Every 180 days or 8,000 km (5,000 miles) the OIL LIFE display in the message center SYSTEM CHECK will decrease gradually from 100% to 0%. At 5% oil life, the CHANGE OIL SOON warning indicator will illuminate. At 0% oil life, the OIL CHANGE REQUIRED warning indicator will illuminate. OIL LIFE status is continually displayed in the SYSTEM CHECK portion of the message center and OIL LIFE warnings appear if OIL LIFE is low. For additional information, refer to the owner literature.

Warning Messages

The warning messages are single cycle, non-resettable and repetitive warning messages. The single cycle warning messages are:

- CHANGE OIL SOON
- OIL CHANGE REQUIRED
- LOW WASHER FLUID LEVEL
- LOW BRAKE FLUID LEVEL
- POWER LIFTGATE

- POWER RUNNING BOARDS

The single cycle warning messages will display once whenever the ignition switch is turned to ON or a fault occurs in a system and can be cleared by pressing the RESET button.

The repetitive warning messages are:

- CHECK CHARGING SYSTEM
- TRANSMISSION OVERHEATED
- CHECK TRANSMISSION
- LOW FUEL LEVEL
- LOW OIL PRESSURE
- CHECK ENGINE TEMPERATURE
- CHECK TIRES
- CHECK FUEL CAP

The repetitive warning messages are displayed at a fixed interval whenever the ignition switch is turned ON or is in the ACC position. To remove a repetitive warning message, press the RESET button. The message will only reoccur after 10 minutes or until the warning condition is corrected.

The non-resettable warning messages will display whenever the ignition switch is turned to ON and a fault occurs in a system. The fault must be corrected to clear the non-resettable warning messages.

The non-resettable warning messages are:

- DOOR AJAR
- BACKUP AID

Inspection and Verification

NOTE: A new instrument cluster must be reconfigured. For additional information, refer to Section 418-01.

NOTE: When installing a new instrument cluster, it is necessary to contact the Instrument Cluster Program.

1. Verify the customer concern by operating the system.

2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Low washer fluid level ● Fuel tank ● Low engine coolant level ● Accessory drive belt ● Low engine oil level	● Central junction box (CJB) fuse(s): ■ 1 (10A) ■ 15 (5A) ■ 21 (15A) ● Instrument cluster

• Low brake fluid level • Low tire pressure	• Switches or sensors • Loose or corroded connectors • Circuitry

3. If the inspection reveals obvious concern(s) that can be readily identified, repair as necessary.

4. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool manual.

6. Carry out the DATA LINK DIAGNOSTICS TEST. If the diagnostic tool responds with:
   - CKT1906, CKT914, CKT915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
   - NO RESP/NOT EQUIP for the instrument cluster, refer to Section 413-01 .
   - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the instrument cluster.

7. If the DTCs retrieved are related to the concern, refer to the Instrument Cluster Diagnostic Trouble Code (DTC) Index to continue diagnostics.

8. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart to continue diagnostics.

Instrument Cluster Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1205	IC Switch 1 Assembly Circuit Failure (Open or Short to Battery)	Instrument cluster	Go To Pinpoint Test D .
B1209	IC Switch 2 Assembly Circuit Failure (Open or Short to Battery)	Instrument cluster	Go To Pinpoint Test D .
U2013	Compass Module — No Response	Instrument cluster	Go To Pinpoint Test B .

Note: For a complete master list of all instrument cluster DTCs, refer to Section 419-10 .

Symptom Chart

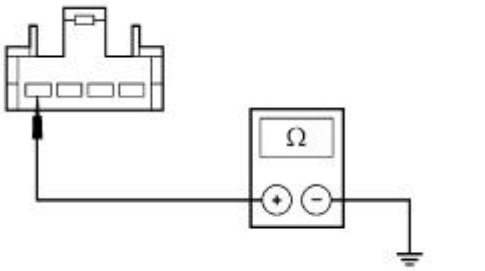
Symptom Chart

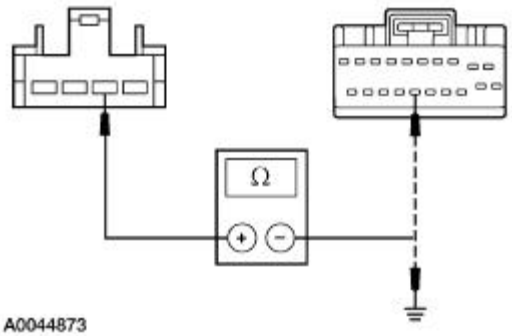
Condition	Possible Sources	Action
• No communication with the instrument cluster	• Central junction box (CJB) fuse (s):	• REFER to Section 413-01 .

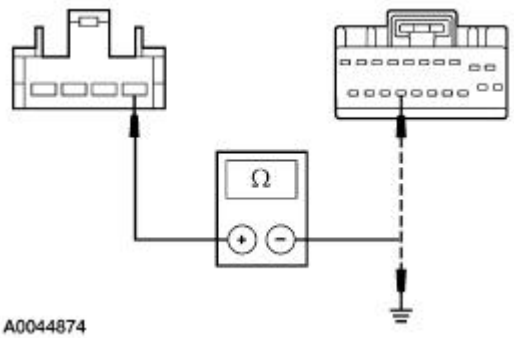
	■ 1 (10A). ■ 15 (5A). ■ 21 (15A). ● Circuitry. ● Standard corporate protocol (SCP) network. ● Instrument cluster.	
● The message center is not operating correctly	● Instrument cluster. ● Message center switch. ● Circuitry.	● Go To Pinpoint Test A .
● The compass is inoperative	● Compass sensor module. ● Instrument cluster. ● Circuitry.	● Go To Pinpoint Test B .
● The compass is inaccurate	● Zone setting. ● Calibration. ● Vehicle magnetization. ● Compass sensor module. ● Circuitry.	● Go To Pinpoint Test C .
● The message center display is blank	● Instrument cluster.	● INSTALL a new instrument cluster. REFER to Section 413-01 .
● The message center switch does not operate correctly	● Message center switch. ● Instrument cluster. ● Circuitry.	● Go To Pinpoint Test D .
● The indicator does not operate correctly — charge system display	● Generator. ● Powertrain control module (PCM). ● Instrument cluster. ● Circuitry.	● REFER to Section 413-01 .
● The indicator does not operate correctly — low washer fluid level display	● Washer fluid level switch. ● Instrument cluster. ● Circuitry.	● Go To Pinpoint Test E .
● The indicator does not operate correctly — door ajar display	● Door ajar switch (es). ● Vehicle security module. ● Instrument cluster. ● Circuitry.	● Go To Pinpoint Test F .
● The indicator does not operate correctly — low fuel level display	● Fuel pump module. ● Instrument	● Go To Pinpoint Test G .

	cluster. • Circuitry.	
• The indicator does not operate correctly — distance to empty, average fuel economy	• Instrument cluster. • Powertrain control module (PCM). • Anti-lock brake system (ABS) module. • Circuitry.	• CHECK the operation of the speedometer, the fuel gauge and the odometer. If inoperative, REFER to Section 413-01 .
• The indicator does not operate correctly — distance to empty, average fuel economy	• Instrument cluster. • Powertrain control module (PCM). • Anti-lock brake system (ABS) module. • Circuitry.	• CHECK the operation of the speedometer, the fuel gauge and the odometer. If inoperative, REFER to Section 413-01 .
• The indicator does not operate correctly — low brake fluid level display	• Brake fluid level switch. • Instrument cluster. • Circuitry.	• Go To Pinpoint Test H .
• The indicator does not operate correctly — low oil pressure display	• Oil pressure switch. • Instrument cluster. • Circuitry.	• Go To Pinpoint Test I .
• The indicator does not operate correctly — check engine temperature	• Engine temperature sensor. • Powertrain control module (PCM). • Instrument cluster. • Circuitry.	• Go To Pinpoint Test J .
• The indicator does not operate correctly — check tire pressure	• Low tire pressure module. • Instrument cluster. • Circuitry.	• Go To Pinpoint Test K .
• The indicator does not operate correctly — power liftgate	• Power liftgate module. • Instrument cluster. • Circuitry.	• Go To Pinpoint Test L .
• The indicator does not operate correctly — power running boards	• Power liftgate module. • Instrument cluster. • Circuitry.	• Go To Pinpoint Test M .
• The indicator does not operate correctly — backup aid	• Parking aid module. • Instrument cluster.	• Go To Pinpoint Test N .

	• Circuitry.	
• The outside air temperature sensor does not operate correctly	• Outside air temperature sensor. • Circuitry.	• For vehicles equipped with EATC, REFER to Section 412-00 . Without EATC, REFER to Section 413-01 .







Pinpoint Tests

PINPOINT TEST A: THE MESSAGE CENTER IS NOT OPERATING CORRECTLY

Test Step	Result / Action to Take
A1 CHECK THE INSTRUMENT CLUSTER ODOMETER OPERATION	
• Key in ON position. • Observe the odometer display in the instrument cluster. • **Is the odometer displayed?**	**Yes** The system is OK. If the INFO, SETUP or RESET buttons are inoperative, Go To Pinpoint Test D . **No** REFER to the instrument cluster self-diagnostic mode in Section 413-01 .

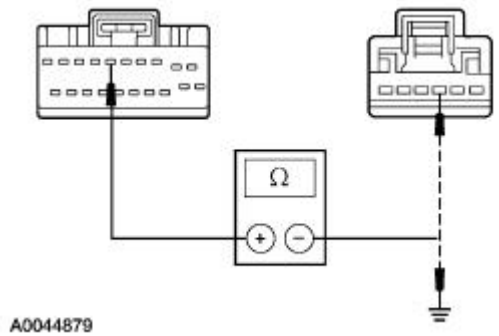
PINPOINT TEST B: THE COMPASS IS INOPERATIVE

Test Step	Result / Action to Take
CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.	
B1 CHECK CIRCUIT 1003 (GY/YE) FOR BATTERY VOLTAGE	
• Key in OFF position. • Disconnect: Compass Sensor Module C909. • Key in ON position. • Measure the voltage between the compass sensor module C909 pin 3, circuit 1003 (GY/YE), harness side and ground.  GK9616-A • **Is the voltage greater than 10 volts?**	**Yes** GO to B2 . **No** REPAIR the circuit. TEST the system for normal operation.
B2 CHECK CIRCUIT 875 (BK/LB) FOR AN OPEN	

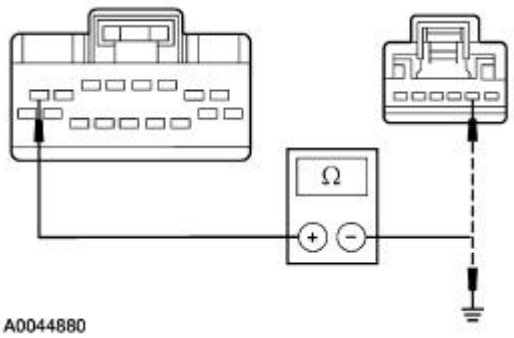
• Key in OFF position. • Measure the resistance between the compass sensor module C909 pin 4, circuit 875 (BK/LB), harness side and ground.  GK9617-A • **Is the resistance less than 5 ohms?**	**Yes** GO to B3 . **No** REPAIR the circuit. TEST the system for normal operation.
B3 CHECK CIRCUIT 702 (WH/BK) AND CIRCUIT 703 (WH/OG) FOR OPEN AND SHORT TO GROUND	
• Disconnect: Instrument Cluster C220a. • Measure the resistance between the compass sensor module C909 pin 2, circuit 703 (WH/OG), harness side and the instrument cluster C220a pin 16, circuit 703 (WH/OG), harness side; and between the compass sensor module C909 pin 2, circuit 703 (WH/OG), harness side and ground.  A0044873 • Measure the resistance between the compass sensor module C909 pin 1, circuit 702 (WH/BK), harness side and the instrument cluster C220a pin 17, circuit 702 (WH/BK), harness side; and between the compass sensor module C909 pin 1, circuit 702 (WH/BK), harness side and ground.  A0044874 • **Are the resistances less than 5 ohms between the compass sensor module and the instrument cluster; and greater than 10,000 ohms between the compass sensor module and ground?**	**Yes** INSTALL a new compass sensor module. SET the zone. REFER to Compass Zone Adjustment—With Message Center or Compass Zone Adjustment—Without Message Center in this section. CALIBRATE the compass. REFER to Compass Calibration—With Message Center or Compass Calibration—Without Message Center in this section. TEST the system for normal operation. **No** REPAIR the circuit(s) in question. TEST the system for normal operation.

PINPOINT TEST C: THE COMPASS IS INACCURATE

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>C1 CHECK THE COMPASS ZONE SETTING AND CALIBRATION
• Set the zone. Refer to Compass Zone Adjustment—With Message Center or Compass Zone Adjustment—Without Message Center in this section.
• Calibrate the compass. Refer to Compass Calibration—With Message Center or Compass Calibration—Without Message Center in this section.
• Does the compass calibrate correctly?</td><td>Yes
GO to C3 .

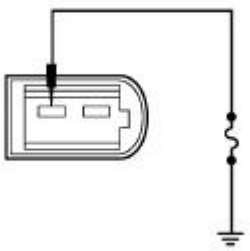


No
GO to C2 .</td></tr>
<tr><td>C2 DEMAGNETIZE THE VEHICLE
• Demagnetize the vehicle. Refer to Vehicle Demagnetizing in this section.
• Does the compass calibrate correctly?</td><td>Yes
GO to C3 .

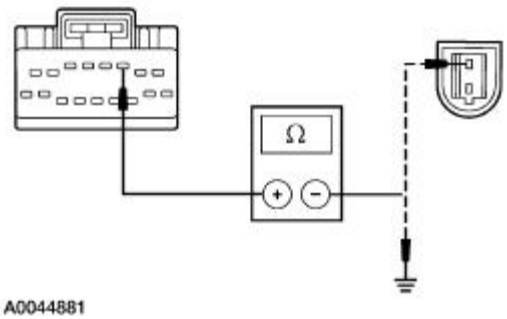


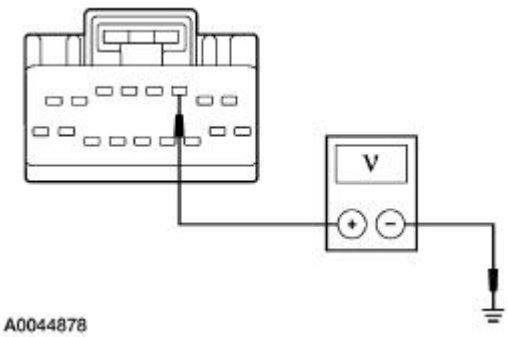
No
INSTALL a new compass sensor module. SET the zone. REFER to Compass Zone Adjustment—With Message Center or Compass Zone Adjustment—Without Message Center in this section. CALIBRATE the compass. REFER to Compass Calibration—With Message Center or Compass Calibration—Without Message Center in this section. TEST the system for normal operation.</td></tr>
<tr><td>C3 CHECK COMPASS ACCURACY
• Position the vehicle and observe the compass display as follows:
<table><tr><th>Direction</th><th>Compass Display</th></tr><tr><td>North</td><td>N</td></tr><tr><td>Northeast</td><td>NE</td></tr><tr><td>East</td><td>E</td></tr><tr><td>Southeast</td><td>SE</td></tr><tr><td>South</td><td>S</td></tr><tr><td>Southwest</td><td>SW</td></tr><tr><td>West</td><td>W</td></tr><tr><td>Northwest</td><td>NW</td></tr></table>• Does the compass display as indicated?</td><td>Yes
Compass is OK.

No
INSTALL a new compass sensor module. SET the zone. REFER to Compass Zone Adjustment—With Message Center or Compass Zone Adjustment—Without Message Center in this section. CALIBRATE the compass. REFER to Compass Calibration—With Message Center or Compass Calibration—Without Message Center in this section. TEST the system for normal operation.</td></tr>
</table>



PINPOINT TEST D: THE MESSAGE CENTER SWITCH DOES NOT OPERATE CORRECTLY





Test Step	Result / Action to

	Take
CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.	
D1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS — INSTRUMENT CLUSTER • Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Use the recorded instrument cluster DTCs from the continuous and on-demand self-test. • **Are any instrument cluster DTCs recorded?**	**Yes** If instrument cluster DTC B1205 or DTC B1209, GO to D3 . For all other instrument cluster DTCs, REFER to Section 419-10 . **No** GO to D2 .
D2 CHECK THE INSTRUMENT CLUSTER PID FOR THE MESSAGE CENTER SWITCH • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID. • Select and monitor the instrument cluster PID RESETSW, INFOSW, and SETUPSW while pressing each message center button (INFO, SETUP and RESET). • **Does the PID agree with the button position?**	**Yes** GO to D5 . **No** GO to D3 .
D3 CHECK THE MESSAGE CENTER SWITCH CIRCUIT 1411 (GY/OG) FOR OPEN AND SHORT TO GROUND • Key in OFF position. • Disconnect: Instrument Cluster C220a. • Disconnect: Message Center Switch C253. • Measure the resistance between the instrument cluster C220a pin 6, circuit 1411 (GY/OG), harness side and the message center switch C253 pin 3, circuit 1411 (GY/OG), harness side; and between the instrument cluster C220a pin 6, circuit 1411 (GY/OG), harness side and ground.  A0044879 • **Are the resistances less than 5 ohms between the instrument cluster and the message center switch; and greater than 10,000 ohms between the instrument cluster and ground?**	**Yes** GO to D4 . **No** REPAIR the circuit. TEST the system for normal operation.
D4 CHECK THE MESSAGE CENTER SWITCH CIRCUIT 1396 (VT/WH) FOR OPEN AND SHORT TO GROUND • Disconnect: Instrument Cluster C220b. • Measure the resistance between the instrument cluster C220b pin 8, circuit 1396 (VT/WH), harness side and the message center switch C253 pin 2, circuit 1396 (VT/WH), harness side; and between the instrument cluster C220b pin 8, circuit 1396 (VT/WH), harness side and ground.	**Yes** INSTALL a new message center switch. REFER to Message Center Switch in this

 A0044880 ● **Are the resistances less than 5 ohms between the instrument cluster and the message center switch; and greater than 10,000 ohms between the instrument cluster and ground?**	section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
D5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

PINPOINT TEST E: THE INDICATOR DOES NOT OPERATE CORRECTLY — LOW WASHER FLUID LEVEL DISPLAY

Test Step	Result / Action to Take
CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.	
E1 CHECK THE LOW WASHER FLUID LEVEL DISPLAY OPERATION	
● Key in OFF position. ● Disconnect: Washer Fluid Level Switch C138. ● Key in ON position. ● Connect a fused (10A) jumper wire between the washer fluid level switch C138 pin 1, circuit 81 (RD/LG), harness side and ground.  GK9178-A ● **Does the LOW WASHER FLUID message display in the message center?**	**Yes** GO to E5 . **No** GO to E2 .

E2 CHECK CIRCUIT 81 (RD/LG) FOR OPEN AND SHORT TO GROUND	
• Key in OFF position. • Disconnect: Instrument Cluster C220b. • Measure the resistance between the instrument cluster C220b pin 3, circuit 81 (RD/LG), harness side and the washer fluid level switch C138 pin 1, circuit 81 (RD/LG), harness side; and between the instrument cluster C220b pin 3, circuit 81 (RD/LG), harness side and ground.  A0044881 • **Are the resistances less than 5 ohms between the instrument cluster and the washer fluid level switch and greater than 10,000 ohms between the instrument cluster and ground?**	**Yes** GO to E3 . **No** REPAIR the circuit. TEST the system for normal operation.
E3 CHECK CIRCUIT 81 (RD/LG) FOR SHORT TO POWER	
• Key in ON position. • Measure the voltage between the instrument cluster C220b pin 3, circuit 81 (RD/LG), harness side and ground.  A0044878 • **Is there any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to E4 .
E4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.
E5 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the washer fluid level switch C138 pin 2, circuit 57 (BK), harness side and ground.	**Yes** INSTALL a new washer fluid level

 GK9179-A ● **Is the resistance less than 5 ohms?**	switch. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST F: THE INDICATOR DOES NOT OPERATE CORRECTLY—DOOR AJAR DISPLAY

Test Step	Result / Action to Take
F1 CHECK THE INTERIOR LAMPS OPERATION	
NOTE: The panel dimmer switch must be in the door position. ● Open and close each of the front doors. ● **Do the interior lamps operate correctly?**	**Yes** GO to F2 . **No** REFER to Section 417-02 .
F2 RETRIEVE THE RECORDED DTCS FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS — VEHICLE SECURITY MODULE	
● Key in OFF position. ● Connect the diagnostic tool. ● Key in ON position. ● Use the recorded vehicle security module DTCs from the continuous and on-demand self-test. ● **Are any DTCs recorded?**	**Yes** REFER to Section 419-10 . **No** GO to F3 .
F3 CHECK THE DOOR AJAR WARNING MESSAGE OPERATION	
● Enter the following diagnostic mode on the diagnostic tool: Vehicle Security Module Active Command. ● Trigger the door ajar active command. ● **Does the DOOR AJAR warning message display in the message center?**	**Yes** GO to F5 . **No** GO to F4 .
F4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
F5 CHECK FOR CORRECT VEHICLE SECURITY MODULE OPERATION	

• Disconnect all vehicle security module connectors. • Check for: • corrosion • pushed-out pins • Connect all vehicle security module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new vehicle security module. REFER to Section 419-10 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST G: THE INDICATOR DOES NOT OPERATE CORRECTLY — LOW FUEL LEVEL DISPLAY

Test Step	Result / Action to Take
G1 CHECK THE FUEL GAUGE OPERATION	
• Key in ON position. • Observe the fuel gauge operation. • **Does the fuel gauge operate correctly?**	**Yes** GO to G2 . **No** REFER to Section 413-01 .
G2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

PINPOINT TEST H: THE INDICATOR DOES NOT OPERATE CORRECTLY — LOW BRAKE FLUID LEVEL DISPLAY

Test Step	Result / Action to Take
H1 MONITOR THE BRAKE WARNING INDICATOR LAMP	
• Key in ON position. • Observe the brake warning indicator. The lamp should prove out for three seconds when the key is turned to the RUN position. • **Does the brake warning lamp illuminate for three seconds then go out?**	**Yes** GO to H2 . **No** REFER to Section 413-01 .
H2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for:	**Yes** INSTALL a new instrument cluster.

● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	REFER to Section 413-01 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

PINPOINT TEST I: THE INDICATOR DOES NOT OPERATE CORRECTLY — LOW OIL PRESSURE DISPLAY

Test Step	Result / Action to Take
I1 CHECK THE OIL PRESSURE GAUGE OPERATION	
● Key in ON position. ● Observe the oil pressure gauge operation. ● **Does the oil pressure gauge operate correctly?**	**Yes** GO to I2 . **No** REFER to Section 413-01 .
I2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

PINPOINT TEST J: THE INDICATOR DOES NOT OPERATE CORRECTLY — CHECK ENGINE TEMPERATURE

Test Step	Result / Action to Take
J1 CHECK THE TEMPERATURE GAUGE OPERATION	
● Key in ON position. ● Observe the temperature gauge operation. ● **Does the temperature gauge operate correctly?**	**Yes** GO to J2 . **No** REFER to Section 413-01 .
J2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or

correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	corroded connector.

PINPOINT TEST K: THE INDICATOR DOES NOT OPERATE CORRECTLY — CHECK TIRE PRESSURE

Test Step	Result / Action to Take
K1 CHECK THE TIRE PRESSURE	
• Check the tire pressure on all tires. Refer to the safety certification sticker located on the driver door jamb for tire inflation pressure specifications. • **Are the tire inflation pressures correct?**	**Yes** GO to K2 . **No** INFLATE the tire(s) to the correct tire inflation pressure specification listed on the safety certification sticker. TEST the system for normal operation.
K2 RETRIEVE THE RECORDED DTCS FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS — LOW TIRE PRESSURE MODULE	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Use the recorded low tire pressure module DTCs from the continuous and on-demand self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 419-10 . **No** GO to K3 .
K3 CHECK THE TIRE PRESSURE WARNING MESSAGE OPERATION	
• Enter the following diagnostic mode on the diagnostic tool: Low Tire Pressure Module Active Command. • Trigger the low tire pressure active command. • **Does the CHECK TIRES warning message display in the message center?**	**Yes** GO to K5 . **No** GO to K4 .
K4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.
K5 CHECK FOR CORRECT LOW TIRE PRESSURE MODULE OPERATION	
• Disconnect the low tire pressure module connector. • Check for: ◦ corrosion ◦ pushed-out pins	**Yes** INSTALL a new low tire pressure module. REFER to Section 413-09 . **No**

• Connect the low tire pressure module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

PINPOINT TEST L: THE INDICATOR DOES NOT OPERATE CORRECTLY—POWER LIFTGATE

Test Step	Result / Action to Take
L1 RETRIEVE THE RECORDED DTCS FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS — POWER LIFTGATE MODULE	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Use the recorded power liftgate module DTCs from the continuous and on-demand self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 419-10 . **No** GO to L2 .
L2 CHECK THE POWER LIFTGATE WARNING MESSAGE OPERATION	
• Enter the following diagnostic mode on the diagnostic tool: Power Liftgate Module PID Access. • Monitor the power liftgate open or closed status PID. • **Does the actual position of the liftgate agree with the PID?**	**Yes** GO to L3 . **No** REFER to Section 501-03 .
L3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST M: THE INDICATOR DOES NOT OPERATE CORRECTLY—POWER RUNNING BOARDS

Test Step	Result / Action to Take
M1 RETRIEVE THE RECORDED DTCS FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS — POWER LIFTGATE MODULE	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Use the recorded power liftgate module	**Yes** REFER to Section 419-10 . **No**

DTCs from the continuous and on-demand self-test. ● **Are any DTCs recorded?**	GO to M2 .
M2 CHECK THE POWER RUNNING BOARDS WARNING MESSAGE OPERATION ● Enter the following diagnostic mode on the diagnostic tool: Power Liftgate Module PID Access. ● Monitor the power running board(s) in or out status PID. ● **Does the actual position of the power running board(s) agree with the PID?**	**Yes** GO to M3 . **No** REFER to Section 501-03 .
M3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION ● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST N: THE INDICATOR DOES NOT OPERATE CORRECTLY—BACKUP AID

Test Step	Result / Action to Take
N1 RETRIEVE THE RECORDED DTCS FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS — PARKING AID MODULE ● Key in OFF position. ● Connect the diagnostic tool. ● Key in ON position. ● Use the recorded parking aid module DTCs from the continuous and on-demand self-test. ● **Are any DTCs recorded?**	**Yes** REFER to Section 419-10 . **No** GO to N2 .
N2 CHECK THE BACKUP AID WARNING MESSAGE OPERATION ● Enter the following diagnostic mode on the diagnostic tool: Parking Aid Module PID Access. ● Monitor the parking aid module PRNDL range status PID. ● **Does the actual position of the PRNDL range agree with the PID?**	**Yes** GO to N3 . **No** REFER to Section 413-13 .
N3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION ● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . **No**

• Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Vehicle Demagnetizing

CAUTION: During demagnetizing, the demagnetizer coil will be pulled toward the vehicle. Place a cloth over the vehicle's roof to protect the vehicle's surface if contact occurs. Make sure the cloth covers the front third and the entire width of the roof.

NOTE: The demagnetizing process requires the use of a demagnetizing coil commonly used by television service technicians to demagnetize television tubes.

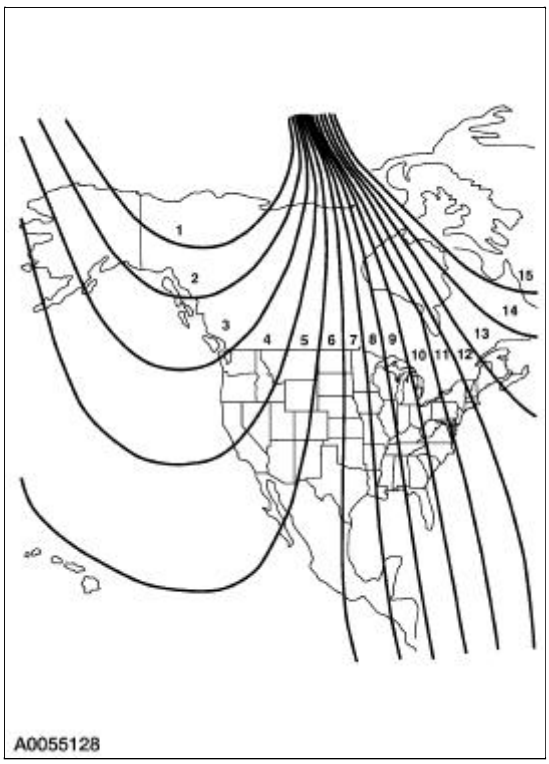
NOTE: To demagnetize, use a constant circular motion over the vehicle's roof. Do not turn off the demagnetizer while sweeping the vehicle's roof to prevent remagnetizing ferrous materials contained in the vehicle.

NOTE: During the demagnetizing process, make sure the phenolic surface of the tool (the side opposite the handle) is closest to the vehicle's surface.

1. Demagnetize the front third of the vehicle's roof.
    1. Turn on the demagnetizer at least 1 meter (3 ft) away from the vehicle.
    2. Holding the demagnetizer no more than 2.5 cm (1 in) from the roof and starting on the passenger side, demagnetize the front third of the roof closest to the windshield using a constant circular motion. Keep the circle's radius within 30 cm (12 in) while sweeping across the entire surface of the roof closest to the windshield. Continue the circular motion four times.
    3. After the fourth pass and without stopping, move the demagnetizer at least 1 meter (3 ft) away from the vehicle.
    4. Turn the demagnetizer off.

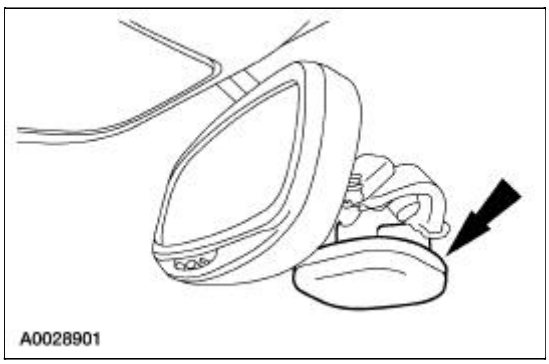
2. **NOTE:** The demagnetizer must be located over the outside of the windshield no greater than 2.5 cm (1 in).

   Demagnetize the inside rear view mirror mounting pad.
    1. Turn on the demagnetizer at least 1 meter (3 ft) away from the vehicle.
    2. Using a circular motion, pass the demagnetizer over the outside of the windshield near the inside rear view mirror mounting pad. Without stopping, move the demagnetizer at least 1 meter (3 ft) away from the vehicle.
    3. Turn the demagnetizer off.



3. Carry out the Compass Zone Adjustment procedure. Refer to Compass Zone Adjustment—With Message Center or Compass Zone Adjustment—Without Message Center in this section.

4. Carry out the Calibration Adjustment procedure. Refer to Compass Calibration—With Message Center or Compass Calibration—Without Message Center in this section.



Compass Zone Adjustment —With Message Center

1. **NOTE:** The compass zone setting is preset from the factory to Zone 8.

   Determine which magnetic zone you are in for your geographic location.

2. Start the engine.
3. Press the message center switch INFO button until the compass information is displayed.
4. Locate the compass module at the base of the mirror.

5. Press and hold the reset button on the LH top of the compass sensor module until RESET FOr ZONE appears in the message center display.

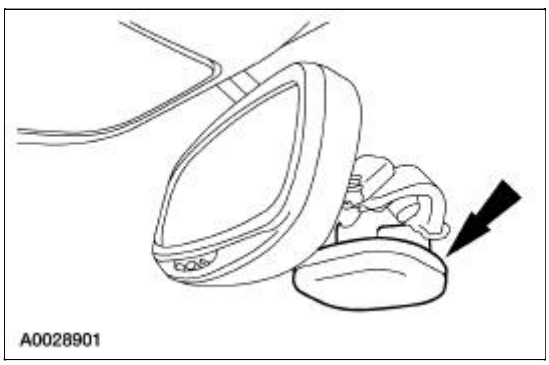
6. Press the message center RESET button until SETUP ZONE XX is displayed in the message center display.

7. **NOTE:** To exit the compass zone adjustment mode before carrying out a compass zone adjustment, press the INFO button.

   Press the SETUP button repeatedly until the correct zone setting for your geographic location is displayed.

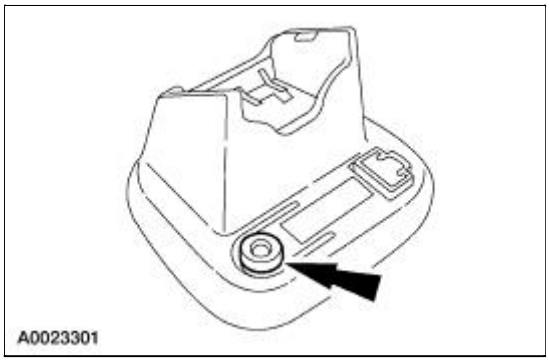
8. Press the RESET button to exit the zone setting mode and lock you individual zone.

Compass Zone Adjustment —Without Message Center



1. **NOTE:** The compass zone setting is preset from the factory to Zone 8.

   Determine which magnetic zone you are in for your geographic location.

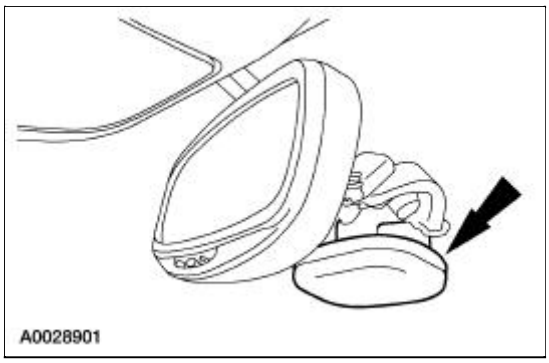


2. Turn the ignition key to the ON position.

3. Locate the compass module at the base of the mirror.

4. Press and hold the reset button on the LH top of the compass sensor module. Press and hold until ZONE and the current zone setting (1-15) appear in the instrument cluster display, and release.

5. Press the reset button repeatedly to cycle through the possible zone settings until the setting for your geographic location is displayed.



6. Release the button to exit the zone setting mode. After approximately five seconds the display will report the direction and the zone will be set.

Compass Calibration —With Message Center

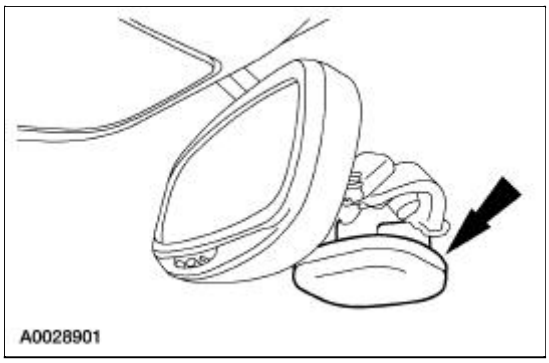
1. **NOTE:** For optimum calibration, drive to an open, level location away from large metallic objects or structures. Switch off all non-essential electrical accessories (rear window defrost, heater A/C, map lamps, wiper, etc.) and make sure all the doors are closed.

   Start the vehicle.

2. Locate the compass module at the base of the mirror.

3. **NOTE:** To exit CAL mode before carrying out a compass adjustment, turn thw ignition switch to the OFF position.

   Press the RESET button located on top LH side of the compass module until ZONE appears. Continue to hold the button down until CIRCLE SLOWLY TO CAL is displayed in the message center display.



4. Slowly drive the vehicle in a circle at no more than five times at no more than 5 km/h (3 mph) until CIRCLE SLOWLY TO CAL changes to CALIBRATION COMPLETED in the message center.

Compass Calibration —Without Message Center

1. **NOTE:** For optimum calibration, drive to an open, level location away from large metallic objects or structures. Switch off all non-essential electrical accessories (rear window defrost, heater A/C, map lamps, wiper, etc.) and make sure all the doors are closed.

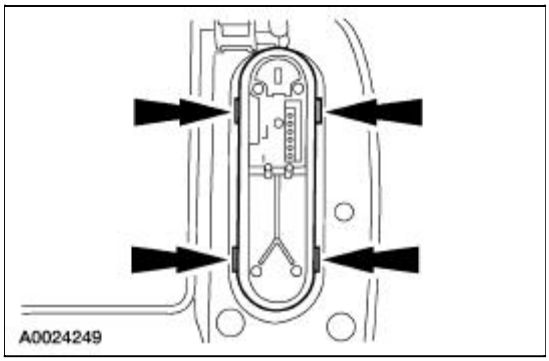
   Start the vehicle.

2. Locate the compass module at the base of the mirror.

3. **NOTE:** To exit CAL mode before carrying out a compass adjustment, turn thw ignition switch to the OFF position.

   Press the RESET button located on top LH side of the compass module until ZONE appears. Continue to hold the button down until CAL is displayed in the instrument cluster compass display and release the button.

4. Slowly drive the vehicle in a circle at no more than 5 km/h (3 mph) until CAL turns off (approximately four to five circles).



Message Center Switch

Removal and Installation

1. Remove the instrument cluster center finish panel. For additional information refer to Section 501-12 .

2. **NOTE:** Navigator shown, Expedition similar.

   Disconnect the message center switch electrical connector.
   Depress the tabs and remove the message center switch.

3. To install, reverse the removal procedure.

Warning Devices

The warning device system consists of the following:

- safety belt warning lamp switch
- door ajar switch
- liftgate ajar switch
- instrument cluster
- key-in-ignition warning switch
- headlamp on warning
- low washer fluid warning
- tire pressure monitor (TPM)
- low oil pressure
- backup aid
- air suspension
- advance traction control

Warning Devices

Refer to Wiring Diagrams Cell 21 for schematic and connector information.

Refer to Wiring Diagrams Cell 59 for schematic and connector information.

Refer to Wiring Diagrams Cell 60 for schematic and connector information.

Refer to Wiring Diagrams Cell 66 for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418–F224 New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool

Principles of Operation

Safety Belt Warning Chime

The safety belt warning chime warns that the safety belt is not fastened. The safety belt warning chime will sound when the driver safety belt is not fastened and the ignition switch is turned to RUN or START.

The safety belt warning chime will stop sounding when:

- the safety belt is fastened.
- the ignition switch is switched to the OFF/LOCK or ACC position.
- the chime has sounded for six seconds.

The safety belt warning chime inputs are:

- ignition switch RUN/START position
- ignition switch RUN/ACC position
- driver safety belt switch
- restraint control module

Output is the instrument cluster chime.

Belt Minder

The belt minder feature is configurable. For additional information, refer to Section 418-01 . To configure without using a diagnostic tool, refer to Belt Minder Deactivating/Activating in this section.

The belt minder feature supplements the current safety belt warning function. The belt minder feature is enabled after the current safety belt warning is complete. The belt minder reminds the driver that their safety belt is unbuckled by intermittently sounding a chime and illuminating the safety belt warning lamp in the instrument cluster once the vehicle speed has exceeded three mph. While activated, the belt minder alternates the chime and indicator from ON for 6 seconds to OFF for 30 seconds.

The belt minder reminder stops when:

- the driver safety belt is buckled.
- the ignition is turned to OFF or ACC.
- five minutes have elapsed since the belt minder has started.

Door Ajar Warning Chime

The door ajar warning chime warns that a door is ajar. The door ajar warning chime is a single chime with a one-second duration. The door ajar chime will sound when the driver or passenger door, liftgate or liftgate glass becomes ajar while the ignition switch is in the RUN position.

The door ajar warning chime inputs are:

- ignition switch RUN position
- door ajar switches
- liftgate/liftgate glass ajar switches

The output is the instrument cluster chime.

Key-In-Ignition Warning Chime

The key-in-ignition chime warns that the key is in the ignition when the driver door is ajar. The key-in-ignition warning chime will sound when all the following conditions are met:

- The driver door is ajar.
- The key is in the ignition.
- The ignition switch is in the OFF/LOCK or ACC position.

The key-in-ignition warning chime will stop sounding when:

- The driver door is closed.
- The key is removed from the ignition.
- The ignition switch is switched to the RUN position.

The key-in-ignition warning chime inputs are:

- ignition switch RUN/START position
- ignition switch RUN/ACC position
- key-in-ignition switch
- LH door ajar switch

Output is the instrument cluster chime.

Headlamp On Warning Chime

The headlamp on warning chime warns that the headlamps are on while the driver door is ajar. The headlamp on warning chime will sound when all the following conditions are met:

- The driver door is ajar.
- The headlamp switch is in the PARK or HEAD position.
- The ignition switch is in the OFF/LOCK position.
- The key is out of the ignition switch.

The headlamp on warning chime will stop sounding when any one of the conditions above are removed.

The headlamp on warning chime inputs are:

- ignition switch not indicating OFF
- headlamp switch is OFF
- driver door ajar switch is closed
- key-in-ignition switch is closed

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Key-in-ignition warning switch • Door open warning lamp switch • Safety belt warning indicator switch • Headlamp switch	• Central junction box (CJB) fuses: ▪ 1 (10A) ▪ 15 (5A) ▪ 21 (15A) • Damaged wiring harness • Loose or corroded connections • Instrument cluster

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident,, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
    - check that the program card is correctly installed.
    - check the connections to the vehicle.
    - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the DATA LINK DIAGNOSTICS TEST. If the diagnostic tool responds with:
    - CKT914, CKT915 or CKT693 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
    - NO RESP/NOT EQUIP for INSTRUMENT CLUSTER, go to Section 413-01 .
    - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs, and carry out the self-test diagnostics for the instrument cluster.

7. If the DTCs retrieved are related to the concern, go to the Instrument Cluster Diagnostic Trouble Code (DTC) Index to continue diagnostics.

8. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart.

Instrument Cluster Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1352	Ignition Key-In Circuit Failure	Instrument Cluster	Go To Pinpoint Test B .
—	All Other DTCs	Instrument Cluster	REFER to Section 419-10 .

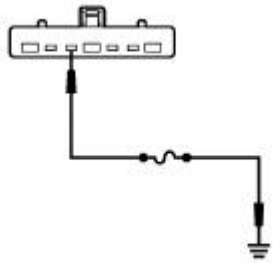
Symptom Chart

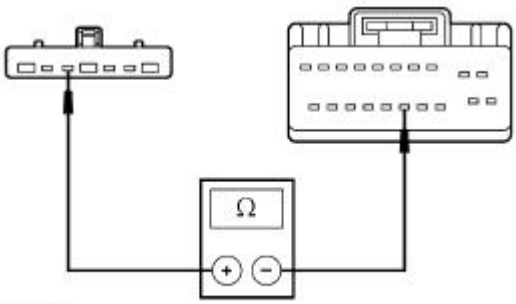
Symptom Chart

Condition	Possible Sources	Action
• No communication with the instrument cluster module	• CJB fuses: ■ 1 (10A). ■ 15 (5A). ■ 21 (15A). • Circuitry. • Instrument cluster.	• REFER to Section 413-01 .
• All chimes are inoperative	• Instrument cluster.	• REFER to Section 413-01 .
• The safety belt warning chime is inoperative	• Circuitry. • Safety belt switch. • Instrument cluster.	• Go To Pinpoint Test A .
• The belt minder feature is not operating correctly	• Circuitry. • Safety belt	• Go To Pinpoint Test

	switch. ● Instrument cluster.	A .
● A chime is inoperative — key in ignition (with door ajar)	● Circuitry. ● Headlamp switch. ● Instrument cluster.	● Go To Pinpoint Test B .
● A chime is inoperative—head/parking lamps ON (with door ajar)	● Circuitry. ● Headlamp switch. ● Instrument cluster.	● Go To Pinpoint Test C .
● The chime sounds when the driver door is ajar (no key in the ignition and headlights off)	● Circuitry. ● Key-in-ignition switch. ● Instrument cluster.	● Go To Pinpoint Test D .
● A chime does not operate correctly — the air bag warning tone	● Instrument cluster. ● Circuitry.	● Go To Pinpoint Test D .

Pinpoint Tests





PINPOINT TEST A: THE SAFETY BELT WARNING CHIME IS INOPERATIVE

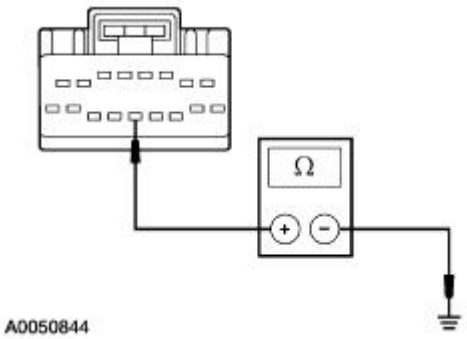
Test Step	Result / Action to Take
A1 CHECK THE CHIME	
NOTE: Verify if the belt minder is in the deactivated or activated mode. ● Connect the diagnostic tool. ● Key in ON position. ● In the active command mode select Warning Lamps and Chime. ● Request chime ON. ● **Did the chime sound?**	**Yes** GO to A2 . **No** GO to A3 .
A2 CHECK THE DRIVER SAFETY BELT SWITCH	
● Key in OFF position. ● Make sure the safety belt is unlatched. ● Key in ON position. ● **Does the safety belt warning lamp illuminate?**	**Yes** GO to A3 . **No** DIAGNOSE safety belt warning indicator. REFER to Section 413-01 .
A3 VERIFY THE SYMPTOM	
● Key in OFF position. ● Key in ON position. ● **Is the symptom still present?**	**Yes** GO to A4 . **No**

	The system is working correctly.
A4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.

PINPOINT TEST B: A CHIME IS INOPERATIVE—KEY IN IGNITION (WITH DOOR AJAR)

Test Step	Result / Action to Take
B1 CHECK FOR FAULTY INSTRUMENT CLUSTER CHIME FUNCTION	
• Key in ON position. • Connect the diagnostic tool. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster ACM. • In the Active Command Mode select Warning Lamps and Chime. • Select Chime ON. • **Did the chime sound?**	**Yes** GO to B2 . **No** GO to B6 .
B2 MONITOR INSTRUMENT CLUSTER PID IGN_KEY	
• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID. • Monitor the instrument cluster PID IGN_KEY while inserting and removing the key from the ignition switch. • **Does the instrument cluster PID IGN_KEY values agree with the key positions?**	**Yes** GO to B3 . **No** GO to B4 .
B3 CHECK THE DRIVER DOOR AJAR PID	
• Key in ON position. • Monitor the instrument cluster PID D_DR_SW while opening and closing the driver front door. • **Does the PID agree with the door position?**	**Yes** GO to B6 . **No** DIAGNOSE the door ajar switches. REFER to Section 417-02 .
B4 CHECK FOR A FAULTY KEY-IN-IGNITION SWITCH	
• Disconnect: Ignition Switch C250. • While monitoring instrument cluster PID IGN_KEY, connect a fused (10A) jumper from ignition switch C250 pin 5, circuit 158 (BK/PK) harness side to ground.	**Yes** INSTALL a new key-in-ignition switch. TEST the system for normal operation. **No** GO to B5 .

 A0050841 ● **Does PID IGN_KEY read OUT then IN when the circuit was jumpered to ground?**	
B5 CHECK CIRCUIT 158 (BK/PK) FOR AN OPEN	
● Key in OFF position. ● Disconnect: Instrument Cluster C220a. ● Measure the resistance between ignition switch C250 pin 5, circuit 158 (BK/PK) harness side and instrument cluster C220a pin 15, circuit 158 (BK/PK) harness side.  A0050842 ● **Is the resistance less than 5 ohms?**	**Yes** GO to B6 . **No** REPAIR the circuit. TEST the system for normal operation.
B6 VERIFY THE SYMPTOM	
● Key in OFF position. ● Connect: Instrument Cluster 220a. ● Connect: Ignition Switch C250. ● Key in ON position. ● **Is the symptom still present?**	**Yes** GO to B7 . **No** The system is working correctly.
B7 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.



PINPOINT TEST C: A CHIME IS INOPERATIVE-HEAD/PARKING LAMPS ON (WITH DOOR AJAR)

Test Step	Result / Action to Take
C1 CHECK THE CHIME FUNCTION	
• Key in ON position. • Connect the diagnostic tool. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster ACM. • In the Active Command Mode, select Warning Lamps and Chime. • Select Chime ON. • **Does the chime sound?**	**Yes** GO to C2 . **No** GO to C6 .
C2 CHECK THE DRIVER DOOR AJAR PID D_DR_SW	
• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID. • Monitor the instrument cluster PID D_DR_SW while opening and closing the driver door. • **Does the instrument cluster PID D_DR_SW agree with the door position?**	**Yes** GO to C3 . **No** REFER to Section 417-02 .
C3 CHECK THE HEADLAMP SWITCH PID PARK_SW	
• Monitor the instrument cluster PID PARK_SW while turning the headlamps on and off. • **Do the instrument cluster PID PARK_SW values agree with the headlamp switch positions?**	**Yes** GO to C4 . **No** GO to C5 .
C4 CHECK THE HEADLAMP SWITCH	
• Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** GO to C5 . **No** INSTALL a new headlamp switch. REFER to Section 417-01 . TEST the system for normal operation.
C5 CHECK CIRCUIT 402 (OG/LG) FOR AN OPEN	
• Key in OFF position. • Disconnect: Headlamp Switch C205b. • Disconnect: Instrument Cluster C220b. • Measure the resistance between headlamp switch C205b pin 2, circuit 402 (OG/LG), harness side and instrument cluster C220b pin 11, circuit 402 (OG/LG), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to C6 . **No** REPAIR the circuit. TEST the system for normal operation.
C6 VERIFY THE SYMPTOM	
• Key in OFF position. • Connect: Instrument Cluster C220b. • Connect: Headlamp Switch C205b. • Key in ON position.	**Yes** GO to C7 . **No**

• **Is the symptom still present?**	The system is working correctly.
C7 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.

PINPOINT TEST D: A CHIME DOES NOT OPERATE CORRECTLY—AIR BAG WARNING TONE

Test Step	Result / Action to Take
D1 CHECK THE AIR BAG WARNING LAMP OPERATION	
• Key in OFF position. • Key in ON position. • **Does the air bag warning lamp illuminate?**	**Yes** GO to D2 . **No** DIAGNOSE the air bag warning lamp. REFER to Section 413-01 .
D2 CHECK EXTERNAL CHIME REQUEST PID IPCHIME	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID. • Monitor the instrument cluster PID IPCHIME. • **Does instrument cluster PID IPCHIME indicate ON?**	**Yes** GO to D3 . **No** GO to D5 .
D3 CHECK FOR A FAULTY RESTRAINT CONTROL MODULE (RCM)	
• Disconnect: RCM C310a. • **Does the instrument cluster PID IPCHIME still read ON?**	**Yes** GO to D4 . **No** DIAGNOSE the RCM module. REFER to Section 501-20B .
D4 CHECK CIRCUIT 1083 (LB/BK) FOR SHORT TO GROUND	
• Disconnect: Instrument Cluster C220b. • Measure the resistance between instrument cluster C220b pin 13, circuit 1083 (LB/BK), harness side and ground.	**Yes** GO to D5 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0050844 ● **Is the resistance greater than 10,000 ohms?**	
D5 VERIFY THE SYMPTOM	**Yes** GO to D6 . **No** The system is working correctly.
● Key in OFF position. ● Connect: Instrument Cluster C220b. ● Connect: RCM C2041. ● Key in ON position. ● **Is the symptom still present?**	
D6 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.
● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	

Switch —Door Ajar

Removal and Installation

For additional information, refer to Section 501-14 .

Switch —Key In Ignition Warning

Removal and Installation

1. The key-in-ignition switch is part of the ignition switch. Refer to Section 211-05 .

General Specifications

Item	Specification
Azimuth system check object position 1 (P1) and position 5 (P5), distance from sensor	160 cm (63 in)
Azimuth system check object position 2 (P2), 3 (3P3), and position 4 (P4), distance from sensor	5 m (16.4 ft)

Parking Aid —Reverse Sensing System

The parking aid system consists of the following:

- one radar sensor (located in the center of the rear bumper)
- two ultrasonic parking aid sensors (located on the left and right side of the rear bumper)
- parking aid module (PAM) (located behind the LH C-pillar trim panel)
- parking aid speaker—audible warning tone (located in the parking aid module)
- reverse gear select input (to the parking aid module from reverse lamp circuit)

Parking Aid —Reverse Sensing System

Refer to Wiring Diagrams Cell 66 , Warning Chimes for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418–F224, New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool

Principles of Operation

NOTE: The liftgate must be closed for correct operation of the parking aid system.

The parking aid system detects objects behind the vehicle when the vehicle is in reverse gear. The parking aid module (PAM) does this by calculating the distance to an object by the use of two ultrasonic sensors and one radar sensor mounted in the rear bumper. The ultrasonic field is emitted in a semicircular area around the rear of the vehicle. The parking aid sensors can detect objects approximately 5 m (16.4 ft) when the vehicle is moving and 3 m (9.8 ft) when the vehicle is stationary to the rear of the vehicle, 50 cm (1.6 ft) to the rear side of the vehicle, and 16 cm (6 in) above ground. A 750 Hz variable warning tone is generated from a parking aid speaker attached to the PAM. The parking aid speaker increases its warning tone rate as the vehicle gets closer to an obstacle. When an object is detected within 45 cm (18 inches) of the sensors, the warning tone becomes continuous.

The parking aid system is enabled when the vehicle ignition is in RUN and reverse (R) gear is selected. The system can be disabled by pressing the menu button on the message center. The parking aid system will indicate it is disabled by illuminating the park assist off located in the message center. The system will always enable when the ignition is transitioned to RUN, or upon entry into REVERSE (R) gear is selected.

The parking aid system will be disabled if a fault is detected in one of the three sensors, the parking aid speaker or the PAM. This will be indicated by the parking assist off in the message center. The PAM is on the International Standards Organization (ISO) 9141 network and can be diagnosed with a diagnostic tool.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Central junction box (CJB) fuse 27 (5A) • Circuitry • Parking aid module (PAM) • Relays • Parking aid sensors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:
   - CKT 914, CKT 915 or CKT 70 — ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
   - NO RESP/NOT EQUIP for PAM, go to Pinpoint Test A.
   - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the parking aid (PAM) module.

7. If the DTCs retrieved are related to the concern, go to the PAM Diagnostic Trouble Code (DTC) Index.

8. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart.

Park Aid Calibration and Self-Test Diagnostics

9. Connect the diagnostic tool.

10. Clear the DTCs.

11. Transmit the Radar Calibration Command ($8905). This will pre-condition the module for the park aid self-test.

12. RUN the park aid self-test.

13. RETRIEVE the stored DTCs. REFER to DTC index.

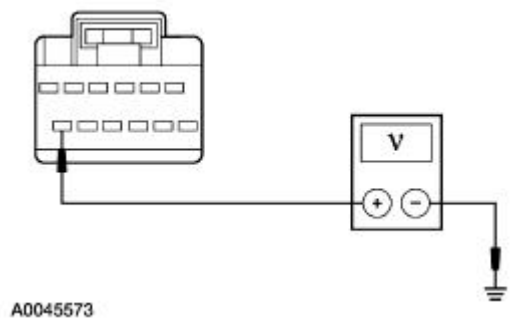
14. Diagnose and repair the vehicle. RERUN the Park Aid Calibration and Self-Test if required.

PAM Diagnostic Trouble Code (DTC) Index

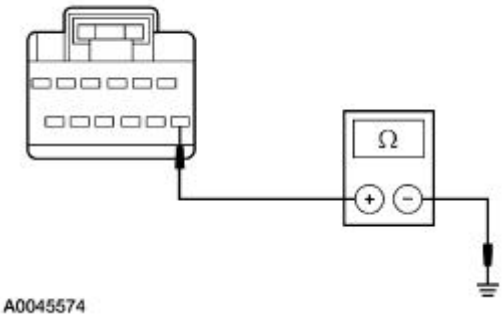
PAM Diagnostic Trouble Code (DTC) Index

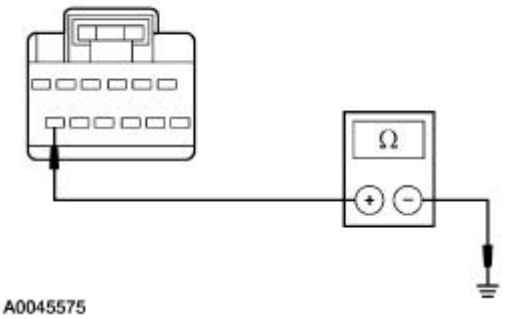
DTC	Description	Source	Action
B1299	Power supply sensor circuit short to ground	PAM	Go To Pinpoint Test A .
B1342	ECU is defective	PAM	CLEAR the DTCs. REPEAT the PAM self-test. If DTC B1342 is retrieved again, INSTALL a new PAM; REFER to Parking Aid Module . CLEAR all DTCs. REPEAT the self-test.
C1700	Left rear sensor circuit failure	PAM	Go To Pinpoint Test B .
C1701	Left rear sensor fault	PAM	Go To Pinpoint Test B .
C1703	Right rear sensor circuit failure	PAM	Go To Pinpoint Test B .
C1704	Right rear sensor fault	PAM	Go To Pinpoint Test B .
C1983	Radar sensor fault	PAM	Go To Pinpoint Test B .
C1984	Radar sensor circuit failure	PAM	Go To Pinpoint Test B .
U2306	Transmission PRNDL Range Selected Status Invalid	PAM	Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1628	Ignition Voltage Out of Range	PAM	REFER to Section 414-00 .
P0725	Speed input stuck low/high	PAM	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart



Symptom Chart

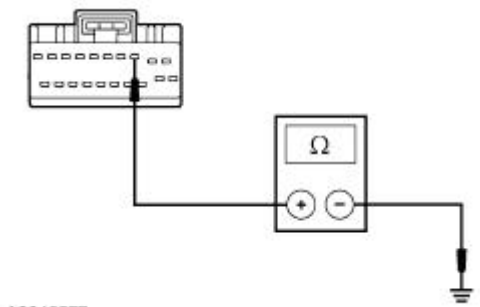


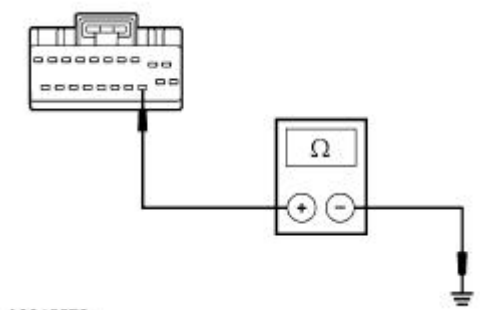


Condition	Possible Sources	Action
● No communication with the parking aid module (PAM)	● Circuitry. ● Fuse junction panel Fuse 27 (5A). ● PAM.	● Go To Pinpoint Test A .
● Parking aid is inoperative	● Circuitry. ● Parking aid sensor. ● Parking aid speaker. ● Parking aid module (PAM).	● Go To Pinpoint Test B .
● Continuous or intermittent tone when no obstacles or fault codes are present (certain obstacles may appear "stealthy" to the system, depending on geometric shape, size and material).	● Dirty or iced over parking aid sensor(s).	● CLEAN the rear bumper and sensors with high-pressure water.

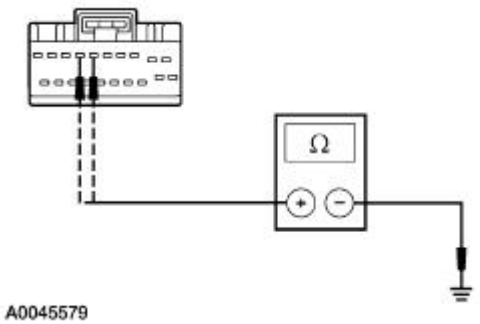
	• Parking aid sensor bezel(s) or parking aid sensor(s) locked into the rear bumper incorrectly. • Parking aid sensors are not aligned correctly.	• INSTALL the parking aid sensor bezel(s) into the rear bumper correctly. INSTALL the parking aid sensor(s) into the parking aid sensor bezel(s) correctly. • CARRY OUT the azimuth check. REFER to Azimuth System Check Minimum Detectable Object Verification in this section.

Pinpoint Tests





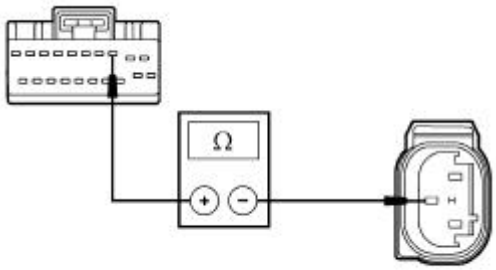
PINPOINT TEST A: NO COMMUNICATION WITH THE PARKING AID MODULE (PAM)

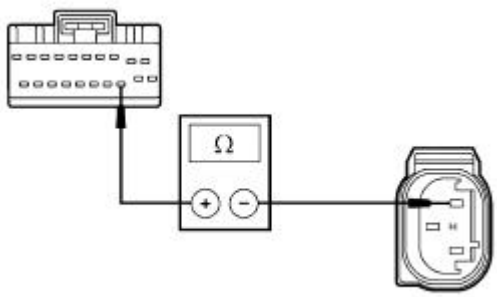


Test Step	Result / Action to Take
A1 USE DIAGNOSTIC TROUBLE CODES (DTCS) FROM PAM MODULE SELF-TEST	
• Use the recorded results from PAM self-test. • **Is DTC B1299 retrieved?**	**Yes** GO to A4 . **No** GO to A2 .
A2 CHECK PAM CIRCUIT 1003 (GY/WH) FOR VOLTAGE	
• Key in OFF position. • Disconnect: PAM C4014b. • Key in ON position. • Measure the voltage between PAM C4014b pin 12, circuit 1003 (GY/WH), harness side and ground.  A0045573 • **Is the voltage greater than 10 volts?**	**Yes** GO to A3 . **No** REPAIR the circuit. TEST the system for normal operation.
A3 CHECK CIRCUIT 875 (BK/LB) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between PAM C4014b pin 7, circuit 875 (BK/LB), harness side and ground.	**Yes** GO to A5 . **No** REPAIR the circuit. TEST the

 A0045574 ● **Is the resistance less than 5 ohms?**	system for normal operation.
A4 CHECK CIRCUIT 1003 (GY/WH)	
● Key in OFF position. ● Disconnect: PAM C4014b. ● Measure the resistance between PAM C4014b pin 12, circuit 1003 (GY/WH), harness side and ground.  A0045575 ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A5 CHECK FOR CORRECT PARKING AID MODULE OPERATION	
● Disconnect all parking aid module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all parking aid module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new parking aid module. REFER to Parking Aid Module in this section. REPEAT the parking aid module self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

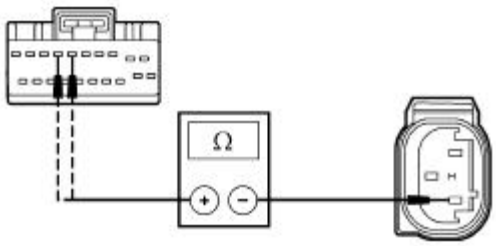
PINPOINT TEST B: PARKING AID IS INOPERATIVE

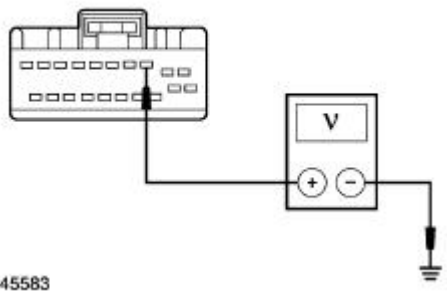


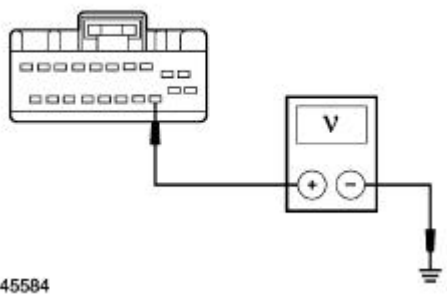


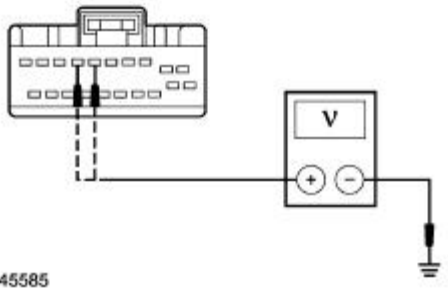
Test Step	Result / Action to Take
B1 USE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM PAM SELF-TEST	
● Use the recorded results from PAM self-test. ● **Are any DTCs recorded?**	**Yes** If DTC C1700 or C1703, GO to B2 . If DTC C1701 or C1704, GO to B8

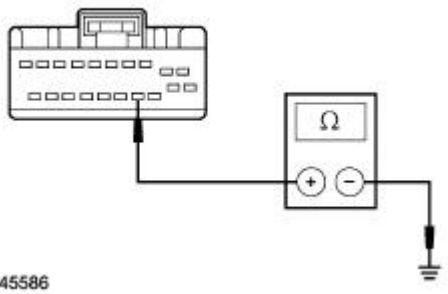
	If DTC C1983 or C1984, GO to B11 . If DTC C2644, GO to B20 . **No** GO to B23 .
B2 CHECK CIRCUIT 1440 (DG/YE) FOR A SHORT TO GROUND ● Disconnect the parking aid ultrasonic sensor in question. ● Disconnect: PAM C4014a. ● Measure the resistance between PAM C4014a pin 3, circuit 1440 (DG/YE), harness side and ground.  A0045577 ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B3 CHECK CIRCUIT 1439 (BN/PK) FOR A SHORT TO GROUND ● Measure the resistance between PAM C4014a pin 13, circuit 1439 (BN/PK), harness side and ground.  A0045578 ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B4 CHECK THE CIRCUIT IN QUESTION FOR SHORT TO GROUND ● Measure the resistance between PAM C4014a pin, harness side and ground; refer to the following chart. **Connector Pin** / **Circuit** C4014a pin 6 / 1441 (WH/LG) C4014a pin 7 / 1444 (DB/YE)	**Yes** GO to B5 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

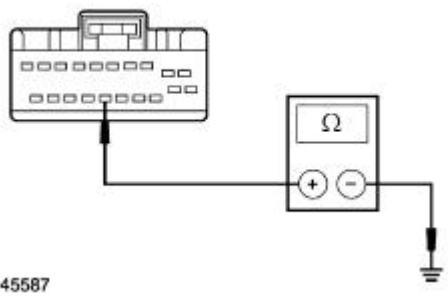




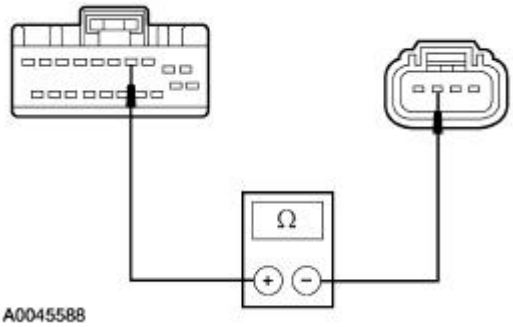


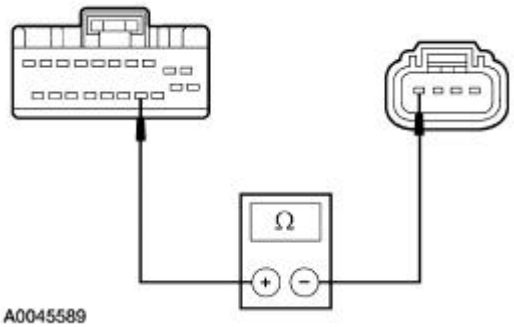


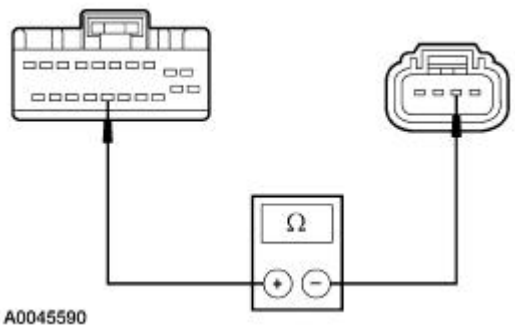




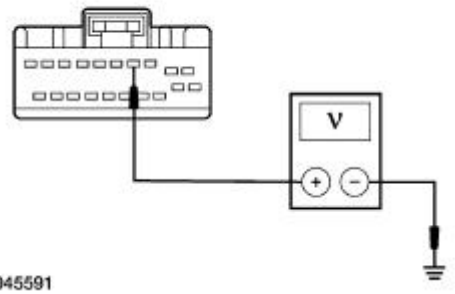
A0045579

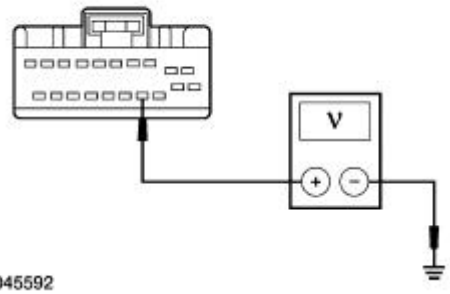


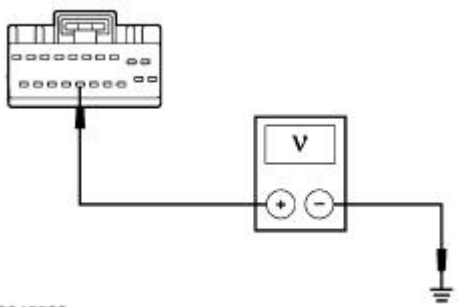




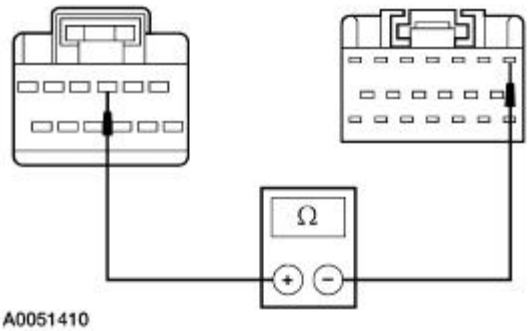
- **Are the resistances greater than 10,000 ohms?**

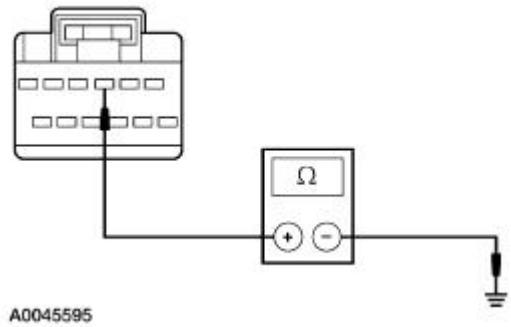


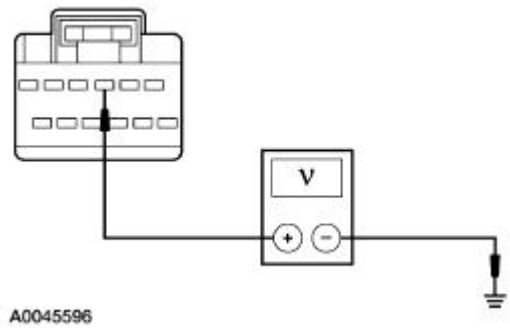




B5 CHECK CIRCUIT 1440 (DG/YE) FOR AN OPEN - Measure the resistance between PAM C4014a pin 3, circuit 1440 (DG/YE), harness side and parking aid sensor pin 2, circuit 1440 (DG/YE), harness side.  A0045580 - **Is the resistance less than 5 ohms?**	**Yes** GO to B6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B6 CHECK CIRCUIT 1439 (BN/PK) FOR AN OPEN - Measure the resistance between PAM C4014a pin 13, circuit 1439 (BN/PK), harness side and parking aid sensor pin 3, circuit 1439 (BN/PK), harness side.  A0045581 - **Is the resistance less than 5 ohms?**	**Yes** GO to B7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B7 CHECK CIRCUIT IN QUESTION FOR AN OPEN - Measure the resistance between PAM C4014a pin, harness side and parking aid sensor pin, harness side; refer to the following chart.	**Yes** If both parking aid sensors recorded DTCs, GO to B24 . If both parking aid sensors did not record DTCs, INSTALL a new sensor(s) for the one in question. REFER to Parking Aid Sensor in this section. CLEAR the DTCs. REPEAT the self-test.







