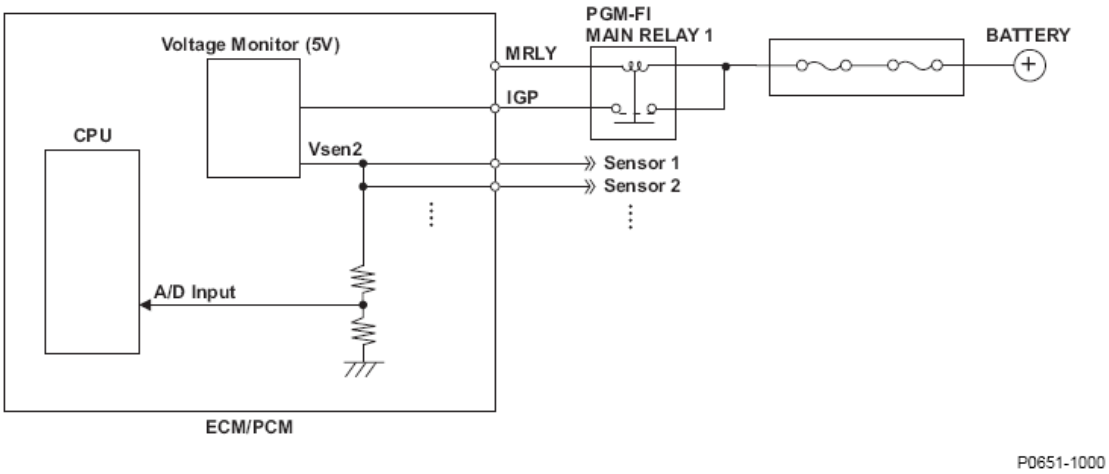

Fig. 137: ECM/PCM - Circuit Diagram (Sensor Reference Voltage B Malfunction)

GENERAL DESCRIPTION

The engine control module (ECM)/powertrain control module (PCM) is equipped with a voltage monitor (5 V power source) to supply a stable 5 V to each sensor as reference voltage. The correct voltage for the sensors are loaded in the CPU of the ECM/PCM (A/D input) and when the condition that sensor power voltage is a set value (high or low) continues for a certain time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

The sensor power voltage is 5.2 V or more, or 4.5 V or less, for at least 2.0 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0685: ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) POWER CONTROL CIRCUIT/INTERNAL CIRCUIT MALFUNCTION

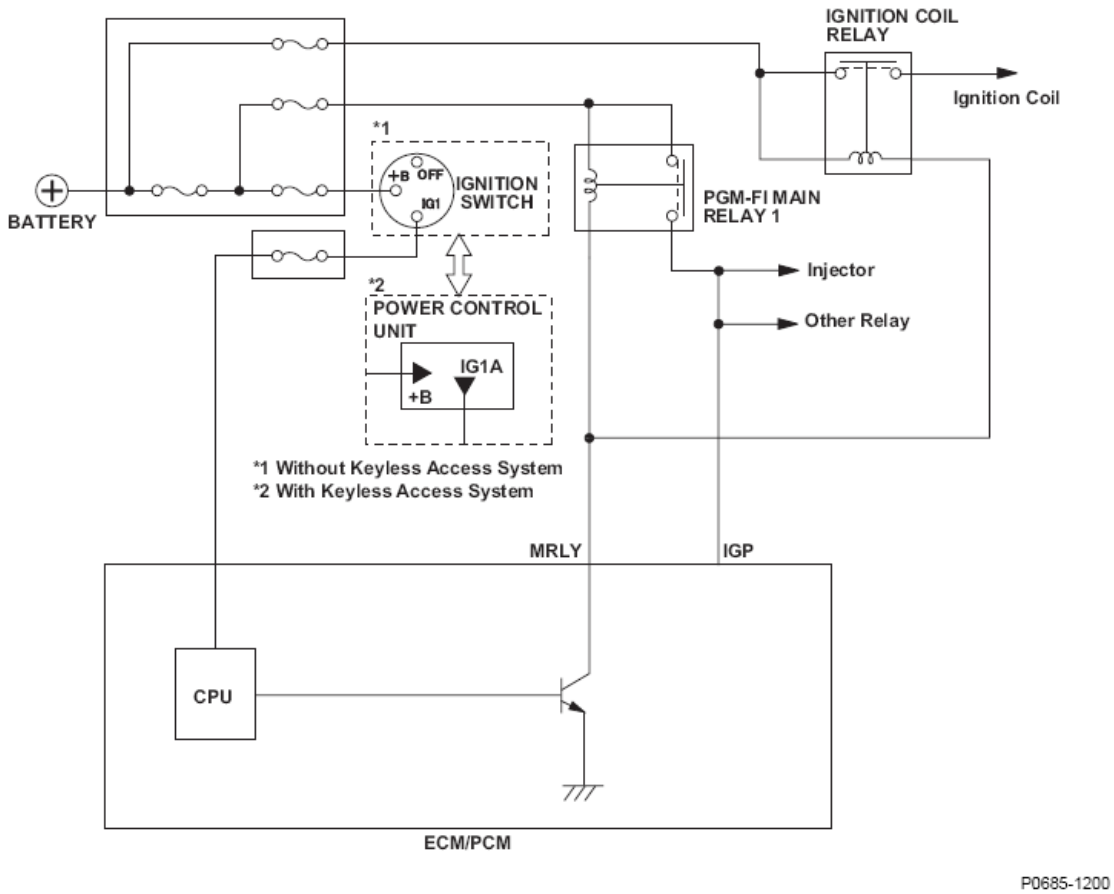

Fig. 138: ECM/PCM - Circuit Diagram (Power Control Circuit/Internal Circuit Malfunction)

GENERAL DESCRIPTION

After the ignition switch is turned to LOCK (0) or the engine start/stop button is pressed to select the OFF mode, the engine control module (ECM)/powertrain control module (PCM) does not shut down immediately. After finishing a predetermined process according to the request of each device and system, the power supply is automatically disconnected (self shut-down function). The ECM/PCM power is disconnected by controlling PGM-FI main relay 1. During a normal ECM/PCM shut down, the shut down process is executed by the CPU, PGM-FI main relay 1 is turned off, and the voltage to the ECM/PCM is turned off to shut down the ECM/PCM. When the voltage to the ECM/PCM is turned off and the ECM/PCM shuts down without the normal shut down procedure, the ECM/PCM detects a malfunction in the PGM-FI main relay 1 control circuit and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or less
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time after starting the engine	10 seconds	-
Engine speed	400 rpm	-

MALFUNCTION THRESHOLD

The ECM/PCM is shut down within 1 second without the normal shut down procedure.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0705: SHORT IN TRANSMISSION RANGE SWITCH CIRCUIT (MULTIPLE SHIFT-POSITION INPUT)

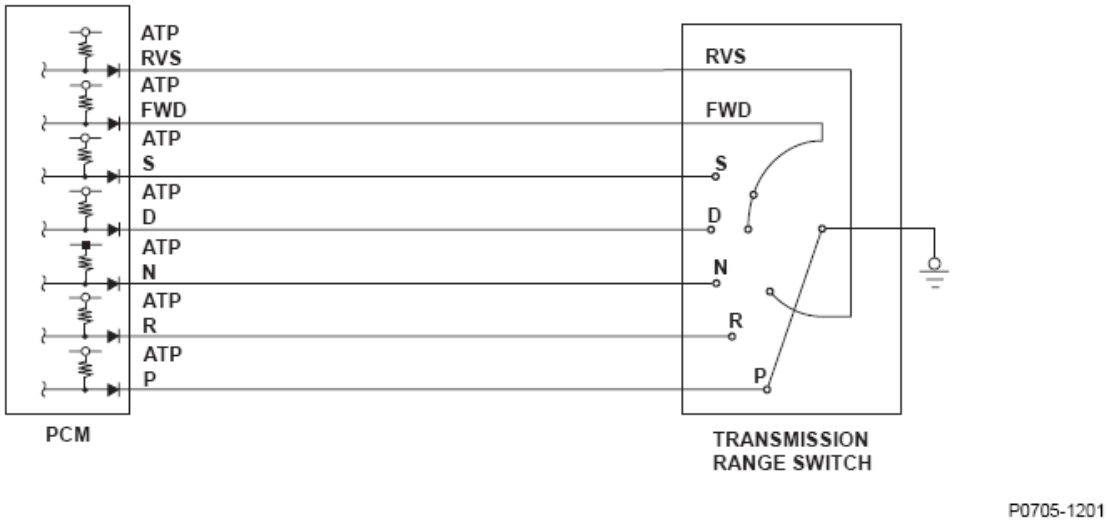

Fig. 139: Transmission Range Switch - Circuit Diagram

TRANSMISSION RANGE SWITCH CONTACT POINT INPUT MATRIX

	Input per switch						

Shift lever position	ATPP	ATPR	ATPN	ATPD	ATPS	ATP FWD	ATP RVS
P	o	X	X	X	X	X	X
R	X	o	X	X	X	X	o
N	X	X	o	X	X	X	X
D	X	X	X	o	X	o	X
S	X	X	X	X	o	o	X
o: Closed X: Open							

GENERAL DESCRIPTION

The transmission range switch is attached to a control shaft. Operating the shift lever makes the control shaft rotate via the shift cable. The A/T gear position indicator shows which position is selected according to the Low/High signal combinations, which vary based on the control shaft rotational angle. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is high (5 V or 12 V) at the powertrain control module (PCM) input terminal when each transmission range switch position is open, and it is low (0 V) when each switch is closed. If the PCM detects multiple switch inputs instead of the correct switch input for the selected range at that time, it detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-

MALFUNCTION THRESHOLD

One of these conditions occurs:

- The PCM detects the selected range switch input and another range switch input (except FWD switch input) simultaneously for at least 1 second.
- The PCM detects the P, R, or N range switch input and the FWD switch input simultaneously for at least 1 second.
- The PCM detects the D or S range switch input and the RVS switch input simultaneously for at least 1 second.

DRIVING PATTERN

1. Start the engine.
2. With the brake pedal pressed, place the shift lever in each position for at least 1 second.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0706: OPEN IN TRANSMISSION RANGE SWITCH CIRCUIT

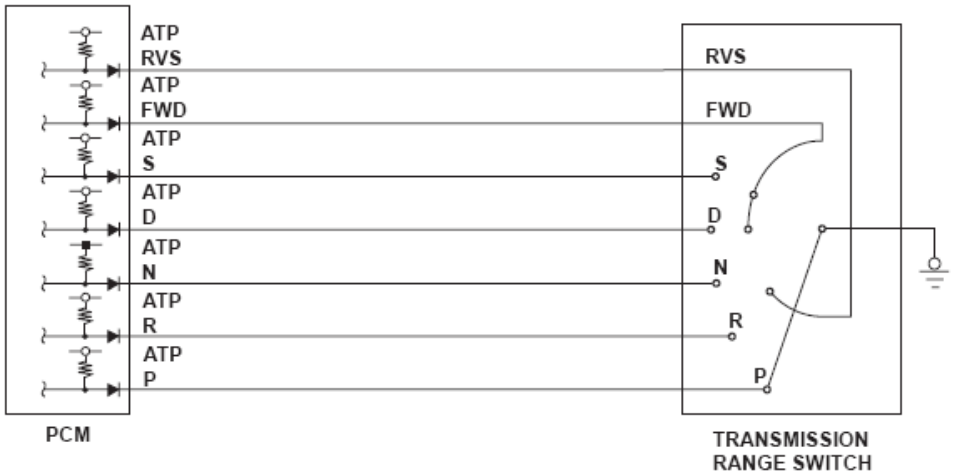

Fig. 140: Transmission Range Switch - Circuit Diagram

TRANSMISSION RANGE SWITCH CONTACT POINT INPUT MATRIX

Shift lever position	Input per switch						
	ATPP	ATPR	ATPN	ATPD	ATPS	ATP FWD	ATP RVS
P	o	X	X	X	X	X	X
R	X	o	X	X	X	X	o
N	X	X	o	X	X	X	X
D	X	X	X	o	X	o	X
S	X	X	X	X	o	o	X

o: Closed X: Open

GENERAL DESCRIPTION

The transmission range switch is attached to a control shaft. Operating the shift lever makes the control shaft rotate via the shift cable. The A/T gear position indicator shows which position is selected according to the Low/High signal combinations, which vary based on the control shaft rotational angle. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is high (5 V or 12 V) at the powertrain control module (PCM) input terminal when each transmission range switch position is open, and it is low (0 V) when each switch is closed. If the FWD switch stays open while the vehicle repeatedly accelerates to a specified vehicle speed and then stops despite being in D or S, the PCM detects a malfunction in the transmission range switch (open) and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL on, D indicator off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0705, P0721, P0722	

MALFUNCTION THRESHOLD

No FWD position signal is detected when the vehicle speed changes from 6 mph (10 km/h) --> 25 mph (40 km/h) --> 6 mph (10 km/h) in D or S.

DRIVING PATTERN

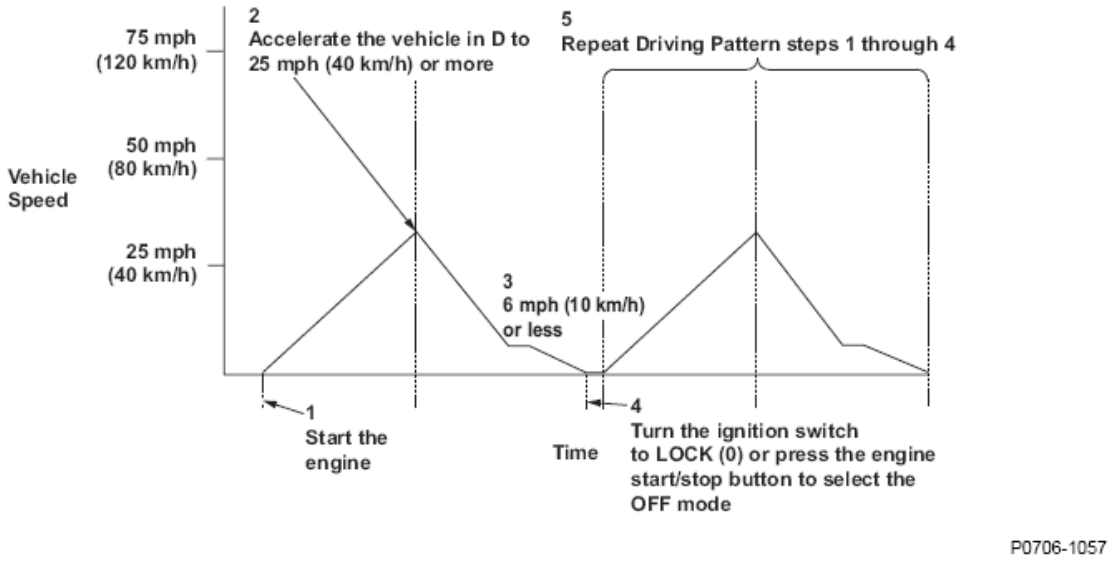

Fig. 141: Vehicle Speed Driving Pattern

1. Start the engine.
2. Accelerate the vehicle in D to 25 mph (40 km/h) or more.
3. Slow down to 6 mph (10 km/h) for several seconds.
4. Stop the vehicle, and turn the ignition switch to LOCK (0) or press the engine start/stop button to select the OFF mode.
5. Repeat Driving Pattern steps 1 through 4.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0711: PROBLEM IN ATF TEMPERATURE SENSOR CIRCUIT

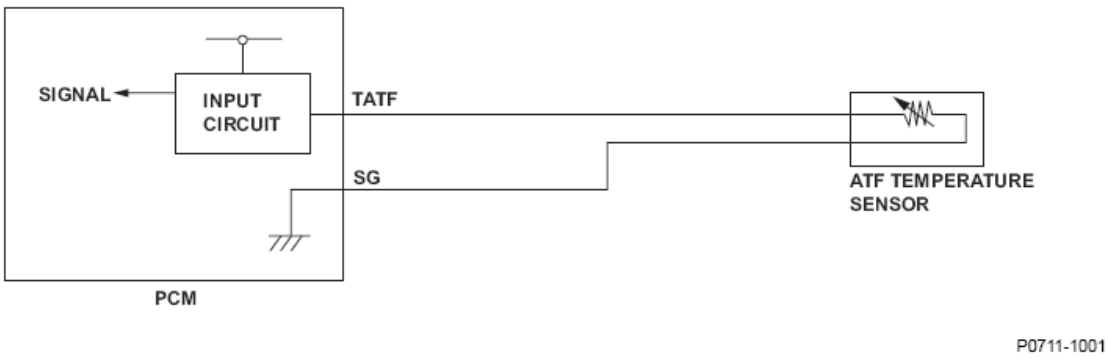

Fig. 142: ATF Temperature Sensor - Circuit Diagram

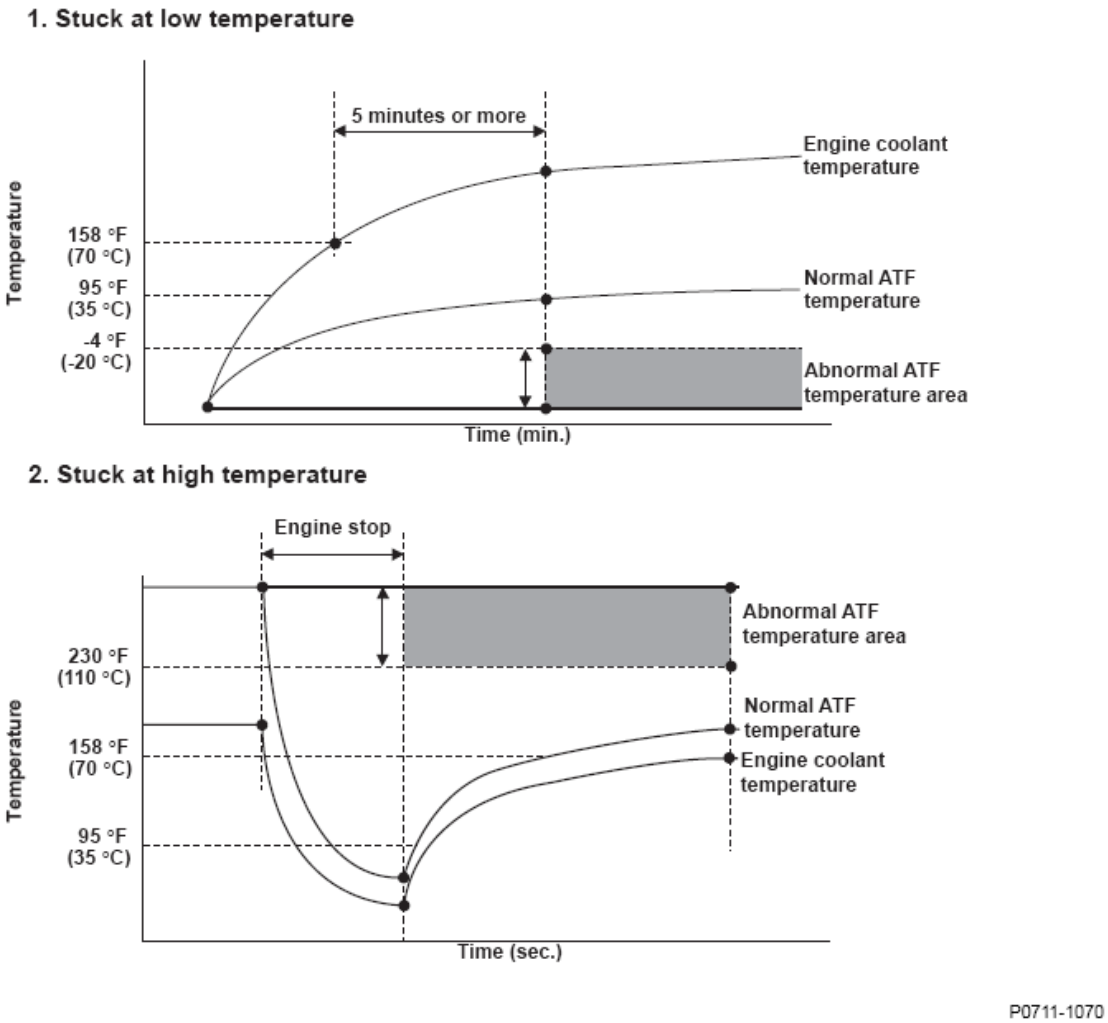

Fig. 143: ATF Temperature Sensor Characteristics Graph

GENERAL DESCRIPTION

The ATF temperature sensor is a thermistor type sensor that changes resistance according to the change in ATF temperature. The powertrain control module (PCM) sends a 5 V reference voltage to the sensor through a pull-

up resistor. When the ATF temperature is low, the sensor resistance increases and the PCM detects a high signal voltage. As the ATF temperature rises, the sensor resistance decreases and the PCM detects a low signal voltage. If the ATF temperature sensor signal does not change, the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	5 minutes or more(1)
	20 seconds or more(2)
DTC Type	Two drive cycles, MIL off, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)
(1) Stuck at low temperature is detected (2) Stuck at high temperature is detected	

ENABLE CONDITIONS

1. Stuck at low temperature

Condition	Minimum	Maximum
Engine coolant temperature	158 °F (70 °C)	-
Initial engine coolant temperature	-	95 °F (35 °C)
ATF temperature	-	-4 °F (-20 °C)
Initial ATF temperature		-4 °F (-20 °C)
Vehicle speed	19 mph (30 km/h)	-
Battery voltage	11 V	-
Throttle position	4 °	-
No active DTCs set (prevents monitor from running)	P0117, P0118, P0712, P0713, P0714, P0721, P0722	
Other	After the engine coolant temperature reaches the fixed value, both the vehicle speed and the throttle position meet the conditions for at least 5 minutes	

2. Stuck at high temperature

Condition	Minimum	Maximum
Engine coolant temperature	158 °F (70 °C)	-
Previous engine coolant temperature when the ignition switch was turned to LOCK (0) or the engine start/stop button was pressed to	158 °F (70 °C)	-

select the OFF mode		
Previous ATF temperature when the ignition switch was turned to LOCK (0) or the engine start/stop button was pressed to select the OFF mode	230 °F (110 °C)	-
Present engine coolant temperature when the ignition switch is turned to ON (II) or the engine start/stop button is pressed to select the ON mode	-	95 °F (35 °C)
Present ATF temperature when the ignition switch is turned to ON (II) or the engine start/stop button is pressed to select the ON mode	230 °F (110 °C)	-
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0117, P0118, P0712, P0713, P0714, P0721, P0722	

MALFUNCTION THRESHOLD

1. Stuck at low temperature

   The current ATF temperature is -4 °F (-20 °C) or less after Enable Conditions.

2. Stuck at high temperature

   The current ATF temperature is 230 °F (110 °C) or more after Enable Conditions.

DRIVING PATTERN

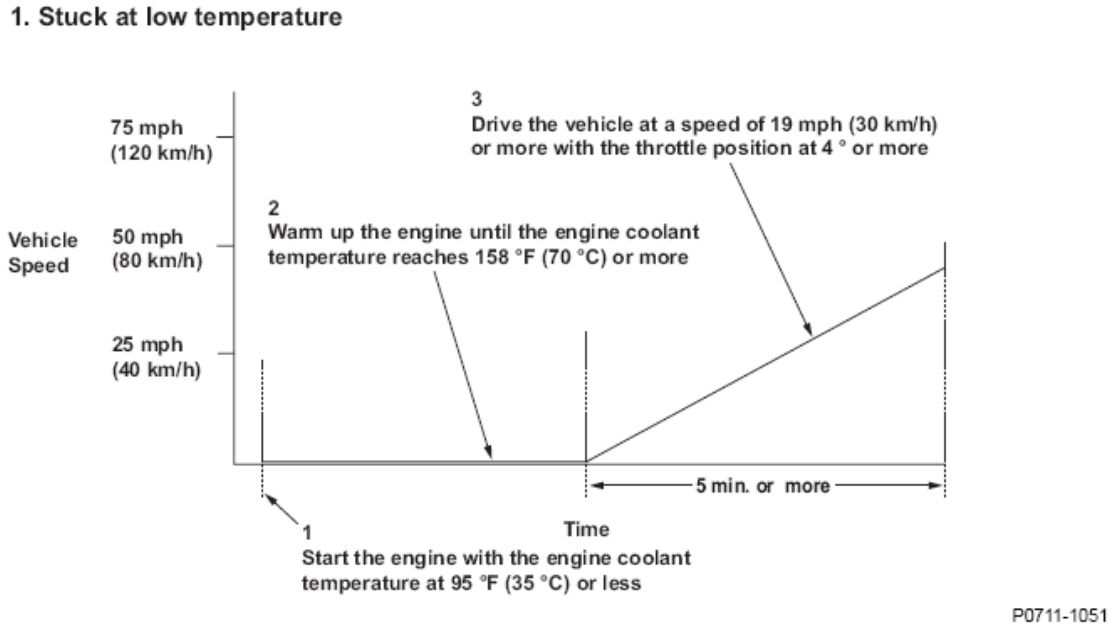

Fig. 144: Vehicle Speed Driving Pattern

1. Stuck at low temperature

1. Start the engine with the engine coolant temperature at 95 °F (35 °C) or less.
2. Warm up the engine until the engine coolant temperature reaches 158 °F (70 °C) or more.
3. Drive the vehicle at a speed of 19 mph (30 km/h) or more with the throttle position at 4 ° or more for at least 5 minutes.

2. Stuck at high temperature
   1. Turn off the engine with the engine coolant temperature at 158 °F (70 °C) or more.
   2. Restart the engine after the engine coolant temperature drops to 95 °F (35 °C) or less.
   3. Warm up the engine until the engine coolant temperature reaches 158 °F (70 °C), and wait for at least 20 seconds.
   - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0712: SHORT IN ATF TEMPERATURE SENSOR CIRCUIT

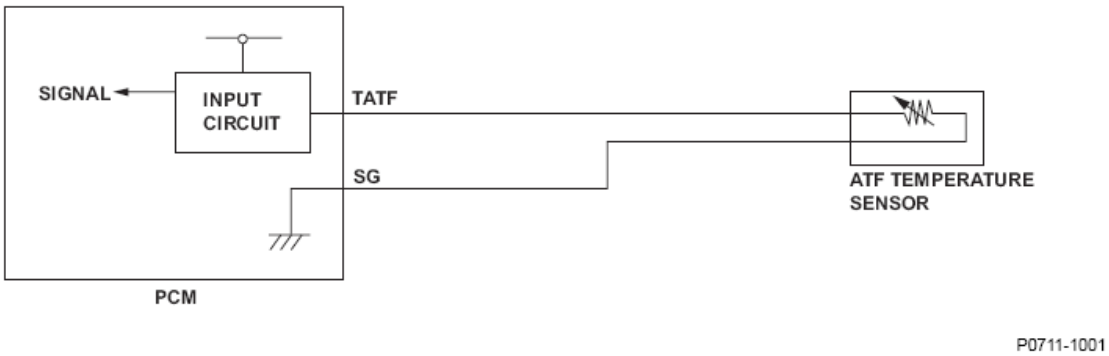

Fig. 145: ATF Temperature Sensor - Circuit Diagram

GENERAL DESCRIPTION

The ATF temperature sensor is a thermistor type sensor that changes resistance according to the change in ATF temperature. The powertrain control module (PCM) sends a 5 V reference voltage to the sensor through a pull-up resistor. When the ATF temperature is low, the sensor resistance increases and the PCM detects a high signal voltage. As the ATF temperature rises, the sensor resistance decreases and the PCM detects a low signal voltage. When the ATF temperature sensor signal voltage to the PCM is under the specification, indicating that

the temperature is above the specification (a short to ground), the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL off, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0711, P0713, P0714	

MALFUNCTION THRESHOLD

The ATF temperature sensor output voltage is less than 0.07 V for at least 10 seconds.

DRIVING PATTERN

1. Start the engine.
2. Shift to P, and wait for at least 10 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0713: OPEN IN ATF TEMPERATURE SENSOR CIRCUIT

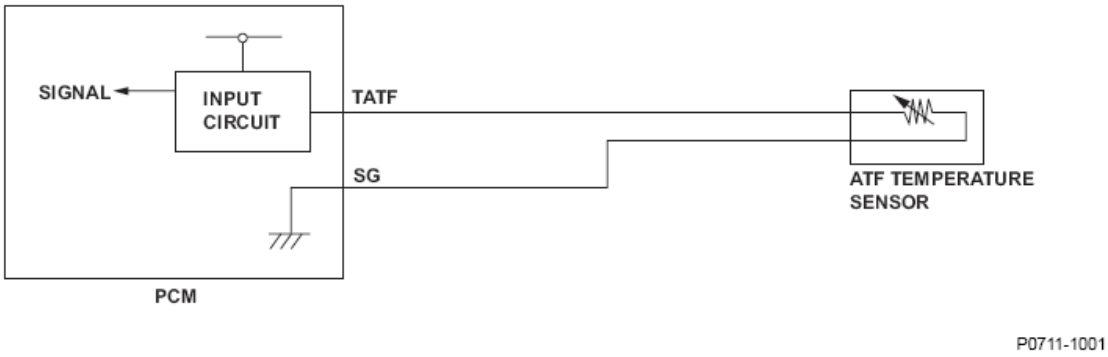

Fig. 146: ATF Temperature Sensor - Circuit Diagram

GENERAL DESCRIPTION

The ATF temperature sensor is a thermistor type sensor that changes resistance according to the change in ATF temperature. The powertrain control module (PCM) sends a 5 V reference voltage to the sensor through a pull-up resistor. When the ATF temperature is low, the sensor resistance increases and the PCM detects a high signal voltage. As the ATF temperature rises, the sensor resistance decreases and the PCM detects a low signal voltage. When the ATF temperature sensor signal voltage to the PCM is above the specification, indicating that the temperature is under the specification (open), the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL off, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0711, P0712, P0714	

MALFUNCTION THRESHOLD

The ATF temperature sensor output voltage is more than 4.93 V for at least 10 seconds.

DRIVING PATTERN

1. Start the engine.
2. Shift to P, and wait at least 10 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0714: ATF TEMPERATURE SENSOR INTERMITTENT FAILURE

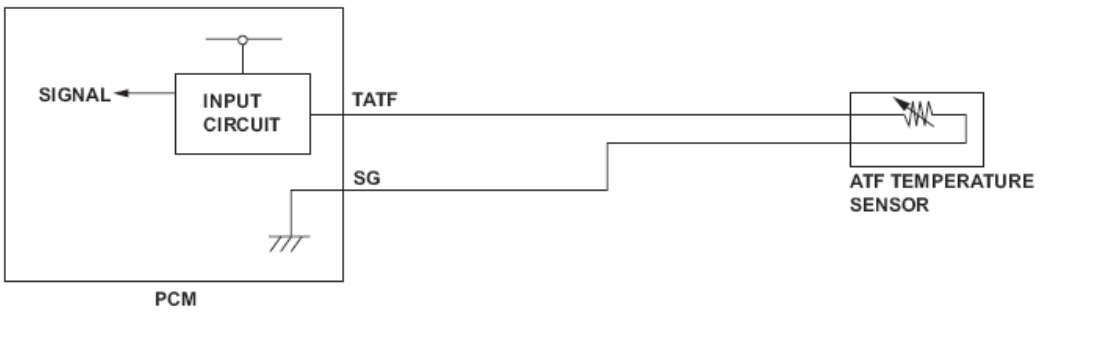

Fig. 147: ATF Temperature Sensor - Circuit Diagram

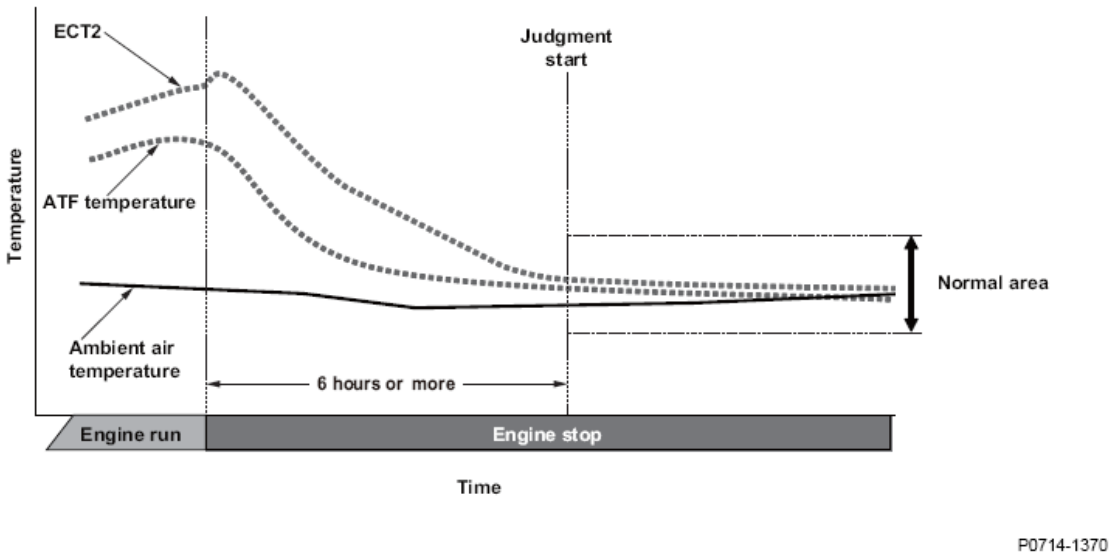

Fig. 148: ATF Temperature Versus Time Characteristics Graph

GENERAL DESCRIPTION

The ATF temperature sensor is a thermistor type sensor that changes resistance according to the change in ATF temperature. The powertrain control module (PCM) sends a 5 V reference voltage to the sensor through a pull-

up resistor. When the ATF temperature is low, the sensor resistance increases and the PCM detects a high signal voltage. As the ATF temperature rises, the sensor resistance decreases and the PCM detects a low signal voltage. When the engine is stopped and enough time has passed, the ATF temperature will equalize to the engine coolant temperature. When the temperature in the ATF temperature sensor deviates from the temperature in engine coolant temperature (ECT) sensor 2 after the engine is stopped and enough time has passed, the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	P0111, P0112, P0113, P0116, P0117, P0118, P0125, P0128, P1116, P2183, P2184, P2185 are judged as OK
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL off, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time after the ignition switch is turned to LOCK (0) or the engine start/stop button is pressed to select the OFF mode	6 hours	-
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0112, P0113, P0117, P0118, P0711, P0712, P0713, P2184, P2185, P2610	
Other	Not to be towed during engine stop	

MALFUNCTION THRESHOLD

The temperature in the ATF temperature sensor deviates from the temperature in ECT sensor 2, less than -43 °F (-24 °C) or greater than 57 °F (32 °C)*.

*: Greater than 108 °F (60 °C) if engine block heater is equipped.

DRIVING PATTERN

1. Turn the ignition switch to LOCK (0) in P or press the engine start/stop button to select the OFF mode in P, and wait for at least 6 hours.
2. Start the engine in P, and wait for at least 10 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0715: INPUT SHAFT (MAINSHAFT) SPEED SENSOR CIRCUIT MALFUNCTION

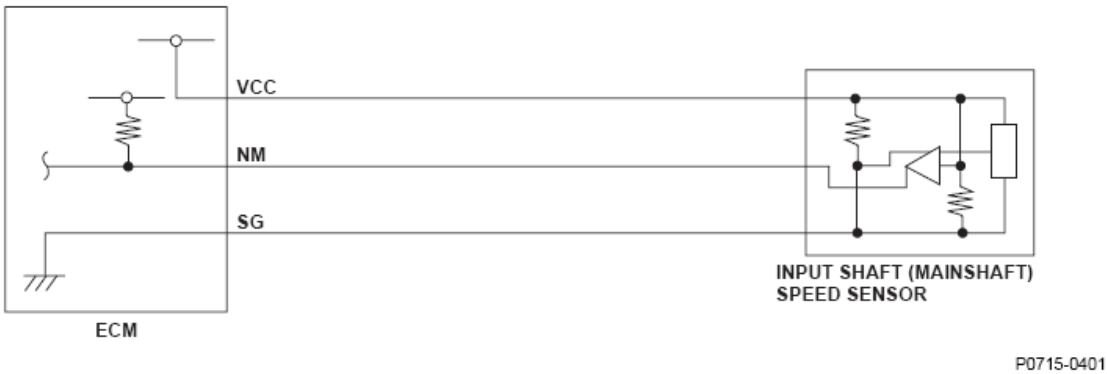

Fig. 149: Input Shaft (Mainshaft) Speed Sensor - Circuit Diagram

GENERAL DESCRIPTION

The input shaft (mainshaft) speed sensor is attached to the transmission housing to sense input shaft (mainshaft) revolutions. The engine control module (ECM) determines the vehicle speed according to the signal from the input shaft (mainshaft) speed sensor for the control units. If no signal from the input shaft (mainshaft) speed sensor is received for a set time, the ECM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	20 seconds or more
DTC Type	Two drive cycles, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine coolant temperature	157 °F (69 °C)	-
Engine speed	1,000 rpm(1)	-

Battery voltage	10.0 V	-
No active DTCs set (prevents monitor from running)	P0117, P0118, P0122, P0123, P0222, P0223, P060A, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176	
(1) Engine speed must not be 1,000 rpm or more if the throttle position is 2.0 ° or more.		

MALFUNCTION THRESHOLD

No signal from the input shaft (mainshaft) speed sensor is detected for at least 20 seconds.

DRIVING PATTERN

Start the engine speed at 3,000 rpm without load (in neutral) until the radiator fan comes on.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0716: PROBLEM IN INPUT SHAFT (MAINSHAFT) SPEED SENSOR CIRCUIT

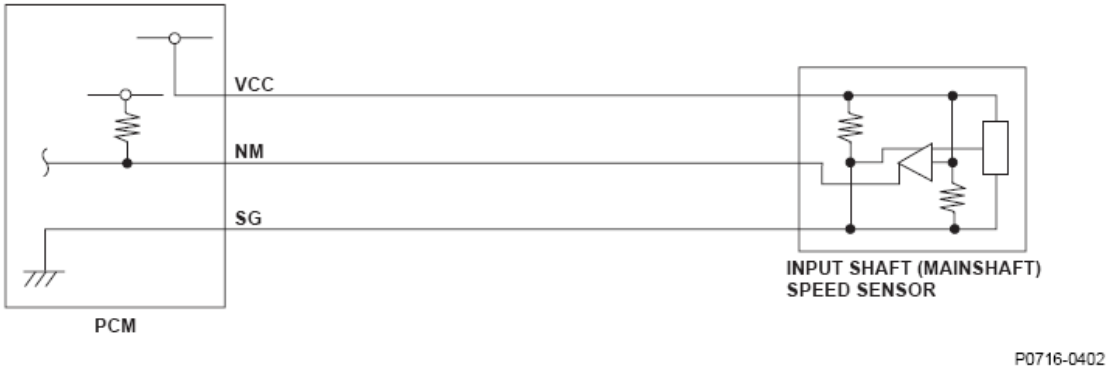

Fig. 150: Input Shaft (Mainshaft) Speed Sensor - Circuit Diagram

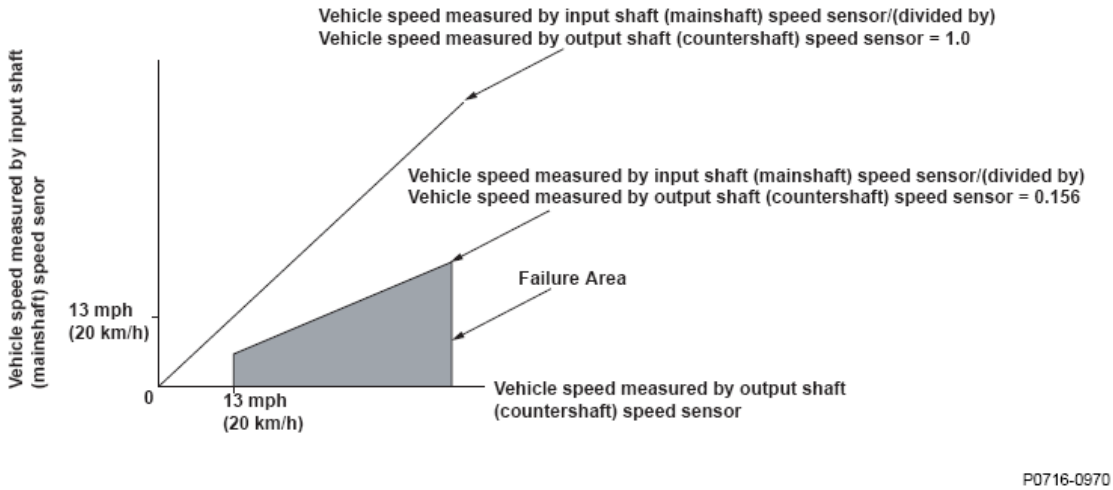

Fig. 151: Input Shaft (Mainshaft) Speed Sensor Characteristics Graph

GENERAL DESCRIPTION

The input shaft (mainshaft) speed sensor is attached to the outside of the transmission housing. The input shaft (mainshaft) speed sensor generates a pulsing signal according to the speed of the idler gear on the input shaft (mainshaft). Using that signal, the powertrain control module (PCM) determines the speed of the input shaft (mainshaft). If no pulses occur with the input shaft (mainshaft) rotating, the PCM detects a malfunction that may be caused by an open, a temporary open, or a short to ground. Based on the velocity ratio measured by the output shaft (countershaft) speed sensor and the input shaft (mainshaft) speed sensor, the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	One drive cycle, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	500 rpm	-
Vehicle speed	13 mph (20 km/h)	-
Battery voltage	11 V	-
Shift lever position	D, S	
No active DTCs set (prevents monitor from running)	P0705, P0706, P0717, P0721, P0722, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P2720, P2721	
	Not during shifting	

Other	Not when the shift lever is being shifted
	No electrical noise in the output shaft (countershaft) speed sensor output circuit
	Except 1st gear

MALFUNCTION THRESHOLD

The vehicle speed measured by the input shaft (mainshaft) speed sensor/(divided by) the vehicle speed measured by the output shaft (countershaft) speed sensor is less than 0.156 for at least 10 seconds.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle at a speed of 13 mph (20 km/h) or more for at least 10 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0717: PROBLEM IN INPUT SHAFT (MAINSHAFT) SPEED SENSOR CIRCUIT (NO SIGNAL INPUT)

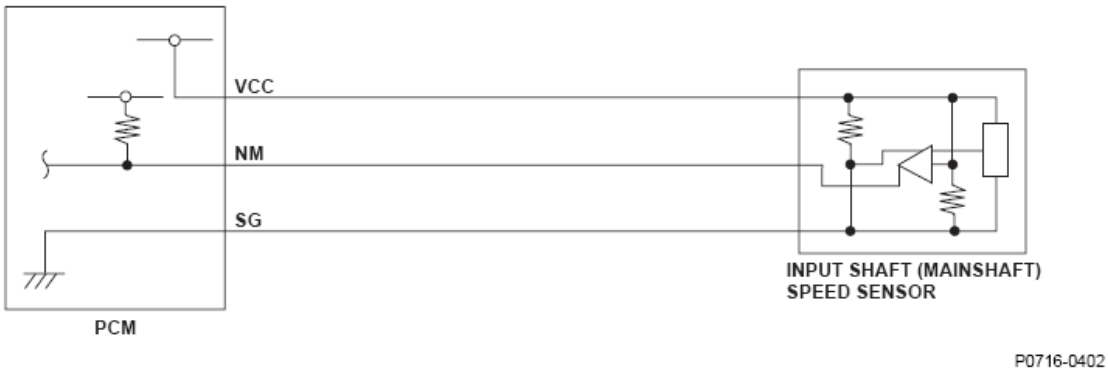

Fig. 152: Input Shaft (Mainshaft) Speed Sensor - Circuit Diagram

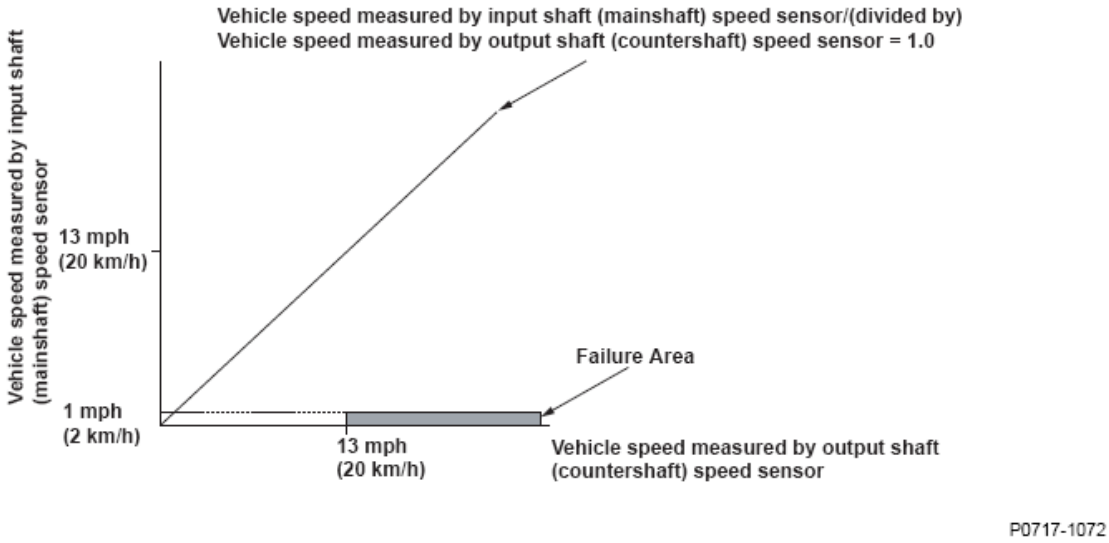

Fig. 153: Input Shaft (Mainshaft) Speed Sensor Characteristics Graph

GENERAL DESCRIPTION

The input shaft (mainshaft) speed sensor is attached to the outside of the transmission housing. The input shaft (mainshaft) speed sensor generates a pulsing signal according to the speed of the idler gear on the input shaft (mainshaft). Using that signal, the powertrain control module (PCM) determines the speed of the input shaft (mainshaft). If no pulses occur with the input shaft (mainshaft) rotating, the PCM detects a malfunction that may be caused by an open, a temporary open, or a short to ground. Based on the correlation between the vehicle speed measured by the output shaft (countershaft) speed sensor and the input shaft (mainshaft) speed sensor, the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	One drive cycle, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	500 rpm	-
Vehicle speed	13 mph (20 km/h)	-
Battery voltage	11 V	-
Shift lever position	D, S	
No active DTCs set (prevents monitor from running)	P0705, P0706, P0716, P0721, P0722, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P2720, P2721	

Other	Not during shifting
	Not when the shift lever is being shifted
	No electrical noise in the output shaft (countershaft) speed sensor output circuit
	Except 1st gear

MALFUNCTION THRESHOLD

When the vehicle speed measured by the output shaft (countershaft) speed sensor is 13 mph (20 km/h) or more, the vehicle speed measured by the input shaft (mainshaft) speed sensor is 1 mph (2 km/h) or less for at least 10 seconds.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle at a speed of 13 mph (20 km/h) or more for at least 10 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0718: INPUT SHAFT (MAINSHAFT) SPEED SENSOR INTERMITTENT FAILURE

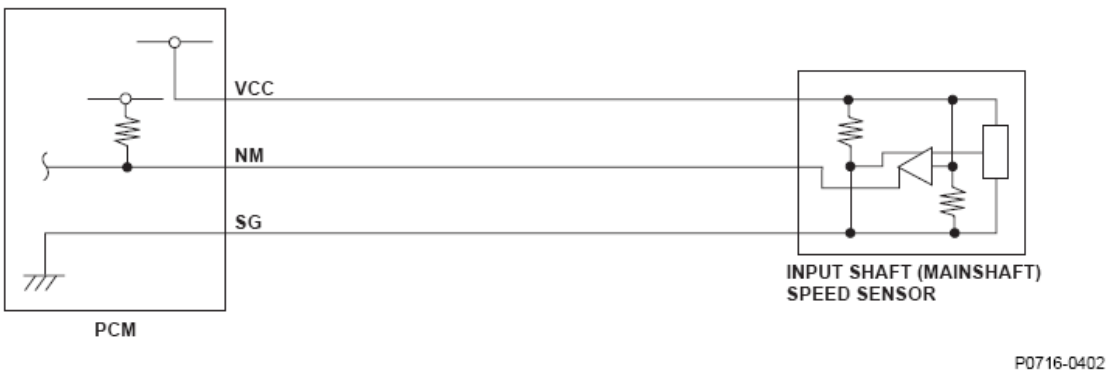

Fig. 154: Input Shaft (Mainshaft) Speed Sensor - Circuit Diagram

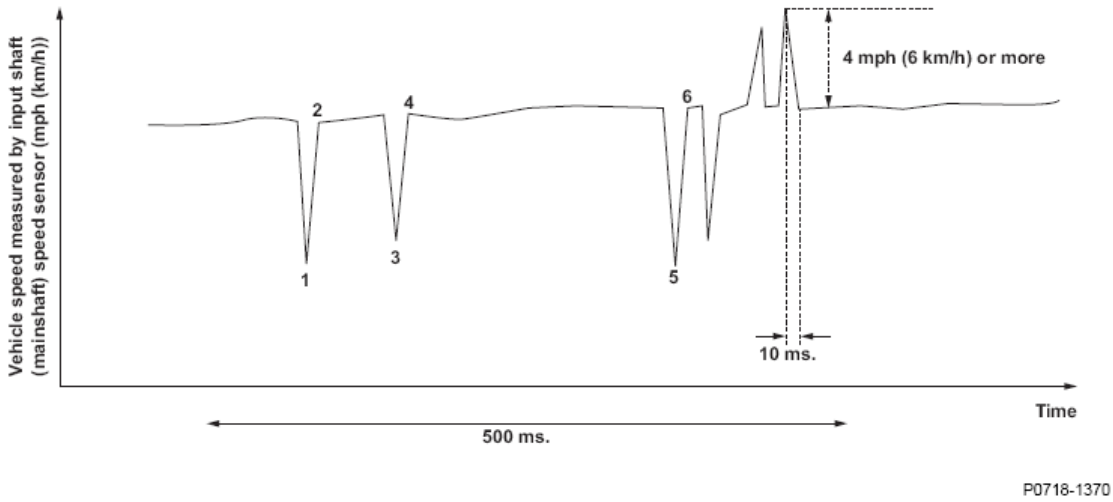

Fig. 155: Input Shaft (Mainshaft) Speed Sensor Characteristics Curve

GENERAL DESCRIPTION

The input shaft (mainshaft) speed sensor is attached to the outside of the transmission housing. The input shaft (mainshaft) speed sensor generates a pulsing signal according to the speed of the idler gear on the input shaft (mainshaft). Using that signal, the powertrain control module (PCM) determines the speed of the input shaft (mainshaft). If no pulses occur with the input shaft (mainshaft) rotating, the PCM detects a malfunction that may be caused by an open, a temporary open, or a short to ground. Based on the fluctuation of the vehicle speed measured by the input shaft (mainshaft) speed sensor, the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	500 milliseconds
DTC Type	Two drive cycles, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Vehicle speed	13 mph (20 km/h)	-
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0716, P0717, P0721, P0722	
Other	Not during shifting	
	Not when an output shaft (countershaft) speed sensor intermittent failure is detected	

MALFUNCTION THRESHOLD

The fluctuation of the vehicle speed measured by the input shaft (mainshaft) speed sensor in 10 milliseconds is 4 mph (6 km/h) or more, and it fluctuates at least six times within 500 milliseconds.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle at a speed of 13 mph (20 km/h) or more so it shifts from 1st to 6th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0720: OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR CIRCUIT MALFUNCTION

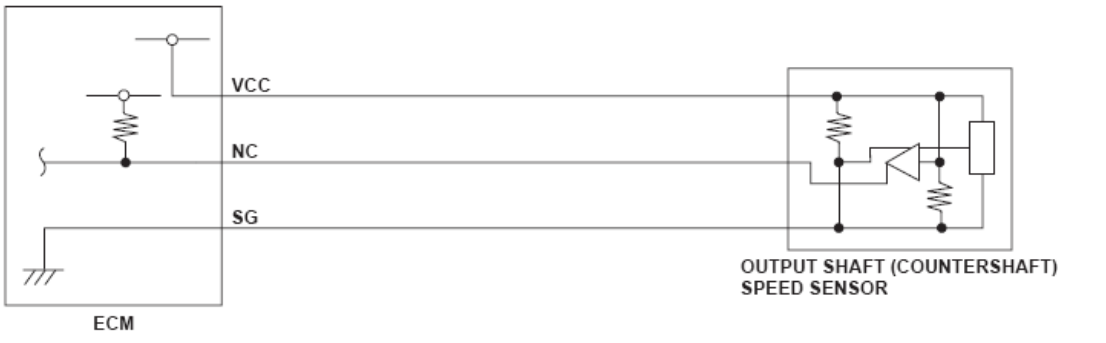

Fig. 156: Output Shaft (Countershaft) Speed Sensor - Circuit Diagram

GENERAL DESCRIPTION

The output shaft (countershaft) speed sensor is attached to the transmission housing to sense output shaft (countershaft) revolutions. The engine control module (ECM) determines the vehicle speed according to the signal from the output shaft (countershaft) speed sensor for the control units. If no signal from the output shaft (countershaft) speed sensor is received for a set time, the ECM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	4,000 rpm	-
Battery voltage	10.0 V	-
Other	During fuel cut-off operation for deceleration	

MALFUNCTION THRESHOLD

No signal from the output shaft (countershaft) speed sensor is detected for at least 5 seconds during deceleration with the engine speed at 4,000 rpm or less.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0721: PROBLEM IN OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR CIRCUIT

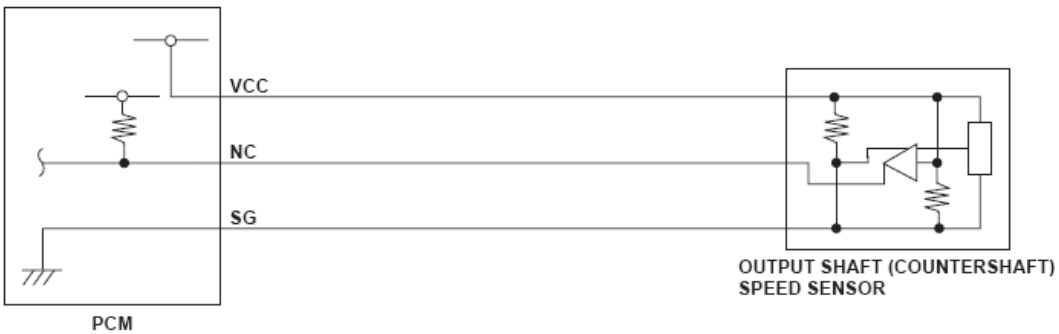

Fig. 157: Output Shaft (Countershaft) Speed Sensor - Circuit Diagram

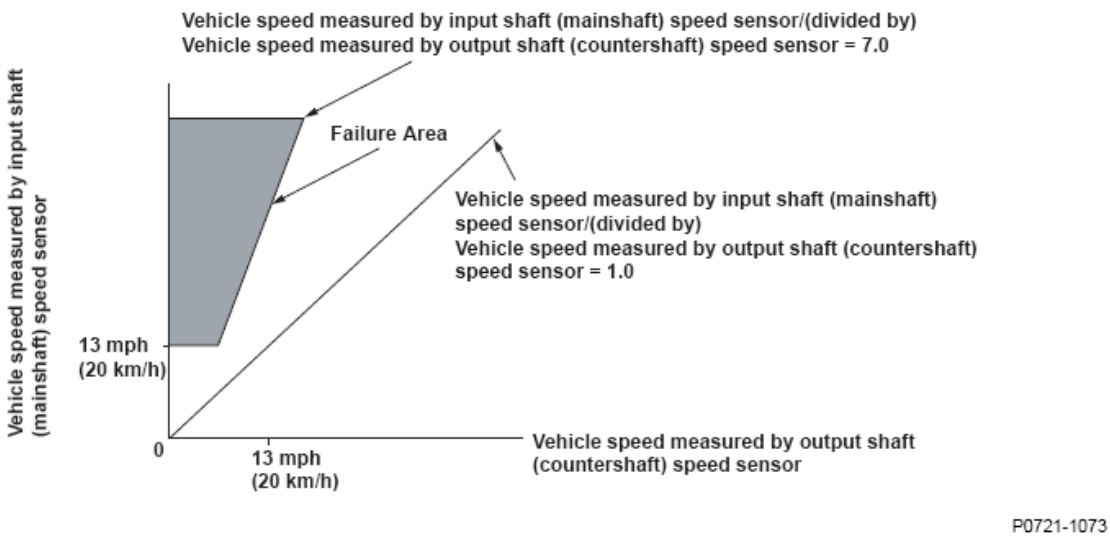

Fig. 158: Output Shaft (Countershaft) Speed Sensor Characteristics Graph

GENERAL DESCRIPTION

The output shaft (countershaft) speed sensor is attached to the outside of the transmission housing. The output shaft (countershaft) speed sensor generates a pulsing signal according to the speed of the park gear on the output shaft (countershaft). Using that signal, the powertrain control module (PCM) determines the speed of the output shaft (countershaft). If no pulses occur with the output shaft (countershaft) rotating, the PCM detects a malfunction that may be caused by an open, a temporary open, or a short to ground. Based on the velocity ratio measured by the output shaft (countershaft) speed sensor and the input shaft (mainshaft) speed sensor, the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous

OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	500 rpm	-
Vehicle speed	13 mph (20 km/h)	-
Battery voltage	11 V	-
Shift lever position	D, S	
No active DTCs set	P0705, P0706, P0716, P0717, P0722, P0962, P0963, P0966, P0967, P0970,	

(prevents monitor from running)	P0971, P0973, P0974, P0976, P0977, P0979, P0980, P2720, P2721
Other	Not during shifting
	Not when the shift lever is being shifted
	No electrical noise in the input shaft (mainshaft) speed sensor output circuit
	Except 1st gear

MALFUNCTION THRESHOLD

The vehicle speed measured by the input shaft (mainshaft) speed sensor/(divided by) the vehicle speed measured by the output shaft (countershaft) speed sensor is greater than 7.0 for at least 10 seconds.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle at a speed of 13 mph (20 km/h) or more for at least 10 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0722: PROBLEM IN OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR CIRCUIT (NO SIGNAL INPUT)

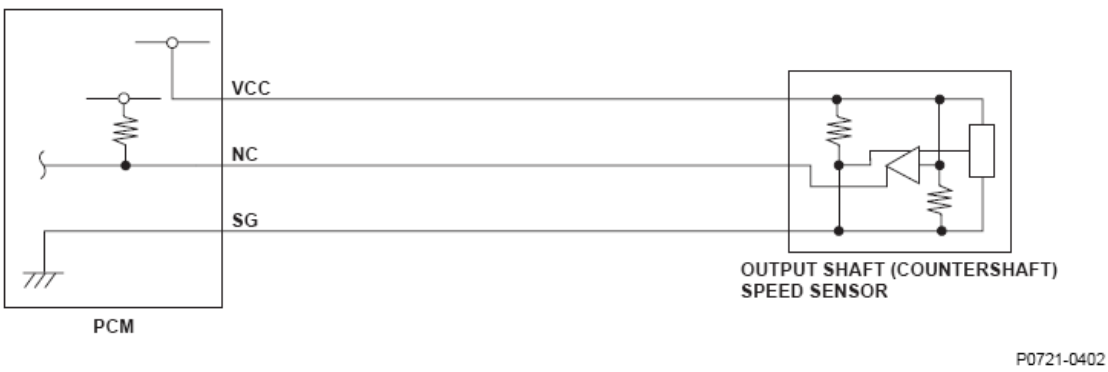

Fig. 159: Output Shaft (Countershaft) Speed Sensor - Circuit Diagram

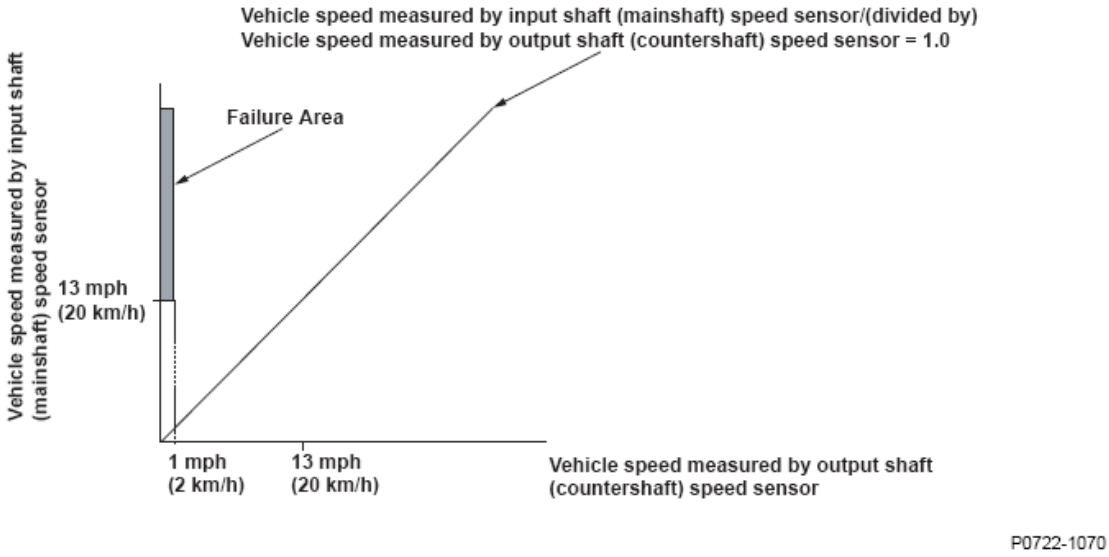

Fig. 160: Output Shaft (Countershaft) Speed Sensor Characteristics Graph

GENERAL DESCRIPTION

The output shaft (countershaft) speed sensor is attached to the outside of the transmission housing. The output shaft (countershaft) speed sensor generates a pulsing signal according to the speed of the park gear on the output shaft (countershaft). Using that signal, the powertrain control module (PCM) determines the speed of the output shaft (countershaft). If no pulses occur with the output shaft (countershaft) rotating, the PCM detects a malfunction that may be caused by an open, a temporary open, or a short to ground. Based on the correlation between the vehicle speed measured by the output shaft (countershaft) speed sensor and the input shaft (mainshaft) speed sensor, the PCM detects a malfunction and stores a DTC.

Duration	500 milliseconds
DTC Type	Two drive cycles, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Vehicle speed	13 mph (20 km/h)	-
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0721, P0722	
Other	Not during shifting	
	Not when an input shaft (mainshaft) speed sensor intermittent failure is detected	

MALFUNCTION THRESHOLD

The fluctuation of the vehicle speed measured by the output shaft (countershaft) speed sensor in 10 milliseconds is 4 mph (6 km/h) or more, and it fluctuates at least six times within 500 milliseconds.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle at a speed of 13 mph (20 km/h) or more so it shifts from 1st to 6th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0729: PROBLEM IN 6TH CLUTCH AND 6TH CLUTCH HYDRAULIC CIRCUIT

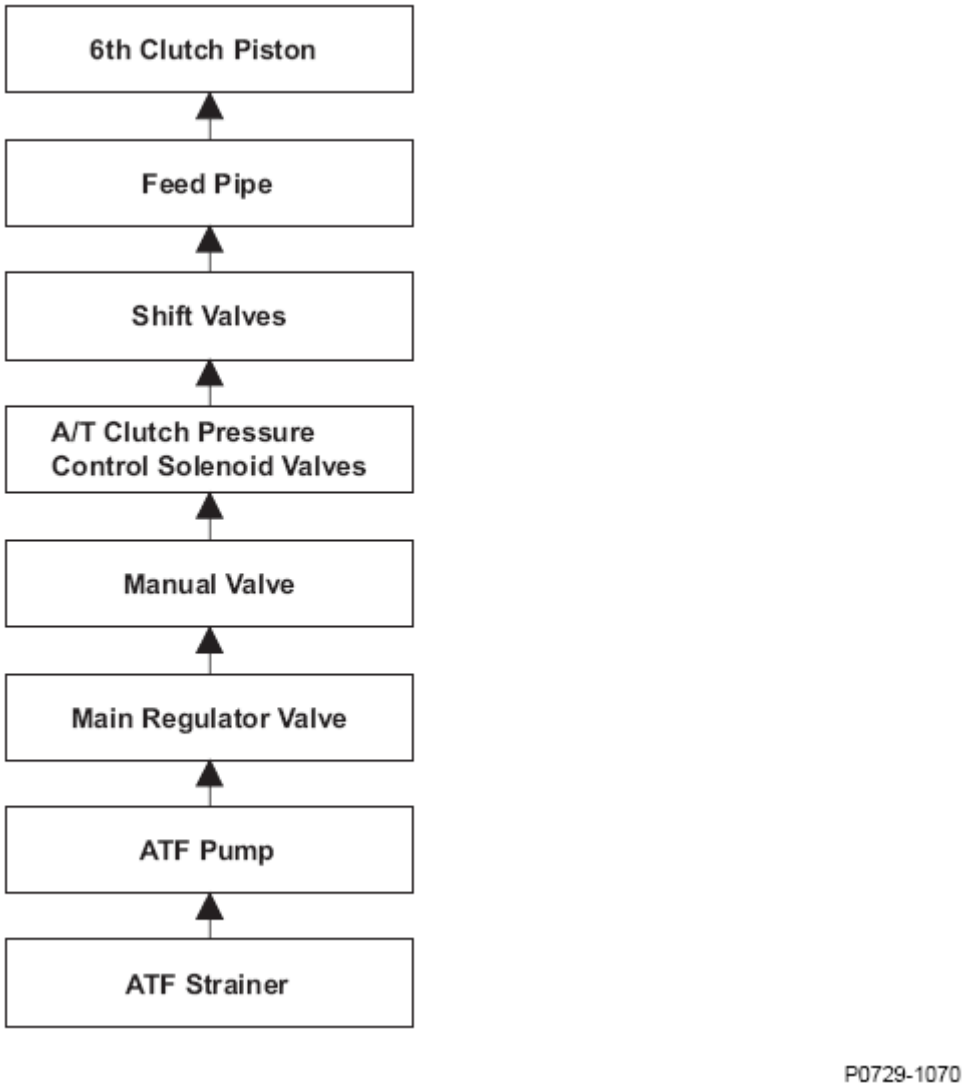

Fig. 163: 6th Clutch Hydraulic Circuit Block Diagram

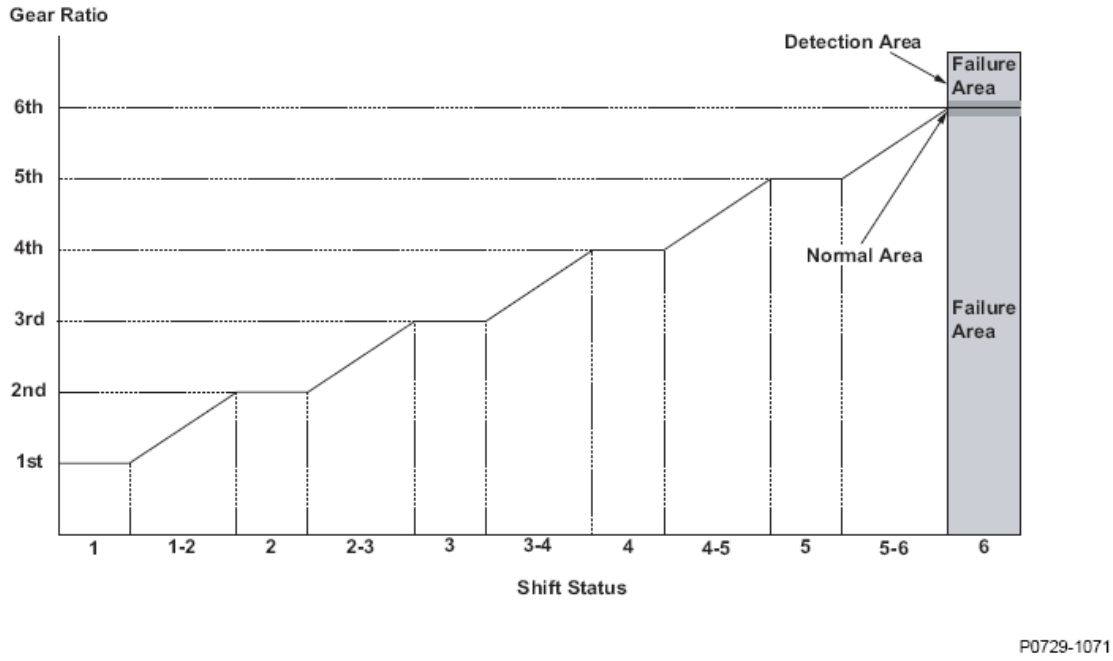

Fig. 164: 6th Clutch Gear Ratio Versus Shifting Status Graph

GENERAL DESCRIPTION

To engage 6th gear, A/T clutch pressure control solenoid valve pressure is supplied to the 6th clutch piston, engaging the 6th clutch, and the mainshaft and the mainshaft 6th gear are connected and revolve together. Hydraulic pressure is supplied to the 6th clutch through the ATF strainer --> the ATF pump --> the main regulator valve --> the manual valve --> the A/T clutch pressure control solenoid valves --> the shift valves --> the feed pipe --> the 6th clutch piston. (An A/T clutch pressure control solenoid valve failure and shift valve failure in the supply route above are detected by the malfunction detection of each solenoid valve.) The powertrain control module (PCM) computes the ratio of the input shaft (mainshaft) speed to the output shaft (countershaft) speed. When the ratio is not the 6th gear ratio, the PCM detects a malfunction of the hydraulic circuit or the 6th clutch and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	12 seconds or more
DTC Type	Two drive cycles, MIL off, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	500 rpm	-
Vehicle speed	8 mph (12 km/h)	-

Battery voltage	11 V	-
Shift lever position	D	
No active DTCs set (prevents monitor from running)	P0117, P0118, P0122, P0123, P0222, P0223, P0705, P0706, P0716, P0717, P0718, P0721, P0722, P0723, P0731, P0732, P0733, P0734, P0735, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0797, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721	

MALFUNCTION THRESHOLD

The actual gear ratio must match one of these conditions for at least 12 seconds with the 6th gear shift command:

- Actual gear ratio is greater than the 6th gear ratio by a factor of 1.25.
- Actual gear ratio is less than the 6th gear ratio by a factor of 0.8.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D at a speed of 8 mph (12 km/h) or more for at least 12 seconds in 6th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0731: PROBLEM IN 1ST CLUTCH AND 1ST CLUTCH HYDRAULIC CIRCUIT

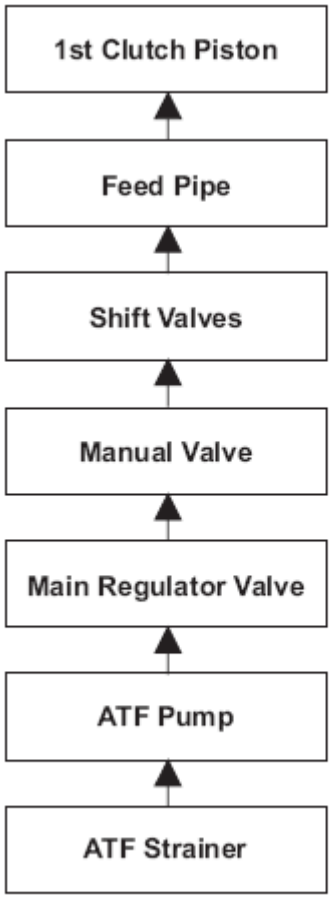

Fig. 165: 1st Clutch Hydraulic Circuit Block Diagram

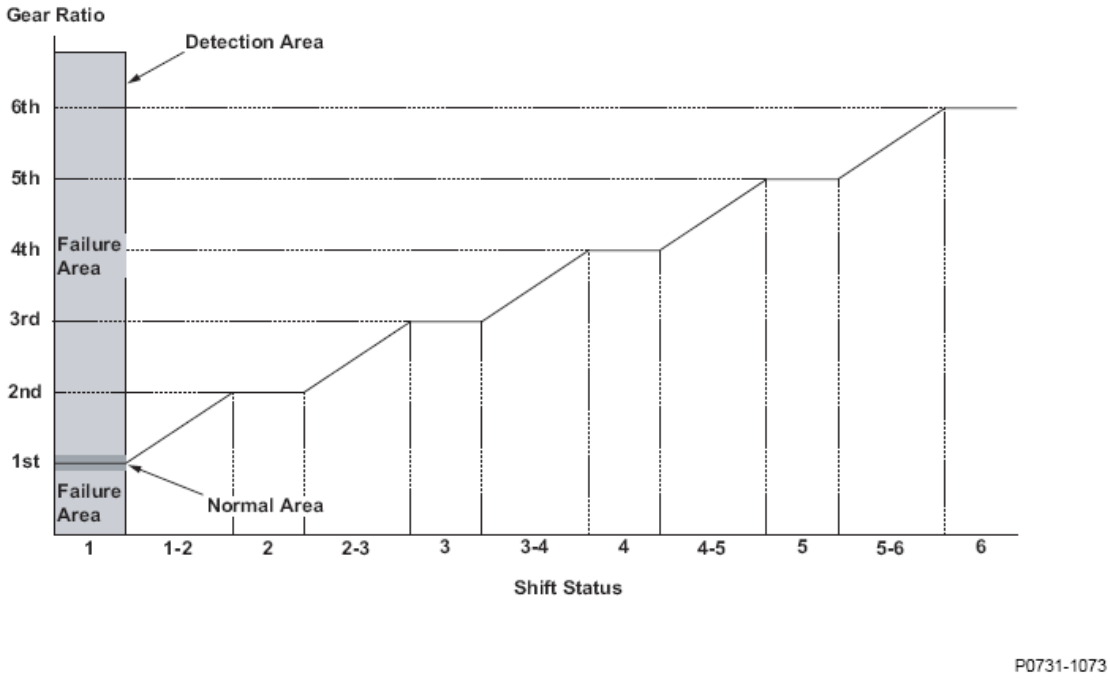

Fig. 166: 1st Clutch Gear Ratio Versus Shifting Status Graph

GENERAL DESCRIPTION

To engage 1st gear, line pressure is supplied to the 1st clutch piston, engaging the 1st clutch, and the secondary shaft and the secondary shaft 1st gear are connected and revolve together. Hydraulic pressure is supplied to the 1st clutch through the ATF strainer --> the ATF pump --> the main regulator valve --> the manual valve --> the shift valves --> the feed pipe --> the 1st clutch piston. (A shift valve failure in the supply route above is detected by the malfunction detection of each shift solenoid valve.) The powertrain control module (PCM) computes the ratio of the input shaft (mainshaft) speed to the output shaft (countershaft) speed. When the ratio is not the 1st gear ratio, the PCM detects a malfunction of the hydraulic circuit or the 1st clutch and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	12 seconds or more
DTC Type	Two drive cycles, MIL off, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	500 rpm	-
Vehicle speed	8 mph (12 km/h)	-
Battery voltage	11 V	-

Shift lever position	D, S
No active DTCs set (prevents monitor from running)	P0117, P0118, P0122, P0123, P0222, P0223, P0705, P0706, P0716, P0717, P0718, P0721, P0722, P0723, P0729, P0732, P0733, P0734, P0735, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0797, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721

MALFUNCTION THRESHOLD

The actual gear ratio must match one of these conditions for at least 12 seconds with the 1st gear shift command:

- Actual gear ratio is greater than the 1st gear ratio by a factor of 1.25.
- Actual gear ratio is less than the 1st gear ratio by a factor of 0.8.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D at a speed of 8 mph (12 km/h) or more for at least 12 seconds in 1st gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0732: PROBLEM IN 2ND CLUTCH AND 2ND CLUTCH HYDRAULIC CIRCUIT

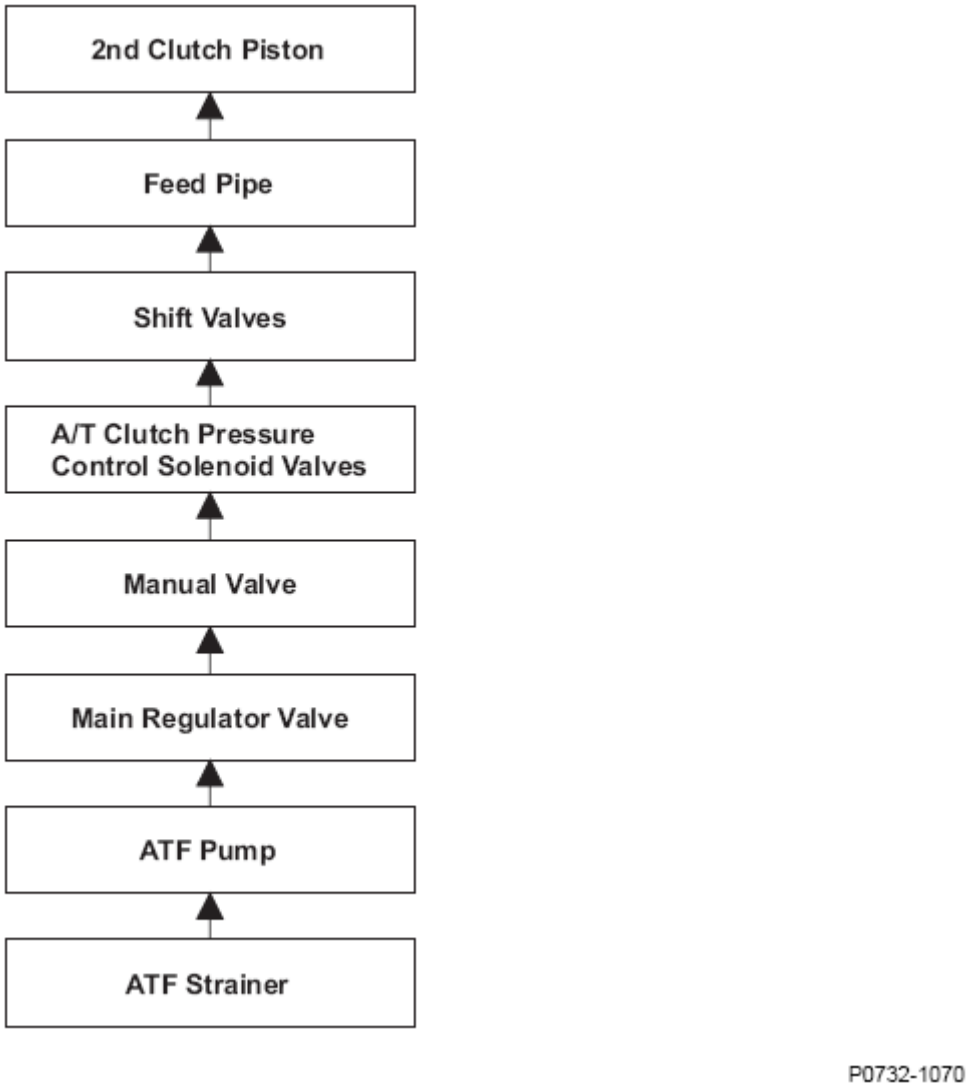

Fig. 167: 2nd Clutch Hydraulic Circuit Block Diagram

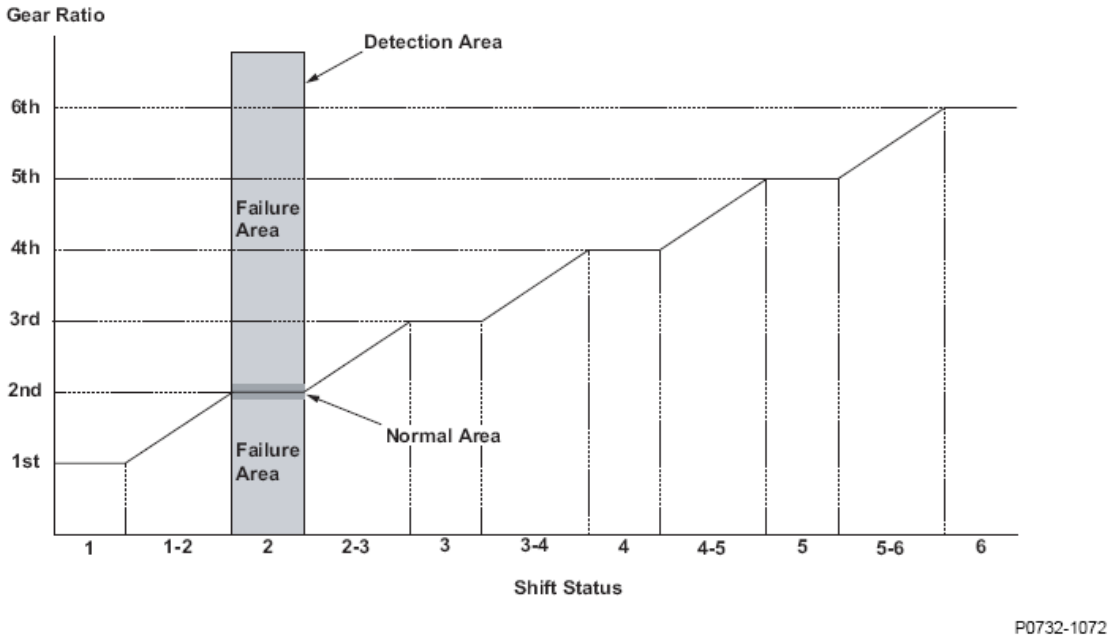

Fig. 168: 2nd Clutch Gear Ratio Versus Shifting Status Graph

GENERAL DESCRIPTION

To engage 2nd gear, A/T clutch pressure control solenoid valve pressure is supplied to the 2nd clutch piston, engaging the 2nd clutch, and the secondary shaft and the secondary shaft 2nd gear are connected and revolve together. Hydraulic pressure is supplied to the 2nd clutch through the ATF strainer --> the ATF pump --> the main regulator valve --> the manual valve --> the A/T clutch pressure control solenoid valves --> the shift valves --> the feed pipe --> the 2nd clutch piston. (An A/T clutch pressure control solenoid valve failure and shift valve failure in the supply route above are detected by the malfunction detection of each solenoid valve.) The powertrain control module (PCM) computes the ratio of the input shaft (mainshaft) speed to the output shaft (countershaft) speed. When the ratio is not the 2nd gear ratio, the PCM detects a malfunction of the hydraulic circuit or the 2nd clutch and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous

OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	500 rpm	-
Vehicle speed	8 mph (12 km/h)	-

Battery voltage	11 V	-
Shift lever position	D, S	
No active DTCs set (prevents monitor from running)	P0117, P0118, P0122, P0123, P0222, P0223, P0705, P0706, P0716, P0717, P0718, P0721, P0722, P0723, P0729, P0731, P0733, P0734, P0735, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0797, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721	

MALFUNCTION THRESHOLD

The actual gear ratio must match one of these conditions for at least 12 seconds with the 2nd gear shift command:

- Actual gear ratio is greater than the 2nd gear ratio by a factor of 1.25.
- Actual gear ratio is less than the 2nd gear ratio by a factor of 0.8.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D at a speed of 8 mph (12 km/h) or more for at least 12 seconds in 2nd gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0733: PROBLEM IN 3RD CLUTCH AND 3RD CLUTCH HYDRAULIC CIRCUIT

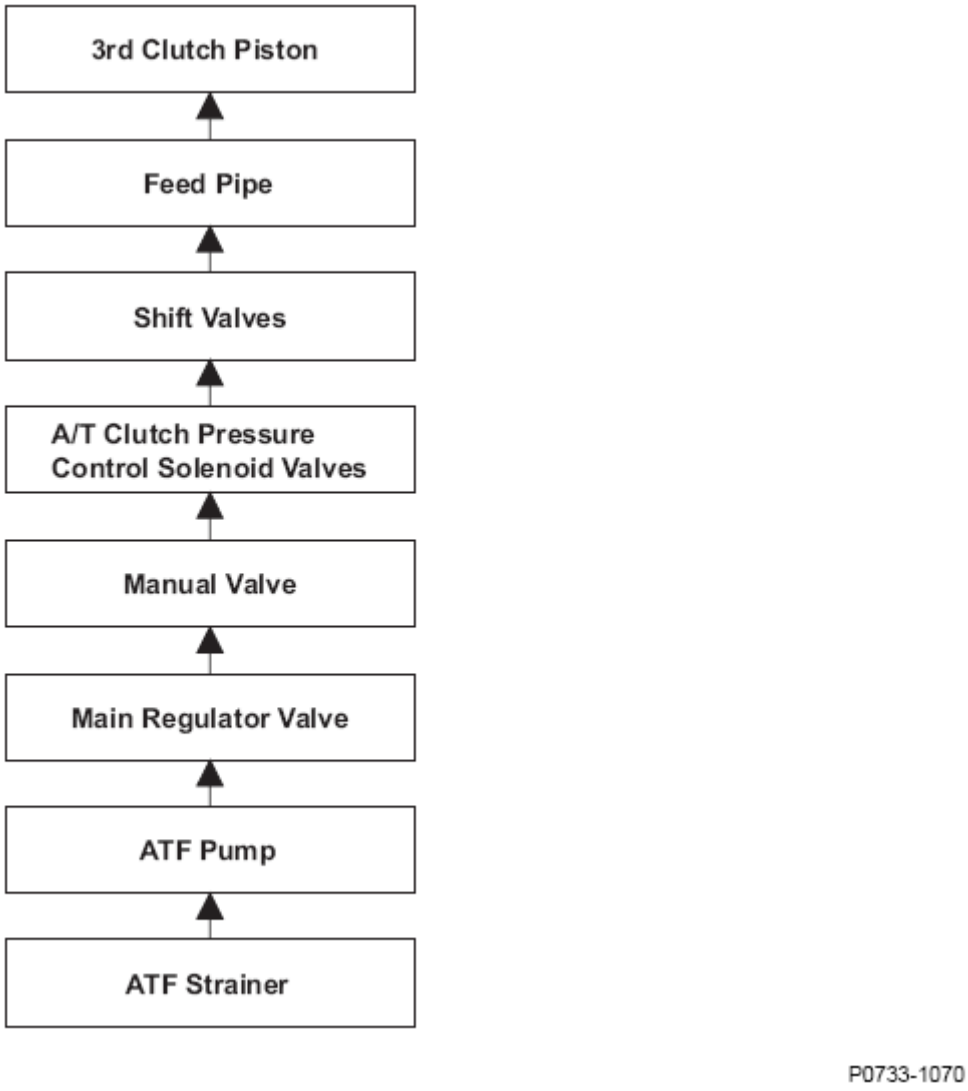

Fig. 169: 3rd Clutch Hydraulic Circuit Block Diagram

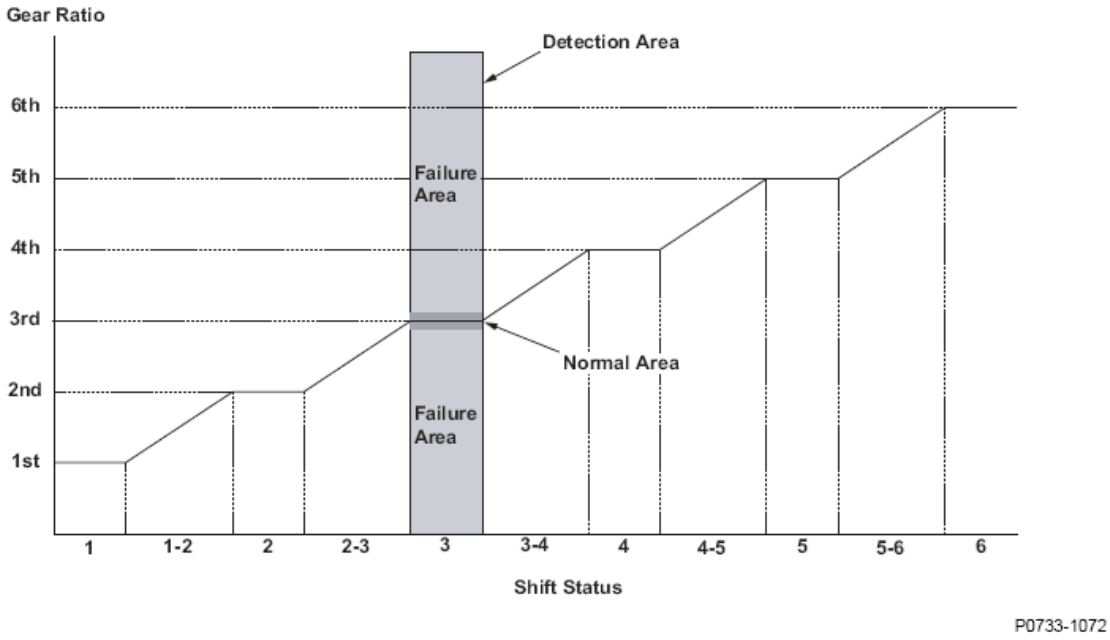

Fig. 170: 3rd Clutch Gear Ratio Versus Shifting Status Graph

GENERAL DESCRIPTION

To engage 3rd gear, A/T clutch pressure control solenoid valve pressure is supplied to the 3rd clutch piston, engaging the 3rd clutch, and the mainshaft and the mainshaft 3rd gear are connected and revolve together. Hydraulic pressure is supplied to the 3rd clutch through the ATF strainer --> the ATF pump --> the main regulator valve --> the manual valve --> the A/T clutch pressure control solenoid valves --> the shift valves --> the feed pipe --> the 3rd clutch piston. (An A/T clutch pressure control solenoid valve failure and shift valve failure in the supply route above are detected by the malfunction detection of each solenoid valve.) The powertrain control module (PCM) computes the ratio of the input shaft (mainshaft) speed to the output shaft (countershaft) speed. When the ratio is not the 3rd gear ratio, the PCM detects a malfunction of the hydraulic circuit or the 3rd clutch and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	12 seconds or more
DTC Type	Two drive cycles, MIL off, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	500 rpm	-
Vehicle speed	8 mph (12 km/h)	-

Battery voltage	11 V	-
Shift lever position	D, S	
No active DTCs set (prevents monitor from running)	P0117, P0118, P0122, P0123, P0222, P0223, P0705, P0706, P0716, P0717, P0718, P0721, P0722, P0723, P0729, P0731, P0732, P0734, P0735, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0797, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721	

MALFUNCTION THRESHOLD

The actual gear ratio must match one of these conditions for at least 12 seconds with the 3rd gear shift command:

- Actual gear ratio is greater than the 3rd gear ratio by a factor of 1.25.
- Actual gear ratio is less than the 3rd gear ratio by a factor of 0.8.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D at a speed of 8 mph (12 km/h) or more for at least 12 seconds in 3rd gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0734: PROBLEM IN 4TH CLUTCH AND 4TH CLUTCH HYDRAULIC CIRCUIT

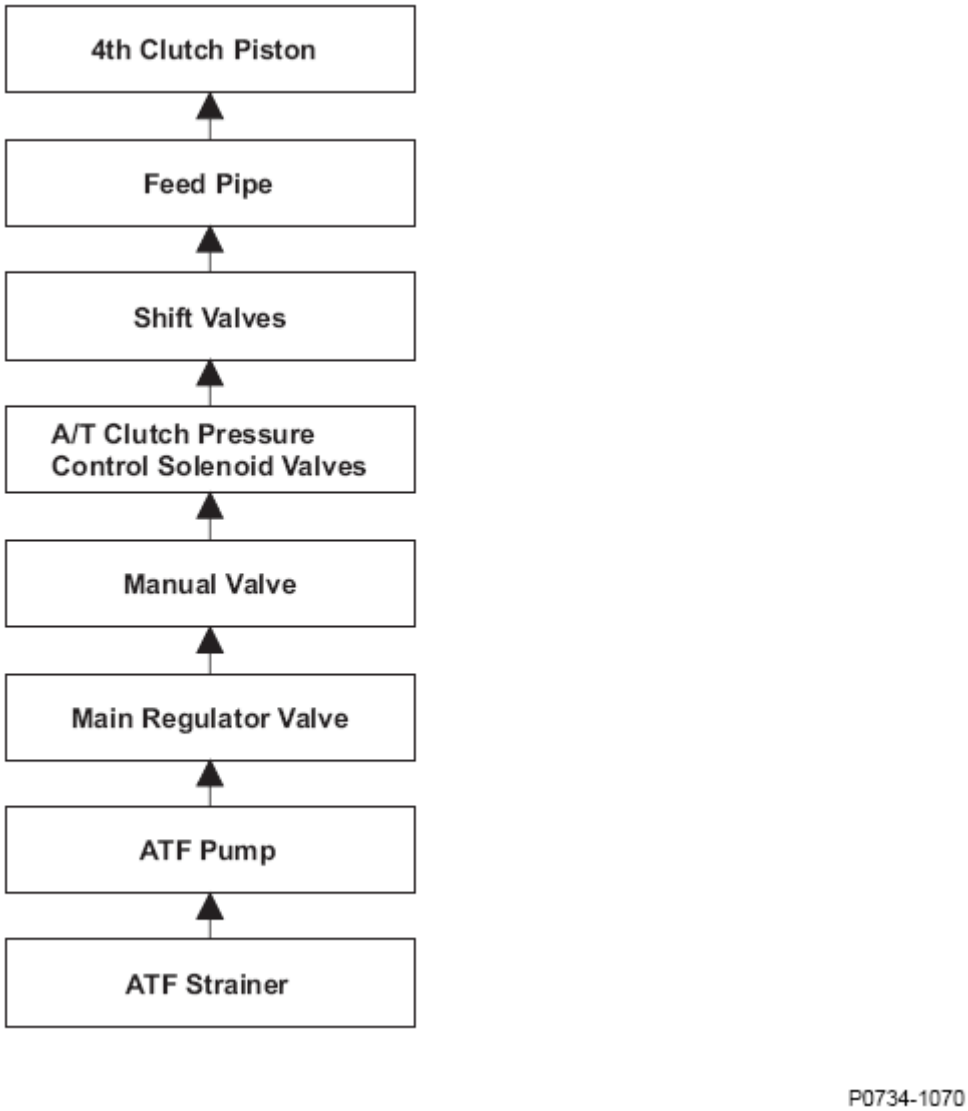

Fig. 171: 4th Clutch Hydraulic Circuit Block Diagram

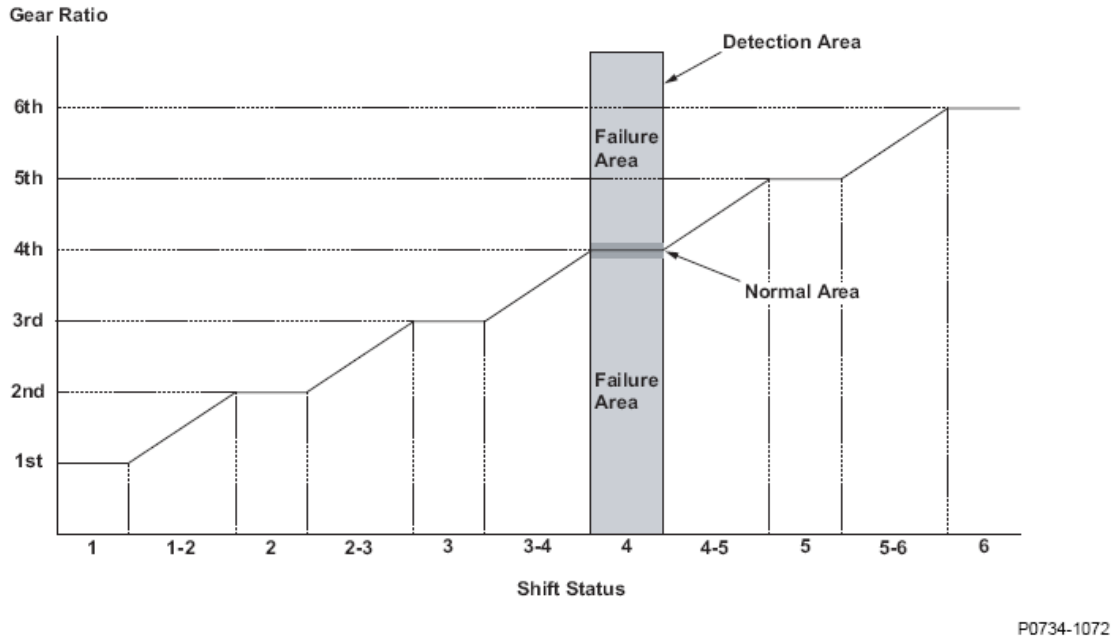

Fig. 172: 4th Clutch Gear Ratio Versus Shifting Status Graph

GENERAL DESCRIPTION

To engage 4th gear, A/T clutch pressure control solenoid valve pressure is supplied to the 4th clutch piston, engaging the 4th clutch, and the third shaft and the third shaft 4th gear are connected and revolve together. Hydraulic pressure is supplied to the 4th clutch through the ATF strainer --> the ATF pump --> the main regulator valve --> the manual valve --> the A/T clutch pressure control solenoid valves --> the shift valves --> the feed pipe --> the 4th clutch piston. (An A/T clutch pressure control solenoid valve failure and shift valve failure in the supply route above are detected by the malfunction detection of each solenoid valve.) The powertrain control module (PCM) computes the ratio of the input shaft (mainshaft) speed to the output shaft (countershaft) speed. When the ratio is not the 4th gear ratio, the PCM detects a malfunction of the hydraulic circuit or the 4th clutch and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None

MALFUNCTION THRESHOLD

The actual gear ratio must match one of these conditions for at least 12 seconds with the 4th gear shift command:

- Actual gear ratio is greater than the 4th gear ratio by a factor of 1.25.
- Actual gear ratio is less than the 4th gear ratio by a factor of 0.8.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D at a speed of 8 mph (12 km/h) or more for at least 12 seconds in 4th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0735: PROBLEM IN 5TH CLUTCH AND 5TH CLUTCH HYDRAULIC CIRCUIT

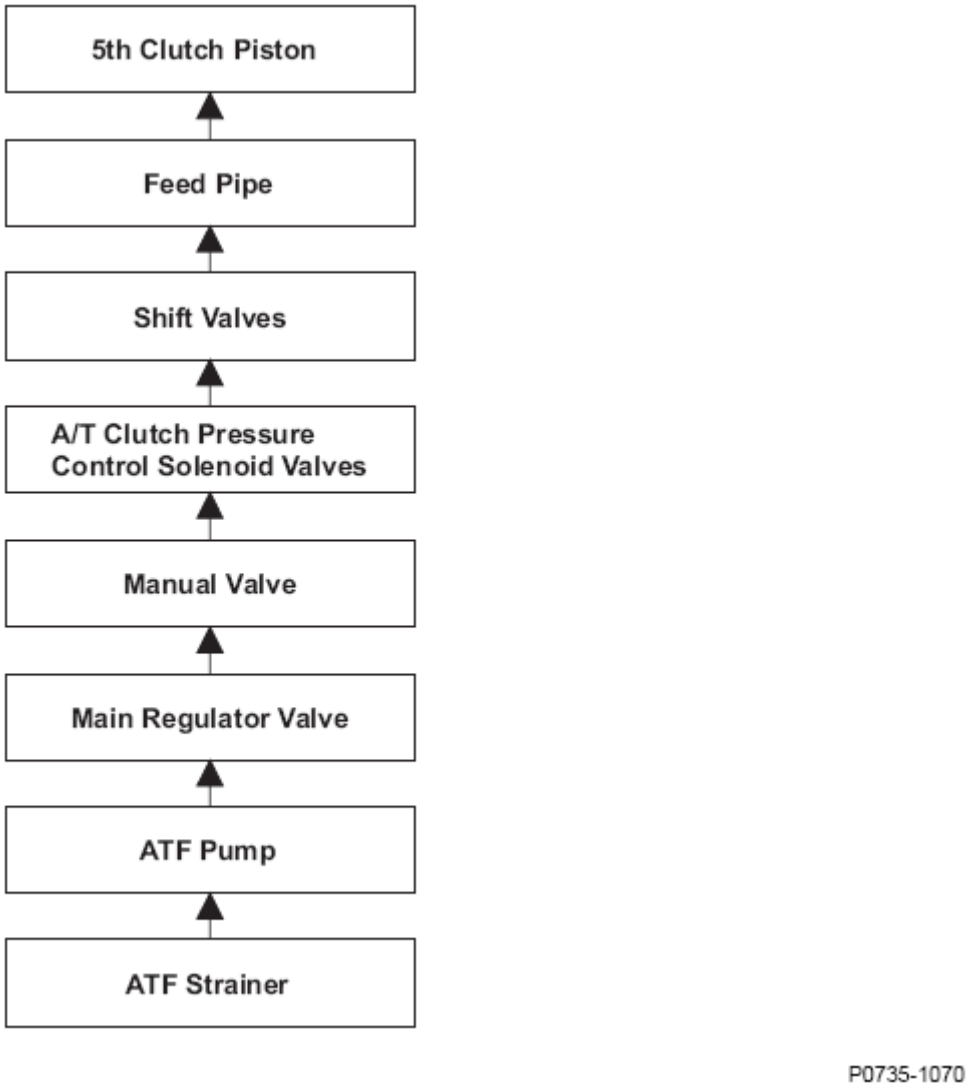

Fig. 173: 5th Clutch Hydraulic Circuit Block Diagram

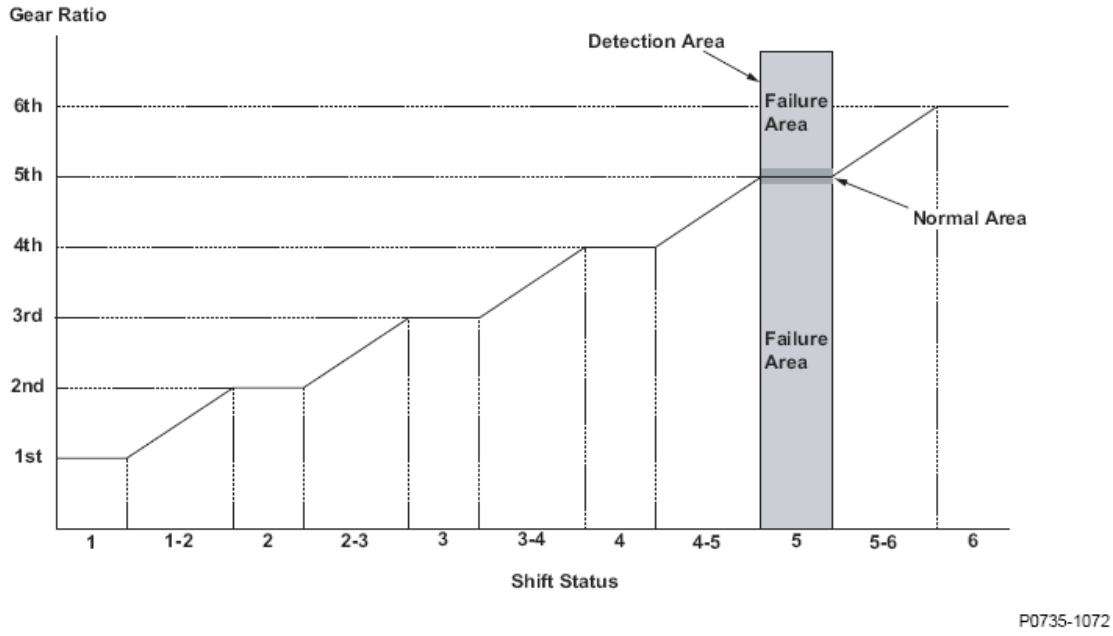

Fig. 174: 5th Clutch Gear Ratio Versus Shifting Status Graph

GENERAL DESCRIPTION

To engage 5th gear, A/T clutch pressure control solenoid valve pressure is supplied to the 5th clutch piston, engaging the 5th clutch, and the secondary shaft and the secondary shaft 5th gear are connected and revolve together. Hydraulic pressure is supplied to the 5th clutch through the ATF strainer --> the ATF pump --> the main regulator valve --> the manual valve --> the A/T clutch pressure control solenoid valves --> the shift valves --> the feed pipe --> the 5th clutch piston. (An A/T clutch pressure control solenoid valve failure and shift valve failure in the supply route above are detected by the malfunction detection of each solenoid valve.) The powertrain control module (PCM) computes the ratio of the input shaft (mainshaft) speed to the output shaft (countershaft) speed. When the ratio is not the 5th gear ratio, the PCM detects a malfunction of the hydraulic circuit or the 5th clutch and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	12 seconds or more
DTC Type	Two drive cycles, MIL off, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	500 rpm	-
Vehicle speed	8 mph (12 km/h)	-
Battery voltage	11 V	-

Shift lever position	D
No active DTCs set (prevents monitor from running)	P0117, P0118, P0122, P0123, P0222, P0223, P0705, P0706, P0716, P0717, P0718, P0721, P0722, P0723, P0729, P0731, P0732, P0733, P0734, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0797, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721

MALFUNCTION THRESHOLD

The actual gear ratio must match one of these conditions for at least 12 seconds with the 5th gear shift command:

- Actual gear ratio is greater than the 5th gear ratio by a factor of 1.25.
- Actual gear ratio is less than the 5th gear ratio by a factor of 0.8.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D at a speed of 8 mph (12 km/h) or more for at least 12 seconds in 5th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0741: TORQUE CONVERTER CLUTCH HYDRAULIC CIRCUIT STUCK OFF

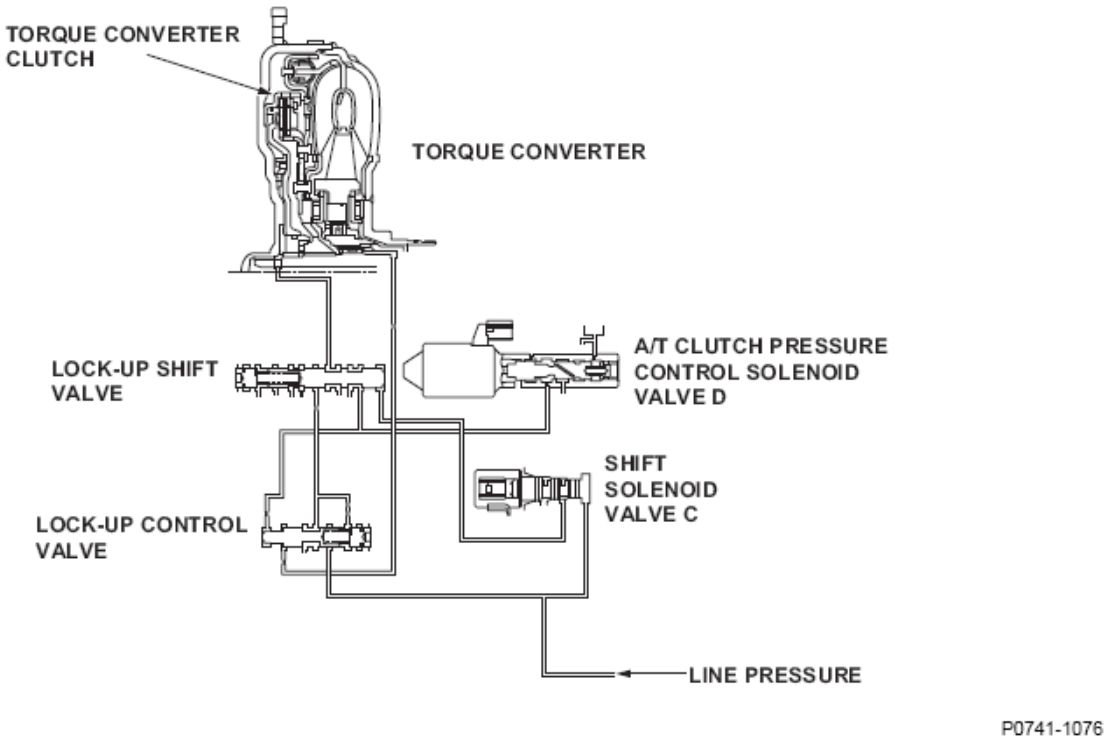

Fig. 175: Torque Converter Clutch - System Diagram

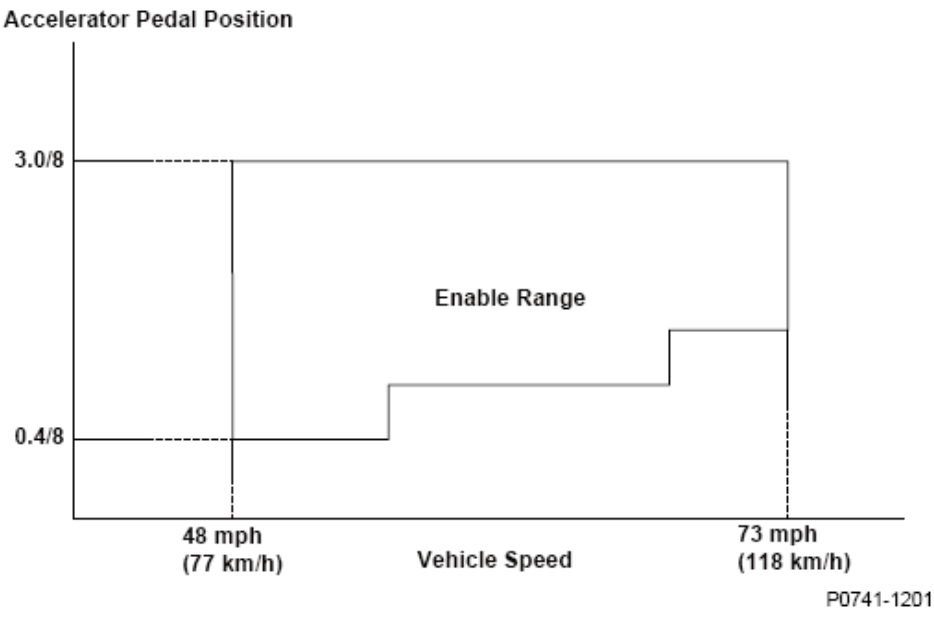
Torque converter clutch operation		A/T clutch pressure control solenoid valve D	
		ON (100 %)	OFF (0 %)
Shift solenoid valve C	ON (12 V)	Torque converter clutch: maximum duty	Torque converter clutch: minimum duty
	OFF (0 V)	Torque converter clutch OFF	Torque converter clutch OFF

GENERAL DESCRIPTION



The power transfer capacity of the torque converter clutch is controlled by the balance of automatic transmission fluid (ATF) supplied to and discharged from the torque converter clutch and the torque converter. When hydraulic pressure supplied to the torque converter clutch is less than the torque converter internal pressure, lock up is off. When hydraulic pressure supplied to the torque converter clutch is greater than the torque converter internal pressure, lock up is on. As the hydraulic pressure supplied to the torque converter clutch is increased, the power transfer capacity of the torque converter clutch is increased. The supply of hydraulic pressure is switched by shift solenoid valve C and the lock-up shift valve. When the powertrain control module (PCM) turns on shift solenoid valve C, the hydraulic pressure is supplied to the torque converter clutch. When the PCM turns off shift solenoid valve C, the hydraulic pressure is not supplied to the torque converter clutch. The balance of hydraulic pressure supplied to the torque converter clutch and the torque converter is controlled by A/T clutch pressure control solenoid valve D and the lock-up control valve. When the PCM turns on A/T clutch pressure control solenoid valve D, the power transfer capacity of the torque converter clutch is at its maximum. When the PCM turns off A/T clutch pressure control solenoid valve D, the power transfer capacity of the torque converter clutch is at its minimum. If the ratio of engine speed and input shaft (mainshaft) speed is not about 1:1 while the PCM is issuing the command to turn shift solenoid valve C and A/T clutch pressure control solenoid valve D on, the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	22 seconds or more
DTC Type	Two drive cycles, MIL off, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine coolant temperature	158 °F (70 °C)	221 °F (105 °C)
Battery voltage	11 V	-
Shift status	6th gear	
Torque converter clutch	During controlling operation	
No active DTCs set (prevents monitor from running)	P0117, P0118, P0122, P0123, P0222, P0223, P0705, P0706, P0716, P0717, P0718, P0721, P0722, P0723, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0797, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721	
Other	When both the vehicle speed and the accelerator pedal position are in Enable Range	

MALFUNCTION THRESHOLD

The ratio of the engine revolutions to the transmission input pulses does not reach about 100 % for at least 22 seconds.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in P or N) until the radiator fan comes on.
2. Drive the vehicle at a constant speed of 60 mph (96 km/h) for at least 22 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

LINE: Line pressure
CPCA: A/T clutch pressure control solenoid valve A pressure
CPCB: A/T clutch pressure control solenoid valve B pressure
CPCC: A/T clutch pressure control solenoid valve C pressure
CPCD: A/T clutch pressure control solenoid valve D pressure

GENERAL DESCRIPTION

A/T clutch pressure control solenoid valve A is installed on the transmission housing. A/T clutch pressure control solenoid valve A is operated by the powertrain control module (PCM) and converts line pressure to A/T clutch pressure control solenoid valve A pressure. A signal from the PCM is output to A/T clutch pressure control solenoid valve A to supply proper A/T clutch pressure control solenoid valve A pressure to the correct gear clutch according to the shift schedule and the driving conditions. When the current from the PCM is high (ON), A/T clutch pressure control solenoid valve A operates and A/T clutch pressure control solenoid valve A pressure increases. When the current from the PCM is low (OFF), A/T clutch pressure control solenoid valve A turns off and A/T clutch pressure control solenoid valve A pressure decreases. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed according to the shift status determined by the shift schedule. When an improper gear ratio is output for the shift schedule, the PCM detects an A/T clutch pressure control solenoid valve A stuck off failure and stores a DTC.

(1) Symptom 1		

MALFUNCTION THRESHOLD

One of these symptoms occurs:

SYMPTOM 1

Symptom	Gear position commanded by the PCM	Actual gear position
1	1st --> 2nd gear upshift	Driving in 1st gear

SYMPTOM 2

Symptom	Gear position commanded by the PCM	Actual gear position
2	Driving in 2nd gear	Neutral

SYMPTOM 3

Symptom	Gear position commanded by the PCM	Actual gear position
3	Driving in 5th gear	Neutral

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D until the transmission shifts into 6th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze

data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

CPCA: A/T clutch pressure control solenoid valve A pressure
CPCB: A/T clutch pressure control solenoid valve B pressure
CPCC: A/T clutch pressure control solenoid valve C pressure
CPCD: A/T clutch pressure control solenoid valve D pressure

GENERAL DESCRIPTION

A/T clutch pressure control solenoid valve A is installed on the transmission housing. A/T clutch pressure control solenoid valve A is operated by the powertrain control module (PCM) and converts line pressure to A/T clutch pressure control solenoid valve A pressure. A signal from the PCM is output to A/T clutch pressure control solenoid valve A to supply proper A/T clutch pressure control solenoid valve A pressure to the correct gear clutch according to the shift schedule and the driving conditions. When the current from the PCM is high (ON), A/T clutch pressure control solenoid valve A operates and A/T clutch pressure control solenoid valve A pressure increases. When the current from the PCM is low (OFF), A/T clutch pressure control solenoid valve A turns off and A/T clutch pressure control solenoid valve A pressure decreases. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed according to the shift status determined by the shift schedule, and monitors the transmission fluid pressure switch according to the shift status determined by the shift schedule. When an improper gear ratio is output for the shift schedule or when the wrong transmission fluid pressure switch is on for the shift schedule, the PCM detects an A/T clutch pressure control solenoid valve A stuck on failure and stores a DTC.

MALFUNCTION THRESHOLD

One of these conditions occurs:

- Either Symptom 1, Symptom 2, Symptom 3, or Symptom 4 occurs.
- The input signal from transmission fluid pressure switch A (2nd clutch) to the PCM is off for at least 4 seconds when the 5th gear shift is commanded or when the shift lever is in P, R, or N, after Symptom 5 occurred.
- The input signal from transmission fluid pressure switch D (5th clutch) to the PCM is off for at least 4 seconds when the 2nd gear shift is commanded or when the shift lever is in P, R, or N, after Symptom 6, Symptom 7, or Symptom 8 occurred.

SYMPTOM 1

Symptom	Gear position commanded by the PCM	Actual gear position
1	2nd --> 3rd gear upshift	Driving in 2nd gear

SYMPTOM 2

Symptom	Gear position commanded by the PCM	Actual gear position
2	5th --> 6th gear upshift	Driving in 5th gear

SYMPTOM 3

Symptom	Gear position commanded by the PCM	Actual gear position
3	5th --> 4th gear downshift	Driving in 5th gear

SYMPTOM 4

Symptom	Gear position commanded by the PCM	Actual gear position
4	5th --> 3rd gear downshift	Driving in 5th gear

SYMPTOM 5

Symptom	Gear position commanded by the PCM	Actual gear position
5	Driving in 1st gear	Turn on transmission fluid pressure switch A (2nd clutch) when driving in 1st gear

SYMPTOM 6

Symptom	Gear position commanded by the PCM	Actual gear position
6	Driving in 3rd gear	Turn on transmission fluid pressure switch D (5th clutch) when driving in 3rd gear

SYMPTOM 7

Symptom	Gear position commanded by the PCM	Actual gear position
7	Driving in 4th gear	Turn on transmission fluid pressure switch D (5th clutch) when driving in 4th gear

SYMPTOM 8

Symptom	Gear position commanded by the PCM	Actual gear position
8	Driving in 6th gear	Turn on transmission fluid pressure switch D (5th clutch) when driving in 6th gear

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D until the transmission shifts into 6th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

GENERAL DESCRIPTION

Shift solenoid valve B is installed on the transmission housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to apply line pressure to shift valve B. A signal from the PCM is output to apply A/T clutch pressure control solenoid valve pressure to the correct gear clutch according to the shift schedule. When the signal to shift solenoid valve B from the PCM is on, and the line pressure is applied to shift valve B, it operates against the shift valve B spring. When the signal to shift solenoid valve B from the PCM is off, and the line pressure is discharged, shift valve B is inactive. The PCM monitors the transmission fluid pressure switch according to the shift status determined by the shift schedule. When the wrong transmission fluid pressure switch is on for the shift schedule, the PCM detects a shift solenoid valve B stuck on failure and stores a DTC.

No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P0705, P0716, P0717, P0718, P0721, P0722, P0723, P0746, P0747, P0751, P0752, P0756, P0761, P0762, P0776, P0777, P0796, P0797, P0842, P0843, P0847, P0848, P0872, P0873, P0877, P0878, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0989, P0990, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721	

MALFUNCTION THRESHOLD

SYMPTOM 1 OCCURS

Symptom	Gear position commanded by the PCM	Actual gear position
1	5th --> 6th gear upshift	Turn on transmission fluid pressure switch B (3rd clutch) when upshifting to 5th --> 6th gear

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D until the transmission shifts into 6th gear.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0761: SHIFT SOLENOID VALVE C STUCK OFF

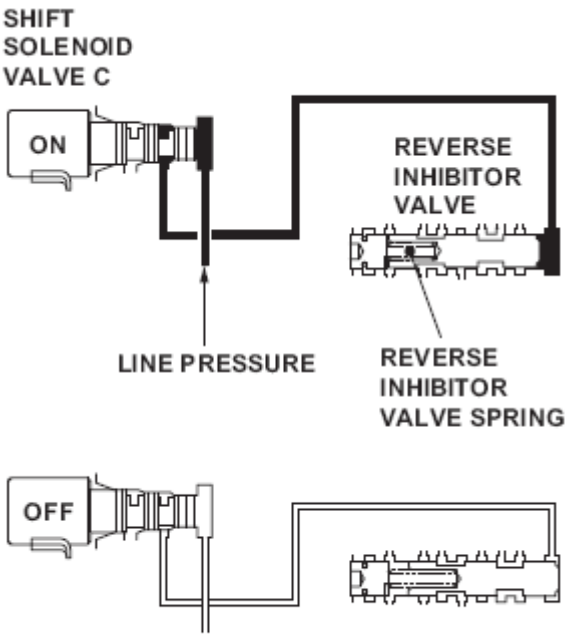

Fig. 190: Shift Solenoid Valve C - System Diagram (Stuck Off)

HYDRAULIC PRESSURE SUPPLY TO CLUTCH BY SHIFT SOLENOID VALVE OUTPUT

Gear position		Neutral-1st	1st	Neutral-Reverse	Reverse
Shift solenoid valve	A	ON	ON	ON	OFF
	B	OFF	ON	OFF	OFF
	C	OFF	OFF	ON	ON
1st clutch		CPCD	LINE	-	-

4th clutch	-	-	CPCD	LINE

LINE: Line pressure
CPCD: A/T clutch pressure control solenoid valve D pressure

GENERAL DESCRIPTION

Shift solenoid valve C is installed on the transmission housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to apply line pressure to the reverse inhibitor valve. A signal from the PCM is output to apply A/T clutch pressure control solenoid valve pressure to the correct gear clutch according to the shift schedule. When the signal to shift solenoid valve C from the PCM is on, and the line pressure is applied to the reverse inhibitor valve, it operates against the reverse inhibitor valve spring. When the signal to shift solenoid valve C from the PCM is off, and the line pressure is discharged, the reverse inhibitor valve is inactive. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed according to the shift status determined by the shift schedule. When an improper gear ratio is output for the shift schedule, the PCM detects a shift solenoid valve C stuck off failure and stores a DTC.

CPCA: A/T clutch pressure control solenoid valve A pressure
CPCB: A/T clutch pressure control solenoid valve B pressure
CPCC: A/T clutch pressure control solenoid valve C pressure
CPCD: A/T clutch pressure control solenoid valve D pressure

GENERAL DESCRIPTION

A/T clutch pressure control solenoid valve B is installed on the transmission housing. A/T clutch pressure control solenoid valve B is operated by the powertrain control module (PCM) and converts line pressure to A/T clutch pressure control solenoid valve B pressure. A signal from the PCM is output to A/T clutch pressure control solenoid valve B to supply proper A/T clutch pressure control solenoid valve B pressure to the correct gear clutch according to the shift schedule and the driving conditions. When the current from the PCM is high (ON), A/T clutch pressure control solenoid valve B operates and A/T clutch pressure control solenoid valve B pressure increases. When the current from the PCM is low (OFF), A/T clutch pressure control solenoid valve B turns off and A/T clutch pressure control solenoid valve B pressure decreases. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed according to the shift status determined by the shift schedule, and monitors the transmission fluid pressure switch according to the shift status determined by the shift schedule. When an improper gear ratio is output for the shift schedule or when the wrong transmission fluid pressure switch is on for the shift schedule, the PCM detects an A/T clutch pressure control solenoid valve B stuck on failure and stores a DTC.

	P2138, P2176, P2714, P2720, P2721

MALFUNCTION THRESHOLD

One of these conditions occurs:

- Either Symptom1, Symptom 2, Symptom 3, or Symptom 4 occurs.
- The input signal from transmission fluid pressure switch B (3rd clutch) is off for at least 4 seconds when the 6th gear shift is commanded or when the shift lever is in P, R, or N, after Symptom 5, Symptom 6, Symptom 7, or Symptom 8 occurred.
- The input signal from transmission fluid pressure switch E (6th clutch) is off for at least 4 seconds when the 3rd gear shift is commanded or when the shift lever is in P, R, or N, after Symptom 9 or Symptom 10 occurred.

SYMPTOM 1

Symptom	Gear position commanded by the PCM	Actual gear position
1	3rd --> 4th gear upshift	Driving in 3rd gear

SYMPTOM 2

Symptom	Gear position commanded by the PCM	Actual gear position
2	6th --> 5th gear downshift	Driving in 6th gear

SYMPTOM 3

Symptom	Gear position commanded by the PCM	Actual gear position
3	6th --> 4th gear downshift	Driving in 6th gear

SYMPTOM 4

Symptom	Gear position commanded by the PCM	Actual gear position
4	3rd --> 2nd gear downshift	Driving in 3rd gear

SYMPTOM 5

Symptom	Gear position commanded by the PCM	Actual gear position
5	Driving in 1st gear	Turn on transmission fluid pressure switch B (3rd clutch) when driving in 1st gear

SYMPTOM 6

Symptom	Gear position commanded by the PCM	Actual gear position
6	Driving in 2nd gear	Turn on transmission fluid pressure switch B (3rd clutch) when driving in 2nd gear

SYMPTOM 7

Symptom	Gear position commanded by the PCM	Actual gear position
7	Driving in 4th gear	Turn on transmission fluid pressure switch B (3rd clutch) when driving in 4th gear

SYMPTOM 8

Symptom	Gear position commanded by the PCM	Actual gear position
8	Driving in 5th gear	Turn on transmission fluid pressure switch B (3rd clutch) when driving in 5th gear

SYMPTOM 9

Symptom	Gear position commanded by the PCM	Actual gear position
9	Driving in 4th gear	Turn on transmission fluid pressure switch E (6th clutch) when driving in 4th gear

SYMPTOM 10

Symptom	Gear position commanded by the PCM	Actual gear position
10	Driving in 5th gear	Turn on transmission fluid pressure switch E (6th clutch) when driving in 5th gear

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D until the transmission shifts into 6th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

CPCA: A/T clutch pressure control solenoid valve A pressure
CPCB: A/T clutch pressure control solenoid valve B pressure
CPCC: A/T clutch pressure control solenoid valve C pressure
CPCD: A/T clutch pressure control solenoid valve D pressure

GENERAL DESCRIPTION

A/T clutch pressure control solenoid valve C is installed on the transmission housing. A/T clutch pressure control solenoid valve C is operated by the powertrain control module (PCM) and converts line pressure to A/T clutch pressure control solenoid valve C pressure. A signal from the PCM is output to A/T clutch pressure control solenoid valve C to supply proper A/T clutch pressure control solenoid valve C pressure to the correct gear clutch according to the shift schedule and the driving conditions. When the current from the PCM is high (ON), A/T clutch pressure control solenoid valve C operates and A/T clutch pressure control solenoid valve C pressure increases. When the current from the PCM is low (OFF), A/T clutch pressure control solenoid valve C turns off and A/T clutch pressure control solenoid valve C pressure decreases. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed according to the shift status determined by the shift schedule. When an improper gear ratio is output for the shift schedule, the PCM detects an A/T clutch pressure control solenoid valve C stuck off failure and stores a DTC.

(1) Symptom 1		

MALFUNCTION THRESHOLD

One of these conditions occurs:

- Symptom 1 occurs.
- Symptom 2 occurs during the 1st drive cycle, and Symptom 1 occurs during the 2nd drive cycle.

SYMPTOM 1

Symptom	Gear position commanded by the PCM	Actual gear position
1	3rd --> 4th gear upshift	The engine speed flares when upshifting to 3rd --> 4th gear

SYMPTOM 2

Symptom	Gear position commanded by the PCM	Actual gear position
2	Driving in 4th gear	Neutral

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D until the transmission shifts into 6th gear.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

LINE: Line pressure
CPCA: A/T clutch pressure control solenoid valve A pressure
CPCB: A/T clutch pressure control solenoid valve B pressure
CPCC: A/T clutch pressure control solenoid valve C pressure
CPCD: A/T clutch pressure control solenoid valve D pressure

GENERAL DESCRIPTION

A/T clutch pressure control solenoid valve C is installed on the transmission housing. A/T clutch pressure control solenoid valve C is operated by the powertrain control module (PCM) and converts line pressure to A/T clutch pressure control solenoid valve C pressure. A signal from the PCM is output to A/T clutch pressure control solenoid valve C to supply proper A/T clutch pressure control solenoid valve C pressure to the correct gear clutch according to the shift schedule and the driving conditions. When the current from the PCM is high (ON), A/T clutch pressure control solenoid valve C operates and A/T clutch pressure control solenoid valve C pressure increases. When the current from the PCM is low (OFF), A/T clutch pressure control solenoid valve C turns off and A/T clutch pressure control solenoid valve C pressure decreases. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed according to the shift status determined by the shift schedule, and monitors the transmission fluid pressure switch according to the shift status determined by the shift schedule. When an improper gear ratio is output for the shift schedule or when the wrong transmission fluid pressure switch is on for the shift schedule, the PCM detects an A/T clutch pressure control solenoid valve C stuck on failure and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution		Continuous
Sequence		None

ENABLE CONDITIONS

Condition	Minimum	Maximum
ATF temperature	-4 °F (-20 °C)	-
Vehicle speed	5 mph (9 km/h)	-
Battery voltage	11 V	-
Shift lever position	D	
No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P0705, P0716, P0717, P0718, P0721, P0722, P0723, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0842, P0843, P0847, P0848, P0872, P0873, P0877, P0878, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0989, P0990, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721	

MALFUNCTION THRESHOLD

One of these conditions occurs:

- Either Symptom 1, Symptom 2, or Symptom 3 occurs.
- The input signal from transmission fluid pressure switch C (4th clutch) is off for at least 4 seconds when the 1st gear shift is commanded or when the shift lever is in P or N, after Symptom 4, Symptom 5, Symptom 6, Symptom 7, or Symptom 8 occurred.

SYMPTOM 1

Symptom	Gear position commanded by the PCM	Actual gear position
1	4th --> 5th gear upshift	Driving in 4th gear

SYMPTOM 2

Symptom	Gear position commanded by the PCM	Actual gear position
2	4th --> 3rd gear downshift	Driving in 4th gear

SYMPTOM 3

Symptom	Gear position commanded by the PCM	Actual gear position
3	4th --> 2nd gear downshift	Driving in 4th gear

SYMPTOM 4

Symptom	Gear position commanded by the PCM	Actual gear position
4	Driving in 1st gear	Turn on transmission fluid pressure switch C (4th clutch) when driving in 1st gear

SYMPTOM 5

Symptom	Gear position commanded by the PCM	Actual gear position
5	Driving in 2nd gear	Turn on transmission fluid pressure switch C (4th clutch) when driving in 2nd gear

SYMPTOM 6

Symptom	Gear position commanded by the PCM	Actual gear position
6	Driving in 3rd gear	Turn on transmission fluid pressure switch C (4th clutch) when driving in 3rd gear

SYMPTOM 7

Symptom	Gear position commanded by the PCM	Actual gear position
7	Driving in 5th gear	Turn on transmission fluid pressure switch C (4th clutch) when driving in 5th gear

SYMPTOM 8

Symptom	Gear position commanded by the PCM	Actual gear position
8	Driving in 6th gear	Turn on transmission fluid pressure switch C (4th clutch) when driving in 6th gear

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D until the transmission shifts into 6th gear.
   - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0812: OPEN IN TRANSMISSION RANGE SWITCH ATPR SWITCH CIRCUIT

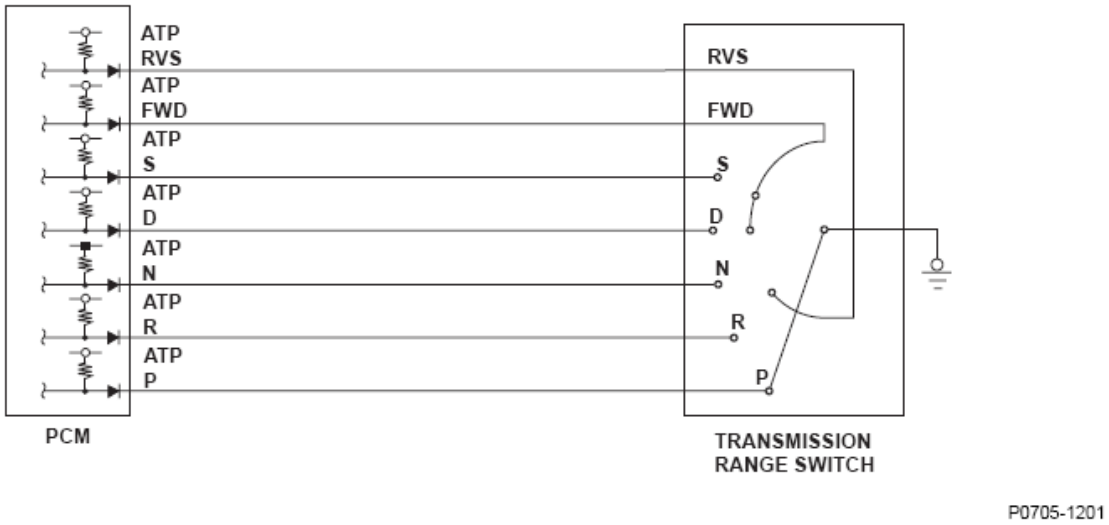

Fig. 203: Transmission Range Switch - Circuit Diagram

TRANSMISSION RANGE SWITCH CONTACT POINT INPUT MATRIX

Shift lever position	Input per switch						
	ATPP	ATPR	ATPN	ATPD	ATPS	ATP FWD	ATP RVS
P	o	X	X	X	X	X	X
R	X	o	X	X	X	X	o
N	X	X	o	X	X	X	X
D	X	X	X	o	X	o	X
S	X	X	X	X	o	o	X
o: Closed X: Open							

GENERAL DESCRIPTION

The transmission range switch is attached to a control shaft. Operating the shift lever makes the control shaft rotate via the shift cable. The A/T gear position indicator shows which position is selected according to the Low/High signal combinations, which vary based on the control shaft rotational angle. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is high (5 V or 12 V) at the powertrain control module (PCM) input terminal when each transmission range switch position is open, and it is low (0 V) when each switch is closed. If the R switch is open while driving the vehicle in R, the PCM detects an R switch open failure and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	1,000 rpm	-
Battery voltage	11 V	-
Shift lever position	R	
No active DTCs set (prevents monitor from running)	P0705, P0716, P0717, P0721, P0722, P1717	

MALFUNCTION THRESHOLD

The RVS position signal input is detected but the R position signal input is not detected.

DRIVING PATTERN

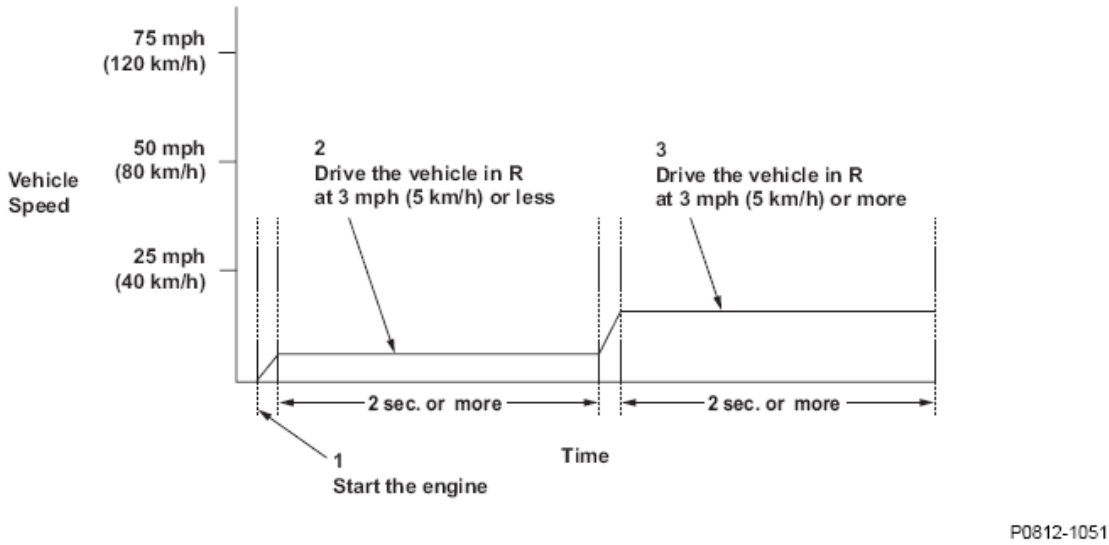

Fig. 204: Vehicle Speed Driving Pattern

1. Start the engine.
2. Drive the vehicle in R at 3 mph (5 km/h) or less for at least 2 seconds.
3. Drive the vehicle in R at 3 mph (5 km/h) or more for at least 2 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0831: CLUTCH PEDAL POSITION SWITCH A CIRCUIT HIGH VOLTAGE

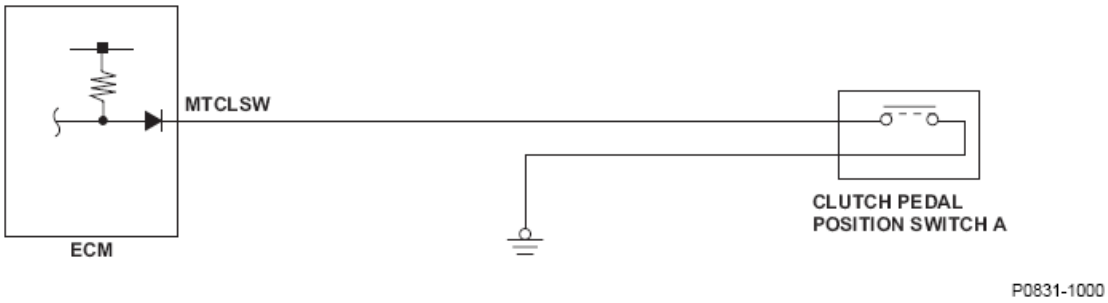

Fig. 205: Clutch Pedal Position Switch A - Circuit Diagram

GENERAL DESCRIPTION

The engine control module (ECM) monitors the clutch pedal position switch A signal to switch the starting system from auto control mode to manual mode when it malfunctions. When the ECM cannot detect an OPEN signal from clutch pedal position switch A while the clutch pedal is released, the detection continues after the engine start/stop button is pressed to select the OFF mode. If the malfunction continues for a set time after the engine start/stop button is pressed to select the OFF mode, the ECM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	5 minutes or more
DTC Type	One drive cycle, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	1,000 rpm	-
Vehicle speed	19 mph (30 km/h)	-
Other	Malfunction judgment executes if ECM cannot detect OPEN signal from clutch pedal position switch A while clutch pedal is released under above conditions	

MALFUNCTION THRESHOLD

The ECM cannot detect an OPEN signal from clutch pedal position switch A for at least 5 minutes after the engine start/stop button is pressed to select the OFF mode.

DRIVING PATTERN

1. Start the engine.

2. Drive the vehicle at a speed of 19 mph (30 km/h) or more.
3. Press the engine start/stop button to select the OFF mode, and wait for at least 5 minutes.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0835: CLUTCH PEDAL POSITION SWITCH B CIRCUIT LOW VOLTAGE

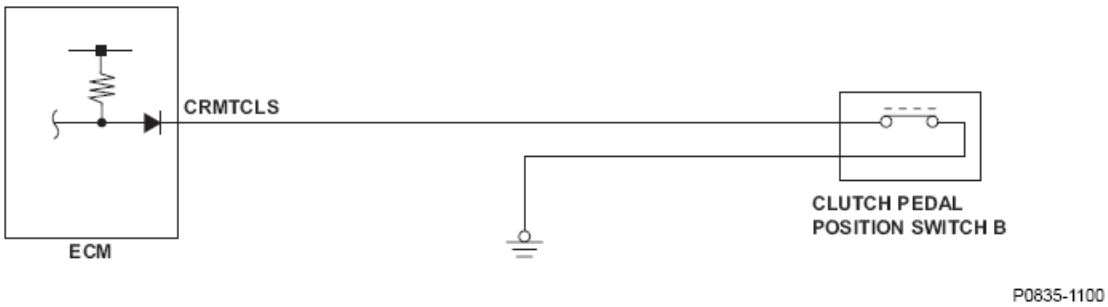

Fig. 206: Clutch Pedal Position Switch B - Circuit Diagram

GENERAL DESCRIPTION

The engine control module (ECM) monitors the clutch pedal position switch B signal to switch the starting system from auto control mode to manual mode when it malfunctions. When the ECM cannot detect a CLOSE signal from clutch pedal position switch B while the clutch pedal is released, the detection continues after the engine start/stop button is pressed to select the OFF mode. If the malfunction continues for a set time after the engine start/stop button is pressed to select the OFF mode, the ECM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	30 minutes or more
DTC Type	Two drive cycles, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	1,000 rpm	-
Vehicle speed	19 mph (30 km/h)	-
Other	Malfunction judgment executes if ECM cannot detect CLOSE signal from clutch pedal position switch B while clutch pedal is released under above conditions	

MALFUNCTION THRESHOLD

The ECM cannot detect a CLOSE signal from clutch pedal position switch B for at least 30 minutes after the engine start/stop button is pressed to select the OFF mode.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle at a speed of 19 mph (30 km/h) or more.
3. Press the engine start/stop button to select the OFF mode, and wait for at least 30 minutes.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0842: SHORT IN TRANSMISSION FLUID PRESSURE SWITCH A (2ND CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH A (2ND CLUTCH) STUCK ON

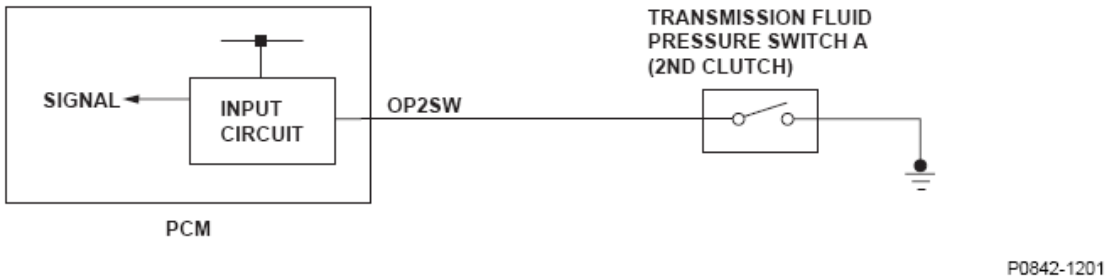

Fig. 207: Transmission Fluid Pressure Switch A - Circuit Diagram

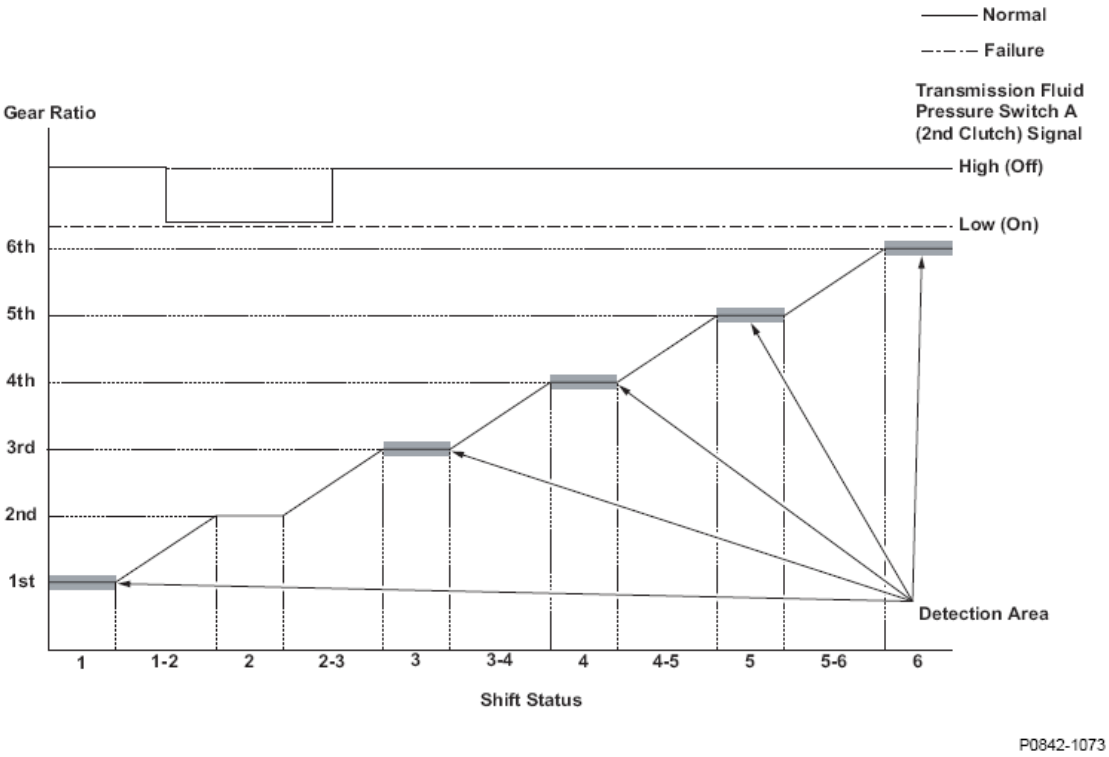

Fig. 208: Gear Ratio Versus Shifting Status Graph

GENERAL DESCRIPTION

Transmission fluid pressure switch A (2nd clutch) is installed in the hydraulic pressure circuit to the 2nd clutch. When hydraulic pressure is supplied to the 2nd clutch, the switch is turned on. When hydraulic pressure is not supplied to the 2nd clutch, the switch is turned off. The signal from transmission fluid pressure switch A (2nd clutch) is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the gear change to 2nd gear (1st --> 2nd) to reduce the shock that occurs at the gear change. If transmission fluid pressure switch A (2nd clutch) is on while driving the vehicle with the rotation speed ratio of the input/output pulses is other than the 2nd gear ratio (the ratio is Neutral or 4th), the PCM detects a transmission fluid pressure switch A (2nd clutch) failure and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P0705, P0716, P0717, P0718, P0721, P0722, P0723, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0797, P0843, P0847, P0848, P0872, P0873, P0877, P0878, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0989, P0990, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721	

MALFUNCTION THRESHOLD

One of these conditions occurs:

- The input signal from transmission fluid pressure switch A (2nd clutch) to the PCM is low for at least 5 seconds when the shift lever is in P, R, or N.
- The input signal from transmission fluid pressure switch A (2nd clutch) to the PCM is low for at least 5 seconds when driving in 3rd, 4th, 5th, or 6th gear.
- The input signal from transmission fluid pressure switch A (2nd clutch) to the PCM is low for at least 5 seconds when the 5th gear shift is commanded or when the shift lever is in P, R, or N, after the signal is low for at least 3 seconds when driving in 1st gear.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D until the transmission shifts into 6th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0843: OPEN IN TRANSMISSION FLUID PRESSURE SWITCH A (2ND CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH A (2ND CLUTCH) STUCK OFF

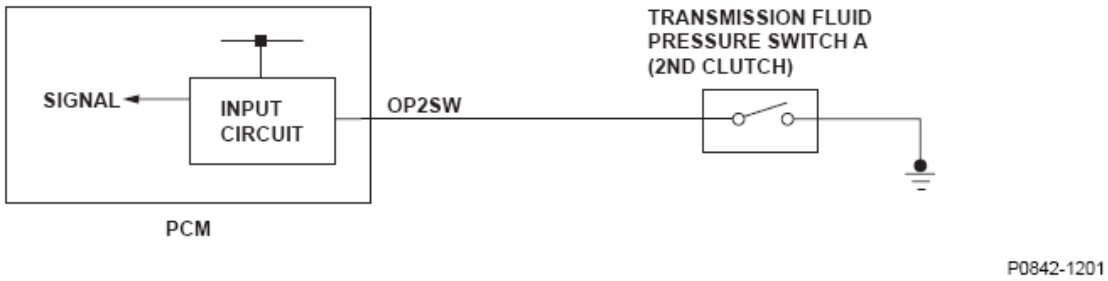

Fig. 209: Transmission Fluid Pressure Switch A - Circuit Diagram

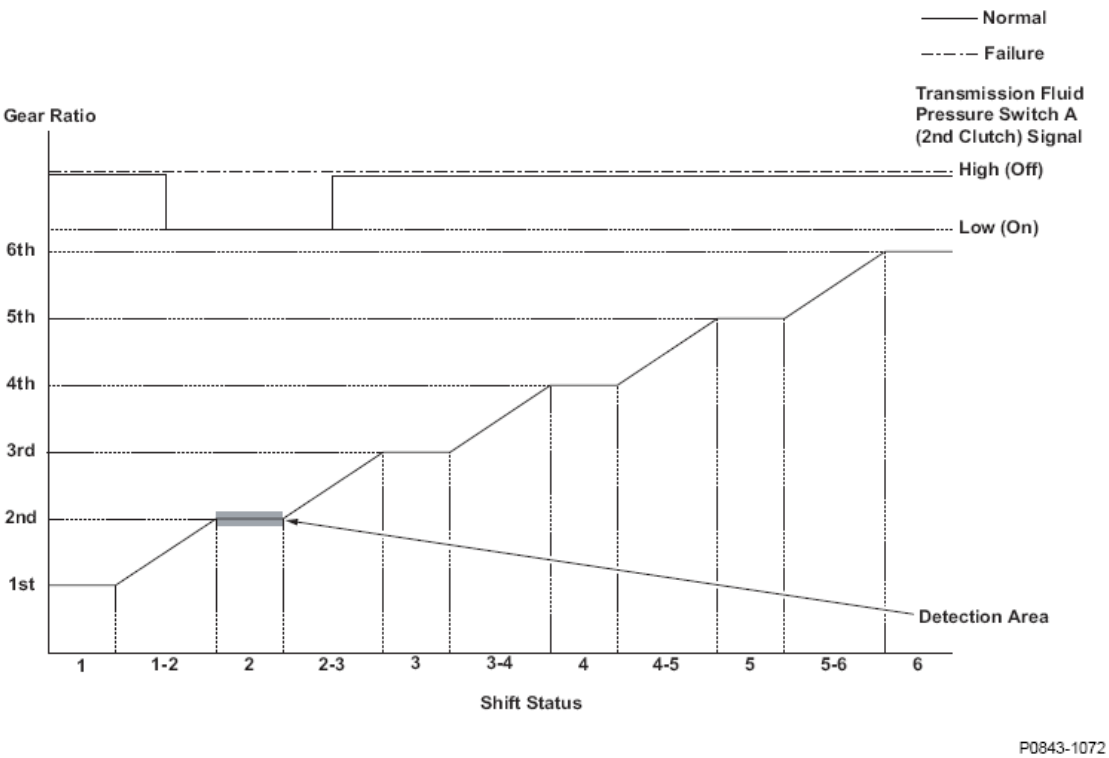

Fig. 210: Gear Ratio Versus Shifting Status Graph (2nd Clutch Detection Area)

GENERAL DESCRIPTION

Transmission fluid pressure switch A (2nd clutch) is installed in the hydraulic pressure circuit to the 2nd clutch. When hydraulic pressure is supplied to the 2nd clutch, the switch is turned on. When hydraulic pressure is not supplied to the 2nd clutch, the switch is turned off. The signal from transmission fluid pressure switch A (2nd

clutch) is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the gear change to 2nd gear (1st --> 2nd) to reduce the shock that occurs at the gear change. If transmission fluid pressure switch A (2nd clutch) is off while driving the vehicle with the rotation speed ratio of the input/output pulses is that of the 2nd gear ratio, the PCM detects a transmission fluid pressure switch A (2nd clutch) failure and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	4 seconds or more
DTC Type	Two drive cycles, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P0705, P0716, P0717, P0718, P0721, P0722, P0723, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0797, P0842, P0847, P0848, P0872, P0873, P0877, P0878, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0989, P0990, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721	

MALFUNCTION THRESHOLD

The input signal from transmission fluid pressure switch A (2nd clutch) to the PCM is high when driving in 2nd gear.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in 2nd gear for at least 4 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0847: SHORT IN TRANSMISSION FLUID PRESSURE SWITCH B (3RD CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH B (3RD CLUTCH) STUCK ON

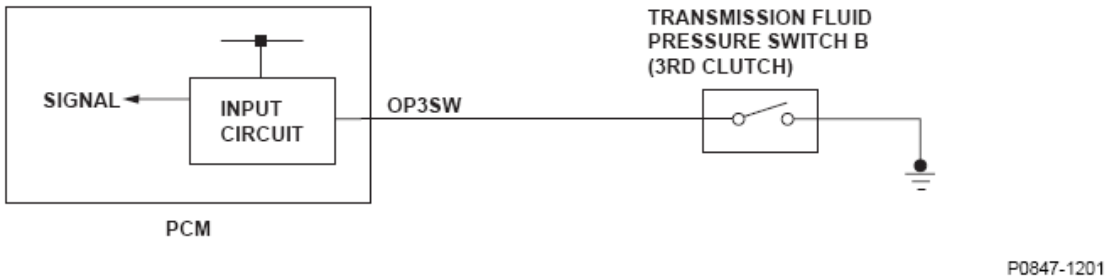

Fig. 211: Transmission Fluid Pressure Switch B - Circuit Diagram

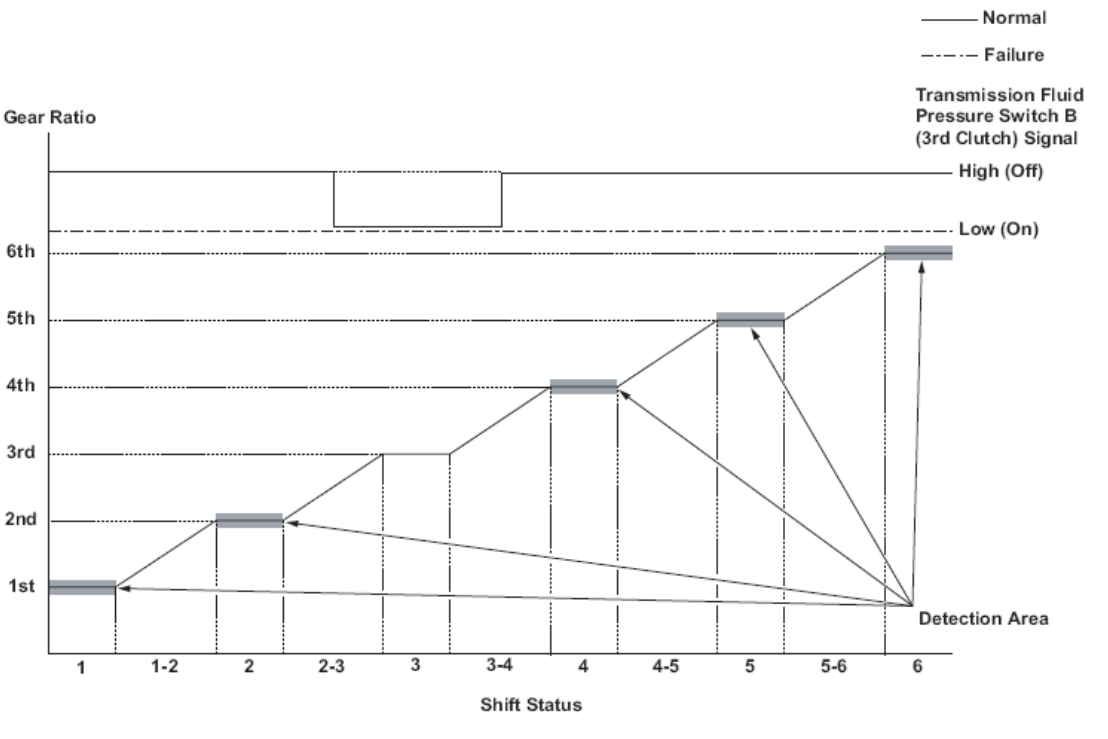

Fig. 212: Gear Ratio Versus Shifting Status Graph

GENERAL DESCRIPTION

Transmission fluid pressure switch B (3rd clutch) is installed in the hydraulic pressure circuit to the 3rd clutch. When hydraulic pressure is supplied to the 3rd clutch, the switch is turned on. When hydraulic pressure is not supplied to the 3rd clutch, the switch is turned off. The signal from transmission fluid pressure switch B (3rd

clutch) is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the gear change to 3rd gear (2nd --> 3rd) to reduce the shock that occurs at the gear change. If transmission fluid pressure switch B (3rd clutch) is on while driving the vehicle with the rotation speed ratio of the input/output pulses is other than the 3rd gear ratio (the ratio is Neutral or 4th), the PCM detects a transmission fluid pressure switch B (3rd clutch) failure and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P0705, P0716, P0717, P0718, P0721, P0722, P0723, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0797, P0842, P0843, P0848, P0872, P0873, P0877, P0878, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0989, P0990, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721		

MALFUNCTION THRESHOLD

One of these conditions occurs:

- The input signal from transmission fluid pressure switch B (3rd clutch) to the PCM is low for at least 4 seconds when the shift lever is in P, R, or N.
- The input signal from transmission fluid pressure switch B (3rd clutch) to the PCM is low for at least 4 seconds when driving in 6th gear.
- The input signal from transmission fluid pressure switch B (3rd clutch) to the PCM is low for at least 4 seconds when the 6th gear shift is commanded or when the shift lever is in P, R, or N, after the signal is low for at least 2 seconds when driving in 1st, 2nd, 4th, or 5th gear.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D until the transmission shifts into 6th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0848: OPEN IN TRANSMISSION FLUID PRESSURE SWITCH B (3RD CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH B (3RD CLUTCH) STUCK OFF

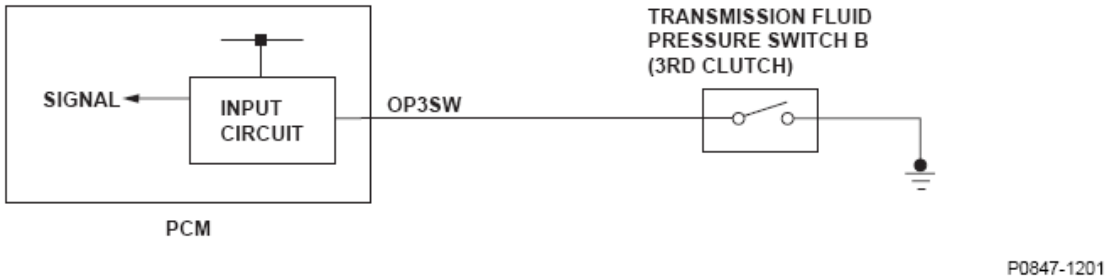

Fig. 213: Transmission Fluid Pressure Switch B - Circuit Diagram

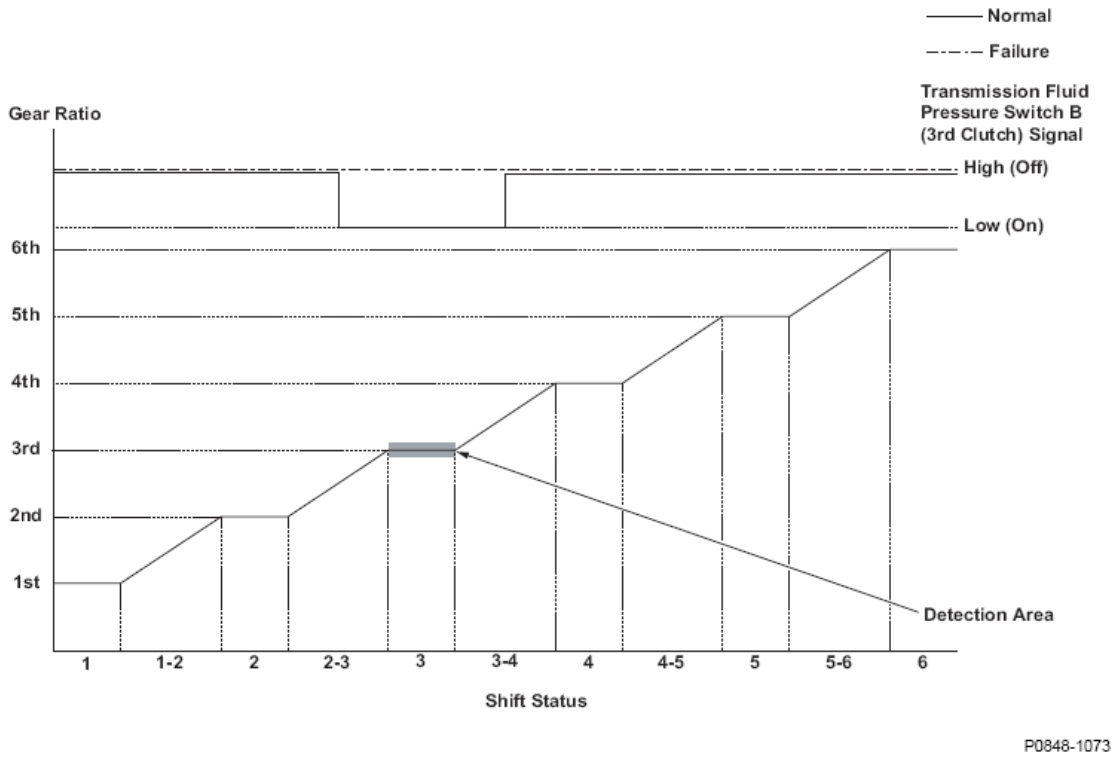

Fig. 214: Gear Ratio Versus Shifting Status Graph (3rd Clutch Detection Area)

GENERAL DESCRIPTION

Transmission fluid pressure switch B (3rd clutch) is installed in the hydraulic pressure circuit to the 3rd clutch. When hydraulic pressure is supplied to the 3rd clutch, the switch is turned on. When hydraulic pressure is not supplied to the 3rd clutch, the switch is turned off. The signal from transmission fluid pressure switch B (3rd clutch) is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the gear change to 3rd gear (2nd --> 3rd) to reduce the shock that occurs at the gear change. If transmission fluid pressure switch B (3rd clutch) is off while driving the vehicle with the rotation speed ratio of the input/output pulses is that of the 3rd gear ratio, the PCM detects a transmission fluid pressure switch B (3rd clutch) failure and stores a DTC.

MALFUNCTION THRESHOLD

The input signal from transmission fluid pressure switch B (3rd clutch) to the PCM is high when driving in 3rd gear.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in 3rd gear for at least 4 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P084C: SHORT IN LINE PRESSURE SWITCH CIRCUIT, OR LINE PRESSURE SWITCH STUCK ON

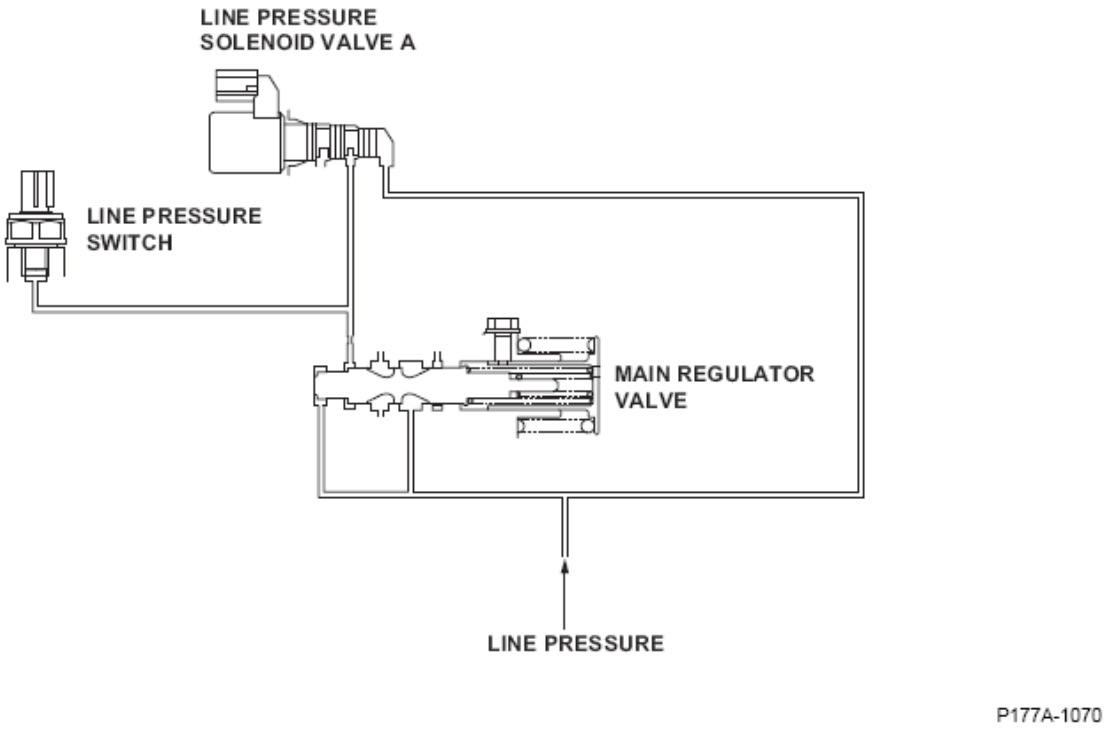

Fig. 215: Line Pressure Switch - System Diagram

LINE PRESSURE MODE COMBINATION TABLE

	Normal line pressure mode	Low line pressure mode
Line pressure solenoid valve A	OFF	ON
Line pressure switch	OFF	ON
Line pressure condition	Normal	Low

GENERAL DESCRIPTION

The line pressure switch is installed in the hydraulic pressure output circuit from line pressure solenoid valve A. When line pressure solenoid valve A outputs hydraulic pressure, the line pressure is regulated to low line pressure and the switch is turned on. When line pressure solenoid valve A does not output hydraulic pressure, the line pressure is at normal line pressure and the switch is turned off. The signal from the line pressure switch is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply condition from line pressure solenoid valve A to detects a malfunction in line pressure solenoid valve A. If the line pressure switch is on against the command to turn off line pressure solenoid valve A, the PCM detects a line pressure switch stuck on failure and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous

(1) Symptom 2		

MALFUNCTION THRESHOLD

One of these symptoms occurs:

- Symptom 1

  The input signal from the line pressure switch to the PCM is low during the self shut down mode after the signal is low when the normal line pressure mode was commanded.

- Symptom 2

  The input signal from the line pressure switch to the PCM is low when the ignition switch is in ON (II) or engine start/stop button is pressed to select the ON mode, with the engine stopped.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D until the transmission shifts into 6th gear.
   - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0873: OPEN IN TRANSMISSION FLUID PRESSURE SWITCH C (4TH CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH C (4TH CLUTCH) STUCK OFF

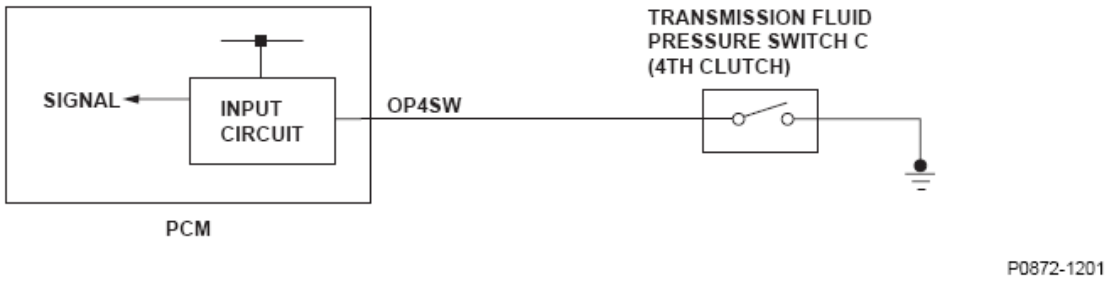

Fig. 216: Transmission Fluid Pressure Switch C - Circuit Diagram

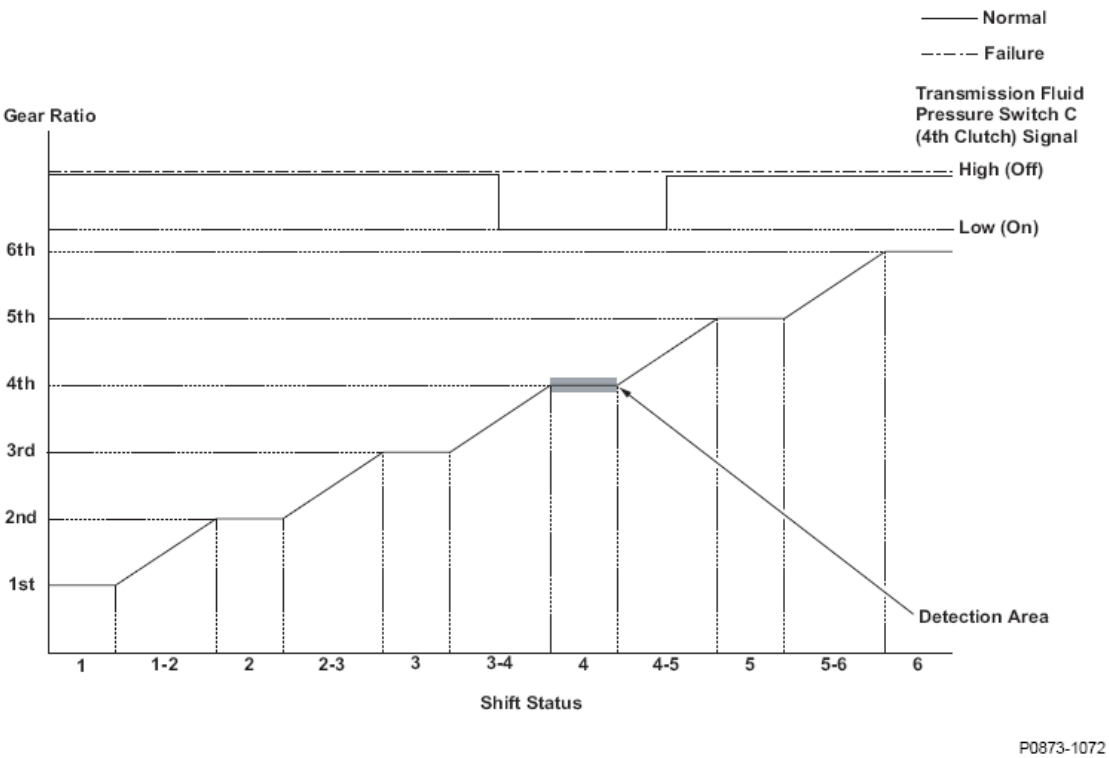

Fig. 217: Gear Ratio Versus Shifting Status Graph (4th Clutch Detection Area)

GENERAL DESCRIPTION

Transmission fluid pressure switch C (4th clutch) is installed in the hydraulic pressure circuit to the 4th clutch. When hydraulic pressure is supplied to the 4th clutch, the switch is turned on. When hydraulic pressure is not supplied to the 4th clutch, the switch is turned off. The signal from transmission fluid pressure switch C (4th

clutch) is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the gear change to 4th gear (3rd --> 4th) to reduce the shock that occurs at the gear change. If transmission fluid pressure switch C (4th clutch) is off while driving the vehicle with the rotation speed ratio of the input/output pulses is that of the 4th gear ratio, the PCM detects a transmission fluid pressure switch C (4th clutch) failure and stores a DTC.

MALFUNCTION THRESHOLD

One of these conditions occurs:

- The input signal from transmission fluid pressure switch C (4th clutch) to the PCM is high when driving in 4th gear.
- The input signal from transmission fluid pressure switch C (4th clutch) to the PCM is high when driving in R.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in 4th gear for at least 4 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the

malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0877: SHORT IN TRANSMISSION FLUID PRESSURE SWITCH D (5TH CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH D (5TH CLUTCH) STUCK ON

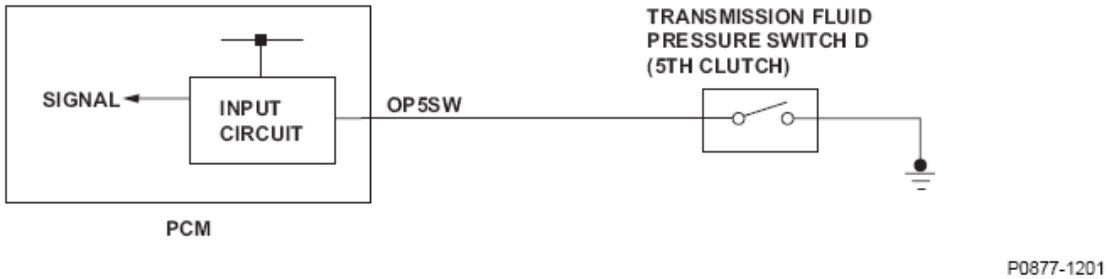

Fig. 218: Transmission Fluid Pressure Switch D - Circuit Diagram

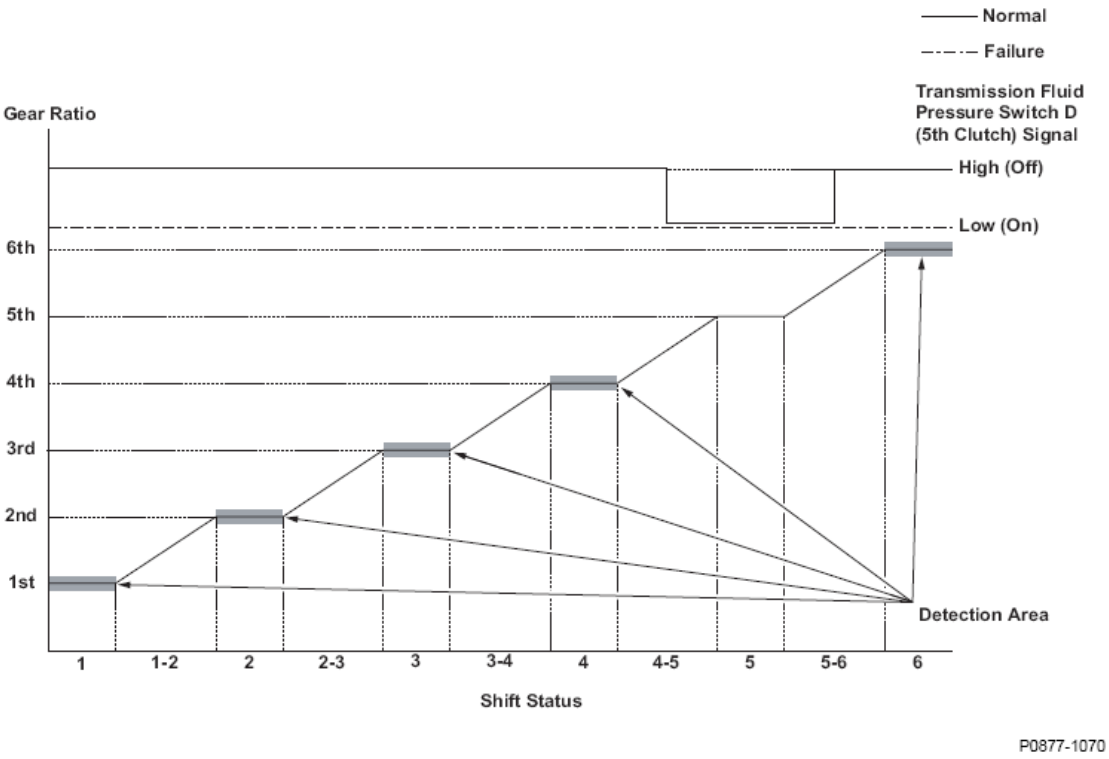

Fig. 219: Gear Ratio Versus Shifting Status Graph

GENERAL DESCRIPTION

Transmission fluid pressure switch D (5th clutch) is installed in the hydraulic pressure circuit to the 5th clutch. When hydraulic pressure is supplied to the 5th clutch, the switch is turned on. When hydraulic pressure is not supplied to the 5th clutch, the switch is turned off. The signal from transmission fluid pressure switch D (5th clutch) is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the gear change to 5th gear (4th --> 5th) to reduce the shock that occurs at the gear change. If transmission fluid pressure switch D (5th clutch) is on while driving the vehicle with the rotation speed ratio of the input/output pulses is other than the 5th gear ratio (the ratio is Neutral or 6th), the PCM detects a transmission fluid pressure switch D (5th clutch) failure and stores a DTC.

MALFUNCTION THRESHOLD

One of these conditions occurs:

- The input signal from transmission fluid pressure switch D (5th clutch) to the PCM is low for at least 5 seconds when the shift lever is in P, R, or N.
- The input signal from transmission fluid pressure switch D (5th clutch) to the PCM is low for at least 5 seconds when driving in 1st or 2nd gear.
- The input signal from transmission fluid pressure switch D (5th clutch) to the PCM is low for at least 5 seconds when the 2nd gear shift is commanded or when the shift lever is in P, R, or N, after the signal is low for at least 3 seconds when driving in 3rd, 4th, or 6th gear.

DRIVING PATTERN

1. Start the engine.

2. Drive the vehicle in D until the transmission shifts into 6th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0878: OPEN IN TRANSMISSION FLUID PRESSURE SWITCH D (5TH CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH D (5TH CLUTCH) STUCK OFF

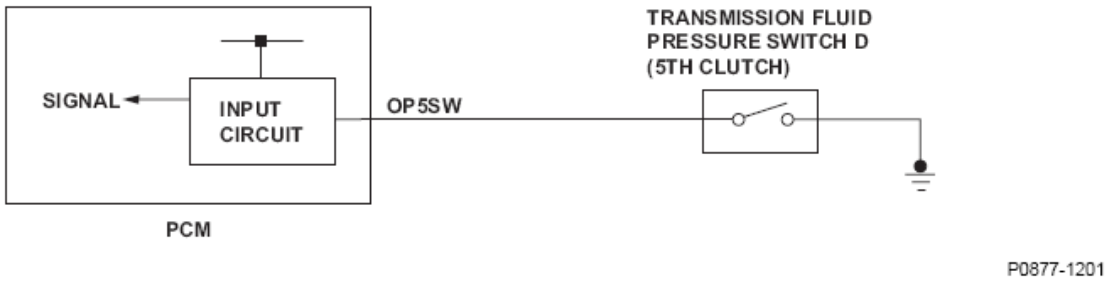

Fig. 220: Transmission Fluid Pressure Switch D - Circuit Diagram

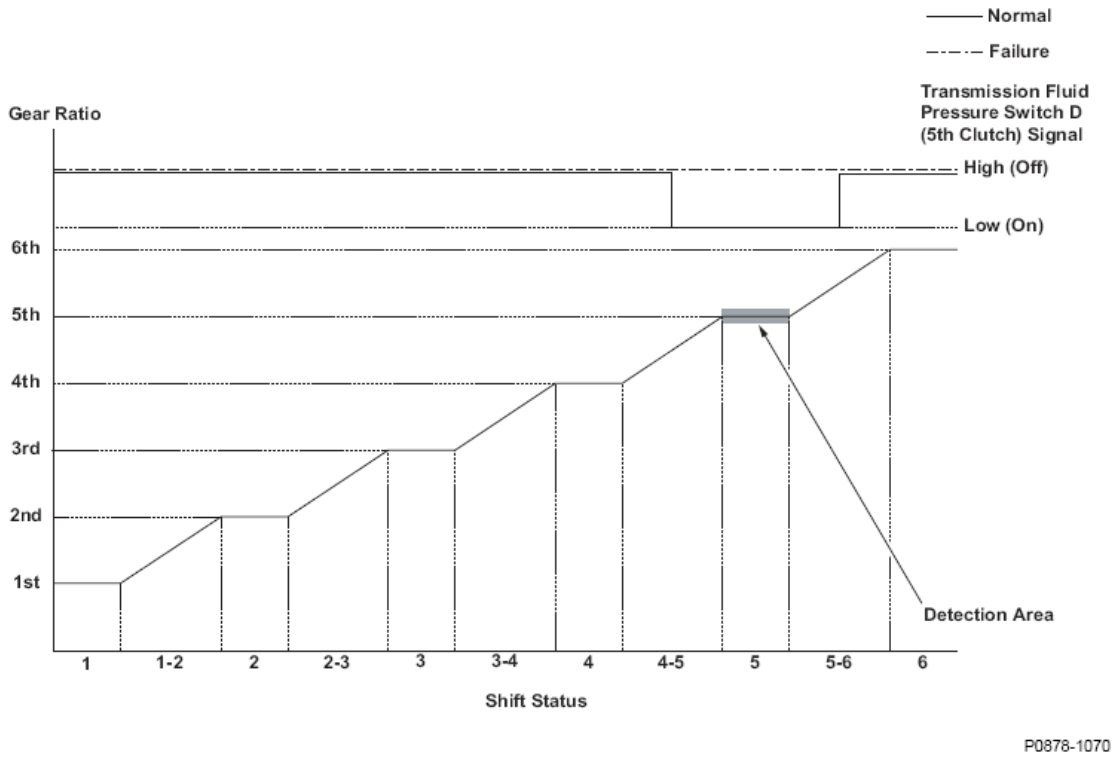

Fig. 221: Gear Ratio Versus Shifting Status Graph (5th Clutch Detection Area)

GENERAL DESCRIPTION

Transmission fluid pressure switch D (5th clutch) is installed in the hydraulic pressure circuit to the 5th clutch. When hydraulic pressure is supplied to the 5th clutch, the switch is turned on. When hydraulic pressure is not supplied to the 5th clutch, the switch is turned off. The signal from transmission fluid pressure switch D (5th clutch) is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the gear change to 5th gear (4th --> 5th) to reduce the shock that occurs at the gear change. If transmission fluid pressure switch D (5th clutch) is off while driving the vehicle with the rotation speed ratio of the input/output pulses is that of the 5th gear ratio, the PCM detects a transmission fluid pressure switch D (5th clutch) failure and stores a DTC.

MALFUNCTION THRESHOLD

The input signal from transmission fluid pressure switch D (5th clutch) to the PCM is high when driving in 5th gear.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in 5th gear for at least 4 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0962: PROBLEM IN A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A CIRCUIT

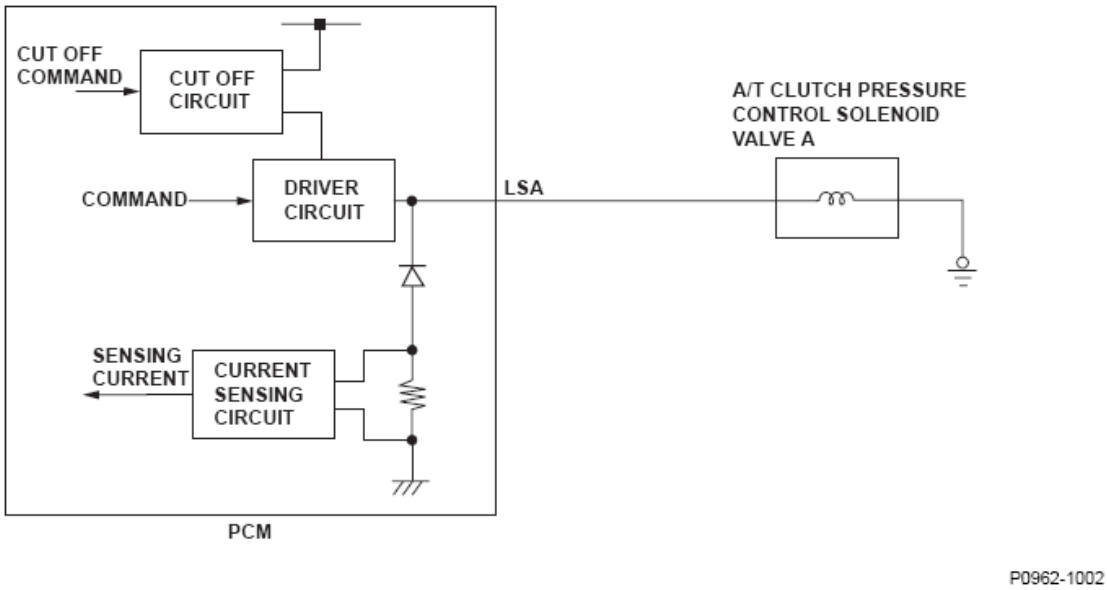

Fig. 222: A/T Clutch Pressure Control Solenoid Valve A - Circuit Diagram

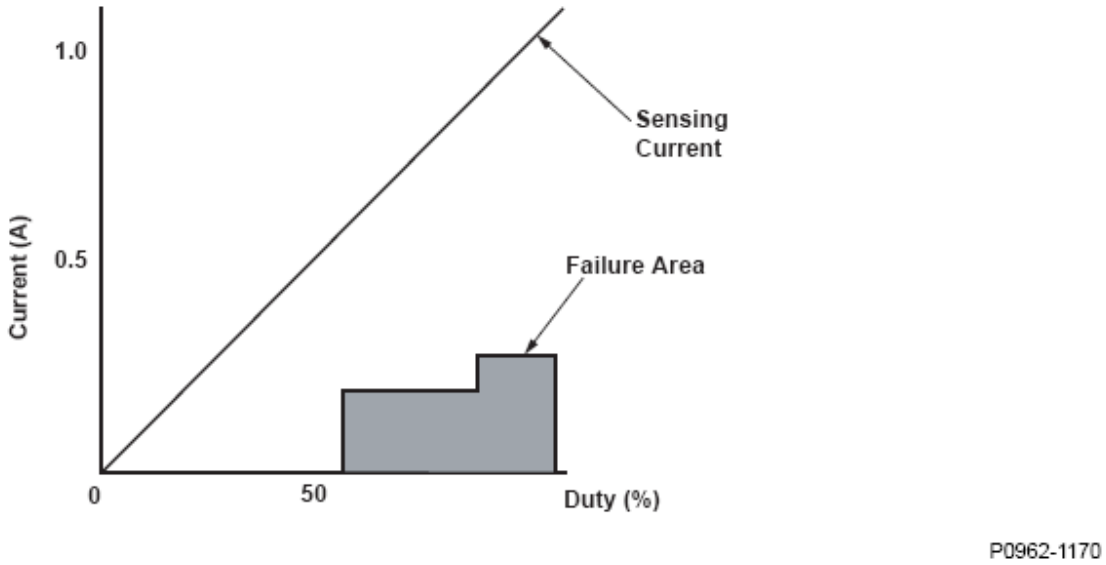

Fig. 223: Current Versus Duty Ratio Graph With Failure Area

GENERAL DESCRIPTION

A/T clutch pressure control solenoid valve A is used for clutch pressure control. A spool in A/T clutch pressure control solenoid valve A pushes the valve according to the duty cycle that is controlled by the powertrain control module (PCM) (The hydraulic pressure is proportional to the current). The PCM measures the current flowing through A/T clutch pressure control solenoid valve A, and uses feedback control to compensate for the difference between the actual current and the commanded one. If the measured current for the PCM output duty cycle is not within a specified range (circuit short or open), the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

CPCA: A/T clutch pressure control solenoid valve A pressure
CPCB: A/T clutch pressure control solenoid valve B pressure
CPCC: A/T clutch pressure control solenoid valve C pressure
CPCD: A/T clutch pressure control solenoid valve D pressure

GENERAL DESCRIPTION

When shift solenoid valves A, B, and C are turned on, the hydraulic pressure circuit opens. The hydraulic pressure circuit supplies/discharges hydraulic pressure to/from each clutch according to the combination of the ON/OFF status of the shift solenoid valves. The powertrain control module (PCM) commands the driver circuit to turn on the shift solenoid valve. The circuit detects malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. When the return signal does not match the PCM command to turn ON the shift solenoid valve, the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous

Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

CPCA: A/T clutch pressure control solenoid valve A pressure
CPCB: A/T clutch pressure control solenoid valve B pressure
CPCC: A/T clutch pressure control solenoid valve C pressure
CPCD: A/T clutch pressure control solenoid valve D pressure

GENERAL DESCRIPTION

When shift solenoid valves A, B, and C are turned on, the hydraulic pressure circuit opens. The hydraulic pressure circuit supplies/discharges hydraulic pressure to/from each clutch according to the combination of the ON/OFF status of the shift solenoid valves. The powertrain control module (PCM) commands the driver circuit to turn on the shift solenoid valve. The circuit detects malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. When the return signal does not match the PCM command to turn OFF the shift solenoid valve, the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0962, P0963, P0973, P0979, P0980, P2720, P2721	

MALFUNCTION THRESHOLD

The return signal does not match the command to turn OFF shift solenoid valve A for at least 1 second.

DRIVING PATTERN

1. Start the engine.
2. With the brake pedal pressed, shift to R, and wait for at least 1 second.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

No active DTCs set (prevents monitor from running)	P0962, P0963, P0973, P0974, P0979, P2720, P2721	

MALFUNCTION THRESHOLD

The return signal does not match the command to turn OFF shift solenoid valve C for at least 1 second.

DRIVING PATTERN

1. Start the engine.
2. With the brake pedal pressed, shift to N or D, and wait for at least 1 second.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0989: SHORT IN TRANSMISSION FLUID PRESSURE SWITCH E (6TH CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH E (6TH CLUTCH) STUCK ON

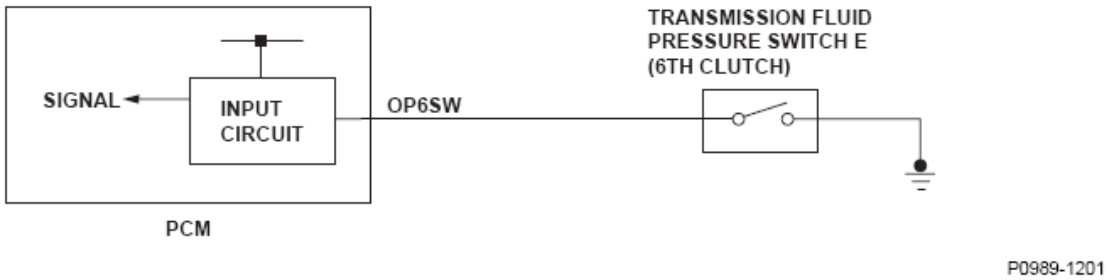

Fig. 240: Transmission Fluid Pressure Switch E - Circuit Diagram

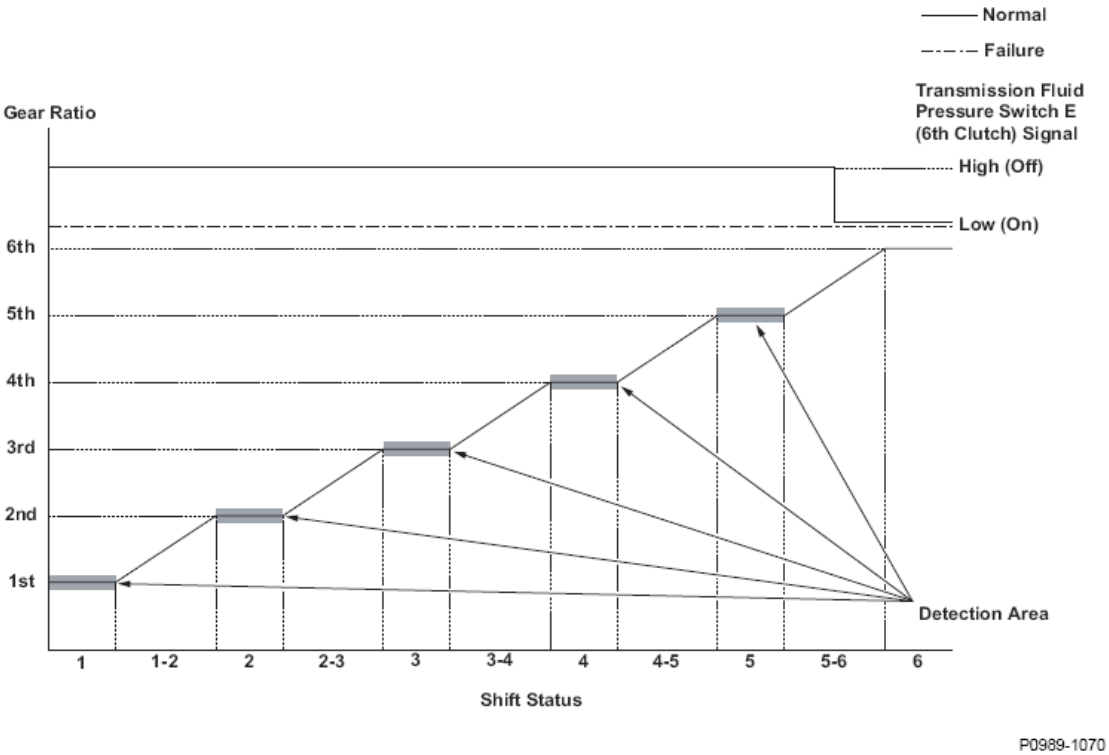

Fig. 241: Gear Ratio Versus Shifting Status Graph

GENERAL DESCRIPTION

Transmission fluid pressure switch E (6th clutch) is installed in the hydraulic pressure circuit to the 6th clutch. When hydraulic pressure is supplied to the 6th clutch, the switch is turned on. When hydraulic pressure is not supplied to the 6th clutch, the switch is turned off. The signal from transmission fluid pressure switch E (6th clutch) is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the gear change to 6th gear (5th --> 6th) to reduce the shock that occurs at the gear change. If transmission fluid pressure switch E (6th clutch) is on while driving the vehicle with the rotation speed ratio of the input/output pulses is other than the 6th gear ratio (the ratio is Neutral or 5th), the PCM detects a transmission fluid pressure switch E (6th clutch) failure and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P0705, P0716, P0717, P0718, P0721, P0722, P0723, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0797, P0842, P0843, P0847, P0848, P0872, P0873, P0877, P0878, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0990, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721	

MALFUNCTION THRESHOLD

One of these conditions occurs:

- The input signal from transmission fluid pressure switch E (6th clutch) to the PCM is low for at least 4 seconds when the shift lever is in P, R, or N.
- The input signal from transmission fluid pressure switch E (6th clutch) to the PCM is low for at least 4 seconds when driving in 1st, 2nd, or 3rd gear.
- The input signal from transmission fluid pressure switch E (6th clutch) to the PCM is low for at least 4 seconds when the 3rd gear shift is commanded or when the shift lever is in P, R, or N, after the signal is low for at least 2 seconds when driving in 4th or 5th gear.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D until the transmission shifts into 6th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P0990: OPEN IN TRANSMISSION FLUID PRESSURE SWITCH E (6TH CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH E (6TH CLUTCH) STUCK OFF

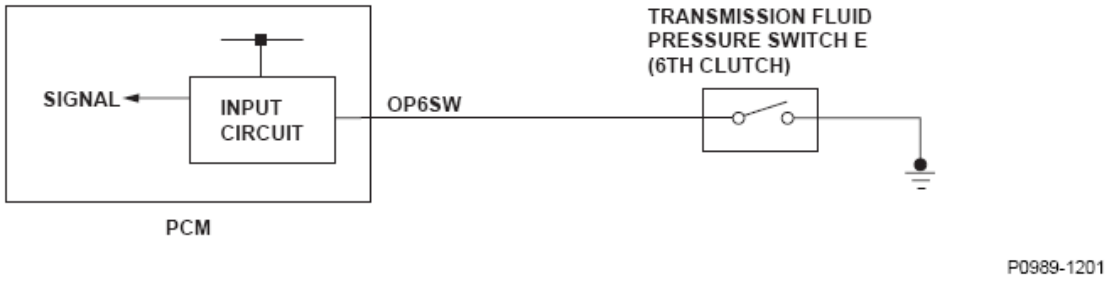

Fig. 242: Transmission Fluid Pressure Switch E - Circuit Diagram

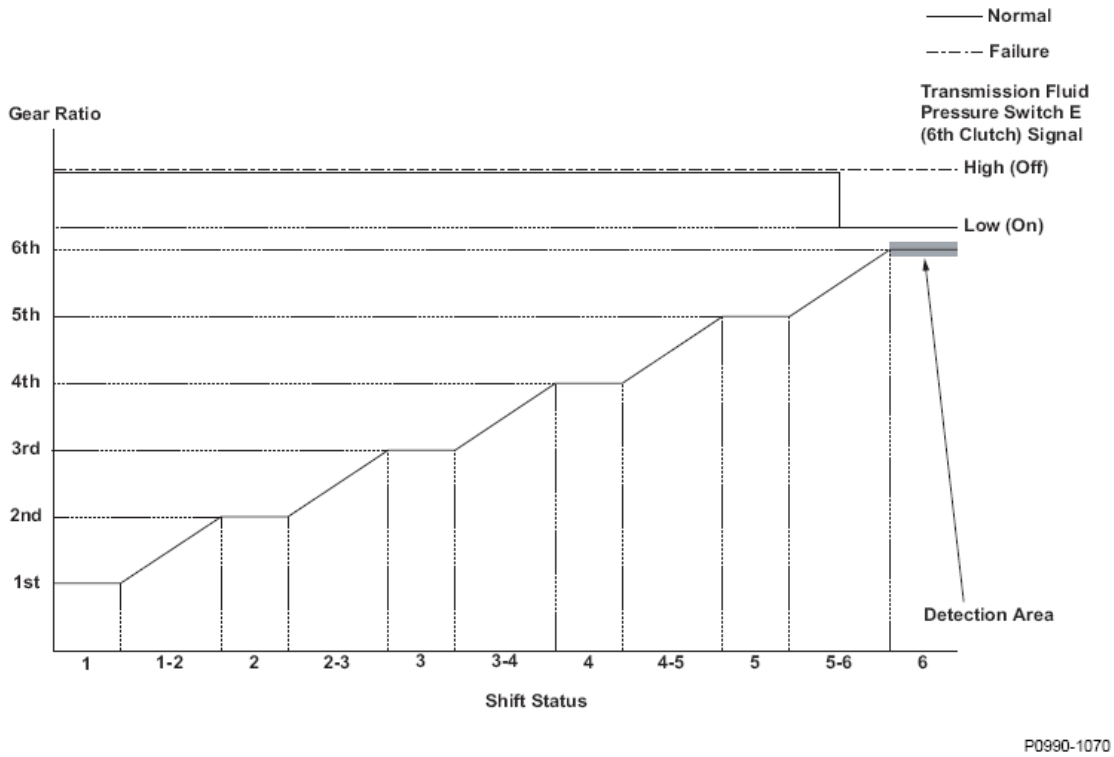

Fig. 243: Gear Ratio Versus Shifting Status Graph (6th Clutch Detection Area)

GENERAL DESCRIPTION

Transmission fluid pressure switch E (6th clutch) is installed in the hydraulic pressure circuit to the 6th clutch. When hydraulic pressure is supplied to the 6th clutch, the switch is turned on. When hydraulic pressure is not supplied to the 6th clutch, the switch is turned off. The signal from transmission fluid pressure switch E (6th clutch) is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the gear change to 6th gear (5th --> 6th) to reduce the shock that occurs at the gear change. If transmission fluid pressure switch E (6th clutch) is off while driving the vehicle with the rotation speed ratio of the input/output pulses is that of the 6th gear ratio, the PCM detects a transmission fluid pressure switch E (6th clutch) failure and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	4 seconds or more
DTC Type	Two drive cycles, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-

No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P0705, P0716, P0717, P0718, P0721, P0722, P0723, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0797, P0842, P0843, P0847, P0848, P0872, P0873, P0877, P0878, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0989, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721

MALFUNCTION THRESHOLD

The input signal from transmission fluid pressure switch E (6th clutch) to the PCM is high when driving in 6th gear.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in 6th gear for at least 4 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1077: INTAKE MANIFOLD TUNING (IMT) VALVE STUCK IN HIGH RPM POSITION

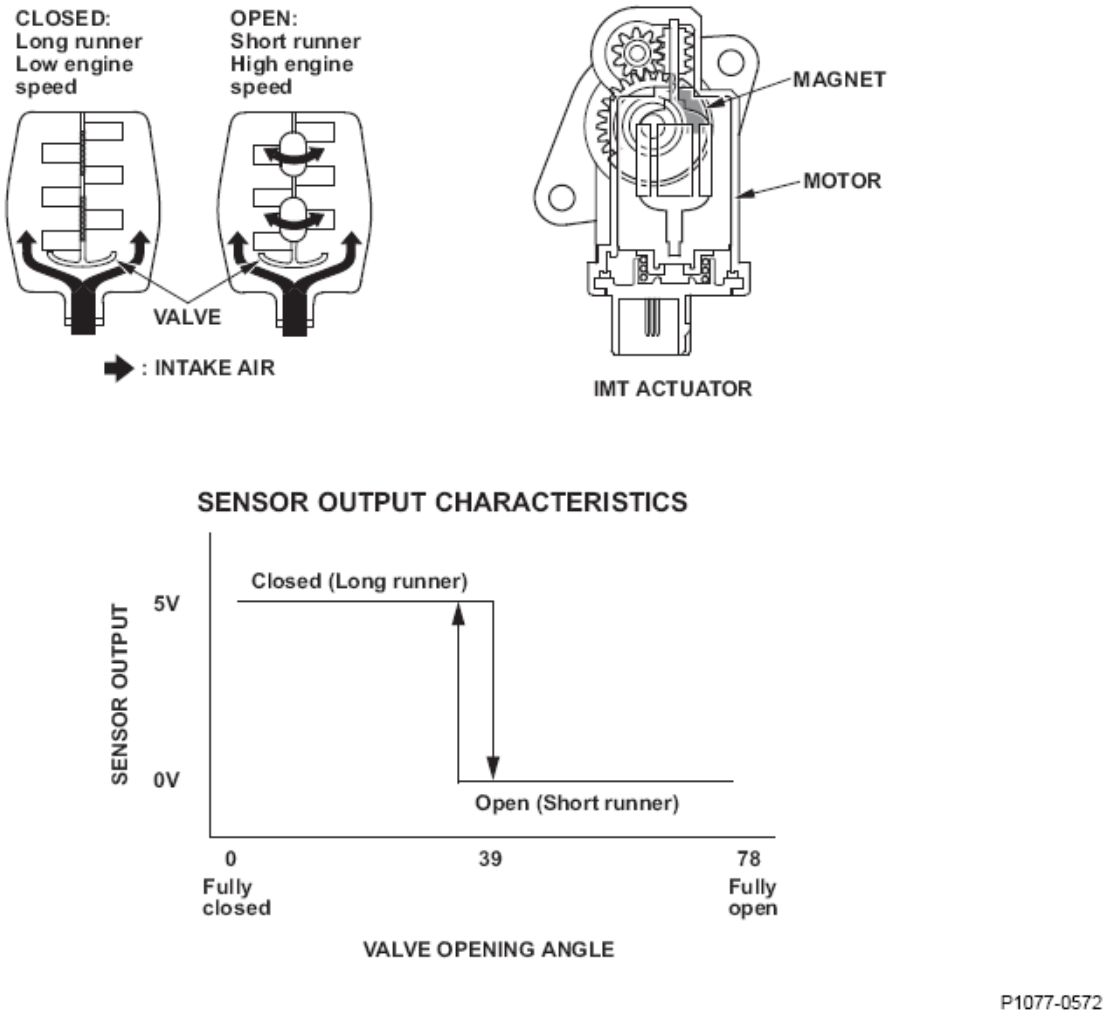

Fig. 244: Intake Manifold Tuning Sensor Output Characteristics Graph

GENERAL DESCRIPTION

The intake manifold tuning (IMT) system aids engine output by selecting either long or short intake runner lengths. The system consists of the IMT valve, the IMT actuator, and the engine control module (ECM)/powertrain control module (PCM). The IMT actuator is attached to the intake manifold and it includes the motor and the Hall-effect-IC position sensing unit. The ECM/PCM actuates the motor, which operates the IMT valve. When the IMT valve is closed, the long runner is selected, increasing torque at low engine speed. When the IMT valve is open, the short runner is selected, increasing torque at high engine speed. A Hall-effect-IC position sensing unit is integrated with the motor to provide precise open/close feedback to the ECM/PCM. The IMT actuator sends a long runner return signal to the ECM/PCM when the IMT valve is closed, and it sends a short runner return signal to the ECM/PCM when the IMT valve is open. If the ECM/PCM receives no closed return signal when it sends a close command, or if it receives no open return signal when sending an open command to the IMT actuator, for a specified time, it detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	7.0 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Intake air temperature	32 °F (0 °C)	-
Engine speed	-	3,750 rpm(1) 3,800 rpm(2)
Battery voltage	10.5 V	-
No active DTCs set (prevents monitor from running)	P0112, P0113	
(1) J35Z6 engine (2) J37A4 engine		

MALFUNCTION THRESHOLD

When the ECM/PCM sends a close (long runner) command, no long runner return signal is received for at least 7.0 seconds.

DRIVING PATTERN

1. Start the engine, and let it idle until the radiator fan comes on.
2. Let the engine idle for at least 7 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1078: INTAKE MANIFOLD TUNING (IMT) VALVE STUCK IN LOW RPM POSITION

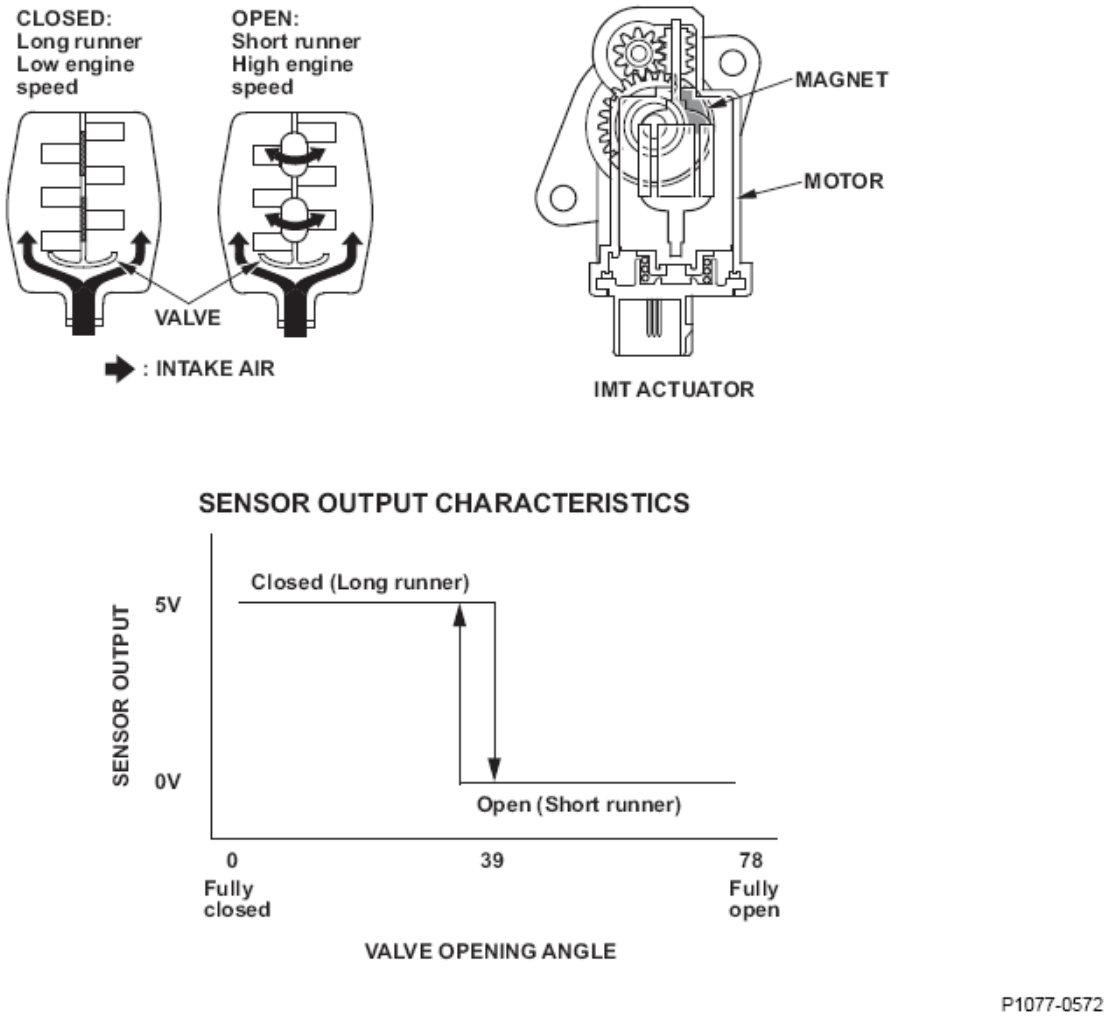

Fig. 245: Intake Manifold Tuning Sensor Output Characteristics Graph

GENERAL DESCRIPTION

The intake manifold tuning (IMT) system aids engine output by selecting either long or short intake runner lengths. The system consists of the IMT valve, the IMT actuator, and the engine control module (ECM)/powertrain control module (PCM). The IMT actuator is attached to the intake manifold and it includes the motor and the Hall-effect-IC position sensing unit. The ECM/PCM actuates the motor, which operates the IMT valve. When the IMT valve is closed, the long runner is selected, increasing torque at low engine speed. When the IMT valve is open, the short runner is selected, increasing torque at high engine speed. A Hall-effect-IC position sensing unit is integrated with the motor to provide precise open/close feedback to the ECM/PCM. The IMT actuator sends a long runner return signal to the ECM/PCM when the IMT valve is closed, and it sends a short runner return signal to the ECM/PCM when the IMT valve is open. If the ECM/PCM receives no closed return signal when it sends a close command, or if it receives no open return signal when sending an open command to the IMT actuator, for a specified time, it detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	3.0 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Intake air temperature	32 °F (0 °C)	-
Engine speed	3,950 rpm(1) 4,000 rpm(2)	-
Battery voltage	10.5 V	-
No active DTCs set (prevents monitor from running)	P0112, P0113	
(1) J35Z6 engine (2) J37A4 engine		

MALFUNCTION THRESHOLD

When the ECM/PCM sends an open (short runner) command, no short runner return signal is received for at least 3.0 seconds.

DRIVING PATTERN

1. Start the engine, and let it idle until the radiator fan comes on.
2. Hold the engine speed to 3,950 rpm*1 (4,000 rpm)*2 or more for at least 3 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1116: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE PROBLEM

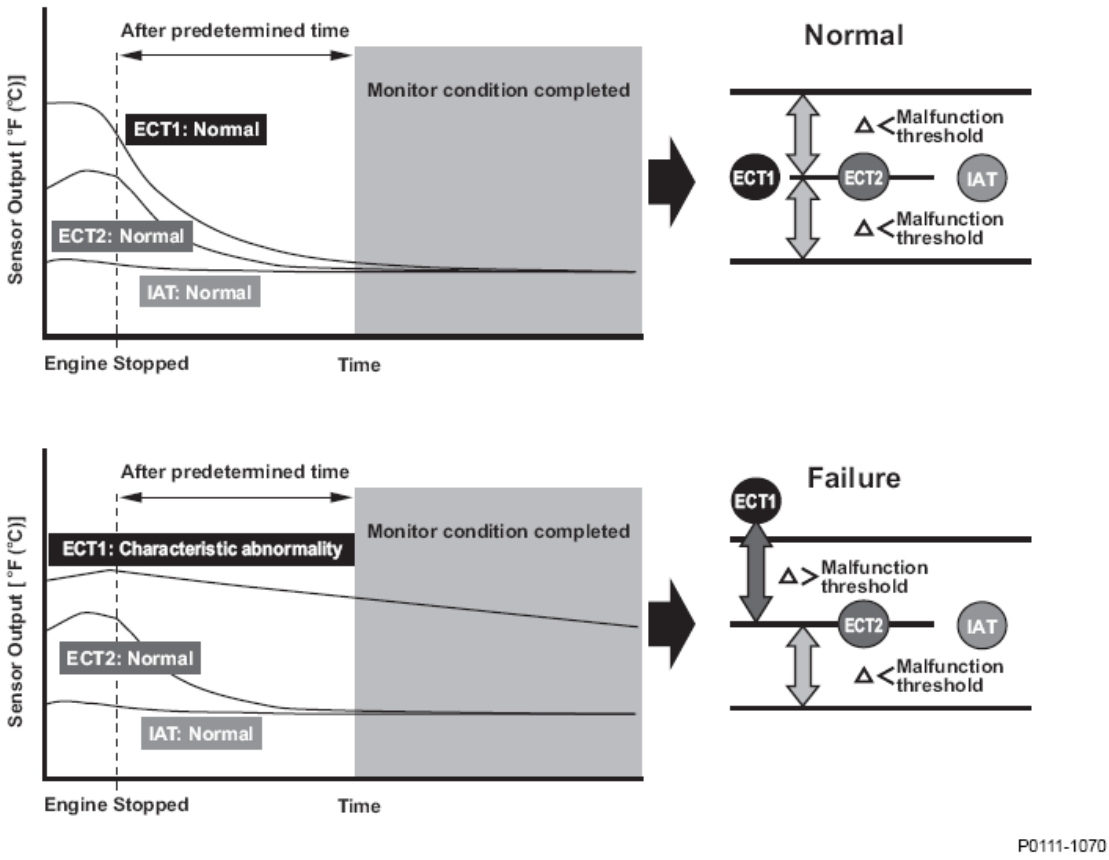

Fig. 246: Engine Coolant Temperature Sensor Characteristics Curve

GENERAL DESCRIPTION

Two engine coolant temperature (ECT) sensors and one intake air temperature (IAT) sensor are used by the engine control module (ECM)/powertrain control module (PCM). When the engine is stopped and enough time has passed, the temperature of the engine will equalize to the ambient temperature. ECT sensor 1 and IAT sensor are compared to ECT sensor 2, and if an inappropriate temperature is read, the ECM/PCM detects a malfunction in the corresponding sensor and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine off time	6 hours	-

No active DTCs set (prevents monitor from running)	P0112, P0113, P0116, P0117, P0118, P0125, P2184, P2185, P2610

MALFUNCTION THRESHOLD

A malfunction is detected if the following conditions are present after the engine has stopped and the ignition switch has been turned to LOCK (0) or engine start/stop button has been pressed to select the OFF mode, for at least 6 hours before restarting the engine:

Temperature difference between each sensor values		Malfunction judgment		
ECT1 - ECT2	**IAT - ECT2**	**ECT sensor 1**	**IAT sensor**	**ECT sensor 2**
Higher than 57 °F (32 °C)	Higher than 57 °F (32 °C)	Normal	Normal	Failure
	From -43 °F (-24 °C) to 57 °F (32 °C)	Failure	Normal	Normal
	Lower than -43 °F (-24 °C)	Failure	Failure	Normal
From -43 °F (-24 °C) to 57 °F (32 °C)	Higher than 57 °F (32 °C)	Normal	Failure	Normal
	From -43 °F (-24 °C) to 57 °F (32 °C)	Normal	Normal	Normal
	From -44 °F (-25 °C) to -108 °F (-60 °C)	Normal	Failure Suspended(1)	Normal
	Lower than -108 °F (-60 °C)	Normal	Failure	Normal
Lower than -43 °F (-24 °C)	Higher than 57 °F (32 °C)	Failure	Failure	Normal
	From -43 °F (-24 °C) to 57 °F (32 °C)	Failure	Normal	Normal
	Lower than -43 °F (-24 °C)	Normal	Normal	Failure
(1) Malfunction judgment is suspended because the cooled air introduced after engine start lowers the intake air temperature; the ambient temperature condition does not stay equal.				

DRIVING PATTERN

1. Turn the ignition switch to LOCK (0) or press the engine start/stop button to select the OFF mode, and wait at least 6 hours.
2. Start the engine, and let it idle for at least 10 seconds.
   - Do not use an engine block heater because the engine coolant temperature will not stay equal during engine stop.
   - When freeze data is stored, test the vehicle under an ambient temperature close to the intake air temperature in the freeze data.
   - When an ambient temperature extremely changes, malfunction judgment may not execute. Avoid extreme temperature changing condition after or before engine start. (When the vehicle is parked in the garage, open the shutter to introduce outside air; then start the engine.)

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1128: MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR SIGNAL LOWER THAN EXPECTED

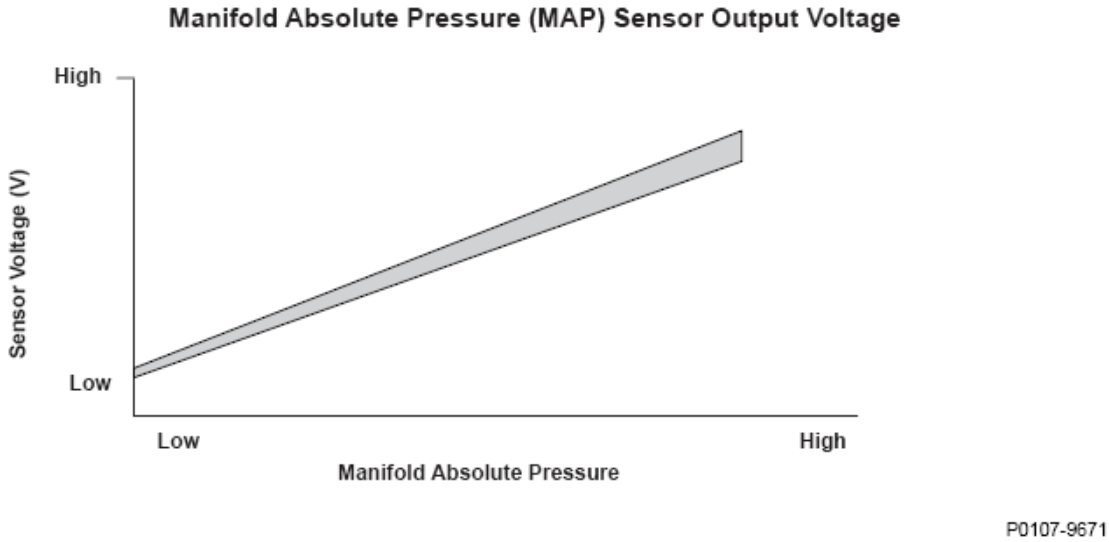

Fig. 247: Manifold Absolute Pressure Sensor Output Voltage Graph

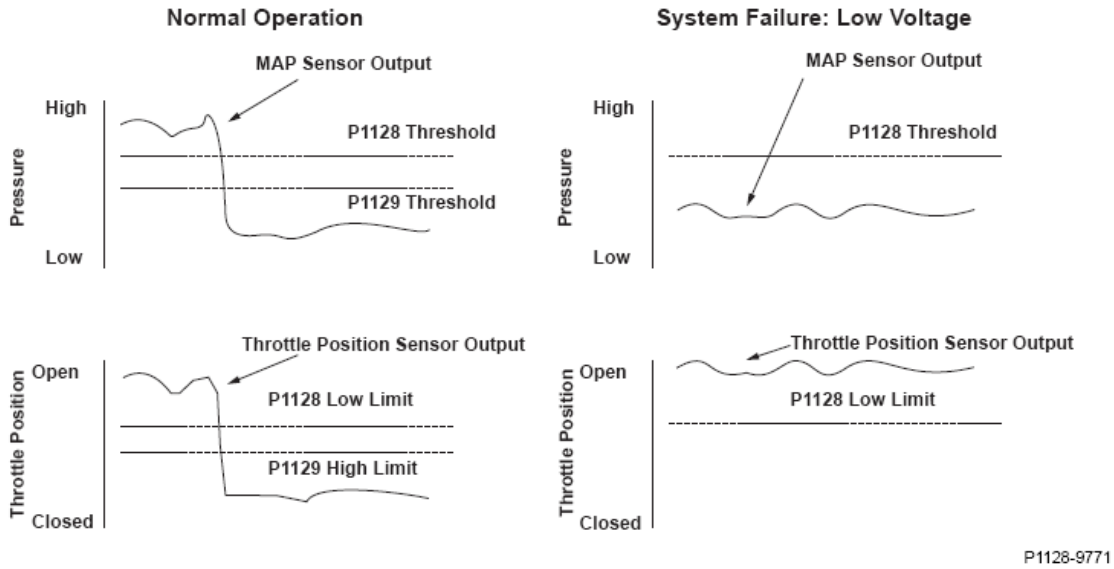

Fig. 248: Manifold Absolute Pressure Sensor Output Voltage Characteristics Curve

GENERAL DESCRIPTION

The manifold absolute pressure (MAP) sensor senses manifold absolute pressure (vacuum) and converts it into electrical signals. The MAP sensor outputs low signal voltage at high vacuum (throttle valve closed) and high signal voltage at low vacuum (throttle valve wide open). The engine control module (ECM)/powertrain control module (PCM) compares a predetermined MAP value at a given throttle position and manifold absolute pressure to the output voltage value of the MAP sensor. If the MAP sensor outputs lower voltage than expected, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition		Minimum	Maximum
Engine coolant temperature		156 °F (69 °C)	-
Engine speed		1,200 rpm	-
Vehicle speed		15 mph (24 km/h)	-
Throttle	1,000 rpm	12.7 °(1) 12.0 °(2)

No active DTCs set (prevents monitor from running)		P0107, P0108, P0117, P0118, P0122, P0123, P0171, P0172, P0174, P0175, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0351, P0352, P0353, P0354, P0355, P0356, P0401, P0404, P0506, P0507, P060A, P0720, P0722, P1077, P1078, P1129, P1659, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2227, P2228, P2229, P2279, P2413, P2646, P2647, P2648, P2649	
Other		Other than during fuel cut-off operation	
(1) J35Z6 engine (2) J37A4 engine			

MALFUNCTION THRESHOLD

The MAP sensor output is 53 kPa (15.9 inHg, 405 mmHg) or less for at least 2.0 seconds when atmospheric pressure is 104 kPa (30.6 inHg, 776 mmHg).

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed of 15 mph (24 km/h) or more under Enable Conditions (see "Throttle position") for at least 2 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1129: MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR SIGNAL HIGHER THAN EXPECTED

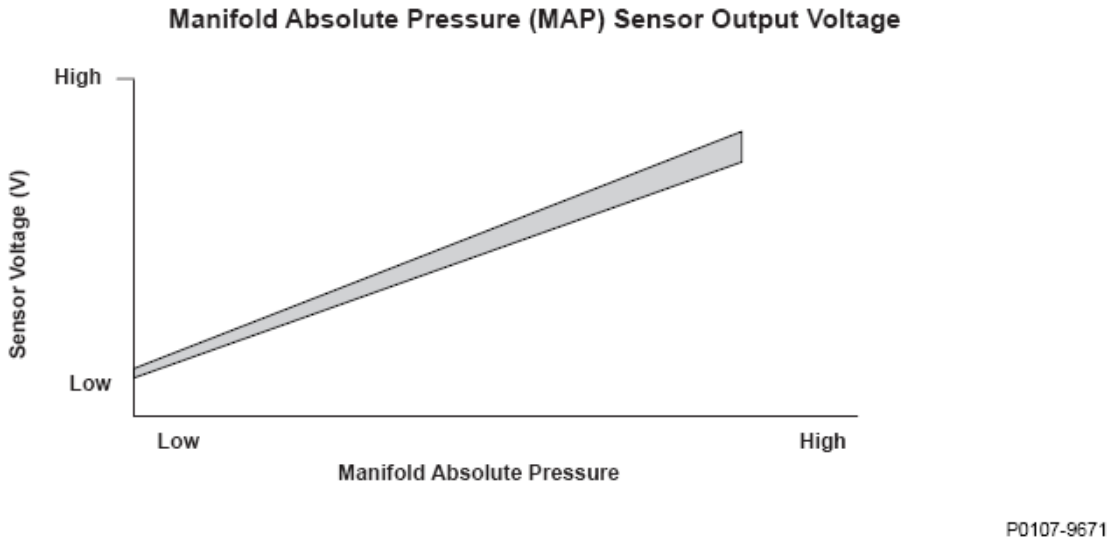

Fig. 249: Manifold Absolute Pressure Sensor Output Voltage Graph

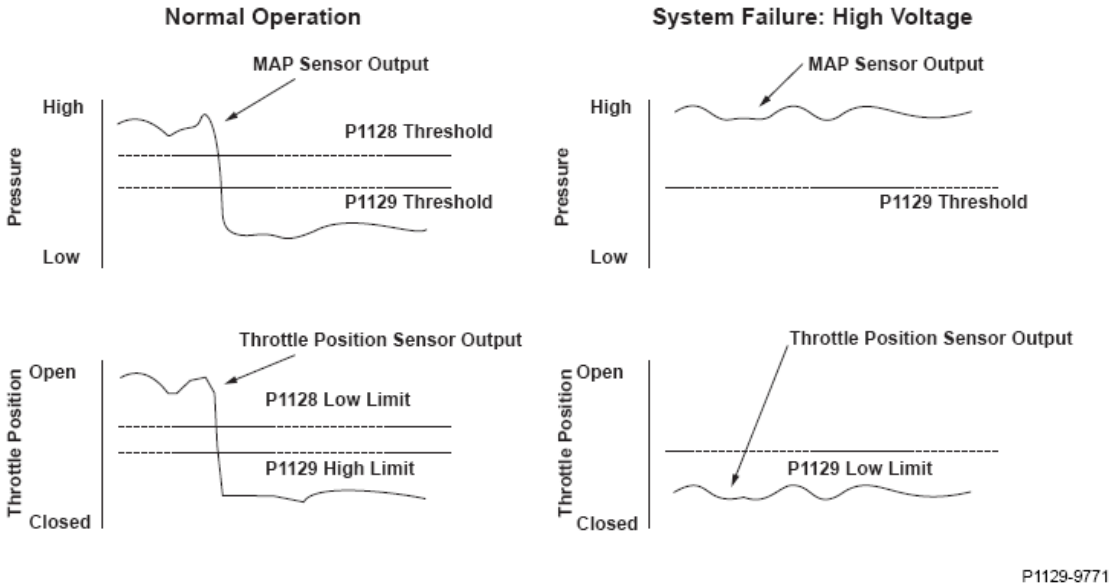

Fig. 250: Manifold Absolute Pressure Sensor Output Voltage Characteristics Curve

GENERAL DESCRIPTION

The manifold absolute pressure (MAP) sensor senses manifold absolute pressure (vacuum) and converts it into electrical signals. The MAP sensor outputs low signal voltage at high vacuum (throttle valve closed) and high signal voltage at low vacuum (throttle valve wide open). The engine control module (ECM)/powertrain control module (PCM) compares a predetermined MAP value at a given throttle position and manifold absolute pressure to the output voltage value of the MAP sensor. If the MAP sensor outputs high voltage during fuel cut-off operation for deceleration with the throttle valve fully closed, which should make the manifold absolute pressure lower, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine coolant temperature	156 °F (69 °C)	-
Engine speed	1,200 rpm	5,900 rpm
Vehicle speed	15 mph (24 km/h)	-
Fuel feedback	During deceleration	
Throttle position	Fully closed	
No active DTCs set (prevents monitor from running)	P0107, P0108, P0117, P0118, P0122, P0123, P0171, P0172, P0174, P0175, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0351, P0352, P0353, P0354, P0355, P0356, P0401, P0404, P0443, P0496, P0497, P0506, P0507, P060A, P0720, P0722, P1077, P1078, P1128, P145C, P1659, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2279, P2413, P2646, P2647, P2648, P2649	

MALFUNCTION THRESHOLD

The MAP sensor output is 37 kPa (11.0 inHg, 277 mmHg) or more for at least 2.0 seconds.

DRIVING PATTERN

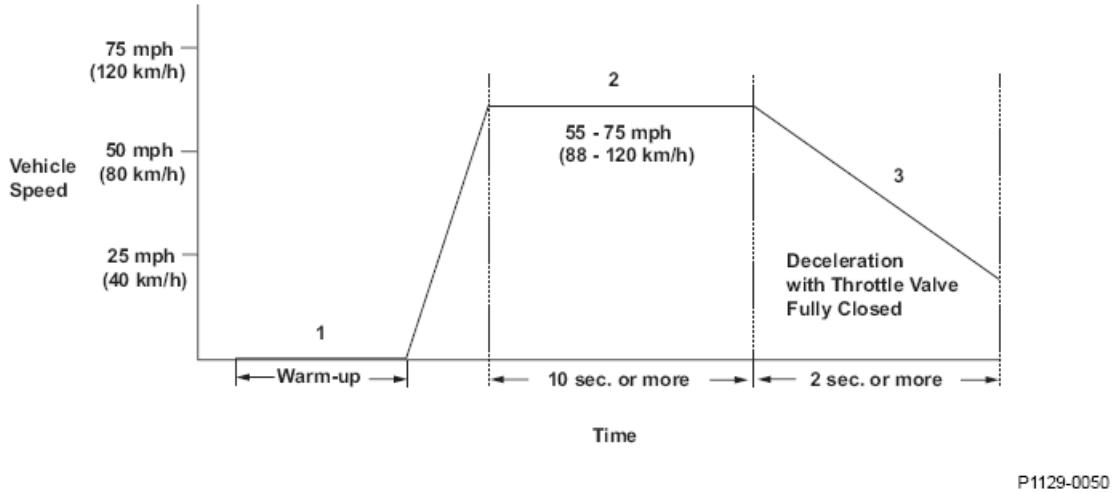

Fig. 251: Vehicle Speed Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.

2. Drive the vehicle at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
3. Decelerate with the throttle valve fully closed for at least 2 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1172: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) CIRCUIT OUT OF RANGE HIGH

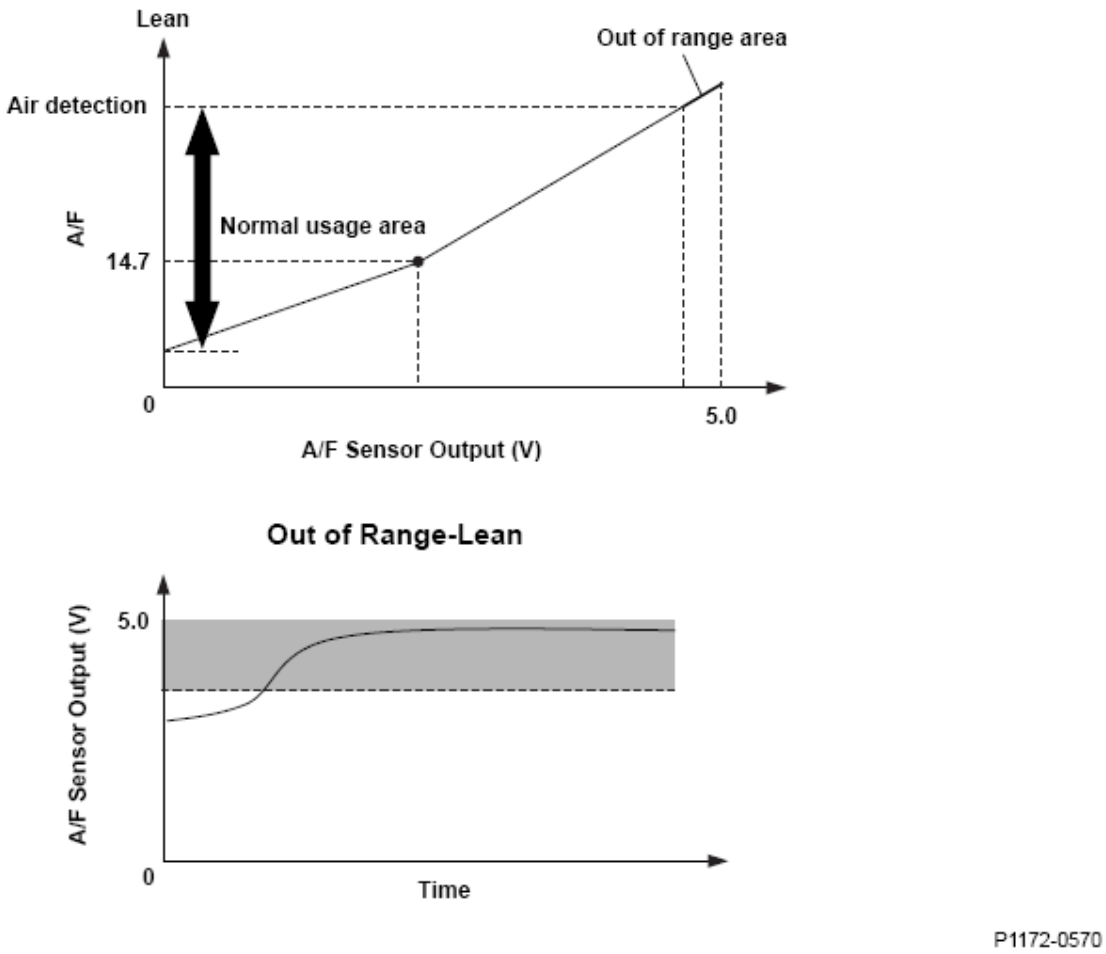

Fig. 252: Air/Fuel Ratio Sensor Characteristics Graph

GENERAL DESCRIPTION

If a malfunction causes the rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) signal to the engine control module (ECM)/powertrain control module (PCM) to deviate from the normal control area, the rear A/F sensor may still become active after the engine starts, but the air/fuel feedback does not start normally and the emissions deteriorate. When the rear A/F sensor output is out of the normal area, and this condition continues after the rear A/F sensor is active, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	7.0 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	
No active DTCs set (prevents monitor from running)	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0134, P0135, P0171, P0172, P0174, P0175, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0351, P0352, P0353, P0443, P0496, P0497, P1128, P1129, P145C, P2195, P2237, P2238, P2243, P2245, P2251, P2252

MALFUNCTION THRESHOLD

A malfunction is detected when the rear A/F sensor (bank 1, sensor 1) output voltage is 4.70 V or more.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
2. Air/fuel ratio feedback is started while idling, hold for at least 7 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1174: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) CIRCUIT OUT OF RANGE HIGH

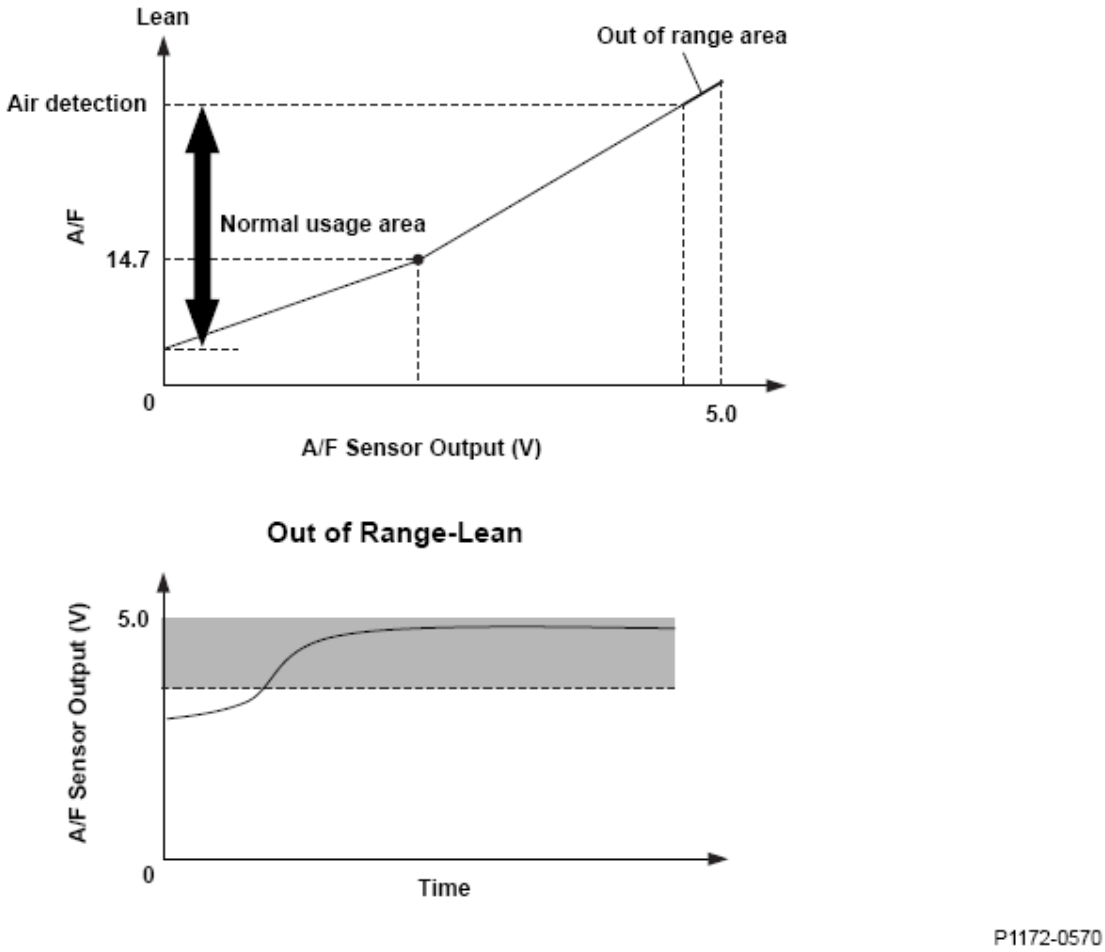

Fig. 253: Air/Fuel Ratio Sensor Characteristics Graph

GENERAL DESCRIPTION

If a malfunction causes the front air/fuel ratio (A/F) sensor (bank 2, sensor 1) signal to the engine control module (ECM)/powertrain control module (PCM) to deviate from the normal control area, the front A/F sensor may still become active after the engine starts, but the air/fuel feedback does not start normally and the emissions deteriorate. When the front A/F sensor output is out of the normal area, and this condition continues after the front A/F sensor is active, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	7.0 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	
No active DTCs set (prevents monitor from running)	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0154, P0155, P0174, P0175, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0354, P0355, P0356, P0443, P0496, P0497, P1128, P1129, P145C, P2197, P2240, P2241, P2247, P2249, P2254, P2255

MALFUNCTION THRESHOLD

A malfunction is detected when the front A/F sensor (bank 2, sensor 1) output voltage is 4.70 V or more.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
2. Air/fuel ratio feedback is started while idling, hold for at least 7 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1297: ELECTRICAL LOAD DETECTOR (ELD) CIRCUIT LOW VOLTAGE

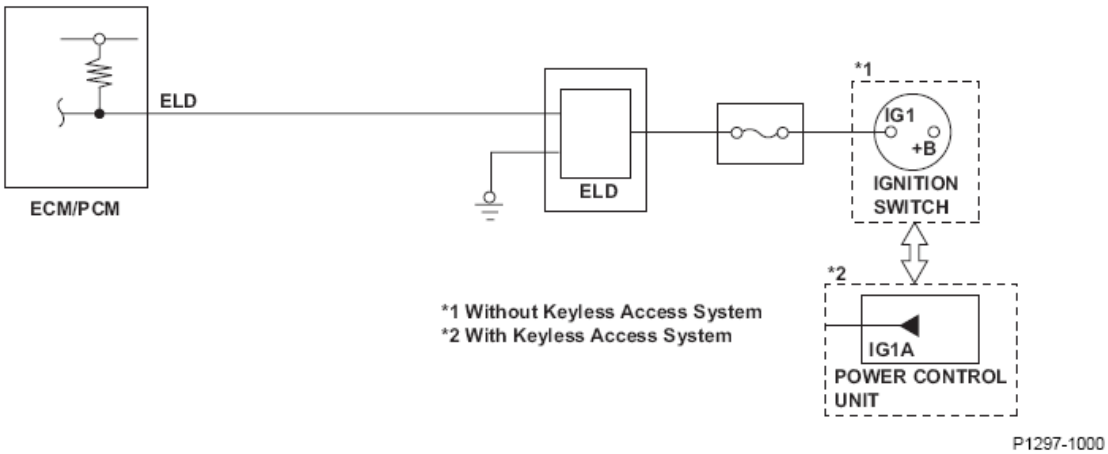

Fig. 254: Electrical Load Detector - Circuit Diagram

GENERAL DESCRIPTION

The electrical load detector (ELD) is built into the under-hood fuse/relay box. It monitors the current fed to the ignition switch and sends a signal to the engine control module (ECM)/powertrain control module (PCM). If the ELD output voltage is extremely low, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5.0 seconds or more
DTC Type	Two drive cycles, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
Ignition switch(1)	ON (II)	
Engine start/stop button(2)	ON mode	
No active DTCs set (prevents monitor from running)	P1298	
(1) Without keyless access system (2) With keyless access system		

MALFUNCTION THRESHOLD

The ELD output voltage is 0.27 V or less for at least 5.0 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1298: ELECTRICAL LOAD DETECTOR (ELD) CIRCUIT HIGH

VOLTAGE

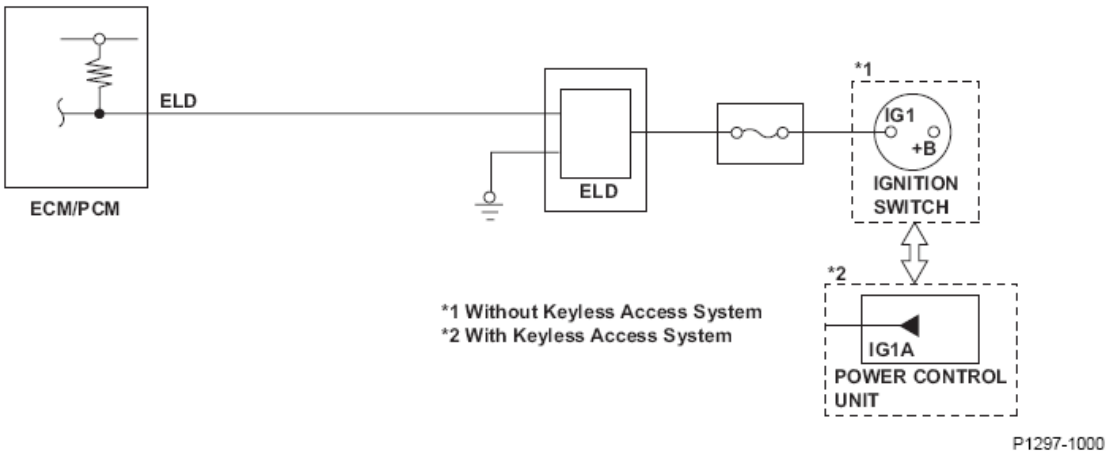

Fig. 255: Electrical Load Detector - Circuit Diagram

GENERAL DESCRIPTION

The electrical load detector (ELD) is built into the under-hood fuse/relay box. It monitors the current fed to the ignition switch and sends a signal to the engine control module (ECM)/powertrain control module (PCM). If the ELD output voltage is extremely high, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5.0 seconds or more
DTC Type	Two drive cycles, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
Ignition switch(1)	ON (II)	
Engine start/stop button(2)	ON mode	
No active DTCs set (prevents monitor from running)	P1297	
(1) Without keyless access system (2) With keyless access system		

MALFUNCTION THRESHOLD

The ELD output voltage is 4.57 V or more for at least 5.0 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1454: FUEL TANK PRESSURE (FTP) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

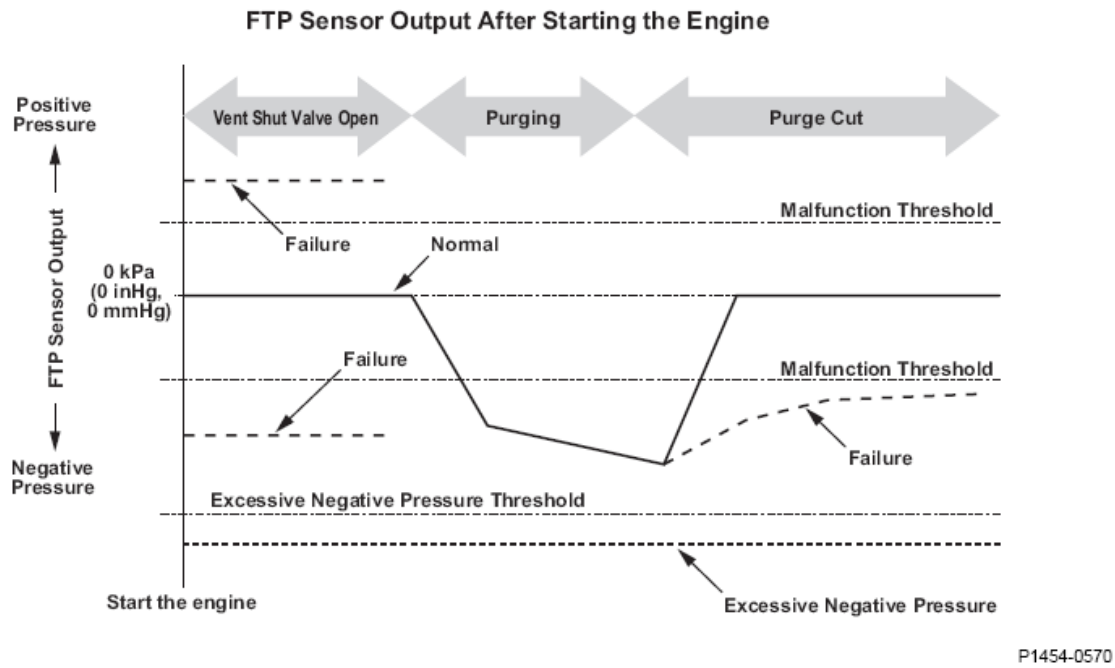

Fig. 256: FTP Sensor Output Characteristics Curve

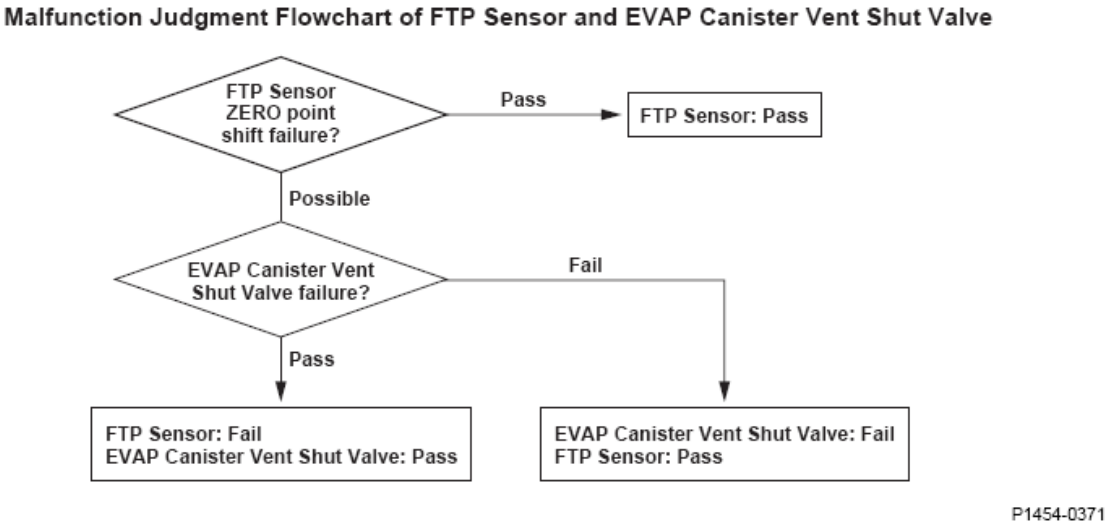

Fig. 257: FTP Sensor And EVAP Canister Vent Shut Valve Malfunction Judgment Flowchart

GENERAL DESCRIPTION

The fuel tank pressure is about 0 kPa (0 inHg, 0 mmHg) when starting a cold engine. When the fuel tank pressure (FTP) sensor output value is out of a specified range and the engine control module (ECM)/powertrain control module (PCM) judges that there's no other cause [no evaporative emission (EVAP) canister vent shut valve failure, etc.] for the FTP sensor zero point shift, the ECM/PCM detects an FTP sensor malfunction. However, if the FTP sensor output when starting the engine, is a prescribed negative value or less (excessive negative pressure is detected), the malfunction judgment should be done as follows because it is difficult to distinguish the FTP sensor zero point shift (P1454) from the EVAP canister vent shut valve failure (P2422).

1. If neither Pending DTCs (P1454 nor P2422) are stored, both Pending DTCs are stored when excessive vacuum is detected at engine start.
2. If both Pending DTCs (P1454 and P2422) are stored and excessive vacuum is detected, both Confirmed DTCs are stored.
3. If either Pending DTC (P1454 or P2422) is stored and excessive vacuum is detected, the ECM/PCM stores the Confirmed DTC which the Pending DTC is stored.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	P0452, P0453 are judged as OK
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum

Elapsed time after starting the engine	10 seconds	-
No active DTCs set (prevents monitor from running)	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0134, P0135, P0154, P0155, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0351, P0352, P0353, P0354, P0355, P0356, P0443, P0451, P0452, P0453, P0496, P0497, P0498, P0499, P1128, P1129, P1172, P1174, P145C, P2195, P2197, P2227, P2228, P2229, P2237, P2238, P2240, P2241, P2243, P2245, P2247, P2249, P2251, P2252, P2254, P2255, P2279, P2422	
Other	The EVAP canister vent shut valve is open	
	The EVAP canister purge valve is closed (the system is not purging)	

MALFUNCTION THRESHOLD

- The FTP sensor output fluctuates by 1.4 kPa (0.4 inHg, 10 mmHg) or more, or -0.7 kPa (-0.2 inHg, -5 mmHg) or less, for at least 10 seconds.
- The FTP sensor output value is -1.4 kPa (-0.4 inHg, -10 mmHg) or less for at least 10 seconds.

DRIVING PATTERN

1. Start the engine, and let it idle until the radiator fan comes on.
2. When the diagnosis does not finish at idle, drive at 30 - 75 mph (48 - 120 km/h) at EVAP canister purge valve duty 20 % or more.
    - Drive the vehicle in the manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1458: FUEL TANK PRESSURE (FTP) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

GENERAL DESCRIPTION

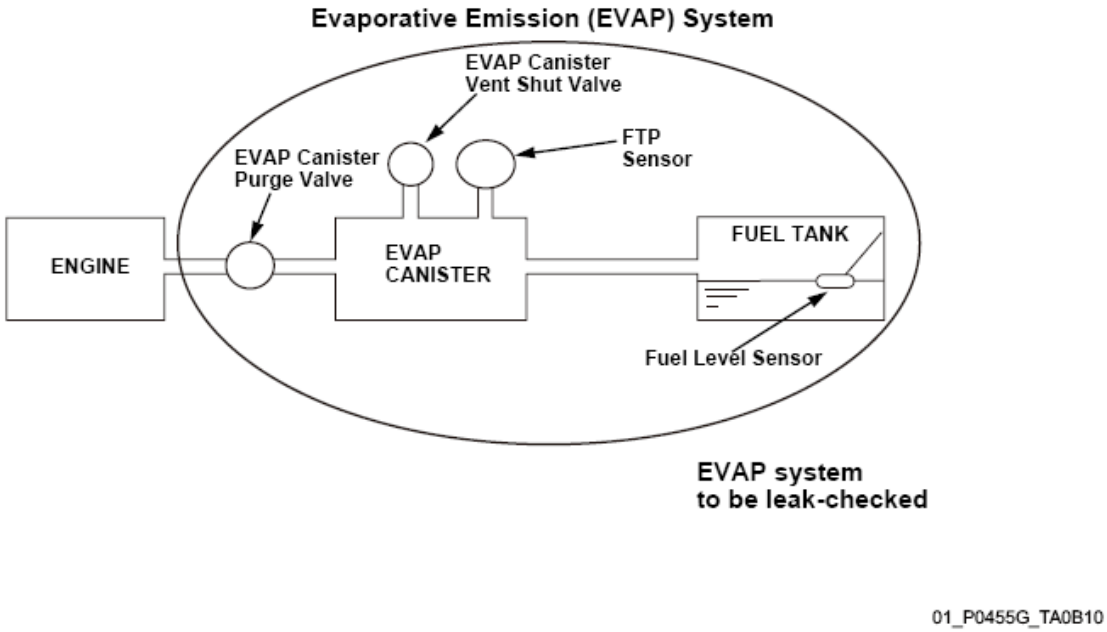

Fig. 258: Evaporative Emission - System Diagram

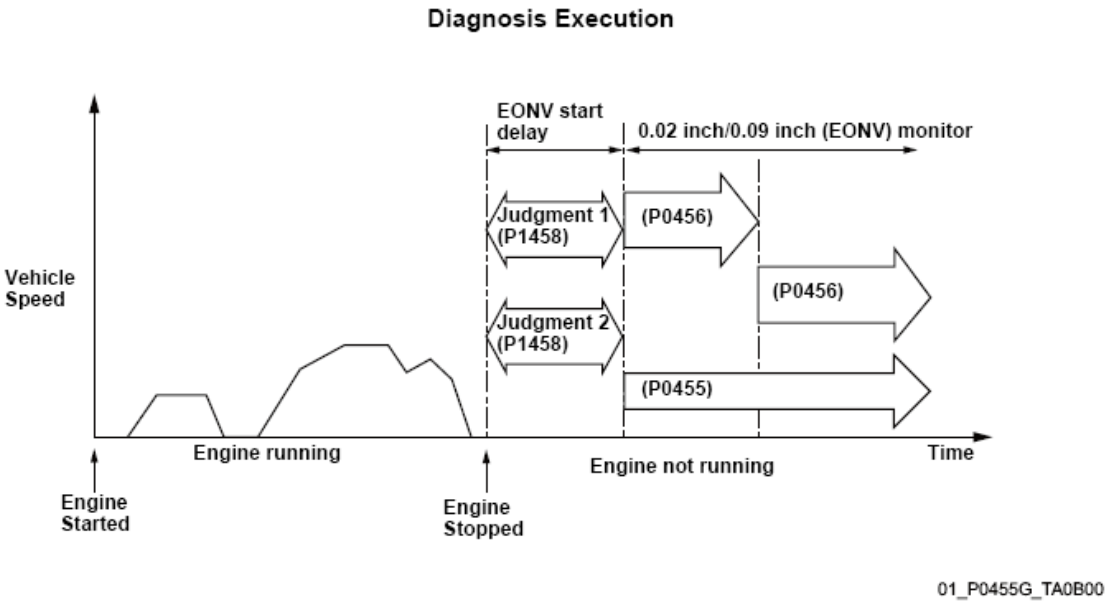

Fig. 259: Evaporative Emission System Diagnosis Execution Graph

The evaporative emission (EVAP) leak detection system uses an engine off natural vacuum (EONV) method. The EONV method detects leakage from the change in fuel tank pressure via the fuel tank pressure (FTP) sensor with the engine off.

Here is an overview of the malfunction detection for the EONV method:

Judgment 1: Detection of atmospheric pressure failure

Judgment 2: Flickering of the FTP sensor

< Judgments 1 and 2 happen at the same time. >

Judgment 1:

After the engine has stopped, the engine control module (ECM)/powertrain control module (PCM) monitors the variation of the FTP sensor output to detect atmospheric pressure, after keeping the canister vent opened for a specified duration to stabilize the pressure inside the fuel tank.

- If the pressure inside the fuel tank after a specified duration has not reached a specified value from the sensor zero point, a canister vent blockage is detected.

Judgment 2:

After the engine has stopped, the ECM/PCM monitors the variation of the FTP sensor output to detect FTP sensor electrical noise failure, after keeping the canister vent opened for a specified time to stabilize the pressure inside the fuel tank.

- If the difference of pressure inside the fuel tank and an average value after a specified duration has exceeded a specified value for a specified duration, an FTP sensor electrical noise failure is detected.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	7 minutes or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time before starting the engine	6 hours	-
Initial condition A(1)	-	36 °F (20 °C)
Initial condition B(2)	-	18 °F (10 °C)
Initial engine coolant temperature	40 °F (5 °C)	95 °F (35 °C)
Initial intake air temperature	40 °F (5 °C)	95 °F (35 °C)
Barometric pressure	76 kPa (22.5 inHg, 569 mmHg)	-
Battery voltage	10.5 V	-
No active DTCs set (prevents monitor from	P0111, P0112, P0113, P0116, P0117, P0118, P0125, P0443, P0451, P0452, P0453, P0496, P0497, P0498, P0499, P0685, P0720, P0722, P1116, P1454,	

running)	P145C, P2227, P2228, P2229, P2422, P2610
Other	Avoid abrupt acceleration, deceleration, and turns
	Test-drive on a flat road to avoid misdetection
	No refueling is required
	Vehicle stopped
(1) The initial intake air temperature minus the current intake air temperature (2) The initial engine coolant temperature minus the initial intake air temperature	

MALFUNCTION THRESHOLD

- The misalignment of zero point pressure inside the fuel tank is 0.7 kPa (0.2 inHg, 5 mmHg) or more.
- The output from the FTP sensor is flickering 3.1 seconds or more.

CONFIRMATION PROCEDURE

With the Driving Pattern

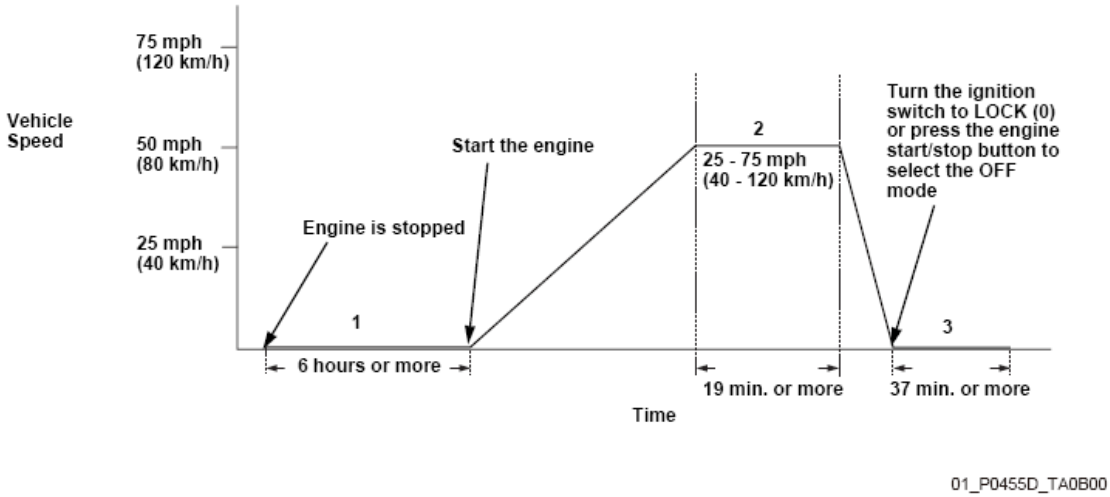

Fig. 260: Vehicle Speed Driving Pattern

1. After the vehicle has been left for an appropriate amount of time as specified, with the engine coolant temperature and intake air temperature within the specified range, start the engine.
2. Drive the vehicle immediately at a speed between 25 - 75 mph (40 - 120 km/h) for at least 19 minutes.
3. After stopping the vehicle, turn the ignition switch to LOCK (0) or press the engine start/stop button to select the OFF mode, and leave the vehicle in this condition for at least 37 minutes (EONV executes).
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P145C: EVAPORATIVE EMISSION (EVAP) SYSTEM PURGE FLOW MALFUNCTION

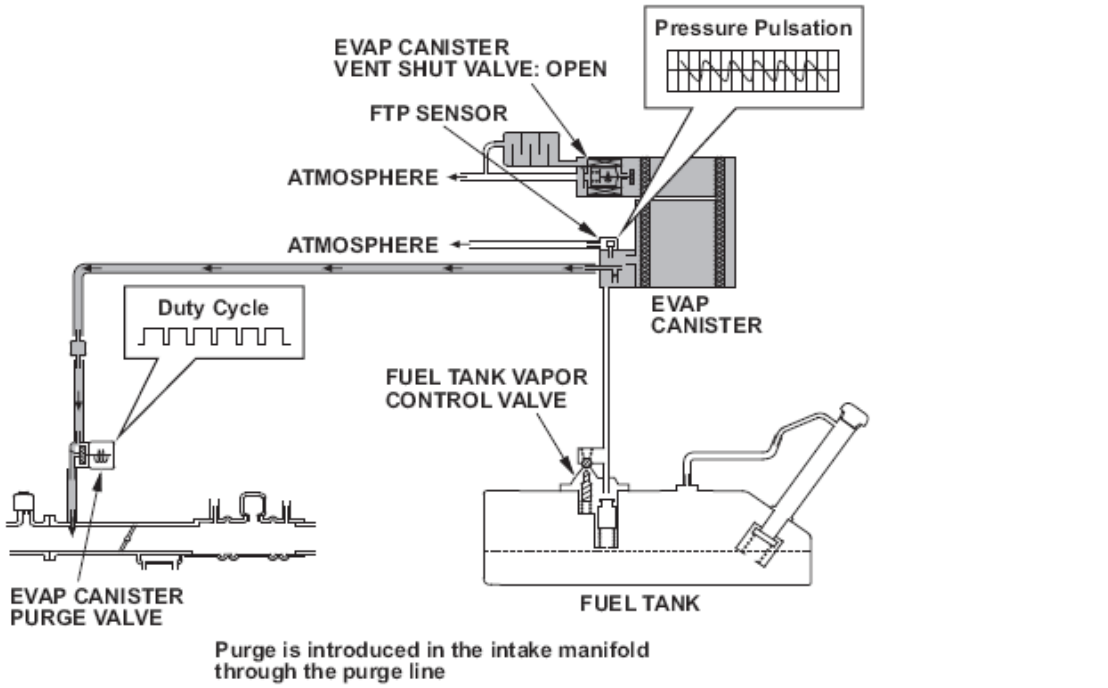

Fig. 261: Evaporative Emission - System Diagram

GENERAL DESCRIPTION

The fuel vapor in the fuel tank is temporarily stored in the evaporative emission (EVAP) canister and drawn into the engine through the EVAP canister purge valve. The engine control module (ECM)/powertrain control module (PCM) controls the amount of vapor introduced into the engine by varying the duty cycle of the EVAP canister purge valve according to the condition of the engine.

< STEP 1 >

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve duty cycle is transmitted to the fuel tank pressure (FTP) sensor during purge flow (pulse method).

OK determination: Pulse exists (P145C OK)

- P0497 Purge flow OK
- P0496 EVAP canister purge valve stuck Open OK

NG determination: No pulse (P145C NG)

- Either purge flow P0497 abnormality or P0496 EVAP canister purge valve OPEN failure.
- In this case, classify the failed part according to < STEP 2 >.

< STEP 2 >

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve is stuck OPEN:

When the FTP sensor fluctuates from negative pressure to atmospheric pressure after the ignition switch is turned to LOCK (0) or the engine start/stop button is pressed to select the OFF mode: P0496 EVAP canister purge valve stuck OPEN When there is no fluctuation of the FTP sensor: P0497 purge flow NG

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	19 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine coolant temperature before EVAP purge control starts	140 °F (60 °C)	-
MAP value	-	54 kPa (16.1 inHg, 410 mmHg)
Battery voltage	10.5 V	-
EVAP canister purge valve duty	30 %	80 %
Fuel trim	0.73	1.47
Fuel feedback	Closed loop at stoichiometric	
No active DTCs	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0134, P0135, P0154, P0155, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0351, P0352,	

set (prevents monitor from running)	P0353, P0354, P0355, P0356, P0443, P0451, P0452, P0453, P0496, P0498, P0499, P1128, P1129, P1172, P1174, P1454, P2195, P2197, P2227, P2228, P2229, P2237, P2238, P2240, P2241, P2243, P2245, P2247, P2249, P2251, P2252, P2254, P2255, P2279, P2422

MALFUNCTION THRESHOLD

The pulses detected by the FTP sensor are 30 % or less for at least 19 seconds.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Let the engine idle for at least 64 seconds.
3. Turn the ignition switch to LOCK (0) or press the engine start/stop button to select the OFF mode for at least 10 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1549: CHARGING SYSTEM HIGH VOLTAGE

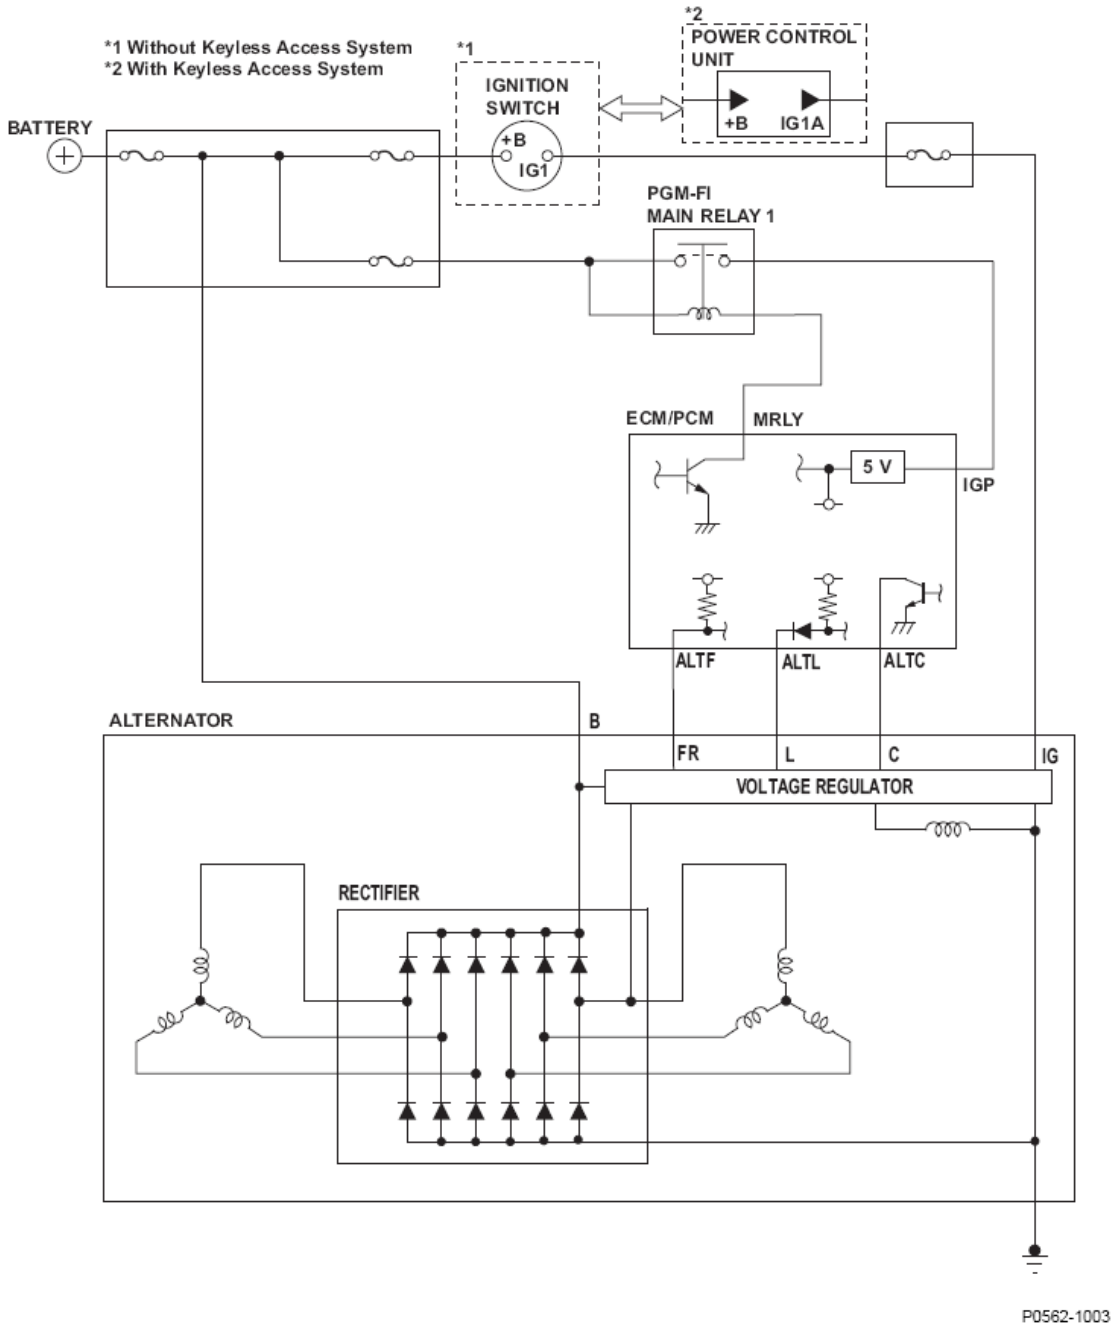

Fig. 262: Charging System - Circuit Diagram

GENERAL DESCRIPTION

The alternator is driven by the engine, and it generates electricity to supply power to the electrical system and to charge the battery. The alternator voltage target values of 14.5 V and 12.5 V are achieved by switching the alternator control mode (controlled by the engine control module (ECM)/powertrain control module (PCM)). The alternator output signal is sent to the ECM/PCM, and it varies according to the battery's state of charge, the electrical load, and the engine speed. When the IGP terminal voltage is a set value for a set time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	60 seconds or more
DTC Type	One drive cycle, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	500 rpm	-

MALFUNCTION THRESHOLD

The IGP terminal voltage is 16.0 V or more for at least 60 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1658: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY ON MALFUNCTION

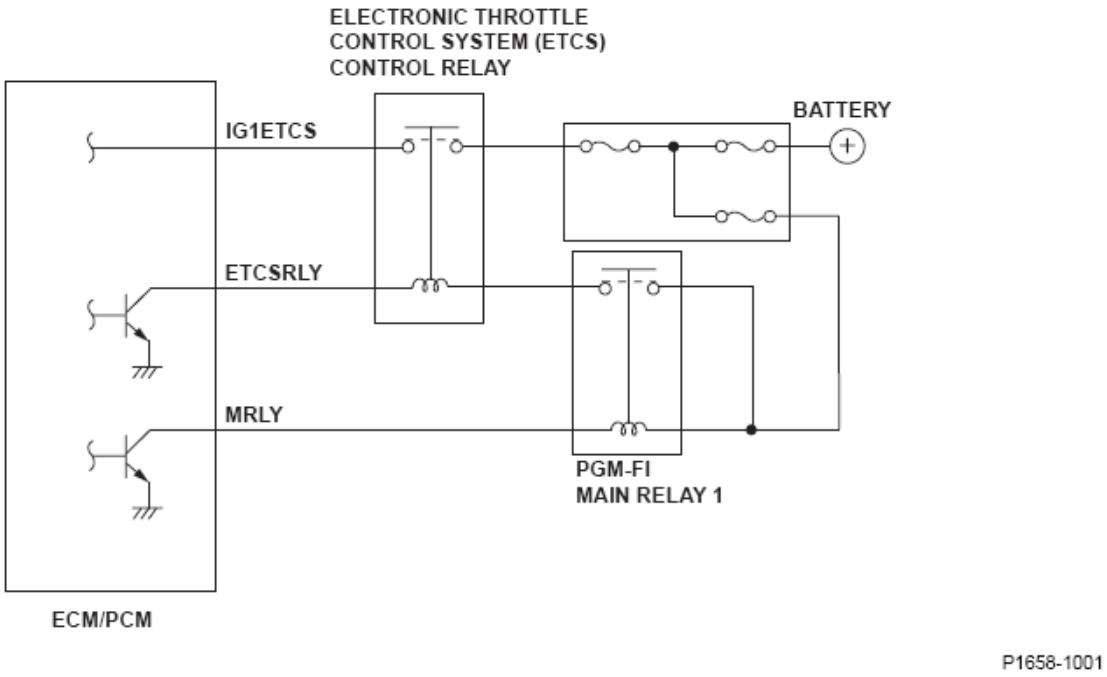

Fig. 263: Electronic Throttle Control System Control Relay - Circuit Diagram

GENERAL DESCRIPTION

The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the ECM/PCM to compute the target position. The ECM/PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensors A and B (installed in the throttle body). When the voltage is applied from the ETCS control relay to the IG1ETCS terminal for a set time after the ETCS control relay is turned off, the ECM/PCM detects a malfunction in the ETCS control relay power switch and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	

Ignition switch(1)	LOCK (0)
Engine start/stop button(2)	OFF mode
No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P1659, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

The communication signal is input from the ECM/PCM for at least 2.0 seconds after the ETCS control relay is turned off.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1659: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY OFF MALFUNCTION

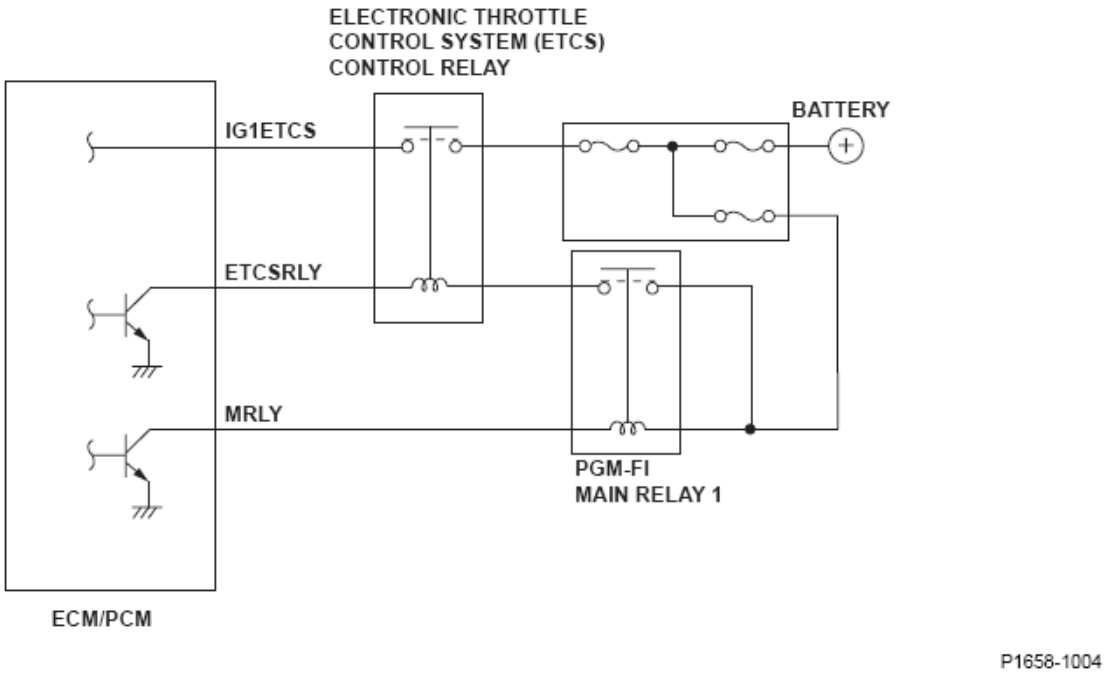

Fig. 264: Electronic Throttle Control System Control Relay - Circuit Diagram

GENERAL DESCRIPTION

The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the ECM/PCM to compute the target position. The ECM/PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensors A and B (installed in the throttle body). When the voltage from the ETCS control relay is not input for a set time after the ETCS control relay is turned on when the ignition switch is turned to ON (II), or when voltage is not applied for a set time when the throttle actuator is operating, the ECM/PCM detects a malfunction in the ETCS control relay power switch and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	10 V	-
Ignition switch(1)	ON (II)	
Engine start/stop button(2)	ON mode	
No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176	
(1) Without keyless access system (2) With keyless access system		

MALFUNCTION THRESHOLD

The voltage is not applied from the ETCS control relay for at least 200 milliseconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1683: THROTTLE VALVE DEFAULT POSITION SPRING PERFORMANCE PROBLEM

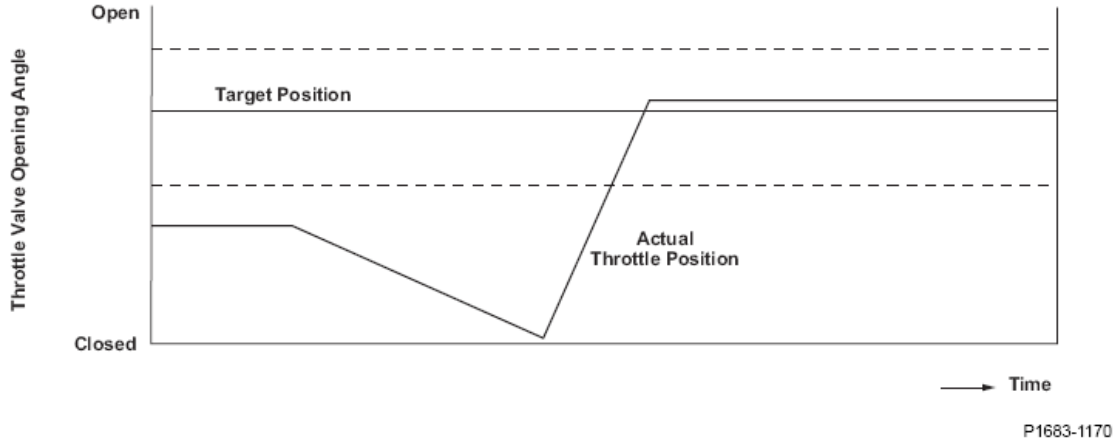

Fig. 265: Throttle Valve Default Position Spring Characteristics Curve

GENERAL DESCRIPTION

The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM). The throttle valve default position spring is attached to the throttle valve gear. It opens the throttle valve to improve starting performance in cold conditions, or to retain minimum running performance in case of an electronic throttle control system failure. To confirm that the throttle valve is operating normally, and if the detecting condition meets, the throttle valve moves to a fully closed position and opens to the target position by the throttle valve default position spring. If the throttle valve does not move to the target position range, the ECM/PCM detects a throttle valve default position spring malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	2.5 seconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine coolant temperature	158 °F (70 °C)	-
Battery voltage	6.0 V	-
Ignition switch(1)	LOCK (0)	
Engine start/stop button(2)	OFF mode	
No active DTCs set (prevents monitor from running)	P0117, P0118, P0122, P0123, P0222, P0223, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176	

(1) Without keyless access system

(2) With keyless access system

MALFUNCTION THRESHOLD

The throttle valve position is more than +5 ° from the fully closed position, or less than +3 ° from the fully closed position, for at least 2.5 seconds.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Turn the ignition switch to LOCK (0) or press the engine start/stop button to select the OFF mode, and wait 10 seconds.
3. Turn the ignition switch to ON (II) or press the engine start/stop button to select the ON mode.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1684: THROTTLE VALVE RETURN SPRING PERFORMANCE PROBLEM

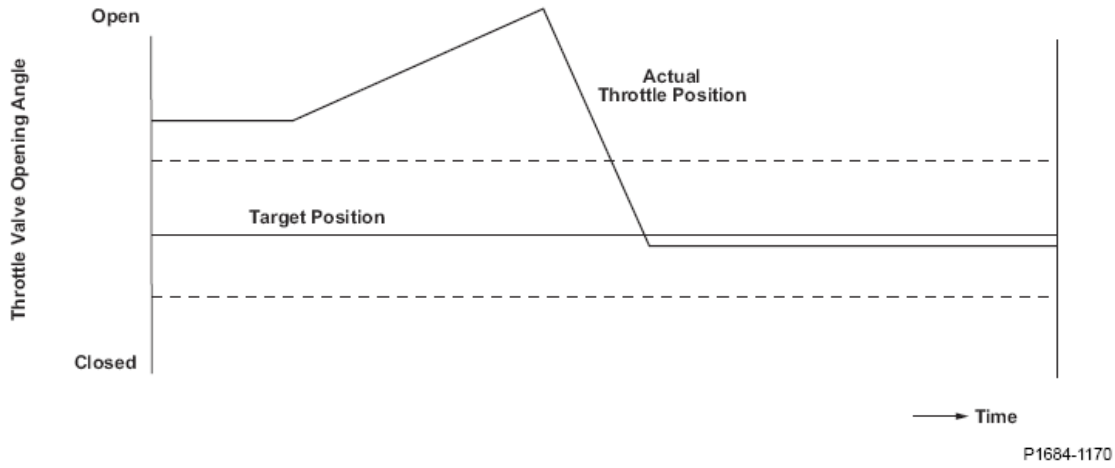

Fig. 266: Throttle Valve Return Spring Characteristics Curve

GENERAL DESCRIPTION

The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM). The throttle valve return spring is attached to the throttle valve gear to return the throttle valve to the default position. To confirm that the throttle valve is operating normally, and if the detecting condition meets, the throttle valve moves to a specified position and closes to the target position by the throttle valve return spring. If the throttle valve does not move to the target position range, the ECM/PCM detects a throttle valve return spring and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None

Duration	2.5 seconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine coolant temperature	158 °F (70 °C)	-
Battery voltage	6.0 V	-
Ignition switch(1)	LOCK (0)	
Engine start/stop button(2)	OFF mode	
No active DTCs set (prevents monitor from running)	P0117, P0118, P0122, P0123, P0222, P0223, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176	
(1) Without keyless access system (2) With keyless access system		

MALFUNCTION THRESHOLD

The throttle valve opening angle is 17 ° or more, or 11 ° or less, for at least 2.5 seconds.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Turn the ignition switch to LOCK (0) or press the engine start/stop button to select the OFF mode, and wait 10 seconds.
3. Turn the ignition switch to ON (II) or press the engine start/stop button to select the ON mode.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P16BB: ALTERNATOR B TERMINAL CIRCUIT LOW VOLTAGE

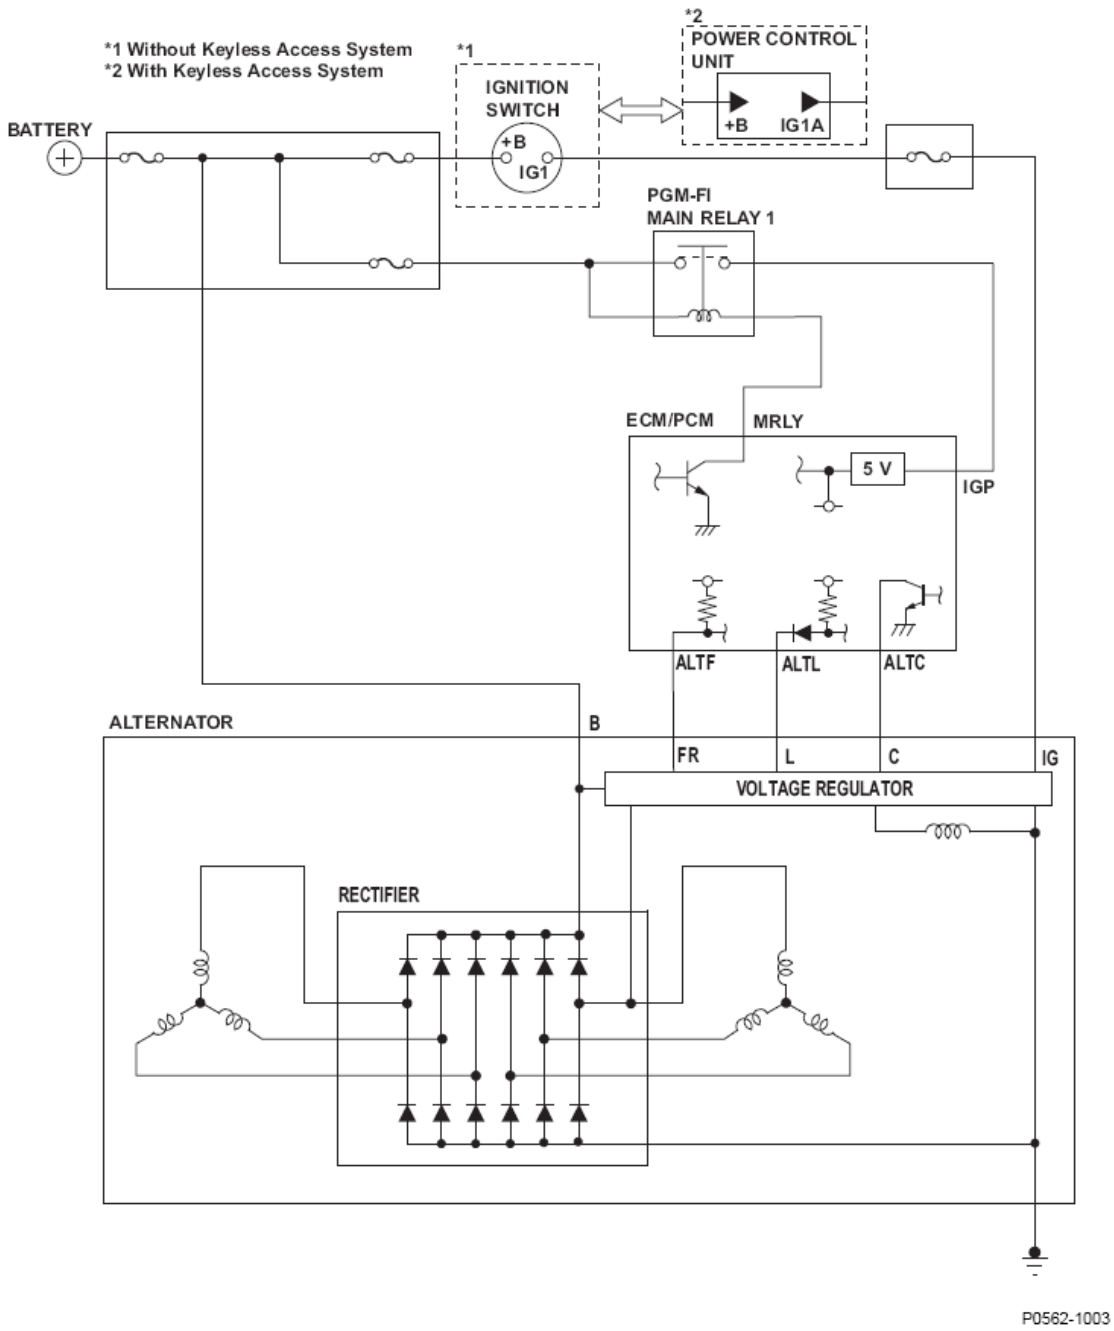

Fig. 267: Charging System - Circuit Diagram

GENERAL DESCRIPTION

The alternator is driven by the engine, and it generates electricity to supply power to the electrical system and to charge the battery. The alternator voltage target values of 14.5 V and 12.5 V are achieved by switching the alternator control mode (controlled by the engine control module (ECM)/powertrain control module (PCM)). The alternator output signal is sent to the ECM/PCM, and it varies according to the battery's state of charge, the electrical load, and the engine speed. When the engine speed is a specified value, the IGP terminal voltage is below a set value when the alternator is in the 14.5 V mode, and the alternator power generation amount is a set

range for a set time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	60 seconds or more
DTC Type	One drive cycle, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	500 rpm	3,000 rpm
Alternator control mode	14.5 V mode	

MALFUNCTION THRESHOLD

The IGP terminal voltage is 12.0 V or less, and the alternator power generation amount is within 1.0 % to 50.0 %, for at least 60 seconds.

DRIVING PATTERN

1. Start the engine.
2. Maintain an engine speed of 500 rpm to 3,000 rpm.
3. Turn on the headlights (high beam) and rear window defogger.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P16BC: ALTERNATOR FR TERMINAL CIRCUIT/IGP CIRCUIT LOW VOLTAGE

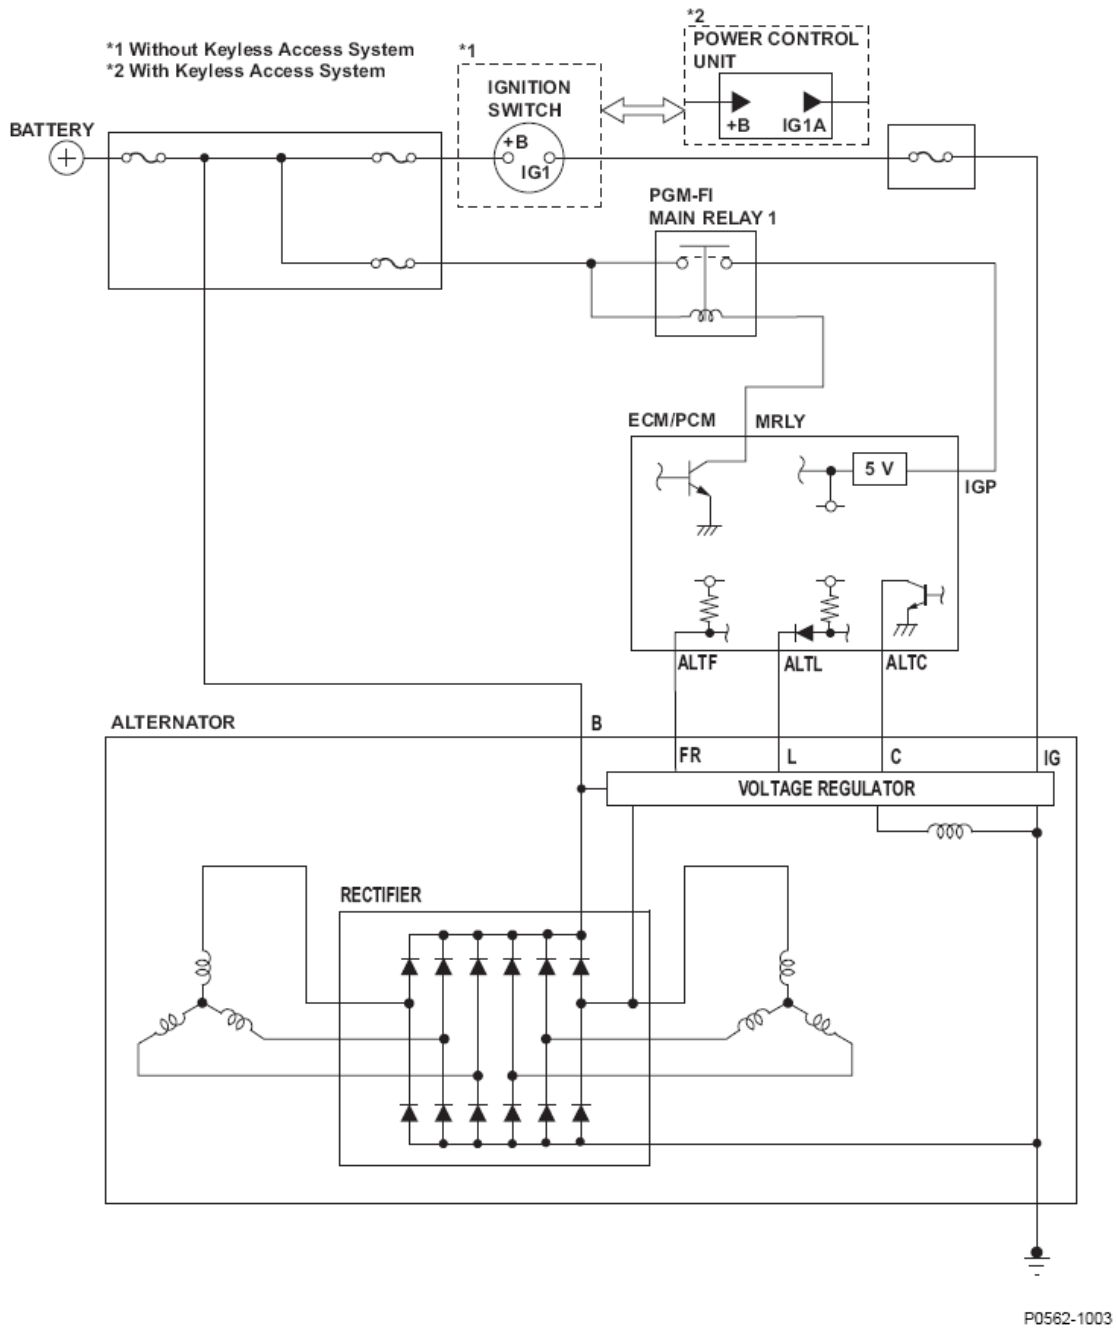

Fig. 268: Charging System - Circuit Diagram

GENERAL DESCRIPTION

The alternator is driven by the engine, and it generates electricity to supply power to the electrical system and to charge the battery. The alternator voltage target values of 14.5 V and 12.5 V are achieved by switching the alternator control mode (controlled by the engine control module (ECM)/powertrain control module (PCM)). The alternator output signal is sent to the ECM/PCM, and it varies according to the battery's state of charge, the electrical load, and the engine speed. When the engine speed is a specified value, the IGP terminal voltage is below a set value when the alternator is in the 14.5 V mode, and the alternator power generation amount is a set

range for a set time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	60 seconds or more
DTC Type	One drive cycle, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	500 rpm	3,000 rpm
Alternator control mode	14.5 V mode	

MALFUNCTION THRESHOLD

The IGP terminal voltage is 12.0 V or less, and the alternator power generation amount is 0.5 % or less, for at least 60 seconds.

DRIVING PATTERN

1. Start the engine.
2. Maintain an engine speed of 500 rpm to 3,000 rpm.
3. Turn on the headlights (high beam) and rear window defogger.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P16BD: STARTER CUT RELAY 2 MALFUNCTION

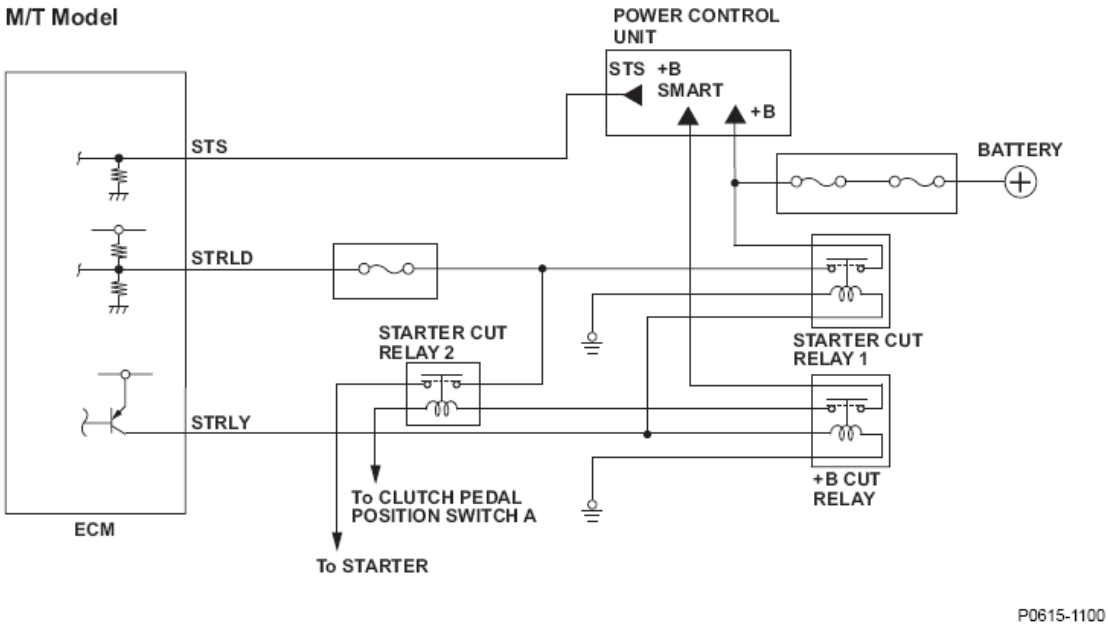

Fig. 269: Starter Cut Relay - Circuit Diagram (M/T Model)

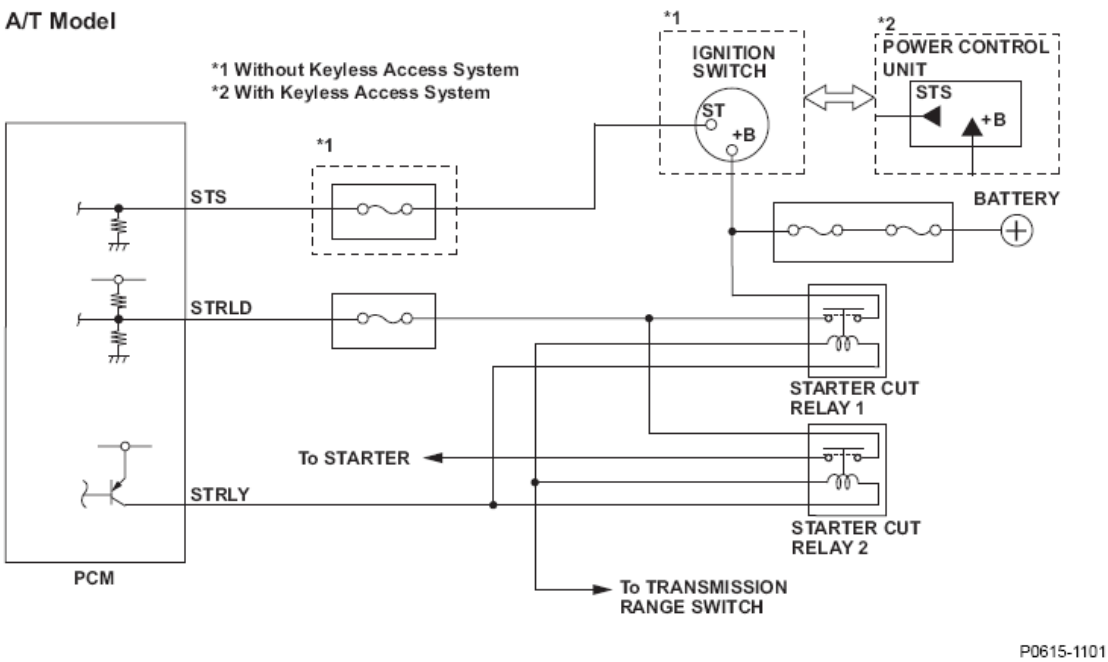

Fig. 270: Starter Cut Relay - Circuit Diagram (A/T Model)

GENERAL DESCRIPTION

To prevent the starter from continuing to run due to a switching failure of the starter cut relay, two starter cut relays are connected in series. When the input voltage of the STRLD terminal drops to a set voltage even when the starter cut relay output (STRLY) is turned off, the engine control module (ECM)/powertrain control module (PCM) detects a malfunction of starter cut relay 2 and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
State of the engine	Running
Starter	Off
No active DTCs set (prevents monitor from running)	P0615, P16BE, P16E1(1)
(1) M/T model	

MALFUNCTION THRESHOLD

The STRLD terminal voltage is 2.2 V or less for at least 5 seconds when the starter cut relay output is turned off.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P16BE: STARTER CUT RELAY 1 MALFUNCTION

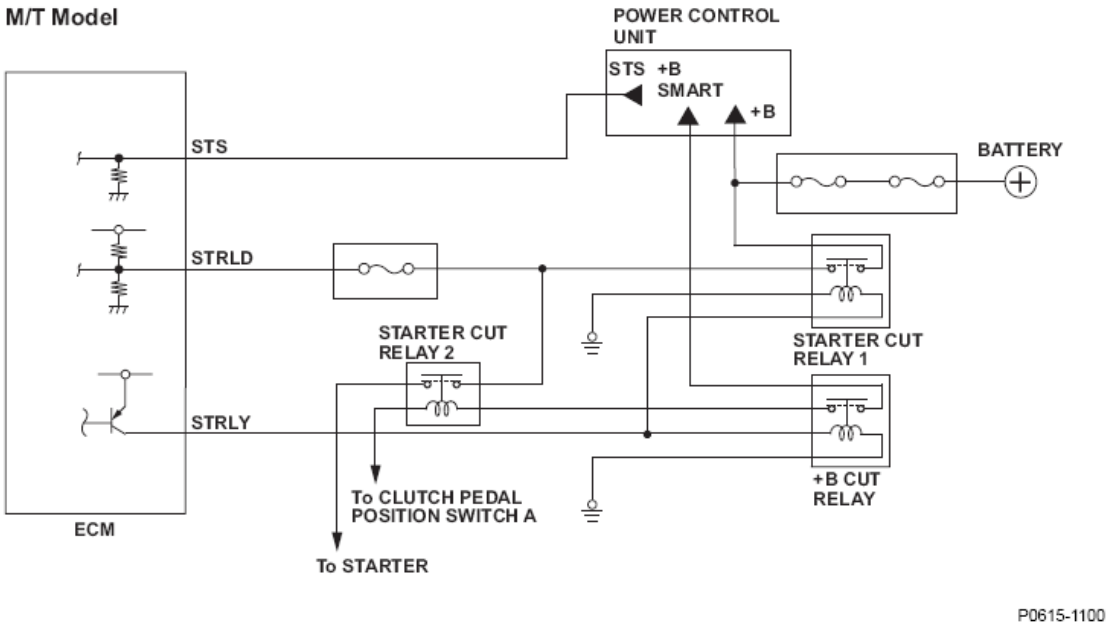

Fig. 271: Starter Cut Relay - Circuit Diagram (M/T Model)

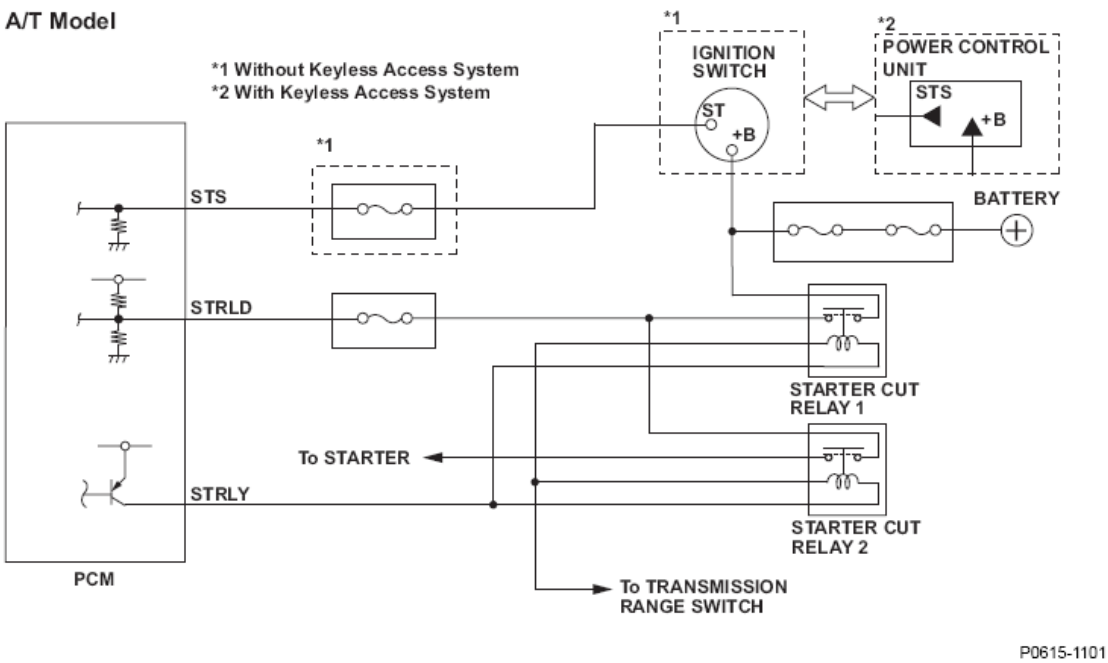

Fig. 272: Starter Cut Relay - Circuit Diagram (A/T Model)

GENERAL DESCRIPTION

To prevent the starter from continuing to run due to a switching failure of the starter cut relay, two starter cut relays are connected in series. When the input voltage of the STRLD terminal exceeds a set voltage even when the starter cut relay output (STRLY) is turned off, the engine control module (ECM)/powertrain control module (PCM) detects a starter cut relay 1 turn on switching failure and stores a DTC. When the starter is turned on, but the STRLD terminal input voltage does not exceed the upper or lower limits, a simultaneous failure of both

starter cut relays or the STRLD open circuit is detected.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5 seconds or more(1), 0.8 second or more(2)
DTC Type	One drive cycle, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)
(1) Starter cut relay turn on switching failure (2) STRLD open circuit failure	

ENABLE CONDITIONS

Condition	
State of the engine	Running
Starter	Off*, on**
No active DTCs set (prevents monitor from running)	P0615, P16BD, P16E1(1)
(1) M/T model	

MALFUNCTION THRESHOLD

One of these conditions occurs:

- The terminal voltage of the STRLD exceeds 3.0 V for at least 5 seconds when the starter cut relay output is turned off.
- The terminal voltage of the STRLD is between 2.4 V to 2.6 V for at least 0.8 second when the starter cut relay output is turned on.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P16BF: STARTER CUT RELAY STRLY CIRCUIT MALFUNCTION

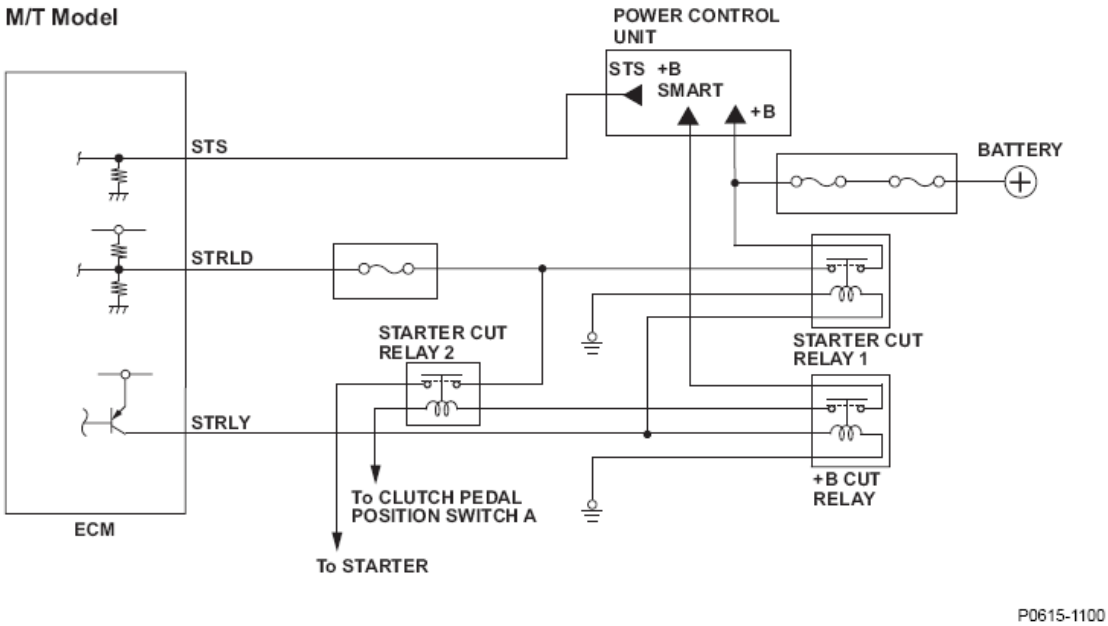

Fig. 273: Starter Cut Relay - Circuit Diagram (M/T Model)

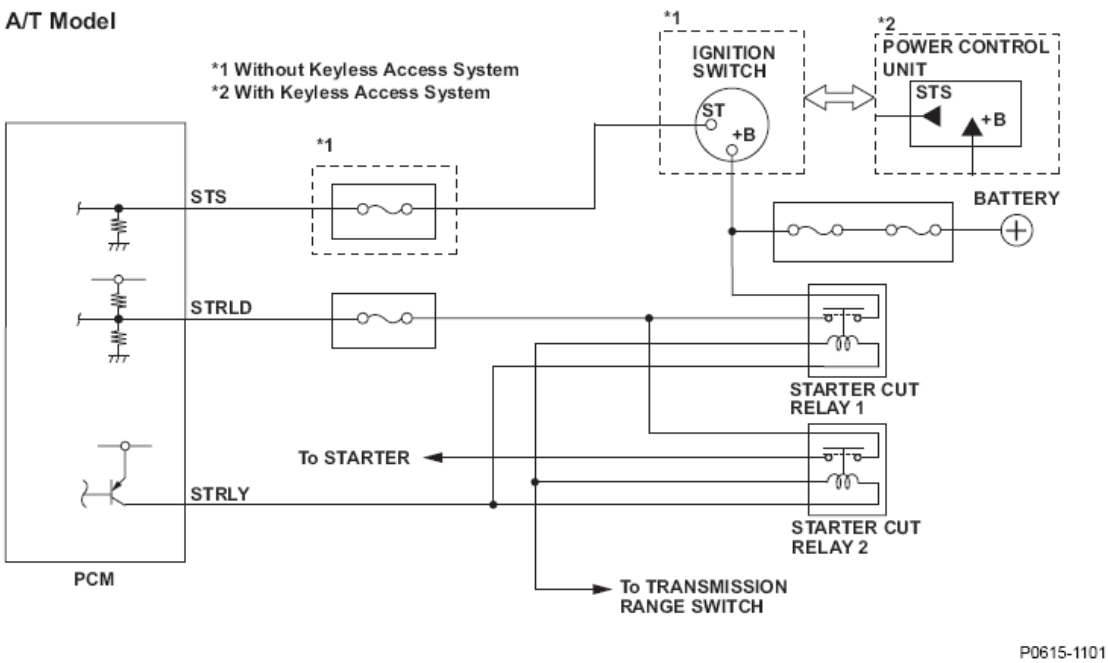

Fig. 274: Starter Cut Relay - Circuit Diagram (A/T Model)

GENERAL DESCRIPTION

The engine control module (ECM)/powertrain control module (PCM) compares the ON command signal to the starter with the return signal from the starter cut relay. When the signals do not coincide for a set time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

The ON command signal from the ECM/PCM to the starter and the return signal from the starter cut relay do not coincide for at least 5 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P16E1: +B CUT RELAY CIRCUIT MALFUNCTION

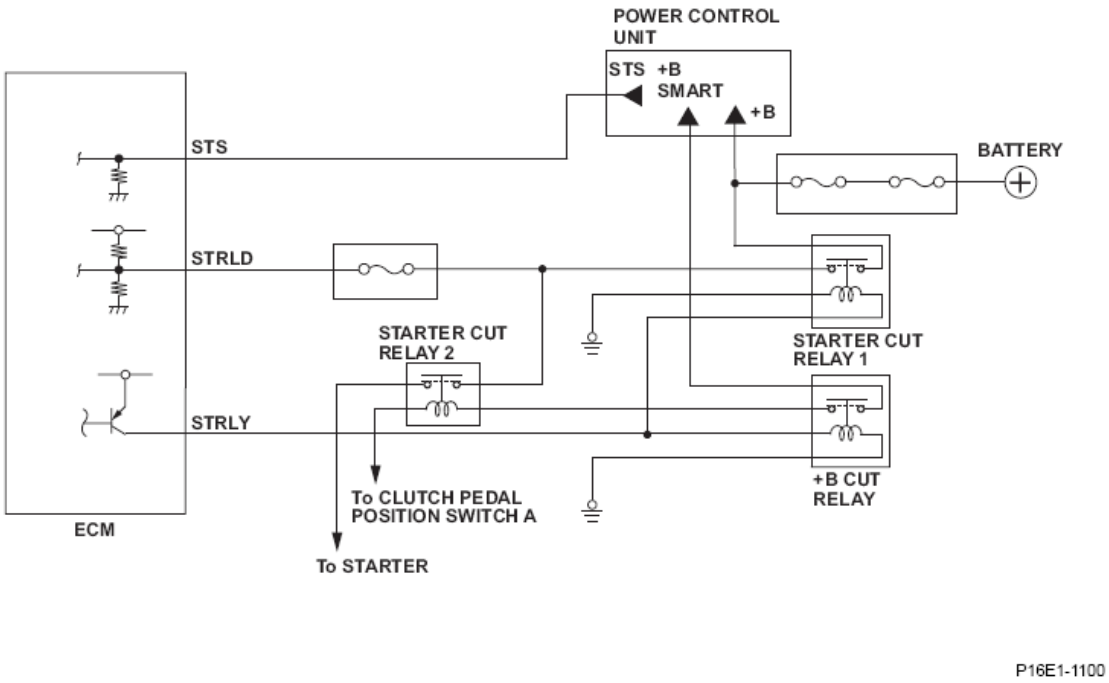

Fig. 275: +B Cut Relay - Circuit Diagram

GENERAL DESCRIPTION

To prevent the starter from continuing to run due to a clutch pedal position switch failure, two starter cut relays are connected in series with an additional cut relay connected to the STRLY terminal. When the STRLD input voltage is a specified value for a set time, the engine control module (ECM) detects a +B cut relay circuit malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
State of the engine	Running
Starter	Off
Clutch pedal	Pressed
No active DTCs set (prevents monitor from running)	P0615, P16BD

MALFUNCTION THRESHOLD

The STRLY terminal voltage is 1.74 V or less for at least 2.0 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P1717: OPEN IN TRANSMISSION RANGE SWITCH ATPRVS SWITCH CIRCUIT

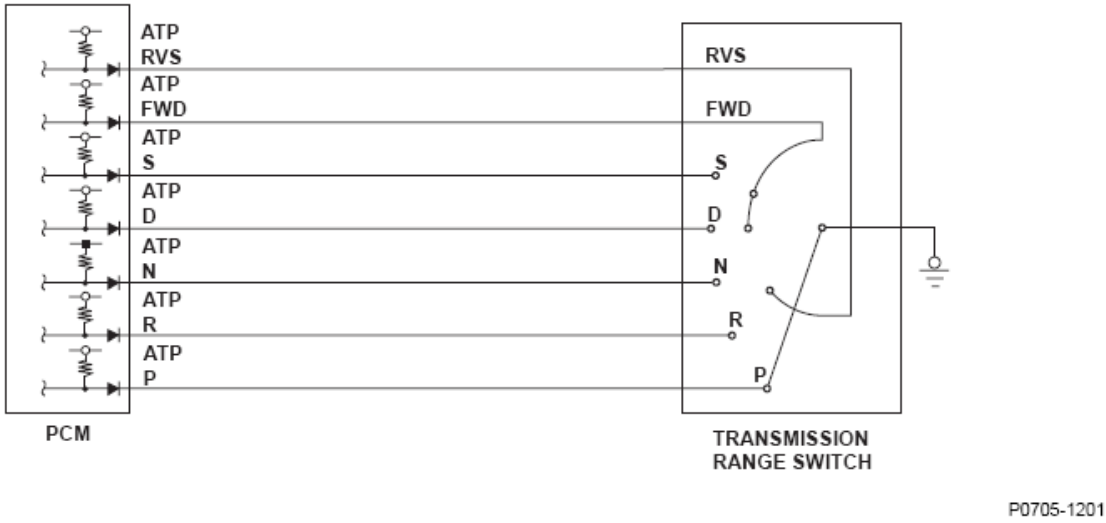

Fig. 276: Transmission Range Switch - Circuit Diagram

TRANSMISSION RANGE SWITCH CONTACT POINT INPUT MATRIX

Shift lever position	Input per switch						
	ATPP	ATPR	ATPN	ATPD	ATPS	ATP FWD	ATP RVS
P	o	X	X	X	X	X	X
R	X	o	X	X	X	X	o
N	X	X	o	X	X	X	X
D	X	X	X	o	X	o	X
S	X	X	X	X	o	o	X
o: Closed X: Open							

GENERAL DESCRIPTION

The transmission range switch is attached to a control shaft. Operating the shift lever makes the control shaft rotate via the shift cable. The A/T gear position indicator shows which position is selected according to the Low/High signal combinations, which vary based on the control shaft rotational angle. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is high (5 V or 12 V) at the powertrain control module (PCM) input terminal when each transmission range switch position is open, and it is low (0 V) when each switch is closed. If the RVS switch is open while driving the vehicle in R, the PCM detects an RVS switch open failure and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	500 rpm	-
Battery voltage	11 V	-
Shift lever position	R	
No active DTCs set (prevents monitor from running)	P0705, P0716, P0717, P0721, P0722, P0812	

MALFUNCTION THRESHOLD

The R position signal input is detected but the RVS position signal input is not detected.

DRIVING PATTERN

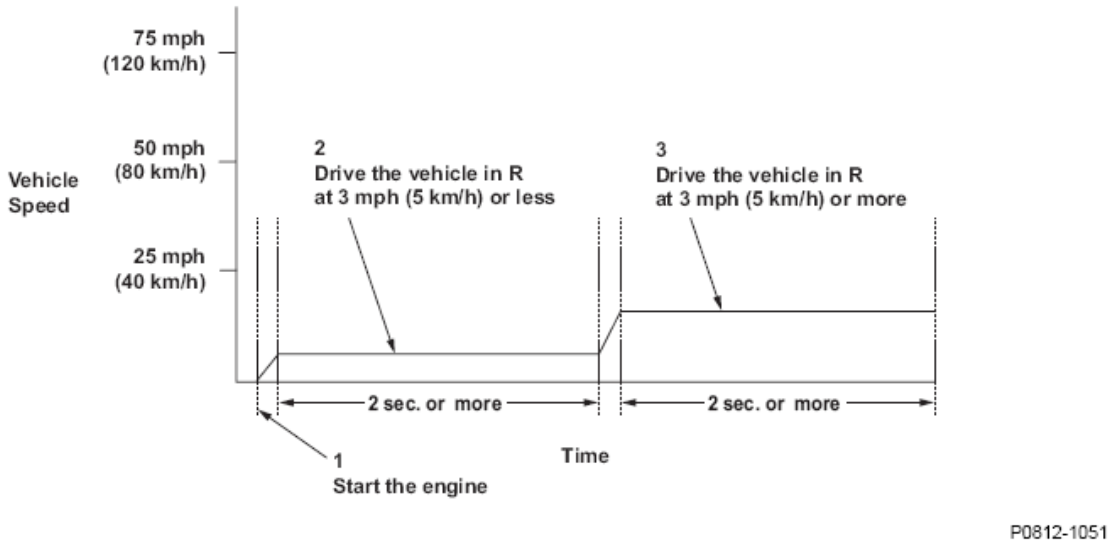

Fig. 277: Vehicle Speed Driving Pattern

1. Start the engine.
2. Drive the vehicle in R at 3 mph (5 km/h) or less for at least 2 seconds.
3. Drive the vehicle in R at 3 mph (5 km/h) or more for at least 2 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P177A: LINE PRESSURE SOLENOID VALVE A STUCK OFF, OR LINE PRESSURE SWITCH STUCK OFF

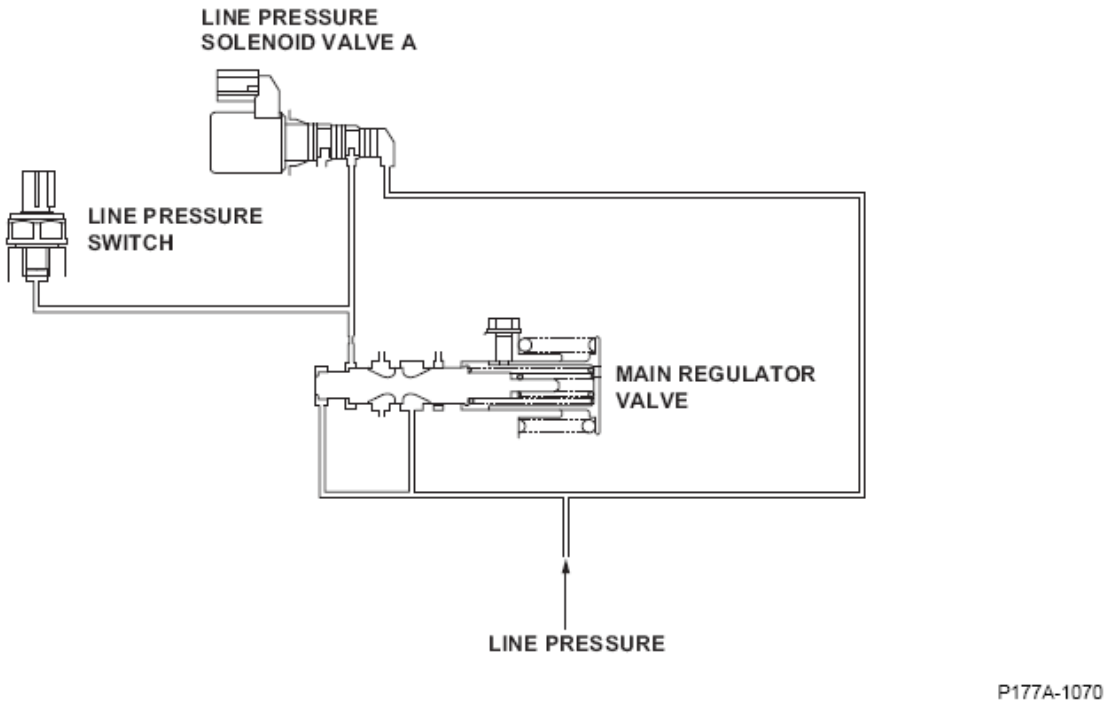

Fig. 278: Line Pressure Solenoid Valve A - System Diagram

LINE PRESSURE MODE COMBINATION TABLE

	Normal line pressure mode	Low line pressure mode
Line pressure solenoid valve A	OFF	ON
Line pressure switch	OFF	ON
Line pressure condition	Normal	Low

GENERAL DESCRIPTION

Line pressure solenoid valve A is installed on the transmission housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to regulate line pressure to low line pressure or normal line pressure. The line pressure switch is installed in the hydraulic pressure output circuit from line pressure solenoid valve A. When line pressure solenoid valve A outputs hydraulic pressure, the line pressure is regulated to low line pressure and the switch is turned on. When line pressure solenoid valve A does not output hydraulic pressure, the line pressure is at normal line pressure and the switch is turned off. The signal from the line pressure switch is input to the PCM. The PCM detects the hydraulic pressure supply condition from line pressure solenoid valve A to detects a malfunction in line pressure solenoid valve A. If the line pressure switch is off against the command to turn on line pressure solenoid valve A, the PCM detects a line pressure solenoid valve A stuck off or line pressure switch stuck off failure and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	4 seconds or more

DTC Type	Two drive cycles, MIL off, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P0716, P0717, P0718, P0721, P0722, P0723, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0797, P0842, P0843, P0847, P0848, P0872, P0873, P0877, P0878, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0989, P0990, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721	

MALFUNCTION THRESHOLD

The input signal from the line pressure switch to the PCM is high when the low line pressure mode is commanded.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D until the transmission shifts into 6th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2101: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) MALFUNCTION

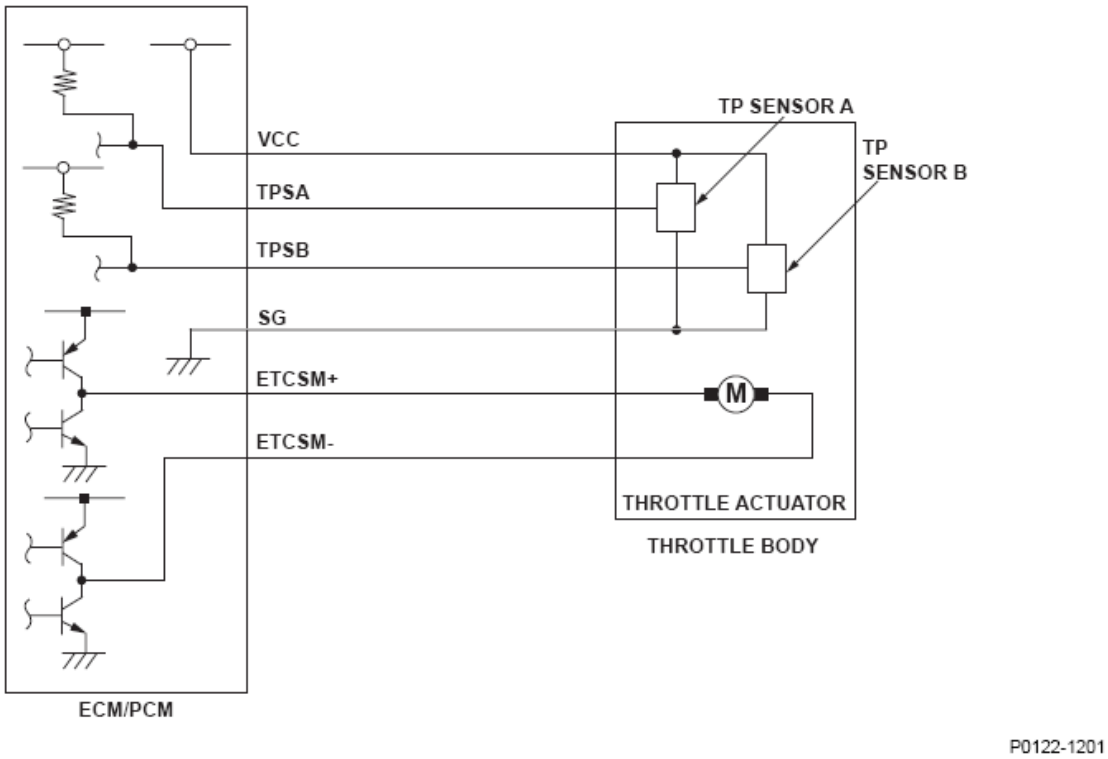

Fig. 279: Throttle Position Sensor - Circuit Diagram

GENERAL DESCRIPTION

The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the ECM/PCM to compute the target position. The ECM/PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A (installed in the throttle body). The ECM/PCM compares the throttle valve target opening angle and the actual throttle valve opening angle from TP sensor A, and when the difference exceeds the specification, the ECM/PCM detects the malfunction of the electronic throttle control system and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	250 milliseconds or more(1), 500 milliseconds or more(2)
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)
(1) Throttle valve closed direction	

(2) Throttle valve open direction

ENABLE CONDITIONS

90 °	6 ° or more

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2118: THROTTLE ACTUATOR CURRENT RANGE/PERFORMANCE PROBLEM

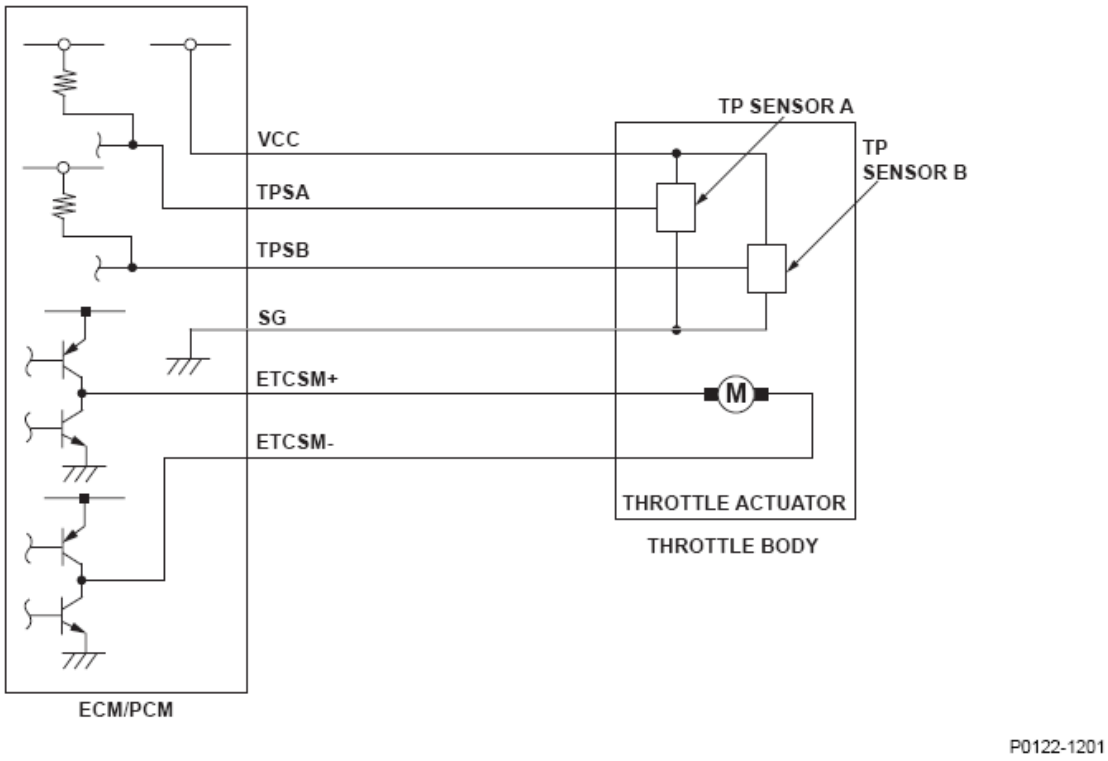

Fig. 280: Throttle Position Sensor - Circuit Diagram

GENERAL DESCRIPTION

The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the ECM/PCM to compute the target position. The ECM/PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A (installed in the throttle body). When the output current to the throttle valve actuator exceeds the specification for a set time, the ECM/PCM detects a malfunction of the throttle actuator system and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	6.0 V	-
Ignition switch(1)	ON (II)	
Engine start/stop button(2)	ON mode	
No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P2101, P2122, P2123, P2127, P2128, P2135, P2138, P2176	
(1) Without keyless access system (2) With keyless access system		

MALFUNCTION THRESHOLD

The current flow to the throttle actuator is 9.4 A or more for at least 200 milliseconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2122: ACCELERATOR PEDAL POSITION (APP) SENSOR A (THROTTLE POSITION (TP) SENSOR D) CIRCUIT LOW VOLTAGE

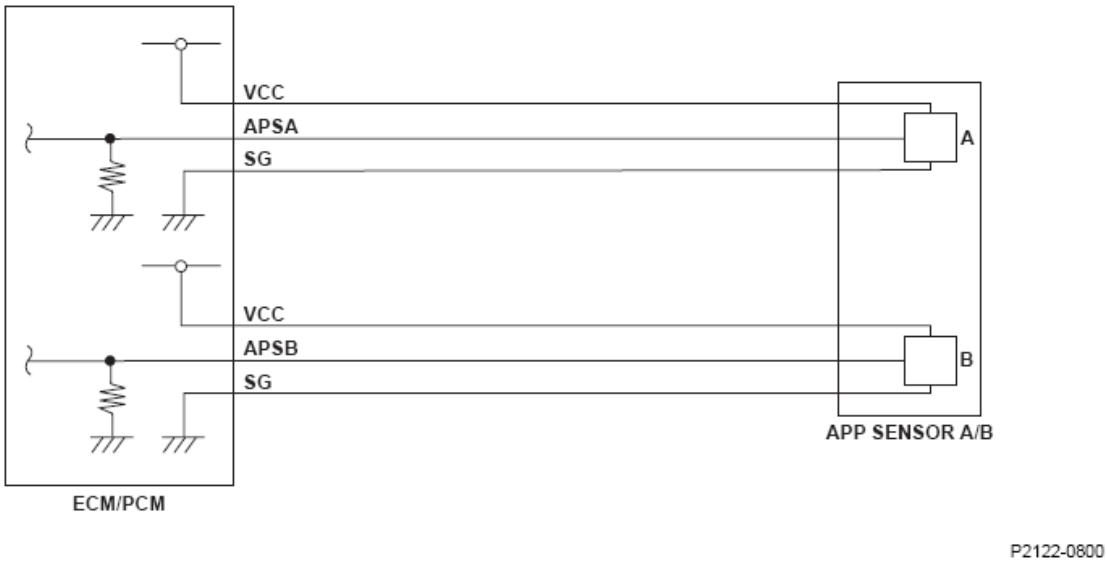

Fig. 281: Accelerator Pedal Position Sensor - Circuit Diagram

GENERAL DESCRIPTION

Accelerator pedal position (APP) sensor A is a part of the electronic throttle control system. It is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the engine control module (ECM)/powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor A is a set value, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
No active DTCs set (prevents monitor from running)	P2123
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

The APP sensor A output voltage is 0.2 V or less for at least 200 milliseconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2123: ACCELERATOR PEDAL POSITION (APP) SENSOR A (THROTTLE POSITION (TP) SENSOR D) CIRCUIT HIGH VOLTAGE

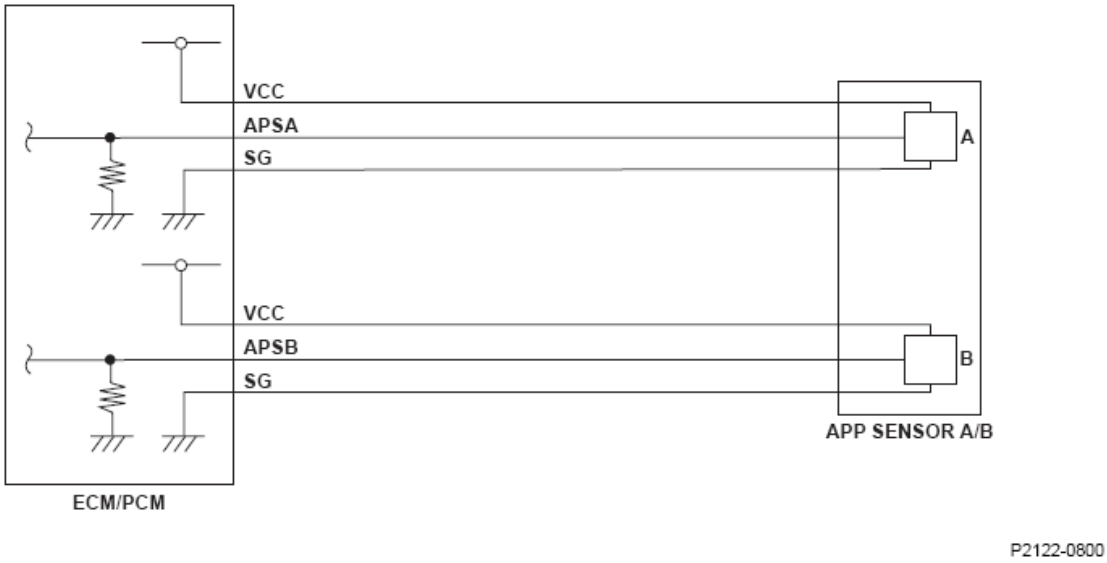

Fig. 282: Accelerator Pedal Position Sensor - Circuit Diagram

GENERAL DESCRIPTION

Accelerator pedal position (APP) sensor A is a part of the electronic throttle control system. It is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the engine control module (ECM)/powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor A is a set value, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
State of the engine	Running
No active DTCs set (prevents monitor from running)	P2122

MALFUNCTION THRESHOLD

The APP sensor A output voltage is 4.9 V or more for at least 200 milliseconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2127: ACCELERATOR PEDAL POSITION (APP) SENSOR B (THROTTLE POSITION (TP) SENSOR E) CIRCUIT LOW VOLTAGE

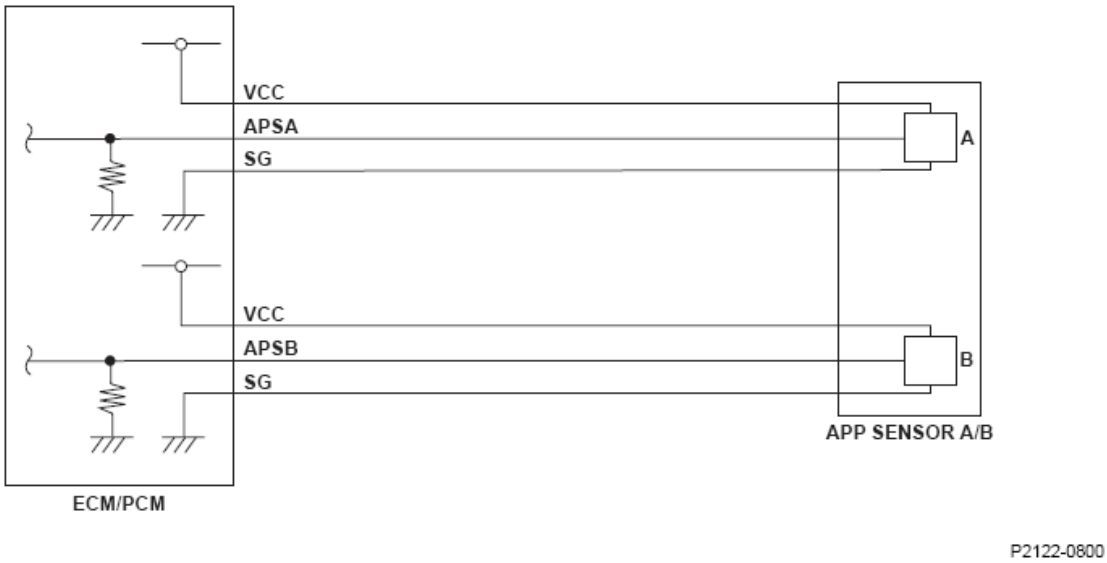

Fig. 283: Accelerator Pedal Position Sensor - Circuit Diagram

GENERAL DESCRIPTION

Accelerator pedal position (APP) sensor B is a part of the electronic throttle control system. It is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the engine control module (ECM)/powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor B is a set value, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
No active DTCs set (prevents monitor from running)	P2128
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

The APP sensor B output voltage is 0.2 V or less for at least 200 milliseconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2128: ACCELERATOR PEDAL POSITION (APP) SENSOR B (THROTTLE POSITION (TP) SENSOR E) CIRCUIT HIGH VOLTAGE

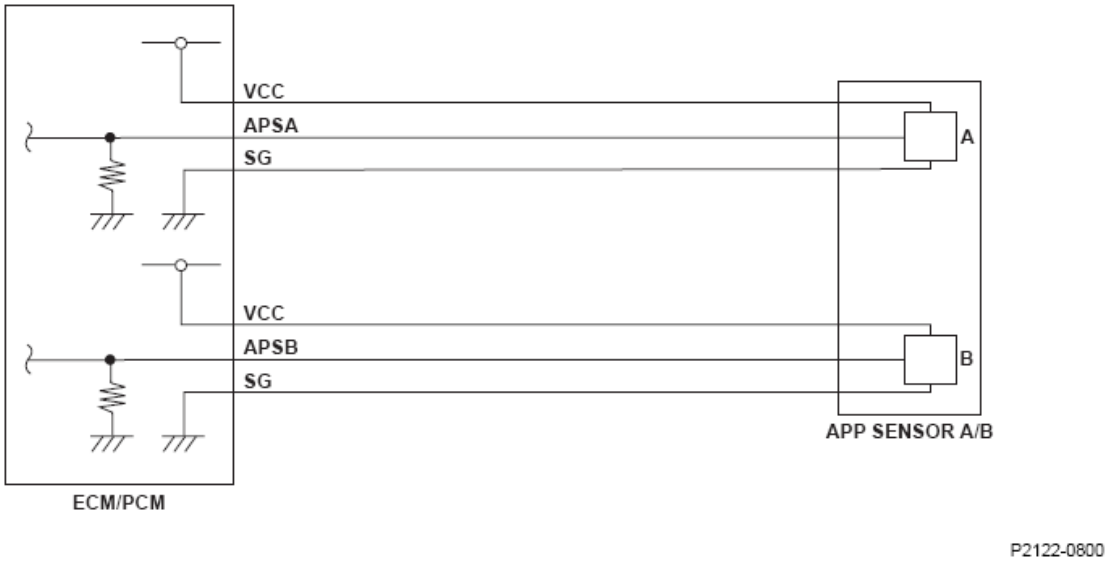

Fig. 284: Accelerator Pedal Position Sensor - Circuit Diagram

GENERAL DESCRIPTION

Accelerator pedal position (APP) sensor B is a part of the electronic throttle control system. It is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the engine control module (ECM)/powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor B is a set value, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
State of the engine	Running
No active DTCs set (prevents monitor from running)	P2127

MALFUNCTION THRESHOLD

The APP sensor B output voltage is 4.0 V or more for at least 200 milliseconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2128: ACCELERATOR PEDAL POSITION (APP) SENSOR B (THROTTLE POSITION (TP) SENSOR E) CIRCUIT HIGH VOLTAGE

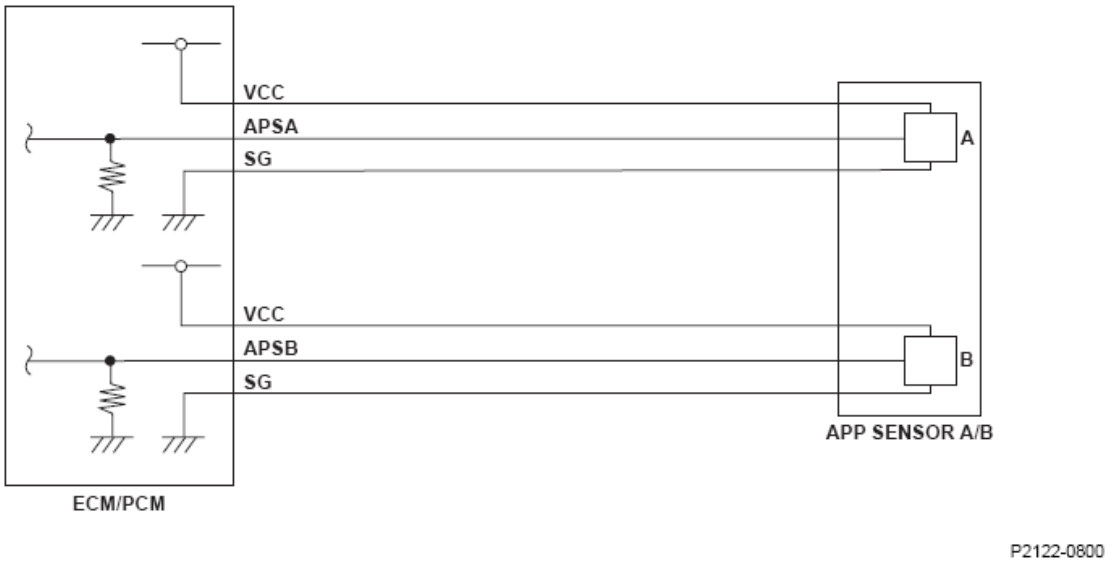

Fig. 285: Accelerator Pedal Position Sensor - Circuit Diagram

GENERAL DESCRIPTION

Accelerator pedal position (APP) sensor B is a part of the electronic throttle control system. It is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the engine control module (ECM)/powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor B is a set value, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
State of the engine	Running
No active DTCs set (prevents monitor from running)	P2127

MALFUNCTION THRESHOLD

The APP sensor B output voltage is 4.0 V or more for at least 200 milliseconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2135: THROTTLE POSITION (TP) SENSOR A/B INCORRECT VOLTAGE CORRELATION

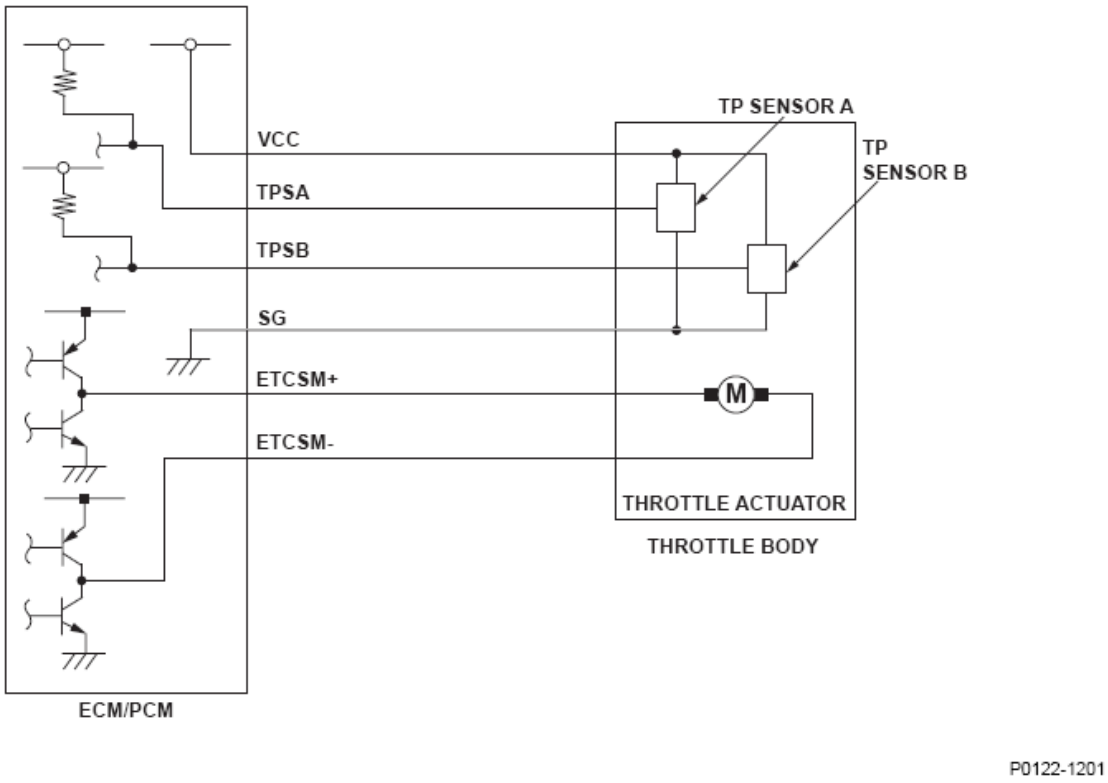

Fig. 286: Throttle Position Sensor - Circuit Diagram

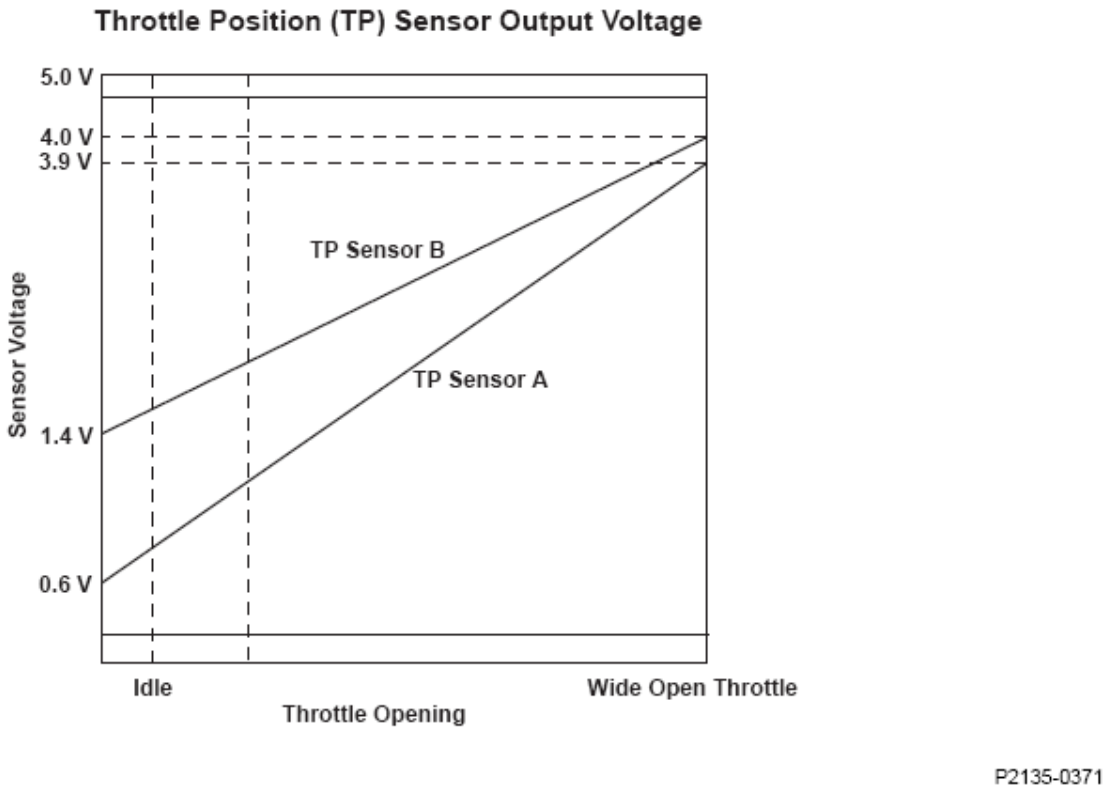

Fig. 287: Throttle Position Sensor Output Voltage Graph

GENERAL DESCRIPTION

The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the ECM/PCM to compute the target position. The ECM/PCM then operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A (installed in the throttle body). The ECM/PCM compares the voltages and the throttle valve positions of TP sensor A and TP sensor B. If the difference of the voltages or the throttle valve positions is a certain value for a set time, the ECM/PCM detects a malfunction in the relationship between TP sensor A and TP sensor B, and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
TP sensor B voltage	-	2.3 V
Ignition switch(1)	ON (II)	
Engine start/stop button(2)	ON mode	
No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P2101, P2118, P2122, P2123, P2127, P2128, P2138, P2176	
Other	After the throttle valve fully closed position registration is completed	
(1) Without keyless access system (2) With keyless access system		

MALFUNCTION THRESHOLD

The difference between the throttle valve positions that TP sensor A and TP sensor B determined exceeds the value shown in this table for at least 200 milliseconds.

Throttle valve position determined by TP sensor A	Difference between TP sensor A and TP sensor B
0 °	1.8 ° or more
83.3 °	14.7 ° or more

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2138: ACCELERATOR PEDAL POSITION (APP) SENSOR A/B (THROTTLE POSITION (TP) SENSOR D/E) INCORRECT VOLTAGE CORRELATION

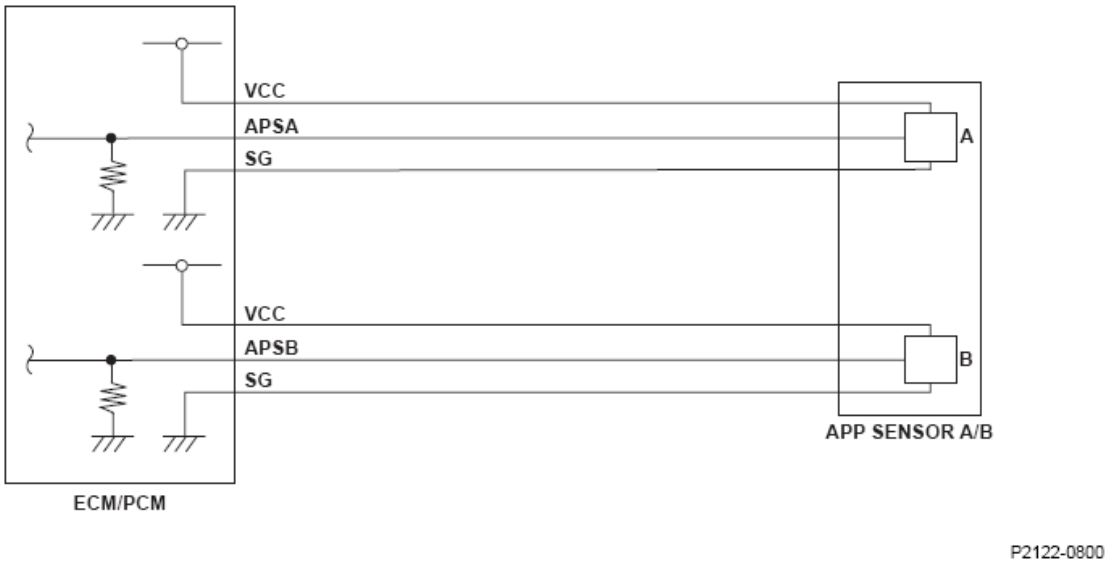

Fig. 288: Accelerator Pedal Position Sensor - Circuit Diagram

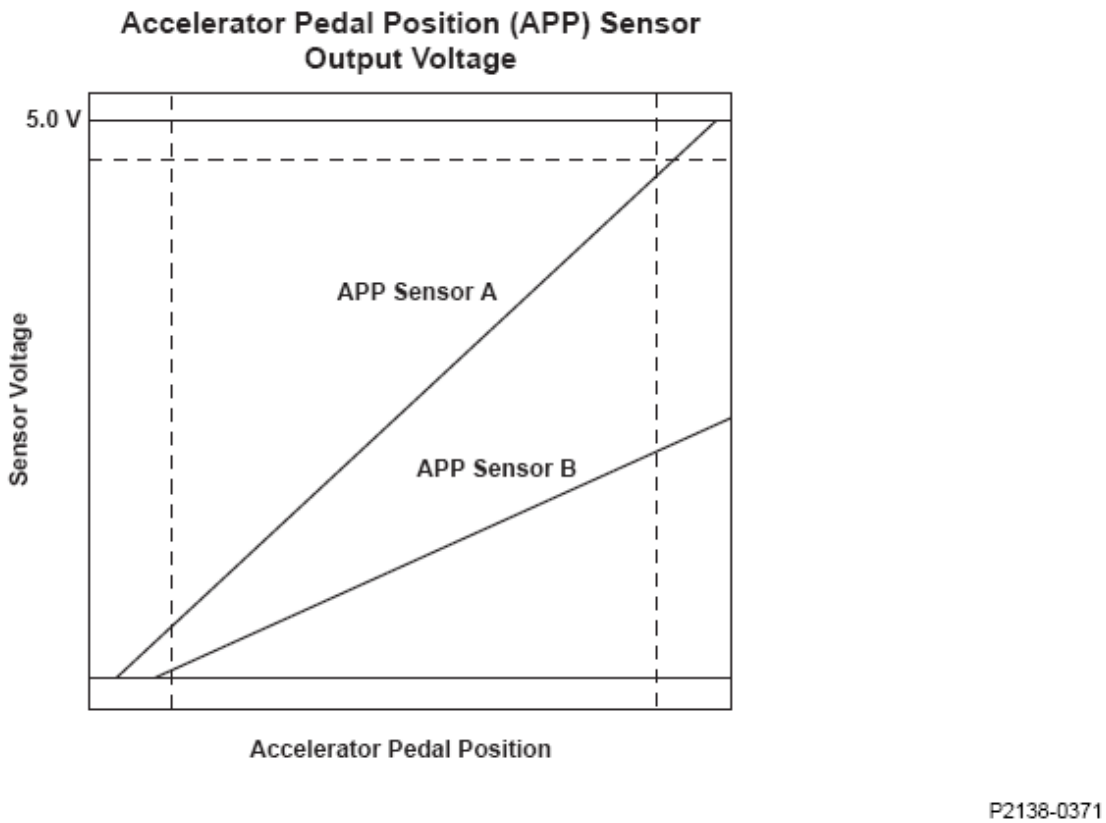

Fig. 289: Accelerator Pedal Position Sensor Output Voltage Graph

GENERAL DESCRIPTION

Accelerator pedal position (APP) sensor A and accelerator pedal position (APP) sensor B are potentiometers. They are installed on the accelerator pedal. When the accelerator pedal is pressed, APP sensors A and B detect

the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in APP sensors A and B and transmitted to the engine control module (ECM)/powertrain control module (PCM) to compute the target position. APP sensor A is the primary control, and APP sensor B is a back-up of APP sensor A in case it malfunctions. Both sensors compare their output voltage to each other for malfunction detection. When the voltage difference of APP sensor B is out of a fixed range for a set time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	300 milliseconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
No active DTCs set (prevents monitor from running)	P2122, P2123, P2127, P2128
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

One of these conditions is met for at least 300 milliseconds:

- The APP sensor B voltage exceeds the range from 0 V or less to 0.37 V or more when the APP sensor A voltage is 0.37 V.
- The APP sensor B voltage exceeds the range from 2.31 V or less to 2.69 V or more when the APP sensor A voltage is 5.0 V.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear

command or by disconnecting the battery.

DTC P2176: THROTTLE ACTUATOR CONTROL SYSTEM IDLE POSITION NOT LEARNED

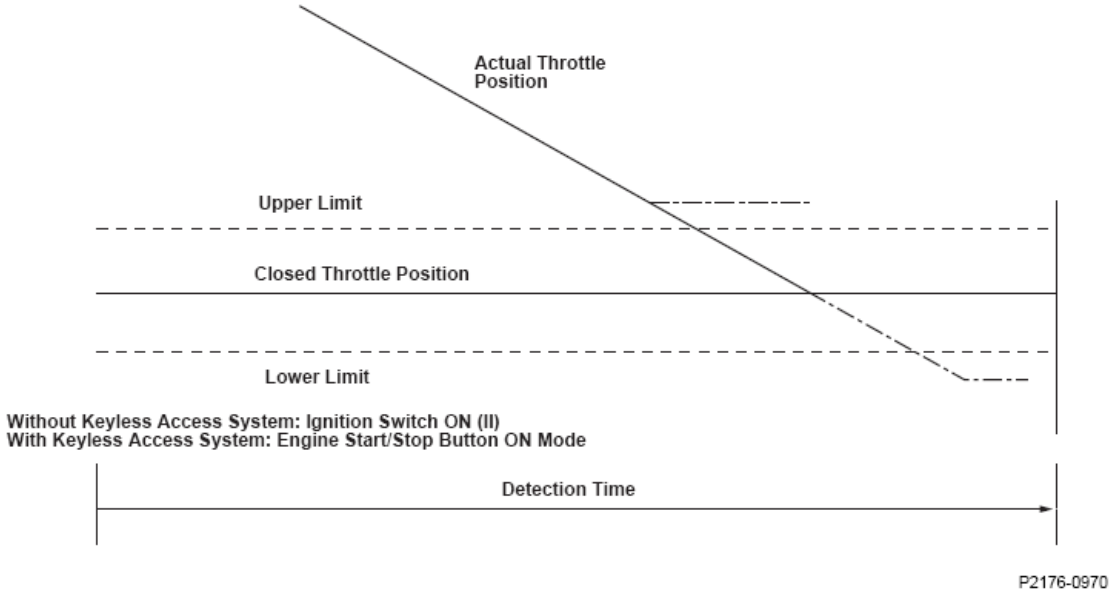

Fig. 290: Throttle Actuator Control System Characteristics Curve

GENERAL DESCRIPTION

The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor, and the engine control module (ECM)/powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the ECM/PCM to compute the target position. The ECM/PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A (installed in the throttle body). The ECM/PCM transmits a signal to the throttle actuator and moves the throttle valve to the fully closed position to register the throttle valve fully closed position after the ignition switch is turned to ON (II) or the engine start/stop button is pressed to select the ON mode. When the registration of the throttle valve fully closed position is not completed within a predetermined time or the registered value is out of predetermined range after the ignition switch is turned to ON (II) or the engine start/stop button is pressed to select the ON mode, the ECM/PCM detects a malfunction in the throttle actuator control system and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	700 milliseconds or more

DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	6.0 V	-
Ignition switch(1)	ON (II)	
Engine start/stop button(2)	ON mode	
No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138	
Other	Engine is stopped	
(1) Without keyless access system (2) With keyless access system		

MALFUNCTION THRESHOLD

One of these conditions is met for at least 700 milliseconds:

- The registration of the throttle valve fully closed position is not completed within a predetermined time after the ignition switch is turned to ON (II) or the engine start/stop button is pressed to select the ON mode.
- The registered value of the throttle valve fully closed position is 0.74 V*, 1.61 V**, or more, or 0.49 V*, 1.37 V**, or less.

*: TP sensor A

**: TP sensor B

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2183: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 2 CIRCUIT RANGE/PERFORMANCE PROBLEM

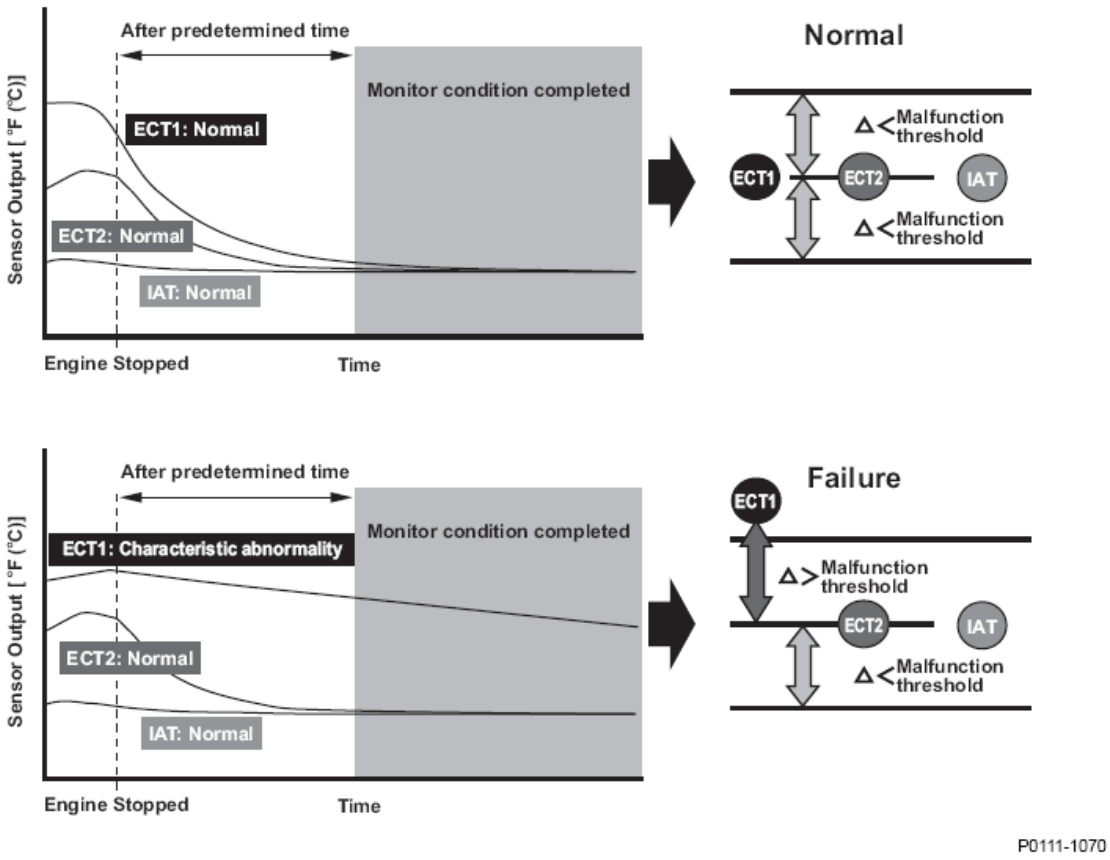

Fig. 291: Engine Coolant Temperature Sensor Characteristics Curve

GENERAL DESCRIPTION

Two engine coolant temperature (ECT) sensors and one intake air temperature (IAT) sensor are used by the engine control module (ECM)/powertrain control module (PCM). When the engine is stopped and enough time has passed, the temperature of the engine will equalize to the ambient temperature. ECT sensor 1 and IAT sensor are compared to ECT sensor 2, and if an inappropriate temperature is read, the ECM/PCM detects a malfunction in the corresponding sensor and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine off time	6 hours	-

No active DTCs set (prevents monitor from running)	P0112, P0113, P0116, P0117, P0118, P0125, P2184, P2185, P2610

MALFUNCTION THRESHOLD

A malfunction is detected if the following conditions are present after the engine has stopped and the ignition switch has been turned to LOCK (0) or engine start/stop button has been pressed to select OFF mode, for at least 6 hours before restarting the engine:

Temperature difference between each sensor values		Malfunction judgment		
ECT1 - ECT2	**IAT - ECT2**	**ECT sensor 1**	**IAT sensor**	**ECT sensor 2**
Higher than 57 °F (32 °C)	Higher than 57 °F (32 °C)	Normal	Normal	Failure
	From -43 °F (-24 °C) to 57 °F (32 °C)	Failure	Normal	Normal
	Lower than -43 °F (-24 °C)	Failure	Failure	Normal
From -43 °F (-24 °C) to 57 °F (32 °C)	Higher than 57 °F (32 °C)	Normal	Failure	Normal
	From -43 °F (-24 °C) to 57 °F (32 °C)	Normal	Normal	Normal
	From -44 °F (-25 °C) to -108 °F (-60 °C)	Normal	Failure Suspended(1)	Normal
	Lower than -108 °F (-60 °C)	Normal	Failure	Normal
Lower than -43 °F (-24 °C)	Higher than 57 °F (32 °C)	Failure	Failure	Normal
	From -43 °F (-24 °C) to 57 °F (32 °C)	Failure	Normal	Normal
	Lower than -43 °F (-24 °C)	Normal	Normal	Failure
(1) Malfunction judgment is suspended because the cooled air introduced after engine start lowers the intake air temperature; the ambient temperature condition does not stay equal.				

DRIVING PATTERN

1. Turn the ignition switch to LOCK (0) or press the engine start/stop button to select the OFF mode, and wait at least 6 hours.
2. Start the engine, and let it idle for at least 10 seconds.
   - Do not use an engine block heater because the engine coolant temperature will not stay equal during engine stop.
   - When freeze data is stored, test the vehicle under an ambient temperature close to the intake air temperature in the freeze data.
   - When an ambient temperature extremely changes, malfunction judgment may not execute. Avoid extreme temperature changing condition after or before engine start. (When the vehicle is parked in the garage, open the shutter to introduce outside air; then start the engine.)

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2184: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 2 CIRCUIT LOW VOLTAGE

Fig. 292: Engine Coolant Temperature Sensor 2 - Circuit Diagram

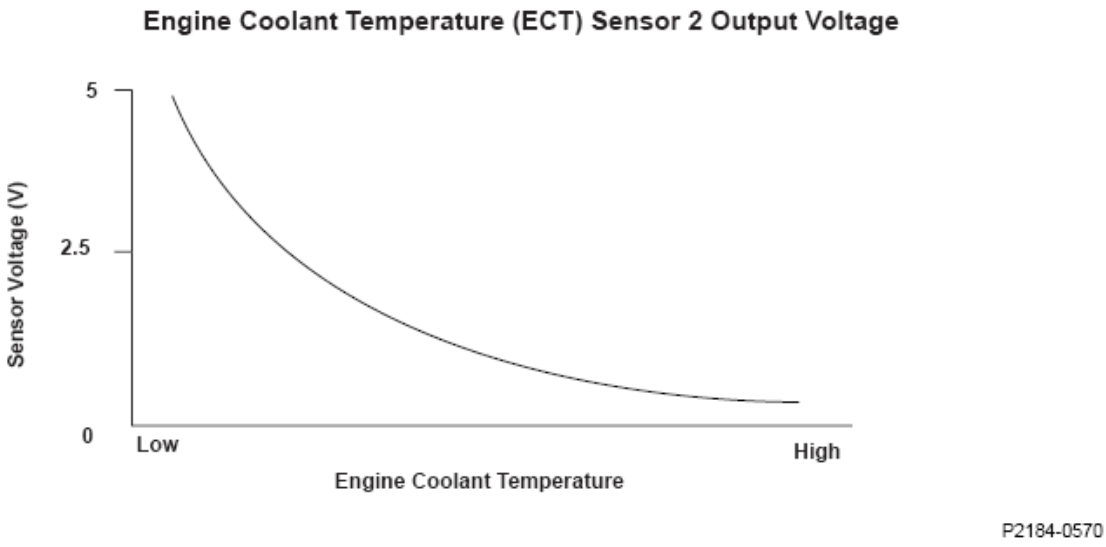

Fig. 293: Engine Coolant Temperature Sensor 2 Output Voltage Graph

GENERAL DESCRIPTION

Engine coolant temperature (ECT) sensor 2 is a thermistor attached to the radiator. The engine control module

(ECM)/powertrain control module (PCM) applies voltage (about 5 V) to the ECT2 signal circuit through a pull-up resistor. As the engine coolant temperature cools, ECT sensor 2 resistance increases, and the ECM/PCM detects a high signal voltage. As the engine coolant warms, the sensor resistance decreases, and the ECM/PCM detects a low signal voltage. If the ECT sensor 2 output voltage is a set value when the engine coolant temperature is high, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
No active DTCs set (prevents monitor from running)	P2185
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

The ECT sensor 2 output voltage is 0.08 V or less for at least 2 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2185: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 2 CIRCUIT HIGH VOLTAGE

Fig. 294: Engine Coolant Temperature Sensor 2 - Circuit Diagram

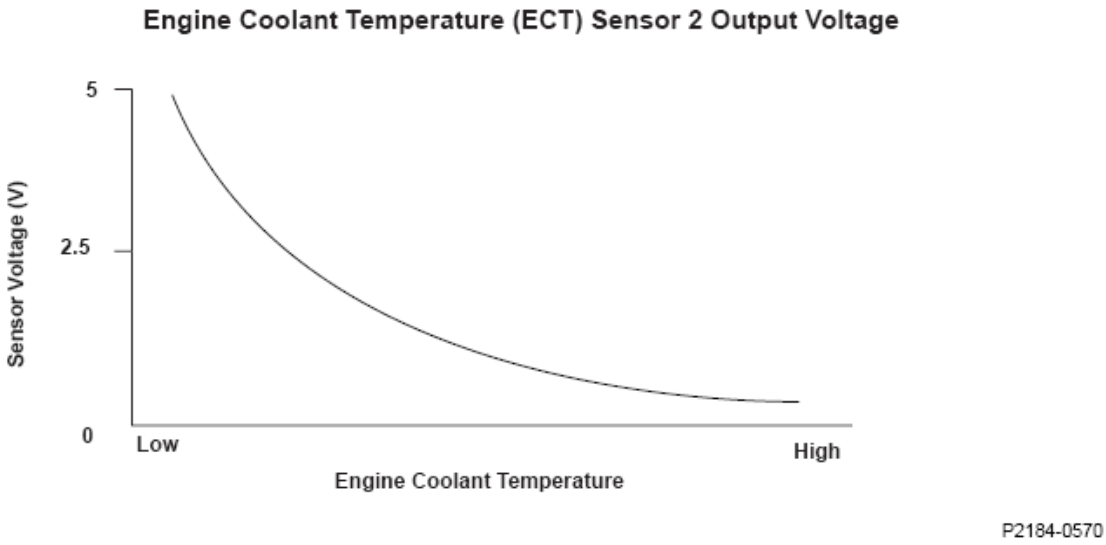

Fig. 295: Engine Coolant Temperature Sensor 2 Output Voltage Graph

GENERAL DESCRIPTION

Engine coolant temperature (ECT) sensor 2 is a thermistor attached to the radiator. The engine control module (ECM)/powertrain control module (PCM) applies voltage (about 5 V) to the ECT2 signal circuit through a pull-up resistor. As the engine coolant temperature cools, ECT sensor 2 resistance increases, and the ECM/PCM detects a high signal voltage. As the engine coolant warms, the sensor resistance decreases, and the ECM/PCM detects a low signal voltage. If the ECT sensor 2 output voltage is a set value when the engine coolant temperature is low, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
No active DTCs set (prevents monitor from running)	P2184
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

The ECT sensor 2 output voltage is 4.92 V or more for at least 2 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2195: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) SIGNAL STUCK LEAN

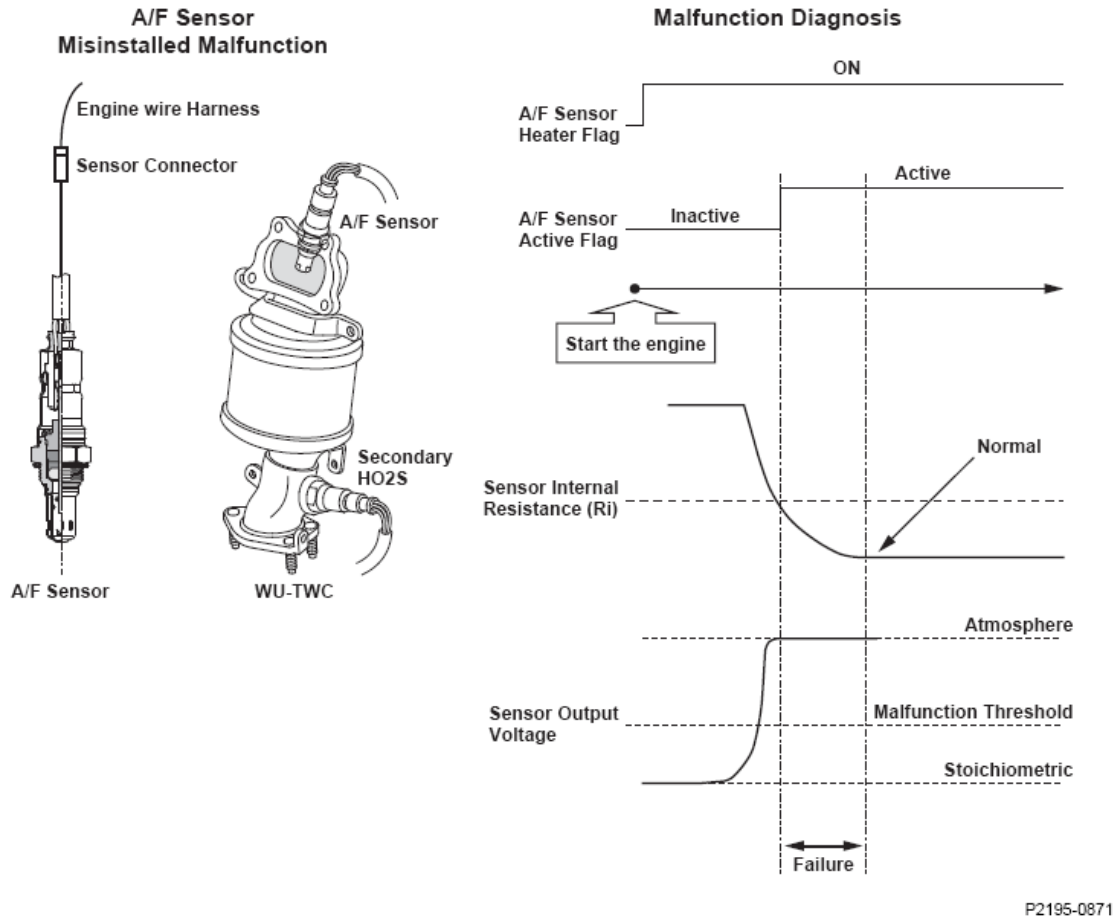

Fig. 296: Rear Air/Fuel Ratio Sensor Characteristics Curve (Bank 1, Sensor 1)

GENERAL DESCRIPTION

When the rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) is properly connected to the engine wire harness, but it is not installed in the exhaust pipe, the feedback is not done properly even if the rear A/F sensor is active after starting the engine. Thus, the exhaust emissions increase. When the rear A/F sensor output stays out of the normal range after the rear A/F sensor becomes active, the engine control module (ECM)/powertrain control module (PCM) detects that the rear A/F sensor is not properly installed and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	7.0 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Fuel feedback	Other than during fuel cut-off operation
No active DTCs set (prevents monitor from running)	P0134, P0135, P0171, P0172, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0351, P0352, P0353, P1172, P2195, P2237, P2238, P2243, P2245, P2251, P2252

MALFUNCTION THRESHOLD

The rear A/F sensor (bank 1, sensor 1) output voltage is 3.37 V or more for at least 7.0 seconds.

DRIVING PATTERN

Start the engine, and let it idle for at least 2 minutes.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2197: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) SIGNAL STUCK LEAN

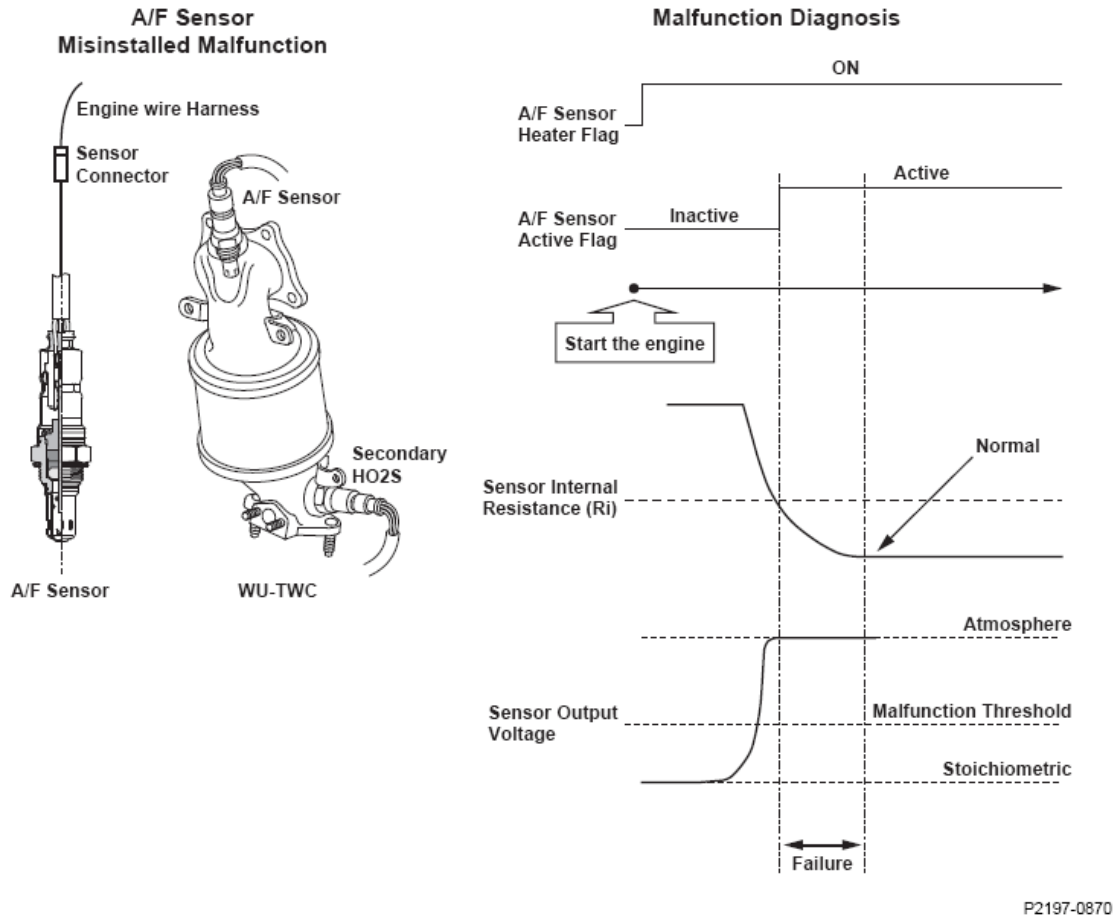

Fig. 297: Front Air/Fuel Ratio Sensor Characteristics Curve (Bank 2, Sensor 1)

GENERAL DESCRIPTION

When the front air/fuel ratio (A/F) sensor (bank 2, sensor 1) is properly connected to the engine wire harness, but it is not installed in the exhaust pipe, the feedback is not done properly even if the front A/F sensor is active after starting the engine. Thus, the exhaust emissions increase. When the front A/F sensor output stays out of the normal range after the front A/F sensor becomes active, the engine control module (ECM)/powertrain control module (PCM) detects that the front A/F sensor is not properly installed and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	7.0 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Fuel feedback	Other than during fuel cut-off operation
No active DTCs set (prevents monitor from running)	P0154, P0155, P0174, P0175, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0354, P0355, P0356, P1174, P2197, P2240, P2241, P2247, P2249, P2254, P2255

MALFUNCTION THRESHOLD

The front A/F sensor (bank 2, sensor 1) output voltage is 3.37 V or more for at least 7.0 seconds.

DRIVING PATTERN

Start the engine, and let it idle for at least 2 minutes.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2227: BAROMETRIC PRESSURE (BARO) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

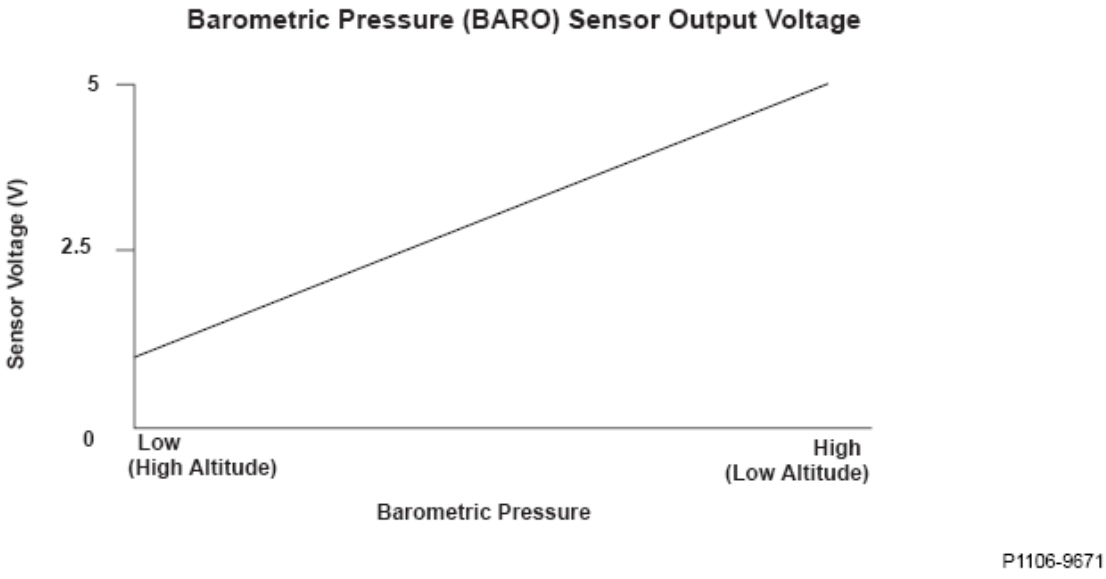

Fig. 298: Barometric Pressure Sensor Output Voltage Graph

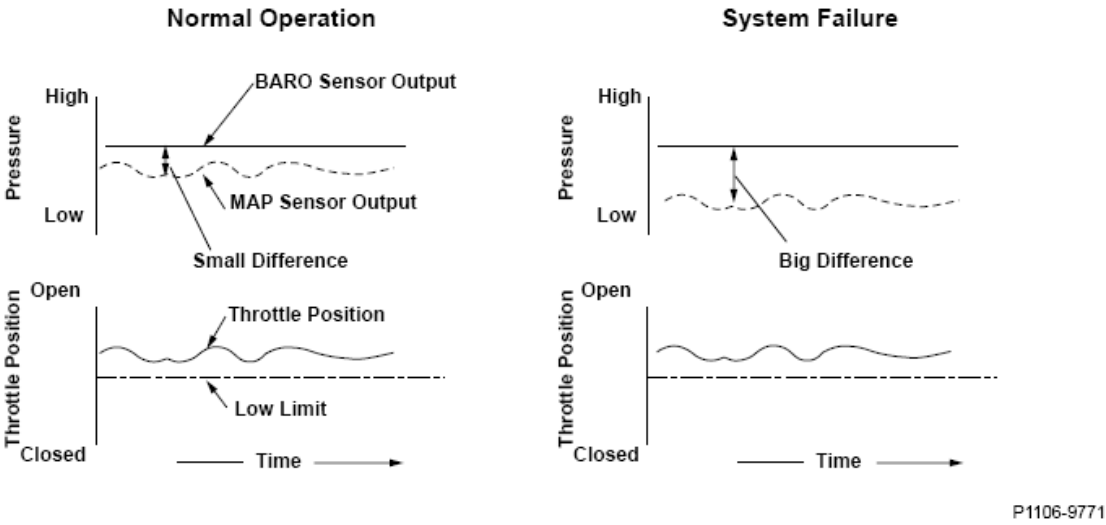

Fig. 299: Barometric Pressure Sensor Output Voltage Characteristics Curve

GENERAL DESCRIPTION

The barometric pressure (BARO) sensor is built into the engine control module (ECM)/powertrain control module (PCM) and monitors atmospheric pressure. When the throttle valve is wide open, the manifold absolute pressure (MAP) sensor output is nearly equal to the BARO sensor output. If the throttle position is beyond a value stored in the ECM/PCM that is used to detect "wide-open throttle," and if the difference between the MAP sensor output and the BARO sensor output is equal to or greater than a set value, the ECM/PCM detects a malfunction in the BARO sensor output and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	2.5 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition		Minimum	Maximum
Throttle position	1,000 rpm	15.3 °(1) 12.9 °(2)	-
	3,000 rpm(1)	30.6 °	
	4,500 rpm(2)	35.1 °	
No active DTCs set (prevents monitor from running)		P0102, P0103, P0107, P0108, P0117, P0118, P0122, P0123, P0171, P0172, P0174, P0175, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0351, P0352, P0353, P0354, P0355, P0356, P0401, P0404, P0506, P0507, P060A, P0720, P0722, P1077, P1078, P1128, P1129, P1659, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2228, P2229, P2279, P2413, P2646, P2647, P2648, P2649	

(1) J35Z6 engine

(2) J37A4 engine

MALFUNCTION THRESHOLD

The difference between the BARO sensor output and the MAP sensor output is 26 kPa (7.5 inHg, 190 mmHg) or more for at least 2.5 seconds.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Drive the vehicle under Enable Conditions (see "Throttle position") for at least 2.5 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2228: BAROMETRIC PRESSURE (BARO) SENSOR CIRCUIT LOW VOLTAGE

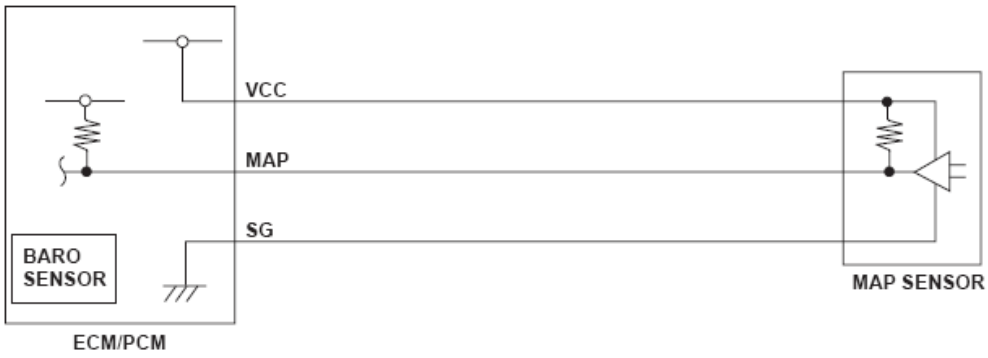

Fig. 300: Barometric Pressure Sensor - Circuit Diagram

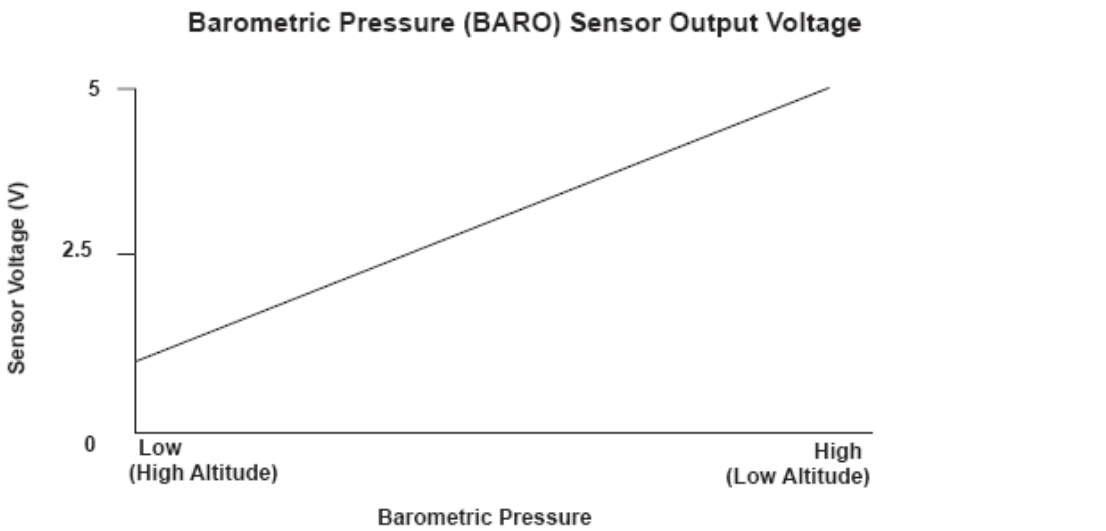

Fig. 301: Barometric Pressure Sensor Output Voltage Graph

GENERAL DESCRIPTION

The barometric pressure (BARO) sensor is built into the engine control module (ECM)/powertrain control module (PCM), and it monitors atmospheric pressure. The ECM/PCM estimates appropriate intake airflow from the manifold absolute pressure (MAP) sensor output voltage and the BARO sensor output voltage. If the BARO

sensor output voltage is a specified value, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
No active DTCs set (prevents monitor from running)	P2229
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

The BARO sensor output voltage is 1.08 V or less for at least 2.0 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2229: BAROMETRIC PRESSURE (BARO) SENSOR CIRCUIT HIGH VOLTAGE

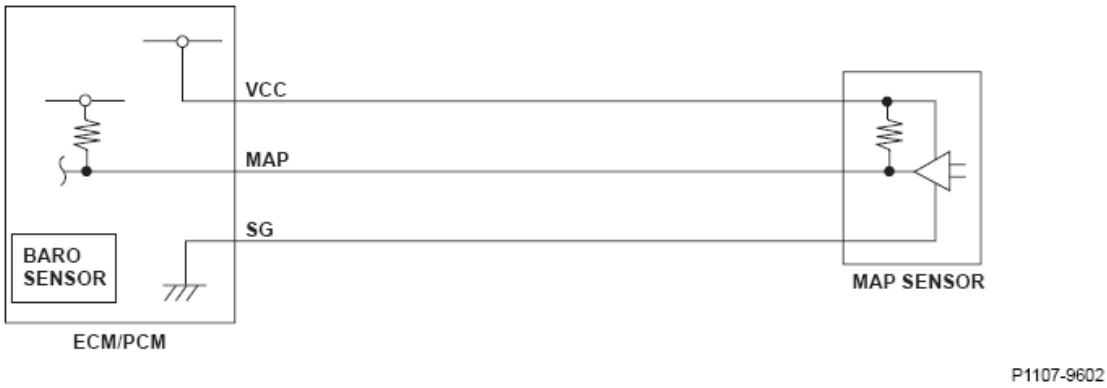

Fig. 302: Barometric Pressure Sensor - Circuit Diagram

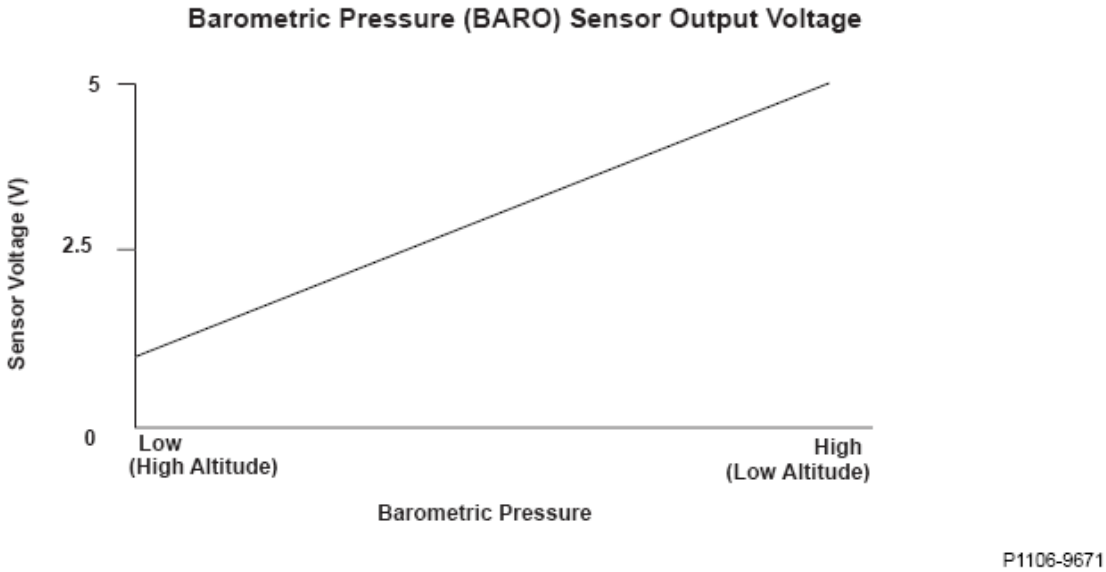

Fig. 303: Barometric Pressure Sensor Output Voltage Graph

GENERAL DESCRIPTION

The barometric pressure (BARO) sensor is built into the engine control module (ECM)/powertrain control module (PCM), and it monitors atmospheric pressure. The ECM/PCM estimates appropriate intake airflow from the manifold absolute pressure (MAP) sensor output voltage and the BARO sensor output voltage. If the BARO sensor output voltage is a specified value, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II)
Engine start/stop button(2)	ON mode
No active DTCs set (prevents monitor from running)	P2228
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

The BARO sensor output voltage is 4.95 V or more for at least 2.0 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2237: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) IP CIRCUIT HIGH VOLTAGE

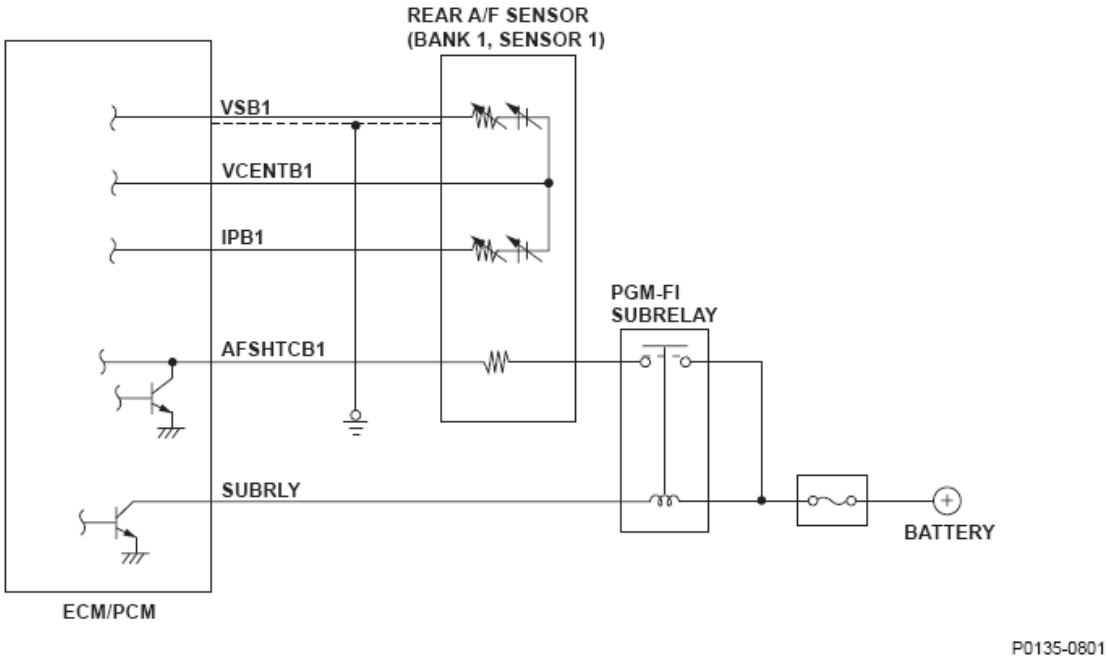

Fig. 304: Rear Air/Fuel Ratio Sensor - Circuit Diagram (Bank 1, Sensor 1)

GENERAL DESCRIPTION

The rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The rear A/F sensor transmits a signal to the engine control module (ECM)/powertrain control module (PCM), and it enables overall feedback control. The ECM/PCM controls fuel injection duration by comparing the target air/fuel ratio with the rear A/F sensor signal. If the IPB1 terminal voltage is out of a specified range, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	15 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
VSB1 terminal voltage	3.4 V	4.8 V
Battery voltage	9.0 V	-
State of the engine	Running	
No active DTCs set (prevents monitor from running)	P0135, P2238, P2243, P2245, P2251, P2252	

MALFUNCTION THRESHOLD

The IPB1 terminal voltage is 2.0 V or less, or 5.6 V or more, for at least 15 seconds.

DRIVING PATTERN

Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2238: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) IP CIRCUIT LOW VOLTAGE

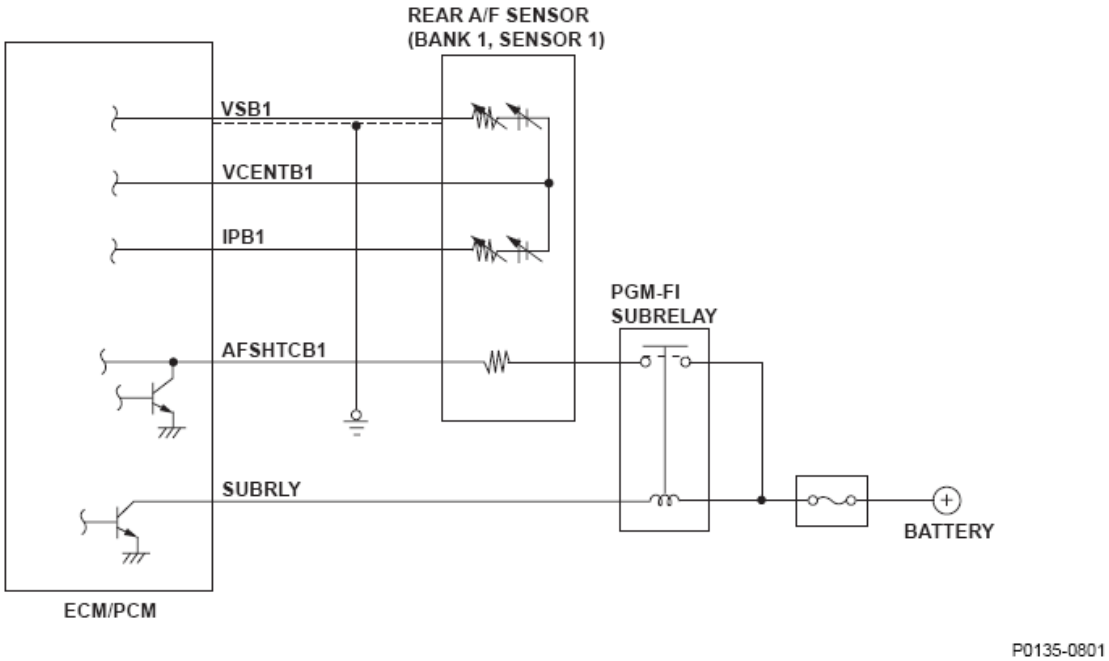

Fig. 305: Rear Air/Fuel Ratio Sensor - Circuit Diagram (Bank 1, Sensor 1)

GENERAL DESCRIPTION

The rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The rear A/F sensor transmits a signal to the engine control module (ECM)/powertrain control module (PCM), and it enables overall feedback control. The ECM/PCM controls fuel injection duration by comparing the target air/fuel ratio with the rear A/F sensor signal. When the self diagnosis function in the ECM/PCM detects a short circuit failure, it measures the ECM/PCM input voltage of VSB1/VCENTB1/IPB1. If the IPB1 terminal voltage is less than VSB1/VCENTB1 terminal voltage, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	0.5 second or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	9.0 V	-
State of the engine	Running	
No active DTCs set (prevents monitor from running)	P0135, P2237, P2243, P2245, P2251, P2252	

MALFUNCTION THRESHOLD

The IPB1 terminal voltage is less than VSB1/VCENTB1 terminal voltage after the self diagnosis function in the ECM/PCM detects a short circuit failure for at least 0.5 second.

DRIVING PATTERN

Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2240: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) IP CIRCUIT HIGH VOLTAGE

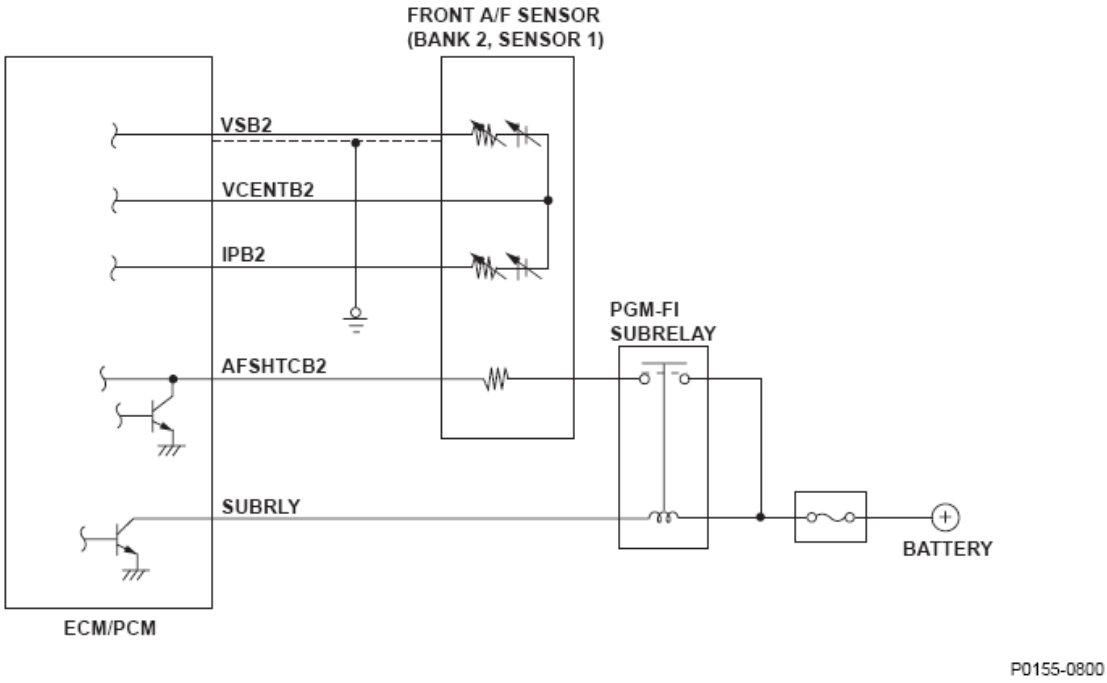

Fig. 306: Front Air/Fuel Ratio Sensor - Circuit Diagram (Bank 2, Sensor 1)

GENERAL DESCRIPTION

The front air/fuel ratio (A/F) sensor (bank 2, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The front A/F sensor transmits a signal to the engine control module (ECM)/powertrain control module (PCM), and it enables overall feedback control. The ECM/PCM controls fuel injection duration by comparing the target air/fuel ratio with the front A/F sensor signal. If the IPB2 terminal voltage is out of a specified range, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	15 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
VSB2 terminal voltage	3.4 V	4.8 V
State of the engine	Running	

No active DTCs set (prevents monitor from running)	P0155, P2241, P2247, P2249, P2254, P2255

MALFUNCTION THRESHOLD

The IPB2 terminal voltage is 2.0 V or less, or 5.6 V or more, for at least 15 seconds.

DRIVING PATTERN

Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2241: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) IP CIRCUIT LOW VOLTAGE

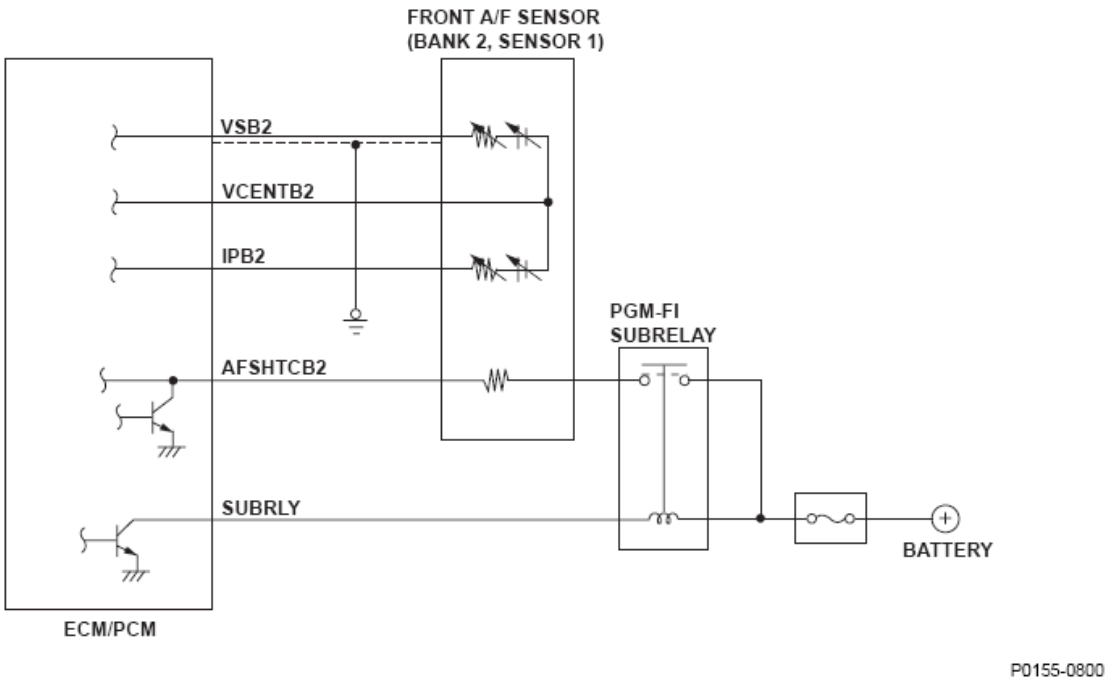

Fig. 307: Front Air/Fuel Ratio Sensor - Circuit Diagram (Bank 2, Sensor 1)

GENERAL DESCRIPTION

The front air/fuel ratio (A/F) sensor (bank 2, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The front A/F sensor transmits a signal to the engine control module (ECM)/powertrain control module (PCM), and it enables overall feedback control. The ECM/PCM controls fuel injection duration by comparing the target air/fuel ratio with the front A/F sensor signal. When the self diagnosis function in the ECM/PCM detects a short circuit failure, it measures the ECM/PCM input voltage of VSB2/VCENTB2/IPB2. If the IPB2 terminal voltage is less than VSB2/VCENTB2 terminal voltage, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	0.5 second or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	9.0 V	-
State of the engine	Running	
No active DTCs set (prevents monitor from running)	P0155, P2240, P2247, P2249, P2254, P2255	

MALFUNCTION THRESHOLD

The IPB2 terminal voltage is less than VSB2/VCENTB2 terminal voltage after the self diagnosis function in the ECM/PCM detects a short circuit failure for at least 0.5 second.

DRIVING PATTERN

Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2243: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) VCENT CIRCUIT HIGH VOLTAGE

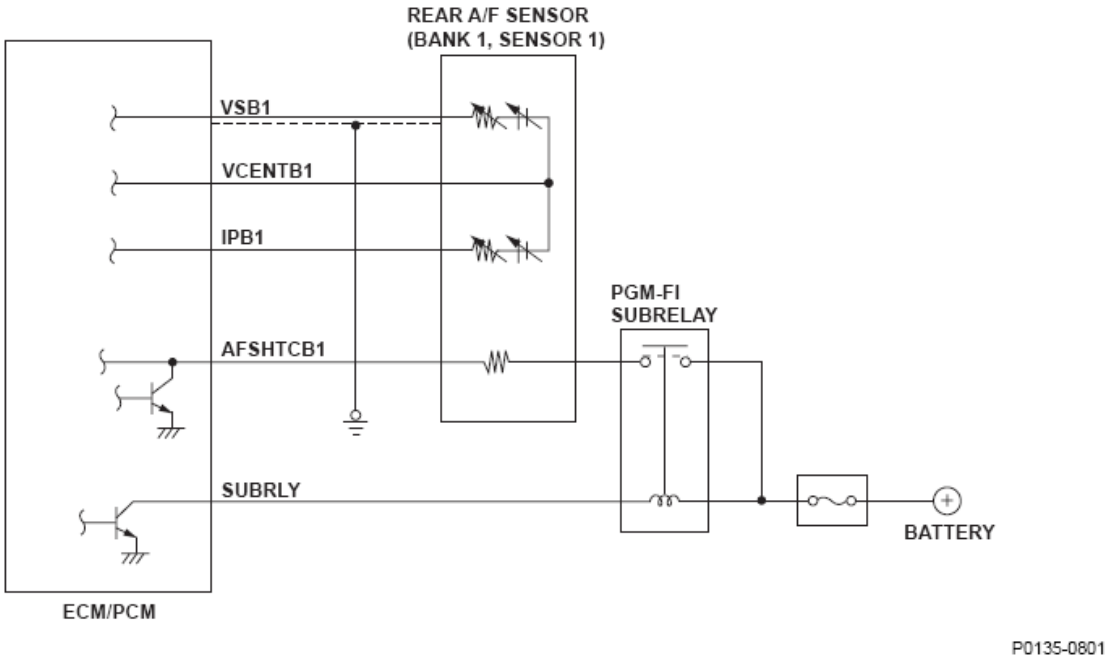

Fig. 308: Rear Air/Fuel Ratio Sensor - Circuit Diagram (Bank 1, Sensor 1)

GENERAL DESCRIPTION

The rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The rear A/F sensor transmits a signal to the engine control module (ECM)/powertrain control module (PCM), and it enables overall feedback control. The ECM/PCM controls fuel injection duration by comparing the target air/fuel ratio with the rear A/F sensor signal. If the VSB1 terminal voltage is a specified value for a set time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5 seconds or more(1), 38 seconds or more(2)
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)
(1) After the sensor becomes active (2) Before the sensor becomes active	

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	9.0 V	-
State of the engine	Running	
No active DTCs set (prevents monitor from running)	P0135, P2237, P2238, P2245, P2251, P2252	

MALFUNCTION THRESHOLD

The VSB1 terminal voltage is 5.3 V or less for at least 5 seconds*, 38 seconds**.

DRIVING PATTERN

Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2245: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) VCENT CIRCUIT LOW VOLTAGE

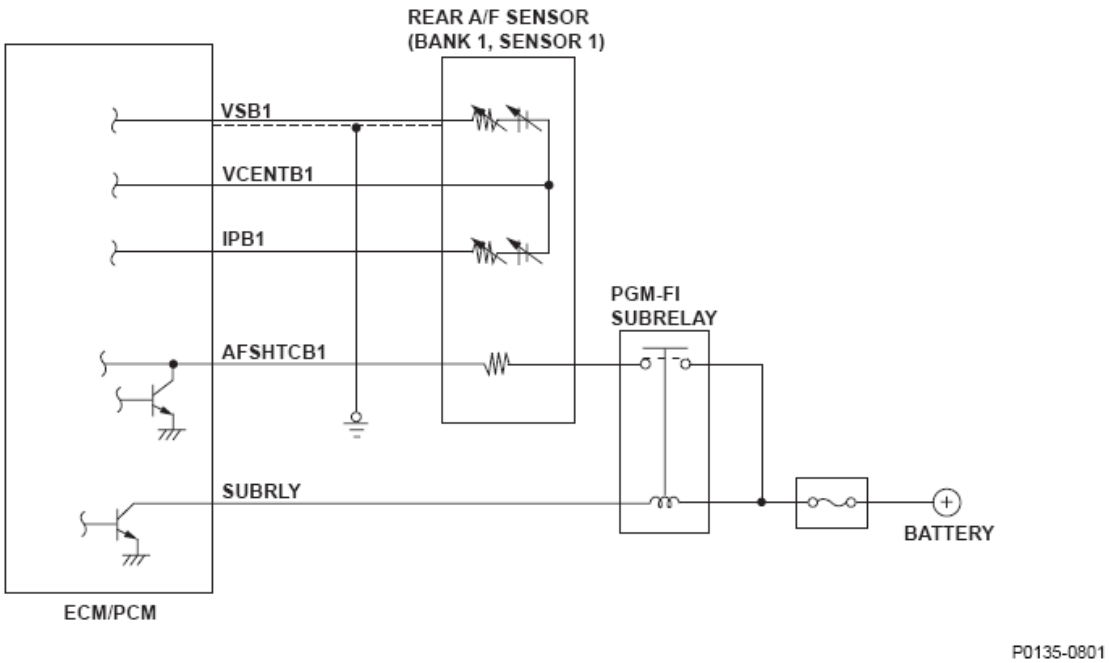

Fig. 309: Rear Air/Fuel Ratio Sensor - Circuit Diagram (Bank 1, Sensor 1)

GENERAL DESCRIPTION

The rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The rear A/F sensor transmits a signal to the engine control module (ECM)/powertrain control module (PCM), and it enables overall feedback control. The ECM/PCM controls fuel injection duration by comparing the target air/fuel ratio with the rear A/F sensor signal. When the self diagnosis function in the ECM/PCM detects a short circuit failure, it measures the ECM/PCM input voltage of VSB1/VCENTB1/IPB1. If the VCENTB1 terminal voltage is less than VSB1/IPB1 terminal voltage, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	0.5 second or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	9.0 V	-
State of the engine	Running	
No active DTCs set (prevents monitor from running)	P0135, P2237, P2238, P2243, P2251, P2252	

MALFUNCTION THRESHOLD

The VCENTB1 terminal voltage is less than VSB1/IPB1 terminal voltage after the self diagnosis function in the ECM/PCM detects a short circuit failure for at least 0.5 second.

DRIVING PATTERN

Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2247: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) VCENT CIRCUIT HIGH VOLTAGE

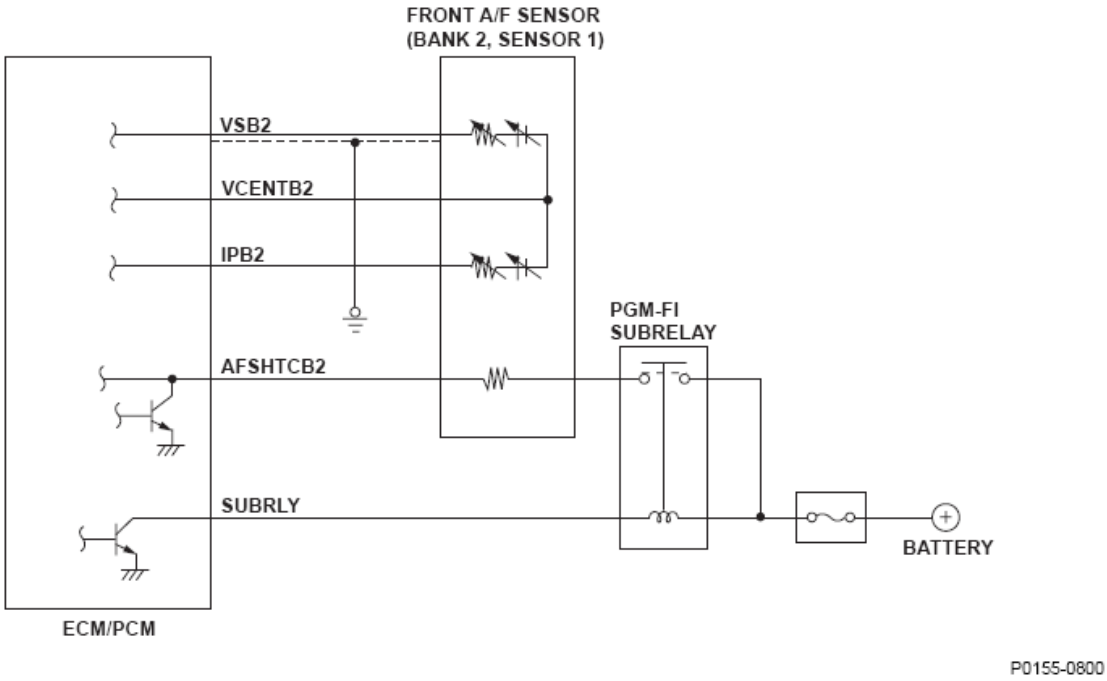

Fig. 310: Front Air/Fuel Ratio Sensor - Circuit Diagram (Bank 2, Sensor 1)

GENERAL DESCRIPTION

The front air/fuel ratio (A/F) sensor (bank 2, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The front A/F sensor transmits a signal to the engine control module (ECM)/powertrain control module (PCM), and it enables overall feedback control. The ECM/PCM controls fuel injection duration by comparing the target air/fuel ratio with the front A/F sensor signal. If the VSB2 terminal voltage is a specified value for a set time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	9.0 V	-
State of the engine	Running	

No active DTCs set (prevents monitor from running)	P0155, P2240, P2241, P2249, P2254, P2255

MALFUNCTION THRESHOLD

The VSB2 terminal voltage is 5.3 V or less for at least 5 seconds*, 38 seconds**.

DRIVING PATTERN

Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2249: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) VCENT CIRCUIT LOW VOLTAGE

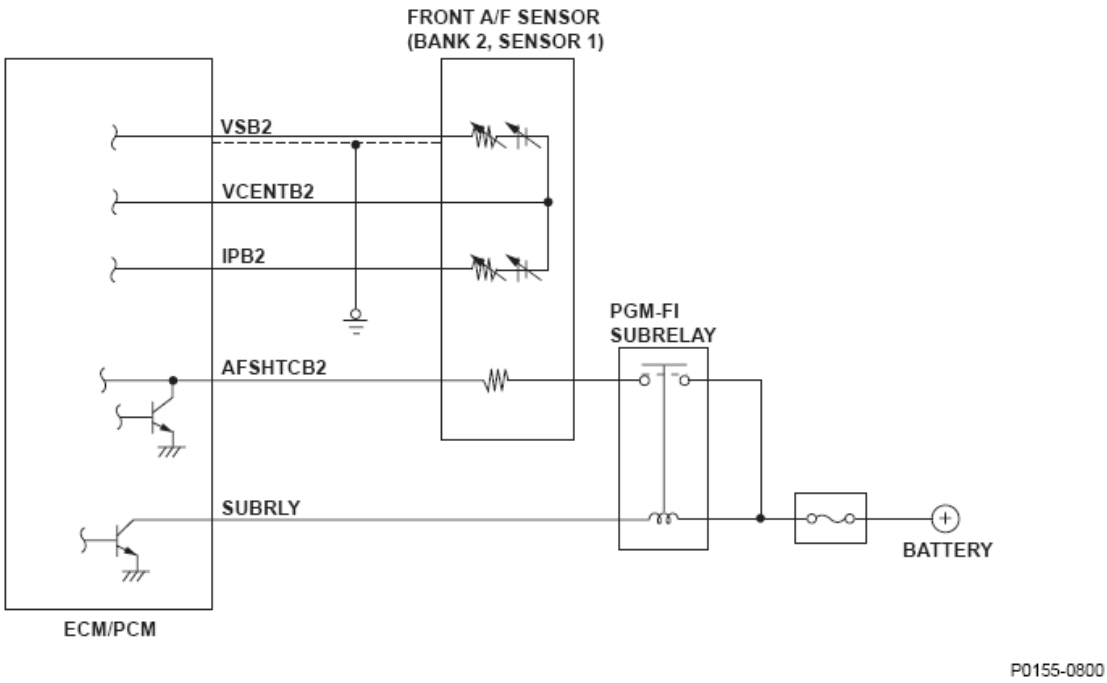

Fig. 311: Front Air/Fuel Ratio Sensor - Circuit Diagram (Bank 2, Sensor 1)

GENERAL DESCRIPTION

The front air/fuel ratio (A/F) sensor (bank 2, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The front A/F sensor transmits a signal to the engine control module (ECM)/powertrain control module (PCM), and it enables overall feedback control. The ECM/PCM controls fuel injection duration by comparing the target air/fuel ratio with the front A/F sensor signal. When the self diagnosis function in the ECM/PCM detects a short circuit failure, it measures the ECM/PCM input voltage of VSB2/VCENTB2/IPB2. If the VCENTB2 terminal voltage is less than VSB2/IPB2 terminal voltage, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	0.5 second or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	9.0 V	-
State of the engine	Running	
No active DTCs set (prevents monitor from running)	P0155, P2240, P2241, P2247, P2254, P2255	

MALFUNCTION THRESHOLD

The VCENTB2 input terminal voltage is less than VSB2/IPB2 terminal voltage after the self diagnosis function in the ECM/PCM detects a short circuit failure for at least 0.5 second.

DRIVING PATTERN

Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2251: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) VS CIRCUIT HIGH VOLTAGE

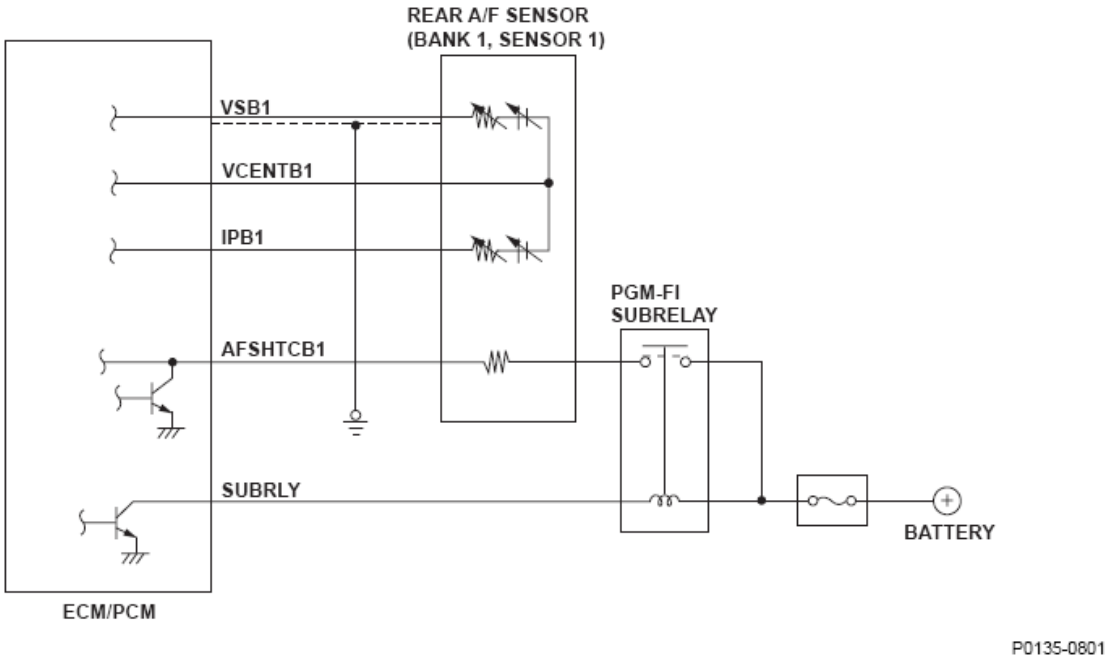

Fig. 312: Rear Air/Fuel Ratio Sensor - Circuit Diagram (Bank 1, Sensor 1)

GENERAL DESCRIPTION

The rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The rear A/F sensor transmits a signal to the engine control module (ECM)/powertrain control module (PCM), and it enables overall feedback control. The ECM/PCM controls fuel injection duration by comparing the target air/fuel ratio with the rear A/F sensor signal. When the VSB1 terminal voltage is a specified value for a predetermined time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5 seconds or more(1), 38 seconds or more(2)
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)
(1) After the sensor becomes active (2) Before the sensor becomes active	

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	9.0 V	-
State of the engine	Running	
No active DTCs set (prevents monitor from running)	P0135, P2237, P2238, P2243, P2245, P2252	

MALFUNCTION THRESHOLD

After the sensor becomes active, the VSB1 terminal voltage is 6.0 V or more for at least 5 seconds.

Before the sensor becomes active, the VSB1 terminal voltage is 5.3 V or more for at least 38 seconds.

DRIVING PATTERN

Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2252: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) VS CIRCUIT LOW VOLTAGE

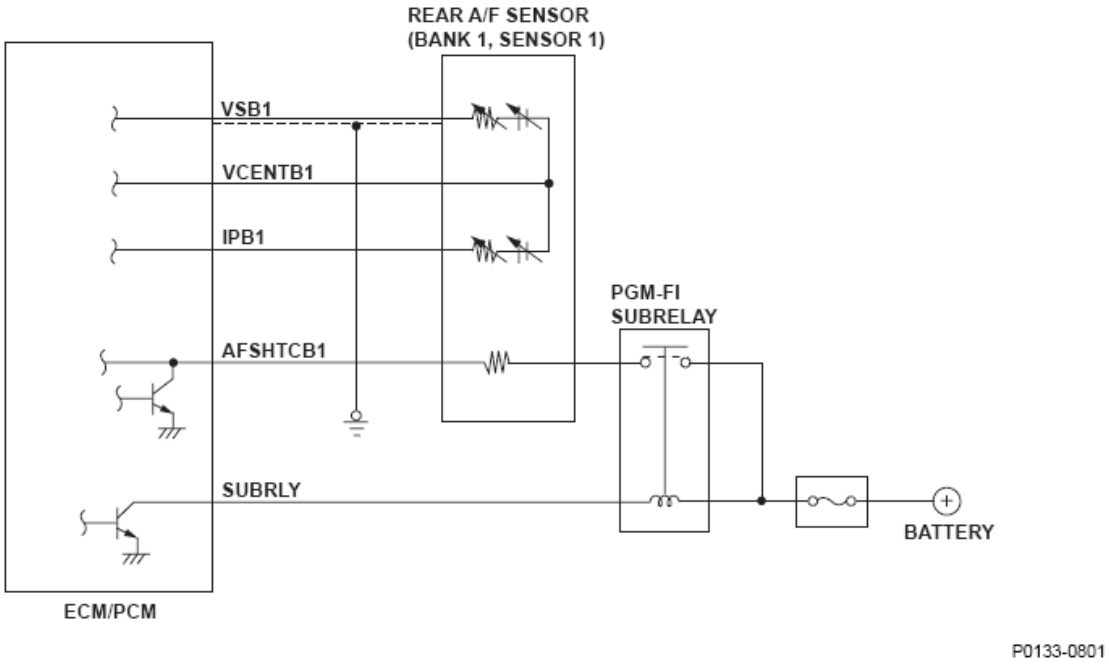

Fig. 313: Rear Air/Fuel Ratio Sensor - Circuit Diagram (Bank 1, Sensor 1)

GENERAL DESCRIPTION

The rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The rear A/F sensor transmits a signal to the engine control module (ECM)/powertrain control module (PCM), and it enables overall feedback control. The ECM/PCM controls fuel injection duration by comparing the target air/fuel ratio with the rear A/F sensor signal. When the self diagnosis function in the ECM/PCM detects a short circuit failure, it measures the ECM/PCM input voltage of VSB1/VCENTB1/IPB1. If the VSB1 terminal voltage is less than VCENTB1/IPB1 terminal voltage, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	0.5 second or more
DTC Type	Two drive cycles, MIL on

OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	9.0 V	-
State of the engine	Running	
No active DTCs set (prevents monitor from running)	P0135, P2237, P2238, P2243, P2245, P2251	

MALFUNCTION THRESHOLD

The VSB1 input terminal voltage is less than the VCENTB1/IPB1 terminal voltage after the self diagnosis function in the ECM/PCM detects a short circuit failure for at least 0.5 second.

DRIVING PATTERN

Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2254: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) VS CIRCUIT HIGH VOLTAGE

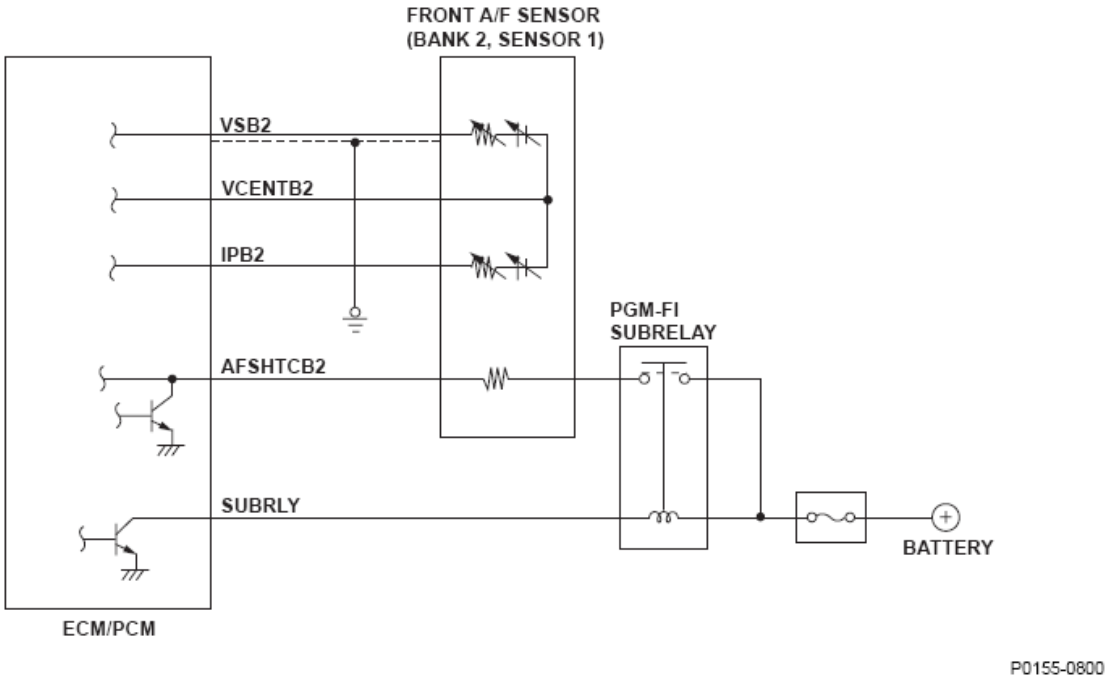

Fig. 314: Front Air/Fuel Ratio Sensor - Circuit Diagram (Bank 2, Sensor 1)

GENERAL DESCRIPTION

The front air/fuel ratio (A/F) sensor (bank 2, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The front A/F sensor transmits a signal to the engine control module (ECM)/powertrain control module (PCM), and it enables overall feedback control. The ECM/PCM controls fuel injection duration by comparing the target air/fuel ratio with the front A/F sensor signal. When the VSB2 terminal voltage is a specified value for a predetermined time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

No active DTCs set (prevents monitor from running)	P0155, P2240, P2241, P2247, P2249, P2255

MALFUNCTION THRESHOLD

After the sensor becomes active, the VSB2 terminal voltage is 6.0 V or more for at least 5 seconds.

Before the sensor becomes active, the VSB2 terminal voltage is 5.3 V or more for at least 38 seconds.

DRIVING PATTERN

Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2255: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) VS CIRCUIT LOW VOLTAGE

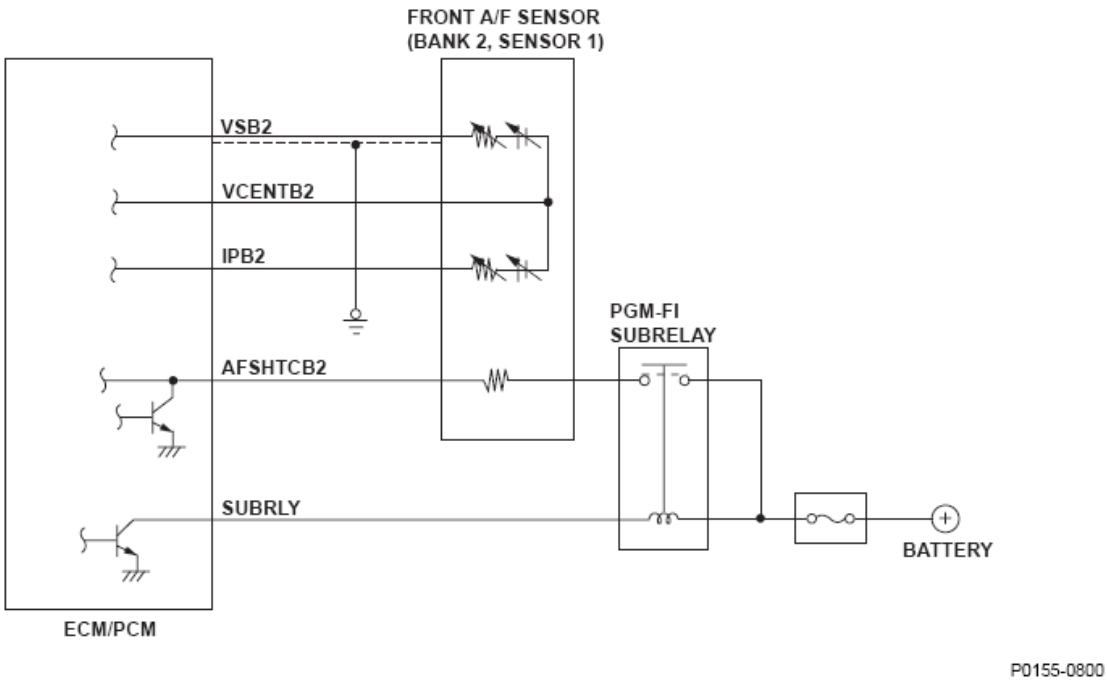

Fig. 315: Front Air/Fuel Ratio Sensor - Circuit Diagram (Bank 2, Sensor 1)

GENERAL DESCRIPTION

The front air/fuel ratio (A/F) sensor (bank 2, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The front A/F sensor transmits a signal to the engine control module (ECM)/powertrain control module (PCM), and it enables overall feedback control. The ECM/PCM controls fuel injection duration by comparing the target air/fuel ratio with the front A/F sensor signal. When the self diagnosis function in the ECM/PCM detects a short circuit failure, it measures the ECM/PCM input voltage of VSB2/VCENTB2/IPB2. If the VSB2 terminal voltage is less than VCENTB2/IPB2 terminal voltage, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	0.5 second or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	9.0 V	-
State of the engine	Running	
No active DTCs set (prevents monitor from running)	P0155, P2240, P2241, P2247, P2249, P2254	

MALFUNCTION THRESHOLD

The VSB2 terminal voltage is less than VCENTB2/IPB2 terminal voltage after the self diagnosis function in the ECM/PCM detects a short circuit failure for at least 0.5 second.

DRIVING PATTERN

Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2270: REAR SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (BANK 1, SENSOR 2)) CIRCUIT SIGNAL STUCK LEAN

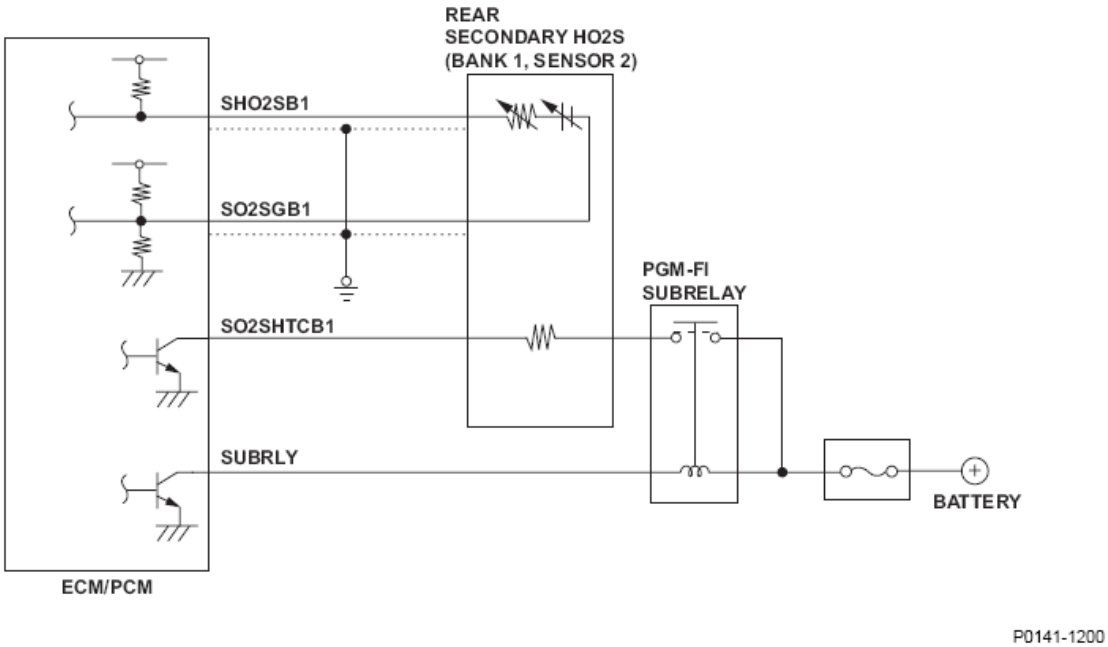

Fig. 316: Rear Secondary Heated Oxygen Sensor - Circuit Diagram (Bank 1, Sensor 2)

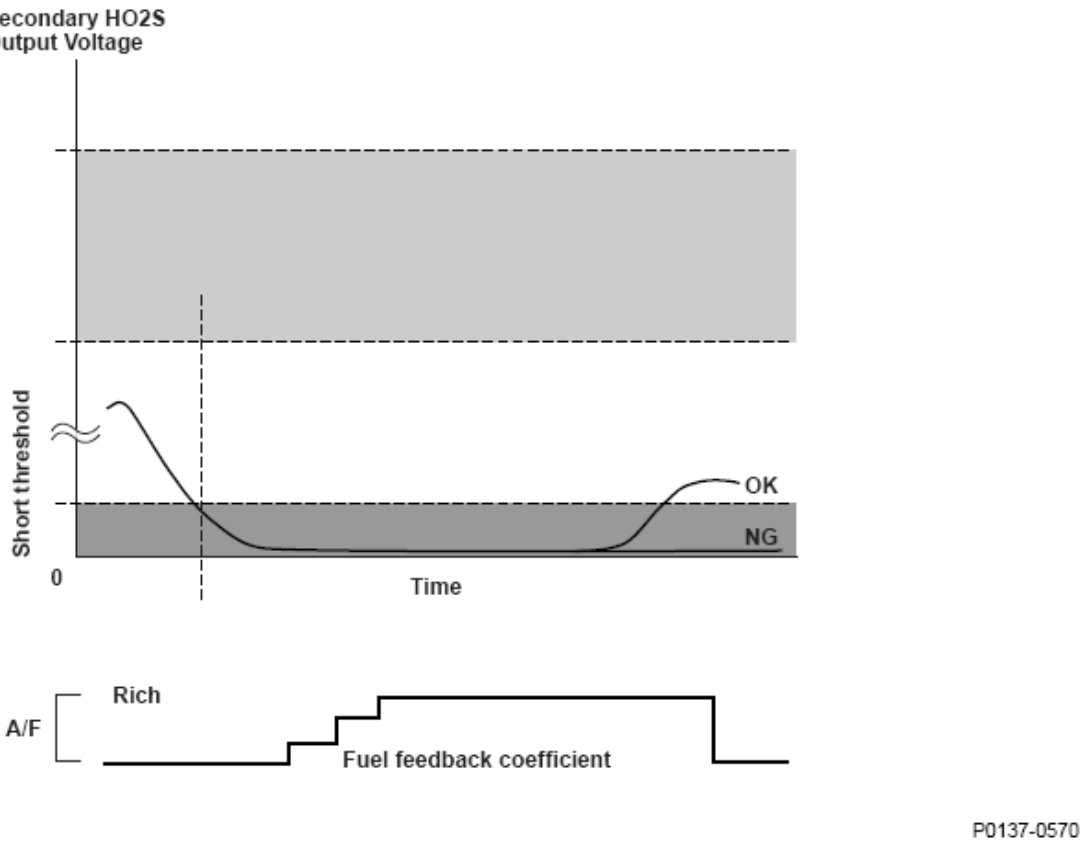

Fig. 317: Secondary HO2S Output Voltage Characteristics Curve

GENERAL DESCRIPTION

The rear secondary heated oxygen sensor (secondary HO2S (bank 1, sensor 2)) detects the oxygen content in the exhaust gas downstream of the warm up three way catalytic converter (WU-TWC) (bank 1) during stoichiometric air/fuel ratio feedback control. The engine control module (ECM)/powertrain control module (PCM) controls the air/fuel ratio from the rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) output voltage so that the WU-TWC efficiency is optimized. After current is applied to the rear secondary HO2S heater, if the rear secondary HO2S output continues to be low (lean) during feedback control, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	35 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time that secondary HO2S activity is not monitored after starting the engine	20 seconds	-
Engine coolant temperature	156 °F (69 °C)	-
Intake air temperature	-13 °F (-25 °C)	-
Fuel trim	0.73	1.47
Fuel feedback	Closed loop	
No active DTCs set (prevents monitor from running)	P0101, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0133, P0134, P0135, P0137, P0138, P0139, P0141, P0171, P0172, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0351, P0352, P0353, P0354, P0355, P0356, P0400, P0401, P0404, P0443, P0496, P0497, P1077, P1078, P1128, P1129, P1172, P145C, P2195, P2237, P2238, P2243, P2245, P2251, P2252, P2279, P2413, P2646, P2647, P2648, P2649, P2A00	
Other	Cruise load or more	

MALFUNCTION THRESHOLD

The rear secondary HO2S output voltage is 0.05 V or less for at least 35 seconds.

DRIVING PATTERN

1. Start the engine, and let it idle until the radiator fan comes on.
2. Drive immediately at a steady engine speed between 1,500 - 3,000 rpm for at least 35 seconds.
    - When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2272: FRONT SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (BANK 2, SENSOR 2)) CIRCUIT SIGNAL STUCK LEAN

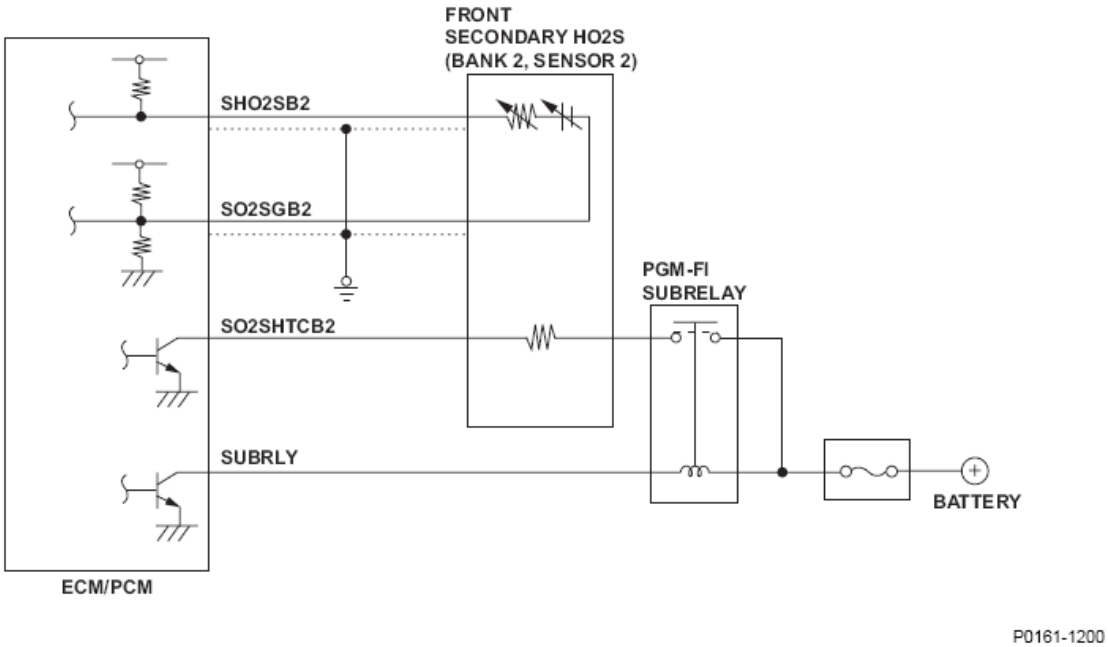

Fig. 318: Front Secondary Heated Oxygen Sensor - Circuit Diagram (Bank 2, Sensor 2)

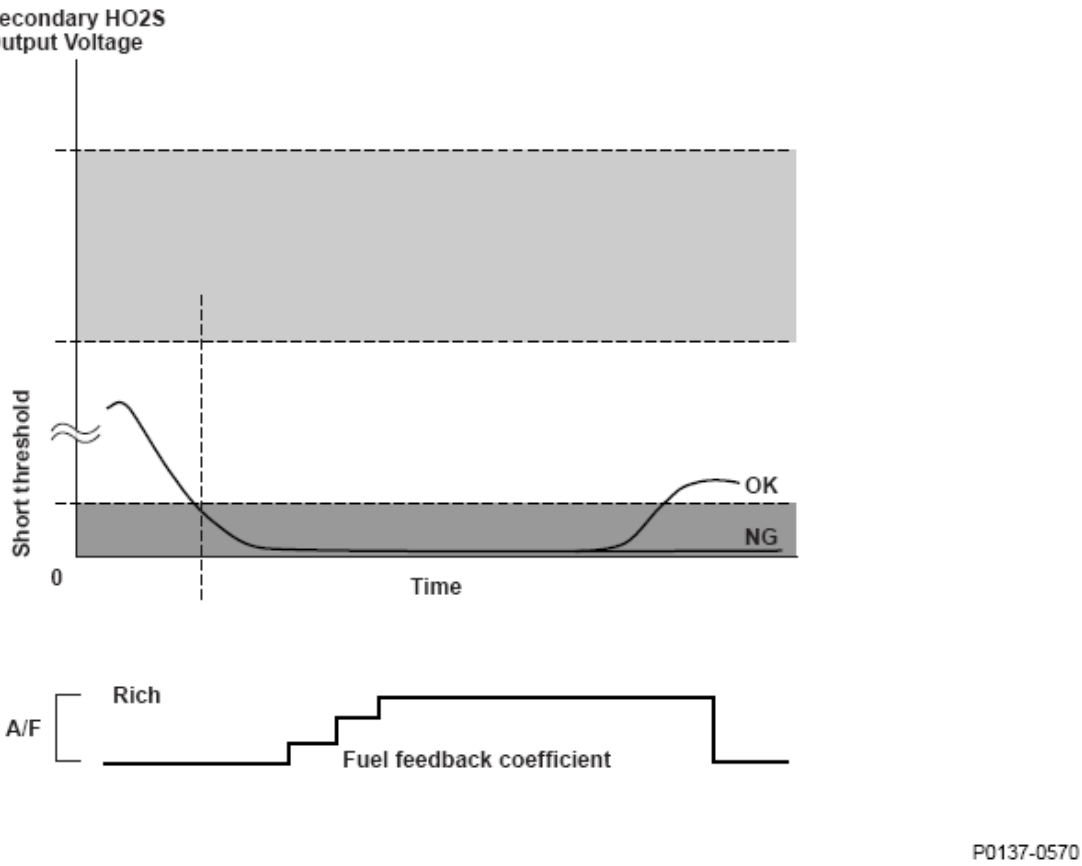

Fig. 319: Secondary HO2S Output Voltage Characteristics Curve

GENERAL DESCRIPTION

The front secondary heated oxygen sensor (secondary HO2S (bank 2, sensor 2)) detects the oxygen content in the exhaust gas downstream of the front warm up three way catalytic converter (WU-TWC) (bank 2) during stoichiometric air/fuel ratio feedback control. The engine control module (ECM)/powertrain control module (PCM) controls the air/fuel ratio from the front air/fuel ratio (A/F) sensor (bank 2, sensor 1) output voltage so that the front WU-TWC efficiency is optimized. After current is applied to the front secondary HO2S heater, if the front secondary HO2S output continues to be low (lean) during feedback control, the ECM/PCM detects a malfunction and stores a DTC.

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2279: INTAKE AIR SYSTEM LEAK (ENGINE TYPE: J35Z6)

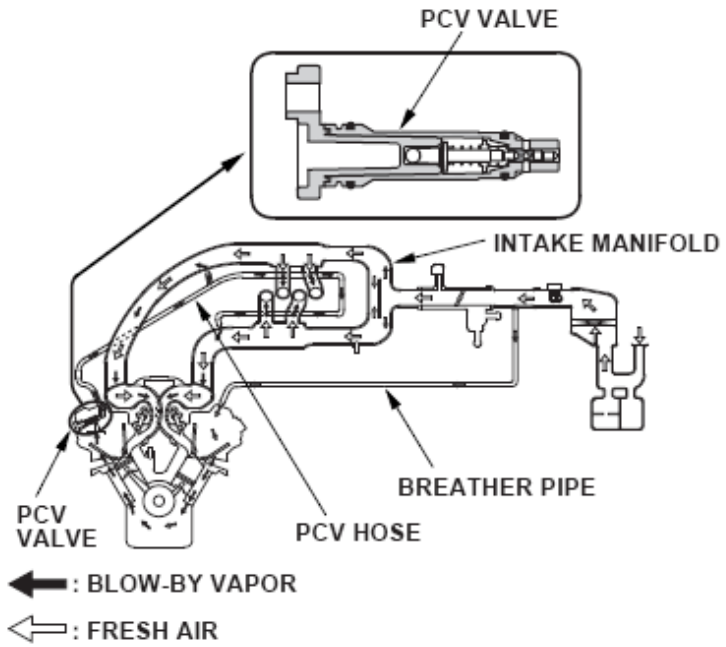

Fig. 320: Intake Air System - Circuit Diagram

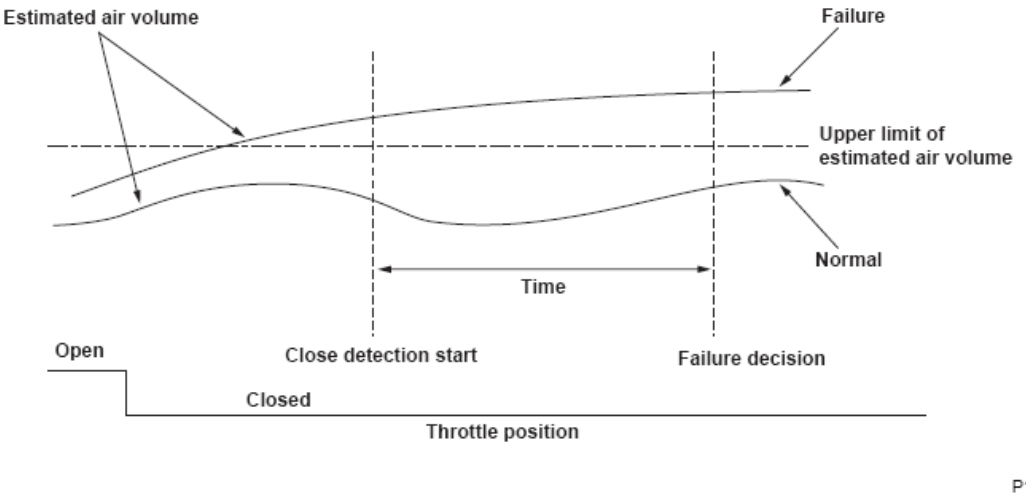

Fig. 321: Intake Air System Characteristics Curve

GENERAL DESCRIPTION

The positive crankcase ventilation (PCV) system reduces hydrocarbon (HC) emissions. The PCV system recirculates unburned air/fuel mixture (blow-by vapor) into the intake manifold so that it is drawn into the engine and burned, thus reducing HC. If the PCV hose comes off at idle with the throttle closed, the amount of air supplied to the engine is considerably more than the amount of air the idle control system supplies. The

powertrain control module (PCM) estimates the amount of air supplied to the engine while the throttle valve is fully closed, and if the estimated amount is more than the upper limit, it detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	22 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time after starting the engine	15 seconds	-
Engine coolant temperature	156 °F (69 °C)	-
Intake air temperature	19 °F (-7 °C)	-
MAP value	-	67 kPa (19.8 inHg, 503 mmHg)
Battery voltage	10.5 V	-
Fuel trim	0.73	1.47
Fuel feedback	Closed loop	
No active DTCs set (prevents monitor from running)	P0101, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0171, P0172, P0174, P0175, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0351, P0352, P0353, P0354, P0355, P0356, P0401, P0404, P0443, P0496, P0497, P060A, P1077, P1078, P1128, P1129, P145C, P1659, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2227, P2228, P2229, P2413, P2646, P2647, P2648, P2649	
Other	At idle	

MALFUNCTION THRESHOLD

Either of these conditions is met:

- The estimated volume of intake air is 185 L/min (196 US qt/min, 163 lmp qt/min) or more when the MAP value is 35 kPa (10.2 inHg, 260 mmHg).
- The estimated volume of intake air is 185 L/min (196 US qt/min, 163 lmp qt/min) or more when the MAP value is 48 kPa (14.2 inHg, 360 mmHg).

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in P or N) until the radiator fan comes

on.

2. Let the engine idle for at least 22 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2279: INTAKE AIR SYSTEM LEAK (ENGINE TYPE: J37A4)

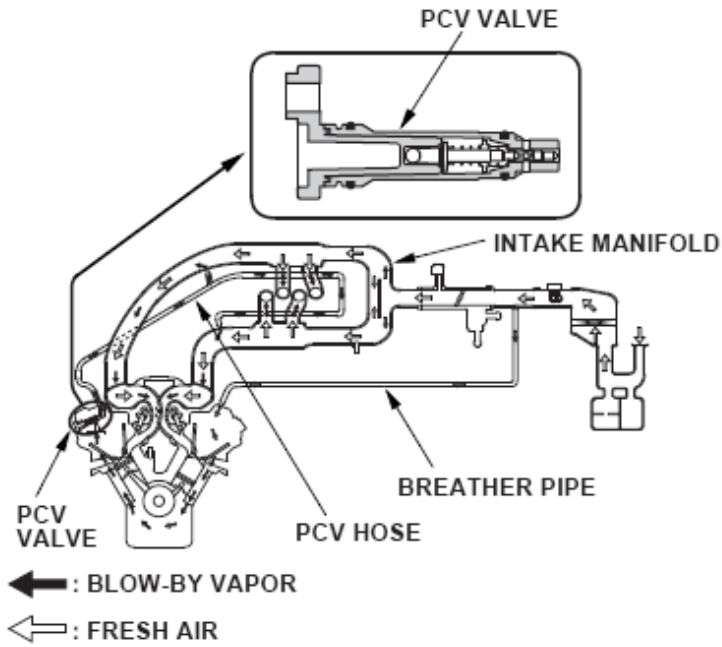

Fig. 322: Intake Air System - Circuit Diagram

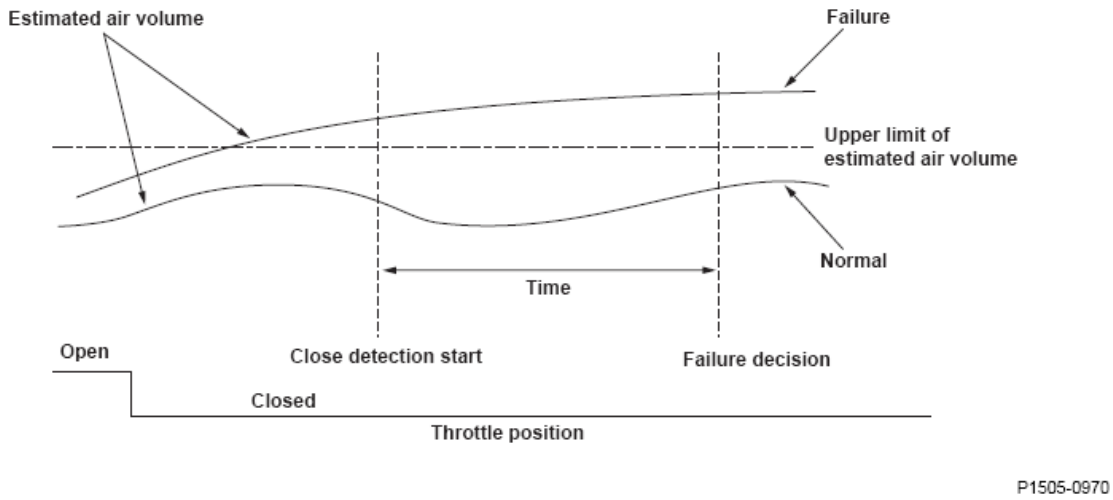

Fig. 323: Intake Air System Characteristics Curve

GENERAL DESCRIPTION

The positive crankcase ventilation (PCV) system reduces hydrocarbon (HC) emissions. The PCV system recirculates unburned air/fuel mixture (blow-by vapor) into the intake manifold so that it is drawn into the engine and burned, thus reducing HC. If the PCV hose comes off at idle with the throttle closed, the amount of air supplied to the engine is considerably more than the amount of air the idle control system supplies. The engine control module (ECM)/powertrain control module (PCM) estimates the amount of air supplied to the engine while the throttle valve is fully closed, and if the estimated amount is more than the upper limit, it detects a malfunction and stores a DTC.

Other	At idle	

MALFUNCTION THRESHOLD

Either of these conditions is met:

- The estimated volume of intake air is 209 L/min (221 US qt/min, 184 lmp qt/min)*1 , 253 L/min (268 US qt/min, 223 lmp qt/min)*2 or more when the MAP value is 35 kPa (10.2 inHg, 260 mmHg).
- The estimated volume of intake air is 209 L/min (221 US qt/min, 184 lmp qt/min)*1 , 253 L/min (268 US qt/min, 223 lmp qt/min)*2 or more when the MAP value is 48 kPa (14.2 inHg, 360 mmHg).

*1 : A/T model

*2 : M/T model

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Let the engine idle for at least 22 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2413: EXHAUST GAS RECIRCULATION (EGR) SYSTEM

MALFUNCTION

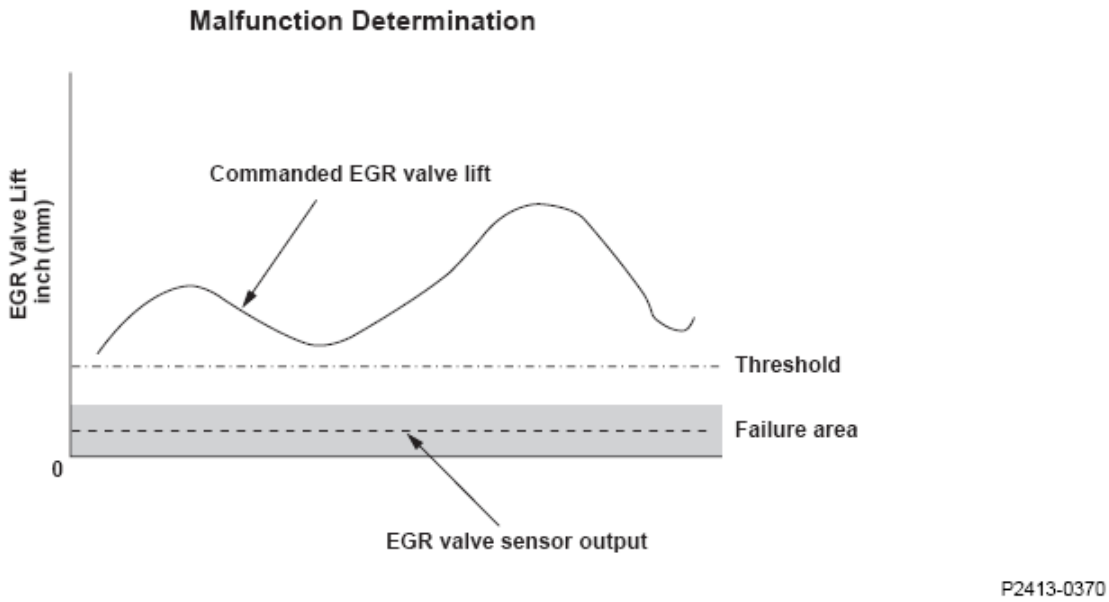

Fig. 324: Exhaust Gas Recirculation System Malfunction Determination Graph

GENERAL DESCRIPTION

The exhaust gas recirculation (EGR) valve, which is controlled by the engine control module (ECM)/powertrain control module (PCM), is opened and the exhaust gas flows through the EGR valve, the intake manifold, and the EGR passage. The exhaust gas is circulated into the air/fuel mixture and the mixture is drawn into the combustion chamber to lower combustion temperatures, thus reducing oxides of nitrogen (NOx) emissions. A sensor (lift sensor) is built into the EGR valve and detects the amount of valve lift. The command value for the target valve lift is stored in the ECM/PCM so that exhaust gas recirculation can be optimized according to driving conditions. Comparing this command value with the lift sensor output signal value, the ECM/PCM controls the EGR valve to make the amount of actual valve lift equal to the command value. If the valve sensor output is insufficient for the commanded valve lift, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	5.0 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	Minimum	Maximum
Engine speed	-	4,600 rpm

Commanded EGR valve lift	0.040 in (1.00 mm)	-
Battery voltage	10.5 V	-
No active DTCs set (prevents monitor from running)	P0101, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0134, P0135, P0154, P0155, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0351, P0352, P0353, P0354, P0355, P0356, P0400, P0401, P0406, P1128, P1129, P1172, P1174, P2195, P2197, P2237, P2238, P2240, P2241, P2243, P2245, P2247, P2249, P2251, P2252, P2254, P2255, P2279	

MALFUNCTION THRESHOLD

If the actual valve lift is 0.005 in (0.15 mm) or less for at least 5.0 seconds, the valve is considered stuck closed.

CONFIRMATION PROCEDURE WITH THE HDS

Do the EGR TEST in the INSPECTION MENU with the HDS.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 5 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2422: EVAPORATIVE EMISSION (EVAP) CANISTER VENT SHUT VALVE STUCK CLOSED MALFUNCTION

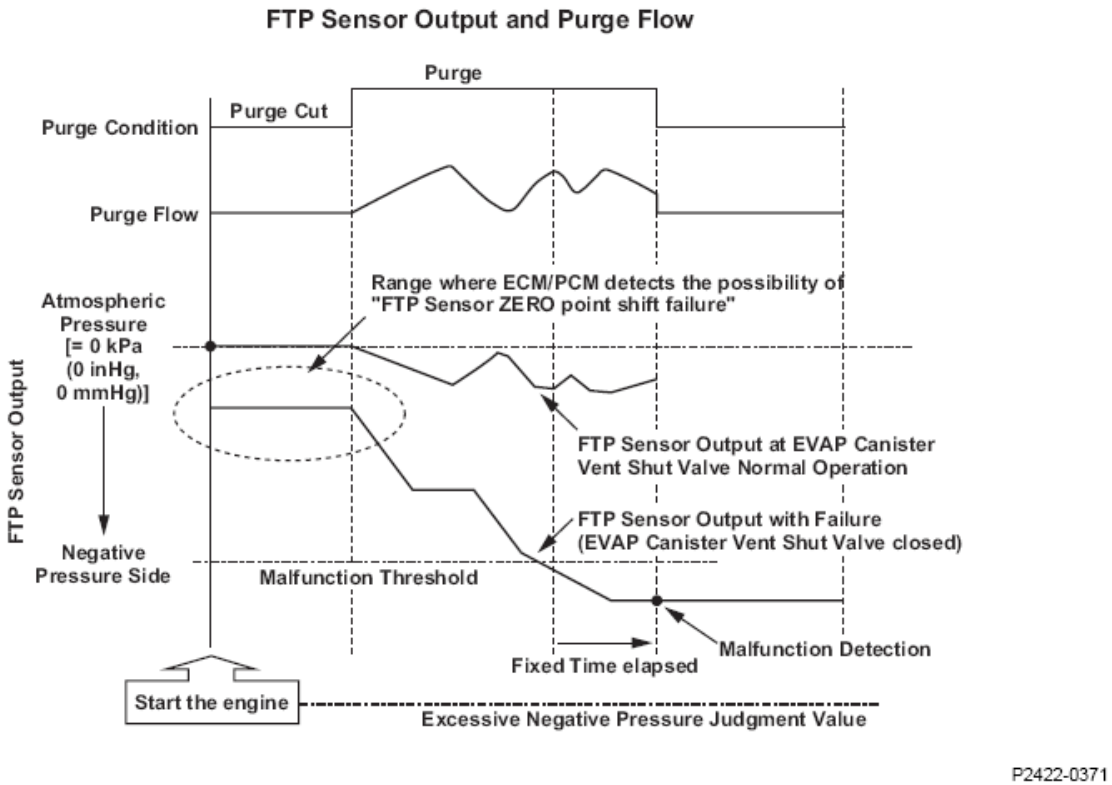

Fig. 325: FTP Sensor Output And Purge Flow Characteristics Curve

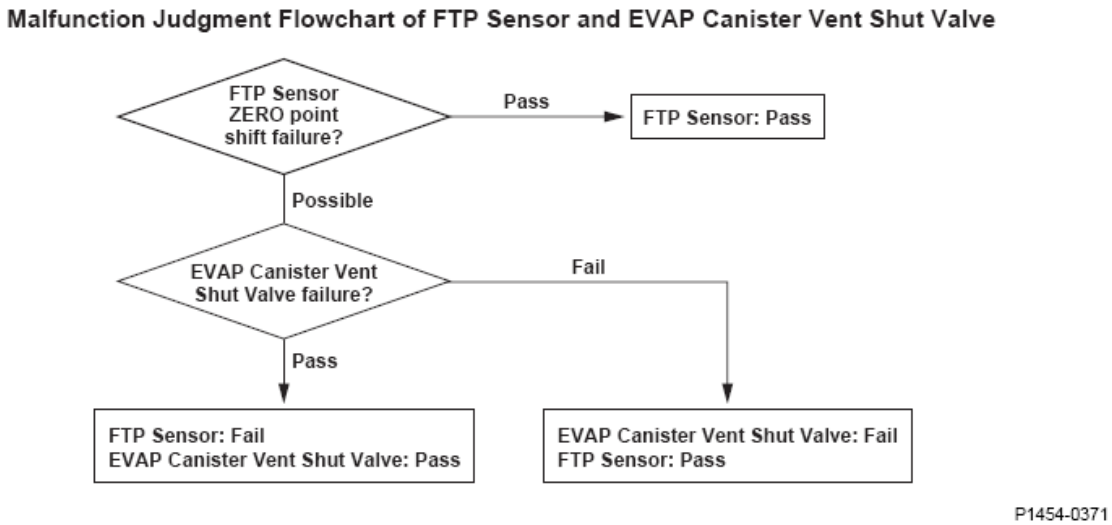

Fig. 326: FTP Sensor And EVAP Canister Vent Shut Valve Malfunction Judgment Flowchart

GENERAL DESCRIPTION

The fuel tank pressure (FTP) sensor output is near atmospheric pressure (0 kPa (0 inHg, 0 mmHg)) before purge starts since the evaporative emission (EVAP) canister vent shut valve is normally open (to the atmosphere). The sensor indicates a negative pressure value (vacuum) while purging. When the FTP sensor indicates vacuum after the engine starts, an FTP sensor zero point shift failure or an EVAP canister vent shut valve stuck closed

can occur. To prevent these failures, the engine control module (ECM)/powertrain control module (PCM) monitors the FTP sensor output after purge starts. The ECM/PCM detects a malfunction of the EVAP canister vent shut valve if the output indicates excessive vacuum. However, if the fuel tank internal pressure is below the specified value (excessive vacuum is detected) when starting the engine, the malfunction detection should be done as follows because it is difficult to distinguish between FTP sensor range problem (P1454) and an EVAP canister vent shut valve stuck closed problem (P2422).

1. If neither Pending DTCs (P1454 nor P2422) are stored, both Pending DTCs are stored when excessive vacuum is detected at engine start.
2. If both Pending DTCs (P1454 and P2422) are stored and excessive vacuum is detected, both Confirmed DTC are stored.
3. If either Pending DTC (p1454 or P2422) is stored and excessive vacuum is detected, the ECM/PCM stores the Confirmed DTC which the Pending DTC is stored.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence(2)	P0452, P0453 are judged as OK
Duration	1.1(1), 10(2) seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)
(1) Elapsed time after the FTP sensor output exceeds the malfunction threshold. (2) Excessive negative pressure is detected.	

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time after starting the engine**	10 seconds	-
Engine coolant temperature(1)	140 °F (60 °C)	-
Battery voltage**	10.5 V	-
Fuel feedback	Closed loop	
No active DTCs set (prevents monitor from running)	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0134, P0135, P0154, P0155, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0351, P0352, P0353, P0354, P0355, P0356, P0443, P0451, P0452, P0453, P0496, P0497, P0498, P0499, P1128, P1129, P1172, P1174, P145C, P2195, P2197, P2227, P2228, P2229, P2237, P2238, P2240, P2241, P2243, P2245, P2247, P2249, P2251, P2252, P2254, P2255, P2279	
Other**	The EVAP canister vent shut valve is open	
	The EVAP canister purge valve is closed (the system is not purging)	

(1) Condition to start the purge control.

MALFUNCTION THRESHOLD

The output from the FTP sensor is -4 kPa (-1.0 inHg, -25 mmHg)*, -2 kPa (-0.4 inHg, -10 mmHg)** or less for at least 1.1*, 10** seconds.

DRIVING PATTERN

1. Start the engine, and let it idle until the radiator fan comes on.
2. When the diagnosis does not finish at idle, drive at 30 - 75 mph (48 - 120 km/h) at EVAP canister purge valve duty 20 % or more.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2610: ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM) IGNITION OFF INTERNAL TIMER MALFUNCTION

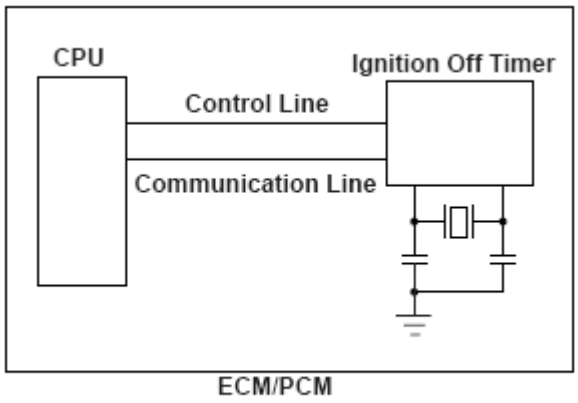

Fig. 327: Engine Control Module/Powertrain Control Module Communication And Control Line

GENERAL DESCRIPTION

The engine control module (ECM)/powertrain control module (PCM) has a built-in ignition off timer that measures the duration of time from ignition off to the next ignition on. The measured duration is used for evaporative emission (EVAP) leak detection and temperature assumption of the catalytic converter. The CPU in the ECM/PCM accesses the ignition off timer when reading the measured duration. If the access process fails, a malfunction is detected and a DTC is stored. When an abnormality is found in the read data, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	
Ignition switch(1)	ON (II) (excludes after battery reconnection)
Engine start/stop button(2)	ON mode (excludes after battery reconnection)
(1) Without keyless access system (2) With keyless access system	

MALFUNCTION THRESHOLD

The access process to the ignition off timer fails, or a malfunction is found in the read data for at least 10 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2646: ROCKER ARM OIL PRESSURE SWITCH CIRCUIT LOW VOLTAGE

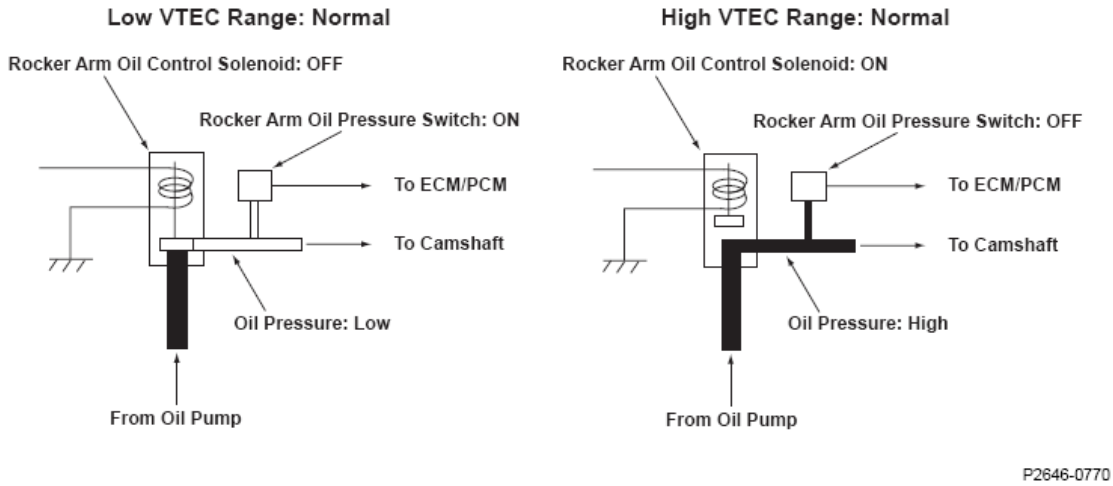

Fig. 328: Rocker Arm Oil Pressure Switch - Circuit Diagram (Low And VTEC Range)

Logic Decision	Rocker Arm Oil Pressure Switch	
	'ON'	'OFF'
Rocker Arm Oil Control Solenoid Command 'ON'	Failure	Normal
Rocker Arm Oil Control Solenoid Command 'OFF'	Normal	Failure

GENERAL DESCRIPTION

The VTEC system activates the rocker arm oil control solenoid with a command from the engine control module (ECM)/powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between Low and High. The ECM/PCM monitors oil pressure in the hydraulic circuit of the VTEC mechanism using the rocker arm oil pressure switch downstream of the rocker arm oil control solenoid. If there is a difference between the oil pressure condition in the hydraulic circuit determined by the ECM/PCM command and the oil pressure condition determined by the status of the rocker arm oil pressure switch, the system is considered faulty, and a DTC is stored.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	3.0 seconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition		Minimum	Maximum
Engine coolant temperature		50 °F (10 °C)	-
Engine speed (High lift cam operation)	J35Z6 engine	4,750 rpm(1)	-
	J37A4 engine		-

		4,700 rpm(1)	
Vehicle speed		7 mph (10 km/h)	-
Battery voltage		10.5 V	-
Shift lever position(2)		Other than P or N	
No active DTCs set (prevents monitor from running)		P2648, P2649	
(1) Variable that is depending on the engine load. (2) A/T model			

MALFUNCTION THRESHOLD

When the rocker arm oil control solenoid is ON, the rocker arm oil pressure switch remains ON.

CONFIRMATION PROCEDURE WITH THE HDS

Do the VTEC TEST in the INSPECTION MENU with the HDS.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Drive the vehicle in a lower gear at 4,750 rpm*2 , 4,700 rpm*3 or more for at least 3 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

*2 : J35Z6 engine

*3 : J37A4 engine

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2647: ROCKER ARM OIL PRESSURE SWITCH CIRCUIT HIGH VOLTAGE

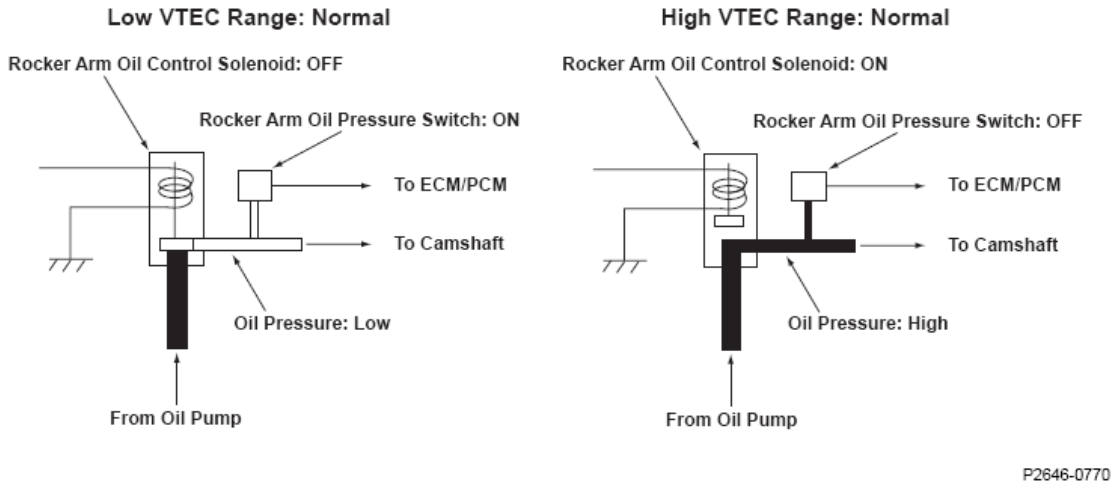

Fig. 329: Rocker Arm Oil Pressure Switch - Circuit Diagram (Low And VTEC Range)

Logic Decision	Rocker Arm Oil Pressure Switch	
	'ON'	'OFF'
Rocker Arm Oil Control Solenoid Command 'ON'	Failure	Normal
Rocker Arm Oil Control Solenoid Command 'OFF'	Normal	Failure

GENERAL DESCRIPTION

The VTEC system activates the rocker arm oil control solenoid with a command from the engine control module (ECM)/powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between Low and High. The ECM/PCM monitors oil pressure in the hydraulic circuit of the VTEC mechanism using the rocker arm oil pressure switch downstream of the rocker arm oil control solenoid. If there is a difference between the oil pressure condition in the hydraulic circuit determined by the ECM/PCM command and the oil pressure condition determined by the status of the rocker arm oil pressure switch, the system is considered faulty, and a DTC is stored.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	7.0 seconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	10.5 V	-
No active DTCs set (prevents monitor from running)	P2648, P2649	
Other	At idle	

MALFUNCTION THRESHOLD

When the rocker arm oil control solenoid is OFF, the rocker arm oil pressure switch remains OFF.

DRIVING PATTERN

Start the engine, and let it idle for at least 7 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2648: ROCKER ARM OIL CONTROL SOLENOID CIRCUIT LOW VOLTAGE

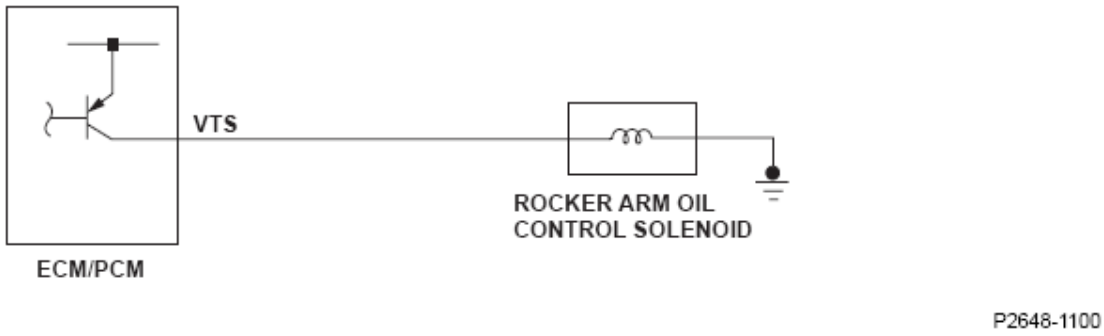

Fig. 330: Rocker Arm Oil Control Solenoid - Circuit Diagram

GENERAL DESCRIPTION

The VTEC system activates the rocker arm oil control solenoid by a command from the engine control module (ECM)/powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between low and high. If the return signal is OFF (low) when the ECM/PCM outputs the ON (high) signal to the rocker arm oil control solenoid, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous

Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
No active DTCs set (prevents monitor from running)	P2649	

MALFUNCTION THRESHOLD

The return signal is OFF (low) for at least 2.0 seconds when the ECM/PCM outputs the ON (high) signal to the rocker arm oil control solenoid.

CONFIRMATION PROCEDURE WITH THE HDS

Do the VTEC TEST in the INSPECTION MENU with the HDS.

DRIVING PATTERN

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Drive the vehicle in a lower gear at 4,800 rpm or more for at least 10 seconds.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2649: ROCKER ARM OIL CONTROL SOLENOID CIRCUIT HIGH VOLTAGE

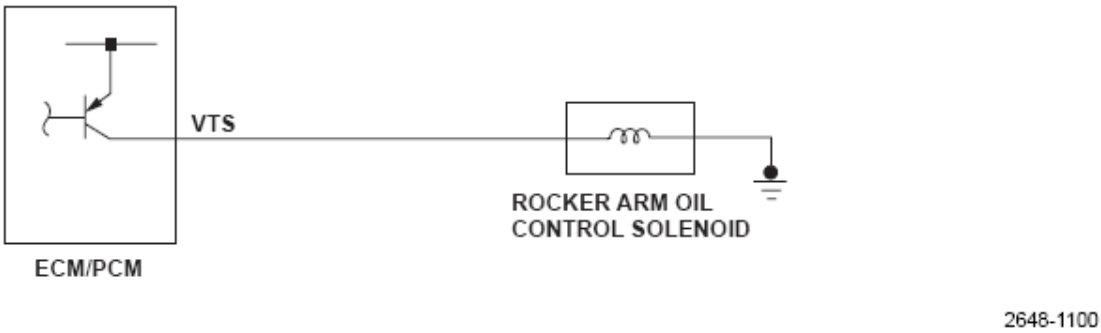

Fig. 331: Rocker Arm Oil Control Solenoid - Circuit Diagram

GENERAL DESCRIPTION

The VTEC system activates the rocker arm oil control solenoid by a command from the engine control module (ECM)/powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between low and high. If the return signal is ON (high) when the ECM/PCM outputs the OFF (low) signal to the rocker arm oil control solenoid, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
State of the engine	Running	
No active DTCs set (prevents monitor from running)	P2648	

MALFUNCTION THRESHOLD

The return signal is ON (high) for at least 2.0 seconds when the ECM/PCM outputs the OFF (low) signal to the rocker arm oil control solenoid.

DRIVING PATTERN

Start the engine, and let it idle for at least 10 seconds.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2714: A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE D STUCK OFF

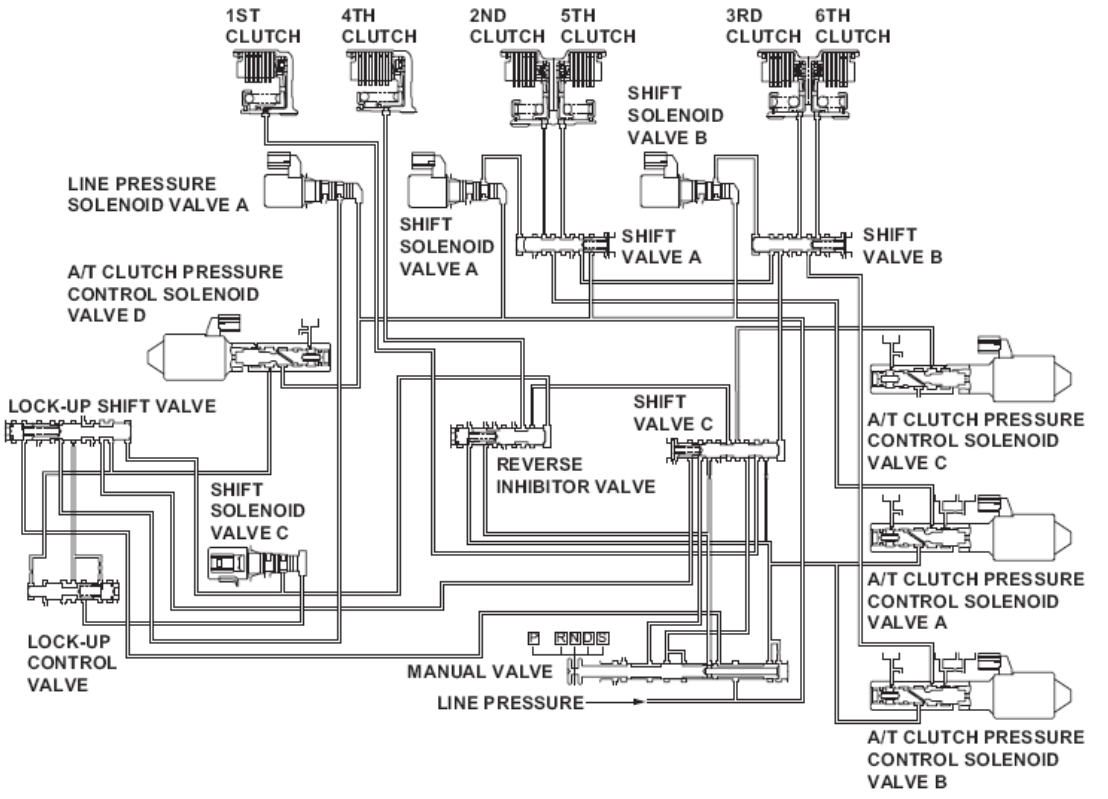

Fig. 332: A/T Clutch Pressure Control Solenoid Valve - System Diagram

HYDRAULIC PRESSURE SUPPLY TO CLUTCH BY SHIFT SOLENOID VALVE OUTPUT

Gear position		Neutral-1st	1st	Neutral-Reverse	Reverse
Shift solenoid valve	A	ON	ON	ON	OFF
	B	OFF	ON	OFF	OFF
	C	OFF	OFF	ON	ON
1st clutch		CPCD	LINE	-	-

4th clutch	-	-	CPCD	LINE

LINE: Line pressure
CPCD: A/T clutch pressure control solenoid valve D pressure

GENERAL DESCRIPTION

A/T clutch pressure control solenoid valve D is installed on the transmission housing. A/T clutch pressure control solenoid valve D is operated by the powertrain control module (PCM) and converts line pressure to A/T clutch pressure control solenoid valve D pressure. A signal from the PCM is output to A/T clutch pressure control solenoid valve D to supply proper A/T clutch pressure control solenoid valve D pressure to the correct gear clutch according to the shift schedule and the driving conditions. When the current from the PCM is high (ON), A/T clutch pressure control solenoid valve D operates and A/T clutch pressure control solenoid valve D pressure increases. When the current from the PCM is low (OFF), A/T clutch pressure control solenoid valve D turns off and A/T clutch pressure control solenoid valve D pressure decreases. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed according to the shift status determined by the shift schedule. When an improper gear ratio is output for the shift schedule, the PCM detects an A/T clutch pressure control solenoid valve D stuck off failure and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution		Continuous
Sequence		None
Duration	Symptom 1-A	10 seconds or more
	Symptom 1-B	3 seconds or more
	Symptom 2-A	10 seconds or more
	Symptom 2-B	
DTC Type		Two drive cycles, MIL on, D indicator blinks
OBD Status		PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
ATF temperature	-4 °F (-20 °C)	248 °F (120 °C)
Vehicle speed	-	3 mph (4 km/h)
Battery voltage	11 V	-
Shift lever position	D, S, R	
No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P0705, P0716, P0717, P0718, P0721, P0722, P0723, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0797, P0842, P0843, P0847, P0848, P0872, P0873, P0877, P0878, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0989, P0990, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2720, P2721	

MALFUNCTION THRESHOLD

One of these symptoms occurs:

SYMPTOM 1 (SYMPTOM 1-B OCCURS AFTER SYMPTOM 1-A OCCURRED)

Symptom		Gear position commanded by the PCM	Actual gear position
1	1-A	Reverse gear in-gear	Neutral
	1-B	Reverse gear in-gear	Reverse gear in-gear

SYMPTOM 2 (SYMPTOM 2-B OCCURS AFTER SYMPTOM 2-A OCCURRED)

Symptom		Gear position commanded by the PCM	Actual gear position
2	2-A	1st gear in-gear	Neutral
	2-B	Reverse gear in-gear	Neutral

DRIVING PATTERN

1. Start the engine.
2. With the brake pedal pressed, shift the transmission to 1st gear.
3. With the brake pedal pressed, shift to R.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2720: PROBLEM IN A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE D CIRCUIT

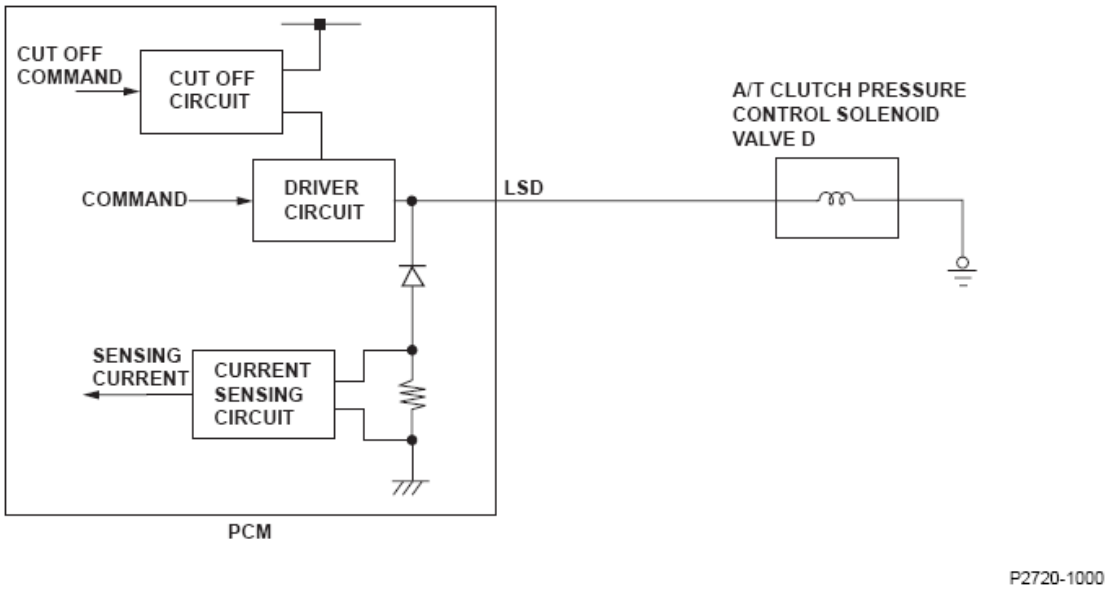

Fig. 333: A/T Clutch Pressure Control Solenoid Valve D - Circuit Diagram

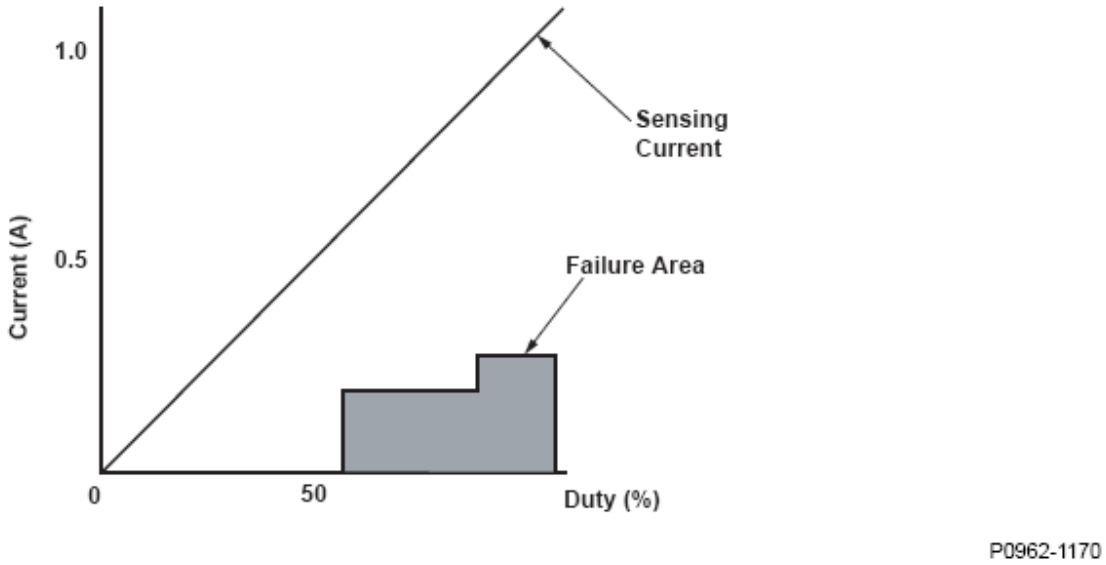

Fig. 334: Current Versus Duty Ratio Graph With Failure Area

GENERAL DESCRIPTION

A/T clutch pressure control solenoid valve D is used for clutch pressure control. A spool in A/T clutch pressure control solenoid valve D pushes the valve according to the duty cycle that is controlled by the powertrain control module (PCM) (The hydraulic pressure is proportional to the current). The PCM measures the current flowing through A/T clutch pressure control solenoid valve D, and uses feedback control to compensate for the difference between the actual current and the commanded one. If the measured current for the PCM output duty cycle is not within a specified range (circuit short or open), the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0962, P0963, P0973, P0974, P0979, P0980, P2721	

MALFUNCTION THRESHOLD

The measured current for the PCM's command value is as specified here for at least 1 second.

Duty (%)	Current (A)	Failure mode
56.5 - 89	Less than 0.19	Low Input
More than 89	Less than 0.27	Low Input

DRIVING PATTERN

Start the engine, and wait for at least 1 second.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2721: PROBLEM IN A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE D

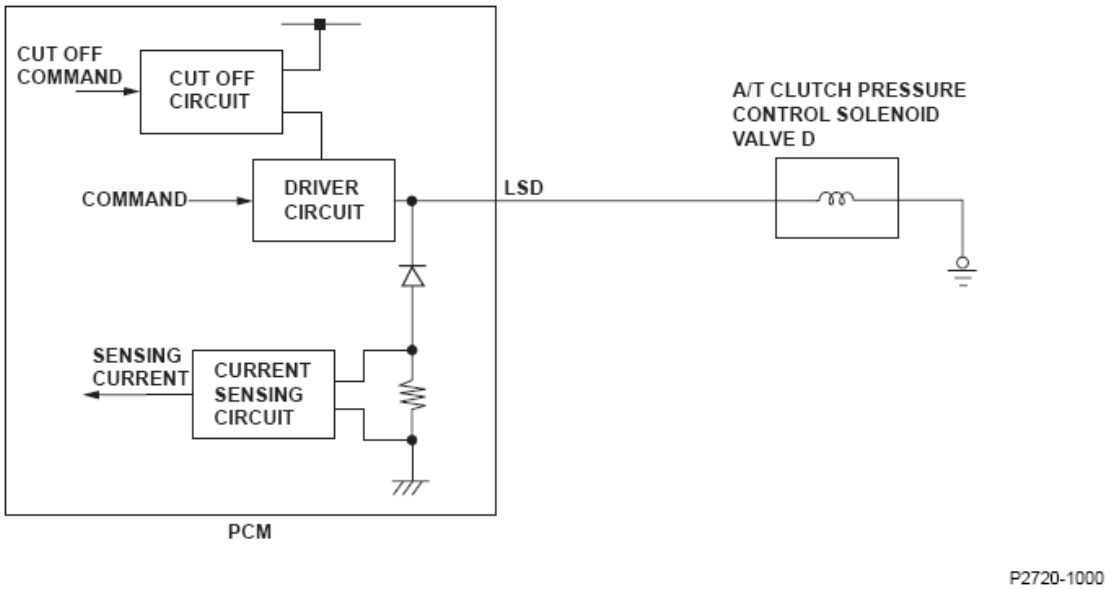

Fig. 335: A/T Clutch Pressure Control Solenoid Valve D - Circuit Diagram

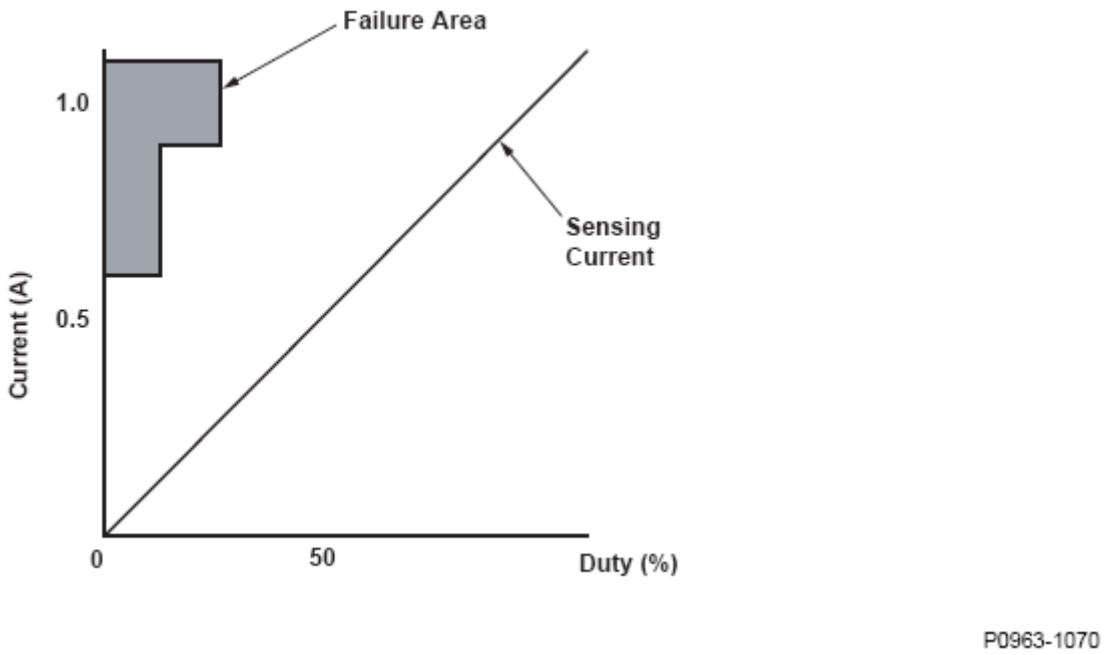

Fig. 336: Current Versus Duty Ratio Graph With Failure Area

GENERAL DESCRIPTION

A/T clutch pressure control solenoid valve D is used for clutch pressure control. A spool in A/T clutch pressure control solenoid valve D pushes the valve according to the duty cycle that is controlled by the powertrain control module (PCM) (The hydraulic pressure is proportional to the current). The PCM measures the current flowing through A/T clutch pressure control solenoid valve D, and uses feedback control to compensate for the difference between the actual current and the commanded one. If the measured current for the PCM output duty cycle is not within a specified range (circuit short or open), the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0962, P0963, P0973, P0974, P0979, P0980, P2720	

MALFUNCTION THRESHOLD

The measured current for the PCM's command value is as specified here for at least 1 second.

Duty (%)	Current (A)	Failure mode
Less than 13.7	More than 0.6	High Input
13.7 - 27	More than 0.9	High Input

DRIVING PATTERN

Start the engine, and wait for at least 1 second.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2821: LINE PRESSURE SOLENOID VALVE A STUCK ON

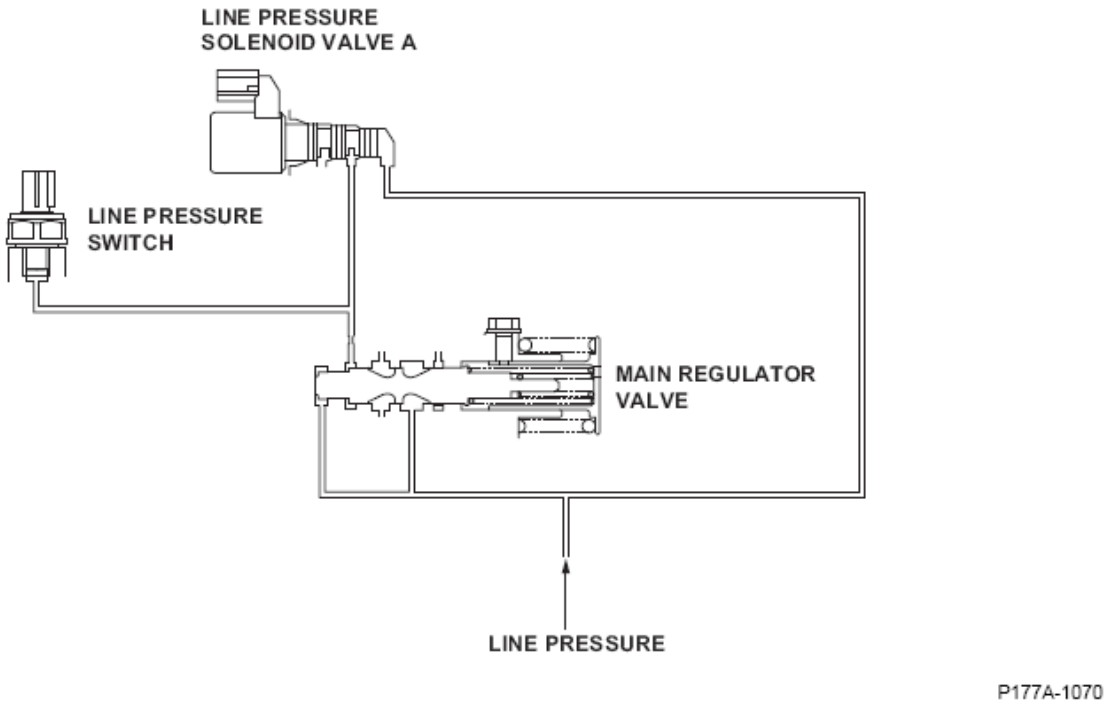

Fig. 337: Line Pressure Solenoid Valve A - System Diagram

LINE PRESSURE MODE COMBINATION TABLE

	Normal line pressure mode	Low line pressure mode
Line pressure solenoid valve A	OFF	ON
Line pressure switch	OFF	ON
Line pressure condition	Normal	Low

GENERAL DESCRIPTION

Line pressure solenoid valve A is installed on the transmission housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to regulate line pressure to low line pressure or normal line pressure. The line pressure switch is installed in the hydraulic pressure output circuit from line pressure solenoid valve A. The signal to line pressure solenoid valve A from the PCM is output to regulate line pressure to proper pressure according to the driving conditions. When line pressure solenoid valve A outputs hydraulic pressure, the line pressure is regulated to low line pressure and the switch is turned on. When line pressure solenoid valve A does not output hydraulic pressure, the line pressure is at normal line pressure and the switch is turned off. If the line pressure switch is on against the command to turn off line pressure solenoid valve A, the PCM detects a line pressure solenoid valve A stuck on failure and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on, D indicator blinks

OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P0122, P0123, P0222, P0223, P0716, P0717, P0718, P0721, P0722, P0723, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0776, P0777, P0796, P0797, P0842, P0843, P0847, P0848, P0872, P0873, P0877, P0878, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0989, P0990, P1658, P1659, P1683, P1684, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2714, P2720, P2721	

MALFUNCTION THRESHOLD

The input signal from the line pressure switch to the PCM is high during the self shut down mode after the signal is low when the normal line pressure mode was commanded.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D until the transmission shifts into 6th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2826: SHORT IN LINE PRESSURE SOLENOID VALVE A CIRCUIT

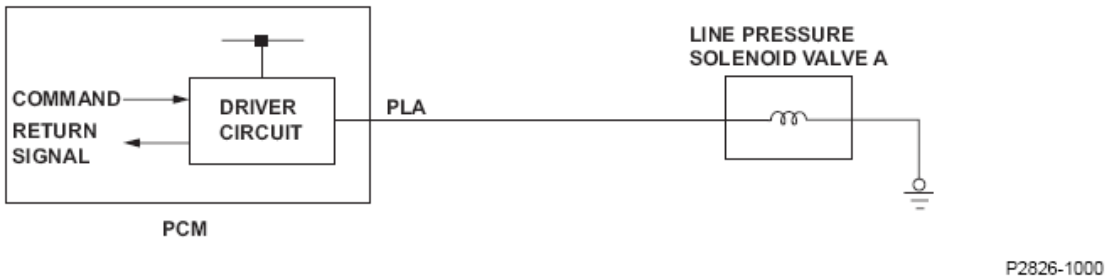

Fig. 338: Line Pressure Solenoid Valve A - Circuit Diagram

LINE PRESSURE MODE COMBINATION TABLE

	Normal line pressure mode	Low line pressure mode
Line pressure solenoid valve A	OFF	ON
Line pressure switch	OFF	ON
Line pressure condition	Normal	Low

GENERAL DESCRIPTION

Line pressure solenoid valve A is installed on the transmission housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to regulate line pressure to low line pressure or to normal line pressure. The PCM commands the driver circuit to turn on line pressure solenoid valve A. The circuit detects malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. When the return signal does not match the PCM command to turn on line pressure solenoid valve A, the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	Two drive cycles, MIL off, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P2827	

MALFUNCTION THRESHOLD

The return signal does not match the command to turn on line pressure solenoid valve A for at least 1 second.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D until the transmission shifts into 6th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2827: OPEN IN LINE PRESSURE SOLENOID VALVE A CIRCUIT

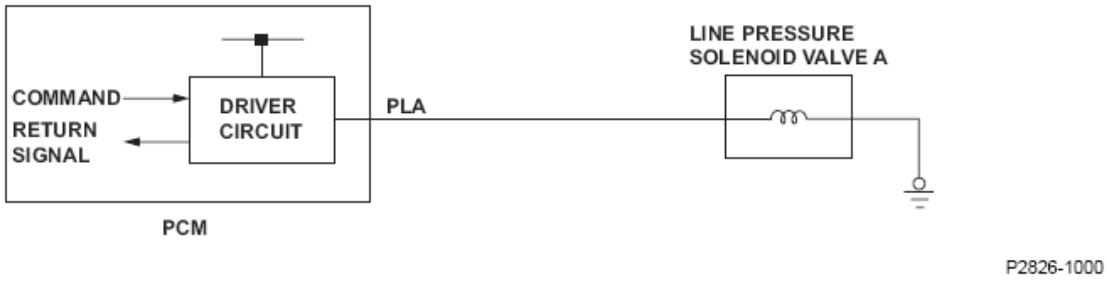

Fig. 339: Line Pressure Solenoid Valve A - Circuit Diagram

LINE PRESSURE MODE COMBINATION TABLE

	Normal line pressure mode	Low line pressure mode
Line pressure solenoid valve A	OFF	ON
Line pressure switch	OFF	ON
Line pressure condition	Normal	Low

GENERAL DESCRIPTION

Line pressure solenoid valve A is installed on the transmission housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to regulate line pressure to low line pressure or to normal line pressure. The PCM commands the driver circuit to turn on line pressure solenoid valve A. The circuit detects malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. When the return signal does not match the PCM command to turn off line pressure solenoid valve A, the PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	Two drive cycles, MIL off, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	11 V	-
No active DTCs set (prevents monitor from running)	P2826	

MALFUNCTION THRESHOLD

The return signal does not match the command to turn off line pressure solenoid valve A for at least 1 second.

DRIVING PATTERN

1. Start the engine.
2. Drive the vehicle in D until the transmission shifts into 6th gear.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2A00: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) CIRCUIT RANGE/PERFORMANCE PROBLEM (ENGINE TYPE: J35Z6)

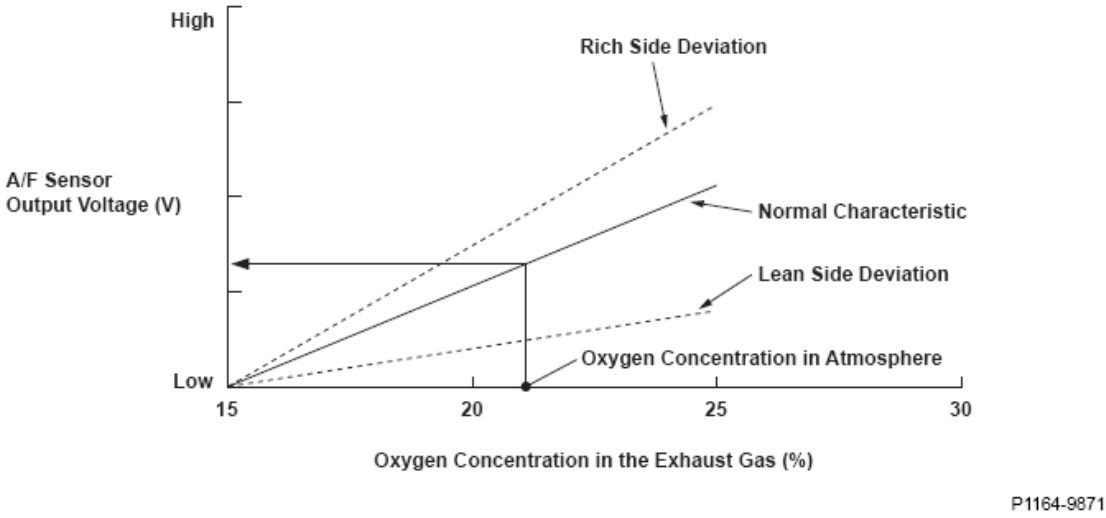

Fig. 340: A/F Sensor Output Voltage Versus Exhaust Gas Oxygen Concentration Ratio Graph

GENERAL DESCRIPTION

The rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) has a linear signal output in relation to the oxygen concentration. The powertrain control module (PCM) computes the air/fuel ratio from the rear A/F sensor output voltage and uses fuel feedback control to improve exhaust emissions. The PCM monitors the rear A/F sensor output voltage during deceleration with the throttle fully closed, and if the output voltage deviates greatly from normal oxygen concentration levels, it detects a malfunction and stores a DTC.

NOTE: Output to the scan tool exhibits a relationship between the rear A/F sensor output and oxygen concentration, which is opposite to the characteristic shown in the graph. That is, a deviation toward the rich side increases the output voltage and one toward the lean side decreases the output voltage, as the stoichiometric ratio is 0.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	5.3 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time after starting the engine	60 seconds	-
Engine coolant temperature	156 °F (69 °C)	-

Intake air temperature	-13 °F (-25 °C)	-
Engine speed	-	2,100 rpm
Vehicle speed	30 mph (48 km/h)	-
Fuel feedback	During deceleration	
No active DTCs set (prevents monitor from running)	P0112, P0113, P0117, P0118, P0122, P0123, P0133, P0134, P0135, P0171, P0172, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0351, P0352, P0353, P0443, P0496, P0497, P060A, P0722, P1172, P145C, P1659, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2195, P2227, P2228, P2229, P2237, P2238, P2243, P2245, P2251, P2252, P2279	

MALFUNCTION THRESHOLD

The rear A/F sensor (bank 1, sensor 1) output voltage is 2.55 V or less, or 4.50 V or more.

DRIVING PATTERN

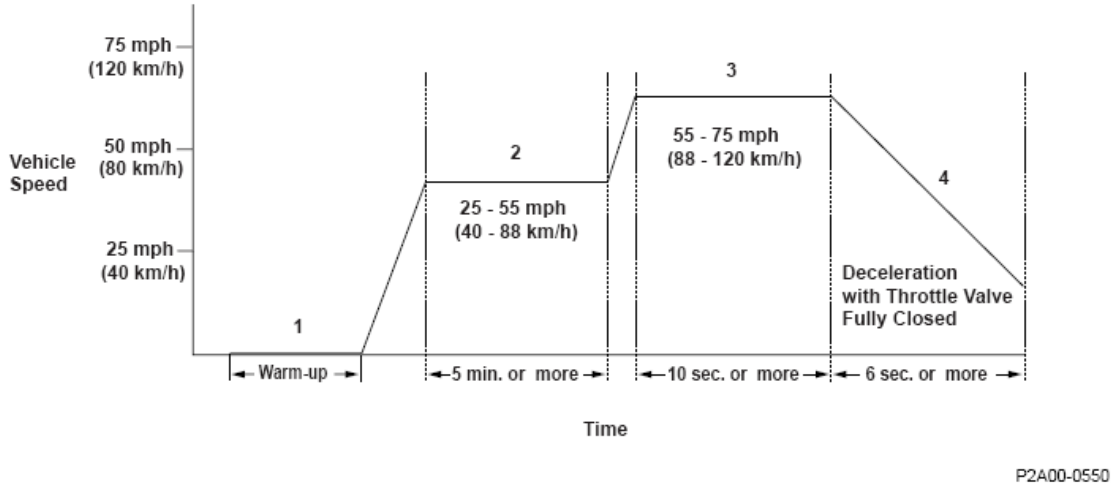

Fig. 341: Vehicle Speed Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in P or N) until the radiator fan comes on.
2. Drive the vehicle at a speed between 25 - 55 mph (40 - 88 km/h) for at least 5 minutes.
3. Drive immediately at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
4. Decelerate with the throttle valve fully closed for at least 6 seconds.
    - If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2A00: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) CIRCUIT RANGE/PERFORMANCE PROBLEM (ENGINE TYPE: J37A4)

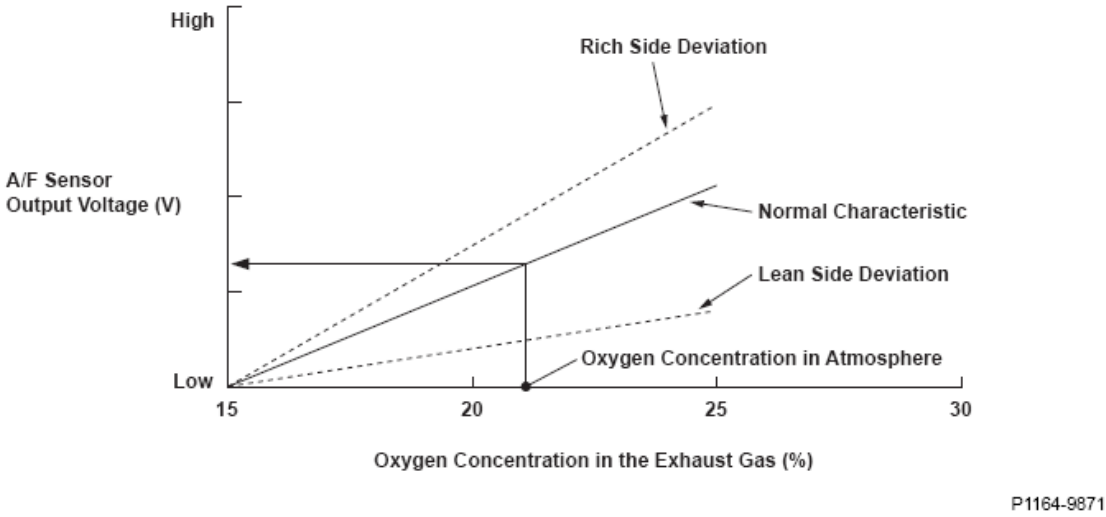

Fig. 342: A/F Sensor Output Voltage Versus Exhaust Gas Oxygen Concentration Ratio Graph

GENERAL DESCRIPTION

The rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) has a linear signal output in relation to the oxygen concentration. The engine control module (ECM)/powertrain control module (PCM) computes the air/fuel ratio from the rear A/F sensor output voltage and uses fuel feedback control to improve exhaust emissions. The ECM/PCM monitors the rear A/F sensor output voltage during deceleration with the throttle fully closed, and if the output voltage deviates greatly from normal oxygen concentration levels, it detects a malfunction and stores a DTC.

NOTE: Output to the scan tool exhibits a relationship between the rear A/F sensor output and oxygen concentration, which is opposite to the characteristic shown in the graph. That is, a deviation toward the rich side increases the output voltage and one toward the lean side decreases the output voltage, as the stoichiometric ratio is 0.

Vehicle speed	30 mph (48 km/h)	-
Fuel feedback	During deceleration	
No active DTCs set (prevents monitor from running)	P0112, P0113, P0117, P0118, P0122, P0123, P0133, P0134, P0135, P0171, P0172, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0351, P0352, P0353, P0443, P0496, P0497, P060A, P0720, P0722, P1172, P145C, P1659, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2195, P2227, P2228, P2229, P2237, P2238, P2243, P2245, P2251, P2252, P2279	

(1) A/T model

(2) M/T model

MALFUNCTION THRESHOLD

The rear A/F sensor (bank 1, sensor 1) output voltage is 2.55 V or less, or 4.50 V or more.

DRIVING PATTERN

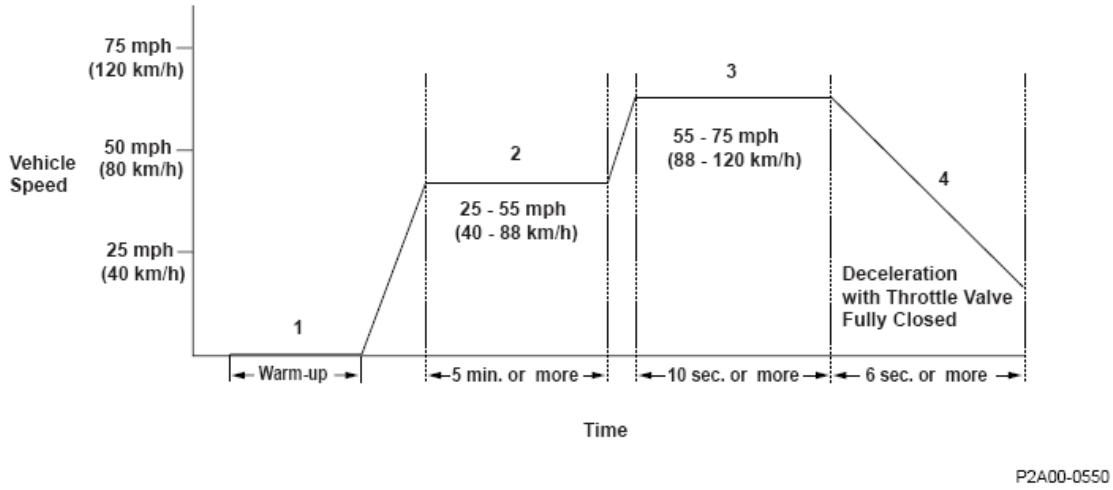

Fig. 343: Vehicle Speed Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 25 - 55 mph (40 - 88 km/h) for at least 5 minutes.
3. Drive immediately at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
4. Decelerate with the throttle valve fully closed for at least 6 seconds.
    - If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2A03: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) CIRCUIT RANGE/PERFORMANCE PROBLEM (ENGINE TYPE: J35Z6)

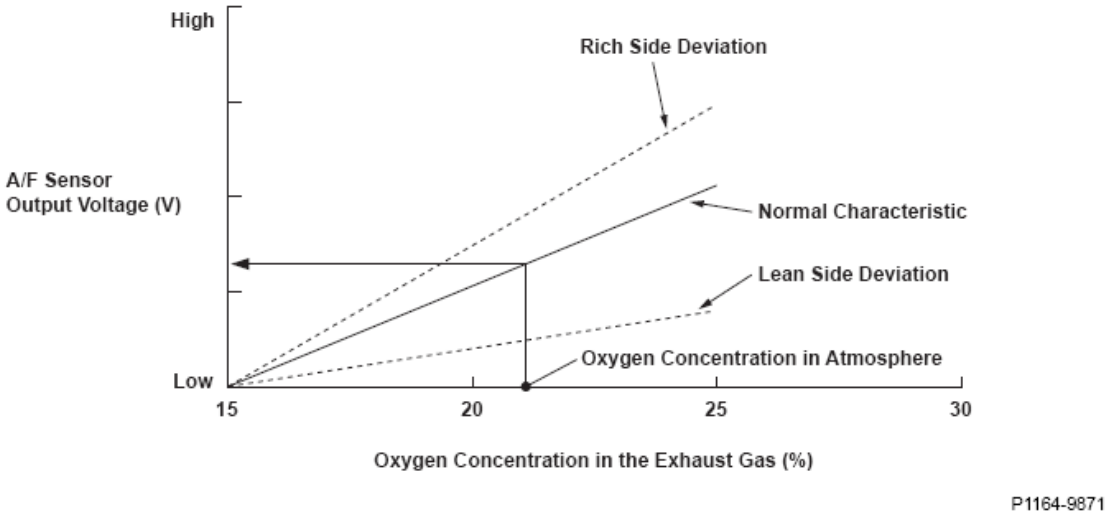

Fig. 344: A/F Sensor Output Voltage Versus Exhaust Gas Oxygen Concentration Ratio Graph

GENERAL DESCRIPTION

The front air/fuel ratio (A/F) sensor (bank 2, sensor 1) has a linear signal output in relation to the oxygen concentration. The powertrain control module (PCM) computes the air/fuel ratio from the front A/F sensor output voltage and uses fuel feedback control to improve exhaust emissions. The PCM monitors the front A/F sensor output voltage during deceleration with the throttle fully closed, and if the output voltage deviates greatly from normal oxygen concentration levels, it detects a malfunction and stores a DTC.

NOTE: Output to the scan tool exhibits a relationship between the front A/F sensor output and oxygen concentration, which is opposite to the characteristic shown in the graph. That is, a deviation toward the rich side increases the output voltage and one toward the lean side decreases the output voltage, as the stoichiometric ratio is 0.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Once per driving cycle
Sequence	None
Duration	5.3 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time after starting the engine	60 seconds	-
Engine coolant temperature	156 °F (69 °C)	-

Intake air temperature	-13 °F (-25 °C)	-
Engine speed	-	2,100 rpm
Vehicle speed	30 mph (48 km/h)	-
Fuel feedback	During deceleration	
No active DTCs set (prevents monitor from running)	P0112, P0113, P0117, P0118, P0122, P0123, P0153, P0154, P0155, P0174, P0175, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0354, P0355, P0356, P0443, P0496, P0497, P060A, P0722, P1174, P145C, P1659, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2197, P2227, P2228, P2229, P2240, P2241, P2247, P2249, P2254, P2255, P2279	

MALFUNCTION THRESHOLD

The front A/F sensor (bank 2, sensor 1) output voltage is 2.55 V or less, or 4.50 V or more.

DRIVING PATTERN

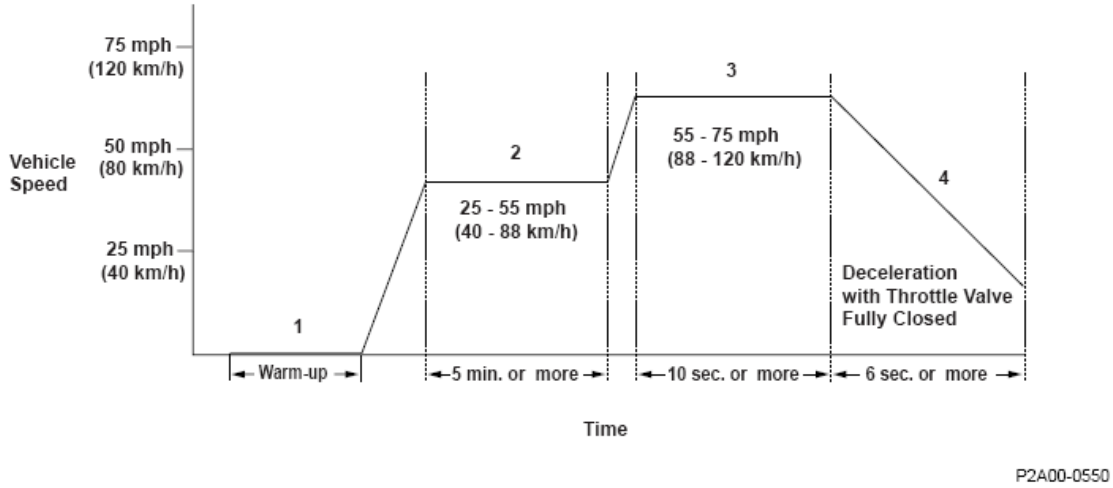

Fig. 345: Vehicle Speed Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in P or N) until the radiator fan comes on.
2. Drive the vehicle at a speed between 25 - 55 mph (40 - 88 km/h) for at least 5 minutes.
3. Drive immediately at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
4. Decelerate with the throttle valve fully closed for at least 6 seconds.
    - If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC P2A03: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) CIRCUIT RANGE/PERFORMANCE PROBLEM (ENGINE TYPE: J37A4)

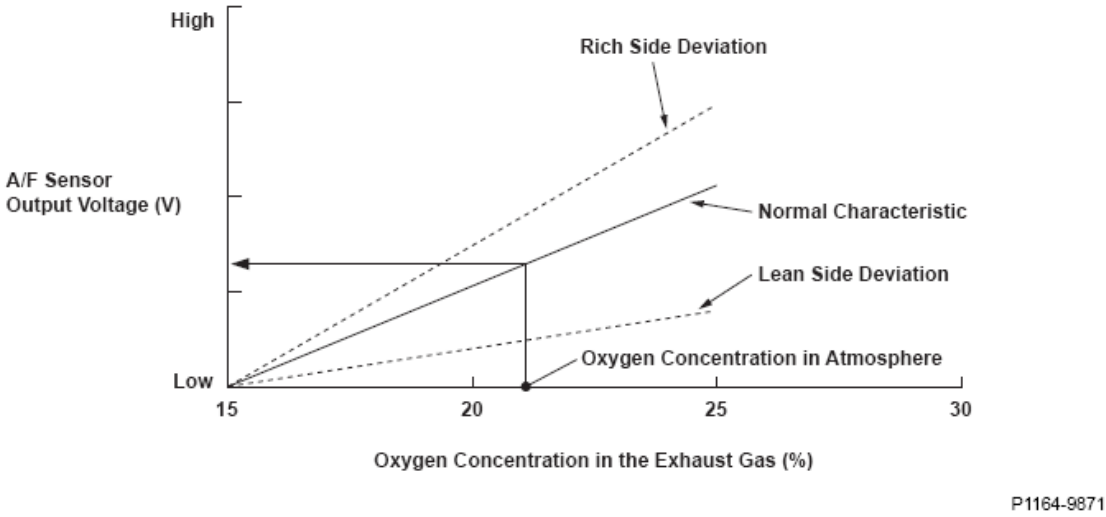

Fig. 346: A/F Sensor Output Voltage Versus Exhaust Gas Oxygen Concentration Ratio Graph

GENERAL DESCRIPTION

The front air/fuel ratio (A/F) sensor (bank 2, sensor 1) has a linear signal output in relation to the oxygen concentration. The engine control module (ECM)/powertrain control module (PCM) computes the air/fuel ratio from the front A/F sensor output voltage and uses fuel feedback control to improve exhaust emissions. The ECM/PCM monitors the front A/F sensor output voltage during deceleration with the throttle fully closed, and if the output voltage deviates greatly from normal oxygen concentration levels, it detects a malfunction and stores a DTC.

NOTE: Output to the scan tool exhibits a relationship between the front A/F sensor output and oxygen concentration, which is opposite to the characteristic shown in the graph. That is, a deviation toward the rich side increases the output voltage and one toward the lean side decreases the output voltage, as the stoichiometric ratio is 0.

(1) A/T model

(2) M/T model

MALFUNCTION THRESHOLD

The front A/F sensor (bank 2, sensor 1) output voltage is 2.55 V or less, or 4.50 V or more.

DRIVING PATTERN

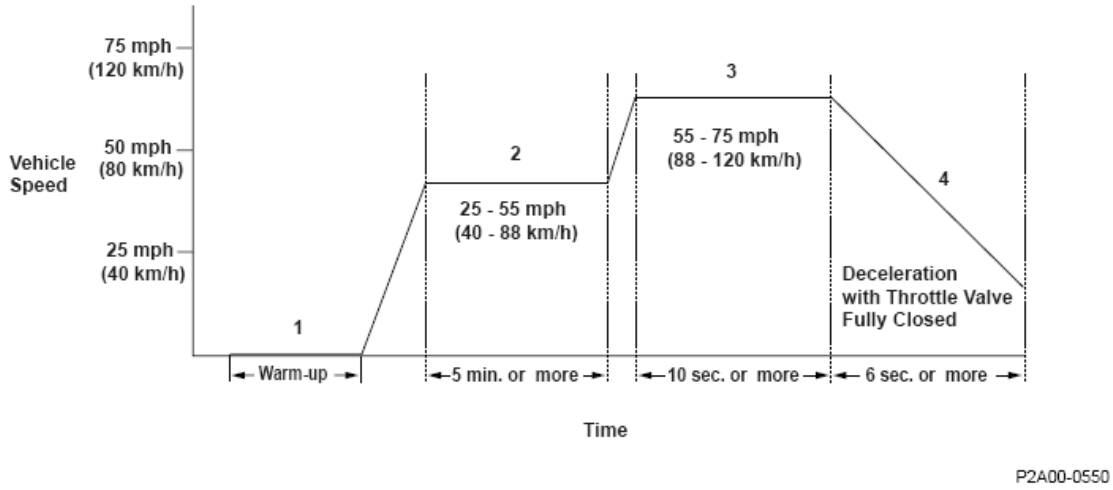

Fig. 347: Vehicle Speed Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 25 - 55 mph (40 - 88 km/h) for at least 5 minutes.
3. Drive immediately at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
4. Decelerate with the throttle valve fully closed for at least 6 seconds.
    - If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
    - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the ECM/PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC U0029: F-CAN MALFUNCTION (BUS-OFF (ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM)))

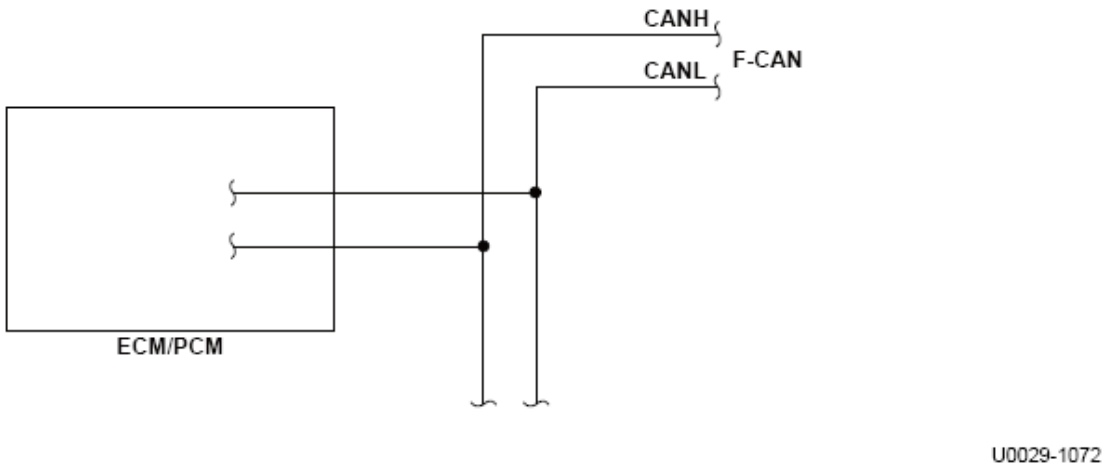

Fig. 348: Engine Control Module/Powertrain Control Module And F-CAN - Circuit Diagram (Bus-Off)

GENERAL DESCRIPTION

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CANH and CANL). When the engine control module (ECM)/powertrain control module (PCM) does not receive the signals via the F-CAN lines for a set time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time after the ignition switch is turned to ON (II)(1) or the engine start/stop button is pressed to select the ON mode(2)	3 seconds	-
Battery voltage	10.0 V	-
(1) Without keyless access system (2) With keyless access system		

MALFUNCTION THRESHOLD

The ECM/PCM does not receive any signals via the F-CAN lines for at least 1 second.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC U0114: F-CAN MALFUNCTION (ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM)-SH-AWD CONTROL UNIT)

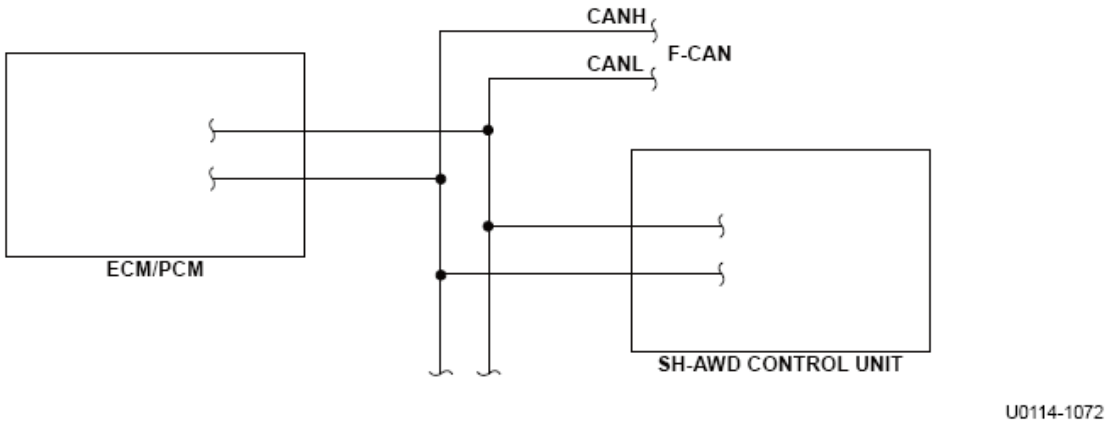

Fig. 349: Engine Control Module/Powertrain Control Module And F-CAN - Circuit Diagram (SH-AWD Control Unit)

GENERAL DESCRIPTION

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CANH and CANL). When the engine control module (ECM)/powertrain control module (PCM) does not receive the signals from the SH-AWD control unit via the F-CAN lines for a set time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	10.0 V	-

MALFUNCTION THRESHOLD

The ECM/PCM does not receive any signals via the F-CAN lines for at least 1 second.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC U0122: F-CAN MALFUNCTION (ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM)-VSA MODULATOR-CONTROL UNIT)

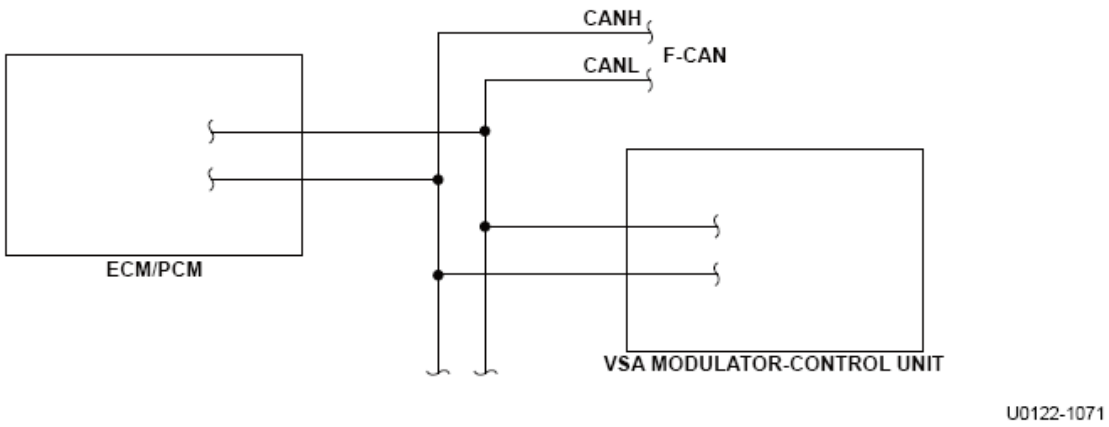

Fig. 350: Engine Control Module/Powertrain Control Module And F-CAN - Circuit Diagram (VSA Modulator-Control Unit)

GENERAL DESCRIPTION

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CANH and CANL). When the information is not sent from the VSA modulator-control unit via the F-CAN lines and this condition continues for a specified time or when the information sent from the VSA modulator-control unit is abnormal and this condition continues for a specified

cycle, the engine control module (ECM)/powertrain control module (PCM) detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Elapsed time after the ignition switch is turned to ON (II)(1) or the engine start/stop button is pressed to select the ON mode(2)	3 seconds	-
Battery voltage	10.0 V	-
No active DTCs set (prevents monitor from running)	U0029	
(1) Without keyless access system (2) With keyless access system		

MALFUNCTION THRESHOLD

One of these conditions is met:

- The ECM/PCM does not receive any signals via the F-CAN lines for at least 1 second.
- The information sent from the VSA modulator-control unit is abnormal at least 20 times.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC U0131: F-CAN MALFUNCTION (ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM)-EPS CONTROL UNIT)

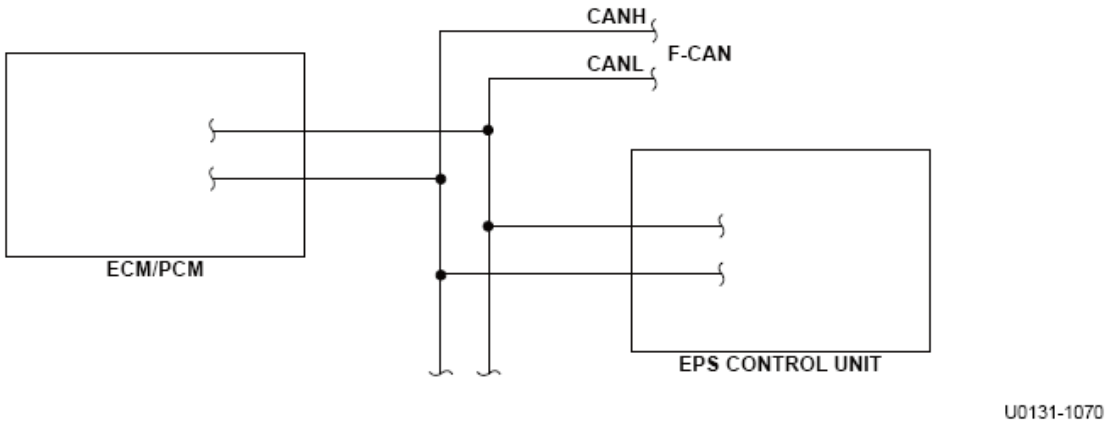

Fig. 351: Engine Control Module/Powertrain Control Module And F-CAN - Circuit Diagram (EPS Control Unit)

GENERAL DESCRIPTION

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CANH and CANL). When the engine control module (ECM)/powertrain control module (PCM) does not receive the signals from the EPS control unit via the F-CAN lines for a set time, the ECM/PCM detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL off
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
No active DTCs set (prevents monitor from running)	U0029	

MALFUNCTION THRESHOLD

The ECM/PCM does not receive any signals via the F-CAN lines for at least 1 second.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the

ECM/PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC U0155: F-CAN MALFUNCTION (ENGINE CONTROL MODULE (ECM)/POWERTRAIN CONTROL MODULE (PCM)-GAUGE CONTROL MODULE)

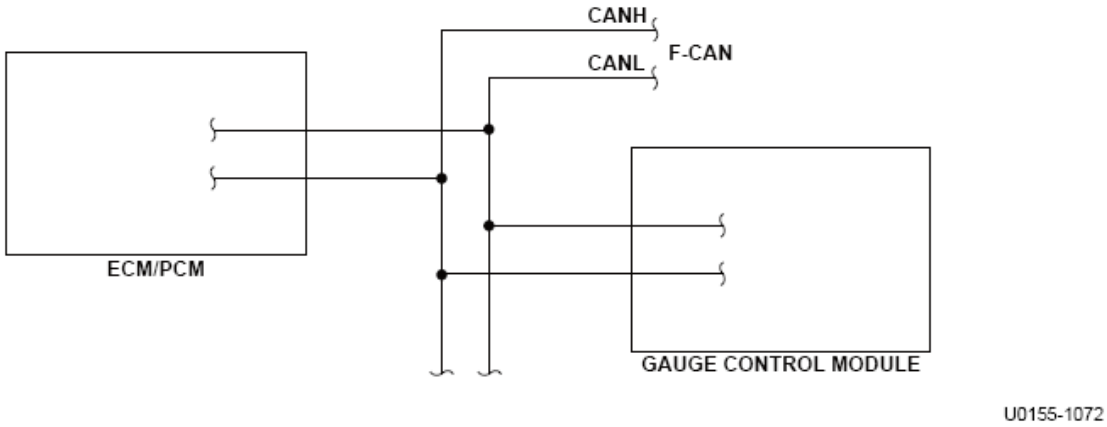

Fig. 352: Engine Control Module/Powertrain Control Module And F-CAN - Circuit Diagram (Gauge Control Module))

GENERAL DESCRIPTION

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CANH and CANL). When the information is not sent from the gauge control module via the F-CAN lines and this condition continues for a specified time or when the information sent from the gauge control module is abnormal and this condition continues for a specified cycle, the engine control module (ECM)/powertrain control module (PCM) detects a malfunction and stores a DTC.