PAM Connector Pin	Parking Aid Sensor Connector Pin	Circuit
C4014a pin 6	C4192 pin 1	1441 (WH/LG)
C4014a pin 7	C4193 pin 1	1444 (DB/YE)

 A0045582 ● **Are the resistances less than 5 ohms?**	**No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
B8 CHECK CIRCUIT 1440 (DG/YE) FOR A SHORT TO VOLTAGE	
● Disconnect the parking aid sensor in question. ● Disconnect: PAM C4014a. ● Key in ON position. ● Measure the voltage between PAM C4014a pin 3, circuit 1440 (DG/YE), harness side and ground.  A0045583 ● **Is any voltage indicated?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to B9 .
B9 CHECK CIRCUIT 1439 (BN/PK) FOR A SHORT TO VOLTAGE	
● Measure the voltage between PAM C4014a pin 13, circuit 1439 (BN/PK), harness side and ground.  A0045584 ● **Is any voltage indicated?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to B10 .
B10 CHECK CIRCUIT IN QUESTION FOR SHORT TO VOLTAGE	
● Measure the voltage between PAM C4014a pin, harness side and ground; refer to the following chart. **Connector Pin** / **Circuit** C4014a pin 7 / 1444 (DB/YE)	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No**

C4014a pin 6 | 1441 (WH/LG)  A0045585 • **Is any voltage indicated?**	If both parking aid sensors recorded DTCs, GO to B24 . If both parking aid sensors did not record DTCs, INSTALL a new sensor(s) for the one in question. REFER to Parking Aid Sensor in this section. CLEAR the DTCs. REPEAT the self-test.
B11 CHECK CIRCUIT 1959 (RD/WH) FOR A SHORT TO GROUND • Measure the resistance between PAM C4014a pin 14, circuit 1959 (RD/WH), harness side and ground.  A0045586 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B12 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B12 CHECK CIRCUIT 1443 (WH/LB) FOR SHORT TO GROUND • Measure the resistance between PAM C4014a pin 16, circuit 1443 (WH/LB), harness side and ground.  A0045587 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to B13 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
B13 CHECK CIRCUIT 1960 (PK/YE) FOR AN OPEN • Measure the resistance between PAM C4014a pin 4, circuit 1960 (PK/YE), harness side and parking aid radar sensor C4191 pin 3, circuit 1960 (PK/YE), harness side.	**Yes** GO to B14 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0045588 ● **Is the resistance less than 5 ohms?**	
B14 CHECK CIRCUIT 1959 (RD/WH) FOR AN OPEN ● Measure the resistance between PAM C4014a pin 14, circuit 1959 (RD/WH), harness side and parking aid radar sensor C4191 pin 4, circuit 1959 (RD/WH), harness side.  A0045589 ● **Is the resistance less than 5 ohms?**	**Yes** GO to B15 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B15 CHECK CIRCUIT IN QUESTION FOR AN OPEN ● Measure the resistance between PAM C4014a pin 16, circuit 1443 (WH/LB), harness side and parking aid radar sensor C4191 pin 2,circuit 1443 (WH/LB), harness side.  A0045590 ● **Is the resistance less than 5 ohms?**	**Yes** GO to B16 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
B16 CHECK CIRCUIT 1960 (PK/YE) FOR A SHORT TO VOLTAGE ● Measure the voltage between PAM C4014a pin 4, circuit 1960 (PK/YE), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to B17 .

 A0045591 ● **Is any voltage indicated?**	
B17 CHECK CIRCUIT 1959 (RD/WH) FOR A SHORT TO VOLTAGE	
● Measure the voltage between PAM C4014a pin 14, circuit 1959 (RD/WH), harness side and ground.  A0045592 ● **Is any voltage indicated?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to B18 .
B18 CHECK CIRCUIT 1443 (WH/LB) FOR SHORT TO VOLTAGE	
● Measure the voltage between PAM C4014a pin 16, circuit 1443 (WH/LB), harness side and ground.  A0045593 ● **Is any voltage indicated?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** GO to B19 .
B19 CHECK THE RADAR SENSOR	
● Install a new radar sensor. Refer to Parking Aid Sensor in this section. ● Restore the system and RUN the PAM self-test. ● **Does the system pass the self test?**	**Yes** The system is operating normally at this time. **No** INSTALL the original radar sensor and GO to B24 .
B20 CHECK CIRCUIT 689 (DB) FOR AN OPEN	
● Disconnect: Radio C290b. ● Disconnect: PAM C4014b. ● Measure the resistance between PAM C4014b pin 3,	**Yes** GO to B21 .

circuit 689 (DB), harness side and radio C290b pin 1, circuit 689 (DB), harness side.  A0051410 • **Is the resistance less than 5 ohms?**	**No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B21 CHECK CIRCUIT 689 (DB) FOR A SHORT TO GROUND	
• Measure the resistance between PAM C4014b pin 3, circuit 689 (DB), harness side and ground.  A0045595 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B22 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B22 CHECK CIRCUIT 689 (DB) FOR A SHORT TO VOLTAGE	
• Measure the voltage between PAM C4014b pin 3, circuit 689 (DB), harness side and ground.  A0045596 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit 689 (DB). CLEAR the DTCs. REPEAT the self-test. **No** GO to B24 .
B23 CHECK PARKING AID SENSORS FOR CORRECT ALIGNMENT	
NOTE: If the vehicle has been in an accident, the PAM sensors may not be aligned correctly. • Check the sensors for correct alignment. Refer to Azimuth System Check and Elevation System Check in this section. • **Are the bumper and parking aid sensors correctly aligned?**	**Yes** GO to B24 . **No** Correctly INSTALL the sensors. REFER to Parking Aid Sensor in this section. If the vehicle has been in an accident, further body work may be necessary to bring the parking aid sensors into

	correct alignment.
B24 CHECK FOR CORRECT PARKING AID MODULE OPERATION	
• Disconnect all parking aid module connectors. • Check for: • corrosion • pushed-out pins • Connect all parking aid module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new parking aid module. REFER to Parking Aid Module in this section. REPEAT the parking aid module self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Azimuth System Check

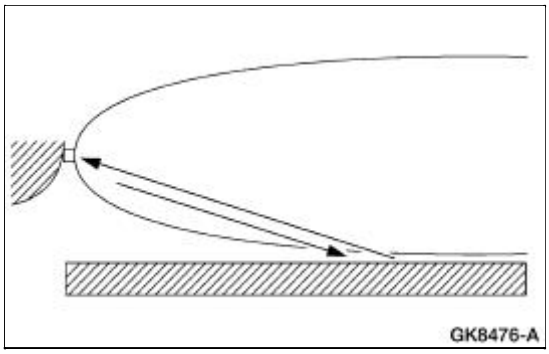
Minimum Detectable Object Locations

1. **NOTE:** The detectable object used in this system check can be fabricated using a 7.62 cm (3 inches) diameter plastic pipe, 99.06 cm (39 inches) in length (available as PVC pipe, or similar from a hardware or plumbing supply).

   NOTE: The following system check should be carried out with the vehicle on a level surface.

   NOTE: The parking aid module (PAM) system will default to on when the ignition key is cycled from the OFF position to the ON position.

   Turn the ignition to the ON position, engine off.



2. Set the parking brake on.

3. Place the gearshift in REVERSE (R).

4. Verify that the PAM detects the detectable object when it is placed within the five specified locations (P1, P2, P3, P4 and P5). These zones are shown ideally and are not absolute. Pipe should be inside of locations.

Elevation System Check

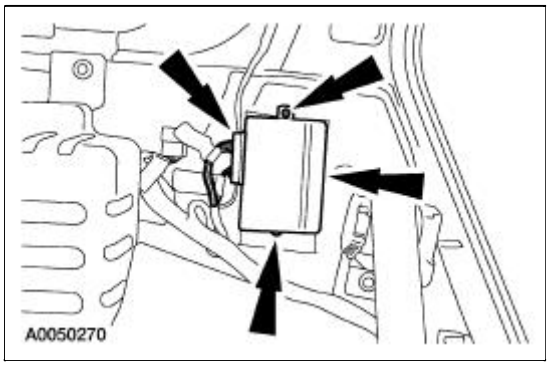
1. Check the parking aid system to make sure that the system **does not** see signals caused by ground reflections.

2. The following system check should be carried out with the vehicle on a 4.57 m (15 feet) wide by 3.05 m (10 feet) deep smooth concrete surface, free of all obstacles. The area should also be free of noise from fans and pneumatic tools.

3. Turn the ignition to the ON position, engine off.

4. Set the parking brake on.

5. Place the gearshift in REVERSE (R).



6. **NOTE:** No audible warning tones should be heard. If audible warning tones are heard, check to make sure the bumper is installed correctly and not tilted downward so that the sensor is pointing towards the ground.

   Verify that **no** audible warning tones are heard.

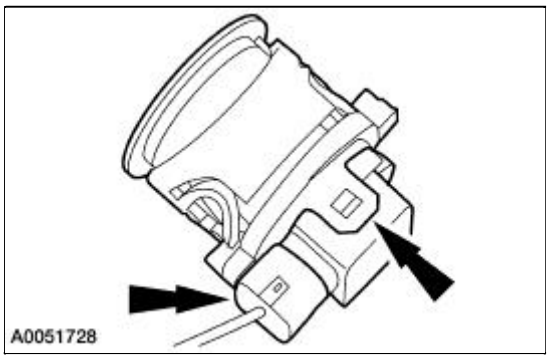
Parking Aid Module

Removal and Installation

1. Remove the LH quarter trim panel. For additional information, refer to Section 501-05 .
2. Remove the parking aid module (PAM).
   - Disconnect the electrical connectors.
   - Remove the screws.

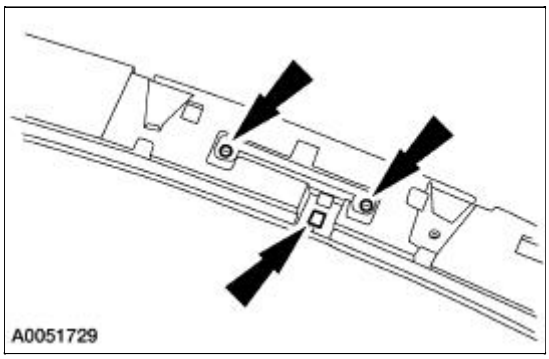
3. To install, reverse the removal procedure.
4. Perform the Park Aid Calibration and Self-Test Diagnostics located in Inspection and Verification.

Parking Aid Sensor



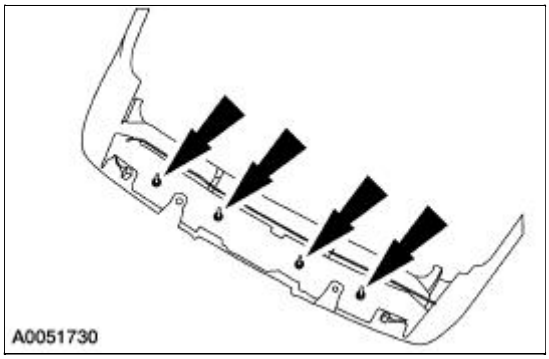
Removal and Installation

All Vehicles



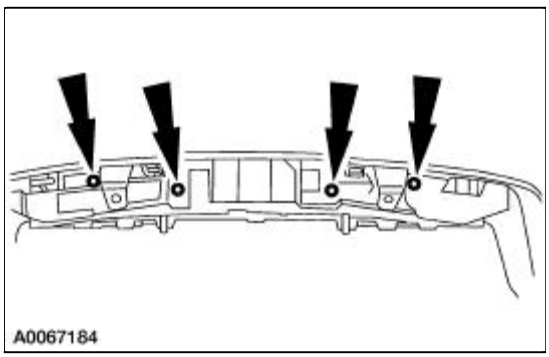
1. Remove the rear bumper cover. For additional information, refer to Section 501-19 .

Navigator, Early Build Expedition

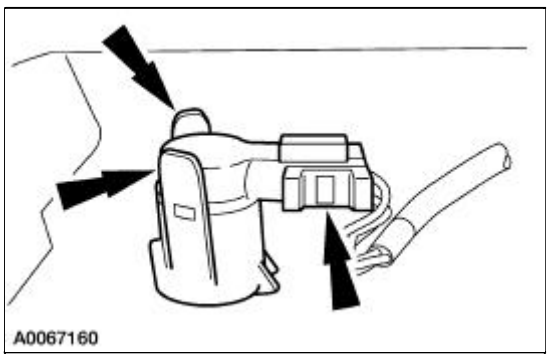


2. Remove the parking aid ultrasonic sensor.
   - Disconnect the electrical connector.
   - Release the locking tabs.

3. Remove the foam absorber from the bumper cover.



4. Remove the radar sensor.
   - Remove the fasteners.
   - Disconnect the electrical connector.



Late Build Expedition

5. Remove the four nuts and the foam absorber from the bumper cover.

6. Remove the sonar sensor.
    - Disconnect the electrical connector.
    - Release the locking tabs.

All vehicles

7. To install, reverse the removal procedure.

8. Perform Park Aid Calibration and Self-Test Diagnostics located in Inspection and Verification in this section.

Charging System

Charging System

The charging system is a negative ground system consisting of the following components:

- generator
- internal voltage regulator
- charging system warning indicator
- voltage gauge
- battery
- circuitry and cables
- powertrain control module

The generator is belt-driven by the engine accessory drive system.

Battery

The battery is a 12 volt direct current (DC) source connected in a negative ground system. The battery case is sealed and includes two vent holes to release gases. The battery has three major functions:

- engine cranking power source
- voltage stabilizer for the electrical system
- temporary power when electrical loads exceed the generator output current

Charging System

Refer to Wiring Diagrams Cell 12 for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2173-A	SABRE Premium Battery and Electrical System Tester 010-00736 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool

Principles of Operation

Charging System

After the engine is started, voltage is applied through the I circuit 1931 (BN/PK) from the powertrain control module (PCM) to the generator. This turns the regulator on, allowing current to flow from the battery sense A circuit 35 (OG/LB) to the generator field coil. When the engine is started, the generator begins to generate alternating current (AC) which is internally converted to direct current (DC). This current is then supplied to the vehicle electrical system through the output (B+) terminal of the generator. Once the generator begins generating current, a voltage signal is taken from the generator stator and fed back to the regulator internally. This voltage feedback signal (typically half the battery voltage) is used to turn off the warning indicator.

With the system functioning normally, the generator output current is determined by the voltage of the A circuit 25 (OG/LB) which is compared to a set voltage internal to the regulator. The regulator controls the generator field current to maintain the current generator output.

The set voltage will vary with temperature and is typically higher in cold temperatures and lower in warm temperatures. This allows improved battery recharge in the winter and reduces the chance of overcharging in the summer.

Circuit Description

B+ Output Terminal Circuit 38 (BK/OG)

Generator output voltage is supplied through the battery positive (B+) output terminal on the rear of the generator to the battery and the electrical system.

Circuit 35 (OG/LB)

This is the A-line battery voltage sense circuit and is used to sense battery voltage.

Circuit 1930 (TN/LG)

The PCM determines the optimal voltage setpoint for the charging system and communicates the information to the voltage regulator via the Alternator Load Feed Forward (ALFF) circuit. This is a communication line only and can only be measured with an ohmeter.

Circuit 1931 (BN/PK)

The I-line circuit is used to turn on the voltage regulator. This circuit is powered by the PCM with the engine running. This circuit is also used by the PCM to determine if and when to send a message to the instrument cluster to turn the charging system warning indicator on if there is a fault in the charging system.

Inspection and Verification

WARNING: Batteries normally produce explosive gases. Therefore, do not allow flames, sparks or lighted substances to come near the battery. When charging or working near a battery, always shield your face and protect your eyes. Always provide ventilation. Failure to follow these instructions may result in personal injury.

WARNING: When lifting a plastic-cased battery, excessive pressure on the end walls could cause acid to spew through the vent caps, resulting in personal injury, damage to the vehicle or battery. Lift with a battery carrier or with your hands on opposite corners. Failure to follow these instructions may result in personal injury.

WARNING: Keep batteries out of the reach of children. Batteries contain sulfuric acid. Avoid contact with skin, eyes, or clothing. Also, shield your eyes when working near the battery to protect against possible splashing of the acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in personal injury.

1. Verify the customer concern by operating the engine to duplicate the concern.

2. Visually inspect for signs of mechanical and electrical damage; refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical
• Battery • Generator drive belt • Generator pulley	• Central junction box (CJB) fuse 9 (10A) • Circuitry • Cables

3. If the inspection reveals obvious concerns that can be readily identified, repair as necessary. Check the generator sense fuse 9 (10A) located in the CJB.

4. Measure the open circuit battery voltage. (Battery is located in the engine compartment.) If the battery voltage is less than 12.0 volts, test and recharge the battery before continuing with diagnosis. Refer to Section 414-01 .

5. Check the operation of the charging system warning indicator lamp (instrument cluster). Normal operation is as follows:
   - With the ignition switch OFF, the charging system warning indicator should be off.
   - With the ignition switch in RUN and the engine off, the charging system warning indicator light should be on.
   - With the engine running, the charging system warning indicator light should be off.

6. Turn off the headlamps and the A/C system. Turn blower to low/off. Check the battery voltage before and after starting the engine to determine if the battery voltage increases. Refer to the Normal Charging System Voltages chart.

Normal Charging System Voltages and Charging System Warning Indicator Operation

Key Position	A-line 35 (OG/LB)	I-line 1931 (BN/PK)	Generator B+ 38 (BK/OG)	Battery	Engine to Battery Ground	Charging System Warning Indicator Operation
Key OFF	12 volts	0 V	12 volts	12 volts	0 volts	Off
RUN — engine OFF	12 volts	0 V	12 volts	12 volts	0 volts	Illuminated
RUN — engine running	13- 15V	8- 12V	13- 15V	13- 15V	0V	Off

7. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located under the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the vehicle selection cannot be entered:
   - check that the diagnostic card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position. If the diagnostic tool still does not allow the vehicle selection to be entered, refer to the diagnostic tool manual.

8. If any PCM DTCs are retrieved, go to the PCM Index below to check if the codes retrieved are related to the charging system and continue diagnosis.

9. If no DTCs related to the charging system are retrieved, go to the Symptom Chart to continue diagnosis.

NOTE: DTC P1246 can be set by the loss of the I-line circuit 1931 (BN/PK). The generator warning indicator will illuminate and the generator will operate in back-up mode (13.5 volts).

Powertrain Control Module Diagnostic Trouble Code (DTC) Index

DTC	Description	Action
P1246	System Voltage	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED)

	Failure	manual.

Symptom Chart

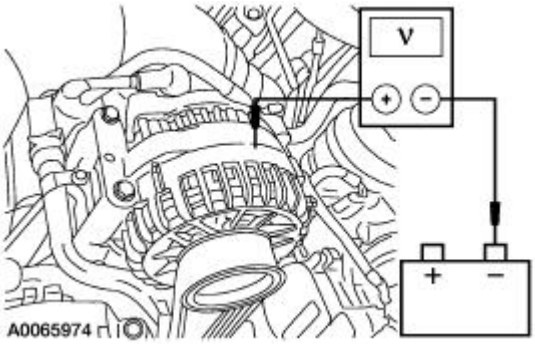
Symptom Chart

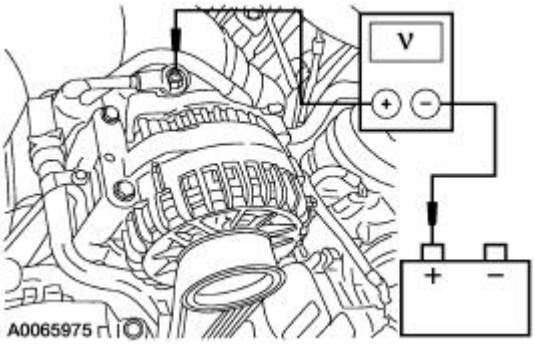
Condition	Possible Sources	Action
• Battery is discharged or battery voltage is low	• Circuitry. • High key-off current drain(s). • Battery. • Generator.	• Go To Pinpoint Test A .
• The charging system warning indicator is on with the engine running (the charging system voltage does not increase)	• Generator. • Central junction box (CJB) fuse (10A) • Circuitry.	• Go To Pinpoint Test B .
• The charging system overcharges (battery voltage greater than 15.5 volts)	• Central junction box (CJB) fuse (10A). • Circuitry. • Generator.	• Go To Pinpoint Test C .
• The charging system warning indicator is on with the engine running and the battery increases voltage	• CJB fuse 9 (10A). • Generator. • Instrument cluster. • Powertrain Control Module (PCM). • Circuitry.	• Go To Pinpoint Test D .
• The charging system warning indicator is off with the ignition switch in the RUN position and the engine off	• Generator connector unplugged (C102a). • Battery. • Circuitry. • Instrument cluster. • Powertrain Control Module (PCM).	• Go To Pinpoint Test E .
• The charging system warning indicator flickers or is intermittent	• CJB fuse 9 (10A). • Generator connector unplugged (C102a). • Circuitry. • Generator.	• Go To Pinpoint Test F .
• The generator is noisy	• Loose bolts/brackets. • Drive belt. • Generator/pulley.	• Go To Pinpoint Test G .
• Radio interference	• Generator. • Wiring/routing. • In-vehicle entertainment system.	• Go To Pinpoint Test H .

Pinpoint Tests

CAUTION: Do not make jumper connections except as directed. Incorrect connections may damage the voltage regulator test terminals, fuses or fuse links.

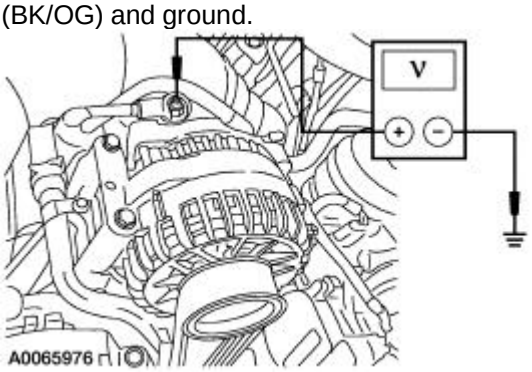
CAUTION: Do not allow any metal object to come in contact with the generator housing



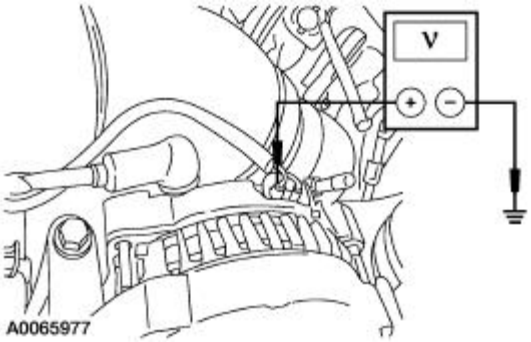


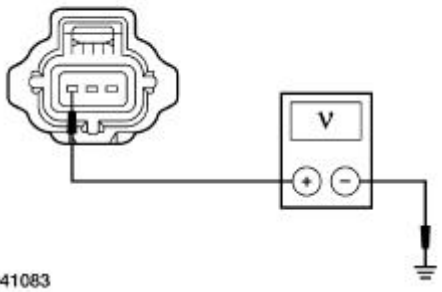
and internal diode cooling fins.

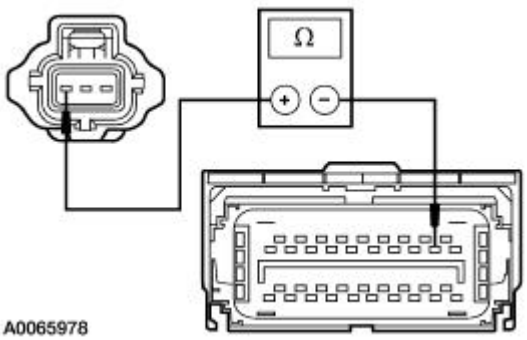
NOTE: While carrying out any pinpoint test, disregard any DTCs set while following any specific pinpoint test. After the completion of any test, be sure to clear all codes in the PCM.



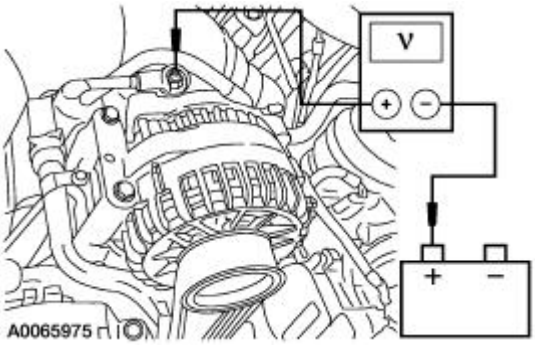
NOTE: All voltage measurements are referenced to the negative (-) battery post unless otherwise specified.





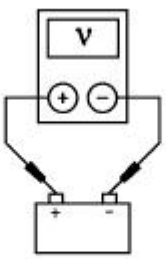


PINPOINT TEST A: BATTERY IS DISCHARGED OR BATTERY VOLTAGE IS LOW

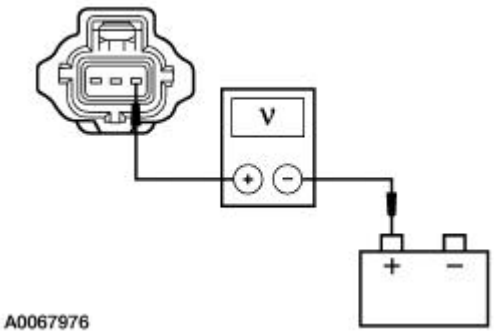


Test Step	Result / Action to Take
A1 CHECK BATTERY CONDITION	
• Carry out the Battery — Condition Test to determine if the battery can hold a charge and is OK for use. Refer to Section 414-01 . • **Is the battery OK?**	**Yes** GO to A2 . **No** INSTALL a new battery. REFER to Section 414-01 . TEST the system for normal operation.
A2 CHECK THE GENERATOR OUTPUT	
• Carry out the Generator On-Vehicle Load Test and No Load Test. Refer to Component Tests in this section. • **Is the generator OK?**	**Yes** GO to A3 . **No** Go To Pinpoint Test B
A3 CHECK FOR CURRENT DRAINS	
• Carry out the Battery — Drain Testing. Refer to Component Tests in this section. • **Are there any excessive current drains?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** GO to A4 .
A4 CHECK VEHICLE GROUNDS	
• Key in START position. • Measure the voltage drop between the generator housing and the negative battery terminal.	**Yes** GO to A5 . **No** CHECK the engine ground and the battery for corrosion. REPAIR as necessary.

 ● **Is the voltage drop less than 0.1 volt?**	
A5 CHECK VOLTAGE DROP IN B+ CIRCUIT 38 (BK/OG)	**Yes** Go To Pinpoint Test B . **No** REPAIR the high resistance in the B+ circuit 38 (BK/OG). TEST the system for normal operation.
● Turn the headlamps on high beam, the heated rear window ON (if applicable) and the blower motor to HIGH. With the engine at approximately 2000 rpm, measure the voltage drop between the generator C102b, circuit 38 (BK/OG) and the positive battery terminal.  ● **Is the voltage drop less than 0.5 volt?**	



PINPOINT TEST B: THE CHARGING SYSTEM WARNING INDICATOR IS ON WITH THE ENGINE RUNNING (THE CHARGING SYSTEM VOLTAGE DOES NOT INCREASE)



Test Step	Result / Action to Take
B1 CHECK THE GENERATOR B+ CIRCUIT 38 (BK/OG)	**Yes** GO to B2 . **No** REPAIR the circuit. TEST the system for normal operation.
● Key in OFF position. ● Measure the voltage between the generator C102b, circuit 38 (BK/OG) and ground.  ● **Is the voltage equal to battery positive voltage?**	
B2 CHECK THE GENERATOR A CIRCUIT 35 (OG/LB)	**Yes**

• Measure the voltage between the generator C102a pin 3, A circuit 35 (OG/LB), harness side and ground.  A0065977 • **Is the voltage equal to battery positive voltage?**	GO to B3 . **No** REPAIR the circuit. TEST the system for normal operation.
B3 CHECK CIRCUIT 1931 (BN/PK) FOR VOLTAGE	
• Disconnect: Generator C102a. • Key in START position. • Measure the voltage between the generator C102a pin 1, circuit 1931 (BN/PK), harness side and ground.  A0041083 • **Is the voltage 8-12 volts?**	**Yes** GO to B5 . **No** GO to B4 .
B4 CHECK CIRCUIT 1931 (BK/PK) FOR INTEGRITY	
• Key in OFF position. • Disconnect: PCM C175b. • Measure the resistance between the generator C102a pin 1, circuit 1931 (BN/PK) harness side and the PCM C175b pin 14, circuit 1931 (BN/PK) harness side; and between the generator C102a pin 1, circuit 1931 (BN/PK) harness side and ground.  A0065978 • **Is the resistance less than 5 ohms between the generator and the PCM; and greater than 10,000 ohms between the generator and ground?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . **No** REPAIR the circuit. TEST the system for normal operation.
B5 CHECK THE VOLTAGE DROP IN B+ CIRCUIT 38 (BK/OG)	
• Key in OFF position. • Connect: Generator C102a. • Key in START position. • Turn the headlamps on high beam, the heated rear window ON (if applicable) and the blower motor to HIGH. With the engine at	**Yes** INSTALL a new generator. REFER to Section 414-02 .

approximately 2000 rpm, measure the voltage drop between the generator B+ C102b, circuit 38 (BK/OG) and the positive battery terminal.  ● **Is the voltage drop less than 0.5 volt?**	**No** REPAIR the high resistance in the B+ circuit 38 (BK/OG). TEST the system for normal operation.

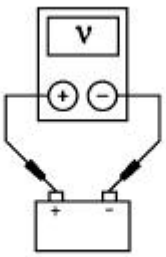
PINPOINT TEST C: THE CHARGING SYSTEM OVERCHARGES (BATTERY VOLTAGE GREATER THAN 15.5 VOLTS)

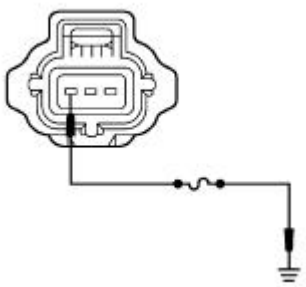
Test Step	Result / Action to Take
C1 CHECK THE FAULT CODES IN THE PCM	
● Connect the diagnostic tool. ● Key in ON position. ● Use the recorded PCM DTCs from the continuous and on-demand self-test. ● **Are any DTCs recorded?**	**Yes** REFER to PCM Diagnostic Trouble Code (DTC) Index. **No** GO to C2 .
C2 CHECK THE BATTERY VOLTAGE	
● Key in OFF position. ● Disconnect the diagnostic tool. ● Key in START position. ● With the engine running and all accessories turned off, measure the voltage at the battery while varying the engine rpm.  ● **Is the voltage greater than 15.5 volts?**	**Yes** GO to C3 . **No** GO to C4 .
C3 CHECK FOR VOLTAGE DROP IN CIRCUIT 35 (OG/LB)	
● Key in OFF position. ● Disconnect: Generator C102a. ● Measure the voltage drop between the generator C102a, pin 3 circuit 35 (OG/LB), harness side and the positive battery terminal.	**Yes** GO to C4 . **No** REPAIR the circuit. TEST the system for normal operation.

 ● **Is the resistance drop less than 0.5 volt?**	
C4 CHECK THE GENERATOR AND BATTERY GROUND CONNECTIONS	
● Key in OFF position. ● Check the ground connections between the generator and the engine, and the battery and the engine. ● **Are all ground connections clean and tight?**	**Yes** INSTALL a new generator. REFER to Section 414-02 . CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the ground connections as necessary. CLEAR the DTCs. TEST the system for normal operation.

PINPOINT TEST D: THE CHARGING SYSTEM WARNING INDICATOR IS ON WITH THE ENGINE RUNNING AND THE BATTERY INCREASES VOLTAGE

Test Step	Result / Action to Take
D1 CHECK THE FAULT CODES IN THE PCM	
● Connect the diagnostic tool. ● Key in ON position. ● Use the recorded PCM DTCs from the continuous and on-demand self-test. ● **Are any DTCs recorded?**	**Yes** REFER to PCM Diagnostic Trouble Code (DTC) Index. **No** REFER to Section 413-01 .





PINPOINT TEST E: THE CHARGING SYSTEM WARNING INDICATOR IS OFF WITH THE IGNITION SWITCH IN THE RUN POSITION AND THE ENGINE IS OFF

Test Step	Result / Action to Take
E1 CHECK THE FAULT CODES IN THE PCM	
● Connect the diagnostic tool. ● Key in ON position. ● Use the recorded PCM DTCs from the continuous and on-demand self-test. ● **Are any DTCs recorded?**	**Yes** REFER to PCM Diagnostic Trouble Code (DTC) Index. **No** GO to E2 .

E2 CHECK THE CHARGING SYSTEM WARNING INDICATOR OPERATION	
• Key in OFF position. • Disconnect the diagnostic tool. • Disconnect: Generator C102a. • Key in ON position. • With the engine off, connect a fused (15A), jumper wire between the generator C102a pin 1, circuit 1931 (BN/PK), harness side and ground.  A0041087 • **Does the charging system warning indicator illuminate?**	**Yes** INSTALL a new generator. REFER to Section 414-02 . TEST the system for normal operation. **No** GO to E3 .
E3 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all PCM connectors. • Check for: • corrosion • pushed-out pins • Connect all PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . REPEAT the PCM self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST F: THE CHARGING SYSTEM WARNING INDICATOR LAMP FLICKERS OR IS INTERMITTENT

Test Step	Result / Action to Take
F1 CHECK THE FAULT CODES IN THE PCM	
• Connect the diagnostic tool. • Key in ON position. • Use the recorded PCM DTCs from the continuous and on-demand self-test. • **Are any DTCs recorded?**	**Yes** REFER to PCM Diagnostic Trouble Code (DTC) Index. **No** GO to F2 .
F2 CHECK FOR LOOSE CONNECTIONS	
• Disconnect: Generator C102a. • Check all generator, battery, and power distribution connections for looseness, corrosion, loose or bent terminals, or loose eyelets. • Connect: Generator C102a. • **Are all connections clean and tight?**	**Yes** GO to F3 . **No** REPAIR as necessary. TEST the system for normal operation.

F3 CHECK FUSE CONNECTION	
• Key in START position. • With the engine running, check CJB fuse 9 (10A) in circuit 35 (OG/LB) for looseness by wiggling the fuse and noting the charging system warning indicator lamp operation. • **Does the charging system warning indicator lamp flicker?**	**Yes** REPAIR loose fuse connections as necessary. TEST the system for normal operation. **No** GO to F4 .
F4 CHECK THE BATTERY VOLTAGE	
• Key in START position. • With the engine running, and all accessories turned off, measure the voltage at the battery while varying the engine rpm.  AJ0210-A • **Is the voltage greater than 15.5 volts?**	**Yes** Go To Pinpoint Test C . **No** GO to F5 .
F5 CHECK THE WARNING SYSTEM INDICATOR OPERATION	
• Key in OFF position. • Disconnect: Generator C102a. • Key in ON position. • Connect a fused jumper wire between generator C102a pin 1, circuit 1931 (BN/PK), harness side and ground.  A0041087 • **Does the charging system warning indicator illuminate?**	**Yes** GO to F6 . **No** REPAIR the circuit. TEST the system for normal operation.
F6 CHECK THE PCM OPERATION	
• Key in OFF position. • Connect: Generator C102a. • Key in ON position. • Monitor the charging system warning indicator operation. • **Is the charging system warning indicator illuminated?**	**Yes** The PCM is operating correctly. RECHECK the generator circuits (including the generator) for intermittent shorts or opens. TEST the system for normal operation. **No** GO to F7 .

F7 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all PCM connectors. • Check for: • corrosion • pushed-out pins • Connect all PCM connectors and make sure they seat correctly • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . REPEAT the PCM self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST G: THE GENERATOR IS NOISY

Test Step	Result / Action to Take
G1 CHECK FOR ACCESSORY DRIVE NOISE AND MOUNTING BRACKETS	
• Check the accessory drive belt for damage and correct installation; refer to Section 303-05 . • Check the accessory mounting brackets and generator pulley for looseness or misalignment. • **Is the accessory drive OK?**	**Yes** GO to G2 . **No** REPAIR as necessary. TEST the system for normal operation.
G2 CHECK GENERATOR FOR ELECTRICAL NOISE	
• Disconnect: Generator C102a. • Key in START position. • With the engine running, • **Is the noise still present?**	**Yes** GO to G3 . **No** INSTALL a new generator. REFER to Section 414-02 . TEST the system for normal operation.
G3 CHECK GENERATOR FOR MECHANICAL NOISE	
• Key in OFF position. • Key in START position. • Turn all accessories off. With the engine running, use a stethoscope or equivalent listening device to probe the generator for unusual mechanical noise. • **Is the generator the noise source?**	**Yes** INSTALL a new generator. REFER to Section 414-02 . TEST the system for normal operation. **No** REFER to Section 303-00 to diagnose the source of the engine noise.

PINPOINT TEST H: RADIO INTERFERENCE

Test Step	Result / Action to Take
H1 VERIFY GENERATOR IS SOURCE OF RADIO INTERFERENCE	
• Key in START position. • Start and run the engine. • Tune the radio to a station where the	**Yes** REFER to Section 415-00 for diagnosis and testing of the in-vehicle entertainment system.

interference is present. • Key in OFF position. • Disconnect: Generator C102a. • Key in START position. • **Is the interference present with the generator disconnected?**	**No** INSTALL a new generator. REFER to Section 414-02 . TEST the system for normal operation.

Component Tests

Battery — Drain Testing

Check for current drains on the battery in excess of 24-26 milliamps (0.024-0.026 amp) with all the electrical accessories off and the vehicle at rest for at least 40 minutes. Current drains can be tested with the following procedure:

WARNING: Do not attempt this test on a lead-acid battery that has recently been recharged. Explosive gases can cause personal injury.

CAUTION: To prevent damage to the meter, do not crank the engine or operate accessories that draw more than 10A.

NOTE: Many electronic modules draw 5 mA or more continuously.

NOTE: Use an in-line digital ammeter between the battery negative post and its respective cable.

1. Make sure the central junction box is accessible without turning on interior or underhood lights.
2. Drive the vehicle at least five minutes and over 48 km/h (30 mph) to turn on and activate vehicle systems.
3. Allow the vehicle to sit with the key off for at least 40 minutes to allow modules to time out/power down.
4. Connect a jumper wire between the negative battery cable and the negative battery post to prevent modules from resetting and to catch capacitive drains.
5. Disconnect the negative battery cable from the negative battery post without breaking the connection of the jumper wire.
6. Connect the battery tester between the negative battery cable and post. The meter must be capable of reading milliamps and should have a 10 amp capacity.

NOTE: It is very important that continuity is not broken between the battery post and the negative cable when connecting the meter. If this happens, the entire procedure must be repeated.

7. Remove the jumper wire.

NOTE: If the meter settings need to be switched or the test leads need to be moved to another jack, the jumper wire must be reinstalled to avoid breaking continuity.

8. Note the amperage draw. Draw will vary from vehicle to vehicle depending on the equipment package. Compare to a similar vehicle for reference. No factory equipped vehicle should have more than a 24-26 mA draw (0.024-0.026 amp).
9. If the draw is found to be excessive, pull fuses from the central junction box one at a time and note the current reading. Do not reinstall fuses until you have finished testing.

10. If the current draw is still excessive, remove the remaining fuses from the junction box one at a time and note the current drop. Do not reinstall fuses until you have finished testing. When the current level drops after pulling a fuse, the circuit containing the excessive draw has been located.

11. Check the Wiring Diagrams for any circuits that run from the battery without passing through the junction box. If the current draw is still excessive, disconnect these circuits until the draw is found. Also disconnect the generator electrical connections if the draw cannot be located. The generator may be internally shorted, causing current drain.

Generator On-Vehicle Tests

CAUTION: To prevent damage to the generator, do not make jumper wire connections except as directed.

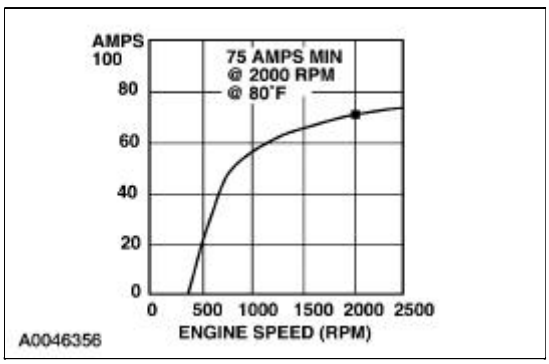
CAUTION: Do not allow any metal object to come in contact with the housing and the internal diode cooling fins with key on or off. A short circuit will result and burn out the diodes.

NOTE: Battery posts and cable clamps must be clean and tight for accurate meter indications.

1. Turn off all lamps and electrical components.

2. Place the vehicle in transmission range NEUTRAL and apply the parking brake.

3. Carry out the Load Test and No Load Test according to the following component tests:



Generator On-Vehicle Tests — Load Test

1. Switch the tester to the ammeter function.

2. Connect the positive and negative leads of the tester to the corresponding battery terminals.

3. Connect the current probe to the generator B+ output terminal, circuit 38 (BK/OG).

4. With the engine running at 2,000 rpm, adjust the tester load bank to determine the output of the generator. Generator output should be greater than the applicable graphs shown below. If not, refer back to the pinpoint test or to the Symptom Chart.

Generator On-Vehicle Tests — No Load Test

1. Switch the tester to the voltmeter function.

2. Connect the voltmeter positive lead to the generator B+ terminal and the negative lead to ground.

3. Turn all electrical accessories off.

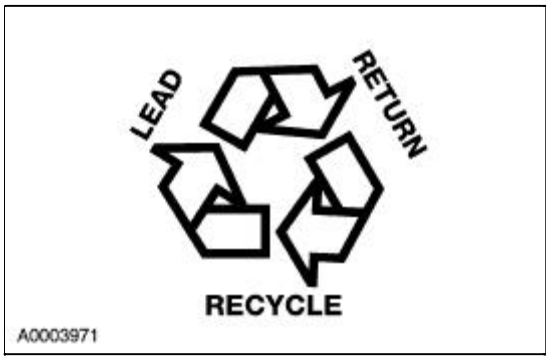
4. With the engine running at 2,000 rpm, check the generator output voltage. The voltage should be between 13.0 and 15.0 volts. If not, refer back to the pinpoint test or to the Symptom Chart.

5. Turn the A/C on, the blower motor on high speed and the headlamps on high beam.

6. The voltage should increase a minimum of 0.5 volt above the base voltage.
    - If the voltage does not increase as specified, refer back to the pinpoint test or to the Symptom Chart.
    - If the voltage increases as specified, the charging system is operating normally.

Torque Specifications

Description	Nm	lb-ft	lb-in
Battery hold-down bolt	10	—	89
Battery tray bolts	30	22	—
Negative battery cable to cowl panel ground bolt	12	9	—
Negative battery cable to frame bolt	12	9	—
Battery ground terminal bolt	7	—	62
Positive battery terminal cable junction nut	9	—	80
Starter motor negative cable nut	22	16	—
Starter solenoid cable nut	5	—	44
Starter motor positive cable nut	12	9	—
Positive battery terminal nut	9	—	80



Battery and Cables

Vehicles are equipped with a 12 volt maintenance-free battery.

The battery and cable system consists of the following components:

- battery
- battery cable assembly
- battery tray

Ford Motor Company strongly recommends that lead-acid batteries be returned to an authorized recycling facility for disposal.

Battery

Special Tool(s)

 ST2442-A	Micro 490 Digital Battery Analyzer 162-00004

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Battery ● Battery mounting	● Battery cables ● Battery posts

3. If an obvious cause for a concern is found, correct the cause before proceeding to the next step.
4. If the fault is not visually evident, proceed to the pinpoint test.

Pinpoint Tests

PINPOINT TEST A: BATTERY CONDITION TEST

Test Step	Result / Action to Take
A1 TEST BATTERY CONDITION	
NOTE: No battery with a red test-eye should be replaced. The red eye only means the battery is discharged, not necessarily defective. **NOTE:** Failure to fully charge the battery before retesting may cause false readings. ● Verify the battery condition using the Battery Analyzer. ● **Is the battery OK?**	**Yes** Does the meter read, GOOD BATTERY? RETURN the battery to service. REFER to Section 414-00 . Does the meter read, GOOD-RECHARGE? CHARGE the battery and RETURN to service. REFER to Section 414-00 . Does the meter read, CHARGE & RETEST? Fully CHARGE the battery and RETEST.

	No Does the meter read, REPLACE BATTERY? INSTALL a new battery. Does the meter read, BAD CELL-REPLACE? INSTALL a new battery.

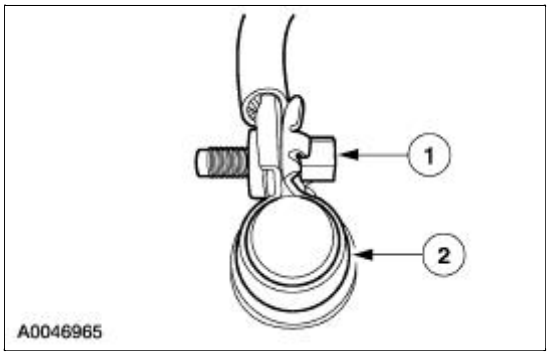
Battery Disconnect

WARNING: Batteries normally produce explosive gases which can cause personal injury. Therefore, do not allow flames, sparks or lighted substances to come near the battery, always shield your face and protect your eyes. Always provide ventilation. Failure to follow these instructions may result in personal injury.

WARNING: To avoid accidental deployment and possible injury, the backup power supply must be depleted before repairing or installing any front or side air bag supplemental restraint system (SRS) components and before repairing, installing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches. Failure to follow these procedures may result in personal injury.

Refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped). Failure to follow these instructions may result in personal injury.



WARNING: When lifting a battery, excessive pressure on the end walls could cause acid to spew through the vent caps, resulting in personal injury. Lift with a battery carrier or with your hands on opposite corners. Failure to follow these instructions may result in personal injury.

WARNING: Keep out of the reach of children. Batteries contain sulfuric acid. Avoid contact with skin, eyes or clothing. Also, shield your eyes when working near the battery to protect against possible splashing of the acid solution. In case of acid contact with the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in personal injury.

1. **CAUTION: Do not lift the battery terminal by grabbing onto the wire.**

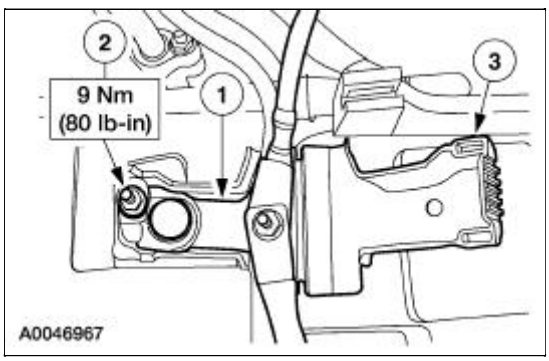
   NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven to relearn its strategy.

   Disconnect the battery ground cable.
   1. Loosen the battery terminal bolt.
   2. Slightly rotate and lift the battery terminal assembly.

2. **CAUTION: Do not lift the battery terminal by grabbing onto the wire or lifting underneath the terminal cover.**

Disconnect the positive battery cable.

1. Open the battery terminal cover.
2. Loosen the battery terminal nut.
3. Slightly rotate and lift the battery terminal and cover assembly.

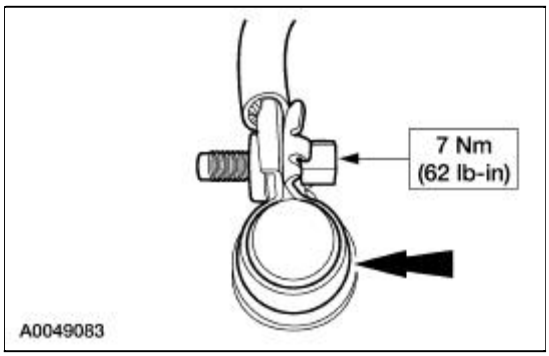


3. **CAUTION: Do not tap, press or excessively push on the battery terminal.**

NOTE: Make sure the battery terminal slides all of the way down the battery post and is not tilted.

Connect the positive battery cable.

1. Install the battery cable.
2. Tighten the nut.
3. Close the terminal cover.

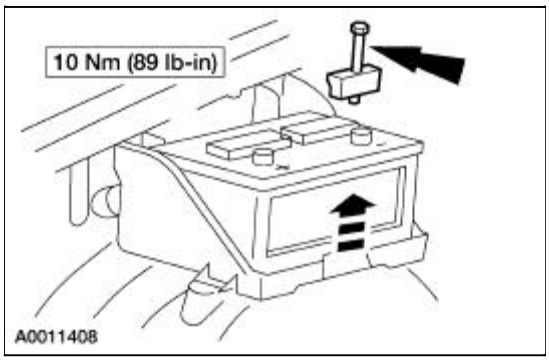


4. **CAUTION: Do not tap, press or excessively push on the battery terminal.**

NOTE: Make sure the battery terminal slides all of the way down the battery post and is not

tilted.

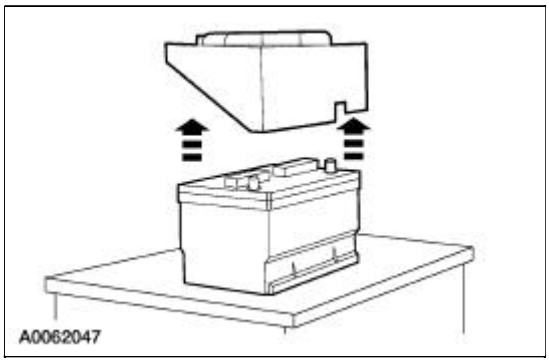
Connect the battery ground cable and tighten the bolt.



Battery

Removal and Installation

1. Disconnect the battery cables. For additional information, refer to Battery Disconnect in this section.

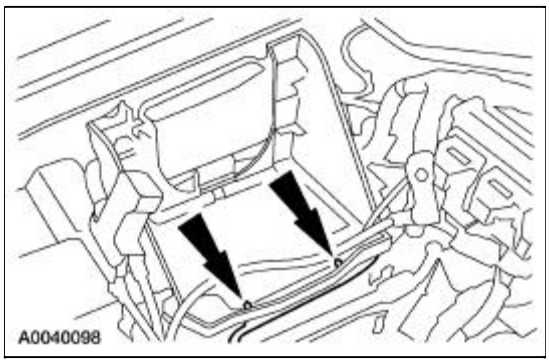


2. Remove the battery hold-down bolt and the battery hold-down clamp.

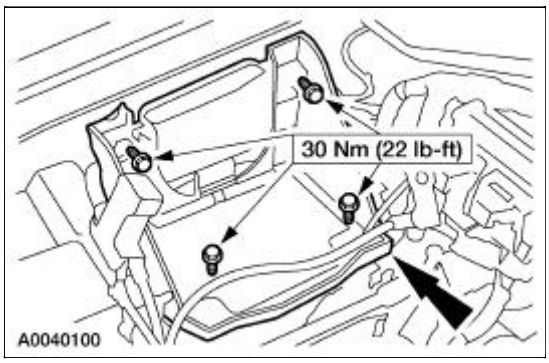
3. **WARNING: When lifting a battery, excessive pressure on the end walls could cause acid to leak out through the vent caps, resulting in personal injury, or damage to the vehicle or battery. Lift with battery carrier.**

   Remove the battery.

4. With the battery on a workbench, remove the battery heat shield, if necessary.

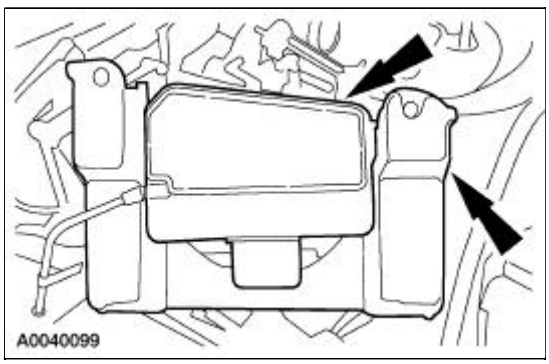


5. To install, reverse the removal procedure.



Battery Tray

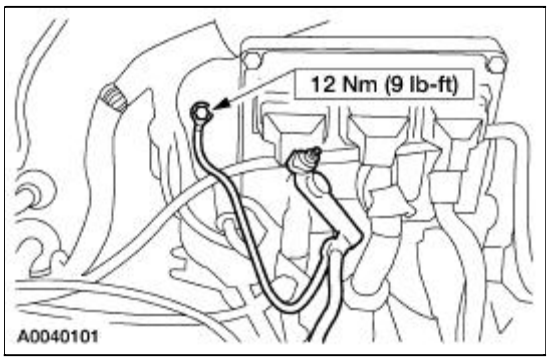
Removal and Installation



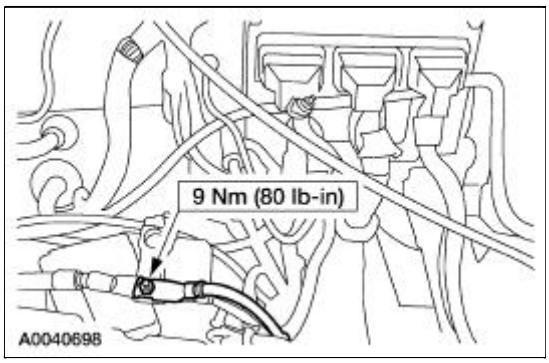
1. Remove the battery. For additional information, refer to Battery in this section.
2. Disconnect the wiring harness locators from the battery tray.

3. Remove the bolts and position the battery tray aside.

4. Remove the battery tray.
   - Disconnect the vacuum reservoir.

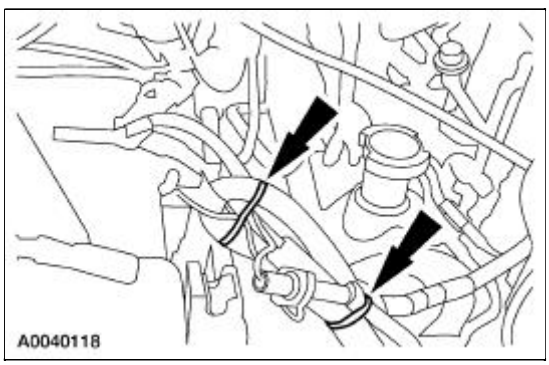


5. To install, reverse the removal procedure.

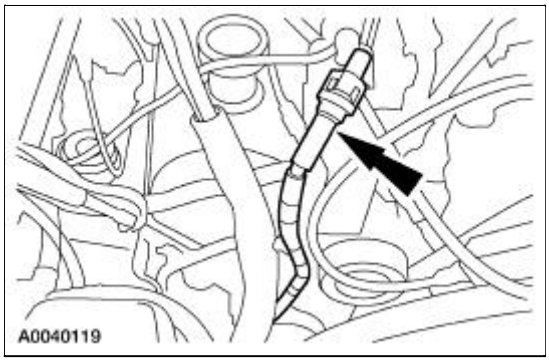


Battery Cables

Removal and Installation

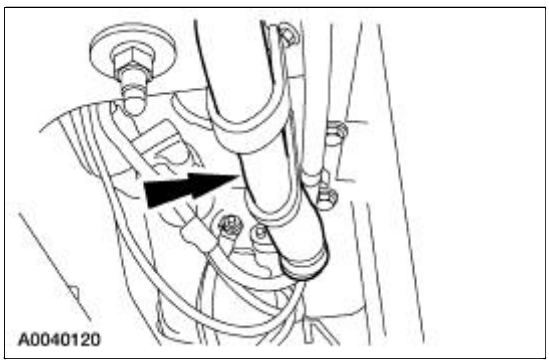


1. Disconnect the battery. For additional information, refer to Battery Disconnect in this section.
2. Remove the negative battery cable ground bolt at the cowl panel.

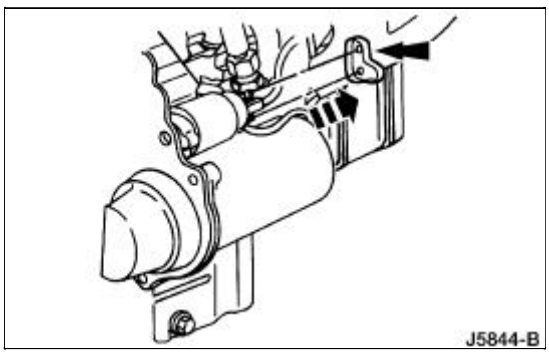


3. Remove the nut and disconnect the positive battery cable at the positive battery terminal junction.

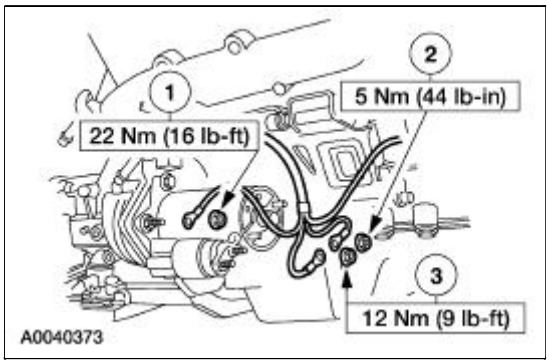
4. Remove the engine cover.
   - Remove the bolts.
5. Remove the two tiestraps from the battery cable harness.



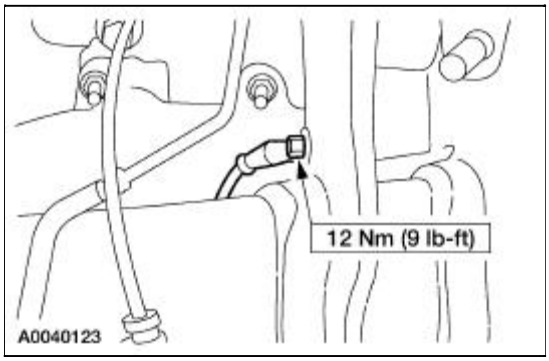
6. Disconnect the electrical connector from the battery cable harness.



7. Raise the vehicle. For additional information, refer to Section 100-02 .



8. Release the battery cable harness from the two support brackets.



9. Remove the starter motor solenoid terminal cover.

10. Disconnect the starter motor connections.
    1. Remove the nut and disconnect the starter motor negative cable.
    2. Remove the nut and disconnect the starter solenoid cable.
    3. Remove the nut and disconnect the starter motor positive cable.

11. Remove the negative battery cable to frame bolt.

12. Remove the battery cable harness.

13. To install, reverse the removal procedure.

General Specifications

Item	Specification
Generator	110 amp

Torque Specifications

Description	Nm	lb-ft	lb-in
Generator B+ cable nut	8	—	71
Generator bolts	25	18	—
Generator bracket bolts	10	—	89

Generator

The charging system consists of the following components:

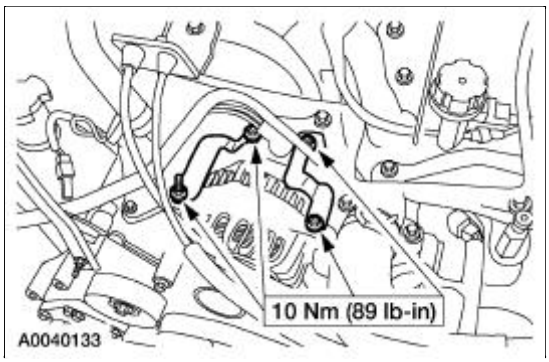
- battery
- generator with internal voltage regulator

Generator

Refer to Section 414-00 .

Generator —4.6L and 5.4L (2V)

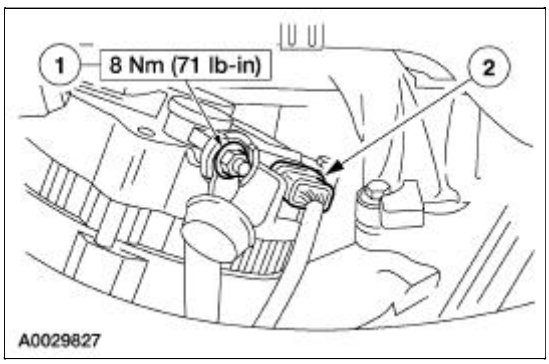
Removal and Installation



1. **NOTE:** The 4.6L (2V) is shown. The 5.4L (2V) procedure is similar.

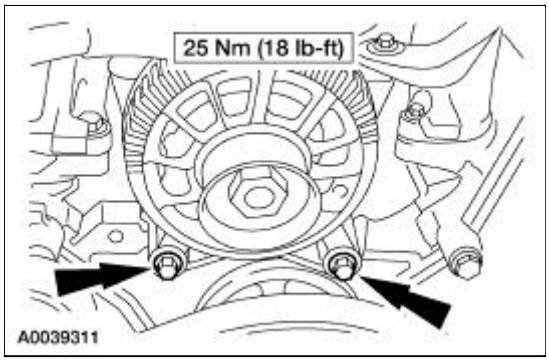
   Disconnect the battery . For additional information, refer to Section 414-01 .

2. Remove the air cleaner outlet pipe assembly. For additional information, refer to Section 303-12 .



3. Relieve the accessory drive belt tension and remove the belt from the generator pulley.

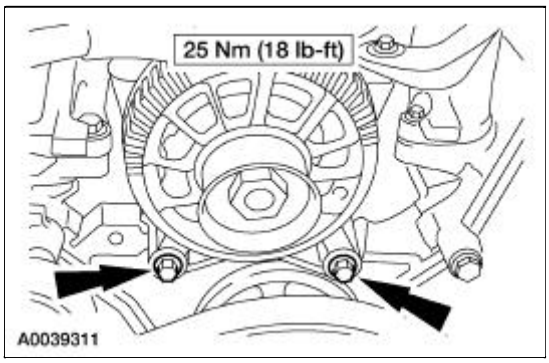
4. Remove the bolts and remove the generator bracket.



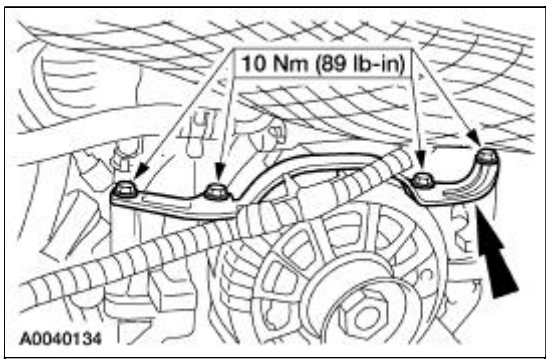
5. **CAUTION: This is a new style connector that has a press-to-release tab. Pulling on the tab could result in damage to the connector or harness.**

   Disconnect the generator electrical connections.
   1. Remove the B + cable nut and cable.
   2. Disconnect the electrical connector.

6. Loosen the lower bolts and remove the generator.



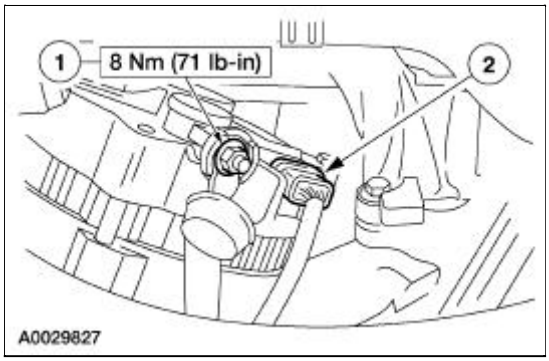
7. To install, reverse the removal procedure.



Generator —5.4L (4V)

Removal and Installation

1. Disconnect the battery. For additional information, refer to Section 414-01 .
2. Remove the radiator shroud and cooling fan. For additional information, refer to Section 303-03 .
3. Relieve the accessory drive belt tension and remove the belt from the generator pulley.
4. Loosen the lower generator bolts.



5. Disconnect the harness pin-type retainer from the water-neck housing.
6. Remove the bolts and the generator bracket.

7. Position the generator aside.
8. **CAUTION: This is a new style connector that has a press-to-release tab. Pulling on the tab could result in damage to the connector or harness.**

   Disconnect the electrical connections and remove the generator.
   1. Remove the B+ cable nut and cable.
   2. Disconnect the electrical connector.

9. To install, reverse the removal procedure.

Audio System

Refer to Wiring Diagrams Cell 130 , Audio for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Inspection and Verification

1. Verify the customer concern by operating the audio system and the video system (if equipped) with the engine running and the vehicle in and out of motion.

2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Audio unit ● Digital audio compact disc changer ● Antenna, wire assembly, or antenna cable ● Radio speakers or mountings ● Radio ignition interference capacitor, radio frequency interference suppression bond and radio receiver hood bonding strap misaligned, corroded or loose	● Central junction box (CJB) fuse(s): ■ 4 (15A) ■ 7 (7.5A) ■ 22 (10A) ■ 31 (25A) ● Ignition switch ● Circuitry ● Audio unit ● Video system ● Rear seat controller (RSC) ● Compact disc/disc jockey (CD/DJ)

3. If the fault is visually evident, proceed to the symptom chart.

4. If the fault is not visually evident, proceed to the speaker walk-around test and audio unit self-diagnostic mode.

Speaker Walk-Around Test—Vehicle Navigation Radio (VNR) Only

NOTE: To enter the speaker walk-around test or audio unit self-diagnostic mode, the audio unit must

be turned on and in radio tuner mode (AM/FM).

5. To enter the speaker walk-around test, simultaneously press the audio unit preset buttons 3 and 6.

6. The speaker walk-around test stops at each speaker and applies sound to each speaker for about one to two seconds. Each speaker is tested and displayed on the audio unit in the following sequence: RF, LF, LR, RR.

7. The speaker walk-around test automatically continues and tests for the operation of the AM/FM antenna. If the antenna is inoperative, NOT FOUND will be displayed. If the vehicle is not equipped with CD/DJ, or if the CD/DJ is not responding, NO DJ will be displayed.

Speaker Walk-Around Test—Navigator with Navigation System (late build only)

NOTE: To enter the speaker walk-around test or audio unit self-diagnostic mode, the audio unit must be turned on and in radio tuner mode (AM/FM).

1. To enter the speaker walk-around test, simultaneously press and hold for five seconds the audio unit preset buttons MAP and DEST.

2. The speaker walk-around test stops at each speaker and applies sound to each speaker for about one to two seconds. Each speaker is tested and displayed on the audio unit in the following sequence: RF, LF, LR, RR, Subwoofer.

Speaker Walk-Around Test—All Audio Units Except VNR

NOTE: To enter the speaker walk-around test or audio unit self-diagnostic mode, the audio unit must be turned on and in radio tuner mode (AM/FM).

1. To enter the speaker walk-around test, simultaneously press the audio unit preset buttons 3 and 6.

2. The speaker walk-around test stops at each speaker and applies sound to each speaker for about one to two seconds. Each speaker is tested and displayed on the audio unit in the following sequence: RF, LF, LR, RR.

3. The speaker walk-around test automatically continues and tests Subwoofer I and Subwoofer II for a speaker short and CD/DJ. If a speaker short exists, SPKR SHORT will be displayed. If the vehicle is not equipped with CD/DJ or if the CD/DJ is not responding, NO DJ will be displayed.

Audio Unit Self-Diagnostic Mode—All Audio Units Except Navigation Audio Units

NOTE: To enter the speaker walk-around test or audio unit self-diagnostic mode, the audio unit must be turned on and in radio tuner mode (AM/FM).

1. To enter the following tests, depress the desired preset button while in the speaker walk-around test or while in the audio unit self-diagnostic mode.

2. To exit the audio unit self-diagnostic mode, turn the ignition switch or the audio unit off.

3. If the concern remains and the fault is not detected, proceed to the Symptom Chart to continue diagnostics.

4. The audio unit self-diagnostic mode has five tests available:
    - Preset Button 1 = Audio internal/external SELF TEST. This test is an on-demand self-test. If SELF FAIL is displayed, press TUNE > to scroll view the DTCs stored. Refer to the audio unit Diagnostic Trouble Code (DTC) Index. If the system is OK, SELF PASS will be displayed.
    - Preset Button 2 = View/Clear continuous DTCs. NO DTCS is displayed if no DTCs are retrieved. If DTCS FOUND is displayed, press TUNE > to view the DTCs retrieved. Refer to the Audio Unit Diagnostic Trouble Code (DTC) Index. To clear all DTCs, press the EJECT button. DTCS CLEAR will be displayed.
    - Preset Button 3 = SIGNAL TEST. This test measures the average strength at the current tuner setting.
    - **NOTE:** Always document, clear, and carry out the audio unit on-demand self-test again.

      Preset Button 4 = Software configuration level. This test queries each audio system controller for its software configuration level. SOFT LEVELS will be displayed upon completion of the query. Press TUNE > to scroll view the software configuration version level.
    - Preset Button 5 = DISPLAY TEST. This test will light all the audio unit display segments for five seconds. When the test is complete, DISPLAY TEST is displayed on the bezel.

Audio Unit Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU is Defective	Audio Unit	For early build vehicles CLEAR and DOCUMENT the DTCs. CARRY OUT the self-test. REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility if DTC B1342 is retrieved again. TEST the system for normal operation. For Navigator with navigation audio unit, REFER to Section 419-07 .
B2103	Antenna Not Connected	Audio Unit	Verify that the radio antenna is connected. CLEAR and DOCUMENT the DTCs. CARRY OUT the self-test. If DTC B2406 is retrieved again, REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation after the repair.
B2139	Data Mismatch	Audio Unit	REFER to Section 419-07 .
B2204	GPS Antenna Open or Short	Audio Unit	REFER to Section 419-07 .
B2208	Navigation To Head Unit Communication Error	Audio Unit	REFER to Section 419-07 .
B2401	Audio Tape Deck Mechanism Fault	Audio Unit	VERIFY that no cassette is inserted in the audio unit. CLEAR and DOCUMENT the DTCs. CARRY OUT the self-test. If DTC B2401 is retrieved again, REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation.
B2402	Audio CD/DJ Thermal Shutdown Fault	Audio Unit	Go To Pinpoint Test B .
B2403	Audio CD/DJ Internal Fault	Audio Unit	Go To Pinpoint Test B .
B2404	Audio Steering Wheel Switch Circuit Fault	Audio Unit	Go To Pinpoint Test K .

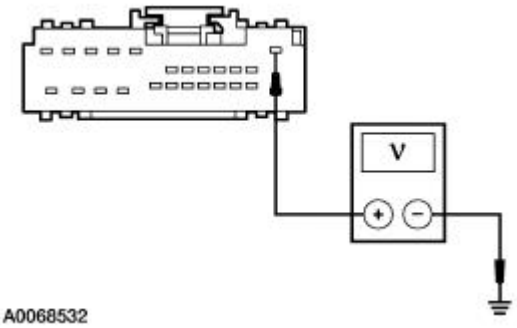
B2405	Audio Single-Disc CD Player Thermal Shutdown Fault	Audio Unit	CLEAR and DOCUMENT the DTCs. CARRY OUT the self-test. If DTC B2405 is retrieved again, REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation after the repair.
B2406	Audio Single-Disc CD Player Internal Fault	Audio Unit	CLEAR and DOCUMENT the DTCs. CARRY OUT the self-test. If DTC B2406 is retrieved again, REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation after the repair.
B2633	Driver-front Microphone Circuit Failure	Audio Unit	REFER to Section 419-07 .
B2858	H/U is Defective	Audio Unit	REFER to Section 419-07 .
B2913	Audio Subwoofer Not Connected	Audio Unit	Go To Pinpoint Test H .
U2003	Audio Compact Disc/Disc Jockey is Not Responding	Audio Unit	If equipped with CD/DJ, Go To Pinpoint Test B .
U2005	Audio Rear Seat Controller (RSC) Unit is Not Responding	Audio Unit	**NOTE:** U2005 is retrieved if RSC Unit is not present, disconnected or inoperative. If equipped with RSC, Go To Pinpoint Test I .
U2014	Audio Subwoofer Unit is Not Responding	Audio Unit	Go To Pinpoint Test H .
U2026	Family Entertainment System is Not Responding	Audio Unit	Go To Pinpoint Test H .
A477	Audio Unit Configuration	Audio Unit	CLEAR and DOCUMENT the DTCs. CARRY OUT the self-test. If DTC A477 is retrieved again, REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation after the repair.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
● The audio unit is inoperative—except Navigator with navigation audio unit	● Central junction box (CJB) fuse (s): ■ 31 (25A). ■ 7 (7.5A). ● Circuitry. ● Audio unit. ● Ignition switch.	● Go To Pinpoint Test A .
● The audio unit is inoperative—Navigator with navigation audio unit only	● Central junction box (CJB) fuse (s): ■ 4 (15A). ■ 7 (7.5A). ■ 31 (25A).	● For Navigator with navigation audio unit, REFER to Section 419-07 .