MONITOR EXECUTION, SEQUENCE, DURATION, DTC TYPE, OBD STATUS

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

ENABLE CONDITIONS

Condition	Minimum	Maximum

Elapsed time after the ignition switch is turned to ON (II)(1) or the engine start/stop button is pressed to select the ON mode(2)	3 seconds	-
Battery voltage	10.0 V	-
No active DTCs set (prevents monitor from running)	U0029	
(1) Without keyless access system (2) With keyless access system		

MALFUNCTION THRESHOLD

One of these conditions is met:

- The ECM/PCM does not receive any signals via the F-CAN lines for at least 1 second.
- The information sent from the gauge control module is abnormal at least 20 times.

DIAGNOSIS DETAILS

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the ECM/PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the battery.

DTC TROUBLESHOOTING

DTC P0420: REAR BANK CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 1);
DTC P0430: FRONT BANK CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 2)

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If some of the DTCs listed below are stored at the same time as DTC P0420**

and/or P0430*, troubleshoot those DTCs first, then recheck for DTC P0420 and/or P0430*.

P0137, P0138, P0157*, P0158*: Secondary HO2S (Sensor 2)

P0141, P0161*: Secondary HO2S (Sensor 2) heater

- **Poor quality fuel can cause these DTCs.**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F(70°C)
   - A/Tin D, or M/T in 4th
   - Vehicle speed between 45- 75 mph (72- 120 km/h) for 5 minutes or more with cruise control set
   - Vehicle speed between 55- 75 mph (88- 120 km/h) for 10 seconds, then decelerate (with the throttle fully closed). Repeat this 3 times or more
   - Maintain the vehicle speed at 55 mph (88 km/h) for 5 minutes or more with cruise control set
5. Monitor the OBD STATUS for DTC P0420 and/or P0430* in the DTCs MENU with the HDS.

   Does the screen indicate EXECUTING?

   YES - Go to step 6.

   NO - If the screen indicates OUT OF CONDITION, go to step 4 and recheck. If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the screen indicates FAILED, go to step 8 and recheck.

6. Continue test driving until a result comes on.
7. Monitor the OBD STATUS for DTC P0420 and/or P0430* in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 8.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 4 and recheck.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the ON mode.
9. Replace the WU-TWC:

- For DTC P0420, replace the rear WU-TWC (Bank 1) (see **REAR (Bank 1)**).
- For DTC P0430, replace the front WU-TWC (Bank 2) (see **FRONT (Bank 2)**).

10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Reset the ECM/PCM with the HDS.
12. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
13. Test-drive for about 10 minutes, continually changing the vehicle speed.
14. Check the CATA MONITOR CONDITION B1 (B2)* in the DATA LIST with the HDS.

    Is the condition OK?

    YES - Go to step 15.

    NO - Go to step 13 and recheck.

15. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F(70°C)
    - A/Tin D, or M/T in 4th
    - Vehicle speed between 55- 75 mph (88 - 120 km/h) for 10 seconds, then decelerate (with the throttle fully closed). Repeat this 3 times or more
    - Maintain the vehicle speed at 55 mph (88 km/h) for 5 minutes or more with cruise control set
16. Continue test driving until a result comes on.
17. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0420 and/or P0430 indicated?*

    YES - Check the fuel quality, then go to step 1.

    NO - Go to step 18.

18. Monitor the OBD STATUS for DTC P0420 and/or P0430* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 17, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the screen indicates FAILED, check the fuel quality, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 15.

WARM UP TWC REMOVAL/INSTALLATION

FRONT (BANK 2)

1. Remove the No. 2 the ignition coil and the ignition coil heat insulator.
2. Remove the front A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**) and front secondary HO2S (Sensor 2) (see **SECONDARY HO2S REPLACEMENT**).
3. Remove the exhaust pipe A mounting nuts (front WU-TWC side); J35Z6 engine (see **EXHAUST PIPE AND MUFFLER REPLACEMENT**), J37A4 engine (see **J37A4 ENGINE (WITH SH-AWD)**).
4. Remove the EGR pipe (see **EGR VALVE REPLACEMENT**).
5. Remove the A/C condenser fan assembly (see **FAN, FAN MOTOR, AND SHROUD REMOVAL AND INSTALLATION**) and the radiator upper bracket/cushion (see **FAN, FAN MOTOR, AND SHROUD REMOVAL AND INSTALLATION**).
6. Remove the front WU-TWC bracket, then carefully remove the front WU-TWC.

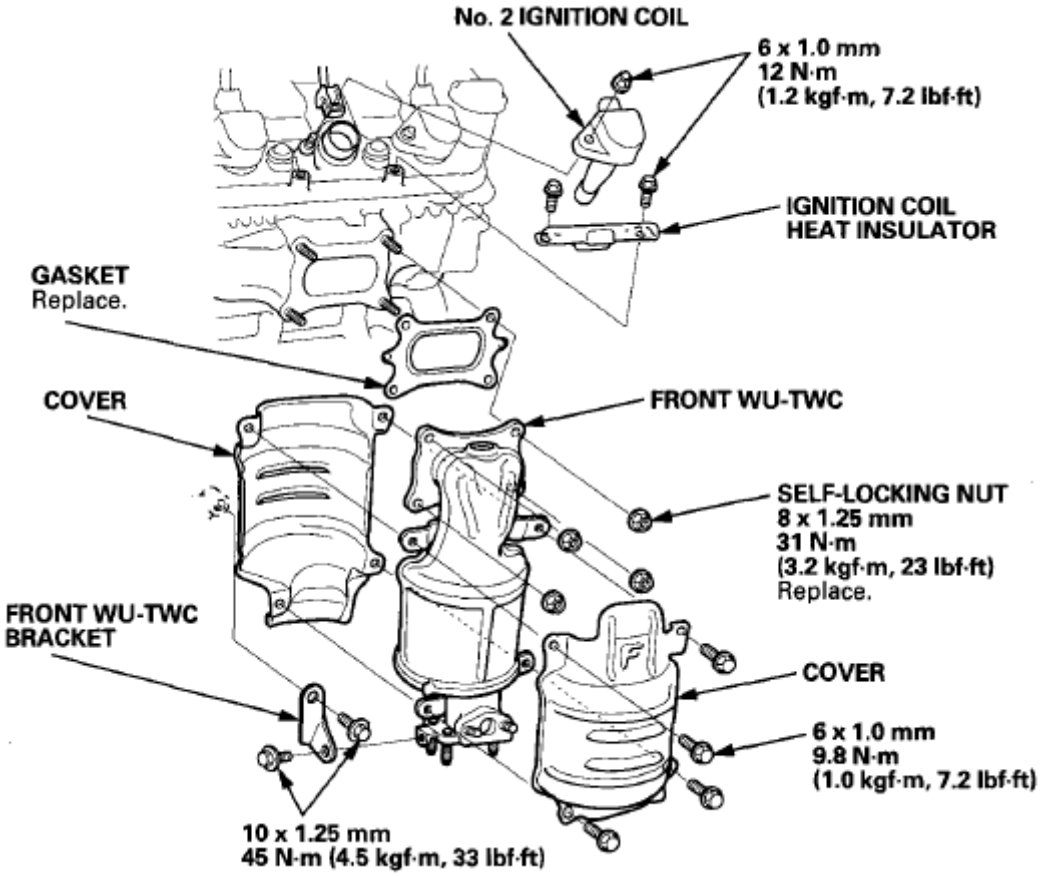

Fig. 2: Identifying Warm Up TWC And Related Components With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Carefully install the front WU-TWC with a new gasket and new self-locking nuts. Tighten the nuts in a crisscross pattern in two or three steps.
8. Install the parts in the reverse order of removal.

REAR (BANK 1)

1. Remove the strut brace (see **FRAME BRACE REPLACEMENT**).
2. Remove the rear A/F sensor (Sensor 1) (see **A/F SENSOR REPLACEMENT**) and rear secondary HO2S (Sensor 2) (see **SECONDARY HO2S REPLACEMENT**).
3. Remove the P/S heat shield (see step 15 **STEERING GEARBOX REMOVAL AND INSTALLATION**).
4. Remove exhaust pipe A; J35Z6 engine (see **EXHAUST PIPE AND MUFFLER REPLACEMENT**), J37A4 engine (see **J37A4 ENGINE (WITH SH-AWD)**).
5. Remove the intermediate shaft (see **INTERMEDIATE SHAFT REMOVAL**).
6. Remove the rear WU-TWC bracket, then carefully remove the rear WU-TWC.

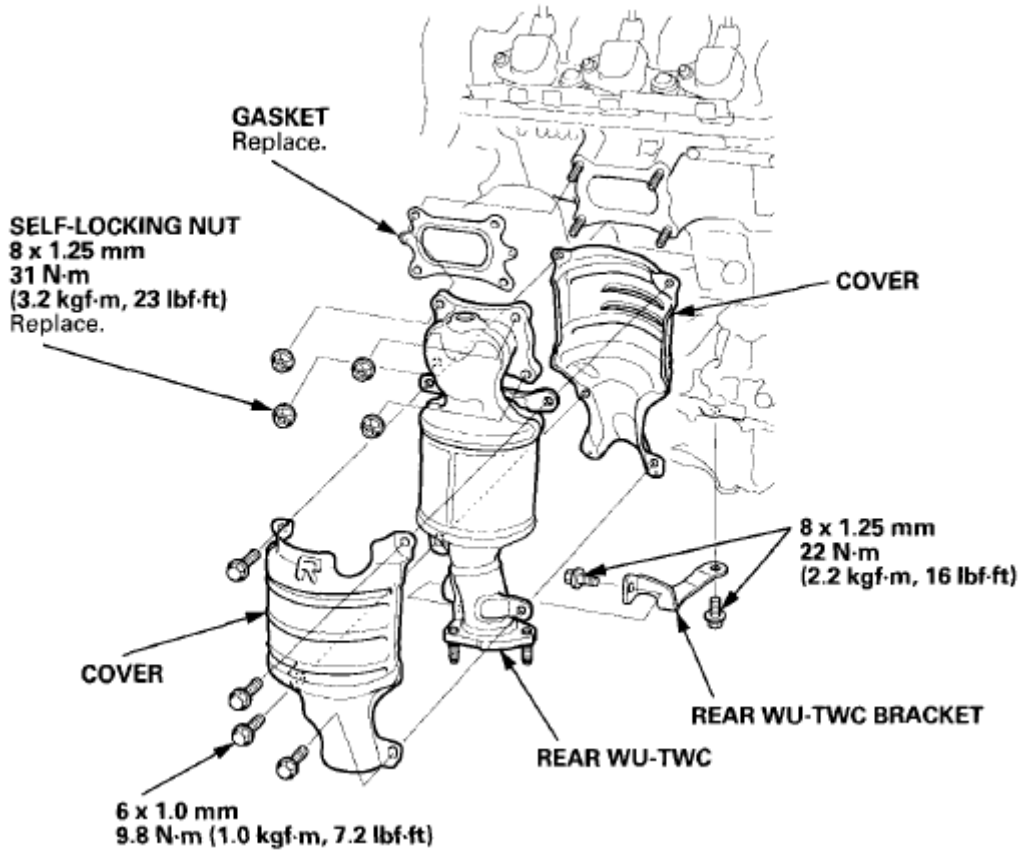

Fig. 3: Identifying Warm Up TWC And Related Components With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Carefully install the rear WU-TWC with a new gasket and new self-locking nuts. Tighten the nuts in a crisscross pattern in two or three steps.
8. Install the parts in the reverse order of removal.

UNDER-FLOOR TWC REMOVAL/INSTALLATION

WITHOUT SH-AWD

1. Raise the vehicle on a lift
2. Remove the exhaust pipe hangers (A).

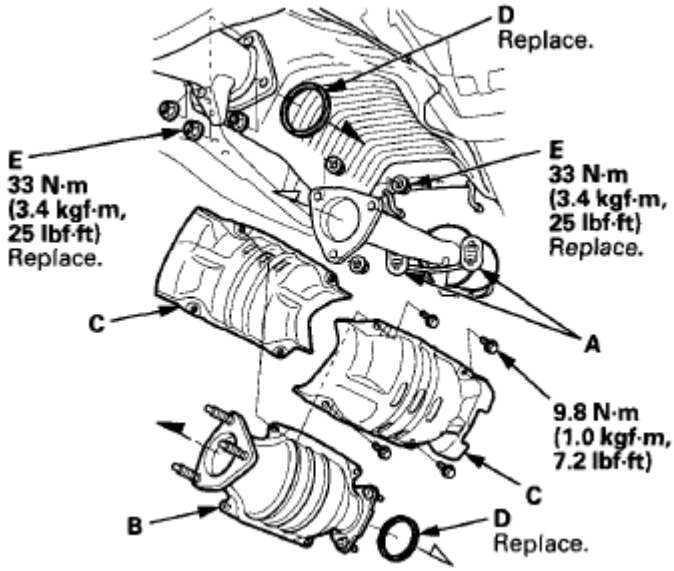

Fig. 4: Identifying Exhaust Pipe Hangers, Under-Floor TWC, Converter Cover, Gasket And Self-Locking Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the under-floor TWC (B).
4. Remove the converter cover (C).
5. Install the parts in the reverse order of removal with new gaskets (D) and new self-locking nuts (E).

WITH SH-AWD

1. Raise the vehicle on a lift.
2. Remove the exhaust pipe hangers (A).

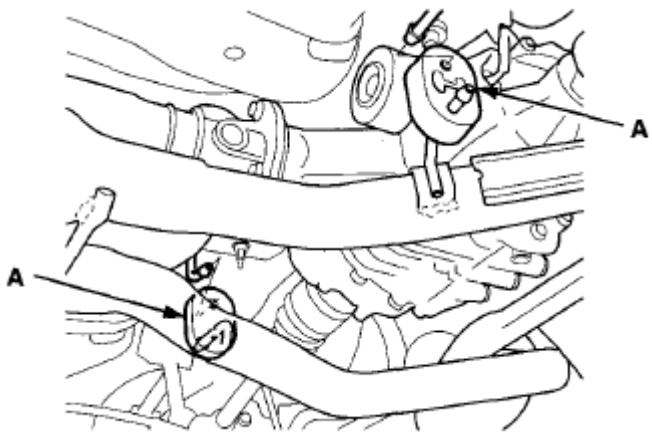

Fig. 5: Identifying Exhaust Pipe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the under-floor TWC (A).

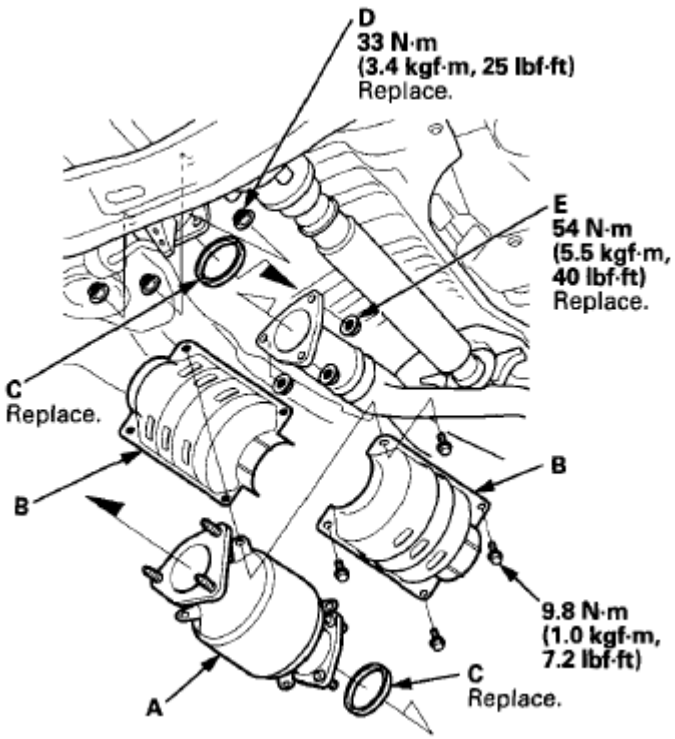

Fig. 6: Identifying Under-Floor TWC, Converter Cover, Gasket And Self Locking Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the converter cover (B).
5. Install the parts in the reverse order of removal with new gaskets (C) and new self-locking nuts (D and E).

2012 ENGINE PERFORMANCE

EGR System - TL

COMPONENT LOCATION INDEX

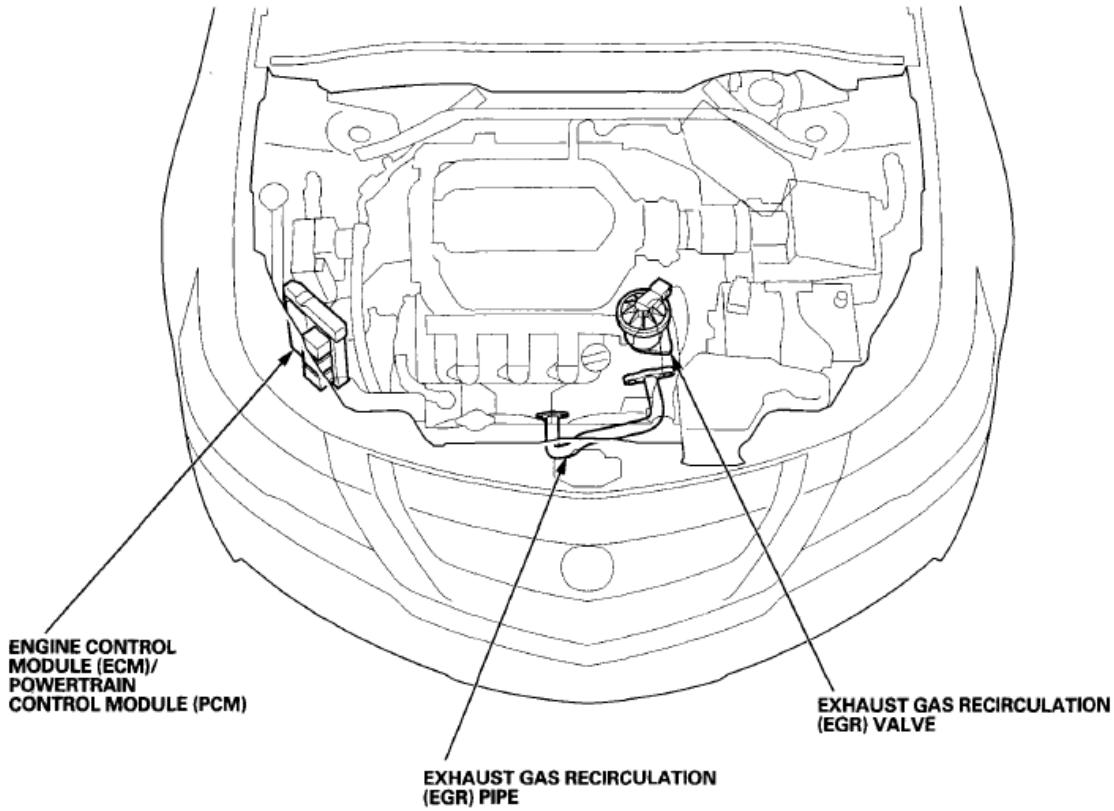

Fig. 1: EGR System Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DTC TROUBLESHOOTING

DTC P0400: EGR SYSTEM LEAK DETECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check for a loose or damaged EGR pipe.

   Is the EGR pipe OK?

   YES - Go to step 2.

NO - Reconnect or replace the EGR pipe, then go to step 7.

2. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
3. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F(70°C)
   - A/T in D, or M/T in 4th
   - Vehicle speed at 25 mph (40 km/h) for 5 minutes or more
   - Maintain the vehicle speed at 32 mph (50 km/h) and engine speed between 1, 450- 3, 000 RPM for 1 minute or more with cruise control set
4. Monitor the OBD STATUS for DTC P0400 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 5.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for exhaust gas leakage between the EGR pipe and the EGR valve. If the screen indicates NOT COMPLETED, go to step 3 and recheck.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Replace the EGR valve (see **EGR VALVE REPLACEMENT**).
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
10. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F(70°C)
    - A/T in D, or M/T in 4th
    - Vehicle speed at 25 mph (40 km/h) for 5 minutes or more
    - Maintain the vehicle speed at 32 mph (50 km/h) and engine speed between 1, 450- 3, 000 RPM for 1 minute or more with cruise control set
11. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0400 indicated?

    YES - Check for leakage between the EGR pipe and the EGR valve, then go to step 1.

    NO - Go to step 12.

12. Monitor the OBD STATUS for DTC P0400 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 11, go to the indicated **DTC'S TROUBLESHOOTING**.

NO - If the screen indicates FAILED, check for leakage between the EGR pipe and the EGR valve, then go to step 1. If the screen indicates NOT COMPLETED, go to step 10.

DTC P0401: EGR INSUFFICIENT FLOW

NOTE: Before you troubleshoot, record ail freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Do the EGR TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Go to step 5.

   NO - Go to step 7.

5. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F(70°C)
   - A/T in D, or M/T in 4th
   - Drive at a steady speed between 55- 75 mph (88- 120 km/h) for at least 10 seconds
   - During the drive, decelerate (with the throttle fully closed) for 5 seconds
6. Monitor the OBD STATUS for DTC P0401 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Clean the intake manifold EGR port and EGR pipe (see **EGR PIPE REPLACEMENT**) with throttle plate cleaner. Also, clean the passage inside the EGR valve with throttle plate cleaner, then go to step 9.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 5 and recheck.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Replace the EGR valve (see **EGR VALVE REPLACEMENT**).

9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Reset the ECM/PCM with the HDS.
11. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
12. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F(70°C)
    - A/T in D, or M/T in 4th
    - Drive at a steady speed between 55- 75 mph (88- 120 km/h) for at least 10 seconds
    - During the drive, decelerate (with the throttle fully closed) for 5 seconds
13. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0401 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the connections are OK, go to step 15.

    NO - Go to step 14.

14. Monitor the OBD STATUS for DTC P0401 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 13, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 12.

15. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
16. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F(70°C)
    - A/T in D, or M/T in 4th
    - Drive at a steady speed between 55- 75 mph (88- 120 km/h) for at least 10 seconds
    - During the drive, decelerate (with the throttle fully closed) for 5 seconds
17. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0401 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 16. If the ECM/PCM was substituted, go to step 1.

NO - Go to step 18.

18. Monitor the OBD STATUS for DTC P0401 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 17, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 16. If the ECM/PCM was substituted, go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 16.

DTC P0404: EGR CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Do the EGR TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Clean any carbon build-up on the EGR valve with throttle plate cleaner.

   NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the EGR valve 5P connector.
7. At the EGR valve side, measure the resistance between EGR valve 5P connector terminals No. 2 and No. 3.

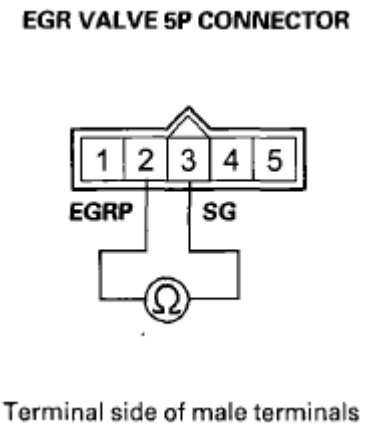

Fig. 2: Measuring Resistance Between EGR Valve 5P Connector Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 100 kohms or more?

YES - Go to step 25.

NO - Go to step 8.

8. At the EGR valve side, measure the resistance between EGR valve 5P connector terminals No. 2 and No. 4.

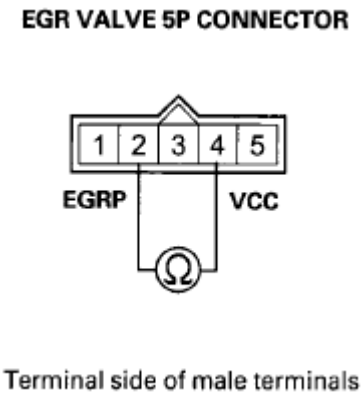

Fig. 3: Measuring Resistance Between EGR Valve 5P Connector Terminals No. 2 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 100 kohms or more?

YES - Go to step 25.

NO - Go to step 9.

9. Check for continuity between EGR valve 5P connector terminal No. 5 and body ground.

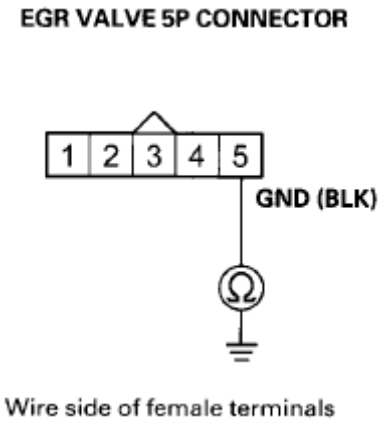

Fig. 4: Checking Continuity Between EGR Valve 5P Connector Terminal No. 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair open in the wire between the EGR valve and G101; M/T (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), A/T (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), then go to step 26.

10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector C (49P).
12. Check for continuity between ECM/PCM connector terminal C10 and body ground.

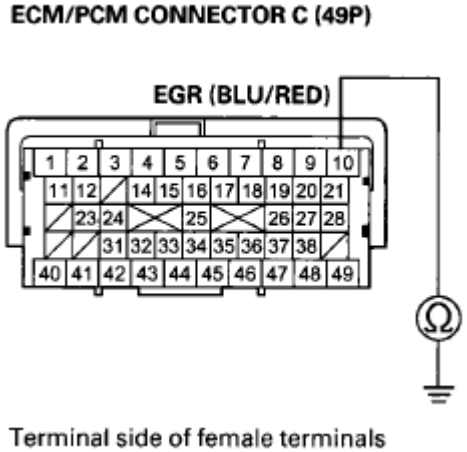

Fig. 5: Checking Continuity Between ECM/PCM Connector Terminal C10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C10) and the EGR valve, then go to step 26.

NO - Go to step 13.

13. Check for continuity between ECM/PCM connector terminal C10 and EGR valve 5P connector terminal No. 1.

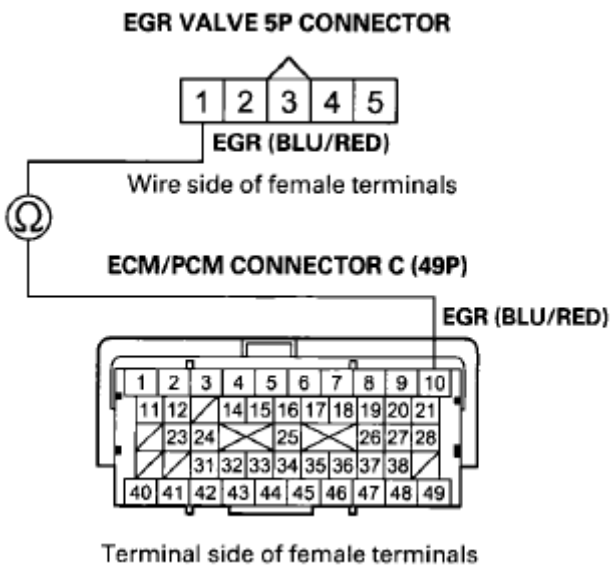

Fig. 6: Checking Continuity Between ECM/PCM Connector Terminal C10 And EGR Valve 5P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 14.

NO - Repair open in the wire between the ECM/PCM (C10) and the EGR valve, then go to step 26.

14. Remove the EGR valve (see **EGR VALVE REPLACEMENT**).
15. Clean any carbon build-up on the EGR valve with throttle plate cleaner.
16. Install the EGR valve (see **EGR VALVE REPLACEMENT**).
17. Reconnect the EGR valve 5P connector.
18. Reconnect ECM/PCM connector C (49P).
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
23. Do the EGR TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Go to step 32.

NO - Go to step 24.

24. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
25. Replace the EGR valve (see **EGR VALVE REPLACEMENT**).
26. Reconnect all connectors.
27. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
28. Reset the ECM/PCM with the HDS.
29. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
30. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
31. Do the EGR TEST in the INSPECTION MENU with the HDS.
32. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0404 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1. If the connections and terminals are OK, go to step 33.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated **DTC'S TROUBLESHOOTING**.

33. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
34. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
35. Do the EGR TEST in the INSPECTION MENU with the HDS.
36. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0404 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 34. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated **DTC'S TROUBLESHOOTING**.

DTC P0406: EGR VALVE POSITION SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL

TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the EGR VLS in the DATA LIST with the HDS.

   Is 4.88 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the ECM/PCM.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the EGR valve 5P connector.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Measure the voltage between EGR valve 5P connector terminals No. 3 and No. 4.

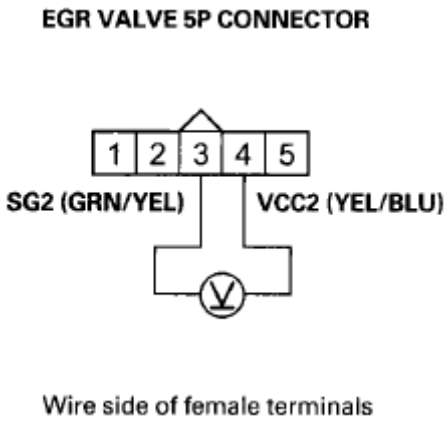

Fig. 7: Measuring Voltage Between EGR Valve 5P Connector Terminals No. 3 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 11.

NO - Go to step 7.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector C (49P).
10. Check for continuity between ECM/PCM connector terminal C16 and EGR valve 5P connector terminal No. 3.

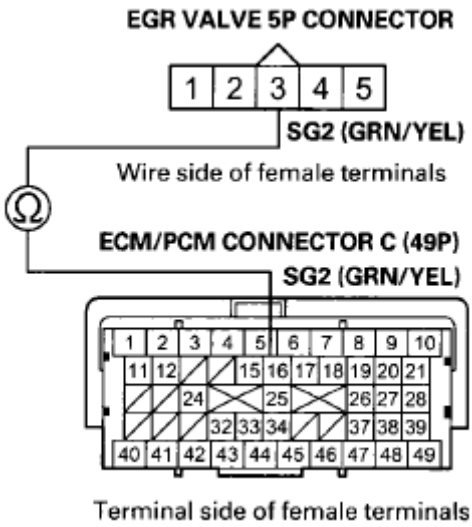

Fig. 8: Checking Continuity Between ECM/PCM Connector Terminal C16 And EGR Valve 5P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 18.

NO - Repair open in the wire between the EGR valve and the ECM/PCM (C16), then go to step 13.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Replace the EGR valve (see **EGR VALVE REPLACEMENT**).
13. Reconnect all connectors.
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0406 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated **DTC'S TROUBLESHOOTING**.

18. Reconnect all connectors.
19. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0406 indicated?

YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated **DTC'S TROUBLESHOOTING**.

DTC P2413: EGR SYSTEM MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Do the EGR TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the ECM/PCM.

   NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Check the EGR VLS in the DATA LIST with the HDS.

   Is about 0 Vindicated?

   YES - Go to step 8.

   NO - Go to step 21.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Disconnect the EGR valve 5P connector.
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Measure the voltage between EGR valve 5P connector terminal No. 4 and body ground.

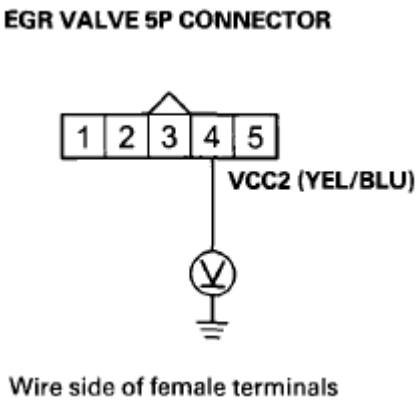

Fig. 9: Measuring Voltage Between EGR Valve 5P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 12.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector C (49P).
15. Check for continuity between ECM/PCM connector terminal C12 and EGR valve 5P connector terminal No. 4.

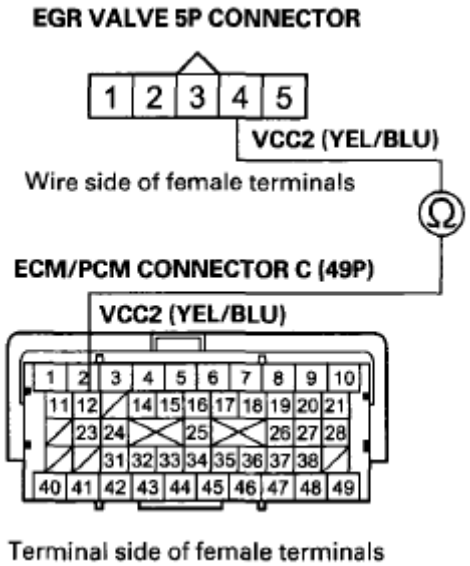

Fig. 10: Checking Continuity Between ECM/PCM Connector Terminal C12 And EGR Valve 5P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 50.

NO - Repair open in the wire between the EGR valve and the ECM/PCM (C12), then go to step 42.

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Jump the SCS line with the HDS.
18. Disconnect ECM/PCM connector C (49P).
19. Check for continuity between ECM/PCM connector terminal C34 and body ground.

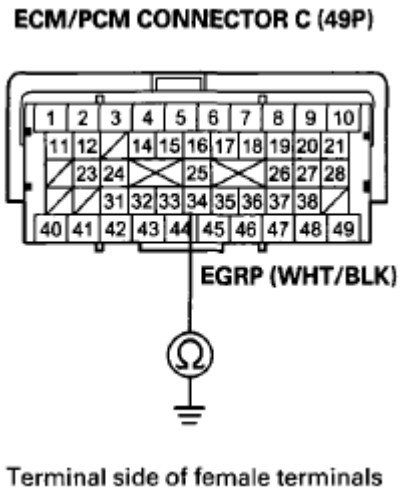

Fig. 11: Checking Continuity Between ECM/PCM Connector Terminal C34 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C34) and the EGR valve, then go to step 42.

NO - Go to step 20.

20. Check for continuity between ECM/PCM connector terminal C34 and EGR valve 5P connector terminal No. 2.

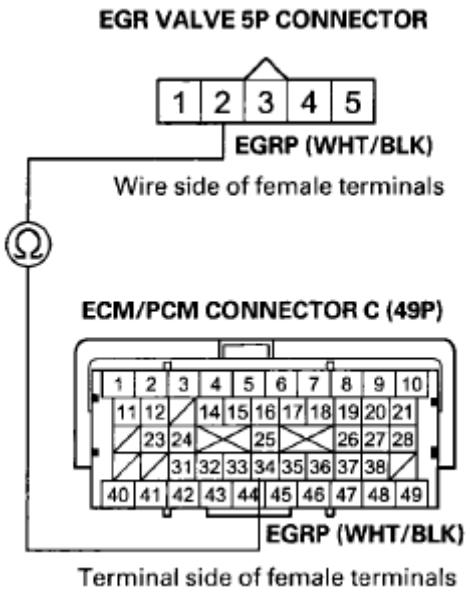

Fig. 12: Checking Continuity Between ECM/PCM Connector Terminal C34 And EGR Valve 5P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 21.

NO - Repair open in the wire between the ECM/PCM (C34) and the EGR valve, then go to step 42.

21. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
22. Disconnect the EGR valve 5P connector.
23. At the EGR valve side, measure the resistance between EGR valve 5P connector terminals No. 2 and No. 3.

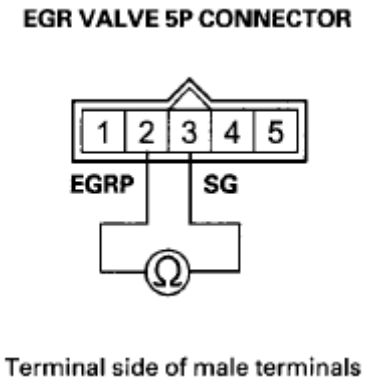

Fig. 13: Measuring Resistance Between EGR Valve 5P Connector Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 100 kohms or more?

YES - Go to step 41.

NO - Go to step 24.

24. At the EGR valve side, measure the resistance between EGR valve 5P connector terminals No. 2 and No. 4.

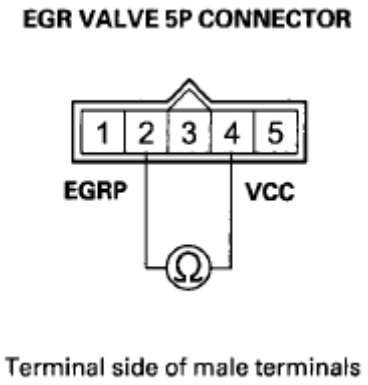

Fig. 14: Measuring Resistance Between EGR Valve 5P Connector Terminals No. 2 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 100 kohms or more?

YES - Go to step 41.

NO - Go to step 25.

25. Check for continuity between ECM/PCM connector terminal C10 and body ground.

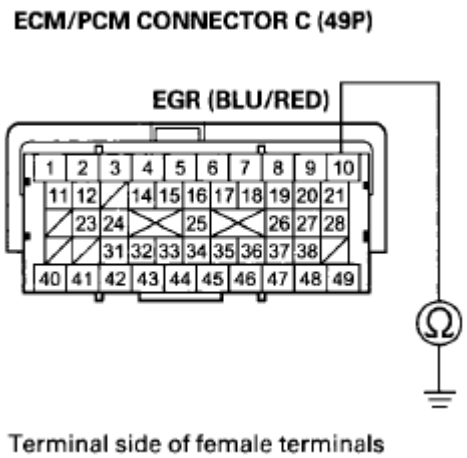

Fig. 15: Checking Continuity Between ECM/PCM Connector Terminal C10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C10) and the EGR valve, then go to step 42.

NO - Go to step 26.

26. Check for continuity between ECM/PCM connector terminal C10 and EGR valve 5P connector terminal No. 1.

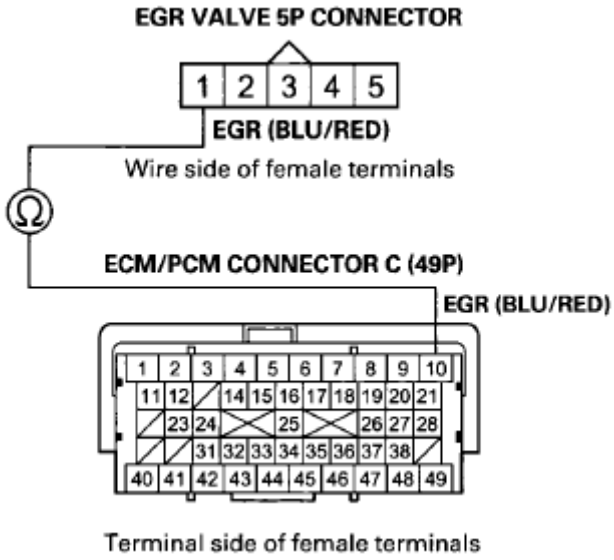

Fig. 16: Checking Continuity Between ECM/PCM Connector And EGR Valve 5P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM/PCM (C10) and the EGR valve, then go to step 42.

27. Check for continuity between EGR valve 5P connector terminal No. 5 and body ground.

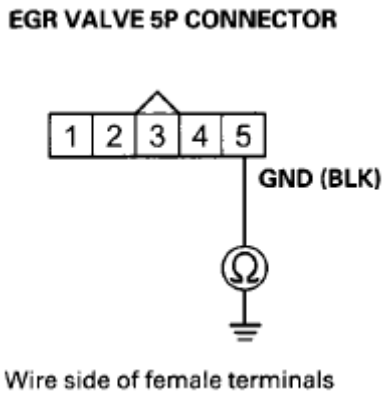

Fig. 17: Checking Continuity Between EGR Valve 5P Connector Terminal No. 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 28.

NO - Repair open in the wire between the EGR valve and G101; M/T(see **CONNECTOR TO FUSE/RELAY BOX INDEX**), A/T (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), then go to step 42.

28. Reconnect ECM/PCM connector C (49P).
29. At the EGR valve side, connect the battery positive terminal to EGR valve 5P connector terminal No. 1 with a jumper wire.

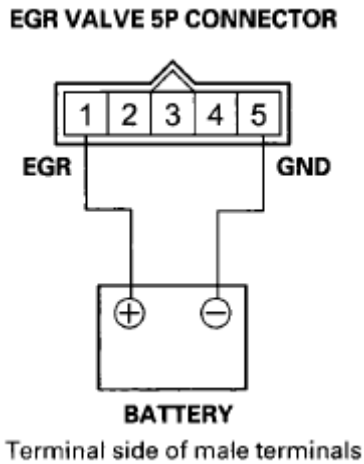

Fig. 18: Connecting Battery Positive Terminal To EGR Valve 5P Connector With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

30. Start the engine, and let it idle, then connect the battery negative terminal to EGR valve 5P connector terminal No. 5 with a jumper wire.

Does the engine stall?

YES - Go to step 48.

NO - Go to step 31.

31. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
32. Remove the EGR valve (see **EGR VALVE REPLACEMENT**).
33. Clean any carbon build-up inside the EGR valve with throttle plate cleaner.
34. Install the EGR valve (see **EGR VALVE REPLACEMENT**).
35. Reconnect all connectors.
36. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
37. Reset the ECM/PCM with the HDS.
38. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
39. Do the EGR TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Go to step 47.

NO - Go to step 40.

40. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
41. Replace the EGR valve (see **EGR VALVE REPLACEMENT**).
42. Reconnect all connectors.
43. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
44. Reset the ECM/PCM with the HDS.
45. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
46. Do the EGR TEST in the INSPECTION MENU with the HDS.
47. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2413 indicated?

YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated **DTC'S TROUBLESHOOTING**.

48. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
49. Reconnect all connectors.
50. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
51. Do the EGR TEST in the INSPECTION MENU with the HDS.

52. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2413 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 51. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated **DTC'S TROUBLESHOOTING**.

EGR VALVE REPLACEMENT

1. Disconnect the EGR valve 5P connector (A).

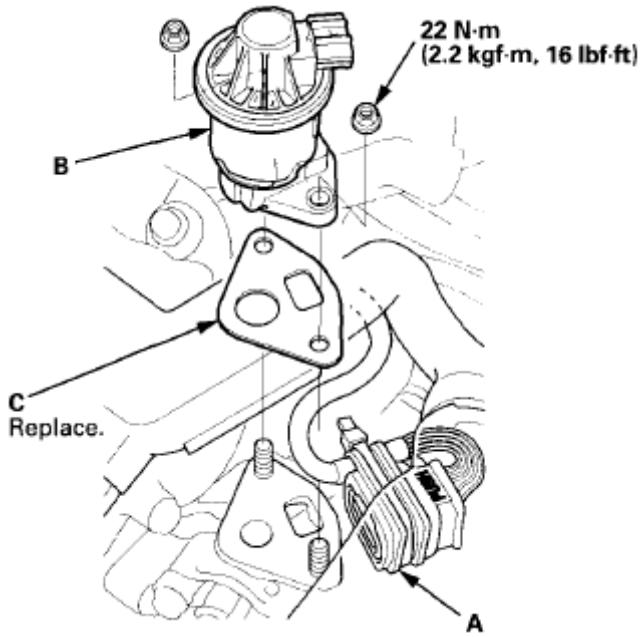

Fig. 19: Identifying EGR Valve 5P Connector, Gasket And EGR Valve With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the EGR valve (B).
3. Install the parts in the reverse order of removal with a new gasket (C).

EGR PIPE REPLACEMENT

1. Raise the vehicle on a lift.
2. Remove the splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
3. Remove the mounting nuts (A).

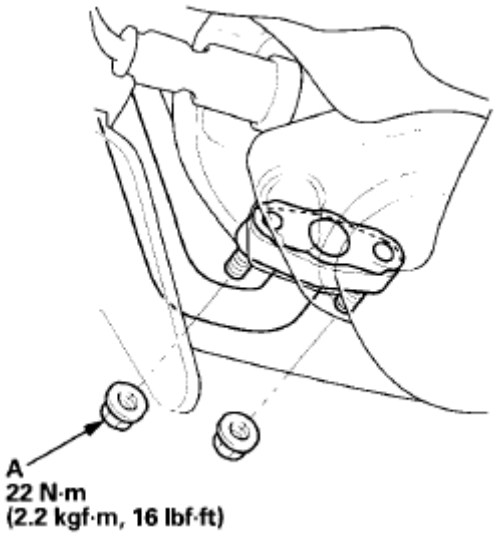

Fig. 20: Identifying Mounting Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Lower the vehicle.
5. Remove the mounting bolts (A).

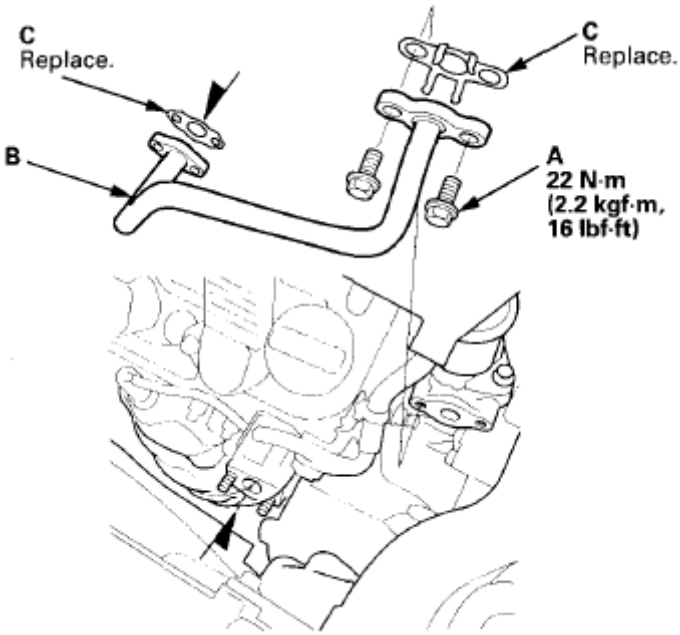

Fig. 21: Identifying EGR Pipe, Gasket And Mounting Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the EGR pipe (B).
7. Install the parts in the reverse order of removal with new gaskets (C).

DTC TROUBLESHOOTING

DTC P0122: TP SENSOR A CIRCUIT LOW VOLTAGE

NOTE: **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check TP SENSOR A in the DATA LIST with the HDS.

   Is there about 0.3 V or less?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM. •

4. Check for Pending or Confirmed DTCs with the HDS.

   Are DTC P0122 and P0222 indicated at the same time?

   YES - Go to step 10.

   NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the throttle body 6P connector.
7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector B (49P).
9. Check for continuity between throttle body 6P connector terminal No. 1 and body ground.

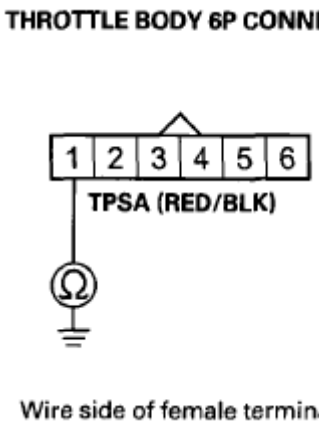

Fig. 2: Checking Continuity Between Throttle Body 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the throttle body and the ECM/PCM (B17), then go to step 18.

NO - Go to step 23.

10. Measure the voltage between throttle body 6P connector terminal No. 2 and body ground.

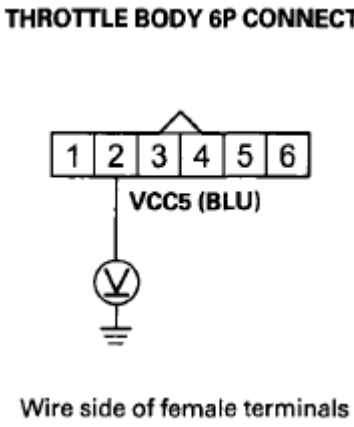

Fig. 3: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 11.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector B (49P).
14. Disconnect the throttle body 6P connector.
15. Check for continuity between ECM/PCM connector terminal B18 and throttle body 6P connector terminal No. 2.

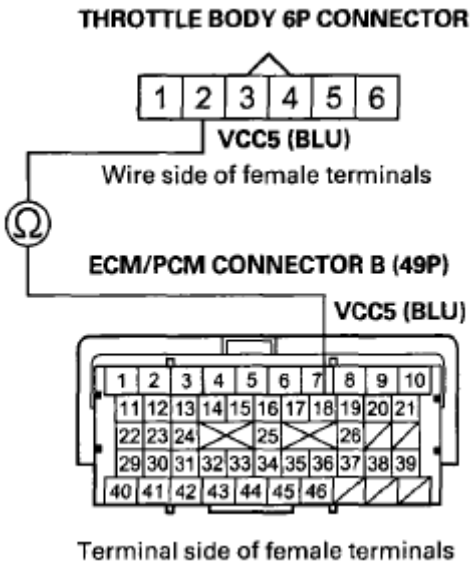

Fig. 4: Checking Continuity Between ECM/PCM Connector Terminal B18 And Throttle Body 6P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the throttle body and the ECM/PCM (B18), then go to step 18.

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
18. Reconnect all connectors.
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0122 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

23. Reconnect all connectors.
24. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).

25. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0122 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0123: TP SENSOR A CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check TP SENSOR A in the DATA LIST with the HDS.

    Is there about 4.8 V or more?

    YES - Go to step 4.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM. •

4. Check for Pending or Confirmed DTCs with the HDS.

    Are DTC P0123 and P0223 indicated at the same time?

    YES - Go to step 13.

    NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the throttle body 6P connector.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Measure the voltage between throttle body 6P connector terminal No. 1 and body ground.

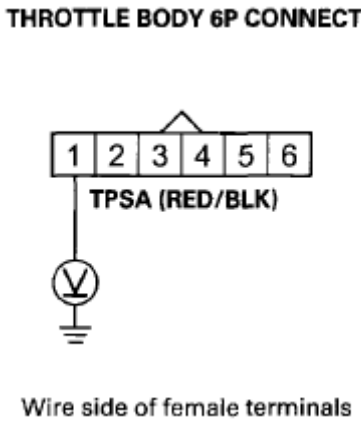

Fig. 5: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 18.

NO - Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector B (49P).
12. Check for continuity between ECM/PCM connector terminal B17 and throttle body 6P connector terminal No. 1.

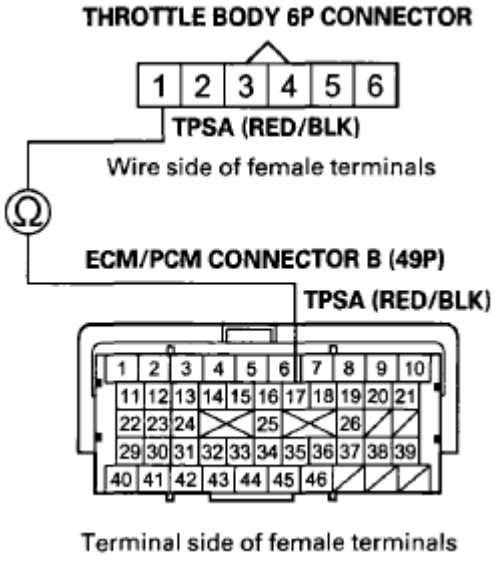

Fig. 6: Checking Continuity Between ECM/PCM Connector Terminal B17 And Throttle Body 6P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM/PCM (B17), then go to step 20.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector B (49P).
17. Check for continuity between ECM/PCM connector terminal B33 and throttle body 6P connector terminal No. 4.

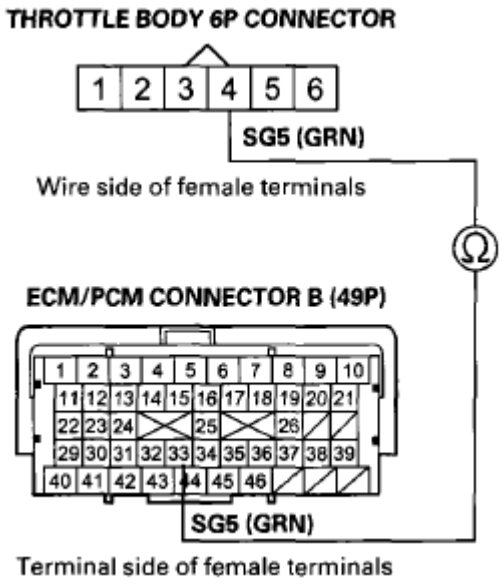

Fig. 7: Checking Continuity Between ECM/PCM Connector Terminal B33 And Throttle Body 6P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM/PCM (B33), then go to step 20.

18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Reset the ECM/PCM with the HDS.

23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0123 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

25. Reconnect all connectors.
26. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
27. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0123 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0222: TP SENSOR B CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check TP SENSOR B in the DATA LIST with the HDS.

    Is there about 0.3 V or less?

    YES - Go to step 4.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM. •

4. Check for Pending or Confirmed DTCs with the HDS.

Are DTC P0122 and P0222 indicated at the same time?

YES - Go to step 10.

NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the throttle body 6P connector.
7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector B (49P).
9. Check for continuity between throttle body 6P connector terminal No. 3 and body ground.

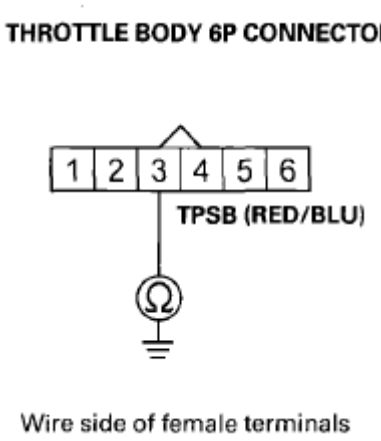

Fig. 8: Checking Continuity Between Throttle Body 6P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the throttle body and the ECM/PCM (B26), then go to step 18.

NO - Go to step 23.

10. Measure the voltage between throttle body 6P connector terminal No. 2 and body ground.

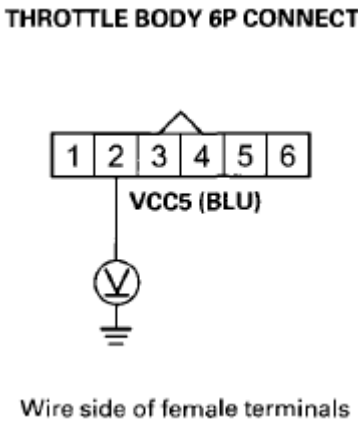

Fig. 9: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 11.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector B (49P).
14. Disconnect the throttle body 6P connector.
15. Check for continuity between ECM/PCM connector terminal B18 and throttle body 6P connector terminal No. 2.

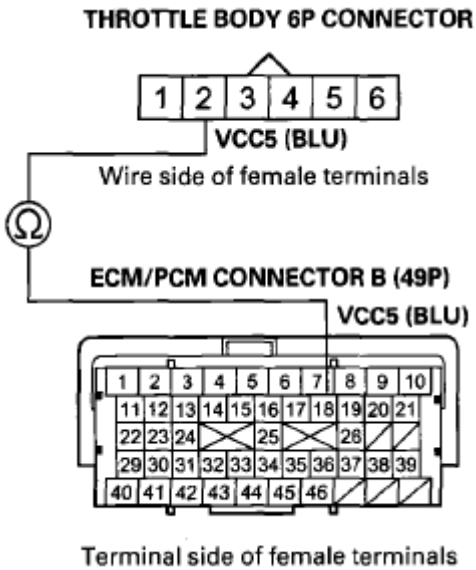

Fig. 10: Checking Continuity Between ECM/PCM Connector Terminal B18 And Throttle Body 6P

Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the throttle body and the ECM/PCM (B18), then go to step 18.

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
18. Reconnect all connectors.
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0222 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

23. Reconnect all connectors.
24. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
25. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0222 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0223: TP SENSOR B CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check TP SENSOR B in the DATA LIST with the HDS.

   Is there about 4.8 V or more?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM. •

4. Check for Pending or Confirmed DTCs with the HDS.

   Are DTC P0123 and P0223 indicated at the same time?

   YES - Go to step 13.

   NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the throttle body 6P connector.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Measure the voltage between throttle body 6P connector terminal No. 3 and body ground.

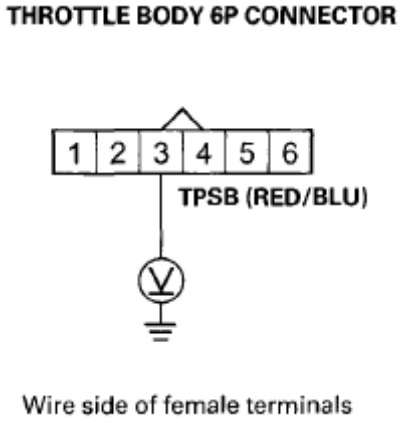

Fig. 11: Measuring Voltage Between Throttle Body 6P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 18.

NO - Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector B (49P).
12. Check for continuity between ECM/PCM connector terminal B26 and throttle body 6P connector terminal No. 3.

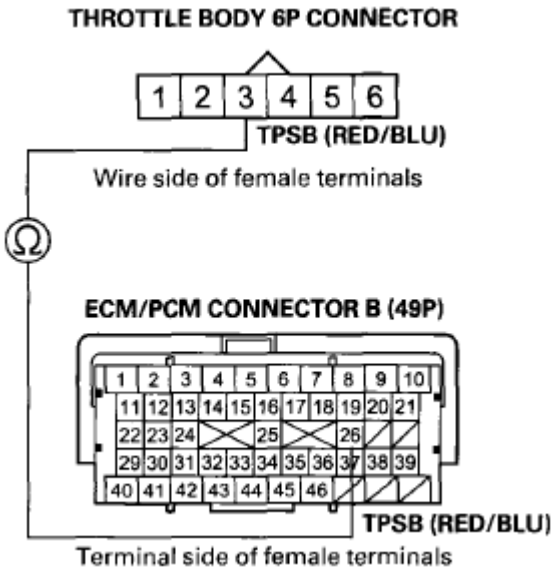

Fig. 12: Checking Continuity Between ECM/PCM Connector Terminal B26 And Throttle Body 6P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM/PCM (B26), then go to step 20.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector B (49P).
17. Check for continuity between ECM/PCM connector terminal B33 and throttle body 6P connector terminal No. 4.

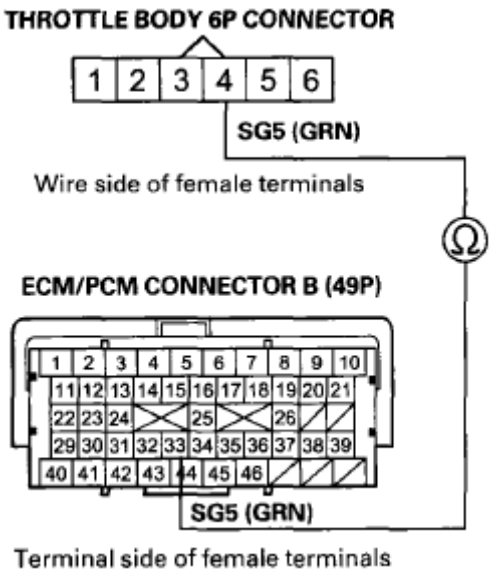

Fig. 13: Checking Continuity Between ECM/PCM Connector Terminal B33 And Throttle Body 6P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the throttle body and the ECM/PCM (B33), then go to step 20.

18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0223 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

25. Reconnect all connectors.
26. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).

27. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0223 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P1658: ETCS CONTROL RELAY ON MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Do the ETCS TEST in the INSPECTION MENU with the HDS.

    Is the RELAY circuit OK?

    YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM. •

    NO - Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Remove the ETCS control relay (A) from the under-hood fuse/relay box.

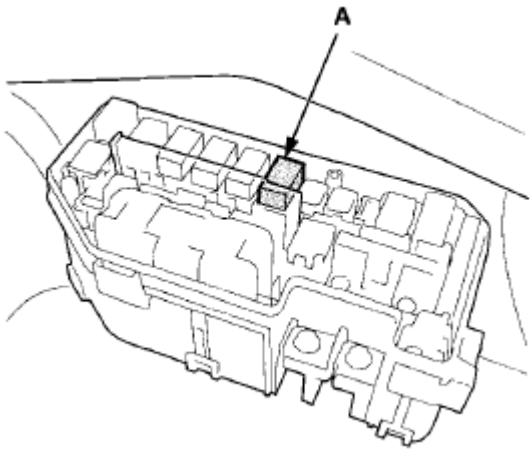

Fig. 14: Identifying ETCS Control Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Test the ETCS control relay (see **POWER RELAY TEST**).

   Is the ETCS control relay OK?

   YES - Go to step 6.

   NO - Replace the ETCS control relay, then go to step 13.

6. Jump the SCS line with the HDS.
7. Disconnect ECM/PCM connector A (49P).
8. Check for continuity between ECM/PCM connector terminal A29 and body ground.

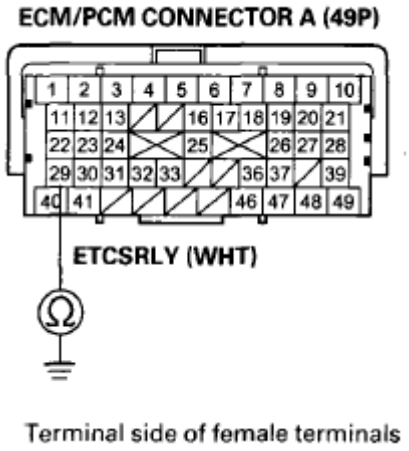

Fig. 15: Checking Continuity Between ECM/PCM Connector Terminal A29 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A29) and the ETCS control relay, then go to step 13.

NO - Go to step 9.

9. Disconnect ECM/PCM connector C (49P).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Measure the voltage between ECM/PCM connector terminal C4 and body ground.

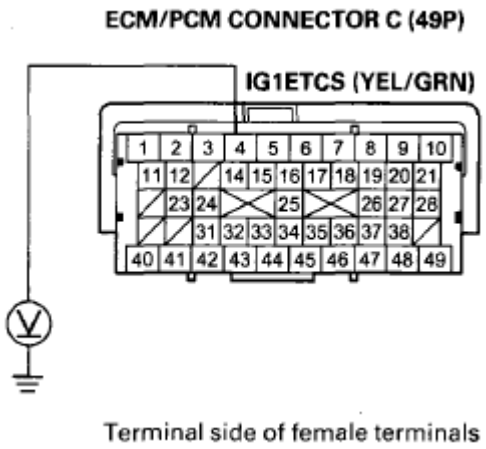

Fig. 16: Measuring Voltage Between ECM/PCM Connector Terminal C4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair short to power in the wire between the ECM/PCM (C4) and the ETCS control relay, then go to step 12.

NO - Go to step 18.

12. Turn the ignition switch to LOCK(0), or press the engine start/stop button to select the OFF mode.
13. Reconnect ail connectors.
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1658 indicated?

    YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
19. Reconnect all connectors.
20. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
21. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1658 indicated?

YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P1659: ETCS CONTROL RELAY OFF MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P1659 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM. •

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Check the No. 18 DBW (ETCS) (15 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES - Go to step 6.

   NO - Go to step 17.

6. Remove the ETCS control relay (A) from the under-hood fuse/relay box.

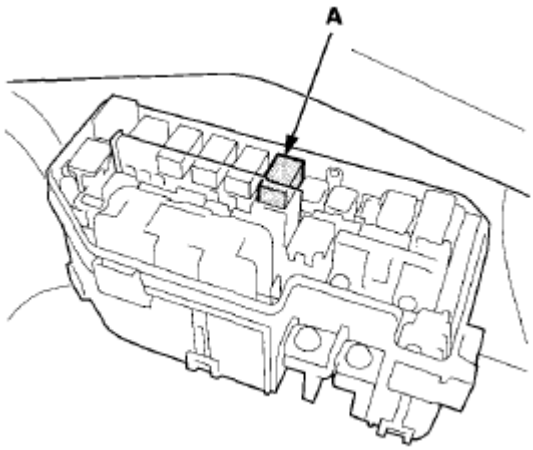

Fig. 17: Identifying ETCS Control Relay On Under-Hood Fuse/Relay Box
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Test the ETCS control relay (see **POWER RELAY TEST**).

   Is the ETCS control relay OK?

   YES - Go to step 8.

   NO - Replace the ETCS control relay, then go to step 23.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Measure the voltage between ETCS control relay 4P connector terminal No. 4 and body ground.

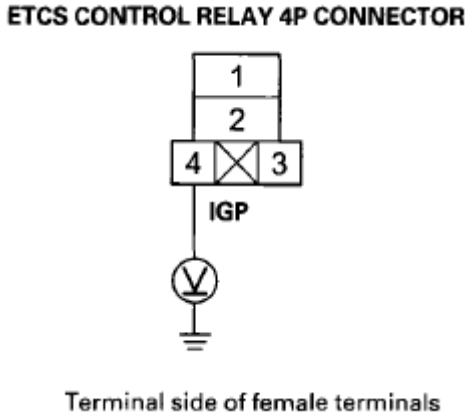

Fig. 18: Measuring Voltage Between ETCS Control Relay 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 22.

10. Measure the voltage between ETCS control relay 4P connector terminal No. 1 and body ground.

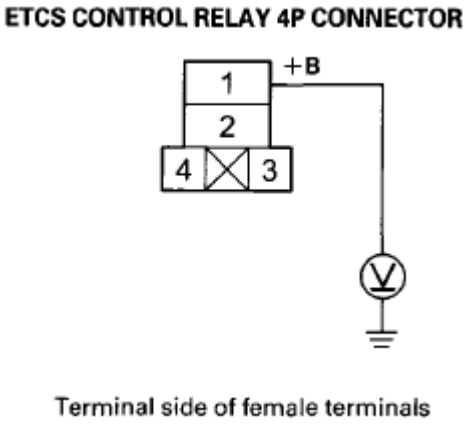

Fig. 19: Measuring Voltage Between ETCS Control Relay 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 11.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 22.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector C (49P).
14. Check for continuity between ETCS control relay 4P connector terminal No. 2 and ECM/PCM connector terminal C4.

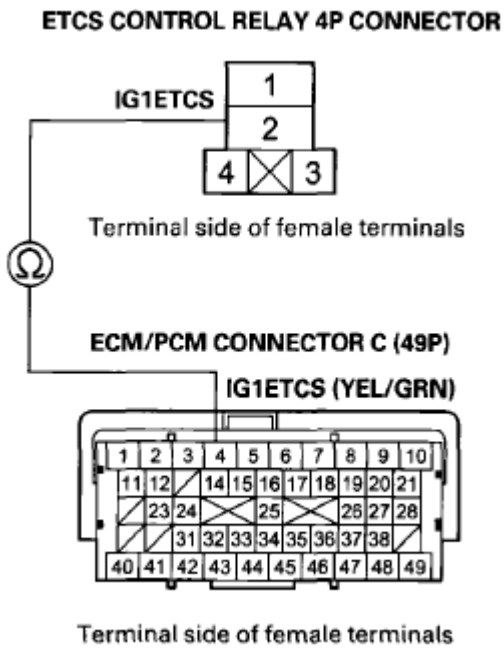

Fig. 20: Checking Continuity Between ETCS Control Relay 4P Connector And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 15.

NO - Repair open in the wire between the ECM/PCM (C4) and the ETCS control relay, then go to step 23.

15. Disconnect ECM/PCM connector A (49P).
16. Check for continuity between ETCS control relay 4P connector terminal No. 3 and ECM/PCM connector terminal A29.

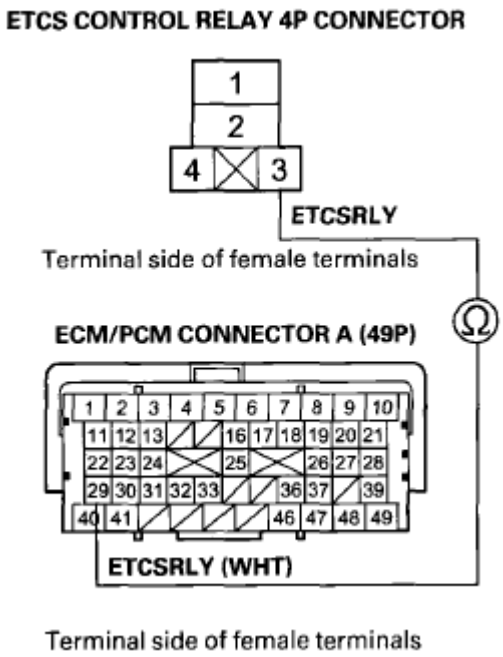

Fig. 21: Checking Continuity Between ETCS Control Relay 4P Connector Terminal No. 3 And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 28.

NO - Repair open in the wire between the ECM/PCM (A29) and the ETCS control relay, then go to step 23.

17. Remove the ETCS control relay (A) from the under-hood fuse/relay box.

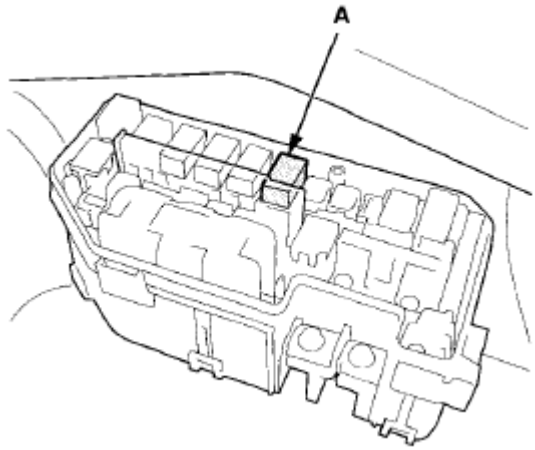

Fig. 22: Identifying ETCS Control Relay On Under-Hood Fuse/Relay Box
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Jump the SCS line with the HDS.
19. Disconnect ECM/PCM connector C (49P).
20. Check for continuity between ECM/PCM connector terminal C4 and body ground.

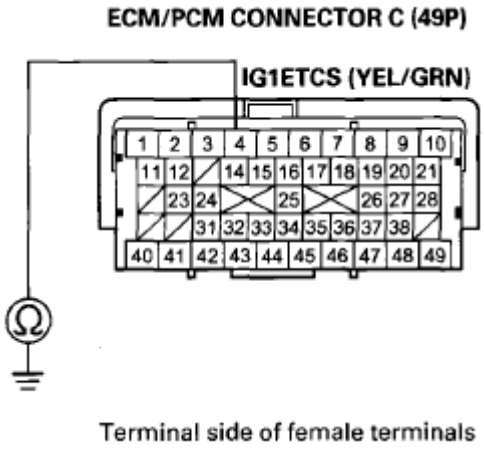

Fig. 23: Checking Continuity Between ECM/PCM Connector Terminal C4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C4) and the ETCS control relay, then go to step 23.

NO - Go to step 21.

21. Check for continuity between ETCS control relay 4P connector terminal No. 1 and body ground.

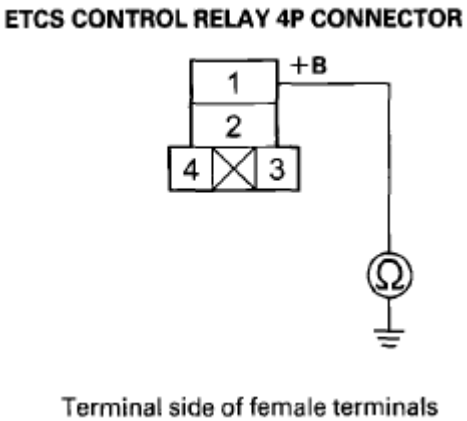

Fig. 24: Checking Continuity Between ETCS Control Relay 4P Connector And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**), then go to step 23.

NO - Go to step 28.

22. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
23. Reconnect all connectors.
24. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
25. Reset the ECM/PCM with the HDS.
26. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
27. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1659 indicated?

    YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

28. Reconnect all connectors.
29. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
30. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1659 indicated?

    YES - Check for poor connections or loose terminals at the ETCS control relay and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P1683: THROTTLE VALVE DEFAULT POSITION SPRING PERFORMANCE PROBLEM

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch to ON (II)/press the engine start/stop button, or while the ignition switch is in ON (II)/vehicle in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and wait 10 seconds.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P1683 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM. •

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect the intake air duct from the throttle body.
9. Push the throttle valve closed as shown in illustration below.

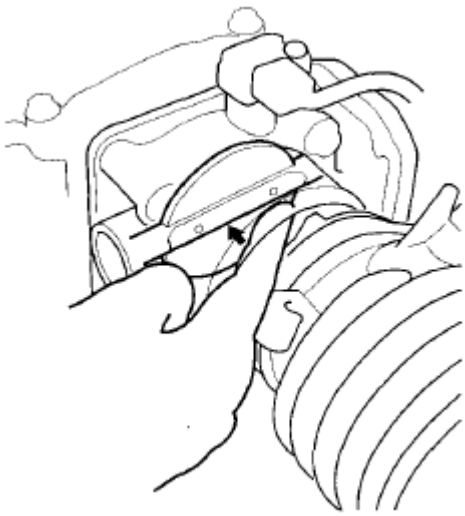

Fig. 25: Pushing Throttle Valve Closed
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Release the throttle valve.

    Does the throttle valve return?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 12 and recheck. If DTC P1683 is indicated, go to step 11.

NO - Go to step 11.

11. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Reset the ECM/PCM with the HDS.
14. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
15. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and wait 10 seconds.
16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
17. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P1683 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P1684: THROTTLE VALVE RETURN SPRING PERFORMANCE PROBLEM

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch to ON (II)/press the engine start/stop button, or while the ignition switch is in ON (II)/vehicle in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and wait 10 seconds.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P1684 indicated?

YES - Go to step 7.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at

the throttle body and the ECM/PCM. •

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect the intake air duct from the throttle body.
9. Push the throttle valve open as shown in illustration below.

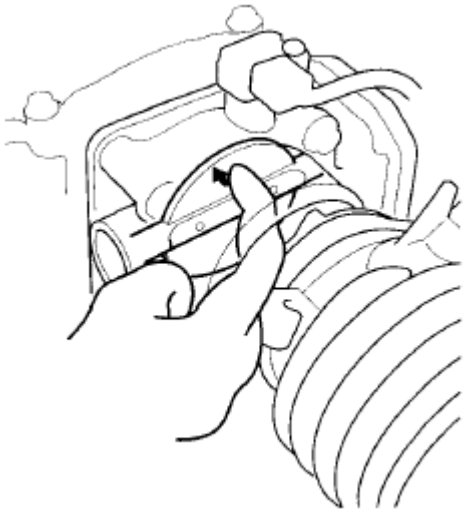

Fig. 26: Pushing Throttle Valve Open
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Release the throttle valve.

    Does the throttle valve return?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 12 and recheck. If DTC P1684 is indicated, go to step 11.

    NO - Go to step 11.

11. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Reset the ECM/PCM with the HDS.
14. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
15. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and wait 10 seconds.
16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
17. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1684 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to

step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2101: ETCS MALFUNCTION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch to ON (II)/press the engine start/stop button, or while the ignition switch is in ON (II)/vehicle in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Do the ETCS TEST in the INSPECTION MENU with the HDS.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2101 indicated?

   YES - Go to step 7.

   NO - Go to step 5.

5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VEHICLE SPEED
   - APP SENSOR
6. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2101 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and at the ECM/PCM, then clean the throttle body (see **THROTTLE BODY CLEANING**). •

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect the intake air duct from the throttle body.
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

10. Clear the DTC with the HDS.
11. Do the ETCS TEST in the INSPECTION MENU with the HDS.
12. Visually check the throttle valve operation.

    Does the throttle valve operate smoothly?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 24 and recheck. If DTC P2101 is indicated, go to step 22.

    NO - Go to step 13.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the throttle body 6P connector.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector B (49P).
17. Check for continuity between ECM/PCM connector terminal B33 and throttle body 6P connector terminal No. 4.

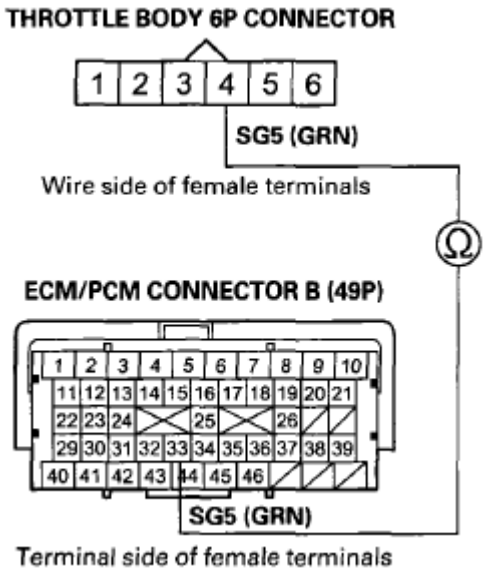

Fig. 27: Checking Continuity Between ECM/PCM Connector Terminal B33 And Throttle Body 6P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 18.

NO - Repair open in the wire between the throttle body and the ECM/PCM (B33), then go to step 24.

18. Disconnect ECM/PCM connector C (49P).

19. Connect throttle body 6P connector terminals No. 5 and No. 6 with a jumper wire.

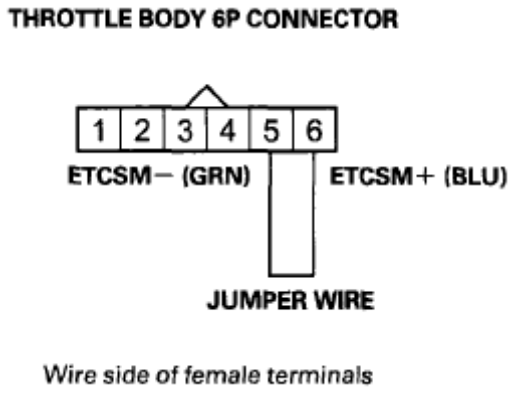

Fig. 28: Connecting Throttle Body 6P Connector Terminals No. 5 And No. 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Check for continuity between ECM/PCM connector terminals C2 and C3.

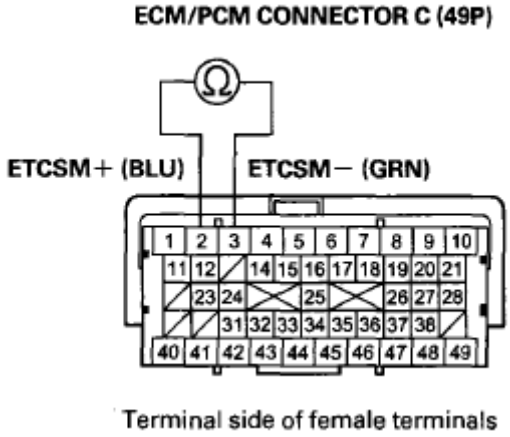

Fig. 29: Checking Continuity Between ECM/PCM Connector Terminals C2 And C3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 21.

NO - Repair open in the wires between the throttle body and the ECM/PCM (C2, C3), then go to step 24.

21. At the throttle body side, measure the resistance between throttle body 6P connector terminals No. 5 and No. 6 with the throttle fully closed.

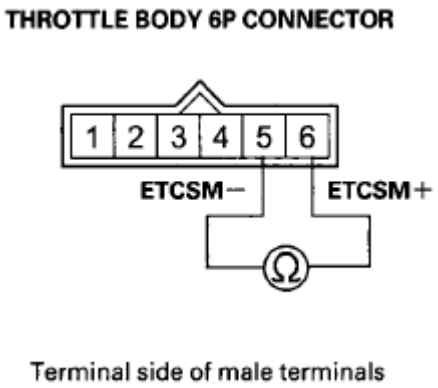

Fig. 30: Measuring Resistance Between Throttle Body 6P Connector Terminals No. 5 And No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 1.0 kohms or more?

YES - Go to step 23.

NO - Go to step 30.

22. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
23. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
24. Reconnect all connectors.
25. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VEHICLE SPEED
    - APP SENSOR
29. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2101 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then clean the throttle body (see **THROTTLE BODY CLEANING**), and go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

30. Reconnect all connectors.
31. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
32. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:

- ENGINE SPEED
- VEHICLE SPEED
- APP SENSOR

33. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2101 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then clean the throttle body (see **THROTTLE BODY CLEANING**). If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 32. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2118: THROTTLE ACTUATOR CURRENT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Slowly press the accelerator pedal to the floor.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2118 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Jump the SCS line with the HDS.
7. Disconnect the throttle body 6P connector.
8. Disconnect ECM/PCM connector B (49P).
9. Check for continuity between ECM/PCM connector terminal B33 and throttle body 6P connector terminal No. 4.

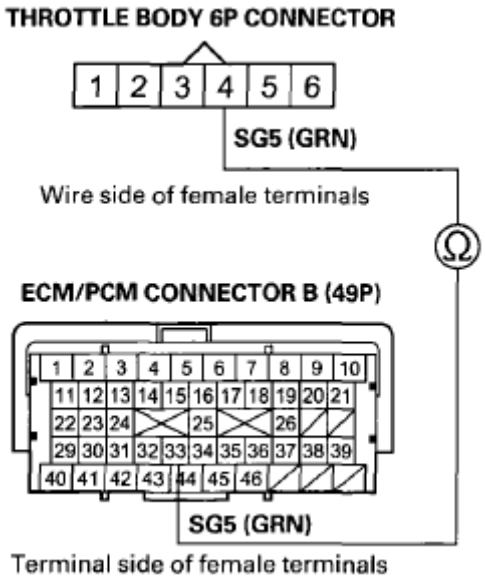

Fig. 31: Checking Continuity Between ECM/PCM Connector And Throttle Body 6P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair open in the wire between the throttle body and the ECM/PCM (B33), then go to step 18.

10. Disconnect ECM/PCM connector C (49P).
11. Check for continuity between throttle body 6P connector terminals No. 5 and No. 6.

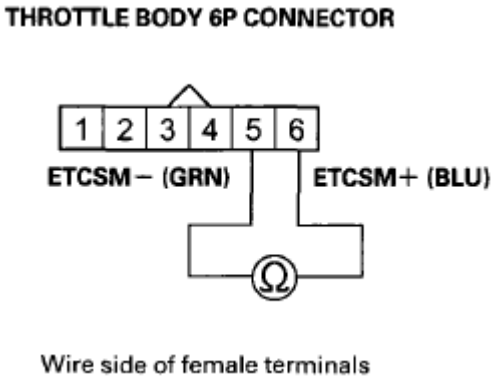

Fig. 32: Checking Continuity Between Throttle Body 6P Connector Terminals No. 5 And No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wires between throttle body 6P connector terminal No. 5 (ETCS- line) and No. 6 (ETCS+ line), then go to step 18.

NO - Go to step 12.

12. Check for continuity between body ground and throttle body 6P connector terminals No. 5 and No. 6 individually.

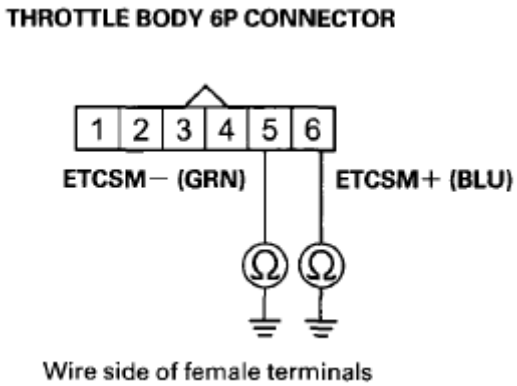

Fig. 33: Checking Continuity Between Body Ground And Throttle Body 6P Connector Terminals No. 5 And No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the throttle body 6P connector and body ground, then go to step 18.

NO - Go to step 13.

13. At the throttle body side, measure the resistance between throttle body 6P connector terminals No. 5 and No. 6 with the throttle fully closed.

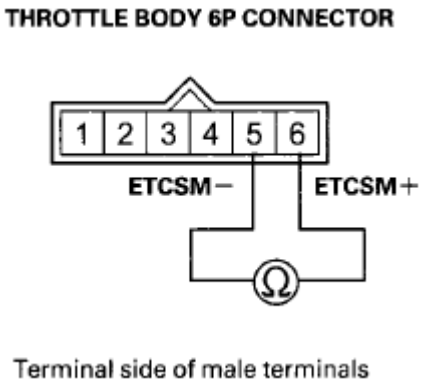

Fig. 34: Measuring Resistance Between Throttle Body 6P Connector Terminals No. 5 And No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 1.0 ohms or less?

YES - Go to step 14.

NO - Go to step 17.

14. Connect throttle body 6P connector terminals No. 5 and No. 6 with a jumper wire.

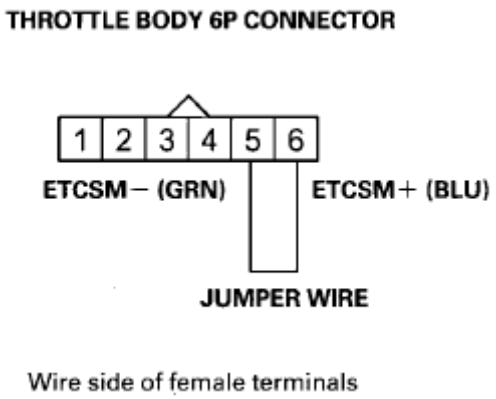

Fig. 35: Connecting Throttle Body 6P Connector Terminals No. 5 And No. 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Check for continuity between ECM/PCM connector terminals C2 and C3.

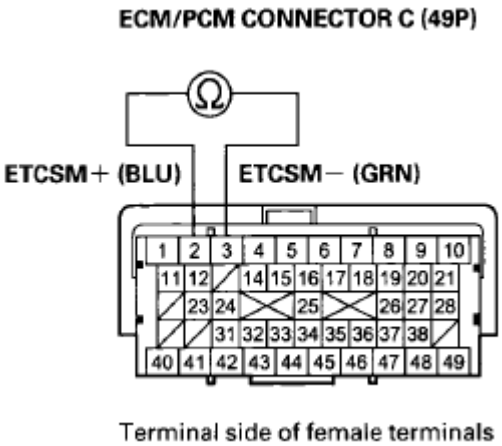

Fig. 36: Checking Continuity Between ECM/PCM Connector Terminals C2 And C3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 16.

NO - Repair open in the wire between the throttle body and the ECM/PCM (C2, C3), then go to step 18.

16. At the throttle body side, check for continuity between body ground and throttle body 6P connector terminals No. 5 and No. 6 individually.

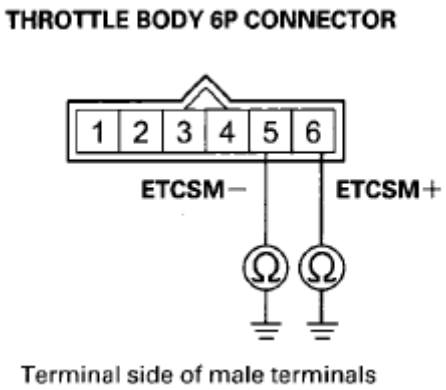

Fig. 37: Checking Continuity Between Body Ground And Throttle Body 6P Connector Terminals No. 5 And No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 17.

NO - Go to step 26.

17. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
18. Reconnect all connectors.
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
23. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
24. Slowly press the accelerator pedal to the floor.
25. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2118 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

26. Reconnect all connectors.
27. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
28. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
29. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

30. Slowly press the accelerator pedal to the floor.
31. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2118 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 27. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2122: APP SENSOR A (TP SENSOR D) CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check APP SENSOR A in the DATA LIST with the HDS.

Is there about 0.2 V or less?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Measure the voltage between APP sensor 6P connector terminals No. 2 and No. 3.

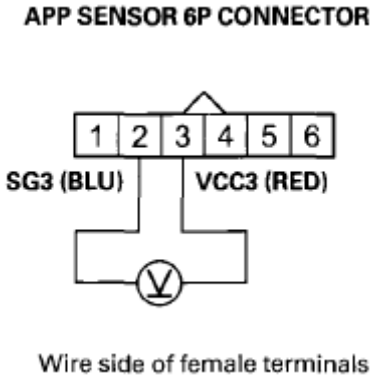

Fig. 38: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 7.

NO - Go to step 17.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (49P).
10. Check for continuity between APP sensor 6P connector terminal No. 1 and body ground.

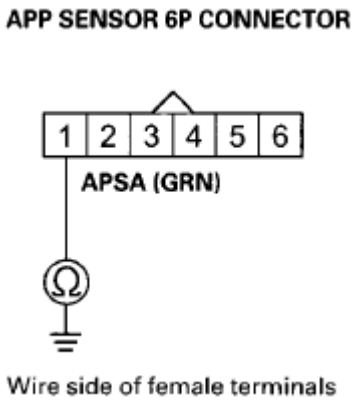

Fig. 39: Checking Continuity Between APP Sensor 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the APP sensor and the ECM/PCM (A18), then go to step 24.

NO - Go to step 11.

11. Connect APP sensor 6P connector terminal No. 1 to body ground with a jumper wire.

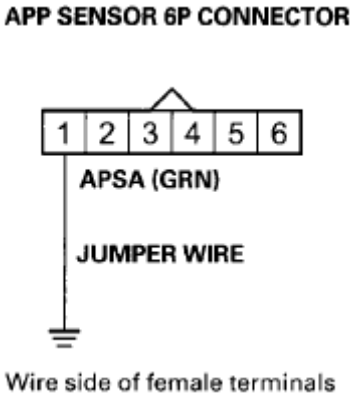

Fig. 40: Connecting APP Sensor 6P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between ECM/PCM connector terminal A18 and body ground.

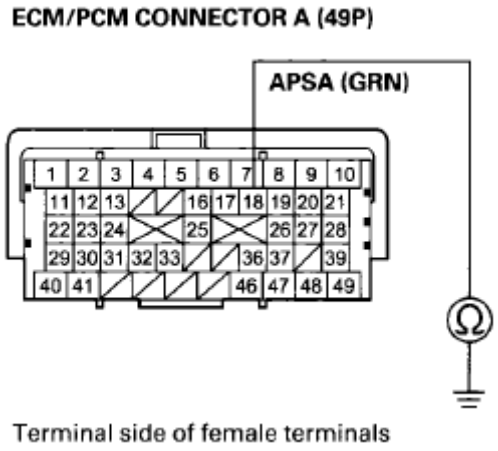

Fig. 41: Checking Continuity Between ECM/PCM Connector Terminal A18 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the APP sensor and the ECM/PCM (A18), then go to step 24.

13. Reconnect ECM/PCM connector A (49P).
14. Connect APP sensor 6P connector terminals No. 1 and No. 3 with a jumper wire.

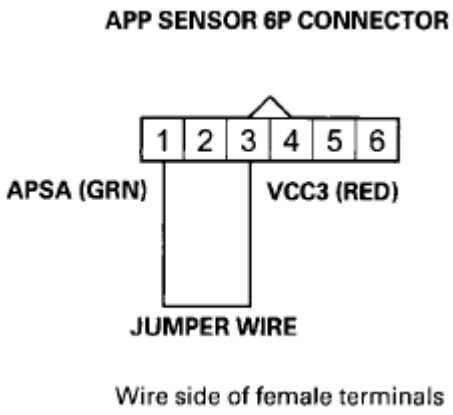

Fig. 42: Connecting APP Sensor 6P Connector Terminals No. 1 And No. 3 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Check APP SENSOR A in the DATA LIST with the HDS.

    Is there 0.2 V or less?

    YES - Go to step 29.

    NO - Go to step 22.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Jump the SCS line with the HDS.
19. Disconnect ECM/PCM connector A (49P).
20. Connect APP sensor 6P connector terminal No. 3 to body ground with a jumper wire.

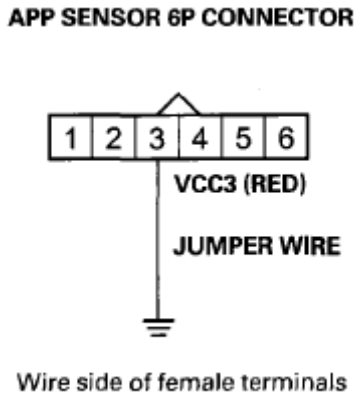

Fig. 43: Connecting APP Sensor 6P Connector Terminal No. 3 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Check for continuity between ECM/PCM connector terminal A24 and body ground.

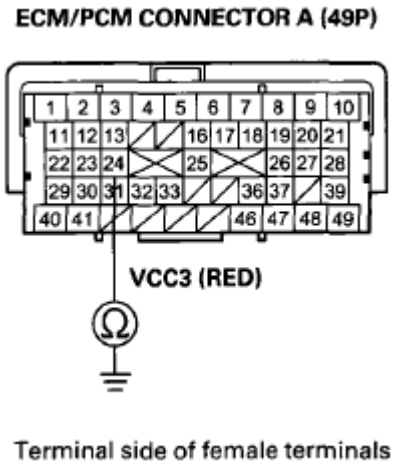

Fig. 44: Checking Continuity Between ECM/PCM Connector Terminal A24 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 29.

NO - Repair open in the wire between the APP sensor and the ECM/PCM (A24), then go to step 24.

22. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
23. Replace the accelerator pedal module (see **Accelerator Pedal Module Removal and Installation**).
24. Reconnect all connectors.
25. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2122 indicated?

YES - Check for poor connections or loose terminals at the APP sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

29. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
30. Reconnect all connectors.
31. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
32. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2122 indicated?

YES - Check for poor connections or loose terminals at the APP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2123: APP SENSOR A (TP SENSOR D) CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check APP SENSOR A in the DATA LIST with the HDS.

Is there about 4.9 V or more?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Measure the voltage between APP sensor 6P connector terminals No. 2 and No. 3.

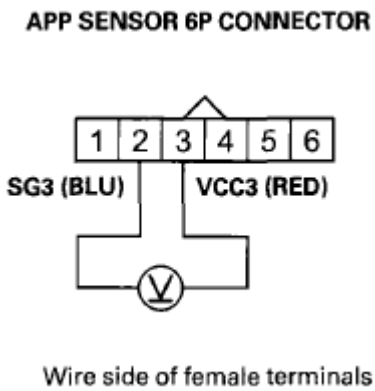

Fig. 45: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 7.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (49P).
10. Connect APP sensor 6P connector terminal No. 2 to body ground with a jumper wire.

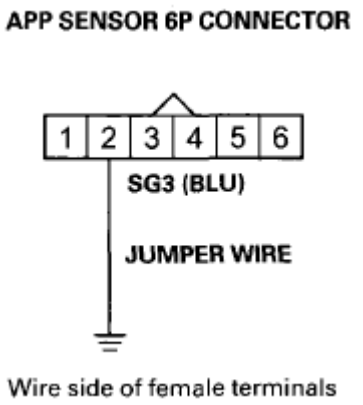

Fig. 46: Connecting APP Sensor 6P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check for continuity between ECM/PCM connector terminal A26 and body ground.

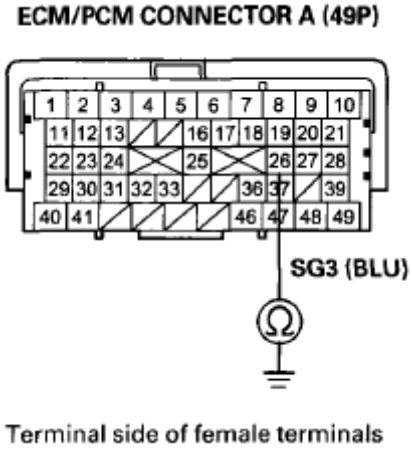

Fig. 47: Checking Continuity Between ECM/PCM Connector Terminal A26 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between the APP sensor and the ECM/PCM (A26), then go to step 14.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Replace the accelerator pedal module (see **Accelerator Pedal Module Removal and Installation**).
14. Reconnect all connectors.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2123 indicated?

    YES - Check for poor connections or loose terminals at the APP sensor and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

19. Reconnect all connectors.
20. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
21. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2123 indicated?

    YES - Check for poor connections or loose terminals at the APP sensor and the ECM/PCM, then go to step 1. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2127: APP SENSOR B (TP SENSOR E) CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check APP SENSOR B in the DATA LIST with the HDS.

   Is there about 0.2 V or less?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Measure the voltage between APP sensor 6P connector terminals No. 5 and No. 6.

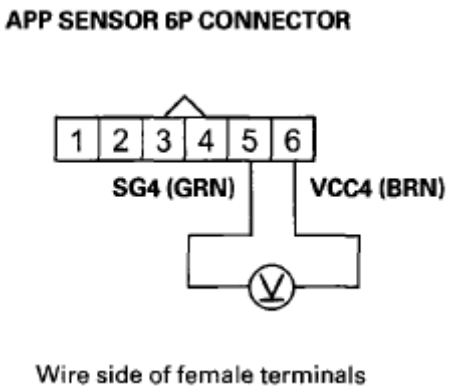

Fig. 48: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 5 And No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 7.

NO - Go to step 17.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (49P).
10. Check for continuity between APP sensor 6P connector terminal No. 4 and body ground.

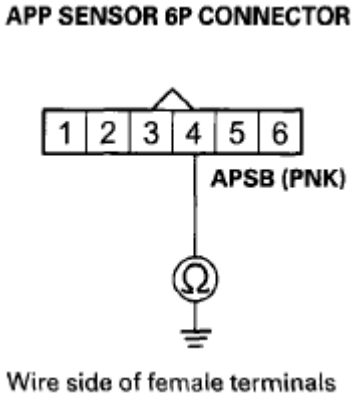

Fig. 49: Checking Continuity Between APP Sensor 6P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the APP sensor and the ECM/PCM (A19), then go to step 24.

NO - Go to step 11.

11. Connect APP sensor 6P connector terminal No. 4 to body ground with a jumper wire.

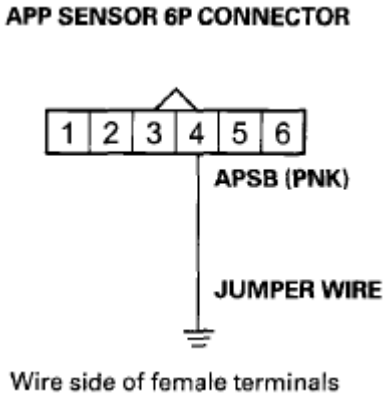

Fig. 50: Connecting APP Sensor 6P Connector Terminal No. 4 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between ECM/PCM connector terminal A19 and body ground.

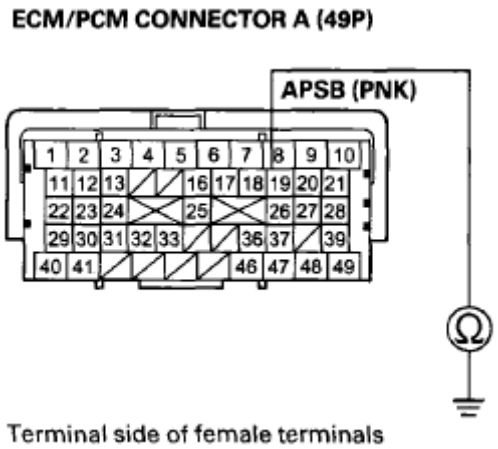

Fig. 51: Checking Continuity Between ECM/PCM Connector Terminal A19 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the APP sensor and the ECM/PCM (A19), then go to step 24.

13. Reconnect ECM/PCM connector A (49P).
14. Connect APP sensor 6P connector terminals No. 4 and No. 6 with a jumper wire.

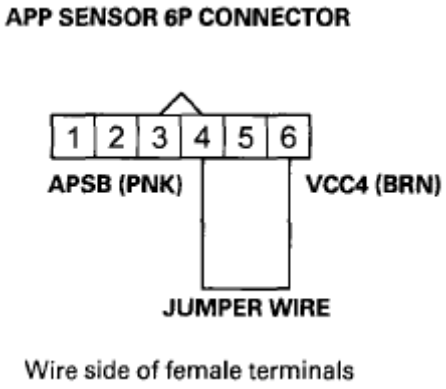

Fig. 52: Connecting APP Sensor 6P Connector Terminals No. 4 And No. 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Check APP SENSOR B in the DATA LIST with the HDS.

Is there about 0.2 V or less?

YES - Go to step 29.

NO - Go to step 22.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Jump the SCS line with the HDS.
19. Disconnect ECM/PCM connector A (49P).
20. Connect APP sensor 6P connector terminal No. 6 to body ground with a jumper wire.

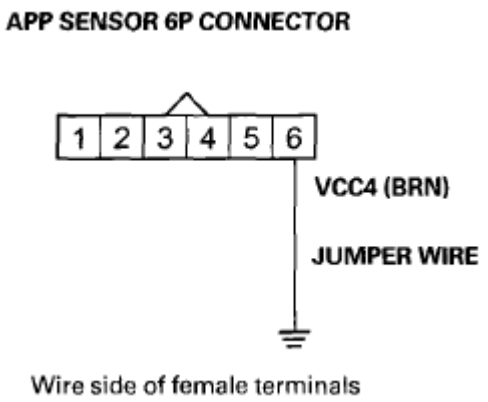

Fig. 53: Connecting APP Sensor 6P Connector Terminal No. 6 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Check for continuity between ECM/PCM connector terminal A25 and body ground.

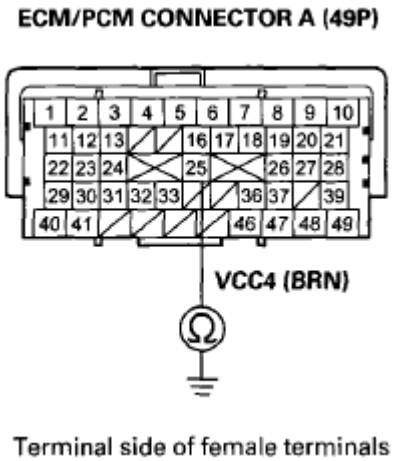

Fig. 54: Checking Continuity Between ECM/PCM Connector Terminal A25 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Repair open in the wire between the APP sensor and the ECM/PCM (A25), then go to step 24.

22. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
23. Replace the accelerator pedal module (see **Accelerator Pedal Module Removal and Installation**).
24. Reconnect all connectors.
25. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2127 indicated?

    YES - Check for poor connections or loose terminals at the APP sensor and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

29. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
30. Reconnect all connectors.
31. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
32. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2127 indicated?

    YES - Check for poor connections or loose terminals at the APP sensor and the ECM/PCM, then go to step 1. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2128: APP SENSOR B (TP SENSOR E) CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check APP SENSOR B in the DATA LIST with the HDS.

   Is there about 4.0 V or more?

   YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the APP sensor 6P connector.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Measure the voltage between APP sensor 6P connector terminals No. 5 and No. 6.

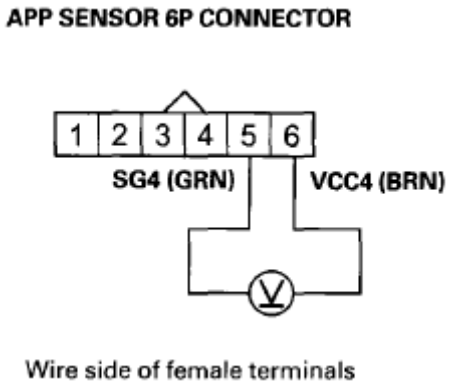

Fig. 55: Measuring Voltage Between APP Sensor 6P Connector Terminals No. 5 And No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 7.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (49P).
10. Connect APP sensor 6P connector terminal No. 5 to body ground with a jumper wire.

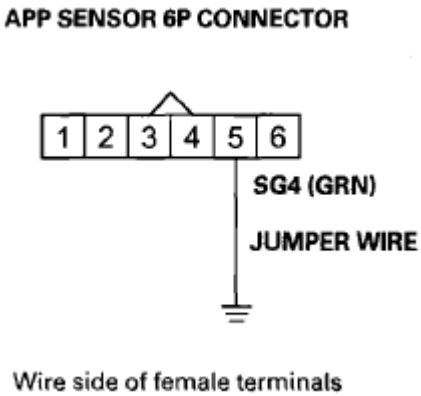

Fig. 56: Connecting APP Sensor 6P Connector Terminal No. 5 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check for continuity between ECM/PCM connector terminal A27 and body ground.

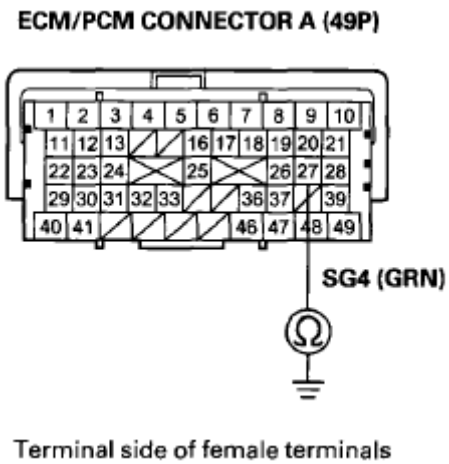

Fig. 57: Checking Continuity Between ECM/PCM Connector Terminal A27 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between the APP sensor and the ECM/PCM (A27), then go to step 14.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Replace the accelerator pedal module (see **Accelerator Pedal Module Removal and Installation**).
14. Reconnect all connectors.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2128 indicated?

YES - Check for poor connections or loose terminals at the APP sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

19. Reconnect all connectors.
20. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a

known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).

21. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2128 indicated?

YES - Check for poor connections or loose terminals at the APP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2135: TP SENSOR A/B INCORRECT VOLTAGE CORRELATION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch to ON (II)/press the engine start/stop button, or while the ignition switch is in ON (II)/vehicle in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Do the ETCS TEST in the INSPECTION MENU with the HDS.
4. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2135 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the intake air duct from the throttle body.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Visually check the throttle valve operation while you clear the DTC with the HDS.

Does the valve temporarily move to its fully closed position?

YES - Go to step 15.

NO - Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector B (49P).
12. Check for continuity between ECM/PCM connector terminals B17 and B26.

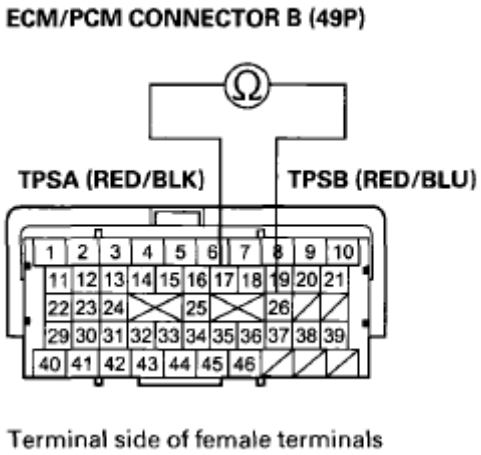

Fig. 58: Checking Continuity Between ECM/PCM Connector Terminals B17 And B26
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Go to step 22.

13. Disconnect the throttle body 6P connector.
14. Check for continuity between ECM/PCM connector terminals B17 and B26.

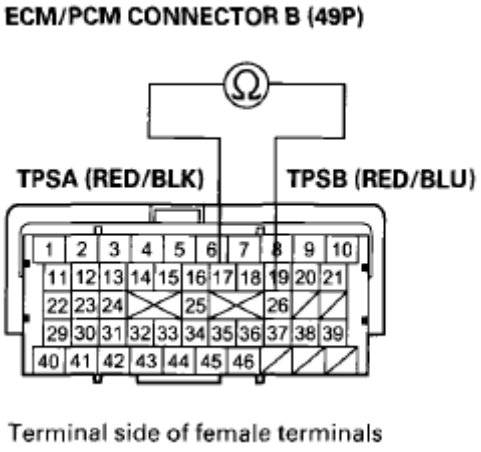

Fig. 59: Checking Continuity Between ECM/PCM Connector Terminals B17 And B26

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wires between the ECM/PCM connector terminals B17 (TPSA line) and B26 (TPSB line), then go to step 17.

NO - Go to step 15.

15. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
16. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
17. Reconnect all connectors.
18. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
19. Reset the ECM/PCM with the HDS.
20. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
21. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2135 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

22. Reconnect all connectors.
23. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2135 indicated?

    YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2138: APP SENSOR A/B (TP SENSOR D/E) INCORRECT VOLTAGE CORRELATION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with HDS.
3. Press the accelerator pedal to the floor.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2138 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the ECM/PCM. •

5. Check APP SENSOR A and APP SENSOR B in the DATA LIST with the HDS.

   Are they the same voltage?

   YES - Go to step 6.

   NO - Go to step 12.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector A (49P).
9. Check for continuity between ECM/PCM connector terminals A18 and A19.

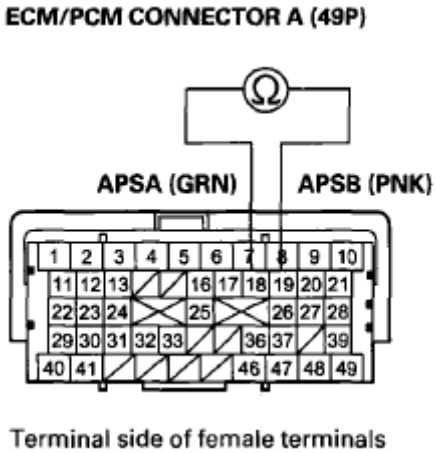

Fig. 60: Checking Continuity Between ECM/PCM Connector Terminals A18 And A19
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Go to step 22.

10. Disconnect the APP sensor 6P connector.
11. Check for continuity between ECM/PCM connector terminals A18 and A19.

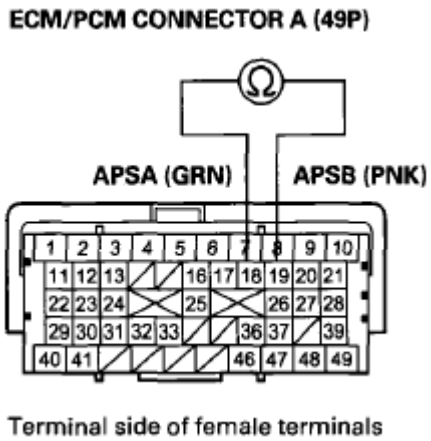

Fig. 61: Checking Continuity Between ECM/PCM Connector Terminals A18 And A19
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wires between ECM/PCM connector terminals A18 (APSA line) and A19 (APSB line), then go to step 14.

NO - Go to step 13.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Replace the accelerator pedal module (see **Accelerator Pedal Module Removal and Installation**).
14. Reconnect all connectors.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Press the accelerator pedal to the floor.
21. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2138 indicated?

YES - Check for poor connections or loose terminals at the APP sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the

indicated DTC's troubleshooting. •

22. Reconnect all connectors.
23. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
24. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
25. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
26. Press the accelerator pedal to the floor.
27. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2138 indicated?

YES - Check for poor connections or loose terminals at the APP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 24. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2176: THROTTLE ACTUATOR CONTROL SYSTEM IDLE POSITION NOT LEARNED

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch to ON (II)/press the engine start/stop button, or while the ignition switch is in ON (II)/vehicle in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P2135 is stored at the same time as DTC P2176, troubleshoot DTC P2135 first, then recheck for DTC P2176.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait 10 seconds.
5. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2176 indicated?

YES - Go to step 6.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then clean the throttle body (see **THROTTLE BODY CLEANING**). •

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Disconnect the intake air duct from the throttle body.
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Clear the DTC with the HDS.
10. Visually check the throttle valve operation while doing the ETCS TEST in the INSPECTION MENU with the HDS.

    Does the throttle valve move to its fully closed position?

    YES - Go to step 11.

    NO - Go to step 12.

11. Check for sludge or carbon on the throttle valve.

    Is there sludge or carbon on the throttle valve?

    YES - Clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 21.

    NO - Go to step 18.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the throttle body 6P connector.
14. Jump the SCS line with the HDS.
15. Disconnect ECM/PCM connector C (49P).
16. Connect throttle body 6P connector terminals No. 5 and No. 6 with a jumper wire.

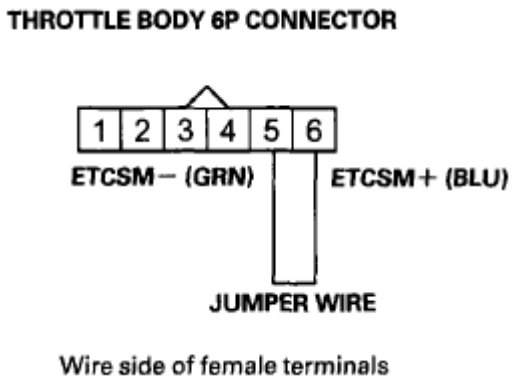

Fig. 62: Connecting Throttle Body 6P Connector Terminals No. 5 And No. 6 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Check for continuity between ECM/PCM connector terminals C2 and C3.

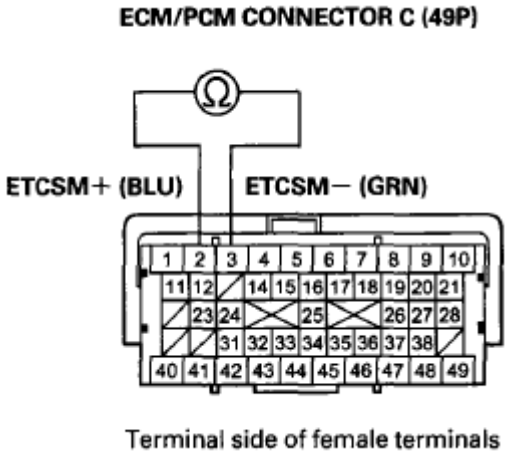

Fig. 63: Checking Continuity Between ECM/PCM Connector Terminals C2 And C3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 28.

NO - Repair open in the wires between the throttle body and the ECM/PCM (C2, C3), then go to step 21.

18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
19. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
25. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait 10 seconds.
26. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2176 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then clean the throttle body (see **THROTTLE BODY CLEANING**), and go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

27. Reconnect all connectors.

28. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
29. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
30. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait 10 seconds.
31. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2176 indicated?

    YES - Check for poor connections or loose terminals at throttle body and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 29. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

APP SENSOR SIGNAL INSPECTION

NOTE:

- **This procedure checks the APP sensor in its fully closed position. In any other position, the APP sensor stores DTCs which are covered in other troubleshooting procedures.**
- **Check for Pending or Confirmed DTCs with the HDS before doing this procedure. If any DTCs are indicated, troubleshoot them first, then do this procedure.**
- **Press the accelerator pedal several times, to check its operation. If it does not operate smoothly, check the pedal. If you find a problem, replace the accelerator pedal module (see Accelerator Pedal Module Removal and Installation).**

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

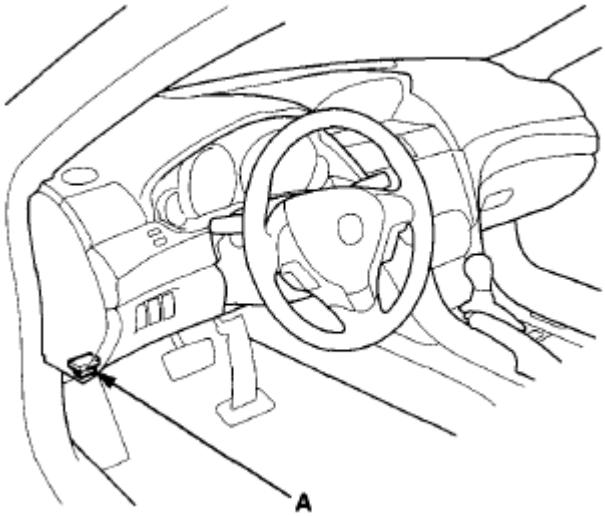

Fig. 64: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0 %, the APP sensor is OK.
   - If it is not 0 %, update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 5.
5. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0 %, the APP sensor is OK.
   - If it is not 0 %, replace the accelerator pedal module (see **Accelerator Pedal Module Removal and Installation**), then go to step 1.

ACCELERATOR PEDAL MODULE REMOVAL AND INSTALLATION

REMOVAL

1. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
2. Disconnect the APP sensor 6P connector (A).

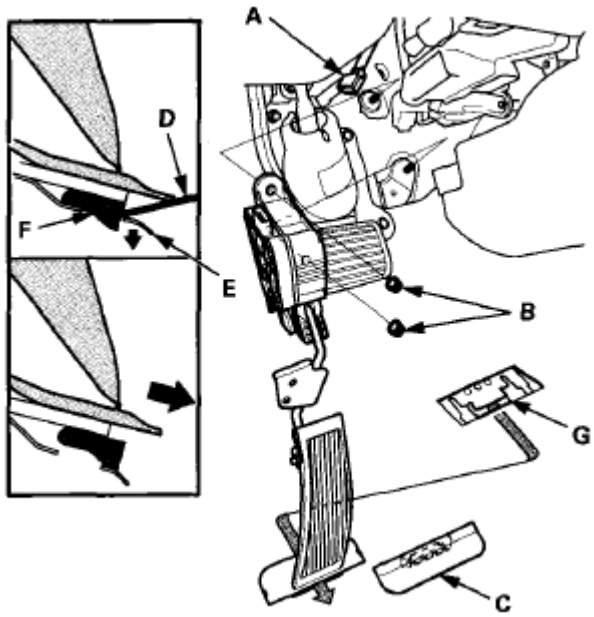

Fig. 65: Identifying APP Sensor 6P Connector, Clip, Screwdriver, Lock, Accelerator Pedal Pad, Mounting Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the two mounting nuts (B), then remove the clip (C). Using a flat-tip screwdriver (D), push the lock (E), then remove the accelerator pedal pad (F) from the pedal stop (G).
4. Remove the accelerator pedal module.

NOTE:

- **The APP sensor is not available separately. Do not disassemble the accelerator pedal module.**
- **If the pedal stop is damaged, replace it by pulling back the carpet (A), and removing the nuts (B), the bolt (C), and the pedal stop (D).**

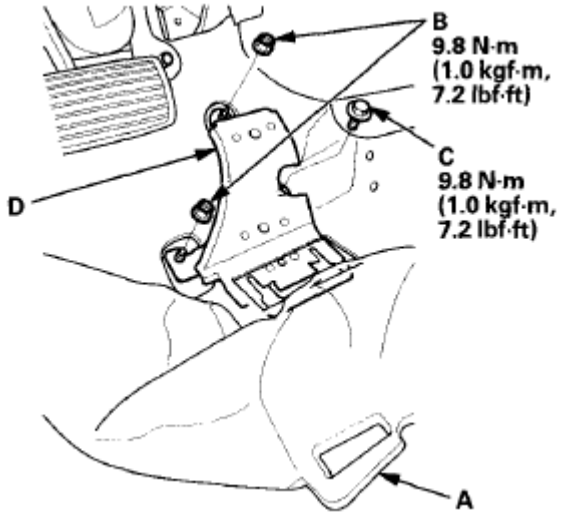

Fig. 66: Identifying Carpet, Nuts, Bolt And Pedal Stop With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

1. Install the accelerator pedal pad (A) to the pedal stop (B). Slide the pad until it locks with a clicking sound.

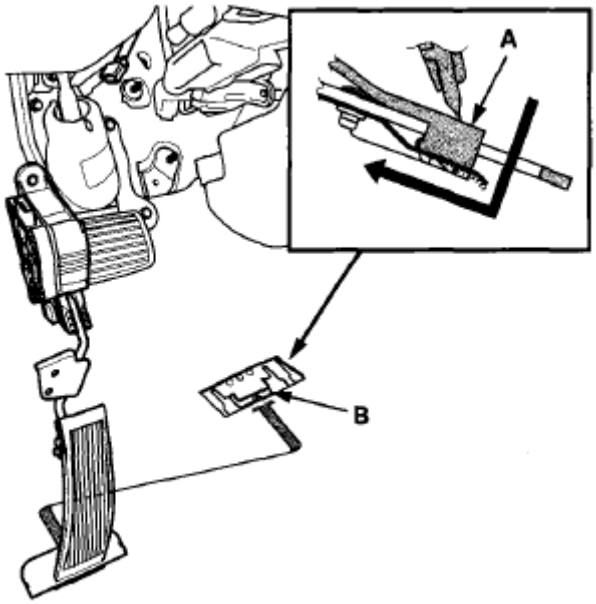

Fig. 67: Identifying Pedal Pad And Stop
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new clip (A).

NOTE:

- **The clip must be replaced whenever the accelerator pedal module is installed.**
- **Make sure that the accelerator pedal module and the clip are secure.**

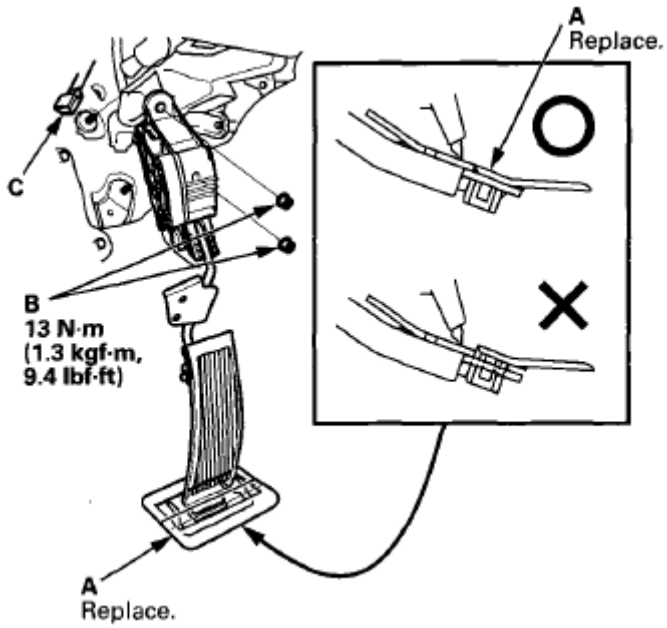

Fig. 68: Identifying Clip, Nuts And APP Sensor 6P Connector With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the nuts (B), and connect the APP sensor 6P connector (C).

EMISSION APPLICATIONS

2012 Acura - TL

EMISSION APPLICATIONS

2012 TL

Engine & Fuel System	(1) Emission Control Systems & Devices	(2) EGR Test No.
3.5L (211") V6 SFI	**PCV, EVAP, TWC, FR, EGR, SPK, (3) HO2S, CEC, (4) MIL,** EVAP-CVSV, EVAP-CPV, EVAP-VC, EGR-PS, FTPS, FT-VCV	3
3.7L (224") V6 SFI	**PCV, EVAP, TWC, FR, EGR, SPK, (3) HO2S, CEC, (4) MIL,** EVAP-CVSV, EVAP-CPV, EVAP-VC, EGR-PS, FTPS, FT-VCV	3

(1) For quick reference, major emission control systems and devices are listed in bold type; components and other related devices are listed in light type.

(2) See ACURA under IMPORTED CARS & TRUCKS in EGR FUNCTION TESTING section. Use EGR test number specified in table.

(3) Equipped with 2 AFS & 2 HO2S.

(4) PCM controlled.

DTC TROUBLESHOOTING

DTC P0443: EVAP CANISTER PURGE VALVE CIRCUIT MALFUNCTION

Special Tools Required

Vacuum Pump/Gauge, 0- 30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0443 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister purge valve and the ECM/PCM.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode and allow the engine to cool to below 140 °F (60 °C).
6. Disconnect the vacuum hose (A) from the purge joint (B) in the engine compartment, and connect a vacuum pump/gauge, 0- 30 inHg, to the hose.

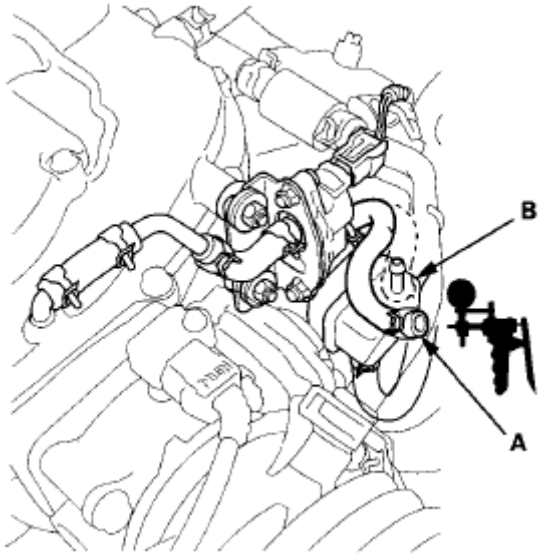

Fig. 4: Identifying Vacuum Hose And Purge Joint
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Start the engine, and let it idle.

   Is there vacuum?

   YES - Go to step 8.

   NO - Go to step 14.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Disconnect the EVAP canister purge valve 2P connector.
10. Check for continuity between EVAP canister purge valve 2P connector terminal No. 1 and body ground.

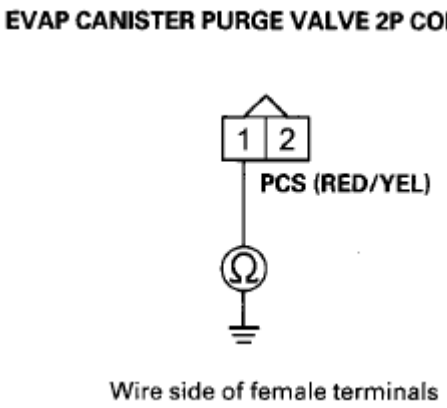

Fig. 5: Checking Continuity Between EVAP Canister Purge Valve 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Go to step 23.

11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connector C (49P).
13. Check for continuity between EVAP canister purge valve 2P connector terminal No. 1 and body ground.

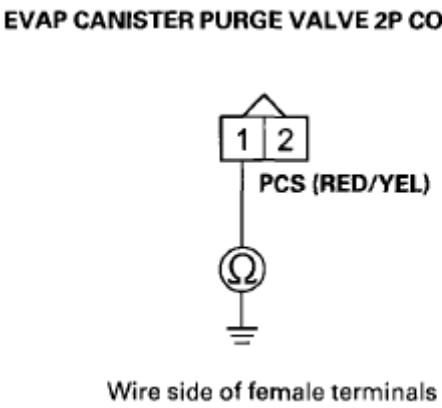

Fig. 6: Checking Continuity Between EVAP Canister Purge Valve 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the EVAP canister purge valve and the ECM/PCM (C40), then go to step 24.

NO - Go to step 30.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Disconnect the EVAP canister purge valve 2P connector.
16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
17. Measure the voltage between EVAP canister purge valve 2P connector terminal No. 2 and body ground.

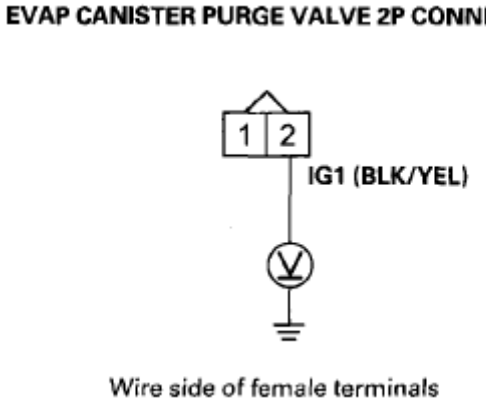

Fig. 7: Measuring Voltage Between EVAP Canister Purge Valve 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 18.

NO - Repair open in the wire between the EVAP canister purge valve and the No. 13 ACG (15 A) fuse in the driver's under-dash fuse/relay box, then go to step 24.

18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
19. Jump the SCS line with the HDS.
20. Disconnect ECM/PCM connector C (49P).
21. Check for continuity between ECM/PCM connector terminal C40 and EVAP canister purge valve 2P connector terminal No. 1.

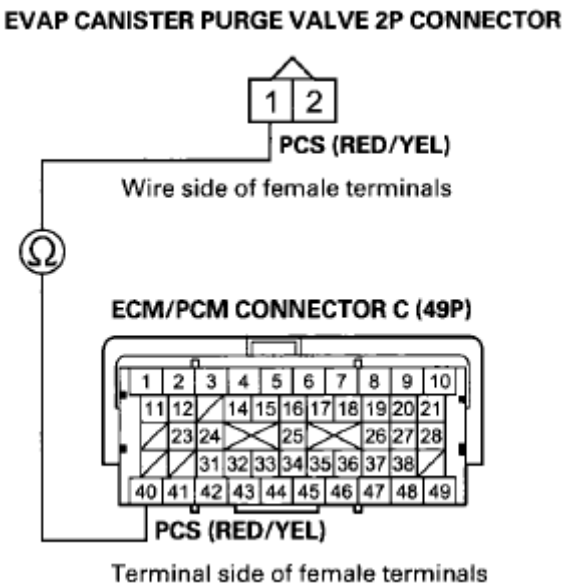

Fig. 8: Checking Continuity Between ECM/PCM Connector Terminal C40 And EVAP Canister Purge Valve 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 22.

NO - Repair open in the wire between the EVAP canister purge valve and the ECM/PCM (C40), then go to step 24.

22. At the valve side, measure the resistance between EVAP canister purge valve 2P connector terminals No. 1 and No. 2.

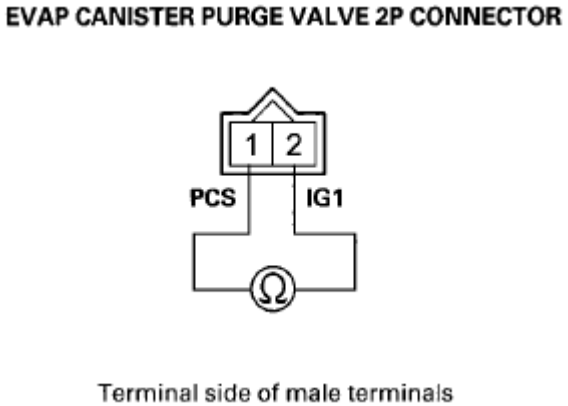

Fig. 9: Measuring Resistance Between EVAP Canister Purge Valve 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 23- 26 ohms at room temperature?

YES - Go to step 30.

NO - Go to step 23.

23. Replace the EVAP canister purge valve (see **EVAP CANISTER PURGE VALVE REPLACEMENT**).
24. Reconnect all connectors.
25. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0443 indicated?

    YES - Check for poor connections or loose terminals at the EVAP canister purge valve and the ECM/PCM, then go to step 1.

    NO - Go to step 29.

29. Monitor the OBD STATUS for DTC P0443 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 28, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister purge valve and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING or OUT OF CONDITION, keep idling until a result comes on.

30. Reconnect all connectors.
31. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
32. Start the engine, and let it idle.
33. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0443 indicated?

    YES - Check for poor connections or loose terminals at the EVAP canister purge valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 32. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 34.

34. Monitor the OBD STATUS for DTC P0443 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 33, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister purge valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 32. If the ECM/PCM was substituted, go to step 1. If the screen indicates EXECUTING or OUT OF CONDITION, keep idling until a result comes on.

DTC P0451: FTP SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P2422 is stored at the same time as DTC P0451, troubleshoot DTC P2422 first, then recheck for DTC P0451.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle for 1 minute.
4. Monitor the OBD STATUS for DTC P0451 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 5.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Replace the FTP sensor; without SH-AWD (see **FTP SENSOR REPLACEMENT**), with SH-AWD (see **WITH SH-AWD**).
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
10. Start the engine, and let it idle for 1 minute.
11. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0451 indicated?

YES - Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1.

NO - Go to step 12.

12. Monitor the OBD STATUS for DTC P0451 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 11, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0452: FTP SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Remove the fuel fill cap.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Check the FTP SENSOR in the DATA LIST with the HDS.

   Is about - 7.3 kPa (- 2.16 inHg, - 55 mmHg), or 0.3 V or less indicated?

   YES - Go to step 10.

   NO - Go to step 7.

7. Install the fuel fill cap.
8. Start the engine.
9. Monitor the OBD STATUS for DTC P0452 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 10.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the screen indicates NOT

COMPLETED, keep idling until a result comes on.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Disconnect the FTP sensor 3P connector.
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is about - 7.3 kPa (- 2.16 inHg, - 55 mmHg), or 0.3 V or less indicated?

    YES - Go to step 20.

    NO - Go to step 14.

14. Measure the voltage between FTP sensor 3P connector terminal No. 1 and body ground.

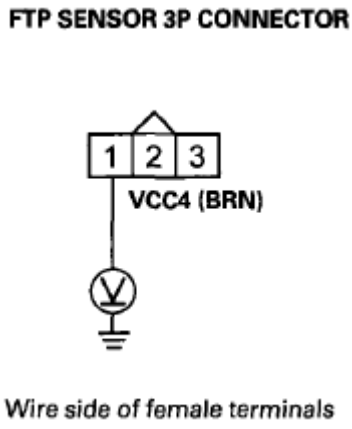

Fig. 10: Measuring Voltage Between FTP Sensor 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 24.

NO - Go to step 15.

15. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
16. Jump the SCS line with the HDS.
17. Disconnect ECM/PCM connector A (49P).
18. Connect FTP sensor 3P connector terminal No. 1 to body ground with a jumper wire.

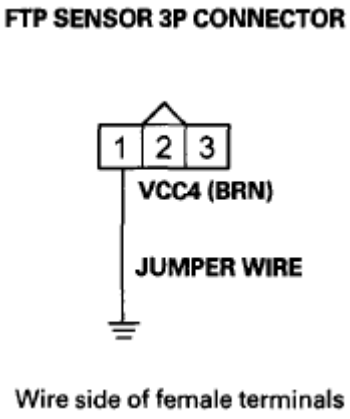

Fig. 11: Connecting FTP Sensor 3P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Check for continuity between ECM/PCM connector terminal A25 and body ground.

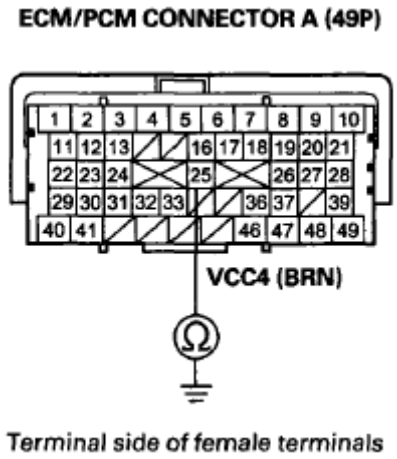

Fig. 12: Checking Continuity Between ECM/PCM Connector Terminal A25 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 32.

NO - Repair open in the wire between the ECM/PCM (A25) and the FTP sensor, then go to step 26.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Jump the SCS line with the HDS.
22. Disconnect ECM/PCM connector A (49P).
23. Check for continuity between FTP sensor 3P connector terminal No. 2 and body ground.

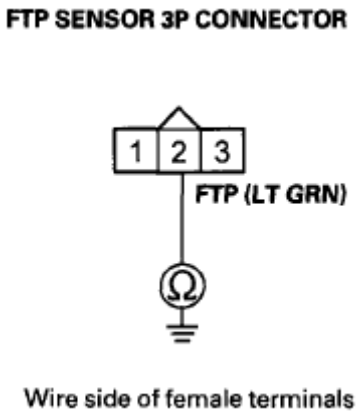

Fig. 13: Checking Continuity Between FTP Sensor 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A39) and the FTP sensor, then go to step 26.

NO - Go to step 32.

24. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
25. Replace the FTP sensor; without SH-AWD (see **FTP SENSOR REPLACEMENT**), with SH-AWD (see **WITH SH-AWD**).
26. Reconnect all connectors.
27. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
28. Reset the ECM/PCM with the HDS.
29. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
30. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0452 indicated?

YES - Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1.

NO - Go to step 31.

31. Monitor the OBD STATUS for DTC P0452 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 30, go to the indicated **DTC'S TROUBLESHOOTING**.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

32. Reconnect all connectors.
33. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
34. Start the engine, and let it idle.
35. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0452 indicated?

    YES - Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 34. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 36.

36. Monitor the OBD STATUS for DTC P0452 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 35, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 34. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0453: FTP SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Remove the fuel fill cap.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Check the FTP SENSOR in the DATA LIST with the HDS.

   Is about 7.3 kPa (2.16 inHg, 55 mmHg), or 4.7 V or more indicated?

YES - Go to step 10.

NO - Go to step 7.

7. Install the fuel fill cap.
8. Start the engine.
9. Monitor the OBD STATUS for DTC P0453 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 10.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Disconnect the FTP sensor 3P connector.
12. Connect FTP sensor 3P connector terminals No. 2 and No. 3 with a jumper wire.

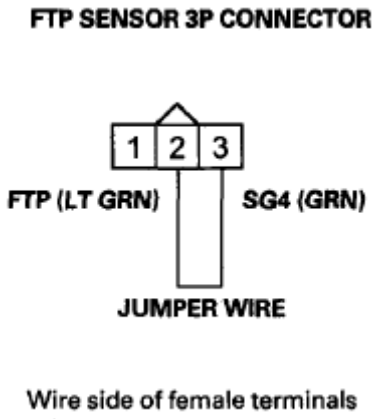

Fig. 14: Connecting FTP Sensor 3P Connector Terminals No. 2 And No. 3 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is about 7.3 kPa (2.16 inHg, 55 mmHg), or 4.7 V or more indicated?

    YES - Go to step 15.

    NO - Go to step 26.

15. Measure the voltage between FTP sensor 3P connector terminals No. 1 and No. 3.

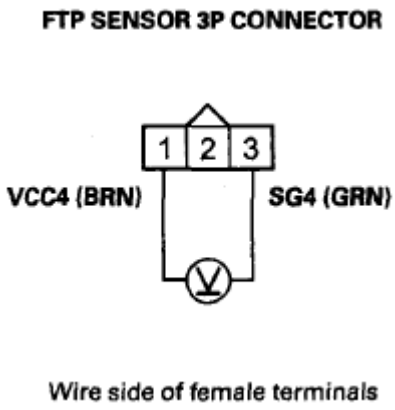

Fig. 15: Measuring Voltage Between FTP Sensor 3P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 21.

NO - Go to step 16.

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Jump the SCS line with the HDS.
18. Disconnect ECM/PCM connector A (49P).
19. Connect FTP sensor 3P connector terminal No. 3 to body ground with a jumper wire.

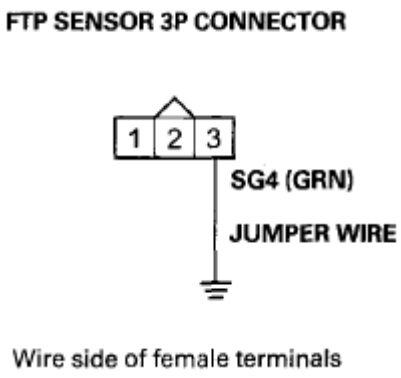

Fig. 16: Connecting FTP Sensor 3P Connector Terminal No. 3 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Check for continuity between ECM/PCM connector terminal A27 and body ground.

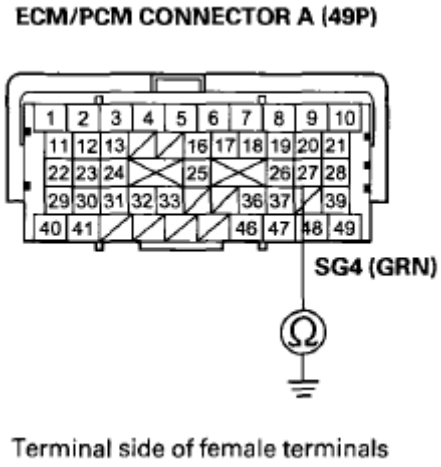

Fig. 17: Checking Continuity Between ECM/PCM Connector Terminal A27 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 34.

NO - Repair open in the wire between the ECM/PCM (A27) and the FTP sensor, then go to step 28.

21. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
22. Jump the SCS line with the HDS.
23. Disconnect ECM/PCM connector A (49P).
24. Connect FTP sensor 3P connector terminal No. 2 to body ground with a jumper wire.

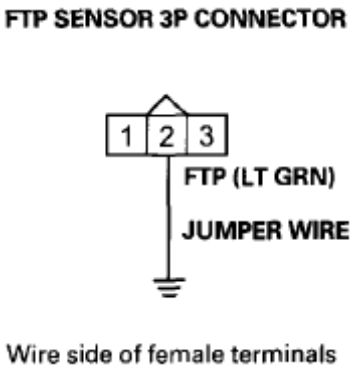

Fig. 18: Connecting FTP Sensor 3P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Check for continuity between ECM/PCM connector terminal A39 and body ground.

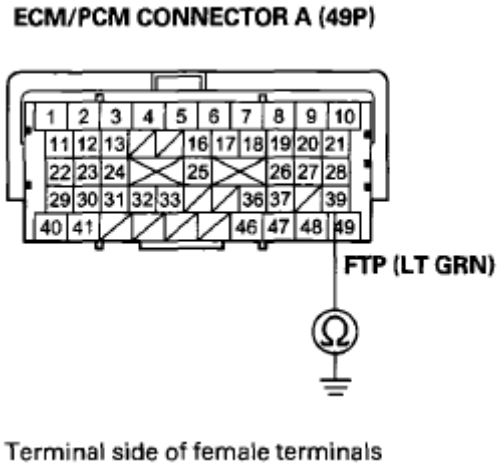

Fig. 19: Checking Continuity Between ECM/PCM Connector Terminal A39 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 34.

NO - Repair open in the wire between the ECM/PCM (A39) and the FTP sensor, then go to step 28.

26. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
27. Replace the FTP sensor; without SH-AWD (see **FTP SENSOR REPLACEMENT**), with SH-AWD (see **WITH SH-AWD**).
28. Reconnect all connectors.
29. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
30. Reset the ECM/PCM with the HDS.
31. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
32. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0453 indicated?

    YES - Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1.

    NO - Go to step 33.

33. Monitor the OBD STATUS for DTC P0453 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 32, go to the indicated **DTC'S TROUBLESHOOTING**.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

34. Reconnect all connectors.
35. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
36. Start the engine, and let it idle.
37. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0453 indicated?

    YES - Check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 36. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 38.

38. Monitor the OBD STATUS for DTC P0453 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 37, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 36. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0455: EVAP SYSTEM LARGE LEAK DETECTED; DTC P0456: EVAP SYSTEM VERY SMALL LEAK DETECTED

NOTE: **The fuel system is designed to allow specified maximum vacuum and pressure conditions. Do not deviate from the vacuum and pressure tests as indicated in these procedures. Excessive pressure/vacuum would damage the EVAP components or cause eventual fuel tank failure.**

Special Tools Required

Vacuum Pump/Gauge, 0- 30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**

- **Fresh fuel has a higher volatility that will create greater pressure/vacuum. The best condition for testing is less than a full tank of fresh fuel. If possible, to assist in leak detection, add 1 gallon of fresh fuel to the tank (as long as it will not fill the tank), just before starting these procedures.**

1. Check the fuel fill cap (the cap must say TIGHTEN TO CLICK). It should turn 1/4 turn after it's tight, then it clicks.

   Is the correct fuel fill cap installed and properly tightened?

   YES - Go to step 2.

   NO - Replace or tighten the cap, then go to step 30.

2. Check the fuel fill cap seal (A) and the fuel fill pipe mating surface (B). Verify that the fuel fill cap tether cord (C) is not caught under the cap.

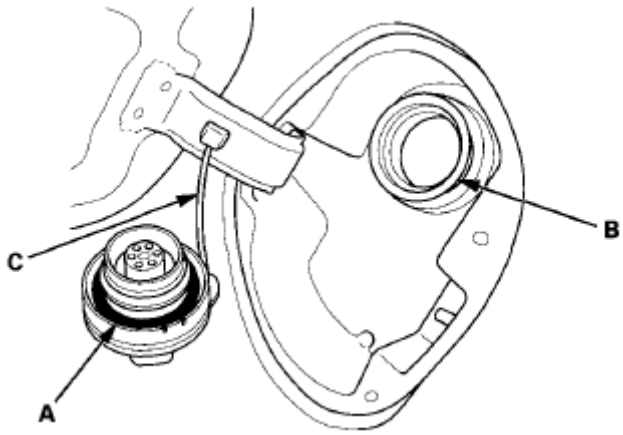

Fig. 20: Checking Fuel Fill Cap Seal And Fuel Fill Pipe Mating Surface
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is the fuel fill cap seal missing or damaged, is the fuel fill pipe damaged, or is the tether cord caught under the cap?

   YES - Replace the fuel fill cap or the fuel fill pipe, then go to step 30.

   NO - Go to step 3.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Clear the DTC with the HDS.
5. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, or the EVAP canister vent shut valve, and the ECM/PCM.

NO - Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Check for a poor connection or damage at the fuel tank vapor recirculation tube.

   Is the tube OK

   YES -

   - With SH-AWD: Go to step 8.
   - Without SH-AWD: Go to step 9.

   NO -

   - Replace the fuel tank vapor recirculation tube, then go to step 29.
   - If necessary, replace the fuel tank; with SH-AWD (see **WITH SH-AWD**), without SH-AWD (see **FUEL TANK REPLACEMENT**), then go to step 29.
8. Remove the fuel tank (see **REMOVAL (WITH SH-AWD)**).
9. Disconnect the fuel tank vapor recirculation tube (A) and fresh air hose (B) from the EVAP canister (C), and plug the EVAP canister ports (D).

   With SH-AWD

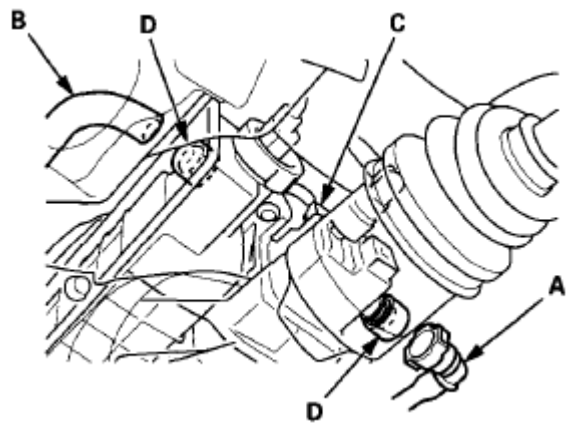

Fig. 21: Identifying Fuel Tank Vapor Recirculation Tube, EVAP Canister, EVAP Canister Ports (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Without SH-AWD B

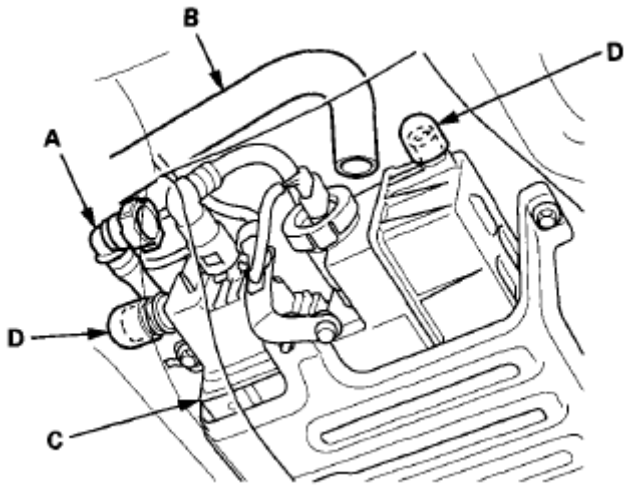

Fig. 22: Identifying Fuel Tank Vapor Recirculation Tube, EVAP Canister, EVAP Canister Ports (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Disconnect the vacuum hose (engine side) (A) from the EVAP canister purge valve (B) in the engine compartment, and connect a vacuum pump/gauge, 0- 30 inHg, to the purge valve as shown.

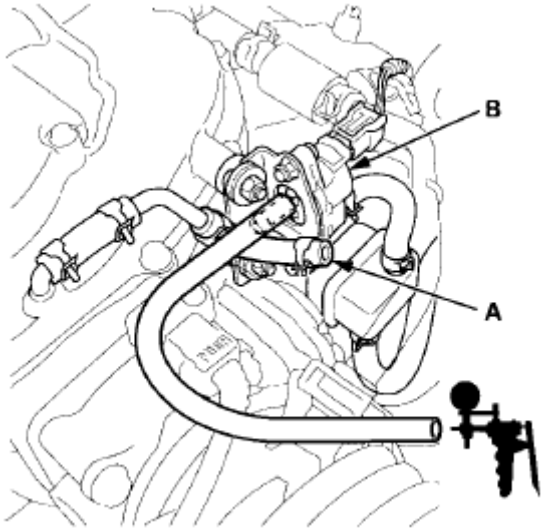

Fig. 23: Identifying Vacuum Hose And Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
12. Select EVAP PCS ON in the INSPECTION MENU with the HDS.
13. Apply vacuum to the hose until the FTP reads 1.90 V (- 0.59 inHg, - 15.1 mmHg).

NOTE: Be careful not to exceed the specified vacuum. If you do, the FTP sensor can be damaged.

14. Select EVAP PCS OFF in the INSPECTION MENU with the HDS, then remove the vacuum pump from the purge valve.
15. Monitor the FTP SENSOR in the DATA LIST for 1 minute with the HDS, and remove the vacuum pump from the purge valve.

    Does the voltage increase more than 0.2 V (0.1 inHg, 2.5 mmHg)?

    YES - Go to step 16.

    NO - Go to step 21.

16. Reconnect the vacuum hose (engine side) to the EVAP canister purge valve.
17. Disconnect the vacuum hose (EVAP canister side) (A) from the EVAP canister purge valve (B) in the engine compartment, and connect the vacuum pump/gauge to the vacuum hose as shown.

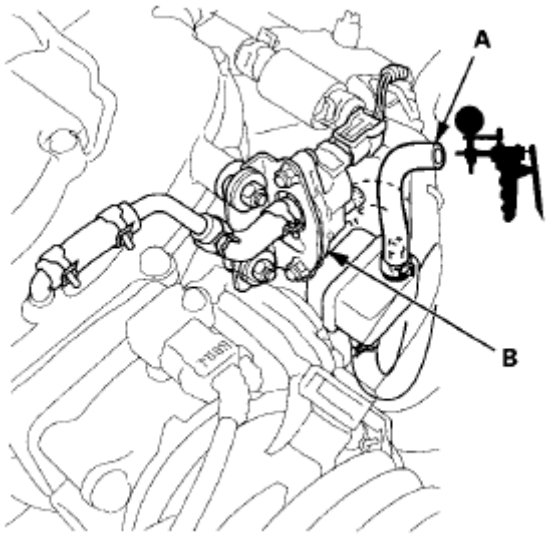

Fig. 24: Identifying Vacuum Hose And EVAP Canister Purge Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Apply vacuum to the hose until the FTP reads 1.90 V (- 0.59 inHg, - 15.1 mmHg).

    NOTE: Be careful not to exceed the specified vacuum. If you do, the FTP sensor can be damaged.

19. Monitor the FTP SENSOR in the DATA LIST for 1 minute with the HDS.

    Does the voltage increase more than 0.2 V (0.1 inHg, 2.5 mmHg)?

    YES - Go to step 20.

    NO - Replace the EVAP canister purge valve (see **EVAP CANISTER PURGE VALVE**

REPLACEMENT), then go to step 29.

20. Check for a loose or damaged EVAP canister purge line between the EVAP canister and the EVAP canister purge valve.

    Is the line OK

    YES - Replace these parts, then go to step 29:

    - FTP sensor O-ring
    - EVAP canister vent shut valve case and O-ring
    - EVAP canister

    NO - Reconnect or repair the EVAP canister purge line, then go to step 29.

21. Reconnect the fresh air hose (A) to the EVAP canister (B).

    With SH-AWD

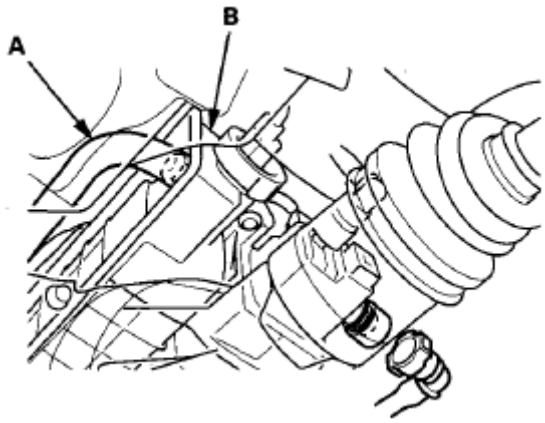

Fig. 25: Identifying Fresh Air Hose And EVAP Canister (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Without SH-AWD

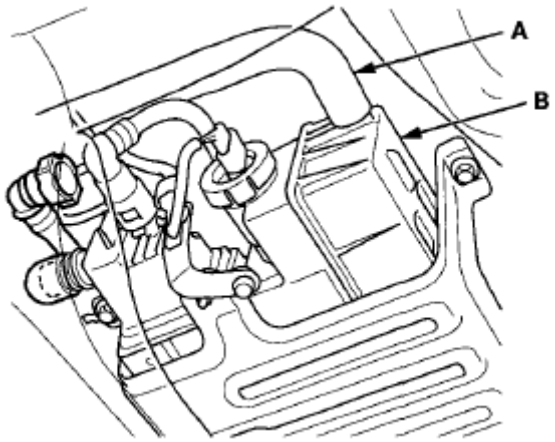

Fig. 26: Identifying Fresh Air Hose And EVAP Canister (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Reconnect the vacuum hose (engine side) to the EVAP canister purge valve.
23. Disconnect the vacuum hose (EVAP canister side) (A) from the EVAP canister purge valve (B) in the engine compartment, and connect the vacuum pump/gauge to the purge valve as shown.

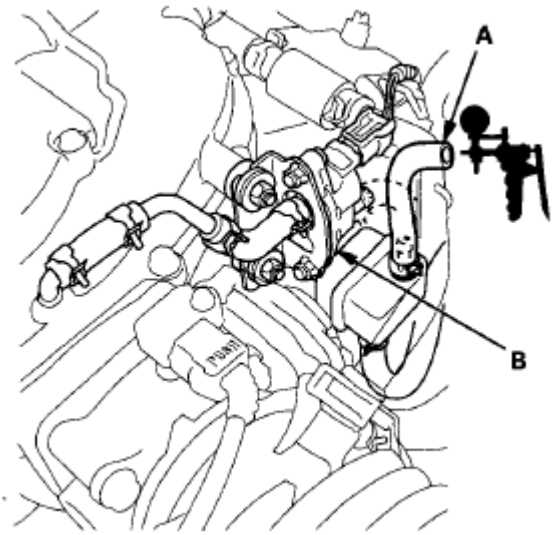

Fig. 27: Identifying Vacuum Hose And EVAP Canister Purge Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
25. Apply vacuum to the EVAP system until the FTP reads 1.90 V (- 0.59 inHg,- 15.1 mmHg).

NOTE: Be careful not to exceed the specified vacuum. If you do, the FTP sensor can be damaged.

26. Monitor the FTP SENSOR in the DATA LIST for 1 minute with the HDS.

Does the voltage increase more than 0.2 V (0.1 inHg, 2.5 mmHg)?

YES - Replace the EVAP canister vent shut valve; with SH-AWD (see **WITH SH-AWD**), without SH-AWD (see **WITH SH-AWD**), then go to step 29.

NO - Go to step 27.

27. Select EVAP CVS OFF in the INSPECTION MENU with the HDS.
28. Check these parts for looseness or damage:
    - Fuel fill pipe
    - Fuel vapor return pipe

    Are the parts OK

    YES -

    - With SH-AWD: Check the fuel tank unit base gasket (see **REMOVAL (WITH SH-AWD)**), the secondary fuel gauge sending unit base gasket (see **SECONDARY FUEL GAUGE SENDING UNIT REMOVAL/INSTALLATION**), and check the fuel tank, then go to step 31.
    - Without SH-AWD: Check the fuel tank unit base gasket (see **FUEL TANK UNIT REMOVAL AND INSTALLATION**), and check the fuel tank, then go to step 31.

    NO - Repair or replace the damaged parts, then go to step 29.

29. Reconnect all hoses and connectors.
30. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
31. Reset the ECM/PCM with the HDS.
32. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
33. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

    Is the result OK?

    YES - Troubleshooting is complete.

    NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, the EVAP canister vent shut valve, and the ECM/PCM, then go to step 1.

DTC P0457: EVAP SYSTEM LEAK DETECTED/FUEL FILL CAP LOOSE OR MISSING

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check the fuel fill cap (the cap must say TIGHTEN TO CLICK). It should turn 1/4 turn after it's tight, then it clicks.

Is the correct fuel fill cap installed and properly tightened?

YES - Go to step 2.

NO - Replace or tighten the cap, then go to step 20.

2. Check the fuel fill cap seal (A) and the fuel fill pipe mating surface (B). Verify that the fuel fill cap tether cord (C) is not caught under the cap.

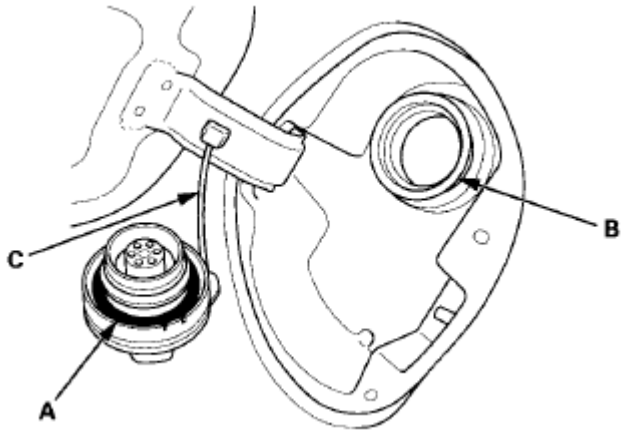

Fig. 28: Identifying Fuel Fill Cap Seal, Mating Surface And Tether Cord
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the fuel fill cap seal missing or damaged, is the fuel fill pipe damaged, or is the tether cord caught under the cap?

YES - Replace the fuel fill cap or the fuel fill pipe, then go to step 20.

NO - Go to step 3.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Clear the DTC with the HDS.
5. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM/PCM.

NO - Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Remove the EVAP canister vent shut valve from the EVAP canister; without SH-AWD (see **WITH SH-AWD**), with SH-AWD (see **WITH SH-AWD**).

8. Connect the 2P connector to the EVAP canister vent shut valve.
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
11. Check the EVAP canister vent shut valve (A) operation.

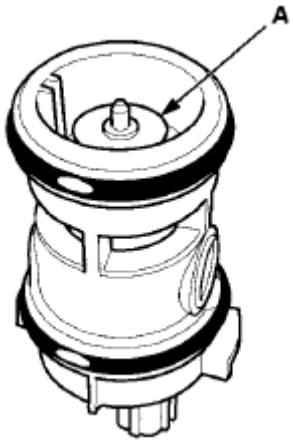

Fig. 29: Identifying EVAP Canister Vent Shut Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the valve operate?

YES - Go to step 18.

NO - Go to step 12.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Replace the EVAP canister vent shut valve; without SH-AWD system (see **WITH SH-AWD**), with SH-AWD system (see **WITH SH-AWD**).
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Troubleshooting is complete.

NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM/PCM, then go to step 1.

18. Check the EVAP canister vent tube.

Is there any damage or blockage?

YES - YES-Remove the blockage, and replace the EVAP canister vent tube if needed, then go to step 19.

NO - Do the DTC P0455 troubleshooting (see **DTC P0455: EVAP SYSTEM LARGE LEAK DETECTED; DTC P0456: EVAP SYSTEM VERY SMALL LEAK DETECTED**).

19. Reinstall the EVAP canister vent shut valve.
20. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
21. Reset the ECM/PCM with the HDS.
22. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
23. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Troubleshooting is complete.

NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM/PCM, then go to step 1.

DTC P0496: EVAP SYSTEM HIGH PURGE FLOW DETECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, the EVAP canister vent shut valve, and the ECM/PCM.

NO - Go to step 4.

NOTE: If the test could not be completed because of another DTC, do the troubleshooting for that DTC, then go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Replace the EVAP canister purge valve (see **EVAP CANISTER PURGE VALVE REPLACEMENT**).
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Reset the ECM/PCM with the HDS.
8. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
9. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Troubleshooting is complete.

NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister purge valve, the EVAP canister vent shut valve, and the ECM/PCM, then go to step 1.

DTC P0497: EVAP SYSTEM LOW PURGE FLOW DETECTED (WITHOUT SH-AWD)

Special Tools Required

- Vacuum Pump/Gauge, 0- 30 inHg Snap-on YA4000A or equivalent, commercially available
- Vacuum/Pressure Gauge, 0- 4 inHg 07JAZ-001000B

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister purge valve, the FTP sensor, and the PCM.

   NO - Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Check for a poor connection, a blockage, or damage at the EVAP canister purge line between the throttle body and the EVAP canister.

   Is the line OK?

   YES - Go to step 6.

   NO - Reconnect or repair the EVAP canister purge line, then go to step 24.

6. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B).

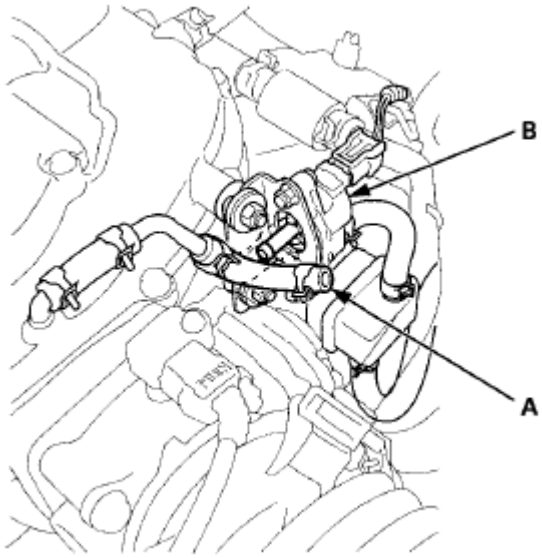

Fig. 30: Identifying Vacuum Hose And EVAP Canister Purge Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect the vacuum hose (A) from the purge line (at the EVAP canister side), then connect a T-fitting (B), a vacuum gauge, and a vacuum pump/gauge, 0- 30 inHg, to the hose as shown.

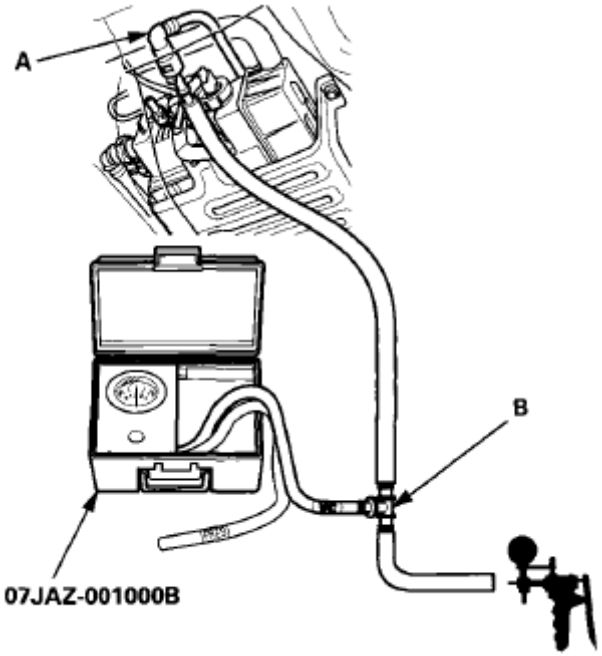

Fig. 31: Identifying Vacuum Hose And T-Fitting
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the hose.

10. Select EVAP PCS ON in the INSPECTION MENU with the HDS.

    Does the vacuum release immediately?

    YES - Go to step 15.

    NO - Go to step 11.

11. Select EVAP PCS OFF in the INSPECTION MENU with the HDS.
12. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B). Connect the T-fitting (C), the vacuum gauge, and the vacuum pump/gauge to the EVAP canister purge valve as shown.

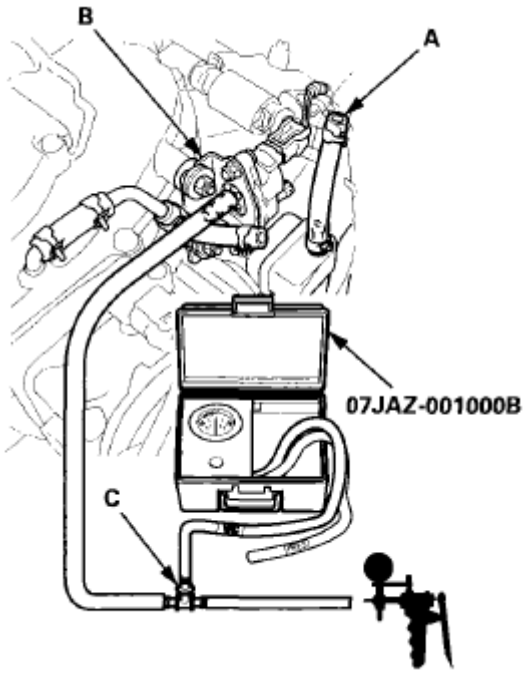

Fig. 32: Identifying Vacuum Hose, EVAP Canister Purge Valve And T-Fitting
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the purge valve.
14. Select EVAP PCS ON in the INSPECTION MENU with the HDS.

    Does the vacuum release immediately?

    YES - Check for a blockage in the vacuum hose between the EVAP canister purge valve and the EVAP canister, then go to step 24.

    NO - Replace the EVAP canister purge valve (see **EVAP CANISTER PURGE VALVE REPLACEMENT**), then go to step 24.

15. Connect the vacuum pump/gauge to the vacuum hose (A) as shown.

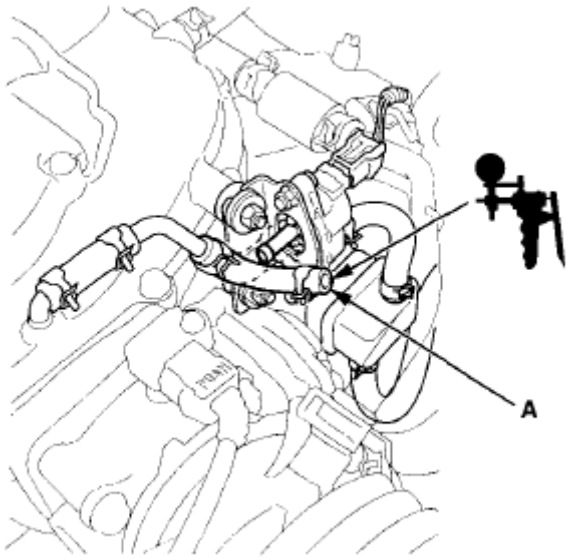

Fig. 33: Identifying Vacuum Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Start the engine, and let it idle.

    Is there vacuum?

    YES - Go to step 17.

    NO - Check for a blockage in the vacuum hose between the EVAP canister purge valve and the intake manifold, then go to step 24.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Remove the FTP sensor with its connector connected (see **FTP SENSOR REPLACEMENT**).
19. Connect the T-fitting (A), the vacuum gauge, and the vacuum pump/gauge to the FTP sensor (B) as shown.

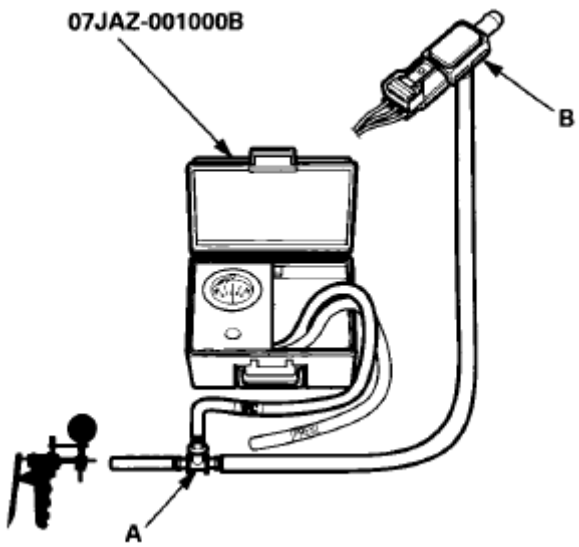

Fig. 34: Identifying T-Fitting, Vacuum Gauge And FTP Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
21. Check and record the FTP SENSOR reading in the DATA LIST with the HDS.
22. Slowly apply about 1.3 kPa (0.4 inHg, 10 mmHg) of vacuum to the hose.
23. Check the FTP SENSOR in the DATA LIST with the HDS.

    Does the value change?

    YES - Check for debris or a blockage at the EVAP canister port, then go to step 24.

    NO - Replace the FTP sensor (see **FTP SENSOR REPLACEMENT**), then go to step 24.

24. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
25. Reset the PCM with the HDS.
26. Do the PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
27. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

    Is the result OK?

    YES - Troubleshooting is complete.

    NO - Check for poor connections or loose terminals at the EVAP canister purge valve, the FTP sensor, and the PCM, then go to step 1.

DTC P0497: EVAP SYSTEM LOW PURGE FLOW DETECTED (WITH SH-AWD)

Special Tools Required

- Vacuum Pump/Gauge, 0- 30 inHg Snap-on YA4000A or equivalent, commercially available
- Vacuum/Pressure Gauge, 0- 4 inHg 07JAZ-001000B

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Select EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister purge valve, the FTP sensor, and the ECM/PCM.

   NO - Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Check for a poor connection, a blockage, or damage at the EVAP canister purge line between the throttle body and the EVAP canister.

   Is the line OK?

   YES - Go to step 6.

   NO - Reconnect or repair the EVAP canister purge line, then go to step 25.

6. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B).

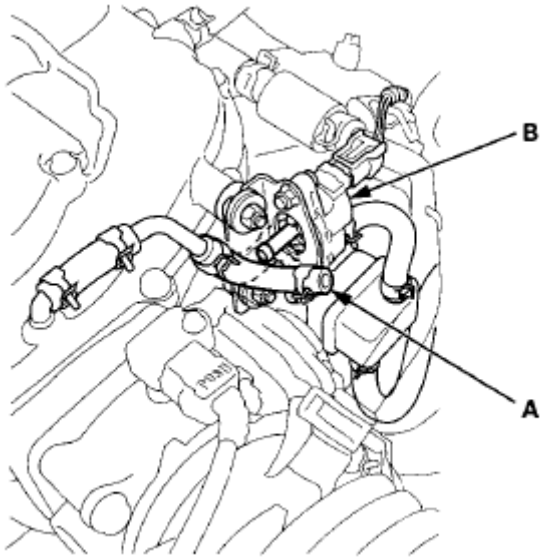

Fig. 35: Identifying Vacuum Hose And EVAP Canister Purge Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the trunk front trim panel (see **TRIM REMOVAL/INSTALLATION - TRUNK AREA**), then remove the access panel from the floor (see step 2).
8. Disconnect the vacuum hose (A) from the purge line (at the EVAP canister side), then connect a T-fitting (B), a vacuum gauge, and a vacuum pump/gauge to the hose as shown.

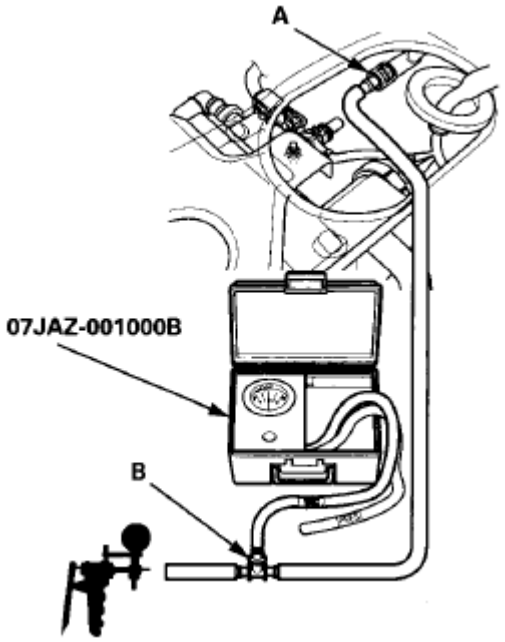

Fig. 36: Identifying Vacuum Hose And T-Fitting
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

10. Apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the hose.
11. Select EVAP PCS ON in the INSPECTION MENU with the HDS.

    Does the vacuum release immediately?

    YES - Go to step 16.

    NO - Go to step 12.

12. Select EVAP PCS OFF in the INSPECTION MENU with the HDS.
13. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B). Connect the T-fitting (C), the vacuum gauge, and the vacuum pump/gauge to the EVAP canister purge valve as shown.

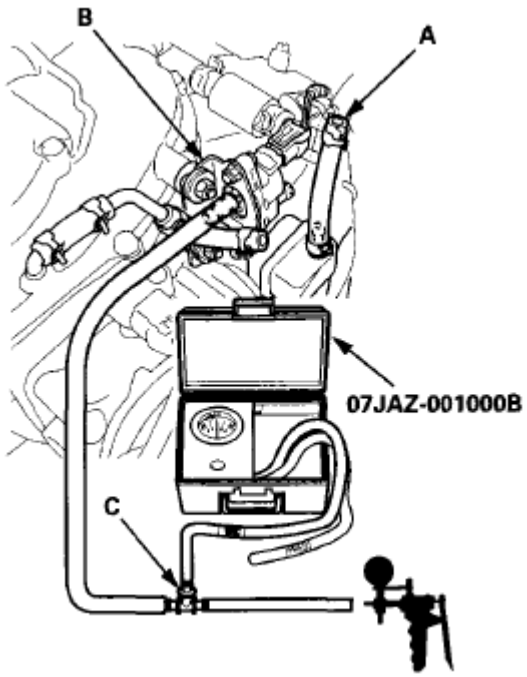

Fig. 37: Identifying Vacuum Hose, EVAP Canister Purge Valve And Vacuum Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the purge valve.
15. Select EVAP PCS ON in the INSPECTION MENU with the HDS.

    Does the vacuum release immediately?

    YES - Check for a blockage in the vacuum hose between the EVAP canister purge valve and the EVAP canister, then go to step 25.

    NO - Replace the EVAP canister purge valve (see **EVAP CANISTER PURGE VALVE REPLACEMENT**), then go to step 25.

16. Connect the vacuum pump/gauge to the vacuum hose (A) as shown.

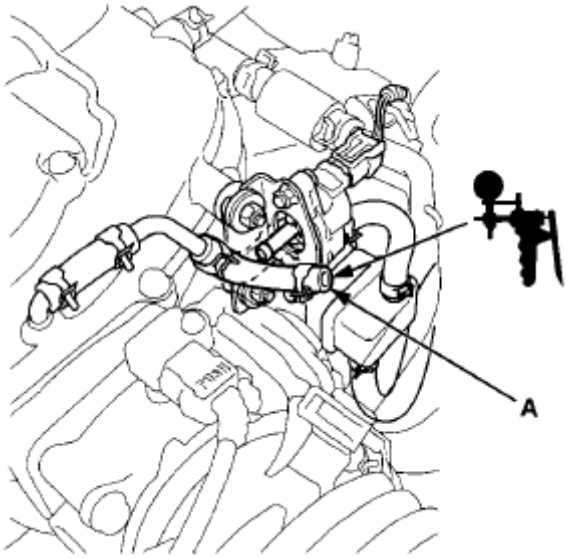

Fig. 38: Connecting Vacuum Pump/Gauge To Vacuum Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Start the engine, and let it idle.

    Is there vacuum?

    YES - Go to step 18.

    NO - Check for a blockage in the vacuum hose between the EVAP canister purge valve and the intake manifold, then go to step 25.

18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
19. Remove the FTP sensor with its connector connected (see **WITH SH-AWD**).
20. Connect the T-fitting (A), the vacuum gauge, and the vacuum pump/gauge to the FTP sensor (B) as shown.

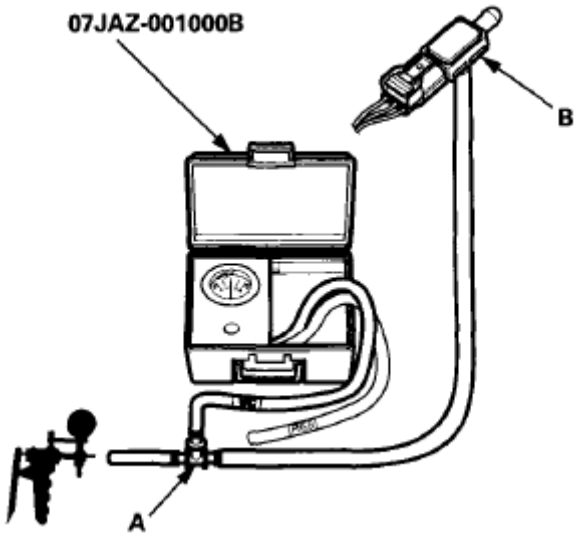

Fig. 39: Identifying FTP Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Check and record the FTP SENSOR reading in the DATA LIST with the HDS.
23. Slowly apply about 1.3 kPa (0.4 inHg, 10 mmHg) of vacuum to the hose.
24. Check the FTP SENSOR in the DATA LIST with the HDS.

    Does the value change?

    YES - Check for debris or a blockage at the EVAP canister port, then go to step 25.

    NO - Replace the FTP sensor (see **WITH SH-AWD**), then go to step 25.

25. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

    Is the result OK?

    YES - Troubleshooting is complete.

    NO - Check for poor connections or loose terminals at the EVAP canister purge valve, the FTP sensor, and the ECM/PCM, then go to step 1.

DTC P0498: EVAP CANISTER VENT SHUT VALVE CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL

TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0498 indicated?

   YES - Go to step 6.

   NO - Go to step 4.

4. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
5. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0498 indicated?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Disconnect the EVAP canister vent shut valve 2P connector.
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Measure the voltage between EVAP canister vent shut valve 2P connector terminal No. 2 and body ground.

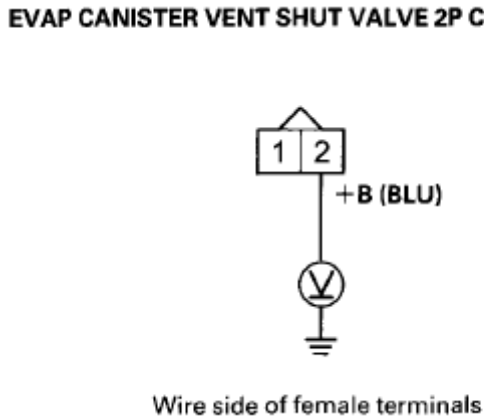

Fig. 40: Measuring Voltage Between EVAP Canister Vent Shut Valve 2P Connector And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Repair open in the wire between the EVAP canister vent shut valve and the PGM-FI subrelay, then go to step 18.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. At the valve side, measure the resistance between EVAP canister vent shut valve 2P connector terminals No. 1 and No. 2.

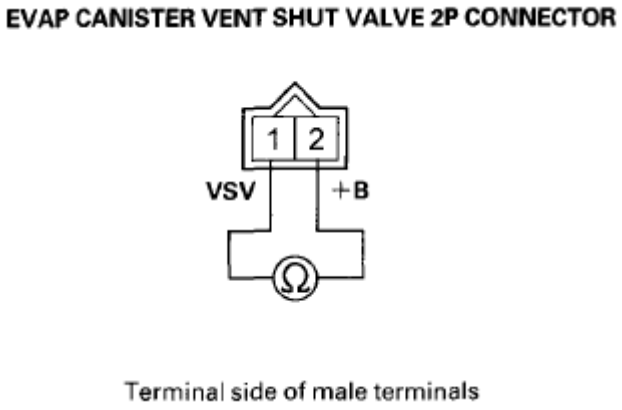

Fig. 41: Measuring Resistance Between EVAP Canister Vent Shut Valve 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 25- 30 ohms at room temperature?

YES - Go to step 12.

NO - Go to step 17.

12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector A (49P).
14. Check for continuity between ECM/PCM connector terminal A22 and body ground.

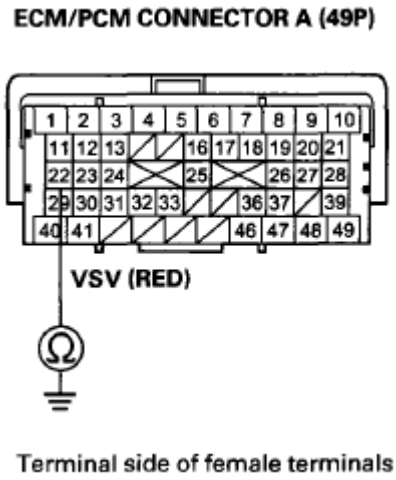

Fig. 42: Checking Continuity Between ECM/PCM Connector Terminal A22 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the EVAP canister vent shut valve and the ECM/PCM (A22), then go to step 18.

NO - Go to step 15.

15. Connect EVAP canister vent shut valve 2P connector terminal No. 1 to body ground with a jumper wire.

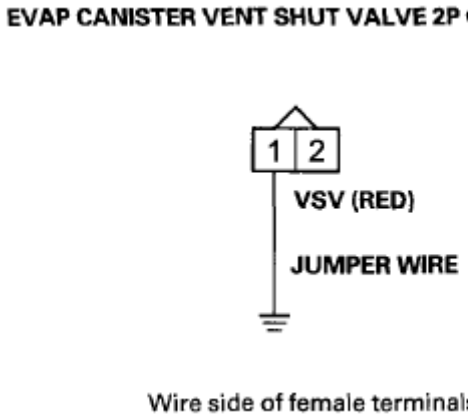

Fig. 43: Connecting EVAP Canister Vent Shut Valve 2P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Check for continuity between ECM/PCM connector terminal A22 and body ground.

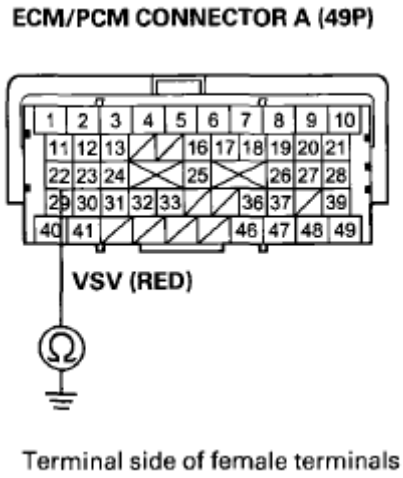

Fig. 44: Checking Continuity Between ECM/PCM Connector Terminal A22 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the EVAP canister vent shut valve and the ECM/PCM (A22), then go to step 18.

17. Replace the EVAP canister vent shut valve; without SH-AWD (see **WITH SH-AWD**), with SH-AWD (see **WITH SH-AWD**).
18. Reconnect all connectors.
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
23. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0498 indicated?

YES - Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM, then go to step 1.

NO - Go to step 24.

24. Monitor the OBD STATUS for DTC P0498 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 23, go to the indicated **DTC'S TROUBLESHOOTING**.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 22.

25. Reconnect all connectors.
26. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
27. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
28. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0498 indicated?

    YES - Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 27. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 29.

29. Monitor the OBD STATUS for DTC P0498 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 28, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 27. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 27.

DTC P0499: EVAP CANISTER VENT SHUT VALVE CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0499 indicated?

   YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM.

5. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
6. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
7. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0499 indicated?

   YES - Check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 6. If the ECM/PCM was substituted, go to step 1.

   NO - Go to step 8.

8. Monitor the OBD STATUS for DTC P0499 in the DTCs MENU with the HDS.

   Does the screen indicate PASSED?

   YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 7, go to the indicated **DTC'S TROUBLESHOOTING**.

   NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EVAP canister vent shut valve and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 6. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 6.

DTC P1454: FTP SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM; DTC P2422: EVAP CANISTER VENT SHUT VALVE STUCK CLOSED MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Remove the fuel fill cap, and wait 1 minute.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Check the FTP SENSOR in the DATA LIST with the HDS.

   Is it between - 0.67 and 0.67 kPa (- 0.2 and 0.2 inHg, - 5 and 5 mmHg), or 2.4 and 2.6 V?

YES - Go to step 7.

NO - Go to step 18.

7. Install the fuel fill cap.
8. Clear the DTC with the HDS.
9. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
10. Monitor the OBD STATUS for DTC P1454 and/or P2422 in the DTCs MENU with the HDS.

    Does the screen indicate FAILED?

    YES - Go to step 11.

    NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM/PCM. Also check for a blockage in the vent hoses and the drain joint. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

11. Clear the DTC with the HDS.
12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Remove the EVAP canister vent shut valve from the EVAP canister; without SH-AWD (see **WITH SH-AWD**), with SH-AWD (see **WITH SH-AWD**).
14. Connect the 2P connector to the EVAP canister vent shut valve.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Select EVAP CVS ON in the INSPECTION MENU with the HDS.
17. Check the EVAP canister vent shut valve (A) operation.

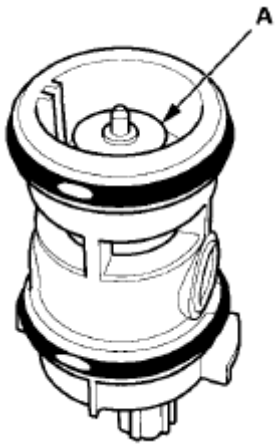

Fig. 45: Checking EVAP Canister Vent Shut Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the valve operate?

YES - Check for a blockage in the EVAP canister, vent hoses, and the drain joint, then install the EVAP canister vent shut valve, and go to step 25.

NO - Replace the EVAP canister vent shut valve; without SH-AWD (see **WITH SH-AWD**), with SH-AWD (see **WITH SH-AWD**), then go to step 25.

18. With SH-AWD: Remove the trunk front trim panel (see **TRIM REMOVAL/INSTALLATION - TRUNK AREA**), then remove the access panel from the floor (see step 2).
19. Disconnect the air tube (A) from the FTP sensor (B).

Without SH-AWD B

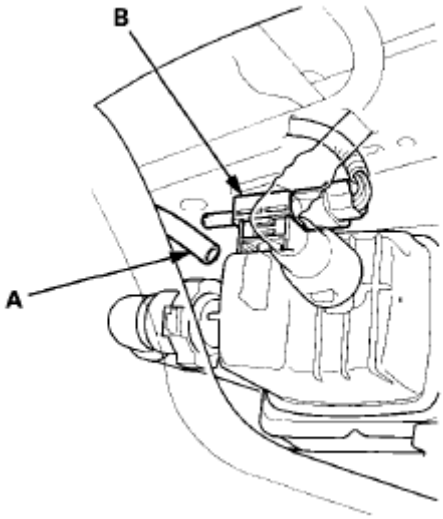

Fig. 46: Identifying Air Tube And FTP Sensor (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

With SH-AWD

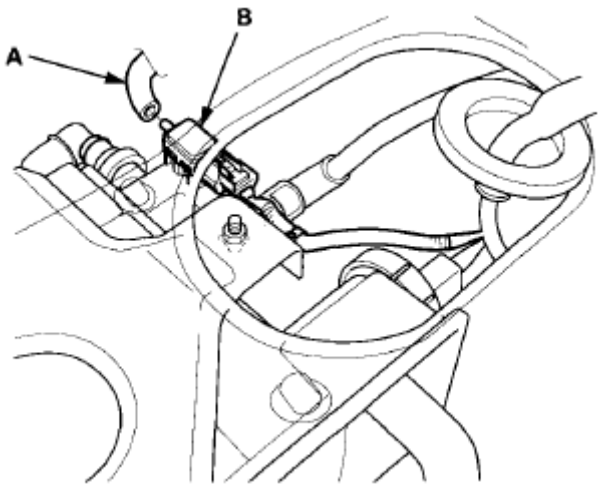

Fig. 47: Identifying Air Tube And FTP Sensor (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is it between - 0.67 and 0.67 kPa (- 0.2 and 0.2 inHg, - 5 and 5 mmHg), or 2.4 and 2.6 V?

    YES - Check for a blockage in the FTP sensor air tube or vent, clear the blockage and reattach the air tube or vent, then go to step 25.

    NO - Go to step 21.

21. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
22. Remove the FTP sensor (A) from the EVAP canister with its connector connected; without SH-AWD (see **FTP SENSOR REPLACEMENT**), with SH-AWD (see **WITH SH-AWD**).

    Without SH-AWD A

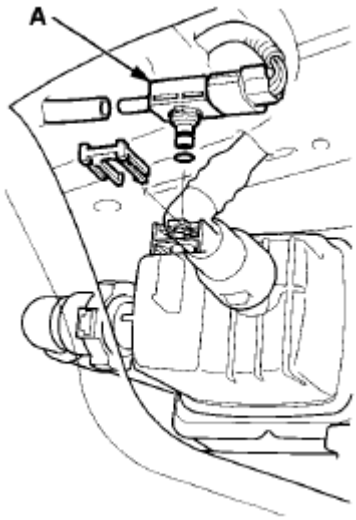

Fig. 48: Identifying FTP Sensor (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

With SH-AWD

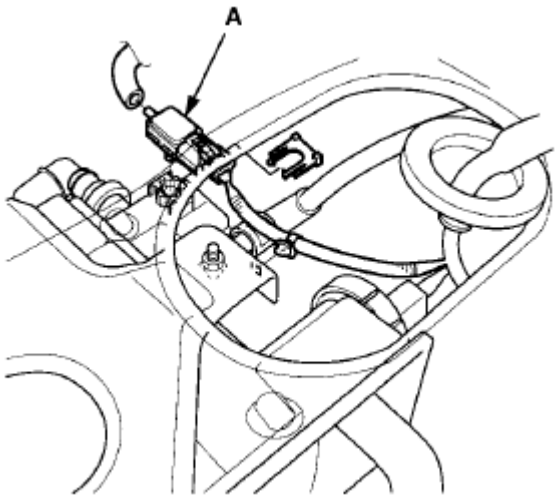

Fig. 49: Identifying FTP Sensor (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
24. Check the FTP SENSOR in the DATA LIST with the HDS.

    Is it between - 0.67 and 0.67 kPa (- 0.2 and 0.2 inHg, -5 and 5 mmHg), or 2.4 and 2.6 V?

    YES - Check for debris or clogging at the EVAP canister and the FTP sensor port, then go to step 25.

    NO - Replace the FTP sensor; without SH-AWD (see **FTP SENSOR REPLACEMENT**), with SH-AWD (see **WITH SH-AWD**), then go to step 25.

25. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1454 and/or P2422 indicated?

    YES - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM/PCM, then go to step 1.

    NO - Go to step 29.

29. Monitor the OBD STATUS for DTC P1454 and/or P2422 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 28, go to the indicated **DTC'S TROUBLESHOOTING**.

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P1458: FTP SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Note these recorded on-board snapshot parameters with the HDS:
   - Max Value of FTP SENSOR
   - Min Value of FTP SENSOR
   - FUEL LEVEL

   HDS on-board snapshot screen

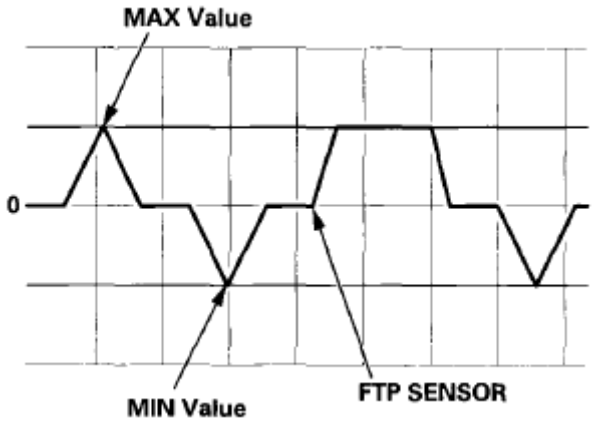

Fig. 50: Showing HDS On-Board Snapshot Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check the FUEL LEVEL in the DATA LIST with the HDS.

   Is the FUEL LEVEL less than it is in the on- board snapshot?

   YES - Go to step 4.

   NO - Drain the fuel until the FUEL LEVEL is less than it is in the on-board snapshot, then go to step 4.

4. Take a snapshot with the HDS for 3 minutes without starting the engine.
5. Check these recorded snapshot parameters with the HDS:
   - Max Value of FTP SENSOR (FINE)
   - Min Value of FTP SENSOR (FINE)

   HDS snapshot screen

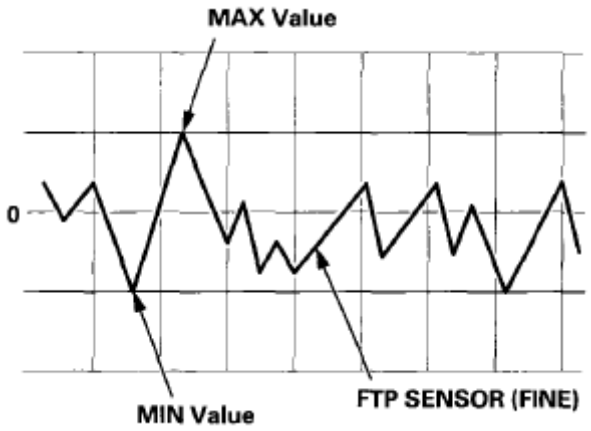

Fig. 51: Showing HDS Snapshot Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is the difference between the MAX and MIN values of the FTP SENSOR (FINE) about 0.67 kPa (0.2 inHg, 5 mmHg) or less?

   YES - Go to step 6.

   NO - Go to step 12.

6. Check the FTP SENSOR (FINE) in the recorded snapshot with the HDS.

   Does it vary 0.067 kPa (0.02 inHg, 0.5 mmHg) or more for 3 seconds?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM/PCM. Also check for a blockage in the EVAP vent hose.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the ON mode.
8. Remove the FTP sensor.
9. Reconnect the FTP sensor 3P connector.
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Check the FTP SENSOR (FINE) in the DATA LIST with the HDS.

Does it vary 0.067 kPa (0.02 inHg, 0.5 mmHg) or more for 3 seconds?

YES - Replace the FTP sensor; with SH-AWD (see **WITH SH-AWD**), without SH-AWD (see **FTP SENSOR REPLACEMENT**), then go to step 28.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM/PCM. Also check for a blockage in the EVAP vent hose.

12. Remove the fuel fill cap.
13. Check the FTP SENSOR (FINE) in the DATA LIST with the HDS.

    Is the value about 0.67 kPa (0.2 inHg, 5 mmHg) or more, or about - 0.67 kPa (- 0.2 inHg, - 5 mmHg) or less?

    YES - Reinstall the fuel fill cap, then go to step 22.

    NO - Go to step 14.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the ON mode.
15. Remove the FTP sensor.
16. Reconnect the FTP sensor 3P connector.
17. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
18. Check the FTP SENSOR (FINE) in the DATA LIST with the HDS.

    Is the value about 0.67 kPa (0.2 inHg, 5 mmHg) or more, or about - 0.67 kPa (- 0.2 inHg, - 5 mmHg) or less?

    YES - Remove the blockage in the EVAP vent hose, and replace it if needed, then go to step 26.

    NO - Go to step 19.

19. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the ON mode.
20. Disconnect the FTP sensor 3P connector.
21. Check for a blockage or damage at the FTP sensor ports (EVAP canister side and vent side).

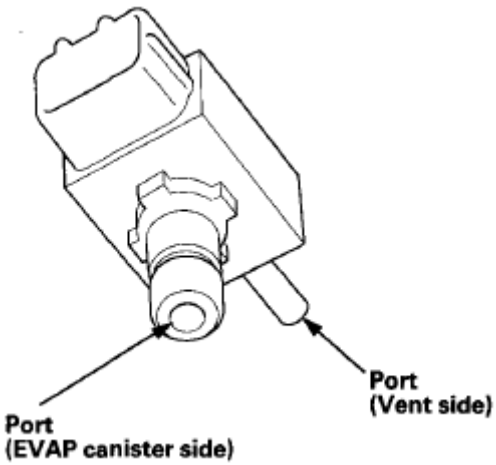

Fig. 52: Checking Blockage Or Damage At FTP Sensor Ports
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any blockage or damage?

YES - Remove the blockage, and replace the FTP sensor if needed; with SH-AWD (see **WITH SH-AWD**), without SH-AWD (see **FTP SENSOR REPLACEMENT**), then go to step 28.

NO - Replace the FTP sensor; with SH-AWD (see **WITH SH-AWD**), without SH-AWD (see **FTP SENSOR REPLACEMENT**), then go to step 28.

22. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the ON mode.
23. Disconnect the fresh air hose (A) from the EVAP canister (B), then connect a vacuum pump/gauge, 0- 30 inHg, to the EVAP vent shut valve as shown.

With SH-AWD

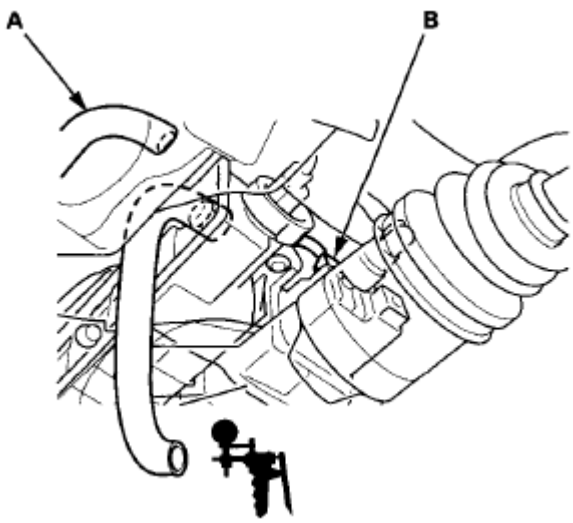

Fig. 53: Identifying Fresh Air Hose And EVAP Canister (With SH-AWD)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Without SH-AWD

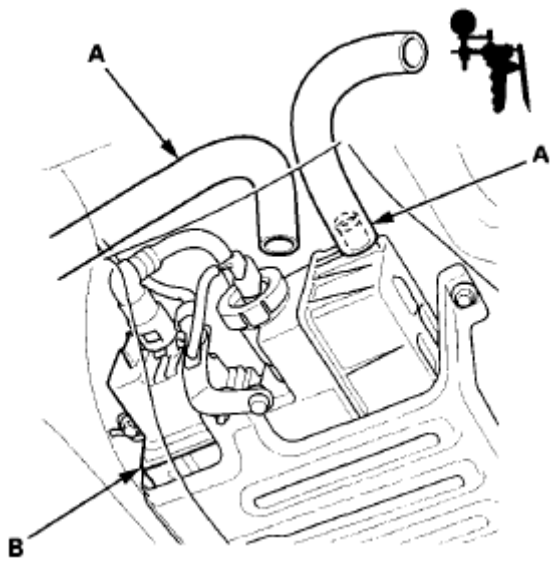

Fig. 54: Identifying Fresh Air Hose And EVAP Canister (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
25. Try to apply vacuum to the valve (not more than 5.3 kPa (1.6 inHg, 40 mmHg)) while checking the FTP SENSOR (FINE) in the DATA LIST with the HDS.

NOTE: To avoid damaging the FTP sensor, do not apply more than 5.3 kPa (1.6 inHg, 40 mmHg) of vacuum.

Does the valve hold more than 1.3 kPa (0.4 inHg, 10 mmHg) of vacuum?

YES - Replace the EVAP canister vent shut valve; with SH-AWD (see **WITH SH-AWD**), without SH-AWD (see **WITH SH-AWD**), then go to step 26.

NO - Remove the blockage in the fresh air hose, and replace it if needed, then go to step 26.

26. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the ON mode.
27. Reconnect all connectors and the fresh air hose.
28. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
29. Reset the ECM/PCM with the HDS.
30. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
31. Take a snapshot with the HDS for 3 minutes without starting the engine.
32. Check these recorded snapshot parameters with the HDS:
    - Max Value of FTP SENSOR (FINE)

- Min Value of FTP SENSOR (FINE)

HDS snapshot screen

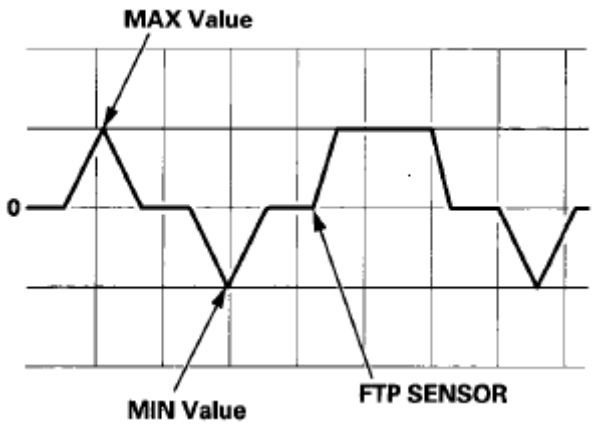

Fig. 55: Showing HDS Snapshot Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the difference between the MAX and MIN values of the FTP SENSOR (FINE) about 0.67 kPa (0.2 inHg, 5 mmHg) or less?

YES - Troubleshooting is complete.

NO - Check for poor connections or loose terminals at the FTP sensor, the EVAP canister vent shut valve, and the ECM/PCM, then go to step 1.

DTC P145C: EVAP SYSTEM PURGE FLOW MALFUNCTION

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P145C is indicated alone, do the troubleshooting for DTC P0496 and P0497 using freeze data for P145C.**
- **If DTC P0497 and P145C stored at the same time, check for a poor connection, a blockage, or damage at the EVAP canister purge line between the EVAP canister purge valve and the EVAP canister. Also check for a stuck closed EVAP canister purge valve.**
- **If any of DTCs listed below are indicated at the same time as DTC P145C, troubleshoot those DTCs first, then recheck for P145C.**

P0496, P0497: EVAP system purge flow

FUEL CAP WARNING MESSAGE SYSTEM TROUBLESHOOTING

Special Tools Required

- Vacuum Pump/Gauge, 0- 30 inHg Snap-on YA4000A or equivalent, commercially available
- Vacuum/Pressure Gauge, 0- 4 inHg 07JAZ-001000B

Do this procedure if the fuel cap warning message comes on frequently, or if the message does not go off after the fuel fill cap is tightened and the vehicle is driven several days.

1. Check the fuel fill cap (the cap must say TIGHTEN TO CLICK). It should turn 1/4 after it's tight, then it clicks.

   Is the correct fuel fill cap installed and properly tightened?

   YES - Go to step 2.

   NO - Replace or tighten the cap, then go to step 13.

2. Check the fuel fill cap seal (A) and the fuel fill pipe mating surface (B). Verify that the fuel fill cap tether cord (C) is not caught under the cap.

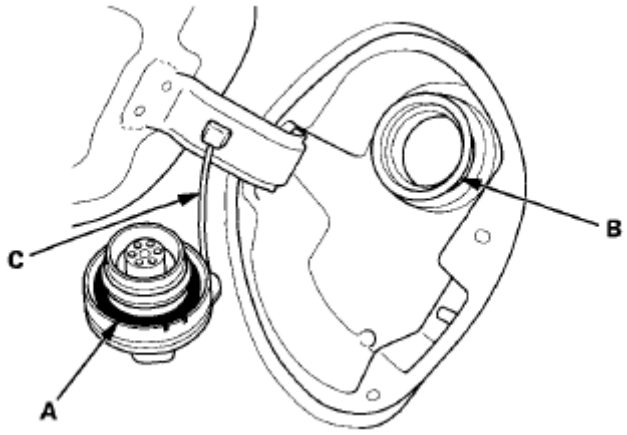

Fig. 56: Identifying Fuel Fill Cap Seal, Pipe Mating Surface And Tether Cord
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is the fuel fill cap seal missing or damaged, is the fuel fill pipe damaged, or is the tether cord caught under the cap?

   YES - Replace the fuel fill cap or the fuel fill pipe, then go to step 13.

   NO - Go to step 3.

3. Reinstall and tighten the fuel fill cap.
4. Clear the DTC with the HDS.
5. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 1 minute.

6. Test drive at 45 mph (72 km/h) for 1 minute or more.

   Does the fuel fill cap warning message come on?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B) in the engine compartment, then connect a T-fitting (C), a vacuum gauge, and a vacuum pump/gauge, 0- 30 inHg, to the EVAP canister purge valve as shown.

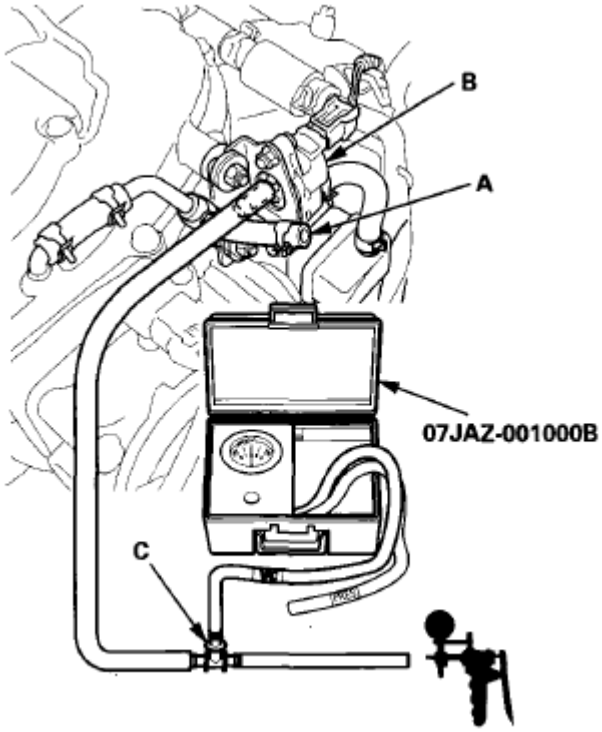

Fig. 57: Identifying Vacuum Hose, EVAP Canister Purge Valve And T-Fitting
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Apply about 2 kPa (0.6 inHg, 15 mmHg) of vacuum to the hose.
11. Select the EVAP PCS ON in the INSPECTION MENU with the HDS.

    Does the vacuum release immediately?

    YES - Check for a blockage in the vacuum hose/line between the EVAP canister purge valve and the EVAP canister, then go to step 12.

NO - Replace the EVAP canister purge valve (see **EVAP CANISTER PURGE VALVE REPLACEMENT**), then go to step 12.

12. Install the parts in the reverse order of removal.
13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
16. Test-drive at 45 mph (72 km/h) for 1 minute or more.

Does the fuel cap warning message come on?

YES - Go to step 1 and recheck.

NO - Troubleshooting is complete.

EVAP CANISTER REPLACEMENT

WITHOUT SH-AWD

1. Raise the vehicle on a lift.
2. Remove the wheel sensor harness clamps (A)

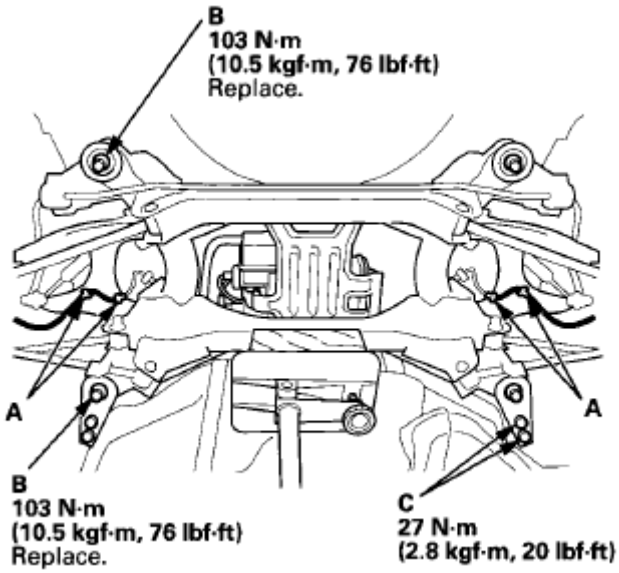

Fig. 58: Identifying Wheel Sensor Harness Clamps With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Support the rear subframe with a transmission jack and a wooden block as shown.
4. Remove the rear subframe mounting bolts (B and C).
5. Lower the transmission jack and the rear subframe about 50 mm.

NOTE: Be careful not to damage the connecting parts.

6. Remove the bolt (A), and disconnect the hoses (B), the EVAP canister vent shut valve 2P connector (C), and the FTP sensor 3P connector (D).

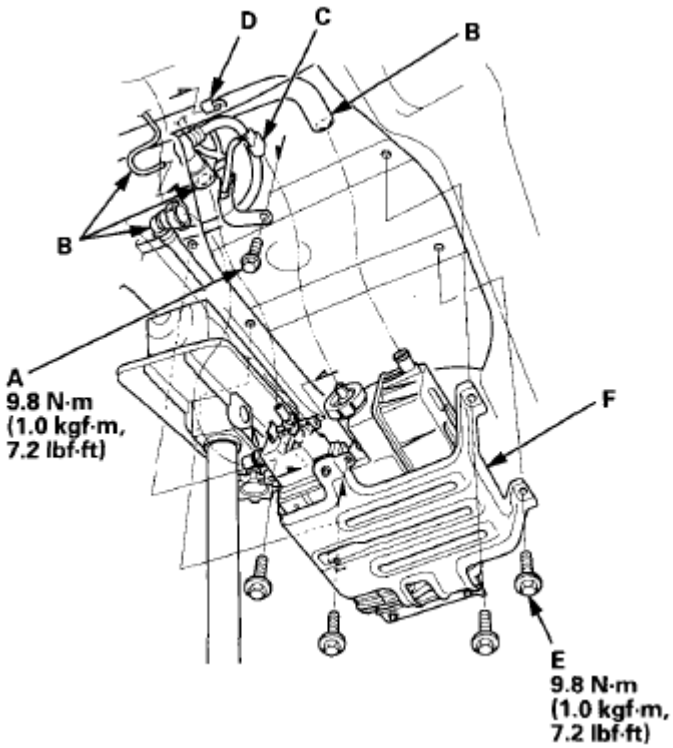

Fig. 59: Identifying Hoses, Bolt, EVAP Canister Vent Shut Valve 2P Connector And FTP Sensor 3P Connector And Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the bolts (E), then remove the EVAP canister assembly (F).
8. Remove the EVAP canister (A) from the EVAP canister bracket (B).

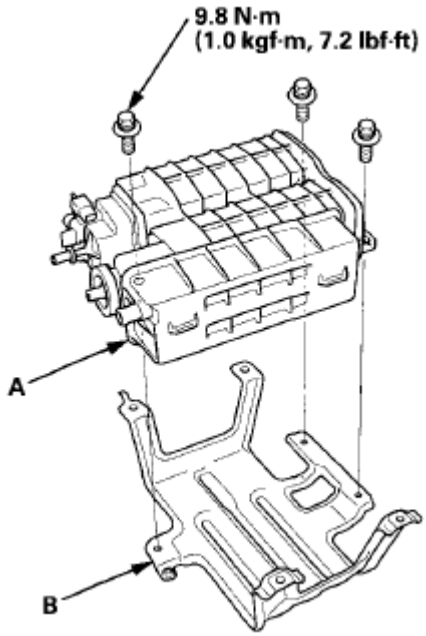

Fig. 60: Identifying EVAP Canister And Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the EVAP canister vent shut valve (A) and the FTP sensor (B) from the canister (C).

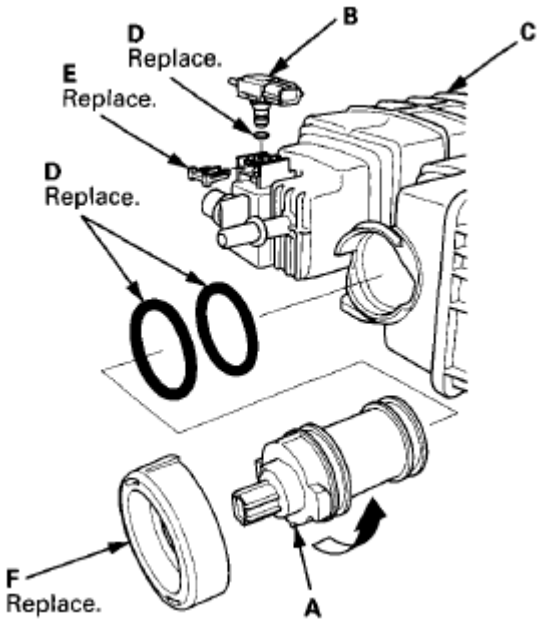

Fig. 61: Identifying EVAP Canister Vent Shut Valve, FTP Sensor And Canister
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Reassemble the EVAP canister with new O-rings (D), a new retainer (E), and a new cap (F), then install the EVAP canister bracket.

NOTE: Do not coat the O-rings with oil.

11. Install the EVAP canister assembly to the body.

NOTE: Attach the bracket arm (A) to the body as shown.

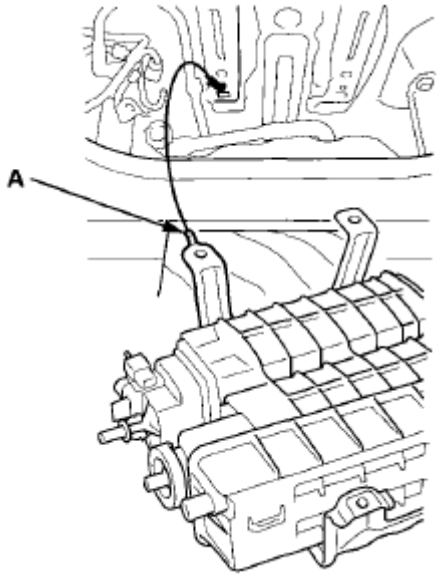

Fig. 62: Identifying Bracket Arm
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Install the parts in the reverse order of removal. Use new bolts when you install the rear subframe.
13. Check the wheel alignment (see **WHEEL ALIGNMENT**).

WITH SH-AWD

1. Remove the rear differential (see **REAR DIFFERENTIAL REMOVAL**).
2. Remove the fuel tank (see **WITH SH-AWD**).
3. Remove the EVAP canister filter (see **EVAP CANISTER FILTER REPLACEMENT**).
4. Disconnect the quick-connect fitting (A), the hose (B), the FTP sensor 3P connector (C), and the EVAP canister vent shut valve 2P connector (D).

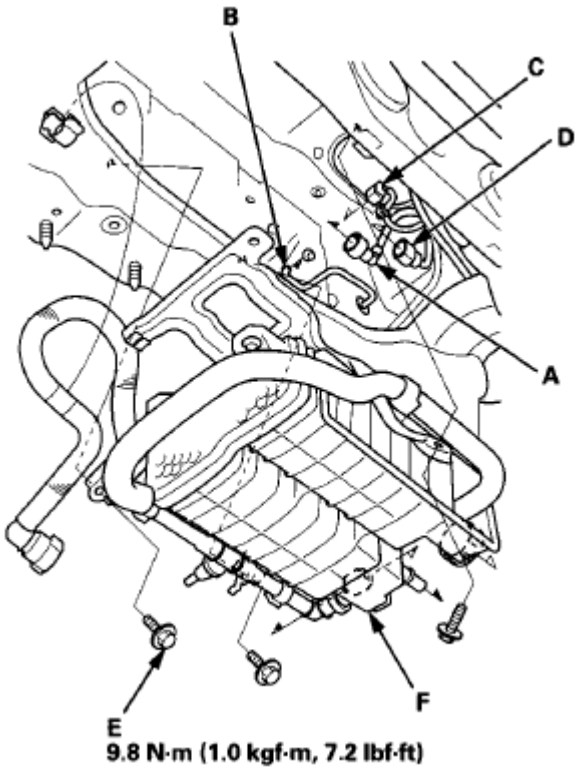

Fig. 63: Identifying Fitting, Hose, FTP Sensor 3P Connector And EVAP Canister Vent Shut Valve 2P Connector With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the bolts (E) and the EVAP canister assembly (F).
6. Remove the EVAP canister (A) from the bracket (B).

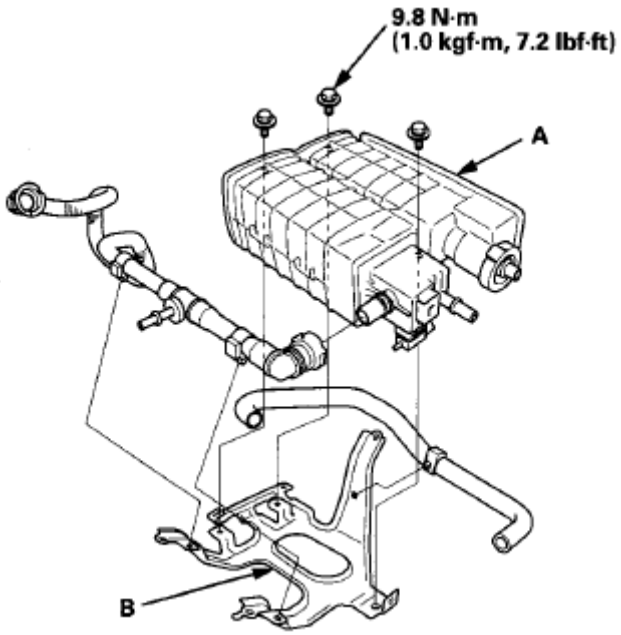

Fig. 64: Identifying EVAP Canister And Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the EVAP canister vent shut valve (A) and the FTP sensor (B) from the EVAP canister (C).

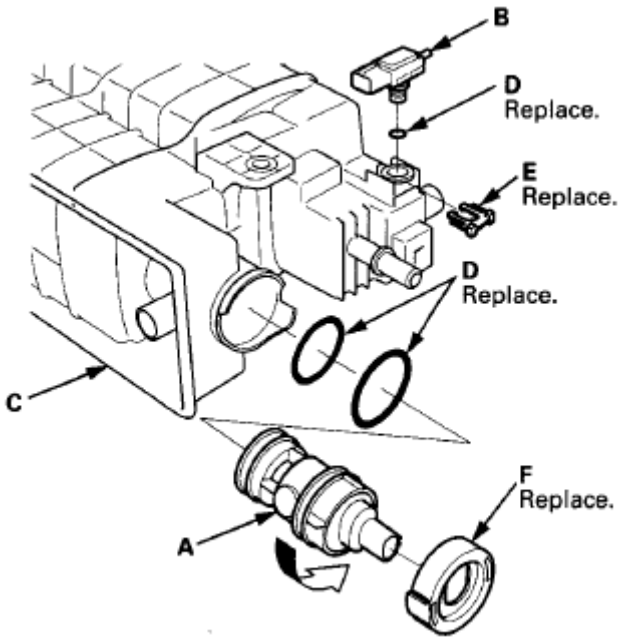

Fig. 65: Identifying EVAP Canister Vent Shut Valve And FTP Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Reassemble the EVAP canister with new O-rings (D), a new retainer (E), and a new cap (F), then install the EVAP canister bracket.

NOTE: Do not coat the O-rings with oil.

9. Install the parts in the reverse order of removal.

NOTE: The new fuel vapor hose has a ring pull (A) at the connector (B). When you connect the connector and confirm that the connection is secure, remove the ring pull by pulling it down.

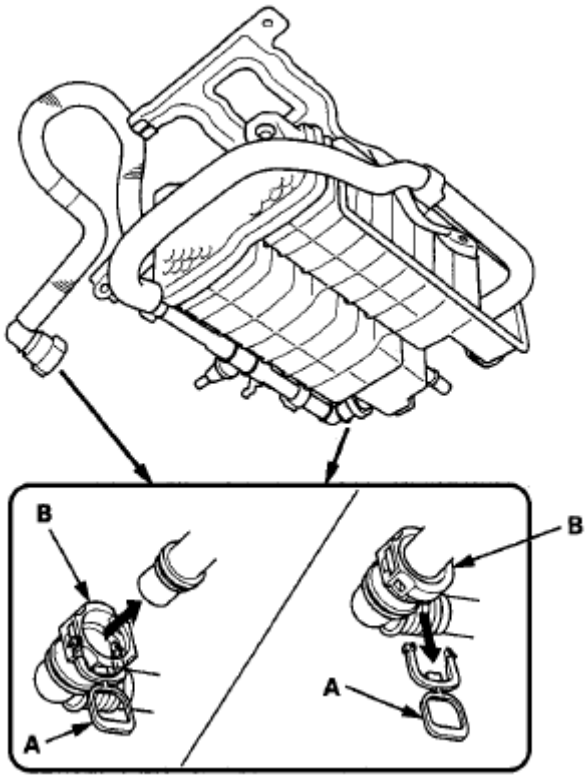

Fig. 66: Identifying Fuel Vapor Hose And Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

FTP SENSOR REPLACEMENT

WITHOUT SH-AWD

1. Remove the bolt (A), and disconnect the EVAP canister vent shut valve 2P connector (B), the FTP sensor 3P connector (C), and the hoses (D).

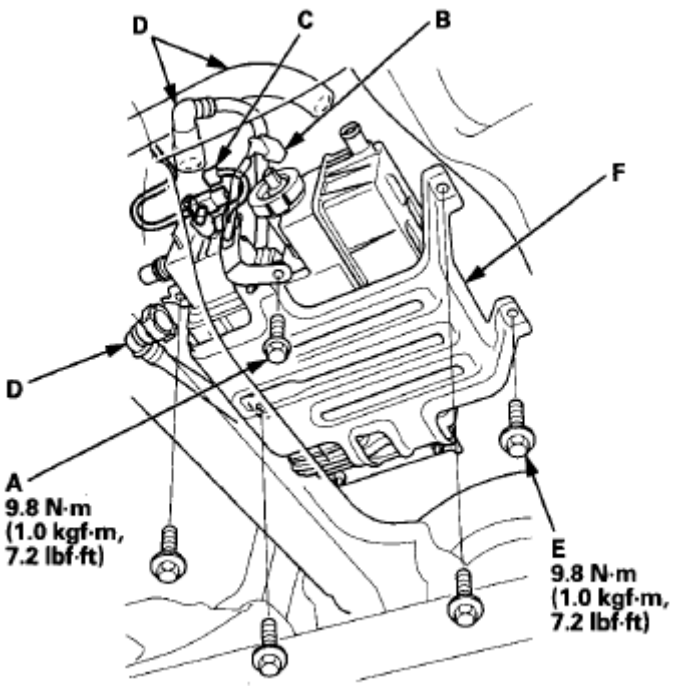

Fig. 67: Identifying Bolt, 2P Connector, FTP Sensor 3P Connector And Hoses With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the bolts (E), and move the EVAP canister assembly (F) to the rear.
3. Remove the FTP sensor (A).

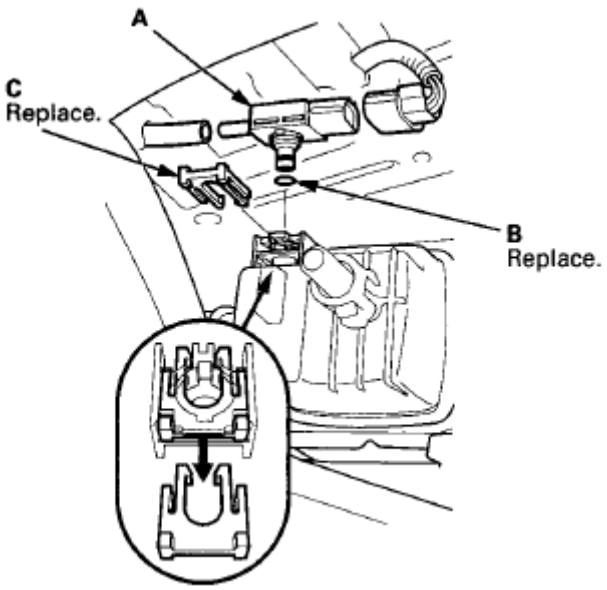

Fig. 68: Identifying FTP Sensor, O-Ring And Retainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the parts in the reverse order of removal with a new O-ring (B) and a new retainer (C).

WITH SH-AWD

1. Remove the trunk front trim panel (see **TRIM REMOVAL/INSTALLATION - TRUNK AREA**).
2. Remove the access panel (A) from the floor.

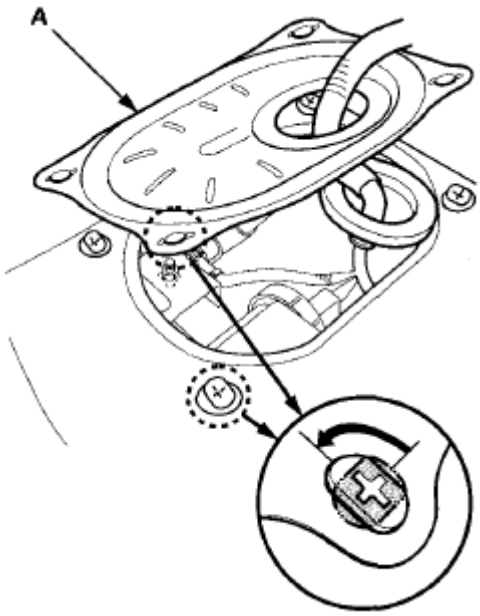

Fig. 69: Identifying Access Panel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the hose (A) and the FTP sensor 3P connector (B).

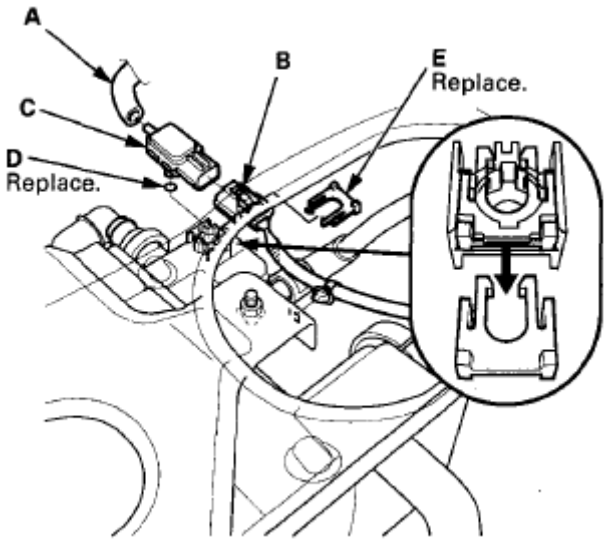

Fig. 70: Identifying Hose, 3P Connector And FTP Sensor

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the FTP sensor (C).
5. Install the parts in the reverse order of removal with a new O-ring (D) and a new retainer (E).

EVAP CANISTER VENT SHUT VALVE REPLACEMENT

WITHOUT SH-AWD

1. Disconnect the EVAP canister vent shut valve 2P connector (A).

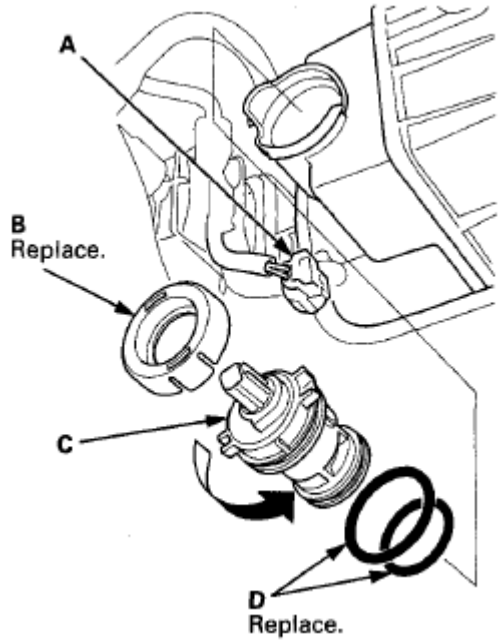

Fig. 71: Identifying EVAP Canister Vent Shut Valve 2P Connector, Shut Valve And Cap
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the cap (B).
3. Remove the EVAP canister vent shut valve (C).
4. Install the parts in the reverse order of removal with new O-rings (D) and a new cap.

NOTE: Do not coat the O-rings with oil.

WITH SH-AWD

1. Remove the trunk front trim panel (see **TRIM REMOVAL/INSTALLATION - TRUNK AREA**).
2. Remove the access panel (A) from the floor.

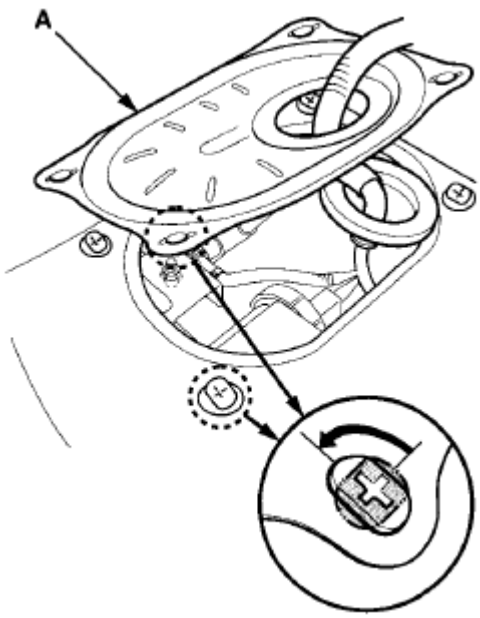

Fig. 72: Identifying Access Panel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the EVAP canister vent shut valve 2P connector (A).

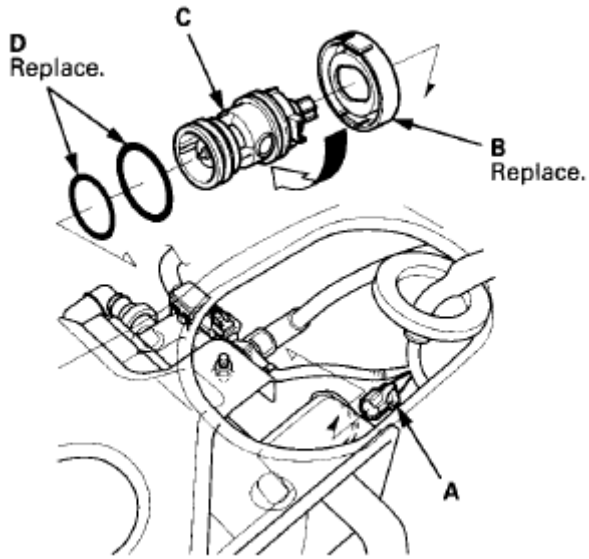

Fig. 73: Identifying 2P Connector, Cap, Shut Valve And O-Rings
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the cap (B).
5. Remove the EVAP canister vent shut valve (C).
6. Install the parts in the reverse order of removal with new O-rings (D) and a new cap.

EVAP CANISTER FILTER REPLACEMENT

WITH SH-AWD

1. Remove the rear differential (see **REAR DIFFERENTIAL REMOVAL**).
2. Disconnect the hoses (A).

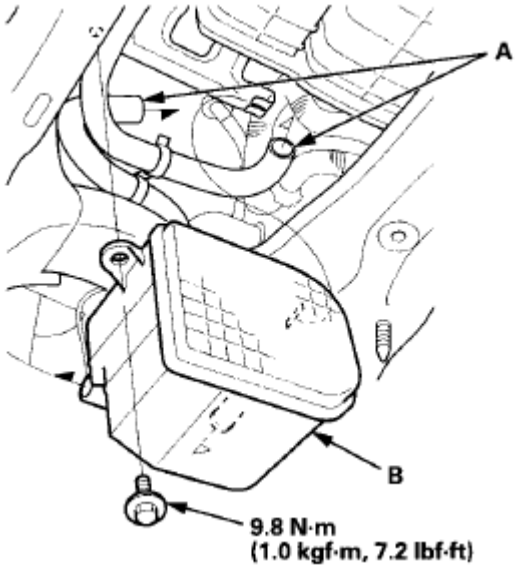

Fig. 74: Identifying Hoses And EVAP Canister Filter With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the EVAP canister filter (B).
4. Install the parts in the reverse order of removal.

EVAP CANISTER PURGE VALVE REPLACEMENT

1. Disconnect the hoses (A) and the EVAP canister purge valve 2P connector (B).

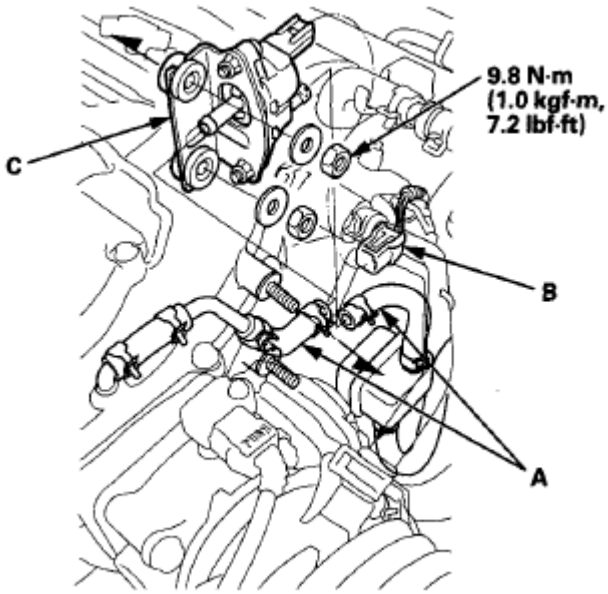

Fig. 75: Identifying Hoses And EVAP Canister Purge Valve 2P Connector And Valve Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the EVAP canister purge valve assembly (C).
3. Remove the EVAP canister purge valve (A) from the bracket (B).

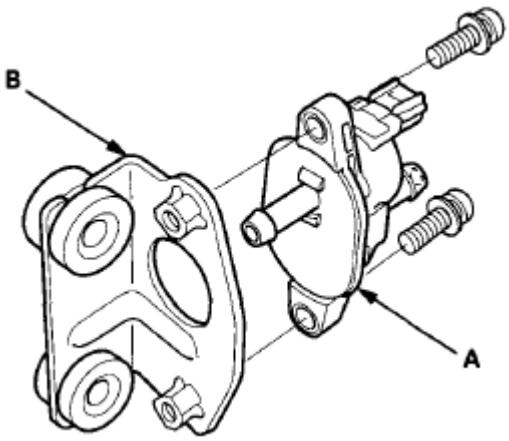

Fig. 76: Identifying EVAP Canister Purge Valve And Bracket
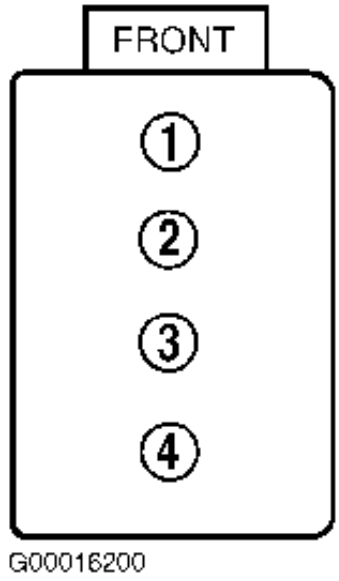
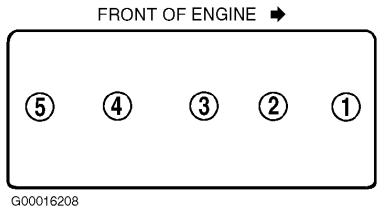
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the parts in the reverse order of removal.



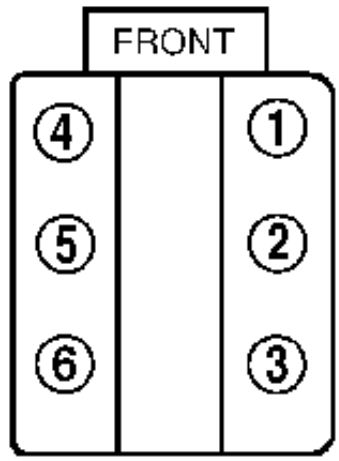
FIRING ORDER & CYLINDER IDENTIFICATION

Firing Order & Cylinder Identification - Acura



FIRING ORDER & CYLINDER IDENTIFICATION

NOTE: **This information is intended as a quick reference for firing order and cylinder identification only. The information provided covers many vehicles and may include some information that does not apply to the vehicle you have currently selected.**



4 CYLINDER ENGINE

GENERAL TROUBLESHOOTING INFORMATION

INTERMITTENT FAILURES

The term intermittent failure means a system may have had a failure, but it checks OK now. If the malfunction

indicator lamp (MIL) on the dash does not come on, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting. If the MIL was on but then went out, the original problem may have been intermittent.

SERVICE INFORMATION

Periodically, new ECM/PCM software or new service procedures may become available. Always check online for the latest software or service information related to the DTCs or symptoms you are troubleshooting.

OPENS AND SHORTS

Open and short are common electrical terms. An open is a break in a wire or at a connection. A short is an accidental connection of a wire to ground or to another wire. In simple electronics, this usually means something won't work at all. With complex electronics (such as ECMs or PCMs) this can sometimes mean something works, but not the way it's supposed to.

HOW TO USE THE HDS (HONDA DIAGNOSTIC SYSTEM)

If the MIL (malfunction indicator lamp) has come on

1. Start the engine, and check the MIL (A).

NOTE: If the ignition switch is turned to ON (II), or press the engine start/stop button to select the ON mode, and the engine is not started, the MIL stays on for 15- 20 seconds.

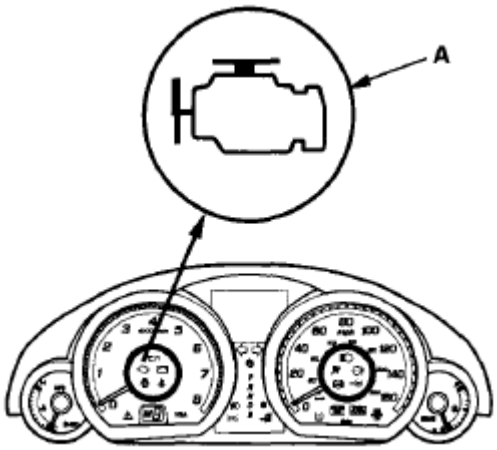

Fig. 2: Identifying Malfunction Indicator Lamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. If the MIL stays on, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

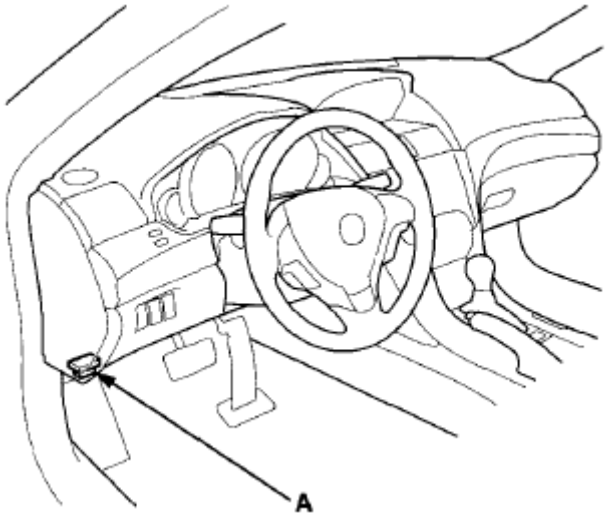

Fig. 3: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
5. Check the diagnostic trouble code (DTC) and note it. Also check the freeze data and/or on-board snapshot data, and download any data found. Then refer to the indicated DTC's troubleshooting, and begin the appropriate troubleshooting procedure.

NOTE:

- **Freeze data indicates the engine conditions when the first system malfunction, misfire, or fuel trim malfunction that activated the MIL was detected.**
- **The HDS can read the DTC, the freeze data, the on-board snapshot, the current data, and other engine control module (ECM) or powertrain control module (PCM) data.**
- **For specific operations, refer to the user's manual that came with the HDS.**

6. If no DTCs are found, go to the MIL circuit troubleshooting (see **MIL CIRCUIT TROUBLESHOOTING**).

If the MIL did not stay on

If the MIL did not stay on but there is a driveability problem, do the symptom troubleshooting.

If you can't duplicate the DTC

Some of the troubleshooting requires you to reset the ECM/PCM and try to duplicate the DTC. If the problem is intermittent and you can't duplicate the DTC, do not continue through the procedure. To do so will only result in confusion and possibly, a needlessly replaced ECM/PCM.

HDS CLEAR COMMAND

The ECM/PCM stores various specific data to backup the system even if there is no electrical power such as when the battery negative terminal or the No. 19 BACK UP Fl ECU (7.5 A) fuse are disconnected. Stored data based on failed parts should be cleared by using the CLEAR COMMAND of the HDS, if parts are replaced.

The HDS has three kinds of clear commands to meet this purpose. They are DTC clear, ECM/PCM reset, and CKP pattern clear. The DTC clear command erases all stored DTC codes, freeze data, on-board snapshot, and readiness codes. This must be done with the HDS after reproducing the DTC during troubleshooting.

The ECM/PCM reset command erases all stored DTCs, freeze data, on-board snapshot, readiness codes, and all specific data to correct the system except CKP pattern. If the CKP pattern data in the ECM/PCM was cleared, you must do the CKP pattern learn procedure. The CKP pattern clear command erases only CKP pattern data. This command is for repair of a misfire or the CKP sensor.

SCAN TOOL CLEAR COMMAND

If you are using a generic scan tool to clear commands, be aware that there is only one setting for clearing the ECM/PCM, and it clears all commands at the same time (CKP pattern learn, idle learn, readiness codes, freeze data, on-board snapshot, and DTCs). After you clear all commands, you then need to do these procedures, in this order: ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**); CKP pattern learn procedure; test-drive to set **readiness codes** to complete.

DTC CLEAR

1. Clear the DTC with the HDS while the engine is stopped.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait 30 seconds.
4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and disconnect the HDS from the DLC.

ECM/PCM RESET

1. Reset the ECM/PCM with the HDS while the engine is stopped.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait 30 seconds.
4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and disconnect the HDS from the DLC.
5. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).

CKP PATTERN CLEAR/CKP PATTERN LEARN

Clear/Learn Procedure (with the HDS)

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

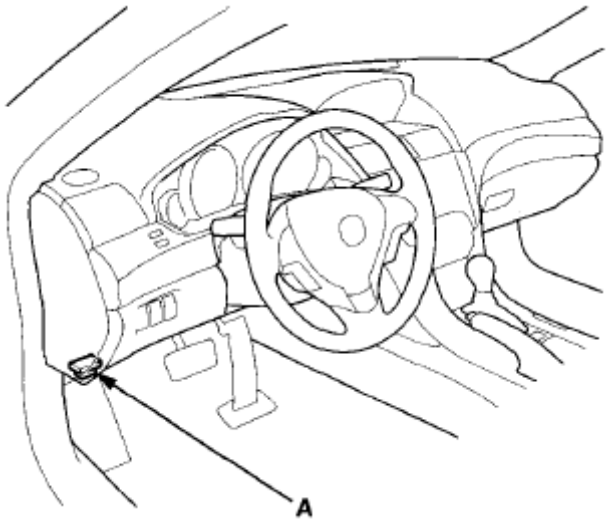

Fig. 4: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Select CRANK PATTERN in the ADJUSTMENT MENU with the HDS.
5. Select CRANK PATTERN CLEAR, and clear the CKP pattern.
6. Select CRANK PATTERN LEARNING with the HDS, and follow the screen prompts.

Learn Procedure (without the HDS)

1. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Test-drive the vehicle on a level road: Decelerate (with the throttle fully closed) from an engine speed of 2, 500 RPM down to 1, 000 RPM with the Transmission in 2nd.
3. Repeat step 2 several times.
4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait 30 seconds.

How to End a Troubleshooting Session (required after any troubleshooting)

1. Reset the ECM/PCM with the HDS.
2. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the HDS from the DLC.

NOTE: The ECM/PCM is part of the immobilizer system. If you replace the ECM/PCM, for the engine to start, you must use the HDS to instruct the new ECM/PCM and the immobilizer-keyless control unit (without keyless access) or the keyless access system (with keyless access) to recognize each other's unique serial code.

How to Troubleshoot Circuits at the ECM/PCM Connectors

NOTE: The ECM/PCM overwrites data and monitors the EVAP system for about 40 minutes after the ignition switch is turned to LOCK (0), or the engine start/stop button is pressed to select the OFF mode. Jumping the SCS line after turning the ignition switch to LOCK (0), or pressing the engine start/stop button to select OFF mode cancels this function. Disconnecting the ECM/PCM during this function, without jumping the SCS line first, can damage the ECM/PCM.

1. Jump the SCS line with the HDS.
2. Disconnect ECM/PCM connectors A, B, and C.

NOTE: ECM/PCM connectors A, B, and C have symbols (A=[], B=delta, C=o) embossed on them for identification.

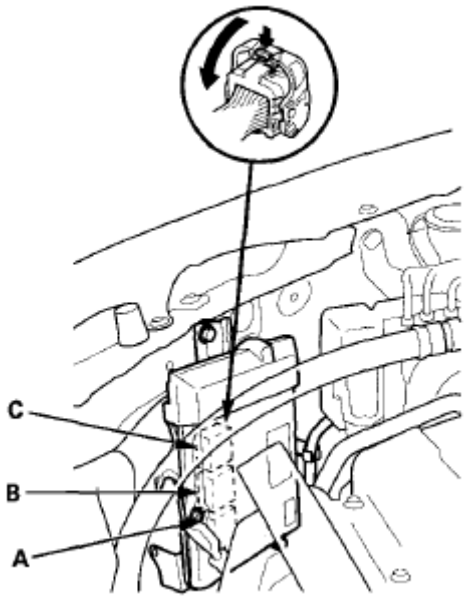

Fig. 5: Identifying ECM/PCM Connectors A, B And C
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. When diagnosis/troubleshooting is done at the ECM/PCM connector, use the terminal test port (A) above the terminal you need to check.

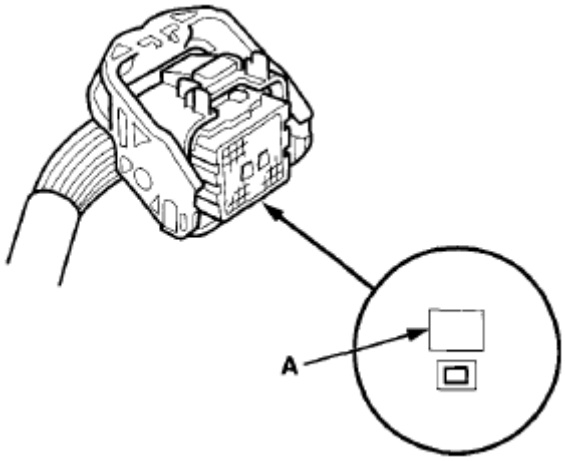

Fig. 6: Identifying Terminal Test Port Of ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Connect one side of the patch cord's terminals (A) to a commercially available digital multimeter (B), and connect the other side of the terminals (C) to a commercially available banana jack (Pomona Electronics Tool No. 3563 or equivalent) (D).

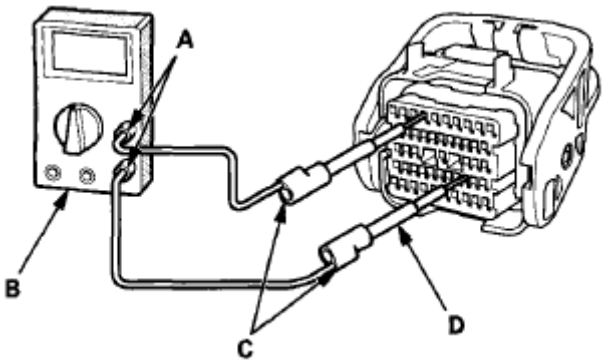

Fig. 7: Identifying Patch Chord's Terminals, Multimeter, Banana Jack And Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Gently contact the pin probe (male) at the terminal test port from the terminal side. Do not force the tips into the terminals.

NOTE:

- **For accurate results, always use the pin probe (male).**
- **To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes. Damaged terminals cause a poor connection and an incorrect measurement.**
- **Do not puncture the insulation on a wire. Punctures can cause poor or intermittent electrical connections.**

Substituting the ECM/PCM

Special Tools Required

- Honda Diagnostic System (HDS) tablet tester
- Honda Interface Module (HIM) and an iN workstation with the latest HDS software version
- HDS pocket tester
- GNA600 and an iN workstation with the latest HDS software version
- MVCI unit with the latest control module (CM) update software installed

Any one of the above updating tools can be used.

NOTE:

- **Use this procedure when you have to substitute a known-good ECM/PCM during the troubleshooting procedure.**
- **Make sure the HDS/iN workstation or the MVCI unit has the latest HDS software version.**

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

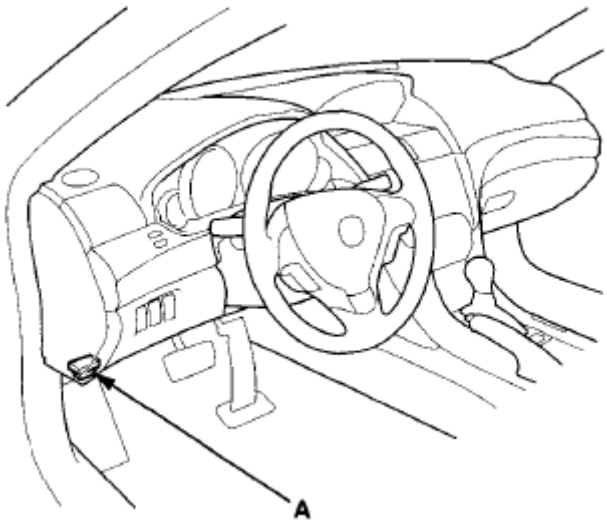

Fig. 8: Identifying Data Link Connector Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**). If you are returning from DLC circuit troubleshooting, skip steps 4 and 5, then clean the throttle body after substituting the ECM/PCM (see **THROTTLE BODY CLEANING**).
4. Select the INSPECTION MENU with the HDS.
5. Select the ETCS TEST, then select the TP POSITION CHECK, and follow the screen prompts.

NOTE: If the TP POSITION CHECK indicates FAILED, continue this procedure.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connectors A, B, and C, then remove the ECM/PCM assembly (D).

NOTE: ECM/PCM connectors A, B, and C have symbols (A=[], B=delta, C=o) embossed on them for identification.

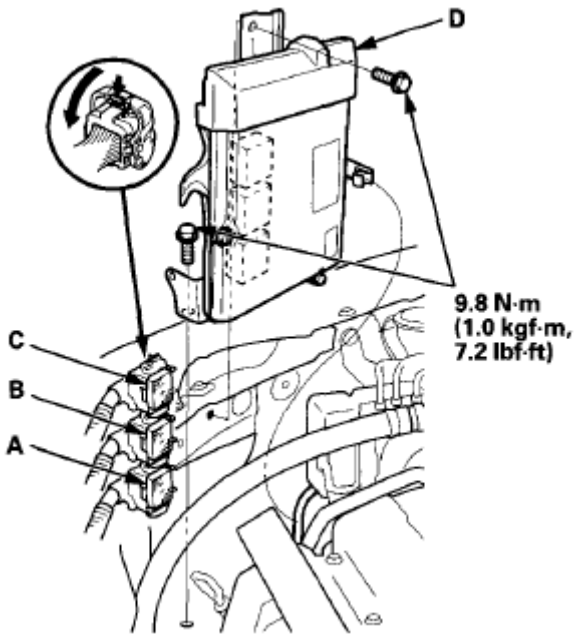

Fig. 9: Identifying ECM/PCM Connectors A, B And C And ECM/PCM Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the cover (A) and the bracket (B) from the ECM/PCM (C).

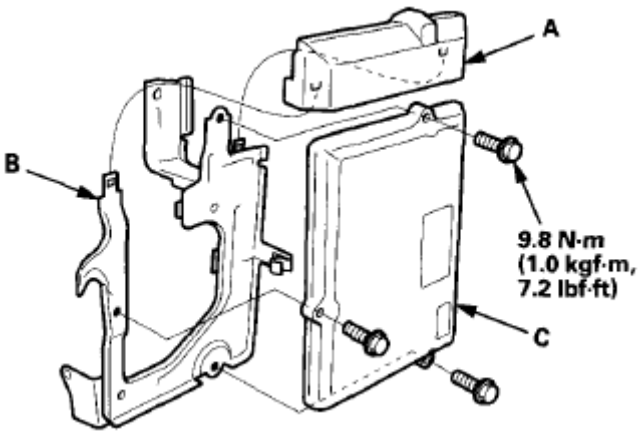

Fig. 10: Identifying Cover, Bracket And ECM/PCM With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install a known-good ECM/PCM in the reverse order of removal.
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

NOTE: DTC P0630 (VIN Not Programmed or Mismatch) may be stored because the VIN has not been programmed into the ECM/PCM; ignore it, and continue this procedure.

12. Manually input the VIN to the ECM/PCM with the HDS.
13. Select the IMMOBI system (without keyless access) or ONE PUSH START system (with keyless access) with the HDS.
14. Enter the immobilizer ECM/PCM code that you got from the iN, and use the ECM/PCM replacement procedure in the IMMOBI Menu (without keyless access) or ONE PUSH START Menu (with keyless access) of the HDS; it allows you to start the engine.
15. Reset the ECM/PCM with the HDS.
16. If the TP POSITION CHECK failed in step 5, clean the throttle body (see **THROTTLE BODY CLEANING**).
17. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**).
18. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
19. Do the CKP pattern clear/CKP pattern learn procedure.

OBD Status

The OBD status shows the current system status of each DTC and all of the parameters. This function is used to see if the repair was successfully completed. The results of diagnostic tests for the DTC are displayed as:

- PASSED: The on board diagnosis is successfully finished.
- FAILED: The on board diagnosis has finished but failed.
- EXECUTING: The vehicle is in enable criteria conditions of the DTC, and the on board diagnosis is running.
- NOT COMPLETED: The on board diagnosis was running but is out of the enable conditions of the DTC.
- OUT OF CONDITION: The vehicle has stayed out of the enable conditions of at the DTC.

DTC TROUBLESHOOTING INDEX

DTC (MIL indication(1))	Two Drive Cycle Detection	Detection Item	MIL	Note
P0101 (50)	o	Mass Air Flow (MAF) Sensor Circuit Range/Performance Problem	ON	DTC Troubleshooting (see **DTC TROUBLESHOOTING**)

NOTE:

The above DTCs are indicated when the PGM-FI system is selected with the HDS. Some automatic transmission DTCs cause the MIL to come on. If the MIL is on and no DTCs are indicated in the PGM-FI system, select the A/T system, and check for automatic transmission DTCs.

(1) These DTCs are indicated by a blinking MIL when the SCS line is jumped with the HDS. Some DTCs do not cause the MIL to blink when the SCS line is jumped; these DTCs are shown in the gauge display.

(2) Without SH-AWD

(3) With SH-AWD

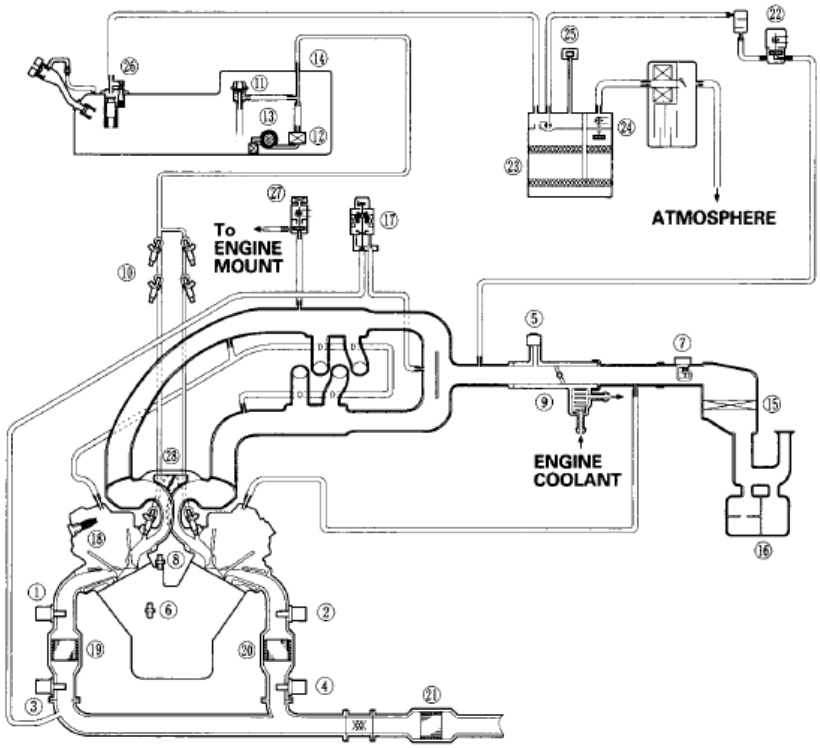
SYMPTOM TROUBLESHOOTING INDEX

When the vehicle has one of these symptoms, check for a diagnostic trouble code (DTC) with the HDS. If there is no DTC, do the diagnostic procedure for the symptom, in the sequence listed, until you find the cause.



Symptom	Diagnostic procedure	Also check for
Engine will not start (MIL works OK, no DTCs set)	1. Test the battery (see **BATTERY TEST**). 2. Test the starter (see **STARTER PERFORMANCE TEST**). 3. Check the fuel pressure (see **FUEL PRESSURE TEST**). 4. Troubleshoot the fuel pump circuit (see **FUEL PUMP CIRCUIT TROUBLESHOOTING**).	• Low compression • No ignition spark • Restricted exhaust system • Intake air leaks • Locked up engine • Broken timing belt • Fuel contamination
Engine will not start (MIL comes on and stays on, no DTCs set)	Troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).	• No power to ECM/PCM • No ground to ECM/PCM
MIL comes on and stays on, or never comes on at all, no DTCs set	Troubleshoot the MIL circuit (see **MIL CIRCUIT TROUBLESHOOTING**).	
Engine will not start (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)	Check the immobilizer system: • Without keyless access system (see **SYMPTOM TROUBLESHOOTING INFORMATION**). • With keyless access system (see **SYMPTOM TROUBLESHOOTING INFORMATION**).	
Engine starts but stalls immediately (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)	Check the immobilizer system: • Without keyless access system (see **SYMPTOM TROUBLESHOOTING INFORMATION**). • With keyless access system (see **SYMPTOM TROUBLESHOOTING INFORMATION**).	
Engine is hard to start (MIL works OK, no DTCs set)	1. Test the battery (see **BATTERY TEST**). 2. Check the fuel pressure (see **FUEL PRESSURE TEST**). 3. Clean the throttle body (see **THROTTLE BODY CLEANING**).	• Low compression • Intake air leaks • Fuel contamination • Weak spark • Low fuel pressure

Cold fast idle too low (MIL works OK, no DTCs set)	1. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**). 2. Check the idle speed (see **IDLE SPEED INSPECTION**). 3. Clean the throttle body (see **THROTTLE BODY CLEANING**).	
Cold fast idle too high (MIL works OK, no DTCs set)	1. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**). 2. Check the idle speed (see **IDLE SPEED INSPECTION**). 3. Do the throttle position learning check (see **THROTTLE BODY TEST**).	Intake air leaks
Idle speed fluctuates (MIL works OK, no DTCs set)	1. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**). 2. Check the idle speed (see **IDLE SPEED INSPECTION**). 3. Do the carbon accumulation check (see **THROTTLE BODY TEST**). 4. Troubleshoot the A/C signal circuit (see **A/C SIGNAL CIRCUIT TROUBLESHOOTING**).	• Incorrect valve timing or clearance adjustment • Intake air leaks
After warming up, idle speed is below specification without load (MIL works OK, no DTCs set)	1. Troubleshoot the alternator FR signal circuit (see **ALTERNATOR FR SIGNAL CIRCUIT TROUBLESHOOTING**). 2. Do the carbon accumulation check (see **THROTTLE BODY TEST**).	Incorrect valve adjustment
After warming up, idle speed is above specification without load (MIL works OK, no DTCs set)	1. Troubleshoot the alternator FR signal circuit (see **ALTERNATOR FR SIGNAL CIRCUIT TROUBLESHOOTING**). 2. Inspect the APP sensor (see **APP SENSOR SIGNAL INSPECTION**).	Intake air leaks
Low power (MIL works OK, no DTCs set)	Check the fuel pressure (see **FUEL PRESSURE TEST**).	• Low compression • Incorrect camshaft timing • Incorrect engine oil level • Exhaust restriction
	1. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN**	

Engine stalls (MIL works OK, no DTCs set)	**PROCEDURE**). 2. Check the fuel pressure (see **FUEL PRESSURE TEST**). 3. Check the idle speed (see **IDLE SPEED INSPECTION**). 4. Troubleshoot the brake pedal position switch signal circuit (see **BRAKE PEDAL POSITION SWITCH SIGNAL CIRCUIT TROUBLESHOOTING**).	• Intake air leaks • Faulty harness and sensor connections
Difficult to refuel (MIL works OK, no DTCs set)	1. Check the fuel vent tube between the EVAP canister and the fuel tank. 2. Check the fuel tank vapor recirculation tube between the fuel pipe and the fuel tank. 3. Replace the fuel tank: • Without SH-AWD (see **FUEL TANK REPLACEMENT**). • With SH-AWD (see **WITH SH-AWD**).	Malfunctioning gas station filling nozzle
Fuel overflows during refueling (No DTCs set)	Replace the fuel tank. • Without SH-AWD (see **FUEL TANK REPLACEMENT**). • With SH-AWD (see **WITH SH-AWD**).	Malfunctioning gas station filling nozzle
Fuel cap warning message stays on (MIL works OK, no DTCs set)	Troubleshoot the fuel cap warning message system (see **FUEL CAP WARNING MESSAGE SYSTEM TROUBLESHOOTING**).	
HDS does not communicate with the ECM/PCM or the vehicle	Troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).	Correct HDS software

ELECTRONIC CONTROL SYSTEMS

The functions of the fuel and emission control systems are managed by the engine control module (ECM) on vehicle with manual transmissions or the powertrain control module (PCM) on vehicle with automatic transmissions.

Self-Diagnosis

The ECM/PCM detects the failure of a signal from a sensor or from another control unit and stores a Pending DTC or a Confirmed DTC. Depending on the failure, a Confirmed DTC is stored in either the first or the second drive cycle. When a Confirmed DTC is stored, the ECM/PCM turns on the malfunction indicator lamp (MIL) by a signal sent to the gauge via F-CAN.

- **One Drive Cycle Detection Method**

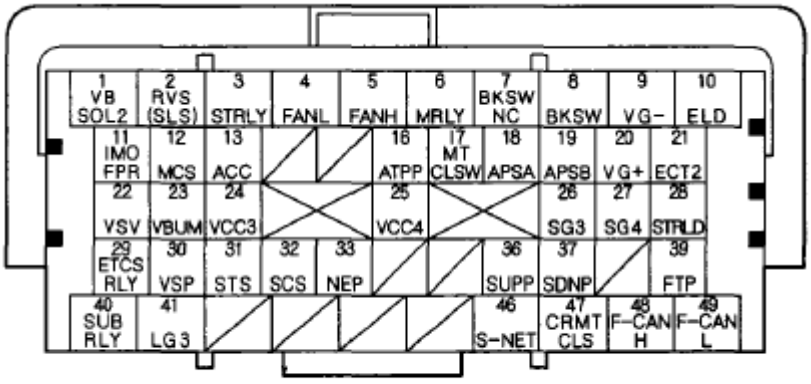
  When an abnormality occurs in the signal from a sensor or from another control unit, the ECM/PCM stores a Confirmed DTC and turns on the MIL immediately.

- **Two Drive Cycle Detection Method**

When an abnormality occurs in the signal from a sensor or from another control unit in the first drive cycle, the ECM/PCM stores a Pending DTC. The MIL does not come on at this time. If the failure continues in the second drive cycle, the ECM/PCM stores a Confirmed DTC and turns on the MIL.

Fail-Safe Function

When an abnormality occurs in the signal from a sensor or from another control unit, the ECM/PCM ignores that signal and substitutes a pre-programmed value for them that allows the engine to continue running. This causes a Confirmed DTC to be stored and the MIL to come on.



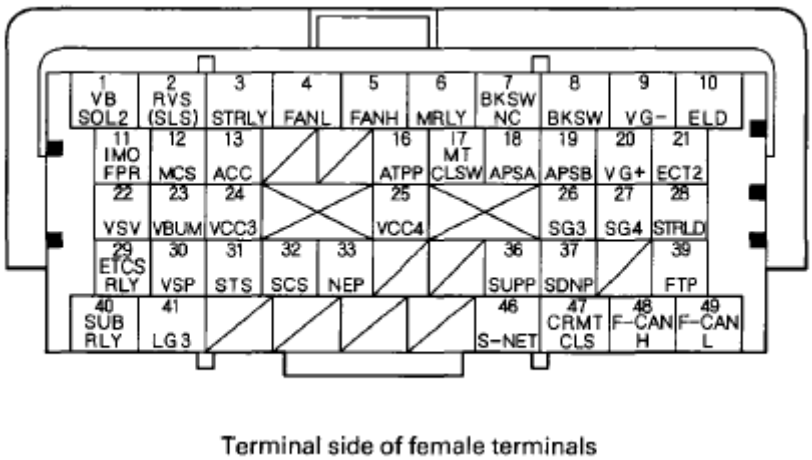
MIL Bulb Check and Readiness Code Condition

When the ignition switch is turned to ON (II), or press the engine start/stop button to select the ON mode, the ECM/PCM turns on the MIL via the F-CAN circuit for about 15 to 20 seconds to check the bulb condition. If any readiness codes are not set to complete, the MIL flashes five times. If all readiness codes are set to complete, the MIL goes off.

Self Shut Down (SSD) Mode

After the ignition switch is turned to LOCK (0), or the engine start/stop button is pressed to select the OFF mode, the ECM/PCM stays on (about 40 minutes). If the ECM/PCM connector is disconnected during this time, the ECM/PCM may be damaged. To cancel this mode, disconnect the negative cable from the battery or jump the SCS line with the HDS after the ignition switch is turned to LOCK (0), or the engine start/stop button is pressed to select the OFF mode.

ECM/PCM Inputs and Outputs at ECM/PCM Connector A ([]) (49P)



Terminal side of female terminals

Terminal number	Wire color	Terminal name	Description	Signal
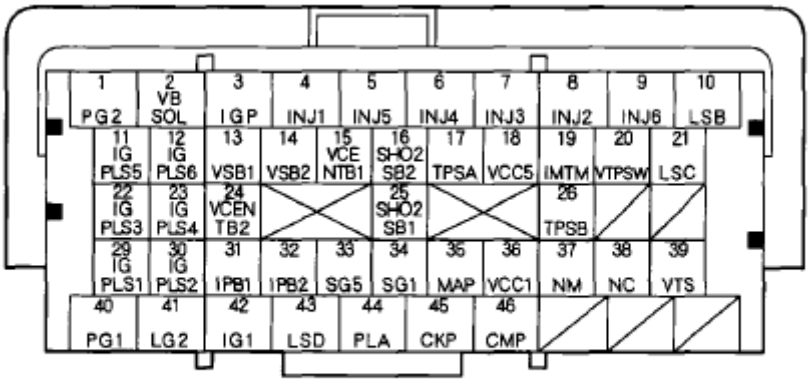
1	BLK	PG2 (POWER GROUND)	Ground circuit for ECM/PCM	Less than 0.2 V at all times
2	BLK/YEL	VBSOL (POWER SOURCE FOR SOLENOID VALVES)	Power source for solenoid valves	With ignition switch ON (II)/vehicle in ON mode: battery voltage
3	YEL/BLK	IGP (POWER SOURCE)	Power source for ECM/PCM circuit	With ignition switch ON (II)/vehicle in ON mode: battery voltage
4	BRN	INJ1 (No. 1 INJECTOR)	Drives No. 1 injector	At idle: duty controlled With ignition switch ON (II)/vehicle in ON mode: battery voltage
5	BLK/RED	INJ5 (No. 5 INJECTOR)	Drives No. 5 injector	
6	YEL	INJ4 (No. 4 INJECTOR)	Drives No. 4 injector	
7	BLU	INJ3 (No. 3 INJECTOR)	Drives No. 3 injector	
8	RED	INJ2 (No. 2 INJECTOR)	Drives No. 2 injector	
9	WHT/BLU	INJ6 (No. 6 INJECTOR)	Drives No. 6 injector	

10(1)	BRN/WHT	LSB (A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B)	Drives A/T clutch pressure control solenoid valve B	With ignition switch ON (II)/vehicle in ON mode: current controlled
(1) A/T				

ECM/PCM Inputs and Outputs at ECM/PCM Connector B (delta) (49P)



Terminal side of female terminals

Fig. 19: Identifying ECM/PCM Inputs And Outputs At ECM/PCM Connector B (delta) (49P) Terminals

Terminal number	Wire color	Terminal name	Description	Signal
11	BLK/RED	IGPLS5 (No. 5 IGNITION COIL PULSE)	Drives No. 5 ignition coil	With ignition switch ON (II)/vehicle in ON mode: about 0 V With engine running: pulses
12	BRN/WHT	IGPLS6 (No. 6 IGNITION COIL PULSE)	Drives No. 6 ignition coil	
13	BLU	VSB1 (VS CELL+ BANK 1)	Detects rear A/F sensor (Bank 1, sensor 1)VS CELL signal	With warmed up engine running: about 3.4- 4.8 V
14	RED/BLU (WHT/RED) (1)	VSB2 (VS CELL+ BANK 2)	Detects front A/F sensor (Bank 2, sensor 1)VS CELL signal	With warmed up engine running: about 3.4- 4.8 V
15	RED	VCENTB1 (VIRTUAL GROUND BANK 1)	Reference voltage for rear A/F sensor (Bank 1, sensor 1)	With warmed up engine at idle: about 3.4- 3.8 V
16	WHT	SHO2SB2 (FRONT SECONDARY HEATED OXYGEN SENSOR (FRONT SECONDARY HO2S) (BANK	Detects front secondary HO2S (Bank 2, sensor 2)	With throttle fully opened from idle and warmed up engine: about 0.6 V

		2, SENSOR 2))	signal	With throttle quickly closed: below 0.4 V
17	RED/BLK	TPSA (THROTTLE POSITION (TP) SENSOR A)	Detects TP sensor A signal	With ignition switch ON (II)/vehicle in ON mode and accelerator pedal pressed: about 3.9 V With ignition switch ON (II)/vehicle in ON mode and accelerator pedal released: about 0.6 V
18	BLU	VCC5 (SENSOR VOLTAGE)	Provides sensor reference voltage	With ignition switch ON (II)/vehicle in ON mode: about 5.0 V
(1) A/T				

ECM/PCM Inputs and Outputs at ECM/PCM Connector B (delta) (49P)

Terminal side of female terminals

PGM-FI SYSTEM

The programmed fuel injection (PGM-FI) system is a sequential multiport fuel injection system.

Alternator Control

The alternator signals the ECM/PCM during charging. The ECM/PCM then controls the voltage generated at the alternator according to the electrical load determined by the electrical load detector (ELD) and the driving mode. This reduces engine load to improve fuel economy.

Air Conditioning (A/C) Compressor Clutch Relay

When the ECM/PCM receives a demand for cooling from the A/C system, it delays the compressor from being energized, and enriches the mixture to assure a smooth transition to the A/C mode.

Air Fuel Ratio (A/F) Sensor

The A/F sensor operates over a wide air/fuel range. The A/F sensor is installed upstream of the warm up three way catalytic converter (WU-TWC), and it sends signals to the ECM/PCM which varies the duration of fuel injection accordingly.

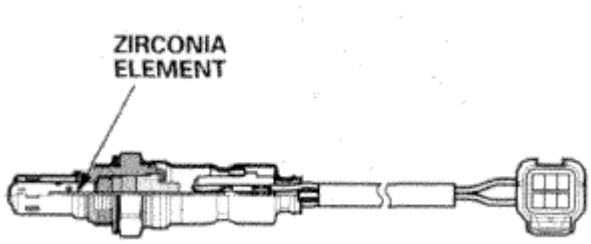

Fig. 54: Identifying Air Fuel Ratio (A/F) Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Barometric Pressure (BARO) Sensor

The BARO sensor is inside the ECM/PCM. It converts atmospheric pressure into a voltage signal that is used by the ECM/PCM to modify the basic duration of the fuel injection discharge.

Camshaft Position (CMP) Sensor

The CMP sensor detects the position of the No, 1 cylinder as a reference for sequential fuel injection to each cylinder.

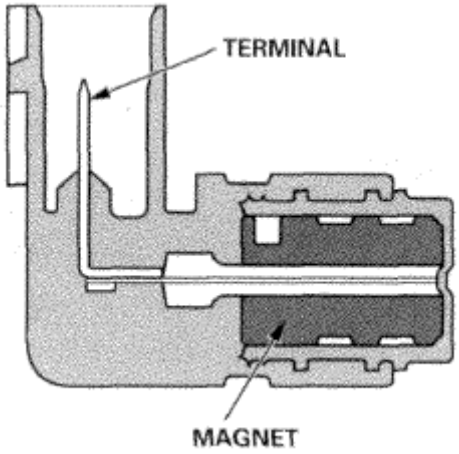

Fig. 55: Identifying Camshaft Position (CMP) Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Crankshaft Position (CKP) Sensor

The CKP sensor detects crankshaft speed, and is used by the ECM/PCM to determine ignition timing, timing for the fuel injection of each cylinder, and engine misfire detection.

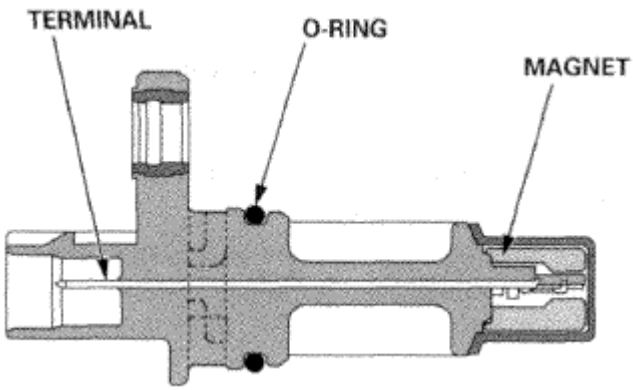

Fig. 56: Identifying Crankshaft Position (CKP) Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Engine Coolant Temperature (ECT) Sensors 1 and 2

ECT sensors 1 and 2 are temperature dependent resistors (thermistors). The resistance decreases as the engine coolant temperature increases.

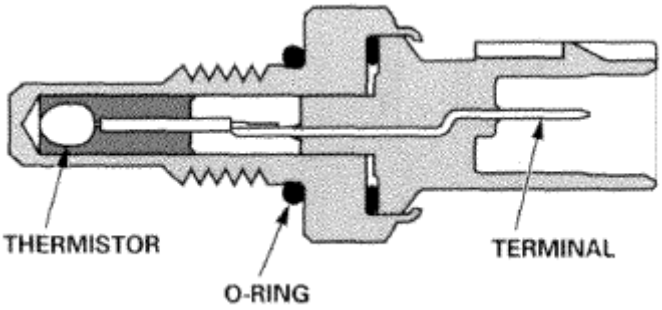

Fig. 57: Identifying Engine Coolant Sensor And Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Ignition Timing Control

The ECM/PCM contains the memory for basic ignition timing at various engine speeds and manifold absolute pressures. It also adjusts the timing according to engine coolant temperature and intake air temperature.

Injector Timing and Duration

The ECM/PCM contains the memory for basic discharge duration at various engine speeds and manifold pressures. The basic discharge duration, after being read out from the memory, is further modified by signals sent from various sensors to obtain the final discharge duration.

By monitoring long term fuel trim, the ECM/PCM detects long term malfunctions in the fuel system and sets diagnostic trouble codes (DTCs) if needed.

Input Shaft (Mainshaft) Speed Sensor

This sensor detects input shaft (mainshaft) speed.

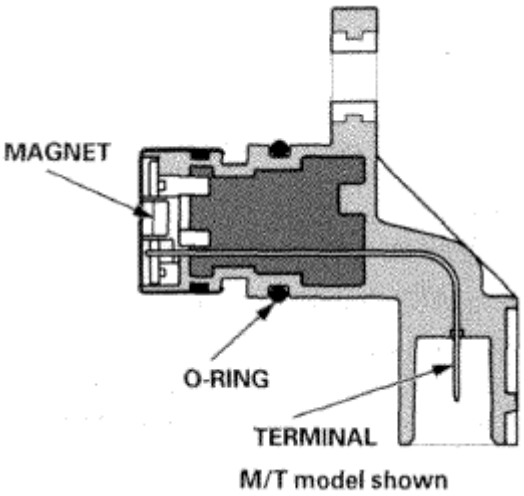

Fig. 58: Identifying Input Shaft (Mainshaft) Speed Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Knock Sensor

The knock control system adjusts the ignition timing to minimize knock.

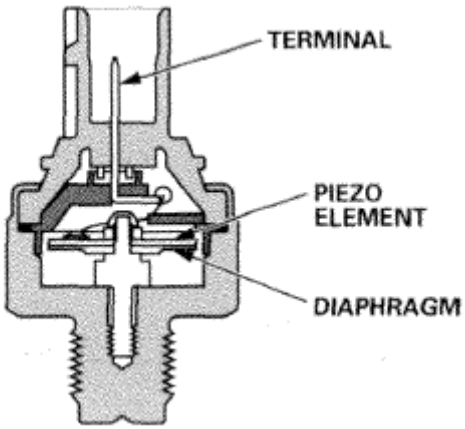

Fig. 59: Identifying Knock Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Malfunction Indicator Lamp (MIL) Indication (In relation to Readiness Codes)

The vehicle has certain readiness codes that are part of the on-board diagnostics for the emissions systems. If the vehicle's battery has been disconnected or gone dead, if DTCs have been cleared, or if the ECM/PCM has been reset, these codes are reset. In some states, part of the emissions testing is to make sure these codes are set to complete. If all of them are not set to complete, the vehicle may fail the test, or the test cannot be finished.

To check if the readiness codes are set to complete, turn the ignition switch to ON (II) or press the engine

start/stop button to select the ON mode, but do not start the engine. The MIL will come on for 15- 20 seconds. If it then goes off, the readiness codes are complete. If it flashes five times, one or more readiness codes are not set to complete. To set each code, drive the vehicle or run the engine as described in the procedures (see **readiness codes**).

Manifold Absolute Pressure (MAP) Sensor

The MAP sensor converts manifold absolute pressure into electrical signals that are sent to the ECM/PCM.

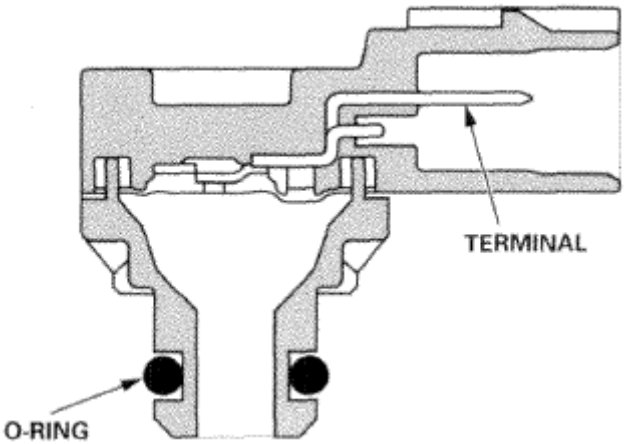

Fig. 60: Identifying Manifold Absolute Pressure (MAP) Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Mass Air Flow (MAF) Sensor/Intake Air Temperature (IAT) Sensor

The mass airflow (MAF) sensor/intake air temperature OAT) sensor contains a hot wire sensor, a cold wire sensor, and a thermistor. It is located in the intake air passage. The resistance of the hot wire sensor, a cold wire sensor, and the thermistor changes due to intake air temperature and air flow. The control circuit in the MAF sensor controls the current to keep the hot wire at a set temperature. The current is converted to voltage in the control circuit, then output to the ECM/PCM.

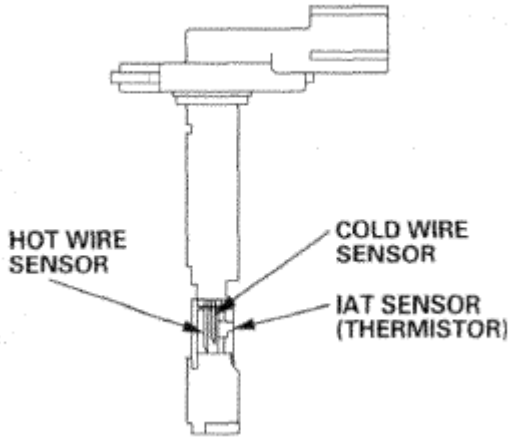

Fig. 61: Identifying Mass Air Flow (MAF) Sensor/Intake Air Temperature (IAT) Sensor

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Output Shaft (Countershaft)

Speed Sensor This sensor detects countershaft speed.

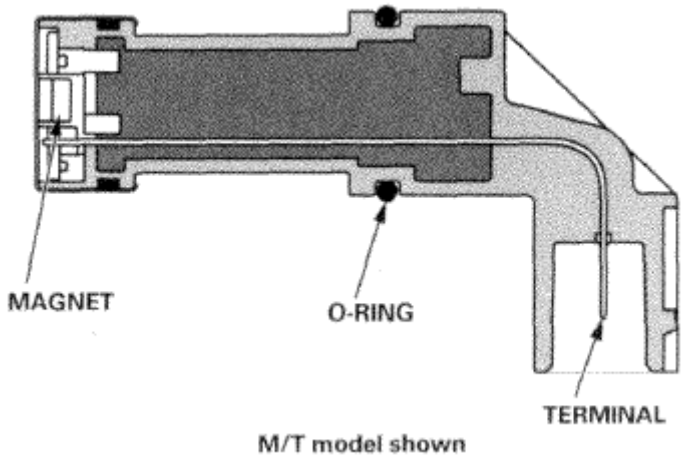

Fig. 62: Identifying Output Shaft (Countershaft) Speed Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Secondary Heated Oxygen Sensor (Secondary HO2S)

The secondary HO2S detects the oxygen content in the exhaust gas downstream of the warm up three way catalytic converter (WU-TWC), and sends signals to the ECM/PCM, To stabilize its output, the sensor has an internal heater. The ECM/PCM compares the HO2S output with the A/F sensor output to determine catalyst efficiency, A secondary HO2S is installed in each bank downstream of the WU-TWC.

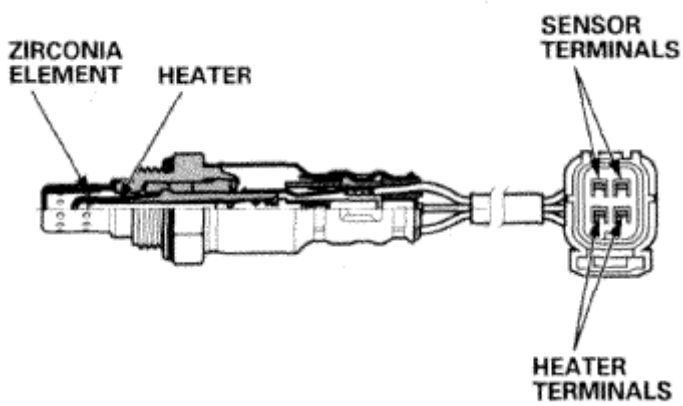

Fig. 63: Identifying Secondary Heated Oxygen Sensor (Secondary HO2S)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

STARTER CONTROL SYSTEM DIAGRAM

M/T

The starter control system controls the starter motor.

- When the engine start/stop button pressed to select the START mode, the ECM applies current to starter cut relay 1, and starter cut relay 2, and the +B cut relay is turned on. Then battery voltage is applied to the starter solenoid, and starter motor runs.
- Once the engine start/stop button is released, the ECM keeps the starter motor running until the engine starts. If the ECM detects that the engine starts, the ECM stops applying current to the relays, and the starter motor stops.
- If you press the engine start/stop button to select START mode while the engine is running, the starter motor does not operate.
- In the following cases, the ECM stops the starter motor:
  - After the starter motor operates for 10 seconds (to prevent the starter motor from overheating).
  - If the engine RPM is too high during starter motor operation.
- If there is a problem with the starter control system, a message appears on the gauge display. When the message is on, the engine can only be started by pressing and holding the engine start/stop button until the engine starts.

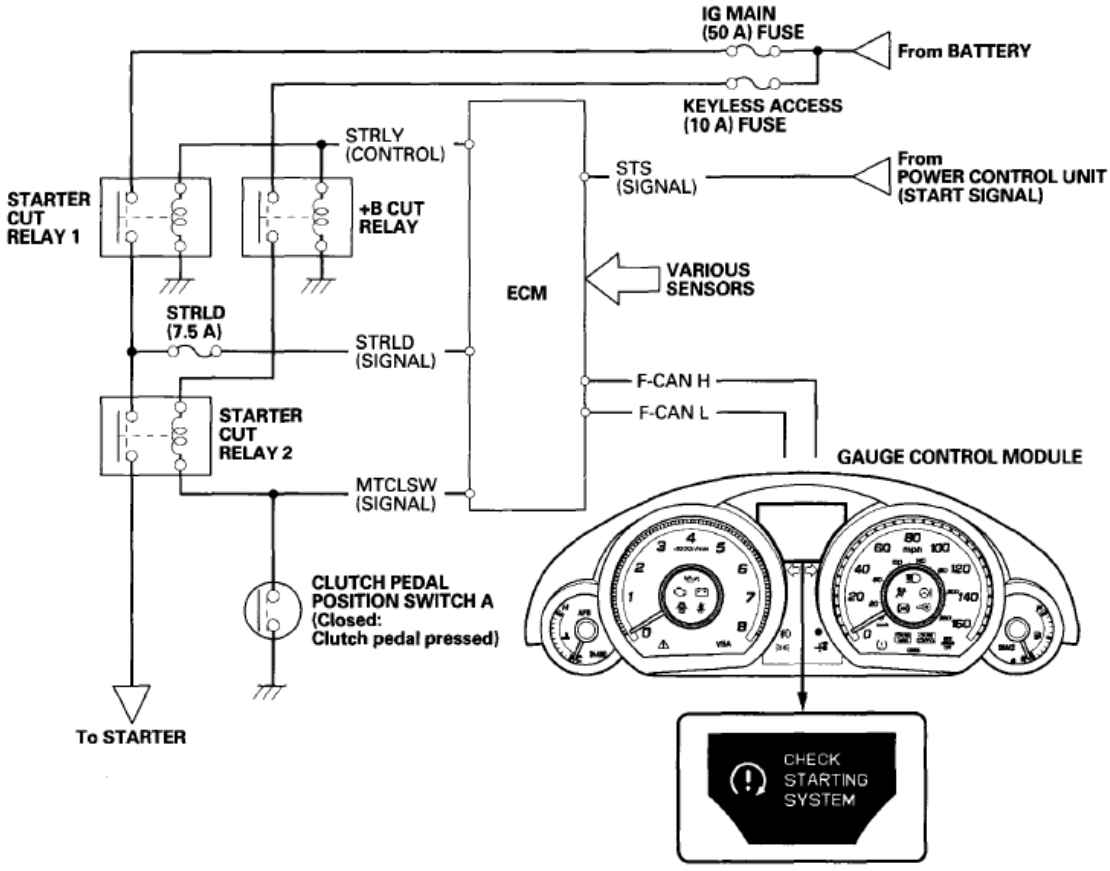

Fig. 64: Starter Control System (M/T) - Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

A/T

The starter control system controls the starter motor.

- When the ignition switch is turned to START (III), or the engine start/stop button pressed to select the START mode, the PCM applies current to starter cut relay 1 and starter cut relay 2, then battery voltage is applied to the starter solenoid, and starter motor runs.
- Once the ignition switch or the engine start/stop button is released, the PCM keeps the starter motor running until the engine starts. If the PCM detects that the engine starts, the PCM stops applying current to the relays, and the starter motor stops.
- If you turn the ignition switch to START (III), or press the engine start/stop button to select START mode while the engine is running, the starter motor does not operate.
- In the following cases, the PCM stops the starter motor:
  - After the starter motor operates for 10 seconds (to prevent the starter motor from overheating).
  - If the engine RPM is too high during starter motor operation.
- If there is a problem with the starter control system, a message appears on the gauge display. When the message is on, the engine can only be started by turning and holding the ignition switch in the START (III) position until the engine starts, or pressing and holding the engine start/stop button until the engine starts.

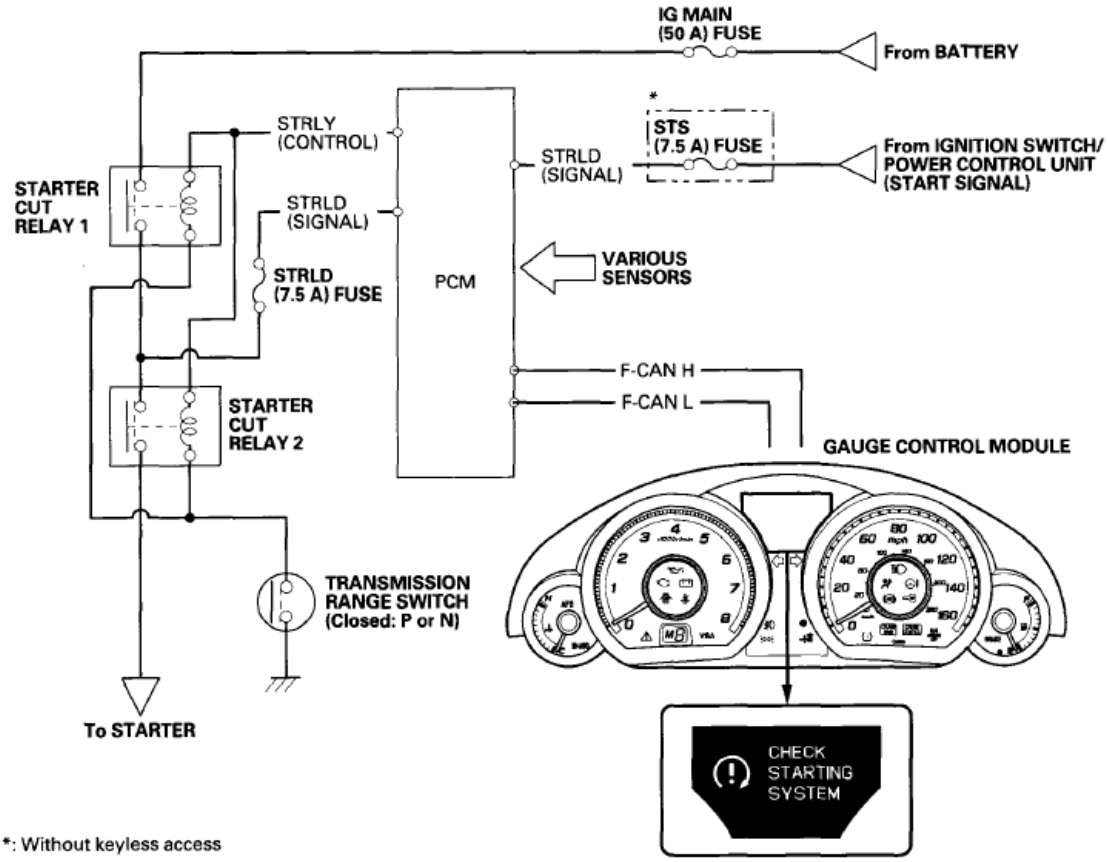

Fig. 65: Starter Control System (A/T) - Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ELECTRONIC THROTTLE CONTROL SYSTEM

The throttle is electronically controlled. Refer to the system diagram to see a functional layout of the system.

Idle control: When the engine is idling, the ECM/PCM controls the throttle actuator to maintain the proper idle speed according to engine loads.

Acceleration control: When the accelerator pedal is pressed, the ECM/PCM opens the throttle valve based on the accelerator pedal position (APP) sensor signal.

Cruise control: The ECM/PCM controls the throttle actuator to maintain the set speed when cruise control is operating. The throttle actuator takes the place of the cruise control actuator.

Accelerator Pedal Position (APP) Sensor

As the accelerator pedal position changes, the sensor varies the signal voltage to the ECM/PCM which then controls the throttle position.

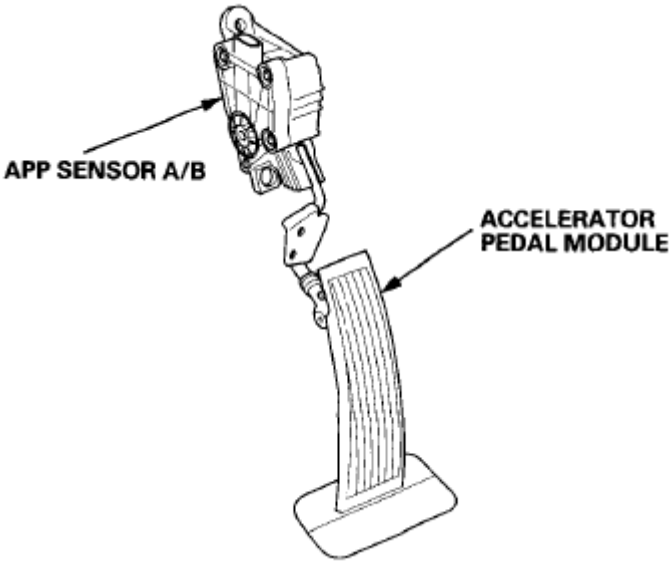

Fig. 66: Identifying Accelerator Pedal Position (APP) Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Throttle Body

The throttle body is a single-barrel side draft type. The lower portion of the throttle valve is heated by engine coolant from the cylinder head to prevent icing of the throttle plate.

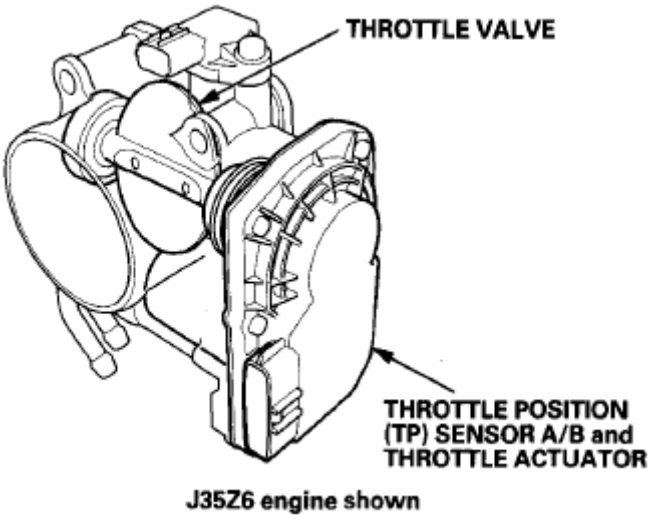

Fig. 67: Identifying Throttle Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ELECTRONIC THROTTLE CONTROL SYSTEM DIAGRAM

The electronic throttle control system consists of the throttle actuator, throttle position (TP) sensor A/B, accelerator pedal position (APP) sensor A/B, the electronic throttle control system (ETCS) control relay, and the ECM/PCM.

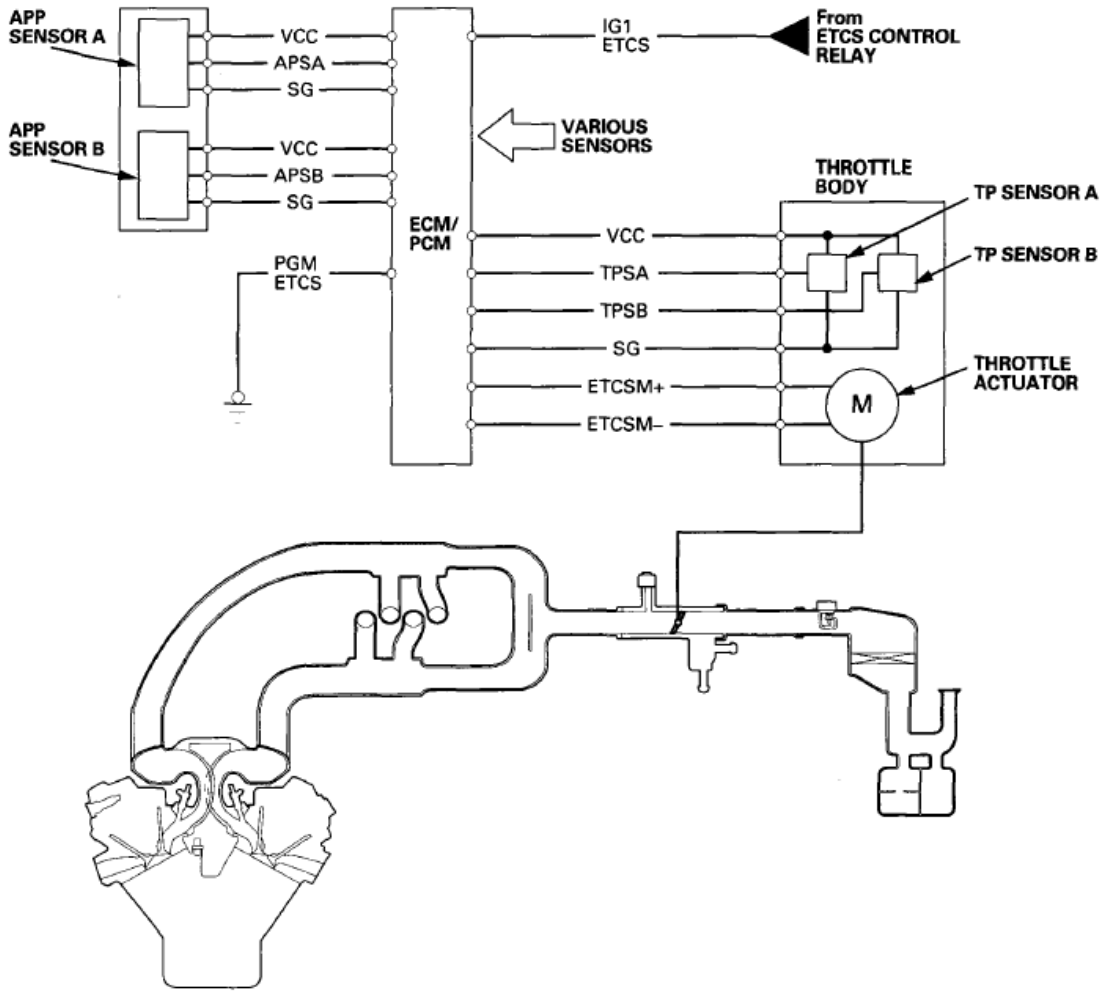

Fig. 68: Electronic Throttle Control System - Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

VTEC SYSTEM (J35Z6 ENGINE)

- The VTEC system changes the cam profile to correspond to engine speed. It maximizes torque at low engine speed and output at high engine speed. The low lift cam is used at low engine speeds, and the high lift cam is used at high engine speeds.
- The intake valve side has primary and secondary rocker arms. These rocker arms are locked and separated to change the cam profile by switching the oil passages. Roller rockers are used to minimize mechanical friction.

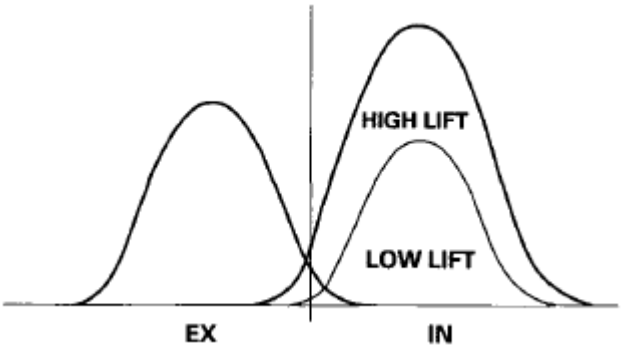

Fig. 69: Identifying VTEC System (J35Z6 Engine) Cam Profile
Courtesy of AMERICAN HONDA MOTOR CO., INC.

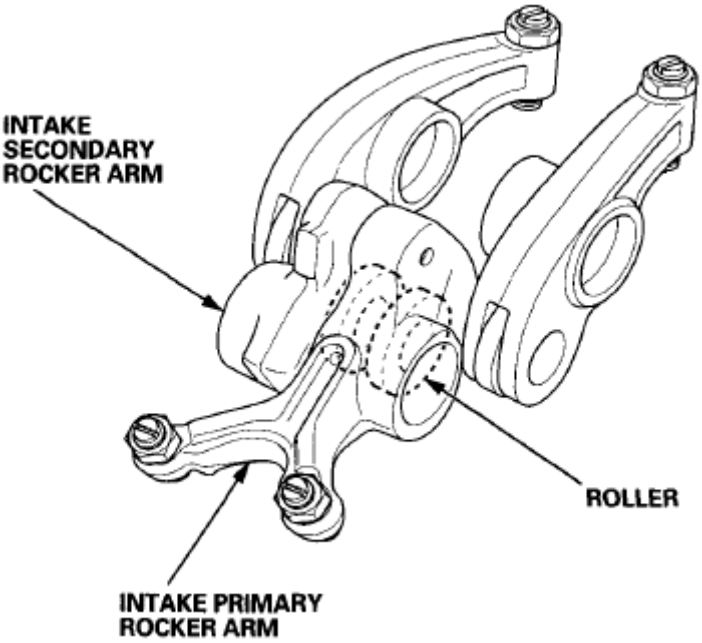

Fig. 70: Identifying Roller Rockers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- The VTEC system oil pressure is switched by the rocker arm oil control valve changing the hydraulic circuit. The rocker arm oil control valve is controlled by the rocker arm oil control solenoid. The rocker arm oil pressure switch detects VTEC system oil pressure and sends this information to the PCM.

ENGINE SPEED	ROCKER ARM OIL CONTROL SOLENOID	INTAKE VALVE LIFT
LOW	OFF	LOW
HIGH	ON	HIGH

VTEC SYSTEM OPERATION (J35Z6 ENGINE)

At low engine speed

The rocker arm oil control solenoid is turned off by the PCM, Oil pressure from the rocker arm oil control valve does not enter the rocker shaft. The intake primary and secondary rocker arms are separated by a return spring and lifted by the low lift cam lobe.

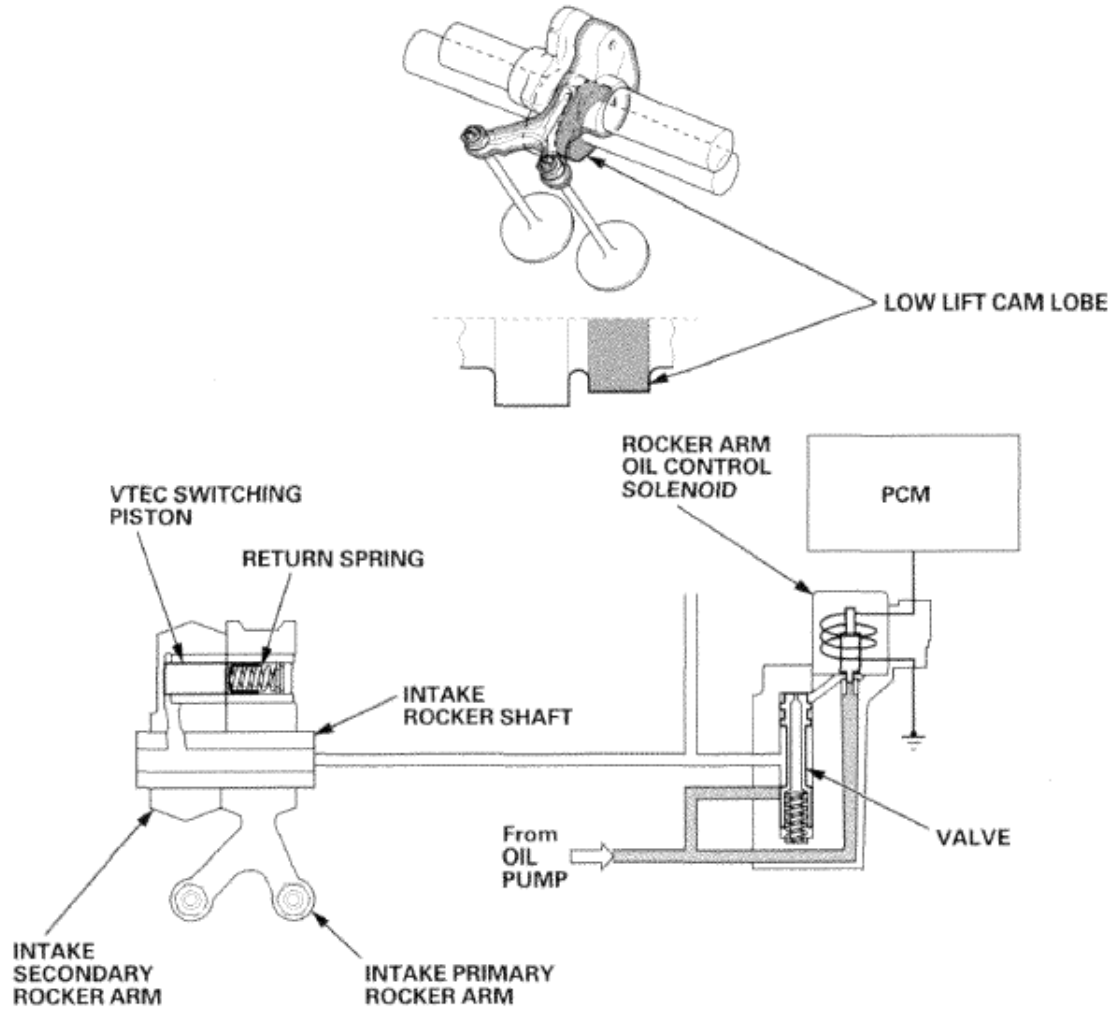

Fig. 71: Identifying VTEC System Operation (J35Z6 Engine) At Low Engine Speed
Courtesy of AMERICAN HONDA MOTOR CO., INC.

VTEC SYSTEM OPERATION (J35Z6 ENGINE)

At high engine speed

The rocker arm oil control solenoid is turned on by the PCM, Oil pressure from the rocker arm control solenoid enters into the intake secondary rocker arm via the rocker shaft, and it moves the VTEC switching piston in the intake secondary rocker arm. This causes the VTEC switching piston to slide into the primary rocker arm, locking the primary and secondary rocker arms together. Both intake rocker arms are lifted by the high lift cam lobe.

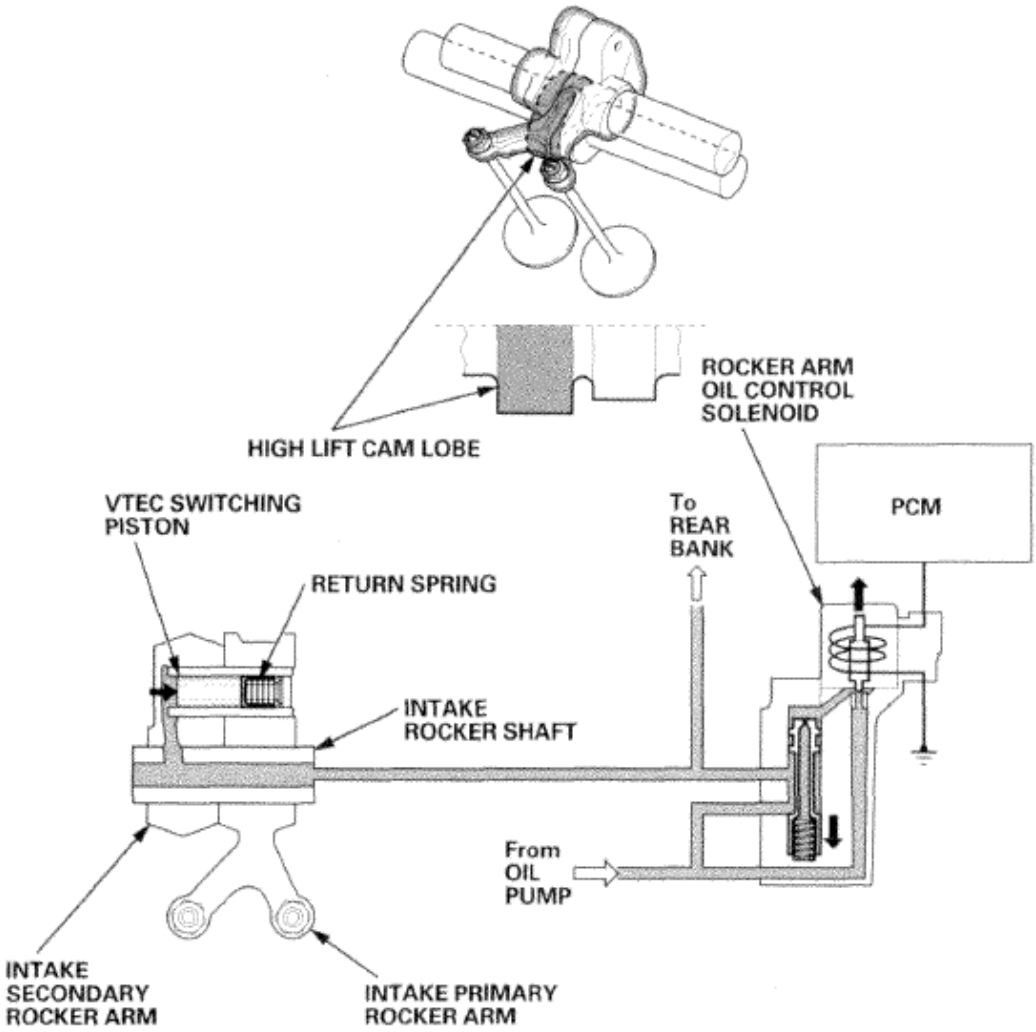

Fig. 72: Identifying VTEC System Operation (J35Z6 Engine) At High Engine Speed
Courtesy of AMERICAN HONDA MOTOR CO., INC.

VTEC SYSTEM (J37A4 ENGINE)

- The VTEC system changes the cam profile to correspond to engine speed. It maximizes torque at low engine speed and output at high engine speed. The low lift cam is used at low engine speeds, and the high lift cam is used at high engine speeds.
- Both the intake valve side and the exhaust valve side have primary and secondary rocker arms. These rocker arms are locked and separated to change the cam profile by switching the oil passages. Roller rockers are used to minimize mechanical friction.

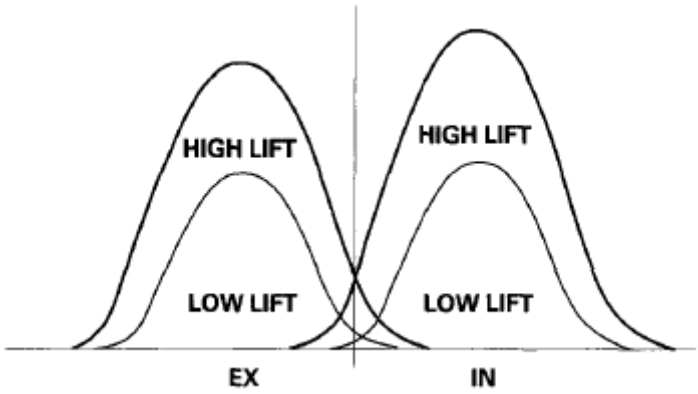

Fig. 73: Identifying VTEC System (J37A4 Engine) Cam Profile
Courtesy of AMERICAN HONDA MOTOR CO., INC.

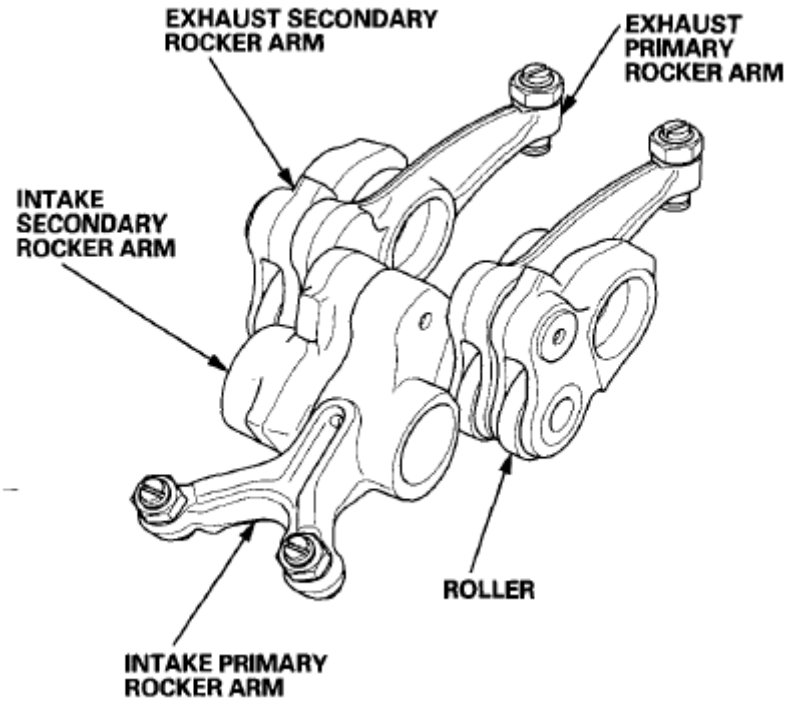

Fig. 74: Identifying Roller Rockers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- The VTEC system oil pressure switched by the rocker arm oil control valve changing the hydraulic circuit. The rocker arm oil control valve is controlled by the rocker arm oil control solenoid. The rocker arm oil pressure switch detects VTEC system oil pressure and sends this information to the ECM/PCM.

ENGINE SPEED	ROCKER ARM OIL CONTROL SOLENOID	INTAKE and EXHAUST VALVE LIFT
LOW	OFF	LOW
HIGH	ON	HIGH

VTEC SYSTEM OPERATION (J37A4 ENGINE)

At low engine speed

The rocker arm oil control solenoid is turned off by the ECM/PCM. Oil pressure from the rocker arm oil control valve does not enter the rocker shaft. The primary and secondary rocker arms are separated by a return spring and lifted by the tow lift cam lobe.

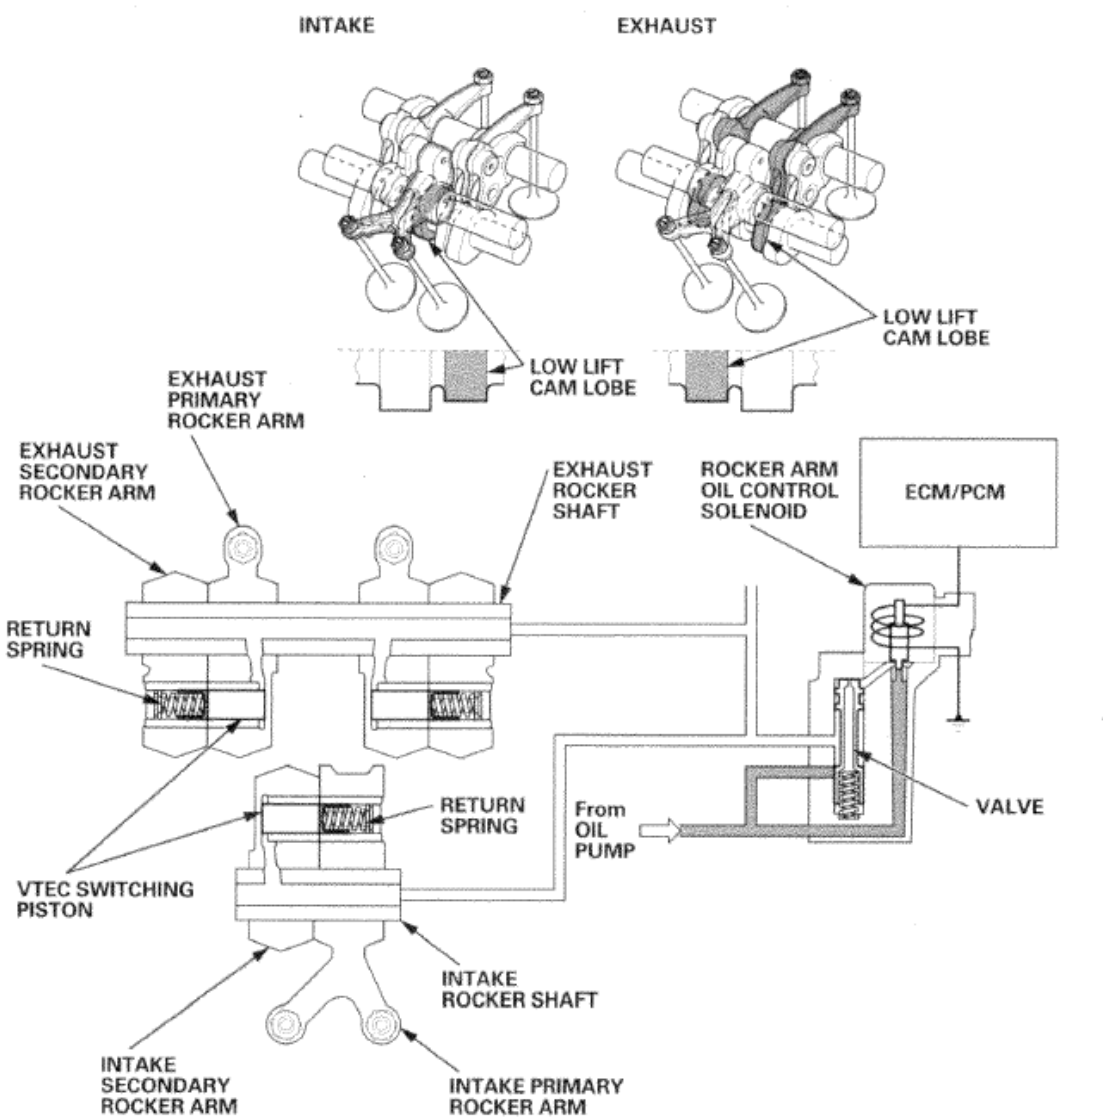

Fig. 75: Identifying VTEC System Operation (J37A4 Engine) At Low Engine Speed
Courtesy of AMERICAN HONDA MOTOR CO., INC.

VTEC SYSTEM OPERATION (J37A4 ENGINE)

At high engine speed

The rocker arm oil control solenoid is turned on by the ECM/PCM. Oil pressure from the rocker arm control

solenoid enters into the intake secondary rocker arm and the exhaust primary rocker arm via the rocker shaft, and it moves the VTEC switching piston into the intake secondary rocker arm and the exhaust primary rocker arm. This causes the VTEC switching pistons to lock both rocker arms (primary and secondary) together. Both rocker arms are then lifted by the high lift cam lobe.

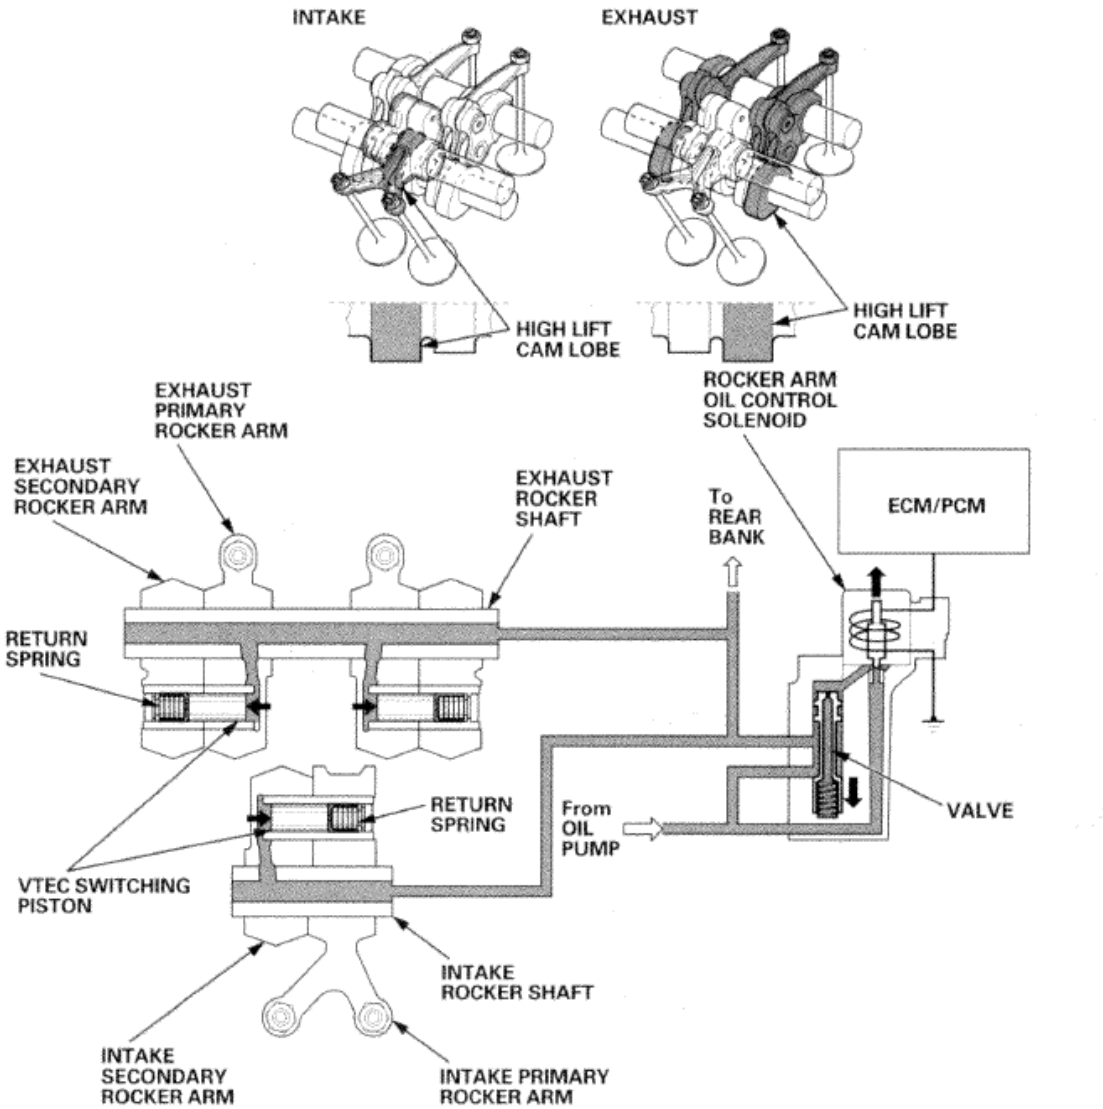

Fig. 76: Identifying VTEC System Operation (J37A4 Engine) At High Engine Speed
Courtesy of AMERICAN HONDA MOTOR CO., INC.

IDLE CONTROL SYSTEM

When the engine is cold, if the A/C compressor is on, the transmission is in gear, the brake pedal is pressed, the power steering load is high, or the alternator is charging, the ECM/PCM controls current to the throttle actuator to maintain the correct idle speed.

Brake Pedal Position Switch

The brake pedal position switch signals the ECM/PCM when the brake pedal is pressed.

FUEL SUPPLY SYSTEM

Fuel Cutoff Control

During deceleration with the throttle valve closed, current to the injectors is cut off to improve fuel economy at engine speeds over 850 RPM. Fuel cutoff control also occurs when the engine speed exceeds 6, 900 RPM (J35Z6 engine) or 6, 800 RPM (J37A4 engine), regardless of the position of the throttle valve, to protect the engine from over-revving. When the vehicle is stopped, the PCM cuts the fuel at engine speeds over 4, 000 RPM (M/T) or 5, 000 RPM (A/T). On a cold engine, fuel cut occurs at a lower engine speed.

Fuel Pump Control

When the ignition switch is turned to ON (II) or when the engine start/stop button is in ON mode, the ECM/PCM grounds PGM-FI main relay 2 which feeds current to the fuel pump for 2 seconds to pressurize the fuel system. When the engine starts, the ECM/PCM grounds PGM-FI main relay 2 and feeds current to the fuel pump. When the engine is not running and the ignition is ON (II) or the vehicle in ON mode, the ECM/PCM cuts ground to PGM-FI main relay 2 which cuts current to the fuel pump.

PGM-FI Main Relays 1 and 2

PGM-FI main relay 1 is energized whenever the ignition switch is ON (II) or whenever the vehicle is in ON mode to supply battery voltage to the ECM/PCM, power to the injectors, and power for PGM-FI main relay 2. PGM-FI main relay 2 is energized to supply power to the fuel pump for 2 seconds when the ignition switch is turned to ON (II) or when the engine start/stop button is in the ON mode, and when the engine is cranking or running.

INTAKE AIR SYSTEM

Intake Manifold Tuning (IMT) Valve

Engine power is adjusted by opening and closing the intake manifold tuning (IMT) valve. When the valve is closed, there is high torque at low engine speed. When the valve is open, there is high torque at high engine speed.

The IMT actuator contains a sensor that detects the IMT valve position and sends it to the ECM/PCM.

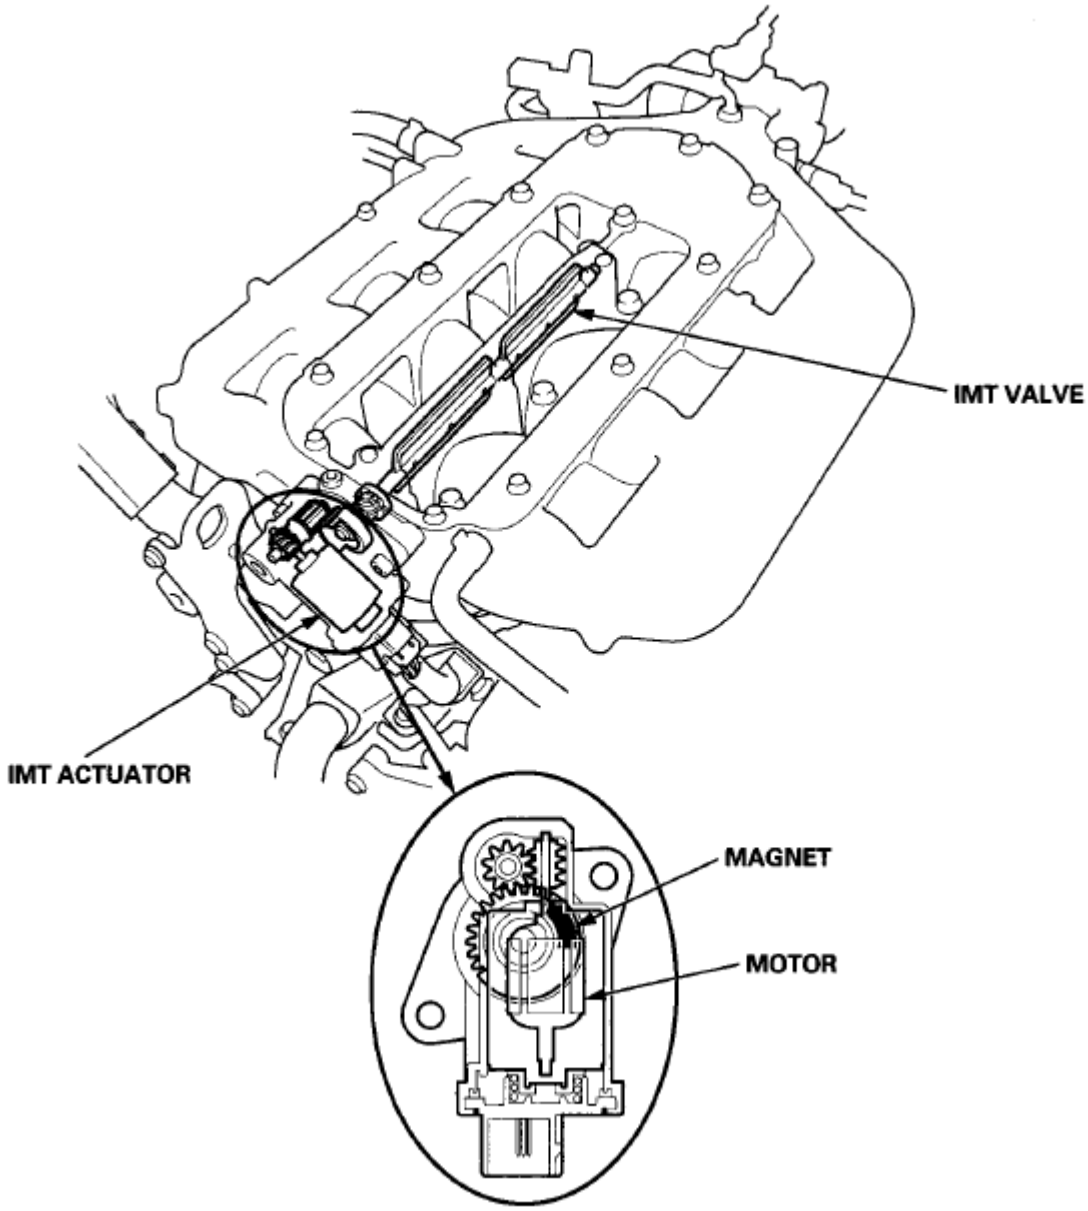

Fig. 77: Identifying Intake Air System And Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CATALYTIC CONVERTER SYSTEM

Warm Up Three Way Catalytic Converter (WU-TWC) and Under-floor Three Way Catalytic Converter (Under-floor TWC)

The WU-TWC/Under-floor TWC converts hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx) in the exhaust gas to carbon dioxide (CO_2), nitrogen (N_2), and water vapor.

WU-TWC

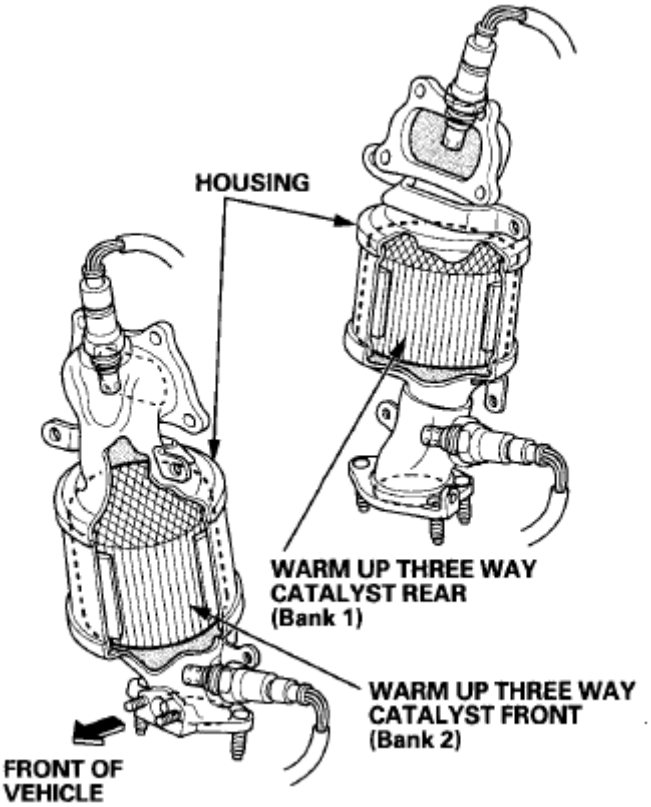

Fig. 78: Identifying Catalytic Converter (WU-TWC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

UNDER-FLOOR TWC

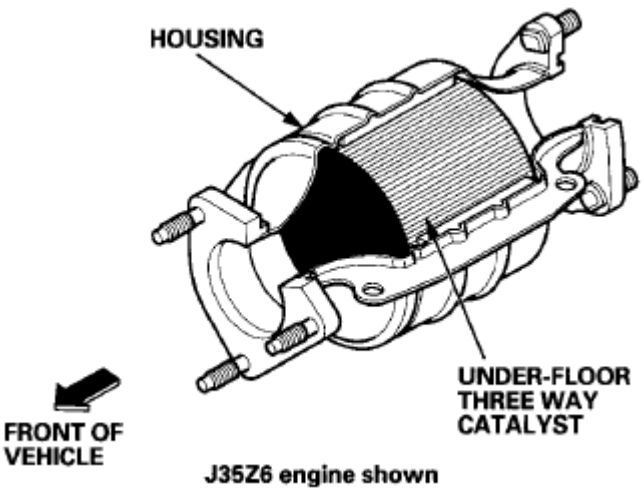

Fig. 79: Identifying Catalytic Converter (Under-Floor TWC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

EXHAUST GAS RECIRCULATION (EGR) SYSTEM

Refer to the system diagram to see a functional layout of the system.

EGR Valve

The EGR valve lowers peak combustion temperatures and reduces oxides of nitrogen emissions (NOx) by recirculating exhaust gas through the intake manifold and into the combustion chambers.

EXHAUST GAS RECIRCULATION (EGR) SYSTEM DIAGRAM

The EGR system reduces oxides of nitrogen (NOx) emissions by recirculating exhaust gas through the EGR pipe to the intake manifold, and into the combustion chambers. Routing the exhaust gas through the EGR pipe helps to prevent carbon deposits from forming in the intake manifold and the throttle body. The ECM/PCM memory includes the ideal EGR valve position for varying operating conditions.

The EGR valve position sensor detects the amount of EGR valve lift and sends it to the ECM/PCM. The ECM/PCM then compares it with the ideal lift in its memory (based on signals sent from other sensors). If there is any difference between the two, the ECM/PCM cuts current to the EGR valve.

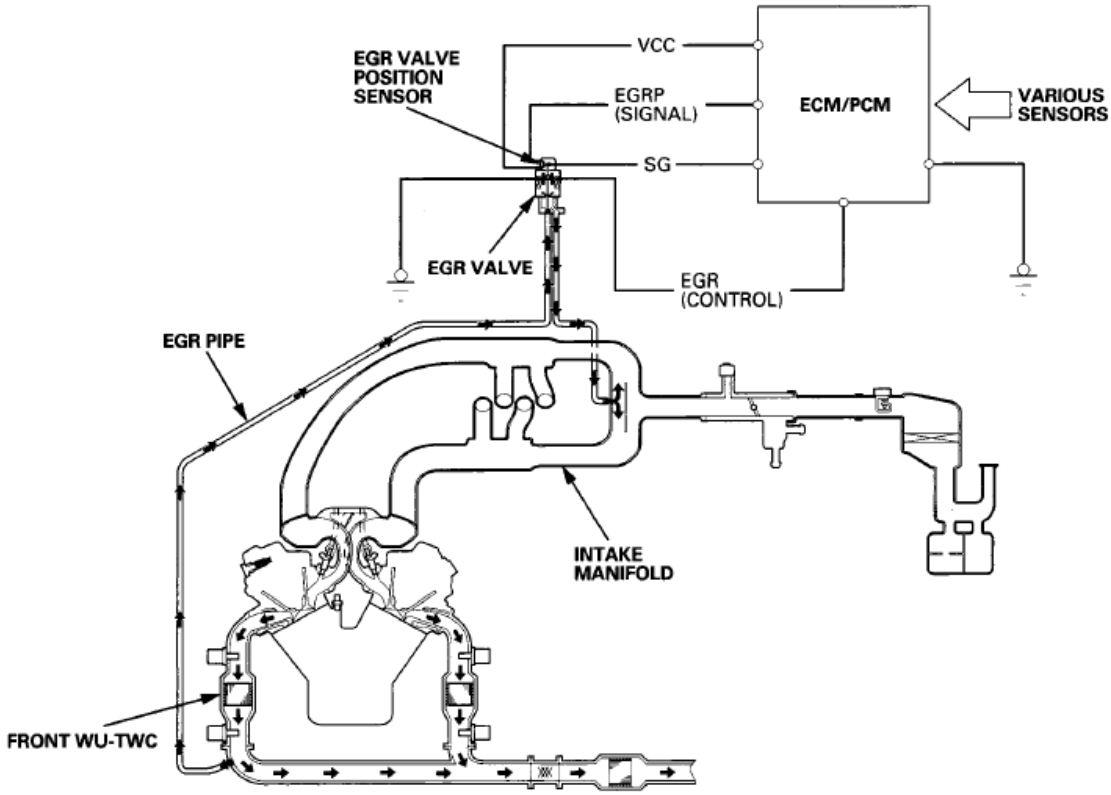

Fig. 80: Exhaust Gas Recirculation (EGR) System - Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM

The PCV valve prevents blow-by gasses from escaping into the atmosphere by venting them into the intake manifold.

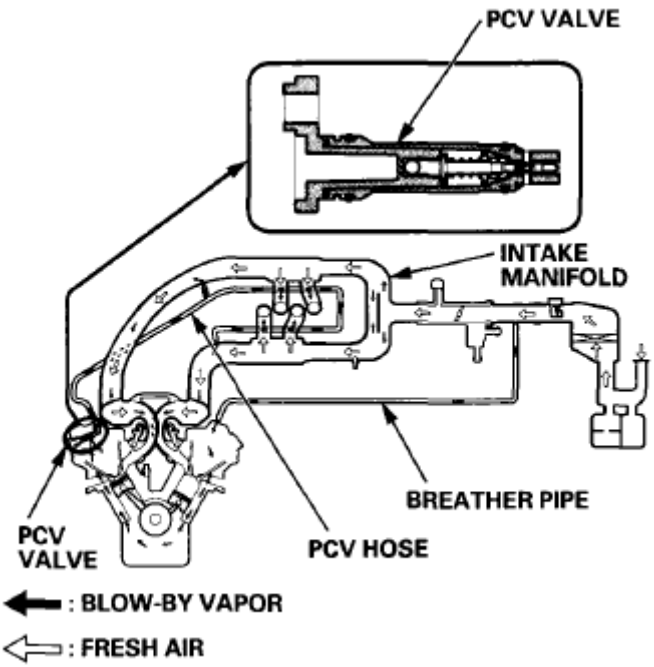

Fig. 81: Identifying Positive Crankcase Ventilation (PCV) System
Courtesy of AMERICAN HONDA MOTOR CO., INC.

EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM

Refer to the system diagram to see a functional layout of the system.

EVAP Canister

The EVAP canister temporarily stores fuel vapor from the fuel tank until it can be purged from the EVAP canister into the engine and burned.

EVAP Canister Purge Valve

When the engine coolant temperature is below 140 °F (60 °C), the ECM/PCM turns off the EVAP canister purge valve which cuts vacuum to the EVAP canister.

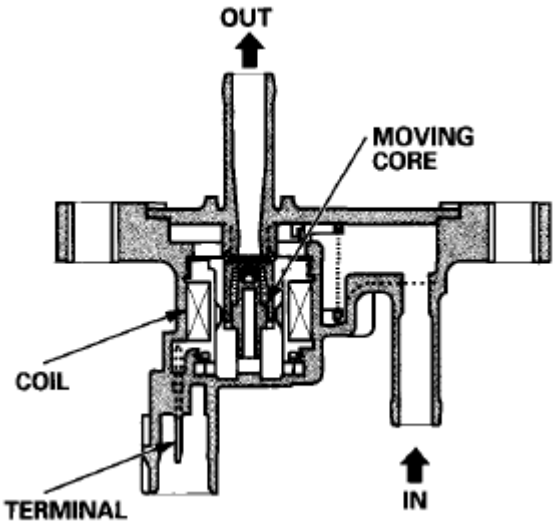

Fig. 82: Identifying EVAP Canister Purge Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Fuel Tank Pressure (FTP) Sensor

The FTP sensor converts fuel tank absolute pressure into an electrical input to the ECM/PCM.

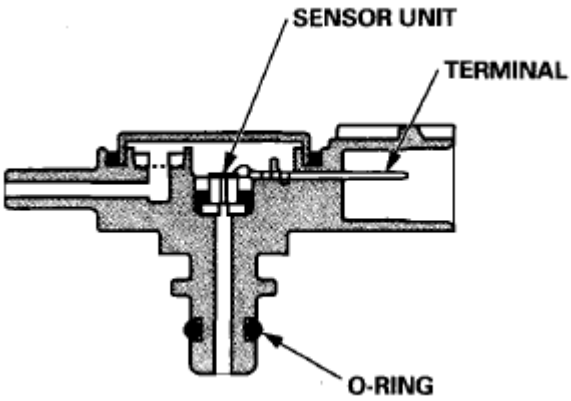

Fig. 83: Identifying Fuel Tank Pressure (FTP) Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

EVAP Canister Vent Shut Valve

The EVAP canister vent shut valve is on the EVAP canister.

The EVAP canister vent shut valve controls the venting of the EVAP canister.

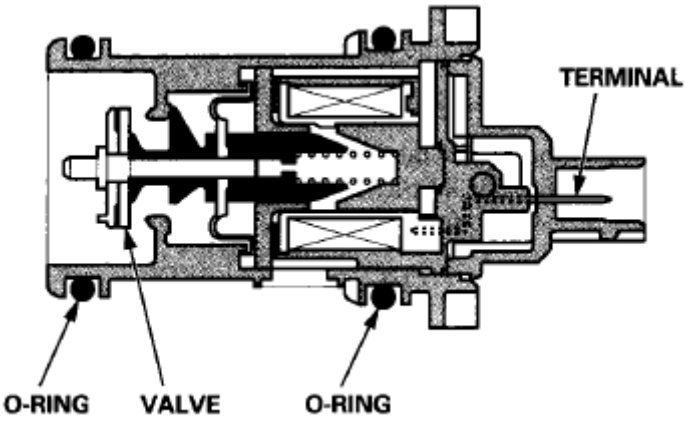

Fig. 84: Identifying EVAP Canister Vent Shut Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

EVAPORATIVE EMISSION (EVAP) CONTROL DIAGRAM

The EVAP controls minimize the amount of fuel vapor escaping to the atmosphere. Vapor from the fuel tank is temporarily stored in the EVAP canister until it can be purged from the canister into the engine and burned.

- The EVAP canister is purged by drawing fresh air through it and into a port on the intake manifold.
- The purging vacuum is controlled by the EVAP canister purge valve, which operates whenever the engine coolant temperature is above 140 °F (60 °C).
- During refueling, the fuel tank vapor control valve opens from pressure in the fuel tank and feeds the fuel vapor to the EVAP canister.

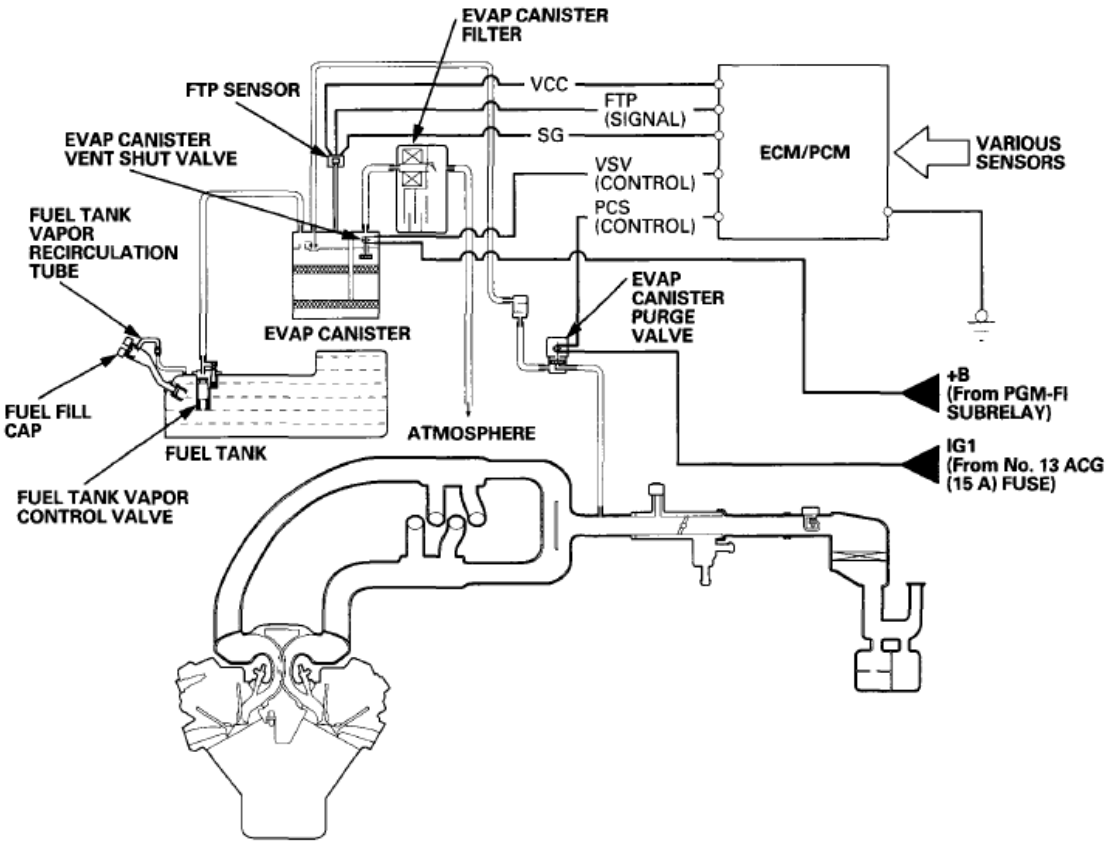

Fig. 85: Evaporative Emission (EVAP) Control - Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

FUEL CAP WARNING MESSAGE

The ECM/PCM detects a loose or missing fuel fill cap as an evaporative system leak and alerts the driver by showing a warning message in the gauge display.

The first time a leak is detected a TIGHTEN FUEL CAP message appears on the gauge display (A). To scroll to another message, press the select/reset button. The "TIGHTEN FUEL CAP" message appears each time you restart the engine until the system turns the message off. Turn the engine off, then replace or tighten the fuel fill cap until it clicks at least once.

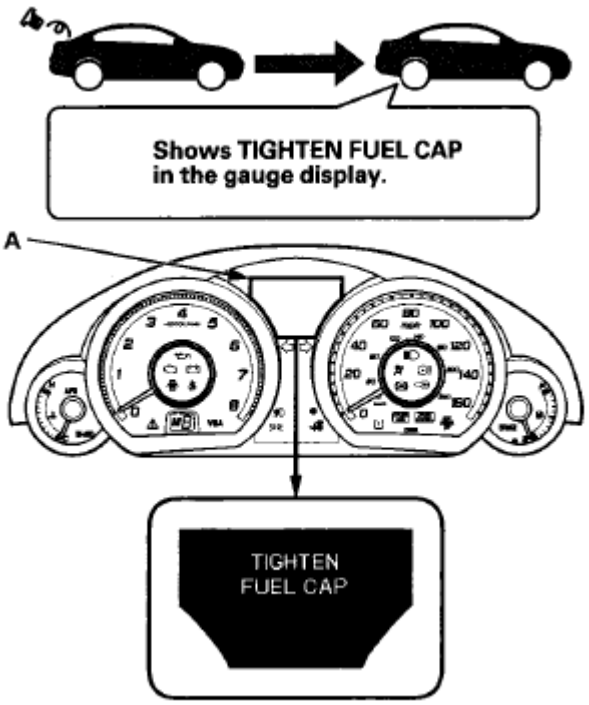

Fig. 86: Display - Fuel Cap Warning Message
Courtesy of AMERICAN HONDA MOTOR CO., INC.

HOW TO CLEAR THE MESSAGE WITH THE HDS

Procedure

1. Tighten the fuel fill cap until it clicks.
2. Clear the Pending DTC with the HDS.
3. Verify there is no leak by doing the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

HOW TO CLEAR THE MESSAGE WITHOUT THE HDS

Procedure

1. Tighten the fuel fill cap until it clicks.
2. Start the engine, then turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
3. Repeat step 2 two more times.

HOW TO SET READINESS CODES

MALFUNCTION INDICATOR LAMP (MIL) INDICATION (IN RELATION TO READINESS CODES)

The vehicle has certain readiness codes that are part of the on-board diagnostics for the emissions systems. If the vehicle's battery has been disconnected or gone dead, if DTCs have been cleared, or if the ECM/PCM has been reset, these readiness codes are reset to incomplete. In some states, part of the emissions testing is to make sure these codes are set to complete. If all of them are not set to complete, the vehicle may fail the emission test, or the test cannot be finished.

To check if the readiness codes are set to complete, turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, but do not start the engine. The MIL comes on for 15- 20 seconds. If it then goes off, the readiness codes are set to complete. If it flashes five times, one or more readiness codes are not set to complete. To set readiness codes from incomplete to complete, do the procedure for the appropriate code.

To check the status of a specific DTC system, check the **OBD status** in the DTC MENU with the HDS. This screen displays the DTC, the current data list of the enable criteria, and the status of the readiness testing.

CATALYTIC CONVERTER MONITOR AND READINESS CODE

NOTE:

- **During the procedure, do not turn the ignition switch to ACC (I) or LOCK (0), or select the ACC or the OFF mode.**
- **All readiness codes are cleared when the battery is disconnected, if DTCs have been cleared, or if the ECM/PCM is reset with the HDS.**
- **Low ambient temperatures or excessive stop-and-go traffic may increase the drive time needed to switch the readiness code from incomplete to complete.**
- **The readiness code will not switch to complete until all the enable criteria are met.**
- **If a fault in the secondary HO2S system caused the MIL to come on, the readiness code cannot be set to complete until you correct the fault.**

Enable Criteria

- ECT SENSOR 1 at 158 °F (70 °C) or more.
- IAT SENSOR at 20 °F (-7 °C) or more.
- Vehicle speed above 25 mph (40 km/h).

Procedure

1. Connect the HDS to the vehicle's data link connector (DLC), and bring up the READINESS CODEs screen for Catalyst in the DTCs MENU.
2. Start the engine.
3. Test-drive the vehicle under stop-and-go conditions with short periods of steady cruise. After about 5 miles (8 km), the readiness code should switch to complete.
4. If the readiness code is still not set to complete, check for a Pending DTC with the HDS. If there is no DTC, one or more of the enable criteria were probably not met; repeat the procedure.

EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM MONITOR AND READINESS CODE

NOTE: All readiness codes are cleared when the battery is disconnected, if DTCs have been cleared, or if the ECM/PCM is reset with the HDS.

ENABLE CRITERIA

- Battery voltage is more than 10.5 V.
- Engine at idle.
- ECT SENSOR 1 and 2 between 176 °F (80 °C) and 212°F (100°C).
- MAP SENSOR less than 46.6 kPa (14 inHg, 350 mmHg).
- Vehicle speed 0 mph (0 km/h).
- IAT SENSOR between 32 °F (0 °C) and 212 °F (100 °C).

Procedure

1. Connect the HDS to the DLC.
2. Start the engine.
3. Select the EVAP TEST in the INSPECTION MENU with the HDS, then select the FUNCTION TEST in the EVAP TEST MENU.
    - If the result is normal, readiness is complete.
    - If the result is not normal, go to the next step.
4. Check for a Pending DTC. If there is no DTC, one or more of the enable criteria were probably not met; repeat the procedure.

AIR FUEL RATIO (A/F) SENSOR MONITOR AND READINESS CODE

NOTE:

- **During the procedure, do not turn the ignition switch to ACC (I) or LOCK (0), or select the ACC or the OFF mode.**
- **All readiness codes are cleared when the battery is disconnected, if DTCs have been cleared, or if the ECM/PCM is reset with the HDS.**

Enable Criteria

ECT SENSOR 1 at 140 °F (60 °C) or more.

Procedure

1. Start the engine.
2. Test-drive the vehicle under stop-and-go conditions with short periods of steady cruise. During the drive, decelerate (with the throttle fully closed) for 5 seconds. After about 3.5 miles (5.6 km), the readiness code should switch from incomplete to complete.
3. Check the readiness codes screen for the AIR FUEL RATIO (A/F) SENSOR in the DTCs MENU with

the HDS.

- If the screen shows complete, readiness is complete.
- If the screen shows not complete, go to the next step.

4. Check for a Pending DTC. If there is no DTC, the enable criteria was probably not met. Select the DATA LIST Menu. Check the ECT SENSOR 1 in the ALL DATA LIST with the HDS. If the ECT SENSOR 1 is less than 140 °F (60 °C), run the engine until it is more than 140 °F (60 °C), then repeat the procedure.

AIR FUEL RATIO (A/F) SENSOR HEATER MONITOR READINESS CODE

NOTE: All readiness codes are cleared when the battery is disconnected, if DTCs have been cleared, or if the ECM/PCM is reset with the HDS.

Procedure

1. Start the engine, and let it idle for 1 minute. The readiness code should switch from incomplete to complete.
2. If the readiness code is still not set to complete, check for a Pending DTC. If there is no DTC, repeat the procedure.

MISFIRE MONITOR AND READINESS CODE

- This readiness code is always set to available because misfiring is continuously monitored.
- Monitoring pauses, and the misfire counter resets, if the vehicle is driven over a rough road.
- Monitoring also pauses, and the misfire counter holds at its current value, if the throttle position changes more than a predetermined value, or if driving conditions fall outside the range of any related enable criteria.

FUEL SYSTEM MONITOR AND READINESS CODE

- This readiness code is always set to available because the fuel system is continuously monitored during closed loop operation.
- Monitoring pauses when the catalytic converter, the EVAP control system, and the A/F sensor monitors are active.
- Monitoring also pauses when any related enable criteria are not being met. Monitoring resumes when the enable criteria is again being met.

COMPREHENSIVE COMPONENT MONITOR AND READINESS CODE

This readiness code is always set to available because the comprehensive component monitor is continuously running whenever the engine is cranking or running.

EGR MONITOR AND READINESS CODE

NOTE:

- **During the procedure, do not turn the ignition switch to ACC (I) or LOCK**

(0), or select the ACC or the OFF mode.

- **All readiness codes are cleared when the battery is disconnected, if DTCs have been cleared, or if the ECM/PCM is reset with the HDS.**

Enable Criteria

ECT SENSOR 1 at 176 °F (80 °C) or more.

Procedure

1. Connect the HDS to the DLC.
2. Start the engine.
3. Drive at a steady speed with the A/T in D, or M/T in 4th at 50- 62 mph (80- 100 km/h) or above for more than 10 seconds.
4. With the A/T in D or M/T in 4th, decelerate from 62 mph (100 km/h) or above by completely releasing the throttle for at least 5 seconds. If the engine is stopped during this procedure, go to step 3 and do the procedure again.
5. Check the OBD status screen for DTC P0401 in the DTCs MENU with the HDS.
    - If it is passed, readiness is complete.
    - If it is not passed, go to step 3 and retest.

2012 ENGINE PERFORMANCE

Fuel Supply System - TL

COMPONENT LOCATION INDEX

WITHOUT SH-AWD

DTC TROUBLESHOOTING

DTC P0461: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**

- **Because it requires 162 miles (260 km) of driving without refueling to complete this diagnosis, this DTC P0461 cannot be duplicated during this troubleshooting.**

1. Test the fuel gauge sending unit; **without SH-AWD**, or **with SH-AWD**.

   Is the fuel gauge sending unit OK?

   YES - Check for poor connections or loose terminals at the fuel gauge sending unit, the secondary fuel gauge sending unit (with SH-AWD), and the gauge control module. •

   NO - Replace the **fuel gauge sending unit** and the secondary fuel gauge sending unit (**with SH-AWD**), then go to step 2.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Reset the ECM/PCM with the HDS.
4. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
5. Check for Pending or Confirmed DTCs with the HDS.

   Are any Pending or Confirmed DTCs indicated?

   YES - Go to the indicated DTC's troubleshooting.

   NO - Troubleshooting is complete. •

DTC P0462: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT LOW VOLTAGE (WITHOUT SH-AWD)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS, and wait 5 seconds.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0462 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module and the fuel gauge sending unit. •

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).

6. Remove the access **panel from the floor**.
7. Disconnect the fuel tank unit 4P connector.
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Clear the DTC with the HDS, and wait 5 seconds.
10. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0463 indicated?

    YES - Replace the **fuel gauge sending unit**, then go to step 23.

    NO - Go to step 11.

11. Measure the voltage between fuel tank unit 4P connector terminal No. 1 and body ground.

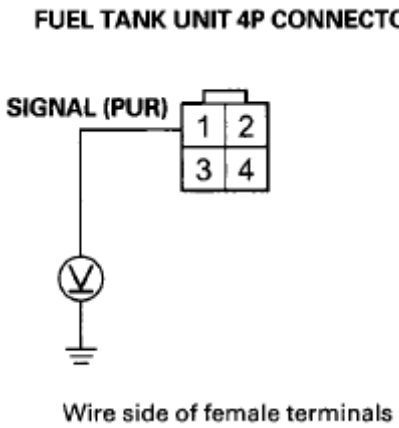

Fig. 4: Measuring Voltage Between Fuel Tank Unit 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 16.

NO - Go to step 12.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Remove the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).
14. Disconnect the gauge control module 32P connector.
15. Check for continuity between fuel tank unit 4P connector terminal No. 1 and body ground.

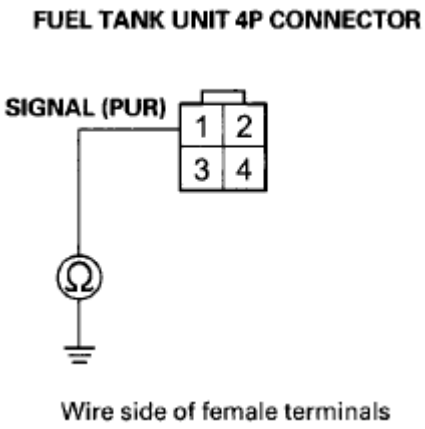

Fig. 5: Checking For Continuity Between Fuel Tank Unit 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the gauge control module (signal line) and the fuel gauge sending unit, then go to step 24.

NO - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), then go to step 24.

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Remove the **fuel tank unit**.
18. Connect the fuel tank unit 4P connector.
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Clear the DTC with the HDS.
21. Set the float (A) to the E position.

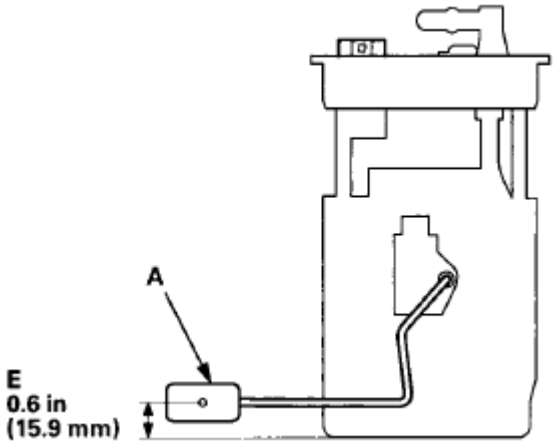

Fig. 6: Identifying Float To E Position

Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Check the fuel gauge.

    Does the fuel gauge move to the empty position?

    YES - Go to step 30.

    NO - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), then go to step 23.

23. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
24. Reinstall all removed parts in the reverse order of removal.
25. Reconnect all connectors.
26. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
27. Reset the PCM with the HDS.
28. Do the PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
29. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0462 indicated?

    YES - Check for poor connections or loose terminals at the fuel gauge sending unit and the gauge control module, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

30. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
31. Reinstall all removed parts in the reverse order of removal.
32. Reconnect all connectors.
33. Update the PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**).
34. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0462 indicated?

    YES - Check for poor connections or loose terminals at the fuel gauge sending unit and the gauge control module. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the PCM was substituted, go to step 1.

    NO - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0462: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT LOW VOLTAGE

(WITH SH-AWD)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS, and wait 5 seconds.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0462 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module, the fuel gauge sending unit, and the secondary fuel gauge sending unit. •

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
6. Remove the access panel from the **right side of the floor**.
7. Disconnect the secondary fuel gauge sending unit 4P connector.
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Clear the DTC with the HDS, and wait 5 seconds.
10. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0463 indicated?

    YES - Check the **secondary fuel gauge sending unit**, then go to step 30.

    NO - Go to step 11.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Remove the access panel from the left **side of the floor**.
13. Disconnect the fuel tank unit 4P connector.
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Clear the DTC with the HDS, and wait 5 seconds.
16. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0463 indicated?

    YES - Go to step 20.

    NO - Go to step 17.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Remove the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), then disconnect the gauge control module 32P connector.
19. Check for continuity between fuel tank unit 4P connector terminal No. 1 and body ground.

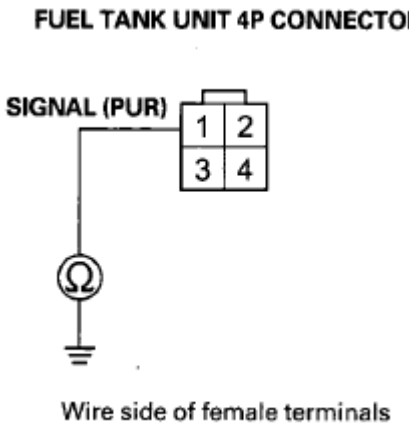

Fig. 7: Checking Continuity Between Fuel Tank Unit 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the gauge control module (signal line) and the fuel gauge sending unit, then go to step 30.

NO - Go to step 22.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Check for continuity between fuel tank unit 4P connector terminal No. 3 and body ground.

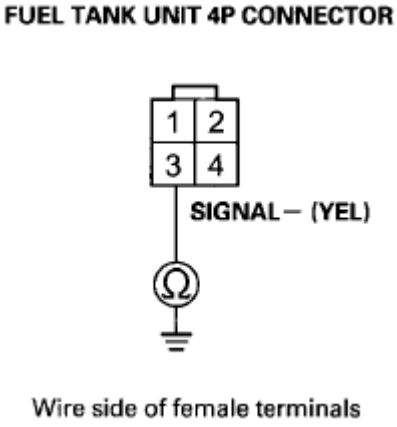

Fig. 8: Checking Continuity Between Fuel Tank Unit 4P Connector Terminal No. 3 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the fuel gauge sending unit and the secondary fuel gauge sending unit, then go to step 30.

NO - Check the fuel **gauge sending unit**.

22. Reconnect the gauge control module 32P connector.
23. Remove the **fuel tank unit** and the **secondary fuel gauge sending unit**.
24. Connect the fuel tank unit and the secondary fuel gauge sending unit 4P connectors.
25. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
26. Clear the DTC with the HDS.
27. Set the floats (A) to the E position.

Fuel gauge sending unit

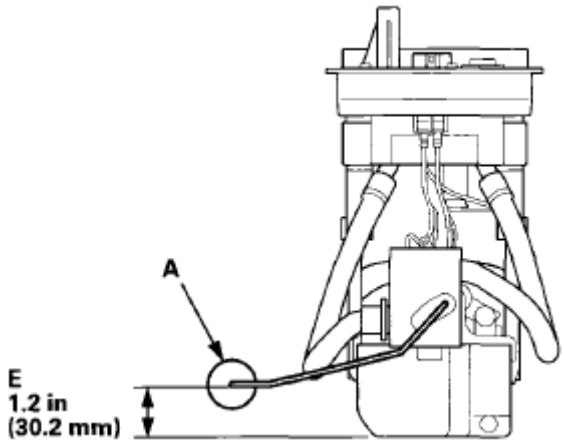

Fig. 9: Identifying Fuel Gauge Sending Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Secondary fuel gauge sending unit

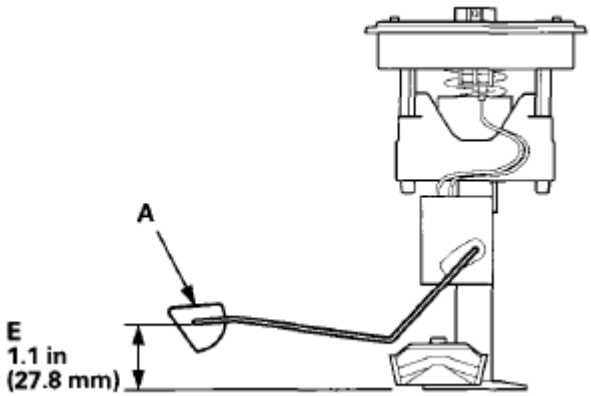

Fig. 10: Identifying Secondary Fuel Gauge Sending Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Check the fuel gauge.

    Does the gauge move to the empty position?

    YES - Go to step 36.

    NO - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), then go to step 29.

29. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
30. Reinstall all removed parts in the reverse order of removal.
31. Reconnect all connectors.
32. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
33. Reset the ECM/PCM with the HDS.
34. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
35. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0462 indicated?

    YES - Check for poor connections or loose terminals at the gauge control module, the fuel gauge sending unit, and the secondary fuel gauge sending unit, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

36. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
37. Reinstall all removed parts in the reverse order of removal.
38. Reconnect all connectors.
39. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).

40. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0462 indicated?

    YES - Check for poor connections or loose terminals at the gauge control module, the fuel gauge sending unit, and the secondary fuel gauge sending unit. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0463: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT HIGH VOLTAGE (WITHOUT SH-AWD)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS, and wait 5 seconds.
3. Check for Pending or Confirmed DTCs in the DTCs MENU with the HDS.

    Is DTC P0463 indicated?

    YES - Go to step 4.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module and the fuel gauge sending unit. •

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
6. Remove the access **panel from the floor**.
7. Disconnect the fuel tank unit 4P connector.
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Measure the voltage between fuel tank unit 4P connector terminals No. 1 and No. 3.

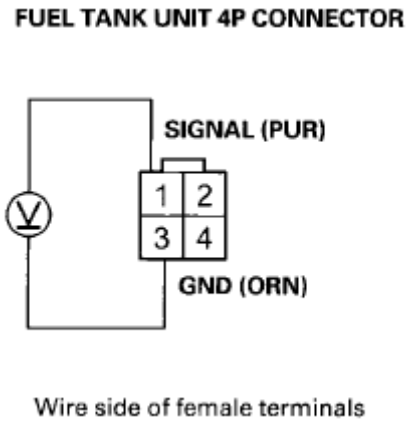

Fig. 11: Measuring Voltage Between Fuel Tank Unit 4P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 17.

NO - Go to step 10.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Connect fuel tank unit 4P connector terminal No. 3 to body ground with a jumper wire.

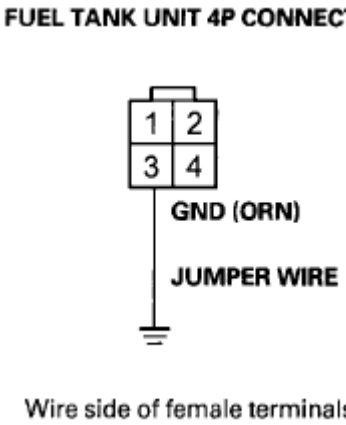

Fig. 12: Connecting Fuel Tank Unit 4P Connector Terminal No. 3 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).
13. Disconnect the gauge control module 32P connector.
14. Check for continuity between gauge control module 32P connector terminal No. 2 and body ground.

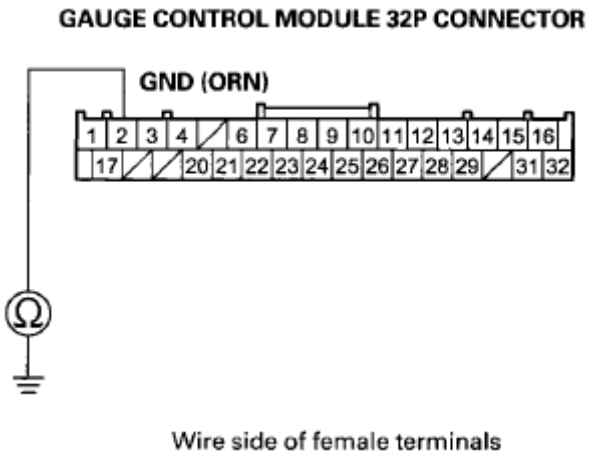

Fig. 13: Checking Continuity Between Gauge Control Module 32P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 15.

NO - Repair open in the wire between the gauge control module (GND line) and the fuel gauge sending unit, then go to step 27.

15. Connect fuel tank unit 4P connector terminal No. 1 to body ground with a jumper wire.

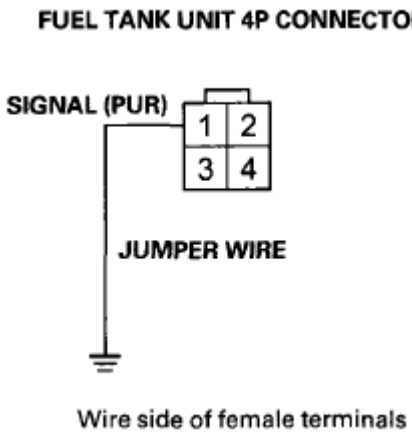

Fig. 14: Connecting Fuel Tank Unit 4P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Check for continuity between gauge control module 32P connector terminal No. 4 and body ground.

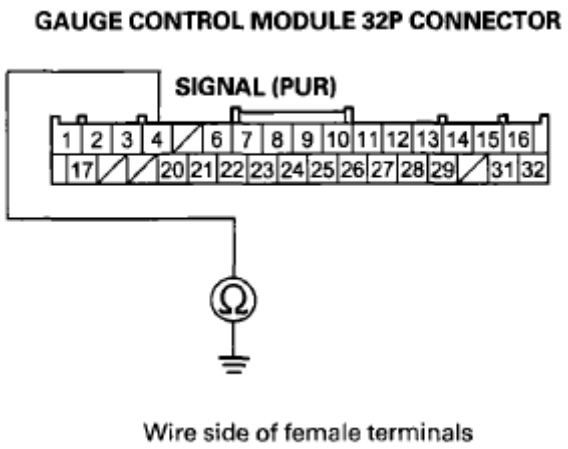

Fig. 15: Checking Continuity Between Gauge Control Module 32P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), then go to step 27.

NO - Repair open in the wire between the gauge control module (signal line) and the fuel gauge sending unit, then go to step 27.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Remove the **fuel tank unit**.
19. Test the fuel **gauge sending unit**.

Is the fuel gauge sending unit OK?

YES - Go to step 20.

NO - Replace the **fuel gauge sending unit**, then go to step 26.

20. Connect the fuel tank unit 4P connector.
21. Reconnect the gauge control module 32P connector.
22. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
23. Clear the DTC with the HDS.
24. Set the float (A) to the F position.

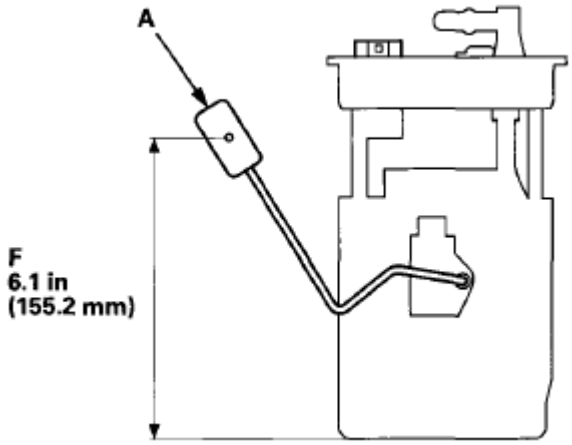

Fig. 16: Identifying Float To F Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Check the fuel gauge.

    Does the gauge move to the full position?

    YES - Go to step 33.

    NO - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), then go to step 26.

26. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
27. Reinstall all removed parts in the reverse order of removal.
28. Reconnect ail connectors.
29. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
30. Reset the PCM with the HDS.
31. Do the PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
32. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0463 indicated?

    YES - Check for poor connections or loose terminals at the gauge control module and fuel gauge sending unit, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

33. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
34. Reinstall all parts removed in the reverse order of removal.
35. Reconnect all connectors.
36. Update the PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a

known-good PCM (see **SUBSTITUTING THE ECM/PCM**).

37. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0463 indicated?

    YES - Check for poor connections or loose terminals at the gauge control module and the fuel gauge sending unit. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the PCM was substituted, go to step 1.

    NO - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0463: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT HIGH VOLTAGE (WITH SH-AWD)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS, and wait 5 seconds.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0463 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module, the fuel gauge sending unit, and the secondary fuel gauge sending unit. •

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
6. Remove the access panel from the left **side of the floor**.
7. Disconnect the fuel tank unit 4P connector.
8. Remove the access panel from the **right side of the floor**.
9. Disconnect the secondary fuel gauge sending unit 4P connector.
10. Check for continuity between fuel tank unit 4P connector terminal No. 3 and secondary fuel gauge sending unit 4P connector terminal No. 1.

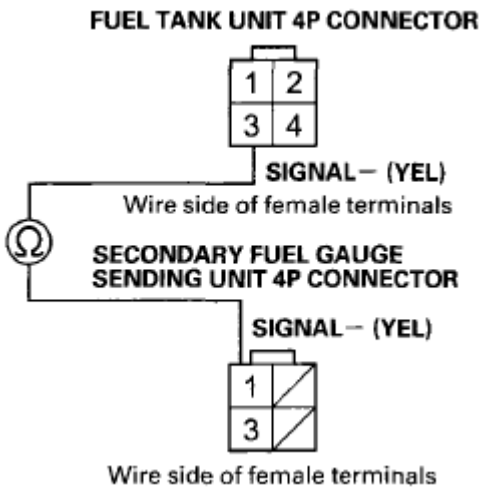

Fig. 17: Checking Continuity Between Fuel Tank Unit 4P Connector Terminal No. 3 And Secondary Fuel Gauge Sending Unit 4P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between the fuel gauge sending unit and the secondary fuel gauge sending unit, then go to step 26.

11. Remove the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), then disconnect the gauge control module 32P connector.
12. Connect secondary fuel gauge sending unit 4P connector terminal No. 3 to body ground with a jumper wire.

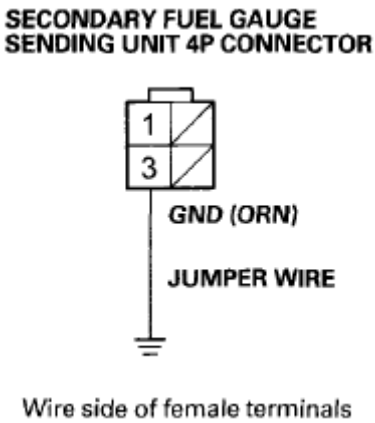

Fig. 18: Connecting Secondary Fuel Gauge Sending Unit 4P Connector Terminal No. 3 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check for continuity between gauge control module 32P connector terminal No. 2 and body ground.

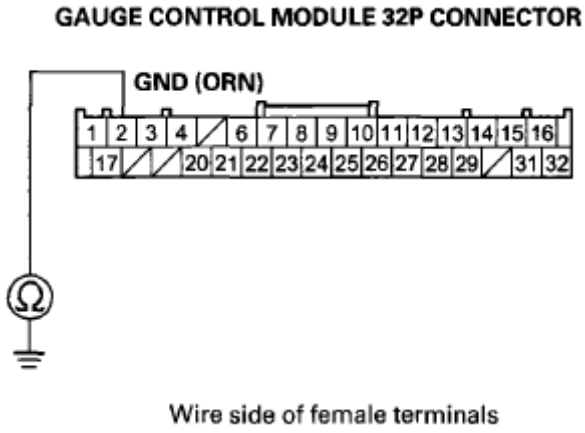

Fig. 19: Checking Continuity Between Gauge Control Module 32P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 14.

NO - Repair open in the wire between the gauge control module and the secondary fuel gauge sending unit, then go to step 26.

14. Connect fuel tank unit 4P connector terminal No. 1 to body ground with a jumper wire.

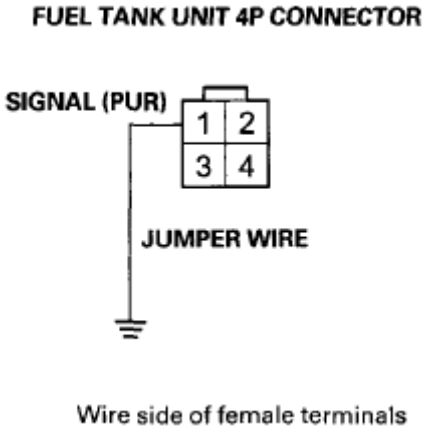

Fig. 20: Connect Fuel Tank Unit 4P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Check for continuity between gauge control module 32P connector terminal No. 4 and body ground.

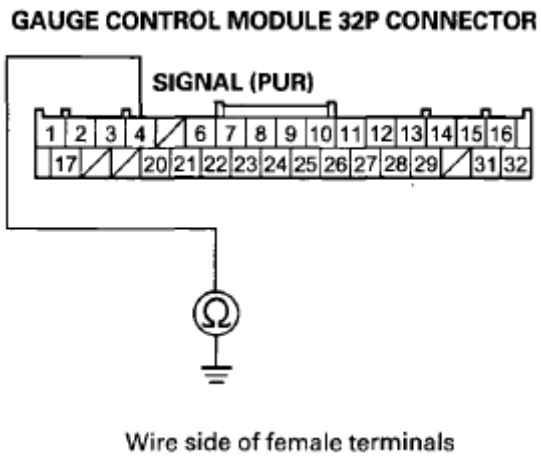

Fig. 21: Checking Continuity Between Gauge Control Module 32P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 16.

NO - Repair open in the wire between the gauge control module and the fuel gauge sending unit, then go to step 26.

16. Disconnect the jumper wire from the fuel gauge sending unit 4P connector.
17. Remove the **fuel tank unit**.
18. Test the **fuel gauge sending unit**.

Is the fuel gauge sending unit OK?

YES - Go to step 19.

NO - Replace the **fuel gauge sending unit**, then go to step 26.

19. Remove the **secondary fuel gauge sending unit**.
20. Test the **secondary fuel gauge sending unit**.

Is the secondary fuel gauge sending unit OK?

YES - Go to step 21.

NO - Replace the **secondary fuel gauge sending unit**, then go to step 26.

21. Reconnect the fuel tank unit 4P connector, the secondary fuel gauge sending unit 4P connector, and the gauge control module 32P connector.
22. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

23. Set the floats (A) to the F position.

Fuel gauge sending unit

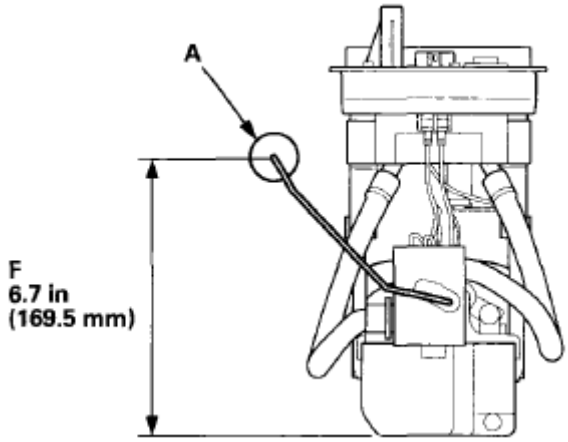

Fig. 22: Identifying Float Of Fuel Gauge Sending Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Secondary fuel gauge sending unit

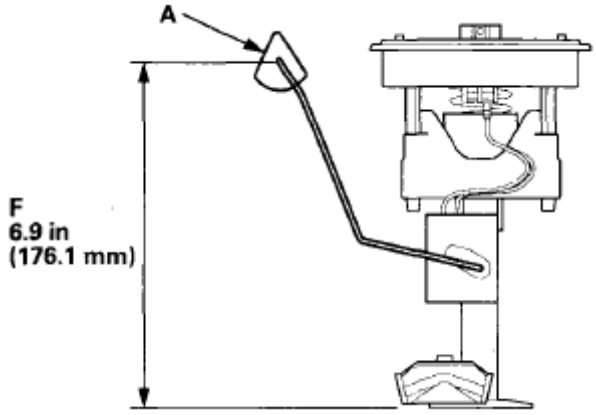

Fig. 23: Identifying Float Of Secondary Fuel Gauge Sending Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Check the fuel gauge.

Does the gauge move to the full position?

YES - Go to step 32.

NO - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), then go to step 25.

25. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
26. Reinstall all removed parts in the reverse order of removal.
27. Reconnect all connectors.
28. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
29. Reset the ECM/PCM with the HDS.
30. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
31. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0463 indicated?

    YES - Check for poor connections or loose terminals at the gauge control module, the fuel gauge sending unit, and the secondary fuel gauge sending unit, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

32. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
33. Reinstall all removed parts in the reverse order of removal.
34. Reconnect all connectors.
35. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
36. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0463 indicated?

    YES - Check for poor connections or loose terminals at the gauge control module, the fuel gauge sending unit, and the secondary fuel gauge sending unit. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

FUEL PUMP CIRCUIT TROUBLESHOOTING

If you suspect a problem with the fuel pump, check that the fuel pump actually runs; when it is on, you will hear some noise if you listen to the fuel fill port with the fuel fill cap removed. The fuel pump should run for 2 seconds when the ignition switch is turned to ON (II), or press the engine start/stop button to select the ON mode. If the fuel pump does not make noise, check as follows:

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).

3. Remove PGM-FI main relay 2 (A) from the driver's under-dash fuse/relay box.

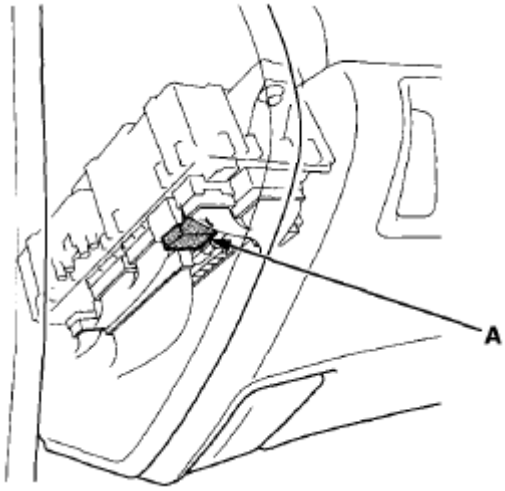

Fig. 24: Identifying PGM-FI Main Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Measure the voltage between PGM-FI main relay 2 4P connector terminal No. 4 and body ground.

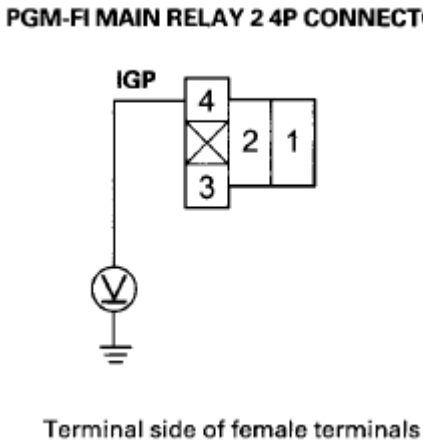

Fig. 25: Measuring Voltage Between PGM-FI Main Relay 2 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 13.

NO - Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

7. Remove PGM-FI main relay 1 (A) and the ETCS control relay (B) from the under-hood fuse/relay box.

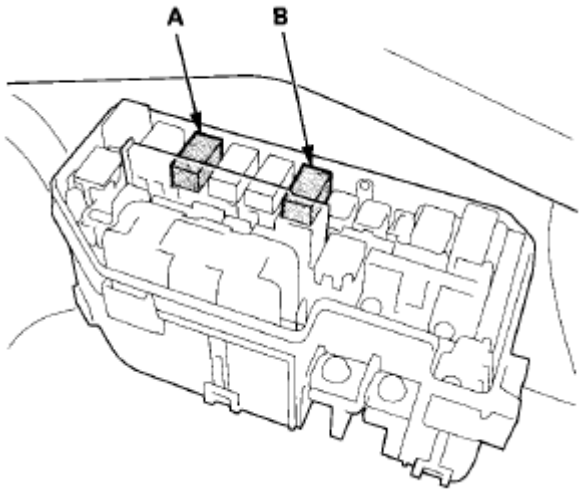

Fig. 26: Identifying PGM-FI Main Relay 1 And ETCS Control Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Jump the SCS line with the HDS.
9. Disconnect the engine wire harness 13P connector (C101).
10. Disconnect driver's under-dash fuse/relay box connector F (33P).
11. Connect PGM-FI main relay 1 4P connector terminal No. 2 to body ground with a jumper wire.

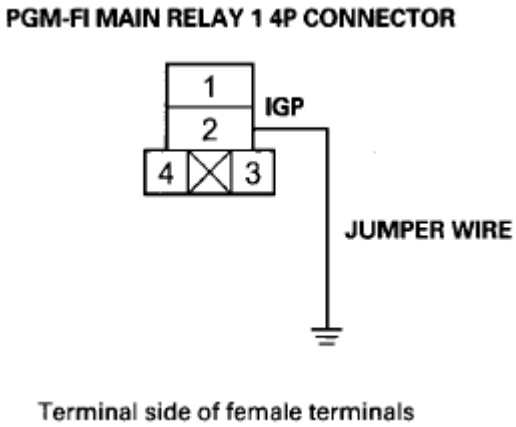

Fig. 27: Connecting PGM-FI Main Relay 1 4P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between driver's under-dash fuse/relay box connector F (33P) terminal No. 31 and body ground.

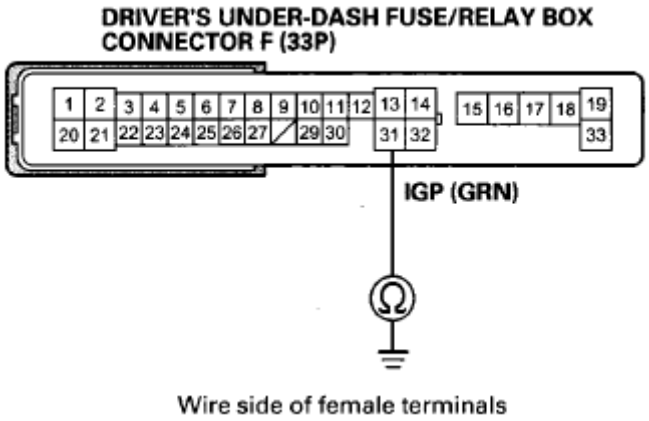

Fig. 28: Checking Continuity Between Driver's Under-Dash Fuse/Relay Box Connector F (33P) Terminal No. 31 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**). •

NO -

- Repair open in the wire between the under-hood fuse/relay box and the driver's under-dash fuse/relay box. •
- If the wire is OK, replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**). •

13. Measure the voltage between PGM-FI main relay 2 4P connector terminal No. 2 and body ground.

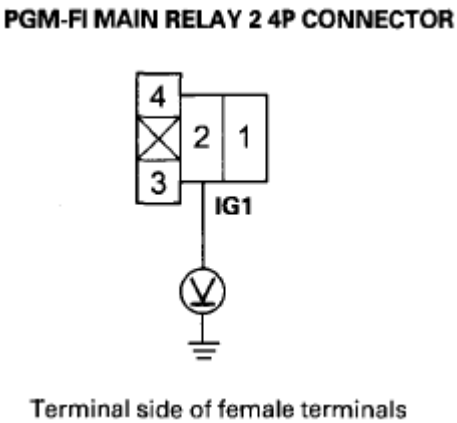

Fig. 29: Measuring Voltage Between PGM-FI Main Relay 2 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 14.

NO -

- Check the No. 9 FUEL PUMP (20 A) fuse in the driver's under-dash fuse/relay box. •
- If the fuse is OK, replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**). •

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Connect PGM-FI main relay 2 4P connector terminal No. 3 to body ground with a jumper wire.

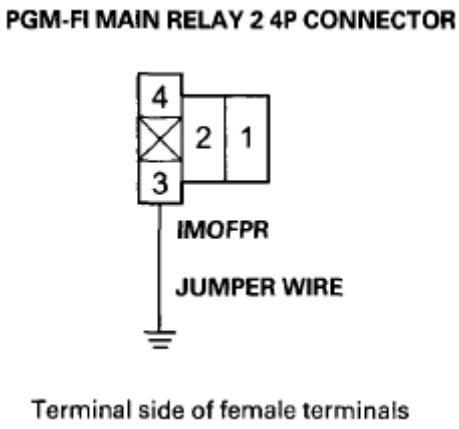

Fig. 30: Connecting PGM-FI Main Relay 2 4P Connector Terminal No. 3 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Jump the SCS line with the HDS.
17. Disconnect ECM/PCM connector A (49P).
18. Check for continuity between ECM/PCM connector terminal A11 and body ground.

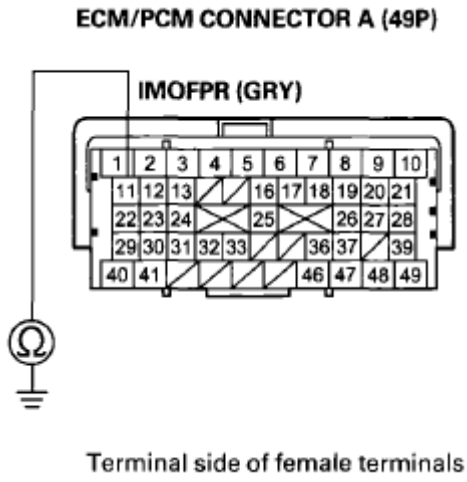

Fig. 31: Checking Continuity Between ECM/PCM Connector Terminal A11 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between PGM-FI main relay 2 and the ECM/PCM (A11). •

19. Reinstall PGM-FI main relay 2.
20. Connect ECM/PCM connector terminal A6 to body ground with a jumper wire.

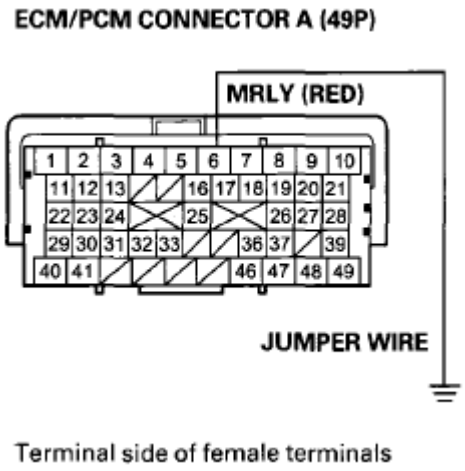

Fig. 32: Connecting ECM/PCM Connector Terminal A6 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Measure the voltage between ECM/PCM connector terminal A11 and body ground.

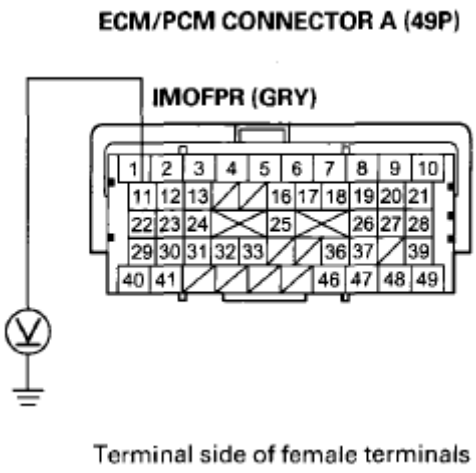

Fig. 33: Measuring Voltage Between ECM/PCM Connector Terminal A11 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 23.

NO - Replace PGM-FI main relay 2. •

23. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
24. Reconnect ECM/PCM connector A (49P).
25. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between driver's under-dash fuse/relay box connector F (33P) terminal No. 22 and body ground within 2 seconds.

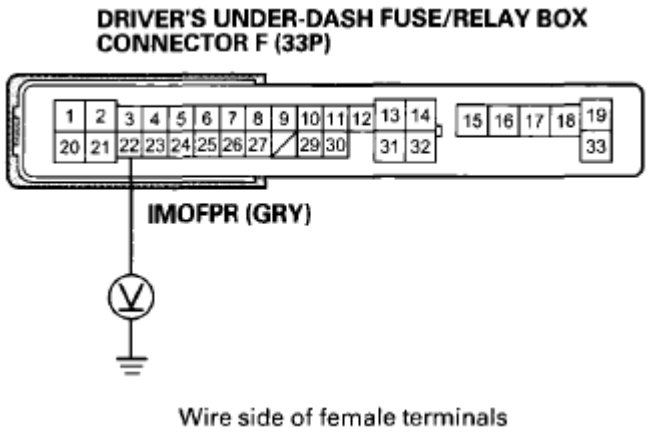

Fig. 34: Measuring Voltage Between Driver's Under-Dash Fuse/Relay Box Connector F (33P) Terminal No. 22 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away and the ECM/PCM was updated, troubleshooting is complete. If the symptom/indication goes away and the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). •

NO - Go to step 26.

26. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between driver's under-dash fuse/relay box connector F (33P) terminal No. 22 and body ground after 2 seconds.

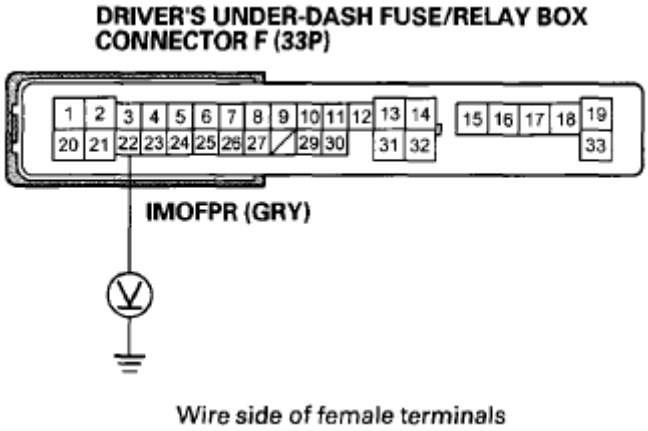

Fig. 35: Measuring Voltage Between Driver's Under-Dash Fuse/Relay Box Connector F (33P) Terminal No. 22 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 27.

NO - Replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

27. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
28. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
29. Remove the access panel from the floor; without SH-AWD (see **Removal (without SH-AWD)**), with SH-AWD (see **Removal (with SH-AWD)**).
30. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between fuel tank unit 4P connector terminal No. 2 and body ground within 2 seconds.

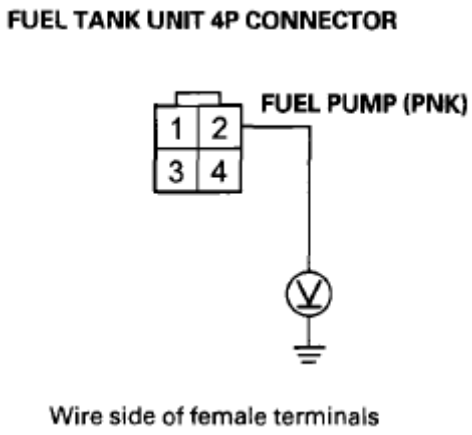

Fig. 36: Measuring Voltage Between Fuel Tank Unit 4P Connector Terminal No. 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 35.

NO - Go to step 31.

31. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
32. Remove PGM-FI main relay 2.
33. Connect PGM-FI main relay 2 4P connector terminals No. 1 and No. 2 with a jumper wire.

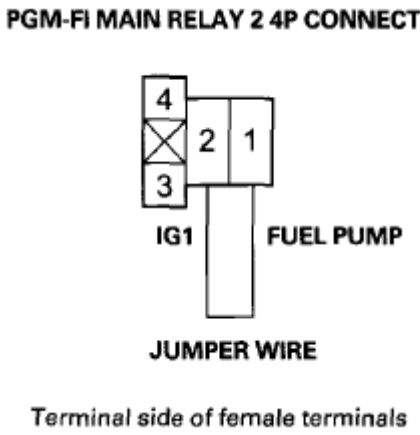

Fig. 37: Connecting PGM-FI Main Relay 2 4P Connector Terminals No. 1 And No. 2 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between fuel tank unit 4P connector terminal No. 2 and body ground.

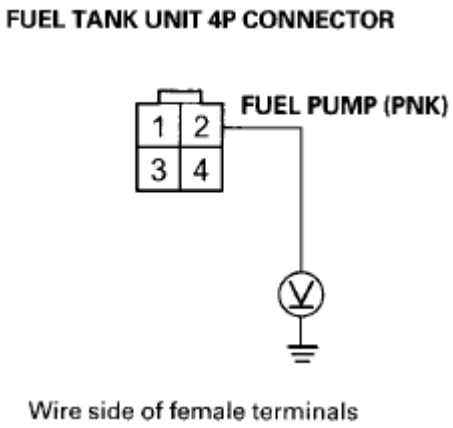

Fig. 38: Measuring Voltage Between Fuel Tank Unit 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Replace PGM-FI main relay 2. •

NO -

- Repair open in the wire between the driver's under-dash fuse/relay box (D10) and the fuel tank unit 4P connector. •
- If the wire is OK, replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**). •

35. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
36. Check for continuity between fuel tank unit 4P connector terminal No. 4 and body ground.

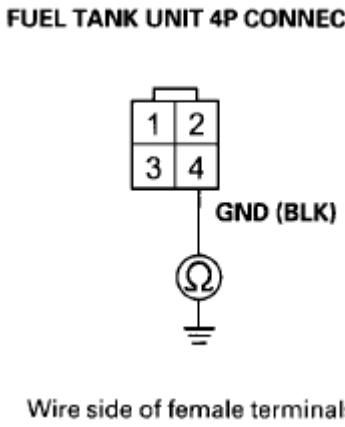

Fig. 39: Checking Continuity Between Fuel Tank Unit 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - **Replace the fuel pump**. •

NO - Repair open in the wire between the fuel tank unit 4P connector and G602; without SH-AWD (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), with SH-AWD (see **CONNECTOR TO FUSE/RELAY BOX INDEX**). •

FUEL PRESSURE RELIEVING

Before disconnecting fuel lines or hoses, relieve pressure from the system by disabling the fuel pump and disconnecting the fuel line/quick connect fitting in the engine compartment.

WITH THE HDS

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

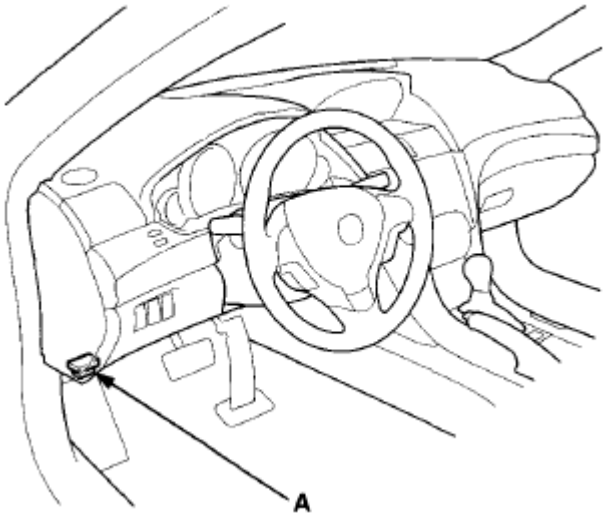

Fig. 40: Identifying Data Link Connector (With HDS)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Remove the fuel fill cap to relieve the pressure in the fuel tank.
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. From the INSPECTION MENU of the HDS, select Fuel Pump OFF, then start the engine, and let it idle until it stalls.

NOTE:

- **Do not allow the engine to idle above 1, 000 RPM or the ECM/PCM will continue to operate the fuel pump.**
- **Pending or Confirmed DTC may be set during this procedure. Check for DTCs, and clear them as needed (see HDS CLEAR COMMAND).**

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
10. Remove the cover (A) and the quick-connect fitting cover (B); **without SH-AWD system**, **with SH-AWD system**.

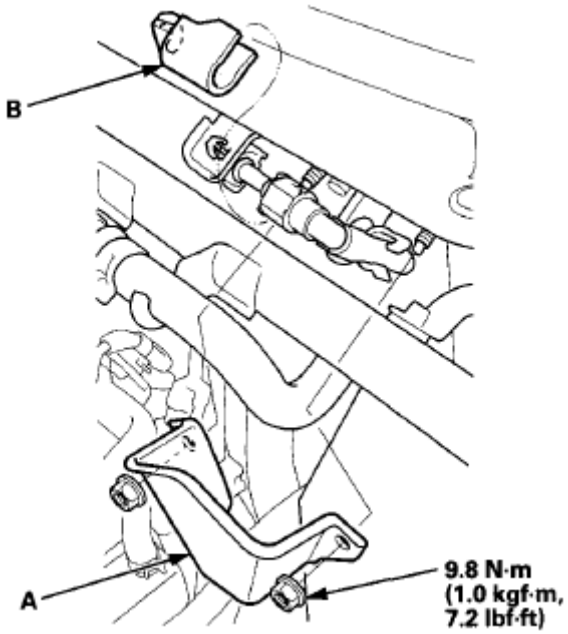

Fig. 41: Identifying Cover And Quick-Connect Fitting Cover With Torque Specifications (With HDS)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check the quick-connect fitting for dirt, and clean it if needed.
12. Place a rag or a shop towel over the quick-connect fitting (A).

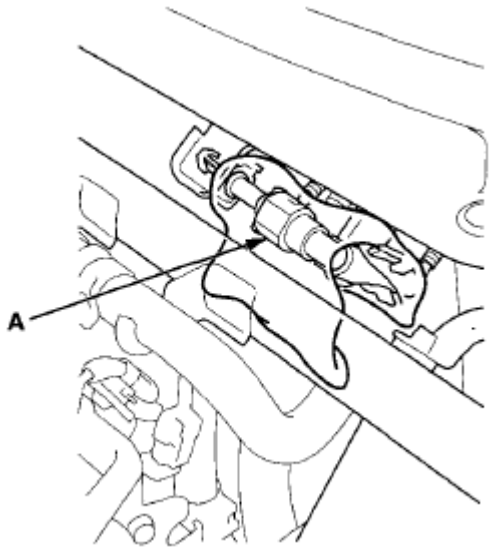

Fig. 42: Identifying Quick-Connect Fitting With Rag Or Shop Towel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Disconnect the quick-connect fitting (A): Hold the connector (B) with one hand, and squeeze the retainer tabs (C) with the other hand to release them from the locking tabs (D). Pull the connector off.

NOTE:

- **Be careful not to damage the line (E) or other parts.**
- **Do not use tools.**
- **If the connector does not move, keep the retainer tabs pressed down, and alternately pull and push the connector until it comes off easily.**
- **Do not remove the retainer from the line; once removed, the retainer must be replaced with a new one.**

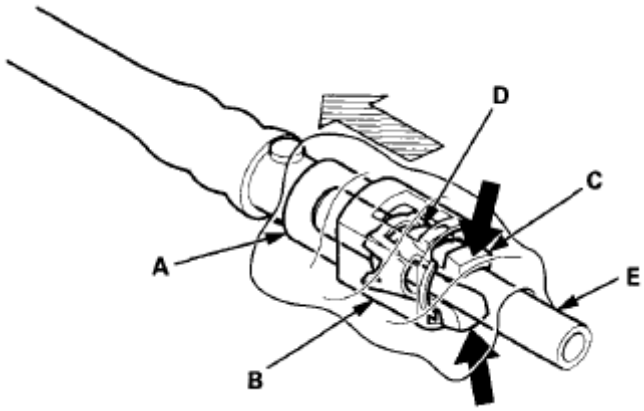

Fig. 43: Disconnecting Connector From Locking Tabs
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. After disconnecting the quick-connect fitting, check it for dirt or damage; without SH-AWD system (see step 5), with SH-AWD system (see step 5).
15. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

WITHOUT THE HDS

1. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
2. Remove PGM-FI main relay 2 (A) from the driver's under-dash fuse/relay box.

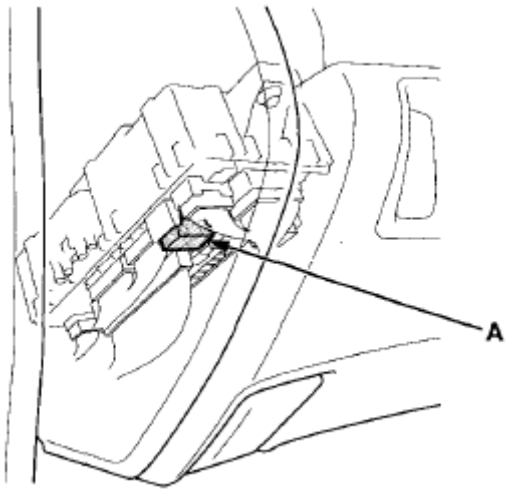

Fig. 44: Identifying PGM-FI Main Relay 2 (Without HDS)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Start the engine, and let it idle until it stalls.

NOTE: If any DTCs are stored, clear and ignore them.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Remove the fuel fill cap to relieve the pressure in the fuel tank.
6. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
7. Remove the cover (A) and the quick-connect fitting cover (B); **without SH-AWD system**, **with SH-AWD system**.

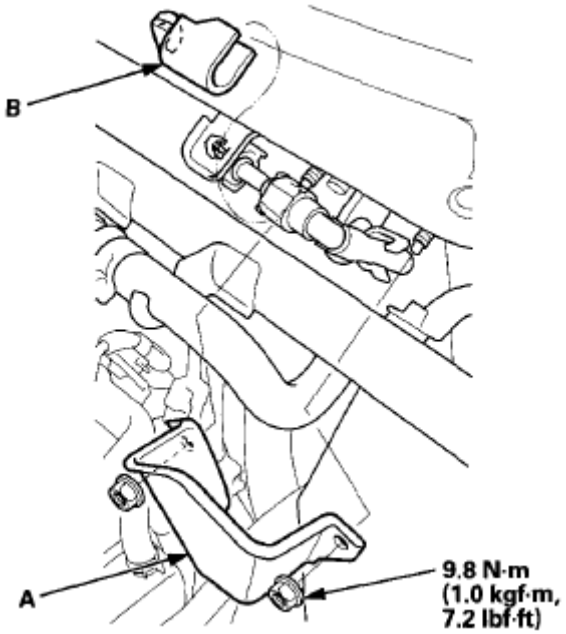

Fig. 45: Identifying Cover And Quick-Connect Fitting Cover With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Check the quick-connect fitting for dirt, and clean it if needed.
9. Place a rag or a shop towel over the quick-connect fitting (A).

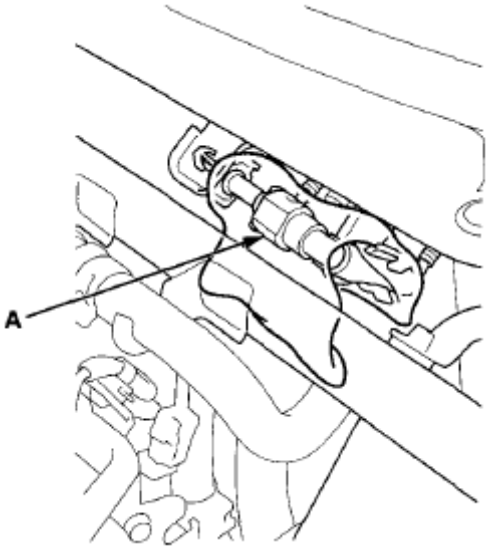

Fig. 46: Identifying Quick-Connect Fitting With Rag Or Shop Towel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Disconnect the quick-connect fitting (A): Hold the connector (B) with one hand, and squeeze the retainer tabs (C) with the other hand to release them from the locking tabs (D). Pull the connector off.

NOTE:

- **Be careful not to damage the line (E) or other parts.**
- **Do not use tools.**
- **If the connector does not move, keep the retainer tabs pressed down, and alternately pull and push the connector until it comes off easily.**
- **Do not remove the retainer from the line; once removed, the retainer must be replaced with a new one.**

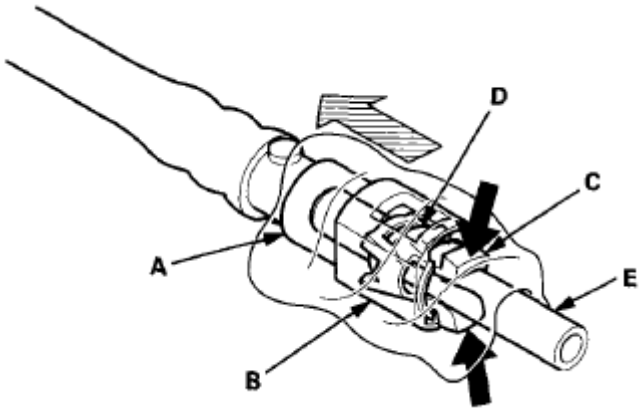

Fig. 47: Disconnecting Connector From Locking Tabs (Without HDS)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. After disconnecting the quick-connect fitting, check it for dirt or damage; without SH-AWD system (see step 5), with SH-AWD system (see step 5).
12. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

FUEL PRESSURE TEST

Special Tools Required

- Fuel Pressure Gauge 07408-004000B
- Fuel Pressure Gauge Attachment Set 07AAJ-S8MA150

1. Relieve the **fuel pressure**.
2. Attach the fuel pressure gauge set and the fuel pressure gauge.

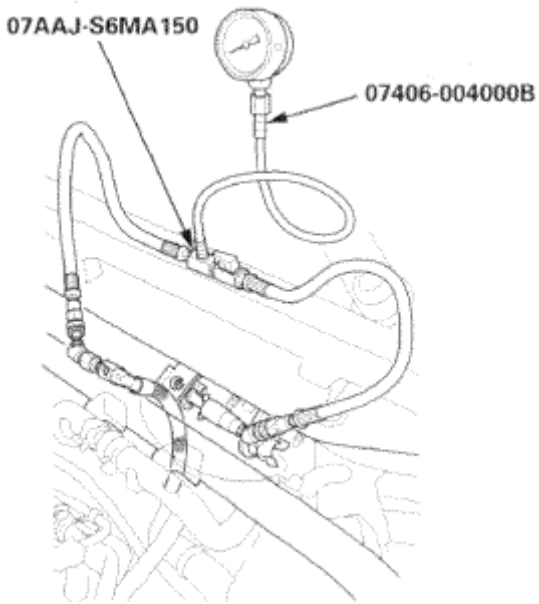

Fig. 48: Installing Fuel Pressure Gauge And Fuel Pressure Set
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Start the engine, and let it idle,
   - If the engine starts, go to step 5.
   - If the engine does not start, go to step 4,
4. Check to see if the fuel pump is running: Listen to the fuel filler port with the fuel fill cap removed. The fuel pump should run for 2 seconds when the ignition switch is first turned to ON (II) or engine start/stop button to select the ON mode.
   - If the pump runs, go to step 5,
   - If the pump does not run, do the **fuel pump circuit troubleshooting**.
5. Read the fuel pressure gauge.

   Fuel pressure should be: 390- 440 kPa (4.0- 4, 5 kgf/cm^2 , 57- 64 psi)

   - If the pressure is OK, the test is complete.
   - If the pressure is out of specification, replace the fuel pressure regulator; **without SH-AWD**, **with SH-AWD** and the fuel filter; **without SH-AWD**, **with SH-AWD**, then recheck the fuel pressure.

TRANSFER FUEL PUMP TEST

Special Tools Required

Vacuum Pump/Gauge, 0- 30 inHg Snap-on YA4000A or equivalent, commercially available

WITH SH-AWD

1. Remove the **secondary fuel gauge sending unit**.
2. Connect a vacuum pump/gauge, 0- 30 inHg, to the transfer tube (A).

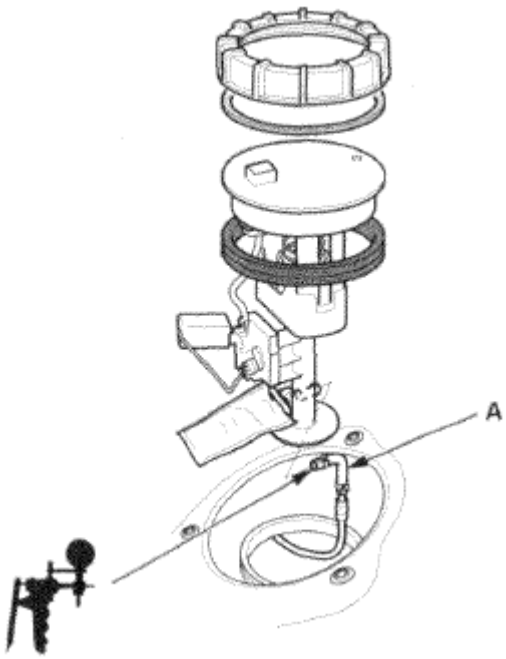

Fig. 49: Connecting Vacuum Pump/Gauge To Transfer Tube (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. From the INSPECTION MENU of the HDS, select Fuel Pump ON.
5. Read the vacuum pump/gauge. The vacuum should be 4, 0 kPa (1.2 inHg, 30 mmHg).
    - If the vacuum is OK, the transfer fuel pump and the transfer tube is OK.
    - If the vacuum is out of specification, go to step 6.
6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Install the **secondary fuel gauge sending unit**.
8. Remove the **fuel tank unit**.
9. Connect the vacuum pump/gauge, to the fuel tank unit (A).

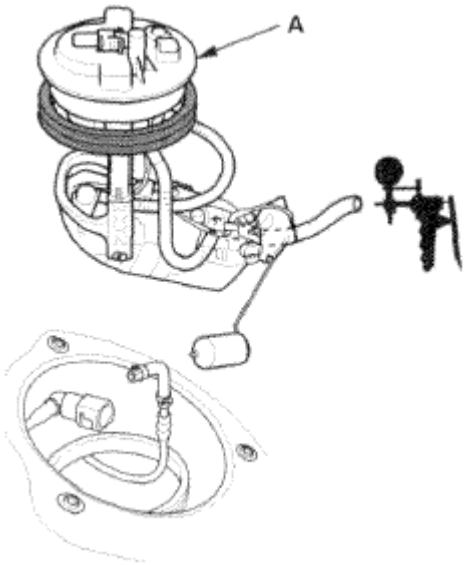

Fig. 50: Connecting Vacuum Pump/Gauge To Fuel Tank Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Lower the fuel tank unit (A) into the fuel tank until the pick up screen is submerged in the fuel.

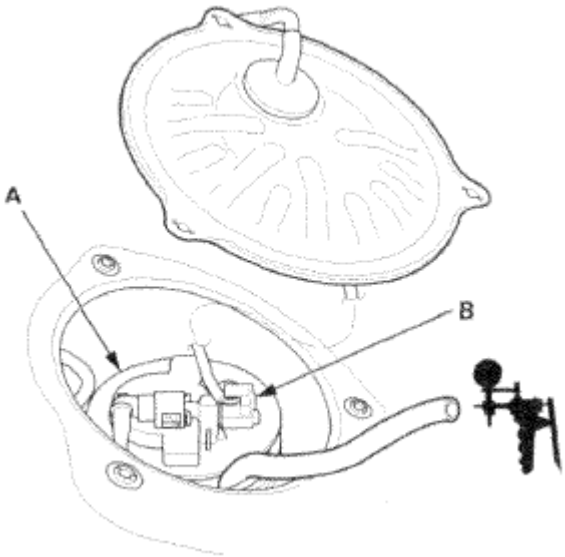

Fig. 51: Connecting 4P Connector And Fuel Tank Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Connect the fuel tank unit 4P connector (B).
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. From the INSPECTION MENU of the HDS, select Fuel Pump ON.
14. Read the vacuum pump/gauge. The vacuum should be 4.0 kPa (1.2 inHg, 30 mmHg).
    - If the vacuum is OK, replace the transfer tube, then recheck the fuel vacuum.

- If the vacuum is out of specification, replace the **fuel tank unit**, then recheck the fuel vacuum.

FUEL TANK DRAINING

1. Remove the fuel tank unit; **without SH-AWD**, or **with SH- AWD**.
2. With SH-AWD: **Remove the secondary fuel gauge sending unit**.
3. Using a hand pump, a boss, and a container suitable for fuel, draw the fuel from the fuel tank.
4. Reinstall the fuel tank unit; **without SH-AWD**, or **with SH-AWD**, and the **secondary fuel gauge sending unit (with SH-AWD)**.

FUEL LINE INSPECTION

Check the fuel system lines and hoses for damage, leaks, and deterioration. Replace any damaged parts.

WITHOUT SH-AWD

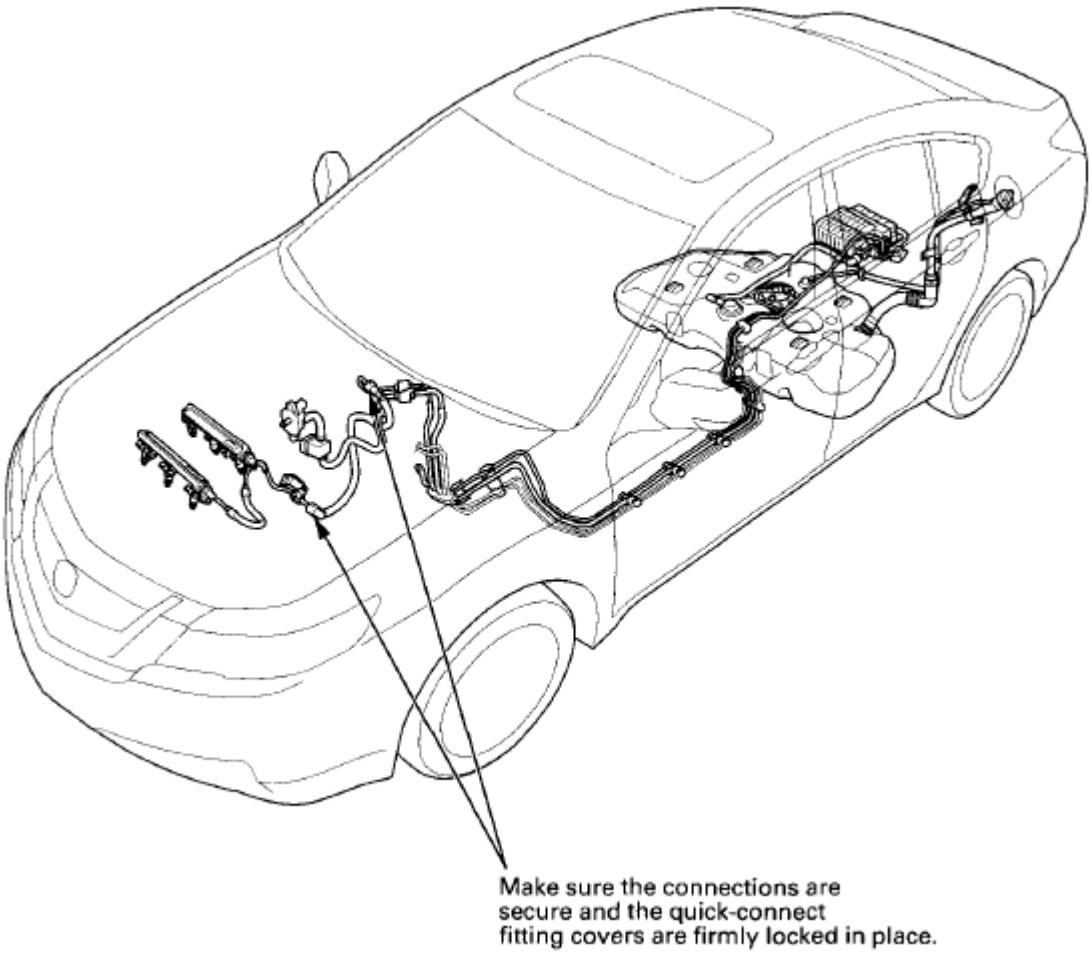

Fig. 52: Overview Of Fuel System Lines And Hoses (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Check all clamps, and make sure they are properly positioned and tightened.

WITHOUT SH-AWD

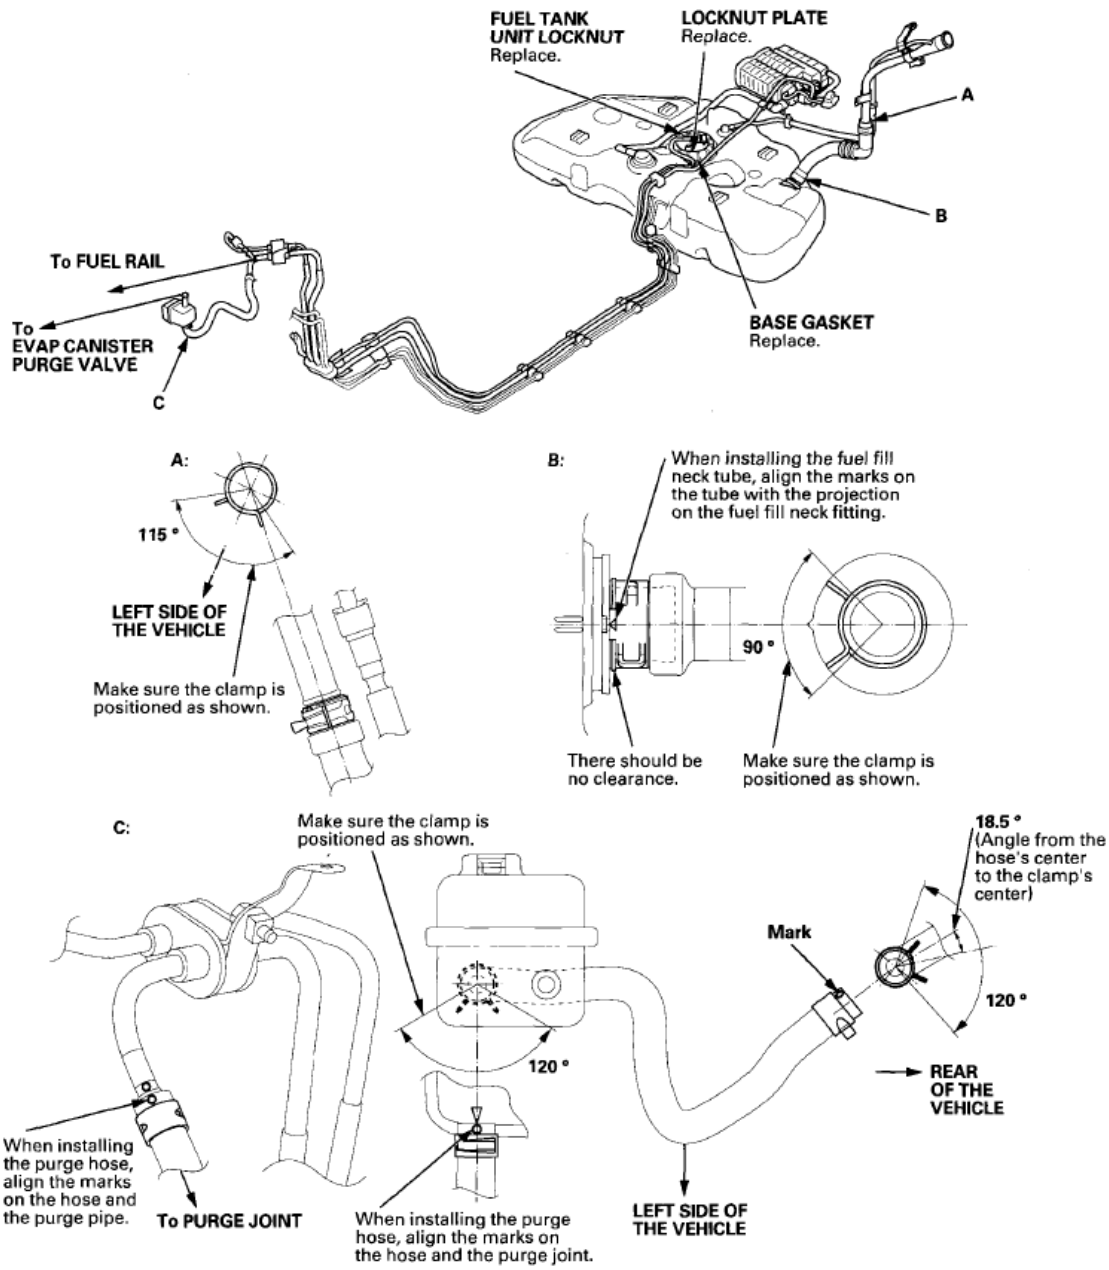

Fig. 53: Identifying Fuel Line Clamps Positions (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Check the fuel system lines and hoses for damage, leaks, and deterioration. Replace any damaged parts.

WITH SH-AWD

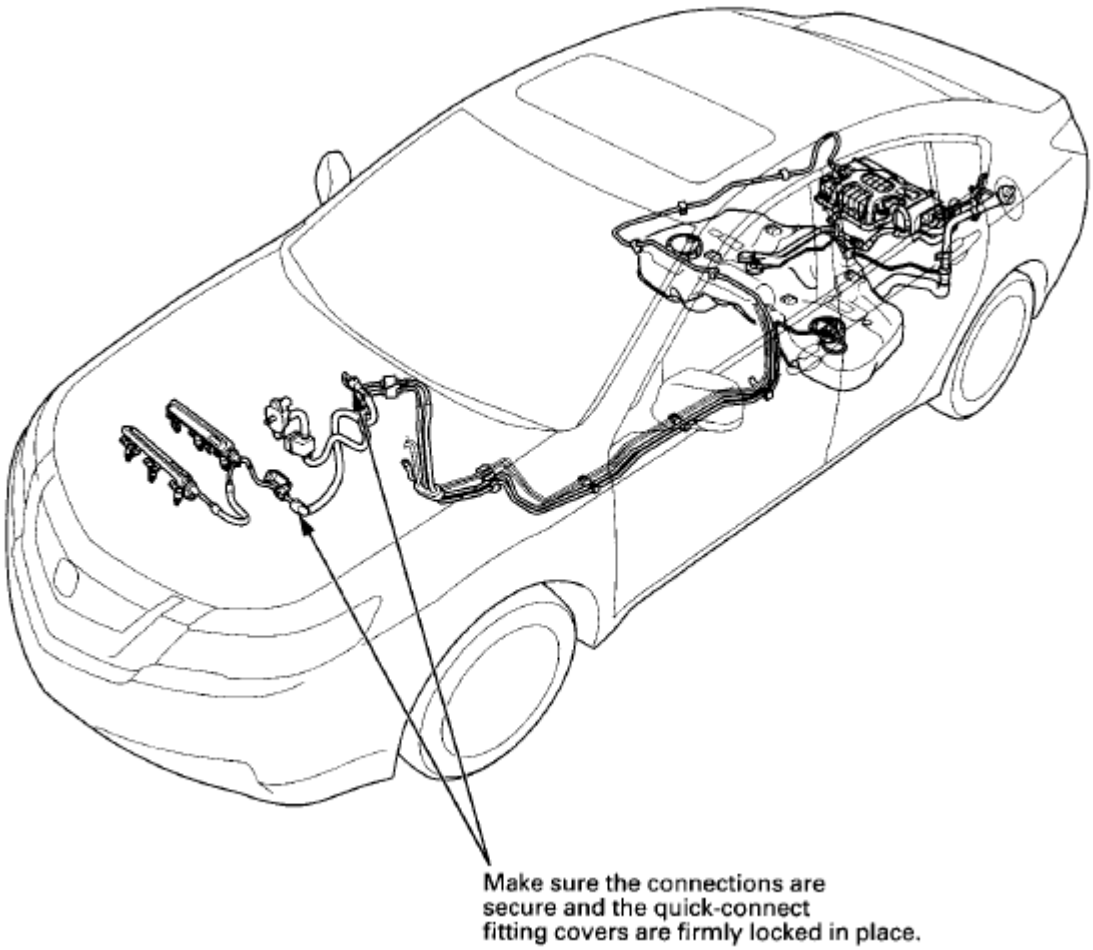

Fig. 54: Overview Of Fuel System Lines And Hoses (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Check all clamps, and make sure they are properly positioned and tightened.

WITH SH-AWD

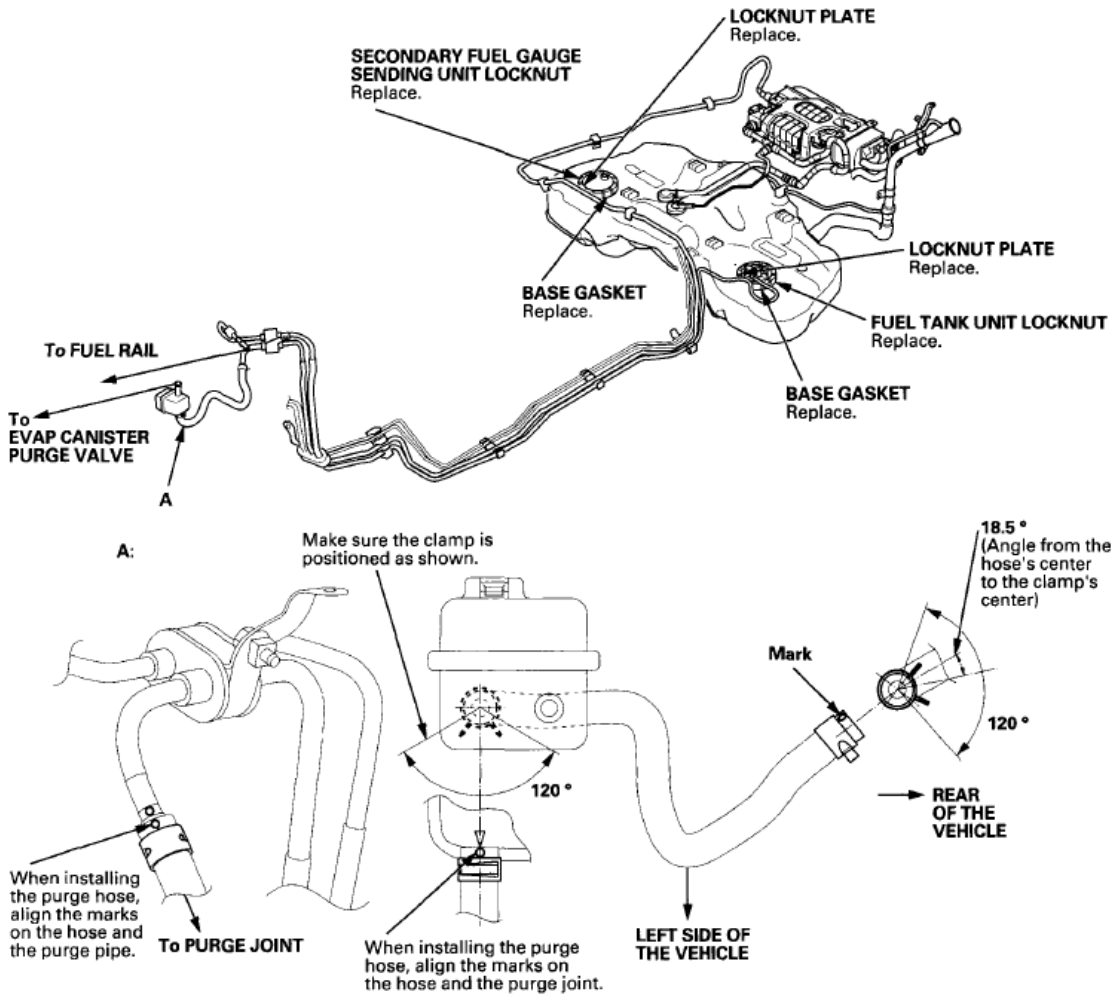

Fig. 55: Identifying Fuel Line Clamps Positions (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

FUEL LINE/QUICK-CONNECT FITTING PRECAUTIONS

WITHOUT SH-AWD

The fuel line/quick-connect fittings (A, B, C, D, and E) connect the fuel joint hose (F) to the fuel feed hose (G), the fuel feed hose to the fuel line (H), the fuel line (I) to the fuel tank unit (J), the fuel vapor line (K) to the EVAP canister (L), and the fuel tank vapor recirculation tube (M) to the fuel fill pipe (N). When removing or installing the fuel feed hose, the fuel tank unit, or the fuel tank, or when disconnecting or connecting the quick-connect fittings, pay attention to the following:

- The fuel feed hoses, the fuel line, and the quick-connect fittings are not heat-resistant; be careful not to damage them during welding or other heat-generating procedures.
- The fuel feed hoses, the fuel line, and the quick-connect fittings are not acid-proof; do not touch them with a shop towel that was used for wiping battery electrolyte. Replace them if they come in contact with electrolyte or something similar.

- When connecting or disconnecting the fuel feed hoses, the fuel line, and the quick-connect fittings, be careful not to bend or twist them excessively. Replace them if they are damaged.

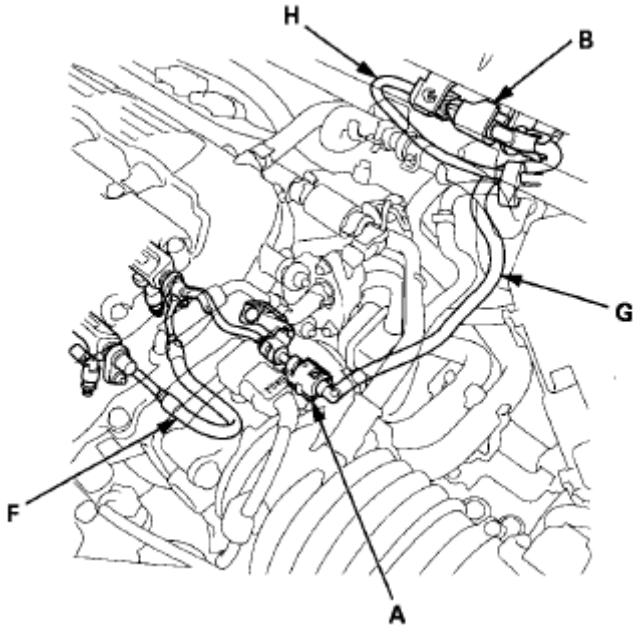

Fig. 56: Identifying Fuel Line/Quick-Connect Fitting - Without SH-AWD (1 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

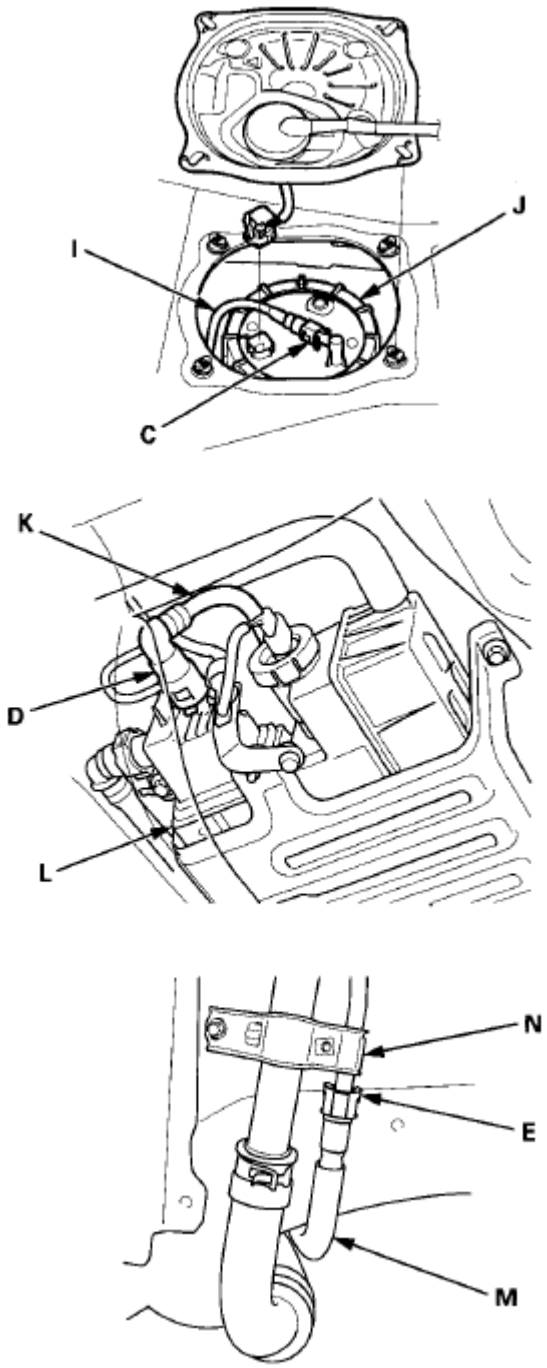

Fig. 57: Identifying Fuel Line/Quick-Connect Fitting - Without SH-AWD (2 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

A disconnected quick-connect fitting can be reconnected, but the retainer on the mating line cannot be reused once it has been removed from the line. Replace the retainer when:

- replacing the fuel rail.
- replacing the fuel line.

- replacing the fuel pump.
- replacing the fuel filter.
- replacing the EVAP canister.
- replacing the fuel fill pipe.
- replacing the fuel tank.
- it has been removed from the line.
- it is damaged.

Use the same manufacturer retainer and the same size when the replacing the retainer.

Location	Manufacturer	Retainer color	Line diameter
A	Tokai	Blue green	0.3 in (8 mm)
B	Tokai	Blue green	0.3 in (8 mm)
C	Tokai	Orange	0.4 in (9.5 mm)
	Sanoh	White	
D	Tokai	Natural	0.5 in (12 mm)
E	Tokai	Natural	0.5 in (12 mm)

WITH SH-AWD

The fuel line/quick-connect fittings (A, B, C, D, E, F, and G) connect the fuel joint hose (H) to the fuel feed hose (I), the fuel feed hose to the fuel line (J), the fuel line (K) to the fuel tank unit (L), the fuel vapor line (M) to the EVAP canister (N), the fuel vent tube (O) to the fuel vent tube B (P) and the fuel tank vapor recirculation tube (Q) and fuel fill neck tube (R) to the fuel fill pipe (S). When removing or installing the fuel feed hose, the fuel tank unit, or the fuel tank, or when disconnecting or connecting the quick-connect fittings, pay attention to the following:

- The fuel feed hoses, the fuel line, the and quick-connect fittings are not heat-resistant; be careful not to damage them during welding or other heat-generating procedures.
- The fuel feed hoses, the fuel line, the and quick-connect fittings are not acid-proof; do not touch them with a shop towel that was used for wiping battery electrolyte. Replace them if they come in contact with electrolyte or something similar.
- When connecting or disconnecting the fuel feed hoses, the fuel line, the and quick-connect fittings, be careful not to bend or twist them excessively. Replace them if they are damaged.

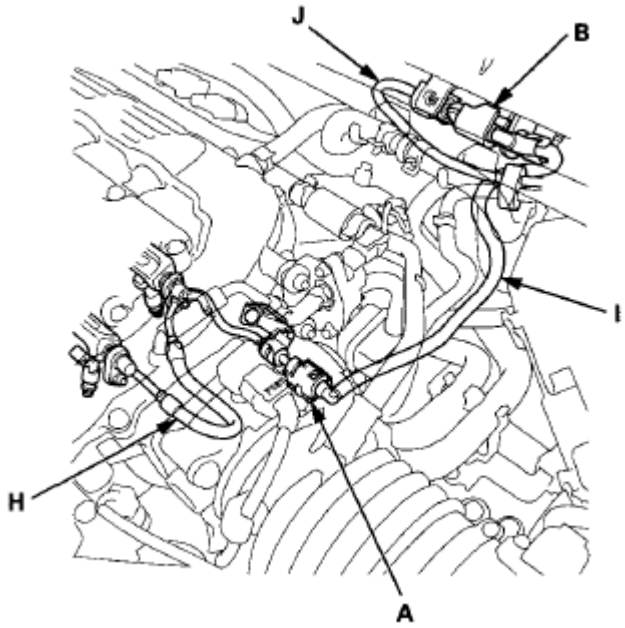

Fig. 58: Identifying Fuel Line/Quick-Connect Fitting - With SH-AWD (1 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

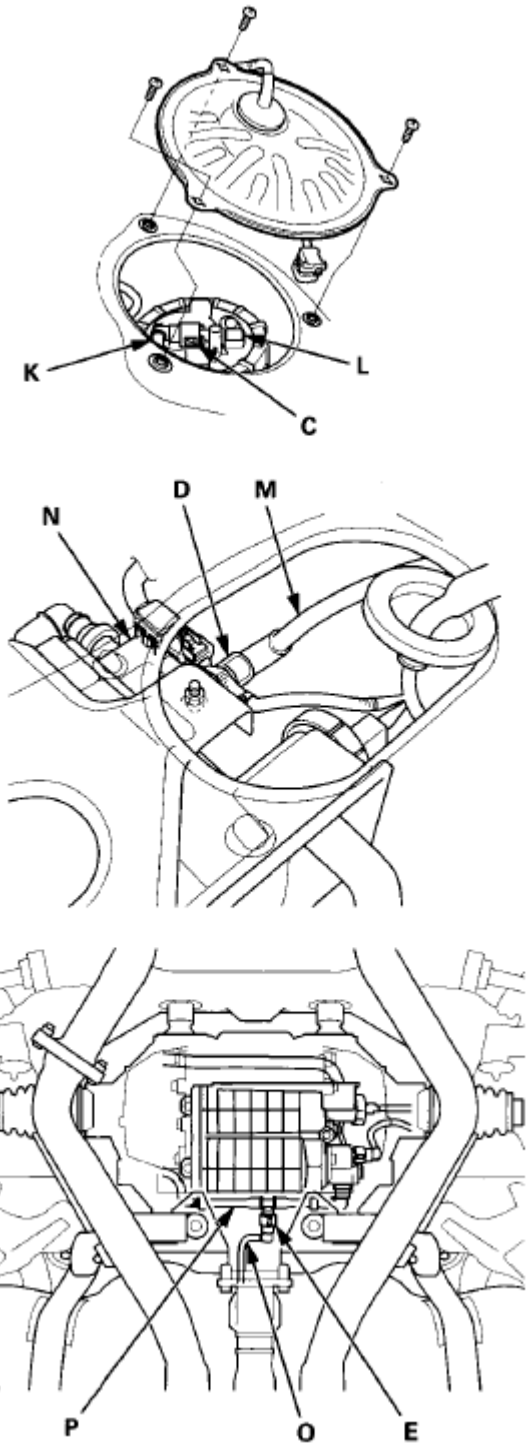

Fig. 59: Identifying Fuel Line/Quick-Connect Fitting - With SH-AWD (2 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

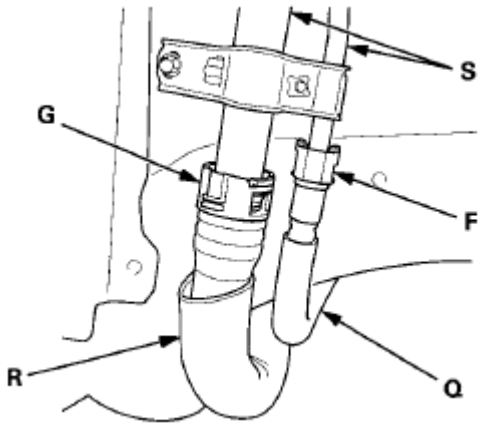

Fig. 60: Identifying Fuel Line/Quick-Connect Fitting - With SH-AWD (3 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

A disconnected quick-connect fitting can be reconnected, but the retainer on the mating line cannot be reused once it has been removed from the line. Replace the retainer when:

- replacing the fuel rail.
- replacing the fuel line.
- replacing the fuel pump.
- replacing the fuel filter.
- replacing the EVAP canister.
- replacing the fuel fill pipe.
- replacing the fuel tank.
- it has been removed from the line.
- it is damaged.

Use the same manufacturer retainer and the same size when the replacing the retainer.

Location	Manufacturer	Retainer color	Line diameter
A	Tokai	Blue green	0.3 in (8 mm)
B	Tokai	Blue green	0.3 in (8 mm)
C	Tokai	Orange	0.4 in (9.5 mm)
	Sanoh	White	
D	Tokai	Natural	0.5 in (12 mm)
E	Toyoda gosei	White	0.3 in (8 mm)
F	Tokai	Natural	0.5 in (12 mm)
G	Tokai	Green	1.1 in (28.6 mm)

FUEL LINE/QUICK-CONNECT FITTING REMOVAL

WITHOUT SH-AWD

NOTE: Before you work on the fuel lines and fittings, read the Fuel Line/Quick-Connect Fitting Precautions.

1. If equipped, remove the quick-connect fitting cover from the fuel line. Raise the cover (A) from the fuel line (B), and remove it as shown.

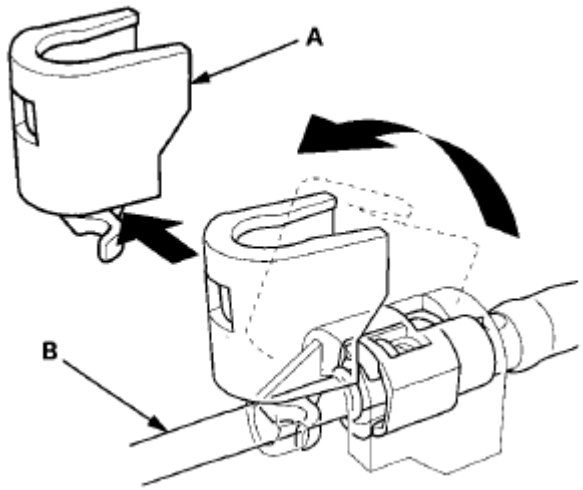

Fig. 61: Removing Quick-Connect Fitting Cover From Fuel Line (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. **Relieve the fuel pressure**.
3. Check the fuel quick-connect fittings (A) for dirt, and clean them if needed.

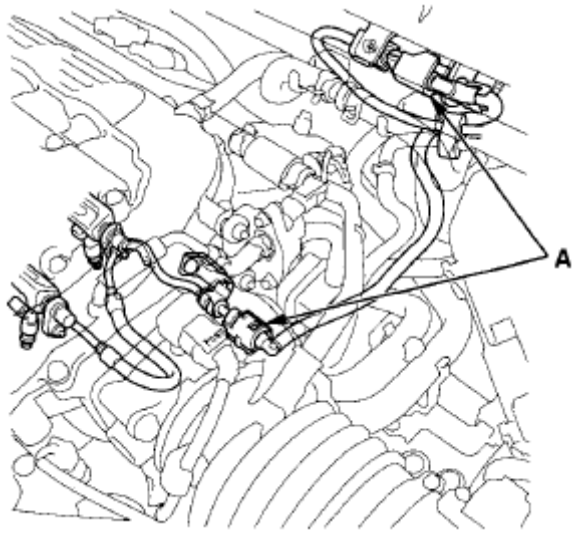

Fig. 62: Identifying Fuel Quick-Connect Fittings - Without SH-AWD (1 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

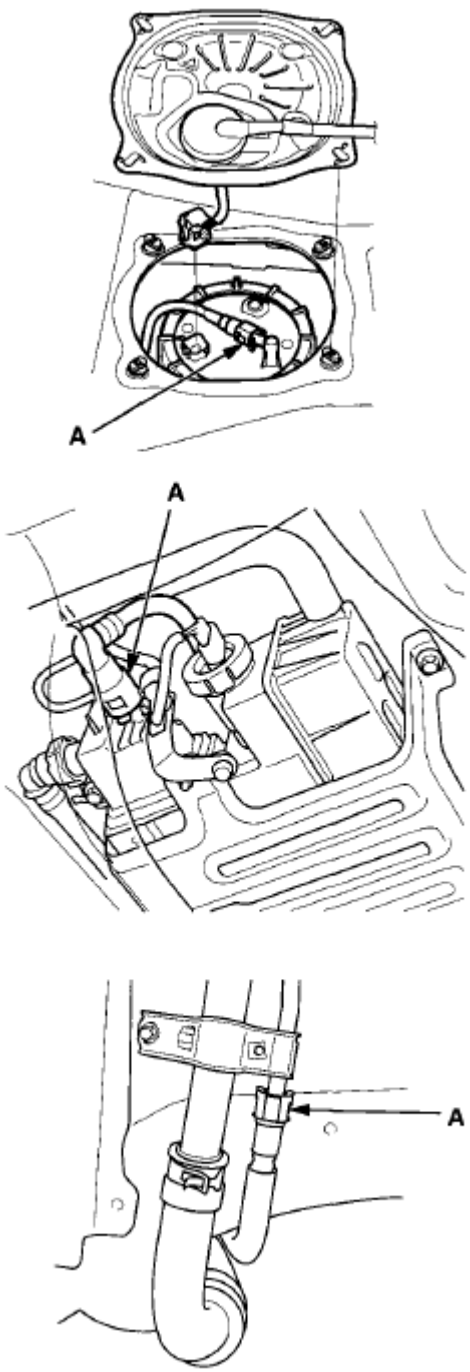

Fig. 63: Identifying Fuel Quick-Connect Fittings - Without SH-AWD (2 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Place a rag or a shop towel over the quick-connect fitting. Hold the connector (A) with one hand, and squeeze the retainer tabs (B) with the other hand to release them from the locking tabs (C). Pull the connector off.

NOTE:

- **Be careful not to damage the line (D) or other parts. Do not use tools.**

- **If the connector does not move, keep the retainer tabs pressed down, and alternately pull and push the connector until it comes off easily.**
- **Do not remove the retainer from the line; once removed, the retainer must be replaced with a new one.**

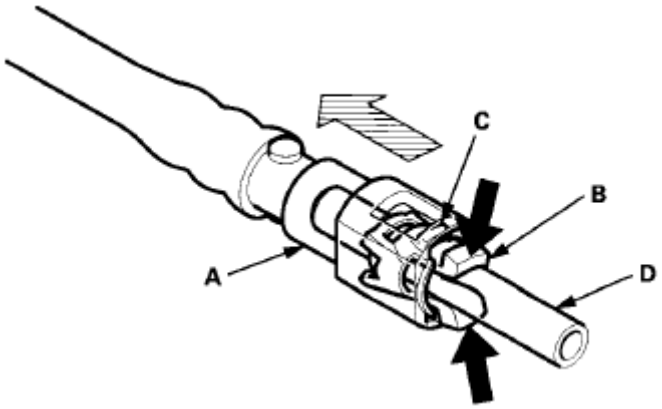

Fig. 64: Disconnecting Connector From Locking Tabs (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Check the contact area (A) of the line (B) for dirt or damage.
   - If it is dirty, clean the connector, and dry it with the compressed air.
   - If it is damaged, replace the fuel filter or the fuel feed line.

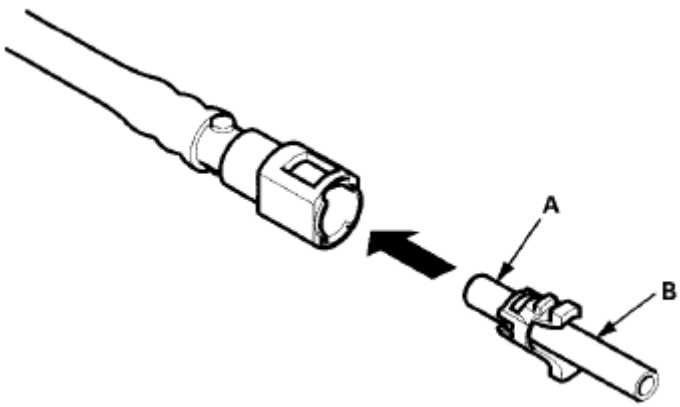

Fig. 65: Checking Contact Area Of Line For Dirt Or Damage (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. To prevent damage and keep foreign matter out, cover the disconnected connector and line ends with plastic bags (A).

NOTE: The retainer cannot be reused once it has been removed from the line.

Replace the retainer when:

- replacing the fuel rail.
- replacing the fuel line.
- replacing the fuel pump.
- replacing the fuel filter.
- replacing the EVAP canister.
- replacing the fuel fill pipe.
- replacing the fuel tank.
- it has been removed from the line.
- it is damaged.

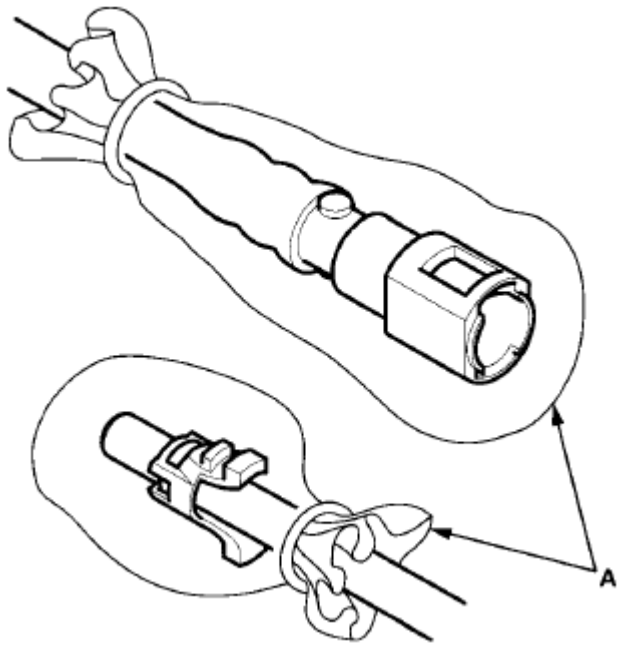

Fig. 66: Covering Connector And Line Ends Using Plastic Bags (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

WITH SH-AWD

NOTE: Before you work on the fuel lines and fittings, read the Fuel Line/Quick-Connect Fitting Precautions.

1. If equipped, remove the quick-connect fitting cover from the fuel line. Raise the cover (A) from the fuel line (B), and remove it as shown.

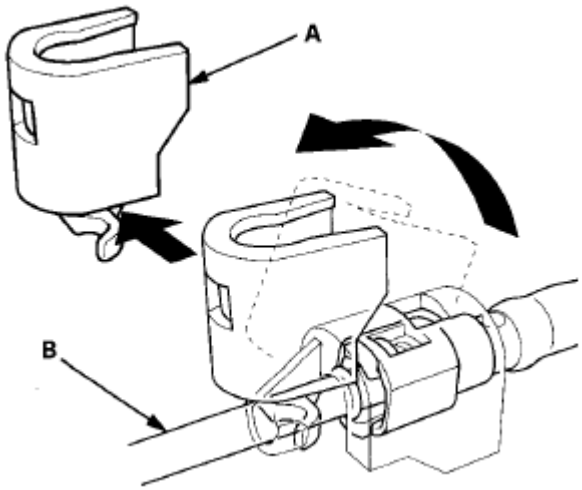

Fig. 67: Removing Quick-Connect Fitting Cover From Fuel Line (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. **Relieve the fuel pressure**.
3. Check the fuel quick-connect fittings (A) for dirt, and clean them if needed.

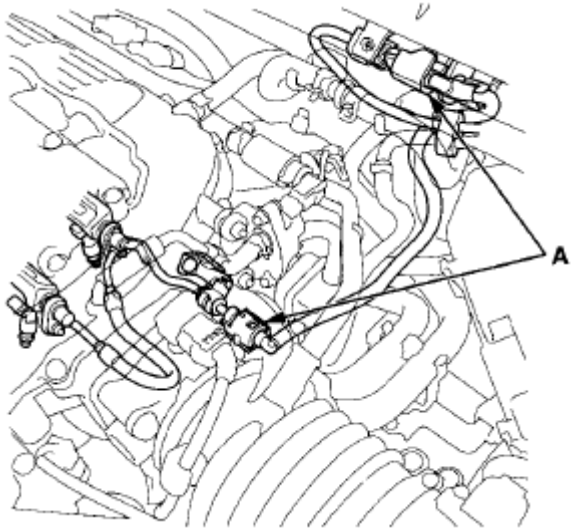

Fig. 68: Identifying Fuel Quick-Connect Fittings - With SH-AWD (1 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

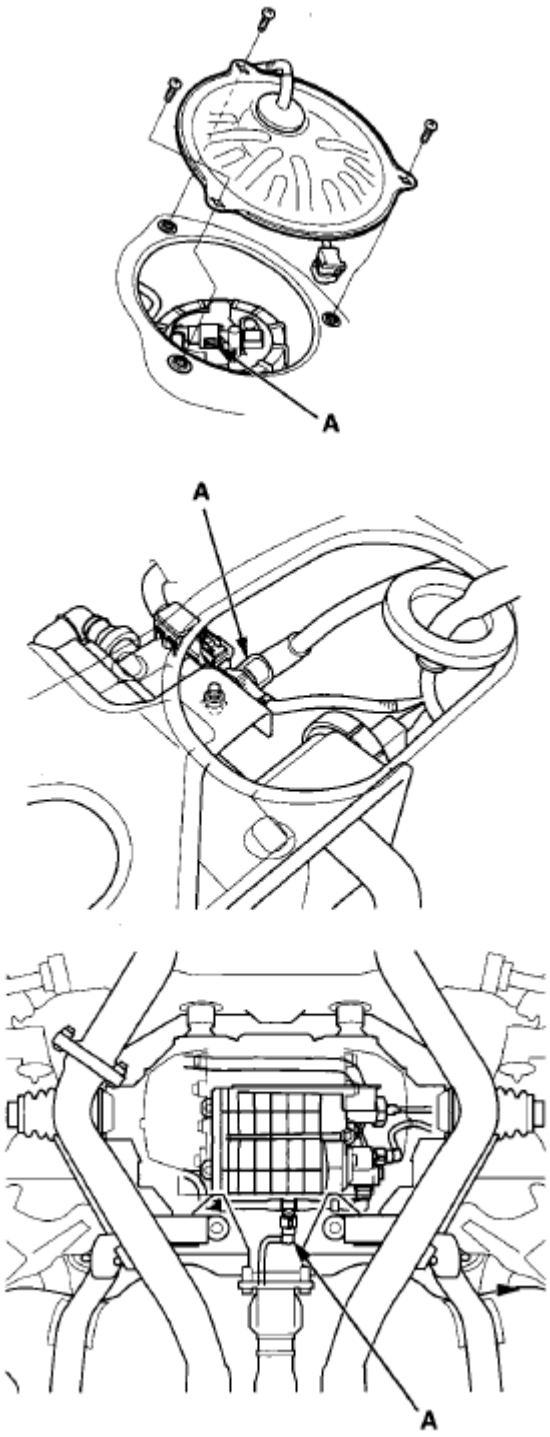

Fig. 69: Identifying Fuel Quick-Connect Fittings - With SH-AWD (2 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

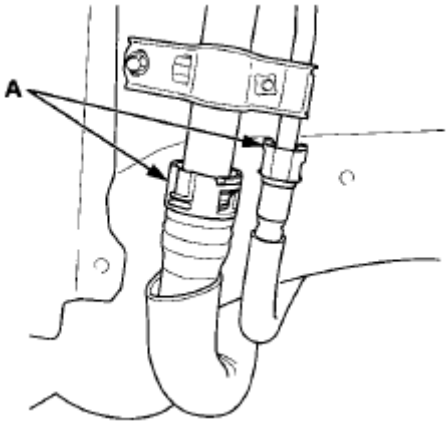

Fig. 70: Identifying Fuel Quick-Connect Fittings - With SH-AWD (3 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Place a rag or a shop towel over the quick-connect fitting. Hold the connector (A) with one hand, and squeeze the retainer tabs (B) with the other hand to release them from the locking tabs (C). Pull the connector off.

NOTE:

- **Be careful not to damage the line (D) or other parts. Do not use tools.**
- **If the connector does not move, keep the retainer tabs pressed down, and alternately pull and push the connector until it comes off easily.**
- **Do not remove the retainer from the line; once removed, the retainer must be replaced with a new one.**

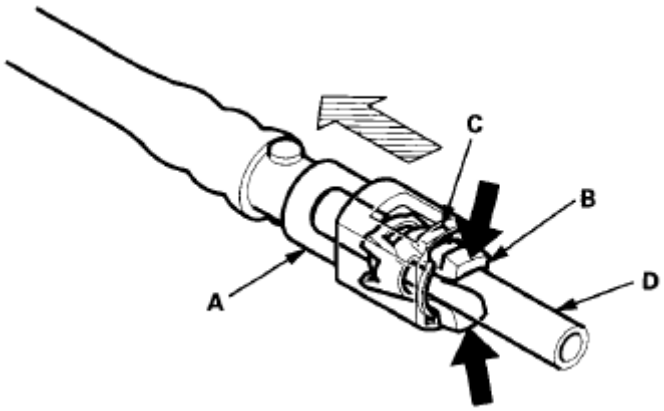

Fig. 71: Disconnecting Connector From Locking Tabs (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Check the contact area (A) of the line (B) for dirt or damage.
   - If it is dirty, clean the connector, and dry it with the compressed air.
   - If it is damaged, replace the fuel filter or the fuel feed line.

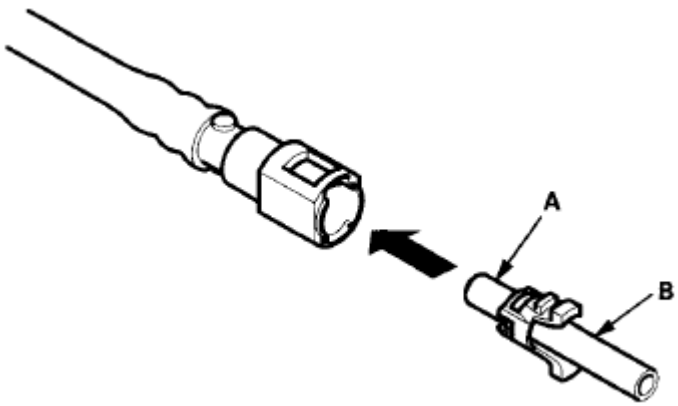

Fig. 72: Checking Contact Area Of Line For Dirt Or Damage (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. To prevent damage and keep foreign matter out, cover the disconnected connector and line ends with plastic bags (A).

NOTE: The retainer cannot be reused once it has been removed from the line.

Replace the retainer when:

- replacing the fuel rail.
- replacing the fuel line.
- replacing the fuel pump.
- replacing the fuel filter.
- replacing the EVAP canister.
- replacing the fuel fill pipe.
- replacing the fuel tank.
- it has been removed from the line.
- it is damaged.

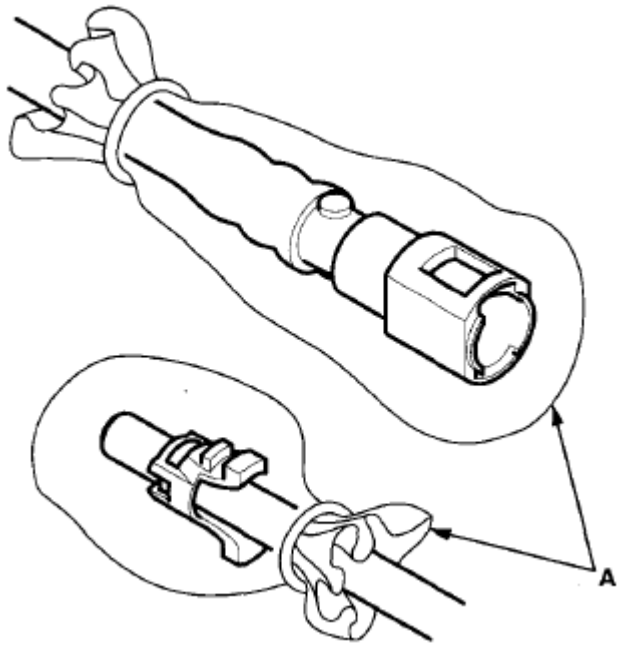

Fig. 73: Covering Connector And Line Ends Using Plastic Bags (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

FUEL LINE/QUICK-CONNECT FITTING INSTALLATION

WITHOUT SH-AWD

NOTE: Before you work on the fuel lines and fittings, read the Fuel Line/Quick-Connect Fitting Precautions.

1. Check the contact area (A) of the line (B) for dirt or damage, and clean it if needed.

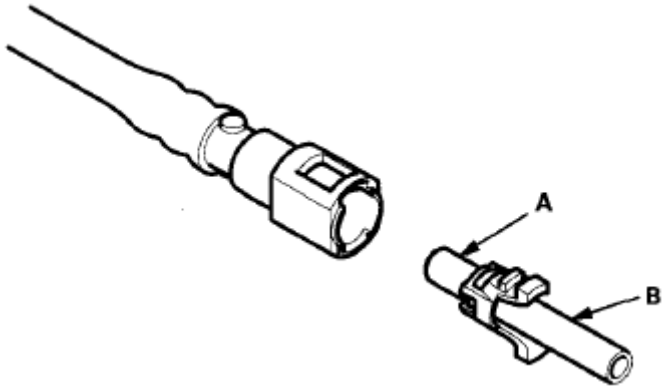

Fig. 74: Identifying Contact Area And Line For Dirt Or Damage (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Insert a new retainer (A) into the connector (B) if the retainer is damaged, or after:

- replacing the fuel rail.
- replacing the fuel line.
- replacing the fuel pump.
- replacing the fuel filter.
- replacing the EVAP canister.
- replacing the fuel fill pipe.
- replacing the fuel tank.
- removing the retainer from the line.

Use the same manufacturer retainer and the **same size when the replacing the retainer**.

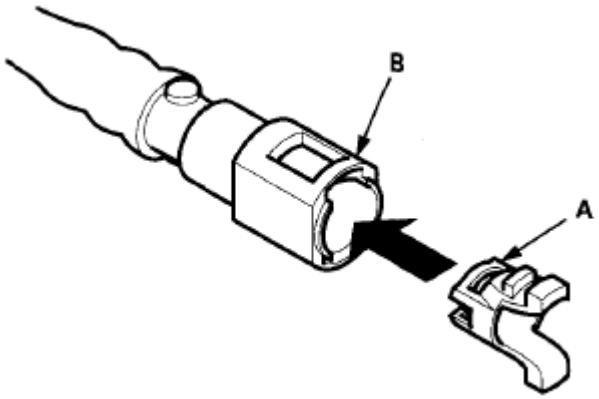

Fig. 75: Inserting Retainer Into Connector (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Before connecting a new fuel line/quick-connect fitting assembly (A), remove the old retainer (B) from the mating line.

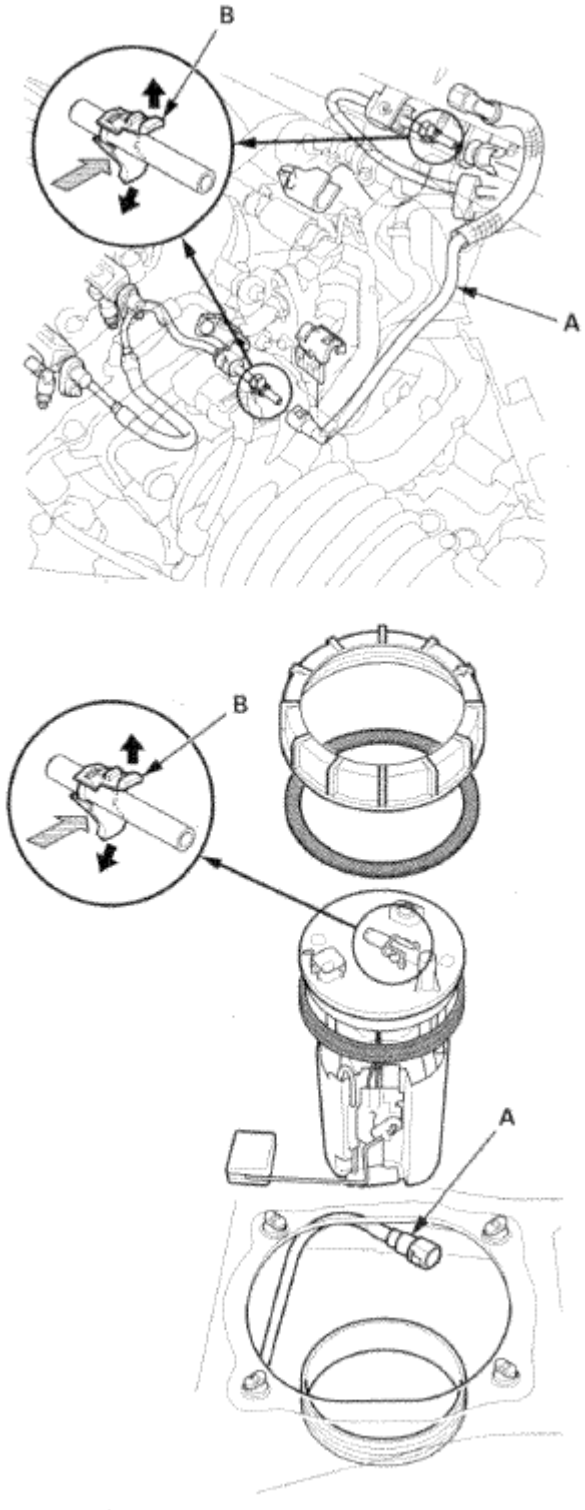

Fig. 76: Removing Retainer From Mating Line (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

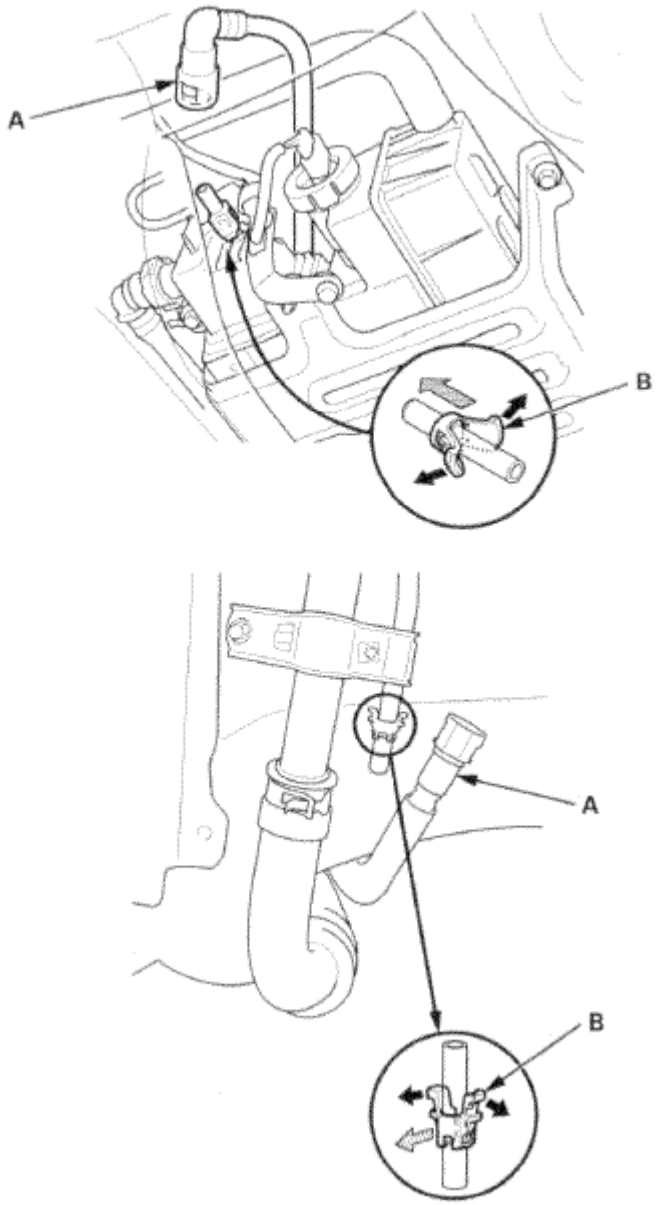

Fig. 77: Connecting Retainer To Connect Fuel Line/Quick-Connect Fitting Assembly (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Align the quick-connect fittings with the line (A), and align the retainer locking tabs (B) with the connector grooves (C). Then press the quick-connect fittings onto the line until both retainer tabs lock with a clicking sound.

NOTE: If it is hard to connect, put a small amount of new engine oil on the line end.

Connection with new retainer

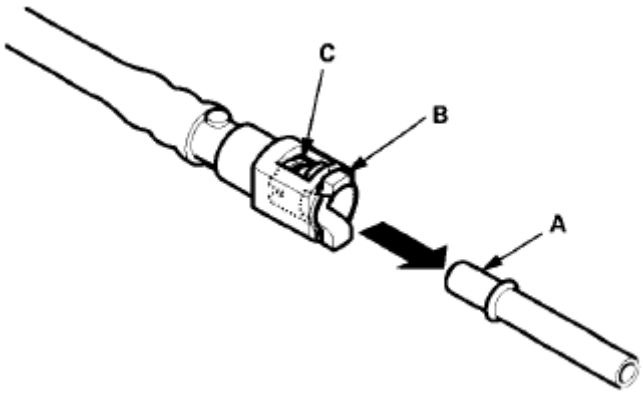

Fig. 78: Installing Fuel Line/Quick-Connect Fitting (Connection With Retainer)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connection to new fuel line

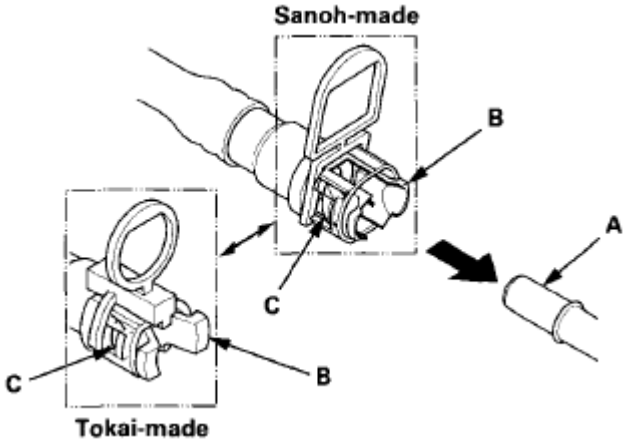

Fig. 79: Installing Fuel Line/Quick-Connect Fitting (Connecting To Fuel Line)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Reconnection to existing retainer

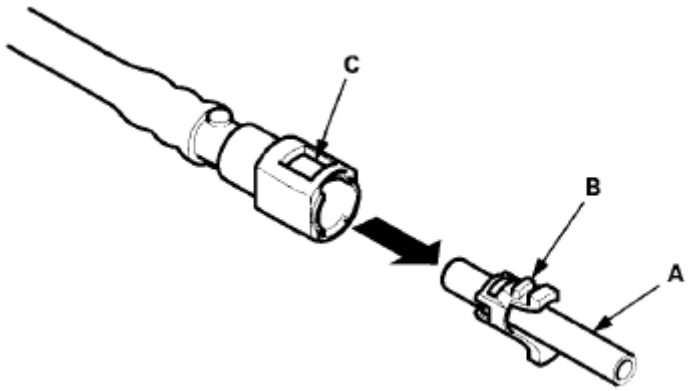

Fig. 80: Installing Fuel Line/Quick-Connect Fitting (Reconnecting To Retainer)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. When you reconnect the connector with the old retainer, make sure the connection is secure and the tabs (A) are firmly locked into place; check visually and also by pulling the connector (B). When you replace the fuel line with a new one, make sure you remove the ring pull (C) upwards after you confirm the connection is secure.

NOTE: Before you remove the ring pull, make sure the fuel line connection is secure. If the connection is not secure, the ring pull could break when you try to remove it.

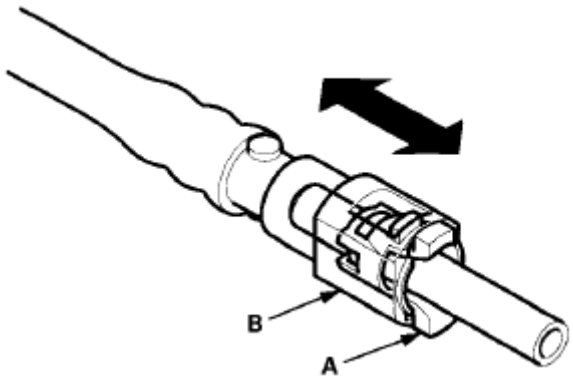

Fig. 81: Installing Fuel Line/Quick-Connect Fitting (Connection With Retainer)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connection to new fuel line

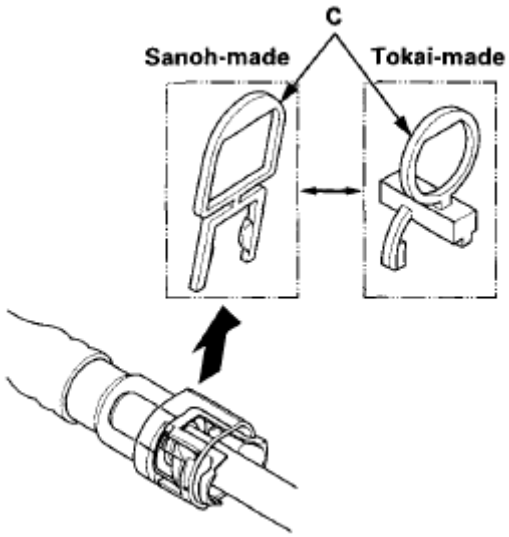

Fig. 82: Installing Fuel Line/Quick-Connect Fitting (Connection To Fuel Line)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Reconnect the negative cable to the battery, and turn the ignition switch to ON (II), or press the engine

start/stop button to select the ON mode (but do not operate the starter motor). The fuel pump runs for about 2 seconds, and fuel pressure rises. Repeat this two or three times, then make sure there are no fuel leaks.

7. If equipped, install the quick-connect fitting cover. Set the groove of the cover (A) on the fuel line (B) as shown, then install it. Make sure the cover is firmly locked in place.

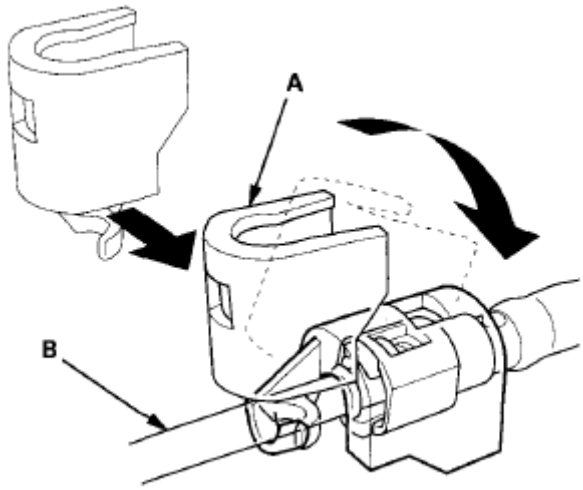

Fig. 83: Installing Quick-Connect Fitting Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

WITH SH-AWD

NOTE: Before you work on the fuel lines and fittings, read the Fuel Line/Quick-Connect Fitting Precautions.

1. Check the contact area (A) of the line (B) for dirt or damage, and clean it if needed.

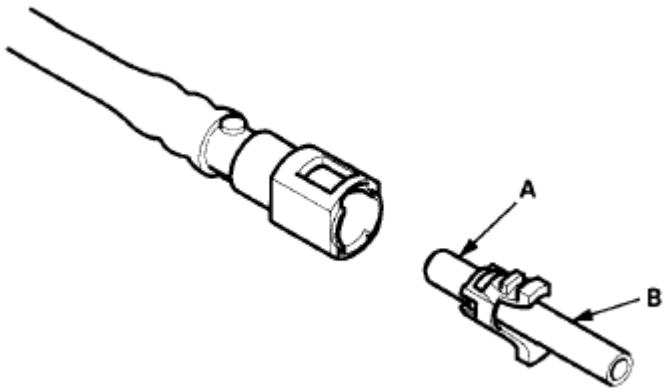

Fig. 84: Identifying Contact Area And Line (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Insert a new retainer (A) into the connector (B) if the retainer is damaged, or after:

- replacing the fuel rail.
- replacing the fuel line.
- replacing the fuel pump.
- replacing the fuel filter.
- replacing the EVAP canister.
- replacing the fuel fill pipe.
- replacing the fuel tank.
- removing the retainer from the line.

Use the same manufacturer retainer and the same size when the **replacing the retainer**.

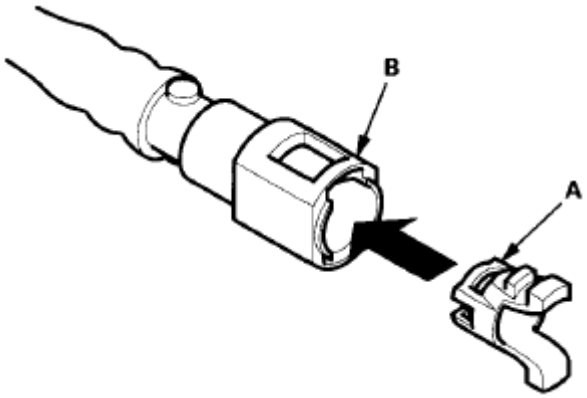

Fig. 85: Inserting Retainer Into Connector (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Before connecting a new fuel line/quick-connect fitting assembly (A), remove the old retainer (B) from the mating line.

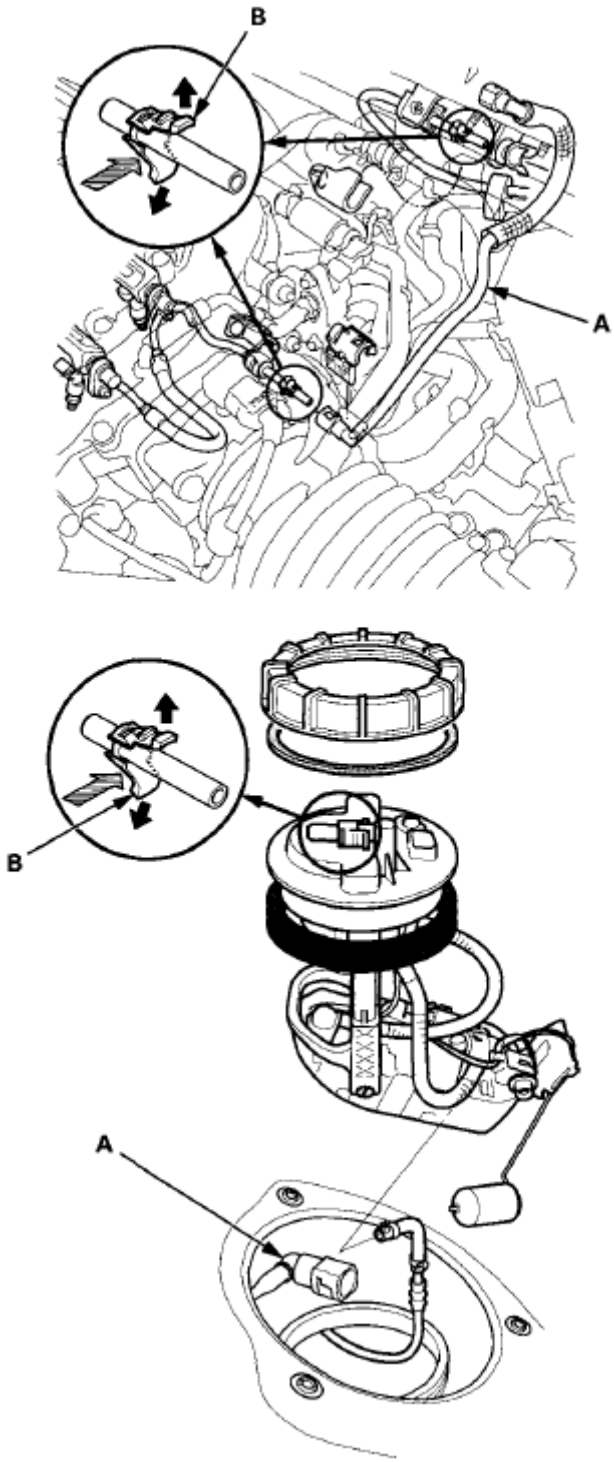

Fig. 86: Removing Retainer From Mating Line (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

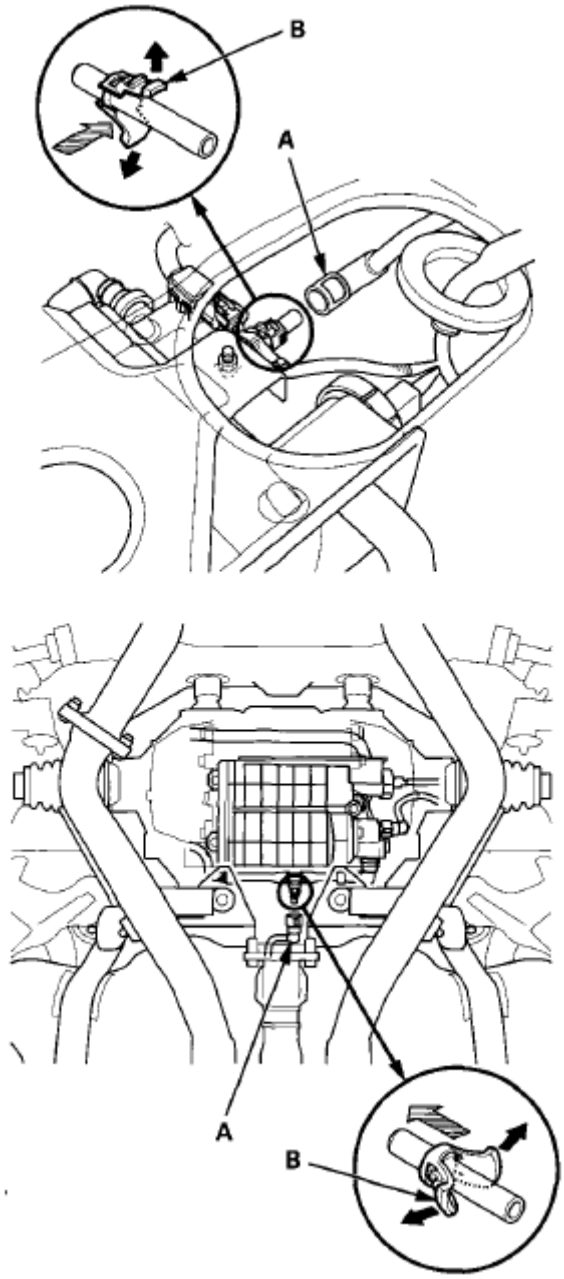

Fig. 87: Connecting Fuel Line/Quick-Connect Fitting Assembly - With SH-AWD (1 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

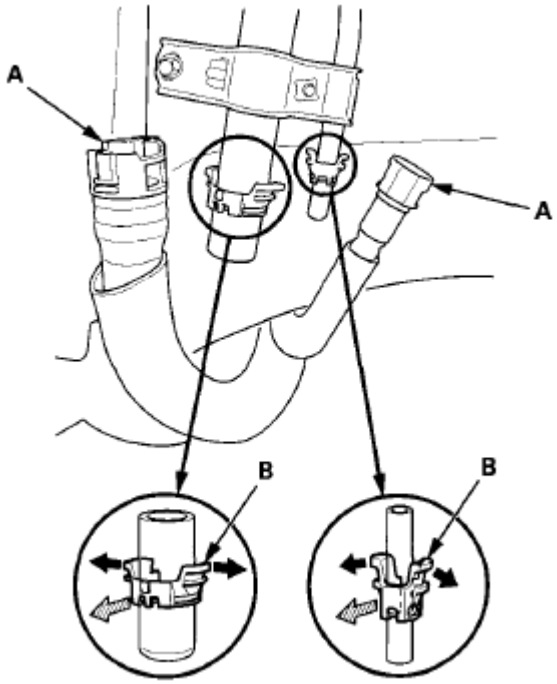

Fig. 88: Connecting Fuel Line/Quick-Connect Fitting Assembly - With SH-AWD (2 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Align the quick-connect fittings with the line (A), and align the retainer locking tabs (B) with the connector grooves (C). Then press the quick-connect fittings onto the line until both retainer tabs lock with a clicking sound.

NOTE: If it is hard to connect, put a small amount of new engine oil on the line end.

Connection with new retainer

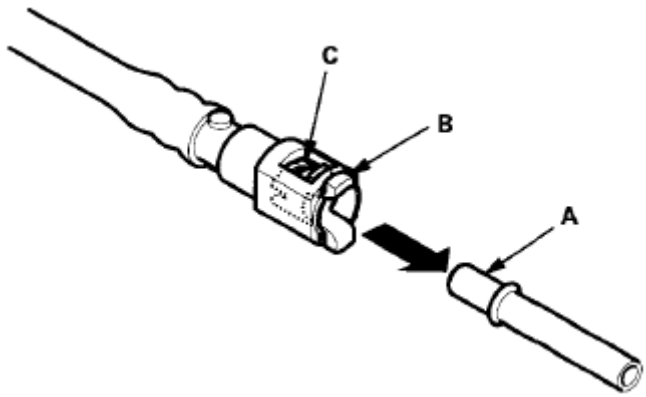

Fig. 89: Installing Fuel Line/Quick-Connect Fitting (Connection With Retainer)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connection with new retainer: Fuel fill neck tube

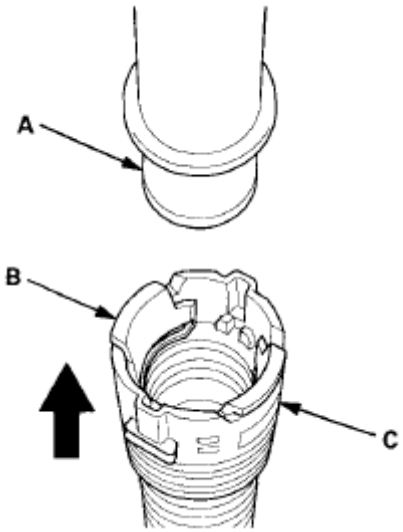

Fig. 90: Installing Fuel Line/Quick-Connect Fitting (Fuel Fill Neck Tube)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connection to new fuel line

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Reconnection to existing retainer

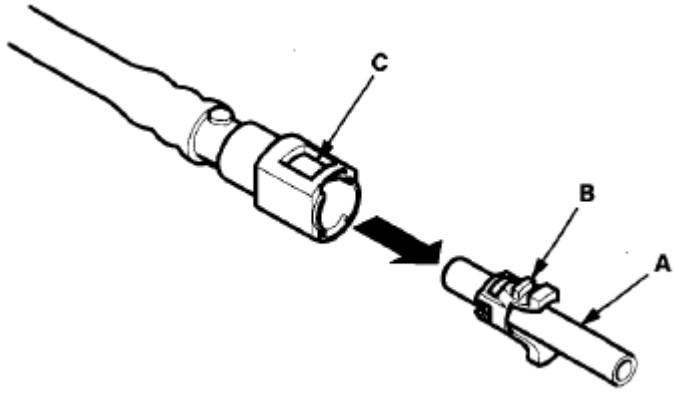

Fig. 93: Installing Fuel Line/Quick-Connect Fitting (Connecting To Retainer)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Reconnection to existing retainer: Fuel fill neck tube

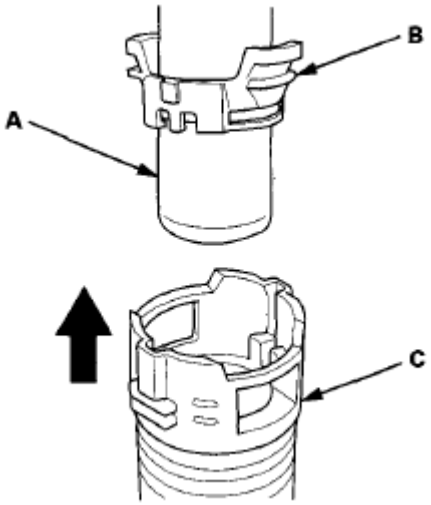

Fig. 94: Installing Fuel Line/Quick-Connect Fitting (Fuel Fill Neck Tube)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. When you reconnect the connector with the old retainer, make sure the connection is secure and the tabs (A) are firmly locked into place; check visually and also by pulling the connector (B). When you replace the fuel line with a new one, make sure you remove the ring pull (C) upwards after you confirm the connection is secure.

NOTE: Before you remove the ring pull, make sure the fuel line connection is secure. If the connection is not secure, the ring pull could break when you try to remove it.

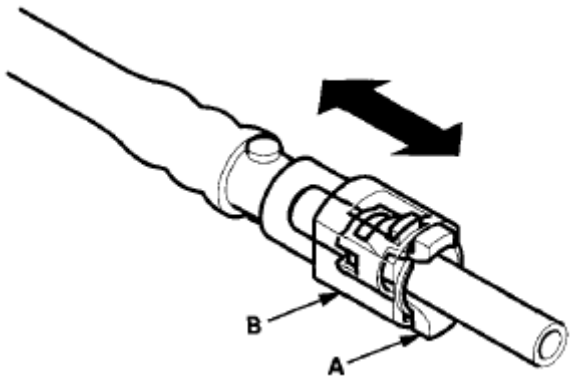

Fig. 95: Connecting Connector With Retainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connection to new fuel line

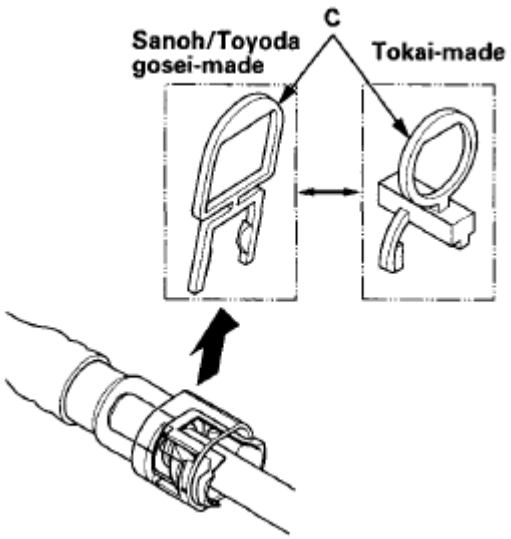

Fig. 96: Connecting To Fuel Line
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Reconnect the negative cable to the battery, and turn the ignition switch to ON (II) or press the engine start/stop button to select the ON mode (but do not operate the starter motor). The fuel pump runs for about 2 seconds, and fuel pressure rises. Repeat this two or three times, then make sure there are no fuel leaks.
7. If equipped, install the quick-connect fitting cover. Set the groove of the cover (A) on the fuel line (B) as shown, then install it. Make sure the cover is firmly locked in place.

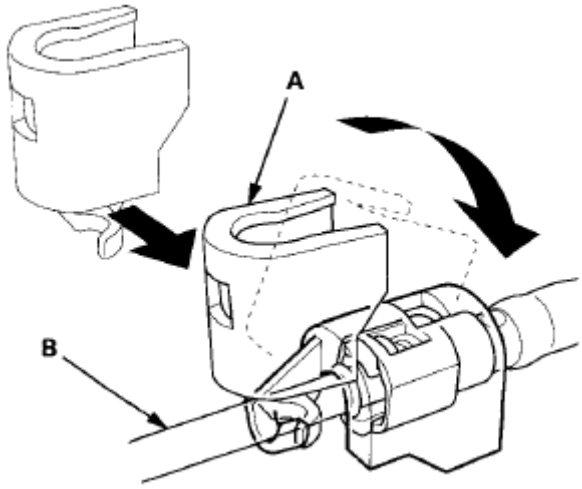

Fig. 97: Installing Quick-Connect Fitting Cover

FUEL TANK UNIT REMOVAL AND INSTALLATION

Special Tools Required

Fuel Sender Wrench 07AAA-S0XA100

REMOVAL (WITHOUT SH-AWD)

1. **Relieve the fuel pressure**.
2. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
3. Remove the access panel (A) from the floor.

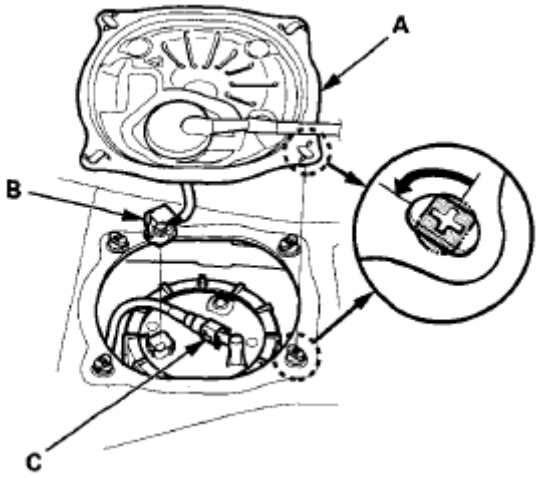

Fig. 98: Removing Access Panel From Floor (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the fuel tank unit 4P connector (B).
5. Disconnect the quick-connect fitting (C) from the fuel tank unit.
6. Using the special tool, loosen the locknut (A).

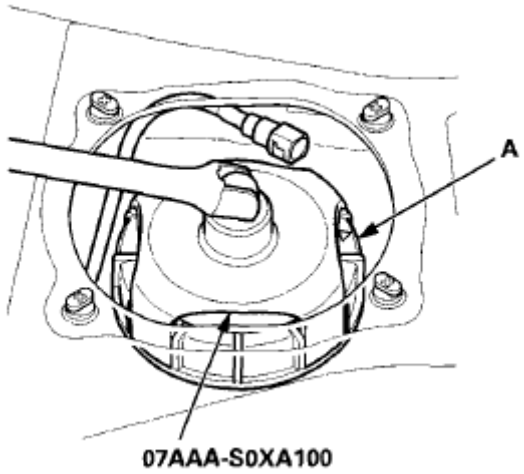

Fig. 99: Loosening Locknut Using Special Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the locknut (A) and the fuel tank unit (B).

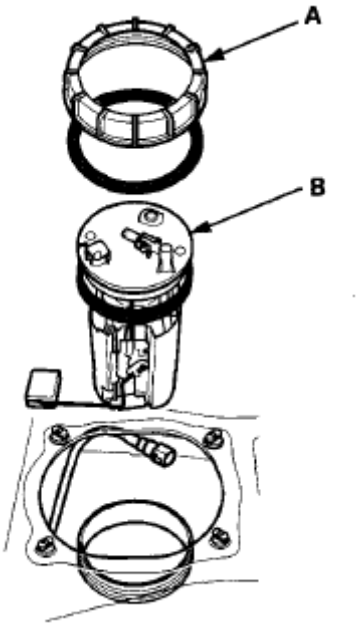

Fig. 100: Identifying Locknut And Fuel Tank Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION (WITHOUT SH-AWD)

1. Temporarily attach a new base gasket (A) to the fuel tank unit (B), then insert the fuel tank unit partially into the fuel tank.

NOTE:

- **Be careful not to damage the new base gasket.**
- **Be careful not to bend the fuel gauge sending unit.**
- **Do not coat the base gasket with oil.**

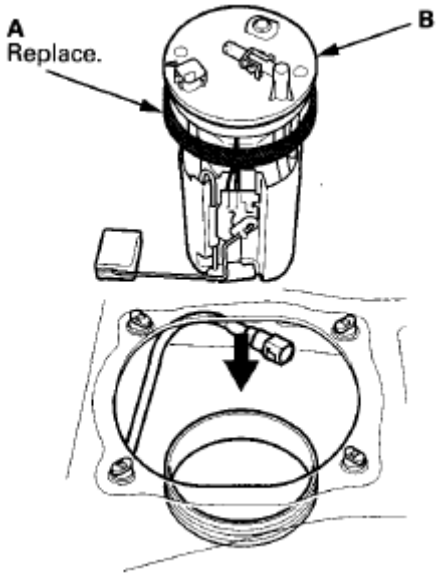

Fig. 101: Inserting Fuel Tank Unit Partially Into Fuel Tank
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Transfer the base gasket (A) from the fuel tank unit to the fuel tank.

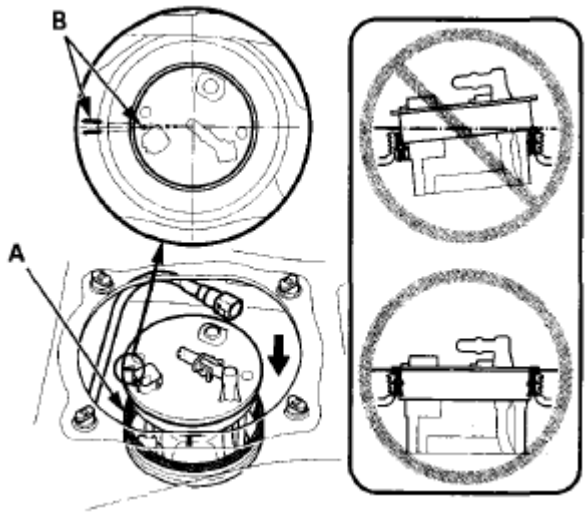

Fig. 102: Identifying Proper And Improper Position For Transferring Base Gasket From Fuel Tank Unit To Fuel Tank
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Align the marks (B) on the fuel tank and fuel tank unit, then insert the fuel tank unit into the fuel tank until the fuel tank unit rests on top of the base gasket.

NOTE: To avoid a fuel leak, check the base gasket, visually or by hand, to make sure it is not pinched.

4. Tighten a new locknut (A) by hand with a new locknut plate (B).

NOTE: Before tightening, align the mark (C) on the locknut with the start of the threads (D).

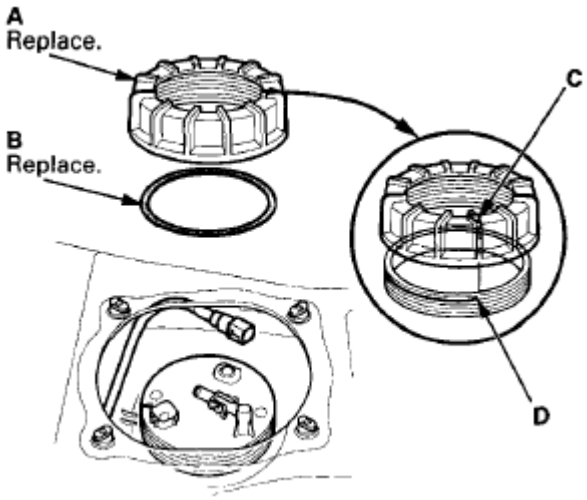

Fig. 103: Identifying Alignment Mark On Locknut And Start Of Threads
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Using the special tool, tighten the locknut to the specified torque.

NOTE:

- **After tightening, make sure the marks (A) are still aligned.**
- **After installation, check the base gasket, visually or by hand, to make sure it is not pinched.**

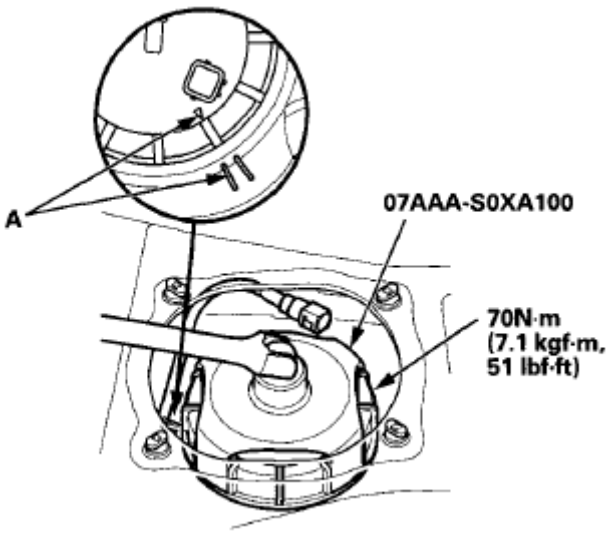

Fig. 104: Tightening Locknut Using Special Tool With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Connect the fuel tank unit 4P connector, then connect the quick-connect fitting.
7. Reconnect the negative cable to the battery, and turn the ignition switch to ON (II) or press the engine start/stop button to select the ON mode (but do not operate the starter motor). The fuel pump runs for about 2 seconds, and fuel pressure rises. Repeat this two or three times, then make sure there are no fuel leaks.
8. Install the access panel.
9. Install the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
10. Install the fuel fill cap.

Special Tools Required

Fuel Sender Wrench 07AAA-S0XA100

REMOVAL (WITH SH-AWD)

1. **Relieve the fuel pressure**.
2. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
3. Remove the access panel (A) from the left side of the floor.

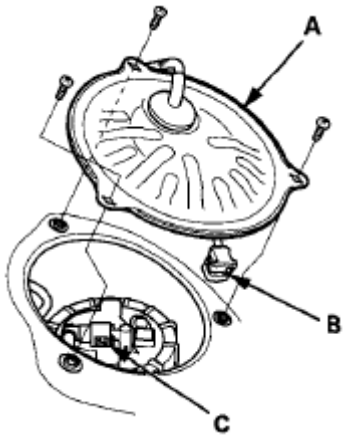

Fig. 105: Identifying Access Panel, Connector And Quick-Connect Fitting
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the fuel tank unit 4P connector (B).
5. Disconnect the quick-connect fitting (C) from the fuel tank unit.
6. Using the special tool, loosen the locknut (A).

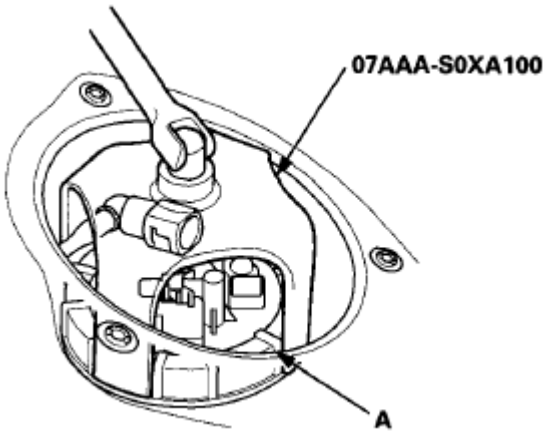

Fig. 106: Loosing Locknut By Using Special Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the locknut (A), and lift up the fuel tank unit (B).

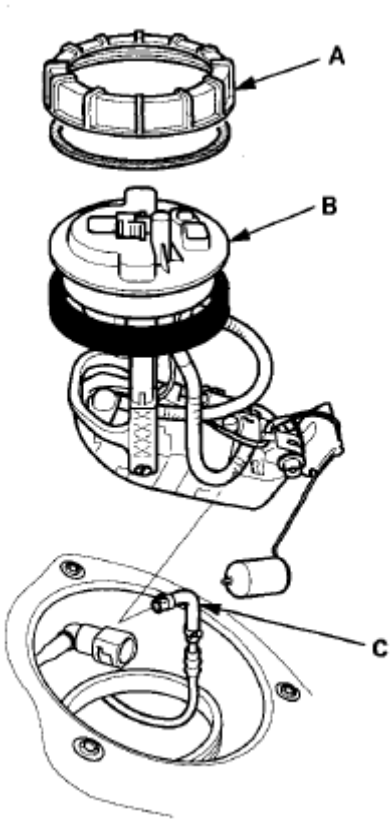

Fig. 107: Identifying Locknut, Fuel Tank Unit And Transfer Tube
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Disconnect the transfer tube (C), and remove the fuel tank unit.

INSTALLATION (WITH SH-AWD)

1. Temporarily attach a new base gasket (A) to the fuel tank unit (B), position the mark of the transfer tube (C) up, connect the transfer tube (D), then insert the fuel tank unit partially into the fuel tank.

NOTE:

- **Be careful not to damage the new base gasket.**
- **Make sure the clamp (E) is positioned as shown.**
- **Be careful not to bend the fuel gauge sending unit.**
- **Do not coat the base gasket with oil.**

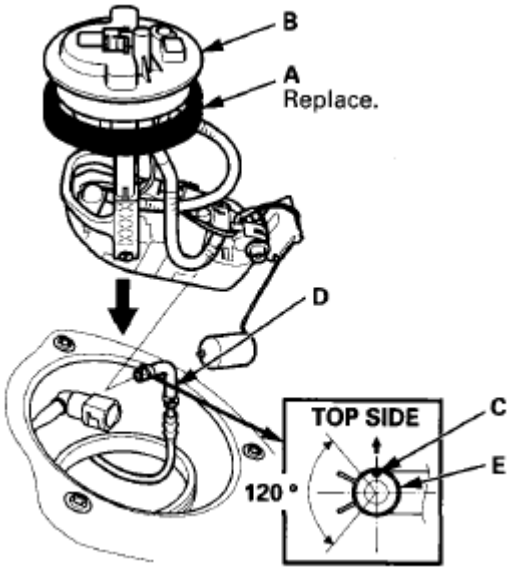

Fig. 108: Inserting Fuel Tank Unit Partially Into Fuel Tank (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Transfer the base gasket (A) from the fuel tank unit to the fuel tank.

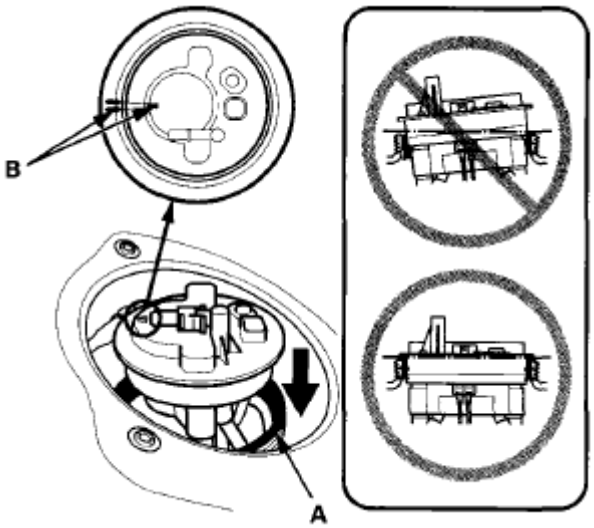

Fig. 109: Identifying Proper And Improper Position For Transferring Base Gasket From Fuel Tank Unit To Fuel Tank With Align Marks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Align the marks (B) on the fuel tank and the fuel tank unit, then insert it straight into the fuel tank. Make sure it evenly contacts the base gasket.

NOTE: To prevent a fuel leak, check the base gasket, visually or by hand, to make sure it is not pinched.

4. Tighten a new locknut (A) by hand with a new locknut plate (B).

NOTE: Before tightening, align the mark (C) on the locknut with the start of the threads (D).

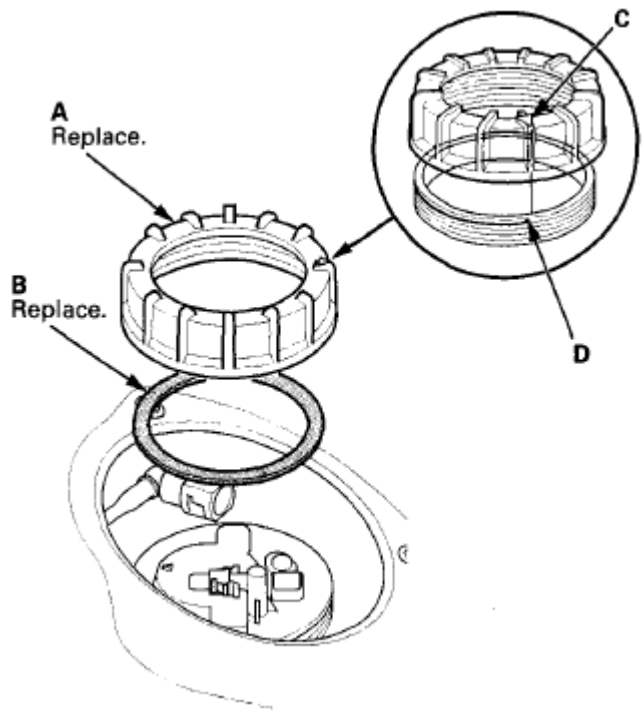

Fig. 110: Identifying Alignment Mark On Locknut And Start Of Threads
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Using the special tool, tighten the locknut to the specified torque.

NOTE:

- **After tightening, make sure the marks (A) are still aligned.**
- **After installation, check the base gasket, visually or by hand, to be sure it is not pinched.**

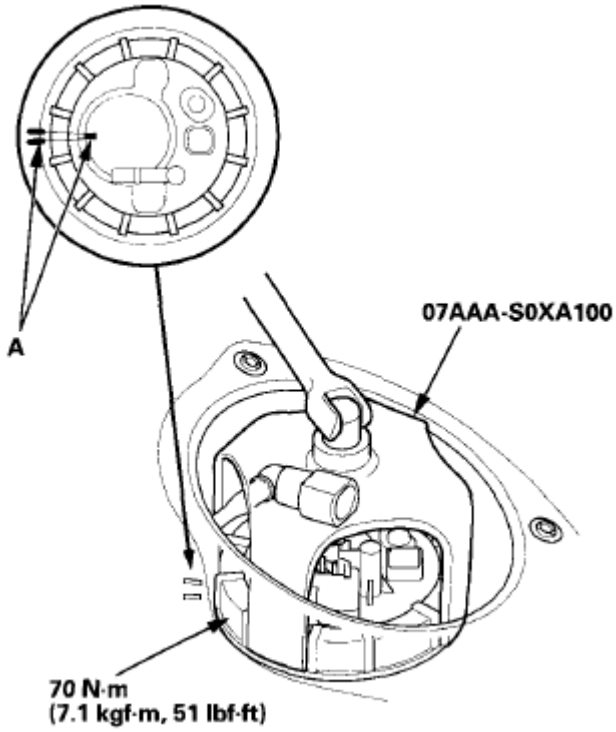

Fig. 111: Tightening Locknut Using Special Tool With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Connect the fuel tank unit 4P connector, then connect the quick-connect fitting.
7. Reconnect the negative cable to the battery, and turn the ignition switch to ON (II) or press the engine start/stop button to select the ON mode (but do not operate the starter motor). The fuel pump runs for about 2 seconds, and fuel pressure rises. Repeat two or three times, then make sure there are no fuel leaks.
8. Install the access panel.
9. Install the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
10. Install the fuel fill cap.

FUEL PRESSURE REGULATOR REPLACEMENT

WITHOUT SH-AWD

1. Remove the **fuel tank unit**.
2. Remove the reservoir (A).

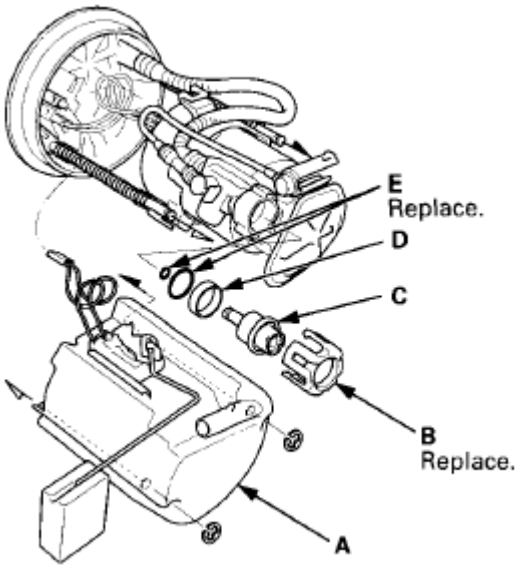

Fig. 112: Identifying Reservoir, Bracket, Pressure Regulator, Backup Ring And O-Rings (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the bracket (B).
4. Remove the fuel pressure regulator (C) and the backup ring (D).
5. Install the parts in the reverse order of removal with new O-rings (E) and a new bracket. When installing the fuel tank unit, align the marks on the **fuel tank unit and the fuel tank**.

NOTE:

- **Coat the O-rings with clean engine oil; do not use any other type oils or fluids.**
- **Do not pinch the O-rings during installation.**
- **Use all the new parts supplied in the pressure regulator replacement kit.**

WITH SH-AWD

1. Remove the **fuel tank unit**.
2. Remove the bracket (A).

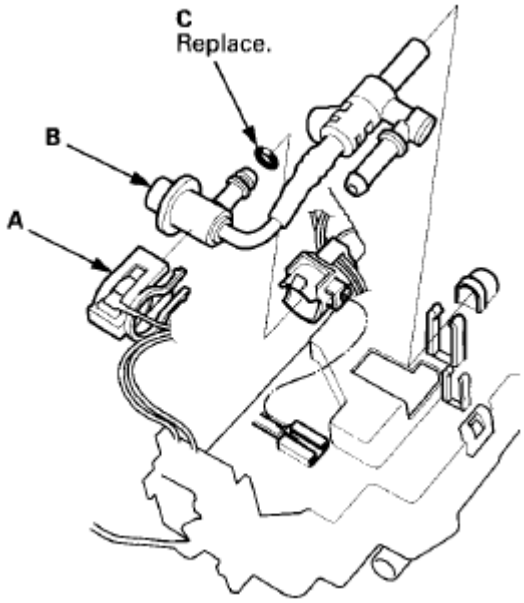

Fig. 113: Identifying Bracket, Pressure Regulator And O-Rings (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the pressure regulator (B).
4. Install the parts in the reverse order of removal with new O-ring (C). When installing the fuel tank unit, align the marks on the fuel tank unit and the **fuel tank**.

NOTE:

- **Coat the O-ring with clean engine oil; do not use any other oil or fluid.**
- **Do not pinch the O-ring during installation.**
- **Use all the new parts supplied in the pressure regulator replacement kit.**

FUEL FILTER REPLACEMENT

WITHOUT SH-AWD

The fuel filter should be replaced whenever the fuel pressure drops below the **specified value**, after making sure that the fuel pump and the fuel pressure regulator are OK.

1. Remove the **fuel tank unit**.
2. Remove the fuel filter set (A).

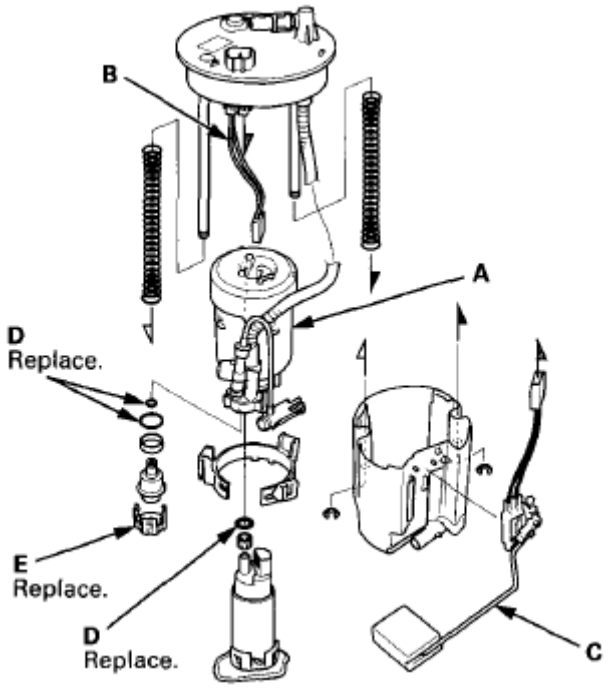

Fig. 114: Identifying Fuel Filter Set, Wire Harness, Fuel Gauge Sending Unit, O-Rings And Bracket (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check these items before installing the fuel tank unit:
   - When connecting the wire harness (B), make sure the connection is secure and the connectors are firmly locked into place.
   - When installing the fuel gauge sending unit (C), make sure the connection is secure and the connector is firmly locked into place. Be careful not to bend or twist it excessively.
4. Install the parts in the reverse order of removal with new O-rings (D) and a new bracket (E). When installing the fuel tank unit, align the marks on the **unit and the fuel tank**.

NOTE:
- **Coat the O-rings with clean engine oil; do not use any other oil or fluid.**
- **Do not pinch the O-rings during installation.**
- **Use all the new parts supplied in the fuel filter replacement kit.**

WITH SH-AWD

The fuel filter should be replaced whenever the fuel pressure drops below the **specified value**, after making sure that the fuel pump and fuel pressure regulator are OK.

1. Remove the **fuel tank unit**.
2. Remove the fuel filter set (A).

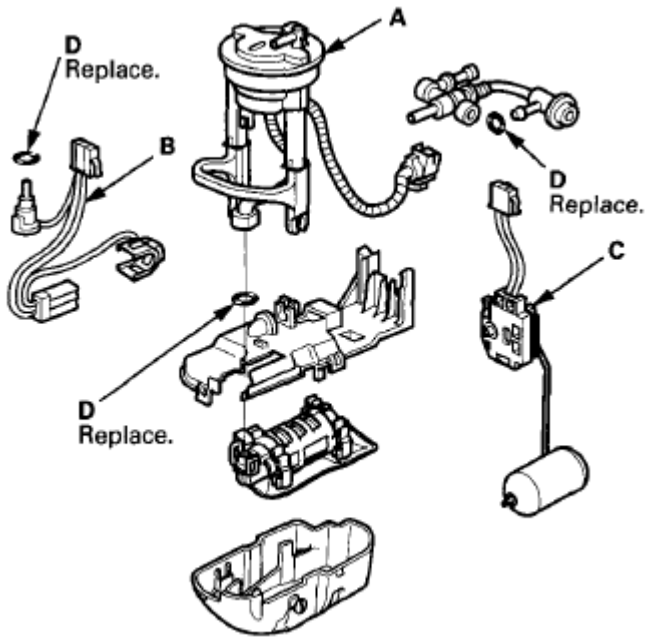

Fig. 115: Identifying Fuel Filter Set, Wire Harness, Fuel Gauge Sending Unit, O-Rings And Bracket (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check these items before installing the fuel tank unit:
   - When connecting the wire harness (B), make sure the connection is secure and the connectors are firmly locked into place.
   - When installing the fuel gauge sending unit (C), make sure the connection is secure and the connector is firmly locked into place. Be careful not to bend or twist it excessively.
4. Install the parts in the reverse order of removal with new O-rings (D). When installing the fuel tank unit, align the marks on the unit and the **fuel tank**.

NOTE:

- **Coat the O-rings with clean engine oil; do not use any other oil or fluid.**
- **Do not pinch the O-rings during installation.**
- **Use all the new parts supplied in the fuel filter replacement kit.**

FUEL PUMP/FUEL GAUGE SENDING UNIT REPLACEMENT

1. Remove the fuel tank unit; **without SH-AWD system**, **with SH-AWD system**.
2. Remove the fuel level sensor (fuel gauge sending unit) (A) from the fuel tank unit (B).

Without SH-AWD

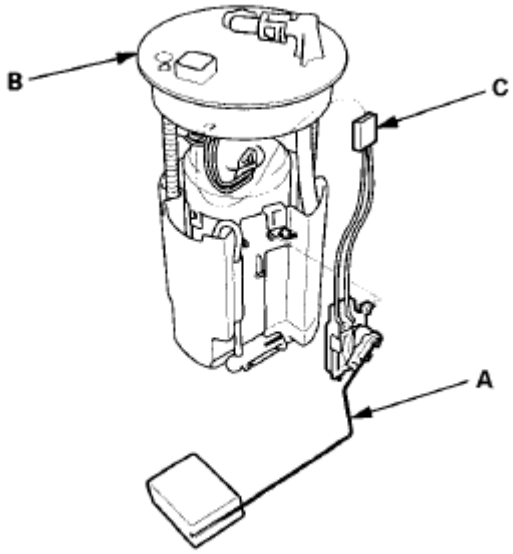

Fig. 116: Identifying Fuel Level Sensor, Fuel Tank Unit And Connector (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

With SH-AWD

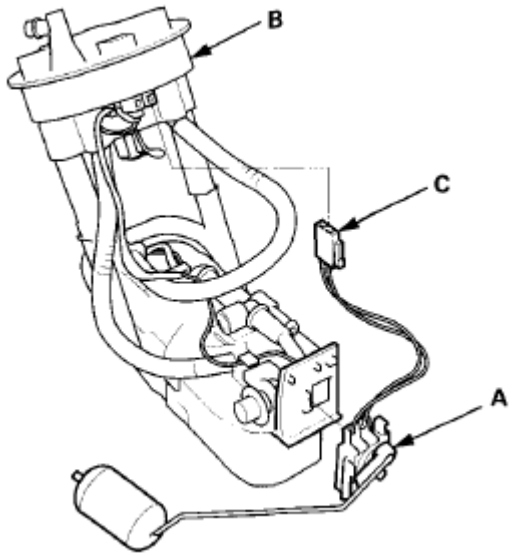

Fig. 117: Identifying Fuel Level Sensor, Fuel Tank Unit And Connector (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check these items before installing the fuel tank unit:
   - When connecting the wire harness, make sure the connection is secure and the connector (C) is firmly locked into place.
   - When installing the fuel gauge sending unit, make sure the connection is secure. Be careful not to bend or twist it excessively.
4. Install the parts in the reverse order of removal. When installing the fuel tank unit, align the marks on the

unit and the fuel tank; **without SH-AWD system**, or **with SH-AWD system**.

SECONDARY FUEL GAUGE SENDING UNIT REMOVAL/INSTALLATION

Special Tools Required

Fuel Sender Wrench 07AAA-S0XA100

REMOVAL (WITH SH-AWD)

1. **Relieve the fuel pressure**.
2. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
3. Remove the access panel (A) from the right side of the floor.

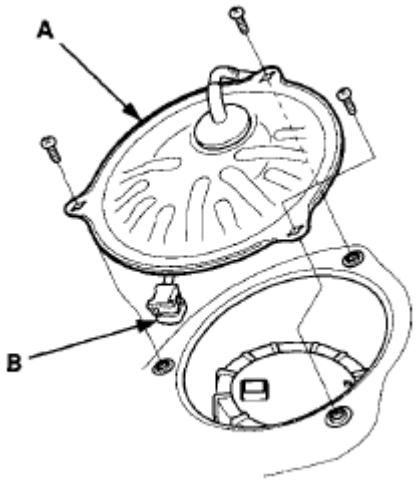

Fig. 118: Identifying Access Panel And Fuel Gauge Sending Unit 4P Connector (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the secondary fuel gauge sending unit 4P connector (B).
5. Using the special tool, loosen the locknut (A).

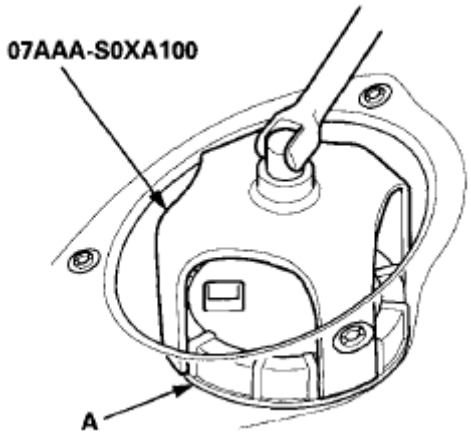

Fig. 119: Loosening Locknut Using Special Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the locknut (A), and lift up the secondary fuel gauge sending unit (B) from the fuel tank.

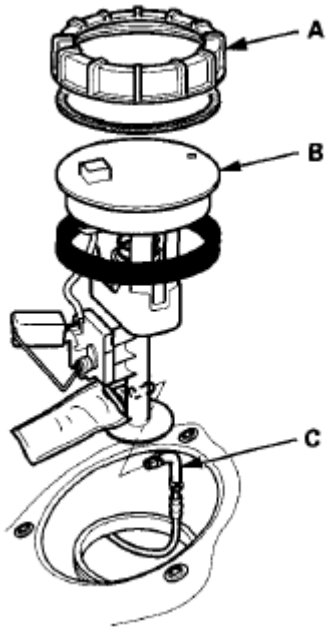

Fig. 120: Identifying Locknut, Secondary Fuel Gauge Sending Unit And Transfer Tube
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect the transfer tube (C), and remove the secondary fuel gauge sending unit.

INSTALLATION (WITH SH-AWD)

1. Temporarily attach a new base gasket (A) to the secondary fuel gauge sending unit (B), position the mark on the transfer tube (C) up, connect the transfer tube (D), then insert the secondary fuel gauge sending unit partially into the fuel tank.

NOTE:

- **Be careful not to damage the new base gasket.**
- **Make sure the clamp (E) is positioned as shown.**
- **Be careful not to bend the secondary fuel gauge sending unit.**
- **Do not coat the base gasket with oil.**

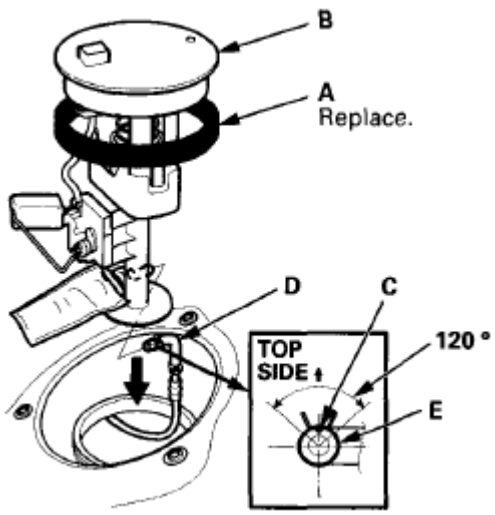

Fig. 121: Inserting Secondary Fuel Gauge Sending Unit Partially Into Fuel Tank
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Transfer the base gasket (A) from the secondary fuel gauge sending unit to the fuel tank.

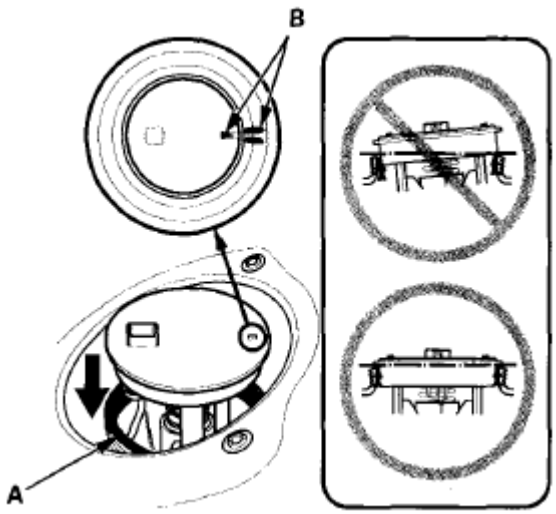

Fig. 122: Identifying Proper And Improper Position For Transfer Base Gasket From Secondary Fuel Gauge Sending Unit To Fuel Tank
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Align the marks (B) on the fuel tank and the secondary fuel gauge sending unit, then insert the secondary fuel gauge sending unit, straight into the fuel tank. Make sure it evenly contacts the base gasket.

NOTE: To avoid a fuel leak, check the base gasket, visually or by hand, to make sure it is not pinched.

4. Tighten a new locknut (A) by hand with a new locknut plate (B).

NOTE: Before tightening, align the mark (C) on the locknut with the start of the threads (D).

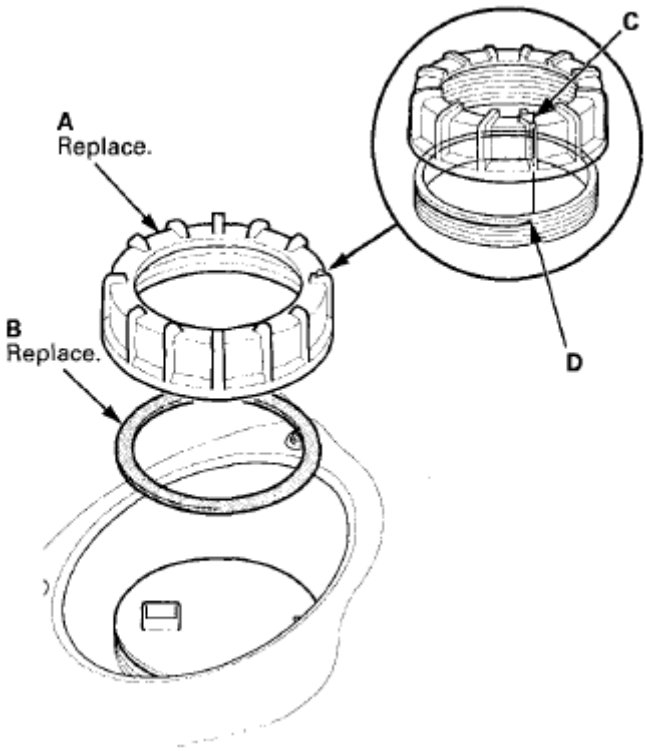

Fig. 123: Identifying Alignment Mark On Locknut And Start Of Threads
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Using the tool, tighten the locknut to the specified torque.

NOTE:

- **After tightening, make sure the marks (A) are still aligned.**
- **After installation, check the base gasket, visually or by hand, to be sure it is not pinched.**

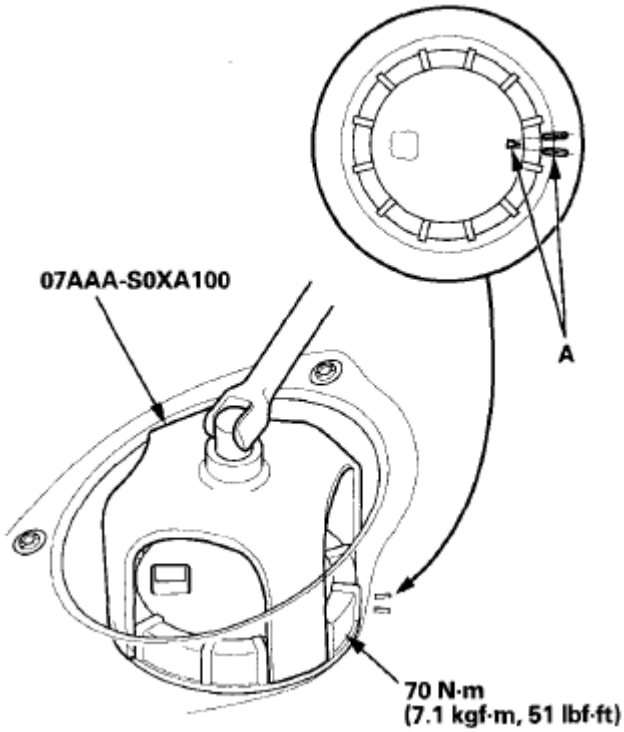

Fig. 124: Tightening Locknut With Alignment Mark Using Tool With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Connect the secondary fuel gauge sending unit 4P connector.
7. Install the parts in the reverse order of removal.

FUEL TANK REPLACEMENT

WITHOUT SH-AWD

1. **Drain the fuel tank**.
2. Reinstall the fuel tank unit without connecting the fuel tank unit 4P connector and the **quick-connect fitting**.
3. Remove the fuel fill pipe cover (see step 3).
4. Disconnect the **quick-connect fittings (A)**, and the fuel fill tube (B) from the fuel fill pipe. Slide back the clamps, then twist the hose as you pull to avoid damaging it.

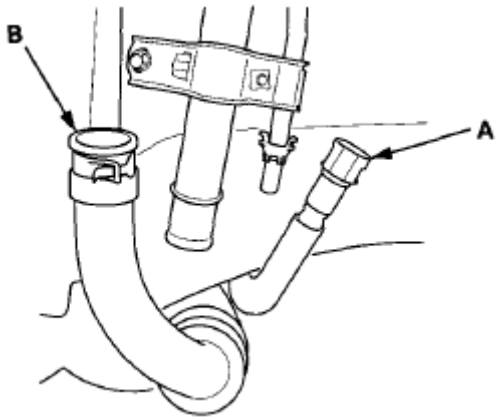

Fig. 125: Identifying Quick-Connect Fittings And Fuel Fill Tube (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Raise the vehicle on a lift.
6. Disconnect the hose (A) from the EVAP canister.

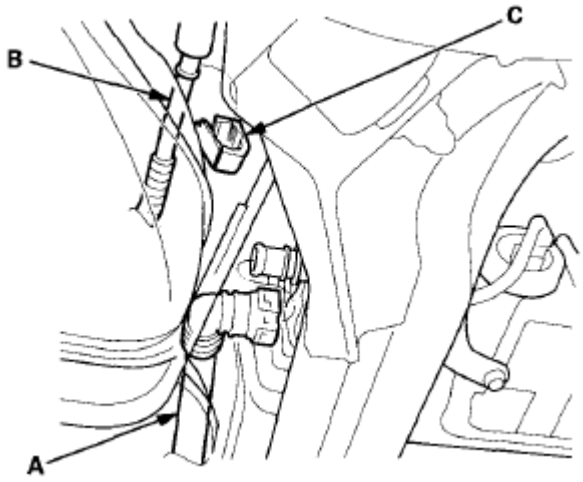

Fig. 126: Identifying Clamp And Hoses
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the hose (B) from the clamp (C).

NOTE: Be careful not to damage the hose.

8. Remove the exhaust pipe (see **EXHAUST PIPE AND MUFFLER REPLACEMENT**).
9. Remove the middle floor undercover (see **MIDDLE FLOOR UNDERCOVER REPLACEMENT**).
10. Remove the fuel tank protector (A).

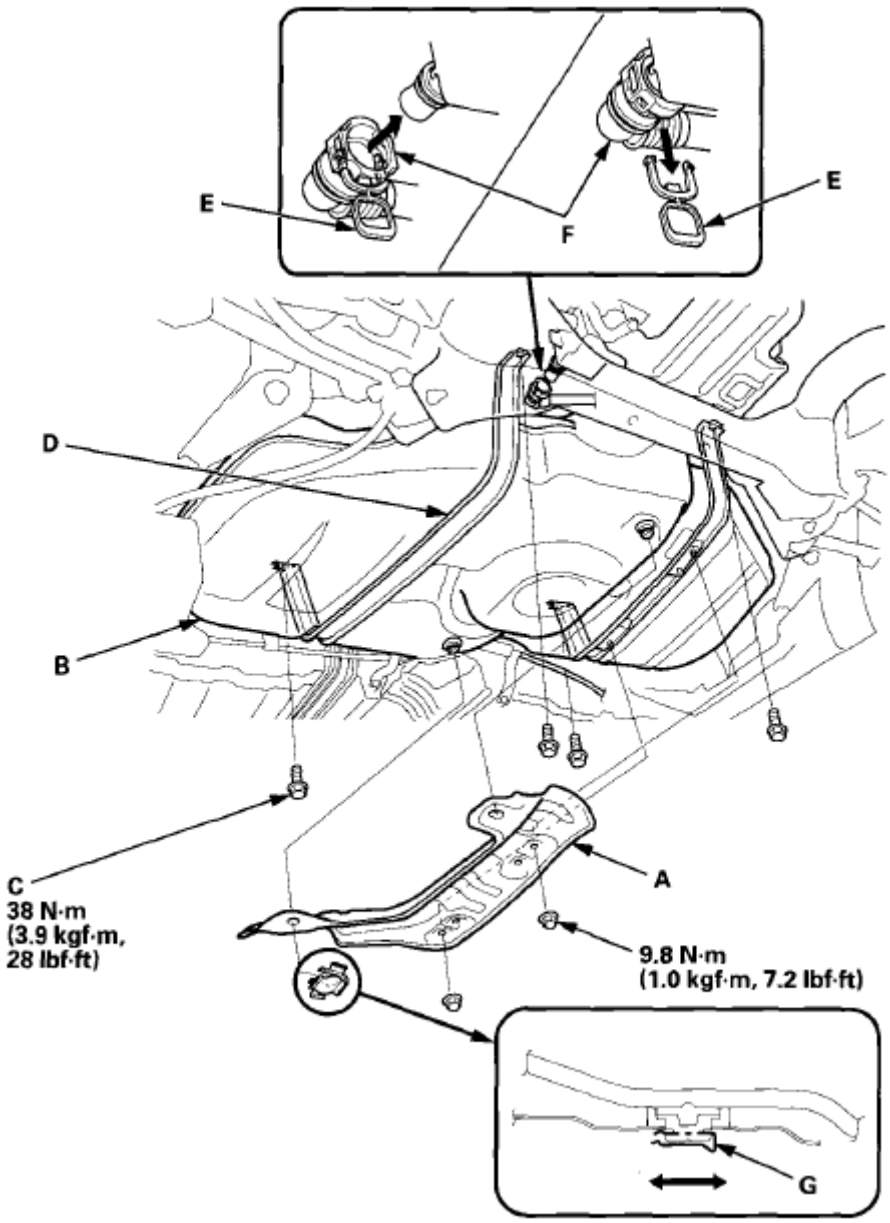

Fig. 127: Identifying Fuel Tank Components With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Remove the right parking brake cable mounting bolts (see **PARKING BRAKE CABLE REPLACEMENT**).
12. Place a jack or other support under the fuel tank (B).
13. Remove the strap bolts (C) and the straps (D).
14. Remove the fuel tank.
15. Install the parts in the reverse order of removal.

NOTE:

- **New fuel tanks have ring pull (E) at the fuel vapor hose connector (F).**

When you connect the hose and confirm that the connection is secure, remove the ring pull by pulling it down.