	• Circuitry. • Audio unit. • Navigation system module. • Ignition switch.	
• The cassette player is inoperative/does not operate correctly	• Audio unit.	• REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation.
• The audio unit does not operate correctly — display is blank	• Audio unit. • Navigation control module.	• Late build Navigator with navigation, REFER to Section 419-07 , all others, REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation.
• The CD changer is inoperative/does not operate correctly	• Central junction box (CJB) fuse 4 (15A). • Circuitry. • Audio unit. • CD changer.	• Go To Pinpoint Test B .
• The audio unit does not display CD changer information—vehicle navigation radio (VNR) only	• Central junction box (CJB) fuse (s): ■ 31 (25A). ■ 7 (7.5A). ■ 4 (15A). • Circuitry. • Audio unit. • CD changer.	• Go To Pinpoint Test C .
• Poor reception	• Antenna. • Antenna connections. • Noise suppression equipment. • Audio unit. • Cellular phone coaxial cable. • Connections at battery, antenna, speaker leads or audio unit. • Antenna isolator module.	• Go To Pinpoint Test D .
• Continuous SEEK/SCAN in AM/FM	• Antenna. • Antenna connections. • Audio unit. • Antenna isolator module.	• Go To Pinpoint Test E .
• Poor sound quality/distorted sound from one or more	• Speaker(s). • Wiring to speaker (s).	• Go To Pinpoint Test F .



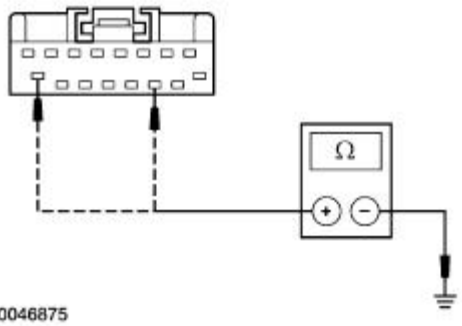
speakers—not all speakers	• Audio cable. • Audio unit.	
• Poor sound quality/distorted sound from all speakers	• Speaker(s). • Wiring to speaker (s). • Audio unit.	• Go To Pinpoint Test G .
• No sound from one or more of the speakers — not all speakers	• Speaker(s). • Wiring to speaker (s). • Audio unit. • Audio amplifier.	• Go To Pinpoint Test F .
• No sound from all speakers	• Audio unit. • Audio amplifier. • Circuitry.	• Go To Pinpoint Test G .
• The subwoofer is inoperative — except Navigator with navigation audio unit	• Central junction box (CJB) fuse 31 (25A). • Circuitry. • Subwoofer. • Subwoofer amplifier.	• For the Navigator with navigation audio unit, Go To Pinpoint Test M . For all others, Go To Pinpoint Test H .
• No auxiliary headphone audio	• Rear seat entertainment unit.	• If the rear radio speakers operate correctly, INSTALL a new RSC unit. REFER to Section 415-01 . TEST the system for normal operation.
• The auxiliary audio control is inoperative—rear seat controller (RSC) unit	• Central junction box (CJB) fuse 4 (15A). • Circuitry. • RSC unit. • Headphone set.	• Go To Pinpoint Test I .
• Loud popping sound when cycling the ignition switch	• Amplifier enable line shorted. • Amplifier.	• Go To Pinpoint Test J .
• The auxiliary audio control is inoperative—steering wheel control	• Battery junction box (BJB) fuse (s): ■ 31 (25A). ■ 7 (7.5A). • Circuitry. • Clockspring. • Steering wheel control switch. • Audio unit.	• Go To Pinpoint Test K .
• Audio unit illumination inoperative	• Circuitry. • Audio unit.	• REFER to Section 413-00 .
• The video system is inoperative/does not operate correctly	• Battery junction box fuse 4 (15A). • Circuitry. • Video system.	• Go To Pinpoint Test L .
• The video display is inoperative	• Circuitry. • Video system.	• Go To Pinpoint Test L .
• The video system does not operate correctly — no audio	• Circuitry. • Video system.	• Go To Pinpoint Test L .

• The video system does not operate correctly—remote control does not function correctly	• Video system.	• INSTALL new batteries in the remote control. If the concern is still present, CONTACT an authorized Ford audio repair facility for further diagnostic test procedures.

Pinpoint Tests

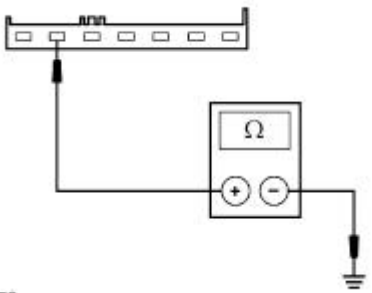
PINPOINT TEST A: THE AUDIO UNIT IS INOPERATIVE — EXCEPT NAVIGATOR WITH NAVIGATION AUDIO UNIT

Test Step	Result / Action to Take
A1 CHECK THE VOLTAGE TO THE AUDIO UNIT	
• Disconnect: Audio Unit C290a (late build CDX6 and all early build except VNR). • Disconnect: Audio Unit C2188a (VNR). • Disconnect: Audio Unit C240a (late build DM100i). • Key in ON position. • For all except VNR and late build DM100i, measure the voltage between the audio unit C290a pin 9, circuit 797 (LG/VT), harness side and ground.  A0039232 • For VNR, measure the voltage between the audio unit C2188a pin 1, circuit 797 (LG/VT), harness side and ground.  A0046874 • For late build DM100i, measure the voltage between the audio unit C240a pin 1, circuit 797 (LG/VT), harness side and ground	**Yes** GO to A2 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.



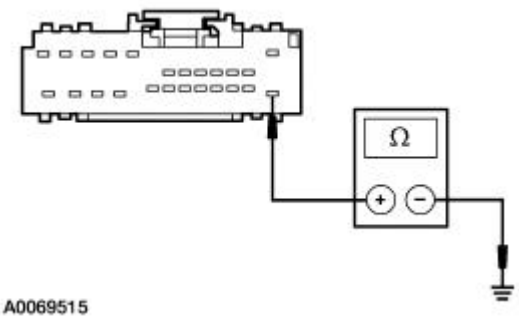
A0068532

- **Is the voltage greater than 10 volts?**



A2 CHECK CIRCUIT 694 (BK/LG) FOR AN OPEN

- Key in OFF position.
- For all except VNR and late build DM100i, measure the resistance between the audio unit C290a pin 11, circuit 694 (BK/LG), harness side and ground; and between the audio unit C290a pin 16, circuit 694 (BK/LG), harness side and ground.

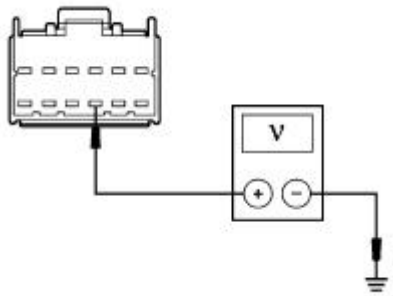


A0046875

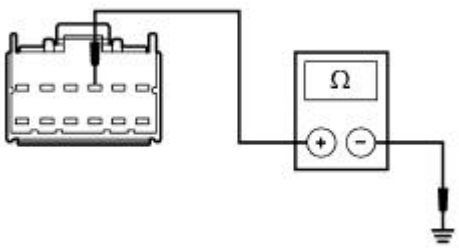
- For VNR, measure the resistance between the audio unit C2188a pin 6, circuit 694 (BK/LG), harness side and ground.

A0046876

- For late build DM100i, measure the resistance between the audio unit C240a pin 13, circuit 694 (BK/LG), harness side and ground



A0069515



- **Are the resistances less than 5 ohms?**

Yes
REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation.

No
REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST B: THE CD CHANGER IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>B1 CHECK VOLTAGE TO THE CD CHANGER
● Key in OFF position.
● Disconnect: CD Changer C3028.
● Disconnect: CD Changer C243 (Navigator).
● Key in ON position.
● Measure the voltage between the CD changer C3028 (or C243) pin 9, circuit 720 (RD/YL), harness side and ground.

A0050791
● Is the voltage greater than 10 volts?</td><td>Yes
GO to B2 .

No
REPAIR the circuit. TEST the system for normal operation.</td></tr>
<tr><td>B2 CHECK CIRCUIT 694 (BK/LG) FOR AN OPEN
● Key in OFF position.
● Measure the resistance between the CD changer C3028 (or C243) pin 3, circuit 694 (BK/LG), harness side and ground.

A0072650
● Is the resistance less than 5 ohms?</td><td>Yes
GO to B3 .

No
REPAIR the circuit. TEST the system for normal operation.</td></tr>
<tr><td>B3 CHECK THE CIRCUITS BETWEEN THE COMPONENTS FOR AN OPEN
● Key in OFF position.
● Disconnect: Audio Unit C2188d.
● Disconnect: Rear Seat Controller Connector.
● Measure the resistance between the following groups of pins: CD changer C3028 (or C243) and the RSC unit C349b, CD changer C3028 (or C243) and the audio unit C2188d, and between RSC unit C349b and audio unit C2188d.
<table>
<tr><th>CD Changer Pin</th><th>RSC Unit Pin</th><th>Audio Unit Pin</th><th>Circuit</th></tr>

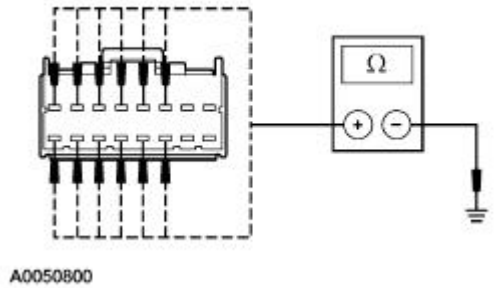
—	C349b pin 6	C2188d pin 6	1561 (OG)

- **Are the resistances less than 5 ohms?**

B4 CHECK THE CIRCUITS BETWEEN THE COMPONENTS FOR A SHORT

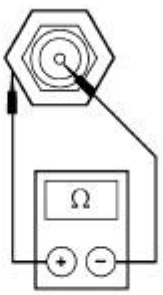
- Measure the resistance between the following RSC unit C349a pins, harness side and ground:
  - 1, circuit 19 (LB/RD)
  - 5, circuit 802 (OG/RD)
  - 6, circuit 803 (BN/PK)
  - 7, circuit 800 (GY/LB)
  - 8, circuit 801 (TN/YL)
  - 9, circuit 720 (RD/YL)
  - 10, circuit 1068 (LG/BK)
  - 12, circuit 833 (TN)
  - 13, circuit 832 (LB/PK)
  - 15, circuit 827 (TN/WH)
  - 16, circuit 825 (TN/LG)



A0050799

- Measure the resistance between the following RSC unit C349b pins, harness side and ground:
  - 3, circuit 1806 (BK)
  - 4, circuit 1804 (LG)
  - 5, circuit 1562 (YE)
  - 6, circuit 1561 (OG)
  - 7, circuit 1560 (WH)
  - 8, circuit 1559 (RD)
  - 11, circuit 1805 (RD)
  - 12, circuit 1803 (WH)
  - 13, circuit 799 (OG/BK)

Yes
REMOVE the CD changer and SEND it to an authorized Ford audio repair facility. TEST the system for normal operation.



No
REPAIR the circuit in question. TEST the system for normal operation.

■ 14, circuit 690 (GY) ■ 15, circuit 798 (LG/RD) ■ 16, circuit 856 (VT)  A0050800 ● **Are the resistances greater than 10,000 ohms?**	

PINPOINT TEST C: THE AUDIO UNIT DOES NOT DISPLAY CD CHANGER INFORMATION—VNR ONLY

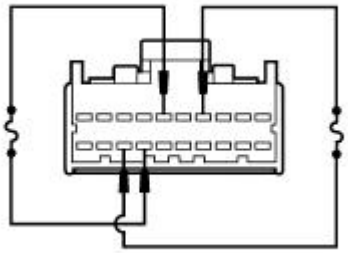
Test Step	Result / Action to Take
C1 CHECK OPERATION OF THE CD CHANGER ● Key in ON position. ● Turn on the audio unit. ● Verify the audio unit is operating correctly. Refer to the owner literature. ● Verify that the CD changer power loading function is operating correctly. Refer to the owner literature for CD loading instructions. ● **Is the CD changer information displayed on the audio unit display?**	**Yes** Go To Pinpoint Test B . **No** GO to C2 .
C2 CHECK FOR SOUND COMING FROM THE SPEAKERS ● Load a known good CD and press the CD button. ● **Is sound coming from the speakers?**	**Yes** GO to C3 . **No** Go To Pinpoint Test G .
C3 CHECK AUDIO UNIT DISPLAY ● Press the AM/FM button. ● Verify that the audio unit display is illuminated. ● **Is the audio unit display illuminated?**	**Yes** GO to C4 . **No** Go To Pinpoint Test A .
C4 CHECK CIRCUIT CONNECTIONS ● Key in OFF position. ● Disconnect: CD Changer C3028. ● Disconnect: CD Changer C243 (Navigator). ● Check circuit connectors and circuits for damage, corrosion or an open circuit at CD changer C243. ● **Are the circuits and connectors OK?**	**Yes** REMOVE the CD changer and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation. **No** REPAIR the circuit or connector as necessary. TEST the system for normal operation.

PINPOINT TEST D: POOR RECEPTION

Test Step	Result / Action to Take
NOTE: If equipped with video system, refer to owner literature before diagnosis.	
D1 CHECK ANTENNA CABLE CONNECTIONS	
• Key in OFF position. • Check the antenna connections, bracket and ground screw. • **Are the connections clean, secure and in metal-to-metal contact?**	**Yes** GO to D2. **No** CLEAN and SECURE the antenna cable and ground connections as necessary. TEST the system for normal operation.
D2 CHECK AUDIO UNIT COAX CABLE CENTER CONDUCTOR FOR AN OPEN	
• Key in OFF position. • Disconnect: Audio Unit Antenna Cable. • Disconnect: Antenna Cable. • Measure the resistance between the audio unit antenna connector center conductor and the antenna connector center conductor of the antenna isolator module. • **Is the resistance less than 4 ohms?**	**Yes** GO to D3. **No** REPAIR or INSTALL a new antenna cable. REFER to Section 415-02. TEST the system for normal operation.
D3 CHECK AUDIO UNIT COAX CABLE FOR A SHORT	
• Measure the resistance between the audio unit cable center conductor and the cable outer shield.  A0004930 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D4. **No** REPAIR or INSTALL a new antenna cable. REFER to Section 415-02. TEST the system for normal operation.
D4 CHECK AUDIO UNIT COAX CABLE FOR AN OPEN	
• Measure the resistance between the antenna cable shield at the audio unit connector to a known good body sheet metal ground. • **Is the resistance less than 5 ohms?**	**Yes** GO to D5. **No** REPAIR or INSTALL a new antenna cable. REFER to Section 415-02. TEST the system for normal operation.
D5 CHECK SUPPRESSION EQUIPMENT	
• Check all necessary suppression equipment, the radio frequency interference suppression bond and the radio strap for security, cleanliness and metal-to-metal contact. Refer to Section 415-01. • **Are the contacts clean, secure and in metal-to-metal**	**Yes** GO to D6. **No** INSTALL a new radio frequency

contact?	interference suppression bond and related equipment, or CLEAN and SECURE the connections as necessary. TEST the system for normal operation.
D6 CHECK MOUNTING AND CONNECTING CIRCUITS	
NOTE: The capacitor mounting points are used to complete the electrical circuit and must be mounted securely to clean surfaces. ● Check the mounting and connecting circuits of the radio ignition interference capacitor(s) for security, cleanliness and metal-to-metal contact. Refer to Section 415-01 . ● **Are the contacts clean, secure and in metal-to-metal contact?**	**Yes** GO to D7 . **No** CLEAN and SECURE the connections as necessary. TEST the system for normal operation.
D7 CHECK RADIO IGNITION INTERFERENCE CAPACITOR(S)	
● Check the operation of the radio ignition interference capacitor(s) by installing known good component(s). ● Key in START position. ● Turn on the radio and check the reception. ● **Is the noise eliminated?**	**Yes** INSTALL a new radio ignition interference capacitor(s) as necessary. TEST the system for normal operation. **No** GO to D8 .
D8 CHECK GENERATOR	
● Key in OFF position. ● Check the generator by disconnecting the wiring harness from the voltage regulator. ● Key in START position. ● Turn on the radio and check the reception. ● **Is the noise eliminated?**	**Yes** INSTALL a new generator. REFER to Section 414-02 . **No** GO to D9 .
D9 CHECK IGNITION CIRCUITS	
● Key in OFF position. ● Check the ignition circuits for correct routing, grounding and security of connections. ● **Are the circuits OK?**	**Yes** GO to D10 . **No** REPAIR the circuit in question.
D10 CHECK IGNITION SYSTEM	
● Check the ignition system. Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual. ● **Is the ignition system OK?**	**Yes** GO to D11 . **No** REPAIR the ignition system as necessary. TEST the system for normal operation.
D11 CHECK AUDIO UNIT MOUNTING POINTS	
● Check all of the audio unit mounting points for security. ● **Are the mounting points secure?**	**Yes** If equipped with VNR, GO to D12 . Without VNR, GO to D13 . **No** CLEAN and SECURE the connections as necessary.

	TEST the system for normal operation.
D12 CHECK THE VOLTAGE TO THE ANTENNA ISOLATOR MODULE	
• Key in OFF position. • Disconnect: Antenna Isolator Module Connector. • Key in START position. • Measure the voltage between the antenna isolator module connector pin 1, circuit 194 (PK), harness side and ground. • **Is the voltage greater than 10 volts?**	**Yes** GO to D13 . **No** REPAIR the circuit in question. TEST the system for normal operation.
D13 SUBSTITUTE ANTENNA	
• **NOTE:** The in-glass antenna will have different reception characteristics than a whip antenna. • If the reception is poor in all speakers, substitute a known good antenna. • Key in START position. • Verify the operation of the audio unit. • **Is the noise eliminated?**	**Yes** REPAIR or INSTALL a new antenna cable. REFER to Section 415-02 . TEST the system for normal operation. **No** REINSTALL the original antenna. GO to D14 .
D14 SUBSTITUTE ANTENNA CABLE	
• Key in OFF position. • **NOTE:** The substitute rear cable must be grounded or poor reception will result. • Substitute a known good antenna cable(s). • Key in START position. • Verify the operation of the audio unit. • **Is the noise eliminated?**	**Yes** REPAIR or INSTALL a new antenna cable. REFER to Section 415-02 . TEST the system for normal operation. **No** REINSTALL the original antenna cable(s). GO to D15 .
D15 SUBSTITUTE AUDIO UNIT	
• Key in OFF position. • Substitute a known good audio unit. • Key in START position. • Verify the operation of the audio unit. • **Is the noise eliminated?**	**Yes** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation. **No** REINSTALL the original audio unit. GROUND various parts of the vehicle (for example: engine, fenders, quarter panels, stone deflectors, engine air cleaner and body sheet metal) to the frame using a jumper cable. When the noise is eliminated, PROVIDE a permanent ground where necessary.



PINPOINT TEST E: CONTINUOUS SEEK/SCAN IN AM/FM

Test Step	Result / Action to Take
E1 CHECK OPERATION OF THE	

SEEK/SCAN FUNCTIONS ● Key in ON position. ● Operate the SEEK/SCAN functions with the audio unit in both AM and FM tuner modes. ● **Do the SEEK/SCAN functions search continuously?**	**Yes** GO to E2 . **No** The system is OK.
E2 CHECK ANTENNA FOR AN OPEN ● Key in OFF position. ● Disconnect: Antenna Cable. ● **NOTE:** The meter lead must be within 25mm (1 inch) of the tab. ● Measure the resistance between the antenna cable lead terminal and the antenna grid center printed line. ● **Is the resistance less than 1 ohm?**	**Yes** GO to E3 . **No** REPAIR or INSTALL a new antenna cable. REFER to Section 415-02 . TEST the system for normal operation.
E3 CHECK ANTENNA CENTER PRINTED LINE FOR AN OPEN ● Measure the resistance of the center printed line between the tab and the bottom of the line. ● **Is the resistance less than 1.4 ohms?**	**Yes** GO to E4 . **No** REPAIR or INSTALL a new antenna cable. REFER to Section 415-02 . TEST the system for normal operation.
E4 CHECK ANTENNA LOOP FOR AN OPEN ● Measure the resistance of the loop around the outside of the glass between the tab and the bottom of the antenna grid loop. ● **Is the resistance less than 1.4 ohms?**	**Yes** GO to E5 . **No** REPAIR or INSTALL a new antenna cable. REFER to Section 415-02 . TEST the system for normal operation.
E5 CHECK ANTENNA TAB FOR AN OPEN ● Measure the resistance between the tab and within one inch of the printed pattern. ● **Is the resistance less than 1 ohm?**	**Yes** GO to E6 . **No** REPAIR or INSTALL a new antenna cable. REFER to Section 415-02 . TEST the system for normal operation.
E6 SUBSTITUTE ANTENNA CABLE ● **NOTE:** The substitute rear cable must be grounded or poor reception will result. ● Substitute a known good antenna cable (s) between the audio unit and the antenna. ● Key in START position. ● Check the operation of the audio unit. ● **Is the noise eliminated?**	**Yes** INSTALL a new antenna cable(s). REFER to Section 415-02 . TEST the system for normal operation. **No** REINSTALL the original cable. REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation.

PINPOINT TEST F: POOR SOUND QUALITY/DISTORTED SOUND FROM ONE OR MORE SPEAKERS — NOT ALL SPEAKERS

Test Step	Result / Action to Take
F1 CHECK FOR POOR/NO SOUND	
• Key in ON position. • Turn on the audio unit. • Carry out the speaker walk-around test by pressing preset buttons 3 and 6 simultaneously. For Navigator with navigation audio unit hold the MAP and the DEST buttons simultaneously for 5 seconds. • **Do all the speakers have poor sound quality or no sound?**	**Yes** Go To Pinpoint Test G . **No** If the subwoofer is inoperative, Go To Pinpoint Test M . All others GO to F2 .
F2 CHECK FOR SPEAKER CONCERNS	
• Check for loose trim panels or attachments that might cause rattles near the speaker in question. • Check for pinched or broken circuits at or near the audio unit or speakers in question. • Check for foreign material in the speaker(s) cone(s). • **Are there any visible speaker concerns?**	**Yes** REPAIR the concerns as necessary. TEST the system for normal operation. **No** GO to F3 .
F3 BYPASS RSC UNIT	
• Key in OFF position. • Disconnect: RSC Unit C349a (early build). • Disconnect: RSC Unit C388 (late build). • For all early build vehicles and for late build vehicles without a DVD player, connect a 10A fused jumper wire between RSC unit C349a pin 5, circuit 802 (OG/RD), harness side and pin 16, circuit 825 (TN/LG), harness side. Connect another 10A fused jumper wire between RSC unit C349a pin 7, circuit 800 (GY/LB), harness side and pin 15, circuit 827 (TN/WH), harness side.  A0050793 • For late build vehicles with a DVD player, connect a 10A fused jumper wire between RSC unit C388 pin 4, circuit 802 (OG/RD), harness side and pin 18, circuit 825 (TN/LG), harness side. Connect another 10A fused jumper wire between RSC unit C388 pin 6, circuit 800 (GY/LB), harness side and pin 17, circuit 827 (TN/WH), harness side.	**Yes** For all late build vehicles, GO to F5 . For all early build vehicles, GO to F4 . **No** INSTALL a new RSC unit. TEST system for normal operation.

A0068546

- Key in ON position.
- **Do the speakers in question still have poor sound quality or no sound?**

F4 CHECK SPEAKER RESISTANCE

- Key in OFF position.
- Disconnect: Audio Unit C290a (all except VNR) .
- Disconnect: Audio Unit C2188b (VNR).
- Measure the resistance between the audio unit C290a output and return circuits for the speaker that has poor sound quality or no sound.

Speaker	Output	Return
RF	pin 7, circuit 805 (WH/LG)	pin 8, circuit 811 (DG/OG)
LF	pin 14, circuit 804 (OG/LG)	pin 15, circuit 813 (LB/WH)
RR	pin 5, circuit 802 (OG/RD)	pin 6, circuit 803 (BN/PK)
LR	pin 12, circuit 800 (GY/LB)	pin 13, circuit 801 (TN/YL)

- For VNR, measure the resistance between the audio unit C2188b output and return circuits for the speaker that has poor sound quality or no sound.

Speaker	Output	Return
RF	pin 5, circuit 805 (WH/LG)	pin 6, circuit 811 (DG/OG)
LF	pin 1, circuit 804 (OG/LG)	pin 2, circuit 813 (LB/WH)
RR	pin 7, circuit 802 (OG/RD)	pin 8, circuit 803 (BN/PK)
LR	pin 3, circuit 800 (GY/LB)	pin 4, circuit 801 (TN/YL)

- **Is the resistance less than 5 ohms?**

Yes
GO to F6 .

No
REPAIR the circuit or INSTALL a new speaker as needed. REFER to Section 415-03 . TEST the system for normal operation.

F5 CHECK THE SPEAKER CIRCUITRY

- Key in OFF position.
- Remove the door panel to gain access to the suspect speaker. REFER to Section 501-05 .
- Remove the speaker that has poor sound quality or no sound. REFER to Section 415-03 .
- Disconnect: Speaker Connector.
- Measure the A/C voltage to the speaker that has poor sound quality or no sound as follows:

All Late Build Vehicles

Speaker	Connector	Output	Return
RF (and tweeter)	C612	pin 1, circuit 805 (WH/LG)	pin 2, circuit 811 (GN/OG)

Yes
GO to F7 .

No
REPAIR the circuit or INSTALL a new speaker as needed. REFER to Section 415-03 . TEST the system for normal operation.

LF (and tweeter)	C523	pin 1, circuit 804 (OG/LG)	pin 2, circuit 813 (LB/WH)
RR	802	pin 1, circuit 827 (TN/WH)	pin 2, circuit 801 (TN/YE)
LR	702	pin 1, circuit 827 (TN/WH)	pin 2, circuit 801 (TN/YE)

- **Is the value approximately 2 A/C volts?**

F6 SUBSTITUTE SPEAKER

- Connect: Audio Unit Connector.
- Substitute a known good speaker for each speaker with poor sound quality or no sound.
- Key in ON position.
- Turn on the audio unit.
- **Does the known good speaker(s) have poor sound quality or no sound?**

Yes
REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation.

No
INSTALL a new speaker(s) as necessary. REFER to Section 415-03 . TEST the system for normal operation.

F7 CHECK SPEAKER SIGNAL CIRCUITS FOR SHORTS AND OPENS

- Disconnect: Audio Amplifier C4208a.
- Disconnect: Audio Unit C2253d.
- Measure the resistance between the audio amplifier C4211a and the audio unit C2253d; and amplifier C4208a harness side and ground for the speaker that has poor sound quality or no sound as follows.

Speaker	Audio Unit C2253d	Amplifier C4208a
RF	pin 2, circuit 279 (WH/RD)	pin 14, circuit 279 (WH/RD)
RF	pin 11, circuit 858 (BN)	pin 15, circuit 858 (BN)
LF	pin 1, circuit 280 (LG/WH)	pin 2, circuit 280 (LG/WH)
LF	pin 10, circuit 857 (WH/OG)	pin 3, circuit 857 (WH/OG)
RR	pin 4, circuit 278 (PK/WH)	pin 18, circuit 278 (PK/WH)
RR	pin 13, circuit 855 (LB)	pin 19, circuit 855 (LB)
LR	pin 3, circuit 277 (LB/BK)	pin 6, circuit 277 (LB/BK)
LR	pin 12, circuit 859 (YE)	pin 7, circuit 859 (YE)

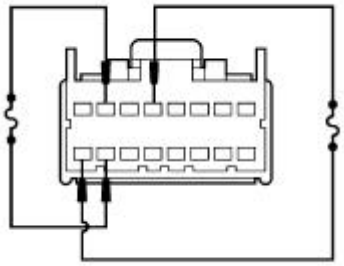
- **Is the resistance less than 5 ohms between the audio unit and the amplifier and greater than 10,000 ohms between the amplifier and ground?**

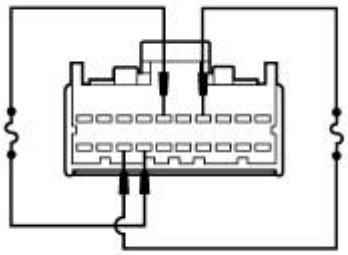
Yes
GO to F8 .

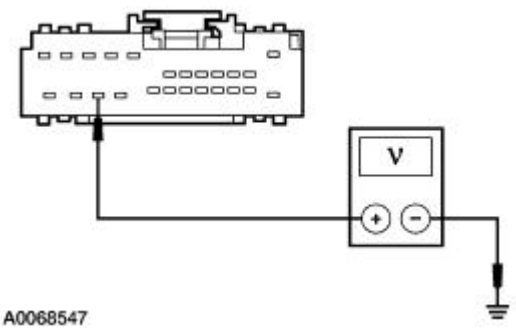
No
REPAIR the circuit. TEST the system for normal operation.

F8 SUBSTITUTE SPEAKER

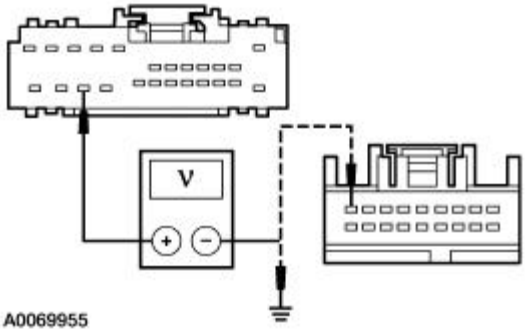
- Connect: Audio Unit Connector.
- Connect: Amplifier C4208a.
- Substitute a known good speaker for each speaker with poor sound quality or no sound.
- Key in ON position.
- Turn on the audio unit.





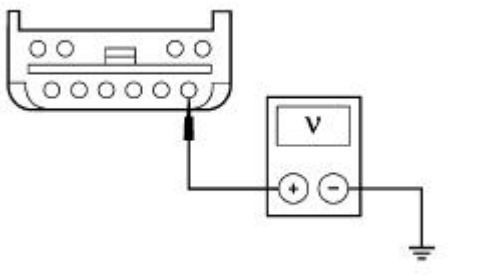


Yes
GO to F9 .

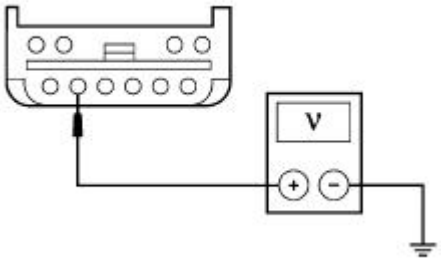


No
INSTALL a new speaker(s) as

• **Does the known good speaker(s) have poor sound quality or no sound?**	necessary. REFER to Section 415-03 . TEST the system for normal operation.
F9 SUBSTITUTE A KNOWN GOOD AUDIO UNIT	
• Substitute a known good audio unit. • **Does the speaker(s) still have poor quality/no sound?**	**Yes** INSTALL a new audio amplifier. REFER to audio amplifier in Section 415-01 . TEST the system for normal operation. **No** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation.



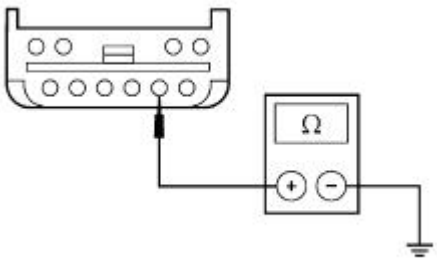
PINPOINT TEST G: POOR SOUND QUALITY/DISTORTED SOUND FROM ALL SPEAKERS



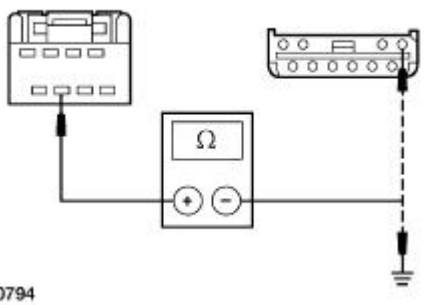
Test Step	Result / Action to Take
G1 CHECK FOR POOR SOUND QUALITY OR NO SOUND	
• Key in ON position. • Turn on the audio unit. • Carry out the speaker walk-around test by pressing the preset buttons 3 and 6 simultaneously. For Navigator with navigation audio unit hold the MAP and the DEST buttons simultaneously for 5 seconds. • **Do all the speakers have poor sound quality or no sound?**	**Yes** GO to G2 . **No** Go To Pinpoint Test F .
G2 BYPASS RSC UNIT	
• Key in OFF position. • Disconnect: RSC Unit C349a (all early build). • Disconnect: RSC Unit C388 (late build with DVD). • For all early build vehicles plus late build vehicles without a DVD player, connect a fused jumper between RSC unit C349a pin 5, circuit 802 (OG/RD) harness side and pin 16, circuit 825 (TN/LG) harness side. Connect another fused jumper between RSC unit C349a pin 7, circuit 800 (GY/LB) harness side and pin 15, circuit 827 (TN/WH) harness side.	**Yes** If all speakers have poor sound quality GO to G3 . If all speakers still have no sound, for Navigator with navigation audio unit GO to G4 . For all others REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation. **No** If all speakers now operate normally, INSTALL a new RSC unit. TEST system for normal operation. If one

 A0050793 ● For late build vehicles with a DVD player, connect a 10A fused jumper wire between RSC unit C388 pin 4, circuit 802 (OG/RD), harness side and pin 18, circuit 825 (TN/LG), harness side. Connect another 10A fused jumper wire between RSC unit C388 pin 6, circuit 800 (GY/LB), harness side and pin 17, circuit 827 (TN/WH), harness side.  A0068546 ● Key in ON position. ● **Do all speakers still have poor sound quality or no sound?**	or more speakers has poor sound quality or no sound, Go To Pinpoint Test F .
G3 CHECK THE VOLUME RANGE FOR DISTORTION ● Vary the volume level of the audio unit. ● **Is the distortion only at high volume levels?**	**Yes** The system is OK. **No** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation.
G4 CHECK CIRCUIT 173 (DG/PK) ● Key in OFF position. ● Disconnect: Audio Amplifier C4208a. ● Key in ON position. ● Measure the voltage between the audio amplifier C4208a pin 22, circuit 173 (DG/PK), harness side and ground.  A0068547 ● **Is the voltage 3.8 - 6.7 volts?**	**Yes** INSTALL a new audio amplifier. TEST the system for normal operation. **No** GO to G5 .

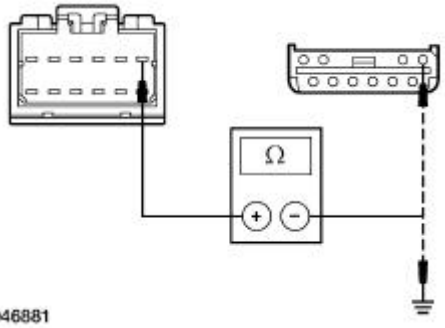
G5 CHECK CIRCUIT 173 (DG/PK) FOR AN OPEN OR A SHORT TO GROUND	
• Disconnect: Audio Unit C2253d. • Measure the resistance between the audio amplifier C4208a pin 22, circuit 173 (DG/PK), harness side and the audio unit C2253d pin 9, circuit 173 (DG/PK), harness side; and between audio amplifier C4208a pin 22, circuit 173 (DG/PK), harness side and ground.  A0069955 • **Is the resistance less than 5 ohms between the audio unit and the amplifier and greater than 10,000 ohms between the amplifier and ground?**	**Yes** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation. **No** REPAIR the circuit, and TEST the system for normal operation.



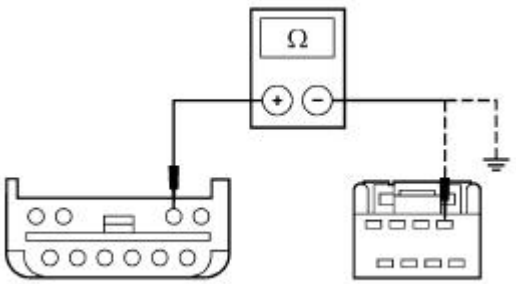
PINPOINT TEST H: THE SUBWOOFER IS INOPERATIVE—EXCEPT NAVIGATOR WITH NAVIGATION AUDIO UNIT

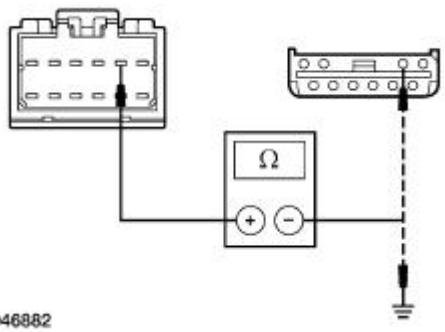


Test Step	Result / Action to Take
H1 CHECK CIRCUIT 173 (DG/VT) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Subwoofer C466. • Key in ON position. • Measure the voltage between the subwoofer amplifier C466 pin 1, circuit 173 (DG/VT), harness side and ground.  GK8799-A • **Is voltage present?**	**Yes** GO to H2 . **No** GO to H6 .
H2 CHECK CIRCUIT 797 (LG/VT) FOR VOLTAGE	
• Key in ON position. • Measure the voltage between the subwoofer amplifier C466 pin 5, circuit 797 (LG/VT), harness side and ground.	**Yes** GO to H3 . **No** REPAIR the circuit. TEST the system for normal operation.

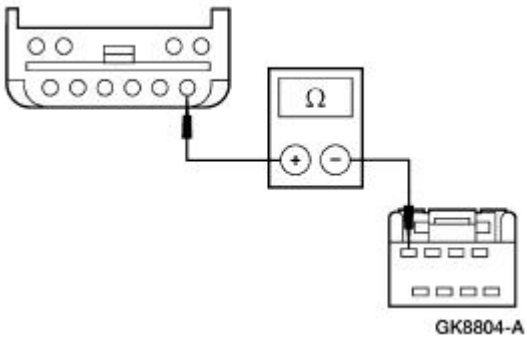


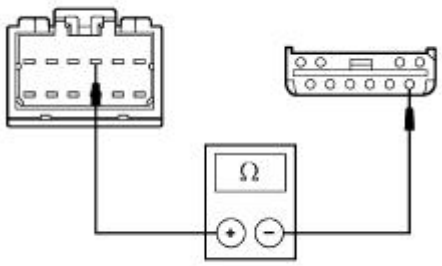
A0050798





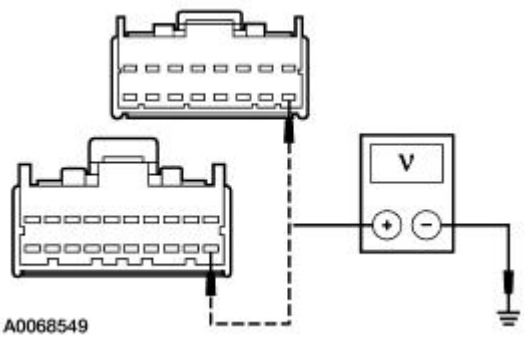
- **Is the voltage greater than 10 volts?**

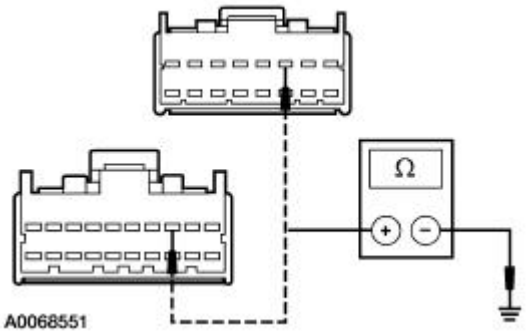


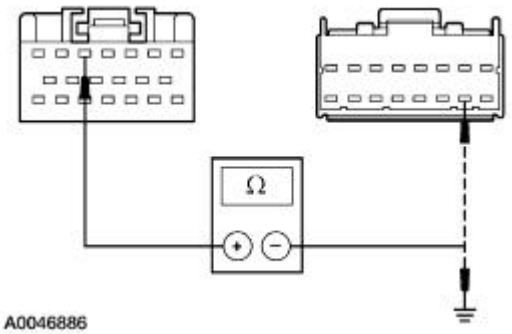


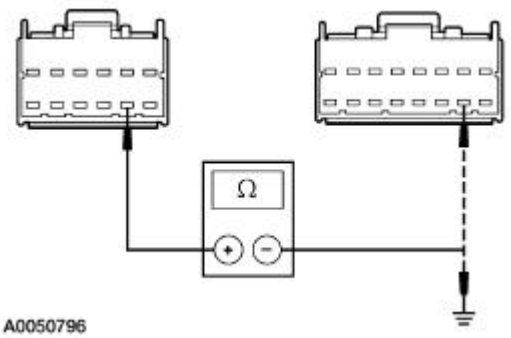
H3 CHECK CIRCUIT 1204 (BK/OG) FOR AN OPEN	
• Measure the resistance between the subwoofer amplifier C466 pin 2, circuit 1204 (BK/OG), harness side and ground.  GK8801-A • **Is the resistance less than 5 ohms?**	**Yes** GO to H4 . **No** REPAIR the circuit. TEST the system for normal operation.

H4 CHECK CIRCUIT 167 (BN/OG) FOR OPEN OR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Audio Unit. • Measure the resistance between the subwoofer amplifier C466 pin 7, circuit 167 (BN/OG), harness side and the audio unit C290c pin 2, circuit 167 (BN/OG), harness side; and between the subwoofer amplifier C466 pin 7, circuit 167 (BN/OG), harness side and ground.  A0050794 • For VNR, measure the resistance between the subwoofer amplifier C466 pin 7, circuit 167 (BN/OG), harness side and the audio unit C2188e pin 1, circuit 167 (BN/OG), harness side; and between the subwoofer amplifier C466 pin 7, circuit 167 (BN/OG), harness side and ground.	**Yes** GO to H5 . **No** REPAIR the circuit. TEST the system for normal operation.

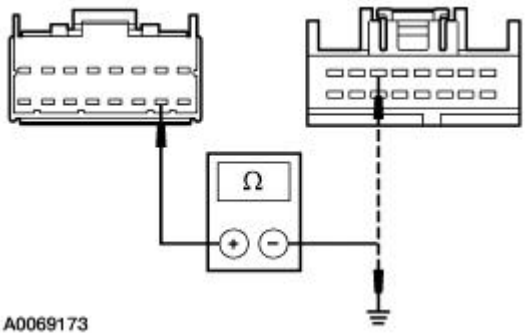








- **Is the resistance less than 5 ohms between the subwoofer amplifier and the audio unit and greater than 10,000 ohms between the subwoofer amplifier and ground?**



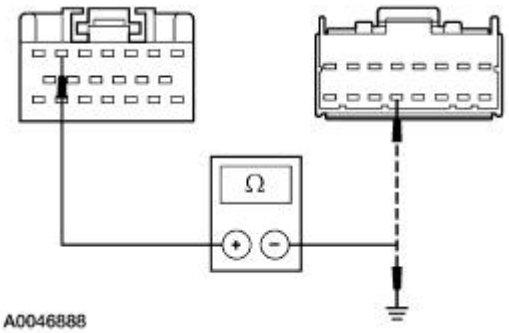
H5 CHECK CIRCUIT 168 (RD/BK) FPR AN OPEN OR A SHORT TO GROUND	
• Measure the resistance between the subwoofer amplifier C466 pin 8, circuit 168 (RD/BK), harness side and the audio unit C290c pin 1, circuit 168 (RD/BK), harness side; and between the subwoofer amplifier C466 pin 8, circuit 168 (RD/BK), harness side and ground.  GK8803-A • For VNR, measure the resistance between the subwoofer amplifier C466 pin 8, circuit 168 (RD/BK), harness side and the audio unit C2188e pin 2, circuit 168 (RD/BK), harness side; and between the subwoofer amplifier C466 pin 8, circuit 168 (RD/BK), harness side and ground.  A0046882 • **Is the resistance less than 5 ohms between the subwoofer amplifier and the audio unit, and greater than 10,000 ohms between the subwoofer amplifier and ground?**	**Yes** REMOVE the subwoofer amplifier and SEND it to an authorized audio system repair facility. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
H6 CHECK CIRCUIT 173 (DG/VT) FOR AN OPEN	
• Measure the resistance between the subwoofer amplifier C466 pin 1, circuit 173 (DG/VT), harness side and the audio unit C290c pin 4, circuit 173 (DG/VT), harness side.	**Yes** REMOVE the subwoofer amplifier and SEND it to an authorized Ford audio system repair facility. TEST the system for

 GK8804-A ● For VNR, measure the resistance between the subwoofer amplifier C466 pin 1, circuit 173 (DG/VT), harness side and the audio unit C2188e pin 3, circuit 173 (DG/VT), harness side.  A0050795 ● **Is the resistance less than 5 ohms?**	normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST I: THE AUXILIARY AUDIO CONTROL IS INOPERATIVE — REAR SEAT CONTROLLER (RSC) UNIT

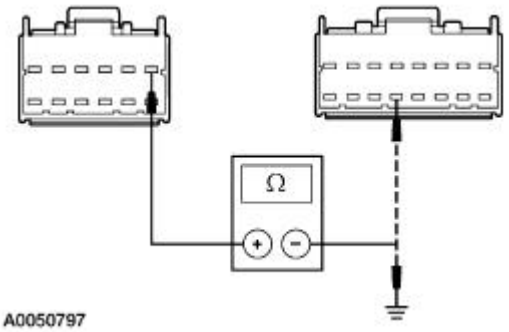
Test Step	Result / Action to Take
I1 CHECK CIRCUIT 720 (RD/YL) FOR AN OPEN	
● Key in OFF position. ● Disconnect: RSC Unit. ● Key in ON position. ● Measure the voltage between the RSC unit C388 pin 11, circuit 720 (RD/YL), harness side and ground (late build with DVD, except VNR). For all others, measure the voltage between the RSC unit C349a pin 9, circuit 720 (RD/YL), harness side and ground.  A0068549 ● **Is the voltage greater than 10 volts?**	**Yes** GO to I2 . **No** REPAIR the circuit. TEST the system for normal operation.
I2 CHECK CIRCUIT 694 (BK/LG) FOR AN OPEN	
● Measure the resistance between C388, pin 3, circuit 694 (BK/LG), harness side and ground (late build with DVD); or between C349a, pin 3,	**Yes** If late build

circuit 694 (BK/LG), harness side and ground (all others).  ● **Is the resistance less than 5 ohms?**	with DVD (except VNR) GO to I6 . All others GO to I3 . **No** REPAIR the circuit. TEST the system for normal operation.
I3 CHECK CIRCUIT 1068 (LG/BK) FOR AN OPEN AND A SHORT TO GROUND — WITHOUT DVD	
● Disconnect: Audio Unit C290b (CDX6). ● Disconnect: Audio Unit C2188d (VNR). ● Disconnect: Audio Unit C2253b (Navigator with navigation audio unit). ● Disconnect: Audio Unit C240b (late build DM100i). ● Measure the resistance between the audio unit C290b pin 5, circuit 1068 (LG/BK), harness side and the RSC unit C349a pin 10, circuit 1068 (LG/BK), harness side; and between the audio unit C290b pin 5, circuit 1068 (LG/BK), harness side and ground.  ● For VNR, measure the resistance between the audio unit C2188d pin 8, circuit 1068 (LG/BK), harness side and the RSC unit C349a pin 10, circuit 1068 (LG/BK), harness side; and between the audio unit C2188d pin 8, circuit 1068 (LG/BK), harness side and ground.  ● Measure the resistance between the audio unit C240b pin 6, circuit 1068 (LG/BK), harness side and the RSC unit C349a pin 10, circuit 1068 (LG/BK), harness side; and between the audio unit C349a pin 10, circuit 1068 (LG/BK), harness side and ground (late build DM100i). Measure the resistance between the audio unit C2253b pin 6, circuit 1068 (LG/BK), harness side and the RSC unit C349a pin 10, circuit 1068 (LG/BK), harness side; and between the RSC unit C349a pin 10, circuit 1068 (LG/BK), harness side and ground (Navigator with navigation audio unit).	**Yes** GO to I4 . **No** REPAIR the circuit. TEST the system for normal operation.



A0069173

- **Is the resistance less than 5 ohms between the audio unit and RSC unit, and greater than 10,000 ohms between the audio unit and ground?**

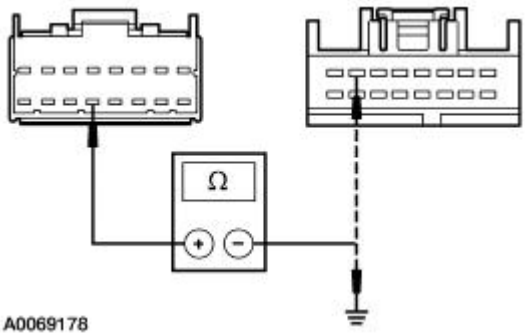


I4 CHECK CIRCUIT 832 (LB/PK) FOR AN OPEN AND SHORT TO GROUND—WITHOUT DVD

- Measure the resistance between the audio unit C290b pin 6, circuit 832 (LB/PK), harness side and the RSC unit C349a pin 13, circuit 832 (LB/PK), harness side and between the audio unit C290b pin 6, circuit 832 (LB/PK), harness side and ground.

A0046888

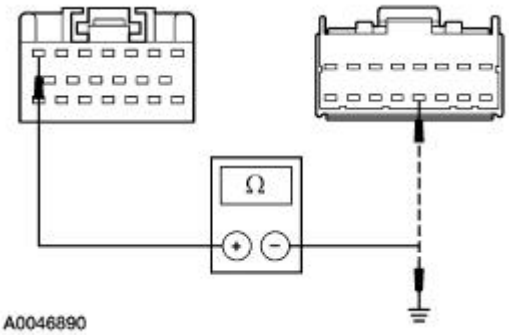
- For VNR, measure the resistance between the audio unit C2188d pin 1, circuit 832 (LB/PK), harness side and the RSC unit C349a pin 13, circuit 832 (LB/PK), harness side and between the audio unit C2188d pin 1, circuit 832 (LB/PK), harness side and ground.



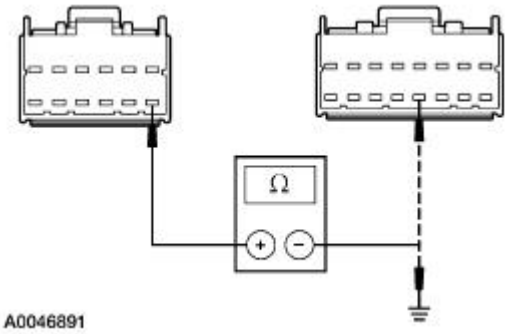
A0050797

- For late build DM100i, measure the resistance between the audio unit C240b pin 7, circuit 832 (LB/PK), harness side and the RSC unit C349a pin 13, circuit 832 (LB/PK), harness side; and between the audio unit C349a pin 13, circuit 832 (LB/PK), harness side and ground. Navigator with navigation audio unit, measure the resistance between the audio unit C2253b pin 7, circuit 832 (LB/PK), harness side and the RSC unit C349a pin 13, circuit 832 (LB/PK), harness side; and between the RSCo unit C349a pin 13, circuit 832 (LB/PK), harness side and ground.

Yes
GO to I5 .



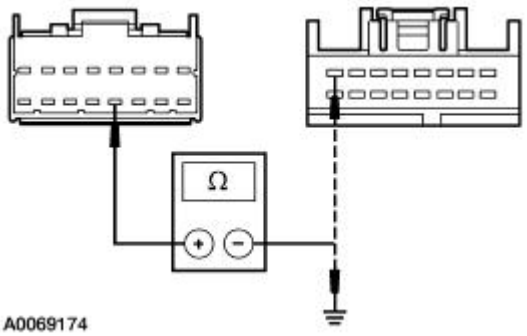
No
REPAIR the circuit. TEST the system for normal operation.



- **Is the resistance less than 5 ohms between the audio unit and the RSC unit, and greater than 10,000 ohms between the audio unit and ground?**

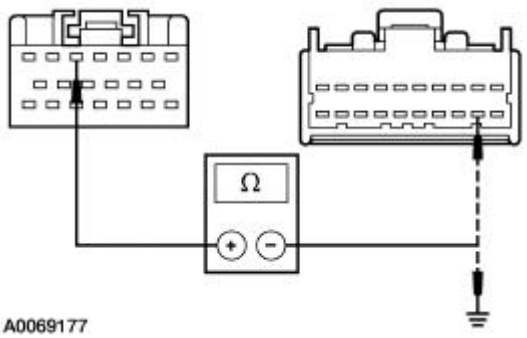
I5 CHECK CIRCUIT 833 (TN) FOR AN OPEN OR SHORT TO GROUND—WITHOUT DVD

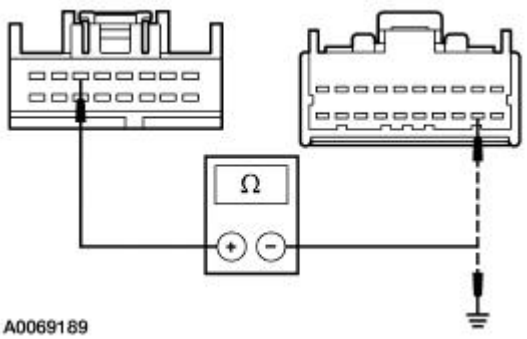
- Measure the resistance between the audio unit C290b pin 7, circuit 833 (TN), harness side and the RSC unit C349a pin 12, circuit 833 (TN), harness side; and between the audio unit C290b pin 7, circuit 833 (TN), harness side and ground.



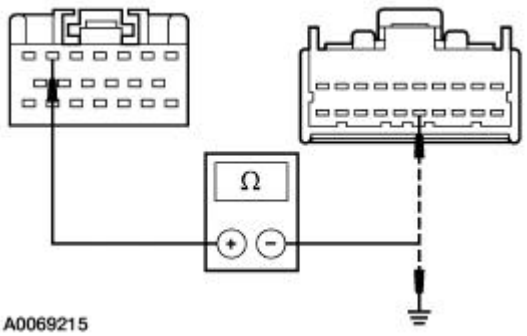
- For VNR, measure the resistance between the audio unit C2188d pin 7, circuit 833 (TN), harness side and the RSC unit C349a pin 12, circuit 833 (TN), harness side; and between the audio unit C2188d pin 7, circuit 833 (TN), harness side and ground.

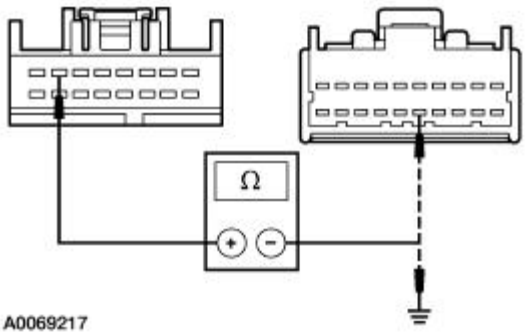
- For late build DM100i, measure the resistance between the audio unit C240b pin 8, circuit 833 (TN), harness side and the RSC unit C349a pin 11, circuit 833 (TN), harness side; and between the audio unit C240b pin 8, circuit 833 (TN), harness side and ground. Navigator with navigation audio unit, measure the resistance between the audio unit C2253b pin 8, circuit 833 (TN), harness side and the RSC unit C349a pin 11, circuit 833 (TN), harness side; and between the audio unit C2253b pin 8, circuit 833 (TN), harness side and ground.

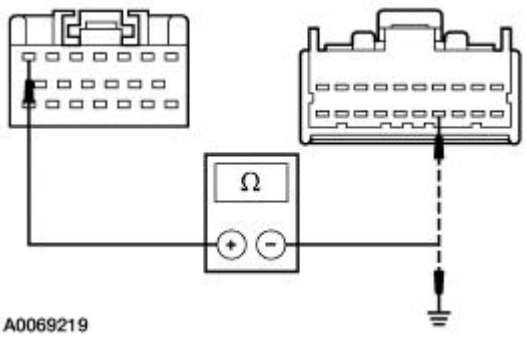




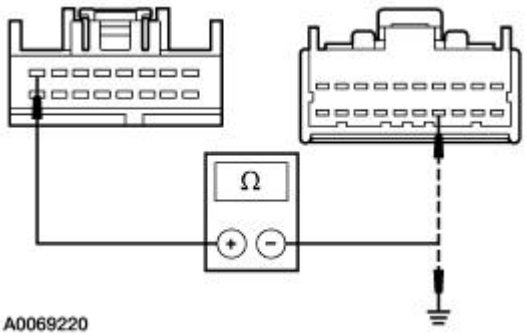
Yes
INSTALL a new RSC unit. REFER to Section 415-01 . TEST the system for normal operation.







No
REPAIR the circuit. TEST the system for normal operation.

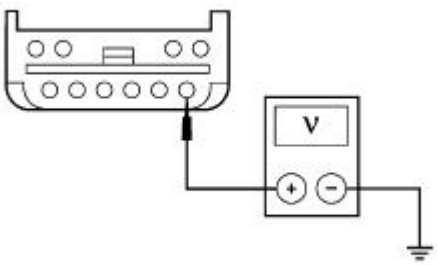


A0069174

- **Is the resistance less than 5 ohms between the audio unit and the RSC unit, and greater than 10,000 ohms between the audio unit and ground?**

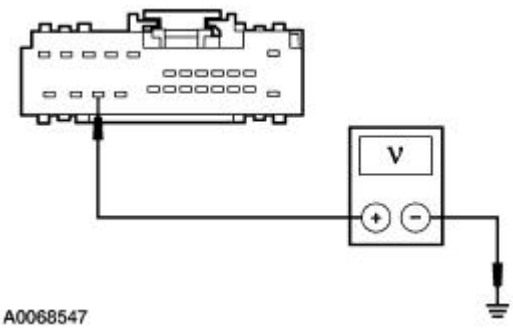
I6 CHECK CIRCUIT 1068 (LG/BK) FOR AN OPEN AND A SHORT TO GROUND—WITH DVD	
• Disconnect: Audio Unit Connector. • For CDX6, measure the resistance between the audio unit C290b pin 5, circuit 1068 (LG/BK), harness side and the RSC unit C388 pin 12, circuit 1068 (LG/BK), harness side; and between the audio unit C290b pin 5, circuit 1068 (LG/BK), harness side and ground.  A0069177 • Measure the resistance between the audio unit C2253b (Navigator with navigation audio unit) or C240b (DM100i) pin 6, circuit 1068 (LG/BK), harness side and the RSC unit C388 pin 12, circuit 1068 (LG/BK), harness side; and between the audio unit C290b pin 6, circuit 1068 (LG/BK), harness side and ground .  A0069189 • **Is the resistance less than 5 ohms between the audio unit and RSC unit, and greater than 10,000 ohms between the audio unit and ground?**	**Yes** GO to I7 . **No** REPAIR the circuit. TEST the system for normal operation.
I7 CHECK CIRCUIT 832 (LB/PK) FOR AN OPEN AND SHORT TO GROUND—WITH DVD	
• For CDX6, measure the resistance between the audio unit C290b pin 6, circuit 832 (LB/PK), harness side and the RSC unit C388 pin 15, circuit 832 (LB/PK), harness side and between the audio unit C290b pin 6, circuit 832 (LB/PK), harness side and ground.	**Yes** GO to I8 . **No** REPAIR the circuit. TEST

 A0069215 ● Measure the resistance between the audio unit C2253b (Navigator with navigation audio unit) or C240b (DM100i) pin 7, circuit 832 (LB/PK), harness side and the RSC unit C388 pin 15, circuit 832 (LB/PK), harness side and between the audio unit C2253b pin 7, circuit 832 (LB/PK), harness side and ground.  A0069217 ● **Is the resistance less than 5 ohms between the audio unit and the RSC unit, and greater than 10,000 ohms between the audio unit and ground?**	the system for normal operation.
I8 CHECK CIRCUIT 833 (TN) FOR AN OPEN OR SHORT TO GROUND—WITH DVD ● For CDX6 measure the resistance between the audio unit C290b pin 7, circuit 833 (TN), harness side and the RSC unit C388 pin 14, circuit 833 (TN), harness side; and between the audio unit C290b pin 7, circuit 833 (TN), harness side and ground.  A0069219 ● Measure the resistance between the audio unit C2253b (Navigator with navigation audio unit) or C240b (DM100i) pin 8, circuit 833 (TN), harness side and the RSC unit C388 pin 14, circuit 833 (TN), harness side and between the audio unit C2253b pin 8, circuit 833 (TN), harness side and ground.	**Yes** INSTALL a new RSC unit. REFER to Section 415-01 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.



A0069220

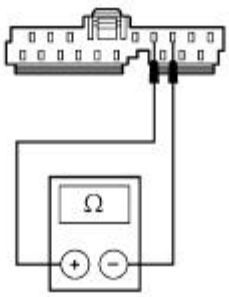
- **Is the resistance less than 5 ohms between the audio unit and the RSC unit, and greater than 10,000 ohms between the audio unit and ground?**

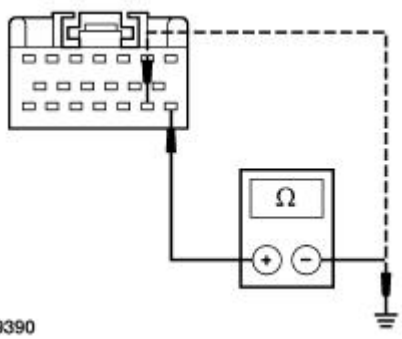


PINPOINT TEST J: LOUD POPPING SOUND WHEN CYCLING THE IGNITION SWITCH

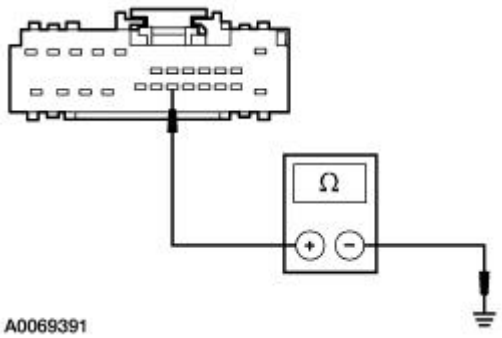
Test Step	Result / Action to Take
J1 CHECK CIRCUIT 173 (DG/VT) FOR A SHORT TO BATTERY	
• Key in OFF position. • Disconnect: Subwoofer Amplifier C466. • Disconnect: Audio Amplifier C4208. • For all early build and CDX6, measure the voltage between the subwoofer amplifier C466 pin 1, circuit 173 (DG/VT), harness side and ground.	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** REMOVE the subwoofer amplifier and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation.

GK8799-A





- For Navigator with navigation audio unit, measure the voltage between the audio amplifier C4208a pin 22, circuit 173 (DG/VT), harness side and ground.



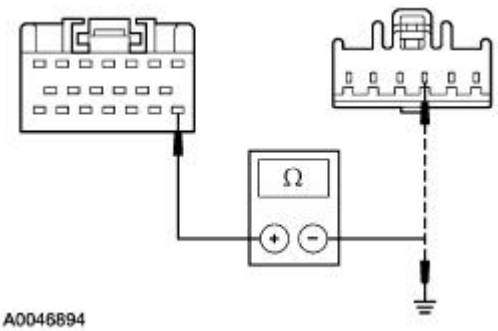
A0068547

- **Is voltage present?**

PINPOINT TEST K: THE AUXILIARY AUDIO CONTROL IS INOPERATIVE — STEERING WHEEL CONTROL

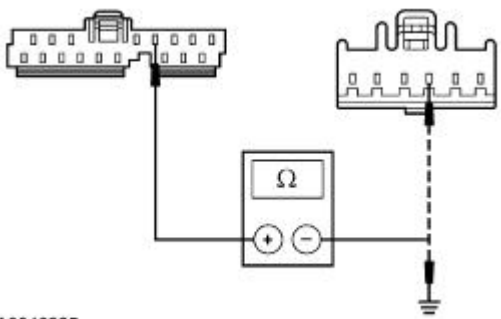
Test Step	Result / Action to Take
K1 CHECK THE STEERING WHEEL CONTROL SWITCH CIRCUITS ● Key in OFF position. ● Disconnect: Audio Unit Connector. ● For VNR, measure the resistance between the audio unit C2188c pin 11, circuit 595 (LB/RD), harness side and audio unit C2188c pin 12, circuit 848 (DG/OG), harness side while pressing the steering wheel control switches as follows:  A0046892 ● For all early build vehicles except VNR, measure the resistance between the audio unit C290b pin 14, circuit 595 (LB/RD), harness side and audio unit C290b pin 15, circuit 848 (DG/OG), harness side; for late build CDX6, measure the resistance between the audio unit C290b pin 14, circuit 595 (LB/RD), harness side and ground while pressing the steering wheel control switches as follows: **Switch** / **Resistance Range** VOL Down — 69.3-77.4 ohms VOL Up — 198.5-217.7 ohms NEXT — 419.4-467.5 ohms MEDIA — 851.4-941.1 ohms No Buttons Pressed — 4,560-5,080 ohms  A0069390 ● For late build DM100i, measure the resistance between the audio unit C240a pin 18, circuit 595 (LB/RD), harness side and ground; or for Navigator with navigation audio unit measure the resistance between the audio unit C2253a pin 18, circuit 595 (LB/RD), harness side and ground as follows: **Switch** / **Resistance Range** MEDIA — 52.4-54.8 ohms NEXT — 143.4-150.0 ohms	**Yes** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation. **No** For all late build vehicles, GO to K4 . For all others GO to K2 .

VOL UP	293.9-307.4 ohms
VOL DOWN	549.0-574.3 ohms
REPEAT	1,013.4-1,060.0 ohms
VOICE	1,990.9-2,082.5 ohms
No Buttons Pressed	4,933.1-5,160 ohms



A0069391

- **Are the resistances within specifications?**

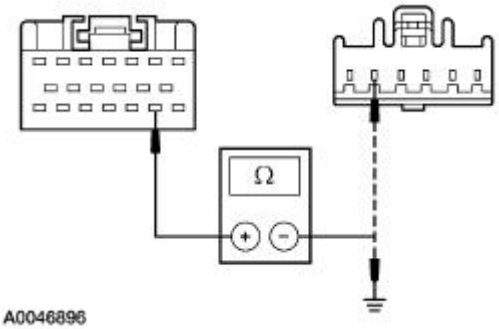


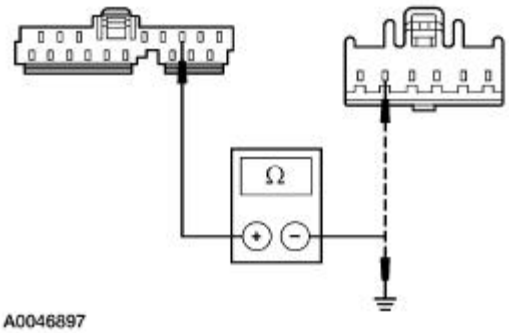
K2 CHECK CIRCUIT 595 (LB/RD) FOR OPEN OR SHORT TO GROUND

- Disconnect: Clockspring C218b.
- For all except VNR, measure the resistance between the audio unit C290b pin 14, circuit 595 (LB/RD), harness side and the clockspring C218b pin 3, circuit 595 (LB/RD), harness side; and between the audio unit C290b pin 14, circuit 595 (LB/RD), harness side and ground.

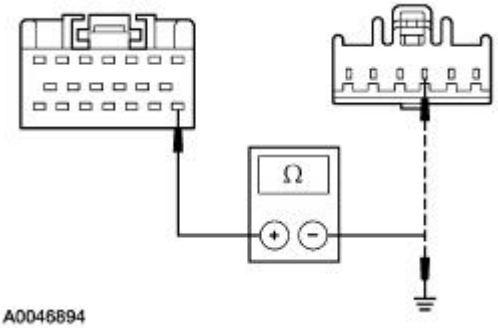
A0046894

- For VNR, measure the resistance between the audio unit C2188c pin 11, circuit 595 (LB/RD), harness side and the clockspring C218b pin 3, circuit 595 (LB/RD), harness side; and between the audio unit C2188c pin 11, circuit 595 (LB/RD), harness side and ground.



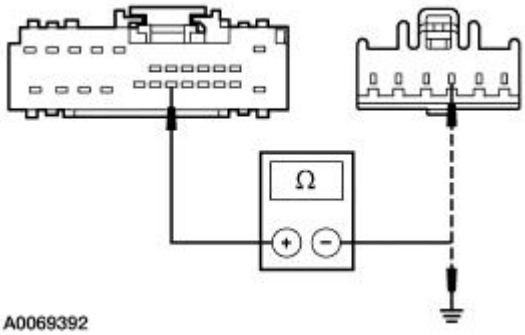


A0046895



- **Is the resistance less than 5 ohms between the audio unit and the clockspring, and greater than 10,000 ohms between the audio unit and ground?**

Yes
GO to K3 .



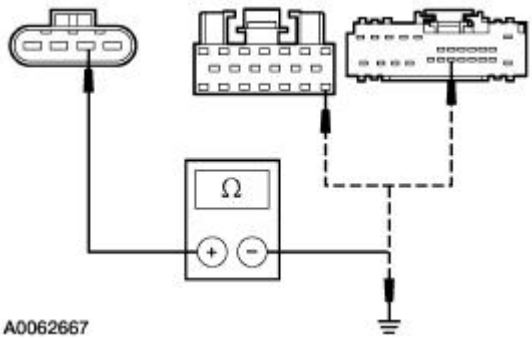
No
REPAIR the circuit. TEST the system for normal operation.

K3 CHECK CIRCUIT 848 (DG/OG) FOR AN OPEN OR A SHORT TO

GROUND ● For all except VNR, measure the resistance between the audio unit C290b pin 15, circuit 848 (DG/OG), harness side, and the clockspring C218b pin 5, circuit 848 (DG/OG), harness side; and between the audio unit C290b pin 15, circuit 848 (DG/OG), harness side and ground.  A0046896 ● For VNR, measure the resistance between the audio unit C2188c pin 12, circuit 848 (DG/OG), harness side and the clockspring C218b pin 5, circuit 848 (DG/OG), harness side; and between the audio unit C2188c pin 12, circuit 848 (DG/OG), harness side and ground.  A0046897 ● **Is the resistance less than 5 ohms between the audio unit and the clockspring, and greater than 10,000 ohms between the audio unit and ground?**	**Yes** INSTALL new steering wheel control switches. REFER to Section 211-05 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
K4 CHECK THE SPEED CONTROL — LATE BUILD ● Verify the correct operation of the speed control. ● **Does the speed control operate correctly?**	**Yes** GO to K5 . **No** REFER to Section 310-03 .
K5 CHECK CIRCUIT 595 (LB/RD) FOR OPEN OR SHORT TO GROUND — LATE BUILD ● Disconnect: Clockspring C218b. ● For CDX6, measure the resistance between the audio unit C290b pin 14, circuit 595 (LB/RD), harness side and the clockspring C218b pin 3, circuit 595 (LB/RD), harness side; and between the audio unit C290b pin 14, circuit 595 (LB/RD), harness side and ground.	**Yes** GO to K6 . **No** REPAIR the circuit. TEST the system for normal operation.

- For DM100i, measure the resistance between the audio unit C240a pin 18, circuit 595 (LB/RD), harness side and the clockspring C218b pin 3, circuit 595 (LB/RD), harness side; and between the audio unit C240a pin 18, circuit 595 (LB/RD), harness side and ground; or for Navigator with navigation audio unit, measure the resistance between the audio unit C2253a pin 18, circuit 595 (LB/RD), harness side and the clockspring C218b pin 3, circuit 595 (LB/RD), harness side; and between the audio unit C2253a pin 18, circuit 595 (LB/RD), harness side and ground.