- **Before connecting the fuel fill pipe and the quick-connect fitting, check for dirt, and clean it if needed, taking care not to damage the fuel fill pipe and other parts.**
- **When installing the fuel tank protector, make sure to insert it into the clip (G) in the direction shown.**

WITH SH-AWD

1. **Drain the fuel tank**.
2. Reinstall the fuel tank unit without connecting the connector and the **quick-connect fitting**, and reinstall secondary fuel gauge sending unit **without connecting the connector**.
3. Remove the **fuel fill pipe cover**.
4. Disconnect the quick-connect fittings from the fuel fill pipe (see step 4).
5. Raise the vehicle on a lift.
6. Remove the exhaust pipe (see **J37A4 ENGINE (WITH SH-AWD)**).
7. Remove the propeller shaft (see **PROPELLER SHAFT REMOVAL**).
8. Place a jack or other support under the fuel tank (A).

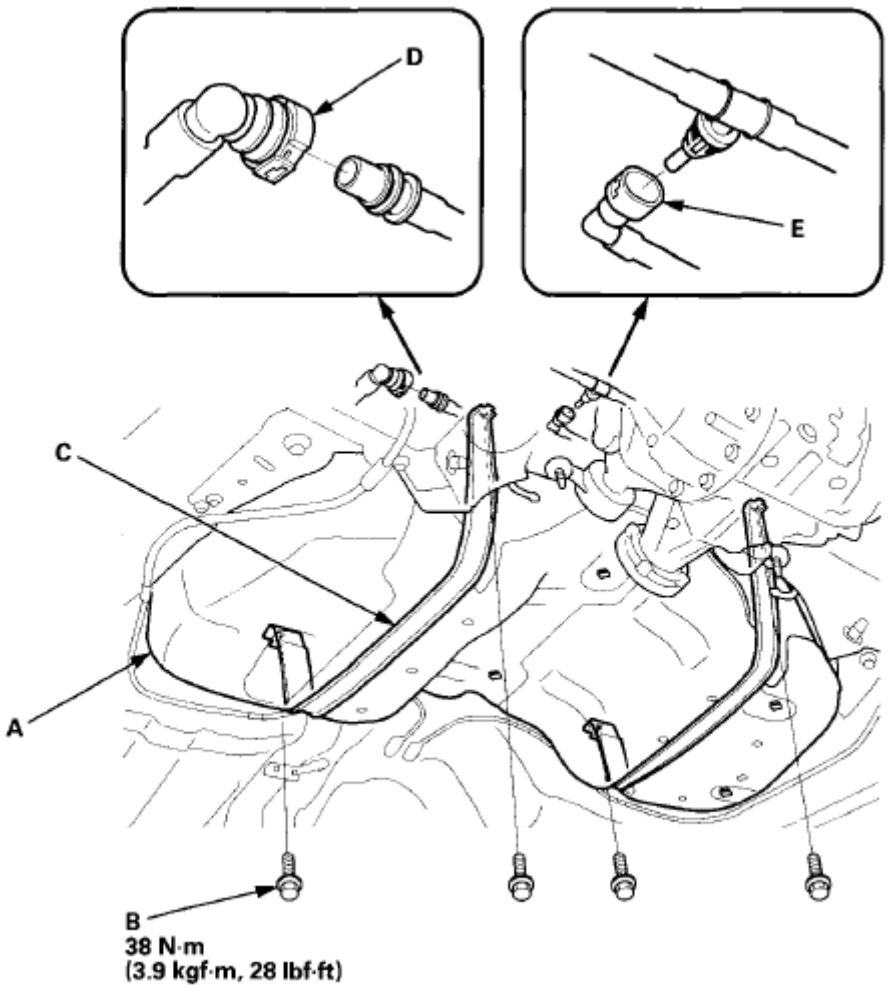

Fig. 128: Installing Jack Or Other Support Under Fuel Tank With Torque Specifications (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the strap bolts (B) and the straps (C).
10. Slowly lower the fuel tank, and disconnect the hose (D) and the quick-connect fitting (E).
11. Remove the fuel tank.
12. Remove the fuel tank protector (A) from the fuel tank.

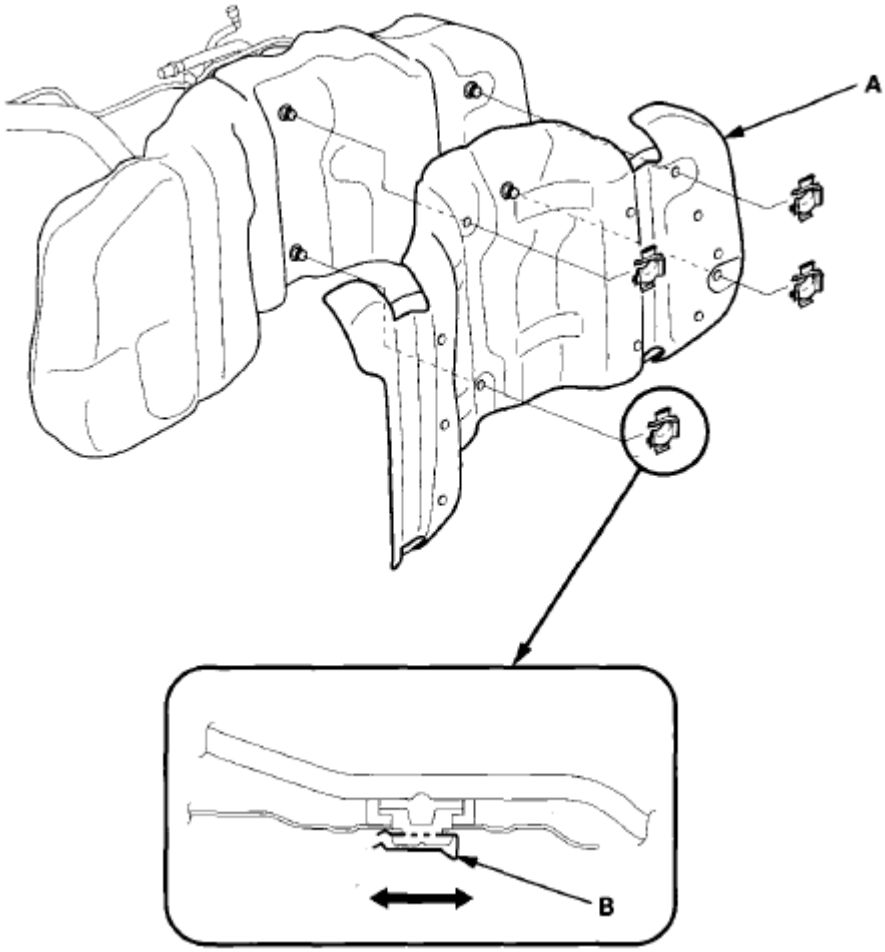

Fig. 129: Identifying Fuel Tank Protector And Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Install the parts in the reverse order of removal.

NOTE:

- **When installing the fuel tank protector, make sure to insert it into the clip (B) in the direction shown.**
- **Before connecting the fuel fill pipe and the quick-connect fittings, check for dirt, and clean them if needed, taking care not to damage the fuel fill pipe and other parts.**

FUEL FILL PIPE REMOVAL/INSTALLATION

1. **Drain the fuel tank**.
2. Remove the left rear wheel.
3. Remove the fuel fill pipe cover (A).

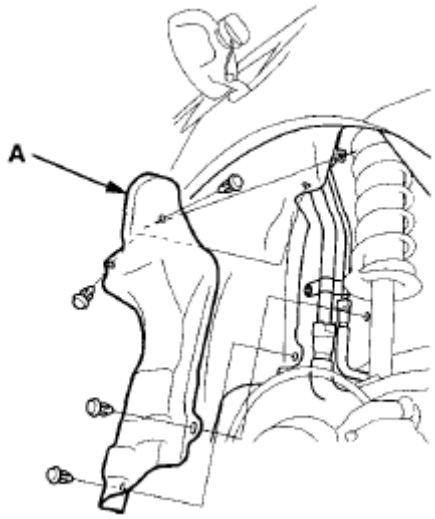

Fig. 130: Identifying Fuel Fill Pipe Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the fuel fill tube:
   - Without SH-AWD: Disconnect the **quick-connect fitting (A)**, and disconnect the fuel fill tube (B) from the fuel fill pipe by sliding back the clamp on the fuel fill tube, then twist the hose as you pull to avoid damaging the hose or pipe.
   - With SH-AWD: Disconnect the **quick-connect fittings (A)**.

Without SH-AWD

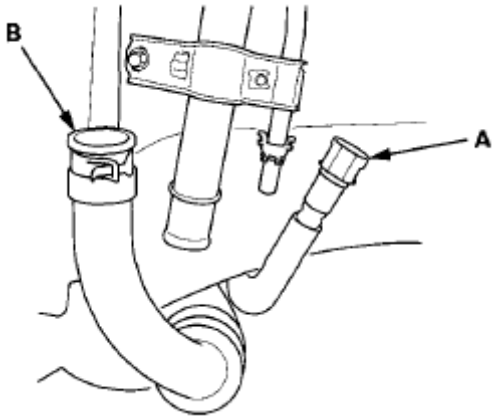

Fig. 131: Identifying Fuel Fill Tube And Quick-Connect Fitting (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

With SH-AWD

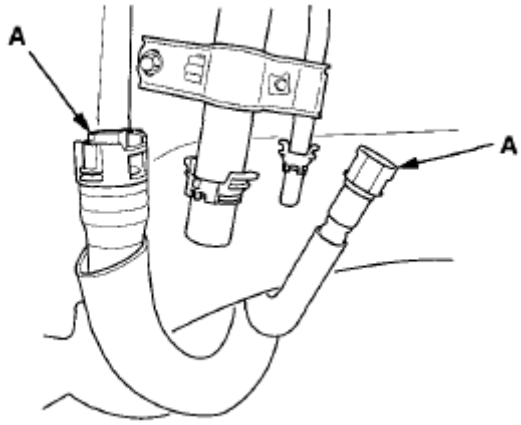

Fig. 132: Identifying Fuel Fill Tube And Quick-Connect Fitting (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the fuel fill pipe (A).

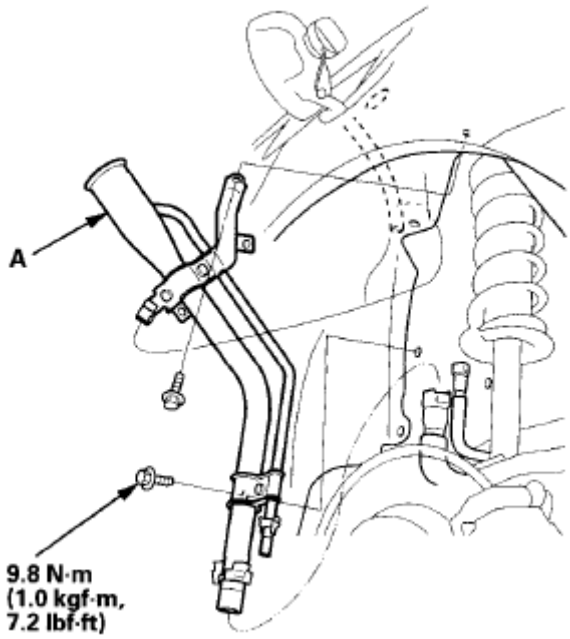

Fig. 133: Identifying Fuel Fill Pipe With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the parts in the reverse order of removal.

NOTE: Before connecting the fuel fill pipe and the quick-connect fitting, check for dirt, and clean it if needed, taking care not to damage the fuel fill pipe and other parts.

FUEL GAUGE SENDING UNIT TEST

WITHOUT SH-AWD

NOTE: For the fuel gauge system circuit diagram, refer to the Gauges Circuit Diagram (see CIRCUIT DIAGRAM).

1. Check the No. 12 METER (7.5 A) fuse in the driver's under-dash fuse/relay box before testing.
2. Check for body electrical system DTCs.
   - If no problem is found, go to step 3.
   - If DTC B1175 or B1176 is indicated, go to the indicated DTC's troubleshooting.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
5. Remove the access panel (A) from the floor.

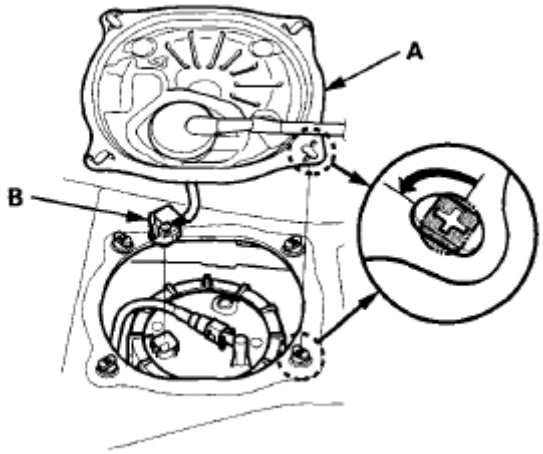

Fig. 134: Removing Access Panel From Floor (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Disconnect the fuel tank unit 4P connector (B).
7. Measure the voltage between fuel tank unit 4P connector terminals No. 1 and No. 3 with the ignition switch turned to ON (II), or press the engine start/stop button to select the ON mode. There should be battery voltage.
   - If the voltage is OK, go to step 8.
   - If the voltage is not as specified, check for:
     - a short in the PUR wire to ground.
     - an open in the PUR or the ORN wire.

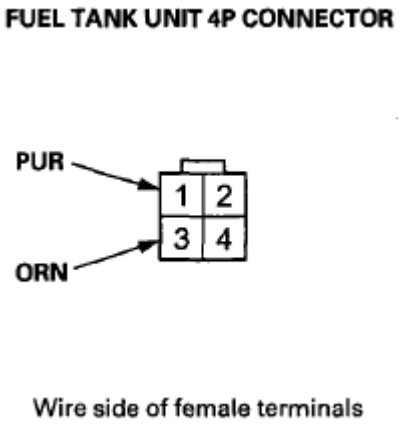

Fig. 135: Identifying Fuel Tank Unit 4P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Remove the fuel tank unit from the **fuel tank**.
10. Measure the resistance between fuel tank unit 4P connector terminals No. 1 and No. 3 with the float at E (EMPTY), LOW (LOW FUEL INDICATOR), 1/2 (HALF FULL), and F (FULL) positions.

    If you do not get the following readings, replace the **fuel gauge sending unit**.

Float Position	F 6.1 in (155.2 mm)	1/2 3.8 in (97.6 mm)	LOW 1.6 in (40.8 mm)	E 0.6 in (15.9 mm)
Resistance (ohms)	19 to 21	196.7 to 206.7	503.8 to 589.4	772 to 788

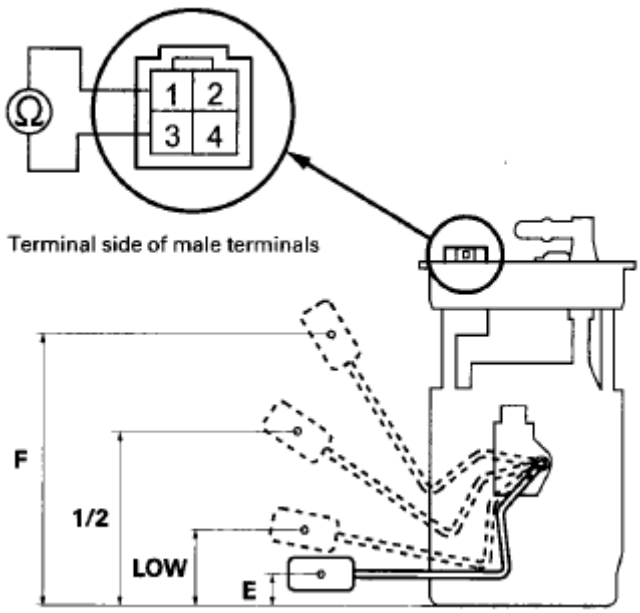

Fig. 136: Measuring Resistance Between Fuel Tank Unit 4P Connector Terminals No. 1 And No. 3

With Float At Specified Positions
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Reconnect the fuel tank unit 4P connector.
12. Remove the No. 15 BACK UP (10 A) fuse from the under-hood fuse/relay box for at least 10 seconds, then reinstall it.
13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Check that the pointer of the fuel gauge indicates F with the float at F.
    - If the pointer of the fuel gauge does not indicate F, replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).
    - If the gauge is OK, the test is complete.

NOTE:
- **The pointer of the fuel gauge returns to the bottom of the gauge dial when the ignition switch is in ACC (I) and LOCK (0) or when the vehicle is in ACC or OFF mode, regardless of the fuel level.**
- **Remove the No. 15 BACK UP (10 A) fuse from the under-hood fuse/relay box for at least 10 seconds after completing troubleshooting, otherwise it may take up to 20 minutes for the fuel gauge to indicate the correct fuel level.**

WITH SH-AWD

NOTE: For the fuel gauge system circuit diagram, refer to the Gauges Circuit Diagram (see CIRCUIT DIAGRAM).

1. Check the No. 12 METER (7.5 A) fuse in the under-dash fuse/relay box before testing.
2. Check for body electrical system DTCs.
    - If no problem is found, go to step 3.
    - If DTC B1175 or B1176 is indicated, go to the indicated DTC's troubleshooting.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
5. Remove the access panel (A) from the left side of the floor.

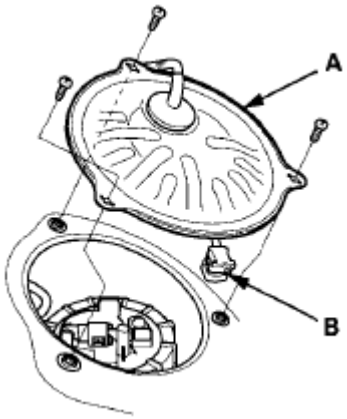

Fig. 137: Identifying Access Panel And Fuel Tank Unit 4P Connector (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Disconnect the fuel tank unit 4P connector (B).
7. Remove the fuel tank unit from the **fuel tank**.
8. Measure the resistance between the No. 1 and No. 3 terminals of the fuel tank unit 4P connector with the float at E (EMPTY), LOW (LOW FUEL INDICATOR), and F (FULL) positions.
   - If you do not get the following readings, replace the **fuel gauge sending unit**.
   - If the fuel gauge sending unit test is OK, do the **secondary fuel gauge sending unit test**.

Float Position	F 6.7 in (169.5 mm)	LOW 2.8 in (70.7 mm)	E 1.2 in (30.2 mm)
Resistance (ohms)	9 to 11	235.8 to 280	336.8 to 343.8

NOTE: Remove the No. 15 BACK UP (10 A) fuse from the under-hood fuse/relay box for at least 30 seconds after completing troubleshooting, otherwise it may take up to 20 minutes for the fuel gauge to indicate the correct fuel level.

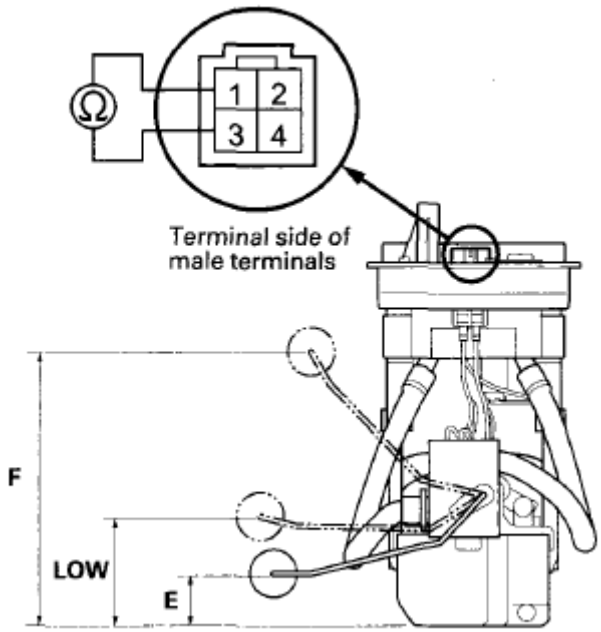

Fig. 138: Measuring Resistance Between No. 1 And No. 3 Terminals Of Fuel Tank Unit 4P Connector With Float Positions
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SECONDARY FUEL GAUGE SENDING UNIT TEST

WITH SH-AWD

1. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
2. Remove the access panel (A) from the right side of the floor.

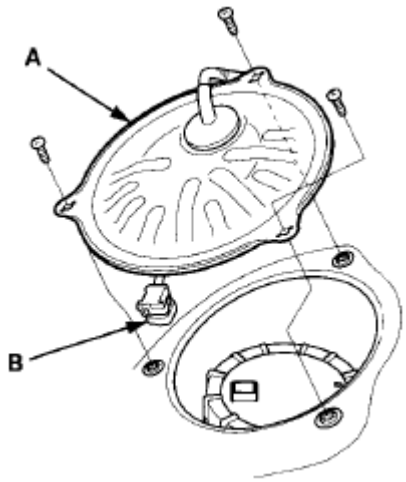

Fig. 139: Identifying Access Panel And Fuel Tank Unit 4P Connector (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the secondary fuel gauge sending unit 4P connector (B).
4. Remove the **secondary fuel gauge sending unit from the fuel tank**.
5. Measure the resistance between the No. 1 and No. 3 terminals of the secondary fuel gauge sending unit 4P connector with the float at E (EMPTY), 1/2 (HALF FULL), and F (FULL) positions.

Float Position	F 6.9 in (176.1 mm)	1/2 1.3 in (33.3 mm)	E 1.1 in (27.8 mm)
Resistance (ohms)	9 to 11	453.2 to 444.2	453.2 to 444.2

NOTE: Remove the No. 15 BACK UP (10 A) fuse from the under-hood fuse/relay box for at least 10 seconds after completing troubleshooting, otherwise it may take up to 20 minutes for the fuel gauge to indicate the correct fuel level.

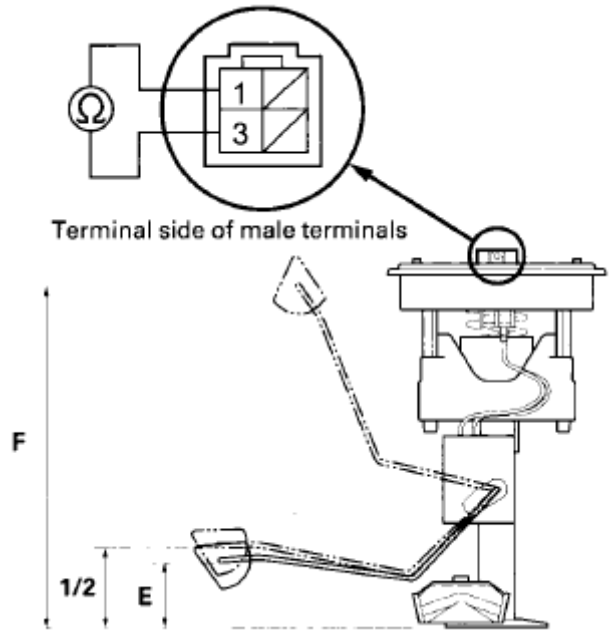

Fig. 140: Measuring Resistance Between No. 1 And No. 3 Terminals Of Fuel Tank Unit 4P Connector With Float Positions
Courtesy of AMERICAN HONDA MOTOR CO., INC.

LOW FUEL INDICATOR TEST

1. Do the gauge self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).
   - If the low fuel indicator flashes, go to step 2.
   - If the low fuel indicator does not flash, replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).
2. Check for body electrical system DTCs.
   - If any DTCs are indicated, do the indicated DTC's troubleshooting.
   - If no DTCs are indicated, go to step 3.

3. Do the fuel gauge sending unit test; **without SH-AWD**, or **with SH-AWD** and **secondary fuel gauge sending unit test**.

2012 ENGINE PERFORMANCE

Idle Control System - TL

COMPONENT LOCATION INDEX

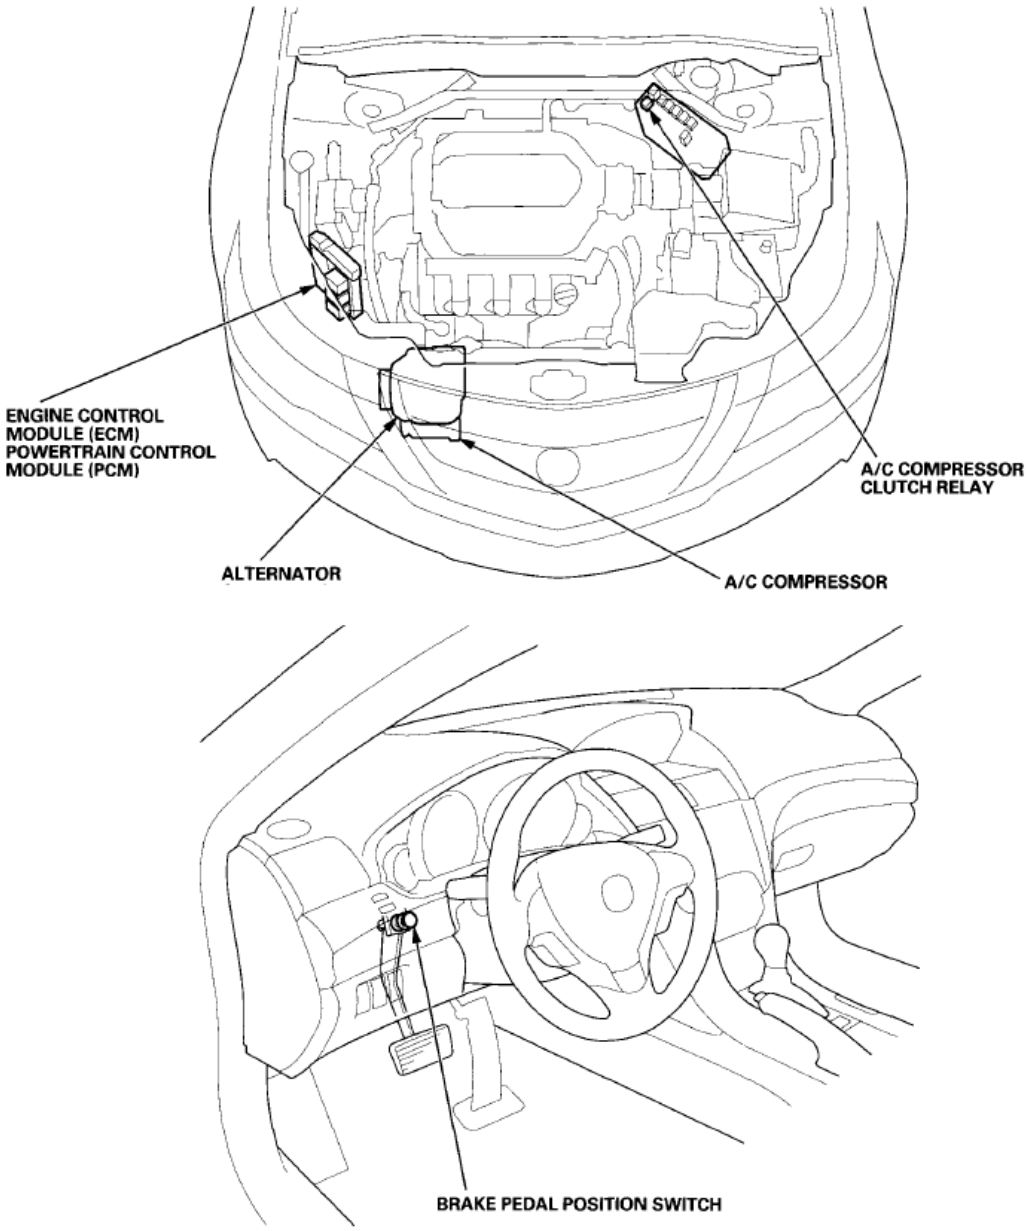

Fig. 1: Idle Control System Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DTC TROUBLESHOOTING

DTC P0506: IDLE CONTROL SYSTEM RPM LOWER THAN EXPECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 20 seconds or more.
4. Check for these conditions in the DATA LIST with the HDS:
   - ECT SENSOR 1 above 158°F (70°C)
   - IAT SENSOR above 32°F (0°C)
   - VEHICLE SPEED is 0 mph (0 km/h)
   - ST FUEL TRIM between 0.73 and 1.47
   - FSS is CLOSED
5. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 6.

   NO - If the screen indicates PASSED, go to step 15. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 4 and recheck.

6. Remove the intake air duct from the throttle body.
7. Check for dirt, carbon, or damage in the throttle bore.

   Is there dirt, carbon, or damage in the throttle bore?

   YES - If there is dirt or carbon, clean the throttle body (see **THROTTLE BODY CLEANING**). Also check for damage to the air cleaner element (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 9. If there is damage in the throttle bore, go to step 8.

   NO - Check the A/C system or the power steering system, then go to step 17.

8. Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
11. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 20 seconds or more.
12. Check for these conditions in the DATA LIST with the HDS:
    - ECT SENSOR 1 above 158°F (70°C)
    - IAT SENSOR above 32°F (0°C)

- VEHICLE SPEED is 0 mph (0 km/h)
- ST FUEL TRIM between 0.73 and 1.47
- FSS is CLOSED

13. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0506 indicated?

    YES - Go to step 1 and recheck.

    NO - Go to step 14.

14. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 13, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the screen indicates FAILED, check the A/C system and/or the power steering system, then go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 12.

15. Remove the intake air duct from the throttle body.
16. Check for dirt, carbon, or damage in the throttle bore.

    Is there dirt, carbon, or damage in the throttle bore?

    YES - If there is dirt or carbon, clean the throttle body (see **THROTTLE BODY CLEANING**). Also check for damage to the air cleaner element (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 9. If there is damage in the throttle bore, go to step 8.

    NO - Go to step 17.

17. Recheck with different load conditions (turn on the headlights, blower motor, the rear window defogger and/or the A/C, change the gear position, etc.).
18. Monitor the OBD STATUS for DTC P0506 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Intermittent failure, the system is OK at this time.

    NO - If the screen indicates FAILED, check the A/C system and/or the power steering system, then go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 12.

DTC P0507: IDLE CONTROL SYSTEM RPM HIGHER THAN EXPECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Monitor the OBD STATUS for DTC P0507 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 5.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, recheck with different load conditions (electrical, A/C, gear position, etc.), then go to step 3.

5. Check for vacuum leaks at these parts:
   - PCV valve
   - PCV hose
   - EVAP canister purge valve
   - Throttle body
   - Intake manifold
   - Brake booster hose
   - Brake booster

   Are there any leaks?

   YES - Repair or replace the leaking part(s), then go to step 6.

   NO - Go to step 6.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Reset the ECM/PCM with the HDS.
8. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
9. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
10. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0507 indicated?

YES - Check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1.

NO - Go to step 11.

11. Monitor the OBD STATUS for DTC P0507 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated instep 10, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the throttle body and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, recheck with different load conditions (turn on the headlights, the blower motor, or the A/C; change the gear position, etc.), then go to step 9.

A/C SIGNAL CIRCUIT TROUBLESHOOTING

1. Start the engine.
2. Turn the blower switch on.
3. Turn the A/C switch on.
4. Check the A/C CLUTCH in the DATA LIST with the HDS.

   Does it indicate ON?

   YES - Go to step 5.

   NO - Check the A/C system (see **A/C SERVICE TIPS AND PRECAUTIONS**).

5. Check the A/C system operation.

   Does the A/C system operate?

   YES - The air conditioning system circuit is OK.

   NO - Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Activate the A/C CLUTCH in the INSPECTION MENU with the HDS.

   Is there a clicking noise from the A/C compressor clutch?

YES - Do the A/C system test (see **A/C SYSTEM TEST**).

NO - Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector A (49P).
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Momentarily connect ECM/PCM connector terminal A13 to body ground with a jumper wire several times.

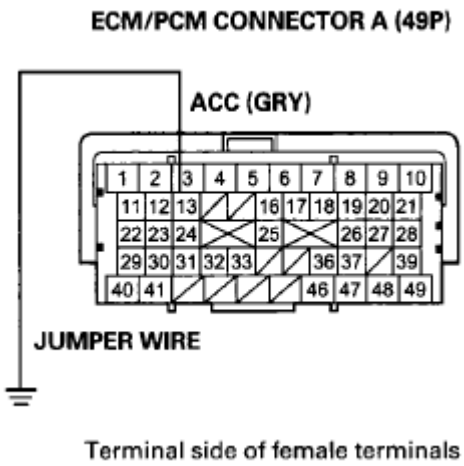

Fig. 2: Connecting ECM/PCM Connector Terminal A13 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there a clicking noise from the A/C compressor clutch?

YES - Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away and the ECM/PCM was updated, troubleshooting is complete. If the symptom/indication goes away and the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

NO - Check for poor connections or loose terminals at the A/C clutch relay and the ECM/PCM. If the connections are OK, check the A/C clutch relay (see **POWER RELAY TEST**). If needed, repair open in the wire between the ECM/PCM (A13) and the A/C clutch relay, and check the other A/C system parts.

ALTERNATOR FR SIGNAL CIRCUIT TROUBLESHOOTING

1. Start the engine, and let it idle.
2. Monitor the ALTERNATOR in the DATA LIST with the HDS.
3. Check if the indicated percentage varies when the headlight switch is turned on.

Does the percentage vary?

YES - The alternator signal circuit is OK.

NO - Go to step 4.

4. Turn the headlight switch off, and turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Jump the SCS line with the HDS.
6. Disconnect the alternator 4P connector.
7. Disconnect ECM/PCM connector C (49P).
8. Check for continuity between ECM/PCM connector terminal C44 and body ground.

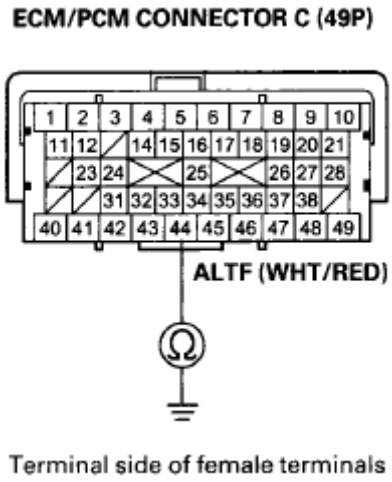

Fig. 3: Checking Continuity Between ECM/PCM Connector Terminal C44 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C44) and the alternator.

NO - Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away and the ECM/PCM was updated, troubleshooting is complete. If the symptom/indication goes away and the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

BRAKE PEDAL POSITION SWITCH SIGNAL CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the BRAKE SWITCH in the DATA LIST with the HDS.

Does it indicate OFF?

YES - Go to step 3.

NO - Inspect the brake pedal position switch (see **BRAKE PEDAL AND BRAKE PEDAL POSITION SWITCH ADJUSTMENT**).

3. Press the brake pedal, and check the BRAKE SWITCH in the DATA LIST with the HDS.

   Does it change to ON?

   YES - The brake pedal position switch signal circuit (BKSW line) is OK.

   NO - Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Jump the SCS line with the HDS.
6. Disconnect the brake pedal position switch 4P connector.
7. Disconnect ECM/PCM connector A (49P).
8. Check for continuity between ECM/PCM connector terminal A8 and body ground.

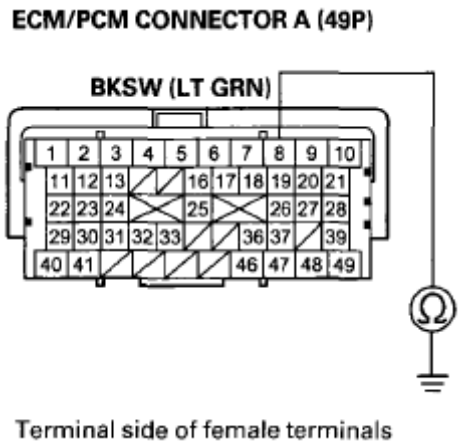

Fig. 4: Checking Continuity Between ECM/PCM Connector Terminal A8 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A8) and the brake pedal position switch. Also replace the No. 10 HORN/STOP (20 A) fuse in the under-hood fuse/relay box.

NO - Go to step 9.

9. Connect brake pedal position switch 4P connector terminal No. 2 to body ground with a jumper wire.

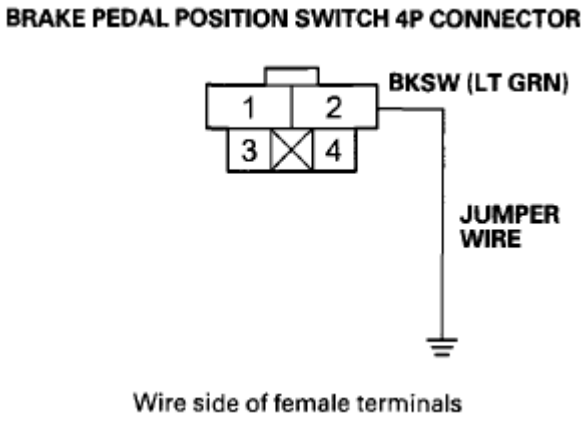

Fig. 5: Connecting Brake Pedal Position Switch 4P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Check for continuity between ECM/PCM connector terminal A8 and body ground.

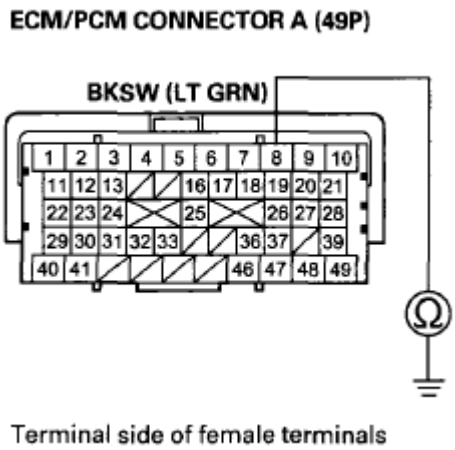

Fig. 6: Checking Continuity Between ECM/PCM Connector Terminal A8 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair open in the wire between the brake pedal position switch and the No. 10 HORN/STOP (20 A) fuse in the under-hood fuse/relay box. Also check the brake pedal position switch (see **BRAKE PEDAL AND BRAKE PEDAL POSITION SWITCH ADJUSTMENT**).

NO - Repair open in the wire between the ECM/PCM (A8) and the brake pedal position switch.

IDLE SPEED INSPECTION

NOTE:

- **Before checking the idle speed, check these items:**
  - **The malfunction indicator lamp (MIL) has not been reported on, and**

there are no DTCs.

- **Ignition timing**
- **Spark plugs**
- **Air cleaner**
- **PCV system**

- **Apply the parking brake, and make sure the headlights are off.**

1. Disconnect the evaporative emission (EVAP) canister purge valve connector.
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

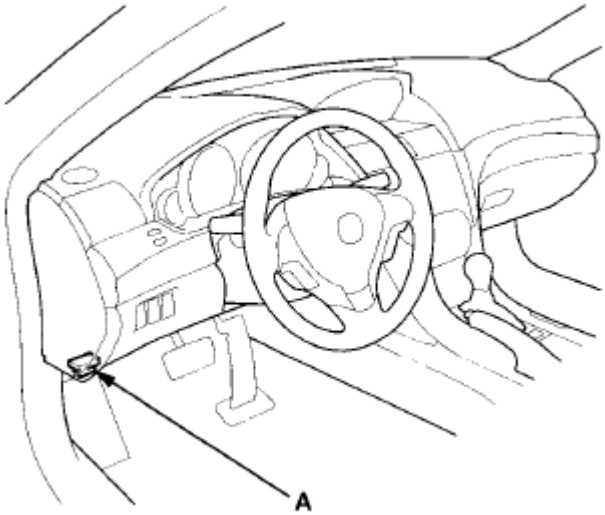

Fig. 7: Identifying HDS To Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
5. Check the idle speed without load conditions: headlights, blower fan, radiator fan, and air conditioner off.

IDLE SPEED SHOULD BE

J35Z6 engine	680 ± 50 RPM (in P or N)
J37A4 engine (M/T)	750 ± 50 RPM (in neutral)
J37A4 engine (A/T)	700 ± 50 RPM (in P or N)

6. Let the engine idle for 1 minute with high electric load (the A/C on, the temperature set to max cool, the blower fan on high, the headlights on high beam).

IDLE SPEED SHOULD BE

J35Z6 engine	680 ± 50 RPM (in P or N)

J37A4 engine (M/T)	750 ± 50 RPM (in neutral)
J37A4 engine (A/T)	700 ± 50 RPM (in P or N)

NOTE: If the idle speed is not within specification, do the ECM/PCM idle learn procedure (see ECM/PCM IDLE LEARN PROCEDURE). If the idle speed is still not within specification, go to the symptom troubleshooting.

7. Reconnect the EVAP canister purge valve connector.

ECM/PCM IDLE LEARN PROCEDURE

The idle learn procedure must be done so the ECM/PCM can learn the engine idle characteristics.

Do the idle learn procedure whenever you do any of these actions:

- Replace the ECM/PCM.
- Reset the ECM/PCM.
- Update the ECM/PCM.
- Replace or clean the throttle body.
- Disassemble the engine or transmission.

NOTE: Clearing DTCs with the HDS does not require you to do the idle learn procedure.

PROCEDURE

1. Make sure all electrical items (the A/C, the audio, the lights, etc.) are off.
2. Reset the ECM/PCM with the HDS.
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait 2 seconds.
4. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, or until the engine coolant temperature reaches 194°F (90°C).
5. Let the engine idle for about 5 minutes with the throttle fully closed.

NOTE: If the radiator fan comes on, do not include its running time in the 5 minutes.

2012 ENGINE PERFORMANCE

Intake Air System - TL

COMPONENT LOCATION INDEX

DTC TROUBLESHOOTING

DTC P1077: IMT VALVE STUCK IN HIGH RPM POSITION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.

3. Do the IMT TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM. •

   NO - Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the IMT actuator 5P connector.
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Measure the voltage between IMT actuator 5P connector terminal No. 1 and body ground.

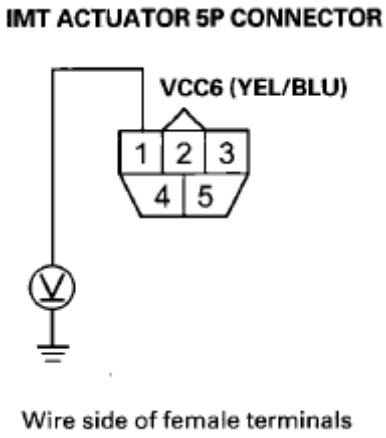

Fig. 2: Measuring Voltage Between IMT Actuator 5P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there about 5 V?

   YES - Go to step 12.

   NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Jump the SCS line with the HDS.
10. Disconnect ECM/PCM connector C (49P).
11. Check for continuity between IMT actuator 5P connector terminal No. 1 and ECM/PCM connector terminal C11.

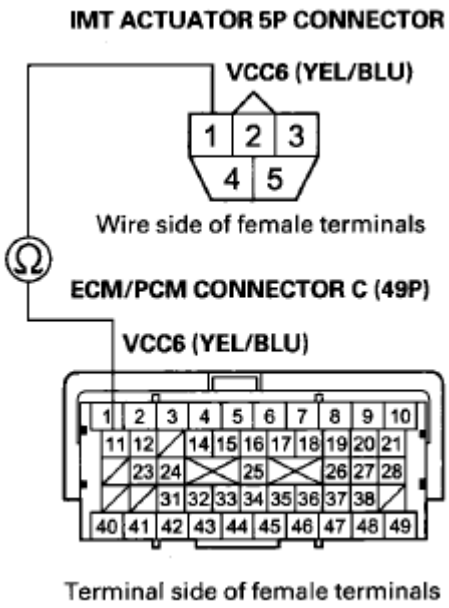

Fig. 3: Checking Continuity Between IMT Actuator 5P Connector Terminal No. 1 And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 36.

NO - Repair open in the wire between the ECM/PCM (C11) and the IMT actuator, then go to step 30.

12. Measure the voltage between IMT actuator 5P connector terminal No. 3 and body ground.

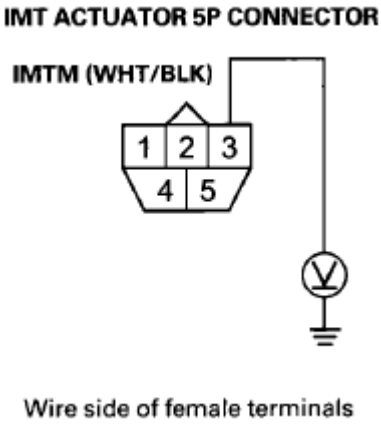

Fig. 4: Measuring Voltage Between IMT Actuator 5P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 17.

NO - Go to step 13.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Jump the SCS line with the HDS.
15. Disconnect ECM/PCM connector B (49P).
16. Check for continuity between IMT actuator 5P connector terminal No. 3 and ECM/PCM connector terminal B19.

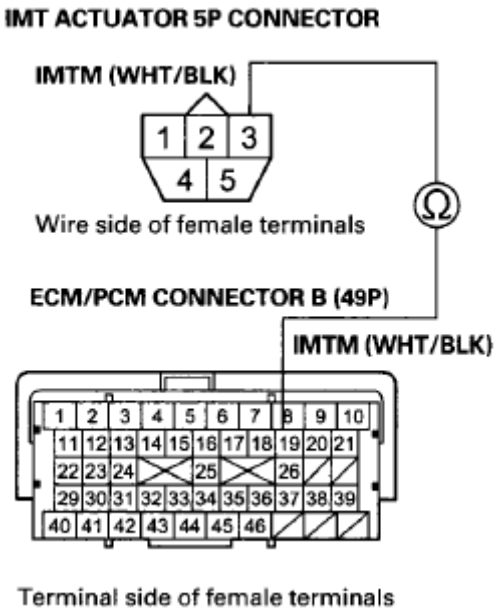

Fig. 5: Checking Continuity Between IMT Actuator 5P Connector And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 36.

NO - Repair open in the wire between the ECM/PCM (B19) and the IMT actuator, then go to step 30.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Jump the SCS line with the HDS.
19. Disconnect ECM/PCM connector C (49P).
20. Check for continuity between IMT actuator 5P connector terminal No. 2 and ECM/PCM connector terminal C16.

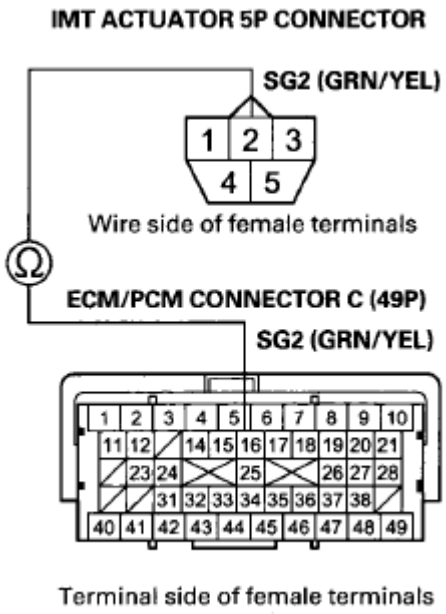

Fig. 6: Checking Continuity Between IMT Actuator 5P Connector And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 21.

NO - Repair open in the wire between the ECM/PCM (C16) and the IMT actuator, then go to step 30.

21. Check for continuity between ECM/PCM connector terminal C48 and body ground.

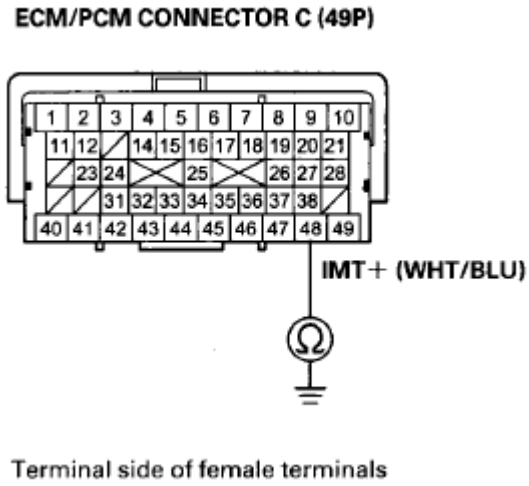

Fig. 7: Checking Continuity Between ECM/PCM Connector Terminal C48 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C48) and the IMT actuator, then go to step 30.

NO - Go to step 22.

22. Check for continuity between ECM/PCM connector terminal C49 and body ground.

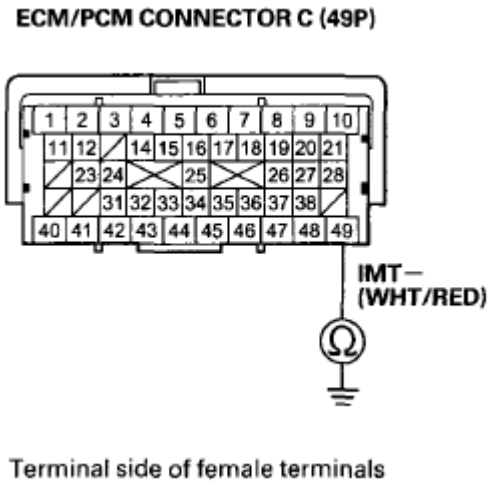

Fig. 8: Checking Continuity Between ECM/PCM Connector Terminal C49 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C49) and the IMT actuator, then go to step 30.

NO - Go to step 23.

23. Check for continuity between IMT actuator 5P connector terminal No. 5 and ECM/PCM connector terminal C48.

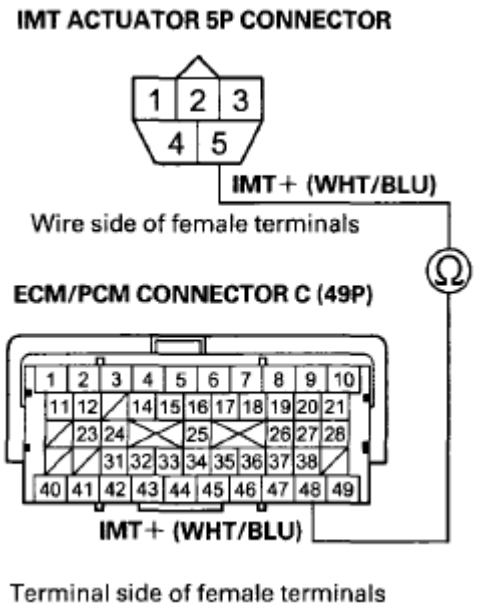

Fig. 9: Checking Continuity Between IMT Actuator 5P Connector Terminal No. 5 And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 24.

NO - Repair open in the wire between the ECM/PCM (C48) and the IMT actuator, then go to step 30.

24. Check for continuity between IMT actuator 5P connector terminal No. 4 and ECM/PCM connector terminal C49.

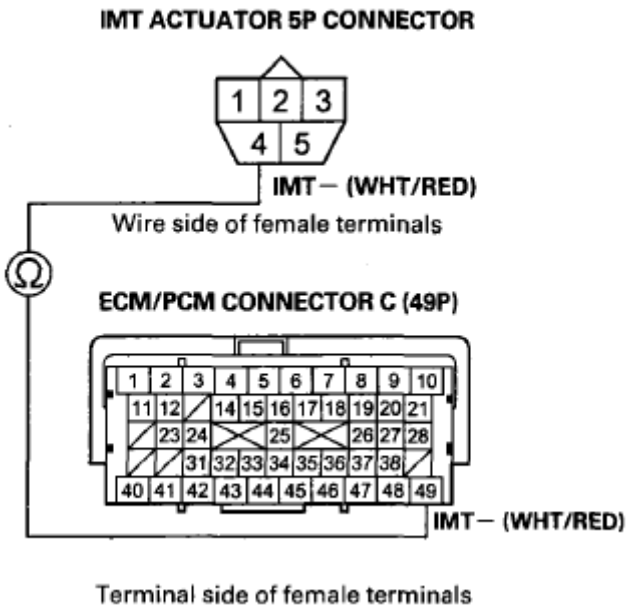

Fig. 10: Checking Continuity Between IMT Actuator 5P Connector Terminal No. 4 And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM/PCM (C49) and the IMT actuator, then go to step 30.

25. Remove the **IMT actuator**.
26. Move the IMT valve by hand.

Does it move smoothly?

YES - Go to step 27.

NO - Remove the intake manifold upper cover (see step 5 under **INTAKE MANIFOLD REMOVAL AND INSTALLATION**), and repair the stuck valve. If needed, replace the intake manifold (see **REMOVAL**), then go to step 30.

27. Substitute a known-good **IMT actuator**.
28. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
29. Do the IMT TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Replace the original **IMT actuator**, then go to step 30.

NO - Go to step 36.

30. Reconnect all connectors.
31. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
32. Reset the ECM/PCM with the HDS.
33. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
34. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1077 indicated?

    YES - Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM, then go to step 1.

    NO - Go to step 35.

35. Monitor the OBD STATUS for DTC PI 077 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 34, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the IMT actuator and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

36. Reconnect ail connectors.
37. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
38. Start the engine, and let it idle without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
39. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1077 indicated?

    YES - Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 38. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 40.

40. Monitor the OBD STATUS for DTC P1077 in the DTCs MENU with the HDS.

    Does the screen indicates PASSED?

YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 39, go to the indicated DTC's troubleshooting. •

NO - If the screen indicated FAILED, check for poor connections or loose terminals at the IMT actuator and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 38. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P1078: IMT VALVE STUCK IN LOW RPM POSITION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Do the IMT TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM. •

   NO - Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the IMT actuator 5P connector.
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Check the IMT VALVE SW in the DATA LIST with the HDS.

   Is CLOSE indicated?

   YES - Go to step 12.

   NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Jump the SCS line with the HDS.
10. Disconnect ECM/PCM connector B (49P).
11. Check for continuity between ECM/PCM connector terminal B19 and body ground.

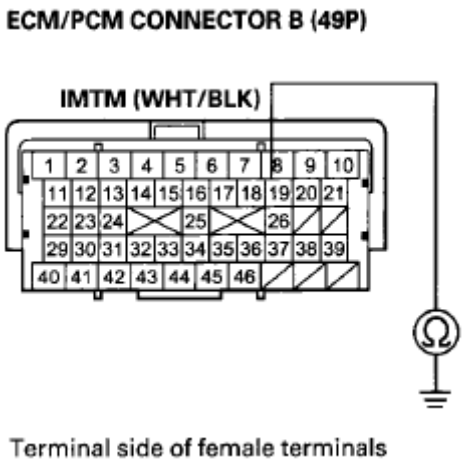

Fig. 11: Checking Continuity Between ECM/PCM Connector Terminal B19 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B19) and the IMT actuator, then go to step 24.

NO - Go to step 31.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector C (49P).
15. Check for continuity between ECM/PCM connector terminal C48 and body ground.

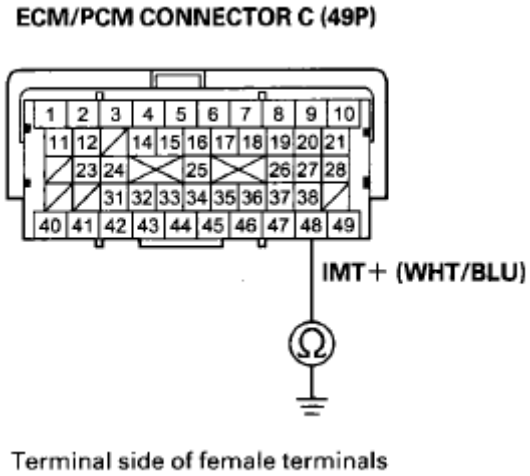

Fig. 12: Checking Continuity Between ECM/PCM Connector Terminal C48 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C48) and the IMT actuator, then go to step 24.

NO - Go to step 16.

16. Check for continuity between ECM/PCM connector terminal C49 and body ground.

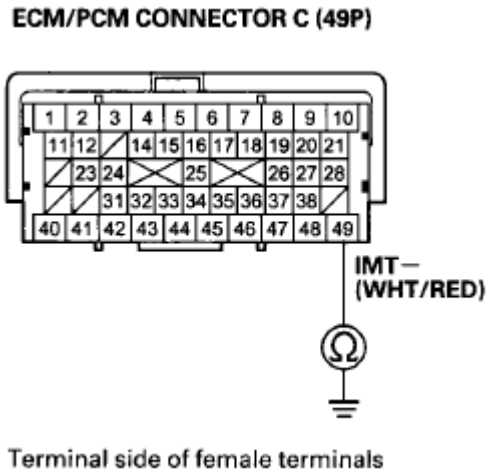

Fig. 13: Checking Continuity Between ECM/PCM Connector Terminal C49 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C49) and the IMT actuator, then go to step 24.

NO - Go to step 17.

17. Check for continuity between IMT actuator 5P connector terminal No. 5 and ECM/PCM connector terminal C48.

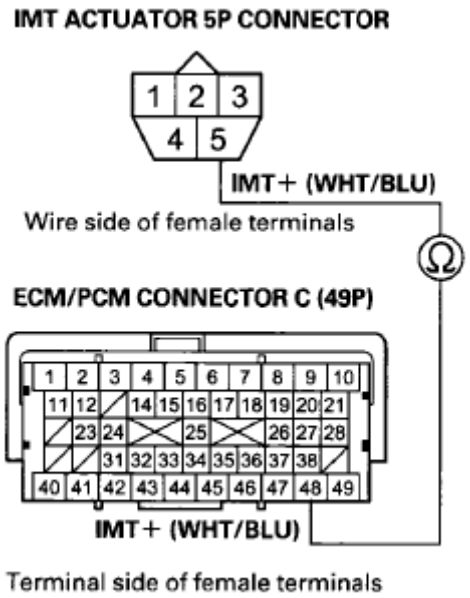

Fig. 14: Checking Continuity Between IMT Actuator 5P Connector And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 18.

NO - Repair open in the wire between the ECM/PCM (C48) and the IMT actuator, then go to step 24.

18. Check for continuity between IMT actuator 5P connector terminal No. 4 and ECM/PCM connector terminal C49.

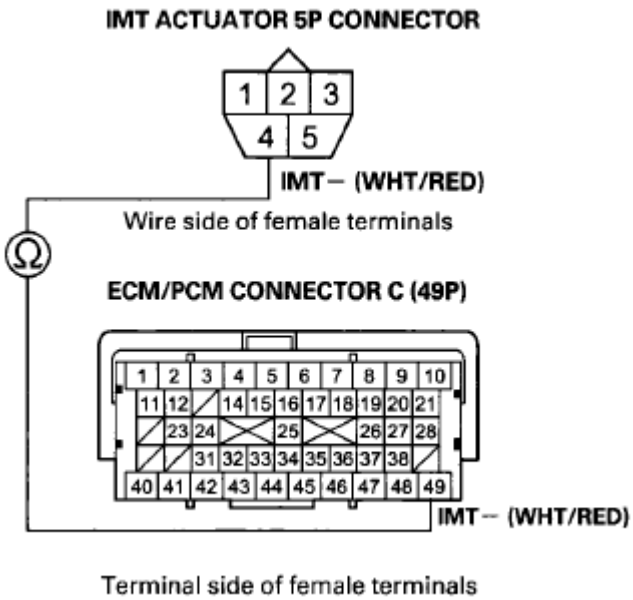

Fig. 15: Checking Continuity Between IMT Actuator 5P Connector And ECM/PCM Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between the ECM/PCM (C49) and the IMT actuator, then go to step 24.

19. Remove the **IMT actuator**.
20. Move the IMT valve by hand.

Does it move smoothly?

YES - Go to step 21.

NO - Remove the intake manifold upper cover (see step 5 under **INTAKE MANIFOLD REMOVAL AND INSTALLATION**), and repair the stuck valve. If needed, replace the intake manifold (see **REMOVAL**), then go to step 24.

21. Substitute a known-good **IMT actuator**.
22. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
23. Do the IMT TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Replace the original **IMT actuator**, then go to step 24.

NO - Go to step 32.

24. Reconnect all connectors.
25. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Start the engine, and let it idle without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
29. Hold the engine speed at 4, 000 RPM for 3 seconds or more, then let it idle.
30. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P1078 indicated?

YES - Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM, then go to step 1.

NO - Go to step 31.

31. Monitor the OBD STATUS for DTC P1078 in the DTCs MENU with the HDS.

    Does the screen indicates PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 30, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the IMT actuator and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 28.

32. Reconnect all connectors.
33. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
34. Start the engine, and let it idle without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
35. Hold the engine speed at 4, 000 RPM for 3 seconds or more, then let it idle.
36. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1078 indicated?

    YES - Check for poor connections or loose terminals at the IMT actuator and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 34. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 37.

37. Monitor the OBD STATUS for DTC P1078 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 36, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicated FAILED, check for poor connections or loose terminals at the IMT actuator and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 34. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 34.

THROTTLE BODY TEST

CARBON ACCUMULATION CHECK

NOTE: If the malfunction indicator lamp (MIL) has been reported on, check for diagnostic trouble codes (DTCs).

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

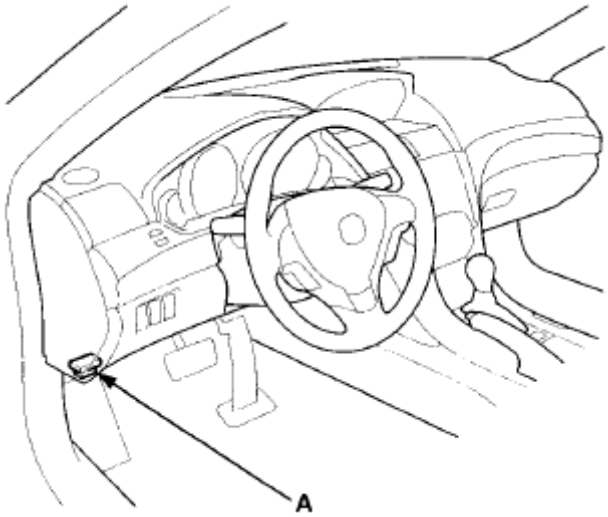

Fig. 16: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the ECM/PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
5. Check the REL TP SENSOR in the DATA LIST with the HDS. The reading should be below 2.46 percent. If it is not, clean the **throttle body**.

THROTTLE POSITION LEARNING CHECK

NOTE: If the malfunction indicator lamp (MIL) has been reported on, check for diagnostic trouble codes (DTCs).

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

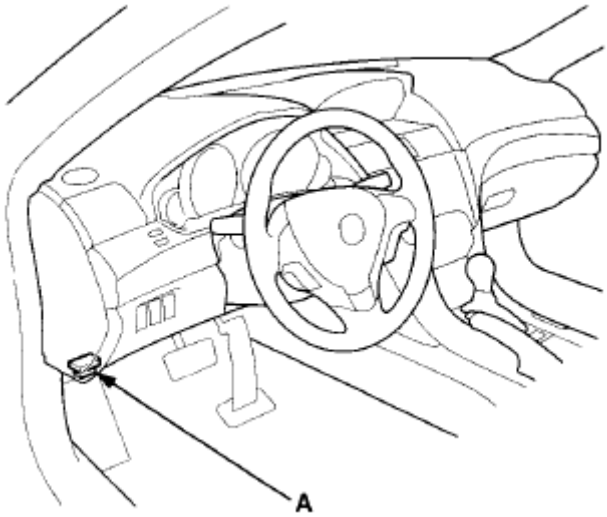

Fig. 17: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the ECM/PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Select the INSPECTION MENU with the HDS.
5. Do the TP LEARNING CHECK in the ETCS TEST. If needed, clean the **throttle body**.

THROTTLE BODY CLEANING

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch to ON (II)/press the engine start/stop button, or while the ignition switch is in ON (II)/vehicle in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.

1. Check for damage to the air cleaner element. If the **air cleaner element** is damaged, replace it.
2. Remove the **throttle body**.
3. Clean off the carbon from the throttle valve and inside the throttle body with a paper towel soaked in throttle plate cleaner.

NOTE:

- **Remove the throttle body to clean it.**
- **Be careful not to pinch your fingers.**
- **To avoid removing the molybdenum coating, do not clean the bearing area of the throttle shaft (A).**
- **Do not spray throttle plate cleaner directly on the throttle body.**
- **Use Acura genuine throttle plate cleaner.**

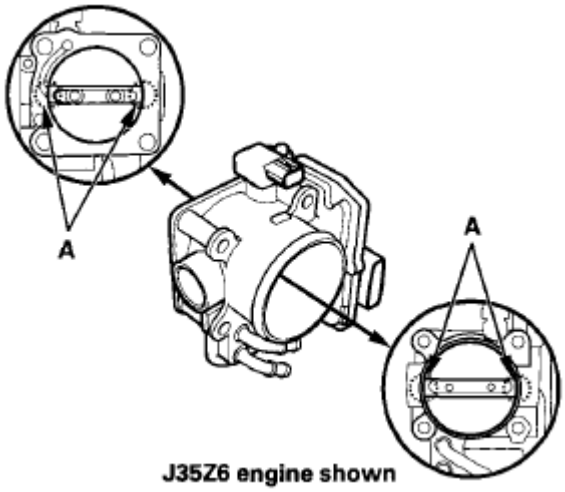

Fig. 18: Identifying Throttle Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the **throttle body**.
5. Reset the ECM/PCM with the HDS (see **HDS CLEAR COMMAND**).
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode and wait 2 seconds.
7. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).

AIR CLEANER REMOVAL/INSTALLATION

1. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
2. Disconnect the MAF sensor/IAT sensor 5P connector (A).

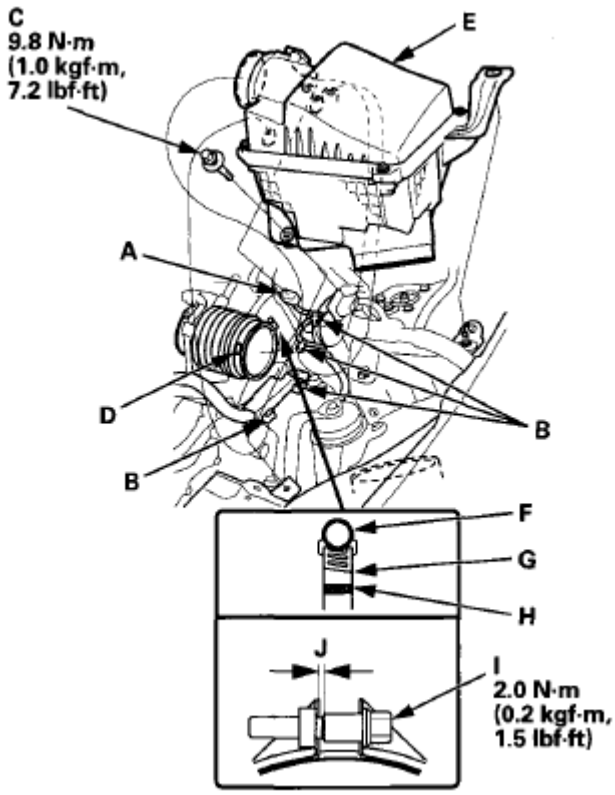

Fig. 19: Identifying 5P Connector, Clamps, Bolts, Band And Air Cleaner Housing With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the harness clamps (B) and the bolt (C).
4. Loosen the band (D), then remove the air cleaner housing (E).
5. Install the parts in the reverse order of removal.

NOTE:

- **J37A4 engine:**

  Before you torque the hose clamp screw (F), align the edge of the clamp (G) within the painted mark (H).

- **J35Z6 engine:**

  After you torque the hose clamp screw (I), make sure the clearance (J) is less than 0.04 in (1.0 mm).

6. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).

AIR CLEANER ELEMENT INSPECTION/REPLACEMENT

1. Open the air cleaner housing cover (A).

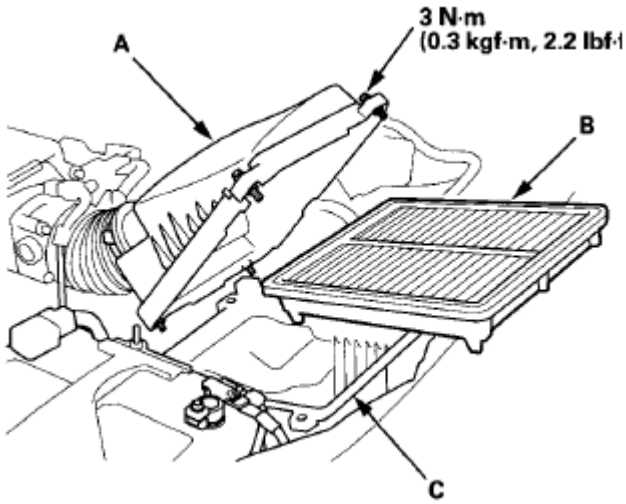

Fig. 20: Identifying Air Cleaner Housing, Element And Cover With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the air cleaner element (B) from the air cleaner housing (C).
3. Check the air cleaner element for damage or clogging. If it is damaged or clogged, replace it.

NOTE: Do not use compressed air to clean the air cleaner element.

4. Clean and remove any debris from inside the air cleaner housing.
5. Install the parts in the reverse order of removal.

- If you did not replace the air cleaner element, this procedure is complete.
- If the Maintenance Minder required air cleaner element replacement, reset the Maintenance Minder (see **MAINTENANCE MINDER™**).
- If the idle speed fluctuates, do the idle speed inspection (see **ECM/PCM IDLE LEARN PROCEDURE**).

INTAKE AIR RESONATOR REMOVAL/INSTALLATION

1. Remove the splash separator (A).

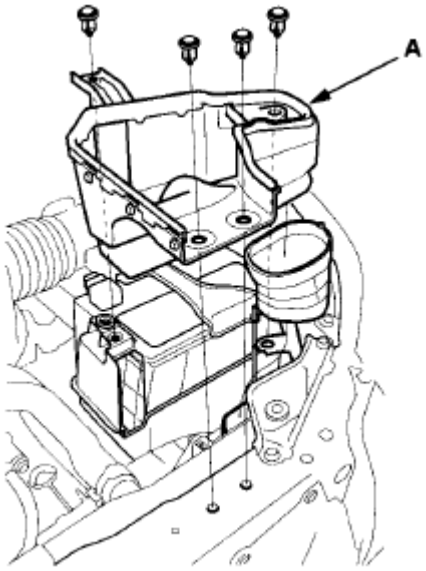

Fig. 21: Identifying Splash Separator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
3. Remove the air cleaner (see).
4. Remove the battery base (A).

A/T

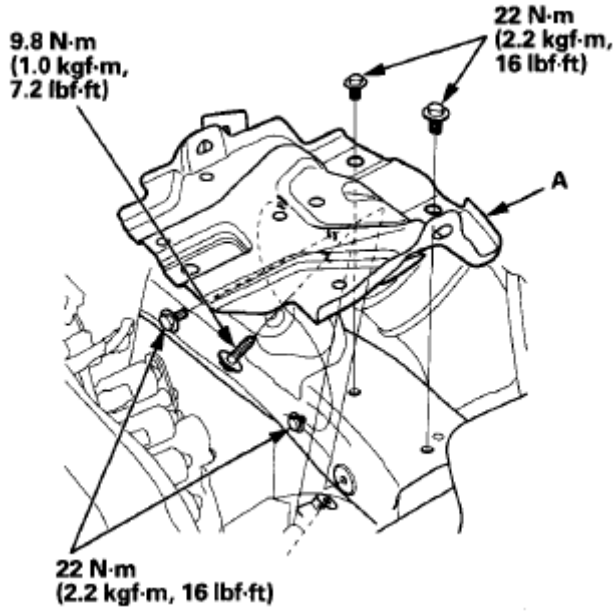

Fig. 22: Identifying Battery Base With Torque Specifications (A/T)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

M/T

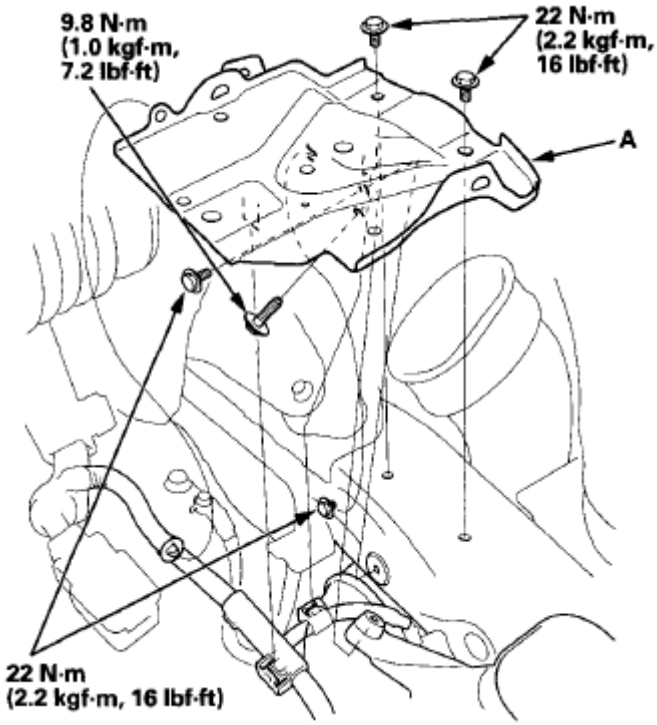

Fig. 23: Identifying Battery Base With Torque Specifications (M/T)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the intake air duct (A).

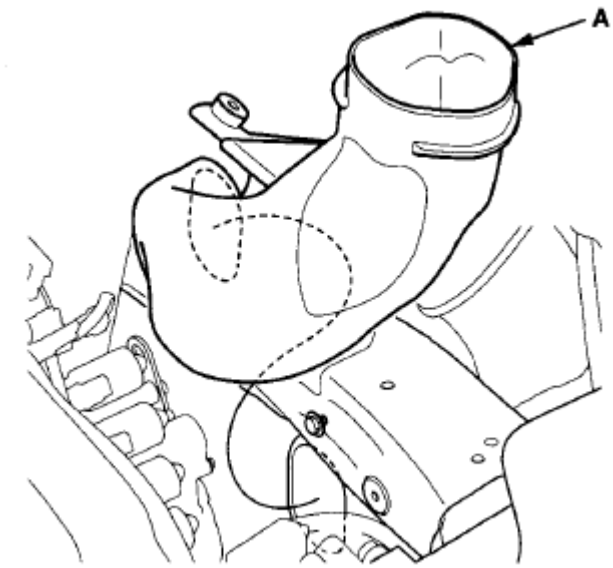

Fig. 24: Identifying Intake Air Duct
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**).
7. Remove the intake air resonator (A).

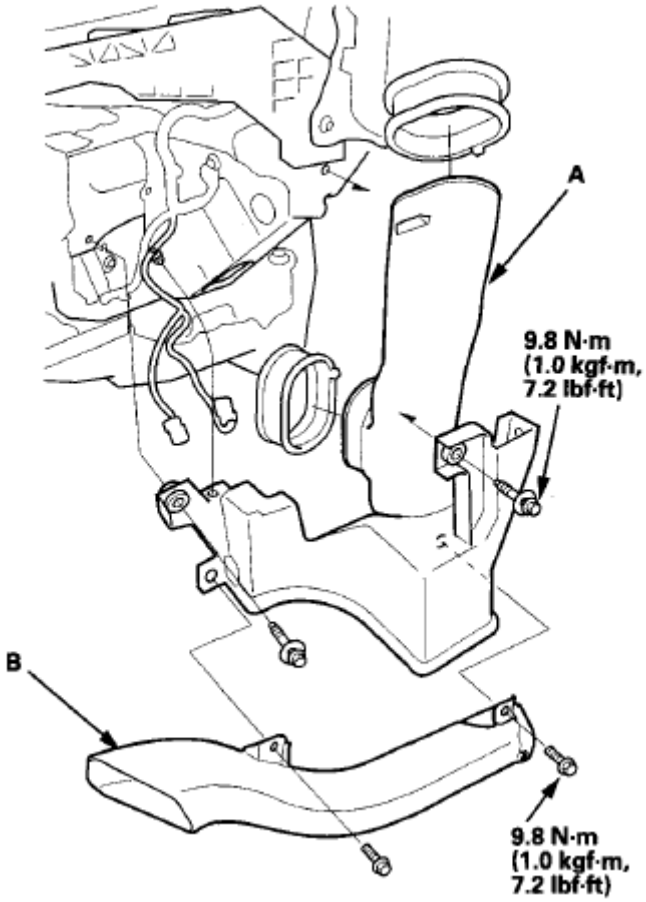

Fig. 25: Identifying Intake Air Resonator And Brake Duct With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. J37A4 engine: Remove the brake duct (B).
9. Install the parts in the reverse order of removal.
10. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).

IMT ACTUATOR REPLACEMENT

1. Disconnect the IMT actuator 5P connector (A).

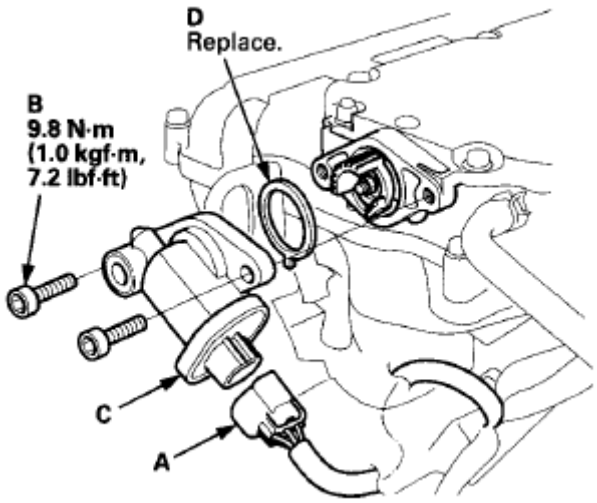

Fig. 26: Identifying IMT Actuator 5P Connector And Actuator, O-Ring And Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the bolts (B) and the IMT actuator (C).
3. Install the parts in the reverse order of removal with a new O-ring (D).

THROTTLE BODY REMOVAL/INSTALLATION

CAUTION: Do not insert your fingers into the installed throttle body when you turn the ignition switch to ON (II)/press the engine start/stop button, or while the ignition switch is in ON (II)/vehicle in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: If you are replacing or cleaning the throttle body, begin at step 1. If you are removing the throttle body temporarily, begin at step 4.

1. Connect the HDS while the engine is stopped.
2. Select the INSPECTION MENU with the HDS.
3. Do the TP POSITION CHECK in the ETCS TEST.
4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the MAP sensor connector (A).

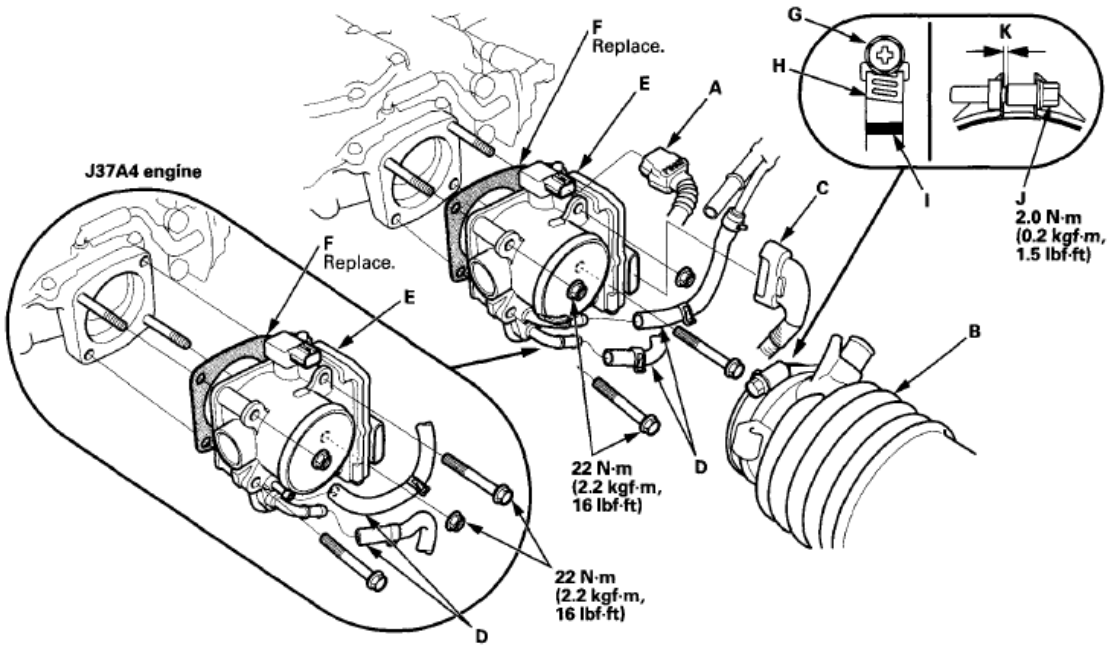

Fig. 27: Exploded View Of Throttle Body With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the intake air duct (B).
7. Disconnect the throttle body connector (C).
8. Disconnect and plug the water bypass hoses (D), then remove the throttle body (E).
9. Install the parts in the reverse order of removal with a new gasket (F).

NOTE:

- **J37A4 engine: Before you torque the hose clamp screw (G), align the edge of the clamp (H) with the painted mark (I).**
- **J35Z6 engine: After you torque the hose clamp screw (J), make sure the clearance (K) is less than 0.04 in (1.0 mm).**

10. Refill the radiator with engine coolant (see **COOLANT CHECK**).
11. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).

2012 ENGINE PERFORMANCE

Mode 6 - Acura

INTRODUCTION

Mode 6 is designed to allow access to the results of onboard diagnostic monitoring tests of specific components/systems that are not continuously monitored. These systems include the catalytic converter, EVAP system, oxygen sensor, oxygen sensor heater, EGR system, secondary AIR system, and sometimes misfire.

Mode 6 data is output from the PCM/ECM in hexadecimal form. The $ sign indicates a hexadecimal number. Depending on the software in the scanner, the output could be displayed in hexadecimal numbers (no conversion), raw data (conversion to decimal numbers), or measurable values (applying conversion factor to raw data).

Before reading mode 6 information, ensure that the monitor for the information you are accessing has run to completion. If the monitor is not complete, the mode 6 data will not be accurate.

MONITOR ID BY MODEL: TL, ZDX, RDX, TSX L4 & TSX V6

OBD Monitor ID by Model: TL, ZDX, RDX, TSX L4 & TSX V6

SAE J1979 SERVICE $06 INFORMATION BY OBD MONITOR ID

A/F SENSOR (BANK 1)

DTC P0134: MONITOR ID $01: TEST ID $80

OBD Monitor ID	**$01**	**Test ID**	**$80**	**Unit and Scaling ID**	**$11**
DTC		P0134			
Test Description		Check of A/F sensor "non-activation" time. See Test ID $81 and $82 for "non-activation" criteria.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.1 (sec.) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 0.1 (sec.)			

DTC P0134: MONITOR ID $01: TEST ID $82

OBD Monitor ID	**$01**	**Test ID**	**$82**	**Unit and Scaling ID**	**$0B**
DTC		P0134			
Test Description		Check of A/F sensor "non-activation" by monitoring the sensor cell voltage.			
Store Timing		Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.01 (V) The lowest limit value: Output value (Decimal) x 0.01 (V) The highest limit value: Output value (Decimal) x 0.01 (V)			

DTC P2195: MONITOR ID $01: TEST ID $83

OBD Monitor ID	**$01**	**Test ID**	**$83**	**Unit and Scaling ID**	**$8D**
DTC		P2195			
Test Description		Check of the A/F sensor "too lean" by monitoring the A/F sensor signal.			
Store Timing		Normal judgment/Failure judgment			

Conversion to Engineering Units	Measured value: Output value (Decimal) x 0.003906 (mA) The lowest limit value: Output value (Decimal) x 0.003906 (mA) The highest limit value: Not applicable

DTC P2A00: MONITOR ID $01: TEST ID $84

OBD Monitor ID	$01	Test ID	$84	Unit and Scaling ID	$8D
DTC		P2A00			
Test Description		Check of A/F sensor rationality by monitoring the sensor signal during fuel cut condition.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.003906 (mA) The lowest limit value: Output value (Decimal) x 0.003906 (mA) The highest limit value: Output value (Decimal) x 0.003906 (mA)			

DTC P0133: MONITOR ID $01: TEST ID $85

OBD Monitor ID	$01	Test ID	$85	Unit and Scaling ID	$01
DTC		P0133			
Test Description		Response check of A/F sensor by monitoring the amplitude of filtered sensor signal during stable driving condition.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: No unit The lowest limit value: No unit The highest limit value: Not applicable			

DTC P1172: MONITOR ID $01: TEST ID $86

OBD Monitor ID	$01	Test ID	$86	Unit and Scaling ID	$8D
DTC		P1172			
Test Description		Check of A/F sensor "out of range" by monitoring the sensor signal.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.003906 (mA) The lowest limit value: Output value (Decimal) x 0.003906 (mA) The highest limit value: Not applicable			

DTC P0134: MONITOR ID $01: TEST ID $87

OBD Monitor ID	$01	Test ID	$87	Unit and Scaling ID	$14
DTC		P0134			
Test Description		Check of A/F sensor "non-activation" by monitoring the sensor element resistance during A/F feedback control.			
Store Timing		Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 1 (W) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 1 (W)			

DTC P0134: MONITOR ID $01: TEST ID $88

OBD Monitor ID	$01	Test ID	$88	Unit and Scaling ID	$0B
DTC		P0134			
Test Description		Check of A/F sensor "non-activation" by monitoring the sensor cell voltage during A/F feedback control.			
Store Timing		Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.01 (V) The lowest limit value: Output value (Decimal) x 0.01 (V) The highest limit value: Output value (Decimal) x 0.01 (V)			

A/F SENSOR (BANK 2)

DTC P0154: MONITOR ID $05: TEST ID $80

OBD Monitor ID	$05	Test ID	$80	Unit and Scaling ID	$11
DTC		P0154			
Test Description		Check of A/F sensor "non-activation" by monitoring the sensor non-activation time.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.1 (sec.) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 0.1 (sec.)			

DTC P0154: MONITOR ID $05: TEST ID $82

OBD Monitor ID	$05	Test ID	$82	Unit and Scaling ID	$0B
DTC		P0154			
Test Description		Check of A/F sensor "non-activation" by monitoring the sensor cell voltage.			
Store Timing		Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.01 (V) The lowest limit value: Output value (Decimal) x 0.01 (V) The highest limit value: Output value (Decimal) x 0.01 (V)			

DTC P2197: MONITOR ID $05: TEST ID $83

OBD Monitor ID	$05	Test ID	$83	Unit and Scaling ID	$8D
DTC		P2197			
Test Description		Check of the A/F sensor "too lean" by monitoring the A/F sensor signal.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.003906 (mA) The lowest limit value: Output value (Decimal) x 0.003906 (mA) The highest limit value: Not applicable			

DTC P2A03: MONITOR ID $05: TEST ID $84

OBD Monitor ID	$05	Test ID	$84	Unit and Scaling ID	$8D
DTC		P2A03			

Test Description	Check of A/F sensor rationality by monitoring the sensor signal during fuel cut condition.
Store Timing	Normal judgment/Failure judgment
Conversion to Engineering Units	Measured value: Output value (Decimal) x 0.003906 (mA) The lowest limit value: Output value (Decimal) x 0.003906 (mA) The highest limit value: Output value (Decimal) x 0.003906 (mA)

DTC P0153: MONITOR ID $05: TEST ID $85

OBD Monitor ID	$05	Test ID	$85	Unit and Scaling ID	$01
DTC		P0153			
Test Description		Response check of A/F sensor by monitoring the amplitude of filtered sensor signal during stable driving condition.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: No unit The lowest limit value: No unit The highest limit value: Not applicable			

DTC P1174: MONITOR ID $05: TEST ID $86

OBD Monitor ID	$05	Test ID	$86	Unit and Scaling ID	$8D
DTC		P1174			
Test Description		Check of A/F sensor "out of range" by monitoring the sensor signal.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.003906 (mA) The lowest limit value: Output value (Decimal) x 0.003906 (mA) The highest limit value: Not applicable			

DTC P0154: MONITOR ID $05: TEST ID $87

OBD Monitor ID	$05	Test ID	$87	Unit and Scaling ID	$14
DTC		P0154			
Test Description		Check of A/F sensor "non-activation" by monitoring the sensor element resistance during A/F feedback control.			
Store Timing		Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 1 (W) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 1 (W)			

DTC P0154: MONITOR ID $05: TEST ID $88

OBD Monitor ID	$05	Test ID	$88	Unit and Scaling ID	$0B
DTC		P0154			
Test Description		Check of A/F sensor "non-activation" by monitoring the sensor cell voltage during A/F feedback control.			
Store Timing		Failure judgment			
Conversion to		Measured value: Output value (Decimal) x 0.01 (V)			

Engineering Units	The lowest limit value: Output value (Decimal) x 0.01 (V) The highest limit value: Output value (Decimal) x 0.01 (V)

SECONDARY HO2S (BANK 1)

DTC P2270: MONITOR ID $02: TEST ID $98

OBD Monitor ID	$02	Test ID	$98	Unit and Scaling ID	$0B
DTC		P2270			
Test Description		Check of secondary heated oxygen sensor signal "lean" stuck by monitoring the sensor output voltage after fuel cut condition.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.001 (V) The lowest limit value: Output value (Decimal) x 0.001 (V) The highest limit value: Not applicable			

DTC P2271: MONITOR ID $02: TEST ID $99

OBD Monitor ID	$02	Test ID	$99	Unit and Scaling ID	$0B
DTC		P2271			
Test Description		Check of secondary heated oxygen sensor signal "rich" stuck by monitoring the sensor output voltage after fuel cut condition.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.001 (V) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 0.001 (V)			

DTC P0137: MONITOR ID $02: TEST ID $9A

OBD Monitor ID	$02	Test ID	$9A	Unit and Scaling ID	$0B
DTC		P0137			
Test Description		Circuit check of secondary heated oxygen sensor by monitoring the sensor output voltage.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.001 (V) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 0.001 (V)			

DTC P0139: MONITOR ID $02: TEST ID $9B

OBD Monitor ID	$02	Test ID	$9B	Unit and Scaling ID	$10
DTC		P0139			
Test Description		Response check of secondary heated oxygen sensor by monitoring the sensor output voltage after fuel cut condition.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 1 (sec.) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 1 (sec.)			

DTC P0138: MONITOR ID $02: TEST ID $9C

OBD Monitor ID	$02	Test ID	$9C	Unit and Scaling ID	$0B
DTC		P0138			
Test Description		Circuit check of secondary heated oxygen sensor by monitoring the sensor output voltage.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.001 (V) The lowest limit value: Output value (Decimal) x 0.001 (V) The highest limit value: Not applicable			

DTC P0139: MONITOR ID $02: TEST ID $9D

OBD Monitor ID	$02	Test ID	$9D	Unit and Scaling ID	$0B
DTC		P0139			
Test Description		Response check of secondary heated oxygen sensor by monitoring the sensor output voltage during fuel cut condition.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.001 (V) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 0.001 (V)			

DTC P2270: MONITOR ID $02: TEST ID $9E

OBD Monitor ID	$02	Test ID	$9E	Unit and Scaling ID	$0B
DTC		P2270			
Test Description		Circuit check of secondary heated oxygen sensor by monitoring the sensor output voltage.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.001 (V) The lowest limit value: Output value (Decimal) x 0.001 (V) The highest limit value: Not applicable			

SECONDARY HO2S (BANK 2)

DTC P0159: MONITOR ID $06: TEST ID $9D

OBD Monitor ID	$06	Test ID	$9D	Unit and Scaling ID	$0B
DTC		P0159			
Test Description		Response check of secondary heated oxygen sensor by monitoring the sensor output voltage during fuel cut condition.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.001 (V) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 0.001 (V)			

DTC P2272: MONITOR ID $06: TEST ID $9E

OBD Monitor ID	$06	Test ID	$9E	Unit and Scaling ID	$0B

DTC	P2272
Test Description	Circuit check of secondary heated oxygen sensor by monitoring the sensor output voltage.
Store Timing	Normal judgment/Failure judgment
Conversion to Engineering Units	Measured value: Output value (Decimal) x 0.001 (V) The lowest limit value: Output value (Decimal) x 0.001 (V) The highest limit value: Not applicable

CATALYST (BANK 1)

DTC P0420: MONITOR ID $21: TEST ID $A0

OBD Monitor ID	**$21**	**Test ID**	**$A0**	**Unit and Scaling ID**	**$01**
DTC		P0420			
Test Description		Catalyst capability, monitored by measuring the fluctuation of the secondary heated oxygen sensor output value.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: No unit The lowest limit value: Not applicable The highest limit value: No unit			

DTC P0420: MONITOR ID $21: TEST ID $A1

OBD Monitor ID	**$21**	**Test ID**	**$A1**	**Unit and Scaling ID**	**$0B**
DTC		P0420			
Test Description		Catalyst capability, monitored by measuring the stability of the secondary heated oxygen sensor output value.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.001 (V) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 0.001 (V)			

CATALYST (BANK 2)

DTC P0430: MONITOR ID $22: TEST ID $0B

OBD Monitor ID	**$22**	**Test ID**	**$A1**	**Unit and Scaling ID**	**$0B**
DTC		P0430			
Test Description		Check of catalyst capability by monitoring the stability of the secondary heated oxygen sensor output value.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.001 (V) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 0.001 (V)			

EGR SYSTEM

DTC P0404: MONITOR ID $31: TEST ID $D0

OBD Monitor ID	$31	Test ID	$D0	Unit and Scaling ID	$32
DTC		P0404			
Test Description		Check of EGR valve by comparing the actual valve lift value to the PCM commanded valve lift value.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.0000305 (inch) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 0.0000305 (inch)			

DTC P2413: MONITOR ID $31: TEST ID $D1

OBD Monitor ID	$31	Test ID	$D1	Unit and Scaling ID	$32
DTC		P2413			
Test Description		Check of EGR valve by comparing the actual valve lift value to the PCM commanded valve lift value.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value lift: Output value (Decimal) x 0.0000305 (inch) The lowest limit value lift: Output value (Decimal) x 0.0000305 (inch) The highest limit value lift: Not applicable			

DTC P0401: MONITOR ID $31: TEST ID $D2

OBD Monitor ID	$31	Test ID	$D2	Unit and Scaling ID	$39
DTC		P0401			
Test Description		Check EGR flow by monitoring the change in intake manifold pressure between EGR valve open and closed during fuel cut.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.01 (%) The lowest limit value: Output value (Decimal) x 0.01 (%) The highest limit value: Not applicable			

DTC P0400: MONITOR ID $31: TEST ID $D3

OBD Monitor ID	$31	Test ID	$D3	Unit and Scaling ID	$01
DTC		P0400			
Test Description		Check for a broken EGR pipe by monitoring the A/F sensor output.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: No unit The lowest limit value: Not applicable The highest limit value: No unit			

VTC (VVT) SYSTEM

DTC P0011: MONITOR ID $35: TEST ID $D4

OBD Monitor ID	$35	Test ID	$D4	Unit and Scaling ID	$1C

DTC	P0011
Test Description	Response check of VTC (VVT) system by monitoring divergence of actual camshaft angle from target angle.
Store Timing	Normal judgment/Failure judgment
Conversion to Engineering Units	Measured value: Output value (Decimal) x 0.01 (deg.) The lowest limit value: Output value (Decimal) x 0.01 (deg.) The highest limit value: Output value (Decimal) x 0.01 (deg.)

DTC P1009: MONITOR ID $35: TEST ID $D5

OBD Monitor ID	**$35**	**Test ID**	**$D5**	**Unit and Scaling ID**	**$1C**
DTC		P1009			
Test Description		Check of VTC (VVT) system by comparing the actual camshaft angle to the target camshaft angle.			
Store Timing		Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.01 (deg.) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 0.01 (deg.)			

DTC P0341: MONITOR ID $35: TEST ID $D9

OBD Monitor ID	**$35**	**Test ID**	**$D9**	**Unit and Scaling ID**	**$9C**
DTC		P0341			
Test Description		Check of the VTC (VVT) system by monitoring divergence of camshaft angle from basis position during VTC (VVT) system stop.			
Store Timing		Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.01 (deg.) The lowest limit value: Output value (Decimal) x 0.01 (deg.) The highest limit value: Output value (Decimal) x 0.01 (deg.)			

EVAP SYSTEM

DTC P0455: MONITOR ID $3A: TEST ID $BA

OBD Monitor ID	**$3A**	**Test ID**	**$BA**	**Unit and Scaling ID**	**$12**
DTC		P0455			
Test Description		Large (gross) leak check of EVAP system by monitoring time of the fuel tank pressure sensor value which is equal atmosphere after the engine off. (EONV)			
Store Timing		Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 1.0 (sec.) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 1.0 (sec.)			

DTC P0456: MONITOR ID $B4: TEST ID $BA

OBD Monitor ID	**$3C**	**Test ID**	**$B4**	**Unit and Scaling ID**	**$06**

DTC	P0456
Test Description	Leak check of EVAP system by monitoring the fuel tank pressure sensor value after the engine off. (EONV)
Store Timing	Normal judgment/Failure judgment
Conversion to Engineering Units	Measured value: Output value (Decimal) x 0.0000305 The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 0.0000305

DTC P0456: MONITOR ID $3C: TEST ID $B5

OBD Monitor ID	**$3C**	**Test ID**	**$B5**	**Unit and Scaling ID**	**$83**
DTC		P0456			
Test Description		Leak check of EVAP system by monitoring the fuel tank pressure sensor value after the engine off. (EONV)			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.01 The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 0.01			

DTC P0456: MONITOR ID $3C: TEST ID $B6

OBD Monitor ID	**$3C**	**Test ID**	**$B6**	**Unit and Scaling ID**	**$12**
DTC		P0456			
Test Description		Leak check of EVAP system by monitoring time of the fuel tank pressure sensor value which is equal atmosphere after the engine off. (EONV)			
Store Timing		Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 1.0 (sec.) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 1.0 (sec.)			

DTC P0456: MONITOR ID $3C: TEST ID $B7

OBD Monitor ID	**$3C**	**Test ID**	**$B7**	**Unit and Scaling ID**	**$10**
DTC		P0456			
Test Description		Check of fuel tank pressure sensor signal unstable after the engine off. (early EONV)			
Store Timing		Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 1.0 (msec.) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 1.0 (msec.)			

DTC P0456: MONITOR ID $3C: TEST ID $B8

OBD Monitor ID	**$3C**	**Test ID**	**$B8**	**Unit and Scaling ID**	**$FE**
DTC		P0456			
Test Description		Check of EVAP system by monitoring the fuel tank pressure sensor signal after			

	the engine off. (comparison with atmosphere)
Store Timing	Normal judgment/Failure judgment
Conversion to Engineering Units	Measured value: Output value (Decimal) x 0.25 (Pa) The lowest limit value: Output value (Decimal) x 0.25 (Pa) The highest limit value: Output value (Decimal) x 0.25 (Pa)

DTC P0457, P0496, P145C: MONITOR ID $3D: TEST ID $B9

OBD Monitor ID	$3D	Test ID	$B9	Unit and Scaling ID	$30
DTC		P0457, P0496, P145C			
Test Description		Purge flow and/or EVAP canister purge valve check by monitoring fuel tank pressure sensor value while the engine is running.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 0.001526 (%) The lowest limit value: Not applicable The highest limit value: Output value (Decimal) x 0.001526 (%)			

DTC P145A, P145D: MONITOR ID $3D: TEST ID $BB

OBD Monitor ID	$3D	Test ID	$BB	Unit and Scaling ID	$30
DTC		P145A, P145D			
Test Description		Purge flow and/or EVAP canister purge valve check by monitoring fuel tank pressure sensor value while the engine is running with positive pressure condition.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value lift: Output value (Decimal) x 0.001526 (%) The lowest limit value lift: Not applicable The highest limit value lift: Output value (Decimal) x 0.001526 (%)			

DTC P145B: MONITOR ID $3D: TEST ID $BC

OBD Monitor ID	$3D	Test ID	$BC	Unit and Scaling ID	$10
DTC		P145B			
Test Description		Purge flow and/or check valve check by monitoring fuel tank pressure sensor value while the engine is running.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value lift: Output value (Decimal) x 1 (msec.) The lowest limit value lift: Output value (Decimal) x 1 (msec.) The highest limit value lift: Not applicable			

MISFIRE

DTC P0301: MONITOR ID $A2: TEST ID $0B

OBD Monitor ID	$A2	Test ID	$0B	Unit and Scaling ID	$24
DTC		P0301			
Test Description		The average number of misfires detected during the last ten driving cycles for #1 cylinder.			

	(current misfire counts) x 0.1 + (previous misfire counts average) x 0.9
Store Timing	Normal judgment/Failure judgment
Conversion to Engineering Units	Measured value: Output value (Decimal) x 1 (time) The lowest limit value: Not applicable The highest limit value: Not applicable

DTC P0301: MONITOR ID $A2: TEST ID $0C

OBD Monitor ID	**$A2**	**Test ID**	**$0C**	**Unit and Scaling ID**	**$24**
DTC		P0301			
Test Description		Total misfire counters in #1 cylinder on the present drive cycle. Previous drive cycle misfire counters are indicated from ignition switch is turned to ON (II) until engine start.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 1 (time) The lowest limit value: Not applicable The highest limit value: Not applicable			

DTC P0302: MONITOR ID $A3: TEST ID $0B

OBD Monitor ID	**$A3**	**Test ID**	**$0B**	**Unit and Scaling ID**	**$24**
DTC		P0302			
Test Description		The average number of misfires detected during the last ten driving cycles for #2 cylinder. (current misfire counts) x 0.1 + (previous misfire counts average) x 0.9			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 1 (time) The lowest limit value: Not applicable The highest limit value: Not applicable			

DTC P0302: MONITOR ID $A3: TEST ID $0C

OBD Monitor ID	**$A3**	**Test ID**	**$0C**	**Unit and Scaling ID**	**$24**
DTC		P0302			
Test Description		Total misfire counters in #2 cylinder on the present drive cycle. Previous drive cycle misfire counters are indicated from ignition switch is turned to ON (II) until engine start.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 1 (time) The lowest limit value: Not applicable The highest limit value: Not applicable			

DTC P0303: MONITOR ID $A4: TEST ID $0B

OBD Monitor ID	**$A4**	**Test ID**	**$0B**	**Unit and Scaling ID**	**$24**
DTC		P0303			

Test Description	The average number of misfires detected during the last ten driving cycles for #3 cylinder. (current misfire counts) x 0.1 + (previous misfire counts average) x 0.9
Store Timing	Normal judgment/Failure judgment
Conversion to Engineering Units	Measured value: Output value (Decimal) x 1 (time) The lowest limit value: Not applicable The highest limit value: Not applicable

DTC P0303: MONITOR ID $A4: TEST ID $0C

OBD Monitor ID	**$A4**	**Test ID**	**$0C**	**Unit and Scaling ID**	**$24**
DTC		P0303			
Test Description		Total misfire counters in #3 cylinder on the present drive cycle. Previous drive cycle misfire counters are indicated from ignition switch is turned to ON (II) until engine start.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 1 (time) The lowest limit value: Not applicable The highest limit value: Not applicable			

DTC P0304: MONITOR ID $A5: TEST ID $0B

OBD Monitor ID	**$A5**	**Test ID**	**$0B**	**Unit and Scaling ID**	**$24**
DTC		P0304			
Test Description		The average number of misfires detected during the last ten driving cycles for #4 cylinder. (current misfire counts) x 0.1 + (previous misfire counts average) x 0.9			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 1 (time) The lowest limit value: Not applicable The highest limit value: Not applicable			

DTC P0304: MONITOR ID $A5: TEST ID $0C

OBD Monitor ID	**$A5**	**Test ID**	**$0C**	**Unit and Scaling ID**	**$24**
DTC		P0304			
Test Description		Total misfire counters in #4 cylinder on the present drive cycle. Previous drive cycle misfire counters are indicated from ignition switch is turned to ON (II) until engine start.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 1 (time) The lowest limit value: Not applicable The highest limit value: Not applicable			

DTC P0305: MONITOR ID $A6: TEST ID $0B

OBD Monitor ID	$A6	Test ID	$0B	Unit and Scaling ID	$24
DTC		P0305			
Test Description		The average number of misfires detected during the last ten driving cycles for #5 cylinder. (current misfire counts) x 0.1 + (previous misfire counts average) x 0.9			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 1 (time) The lowest limit value: Not applicable The highest limit value: Not applicable			

DTC P0305: MONITOR ID $A6: TEST ID $0C

OBD Monitor ID	$A6	Test ID	$0C	Unit and Scaling ID	$24
DTC		P0305			
Test Description		Total misfire counters in #5 cylinder on the present drive cycle. Previous drive cycle misfire counters are indicated from ignition switch is turned to ON (II) until engine start.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value lift: Output value (Decimal) x 1 (time) The lowest limit value lift: Not applicable The highest limit value lift: Not applicable			

DTC P0306: MONITOR ID $A7: TEST ID $0B

OBD Monitor ID	$A7	Test ID	$0B	Unit and Scaling ID	$24
DTC		P0306			
Test Description		The average number of misfires detected during the last ten driving cycles for #6 cylinder. (current misfire counts) x 0.1 + (previous misfire counts average) x 0.9			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value: Output value (Decimal) x 1 (time) The lowest limit value: Not applicable The highest limit value: Not applicable			

DTC P0306: MONITOR ID $A7: TEST ID $0C

OBD Monitor ID	$A7	Test ID	$0C	Unit and Scaling ID	$24
DTC		P0306			
Test Description		Total misfire counters in #6 cylinder on the present drive cycle. Previous drive cycle misfire counters are indicated from ignition switch is turned to ON (II) until engine start.			
Store Timing		Normal judgment/Failure judgment			
Conversion to Engineering Units		Measured value lift: Output value (Decimal) x 1 (time) The lowest limit value lift: Not applicable The highest limit value lift: Not applicable			

2012 ENGINE PERFORMANCE

PCV System - TL

DTC TROUBLESHOOTING

DTC P2279: INTAKE AIR SYSTEM LEAK

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0443 is stored at the same time as DTC P2279, troubleshoot DTC P0443 first, then recheck for DTC P2279.**

1. Check for vacuum leaks at these parts:
   - PCV valve
   - PCV hose
   - Purge (PCS) line
   - Throttle body
   - Intake manifold
   - Brake booster
   - Brake booster hose
   - Engine mount
   - Engine mount control solenoid valve
   - Vacuum hose/line of the engine mount control system

   Are the parts OK?

   YES - Go to step 2.

   NO - Repair or replace any damaged part(s), then go to step 4.

2. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle 1 minute.
3. Monitor the OBD STATUS for DTC P2279 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Check the camshaft timing (see **TIMING BELT INSTALLATION**), then go to step 4.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 2 and recheck.

4. Reset the ECM/PCM with the HDS.
5. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
6. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2279 indicated?

   YES - Check for vacuum leaks at the PCV valve, the PCV hose, the purge (PCS) line, the throttle body, the intake manifold, the brake booster, the brake booster hose, and the engine mount control system, then go to step 1.

   NO - Go to step 7.

7. Monitor the OBD STATUS for DTC P2279 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 6, go to the indicated DTC's troubleshooting. •

NO - If the screen indicates FAILED, go to step 1. If the screen indicates EXECUTING or OUT OF CONDITION, keep idling until a result comes on.

PCV VALVE INSPECTION

1. Check the PCV valve (A), the hoses (B), and connections for leaks or restrictions.

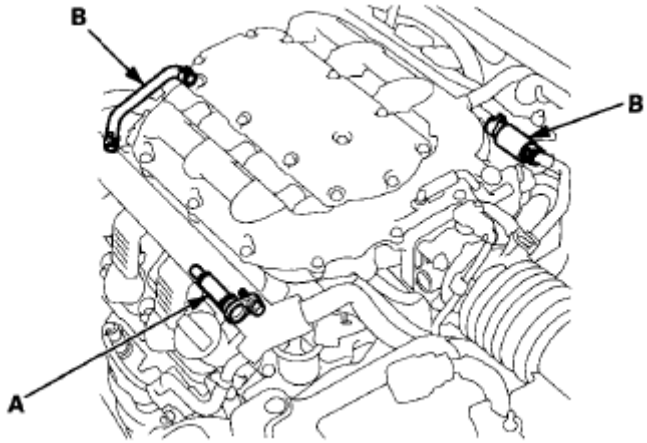

Fig. 2: Identifying PCV Valve And Hoses
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. At idle, listen to the PCV valve (A) with a stethoscope as you lightly pinch the PCV hose (B) with your fingers or pliers several times. Each time the hose is pinched, the valve should click.

   If there is no clicking sound, check the PCV valve collar and O-rings for cracks or damage. If they are OK, replace the PCV valve (see **PCV Valve Replacement**) and recheck.

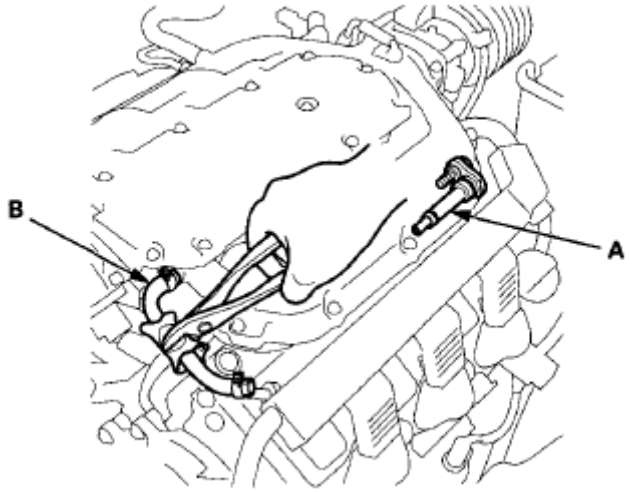

Fig. 3: Identifying PCV Valve And Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

PCV VALVE REPLACEMENT

1. Lift up the harness cover (A).

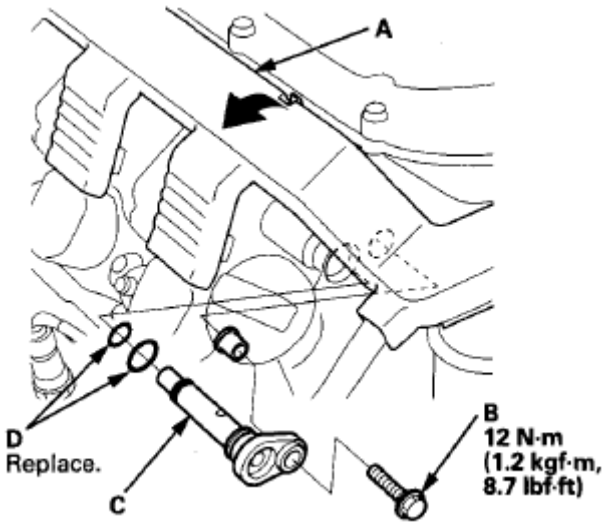

Fig. 4: Identifying Harness Cover, Bolt And PCV Valve With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the bolt (B).
3. Remove the PCV valve (C).

NOTE: Do not to spill oil on the hot exhaust manifold.

4. Install the parts in the reverse order of removal.

NOTE:

- **When installing a new PCV valve, make sure the O-rings (D) are in place.**
- **When installing a used PCV valve, use new O-rings.**

2012 ENGINE PERFORMANCE

PGM-FI System - TL

COMPONENT LOCATION INDEX

DTC TROUBLESHOOTING

DTC P0101: MAF SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see**

GENERAL TROUBLESHOOTING INFORMATION).

- **If DTC P1128, P1129, P2228, and/or P2229 are stored at the same time as DTC P0101, troubleshoot those DTCs first, then recheck for DTC P0101.**

1. Check for poor connections or damage to these parts:
   - PCV hose
   - Intake air duct
   - Air cleaner
   - Purge (PCS) line
   - Brake booster
   - Brake booster hose

   Are the parts OK?

   YES - Go to step 2.

   NO - Repair or replace the damaged part(s), then go to step 14.

2. Check for damage or looseness at the intake air duct in the air cleaner.

   Is it OK?

   YES - Go to step 3.

   NO - Reconnect or replace the intake air duct, then go to step 14.

3. Check for a dirty air cleaner element.

   Is it dirty?

   YES - Replace the air cleaner element (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 14.

   NO - Go to step 4.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Check the MAF SENSOR in the DATA LIST with the HDS.

   Is there about 0.2 gm/s or 0.5 V?

   YES - Go to step 6.

   NO - Go to step 12.

6. Start the engine.

7. Vary the engine speed between 2, 000 and 3, 000 RPM.
8. Check the MAF SENSOR in the DATA LIST with the HDS.

   Does the reading change?

   YES - Go to step 9.

   NO - Go to step 12.

9. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
10. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VEHICLE SPEED
    - MAP SENSOR
    - MAF SENSOR
11. Monitor the OBD STATUS for DTC P0101 in the DTCs MENU with the HDS.

    Does the screen indicate FAILED?

    YES - Go to step 12.

    NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, go to step 10 and recheck.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Replace the MAF sensor/IAT sensor (see **MAF Sensor/IAT Sensor Replacement**).
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VEHICLE SPEED
    - MAP SENSOR
    - MAF SENSOR
18. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0101 indicated?

    YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM, then go to step 1.

NO - Go to step 19.

19. Monitor the OBD STATUS for DTC P0101 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 18, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 17.

DTC P0102: MAF SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait 2 seconds.
2. Check the MAF SENSOR in the DATA LIST with the HDS.

   Is about 0 gm/s, or 0.1 V or less indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the MAF sensor/IAT sensor 5P connector.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Measure the voltage between MAF sensor/IAT sensor 5P connector terminal No. 5 and body ground.

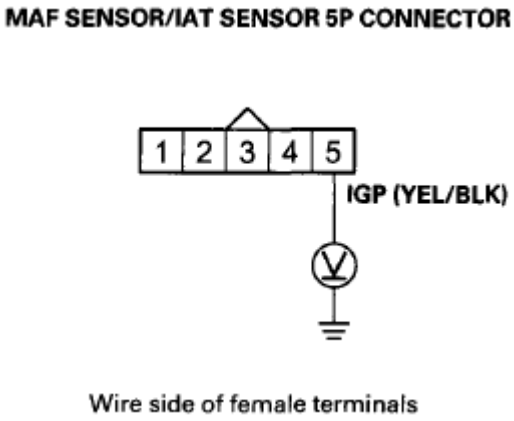

Fig. 3: Measuring Voltage Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 7.

NO - Repair open in the wire between PGM-FI main relay 1 and the MAF sensor/IAT sensor, then go to step 19.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Measure the resistance between MAF sensor/IAT sensor 5P connector terminal No. 3 and body ground.

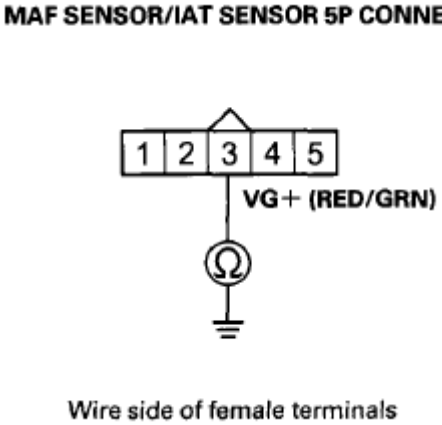

Fig. 4: Measuring Resistance Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 190- 210 kohms?

YES - Go to step 13.

NO - Go to step 9.

9. Jump the SCS line with the HDS.
10. Disconnect ECM/PCM connector A (49P).
11. Check for continuity between ECM/PCM connector terminal A20 and body ground.

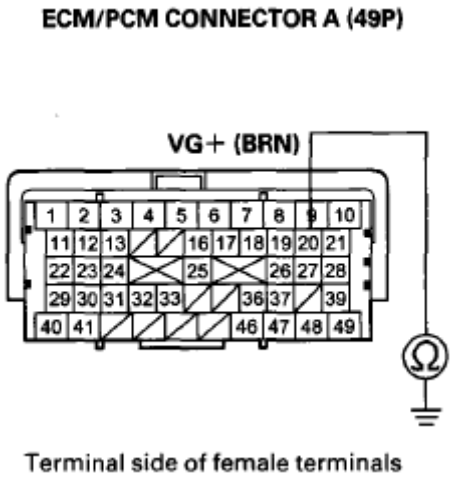

Fig. 5: Checking Continuity Between ECM/PCM Connector Terminal A20 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A20) and the MAF sensor/IAT sensor, then go to step 20.

NO - Go to step 12.

12. Check for continuity between MAF sensor/IAT sensor 5P connector terminal No. 3 and ECM/PCM connector terminal A20.

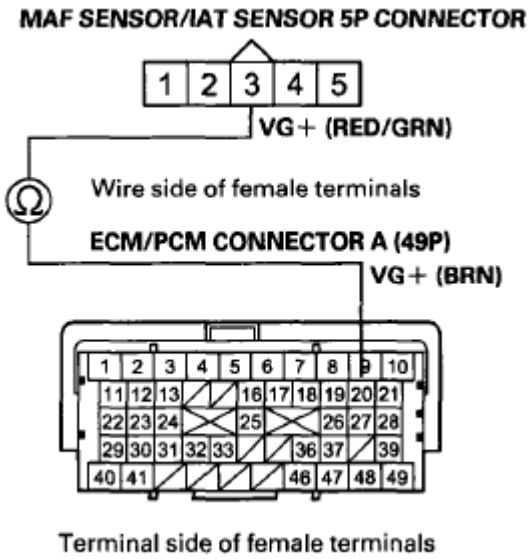

Fig. 6: Checking Continuity Between MAF Sensor/IAT Sensor 5P Connector And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM/PCM (A20) and the MAF sensor/IAT sensor, then go to step 20.

13. Substitutes known-good **MAF sensor/IAT sensor**.
14. Reconnect all connectors.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Clear the DTC with the HDS.
17. Start the engine. Hold the engine speed at 2, 000 RPM without load (A/T in P or N, M/T in neutral).
18. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0102 indicated?

YES - Reinstall the original MAF sensor/IAT sensor, then go to step 26.

NO - Replace the original **MAF sensor/IAT sensor**, then go to step 19.

19. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
20. Reconnect all connectors.
21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).

24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0102 indicated?

    YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

25. Reconnect all connectors.
26. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
27. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0102 indicated?

    YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0103: MAF SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait 2 seconds.
2. Check the MAF SENSOR in the DATA LIST with the HDS.

    Is about 202 gm/s, or 4.89 V or more indicated?

    YES - Go to step 3.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Jump the SCS line with the HDS.
5. Disconnect the MAF sensor/IAT sensor 5P connector.

6. Disconnect ECM/PCM connector A (49P).
7. Check for continuity between MAF sensor/IAT sensor 5P connector terminal No. 4 and ECM/PCM connector terminal A9.

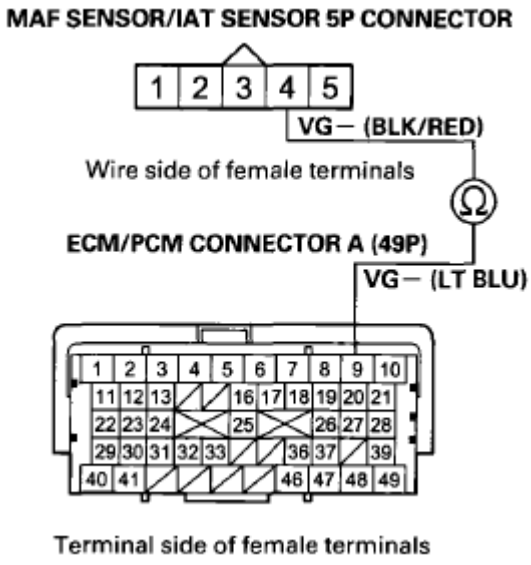

Fig. 7: Checking Continuity Between MAF Sensor/IAT Sensor 5P Connector And ECM/PCM Connector Terminal A20
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 8.

NO - Repair open in the wire between the ECM/PCM (A9) and the MAF sensor/IAT sensor, then go to step 15.

8. Reconnect ECM/PCM connector A (49P).
9. Connect MAF sensor/IAT sensor 5P connector terminals No. 3 and No. 4 with a jumper wire.

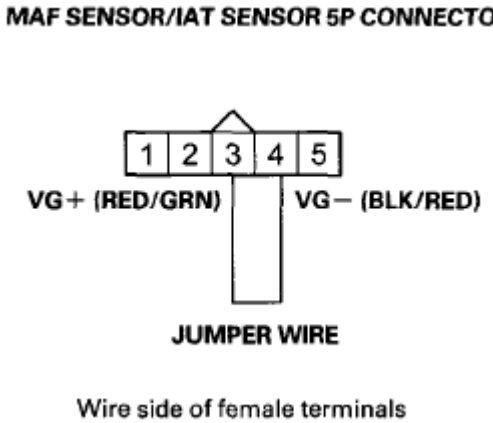

Fig. 8: Connecting MAF Sensor/IAT Sensor 5P Connector Terminals No. 3 And No. 4 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Clear the DTC with the HDS.
12. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0103 indicated?

    YES - Go to step 20.

    NO - Go to step 13.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Replace the **MAF sensor/IAT sensor**.
15. Reconnect all connectors.
16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
17. Reset the ECM/PCM with the HDS.
18. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
19. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0103 indicated?

    YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Reconnect all connectors.
22. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
23. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0103 indicated?

    YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0107: MAP SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is about 3 kPa (1.0 inHg, 26 mmHg), or 0.23 V or less indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the MAP sensor 3P connector.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is about 3 kPa (1.0 inHg, 26 mmHg), or 0.23 V or less indicated?

   YES - Go to step 12.

   NO - Go to step 7.

7. Measure the voltage between MAP sensor 3P connector terminals No. 1 and No. 3.

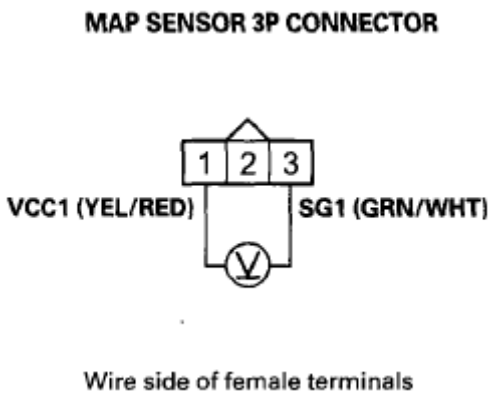

Fig. 9: Measuring Voltage Between MAP Sensor 3P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Jump the SCS line with the HDS.
10. Disconnect ECM/PCM connector B (49P).
11. Check for continuity between ECM/PCM connector terminal B36 and MAP sensor 3P connector terminal No. 1.

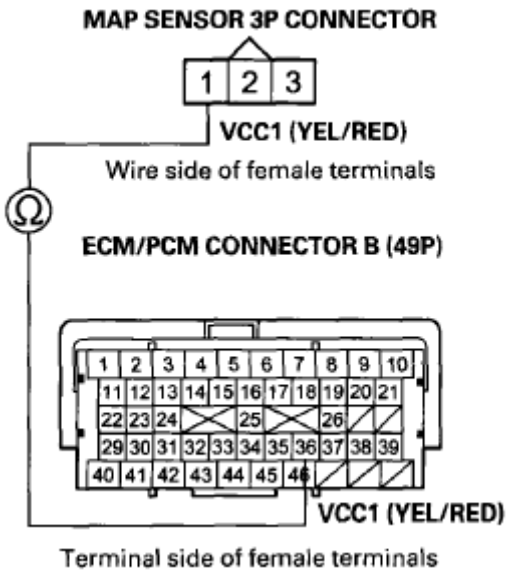

Fig. 10: Checking Continuity Between ECM/PCM Connector Terminal B36 And MAP Sensor 3P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the ECM/PCM (B36) and the MAP sensor, then go to step 18.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector B (49P).
15. Check for continuity between MAP sensor 3P connector terminal No. 2 and body ground.

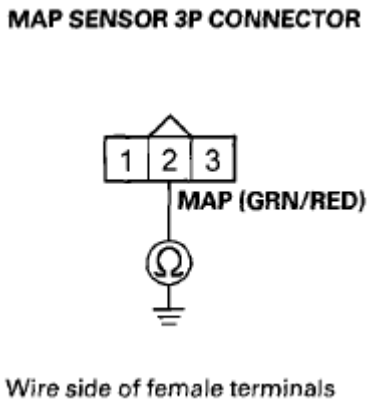

Fig. 11: Checking Continuity Between MAP Sensor 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B35) and the MAP sensor, then go to step 18.

NO - Go to step 23.

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Replace the MAP sensor (see **MAP Sensor Replacement**).
18. Reconnect all connectors.
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0107 indicated?

    YES - Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

23. Reconnect all connectors.
24. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
25. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0107 indicated?

YES - Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0108: MAP SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is about 160 kPa (47.1 inHg, 1, 197 mmHg), or 4.49 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the MAP sensor 3P connector.
5. Connect MAP sensor 3P connector terminals No. 2 and No. 3 with a jumper wire.

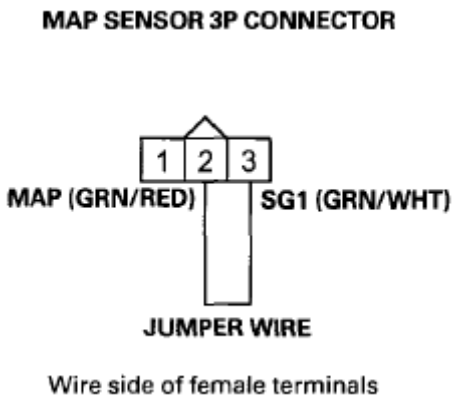

Fig. 12: Connecting MAP Sensor 3P Connector Terminals No. 2 And No. 3 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Check the MAP SENSOR in the DATA LIST with the HDS.

Is about 160 kPa (47.1 inHg, 1, 197 mmHg), or 4.49 V or more indicated?

YES - Go to step 8.

NO - Go to step 18.

8. Remove the jumper wire from the MAP sensor 3P connector.
9. Measure the voltage between MAP sensor 3P connector terminals No. 1 and No. 3.

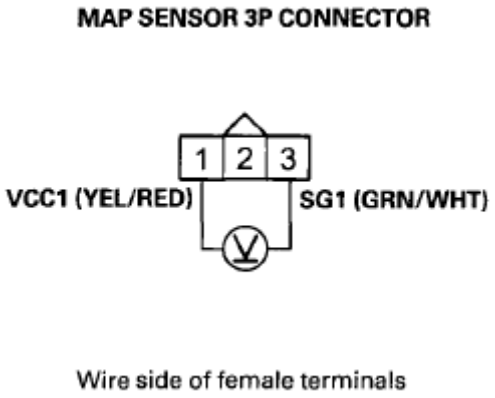

Fig. 13: Measuring Voltage Between MAP Sensor 3P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 14.

NO - Go to step 10.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connector B (49P).
13. Check for continuity between ECM/PCM connector terminal B34 and MAP sensor 3P connector terminal No. 3.

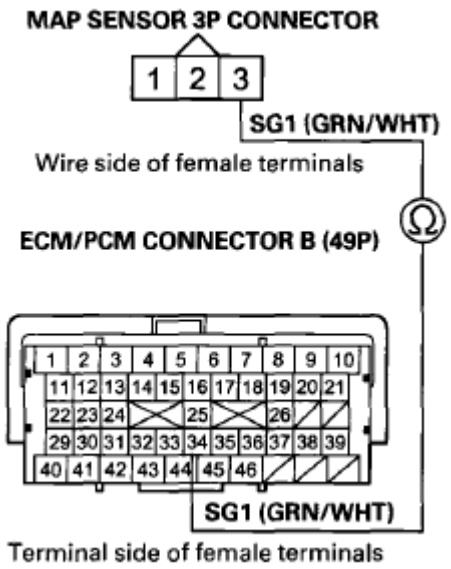

Fig. 14: Checking Continuity Between ECM/PCM Connector Terminal B34 And MAP Sensor 3P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM/PCM (B34) and the MAP sensor, then go to step 20.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector B (49P).
17. Check for continuity between ECM/PCM connector terminal B35 and MAP sensor 3P connector terminal No. 2.

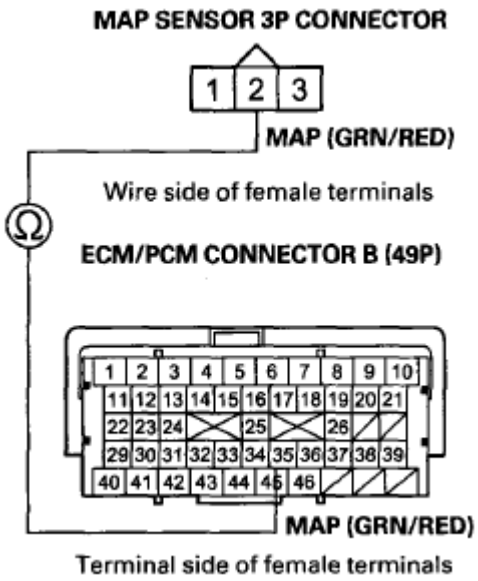

Fig. 15: Checking Continuity Between ECM/PCM Connector Terminal B35 And MAP Sensor 3P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM/PCM (B35) and the MAP sensor, then go to step 20.

18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
19. Replace the MAP sensor (see **MAP Sensor Replacement**).
20. Reconnect all connectors.
21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0108 indicated?

    YES - Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

25. Reconnect all connectors.
26. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).

27. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0108 indicated?

    YES - Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0111: IAT SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check for poor connections or loose terminals at ECT sensors 1 and 2, and the MAF sensor/IAT sensor.

   Are the connections and terminals OK?

   YES - Go to step 2.

   NO - Repair the connections or terminals, then go to step 15.

2. Remove the **MAF sensor/IAT sensor**.
3. Allow the MAF sensor/IAT sensor to cool to the ambient temperature.
4. Note the ambient temperature.
5. Connect the MAF sensor/IAT sensor to its 5P connector, but do not install it.
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Quickly note the value of the IAT SENSOR in the DATA LIST with the HDS.
8. Compare the value of the IAT SENSOR to the ambient temperature.

   Does the value of the IAT SENSOR differ 5.4°F (3°C) or more from ambient temperature?

   YES - Go to step 13.

   NO - Go to step 9.

9. Disconnect the MAF sensor/IAT sensor from its 5P connector.
10. Using a heat gun, blow hot air on the MAF sensor/IAT sensor for a few seconds. Do not apply the heat longer than a few seconds or you will damage the sensor.
11. Connect the MAF sensor/IAT sensor to its 5P connector, but do not install it.

12. Check the IAT SENSOR in the DATA LIST with the HDS.

    Does the IAT SENSOR change 68°F (38°C) or more?

    YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM. •

    NO - Go to step 13.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Replace the **MAF sensor/IAT sensor**.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0111 indicated?

    YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0112: IAT SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the IAT SENSOR in the DATA LIST with the HDS.

    Is about 356°F (180°C) or more, or 0.08 V or less indicated?

    YES - Go to step 3.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the MAF sensor/IAT sensor 5P connector.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Check the IAT SENSOR in the DATA LIST with the HDS.

Is about 356°F (180°C) or more, or 0.08 V or less indicated?

YES - Go to step 7.

NO - Go to step 11.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector C (49P).
10. Check for continuity between MAF sensor/IAT sensor 5P connector terminal No. 2 and body ground.

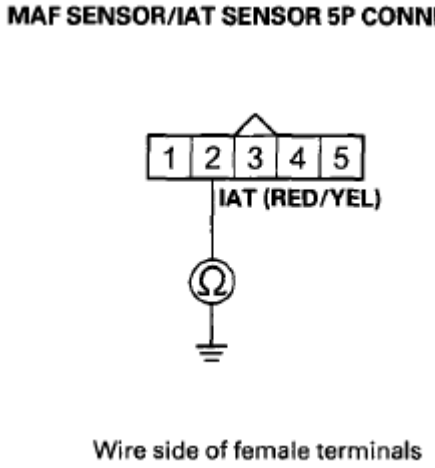

Fig. 16: Checking Continuity Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the MAF sensor/IAT sensor and the ECM/PCM (C24), then go to step 13.

NO - Go to step 18.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Replace the **MAF sensor/IAT sensor**.
13. Reconnect all connectors.
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0112 indicated?

YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

18. Reconnect all connectors.
19. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0112 indicated?

    YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0113: IAT SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the IAT SENSOR in the DATA LIST with the HDS.

   Is about - 40°F (- 40°C) or less, or 4.92 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the MAF sensor/IAT sensor 5P connector.
5. Connect MAF sensor/IAT sensor 5P connector terminals No. 1 and No. 2 with a jumper wire.

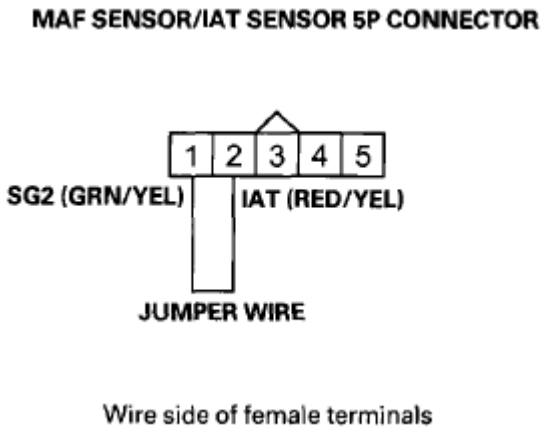

Fig. 17: Connecting MAF Sensor/IAT Sensor 5P Connector Terminals No. 1 And No. 2 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Check the IAT SENSOR in the DATA LIST with the HDS.

   Is about -40°F (-40°C) or less, or 4.92 V or more indicated?

   YES - Go to step 8.

   NO - Go to step 20.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Remove the jumper wire from the MAF sensor/IAT sensor 5P connector.
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Measure the voltage between MAF sensor/IAT sensor 5P connector terminal No. 2 and body ground.

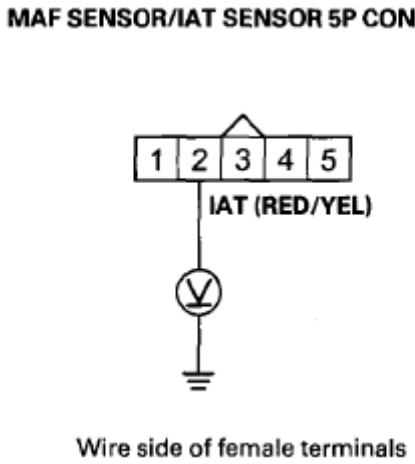

Fig. 18: Measuring Voltage Between MAF Sensor/IAT Sensor 5P Connector Terminal No. 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 16.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector C (49P).
15. Check for continuity between ECM/PCM connector terminal C16 and MAF sensor/IAT sensor 5P connector terminal No. 1.

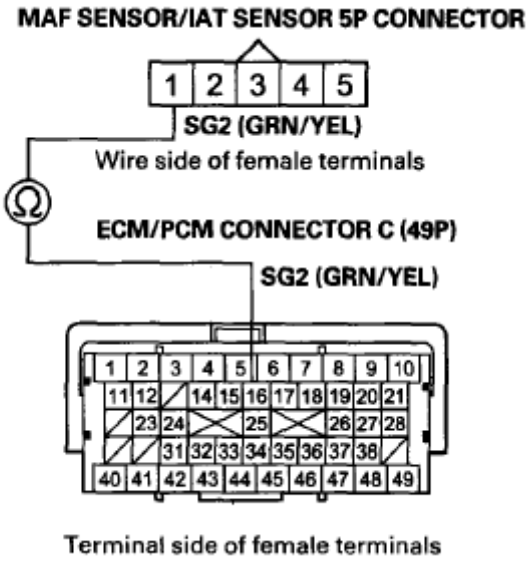

Fig. 19: Checking Continuity Between ECM/PCM Connector And MAF Sensor/IAT Sensor 5P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM/PCM (C16) and the MAF sensor/IAT sensor, then go to step 22.

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Jump the SCS line with the HDS.
18. Disconnect ECM/PCM connector C (49P).
19. Check for continuity between ECM/PCM connector terminal C24 and MAF sensor/IAT sensor 5P

connector terminal No. 2.

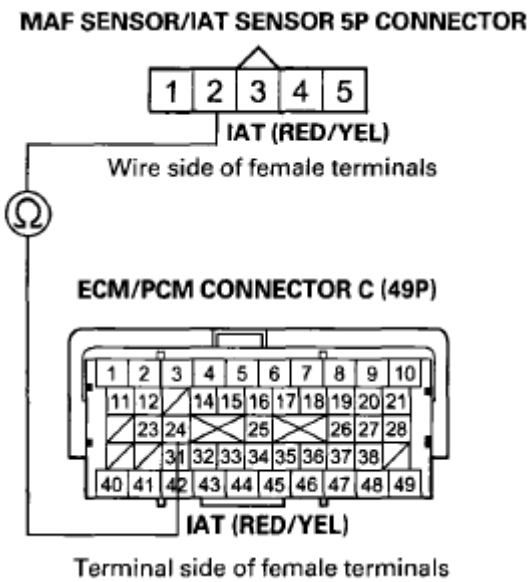

Fig. 20: Checking Continuity Between ECM/PCM Connector And MAF Sensor/IAT Sensor 5P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM/PCM (C24) and the MAF sensor/IAT sensor, then go to step 22.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Replace the **MAF sensor/IAT sensor**.
22. Reconnect all connectors.
23. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
24. Reset the ECM/PCM with the HDS.
25. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
26. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0113 indicated?

YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

27. Reconnect all connectors.
28. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
29. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0113 indicated?

    YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0116: ECT SENSOR 1 CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about 176°F (80°C) or more, or 0.78 V or less indicated?

   YES - Go to step 6.

   NO - Go to step 3.

3. Note the value of ECT SENSOR 1 in the DATA LIST with the HDS.
4. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
5. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Does ECT SENSOR 1 change 18°F (10°C) or more?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM. •

   NO - Go to step 11.

6. Note the value of ECT SENSOR 1 in the DATA LIST with the HDS.
7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Open the hood, and let the engine cool for 3 hours.

9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Check ECT SENSOR 1 in the DATA LIST with the HDS.

    Does ECT SENSOR 1 change 18°F (10°C) or more?

    YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM. •

    NO - Go to step 11.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Replace ECT sensor 1 (see **ECT Sensor 1 Replacement**).
13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
16. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0116 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0117: ECT SENSOR 1 CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

    Is about 356°F (180°C) or more, or 0.08 V or less indicated?

    YES - Go to step 3.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the ECT sensor 1 2P connector.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

6. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about 356°F (180°C) or more, or 0.08 V or less indicated?

   YES - Go to step 7.

   NO - Go to step 11.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector C (49P).
10. Check for continuity between ECT sensor 1 2P connector terminal No. 1 and body ground.

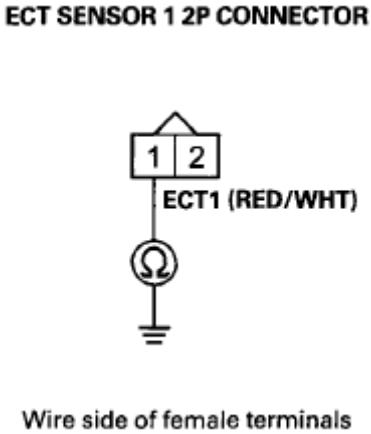

Fig. 21: Checking Continuity Between ECT Sensor 1 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between ECT sensor 1 and the ECM/PCM (C32), then go to step 13.

NO - Go to step 18.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Replace ECT sensor 1 (see **ECT Sensor 1 Replacement**).
13. Reconnect all connectors.
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0117 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

18. Reconnect all connectors.
19. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0117 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0118: ECT SENSOR 1 CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about - 40°F (- 40°C) or less, or 4.92 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the ECT sensor 1 2P connector.
5. Connect ECT sensor 1 2P connector terminals No. 1 and No. 2 with a jumper wire.

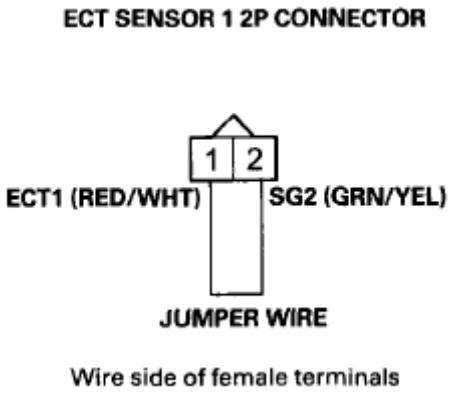

Fig. 22: Connecting ECT Sensor 1 2P Connector Terminals No. 1 And No. 2 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about - 40°F (- 40°C) or less, or 4.92 V or more indicated?

   YES - Go to step 8.

   NO - Go to step 20.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Remove the jumper wire from the ECT sensor 1 2P connector.
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Measure the voltage between ECT sensor 1 2P connector terminal No. 1 and body ground.

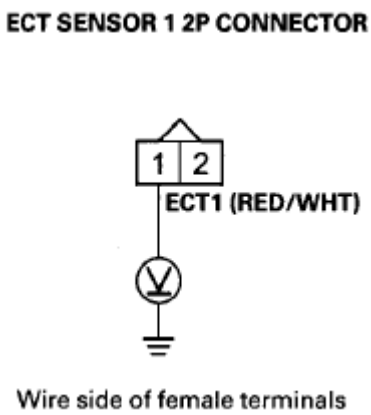

Fig. 23: Measuring Voltage Between ECT Sensor 1 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 12.

NO - Go to step 16.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector C (49P).
15. Check for continuity between ECM/PCM connector terminal C16 and ECT sensor 1 2P connector terminal No. 2.

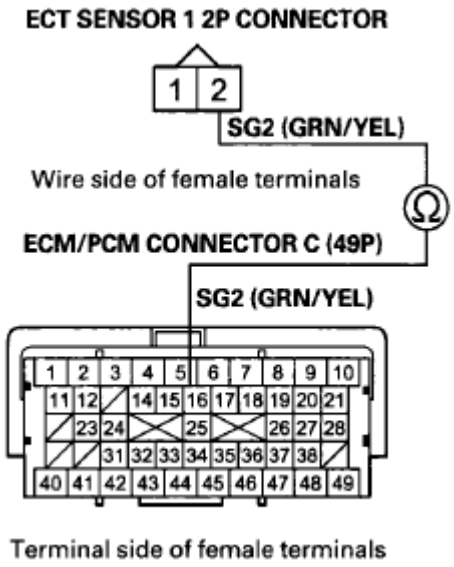

Fig. 24: Checking Continuity Between ECM/PCM Connector Terminal C16 And ECT Sensor 1 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM/PCM (C16) and ECT sensor 1, then go to step 22.

16. Turn the ignition switch to LOCK(0), or press the engine start/stop button to select the OFF mode.
17. Jump the SCS line with the HDS.
18. Disconnect ECM/PCM connector C (49P).
19. Check for continuity between ECM/PCM connector terminal C32 and ECT sensor 1 2P connector terminal No. 1.

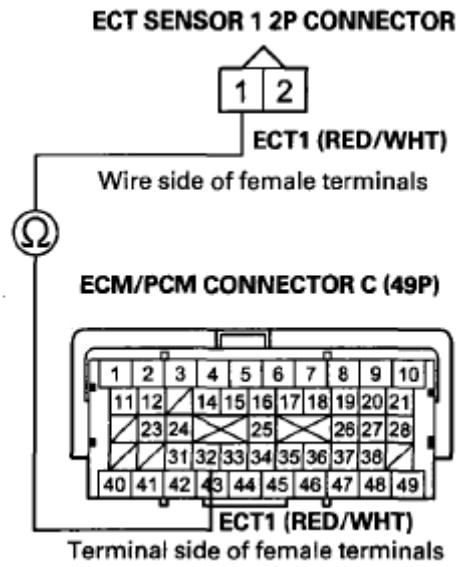

Fig. 25: Checking Continuity Between ECM/PCM Connector Terminal C32 And ECT Sensor 1 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM/PCM (C32) and ECT sensor 1, then go to step 22.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Replace ECT sensor 1 (see **ECT Sensor 1 Replacement**).
22. Reconnect all connectors.
23. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
24. Reset the ECM/PCM with the HDS.
25. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
26. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0118 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

27. Reconnect all connectors.
28. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).

29. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0118 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1 and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0125: ECT SENSOR 1 MALFUNCTION/SLOW RESPONSE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Start the engine, and let it idle for 5 minutes or more.
2. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about 10°F (-12°C) or less indicated?

   YES - Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. If the connections and the terminals are OK, replace ECT sensor 1 (see **ECT Sensor 1 Replacement**), then go to step 7.

   NO - Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Allow the engine to cool to 104°F (40°C) or less.
5. Start the engine, and let it idle until ECT SENSOR 1 goes up to about 158°F (70°C).

   Does ECT SENSOR 2 also read about 158°F (70°C)?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. •

6. Check the thermostat (see **FAN MOTOR TEST**).

   Is the thermostat OK?

   YES - Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. If the connections and the terminals are OK, replace ECT sensor 1 (see **ECT Sensor 1 Replacement**),

then go to step 7.

NO - Replace the thermostat (see **THERMOSTAT REPLACEMENT**), then go to step 7.

7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Reset the ECM/PCM with the HDS.
9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Allow the engine to cool to 104°F (40°C) or less.
11. Start the engine, and let it idle until ECT SENSOR 1 goes up to about 158°F (70°C).

Does ECT SENSOR 2 also read about 158°F (70°C)?

YES - Go to step 1 and recheck.

NO - Troubleshooting is complete. •

DTC P0128: COOLING SYSTEM MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the blower switch OFF.
4. Check the FAN HIGH CONTROL and FAN LOW CONTROL in the DATA LIST with the HDS.

Is it OFF?

YES - Go to step 5.

NO - Wait until the FAN HIGH CONTROL and FAN LOW CONTROL is off, then go to step 5.

5. Check the radiator fan operation.

Does the radiator fan keep running?

YES - Check the radiator fan high speed circuit (see **RADIATOR FAN HIGH SPEED CIRCUIT TROUBLESHOOTING**), and the radiator fan relay (see **POWER RELAY TEST**). If the circuit and the relay are OK, go to step 19.

NO - Go to step 6.

6. Let the engine cool until the coolant temperature is 104°F (40°C) or less.
7. Note the value of ECT SENSOR 1 and ECT SENSOR 2 in the DATA LIST with the HDS.

8. Start the engine, and let it idle.
9. Let the engine idle until ECT SENSOR 1 goes up 34°F (19°C) or more from the recorded temperature.
10. Check ECT SENSOR 2 in the DATA LIST with the HDS.
11. Compare the recorded value of ECT SENSOR 2 and the present value of ECT SENSOR 2.

    Did the temperature rise 9°F (5°C) or more?

    YES - Test the thermostat (see **FAN MOTOR TEST**), then go to step 12.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. •

12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Reset the ECM/PCM with the HDS.
14. Let the engine cool until the coolant temperature is between 21°F (-6°C) and 104°F (40°C).
15. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
16. Test-drive at a steady speed between 15- 75 mph (24-120 km/h) for 10 minutes.
17. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0128 indicated?

    YES - Check the cooling the system, then go to step 19.

    NO - Go to step 18.

18. Monitor the OBD STATUS for DTC P0128 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 17, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check the cooling the system, then go to step 19. If the screen indicates NOT COMPLETED, go to step 14.

19. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Let the engine cool until the coolant temperature is between 21°F (-6°C) and 104°F (40°C).
21. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
22. Test-drive at a steady speed between 15- 75 mph (24-120 km/h) for 10 minutes.
23. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0128 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 20. If the ECM/PCM was substituted, go to step 1.

NO - Go to step 24.

24. Monitor the OBD STATUS for DTC P0128 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 23, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 20. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 20.

DTC P0133: REAR A/F SENSOR (BANK 1, SENSOR 1) MALFUNCTION/SLOW RESPONSE; DTC P0153: FRONT A/F SENSOR (BANK 2, SENSOR 1) MALFUNCTION/SLOW RESPONSE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0139 and/or P0159* is stored at the same time as DTC P0133 and/or P0153*, troubleshoot DTC P0139 and/or P0159* first, then recheck for DTC P0133 and/or P0153*.**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, or M/T in neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - A/T in D, or M/T in 5th
   - Engine speed between 1, 250- 2, 100 RPM
   - Drive the vehicle at 25 mph (40 km/h) or less for 5 minutes, then drive at a steady speed of 35 mph (57 km/h) or more
5. Monitor the OBD STATUS for DTC P0133 and/or P0153* in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

YES - Go to step 6.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Replace the **A/F sensor (Sensor 1)**.
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
11. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
12. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D, or M/T in 5th
    - Engine speed between 1, 250- 2, 100 RPM
    - Drive the vehicle at 25 mph (40 km/h) or less for 5 minutes, then drive at a steady speed of 35 mph (57 km/h) or more
13. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0133 and/or P0153 indicated?*

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1.

    NO - Go to step 14.

14. Monitor the OBD STATUS for DTC P0133 and/or P0153* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 13, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 11.

DTC P0134: REAR A/F SENSOR (BANK 1, SENSOR 1) HEATER SYSTEM MALFUNCTION; DTC P0154: FRONT A/F SENSOR (BANK 2, SENSOR 1) HEATER SYSTEM MALFUNCTION

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board**

snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

- **If DTC P2251 and/or P2254* is stored at the same time as DTC P0134 and/or P0154*, troubleshoot DTC P2251 and/or P2254* first, then recheck for P0134 and/or P0154*.**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (A/T in P or N, M/T in neutral) for at least 1 minute.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0134 and/or P0154 indicated?*

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 6P connector.
8. Disconnect ECM/PCM connector B (49P).
9. Check for continuity between A/F sensor (Sensor 1) 6P connector terminal No. 4 and ECM/PCM connector terminal B13(B14)*.

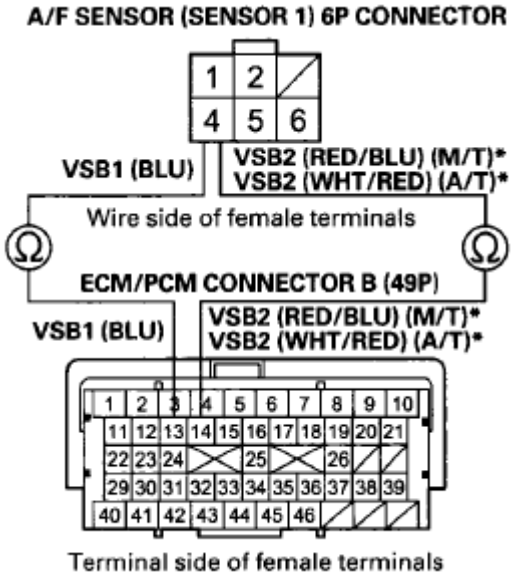

Fig. 26: Checking Continuity Between A/F Sensor (Sensor 1) 6P Connector Terminal No. 4 And ECM/PCM Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair open in the wire between the ECM/PCM (B13 (B14)*) and A/F sensor (Sensor 1), then go to step 14.

10. Reconnect ECM/PCM connector B (49P).
11. Start the engine, and let it idle without load (A/T in P or N, M/T in neutral) for at least 1 minute.
12. Measure the voltage between A/F sensor (Sensor 1) 6P connector terminal No. 4 and body ground.

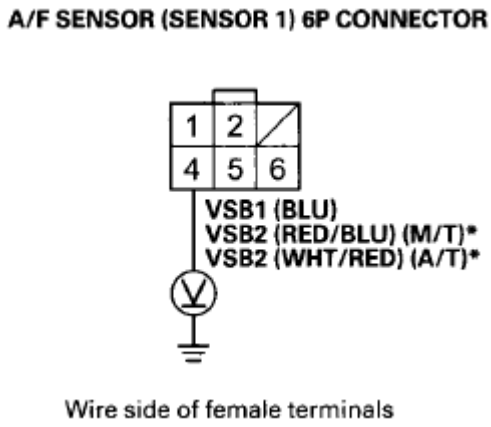

Fig. 27: Measuring Voltage Between A/F Sensor (Sensor 1) 6P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 0.2 V or less?

YES - Go to step 20.

NO - Go to step 13.

13. Replace **A/F sensor (Sensor 1)**.
14. Reconnect all connectors.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0134 and/or P0154 indicated?*

YES - Check for poor connections or loose terminals at A/F sensor (Sensor 1), the PGM-FI subrelay, and

the ECM/PCM, then go to step 1.

NO - Go to step 19.

19. Monitor the OBD STATUS for DTC P0134 and/or P0154* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 18, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Reconnect all connectors.
22. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
23. Start the engine, and let it idle without load (A/T in P or N, M/T in neutral) for at least 1 minute.
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0134 and/or P0154 indicated?*

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 23. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 25.

25. Monitor the OBD STATUS for DTC P0134 and/or P0154* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 24, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 23. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0135: REAR A/F SENSOR (BANK 1, SENSOR 1) HEATER CIRCUIT MALFUNCTION; DTC P0155: FRONT A/F SENSOR (BANK 2, SENSOR 1) HEATER CIRCUIT MALFUNCTION

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0135 and/or P0155 indicated?*

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check the No. 14 Fl SUB (15 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES - Go to step 7.

   NO - Go to step 20.

7. Remove the PGM-FI subrelay (A) from the under-hood fuse/relay box.

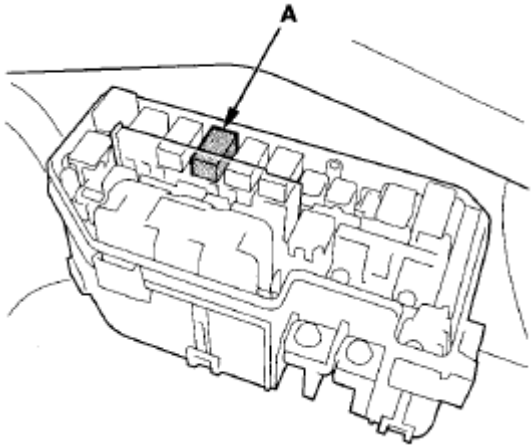

Fig. 28: Identifying PGM-FI Subrelay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Test the PGM-FI subrelay (see **POWER RELAY TEST**).

Is the relay OK?

YES - Go to step 9.

NO - Replace the PGM-FI subrelay, then go to step 26.

9. Disconnect the A/F sensor (Sensor 1) 6P connector.
10. At the sensor side, measure the resistance between A/F sensor (Sensor 1) 6P connector terminals No. 1 and No. 2.

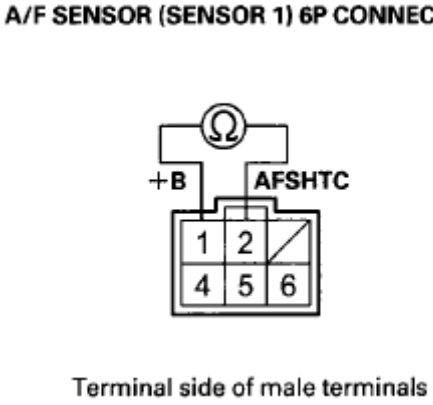

Fig. 29: Measuring Resistance Between A/F Sensor (Sensor 1) 6P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 2.5- 4.0 ohms at the room temperature?

YES - Go to step 11.

NO - Go to step 25.

11. At the sensor side, check for continuity between each terminal of at the A/F sensor (Sensor 1) 6P connector and body ground.

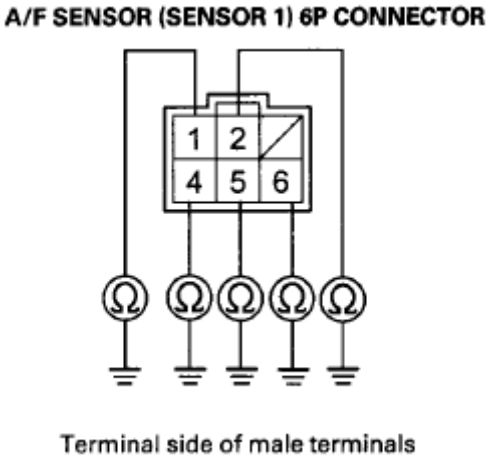

Fig. 30: Checking Continuity Between Each Terminal Of At A/F Sensor (Sensor 1) 6P Connector And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity to ground at any of the terminals?

YES - Go to step 25.

NO - Go to step 12.

12. At the sensor side, check for continuity between A/F sensor (Sensor 1) 6P connector terminal No. 1 and each of the other terminals in the connectors individually.

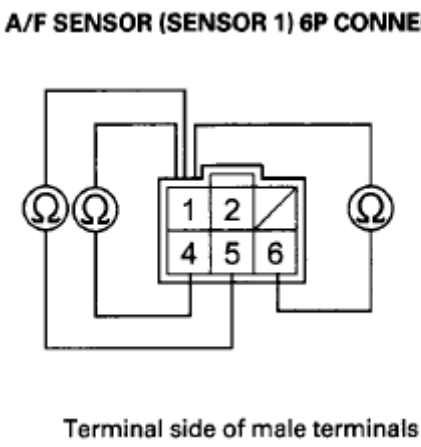

Fig. 31: Checking Continuity Between A/F Sensor 6P Connector And Terminals In Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Go to step 13.

13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector C (49P).
15. Check for continuity between ECM/PCM connector terminal C6 (C8)* and body ground.

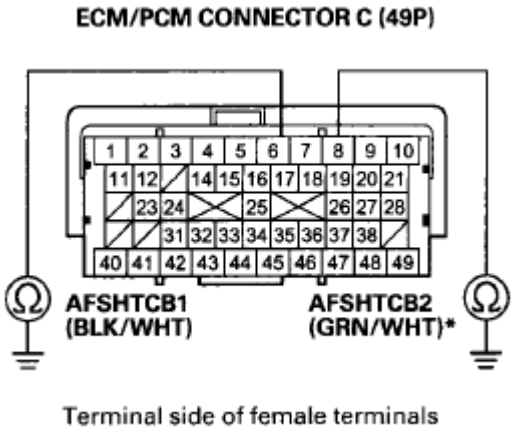

Fig. 32: Checking Continuity Between ECM/PCM Connector Terminal C6 (C8)* And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C6 (C8)*) and A/F sensor (Sensor 1), then go to step 26.

NO - Go to step 16.

16. Check for continuity between A/F sensor (Sensor 1)6P connector terminal No. 2 and ECM/PCM connector terminal C6(C8)\

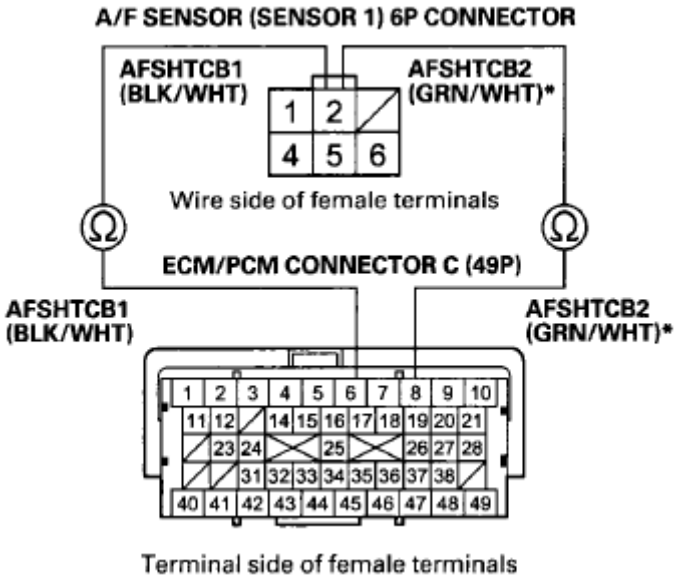

Fig. 33: Checking Continuity Between A/F Sensor 6P Connector Terminal No. 2 And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 17.

NO - Repair open in the wire between the ECM/PCM (C6 (C8)*) and A/F sensor (Sensor 1), then go to step 26.

17. Check for continuity between A/F sensor (Sensor 1) 6P connector terminal No. 1 and PGM-FI subrelay 4P connector terminal No. 2.

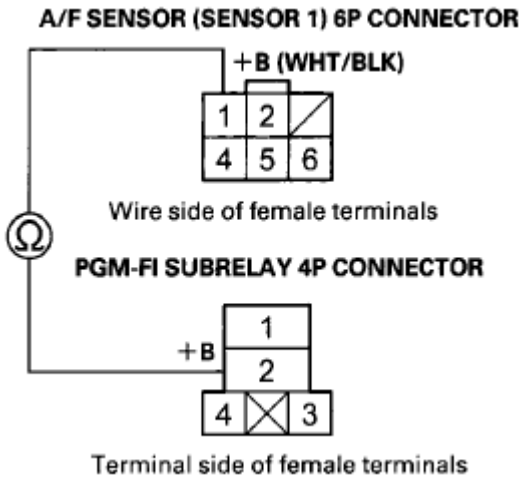

Fig. 34: Checking Continuity Between A/F Sensor 6P Connector Terminal No. 1 And PGM-FI Subrelay 4P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 18.

NO - Repair open in the wire between A/F sensor (Sensor 1) and the PGM-FI subrelay, then go to step 26.

18. Disconnect ECM/PCM connector A (49P).
19. Check for continuity between PGM-FI subrelay 4P connector terminal No. 3 and ECM/PCM connector terminal A40.

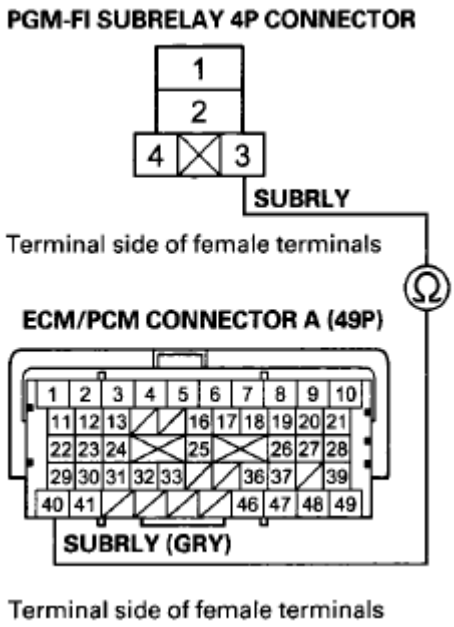

Fig. 35: Checking Continuity Between PGM-FI Subrelay 4P Connector Terminal No. 3 And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 32.

NO - Repair open in the wire between the PGM-FI subrelay, and the ECM/PCM (A40), then go to step 26.

20. Remove the PGM-FI subrelay (A) from the under-hood fuse/relay box.

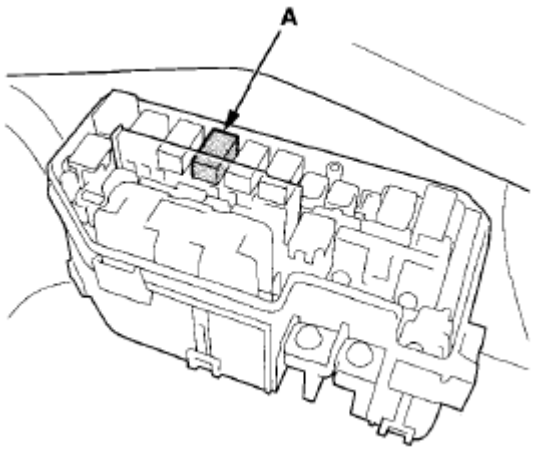

Fig. 36: Identifying PGM-FI Subrelay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Disconnect the front and rear A/F sensor (Sensor 1) 6P connectors.
22. Disconnect the front and rear secondary HO2S (Sensor 2) 4P connectors.
23. Disconnect the EVAP canister vent shut valve 2P connector.
24. Check for continuity between A/F sensor (Sensor 1) 6P connector terminal No. 1 and body ground.

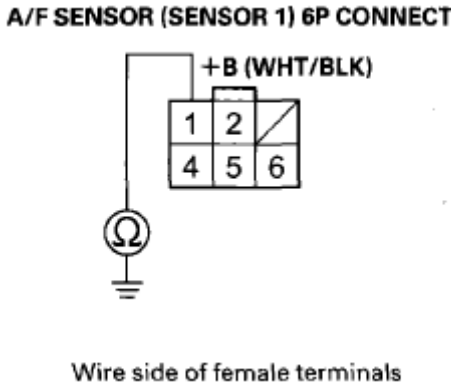

Fig. 37: Checking Continuity Between A/F Sensor 6P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the PGM-FI subrelay and A/F sensor (Sensor 1), then go to step 26.

NO - Check the under-hood fuse/relay box, and replace it if needed (see **REMOVAL AND INSTALLATION**). Also replace the No. 14 FI SUB (15 A) fuse, then go to step 26.

25. Replace **A/F sensor (Sensor 1)**.
26. Reconnect all connectors.

27. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
28. Reset the ECM/PCM with the HDS.
29. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
30. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0135 and/or P0155 indicated?*

    YES - Check for poor connections or loose terminals at A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM, then go to step 1.

    NO - Go to step 31.

31. Monitor the OBD STATUS for DTC P0135 and/or P0155* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 30, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

32. Reconnect all connectors.
33. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
34. Start the engine, and let it idle.
35. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0135 and/or P0155 indicated?*

    YES - Check for poor connections or loose terminals at A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 34. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 36.

36. Monitor the OBD STATUS for DTC P0135 and/or P0155* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 35, go to the indicated DTC's troubleshooting. •

NO - If the screen indicates FAILED, check for poor connections or loose terminals at A/F sensor (Sensor 1), the PGM-FI subrelay, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 34. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0137: REAR SECONDARY HO2S (BANK 1, SENSOR 2) CIRCUIT LOW VOLTAGE; DTC P0157: FRONT SECONDARY HO2S (BANK 2, SENSOR 2) CIRCUIT LOW VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Monitor the OBD STATUS for DTC P0137 and/or P0157* in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES - Go to step 5.

   NO - If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the ECM/PCM. If the HDS indicates EXECUTING or OUT OF CONDITION, keep idling until a result comes on.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the secondary HO2S (Sensor 2) 4P connector.
7. Connect secondary HO2S (Sensor 2) 4P connector terminal No. 1 and No. 2 with a jumper wire.

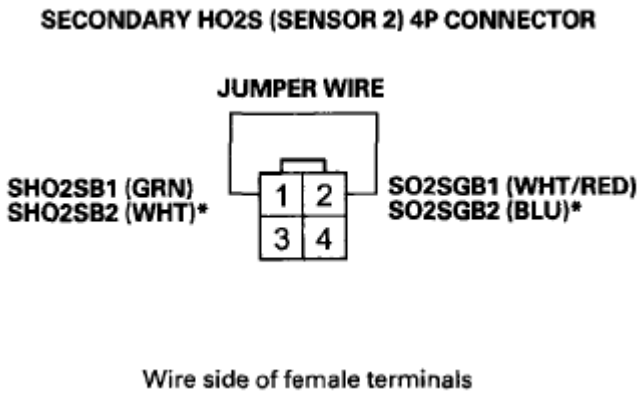

Fig. 38: Connecting Secondary HO2S (Sensor 2) 4P Connector Terminal No. 1 And No. 2 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Check the HO2S B1 S2 OUTPUT VOLTAGE and/or HO2S B2 S2 OUTPUT VOLTAGE* in the DATA LIST with the HDS.

   Does the voltage stay at 0.12 V or less?

   YES - Go to step 10.

   NO - Go to step 22.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Check the HO2S B1 S2 OUTPUT VOLTAGE and/or HO2S B2 S2 OUTPUT VOLTAGE* in the DATA LIST with the HDS.

    Is there about 5 V?

    YES - Go to step 14.

    NO - Go to step 18.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector C (49P).
17. Check for continuity between ECM/PCM connector terminal C23 (C36)* and body ground.

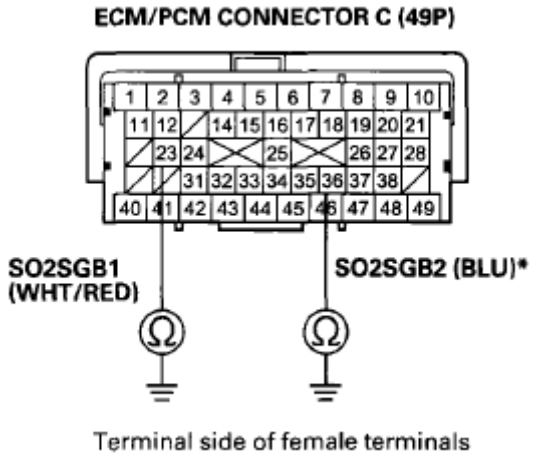

Fig. 39: Checking Continuity Between ECM/PCM Connector Terminal C23 (C36) And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short in the wire between the ECM/PCM (C23 (C36)*) and secondary HO2S (Sensor 2), then go to step 24.

NO - Go to step 31.

18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
19. Jump the SCS line with the HDS.
20. Disconnect ECM/PCM connector B (49P).
21. Check for continuity between ECM/PCM connector terminal B25 (B16)* and body ground.

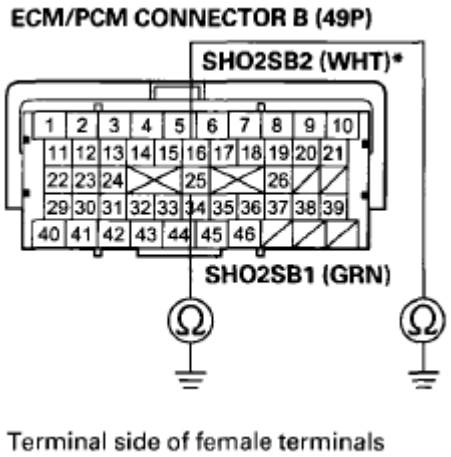

Fig. 40: Checking Continuity Between ECM/PCM Connector Terminal B25 (B16) And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short in the wire between the ECM/PCM (B25 (B16)*) and secondary HO2S (Sensor 2), then go to step 24.

NO - Go to step 31.

22. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
23. Replace **secondary HO2S (Sensor 2)**.
24. Reconnect all connectors.
25. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
26. Reset the ECM/PCM with the HDS.
27. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
28. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
29. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0137 and/or P0157 indicated?*

YES - Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1.

NO - Go to step 30.

30. Monitor the OBD STATUS for DTC P0137 and/or P0157* in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 29, go to the indicated DTC's troubleshooting. •

    NO - If the HDS indicates FAILED, check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If the HDS indicates EXECUTING or OUT OF CONDITION, keep idling until a result comes on.

31. Reconnect all connectors.
32. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
33. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
34. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0137 and/or P0157 indicated?*

    YES - Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 33. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 35.

35. Monitor the OBD STATUS for DTC P0137 and/or P0157* in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 34, go to the indicated DTC's troubleshooting. •

    NO - If the HDS indicates FAILED, check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 33. If the PCM was substituted, go to step 1. If the HDS indicates EXECUTING or OUT OF CONDITION, keep idling until a result comes on.

DTC P0138: REAR SECONDARY HO2S (BANK 1, SENSOR 2) CIRCUIT HIGH VOLTAGE; DTC

P0158: FRONT SECONDARY HO2S (BANK 2, SENSOR 2) CIRCUIT HIGH VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
4. Check the HO2S B1 S2 OUTPUT VOLTAGE and/or HO2S B2 S2 OUTPUT VOLTAGE* in the DATA LIST with the HDS.

   Does the voltage stay at 1.27 V or more?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the secondary HO2S (Sensor 2) 4P connector.
7. Connect secondary HO2S (Sensor 2) 4P connector terminals No. 1 and No. 2 with a jumper wire.

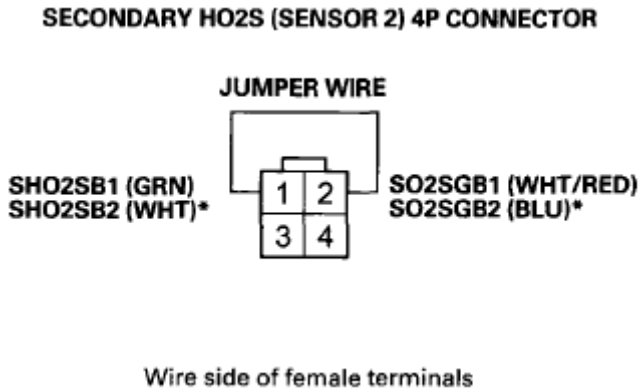

Fig. 41: Connecting Secondary HO2S (Sensor 2) 4P Connector Terminals No. 1 And No. 2 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Check the HO2S B1 S2 OUTPUT VOLTAGE and/or HO2S B2 S2 OUTPUT VOLTAGE* in the DATA LIST with the HDS.

Does the voltage stay at 1.27 V or more?

YES - Go to step 10.

NO - Go to step 19.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.
12. Connect secondary HO2S (Sensor 2) 4P connector terminal No. 1 to body ground with a jumper wire.

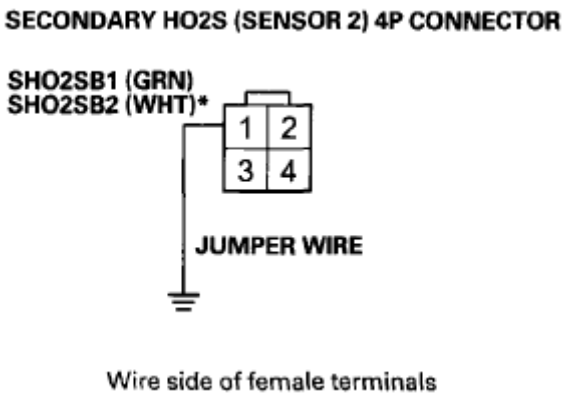

Fig. 42: Connecting Secondary HO2S 4P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Check the HO2S B1 S2 OUTPUT VOLTAGE and/or HO2S B2 S2 OUTPUT VOLTAGE* in the DATA LIST with the HDS.

Does the voltage stay at 1.27 V or more?

YES - Go to step 15.

NO - Repair an open in the wire between the ECM/PCM (C23 (C36)*) and secondary HO2S (Sensor 2), then go to step 21.

15. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
16. Jump the SCS line with the HDS.
17. Disconnect ECM/PCM connector B (49P).
18. With the jumper wire still connected between secondary HO2S terminal No. 1 and body ground, check for continuity between ECM/PCM connector terminal B25 (B16)* and body ground.

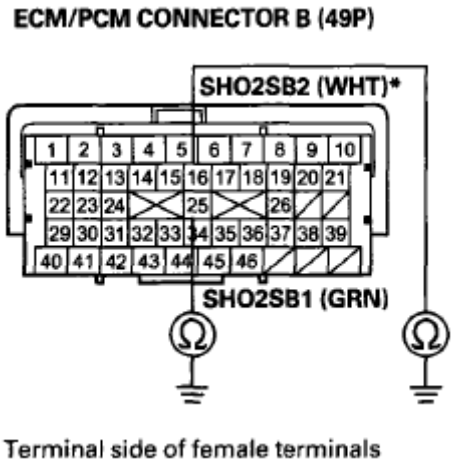

Fig. 43: Checking Continuity Between ECM/PCM Connector Terminal B25 (B16) And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 29.

NO - Repair an open in the wire between the ECM/PCM (B25 (B16)*) and secondary HO2S (Sensor 2), then go to step 21.

19. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
20. Replace **secondary HO2S (Sensor 2)**.
21. Reconnect all connectors.
22. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
23. Reset the ECM/PCM with the HDS.
24. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
25. Start the engine, and let it idle without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
26. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D, or M/T in 4th
    - Engine speed at 1, 500- 3, 000 RPM
    - Maintain a steady speed for 5 seconds or more
27. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0138 and/or P0158 indicated?*

YES - Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1.

NO - Go to step 28.

28. Monitor the OBD STATUS for DTC P0138 and/or P0158* in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 27, go to the indicated DTC's troubleshooting. •

    NO - If the HDS indicates FAILED, check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 25.

29. Reconnect all connectors.
30. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
31. Start the engine, and let it idle without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
32. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D, or M/T in 4th
    - Engine speed at 1, 500- 3, 000 RPM
    - Maintain a steady speed for 5 seconds or more
33. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0138 and/or P0758 indicated?*

    YES - Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 32. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 34.

34. Monitor the OBD STATUS for DTC P0138 and/or P0158* in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the **original PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 33, go to the indicated DTC's troubleshooting. •

    NO - If the HDS indicates FAILED, check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 31. If the ECM/PCM was substituted, go to step 1. If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF

CONDITION, go to step 31.

DTC P0139: REAR SECONDARY HO2S (BANK 1, SENSOR 2) SLOW RESPONSE; DTC P0159: FRONT SECONDARY HO2S (BANK 2, SENSOR 2) SLOW RESPONSE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - A/T in D, or M/T in 4th
   - Drive at a steady speed between 55- 75 mph (88- 120 km/h) for 1 minute, then decelerate (with the throttle fully closed) for 10 seconds.
5. Monitor the OBD STATUS for DTC P0139 and/or P0159* in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 6.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Replace **secondary HO2S (Sensor 2)**.
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
11. Start the engine, and let it idle without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
12. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D, or M/T in 4th
    - Drive at a steady speed between 55- 75 mph (88- 120 km/h) for 1 minute, then decelerate (with the throttle fully closed) for 10 seconds.

13. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0139 and/or P0159 indicated?*

    YES - Check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1.

    NO - Go to step 14.

14. Monitor the OBD STATUS for DTC P0139 and/or P0159* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 13, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 11.

DTC P0141: REAR SECONDARY HO2S (BANK 1, SENSOR 2) HEATER CIRCUIT MALFUNCTION; DTC P0161: FRONT SECONDARY HO2S (BANK 2, SENSOR 2) HEATER CIRCUIT MALFUNCTION

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0141 and/or P0161 indicated?*

   YES - Go to step 5.

   NO - Intermittent failure, the systems is OK at this time. Check for poor connections or loose terminals at secondary HO2S (Sensor 2), the PGM-FI subrelay, and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check the No. 14 Fl SUB (15 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

YES - Go to step 7.

NO - Go to step 19.

7. Remove the PGM-FI subrelay (A) from the under-hood fuse/relay box.

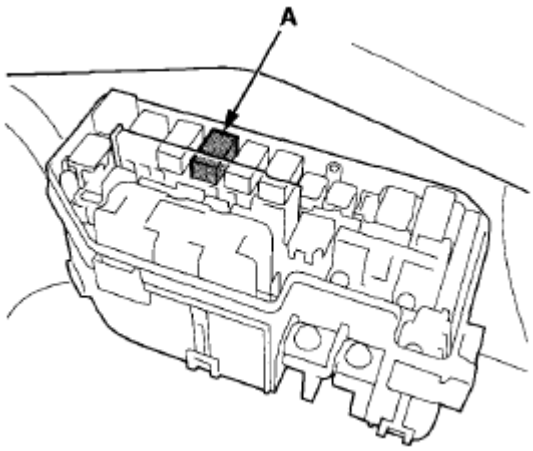

Fig. 44: Identifying PGM-FI Subrelay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Test the PGM-FI subrelay (see **POWER RELAY TEST**).

Is the relay OK?

YES - Go to step 9.

NO - Replace the PGM-FI subrelay, then go to step 25.

9. Disconnect the secondary HO2S (Sensor 2) 4P connector.
10. At the sensor side, measure the resistance between secondary HO2S (Sensor 2) 4P connector terminals No. 3 and No. 4.

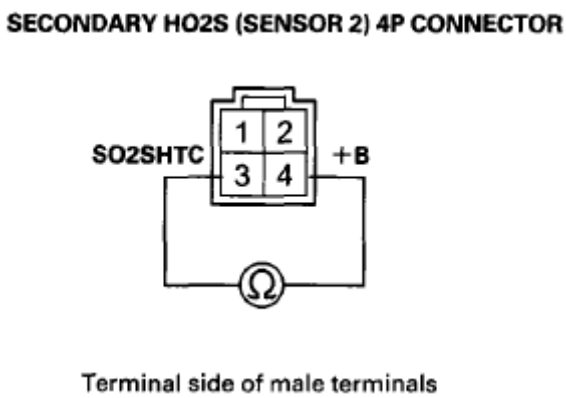

Fig. 45: Measuring Resistance Between Secondary HO2S 4P Connector Terminals No. 3 And No. 4

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 5.4- 7.3 ohms at room temperature?

YES - Go to step 11.

NO - Go to step 24.

11. At the sensor side, check for continuity between body ground and secondary HO2S (Sensor 2) 4P connector terminals No. 3 and No. 4 individually.

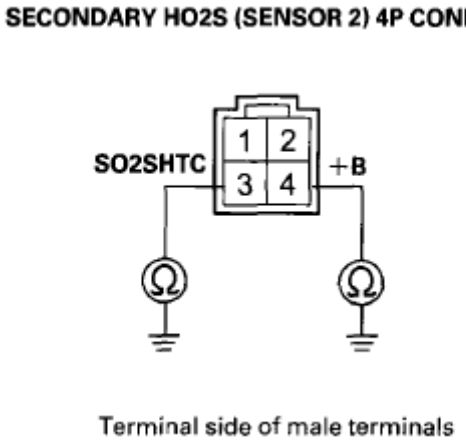

Fig. 46: Checking Continuity Between Body Ground And Secondary HO2S 4P Connector Terminals No. 3 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 24.

NO - Go to step 12.

12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector C (49P).
14. Check for continuity between ECM/PCM connector terminal C5 (C7)* and body ground.

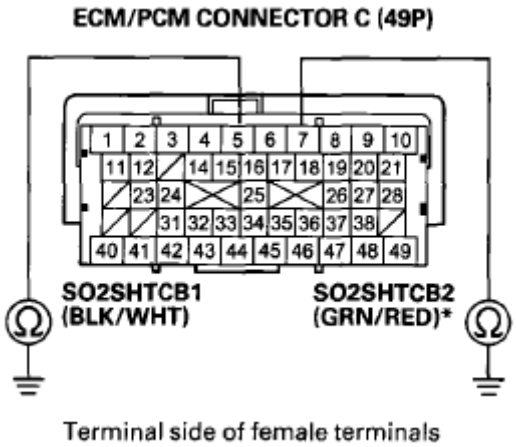

Fig. 47: Checking Continuity Between ECM/PCM Connector Terminal C5 (C7) And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C5 (C7)*) and secondary HO2S (Sensor 2), then go to step 25.

NO - Go to step 15.

15. Check for continuity between secondary HO2S (Sensor 2) 4P connector terminal No. 3 and ECM/PCM connector terminal C5 (C7)*.

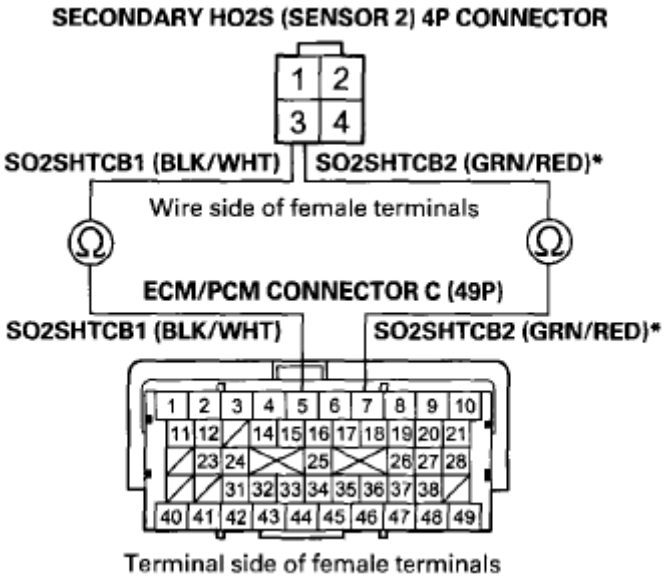

Fig. 48: Checking Continuity Between Secondary HO2S 4P Connector Terminal No. 3 And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 16.

NO - Repair open in the wire between the ECM/PCM (C5 (C7)*) and secondary HO2S (Sensor 2), then go to step 25.

16. Check for continuity between secondary HO2S (Sensor 2) 4P connector terminal No. 4 and PGM-FI subrelay 4P connector terminal No. 2.

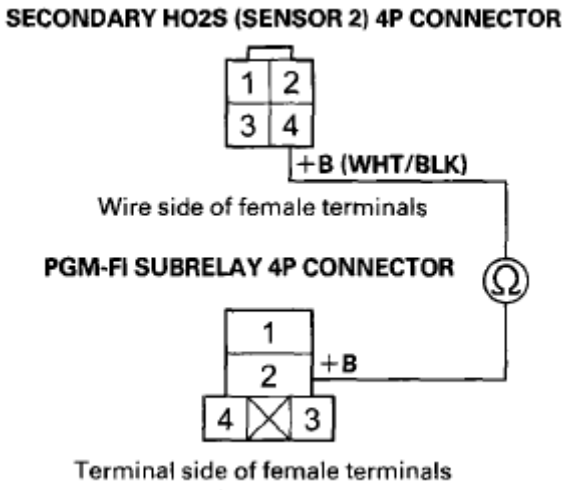

Fig. 49: Checking Continuity Between Secondary HO2S 4P Connector Terminal No. 4 And PGM-FI Subrelay 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 17.

NO - Repair open in the wire between secondary HO2S (Sensor 2) and the PGM-FI subrelay, then go to step 25.

17. Disconnect ECM/PCM connector A (49P).
18. Check for continuity between PGM-FI subrelay 4P connector terminal No. 3 and ECM/PCM connector terminal A40.

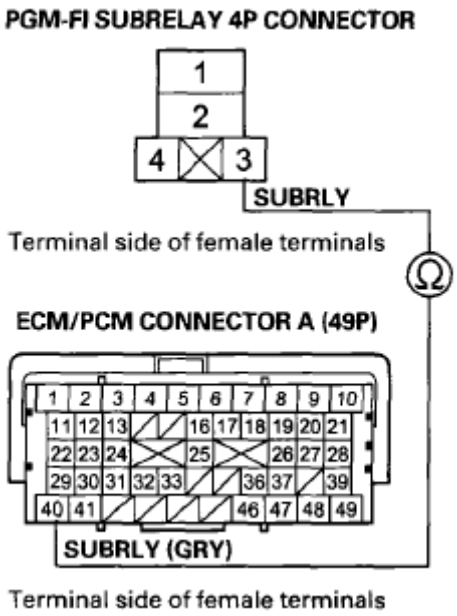

Fig. 50: Checking Continuity Between PGM-FI Subrelay 4P Connector Terminal No. 3 And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 31.

NO - Repair open in the wire between the PGM-FI subrelay, and the ECM/PCM (A40), then go to step 25.

19. Remove the PGM-FI subrelay (A) from the under-hood fuse/relay box.

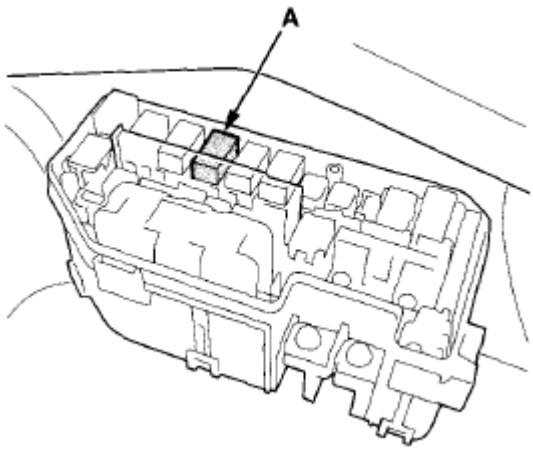

Fig. 51: Identifying PGM-FI Subrelay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Disconnect the front and rear secondary HO2S (Sensor 2) 4P connectors.
21. Disconnect the front and rear A/F sensor (Sensor 1) 6P connectors.
22. Disconnect the EVAP canister vent shut valve 2P connector.
23. Check for continuity between secondary HO2S (Sensor 2) 4P connector terminal No. 4 and body ground.

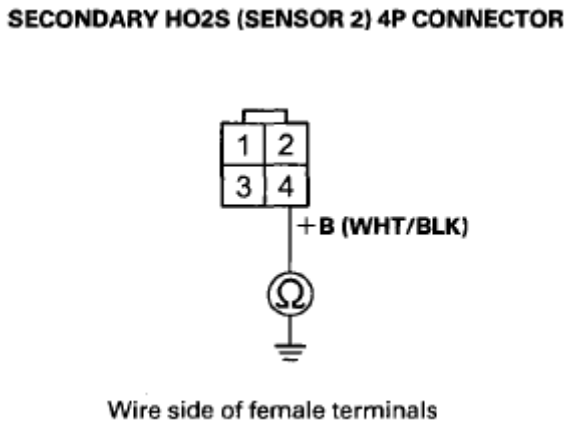

Fig. 52: Checking Continuity Between Secondary HO2S 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the PGM-FI subrelay and secondary HO2S (Sensor 2), then go to step 25.

NO - Check the under-hood fuse/relay box, and replace it if needed (see **REMOVAL AND INSTALLATION**). Also replace the No. 14 Fl SUB (15 A) fuse, then go to step 25.

24. Replace **secondary HO2S (Sensor 2)**.
25. Reconnect all connectors.
26. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
27. Reset the ECM/PCM with the HDS.
28. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
29. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0141 and/or P0161 indicated?*

YES - Check for poor connections or loose terminals at secondary HO2S (Sensor 2), the PGM-FI subrelay, and the ECM/PCM, then go to step 1.

NO - Go to step 30.

30. Monitor the OBD STATUS for DTC P0141 and/or P0161* in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 29, go to the indicated DTC's troubleshooting. •

NO - If the screen indicates FAILED, check for poor connections or loose terminals at secondary HO2S (Sensor 2), the PGM-FI subrelay, and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

31. Reconnect all connectors.
32. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
33. Start the engine, and let it idle.
34. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0141 and/or P0161 indicated?*

YES - Check for poor connections or loose terminals at secondary HO2S (Sensor 2), the PGM-FI subrelay, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 33. If the ECM/PCM was substituted, go to step 1.

NO - Go to step 35.

35. Monitor the OBD STATUS for DTC P0141 and/or P0161* in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 34, go to the indicated DTC's troubleshooting. •

NO - If the screen indicates FAILED, check for poor connections or loose terminals at secondary HO2S (Sensor 2), the PGM-FI subrelay, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 33. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0171: REAR BANK (BANK 1) FUEL SYSTEM TOO LEAN; DTC P0172: REAR BANK (BANK 1) FUEL SYSTEM TOO RICH; DTC P0174: FRONT BANK (BANK 2) FUEL SYSTEM TOO LEAN; DTC P0175: FRONT BANK (BANK 2) FUEL SYSTEM TOO RICH

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Poor fuel quality can also cause DTC P0171/P0174.**
- **If any of the DTCs listed below are stored at the same time as DTC P0171, P0172, P0174, and/or P0175, troubleshoot those DTCs first, then recheck**

for P0171, P0172, P0174, and/or P0175:

P0101, P0102, P0103: MAF sensor

P0107, P0108, P1128, P1129: MAP sensor

P0133, P0153, P1172, P1174, P2195, P2197, P2237,

P2238, P2240, P2241, P2243, P2245, P2247, P2249,

P2251, P2252, P2254, P2255, P2A00, P2A03: A/F sensor (Sensor 1)

P0134, P0135, P0154, P0155: A/F sensor (Sensor 1) heater

P0137, P0138, P0139, P0157, P0158, P0159, P2270,

P2271, P2272, P2273: Secondary HO2S (Sensor 2)

P0141, P0161: Secondary HO2S (Sensor 2) heater

P0401, P0404, P0406, P2413: EGR system

P2279: Intake air leakage

P2646, P2647, P2648, P2649: VTEC system

1. Check the fuel pressure (see **FUEL PRESSURE TEST**).

   Is the fuel pressure OK?

   YES - Go to step 2.

   NO - Check these items:

   - If the pressure is too high, replace the fuel pressure regulator; without SH-AWD (see **FUEL PRESSURE REGULATOR REPLACEMENT**), with SH-AWD (see **FUEL PRESSURE REGULATOR REPLACEMENT**), then go to step 6.
   - If the pressure is too low, check the fuel pump, the fuel pressure regulator, the fuel filter, and the fuel lines for restrictions, then go to step 6.
2. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or IM, M/T in neutral) until the radiator fan comes on, then let it idle.
3. Check for these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - A/T in P or N, M/T in neutral
   - All electrical loads off

4. Monitor the ENGINE SPEED in the DATA LIST with the HDS, and hold the engine speed at 2, 500 RPM. Once the engine speed is met, hold the accelerator pedal steady for more than 10 seconds.

   Did the engine speed vary more than 100 RPM from 2, 500 RPM?

   YES - Repeat step 4.

   NO - Go to step 5.

5. While holding the engine speed at 2, 500 RPM, check the MAF SENSOR in the DATA LIST with the HDS.

   Is there about 11.0- 15.5 gm/s (J35Z6 engine) or 11.8- 16.6 gm/s (J37A4 engine)?

   YES - Check the engine valve clearances, and adjust them if needed (see **VALVE CLEARANCE ADJUSTMENT**). If the valve clearances are OK, replace the **injectors**, then go to step 6.

   NO - Replace the **MAF sensor/IAT sensor**, then go to step 6.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Reset the ECM/PCM with the HDS.
8. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
9. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
10. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D, or M/T in 4th
    - Drive at a steady speed between 15- 75 mph (24- 120 km/h) for 15 minutes.

    NOTE: DTC P0171, P0172, P0174, and/or P0175 may take up to 80 minutes of test driving to set. Using the HDS, monitor the short term fuel trim (ST FUEL TRIM). If the ST FUEL TRIM stays within 0.8-1.21, there is no problem at this time.

11. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0171, P0172, P0174, or P0175 indicated?

    YES - Go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0300: RANDOM MISFIRE AND ANY COMBINATION OF THE FOLLOWING:; DTC P0301: NO. 1 CYLINDER MISFIRE DETECTED; DTC P0302: NO. 2 CYLINDER MISFIRE DETECTED;

DTC P0303: NO. 3 CYLINDER MISFIRE DETECTED; DTC P0304: NO. 4 CYLINDER MISFIRE DETECTED DTC P0305: NO. 5 CYLINDER MISFIRE DETECTED; DTC P0306: NO. 6 CYLINDER MISFIRE DETECTED

Special Tools Required

- Pressure Gauge Adapter 07NAJ-P07010A
- A/T Low Pressure Gauge w/Panel 07406-0070301
- AT Pressure Test Hose 07AAJ-PY4A100
- A/T Pressure Adapter 07MAJ-PY40120
- Oil Pressure Hose 07ZAJ-S5AA200

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If the misfire is frequent enough to trigger detection of increased emissions during two consecutive driving cycles, the MIL will come on, and DTC P0300 (and some combination of P0301 through P0306) will be stored.**
- **If the misfire is frequent enough to damage the catalyst, the MIL will blink whenever the misfire occurs, and DTC P0300 (and some combination of P0301 through P0306) will be stored. When the misfire stops, the MIL will remain on.**
- **Troubleshoot the following DTCs first, if any of them were stored along with the random misfire DTC(s) (Because parts can sometimes fail without setting DTCs you should also do a physical inspection of the systems listed below):**

  P0101, P0102, P0103: MAF sensor

  P0107, P0108, P1128, P1129: MAP sensor

  P0171, P0172, P0174, P0175: Fuel system

  P0335, P0339: CKP sensor

  P0506, P0507: Idle control system

  P0365, P0369: CMP sensor

  P0401, P0404, P0406, P2413: EGR system

  P2646, P2647, P2648, P2649: VTEC system

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (A/T in P or N, M/Tin neutral).
4. Monitor the OBD STATUS for DTC P0301, P0302, P0303, P0304, P0305, or P0306 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 9.

   NO - If the screen indicates PASSED, go to step 5. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, wait for several minutes, then recheck.

5. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

   YES - Go to step 9.

   NO - Go to step 6.

6. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VEHICLE SPEED
   - REL TP SENSOR
   - CLV (calculated load value)
   - ECT SENSOR 1
   - APP SENSOR
7. Monitor the OBD STATUS for DTC P0301, P0302, P0303, P0304, P0305, or P0306 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 9.

   NO - If the screen indicates PASSED, go to step 8. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 6 and recheck.

8. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

YES - Go to step 9.

NO - Intermittent failure, the system is OK at this time. •

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Check the fuel quality.

    Is the quality good?

    YES - Go to step 11.

    NO - Drain the fuel tank, and fill it with known-good fuel, then go to step 23.

11. Inspect the spark plugs (see **SPARK PLUG INSPECTION**). If the spark plugs are fouled or worn, replace them.
12. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VEHICLE SPEED
    - REL TP SENSOR
    - CLV (calculated load value)
    - ECT SENSOR 1
    - APP SENSOR
13. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

    YES - Go to step 14.

    NO - Go to step 23.

14. Check the fuel pressure (see **FUEL PRESSURE TEST**).

    Is the fuel pressure OK?

    YES - Go to step 15.

    NO -

    - If the pressure is too high, replace the fuel pressure regulator; without SH-AWD (see **FUEL PRESSURE REGULATOR REPLACEMENT**), with SH-AWD (see **FUEL PRESSURE REGULATOR REPLACEMENT**), then go to step 23.
    - If the pressure is too low, check the fuel pump, the fuel feed lines, and the fuel filter. If they are OK, replace the fuel pressure regulator; without SH-AWD (see **FUEL PRESSURE**

REGULATOR REPLACEMENT), with SH-AWD (see **FUEL PRESSURE REGULATOR REPLACEMENT**), then go to step 23.

15. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
16. Check under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 176°F (80°C)
    - A/T in N, M/T in neutral
    - All electrical loads off
17. Monitor the ENGINE SPEED in the DATA LIST with the HDS, and hold the engine speed at 2, 500 RPM. Once the engine speed is met, hold the accelerator pedal steady for more than 10 seconds.

    Did the engine speed vary more than 100 RPM from 2, 500 RPM?

    YES - Repeat step 17.

    NO - Go to step 18.

18. While holding the engine speed at 2, 500 RPM, check the MAF SENSOR in the DATA LIST with the HDS.

    Is there about 11.0- 15.5 gm/s (J35Z6 engine) or 11.8- 16.6 gm/s (J37A4 engine)?

    YES - Go to step 19.

    NO - Replace the **MAF sensor/IAT sensor**, then go to step 23.

19. Remove the rocker arm oil pressure switch (A), and attach the special tools as shown in illustration below, then attach the rocker arm oil pressure switch to the pressure gauge adapter (B).

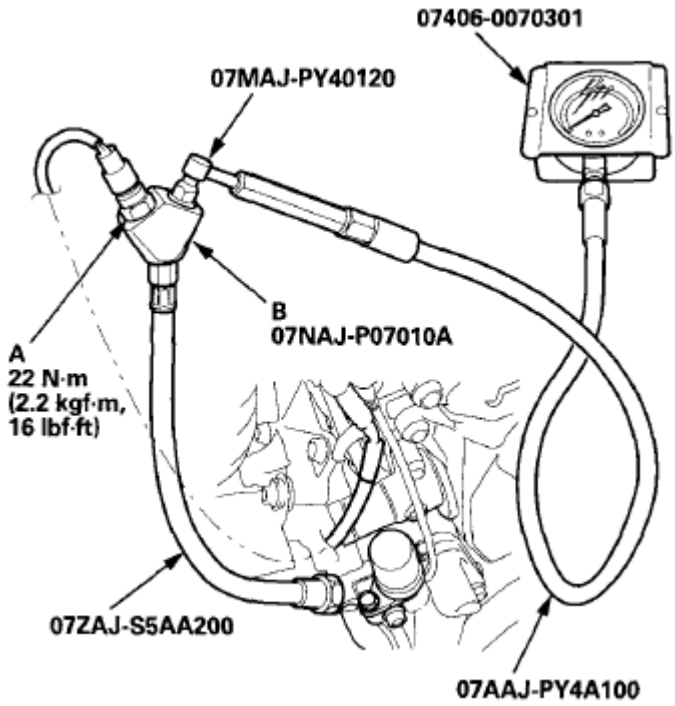

Fig. 53: Identifying Rocker Arm Oil Pressure Switch And Pressure Gauge Adapter With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Reconnect the rocker arm oil pressure switch 2P connector.
21. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
22. Check the oil pressure at engine speeds of 1, 000 and 2, 000 RPM. Keep the measuring time as short as possible (less than 1 minute) because the engine is running without load.

    Is the oil pressure below 49 kPa (0.5 kgf/cm^2 , 7 psi)?

    YES - Remove the special tools, and reinstall the rocker arm oil pressure switch with a new O-ring, then go to step 23.

    NO - Inspect the VTEC system, then go to step 23.

23. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
24. Reset the ECM/PCM with the HDS.
25. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
26. Do the CKP pattern clear/CKP pattern learn procedure (see **CKP PATTERN CLEAR/CKP PATTERN LEARN**).
27. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VEHICLE SPEED

- REL TP SENSOR
- CLV (calculated load value)
- ECT SENSOR 1
- APP SENSOR

28. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0300 and any combination of DTC P0301, P0302, P0303, P0304, P0305, or P0306 indicated?

    YES - Check for poor connections or loose terminals at the ignition coils, the injectors, and the ECM/PCM, then go to the DTC P0301, P0302, P0303, P0304, P0305, or P0306 troubleshooting (see **DTC Troubleshooting**).

    NO - Go to step 29.

29. Monitor the OBD STATUS for DTC P0301, P0302, P0303, P0304, P0305, or P0306 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 28, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connection or loose terminals at the ignition coils, the injectors, and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 27.

DTC P0301: NO. 1 CYLINDER MISFIRE DETECTED; DTC P0302: NO. 2 CYLINDER MISFIRE DETECTED; DTC P0303: NO. 3 CYLINDER MISFIRE DETECTED; DTC P0304: NO. 4 CYLINDER MISFIRE DETECTED; DTC P0305: NO. 5 CYLINDER MISFIRE DETECTED; DTC P0306: NO. 6 CYLINDER MISFIRE DETECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load for 2 minutes (A/T in P or N, M/T in neutral).
4. Monitor the OBD STATUS for DTC P0301, P0302, P0303, P0304, P0305, or P0306 in the DTCs MENU with the HDS.

    Does the screen indicate FAILED?

    YES - Go to step 9.

NO - If the screen indicates PASSED, go to step 5. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, wait for several minutes, and recheck.

5. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

   YES - Go to step 9.

   NO - Go to step 6.

6. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VEHICLE SPEED
   - REL TP SENSOR
   - CLV (calculated load value)
   - GEAR POSITION
   - ECT SENSOR 1
7. Monitor the OBD STATUS for DTC P0301, P0302, P0303, P0304, P0305, or P0306 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 9.

   NO - If the screen indicates PASSED, go to step 8. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 6.

8. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

   YES - Go to step 9.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals in the fuel system and ignition system. •

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Exchange the ignition coil from the problem cylinder with one from another cylinder.
11. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED

- VEHICLE SPEED
- REL TP SENSOR
- CLV (calculated load value)
- GEAR POSITION
- ECT SENSOR 1

12. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

    YES - Go to step 13.

    NO - Intermittent failure due to poor contact at the ignition coil contactor (no misfire at this time). Make sure that the ignition coil connectors are secure. •

13. Determine which cylinder had the misfire.

    Does the misfire occur in the cylinder where the ignition coil was moved?

    YES - Replace the faulty ignition coil (see **IGNITION COIL AND SPARK PLUG REMOVAL/INSTALLATION**), then go to step 44.

    NO - Go to step 14.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Exchange the spark plug from the problem cylinder with one from another cylinder.
16. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VEHICLE SPEED
    - REL TP SENSOR
    - CLV (calculated load value)
    - GEAR POSITION
    - ECT SENSOR 1
17. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

    YES - Go to step 18.

    NO - Intermittent failure due to spark plug fouling (no misfire at this time). •

18. Determine which cylinder had the misfire.

    Does the misfire occur in the cylinder where the spark plug was moved?

    YES - Replace the faulty spark plug, then go to step 44.

    NO - Go to step 19.

19. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
20. Jump the SCS line with the HDS.
21. Disconnect ECM/PCM connector B (49P).
22. Remove the intake manifold (see **REMOVAL**).
23. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
24. Measure the voltage between body ground and the appropriate ECM/PCM connector terminal (see table).

PROBLEM CYLINDER	DTC	ECM/PCM TERMINAL	WIRE COLOR
No. 1	P0301	B4	BRN
No. 2	P0302	B8	RED
No. 3	P0303	B7	BLU
No. 4	P0304	B6	YEL
No. 5	P0305	B5	BLK/RED
No. 6	P0306	B9	WHT/BLU

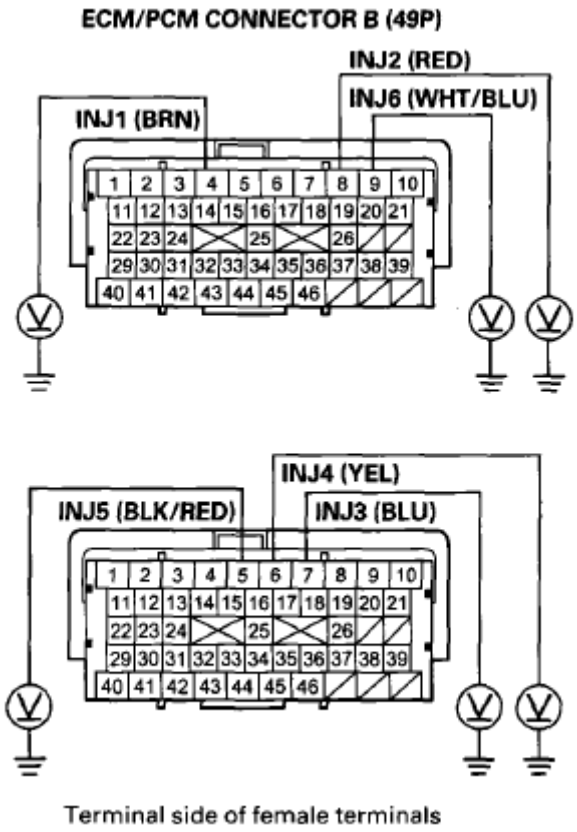

Fig. 54: Measuring Voltage Between Body Ground And Appropriate ECM/PCM Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 29.

NO - Go to step 25.

25. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
26. Disconnect the injector 2P connector from the problem cylinder.
27. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
28. Measure the voltage between injector 2P connector terminal No. 1 and body ground.

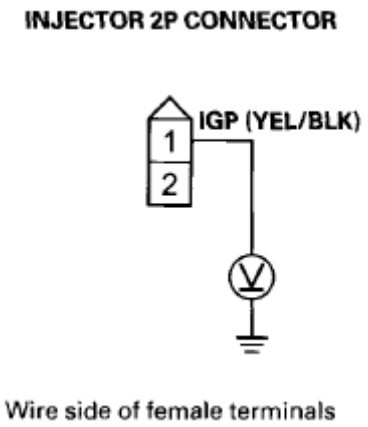

Fig. 55: Measuring Voltage Between Injector 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 29.

NO - Repair open in the wire between the injector and PGM-FI main relay 1, then go to step 44.

29. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
30. Check for continuity between body ground and the appropriate ECM/PCM connector terminal (see table).

PROBLEM CYLINDER	DTC	ECM/PCM TERMINAL	WIRE COLOR
No. 1	P0301	B4	BRN
No. 2	P0302	B8	RED
No. 3	P0303	B7	BLU
No. 4	P0304	B6	YEL
No. 5	P0305	B5	BLK/RED
No. 6	P0306	B9	WHT/BLU

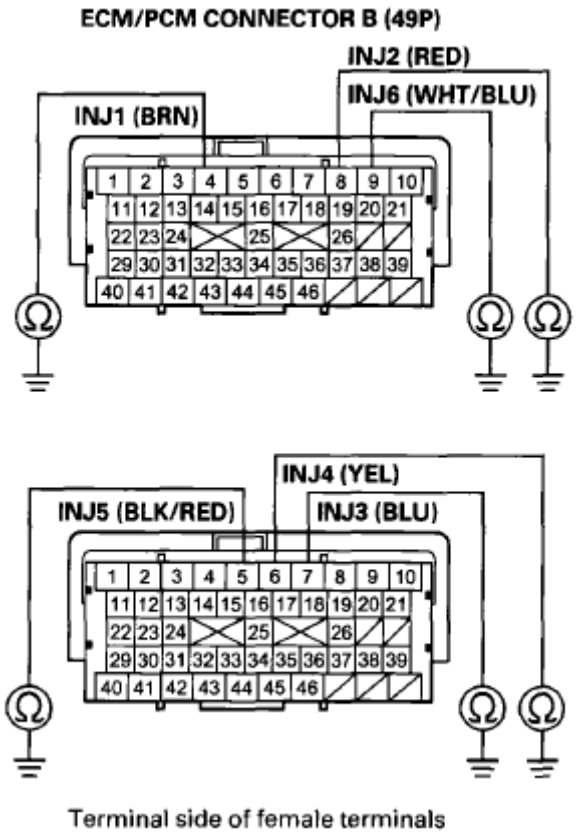

Fig. 56: Checking Continuity Between Body Ground And Appropriate ECM/PCM Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM and the injector, then go to step 44.

NO - Go to step 31.

31. Check for continuity between appropriate injector 2P connector terminal No. 2 and the ECM/PCM connector terminal of the problem cylinder (see table).

PROBLEM CYLINDER	DTC	ECM/PCM TERMINAL	WIRE COLOR
No. 1	P0301	B4	BRN
No. 2	P0302	B8	RED
No. 3	P0303	B7	BLU
No. 4	P0304	B6	YEL
No. 5	P0305	B5	BLK/RED
No. 6	P0306	B9	WHT/BLU

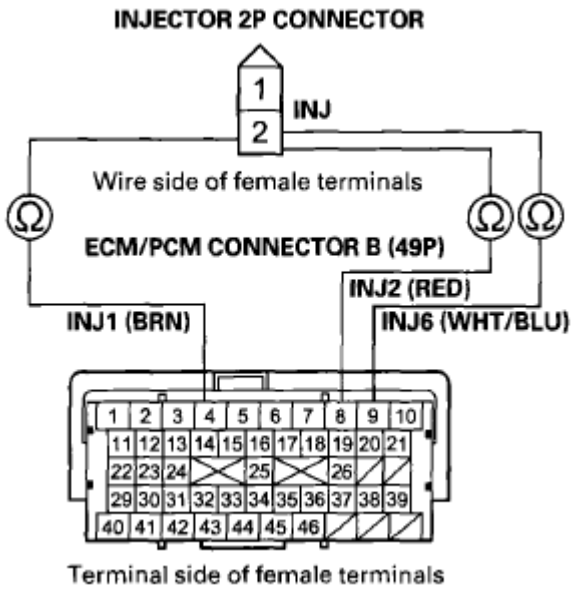

Fig. 57: Checking Continuity Between Appropriate Injector 2P Connector And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

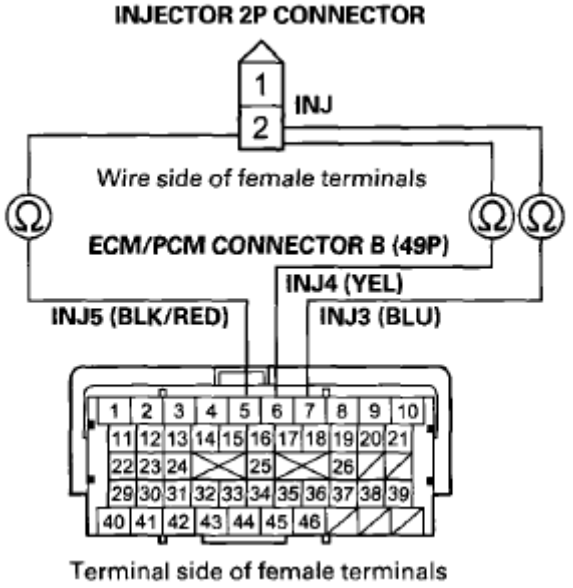

Fig. 58: Checking Continuity Between Appropriate Injector 2P Connector And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for poor connections or loose terminals at the injector and PGM-FI main relay 1, then go to step 32.

NO - Repair open in the wire between the ECM/PCM and the injector, then go to step 44.

32. At the injector side, measure the resistance between injector 2P connector terminals No. 1 and No. 2.

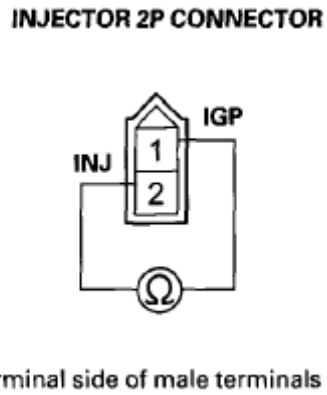

Fig. 59: Measuring Resistance Between Injector 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 10- 13 ohms at room temperature?

YES - Go to step 33.

NO - Replace the **injector**, then go to step 44.

33. Exchange the injector from the problem cylinder with the one from another cylinder. Also check the injector fuel inlet screen for debris, and clean it if needed.
34. Reconnect all connectors, and install the intake manifold (see **INSTALLATION**).
35. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
36. Clear the DTCs with the HDS.
37. Start the engine, and let it idle without load (A/T in P or N, M/T in neutral) for 2 minutes.
38. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VEHICLE SPEED
    - REL TP SENSOR
    - CLV (calculated load value)
    - GEAR POSITION
    - ECT SENSOR 1
39. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, CYL4 MISFIRE, CYL5 MISFIRE, and/or CYL6 MISFIRE show misfire counts?

YES - Go to step 40.

NO - Intermittent failure due to poor contact in the injector connector (no misfire at this time). Check for poor connections or loose terminals at the injector. •

40. Determine which cylinder had the misfire.

    Does the misfire occur in the cylinder where the injector was moved?

    YES - Replace the faulty **injector**, then go to step 44.

    NO - Go to step 41.

41. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
42. Do an engine compression and a cylinder leakdown test (see **ENGINE COMPRESSION INSPECTION**).

    Did the engine pass both tests?

    YES - Go to step 43.

    NO - Repair the engine, then go to step 44.

43. Do the VTEC rocker arm test (see **VTEC ROCKER ARM TEST**).

    Did the engine pass the test?

    YES - Go to step 51.

    NO - Repair the VTEC rocker arm, then go to step 44.

44. Reconnect all connectors.
45. Reset the ECM/PCM with the HDS.
46. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
47. Do the CKP pattern learn/CKP pattern learn procedure (see **CKP PATTERN CLEAR/CKP PATTERN LEARN**).
48. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VEHICLE SPEED
    - REL TP SENSOR
    - CLV (calculated load value)
    - GEAR POSITION
    - ECT SENSOR 1
49. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0301, P0302, P0303, P0304, P0305, or P0306 indicated?

YES - Check for poor connections or loose terminals at the ignition coils, the injectors, and the ECM/PCM, then go to step then go to troubleshooting **DTC P0300, P0301, P0302, P0303, P0304, P0305, or P0306** (see **DTC Troubleshooting**).

NO - Go to step 50.

50. Monitor the OBD STATUS for DTC P0301, P0302, P0303, P0304, P0305, or P0306 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 49, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the ignition coils, the injectors, and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 48.

51. Reconnect all connectors.
52. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
53. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VEHICLE SPEED
    - REL TP SENSOR
    - CLV (calculated load value)
    - GEAR POSITION
    - ECT SENSOR 1
54. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0301, P0302, P0303, P0304, P0305, or P0306 indicated?

    YES - Check for poor connections or loose terminals at the ignition coils, the injectors, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 53. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 55.

55. Monitor the OBD STATUS for DTC P0301, P0302, P0303, P0304, P0305, or P0306 in the DTCs MENU with the HDS.

    Is the screen indicate PASSED?

YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see). If any other Pending or Confirmed DTCs were indicated in step 54, go to the indicated DTC's troubleshooting. •

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the ignition coils, the injectors, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 53. If the ECM/PCM was substituted, go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 53.

DTC P0325: KNOCK SENSOR CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Hold the engine speed at 3, 000- 4, 000 RPM for at least 10 seconds.
5. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0325 indicated?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the knock sensor and the ECM/PCM. •

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Jump the SCS line with the HDS.
8. Disconnect the knock sensor subharness 1P connector.
9. Disconnect ECM/PCM connector C (49P).
10. Check for continuity between ECM/PCM connector terminal C47 and body ground.

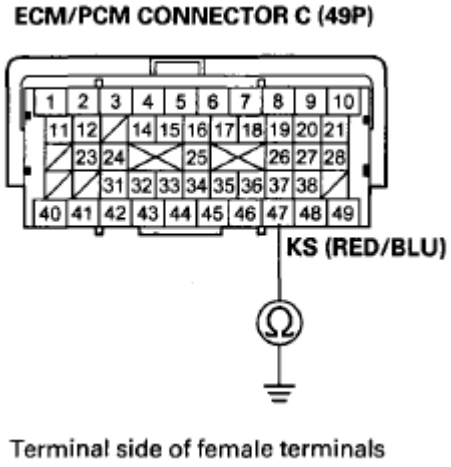

Fig. 60: Checking Continuity Between ECM/PCM Connector Terminal C47 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (C47) and the knock sensor subharness, then go to step 20.

NO - Go to step 11.

11. Connect the engine wire harness C104 1P connector terminal to body ground with a jumper wire.

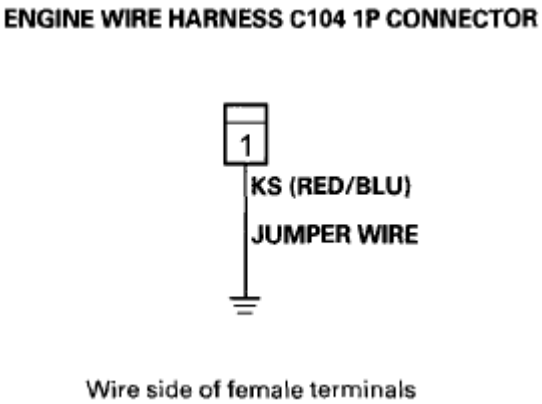

Fig. 61: Connecting Engine Wire Harness C104 1P Connector Terminal To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between ECM/PCM connector terminal C47 and body ground.

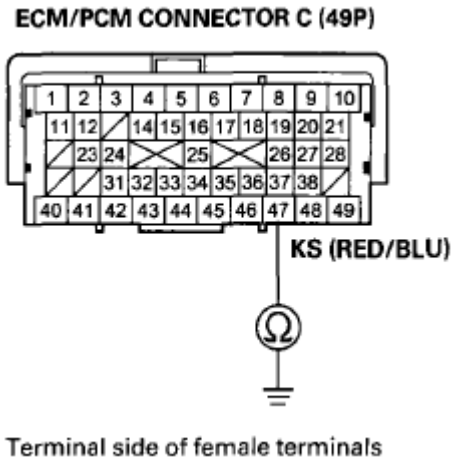

Fig. 62: Checking Continuity Between ECM/PCM Connector Terminal C47 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the ECM/PCM (C47) and the engine wire harness (C104 connector), then go to step 20.

13. Remove the jumper wire from the engine wire harness.
14. Remove the intake manifold (see **REMOVAL**), and the injector base (see **INJECTOR BASE REMOVAL AND INSTALLATION**).
15. Disconnect the knock sensor 1P connector.
16. Check for continuity between the knock sensor 1P connector terminal and body ground.

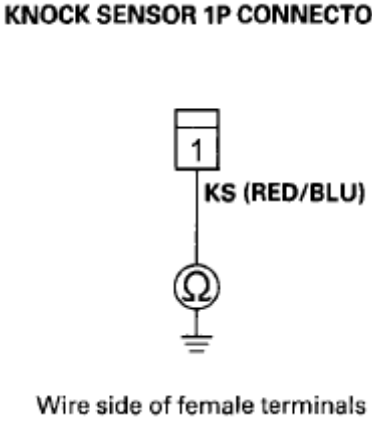

Fig. 63: Checking Continuity Between Knock Sensor 1P Connector Terminal And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the knock sensor subharness, then go to step 19.

NO - Go to step 17.

17. Check for an open in the knock sensor subharness.

    Is the harness OK?

    YES - Go to step 18.

    NO - Repair open in the knock sensor subharness, then go to step 19.

18. Replace the **knock sensor**.
19. Install the injector base (see **INJECTOR BASE REMOVAL AND INSTALLATION**), and the intake manifold (see **INSTALLATION**).
20. Reconnect all connectors.
21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Hold the engine speed at 3, 000- 4, 000 RPM for at least 10 seconds.
25. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0325 indicated?

    YES - Check for poor connections or loose terminals at the knock sensor and the ECM/PCM, then go to step 27.

    NO - Go to step 26.

26. Monitor the OBD STATUS for DTC P0325 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 25, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the knock sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 24.

27. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
28. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
29. Hold the engine speed at 3, 000- 4, 000 RPM for at least 10 seconds.
30. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0325 indicated?

YES - Check for poor connections or loose terminals at the knock sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 28. If the ECM/PCM was substituted, go to step 1.

NO - Go to step 31.

31. Monitor the OBD STATUS for DTC P0325 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 30, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the knock sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 28. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 28.

DTC P0335: CKP SENSOR NO SIGNAL

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0335 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the CKP sensor 3P connector.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Measure the voltage between CKP sensor 3P connector terminal No. 3 and body ground.

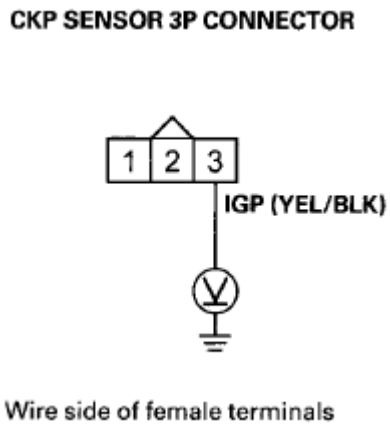

Fig. 64: Measuring Voltage Between CKP Sensor 3P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 9.

NO - Repair open in the wire between the CKP sensor and PGM-FI main relay 1, then go to step 19.

9. Measure the voltage between CKP sensor 3P connector terminal No. 1 and body ground.

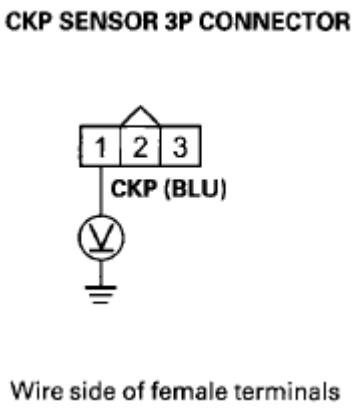

Fig. 65: Measuring Voltage Between CKP Sensor 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 10.

NO - Go to step 11.

10. Measure the voltage between CKP sensor 3P connector terminals No. 2 and No. 3.

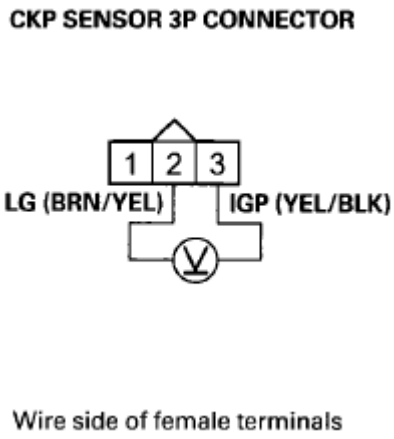

Fig. 66: Measuring Voltage Between CKP Sensor 3P Connector Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 17.

NO - Repair open in the wire between the CKP sensor and G101; M/T (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), A/T (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), then go to step 19.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector B (49P).
14. Check for continuity between ECM/PCM connector terminal B45 and body ground.

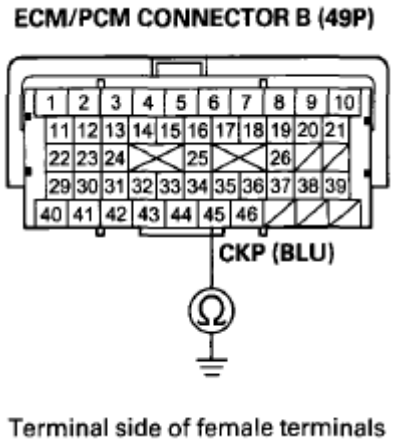

Fig. 67: Checking Continuity Between ECM/PCM Connector Terminal B45 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B45) and the CKP sensor, then go to step 19.

NO - Go to step 15.

15. Connect CKP sensor 3P connector terminal No. 1 to body ground with a jumper wire.

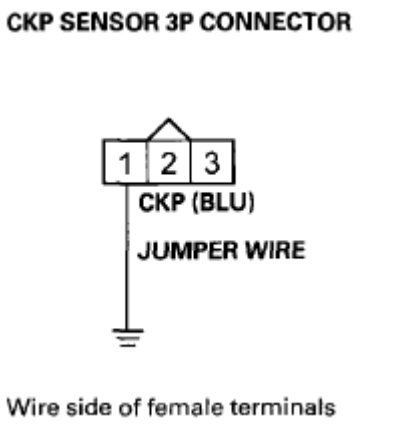

Fig. 68: Connecting CKP Sensor 3P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Check for continuity between ECM/PCM connector terminal B45 and body ground.

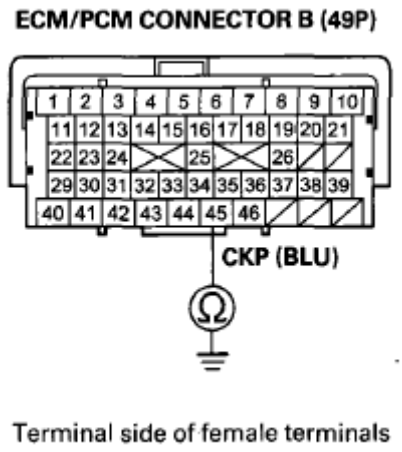

Fig. 69: Checking Continuity Between ECM/PCM Connector Terminal B45 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM/PCM (B45) and the CKP sensor, then go to step 19.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Replace the **CKP sensor**.
19. Reconnect all connectors.
20. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
21. Reset the ECM/PCM with the HDS.
22. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
23. Do the CKP pattern clear/CKP pattern learn procedure (see **CKP PATTERN CLEAR/CKP PATTERN LEARN**).
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0335 indicated?

    YES - Check for poor connections or loose terminals at the CKP sensor and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

25. Reconnect all connectors.
26. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
27. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0335 indicated?

    YES - Check for poor connections or loose terminals at the CKP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0339: CKP SENSOR CIRCUIT INTERMITTENT INTERRUPTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle for 10 seconds.
4. Check the CKP NOISE in the DATA LIST with the HDS.

Are 0 counts indicated?

YES - Go to step 7.

NO - Go to step 5.

5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VEHICLE SPEED
6. Check the CKP NOISE in the DATA LIST with the HDS.

   Are 0 counts indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor and the ECM/PCM. •

7. Check for poor connections or loose terminals and terminals at these locations:
   - CKP sensor
   - ECM/PCM
   - Engine ground
   - Body ground

   Are the connections and terminals OK?

   YES - Go to step 8.

   NO - Repair the connections or terminals, then go to step 11.

8. Remove the oil pan (see **OIL PAN REMOVAL**), and check for damage to the CKP pulse plate.

   Is the pulse plate damaged?

   YES - Replace the CKP pulse plate (see **CKP PULSE PLATE REPLACEMENT**), then go to step 11.

   NO - Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Replace the **CKP sensor**.
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
12. Reset the ECM/PCM with the HDS.
13. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
14. Do the CKP pattern clear/CKP pattern learn procedure (see **CKP PATTERN CLEAR/CKP PATTERN**

LEARN).

15. Start the engine, and let it idle for 10 seconds.
16. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0339 indicated?

YES - Check for poor connections or loose terminals at the CKP sensor and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0351: NO. 1 CYLINDER IGNITION COIL CIRCUIT MALFUNCTION; DTC P0352: NO. 2 CYLINDER IGNITION COIL CIRCUIT MALFUNCTION; DTC P0353: NO. 3 CYLINDER IGNITION COIL CIRCUIT MALFUNCTION; DTC P0354: NO. 4 CYLINDER IGNITION COIL CIRCUIT MALFUNCTION; DTC P0355: NO. 5 CYLINDER IGNITION COIL CIRCUIT MALFUNCTION; DTC P0356: NO. 6 CYLINDER IGNITION COIL CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0351, P0352, P0353, P0354, P0355, and/or P0356 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ignition coil(s) and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Exchange the ignition coil from the problem cylinder with one from another cylinder.
7. Start the engine.
8. Check for Pending or Confirmed DTCs with the HDS.

Is an ignition coil DTC indicated at the exchanged cylinder?

YES - Replace the faulty ignition coil (see **IGNITION COIL AND SPARK PLUG REMOVAL/INSTALLATION**), then go to step 27.

NO - Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Check the No. 13 IG COIL (15 A) fuse in the under-hood fuse/relay box.

    Is the fuse OK?

    YES - Go to step 11.

    NO - Go to step 13.

11. Remove the ignition coil relay (A) from the under-hood fuse/relay box.

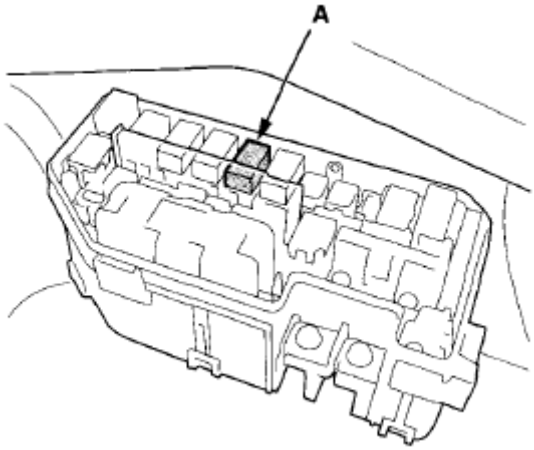

Fig. 70: Identifying Ignition Relay Coil
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Test the ignition coil relay (see **POWER RELAY TEST**).

    Is the relay OK?

    YES - Go to step 16.

    NO - Replace the ignition coil relay, then go to step 26.

13. Remove the ignition coil relay (A) from the under-hood fuse/relay box.

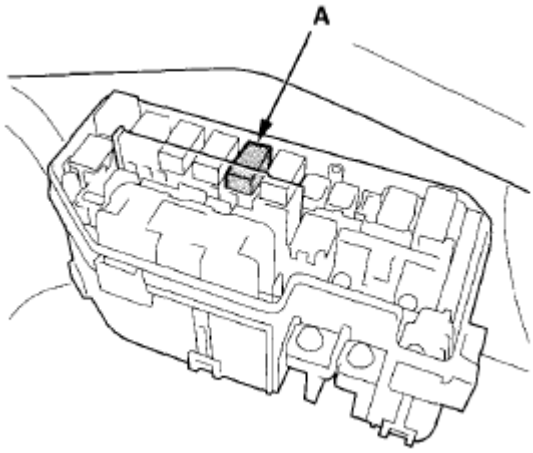

Fig. 71: Identifying Ignition Coil Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Disconnect all ignition coil 3P connectors.
15. Check for continuity between No. 1 ignition coil 3P connector terminal No. 3 and body ground.

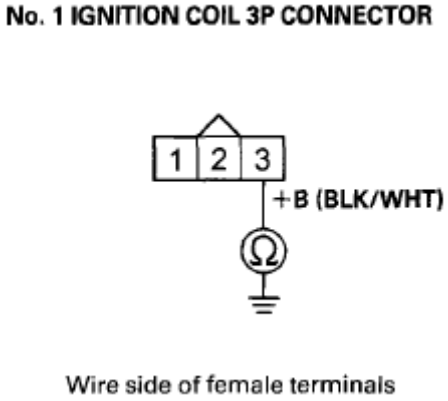

Fig. 72: Checking Continuity Between No. 1 Ignition Coil 3P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ignition coils and the ignition coil relay. Also replace the No. 13 IG COIL (15 A) fuse, then go to step 26.

NO - Check the under-hood fuse/relay box, and replace it if needed (see **REMOVAL AND INSTALLATION**), then go to step 26.

16. Reinstall the ignition coil relay.
17. Disconnect the ignition coil 3P connector from the problem cylinder.
18. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

19. Measure the voltage between ignition coil 3P connector terminal No. 3 of the problem cylinder and body ground (see table).

PROBLEM CYLINDER	DTC
No. 1	P0351
No. 2	P0352
No. 3	P0353
No. 4	P0354
No. 5	P0355
No. 6	P0356

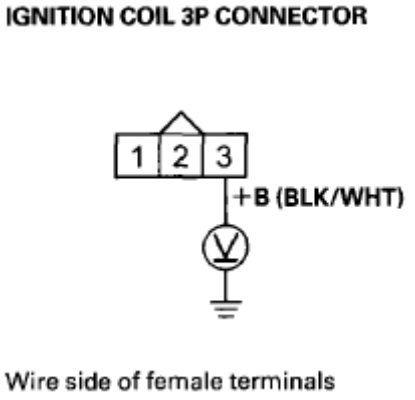

Fig. 73: Measuring Voltage Between Ignition Coil 3P Connector Of Problem Cylinder And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 20.

NO - Repair open in the wire between the ignition coil and the ignition coil relay, then go to step 26.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Check for continuity between ignition coil 3P connector terminal No. 2 of the problem cylinder and body ground (see table).

PROBLEM CYLINDER	DTC
No. 1	P0351
No. 2	P0352
No. 3	P0353
No. 4	P0354
No. 5	P0355

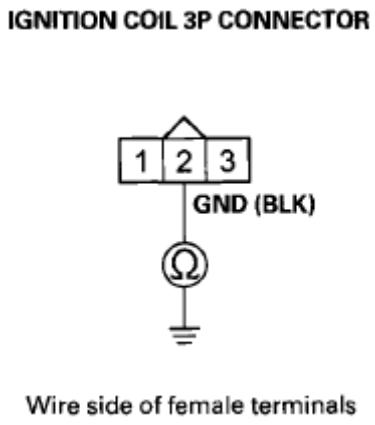

Fig. 74: Checking Continuity Between Ignition Coil 3P Connector Of Problem Cylinder And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 22.

NO - Repair open in the wire between the ignition coil and G101; M/T (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), A/T (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), then go to step 26.

22. Jump the SCS line with the HDS.
23. Disconnect ECM/PCM connector B (49P).
24. Check for continuity between body ground and the appropriate ECM/PCM connector terminal (see table).

PROBLEM CYLINDER	DTC	ECM/PCM TERMINAL	WIRE COLOR
No. 1	P0351	B29	YEL/GRN
No. 2	P0352	B30	BLU/RED
No. 3	P0353	B22	WHT/BLU
No. 4	P0354	B23	BRN
No. 5	P0355	B11	BLK/RED
No. 6	P0356	B12	BRN/WHT

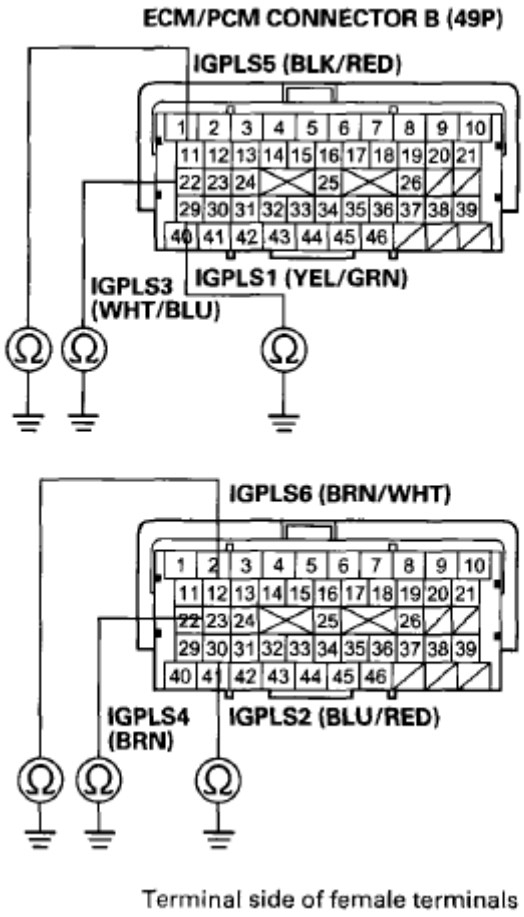

Fig. 75: Checking Continuity Between Body Ground And Appropriate ECM/PCM Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM and the ignition coil, then go to step 26.

NO - Go to step 25.

25. Check for continuity between appropriate ignition coil 3P connector terminal No. 1 and the ECM/PCM connector terminal of the problem cylinder (see table).

PROBLEM CYLINDER	DTC	ECM/PCM TERMINAL	WIRE COLOR
No. 1	P0351	B29	YEL/GRN
No. 2	P0352	B30	BLU/RED

Courtesy of AMERICAN HONDA MOTOR CO., INC.

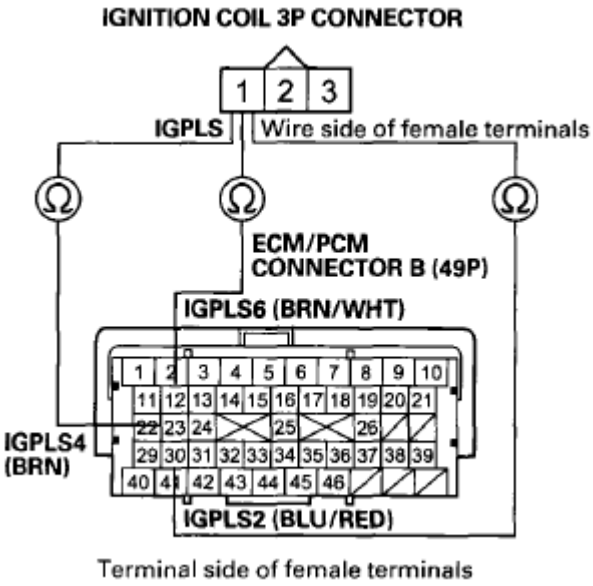

Fig. 77: Checking Continuity Between Appropriate Ignition Coil 3P Connector And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 32.

NO - Repair open in the wire between the ECM/PCM and the ignition coil, then go to step 26.

26. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
27. Reconnect all connectors.
28. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
29. Reset the ECM/PCM with the HDS.
30. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
31. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0351, P0352, P0353, P0354, P0355, and/or P0356 indicated?

    YES - Check for poor connections or loose terminals at the ignition coil(s) and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

32. Reconnect all connectors.
33. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
34. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0351, P0352, P0353, P0354, P0355, and/or P0356 indicated?

    YES - Check for poor connections or loose terminals at the ignition coil(s) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - --If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0365: CMP SENSOR CIRCUIT NO SIGNAL

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0365 indicated?

   YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CMP sensor and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the CMP sensor 3P connector.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Measure the voltage between CMP sensor 3P connector terminal No. 3 and body ground.

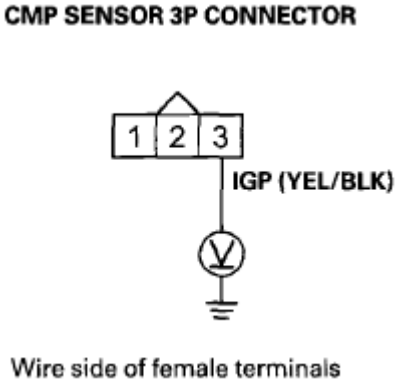

Fig. 78: Measuring Voltage Between CMP Sensor 3P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 9.

NO - Repair open in the wire between the CMP sensor and PGM-FI main relay 1, then go to step 18.

9. Measure the voltage between CMP sensor 3P connector terminal No. 1 and body ground.

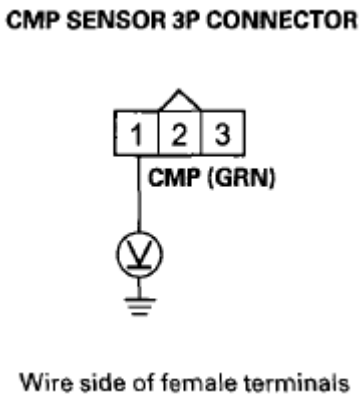

Fig. 79: Measuring Voltage Between CMP Sensor 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 10.

NO - Go to step 11.

10. Measure the voltage between CMP sensor 3P connector terminals No. 2 and No. 3.

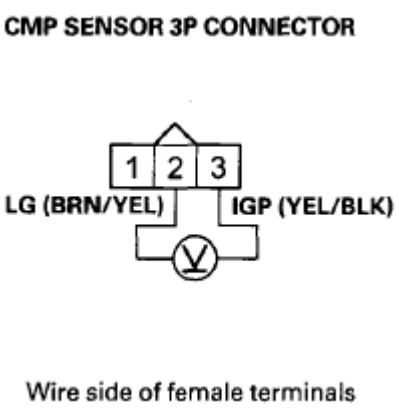

Fig. 80: Measuring Voltage Between CMP Sensor 3P Connector Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 16.

NO - Repair open in the wire between the CMP sensor and G101; M/T (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), A/T (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), then go to step 18.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector B (49P).
14. Check for continuity between ECM/PCM connector terminal B46 and body ground.

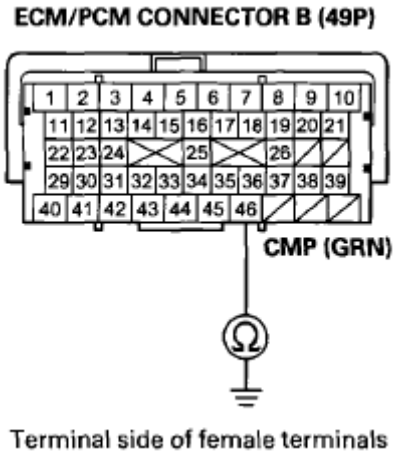

Fig. 81: Checking Continuity Between ECM/PCM Connector Terminal B46 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B46) and the CMP sensor, then go to step 18.

NO - Go to step 15.

15. Check for continuity between CMP sensor 3P connector terminal No. 1 and ECM/PCM connector terminal B46.

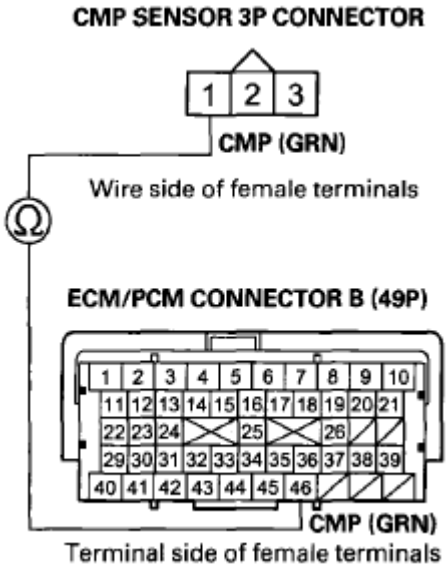

Fig. 82: Checking Continuity Between CMP Sensor 3P Connector Terminal No. 1 And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - Repair open in the wire between the ECM/PCM (B46) and the CMP sensor, then go to step 18.

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Replace the **CMP sensor**.
18. Reconnect all connectors.
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0365 indicated?

    YES - Check for poor connections or loose terminals at the CMP sensor and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

23. Reconnect all connectors.
24. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
25. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0365 indicated?

    YES - Check for poor connections or loose terminals at the CMP sensor and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0369: CMP SENSOR CIRCUIT INTERMITTENT INTERRUPTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle for 10 seconds.

4. Check the CMP B NOISE in the DATA LIST with the HDS.

   Are 0 counts indicated?

   YES - Go to step 7.

   NO - Go to step 5.

5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VEHICLE SPEED
6. Check the CMP B NOISE in the DATA LIST with the HDS.

   Are 0 counts indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CMP sensor and the ECM/PCM. •

7. Check for poor connections or loose terminals at these locations:
   - CMP sensor
   - ECM/PCM
   - Engine ground
   - Body ground

   Are the connections and terminals OK?

   YES - Go to step 8.

   NO - Repair the connections or the terminals, then go to step 11.

8. Check for damage to the front camshaft pulley (**CMP** pulse plate).

   Is the pulse plate damaged?

   YES - Replace the front camshaft pulley (CMP pulse plate); J35Z6 engine (see **CAMSHAFT REPLACEMENT**), J37A4 engine (see **CAMSHAFT REPLACEMENT**), then go to step 11.

   NO - Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Replace the **CMP sensor**.
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

12. Reset the ECM/PCM with the HDS.
13. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
14. Start the engine, and let it idle for 10 seconds.
15. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0369 indicated?

    YES - Check for poor connections or loose terminals at the CMP sensor and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P050A: COLD START IDLE AIR CONTROL SYSTEM PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check for Pending or Confirmed DTCs with the HDS.

   Are any Pending or Confirmed DTCs other than P050A indicated?

   YES - Go to the indicated DTC's troubleshooting. •

   NO - Go to step 3.

3. Check for poor connections or a blockage at the intake air duct.

   Is it OK?

   YES - Go to step 4.

   NO - Reconnect or repair the intake air duct, then go to step 19.

4. Check for damage at the air cleaner housing.

   Is it OK?

   YES - Go to step 5.

   NO - Replace the air cleaner housing (see **THROTTLE BODY CLEANING**), then go to step 19.

5. Check for dirt or debris in the air cleaner element.

Is it dirty?

YES - Replace the air cleaner element or remove the debris (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 19.

NO - Go to step 6.

6. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
7. Clear the DTC with the HDS.
8. Start the engine, and let it idle for 10 seconds or more.
9. Monitor the OBD STATUS for DTC P050A in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 10.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body, the MAF sensor/IAT sensor, and the ECM/PCM. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 6.

10. Do the ETCS TEST in the INSPECTION MENU with the HDS.

    Is the THROTTLE ACTUATOR CONTROL VALVE normal?

    YES - Go to step 11.

    NO - Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**), then go to step 19.

11. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
12. While holding the engine speed at 2, 500 RPM for 30 seconds, check the MAF SENSOR in the DATA LIST with the HDS.

    Is there about 11.0- 15.5 gm/s (J35Z6 engine) or 11.8- 16.6 gm/s (J37A4 engine)?

    YES - Go to step 13.

    NO - Replace the **MAF sensor/IAT sensor**, then go to step 19.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Allow the engine to cool to the ambient temperature.
15. Note the ambient temperature.
16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

17. Quickly note the value of IAT SENSOR in the DATA LIST with the HDS.
18. Compare the value of the IAT SENSOR and the ambient temperature.

    Does the value of the IAT SENSOR differ 5.4°F (3°C) or more from ambient temperature?

    YES - Replace the **MAF sensor/IAT sensor**, then go to step 19.

    NO - Check for dirt, carbon, or damage in the throttle bore. If there is dirt or carbon, clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 19. If there is damage in the throttle bore, replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**), then go to step 19.

19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Reset the PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
23. Start the engine, and let it idle for 10 seconds or more.
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P050A indicated?

    YES - Check for poor connections or loose terminals at the throttle body, the MAF sensor/IAT sensor, and the ECM/PCM, then go to step 1.

    NO - Go to step 25.

25. Monitor the OBD STATUS for DTC P050A in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 24, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the throttle body, the MAF sensor/IAT sensor, and the PCM, then go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 22.

DTC P050B: COLD START IGNITION TIMING CONTROL SYSTEM PERFORMANCE PROBLEM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check for Pending or Confirmed DTCs with the HDS.

Are any Pending or Confirmed DTCs other than P050B indicated?

YES - Go to the indicated DTC's troubleshooting. •

NO - Go to step 3.

3. Check for poor connections or a blockage at the intake air duct.

   Is it OK?

   YES - Go to step 4.

   NO - Correct the problem, then reconnect the intake air duct, and go to step 21.

4. Check for damage at the air cleaner housing.

   Is it OK?

   YES - Go to step 5.

   NO - Replace the air cleaner housing (see **THROTTLE BODY CLEANING**), then go to step 21.

5. Check for dirt or debris in the air cleaner element.

   Is it dirty?

   YES - Replace the air cleaner element or remove the debris (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**), then go to step 21.

   NO - Go to step 6.

6. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
7. Clear the DTC with the HDS.
8. Start the engine, and let it idle for 10 seconds or more.
9. Monitor the OBD STATUS for DTC P050B in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 10.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor, the throttle body, the MAF sensor/IAT sensor, ECT sensor 1, ECT sensor 2, and the ECM/PCM. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 6.

10. Inspect the ignition timing (see **IGNITION TIMING INSPECTION**).

Is the ignition timing OK?

YES - Go to step 12.

NO - Go to step 11.

11. Check for damage at the **CKP sensor** and the CKP pulse plate (see **CKP PULSE PLATE REPLACEMENT**).

    Is the CKP sensor and/or the CKP pulse plate damaged?

    YES - Replace the **CKP sensor** and/or the CKP pulse plate (see **CKP PULSE PLATE REPLACEMENT**), then go to step 21.

    NO - Go to step 28.

12. Do the ETCS TEST in the INSPECTION MENU with the HDS.

    Is the THROTTLE ACTUATOR CONTROL VALVE normal?

    YES - Go to step 13.

    NO - Replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**), then go to step 21.

13. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
14. While holding the engine speed at 2, 500 RPM for 30 seconds, check the MAF SENSOR in the DATA LIST with the HDS.

    Is there about 11.0- 15.5 gm/s (J35Z6 engine) or 11.8- 16.6 gm/s (J37A4 engine)?

    YES - Go to step 15.

    NO - Replace the **MAF sensor/IAT sensor**, then go to step 21.

15. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
16. Allow ECT sensor 1 and ECT sensor 2 to cool to the ambient temperature.
17. Note the ambient temperature.
18. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
19. Quickly note the value of ECT SENSOR 1 and ECT SENSOR 2 in the DATA LIST with the HDS.
20. Compare the value of ECT SENSOR 1 and the ambient temperature, and the value of ECT SENSOR 2 and the ambient temperature individually.

    Does either sensor differ more than 5.4°F (3°C) from the ambient temperature?

YES - Replace the sensor that differed more than 5.4°F (3°C) from the ambient temperature. Refill the cooling system (see **COOLANT CHECK**), then go to step 21.

NO - Check and repair any problems with the following items. Repair or replace them if needed, then go to step 21. If all of the items are OK, go to step 28.

- Engine compression and cylinder leakdown
- VTEC system
- Engine oil
- A/C system
- Power steering

21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
25. Start the engine, and let it idle for 10 seconds or more.
26. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P050B indicated?

    YES - Check for poor connections or loose terminals at the CKP sensor, the throttle body, the MAF sensor/IAT sensor, ECT sensor 1, ECT sensor 2, and the ECM/PCM, then go to step 1.

    NO - Go to step 27.

27. Monitor the OBD STATUS for DTC P050B in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 26, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the CKP sensor, the throttle body, the MAF sensor/IAT sensor, ECT sensor 1, ECT sensor 2, and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 24.

28. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
29. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
30. Let the engine cool until the value of ECT SENSOR 1 is 122°F (50°C) or less.
31. Start the engine, and let it idle for 10 seconds or more.
32. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P050B indicated?

YES - Check for poor connections or loose terminals at the CKP sensor, the throttle body, the MAF sensor/IAT sensor, ECT sensor 1, ECT sensor 2, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 30. If the ECM/PCM was substituted, go to step 1.

NO - Go to step 33.

33. Monitor the OBD STATUS for DTC P050B in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 32, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the CKP sensor, the throttle body, the MAF sensor/IAT sensor, ECT sensor 1, ECT sensor 2, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 30. If the ECM/PCM was substituted, go to step 1. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 30.

DTC P0560: PCM POWER SOURCE CIRCUIT UNEXPECTED VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0560 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the No. 19 BACK UP Fl ECU (7.5 A) fuse in the under-hood fuse relay box and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check the No. 19 BACK UP Fl ECU (7.5 A) fuse in the under-hood fuse relay box.

   Is the fuse OK?

YES - Go to step 7.

NO - Go to step 10.

7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector A (49P).
9. Measure the voltage between ECM/PCM connector terminal A23 and body ground.

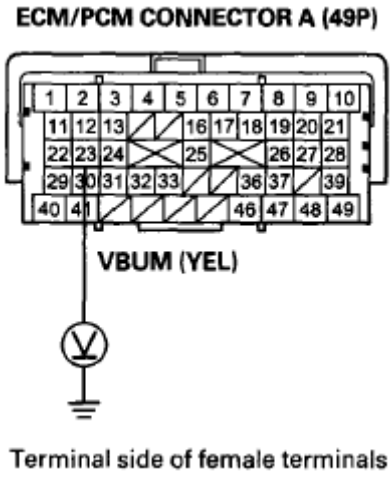

Fig. 83: Measuring Voltage Between ECM/PCM Connector Terminal A23 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 19.

NO - Repair open in the wire between the ECM/PCM (A23) and the No. 19 BACK UP Fl ECU (7.5 A) fuse, then go to step 13.

10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector A (49P).
12. Check for continuity between ECM/PCM connector terminal A23 and body ground.

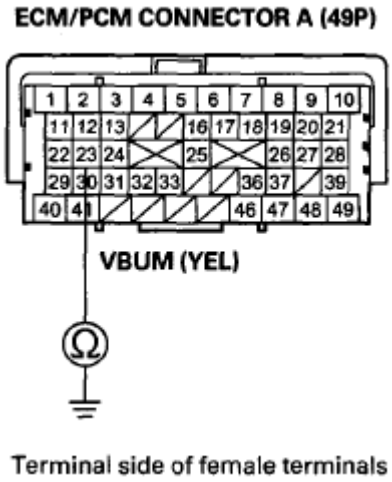

Fig. 84: Checking Continuity Between ECM/PCM Connector Terminal A23 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A23) and the No. 19 BACK UP Fl ECU (7.5 A) fuse. Also replace the No. 19 BACK UP Fl ECU (7.5 A) fuse, then go to step 13.

NO - Check the under-hood fuse/relay box, and replace it if needed (see **REMOVAL AND INSTALLATION**). Also replace the No. 19 BACK UP Fl ECU (7.5 A) fuse, then go to step 13.

13. Reconnect all connectors.
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Start the engine, and let it idle.
18. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0560 indicated?

    YES - Check for poor connections or loose terminals at the No. 19 BACK UP Fl ECU (7.5 A) fuse and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

19. Reconnect all connectors.
20. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
21. Start the engine, and let it idle.
22. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0560 indicated?

YES - Check for poor connections or loose terminals at the No. 19 BACK UP Fl ECU (7.5 A) fuse and the ECM/PCM. If the ECM/PCM updated, substitute a known-good ECM/PCM, then go to step 21. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0562: CHARGING SYSTEM LOW VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If any high current load accessories are installed, this DTC can be set.**
- **If DTC P16BB and/or P16BC is stored at the same time as DTC P0562, troubleshoot DTC P16BB and/or P16BC first, then recheck for DTC P0562.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check under these conditions:
   - A/C on
   - Temperature control at maximum cool
   - Blower fan at maximum speed
   - Headlights on high beam
   - Rear window defogger on
5. Hold the engine speed at 2, 000 RPM (A/T in P or N, M/T in neutral) for 1 minute.
6. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0562 indicated?

YES - Replace the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**), then go to step 7.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, and check the battery performance (see **BATTERY TEST**). •

7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).

10. Start the engine.
11. Check under these conditions:
    - A/C on
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Headlights on high beam
    - Rear window defogger on
12. Hold the engine speed at 2, 000 RPM (A/T in P or N, M/T in neutral) for 1 minute.
13. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0562 indicated?

    YES - Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0563: ECM/PCM POWER SOURCE CIRCUIT UNEXPECTED VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Wait 10 seconds.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0563 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at PGM-FI main relay 1 and the ECM/PCM. •

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (49P).
10. Measure the voltage between ECM/PCM connector terminal A6 and body ground.

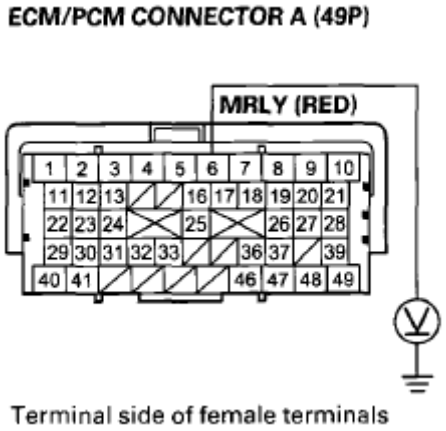

Fig. 85: Measuring Voltage Between ECM/PCM Connector Terminal A6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 13.

NO - Go to step 11.

11. Remove PGM-FI main relay 1 (A) from the under-hood fuse/relay box.

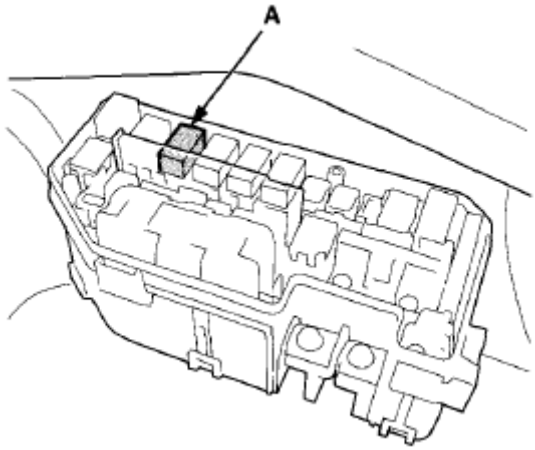

Fig. 86: Identifying PGM-FI Main Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check for continuity between ECM/PCM connector terminal A6 and body ground.

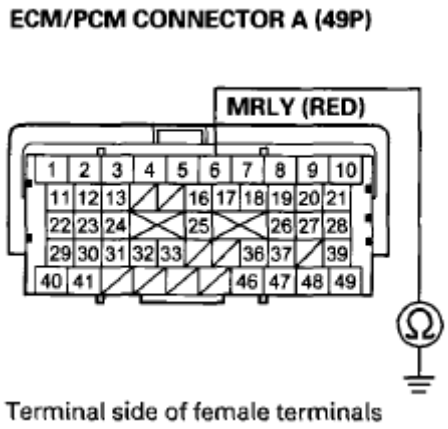

Fig. 87: Checking Continuity Between ECM/PCM Connector Terminal A6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A6) and PGM-FI main relay 1, then go to step 19.

NO - Go to step 18.

13. Reconnect ECM/PCM connector A (49P).
14. Disconnect ECM/PCM connector B (49P).
15. Measure the voltage between ECM/PCM connector terminal B3 and body ground.

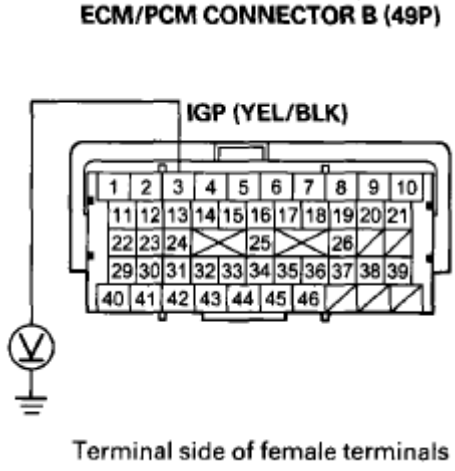

Fig. 88: Measuring Voltage Between ECM/PCM Connector Terminal B3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 16.

NO - Go to step 26.

16. Remove PGM-FI main relay 1 (A) from the under-hood fuse/relay box.

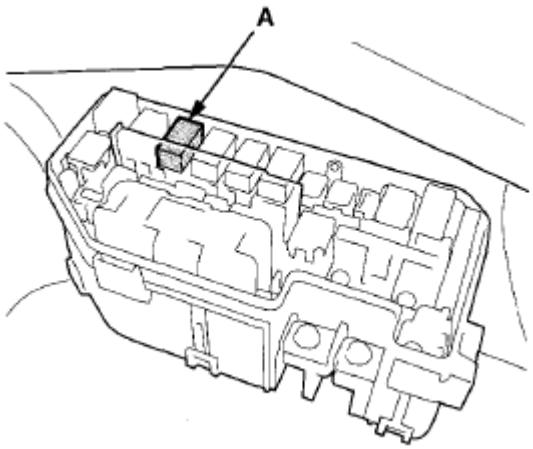

Fig. 89: Identifying PGM-FI Main Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Measure the voltage between ECM/PCM connector terminal B3 and body ground.

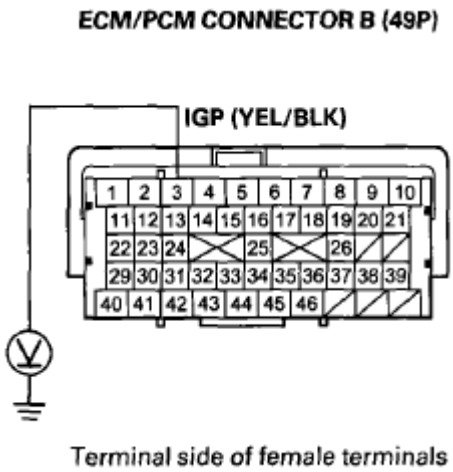

Fig. 90: Measuring Voltage Between ECM/PCM Connector Terminal B3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair short to power in the wire between the ECM/PCM (B3) and PGM-FI main relay 1, then go to step 19.

NO - Go to step 18.

18. Test PGM-FI main relay 1 (see **POWER RELAY TEST**).

Is the relay OK?

YES - Go to step 26.

NO - Replace PGM-FI main relay 1, then go to step 19.

19. Reconnect all connectors.
20. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
21. Reset the ECM/PCM with the HDS.
22. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
23. Wait 10 seconds.
24. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
25. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0563 indicated?

    YES - Check for poor connections or loose terminals at PGM-FI main relay 1 and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

26. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
27. Reconnect all connectors.
28. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
29. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0563 indicated?

    YES - Check for poor connections or loose terminals at PGM-FI main relay 1 and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - --If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0602: ECM/PCM PROGRAMMING ERROR

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This DTC is indicated when an ECM/PCM update is not completed.**

- **Do not turn the ignition switch to ACC (I) or LOCK (0) or do not press the engine start/stop button while updating the ECM/PCM. If you do, the ECM/PCM can be damaged.**

1. Do the **ECM/PCM update** procedure.
2. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0602 indicated?

   YES - Replace the original **ECM/PCM** (see **ECM/PCM Replacement**). •

   NO - The update is complete. •

DTC P060A: ECM/PCM INTERNAL CONTROL MODULE MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P060A indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. •

4. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
5. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P060A indicated?

   YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

   NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0615: STARTER CUT RELAY STRLD CIRCUIT MALFUNCTION (M/T)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and

review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Press the engine start/stop button to select the ON mode.
2. Check for Pending or Confirmed DTCs with the HDS.

   Are DTC P16BD and P0615 indicated at the same time?

   YES - Go to the troubleshooting for **DTC P16BD**.

   NO - Go to step 3.

3. Clear the DTC with the HDS.
4. Press the engine start/stop button to select the START mode, for 1 second or more.
5. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0615 indicated?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, the + B cut relay, and the ECM. •

6. Try to start engine.

   Does the engine start?

   YES - Go to step 7.

   NO - Go to step 17.

7. Press the engine start/stop button to select the OFF mode.
8. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**), then check the No. 8 STRLD (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

   YES - Go to step 9.

   NO - Replace the fuse, then go to step 26.

9. Jump the SCS line with the HDS.
10. Disconnect ECM connector A (49P).
11. Remove starter cut relay 1 (A) from the driver's under-dash fuse/relay box.

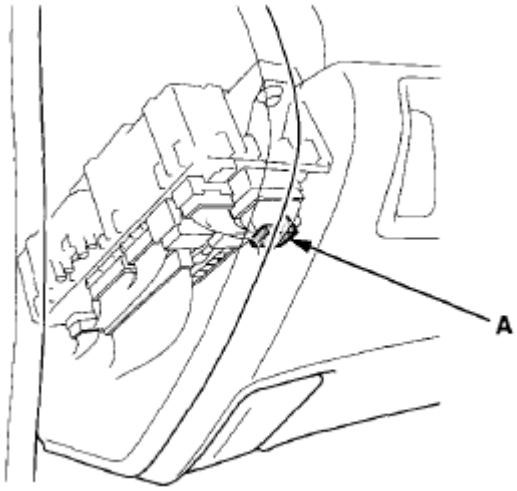

Fig. 91: Identifying Starter Cut Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Connect starter cut relay 1 4P connector terminal No. 1 to body ground with a jumper wire.

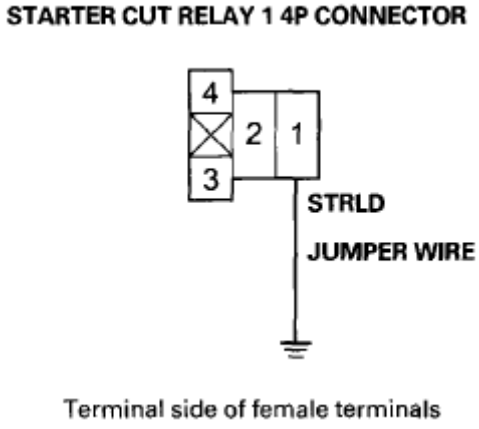

Fig. 92: Connecting Starter Cut Relay 4P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check for continuity between ECM connector terminal A28 and body ground.

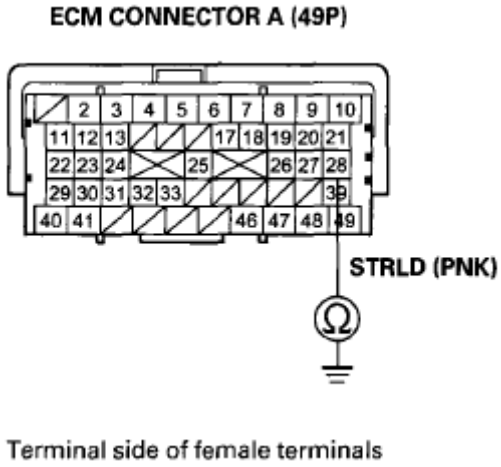

Fig. 93: Checking Continuity Between ECM Connector Terminal A28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Go to step 14.

14. Disconnect driver's under-dash fuse/relay box connector G (13P).
15. Connect driver's under-dash fuse/relay box connector G (13P) terminal No. 6 to body ground with a jumper wire.

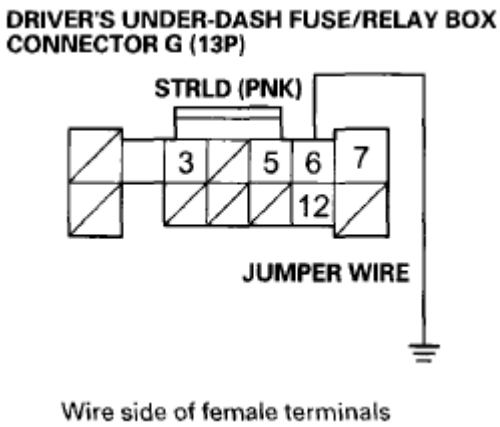

Fig. 94: Connecting Driver's Under-Dash Fuse/Relay Box Connector G (13P) To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Check for continuity between ECM connector terminal A28 and body ground.

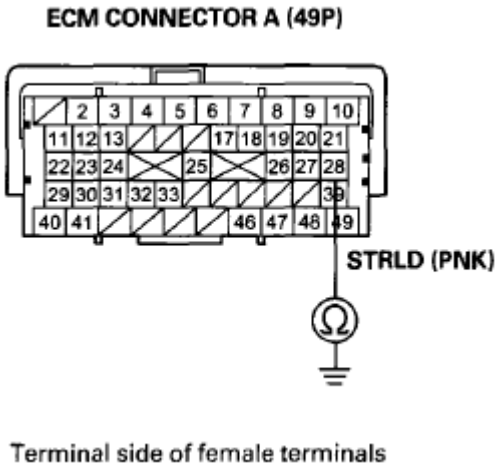

Fig. 95: Checking Continuity Between ECM Connector Terminal A28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**), then go to step 25.

NO - Repair open in the wire between the ECM (A28) and the driver's under-dash fuse/relay box, then go to step 25.

17. Press the engine start/stop button to select the OFF mode.
18. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**), then remove starter cut relay 1 (A) from the driver's under-dash fuse/relay box.

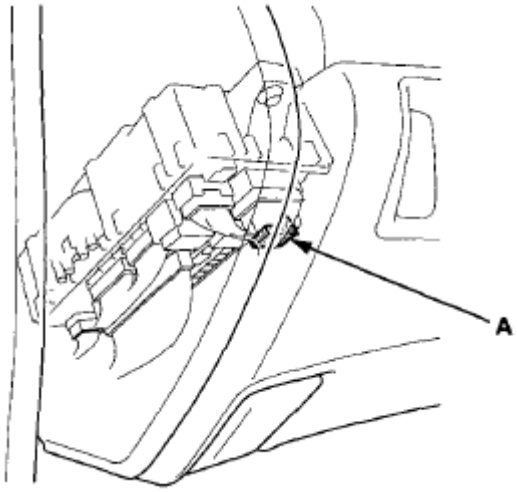

Fig. 96: Identifying Starter Cut Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Check for continuity between starter cut relay 1 4P connector terminal No. 3 and body ground.

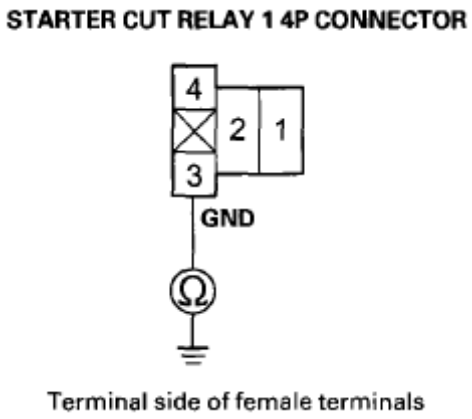

Fig. 97: Checking Continuity Between Starter Cut Relay 4P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 20.

NO - Repair open in the wire between starter cut relay 1 and G301 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), then go to step 25.

20. Check for continuity between the +B cut relay terminal No. 3 and body ground.

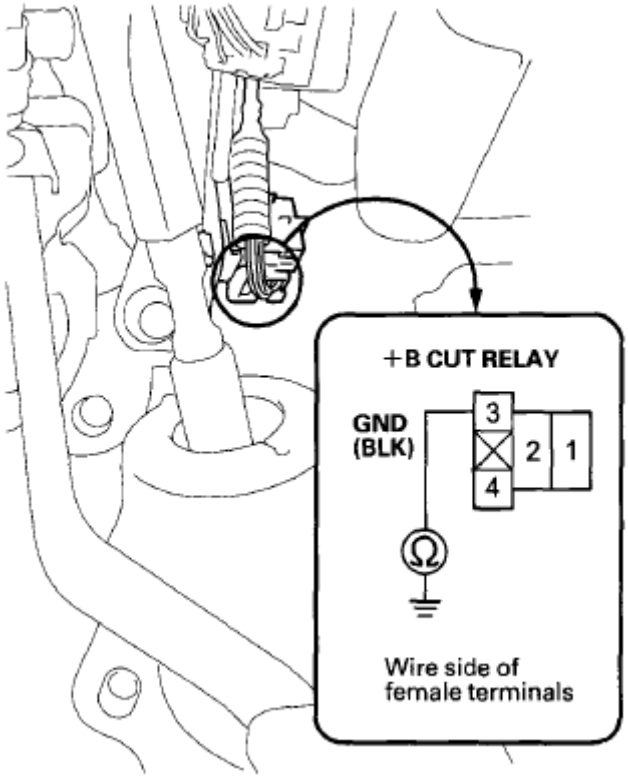

Fig. 98: Checking Continuity Between +B Cut Relay Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 21.

NO - Repair open in the wire between the +B cut relay and G403 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), then go to step 25.

21. Jump the SCS line with the HDS.
22. Disconnect ECM connector A (49P).
23. Connect starter cut relay 1 4P connector terminal No. 4 to body ground with a jumper wire.

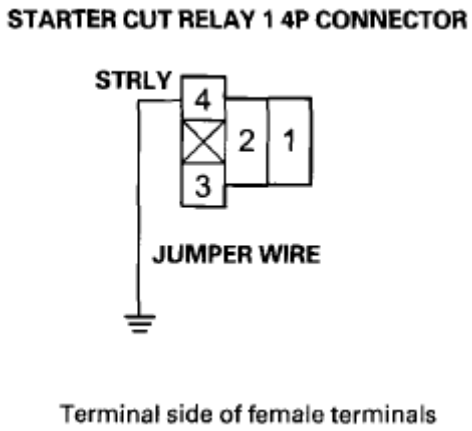

Fig. 99: Connecting Starter Cut Relay 4P Connector Terminal No. 4 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Check for continuity between ECM connector terminal A3 and body ground.

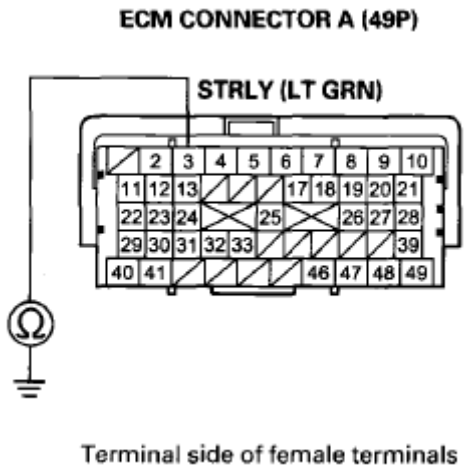

Fig. 100: Checking Continuity Between ECM Connector Terminal A3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Repair open in the wire between the ECM (A3) and starter cut relay 1, then go to step 25.

25. Reconnect all connectors.
26. Press the engine start/stop button to select the ON mode.
27. Reset the ECM with the HDS.
28. Do the ECM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
29. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0615 indicated?

YES - Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, the +B cut relay, and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

30. Reconnect all connectors.
31. Update the **ECM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**).
32. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0615 indicated?

YES - Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, the +B cut relay, and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original **ECM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0615: STARTER CUT RELAY STRLD CIRCUIT MALFUNCTION (A/T)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to the select the ON mode.
2. Check for Pending or Confirmed DTCs with the HDS.

Are DTC P16BD and P0615 indicated at the same time?

YES - Go to the troubleshooting for **DTC P16BD**.

NO - Go to step 3.

3. Clear the DTC with the HDS.
4. Turn the ignition switch to START (III), or press the engine start/stop button to select the START mode, for 1 second or more.
5. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0615 indicated?

YES - Go to step 6.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the PCM. •

6. Try to start engine.

   Does the engine start?

   YES - Go to step 7.

   NO - Go to step 17.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**), then check the No. 8 STRLD (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

   YES - Go to step 9.

   NO - Replace the fuse, then go to step 32.

9. Jump the SCS line with the HDS.
10. Disconnect PCM connector A (49P).
11. Remove starter cut relay 1 (A) from the driver's under-dash fuse/relay box.

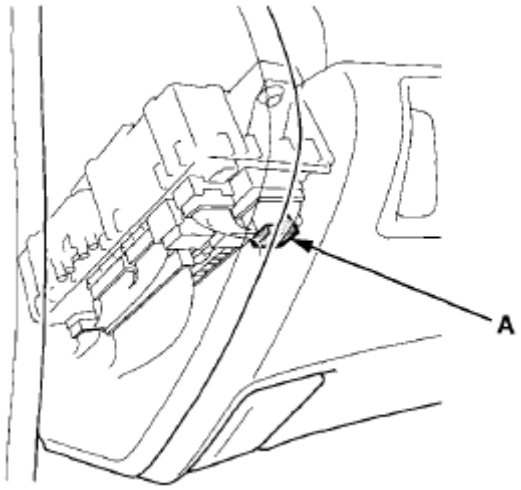

Fig. 101: Identifying Starter Cut Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Connect starter cut relay 1 4P connector terminal No. 1 to body ground with a jumper wire.

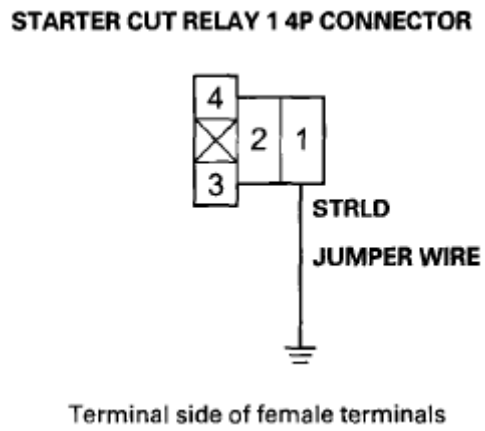

Fig. 102: Connecting Starter Cut Relay 4P Connector Terminal No. 1 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check for continuity between PCM connector terminal A28 and body ground.

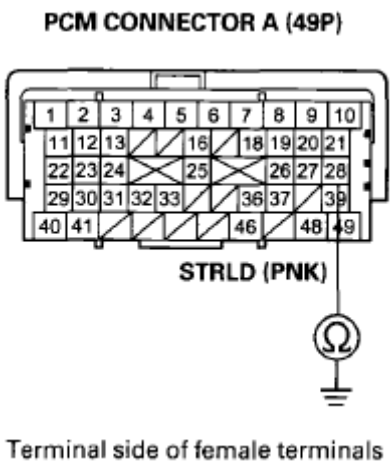

Fig. 103: Checking Continuity Between PCM Connector Terminal A28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 36.

NO - Go to step 14.

14. Disconnect driver's under-dash fuse/relay box connector G(13P).
15. Connect driver's under-dash fuse/relay box connector G (13P) terminal No. 6 to body ground with a jumper wire.

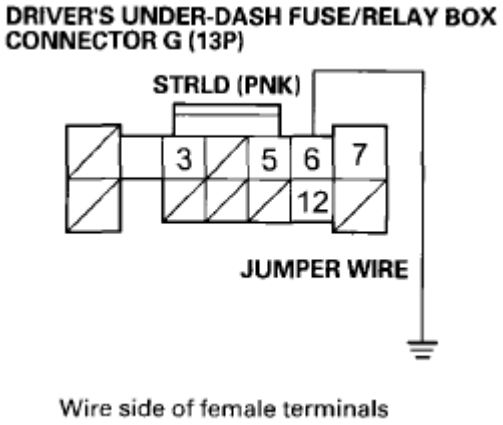

Fig. 104: Connecting Driver's Under-Dash Fuse/Relay Box Connector G (13P) To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Check for continuity between PCM connector terminal A28 and body ground.

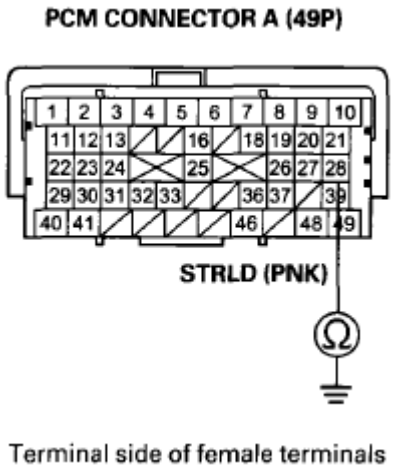

Fig. 105: Checking Continuity Between PCM Connector Terminal A28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**), then go to step 31.

NO - Repair open in the wire between the PCM (A28) and the driver's under-dash fuse/relay box, then go to step 31.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**), then remove starter cut relay 1 (A) from the driver's under-dash fuse/relay box.

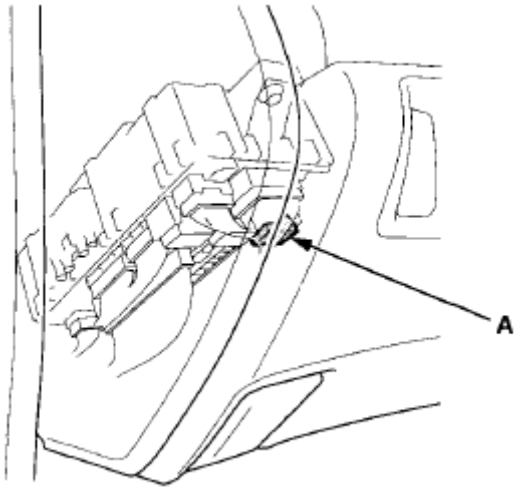

Fig. 106: Identifying Starter Cut Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Remove starter cut relay 2 (A) from the under-hood fuse/relay box.

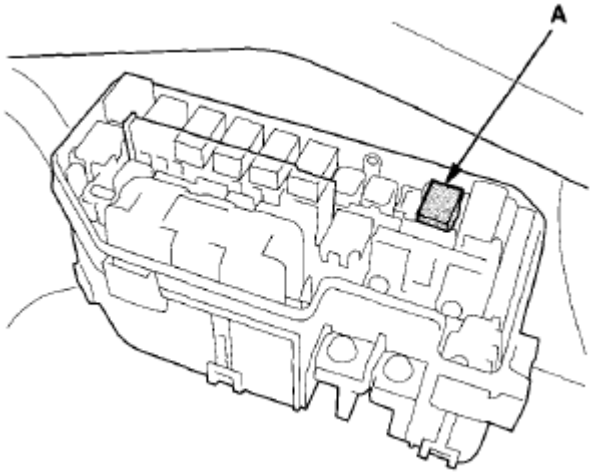

Fig. 107: Identifying Starter Cut Relay 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Connect starter cut relay 1 4P connector terminal No. 4 to body ground with a jumper wire.

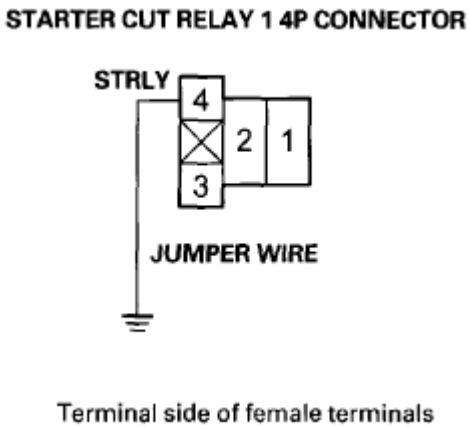

Fig. 108: Connecting Starter Cut Relay 1 4P Connector Terminal No. 4 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Check the STARTER RELAY CONTROL RETURN in the DATA LIST with the HDS while the ignition switch is in START (III) or when you press the engine start/stop button to select the START mode.

    Is OFF indicated?

    YES - Go to step 23.

    NO - Go to step 27.

23. Remove the jumper wire from the starter cut relay 1 4P connector.
24. Turn the ignition switch to LOCK (0).
25. Disconnect the transmission range switch 10P connector (see **TRANSMISSION RANGE SWITCH TEST**).
26. At the switch side, check for continuity between transmission range switch 10P connector terminals No. 2 and No. 6 with the shift lever in N, and then in P.

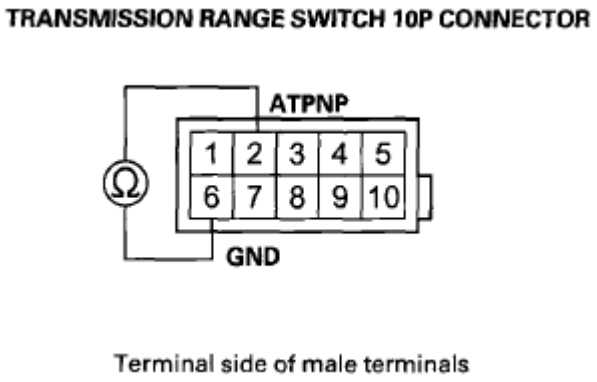

Fig. 109: Checking Continuity Between Transmission Range Switch 10P Connector Terminals No.

2 And No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity in each shift lever position?

YES - Repair open in the wire between the transmission range switch and starter cut relay 1, starter cut relay 2, or G101 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), then go to step 31.

NO - Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH TEST**), then go to step 31.

27. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
28. Jump the SCS line with the HDS.
29. Disconnect PCM connector A (49P).
30. Check for continuity between PCM connector terminal A3 and body ground.

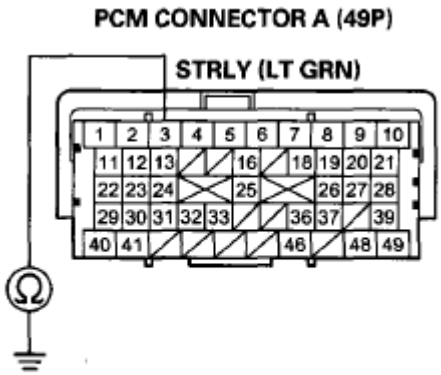

Fig. 110: Checking Continuity Between PCM Connector Terminal A3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 36.

NO - Repair open in the wire between the PCM (A3) and the starter cut relay 1, then go to step 31.

31. Reconnect all connectors.
32. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
33. Reset the PCM with the HDS.
34. Do the PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
35. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0615 indicated?

YES - Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

36. Reconnect all connectors.
37. Update the **PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**).
38. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0615 indicated?

YES - Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original **PCM** (see **ECM/PCM Replacement**), If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P062F: ECM/PCM INTERNAL CONTROL MODULE KEEP ALIVE MEMORY (KAM) ERROR

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

Are any Pending or Confirmed DTCs indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. •

4. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
5. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P062F indicated?

YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0630: VIN NOT PROGRAMMED OR MISMATCH

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This DTC is stored only when the ECM/PCM does not have the VIN information of the vehicle. Use the HDS to input the missing VIN information.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the VIN with the HDS.

   Does the HDS show the vehicle's VIN?

   YES - Go to step 5.

   NO - Go to step 3.

3. Input the VIN to the ECM/PCM with the HDS.

   Does the screen show COMPLETE?

   YES - Go to step 5.

   NO - Go to step 4.

4. Check for DTCs with the HDS.

   Is DTC P062F indicated?

   YES - Go to the **DTC P062F** troubleshooting. •

   NO - Go to step 9.

5. Clear the DTC with the HDS.
6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait 5 seconds.
8. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0630 indicated?

YES - Go to step 9.

NO - Intermittent failure, the system is OK at this time. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

9. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
10. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0630 indicated?

YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0641: SENSOR REFERENCE VOLTAGE A MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0641 indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ECM/PCM and these parts: •

- Throttle body
- EGR valve
- Input shaft (mainshaft) speed sensor
- APP sensor

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the connectors of these parts:
   - Throttle body
   - EGR valve
   - Input shaft (mainshaft) speed sensor

- APP sensor

6. Turn the ignition switch ON (II), or press the engine start/stop button to select the ON mode.
7. Clear the DTC with the HDS.
8. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0641 indicated?

   YES - Go to step 10.

   NO - Go to step 9.

9. Check for Pending or Confirmed DTCs with the HDS while reconnecting these parts, one at a time:
   - Throttle body
   - EGR valve
   - Input shaft (mainshaft) speed sensor
   - APP sensor

   Is DTC P0641 indicated?

   YES - Replace the part that caused the DTC when it was reconnected, then go to step 14.

   NO - Check for poor connections or loose terminals at the ECM/PCM and the following parts, then go to step 1.

   - Throttle body
   - EGR valve
   - Input shaft (mainshaft) speed sensor
   - APP sensor

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connectors A (49P), B (49P), and C (49P).
13. Check for continuity between body ground and ECM/PCM connector terminals A24, B18, and C12 individually.

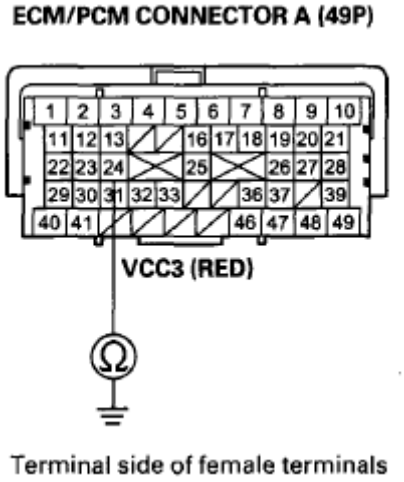

Fig. 111: Checking Continuity Between Body Ground And ECM/PCM Connector Terminals A24
Courtesy of AMERICAN HONDA MOTOR CO., INC.

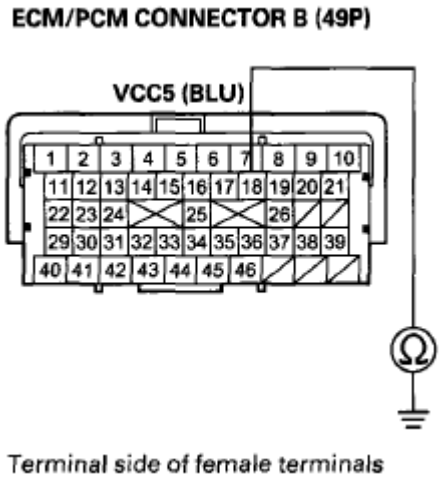

Fig. 112: Checking Continuity Between Body Ground And ECM/PCM Connector Terminals B18
Courtesy of AMERICAN HONDA MOTOR CO., INC.

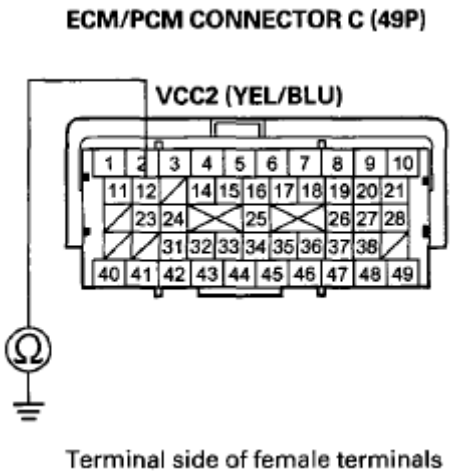

Fig. 113: Checking Continuity Between Body Ground And ECM/PCM Connector Terminals C12
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A24, B18, or C12) and each part that was disconnected in step 5, then go to step 14.

NO - Go to step 20.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Reconnect all connectors.
16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
17. Reset the ECM/PCM with the HDS.
18. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
19. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0641 indicated?

    YES - Check for poor connections or loose terminals at the ECM/PCM and the following parts, then go to step 1.

    - Throttle body
    - EGR valve
    - Input shaft (mainshaft) speed sensor
    - APP sensor

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

20. Reconnect all connectors.

21. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
22. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0641 indicated?

    YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, check for poor connections or loose terminals at the ECM/PCM and the following parts, then go to step 1.

    - Throttle body
    - EGR valve
    - Input shaft (mainshaft) speed sensor
    - APP sensor

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0651: SENSOR REFERENCE VOLTAGE B MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0651 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ECM/PCM and these parts: •

   - MAP sensor
   - Output shaft (countershaft) speed sensor
   - IMT actuator
   - APP sensor
   - FTP sensor
4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the connectors of these parts:

- MAP sensor
- Output shaft (countershaft) speed sensor
- IMT actuator
- APP sensor
- FTP sensor

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Clear the DTC with the HDS.
8. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0651 indicated?

   YES - Go to step 10.

   NO - Go to step 9.

9. Check for Pending or Confirmed DTCs with the HDS while reconnecting these parts, one at a time:
   - MAP sensor
   - Output shaft (countershaft) speed sensor
   - IMT actuator
   - APP sensor
   - FTP sensor 4

   Is DTC P0651 indicated?

   YES - Replace the part that caused the DTC when it was reconnected, then go to step 14.

   NO - Check for poor connections or loose terminals at the ECM/PCM and the following parts, then go to step 1.

   - MAP sensor
   - Output shaft (countershaft) speed sensor
   - IMT actuator
   - APP sensor
   - FTP sensor

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connectors A (49P), B (49P), and C (49P).
13. Check for continuity between body ground and ECM/PCM connector terminals A25, B36, and C11 individually.

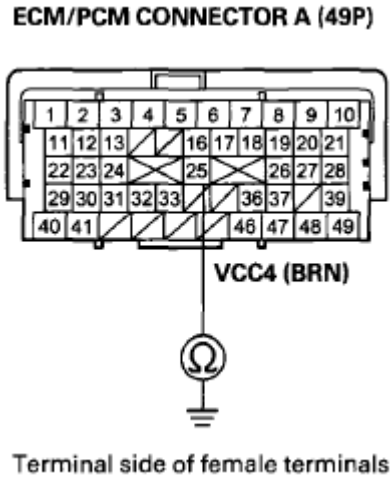

Fig. 114: Checking For Continuity Between Body Ground And ECM/PCM Connector Terminals A25
Courtesy of AMERICAN HONDA MOTOR CO., INC.

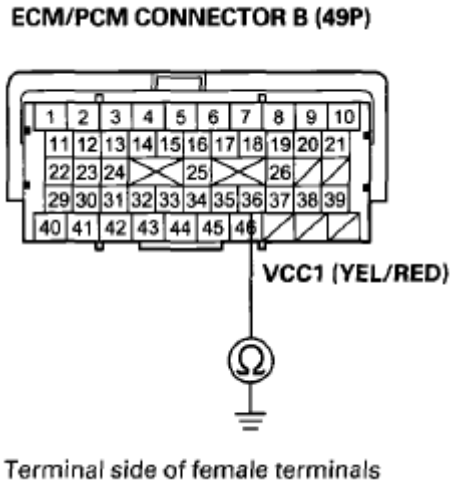

Fig. 115: Checking For Continuity Between Body Ground And ECM/PCM Connector Terminals B36
Courtesy of AMERICAN HONDA MOTOR CO., INC.

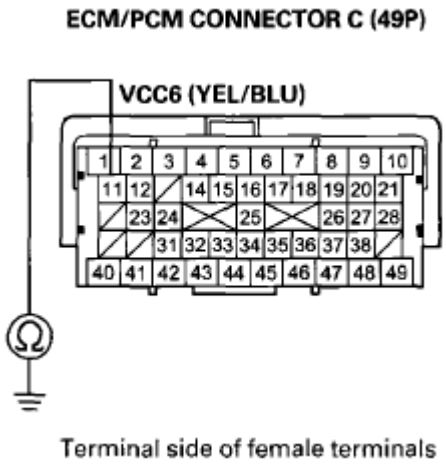

Fig. 116: Checking For Continuity Between Body Ground And ECM/PCM Connector Terminals C11
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A25, B36, or C11) and each part that was disconnected in step 5, then go to step 14.

NO - Go to step 20.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Reconnect all connectors.
16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
17. Reset the ECM/PCM with the HDS.
18. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
19. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0651 indicated?

YES - Check for poor connections or loose terminals at the ECM/PCM and the following parts, then go to step 1.

- MAP sensor
- Output shaft (countershaft) speed sensor
- IMT actuator
- APP sensor
- FTP sensor

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

20. Reconnect all connectors.
21. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
22. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0651 indicated?

    YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, check for poor connections or loose terminals at the ECM/PCM and the following parts, then go to step 1.

    - MAP sensor
    - Output shaft (countershaft) speed sensor
    - IMT actuator
    - APP sensor
    - FTP sensor

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0685: ECM/PCM POWER CONTROL CIRCUIT/INTERNAL CIRCUIT MALFUNCTION

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If the problem doesn't return after you clear the DTC, or if this DTC is stored intermittently, check for loose terminals at the IGP line connectors before replacing the ECM/PCM.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle for 30 seconds.
4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Start the engine, and let it idle for 30 seconds.
6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0685 indicated?

   YES - Go to step 9.

NO - Intermittent failure, the system is OK at this time. •

9. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
10. Start the engine, and let it idle for 30 seconds.
11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Start the engine, and let it idle for 30 seconds.
13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0685 indicated?

YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 10. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0715: INPUT SHAFT (MAINSHAFT) SPEED SENSOR CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Start the engine. Hold the engine speed at 3, 000 RPM without load (in neutral) until the radiator fan comes on, then let it idle.
2. Test-drive several minutes.
3. Check the M SHAFT SPD in the DATA LIST with the HDS.

Is any vehicle speed indicated?

YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the ECM. •

NO - Go to step 4.

4. Press the engine start/stop button to select the OFF mode.
5. Disconnect the input shaft (mainshaft) speed sensor 3P connector.
6. Press the engine start/stop button to select the ON mode.
7. Measure the voltage between input shaft (mainshaft) speed sensor 3P connector terminal No. 1 and body ground.

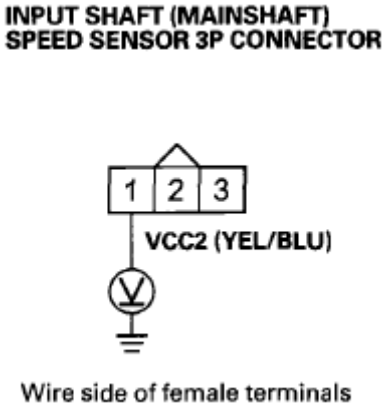

Fig. 117: Measuring Voltage Between Input Shaft Speed Sensor 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 8.

NO - Repair open in the wire between the ECM (C12) and the input shaft (mainshaft) speed sensor, then go to step 18.

8. Measure the voltage between input shaft (mainshaft) speed sensor 3P connector terminal No. 2 and body ground.

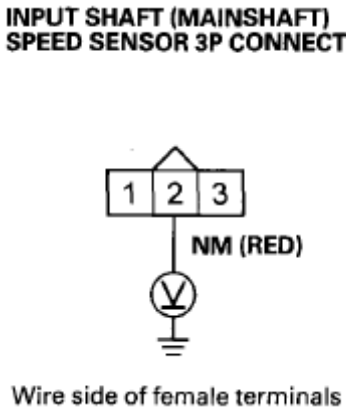

Fig. 118: Measuring Voltage Between Input Shaft Speed Sensor 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 9.

NO - Go to step 10.

9. Measure the voltage between input shaft (mainshaft) speed sensor 3P connector terminals No. 1 and No. 3.

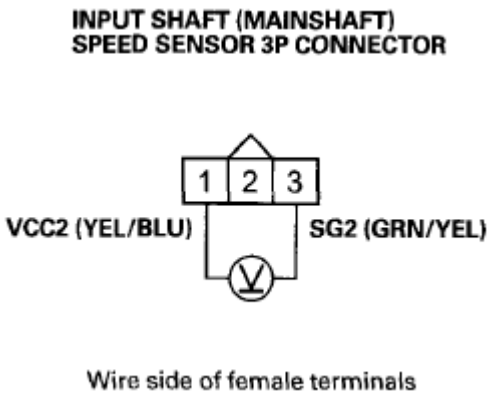

Fig. 119: Measuring Voltage Between Input Shaft Speed Sensor 3P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Repair open in the wire between the ECM (C16) and the input shaft (mainshaft) speed sensor, then go to step 18.

10. Press the engine start/stop button to select the OFF mode.
11. Jump the SCS line with the HDS.
12. Disconnect ECM connector B (49P).
13. Check for continuity between ECM connector terminal B37 and body ground.

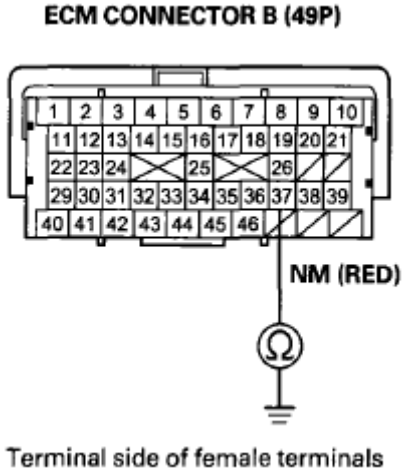

Fig. 120: Checking Continuity Between ECM Connector Terminal B37 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (B37) and the input shaft (mainshaft) speed sensor, then go to step 18.

NO - Go to step 14.

14. Connect input shaft (mainshaft) speed sensor 3P connector terminal No. 2 to body ground with a jumper wire.

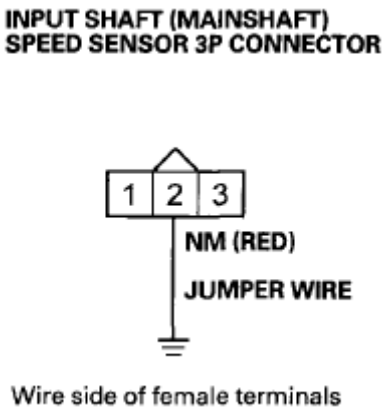

Fig. 121: Connecting Input Shaft Speed Sensor 3P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Check for continuity between ECM connector terminal B37 and body ground.

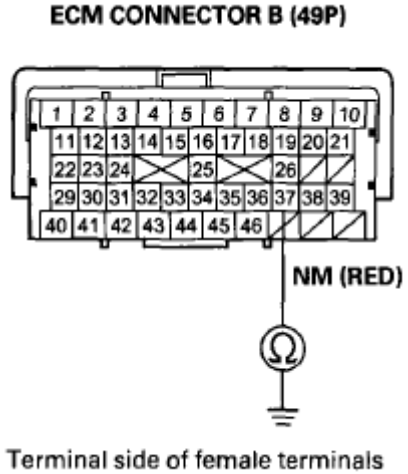

Fig. 122: Checking Continuity Between ECM Connector Terminal B37 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM (B37) and the input shaft (mainshaft) speed sensor, then go to step 18.

16. Press the engine start/stop button to select the OFF mode.
17. Replace the input shaft (mainshaft) speed sensor (see **Input Shaft (Mainshaft) Speed Sensor Replacement**).
18. Reconnect all connectors.
19. Press the engine start/stop button to select the ON mode.
20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 176°F (80°C)
    - Transmission in 5th
    - Engine speed between 2, 000- 3, 000 RPM
    - Drive for several minutes, then decelerate (with the throttle fully closed) for 8 seconds
23. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0715 indicated?

    YES - Check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the ECM, then go to step 1.

    NO - Go to step 24.

24. Monitor the OBD STATUS for DTC P0715 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 23, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 22.

25. Reconnect all connectors.
26. Update the **ECM** if does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**).
27. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 176°F (80°C)
    - Transmission in 5th

- Engine speed between 2, 000- 3, 000 RPM
- Drive for several minutes, then decelerate (with the throttle fully closed) for 8 seconds

28. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0715 indicated?

    YES - Check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**), then go to step 27. If the ECM was substituted, go to step 1.

    NO - Go to step 29.

29. Monitor the OBD STATUS for DTC P0715 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original **ECM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 28, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**), then go to step 27. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 27.

DTC P0720: OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Start the engine. Hold the engine speed at 3, 000 RPM without load (in neutral) until the radiator fan comes on, then let it idle.
2. Test-drive several minutes.
3. Check the C SHAFT SPD in the DATA LIST with the HDS.

    Is any vehicle speed indicated?

    YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM. •

    NO - Go to step 4.

4. Press the engine start/step button to select the OFF mode.
5. Disconnect the output shaft (countershaft) speed sensor 3P connector.

6. Press the engine start/stop button to select the ON mode.
7. Measure the voltage between output shaft (countershaft) speed sensor 3P connector terminal No. 1 and body ground.

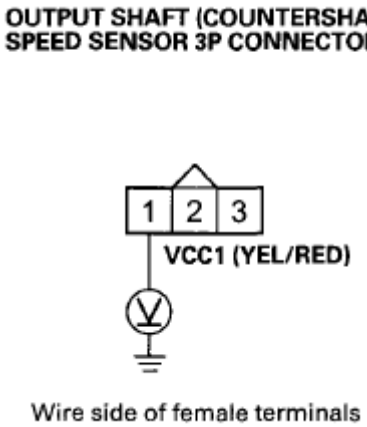

Fig. 123: Measuring Voltage Between Output Shaft Speed Sensor 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 8.

NO - Repair open in the wire between the ECM (B36) and the output shaft (countershaft) speed sensor, then go to step 18.

8. Measure the voltage between output shaft (countershaft) speed sensor 3P connector terminal No. 2 and body ground.

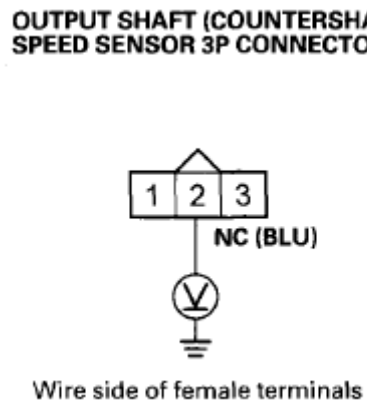

Fig. 124: Measuring Voltage Between Output Shaft Speed Sensor 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 9.

NO - Go to step 10.

9. Measure the voltage between output shaft (countershaft) speed sensor 3P connector terminals No. 1 and No. 3.

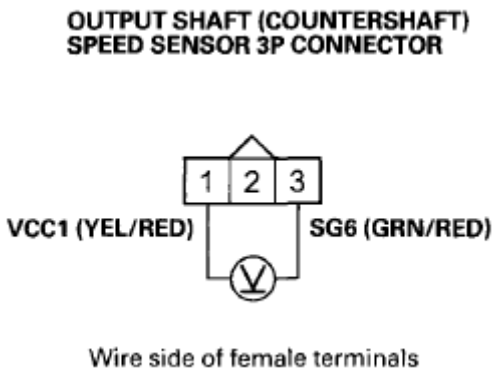

Fig. 125: Measuring Voltage Between Output Shaft Speed Sensor 3P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 16.

NO - Repair open in the wire between the ECM (C15) and the output shaft (countershaft) speed sensor, then go to step 18.

10. Press the engine start/stop button to select the OFF mode.
11. Jump the SCS line with the HDS.
12. Disconnect ECM connector B (49P).
13. Check for continuity between ECM connector terminal B38 and body ground.

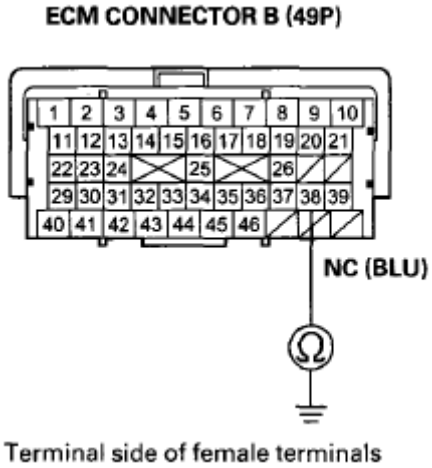

Fig. 126: Checking Continuity Between ECM Connector Terminal B38 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (B38) and the output shaft (countershaft) speed sensor, then go to step 18.

NO - Go to step 14.

14. Connect output shaft (countershaft) speed sensor 3P connector terminal No. 2 to body ground with a jumper wire.

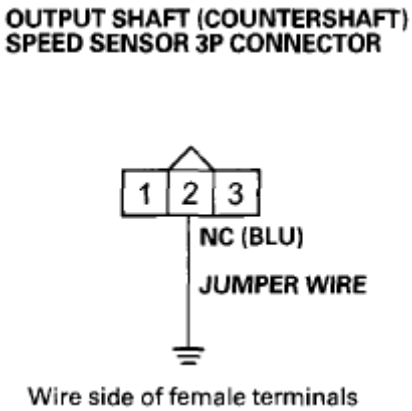

Fig. 127: Connecting Output Shaft Speed Sensor 3P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Check for continuity between ECM connector terminal B38 and body ground.

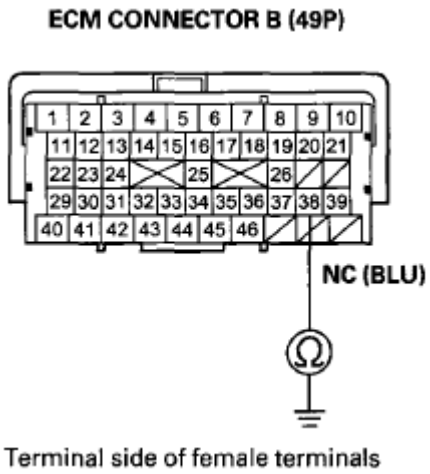

Fig. 128: Checking Continuity Between ECM Connector Terminal B38 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - Repair open in the wire between the ECM (B38) and the output shaft (countershaft) speed sensor, then go to step 18.

16. Press the engine start/stop button to select the OFF mode.
17. Replace the **output shaft (countershaft) speed sensor**.
18. Reconnect all connectors.
19. Press the engine start/stop button to select the ON mode.
20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 176°F (80°C)
    - Transmission in 5th
    - Engine speed between 2, 000- 3, 000 RPM
    - Drive for several minutes, then decelerate (with the throttle fully closed) for 8 seconds
23. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0720 indicated?

    YES - Check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM, then go to step 1.

    NO - Go to step 24.

24. Monitor the OBD STATUS for DTC P0720 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 23, go to the indicated DTC's troubleshooting. •

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 22.

25. Reconnect the all connectors.
26. Update the **ECM** if does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**).
27. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 176°F (80°C)
    - Transmission in 5th
    - Engine speed between 2, 000- 3, 000 RPM
    - Drive for several minutes, then decelerate (with the throttle fully closed) for 8 seconds
28. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0720 indicated?

    YES - Check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**), then go to step 27. If the ECM was substituted, go to step 1.

    NO - Go to step 29.

29. Monitor the OBD STATUS for DTC P0720 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original **ECM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 28, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the output shaft (countershaft) speed sensor and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**), then go to step 27. If the ECM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 27.

DTC P0831: CLUTCH PEDAL POSITION SWITCH A CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check the CLUTCH PEDAL POSITION SWITCH A in the DATA LIST with the HDS.

   Is CLOSE indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at clutch pedal position switch A and the ECM, and check the installation of clutch pedal position switch A.
   •

4. Check clutch pedal position switch A.

   Is it damaged or loose?

   YES - Repair or replace clutch pedal position switch A, then go to step 11.

   NO - Go to step 5.

5. Disconnect the clutch pedal position switch A 2P connector.
6. Check the CLUTCH PEDAL POSITION SWITCH A in the DATA LIST with the HDS.

   Is OPEN indicated?

   YES - Replace clutch pedal position switch A (see **CLUTCH PEDAL POSITION SWITCH A TEST**), then go to step 11.

   NO - Go to step 7.

7. Press the engine start/stop button to select the OFF mode.
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (49P).
10. Check for continuity between the clutch pedal position switch A 2P connector terminal No. 1 and body ground.

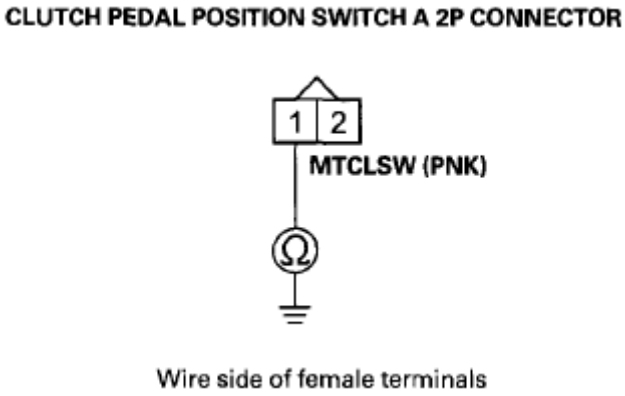

Fig. 129: Checking Continuity Between Clutch Pedal Position Switch A 2P Connector And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between clutch pedal position switch A and the ECM (A17), then go to step 11.

NO - Go to step 16.

11. Reconnect all connectors.
12. Press the engine start/stop button to select the ON mode.
13. Reset the ECM with the HDS.
14. Do the ECM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
15. Check the CLUTCH PEDAL POSITION SWITCH A in the DATA LIST with the HDS.

Is CLOSE indicated?

YES - Check for poor connections or loose terminals at clutch pedal position switch A and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

16. Reconnect all connectors.
17. Update the **ECM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**).
18. Check the CLUTCH PEDAL POSITION SWITCH A in the DATA LIST with the HDS.

Is CLOSE indicated?

YES - Check for poor connections or loose terminals at clutch pedal position switch A and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**), then

recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original **ECM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P0835: CLUTCH PEDAL POSITION SWITCH B CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snap shot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check the CLUTCH PEDAL POSITION SWITCH B in the DATA LIST with the HDS.

   Is OPEN indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at clutch pedal position switch B and the ECM, and check the installation of the clutch pedal position switch B.

4. Check clutch pedal position switch B.

   Is it damaged or loose?

   YES - Repair or replace clutch pedal position switch B, then go to step 14.

   NO - Go to step 5.

5. Disconnect the clutch pedal position switch B 3P connector.
6. Connect the clutch pedal position switch B 3P connector terminal No. 2 and No. 3 with a jumper wire.

CLUTCH PEDAL POSITION SWITCH B 3P CONNECTOR

Wire side of female terminals

Fig. 130: Connecting Clutch Pedal Position Switch B 3P Connector Terminal No. 2 And No. 3 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Check the CLUTCH PEDAL POSITION SWITCH B in the DATA LIST with the HDS.

   Is OPEN indicated?

   YES - Go to step 8.

   NO - Replace clutch pedal position switch B (see **CLUTCH PEDAL POSITION SWITCH B TEST**), then go to step 14.

8. Connect the clutch pedal position switch B 3P connector terminal No. 2 to body ground with a jumper wire.

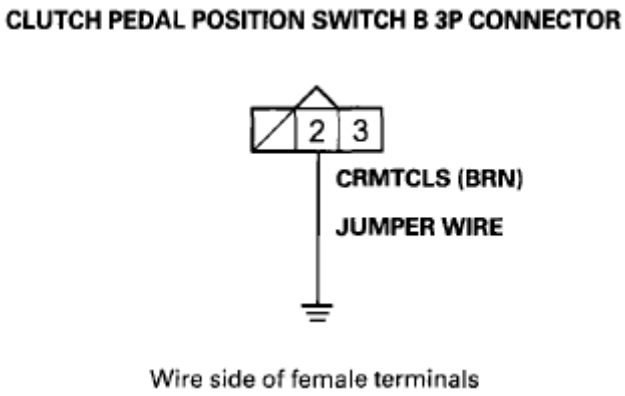

Fig. 131: Connecting Clutch Pedal Position Switch B 3P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Check the CLUTCH PEDAL POSITION SWITCH B in the DATA LIST with the HDS.

   Is OPEN indicated?

   YES - Go to step 10.

   NO - Repair open in the wire between clutch pedal position switch B and the G301 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), then go to step 14.

10. Press the engine start/stop button to select the OFF mode.
11. Jump the SCS line with the HDS.
12. Disconnect ECM connector A (49P).
13. Check for continuity between ECM connector terminal A47 and body ground.

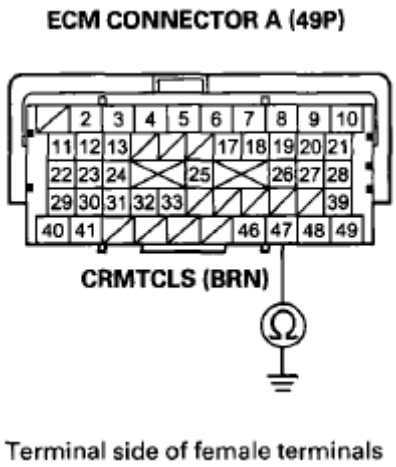

Fig. 132: Checking Continuity Between ECM Connector Terminal A47 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair open in the wire between clutch pedal position switch B and the ECM (A47), then go to step 14.

14. Reconnect all connectors.
15. Press the engine start/stop button to select the ON mode.
16. Reset the ECM with the HDS.
17. Do the ECM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check the CLUTCH PEDAL POSITION SWITCH B in the DATA LIST with the HDS.

    Is OPEN indicated?

    YES - Check for poor connections or loose terminals at clutch pedal position switch B and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

19. Reconnect all connectors.
20. Update the **ECM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**).
21. Check the CLUTCH PEDAL POSITION SWITCH B in the DATA LIST with the HDS.

    Is OPEN indicated?

    YES - Check for poor connections or loose terminals at clutch pedal position switch B and the ECM. If

the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original **ECM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P1116: ECT SENSOR 1 CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0111 is stored at the same time as DTC P1116, troubleshoot DTC P0111 first, then recheck for DTC P1116.**

1. Check for poor connections or loose terminals at ECT sensor 1 and ECT sensor 2.

   Are the connections and the terminals OK?

   YES - Go to step 2.

   NO - Repair the connectors or terminals, then go to step 21.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Check for Pending or Confirmed DTCs with the HDS.

   Are DTC P1116 and P2183 indicated at the same time?

   YES - Go to step 12.

   NO - Go to step 4.

4. Start the engine, and let it idle for 10 minutes.
5. Check ECT SENSOR 1 in the DATA LIST with the HDS.

   Is about 108°F (42°C) or less indicated?

   YES - Replace **ECT sensor 1**, then go to step 21.

   NO - Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Allow ECT sensor 1 to cool to the ambient temperature.
8. Note the ambient temperature.
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

10. Quickly note the value of ECT SENSOR 1 in the DATA LIST with the HDS.
11. Compare the value of ECT SENSOR 1 to the ambient temperature.

    Does the value of ECT SENSOR 1 differ 5.4°F (3°C) or more from ambient temperature?

    YES - Replace **ECT sensor 1**, then go to step 21.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. •

12. Start the engine, and let it idle for 10 minutes.
13. Check ECT SENSOR 1 in the DATA LIST with the HDS.

    Is about 108°F (42°C) or less indicated?

    YES - Replace **ECT sensor 1**, then go to step 21.

    NO - Go to step 14.

14. Check ECT SENSOR 2 in the DATA LIST with the HDS.

    Is about 108°F (42°C) or less indicated?

    YES - Replace **ECT sensor 2**, then go to step 21.

    NO - Go to step 15.

15. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
16. Allow ECT sensor 1 and ECT sensor 2 to cool to the ambient temperature.
17. Note the ambient temperature.
18. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
19. Quickly note the value of ECT SENSOR 1 and ECT SENSOR 2 in the DATA LIST with the HDS.
20. Compare the value of ECT SENSOR 1 and the ambient temperature, and the value of ECT SENSOR 2 and the ambient temperature individually.

    Does either sensor differ more than 5.4°F (3°C) from the ambient temperature?

    YES - Replace the sensor that differed more than 5.4 CF (3°C) from the ambient temperature. Refill the cooling system (see **COOLANT REPLACEMENT**), then go to step 21.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. •

21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Reset the ECM/PCM with the HDS.

23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1116 indicated?

    YES - Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P1128: MAP SENSOR SIGNAL LOWER THAN EXPECTED

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before starting this troubleshooting, check for poor connections or a blockage at the intake air duct.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is less than 54.1 kPa (16.0 inHg, 406 mmHg) or 1.61 V held for more than 5 seconds?

   YES - Go to step 7.

   NO - Go to step 3.

3. Clear the DTC with the HDS.
4. Start the engine. Hold the engine speed at 3, 000 RPM without load (AT in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
5. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - Engine speed about 1, 200 RPM or more
   - A/T in D, or M/T in 3rd
   - Vehicle speed about 25 mph (40 km/h) or more under half throttle
6. Monitor the OBD STATUS for DTC P1128 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 7.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM. If the screen indicates NOT

COMPLETED, go to step 4 and recheck.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Replace the **MAP sensor**.
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Reset the ECM/PCM with the HDS.
11. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
12. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
13. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - Engine speed about 1, 200 RPM or more
    - A/T in D, or M/T in 3rd
    - Vehicle speed about 25 mph (40 km/h) or more under half throttle
14. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1128 indicated?

    YES - Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1.

    NO - Go to step 15.

15. Monitor the OBD STATUS for DTC P1128 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 14, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 12.

DTC P1129: MAP SENSOR SIGNAL HIGHER THAN EXPECTED

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check for vacuum leaks at these parts:
    - PCV valve
    - PCV hose
    - EVAP canister purge valve

- Throttle body
- Intake manifold
- Brake booster
- Brake booster hose

Are there any vacuum leaks?

YES - Repair or replace the part(s) with vacuum leaks, then go to step 9.

NO - Go to step 2.

2. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
3. Check the MAP SENSOR in the DATA LIST with the HDS.

   Is there more than 36.9 kPa (11.0 inHg, 277 mmHg), or 1.14 V held for more than 5 seconds?

   YES - Go to step 7.

   NO - Go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - Engine speed between 1, 200 and 5, 900 RPM
   - A/T in D, or M/T in 5th
   - Drive at a steady speed between 55- 75 mph (88-120 km/h) for 10 seconds, then decelerate (with the throttle fully closed) for 5 seconds
6. Monitor the OBD STATUS for DTC P1129 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 7.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM. If the screen indicates NOT COMPLETED, go to step 5 and recheck.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Replace the **MAP sensor**.
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Reset the ECM/PCM with the HDS.
11. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).

12. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or IM, M/T in neutral) until the radiator fan comes on, then let it idle.
13. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - Engine speed between 1, 200 and 5, 900 RPM
    - A/T in D, or M/T in 5th
    - Drive at a steady speed between 55- 75 mph (88- 120 km/h) for 10 seconds, then decelerate (with the throttle fully closed) for 5 seconds
14. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1129 indicated?

    YES - Check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1.

    NO - Go to step 15.

15. Monitor the OBD STATUS for DTC P1129 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 14, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the MAP sensor and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 12.

DTC P1172: REAR A/F SENSOR (BANK 1, SENSOR 1) CIRCUIT OUT OF RANGE HIGH; DTC P1174: FRONT A/F SENSOR (BANK 2, SENSOR 1) CIRCUIT OUT OF RANGE HIGH

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Monitor the OBD STATUS for P1172 and/or P1174* in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 5.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Replace the **A/F sensor (Sensor 1)**.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
10. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
11. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1172 and/or P1174 indicated?*

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1.

    NO - Go to step 12.

12. Monitor the OBD STATUS for DTC P1172 and/or P1174* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 11, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING keep idling until a result comes on. If the screen indicates OUT OF CONDITION, go to step 10.

DTC P1297: ELD CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the ELD in the DATA LIST with the HDS.

   Is 72 A or more indicated?

   YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ELD and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the ELD 3P connector.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Check the ELD in the DATA LIST with the HDS.

Is 72 A or more indicated?

YES - Go to step 7.

NO - Go to step 11.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (49P).
10. Check for continuity between ECM/PCM connector terminal A10 and body ground.

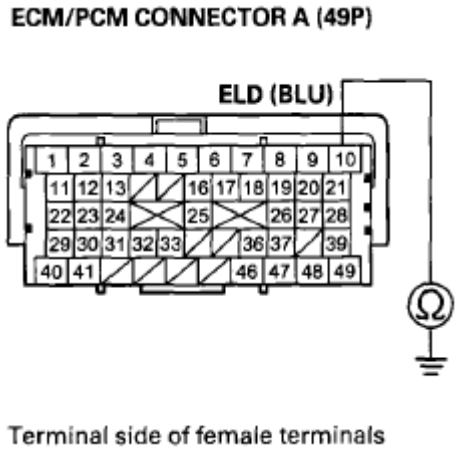

Fig. 133: Checking Continuity Between ECM/PCM Connector Terminal A10 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A10) and the ELD, then go to step 13.

NO - Go to step 20.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Replace the **ELD**.
13. Reconnect all connectors.
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Start the engine.
18. Turn on the headlights.
19. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1297 indicated?

    YES - Check for poor connections or loose terminals at the ELD and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

20. Reconnect all connectors.
21. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
22. Start the engine.
23. Turn on the headlights.
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1297 indicated?

    YES - Check for poor connections or loose terminals at the ELD and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 22. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P1298: ELD CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Start the engine, and let it idle.
2. Check the ELD in the DATA LIST with the HDS.

   Is 0.2 A or less indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at

the ELD and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the ELD 3P connector.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Measure the voltage between ELD 3P connector terminal No. 1 and body ground.

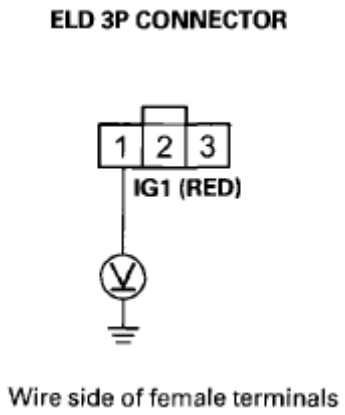

Fig. 134: Measuring Voltage Between ELD 3P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 7.

NO - Repair open in the wire between the No. 13 ACG (15 A) fuse in the driver's under-dash fuse/relay box and the ELD, then go to step 13.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (49P).
10. Check for continuity between ECM/PCM connector terminal A10 and ELD 3P connector terminal No. 3.

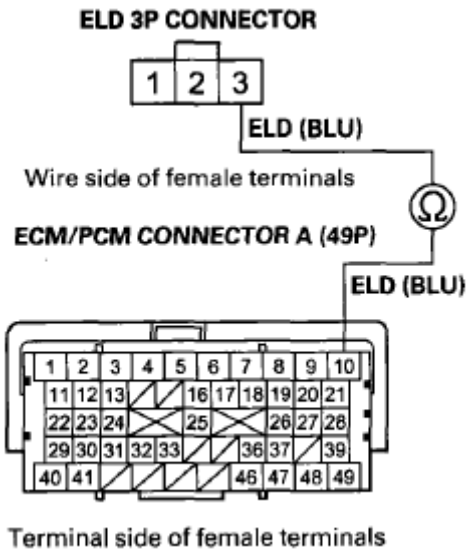

Fig. 135: Checking Continuity Between ECM/PCM Connector Terminal A10 And ELD 3P Connector Terminal No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between the ECM/PCM (A10) and the ELD, then go to step 13.

11. Check for continuity between ELD 3P connector terminal No. 2 and body ground.

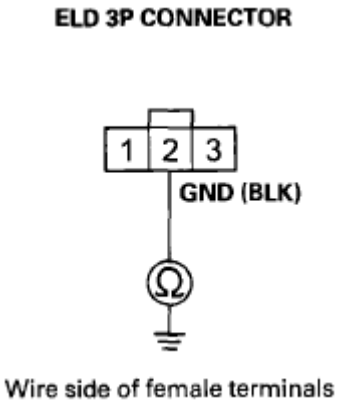

Fig. 136: Checking Continuity Between ELD 3P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 12.

NO - Repair open in the wire between the ELD and G301 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), then go to step 13.

12. Replace the ELD (see **ELD Replacement**).
13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
16. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1298 indicated?

    YES - Check for poor connections or loose terminals at the ELD and the ECM/PCM, then go to step 17.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

17. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
18. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1298 indicated?

    YES - Check for poor connections or loose terminals at the ELD and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P1549: CHARGING SYSTEM HIGH VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If a high voltage battery (24 V, etc.) is connected to the vehicle, this DTC can be stored.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check under these conditions:
   - A/C off
   - Headlights off

- Rear window defogger off

5. Hold the engine speed at 2, 000 RPM (A/T in P or N, M/T in neutral) 1 minute.
6. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P1549 indicated?

   YES - Replace the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**), then go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box. •

7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
10. Start the engine.
11. Check under these conditions:
    - A/C off
    - Headlights off
    - Rear window defogger off
12. Hold the engine speed at 2, 000 RPM (A/T in P or N, M/T in neutral) 1 minute.
13. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P1549 indicated?

    YES - Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P16BB: ALTERNATOR B TERMINAL CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check under these conditions:
   - A/C on
   - Temperature control at maximum cool

- Blower fan at maximum speed
- Headlights on high beam
- Rear window defogger on

5. Hold the engine speed at 2, 000 RPM (A/T in P or N, M/T in neutral) 1 minute.
6. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P16BB indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, and check the battery performance (see **BATTERY TEST**). •

7. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box

   Are the connections and terminals OK?

   YES - Go to step 8.

   NO - Repair the connections or the terminals, then go to step 9.

8. Check for an open in the wire between the alternator and the under-hood fuse/relay box at the engine harness.

   Is the harness OK?

   YES - Replace the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**), then go to step 9.

   NO - Repair open in the wire between the alternator and the under-hood fuse/relay box, then go to step 9.

9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Reset the ECM/PCM with the HDS.
11. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
12. Start the engine.
13. Check under these conditions:
    - A/C on
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Headlights on high beam
    - Rear window defogger on
14. Hold the engine speed at 2, 000 RPM (A/T in P or N, M/T in neutral) 1 minute.

15. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P16BB indicated?

    YES - Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P16BC: ALTERNATOR FR TERMINAL CIRCUIT/IGP CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check for poor connections or loose terminals at the alternator 4P connector.

   Are the connections and terminals OK?

   YES - Go to step 2.

   NO - Repair the connections or terminals, then go to step 18.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Clear the DTC with the HDS.
4. Start the engine.
5. Check under these conditions:
   - A/C on
   - Temperature control at maximum cool
   - Blower fan at maximum speed
   - Headlights on high beam
   - Rear window defogger on
6. Hold the engine speed at 2, 000 RPM (A/T in P or N, M/T in neutral) for 1 minute.
7. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P16BC indicated?

   YES - Go to step 8.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator. •

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

9. Disconnect the alternator 4P connector.
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Measure the voltage between alternator 4P connector terminal No. 1 and body ground.

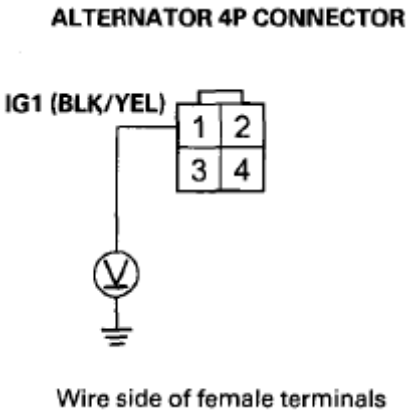

Fig. 137: Measuring Voltage Between Alternator 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 12.

NO - Repair open in the wire between the alternator (IG1 line) and the No. 13 ACG (15 A) fuse in the driver's under-dash fuse/relay box, then go to step 17.

12. Measure the voltage between alternator 4P connector terminal No. 4 and body ground.

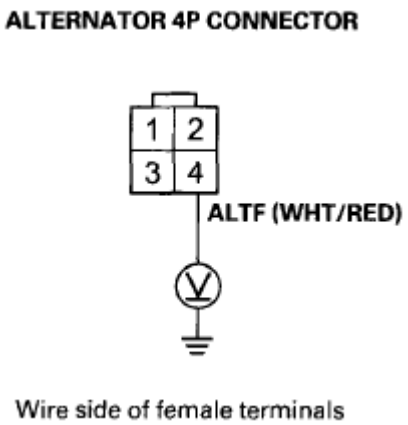

Fig. 138: Measuring Voltage Between Alternator 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Replace the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**), then go to

step 17.

NO - Go to step 13.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Jump the SCS line with the HDS.
15. Disconnect ECM/PCM connector C (49P).
16. Check for continuity between alternator 4P connector terminal No. 4 and ECM/PCM connector terminal C44.

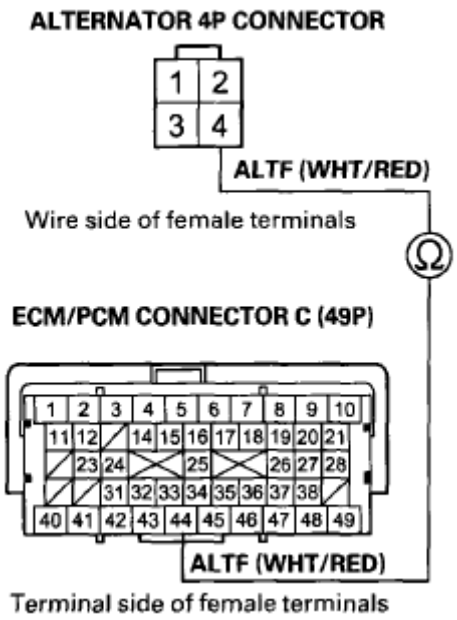

Fig. 139: Checking Continuity Between Alternator 4P Connector Terminal No. 4 And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 26.

NO - Repair open in the wire between the ECM/PCM (C44) and the alternator, then go to step 18.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Reconnect all connectors.
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Start the engine.
23. Check under these conditions:

- A/C on
- Temperature control at maximum cool
- Blower fan at maximum speed
- Headlights on high beam
- Rear window defogger on

24. Hold the engine speed at 2, 000 RPM (A/T in P or N, M/T in neutral) for 1 minute.
25. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P16BC indicated?

    YES - Check for poor connections or loose terminals at the alternator and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

26. Reconnect all connectors.
27. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
28. Start the engine.
29. Check under these conditions:
    - A/C on
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Headlights on high beam
    - Rear window defogger on
30. Hold the engine speed at 2, 000 RPM (A/T in P or N, M/T in neutral) for 1 minute.
31. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P16BC indicated?

    YES - Check for poor connections or loose terminals at the alternator and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 28. If the ECM/PCM was substituted, go to step 1.

    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P16BD: STARTER CUT RELAY 2 MALFUNCTION (M/T)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL

TROUBLESHOOTING INFORMATION).

1. Press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

   Is 2.2 V or less indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at starter cut relay 1, starter cut relay 2, and the ECM. •

4. Try to start engine.

   Does the engine start?

   YES - Go to step 5.

   NO - Go to step 13.

5. Press the engine start/stop button to select the OFF mode.
6. Check the No. 8 STRLD (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

   YES - Replace starter cut relay 2, then go to step 17.

   NO - Go to step 7.

7. Remove the blown fuse the driver's under-dash fuse/relay box.
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (49P).
10. Check for continuity between the ECM connector terminal A28 and body ground.

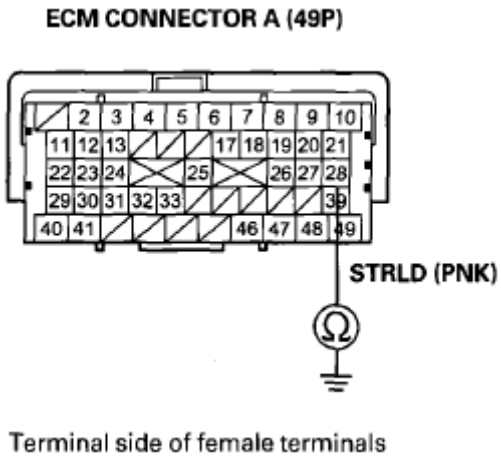

Fig. 140: Checking Continuity Between ECM Connector Terminal A28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Replace the No. 8 STRLD (7.5 A) fuse, then go to step 22.

11. Disconnect driver's under-dash fuse/relay box connector G (13P).
12. Check for continuity between the ECM connector terminal A28 and the body ground.

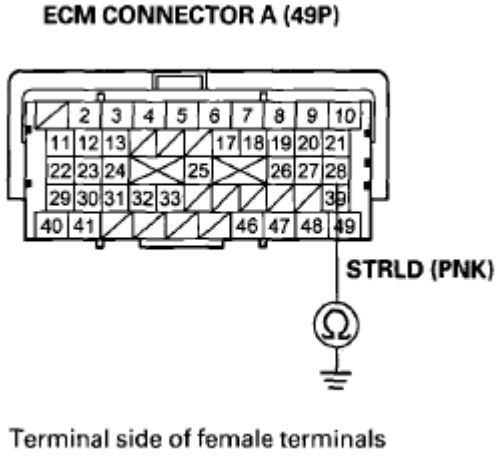

Fig. 141: Checking Continuity Between ECM Connector Terminal A28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM (A28) and the driver's under-dash fuse/relay box, then go to step 17.

NO - Replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**), then go to step 17.

13. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**), then remove starter cut relay 1 (A) from the driver's under-dash fuse/relay box.

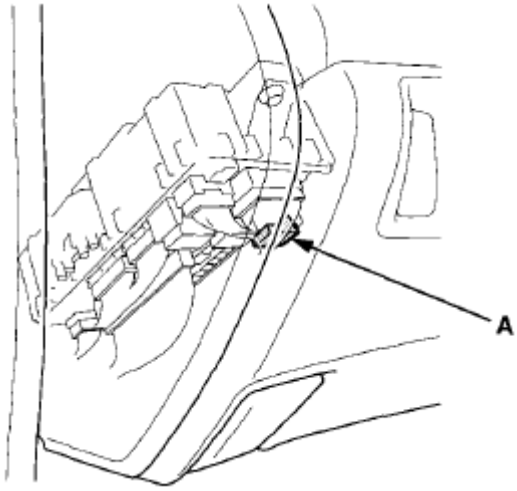

Fig. 142: Identifying Starter Cut Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

    Is 2.2 V or less indicated?

    YES - Go to step 15.

    NO - Replace starter cut relay 1, then go to step 17.

15. Disconnect driver's under-dash fuse/relay box connectors F (33P) and G (13P).
16. Check for continuity between starter cut relay 1 4P connector terminal No. 1 and body ground.

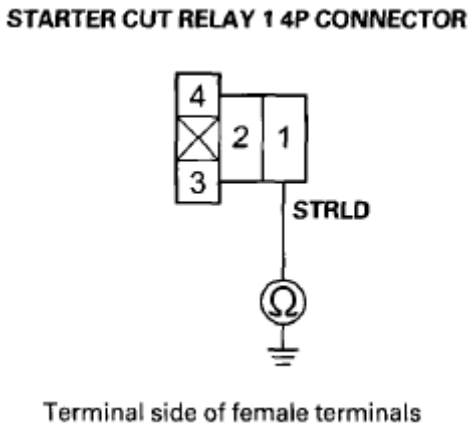

Fig. 143: Checking Continuity Between Starter Cut Relay 1 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**), then go to step 17.

NO - Repair short in the wire between the driver's under-dash fuse/relay box and the under-hood fuse/relay box (starter cut relay 2), then go to step 17.

17. Reconnect all connectors.
18. Press the engine start/stop button to select the ON mode.
19. Reset the ECM with the HDS.
20. Do the ECM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
21. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P16BD indicated?

    YES - Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

22. Reconnect all connectors.
23. Update the ECM if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**).
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P16BD indicated?

YES - Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM was substituted, go to step 1.

NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original **ECM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P16BD: STARTER CUT RELAY 2 MALFUNCTION (A/T)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

   Is 2.2 V or less indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the PCM. •

4. Try to start engine.

   Does the engine start?

   YES - Go to step 5.

   NO - Go to step 13.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check the No. 8 STRLD (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

   YES - Replace starter cut relay 2, then go to step 20.

   NO - Go to step 7.

7. Remove the blown fuse from the driver's under-dash fuse/relay box.
8. Jump the SCS line with the HDS.
9. Disconnect PCM connector A (49P).

10. Check for continuity between the PCM connector terminal A28 and body ground.

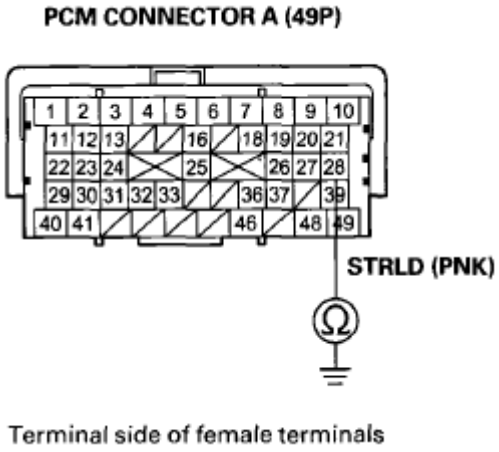

Fig. 144: Checking Continuity Between PCM Connector Terminal A28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Replace the No. 8 STRLD (7.5 A) fuse, then go to step 25.

11. Disconnect driver's under-dash fuse/relay box connector G (13P).
12. Check for continuity between the PCM connector terminal A28 and the body ground.

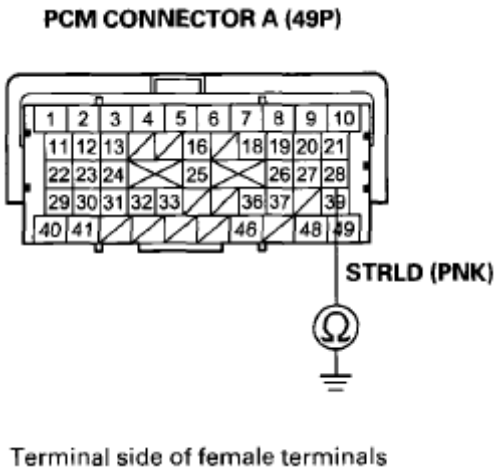

Fig. 145: Checking Continuity Between PCM Connector Terminal A28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the PCM (A28) and the driver's under-dash fuse/relay box. Also

replace the No. 8 STRLD (7.5 A) fuse, then go to step 20.

NO - Replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**), then go to step 20.

13. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**), then remove starter cut relay 1 (A) from the driver's under-dash fuse/relay box.

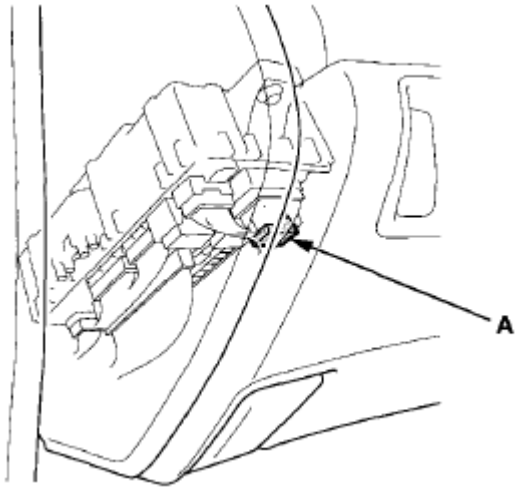

Fig. 146: Identifying Starter Cut Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

Is 2.2 V or less indicated?

YES - Go to step 15.

NO - Replace starter cut relay 1, then go to step 20.

15. Remove the starter cut relay 2 (A) from the under-hood fuse/relay box.

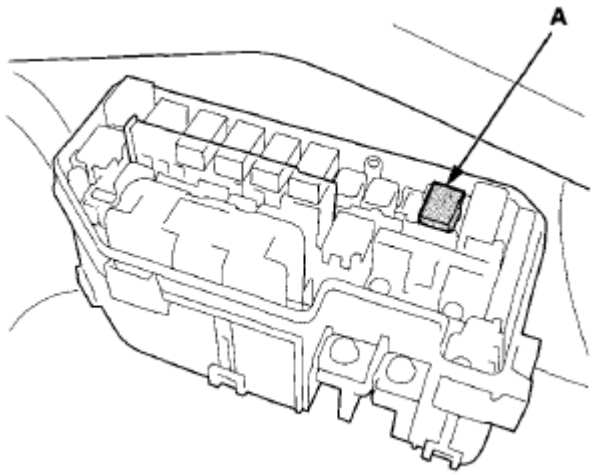

Fig. 147: Identifying Starter Cut Relay 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

    Is 2.2 V or less indicated?

    YES - Go to step 17.

    NO - Replace starter cut relay 2, then go to step 20.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Disconnect driver's under-dash fuse/relay box connectors F (33P) and G (13P).
19. Check for continuity between starter cut relay 1 4P connector terminal No. 1 and body ground.

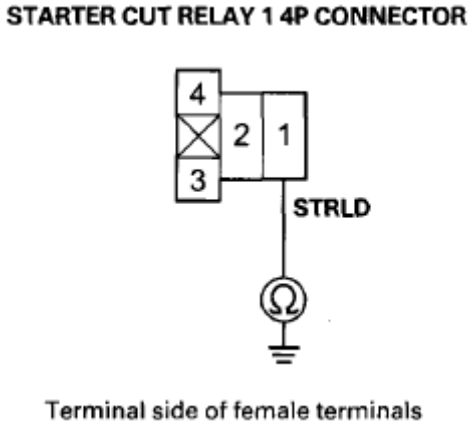

Fig. 148: Checking Continuity Between Starter Cut Relay 1 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**), then go to step 20.

NO - Repair short in the wire between the driver's under-dash fuse/relay box and the under-hood fuse/relay box (starter cut relay 2), then go to step 20.

20. Reconnect all connectors.
21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Reset the PCM with the HDS.
23. Do the PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P16BD indicated?

    YES - Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

25. Reconnect all connectors.
26. Update the **PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**).
27. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P16BD indicated?

    YES - Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the PCM was substituted, go to step 1.

    NO - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original **PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P16BE: STARTER CUT RELAY 1 MALFUNCTION (M/T)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

Is 3.0 V or more indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the ECM. •

4. Remove the No. 8 STRLD (7.5 A) fuse from the driver's under-dash fuse/relay box.
5. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

Is 3.0 V or more indicated?

YES - Go to step 6.

NO - Go to step 13.

6. Press the engine start/stop button to select the OFF mode.
7. Jump the SCS line with the HDS.
8. Disconnect ECM connector A (49P).
9. Press the engine start/stop button to select the ON mode.
10. Measure the voltage between ECM connector terminal A28 and body ground.

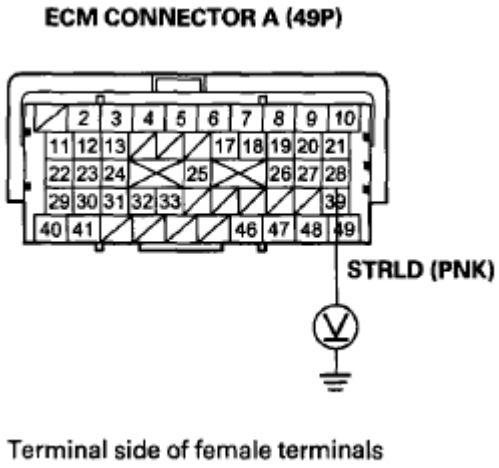

Fig. 149: Measuring Voltage Between ECM Connector Terminal A28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 3.0 V or more?

YES - Go to step 11.

NO - Reinstall the No. 8 STRLD (7.5 A) fuse, then go to step 23.

11. Disconnect driver's under-dash fuse/relay box connector G (13P).

12. Measure the voltage between ECM connector terminal A28 and body ground.

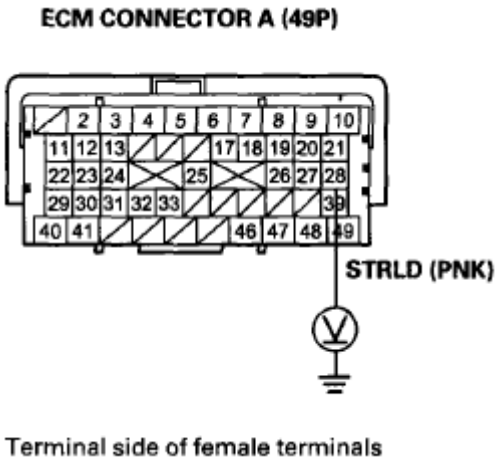

Fig. 150: Measuring Voltage Between ECM Connector Terminal A28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 3.0 V or more?

YES - Repair short to power in the wire between the driver's under-dash fuse/relay box and the ECM (A28), then go to step 18.

NO - Replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**), then go to step 18.

13. Remove starter cut relay 1 from the driver's under-dash fuse/relay box.

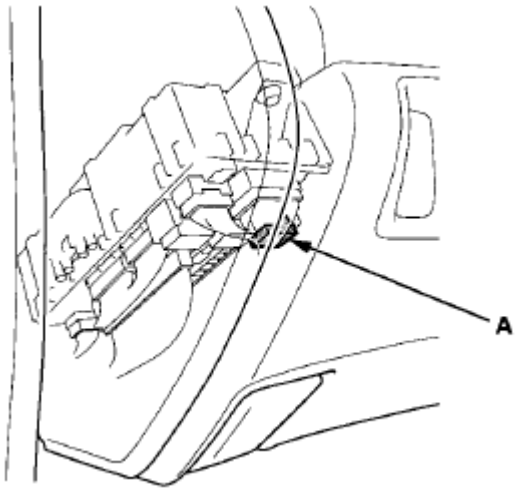

Fig. 151: Identifying Starter Cut Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

Is 3.0 V or more indicated?

YES - Go to step 15.

NO - Replace starter cut relay 1, then go to step 18.

15. Press the engine start/stop button to select the OFF mode.
16. Disconnect under-dash fuse/relay box connector F (33P).
17. Measure the voltage between the starter cut relay 1 terminal No. 1 and body ground.

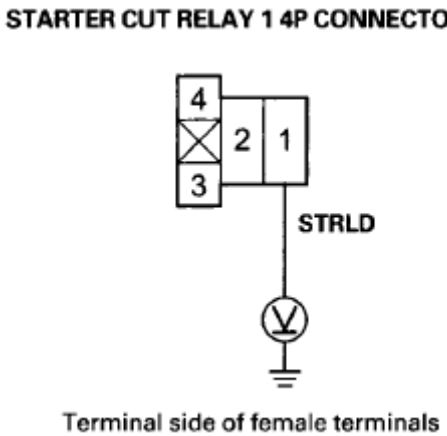

Fig. 152: Measuring Voltage Between Starter Cut Relay 1 Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 3.0 V or more?

YES - Replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**), then go to step 18.

NO - Repair short to power in the wire between the driver's under-dash fuse/relay box and the under-hood fuse/relay box (starter cut relay 2), then go to step 18.

18. Reconnect all connectors.
19. Press the engine start/stop button to select the ON mode.
20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P16BE indicated?

YES - Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the ECM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the

indicated DTC's troubleshooting. •

23. Reconnect all connectors.
24. Update the **ECM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**).
25. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P16BE indicated?

    YES - Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original **ECM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P16BE: STARTER CUT RELAY 1 MALFUNCTION (A/T)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS, and wait 5 seconds.
3. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

   Is 3.0 V or more indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the PCM. •

4. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**), then remove starter cut relay 1 (A) from the driver's under-dash fuse/relay box.

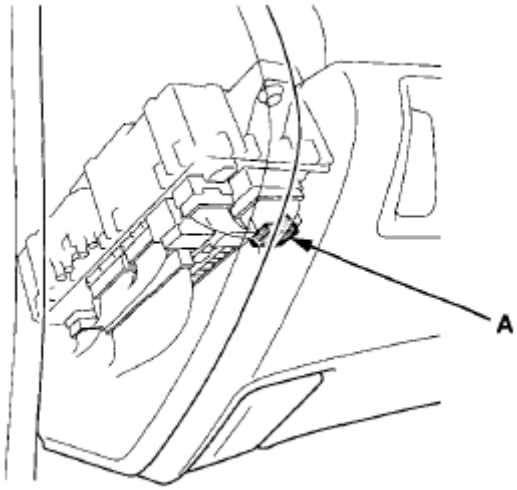

Fig. 153: Identifying Starter Cut Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

   Is 3.0 V or more indicated?

   YES - Go to step 6.

   NO - Replace starter cut relay 1, then go to step 7.

6. Measure the voltage between starter cut relay 1 4P connector terminal No. 1 and body ground.

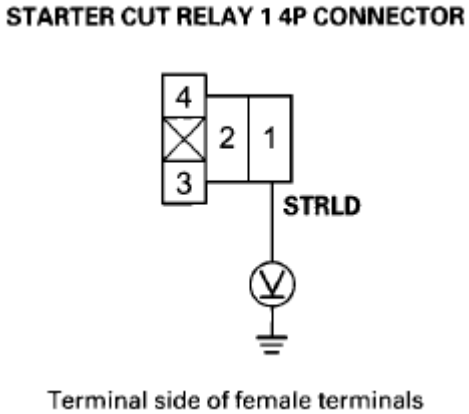

Fig. 154: Measuring Voltage Between Starter Cut Relay 1 4P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is 3.0 V or more?

YES - Repair short to power in the wire between starter cut relay 1, starter cut relay 2, and the PCM, then

go to step 7.

NO - Go to step 11.

7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Reset the PCM with the HDS.
9. Do the PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
10. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P16BE indicated?

    YES - Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Reconnect all connectors.
13. Update the **PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**).
14. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P16BE indicated?

    YES - Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the PCM was substituted, go to step 1.

    NO - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original **PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P16BF: STARTER CUT RELAY STRLY CIRCUIT MALFUNCTION (M/T)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check the STARTER RELAY CONTROL RETURN in the DATA LIST with the HDS.

   Is ON indicated?

YES - Go to step 4.

NO - Go to step 21.

4. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**), then remove start cut relay 1 (A) from the driver's under-dash fuse/relay box.

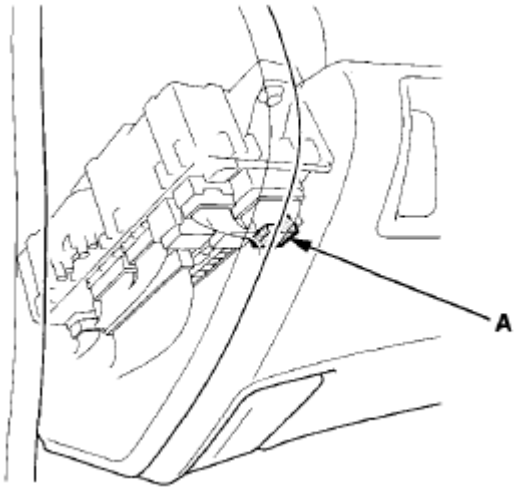

Fig. 155: Identifying Start Cut Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Check the STARTER RELAY CONTROL RETURN in the DATA LIST with the HDS.

   Is ON indicated?

   YES - Go to step 6.

   NO - Replace starter cut relay 1, then go to step 34.

6. Remove the +B cut relay (A) from the relay holder.

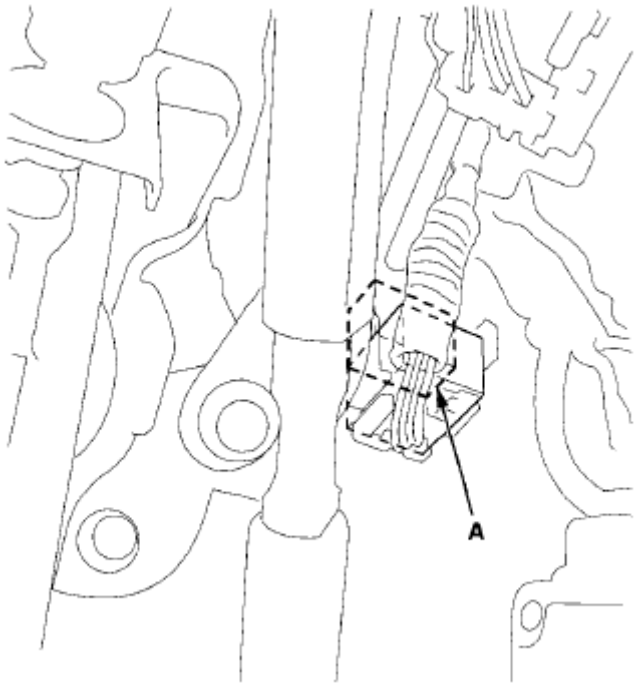

Fig. 156: Identifying +B Cut Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Check the STARTER RELAY CONTROL RETURN in the DATA LIST with the HDS.

   Is ON indicated?

   YES - Go to step 8.

   NO - Replace the + B cut relay, then go to step 34.

8. Press the engine start/stop button to select the OFF mode.
9. Disconnect driver's under-dash fuse/relay box connector N (16P).
10. Press the engine start/stop button to select the ON mode.
11. Measure the voltage between the +B cut relay 4P connector terminal No. 4 and body ground.

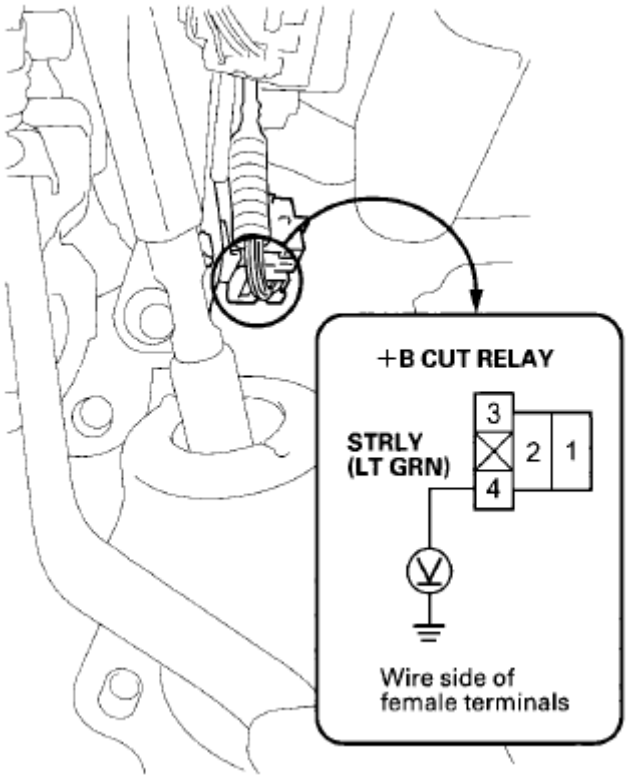

Fig. 157: Measuring Voltage Between +B Cut Relay 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 1.0 V or more?

YES - Go to step 12.

NO - Repair short to power in the wire between the +B cut relay and the driver's under-dash fuse/relay box, then go to step 34.

12. Press the engine start/stop button to select the OFF mode.
13. Disconnect driver's under-dash fuse/relay box connector G (13P).
14. Press the engine start/stop button to select the ON mode.
15. Measure the voltage between starter cut relay 1 4P connector terminal No. 4 and body ground.

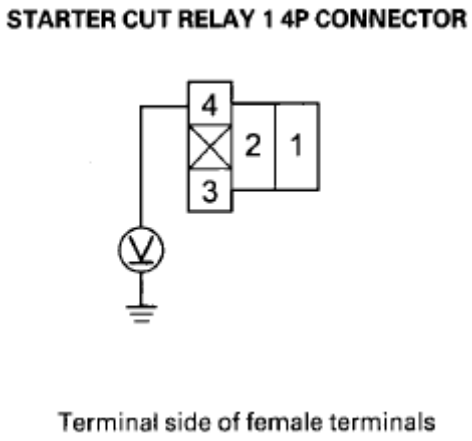

Fig. 158: Measuring Voltage Between Starter Cut Relay 1 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 1.0 V or more?

YES - Go to step 16.

NO - Replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**), then go to step 34.

16. Press the engine start/stop button to select the OFF mode.
17. Jump the SCS line with the HDS.
18. Disconnect ECM connector A (49P)
19. Press the engine start/stop button to select the ON mode.
20. Measure the voltage between ECM connector terminal A3 and body ground.

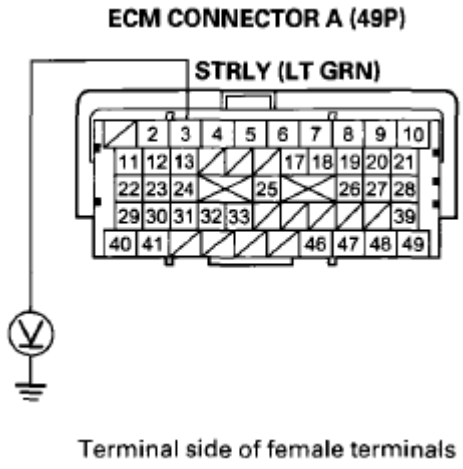

Fig. 159: Measuring Voltage Between ECM Connector Terminal A3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 1.0 V or more?

YES - Repair short to power in the between the driver's under-dash fuse/relay box and the ECM (A3), then go to step 34.

NO - Go to step 39.

21. While pressing the engine start/stop button to select the START mode, check the STARTER RELAY CONTROL RETURN in the DATA LIST with the HDS.

    Is OFF indicated?

    YES - Go to step 22.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the starter cut relay 1, the +B cut relay, and the ECM.

22. Remove starter cut relay 1 (A) from the driver's under-dash fuse/relay box.

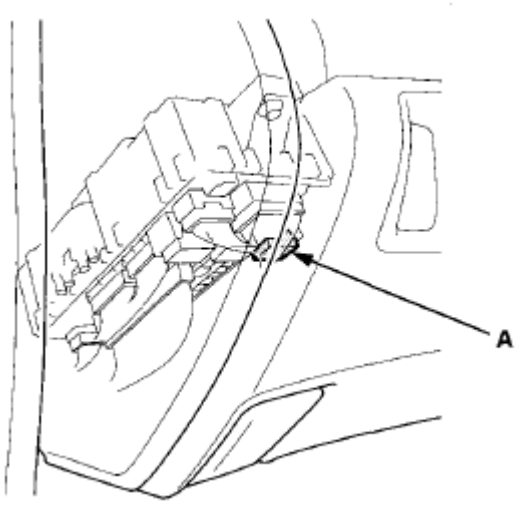

Fig. 160: Identifying Starter Cut Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. While pressing the engine start/stop button to select the START mode, check the STARTER RELAY CONTROL RETURN in the DATA LIST with the HDS.

    Is OFF indicated?

    YES - Go to step 24.

    NO - Replace starter cut relay 1, then go to step 34.

24. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER**

REMOVAL/INSTALLATION), then remove the + B cut relay (A) from the relay holder.

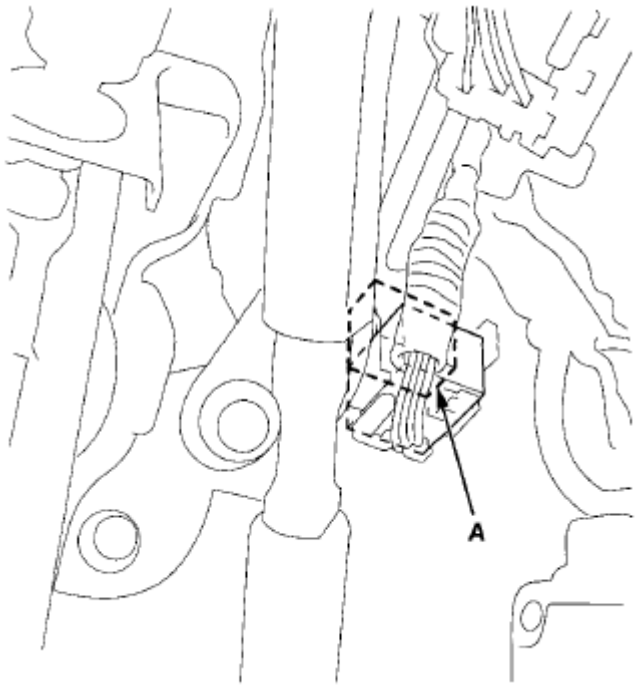

Fig. 161: Identifying +B Cut Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. While pressing the engine start/stop button to select the START mode, check the STARTER RELAY CONTROL RETURN in the DATA LIST with the HDS.

    Is ON indicated?

    YES - Go to step 26.

    NO - Replace the +B cut relay, then go to step 34.

26. Press the engine start/stop button to select the OFF mode.
27. Disconnect driver's under-dash fuse/relay box connector N (16P).
28. Check for continuity between +B cut relay terminal No. 4 and body ground.

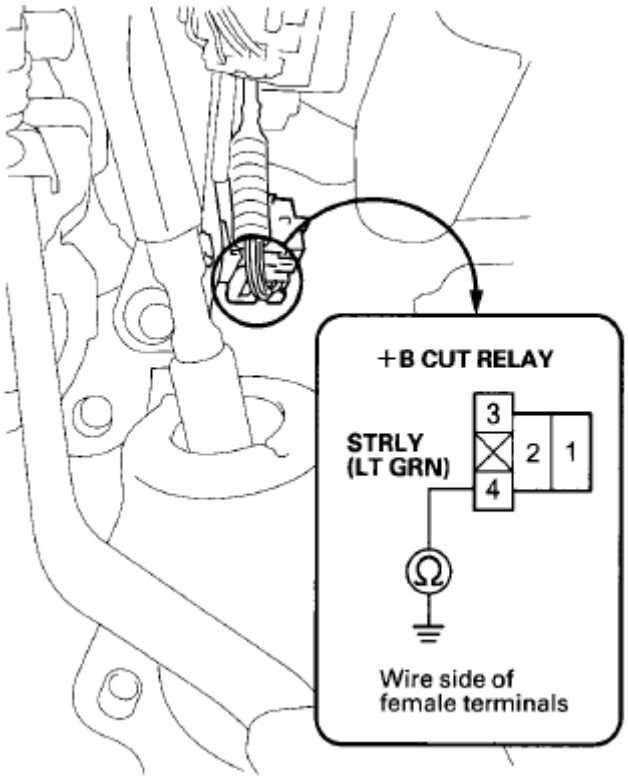

Fig. 162: Checking Continuity Between +B Cut Relay Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the driver's under-dash fuse/relay box and the +B cut relay, then go to step 34.

NO - Go to step 29.

29. Disconnect driver's under-dash fuse/relay box connector G (13P).
30. Check for continuity between starter cut relay 1 terminal No. 4 and body ground.

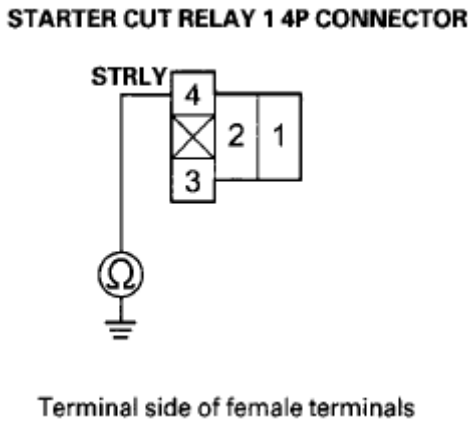

Fig. 163: Checking Continuity Between Starter Cut Relay 1 Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**), then go to step 34.

NO - Go to step 31.

31. Jump the SCS line with the HDS.
32. Disconnect ECM connector A (49P).
33. Check for continuity between ECM connector terminal A3 and body ground.

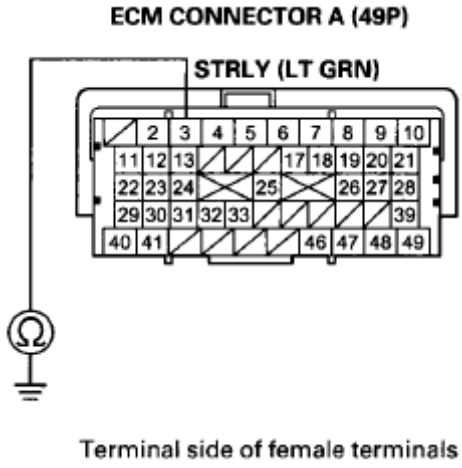

Fig. 164: Checking Continuity Between ECM Connector Terminal A3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the driver's under-dash fuse/relay box and the ECM (A3), then go to step 34.

NO - Go to step 39.

34. Reconnect all connectors.
35. Press the engine start/stop button to select the ON mode.
36. Reset the ECM with the HDS.
37. Do the ECM idle learn procedure, (see **ECM/PCM IDLE LEARN PROCEDURE**)
38. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P16BF indicated?

    YES - Check for poor connections or loose terminals at starter cut relay 1, the +B cut relay, and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

39. Reconnect all connectors.
40. Update the **ECM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**).
41. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P16BF indicated?

    YES - Check for poor connections or loose terminals at starter cut relay 1, the +B cut relay, and the ECM. If the ECM was updated, substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM was substituted, go to step 1.

    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original **ECM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P16BF: STARTER CUT RELAY STRLY CIRCUIT MALFUNCTION (A/T)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS, and wait 5 seconds.
3. Check the STARTER RELAY CONTROL RETURN in the DATA LIST with the HDS.

    Is OFF indicated?

    YES - Go to step 4.

NO - Go to step 13.

4. Turn the ignition switch to START (III), or press the engine start/stop button to select the START mode, for 5 second or more.
5. While holding the ignition switch in START (III) or pressing the engine start/stop button to select START mode, check the STARTER RELAY CONTROL RETURN in the DATA LIST with the HDS.

   Is OFF indicated?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the PCM. •

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**), then remove starter cut relay 1 (A) from the driver's under-dash fuse/relay box.

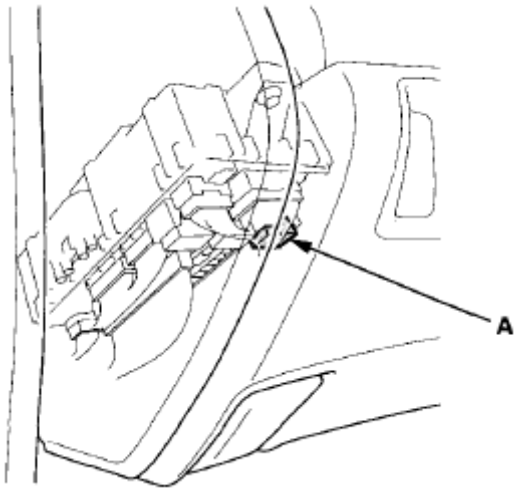

Fig. 165: Identifying Starter Cut Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove starter cut relay 2 (A) from the under-hood fuse/relay box.

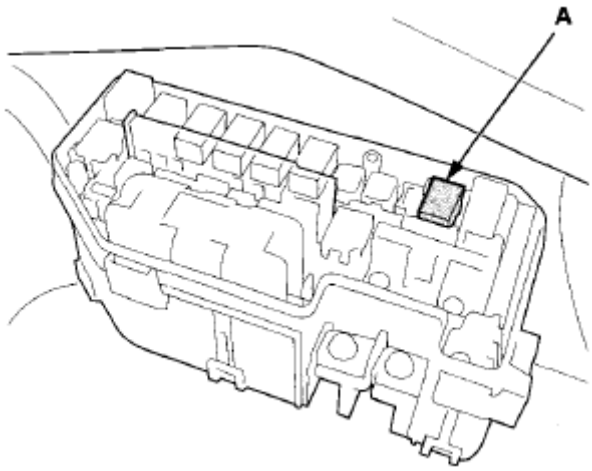

Fig. 166: Identifying Starter Cut Relay 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Test the starter cut relays (see **POWER RELAY TEST**).

   Are the relays OK?

   YES - Go to step 10.

   NO - Replace starter cut relay 1 and/or starter cut relay 2, then go to step 21.

10. Jump the SCS line with the HDS.
11. Disconnect PCM connector A (49P).
12. Check for continuity between PCM connector terminal A3 and body ground.

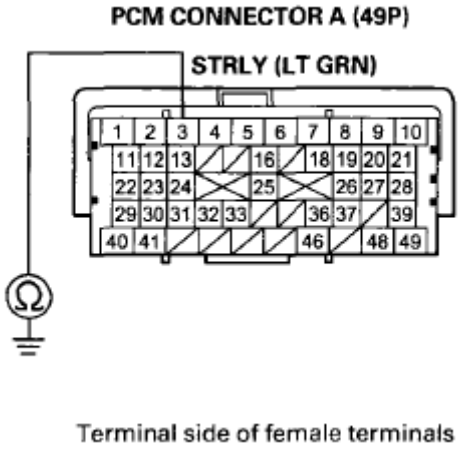

Fig. 167: Checking Continuity Between PCM Connector Terminal A3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the PCM (A3) and starter cut relay 1 or starter cut relay 2, then go to step 21.

NO - Go to step 27.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**), then remove starter cut relay 1 (A) from the driver's under-dash fuse/relay box.

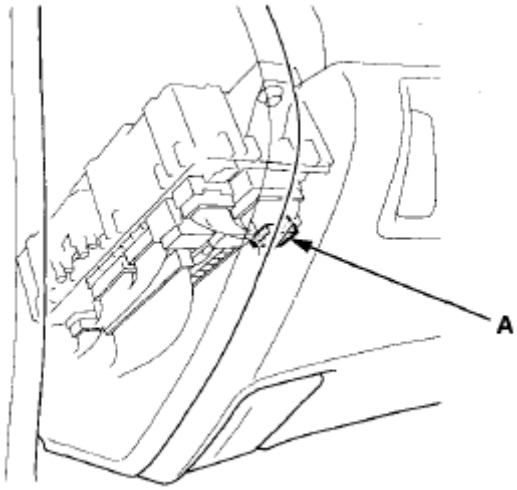

Fig. 168: Identifying Starter Cut Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Remove starter cut relay 2 (A) from the under-hood fuse/relay box.

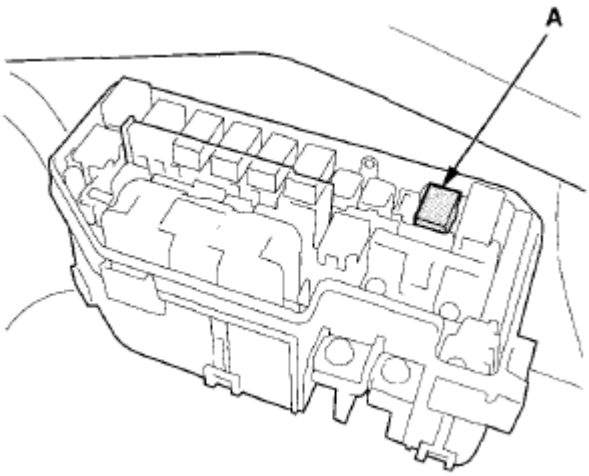

Fig. 169: Identifying Starter Cut Relay 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Test the starter cut relays (see **POWER RELAY TEST**).

Are the relays OK?

YES - Go to step 17.

NO - Replace starter cut relay 1 and/or starter cut relay 2, then go to step 21.

17. Jump the SCS line with the HDS.
18. Disconnect PCM connector A (49P).
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Measure the voltage between PCM connector terminal A3 and body ground.

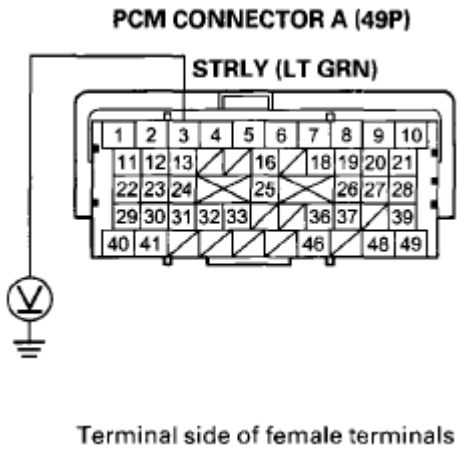

Fig. 170: Measuring Voltage Between PCM Connector Terminal A3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 1.0 V or more?

YES - Repair short to power in the wire between starter cut relay 1, starter cut relay 2, and the PCM (A3) then go to step 21.

NO - Go to step 26.

21. Reconnect all connectors.
22. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
23. Reset the PCM with the HDS.
24. Do the PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
25. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P16BF indicated?

YES - Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

26. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
27. Reconnect all connectors.
28. Update the **PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**).
29. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P16BF indicated?

    YES - Check for poor connections or loose terminals at starter cut relay 1, starter cut relay 2, and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the PCM was substituted, go to step 1.

    NO - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original **PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P16E1: +B CUT RELAY CIRCUIT MALFUNCTION

NOTE: Before you troubleshoot, record all freeze data and any on-board snap shot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

   Is 1.74 V or less indicated when the clutch pedal is pressed?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at the + B cut relay, starter cut relay 2, and the ECM. •

4. Remove the driver's dashboard under cover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**), then remove the +B cut relay (A).

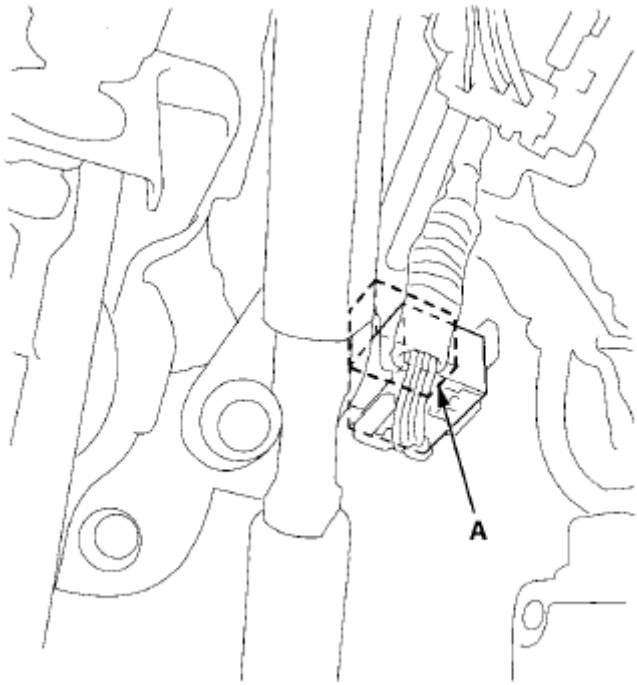

Fig. 171: Identifying +B Cut Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

   Is 1.74 V or less indicated only when clutch pedal is pressed?

   YES - Go to step 6.

   NO - Replace the +B cut relay, then go to step 10.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Remove starter cut relay 2 (A) from the under-hood fuse/relay box.

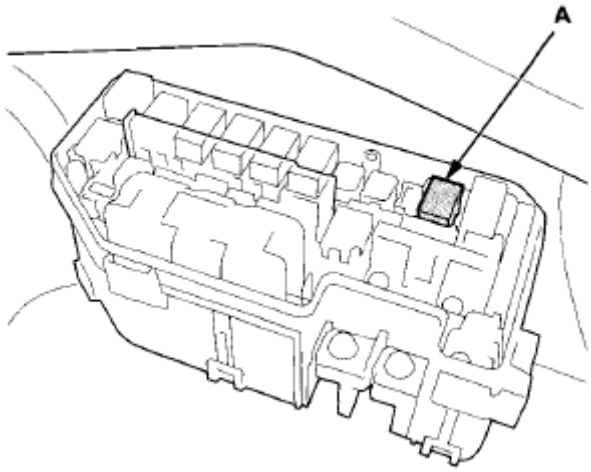

Fig. 172: Identifying Starter Cut Relay 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Press the engine start/stop button to select the ON mode.
9. Measure the voltage between starter cut relay 2 4P connector terminal No. 4 and body ground.

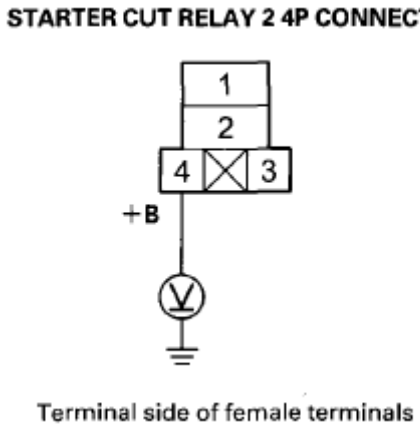

Fig. 173: Measuring Voltage Between Starter Cut Relay 2 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 1.0 V or less?

YES - Replace starter cut relay 2, then go to step 10.

NO - Repair short to power in the wire between the +B cut relay and the under-hood fuse/relay box (starter cut relay 2), then go to step 10.

10. Reconnect all connectors.
11. Press the engine start/stop button to select the ON mode.
12. Reset the ECM with the HDS.

13. Do the ECM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
14. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P16E1 indicated?

    YES - Check for poor connections or loose terminals at the +B cut relay, starter cut relay 2, and the ECM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2183: ECT SENSOR 2 CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0111 is stored at the same time as DTC P2183, troubleshoot DTC P0111 first, then recheck for DTC P2183.**

1. Check for poor connections or loose terminals at ECT sensor 1 and ECT sensor 2.

   Are the connections and terminals OK?

   YES - Go to step 2.

   NO - Repair the connections or terminals, then go to step 21.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Check for Pending or Confirmed DTCs with the HDS.

   Are DTC P1116 and P2183 indicated at the same time?

   YES - Go to step 12.

   NO - Go to step 4.

4. Start the engine, and let it idle for 10 minutes.
5. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about 120°F (49°C) or less indicated?

   YES - Replace **ECT sensor 2**, then go to step 21.

   NO - Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Allow ECT sensor 2 to cool to the ambient temperature.
8. Note the ambient temperature.
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Quickly note the value of ECT SENSOR 2 in the DATA LIST with the HDS.
11. Compare the value of ECT SENSOR 2 and the ambient temperature.

    Does ECT SENSOR 2 differ 5.4°F (3°C) or more from the ambient temperature?

    YES - Replace **ECT sensor 2**, then go to step 21.

    NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. •

12. Start the engine, and let it idle for 10 minutes.
13. Check ECT SENSOR 1 in the DATA LIST with the HDS.

    Is about 120°F (49°C) or less indicated?

    YES - Replace **ECT sensor 1**, then go to step 21.

    NO - Go to step 14.

14. Check ECT SENSOR 2 in the DATA LIST with the HDS.

    Is about 120°F (49°C) or less indicated?

    YES - Replace **ECT sensor 2**, then go to step 21.

    NO - Go to step 15.

15. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
16. Allow ECT sensor 1 and ECT sensor 2 to cool to the ambient temperature.
17. Note the ambient temperature.
18. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
19. Quickly note the value of ECT SENSOR 1 and ECT SENSOR 2 in the DATA LIST with the HDS.
20. Compare the value of ECT SENSOR 1 and the ambient temperature, and the value of ECT SENSOR 2 and the ambient temperature individually.

    Does either sensor differ more than 5.4°F (3°C) from the ambient temperature?

    YES - Replace the sensor that differed more than 5.4°F (3°C) from the ambient temperature. Refill the cooling system (see **COOLANT REPLACEMENT**), then go to step 21.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM. •

21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Reset the ECM/PCM with the HDS.
23. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
24. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2183 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2184: ECT SENSOR 2 CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check ECT SENSOR 2 in the DATA LIST with the HDS.

Is about 356°F (180°C) or more, or 0.08 V or less indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the ECT sensor 2 2P connector.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Check ECT SENSOR 2 in the DATA LIST with the HDS.

Is about 356°F (180°C) or more, or 0.08 V or less indicated?

YES - Go to step 7.

NO - Go to step 11.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Jump the SCS line with the HDS.

9. Disconnect ECM/PCM connector A (49P).
10. Check for continuity between ECT sensor 2 2P connector terminal No. 1 and body ground.

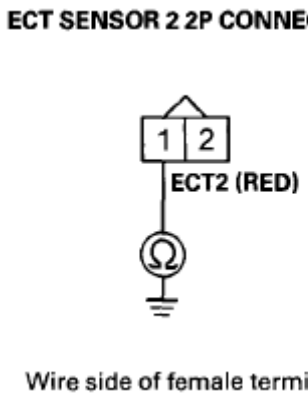

Fig. 174: Checking Continuity Between ECT Sensor 2 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between ECT sensor 2 and the ECM/PCM (A21), then go to step 13.

NO - Go to step 18.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Replace **ECT sensor 2**.
13. Reconnect all connectors.
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Reset the ECM/PCM with the HDS.
16. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
17. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2184 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

18. Reconnect all connectors.
19. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2184 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2185: ECT SENSOR 2 CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about -40°F (-40°C) or less, or 4.92 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM. •

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the ECT sensor 2 2P connector.
5. Connect ECT sensor 2 2P connector terminals No. 1 and No. 2 with a jumper wire.

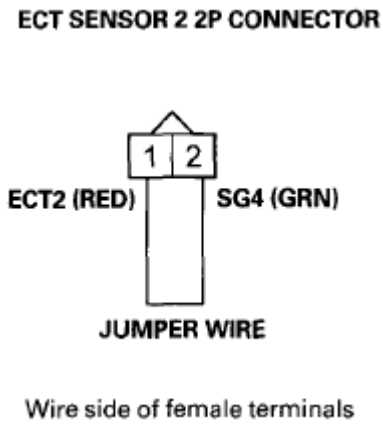

Fig. 175: Connecting ECT Sensor 2 2P Connector Terminals No. 1 And No. 2 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

7. Check ECT SENSOR 2 in the DATA LIST with the HDS.

   Is about - 40°F (-40°C) or less, or 4.92 V or more indicated?

   YES - Go to step 8.

   NO - Go to step 20.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Remove the jumper wire from the ECT sensor 2 2P connector.
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Measure the voltage between ECT sensor 2 2P connector terminal No. 1 and body ground.

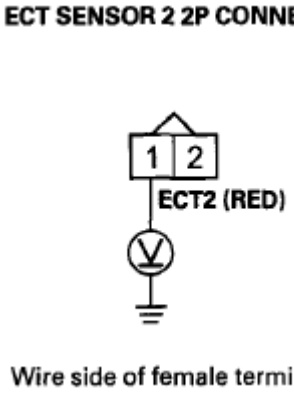

Fig. 176: Measuring Voltage Between ECT Sensor 2 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there about 5 V?

   YES - Go to step 12.

   NO - Go to step 16.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector A (49P).
15. Check for continuity between ECM/PCM connector terminal A27 and ECT sensor 2 2P connector terminal No. 2.

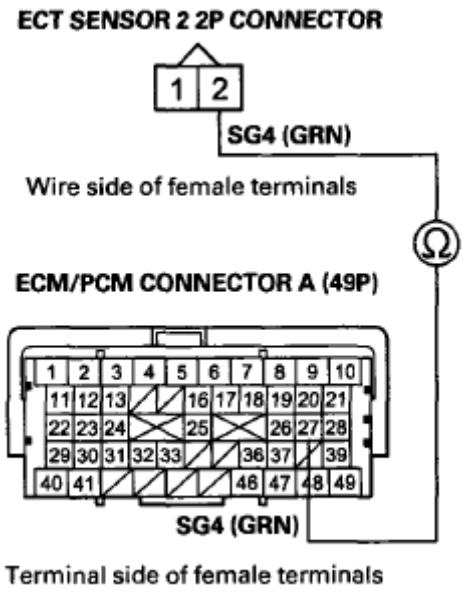

Fig. 177: Checking Continuity Between ECM/PCM Connector And ECT Sensor 2 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM/PCM (A27) and ECT sensor 2, then go to step 22.

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Jump the SCS line with the HDS.
18. Disconnect ECM/PCM connector A (49P).
19. Check for continuity between ECM/PCM connector terminal A21 and ECT sensor 2 2P connector terminal No. 1.

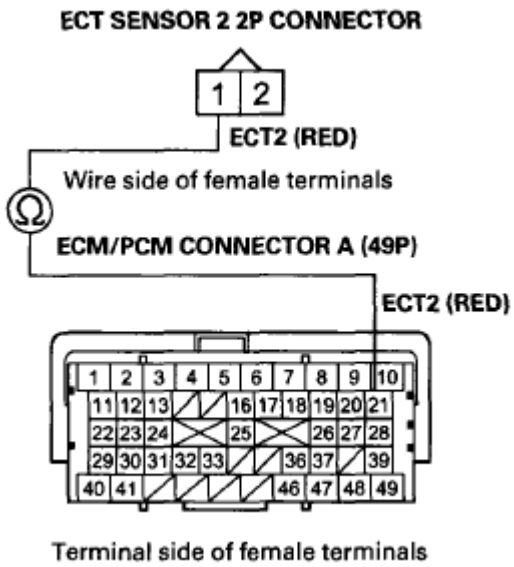

Fig. 178: Checking Continuity Between ECM/PCM Connector And ECT Sensor 2 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 27.

NO - Repair open in the wire between the ECM/PCM (A21) and ECT sensor 2, then go to step 22.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Replace **ECT sensor 2**.
22. Reconnect all connectors.
23. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
24. Reset the ECM/PCM with the HDS.
25. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
26. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2185 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

27. Reconnect all connectors.
28. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
29. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2185 indicated?

YES - Check for poor connections or loose terminals at ECT sensor 2 and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2195: REAR A/F SENSOR (BANK 1, SENSOR 1) SIGNAL STUCK LEAN; DTC P2197: FRONT A/F SENSOR (BANK 2, SENSOR 1) SIGNAL STUCK LEAN

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**
- **If the vehicle was out of fuel and the engine stalled before this DTC was stored, refuel, and clear the DTC with the HDS.**
- **If DTC P2101, P2118, P2135, P2138, P2176, or a combination of P2122 and P2127, P2122 and P2138, or P2127 and P2138 is stored at the same time as DTC P2195 (P2197)*, troubleshoot those DTCs first, then recheck for DTC P2195 (P2197)*.**

1. Check for dirt or debris on the MAF sensor/IAT sensor.

   Is it dirty?

   YES - Remove the debris. If needed, replace the **MAF sensor/IAT sensor**, then go to step 9.

   NO - Go to step 2.

2. Check the installation of the A/F sensor (Sensor 1).

   Is the A/F sensor loose or disconnected from the exhaust pipe?

   YES - Go to step 7.

   NO - Go to step 3.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Clear the DTC with the HDS.
5. Start the engine, and let it idle for 2 minutes.
6. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2195 and/or P2197 indicated?*

YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 14.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Reinstall the **A/F sensor (Sensor 1)**.
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Reset the ECM/PCM with the HDS.
11. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
12. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2195 and/or P2197 indicated?*

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1.

    NO - Go to step 13.

13. Monitor the OBD STATUS for DTC P2195 and/or P2197* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 12, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

14. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**).
15. Start the engine, and let it idle for 2 minutes.
16. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2195 and/or P2197 indicated?*

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 15. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 17.

17. Monitor the OBD STATUS for DTC P2195 and/or P2197* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated instep 16, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 15. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2227: BARO SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0107, P0108, P1128, and/or P1129 are stored at the same time as DTC P2227, troubleshoot those DTCs first, then recheck for DTC P2227.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait 2 seconds.
2. Check the BARO SENSOR in the DATA LIST with the HDS.

   Is about 101 kPa (29.9 inHg, 760 mmHg), or about 2.9 V at sea level indicated?

   YES - Go to step 3.

   NO - Go to step 15.

3. Clear the DTC with the HDS.
4. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
5. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - A/T in D, or M/T in 4th
   - Throttle position between 16 and 31 degrees for at least 3 seconds
6. Monitor the OBD STATUS for DTC P2227 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the screen indicates NOT COMPLETED, go to step 4 and recheck.

7. Check the intake air system for clogging or the restrictions (foreign material, dirty air cleaner element, etc).

   Is the intake air system clogged or restricted?

   YES - Remove the clog or restriction, then go to step 8.

   NO - Go to step 15.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
11. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
12. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D, or M/T in 4th
    - Throttle position between 16 and 31 degrees for at least 3 seconds
13. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2227 indicated?

    YES - Check for poor connections or loose terminals at the ECM/PCM, then go to step 1.

    NO - Go to step 14.

14. Monitor the OBD STATUS for DTC P2227 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated instep 13, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 11.

15. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
16. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
17. Test-drive under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
- A/T in D, or M/T in 4th
- Throttle position between 16 and 31 degrees for at least 3 seconds

18. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2227 indicated?

    YES - Check for poor connections or loose terminals at the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 16. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 19.

19. Monitor the OBD STATUS for DTC P2227 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated instep 18, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 16. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 16.

DTC P2228: BARO SENSOR CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the BARO SENSOR in the DATA LIST with the HDS.

   Is about 53 kPa (15.6 inHg, 397 mmHg), or 1.08 V or less indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. •

3. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
4. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2228 indicated?

YES - Check for poor connections or loose terminals at the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2229: BARO SENSOR CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the BARO SENSOR in the DATA LIST with the HDS.

   Is about 160 kPa (47.2 inHg, 1, 200 mmHg), or 4.95 V or more indicated?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. •

3. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2229 indicated?

   YES - Check for poor connections or loose terminals at the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

   NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2237: REAR A/F SENSOR (BANK 1, SENSOR 1) IP CIRCUIT HIGH VOLTAGE; DTC P2240: FRONT A/F SENSOR (BANK 2, SENSOR 1) IP CIRCUIT HIGH VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2237 and/or P2240 indicated?*

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 6P connector.
8. Disconnect ECM/PCM connector B (49P).
9. Check for continuity between A/F sensor (Sensor 1) 6P connector terminal No. 5 and ECM/PCM connector terminal B31 (B32)*.

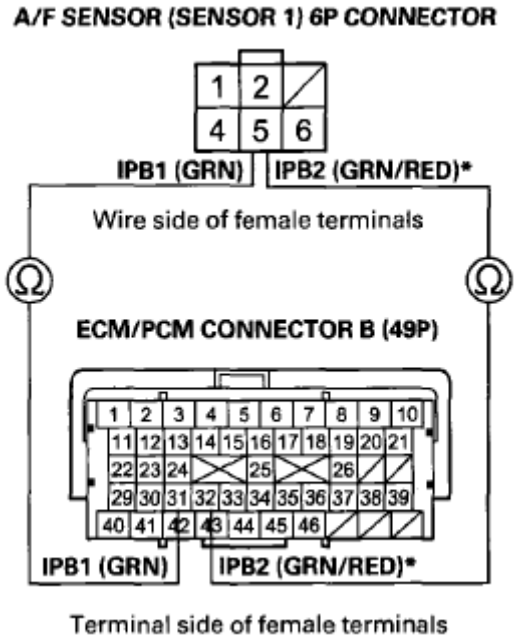

Fig. 179: Checking Continuity Between A/F Sensor 6P Connector Terminal No. 5 And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair open in the wire between the ECM/PCM (B31 (B32)*) and the A/F sensor (Sensor 1), then go to step 14.

10. Reconnect ECM/PCM connector B (49P).
11. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.
12. Measure the voltage between A/F sensor (Sensor 1) 6P connector terminal No. 5 and body ground.

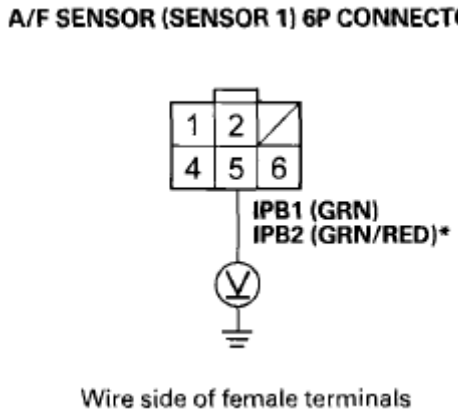

Fig. 180: Measuring Voltage Between A/F Sensor 6P Connector Terminal No. 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 0.2 V or less?

YES - Go to step 20.

NO - Go to step 13.

13. Replace the **A/F sensor (Sensor 1)**.
14. Reconnect all connectors.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2237 and/or P2240 indicated?*

YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1.

NO - Go to step 19.

19. Monitor the OBD STATUS for DTC P2237 and/or P2240* in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 18, go to the indicated DTC's troubleshooting. •

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Reconnect all connectors.
22. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
23. Start the engine, and let it idle.
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2237 and/or P2240 indicated?*

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 23. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 25.

25. Monitor the OBD STATUS for DTC P2237 and/or P2240* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 24, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 23. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2238: REAR A/F SENSOR (BANK 1, SENSOR 1) IP CIRCUIT LOW VOLTAGE; DTC P2241: FRONT A/F SENSOR (BANK 2, SENSOR 1) IP CIRCUIT LOW VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2238 and/or P2241 indicated?*

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 6P connector.
8. Disconnect ECM/PCM connector B (49P).
9. Check for continuity between ECM/PCM connector terminal B31 (832)* and body ground.

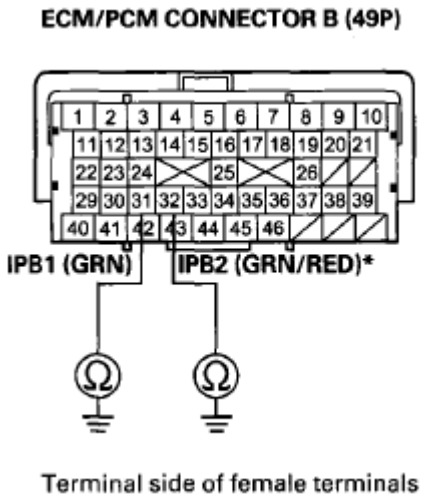

Fig. 181: Checking Continuity Between ECM/PCM Connector Terminal B31 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B31 (B32)*) and the A/F sensor (Sensor 1), then go to step 14.

NO - Go to step 10.

10. Reconnect ECM/PCM connector B (49P).
11. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.

12. Measure the voltage between A/F sensor (Sensor 1) 6P connector terminal No. 5 and body ground.

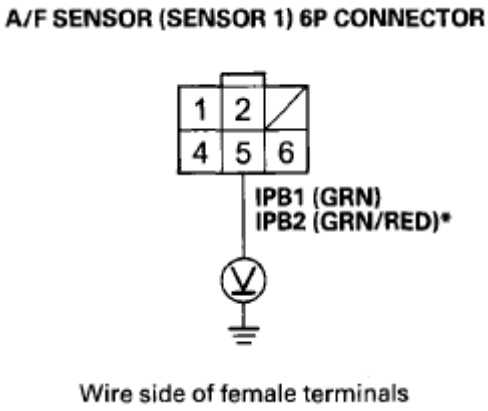

Fig. 182: Measuring Voltage Between A/F Sensor 6P Connector Terminal No. 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 0.2 V or less?

YES - Go to step 20.

NO - Go to step 13.

13. Replace the **A/F sensor (Sensor 1)**.
14. Reconnect all connectors.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2238 and/or P2241 indicated?*

YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1.

NO - Go to step 19.

19. Monitor the OBD STATUS for DTC P2238 and/or P2241* in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 18, go to the indicated DTC's troubleshooting. •

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling

until a result comes on.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Reconnect all connectors.
22. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
23. Start the engine, and let it idle.
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2238 and/or P2241 indicated?*

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 23. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 25.

25. Monitor the OBD STATUS for DTC P2238 and/or P2241* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 24, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 23. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2243: REAR A/F SENSOR (BANK 1, SENSOR 1) VCENT CIRCUIT HIGH VOLTAGE; DTC P2247: FRONT A/F SENSOR (BANK 2, SENSOR 1) VCENT CIRCUIT HIGH VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2243 and/or P2247 indicated?*

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 6P connector.
8. Disconnect ECM/PCM connector B (49P).
9. Check for continuity between A/F sensor (Sensor 1) 6P connector terminal No. 6 and ECM/PCM connector terminal B15 (B24)*.

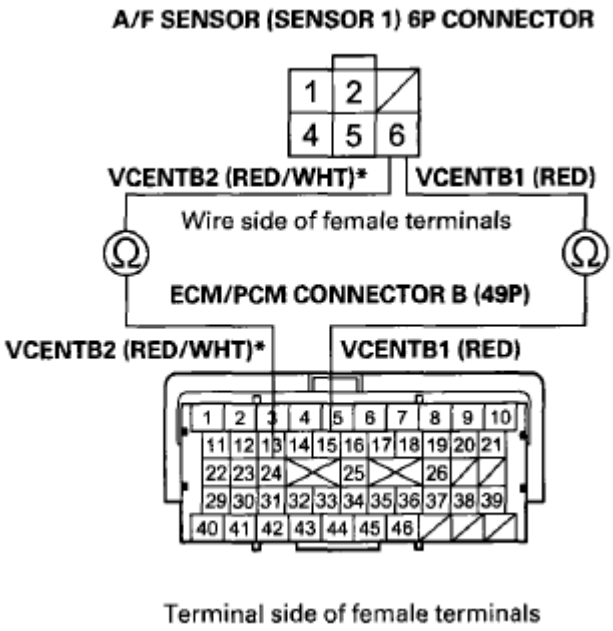

Fig. 183: Checking Continuity Between A/F Sensor 6P Connector Terminal No. 6 And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair open in the wire between the ECM/PCM (B15 (B24)*) and the A/F sensor (Sensor 1), then go to step 14.

10. Reconnect ECM/PCM connector B (49P).
11. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.
12. Measure the voltage between A/F sensor (Sensor 1) 6P connector terminal No. 6 and body ground.

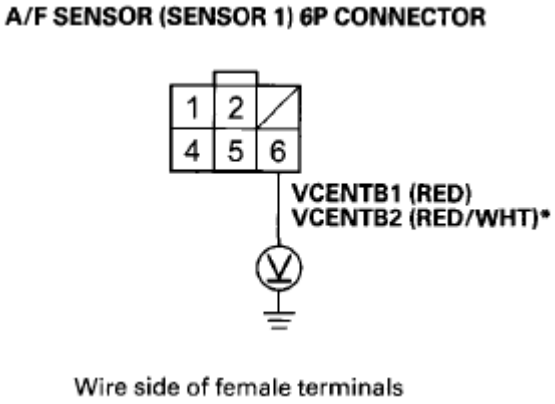

Fig. 184: Measuring Voltage Between A/F Sensor 6P Connector Terminal No. 6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 0.2 V or less?

YES - Go to step 20.

NO - Go to step 13.

13. Replace the **A/F sensor (Sensor 1)**.
14. Reconnect all connectors.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2243 and/or P2241 indicated?*

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1.

    NO - Go to step 19.

19. Monitor the OBD STATUS for DTC P2243 and/or P2247* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 18, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Reconnect all connectors.
22. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
23. Start the engine, and let it idle.
24. Check for Pending or Confirmed DTCs with the HDS.

    If DTC P2243 and/or P2247 indicated?*

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 23. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 25.

25. Monitor the OBD STATUS for DTC P2243 and/or P2247* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 24, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 23. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2245: REAR A/F SENSOR (BANK 1, SENSOR 1) VCENT CIRCUIT LOW VOLTAGE; DTC P2249: FRONT A/F SENSOR (BANK 2, SENSOR 1) VCENT CIRCUIT LOW VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2245 and/or P2249 indicated?*

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 6P connector.
8. Disconnect ECM/PCM connector B (49P).
9. Check for continuity between ECM/PCM connector terminal B15 (B24)* and body ground.

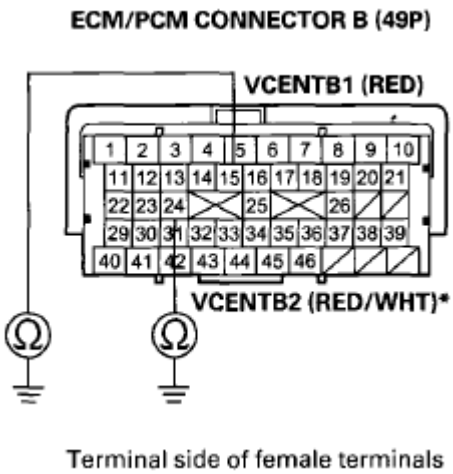

Fig. 185: Checking Continuity Between ECM/PCM Connector Terminal B15 (B24) And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B15 (B24)*) and the A/F sensor (Sensor 1), then go to step 14.

NO - Go to step 10.

10. Reconnect ECM/PCM connector B (49P).
11. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.
12. Measure the voltage between A/F sensor (Sensor 1) 6P connector terminal No. 6 and body ground.

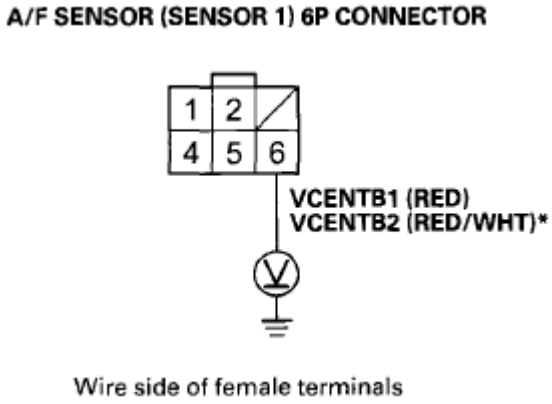

Fig. 186: Measuring Voltage Between A/F Sensor 6P Connector Terminal No. 6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 0.2 V or less?

YES - Go to step 20.

NO - Go to step 13.

13. Replace the **A/F sensor (Sensor 1)**.
14. Reconnect all connectors.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2245 and/or P2249 indicated?*

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1.

    NO - Go to step 19.

19. Monitor the OBD STATUS for DTC P2245 and/or P2249* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 18, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Reconnect all connectors.
22. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
23. Start the engine, and let it idle.
24. Check for Pending or Confirmed DTCs with the HDS.

    If DTC P2245 and/or P2249 indicated?*

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 23. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 25.

25. Monitor the OBD STATUS for DTC P2245 and/or P2249* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 24, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 23. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2251: REAR A/F SENSOR (BANK 1, SENSOR 1) VS CIRCUIT HIGH VOLTAGE; DTC P2254: FRONT A/F SENSOR (BANK 2, SENSOR 1) VS CIRCUIT HIGH VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P2251 and/or P2254* is stored at the same time as DTC P0134 and/or P0154*, troubleshoot DTC P2251 and/or P2254* first, then recheck for P0134 and/or P0154*.**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.
4. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2251 and/or P225 indicated?*

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 6P connector.
8. Disconnect ECM/PCM connector B (49P).
9. Check for continuity between A/F sensor (Sensor 1) 6P connector terminal No. 4 and ECM/PCM connector terminal B13(B14)*.

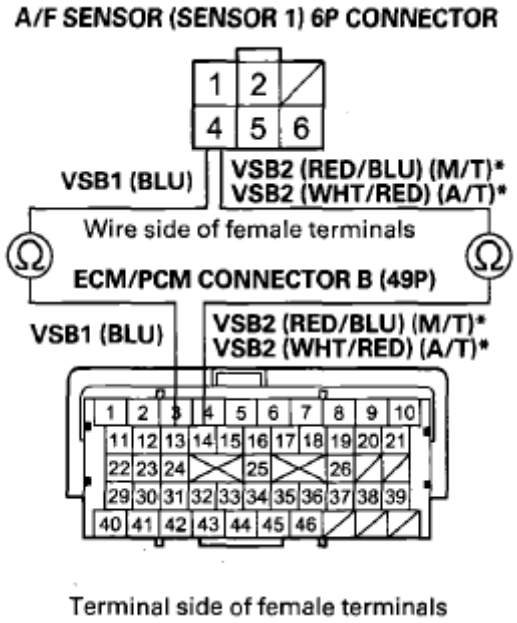

Fig. 187: Checking Continuity Between A/F Sensor 6P Connector Terminal No. 4 And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair open in the wire between the ECM/PCM (B13 (B14)*) and the A/F sensor (Sensor 1), then go to step 14.

10. Reconnect ECM/PCM connector B (49P).
11. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.

12. Measure the voltage between A/F sensor (Sensor 1) 6P connector terminal No. 4 and body ground.

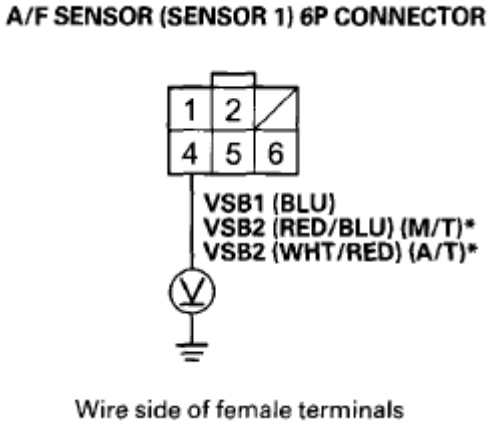

Fig. 188: Measuring Voltage Between A/F Sensor 6P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 0.2 V or less?

YES - Go to step 20.

NO - Go to step 13.

13. Replace the **A/F sensor (Sensor 1)**.
14. Reconnect all connectors.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2251 and/or P225 indicated?*

YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1.

NO - Go to step 19.

19. Monitor the OBD STATUS for DTC P2251 and/or P2254* in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 18, go to the indicated DTC's troubleshooting. •

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor

(Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Reconnect all connectors.
22. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
23. Start the engine, and let it idle.
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2251 and/or P2254 indicated?*

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 23. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 25.

25. Monitor the OBD STATUS for DTC P2251 and/or P2254* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 24, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 23. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2252: REAR A/F SENSOR (BANK 1, SENSOR 1) VS CIRCUIT LOW VOLTAGE; DTC P2255: FRONT A/F SENSOR (BANK 2, SENSOR 1) VS CIRCUIT LOW VOLTAGE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.
4. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2252 and/or P2255 indicated?*

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Jump the SCS line with the HDS.
7. Disconnect the A/F sensor (Sensor 1) 6P connector.
8. Disconnect ECM/PCM connector B (49P).
9. Check for continuity between ECM/PCM connector terminal B13 (B14)* and body ground.

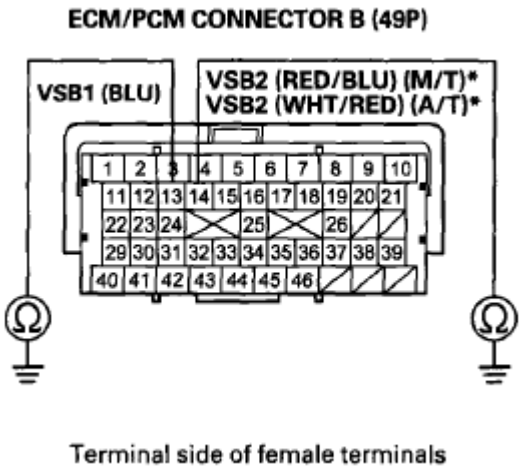

Fig. 189: Checking Continuity Between ECM/PCM Connector Terminal B13 (B14) And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B13 (B14)*) and the A/F sensor (Sensor 1), then go to step 14.

NO - Go to step 10.

10. Reconnect ECM/PCM connector B (49P).
11. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle for 2 minutes.
12. Measure the voltage between A/F sensor (Sensor 1) 6P connector terminal No. 4 and body ground.

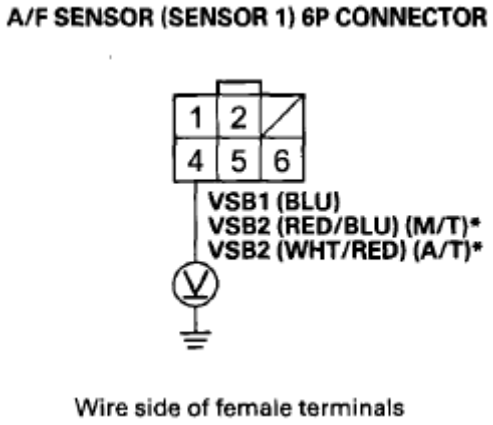

Fig. 190: Measuring Voltage Between A/F Sensor 6P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 0.2 V or less?

YES - Go to step 20.

NO - Go to step 13.

13. Replace the **A/F sensor (Sensor 1)**.
14. Reconnect all connectors.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
18. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2252 and/or P2255 indicated?*

YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1.

NO - Go to step 19.

19. Monitor the OBD STATUS for DTC P2252 and/or P22551 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 18, go to the indicated DTC's troubleshooting. •

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Reconnect all connectors.
22. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
23. Start the engine, and let it idle.
24. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2252 and/or P2255 indicated?*

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 23. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 25.

25. Monitor the OBD STATUS for DTC P2252 and/or P2255* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs were indicated in step 24, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 23. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2270: REAR SECONDARY HO2S (BANK 1, SENSOR 2) CIRCUIT SIGNAL STUCK LEAN;
DTC P2272: FRONT SECONDARY HO2S (BANK 2, SENSOR 2) CIRCUIT SIGNAL STUCK LEAN

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - A/T in D, or M/T in 4th
   - Engine speed between 1, 500 - 3, 000 RPM

- Drive 35 seconds or more

5. Monitor the OBD STATUS for DTC P2270 and/or P2272* in the DTCs MENU with the HDS.

   Does the HDS indicate FAILED?

   YES - Go to step 6.

   NO - If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM. If the HDS indicates NOT COMPLETED, go to step 3 and recheck.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Replace the **secondary HO2S (Sensor 2)**.
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
11. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
12. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D, or M/T in 4th
    - Engine speed between 1, 500- 3, 000 RPM
    - Drive 35 seconds or more
13. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2270 and/or P2272 indicated?*

    YES - Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1.

    NO - Go to step 14.

14. Monitor the OBD STATUS for DTC P2270 and/or P2272* in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated instep 13, go to the indicated DTC's troubleshooting. •

    NO - If the HDS indicates FAILED, check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the ECM/PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 11.

DTC P2610: ECM/PCM IGNITION OFF INTERNAL TIMER MALFUNCTION

NOTE: **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2610 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

4. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
5. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2610 indicated?

   YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

   NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2A00: REAR A/F SENSOR (BANK 1, SENSOR 1) CIRCUIT RANGE/PERFORMANCE PROBLEM; DTC P2A03: FRONT A/F SENSOR (BANK 2, SENSOR 1) CIRCUIT RANGE/PERFORMANCE PROBLEM

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Information marked with an asterisk (*) applies to the front bank (Bank 2).**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
   - A/T in D, or M/T in 3rd

- Vehicle speed between 25- 55 mph (40- 88 km/h) for 5 minutes
- Drive at a steady speed between 55- 75 mph (88 - 120 km/h) for 10 seconds, then decelerate (with the throttle fully closed) for 6 seconds

5. Monitor the OBD STATUS for DTC P2A00 and/or P2A03* in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?

   YES - Go to step 6.

   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 3 and recheck.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Replace the **A/F sensor (Sensor 1)**.
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Reset the ECM/PCM with the HDS.
10. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
11. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 158°F (70°C)
    - A/T in D, or M/T in 3rd
    - Vehicle speed between 25- 55 mph (40- 88 km/h) for 5 minutes
    - Drive at a steady speed between 55- 75 mph (88- 120 km/h) for 10 seconds, then decelerate (with the throttle fully closed) for 6 seconds
12. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2A00 and/or P2A03 indicated?*

    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1.

    NO - Go to step 13.

13. Monitor the OBD STATUS for DTC P2A00 and/or P2A03* in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 12, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the ECM/PCM, then go to step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION, go to step 11.

DTC U0029: F-CAN MALFUNCTION (BUS-OFF (ECM/PCM))

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC U0029 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. •

4. Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
5. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC U0029 indicated?

   YES - If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

   NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC U0114: F-CAN MALFUNCTION (ECM/PCM-SH-AWD CONTROL UNIT)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check for Pending or Confirmed DTCs with the HDS.

   Are DTC U0029 and U0114 indicated at the same time?

   YES - Go to troubleshooting for **DTC U0029**. •

   NO - Go to step 3.

3. Clear the DTC with the HDS.

4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC U0114 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the SH-AWD control unit and the ECM/PCM. •

5. Check for communication to the SH-AWD system with the HDS.

   Does the HDS communicate with the SH-AWD control unit?

   YES - Go to step 6.

   NO - Go to the symptom troubleshooting for the SH-AWD indicator does not go off, and no DTCs are stored (see **DTC 91-1: SH-AWD CONTROL UNIT PROGRAMMING ERROR**). •

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Jump the SCS line with the HDS.
8. Disconnect SH-AWD control unit connector A (20P).
9. Disconnect ECM/PCM connector A (49P).
10. Check for continuity between ECM/PCM connector terminals A48 and SH-AWD control unit connector A (20P) terminal No. 10.

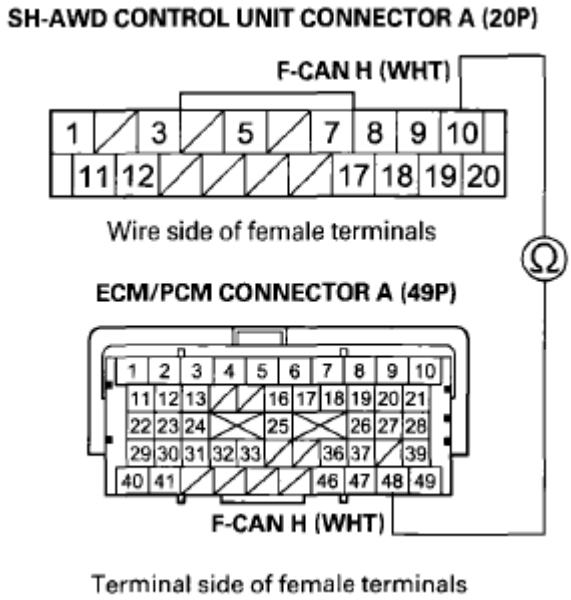

Fig. 191: Checking Continuity Between ECM/PCM Connector Terminals A48 And SH-AWD Control Unit Connector A (20P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between the ECM/PCM (A48) and the SH-AWD control unit, then go to step 12.

11. Check for continuity between ECM/PCM connector terminal A49 and SH-AWD control unit connector A (20P) terminal No. 20.

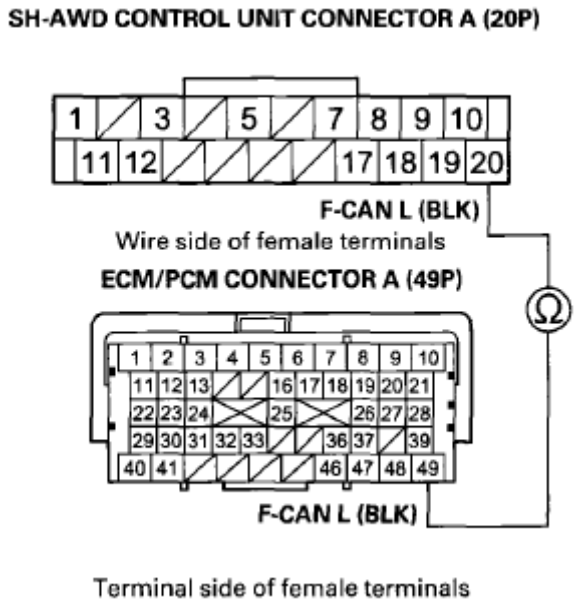

Fig. 192: Checking Continuity Between ECM/PCM Connector Terminal A49 And SH-AWD Control Unit Connector A (20P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Update the SH-AWD control unit if it does not have the latest software (see **SH-AWD® CONTROL UNIT UPDATE**), or substitute a known-good SH-AWD control unit (see **REAR DIFFERENTIAL FLUID TEMPERATURE SENSOR REPLACEMENT**), then go to step 12 and recheck. If DTC U0114 is not indicated after substitution, replace the original SH-AWD control unit (see **REAR DIFFERENTIAL FLUID TEMPERATURE SENSOR REPLACEMENT**), then go to step 12.

NO - Repair open in the wire between the PCM (A49) and the SH-AWD control unit, then go to step 12.

12. Reconnect all connectors.
13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).

16. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC U0114 indicated?

    YES - Check for poor connections or loose terminals at the SH-AWD control unit and the ECM/PCM, then go to step 1.

    NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC U0122: F-CAN MALFUNCTION (ECM/PCM-VSA MODULATOR-CONTROL UNIT)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check for Pending or Confirmed DTCs with the HDS.

   Are DTC U0029 and U0122 indicated at the same time?

   YES - Go to the troubleshooting for DTC U0029 (see **DTC U0029**). •

   NO - Go to step 3.

3. Clear the DTC with the HDS.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC U0122 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the VSA modulator-control unit and the ECM/PCM. •

5. Check for communication to the VSA system with the HDS.

   Does the HDS communicate with the VSA modulator-control unit?

   YES - Go to step 6.

   NO - Go to the symptom troubleshooting for ABS indicator, brake system indicator, and VSA indicator do not go off (see **ABS INDICATOR, BRAKE SYSTEM INDICATOR, AND VSA INDICATOR DO NOT GO OFF**). •

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

7. Jump the SCS line with the HDS.
8. Disconnect the VSA modulator-control unit 47P connector.
9. Disconnect ECM/PCM connector A (49P).
10. Check for continuity between ECM/PCM connector terminal A48 and VSA modulator-control unit 47P connector terminal No. 12.

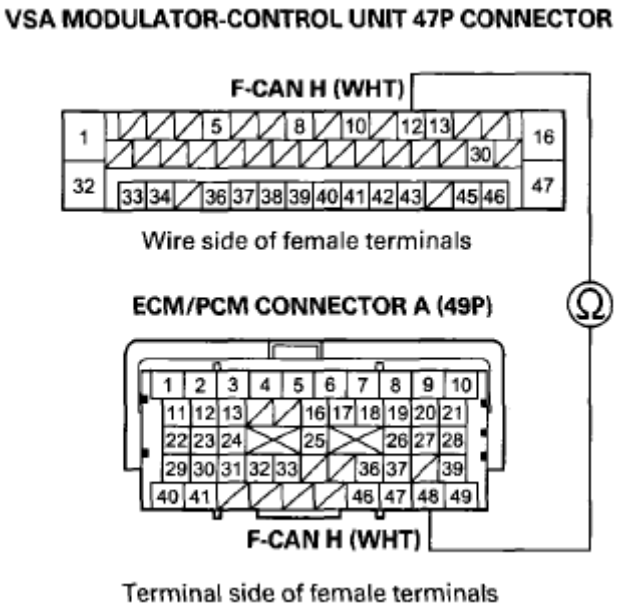

Fig. 193: Checking Continuity Between ECM/PCM Connector Terminal A48 And VSA Modulator-Control Unit 47P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between the ECM/PCM (A48) and the VSA modulator-control unit, then go to step 12.

11. Check for continuity between ECM/PCM connector terminal A49 and VSA modulator-control unit 47P connector terminal No. 13.

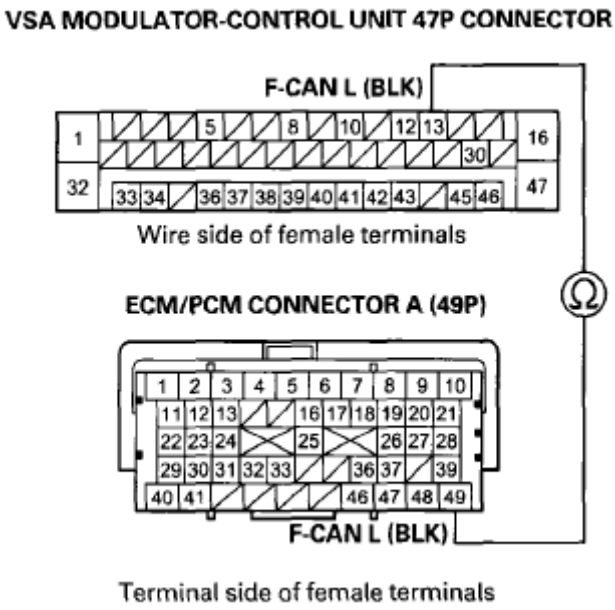

Fig. 194: Checking Continuity Between ECM/PCM Connector Terminal A49 And VSA Modulator-Control Unit 47P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Update the VSA modulator-control unit if it does not have the latest software (see **VSA MODULATOR-CONTROL UNIT UPDATE**), or substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**), then go to step 12 and recheck. If DTC U0122 is not indicated after substitution, replace the original VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**), then go to step 12.

NO - Repair open in the wire between the ECM/PCM (A49) and the VSA modulator-control unit, then go to step 12.

12. Reconnect all connectors.
13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
16. Check for Pending or Confirmed DTCs with the HDS.

Is DTC U0122 indicated?

YES - Check for poor connections or loose terminals at the VSA modulator-control unit and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC U0131: F-CAN MALFUNCTION (ECM/PCM-EPS CONTROL UNIT)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check for Pending or Confirmed DTCs with the HDS.

   Are DTC U0029 and U0131 indicated at the same time?

   YES - Go to the troubleshooting for **DTC U0029**. •

   NO - Go to step 3.

3. Clear the DTC with the HDS.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC U0131 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EPS control unit, and the ECM/PCM. •

5. Check for communication the EPS system with the HDS.

   Does the HDS communicate with the EPS control unit?

   YES - Go to step 6.

   NO - Go to the symptom troubleshooting for EPS indicator does not go off, and no DTCs are stored (see **EPS INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED**). •

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Jump the SCS line with the HDS.
8. Disconnect EPS control unit connector D (28P).
9. Disconnect ECM/PCM connector A (49P).
10. Check for continuity between ECM/PCM connector terminal A48 and EPS control unit connector D (28P) terminal No. 1.

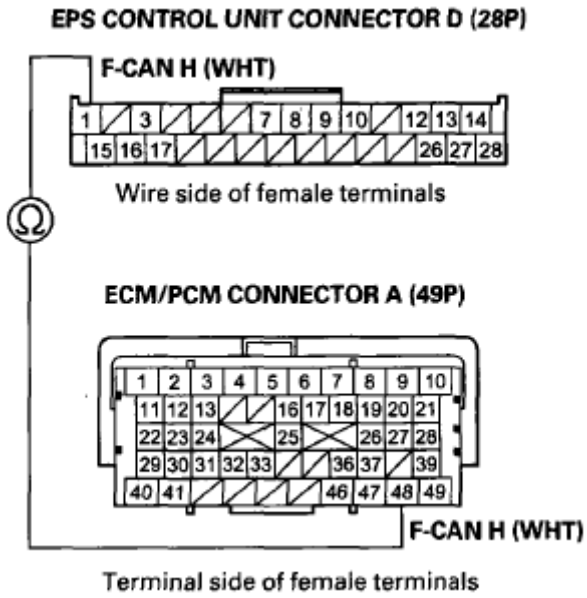

Fig. 195: Checking Continuity Between ECM/PCM Connector Terminal A48 And EPS Control Unit Connector D (28P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between the ECM/PCM (A48) and the EPS control unit, then go to step 12.

11. Check for continuity between ECM/PCM connector terminal A49 and EPS control unit connector D (28P) terminal No. 15.

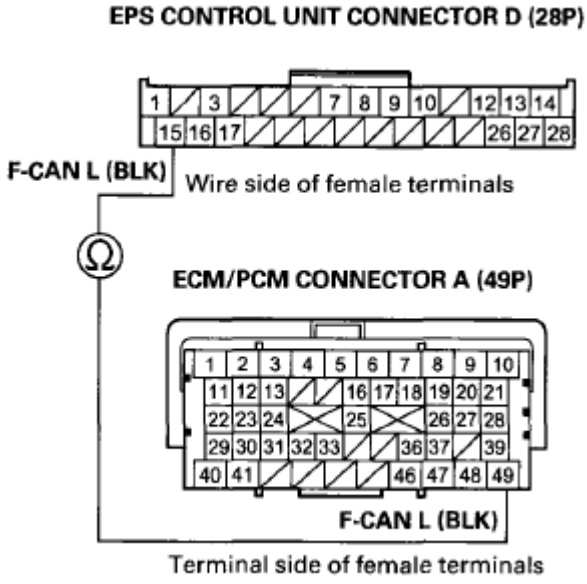

Fig. 196: Checking Continuity Between ECM/PCM Connector Terminal A49 And EPS Control Unit Connector D (28P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Substitute a known-good EPS control unit (see **RACK GUIDE REMOVAL/INSTALLATION**), then go to step 12 and recheck. If DTC U0131 is not indicated, replace the original EPS control unit (see **RACK GUIDE REMOVAL/INSTALLATION**), then go to step 12.

NO - Repair open in the wire between the ECM/PCM (A49) and the EPS control unit, then go to step 12.

12. Reconnect all connectors.
13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
16. Check for Pending or Confirmed DTCs with the HDS.

Is DTC U0131 indicated?

YES - Check for poor connections or loose terminals at the EPS control unit and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC U0155: F-CAN MALFUNCTION (ECM/PCM-GAUGE CONTROL MODULE)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

Is DTC U0155 indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module and the ECM/PCM. •

4. Check for body electrical DTCs in the DTCs MENU with the HDS.

Is DTC U0029 and/or U0100 indicated?

YES - Go to step 5.

NO - Do the gauge control module input test (see **GAUGE CONTROL MODULE INPUT TEST**). •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Jump the SCS line with the HDS.
7. Remove the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).
8. Disconnect the gauge control module 32P connector.
9. Disconnect ECM/PCM connector A (49P).
10. Check for continuity between ECM/PCM connector terminal A48 and gauge control module 32P connector terminal No. 14.

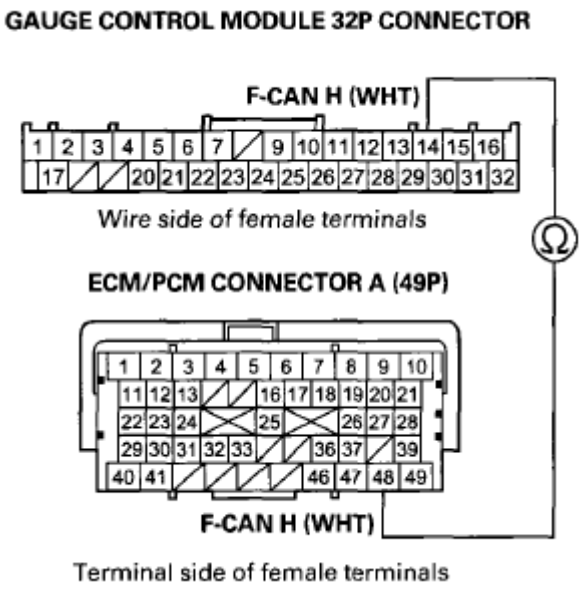

Fig. 197: Checking Continuity Between ECM/PCM Connector And Gauge Control Module 32P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between the ECM/PCM (A48) and the gauge control module, then go to step 12.

11. Check for continuity between ECM/PCM connector terminal A49 and gauge control module 32P connector terminal No. 13.

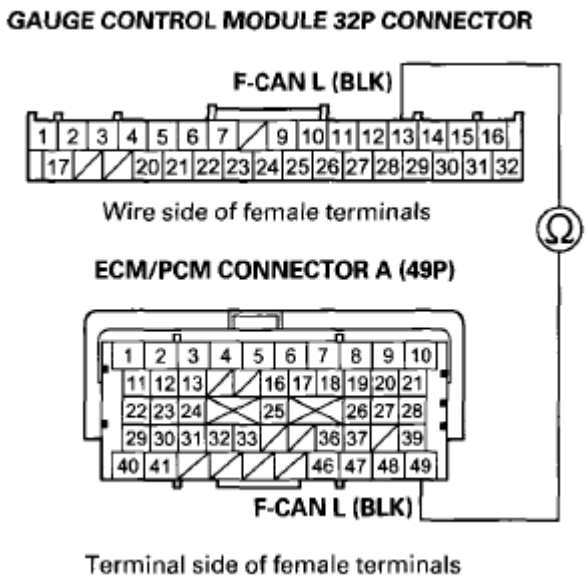

Fig. 198: Checking Continuity Between ECM/PCM Connector And Gauge Control Module 32P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Substitute a known-good gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), then go to step 12 and recheck. If DTC U0155 is not indicated after substitution, replace the original gauge control module, then go to step 12.

NO - Repair open in the wire between the ECM/PCM (A49) and the gauge control module, then go to step 12.

12. Reconnect all connectors.
13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Reset the ECM/PCM with the HDS.
15. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
16. Check for Pending or Confirmed DTCs with the HDS.

Is DTC U0155 indicated?

YES - Check for poor connections or loose terminals at the gauge control module and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

F-CAN CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Jump the SCS line with the HDS.
3. Disconnect ECM/PCM connector A (49P).
4. Measure the resistance between ECM/PCM connector terminals A48 and A49.

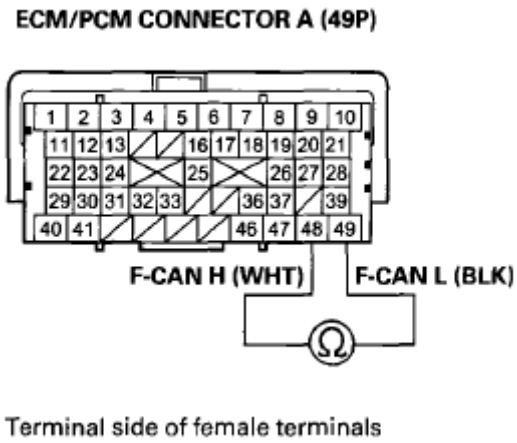

Fig. 199: Measuring Resistance Between ECM/PCM Connector Terminals A48 And A49
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 74- 107 ohms?

YES - Go to step 17.

NO - Go to step 5.

5. Disconnect these connectors:
   - Gauge control module 32P connector (see **GAUGE CONTROL MODULE REPLACEMENT**).
   - VSA modulator-control unit 47P connector (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).
   - EPS control unit connector D(28P) (see **RACK GUIDE REMOVAL/INSTALLATION**).
   - SH-AWD control unit connector A (20P) (with SH-AWD) (see **REAR DIFFERENTIAL FLUID TEMPERATURE SENSOR REPLACEMENT**).
   - Yaw rate-lateral acceleration sensor 4P connector (see **YAW RATE-ACCELERATION SENSOR REPLACEMENT**).
   - Steering angle sensor 5P connector (with SH-AWD) (see **STEERING ANGLE SENSOR REPLACEMENT**).
   - SRS unit connector A (39P) (see **SRS UNIT REPLACEMENT**).
   - TPMS control unit 20P connector (see **TPMS CONTROL UNIT REPLACEMENT**).
   - Power control unit connector C (36P) (with keyless access) (see **RF UNIT REPLACEMENT**).
   - Audio-Navigation unit connector H (28P) (with navigation) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).

- AcuraLink control unit connector A (32P) (USA model with navigation) (see **ACURALINK CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

6. Check for continuity between ECM/PCM connector terminals A48 and A49.

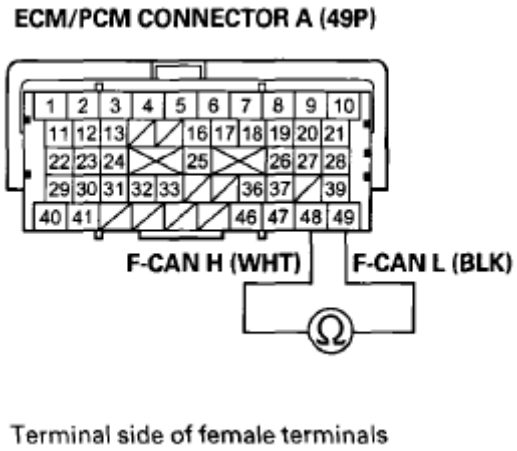

Fig. 200: Checking Continuity Between ECM/PCM Connector Terminals A48 And A49
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wires between ECM/PCM connector terminals A48 and A49. •

NO - Go to step 7.

7. Check for continuity between ECM/PCM connector terminals A48 and gauge control module 32P connector terminal No. 14.

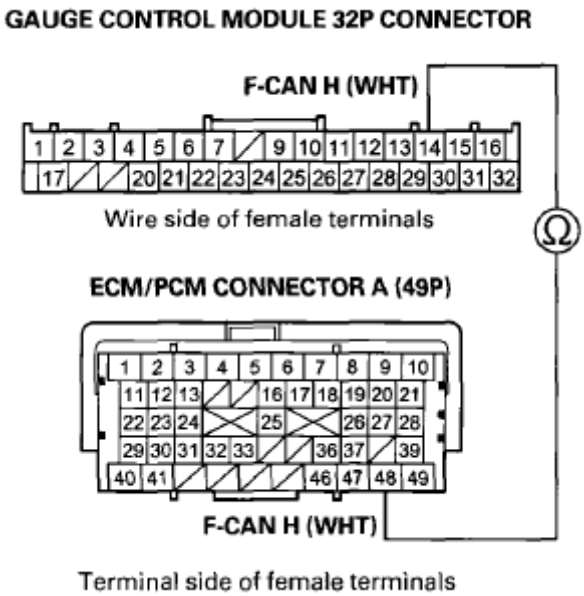

Fig. 201: Checking Continuity Between ECM/PCM Connector And Gauge Control Module 32P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 8.

NO - Repair open in the wire between the ECM/PCM (A48) and the gauge control module. •

8. Check for continuity between ECM/PCM connector terminals A48 and VSA modulator-control unit 47P connector terminal No. 12.

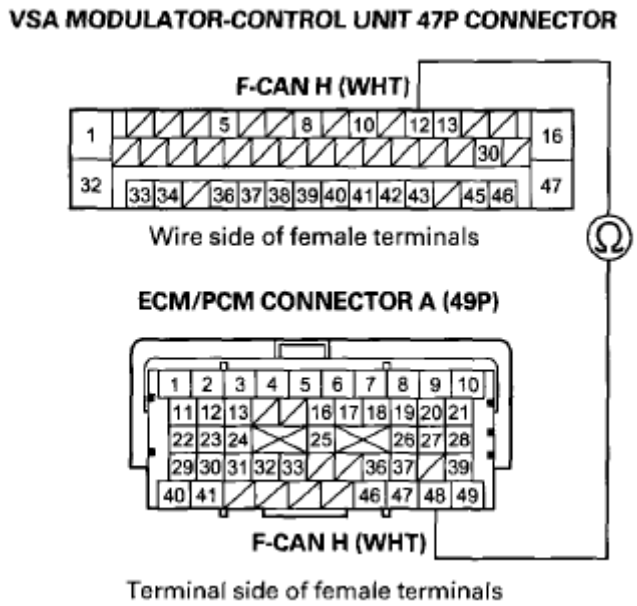

Fig. 202: Checking Continuity Between ECM/PCM Connector And VSA Modulator-Control Unit 47P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Repair open in the wire between the ECM/PCM (A48) and the VSA modulator-control unit. •

9. Check for continuity between ECM/PCM connector terminals A48 and EPS control unit connector D (28P) terminal No. 1.

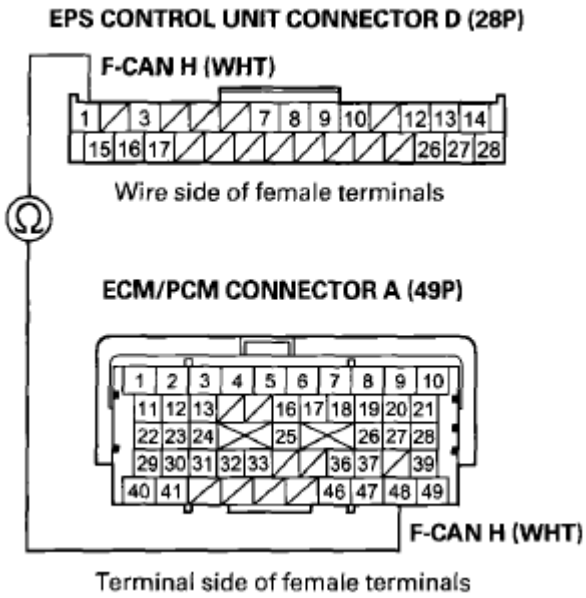

Fig. 203: Checking Continuity Between ECM/PCM Connector And EPS Control Unit Connector D (28P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -

- With SH-AWD: Go to step 10.
- Without SH-AWD: Go to step 11.

NO - Repair open in the wire between the ECM/PCM (A48) and the EPS control unit. •

10. Check for continuity between ECM/PCM connector terminals A48 and SH-AWD control unit connector A (20P) terminal No. 10.

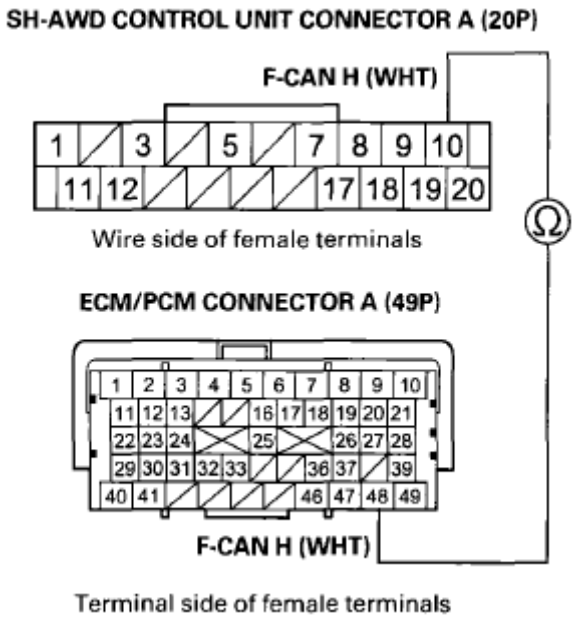

Fig. 204: Checking Continuity Between ECM/PCM Connector And SH-AWD Control Unit Connector A (20P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between the ECM/PCM (A48) and the SH-AWD control unit. •

11. Check for continuity between ECM/PCM connector terminals A49 and gauge control module 32P connector terminal No. 13.

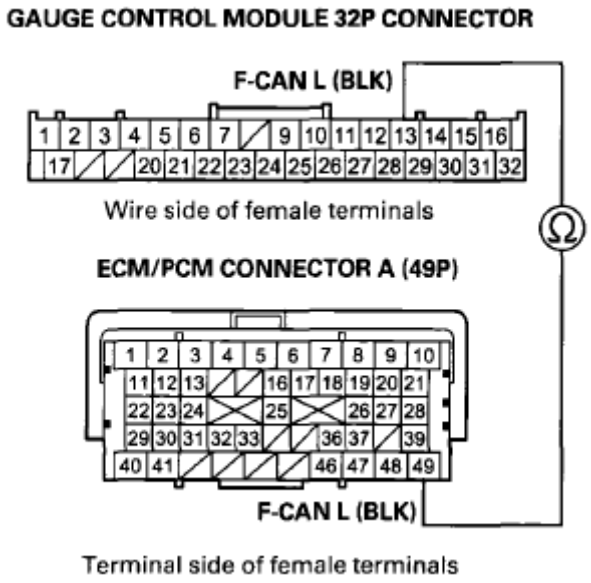

Fig. 205: Checking Continuity Between ECM/PCM Connector And Gauge Control Module 32P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 12.

NO - Repair open in the wire between the ECM/PCM (A49) and the gauge control module. •

12. Check for continuity between ECM/PCM connector terminals A49 and VSA modulator-control unit 47P connector terminal No. 13.

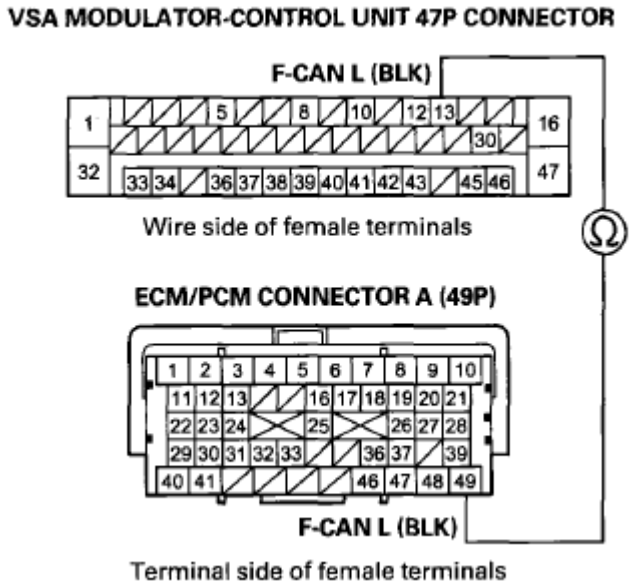

Fig. 206: Checking Continuity Between ECM/PCM Connector And VSA Modulator-Control Unit 47P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between the ECM/PCM (A49) and the VSA modulator-control unit. •

13. Check for continuity between ECM/PCM connector terminals A49 and EPS control unit connector D (28P) terminal No. 15.

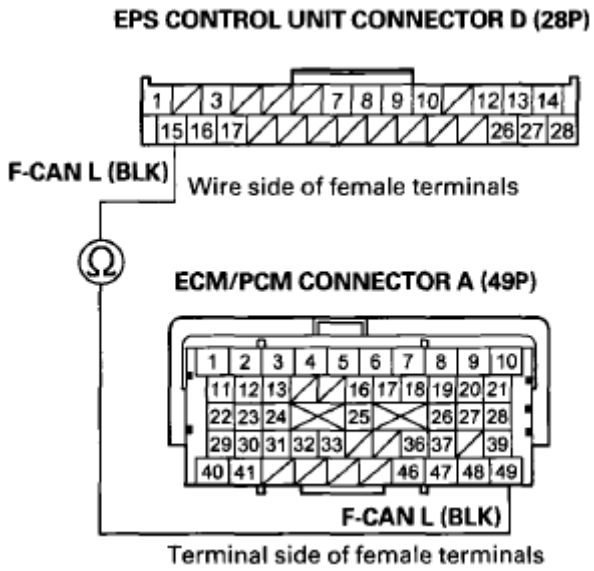

Fig. 207: Checking Continuity Between ECM/PCM Connector And EPS Control Unit Connector D (28P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -

- With SH-AWD: Go to step 14.
- Without SH-AWD: Go to step 15.

NO - Repair open in the wire between the ECM/PCM (A49) and the EPS control unit. •

14. Check for continuity between ECM/PCM connector terminals A49 and SH-AWD control unit connector A (20P) terminal No. 20.

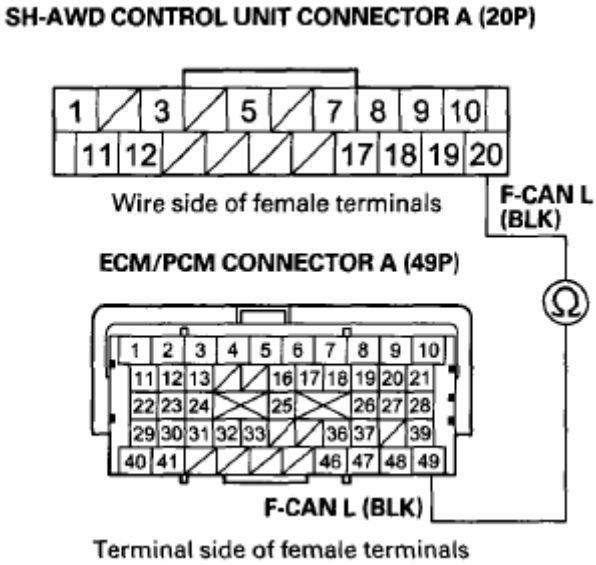

Fig. 208: Checking Continuity Between ECM/PCM Connector And SH-AWD Control Unit Connector A (20P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 15.

NO - Repair open in the wire between the ECM/PCM (A49) and the SH-AWD control unit. •

15. Reconnect the VSA modulator-control unit 47P connector.
16. Measure the resistance between ECM/PCM connector terminals A48 and A49.

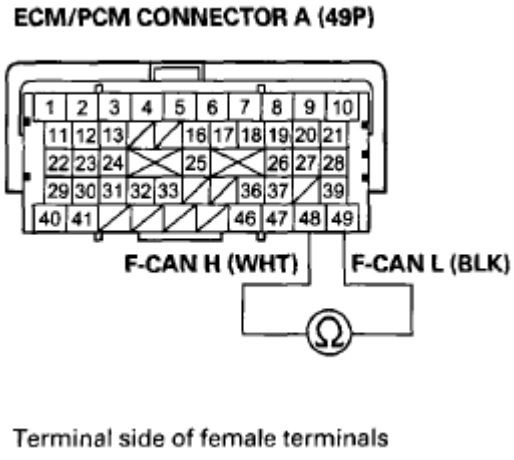

Fig. 209: Measuring Resistance Between ECM/PCM Connector Terminals A48 And A49
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 108-132 ohms?

YES - Disconnect the VSA modulator-control unit 47P connector, then go to step 17.

NO - Substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**), and reconnect ECM/PCM connector A (49P). If the HDS identifies the vehicle, replace the original VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**). •

17. Disconnect these connectors:
    - Gauge control module 32P connector (see **GAUGE CONTROL MODULE REPLACEMENT**).
    - VSA modulator-control unit 47P connector (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).
    - EPS control unit connector D(28P) (see **RACK GUIDE REMOVAL/INSTALLATION**).
    - SH-AWD control unit connector A (20P) (with SH-AWD) (see **REAR DIFFERENTIAL FLUID TEMPERATURE SENSOR REPLACEMENT**).
    - Yaw rate-lateral acceleration sensor 4P connector (see **YAW RATE-ACCELERATION SENSOR REPLACEMENT**).
    - Steering angle sensor 5P connector (with SH-AWD) (see **STEERING ANGLE SENSOR REPLACEMENT**).
    - SRS unit connector A (39P) (see **SRS UNIT REPLACEMENT**).
    - TPMS control unit 20P connector (see **TPMS CONTROL UNIT REPLACEMENT**).
    - Power control unit connector C (36P) (with keyless access) (see **RF UNIT REPLACEMENT**).
    - Audio-navigation unit connector H (28P) (with navigation) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**).
    - AcuraLink control unit connector A (32P) (USA model with navigation) (see **ACURALINK CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).
18. Check for continuity between ECM/PCM connector terminal A48 and body ground.

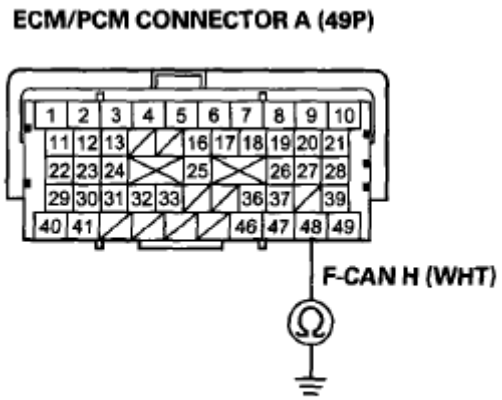

Fig. 210: Checking Continuity Between ECM/PCM Connector Terminal A48 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM terminals A48 and the gauge control module, the VSA modulator-control unit, the yaw rate-lateral acceleration sensor, the EPS control unit, the SH-AWD control unit (with SH-AWD), the steering angle sensor (with SH-AWD), the SRS unit, the TPMS control unit, the audio-navigation unit (with navigation), the AcuraLink control unit (USA model with navigation), the power control unit (with keyless access), or the DLC. •

NO - Go to step 19.

19. Check for continuity between ECM/PCM connector terminal A49 and body ground.

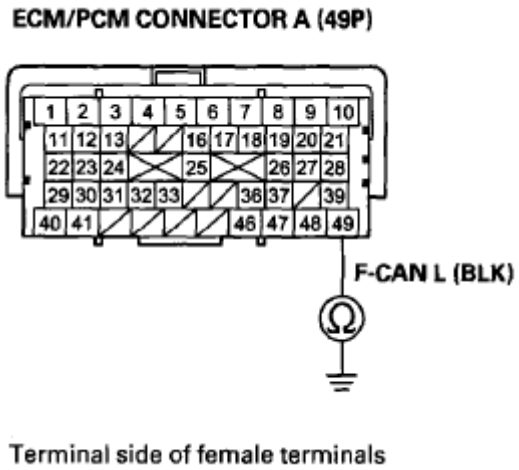

Fig. 211: Checking Continuity Between ECM/PCM Connector Terminal A49 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM terminals A49 and the gauge control module, the VSA modulator-control unit, the yaw rate-lateral acceleration sensor, the EPS control unit, the SH-AWD control unit (with SH-AWD), the steering angle sensor (with SH-AWD), the SRS unit, the TPMS control unit, the audio-navigation unit (with navigation), the AcuraLink control unit (USA model with navigation), the power control unit (with keyless access), or the DLC. •

NO - Go to step 20.

20. Reconnect all connectors.
21. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).
22. Disconnect the gauge control module 32P connector.
23. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**). •

NO - Go to step 24.

24. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
25. Reconnect the gauge control module 32P connector.
26. Disconnect the VSA modulator-control unit 47P connector.
27. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and read the HDS.

    Does the HDS identify the vehicle?

    YES - Replace the VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**). •

    NO - Go to step 28.

28. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
29. Reconnect the VSA modulator-control unit 47P connector.
30. Disconnect EPS control unit connector D (28P).
31. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and read the HDS.

    Does the HDS identify the vehicle?

    YES - Replace the EPS control unit (see **RACK GUIDE REMOVAL/INSTALLATION**). •

    NO -

    - With SH-AWD: Go to step 32.
    - Without SH-AWD: Turn the ignition switch to LOCK (0), or press the engine start/stop button to select OFF mode, then reconnect EPS control unit connector D (28P), and go to step 38.

32. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
33. Reconnect EPS control unit connector D (28P).
34. Disconnect SH-AWD control unit connector A (20P).
35. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and read the HDS.

    Does the HDS identify the vehicle?

    YES - Replace the SH-AWD control unit (see **REAR DIFFERENTIAL FLUID TEMPERATURE SENSOR REPLACEMENT**). •

    NO - Go to step 36.

36. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
37. Reconnect SH-AWD control unit connector A (20P).
38. Disconnect or the yaw rate-lateral acceleration sensor 5P connector.
39. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and read the HDS.

    Does the HDS identify the vehicle?

    YES - Replace the yaw rate-lateral acceleration sensor (see **YAW RATE-ACCELERATION SENSOR REPLACEMENT**). •

    NO -

    - With SH-AWD: Go to step 40.
    - Without SH-AWD: Turn the ignition switch to LOCK (0), or press the engine start/stop button to select OFF mode, then reconnect yaw rate-lateral acceleration sensor 5P connector, then go to step 46.
40. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
41. Reconnect the yaw rate-lateral acceleration sensor 5P connector.
42. Disconnect the steering angle sensor 5P connector.
43. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and read the HDS.

    Does the HDS identify the vehicle?

    YES - Replace the steering angle sensor (see **STEERING ANGLE SENSOR REPLACEMENT**). •

    NO - Go to step 44.

44. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
45. Reconnect the steering angle sensor 5P connector.
46. Disconnect SRS unit connector A (39P).
47. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and read the HDS.

    Does the HDS identify the vehicle?

    YES - Replace the SRS unit (see **SRS UNIT REPLACEMENT**). •

    NO - Go to step 48.

48. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
49. Reconnect SRS unit connector A (39P).
50. Disconnect the TPMS control unit 20P connector.

51. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and read the HDS.

    Does the HDS identify the vehicle?

    YES - Replace the TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**). •

    NO -

    - With keyless access: Go to step 52.
    - Without keyless access: Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the HDS identifies the vehicle and the ECM/PCM was updated, troubleshooting is complete. If the HDS identifies the vehicle and the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). •
52. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
53. Reconnect the TPMS control unit 20P connector.
54. Disconnect power control unit connector C (36P).
55. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and read the HDS.

    Does the HDS identify the vehicle?

    YES - Replace the power control unit (see **RF UNIT REPLACEMENT**). •

    NO -

    - With navigation: Go to step 56.
    - Without navigation: Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the HDS identifies the vehicle and the ECM/PCM was updated, troubleshooting is complete. If the HDS identifies the vehicle and the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). •
56. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
57. Reconnect power control unit connector C (36P).
58. Disconnect audio-navigation unit connector H (28P).
59. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and read the HDS.

    Does the HDS identify the vehicle?

    YES - Replace the audio-navigation unit (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**). •

    NO -

- USA model (with AcuraLink): Go to step 60.
- Canada model (without AcuraLink): Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the HDS identifies the vehicle and the ECM/PCM was updated, troubleshooting is complete. If the HDS identifies the vehicle and the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). •

60. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
61. Reconnect audio-navigation unit connector H (28P).
62. Disconnect AcuraLink control unit connector A (32P).
63. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and read the HDS.

    Does the HDS identify the vehicle?

    YES - Replace the AcuraLink control unit (see **ACURALINK CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**). •

    NO - Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the HDS identifies the vehicle and the ECM/PCM was updated, troubleshooting is complete. If the HDS identifies the vehicle and the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). •

MIL CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Do the gauge self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

   Does the MIL flash?

   YES - Go to step 3.

   NO - Substitute a known-good gauge control module, and recheck. If the symptom/indication goes away with a known-good gauge control module, replace the original gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**). •

3. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).
4. Check the SCS in the DATA LIST with the HDS.

   Is a short indicated?

   YES - Go to step 5.

   NO - Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the

symptom/indication goes away and the ECM/PCM was updated, troubleshooting is complete. If the symptom/indication goes away and the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect ECM/PCM connector A (49P), then disconnect the HDS.
7. Check for continuity between ECM/PCM connector terminal A32 and body ground.

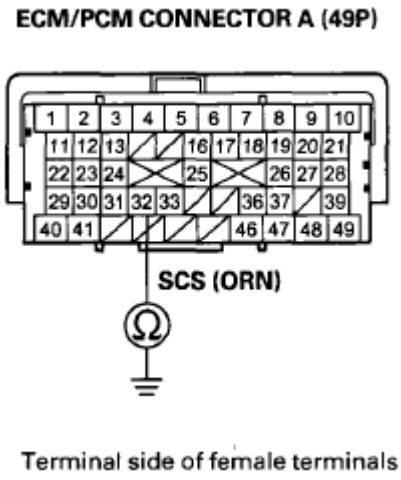

Fig. 212: Checking Continuity Between ECM/PCM Connector Terminal A32 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (A32) and the DLC. •

NO - Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away and the ECM/PCM was updated, troubleshooting is complete. If the symptom/indication goes away and the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). •

DLC CIRCUIT TROUBLESHOOTING

NOTE: If you suspect the HDS or the HDS DLC cable may be the source of the communication problem, verify that they are working properly by connecting them to a known-good, like vehicle and system, and checking for communication problem.

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and read the HDS.

Does the HDS identify the vehicle?

YES - Go to step 4.

NO - Go to step 27.

4. Check for Pending or Confirmed DTCs in the PGM-FI system with the HDS.

   Are any Pending or Confirmed DTCs indicated?

   YES - Go to the indicated DTC's troubleshooting. •

   NO -

   - If the HDS does not communicate with the SRS, go to step 5.
   - If the HDS does not communicate with the VSA system, go to step 7.
   - If the HDS does not communicate with the EPS, go to step 9.
   - If the HDS does not communicate with the SH-AWD system, go to step 11.
   - If the HDS does not communicate with the TPMS, go to step 13.
   - If the HDS does not communicate with the IMMOBI (immobilizer) system, go to step 15.
   - If the HDS does not communicate with the ONE PUSH START system, go to step 17.
   - If the HDS does not communicate with the BODY ELECTRICAL system, go to step 19.
5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and watch the SRS indicator.

   Does the SRS indicator come on and go off?

   YES - Go to step 21.

   NO - Go to the SRS general troubleshooting information (see **GENERAL TROUBLESHOOTING INFORMATION**). •

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and watch the VSA indicator.

   Does the VSA indicator come on and go off?

   YES - Go to step 21.

   NO - Go to the symptom troubleshooting for ABS indicator, brake system indicator, VSA indicator do not go off (see **ABS INDICATOR, BRAKE SYSTEM INDICATOR, AND VSA INDICATOR DO NOT GO OFF**). •

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Start the engine, and watch the EPS indicator.

    Does the EPS indicator come on and go off?

    YES - Go to step 21.

    NO - Go to the symptom troubleshooting for EPS indicator dose not go off, and no DTCs are stored (see **EPS INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED**). •

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and watch the SH-AWD indicator.

    Does the SH-AWD indicator come on and go off?

    YES - Go to step 21.

    NO - Go to the symptom troubleshooting for SH-AWD indicator dose not go off, and no DTCs are stored (see **DTC 91-1: SH-AWD CONTROL UNIT PROGRAMMING ERROR**). •

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Turn the ignition switch to ON (II), and watch the TPMS indicator.

    Does the TPMS indicator come on and go off?

    YES - Go to step 21.

    NO - Go to the symptom troubleshooting for TPMS indicator dose not go off, and no DTCs are stored (see **TPMS INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED**). •

15. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and watch the immobilizer indicator.

    Does the immobilizer indicator stay on or flash?

    YES - Go to the immobilizer system's troubleshooting; without keyless access (see **SYMPTOM TROUBLESHOOTING INFORMATION**), with keyless access (see **SYMPTOM TROUBLESHOOTING INFORMATION**). •

    NO - Go to step 21.

17. Press the engine start/stop button to select the OFF mode.
18. Press the engine start/stop button to select the ON mode, and watch the keyless access indicator.

Does the keyless access indicator stay on?

YES - Go to the keyless access system general troubleshooting information (see **GENERAL TROUBLESHOOTING INFORMATION**). •

NO - Go to step 21.

19. Do the gauge self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).
20. Check the gauge display.

Is B-CAN- - ERROR indicated?

YES - Check for B-CAN system DTCs (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE 1 AND TEST MODE 2 (WITHOUT THE HDS)**). •

NO - Go to step 21.

21. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
22. Disconnect the HDS from the DLC.
23. Check for continuity between DLC terminal No. 7 and body ground (with keyless access; between body ground and DLC terminals No. 1 and No. 7 individually).

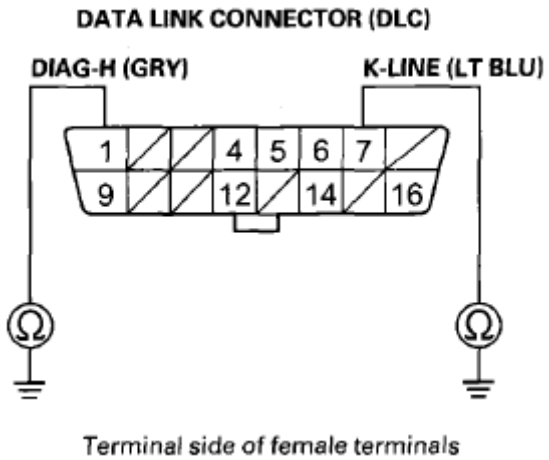

Fig. 213: Checking Continuity Between DLC Terminal No. 7 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 24.

NO - Go to step 25.

24. Continue to check for continuity between DLC terminal No. 7 and body ground (with keyless access; between body ground and DLC terminals No. 1 and No. 7 individually), while disconnecting these

connectors, one at a time:

- SRS unit A (39P)
- VSA modulator-control unit 47P
- EPS control unit D (28P)
- SH-AWD control unit A (20P) (with SH-AWD)
- TPMS control unit 20P
- Immobilizer-keyless control unit 7P (without keyless access)
- Audio unit A (24P) (without navigation)
- Audio-navigation unit A (24P) (with navigation)
- Driver's under-dash fuse/relay box Q (20P)
- Remote slot control unit 40P (with keyless access)
- Keyless access control unit B (32P) (with keyless access)
- Power control unit C (36P) (with keyless access)

Does continuity go away when one of the above connectors is disconnected?

YES - Replace the part that caused continuity go away when it was disconnected. •

NO - Repair short in the wire between the DLC No. 7 (K-Line) and the VSA modulator-control unit, the EPS control unit, the SH-AWD control unit, the SRS unit, the TPMS control unit, the immobilizer-keyless control unit, the audio unit, the audio-navigation unit, the driver's under-dash fuse/relay box, the remote slot control unit, the keyless access control unit, or the DLC No. 1 (Diag-H line) and the power control unit (with keyless access). •

25. Connect DLC terminal No. 7 to body ground with a jumper wire (with keyless access system, also connect DLC terminal No. 1 to body ground with a jumper wire).

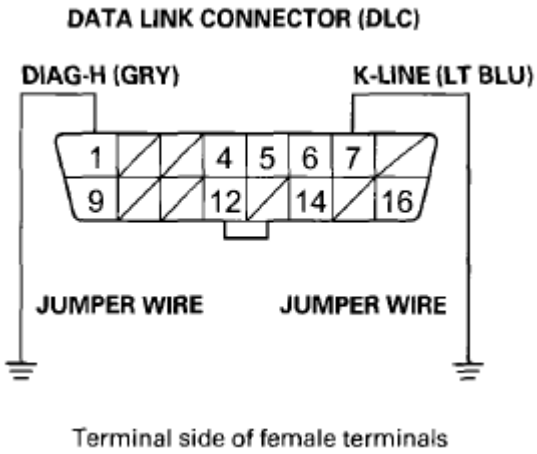

Fig. 214: Connecting DLC Terminal No. 7 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

26. Check for continuity between body ground and these connector terminals:

Connector	Terminal
SRS unit A (39P)	No. 18 (LT BLU)
VSA modulator-control unit 47P	No. 10 (LT BLU)
EPS control unit D (28P)	No. 17 (LT BLU)
SH-AWD control unit A (20P) (with SH-AWD)	No. 5 (LT BLU)
TPMS control unit 20P	No. 7 (LT BLU)
Immobilizer-keyless control unit 7P (without keyless access)	No. 5 (LT BLU)
Audio unit A (24P) (without navigation)	No. 3 (LT BLU)
Audio-navigation unit connector A (24P) (with navigation)	No. 3 (LT BLU)
Driver's under-dash fuse/relay box Q (20P)	No. 16 (LT BLU)
Remote slot control unit 40P (with keyless access)	No. 34 (LT BLU)
Keyless access control unit B (32P) (with keyless access)	No. 4 (LT BLU)
Power control unit C (36P) (with keyless access)	No. 3 (GRY)

Is there continuity between the body ground and each of the terminals in the chart?

YES - Replace the part that does not communicate with the HDS. •

NO - Repair open in the wire between the DLC (K-Line or Diag-H) and the appropriate connector. •

27. Check for B-CAN system DTCs without the HDS (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE 1 AND TEST MODE 2 (WITHOUT THE HDS)**).

    Is DTC U0029 and/or U0100 indicated?

    YES - Go to step 38.

    NO - Go to step 28.

28. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
29. Disconnect the HDS from the DLC.
30. Measure the voltage between DLC terminal No. 16 and body ground.

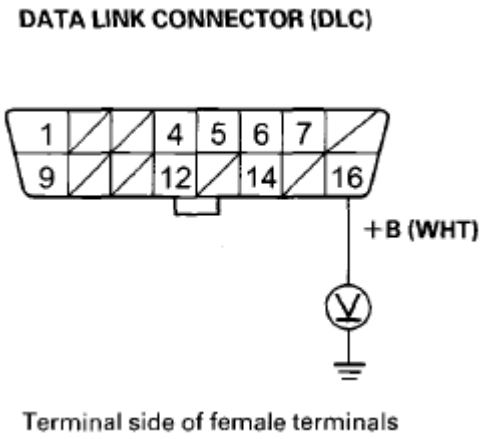

Fig. 215: Measuring Voltage Between DLC Terminal No. 16 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 31.

NO - Repair open in the wire between DLC terminal No. 16 and the No. 15 BACK UP (10 A) fuse in the under-hood fuse/relay box. •

31. Measure the voltage between DLC terminals No. 4 and No. 16.

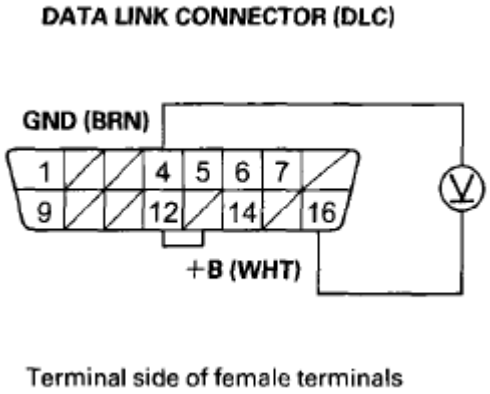

Fig. 216: Measuring Voltage Between DLC Terminals No. 4 And No. 16
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 32.

NO - Repair open in the wire between DLC terminal No. 4 and body ground (G401 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**)). •

32. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).

33. Jump the SCS line with the HDS.
34. Disconnect ECM/PCM connector A (49P).
35. Disconnect the HDS from the DLC.
36. Check for continuity between ECM/PCM connector terminal A48 and DLC terminal No. 6.

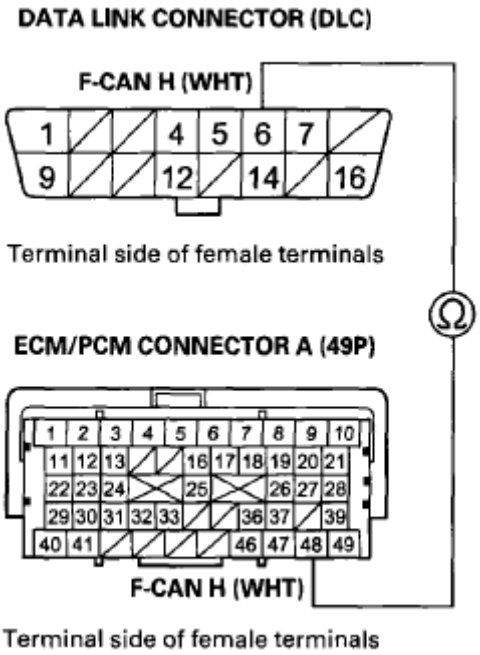

Fig. 217: Checking Continuity Between ECM/PCM Connector Terminal A48 And DLC Terminal No. 6
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 37.

NO - Repair open in the wire between the ECM/PCM (A48) and DLC terminal No. 6. •

37. Check for continuity between ECM/PCM connector terminal A49 and DLC terminal No. 14.

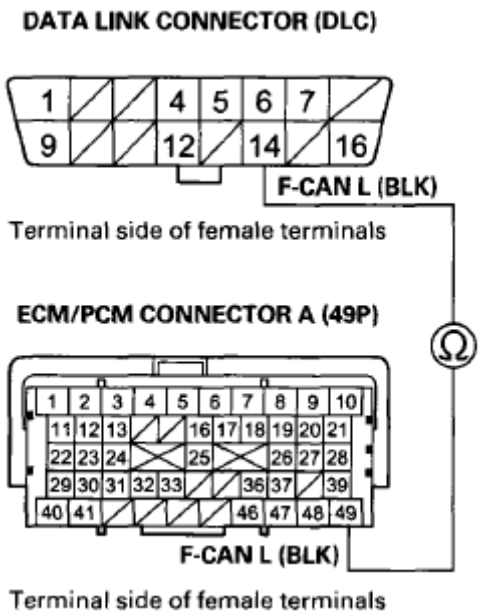

Fig. 218: Checking Continuity Between ECM/PCM Connector Terminal A49 And DLC Terminal No. 14
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away and the ECM/PCM was updated, troubleshooting is complete. If the symptom/indication goes away and the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). •

NO - Repair open in the wire between the ECM/PCM (A49) and DLC terminal No. 14. •

38. Try to start the engine.

    Does the engine start and idle?

    YES - Go to the **F-CAN circuit troubleshooting**. •

    NO -

    - If the starter does not crank, go to step 39.
    - If the starter cranks, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode; and go to step 41.
39. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
40. Check the No. 3-1 IG MAIN (50 A) fuse in the under-hood fuse/relay box.

    Is the fuse OK?

YES - Repair open in the wire between the No. 3-1 IG MAIN (50 A) fuse and the ignition switch (without keyless access) or power control unit (with keyless access). If the wire is OK, go to step 41.

NO - Repair short in the wire between the No. 3-1 IG MAIN (50 A) fuse and the ignition switch (without keyless access) or power control unit (with keyless access). Also replace the No. 3-1 IG MAIN (50 A) fuse. •

41. Inspect the No. 17 Fl MAIN (15 A) fuse in the under-hood fuse/relay box.

    Is the fuse OK?

    YES - Go to step 48.

    NO - Go to step 42.

42. Remove the blown No. 17 Fl MAIN (15 A) fuse from the under-hood fuse/relay box.
43. Remove PGM-FI main relay 1 (A) from the under-hood fuse/relay box.

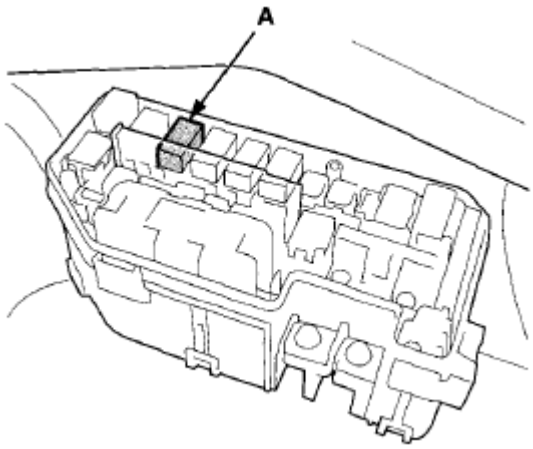

Fig. 219: Identifying PGM-FI Main Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

44. Check for continuity between body ground and PGM-FI main relay 1 4P connector terminals No. 1 and No. 4 individually.

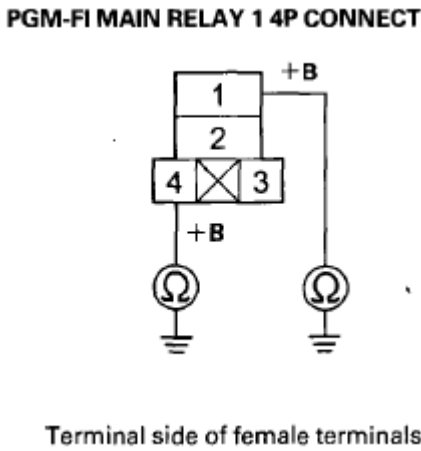

Fig. 220: Checking Continuity Between Body Ground And PGM-FI Main Relay 1 4P Connector Terminals No. 1 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**). Also replace the No. 17 Fl MAIN (15 A) fuse. •

NO - Go to step 45.

45. While disconnecting each of the parts or connectors below, one at a time, check for continuity between PGM-FI main relay 1 4P connector terminal No. 2 and body ground:
    - PGM-FI main relay 2
    - ECM/PCM connector B (49P)
    - Each injector 2P connector
    - CMP sensor 3P connector
    - CKP sensor 3P connector
    - MAF sensor/IAT sensor 5P connector
    - Electronic throttle control system (ETCS) control relay

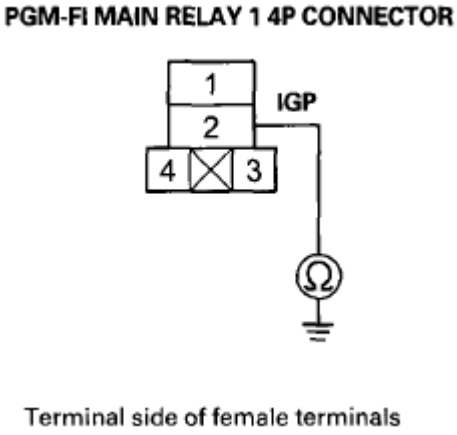

Fig. 221: Checking Continuity Between PGM-FI Main Relay 1 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does continuity go away when one of the above parts or connectors is disconnected?

YES - Replace the part that made the short to body ground go away when disconnected. If the part is the ECM/PCM, update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away and the ECM/PCM was updated, troubleshooting is complete. If the symptom/indication goes away and the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). Also replace the No. 17 Fl MAIN (15 A) fuse. •

NO - Go to step 46.

46. Disconnect the connectors from these components:
    - PGM-FI main relay 2
    - ECM/PCM connector B (49P)
    - Injectors
    - CMP sensor
    - CKP sensor
    - MAF sensor/IAT sensor
    - Electronic throttle control system (ETCS) control relay
47. Check for continuity between PGM-FI main relay 1 4P connector terminal No. 2 and body ground.

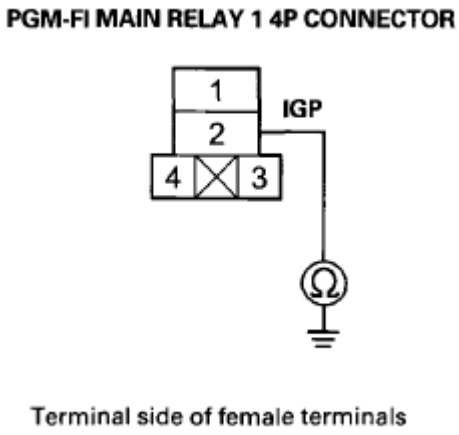

Fig. 222: Checking Continuity Between PGM-FI Main Relay 1 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PGM-FI main relay 1 and each part. Also replace the No. 17 Fl MAIN (15A)fuse. •

NO - Replace PGM-FI main relay 1. Also replace the No. 17 FI MAIN (15A)fuse. •

48. Inspect the No. 9 FUEL PUMP (20 A) fuse in the driver's under-dash fuse/relay box.

    Is the fuse OK?

    YES - Go to step 60.

    NO - Go to step 49.

49. Remove the blown No. 9 FUEL PUMP (20 A) fuse from the driver's under-dash fuse/relay box.
50. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**), then remove PGM-FI main relay 2 (A) from the driver's under-dash fuse/relay box.

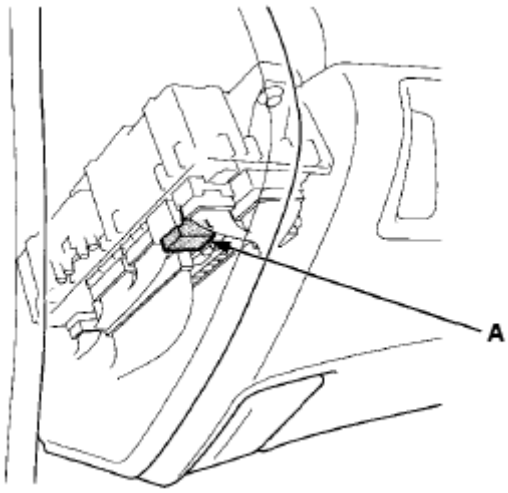

Fig. 223: Identifying PGM-FI Main Relay
Courtesy of AMERICAN HONDA MOTOR CO., INC.

51. Test PGM-FI main relay 2 (see **POWER RELAY TEST**).

    Is the relay OK?

    YES - Go to step 52.

    NO - Replace PGM-FI main relay 2. Also replace the No. 9 FUEL PUMP (20 A) fuse. •

52. Check for continuity between PGM-FI main relay 2 4P connector terminal No. 2 and body ground.

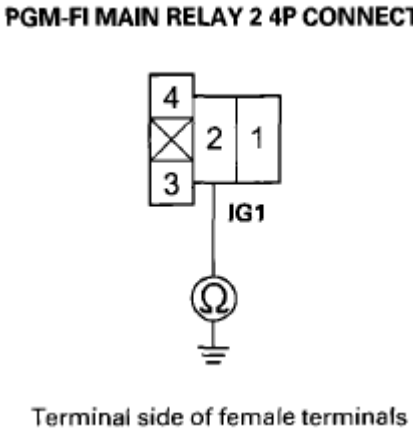

Fig. 224: Checking Continuity Between PGM-FI Main Relay 2 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 53.

NO - Go to step 56.

53. Jump the SCS line with the HDS.
54. Disconnect ECM/PCM connector B (49P).
55. Check for continuity between ECM/PCM connector terminal B42 and body ground.

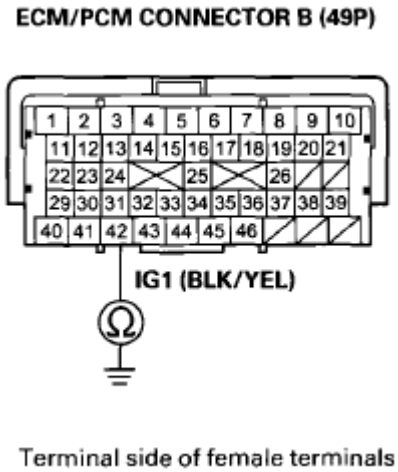

Fig. 225: Checking Continuity Between ECM/PCM Connector Terminal B42 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the No. 9 FUEL PUMP (20 A) fuse and the ECM/PCM (B42), between the No. 9 FUEL PUMP (20 A) fuse and PGM-FI main relay 2, or between the No. 9 FUEL PUMP (20 A) fuse and the immobilizer control unit. Also replace the No. 9 FUEL PUMP (20 A) fuse. •

NO - Replace the No. 9 FUEL PUMP (20 A) fuse, and update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away and the ECM/PCM was updated, troubleshooting is complete. If the symptom/indication goes away and the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). •

56. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
57. Remove the access panel from the floor (see **FUEL TANK UNIT REMOVAL AND INSTALLATION**).
58. Disconnect the fuel pump 4P connector.
59. Check for continuity between fuel pump 4P connector terminal No. 2 and body ground.

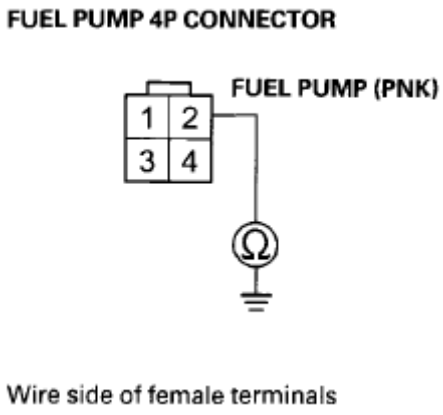

Fig. 226: Checking Continuity Between Fuel Pump 4P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the fuel pump and PGM-FI main relay 2. Also replace the No. 9 FUEL PUMP(20A)fuse. •

NO - Check the fuel pump, and replace it if needed (see **FUEL PUMP/FUEL GAUGE SENDING UNIT REPLACEMENT**). Also replace the No. 9 FUEL PUMP (20 A) fuse. •

60. Jump the SCS line with the HDS.
61. Disconnect ECM/PCM connectors A (49P) and B (49P).
62. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
63. Measure the voltage between ECM/PCM connector terminal B42 and body ground.

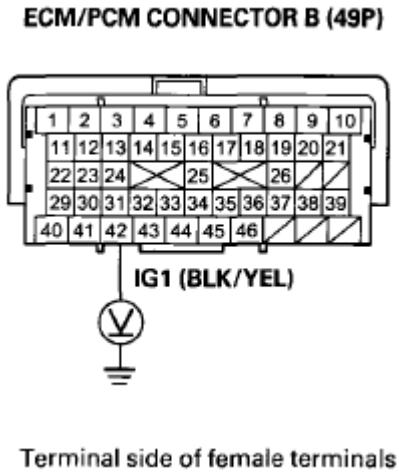

Fig. 227: Measuring Voltage Between ECM/PCM Connector Terminal B42 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 64.

NO - Repair open in the wire between the No. 9 FUEL PUMP (20 A) fuse and the ECM/PCM (B42). •

64. Measure the voltage between ECM/PCM connector terminal A6 and body ground.

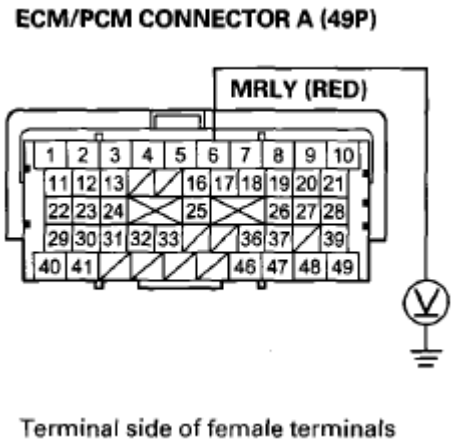

Fig. 228: Measuring Voltage Between ECM/PCM Connector Terminal A6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 69.

NO - Go to step 65.

65. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
66. Remove PGM-FI main relay 1 (A) from the under-hood fuse/relay box.

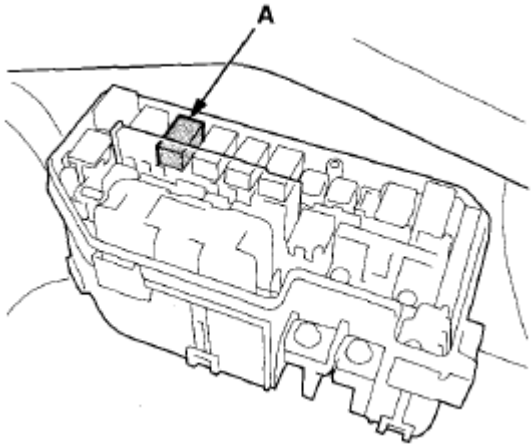

Fig. 229: Identifying PGM-FI Main Relay 1

Courtesy of AMERICAN HONDA MOTOR CO., INC.

67. Measure the voltage between PGM-FI main relay 1 4P connector terminal No. 4 and body ground.

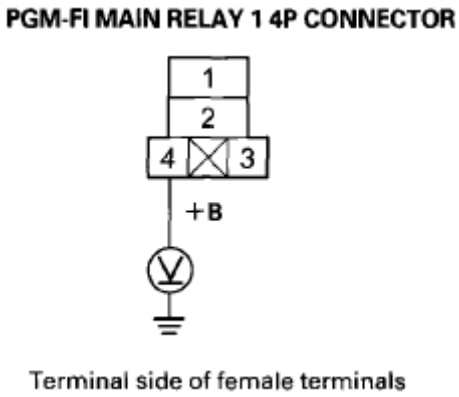

Fig. 230: Measuring Voltage Between PGM-FI Main Relay 1 4P Connector Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 68.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**). •

68. Check for continuity between PGM-FI main relay 1 4P connector terminal No. 3 and ECM/PCM connector terminal A6.

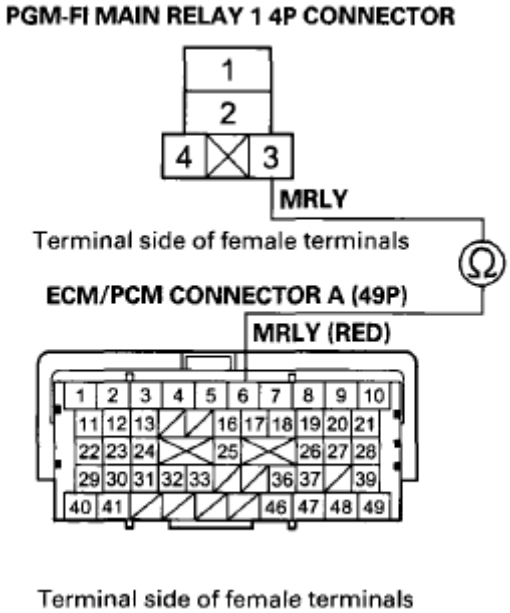

Fig. 231: Checking Continuity Between PGM-FI Main Relay 1 4P Connector Terminal No. 3 And

ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Test PGM-FI main relay 1 (see **POWER RELAY TEST**). If the relay is OK, update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away and the ECM/PCM was updated, troubleshooting is complete. If the symptom/indication goes away and the ECM/PCM was substituted, replace the original **ECM/PCM** (see **ECM/PCM Replacement**). •

NO - Repair open in the wire between the ECM/PCM (A6) and PGM-FI main relay 1. •

69. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
70. Remove PGM-FI main relay 1 (A) from the under-hood fuse/relay box.

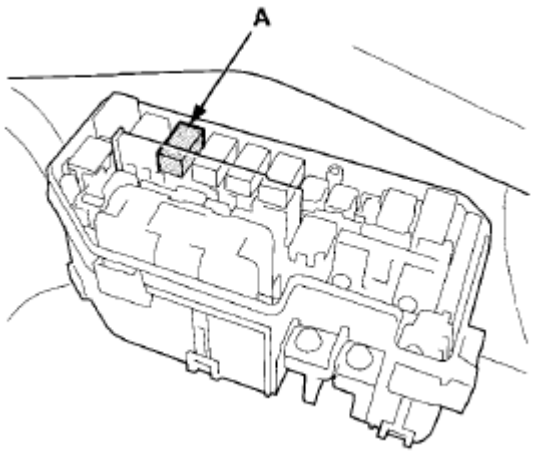

Fig. 232: Identifying PGM-FI Main Relay 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

71. Measure the voltage between PGM-FI main relay 1 4P connector terminal No. 1 and body ground.

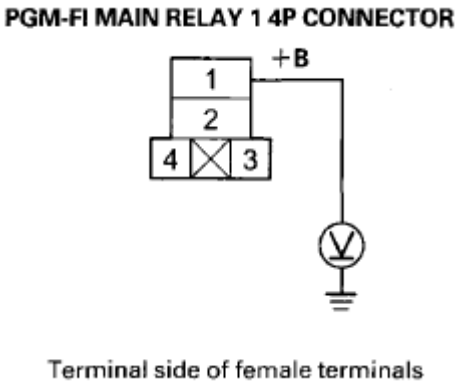

Fig. 233: Measuring Voltage Between PGM-FI Main Relay 1 4P Connector Terminal No. 1 And

Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 72.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**). •

72. Check for continuity between PGM-FI main relay 1 4P connector terminal No. 2 and ECM/PCM connector terminal B3.

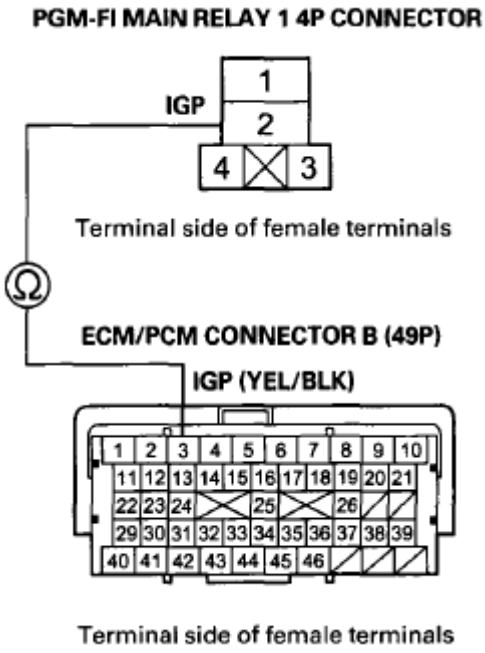

Fig. 234: Checking Continuity Between PGM-FI Main Relay 1 4P Connector Terminal No. 2 And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 73.

NO - Repair open in the wire between the ECM/PCM (B3) and PGM-FI main relay 1. •

73. Test PGM-FI main relay 1 (see **POWER RELAY TEST**).

Is PGM-FI main relay 1 OK?

YES - Go to step 74.

NO - Replace PGM-FI main relay 1. •

74. Disconnect ECM/PCM connectors A (49P), B (49P), and C (49P).
75. Check for continuity between body ground and

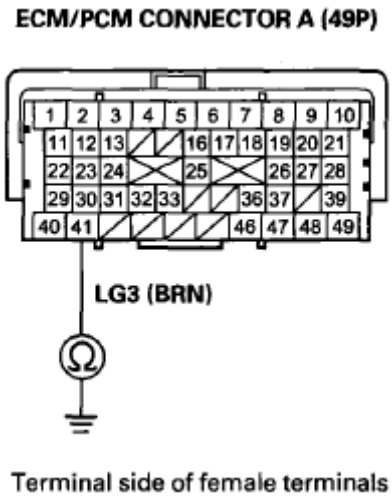

Fig. 235: Checking Continuity Between Body Ground And ECM/EPM Connector A(49P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

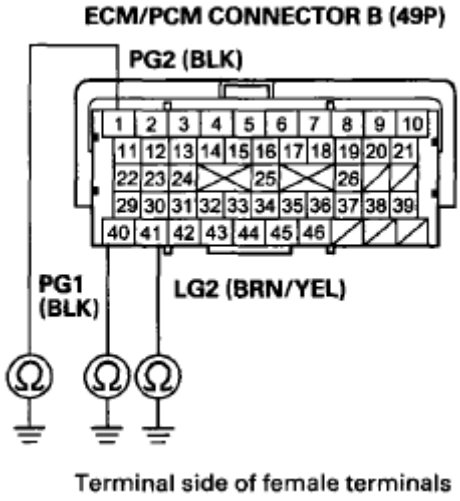

Fig. 236: Checking Continuity Between Body Ground And ECM/EPM Connector B(49P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

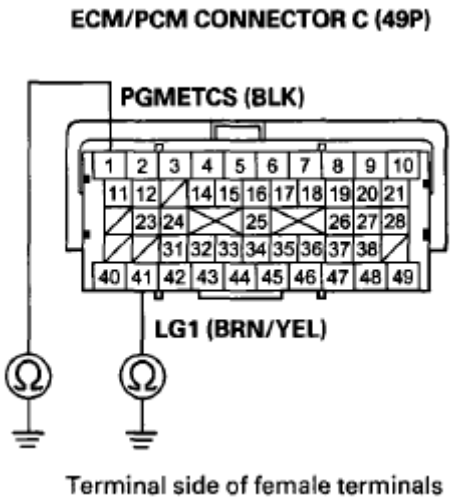

Fig. 237: Checking Continuity Between Body Ground And ECM/EPM Connector C(49P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Update the **ECM/PCM** if it does not have the latest software (see **ECM/PCM Update**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom/indication goes away and the ECM/PCM was updated, troubleshooting is complete. If the symptom/indication goes away and the ECM/PCM was substituted, replace the original **ECM/PCM**. •

NO - Repair open in the wire(s) between the PCM (A41, B1, B40, B41, C1, C41)and body ground (G101; M/T (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), A/T (see **CONNECTOR TO FUSE/RELAY BOX INDEX**)). •

INJECTOR REPLACEMENT

1. Relieve the fuel pressure (see **FUEL PRESSURE RELIEVING**).
2. Remove the intake manifold (see **REMOVAL**).
3. Disconnect the quick-connect fitting (A); without SH-AWD (see **FUEL LINE/QUICK-CONNECT FITTING REMOVAL**), with SH-AWD (see **WITH SH-AWD**).

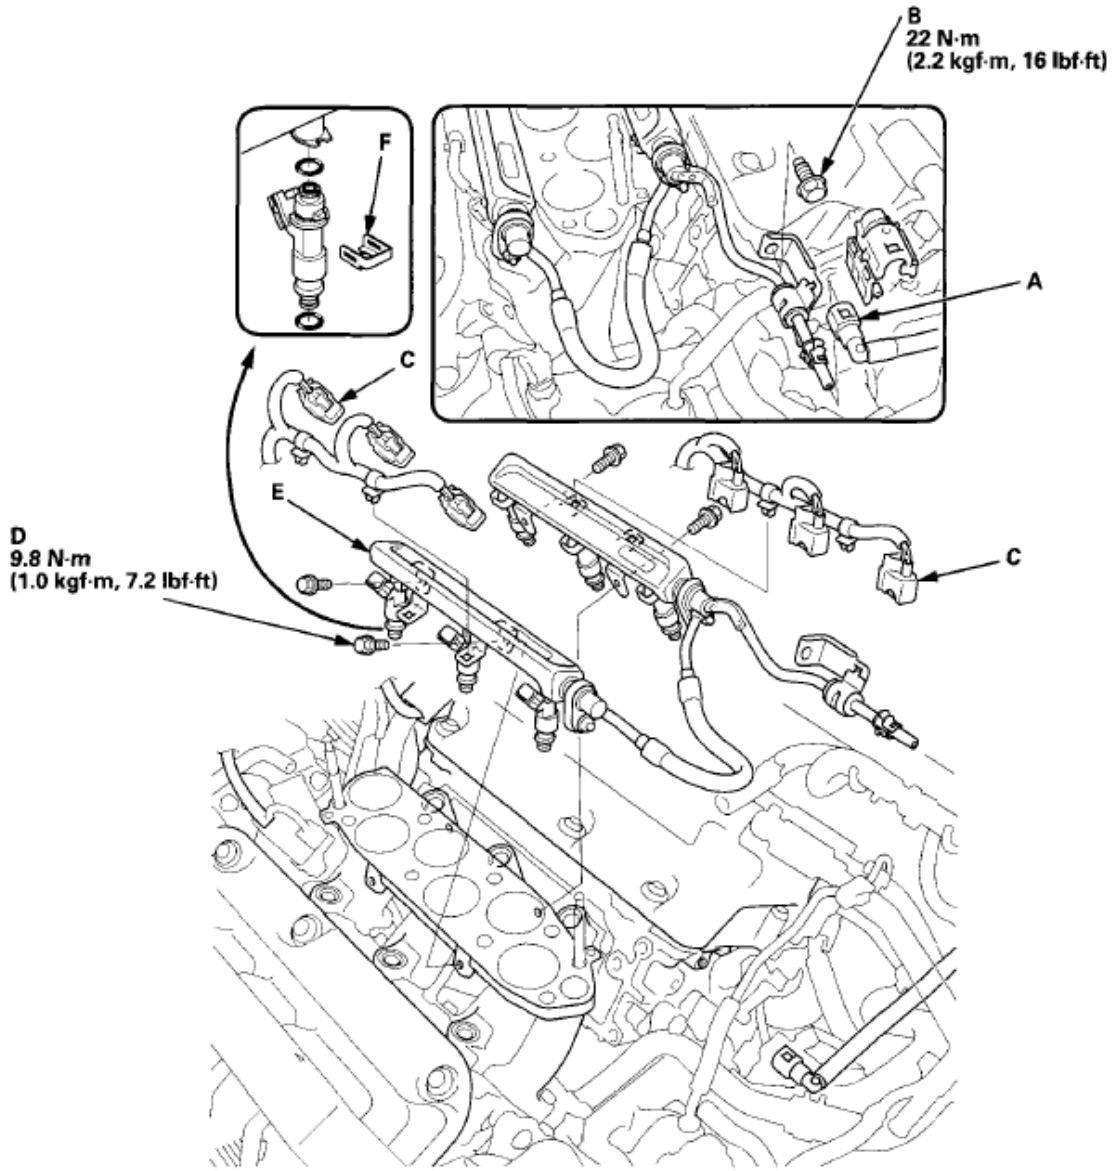

Fig. 238: Identifying Injector And Related Components With Torque Specifications (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the fuel joint hose mounting bolt (B).
5. Disconnect the connectors (C) from the injectors.
6. Remove the fuel rail mounting bolts (D) from the fuel rails (E).
7. Remove the fuel rails and the injectors from the injector base.
8. Remove the injector clips (F) from the fuel rails.
9. Remove the injectors from the fuel rails.
10. Coat the new O-rings (black) (A) with clean engine oil, and insert the injectors (B) into the fuel rails (C).

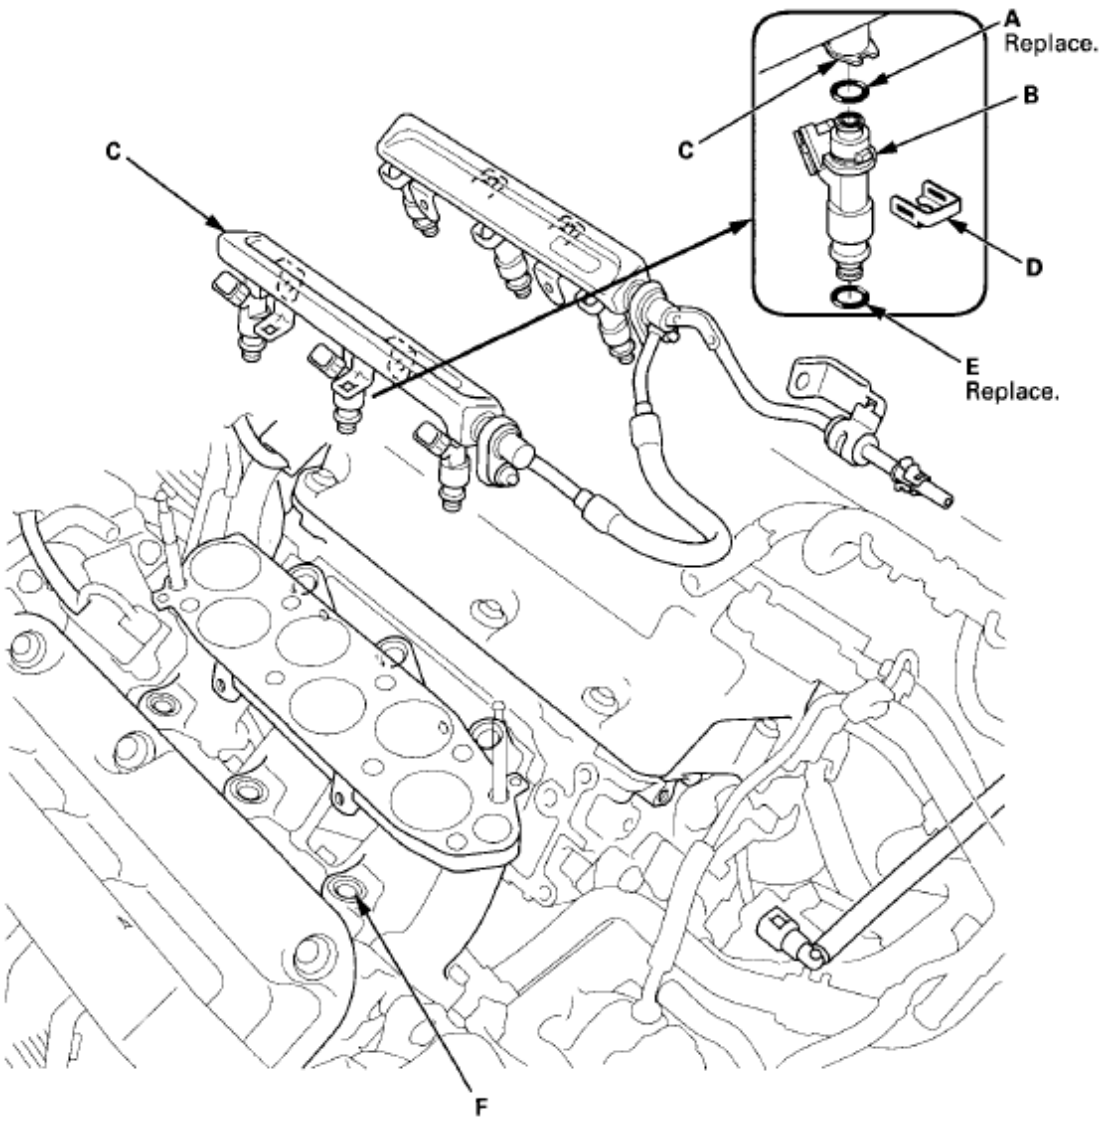

Fig. 239: Identifying Injector And Related Components (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Install the injector clips (D).
12. Coat the new O-rings (green) (E) with clean engine oil.
13. Install the fuel rails and the injectors in the injector base (F).
14. Install the fuel rail mounting bolts, and connect the injector connectors.
15. Install the fuel joint hose mounting bolt.
16. Connect the quick-connect fitting; without SH-AWD (see **FUEL LINE/QUICK-CONNECT FITTING INSTALLATION**), with SH-AWD (see **WITH SH-AWD**).
17. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, but do not operate the starter. After the fuel pump runs for about 2 seconds, the fuel rail will be pressurized. Repeat this two or three times, then make sure there are no fuel leaks.
18. Install the intake manifold with a new gasket (see **INSTALLATION**).

MAP SENSOR REPLACEMENT

1. Disconnect the MAP sensor connector (A).

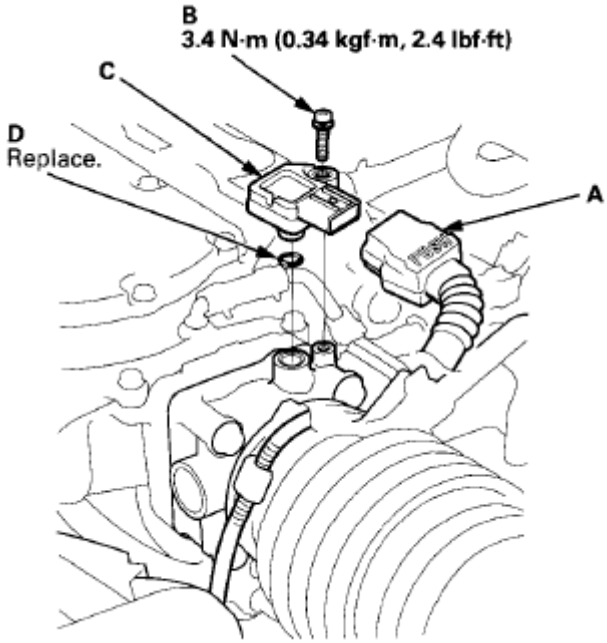

Fig. 240: Identifying MAP Sensor Connector, Screw, MAP Sensor And O-Ring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the screw (B).
3. Remove the MAP sensor (C).
4. Install the parts in the reverse order of removal with a new O-ring (D).

MAF SENSOR/IAT SENSOR REPLACEMENT

1. Disconnect the MAF sensor/IAT senor 5P connector (A).

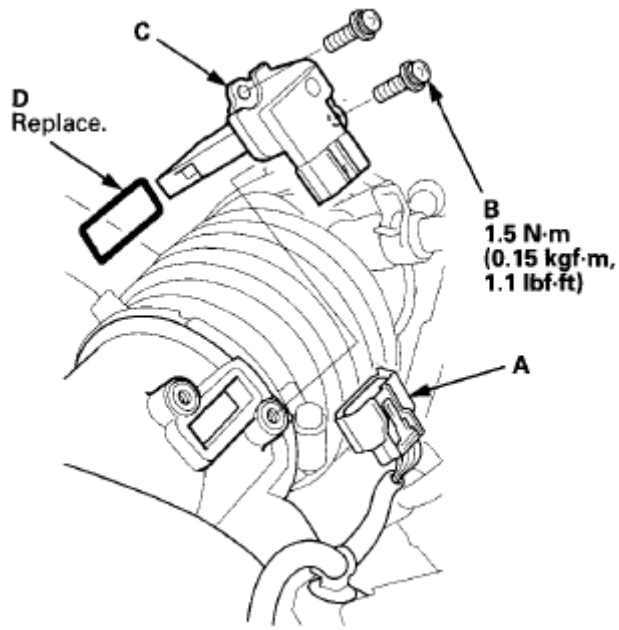

Fig. 241: Identifying MAF Sensor/IAT Sensor And Connector, Screws And O-Ring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the screws (B).
3. Remove the MAF sensor/IAT sensor (C).
4. Install the parts in the reverse order of removal with a new O-ring (D).

ECT SENSOR 1 REPLACEMENT

1. Drain the engine coolant (see **COOLANT CHECK**).
2. Disconnect the ECT sensor 1 2P connector (A).

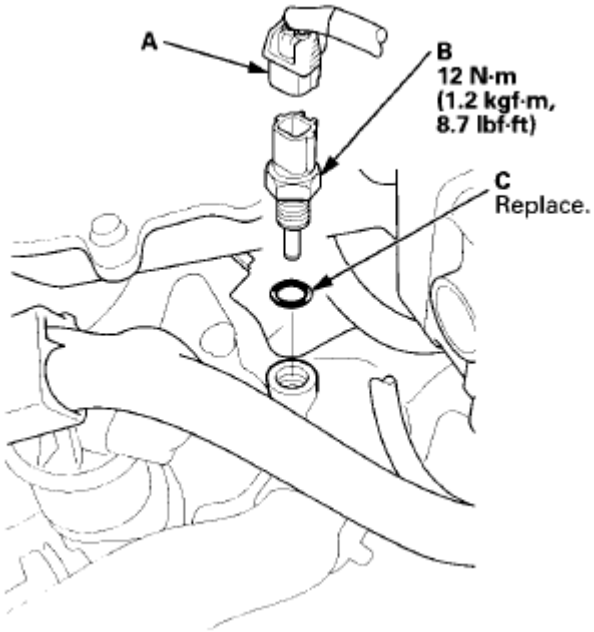

Fig. 242: Identifying ECT Sensor 12P Connector, ECT Sensor And O-Ring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove ECT sensor 1 (B).
4. Install the parts in the reverse order of removal with a new O-ring (C), then refill the radiator with engine coolant (see **COOLANT CHECK**).

ECT SENSOR 2 REPLACEMENT

1. Remove the splash shield.
2. Drain the engine coolant (see **COOLANT CHECK**).
3. Disconnect the ECT sensor 2 2P connector (A).

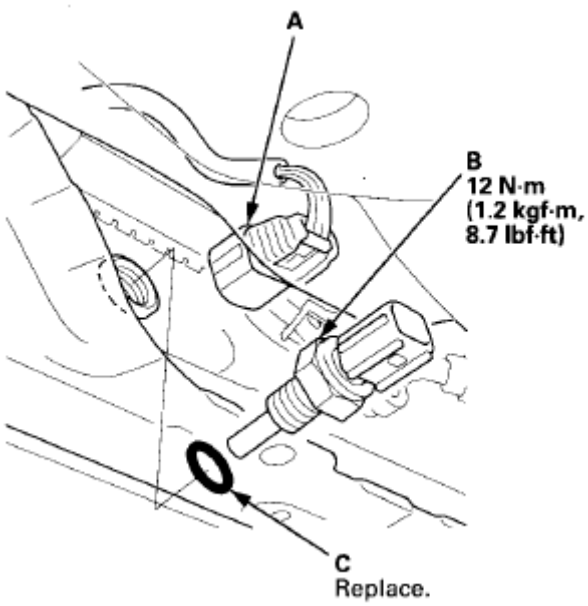

Fig. 243: Identifying ECT Sensor 2 2P Connector, ECT Sensor 2 And O-Ring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove ECT sensor 2 (B).
5. Install the parts in the reverse order of removal with a new O-ring (C), then refill the radiator with engine coolant (see **COOLANT CHECK**).

A/F SENSOR REPLACEMENT

Special Tools Required

O2 Sensor Socket Wrench Snap-on SWR2 or O2 Sensor Wrench Snap-on YA8875, commercially available

FRONT BANK (BANK 2)

1. Disconnect the front A/F sensor 6P connector (A), then remove the A/F sensor (B).

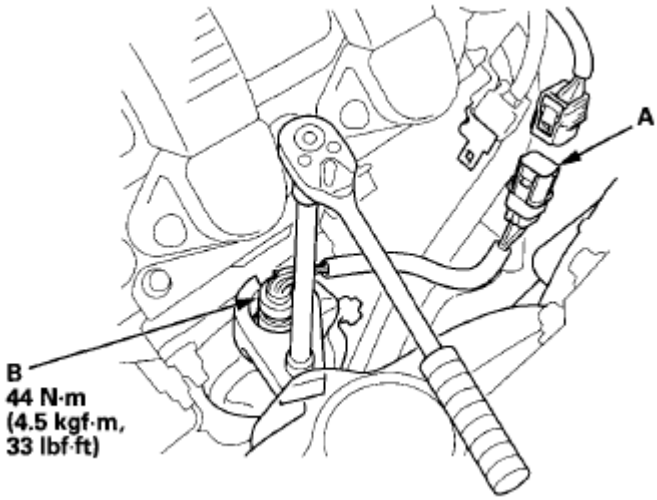

Fig. 244: Identifying Front A/F Sensor 6P Connector And A/F Sensor With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the parts in the reverse order of removal.

REAR BANK(BANK 1)

1. Disconnect the rear A/F sensor 6P connector (A), then remove the A/F sensor (B).

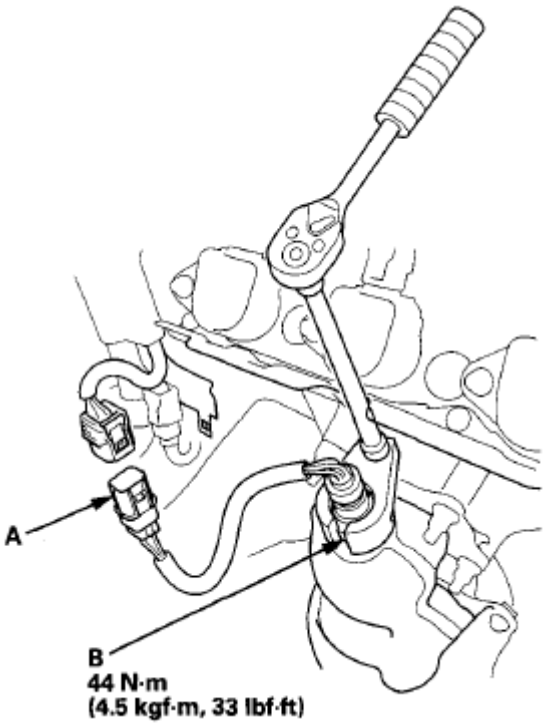

Fig. 245: Identifying Rear A/F Sensor 6P Connector And A/F Sensor With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the parts in the reverse order of removal.

SECONDARY HO2S REPLACEMENT

SPECIAL TOOLS REQUIRED

O2 Sensor Socket Wrench Snap-on SWR2 or O2 Sensor Wrench Snap-on YA8875, commercially available

FRONT BANK (BANK 2)

M/T

1. Raise the vehicle on a lift.
2. Disconnect the front secondary HO2S 4P connector (A), and remove the harness clamp (B).

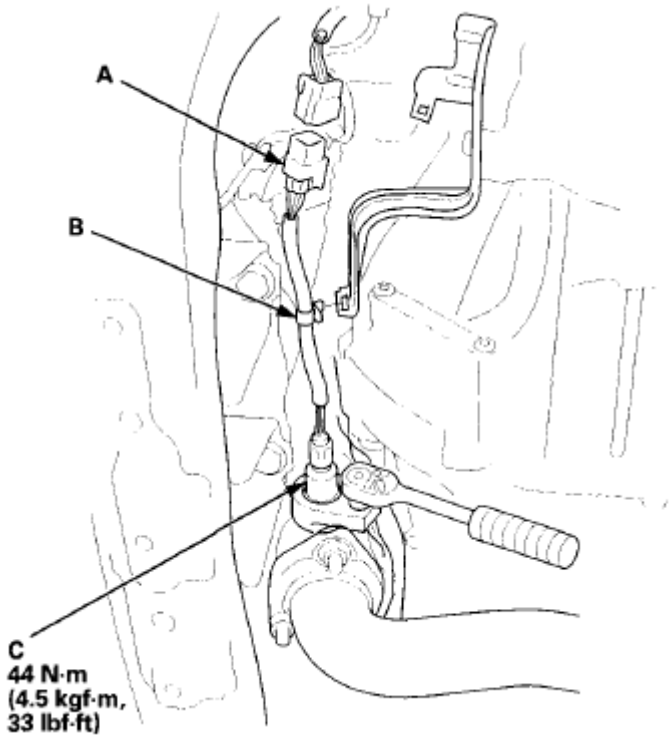

Fig. 246: Identifying Front Secondary HO2S 4P Connector And Harness Clamp With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove front secondary HO2S (C).
4. Install the parts in the reverse order of removal.

FRONT BANK (BANK 2)

A/T

1. Disconnect the front secondary HO2S 4P connector (A), and remove the harness clamps (B) and the bolt (C).

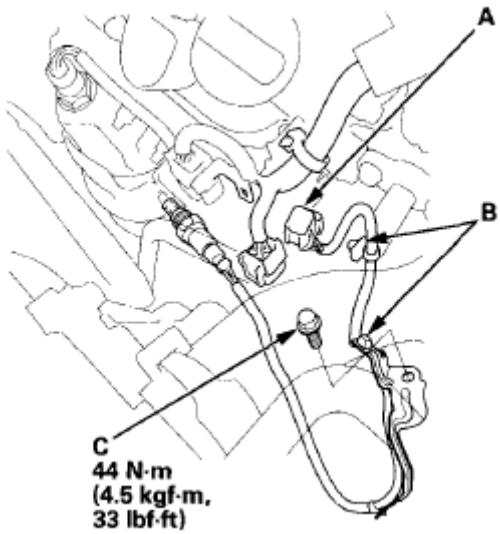

Fig. 247: Identifying Front Secondary HO2S 4P Connector, Harness Clamps And Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Raise the vehicle on a lift.
3. Remove front secondary HO2S (A).

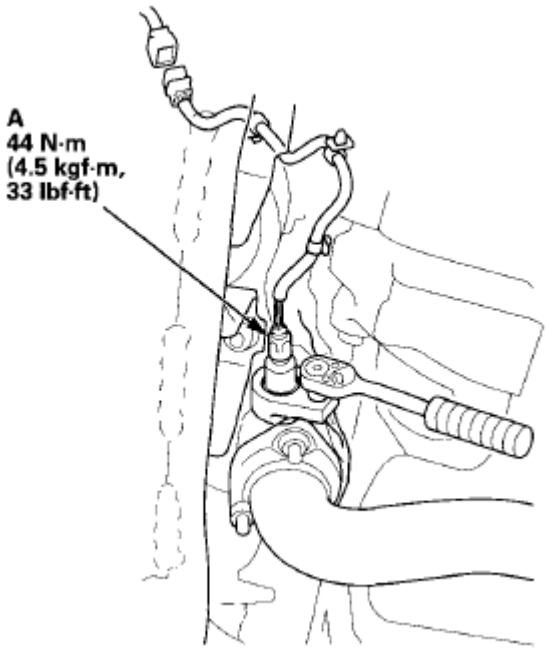

Fig. 248: Identifying Front Secondary HO2S With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the parts in the reverse order of removal.

REAR BANK(BANK 1)

1. Raise the vehicle on a lift.
2. Disconnect the rear secondary HO2S 4P connector (A), and remove the harness clamps (B).

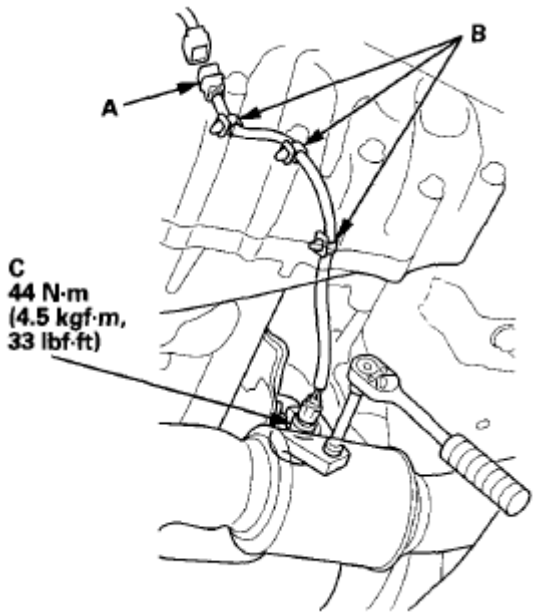

Fig. 249: Identifying Rear Secondary HO2S 4P Connector And Harness Clamps With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove rear secondary HO2S (C).
4. Install the parts in the reverse order of removal.

CMP SENSOR REPLACEMENT

1. Remove the timing belt (see **TIMING BELT REMOVAL**).
2. Remove the front camshaft pulley (CMP sensor pulse plate) (A).

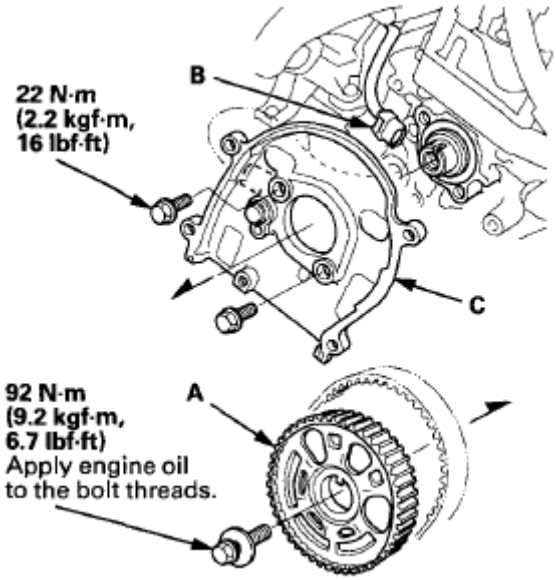

Fig. 250: Identifying Front Camshaft Pulley (CMP Sensor Pulse Plate) With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the CMP sensor connector (B), then remove the back cover (C).
4. Remove the CMP sensor (A) from the back cover.

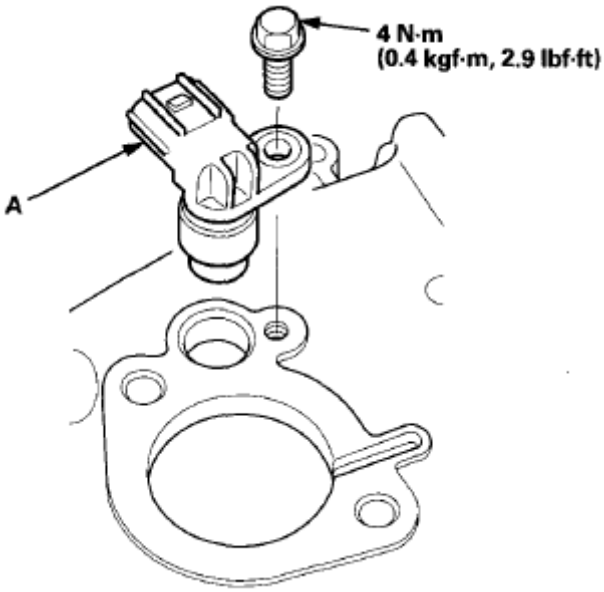

Fig. 251: Identifying CMP Sensor On Back Cover With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the parts in the reverse order of removal. Install the timing belt (see **TIMING BELT INSTALLATION**).
6. Do the CKP pattern clear/CKP pattern learn procedure (see **CKP PATTERN CLEAR/CKP PATTERN LEARN**).

CKP SENSOR REPLACEMENT

1. Raise the vehicle on a lift.

NOTE: Make the vehicle is level, because engine oil will drip out when you remove the sensor.

2. Remove the CKP sensor cover (A).

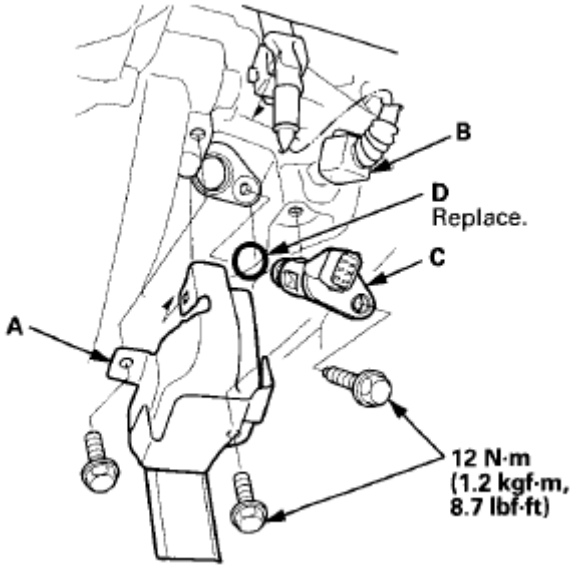

Fig. 252: Identifying CKP Sensor Cover With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the CKP sensor connector (B).
4. Remove the CKP sensor (C).
5. Install the parts in the reverse order of removal with a new O-ring (D).
6. Do the CKP pattern clear/CKP pattern learn procedure (see **CKP PATTERN CLEAR/CKP PATTERN LEARN**).
7. Check for engine oil level, and add more oil if needed.

KNOCK SENSOR REPLACEMENT

1. Remove the intake manifold (see **REMOVAL**).
2. Remove the injector base (see **INJECTOR BASE REMOVAL AND INSTALLATION**).
3. Disconnect the knock sensor connector (A).

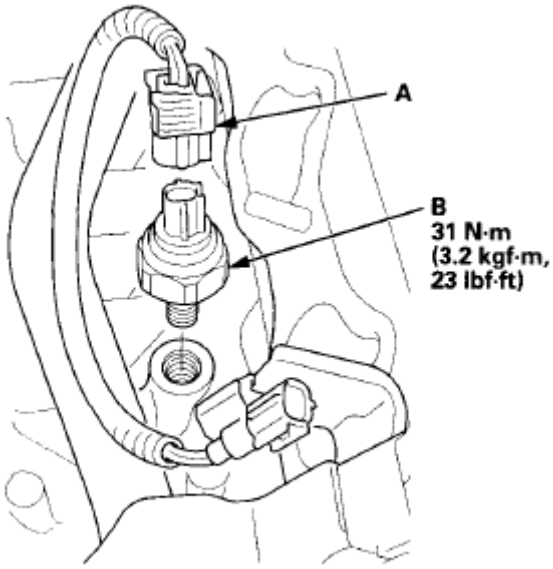

Fig. 253: Identifying Knock Sensor Connector With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the knock sensor (B).
5. Install the parts in the reverse order of removal.

INPUT SHAFT (MAINSHAFT) SPEED SENSOR REPLACEMENT

NOTE: For A/T models (see INPUT SHAFT (MAINSHAFT) SPEED SENSOR REPLACEMENT).

M/T

1. Raise the vehicle on a lift.
2. Remove the splash shield.
3. Disconnect the input shaft (mainshaft) speed sensor connector (A).

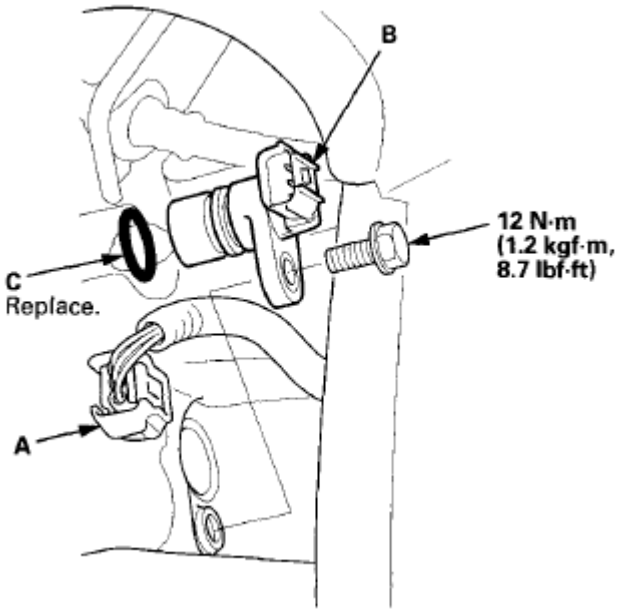

Fig. 254: Identifying Input Shaft Speed Sensor Connector With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the input shaft (mainshaft) speed sensor (B).
5. Install the parts in the reverse order of removal with a new O-ring (C).
6. If needed, refill the manual transmission fluid (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**).

OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR REPLACEMENT

NOTE: For A/T models (see INPUT SHAFT (MAINSHAFT) SPEED SENSOR REPLACEMENT).

M/T

1. Raise the vehicle on a lift.
2. Remove the splash shield.
3. Disconnect the output shaft (countershaft) speed sensor connector (A).

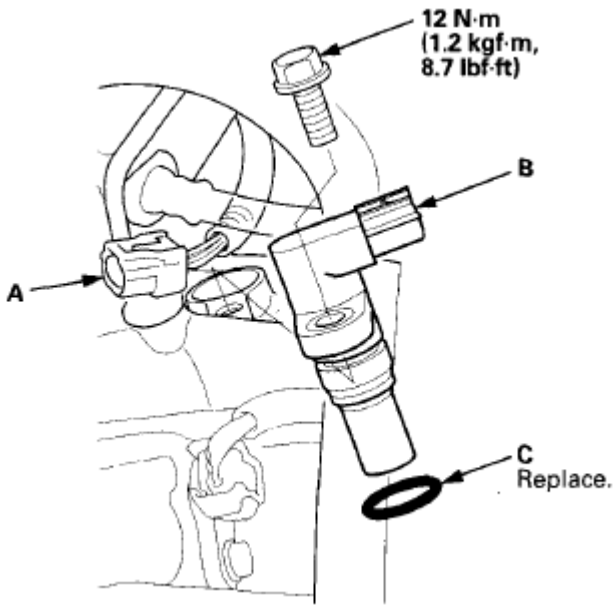

Fig. 255: Identifying Output Shaft Speed Sensor Connector With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the output shaft (countershaft) speed sensor (B).
5. Install the parts in the reverse order of removal with a new O-ring (C).

ELD REPLACEMENT

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
2. Remove the upper cover (A), then remove the two positive (+) terminals (B).

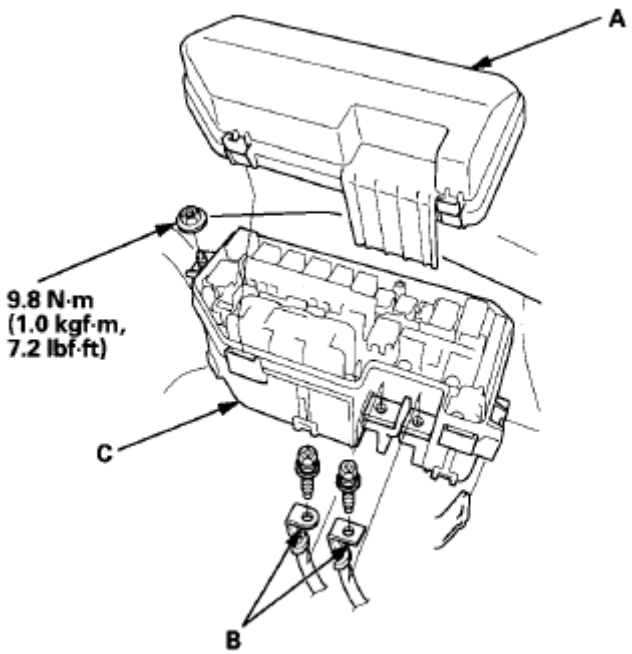

Fig. 256: Identifying Upper Cover With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the under-hood fuse/relay box (C) from the bracket.
4. Remove the lower cover (A). A-

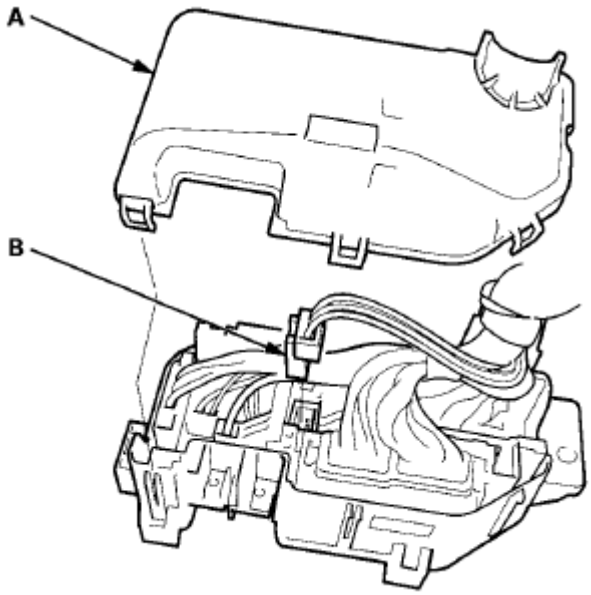

Fig. 257: Identifying Lower Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Disconnect the ELD 3P connector (B).
6. Remove the fuses (A and B).

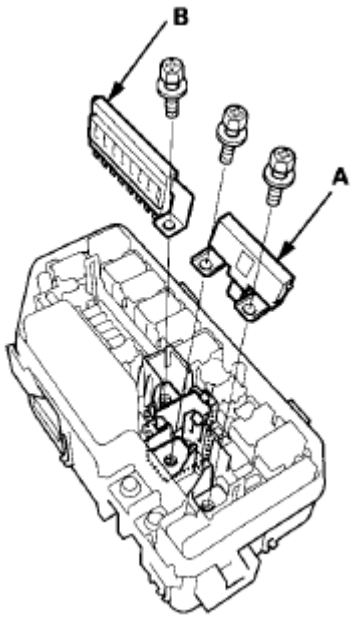

Fig. 258: Identifying Fuses
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Release the three lock tabs (A), then remove the ELD (B).

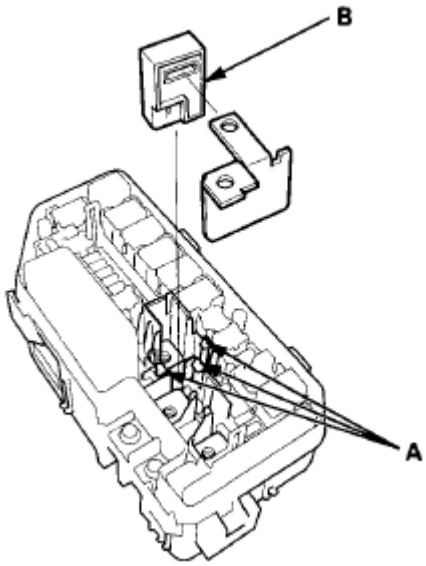

Fig. 259: Identifying Lock Tabs And ELD
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the parts in the reverse order of removal.
9. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

ECM/PCM UPDATE

Special Tools Required

- Honda Diagnostic System (HDS) tablet tester
- Honda Interface Module (HIM) and an iN workstation with the latest HDS software version
- HDS pocket tester
- GNA600 and an iN workstation with the latest HDS software version
- MVCI unit with the latest control module (CM) update software installed

Any one of the above updating tools can be used.

NOTE:

- **Make sure the HDS/iN workstation or the MVCI unit has the latest HDS software version.**
- **Before you update the ECM/PCM, make sure the battery in the vehicle is fully charged, and connect a jumper battery (not a battery charger) to maintain system voltage.**
- **Never turn the ignition switch to ACC (I) or LOCK (0), or never press the engine start/stop button to select the OFF or ACC mode during the update. If there is a problem with the update, leave the ignition switch ON (II) or vehicle in the ON mode.**
- **To prevent ECM/PCM damage, do not operate anything electrical (headlights, audio system, brakes, A/C, power windows, moonroof, door locks, etc.) during the update.**
- **To ensure the latest program is installed, do a ECM/PCM update whenever the ECM/PCM is substituted or replaced.**
- **You cannot update a ECM/PCM with a program it already has. It will only accept a new program.**
- **High temperature in the engine compartment might cause the ECM/PCM to become too hot to run the update. If the engine has been running before this procedure, open the hood and cool the engine compartment.**
- **If you need to diagnose the Honda interface module (HIM) because the HIM's red (#3) light came on or was flashing during the update, leave the ignition switch in ON (II) or vehicle in the ON mode when you disconnect the HIM from the data link connector (DLC). This will prevent ECM/PCM damage.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, but do not start the engine.
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

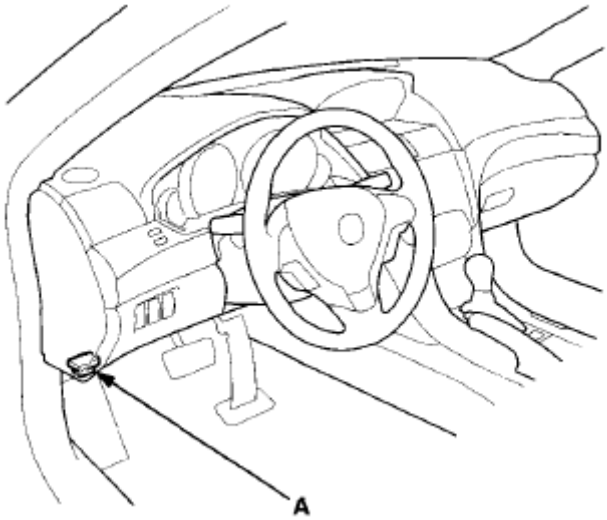

Fig. 260: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it doesn't, go to the **DLC circuit troubleshooting**. If you are returning from the DLC circuit troubleshooting, skip steps 4 and 5, and clean the throttle body (see **THROTTLE BODY CLEANING**) after updating the ECM/PCM.
4. Select the INSPECTION MENU with the HDS.
5. Select the ETCS TEST, then select the TP POSITION CHECK, and follow the HDS screen prompts.

NOTE: If the TP POSITION CHECK indicates FAILED, continue this procedure.

6. Exit the HDS diagnostic system, then select the update mode, and follow the screen prompts to update the ECM/PCM.
7. If the software in the ECM/PCM is the latest, disconnect the updating tool from the DLC, and go back to the procedure that you were doing. If the software in the ECM/PCM is not the latest, follow the instructions on the screen. If prompted to choose the PGM-FI system or the A/T system, make sure you update both.

NOTE: If the ECM/PCM update system requires you to cool the ECM/PCM, follow the instructions on screen. If you run into a problem during the update procedure (programming takes over 15 minutes, status bar goes over 100 %, D or immobilizer indicator flashes, HDS tablet freezes, etc.), follow these steps to minimize the chance of damaging the ECM/PCM:

- Leave the ignition switch in ON (II) or vehicle in the ON mode.
- Connect a jumper battery (do not connect a battery charger).
- Shut down the updating tool.
- Disconnect the updating tool from the DLC.
- Reboot the updating tool.

- Reconnect the updating tool to the DLC, and try the update procedure again.

8. If the TP POSITION CHECK failed in step 5, clean the throttle body (see **THROTTLE BODY CLEANING**).
9. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
10. Do the CKP pattern clear/CKP pattern learn procedure (see **CKP PATTERN CLEAR/CKP PATTERN LEARN**).

ECM/PCM REPLACEMENT

Special Tools Required

- Honda Diagnostic System (HDS) tablet tester
- Honda Interface Module (HIM) and an iN workstation with the latest HDS software version
- HDS pocket tester
- GNA600 and an iN workstation with the latest HDS software version
- MVCI unit with the latest control module (CM) update software installed

Any one of the above updating tools can be used.

NOTE: Make sure the HDS/iN workstation or the MVCI unit has the latest HDS software version.

1. Connect HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

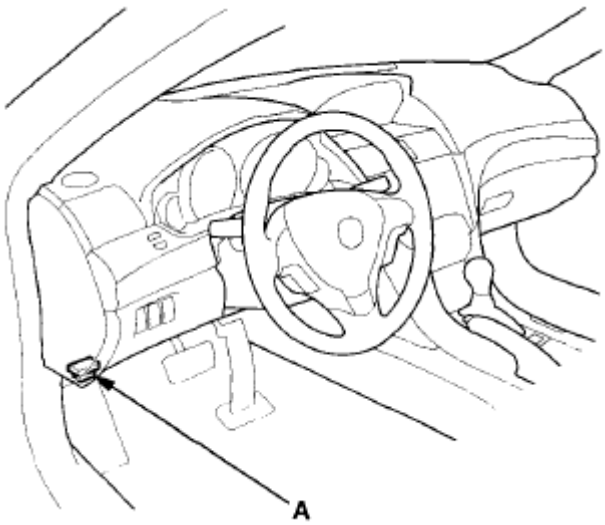

Fig. 261: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it doesn't, go to the

DLC circuit troubleshooting. If you are returning from the DLC circuit troubleshooting, skip steps 4 through 9, 17 through 22, and 25 through 27, and do this after replacing the ECM/PCM:

- Replace the engine oil (see **ENGINE OIL LEVEL CHECK**) and the engine oil filter (see **ENGINE OIL FILTER REPLACEMENT**).
- Replace the ATF (A/T) (see **ATF REPLACEMENT**).
- Clean the throttle body (see **THROTTLE BODY CLEANING**).

4. Select the PGM-FI system with the HDS.
5. Select the INSPECTION MENU with the HDS.
6. Select the ETCS TEST, then select the TP POSITION CHECK, and follow the screen prompts.

NOTE: If the TP POSITION CHECK indicates FAILED, continue with this procedure.

7. Select the REPLACE PCM MENU, then select READ DATA, and follow the screen prompts.

NOTE:

- **Doing this step copies (READS) the engine oil life data from the original ECM/PCM so you can later download (WRITES) it into the new ECM/PCM.**
- **If READ DATA indicates FAILED, continue with this procedure.**

8. A/T: Select the A/T system with the HDS.
9. A/T: Select the REPLACE TCM/PCM MENU, then select READ DATA, and follow the screen prompts.

NOTE:

- **Doing this step copies (READS) the ATF life data from the original PCM so you can later download (WRITES) it into the new PCM.**
- **If READ DATA indicates FAILED, continue with this procedure.**

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Jump the SCS line with the HDS.
12. Disconnect ECM/PCM connectors A, B, and C, then remove the ECM/PCM assembly (D).

NOTE: ECM/PCM connectors A, B, and C have symbols (A=[], B=delta, C=o) embossed on them for identification.