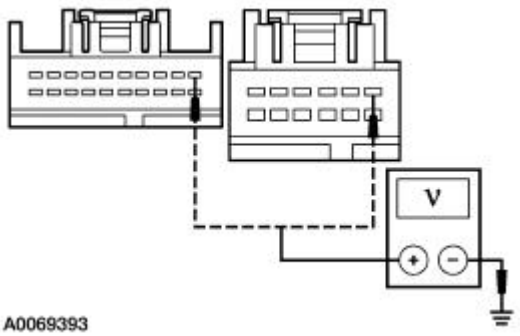
- **Is the resistance less than 5 ohms between the audio unit and the clockspring, and greater than 10,000 ohms between the audio unit and ground?**



K6 CHECK CIRCUIT 595 (LB/RD) FOR OPEN OR SHORT TO GROUND — LATE BUILD

- Connect: Clockspring C218b.
- Disconnect: Steering Wheel Audio Control Switch Connector.
- Measure the resistance between the steering wheel audio control switch connector pin 2, circuit 595 (LB/RD), harness side and ground; and between the steering wheel audio control switch connector pin 2, circuit 595 (LB/RD), harness side and the audio unit as follows.

Audio Unit	Connector-Pin	Circuit
CDX6	C240c-14	595
DM100i	C240a-18	595
Navigator with navigation audio unit	C2253a-18	595



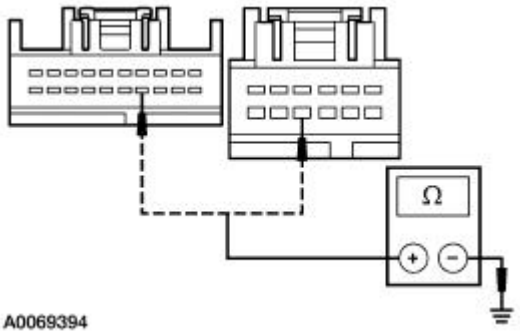
Yes
INSTALL new steering wheel audio control switches. REFER to Steering Wheel Audio Controls in this section. TEST the system for normal operation.

No
GO to K7

 ● **Is the resistance greater than 10,000 ohms between the steering wheel audio control switch and ground; and less than 5 ohms between the steering wheel audio control switch and the audio unit?**	
K7 CHECK THE HORN SWITCH HARNESS FOR AN OPEN OR SHORT TO GROUND — LATE BUILD	
● Inspect the horn switch harness for opens and shorts to ground. ● **Is the horn switch harness OK?**	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . TEST the system for normal operation. **No** REPAIR the circuit and TEST the system for normal operation.

PINPOINT TEST L: THE VIDEO SYSTEM IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
L1 VERIFY OPERATION OF THE DVD PLAYER	
● Key in ON position. ● Insert a known good DVD disc into the DVD player. ● **Is there an image displayed on the screen?**	**Yes** If the DVD player turns on and there is no audio, GO to L4 . **No** GO to L2 .
L2 CHECK VOLTAGE TO THE DVD PLAYER	
● Key in OFF position. ● Disconnect: DVD C949 (early build). ● Disconnect: DVD C9020 (late build). ● Key in ON position. ● Measure the voltage between the DVD player C949 (early build) pin 1, circuit 720 (RD/YL), harness side and ground; or C9020 pin 1 (late build), circuit 720 (RD/YL), harness side and ground.	**Yes** GO to L3 . **No** REPAIR the circuit. TEST the system for normal operation.



A0069393

- **Is voltage greater than 10 volts?**

L3 CHECK GROUND CIRCUIT 694 (BK/LG) FOR AN OPEN

- Key in OFF position.
- Measure the resistance between the DVD player C949 (early build) pin 10, circuit 694 (BK/LG), harness side and ground; or C9020 pin 14 (late build), circuit 694 (BK/LG), harness side and ground.

A0069394

- **Is resistance less than 5 ohms?**

Yes
GO to L4 .

No
REPAIR the circuit. TEST the system for normal operation.

L4 CHECK AUDIO AND ACP CIRCUITS FOR AN OPEN

- Key in OFF position.
- Disconnect: Audio Unit Connector.
- Disconnect: RSC Unit connector(s).
- Disconnect: DVD Connector.
- Measure the resistance between the audio unit and the DVD player and between the RSC unit and the DVD player in the following groups:

VNR Unit Pin	All CDX6 Audio Unit Pin	Navigator Navigation Audio Unit Pin	RSC Unit Pin	DVD Pin	Circuit
C2188d pin 8	C290b pin 5	C2253b pin 6	C349a pin 10 (early build), or C388 pin 12 (late build)	C949 pin 2 (early build), or C9020 pin 2 (late build)	1068 (LG/BK)
C2188d pin 1	C290b pin 6	C2253b pin 7	C349a pin 13 (early build), or C388 pin 15 (late build)	C949 pin 7 (early build), or C9020 pin 11 (late build)	832 (LB/PK)
C2188d pin 7	C290b pin 7	C2253b pin 8	C349a pin 12 (early	C949 pin 8 (early	833 (TN)

Yes
CONTACT an authorized Ford audio repair facility for further diagnostic test procedures.

No
REPAIR the circuit. TEST the system for normal operation.

			build), or C388 pin 14 (late build)	build), or C9020 pin 12 (late build)	
—	C290b pin 17	C2253b pin 9	C349b pin 11 (VNR)	C949 pin 6 (early build), or C9020 pin 6 (late build)	1805 (RD)

VNR Unit Pin	All CDX6 Audio Unit Pin	Navigator Navigation Audio Unit Pin	RSC Unit Pin	DVD Pin	Circuit
—	C290b pin 18	C2253b pin 10	C349b pin 3 (VNR)	C949 pin 12 (early build), or C9020 pin 16 (late build)	1806 (BK)
—	C290b pin 19	C2253b pin 1	C349b pin 12 (VNR)	C949 pin 5 (early build), or C9020 pin 5 (late build)	1803 (WH)
—	C290b pin 20	C2253b pin 2	C349b pin 4 (VNR)	C949 pin 11 (early build), or C9020 pin 15 (late build)	1804 (LG)

- **Are the resistances less than 5 ohms?**

PINPOINT TEST M: THE SUBWOOFER IS INOPERATIVE—NAVIGATOR WITH NAVIGATION AUDIO UNIT ONLY

Test Step	Result / Action to Take
M1 CHECK THE AMPLIFIER OUTPUT CIRCUITS	
• Key in OFF position. • Disconnect: Subwoofer C4212. • Disconnect: Audio Amplifier C4208b. • Measure the resistance between the audio amplifier and the subwoofer; and between the audio amplifier and ground as follows.	**Yes** GO to M2 . **No** REPAIR the circuit and TEST the system for normal operation.

Audio Amplifier C4208b	Subwoofer C4212
pin 13, circuit 287 (BK/WH)	pin 3, circuit 287 (BK/WH)
pin 15, circuit 288 (VT)	pin 1, circuit 288 (VT)
pin 14, circuit 822 (BK/LG)	pin 4, circuit 287 (BK/LG)

pin 16, circuit 823 (LG)	pin 2, circuit 823 (LG)

- **Is the resistance less than 5 ohms between the amplifier and the subwoofer and greater than 10,000 ohms between the amplifier and ground?**

M2 CHECK THE AMPLIFIER INPUT CIRCUITS	
• Key in OFF position. • Disconnect: Audio Amplifier C4208a. • Disconnect: Audio Unit C2253d. • Measure the resistance between the audio amplifier and the audio unit; and between the audio amplifier and ground as follows. **Audio Amplifier C4208b** / **Audio Unit C2253d** pin 5, circuit 167 (BN/OG) / pin 16, circuit 167 (BN/OG) pin 4, circuit 168 (RD/BK) / pin 7, circuit 168 (RD/BK) • **Is the resistance less than 5 ohms between the amplifier and the subwoofer and greater than 10,000 ohms between the amplifier and ground?**	**Yes** GO to M3 . **No** REPAIR the circuit. TEST the system for normal operation.
M3 SUBSTITUTE A KNOWN GOOD AUDIO UNIT	
• Substitute a known good audio unit. • **Does the subwoofer operate correctly?**	**Yes** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation. **No** REMOVE the audio amplifier and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation.

Torque Specifications

Description	Nm	lb-ft	lb-in
Radio frequency interference suppression bond to bulkhead screw	12	9	—
Radio frequency interference suppression bond to engine nut	11	8	—
Radio frequency interference suppression bond frame to floorpan screws	12	9	—
Air bag module plate bolts	8	—	71
Steering wheel controls fasteners	2	—	18

Audio System

Two audio systems are available:

- DM100 premium AM/FM/Cassette/CD (standard on Expedition)
- CDX6 AM/FM/6 disc CD in-dash (premium)
- audiophile CDX6 AM/FM/6 disc CD in-dash (standard on Navigator)
- optional Vehicle Navigation Radio (VNR) with remote 6 disc CDDJ

The following options are available:

- rear passenger controls
- steering wheel integrated audio controls (Expedition Eddie Bauer and Navigator)
- the dual media and premium CDX6 systems include four door-mounted speakers
- audiophile and VNR systems include premium front door speakers, rear door speakers and rear mounted subwoofer assembly.
- an optional video system is available (Eddie Bauer only). For additional information, refer to Section 415-07 .

Rear Auxiliary Audio Controls

The rear audio unit control panel controls allow the rear passengers to control volume, station, AM/FM band, memory presets, and speaker or headphone selection. The mini-headphone jacks are also located on the panel.

The rear audio unit control panel is located at the rear of the center console.

Steering Wheel Integrated Audio Controls

The audio controls on the steering wheel allow the driver to control volume, AM/FM band, CD and memory presets.

Audio System —Radio Frequency Interference Suppression Equipment

The radio frequency suppression equipment consists of the following components:

- radio frequency interference suppression bond to bulkhead screw
- radio frequency interference suppression bond straps
- radio frequency interference suppression bond to engine nut
- radio ignition interference capacitors
- radio frequency interference suppression bond frame to floorpan screws

The radio suppression equipment reduces interference transmitted through the speakers by the engine ignition and electrical systems. When installing any radio suppression equipment components, make sure that a good contact is made at all connections. Remove any paint or dirt from between a component and its ground. Tighten all connectors and screws securely according to torque specifications. Refer to Specifications in this section.

Audio System —Radio Frequency Interference Suppression Equipment

Refer to Section 415-00 .

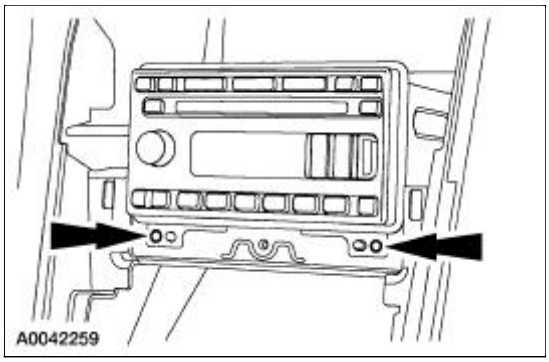
Removal and Installation

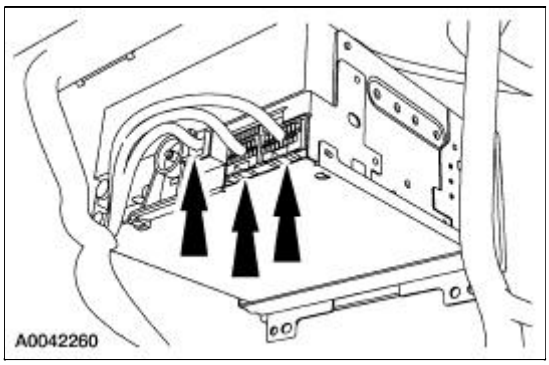
Vehicles with column shift



1. Remove the instrument cluster finish panel. For additional information, refer to Section 501-12 .

Vehicles with floor shift

2. Remove the instrument cluster center finish panel. For additional information, refer to Section 501-12 .

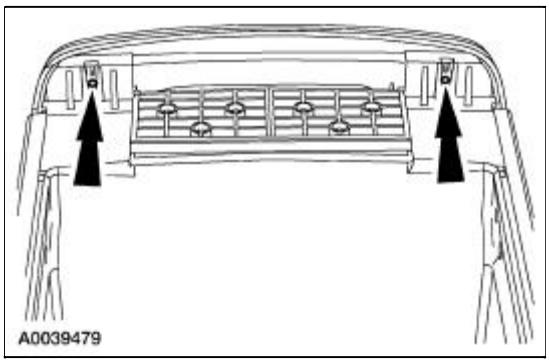


All vehicles

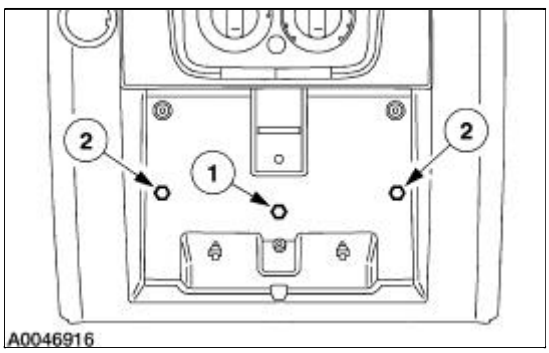
3. Remove the bolts.

NOTE: Standard audio is shown, others are similar

4. Disconnect the audio unit antenna lead-in cable and the audio unit electrical connectors.

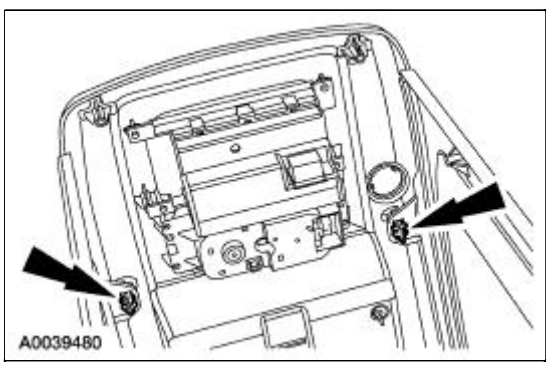


5. To install, reverse the removal procedure.



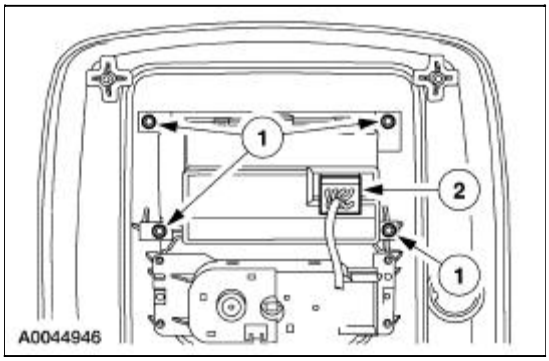
Rear Auxiliary Audio Controls

Removal and Installation



1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the screws underneath the armrest cover.

3. Open the rear cup holder and remove the bolt(s).
    1. Navigator
    2. Expedition

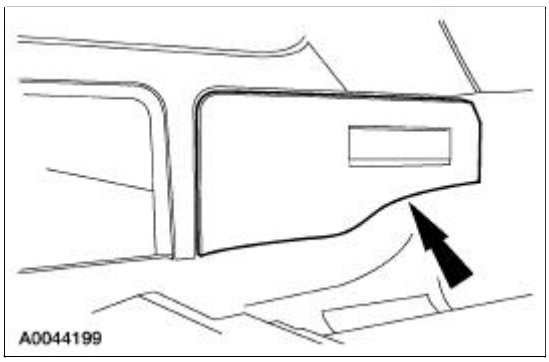


4. Detach the pin-type retainers.

NOTE: Standard audio is shown, others are similar

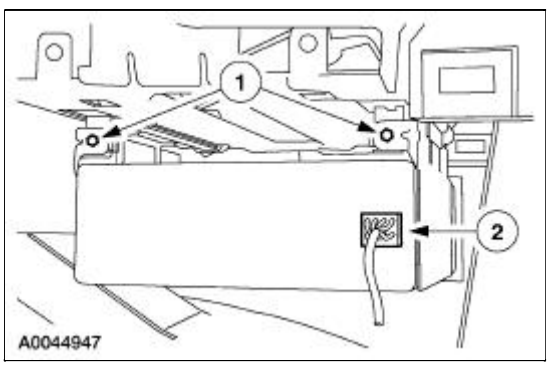
5. Remove the rear auxiliary audio control unit.
    1. Remove the screws.

2. Disconnect the electrical connector.



6. To install, reverse the removal procedure.

Compact Disc (CD) Changer —Navigator



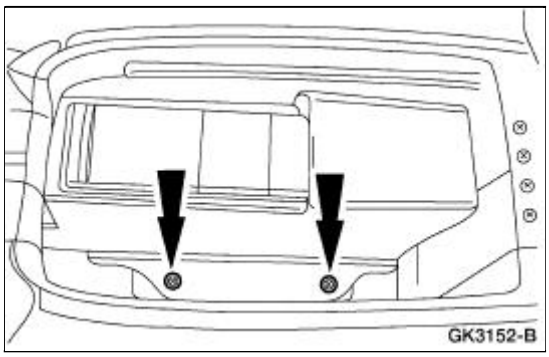
Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. **NOTE:** Right side shown, left side similar.

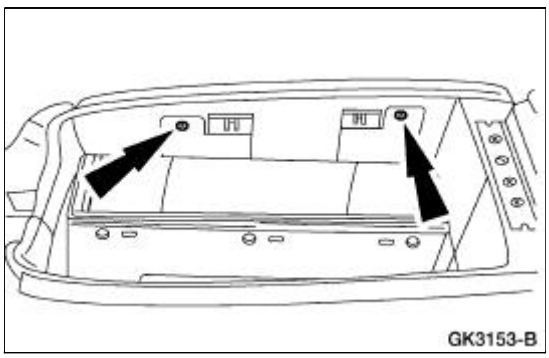
   Remove the right and left side lower kick panels.

3. Remove the CD changer.
   1. Remove the screws on the rear of the CD changer.
   2. Disconnect electrical connectors.
   3. Slide the CD changer out by pulling back until the tangs slide out of the retaining slots.

4. Remove the brackets from the CD changer.
   - Remove the screws.

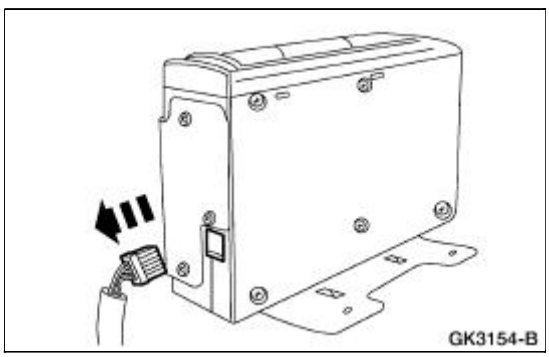


5. To install, reverse the removal procedure.

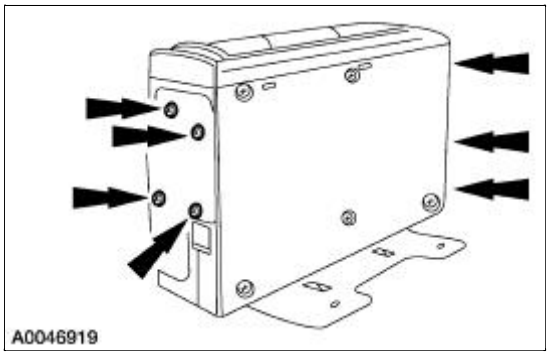


Compact Disc (CD) Changer —Expedition

Removal and Installation



1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the mat at the bottom of the console bin and remove the screws.
   - To ease removal of the trim panel, pull the front edge back and lift out.



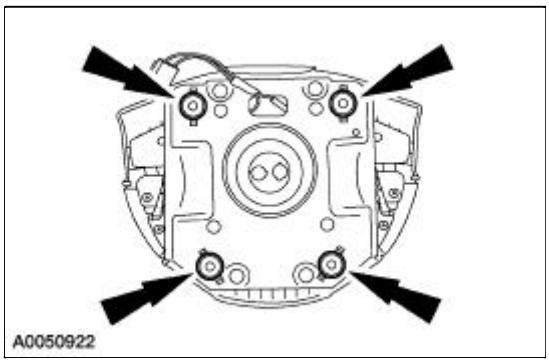
3. Remove the screws and pull out the CD changer and the bracket.

4. Disconnect the electrical connector.

5. Remove the screws.

6. To install, reverse the removal procedure.

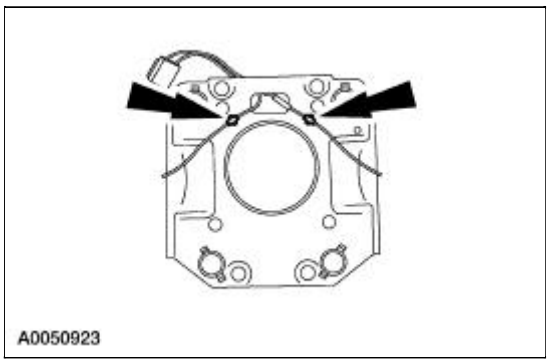
Steering Wheel Audio Controls



Removal

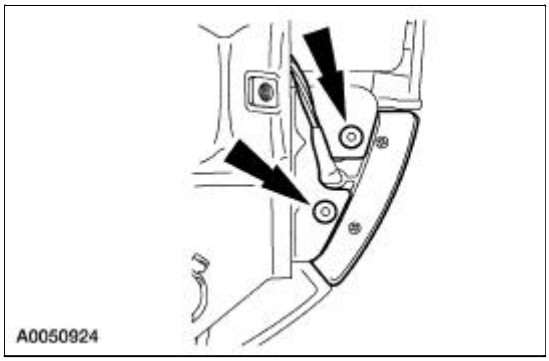
All Vehicles

1. For Navigator the steering wheel audio controls are integral to the air bag module. Remove the drivers side air bag module. For additional information, refer to Section 501-20B .



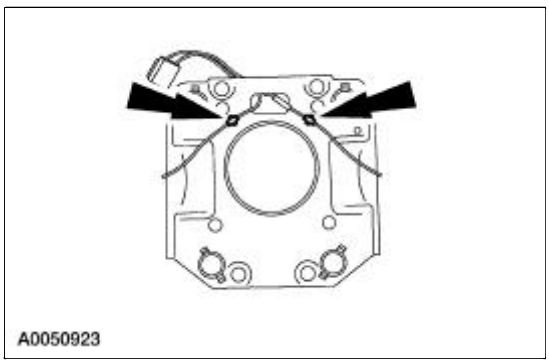
Expedition Only

2. Remove the bolts and springs and position the module plate aside.

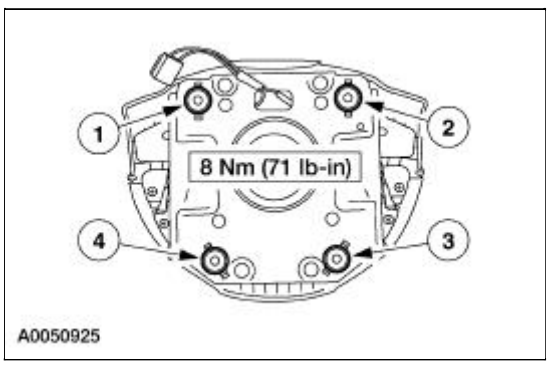


3. **NOTE:** Note the routing of the steering wheel audio controls harness wire on the module plate for installation of the new steering wheel audio controls.

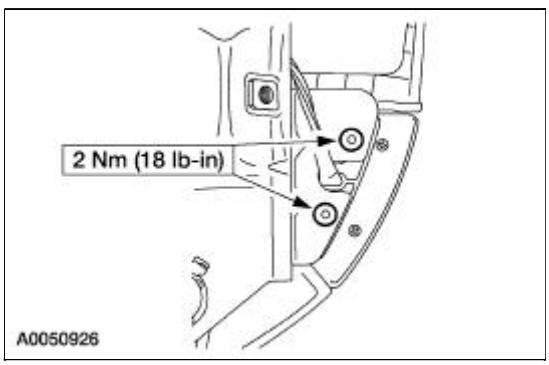
   Disconnect the steering wheel audio controls harness from the clips.



4. Remove the screws and steering wheel audio controls.

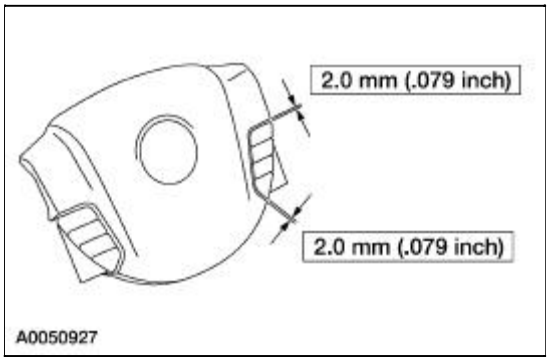


Installation



1. Install the steering wheel audio controls wire harness into the clips on the module plate.

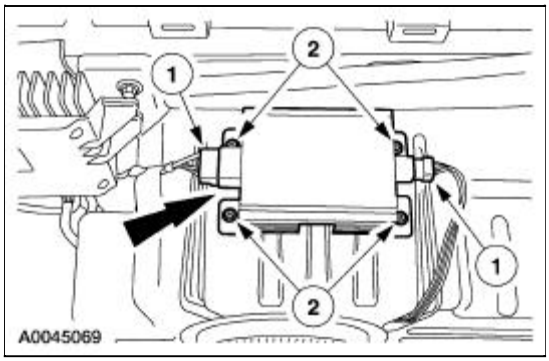
2. Install the module plate-to-driver air bag module.
    - Install the plate, springs and bolts and tighten in the sequence shown.



3. Install the steering wheel audio controls.

4. Check the gap between driver air bag module and steering wheel audio controls and adjust as

necessary.

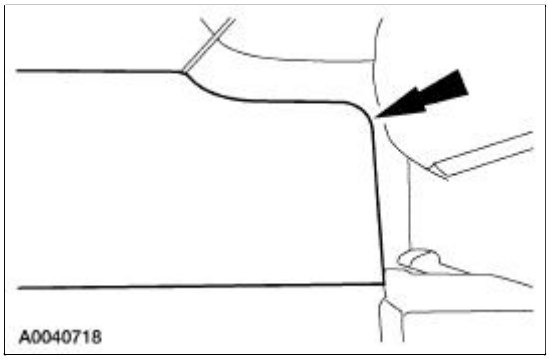


5. Install the driver airbag module. For additional information, refer to Section 501-20B .

Subwoofer Amplifier

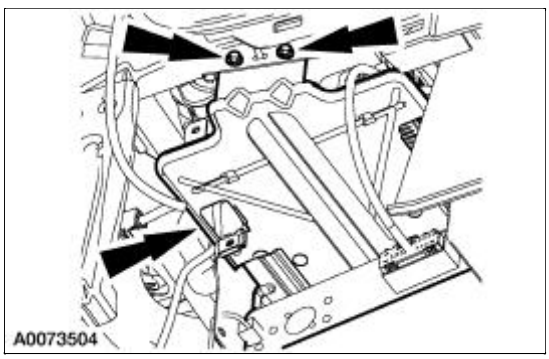
Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the rear quarter trim. Refer to Section 501-05 .
3. Remove the subwoofer amplifier.
    1. Disconnect the electrical connectors.
    2. Remove the screws.



4. To install, reverse the removal procedure.

Audio Amplifier



Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. **NOTE:** RH side is shown, LH side is similar.

   Remove the LH and RH front floor console side finish panels

3. Remove the bolts and audio amplifier/navigation DVD assembly.
   - Disconnect the electrical connectors.

4. Remove the four bolts and the audio amplifier.

5. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in
Antenna rear lead-in cable mounting bolt	9	—	80
Antenna isolator module bolt to body	9	—	80

General Specifications

Item	Specification
Rear Window Defroster Repair D8A2-19562-AA	WSB-MYJ58-B

Antenna

The antenna system consists of the following components:

- antenna grid and quarter glass assembly
- antenna lead-in, front cable
- antenna lead-in, rear cable
- antenna isolator module [vehicle navigation radio (VNR) only]

The antenna receives AM and FM radio waves. The waves are sent to the audio unit through the radio antenna lead-in cable.

The antenna is located on the inside of the right rear quarter glass and can be repaired, but not replaced separately from the glass. For additional information, refer to Antenna Grid Wire Repair in this section.

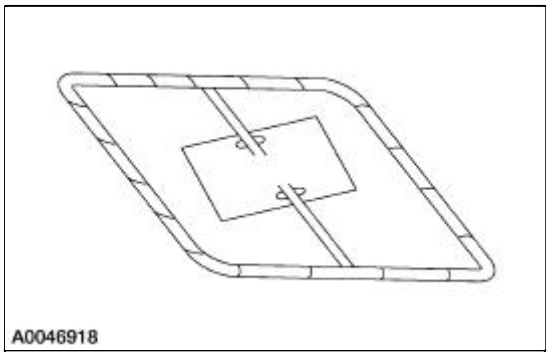
If the antenna cannot be repaired, install a new rear quarter window glass. For additional information, refer to Section 501-11 .

Antenna Grid Wire Repair

Special Tool(s)

 ST1171-A	Heat Gun 107-R0300 or equivalent

NOTE: Any breaks longer than 25.4 mm (1 in) in one grid cannot be repaired. The right quarter window glass must be replaced. Breaks equal to or shorter than 25.4 mm (1 in) in the antenna grid wire can be successfully repaired by using the following procedure:



1. Obtain a grid wire repair repair kit meeting Ford specification WSB-M4J58-B.

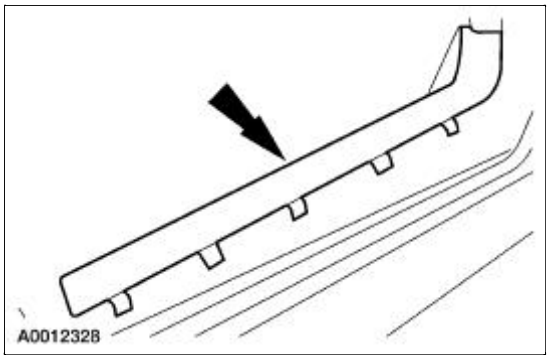
2. The vehicle should be brought inside and allowed to reach 16°C (60°F) or above.

NOTE: The grid line is very close to the interior trim/headliner. It is recommended to remove the trim (or drop the headliner) in the vicinity of the repair area to allow full access to the grid lind and to prevent any damage to trim/headliner while following the repair procedure.

3. Clean the repair area with denatured alcohol.

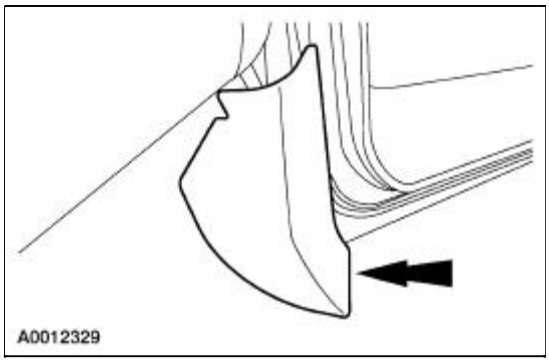
4. Place the grid line mask over the break, aligning the cut out slots on either side of the repair area.

5. Apply the epoxy to the repair area.



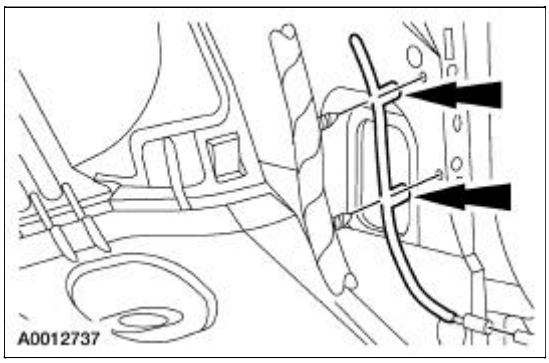
6. Remove the mask without disturbing the epoxy.

7. Use the heat gun to heat the repair area for one to two minutes at a distance of about 25-50 mm (1-2 in). This procedure should heat the repair area to approximately 149°C (300°F).

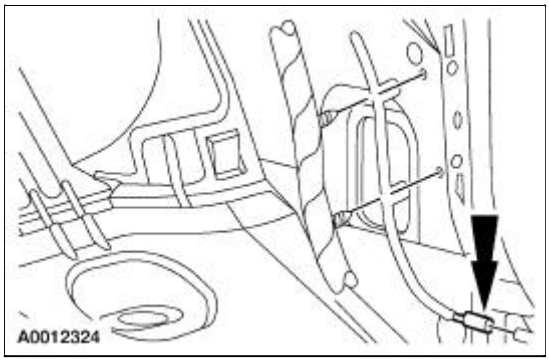


8. Optimum hardness and adhesion will occur after 24 hours. Do not disturb the repaired area until that time.

Antenna Lead-In Cable —Front



1. Remove the RH scuff plate.



2. Remove the RH A-pillar lower trim panel.

3. Disconnect the two pin-type retainers from the lower A-pillar.

4. Disconnect the rear antenna lead-in cable from the front antenna lead-in cable.

5. **NOTE:** The antenna is an integral part of the wiring harness and cannot be replaced separately from the harness. Cut the ends off of the old antenna cable and tape the remainder to the wiring harness to prevent noise.

   Remove the ground plate and remove the antenna cable ends.

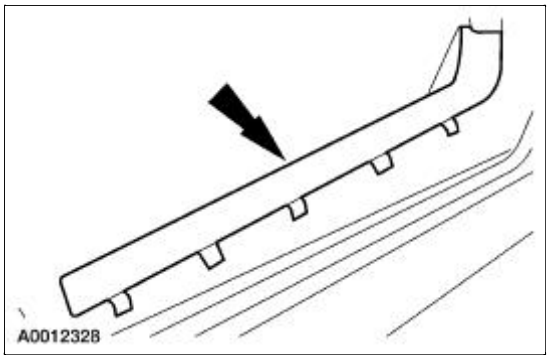
6. **NOTE:** When installing the new cable, tape or wire-tie the new cable to the wiring harness to prevent noise.

   To install, reverse the removal procedure.

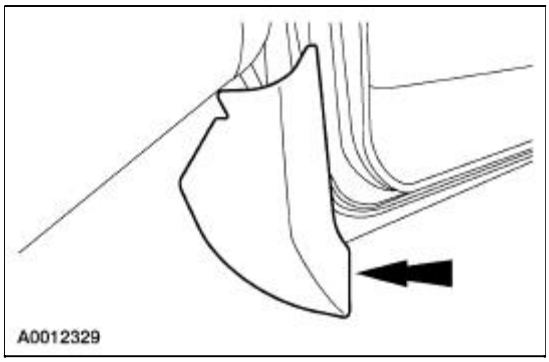
Antenna Isolator Module

1. Remove the RH coat hanger clips.

2. Lower the right rear of the headliner enough to gain access to the isolator module.

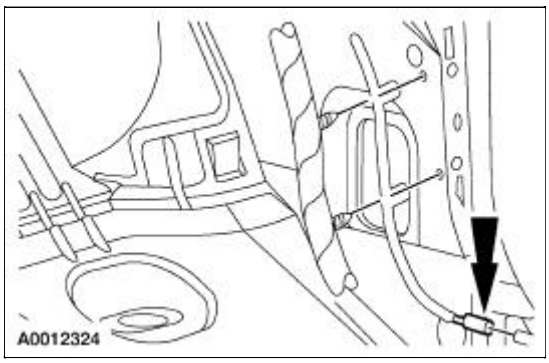


3. Remove the isolator module.
    1. Remove the bolt.
    2. Disconnect the electrical connector.
    3. Disconnect the antenna cable.
    4. Disconnect the antenna glass-to-module connector.

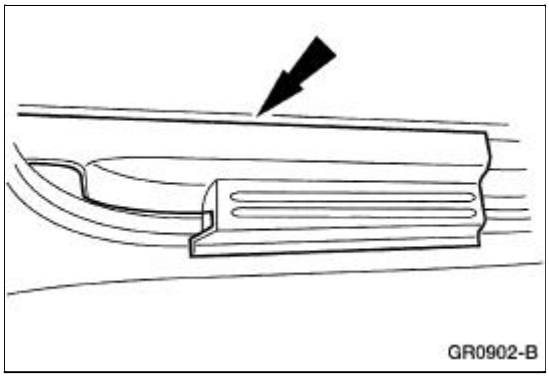


4. To install, reverse the removal procedure.

Antenna Lead-In Cable —Rear



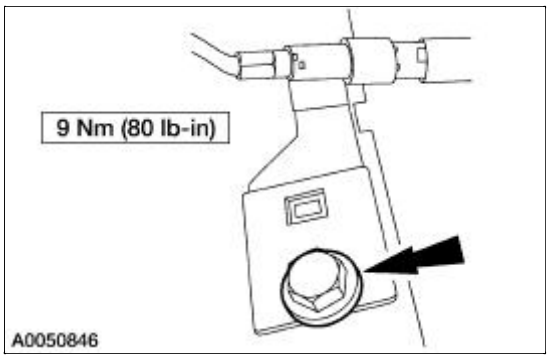
1. Remove the RH scuff plate.



2. Remove the RH A-pillar lower trim panel.

3. Disconnect the rear antenna lead-in cable from the front antenna lead-in cable.

4. Remove the RH rear door scuff plate.



5. Remove the RH rear quarter trim. For additional information, refer to Section 501-05 .

6. Lower the headliner enough to gain access to the rear antenna cable connection.

7. Disconnect the rear lead-in cable from the antenna cable.

8. Remove the bolt from the ground plate.

9. **NOTE:** The antenna is an integral part of the wiring harness and can not be replaced separately from the harness. Cut the ends off of the old antenna cable and tape the remainder to the wiring harness to prevent noise.

   Remove the ground plate and remove the antenna cable ends.

10. **NOTE:** When installing the new cable, tape or wire tie the new cable to the wiring harness to prevent noise.

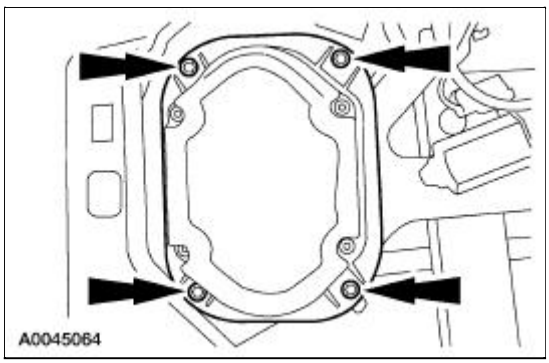
    To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-in
Speaker screws	2	22
Subwoofer enclosure screws	4	35

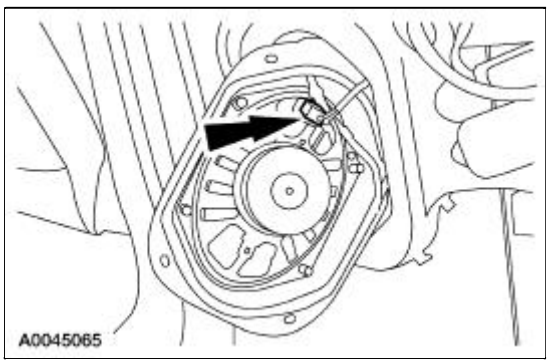
Speakers

The speaker system consists of the following components:



- subwoofer
- speakers

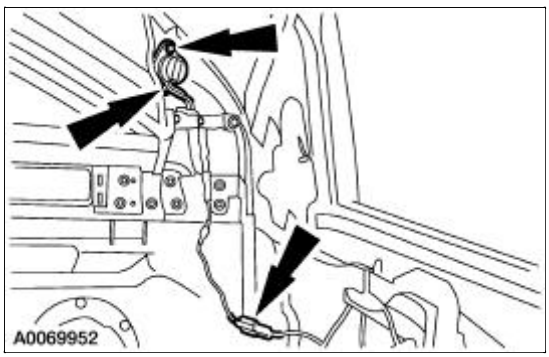
On all vehicles:



- The rear speakers are located behind the rear door trim panels.
- The front speakers are located behind the front door trim panels (23942)
- The subwoofer is located behind the LH quarter trim panel.

Door Speaker

1. Remove the door trim panels . For additional information, refer to Section 501-05 .
2. Remove the bolts.

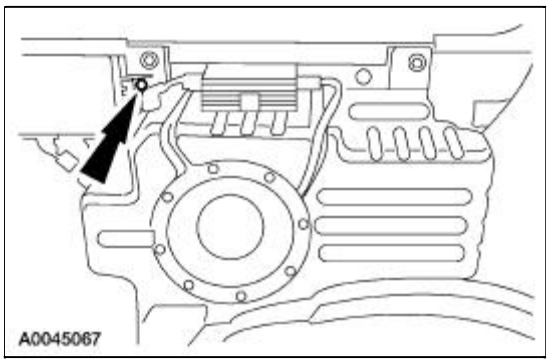


3. Disconnect the electrical connector.

4. To install, reverse the removal procedure.

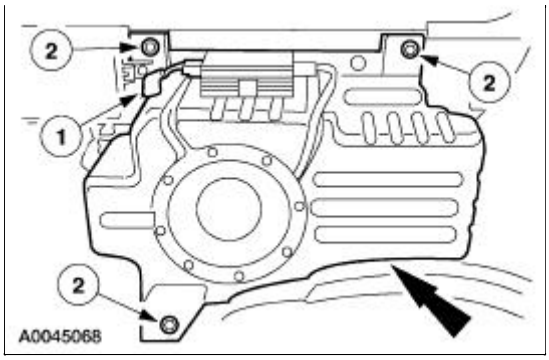
Front Door Tweeter Speaker

1. Remove the door trim panel. For additional information, refer to Section 501-05 .
2. Disconnect the electrical connector and remove the bolts.



3. To install, reverse the removal procedure.

Subwoofer Speaker



Removal and Installation

1. Remove the rear quarter trim panel. Refer to Section 501-05 .
2. Remove liftgate module bolt (if equipped) and remove liftgate module.

NOTE: Early build is shown, late build is similar

3. Remove the subwoofer assembly.
    1. Disconnect the subwoofer amplifier electrical connector.
    2. Remove the bolts.

4. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in
DVD assembly screws	1.9	—	8.9

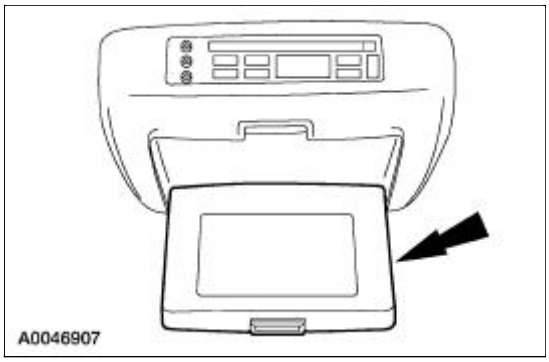
Video System

The video system consists of the following components:

- an overhead assembly containing the video display screen and the digital versatile disc (DVD) player
- remote control

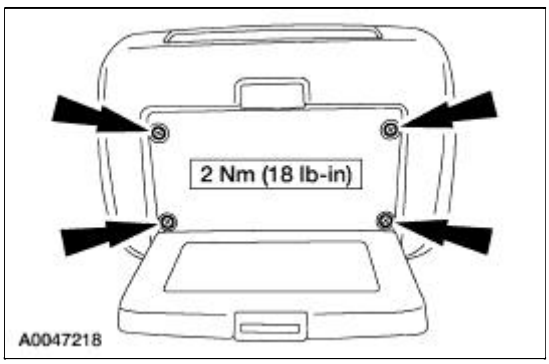
The components of the assembly are not repairable. For diagnosis and testing, refer to Section 415-00 .

Video System



Refer to Section 415-00 .

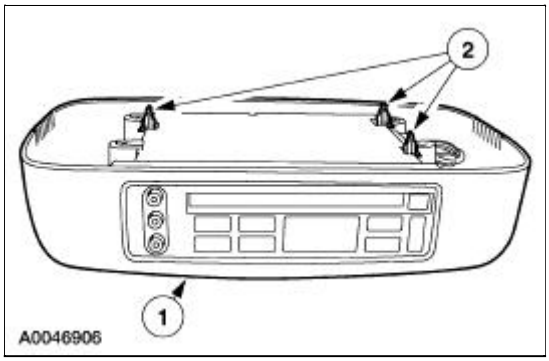
Digital Versatile Disc (DVD) Player



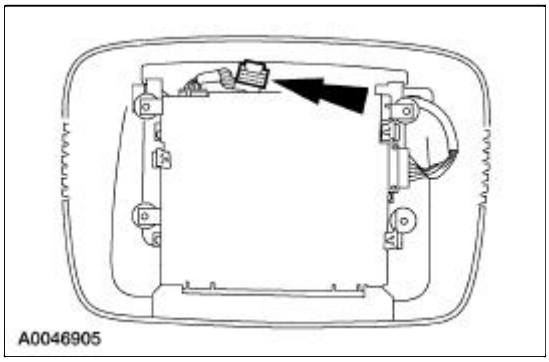
Removal and Installation

CAUTION: When removing the DVD unit do not pull on the display. This may cause damage to the unit and void the warranty.

1. Disconnect the battery ground cable. Refer to Section 414-01 .
2. Open the video display door.



3. Remove the screws.



4. **NOTE:** The DVD assembly must be supported while disengaging the clips.

   Remove the DVD assembly.
   1. Close the video display door.
   2. Disengage the clips.

5. Disconnect the electrical connector.

6. Remove the DVD player.
    1. Remove the four screws.
    2. Disconnect the electrical connector.

7. To install, reverse the removal procedure.

Exterior Lighting

The exterior lighting system components include:

- headlamps
- ballast (if equipped with high intensity discharge [HID] headlamps)
- rear lamps
- reversing lamps (integral to the rear lamps for Expedition)(located in the liftgate for Navigator)
- turn signal lamps
- fog lamps (if equipped)
- signal mirror lamp (if equipped)
- parking lamps
- high mounted stoplamp
- headlamp switch
- fog lamp switch (integral to the headlamp switch)
- multifunction switch
- photocell and amplifier (if equipped with autolamps)
- vehicle security module
- brake pedal position (BPP) switch
- headlamp relay
- fog lamp relay (if equipped)
- trailer tow relays

The fog lamp switch is integral to the headlamp switch.

Headlamps

Refer to Wiring Diagrams Cell 87 , Headlamps for schematic and connector information.

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Inspection and Verification

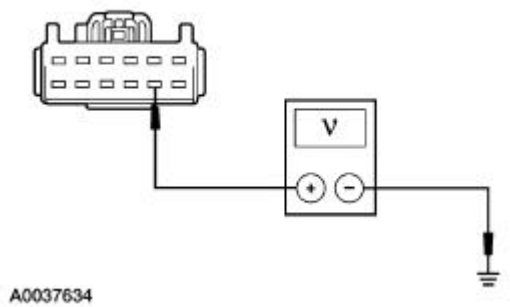
1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

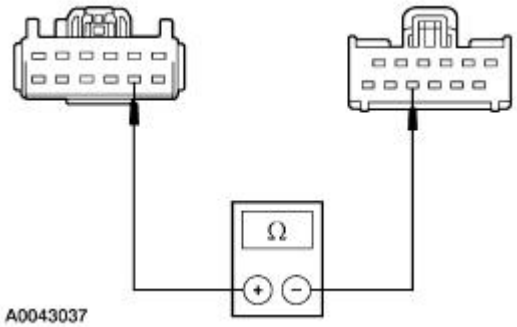
Mechanical	Electrical
● Headlamp switch ● Multifunction switch	● Central junction box (CJB) fuse(s): ■ 17 (15A) ■ 23 (10A) ■ 25 (10A) ■ 35 (20A) ■ 40 (20A) ● Circuitry ● Headlamp bulbs ● Daytime running lamp (DRL) relay

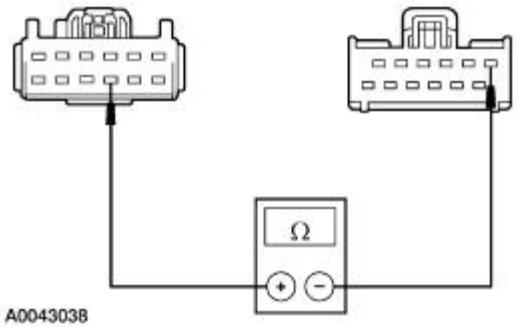
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom and refer to the Symptom Chart.

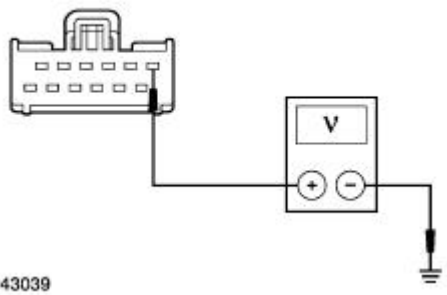
Symptom Chart



Symptom Chart



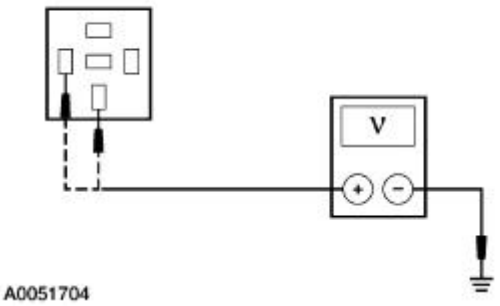


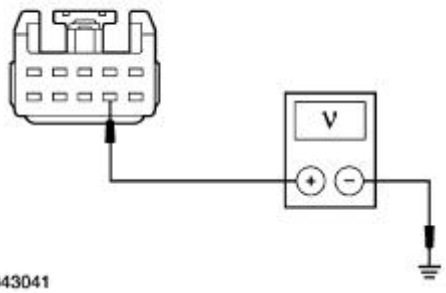


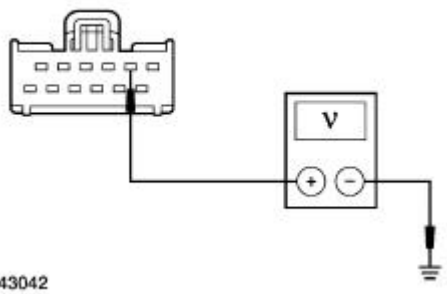
Condition	Possible Sources	Action
● The low beams are inoperative	● Circuitry. ● Headlamp switch. ● Central junction box (CJB).	● Go To Pinpoint Test A .
● The high beams are	● Central junction box (CJB)	● Go To

inoperative	fuse 35 (20A). ● Circuitry. ● High beam relay. ● Multifunction switch. ● CJB.	Pinpoint Test B .
● One low beam headlamp is inoperative	● Central junction box (CJB) fuse 23 (10A) (RH headlamp). ● CJB fuse 25 (10A) (LH headlamp). ● Circuitry. ● CJB.	● Go To Pinpoint Test C .
● One high beam headlamp is inoperative	● Circuitry. ● Headlamp assembly.	● Go To Pinpoint Test D .
● The headlamps are on continuously	● Circuitry. ● Headlamp switch. ● Multifunction switch. ● Central junction box (CJB). ● Vehicle security module.	● Go To Pinpoint Test E .
● The high and low beam headlamp is inoperative on one side	● Circuitry.	● REPAIR circuit 57 (BK).
● The flash-to-pass feature is inoperative	● Multifunction switch. ● Circuitry.	● Go To Pinpoint Test F .

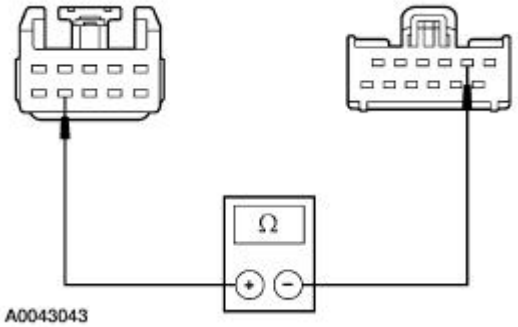
Pinpoint Tests

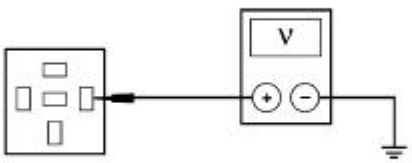


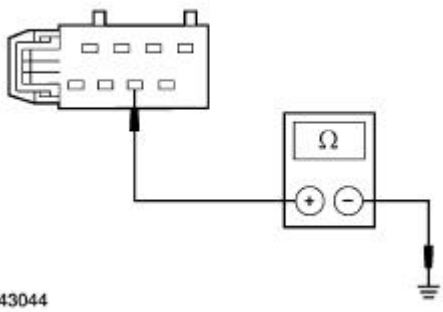




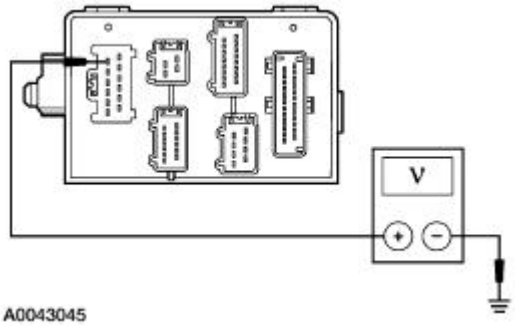
PINPOINT TEST A: THE LOW BEAMS ARE INOPERATIVE





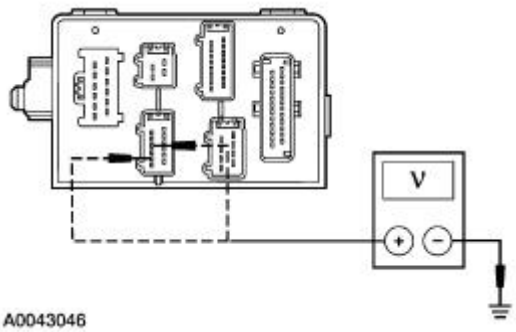


Test Step	Result / Action to Take
A1 CHECK CIRCUIT 196 (DB/OG) FOR VOLTAGE	
● Key in OFF position. ● Disconnect: Headlamp Switch C205a. ● Measure the voltage between the headlamp switch C205a pin 8, circuit 196 (DB/OG), harness side and ground.  A0037634 ● **Is the voltage greater than 10 volts?**	**Yes** GO to A3 . **No** GO to A2 .
A2 CHECK CIRCUIT 196 (DB/OG) FOR AN OPEN	
● Disconnect: Central Junction Box (CJB) C270h.	**Yes**

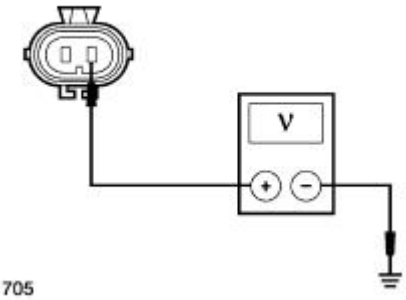


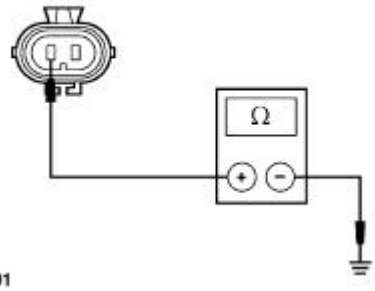
• Measure the resistance between the headlamp switch C205a pin 8, circuit 196 (DB/OG), harness side and the CJB C270h pin 10, circuit 196 (DB/OG), harness side.  A0043037 • **Is the resistance less than 5 ohms?**	INSTALL a new CJB. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
A3 CHECK CIRCUIT 15 (RD/YE) FOR AN OPEN	
• Disconnect: CJB C270h. • Measure the resistance between the headlamp switch C205a pin 9, circuit 15 (RD/YE), harness side and the CJB C270h pin 1, circuit 15 (RD/YE), harness side.  A0043038 • **Is the resistance less than 5 ohms?**	**Yes** RECONNECT the headlamp switch. GO to A4 . **No** REPAIR the circuit. TEST the system for normal operation.
A4 CHECK FOR VOLTAGE TO THE CJB	
• Turn the headlamp switch to the headlamps ON position. • Measure the voltage between the CJB C270h pin 1 circuit 15 (RD/YE), harness side and ground.  A0043039 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new CJB. TEST the system for normal operation. **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation.

PINPOINT TEST B: THE HIGH BEAMS ARE INOPERATIVE



Test Step	Result / Action to Take
B1 CHECK FOR VOLTAGE TO THE HIGH BEAM RELAY	
• Key in OFF position. • Disconnect: High Beam Relay C2242.	**Yes** TURN the headlamp

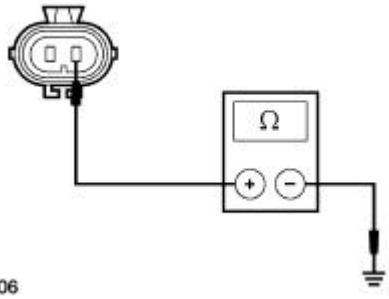




• Turn the headlamp switch to the headlamps ON position. • Place the multifunction switch in the high beam position. • Measure the voltage between the high beam relay C2242 pin 85, harness side and ground; and between the high beam relay C2242 pin 30, harness side and ground.  A0051704 • **Are the voltages greater than 10 volts?**	switch off. GO to B5 . **No** If no voltage at pin 85, TURN the headlamp switch off. GO to B2 . If no voltage at pin 30, INSTALL a new central junction box (CJB). TEST the system for normal operation.
B2 CHECK CIRCUIT 15 (RD/YE) FOR AN OPEN	
• Disconnect: Multifunction Switch C202c. • Measure the voltage between the multifunction switch C202c pin 7, circuit 15 (RD/YE), harness side and ground.  A0043041 • **Is the voltage greater than 10 volts?**	**Yes** GO to B3 . **No** REPAIR the circuit. TEST the system for normal operation.
B3 CHECK FOR VOLTAGE TO THE CENTRAL JUNCTION BOX (CJB)	
• Connect: Multifunction Switch C202c. • Disconnect: CJB C270h. • Turn the headlamp switch to the headlamps ON position. • Measure the voltage between the CJB C270h pin 2, circuit 275 (YE), harness side and ground.  A0043042 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new CJB. TEST the system for normal operation. **No** TURN the headlamp switch off. GO to B4 .
B4 CHECK CIRCUIT 275 FOR AN OPEN	
• Disconnect: Multifunction Switch C202c. • Measure the resistance between the multifunction switch C202c pin 9, circuit 275 (YE), harness side and the CJB C270h pin 2, circuit 275 (YE), harness side.	**Yes** INSTALL a new multifunction switch. REFER to Section 211-

 A0043043 ● **Is the resistance less than 5 ohms?**	05 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
B5 CHECK THE HIGH BEAM RELAY ● Carry out the high beam relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Is the high beam relay OK?**	**Yes** GO to B6 . **No** INSTALL a new high beam relay. TEST the system for normal operation.
B6 CHECK THE HIGH BEAM RELAY GROUND ● Measure the resistance between the high beam relay C2242 pin 86, harness side and ground.  GN1438-A ● **Is the resistance less than 5 ohms?**	**Yes** GO to B8 . **No** GO to B7 .
B7 CHECK CIRCUIT 57 (BK) FOR AN OPEN ● Disconnect: Central Junction Box (CJB) C270f. ● Measure the resistance between the CJB C270f pin 6, harness side and ground.  A0043044 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new CJB. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
B8 CHECK THE CENTRAL JUNCTION BOX (CJB) ● Connect: High Beam Relay C2242. ● Disconnect: CJB C270a. ● Turn the headlamp switch to the headlamps ON position.	**Yes** REPAIR circuit 12 (LG/BK). TEST the

• Place the multifunction switch in the high beam position. • Measure the voltage between the CJB C270a pin 6, component side and ground.  A0043045 • **Is the voltage greater than 10 volts?**	system for normal operation. **No** INSTALL a new CJB. TEST the system for normal operation.



PINPOINT TEST C: ONE LOW BEAM HEADLAMP IS INOPERATIVE

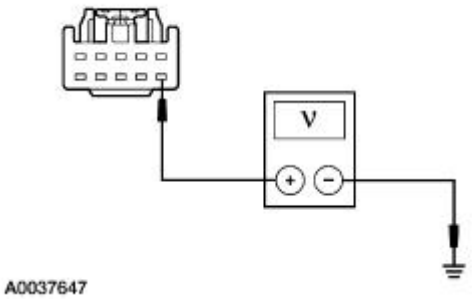
Test Step	Result / Action to Take
C1 CHECK THE CENTRAL JUNCTION BOX (CJB)	
• Key in OFF position. • Disconnect: CJB C270b. • Turn the headlamp switch to the headlamps ON position. • Place the multifunction switch in the low beam position. • Measure the voltage between the CJB C270b pin 5, circuit 160 (DB/WH) (LH headlamp), component side and ground; or between the CJB C270b pin 9, circuit 161 (DG/OG) (RH headlamp), component side and ground.  A0043046 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new CJB. TEST the system for normal operation. **No** TURN the headlamp switch off. GO to C2 .
C2 CHECK CIRCUIT 160 (DB/WH) OR 161 (DG/OG) FOR AN OPEN	
• Connect: CJB C270b. • Disconnect: Inoperative Headlamp. • Turn the headlamp switch to the headlamps ON position. • Measure the voltage between the LH headlamp C1111 pin 2, circuit 160 (DB/WH), harness side and ground; or between the RH headlamp C1112 pin 2, circuit 160 (DB/WH), harness side and ground.	**Yes** If not equipped with HID headlamp, REPAIR circuit 57 (BK). TEST the system for normal operation. If equipped with HID headlamp, TURN the headlamp switch off. GO to C3 **No** REPAIR circuit 160

 A0051705 ● **Is the voltage greater than 10 volts?**	(DB/WH) or 161 (DG/OG) as necessary. TEST the system for normal operation.
C3 CHECK CIRCUIT 57 FOR AN OPEN	
● Measure the resistance between the headlamp C1111 (LH lamp) or C1112 (RH lamp) pin 1, circuit 57 (BK), harness side and ground.  A0044891 ● **Is the resistance less than 5 ohms?**	**Yes** GO to C4 . **No** REPAIR the circuit. TEST the system for normal operation.
C4 CHECK THE HID BALLAST	
● Substitute a known good HID ballast. ● Turn the headlamp switch to the headlamps ON position. ● **Does the headlamp illuminate?**	**Yes** INSTALL a new HID ballast. REFER to Headlamp Bulb in this section. **No** INSTALL a new HID bulb. REFER to Headlamp Bulb in this section.

PINPOINT TEST D: ONE HIGH BEAM HEADLAMP IS INOPERATIVE

Test Step	Result / Action to Take
D1 CHECK THE VOLTAGE TO THE INOPERATIVE HEADLAMP BULB	
● Key in OFF position. ● Disconnect the inoperative headlamp. ● Turn the headlamp switch to the headlamps ON position. ● Place the multifunction switch in the high beam position. ● Measure the resistance between the LH high beam lamp C1020 pin 2, circuit 12 (LG/BK), harness side or the RH high beam lamp C1040 pin 2, circuit 12 (LG/BK), harness side and ground.	**Yes** REPAIR circuit 12 (LG/BK). TEST the system for normal operation. **No** REPAIR circuit 57 (BK). TEST the system for normal

 ● **Is the resistance less than 5 ohms?**	operation.



PINPOINT TEST E: THE HEADLAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
E1 CHECK THE HIGH BEAM CIRCUIT FOR SHORT TO POWER	
● Key in OFF position. ● Place the multifunction switch in the low beam position. ● **Is the high beam indicator illuminated?**	**Yes** GO to E2 . **No** GO to E7 .
E2 CHECK CIRCUIT 12 (LG/BK) TO THE HEADLAMPS FOR SHORT TO POWER	
● Disconnect: Central Junction Box (CJB) C270a. ● **Do the headlamps continue to illuminate?**	**Yes** REPAIR circuit 12 (LG/BK). TEST the system for normal operation. **No** GO to E3 .
E3 CHECK THE CJB FOR SHORT TO POWER	
● Connect: CJB C270a. ● Disconnect: High Beam Relay C2242. ● **Do the headlamps continue to illuminate?**	**Yes** INSTALL a new CJB. TEST the system for normal operation. **No** GO to E4 .
E4 CHECK THE HIGH BEAM RELAY	
● Carry out the high beam relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Is the high beam relay OK?**	**Yes** GO to E5 . **No** INSTALL a new high beam relay. TEST the system for normal operation.
E5 CHECK THE HIGH BEAM RELAY POWER SUPPLY CIRCUIT FOR SHORT TO POWER	
● Connect: High Beam Relay C2242. ● Disconnect: CJB C270h. ● **Do the headlamps continue to illuminate?**	**Yes** INSTALL a new CJB. TEST the system for normal operation.

	No GO to E6 .
E6 CHECK CIRCUIT 275 (YE) FOR SHORT TO POWER ● Connect: CJB C270h. ● Disconnect: Multifunction Switch C202c. ● **Do the headlamps continue to illuminate?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.
E7 CHECK THE AUTOLAMP SYSTEM ● Disconnect: Vehicle Security Module C2113b. ● **Do the headlamps continue to illuminate?**	**Yes** GO to E8 . **No** REFER to Autolamps in this section.
E8 CHECK CIRCUITS 160 (DB/WH) AND 161 (DB/OG) FOR SHORT TO POWER ● Disconnect: Central Junction Box (CJB) C270b. ● **Do the headlamps continue to illuminate?**	**Yes** REPAIR circuit 160 (DB/WH) or 161 (DG/OG) as necessary. TEST the system for normal operation. **No** GO to E9 .
E9 CHECK THE CJB ● Connect: CJB C270b. ● Disconnect: CJB C270h. ● **Do the headlamps continue to illuminate?**	**Yes** INSTALL a new CJB. TEST the system for normal operation. **No** RECONNECT the CJB C270h. GO to E10 .
E10 CHECK THE MULTIFUNCTION SWITCH ● Disconnect: Multifunction Switch C202c. ● **Do the headlamps continue to illuminate?**	**Yes** GO to E11 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.
E11 CHECK CIRCUIT 15 (RD/YE) FOR SHORT TO POWER ● Disconnect: Headlamp Switch C205a. ● **Do the headlamps continue to illuminate?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation.

PINPOINT TEST F: THE FLASH TO PASS FEATURE IS

INOPERATIVE

Test Step	Result / Action to Take
F1 CHECK CIRCUIT 196 (DB/OG) FOR AN OPEN	
• Disconnect: Multifunction Switch C202c. • Measure the voltage between the multifunction switch C202c pin 8, circuit 196 (DB/OG), harness side and ground.  A0037647 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

Autolamps

Refer to Wiring Diagrams Cell 87 , Autolamps for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool

Principles of Operation

The autolamp system provides light-sensitive automatic on/off control of the headlamps and parking lamps controlled by the vehicle security module when the headlamp switch is in the autolamps position. When the ignition switch is turned to the RUN or START position with the autolamps feature already enabled and the ambient light level is dark, the vehicle security module will request the headlamps and parking lamps be turned on. When the autolamps are disabled, the vehicle security module will request the headlamps and parking lamps to be turned off, regardless of the ignition switch position. When the vehicle security module has turned on the exterior lamps and the ignition is turned to the OFF or ACCY position, the exterior lamps will remain on for an additional time specified by the customer or the headlamp switch is turned off.

When the autolamps have been enabled and the ignition switch is in the RUN/START position, the vehicle security module will request that the exterior lamps be turned on or off based on ambient light level. If the vehicle enters darkness for at least 15 seconds, the vehicle security module will request the exterior lamps on. If the vehicle enters light for at least 15 seconds, the vehicle security module will request the exterior lamps off. By delaying turning on and off the exterior lamps during short periods of darkness and light, the vehicle security module prevents the exterior lamps from flashing on and off.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

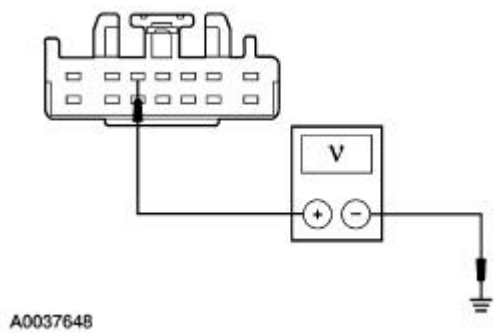
Visual Inspection Chart

Mechanical	Electrical
● Headlamp switch	● Central junction box (CJB) fuse(s): ■ 5 (7.5A)

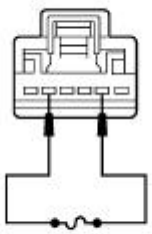
	■ 30 (30A) ● Circuitry ● Headlamp bulb ● Vehicle security module ● Photocell

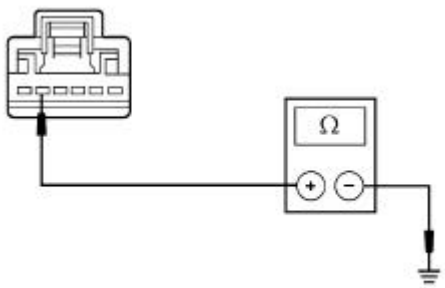
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern is not visually evident, determine the symptom and refer to the Symptom Chart.

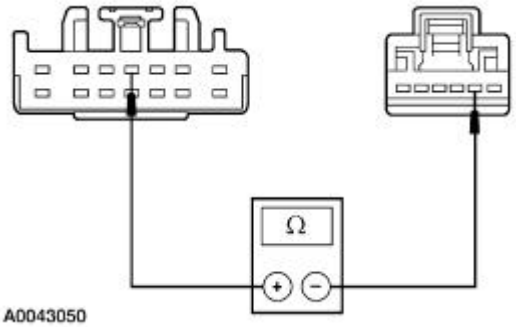


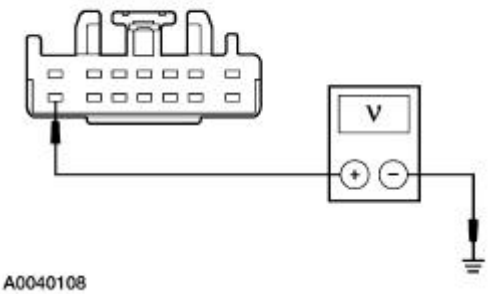
Symptom Chart

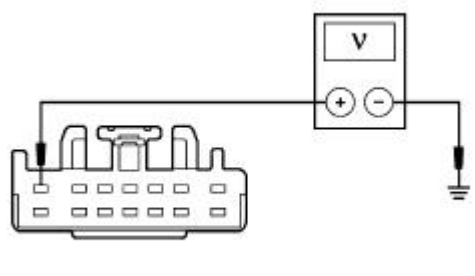




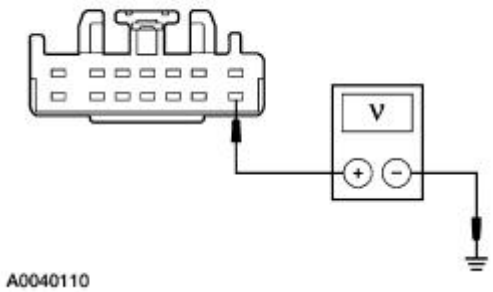
Symptom Chart

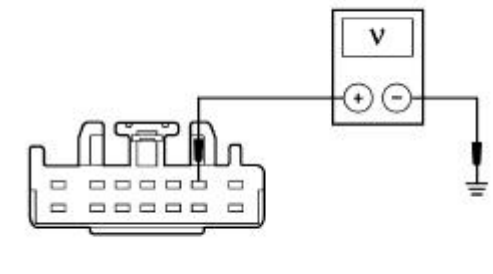






Condition	Possible Sources	Action
● No communication with the vehicle security module	● Central junction box (CJB) fuse(s): ■ 5 (7.5A). ■ 30 (30A). ● Circuitry. ● Vehicle security module.	● REFER to Section 419-10 .
● The autolamps are inoperative — do not operate correctly	● Circuitry. ● Photocell. ● Headlamp switch. ● Vehicle security module.	● Go To Pinpoint Test G .
● The autolamps are on continuously	● Photocell covered by opaque material/obstructed. ● Photocell incorrectly installed. ● Circuitry. ● Photocell. ● Vehicle security module.	● REMOVE opaque material/obstruction. ● INSTALL the photocell correctly. ● Go To Pinpoint Test G .
● The autolamp time delay is inoperative	● Vehicle security module.	● INSTALL a new vehicle security module. REFER to Section 419-10 .
● The headlamps are inoperative with autolamps on	● Circuitry. ● Vehicle security module.	● Go To Pinpoint Test G .
● The autolamps operate, but parking, rear or license lamps are inoperative	● Circuitry. ● Vehicle security module.	● Go To Pinpoint Test G .





Pinpoint Tests

PINPOINT TEST G: THE AUTOLAMPS ARE INOPERATIVE — DO NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
G1 CHECK THE HEADLAMPS AND PARKING LAMPS	
• Key in OFF position. • Turn the headlamp switch to the headlamps ON position. • **Did the headlamps and parking lamps turn on?**	**Yes** Turn the headlamp switch off. GO to G2 . **No** REFER to Headlamps or Parking, Rear and License Lamps in this section.
G2 MONITOR THE AUTOLAMP PID	
• Key in ON position. • Connect the diagnostic tool. • Enter the following diagnostic mode on the diagnostic tool: Autolamp PID. • Place the headlamp switch in the autolamp position. • Monitor the autolamp PID. • **Does the autolamp PID indicate ON?**	**Yes** Turn the headlamp switch off. GO to G5 . **No** Turn the headlamp switch off. GO to G3 .
G3 CHECK THE INPUT FROM THE HEADLAMP SWITCH	
• Key in OFF position. • Disconnect: Vehicle Security Module C2113b. • Measure the voltage between the vehicle security module C2113b pin 5, circuit 219 (DG/YE), harness side and ground while placing the headlamp switch in the autolamp and off positions.  • **Is the voltage greater than 10 volts with the headlamp switch in the autolamp position and less than 5 volts with the headlamp switch in the off position?**	**Yes** Turn the headlamp switch off. GO to G15 . **No** Turn the headlamp switch off. GO to G4 .
G4 CHECK THE HEADLAMP SWITCH	
• Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** REPAIR circuit 219 (DG/YE). TEST the system for normal operation. **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for

	normal operation.
G5 CHECK THE PHOTOCELL INPUT — MONITOR THE VEHICLE SECURITY MODULE LIGHT SENSOR PID	
• Enter the following diagnostic mode on the diagnostic tool: Light Sensor PID. • Monitor the vehicle security module photocell sensor PID while illuminating the photocell, then remove the light source. • **Does the PID indicate NO with the light source applied and YES with the light removed?**	**Yes** GO to G9 . **No** GO to G6 .
G6 CHECK THE PHOTOCELL	
• Key in OFF position. • Disconnect: Photocell C286. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Light Sensor PID. • Monitor the photocell PID while connecting a fused jumper wire (5A) between the photocell C286 pin 2, circuit 218 (WH/VT), harness side and the photocell C286 pin 5, circuit 875 (BK/LB), harness side.  A0043049 • **Does the photocell sensor PID indicate YES?**	**Yes** INSTALL a new photocell. REFER to Photocell and Amplifier in this section. TEST the system for normal operation. **No** GO to G7 .
G7 CHECK CIRCUIT 875 (BK/LB) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the photocell C286 pin 5, circuit 875 (BK/LB), harness side and ground.  A0008729 • **Is the resistance less than 5 ohms?**	**Yes** GO to G8 . **No** REPAIR the circuit. TEST the system for normal operation.
G8 CHECK THE CIRCUIT 218 (WH/VT) FOR AN OPEN	
• Disconnect: Vehicle Security Module C2113b. • Measure the resistance between the photocell C286 pin 2, circuit 218 (WH/VT), harness side and the vehicle security module C2113b pin 4, circuit 218 (WH/VT), harness side.	**Yes** GO to G15 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0043050 ● **Is the resistance less than 5 ohms?**	
G9 CHECK THE HEADLAMP CIRCUITS	
● Enter the following diagnostic mode on the diagnostic tool: Headlamps Active Command. ● Activate the active command for the headlamps. ● **Do the headlamps operate with the active command?**	**Yes** GO to G12 . **No** GO to G10 .
G10 CHECK CIRCUIT 196 (DB/OG) FOR AN OPEN	
● Key in OFF position. ● Disconnect: Vehicle Security Module C2113b. ● Measure the voltage between the vehicle security module C2113b pin 14, circuit 196 (DB/OG), harness side and ground.  A0040108 ● **Is the voltage greater than 10 volts?**	**Yes** GO to G11 . **No** REPAIR the circuit. TEST the system for normal operation.
G11 CHECK CIRCUIT 15 (RD/YE) FOR AN OPEN	
● Turn the headlamp switch to the headlamps ON position. ● Measure the voltage between the vehicle security module C2113b pin 7, circuit 15 (RD/YE), harness side and ground.  A0040109 ● **Is the voltage greater than 10 volts?**	**Yes** GO to G15 . **No** REPAIR the circuit. TEST the system for normal operation.
G12 CHECK THE PARKING LAMP CIRCUITS	
● Enter the following diagnostic mode on the diagnostic tool: Parking Lamps Active Command. ● Activate the active command for the parking lamps. ● **Do the parking lamps operate with the active command?**	**Yes** GO to G15 . **No**

	GO to G13 .
G13 CHECK CIRCUIT 195 (TN/WH) FOR AN OPEN	
• Key in OFF position. • Disconnect: Vehicle Security Module C2113b. • Measure the voltage between the vehicle security module C2113b pin 8, circuit 195 (TN/WH), harness side and ground.  A0040110 • **Is the voltage greater than 10 volts?**	**Yes** GO to G14 . **No** REPAIR the circuit. TEST the system for normal operation.
G14 CHECK CIRCUIT 14 (BN) FOR AN OPEN	
• Turn the headlamp switch to the headlamps ON position. • Measure the voltage between the vehicle security module C2113b pin 2, circuit 14 (BN), harness side and ground.  A0040111 • **Is the voltage greater than 10 volts?**	**Yes** GO to G15 . **No** REPAIR the circuit. TEST the system for normal operation.
G15 CHECK FOR VEHICLE SECURITY MODULE OPERATION	
• Key in OFF position. • Disconnect all vehicle security module connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all vehicle security module connectors and make sure they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new vehicle security module. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Stoplamps

Refer to Wiring Diagrams Cell 90 , Turn/Stop/Hazard Lamps for schematic and connector information.

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

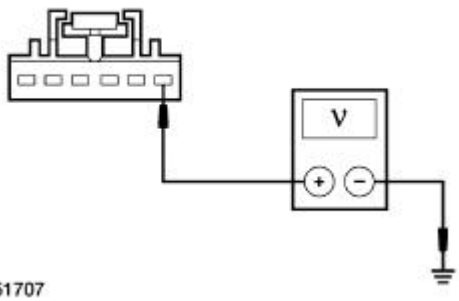
Mechanical	Electrical
● Central junction box (CJB) ● Brake pedal position (BPP) switch ● Multifunction switch	● CJB fuse 2 (20A) ● Circuitry ● Stoplamp bulbs

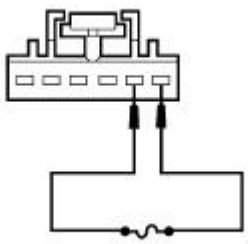
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom and refer to the Symptom Chart.

Symptom Chart

NOTE:

Refer to Wiring Diagrams Cell 90 for schematic and connector information.

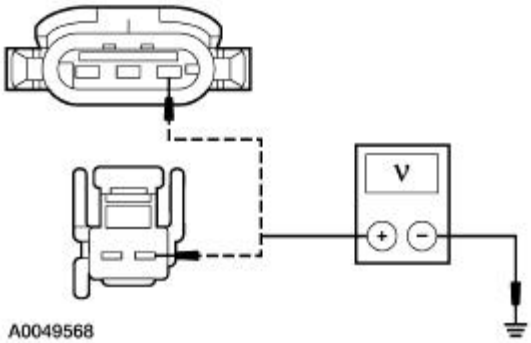


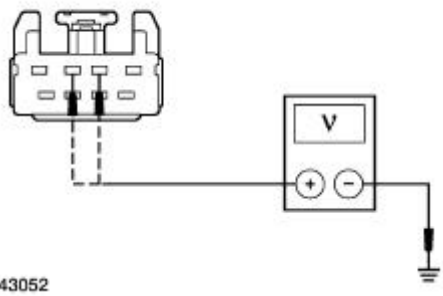


Symptom Chart

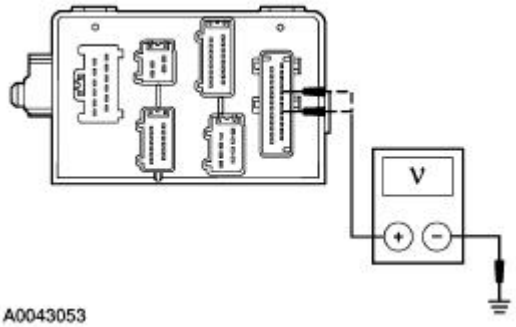
Condition	Possible Sources	Action
● The stoplamps are inoperative	● Central junction box (CJB) fuse 2 (20A). ● Circuitry. ● Brake pedal position (BPP) switch.	● Go To Pinpoint Test H .
● One or more stoplamps	● Stoplamp bulb.	● Go To Pinpoint

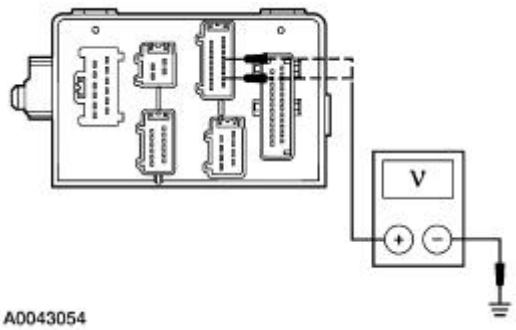
are inoperative	• Circuitry. • Multifunction switch. • Central junction box (CJB).	Test I .
• The stoplamps are on continuously	• Brake pedal position (BPP) switch. • Circuitry. • Multifunction switch. • Central junction box (CJB).	• Go To Pinpoint Test J .





Pinpoint Tests



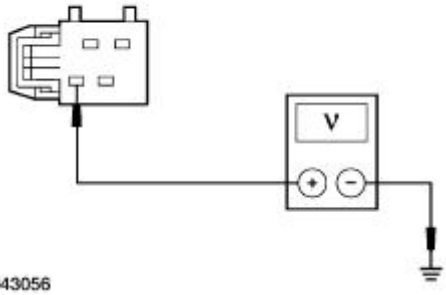


PINPOINT TEST H: THE STOPLAMPS ARE INOPERATIVE

Test Step	Result / Action to Take
H1 CHECK CIRCUIT 10 (LG/RD) FOR AN OPEN • Disconnect: BPP Switch C278. • Measure the voltage between BPP switch C278 pin 1, circuit 10 (LG/RD), harness side and ground.  A0051707 • **Is the voltage greater than 10 volts?**	**Yes** GO to H2 . **No** REPAIR the circuit. TEST the system for normal operation.
H2 CHECK THE BPP SWITCH • Connect a fused jumper wire (20A) between BPP C278 pin 1, circuit 10 (LG/RD), harness side and BPP C278 pin 2, circuit 511 (LG), harness side.  A0051708 • **Do the stoplamps operate?**	**Yes** INSTALL a new BPP switch. REFER to Brake Pedal Position (BPP) Switch in this section. **No** REPAIR circuit 511 (LG). TEST the system for normal operation.

PINPOINT TEST I: ONE OR MORE STOPLAMPS ARE INOPERATIVE

	Result / Action to



Test Step	Take
I1 CHECK THE VOLTAGE TO THE STOPLAMP	
• Disconnect: Inoperative Stoplamp. • Depress the brake pedal. • Measure the voltage between the inoperative stoplamp connector pin 3, circuit 9 (LG/OG) (LH) or circuit 5 (OG/LB) (RH), harness side and ground; or between the inoperative high mounted stoplamp C475 pin 1, circuit 511 (LG), harness side and ground.  A0049568 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit 57 (BK). TEST the system for normal operation. **No** If high mounted stoplamp, REPAIR circuit 511 (LG). TEST the system for normal operation. If both stoplamps are inoperative, INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. If a single stoplamp is inoperative, GO to I2 .
I2 CHECK CIRCUIT 511 (LG) FOR VOLTAGE	
• Disconnect: Multifunction Switch C202b. • Depress the brake pedal. • Measure the voltage between the multifunction switch C202b pin 2, circuit 511 (LG) (RH stoplamp), harness side and ground; or between the multifunction switch C202b pin 3, circuit 511 (LG) (LH stoplamp), harness side and ground.  A0043052 • **Is the voltage greater than 10 volts?**	**Yes** GO to I3 . **No** REPAIR the circuit. TEST the system for normal operation.
I3 CHECK THE MULTIFUNCTION SWITCH	
• Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the multifunction switch OK?**	**Yes** GO to I4 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.
I4 CHECK FOR VOLTAGE TO THE CENTRAL JUNCTION BOX (CJB)	
• Connect: Multifunction Switch C202b. • Disconnect: CJB C270e. • Depress the brake pedal.	**Yes** GO to I5 .

• Measure the voltage between the CJB C270e pin 15, circuit 9 (LG/OG) (LH stoplamp), component side and ground; or between the CJB C270e pin 18, circuit 5 (OG/LB) (RH stoplamp), component side and ground.  A0043053 • **Is the voltage greater than 10 volts?**	**No** REPAIR circuit 9 (LG/OG) or circuit 5 (OG/LB) as necessary. TEST the system for normal operation.
I5 CHECK THE CJB	
• Connect: CJB C270e. • Disconnect: CJB C270j. • Depress the brake pedal. • Measure the voltage between the CJB C270j pin 8, circuit 9 (LG/OG) (LH stoplamp), component side and ground; or between the CJB C270j pin 14, circuit 5 (OG/LB) (RH stoplamp), component side and ground.  A0043054 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit 9 (LG/OG) or circuit 5 (OG/LB) as necessary. TEST the system for normal operation. **No** INSTALL a new CJB. TEST the system for normal operation.

PINPOINT TEST J: THE STOPLAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
J1 CHECK THE BRAKE PEDAL POSITION (BPP) SWITCH	
• Disconnect: BPP Switch C278. • **Are the stoplamps illuminated?**	**Yes** GO to J2 . **No** INSTALL a new BPP switch. REFER to Brake Pedal Position (BPP) Switch in this section. TEST the system for normal operation.
J2 CHECK CIRCUIT 511 (LG) FOR SHORT TO POWER	
• Disconnect: Multifunction Switch C202b. • **Do the stoplamps continue to illuminate?**	**Yes** If center high mounted stoplamp, REPAIR circuit 511 (LG). TEST the system for normal operation.

	If rear stoplamp, GO to J3 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.
J3 CHECK CIRCUIT TO CENTRAL JUNCTION BOX (CJB) FOR SHORT TO POWER ● Disconnect: CJB C270a. ● **Does the rear stoplamp continue to illuminate?**	**Yes** GO to J4 . **No** REPAIR circuit 5 (OG/LB) (RH stoplamp) or circuit 9 (LG/OG) (LH stoplamp) as necessary. TEST the system for normal operation.
J4 CHECK CIRCUIT 5 (OG/LB) OR CIRCUIT 9 (LG/OG) FOR AN OPEN ● Disconnect: CJB C270j. ● **Does the rear stoplamp continue to illuminate?**	**Yes** REPAIR circuit 5 (OG/LB) (RH stoplamp) or circuit 9 (LG/OG) (LH stoplamp) as necessary. TEST the system for normal operation. **No** If LH stoplamp, GO to J5 . If RH stoplamp, GO to J6 .
J5 CHECK CIRCUIT 64 (DG) FOR SHORT TO POWER ● Disconnect: Trailer Tow C4098 (4-pin). ● Disconnect: Trailer Tow C4099 (7-pin). ● Measure the voltage between the CJB C270j pin 16, circuit 64 (DG), harness side and ground.  A0043055 ● **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new CJB. TEST the system for normal operation.
J6 CHECK CIRCUIT 52 (YE) FOR SHORT TO POWER ● Disconnect: CJB C270k. ● Disconnect: Trailer Tow C4098 (4-pin). ● Disconnect: Trailer Tow C4099 (7-pin). ● Measure the voltage between the CJB C270k pin 2, circuit 52 (YE), harness side and ground.	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new CJB. TEST the system for normal operation.

A0043056

- **Is the voltage greater than 10 volts?**

Turn Signal and Hazard Lamps

Refer to Wiring Diagrams Cell 90 , Turn/Stop/Hazard Lamps for schematic and connector information.

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

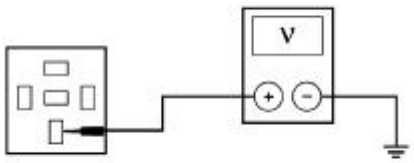
Mechanical	Electrical
● Multifunction switch	● Central junction box (CJB) fuse(s): ■ 2 (20A) ■ 18 (10A) ● Circuitry ● Electronic flasher ● Signal/hazard lamp

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom and refer to the Symptom Chart.

Symptom Chart

NOTE: Refer to Wiring Diagrams for the connector numbers stated in the pinpoint tests.

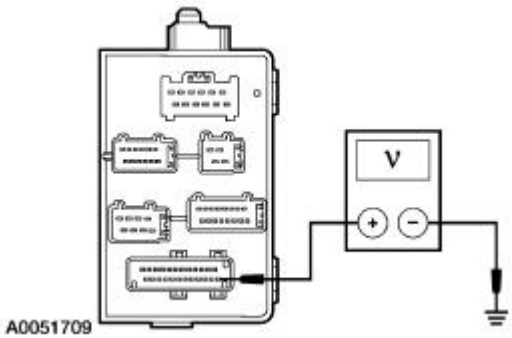
Symptom Chart

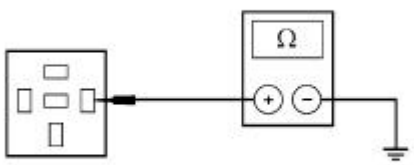


Condition	Possible Sources	Action
● The turn signal lamps are	● Central junction box (CJB) fuse 18	● Go To Pinpoint Test K .

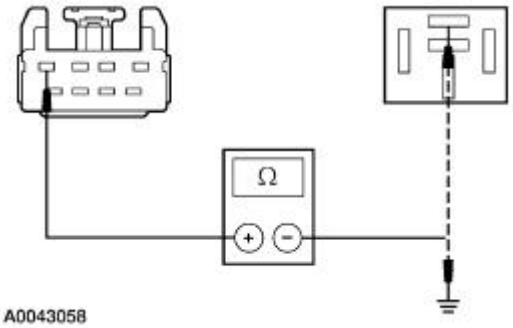
inoperative	(10A). ● Circuitry. ● Electronic flasher. ● Multifunction switch. ● CJB.	
● The turn signal lamps are always on	● Multifunction switch.	● INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.
● One turn signal/hazard lamp is inoperative	● Turn signal/hazard flasher lamp. ● Multifunction switch. ● Circuitry.	● Go To Pinpoint Test L .
● The hazard lamps are inoperative	● Central junction box (CJB) fuse 2 (20A). ● Circuitry. ● Electronic flasher. ● Multifunction switch. ● CJB.	● Go To Pinpoint Test M .
● The hazard lamps are always on	● Multifunction switch.	● INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.
● The turn signal lamps are inoperative—signal mirror	● Circuitry. ● Signal mirror.	● Go To Pinpoint Test N .

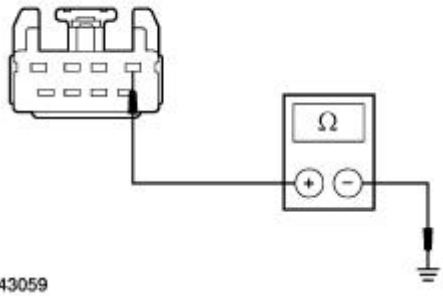
Pinpoint Tests





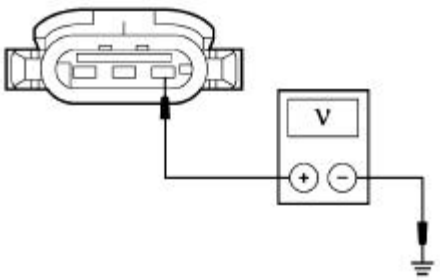
PINPOINT TEST K: THE TURN SIGNAL LAMPS ARE INOPERATIVE





Test Step	Result / Action to Take
K1 CHECK THE VOLTAGE TO THE ELECTRONIC FLASHER	
● Key in OFF position. ● Disconnect: Electronic Flasher C2047. ● Key in ON position. ● Measure the voltage between the electronic flasher C2047 pin 30, circuit 294 (WH/LB), harness side and ground.	**Yes** GO to K3 . **No** GO to K2 .

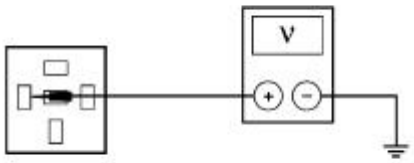
GN1437-A



- **Is the voltage greater than 10 volts?**

K2 CHECK CIRCUIT 294 (WH/LB) FOR AN OPEN - Key in OFF position. - Disconnect: Central Junction Box (CJB) C270e. - Key in ON position. - Measure the voltage between the CJB C270e pin 1, circuit 294 (WH/LB), component side and ground.  A0051709 - **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new CJB. TEST the system for normal operation.
K3 CHECK CIRCUIT 57 (BK) FOR AN OPEN - Key in OFF position. - Measure the resistance between the electronic flasher C2047 pin 86, circuit 57 (BK), harness side and ground.  GN1433-A - **Is the resistance less than 5 ohms?**	**Yes** GO to K4 . **No** REPAIR the circuit. TEST the system for normal operation.
K4 CHECK CIRCUIT 44 (LB) FOR OPEN OR SHORT TO GROUND - Disconnect: Multifunction Switch C202b. - Measure the resistance between the multifunction switch C202b pin 4, circuit 44 (LB), harness side and the electronic flasher C2047 pin 87, circuit 44 (LB), harness side; and between the multifunction switch C202b pin 4, circuit 44 (LB), harness side and ground.	**Yes** GO to K5 . **No** REPAIR the circuit. TEST the system for normal operation.

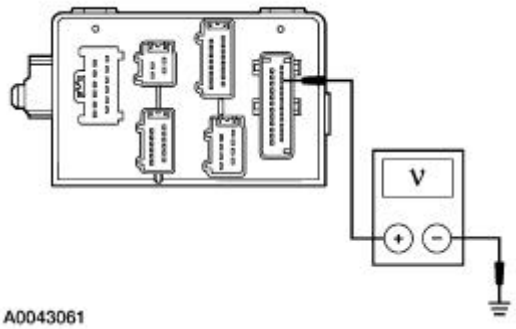
 A0043058 ● **Is the resistance less than 5 ohms between the multifunction switch and the electronic flasher, and greater than 10,000 ohms between the multifunction switch and ground?**	
K5 CHECK CIRCUIT 385 (WH/RD) FOR SHORT TO GROUND	**Yes** GO to K6 . **No** REPAIR the circuit. TEST the system for normal operation.
● Measure the resistance between the multifunction switch C202b pin 1, circuit 385 (WH/RD), harness side and ground.  A0043059 ● **Is the resistance greater than 10,000 ohms?**	
K6 CHECK THE MULTIFUNCTION SWITCH	**Yes** INSTALL a new electronic flasher. TEST the system for normal operation. **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.
● Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Is the multifunction switch OK?**	

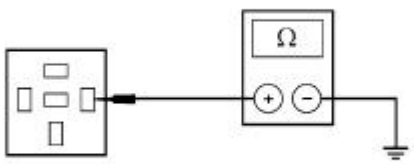


PINPOINT TEST L: ONE TURN SIGNAL/HAZARD LAMP IS INOPERATIVE

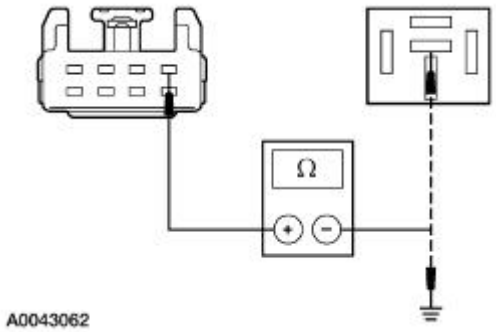
Test Step	Result / Action to Take
L1 CHECK THE STOPLAMPS FOR CORRECT OPERATION	
● Key in OFF position. ● Depress and release the brake pedal. ● **Doe the stoplamps operate correctly?**	**Yes** GO to L2 . **No** REFER to Stoplamps in this

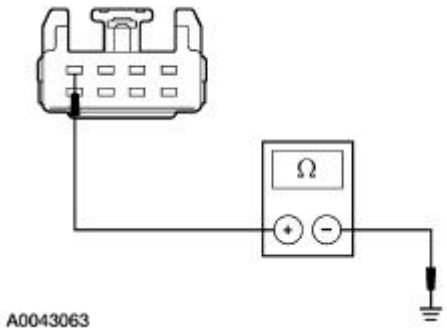
	section.
L2 CHECK THE VOLTAGE TO THE INOPERATIVE LAMP	
• Key in OFF position. • Disconnect: Inoperative Turn Signal/Hazard Flasher Lamp. • Place the hazard flasher lamp switch in the ON position. • Measure the voltage between the inoperative lamp connector pin 3, harness side and ground: **Inoperative Lamp / Circuit** LF C1023 — 3 (LG/WH) RF C1043 — 2 (WH/LB) LR C4035 — 9 (LG/OG) RR C4032 — 5 (OG/LB)  A0039258 • **Does the voltage alternate between less than 1 volt and greater than 10 volts?**	**Yes** REPAIR circuit 57 (BK). TEST the system for normal operation. **No** If rear lamp is inoperative, INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. If front lamp is inoperative, GO to L3 .
L3 CHECK THE MULTIFUNCTION SWITCH	
• Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the multifunction switch OK?**	**Yes** REPAIR circuit 3 (LG/WH) or 2 (WH/LB). TEST the system for normal operation. **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.





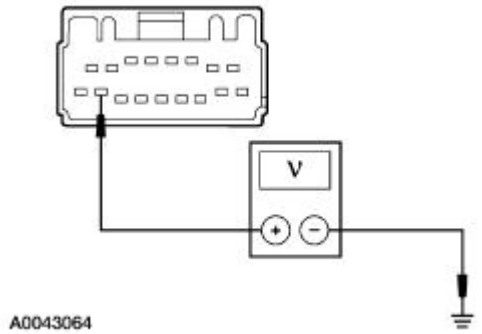
PINPOINT TEST M: THE HAZARD LAMPS ARE INOPERATIVE

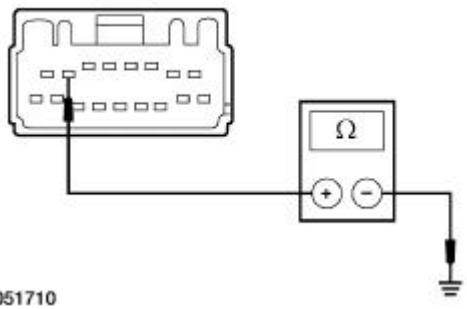




Test Step	Result / Action to Take
M1 CHECK THE VOLTAGE TO THE ELECTRONIC FLASHER	
• Disconnect: Electronic Flasher C2047. • Measure the voltage between the electronic flasher C2047 pin 85, circuit 383 (RD/WH), harness side and ground.	**Yes** GO to M3 . **No** GO to M2 .

GN1436-A





- **Is the voltage greater than 10 volts?**

M2 CHECK CIRCUIT 10 (LG/RD) AND 383 (RD/WH) FOR AN OPEN	
• Disconnect: Central Junction Box (CJB) C270f. • Measure the voltage between the CJB C270f pin 3, circuit 10 (LG/RD), component side and ground.  A0043061 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit 10 (LG/RD) or 383 (RD/WH) as necessary. TEST the system for normal operation. **No** INSTALL a new CJB. TEST the system for normal operation.
M3 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Measure the resistance between the electronic flasher C2047 pin 86, circuit 57 (BK), harness side and ground.  GN1433-A • **Is the resistance less than 5 ohms?**	**Yes** GO to M4 . **No** REPAIR the circuit. TEST the system for normal operation.
M4 CHECK CIRCUIT 385 (WH/RD) FOR OPEN OR SHORT TO GROUND	
• Disconnect: Multifunction Switch C202b. • Measure the resistance between the multifunction switch C202b pin 1, circuit 385 (WH/RD), harness side and the electronic flasher C2047 pin 87a, circuit 385 (WH/RD), harness side; and between the multifunction switch C202b pin 1, circuit 385 (WH/RD), harness side and ground.	**Yes** GO to M5 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0043062 ● **Is the resistance less than 5 ohms between the multifunction switch and the electronic flasher, and greater than 10,000 ohms between the multifunction switch and ground?**	
M5 CHECK CIRCUIT 44 (LB) FOR SHORT TO GROUND	
● Measure the resistance between the multifunction switch C202b pin 4, circuit 44 (LB), harness side and ground.  A0043063 ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to M6 . **No** REPAIR the circuit. TEST the system for normal operation.
M6 CHECK THE MULTIFUNCTION SWITCH	
● Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Is the multifunction switch OK?**	**Yes** INSTALL a new electronic flasher. TEST the system for normal operation. **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.

PINPOINT TEST N: THE TURN SIGNAL LAMPS ARE INOPERATIVE—SIGNAL MIRROR

Test Step	Result / Action to Take
N1 CHECK CIRCUIT 2 (WH/LB) OR CIRCUIT 3 (LG/WH) FOR AN OPEN	
● Key in OFF position. ● Disconnect: Inoperative Outside Rear View Mirror Connector. ● Place the hazard switch on. ● Measure the voltage between the LH outside rear view mirror	**Yes** GO to N2 . **No**

C516 pin 10, circuit 3 (LG/WH), harness side and ground; or between the RH outside rear view mirror C622 pin 10, circuit 2 (WH/LB), harness side and ground.  A0043064 • **Does the voltage vary between 0 and greater than 10 volts?**	REPAIR the circuit in question. TEST the system for normal operation.
N2 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Measure the resistance between the LH outside rear view mirror C516 pin 2, circuit 57 (BK), harness side and ground; or between the RH outside rear view mirror C622 pin 2, circuit 57 (BK), harness side and ground.  A0051710 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new outside rear view mirror. REFER to Section 501-09 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

Parking, Rear and License Lamps

Refer to Wiring Diagrams Cell 92 , Exterior Lamps for schematic and connector information.

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

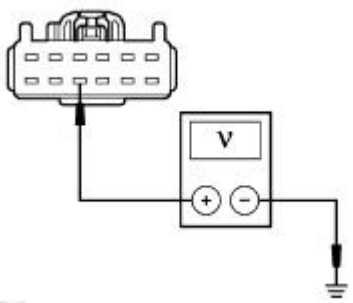
Visual Inspection Chart

Mechanical	Electrical
● Headlamp switch ● Vehicle security module	● Central junction box (CJB) fuse 6 (15A) ● Parking, rear or license lamp ● Circuitry ● CJB

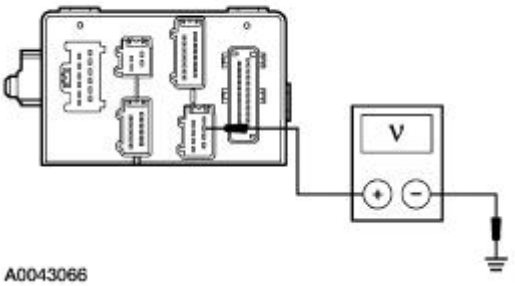
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom and refer to the Symptom Chart.

Symptom Chart

NOTE: Refer to Wiring Diagrams for the connector numbers stated in the pinpoint tests.



Symptom Chart



Condition	Possible Sources	Action
● The autolamps operate but parking, rear and license lamps are inoperative	● Central junction box (CJB) fuse 6 (15A). ● Circuitry. ● Vehicle security	● Go To Pinpoint Test G .

	module.	
• The exterior lamps are inoperative	• Central Junction Box (CJB) fuse 6 (15A). • Circuitry. • Headlamp switch. • CJB.	• Go To Pinpoint Test O .
• One or more parking, rear or license lamp is inoperative	• Parking, rear or license lamp. • Circuitry. • Central junction box (CJB).	• Go To Pinpoint Test P .
• The parking, rear or license lamps are on continuously	• Circuitry. • Headlamp switch. • Central junction box (CJB). • Vehicle security module.	• Go To Pinpoint Test O .

Pinpoint Tests

PINPOINT TEST O: THE PARKING, REAR OR LICENSE LAMPS ARE INOPERATIVE

Test Step	Result / Action to Take
O1 CHECK VOLTAGE TO THE HEADLAMP SWITCH	
• Key in OFF position. • Disconnect: Headlamp Switch C205a. • Measure the voltage between the headlamp switch C205a pin 10 , circuit 195 (TN/WH), harness side and ground.  A0037718 • **Is the voltage greater than 10 volts?**	**Yes** GO to O3 . **No** GO to O2 .
O2 CHECK CIRCUIT 195 (TN/WH) FOR AN OPEN	
• Disconnect: Central Junction Box (CJB) C270f. • Measure the voltage between the CJB C270f pin 4, circuit 195 (TN/WH), component side and ground.	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new CJB. TEST the system for normal operation.

- **Is the voltage greater than 10 volts?**

O3 CHECK THE HEADLAMP SWITCH	
• Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** REPAIR circuit 14 (BN). TEST the system for normal operation. **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation.

PINPOINT TEST P: ONE OR MORE PARKING, REAR OR LICENSE LAMP IS INOPERATIVE

Test Step	Result / Action to Take
P1 CHECK THE VOLTAGE TO THE INOPERATIVE LAMP (S)	
• Disconnect: Inoperative Lamp. • Measure the voltage between inoperative lamp connector, harness side and ground as follows: • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit 57 (BK). TEST the system for normal operation. **No** REPAIR circuit 14 (BN). TEST the system for normal operation.

Inoperative Lamp	Pin	Circuit
LF park/turn C1023	2	14 (BN)
RF park/turn C1043	2	14 (BN)
LF side marker C151	1	14 (BN)
RF side marker C161	1	14 (BN)
LR turn/stop/park C4035	2	14 (BN)
RR turn/stop/park C4032	2	14 (BN)
LH license C452	2	14 (BN)
RH license C462	1	14 (BN)

PINPOINT TEST Q: THE PARKING, REAR OR LICENSE LAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
Q1 CHECK THE HEADLAMP SWITCH ● Turn the headlamp switch off. ● Disconnect: Headlamp Switch C205a. ● **Do the parking, rear or license lamps continue to illuminate?**	**Yes** GO to Q2 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation.
Q2 CHECK THE VEHICLE SECURITY MODULE ● Disconnect: Vehicle Security Module C2113b. ● **Do the parking, rear or license lamps continue to illuminate?**	**Yes** GO to Q3 . **No** REFER to Autolamps in this section.
Q3 CHECK CIRCUIT 14 (BN) FOR AN OPEN ● Disconnect: Central Junction Box (CJB) C270a. ● **Do the parking, rear or license lamps continue to illuminate?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new CJB. TEST the system for normal operation.

Fog Lamps

Refer to Wiring Diagrams Cell 86 , Fog Lamps for schematic and connector information.

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Inspection and verification

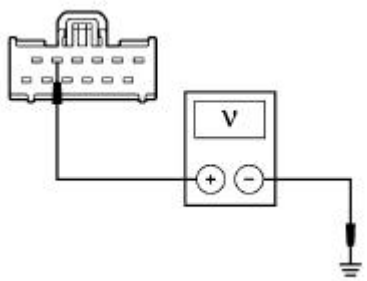
1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

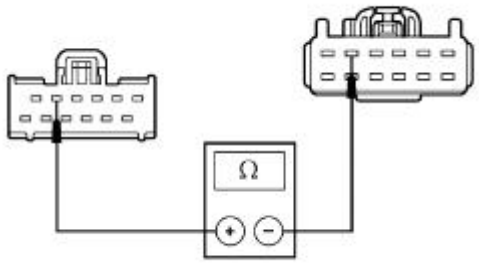
Mechanical	Electrical
● Headlamp switch	● Central junction box (CJB) fuse 17 (15A) ● Circuitry ● Fog lamp relay ● Daytime running lamp (DRL) relay ● Fog lamp

3. If an obvious cause for an observed or reported concern is found, correct the cause before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom and refer to the Symptom Chart.

Symptom Chart



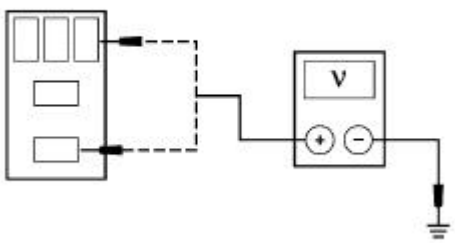
Symptom Chart



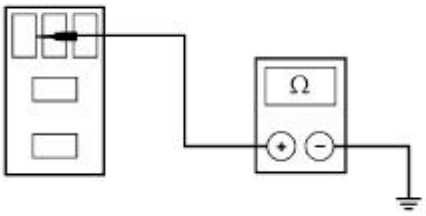
Condition	Possible Sources	Action
● The fog lamps are inoperative	● Central junction box (CJB) fuse 17 (15A). ● Circuitry. ● Headlamp switch. ● Fog lamp relay. ● CJB.	● Go To Pinpoint Test R .

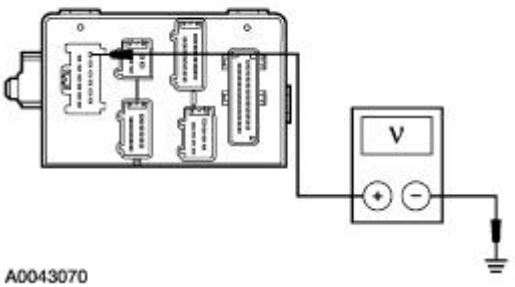
• The individual fog lamp is inoperative	• Circuitry.	• Go To Pinpoint Test S .
• The fog lamps are on continuously	• Circuitry. • Fog lamp relay. • Headlamp switch. • Central junction box (CJB).	• Go To Pinpoint Test T .

Pinpoint Tests



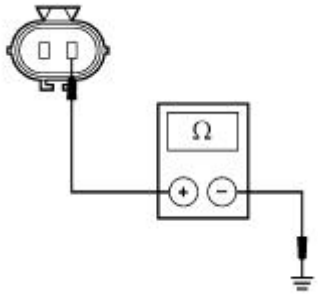
PINPOINT TEST R: THE FOG LAMPS ARE INOPERATIVE





Test Step	Result / Action to Take
R1 CHECK HIGH BEAM HEADLAMPS	
• Inspect the high beam headlamp operation. • **Do the high beams operate correctly?**	**Yes** GO to R2 . **No** REFER to Headlamps in this section.
R2 CHECK HEADLAMP SWITCH OUTPUT	
• Key in OFF position. • Disconnect: Central Junction Box (CJB) C270h. • **NOTE:** Headlamps must be in the low beam position. • Turn the headlamp switch to the headlamps ON position and engage the fog lamp switch. • Measure the voltage between the CJB C270h pin 5, circuit 188 (WH/BK), harness side and ground.  A0043067 • **Is the voltage greater than 10 volts?**	**Yes** TURN the headlamp switch off. GO to R5 . **No** TURN the headlamp switch off. GO to R3 .
R3 CHECK CIRCUIT 188 (WH/BK) FOR AN OPEN	
• Disconnect: Headlamp Switch C205a. • Measure the resistance between the CJB C270h pin 5, circuit 188 (WH/BK), harness side and the headlamp switch C205a pin 5, circuit 188 (WH/BK), harness side.	**Yes** GO to R4 . **No** REPAIR the circuit. TEST the system for normal operation.

A0043068



- **Is the resistance less than 5 ohms?**

R4 CHECK THE HEADLAMP SWITCH	
• Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** REPAIR circuit 14 (BN). TEST the system for normal operation. **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation.
R5 CHECK FOR POWER TO THE FOG LAMP RELAY	
• Connect: Central Junction Box (CJB) C270h. • Disconnect: Fog Lamp Relay C2241. • **NOTE:** Headlamps must be in the low beam position. • Turn the headlamp switch to the headlamps ON position and engage the fog lamp switch. • Measure the voltage between the fog lamp relay C2241 pin 1, harness side and ground; and between the fog lamp relay C2241 pin 3, harness side and ground.  A0043069 • **Are the voltages greater than 10 volts?**	**Yes** TURN the headlamp switch off. GO to R6 . **No** INSTALL a new CJB. TEST the system for normal operation.
R6 CHECK FOG LAMP RELAY GROUND CIRCUIT	
• Measure the resistance between the fog lamp relay C2241 pin 2, harness side and ground.	**Yes** GO to R7 . **No** INSTALL a new CJB. TEST the system for normal operation.

 GN1455-A ● **Is the resistance less than 5 ohms?**	
R7 CHECK THE FOG LAMP RELAY	
● Carry out the fog lamp relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Is the fog lamp relay OK?**	**Yes** GO to R8 . **No** INSTALL a new fog lamp relay. TEST the system for normal operation.
R8 CHECK CIRCUIT 478 (TN/OG) FOR AN OPEN	
● Connect: Fog Lamp Relay C2241. ● Disconnect: CJB C270a. ● **NOTE:** Headlamps must be in the low beam position. ● Turn the headlamp switch to the headlamps ON position and engage the fog lamp switch. ● Measure the voltage between the CJB C270a pin 12, component side and ground.  A0043070 ● **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new CJB. TEST the system for normal operation.

PINPOINT TEST S: THE INDIVIDUAL FOG LAMP IS INOPERATIVE

Test Step	Result / Action to Take
S1 CHECK FOG LAMP GROUND	
● Key in OFF position. ● Disconnect: Inoperative Fog Lamp. ● Measure the resistance between the fog lamp connector pin 2, circuit 57 (BK), harness side and ground.	**Yes** REPAIR circuit 478 (TN/OG). TEST the system for normal operation. **No** REPAIR circuit 57 (BK). TEST the system for normal operation.

 A0043071 ● **Is the resistance less than 5 ohms?**	

PINPOINT TEST T: THE FOG LAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
T1 CHECK THE HEADLAMP SWITCH	**Yes** GO to T2 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation.
● Key in OFF position. ● Disconnect: Headlamp Switch C205a. ● **Do the fog lamps continue to illuminate?**	
T2 CHECK CIRCUIT 188 (WH/BK) FOR SHORT TO POWER	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** If equipped with daytime running lamps (DRL), GO to T3 . If not equipped with DRL, GO to T4 .
● Disconnect: Central Junction Box (CJB) C270h. ● **Do the fog lamps continue to illuminate?**	
T3 CHECK THE DRL SYSTEM	**Yes** GO to T4 . **No** REFER to Section 417-04 .
● Disconnect: DRL Headlamp Relay C1359. ● **Do the fog lamps continue to illuminate?**	
T4 CHECK CIRCUIT 478 (TN/OG) FOR SHORT TO POWER	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to T5 .
● Disconnect: CJB C270a. ● **Do the fog lamps continue to illuminate?**	
T5 CHECK THE FOG LAMP RELAY	**Yes** INSTALL a new CJB. TEST the system for normal operation. **No**
● Carry out the fog lamp relay component test. Refer to Wiring Diagrams Cell 149	

for schematic and connector information. • **Is the fog lamp relay OK?**	INSTALL a new fog lamp relay. TEST the system for normal operation.

Reversing Lamps

Refer to Wiring Diagrams Cell 93 , Reversing Lamps for schematic and connector information.

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

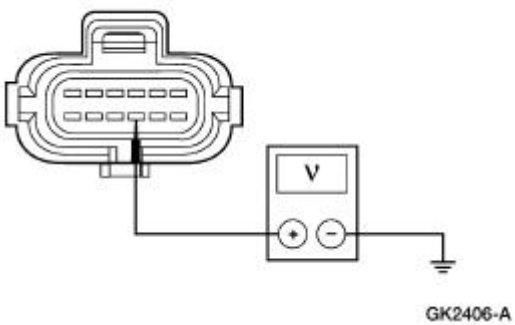
Visual Inspection Chart

Mechanical	Electrical
● Digital transmission range (TR) sensor	● Central junction box (CJB) fuse(s): ■ 14 (10A) ■ 10 (20A) ● Circuitry ● Reversing lamp relay ● Reversing lamp ● Digital transmission range (TR) sensor

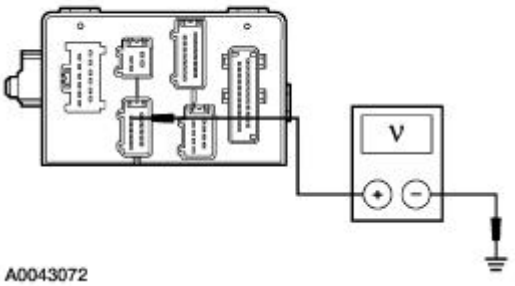
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom and refer to the Symptom Chart.

Symptom Chart

NOTE: Refer to Wiring Diagrams for the connector numbers stated in the pinpoint tests.



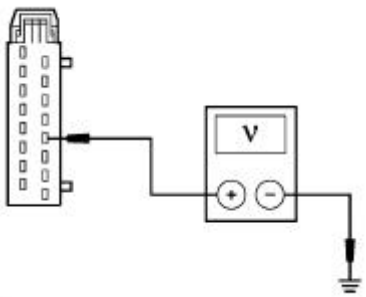
Symptom Chart

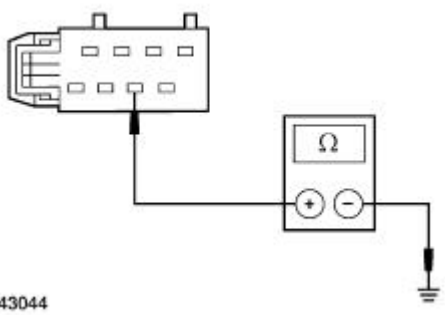


Condition	Possible Sources	Action
● The reversing lamps are	● Central junction box	● Go To Pinpoint

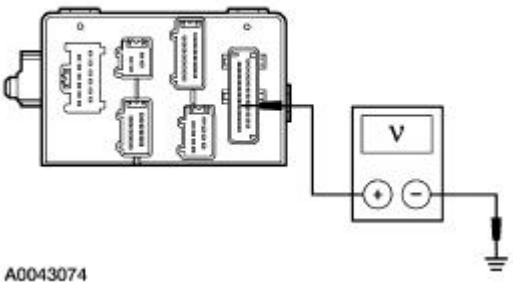
inoperative	(CJB) fuse(s): ■ 14 (10A). ■ 10 (20A). ● Reversing lamp relay ● Circuitry. ● Digital transmission range (TR) sensor. ● CJB.	Test U .
● The individual reversing lamp is inoperative	● Reversing lamp. ● Circuitry.	● Go To Pinpoint Test V .
● The reversing lamps are on continuously	● Reversing lamp relay ● Circuitry. ● Digital transmission range (TR) sensor. ● Central junction box (CJB).	● Go To Pinpoint Test W .

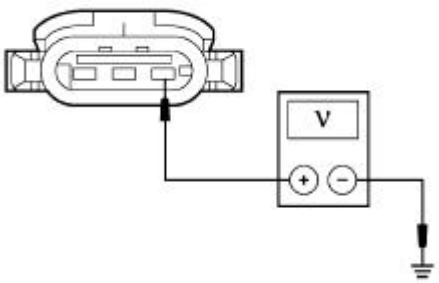
Pinpoint Tests





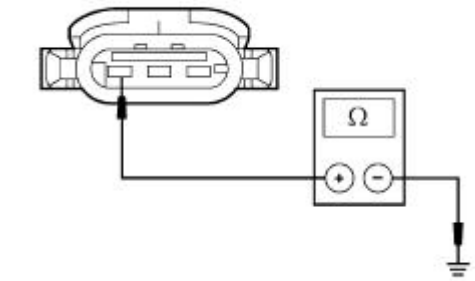
PINPOINT TEST U: THE REVERSING LAMPS ARE INOPERATIVE





Test Step	Result / Action to Take
U1 CHECK THE VOLTAGE TO THE DIGITAL TR SENSOR	
● Key in OFF position. ● Disconnect: Digital TR Sensor C167. ● Key in ON position. ● Measure the voltage between the digital TR sensor C167 pin 9, circuit 295 (LB/PK), harness side and ground.  GK2406-A ● **Is the voltage greater than 10 volts?**	**Yes** GO to U3 . **No** GO to U2 .
U2 CHECK CIRCUIT 295 (LB/PK) FOR AN OPEN	
● Key in OFF position. ● Disconnect: Central Junction Box (CJB) C270b. ● Key in ON position. ● Measure the voltage between the CJB C270b pin 1, circuit 295 (LB/PK), component side and ground.	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new CJB. TEST the system for normal operation.

A0043072



- **Is the voltage greater than 10 volts?**

U3 CHECK THE DIGITAL TR SENSOR	
• Carry out the digital TR sensor component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the digital TR sensor OK?**	**Yes** GO to U4 . **No** INSTALL a new digital TR sensor. TEST the system for normal operation.
U4 CHECK CIRCUIT 1789 (VT/WH) FOR AN OPEN	
• Key in OFF position. • Connect: Digital TR Sensor C167. • Disconnect: Central Junction Box (CJB) C270j. • Apply the parking brake. • Key in ON position. • Select REVERSE. • Measure the voltage between the CJB C270j pin 9, circuit 1789 (VT/WH), harness side and ground.  A0043073 • **Is the voltage greater than 10 volts?**	**Yes** GO to U5 . **No** REPAIR the circuit. TEST the system for normal operation.
U5 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Key in OFF position. • Disconnect: CJB C270f. • Measure the resistance between the CJB C270f pin 6, circuit 57 (BK), harness side and ground.  A0043044	**Yes** GO to U6 . **No** REPAIR the circuit. TEST the system for normal operation.

• **Is the resistance less than 5 ohms?**	
U6 CHECK THE CJB	
• Connect: CJB C270j. • Connect: CJB C270f. • Disconnect: CJB C270e. • Apply the parking brake. • Key in ON position. • Select REVERSE. • Measure the voltage between the CJB C270e pin 20, circuit 140 (BK/PK), component side and ground.  A0043074 • **Is the voltage greater than 10 volts?**	**Yes** GO to U7 . **No** INSTALL a new CJB. TEST the system for normal operation.
U7 CHECK CIRCUIT 140 (BK/PK) FOR AN OPEN	
• Key in OFF position. • Connect: CJB C270e. • Disconnect: RH Reversing Lamp C461. • Key in ON position. • Select REVERSE. • Measure the voltage between the RH reversing lamp C461 pin 3, circuit 140 (BK/PK), harness side and ground.  A0039258 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit 140 (BK/PK). TEST the system for normal operation. **No** REPAIR circuit 57 (BK). TEST the system for normal operation.

PINPOINT TEST V: THE INDIVIDUAL REVERSING LAMP IS INOPERATIVE

Test Step	Result / Action to Take
V1 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Key in OFF position. • Disconnect: Inoperative Reversing Lamp. • Measure the resistance between inoperative reversing lamp connector pin 1, circuit 57 (BK), harness side and ground.	**Yes** REPAIR circuit 140 (BK/PK). TEST the system for normal operation. **No**

 A0039259 ● **Is the resistance less than 5 ohms?**	REPAIR circuit 57 (BK). TEST the system for normal operation.

PINPOINT TEST W: THE REVERSING LAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
W1 CHECK THE DIGITAL TR SENSOR	
● Key in OFF position. ● Disconnect: Digital TR Sensor C167. ● **Do the reversing lamps continue to illuminate?**	**Yes** GO to W2 . **No** INSTALL a new digital TR sensor. REFER to Section 307-01A or Section 307-01B . TEST the system for normal operation.
W2 CHECK CIRCUIT 3078 (LB/OG) FOR SHORT TO POWER	
● Disconnect: Central Junction Box (CJB) C270j. ● **Do the reversing lamps continue to illuminate?**	**Yes** GO to W3 . **No** REPAIR the circuit. TEST the system for normal operation.
W3 CHECK CIRCUIT 140 (BK/PK) FOR SHORT TO POWER	
● Disconnect: CJB C270e. ● **Do the reversing lamps continue to illuminate?**	**Yes** REPAIR circuit 140 (BK/PK) or circuit 963 (BK/LG). TEST the system for normal operation. **No** INSTALL a new CJB. TEST the system for normal operation.

Trailer Lamps

Refer to Wiring Diagrams Cell 95 , Trailer/Camper Lamps for schematic and connector information.

Refer to Wiring Diagrams Cell 13 , Power Distribution for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

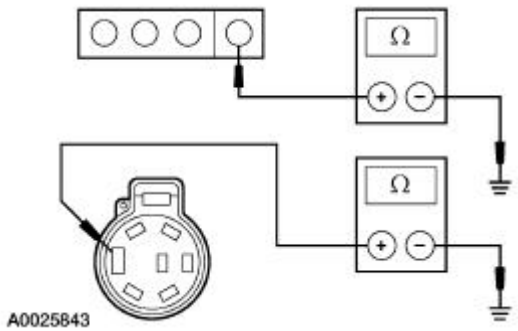
Electrical
● Central junction box (CJB) fuse(s): ■ 10 (20A) ■ 13 (10A) ■ 29 (30A) ■ 36 (10A) ■ 42 (10A) ■ 106 (30A) ● Circuitry ● Lamps ● Trailer tow battery charge relay ● Trailer tow park lamp relay ● Trailer tow electric brake controller ● CJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom and refer to the Symptom Chart.

Symptom Chart

NOTE: Refer to Wiring Diagrams for the connector numbers stated in the pinpoint tests.

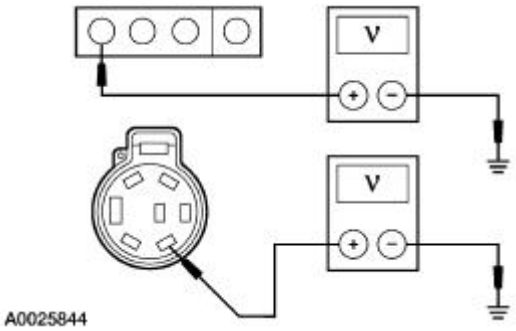
Symptom Chart

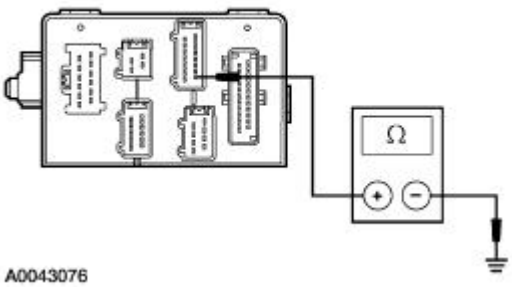


Condition	Possible Sources	Action

• The trailer lamps are inoperative	• Circuitry.	• Go To Pinpoint Test X .
• The individual trailer lamp is inoperative — RH trailer turn signal/stoplamp/hazard flasher lamp	• Central junction box (CJB) fuse 36 (10A). • Circuitry. • CJB.	• Go To Pinpoint Test Y .
• The individual trailer lamp is inoperative — LH trailer turn signal/stoplamp/hazard flasher lamp	• Central junction box (CJB) fuse 42 (10A). • Circuitry. • CJB.	• Go To Pinpoint Test Z .
• The trailer lamps are inoperative — trailer parking lamps	• Central junction box (CJB) fuse 10 (20A). • Trailer tow parking lamp relay. • Circuitry. • CJB.	• Go To Pinpoint Test AA .
• The trailer lamps are inoperative — trailer reversing lamps	• Circuitry.	• Go To Pinpoint Test AB .
• The trailer lamps are on continuously	• Trailer tow parking lamp relay. • Circuitry. • Central junction box (CJB).	• Go To Pinpoint Test AC .
• The trailer battery charging is inoperative	• Central junction box (CJB) fuse 106 (30A). • Circuitry. • CJB.	• Go To Pinpoint Test AD .
• The trailer electric brakes are inoperative	• Central junction box (CJB) fuse 29 (30A). • Circuitry. • Trailer tow electric brake controller. • CJB.	• Go To Pinpoint Test AE .

Pinpoint Tests

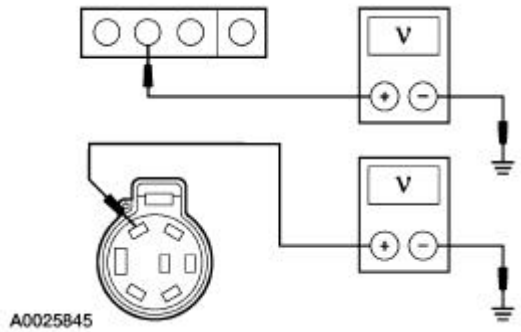


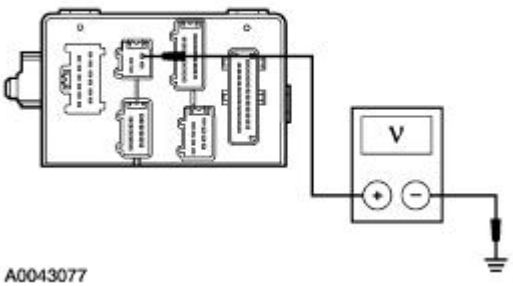


PINPOINT TEST X: THE TRAILER LAMPS ARE INOPERATIVE

Test Step	Result / Action to Take
X1 CHECK LIGHTING OPERATION	**Yes** GO to X2 .
• Key in OFF position. • Disconnect: Trailer Tow C4098 (4-pin). • Disconnect: Trailer Tow C4099 (7-pin) .	

• Disconnect the trailer from the vehicle. • Check the operation of the vehicle exterior lighting systems for any concerns. • **Does the exterior lighting system of the vehicle operate correctly?**	**No** REPAIR any vehicle exterior lighting concerns. TEST the system for normal operation.
X2 CHECK CIRCUIT 206 (WH) FOR AN OPEN	
• Measure the resistance between the trailer tow C4098 pin 1, circuit 206 (WH) (4–pin connector), or the trailer tow C4099 pin 2, circuit 206 (WH) (7–pin connector), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** Vehicle is operating correctly. HAVE the trailer repaired by an authorized camper/trailer repair center. **No** REPAIR the circuit. TEST the system for normal operation.

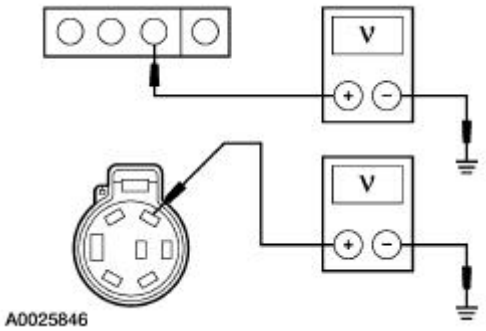


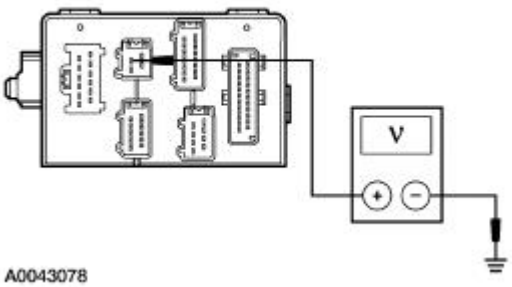


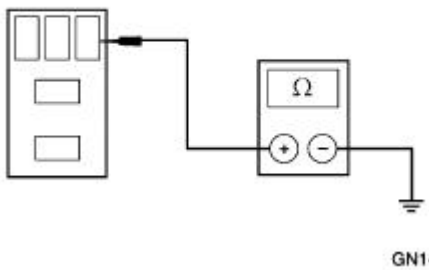
PINPOINT TEST Y: THE INDIVIDUAL TRAILER LAMP IS INOPERATIVE — RH TRAILER TURN SIGNAL/STOPLAMP/HAZARD FLASHER LAMP

Test Step	Result / Action to Take
Y1 CHECK TURN SIGNAL OPERATION	
• Key in OFF position. • Disconnect: Trailer Tow C4098 (4-pin). • Disconnect: Trailer Tow C4099 (7-pin) . • Disconnect the trailer from the vehicle. • Check the operation of the vehicle exterior lighting systems for any concerns. • **Does the exterior lighting system of the vehicle operate correctly?**	**Yes** GO to Y2 . **No** REPAIR any vehicle exterior lighting concerns. TEST the system for normal operation.
Y2 CHECK CIRCUIT 64 (DG) FOR POWER	
• Key in ON position. • Place the multifunction switch in the RH turn position. • Measure the voltage between the trailer tow C4098 pin 4, circuit 64 (DG) (4-pin connector), or the trailer tow C4099 pin 4, circuit 64 (DG) (7– pin connector), harness side and ground.	**Yes** Vehicle is operating correctly. HAVE the trailer repaired by an authorized camper/trailer repair center. **No** GO to Y3 .

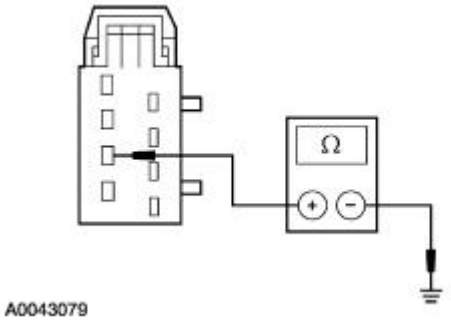
 A0025844 ● **Does the voltage alternate between less than 1 volt and greater than 10 volts?**	
Y3 CHECK CIRCUIT 64 (DG) FOR AN OPEN	
● Key in OFF position. ● Disconnect: Central Junction Box (CJB) C270j. ● Key in ON position. ● Measure the resistance between the CJB C270j pin 16, circuit 64 (DG), component side and ground.  A0043076 ● **Does the voltage alternate between less than 1 volt and greater than 10 volts?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new CJB. TEST the system for normal operation.

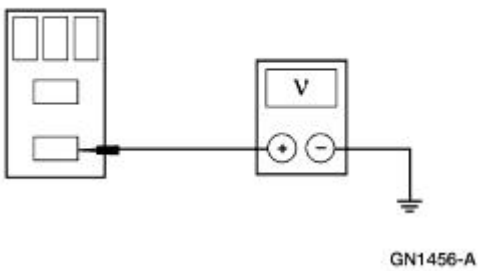


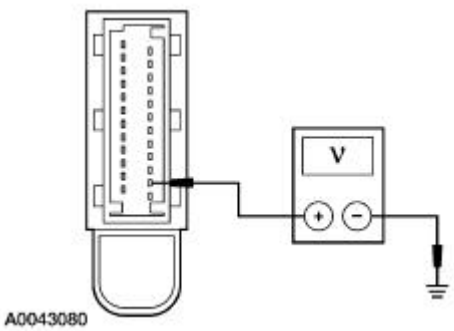




PINPOINT TEST Z: THE INDIVIDUAL TRAILER LAMP IS INOPERATIVE — LH TRAILER TURN SIGNAL/STOPLAMP/HAZARD FLASHER LAMP



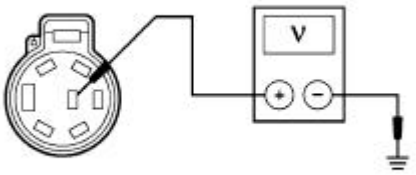




Test Step	Result / Action to Take
Z1 CHECK TURN SIGNAL OPERATION	
● Key in OFF position. ● Disconnect: Trailer Tow C4098 (4-pin). ● Disconnect: Trailer Tow C4099 (7-pin) . ● Disconnect the trailer from the vehicle. ● Check the operation of the vehicle exterior lighting systems for any concerns. ● **Does the exterior lighting system of the vehicle operate correctly?**	**Yes** GO to Z2 . **No** REPAIR any vehicle exterior lighting concerns. TEST the system for normal operation.
Z2 CHECK CIRCUIT 52 (YE) FOR POWER	
● Key in ON position. ● Place the multifunction switch in the LH turn position. ● Measure the voltage between the trailer tow C4098 pin 3, circuit 52 (YE) (4-pin connector), or the trailer tow C4099 pin 1, circuit 52 (YE) (7-pin connector), harness side and ground.	**Yes** Vehicle is operating correctly. HAVE the trailer repaired by an authorized camper/trailer repair center.

 ● **Does the voltage alternate between less than 1 volt and greater than 10 volts?**	**No** GO to Z3 .
Z3 CHECK CIRCUIT 52 (YE) FOR AN OPEN ● Key in OFF position. ● Disconnect: Central Junction Box (CJB) C270k. ● Key in ON position. ● Measure the voltage between the CJB C270k pin 2, circuit 52 (YE), component side and ground.  ● **Does the voltage alternate between less than 1 volt and greater than 10 volts?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new CJB. TEST the system for normal operation.

PINPOINT TEST AA: THE TRAILER LAMPS ARE INOPERATIVE — TRAILER PARKING LAMPS

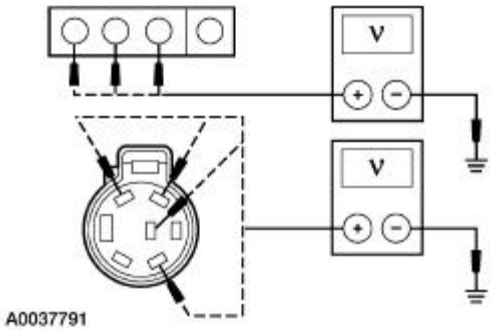


Test Step	Result / Action to Take
AA1 CHECK LIGHTING OPERATION ● Key in OFF position. ● Disconnect: Trailer Tow C4098 (4-pin). ● Disconnect: Trailer Tow C4099 (7-pin) . ● Disconnect the trailer from the vehicle. ● Check the operation of the vehicle exterior lighting systems for any concerns. ● **Does the exterior lighting system of the vehicle operate correctly?**	**Yes** GO to AA2 . **No** REPAIR any vehicle exterior lighting concerns. TEST the system for normal operation.
AA2 CHECK CIRCUIT 962 (BN/WH) FOR POWER ● Turn the headlamp switch to the parking lamps ON position. ● Measure the voltage between the trailer tow C4098 pin 2, circuit 962 (BN/WH) (4-pin connector) or the trailer tow C4099 pin 6, circuit 962 (BN/WH) (7-pin connector), harness side and ground.	**Yes** Vehicle is operating correctly. HAVE the trailer repaired by an authorized camper/trailer repair center.

 A0025846 ● **Is the voltage greater than 10 volts?**	**No** GO to AA3 .
AA3 CHECK CIRCUIT 962 (BN/WH) FOR AN OPEN	
● Turn the headlamp switch off. ● Disconnect: Central Junction Box (CJB) C270k. ● Turn the headlamp switch to the parking lamps ON position. ● Measure the voltage between the CJB C270k pin 1, circuit 962 (BN/WH), component side and ground.  A0043078 ● **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to AA4 .
AA4 CHECK THE TRAILER TOW PARKING LAMP RELAY	
● Turn the headlamp switch off. ● Carry out the trailer tow parking lamp relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Is the trailer tow parking lamp relay OK?**	**Yes** GO to AA5 . **No** INSTALL a new trailer tow parking lamp relay. TEST the system for normal operation.
AA5 CHECK THE TRAILER TOW PARKING LAMP RELAY GROUND	
● Disconnect: Trailer Tow Parking Lamp Relay C2240. ● Measure the resistance between the trailer tow parking lamp relay C2240 pin 1, component side and ground.  GN1453-A ● **Is the resistance less than 5 ohms?**	**Yes** GO to AA7 . **No** GO to AA6 .
AA6 CHECK CIRCUIT 57 (BK) FOR AN OPEN	

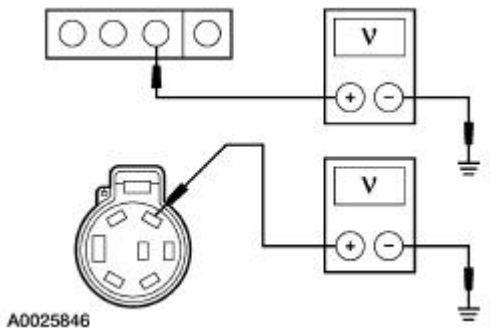
• Disconnect: CJB C270f. • Measure the resistance between the CJB C270f pin 6, harness side and ground.  A0043079 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new CJB. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
AA7 CHECK THE TRAILER TOW PARKING LAMP RELAY POWER SUPPLY	
• Measure the voltage between the trailer tow parking lamp relay C2240 pin 3, harness side and ground.  GN1456-A • **Is the voltage greater than 10 volts?**	**Yes** GO to AA8 . **No** INSTALL a new CJB. TEST the system for normal operation.
AA8 CHECK CIRCUIT 14 (BN) FOR AN OPEN	
• Disconnect: CJB C270e. • Turn the headlamp switch to the parking lamps ON position. • Measure the voltage between the CJB C270e pin 2, circuit 14 (BN), harness side and ground.  A0043080 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new CJB. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

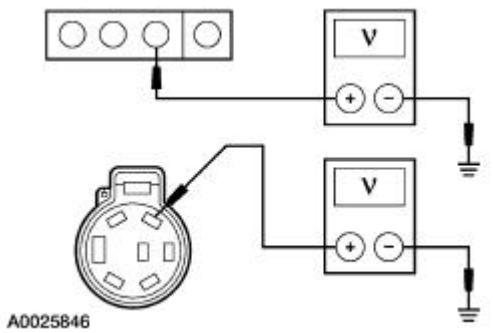
PINPOINT TEST AB: THE TRAILER LAMPS ARE INOPERATIVE — TRAILER REVERSING LAMPS



Test Step	Result / Action to Take
AB1 CHECK LIGHTING OPERATION	

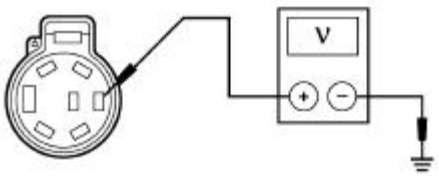
• Key in OFF position. • Disconnect: Trailer Tow C4098 (4-pin). • Disconnect: Trailer Tow C4099 (7-pin) . • Disconnect the trailer from the vehicle. • Check the operation of the vehicle exterior lighting systems for any concerns. • **Does the exterior lighting system of the vehicle operate correctly?**	**Yes** GO to AB2 . **No** REPAIR any vehicle exterior lighting concerns. TEST the system for normal operation.
AB2 CHECK CIRCUIT 963 (BK/LG) FOR AN OPEN	
• Apply the parking brake. • Key in ON position. • Select REVERSE. • Measure the voltage between the trailer tow C4099 pin 7, circuit 963 (BK/LG), and ground.  A0025848 • **Is the voltage greater than 10 volts?**	**Yes** Vehicle is operating correctly. HAVE the trailer repaired by an authorized camper/trailer repair center. **No** REPAIR the circuit. TEST the system for normal operation.

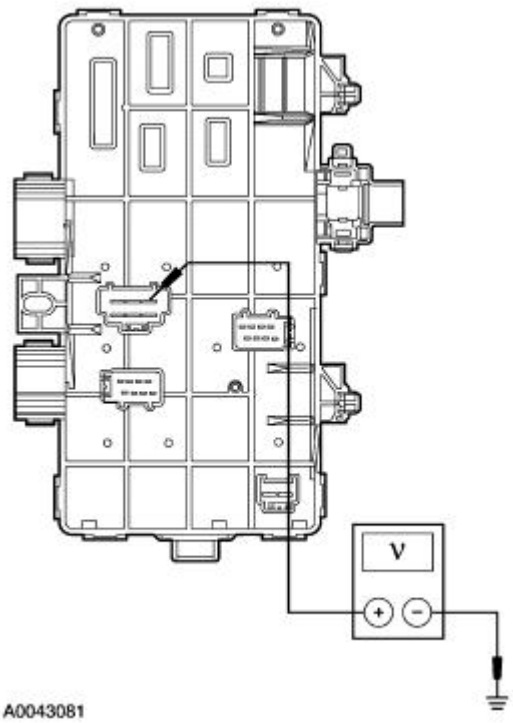




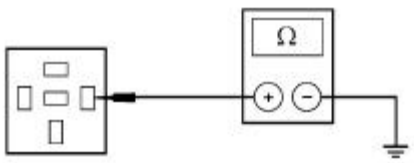
PINPOINT TEST AC: THE TRAILER LAMPS ARE ON CONTINUOUSLY

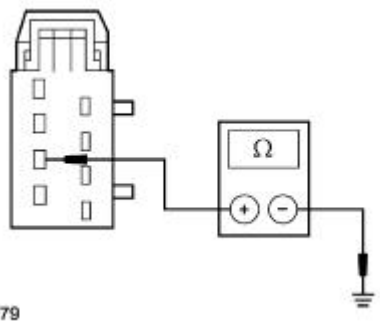
Test Step	Result / Action to Take
AC1 CHECK LIGHTING OPERATION	
• Key in OFF position. • Disconnect: Trailer Tow C4098 (4-pin). • Disconnect: Trailer Tow C4099 (7-pin) . • Disconnect the trailer from the vehicle. • Check the operation of the vehicle exterior lighting systems for any concerns. • **Does the exterior lighting system of the vehicle operate correctly?**	**Yes** GO to AC2 . **No** REPAIR any vehicle exterior lighting concerns. TEST the system for normal operation.
AC2 CHECK FOR VOLTAGE AT THE TRAILER TOW CONNECTOR	
• Disconnect the trailer from the vehicle. • Turn the headlamp switch off. • Measure the voltage between the trailer tow C4098 (4-pin connector) or trailer tow C4099 (7-pin connector) and ground as follows: **C4098 Pin** / **C4099 Pin** / **Circuit** 3 / 1 / 52 (YE) 4 / 4 / 64 (DG) 2 / 6 / 962 (BN/WH)	**Yes** GO to AC3 . **No** Vehicle is operating correctly. HAVE the trailer repaired by an authorized camper/trailer repair center.