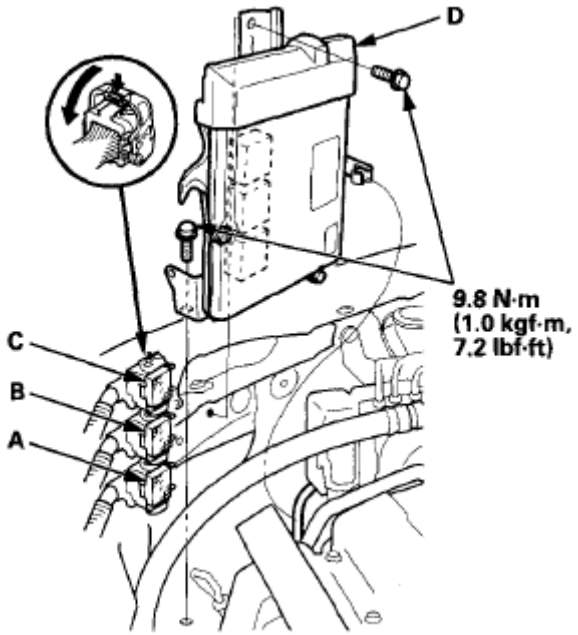

Fig. 262: Identifying ECM/PCM Connectors A, B And C With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Remove the cover (A) and the bracket (B) from the ECM/PCM (C).

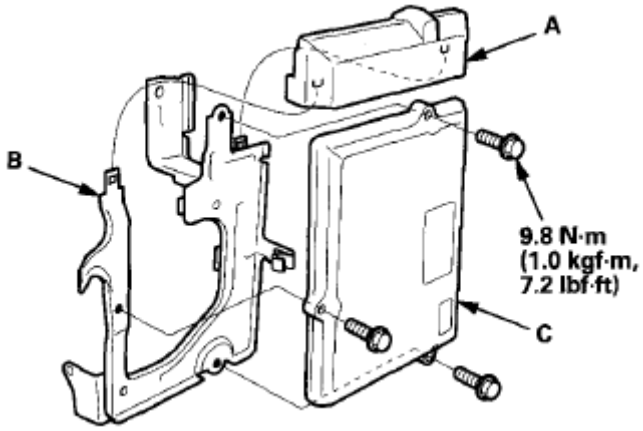

Fig. 263: Identifying Cover, Bracket And ECM/PCM With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Install the ECM/PCM in the reverse order of removal.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Manually input the VIN to the ECM/PCM with the HDS.

NOTE: DTC P0630 VIN Not Programmed or Mismatch may be stored because the VIN has not been programmed into the ECM/PCM; ignore it, and continue this procedure.

17. If the READ DATA (engine oil life) failed in step 7, go to step 20 (A/T) or step 23 (M/T). Otherwise, go to step 18.
18. Select the PGM-FI system with the HDS.
19. Select the REPLACE PCM MENU, then select WRITE DATA, and follow the screen prompts.

NOTE: If the WRITE DATA indicates FAILED, continue with this procedure.

20. A/T: If the READ DATA (ATF life) failed in step 9, go to step 23. Otherwise go to step 21.
21. A/T: Select the A/T SYSTEM with the HDS.
22. A/T: Select the REPLACE TCM/PCM MENU, then select WRITE DATA, and follow the screen prompts.

NOTE: If the WRITE DATA indicates FAILED, continue with this procedure.

23. Select IMMOBI system (without keyless access) or ONE PUSH START system (with keyless access) with the HDS.
24. Enter the immobilizer ECM/PCM code that you got from the iN, and use the ECM/PCM replacement procedure in the IMMOBI Menu (without keyless access) or ONE PUSH START Menu (with keyless access) of the HDS; it allows you to start the engine.
25. If the TP POSITION CHECK failed in step 6 clean the throttle body (see **THROTTLE BODY CLEANING**), then go to step 26.
26. If the READ DATA failed in step 7 or the WRITE DATA failed in step 19, replace the engine oil (see **ENGINE OIL LEVEL CHECK**) and engine oil filter (see **ENGINE OIL FILTER REPLACEMENT**), then go to step 27 (A/T) or step 28 (M/T).
27. If the READ DATA failed in step 9 or the WRITE DATA failed in step 22, replace the ATF (see **ATF REPLACEMENT**), then go to step 28.
28. Select PGM-FI system, and reset the ECM/PCM with the HDS.
29. Update the **ECM/PCM** if it does not have the latest software.
30. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
31. Do the CKP pattern clear/CKP pattern learn procedure (see **CKP PATTERN CLEAR/CKP PATTERN LEARN**).

2012 ENGINE PERFORMANCE

VTEC - TL

COMPONENT LOCATION INDEX

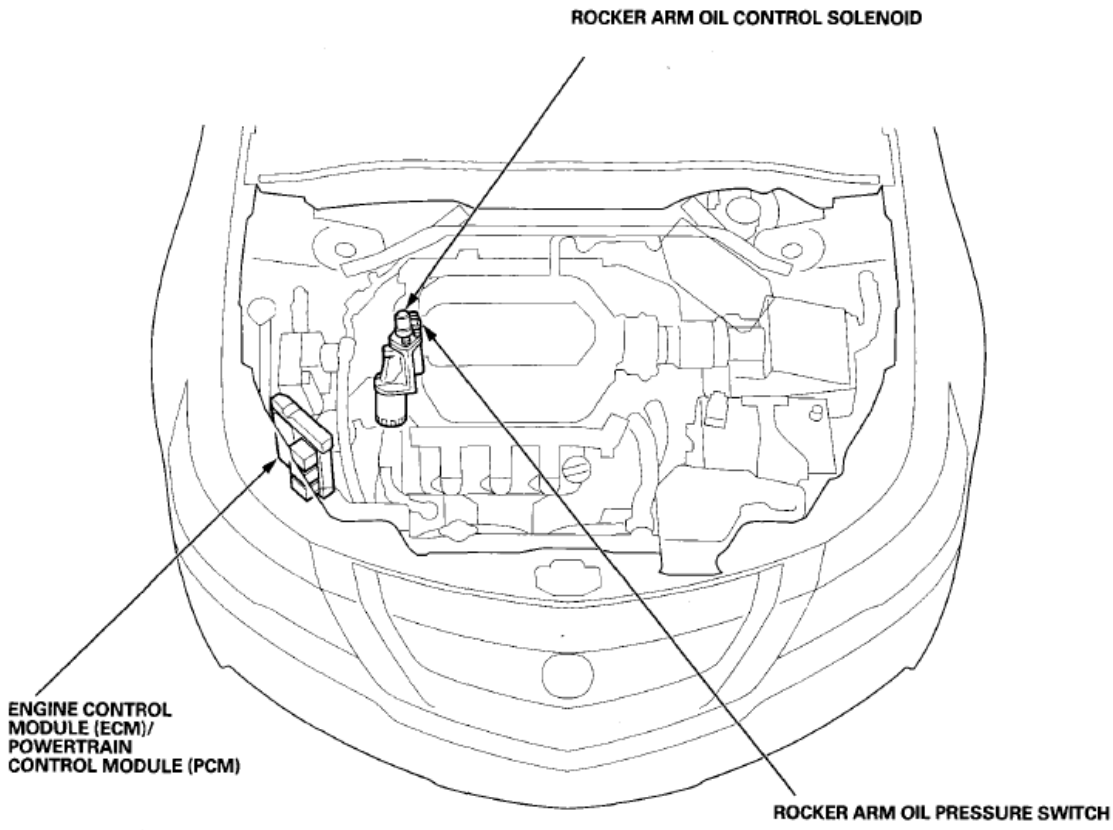

Fig. 1: VTEC Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DTC TROUBLESHOOTING

DTC P2646: ROCKER ARM OIL PRESSURE SWITCH CIRCUIT LOW VOLTAGE

Special Tools Required

- Pressure Gauge Adapter 07NAJ-P07010A
- A/T Low Pressure Gauge w/Panel 07406-0070301
- AT Pressure Test Hose 07AAJ-PY4A100
- A/T Pressure Adapter 07MAJ-PY40120
- Oil Pressure Hose 07ZAJ-S5AA200

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check the engine oil level.

   Is the engine oil level OK?

   YES - Go to step 2.

   NO - Adjust the engine oil to the proper level, then go to step 19.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Clear the DTC with the HDS.
4. Do the VTEC TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid, and the ECM/PCM. •

   NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the rocker arm oil pressure switch 2P connector.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Check the VTEC PRES SW in the DATA LIST with the HDS.

   Is switch ON indicated?

   YES - Go to step 14.

   NO - Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Remove the rocker arm oil pressure switch (A), attach the special tools as shown in illustration below, then attach the rocker arm oil pressure switch to the oil pressure gauge adapter (B).

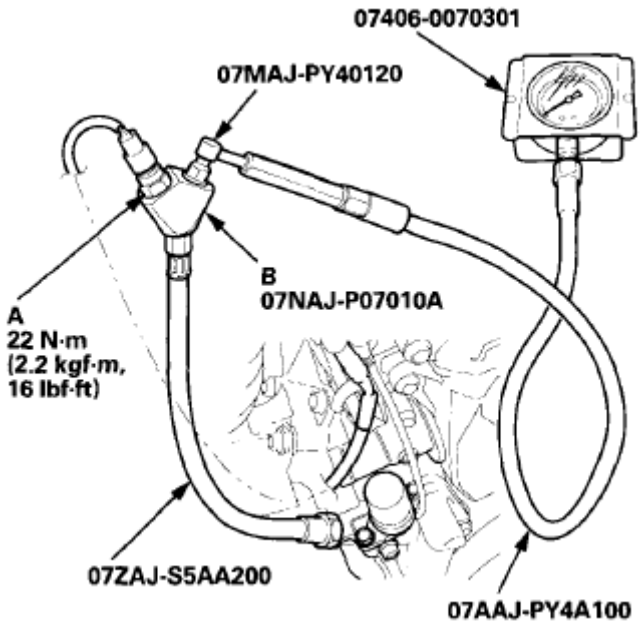

Fig. 2: Installing Special Switch And Rocker Arm Oil Pressure Switch With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Start the engine.
12. Do the VTEC TEST in the INSPECTION MENU with the HDS.
13. Check the oil pressure.

    Does the oil pressure increase to at least 392 kPa (4.0 kgf/cm^2 , 56.9 psi)?

    YES - Replace the **rocker arm oil pressure switch**, then go to step 18.

    NO - Inspect the VTEC system. If it is OK, replace the **rocker arm oil control solenoid**, then go to step 18.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Jump the SCS line with the HDS.
16. Disconnect ECM/PCM connector B (49P).
17. Check for continuity between ECM/PCM connector terminal B20 and body ground.

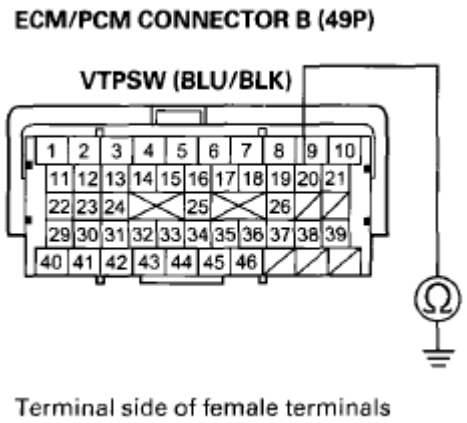

Fig. 3: Checking Continuity Between ECM/PCM Connector Terminal B20 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B20) and the rocker arm oil pressure switch, then go to step 18.

NO - Go to step 24.

18. Reconnect all connectors.
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Reset the ECM/PCM with the HDS.
21. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
22. Do the VTEC TEST in the INSPECTION MENU with the HDS.
23. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2646 indicated?

YES - Check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid, and the ECM/PCM, then go to step 1.

NO - Troubleshooting is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

24. Reconnect all connectors.
25. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
26. Do the VTEC TEST in the INSPECTION MENU with the HDS.
27. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2646 indicated?

YES - Check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 26. If the ECM/PCM was substituted, go to step 1.

NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting. •

DTC P2647: ROCKER ARM OIL PRESSURE SWITCH CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Check the engine oil level.

   Is the engine oil level OK?

   YES - Go to step 2.

   NO - Adjust the engine oil level, then go to step 17.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Clear the DTC with the HDS.
4. Check the rocker arm oil pressure switch in the DATA LIST with the HDS.

   Does the screen indicate OFF?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid, and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the rocker arm oil pressure switch 2P connector.
7. Connect rocker arm oil pressure switch 2P connector terminals No. 1 and No. 2 with a jumper wire.

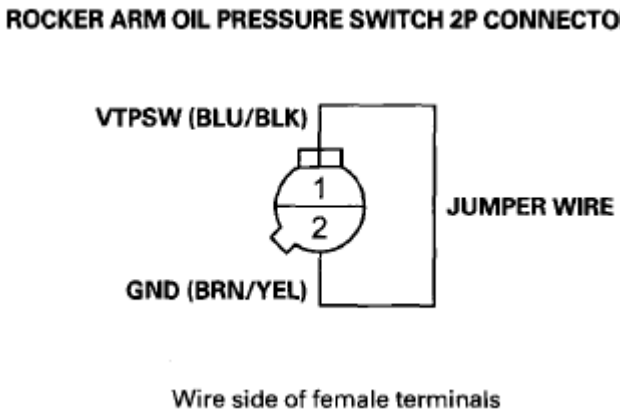

Fig. 4: Connecting Rocker Arm Oil Pressure Switch 2P Connector Terminals No. 1 And No. 2 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Check the rocker arm oil pressure switch in the DATA LIST with the HDS.

   Does the screen indicate ON?

   YES - Replace the **rocker arm oil pressure switch**, then go to step 16.

   NO - Go to step 10.

10. Turn the ignition switch to LOCK(0), or press the engine start/stop button to select the OFF mode.
11. Remove the jumper wire from the rocker arm oil pressure switch.
12. Jump the SCS line with the HDS.
13. Disconnect ECM/PCM connector B (49P).
14. Check for continuity between ECM/PCM connector terminal B20 and rocker arm oil pressure switch 2P connector terminal No. 1.

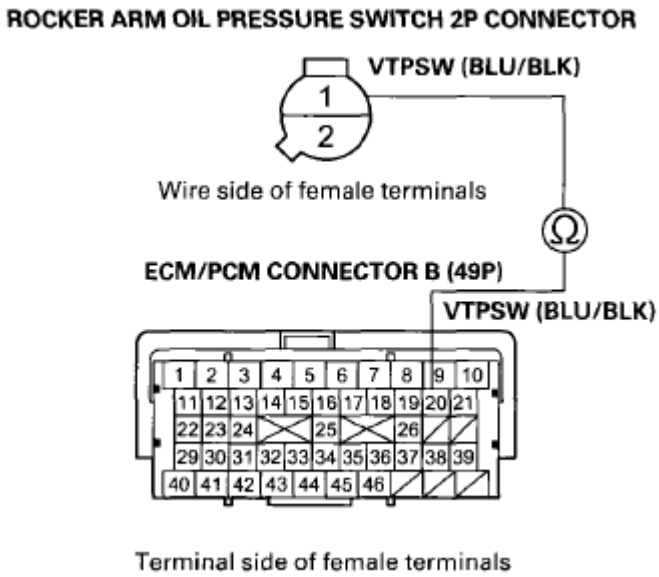

Fig. 5: Checking Continuity Between ECM/PCM Connector Terminal B20 And Rocker Arm Oil Pressure Switch 2P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 15.

NO - Repair open in the wire between the ECM/PCM (B20) and the rocker arm oil pressure switch, then go to step 16.

15. Check for continuity between the rocker arm oil pressure switch 2P connector terminal No. 2 and body ground.

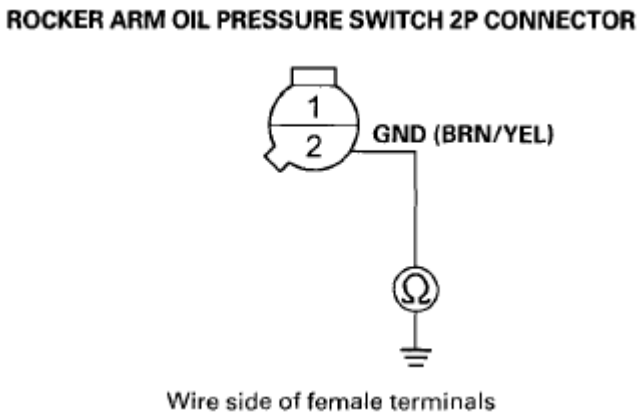

Fig. 6: Checking Continuity Between Rocker Arm Oil Pressure Switch 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 22.

NO - Repair open in the wire between the rocker arm oil pressure switch and G101; M/T (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), ATT (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), then go to step 16.

16. Reconnect all connectors.
17. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
18. Reset the ECM/PCM with the HDS.
19. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
20. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2647 indicated?

YES - Check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid, and the ECM/PCM, then go to step 1.

NO - Go to step 21.

21. Monitor the OBD STATUS for DTC P2647 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 20, go to the indicated DTC's troubleshooting. •

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid, and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

22. Reconnect all connectors.
23. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
24. Start the engine, and let it idle.
25. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2647 indicated?

YES - Check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 24. If the ECM/PCM was substituted, go to step 1.

NO - Go to step 26.

26. Monitor the OBD STATUS for DTC P2647 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 25, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the rocker arm oil pressure switch, the rocker arm oil control solenoid, and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 24. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

DTC P2648: ROCKER ARM OIL CONTROL SOLENOID CIRCUIT LOW VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Do the VTEC TEST in the INSPECTION MENU with the HDS.

   Is the result OK?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM. •

   NO - Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the rocker arm oil control solenoid 1P connector.
6. At the solenoid side, measure the resistance between the rocker arm oil control solenoid 1P connector terminal and the solenoid valve body.

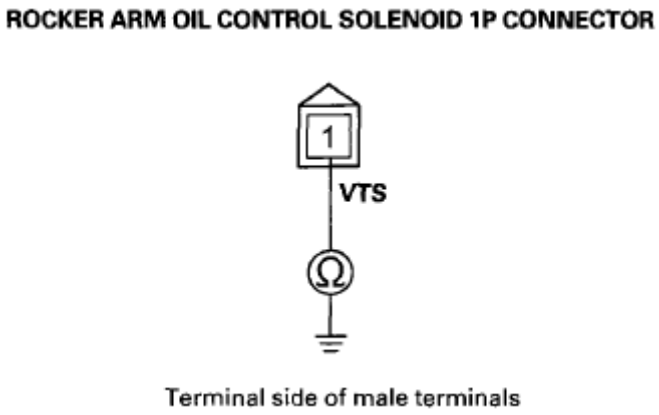

Fig. 7: Measuring Resistance Between Rocker Arm Oil Control Solenoid 1P Connector Terminal And Solenoid Valve Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 14- 30 ohms at room temperature?

YES - Go to step 7.

NO - Go to step 10.

7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector B (49P).
9. Check for continuity between ECM/PCM connector terminal B39 and body ground.

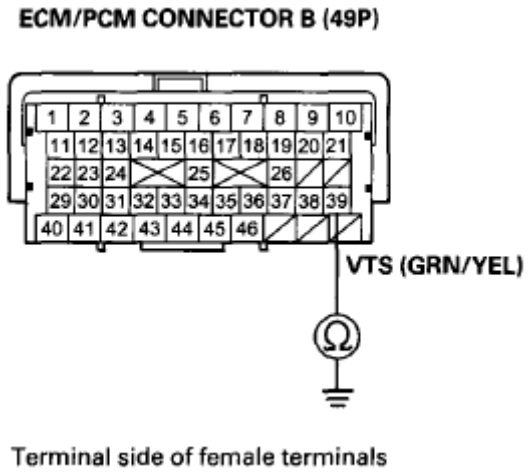

Fig. 8: Checking Continuity Between ECM/PCM Connector Terminal B39 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the ECM/PCM (B39) and the rocker arm oil control solenoid, then go to step 11.

NO - Go to step 18.

10. Replace the rocker arm oil control solenoid (see **Rocker Arm Oil Control Solenoid Replacement**).
11. Reconnect all connectors.
12. Turn the ignition switch ON (II), or press the engine start/stop button to select the ON mode.
13. Reset the ECM/PCM with the HDS.
14. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
15. Do the VTEC TEST in the INSPECTION MENU with the HDS.
16. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2648 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM, then go to step 1.

    NO - Go to step 17.

17. Monitor the OBD STATUS for DTC P2648 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 16, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 15.

18. Reconnect all connectors.
19. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Do the VTEC TEST in the INSPECTION MENU with the HDS.
21. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2648 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 20. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 22.

22. Monitor the OBD STATUS for DTC P2648 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 21, go to the indicated DTC's troubleshooting. •

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 20. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 20.

DTC P2649: ROCKER ARM OIL CONTROL SOLENOID CIRCUIT HIGH VOLTAGE

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3, 000 RPM without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2649 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM. •

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the rocker arm oil control solenoid 1P connector.
7. At the solenoid side, measure the resistance between the rocker arm oil control solenoid 1P connector terminal and the solenoid valve body.

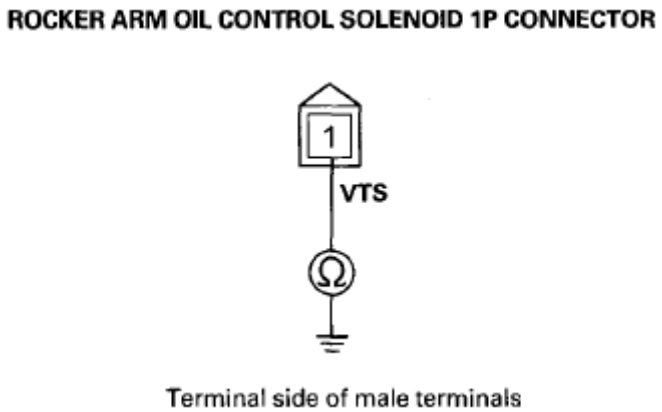

Fig. 9: Measuring Resistance Between Rocker Arm Oil Control Solenoid 1P Connector Terminal

And Solenoid Valve Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 14- 30 ohms at room temperature?

YES - Go to step 8.

NO - Go to step 11.

8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector B (49P).
10. Check for continuity between ECM/PCM connector terminal B39 and the rocker arm oil control solenoid 1P connector terminal.

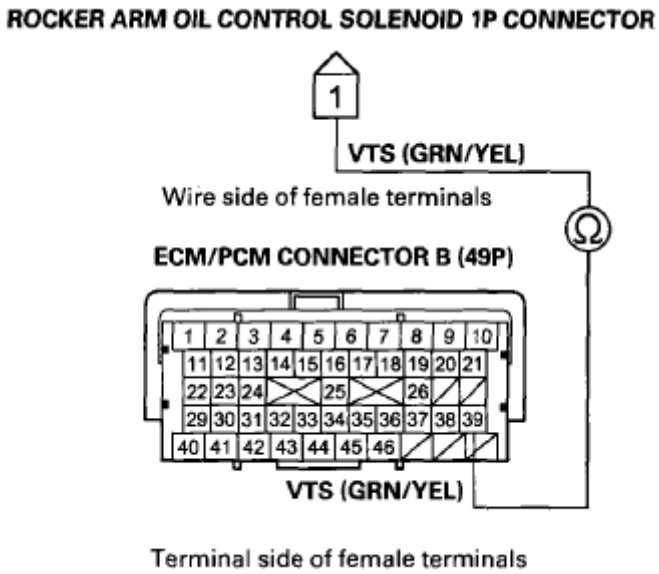

Fig. 10: Checking Continuity Between ECM/PCM Connector Terminal B39 And Rocker Arm Oil Control Solenoid 1P Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 18.

NO - Repair open in the wire between the ECM/PCM (B39) and the rocker arm oil control solenoid, then go to step 12.

11. Replace the rocker arm oil control solenoid (see **Rocker Arm Oil Control Solenoid Replacement**).
12. Reconnect all connectors.
13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Reset the ECM/PCM with the HDS.

15. Do the ECM/PCM idle learn procedure (see **ECM/PCM IDLE LEARN PROCEDURE**).
16. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2649 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM, then go to step 1.

    NO - Go to step 17.

17. Monitor the OBD STATUS for DTC P2649 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated instep 16, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, go to step 1 and recheck. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

18. Reconnect all connectors.
19. Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Start the engine, and let it idle.
21. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2649 indicated?

    YES - Check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1.

    NO - Go to step 22.

22. Monitor the OBD STATUS for DTC P2649 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 21, go to the indicated DTC's troubleshooting. •

    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the rocker arm oil control solenoid and the ECM/PCM. If the ECM/PCM was updated, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the ECM/PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, keep idling until a result comes on.

ROCKER ARM OIL CONTROL SOLENOID REPLACEMENT

1. Disconnect the rocker arm oil control solenoid connector (A).

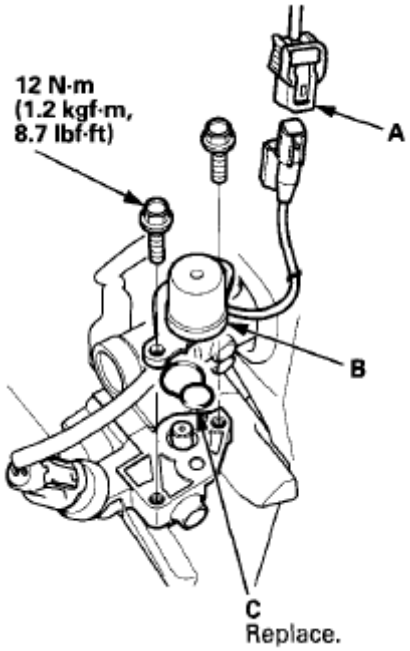

Fig. 11: Identifying Rocker Arm Oil Control Solenoid, Connector And O-Ring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the rocker arm oil control solenoid (B).
3. Install the parts in the reverse order of removal with a new O-ring (C).

ROCKER ARM OIL PRESSURE SWITCH REMOVAL/INSTALLATION

1. Disconnect the rocker arm oil pressure switch connector (A), then remove the rocker arm oil pressure switch (B).

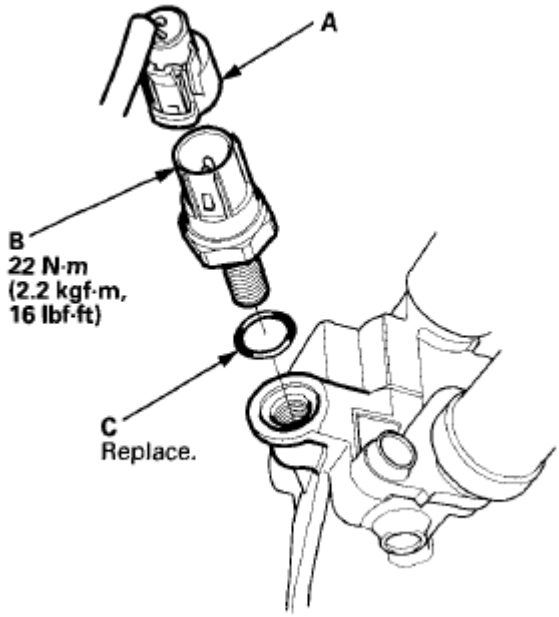

Fig. 12: Identifying O-Ring, Rocker Arm Oil Pressure Connector And Switch With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the parts in the reverse order of removal with a new O-ring (C).

2009-2014 CABIN AIR FILTER

Acura - TSX & TL

REMOVAL & INSTALLATION

NOTE: Manufacturer's terminology for this filter is dust and pollen filter.

1. Open the glove box. Remove the glove box separator (A) by carefully pulling it straight back.

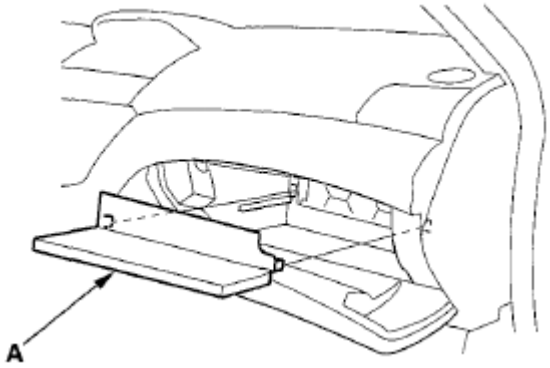

Fig. 1: Identifying Glove Box Separator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the dust and pollen filter assembly (A) from the blower unit.

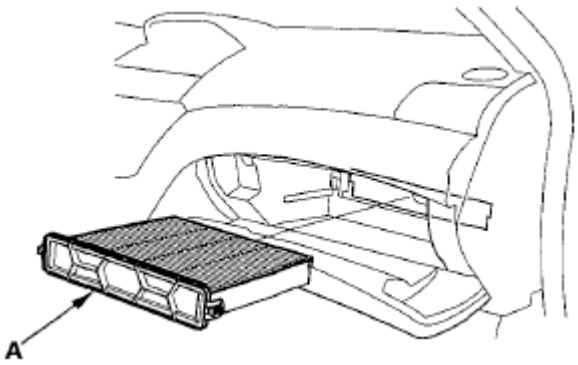

Fig. 2: Identifying Dust And Pollen Filter Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the filter (A) from the housing (B), and replace the filter.

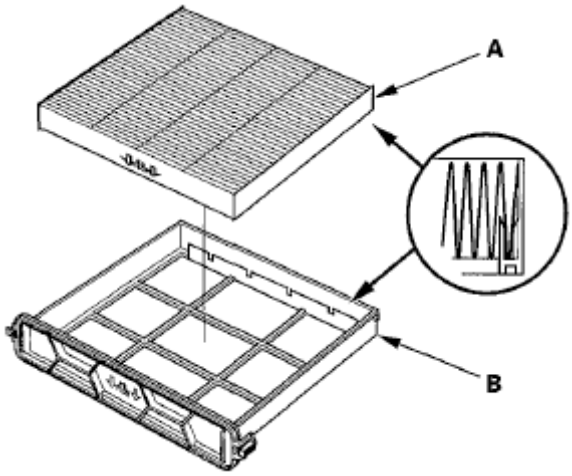

Fig. 3: Identifying Filter And Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the filter in the reverse order of removal. Make sure that there is no air leaking out of the blower unit.

A/C SERVICE TIPS AND PRECAUTIONS

WARNING:

- **Compressed air mixed with the R-134a forms a combustible vapor.**
- **The vapor can burn or explode causing serious injury.**
- **Never use compressed air to pressure test R-134a service equipment or vehicle air conditioning systems.**

CAUTION:

- **Air conditioning refrigerant or lubricant vapor can irritate your eyes,**

nose, or throat.

- **Be careful when connecting service equipment.**
- **Do not breathe refrigerant or vapor.**

The air conditioning system uses HFC-134a (R-134a) refrigerant and polyalkyleneglycol (PAG) refrigerant oil.

Use only service equipment that is U.L.-listed and is certified to meet the requirements of SAE J2788 to remove R-134a from the air conditioning system.

If accidental system discharge occurs, ventilate the work area before resuming service.

R-134a service equipment or vehicle air conditioning systems should not be pressure tested or leak tested with compressed air.

Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

- Always disconnect the negative cable from the battery whenever replacing air conditioning parts.
- Keep moisture and dirt out of the system. When disconnecting any lines, plug or cap the fittings immediately; do not remove the caps or plugs until just before you reconnect each line.
- Before connecting any hose or line, apply a few drops of refrigerant oil to the O-ring.
- When tightening or loosening a fitting, use a second wrench to support the matching fitting.
- When discharging the system, use an R-134a refrigerant recovery/recycling/charging station; do not release refrigerant into the atmosphere.

A/C SYSTEM INSPECTION

NOTE: For A/C system noise, go to the A/C SYSTEM NOISE CHECK.

Before troubleshooting any problem with the air conditioning system, do the following:

1. Check that the HVAC air intake plenum at the base of the windshield is not blocked by leaves or debris. Remove any blockage.
2. Check for kinks or sharp bends in the A/C lines and hoses (which can greatly reduce system performance). If any of the A/C lines and hoses are kinked or bent, replace them (see **A/C LINE REPLACEMENT**).
3. Inspect the A/C components, the pressure lines, and the hoses for stains that may indicate a refrigerant or an A/C compressor oil leak. If there is any indication of leaks, do the Refrigerant Leak Check (see **REFRIGERANT LEAK CHECK**) to confirm the leak(s).

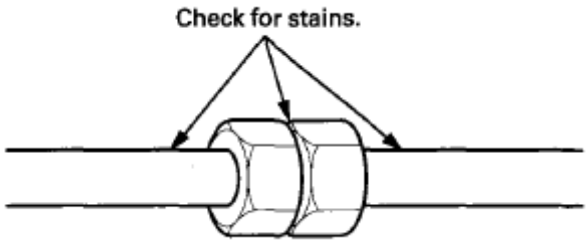

Fig. 4: Inspecting A/C System
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the drive belt for physical damage or signs of slippage (see **DRIVE BELT INSPECTION**). If the drive belt is damaged or shows signs of slippage, replace it and recheck.
5. Check the A/C condenser (A) for material clogging the fins (dirt, insects, etc.). If the A/C condenser is clogged or restricted, carefully clean any material from the A/C condenser fins with water and detergent. If deeper cleaning is required, clean the fins with HondaBrite cleaner (P/N 08732-0020B). Do not perform pressure test until the A/C condenser is completely dry.

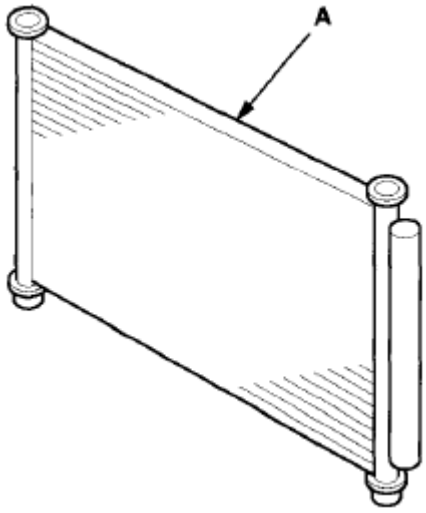

Fig. 5: Identifying A/C Condenser
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Check the A/C condenser for fin damage (bent fins). If any of the A/C condenser fins are bent, try to comb them straight. Do the Refrigerant Leak Check (see **REFRIGERANT LEAK CHECK**) to check for leaks if there is visible damage to the A/C condenser. If the A/C condenser is leaking or the fins cannot be straightened, replace the A/C condenser.
7. Check the dust and pollen filter. If the dust and pollen filter is clogged or restricted, replace it (see **DUST AND POLLEN FILTER REPLACEMENT**).
8. Check for climate control DTCs using the Self-Diagnostic Function (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**). If there are any DTCs, go to the **APPROPRIATE TROUBLESHOOTING**.
9. Start the engine, turn the air conditioning system on, and allow it to run for a few minutes and reach stable operation.

10. Check that the A/C operates at each position of the fan control switch (except OFF). If the A/C does not operate at all fan control switch positions, refer to the symptom troubleshooting.
11. Check that the A/C compressor clutch pressure plate (A) is rotating at the same speed as the pulley and is engaging. If the A/C compressor clutch is not engaging properly, go to the **A/C COMPRESSOR CLUTCH CIRCUIT TROUBLESHOOTING**.

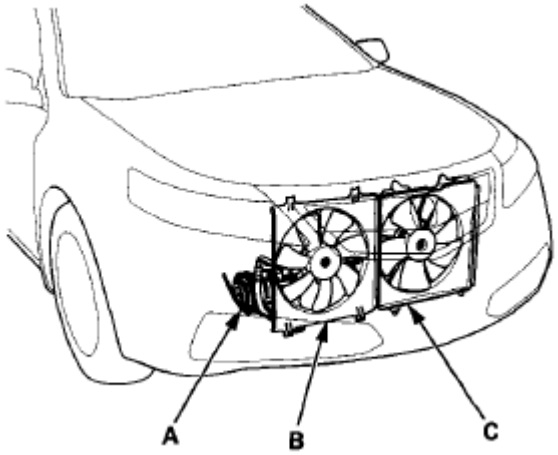

Fig. 6: Identifying A/C Compressor Clutch Plate, A/C Condenser Fan And Radiator Fan
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Check that the A/C condenser fan (B) and the radiator fan (C) operate when the A/C compressor clutch is engaged and blow air toward the engine compartment. If one or both of the fans is not working properly, refer to the symptom troubleshooting.
13. Check that the engine idle speed is correctly maintained when the A/C is switched on and off, (A/C compressor clutch is engaged and disengaged). If the idle speed increases more than 100 RPM when the A/C compressor engages, confirm that the A/C compressor is the cause of the idle speed increase. Replace the A/C compressor, if necessary.

GENERAL TROUBLESHOOTING INFORMATION

HOW TO CHECK FOR DTCS WITH THE HDS

NOTE:

- **There are three methods used to check for DTCs. The recommended method is to use the Honda Diagnostic System (HDS) with the appropriate software, plugged into the data link connector (DLC).**
- **The second method is to run the self-diagnostic function built into the HVAC control unit.**
- **The third method is to use B-CAN system diagnosis test mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**

1. Make sure the ignition switch is in LOCK(0), or the vehicle ignition is in the OFF mode.
2. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC) (A) located under the

driver's side of the dashboard.

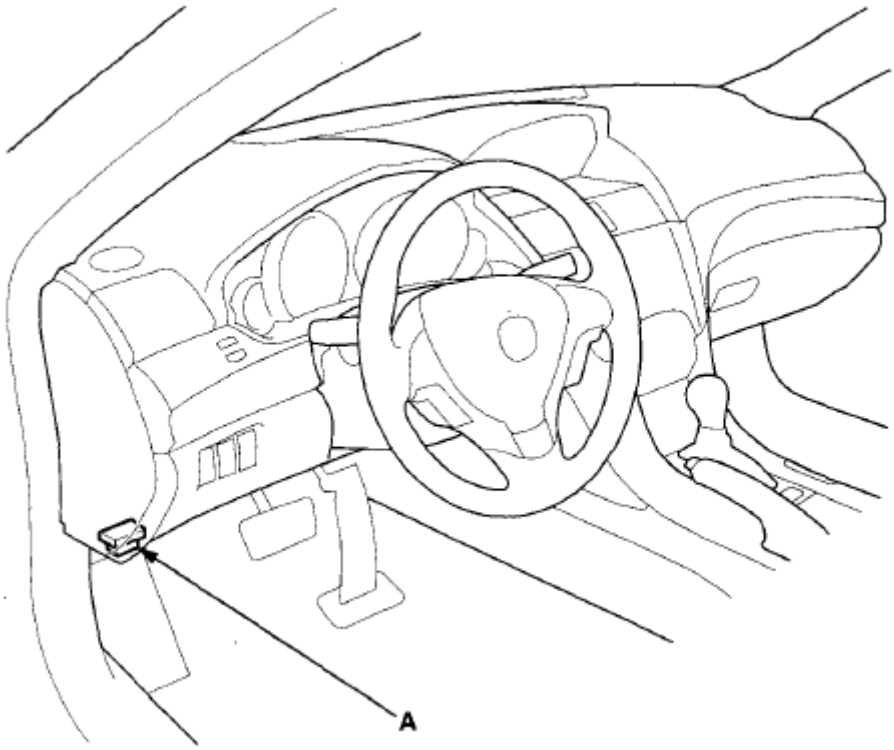

Fig. 7: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Make sure the HDS communicates with the vehicle and the climate control unit. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
5. Select HVAC/CLIMATE CONTROL in the BODY ELECTRICAL menu.
6. Select DTCs in the HVAC/CLIMATE CONTROL menu.
7. Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated **DTC TROUBLESHOOTING**. If no DTCs are indicated, do all system scan, then refer to symptom troubleshooting.

NOTE:

- **After troubleshooting, clear the DTCs with the HDS.**
- **For specific operations, refer to the user's manual that came with the HDS.**

HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS

NOTE: This method is only available if the HDS can communication with the HVAC control unit. If there is a communicate problem with the HDS, go to B-CAN system diagnosis test mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Make sure the ignition switch is in LOCK (0), or the vehicle ignition is in the OFF mode.
2. Connect the HDS to the DLC.
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Make sure the HDS communicates with the vehicle and the climate control unit. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
5. Select HVAC/CLIMATE CONTROL in the BODY ELECTRICAL menu.
6. Select INSPECTION in the HVAC/CLIMATE CONTROL menu.
7. Select CLIMATE CONTROL SELF TEST in the INSPECTION menu.
8. Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated **DTC TROUBLESHOOTING**.

NOTE:

- **After troubleshooting, clear the DTCs with the HDS.**
- **For specific operations, refer to the user's manual that came with the HDS.**

HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS

The climate control unit has a self-diagnostic function. To run the self-diagnostic function, do the following:

1. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
2. Press and hold the ON/OFF button, then within 10 seconds press and release the REAR WINDOW DEFOGGER/MIRROR DEFOGGER button five times. Release the ON/OFF button, then the self-diagnosis begins.

NOTE:

- **The blower motor runs at various speeds regardless of what the panel is displaying.**
- **If there is a problem with the system, it will flash AUTO, 88 and AUTO, 88 and WINDSHIELD DEFROST, or 88 and MODE, and one or more of the 14 indicator segments (A through N). Refer to checking for DTCs.**
- **If there is more than one DTC, they are displayed one at a time in sequence followed by a pause (all the display indicator segments illuminate) between the DTCs.**
- **If there are no problems detected, the segments do not illuminate, and the system appears to be turned off.**

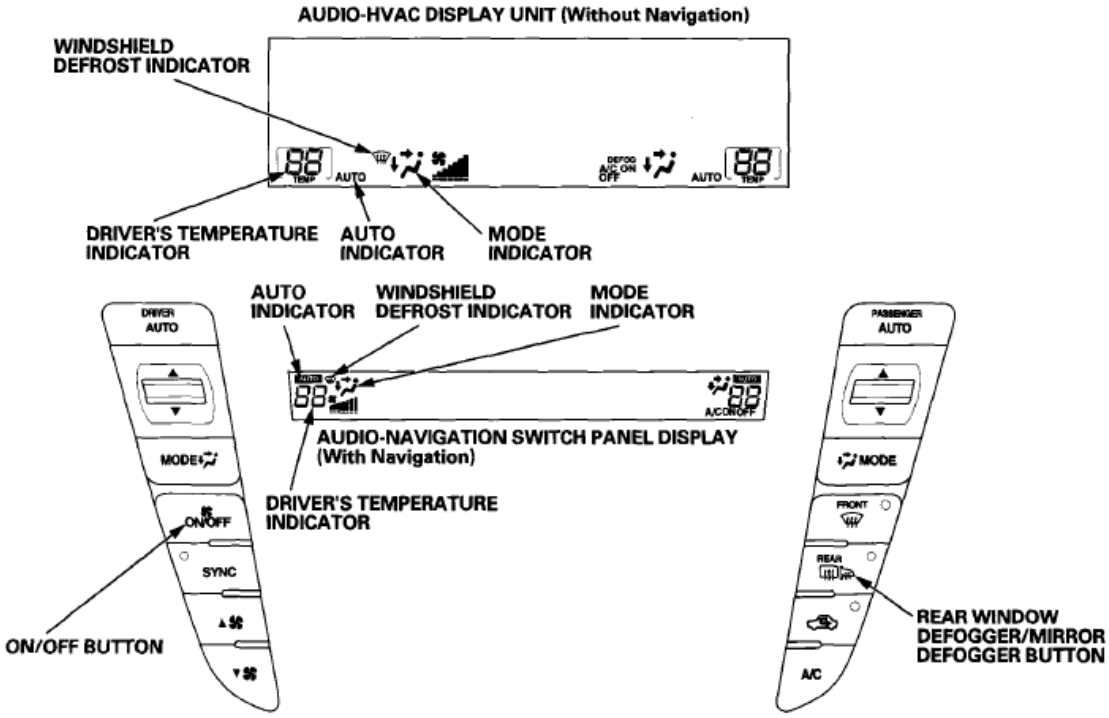

Fig. 8: Identifying Audio-HVAC Display Unit (Without Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Canceling the Self-Diagnostic Function

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode to cancel the self-diagnostic function. After completing repair work, run the self-diagnostic function again to make sure that there are no other DTCs.

CHECKING FOR DTCS

The temperature display indicates single or multiple DTCs. If no DTCs are present, the indicator remains blank.

NOTE: If the driver's indicator segments A, C, E, G, J, and M, with the AUTO indicator, MODE indicator, and the WINDSHIELD DEFROST indicator are on at the same time, there may be an open in the sensor common ground wire.

DRIVER'S TEMPERATURE INDICATOR

J and MODE	An open or short in the recirculation control motor circuit (see **DTC B1215 OR DTC INDICATOR J AND MODE: AN OPEN OR SHORT IN THE RECIRCULATION CONTROL MOTOR CIRCUIT**)
K and MODE	A problem in the recirculation control motor circuit, linkage, door, or motor (see **DTC B2983 OR DTC INDICATOR K AND MODE: A PROBLEM IN THE RECIRCULATION CONTROL MOTOR CIRCUIT, LINKAGE, DOOR, OR MOTOR**)

DISPLAYING SENSOR INPUTS AT THE CLIMATE CONTROL UNIT

The climate control unit has a mode that displays the sensor inputs it receives. This mode shows you what the climate control unit is receiving from each of the sensors, one at a time, and it can help you determine if a sensor is faulty.

CHECKS BEFORE USING THE SENSOR INPUT DISPLAY MODE

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check the recirculation door function; press the recirculation button to switch from FRESH to RECIRC. The air volume and sound should change slightly.
2. Set the desired test temperature using the driver's control switch:

   Press the SYNC button off, the LED turns off.

   When selecting the test temperature, note these items:

   - "Lo" temperature setting will default to MAX COOL, VENT, and RECIRC.
   - "Hi" temperature setting will default to MAX HOT, HEAT, and FRESH.
   - 58 through 86°F settings will use the automatic climate control logic.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

RUN THE SENSOR INPUT DISPLAY MODE

1. Make sure the ignition switch is in LOCK (0), or the vehicle ignition is in the OFF mode.
2. Press and hold both the passenger's AUTO and RECIRCULATION CONTROL buttons, then start the engine.
3. After the engine starts, release both buttons. The display panel control unit flashes the sensor number, then the value for that sensor. Record the value displayed.
4. To advance to the next sensor, press the REAR WINDOW DEFOGGER/MIRROR DEFOGGER button.

NOTE:

- **The sensor values are displayed in degrees Celsius (°C) or an alphanumeric code. Use the charts to convert degrees Fahrenheit (° F), or convert the alphanumeric code to a numerical value.**
- **If the sensor value displays "Er", this indicates there is an open or short in the circuit or sensor. Check for DTCs using the HDS, or use the climate control unit self-diagnostic function.**
- **If necessary, compare the sensor input display to a known-good vehicle under the same test conditions.**
- **If the sensor displayed value is out of the normal range, refer to the sensor test or substitute a known-good sensor, and recheck.**

Sensor	Item	Displayed Value
1	In-car temperature	°C
2	Outside air temperature	°C
3	Solar radiation sensor value: dark = 00, flashlight = 04, cloudy = 10, sunny = 65	$kcal/m^2$ .h
4	Engine coolant temperature	°C
5	Evaporator outlet air temperature	°C
6	Driver's air mix opening (low value indicates cooler air distribution, higher value indicates warmer air distribution)	% of opening
	Passenger's air mix opening (low value indicates cooler air distribution, higher value indicates warmer air distribution) (passenger's side of display)	% of opening
7	Vent temperature air out (TAO)	°C
8	Vehicle speed (vehicle must be driven to display speed)	km/h
9	A/C pressure	10kPa
A	Humidity sensor value	%rh
b	Fog margin	°C
C	Solar radiation azimuth (with navigation)	10°
d	Solar radiation angle of elevation (with navigation)	10°

5. To cancel the sensor input display mode, press the driver's AUTO button or turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

DTC TROUBLESHOOTING INDEX

CHECKING DTCS WITH HDS

DTC	Detection Item or Symptom	ECU	DTC Type
U1280	Communication bus line error (BUS-OFF)	Climate control unit	Loss of communication
U0155	Lost communication with gauge control module (climate control unit)	Climate control unit	Loss of communication
B1215	An open or short in the recirculation control motor circuit	Climate control unit	Signal error
B1225	An open in the in-car temperature sensor circuit	Climate control unit	Signal error
B1226	A short in the in-car temperature sensor circuit	Climate control unit	Signal error
B1227	An open in the outside air temperature sensor circuit	Climate control unit	Signal error
B1228	A short in the outside air temperature sensor circuit	Climate control unit	Signal error
B1229	An open in the sunlight	Climate control unit	Signal error

	sensor circuit		
B1230	A short in the sunlight sensor circuit	Climate control unit	Signal error
B1231	An open in the evaporator temperature sensor circuit	Climate control unit	Signal error
B1232	A short in the evaporator temperature sensor circuit	Climate control unit	Signal error
B1233	An open in the air mix control motor circuit (driver's)	Climate control unit	Signal error
B1234	A short in the air mix control motor circuit (driver's)	Climate control unit	Signal error
B1235	A problem in the air mix control motor circuit, linkage, door, or motor (driver's)	Climate control unit	Signal error
B1236	An open in the passenger's air mix control motor circuit	Climate control unit	Signal error
B1237	A short in the passenger's air mix control motor circuit	Climate control unit	Signal error
B1238	A problem in the passenger's air mix control motor circuit, linkage, door, or motor	Climate control unit	Signal error

CHECKING DTCS WITH HDS

DTC	Detection Item or Symptom	ECU	DTC Type
B1239	An open or short in the mode control motor circuit (driver's)	Climate control unit	Signal error
B1240	A problem in the mode control motor circuit, linkage, doors, or motor (driver's)	Climate control unit	Signal error
B1241	A problem in the blower motor circuit	Climate control unit	Signal error
B1242	An open or short in the passenger's mode control motor circuit	Climate control unit	Signal error
B1243	A problem in the passenger's mode control motor circuit, linkage, doors, or motor	Climate control unit	Signal error

B2967	An open in the humidity sensor circuit	Climate control unit	Signal error
B2968	A short in the humidity sensor circuit	Climate control unit	Signal error
B2969	Climate control unit lost communication with driver's MICU (WIPSW message)	Climate control unit	Loss of communication
B2979	An open in the A/C pressure sensor circuit	Climate control unit	Signal error
B2980	A short in the A/C pressure sensor circuit	Climate control unit	Signal error
B2983	A problem in the recirculation control motor circuit, linkage, door, or motor	Climate control unit	Signal error

Symptom	Diagnostic procedure	Also check for
The blower and heater controls and the A/C system do not work	Probable cause: The climate control unit has malfunctioned, or has lost power or ground Do the climate control power and ground circuit troubleshooting (see **CLIMATE CONTROL POWER AND GROUND CIRCUIT TROUBLESHOOTING**)	• Climate control DTCs (see **HOW TO CHECK FOR DTCS WITH THE HDS**) • Blown fuse No. 16 (7.5 A) in the driver's under-dash fuse/relay box • Poor ground at G403 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**) • Poor or loose connections at the terminals
The A/C compressor clutch and the A/C condenser/radiator fans are inoperative, but the blower and heater controls work	Probable cause: A/C pressure sensor circuit malfunction **NOTE:** **When the A/C pressure sensor malfunctions, it may or may not set a DTC**	• Climate control DTCs (see **HOW TO CHECK FOR DTCS WITH THE HDS**) • Powertrain DTCs • Poor or loose connections at the terminals • A/C signal circuit problem in the ECM/PCM (see **A/C SIGNAL CIRCUIT TROUBLESHOOTING**) • Check sensor input display mode (see **RUN THE SENSOR INPUT DISPLAY MODE**): ○ Sensor #5 Evaporator ○ Sensor #9 A/C Pressure

The A/C compressor clutch does not engage, but the A/C condenser/radiator fans operate, and the blower and heater controls work	Probable cause: • No power to the A/C compressor clutch Do the A/C compressor clutch circuit troubleshooting (see **A/C COMPRESSOR CLUTCH CIRCUIT TROUBLESHOOTING**) • Low speed idle • High engine coolant temperature (ECT) • Do the evaporator temperature sensor test (see **EVAPORATOR TEMPERATURE SENSOR TEST**)	• Climate control DTCs (see **HOW TO CHECK FOR DTCS WITH THE HDS**) • Powertrain DTCs • Blown fuse No. 20 (7.5 A) in the under-hood fuse/relay box • A/C system pressure is normal (see **SYSTEM DESCRIPTION**) • Poor or loose connections at the terminals
The A/C condenser fan and/or the radiator fan do not run with the A/C on	Probable cause: A/C condenser/radiator fan low speed circuit malfunction Do the radiator and A/C condenser fan low speed circuit troubleshooting (see **RADIATOR AND A/C CONDENSER FAN LOW SPEED CIRCUIT TROUBLESHOOTING**)	• Climate control DTCs (see **HOW TO CHECK FOR DTCS WITH THE HDS**) • Powertrain DTCs • Blown fuse No. 3-3 (SUB FAN) (30 A) • Poor ground at G301 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**) • Poor or loose connections at the terminals
The A/C condenser/radiator fans do not run at high speed, but do run at low speed	Probable cause: Malfunction in the fan high speed circuit(s) Do the following troubleshooting as needed: • A/C condenser fan high speed circuit troubleshooting (see **A/C CONDENSER FAN HIGH SPEED CIRCUIT TROUBLESHOOTING**) • Radiator fan high speed circuit troubleshooting (see **RADIATOR FAN HIGH SPEED CIRCUIT TROUBLESHOOTING**)	• Climate control DTCs (see **HOW TO CHECK FOR DTCS WITH THE HDS**) • Powertrain DTCs • Blown fuse on the fan circuit: ○ No. 3-3 (SUB FAN) (30 A) ○ No. 3-5 (MAIN FAN) (30 A, without SH-AWD), (40 A, with SH-AWD) • Poor ground at G301 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**) • Poor or loose connections at the terminals
	Probable cause: Communication problem between the climate control unit and the	• Climate control DTCs (see **HOW TO CHECK FOR DTCS WITH THE HDS**)

Voice commands do not work	audio-navigation unit Do the navigation communication line circuit troubleshooting (see **NAVIGATION COMMUNICATION LINE CIRCUIT TROUBLESHOOTING**)	• Navigation unit DTCs (see **HOW TO CHECK ERROR HISTORY (NAVIGATION DTCS)**) • Poor or loose connections at the terminals
The climate control display is inoperative	Probable cause: Communication problem between the climate control unit and the audio-HVAC display unit (without navigation) or the audio-navigation switch panel (with navigation) Do the audio communication line circuit troubleshooting (see **AUDIO COMMUNICATION LINE CIRCUIT TROUBLESHOOTING**)	• Climate control DTCs (see **HOW TO CHECK FOR DTCS WITH THE HDS**) • Audio-HVAC display failure • Poor or loose connections at the terminals
Blower fan runs slower than expected in cold weather (when in AUTO mode) **NOTE:** **It is normal for the blower fan to run slowly until the coolant temperature rises when in AUTO mode**	Probable cause: Engine coolant temperature (ECT) circuit malfunction Troubleshoot ECT Sensor 2 Circuit Range/ Performance Problem (see **DTC P2183: ECT SENSOR 2 CIRCUIT RANGE/PERFORMANCE PROBLEM**)	• Climate control DTCs (see **HOW TO CHECK FOR DTCS WITH THE HDS**) • Powertrain DTCs • Manual blower motor operation
The A/C compressor clutch cycles rapidly on and off	Probable cause: • A/C system is very low on refrigerant, indicating a possible leak. Do the refrigerant leak check (see **REFRIGERANT LEAK CHECK**) and repair any leaks • Evaporator temperature sensor malfunction Do the evaporator temperature sensor test (see **EVAPORATOR TEMPERATURE SENSOR TEST**)	• Climate control DTCs (see **HOW TO CHECK FOR DTCS WITH THE HDS**) • If there is no leak and the refrigerant level is normal, do the A/C compressor clutch circuit troubleshooting (see **A/C COMPRESSOR CLUTCH CIRCUIT TROUBLESHOOTING**), and look for an intermittent problem
	Probable cause: The A/C compressor clutch circuit is on (energized) continuously, shorted to ground, stuck A/C compressor clutch relay, or the A/C	

The A/C compressor clutch does not disengage when the A/C switch is off	compressor clutch is mechanically jammed • Do the A/C compressor clutch circuit troubleshooting (see **A/C COMPRESSOR CLUTCH CIRCUIT TROUBLESHOOTING**), and repair any circuit problems • If the A/C compressor clutch circuit is OK, then do the A/C compressor clutch check (see **A/C COMPRESSOR CLUTCH CHECK**), and repair any problems with the A/C compressor clutch	The A/C compressor relief valve. If it has vented refrigerant to the atmosphere, correct the problem with the A/C compressor clutch or clutch circuit, then replace the relief valve (see **A/C COMPRESSOR RELIEF VALVE REPLACEMENT**)
The A/C compressor relief valve has vented refrigerant **NOTE:** **This indicates the A/C system pressure was very high**	Probable cause: A high-side restriction, the A/C condenser/radiator fans are inoperative, or the A/C compressor clutch is not disengaging • If the fans and A/C compressor clutch operate normally, recover refrigerant (see **REFRIGERANT RECOVERY**), and check for restrictions • If the A/C compressor clutch will not disengage, troubleshoot the clutch circuit (see **A/C COMPRESSOR CLUTCH CIRCUIT TROUBLESHOOTING**), and check for mechanical problems (see **A/C COMPRESSOR CLUTCH CHECK**) • If the fans are inoperative, troubleshoot the fan circuits (see **RADIATOR AND A/C CONDENSER FAN LOW SPEED CIRCUIT TROUBLESHOOTING**)	Powertrain DTCs
HDS does not communicate with the climate control unit or the vehicle	Troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**)	
	1. Check the coolant level (see **COOLANT CHECK**)	

Insufficient heating	2. Check the radiator cap (see **RADIATOR CAP TEST**) 3. Check the coolant temperature during normal operation 4. Check the heater core inlet hose temperature: • If it is COLD, check for restrictions in the hose, a damaged or leaking thermostat, or a damaged or leaking water pump • If it is HOT, check for restrictions in the heater core. Back flush or replace the heater core 5. Check the operation of the air mix doors: • Drive's (see **DRIVER'S AIR MIX CONTROL MOTOR TEST** • Passenger's (see **PASSENGER'S AIR MIX CONTROL MOTOR REPLACEMENT**) 6. Check the blower motor unit for obstructions 7. Check for air leaks around the ducts and vents	• Climate control DTCs (see **HOW TO CHECK FOR DTCS WITH THE HDS**) • Damaged cylinder head gasket

SYSTEM DESCRIPTION

The air conditioning (A/C) system removes heat from the passenger compartment by transferring heat from the ambient air to the evaporator. The A/C system refrigerant expands in the evaporator, and the evaporator becomes very cold and absorbs the heat from the ambient air. The blower fan pushes air across the evaporator where the heat is absorbed, and then it blows the cool air into the passenger compartment.

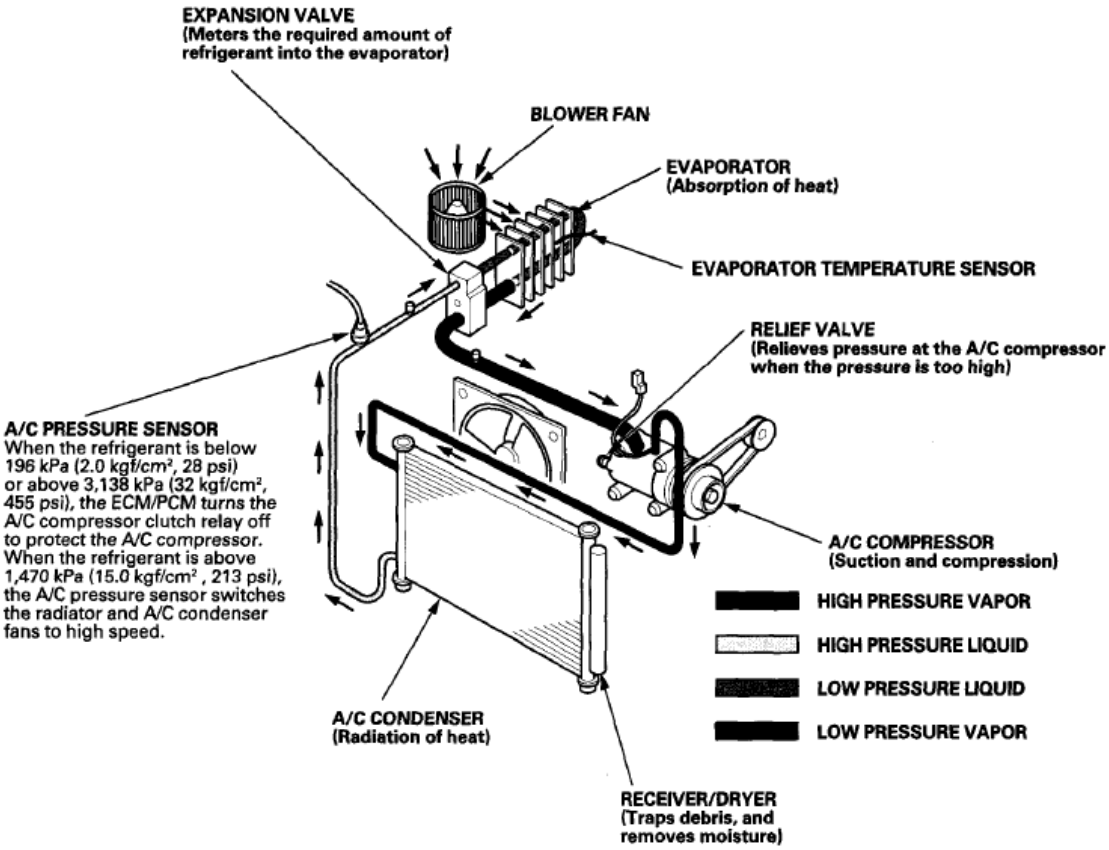

Fig. 13: Climate Control System Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

This vehicle uses HFC-134a (R-134a) refrigerant, which does not contain chlorofluorocarbons. Pay attention to the following service items:

- Use only the recommended polyalkyleneglycol (PAG) refrigerant oil (DENSO ND-OIL 8) designed for the R-134a A/C compressor. Intermixing the recommended (PAG) refrigerant oil with any other refrigerant oil will result in A/C compressor failure.
- All A/C system parts (A/C compressor, discharge line, suction line, evaporator, A/C condenser, receiver/dryer, expansion valve, O-rings for joints) are designed for refrigerant R-134a.
- Use a halogen gas leak detector designed for refrigerant R-134a.
- Use only a recovery/recycling/charging station that is U.L.-listed and is certified to meet the requirements of SAE J2788 to service the R-134a air conditioning systems.
- Always recover refrigerant R-134a with an approved recovery/recycling/charging station before disconnecting any A/C fitting.

A/C PRESSURE SENSOR

The A/C pressure sensor converts A/C pressure into electrical signals to the ECM/PCM.

	Sensor	

A/C System Pressure(1)	Output Voltage (V out)	System Operation
Abnormally low pressure: Below 196 kPa (2.0 kgf/cm^2 , 28 psi)	Below 0.685 V	The ECM/PCM disengages the A/C compressor clutch. The radiator and A/C condenser fans operate based on engine coolant temperature.
Normal operating pressure: • Above 196 kPa (2.0 kgf/cm^2 , 28 psi) • Below 1, 470 kPa (15.0 kgf/cm^2 , 213 psi)	0.686 V to 1.944 V	The ECM/PCM cycles the A/C compressor clutch based on cooling demand. The radiator and A/C condenser fans operate at low speed unless the engine coolant temperature exceeds 206°F (97 °C).
High operating pressure: • Above 1, 470 kPa (15.0 kgf/cm^2 , 213 psi) • Below 3, 138 kPa (32 kgf/cm^2 , 455 psi)	1.945 V to 4.575 V	The ECM/PCM cycles the A/C compressor clutch based on cooling demand. The radiator and A/C condenser fans operate at high speed.
Abnormally high pressure: More than 3, 138 kPa (32 kgf/cm^2 , 455 psi)	Above 4.575 V	The ECM/PCM disengages the A/C compressor clutch. The radiator and A/C condenser fans operate based on engine coolant temperature.
(1) The A/C system pressure can be monitored through the climate control sensor input display function (see **RUN THE SENSOR INPUT DISPLAY MODE**).		

The response of the A/C pressure sensor is shown in the graph in illustration below.

NOTE: **When the refrigerant is below 196 kPa (2.0 kgf/cm^2 , 28 psi) or above 3, 138 kPa (32 kgf/cm^2 , 455 psi), the ECM/PCM turns the A/C compressor clutch relay off to protect the A/C compressor. When the refrigerant pressure is above 1, 470 kPa (15.0 kgf/cm^2 , 213 psi), the ECM/PCM switches the radiator and A/C condenser fans to high speed.**

DUAL AIR MIX CONTROL SYSTEM

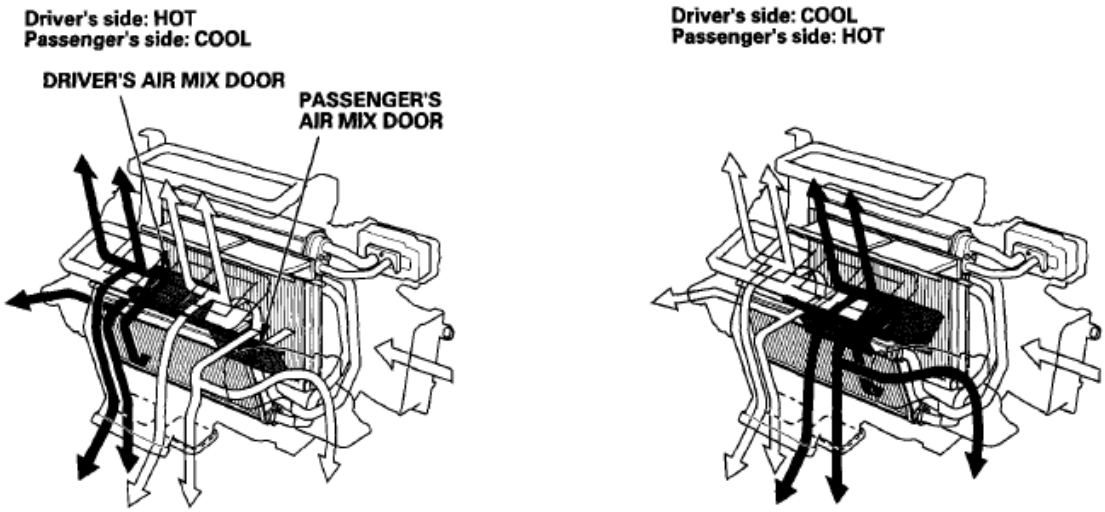

Fig. 17: Climate Control System Diagram (Dual Air Mix Control System)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DUAL MODE CONTROL SYSTEM

All modes (except defroster) can be controlled independently.

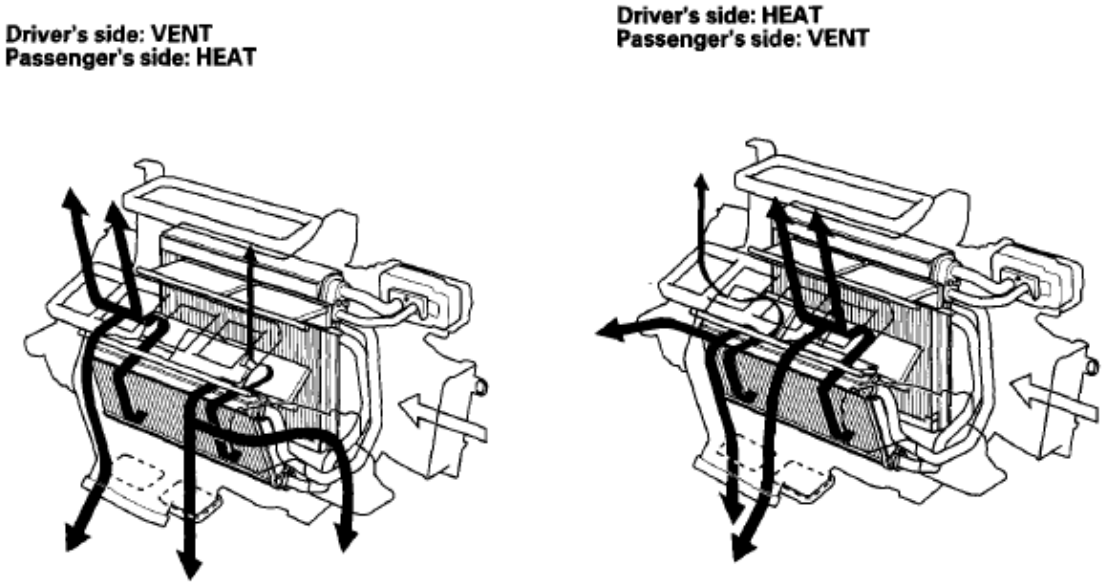

Fig. 18: Climate Control System Diagram (Dual Mode Control System)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

I-DUAL CLIMATE CONTROL SYSTEM (WITH NAVIGATION)

The i-Dual climate control system automatically controls the temperature and the air direction to the driver and passenger's side depending on the angle of the sun and the direction of the vehicle. It calculates information such as date, time, longitude, and latitude from the navigation system, as well as the radiant strength of the sun

from the sunlight sensor, to determine the appropriate mode position and temperature to be directed to each side.

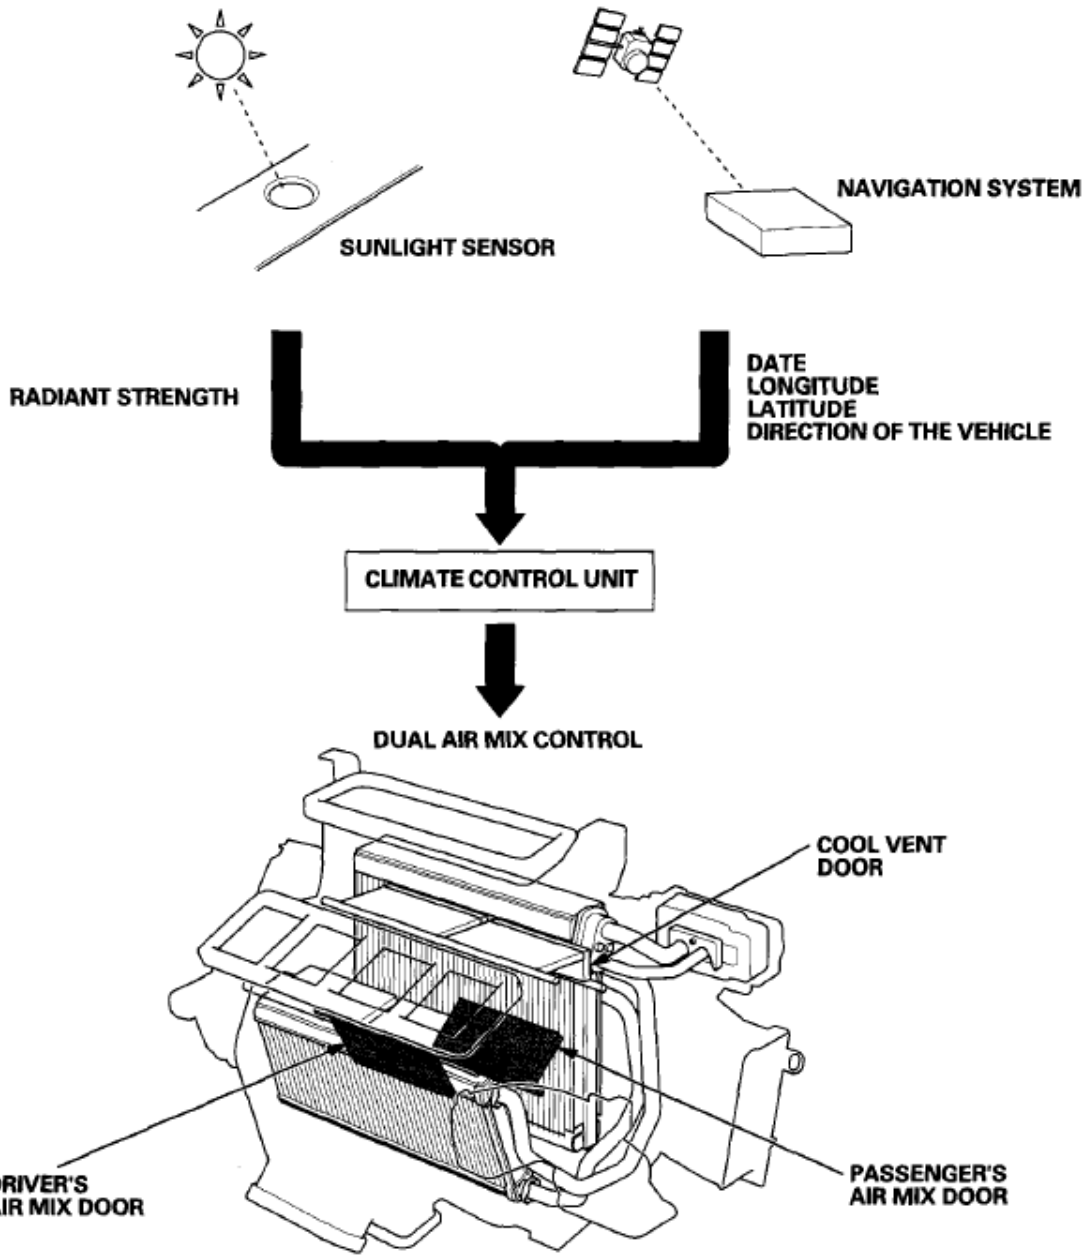

Fig. 19: Identifying I-Dual Climate Control System (With Navigation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

In the event that the navigation system malfunctions, or when driving in areas where the navigation system cannot determine the vehicle position (non-coverage areas, tunnels, etc.), the climate control system will operate the same as a vehicle without navigation.

CLIMATE CONTROL UNIT INPUTS AND OUTPUTS

DTC TROUBLESHOOTING

DTC U0155: LOST COMMUNICATION WITH GAUGE CONTROL MODULE (CLIMATE CONTROL UNIT)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTC with the HDS.

2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**).
4. Check for DTCs.

   Is DTC U0155 indicated?

   YES - Go to step 5.

   NO - The system is OK at this time. Check for loose wires or poor connections on the B-CAN lines between the gauge control module and the climate control unit.

5. Select B-CAN Control Units Information in the BODY ELECTRICAL menu.
6. Select Check Connected Units in the B-CAN Control Units Information menu.

   Is the gauge control module detected?

   YES - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

   NO - Go to step 7.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect the gauge control module 32P connector.
9. Disconnect climate control unit connector C (20P).
10. Check for continuity between the following terminals of the gauge control module 32P connector and climate control unit connector C (20P).

    32P: 20P:

    No. 29 No. 7

    No. 30 No. 8

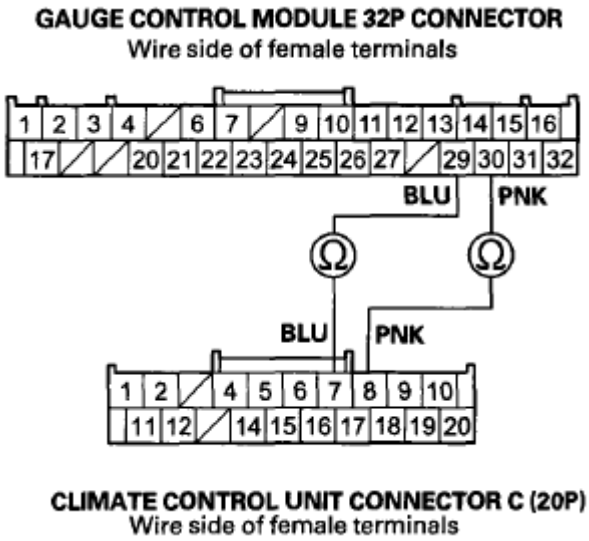

Fig. 28: Checking Continuity Between Terminals Of Gauge Control Module 32P Connector And Climate Control Unit Connector C (20P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to the gauge control module input test (see **GAUGE CONTROL MODULE INPUT TEST**).

NO - Repair an open in the wire(s) between the climate control unit and the gauge control module.

DTC B1215 OR DTC INDICATOR J AND MODE: AN OPEN OR SHORT IN THE RECIRCULATION CONTROL MOTOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then ON (II) or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1215 or J and MODE indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the recirculation control motor circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Test the recirculation control motor (see **RECIRCULATION CONTROL MOTOR TEST**).

Is the recirculation control motor OK?

YES - Go to step 7.

NO - Replace the recirculation control motor (see **RECIRCULATION CONTROL MOTOR REPLACEMENT**).

7. Disconnect the recirculation control motor 7P connector.
8. Disconnect climate control unit connector C (20P).
9. Check for continuity between the following terminals of climate control unit connector C (20P) and the recirculation control motor 7P connector.

   20P: 7P:

   No. 1 No. 7

   No. 18 No. 5

   No. 19 No. 4

   No. 20 No. 3

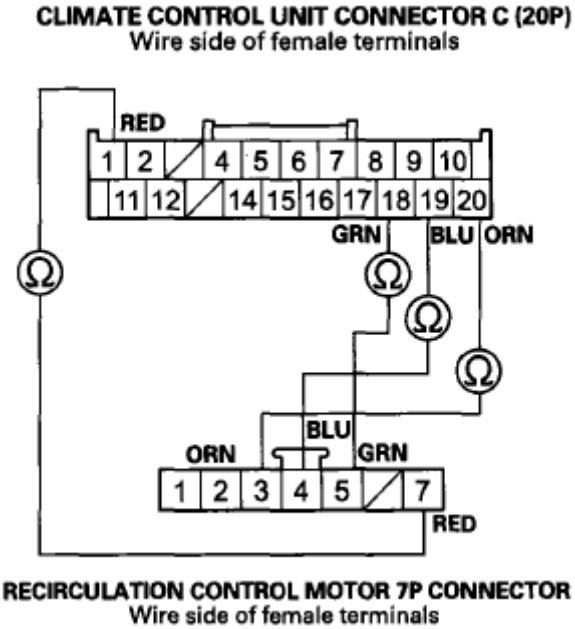

Fig. 29: Checking Continuity Between Terminals Of Climate Control Unit Connector And Recirculation Control Motor 7P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open in the wire(s) between the climate control unit and the recirculation control motor.

10. Check for continuity between body ground and climate control unit connector C (20P) terminals No. 18, No. 19, and No. 20 individually.

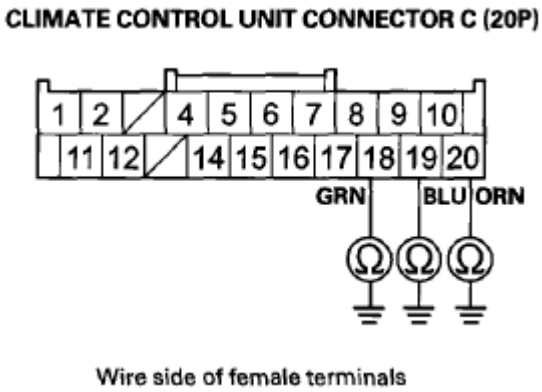

Fig. 30: Checking For Continuity Between Body Ground And Climate Control Unit Connector C (20P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire(s) between the climate control unit and the recirculation control motor.

NO - Go to step 11.

11. Check for continuity between climate control unit connector C (20P) terminals as follows.

From terminal	To terminals
18	19, 20
19	20

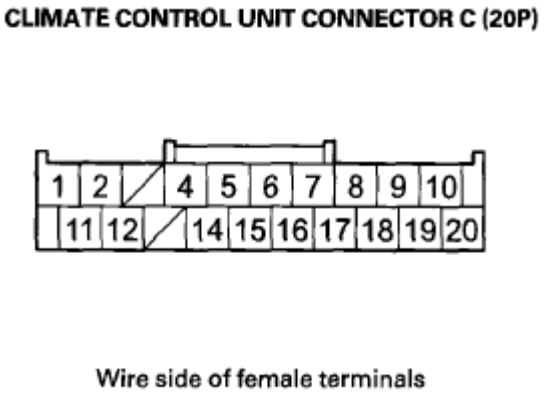

Fig. 31: Checking Continuity Between Climate Control Unit Connector C (20P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - Repair a short in the wire(s).

NO - Go to step 12.

12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between body ground and climate control unit connector C(20P) terminals No. 18, No. 19 and No. 20 individually.

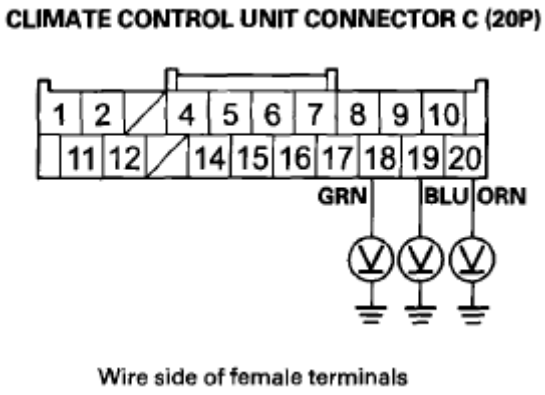

Fig. 32: Measuring Voltage Between Body Ground And Climate Control Unit Connector C(20P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES - Repair a short to power in the wire(s) between the climate control unit and the recirculation control motor. This short may also damage the climate control unit. Repair a short to power before replacing the climate control unit.

NO - Check for loose wires or poor connections at climate control unit connector C (20P) and at the

recirculation control motor 7P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

DTC B1225 OR DTC INDICATOR A AND AUTO: AN OPEN IN THE IN-CAR TEMPERATURE SENSOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1225 or A and AUTO indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the in-car temperature sensor circuit

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Remove the in-car temperature sensor (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR REPLACEMENT**), and test it (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR TEST**).

   Is the in-car temperature sensor OK?

   YES - With the humidity/in-car temperature sensor disconnected, go to step 7.

   NO - Replace the humidity/in-car temperature sensor (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR REPLACEMENT**).

7. Disconnect climate control unit connectors C (20P).
8. Check for continuity between climate control unit connector C (20P) terminal No. 15 and humidity/in-car temperature sensor 4P connector terminal No. 4.

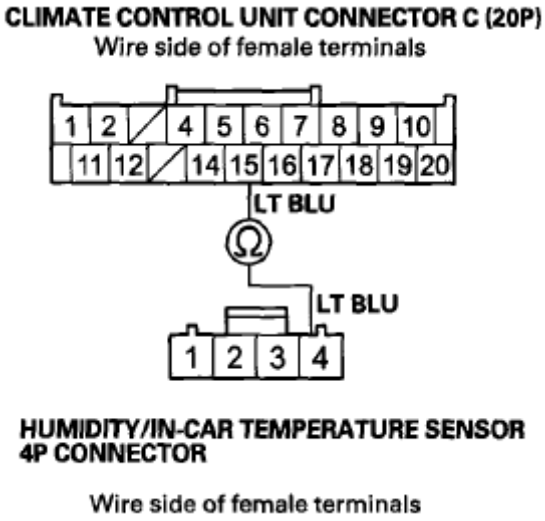

Fig. 33: Checking Continuity Between Climate Control Unit Connector C (20P) And Humidity/In-Car Temperature Sensor 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Repair an open in the wire between the climate control unit and the in-car temperature sensor.

9. Check for continuity between climate control unit connector C (20P) terminal No. 1 and humidity/in-car temperature sensor 4P connector terminal No. 3.

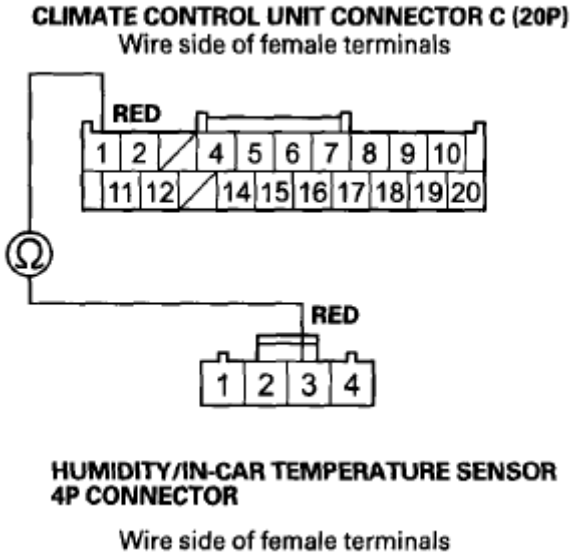

Fig. 34: Checking Continuity Between Climate Control Unit Connector C (20P) And Humidity/In-Car Temperature Sensor 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for loose wires or poor connections at climate control unit connectors C (20P) and at the in-car temperature sensor 4P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Repair an open in the wire between the climate control unit and the in-car temperature sensor.

DTC B1226 OR DTC INDICATOR B AND AUTO: A SHORT IN THE IN-CAR TEMPERATURE SENSOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1226 or B and AUTO indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the in-car temperature sensor circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Remove the humidity/in-car temperature sensor (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR REPLACEMENT**), and test it (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR TEST**).

   Is the in-car temperature sensor OK?

   YES - With the humidity/in-car temperature sensor disconnected, go to step 7.

   NO - Replace the humidity/in-car temperature sensor (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR REPLACEMENT**).

7. Disconnect climate control unit connector C (20P).
8. Check for continuity between climate control unit connector C(20P) terminal No. 15 and body ground.

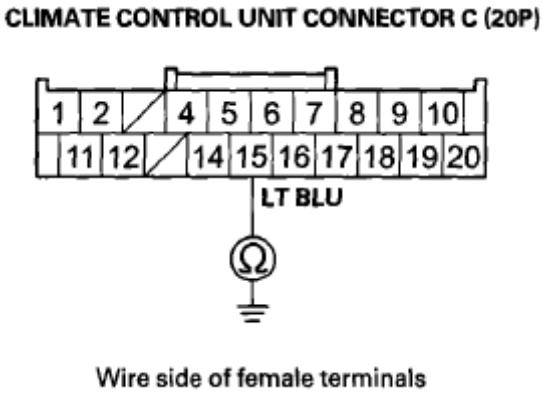

Fig. 35: Checking Continuity Between Climate Control Unit Connector C(20P) Terminal And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the climate control unit and the in-car temperature sensor.

NO - Go to step 9.

9. Check for continuity between climate control unit connector C (20P) terminals No. 1 and No. 15.

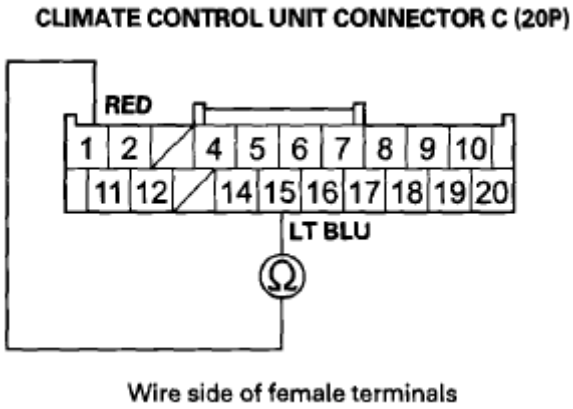

Fig. 36: Checking Continuity Between Climate Control Unit Connector C (20P) Terminals No. 1 And No. 15
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short in the wires between the climate control unit and the in-car temperature sensor.

NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

DTC B1227 OR DTC INDICATOR C AND AUTO: AN OPEN IN THE OUTSIDE AIR TEMPERATURE SENSOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1227 or C and AUTO indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the outside air temperature sensor circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Remove the outside air temperature sensor (see **OUTSIDE AIR TEMPERATURE SENSOR REPLACEMENT**), and test it (see **OUTSIDE AIR TEMPERATURE SENSOR TEST**).

   Is the outside air temperature sensor OK?

   YES - With the outside air temperature sensor disconnected, go to step 7.

   NO - Replace the outside air temperature sensor (see **OUTSIDE AIR TEMPERATURE SENSOR REPLACEMENT**).

7. Disconnect climate control unit connector C (20P).
8. Check for continuity between climate control unit connector C (20P) terminal No. 17 and outside air temperature sensor 2P connector terminal No. 2.

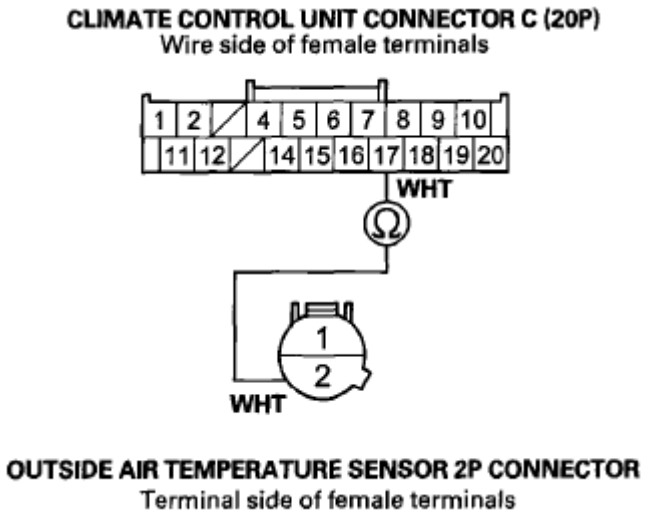

Fig. 37: Checking Continuity Between Climate Control Unit Connector C (20P) And Outside Air Temperature Sensor 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Repair an open in the wire between the climate control unit and the outside air temperature sensor.

9. Check for continuity between climate control unit connector C (20P) terminal No. 1 and outside air temperature sensor 2P connector terminal No. 1.

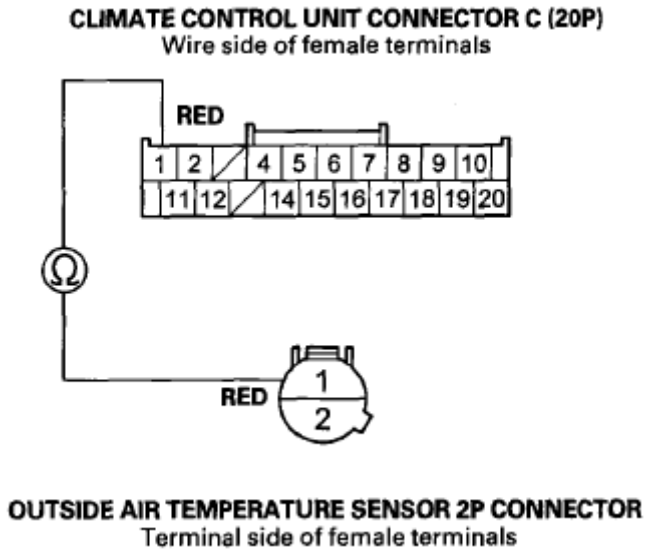

Fig. 38: Checking Continuity Between Climate Control Unit Connector C (20P) And Outside Air Temperature Sensor 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for loose wires or poor connections at climate control unit connectors C (20P) and at the outside air temperature sensor 2P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Repair an open in the wire between the climate control unit and the outside air temperature sensor.

DTC B1228 OR DTC INDICATOR D AND AUTO: A SHORT IN THE OUTSIDE AIR TEMPERATURE SENSOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1228 or D and AUTO indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the outside air temperature sensor circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Remove the outside air temperature sensor (see **OUTSIDE AIR TEMPERATURE SENSOR REPLACEMENT**), and test it (see **OUTSIDE AIR TEMPERATURE SENSOR TEST**).

   Is the outside air temperature sensor OK?

   YES - With the outside air temperature sensor disconnected, go to step 7.

   NO - Replace the outside air temperature sensor.

7. Disconnect climate control unit connector C (20P).
8. Check for continuity between climate control unit connector C (20P) terminal No. 17 and body ground.

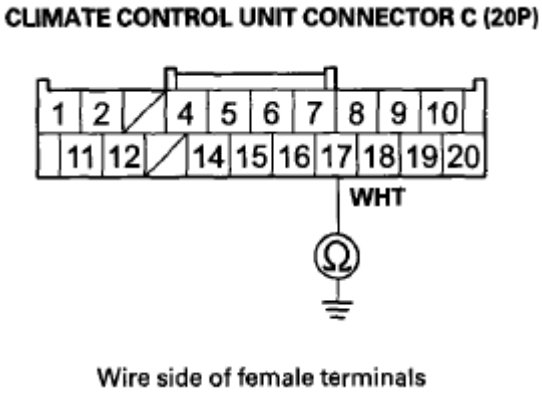

Fig. 39: Checking Continuity Between Climate Control Unit Connector C (20P) Terminal No. 17 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the climate control unit and the outside air temperature sensor.

NO - Go to step 9.

9. Check for continuity between climate control unit connector C (20P) terminals No. 1 and No. 17.

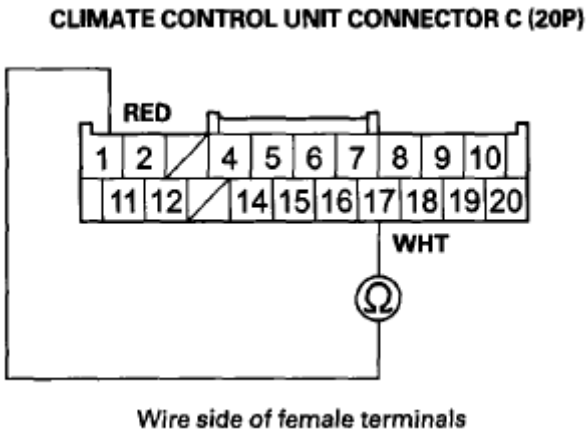

Fig. 40: Checking Continuity Between Climate Control Unit Connector C (20P) Terminals No. 1 And No. 17
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short in the wires between the climate control unit and the outside air temperature sensor.

NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT**

REMOVAL/INSTALLATION).

DTC B1229 OR DTC INDICATOR E AND AUTO: AN OPEN IN THE SUNLIGHT SENSOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1229 or E and AUTO indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the sunlight sensor circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the sunlight sensor 2P connector.
7. Disconnect climate control unit connector C (20P).
8. Check for continuity between climate control unit connector C (20P) terminal No. 14 and sunlight sensor 2P connector terminal No. 2.

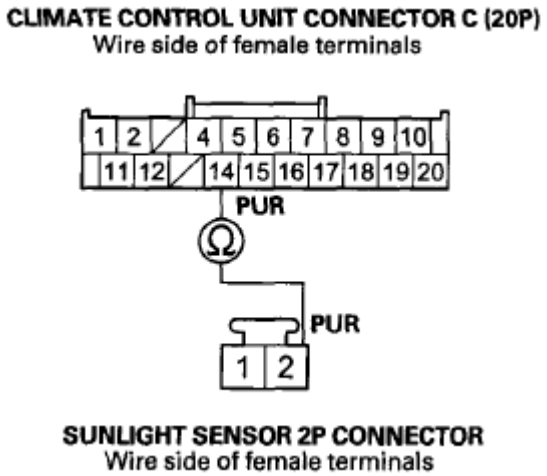

Fig. 41: Checking Continuity Between Climate Control Unit Connector C (20P) And Sunlight Sensor 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Repair an open in the wire between the climate control unit and the sunlight sensor.

9. Check for continuity between climate control unit connector C (20P) terminal No. 1 and sunlight sensor 2P connector terminal No. 1.

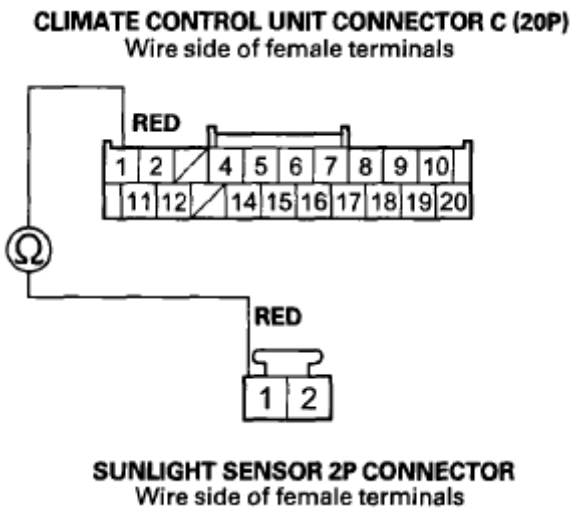

Fig. 42: Checking Continuity Between Climate Control Unit Connector C (20P) And Sunlight Sensor 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open in the wire between the climate control unit and the sunlight sensor.

10. Reconnect the sunlight sensor 2P connector.
11. Reconnect climate control unit connector C (20P).
12. Test the sunlight sensor (see **SUNLIGHT SENSOR TEST**).

Is the sunlight sensor OK?

YES - Check for loose wires or poor connections at climate control unit connector C (20P) and at the sunlight sensor 2P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Replace the sunlight sensor (see **SUNLIGHT SENSOR REPLACEMENT**).

DTC B1230 OR DTC INDICATOR F AND AUTO: A SHORT IN THE SUNLIGHT SENSOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to

select the OFF mode, and then the ON mode.

3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1230 or F and AUTO indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the sunlight sensor circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the sunlight sensor 2P connector.
7. Disconnect climate control unit connector C (20P).
8. Check for continuity between climate control unit connector C (20P) terminal No. 14 and body ground.

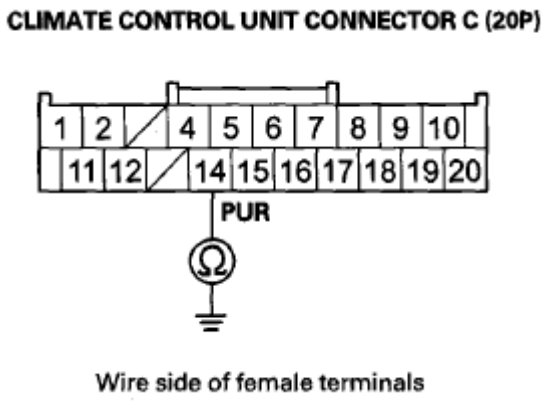

Fig. 43: Checking Continuity Between Climate Control Unit Connector C (20P) Terminal No. 14 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there continuity?

   YES - Repair a short to body ground in the wire between the climate control unit and the sunlight sensor.

   NO - Go to step 9.

9. Check for continuity between climate control unit connector C (20P) terminals No. 1 and No. 14.

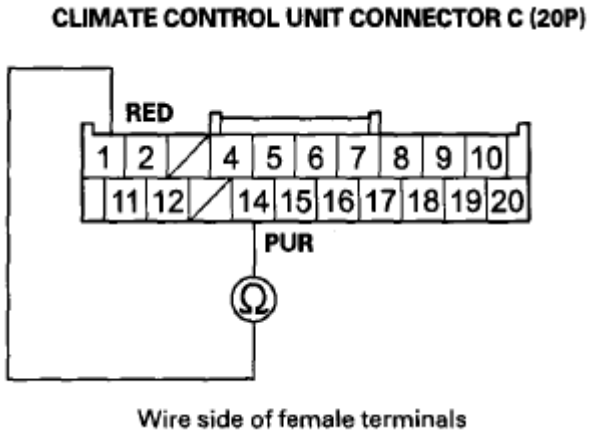

Fig. 44: Checking Continuity Between Climate Control Unit Connector C (20P) Terminals No. 1 And No. 14
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short in the wires between the climate control unit and the sunlight sensor.

NO - Go to step 10.

10. Reconnect the sunlight sensor 2P connector.
11. Reconnect climate control unit connector C (20P).
12. Test the sunlight sensor (see **SUNLIGHT SENSOR TEST**).

Is the sunlight sensor OK?

YES - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Replace the sunlight sensor (see **SUNLIGHT SENSOR REPLACEMENT**).

DTC B1231 OR DTC INDICATOR G AND AUTO: AN OPEN IN THE EVAPORATOR TEMPERATURE SENSOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

Is DTC B1231 or G and AUTO indicated?

YES - Go to step 5.

NO - Intermittent failure. Check for loose wires or poor connections on the evaporator temperature sensor circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect climate control unit connector C (20P).
7. Disconnect the evaporator temperature sensor 2P connector.
8. Check for continuity between climate control unit connector C (20P) terminal No. 16 and evaporator temperature sensor 2P connector terminal No. 1.

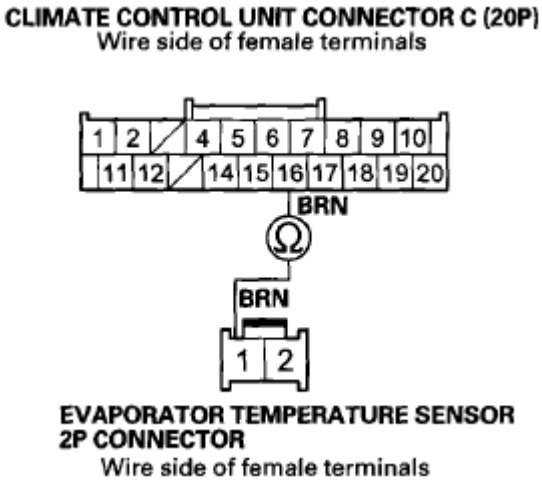

Fig. 45: Checking Continuity Between Climate Control Unit Connector C (20P) And Evaporator Temperature Sensor 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Repair an open in the wire between the climate control unit and the evaporator temperature sensor.

9. Check for continuity between climate control unit connector C (20P) terminal No. 1 and evaporator temperature sensor 2P connector terminal No. 2.

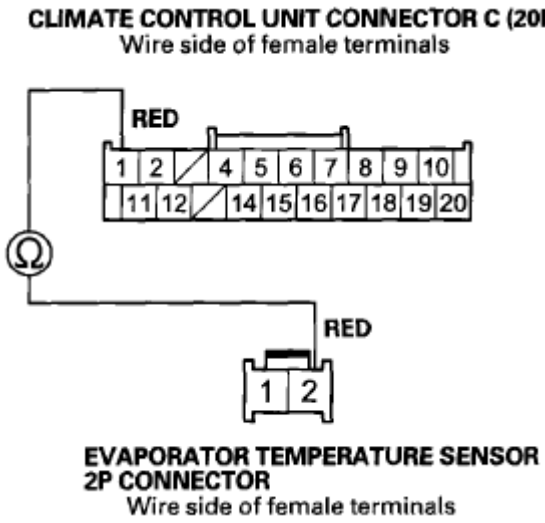

Fig. 46: Checking Continuity Between Climate Control Unit Connector C (20P) And Evaporator Temperature Sensor 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open in the wire between the climate control unit and the evaporator temperature sensor.

10. Remove the evaporator temperature sensor (see **EVAPORATOR TEMPERATURE SENSOR REPLACEMENT**), and test it (see **EVAPORATOR TEMPERATURE SENSOR TEST**).

    Is the evaporator temperature sensor OK?

    YES - Check for loose wires or poor connections at climate control unit connector C (20P) and at the evaporator temperature sensor 2P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

    NO - Replace the evaporator temperature sensor (see **EVAPORATOR TEMPERATURE SENSOR REPLACEMENT**).

DTC B1232 OR DTC INDICATOR H AND AUTO: A SHORT IN THE EVAPORATOR TEMPERATURE SENSOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).

4. Check for DTCs.

   Is DTC B1232 or H and AUTO indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the evaporator temperature sensor circuit

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect climate control unit connector C (20P).
7. Disconnect the evaporator temperature sensor 2P connector.
8. Check for continuity between climate control unit connector C (20P) terminal No. 16 and body ground.

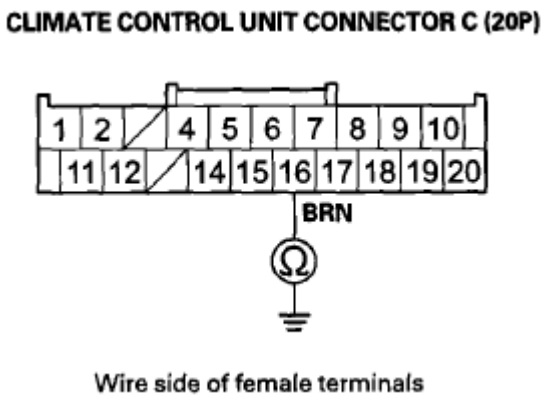

Fig. 47: Checking Continuity Between Climate Control Unit Connector C (20P) And Evaporator Temperature Sensor 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there continuity?

   YES - Repair a short to body ground in the wire between the climate control unit and the evaporator temperature sensor.

   NO - Go to step 9.

9. Check for continuity between climate control unit connector C (20P) terminals No. 1 and No. 16.

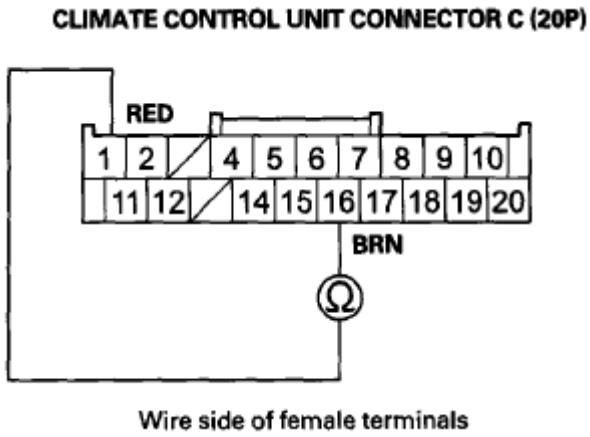

Fig. 48: Checking Continuity Between Climate Control Unit Connector C (20P) Terminals No. 1 And No. 16
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short in the wires between the climate control unit and the evaporator temperature sensor.

NO - Go to step 10.

10. Remove the evaporator temperature sensor (see **EVAPORATOR TEMPERATURE SENSOR REPLACEMENT**), and test it (see **EVAPORATOR TEMPERATURE SENSOR TEST**).

    Is the evaporator temperature sensor OK?

    YES - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

    NO - Replace the evaporator temperature sensor (see **EVAPORATOR TEMPERATURE SENSOR REPLACEMENT**).

DTC B1233 OR DTC INDICATOR J AND AUTO: AN OPEN IN THE AIR MIX CONTROL MOTOR CIRCUIT (DRIVER'S)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1233 or J and AUTO indicated?

YES - Go to step 5.

NO - Intermittent failure. Check for loose wires or poor connections on the driver's air mix control motor circuit

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Test the driver's air mix control motor (see **DRIVER'S AIR MIX CONTROL MOTOR TEST**).

   Is the driver's air mix control motor OK?

   YES - Go to step 7.

   NO - Replace the driver's air mix control motor (see **DRIVER'S AIR MIX CONTROL MOTOR REPLACEMENT**).

7. Disconnect the driver's air mix control motor 7P connector.
8. Disconnect climate control unit connectors A (32P) and C (20P).
9. Check for continuity between the following terminals of climate control unit connectors A (32P), C (20P), and the driver's air mix control motor 7P connector.

   32P 7P:

   No. 25 No. 3

   20P 7P:

   No. 1 No. 5

   No. 2 No. 7

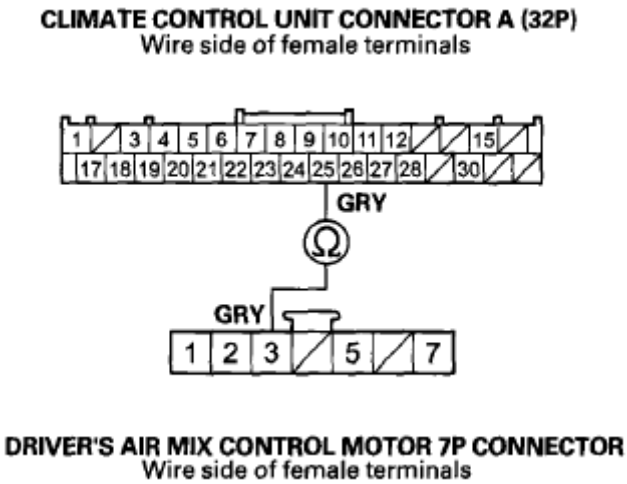

Fig. 49: Checking Continuity Between Terminals Of Climate Control Unit Connectors And Driver's Air Mix Control Motor 7P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

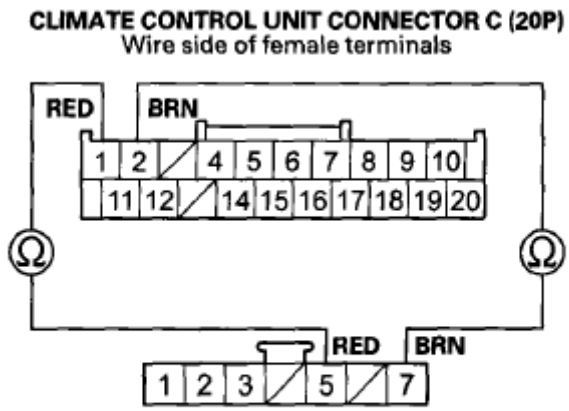

Fig. 50: Measuring Resistance Climate Control Unit Connector And Driver's Air Mix Control Motor 7P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - Check for loose wires or poor connections at climate control unit connectors A (32P), C (20P), and at the driver's air mix control motor 7P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Repair an open in the wire(s) between the climate control unit and the driver's air mix control motor.

DTC B1234 OR DTC INDICATOR K AND AUTO: A SHORT IN THE AIR MIX CONTROL MOTOR CIRCUIT (DRIVER'S)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1234 or K and AUTO indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose or poor connection on the driver's air mix control motor circuit.

5. Check for DTCs.

   Are these DTCs also present; B1237 or N and AUTO, and/or B2968 or B and WINDSHIELD DEFROST, and/or B2980 or F and WINDSHIELD DEFROST?

   YES - Go to step 13.

   NO - Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Test the driver's air mix control motor (see **DRIVER'S AIR MIX CONTROL MOTOR TEST**).

   Is the driver's air mix control motor OK?

   YES - Go to step 8.

   NO - Replace the driver's air mix control motor (see **DRIVER'S AIR MIX CONTROL MOTOR REPLACEMENT**).

8. Disconnect the driver's air mix control motor 7P connector.
9. Disconnect climate control unit connectors A (32P) and C (20P).
10. Check for continuity between climate control unit connector A (32P) terminal No. 25 and body ground

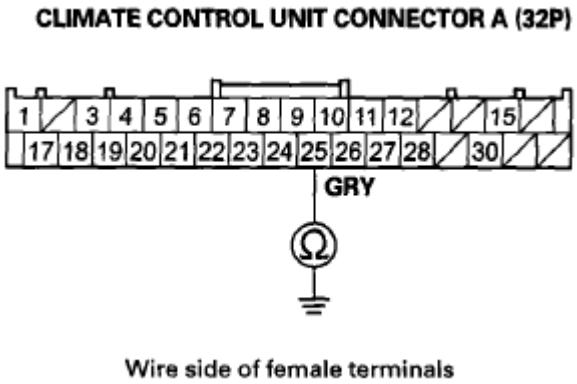

Fig. 51: Checking Continuity Between Climate Control Unit Connector A (32P) Terminal No. 25 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the climate control unit and the driver's air mix control motor.

NO - Go to step 11.

11. Check for continuity between climate control unit connector A (32P) terminal No. 25 and climate control

unit connector C (20P) terminal No. 2.

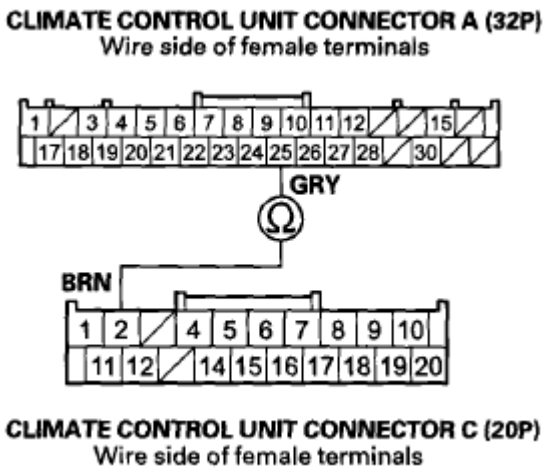

Fig. 52: Checking Continuity Between Climate Control Unit Connector A (32P) And Climate Control Unit Connector C (20P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short in the wires.

NO - Go to step 12.

12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between climate control unit connector A (32P) terminal No. 25 and body ground.

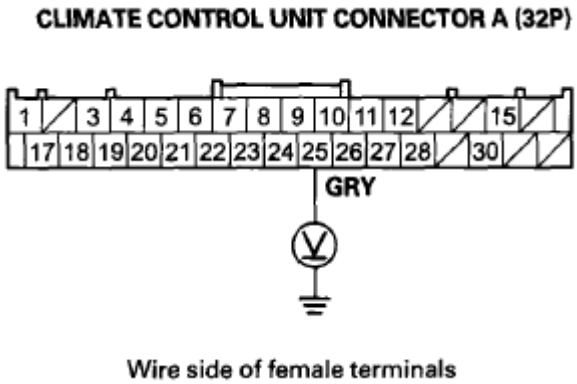

Fig. 53: Measuring Voltage Between Climate Control Unit Connector A (32P) Terminal No. 25 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES - Repair a short to power in the wire between the climate control unit and the driver's air mix control

motor. This short may also damage the climate control unit. Repair a short to power before replacing the climate control unit.

NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and disconnect climate control unit connector C (20P).
14. Disconnect these items:
    - Driver's air mix control motor
    - Passenger's air mix control motor
    - Humidity/in-car temperature sensor
    - A/C pressure sensor
15. Check for continuity between climate control unit connector C (20P) terminal No. 2 and body ground.

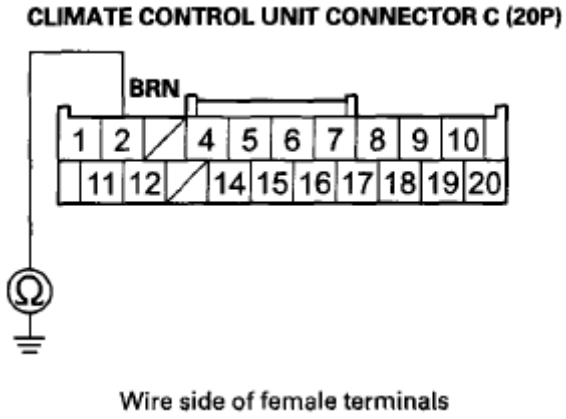

Fig. 54: Checking Continuity Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire.

NO - Go to step 16.

16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between climate control unit connector C (20P) terminal No. 2 and body ground.

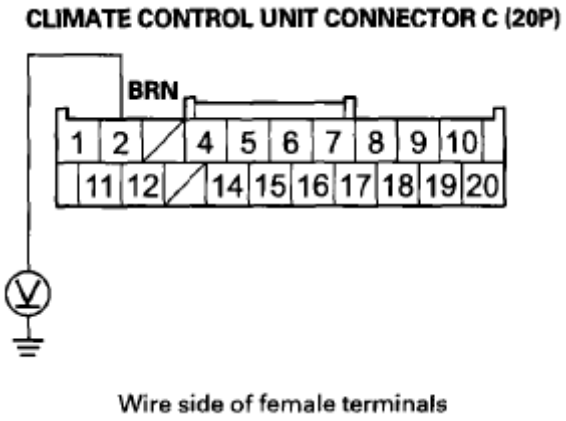

Fig. 55: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES - Repair a short to power in the wire. This short may have also damaged the climate control unit. Repair a short to power before replacing the climate control unit.

NO - Go to step 17.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Reconnect climate control unit connector C (20P).
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between climate control unit connector C (20P) terminal No. 2 and body ground.

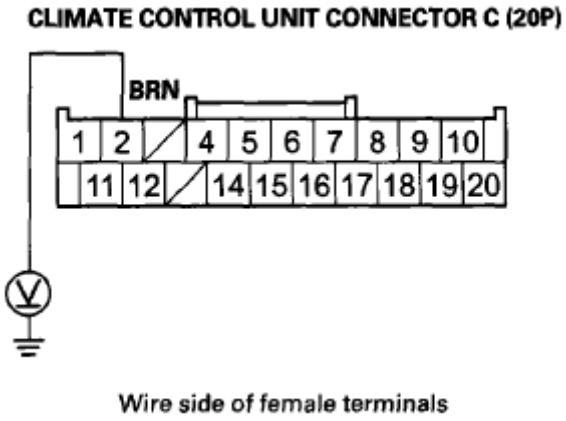

Fig. 56: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 20.

NO - Check for a loose wire or poor connection at climate control unit connector C (20P). If the connection is good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

20. While measuring the voltage between climate control unit connector C (20P) terminal No. 2 and body ground, reconnect these items individually and note the voltage reading each time:
    - Driver's air mix control motor
    - Passenger's air mix control motor
    - Humidity/in-car temperature sensor
    - A/C pressure sensor

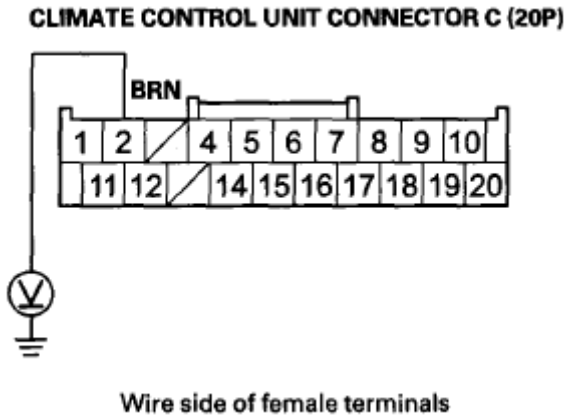

Fig. 57: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the voltage remain at about 5 V?

YES - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Replace the component that caused the voltage drop.

DTC B1235 OR DTC INDICATOR L AND AUTO: A PROBLEM IN THE AIR MIX CONTROL MOTOR CIRCUIT, LINKAGE, DOOR, OR MOTOR (DRIVER'S)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC**

FUNCTION WITH THE HDS) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).

4. Check for DTCs.

   Is DTC B1235 or L and AUTO indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the driver's air mix control motor circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Test the driver's air mix control motor (see **DRIVER'S AIR MIX CONTROL MOTOR TEST**).

   Is the driver's air mix control motor OK?

   YES - Go to step 7.

   NO - Replace the driver's air mix control motor (see **DRIVER'S AIR MIX CONTROL MOTOR REPLACEMENT**), or repair the driver's air mix control linkage or door.

7. Disconnect the driver's air mix control motor 7P connector.
8. Disconnect climate control unit connector A (32P).
9. Check for continuity between the following terminals of climate control unit connector A (32P) and the driver's air mix control motor 7P connector.

   32P: 7P:

   No. 11 No. 1

   No. 12 No. 2

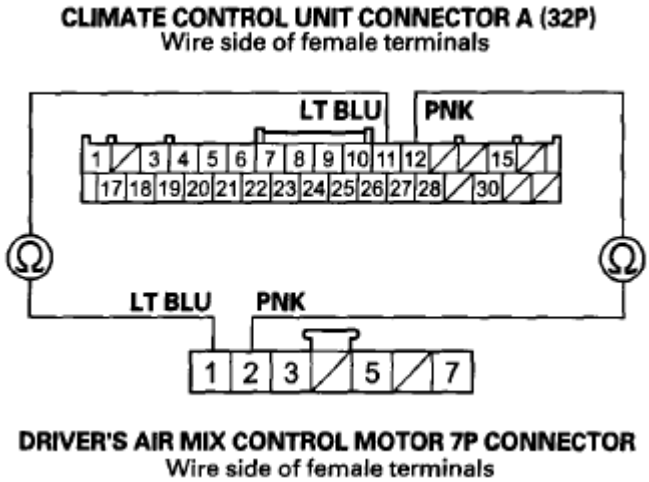

Fig. 58: Checking Continuity Between Terminals Of Climate Control Unit Connector And Driver's Air Mix Control Motor 7P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open in the wire(s) between the climate control unit and the driver's air mix control motor.

10. Check for continuity between body ground and climate control unit connector A (32P) terminals No. 11 and No. 12 individually.

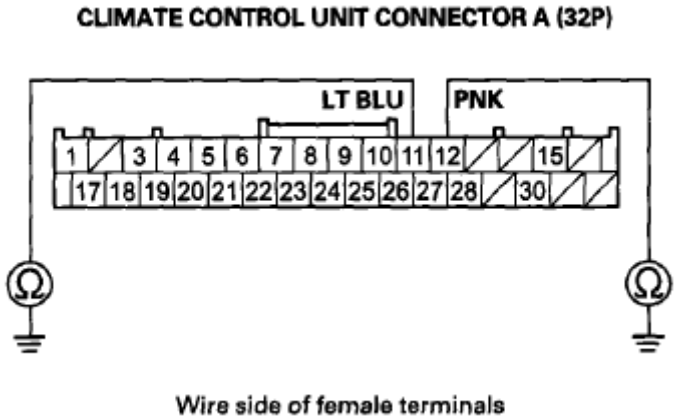

Fig. 59: Checking Continuity Between Body Ground And Climate Control Unit Connector A (32P) Terminals No. 11 And No. 12
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire(s) between the climate control unit and the driver's air mix control motor.

NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

DTC B1236 OR DTC INDICATOR M AND AUTO: AN OPEN IN THE PASSENGER'S AIR MIX CONTROL MOTOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC**

FUNCTION WITH THE HDS) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).

4. Check for DTCs.

   Is DTC B1236 or M and AUTO indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the passenger's air mix control motor circuit

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Test the passenger's air mix control motor (see **PASSENGER'S AIR MIX CONTROL MOTOR TEST**).

   Is the passenger's air mix control motor OK?

   YES - Go to step 7.

   NO - Replace the passenger's air mix control motor (see **PASSENGER'S AIR MIX CONTROL MOTOR REPLACEMENT**).

7. Disconnect the passenger's air mix control motor 7P connector.
8. Disconnect climate control unit connectors A (32P) and C (20P).
9. Check for continuity between the following terminals of climate control unit connectors A (32P), C (20P), and the passenger's air mix control motor 7P connector.

   32P: 7P:

   No. 26 No. 3

   20P: 7P:

   No. 1 No. 5

   No. 2 No. 7

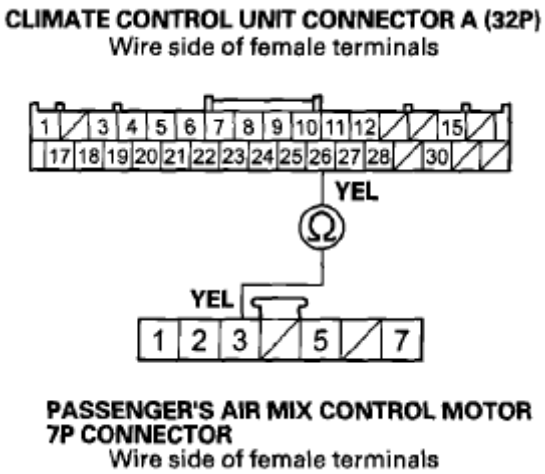

Fig. 60: Checking Continuity Between Terminals Of Climate Control Unit Connectors And Passenger's Air Mix Control Motor 7P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

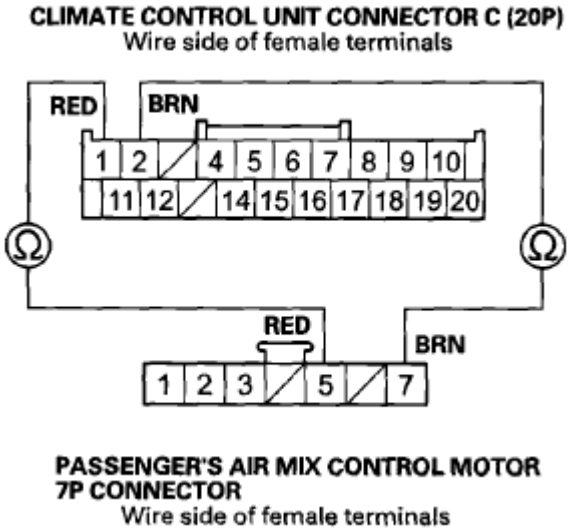

Fig. 61: Measuring Resistance Between Climate Control Unit Connector C And Passenger's Air Mix Control Motor 7P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for loose wires or poor connections at climate control unit connectors A (32P), C (20P), and at the passenger's air mix control motor 7P connector. If the connections are good, substitute a known-good climate control unit and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Repair an open in the wire(s) between the climate control unit and the passenger's air mix control motor.

DTC B1237 OR DTC INDICATOR N AND AUTO: A SHORT IN THE PASSENGER'S AIR MIX CONTROL MOTOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1237 or N and AUTO indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose or poor connection on the passenger's air mix control motor circuit

5. Check for DTCs.

   Are these DTCs also present; B1234 or K and AUTO, and/or B2968 or B and WINDSHIELD DEFROST, and/or B2980 or F and WINDSHIELD DEFROST?

   YES - Go to step 13.

   NO - Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Test the passenger's air mix control motor (see **PASSENGER'S AIR MIX CONTROL MOTOR TEST**).

   Is the passenger's air mix control motor OK?

   YES - Go to step 8.

   NO - Replace the passenger's air mix control motor (see **PASSENGER'S AIR MIX CONTROL MOTOR REPLACEMENT**).

8. Disconnect the passenger's air mix control motor 7P connector.
9. Disconnect climate control unit connectors A (32P) and C (20P).
10. Check for continuity between climate control unit connector A (32P) terminal No. 26 and body ground.

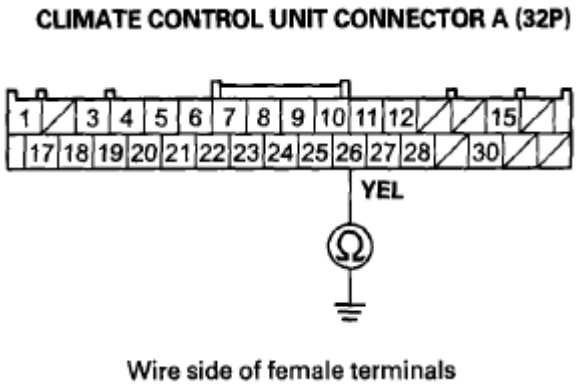

Fig. 62: Checking Continuity Between Climate Control Unit Connector A (32P) Terminal No. 26 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the climate control unit and the passenger's air mix control motor.

NO - Go to step 11.

11. Check for continuity between climate control unit connector A (32P) terminal No. 26 and climate control unit connector C (20P) terminal No. 2.

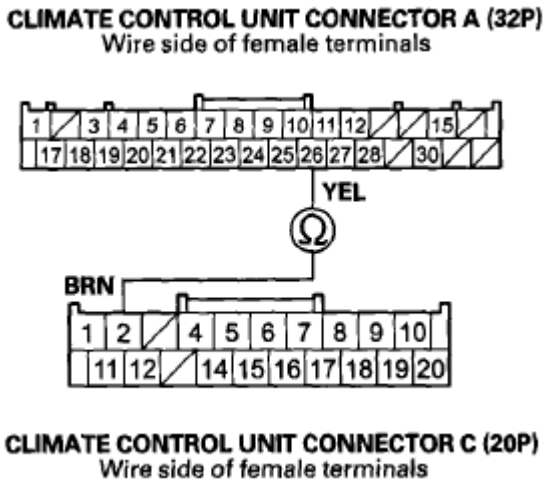

Fig. 63: Checking Continuity Between Climate Control Unit Connector A (32P) And Climate Control Unit Connector C (20P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short in the wire.

NO - Go to step 12.

12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between climate control unit connector A (32P) terminal No. 26 and body ground.

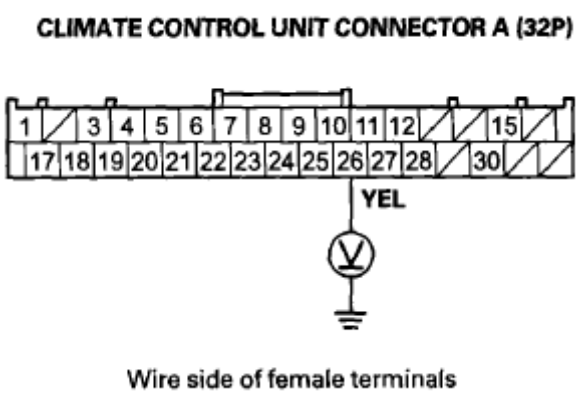

Fig. 64: Measuring Voltage Between Climate Control Unit Connector A (32P) Terminal No. 26 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES - Repair a short to power in the wire(s) between the climate control unit and the passenger's air mix control motor. This short may also damage the climate control unit. Repair a short to power before replacing the climate control unit.

NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and disconnect climate control unit connector C (20P).
14. Disconnect these items:
    - Driver's air mix control motor
    - Passenger's air mix control motor
    - Humidity/in-car temperature sensor
    - A/C pressure sensor
15. Check for continuity between climate control unit connector C (20P) terminal No. 2 and body ground.

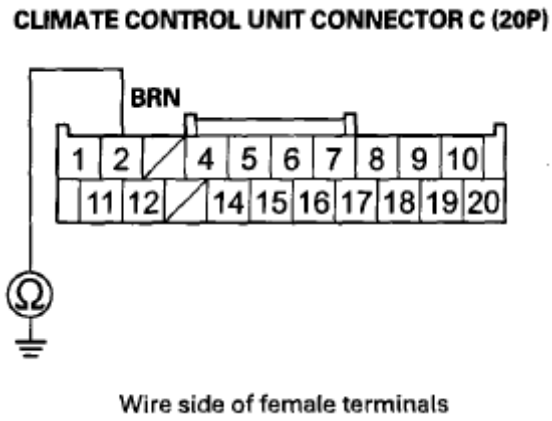

Fig. 65: Checking Continuity Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire.

NO - Go to step 16.

16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between climate control unit connector C (20P) terminal No. 2 and body ground.

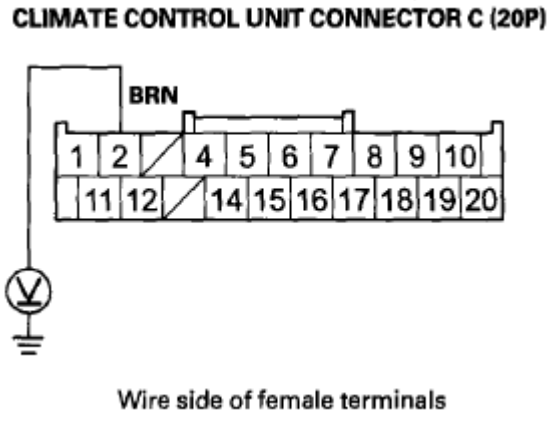

Fig. 66: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES - Repair a short to power in the wire. This short may have also damaged the climate control unit. Repair a short to power before replacing the climate control unit.

NO - Go to step 17.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Reconnect climate control unit connector C (20P).
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between climate control unit connector C (20P) terminal No. 2 and body ground.

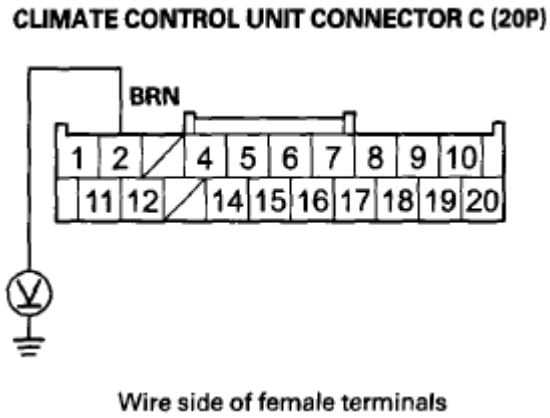

Fig. 67: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 20.

NO - Check for a loose wire or poor connection at climate control unit connector C (20P). If the connection is good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

20. While measuring the voltage between climate control unit connector C (20P) terminal No. 2 and body ground, reconnect these items individually and note the voltage reading each time:
    - Driver's air mix control motor
    - Passenger's air mix control motor
    - Humidity/in-car temperature sensor
    - A/C pressure sensor

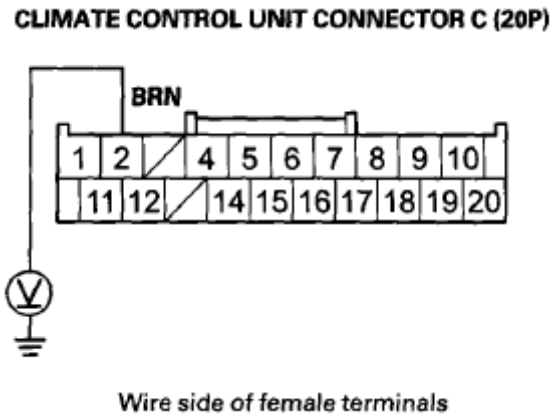

Fig. 68: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the voltage remain at about 5 V?

YES - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Replace the component that caused the voltage drop.

DTC B1238 OR DTC INDICATOR P AND AUTO: A PROBLEM IN THE PASSENGER'S AIR MIX CONTROL MOTOR CIRCUIT, LINKAGE, DOOR, OR MOTOR

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II) or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1238 or P and AUTO indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the passenger's air mix control motor circuit

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Test the passenger's air mix control motor (see **PASSENGER'S AIR MIX CONTROL MOTOR TEST**).

Is the passenger's air mix control motor OK?

YES - Go to step 7.

NO - Replace the passenger's air mix control motor (see **PASSENGER'S AIR MIX CONTROL MOTOR REPLACEMENT**), or repair the passenger's air mix control linkage or door.

7. Disconnect the passenger's air mix control motor 7P connector.
8. Disconnect climate control unit connector A (32P).
9. Check for continuity between the following terminals of climate control unit connector A (32P) and the passenger's air mix control motor 7P connector.

   32P: 7P:

   No. 9 No. 1

   No. 10 No. 2

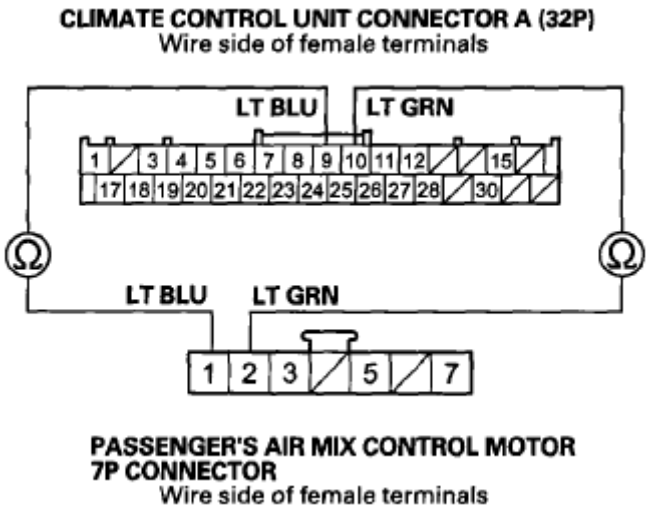

Fig. 69: Checking Continuity Between Terminals Of Climate Control Unit Connector And Passenger's Air Mix Control Motor 7P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open in the wire(s) between the climate control unit and the passenger's air mix control motor.

10. Check for continuity between body ground and climate control unit connector A (32P) terminals No. 9 and No. 10 individually.

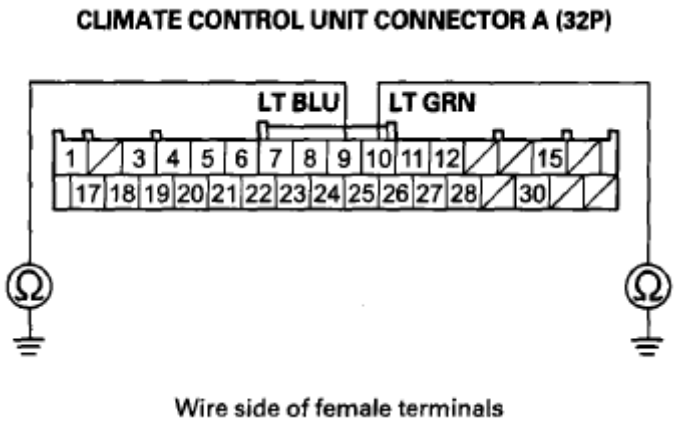

Fig. 70: Checking Continuity Between Body Ground And Climate Control Unit Connector A (32P) Terminals No. 9 And No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire(s) between the climate control unit and the passenger's air mix control motor.

NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

DTC B1239 OR DTC INDICATOR A AND MODE: AN OPEN OR SHORT IN THE MODE CONTROL MOTOR CIRCUIT (DRIVER'S)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II) or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1239 or A and MODE indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the driver's mode control motor circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Test the driver's mode control motor (see **DRIVER'S MODE CONTROL MOTOR TEST**).

Is the driver's mode control motor OK?

YES - Go to step 7.

NO - Replace the driver's mode control motor (see **PASSENGER'S AIR MIX CONTROL MOTOR REPLACEMENT**).

7. Disconnect the driver's mode control motor 7P connector.
8. Disconnect climate control unit connectors A (32P) and C (20P)
9. Check for continuity between the following terminals of climate control unit connector A (32P), C (20P) and the driver's mode control motor 7P connector.

   32P: 7P:

   No. 21 No. 6

   No. 22 No. 5

   No. 23 No. 4

   No. 24 No. 3

   20P: 7P:

   No. 1 No. 7

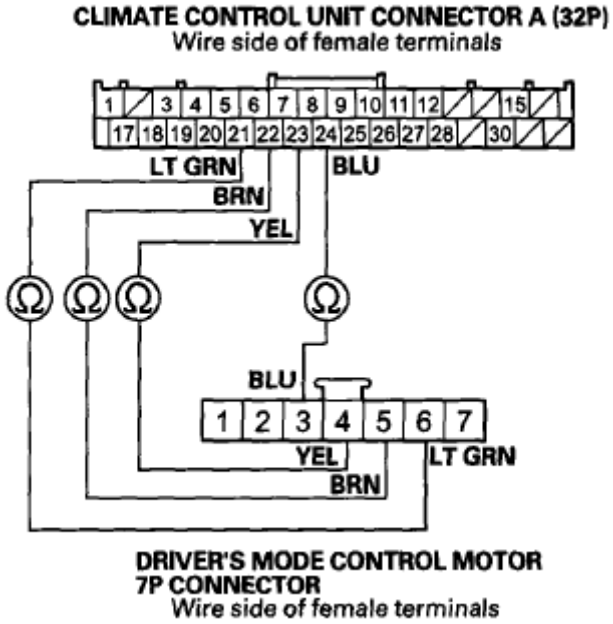

Fig. 71: Checking Continuity Between Terminals Of Climate Control Unit Connector And Driver's Mode Control Motor 7P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

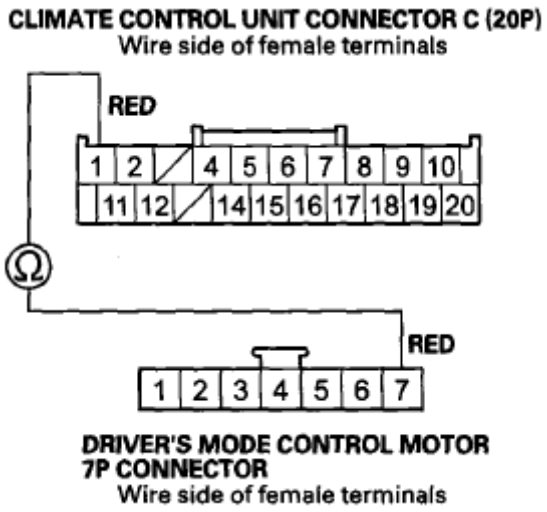

Fig. 72: Measuring Resistance Between Climate Control Unit Connector C And Driver's Mode Control Motor 7P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open in the wire(s) between the climate control unit and the driver's mode control motor.

10. Check for continuity between body ground and climate control unit connector A (32P) terminals No. 21, No. 22, No. 23, and No. 24 individually.

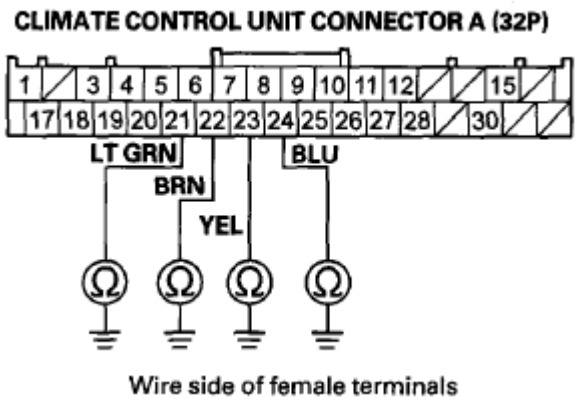

Fig. 73: Checking Continuity Between Body Ground And Climate Control Unit Connector A (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire(s) between the climate control unit and the driver's mode

control motor

NO - Go to step 11.

11. Check for continuity between climate control unit connector A (32P) terminals as follows.

From terminal	To terminals
21	22, 23, 24
22	23, 24
23	24

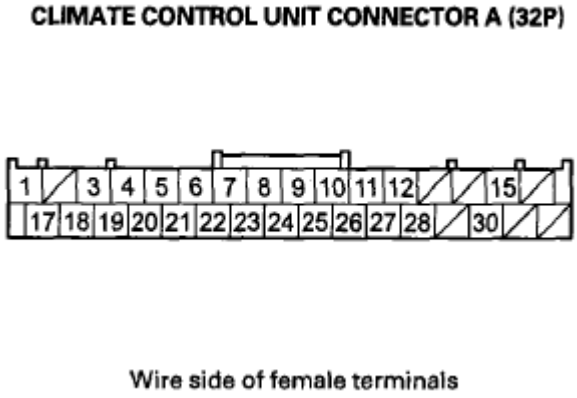

Fig. 74: Checking Continuity Between Climate Control Unit Connector A (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - Repair a short in the wires.

NO - Go to step 12.

12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between body ground and climate control unit connector A (32P) terminals No. 21, No. 22, No. 23, and No. 24 individually.

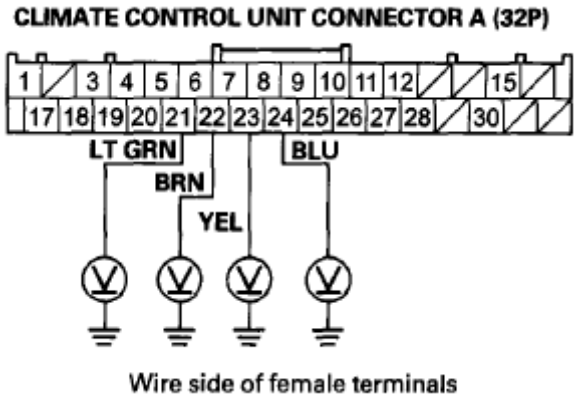

Fig. 75: Measuring Voltage Between Body Ground And Climate Control Unit Connector A (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES - Repair a short to power in the wire(s) between the climate control unit and the driver's mode control motor. This short may also damage the climate control unit. Repair a short to power before replacing the climate control unit.

NO - Check for loose wires or poor connections at climate control unit connector A (32P) and at the driver's mode control motor 7P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

DTC B1240 OR DTC INDICATOR B AND MODE: A PROBLEM IN THE MODE CONTROL MOTOR CIRCUIT, LINKAGE, DOORS, OR MOTOR (DRIVER'S)

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1240 or B and MODE indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the driver's mode control motor circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Test the driver's mode control motor (see **DRIVER'S MODE CONTROL MOTOR TEST**).

Is the driver's mode control motor OK?

YES - Go to step 7.

NO - Replace the driver's mode control motor (see **PASSENGER'S AIR MIX CONTROL MOTOR REPLACEMENT**), or repair the driver's mode control linkage or doors.

7. Disconnect the driver's mode control motor 7P connector.
8. Disconnect climate control unit connector A (32P).
9. Check for continuity between the following terminals of climate control unit connector A (32P) and the driver's mode control motor 7P connector.

   32P: 7P:

   No. 7 No. 2

   No. 8 No. 1

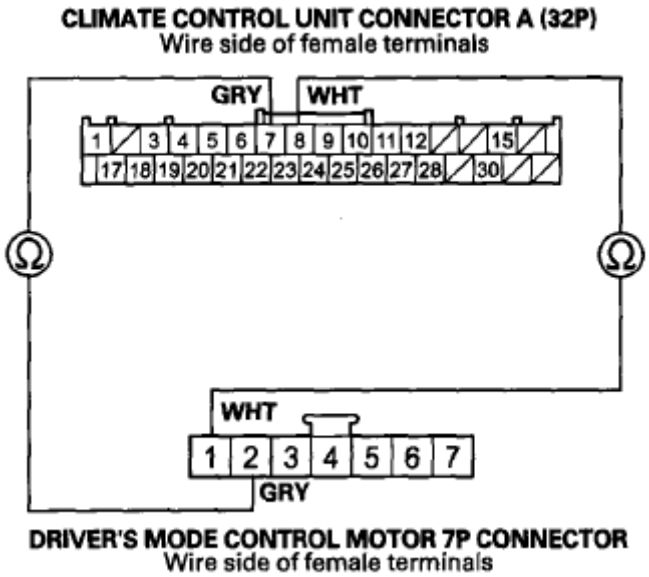

Fig. 76: Checking Continuity Between Terminals Of Climate Control Unit Connector And Driver's Mode Control Motor 7P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open in the wire(s) between the climate control unit and the driver's mode control motor.

10. Check for continuity between body ground and climate control unit connector A (32P) terminals No. 7 and No. 8 individually.

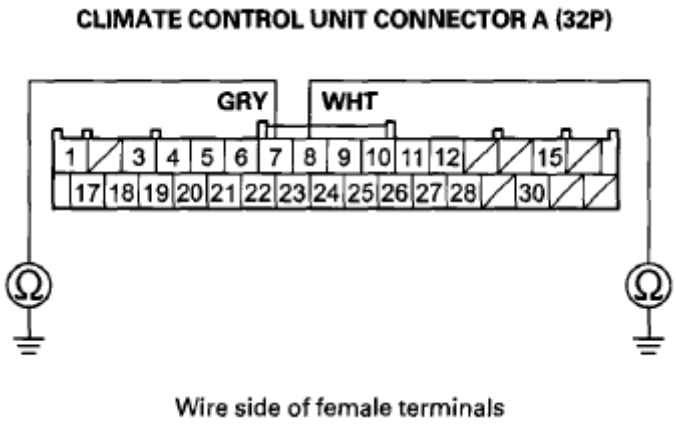

Fig. 77: Checking Continuity Between Body Ground And Climate Control Unit Connector A (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire(s) between the climate control unit and the driver's mode control motor.

NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

DTC B1241 OR DTC INDICATOR C AND MODE: A PROBLEM IN THE BLOWER MOTOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1241 or C and MODE indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the blower motor circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check the No. 8 (40 A) fuse in the under-hood fuse/relay box, and the No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box.

Are the fuses OK?

YES - Go to step 7.

NO - Replace the fuse(s), and recheck. If the fuse(s) blow again, check for a short in the No. 8 (40 A) fuse and the No. 16 (7.5 A) fuse circuits.

7. Connect blower motor 2P connector terminal No. 2 to body ground with a jumper wire.

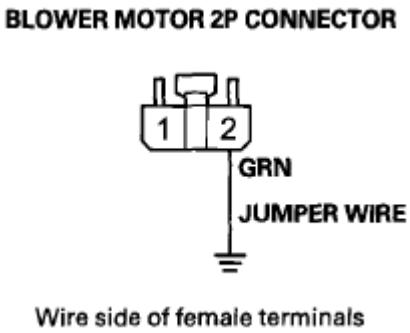

Fig. 78: Connecting Blower Motor 2P Connector Terminal No. 2 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

   Does the blower motor run?

   YES - Go to step 9.

   NO - Go to step 24.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect the jumper wire.
11. Disconnect the power transistor 5P connector.
12. Check for continuity between power transistor 5P connector terminal No. 5 and body ground.

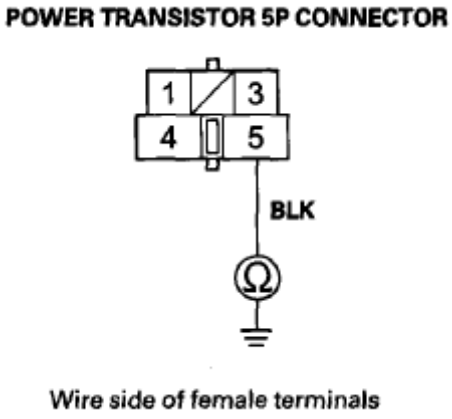

Fig. 79: Checking Continuity Between Power Transistor 5P Connector Terminal No. 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Check for an open in the wire between the power transistor and body ground. If the wire is OK, check for poor ground at G302 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

13. Connect power transistor 5P connector terminals No. 4 and No. 5 with a jumper wire.

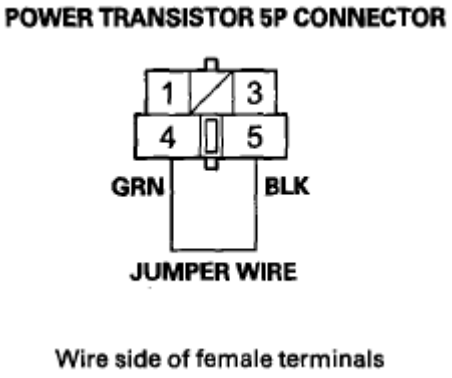

Fig. 80: Connecting Power Transistor 5P Connector Terminals No. 4 And No. 5 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

Does the blower motor run at high speed?

YES - Go to step 15.

NO - Repair an open in the GRN wire between the power transistor and the blower motor.

15. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF.
16. Disconnect the jumper wire.
17. Disconnect climate control unit connector A (32P).
18. Check for continuity between body ground and climate control unit connector A (32P) terminals No. 27 and No. 28 individually.

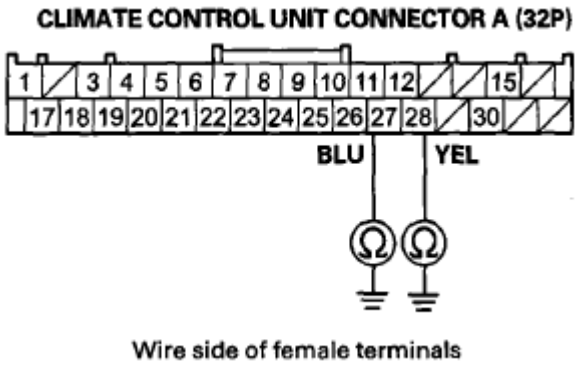

Fig. 81: Checking Continuity Between Body Ground And Climate Control Unit Connector A (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire(s) between the climate control unit and the power transistor.

NO - Go to step 19.

19. Check for continuity between the following terminals of the climate control unit connector A (32P) and the power transistor 5P connector.

    32P: 5P:

    No. 27 No. 1

    No. 28 No. 3

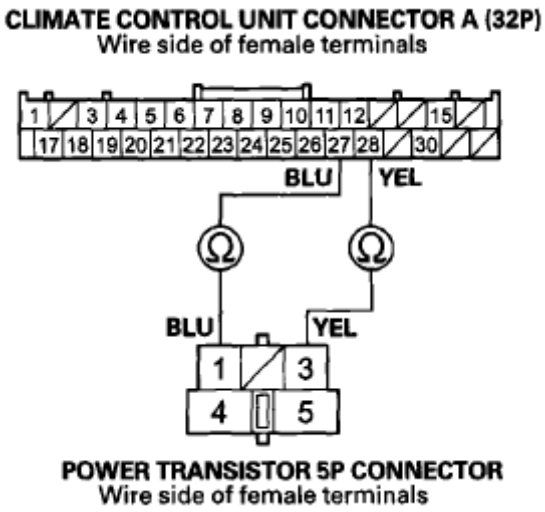

Fig. 82: Checking Continuity Between Terminals Of Climate Control Unit Connector A (32P) And Power Transistor 5P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 20.

NO - Repair an open in the wire(s) between the climate control unit and the power transistor.

20. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
21. Measure the voltage between body ground and climate control unit connector A (32P) terminals No. 27 and No. 28 individually.

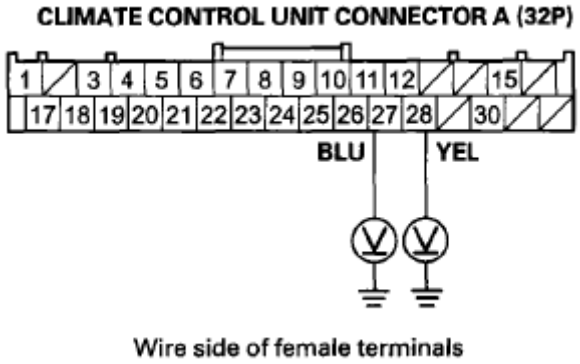

Fig. 83: Measuring Voltage Between Body Ground And Climate Control Unit Connector A (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES - Repair a short to power in the wire(s).

NO - Go to step 22.

22. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
23. Test the power transistor (see **POWER TRANSISTOR TEST**).

Is the power transistor OK?

YES - Check for loose wires or poor connections at the climate control unit connector A (32P) and at the power transistor 5P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Replace the power transistor.

NOTE: If the power transistor is faulty, check the blower motor for damage. If necessary, replace the blower motor.

24. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
25. Disconnect the jumper wire.
26. Disconnect the blower motor 2P connector.
27. Measure the voltage between blower motor 2P connector terminal No. 1 and body ground.

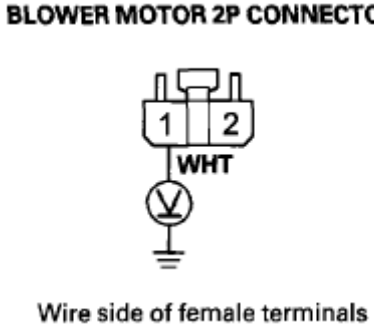

Fig. 84: Measuring Voltage Between Blower Motor 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Replace the blower motor (see **BLOWER UNIT COMPONENT REPLACEMENT**).

NO - Go to step 28.

28. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
29. Remove the blower motor relay from the under-hood fuse/relay box, and test it (see **POWER RELAY TEST**).

Is the relay OK?

YES - Go to step 30.

NO - Replace the blower motor relay.

30. Check for continuity between blower motor relay 4P socket terminal No. 2 and blower motor 2P connector terminal No. 1.

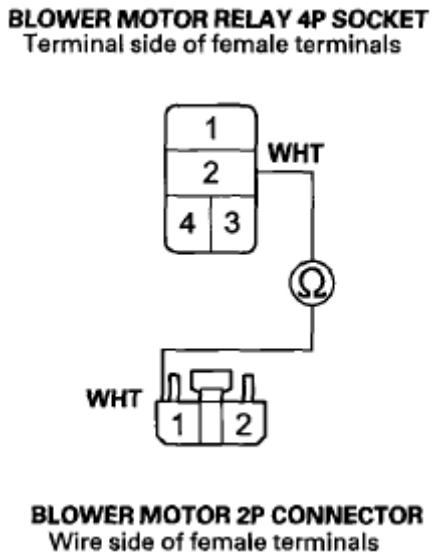

Fig. 85: Checking Continuity Between Blower Motor Relay 4P Socket Terminal No. 2 And Blower Motor 2P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 31.

NO - Repair an open in the wire between the blower motor relay and blower motor.

31. Measure the voltage between blower motor relay 4P socket terminal No. 1 and body ground.

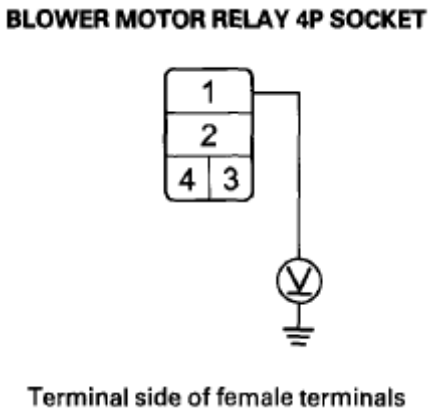

Fig. 86: Measuring Voltage Between Blower Motor Relay 4P Socket Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 32.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

32. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
33. Measure the voltage between blower motor relay 4P socket terminal No. 4 and body ground.

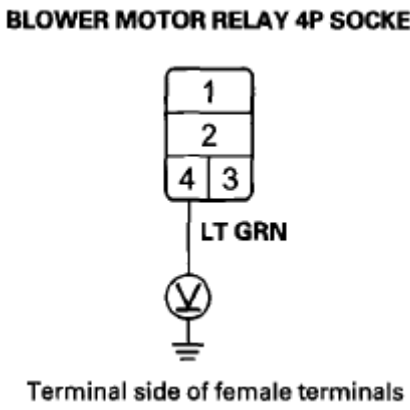

Fig. 87: Measuring Voltage Between Blower Motor Relay 4P Socket Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Check for an open in the wire between blower motor relay 4P socket terminal No. 3 and body ground. If the wire is OK, check for poor body ground at G302 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

NO - Repair an open in the wire between the No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box and the blower motor relay 4P socket.

DTC B1242 OR DTC INDICATOR E AND MODE: AN OPEN OR SHORT IN THE PASSENGER'S MODE CONTROL MOTOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode, and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1242 or E and MODE indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the passenger's mode control motor circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Test the passenger's mode control motor (see **RECIRCULATION CONTROL MOTOR TEST**).

   Is the passenger's mode control motor OK?

   YES - Go to step 7.

   NO - Replace the passenger's mode control motor (see **PASSENGER'S MODE CONTROL MOTOR REPLACEMENT**).

7. Disconnect the passenger's mode control motor 7P connector.
8. Disconnect climate control unit connectors A (32P) and C (20P).
9. Check for continuity between the following terminals of climate control unit connector A (32P), C (20P) and the passenger's mode control motor 7P connector.

   32P: 7P:

   No. 17 No. 6

   No. 18 No. 5

   No. 19 No. 4

   No. 20 No. 3

20P: 7P:

No. 1 No. 7

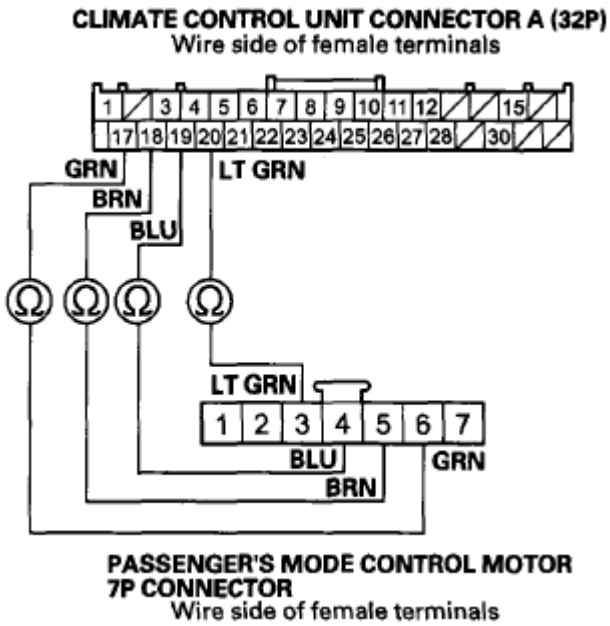

Fig. 88: Checking Continuity Between Terminals Of Climate Control Unit Connector And Passenger's Mode Control Motor 7P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

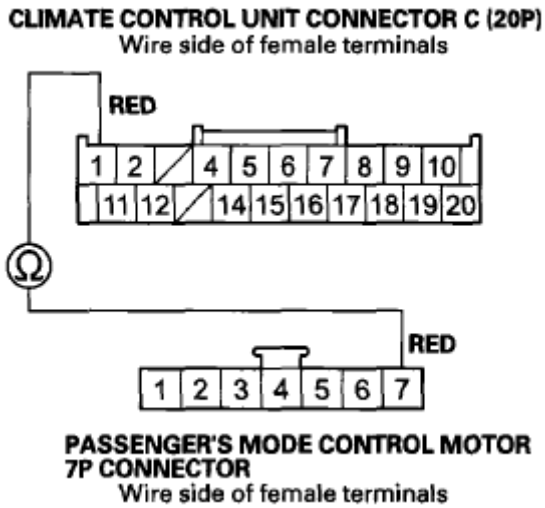

Fig. 89: Measuring Resistance Between Climate Control Unit Connector C And Passenger's Mode Control Motor 7P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open in the wire(s) between the climate control unit and the passenger's mode control motor.

10. Check for continuity between body ground and climate control unit connector A (32P) terminals No. 17, No. 18, No. 19, and No. 20 individually.

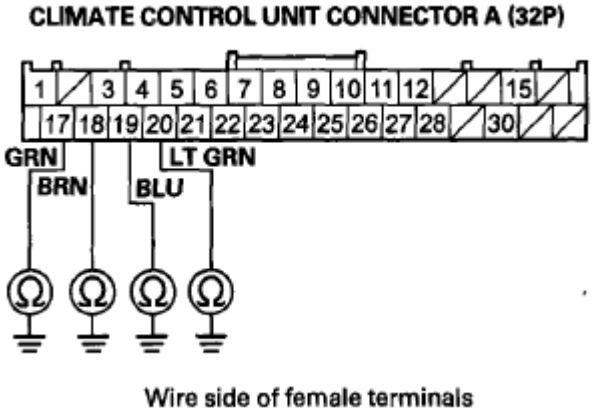

Fig. 90: Checking Continuity Between Body Ground And Climate Control Unit Connector A (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire(s) between the climate control unit and the passenger's mode control motor.

NO - Go to step 11.

11. Check for continuity between climate control unit connector A (32P) terminals as follows.

From terminal	To terminals
17	18, 19, 20
18	19, 20
19	20

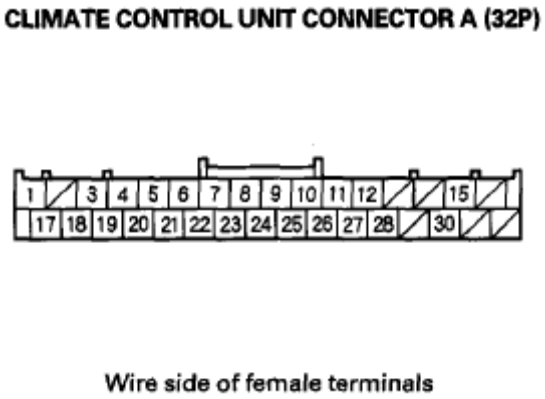

Fig. 91: Checking Continuity Between Climate Control Unit Connector A (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - Repair a short in the wires.

NO - Go to step 12.

12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between body ground and climate control unit connector A (32P) terminals No. 17, No. 18, No. 19, and No. 20 individually.

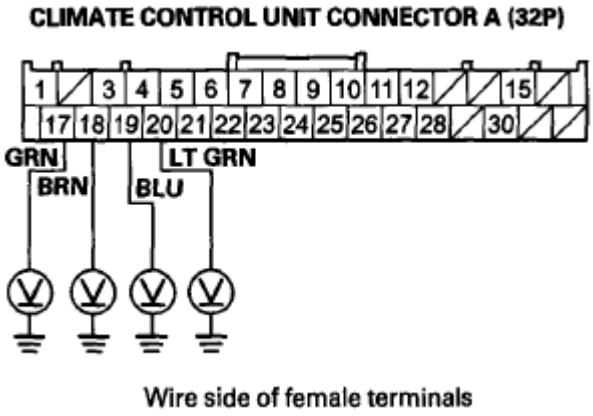

Fig. 92: Measuring Voltage Between Body Ground And Climate Control Unit Connector A (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES - Repair a short to power in the wire(s) between the climate control unit and the passenger's mode control motor. This short may also damage the climate control unit. Repair a short to power before replacing the climate control unit

NO - Check for loose wires or poor connections at climate control unit connector A (32P) and at the passenger's mode control motor 7P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

DTC B1243 OR DTC INDICATOR F AND MODE: A PROBLEM IN THE PASSENGER'S MODE CONTROL MOTOR CIRCUIT, LINKAGE, DOORS, OR MOTOR

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B1243 or F and MODE indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the passenger's mode control motor circuit

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Test the passenger's mode control motor (see **RECIRCULATION CONTROL MOTOR TEST**).

   Is the passenger's mode control motor OK?

   YES - Go to step 7.

   NO - Replace the passenger's mode control motor (see **PASSENGER'S MODE CONTROL MOTOR REPLACEMENT**), or repair the Passenger's mode control linkage or doors.

7. Disconnect the passenger's mode control motor 7P connector.
8. Disconnect climate control unit connector A (32P).
9. Check for continuity between the following terminals of climate control unit connector A (32P) and the passenger's mode control motor 7P connector.

   32P: 7P:

   No. 5 No. 1

   No. 6 No. 2

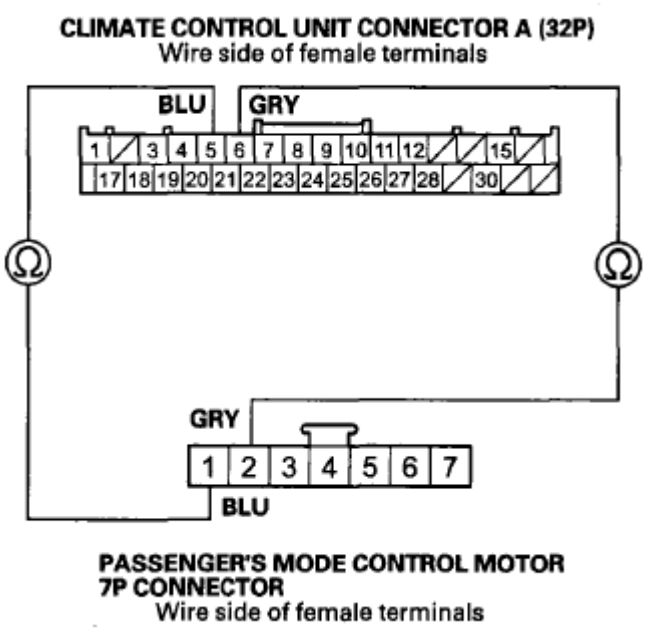

Fig. 93: Checking Continuity Between Terminals Of Climate Control Unit Connector And Passenger's Mode Control Motor 7P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open in the wire(s) between the climate control unit and the passenger's mode control motor.

10. Check for continuity between body ground and climate control unit connector A (32P) terminals No. 5 and No. 6 individually.

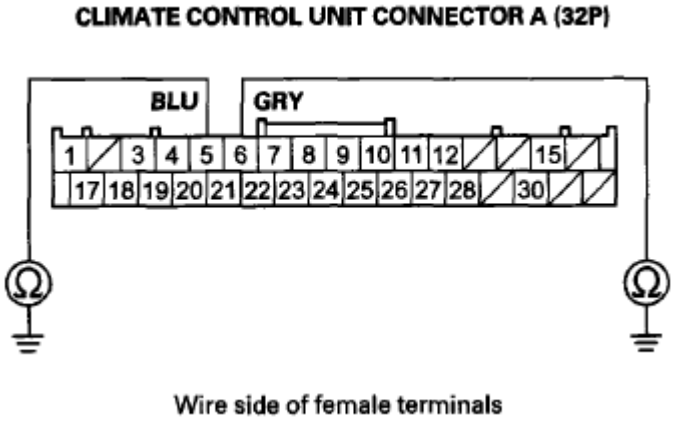

Fig. 94: Checking Continuity Between Body Ground And Climate Control Unit Connector A (32P) Terminals No. 5 And No. 6

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire(s) between the climate control unit and the passenger's mode control motor.

NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

DTC B2967 OR DTC INDICATOR A AND WINDSHIELD DEFROST: AN OPEN IN THE HUMIDITY SENSOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B2967 or A and WINDSHIELD DEFROST indicated?

   YES - Go to step 5.

   NO - Intermittent failure, check for loose wires or poor connections on the humidity sensor circuit

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Remove the humidity/in-car temperature sensor (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR REPLACEMENT**), and test it (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR TEST**).

   Is the humidity sensor OK?

   YES - Go to step 7.

   NO - Replace the humidity/in-car temperature sensor (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR REPLACEMENT**).

7. Disconnect the humidity/in-car temperature sensor 4P connector.
8. Disconnect climate control unit connector C (20P).
9. Check for continuity between the following terminals of climate control unit connector C (20P) and the humidity/in-car temperature sensor 4P connector.

   20P: 4P:

No. 1 No. 3

No. 2 No. 1

No. 12 No. 2

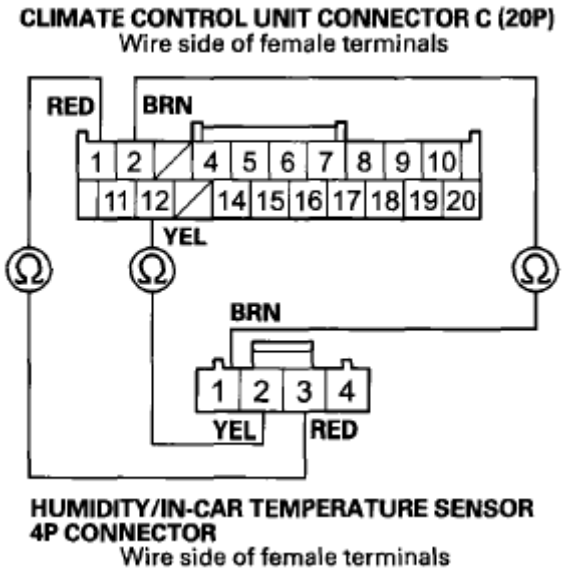

Fig. 95: Checking Continuity Between Terminals Of Climate Control Unit Connector And Humidity/In-Car Temperature Sensor 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for loose wires or poor connections at climate control unit connector C (20P) and at the humidity/in-car temperature sensor 4P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Repair an open in the wire(s) between the climate control unit and the humidity sensor.

DTC B2968 OR DTC INDICATOR B AND WINDSHIELD DEFROST: A SHORT IN THE HUMIDITY SENSOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

Is DTC B2968 or B and WINDSHIELD DEFROST indicated?

YES - Go to step 5.

NO - Intermittent failure. Check for loose wires or poor connections on the humidity sensor circuit.

5. Check for DTCs.

   Are these DTCs also present; B1234 or K and AUTO, and/or B1237 or N and AUTO, and/or B2980 or F and WINDSHIELD DEFROST?

   YES - Go to step 13.

   NO - Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Remove the humidity/in-car temperature sensor (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR REPLACEMENT**), and test it (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR TEST**).

   Is the humidity sensor OK?

   YES - Go to step 8.

   NO - Replace the humidity/in-car temperature sensor (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR REPLACEMENT**).

8. Disconnect the humidity/in-car temperature sensor 4P connector.
9. Disconnect climate control unit connector C (20P).
10. Check for continuity between climate control unit connector C (20P) terminal No. 12 and body ground.

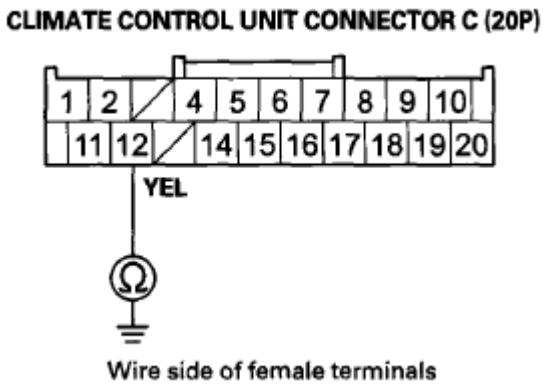

Fig. 96: Checking Continuity Between Climate Control Unit Connector C (20P) Terminal No. 12 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the climate control unit and the humidity sensor.

NO - Go to step 11.

11. Check for continuity between climate control unit connector C (20P) terminals No. 2 and No. 12.

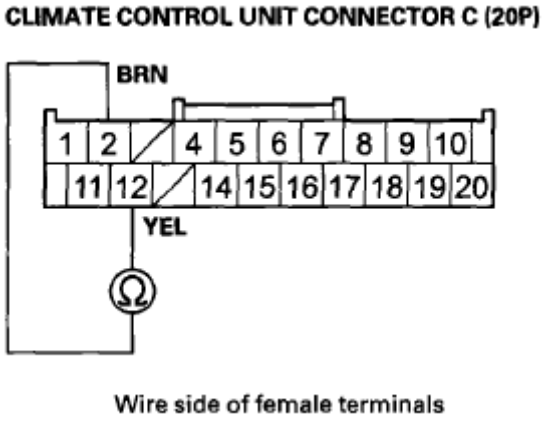

Fig. 97: Checking Continuity Between Climate Control Unit Connector C (20P) Terminals No. 2 And No. 12
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short in the wires.

NO - Go to step 12.

12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between climate control unit connector C (20P) terminal No. 12 and body ground.

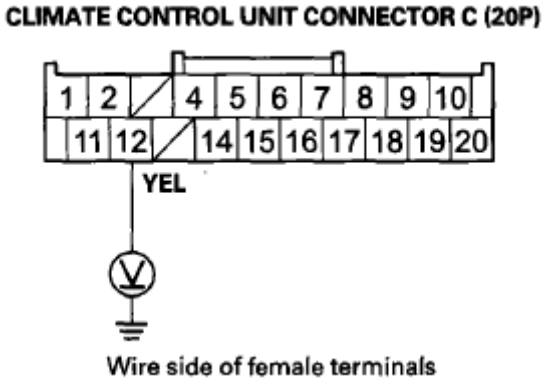

Fig. 98: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminal No. 12 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES - Repair a short to power in the wire between the climate control unit and the humidity sensor. This short may also damage the climate control unit. Repair a short to power before replacing the climate control unit.

NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and disconnect climate control unit connector C (20P).
14. Disconnect these items:
    - Driver's air mix control motor
    - Passenger's air mix control motor
    - Humidity/in-car temperature sensor
    - A/C pressure sensor
15. Check for continuity between climate control unit connector C (20P) terminal No. 2 and body ground.

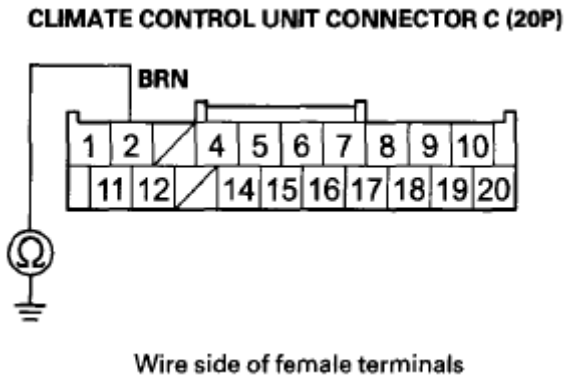

Fig. 99: Checking Continuity Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire.

NO - Go to step 16.

16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between climate control unit connector C (20P) terminal No. 2 and body ground.

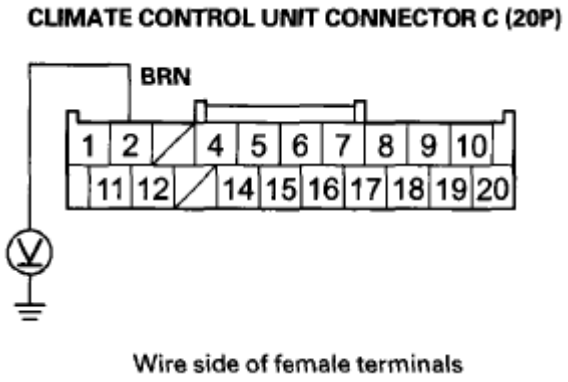

Fig. 100: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES - Repair a short to power in the wire. This short may have also damaged the climate control unit. Repair the short to power before replacing the climate control unit

NO - Go to step 17.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Reconnect the climate control unit connector C (20P).
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode and measure the voltage between climate control unit connector C (20P) terminal No. 2 and body ground.

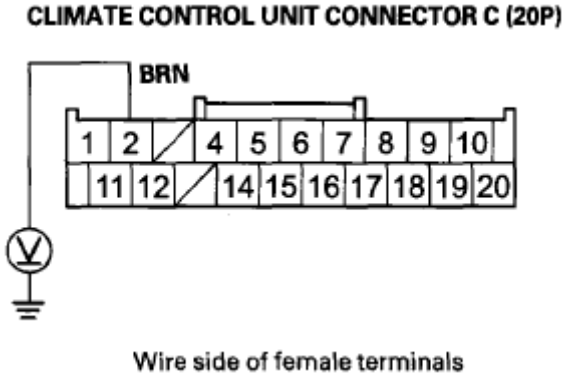

Fig. 101: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 20.

NO - Check for a loose wire or poor connection at climate control unit connector C (20P). If the connection is good, substitute a known-good climate control unit and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

20. While measuring the voltage between climate control unit connector C (20P) terminal No. 2 and body ground, reconnect these items individually and note the voltage reading each time:
    - Driver's air mix control motor
    - Passenger's air mix control motor
    - Humidity/in-car temperature sensor
    - A/C pressure sensor

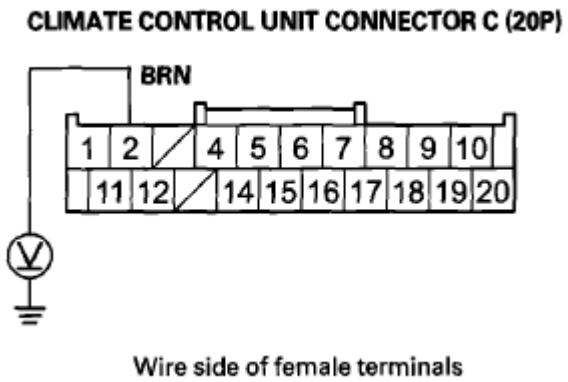

Fig. 102: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the voltage remain at about 5 V?

YES - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Replace the component that caused the voltage drop.

DTC B2969: CLIMATE CONTROL UNIT LOST COMMUNICATION WITH DRIVER'S MICU (WIPSW MESSAGE)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in the B-CAN system diagnosis test mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.

3. Wait for at least 6 seconds.
4. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**).
5. Check the DTCs.

   Is DTC B2969 indicated?

   YES - Go to step 6.

   NO - The system is OK at this time. Check for loose wires or poor connections on the driver's MICU and climate control unit circuit

6. Select B-CAN Control Units Information in the BODY ELECTRICAL menu.
7. Select Check Connected Control Units in the B-CAN Control Units Information menu.

   Is the driver's MICU detected?

   YES - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

   NO - Go to step 8.

8. Disconnect driver's under-dash fuse/relay box connector P (20P).
9. Disconnect climate control unit connector C (20P).
10. Check for continuity between the following terminals of climate control unit connector C (20P) and driver's under-dash fuse/relay box connector P (20P).

    20P: 20P:

    No. 7 No. 5

    No. 8 No. 6

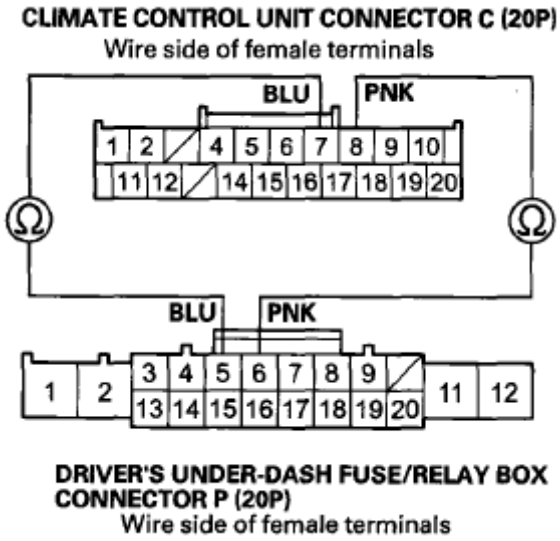

Fig. 103: Checking Continuity Between Terminals Of Climate Control Unit Connector And Driver's Under-Dash Fuse/Relay Box Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to the driver's MICU input test (see **MICU INPUT TEST**).

NO - Repair an open in the wire(s) between the driver's MICU and the climate control unit.

DTC B2979 OR DTC INDICATOR E AND WINDSHIELD DEFROST: AN OPEN IN THE A/C PRESSURE SENSOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B2979 or E and WINDSHIELD DEFROST indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the A/C pressure sensor circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the A/C pressure sensor 3P connector.
7. Disconnect climate control unit connector C (20P).

8. Check for continuity between the following terminals of climate control unit connector C (20P) and the A/C pressure sensor 3P connector.

   20P: 3P:

   No. 1 No. 3

   No. 2 No. 1

   No. 11 No. 2

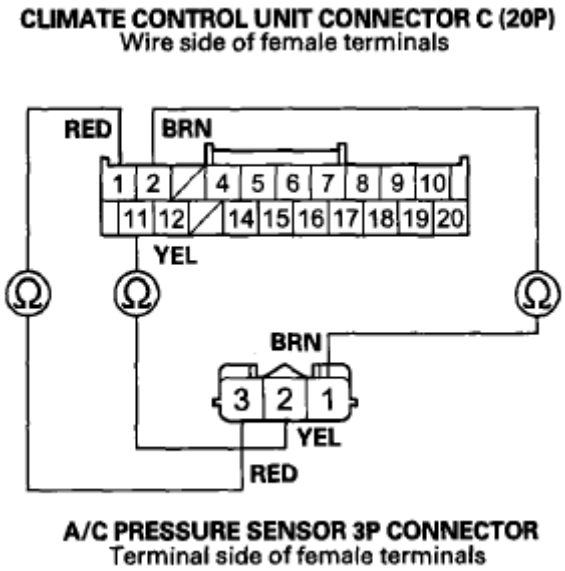

Fig. 104: Checking Continuity Between Terminals Of Climate Control Unit Connector And A/C Pressure Sensor 3P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Repair an open in the wire(s) between the climate control unit and the A/C pressure sensor.

9. Reconnect climate control unit connector C (20P).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Measure the voltage between climate control unit connector C (20P) terminals No. 1 and No. 2, and between climate control unit connector C (20P) terminals No. 1 and No. 11.

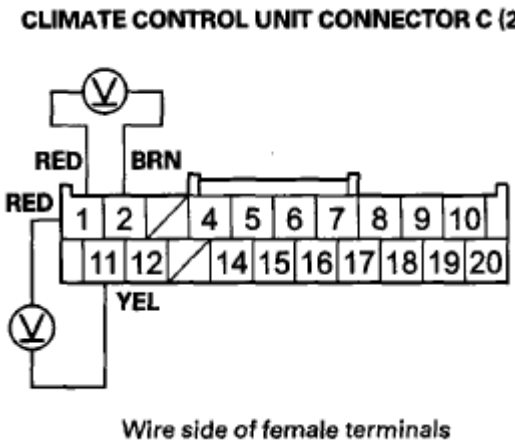

Fig. 105: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Replace the A/C pressure sensor.

NO - Check for loose wires or poor connections at climate control unit connector C (20P) and at the A/C pressure sensor 3P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

DTC B2980 OR DTC INDICATOR F AND WINDSHIELD DEFROST: A SHORT IN THE A/C PRESSURE SENSOR CIRCUIT

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check for DTCs.

   Is DTC B2980 or F and WINDSHIELD DEFROST indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the A/C pressure sensor circuit.

5. Check for DTCs.

   Are these DTCs also present; B1234 or K and AUTO, and/or B1237 or N and AUTO, and/or B2968 or B and WINDSHIELD DEFROST?

YES - Go to step 16.

NO - Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Disconnect the A/C pressure sensor 3P connector.
8. Disconnect climate control unit connector C (20P).
9. Check for continuity between climate control unit connector C (20P) terminal No. 11 and body ground.

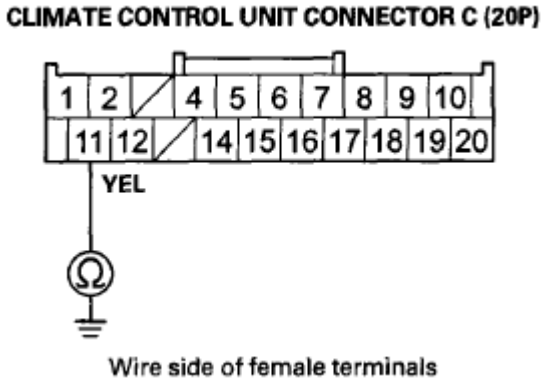

Fig. 106: Checking Continuity Between Climate Control Unit Connector C (20P) Terminal No. 11 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the climate control unit and the A/C pressure sensor.

NO - Go to step 10.

10. Check for continuity between climate control unit connector C (20P) terminals No. 2 and No. 11.

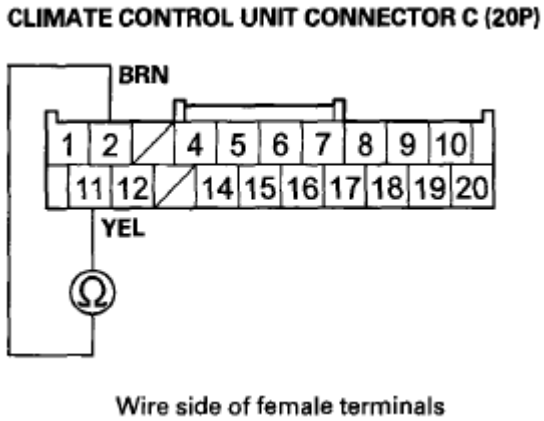

Fig. 107: Checking Continuity Between Climate Control Unit Connector C (20P) Terminals No. 2

And No. 11
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short in the wires.

NO - Go to step 11.

11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between climate control unit connector C (20P) terminal No. 11 and body ground.

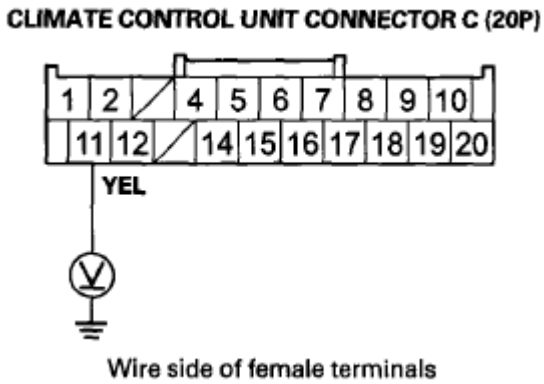

Fig. 108: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminal No. 11 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES - Repair a short to power in the wire between the climate control unit and the A/C pressure sensor. This short may also damage the climate control unit. Repair a short to power before replacing the climate control unit.

NO - Go to step 12.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Reconnect climate control unit connector C (20P).
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Measure the voltage between climate control unit connector C (20P) terminals No. 1 and No. 2, and between climate control unit connector C (20P) terminals No. 1 and No. 11.

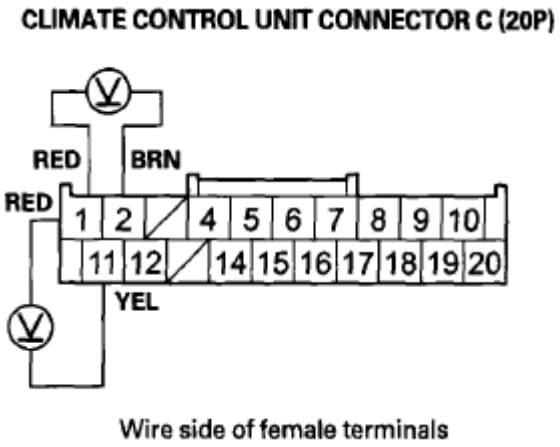

Fig. 109: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Replace the A/C pressure sensor.

NO - Check for loose wires or poor connections at climate control unit connector C (20P) and at the A/C pressure sensor 3P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and disconnect climate control unit connector C (20P).
17. Disconnect these items:
    - Driver's air mix control motor
    - Passenger's air mix control motor
    - Humidity/in-car temperature sensor
    - A/C pressure sensor
18. Check for continuity between climate control unit connector C (20P) terminal No. 2 and body ground.

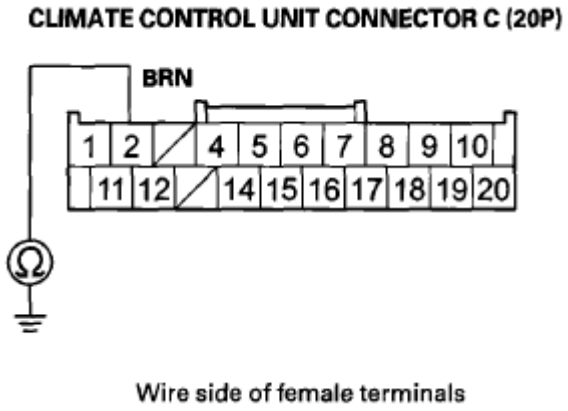

Fig. 110: Checking Continuity Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire.

NO - Go to step 19.

19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between climate control unit connector C (20P) terminal No. 2 and body ground.

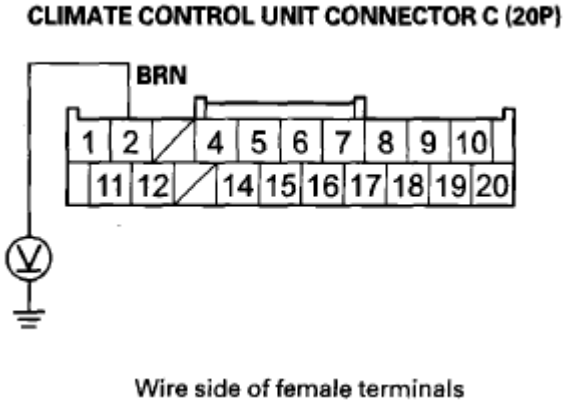

Fig. 111: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES - Repair a short to power in the wire. This short may have also damaged the climate control unit. Repair the short to power before replacing the climate control unit.

NO - Go to step 20.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Reconnect climate control unit connector C (20P).
22. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and measure the voltage between climate control unit connector C (20P) terminal No. 2 and body ground.

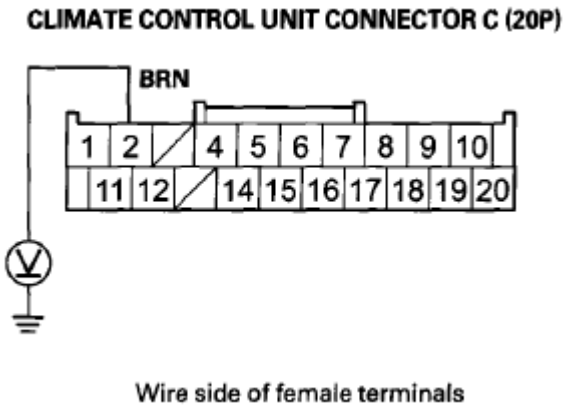

Fig. 112: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 23.

NO - Check for a loose wire or poor connection at climate control unit connector C (20P). If the connection is good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

23. While measuring the voltage between climate control unit connector C (20P) terminal No. 2 and body ground, reconnect these items individually and note the voltage reading each time:
    - Driver's air mix control motor
    - Passenger's air mix control motor
    - Humidity/in-car temperature sensor
    - A/C pressure sensor

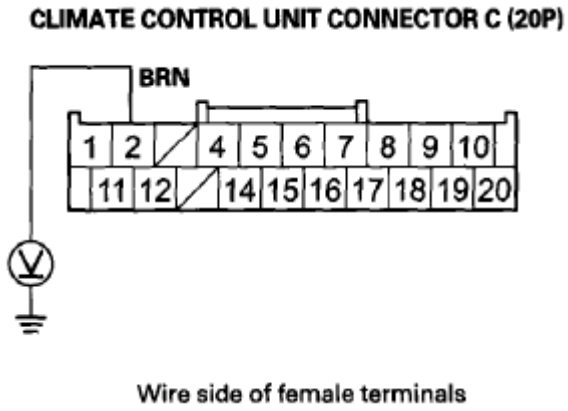

Fig. 113: Measuring Voltage Between Climate Control Unit Connector C (20P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the voltage remain at about 5 V?

YES - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Replace the component that caused the voltage drop.

DTC B2983 OR DTC INDICATOR K AND MODE: A PROBLEM IN THE RECIRCULATION CONTROL MOTOR CIRCUIT, LINKAGE, DOOR, OR MOTOR

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Do the Self-diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**) or with the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).
4. Check the DTCs.

   Is DTC B2983 or K and MODE indicated?

   YES - Go to step 5.

   NO - Intermittent failure. Check for loose wires or poor connections on the recirculation control motor circuit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Test the recirculation control motor (see **RECIRCULATION CONTROL MOTOR TEST**).

   Is the recirculation control motor OK?

YES - Go to step 7.

NO - Replace the recirculation control motor (see **RECIRCULATION CONTROL MOTOR REPLACEMENT**), or repair the recirculation control linkage or door.

7. Disconnect the recirculation control motor 7P connector.
8. Disconnect climate control unit connector C (20P).
9. Check for continuity between the following terminals of climate control unit connector C (20P) and the recirculation control motor 7P connector.

   20P: 7P:

   No. 9 No. 2

   No. 10 No. 1

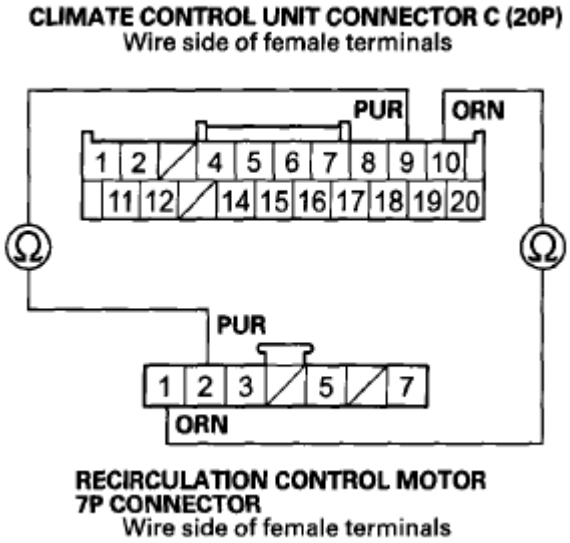

Fig. 114: Checking Continuity Between Terminals Of Climate Control Unit Connector And Recirculation Control Motor 7P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open in the wire(s) between the climate control unit and the recirculation control motor.

10. Check for continuity between body ground and climate control unit connector C (20P) terminals No. 9 and No. 10 individually.

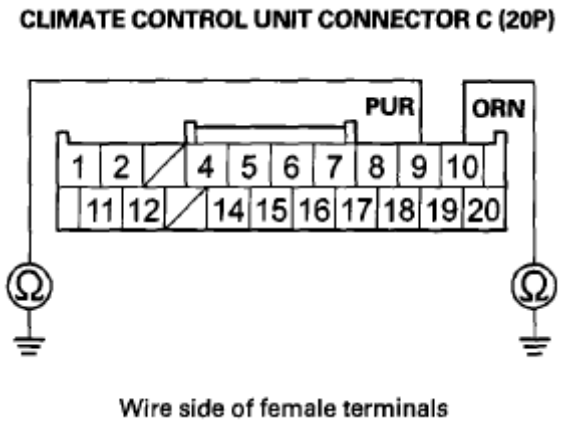

Fig. 115: Checking Continuity Between Body Ground And Climate Control Unit Connector C (20P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire(s) between the climate control unit and the recirculation control motor.

NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

CLIMATE CONTROL POWER AND GROUND CIRCUIT TROUBLESHOOTING

1. Check the No. 16(7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

   YES - Go to step 2.

   NO - Replace the fuse, and recheck. If the fuse blows again, check for a short in the No. 16 (7.5 A) fuse circuit.

2. Disconnect climate control unit connector A (32P).
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Measure the voltage between climate control unit connector A (32P) terminal No. 15 and body ground.

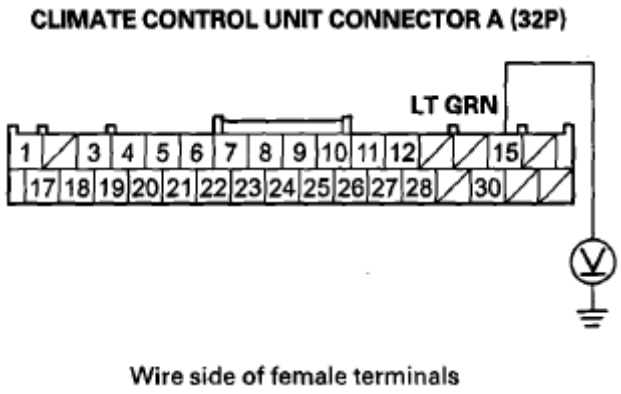

Fig. 116: Measuring Voltage Between Climate Control Unit Connector A (32P) Terminal No. 15 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 5.

NO - Repair an open in the wire between the No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box and the climate control unit.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check for continuity between climate control unit connector A (32P) terminal No. 1 and body ground.

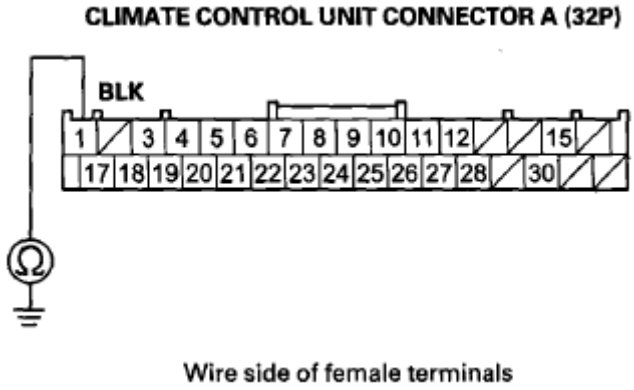

Fig. 117: Checking Continuity Between Climate Control Unit Connector A (32P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for loose wires or poor connections at climate control unit connector A (32P). If the connections are good, substitute a known-good climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**), and recheck.

NO - Check for an open in the wire between the climate control unit and body ground. If the wire is OK, check for poor body ground at G403 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

RADIATOR AND A/C CONDENSER FAN LOW SPEED CIRCUIT TROUBLESHOOTING

NOTE:

- **Do not use this troubleshooting procedure if the A/C compressor is inoperative. Refer to the symptom troubleshooting.**
- **Before doing symptom troubleshooting, check for PGM-FI DTCs (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Check the No. 3-3 (SUB FAN) (30 A) fuse in the under-hood fuse/relay, and the No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Are the fuses OK?

   YES - Go to step 2.

   NO - Replace the fuse(s), and recheck. If the fuse(s) blow again, check for a short in the No. 3-3 (SUB FAN) (30 A) fuse in the under-hood fuse/relay, and the No. 16 (7.5 A) fuse circuits.

2. Remove the A/C condenser fan relay from the relay block, and test it (see **POWER RELAY TEST**).

   Is the relay OK?

   YES - Go to step 3.

   NO - Replace the A/C condenser fan relay.

3. Reinstall the A/C condenser fan relay.
4. Connect the HDS to the DLC.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Turn on the A/C.
7. Check the FAN LOW CTRL in the PGM-FI Data List with the HDS.

   Is the FAN LOW CTRL on?

   YES - Go to step 8.

   NO - Substitute a known-good ECM/PCM (see **ECM/PCM REPLACEMENT**), and retest. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Jump the SCS line with the HDS.

NOTE: This step must be done to protect the ECM/PCM from damage.

10. Disconnect ECM/PCM connector A (49P).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
12. Measure the voltage between ECM/PCM connector A terminal No. 4 and body ground.

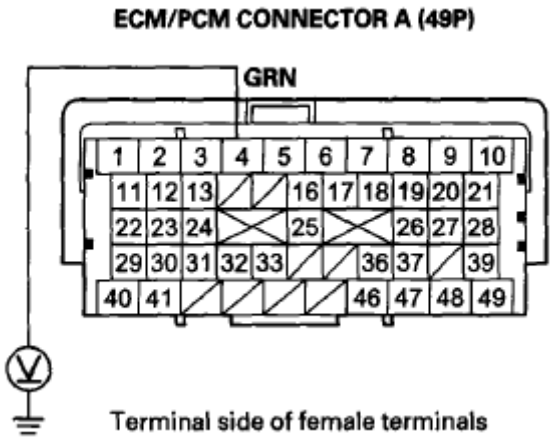

Fig. 118: Measuring Voltage Between ECM/PCM Connector A Terminal No. 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 13.

NO - Repair an open in the wires between the under-hood fuse/relay box and the ECM/PCM, or between the No. 16 (7.5 A) fuse in driver's under-dash fuse/relay box and the under-hood fuse/relay box. If wires are OK, replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Connect the ECM/PCM connector A (49P) terminal No. 4 to body ground with a jumper wire.

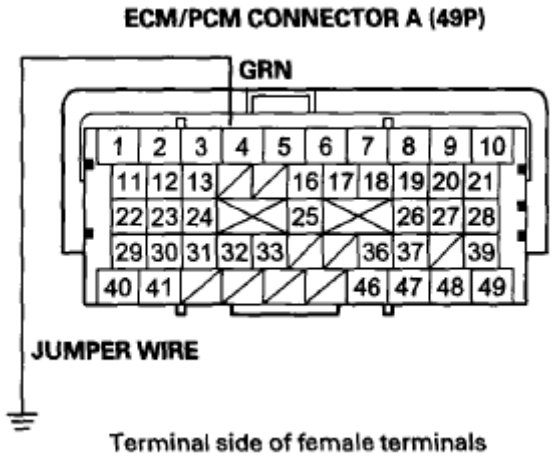

Fig. 119: Connecting ECM/PCM Connector A (49P) Terminal No. 4 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

    Do the A/C condenser and radiator fans run on low?

    YES - Check for loose wires or poor connections at ECM/PCM connector A (49P) terminal No. 4. If the connections are good, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), and recheck. If the symptom/indication goes away, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

    NO - Go to step 16.

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Disconnect the jumper wire.
18. Reconnect ECM/PCM connector A (49P).
19. Disconnect the A/C condenser fan motor 2P connector.
20. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then set the A/C button and fan control button ON.
21. Measure the voltage between A/C condenser fan motor 2P connector terminal No. 2 and body ground.

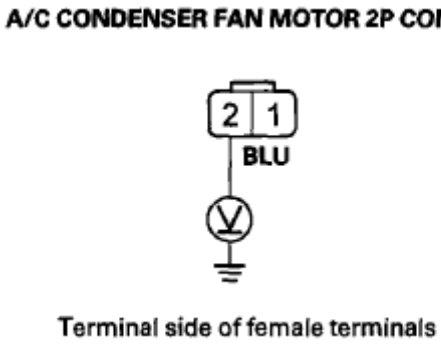

Fig. 120: Measuring Voltage Between A/C Condenser Fan Motor 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 22.

NO - Repair an open in the wire between the under-hood fuse/relay box and the A/C condenser fan motor. If the wire is OK, replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

22. Set the A/C button and fan control button OFF, then turn the ignition switch to LOCK (0), or press the

engine start/stop button to select the OFF mode.

23. Test the A/C condenser fan motor (see **FAN MOTOR TEST**).

    Is the A/C condenser fan motor OK?

    YES - Go to step 24.

    NO - Replace the A/C condenser fan motor (see **FAN, FAN MOTOR, AND SHROUD REMOVAL AND INSTALLATION** .

24. Remove the relay circuit board (see **REMOVAL AND INSTALLATION**) from the under-hood fuse/relay box, and test the fan control relay (see **POWER RELAY TEST**).

    Is the relay OK?

    YES - Go to step 25.

    NO - Replace the relay circuit board.

25. Disconnect under-hood fuse/relay box connector C (5P).
26. Disconnect the A/C condenser fan motor 2P connector. *
27. Check for continuity between under-hood fuse/relay box connector C (5P) terminal No. 5 and A/C condenser fan motor 2P connector terminal No. 1.

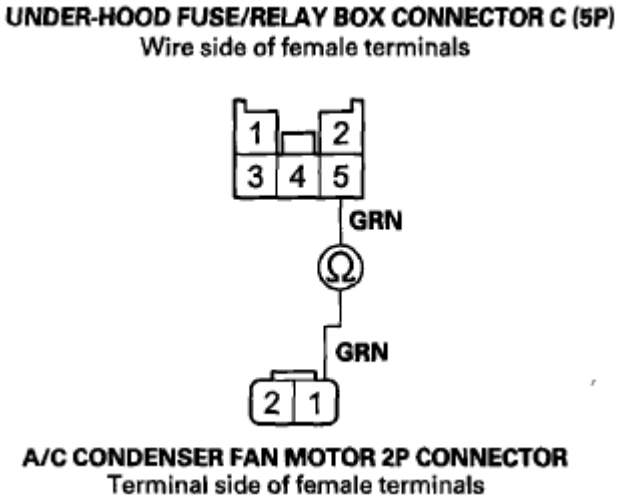

Fig. 121: Checking Continuity Between Under-Hood Fuse/Relay Box Connector And A/C Condenser Fan Motor 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 28.

NO - Repair an open in the wire between the under-hood fuse/relay box and the A/C condenser fan motor.

28. Disconnect the radiator fan motor 2P connector.
29. Check for continuity between under-hood fuse/relay box connector C (5P) terminal No. 1 and radiator fan motor 2P connector terminal No. 2.

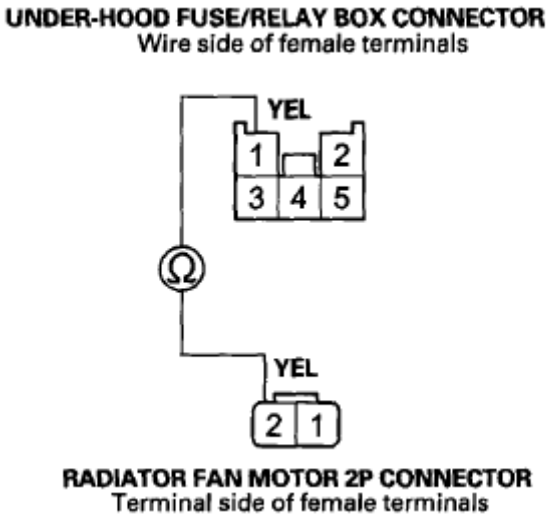

Fig. 122: Checking Continuity Between Under-Hood Fuse/Relay Box Connector And Radiator Fan Motor 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 30.

NO - Repair an open in wire between the under-hood fuse/relay box and the radiator fan motor.

30. Check for continuity between radiator fan motor 2P connector terminal No. 1 and body ground.

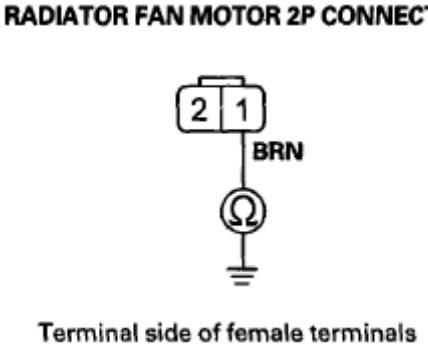

Fig. 123: Checking Continuity Between Radiator Fan Motor 2P Connector Terminal No. 1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the radiator fan motor (see **FAN, FAN MOTOR, AND SHROUD REMOVAL AND INSTALLATION**).

NO - Check for an open in the wire between the radiator fan motor and body ground. If the wire is OK, check for poor body ground at G301 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

A/C CONDENSER FAN HIGH SPEED CIRCUIT TROUBLESHOOTING

NOTE:

- **Do not use this troubleshooting procedure if the A/C compressor is inoperative. Refer to the symptom troubleshooting.**
- **Before doing any symptom troubleshooting, check for PGM-FI DTCs (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Check the No. 3-3 (SUB FAN) (30 A) fuse in the under-hood fuse/relay, and the No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Are the fuses OK?

   YES - Go to step 2.

   NO - Replace the fuse(s), and recheck. If fuse(s) blow again, check for a short in the No. 3-3 (SUB FAN) (30 A) fuse in the under-hood fuse/relay, and the No. 16 (7.5 A) fuse circuits.

2. Jump the SCS line with the HDS.

   NOTE: This step must be done to protect the ECM/PCM from damage.

3. Disconnect ECM/PCM connector A (49P).
4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Measure the voltage between ECM/PCM connector A terminal No. 5 and body ground.

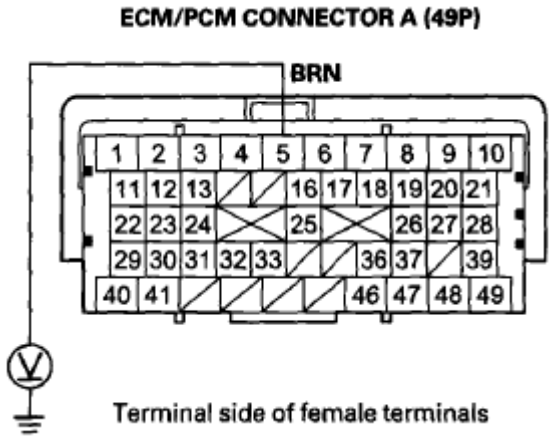

Fig. 124: Measuring Voltage Between ECM/PCM Connector A Terminal No. 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 6.

NO - Repair an open in the wire between the under-hood fuse/relay box and the ECM/PCM. If the wire is OK, replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Connect the ECM/PCM connector A (49P) terminals No. 4, No. 5, and No. 40 to body ground with jumper wires.

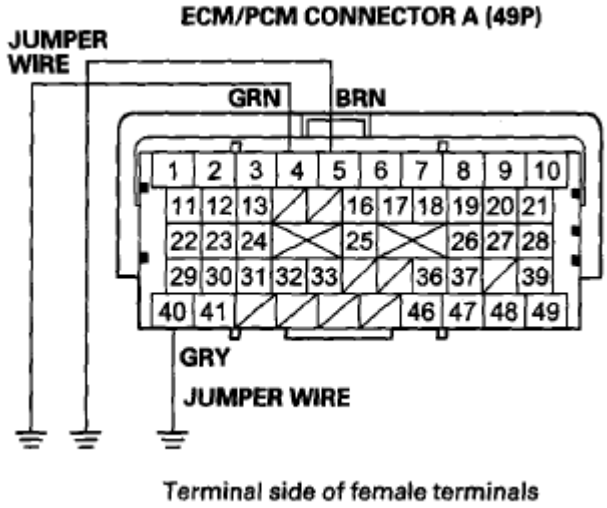

Fig. 125: Connecting ECM/PCM Connector A (49P) Terminals No. 4, No. 5, And No. 40 To Body Ground With Jumper Wires
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

Does the A/C condenser fan and radiator fan run on high?

YES - Check for loose wires or poor connections at ECM/PCM connector A (49P) terminals No. 4, No. 5, and No. 40. If the connections are good, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), and recheck. If the symptom/indication goes away, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

NO - Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect under-hood fuse/relay box connector C (5P).
11. Check for continuity between under-hood fuse/relay box connector C (5P) terminal No. 2 and body ground.

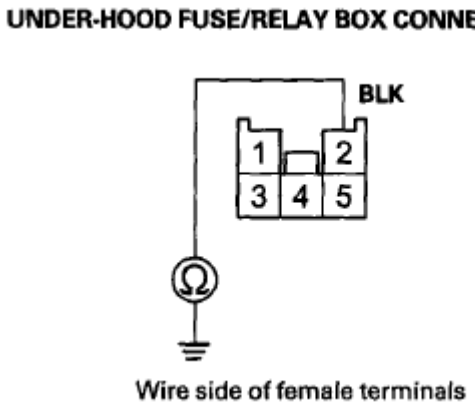

Fig. 126: Checking Continuity Between Under-Hood Fuse/Relay Box Connector C (5P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

NO - Check for an open in the wire between the under-hood fuse/relay box and body ground. If the wire is OK, check for poor ground at G301 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

A/C COMPRESSOR CLUTCH CIRCUIT TROUBLESHOOTING

NOTE:

- **It is normal for the A/C compressor to turn off under certain conditions, such as low idle, high engine coolant temperature, hard acceleration, or high/low refrigerant pressure.**
- **Do not use this troubleshooting procedure if the fans are also inoperative with the A/C on. Refer to the symptom troubleshooting.**
- **Before doing any symptom troubleshooting, check for PGM-FI DTCs (see**

GENERAL TROUBLESHOOTING INFORMATION).

1. Check the No. 20 (7.5 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?

   YES - Go to step 2.

   NO - Replace the fuse, and recheck. If the fuse blow again, check for a short in the No. 20 (7.5 A) fuse circuit.

2. Connect the HDS to the DLC.
3. Start the engine.
4. Turn on the A/C.
5. Check the A/C switch in the PGM-FI Data List with the HDS.

   Is the A/C switch ON?

   YES - Go to step 6.

   NO - Go to A/C Signal Circuit Troubleshooting (see **A/C SIGNAL CIRCUIT TROUBLESHOOTING**).

6. Using the HDS, confirm the following values in the PGM-FI Data List at idle.

TP SENSOR	About 0.5 V
ENGINE IDLE	J35Z6 engine: 630-730 RPM
	J37A4 engine (M/T): 700-800 RPM
	J37A4 engine (A/T): 650-750 RPM
ECT SENSOR 2	176-212°F (80-100 °C)
A/C SWITCH	ON
A/C CLUTCH	ON

   Are all the values within specifications?

   YES - Go to step 7.

   NO - Troubleshoot the value that is not within the specifications.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Remove the A/C compressor clutch relay from the under-hood fuse/relay box, and test it (see **POWER RELAY TEST**).

   Is the relay OK?

YES - Go to step 9.

NO - Replace the A/C compressor clutch relay.

9. Measure the voltage between A/C compressor clutch relay 4P socket terminal No. 1 and body ground.

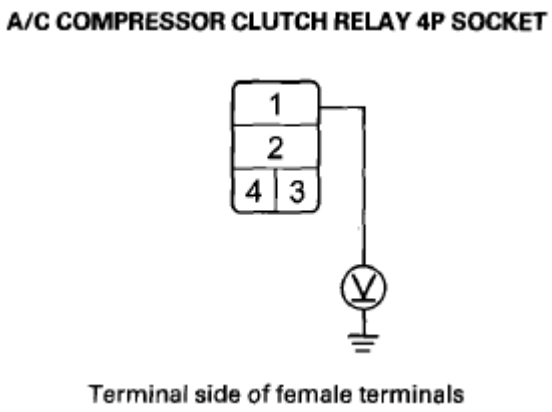

Fig. 127: Measuring Voltage Between A/C Compressor Clutch Relay 4P Socket Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Replace the under-hood fuse/relay box (see **REMOVAL AND INSTALLATION**).

10. Connect A/C compressor clutch relay 4P socket terminals No. 1 and No. 2 with a jumper wire.

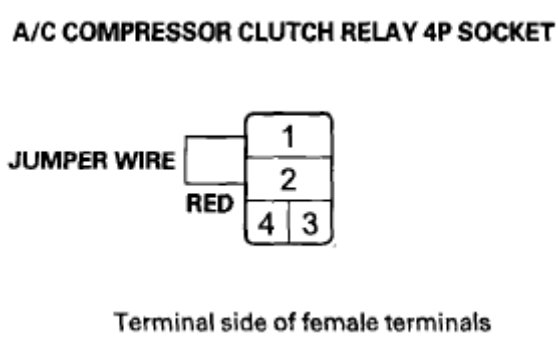

Fig. 128: Connecting A/C Compressor Clutch Relay 4P Socket Terminals No. 1 And No. 2 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Does the A/C compressor clutch click?

YES - Go to step 11.

NO - Go to step 20.

11. Disconnect the jumper wire.
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Measure the voltage between A/C compressor clutch relay 4P socket terminal No. 3 and body ground.

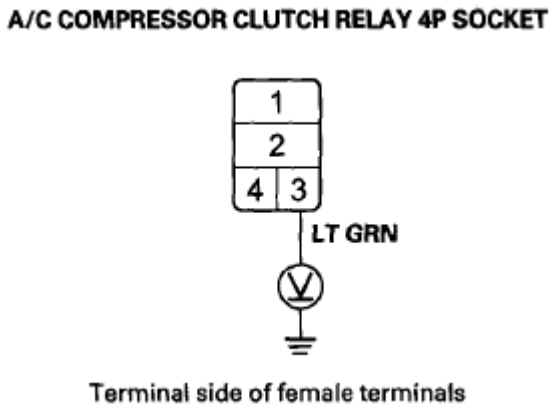

Fig. 129: Measuring Voltage Between A/C Compressor Clutch Relay 4P Socket Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 14.

NO - Repair an open in the wire between the No. 16 (7.5 A) fuse in the driver's under-dash fuse/relay box and the A/C compressor clutch relay.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Reinstall the A/C compressor clutch relay.
16. Jump the SCS line with the HDS.

NOTE: This step must be done to protect the ECM/PCM from damage.

17. Disconnect ECM/PCM connector A (49P).
18. Connect ECM/PCM connector A (49P) terminal No. 13 to body ground with a jumper wire.

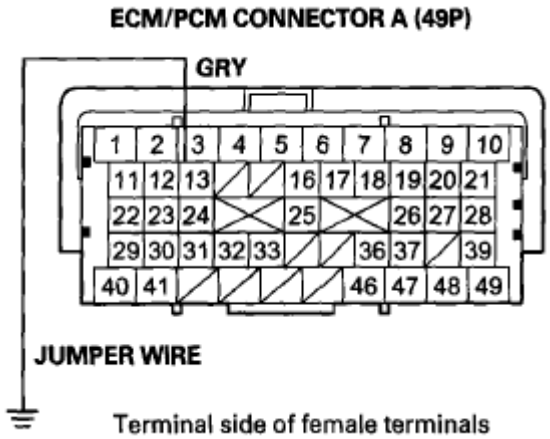

Fig. 130: Connecting ECM/PCM Connector A (49P) Terminal No. 13 To Body Ground With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

    Does the A/C compressor clutch click?

    YES - Check for loose wires or poor connections at ECM/PCM connector A (49P). If the connections are good, check the ECM/PCM grounds. If the grounds are good, substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), and recheck. If the symptom/indication goes away, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

    NO - Repair an open in the wire between the A/C compressor clutch relay and the ECM/PCM.

20. Disconnect the jumper wire.
21. Disconnect the A/C compressor clutch 1P connector.
22. Check for continuity between A/C compressor clutch relay 4P socket terminal No. 2 and A/C compressor clutch 1P connector terminal No. 1.

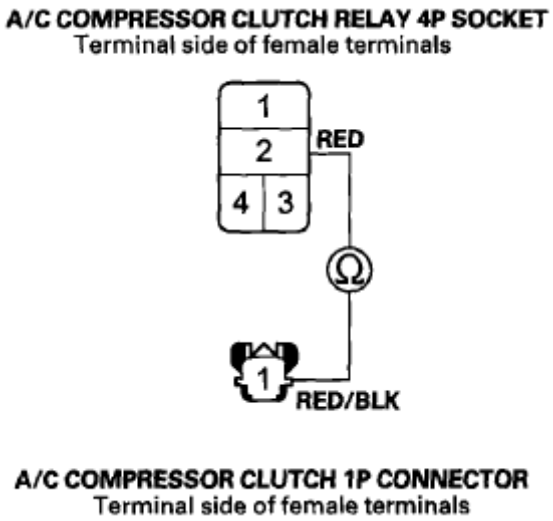

Fig. 131: Checking Continuity Between A/C Compressor Clutch Relay 4P Socket Terminal No. 2 And A/C Compressor Clutch 1P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check the A/C compressor clutch clearance, and the A/C compressor clutch field coil (see **A/C COMPRESSOR CLUTCH CHECK**). Repair as needed.

NO - Repair an open in the wire between the A/C compressor clutch relay and the A/C compressor clutch.

AUDIO COMMUNICATION LINE CIRCUIT TROUBLESHOOTING

WITH NAVIGATION

1. Disconnect climate control unit connector A (32P) and the audio-navigation switch panel 24P connector.
2. Check for continuity between the following terminals of climate control unit connector A (32P) and the audio-navigation switch panel 24P connector.

   32P: 24P:

   No. 3 No. 7

   No. 4 No. 19

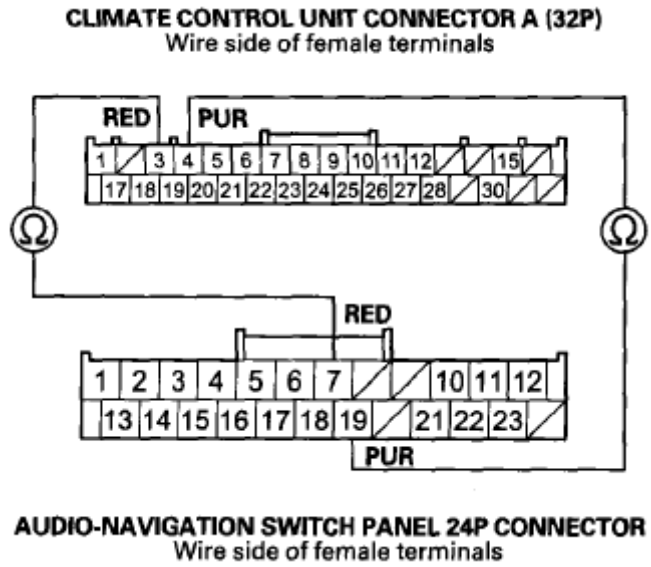

Fig. 132: Checking Continuity Between Terminals Of Climate Control Unit Connector And Audio-Navigation Switch Panel 24P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 3.

NO - Repair an open in the wire between climate control unit connector A (32P) and the audio-navigation switch panel 24P connector.

3. Check for continuity between body ground and climate control unit connector A (32P) terminals No. 3 and No. 4 individually.

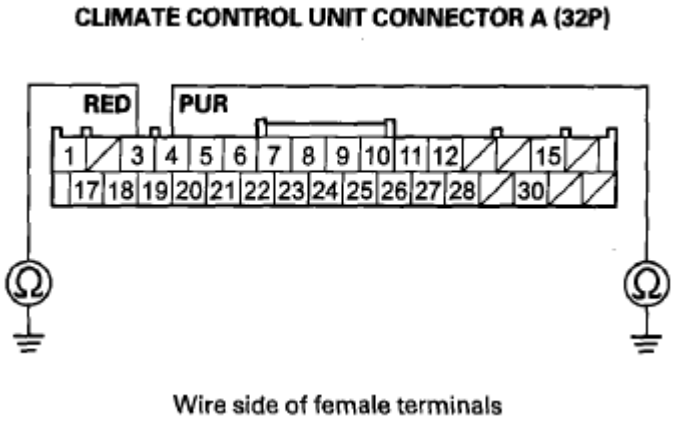

Fig. 133: Checking Continuity Between Body Ground And Climate Control Unit Connector A (32P) Terminals No. 3 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between climate control unit connector A (32P) and the audio-navigation switch panel 24P connector.

NO - Go to step 4.

4. Reconnect climate control unit connector A (32P).
5. Connect audio-navigation switch panel 24P connector terminals No. 7 and No. 19 with a jumper wire.

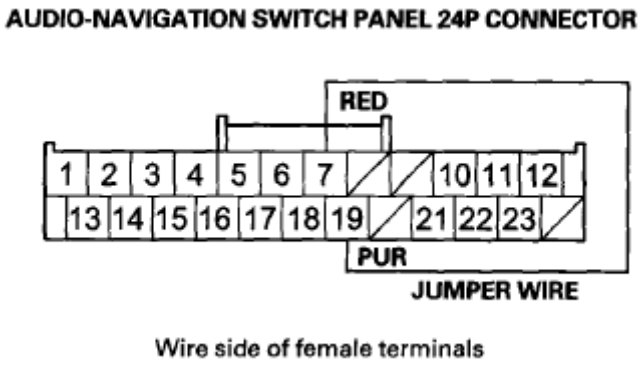

Fig. 134: Connecting Audio-Navigation Switch Panel 24P Connector Terminals No. 7 And No. 19 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Press and hold the front DEF button and OFF button.

Is the front DEF button LED blinking?

YES - The audio-navigation switch panel is faulty, replace the audio-navigation switch panel (see **AUDIO-NAVIGATION SWITCH PANEL REMOVAL/INSTALLATION**).

NO - The climate control unit is faulty, replace the climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

WITHOUT NAVIGATION

1. Disconnect climate control unit connector A (32P) and the audio-HVAC display unit 12P connector.
2. Check for continuity between the following terminals of climate control unit connector A (32P) and the audio-HVAC display unit 12P connector.

32P: 12P:

No. 3 No. 7

No. 4 No. 8

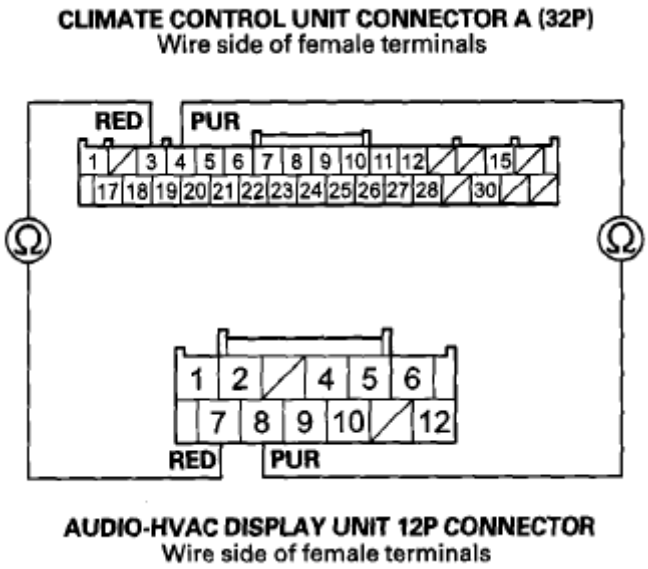

Fig. 135: Checking Continuity Between Terminals Of Climate Control Unit Connector And Audio-HVAC Display Unit 12P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 3.

NO - Repair an open in the wire between climate control unit connector A (32P) and the audio-HVAC display unit 12P connector.

3. Check for continuity between body ground and climate control unit connector A (32P) terminals No. 3 and No. 4 individually.

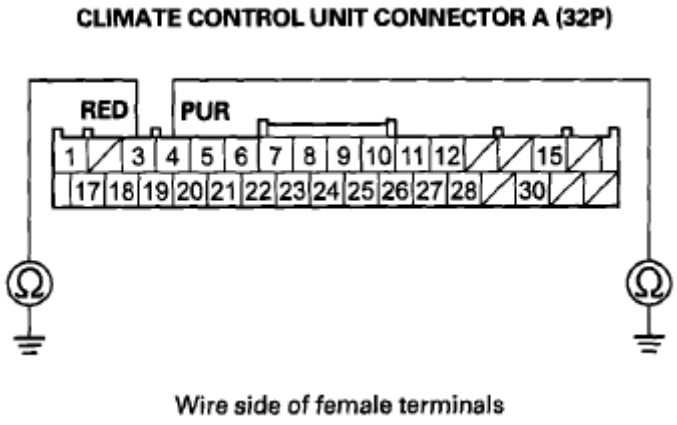

Fig. 136: Checking Continuity Between Body Ground And Climate Control Unit Connector Terminals No. 3 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between climate control unit connector A (32P) and the audio-HVAC display unit 12P connector.

NO - Go to step 4.

4. Reconnect climate control unit connector A (32P).
5. Connect audio-HVAC display unit 12P connector terminals No. 7 and No. 8 with a jumper wire.

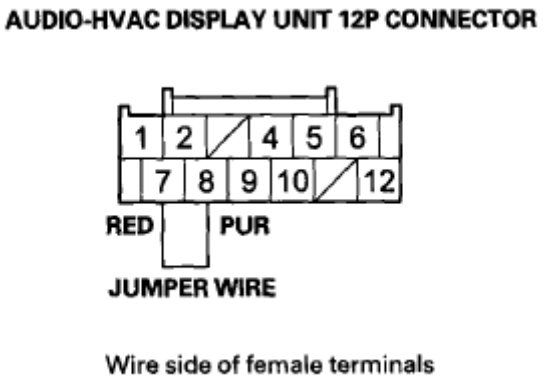

Fig. 137: Connecting Audio-HVAC Display Unit 12P Connector Terminals No. 7 And No. 8 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON (II).
7. Press and hold the front DEF button and OFF button.

Is the front DEF button LED blinking?

YES - The audio-HVAC display unit is faulty, replace the audio-HVAC display unit (see **AUDIO-HVAC DISPLAY UNIT REMOVAL/INSTALLATION**).

NO - The climate control unit is faulty, replace the climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

NAVIGATION COMMUNICATION LINE CIRCUIT TROUBLESHOOTING

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Operate the climate control system in several modes.

Is the climate control system OK?

YES - Go to step 3.

NO - Do the Self-Diagnostic Function with the HDS (see **HOW TO USE THE SELF-DIAGNOSTIC**

FUNCTION WITH THE HDS) or the climate control unit (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITHOUT THE HDS**).

3. Go into the System Diagnostic Mode (see **SYSTEM DIAGNOSTIC MODE**), and select the Self-Diagnosis Mode to check the System Link.

   Is the A/C or Mic icon red?

   YES -

   - If A/C icon is red, go to step 4.
   - If Mic icon is red, go to "Voice control does not work/respond" in the navigation system Symptom Troubleshooting (see **VOICE CONTROL DOES NOT WORK/RESPOND**).

   NO - Go to step 10.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect audio-navigation unit connector D (36P).
6. Disconnect climate control unit connector C (20P).
7. Check for continuity between the following terminals of climate control unit connector C (20P) and audio-navigation unit connector D (36P).

   20P: 36P:

   No. 4 No. 10

   No. 5 No. 11

   No. 6 No. 27

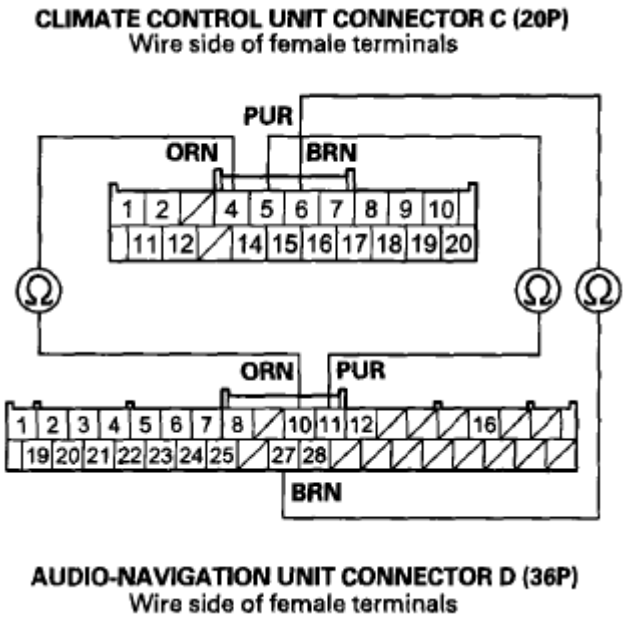

Fig. 138: Checking Continuity Between Terminals Of Climate Control Unit Connector C (20P) And Audio-Navigation Unit Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 8.

NO - Repair an open in the wire(s) between the climate control unit and the audio-navigation unit.

8. Check for continuity between body ground and climate control unit connector terminals No. 4, No. 5, and No. 6 individually.

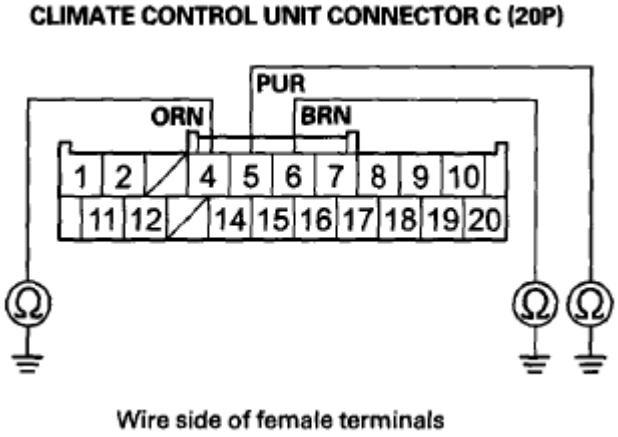

Fig. 139: Checking Continuity Between Body Ground And Climate Control Unit Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire(s) between the climate control unit and the audio-navigation unit.

NO - Go to step 9.

9. Reconnect climate control unit connector C (20P).
10. Connect audio-navigation unit connector D (36P) terminals No. 10 and No. 11, then terminals No. 11 and No. 27 with jumper wires.

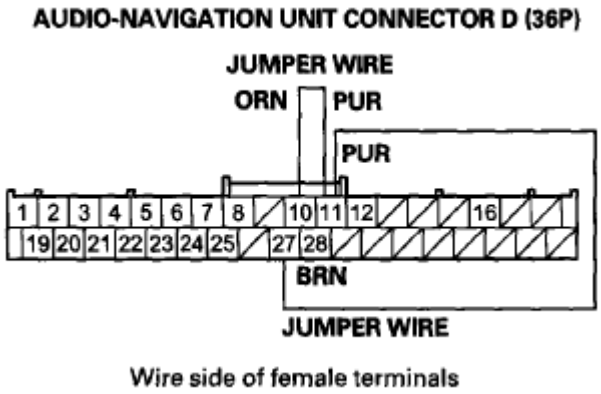

Fig. 140: Connecting Audio-Navigation Unit Connector D (36P) Terminals No. 11 And No. 27 With Jumper Wires
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
12. Press and hold the AUTO button, then press and hold the OFF button.

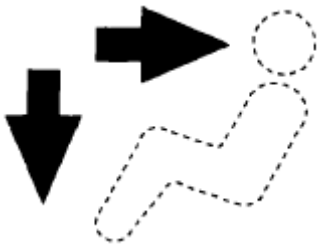

Fig. 141: Pressing Auto Button
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the HEAT/VENT indicator solid with the remaining icons blinking?

YES - Do the Unit Check with the navigation system (see **UNIT CHECK (QUICK CHECK)**).

NO - Substitute a known-good climate control unit, and recheck. If the symptom goes away, replace the original climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).

HUMIDITY/IN-CAR TEMPERATURE SENSOR TEST

HUMIDITY SENSOR TEST

NOTE: Before testing the sensor, check for climate control DTCs (see HOW TO CHECK FOR DTCS WITH THE HDS).

1. Remove the humidity/in-car temperature sensor (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR REPLACEMENT**).
2. Connect the humidity/in-car temperature sensor 4P connector.
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. Measure the voltage between the terminals with the (+) probe on terminal No. 2 and the (-) probe on terminal No. 3 with the connector connected.

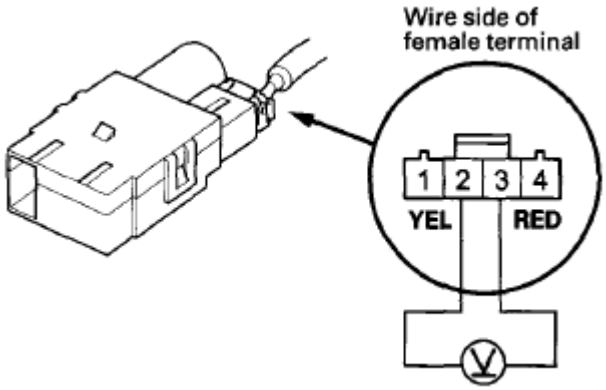

Fig. 142: Measuring Voltage Between Terminals With (+) Terminal And (-) Terminal With Connector Connected
Courtesy of AMERICAN HONDA MOTOR CO., INC.

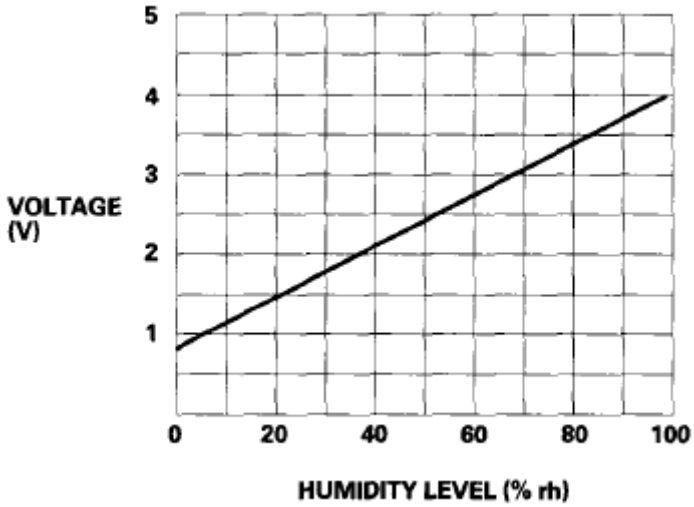

Fig. 143: Humidity Sensor Graph
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the voltage is not as specified, replace the humidity/in-car temperature sensor (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR REPLACEMENT**).

IN-CAR TEMPERATURE SENSOR TEST

NOTE: Before testing the sensor, check for climate control DTCs (see HOW TO CHECK FOR DTCS WITH THE HDS).

1. Remove the humidity/in-car temperature sensor (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR REPLACEMENT**).
2. Test the humidity/in-car temperature sensor while holding it in front of the dashboard center vent.
   - Measure the resistance with the system set to Max Cool.
   - Measure the resistance with the system set to Max Hot.
3. Compare the resistance reading between terminals No. 3 and No. 4 of the humidity/in-car temperature sensor with the specifications shown in the graph in illustration below; the resistance should be within the specifications.

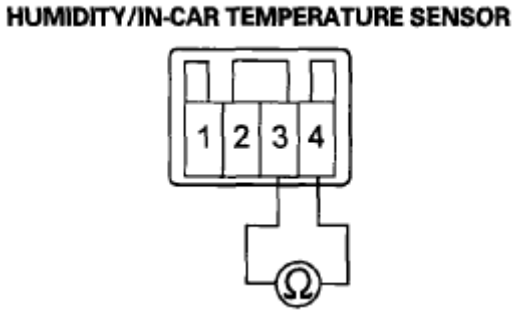

Fig. 144: Comparing Resistance Reading Between Terminals No. 3 And No. 4 Of Humidity/In-Car Temperature Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

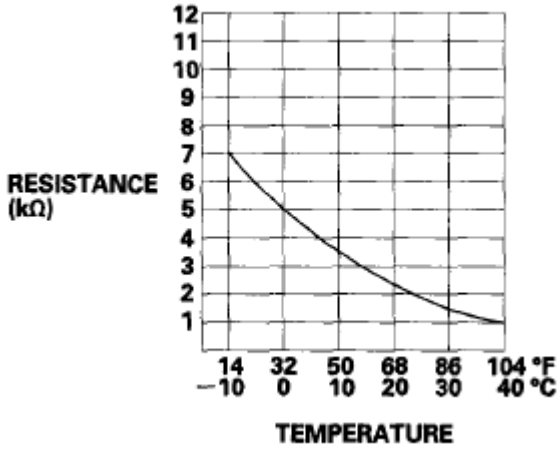

Fig. 145: In-Car Temperature Sensor Graph
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the resistance is not as specified, replace the humidity/in-car temperature sensor (see **HUMIDITY/IN-CAR TEMPERATURE SENSOR REPLACEMENT**).
5. Clear any DTCs set when you disconnected the humidity/in-car temperature sensor.

OUTSIDE AIR TEMPERATURE SENSOR TEST

NOTE: before testing the sensor, check for climate control DTCs (see HOW TO CHECK FOR DTCS WITH THE HDS).

1. Remove the outside air temperature sensor (see **OUTSIDE AIR TEMPERATURE SENSOR REPLACEMENT**).
2. Dip the sensor in ice water, and measure the resistance. Then pour warm water on the sensor, and check for a change in resistance.
3. Compare the resistance reading between terminals No. 1 and No. 2 of the outside air temperature sensor with the specifications shown in the graph in illustration below; the resistance should be within the specifications.

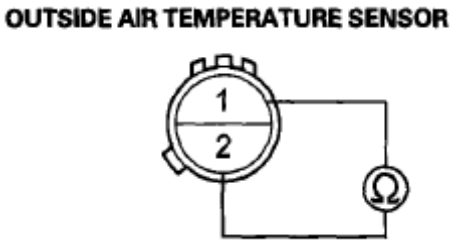

Fig. 146: Comparing Resistance Reading Between Terminals No. 1 And No. 2 Of Outside Air Temperature Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

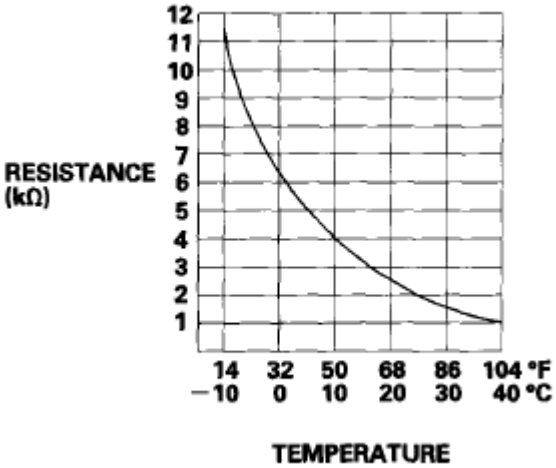

Fig. 147: Outside Air Temperature Sensor Graph
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the resistance is not as specified, replace the outside air temperature sensor (see **OUTSIDE AIR TEMPERATURE SENSOR REPLACEMENT**).

SUNLIGHT SENSOR TEST

NOTE: Before testing the sensor, check for climate control DTCs (see HOW TO CHECK FOR DTCS WITH THE HDS).

1. Remove the sunlight sensor (A) (see **SUNLIGHT SENSOR REPLACEMENT**).

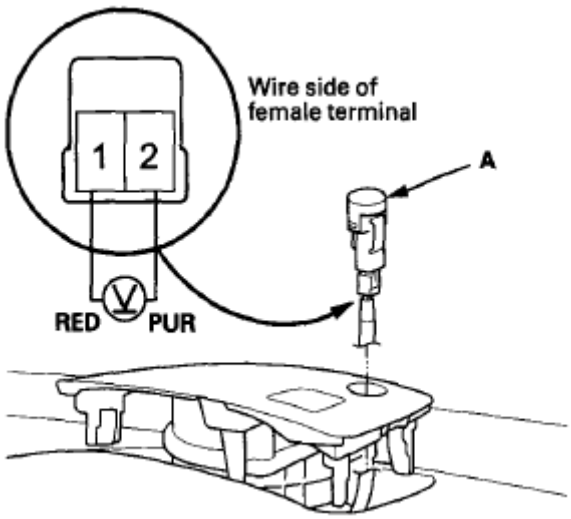

Fig. 148: Identifying Sunlight Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II). Measure the voltage between terminals with the (+) probe on terminal No. 2 and the (-) probe on terminal No. 1 with the connector connected.

NOTE: The voltage readings do not change under the light of a flashlight or a fluorescent lamp.

Voltage should be:

- 3.56 V with no sunlight or the sensor covered up
- Less than 3.56 V with sunlight on the sensor (depending on sunlight intensity)

3. If the voltage is not as specified, replace the sunlight sensor (see **SUNLIGHT SENSOR REPLACEMENT**).

EVAPORATOR TEMPERATURE SENSOR TEST

NOTE: Before testing the sensor, check for climate control DTCs (see HOW TO CHECK FOR DTCS WITH THE HDS).

1. Remove the evaporator temperature sensor (see **EVAPORATOR TEMPERATURE SENSOR REPLACEMENT**).
2. Dip the sensor in ice water, and measure the resistance between terminals No. 1 and No. 2.

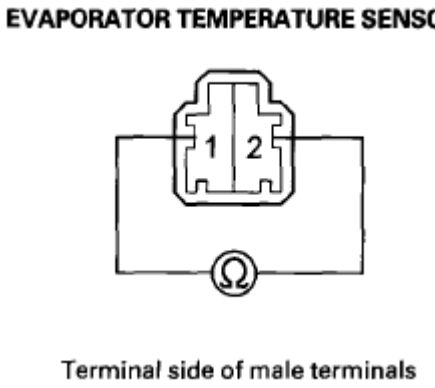

Fig. 149: Measuring Resistance Between Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Pour warm water on the sensor, and measure the resistance.
4. Compare the resistance readings with the specifications shown in the graph in illustration below; the resistance should be within the specifications.

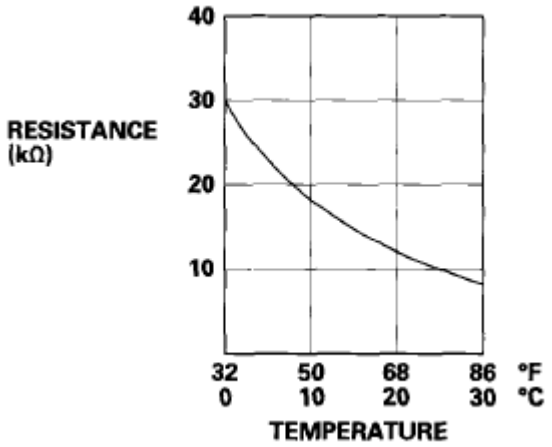

Fig. 150: Evaporator Temperature Sensor Graph
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the resistance is not as specified, replace the evaporator temperature sensor (see **EVAPORATOR TEMPERATURE SENSOR REPLACEMENT**).

POWER TRANSISTOR TEST

1. Remove the passenger's dashboard undercover (see **GLOVE BOX DAMPER REPLACEMENT**).
2. Disconnect the 5P connector from the power transistor.

3. Measure the resistance between terminals No. 1 and No. 4 of the power transistor. It should be about 1.5 kohms.
   - If the resistance is within the specifications, go to step 4.
   - If the resistance is not within the specifications, replace the power transistor.

NOTE: Also check the blower motor. Power transistor failure can be caused by a defective blower motor.

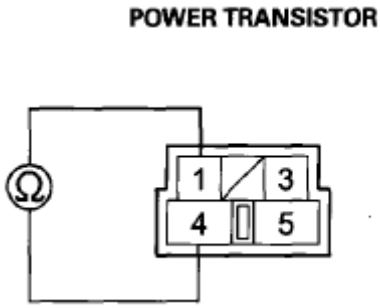

Fig. 151: Measuring Resistance Between Terminals No. 1 And No. 4 Of Power Transistor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Reconnect the 5P connector to the power transistor.
5. Disconnect climate control unit connector A (32P).
6. Connect climate control unit connector A (32P) terminals No. 15 and No. 28 with a jumper wire.

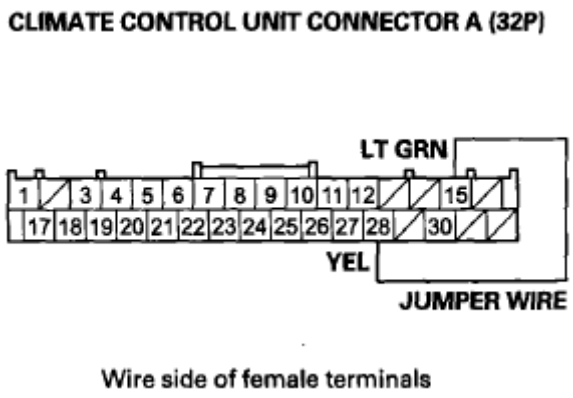

Fig. 152: Connecting Climate Control Unit Connector A (32P) Terminals No. 15 And No. 28 With Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the blower motor runs.
   - If the blower motor does not run, replace the power transistor.

NOTE: A faulty blower motor can cause the power transistor to fail. If the

power transistor is replaced, also check the blower motor for binding, and replace it if necessary.

- If the blower motor runs, the power transistor is OK.

DRIVER'S AIR MIX CONTROL MOTOR TEST

Special Tools Required

Backprobe Set 07SAZ-001000A

NOTE: Before testing the motor, check for climate control DTCs (see HOW TO CHECK FOR DTCS WITH THE HDS).

1. Disconnect the 7P connector from the driver's air mix control motor.

   NOTE: Incorrectly applying power and ground to the air mix control motor will damage it. Follow the instructions carefully.

2. Connect battery power to terminal No. 1 of the driver's air mix control motor, and ground terminal No. 2; the driver's air mix control motor should run, and stop at Max Cool. If it does not, reverse the connections; the driver's air mix control motor should run, and stop at Max Hot. When the driver's air mix control motor stops running, disconnect battery power immediately.

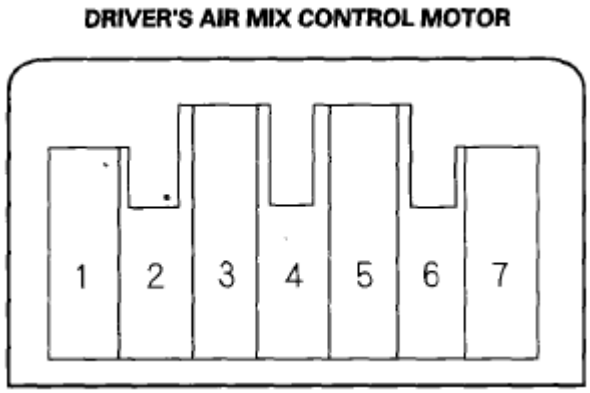

Fig. 153: Identifying Driver's Air Mix Control Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the driver's air mix control motor did not run in step 2, remove it, then check the driver's air mix control linkage and door for smooth movement.
   - If the linkage and door move smoothly, replace the driver's air mix control motor (see **DRIVER'S AIR MIX CONTROL MOTOR REPLACEMENT**).
   - If the linkage or door sticks or binds, repair them as needed.
   - If the air mix control motor runs smoothly, go to step 4.

4. Measure the resistance between terminals No. 5 and No. 7 of the driver's air mix control motor. It should be between 4.2 and 7.8 kohms.
5. Reconnect the air mix control motor 7P connector, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Using the backprobe set (07SAZ-001000A), measure the voltage between terminals No. 3 and No. 7.

   Max Cool: About 1.0 V

   Max Hot: About 4.0 V

7. If either the resistance or the voltage readings are not as specified, replace the driver's air mix control motor (see **DRIVER'S AIR MIX CONTROL MOTOR REPLACEMENT**).

PASSENGER'S AIR MIX CONTROL MOTOR TEST

Special Tools Required

Backprobe Set 07SAZ-001000A

NOTE: Before testing the motor, check for climate control DTCs (see HOW TO CHECK FOR DTCS WITH THE HDS).

1. Disconnect the 7P connector from the driver's air mix control motor.

   NOTE: Incorrectly applying power and ground to the passenger's air mix control motor will damage it. Follow the instructions carefully.

2. Connect battery power to terminal No. 1 of the passenger's air mix control motor, and ground terminal No. 2; the passenger's air mix control motor should run, and stop at Max Cool. If it does not, reverse the connections; the passenger's air mix control motor should run, and stop at Max Hot. When the passenger's air mix control motor stops running, disconnect battery power immediately.

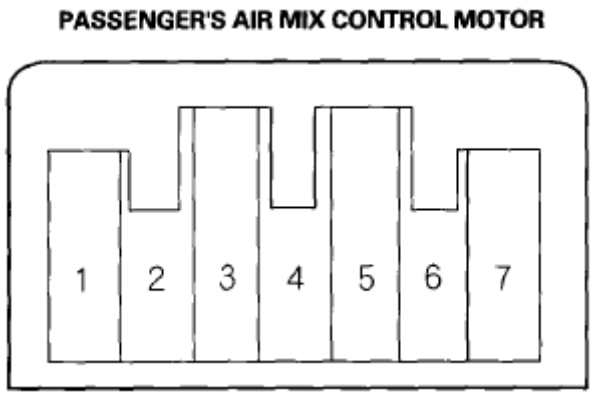

Fig. 154: Identifying Passenger's Air Mix Control Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the passenger's air mix control motor did not run in step 2, remove it, then check the passenger's air mix control linkage and door for smooth movement.
   - If the linkage and door move smoothly, replace the passenger's air mix control motor (see **PASSENGER'S AIR MIX CONTROL MOTOR REPLACEMENT**).
   - If the linkage or door sticks or binds, repair them as needed.
   - If the passenger's air mix control motor runs smoothly, go to step 4.
4. Measure the resistance between terminals No. 5 and No. 7 of the passenger's air mix control motor. It should be between 4.2 and 7.8 kohms.
5. Reconnect the air mix control motor 7P connector, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Using the backprobe set (07SAZ-001000A), measure the voltage between terminals No. 3 and No. 5.

   Max Cool: About 1.0 V

   Max Hot: About 4.0 V

7. If either the resistance or the voltage readings are not as specified, replace the passenger's air mix control motor (see **PASSENGER'S AIR MIX CONTROL MOTOR REPLACEMENT**).

DRIVER'S MODE CONTROL MOTOR TEST

NOTE: Before testing the motor, check for climate control DTCs (see HOW TO CHECK FOR DTCS WITH THE HDS).

1. Disconnect the 7P connector from the driver's mode control motor.

   NOTE: Incorrectly applying power and ground to the driver's mode control motor will damage it. Follow the instructions carefully.

2. Connect battery power to terminal No. 1 of the driver's mode control motor, and ground terminal No. 2; the driver's mode control motor should run, and stop at Vent. If it does not, reverse the connections; the driver's mode control motor should run, and stop at Defrost. When the driver's mode control motor stops running, disconnect battery power immediately.

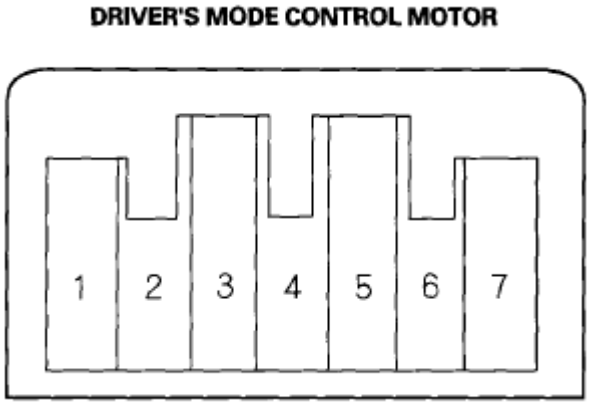

Fig. 155: Identifying Driver's Mode Control Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the driver's mode control motor did not run in step 2, remove it, then check the mode control linkage and door for smooth movement.
   - If the linkage and door move smoothly, replace the driver's mode control motor (see **PASSENGER'S AIR MIX CONTROL MOTOR REPLACEMENT**).
   - If the linkage or door sticks or binds, repair them as needed.
   - If the driver's mode control motor runs smoothly, go to step 4.
4. Use a digital multimeter with an output of 1 mA or less at the 20 kohms range. Operate the driver's mode control motor as in step 2, and check for continuity between terminals No. 3, No. 4, No. 5, and No. 6 and terminal No. 7 individually. There should be continuity for a moment at each terminal as the motor moves through its travel.
5. If there is no continuity for a moment at each terminal, replace the driver's mode control motor (see **PASSENGER'S AIR MIX CONTROL MOTOR REPLACEMENT**).

PASSENGER'S MODE CONTROL MOTOR TEST

NOTE: Before testing the motor, check for climate control DTCs (see HOW TO CHECK FOR DTCS WITH THE HDS).

1. Disconnect the 7P connector from the passenger's mode control motor.

NOTE: Incorrectly applying power and ground to the mode control motor will damage it. Follow the instructions carefully.

2. Connect battery power to terminal No. 2 of the passenger's mode control motor, and ground terminal No. 1; the passenger's mode control motor should run, and stop at Vent. If it does not, reverse the connections; the passenger's mode control motor should run, and stop at Defrost. When the passenger's mode control motor stops running, disconnect battery power immediately.

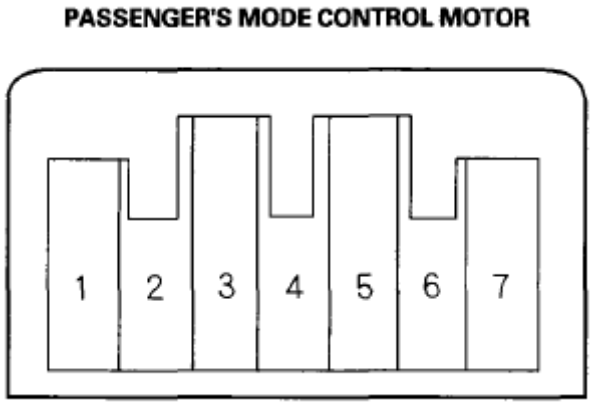

Fig. 156: Identifying Passenger's Mode Control Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the passenger's mode control motor did not run in step 2, remove it, then check the mode control linkage and door for smooth movement.
   - If the linkage and door move smoothly, replace the passenger's mode control motor (see **PASSENGER'S MODE CONTROL MOTOR REPLACEMENT**).
   - If the linkage or door sticks or binds, repair them as needed.
   - If the passenger's mode control motor runs smoothly, go to step 4.
4. Use a digital multimeter with an output of 1 mA or less at the 20 kohms range. Operate the passenger's mode control motor as in step 2, and check for continuity between terminals No. 3, No. 4, No. 5, and No. 6 and terminal No. 7 individually. There should be continuity for a moment at each terminal as the motor moves through its travel.
5. If there is no continuity for a moment at each terminal, replace the passenger's mode control motor (see **PASSENGER'S MODE CONTROL MOTOR REPLACEMENT**).

RECIRCULATION CONTROL MOTOR TEST

NOTE: Before testing the motor, check for climate control DTCs (see HOW TO CHECK FOR DTCS WITH THE HDS).

1. Disconnect the 7P connector from the recirculation control motor.

NOTE: Incorrectly applying power and ground to the recirculation control motor will damage it. Follow the instructions carefully.

2. Connect battery power to terminal No. 1 of the recirculation control motor, and ground terminal No. 2; the recirculation control motor should run smoothly, and stop at Recirculate. If it does not, reverse the connections; the recirculation control motor should run smoothly, and stop at Fresh. When the recirculation control motor stops running, disconnect battery power immediately.

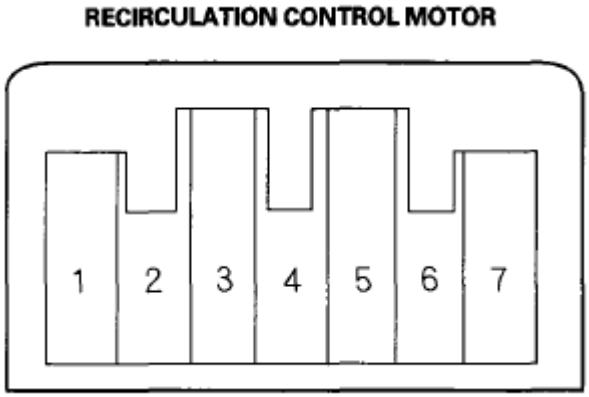

Fig. 157: Identifying Recirculation Control Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the recirculation control motor did not run in step 2, remove it, then check the recirculation control linkage and door for smooth movement.
   - If the linkage and door move smoothly, replace the recirculation control motor (see **RECIRCULATION CONTROL MOTOR REPLACEMENT**).
   - If the linkage or door stick or bind, repair them as needed.
   - If the recirculation control motor runs smoothly, go to step 4.
4. Use a digital multimeter with an output of 1 mA or less at the 20 kohms range. Operate the recirculation control motor running as in step 2, and check for continuity between terminals No. 3, No. 4, and No. 5 and terminal No. 1 individually. There should be continuity for a moment at each terminal as the motor through its travel.
5. If there is no continuity for a moment at each terminal, replace the recirculation control motor (see **RECIRCULATION CONTROL MOTOR REPLACEMENT**).

A/C COMPRESSOR CLUTCH CHECK

1. Check the pressure plate for discoloration, peeling, or other damage. If there is damage, replace the clutch set (see **A/C COMPRESSOR CLUTCH OVERHAUL**).
2. Check the pulley bearing play and drag by rotating the pulley by hand. Also check for grease leakage from the bearing. Replace the clutch set with a new one if it is noisy, has excessive play/drag (see **A/C COMPRESSOR CLUTCH OVERHAUL**).

NOTE: The pulley and the pressure plate were mated at the factory by a burnishing operation. Always replace the pulley and the pressure plate as a set. Replacing only one part of the clutch set will cause clutch slippage.

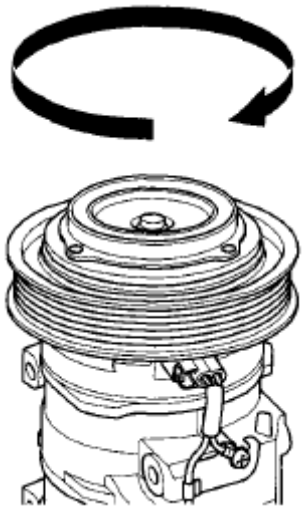

Fig. 158: Rotating Pulley By Hand
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the clearance between the rotor pulley (A) and the pressure plate (B) all the way around. If the clearance is not within specified limits, remove the pressure plate (see **A/C COMPRESSOR CLUTCH OVERHAUL**) and add or remove shims as needed to increase or decrease clearance.

   Clearance: 0.35-0.60 mm (0.014-0.023 in)

   NOTE: The shims are available in three thicknesses: 0.1 mm, 0.3 mm, and 0.5 mm.

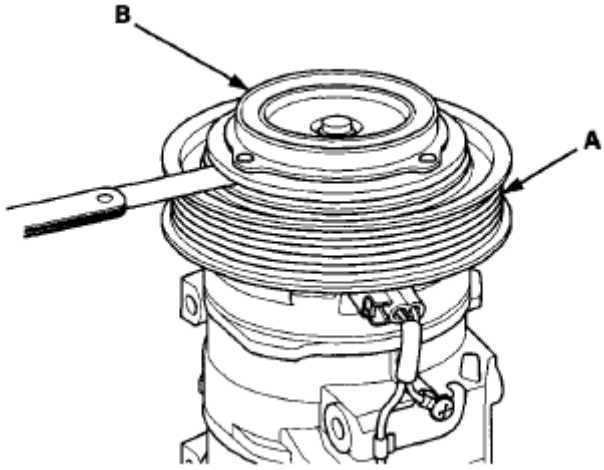

Fig. 159: Measuring Clearance Between Rotor Pulley And Pressure Plate
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the pressure plate (see **A/C COMPRESSOR CLUTCH OVERHAUL**), and inspect the pressure plate and pulley friction surface for wear. If there is excessive wear, roughness, or scoring, replace the clutch set.
5. Inspect the friction surfaces and the A/C compressor shaft hub for excess oil. If excess oil is present, and

it is not from the engine or power steering system, then the A/C compressor shaft seal is leaking. In that case, replace the A/C compressor (see **A/C COMPRESSOR REPLACEMENT**).

6. Check the resistance of the field coil. If resistance is not within specifications, replace the field coil (see **A/C COMPRESSOR CLUTCH OVERHAUL**).

   Field Coil Resistance: 3.9-4.3 ohms at 68°F (20 °C)

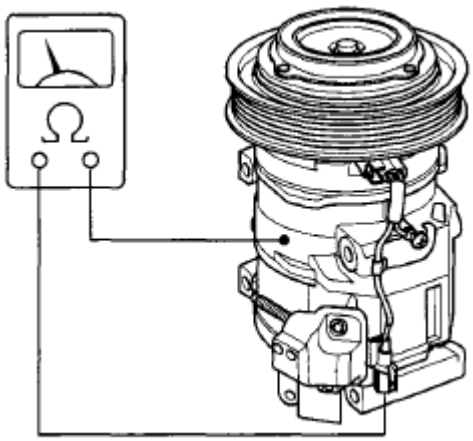

Fig. 160: Checking Resistance Of Field Coil
Courtesy of AMERICAN HONDA MOTOR CO., INC.

REFRIGERANT LEAK CHECK

Special Tools Required

- Leak Detector YGK-H-10PM*
- Leak Detector HLD-100*
- Leak Detector TIFZX-1*
- OPTIMAX Jr. A/C Leak Detection Kit TRP124893*

*: These tools are available through the Acura Tool and Equipment Program; call 888-424-6857

CAUTION:

- **Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.**
- **Be careful when connecting service equipment.**
- **Do not breathe refrigerant or vapor.**

NOTE:

- **If accidental system discharge occurs, ventilate the work area before resuming service.**
- **Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.**
- **Check the system for leaks using an R-134a refrigerant leak detector with**

an accuracy of 14 g (0.5 oz) per year or better.

LEAK DETECTOR USAGE TIPS (REFER TO THE OPERATOR'S MANUAL FOR COMPLETE OPERATING INSTRUCTIONS)

- Position the vehicle in a wind-free work area. This will aid in detecting small leaks.
- When using the leak detector for the first time, allow it to warm up for 2 minutes with the probe in a clean atmosphere. This lets the temperature sensor in the detector stabilize.
- The calibration check should be done in the "Search 2" mode. Once that is done, the other check modes do not need calibrating.
- When leak checking through the HVAC module drain hose, avoid drawing water into the probe. Water can damage the internal pump and sensor.
- Avoid creasing the flexible probe extension. Creases can restrict air flow and give false readings.
- Because the detector recalibrates itself for ambient gases, it may be necessary to move the detector away from the leak to clear the sensor. Once the sensor has cleared, recheck the suspected leak.
- When removing the clear probe tip, be careful not to lose the flow ball.
- R-134a is heavier than air; always check below and to the sides of all potential leak sources.
- Halogen leak detectors are sensitive to chemicals: windshield washing solutions, solvents/cleaners, and some vehicle adhesives. Keep these chemicals out of the area when doing leak detection.

FLUORESCENT DYE USAGE TIPS

- Use only Tracer-Stick single dose fluorescent dye capsules from Tracerline®. Other dyes contain solvents that may contaminate the refrigerant oil, leading to component failure.
- Adding excessive amounts of dye can damage the A/C compressor.
- PAG oil is water soluble, so condensation on the evaporator core or the refrigerant lines may wash the PAG oil and fluorescent dye away from the actual leak. Condensation may also carry dye through the evaporator module drain.
- After checking and repairing leaks, thoroughly clean any residual dye from the areas where leaks were found. Use GLO-AWAY dye cleaner, from Tracerline®, and hot water to remove the dye (follow the instructions on the bottle). Residual dye stains can cause misdiagnosis of any future A/C system leaks.
- If any refrigerant dye contacts an exterior paint surface, remove it by doing this:

  - Carefully wash the affected surfaces to remove any dirt, and to prevent paint scratching.
  - Mix water and isopropyl alcohol in a 50/50 mixture.
  - Soak a soft cotton towel with the water/alcohol mixture, and place the cloth on the affected areas to remove the dye.
  - After removing the dye with the water/alcohol-soaked cloth, carefully wash the affected areas, and check that there is no remaining dye.

1. Connect an R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions.

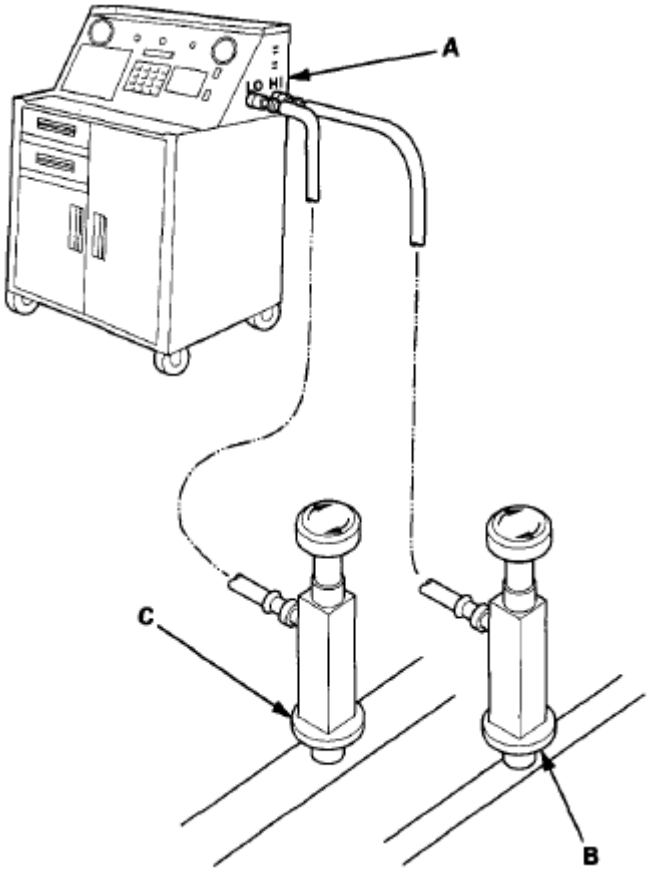

Fig. 161: Connecting R-134A Refrigerant Recovery/Recycling/Charging Station To High-Pressure Service Port And Low-Pressure Service Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Recover refrigerant from the A/C system (see **REFRIGERANT RECOVERY**), and evacuate the system (see **SYSTEM EVACUATION**). If the system achieves a vacuum of approximately -93.3 kPa (-700 mmHg, -27.6 inHg) in 15 minutes, and holds the vacuum for 15 minutes, then the system does not have a leak at this time. If the system cannot achieve or hold a vacuum, continue the refrigerant leak check.
3. Open the high pressure valve to charge the system to the specified capacity.

   Select the appropriate units of measure for your refrigerant charging station.

   Refrigerant Capacity:

   505 to 555g

   17.8 to 19.6 oz

   0.505 to 0.555 kg

   1.11 to 1.22 lbs

4. With the engine OFF, use a halogen leak detector first to detect the leak source. Follow a continuous path in order to ensure that you will not miss any possible leaks. Test the following areas of the system for leaks:

Possible Leak Area	Diagnostic Procedure with the Leak Detector	Notes
Service ports	• Check the service ports • If the detector "sniffs" a leak, use fluorescent dye to confirm it	When capping the service ports, ensure that the seals on the port caps are in place, and that the caps are tight. The caps are used as the final seals in the system
A/C condenser	If the detector "sniffs" a leak, use fluorescent dye to confirm it	• Check for joints or connections coated with oily dust • Check for damaged and corroded areas • Check all fittings, couplings, brazed/welded areas and areas around attachment points • Move the probe slowly (1 inch/second or less), and keep it within 1/4 inch of the component being checked. This maximizes the chance of detecting a leak • If you detect a leak, blow compressed air over the area, then recheck for leaks. For large leaks, cleaning the area with compressed air may help you pinpoint the leak source
Evaporator	• Check at the evaporator drain hose • Check at the passenger's side vent and turn blower on low speed	
A/C lines	• Wiggle the rubber hoses when checking crimped metal ends • If the detector "sniffs" a leak, use fluorescent dye to confirm it	• Check all fittings, couplings, pressure switches, brazed/welded areas, and areas around attachment points on A/C lines and components • Check for damaged and corroded areas • Move the probe slowly (1 inch/second or less), and keep it within 1/4 inch of the component being checked. This maximizes the chance of detecting a leak

5. Close the quick coupler valves, then disconnect the quick couplers from the vehicle service ports.
6. Attach the universal connect set, from the Optimax Jr. Leak Detection Kit, to the service valve fitting. Close the control valve (the black knob on the connect set).
7. Attach the charging station low pressure hose quick coupler to the service valve fitting, and open the quick coupler valve. Evacuate the connect set using the charging station vacuum pump, then close the quick coupler valve.
8. Detach the universal connect set, and install a Tracer-Stick® dye capsule between the connect set and the

service valve fitting (see the manufacturer's instructions for more detail).

9. Attach the quick coupler on the universal connect set to the low pressure service port on the vehicle. Open the charging station low pressure hose quick coupler valve, but do not open the control valve.
10. Start the engine, and set the A/C system to maximum cooling. Open the control valve to let refrigerant and the dye enter the A/C system through the low pressure service port. Close the control valve when the Tracer-Stick® dye capsule is empty.
11. Run the engine and A/C system for 15 minutes to thoroughly circulate the dye. Then shut the engine off, and inspect the following areas of the system for leaks.

NOTE:

- **Check for leaks in a dark work area, and use the UV light and the special glasses from the leak check kit. Other UV lights may not work well with the Tracer-Stick® dye.**
- **Small leaks may take up to 1 week of vehicle operation (with normal A/C use) to become visible.**

Possible Leak Area	Diagnostic Procedure with Fluorescent Dye
Service ports	If a leak is found, replace the cap/o-ring seal or A/C line as needed
A/C lines	• Use a permanent marker pen to circle the leak area • If a leak is found, remove and replace the A/C line (see **A/C LINE REPLACEMENT**)
A/C condenser	• If a leak is found, remove the A/C condenser (see **A/C CONDENSER REPLACEMENT**) • Determine whether leak is in the A/C condenser or the receiver/dryer • Use a permanent marker pen to circle the leak area • Replace either the receiver/dryer (see **RECEIVER/DRYER DESICCANT REPLACEMENT**), or the A/C condenser (see **A/C CONDENSER REPLACEMENT**), depending upon which is leaking
A/C compressor	• Check for leaks at all of the A/C compressor joints, the clutch center, the A/C compressor front housing bolts, and the scroll bolts on the back of the A/C compressor • If a leak is found, use a permanent marker pen to circle the leak area • If the A/C compressor relief valve appears to be leaking, determine whether the leak is coming from the relief valve, or the joint between the A/C compressor casing and the valve. If the leak is from the relief valve, check the A/C system pressures, and refer to the pressure test table in the A/C system test (see **A/C SYSTEM TEST**). If the leak is from the casing/valve joint, replace the A/C compressor relief valve (see **A/C COMPRESSOR RELIEF VALVE REPLACEMENT**) • If the leak is coming from the suction hose and/or discharge hose fittings on the A/C compressor, clean the A/C fittings and replace the suction/discharge fitting O-rings • For all other A/C compressor leaks, remove and replace the A/C compressor (see

	A/C COMPRESSOR REPLACEMENT)
Evaporator	• Start checking for evaporator leaks by illuminating the evaporator drain tube area • If a leak is found, remove the evaporator core (see **EVAPORATOR CORE REPLACEMENT**) • Determine whether leak is from evaporator or expansion valve • Use a permanent marker pen to circle leak area • Replace the expansion valve (see **EXPANSION VALVE REPLACEMENT**), or the evaporator core (see **EVAPORATOR CORE REPLACEMENT**), depending upon which is leaking

A/C SYSTEM NOISE CHECK

CAUTION:

- **Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.**
- **Be careful when connecting service equipment.**
- **Do not breathe refrigerant or vapor.**

The A/C system noise check will help you determine the source of abnormal A/C system noise.

NOTE:

- **If accidental system discharge occurs, ventilate the work area before resuming service.**
- **Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.**
- **Identify the conditions when the noise occurs. The weather, the vehicle speed, the vehicle being in gear or in neutral, the engine temperature, or other conditions may be factors in determining the noise source.**
- **Do the A/C system inspection (see A/C SYSTEM INSPECTION), and correct any problems found prior to diagnosing abnormal noises.**
- **Abnormal A/C noises can be misleading. For example, a sound similar to a failed bearing may be caused by loose fasteners, loose mounting brackets, or a faulty A/C compressor clutch assembly.**

1. Inspect the air inlet grille in the cowl cover for debris. If debris is present, remove it.
2. Sit inside the vehicle, close the doors and windows, and turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, but do not start the engine. Cycle the HVAC system through all blower speeds and all air distribution modes to determine where and when the noise occurs.
3. Operate the blower at each speed with the engine and A/C off, and check for unusual noises and excessive vibration. If noise and/or vibration are present, do the following checks:
    1. If the noise or vibration occurs only in a specific mode or setting, then check these items:
        - Operation of the mode control motor(s), door(s), and linkage
        - Operation of the air mix control motor(s), door(s), and linkage

- Operation of the recirculation control motor, door, and linkage

2. If there is a squeaking or chirping noise, but no unusual vibration, replace the blower motor (see **BLOWER UNIT COMPONENT REPLACEMENT**).
3. Remove the blower unit (see **BLOWER UNIT REMOVAL/INSTALLATION**), and check for foreign material (leaves or twigs, for example) on the blower motor and fan. If foreign material is present, remove it, and recheck for noise. If you do not find any foreign material, remove the blower motor (see **BLOWER UNIT COMPONENT REPLACEMENT**), and check these items:

- Check if the fan blades are cracked or broken
- Make sure the fan retainer is tight
- Inspect the fan alignment on the blower motor shaft

Replace the blower motor if any problems are present.

4. Set up the vehicle for the running A/C checks:
   - Select a quiet area for testing
   - Apply the parking brake
   - Shift the vehicle to P or N (A/T) or neutral (M/T)
   - Start the engine
   - Set the temperature control switches to Max Cool
   - Set the mode control buttons to Vent
   - Set the fan control buttons to minimum (but not OFF)
   - Turn the air conditioning button ON

   Switch the A/C compressor on and off several times to clearly identify the sound during A/C compressor operation. Listen to the noise while the A/C compressor clutch is engaged and disengaged. Probe the A/C system with a stethoscope to pinpoint the noise.

   NOTE: If the noise does not change when the A/C compressor clutch engages or disengages, the noise may be caused by an engine-related component. Probe the engine area with a stethoscope to pinpoint the noise.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and check the drive belt for excessive wear, oil contamination, improper routing, or a faulty belt tensioner (see **DRIVE BELT INSPECTION**). Correct any problems found. Start the engine, run the A/C system, and check if the noise is coming from the drive belt, the belt tensioner or any of the pulleys. Repair or replace any faulty components.
6. Listen for noises coming from the A/C lines, the A/C hoses, the A/C condenser, the evaporator, the receiver/dryer, or the expansion valve, and check these items:
   - Noises caused by A/C components touching other components or the body. Reroute or insulate the A/C component(s) as needed, and recheck for noise.
   - Loose, damaged or excessively worn A/C components or mounting hardware. Repair or replace the faulty component(s) or hardware, and recheck for noise.
   - A moaning noise from the A/C suction line. If there is a moaning noise, check the system

refrigerant charge (see **SYSTEM CHARGING**). If the refrigerant charge is OK, replace the receiver/dryer.

- A whistling or hissing noise from the expansion valve. Evacuate the system for 3 hours (see **SYSTEM EVACUATION**), then recheck. If the noise is still present, replace the expansion valve (see **EXPANSION VALVE REPLACEMENT**).

7. Check the operation of the A/C compressor clutch:
   - Make sure A/C compressor clutch engages without slipping. If the clutch does not engage, troubleshoot the A/C compressor clutch circuit (see **A/C COMPRESSOR CLUTCH CIRCUIT TROUBLESHOOTING**). If the A/C compressor clutch slips, replace the A/C compressor clutch assembly (see **A/C COMPRESSOR CLUTCH OVERHAUL**). And if there is a leak from the shaft seal when the A/C compressor clutch slips, replace the A/C compressor also (see **A/C COMPRESSOR REPLACEMENT**).
   - Make sure the A/C compressor clutch disengages. If the clutch does not disengage, do the A/C compressor clutch circuit troubleshooting (see **A/C COMPRESSOR CLUTCH CIRCUIT TROUBLESHOOTING**). If the clutch circuit is OK, do the A/C compressor clutch check (see **A/C COMPRESSOR CLUTCH CHECK**), and see if the clutch is mechanically jammed. If there are no electrical or mechanical problems with the A/C compressor clutch, replace the A/C compressor (see **A/C COMPRESSOR REPLACEMENT**).
   - Make sure the A/C compressor clutch cycles normally. If the A/C compressor clutch is cycling rapidly, the A/C system is probably low on refrigerant due to a leak. Do the refrigerant leak check (see **REFRIGERANT LEAK CHECK**). If the refrigerant charge is OK, and there are no leaks, troubleshoot the A/C compressor clutch circuit.
8. Listen with a stethoscope for noises coming from the A/C compressor, and check these items:
   - The noise changes when the A/C compressor clutch disengages. If the noise does not change when the A/C compressor disengages, the noise may be caused by an engine-related component. Probe the engine area with a stethoscope to pinpoint the noise.
   - The A/C system operating pressures are normal. If the system pressures are abnormal, troubleshoot the problem using the pressure test table in the A/C system test (see **A/C SYSTEM TEST**). Correct the pressure-related problem(s), and recheck for noise.
   - The A/C compressor hose connections, mounting brackets, and fasteners are in good condition. If any of these components are loose, damaged, or excessively worn, repair or replace the faulty component(s), and recheck for noise. If these components are in good condition, and the noise is still present, replace the A/C compressor (see **A/C COMPRESSOR REPLACEMENT**).

A/C SYSTEM TEST

Special Tools Required

- Big Digit Hygro-Thermometer PYR445703, commercially available
- Throttle Pedal Depressor Tool B240B, commercially available

PERFORMANCE TEST

CAUTION:
- **Air conditioning refrigerant or lubricant vapor can irritate your eyes,**

nose, or throat.

- **Be careful when connecting service equipment.**
- **Do not breathe refrigerant or vapor.**

The performance test will help determine if the A/C system is operating within specifications.

NOTE:

- **If accidental system discharge occurs, ventilate the work area before resuming service.**
- **Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.**

1. Do the A/C system inspection (see **A/C SYSTEM INSPECTION**), and correct any problems found.
2. Connect an R-134a refrigerant recovery/recycling/charging station to the high-pressure service port and the low-pressure service port, following the equipment manufacturer's instructions.
3. Determine the relative humidity and air temperature.
4. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
5. Insert a thermometer (A) in the center vent.

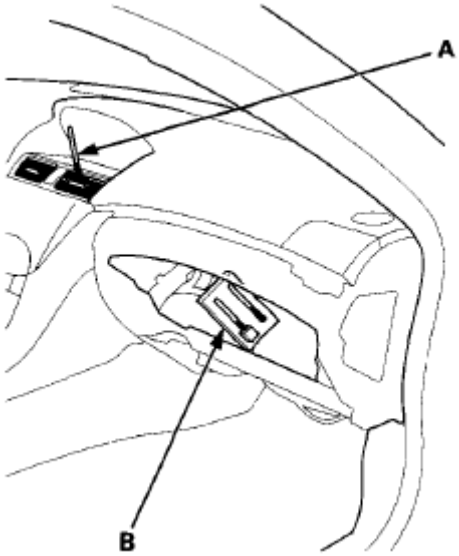

Fig. 162: Identifying Thermometers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Place a thermometer (B) near the blower unit's recirculation inlet duct.
7. Test conditions:
   - Move the vehicle out of direct sunlight and let it cool down to the surrounding (ambient) temperature. If necessary, wash the vehicle to cool it down more quickly.
   - The blower intake temperature must be at least 68°F (20 °C).
   - Open the hood.

- Open the front doors.
- Start the engine. Set the temperature control switches to Max Cool, the mode control buttons to Vent, and the recirculation control button to Recirculate.
- Turn the air conditioning button ON and the fan control button to Max.
- Run the engine speed at 1, 500 RPM.
- No driver or passengers in the vehicle.

8. Inspect the A/C components for the following conditions:
   - A/C compressor clutch not engaged.
   - Abnormal frost areas.
   - Unusual noises.

   If you observe any of these conditions, refer to the Symptom Troubleshooting.

9. After running the air conditioning for 10 minutes under the above test conditions, read the delivery temperature from the thermometer in the center vent, the intake temperature near the blower unit, and the discharge (high) and suction (low) pressures on the A/C gauges.
10. To complete the vent (delivery)/intake temperature chart:
    - Mark the vent (delivery) temperature on the vertical line.
    - Mark the intake temperature on the bottom line.
    - Draw a vertical line from the intake temperature mark.
    - Draw a horizontal line from the vent (delivery) temperature mark until it intersects the vertical line.

NOTE: The vent temperature and the ambient air temperature should intersect in the shaded area. Any measurements outside the area may indicate the need for further inspection.

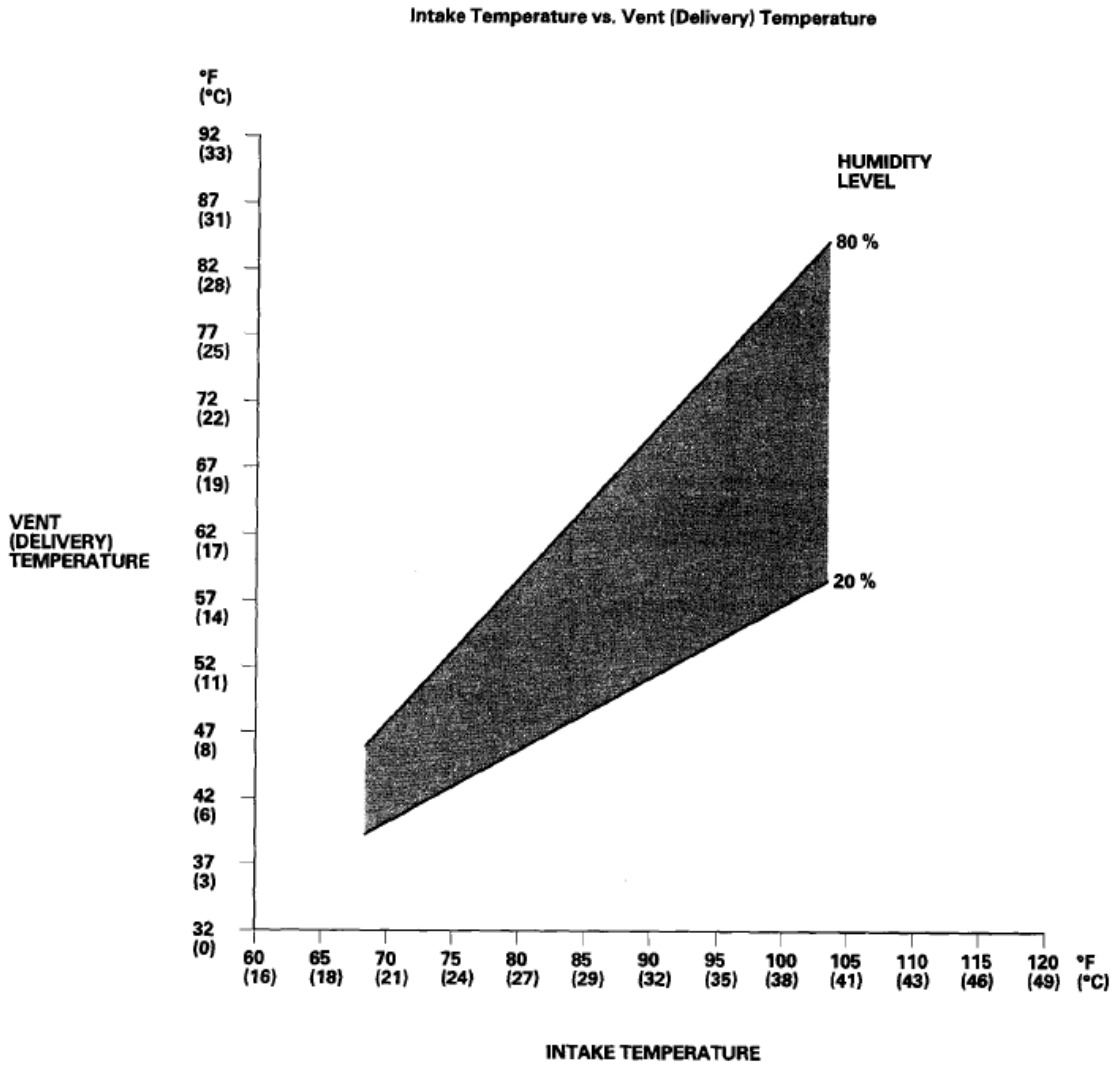

Fig. 163: Intake Temperature Versus Vent (Delivery) Temperature Graph
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. To complete the high side (discharge) pressure/intake temperature chart:
    - Mark the high side (discharge) pressure on the vertical line.
    - Mark the intake temperature on the bottom line.
    - Draw a vertical line from the intake temperature mark.
    - Draw a horizontal line from the high side (discharge) pressure mark until it intersects the vertical line.

NOTE: The high side pressure and the ambient air temperature should intersect in the shaded area. Any measurements outside the area may indicate the need for further inspection.

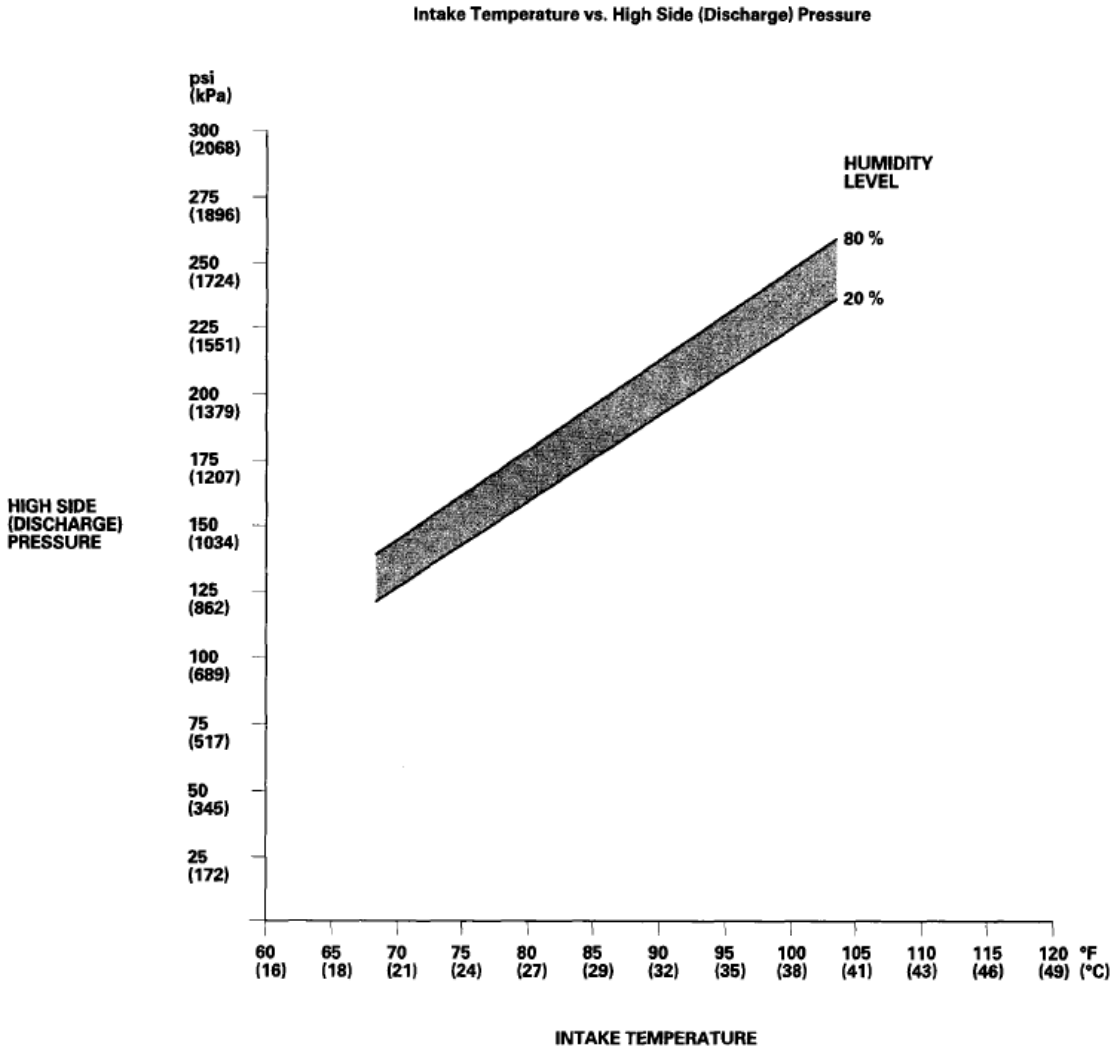

Fig. 164: Intake Temperature Versus High Side (Discharge) Pressure
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. To complete the low side (suction) pressure/intake temperature chart:
    - Mark the low side (suction) pressure along the vertical line.
    - Mark the intake temperature along the bottom line.
    - Draw a vertical line from the intake temperature mark.
    - Draw a horizontal line from the low side (suction) pressure mark until it intersects the vertical line.

NOTE: The low side pressure and the ambient air temperature should intersect in the shaded area. Any measurements outside the area may indicate the need for further inspection.

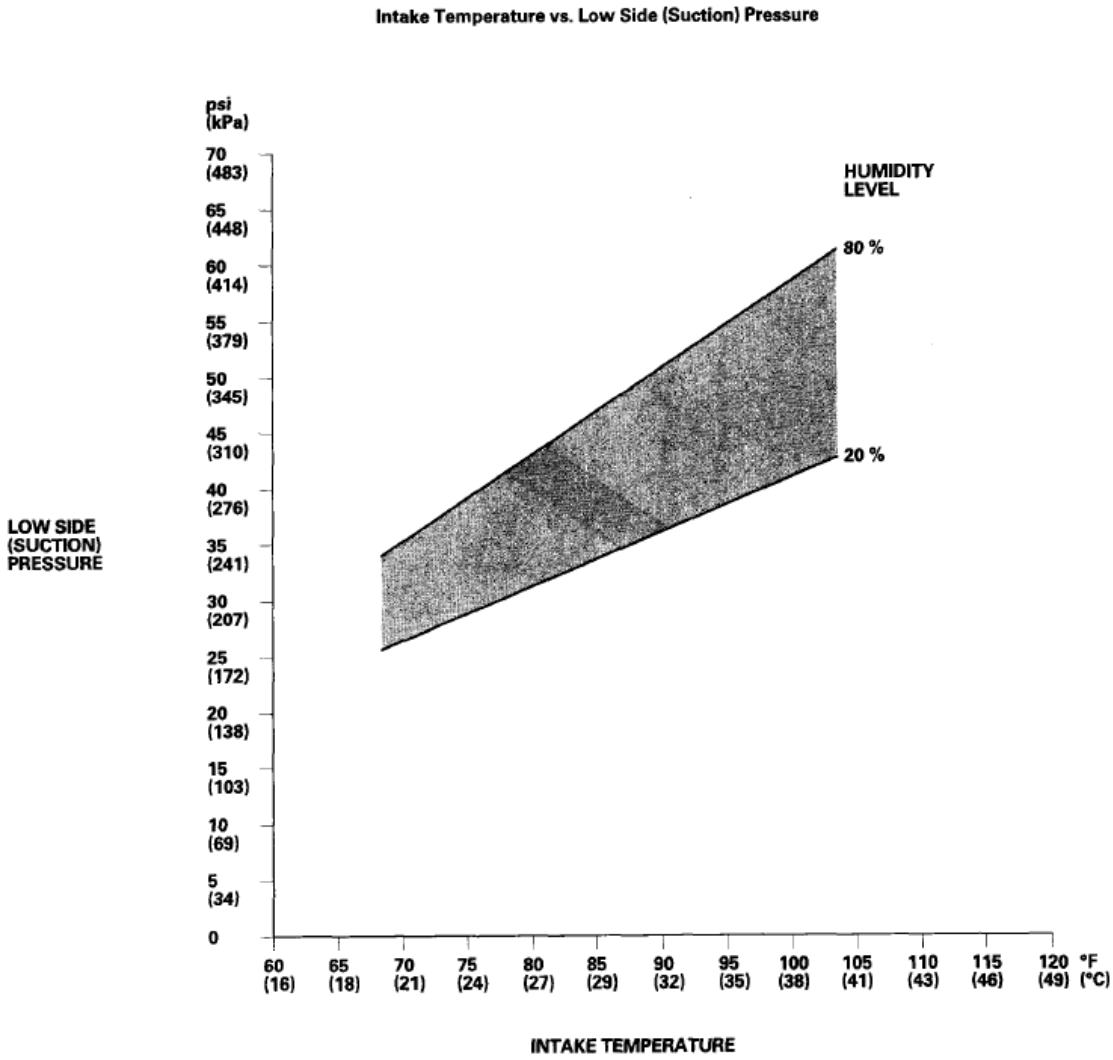

Fig. 165: Intake Temperature Versus Low (Suction) Pressure
Courtesy of AMERICAN HONDA MOTOR CO., INC.

PRESSURE TEST

Test results	Related symptoms	Probable cause
Driver and passenger's side A/C vent temperatures may vary by approximately 20°F (11 ° C) or more	Suction pressure may be low	• Low refrigerant charge • Expansion valve not opening sufficiently
	Driver's or passenger's air mix door DTCs present	One air mix door stuck or inoperative
	• Discharge pressure reduced when A/C condenser cooled with water spray • With doors open, fresh air selected and radiator and A/C condenser fan	Significant refrigerant overcharge

	run on high speed, temperature drop across A/C condenser inlet to outlet is less than about 41°F (5 °C)	
Discharge pressure abnormally High	Restricted/weak airflow through A/C condenser	• Dirty A/C condenser or damaged fins • Debris between A/C condenser and radiator • One or more cooling fans malfunctioning
Discharge pressure abnormally Low	• Suction and discharge pressures equalize rapidly after stopping A/C compressor • Suction pressure higher than normal	Faulty A/C compressor discharge valve or seal
Suction pressure abnormally Low	Weak or insufficient airflow across evaporator	Restricted blower intake or dust and pollen filter
	Suction pressure varies from near normal to a vacuum, as moisture freezes in expansion valve orifice	• Moisture in the system • Faulty expansion valve
	• Reduced airflow from vents • Vent temperature is very low	• Condensation freezing on evaporator • Faulty evaporator temperature sensor (check DTC) • Faulty expansion valve or A/C compressor clutch relay
Suction pressure abnormally High	• Lack of slight suction pressure variation at 1, 500 RPM when "Recirculated" airflow is switched to "Fresh Air" • Discharge pressure near normal	Expansion valve stuck open or open too long
Suction and Discharge pressures abnormally High	• Sheet of paper does not stick to front of A/C condenser surface with cooling fans on • With doors open, fresh air selected and radiator and A/C condenser fan run on high speed, temperature drop across A/C condenser inlet to outlet is less than about 41°F (5 °C)	One (or both) cooling fan motor inoperative or wires reversed
	• A/C compressor clutch remains engaged during off cycle	• Insufficient A/C compressor clutch clearance • A/C compressor clutch

	• Pressure relief valve may open	relay or circuit problem • Excessive air in system
Suction and Discharge pressures abnormally Low	Suction line from expansion valve to A/C compressor is not cold	Excessively low refrigerant charge
	Lack of slight suction pressure variation at 1, 500 RPM when "Recirculated" airflow is switched to "Fresh Air"	Expansion valve clogged with debris/desiccant, stuck closed, or not opening sufficiently
	More than 50-60°F (10-16 °C) temperature drop across A/C condenser inlet to outlet pipes	Blocked or restricted A/C condenser internal passages or lines/components restricting refrigerant flow
	Significant temperature difference along high or low side A/C lines or components **NOTE:** **Some restrictions may not show up until 3, 000 RPM)**	Restriction in A/C suction or discharge lines or components (check temperatures to isolate)
Suction pressure High and Discharge pressure Low	• Excessive A/C compressor noise • Pressures equalize quickly and noise after A/C compressor turns off	A/C compressor internal damage (Check for A/C system debris contamination)
Suction and discharge pressures normal (or near normal)	Vent temperature too high	• Slightly low refrigerant charge • Air mix door sticking, misadjusted or inoperative • Excessive refrigerant oil in system
	Static pressures high with A/C system equalized. (After engine is off 4- 12 hours)	• Air/Non-condensable gasses in system • Contaminated or incorrect refrigerant

A/C CONDENSER REPLACEMENT

1. Recover the refrigerant with a recovery/recycling/charging station (see **REFRIGERANT RECOVERY**).
2. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
3. Remove the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**).
4. Remove the intake duct (see **THROTTLE BODY REMOVAL/INSTALLATION**).
5. Remove the bolt, then disconnect the receiver line (A) from the A/C condenser. Remove the O-ring (B).

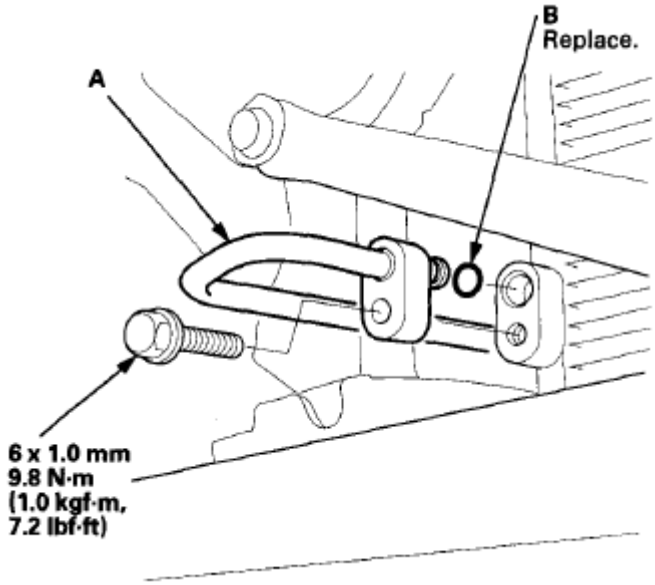

Fig. 166: Identifying Receiver Line And O-Ring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the bolts, then disconnect the discharge hose (A) from the A/C condenser. Remove the O-ring (B)

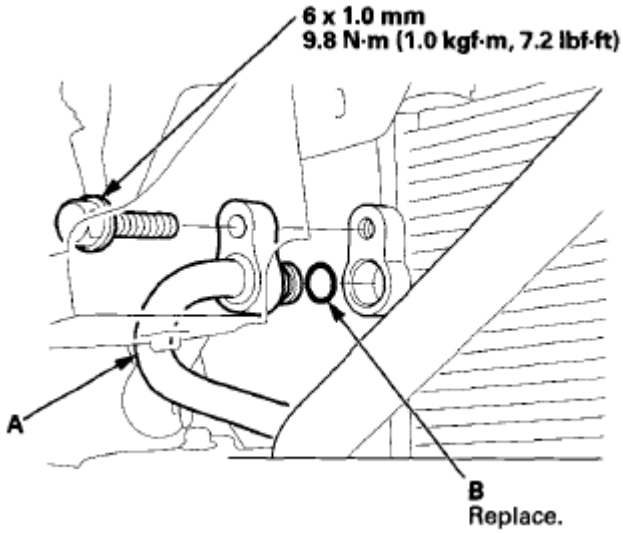

Fig. 167: Identifying Discharge Hose And O-Ring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the bolts and the radiator upper mount brackets (A). Remove the clips and the front bulkhead brace cover (B).

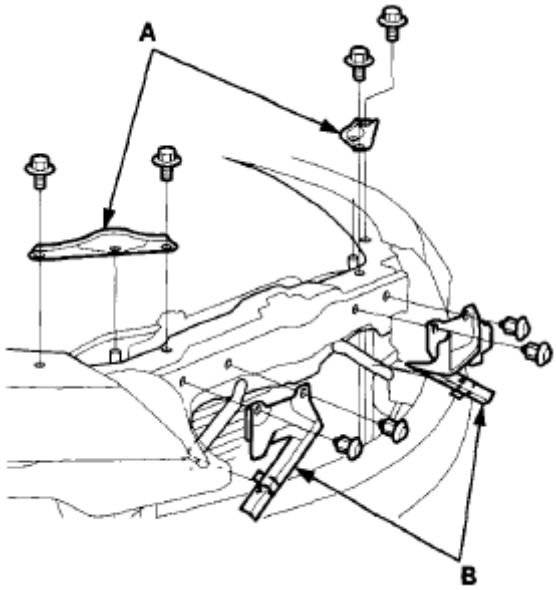

Fig. 168: Identifying Radiator Upper Mount Brackets And Bulkhead Brace Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the bolts and the A/C condenser upper mount brackets (A).

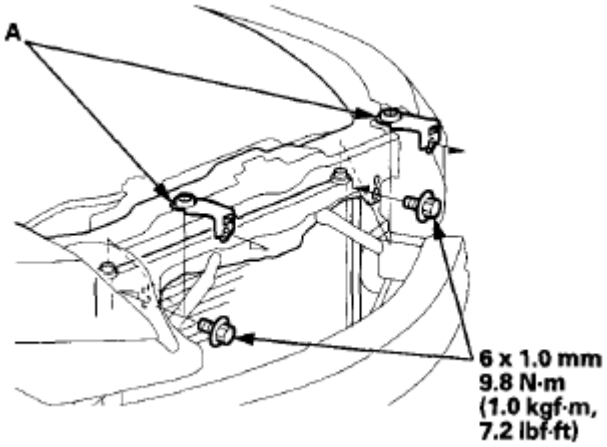

Fig. 169: Identifying A/C Condenser Upper Mount Brackets With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the A/C condenser (A) by lifting it up. Be careful not to damage the radiator or the A/C condenser fins when removing the A/C condenser.

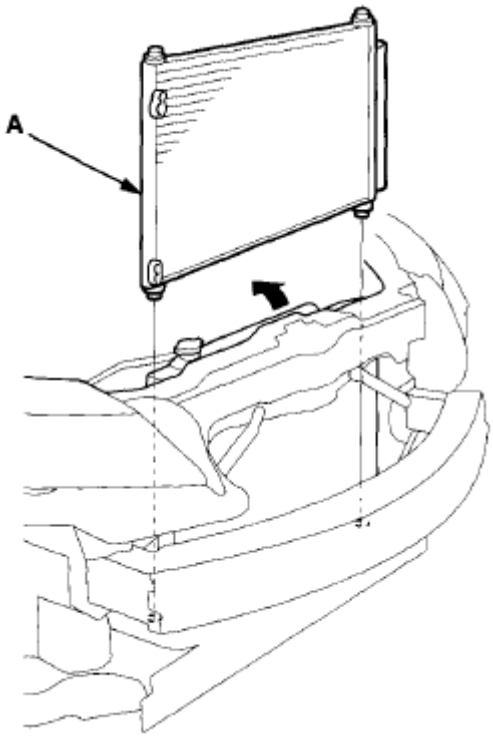

Fig. 170: Lifting A/C Condenser To Remove It
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the A/C condenser in the reverse order of removal, and note these items:
    - If you're installing a new A/C condenser, add refrigerant oil (DENSO ND-OIL 8) (see **A/C SYSTEM INSPECTION**).
    - Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
    - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
    - Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
    - Be careful not to damage the radiator or the A/C condenser fins when installing the A/C condenser.
    - Charge the system (see **SYSTEM CHARGING**).
11. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

RECEIVER/DRYER DESICCANT REPLACEMENT

NOTE: Install the receiver/dryer as quickly as possible to prevent the system from absorbing moisture from the air.

1. Remove the A/C condenser (see **A/C CONDENSER REPLACEMENT**).

2. Remove the cap (A) from the bottom of the A/C condenser. Remove the O-ring (B) and the desiccant (C).

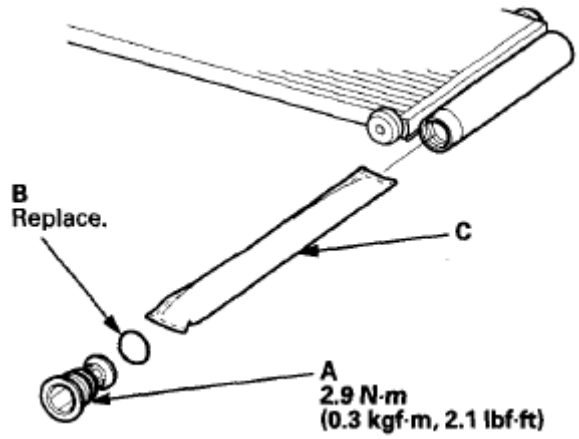

Fig. 171: Identifying Cap, O-Ring And Desiccant With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the receiver/dryer in the reverse order of removal, and note these items:
   - If you are installing a new desiccant, add refrigerant oil (DENSO ND-OIL 8) (see **A/C REFRIGERANT OIL REPLACEMENT**)
   - Replace the O-rings with new ones, and apply a thin coat of refrigerant oil (DENSO ND-OIL 8) before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
   - Install the cap to the specified torque. It is made of plastic and can be easily stripped.

A/C COMPRESSOR REPLACEMENT

NOTE: Do not install the A/C compressor into a system unless you are completely sure that the system is free of contamination. Installing the A/C compressor into a contaminated system can result in premature A/C compressor failure.

1. If the A/C compressor is marginally operable, run the engine at idle speed, and let the air conditioning work for a few minutes, then shut the engine off.
2. Recover the refrigerant with a recovery/recycling/charging station (see **REFRIGERANT RECOVERY**).
3. Remove the A/C condenser fan shroud assembly (see **FAN, FAN MOTOR, AND SHROUD REMOVAL AND INSTALLATION**).

NOTE: To avoid damage to the radiator, cover it with cardboard until reinstalling the fan.

4. Remove the alternator (see **ALTERNATOR REMOVAL AND INSTALLATION**).
5. Disconnect the A/C compressor clutch connector (A). Remove the bolts and the nut, then disconnect the suction hose (B) and the discharge hose (C) from the A/C compressor. Remove the O-rings (D). Plug or cap the lines immediately after disconnecting them to avoid moisture and dust contamination.

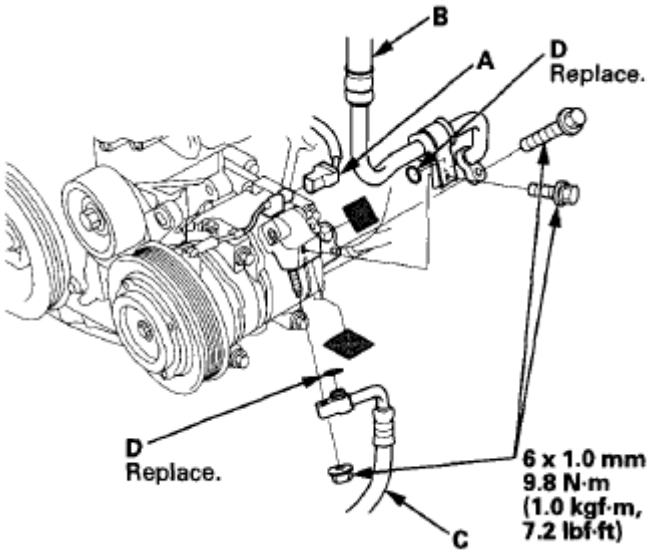

Fig. 172: Identifying A/C Compressor Clutch Connector, Suction Hose, Discharge Hose And O-Rings With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the mounting bolts and the A/C compressor (A). Be careful not to damage the radiator fins when removing the A/C compressor.

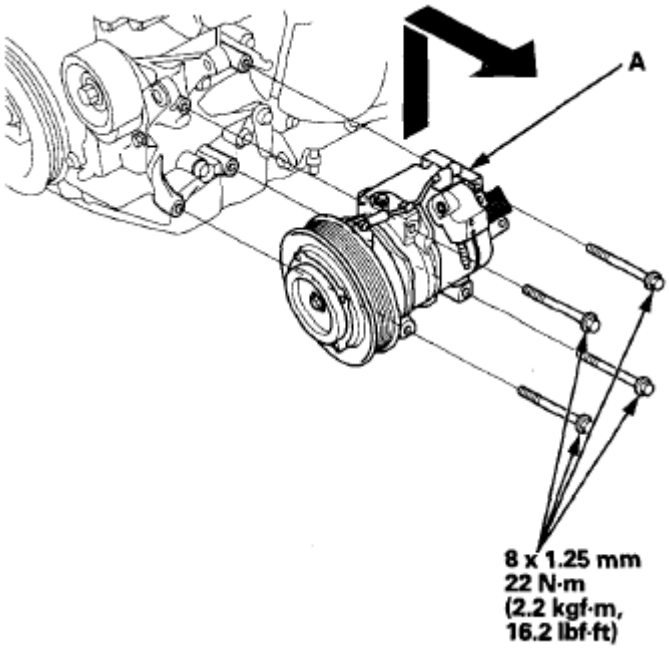

Fig. 173: Removing Mounting Bolts And A/C Compressor With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the A/C compressor in the reverse order of removal, and note these items:
   - Inspect the A/C lines for any signs of contamination.

- Before installing a new A/C compressor, adjust the A/C compressor oil level (see **A/C REFRIGERANT OIL REPLACEMENT**).
- Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
- Use only refrigerant oil (DENSO ND-OIL 8) for HFC-134a DENSO A/C compressors only.
- To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle; it may damage the paint. If the refrigerant oil contacts the paint, wash it off immediately.
- Be careful not to damage the radiator fins when installing the A/C compressor and the A/C condenser fan shroud.
- Charge the system (see **SYSTEM CHARGING**).

A/C COMPRESSOR CLUTCH OVERHAUL

Special Tools Required

A/C Compressor Kit 07AAF-000A150

1. Remove the center bolt (A) while holding the pressure plate with the A/C clutch holder (B).

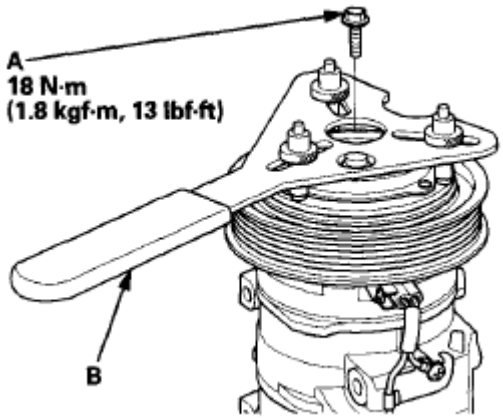

Fig. 174: Identifying Center Bolt And A/C Clutch Holder With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the pressure plate (A) and the shim(s) (B), taking care not to lose the shim(s). If the clutch needs adjustment, increase or decrease the number and thickness of shims as necessary, then reinstall the pressure plate, and recheck its clearance (see **A/C COMPRESSOR CLUTCH CHECK**).

NOTE:

- **The shims are available in three thicknesses: 0.1 mm, 0.3 mm, and 0.5 mm.**

- **Do not pry on the pressure plate with screwdrivers or similar tools. Prying damages the pressure plate and the pulley.**
- **When replacing the clutch set, place a trial stack of shims, 1 mm total thickness, on the A/C compressor shaft. Install the pressure plate, and check its clearance (see A/C COMPRESSOR CLUTCH CHECK). If the clearance is not with specification, add or subtract shims as needed.**

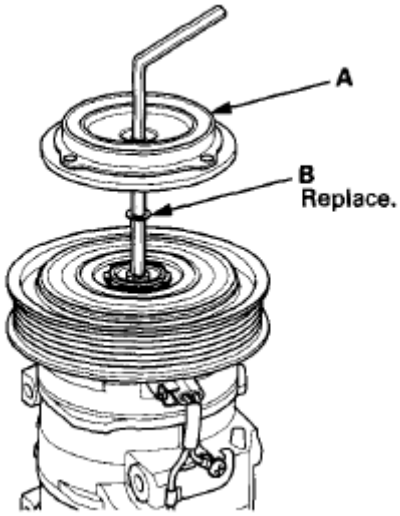

Fig. 175: Identifying Pressure Plates And Shim
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If you are replacing the field coil, remove the snap ring (A) with snap ring pliers, then remove the pulley (B). Be careful not to damage the pulley or the A/C compressor.

NOTE: Do not hammer or pry on the pulley to remove it. Using a hammer damages the A/C compressor. If the pulley is difficult to remove, use a commercially available pulley removing tool. Make sure the jaws of the pulling tool engage the back face of the pulley, not the pulley grooves.

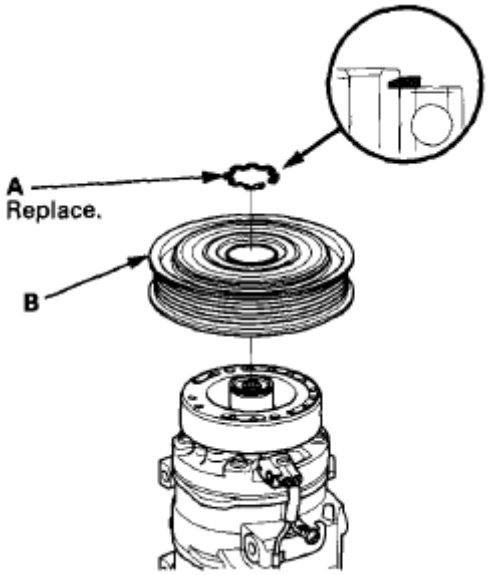

Fig. 176: Identifying Snap Ring And Pulley
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the screw from the field coil ground terminal (A), then remove the wire harness (B) and the bracket (C). Disconnect the field coil connector (D). Remove the snap ring (E) with snap ring pliers, then remove the field coil (F). Be careful not to damage the field coil or the A/C compressor.

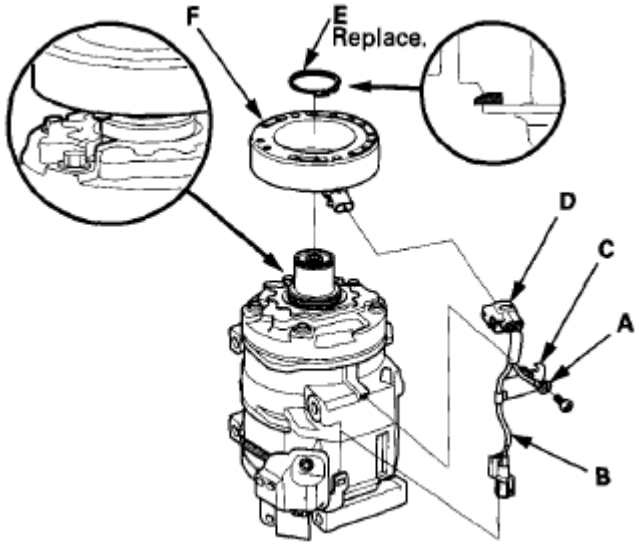

Fig. 177: Identifying Field Coil Ground Terminal, Wire Harness, Bracket, Connector, Snap Ring And Field Coils
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Reassemble the clutch in the reverse order of disassembly, and note these items:
   - When replacing the field coil, check that the new coil has the correct resistance (see step 6).
   - Install the field coil with the wire side facing down, and align the boss on the field coil with the

hole in the A/C compressor.

- Clean the pulley and A/C compressor friction surfaces with contact cleaner or other non-petroleum solvent.
- Install new snap rings, note the installation direction, and make sure they are fully seated in the grooves.
- Make sure that the pulley turns smoothly after it's reassembled.
- Route and clamp the wires properly to prevent damage by the pulley.

6. Cycle the A/C clutch approximately 20 times by running the engine at 1, 500-2, 000 RPM and setting the climate control temperature to Lo with the air conditioning button ON. This procedure seats the clutch friction surfaces, and increases clutch torque capacity.

A/C COMPRESSOR RELIEF VALVE REPLACEMENT

NOTE: If the A/C compressor relief valve released refrigerant to the atmosphere, determine and correct the cause of the excessive system pressure, then replace the relief valve.

1. Recover the refrigerant with a recovery/recycling/charging station (see **REFRIGERANT RECOVERY**).
2. Remove the relief valve (A) and the O-ring (B). Plug the opening to keep moisture and foreign material from entering the system, and the A/C compressor oil from running out.

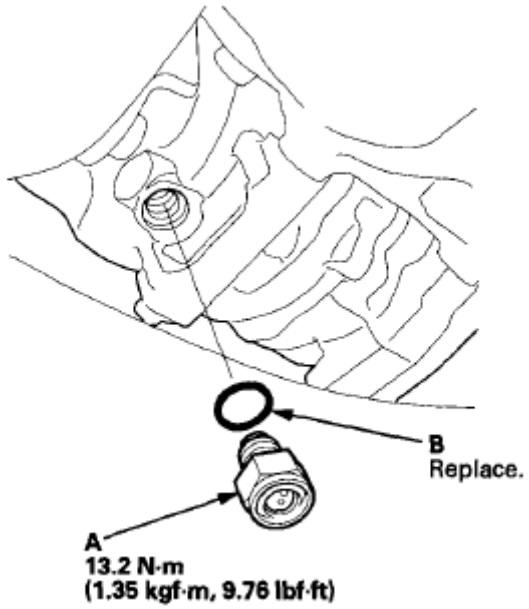

Fig. 178: Identifying Relief Valve And O-Ring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Clean the mating surfaces.
4. Replace the O-ring with a new one, and apply a thin coat of refrigerant oil before installing it.

5. Remove the plug you installed in step 2, then install and tighten the relief valve.
6. Charge the system (see **SYSTEM CHARGING**).

A/C REFRIGERANT OIL REPLACEMENT

Special Tools Required

Oil Injector Tool Robinair ROB16256*, commercially available

*Available through the Acura Tool and Equipment Program; call 888-424-6857

Recommended PAG oil: DENSO ND-OIL 8

P/N 38897-PR7-A01AH: 120 mL (4 fl.oz)

It is important to have the correct amount of refrigerant oil in the A/C system to ensure proper lubrication of the A/C compressor. Too little oil damages the A/C compressor; too much oil reduces the cooling capacity of the system, and can produce high vent temperatures.

- To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle; it may damage the paint; if it gets on the paint, wash it off immediately.

Add the recommended refrigerant oil in the amount listed if you replace any of the following parts:

A/C condenser (including Dryer Desiccant).....35 mL (1 1/5 fl.oz)

Evaporator.....35 mL (1 1/5 fl.oz)

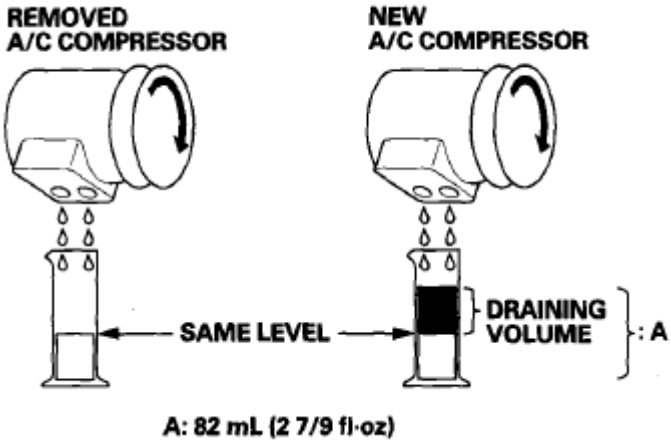
Line or hose.....10 mL (1/3 fl.oz)

Dryer desiccant.....10 mL (1/3 fl.oz)

Leakage repair.... 25 mL (5/6 fl.oz)

A/C compressor.... For A/C compressor replacement, subtract the volume of oil drained from the removed A/C compressor from 82 mL (2 7/9 fl-oz), and drain the calculated volume of oil from the new A/C compressor: 82 mL (2 7/9 fl-oz) - Volume of removed A/C compressor = Volume to drain from new A/C compressor.

NOTE: Even if no oil is drained from the removed A/C compressor, do not drain more than 50 mL (1 2/3 fl.oz) from the new A/C compressor.



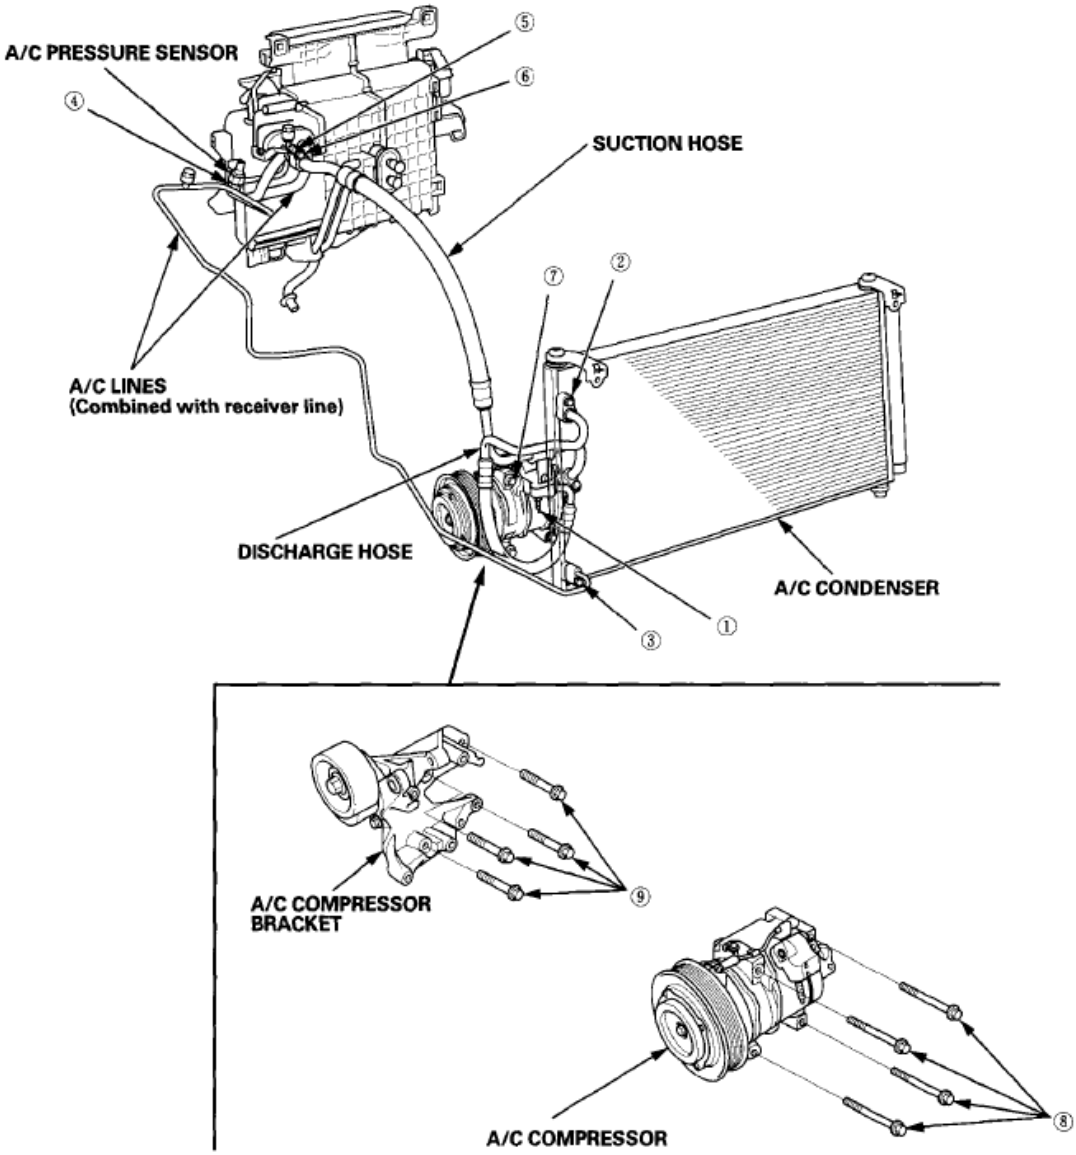


Fig. 179: Identifying A/C Compressor Oil Level
Courtesy of AMERICAN HONDA MOTOR CO., INC.

A/C LINE REPLACEMENT

① Discharge hose to the A/C compressor (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
② Discharge hose to the A/C condenser (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
③ Receiver line to the A/C condenser (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
④ A/C pressure sensor to the receiver line (11 x 1.0 mm): 10.8 N·m (1.1 kgf·m, 8.0 lbf·ft)
⑤ A/C lines to the evaporator (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
⑥ A/C line to the suction hose (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
⑦ Suction hose to the A/C compressor (6 x 1.0 mm): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
⑧ A/C compressor to the A/C compressor bracket (8 x 1.25 mm): 22 N·m (2.2 kgf·m, 16.2 lbf·ft)
⑨ A/C compressor bracket to the engine block (10 x 1.25 mm): 44 N·m (4.5 kgf·m, 32.5 lbf·ft)

Fig. 180: Identifying A/C Line & Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DUST AND POLLEN FILTER REPLACEMENT

1. Open the glove box. Remove the glove box separator (A) by carefully pulling it straight back.

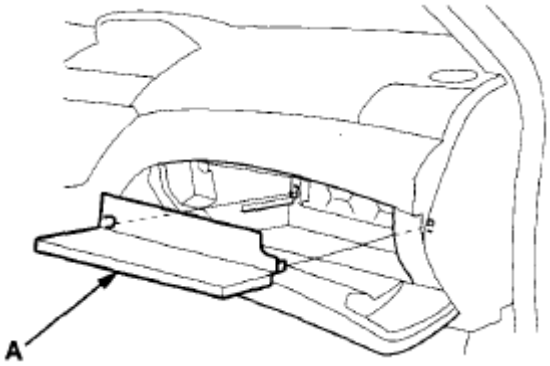

Fig. 181: Identifying Glove Box Separator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the dust and pollen filter assembly (A) from the blower unit.

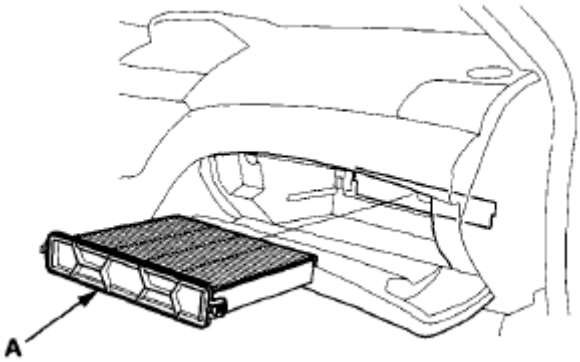

Fig. 182: Identifying Dust And Pollen Filter Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the filter (A) from the housing (B), and replace the filter.

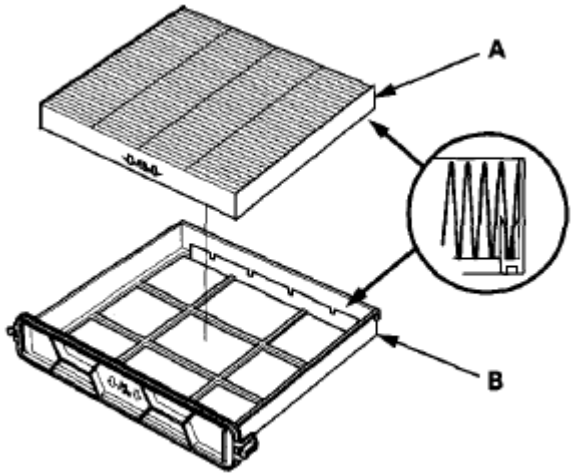

Fig. 183: Identifying Filter And Housing

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the filter in the reverse order of removal. Make sure that there is no air leaking out of the blower unit.

BLOWER UNIT REMOVAL/INSTALLATION

1. Remove the passenger's dashboard undercover (see **GLOVE BOX DAMPER REPLACEMENT**).
2. Remove the passenger's dashboard trim (see **PASSENGER'S DASHBOARD TRIM REMOVAL/INSTALLATION**).
3. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
4. Detach the harness clips (A). Remove the bolts, and the glove box frame (B).

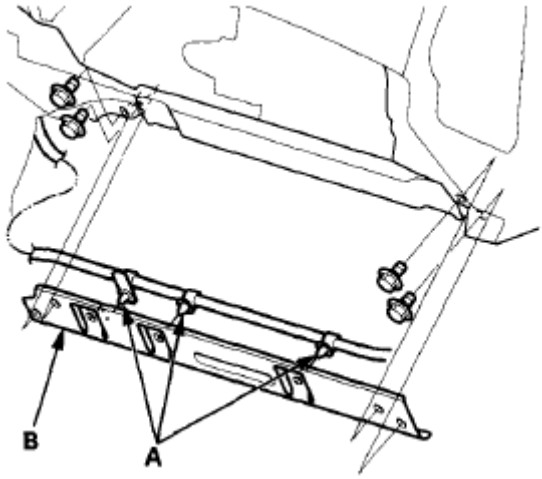

Fig. 184: Identifying Harness Clips And Glove Box Frame
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Cut the plastic cross brace (A) in the glove box opening with diagonal cutters in the area shown, and discard it.

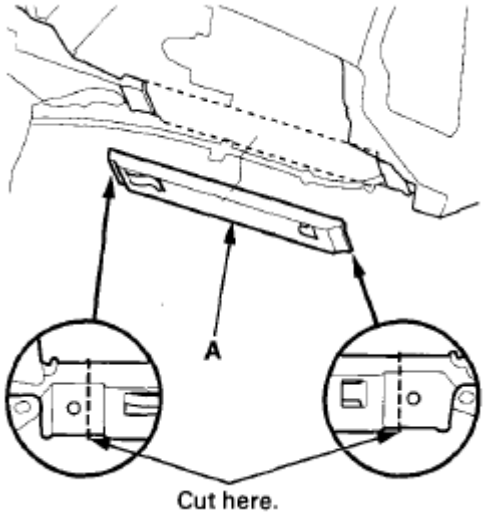

Fig. 185: Identifying Cross Brace
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Release the harness clip (A), then remove the self-tapping screws, and the passenger's heater duct (B).

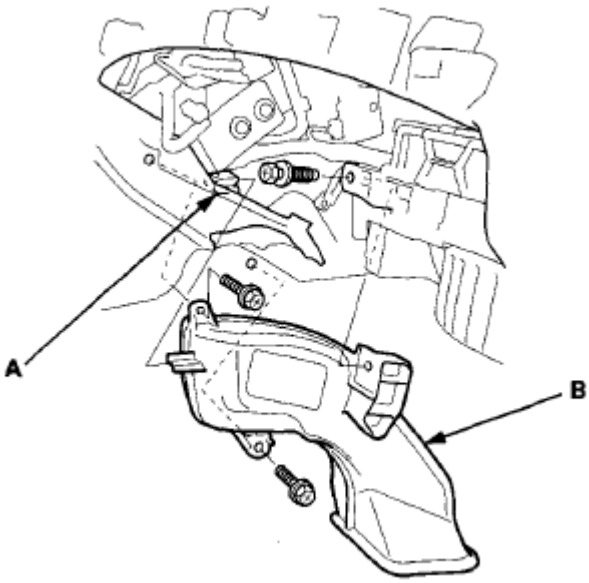

Fig. 186: Identifying Harness Clip And Passenger's Heater Duct
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect the connector (A) from the blower motor, and detach the harness clips (B).

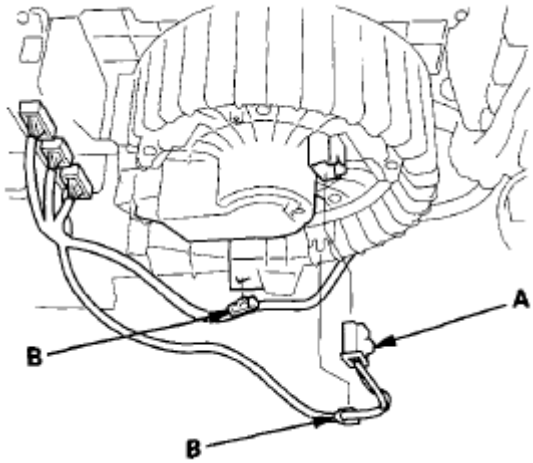

Fig. 187: Identifying Connector And Harness Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the self-tapping screws and disconnect the climate control unit connectors (A), and recirculation control motor connector (B).

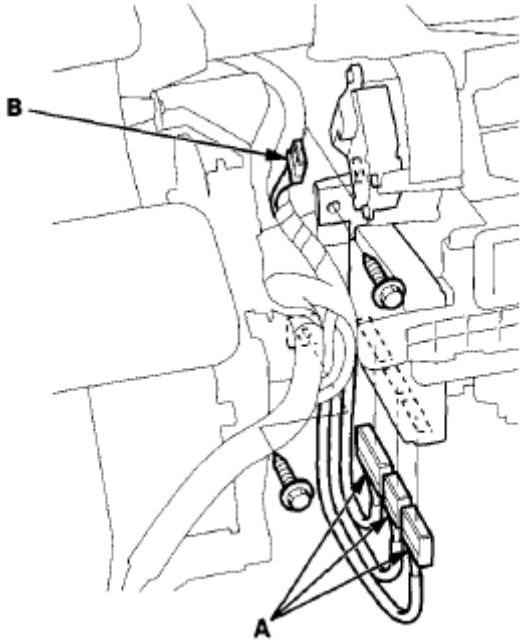

Fig. 188: Identifying Unit Connectors And Recirculation Control Motor Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Disconnect the right engine compartment harness connector (A) and harness clips (B). Remove the mounting nuts, and the blower unit (C).

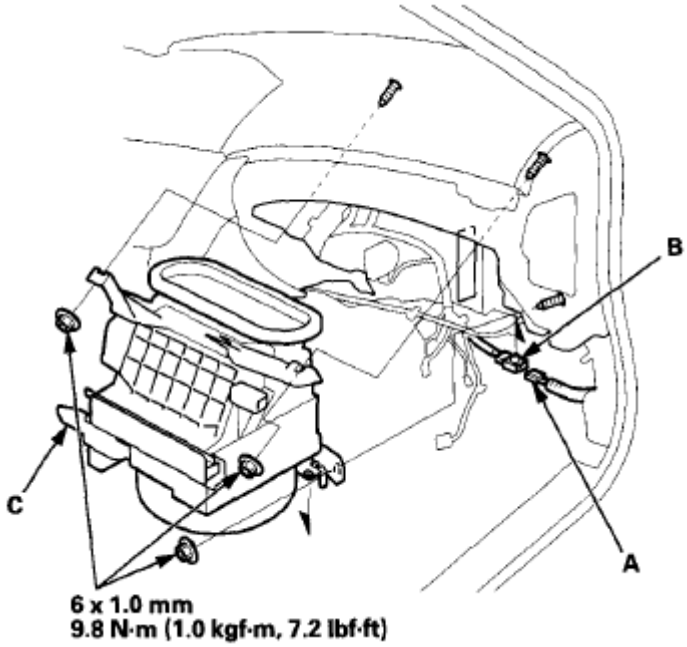

Fig. 189: Identifying Harness Connector, Harness Clips And Blower Unit With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the unit in the reverse order of removal. Make sure that there are no air leaks.

BLOWER UNIT COMPONENT REPLACEMENT

Note these items when overhauling the blower unit:

- The recirculation control motor (A), the blower motor (B), and the dust and pollen filter (C) can be replaced without removing the blower unit.
- Before reassembly, make sure that the recirculation control linkage and door move smoothly without binding.
- After reassembly, make sure the recirculation control motor runs smoothly (see **RECIRCULATION CONTROL MOTOR TEST**).

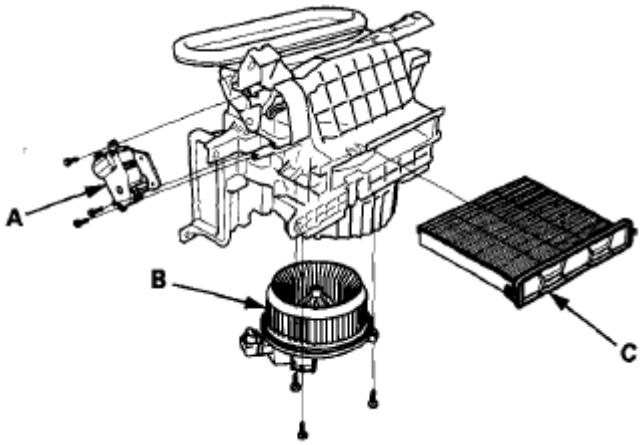

Fig. 190: Identifying Recirculation Control Motor, Blower Motor And Pollen Filter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

EXPANSION VALVE REPLACEMENT

1. Remove the evaporator core (see **EVAPORATOR CORE REPLACEMENT**).
2. Remove the insulator (A) and bolts, then remove the expansion valve (B) and the O-rings (C).

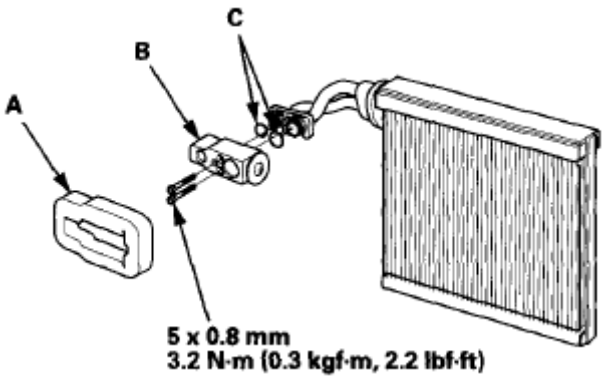

Fig. 191: Identifying Insulator, Expansion Valve And O-Rings With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the expansion valve in the reverse order of removal, and note these items:
   - Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a> to avoid leakage.
   - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
   - Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
   - Make sure that there are no air leaks.
   - Charge the system (see **SYSTEM CHARGING**).

EVAPORATOR CORE REPLACEMENT

1. Recover the refrigerant with a recovery/recycling/charging station (see **REFRIGERANT RECOVERY**).
2. Remove the bolt from the A/C line clamp (A).

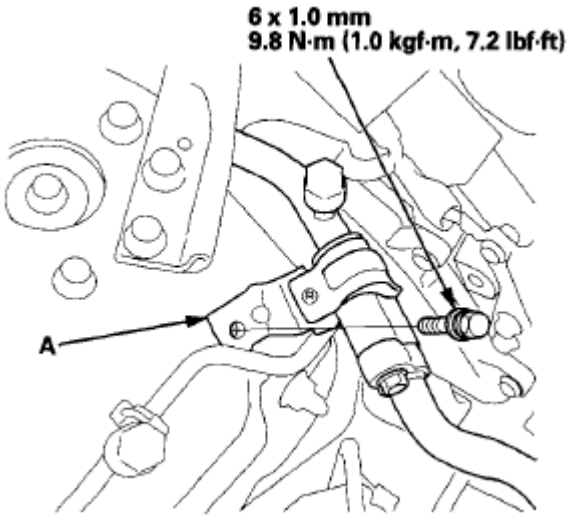

Fig. 192: Identifying A/C Line Clamp With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the bolt, then disconnect the A/C line (A) from the evaporator core. Replace the O-rings (B).

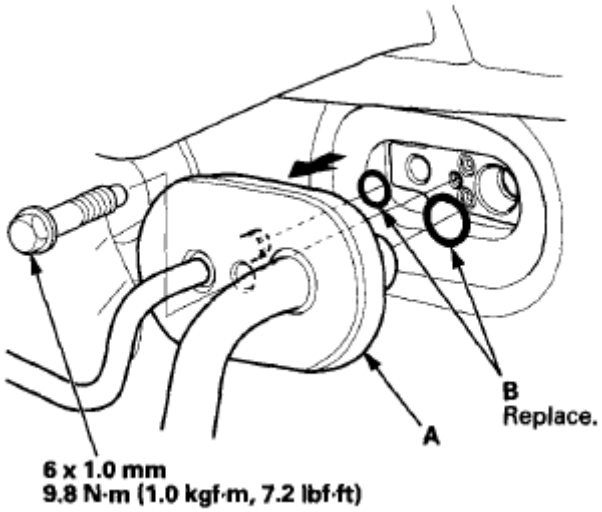

Fig. 193: Identifying A/C Line And O-Rings With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the blower unit (see **BLOWER UNIT REMOVAL/INSTALLATION**).
5. Disconnect the power transistor connector (A). Detach the harness clips (B). Remove the self-tapping

screws, the joint duct (C), and the seal (D).

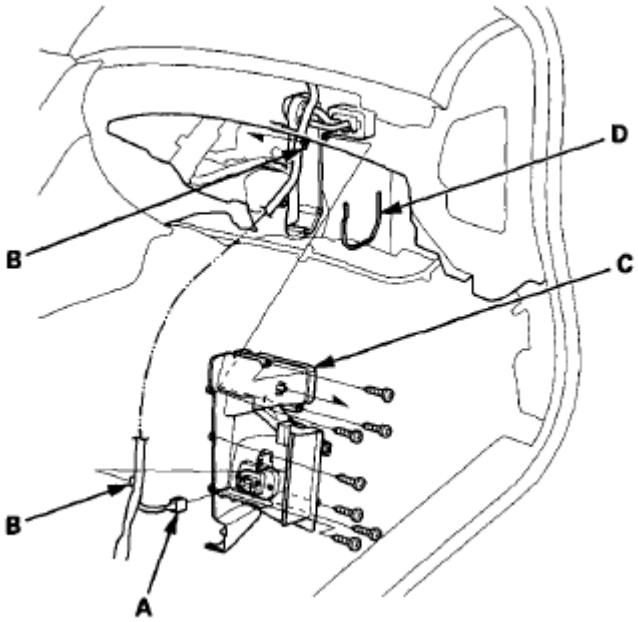

Fig. 194: Identifying Power Transistor Connector, Harness Clips, Joint Duct And Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Carefully pull out the evaporator core (A) without bending the lines, then remove the plate (B).

NOTE: Be careful not to damage the wire harness.

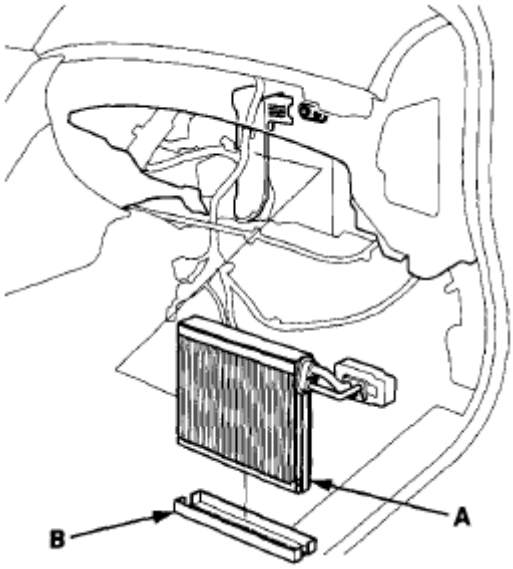

Fig. 195: Identifying Evaporator Core And Plate
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the core in the reverse order of removal, and note these items:
   - If you're installing a new evaporator core, add refrigerant oil (DENSO ND-OIL 8) (see **A/C REFRIGERANT OIL REPLACEMENT**).
   - Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
   - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
   - Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
   - Make sure that there is no air leakage.
   - Charge the system (see **SYSTEM CHARGING**).

HEATER UNIT/CORE REPLACEMENT

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repairs or service.

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
2. Recover the refrigerant with a recovery/recycling/charging station (see **REFRIGERANT RECOVERY**).
3. Disconnect the A/C line from the evaporator core (see **EVAPORATOR CORE REPLACEMENT**).
4. When the engine is cool, drain the engine coolant from the radiator (see **COOLANT CHECK**).
5. From under the hood, slide the hose clamps (A) back. Disconnect the inlet heater hose (B) and the outlet heater hose (C) from the heater unit. Note the layout of the hoses.

   Engine coolant will run out when the hoses are disconnected; drain it into a clean drip pan. Be sure not to let coolant spill on the electrical parts or the painted surfaces. If any coolant spills, rinse it off immediately.

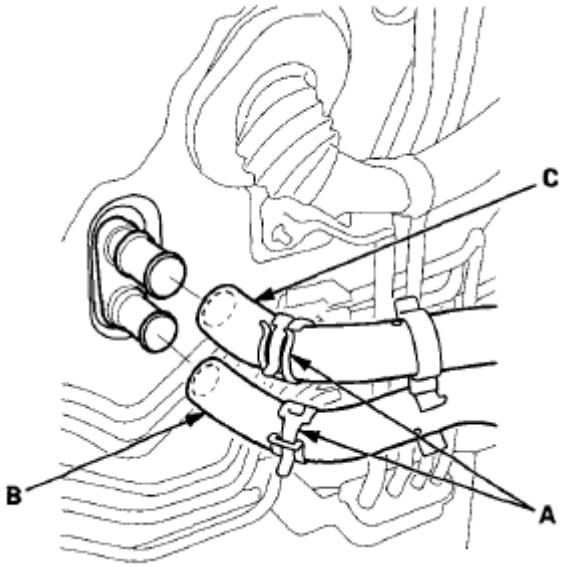

Fig. 196: Identifying Hose Clamps, Inlet And Outlet Heater Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the mounting nut from the heater unit. Take care not to damage or bend the fuel lines or the brake lines.

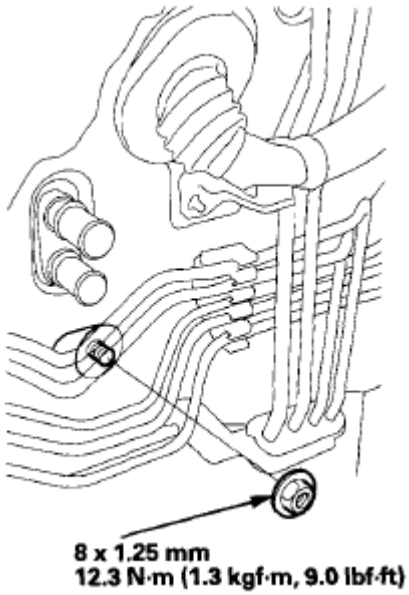

Fig. 197: Removing Mounting Nut From Heater Unit With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the dashboard (see **DASHBOARD REPLACEMENT**).
8. Disconnect the left engine compartment wire harness connectors (A). Remove the ducts (B), and the drain hose (C). Then remove the mounting nuts, and the blower-heater unit (D).

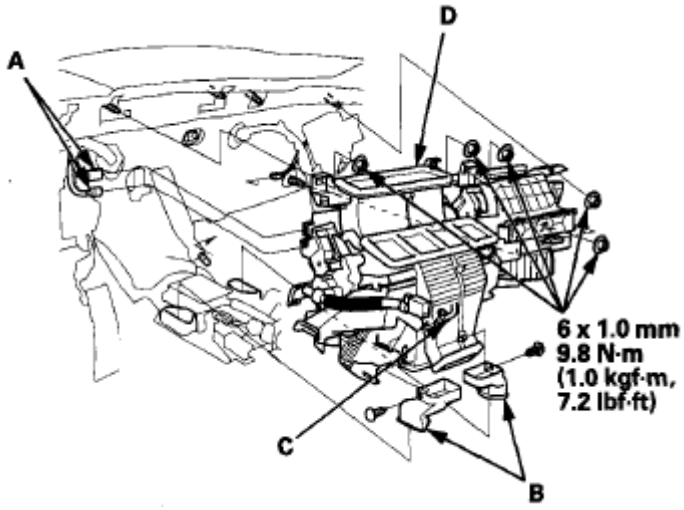

Fig. 198: Identifying Harness Connectors, Ducts, Drain Hose And Blower-Heater Unit With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Disconnect the connector (A) from the blower motor. Detach the harness clips (B).

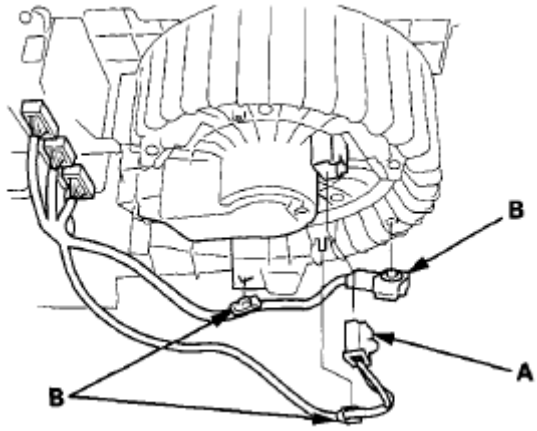

Fig. 199: Identifying Connector And Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Disconnect these connectors (A): The passenger's mode control motor, the power transistor, and the passenger's air mix control motor. Detach the harness clips (B).

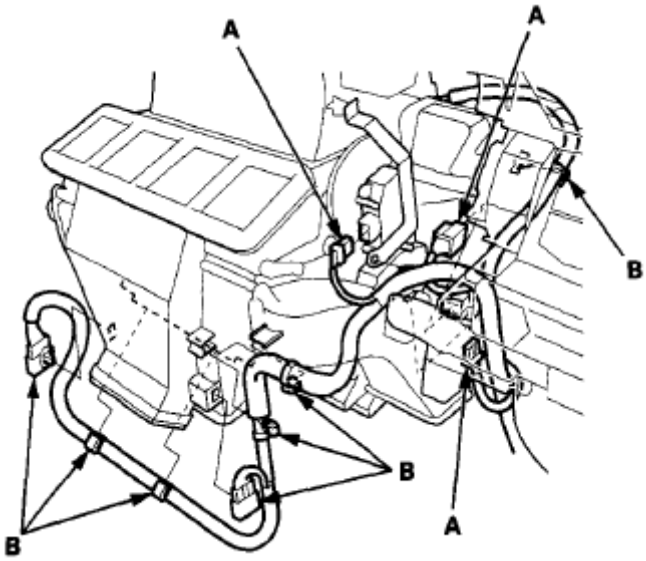

Fig. 200: Identifying Connectors And Harness Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Disconnect these connectors (A): The recirculation control motor, and the climate control unit. Detach the harness clip (B).

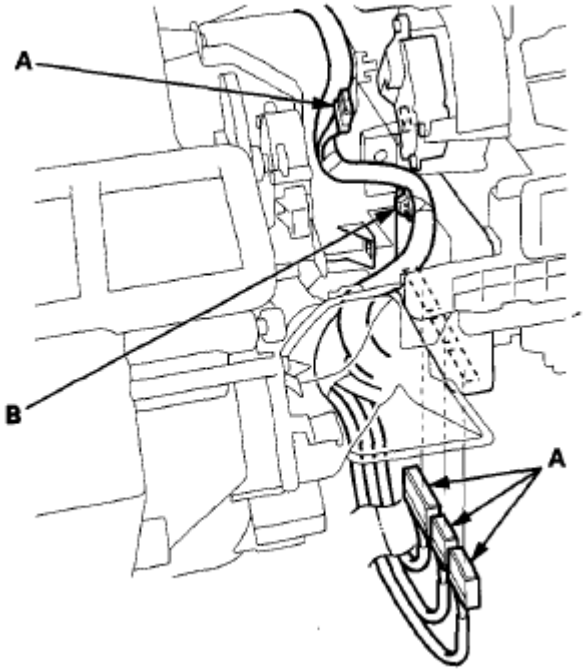

Fig. 201: Identifying Connectors And Harness Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Disconnect these connectors (A): the driver's air mix control motor, the driver's mode control motor, and evaporator temperature sensor. Detach the harness clips (B), and remove the wire harness (C).

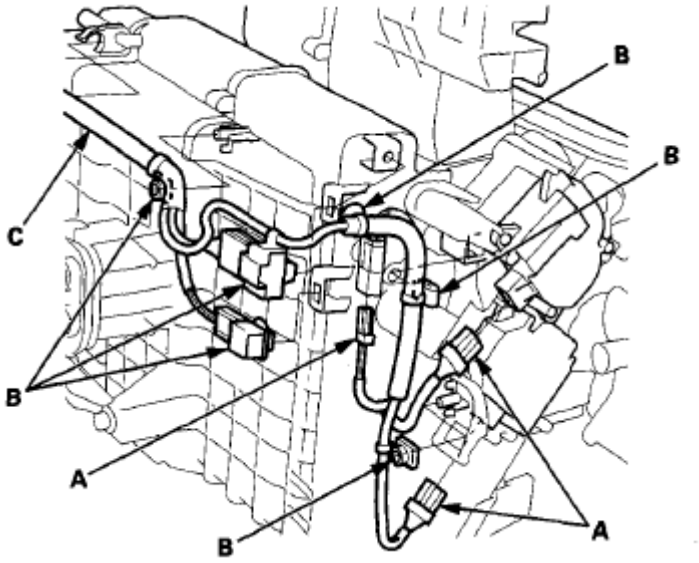

Fig. 202: Identifying Connectors, Wire Harness And Harness Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Remove the self-tapping screws and the passenger's heater duct (A). Remove the self-tapping screws and the joint duct (B). Remove the self-tapping screw and the heater core cover (C). Remove the self-tapping screw, the heater pipe bracket (D), and the grommet (E), and carefully pull out the heater core (F).

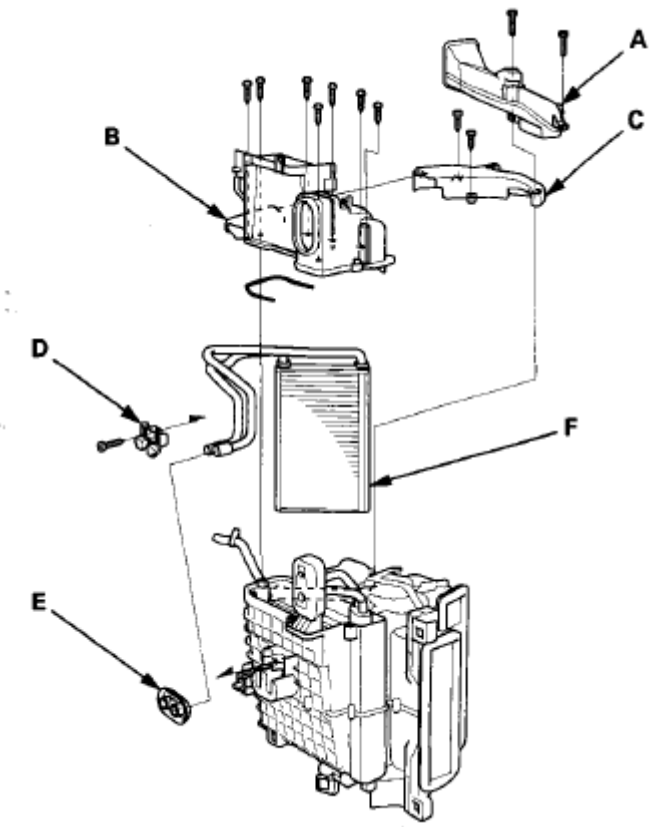

Fig. 203: Identifying Joint Duct, Passenger's Heater Duct, Heater Core Cover, Grommet And Heater Core
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Install the heater core in the reverse order of removal.
15. Install the heater unit in the reverse order of removal, and note these items:
    - Do not interchange the inlet and outlet heater hoses, and install the hose clamps securely.
    - Refill the cooling system with engine coolant (see **COOLANT CHECK**).
    - Make sure that there is no coolant leakage.
    - Make sure that there is no air leakage.
    - Charge the system (see **SYSTEM CHARGING**).
16. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

DRIVER'S AIR MIX CONTROL MOTOR REPLACEMENT

1. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
2. Remove the self-tapping screws, the aspirator hose (A), and the driver's heater duct (B).

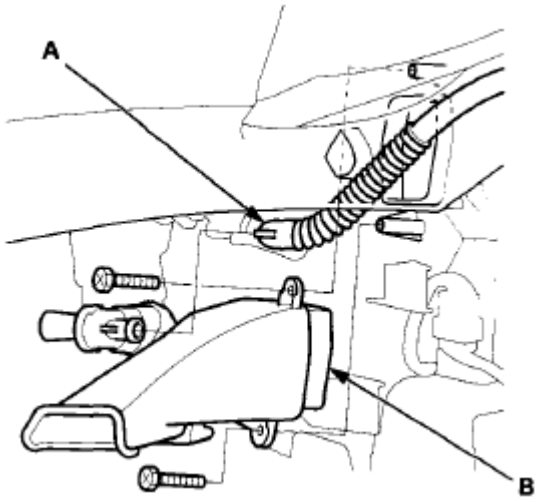

Fig. 204: Identifying Aspirator's Hose And Driver's Heater Duct
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the 7P connector (A) from the driver's air mix control motor (B). Remove the self-tapping screws and the driver's air mix control motor from the heater unit.

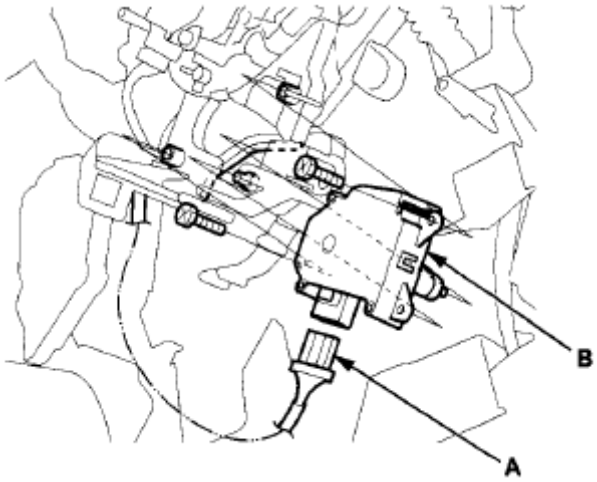

Fig. 205: Identifying Connector And Driver's Air Mix Control Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

PASSENGER'S AIR MIX CONTROL MOTOR REPLACEMENT

1. Remove the passenger's dashboard undercover (see **GLOVE BOX DAMPER REPLACEMENT**).
2. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
3. Release the harness clip (A), then remove the self-tapping screws and the passenger's heater duct (B).

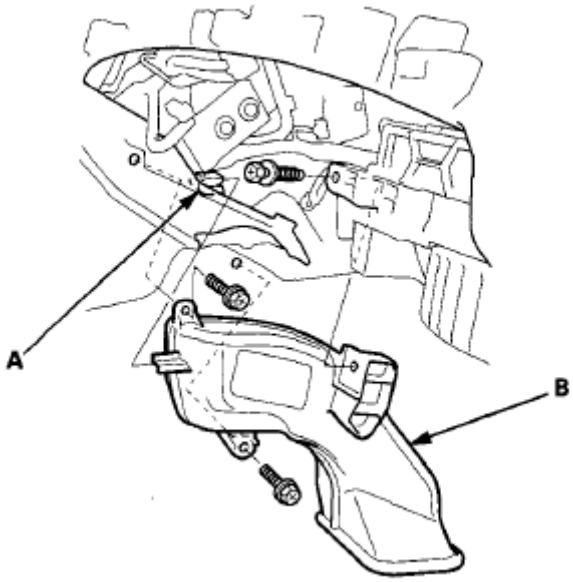

Fig. 206: Identifying Harness Clip And Passenger's Heater Duct
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the 5P connector (A) from the power transistor, and the 7P connector (B) from the passenger's air mix control motor (C). Remove the self-tapping screws and the passenger's air mix control motor from the heater unit.

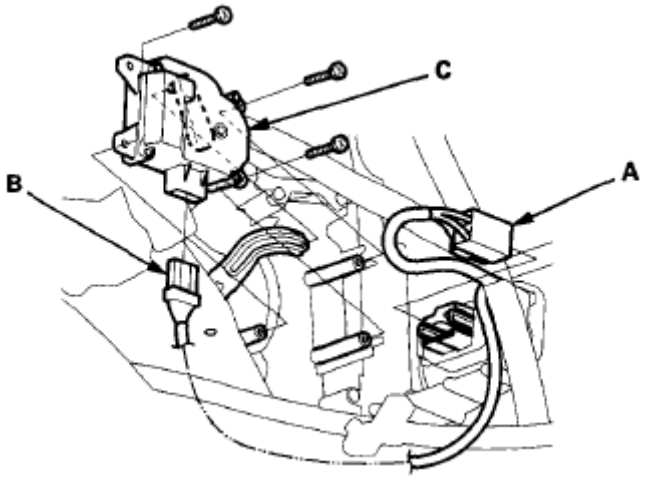

Fig. 207: Identifying Connectors And Passenger's Air Mix Control Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

DRIVER'S MODE CONTROL MOTOR REPLACEMENT

1. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
2. Disconnect the 7P connector (A) from the driver's mode control motor (B). Remove the self-tapping screws and the driver's mode control motor from the heater unit.

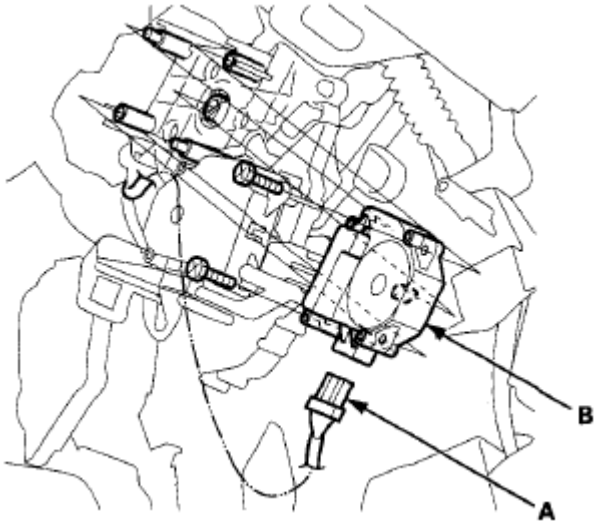

Fig. 208: Identifying Connector And Driver's Mode Control Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

PASSENGER'S MODE CONTROL MOTOR REPLACEMENT

REMOVAL

NOTE: Set the passenger's side climate control to the VENT position before removing the motor.

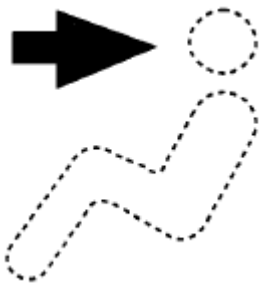

Fig. 209: Setting Passenger's Side Climate Control To Vent Position Before Removing Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

1. Remove the passenger's dashboard undercover (see **GLOVE BOX DAMPER REPLACEMENT**).
2. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
3. Remove the glove box frame (see step 4).
4. Release the harness clip (A), then remove the self-tapping screws and the passenger's heater duct (B).

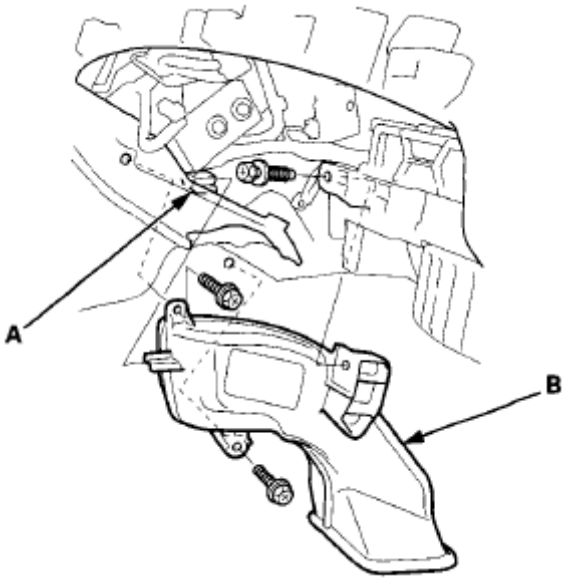

Fig. 210: Identifying Harness Clip And Passenger's Heater Duct
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Disconnect the 7P connector (A) from the passenger's mode control motor (B). Release the wire from its harness clip (C), then remove the self-tapping screws and the passenger's mode control motor from the heater unit.

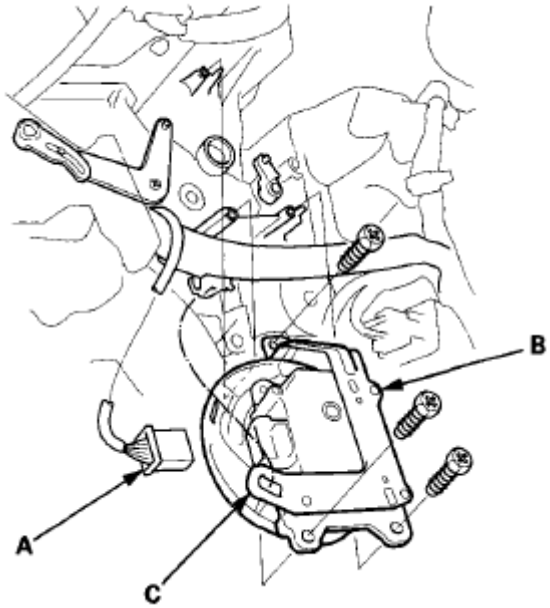

Fig. 211: Identifying Passenger's Mode Control Motor, Connector And Harness Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

1. Release the lock (A), then remove the motor lever (B) from the mode control motor (C).

NOTE: Before installing the mode control motor, plug in the 7P connector, and set the passenger's side climate control mode to VENT. Check that the motor output shaft is lined up as indicated (D).

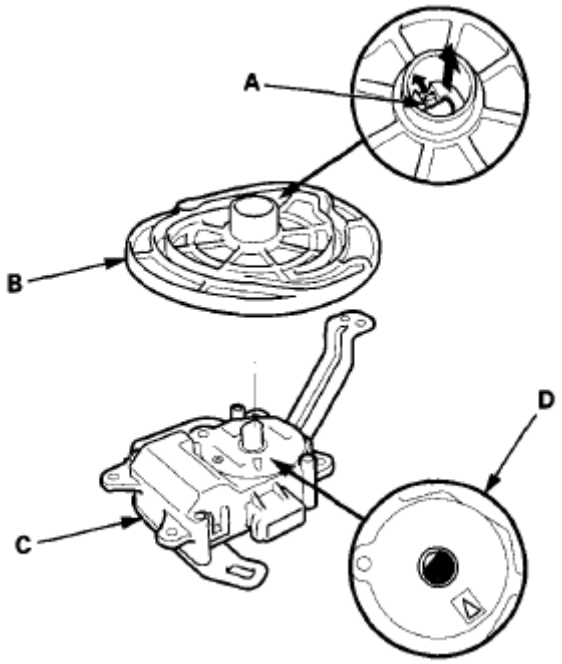

Fig. 212: Identifying Lock, Motor Lever And Mode Control Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Align the position of the damper lever pins (A), then install the motor lever (B).

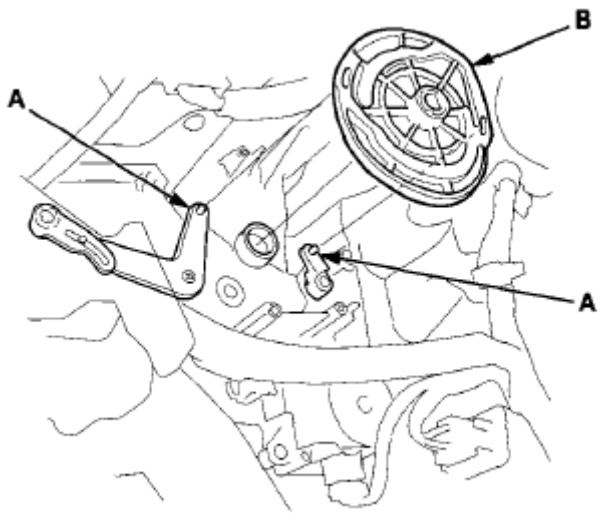

Fig. 213: Identifying Damper Lever Pins And Motor Lever
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Make sure the damper lever pins in the motor lever are visible through the holes.

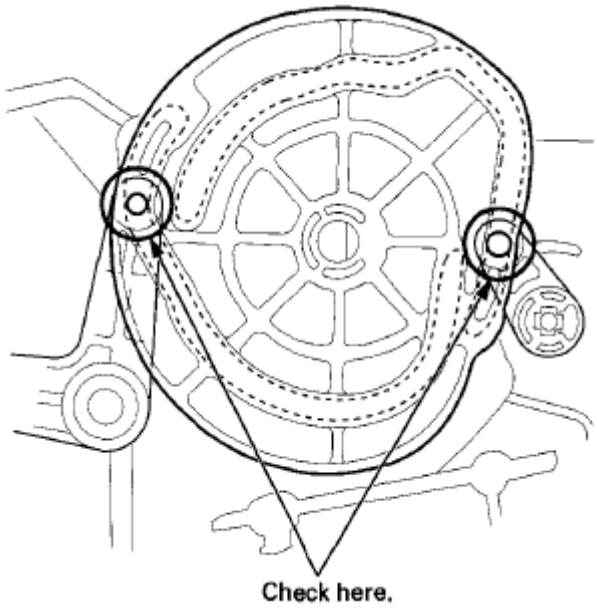

Fig. 214: Checking Damper Level Pins In Motor Lever Through Holes
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the mode control motor (A) while holding the motor lever (B).

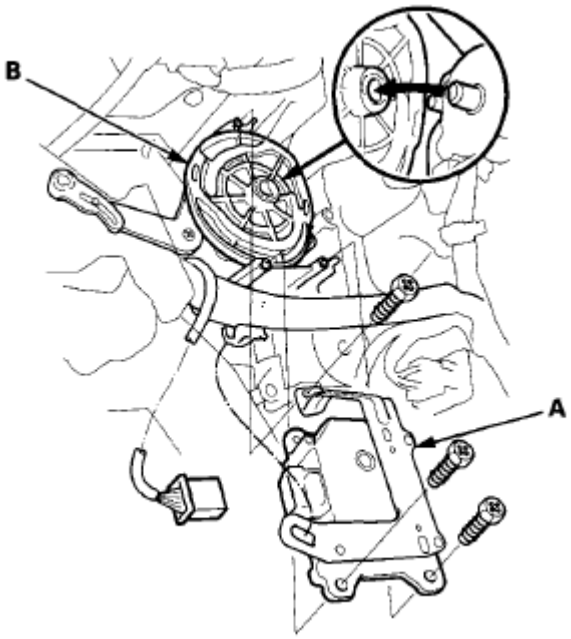

Fig. 215: Identifying Mode Control Motor And Motor Lever
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. After installation, make sure the motor runs smoothly.

RECIRCULATION CONTROL MOTOR REPLACEMENT

REMOVAL

1. Remove the passenger's dashboard undercover (see **GLOVE BOX DAMPER REPLACEMENT**).
2. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
3. Remove the climate control unit (see **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION**).
4. Disconnect the 7P connector (A) from the recirculation control motor (B). Remove the self-tapping screws and the recirculation control motor from the blower unit.

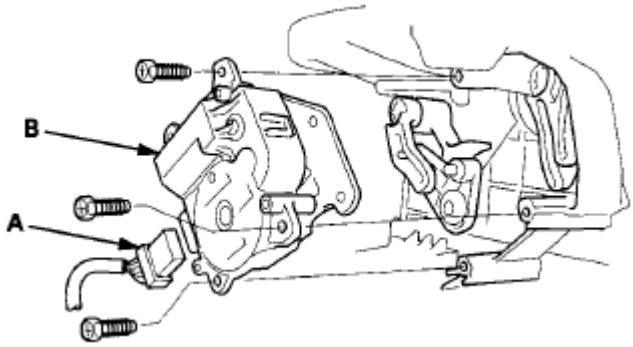

Fig. 216: Identifying 7P Connector And Recirculation Control Motor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

1. Make sure the damper lever pins in the motor lever are visible through the holes.

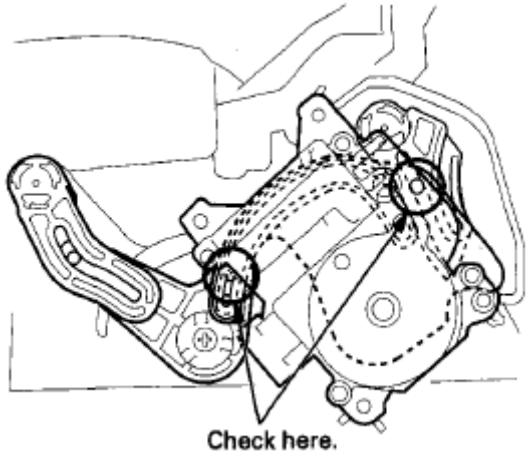

Fig. 217: Checking Damper Lever Pins In Motor Lever Through Holes
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. While holding the recirculation control motor (A), install the self-tapping screws and connect the 7P connector (B).

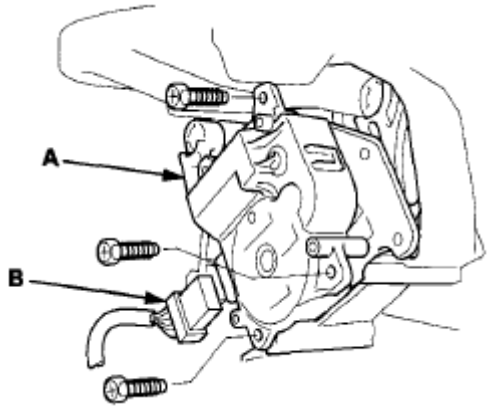

Fig. 218: Identifying Recirculation Control Motor And 7P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Reinstall the climate control unit.
4. After installation, make sure the motor runs smoothly.

HUMIDITY/IN-CAR TEMPERATURE SENSOR REPLACEMENT

1. Remove these items:
   - Driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**)
   - Remote slot (with keyless access system) (see **REMOTE SLOT TEST/REPLACEMENT**)
2. Disconnect the air hose from the heater unit (see step 2). Keep grip on air hose while doing following procedures to assist in removal of sensor.
3. Disconnect the connector (A) from the humidity/in-car temperature sensor (B).

View from top

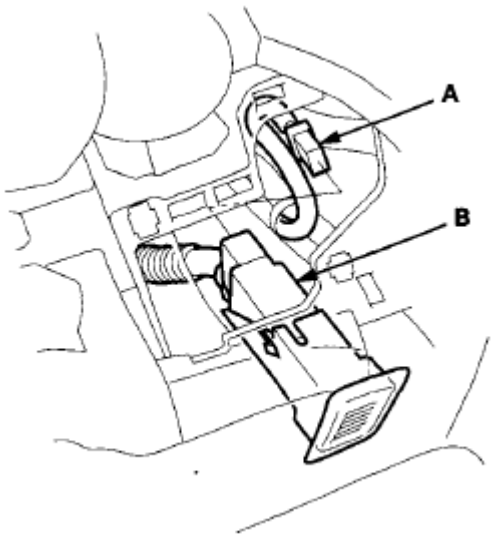

Fig. 219: Identifying Connector And Temperature Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Unhook the left lock tab (A) of the humidity/in-car temperature sensor by pushing your thumb (B) between the sensor and tab (C).

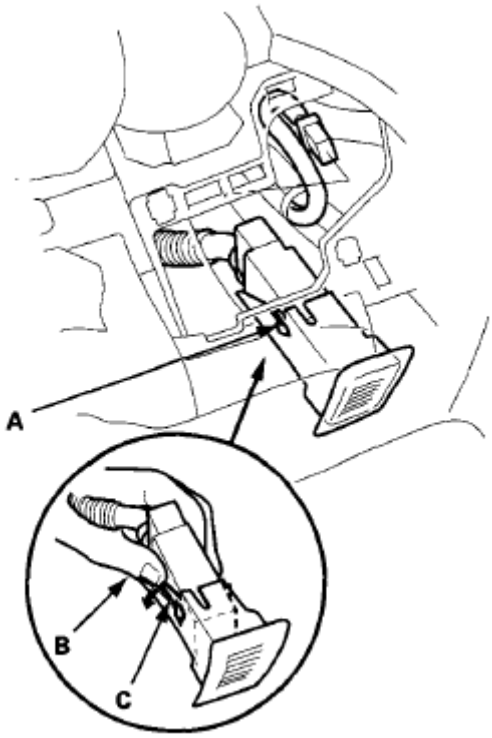

Fig. 220: Identifying Lock Tab, Temperature Sensor Thumb And Tab
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Pull sensor toward steering column to unlock right lock tab (A). Maintain the pressure with thumb to keep left tab unlocked while unhooking right lock tab then pull out the sensor.

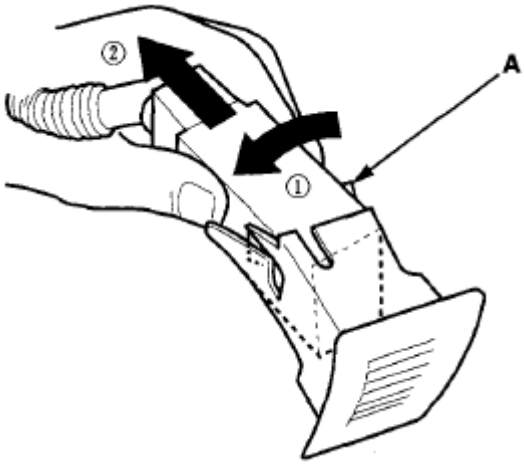

Fig. 221: Pulling Sensor Toward Steering Column To Unlock Right Lock Tab
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the sensor in the reverse order of removal.

OUTSIDE AIR TEMPERATURE SENSOR REPLACEMENT

1. From behind the bumper, disconnect the 2P connector (A). Detach the clip and remove the outside air temperature sensor (B).

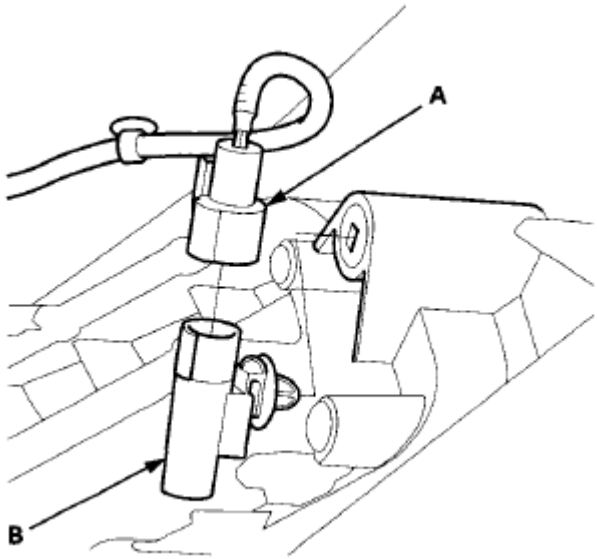

Fig. 222: Identifying 2P Connector And Outside Air Temperature Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the sensor in the reverse order of removal.

SUNLIGHT SENSOR REPLACEMENT

1. Remove the center speaker lid (see **FRONT CENTER SPEAKER**).
2. Push out the sunlight sensor (A) from the speaker lid, then disconnect the connector (B). Be careful not to damage the sensor or the dashboard.

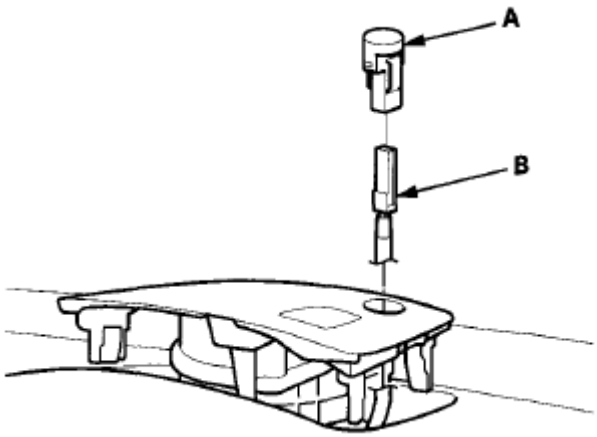

Fig. 223: Identifying Sunlight Sensor And Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the sensor in the reverse order of removal.

EVAPORATOR TEMPERATURE SENSOR REPLACEMENT

1. Remove the driver's dashboard undercover (see **GLOVE BOX DAMPER REPLACEMENT**).
2. Disconnect the 2P connector (A) from the evaporator temperature sensor (B) by pressing the lock tab toward the evaporator housing, and remove the connector clip (C). Remove the self-tapping screw and the evaporator temperature sensor.

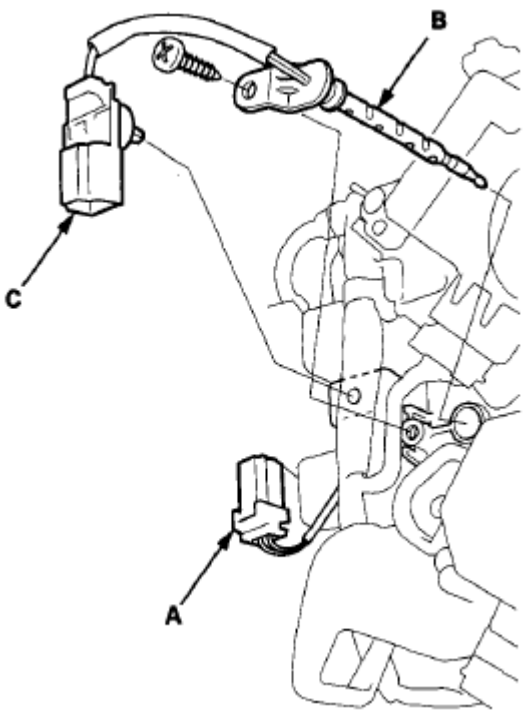

Fig. 224: Identifying 2P Connector, Evaporator Temperature Sensor And Connector Clip

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the sensor in the reverse order of removal.

CLIMATE CONTROL UNIT REMOVAL/INSTALLATION

1. Remove the passenger's dashboard undercover (see **GLOVE BOX DAMPER REPLACEMENT**).
2. Disconnect the connectors (A). Remove the bolts (B) and the climate control unit (C).

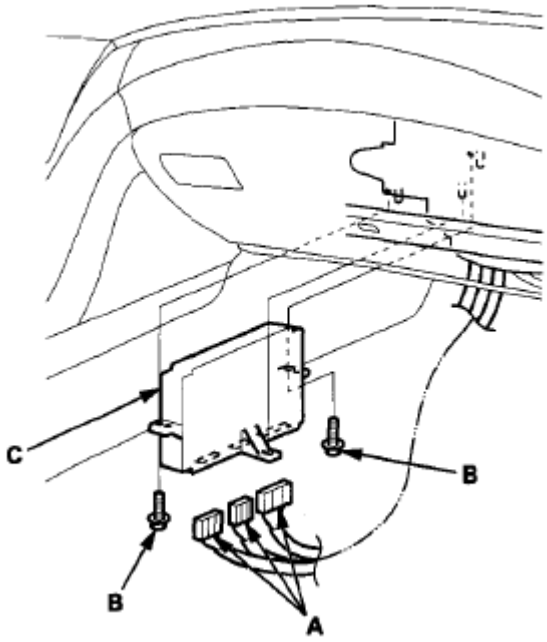

Fig. 225: Identifying Connectors, Bolts And Climate Control Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the climate control unit in the reverse order of removal. After installation, operate the various functions to make sure they work properly.
4. Run the self-diagnostic function to confirm that there are no problems in the system (see **HOW TO USE THE SELF-DIAGNOSTIC FUNCTION WITH THE HDS**).

CLIMATE CONTROL SWITCH REMOVAL/INSTALLATION

1. Remove the audio-navigation unit (with navigation) (see **AUDIO-NAVIGATION UNIT REMOVAL/INSTALLATION**), or the audio unit (without navigation) (see **AUDIO UNIT REMOVAL/INSTALLATION**).
2. Remove the self-tapping screws and the climate control switches (A).

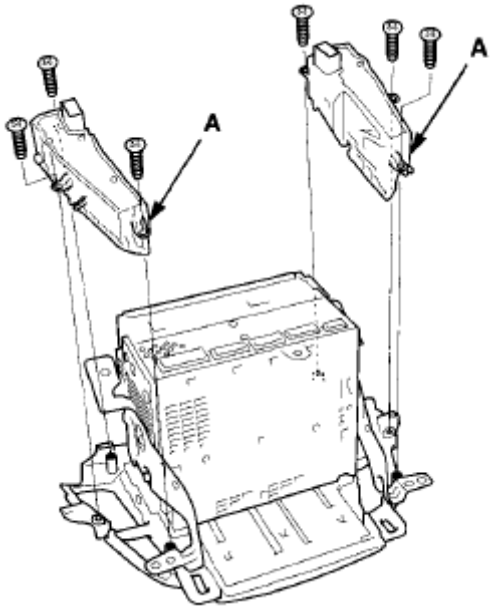

Fig. 226: Identifying Climate Control Switches
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the control switches in the reverse order of removal. After installation, operate the various functions to make sure they work properly.

REFRIGERANT RECOVERY

CAUTION:

- **Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.**
- **Be careful when connecting service equipment.**
- **Do not breathe refrigerant or vapor.**

NOTE:

- **If accidental system discharge occurs, ventilate the work area before resuming service.**
- **Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.**

1. Connect an R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions.

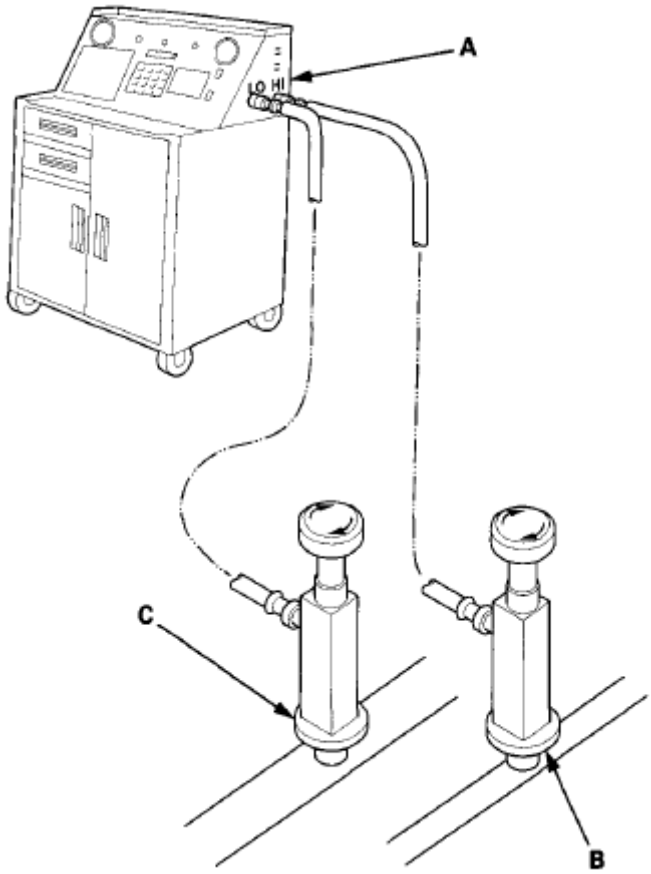

Fig. 227: Identifying R-134A Refrigerant Recovery/Recycling/Charging Station, High-Pressure Service Port And Low-Pressure Service Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the amount of refrigerant oil removed from the A/C system after the recovery process is completed. Be sure to put the same amount of new refrigerant oil back into the A/C system before charging.

SYSTEM EVACUATION

Special Tools Required

Compact Electronic Vacuum Gauge Robinair ROB14777*, commercially available

*Available through the Acura Tool and Equipment Program; call 888-424-6857

CAUTION:
- **Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.**
- **Be careful when connecting service equipment.**
- **Do not breathe refrigerant or vapor.**

NOTE:

- **If accidental system discharge occurs, ventilate the work area before resuming service.**
- **Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.**
- **Do not allow moisture to contaminate the A/C system oil. Moisture in the oil is difficult to remove, and it can damage the A/C compressor.**
- **Using a compact electronic vacuum gauge may decrease the required evacuation time because you can measure actual moisture level with this tool.**

A more efficient way to measure moisture removal is with a special tool called a compact electronic vacuum gauge, measuring vacuum levels in microns.

Connect the tool according to the manufacturers instructions and allow the vacuum pump to run until the gauge reads 500 microns.

Shut off and isolate the vacuum pump, then observe the gauge reading:

- If the vacuum level remains stable for at least three minutes, all moisture in the system has been removed.
- A slow increase in the micron reading means there is still moisture boiling out of the system. Restart the vacuum pump and continue evacuating.
- A quick increase of micron levels indicates a leak is present in the system or your service equipment. Determine the cause and correct the leak before continuing.

1. When an A/C System has been opened to the atmosphere, such as during installation or repair, it must be evacuated using an R-134a refrigerant recovery/recycling/charging station. If the system has been open for several days, replace the receiver/dryer, drain the refrigerant oil, and add fresh oil (see **A/C SYSTEM INSPECTION**). then evacuate the system for several hours before charging it.
2. Connect an R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions.

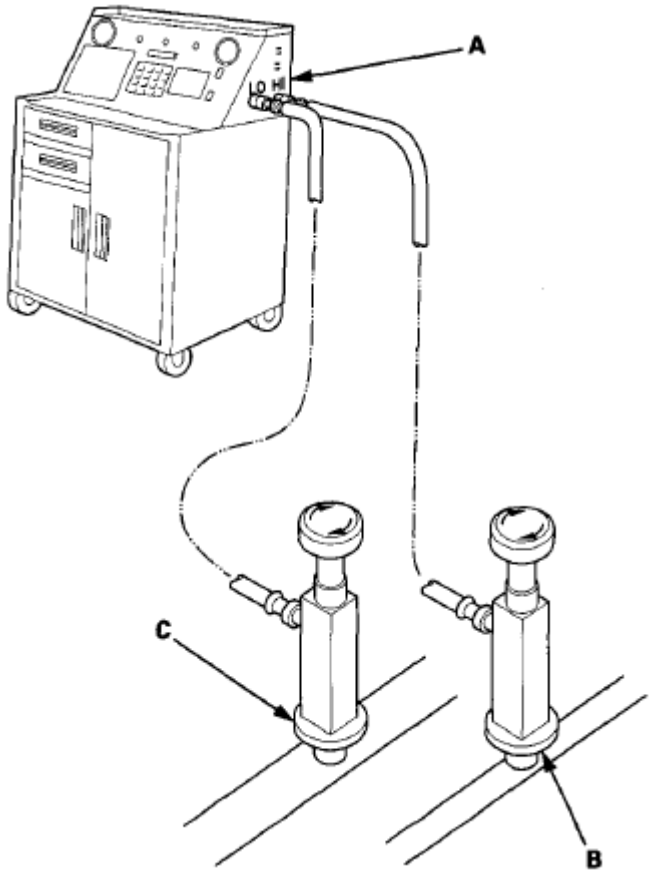

Fig. 228: Identifying R-134A Refrigerant Recovery/Recycling/Charging Station, High-Pressure Service Port And Low-Pressure Service Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Evacuate the system. The vacuum pump should run for a minimum of 30 minutes to eliminate all moisture from the system. When the suction gauge reads -93.3 kPa (-700 mmHg, -27.6 inHg) for at least 30 minutes, close all valves, and turn off the vacuum pump.
4. If the suction gauge does not reach approximately -93.3 kPa (-700 mmHg, -27.6 inHg) in 15 minutes, there is probably a large leak in the system. Partially charge the system, and check for leaks (see **REFRIGERANT LEAK CHECK**).

SYSTEM CHARGING

CAUTION:
- **Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.**
- **Be careful when connecting service equipment.**
- **Do not breathe refrigerant or vapor.**

NOTE:
- **If accidental system discharge occurs, ventilate the work area before resuming service.**

- **Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.**

1. Connect an R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions.

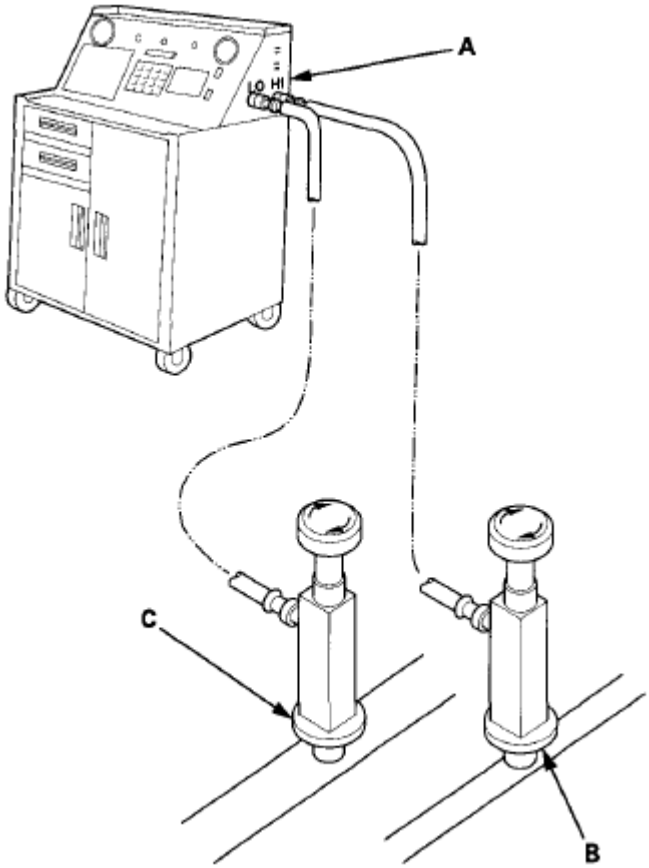

Fig. 229: Identifying R-134A Refrigerant Recovery/Recycling/Charging Station, High-Pressure Service Port And Low-Pressure Service Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Recover the refrigerant in the A/C system (see **REFRIGERANT RECOVERY**).
3. Evacuate the system (see **SYSTEM EVACUATION**). If the system cannot reach a vacuum of -93.3 kPa (-700 mmHg, -27.6 inHg) in 15 minutes, or cannot hold a vacuum for at least 15 minutes, there is probably a large leak. Do the refrigerant leak check (see **REFRIGERANT LEAK CHECK**), and repair any leaks before charging the system.
4. Add the same amount of new refrigerant oil to the system that was removed during recovery. Use only DENSO ND-OIL 8 refrigerant oil.
5. Charge the system with the specified amount of R-134a refrigerant. Do not overcharge the system; the A/C compressor will be damaged.

   Select the appropriate units of measure for your refrigerant charging station.

Refrigerant Capacity:

505 to 555 g

17.8 to 19.6 oz

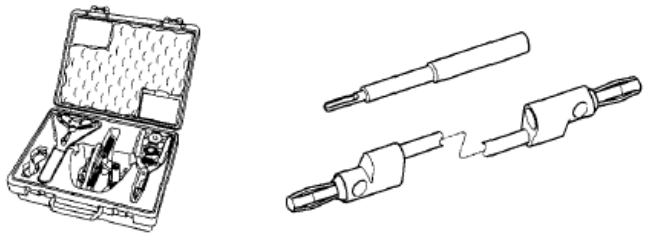
0.505 to 0.555 kg

1.11 to 1.22 lbs

6. Check for refrigerant leaks (see **REFRIGERANT LEAK CHECK**).
7. Check the system performance (see **PERFORMANCE TEST**).

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) (If body electrical maintenance is required)

The Acura TL SRS includes a driver's airbag in the steering wheel hub, a front passenger's airbag in the dashboard above the glove box, front seat belt tensioners in the front seat belt retractors, side curtain airbags in the sides of the roof, and side airbags in the front seat-backs. Information necessary to safely service the SRS is included in this Service Information. Servicing, disassembling, or replacing SRS items requires special precautions and tools, and should be done by an authorized Acura dealer.



- To avoid rendering the SRS inoperative, which could lead to personal injury or death in the event of a severe frontal or side collision, all SRS service work should be done by an authorized Acura dealer.
- Improper service procedures, including incorrect removal and installation of the SRS, could lead to personal injury caused by unintentional deployment of the front airbags, side airbags, side curtain airbags, and/or front seat belt tensioners.
- Do not bump or impact the SRS unit, front impact sensors, side impact sensors, or rear safing sensor, especially when the ignition switch is in ON (II), or the engine start/stop button is in the ON mode, for at least 3 minutes after the ignition switch is turned to LOCK (0), or after the engine start/stop button is pressed to select the OFF mode; otherwise, the system may fail in a collision, or the airbags or the tensioners may deploy.
- SRS electrical connectors are identified by yellow color coding. Related components are located in the steering column, center console, dashboard, dashboard undercover, in the dashboard above the glove box, in the front seats, in the roof side, and around the floor. Do not use electrical test equipment on these circuits.

CONTROL UNIT INPUT TEST

NOTE: Before testing, troubleshoot the multiplex integrated control system first, using B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

Driver's MICU

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
3. Disconnect driver's under-dash fuse/relay box connectors D, P, Q, and R.

NOTE: All connector views are wire side of female terminals.

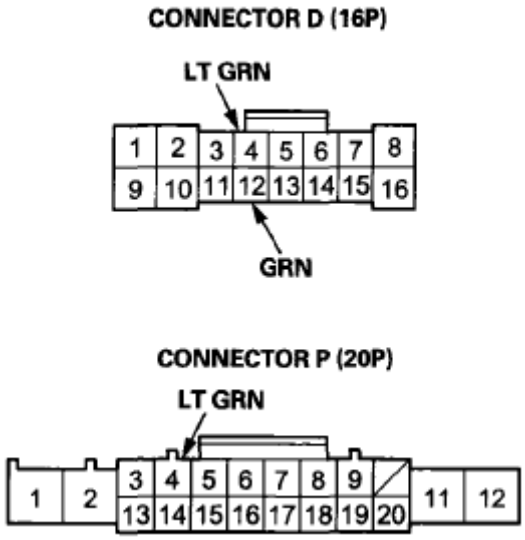

Fig. 5: Under-Dash Fuse/Relay Box D (16P) & P (20P) Connector End Views
Courtesy of AMERICAN HONDA MOTOR CO., INC.

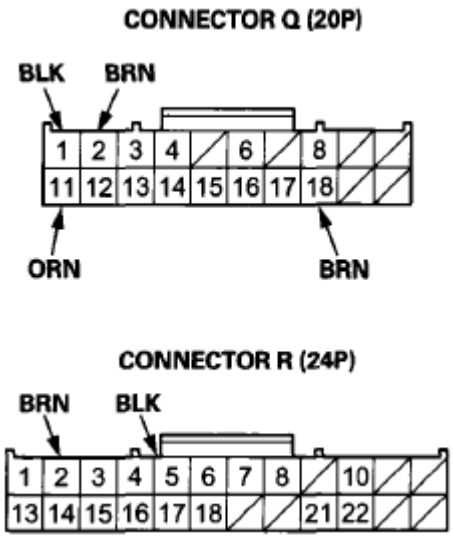

Fig. 6: Under-Dash Fuse/Relay Box Q (20P) & R (24P) Connector End Views
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.

- If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
- If the terminals look OK, go to step 5.

5. Reconnect the connectors to the driver's under-dash fuse/relay box, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 6.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
Q1	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G402) • An open or high resistance in the ground wire
Q2	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
R2	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
R5	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G402) • An open or high resistance in the ground wire
D4	LT GRN	Left rear door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty left rear door switch • Faulty left rear door switch ground • An open or high resistance in the wire
		Left rear door closed	Measure the voltage to ground: There should be about 5 V.	• Faulty left rear door switch • A short to ground in the wire
D12	GRN	Driver's door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driver's door switch • Faulty driver's door switch ground • An open or high resistance in the wire

		Driver's door closed	Measure the voltage to ground: There should be about 5 V.	• Faulty driver's door switch • A short to ground in the wire
P4	LT GRN	Interior light switch in the DOOR position	Connect to ground with a jumper wire: The individual map lights should come on.	• Blown No. 16 (7.5 A) fuse in the under-hood fuse/relay box • Faulty front and/or rear individual map lights • An open or high resistance in the wire
Q11(1)	ORN	Under all conditions	Connect to ground with a jumper wire: The remote slot light should come on.	• Blown No. 12 (10 A) fuse in the passenger's under-dash fuse/relay box • Faulty remote slot light • An open or high resistance in the wire
Q11(2)	ORN	Under all conditions	Connect to ground with a jumper wire: The ignition key light should come on.	• Blown No. 16 (7.5 A) fuse in the under-hood fuse/relay box • Faulty ignition key light • An open or high resistance in the wire
Q18(1)	BRN	Remote key inserted into the remote slot	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty remote slot • Faulty power control unit • Poor ground (G402) or an open in the ground wire • An open or high resistance in the wire
		Remote key removed from the remote slot	Measure the voltage to ground: There should be about 5 V.	• Faulty remote slot • Faulty power control unit • A short to ground in the wire
Q18(2)	BRN	Ignition key inserted into the ignition switch	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty ignition key switch • Poor ground (G403) or an open in the ground wire • An open or high resistance in the wire
		Ignition switch. LOCK (0), and the ignition key removed from the ignition	Measure the voltage to ground: There should be	• Faulty ignition key switch • A short to ground in the

		switch	about 5 V.	wire

(1) With keyless access system

(2) With keyless access system

Passenger's MICU

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Remove the right kick panel (see **TRIM REMOVAL/INSTALLATION - DOOR AREAS**).
8. Disconnect passenger's under-dash fuse/relay box connectors A, E, and G*1 (or H*2).

*1: Without SH-AWD

*2: With SH-AWD

NOTE: All connector views are wire side of female terminals.

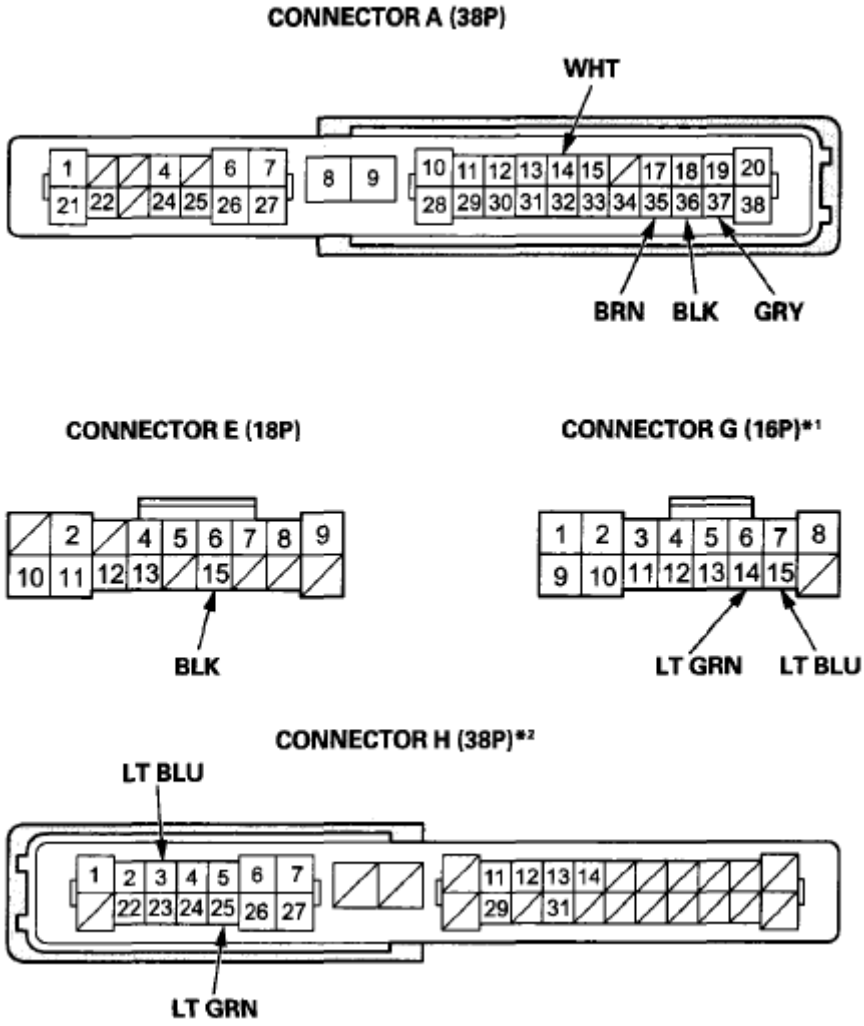

Fig. 7: A (38P), E (18P), G (16P) & H (38P) Connector End Views

		Right rear door closed	Measure the voltage to ground: There should be about 5 V.	• Faulty right rear door switch • A short to ground in the wire
G15(1) or H3(2)	LT BLU	Front passenger's door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty front passenger's door switch • Faulty front passenger's door switch ground • An open or high resistance in the wire
		Front passenger's door closed	Measure the voltage to ground: There should be about 5 V.	• Faulty front passenger's door switch • A short to ground in the wire
(1) Without SH-AWD (2) With SH-AWD				

Door Multiplex Control Unit

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Remove the driver's door panel (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**).
13. Disconnect the 37P connector from the power window master switch.

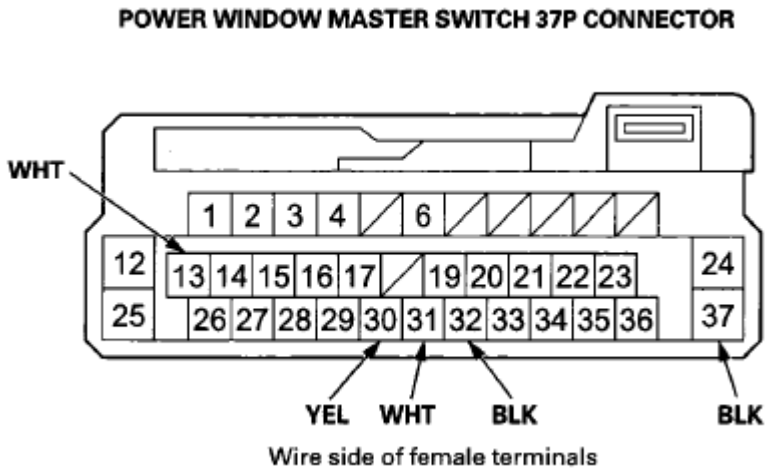

Fig. 8: Power Window Master Switch 37P Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Inspect the connector and socket terminals to be sure they are all making good contact.
    - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.

- If the terminals look OK, go to step 16.

15. Reconnect the driver's door harness to driver's door subharness.
16. Reconnect the 37P connector to the power window master switch, and do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 17.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
13	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
32	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
37	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G402) • An open or high resistance in the ground wire
30	YEL	Driver's door lock knob switch in LOCK	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driver's door lock knob switch • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Driver's door lock knob switch in UNLOCK	Measure the voltage to ground: There should be battery voltage.	• Faulty driver's door lock knob switch • A short to ground in the wire
31	WHT	Driver's door lock knob switch in UNLOCK	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driver's door lock knob switch • Poor ground (G401) or an open in the ground wire • An open or high resistance in the wire
		Driver's door lock knob switch in LOCK	Measure the voltage to ground: There should be battery voltage.	• Faulty driver's door lock knob switch • A short to ground in the

				wire

17. If multiple failures are found on more than one control unit, replace the driver's under-dash fuse/relay box (includes the driver's MICU) (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**). If input failures are related to a particular control unit, replace the control unit.

IGNITION KEY SWITCH TEST

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Remove the steering column upper and lower covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
2. Disconnect the 6P connector (A).

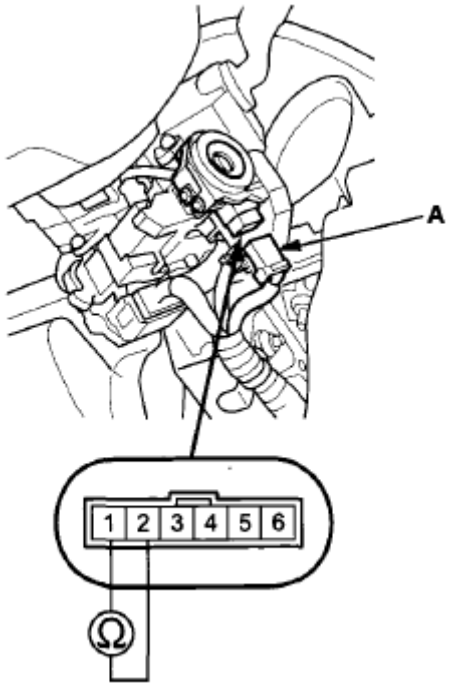

Fig. 9: Checking Continuity Between Terminals No. 1 And No. 2.
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between terminals No. 1 and No. 2.
   - There should be continuity with the key in the ignition switch.
   - There should be no continuity with the key removed.
4. If the continuity is not as specified, the ignition key switch is faulty; replace the steering lock (see **STEERING LOCK REPLACEMENT**).

IGNITION KEY LIGHT TEST

NOTE: SRS components are located in this area. Review the SRS component locations (see COMPONENT LOCATION INDEX), and precautions and procedures (see PRECAUTIONS AND PROCEDURES) before doing repairs or servicing.

1. Remove the steering column upper and lower covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
2. Disconnect the 6P connector (A).

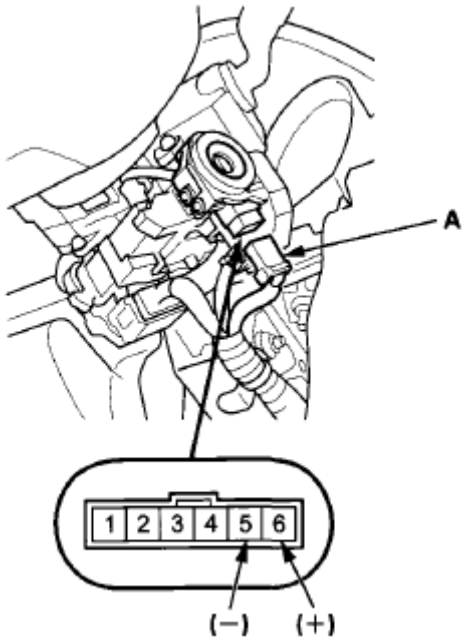

Fig. 10: Checking Ignition Key Light
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. The LED should come on when power is connected to terminal No. 6 and ground is connected to terminal No. 5.
4. If the LED does not come on, the ignition key light is faulty; replace the steering lock (see **STEERING LOCK REPLACEMENT**).

REMOTE SLOT LIGHT TEST

1. Remove the column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
2. Remove the driver's center trim (see **DASHBOARD CENTER TRIM REMOVAL/INSTALLATION**).
3. Remove the two screws, then pull out the remote slot (A).

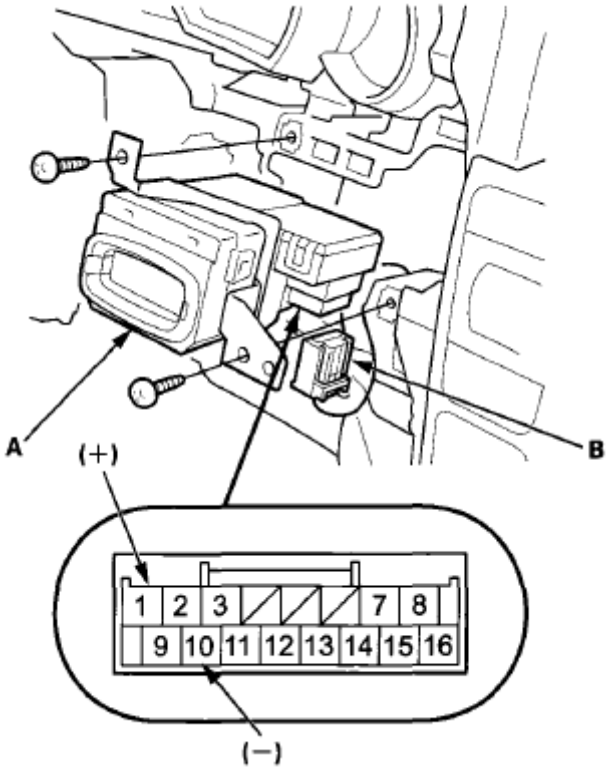

Fig. 11: Checking Remote Slot Light
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the 16P connector (B) from the remote slot.
5. The LED should come on when power is connected to terminal No. 1 and ground is connected to terminal No. 10.
6. The LED does not come on, the remote slot light is faulty; replace the remote slot control unit.

SYSTEM DESCRIPTION

HEADLIGHTS SYSTEM DESCRIPTION

The headlight system is composed of the driver's MICU, the passenger's MICU, the headlight and dimmer/flash-to-pass switches (inside the combination light switch), the left and right headlights, and the high beam indicator.

Each MICU controls each side of the front parking/side marker light and headlights. The taillights, rear side

marker lights, and license plate lights, the back-up lights and the turn signal/hazard lights are controlled by the driver's MICU.

Low Beams

When you move the headlight switch to the ON position and the dimmer/flash-to-pass switch to the low position, a ground signal is supplied to terminal No. 8 of driver's under-dash fuse/relay box connector R (24P). The driver's MICU then energizes the low beam control circuit, supplying battery voltage to the low beam of the left headlight, turning it on. Also the driver's MICU sends the message to the passenger's MICU via the B-CAN communication lines. The passenger's MICU then energizes the low beam control circuit, supplying battery voltage to the low beam of the right headlight, turning it on.

NOTE: If there is a B-CAN communication failure, the headlight back-up circuit commands the right low beam to come on when the ignition is on and the headlight switch is in the ON position. The right high beam does not come on if there is a B-CAN system failure.

High Beams

When you turn the headlight switch to the ON position and the dimmer/flash-to-pass switch to the high position, ground signals are supplied to terminals No. 8 and No. 22 of driver's under-dash fuse/relay box (driver's MICU) connector R (24P). The driver's and passenger's MICUs then energize the each side of the high beam headlight control circuits, supplying battery voltage to the high beam headlights, turning them on.

Flash-to-Pass

When you pull the dimmer/flash-to-pass switch to the passing position, a ground signal is supplied to terminal No. 21 of driver's under-dash fuse/relay box (MICU) connector R (24P). The driver's and passenger's MICUs then energize the high beam control circuits for as long as the switch is held, supplying battery voltage to the high beam headlights, turning them on.

DAYTIME RUNNING LIGHTS SYSTEM DESCRIPTION

The daytime running lights system includes the driver's and passenger's MICUs, the left and right high beam headlights, the parking brake switch, and the DRL indication on the multi-information display (MID). The daytime running lights operate with the ignition switch turned to ON (II), or the engine start/stop button is pressed to select the ON mode, the headlights off (headlight switch OFF or in the parking position), and the parking brake released.

When the daytime running lights are on, the driver's and passenger's MICUs turn each relative daytime running light circuit on and off (duty cycle), which provides a reduced voltage (approximately 6-8 volts) to the high beam headlights (via the No. 1 and No. 28 fuses in the driver's under-dash fuse/relay box and No. 1 fuse in the passenger's under-dash fuse/relay box); the high beam headlights come on with reduced brightness. The MICUs also send signals to the gauge control module, and the DRL indication is indicated by the high beam indicator glowing dimly.

NOTE:

- **The daytime running lights are disabled when the ignition switch is turned**

to LOCK (0), or the engine start/stop button is pressed to select the OFF mode. To keep the daytime running lights from coming on, apply the parking brake switch while the ignition switch is in LOCK (0) position, or the vehicle is in OFF mode. When you then turn the ignition switch back to ON (II), or press the engine start/stop button to select the ON mode, the daytime running lights will not come on until the parking brake is released.

- **The headlights revert to normal operation when you turn them on with the headlight switch.**

DTC TROUBLESHOOTING

DTC B10CF: LEFT DAYTIME RUNNING LIGHTS CIRCUIT MALFUNCTION

NOTE:

- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-**

CAN SYSTEM DIAGNOSIS TEST MODE A).

- **Make sure the No. 15 (7.5 A) fuse in the driver's under-dash fuse/relay box is OK.**

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
3. Release the parking brake lever.
4. Turn the headlight switch OFF.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

   Is DTC B10CF indicated?

   YES -Go to step 6.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

6. Turn the headlight high beam ON.

   Does the left headlight (high beam) come on?

   YES -Go to step 7.

   NO -Go to step 9.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Measure the voltage between body ground and driver's under-dash fuse/relay box connector Q (20P) terminals No. 1 and No. 2, and between body ground and connector R (24P) terminals No. 2 and No. 5 individually.

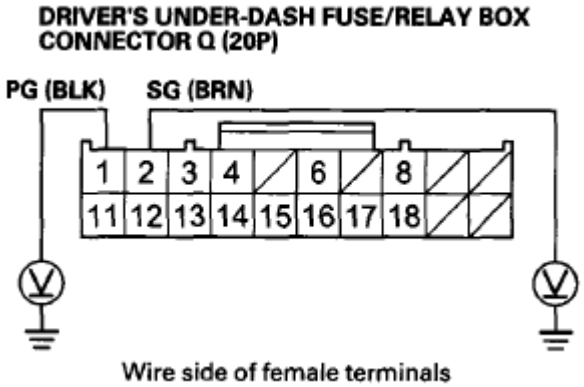

Fig. 10: Measuring Voltage Between Body Ground And Driver's Under-Dash Fuse/Relay Box Connector Q (20P) Terminals No. 1 And No. 2 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

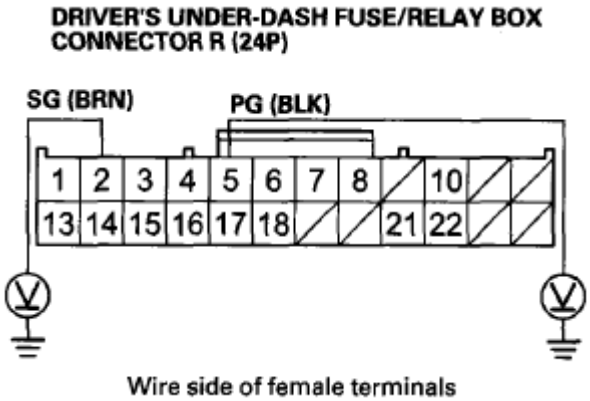

Fig. 11: Measuring Voltage Between Body Ground And Driver's Under-Dash Fuse/Relay Box Connector R (24P) Terminals No. 2 And No. 5 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO -Repair an open or high resistance in the wire or poor ground (G401, G402).

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Turn the headlight switch OFF.
11. Check the No. 28 (10 A) fuse in the driver's under-dash fuse/relay box.

    Is the fuse OK?

    YES -Go to step 12.

    NO -Replace the fuse. If the fuse blows again, repair the short to ground on the No. 28 (10 A) fuse circuit.

12. Check the left headlight bulb.

    Is the bulb OK?

    YES -Go to step 13.

    NO -Replace the bulb and recheck.

13. Disconnect driver's under-dash fuse/relay box connector F (33P).
14. Disconnect the left headlight (high beam) 2P connector.
15. Check for continuity between driver's under-dash fuse/relay box connector F (33P) terminal No. 13 and left headlight (high beam) 2P connector terminal No. 2.

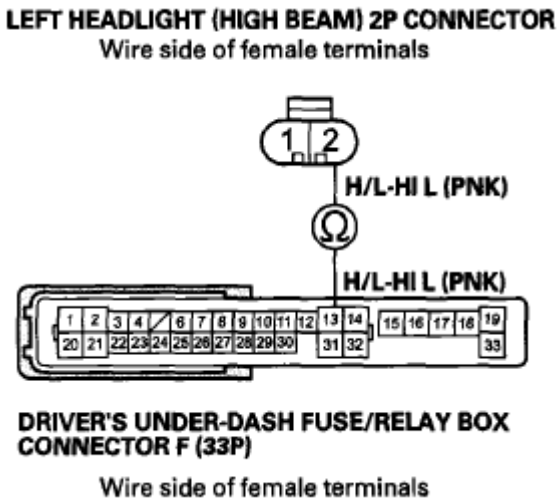

Fig. 12: Checking Continuity Between Driver's Under-Dash Fuse/Relay Box Connector F (33P) Terminal No. 13 And Left Headlight (High Beam) 2P Connector Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 16.

NO -Repair an open or high resistance in the wire.

16. Check for continuity between left headlight (high beam) 2P connector terminal No. 1 and body ground.

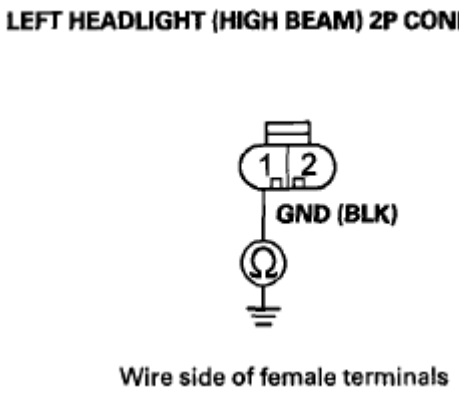

Fig. 13: Checking Continuity Between Left Headlight (High Beam) 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO -Repair an open or high resistance in the wire or poor ground (G302).

DTC B11CF: RIGHT DAYTIME RUNNING LIGHTS CIRCUIT MALFUNCTION

NOTE:

- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **Make sure the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box is OK.**

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
3. Release the parking brake lever.
4. Turn the headlight switch OFF.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

   Is DTC B11CF indicated?

   YES -Go to step 6.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

6. Turn the headlight high beam ON.

   Does the right headlight (high beam) come on?

   YES -Go to step 7.

   NO -Go to step 9.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Measure the voltage between body ground and passenger's under-dash fuse/relay box connector A (38P) terminals No. 36 and No. 37, and between body ground and passenger's under-dash fuse/relay box connector E (18P) terminals No. 15 individually.

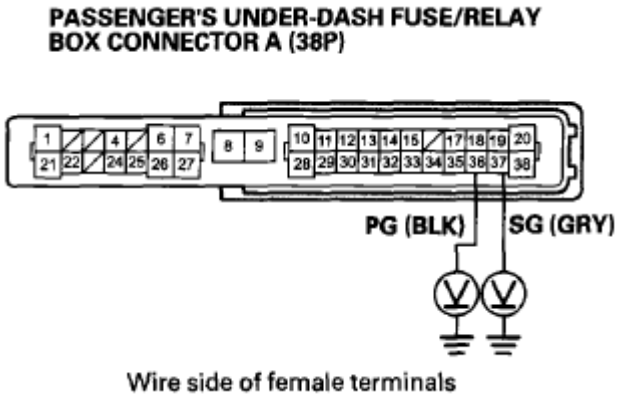

Fig. 14: Measuring Voltage Between Body Ground And Passenger's Under-Dash Fuse/Relay Box Connector A (38P) Terminals No. 36 And No. 37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

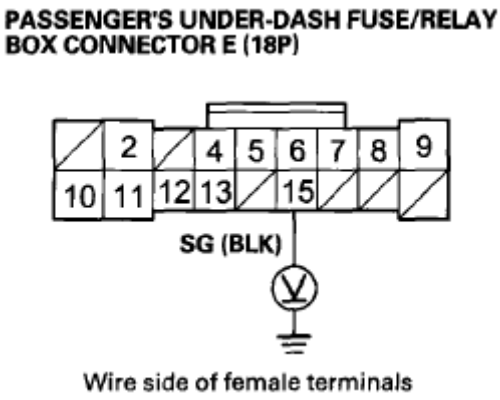

Fig. 15: Measuring Voltage Between Body Ground And Passenger's Under-Dash Fuse/Relay Box Connector E (18P) Terminals No. 15
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.2 V?

YES -Faulty passenger's MICU; replace the passenger's under-dash fuse/relay box (see **PASSENGER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO -Repair an open or high resistance in the wire or poor ground (G203, G401, G405).

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Turn the headlight switch OFF.
11. Check the No. 1 (10 A) fuse in the passenger's under-dash fuse/relay box.

Is the fuse OK?

YES -Go to step 12.

NO -Replace the fuse. If the fuse blows again, repair the short to ground on the No. 1 (10 A) fuse circuit.

12. Check the right headlight bulb.

    Is the bulb OK?

    YES -Go to step 13.

    NO -Replace the bulb and recheck.

13. Disconnect passenger's under-dash fuse/relay box connector E (18P).
14. Disconnect the right headlight (high beam) 2P connector.
15. Check for continuity between passenger's under-dash fuse/relay box connector E (18P) terminal No. 2 and right headlight (high beam) 2P connector terminal No. 2.

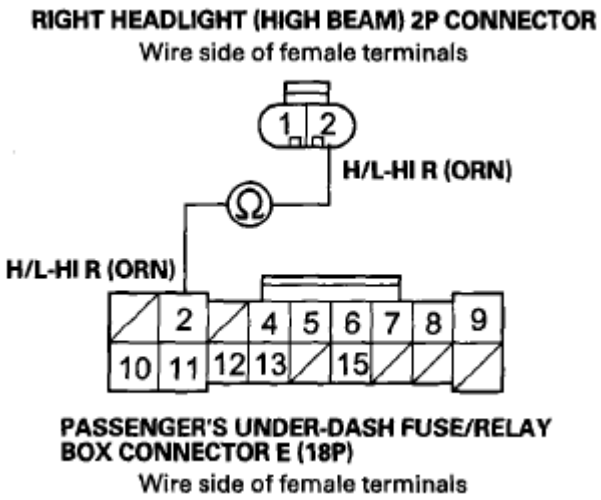

Fig. 16: Checking Continuity Between Passenger's Under-Dash Fuse/Relay Box Connector E (18P) Terminal No. 2 And Right Headlight (High Beam) 2P Connector Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 16.

NO -Repair an open or high resistance in the wire.

16. Check for continuity between right headlight (high beam) 2P connector terminal No. 1 and body ground.

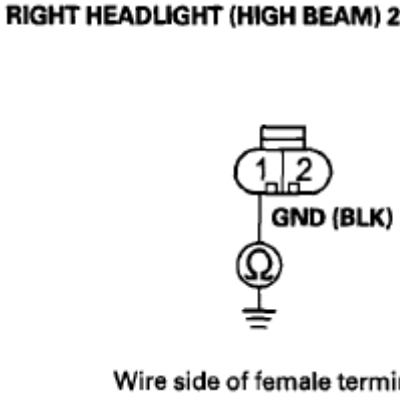

Fig. 17: Checking Continuity Between Right Headlight (High Beam) 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Faulty passenger's MICU; replace the passenger's under-dash fuse/relay box (see **PASSENGER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO -Repair an open or high resistance in the wire or poor ground (G203).

DTC B1275: HEADLIGHT SWITCH OFF POSITION CIRCUIT MALFUNCTION; DTC B1276: HEADLIGHT SWITCH PARKING POSITION CIRCUIT MALFUNCTION; DTC B1277: HEADLIGHT AUTO POSITION CIRCUIT MALFUNCTION; DTC B1278: HEADLIGHT ON POSITION CIRCUIT MALFUNCTION

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then ON mode.
3. Turn the combination light switch to the PARKING, AUTO, and ON (low beam) positions for 6 seconds in each position, and then to the OFF position.
4. Check for DTCs with the HDS.

   Are DTCs B1275, B1276, B1277, and/or B1278 indicated?

   YES -Go to step 5.

   NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Select LIGHTING from the BODY ELECTRICAL SYSTEM SELECT menu, and enter DATA LIST.

6. Check each combination light switch position value with the DATA LIST menu.

WHEN COMBINATION LIGHT SWITCH IS TURNED OFF

Data List	Value
Headlight Switch (OFF)	ON
Headlight Switch (PARKING)	OFF
Headlight Switch (AUTO)	OFF
Headlight Switch (HEADLIGHT)	OFF

WHEN COMBINATION LIGHT SWITCH IS TURNED TO PARKING LIGHT

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (PARKING)	ON
Headlight Switch (AUTO)	OFF
Headlight Switch (HEADLIGHT)	OFF

WHEN COMBINATION LIGHT SWITCH IS TURNED TO AUTO

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (PARKING)	OFF
Headlight Switch (AUTO)	ON
Headlight Switch (HEADLIGHT)	OFF

WHEN COMBINATION LIGHT SWITCH IS TURNED ON (HEADLIGHT)

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (PARKING)	ON
Headlight Switch (AUTO)	OFF
Headlight Switch (HEADLIGHT)	ON

Are all data list values correct?

YES -Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO -Go to step 7.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect the combination light switch 12P connector.
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Select LIGHTING from the BODY ELECTRICAL SYSTEM SELECT menu, and enter DATA LIST.
11. Check each combination light switch position value with the DATA LIST menu.

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (PARKING)	OFF
Headlight Switch (AUTO)	OFF
Headlight Switch (HEADLIGHT)	OFF

Are all data list values indicated OFF?

YES -Go to step 15.

NO -Go to step 12.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect driver's under-dash fuse/relay box connector R (24P).
14. Check for continuity between body ground and driver's under-dash fuse/relay box connector R (24P) terminals No. 6, No. 7, and No. 8 individually.

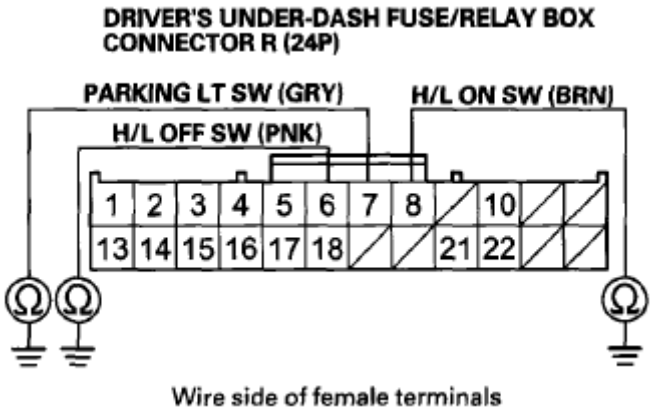

Fig. 18: Checking Continuity Between Body Ground And Driver's Under-Dash Fuse/Relay Box Connector R (24P) Terminals Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

15. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
16. Do the combination light switch test (see **COMBINATION LIGHT SWITCH TEST/REPLACEMENT**).

Is the combination light switch OK?

YES -Go to step 17.

NO -Replace the combination light switch (see **COMBINATION LIGHT SWITCH TEST/REPLACEMENT**).

17. Disconnect driver's under-dash fuse/relay box connector R (24P).
18. Check for continuity between driver's under-dash fuse/relay box connector R (24P) terminals and the combination light switch 12P connector terminals as shown:

Driver's under-dash fuse/relay box connector R (24P)	Combination light switch 12P connector
6 (PNK)	9 (PNK)
8 (BRN)	10 (BRN)
7 (GRY)	11 (GRY)
3 (BLK)	12 (BLK)

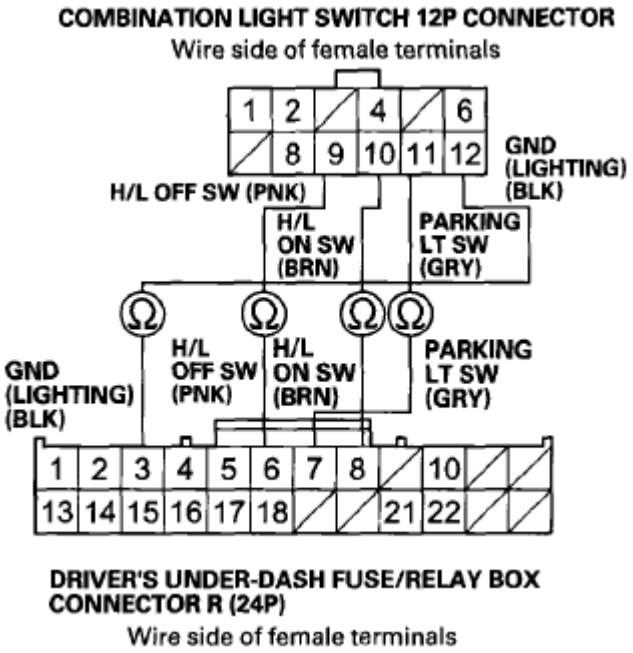

Fig. 19: Checking Continuity Between Driver's Under-Dash Fuse/Relay Box Connector R (24P) Terminals And Combination Light Switch 12P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 19.

NO -Repair an open or high resistance in the wire.

19. Check for continuity between driver's under-dash fuse/relay box connector R (24P) terminals as shown:

From terminal	To terminal
6 (PNK)	7 (GRY) 8 (BRN) 21 (RED) 22(LT BLU)
7 (GRY)	8 (BRN) 21 (RED) 22 (LT BLU)

Is there continuity?

YES -Repair a short between the wires.

NO -Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

DTC B1279: DIMMER SWITCH CIRCUIT MALFUNCTION

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Turn the combination light (headlight) switch ON.
4. Change the dimmer switch from low beam to high beam.
5. Turn the combination light switch OFF, and then to the passing position, and wait for at least 6 seconds.
6. Check for DTCs with the HDS.

Is DTC B1279 indicated?

YES -Go to step 7.

NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

7. Select LIGHTING from the BODY ELECTRICAL SYSTEM SELECT menu, then enter DATA LIST.
8. Check each combination light switch position value with the DATA LIST menu.

WHEN PASSING SWITCH IS OPERATED

Data List	Value
Headlight Switch (PASSING)	ON
Headlight Switch (High beam)	OFF

WHEN HEADLIGHT SWITCH IS TURNED ON, AND DIMMER SWITCH CHANGED FROM LOW BEAM TO HIGH BEAM

Data List	Value
Headlight Switch (PASSING)	OFF
Headlight Switch (High beam)	ON
Headlight Switch (HEADLIGHT)	ON

Are all data list values correct?

YES -Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO -Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect the combination light switch 12P connector.
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
12. Select LIGHTING from the BODY ELECTRICAL SYSTEM SELECT menu, then enter DATA LIST.
13. Check each combination light switch position value with the DATA LIST menu.

Data List	Value
Headlight Switch (PASSING)	OFF
Headlight Switch (High beam)	OFF
Headlight Switch (HEADLIGHT)	OFF

Are all data list values Indicated OFF?

YES -Go to step 17.

NO -Go to step 14.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Disconnect under-dash fuse/relay box connector R (24P).
16. Check for continuity between body ground and driver's under-dash fuse/relay box connector R (24P) terminals No. 8, No. 21, and No. 22 individually.

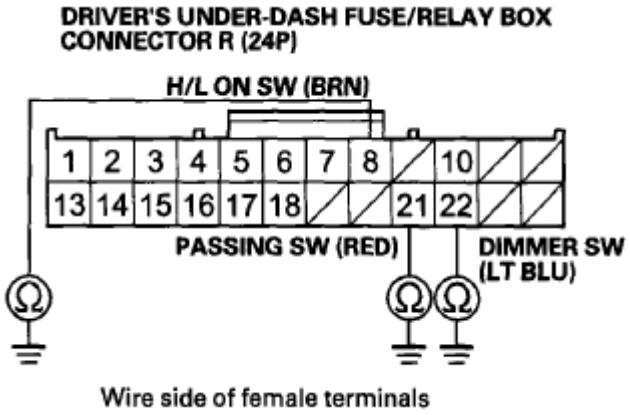

Fig. 20: Checking Continuity Between Body Ground And Driver's Under-Dash Fuse/Relay Box Connector R (24P) Terminals Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair a short to ground in the wire.

NO -Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Do the combination light switch test (see **COMBINATION LIGHT SWITCH TEST/REPLACEMENT**).

    Is the combination light switch OK?

    YES -Go to step 19.

    NO -Replace the combination light switch (see **COMBINATION LIGHT SWITCH TEST/REPLACEMENT**).

19. Disconnect driver's under-dash fuse/relay box connector R (24P).
20. Check for continuity between driver's under-dash fuse/relay box connector R (24P) terminals and the combination light switch 12P connector terminals as shown:

Driver's under-dash fuse/relay box connector R (24P)	Combination light switch 12P connector
3 (BLK)	12 (BLK)
8 (BRN)	10 (BRN)
21 (RED)	6 (RED)
22 (LT BLU)	4 (LT BLU)

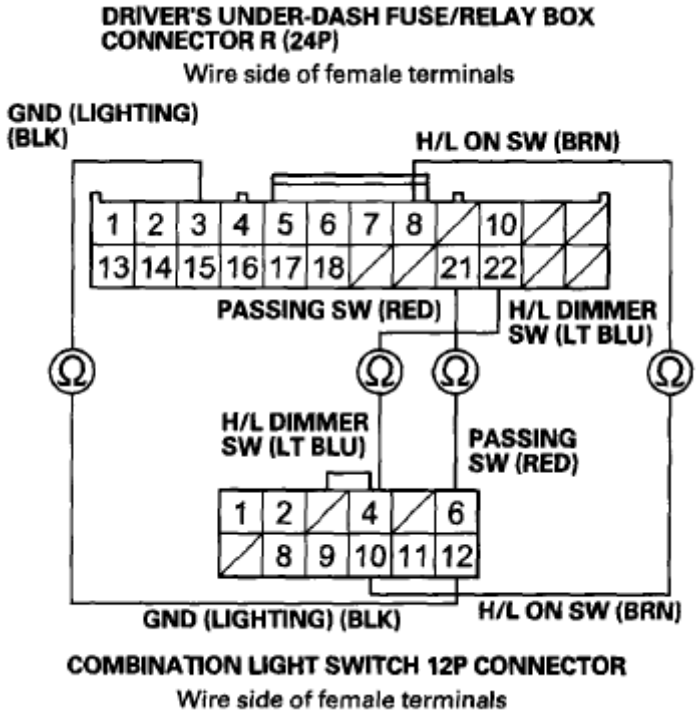

Fig. 21: Checking Continuity Between Driver's Under-Dash Fuse/Relay Box Connector R (24P) Terminals And Combination Light Switch 12P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 21.

NO -Repair an open or high resistance in the wire.

21. Check for continuity between driver's under-dash fuse/relay box connector R (24P) terminals as shown:

From terminal	To terminal
21 (RED)	6 (PNK) 7 (GRY) 8(BRN) 22(LT BLU)
22 (LT BLU)	6 (PNK) 7 (GRY) 8(BRN)

Is there continuity?

YES -Repair a short between the wires.

NO -Faulty driver's MICU; replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-**

DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION).

DTC B1575: AUTO LIGHTING SENSOR MALFUNCTION

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Wait for one second.
4. Check for DTCs with the HDS.

Is DTC B1575 indicated?

YES -Go to step 5.

NO -Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the automatic lighting sensor 5P connector.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Measure the voltage between body ground and automatic lighting sensor 5P connector terminal No. 1.

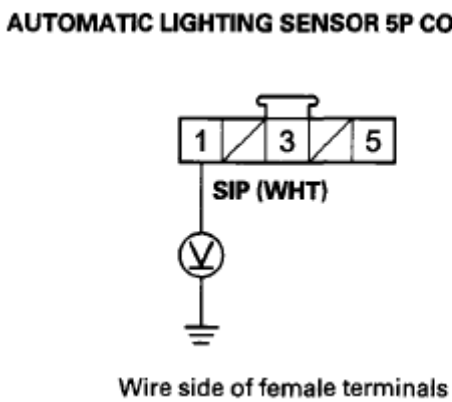

Fig. 22: Measuring Voltage Between Body Ground And Automatic Lighting Sensor 5P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES -Replace the automatic lighting sensor (see **AUTOMATIC LIGHTING SENSOR TEST/REPLACEMENT**).

NO -Go to step 9.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect passenger's under-dash fuse/relay box connector D (28P).
11. Check for continuity between passenger's under-dash fuse/relay box connector D (28P) terminal No. 9 and automatic lighting sensor 5P connector terminal No. 1.

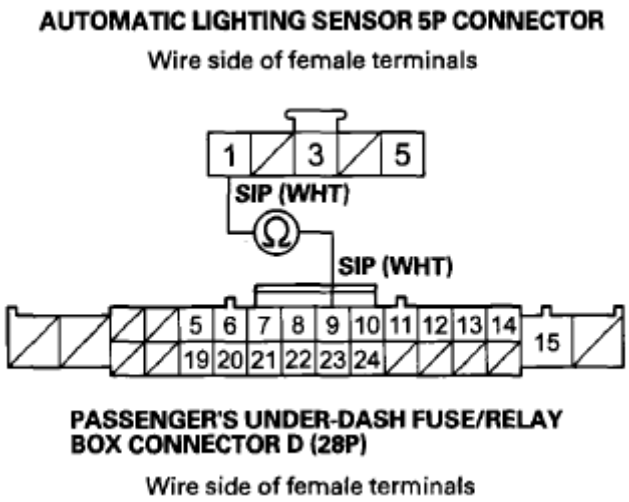

Fig. 23: Checking Continuity Between Passenger's Under-Dash Fuse/Relay Box Connector D (28P) Terminal No. 9 And Automatic Lighting Sensor 5P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Faulty passenger's MICU; replace the passenger's under-dash fuse/relay box (see **PASSENGER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO -Repair an open or high resistance in the wire.

HID LAMP SYSTEM TROUBLESHOOTING

WARNING: A transient high tension (25, 000 V) occurs at the bulb sockets of the high intensity discharge (HID) lamps when the combination light switch is turned ON, that may cause serious electrical shock or electrocution if you do not observe the cautions.

CAUTION:

- **Never turn on the combination light switch before fitting the HID bulbs to their bulb sockets and completing the reassembly of the headlight assembly.**
- **Do not service the headlights assembly in wet conditions, such as rain or snow, near a sprinkler system, or when your hands are wet to prevent electrocution.**

- **Do not touch the surface of the HID bulbs with your bare hands and do not stain it with any oils and fats.**
- **Do not disassemble the inverter unit and the igniter unit.**
- **Do not turn on the HID bulb by using a power source other than the battery mounted on the vehicle.**

Special Tools Required

HID Bulb Test Light 07AAJ-S3MA100

NOTE: Before troubleshooting the HID Lamp System, perform the multiplex integrated control system troubleshooting using B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Check the No. 30 (15 A) fuse in the driver's under-dash fuse/relay box and No. 4 (15 A) fuses in the passenger's under-dash fuse/relay box.

   Are the fuses OK?

   YES -Go to step 2.

   NO -Replace the fuse(s). If the fuse blows again, repair a short to ground on the No. 30 (15 A) and No. 4 (15 A) fuse circuit(s).

2. Turn the combination light switch to OFF.
3. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
4. Remove the bulb socket from the HID bulb (see **HID BULB REPLACEMENT**).
5. Check for corrosion and traces of electrical arcing on the contacts of the socket (A).

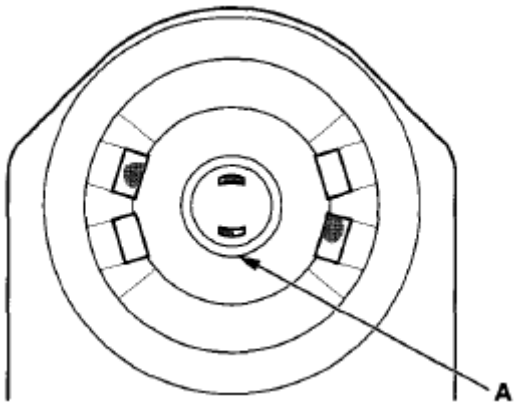

Fig. 24: Identifying Socket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the socket corroded or burnt?

YES -Replace the socket, and recheck.

NO -Go to step 6.

6. Connect the HID bulb test light assembly (A) to the bulb socket (B).

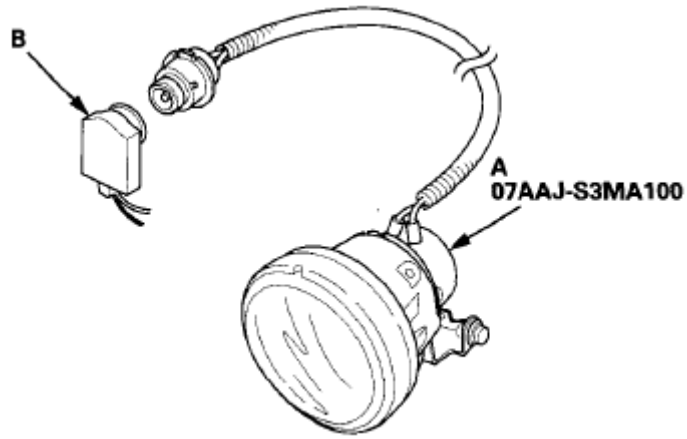

Fig. 25: Connecting HID Bulb Test Light Assembly To Bulb Socket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
8. Turn the combination light (headlight) switch to ON.

   Does the HID bulb test light come on?

   YES -Replace the original HID bulb (see **HID BULB REPLACEMENT**).

   NO -Go to step 9.

9. Measure the voltage between HID unit 2P connector terminal No. 2 and body ground.

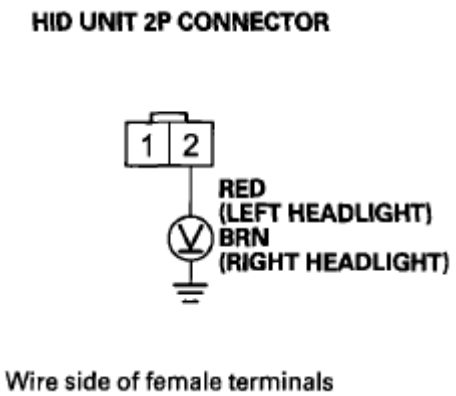

Fig. 26: Measuring Voltage Between HID Unit 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 10.

NO -Repair an open or high resistance in the RED or BRN wire.

10. Turn the combination light (headlight) switch to OFF.
11. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
12. Remove the HID bulb test light assembly from the bulb socket.
13. Disconnect the HID unit 2P connector.
14. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
15. Check for continuity between HID unit 2P connector terminal No. 1 and body ground.

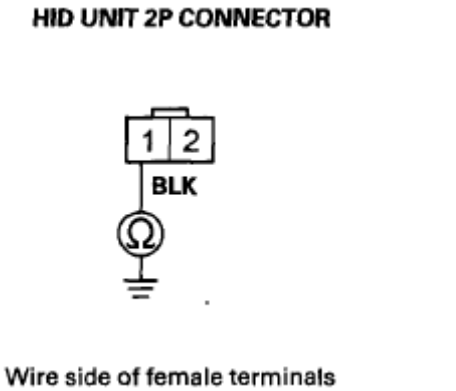

Fig. 27: Checking Continuity Between HID Unit 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the HID unit (see **HID UNIT REPLACEMENT**).

NO -Repair an open or high resistance in the wire between the HID unit and body ground. If the wire is OK, check for poor ground (G203, G302).

MICU INPUT TEST

NOTE:

- **Before testing, troubleshoot the multiplex integrated control system first, using B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **Before testing, make sure the No. 12 (7.5 A), No. 15 (7.5 A), No. 26 (10 A), No. 27 (10 A), No. 28 (10 A), and No. 30 (15 A) fuse in the driver's under-dash fuse/relay box, and the No. 1 (10 A), No. 2 (10 A), No. 3 (10 A), and No. 4(15 A) fuse in the passenger's under-dash fuse/relay box are OK.**

Driver's MICU

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
3. Disconnect driver's under-dash fuse/relay box connectors B, D, E, F, G, Q, and R.

NOTE: All connector views are wire side of female terminals.

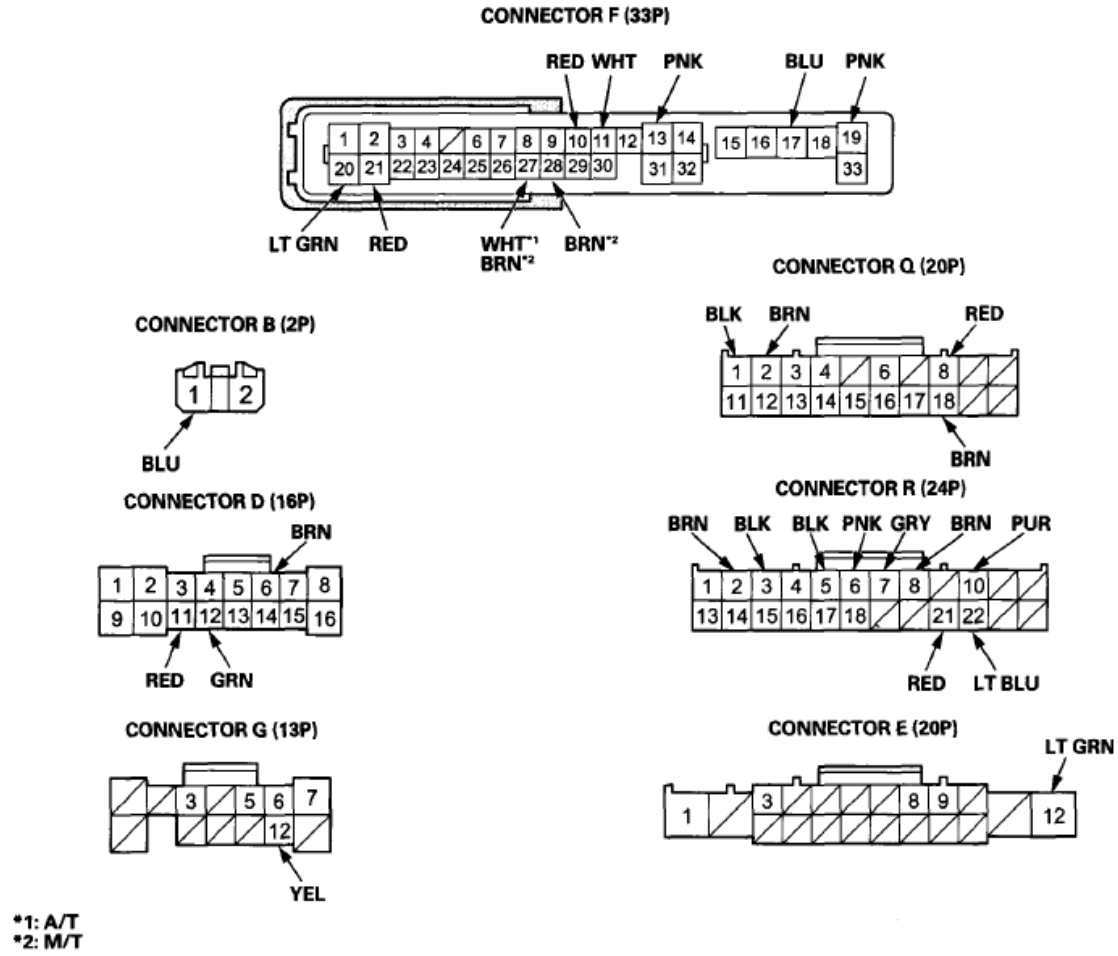

Fig. 28: Identifying Driver's MICU Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.
5. With the connectors still disconnected, do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 6.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
D6	BRN	Ignition switch ON (II), or power mode ON	Connect terminals C5 and D6 with a jumper wire: The back-up lights should come on.	• Blown bulb • Poor ground (G603) or an open in the ground wire • An open or high resistance in the wire

D11	RED	Under all conditions	Connect terminals F19 and D11 with a jumper wire: The taillights, license plate lights, and the rear side marker lights should come on.	• Blown bulb • Poor ground (G603) or an open in the ground wire • An open or high resistance in the wire
E12	LT GRN	Brake pedal pressed	Connect terminals F20 and E12 with a jumper wire: The brake lights should come on.	• Faulty LED • Poor ground (G402, G603) or an open in the ground wire • An open or high resistance in the wire
F20		Brake pedal released	Measure the voltage to ground: There should be no voltage.	• Faulty brake pedal position switch • A short to ground in the wire
F10	RED	Under all conditions	Connect terminals F19 and F10 with a jumper wire: The left front parking light and the left front side marker light should come on.	• Blown left front parking and side marker bulb • Poor ground (G302) or an open in the ground wire • An open or high resistance in the wire
F13	PNK	Under all conditions	Connect terminals F19 and F13 with a jumper wire: The left headlight (high beam) should come on.	• Blown left high beam bulb • Poor ground (G302) or an open in the ground wire • An open or high resistance in the wire
F21	RED	Under all conditions	Connect terminals F19 and F21 with a jumper wire: The left headlight (low beam) should come on.	• Blown left low beam (HID) bulb • Faulty HID unit • Poor ground (G302) or an open in the ground wire • An open or high resistance in the wire
			Connect terminals F19 and G12 with a	• Blown left fog bulb • Poor ground (G302)

G12	YEL	Under all conditions	jumper wire: The left fog light should come on.	or an open in the ground wire • An open or high resistance in the wire

6. Reconnect the connectors to the driver's under-dash fuse/relay box, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 7.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
B1	BLU	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 3-8 (AS LT MAIN) (30 A) fuse in the under-hood fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
Q1	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G402) • An open or high resistance in the ground wire
Q2	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
R2	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G401) • An open or high resistance in the ground wire
R5	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G402) • An open or high resistance in the ground wire
D12	GRN	Driver's door open	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty driver's door switch • Faulty driver's door switch ground • An open or high resistance in the wire

		Driver's door closed	Measure the voltage to ground: There should be about 5 V.	• Faulty driver's door switch • A short to ground in the wire
F11	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • An open or high resistance in the wire
F17	BLU	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 3-8 (AS LT MAIN) (30 A) fuse in the under-hood fuse/relay box • An open or high resistance in the wire
F19	PNK	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 3-6 (DR LT MAIN) (30 A) fuse in the under-hood fuse/relay box • An open or high resistance in the wire
F27 (A/T)	WHT	Ignition switch ON (II), or power mode ON. Lever in R position.	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty transmission range switch • Poor ground (G101) or an open in the ground wire • An open or high resistance in the wire
		Ignition switch ON (II), or power mode ON. Transmission range switch in any other position than R.	Measure the voltage to ground: There should be battery voltage.	• Blown No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box • Faulty driver's under-dash fuse/relay box
F27 (M/T)	BRN	Power mode ON	Connect terminals F28 and F27 with a jumper wire: The back-up lights should come on.	• Blown No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box • Faulty driver's under-dash fuse/relay box • Blown bulb(s) • Poor ground (G603) or an open in the ground wire

				• A short to ground in the wire • An open or high resistance in the wire
Q18(1)	BRN	Ignition key inserted into the ignition switch	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty ignition key switch • Poor ground (G403) or an open in the ground wire • An open or high resistance in the wire
		Ignition key removed from the ignition switch	Measure the voltage to ground: There should be about 5 V.	• Faulty ignition key switch • A short to ground in the wire
Q18(2)	BRN	Keyless access remote inserted into the remote slot	Measure the voltage to ground: There should be less than 0.2 V.	• Faulty power control unit • Poor ground (G402) or an open in the ground wire • An open or high resistance in the wire
		Keyless access remote removed from the remote slot	Measure the voltage to ground: There should be about 5 V.	• Faulty power control unit • A short to ground in the wire
R6 . R3	PNK . BLK	Combination light switch OFF	Measure the voltage between terminals R6 and R3: There should be less than 0.2 V.	• Faulty combination light switch • An open or high resistance in the wire
		Combination light switch in any other position than OFF	Measure the voltage between terminals R6 and R3: There should be about 5 V.	• Faulty combination light switch • A short to ground in the wire
R7 . R3	GRY . BLK	Combination light switch (PARKING LIGHT position) ON	Measure the voltage between terminals R7 and R3: There should be less than 0.2 V.	• Faulty combination light switch • An open or high resistance in the wire
		Combination light switch OFF	Measure the voltage between terminals R7 and R3: There should be about 5 V.	• Faulty combination light switch • A short to ground in the wire

R8 . R3	BRN . BLK	Combination light switch (headlight) ON	Measure the voltage between terminals R8 and R3: There should be less than 0.2 V.	• Faulty combination light switch • An open or high resistance in the wire
		Combination light switch OFF	Measure the voltage between terminals R8 and R3: There should be about 5 V.	• Faulty combination light switch • A short to ground in the wire
R21 . R3	RED . BLK	Combination light switch lever pulled (Passing)	Measure the voltage between terminals R21 and R3: There should be less than 0.2 V.	• Faulty combination light switch • An open or high resistance in the wire
		Combination light switch lever released (OFF)	Measure the voltage between terminals R21 and R3: There should be about 5 V.	• Faulty combination light switch • A short to ground in the wire
R22 . R3	LT BLU . BLK	Combination light switch (Dimmer) in high beam position	Measure the voltage between terminals R22 and R3: There should be less than 0.2 V.	• Faulty combination light switch • An open or high resistance in the wire
		Combination light switch (Dimmer) in low beam position	Measure the voltage between terminals R22 and R3: There should be about 5 V.	• Faulty combination light switch • A short to ground in the wire
R10 . R3	PUR . BLK	Fog light switch ON	Measure the voltage between terminals R10 and R3: There should be less than 0.2 V.	• Faulty combination light switch • An open or high resistance in the wire
		Fog light switch OFF	Measure the voltage between terminals R10 and R3: There should be about 5 V.	• Faulty combination light switch • A short to ground in the wire
(1) Without keyless access system (2) With keyless access system				

Passenger's MICU

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Remove the passenger's side kick panel (see **TRIM REMOVAL/INSTALLATION - DOOR AREAS**).
9. Disconnect passenger's under-dash fuse/relay box connectors A and E.

NOTE: All connector views are wire side of female terminals.

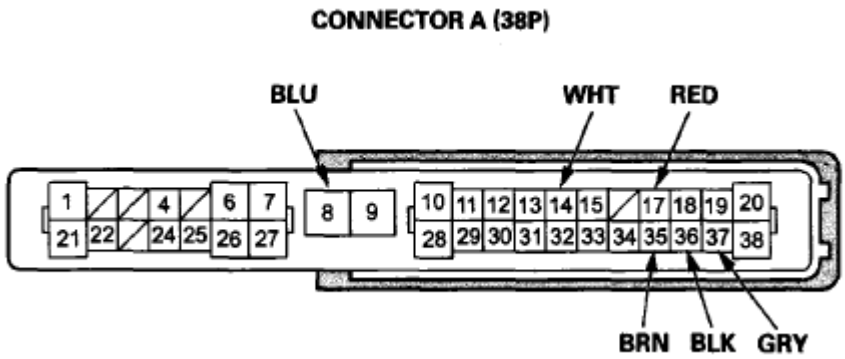

Fig. 29: Identifying Passenger's MICU Connector A (38P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

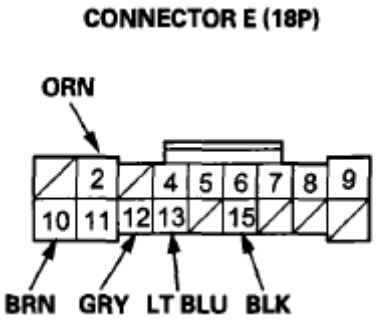

Fig. 30: Identifying Passenger's MICU Connector E (18P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Inspect the connector and socket terminals to be sure they are all making good contact.
    - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
    - If the terminals look OK, go to step 11.
11. With the connectors still disconnected, do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 12.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
A8	BLU	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 3-8 (AS LT MAIN) (30 A) fuse in the under-hood fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high

				resistance in the wire
A17	RED	Under all conditions	Check for continuity between passenger's under-dash fuse/relay box connector A (38P) terminal No. 17 and driver's under-dash fuse/relay box connector Q (20P) terminal No. 8: There should be continuity.	An open or high resistance in the wire
E2	ORN	Under all conditions	Connect terminals A8 and E2 with a jumper wire: The right headlight (high beam) should come on.	• Blown right high beam bulb • Poor ground (G203) or an open in the ground wire • An open or high resistance in the wire
E10	BRN	Under all conditions	Connect terminals A8 and E10 with a jumper wire: The right headlight (low beam) should come on.	• Blown right low beam (HID) bulb • Faulty HID unit • Poor ground (G203) or an open in the ground wire • An open or high resistance in the wire
E12	GRY	Under all conditions	Connect terminals A8 and E12 with a jumper wire: The right front parking light and the right front side marker light should come on.	• Blown right front parking or side marker bulb • Poor ground (G203) or an open in the ground wire • An open or high resistance in the wire
E13	LT BLU	Under all conditions	Connect terminals A8 and E13 with a jumper wire: The right fog light should come on.	• Blown right fog bulb • Poor ground (G203) or an open in the ground wire • An open or high resistance in the wire

12. Reconnect the connectors to the passenger's under-dash fuse/relay box, turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and do the following input tests:
    - If any test indicates a problem, find and correct the cause, then recheck the system.
    - If all the input tests prove OK, go to step 13.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is

				not obtained
A14	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15 (10 A) fuse in the under-hood fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
A35	BRN	Ignition switch ON (II), or power mode ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box • Faulty driver's under-dash fuse/relay box • An open or high resistance in the wire
A36	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G405) • An open or high resistance in the ground wire
A37	GRY	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
E15	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G203) • An open or high resistance in the ground wire

13. If multiple failures are found on more than one control unit, replace the driver's under-dash fuse/relay box (includes the driver's MICU) (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**). If input failures are related to a particular control unit, replace the control unit.

COMBINATION LIGHT SWITCH TEST/REPLACEMENT

1. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
2. Remove the steering column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
3. Disconnect the dashboard wire harness 12P connector (A) from the combination light switch (B).

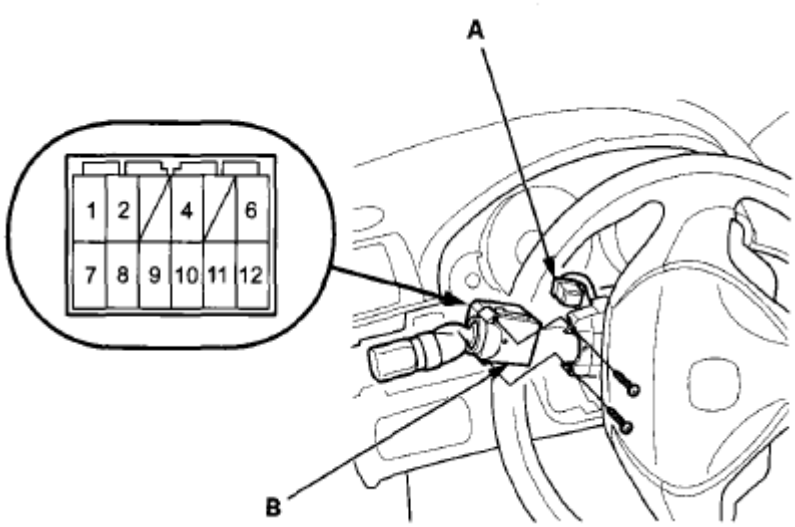

Fig. 31: Identifying Dashboard Wire Harness 12P Connector And Light Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the two screws, then slide out the combination light switch.
5. Inspect the connector terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, check for continuity between the terminals in each switch position according to the tables.

Light switch

Position \ Terminal			4	6	9	10	11	12
Headlight switch	OFF				○			○
	≡◯						○	○
	≡D	LOW				○	○	○
		HIGH	○			○	○	○
Passing switch	OFF							
	ON			○				○

Fig. 32: Continuity Reference Chart For Light Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Turn signal switch

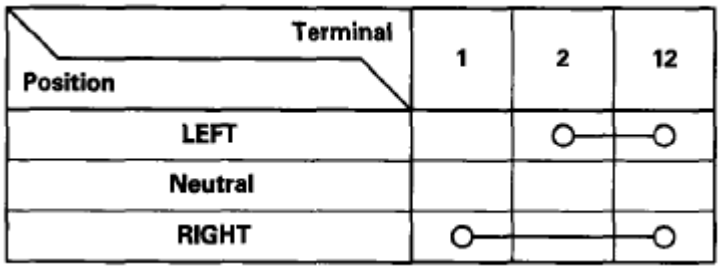

Fig. 33: Continuity Reference Chart For Turn Signal Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Fog light switch

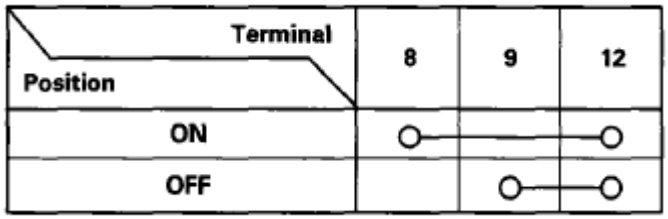

Fig. 34: Continuity Reference Chart For Fog Light Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If all the continuity is not as specified, remove the two screws and replace the switch.
7. Install the parts in the reverse order of removal.

HEADLIGHT ADJUSTMENT

CAUTION: Headlights become very hot during use; do not touch them or any attaching hardware immediately after they have been turned off.

Before adjusting the headlights:

- Park the vehicle on a level surface.
- Make sure the tire pressures are correct.
- The driver or someone who weighs the same should sit in the driver's seat.

1. Clean the outer lens so that you can see the center mark (A) of the headlights.

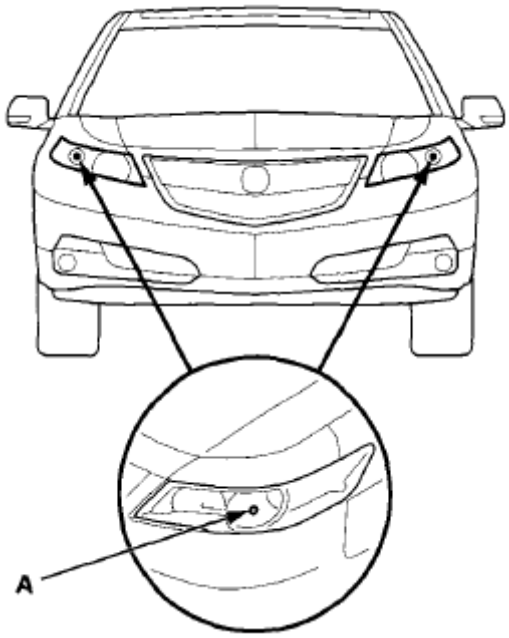

Fig. 35: Identifying Center Mark Of Headlights
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Park the vehicle so that the center mark of the headlight (A) is 7.5 m (25 ft) away from a wall or screen (B).

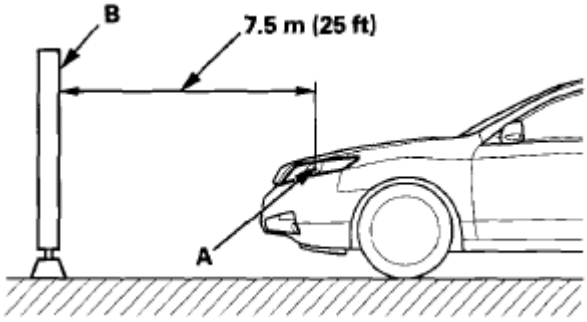

Fig. 36: Measuring Distance Between Center Mark Of Vehicle Headlight And Wall Or Screen
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the height of the headlight's center mark (A), then mark the same height of the headlights on the wall or screen (B) with masking tape in a straight, horizontal line (C).

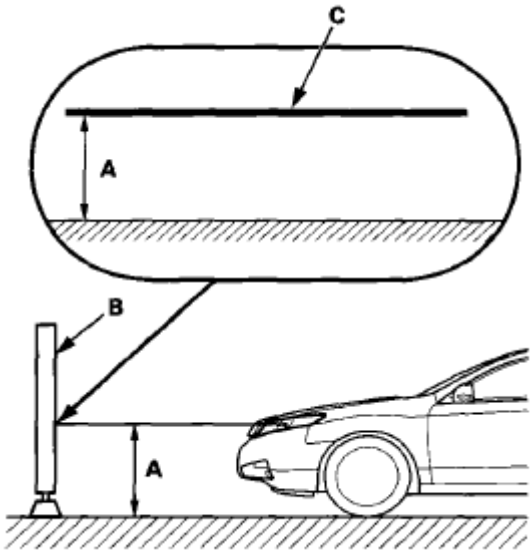

Fig. 37: Identifying Headlight's Center Mark, Wall Or Screen And Masking Tape
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Turn on the low beam headlights.
5. To see if the headlights are adjusted properly, observe the beams of light projected on the wall or screen. The highest edge or "cut line" (A) of the headlights should be at the same height as the masking tape (B).

NOTE: To help determine which headlight is out of adjustment, block one of the beams with a large piece of cardboard or equivalent, and observe the other beam on the wall or screen. Repeat this for the other headlight.

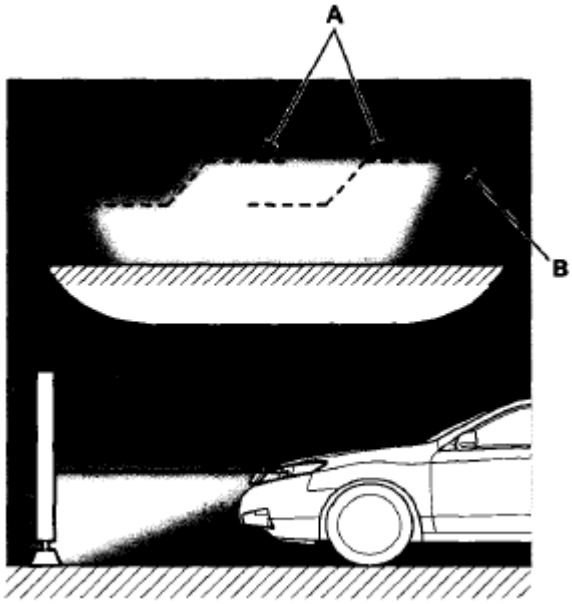

Fig. 38: Checking Adjustment Of Headlights
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If adjustment is necessary, open the hood and adjust the head lights by turning the vertical adjuster (A).

NOTE: The R and L adjusters are not applicable for USA models.

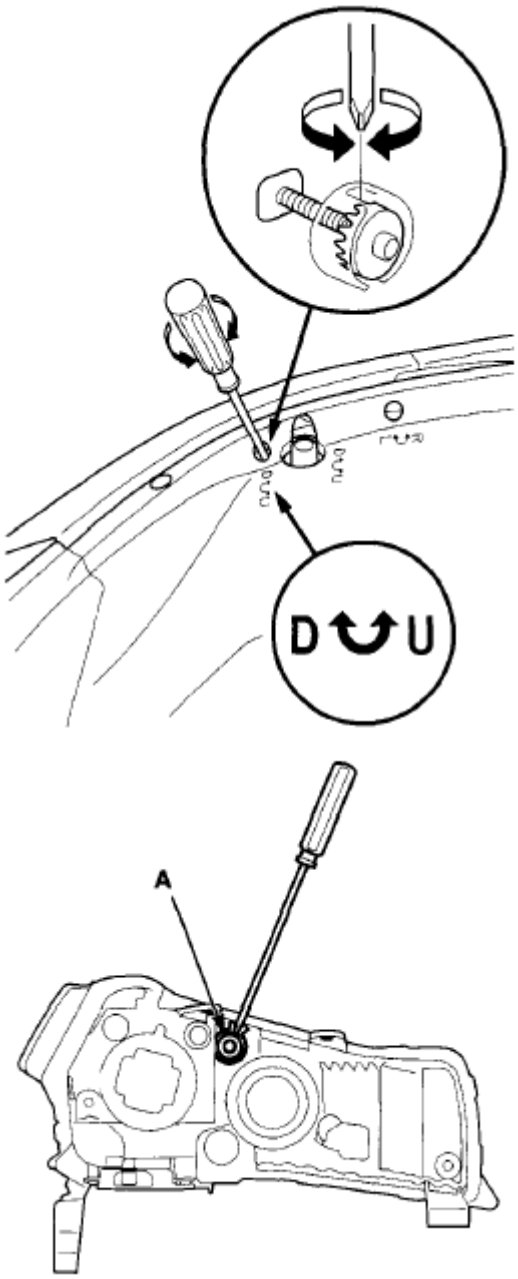

Fig. 39: Adjusting Head Lights By Turning Vertical Adjuster
Courtesy of AMERICAN HONDA MOTOR CO., INC.

HEADLIGHT REPLACEMENT

1. Turn the combination light switch OFF.

2. Remove these items:
   - Front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**)
   - Bulkhead cover (see **ENGINE COMPARTMENT COVER REPLACEMENT**)
3. Remove the three bolts (A), and pull the headlight (B) out slightly.

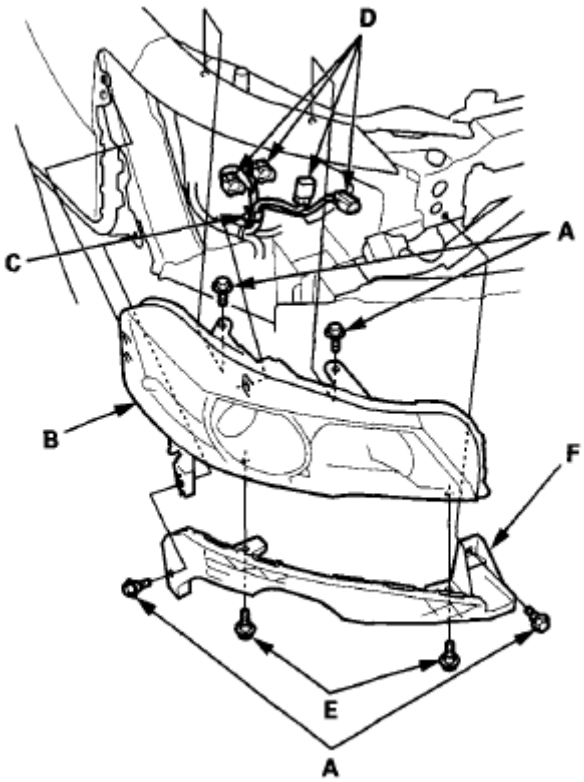

Fig. 40: Identifying Connectors, Headlight, Corner Upper Beam, Harness Clip And Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

The illustration shows the right side.

4. Remove the harness clip (C) from the headlight housing, and disconnect the connectors (D) from the bulb sockets. Remove the two bolts (E).
5. Remove the headlight with the corner upper beam (F).

NOTE: Be careful not to scratch the headlight lens and the fender.

6. Remove the bolt and the corner upper beam from the headlight.
7. Install the headlight in the reverse order of removal.
8. After replacement, adjust the headlights (see **HEADLIGHT ADJUSTMENT**).

HID UNIT REPLACEMENT

1. Turn the combination light switch OFF.
2. Make sure the ignition switch is in LOCK (0), or the vehicle ignition is in the OFF mode, then do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
3. Remove the headlight assembly (see **HEADLIGHT REPLACEMENT**).
4. Remove the three mounting screws and the HID unit (A).

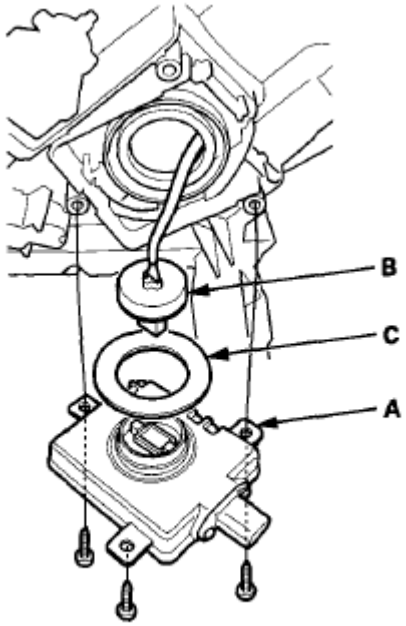

Fig. 41: Identifying HID Unit, 4P Connector And Gasket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

The illustration shows the right side.

5. Disconnect the 4P connector (B) from the HID unit.
6. Inspect the gasket (C) for damage. If damaged, replace it.
7. Install the HID unit in the reverse order of removal.
8. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
9. After replacement, adjust the headlights (see **HEADLIGHT ADJUSTMENT**).

HID BULB REPLACEMENT

HID BULB (HEADLIGHT LOW BEAM)

WARNING: A transient high tension (25, 000 V) occurs at the bulb sockets of the high intensity discharge (HID) lamps when the combination light switch is

turned ON, that may cause serious electrical shock or electrocution if you do not observe the cautions.

CAUTION:

- **Never turn on the combination light switch before fitting the HID bulbs to their bulb sockets and completing the reassembly of the headlight assembly.**
- **Do not service the headlights assembly in wet conditions, such as rain or snow, near a sprinkler system, or when your hands are wet to prevent electrocution.**
- **Do not touch the surface of the HID bulbs with your bare hands and do not stain it with any oils and fats.**
- **Do not disassemble the inverter unit and the igniter unit.**
- **Do not turn on the HID bulb by using a power source other than the battery mounted on the vehicle.**

1. Turn the combination light switch OFF.
2. Make sure the ignition switch is in the LOCK (0), or the vehicle ignition is in the OFF mode, then do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
3. Remove the inner fender (see **FRONT INNER FENDER REPLACEMENT**).
4. Turn the cover (A) 45 ° counterclockwise to remove it from the headlight assembly.

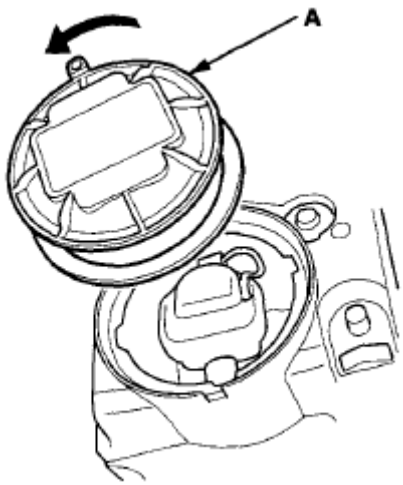

Fig. 42: Turning Cover Counterclockwise To Remove It From Headlight Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Turn the socket (A) 45 ° counterclockwise to remove it from the bulb (B).

Headlight: 35 W

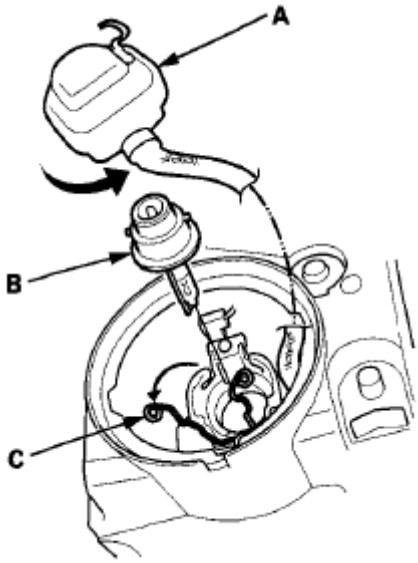

Fig. 43: Turning Socket Counterclockwise To Remove It From Bulb
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Pull the retaining spring (C) away from the bulb then remove the bulb.
7. Install a new bulb in the reverse order of removal. Make sure the notches in the bulb align with the tabs in the headlight.
8. Install the parts in the reverse order of removal.
9. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

BULB REPLACEMENT

HEADLIGHT (HIGH BEAM)

1. Left headlight: Remove the intake air duct cover and duct (see step 4 in **ENGINE REMOVAL**).
2. Right headlight: Remove the coolant reservoir from its mounting bracket, and set them aside.
3. Disconnect the 2P connector (A) from the headlight.

Headlight (High Beam): 60 W

Headlight (High Beam): 60 W

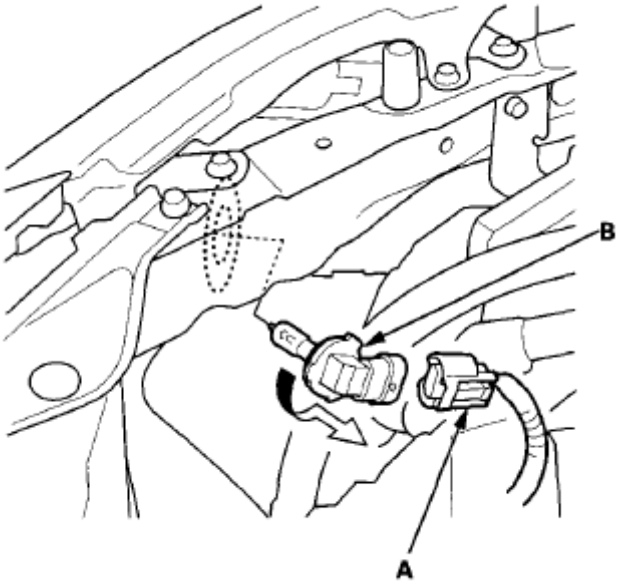

Fig. 44: Disconnecting 2P Connector From Headlight
Courtesy of AMERICAN HONDA MOTOR CO., INC.

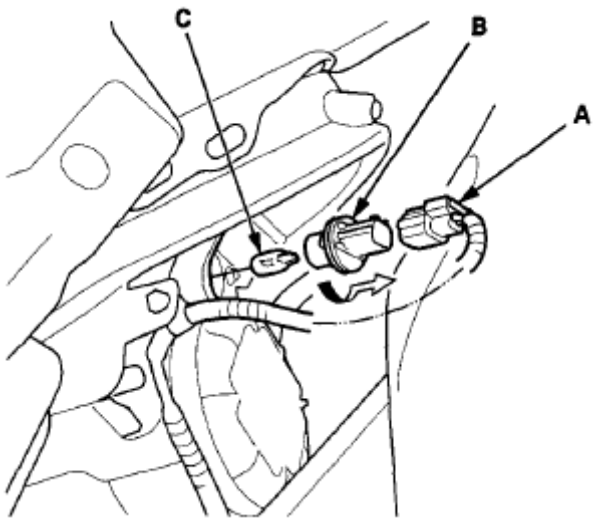
The illustration shows the right side.

4. Turn the bulb socket (B) 45 ° counterclockwise to remove the bulb.
5. Install a new bulb in the reverse order of removal.

FRONT SIDE MARKER LIGHT

1. Remove the inner fender (see **FRONT INNER FENDER REPLACEMENT**).
2. Disconnect the 2P connector (A) from the front side marker light.

Front Side Marker Light: 3 CP



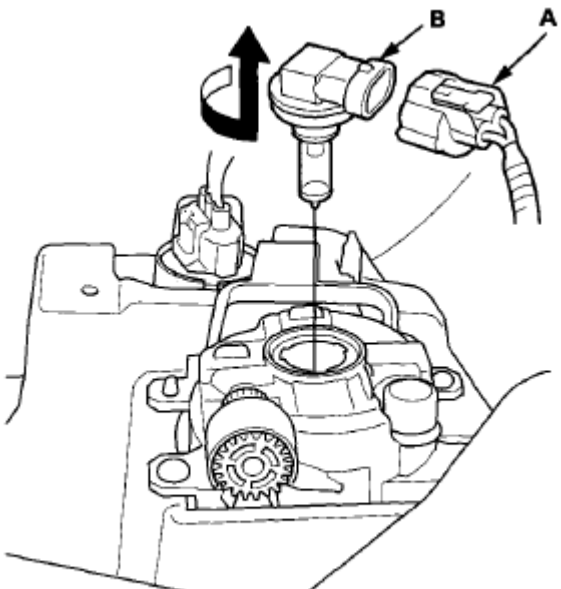


Fig. 45: Disconnecting 2P Connector From Front Side Marker Light
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the bulb socket (B) 45 ° counterclockwise to remove the bulb (C).
4. Install a new bulb in the reverse order of removal.

FOG LIGHT

1. Remove the splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
2. Disconnect the 2P connector (A) from the fog light (B).

Fog Light: 55 W

The illustration shows the right side.

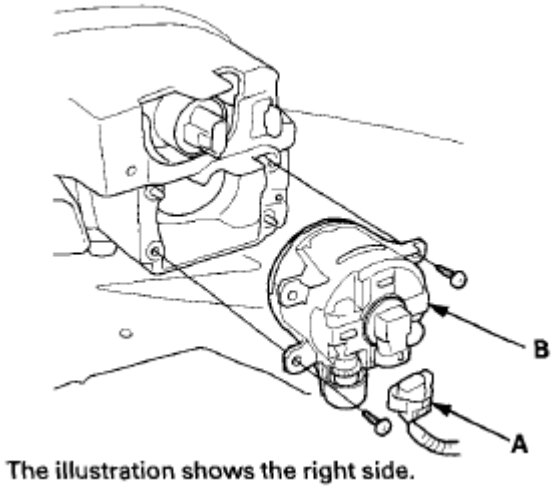

Fig. 46: Disconnecting 2P Connector From Fog Light
Courtesy of AMERICAN HONDA MOTOR CO., INC.

The illustration shows the right side.

3. Turn the bulb socket 45 ° counterclockwise to remove it from the housing.
4. Install a new bulb in the reverse order of removal.

FOG LIGHT REPLACEMENT

1. Remove the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**).
2. Disconnect the 2P connector (A) from the fog light (B).

The illustration shows the right side.

Fig. 47: Disconnecting 2P Connector From Fog Light
Courtesy of AMERICAN HONDA MOTOR CO., INC.

The illustration shows the right side.

3. Remove the two screws, then remove the fog light from the front bumper.
4. Install the fog light in the reverse order of removal.
5. After replacement, adjust the fog lights (see **FOG LIGHT REPLACEMENT**).

FOG LIGHT ADJUSTMENT

Before adjusting the fog lights:

- Park the vehicle on a level surface.
- Make sure the tire pressures are correct.
- The driver or someone who weighs the same should sit in the driver's seat.
- Unload the vehicle.

The fog lights should aim down slightly. To check for proper adjustment:

1. Park the vehicle in front of a wall (A).

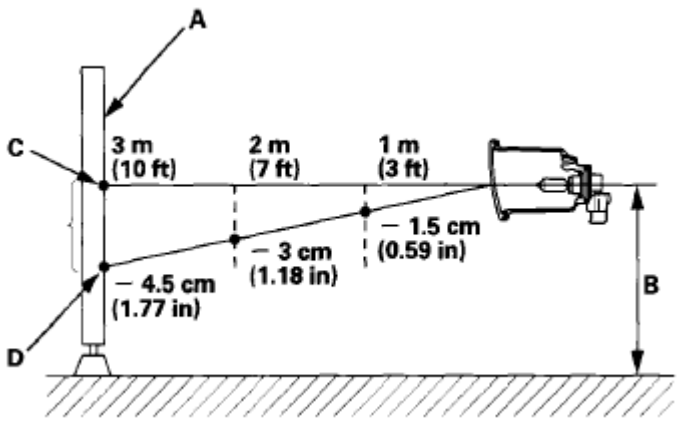

Fig. 48: Checking Aiming Of Fog Lights
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the fog lights on.
3. Determine if the fog lights are aimed properly:
   - Measure the height of the fog lights (B).
   - On the wall, mark the height of the fog lights with a piece of tape (C).
   - Check each fog light beam's height. With the vehicle parked 3 m (9.6 ft) from the screen, the top of the fog light beam should be 4.5 cm (1.77 in) below the tape mark.
4. If necessary, adjust each fog light to the specified height by turning the adjuster (A).

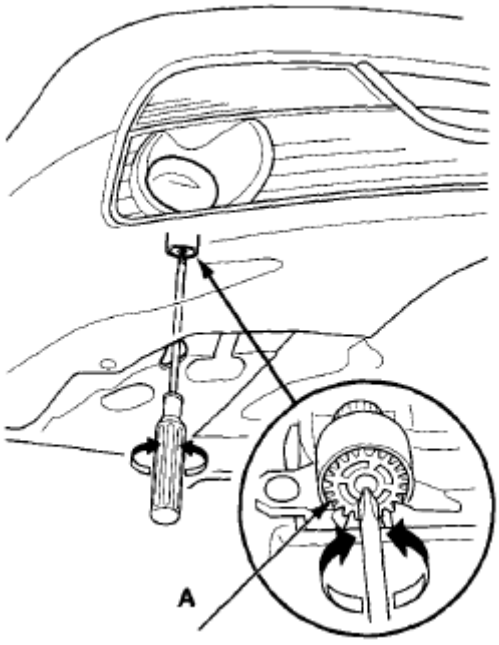

Fig. 49: Turning Adjuster To Adjust Each Fog Light To Specified Height
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TAILLIGHT REPLACEMENT

1. Open the trunk lid, and remove the trunk side trim panel (see **TRIM REMOVAL/INSTALLATION - TRUNK AREA**).
2. Remove the three special nuts (A) from the taillight unit.

   Rear Turn Signal Light: 21 W

   Rear Side Marker Light: 3 CP

   Back-Up Light: 16 W

   Brake Light: (LED)

   Taillight: (LED)

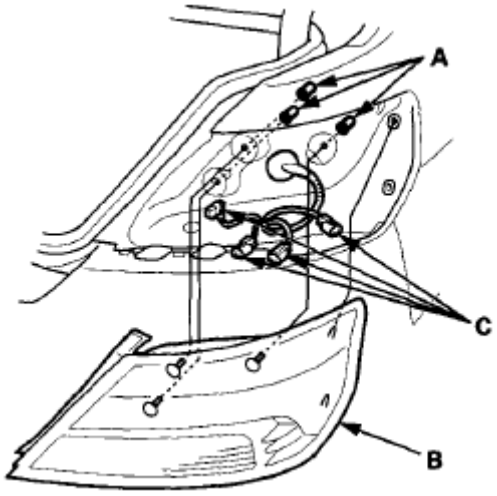

Fig. 50: Identifying Connectors, Taillight And Special Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Carefully pull out the taillight (B).
4. Disconnect the connectors (C) from the taillight.
5. Turn the bulb sockets (A) 45 ° counterclockwise to remove the bulbs (B).

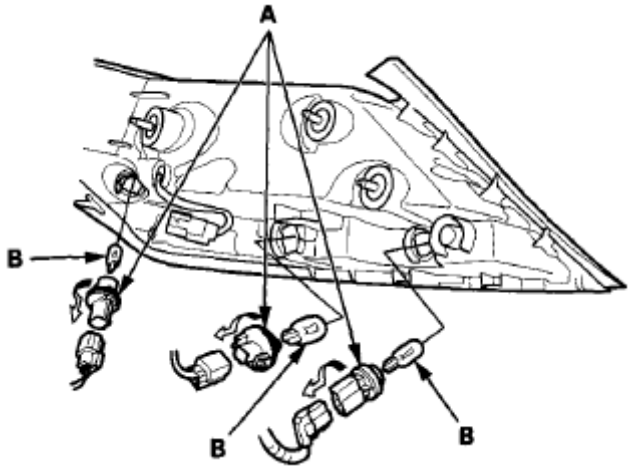

Fig. 51: Identifying Bulbs And Bulb Sockets
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the light in the reverse order of removal.

LICENSE PLATE LIGHT REPLACEMENT

1. Remove the license plate light (A) by pushing it away from the bumper to release the clips (B) from the rear bumper.

   License Plate Light: 3 CP

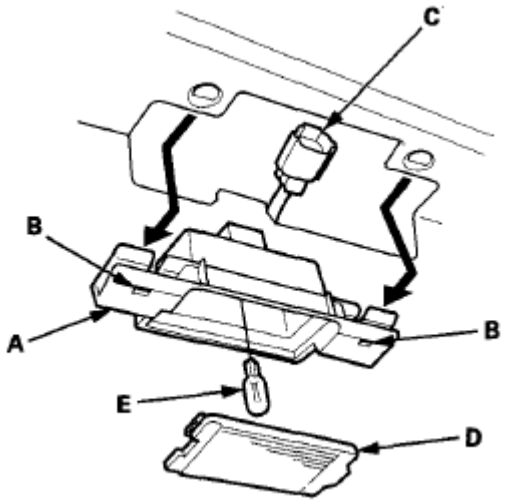

Fig. 52: Removing License Plate Light
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Disconnect the 2P connector (C) from the light.
3. Take the lens (D) off, then remove the bulb (E).
4. Install the light in the reverse order of removal.

HIGH MOUNT BRAKE LIGHT REPLACEMENT

1. Remove the high mount brake light cover (A) by pulling straight down on the cover to release the clips.

High Mount Brake Light: LED

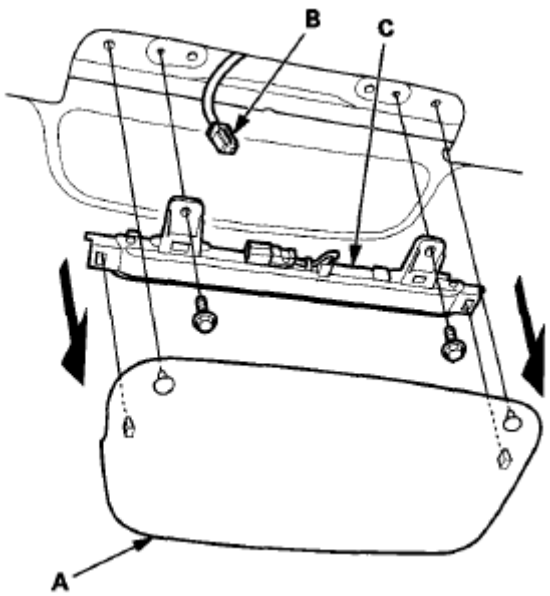

Fig. 53: Removing High Mount Brake Light
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Disconnect the 2P connector (B) from the high mount brake light (C).
3. Remove the two bolts and the high mount brake light.
4. Install the light in the reverse order of removal.
5. Clean the rear window, and install the high mount brake light cover in the reverse order of removal.

BRAKE PEDAL POSITION SWITCH TEST

1. Disconnect the 4P connector (A) from the brake pedal position switch (B).

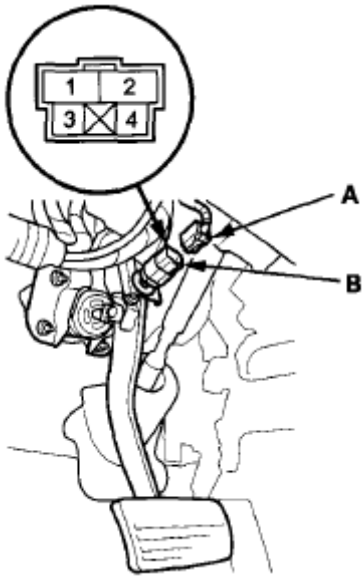

Fig. 54: Identifying 4P Connector And Brake Pedal Position Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Check for continuity between terminals No. 1 and No. 2.
   - There should be no continuity when the brake pedal is released.
   - There should be continuity when the brake pedal is pressed.
3. Check for continuity between terminals No. 3 and No. 4.
   - There should be continuity when the brake pedal is released.
   - There should be no continuity when the brake pedal is pressed.
4. If the test results are not as specified, do the brake pedal and brake pedal position switch adjustment (see **BRAKE PEDAL AND BRAKE PEDAL POSITION SWITCH ADJUSTMENT**), then recheck. If the results are still not as specified, replace the switch (see **BRAKE PEDAL REPLACEMENT**).

AUTOMATIC LIGHTING SENSOR TEST/REPLACEMENT

NOTE: Take care not to scratch the dashboard.

1. Remove the center speaker lid (see **FRONT CENTER SPEAKER**).
2. Pop out the automatic lighting sensor (A).

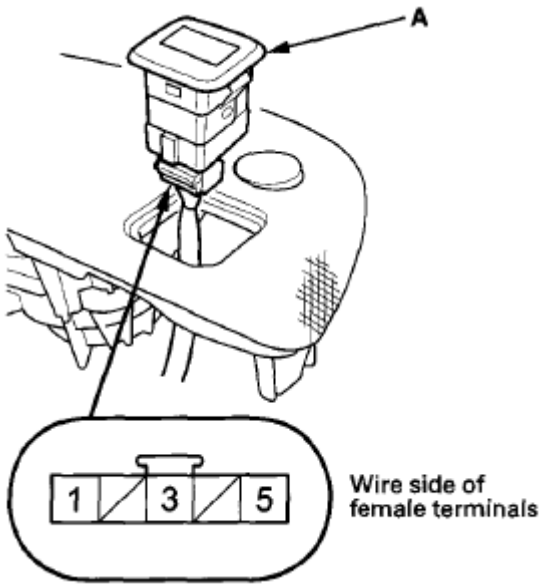

Fig. 55: Identifying Automatic Lighting Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Measure the voltage between automatic lighting sensor 5P connector terminals No. 3 and No. 5.
   - About 3.6 V in direct sunlight.
   - About 0.2 V when the sensor is covered up.
5. If the voltage is not as specified, replace the automatic lighting sensor.

NOTE: In auto mode, the headlights should turn on at about 1.4 V or less, and turn off at about 2.2 V or more.

2012 ACCESSORIES & EQUIPMENT

Interior Lights - TL

Courtesy of AMERICAN HONDA MOTOR CO., INC.

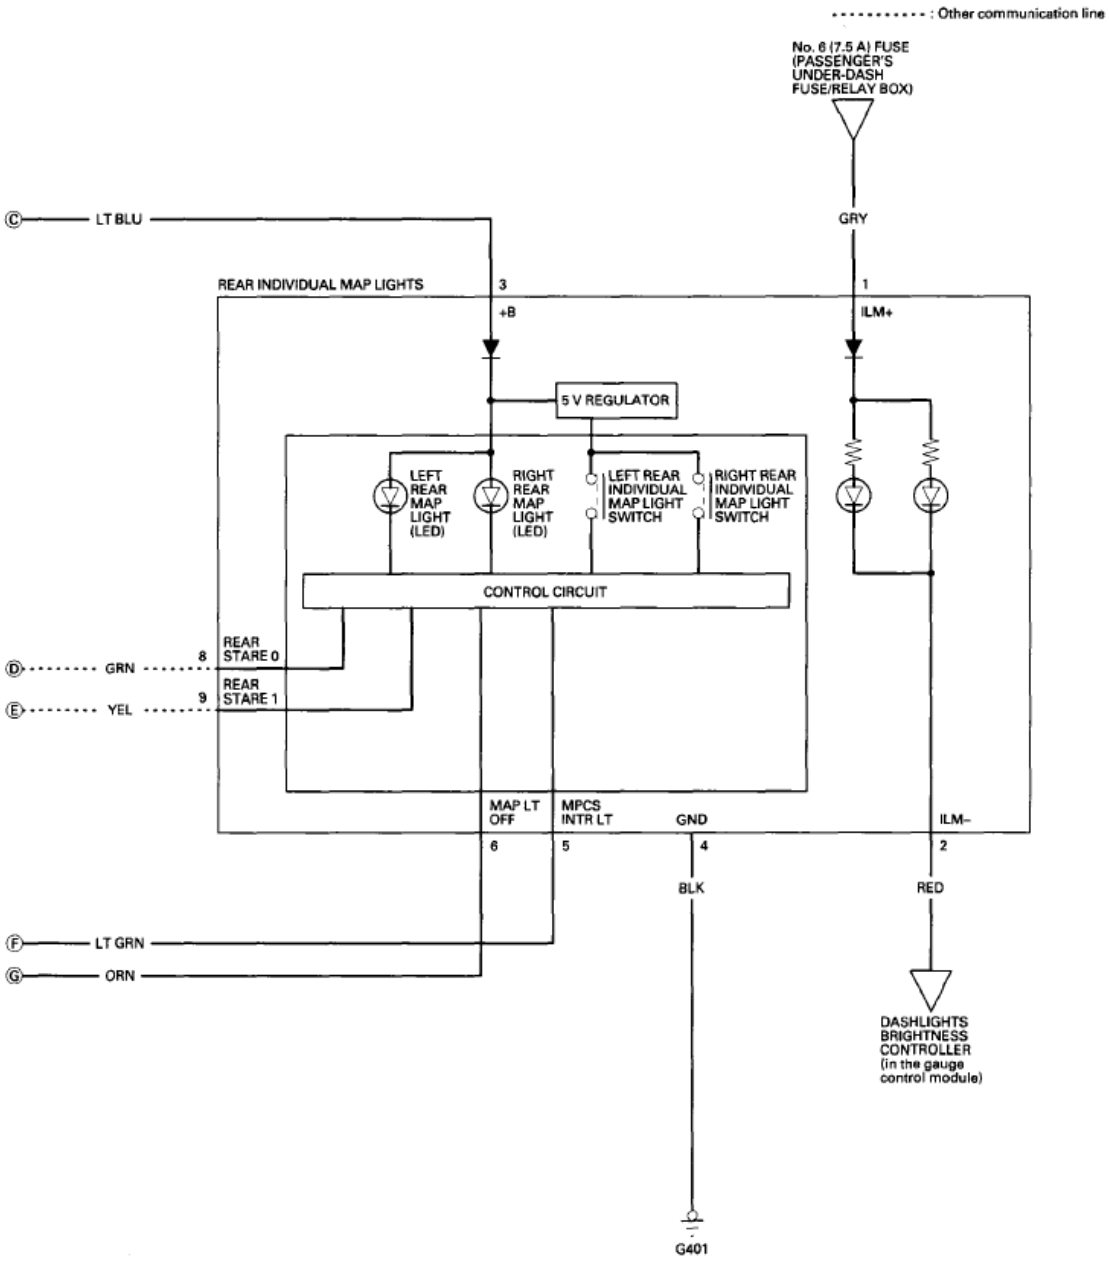

Fig. 7: Interior Lights Circuit Diagram (4 Of 4)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ROOF CONSOLE INPUT TEST/REPLACEMENT

1. Turn the map light switch OFF.
2. Open the sunglass holder, then remove the two screws (A).

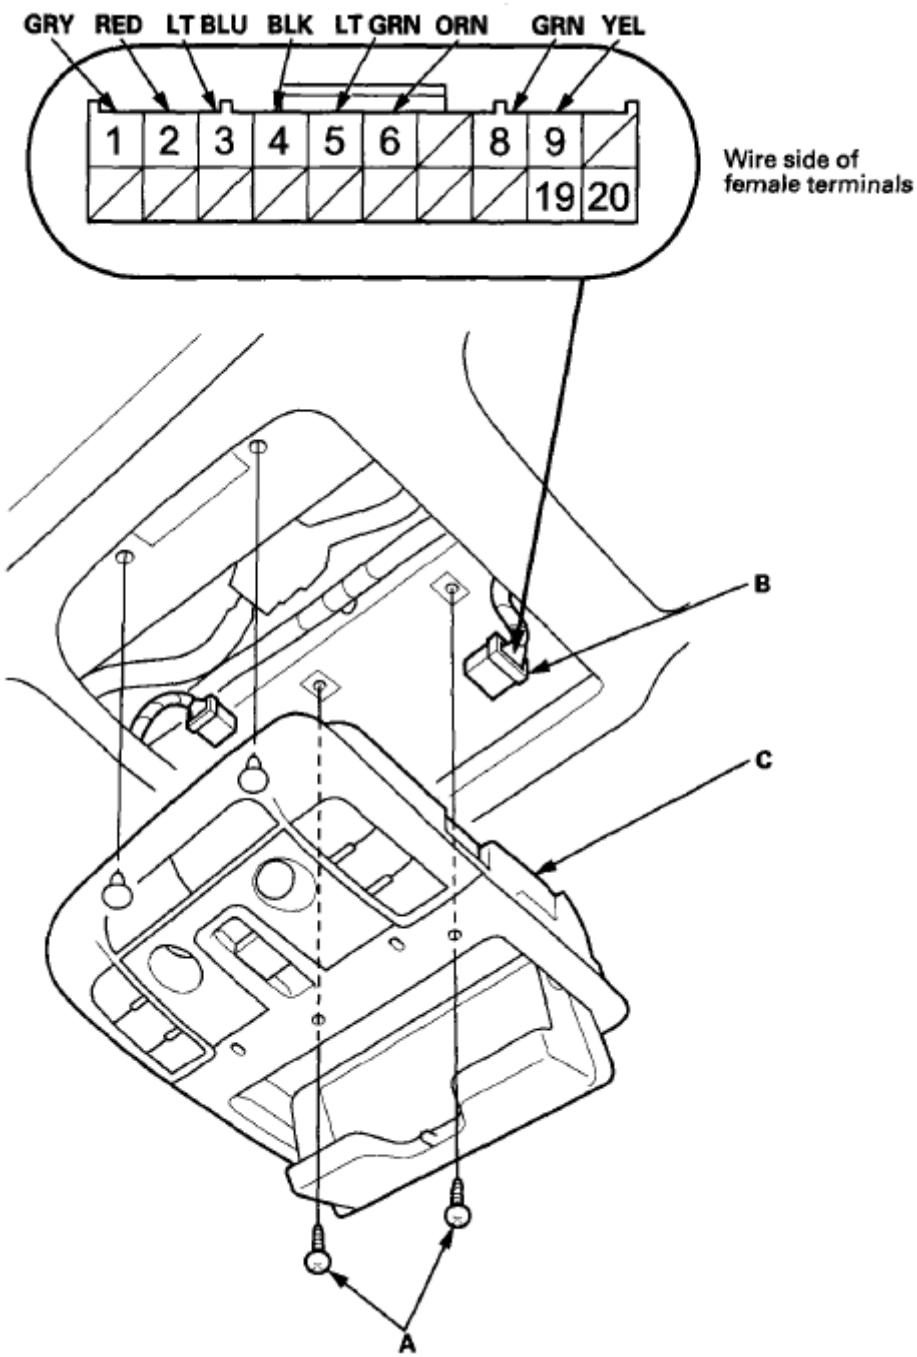

Fig. 8: Identifying 20P Connector End View, Roof Console And Screws
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the 20P connector (B) from the roof console (C).
4. Inspect the connector and socket terminals to be sure they are all making good contact.
    - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
    - If the terminals look OK, go to step 5.
5. With the connector still disconnected, do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 6.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
5	LT GRN	Disconnect driver's under-dash fuse/relay box connector P (20P)	Check for continuity between terminal No. 5 and driver's under-dash fuse/relay box connector P (20P) terminal No. 4: There should be continuity.	An open or high resistance in the wire
6	ORN	Disconnect driver's under-dash fuse/relay box connector Q (20P)	Check for continuity between terminal No. 6 and driver's under-dash fuse/relay box connector Q (20P) terminal No. 4: There should be continuity.	An open or high resistance in the wire
8	GRN	Disconnect the rear individual map lights 10P connector	Check for continuity between terminal No. 8 and rear individual map lights 10P connector terminal No. 8: There should be continuity.	An open in the wire
9	YEL	Disconnect the rear individual map lights 10P connector	Check for continuity between terminal No. 9 and rear individual map lights 10P connector terminal No. 9: There should be continuity.	An open in the wire
2	RED	Disconnect the gauge control module 32P connector	Check for continuity between terminal No. 2 and gauge control module 32P connector terminal No. 8: There should be continuity.	An open or high resistance in the wire

6. Reconnect the connector to the roof console, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the roof console must be faulty; replace it.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
3	LT BLU	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 16 (7.5 A) fuse in the under-hood fuse/relay box • An open or high resistance in the wire
4	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the ground wire
1	GRY	Combination light switch (PARKING position) ON	Measure the voltage to ground: There should be battery voltage.	• Blown No. 6 (7.5 A) fuse in the passenger's under-dash fuse/relay box • An open or high resistance in the wire

REAR INDIVIDUAL MAP LIGHT INPUT TEST/REPLACEMENT

1. Carefully pry off the lens (A) with a small screwdriver.

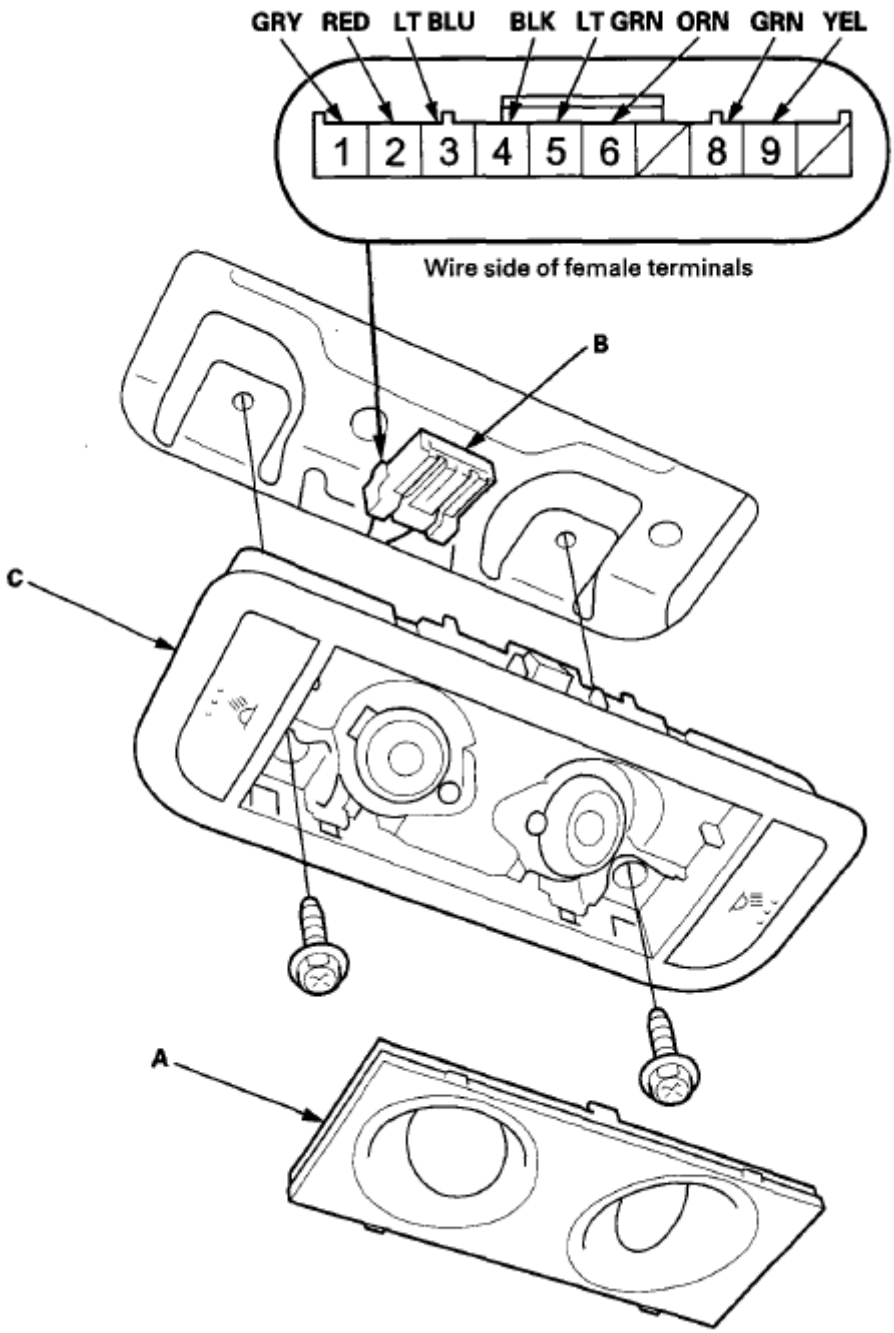

Fig. 9: Identifying 10P Connector End View, Rear Map Light And Lens
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the two mounting bolts.
3. Disconnect the 10P connector (B) from the rear individual map light (C).

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.
5. With the connector still disconnected, do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 6.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
5	LT GRN	Disconnect driver's under-dash fuse/relay box connector P (20P)	Check for continuity between terminal No. 5 and driver's under-dash fuse/relay box connector P (20P) connector terminal No. 4: There should be continuity.	An open or high resistance in the wire
6	ORN	Disconnect driver's under-dash fuse/relay box connector Q (20P)	Check for continuity between terminal No. 6 and driver's under-dash fuse/relay box connector Q (20P) connector terminal No. 4: There should be continuity.	An open or high resistance in the wire
8	GRN	Disconnect the roof console 20P connector	Check for continuity between terminal No. 8 and roof console 20P connector terminal No. 8: There should be continuity.	An open in the wire
9	YEL	Disconnect the roof console 20P connector	Check for continuity between terminal No. 9 and roof console 20P connector terminal No. 9: There should be continuity.	An open in the wire
2	RED	Disconnect the gauge control module 32P connector	Check for continuity between terminal No. 2 and gauge control module 32P connector terminal No. 8: There should be continuity.	An open or high resistance in the wire

6. Reconnect the connector to the rear individual map light, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the rear individual map light must be faulty; replace it.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
3	LT BLU	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 16 (7.5 A) fuse in the under-hood fuse/relay box • An open or high resistance in the wire
4	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G401) • An open or high resistance in the ground wire
				• Blown No. 6 (7.5 A) fuse in

1	GRY	Combination light switch (PARKING position) ON	Measure the voltage to ground: There should be battery voltage.	the passenger's under-dash fuse/relay box • An open or high resistance in the wire

TRUNK LIGHT TEST/REPLACEMENT

1. Open the trunk lid.
2. Carefully pry out the trunk light (A).

Trunk Light: 5 W

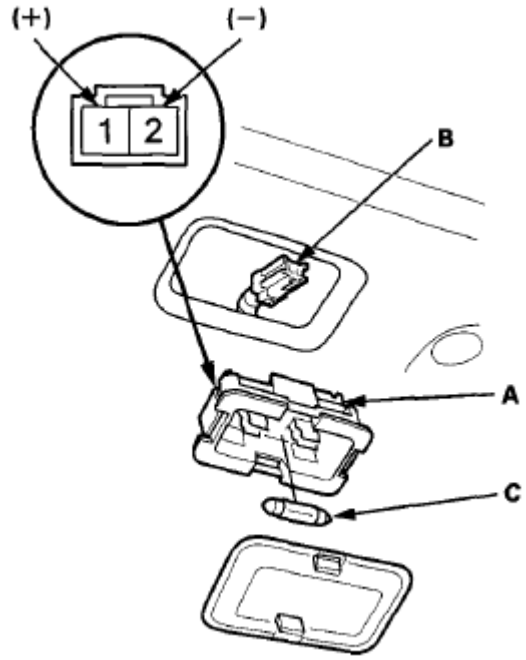

Fig. 10: Identifying 2P Connector End View, Bulb And Trunk Light
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the 2P connector (B) from the light.
4. Check for continuity between terminals No. 1 (+) and No. 2 (-). There should be continuity. If there is no continuity, check the bulb (C). If the bulb is OK, replace the trunk light assembly.
5. Install the light in the reverse order of removal.

COURTESY LIGHT REPLACEMENT

1. Carefully pry off the lens (A) with a small screwdriver.

Courtesy Light: 3.4 W

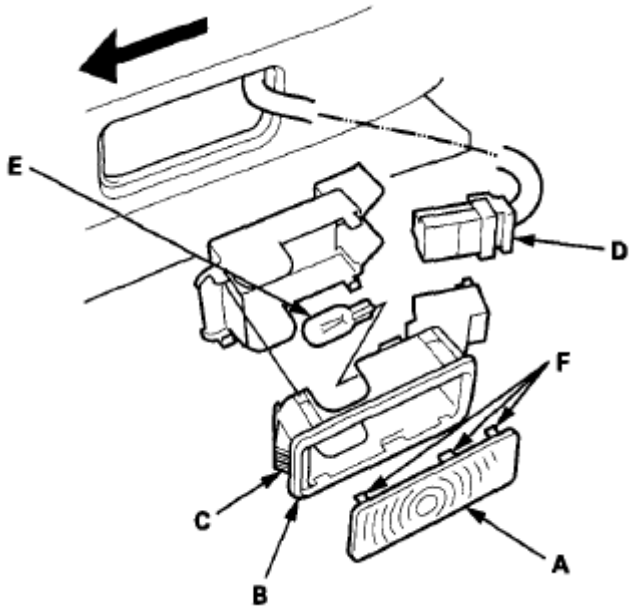

Fig. 11: Removing Housing From Door Panel By Prying At Lift Point And Disconnecting 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Carefully remove the housing (B) from the door panel by prying at the lift point (C), then disconnect the 2P connector (D).
3. Remove the bulb (E) from the socket.
4. Install the parts in the reverse order of removal. Note the direction of the lens lock tabs (F).

GLOVE BOX LIGHT REPLACEMENT

1. Remove the glove box stops and damper (see **GLOVE BOX DAMPER REPLACEMENT**).
2. Carefully pry the glove box light out of the glove box housing.
3. Twist the socket (A) to remove it from the glove box light (B).

Glove Box Light: 1.4 W

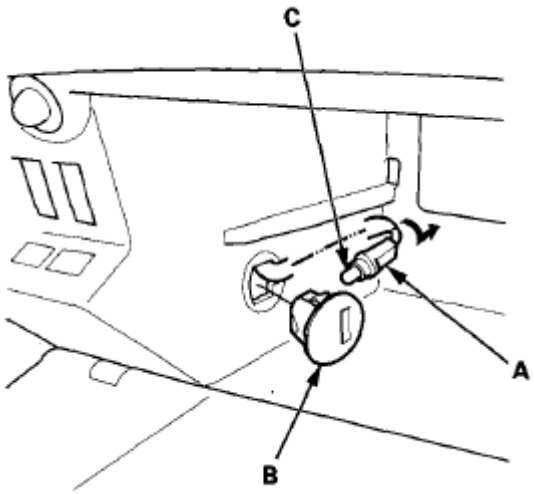

Fig. 12: Identifying Socket, Glove Box Light And Bulb
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the bulb (C) from the socket.
5. Install the light in the reverse order of removal.

CONSOLE BOX LIGHT REPLACEMENT

1. Open the center console lid.
2. Carefully pry out the console box light out of the center console.
3. Twist the socket (A) to remove it from the console box light (B).

Console Box Light: 1.4 W

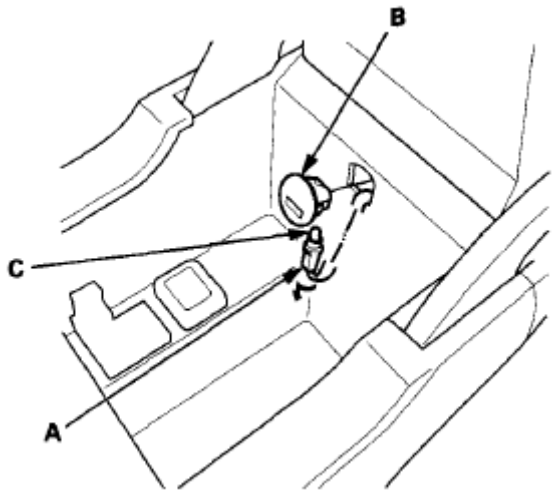

Fig. 13: Identifying Socket, Console Box Light And Bulb
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the bulb (C) from the socket.
5. Install the light in the reverse order of removal.

VANITY MIRROR LIGHT TEST/REPLACEMENT

1. Remove the sunvisor (see **TRUNK LID HINGE TRIM**).
2. Disconnect the 2P connector (A) from the sunvisor (B).

Vanity Mirror Light: 1.1 W x 2

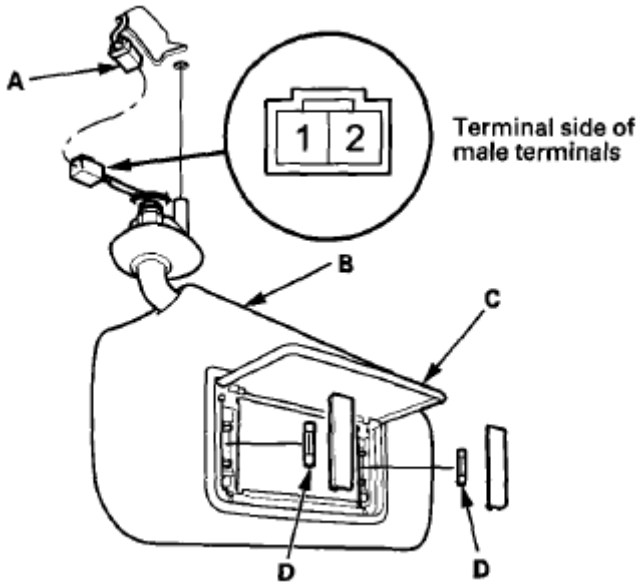

Fig. 14: Identifying 2P Connector, Sunvisor, Mirror Cover And Bulbs
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between the terminals in each vanity mirror cover (C) position according to the table.

Terminal / Position	1		2
Open	○	○	○
Closed			

Fig. 15: Continuity Reference Chart For Vanity Mirror Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the continuity is not as specified, check the bulbs (D). If the bulbs are OK, replace the sunvisor (see **TRUNK LID HINGE TRIM**).
5. Install the parts in the reverse order of removal.

FOOTWELL LIGHT REPLACEMENT

DRIVER'S

1. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
2. Remove the footwell light (A) from the driver's dashboard undercover.

   Footwell Light: LED

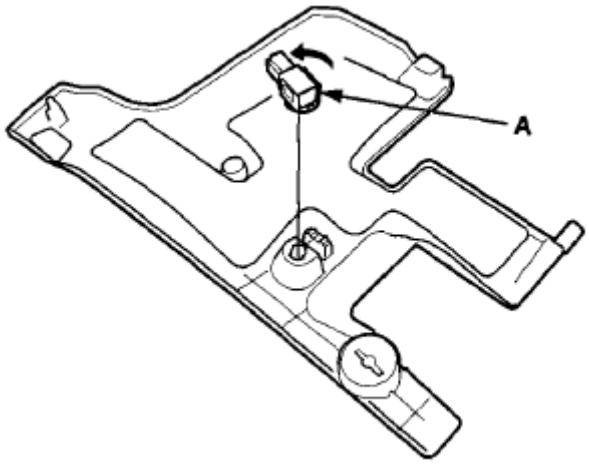

Fig. 16: Identifying Footwell Light On Driver's Dashboard Undercover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the light.
4. Install the light in the reverse order of removal.

PASSENGER'S

1. Remove the passenger's dashboard undercover (see **GLOVE BOX DAMPER REPLACEMENT**).
2. Remove the footwell light (A) from the passenger's dashboard undercover.

   Footwell Light: LED

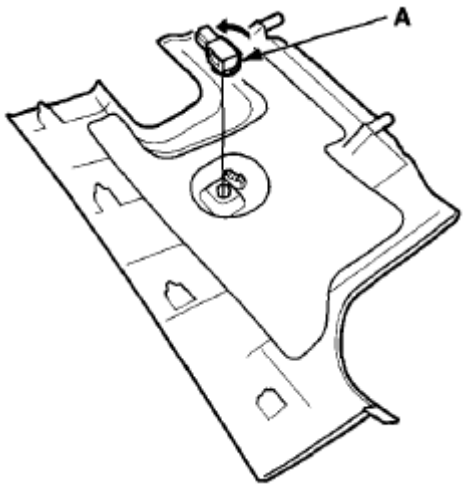

Fig. 17: Identifying Footwell Light On Passenger's Dashboard Undercover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the light.
4. Install the light in the reverse order of removal.

TRUNK LID LATCH SWITCH TEST

1. Open the trunk lid, and remove the trunk lid trim (see **TRIM REMOVAL/INSTALLATION - TRUNK LID**).
2. Disconnect the 3P connector (A) from the trunk lid latch (B).

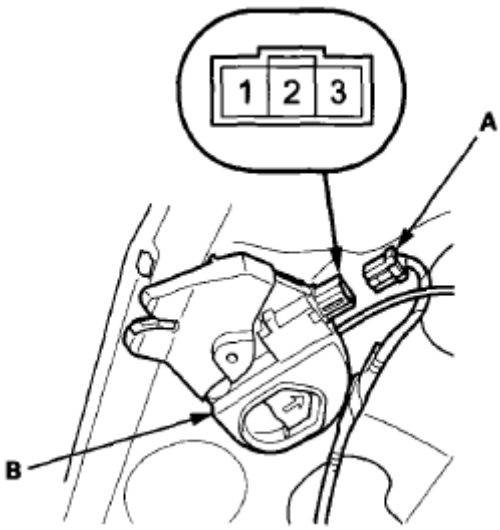

Fig. 18: Identifying 3P Connector End View, & Trunk Lid Latch
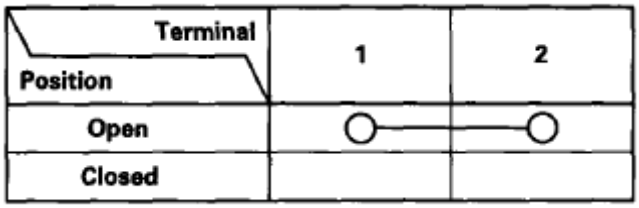
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between the terminals in each switch position according to the table.



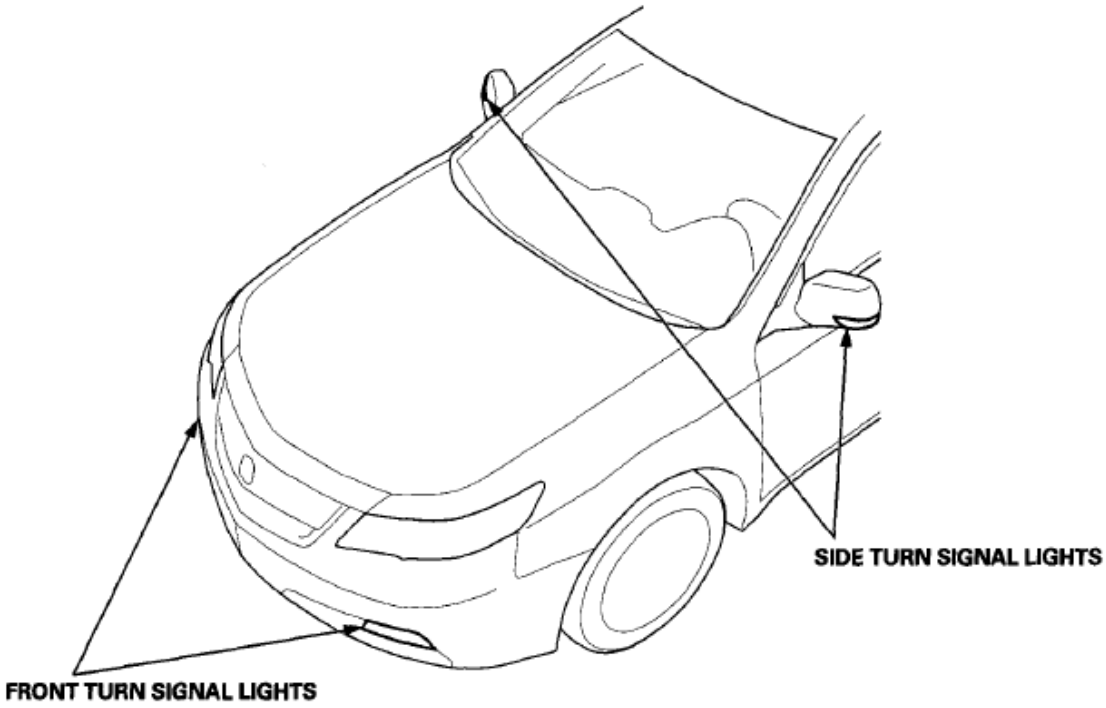


Fig. 19: Trunk Lid Latch Switch Continuity Reference Chart
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the continuity is not as specified, the trunk lid latch switch is faulty; replace the trunk lid latch (see **TRUNK LID LATCH REPLACEMENT**).

DTC TROUBLESHOOTING

DTC B1280: TURN SIGNAL SWITCH CIRCUIT MALFUNCTION

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
3. Operate the turn signal switch in the left and the right positions, and wait for at least 6 seconds.
4. Check for DTCs with the HDS.

Is DTC B1280 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.

5. Select LIGHTING from the BODY ELECTRICAL SYSTEM SELECT menu, then enter DATA LIST.
6. Check each turn signal switch position value with the DATA LIST menu.

WHEN TURN SIGNAL SWITCH IS IN LEFT POSITION

Data List	Value
Turn Signal Switch (LEFT)	ON
Turn Signal Switch (RIGHT)	OFF

WHEN TURN SIGNAL SWITCH IS IN RIGHT POSITION

Data List	Value
Turn Signal Switch (LEFT)	OFF
Turn Signal Switch (RIGHT)	ON

Are all data list values correct?

YES - Faulty driver's MICU; replace the driver's under- dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

NO - Go to step 7.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect driver's under- dash fuse/relay box connector R (24P).
9. Check for continuity between body ground and driver's under- dash fuse/relay box connector R (24P) terminals No. 13 and No. 14 individually.

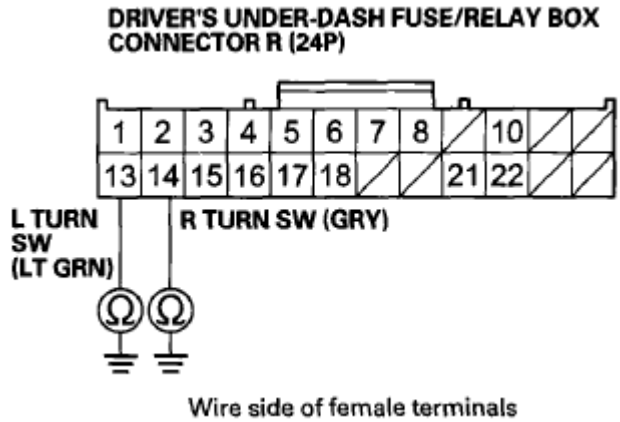

Fig. 5: Checking Continuity Between Body Ground And Driver's Under- Dash Fuse/Relay Box Connector R (24P) Terminals No. 13 And No. 14 Individually

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire.

NO - Go to step 10.

10. Check for continuity between driver's under- dash fuse/relay box connector R (24P) terminals No. 13 and No. 14.

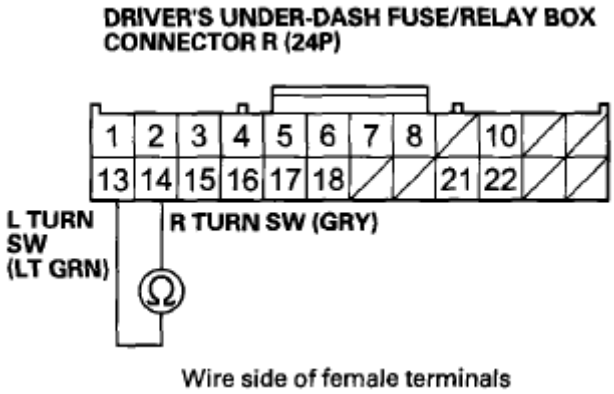

Fig. 6: Checking Continuity Between Driver's Under- Dash Fuse/Relay Box Connector R (24P) Terminals No. 13 And No. 14
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short between the wires.

NO - Replace the combination light switch (see **COMBINATION LIGHT SWITCH TEST/REPLACEMENT**).

MICU INPUT TEST

NOTE:

- **Before testing, troubleshoot the multiplex integrated control system first, using B- CAN System Diagnosis Test Mode A (see TROUBLESHOOTING - B- CAN SYSTEM DIAGNOSIS TEST MODE A).**
- **Before testing, make sure the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box is OK.**

Driver's MICU

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER**

REMOVAL/INSTALLATION).

3. Disconnect driver's under- dash fuse/relay box connectors D, F, N, P, Q, and R.

NOTE: All connector views are wire side of female terminals.

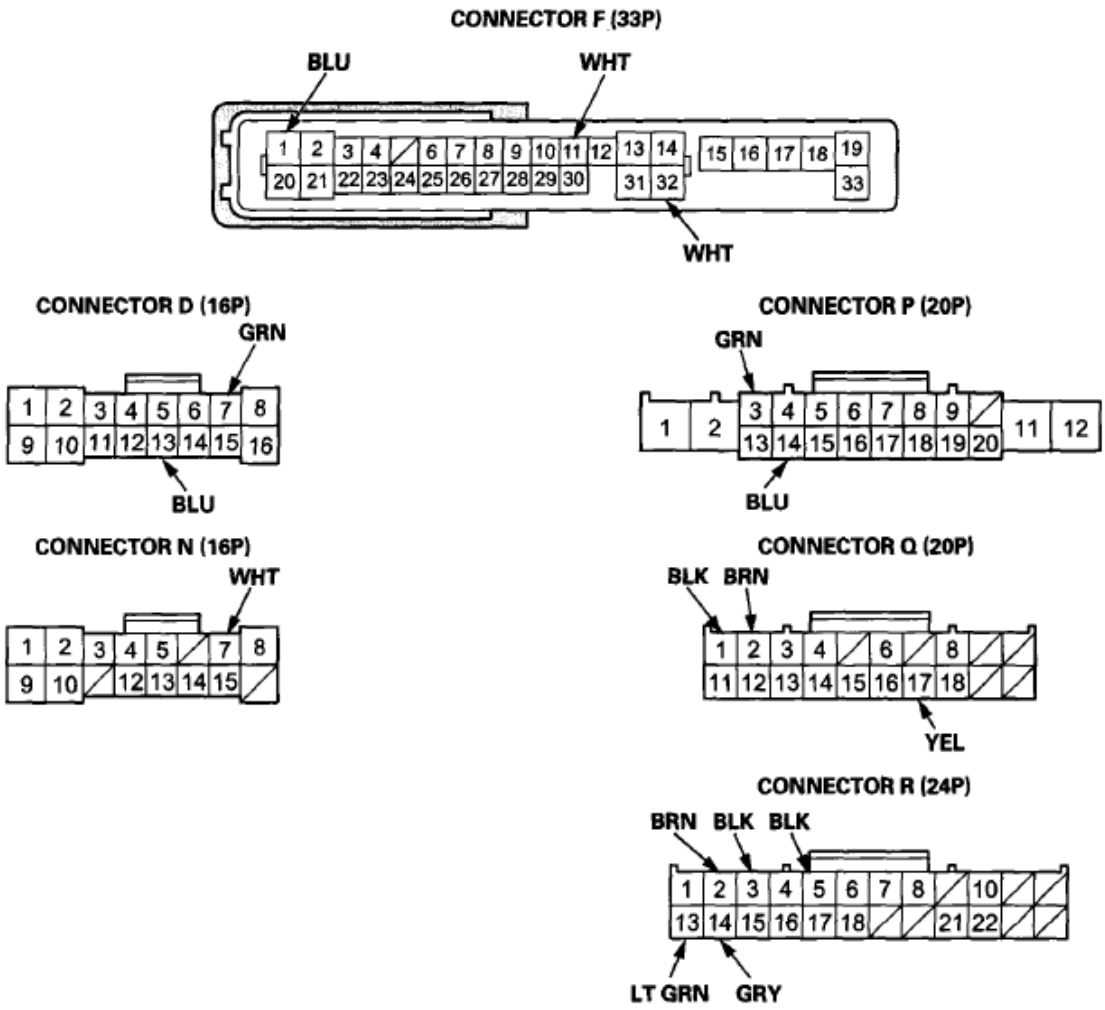

Fig. 7: Identifying Driver's MICU F (33P), D (16P), P (20P), N (16P), Q (20P) & R (24P) Connector End Views
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to step 5.
5. With the connectors still disconnected, do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to step 6.

		Test		Possible cause if desired

Cavity	Wire	condition	Test: Desired result	result is not obtained
F32	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 9 (15 A) fuse in the under-hood fuse/relay box • An open or high resistance in the wire
D7	GRN	Under all conditions	Connect terminals F32 and D7 with a jumper wire: The right rear turn signal light should come on.	• Blown bulb • Poor ground(G603)or an open in the ground wire • An open or high resistance in the wire
D13	BLU	Under all conditions	Connect terminals F32 and D13 with a jumper wire: The left rear turn signal light should come on.	• Blown bulb • Poor ground(G603)or an open in the ground wire • An open or high resistance in the wire
F1	BLU	Under all conditions	Connect terminals F32 and F1 with a jumper wire: The left front turn signal light should come on.	• Blown bulb • Poor ground(G302) or an open in the ground wire • An open or high resistance in the wire
P3	GRN	Under all conditions	Connect terminals F32 and P3 with a jumper wire: The right front turn signal light, the right side turn signal light, and the right turn signal indicator should come on.	• Blown bulb • Faulty gauge control module • Faulty indicator • Poor ground(G203, G405) or an open in the ground wire • An open or high resistance in the wire
P14	BLU	Under all conditions	Connect terminals F32 and P14 with a jumper wire: The left side turn signal light and the left turn signal indicator should come on.	• Faulty gauge control module • Faulty indicator • Poor ground(G401)or an open in the ground wire • An open or high resistance in the wire