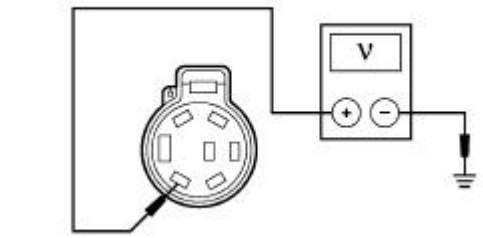
—	7	963 (BK/LG)

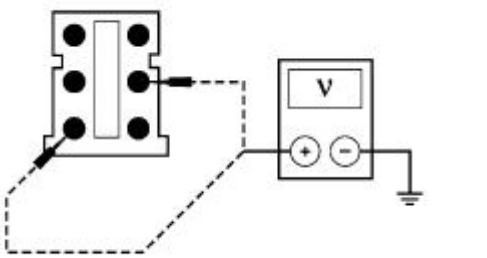


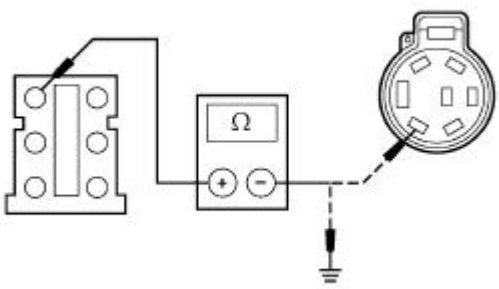


- **Are the voltages greater than 10 volts?**

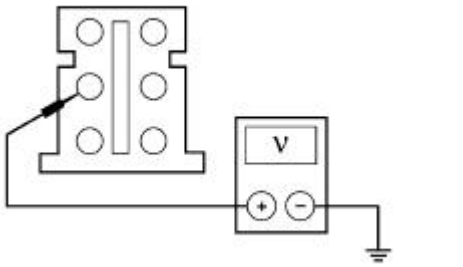
AC3 CHECK THE TRAILER TOW PARKING LAMP RELAY	
• Disconnect: Trailer Tow Parking Lamp Relay C2240. • Measure the voltage between the trailer tow C4098 pin 2, circuit 962 (BN/WH) (4-pin connector) or the trailer tow C4099 pin 6, circuit 962 (BN/WH) (7-pin connector), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to AC4 . **No** INSTALL a new trailer tow parking lamp relay. TEST the system for normal operation.
AC4 CHECK CIRCUIT 962 (BN/WH) FOR SHORT TO POWER	
• Disconnect: Central Junction Box (CJB) C270k. • Measure the voltage between the trailer tow C4098 pin 2, circuit 962 (BN/WH) (4-pin connector) or the trailer tow C4099 pin 6, circuit 962 (BN/WH) (7-pin connector), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new CJB. TEST the system for normal operation.

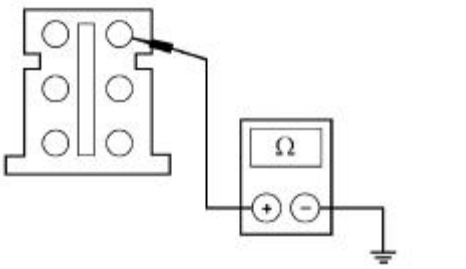






PINPOINT TEST AD: THE TRAILER BATTERY CHARGING IS INOPERATIVE





Test Step	Result / Action to Take
AD1 CHECK VOLTAGE FOR THE BATTERY CHARGE AT THE TRAILER TOW CONNECTOR	
• Key in OFF position. • Disconnect: Trailer Tow C4099 (7-pin) . • Disconnect the trailer from the vehicle. • Key in ON position. • Measure the voltage between the trailer tow C4099 pin 5, circuit 49 (OG) and ground.  A0025428 • **Is the voltage greater than 10 volts?**	**Yes** Vehicle is operating correctly. HAVE the trailer repaired by an authorized camper/trailer repair center. **No** GO to AD2 .
AD2 CHECK CIRCUIT 49 (OG) FOR AN OPEN	
• Key in OFF position. • Disconnect: Central Junction Box (CJB) C270n. • Key in ON position. • Measure the voltage between the CJB C270n pin 4, circuit 49 (OG), component side and ground.  A0043081 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to AD3 .
AD3 CHECK THE TRAILER TOW BATTERY CHARGE RELAY	
• Turn the headlamp switch off. • Disconnect: Trailer Tow Battery Charge Relay C2110. • Carry out the trailer tow battery charge relay component test.	**Yes** GO to AD4 . **No**

Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Is the trailer tow battery charge relay OK?**	INSTALL a new trailer tow battery charge relay. TEST the system for normal operation.
AD4 CHECK THE TRAILER TOW BATTERY CHARGE RELAY GROUND	
● Key in OFF position. ● Disconnect: CJB C270f. ● Measure the resistance between the trailer tow battery charge relay C2110 pin 86, harness side and ground.  GN1433-A ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new CJB. TEST the system for normal operation. **No** GO to AD5 .
AD5 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
● Measure the resistance between the CJB C270f pin 6, harness side and ground.  A0043079 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new CJB. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST AE: THE TRAILER ELECTRIC BRAKES ARE INOPERATIVE

Test Step	Result / Action to Take
AE1 CHECK LIGHTING OPERATION	
● Key in OFF position. ● Disconnect: Trailer Tow C4098 (4-pin). ● Disconnect: Trailer Tow C4099 (7-pin) . ● Disconnect the trailer from the vehicle. ● Check the operation of the vehicle exterior lighting systems for any concerns. ● **Does the exterior lighting system of the vehicle operate correctly?**	**Yes** GO to AE2 . **No** REPAIR any vehicle exterior lighting concerns. TEST the system for normal operation.
AE2 CHECK VOLTAGE FROM THE ELECTRIC BRAKE	

CONTROLLER AT THE TRAILER TOW CONNECTOR	
• Apply the brake. • Measure the voltage between the trailer tow C4099 pin 3, circuit 43 (DB), harness side and ground.  A0025430 • **Is the voltage greater than 10 volts?**	**Yes** The vehicle is operating correctly. HAVE the trailer repaired by an authorized camper/trailer repair center. **No** GO to AE3 .
AE3 CHECK THE VOLTAGE TO THE TRAILER TOW ELECTRIC BRAKE CONTROLLER	
• Disconnect: Trailer Tow Electric Brake Controller C2142. • Turn the headlamp switch to the parking lamps ON position. • Measure the voltage between the trailer tow electric brake controller C2142 pin 1, circuit 50 (RD), harness side and ground; and between the trailer tow electric brake controller C2142 pin 5, circuit 14 (BN), harness side and ground.  GK7573-A • **Are the voltages greater than 10 volts?**	**Yes** GO to AE4 . **No** REPAIR circuit 50 (RD) or circuit 14 (BN) as necessary. TEST the system for normal operation.
AE4 CHECK CIRCUIT 43 (DB) FOR AN OPEN	
• Measure the resistance between the trailer tow electric brake controller C2142 pin 3, circuit 43 (DB), harness side and the trailer tow C4099 pin 3, circuit 43 (DB), harness side; and between the trailer tow electric brake controller C2142 pin 3, circuit 43 (DB), harness side and ground.  A0025431 • **Is the resistance less than 5 ohms between the connectors and greater than 10,000 ohms between the trailer tow electric brake controller connector and ground?**	**Yes** GO to AE5 . **No** REPAIR the circuit. TEST the system for normal operation.
AE5 CHECK CIRCUIT 511 (LG) FOR AN OPEN	

• Apply the brake. • Measure the voltage between the trailer tow electric brake controller C2142 pin 2, circuit 511 (LG), harness side and ground.  GK2178-A • **Is the voltage greater than 10 volts?**	**Yes** GO to AE6 . **No** REPAIR the circuit. TEST the system for normal operation.
AE6 CHECK CIRCUIT 206 (WH) FOR AN OPEN	
• Measure the resistance between the trailer tow electric brake controller C2142 pin 6, circuit 206 (WH), harness side and ground.  GK2179-A • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new trailer tow electric brake controller. TEST the system for normal operation. **No** REPAIR circuit 206 (WH) or circuit 57 (BK) as necessary. TEST the system for normal operation.

Headlamp Adjustment

Headlamp Aiming

1. The headlamp aiming procedure depends on the type of beam pattern the headlamp is equipped with. Vehicles may come equipped with visual optical right (VOR), visual optical left (VOL), or SAE only (includes sealed beam type) headlamps. To identify the headlamp beam pattern, look on the headlamp lens. Molded in small letters on the headlamp lens is one of the following:
    - SAE
    - VOR or SAE
    - VOL or SAE
2. Once the headlamp beam pattern is identified, aim the headlamps using one of the following methods as applicable.
    - Photometric aimers can aim SAE, VOR and VOL type headlamps. This is the preferred method of headlamp aiming.
    - Visual or screen method aiming can be used to aim SAE, VOR and VOL type headlamps.
    - Mechanical aimers can be used only with SAE type headlamps. Lamps that can be aimed mechanically will have three nibs molded into the lens of the lamp.

Photometric Aiming

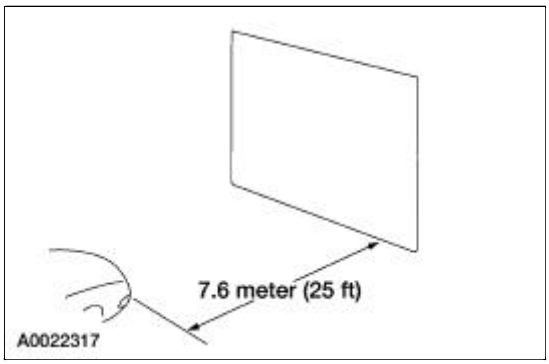
1. For the photometric aiming procedure, refer to the appropriate photometric headlamp aimer instruction manual.

Screen Method Aiming

All headlamp types

NOTE: Horizontal aim is not necessary for VOR or VOL headlamps.

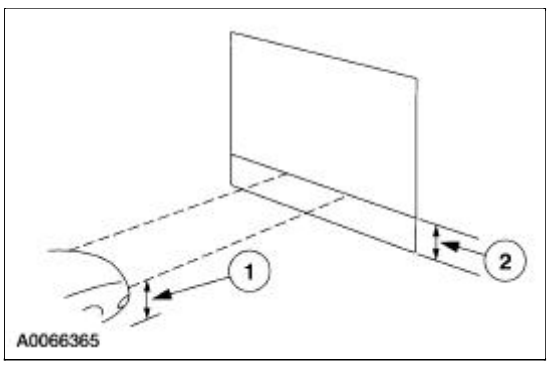
NOTE: Consult your state vehicle inspection manual for recommended tolerance ranges for visual aiming.



NOTE: The sight shield may need to be positioned or removed for access to the adjusters.

1. Before starting headlamp adjustment:
    - Check the tire inflation.
    - Check that no other load is in the vehicle other than a half tank of fuel.
    - Check that the headlamps are clean.
    - Check for correct headlamp operation.

- Check that the vehicle is on level ground.
- If the vehicle is equipped with air suspension, make sure that the switch is on.



2. **NOTE:** The vertical wall or screen must be a minimum of 2.4 meters (8 feet) wide.

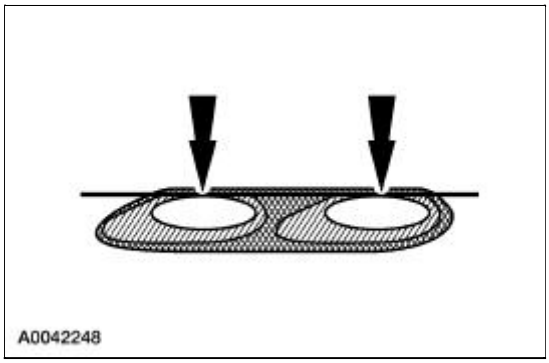
   Park the vehicle on a level surface approximately 7.6 meters (25 feet) from the vertical wall or screen directly in front of it.

3. **NOTE:** The center of the lamp is marked by a 3 mm (0.12 in) circle on the headlamp lens.

   Mark a horizontal reference line on the vertical wall or screen.
   1. Measure the center of the headlamp height to ground and record.
   2. Make a 2.4 meter (8 foot) horizontal mark (masking tape) on the vertical wall or screen at the same distance from the ground as previously recorded.

4. **NOTE:** This procedure should be done in a dark environment to effectively see the headlamp beam pattern.

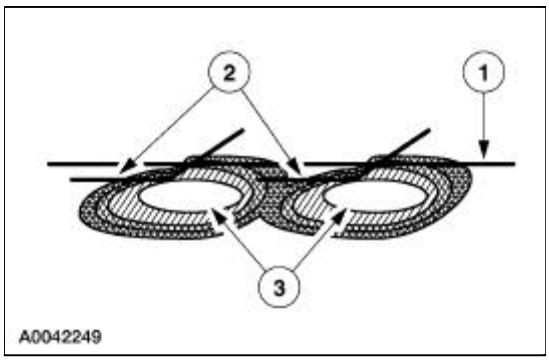
   Turn on the low beam headlamps to illuminate the wall or screen and open the hood.



5. **NOTE:** For SAE type headlamps, the appearance of the beam pattern may vary between vehicles.

   On the wall or screen, locate the high intensity area of the beam pattern. Place the top edge of the high intensity zone even with the horizontal reference line.

VOR type headlamps



6. **NOTE:** The appearance of the VOR beam pattern may vary between vehicles.

   Identify at the top edge of this high intensity area a distinct horizontal cutoff in the beam pattern. If the top edge of this cutoff is not even with the horizontal reference line, the headlamp beam will need to be adjusted.

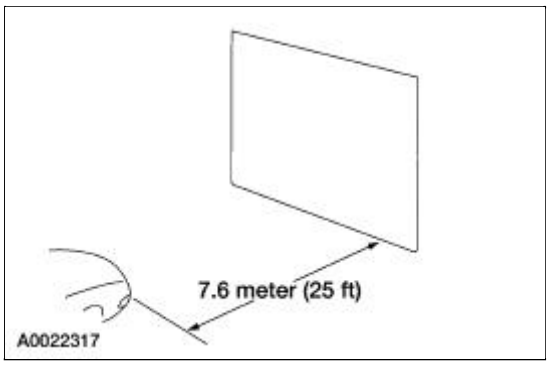
VOL type headlamps

7. For VOL type headlamps, there will be a distinct cutoff in the left portion of the beam pattern. The edge of this cutoff should be positioned 50.2 mm (2 in) below the horizontal reference line.
    1. Horizontal reference line.
    2. Top edge of the beam pattern.
    3. High intensity zone.

Mechanical Aiming

1. For the mechanical aiming procedure, refer to the appropriate mechanical headlamp aimer instruction manual.

Front Fog Lamp Adjustment



1. **NOTE:** Horizontal aim is not required for this vehicle and is not adjustable. Consult your state vehicle inspection center for recommended tolerance ranges for visual aiming.

   Before starting the fog lamp assembly adjustment:

   - check the tire inflation.
   - make sure there are no other loads in the vehicle other than a half tank of fuel.
   - make sure the vehicle is on level ground.
   - make sure the fog lamps and headlamps are clean.
   - make sure the headlamps are operating and are correctly aimed.

2. **NOTE:** The vertical wall screen must be a minimum of 2.4 meters (8 ft) wide.

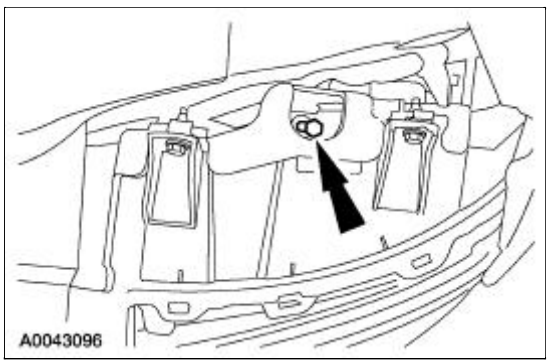
   Park the vehicle on a level surface approximately 7.6 meters (25 ft) from the vertical wall or screen directly in front of it.

3. The correct visual aim for the fog lamps is with the top edge of the high-intensity zone 10 cm (4 in) below the horizontal center of the fog lamps.

Headlamp Bulb

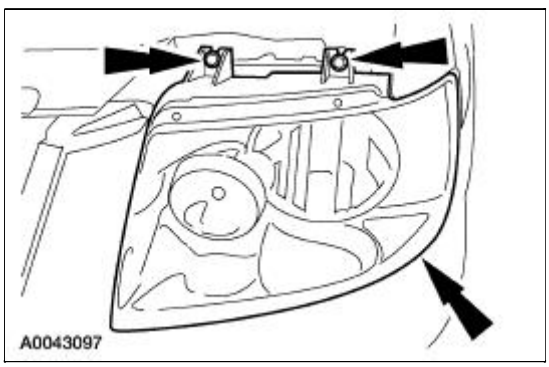
Removal and Installation

All vehicles



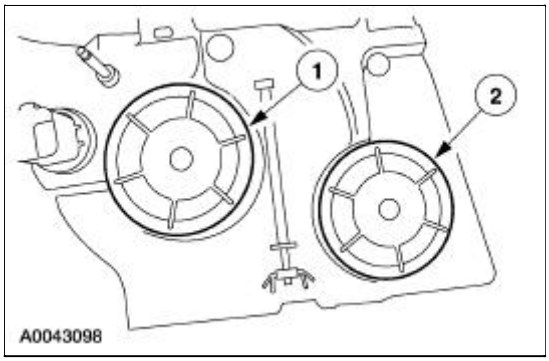
WARNING: The halogen bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

NOTE: The headlamp bulb should not be removed from the headlamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp where they can settle on the lens and reflector. Never turn on the headlamp with the bulb removed from the headlamp.



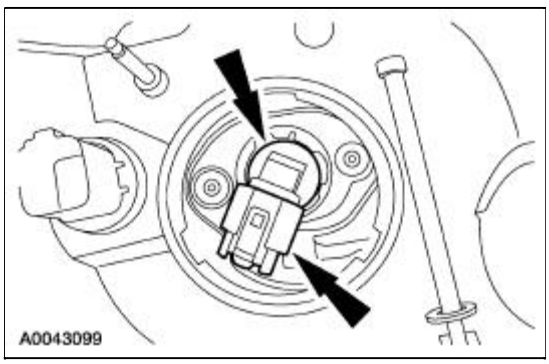
1. Make sure that the headlamp switch and the ignition switch are in the OFF position.

Expedition



2. Loosen the headlamp retaining bolt.

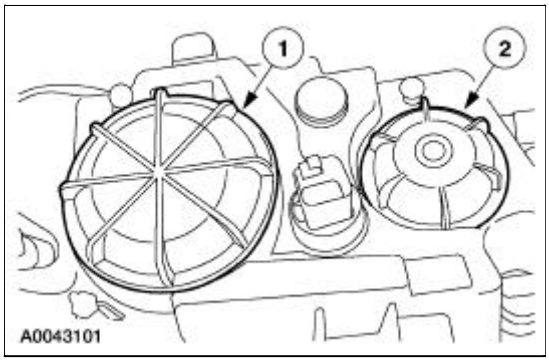
3. Remove the bolts and the headlamp assembly.
   - Disconnect the electrical connectors.



4. Remove the headlamp bulb protective cover(s).
   1. Remove the low beam cover.
   2. Remove the high beam cover.

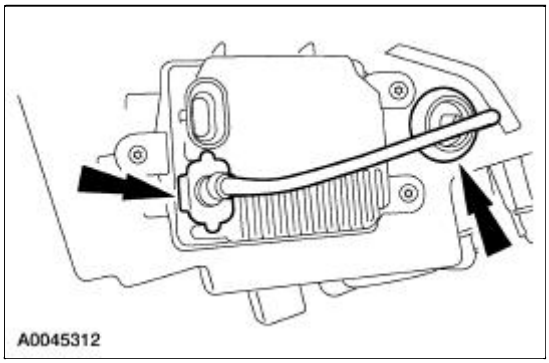
5. **CAUTION: Bulbs 9004 and 9007 look similar, but are not interchangeable.**

   Disconnect the electrical connector and remove the headlamp bulb.

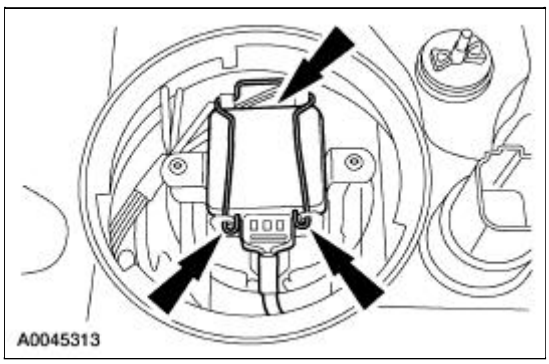


Navigator high intensity discharge (HID) headlamp

6. Remove the front radiator air deflector.

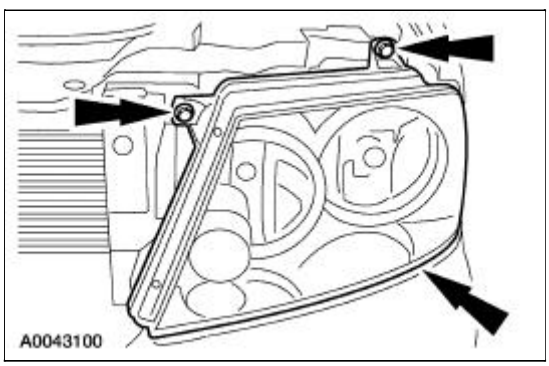


7. Remove the three bolts and the headlamp assembly.
   - Disconnect the electrical connectors.

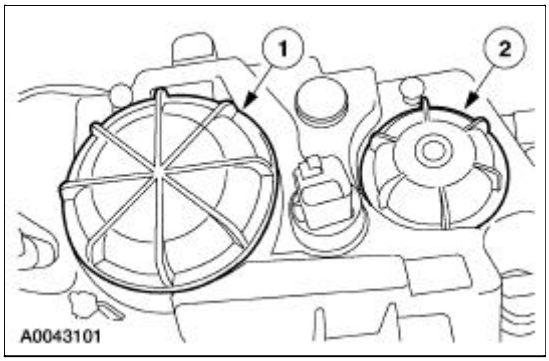


8. Remove the headlamp bulb protective cover(s).
   1. Remove the HID lamp cover.
   2. Remove the high beam cover.

9. Disconnect the electrical connector and push the grommet into the headlamp assembly.



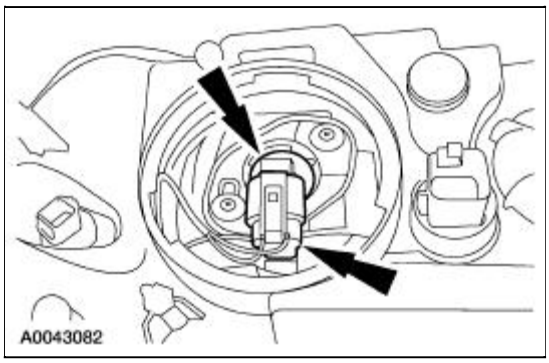
10. Release the spring tabs and remove the HID low beam bulb.



Navigator standard headlamp

11. Remove the front radiator air deflector.

12. Remove the three bolts and the headlamp assembly.
    - Disconnect the electrical connectors.

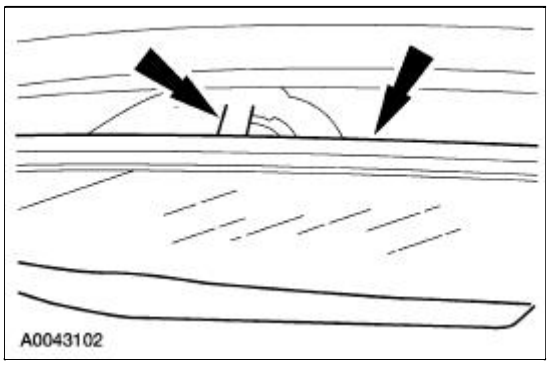


13. Remove the headlamp bulb protective cover.
    1. Low beam cover.
    2. High beam cover.

14. **CAUTION: Bulbs 9004 and 9007 look similar, but are not interchangeable.**

    Disconnect the electrical connector and remove the headlamp bulb.

All vehicles

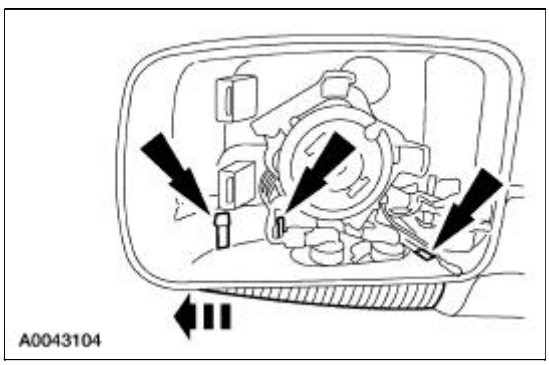


15. To install, reverse the removal procedure.

Side Turn Signal Lamp —Signal Mirror

Removal and Installation

NOTE: Navigator shown, Expedition similar.



1. Release the two tabs and remove the mirror glass.

2. **CAUTION: Take care not to break the tabs.**

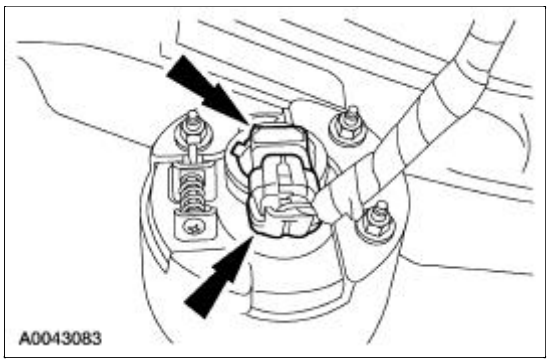
   Slide the lamp assembly away from the vehicle, release the tabs and remove the signal mirror lamp assembly.

   - Separate the bulb holders from the lamp assembly.

3. To install, reverse the removal procedure.

Fog Lamp Bulb

Removal and Installation



WARNING: The halogen bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

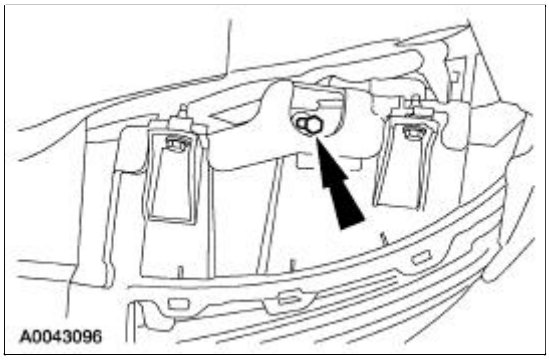
NOTE: The fog lamp bulb should not be removed from the fog lamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp where they can settle on the lens and reflector. Never turn on the fog lamp with the bulb removed from the fog lamp.

NOTE: Navigator shown, Expedition similar.

1. **NOTE:** Make sure the headlamp switch and the ignition switch are in the OFF position.

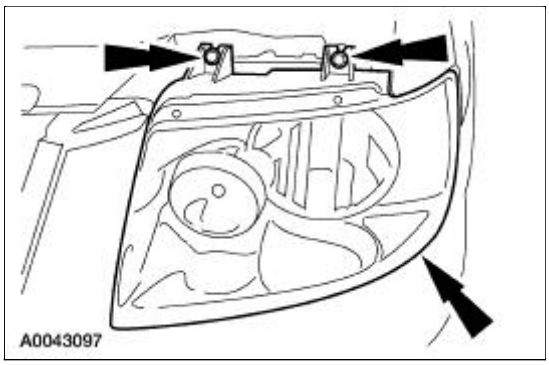
   Disconnect the electrical connector and remove the fog lamp bulb.

2. To install, reverse the removal procedure.



Headlamp Assembly

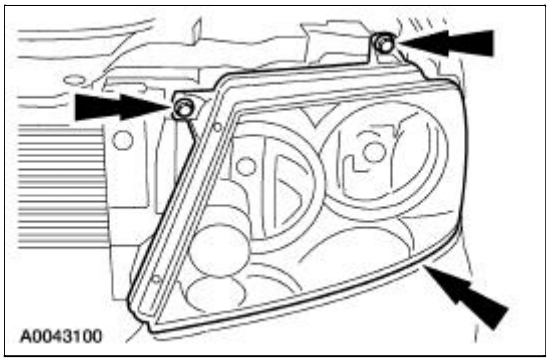
Removal and Installation



NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

Expedition

1. Loosen the headlamp retaining bolt.



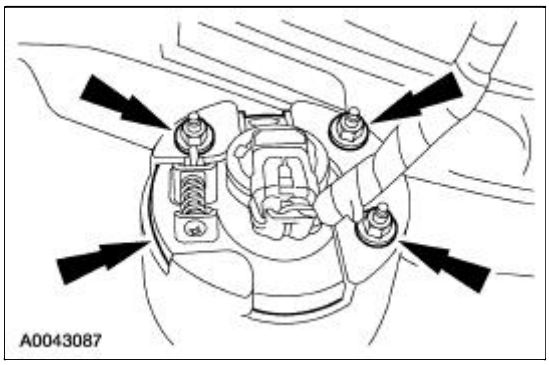
2. Remove the bolts and the headlamp assembly.
    - Disconnect the electrical connectors.

Navigator

3. Remove the front radiator air deflector.
4. Remove the three bolts and the headlamp assembly.
    - Disconnect the electrical connectors.

All vehicles

5. To install, reverse the removal procedure.
    - If necessary, adjust the headlamps. For additional information, refer to Headlamp Adjustment in this section.



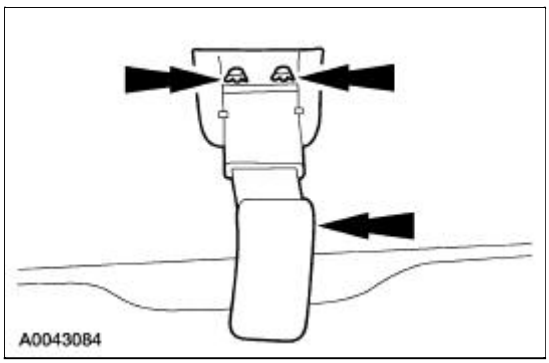
Fog Lamp

Removal and Installation

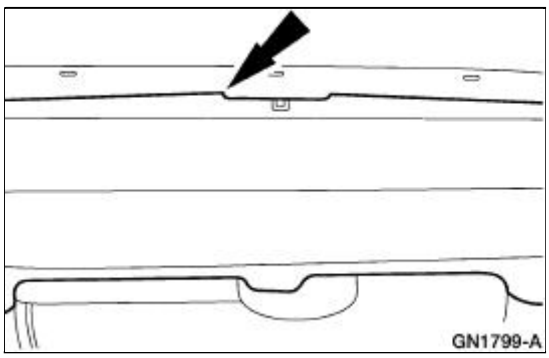
NOTE: Navigator shown, Expedition similar.

1. **NOTE:** Make sure that the headlamp switch and the ignition switch are in the OFF position.

   Remove the nuts and the fog lamp.
   - Disconnect the electrical connector.

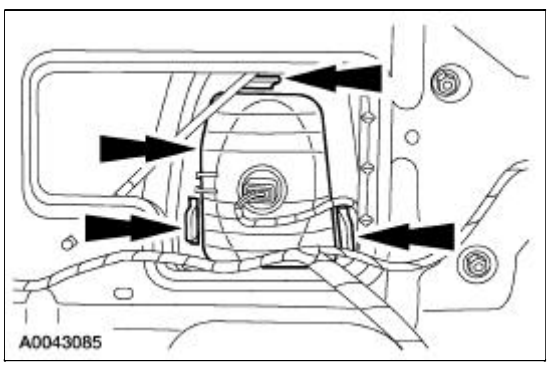


2. To install, reverse the removal procedure.
   - If necessary, adjust the fog lamps. Refer to Front Fog Lamp Adjustment in this section



Reversing Lamp

Removal and Installation



1. Remove the screws and the liftgate pull handle.

2. Remove the liftgate trim panel.
   - Remove the water shield.

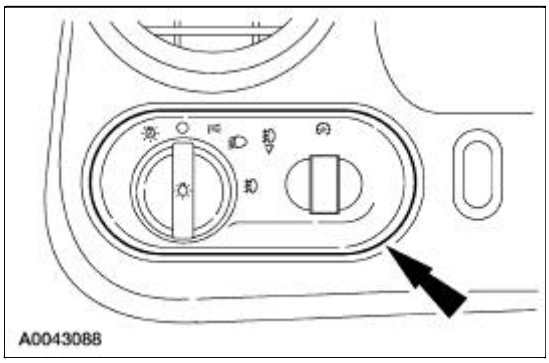
3. Release the tabs and remove the reversing lamp.
   - Disconnect the reversing lamp.

4. To install, reverse the removal procedure.

Headlamp Switch

Removal and Installation

All vehicles



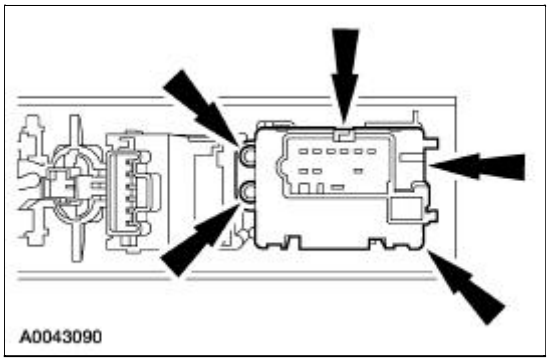
1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

Expedition

2. **CAUTION: Cover the end of the tool with tape to prevent damage to the trim panel.**

   NOTE: Use a thin-bladed tool to remove the headlamp switch bezel assembly.

   Remove the headlamp switch and bezel assembly.
   - Disconnect the electrical connectors.

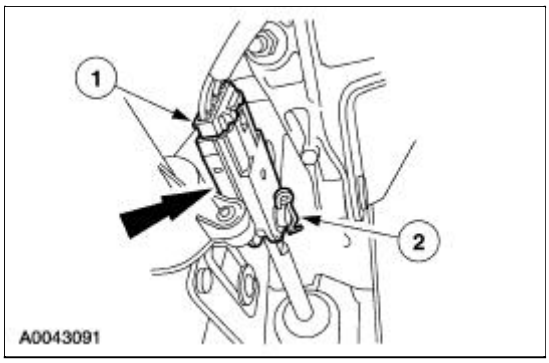


Navigator

3. Remove the headlamp switch and bezel assembly.
   - Disconnect the electrical connectors.

4. Remove the screws, release the tabs and remove the headlamp switch.

All vehicles



5. To install, reverse the removal procedure.

Brake Pedal Position (BPP) Switch

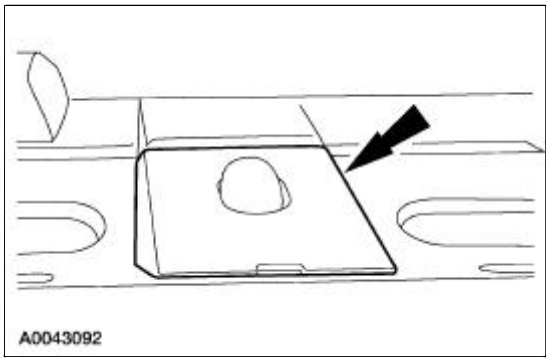
Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Remove the BPP switch.
    1. Disconnect the electrical connector.
    2. Remove the self-locking pin and the BPP switch.

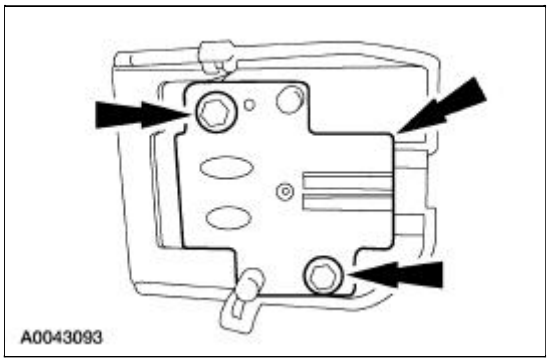
3. To install, reverse the removal procedure.

Photocell and Amplifier



Removal and Installation

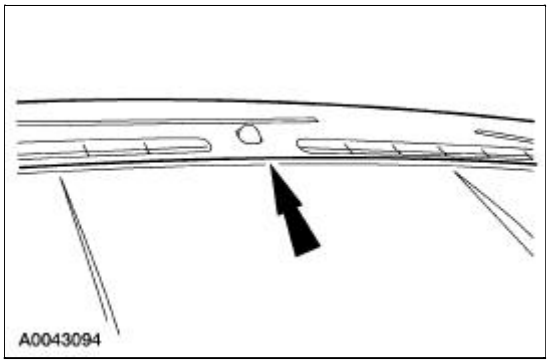
All vehicles



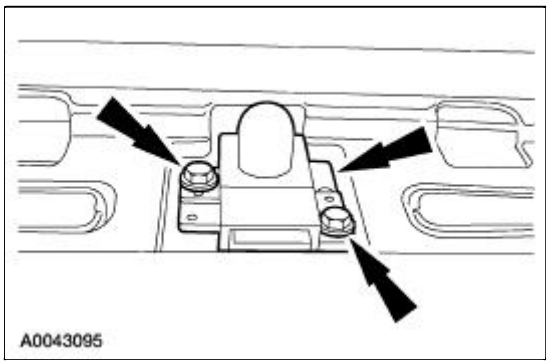
1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

Expedition

2. Remove the photocell and bezel from the defroster grille.
   - Disconnect the electrical connector.



3. Remove the screws and the photocell and amplifier.

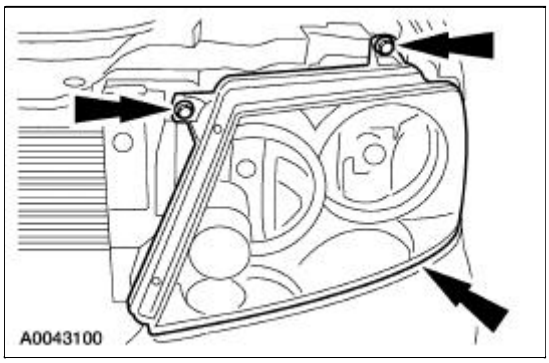


Navigator

4. Remove the defroster grille.

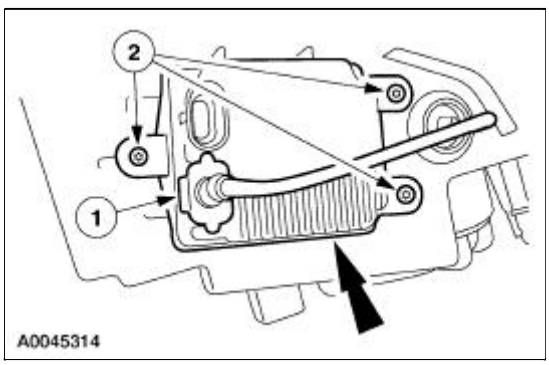
5. Remove the screws and the photocell.
    - Disconnect the electrical connector.

All vehicles



6. To install, reverse the removal procedure.

Ballast



Removal and Installation

NOTE: Make sure that the headlamp switch and the ignition switch are in the OFF position.

1. Remove the front radiator air deflector.
2. Remove the three bolts and the headlamp assembly.
   - Disconnect the electrical connectors.

3. Remove the ballast.
   1. Disconnect the electrical connector.
   2. Remove the screws.

4. To install, reverse the removal procedure.

Interior Lighting

The interior lighting system consists of the following:

- front map lamp assembly
- front door courtesy lamp
- glove box lamp assembly
- instrument cluster
- vehicle security module
- interior lamp switch
- interior lamp relay
- illuminated vanity mirrors
- reading lamp assembly
- rear courtesy lamp
- puddle lamps
- underhood lamp assembly

Interior Lighting

Refer to Wiring Diagrams Cell 89 , Courtesy Lamps for schematic and connector information.

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry (RKE) for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418–F224 New Generation STAR (NGS) Tester 418–F052 or equivalent diagnostic tool

Principles of Operation

Vehicle Security Module

The vehicle security module receives inputs from the following:

- door ajar switches
- keyless entry keypad
- ignition switch
- remote keyless entry transmitter

The vehicle security module uses these inputs to control an output signal to the instrument cluster which controls the battery saver relay and courtesy lamp output.

Interior Lighting Systems

The instrument cluster grounds the battery saver relay and supplies the power for courtesy lamps when any door ajar switch is opened, or the interior lamp (headlamp) switch is closed. The instrument cluster then supplies voltage to the interior lamp circuit. Vehicle speed must be less than 24 kph (15 mph) for the instrument cluster module to keep courtesy lamps on. The interior lamps will remain illuminated for up to 25 seconds after all doors are closed unless the instrument cluster module receives an input from any of the following:

- voltage from the ignition switch
- a vehicle speed signal

- input from the keyless entry keypad through the vehicle security module
- input from the remote keyless entry transmitter lock or panic switch through the vehicle security module

Illuminated Entry

Illuminated entry is activated when a vehicle is unlocked using the keyless entry keypad or the remote keyless entry transmitter. The vehicle security module then requests that the instrument cluster module supply voltage to the interior lamps. Illuminated entry is deactivated when the vehicle security module receives a lock signal from the remote keyless entry transmitter. Illuminated entry will also be deactivated when the instrument cluster module receives a change in ignition switch pid status.

Battery Saver

The battery saver is activated when the instrument cluster module is not receiving voltage input from the ignition switch (OFF position). The instrument cluster module will then provide ground to the battery saver relay coil. This activates for a period of 10 minutes with the interior lamp (headlamp) switch in the OFF position, or a maximum period of 30 minutes with the interior lamp (headlamp) switch in the ON position, or a door is ajar, provided that the instrument cluster module does not receive any other input signals within the time-out period. The activated battery saver relay switches voltage to the demand lamp circuit . After time-out, the instrument cluster module disconnects ground from the battery saver relay coil, disabling the demand lamp circuit.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of electrical damage:

Visual Inspection Chart

Electrical
• Bulbs • Central junction box (CJB) fuse(s):   ▪ 21 (15A).   ▪ 24 (15A). • Circuitry • Vehicle security module • Instrument cluster module

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the diagnostic card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.
5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool

operating manual.

6. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:
   - CKT 70, CKT 914, CKT 915 or CKT 693 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
   - NO RESPONSE/NOT EQUIPPED for Instrument cluster, refer to Section 413-01 , or Vehicle Security Module, refer to Section 419-10 .
   - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs, and carry out self-test diagnostics.

7. If the DTCs retrieved are related to the concern, go to the Instrument Cluster Diagnostic Trouble Code (DTC) Index.

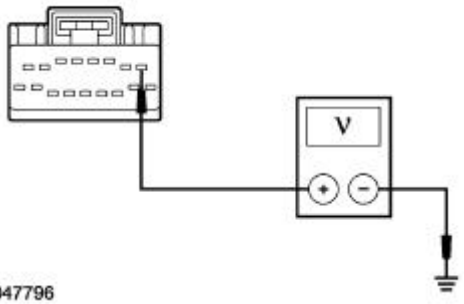
8. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart.

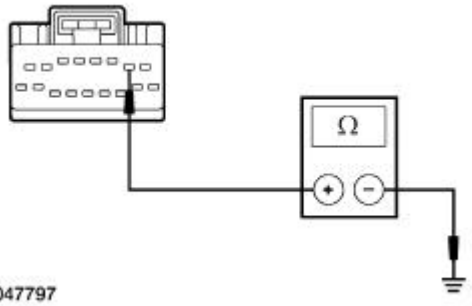
Instrument Cluster Diagnostic Trouble Code Index

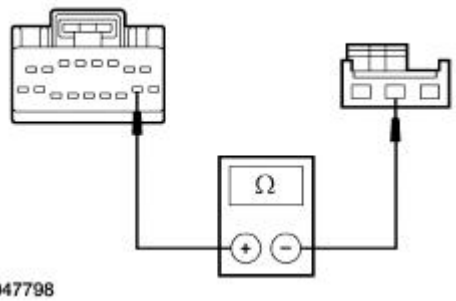
DTC	Description	Source	Action
B1342	ECU is Defective	Instrument Cluster	REFER to Section 413-01 .
B2499	Courtesy Lamp Output Failure	Instrument Cluster	Go To Pinpoint Test A .
B1320	Driver Door Ajar Circuit Open	Instrument Cluster	Go To Pinpoint Test A .
B1328	Passenger Door Ajar Circuit Open	Instrument Cluster	Go To Pinpoint Test A .
—	All Other DTCs	Instrument Cluster	REFER to Section 419-10 .

Symptom Chart

Symptom Chart







Condition	Possible Sources	Action
• The interior lamps are inoperative	• Instrument cluster module. • Vehicle security module	• Go To Pinpoint Test A .
• An individual interior lamp is inoperative	• Circuitry. • Lamp	• Go To Pinpoint Test B .
• The interior lamps stay on continuously	• Circuitry. • Instrument cluster module. • Door ajar switch. • Vehicle security module.	• Go To Pinpoint Test C .
• The interior lamps do not turn on with one door open	• Vehicle security module. • Door ajar switch. • Circuitry.	• GO to Section 419-10 .
• The illuminated entry is inoperative from one/both door handles	• Vehicle security module. • Door ajar	• GO to Section 419-10 .

	switches. ● Circuitry.	
● The illuminated entry is inoperative when using the remote transmitter/keypad	● Vehicle security module. ● Circuitry. ● Keyless entry keypad. ● Remote keyless entry transmitter.	● GO to Section 419-10 .
● The demand lighting is inoperative	● Circuitry. ● Instrument cluster module.	● Go To Pinpoint Test D .
● The individual demand lamp is inoperative	● Circuitry. ● Lamp	● Go To Pinpoint Test E .
● The interior lamps are inoperative—do not deactivate after time-out	● Instrument cluster module.	● Go To Pinpoint Test G .
● The battery saver does not deactivate after time-out	● Instrument cluster module.	● Go To Pinpoint Test F .
● All battery saver components do not operate	● Circuitry. ● Instrument cluster module.	● Go To Pinpoint Test G .
● No communication with the vehicle security module	● Circuity ● Vehicle security module	● REFER to Section 419-10 .
● No communication with the instrument cluster module	● Circuitry ● Instrument cluster module	● REFER to Section 413-01 .

Pinpoint Tests

PINPOINT TEST A: THE INTERIOR LAMPS ARE INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK INTERIOR LAMP OPERATION AT DOOR AJAR SWITCHES	
● Key in OFF position. ● Operate the interior lamps by opening and closing the doors. ● **Do the interior lamps illuminate?**	**Yes** GO to the Symptom Chart. **No** GO to A2 .
A2 CHECK INTERIOR LAMP OPERATION AT THE HEADLAMP SWITCH	
● Operate the interior lamps by turning the interior lamp switch on. ● **Do any interior lamps illuminate?**	**Yes** CARRY OUT no communication test with suspect module. REFER to Section 413-01 for the instrument cluster module or Section 419-10 for the vehicle security module.

	No GO to A3 .
A3 CHECK CIRCUIT 3049 (BK/LG)	
• Key in OFF position. • Disconnect: Instrument Cluster C220b. • Key in ON position. • Measure the voltage between instrument cluster C220b, pin 1, circuit 3049 (BK/LG) and ground.  A0047796 • **Is the voltage greater than 10 volts?**	**Yes** GO to A4 . **No** REPAIR power supply circuit. CLEAR the DTCs. REPEAT the self-test.
A4 CHECK CIRCUIT 676 (PK/OG)	
• Key in OFF position. • Disconnect: Instrument Cluster C220b. • Measure the resistance between instrument cluster C220b, pin 2, circuit 676 (PK/OG) and ground.  A0047797 • **Is the resistance less than 5 ohms?**	**Yes** GO to A5 . **No** REPAIR circuit 676 (PK/OG). CLEAR the DTCs. REPEAT the self-test.
A5 CHECK CIRCUIT 53 (BK/LB)	
• Disconnect: LH Roof Rail Lamp C941. • Measure the resistance between instrument cluster C220b, pin 10, circuit 53 (BK/LB) and LH roof rail lamp C941, pin 2, circuit 53 (BK/LB).  A0047798 • **Is the resistance less than 5 ohms?**	**Yes** GO to A6 . **No** REPAIR circuit 53 (BK/LB). CLEAR the DTCs. REPEAT the self-test.
A6 CHECK FOR CORRECT INSTRUMENT CLUSTER MODULE OPERATION	

• Disconnect all instrument cluster module connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster module. REFER to Section 413-01 . CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST B: AN INDIVIDUAL INTERIOR LAMP IS INOPERATIVE

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>B1 CHECK CIRCUIT 53 (BK/LB)</td><td rowspan="2">Yes
GO to B2 .

No
REPAIR circuit 53 (BK/LB). CLEAR the DTCs. REPEAT the self-test.</td></tr>
<tr><td>• Key in ON position.
• Operate the interior lamps by turning the interior lamps switch on.
• Disconnect the inoperative interior lamp connector.
• Measure the voltage from the inoperative interior lamp connector circuit 53 (BK/LB) to ground. Refer to the following table for connector and pin number.

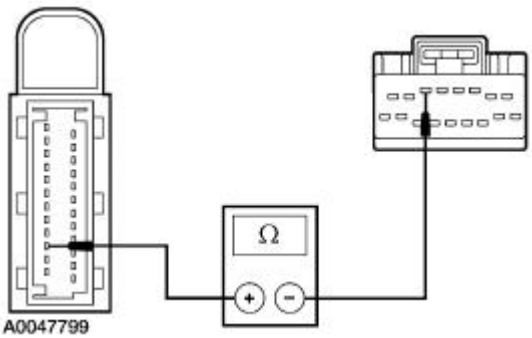
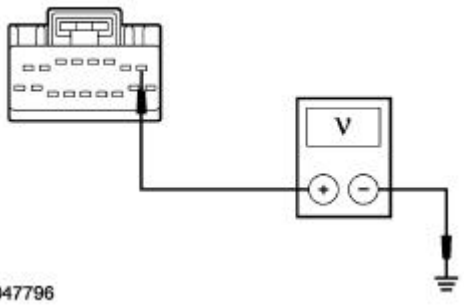
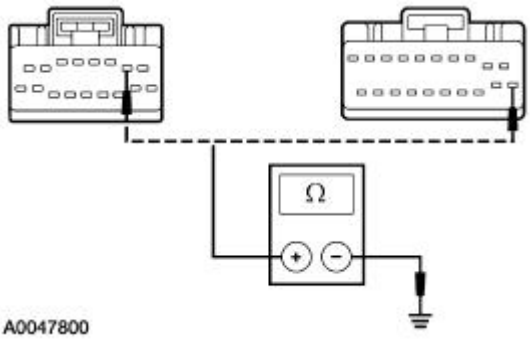
- **Is the resistance less than 5 ohms?**

REPEAT the self-test.

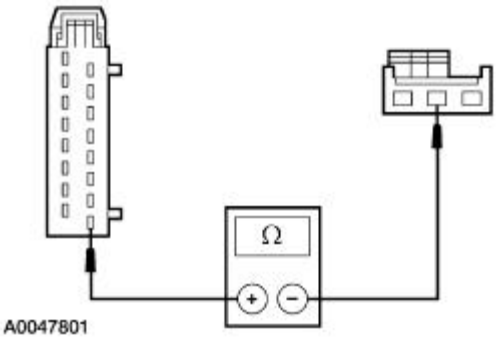


No
REPAIR circuit 57 (BK). CLEAR the DTCs. REPEAT the self-test.





PINPOINT TEST C: THE INTERIOR LAMPS STAY ON CONTINUOUSLY



Test Step	Result / Action to Take
C1 CHECK THE DOOR AJAR PIDS ● Key in OFF position. ● Check the door ajar PIDs while opening and closing the doors. ● **Do the door ajar PID values agree with the door positions?**	**Yes** GO to C2 . **No** REFER to Section 501-14 for door ajar switch diagnosis.
C2 CHECK CIRCUIT 53 (BK/LB) ● Key in OFF position. ● Disconnect: Instrument Cluster C220b. ● **Are the interior lamps still illuminated?**	**Yes** REPAIR short to power in circuit 53 (BK/LB). CLEAR the DTCs. REPEAT the self-test. **No** GO to C3 .
C3 CHECK FOR CORRECT INSTRUMENT CLUSTER MODULE OPERATION ● Disconnect all instrument cluster module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster module connectors and make sure they seat correctly. ● Operate the system and verify the	**Yes** INSTALL a new instrument cluster module. REFER to Section 413-01 . CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the

concern is still present. ● **Is the concern still present?**	self-test.

PINPOINT TEST D: THE DEMAND LIGHTING IS INOPERATIVE

Test Step	Result / Action to Take
D1 CHECK GLOVE COMPARTMENT LAMP	
● Key in OFF position. ● Open the glove compartment and observe lamp. ● **Is the glove compartment lamp illuminated?**	**Yes** GO to D9 . **No** GO to D2 .
D2 CHECK GLOVEBOX SWITCH ALIGNMENT	
● Check glovebox switch for correct operation during opening and closing of glove box compartment. ● **Is the glovebox switch correctly positioned for normal operation?**	**Yes** GO to D3 . **No** Adjust glovebox switch for correct operation.
D3 CHECK CIRCUIT 705 (LG/OG) FOR VOLTAGE	
● Measure the voltage between the glovebox lamp connector circuit 705 (LG/OG) and ground. ● **Is the voltage greater than 10 volts?**	**Yes** GO to D4 . **No** REPAIR the circuit. TEST the system for normal operation.
D4 CHECK CIRCUIT 1005 (VT/OG)	
● Key in OFF position. ● Disconnect: Instrument Cluster C220b. ● Disconnect: Battery Junction Box C270e. ● Measure the resistance between instrument cluster C220b, pin 6 circuit 1005 (VT/OG) and battery junction box C270e, pin 10, circuit 1005 (VT/OG).  ● **Is the resistance less than 5 ohms?**	**Yes** GO to D5 . **No** REPAIR circuit 1005 (VT/OG). CLEAR the DTCs. REPEAT the self-test.
D5 CHECK CIRCUIT 3049 (BK/LG)	
● Measure the voltage between instrument cluster C220b, pin 1, circuit 3049 (BK/LG) and ground.	**Yes** GO to D6 . **No** REPAIR power supply circuit. CLEAR the DTCs. REPEAT the self-test.

 A0047796 ● **Is the voltage greater than 10 volts?**	
D6 CHECK CIRCUITS 676 (PK/OG) AND 57 (BK) ● Disconnect: Instrument Cluster C220a. ● Measure the resistance between instrument cluster C220b, pin 2, circuit 676 (PK/OG) and ground and instrument cluster C220a, pin 11, circuit 57 (BK) and ground.  A0047800 ● **Is the resistance less than 5 ohms?**	**Yes** GO to D7 . **No** REPAIR circuit 676 (PK/OG) or circuit 57 (BK). CLEAR the DTCs. REPEAT the self-test.
D7 CHECK BATTERY SAVER RELAY ● Carry out the component testing. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Did the battery saver relay pass the component test?**	**Yes** GO to D8 . **No** INSTALL a new batter saver relay. CLEAR the DTCs. REPEAT the self-test.
D8 CHECK FOR CORRECT INSTRUMENT CLUSTER MODULE OPERATION ● Disconnect all instrument cluster module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new instrument cluster module. REFER to Section 413-01 . CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
D9 CHECK CIRCUIT 705 (LG/OG) ● Disconnect: Battery Junction Box C270j. ● Disconnect: LH Roof Rail Lamp C941. ● Measure the resistance between connectors battery	**Yes** REPAIR circuit 57 (BK). CLEAR the DTCs. REPEAT

junction box C270j, pin 15, circuit 705 (LG/OG) and LH roof rail lamp C941, pin 1, circuit 705 (LG/OG).  ● **Is the resistance less than 5 ohms?**	the self-test. **No** REPAIR circuit 705 (LG/OG). CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST E: AN INDIVIDUAL DEMAND LAMP IS INOPERATIVE

Test Step	Result / Action to Take
E1 CHECK CIRCUIT 705 (LG/OG)	
● Key in OFF position. ● Measure the voltage from the inoperative demand lamp connector, circuit 705 (LG/OG) to ground. Refer to the following table for connector and pin number. **Location / Connector / Pin** Underhood lamp / C1159 / 2 Glove compartment lamp / C254 / 2 RH vanity lamp / C952 / 1 LH vanity lamp / C907 / 1 Front row dome/map lamp / C903 / 3 Second row dome/map lamp / C908 / 3 RH roof rail lamp / C942 / 3 LH roof rail lamp / C941 / 1 Cargo lamp / C926 / 3 ● **Is the voltage greater than 10 volts?**	**Yes** GO to E2 . **No** REPAIR circuit 705 (LG/OG). CLEAR the DTCs. REPEAT the self-test.
E2 CHECK CIRCUIT 57 (BK)	
● Measure the resistance from the inoperative demand lamp connector, circuit 57 (BK) to ground. Refer to the following table for connector and pin number. **Location / Connector / Pin** Underhood lamp / C1159 / 1 Glove compartment lamp / C254 / 1 RH vanity lamp / C906 / 2 LH vanity lamp / C907 / 2	**Yes** INSTALL a new lamp. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit 57 (BK). CLEAR the DTCs. REPEAT the self-test.

Front row dome/map lamp	C931	1 (with overhead console) 2 (without overhead console)
Second row dome/map lamp	C932	1

- **Is the resistance less than 5 ohms?**

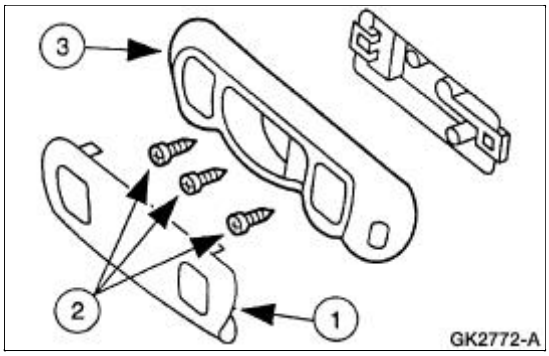
PINPOINT TEST F: THE BATTERY SAVER DOES NOT DEACTIVATE AFTER TIME-OUT

Test Step	Result / Action to Take
F1 CHECK FOR CORRECT INSTRUMENT CLUSTER MODULE OPERATION	
• Disconnect all instrument cluster module connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster module. REFER to Section 413-01 . CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST G: ALL BATTERY SAVER COMPONENTS DO NOT OPERATE

Test Step	Result / Action to Take
G1 CHECK CIRCUIT 1005 (VT/OG)	
• Key in OFF position. • Disconnect: Instrument Cluster C220b. • Disconnect: Battery Junction Box C270e. • Measure the resistance between instrument cluster C220b, pin 6 circuit 1005 (VT/OG) and battery junction box C270e, pin 10, circuit 1005 (VT/OG).	**Yes** GO to G2 . **No** REPAIR circuit 1005 (VT/OG). CLEAR the DTCs. REPEAT the self-test.

 ● **Is the resistance less than 5 ohms?**	
G2 CHECK CIRCUIT 3049 (BK/LG) ● Measure the voltage between instrument cluster C220b, pin 1, circuit 3049 (BK/LG) and ground.  ● **Is the voltage greater than 10 volts?**	**Yes** GO to G3 . **No** REPAIR power supply circuit. CLEAR the DTCs. REPEAT the self-test.
G3 CHECK CIRCUITS 676 (PK/OG) AND 57 (BK) ● Disconnect: Instrument Cluster C220a. ● Measure the resistance between instrument cluster C220b, pin 2, circuit 676 (PK/OG) and ground and instrument cluster C220a, pin 11, circuit 57 (BK) and ground.  ● **Is the resistance less than 5 ohms?**	**Yes** GO to G4 . **No** REPAIR circuit 676 (PK/OG) or circuit 57 (BK). CLEAR the DTCs. REPEAT the self-test.
G4 CHECK BATTERY SAVER RELAY ● Carry out the component testing. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Did the battery saver relay pass the component test?**	**Yes** GO to G5 . **No** INSTALL a new batter saver relay. CLEAR the DTCs. REPEAT the self-test.
G5 CHECK FOR CORRECT INSTRUMENT CLUSTER MODULE OPERATION ● Disconnect all instrument cluster module connectors. ● Check for:	**Yes** INSTALL a new instrument



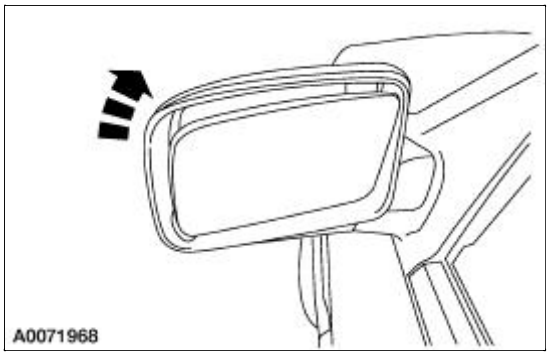
● corrosion ● pushed-out pins ● Connect all instrument cluster module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	cluster module. REFER to Section 413-01 . CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Lamp Assembly —Map

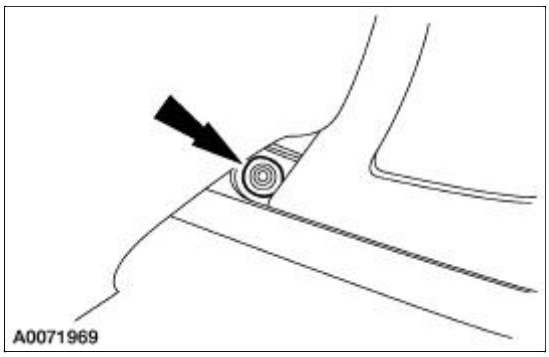
Removal

1. Remove the map lamp assembly.
    1. Carefully release the lamp lens.
    2. **NOTE:** Identify the location of each screw to aid in the installation of the map lamp assembly.

       Remove interior lamp screws.
    3. Remove the map lamp assembly.

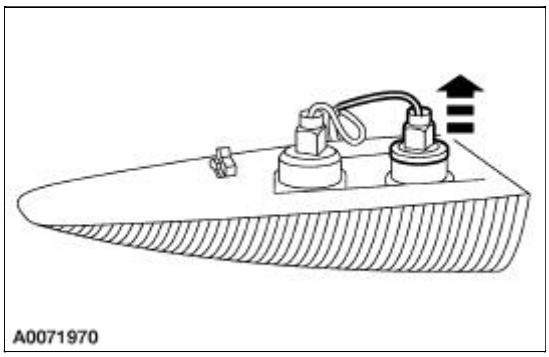


Installation

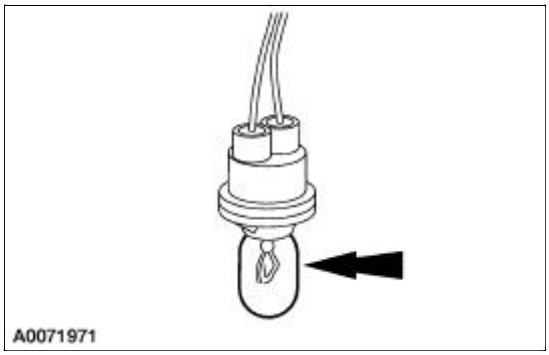


1. To install, reverse the removal procedure.

Approach Lamp

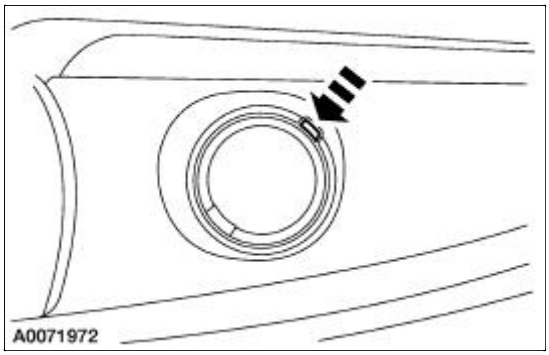


1. Fold the mirror assembly forward.

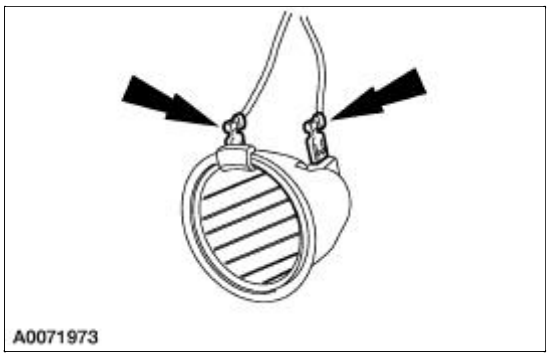


2. Remove the Torx®-head screw.

3. Remove the approach lamp connector from the turn signal assembly.



4. Remove the approach lamp bulb.

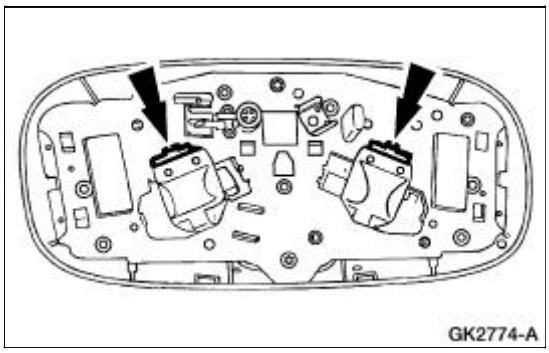


5. To install, reverse the removal procedure.

Approach Lamp Assembly

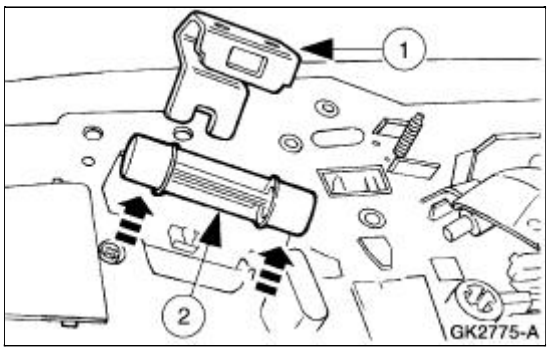
1. Squeeze the tab and lower the approach lamp assembly.

2. Disconnect the electrical connectors.



3. To install, reverse the removal procedure.

Bulb —Map Lamp



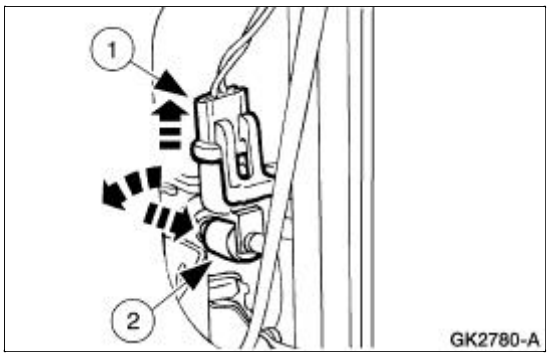
Removal

1. Remove the map lamp assembly. For additional information, refer to Lamp Assembly—Map in this section.

2. Release the clip on the bulb(s) to be replaced.

3. Remove the map lamp bulb.
    1. Remove the map lamp reflector.
    2. Remove the map lamp bulb from the clips.

Installation



1. To install, reverse the removal procedure.

Switch —Interior Lamp

Removal

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .

2. Remove the interior lamp switch.
    1. Disconnect the electrical connector.
    2. Rotate the interior lamp switch counterclockwise to remove.

Installation

1. To install, reverse the removal procedure.

Daytime Running Lamps (DRL)

The DRL system illuminates the fog lamps at full intensity.

The system operates when the following conditions are met:

- The high beam headlamps are disabled.
- The ignition switch is in the RUN position.
- The headlamp switch is in the OFF position.

The DRL system consists of the DRL relays (located in the engine compartment).

Daytime Running Lamps (DRL)

Refer to Wiring Diagrams Cell 97 , Daytime Running Lamps for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Digital Multimeter or equivalent 105-R0057

Principles of Operation

The daytime running lamps are implemented by using the fog lamps at 100% system voltage.

Inspection and Verification

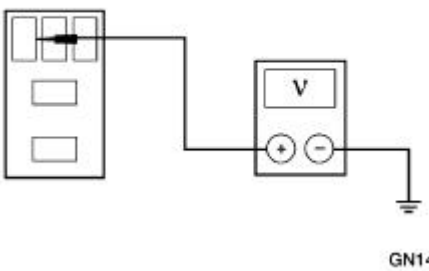
1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

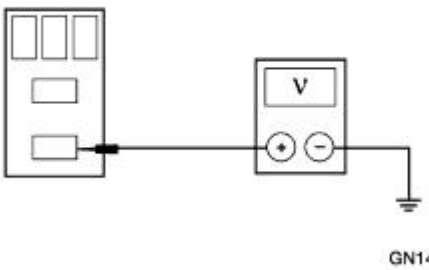
Visual Inspection Chart

Electrical
● Central junction box (CJB) fuse 14 (10A) ● DRL ignition relay ● DRL headlamp relay

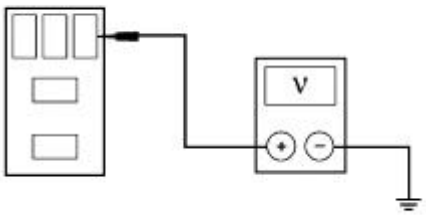
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, determine the symptom and refer to the Symptom Chart.

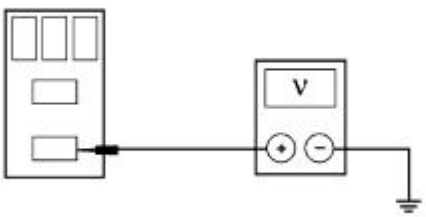
Symptom Chart





Symptom Chart





Condition	Possible Sources	Action
● The daytime running lamps (DRL) are inoperative	● Central junction box (CJB) Fuse 14 (10A). ● Circuitry.	● Go To Pinpoint Test A .

	• DRL ignition relay. • DRL headlamp relay.	
• The daytime running lamps (DRL) are on with the ignition switch OFF	• Circuitry. • DRL ignition relay.	• Go To Pinpoint Test B.

Pinpoint Tests

PINPOINT TEST A: THE DAYTIME RUNNING LAMPS (DRL) ARE INOPERATIVE

Test Step	Result / Action to Take
A1 VERIFY THE FOG LAMPS OPERATE CORRECTLY	
NOTE: Make sure the steering column multifunction switch is in the low beam position. • Key in OFF position. • Turn the headlamp switch to the headlamps ON position and engage the fog lamp switch. • **Do the fog lamps operate correctly?**	**Yes** TURN the headlamp switch OFF. GO to A2. **No** REFER to Section 417-01.
A2 CHECK CIRCUIT 295 (LB/PK) FOR AN OPEN	
• Disconnect: DRL Ignition Relay C1171. • Key in ON position. • Measure the voltage between the DRL ignition relay C1171 pin 1, circuit 295 (LB/PK), harness side and ground.  GN1460-A • **Is the voltage greater than 10 volts?**	**Yes** GO to A3. **No** REPAIR the circuit. TEST the system for normal operation.
A3 CHECK CIRCUIT 196 (DB/OG) FOR AN OPEN	
• Measure the voltage between the DRL ignition relay C1171 pin 3, circuit 196 (DB/OG), harness side and ground.  GN1456-A	**Yes** GO to A4. **No** REPAIR the circuit. TEST the system for normal operation.

• **Is the voltage greater than 10 volts?**	
A4 CHECK CIRCUIT 12 (LG/BK) FOR AN OPEN	
• Turn the headlamp switch to the headlamps ON position. • Place the multifunction switch in the high beam position • Measure the voltage between the DRL ignition relay C1171 pin 2, circuit 12 (LG/BK), harness side and ground.  GN1458-A • **Is the voltage greater than 10 volts?**	**Yes** TURN the headlamp switch OFF. PLACE the multifunction switch in the low beam position. GO to A5 . **No** REPAIR the circuit. TEST the system for normal operation.
A5 CHECK DRL IGNITION RELAY	
• Key in OFF position. • Carry out the DRL ignition relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the DRL ignition relay OK?**	**Yes** REINSTALL the DRL ignition relay. GO to A6 . **No** INSTALL a new DRL ignition relay. TEST the system for normal operation.
A6 CHECK CIRCUIT 2017 (WH/RD) FOR AN OPEN	
• Disconnect: DRL Headlamp Relay C1359. • Key in ON position. • Measure the voltage between the DRL headlamp relay C1359 pin 3, circuit 2017 (WH/RD), harness side and ground.  GN1456-A • **Is the voltage greater than 10 volts?**	**Yes** GO to A7 . **No** REPAIR the circuit. TEST the system for normal operation.
A7 CHECK THE DRL HEADLAMP RELAY	
• Key in OFF position. • Carry out the headlamp relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the DRL headlamp relay OK?**	**Yes** REINSTALL the DRL headlamp relay.GO to A8 . **No** INSTALL a new DRL headlamp relay. TEST the system for normal operation.
A8 CHECK CIRCUIT 478 (TN/OG) FOR AN OPEN	
• Turn the headlamp switch to the headlamps ON position	**Yes**

and engage the fog lamp switch. ● Measure the voltage between the DRL headlamp relay C1172 pin 4, circuit 478 (TN/OG), harness side and ground.  GN1459-A ● **Is the voltage greater than 10 volts?**	INSTALL a new DRL headlamp relay. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST B: THE DAYTIME RUNNING LAMPS (DRL) ARE ON WITH THE IGNITION SWITCH OFF

Test Step	Result / Action to Take
B1 CHECK FOR VOLTAGE FROM THE DRL IGNITION RELAY ● Key in OFF position. ● Disconnect: DRL Ignition Relay C1171. ● **Do the fog lamps continue to illuminate?**	**Yes** GO to B3 . **No** GO to B2 .
B2 CHECK CIRCUIT 295 (LB/PK) FOR SHORT TO POWER ● Carry out the DRL ignition relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Is the DRL ignition relay OK?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new DRL ignition relay. TEST the system for normal operation.
B3 CHECK CIRCUIT 2017 (WH/RD) FOR SHORT TO POWER (NAVIGATOR) ● Disconnect: DRL Headlamp Relay C1359. ● **Do the fog lamps continue to illuminate?**	**Yes** REFER to Section 417-01 . **No** REPAIR the circuit. TEST the system for normal operation.

General Specifications

Item	Specification
Heat shrink tube overlap mm (inch)	12.7 (0.5)
Wire insulation removal length (twist side) mm (inch)	37.2 (1.5)
Wire insulation removal length (receiving side) mm (inch)	19.5 (0.75)
Raychem SCT® Heat Shrink Tubing, Motorcraft part number WT-5627	ESB-M99D56-A2

Communications Network

Module Communications Network Components

- powertrain control module (PCM)
- restraint control module (RCM)
- instrument cluster
- driver seat module (DSM)
- climate controlled seat module
- parking aid module
- central junction box (CJB)
- vehicle security module
- air suspension control module
- 4-wheel anti-lock brake/traction control (ABS/TC) module or stability assist module
- electronic automatic temperature control (EATC) module
- four-wheel drive (4WD) control module
- power liftgate module
- tire pressure monitoring system module

Communications Network

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool

Principles of Operation

The vehicle has three module communication networks:

- the standard corporate protocol (SCP) communications network
- the international standards organization (ISO) 9141 communications network
- the UART based protocol (UBP) communications network

The diagnostic tool connects to all three networks through the data link connector (DLC). This makes diagnosis and testing of these systems easier by allowing one smart tester to be able to diagnose and control any module on the three networks from one connector. The DLC can be found under the instrument panel between the steering column and the radio.

The ISO 9141 communications network does not permit intermodule communication. When the diagnostic tool communicates to modules on the ISO 9141 communication network, the diagnostic tool must request all information, or initiate module commands.

The ISO 9141 communications network will not function if the wire is shorted to ground or battery voltage. Also, if one of the modules on the ISO 9141 communications network loses power or shorts internally, communications to that module will fail.

The SCP communications network will remain operational even with the severing of one of the bus wires. Communications will also continue if one of the bus wires is shorted to ground or voltage, or if some but not all termination resistors are lost. The SCP communications network allows inter-module communication.

The UBP communications network will not function if the wire is shorted to ground or voltage. The UBP is different from the ISO communication network in that it allows intermodule communication.

The powertrain control module (PCM) is on the SCP communication network. The PCM controls the engine for better fuel economy, emissions control, and failure mode detection and storage. For additional information, refer to Section 303-14 .

The restraint control module (RCM) is on the ISO 9141 network. The RCM controls the deployment of the air bags based on sensor input. For additional information, refer to Section 501-20B .

The tire pressure monitoring system module is on the SCP communications network. The module and sensors monitor tire pressure and alert the driver when a concern may exist. For additional information, refer to Section 204-04 .

The electronic automatic temperature control (EATC) module is on the UBP communication network. The EATC module controls automatic climate functions that maintain the vehicle interior temperature at a constant setting. For additional information, refer to Section 412-00 .

The driver and passenger climate controlled seat modules are on the UBP network. The climate controlled seat modules control the temperature of the driver and passenger seats. For additional information, refer to Section 501-10 .

The vehicle security module is on the UBP communication network. The vehicle security module controls a variety of systems:

- windshield wipers
- courtesy lamps
- warning chimes
- interior lamps
- exterior lamps
- power windows
- perimeter security
- RKE/keyless entry
- lock functions
- monitors the entry doors and radio

Refer to Section 419-10 .

The driver seat module (DSM) is on the UBP communication network. The DSM controls the positioning and programming of the driver seat, pedals and both outside mirrors. Refer to Section 501-10 .

The 4-wheel anti-lock brake/traction control (ABS/TC) module or stability assist module is on the ISO 9141 and the SCP communication network. The ABS/TC module or stability assist module controls the brake pressure to the four wheels to keep the vehicle under control while braking. Refer to Section 206-09A .

The air suspension control module is on the UBP communication network and controls the air compressor motor (through a solid state relay) and all system solenoids. The module also provides power to front and rear height sensors on four-wheel air suspension systems, or rear height sensors on the rear-wheel suspension systems. The module controls vehicle height adjustments by monitoring two height sensors, vehicle speed, a steering sensor, acceleration input, the door ajar signal, transfer case signals and the brake switch. The module also conducts all fail-safe and diagnostic strategies and contains self-test and communication software for testing the vehicle and module.

The control module is mounted in the passenger compartment inside the instrument panel above the radio and temperature controls.

The air suspension control module monitors and controls the system through a 32–pin two-way connector. It is keyed so that the control module cannot be plugged into an incorrect harness. There are two sides of the harness connection to the module. Each is uniquely colored and keyed to prevent reversal of connections.

For additional air suspension information, refer to Section 204-05 .

The instrument cluster is on the SCP and UBP communication network. It is an analog face cluster with a digital odometer. The instrument cluster displays a variety of information. For additional information, refer to Section 413-01 .

The parking aid module is connected to the UBP communication module. The module controls sensors in the rear bumper that detect close objects when the vehicle is in reverse. Refer to Section 413-13 .

The four-wheel drive (4WD) control module is on the UBP communication network. The 4WD control module controls the four-wheel drive functions for the vehicle. Refer to Section 308-07A .

The power liftgate module is on the UBP network. The module controls the motor that opens and closes the liftgate. Refer to Section 501-03 .

Inspection and Verification

1. Verify the customer concern by operating the system.

2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
● Central junction box (CJB) fuse 41 (20 A) ● Wiring harness ● Connections

3. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
    - check that the program card is correctly installed.
    - check the connections to the vehicle.
    - check the ignition switch position.

If the diagnostic tool still does not communicate with the vehicle, Go To Pinpoint Test S .

4. Go To Pinpoint Test PC .

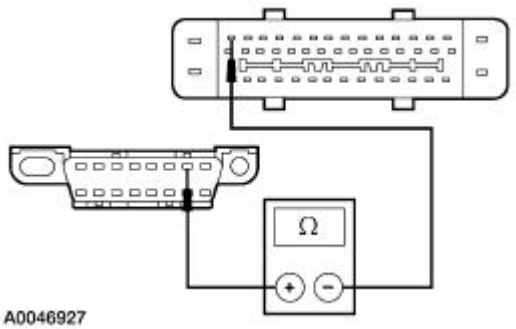
System Precheck

PINPOINT TEST PC: DATA LINK DIAGNOSTICS NETWORK TEST

Test Step	Result / Action to Take
PC1 RUN THE DATA LINK DIAGNOSTICS NETWORK TEST	
• Carry out the DATA LINK DIAGNOSTICS test. • **Is SYSTEM PASSED obtained?**	**Yes** Test passed. RETURN to the Symptom Chart of the section for the module in question. **No** If no response from the diagnostic tool, Go To Pinpoint Test S . If CKT70, CKT914 and/or CKT915 = SOME ECUS NO RESP/NOT EQUIP, REFER to the Symptom Chart. If CKT70 = ALL ECUS NO RESP/NOT EQUIP, Go To Pinpoint Test P . If CKT914 = ALL ECUS NO RESP/NOT EQUIP, Go To Pinpoint Test Q . If CKT915 = ALL ECUS NO RESP/NOT EQUIP, Go To Pinpoint Test Q . If the module in question is NO RESPONSE/NOT EQUIPPED, REFER to the Symptom Chart. If the module in question is NO RESPONSE ON CKT914 (BUS+), REFER to the Symptom Chart. If the module in question is NO RESPONSE ON CKT915 (BUS-), REFER to the Symptom Chart.

Symptom Chart

Symptom Chart

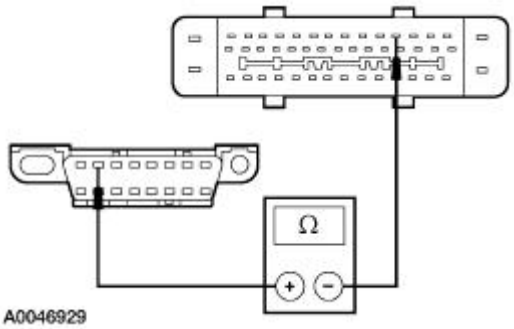


Condition	Possible Sources	Action
• The 4-wheel anti-lock brake/traction control (ABS/TC) module or stability assist module does not respond to the diagnostic tool (ISO)	• Circuit or connection in the international standards organization (ISO) 9141 network. • ABS/TC module.	• Go To Pinpoint Test A .
• The 4-wheel anti-lock brake/traction control (ABS/TC) module or stability assist module does not respond to the diagnostic tool (SCP)	• Circuit or connection in the standard corporate protocol (SCP) network. • ABS/TC module.	• Go To Pinpoint Test B .
• The restraint control module (RCM) does not respond to the diagnostic tool	• Circuit or connection in the ISO 9141 communication network. • RCM.	• Go To Pinpoint Test C .
• The vehicle security module does not respond to the diagnostic tool	• Circuit or connection in the UART based protocol (UBP) network. • Vehicle security module.	• Go To Pinpoint Test D .
• The powertrain control module (PCM) does not respond to the diagnostic tool	• Circuit or connection in the SCP communication network.	• Go To Pinpoint Test E .

	• PCM.	
• The electronic automatic temperature control (EATC) module does not respond to the diagnostic tool	• Circuit or connection in the UBP network. • EATC module.	• Go To Pinpoint Test F .
• The driver seat module (DSM) does not respond to the diagnostic tool	• Circuit or connection in the UBP network. • DSM.	• Go To Pinpoint Test G .
• The parking aid module does not respond to the diagnostic tool	• Circuit or connection in the UBP network. • Parking aid module.	• Go To Pinpoint Test H .
• The four-wheel drive (4WD) control module does not respond to the diagnostic tool	• Circuit or connection in the UBP network. • 4WD control module.	• Go To Pinpoint Test I .
• The instrument cluster does not respond to the diagnostic tool (SCP)	• Circuit or connection in the SCP communication network. • Instrument cluster.	• Go To Pinpoint Test J .
• The instrument cluster does not respond to the diagnostic tool (UBP)	• Circuit or connection in the UBP communication network. • Instrument cluster.	• Go To Pinpoint Test K .
• The tire pressure monitor module does not respond to the diagnostic tool	• Circuit or connection in the SCP communication network. • Tire pressure monitor module.	• Go To Pinpoint Test L .
• The power liftgate module does not respond to the diagnostic tool	• Circuit or connection in the UBP communication network. • Power liftgate module.	• Go To Pinpoint Test M .
• The air suspension control module does not respond to the diagnostic tool	• Circuit or connection in the UBP communication network. • Air suspension control module.	• Go To Pinpoint Test N .
• The climate controlled seat module does not respond to the diagnostic tool	• Circuit or connection in the UBP communication network. • Climate controlled seat module.	• Go To Pinpoint Test O .
• No international standards organization (ISO 9141) network communication	• Circuit or connection in the ISO 9141 communication network. • ISO 9141 networked modules.	• Go To Pinpoint Test P .
• No standard corporate protocol (SCP) network communication	• Circuit or connection in the SCP communication network. • SCP networked modules.	• Go To Pinpoint Test Q .
• No UART based protocol (UBP) network communication	• Circuit or connection in the UBP communication network. • UBP networked modules.	• Go To Pinpoint Test R .

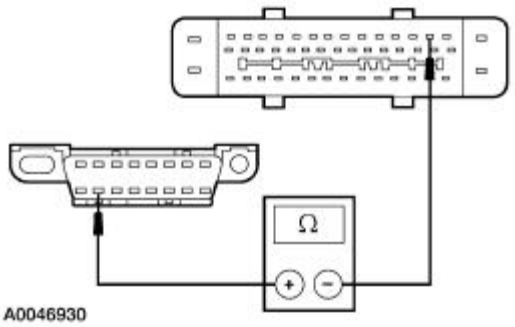
• No module/network communication — no power to the diagnostic tool	• Data link connector (DLC). • Central junction box (CJB) fuse 41 (20A). • Circuitry. • Diagnostic tool.	• Go To Pinpoint Test S .

Pinpoint Tests



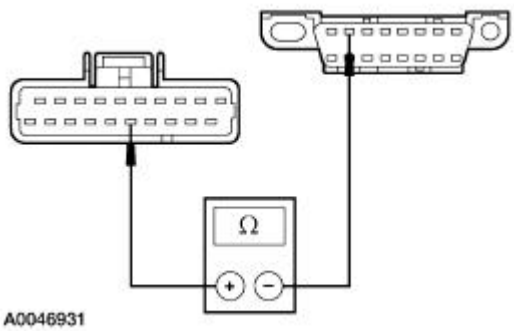
PINPOINT TEST A: THE 4-WHEEL ANTI-LOCK BRAKE/TRACTION CONTROL (ABS/TC) MODULE OR STABILITY ASSIST MODULE (IF EQUIPPED) DOES NOT RESPOND TO THE DIAGNOSTIC TOOL (ISO)

Test Step	Result / Action to Take
A1 CHECK THE ABS/TC MODULE C135 FOR DAMAGE	
• Key in OFF position. • Disconnect: ABS/TC Module C135. • Inspect the ABS/TC module C135 for damage. • **Is the ABS/TC module C135 OK?**	**Yes** GO to A2 . **No** REPAIR the ABS/TC module C135. CARRY OUT the DATA LINK DIAGNOSTICS test.
A2 CHECK CIRCUIT 70 (LB/WH) BETWEEN THE DLC C251 AND THE ABS/TC MODULE C135 FOR AN OPEN	
• Measure the resistance between the ABS/TC module C135 pin 2, circuit 70 (LB/WH), harness side and the DLC C251 pin 7, circuit 70 (LB/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to A5 . **No** GO to A3 .
A3 CHECK IN-LINE C213	
• Disconnect: In-Line C213. • Inspect in-lines C213M and C213F for damage. • **Are in-lines C213M and C213F OK?**	**Yes** GO to A4 . **No** REPAIR in-lines C213M and C213F. CARRY OUT the DATA LINK DIAGNOSTICS test.
A4 CHECK CIRCUIT 70 (LB/WH) BETWEEN IN-LINE C213F AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between in-line C213F pin 12, circuit 70 (LB/WH), harness side and the DLC C251 pin 7,	**Yes** REPAIR circuit 70 (LB/WH)

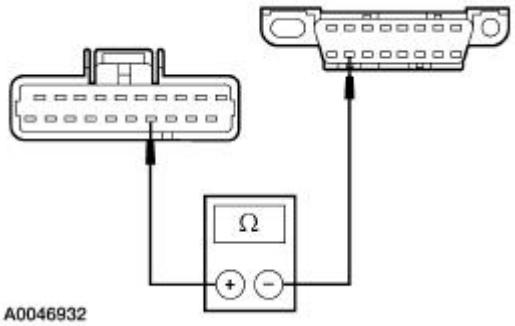


circuit 70 (LB/WH), harness side.  ● **Is the resistance less than 5 ohms?**	between in-line C213M and ABS/TC module C135. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR circuit 70 (LB/WH) between DLC C251 and in-line C213F. CARRY OUT the DATA LINK DIAGNOSTICS test.
A5 CHECK FOR CORRECT ABS/TC MODULE OPERATION	
● Disconnect all the ABS/TC module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the ABS/TC module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new ABS/TC module. REFER to Section 206-09A . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

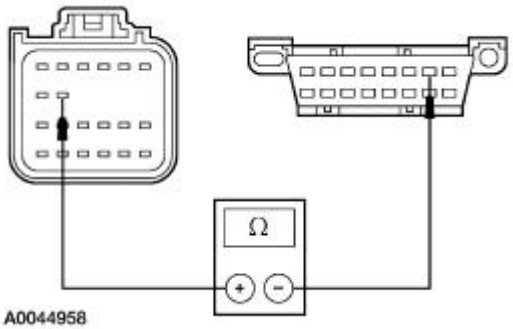
PINPOINT TEST B: THE 4-WHEEL ANTI-LOCK BRAKE/TRACTION CONTROL (ABS/TC) MODULE OR STABILITY ASSIST MODULE (IF EQUIPPED) DOES NOT RESPOND TO THE DIAGNOSTIC TOOL (SCP)

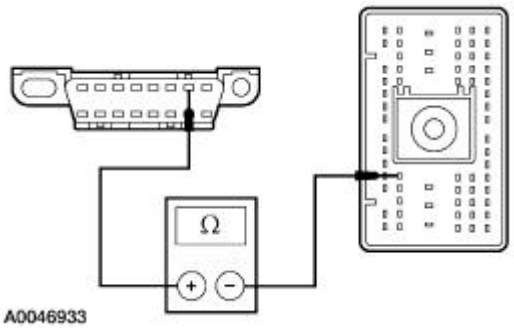


Test Step	Result / Action to Take
B1 CHECK THE ABS/TC MODULE C135	
● Key in OFF position. ● Disconnect: ABS/TC Module C135. ● Inspect the ABS/TC module C135 for damage. ● **Is the ABS/TC module C135 OK?**	**Yes** GO to B2 . **No** REPAIR the ABS/TC Module C135. CARRY OUT the DATA LINK DIAGNOSTICS test.
B2 CHECK CIRCUITS 914 (TN/OG) AND 915 (PK/LB) BETWEEN THE ABS/TC MODULE C135 AND THE DLC C251 FOR AN OPEN	
● Measure the resistance between the ABS/TC module C135 pin 12, circuit 914 (TN/OG), harness side and the DLC C251 pin 2, circuit 914 (TN/OG), harness side.	**Yes** GO to B5 . **No** GO to B3 .



- Measure the resistance between the ABS/TC module C135 pin 14, circuit 915 (PK/LB), harness side and the DLC C251 pin 10, circuit 915 (PK/LB), harness side.

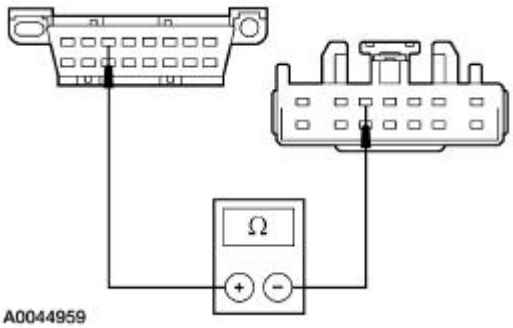


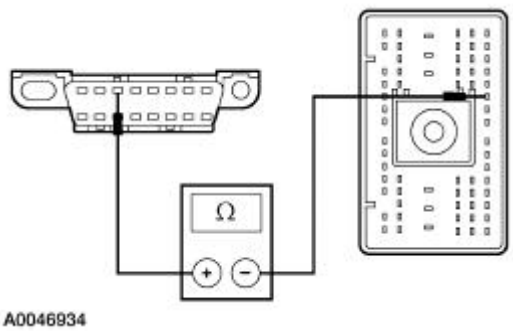


- **Are the resistances less than 5 ohms?**

B3 CHECK IN-LINE C210 FOR DAMAGE - Disconnect: In-Line C210. - Inspect in-lines C210M and C210F for damage. - **Are in-lines C210M and C210F OK?**	**Yes** GO to B4 . **No** REPAIR the in-lines C210M and C210F. CARRY OUT the DATA LINK DIAGNOSTICS test.
B4 CHECK CIRCUITS 914 (TN/OG) AND 915 (PK/LB) BETWEEN IN-LINE C210F AND THE DLC C251 FOR AN OPEN - Measure the resistance between in-line C210F pin 15, circuit 914 (TN/OG), harness side and the DLC C251 pin 2, circuit 914 (TN/OG), harness side.  - Measure the resistance between in-line C210F pin 14 circuit 915 (PK/LB), harness side and the DLC C251 pin 10, circuit 915 (PK/LB), harness side.	**Yes** REPAIR the circuit(s) in question between in-line C210M and the ABS/TC module C135. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit(s) in question between in-line C210F and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.

 ● **Are the resistances less than 5 ohms?**	
B5 CHECK FOR CORRECT ABS/TC MODULE OPERATION ● Disconnect all the ABS/TC module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the ABS/TC module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new ABS/TC module. REFER to Section 206-09A . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

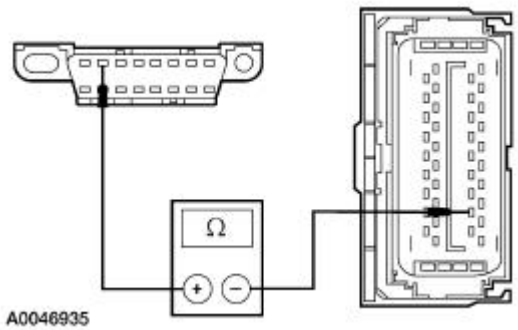


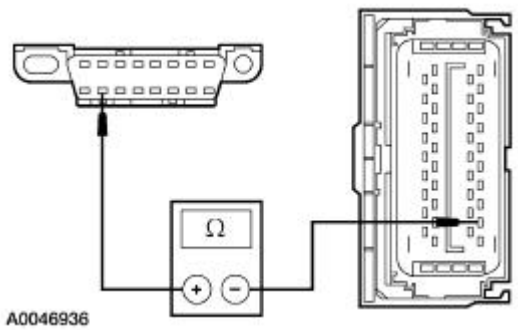


PINPOINT TEST C: THE RESTRAINT CONTROL MODULE (RCM) DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

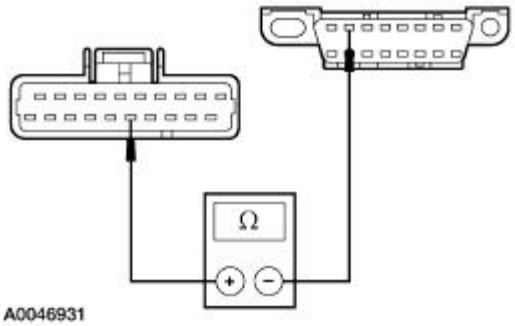
Test Step	Result / Action to Take
C1 CHECK THE RCM C310a FOR DAMAGE ● Key in OFF position. ● Deactivate the air bag system; refer to Section 501-20B . ● Disconnect: RCM C310a. ● Inspect the RCM C310a for damage. ● **Is the RCM C310a OK?**	**Yes** GO to C2 . **No** REPAIR the RCM C310a. CARRY OUT the DATA LINK DIAGNOSTICS test.
C2 CHECK CIRCUIT 70 (LB/WH) BETWEEN THE DLC C251 AND THE RCM C310a FOR AN OPEN ● Measure the resistance between the RCM C310a pin 11, circuit 70 (LB/WH), harness side and the DLC C251 pin 7, circuit 70 (LB/WH), harness side.	**Yes** GO to C4 . **No** GO to C3 .

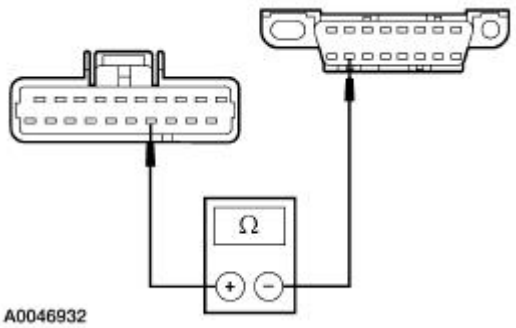
 ● **Is the resistance less than 5 ohms?**	
C3 CHECK THE RESISTANCE BETWEEN IN-LINE C238M AND THE DLC C251	
● Measure the resistance between in-line C238M pin 48, circuit 70 (LB/WH), harness side and the DLC C251 pin 7, circuit 70 (LB/WH), harness side.  ● **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between in-line C238F and the RCM C310a. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
C4 CHECK FOR CORRECT RCM OPERATION	
● Disconnect all the RCM connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the RCM connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new RCM; REFER to Section 501-20B . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.





PINPOINT TEST D: THE VEHICLE SECURITY MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

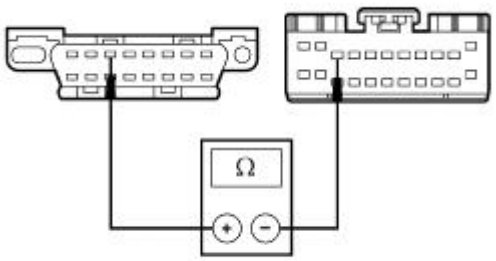




Test Step	Result / Action to Take
D1 CHECK THE VEHICLE SECURITY MODULE C2113c FOR DAMAGE	
● Key in OFF position. ● Disconnect the battery before removal of any vehicle security module connectors. Refer to Section 414-01 .	**Yes** GO to D2 .

• Disconnect: Vehicle Security Module C2113c. • Inspect the vehicle security module C2113c for damage. • **Is the vehicle security module C2113c OK?**	**No** REPAIR the vehicle security module C2113c. CARRY OUT the DATA LINK DIAGNOSTICS test.
D2 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE VEHICLE SECURITY MODULE C2113c FOR AN OPEN	
• Measure the resistance between the vehicle security module C2113c pin 5, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to D4 . **No** GO to D3 .
D3 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between in-line C238M pin 6, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between the vehicle security module and in-line C238F. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit between the DLC C251 and in-line C238M. CARRY OUT the DATA LINK DIAGNOSTICS test.
D4 CHECK FOR CORRECT VEHICLE SECURITY MODULE OPERATION	
• Disconnect all the vehicle security module connectors. • Check for: • corrosion • pushed-out pins • Re-connect the battery. Refer to Section 414-01 . • Connect all the vehicle security module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new vehicle security module. REFER to Section 419-10 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the

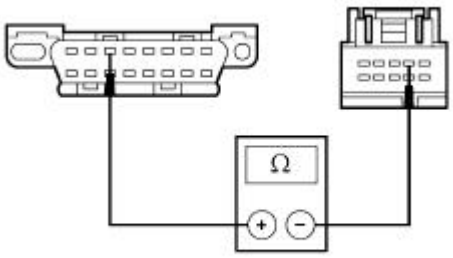
	self-test. CARRY OUT the DATA LINK DIAGNOSTICS test.

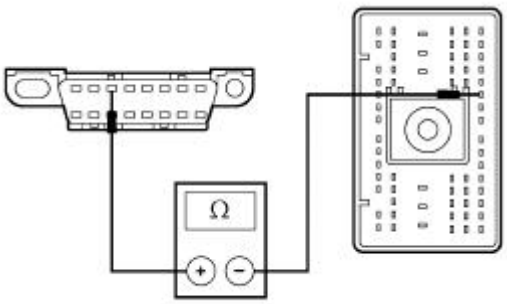


PINPOINT TEST E: THE POWERTRAIN CONTROL MODULE (PCM) DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

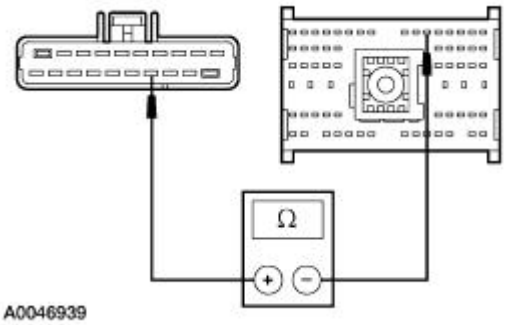
Test Step	Result / Action to Take
E1 CHECK THE PCM C175a	
• Key in OFF position. • Disconnect: PCM C175a. • Inspect the PCM C175a for damage. • **Is the PCM C175a OK?**	**Yes** GO to E2 . **No** REPAIR the PCM C175a. CARRY OUT the DATA LINK DIAGNOSTICS test.
E2 CHECK CIRCUITS 914 (TN/OG) AND 915 (PK/LB) BETWEEN THE PCM C175a AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between the PCM C175a pin 32, circuit 914 (TN/OG), harness side and the DLC C251 pin 2, circuit 914 (TN/OG), harness side.  • Measure the resistance between the PCM C175a pin 44, circuit 915 (PK/LB), harness side and the DLC C251 pin 10, circuit 915 (PK/LB), harness side.  • **Are the resistances less than 5 ohms?**	**Yes** GO to E5 . **No** GO to E3 .
E3 CHECK IN-LINE C210 FOR DAMAGE	
• Disconnect: In-Line C210. • Inspect in-lines C210M and C210F for damage. • **Are in-lines C210M and C210F OK?**	**Yes** GO to E4 . **No** REPAIR the in-lines C210M and C210F. CARRY OUT the

	DATA LINK DIAGNOSTICS test.
E4 CHECK CIRCUITS 914 (TN/OG) AND 915 (PK/LB) BETWEEN IN-LINE C210M AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between in-line C210F pin 15, circuit 914 (TN/OG), harness side and the DLC C251 pin 2, circuit 914 (TN/OG), harness side.  • Measure the resistance between in-line C210F pin 14, circuit 915 (PK/LB), harness side and the DLC C251 pin 10, circuit 915 (PK/LB), harness side.  • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit(s) in question between in-line C210M and the PCM C175a. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit(s) in question between in-line C210F and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
E5 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: • corrosion • pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.





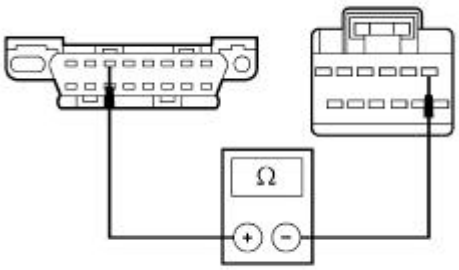
PINPOINT TEST F: THE ELECTRONIC AUTOMATIC TEMPERATURE CONTROL (EATC) MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

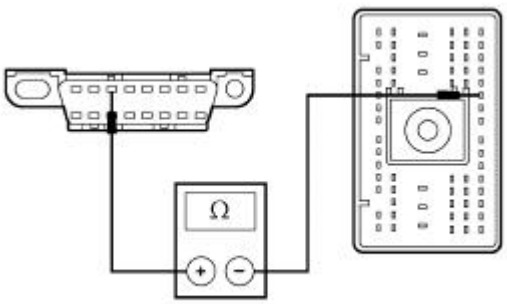


Test Step	Result / Action to Take

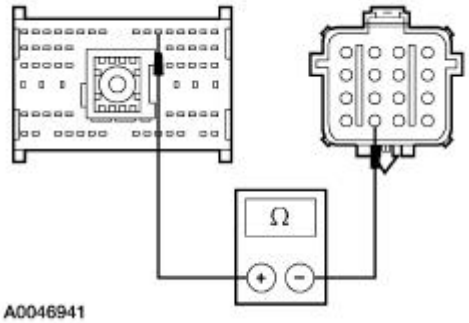
F1 CHECK THE EATC MODULE C228b FOR DAMAGE	
• Key in OFF position. • Disconnect: EATC Module C228b. • Inspect the EATC module C228b for damage. • **Is the EATC module C228b OK?**	**Yes** GO to F2 . **No** REPAIR the EATC module C228b. TEST the system for normal operation.
F2 CHECK CIRCUIT 1906 (VT) FOR AN OPEN	
• Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and the EATC module C228b pin 3, circuit 1906 (VT), harness side.  A0046937 • **Are the resistances less than 5 ohms?**	**Yes** GO to F3 . **No** REPAIR the circuit(s) in question. CARRY OUT the DATA LINK DIAGNOSTICS test.
F3 CHECK FOR CORRECT EATC OPERATION	
• Disconnect all the EATC connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all the EATC connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new EATC module. REFER to Section 412-00 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST G: THE DRIVER SEAT MODULE (DSM) DOES NOT RESPOND TO THE DIAGNOSTIC TOOL





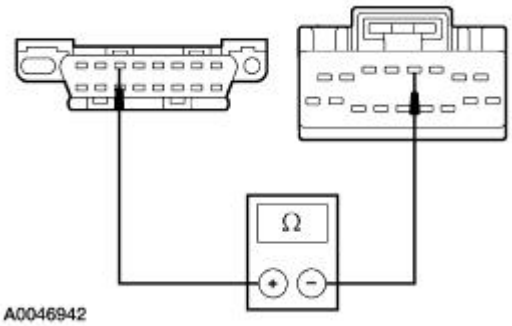
Test Step	Result / Action to Take
G1 CHECK THE DSM C341c FOR DAMAGE	
• Key in OFF position. • Disconnect: DSM C341c. • Inspect the DSM C341c for damage. • **Is the DSM C341c OK?**	**Yes** GO to G2 . **No** REPAIR the DSM C341c. CARRY OUT the DATA LINK DIAGNOSTICS test.
G2 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251	

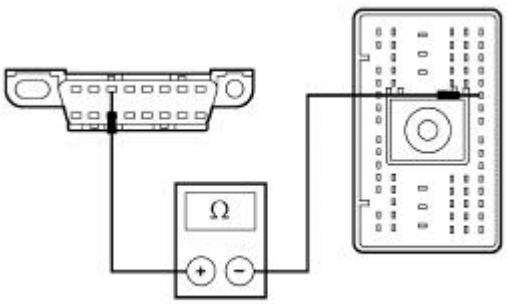


AND THE DSM C341c FOR AN OPEN	
• Measure the resistance between the DSM C341c pin 2, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  A0046938 • **Is the resistance less than 5 ohms?**	**Yes** GO to G7 . **No** GO to G3 .
G3 CHECK IN-LINE C238 FOR DAMAGE	
• Disconnect: In-Line C238. • Inspect in-lines C238M and C238F for damage. • **Are in-lines C238M and C238F OK?**	**Yes** GO to G4 . **No** REPAIR in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
G4 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and in-line C238M pin 6, circuit 1906 (VT), harness side.  A0046934 • **Is the resistance less than 5 ohms?**	**Yes** GO to G5 . **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
G5 CHECK IN-LINE C312 FOR DAMAGE	
• Disconnect: In-Line C312. • Inspect in-lines C312M and C312F for damage. • **Are in-lines C312M and C312F OK?**	**Yes** GO to G6 . **No** REPAIR in-lines C312M and C312F. CARRY OUT the DATA LINK DIAGNOSTICS test.
G6 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238F AND IN-LINE C312F FOR AN OPEN	
• Measure the resistance between in-line C238F pin 6, circuit 1906 (VT), harness side and in-line C312F pin 14, circuit 1906 (VT), harness side.	**Yes** REPAIR the circuit between in-line C312M and the DSM C341c. CARRY OUT the DATA

 ● **Is the resistance less than 5 ohms?**	LINK DIAGNOSTICS test. **No** REPAIR the circuit between in-lines C238F and C312F. CARRY OUT the DATA LINK DIAGNOSTICS test.
G7 CHECK FOR CORRECT DSM OPERATION	
● Disconnect all the DSM connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the DSM connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new DSM. REFER to Section 501-10 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST H: THE PARKING AID MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL





Test Step	Result / Action to Take
H1 CHECK THE PARKING AID MODULE C4014b FOR DAMAGE	
● Key in OFF position. ● Disconnect: Parking Aid Module C4014b. ● Inspect the parking aid module C4014b for damage. ● **Is the parking aid module C4014b OK?**	**Yes** GO to H2 . **No** REPAIR the parking aid module C4014b. CARRY OUT the DATA LINK DIAGNOSTICS test.
H2 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE PARKING AID MODULE C4014b FOR AN OPEN	
● Measure the resistance between the parking aid module C4014b pin 1, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.	**Yes** GO to H7 . **No** GO to H3 .

 A0046940 ● **Is the resistance less than 5 ohms?**	
H3 CHECK IN-LINE C238 FOR DAMAGE ● Disconnect: In-Line C238. ● Inspect in-lines C238M and C238F for damage. ● **Are in-lines C238M and C238F OK?**	**Yes** GO to H4 . **No** REPAIR in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
H4 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN ● Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and in-line C238M pin 6, circuit 1906 (VT), harness side.  A0046934 ● **Is the resistance less than 5 ohms?**	**Yes** GO to H5 . **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
H5 CHECK IN-LINE C465 FOR DAMAGE ● Disconnect: In-Line C465. ● Inspect in-lines C465M and C465F for damage. ● **Are in-lines C465M and C465F OK?**	**Yes** GO to H6 . **No** REPAIR in-lines C465M and C465F. CARRY OUT the DATA LINK DIAGNOSTICS test.
H6 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238F AND IN-LINE C465F FOR AN OPEN ● Measure the resistance between in-line C238F pin 6, circuit 1906 (VT), harness side and in-line C465F pin 15, circuit 1906 (VT), harness side.	**Yes** REPAIR the circuit between in-line C465M and the parking aid module C4014b. CARRY OUT the DATA LINK DIAGNOSTICS test. **No**

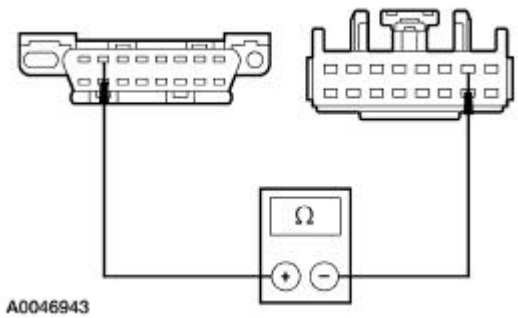
 ● **Is the resistance less than 5 ohms?**	REPAIR the circuit between in-line C238F and in-line C465F. CARRY OUT the DATA LINK DIAGNOSTICS test.
H7 CHECK FOR CORRECT PARKING AID MODULE OPERATION	
● Disconnect all the parking aid module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the parking aid module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new parking aid module. REFER to Section 413-13 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

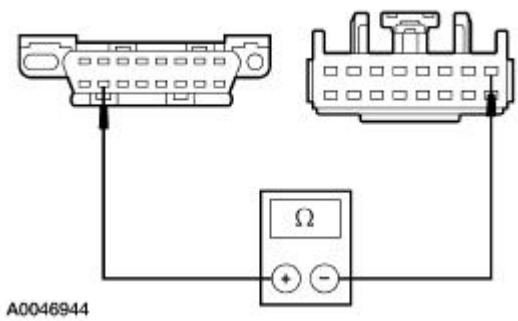
PINPOINT TEST I: THE FOUR-WHEEL DRIVE (4WD) CONTROL MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
I1 CHECK THE 4WD CONTROL MODULE C3184b FOR DAMAGE	
● Key in OFF position. ● Disconnect: 4WD Control Module C3184b. ● Inspect the 4WD control module C3184b for damage. ● **Is the 4WD control module C3184b OK?**	**Yes** GO to I2 . **No** REPAIR the 4WD control module C3184b. CARRY OUT the DATA LINK DIAGNOSTICS test.
I2 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE 4WD CONTROL MODULE C3184b FOR AN OPEN	
● Measure the resistance between the 4WD control module C3184b pin 4, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.	**Yes** GO to I5 . **No** GO to I3 .

 A0046942 ● **Is the resistance less than 5 ohms?**	
I3 CHECK IN-LINE C238 FOR DAMAGE ● Disconnect: In-Line C238. ● Inspect in-lines C238M and C238F for damage. ● **Are in-lines C238M and C238F OK?**	**Yes** GO to I4 . **No** REPAIR in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
I4 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN ● Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and in-line C238M pin 6, circuit 1906 (VT), harness side.  A0046934 ● **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between in-line C238F and the 4WD control module C3184b. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
I5 CHECK FOR CORRECT 4WD CONTROL MODULE OPERATION ● Disconnect all the 4WD control module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the 4WD control module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new 4WD control module. REFER to Section 308-07A . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST J: THE INSTRUMENT CLUSTER DOES NOT RESPOND TO THE DIAGNOSTIC TOOL (SCP)



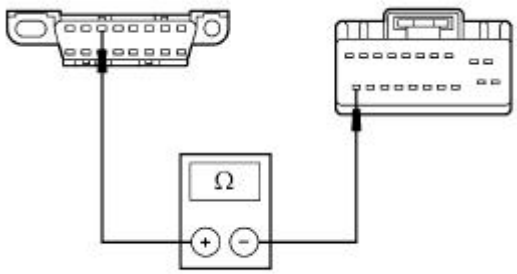


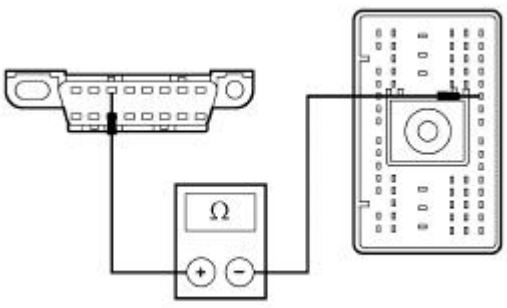
Test Step	Result / Action to Take
J1 CHECK THE INSTRUMENT CLUSTER C220a FOR DAMAGE	
• Key in OFF position. • Disconnect: Instrument Cluster C220a. • Inspect the instrument cluster C220a for damage. • **Is the instrument cluster C220a OK?**	**Yes** GO to J2. **No** REPAIR the instrument cluster C220a. CARRY OUT the DATA LINK DIAGNOSTICS test.
J2 CHECK CIRCUITS 914 (TN/OG) AND 915 (PK/LB) FOR AN OPEN	
• Measure the resistance between the DLC C251 pin 2, circuit 914 (TN/OG), harness side and the instrument cluster C220a pin 8, circuit 914 (TN/OG), harness side.  • Measure the resistance between the DLC C251 pin 10, circuit 915 (PK/LB), harness side and the instrument cluster C220a pin 9, circuit 915 (PK/LB), harness side.  • **Are the resistances less than 5 ohms?**	**Yes** GO to J3. **No** REPAIR the circuit(s) in question. CARRY OUT the DATA LINK DIAGNOSTICS test.
J3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all the instrument cluster connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all the instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-00. TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No**

	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

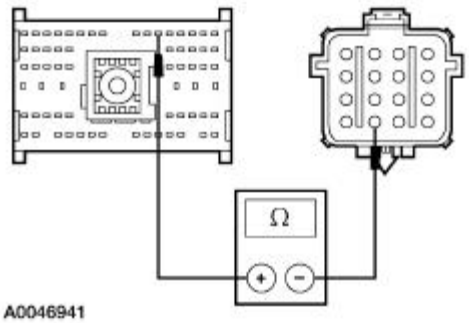
PINPOINT TEST K: THE INSTRUMENT CLUSTER DOES NOT RESPOND TO THE DIAGNOSTIC TOOL (UBP)

Test Step	Result / Action to Take
K1 CHECK THE INSTRUMENT CLUSTER C220a FOR DAMAGE	
• Key in OFF position. • Disconnect: Instrument Cluster C220a. • Inspect the instrument cluster C220a for damage. • **Is the instrument cluster C220a OK?**	**Yes** GO to K2 . **No** REPAIR the instrument cluster C220a. CARRY OUT the DATA LINK DIAGNOSTICS test.
K2 CHECK CIRCUIT 1906 (VT) FOR AN OPEN	
• Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and the instrument cluster C220a pin 7, circuit 1906 (VT), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to K3 . **No** REPAIR the circuit in question. CARRY OUT the DATA LINK DIAGNOSTICS test.
K3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all the instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all the instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.





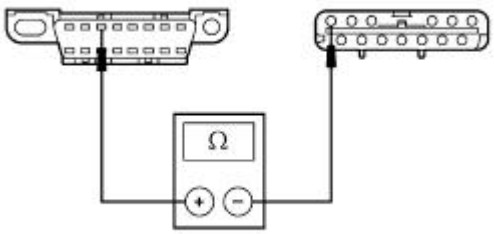
PINPOINT TEST L: THE TIRE PRESSURE MONITOR MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

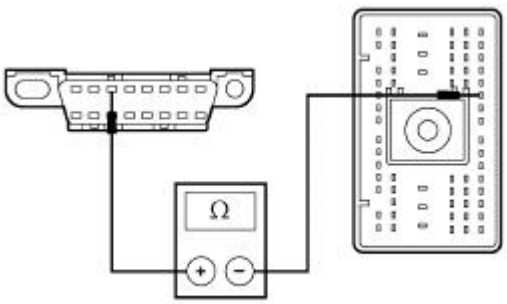


Test Step	Result / Action to Take
L1 CHECK THE TIRE PRESSURE MONITOR MODULE C3183	
• Key in OFF position. • Disconnect: Tire Pressure Monitor Module C3183. • Inspect the tire pressure monitor module C3183 for damage. • **Is the tire pressure monitor module C3183 OK?**	**Yes** GO to L2 . **No** REPAIR the tire pressure monitor module C3183 CARRY OUT the DATA LINK DIAGNOSTICS test.
L2 CHECK CIRCUITS 914 (TN/OG) AND 915 (PK/LB) BETWEEN THE TIRE PRESSURE MONITOR MODULE C3183 AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between the tire pressure monitor module C3183 pin 2, circuit 914 (TN/OG), harness side and the DLC C251 pin 2, circuit 914 (TN/OG), harness side.  A0046943 • Measure the resistance between the tire pressure monitor module C3183 pin 1, circuit 915 (PK/LB), harness side and the DLC C251 pin 10, circuit 915 (PK/LB), harness side.  A0046944 • **Are the resistances less than 5 ohms?**	**Yes** GO to L5 . **No** GO to L3 .
L3 CHECK IN-LINE C238 FOR DAMAGE	
• Disconnect: In-Line C238. • Inspect in-lines C238M and C238F for damage. • **Are in-lines C238M and C238F OK?**	**Yes** GO to L4 . **No** REPAIR the in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
L4 CHECK CIRCUITS 914 (TN/OG) AND 915 (PK/LB) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN	

OPEN	
• Measure the resistance between in-line C238M pin 34, circuit 914 (TN/OG), harness side and the DLC C251 pin 2, circuit 914 (TN/OG), harness side.  A0049339 • Measure the resistance between in-line C238M pin 33, circuit 915 (PK/LB), harness side and the DLC C251 pin 10, circuit 915 (PK/LB), harness side.  A0046946 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit(s) in question between in-line C238F and the tire pressure monitor module C3183 CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit(s) in question between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
L5 CHECK FOR CORRECT TIRE PRESSURE MONITOR MODULE OPERATION	
• Disconnect all the tire pressure monitor module connectors. • Check for: • corrosion • pushed-out pins • Connect all the tire pressure monitor module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new tire pressure monitor module. REFER to Section 413-08 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST M: THE POWER LIFTGATE MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

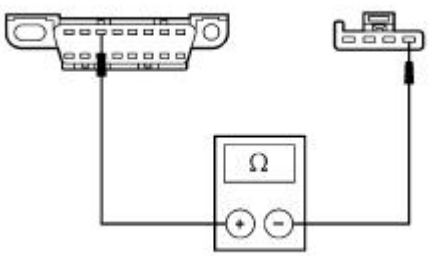




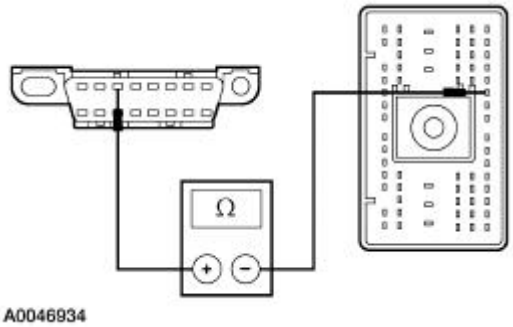
Test Step	Result / Action to Take
M1 CHECK THE POWER LIFTGATE MODULE C4174d FOR DAMAGE	
• Key in OFF position.	**Yes**

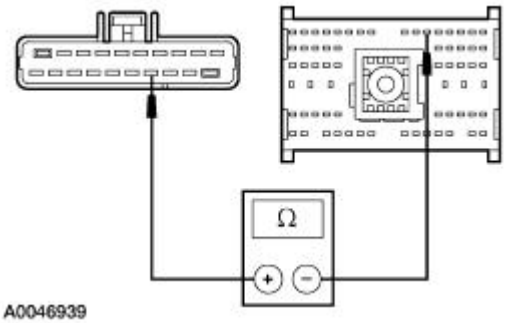
• Disconnect: Power Liftgate Module C4174d. • Inspect the power liftgate module C4174d for damage. • **Is the power liftgate module C4174d OK?**	GO to M2 . **No** REPAIR the power liftgate module C4174d. CARRY OUT the DATA LINK DIAGNOSTICS test.
M2 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE POWER LIFTGATE MODULE C4174d FOR AN OPEN	
• Measure the resistance between the power liftgate module C4174d pin 20, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  A0046947 • **Is the resistance less than 5 ohms?**	**Yes** GO to M7 . **No** GO to M3 .
M3 CHECK IN-LINE C238 FOR DAMAGE	
• Disconnect: In-Line C238. • Inspect in-lines C238M and C238F for damage. • **Are in-lines C238M and C238F OK?**	**Yes** GO to M4 . **No** REPAIR in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
M4 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and in-line C238M pin 6, circuit 1906 (VT), harness side.  A0046934 • **Is the resistance less than 5 ohms?**	**Yes** GO to M5 . **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
M5 CHECK IN-LINE C465 FOR DAMAGE	
• Disconnect: In-Line C465. • Inspect in-lines C465M and C465F for damage. • **Are in-lines C465M and C465F OK?**	**Yes** GO to M6 . **No** REPAIR in-lines C465M and

	C465F. CARRY OUT the DATA LINK DIAGNOSTICS test.
M6 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238F AND IN-LINE C465F FOR AN OPEN	
• Measure the resistance between in-line C238F pin 6, circuit 1906 (VT), harness side and in-line C465F pin 15, circuit 1906 (VT), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between in-line C465M and the power liftgate module C4174d. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit between in-line C238F and in-line C465F. CARRY OUT the DATA LINK DIAGNOSTICS test.
M7 CHECK FOR CORRECT PARKING AID MODULE OPERATION	
• Disconnect all the power liftgate module connectors. • Check for: • corrosion • pushed-out pins • Connect all the power liftgate module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new power liftgate module. REFER to Section 501-03 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

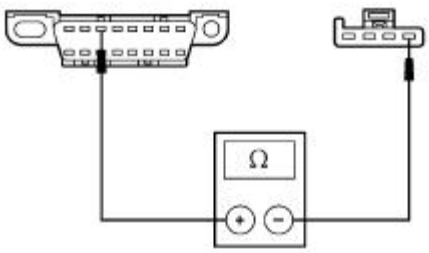


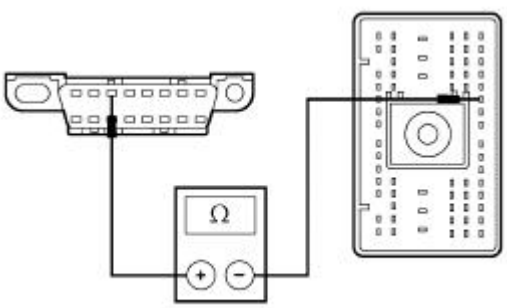
PINPOINT TEST N: THE AIR SUSPENSION CONTROL MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL





Test Step	Result / Action to Take
N1 CHECK THE AIR SUSPENSION CONTROL MODULE C2131b FOR DAMAGE	
• Key in OFF position. • Disconnect: Air Suspension Control Module C2131b. • Inspect the air suspension control module C2131b for damage. • **Is the air suspension control module C2131b OK?**	**Yes** GO to N2 . **No** REPAIR the air suspension control module C2131b. CARRY OUT the DATA LINK DIAGNOSTICS test.
N2 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE AIR SUSPENSION CONTROL C2131b FOR AN OPEN	





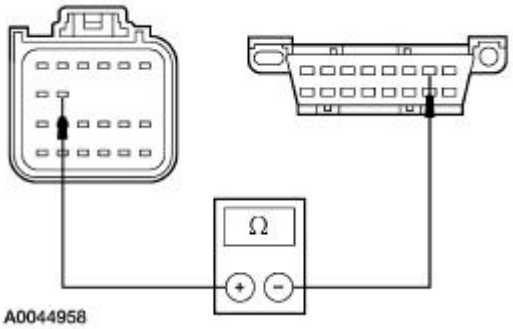
• Measure the resistance between the air suspension control module C2131b pin 26, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  A0046948 • **Is the resistance less than 5 ohms?**	**Yes** GO to N5 . **No** GO to N3 .
N3 CHECK IN-LINE C238 FOR DAMAGE	
• Disconnect: In-Line C238. • Inspect in-lines C238M and C238F for damage. • **Are in-lines C238M and C238F OK?**	**Yes** GO to N4 . **No** REPAIR in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
N4 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and in-line C238M pin 6, circuit 1906 (VT), harness side.  A0046934 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between in-line C238F and the air suspension control module C2131b. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
N5 CHECK FOR CORRECT AIR SUSPENSION CONTROL MODULE OPERATION	
• Disconnect all the air suspension control module connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all the air suspension control module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new air suspension control module. REFER to Section 204-05 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a

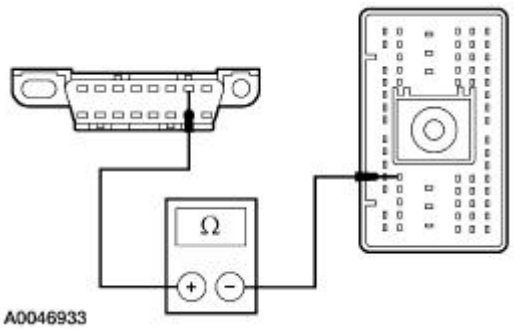
	loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST O: THE CLIMATE CONTROLLED SEAT MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
O1 CHECK THE CLIMATE CONTROLLED SEAT MODULE C3031b FOR DAMAGE	
• Key in OFF position. • If the passenger seat module does not respond to the diagnostic tool, GO to O8. • Disconnect: Climate Controlled Seat Module C3031b. • Inspect the climate controlled seat module C3031b for damage. • **Is the climate controlled seat module C3031b OK?**	**Yes** GO to O2 . **No** REPAIR the climate controlled seat module C3031b. CARRY OUT the DATA LINK DIAGNOSTICS test.
O2 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE CLIMATE CONTROLLED SEAT MODULE C3031b FOR AN OPEN	
• Measure the resistance between the climate controlled seat module C3031b pin 1, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  A0046949 • **Is the resistance less than 5 ohms?**	**Yes** GO to O7 . **No** GO to O3 .
O3 CHECK IN-LINE C238 FOR DAMAGE	
• Disconnect: In-Line C238. • Inspect in-lines C238M and C238F for damage. • **Are in-lines C238M and C238F OK?**	**Yes** GO to O4 . **No** REPAIR in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
O4 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and in-line C238M pin 6, circuit 1906 (VT), harness side.	**Yes** GO to O5 . **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the

 A0046934 ● **Is the resistance less than 5 ohms?**	DATA LINK DIAGNOSTICS test.
O5 CHECK IN-LINE C312 FOR DAMAGE	
● Disconnect: In-Line C312. ● Inspect in-lines C312M and C312F for damage. ● **Are in-lines C312M and C312F OK?**	**Yes** GO to O6 . **No** REPAIR in-lines C312M and C312F. CARRY OUT the DATA LINK DIAGNOSTICS test.
O6 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238F AND IN-LINE C312F FOR AN OPEN	
● Measure the resistance between in-line C238F pin 6, circuit 1906 (VT), harness side and in-line C312F pin 14, circuit 1906 (VT), harness side.  A0046939 ● **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between in-line C312M and the climate controlled seat module C3036b. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit between in-lines C238F and C312F. CARRY OUT the DATA LINK DIAGNOSTICS test.
O7 CHECK FOR CORRECT CLIMATE CONTROLLED SEAT MODULE OPERATION	
● Disconnect all the climate controlled seat module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the climate controlled seat module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new climate controlled seat module. REFER to Section 501-10 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
O8 CHECK THE CLIMATE CONTROLLED SEAT MODULE	



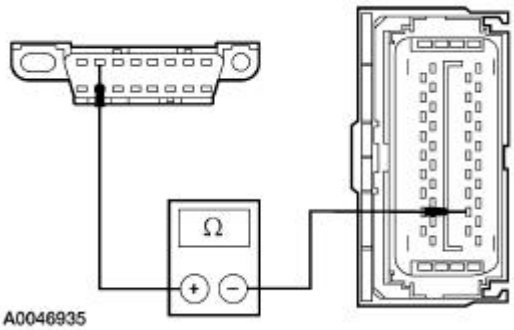


C3036B FOR DAMAGE	
• Key in OFF position. • Disconnect: Climate Controlled Seat Module C3036b. • Inspect the climate controlled seat module C3036b for damage. • **Is the climate controlled seat module C3036b OK?**	**Yes** GO to O9 . **No** REPAIR the climate controlled seat module C3036b. CARRY OUT the DATA LINK DIAGNOSTICS test.
O9 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE CLIMATE CONTROLLED SEAT MODULE C3036B FOR AN OPEN	
• Measure the resistance between the climate controlled seat module C3036b pin 1, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  A0046949 • **Is the resistance less than 5 ohms?**	**Yes** GO to O14 . **No** GO to O10 .
O10 CHECK IN-LINE C238 FOR DAMAGE	
• Disconnect: In-Line C238. • Inspect in-lines C238M and C238F for damage. • **Are lines C238M and C238F OK?**	**Yes** GO to O11 . **No** REPAIR in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
O11 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AND OPEN	
• Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and in-line C238M pin 6, circuit 1906 (VT), harness side.  A0046934 • **Is the resistance less than 5 ohms?**	**Yes** GO to O12 . **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
O12 CHECK IN-LINE C313 FOR DAMAGE	
• Disconnect: In-Line C313. • Inspect in-lines C313M and C313F for damage.	**Yes** GO to O13 .

• **Are in-lines C313M and C313F OK?**	**No** REPAIR in-lines C313M and C313F. CARRY OUT the DATA LINK DIAGNOSTICS test.
O13 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238F AND IN-LINE C313F FOR AN OPEN	
• Measure the resistance between in-line C238F pin 6, circuit 1906 (VT), harness side and in-line C313F pin 2, circuit 1906 (VT), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between in-line C313M and the climate controlled seat module C3036b. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit between in-lines C238F and C313F. CARRY OUT the DATA LINK DIAGNOSTICS test.
O14 CHECK FOR CORRECT CLIMATE CONTROLLED SEAT MODULE OPERATION	
• Disconnect all the climate controlled seat module connectors. • Check for: • corrosion • pushed-out pins • Connect all the climate controlled seat module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new climate controlled seat module. REFER to Section 501-10 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST P: NO INTERNATIONAL STANDARDS ORGINIZATION (ISO) 9141 NETWORK COMMUNICATION

Test Step	Result / Action to Take
P1 CHECK THE DLC C251 FOR DAMAGE	
• Key in OFF position. • Inspect the DLC C251. • **Is the DLC C251 OK?**	**Yes** GO to P2 . **No** REPAIR the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
P2 CHECK THE 4-WHEEL ANTI-LOCK BRAKE/TRACTION	

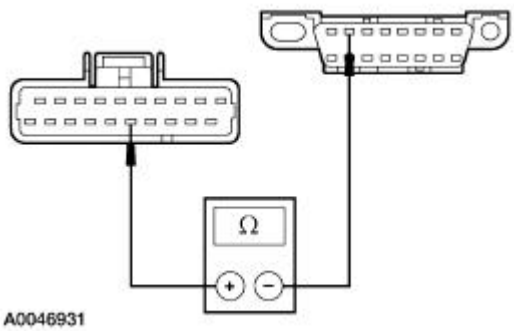


CONTROL (ABS/TC) MODULE OR STABILITY ASSIST MODULE (IF EQUIPPED) C135 FOR DAMAGE	
• Key in OFF position. • Disconnect: ABS/TC Module C135. • Inspect the ABS/TC module C135 for damage. • **Is the ABS/TC module C135 OK?**	**Yes** GO to P3 . **No** REPAIR the ABS/TC module C135. CARRY OUT the DATA LINK DIAGNOSTICS test.
P3 CHECK CIRCUIT 70 (LB/WH) BETWEEN THE DLC C251 AND THE ABS/TC MODULE C135 FOR AN OPEN	
• Measure the resistance between the ABS/TC module C135 pin 2, circuit 70 (LB/WH), harness side and the DLC C251 pin 7, circuit 70 (LB/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to P5 . **No** GO to P4 .
P4 CHECK CIRCUIT 70 (LB/WH) BETWEEN IN-LINE C213F AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between in-line C213F pin 12, circuit 70 (LB/WH), harness side and the DLC C251 pin 7, circuit 70 (LB/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR circuit 70 (LB/WH) between in-line C213M and ABS module C135. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR circuit 70 (LB/WH) between DLC C251 and in-line C213F. CARRY OUT the DATA LINK DIAGNOSTICS test.
P5 CHECK THE ISO 9141 NETWORK WITH THE ABS/TC MODULE C135 DISCONNECTED	
• Key in ON position. • Carry out the DATA LINK DIAGNOSTICS TEST. • **Did the diagnostic tool indicate SYSTEM PASSED?**	**Yes** GO to P10 . **No** GO to P6 .
P6 CHECK THE RESTRAINT CONTROL MODULE (RCM) C310a FOR DAMAGE	
• Key in OFF position. • Connect: ABS/TC Module C135. • Connect: In-line C213. • Deactivate the air bag system; refer to Section 501-20B . • Disconnect: RCM C310a.	**Yes** GO to P7 . **No** REPAIR the RCM C310a.

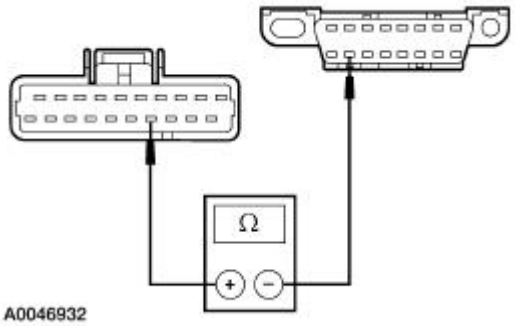
• Inspect the RCM C310a for damage. • **Is the RCM C310a OK?**	CARRY OUT the DATA LINK DIAGNOSTICS test.
P7 CHECK CIRCUIT 70 (LB/WH) BETWEEN THE DLC C251 AND THE RCM C310a FOR AN OPEN	
• Measure the resistance between the RCM C310a pin 11, circuit 70 (LB/WH), harness side and the DLC C251 pin 7, circuit 70 (LB/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to P9 . **No** GO to P8 .
P8 CHECK THE RESISTANCE BETWEEN IN-LINE C238M AND THE DLC C251	
• Measure the resistance between in-line C238M pin 48, circuit 70 (LB/WH), harness side and the DLC C251 pin 7, circuit 70 (LB/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between in-line C238F and the RCM C310a. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
P9 CHECK THE ISO 9141 NETWORK WITH THE RCM C310a DISCONNECTED	
• Key in ON position. • Carry out the DATA LINK DIAGNOSTICS TEST. • **Did the diagnostic tool indicate SYSTEM PASSED?**	**Yes** GO to P11 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
P10 CHECK FOR CORRECT ABS/TC MODULE OPERATION	
• Disconnect all the ABS/TC module connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all the ABS/TC module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS/TC module. REFER to Section 206-09A . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test.

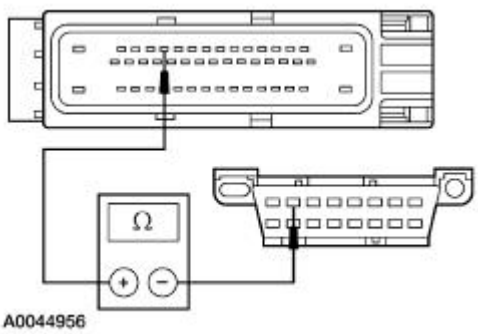
	No The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
P11 CHECK FOR CORRECT RCM OPERATION ● Disconnect all the RCM connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the RCM connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new RCM; REFER to Section 501-20B . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

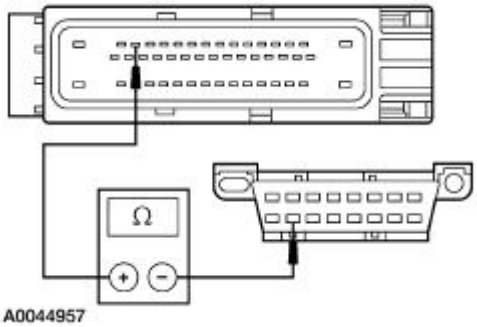
PINPOINT TEST Q: NO STANDARD CORPORATE PROTOCOL (SCP) NETWORK COMMUNICATION

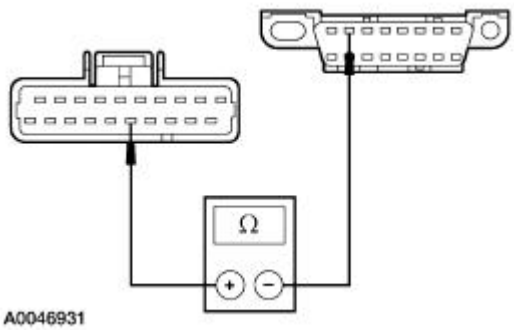


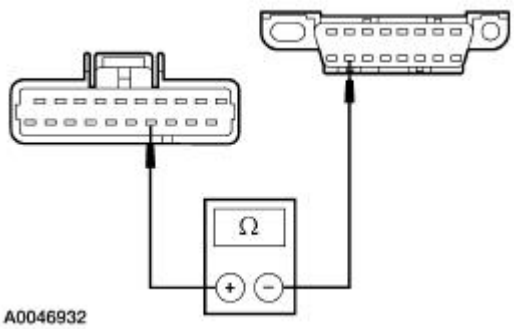
Test Step	Result / Action to Take
Q1 CHECK THE DLC C251 FOR DAMAGE ● Key in OFF position. ● Inspect the DLC C251 for damage. ● **Is the DLC C251 OK?**	**Yes** GO to Q2 . **No** REPAIR the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
Q2 CHECK THE POWERTRAIN CONTROL MODULE (PCM) C175a ● Key in OFF position. ● Disconnect: PCM C175a. ● Inspect the PCM C175a for damage. ● **Is the PCM C175a OK?**	**Yes** GO to Q3 . **No** REPAIR the PCM C175a. CARRY OUT the DATA LINK DIAGNOSTICS test.
Q3 CHECK CIRCUITS 914 (TN/OG) AND 915 (PK/LB) BETWEEN THE PCM C175a AND THE DLC C251 FOR AN OPEN ● Measure the resistance between the PCM C175a pin 32, circuit 914 (TN/OG), harness side and the DLC C251 pin 2, circuit 914 (TN/OG), harness side.	**Yes** GO to Q6 . **No** GO to Q4 .



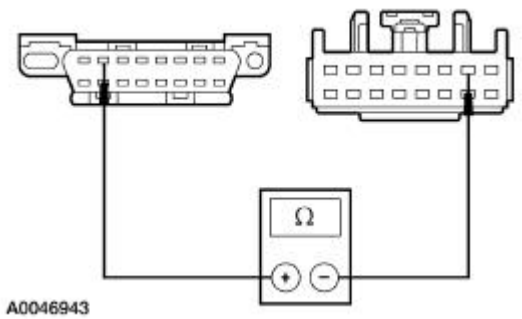


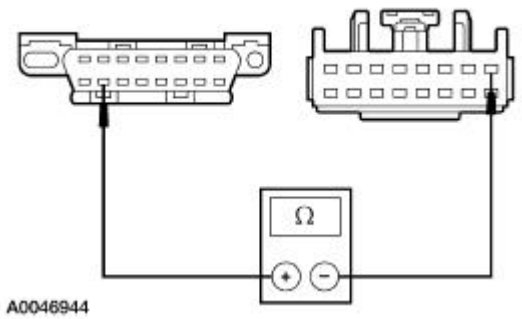


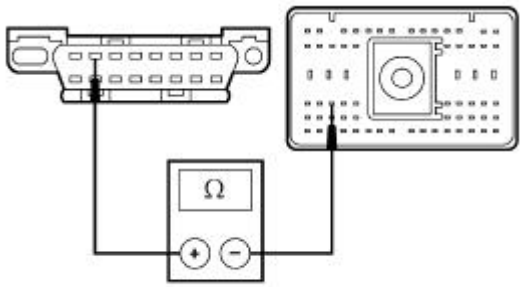


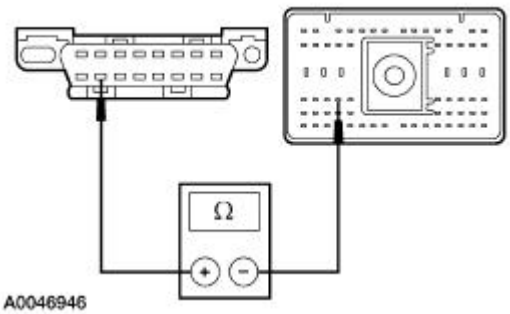


- Measure the resistance between the PCM C175a pin 44, circuit 915 (PK/LB), harness side and the DLC C251 pin 10, circuit 915 (PK/LB), harness side.

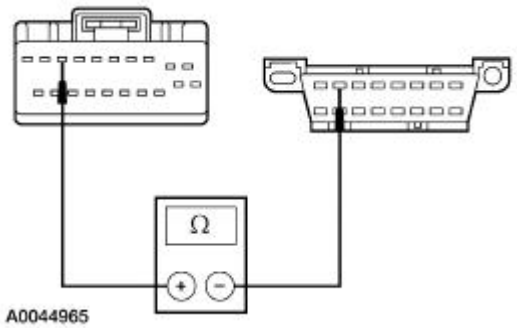


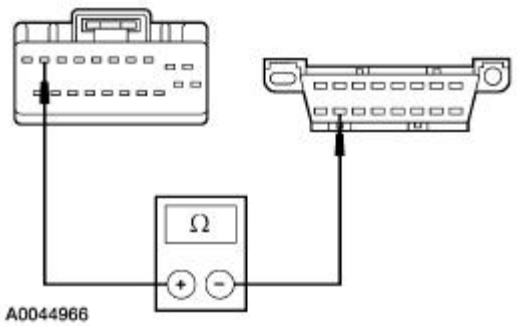






- **Are the resistances less than 5 ohms?**



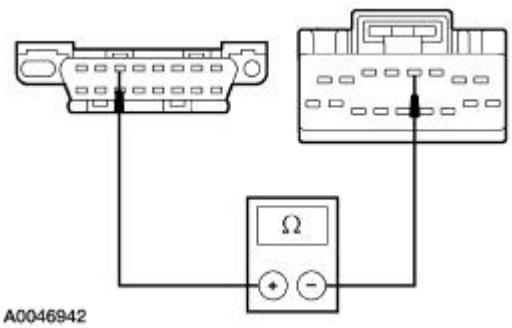


Q4 CHECK IN-LINE C210 FOR DAMAGE - Disconnect: In-Line C210. - Inspect in-lines C210M and C210F for damage. - **Are in-lines C210M and C210F OK?**	**Yes** GO to Q5 . **No** REPAIR the in-lines C210M and C210F. CARRY OUT the DATA LINK DIAGNOSTICS test.
Q5 CHECK CIRCUITS 914 (TN/OG) AND 915 (PK/LB) BETWEEN IN-LINE C210M AND THE DLC C251 FOR AN OPEN - Measure the resistance between in-line C210F pin 15, circuit 914 (TN/OG), harness side and the DLC C251 pin 2, circuit 914 (TN/OG), harness side.  - Measure the resistance between in-line C210F pin 14, circuit 915 (PK/LB), harness side and the DLC C251 pin 10, circuit 915 (PK/LB), harness side.	**Yes** REPAIR the circuit(s) in question between in-line C210M and the PCM C175a. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit(s) in question between in-line C210F and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.

 A0046932 ● **Are the resistances less than 5 ohms?**	
Q6 CHECK THE SCP NETWORK WITH THE PCM C175a DISCONNECTED	
● Key in ON position. ● Carry out the DATA LINK DIAGNOSTICS TEST. ● **Did the diagnostic tool indicate SYSTEM PASSED?**	**Yes** GO to Q20 . **No** GO to Q7 .
Q7 CHECK THE 4-WHEEL ANTI-LOCK BRAKE/TRACTION CONTROL (ABS/TC) MODULE OR STABILITY ASSIST MODULE (IF EQUIPPED) C135	
● Key in OFF position. ● Connect: PCM C175. ● Connect: In-Line C210. ● Disconnect: ABS/TC Module C135. ● Inspect the ABS/TC module C135 for damage. ● **Is the ABS/TC module C135 OK?**	**Yes** GO to Q8 . **No** REPAIR the ABS/TC module C135. CARRY OUT the DATA LINK DIAGNOSTICS test.
Q8 CHECK CIRCUITS 914 (TN/OG) AND 915 (PK/LB) BETWEEN THE ABS/TC MODULE C135 AND THE DLC C251 FOR AN OPEN	
● Measure the resistance between the ABS/TC module C135 pin 12, circuit 914 (TN/OG), harness side and the DLC C251 pin 2, circuit 914 (TN/OG), harness side.  A0044956 ● Measure the resistance between the ABS/TC module C135 pin 14, circuit 915 (PK/LB), harness side and the DLC C251 pin 10, circuit 915 (PK/LB), harness side.	**Yes** GO to Q11 . **No** GO to Q9 .

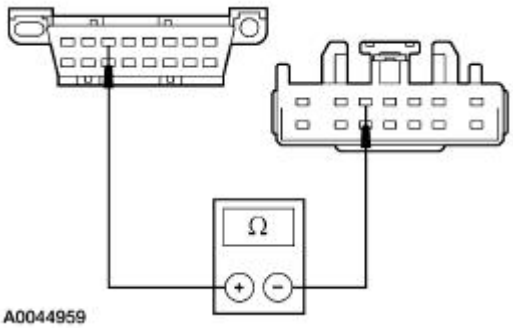
 A0044957 ● **Are the resistances less than 5 ohms?**	
Q9 CHECK IN-LINE C210 FOR DAMAGE ● Disconnect: In-Line C210. ● Inspect in-lines C210M and C210F for damage. ● **Are in-lines C210M and C210F OK?**	**Yes** GO to Q10 . **No** REPAIR the in-lines C210M and C210F. CARRY OUT the DATA LINK DIAGNOSTICS test.
Q10 CHECK CIRCUITS 914 (TN/OG) AND 915 (PK/LB) BETWEEN IN-LINE C210F AND THE DLC C251 FOR AN OPEN ● Measure the resistance between in-line C210F pin 15, circuit 914 (TN/OG), harness side and the DLC C251 pin 2, circuit 914 (TN/OG), harness side.  A0046931 ● Measure the resistance between in-line C210F pin 14 circuit 915 (PK/LB), harness side and the DLC C251 pin 10, circuit 915 (PK/LB), harness side.  A0046932 ● **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit(s) in question between in-line C210M and the ABS/TC module C135. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit(s) in question between in-line C210F and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
Q11 CHECK THE SCP NETWORK WITH THE ABS/TC MODULE C135 DISCONNECTED ● Key in ON position. ● Carry out the DATA LINK DIAGNOSTICS TEST.	**Yes** GO to Q21 .

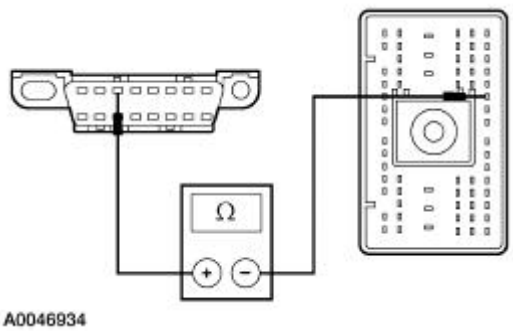
• **Did the diagnostic tool indicate SYSTEM PASSED?**	**No** GO to Q12 .
Q12 CHECK THE TIRE PRESSURE MONITOR MODULE C3183	
• Key in OFF position. • Connect: ABS/TC Module C135. • Connect: In-Line C210. • Disconnect: Tire Pressure Monitor Module C3183. • Inspect the tire pressure monitor module C3183 for damage. • **Is the tire pressure monitor module C3183 OK?**	**Yes** GO to Q13 . **No** REPAIR the tire pressure monitor module C3183. CARRY OUT the DATA LINK DIAGNOSTICS test.
Q13 CHECK CIRCUITS 914 (TN/OG) AND 915 (PK/LB) BETWEEN THE TIRE PRESSURE MONITOR MODULE C3183 AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between the tire pressure monitor module C3183 pin 2, circuit 914 (TN/OG), harness side and the DLC C251 pin 2, circuit 914 (TN/OG), harness side.  A0046943 • Measure the resistance between the tire pressure monitor module C3183 pin 1, circuit 915 (PK/LB), harness side and the DLC C251 pin 10, circuit 915 (PK/LB), harness side.  A0046944 • **Are the resistances less than 5 ohms?**	**Yes** GO to Q16 . **No** GO to Q14 .
Q14 CHECK IN-LINE C238 FOR DAMAGE	
• Disconnect: In-Line C238. • Inspect in-lines C238M and C238F for damage. • **Are in-lines C238M and C238F OK?**	**Yes** GO to Q15 . **No** REPAIR the in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
Q15 CHECK CIRCUITS 914 (TN/OG) AND 915 (PK/LB) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN	



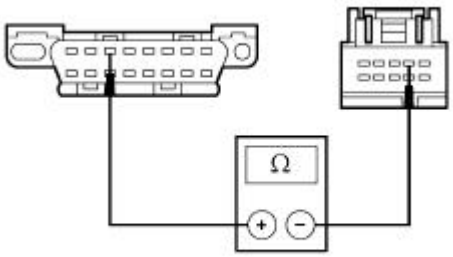
• Measure the resistance between in-line C238M pin 34, circuit 914 (TN/OG), harness side and the DLC C251 pin 2, circuit 914 (TN/OG), harness side.  A0049339 • Measure the resistance between in-line C238M pin 33, circuit 915 (PK/LB), harness side and the DLC C251 pin 10, circuit 915 (PK/LB), harness side.  A0046946 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit(s) in question between in-line C238F and the tire pressure monitor module C3183 CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit(s) in question between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
Q16 CHECK THE SCP NETWORK WITH THE TIRE PRESSURE MONITOR MODULE C3183 DISCONNECTED	
• Key in ON position. • Carry out the DATA LINK DIAGNOSTICS TEST. • **Did the diagnostic tool indicate SYSTEM PASSED?**	**Yes** GO to Q22 . **No** GO to Q17 .
Q17 CHECK THE INSTRUMENT CLUSTER C220a FOR DAMAGE	
• Key in OFF position. • Connect: Tire Pressure Monitor Module C3183. • Connect: In-Line C238. • Disconnect: Instrument Cluster C220a. • Inspect the instrument cluster C220a for damage. • **Is the instrument cluster C220a OK?**	**Yes** GO to Q18 . **No** REPAIR the instrument cluster C220a. TEST the system for normal operation.
Q18 CHECK CIRCUITS 914 (TN/OG) AND 915 (PK/LB) FOR AN OPEN	
• Measure the resistance between the DLC C251 pin 2, circuit 914 (TN/OG), harness side and the instrument cluster C220a pin 8, circuit 914 (TN/OG), harness side.	**Yes** GO to Q19 . **No** REPAIR the circuit(s) in question. CARRY OUT the DATA LINK DIAGNOSTICS test.

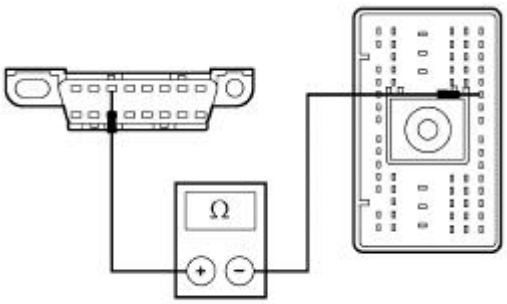
 A0044965 ● Measure the resistance between the DLC C251 pin 10, circuit 915 (PK/LB), harness side and the instrument cluster C220a pin 9, circuit 915 (PK/LB), harness side.  A0044966 ● **Are the resistances less than 5 ohms?**	
Q19 CHECK SCP NETWORK WITH THE INSTRUMENT CLUSTER C220b DISCONNECTED ● Key in ON position. ● Carry out the DATA LINK DIAGNOSTICS TEST. ● **Did the diagnostic tool indicate SYSTEM PASSED?**	**Yes** GO to Q23 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
Q20 CHECK FOR CORRECT PCM OPERATION ● Disconnect all the PCM connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the PCM connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
Q21 CHECK FOR CORRECT ABS/TC MODULE OPERATION ● Disconnect all the ABS/TC module connectors. ● Check for:	**Yes** INSTALL a new ABS/TC



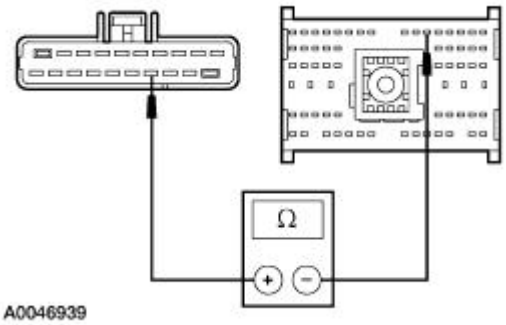


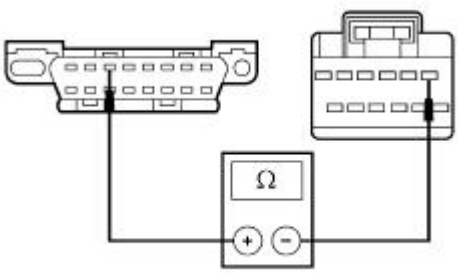
● corrosion ● pushed-out pins ● Connect all the ABS/TC module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	module. REFER to Section 206-09A . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
Q22 CHECK FOR CORRECT TIRE PRESSURE MONITOR MODULE OPERATION	
● Disconnect all the tire pressure monitor module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the tire pressure monitor module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new tire pressure monitor module. REFER to Section 413-08 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
Q23 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
● Disconnect all the instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.



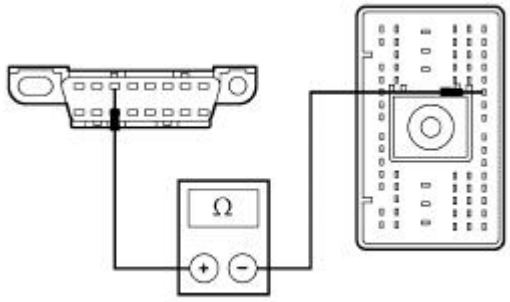


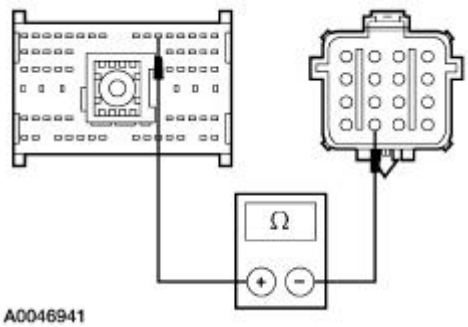
PINPOINT TEST R: NO UART BASED PROTOCOL (UBP) NETWORK COMMUNICATION





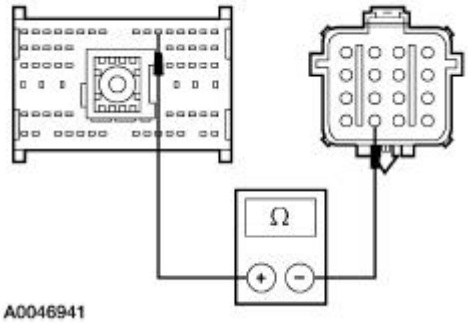
Test Step	Result / Action to Take
R1 CHECK THE DLC C251 FOR DAMAGE	
● Key in OFF position.	**Yes**

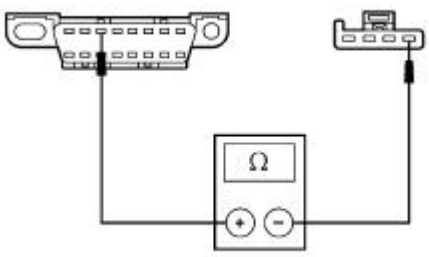




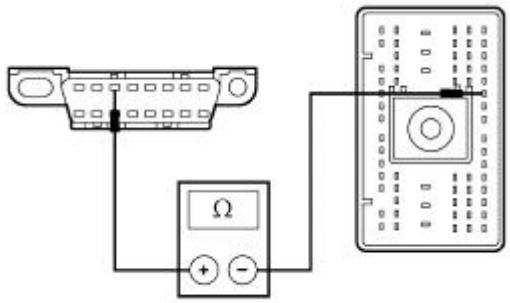
• Inspect the DLC C251 for damage. • **Is the DLC C251 OK?**	GO to R2 . **No** REPAIR the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
R2 CHECK THE FOUR-WHEEL DRIVE (4WD) CONTROL MODULE C3184b FOR DAMAGE	
• Key in OFF position. • Disconnect: 4WD Control Module C3184b. • Inspect the 4WD control module C3184b for damage. • **Is the 4WD control module C3184b OK?**	**Yes** GO to R3 . **No** REPAIR the 4WD control module C3184b. CARRY OUT the DATA LINK DIAGNOSTICS test.
R3 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE 4WD CONTROL MODULE C3184b FOR AN OPEN	
• Measure the resistance between the 4WD control module C3184b pin 4, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to R6 . **No** GO to R4 .
R4 CHECK IN-LINE C238 FOR DAMAGE	
• Disconnect: In-Line C238. • Inspect in-lines C238M and C238F for damage. • **Are in-lines C238M and C238F OK?**	**Yes** GO to R5 . **No** REPAIR in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R5 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and in-line C238M pin 6, circuit 1906 (VT), harness side.	**Yes** REPAIR the circuit between in-line C238F and the 4WD control module C3184b. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.

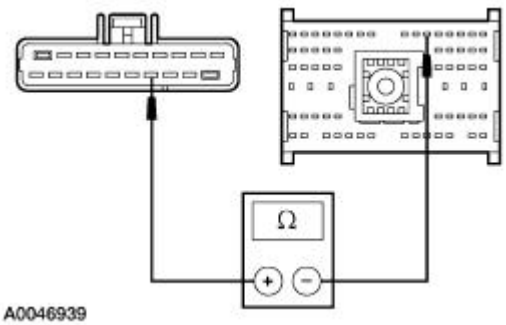
 A0046934 ● **Is the resistance less than 5 ohms?**	
R6 CHECK THE UBP NETWORK WITH THE 4WD CONTROL MODULE C3184b DISCONNECTED ● Key in ON position. ● Carry out the DATA LINK DIAGNOSTICS TEST. ● **Did the diagnostic tool indicate SYSTEM PASSED?**	**Yes** GO to R56 . **No** GO to R7 .
R7 CHECK THE INSTRUMENT CLUSTER C220a FOR DAMAGE ● Key in OFF position. ● Connect: 4WD Control Module C3184b. ● Connect: In-Line C238. ● Disconnect: Instrument Cluster C220a. ● Inspect the instrument cluster C220a for damage. ● **Is the instrument cluster C220a OK?**	**Yes** GO to R8 . **No** REPAIR the instrument cluster C220a. CARRY OUT the DATA LINK DIAGNOSTICS test.
R8 CHECK CIRCUIT 1906 (VT) FOR AN OPEN ● Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and the instrument cluster C220a pin 7, circuit 1906 (VT), harness side.  A0044967 ● **Is the resistance less than 5 ohms?**	**Yes** GO to R9 . **No** REPAIR the circuit in question. CARRY OUT the DATA LINK DIAGNOSTICS test.
R9 CHECK THE UBP NETWORK WITH THE INSTRUMENT CLUSTER C220a DISCONNECTED ● Key in ON position. ● Carry out the DATA LINK DIAGNOSTICS TEST. ● **Did the diagnostic tool indicate SYSTEM PASSED?**	**Yes** GO to R57 . **No** GO to R10 .
R10 CHECK THE VEHICLE SECURITY MODULE C2113c FOR DAMAGE ● Key in OFF position. ● Connect: Instrument Cluster C220a. ● Disconnect the battery before removal of any vehicle	**Yes** GO to R11 .





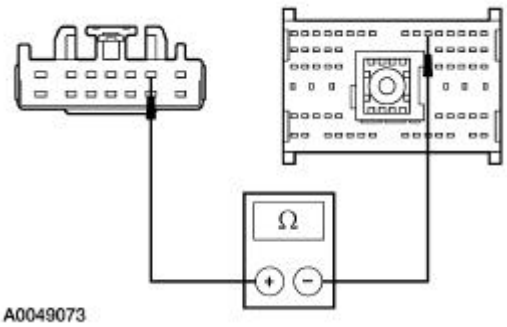
security module connectors. Refer to Section 414-01 . ● Disconnect: Vehicle Security Module C2113c. ● Inspect the vehicle security module C2113c for damage. ● **Is the vehicle security module C2113c OK?**	**No** REPAIR the vehicle security module C2113c. CARRY OUT the DATA LINK DIAGNOSTICS test.
R11 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE VEHICLE SECURITY MODULE C2113c FOR AN OPEN	
● Measure the resistance between the vehicle security module C2113c pin 5, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  ● **Is the resistance less than 5 ohms?**	**Yes** GO to R13 . **No** GO to R12 .
R12 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN	
● Measure the resistance between in-line C238M pin 6, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  ● **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between the vehicle security module and in-line C238F. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit between the DLC C251 and in-line C238M. CARRY OUT the DATA LINK DIAGNOSTICS test.
R13 CHECK THE UBP NETWORK WITH THE VEHICLE SECURITY MODULE C2113c DISCONNECTED	
● Key in ON position. ● Carry out the DATA LINK DIAGNOSTICS TEST. ● **Did the diagnostic tool indicate SYSTEM PASSED?**	**Yes** GO to R58 . **No** GO to R14 .
R14 CHECK THE DRIVER SEAT MODULE (DSM) C341c FOR DAMAGE	
● Key in OFF position. ● Connect: Vehicle Security Module C2113c. ● Connect: In-Line C238. ● Disconnect: DSM C341c. ● Inspect the DSM C341c for damage. ● **Is the DSM C341c OK?**	**Yes** GO to R15 . **No** REPAIR the DSM C341c. CARRY OUT the DATA LINK DIAGNOSTICS test.

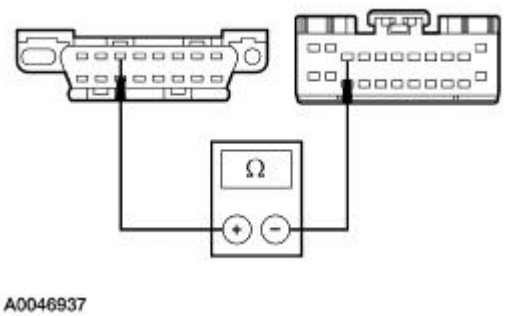




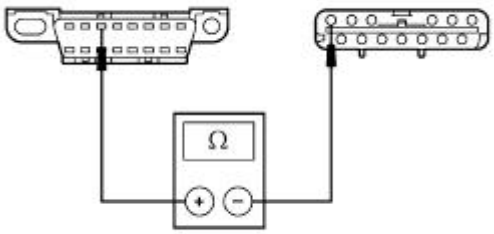
R15 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE DSM C341c FOR AN OPEN	
• Measure the resistance between the DSM C341c pin 2, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  A0046938 • **Is the resistance less than 5 ohms?**	**Yes** GO to R20 . **No** GO to R16 .
R16 CHECK IN-LINE C238 FOR DAMAGE	
• Disconnect: In-Line C238. • Inspect in-lines C238M and C238F for damage. • **Are in-lines C238M and C238F OK?**	**Yes** GO to R17 . **No** REPAIR in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R17 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and in-line C238M pin 6, circuit 1906 (VT), harness side.  A0046934 • **Is the resistance less than 5 ohms?**	**Yes** GO to R18 . **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
R18 CHECK IN-LINE C312 FOR DAMAGE	
• Disconnect: In-Line C312. • Inspect in-lines C312M and C312F for damage. • **Are in-lines C312M and C312F OK?**	**Yes** GO to R19 . **No** REPAIR in-lines C312M and C312F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R19 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238F AND IN-LINE C312F FOR AN OPEN	
• Measure the resistance between in-line C238F pin 6, circuit 1906 (VT), harness side and in-line C312F pin 14, circuit 1906 (VT), harness side.	**Yes** REPAIR the circuit between in-line C312M and the DSM C341c. CARRY OUT the DATA LINK DIAGNOSTICS test.

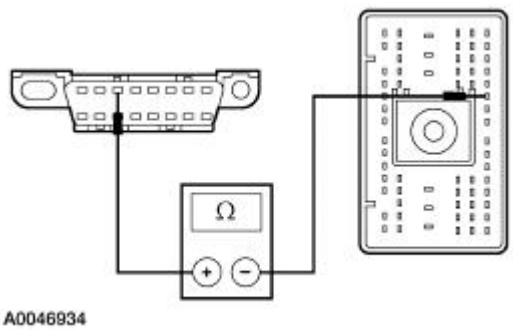
 A0046939 ● **Is the resistance less than 5 ohms?**	**No** REPAIR the circuit between in-lines C238F and C312F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R20 CHECK THE UBP NETWORK WITH THE DSM C341c DISCONNECTED ● Key in ON position. ● Carry out the DATA LINK DIAGNOSTICS TEST. ● **Did the diagnostic tool indicate SYSTEM PASSED?**	**Yes** GO to R59 . **No** GO to R21 .
R21 CHECK THE PARKING AID MODULE C4014b FOR DAMAGE ● Key in OFF position. ● Connect: DSM C341c. ● Connect: In-Line C238. ● Connect: In-Line C312. ● Disconnect: Parking Aid Module C4014b. ● Inspect the parking aid module C4014b for damage. ● **Is the parking aid module C4014b OK?**	**Yes** GO to R22 . **No** REPAIR the parking aid module C4014b. CARRY OUT the DATA LINK DIAGNOSTICS test.
R22 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE PARKING AID MODULE C4014b FOR AN OPEN ● Measure the resistance between the parking aid module C4014b pin 1, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  A0046940 ● **Is the resistance less than 5 ohms?**	**Yes** GO to R27 . **No** GO to R23 .
R23 CHECK IN-LINE C238 FOR DAMAGE ● Disconnect: In-Line C238. ● Inspect in-lines C238M and C238F for damage. ● **Are in-lines C238M and C238F OK?**	**Yes** GO to R24 . **No** REPAIR in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R24 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN	





• Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and in-line C238M pin 6, circuit 1906 (VT), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to R25 . **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
R25 CHECK IN-LINE C465 FOR DAMAGE	
• Disconnect: In-Line C465. • Inspect in-lines C465M and C465F for damage. • **Are in-lines C465M and C465F OK?**	**Yes** GO to R26 . **No** REPAIR in-lines C465M and C465F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R26 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238F AND IN-LINE C465F FOR AN OPEN	
• Measure the resistance between in-line C238F pin 6, circuit 1906 (VT), harness side and in-line C465F pin 15, circuit 1906 (VT), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between in-line C465M and the parking aid module C4014b. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit between in-line C238F and in-line C465F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R27 CHECK THE UBP NETWORK WITH THE PARKING AID MODULE C4014b DISCONNECTED	
• Key in ON position. • Carry out the DATA LINK DIAGNOSTICS TEST. • **Did the diagnostic tool indicate SYSTEM PASSED?**	**Yes** GO to R60 . **No** GO to R28 .
R28 CHECK THE POWER LIFTGATE MODULE C4174d FOR DAMAGE	
• Key in OFF position. • Connect: Parking Aid Module C4014b. • Connect: In-Line C238. • Connect: In-Line C465. • Disconnect: Power Liftgate Module C4174d. • Inspect the power liftgate module C4174d for damage. • **Is the power liftgate module C4174d OK?**	**Yes** GO to R29 . **No** REPAIR the power liftgate module C4174d. CARRY OUT the DATA LINK DIAGNOSTICS test.





R29 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE POWER LIFTGATE MODULE C4174d FOR AN OPEN	
• Measure the resistance between the power liftgate module C4174d pin 20, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  A0046947 • **Is the resistance less than 5 ohms?**	**Yes** GO to R34 . **No** GO to R30 .
R30 CHECK IN-LINE C238 FOR DAMAGE	
• Disconnect: In-Line C238. • Inspect in-lines C238M and C238F for damage. • **Are in-lines C238M and C238F OK?**	**Yes** GO to R31 . **No** REPAIR in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R31 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and in-line C238M pin 6, circuit 1906 (VT), harness side.  A0046934 • **Is the resistance less than 5 ohms?**	**Yes** GO to R32 . **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
R32 CHECK IN-LINE C465 FOR DAMAGE	
• Disconnect: In-Line C465. • Inspect in-lines C465M and C465F for damage. • **Are in-lines C465M and C465F OK?**	**Yes** GO to R33 . **No** REPAIR in-lines C465M and C465F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R33 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238F AND IN-LINE C465F FOR AN OPEN	
• Measure the resistance between in-line C238F pin 6, circuit 1906 (VT), harness side and in-line C465F pin 15, circuit 1906 (VT), harness side.	**Yes** REPAIR the circuit between in-line C465M and the power

 A0046941 ● **Is the resistance less than 5 ohms?**	liftgate module C4174d. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit between in-line C238F and in-line C465F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R34 CHECK THE UBP NETWORK WITH THE POWER LIFTGATE MODULE C4174d DISCONNECTED	
● Key in ON position. ● Carry out the DATA LINK DIAGNOSTICS TEST. ● **Did the diagnostic tool indicate SYSTEM PASSED?**	**Yes** GO to R61 . **No** GO to R35 .
R35 CHECK THE CLIMATE CONTROLLED SEAT MODULE C3031b FOR DAMAGE	
● Key in OFF position. ● Connect: Power Liftgate Module C4174d. ● Connect: In-Line C238. ● Connect: In-Line C465. ● Disconnect: Driver Climate Controlled Seat Module C3031b. ● For passenger climate controlled seat module, GO to R41. ● Inspect the climate controlled seat module C3031b for damage. ● **Is the climate controlled seat module C3031b OK?**	**Yes** GO to R36 . **No** REPAIR the climate controlled seat module C3031b. CARRY OUT the DATA LINK DIAGNOSTICS test.
R36 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE CLIMATE CONTROLLED SEAT MODULE C3031b FOR AN OPEN	
● Measure the resistance between the climate controlled seat module C3031b pin 1, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  A0046949 ● **Is the resistance less than 5 ohms?**	**Yes** GO to R47 . **No** GO to R37 .
R37 CHECK IN-LINE C238 FOR DAMAGE	
● Disconnect: In-Line C238. ● Inspect in-lines C238M and C238F for damage. ● **Are in-lines C238M and C238F OK?**	**Yes** GO to R38 . **No** REPAIR in-lines C238M and

	C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R38 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and in-line C238M pin 6, circuit 1906 (VT), harness side.  A0046934 • **Is the resistance less than 5 ohms?**	**Yes** GO to R39 . **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
R39 CHECK IN-LINE C312 FOR DAMAGE	
• Disconnect: In-Line C312. • Inspect in-lines C312M and C312F for damage. • **Are in-lines C312M and C312F OK?**	**Yes** GO to R40 . **No** REPAIR in-lines C312M and C312F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R40 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238F AND IN-LINE C312F FOR AN OPEN	
• Measure the resistance between in-line C238F pin 6, circuit 1906 (VT), harness side and in-line C312F pin 14, circuit 1906 (VT), harness side.  A0046939 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between in-line C312M and the climate controlled seat module C3031b. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit between in-lines C238F and C312F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R41 CHECK THE CLIMATE CONTROLLED SEAT MODULE CONNECTOR FOR DAMAGE	
• Key in OFF position. • Disconnect: Climate Controlled Seat Module C3036b. • Inspect the connector for damage. • **Is the connector OK?**	**Yes** GO to R42 . **No** REPAIR the climate controlled seat module C3036b. CARRY OUT the DATA LINK DIAGNOSTICS test.
R42 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE CLIMATE CONTROLLED SEAT MODULE C3036B FOR AN OPEN	

• Measure the resistance between the climate controlled seat module C3036b pin 1, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  A0046949 • **Is the resistance less than 5 ohms?**	**Yes** GO to R47 . **No** GO to R43 .
R43 CHECK IN-LINE C238 FOR DAMAGE • Disconnect: In-Line C238. • Inspect in-lines C238M and C238F for damage. • **Are in-lines C238M and C238F OK?**	**Yes** GO to R44 . **No** REPAIR in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R44 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN • Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and in-line C238M pin 6, circuit 1906 (VT), harness side.  A0046934 • **Is the resistance less than 5 ohms?**	**Yes** GO to R45 . **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
R45 CHECK IN-LINE C313 FOR DAMAGE • Disconnect: In-Line C313. • Inspect in-lines C313M and C313F for damage. • **Are in-lines C313M and C313F OK?**	**Yes** GO to R46 . **No** REPAIR in-lines C313M and C313F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R46 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238F AND IN-LINE C313F FOR AN OPEN • Measure the resistance between in-line C238F pin 6, circuit 1906 (VT), harness side and in-line C313F pin 2, circuit 1906 (VT), harness side.	**Yes** REPAIR the circuit between in-line C313M and the climate controlled seat module C3036b. CARRY OUT the DATA LINK DIAGNOSTICS test.

 ● **Is the resistance less than 5 ohms?**	**No** REPAIR the circuit between in-lines C238F and C313F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R47 CHECK THE UBP NETWORK WITH THE CLIMATE CONTROLLED SEAT MODULE C3031b DISCONNECTED	
● Key in ON position. ● Carry out the DATA LINK DIAGNOSTICS TEST. ● **Did the diagnostic tool indicate SYSTEM PASSED?**	**Yes** GO to R64 . **No** GO to R48 .
R48 CHECK THE ELECTRONIC AUTOMATIC TEMPERATURE CONTROL (EATC) MODULE C228b FOR DAMAGE	
● Key in OFF position. ● Connect: Climate Controlled Seat Module C3031b. ● Connect: In-Line C238. ● Connect: In-Line C312. ● Disconnect: EATC Module C228b. ● Inspect the EATC module C228b for damage. ● **Is the DEATC module C228b OK?**	**Yes** GO to R49 . **No** REPAIR the EATC module C228b. TEST the system for normal operation.
R49 CHECK CIRCUIT 1906 (VT) FOR AN OPEN	
● Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and the EATC module C228b pin 3, circuit 1906 (VT), harness side.  ● **Are the resistances less than 5 ohms?**	**Yes** GO to R50 . **No** REPAIR the circuit(s) in question. CARRY OUT the DATA LINK DIAGNOSTICS test.
R50 CHECK THE UBP NETWORK WITH THE EATC MODULE C228b DISCONNECTED	
● Key in ON position. ● Carry out the DATA LINK DIAGNOSTICS TEST. ● **Did the diagnostic tool indicate SYSTEM PASSED?**	**Yes** GO to R62 . **No** GO to R51 .
R51 CHECK THE AIR SUSPENSION CONTROL MODULE C2131b FOR DAMAGE	
● Key in OFF position. ● Connect: EATC Module C228b.	**Yes** GO to R52 .

• Disconnect: Air Suspension Control Module C2131b. • Inspect the air suspension control module C2131b for damage. • **Is the air suspension control module C2131b OK?**	**No** REPAIR the air suspension control module C2131b. CARRY OUT the DATA LINK DIAGNOSTICS test.
R52 CHECK CIRCUIT 1906 (VT) BETWEEN THE DLC C251 AND THE AIR SUSPENSION CONTROL C2131b FOR AN OPEN	
• Measure the resistance between the air suspension control module C2131b pin 26, circuit 1906 (VT), harness side and the DLC C251 pin 3, circuit 1906 (VT), harness side.  A0046948 • **Is the resistance less than 5 ohms?**	**Yes** GO to R55 . **No** GO to R53 .
R53 CHECK IN-LINE C238 FOR DAMAGE	
• Disconnect: In-Line C238. • Inspect in-lines C238M and C238F for damage. • **Are in-lines C238M and C238F OK?**	**Yes** GO to R54 . **No** REPAIR in-lines C238M and C238F. CARRY OUT the DATA LINK DIAGNOSTICS test.
R54 CHECK CIRCUIT 1906 (VT) BETWEEN IN-LINE C238M AND THE DLC C251 FOR AN OPEN	
• Measure the resistance between the DLC C251 pin 3, circuit 1906 (VT), harness side and in-line C238M pin 6, circuit 1906 (VT), harness side.  A0046934 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between in-line C238F and the air suspension control module C2131b. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** REPAIR the circuit between in-line C238M and the DLC C251. CARRY OUT the DATA LINK DIAGNOSTICS test.
R55 CHECK THE UBP NETWORK WITH THE AIR SUSPENSION CONTROL C2131b DISCONNECTED	
• Key in ON position. • Carry out the DATA LINK DIAGNOSTICS TEST. • **Did the diagnostic tool indicate SYSTEM PASSED?**	**Yes** GO to R63 . **No** The system is operating

	correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
R56 CHECK FOR CORRECT 4WD CONTROL MODULE OPERATION • Disconnect all the 4WD control module connectors. • Check for: • corrosion • pushed-out pins • Connect all the 4WD control module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4WD control module. REFER to Section 308-07A . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
R57 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION • Disconnect all the instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all the instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
R58 CHECK FOR CORRECT VEHICLE SECURITY MODULE OPERATION • Disconnect all the vehicle security module connectors. • Check for: • corrosion • pushed-out pins • Re-connect the battery. Refer to Section 414-01 . • Connect all the vehicle security module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new vehicle security module. REFER to Section 419-10 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. CARRY OUT the DATA LINK DIAGNOSTICS

	test.
R59 CHECK FOR CORRECT DSM OPERATION • Disconnect all the DSM connectors. • Check for: • corrosion • pushed-out pins • Connect all the DSM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DSM. REFER to Section 501-10 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
R60 CHECK FOR CORRECT PARKING AID MODULE OPERATION • Disconnect all the power liftgate module connectors. • Check for: • corrosion • pushed-out pins • Connect all the power liftgate module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new power liftgate module. REFER to Section 501-03 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
R61 CHECK FOR CORRECT POWER LIFTGATE MODULE OPERATION • Disconnect all the power liftgate module connectors. • Check for: • corrosion • pushed-out pins • Connect all the power liftgate module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new power liftgate module. REFER to Section 501-03 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
R62 CHECK FOR CORRECT EATC OPERATION • Disconnect all the EATC connectors. • Check for: • corrosion • pushed-out pins • Connect all the EATC connectors and make sure they	**Yes** INSTALL a new EATC module. REFER to Section 412-00 . TEST the system for normal operation.

seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
R63 CHECK FOR CORRECT AIR SUSPENSION CONTROL MODULE OPERATION	
● Disconnect all the air suspension control module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the air suspension control module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new air suspension control module. REFER to Section 204-05 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
R64 CHECK FOR CORRECT CLIMATE CONTROLLED SEAT MODULE OPERATION	
● Disconnect all the climate controlled seat module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the climate controlled seat module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new climate controlled seat module. REFER to Section 501-10 . TEST the system for normal operation. CARRY OUT the DATA LINK DIAGNOSTICS test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST S: NO MODULE/NETWORK COMMUNICATION — NO POWER TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
S1 CHECK THE DIAGNOSTIC TOOL CONNECTOR	
● Inspect the diagnostic tool pins for damage. ● **Are the pins OK?**	**Yes** GO to S2 .

	No REPAIR the diagnostic tool connector. TEST the system for normal operation.
S2 CHECK THE DLC C251 FOR DAMAGE ● Key in OFF position. ● Inspect the DLC C251 pins for damage. ● **Are the pins OK?**	**Yes** GO to S3 . **No** REPAIR the DLC C251. TEST the system for normal operation.
S3 CHECK THE VOLTAGE TO THE DIAGNOSTIC TOOL CIRCUIT 40 (LB/WH) ● Measure the voltage between the DLC C251 pin 16, circuit 40 (LB/WH), harness side and ground.  GK2634-A ● **Is the voltage greater than 10 volts?**	**Yes** GO to S4 . **No** REPAIR the supply circuit. TEST the system for normal operation.
S4 CHECK THE DLC GROUND — CIRCUIT 57 (BK) AND CIRCUIT 570 (BK/WH) ● Measure the resistance between the DLC C251 pin 4, circuit 57 (BK), harness side and ground and between the DLC C251 pin 5, circuit 570 (BK/WH), harness side and ground.  GK4963-A ● **Is the resistance less than 5 ohms?**	**Yes** REPAIR the diagnostic tool. TEST the system for normal operation. **No** REPAIR the circuit(s) in question. TEST the system for normal operation.

Module Configuration

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool

Principles of Operation

Some modules must be programmed as part of the repair procedure. If this procedure is not followed the module will not function correctly and may set a number of DTCs, including B2477 or P1639, which indicate that some necessary data has not been programmed into the module.

Modules that need programming should not be exchanged between vehicles. In most cases the parameter values or settings are unique to that vehicle, and if not set correctly will cause concerns or faults.

Some programmable parameters, such as belt minder on/off, can be changed from the factory setting at the customer's request.

WDS will automatically attempt to retrieve the module configuration information from all modules. If the module does not contain correct information, the diagnostic tool will either request "As Built" data or display a list of items that you will need to manually configure. The diagnostic tool will program the module based on the data you enter.

There are three different methods that are used for module programming:

- programmable module installation (PMI)
- calibration update
- programmable parameters

Some modules do not support all three methods.

Programmable Module Installation (PMI)

The programmable module installation (PMI) method is used when a new programmable module is installed on the vehicle. It is no longer necessary to command the diagnostic tool to gather module option content from the old module. The diagnostic tool automatically obtains any available module option content information from the old module during the vehicle ID routine that runs when the diagnostic tool is initially connected to the vehicle. It is important that you connect WDS to the vehicle and allow it to identify the vehicle and obtain configuration data prior to removing any modules.

Calibration Update

Calibration update is used to install a new calibration and strategy into a module. The updates are usually issued to fix a concern in the module software and would normally be addressed by a technical service bulletin (TSB). This method has been used by the PCM for several years. Other modules will be adopting this strategy as well.

Programmable Parameters

This method is used to configure parameters that can be modified in service. These are typically at the preference of the customer. Not all features controlled by the module are listed in this configuration method. Refer to the Module Configuration Index for a list of features by system.

If a module that has been modified using programmable parameters needs to be installed, the PMI procedure will maintain the parameters in their altered state if WDS is able to communicate with the old module during vehicle ID. Otherwise you may need to use programmable parameters to return them to the altered state.

As-Built Data Center

The As-Built Data Center maintains a record of the vehicle configuration in a database. The vehicle VIN is required to obtain this information. The As-Built Data Center records the applicable module configurations stored in each module before the vehicle leaves the factory. The As-Built Data Center will always reflect the original build of the vehicle as it left the factory. Only contact the As-Built Data Center when directed to do so by the diagnostic tool.

Inspection and Verification

1. Visually inspect for obvious signs of electrical damage. Refer to the following chart:

Visual Inspection Chart

Electrical
• Wiring harness • Connectors

Configurable Modules

The vehicle contains the following modules that are configurable:

- vehicle security module
- 4-wheel anti-lock brake/traction control (ABS/TC) module or stability assist module (if equipped)
- electronic automatic temperature control (EATC) module
- instrument cluster
- powertrain control module (PCM)
- driver seat module (DSM)
- tire pressure monitor module
- vehicle dynamics module
- power liftegate module
- temperature-controlled seat module

Programmable Parameters Index

System	Programmable Parameter Items
Security	● Power door lock inhibit ● Auto-lock/relock
Warnings and Chimes	● Tire pressure monitor system ● Tire pressure warning types ● Beltminder
Power Seats	● Easy entry/exit feature customer preference ● Reverse mirror feature customer preference

Torque Specifications

Description	Nm	lb-in
Battery ground cable	7-10	62-89

Anti-Theft —Passive

The passive anti-theft system (PATS) contains the following components:

- theft indicator
- encoded ignition key

Anti-Theft —Passive Anti-Theft System (PATS)

Refer to Wiring Diagrams Cell 112 for schematic and connector information.

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool
 ST1137-A	73III Automotive Meter 105-R0057

Principles of Operation

The PATS uses a specially encoded ignition key. Each encoded ignition key contains a permanently installed electronic device called a transponder. Each transponder contains a unique electronic identification code out of over 18 billion, billion combinations.

The passive anti-theft system (PATS), also known as SecuriLock ®, uses radio frequency identification technology to deter a driveaway theft. This system is known as Securilock® in North America, Safeguard® in the U.K., and PATS in Continental Europe. Passive means that it does not require any activity from the user.

The SecuriLock® System (PATS) is not compatible with aftermarket remote start systems, which allow the vehicle to be started from outside the vehicle. These systems may reduce the vehicle security level, and also may cause no-start issues. If equipped the remote start system must be removed before investigation of PATS-related, no-start issues.

Each encoded ignition key must be programmed into the vehicle's powertrain electronic control (PCM) before it can be used to start the engine. There are special diagnostic repair procedures described in this section that must be carried out if a new encoded ignition key is necessary.

This system contains a new feature named Unlimited Key Mode. This feature allows a customer to program more than eight keys to the vehicle if they request it. Each vehicle in Unlimited Key Mode is set up with a special Unlimited Transponder Security Key. This allows all the customer vehicles to share the same keys, but no other keys from outside can be used to operate the vehicles. For an individual customer, any randomly selected Security Key is acceptable. Refer to Unlimited Key Mode Programming in Key Programming Switch State Control in this section.

The PATS transceiver module communicates with the encoded ignition key. The module is located behind the steering column shroud and contains an antenna connected to a small electronics module. During each vehicle start sequence, the transceiver module reads the encoded ignition key identification code and sends data to the PCM.

The control functions are contained in the PCM. This module carries out all of the PATS functions, such as receiving the identification code from the encoded ignition key and controlling the engine enable. The PCM initiates the key interrogation sequence when the vehicle ignition switch is turned to RUN or START.

All elements of the PATS must be functional before the engine is allowed to start. If any of the components are not working correctly, the vehicle will not start.

The PATS uses a visual theft indicator. The indicator will prove out for three seconds when the ignition switch is turned to RUN or START under normal operation. If there is a PATS concern, this indicator will either flash rapidly or glow steadily when the ignition switch is turned to RUN or START. The PATS system also flashes the theft indicator every two seconds at ignition OFF to act as a visual deterrent.

The following will activate the PATS and will disable the vehicle from starting:

- incorrectly encoded ignition key
- damaged encoded ignition key
- unprogrammed key
- non-encoded key (key has no electronics)
- damaged wiring
- damaged transceiver
- damaged PCM

Inspection and Verification

1. Verify the customer concern by operating the system.

2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Large metallic objects, a second ignition key on the same key ring as the PATS ignition key or electronic devices on the key chain that can be used to purchase gasoline or similar items ● Ignition lock cylinder ● PATS key ● Use of a non-PATS key ● More than one PATS key on key chain	● Central junction box (CJB) fuse: ■ 102 (30A) ● PATS transceiver module ● Ignition switch ● Loose or corroded connection(s)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the diagnostic tool does not power up, refer to the diagnostic tool manual.

5. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:
   - CKT914, CKT915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00.

- NO RESP/NOT EQUIP for PCM, refer to Section 303-14 .
- SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the PCM.

6. If the DTCs retrieved are related to the concern, go to the (PCM) Diagnostic Trouble Code (DTC) Index to continue diagnostics.

7. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart to continue diagnostics.

Powertrain Control Module Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1213	Anti-Theft Number of Programmed Keys is Below Minimum	PCM	GO to Pinpoint Test F .
B2431	Key Program Failure (Defective Key or Transceiver)	PCM	VERIFY if using correct PATS key, if defective USE new key.
B1342	ECU is Defective (EEPROM in PCM not working)	PCM	INSTALL a new PCM. REFER to Section 303-14 .
B2103	Antenna Not Connected	PCM	GO to Pinpoint Test A .
B1600	PATS Ignition Key Transponder Signal is Not Received	PCM	GO to Pinpoint Test B .
B1601	PATS Received Incorrect Key-Code From Ignition Key Transponder	PCM	GO to Pinpoint Test C .
B1602	PATS Received Invalid Format of Key-Code From Ignition Key Transponder	PCM	GO to Pinpoint Test D .
B1681	PATS Transceiver Module Signal is Not Received	PCM	GO to Pinpoint Test E .
—	All other DTCs	PCM	REFER to Section 419-10 .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The anti-theft indicator is always/never on — no three second theft indicator prove-out	• Circuitry. • Theft LED. • Powertrain control module (PCM).	• GO to Pinpoint Test G .
• The vehicle does not start	• Starter relay. • PCM. • Circuitry. • Encoded ignition key. • Ignition key code. • Ignition key transponder key code. • Ignition key transponder key	• GO to Pinpoint Test H .

	code format.	

Pinpoint Tests

PINPOINT TEST A: NO ANTENNA DETECTED

Test Step	Result / Action to Take
A1 INSPECT THE ANTENNA FOR CORRECT INSTALLATION OR PHYSICAL DAMAGE	
• Key in OFF position. • Verify the PATS transceiver module is correctly installed. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • Enter the following diagnostic mode on the diagnostic tool: Clear Continuous DTCs. • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve The PCM Continuous DTCs. • **Is DTC B2103 retrieved?**	**Yes** INSTALL a new PATS transceiver module. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. REPEAT the self-test. TURN the ignition OFF then back to RUN. **No** The system is OK.

PINPOINT TEST B: PATS IGNITION KEY TRANSPONDER SIGNAL IS NOT RECEIVED

Test Step	Result / Action to Take
NOTE: Large metallic objects, electronic devices on the key chain that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS ignition key may cause vehicle starting problems and record DTCs under certain conditions. If a fault cannot be identified, examine the customer's key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS ignition key while starting the engine. These objects and devices cannot damage the PATS ignition key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn ignition OFF and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the encoded ignition key used by the customer is a Ford approved encoded ignition key (Rotunda is the only approved encoded ignition key).	
B1 CHECK THE DIAGNOSTIC TROUBLE CODES (DTCS)	
• Enter the following diagnostic mode on the diagnostic tool: Clear Continuous PCM DTCs. • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM Continuous DTCs. • **Is DTC B1600 retrieved?**	**Yes** GO to B2 . **No** If other than PATS PCM DTCs are retrieved. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual. If no PATS DTCs are retrieved, the system is OK.

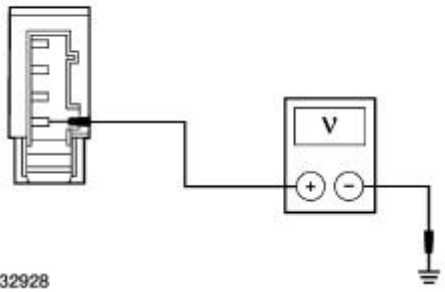
B2 INSTALL A NEW ENCODED IGNITION KEY	
NOTE: Check to make sure the customer and new encoded ignition keys are Ford approved, encoded PATS ignition keys. Unapproved PATS keys do not always operate correctly over different temperature ranges (Rotunda is the only approved encoded ignition key). ● Cut a new encoded ignition key. ● Program the new encoded ignition key. Refer to Spare Key Programming in this section. ● Enter the following diagnostic mode on the diagnostic tool: Clear PCM Continuous DTCs. ● Key in OFF position. ● Key in ON position. ● Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM Continuous DTCs. ● **Is DTC B1600 present?**	**Yes** GO to B3 . **No** If other than PATS PCM DTCs are retrieved, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. If no PATS DTCs are retrieved, the system is OK.
B3 INSTALL A NEW PATS TRANSCEIVER	
NOTE: When a new PCM is installed, the encoded ignition keys must be reprogrammed. ● Key in OFF position. ● Install a new PATS transceiver. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. ● Key in ON position. ● Enter the following diagnostic mode on the diagnostic tool: Clear PCM Continuous DTCs. ● Key in OFF position. ● **NOTE:** Do not use the encoded ignition key that was programmed in Step B2. ● Turn the ignition to RUN using an existing customer encoded ignition key. ● Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM Continuous DTCs. ● **Is DTC B1600 retrieved?**	**Yes** GO to B4 . **No** The system is OK.
B4 CHECK FOR CORRECT PCM OPERATION	
● Disconnect all PCM connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all PCM connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . REPROGRAM the encoded ignition keys. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST C: PATS RECEIVED INCORRECT KEY-CODE FROM IGNITION KEY TRANSPONDER

Test Step	Result / Action to Take

NOTE: The PCM disables the engine for one second every time DTC B1601 is set. The ignition must remain in the RUN position for at least one second before an attempt is made to start the vehicle with any encoded ignition key. Check the PCM PID ANTISCAN for this unprogrammed key timeout status.	
NOTE: Large metallic objects, electronic devices on the key chain that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS ignition key may cause vehicle starting problems and record DTCs under certain conditions. If a fault cannot be identified, examine the customer's key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS ignition key while starting the engine. These objects and devices cannot damage the PATS ignition key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn ignition OFF and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the encoded ignition key used by the customer is a Ford approved encoded ignition key (Rotunda is the only approved encoded ignition key).	
C1 RETRIEVE THE DIAGNOSTIC TROUBLE CODES (DTCS) • Enter the following diagnostic mode on the diagnostic tool: Clear PCM Continuous DTCs. • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM Continuous DTCs . • **Is DTC B1601 retrieved?**	**Yes** GO to C2 . **No** The system is OK. CHECK all customer encoded ignition keys by attempting to start the vehicle with each key to verify all other encoded ignition keys are programmed.
C2 CHECK FOR PROGRAMMED ENCODED IGNITION KEYS — MONITOR THE PCM PID NUMKEYS • Enter the following diagnostic mode on the diagnostic tool: Monitor the PCM PID NUMKEYS. • **Does the PCM PID NUMKEYS display 8?**	**Yes** ERASE and REPROGRAM the key codes. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to C3 .
C3 CHECK THE NUMBER OF PROGRAMMED ENCODED IGNITION KEYS AVAILABLE • Verify there are at least two currently programmed encoded ignition keys available with the vehicle. • **Are at least two currently programmed encoded ignition keys available with the vehicle?**	**Yes** GO to C4 . **No** CUT a new encoded ignition key so that at least two encoded ignition keys are available. PROGRAM the encoded ignition keys. REFER to Key Programming Using Diagnostic Equipment in this section. GO to C5 .
C4 VERIFY THE PCM PID SPARE_KY INDICATES YES • Enter the following diagnostic mode on the diagnostic tool: Monitor the PCM PID SPARE_KY. • **Does the PCM PID SPARE_KY indicate ENABLE?**	**Yes** Spare Key Programming is enabled. REFER to Key Programming Using Two Programmed Keys in this section. CLEAR the DTCs. REPEAT the self-test. **No** ENABLE the PCM PID SPARE_KEY. REFER to Key Programming Switch State Control in this section. CLEAR the DTCs. REPEAT the self-test.
C5 CHECK THE ENCODED	

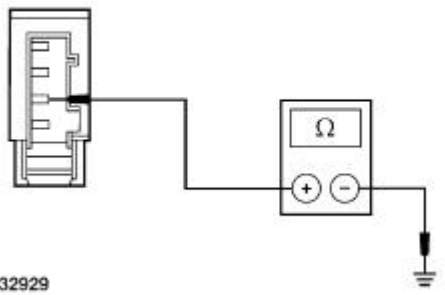
IGNITION KEYS FOR CORRECT OPERATION	
• Key in OFF position. • Turn the ignition switch to RUN for three seconds using the first encoded ignition key. • Key in ON position. • Turn the ignition switch to RUN for three seconds using the second ignition key. • Start the vehicle using the second encoded ignition key. • **Does the vehicle start?**	**Yes** The system is OK. If there are additional keys that need to be programmed, REFER to Key Programming Using Two Programmed Keys in this section. **No** GO to C6.
C6 RETRIEVE THE DTCS — CHECK FOR DTC B1601	
NOTE: When a new PCM is installed, the encoded ignition keys must be reprogrammed. • Enter the following diagnostic mode on the diagnostic tool: Clear PCM Continuous DTCs. • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM Continuous DTCs. • **Is DTC B1601 retrieved?**	**Yes** GO to C7. **No** If other than PATS PCM DTCs are retrieved, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. If no PATS DTCs are retrieved, the system is OK.
C7 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all PCM connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14. REPROGRAM the encoded ignition keys. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

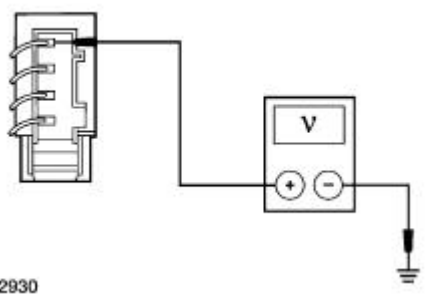


PINPOINT TEST D: PATS RECEIVED INVALID FORMAT OF KEY-CODE FROM IGNITION KEY TRANSPONDER

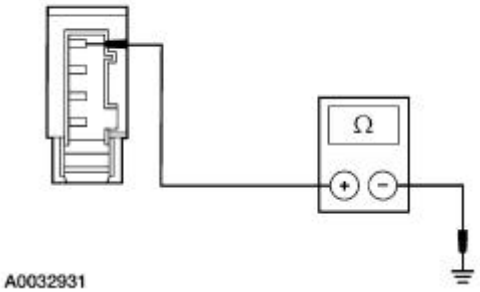
Test Step	Result / Action to Take
NOTE: Large metallic objects, electronic devices on the key chain that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS ignition key may cause vehicle starting problems and record DTCs under certain conditions. If a fault cannot be identified, examine the customer's key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS ignition key while starting the engine. These objects and devices cannot damage the PATS ignition key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn ignition OFF and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the encoded ignition key used by the customer is a Ford approved encoded ignition key (Rotunda is the only approved encoded ignition key).	
D1 RETRIEVE THE DTCS	

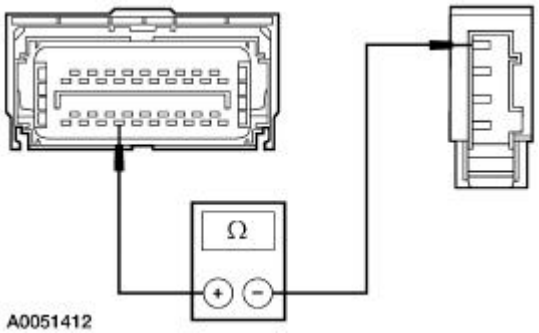
• Enter the following diagnostic mode on the diagnostic tool: Clear PCM Continuous DTCs . • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM Continuous DTCs. • **Is DTC B1602 retrieved?**	**Yes** GO to D2 . **No** The system is OK. CHECK all customer encoded ignition keys by cycling them in the ignition switch and determining if the vehicle starts.
D2 INSTALL A NEW ENCODED IGNITION KEY	
NOTE: Check to make sure the customer and new encoded ignition keys are approved encoded PATS ignition keys. Unapproved PATS keys do not always operate correctly over different temperature ranges (Rotunda is the only approved encoded ignition key). • Cut a new encoded ignition key. • Program a new encoded ignition key. Refer to Spare Key Programming in this section. • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM Continuous DTCs. • **Is DTC B1602 retrieved?**	**Yes** GO to D3 . **No** If other than PATS PCM DTCs are retrieved, REFER to thePowertrain Control/Emissions Diagnosis (PC/ED) manual. If no PATS DTCs are retrieved, the system is OK.
D3 INSTALL A NEW PATS TRANSCEIVER	
• Enter the following diagnostic mode on the diagnostic tool: Clear PCM Continuous DTCs. • Key in OFF position. • Install a new PATS transceiver module. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM Continuous DTCs. • **Are any PATS DTCs retrieved?**	**Yes** REFER to the PCM Diagnostic Trouble Code (DTC) Index. **No** The system is OK.

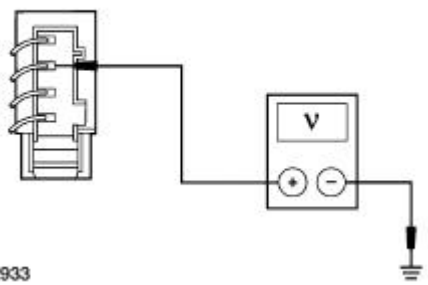




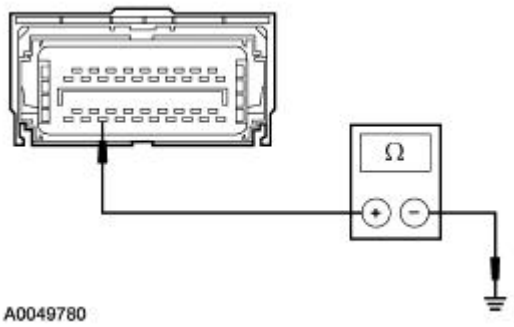
PINPOINT TEST E: THE PATS TRANSCEIVER MODULE SIGNAL IS NOT RECEIVED

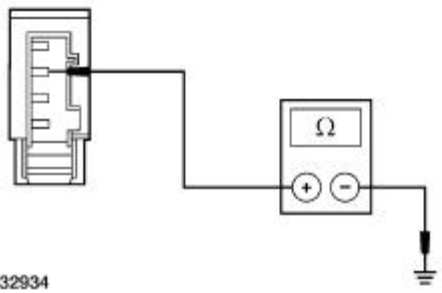


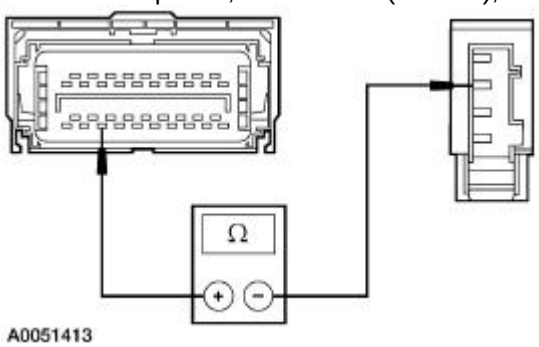


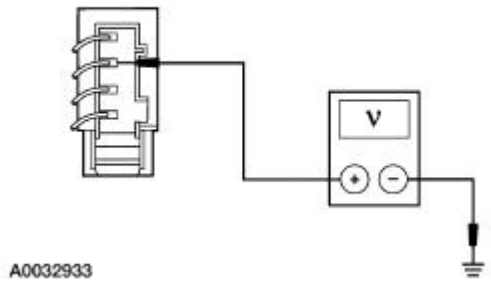


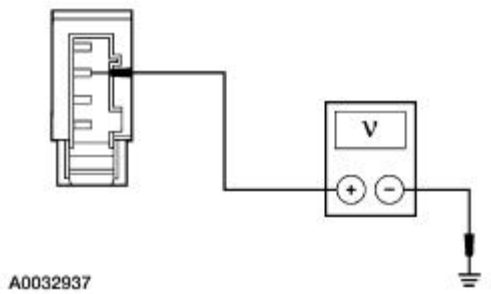
Test Step	Result / Action to Take
E1 RETRIEVE THE DTCS	
• Enter the following diagnostic mode on the diagnostic tool: Clear PCM Continuous DTCs. • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM Continuous DTCs. • **Is DTC B1681 retrieved?**	**Yes** GO to E2 . **No** The system is OK.
E2 CHECK THE PATS TRANSCEIVER FOR VOLTAGE CIRCUIT 1044 (WH/YE)	
• Key in OFF position. • Disconnect: PATS Transceiver C2007. • Key in ON position. • Measure the voltage between the PATS transceiver C2007 pin 1, circuit 1044 (WH/YE), harness side and ground.	**Yes** GO to E3 . **No** REPAIR the supply circuit. CLEAR the DTCs. TEST the system for normal operation.











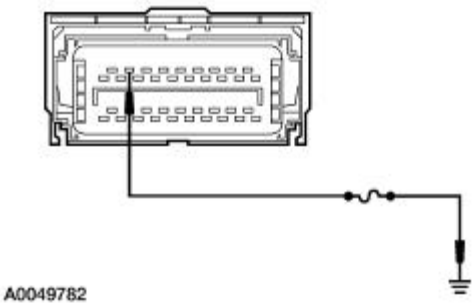
A0032928

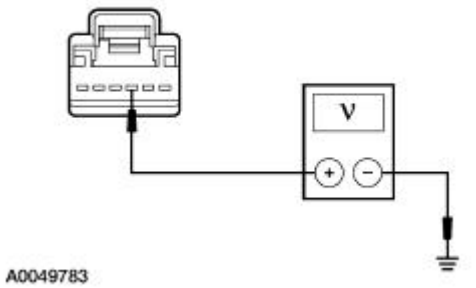
- **Is the voltage greater than 10 volts?**

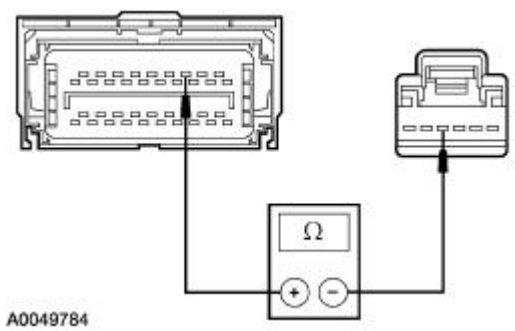
E3 CHECK THE PATS TRANSCEIVER GROUND CIRCUIT 875 (BK/LB)	
• Key in OFF position. • Measure the resistance between the PATS transceiver C2007 pin 2, circuit 875 (BK/LB), harness side and ground.  A0032929 • **Is the resistance less than 5 ohms?**	**Yes** GO to E4 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
E4 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT FOR VOLTAGE CIRCUIT 1216 (GY/OG)	
• Connect: PATS Transceiver C2007. • Key in ON position. • Measure the voltage by backprobing between the PATS transceiver C2007 pin 4, circuit 1216 (GY/OG), harness side and ground.  A0032930 • **Is the voltage greater than 9 volts?**	**Yes** GO to E6 . **No** GO to E5 .
E5 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT FOR A SHORT TO GROUND CIRCUIT 1216 (GY/OG)	
• Key in OFF position. • Disconnect: PATS Transceiver C2007. • Measure the resistance between the PATS transceiver C2007 pin 4, circuit 1216 (GY/OG), harness side and ground.	**Yes** GO to E6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-

 A0032931 ● **Is the resistance greater than 10,000 ohms?**	test. If the system fails again, GO to E13 .
E6 CHECK CIRCUIT 1216 (GY/OG) FOR AN OPEN	
● Key in OFF position. ● Disconnect: PATS Transceiver C2007. ● Disconnect: PCM C175b. ● Measure the resistance between the PATS transceiver C2007 pin 4, circuit 1216 (GY/OG), harness side and the PCM C175b pin 42, circuit 1216 (GY/OG), harness side.  A0051412 ● **Is the resistance less than 5 ohms?**	**Yes** GO to E7 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
E7 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR VOLTAGE CIRCUIT 1215 (WH/LG)	
● Key in OFF position. ● Connect: PATS Transceiver C2007. ● Connect: PCM C175b. ● Key in ON position. ● Measure the voltage by backprobing between the PATS transceiver C2007 pin 3, circuit 1215 (WH/LG), harness side and ground.  A0032933 ● **Is the voltage greater than 9 volts?**	**Yes** GO to E11 . **No** GO to E8 .
E8 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR SHORT TO GROUND CIRCUIT 1215 (WH/LG) TRANSCEIVER CONNECTED	
● Key in OFF position. ● Disconnect: PCM C175b. ● Measure the resistance between the PCM C175b pin 43,	**Yes** GO to E10 .

circuit 1215 (WH/LG), harness side and ground.  ● **Is the resistance greater than 10,000 ohms?**	**No** GO to E9 .
E9 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR A SHORT TO GROUND CIRCUIT 1215 (WH/LG) TRANSCEIVER DISCONNECTED	
● Disconnect: PATS Transceiver C2007. ● Measure the resistance between the PATS transceiver C2007 pin 3, circuit 1215 (WH/LG), harness side and ground.  ● **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
E10 CHECK THE PATS TRANSMIT CIRCUIT FOR AN OPEN CIRCUIT 1215 (WH/LG)	
NOTE: When a new PCM is installed, the encoded ignition keys must be reprogrammed. ● Disconnect: PATS Transceiver C2007. ● Measure the resistance between the PATS transceiver C2007 pin 3, circuit 1215 (WH/LG), harness side and the PCM C175b pin 43, circuit 1215 (WH/LG), harness side.  ● **Is the resistance less than 5 ohms?**	**Yes** GO to E13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
E11 CHECK THE TRANSCEIVER TRANSMIT CIRCUIT FOR VOLTAGE CIRCUIT 1215 (WH/LG)	
● Key in ON position. ● Select PCM active command TRANSMIT SIGNAL COMMAND.	**Yes** INSTALL a new PATS transceiver, REFER Passive Anti-Theft System (PATS)



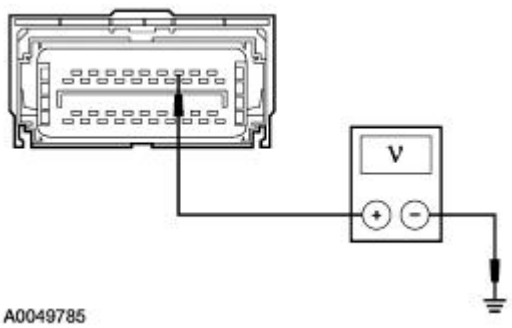


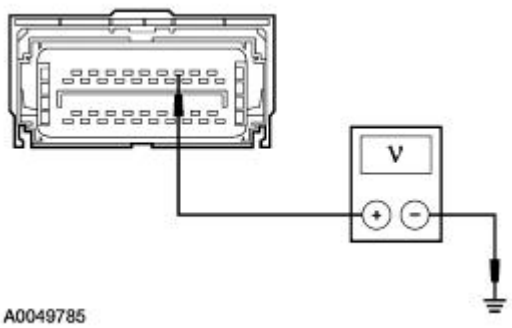


• Trigger TRANSMIT to ON. • Measure the voltage by backprobing between the PATS transceiver C2007 pin 3, circuit 1215 (WH/LG), harness side and ground.  A0032933 • **Is the voltage less than 5 volts?**	Transceiver in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to E12.
E12 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR A SHORT TO BATTERY	
NOTE: When a new PCM is installed, the encoded ignition keys must be reprogrammed. • Key in OFF position. • Disconnect: PCM C175b. • Disconnect: PATS Transceiver C2007. • Key in ON position. • Measure the voltage between the PATS transceiver C2007 pin 3, circuit 1215 (WH/LG), harness side and ground.  A0032937 • **Is voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to E13.
E13 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all PCM connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14. REPROGRAM the encoded ignition keys. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST F: ANTI-THEFT NUMBER OF PROGRAMMED KEYS IS BELOW MINIMUM

Test Step	Result / Action to Take
F1 RETRIEVE THE DTCS ● Enter the following diagnostic mode on the diagnostic tool: Clear PCM Continuous DTCs . ● Key in ON position. ● Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM Continuous DTCs. ● **Is DTC B1213 retrieved?**	**Yes** GO to F2 . **No** If other than PATS PCM DTCs are retrieved, REFER to thePowertrain Control/Emissions Diagnosis (PC/ED) manual. If no PATS DTCs are retrieved, the system is OK.
F2 CHECK THE NUMBER OF KEYS ENCODED — MONITOR THE PCM PID NUMKEYS ● Monitor the PCM PID NUMKEYS. ● **Does the PCM PID NUMKEYS display less than PCM PID MIN#KEY?**	**Yes** GO to F3 . **No** The system is OK.
F3 PROGRAM ENCODED IGNITION KEYS ● **NOTE:** Two programmed encoded ignition keys must be available to start the vehicle. ● Cut a new encoded PATS ignition lock cylinder key. ● PROGRAM the new encoded ignition key. Refer to Spare Key Programming in this section. ● **Does the theft LED illuminate for three seconds and then go out?**	**Yes** CLEAR the DTCs. CYCLE the ignition OFF then back to RUN to verify all codes have been cleared. CLEAR the DTCs. REPEAT the self-test. **No** GO to F4 .
F4 CHECK FOR A REPAIR MODULE — MONITOR THE PCM PID SERV_MOD ● Monitor the PCM PID SERV_MOD. ● **Does the PCM PID SERV_MOD indicate YES?**	**Yes** PROGRAM the encoded ignition keys. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test. **No** If the LED is illuminated continuously, REPEAT Step F3 using a new encoded ignition key. If the LED is flashing, RETRIEVE the PCM DTC stored for the new PATS fault.





PINPOINT TEST G: THE ANTI-THEFT INDICATOR IS ALWAYS/NEVER ON

Test Step	Result / Action to Take

G1 CHECK THE ANTI-THEFT INDICATOR FOR CORRECT OPERATION	
NOTE: When a new PCM is installed, the encoded ignition keys must be reprogrammed. ● Key in OFF position. ● Disconnect: PCM C175b. ● Connect a fused (15A) jumper wire between the PCM C175b pin 9, circuit 1269 (OG/RD), harness side and ground.  A0049782 ● **Does the theft LED illuminate?**	**Yes** GO to G4 . **No** GO to G2 .
G2 CHECK THE VOLTAGE TO THE ANTI-THEFT LED CIRCUIT 729 (RD/WH)	
● Disconnect: Sunload Sensor C286. ● Measure the voltage between the sunload sensor C286 pin 3, circuit 729 (RD/WH), harness side and ground.  A0049783 ● **Is the voltage greater than 10 volts?**	**Yes** GO to G3 . **No** REPAIR the supply circuit. TEST the system for normal operation.
G3 CHECK CIRCUIT 1269 (OG/RD) FOR AN OPEN BETWEEN THE PCM AND THE SUNLOAD SENSOR	
● Measure resistance between the PCM C175b pin 9, circuit 1269 (OG/RD), harness side and the sunload sensor C286 pin 4, circuit 1269 (OG/RD), harness side.  A0049784 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new sunload sensor. REFER to Section 417-01 . **No** REPAIR the circuit in question. TEST system for normal operation.
G4 CHECK FOR CORRECT PCM OPERATION	
● Disconnect all PCM connectors.	**Yes**

• Check for: • corrosion • pushed-out pins • Connect all PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	INSTALL a new PCM. REFER to Section 303-14 . REPROGRAM the encoded ignition keys. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST H: THE VEHICLE DOES NOT START

Test Step	Result / Action to Take
H1 CHECK THE STARTING SYSTEM FOR CORRECT VOLTAGE • Key in OFF position. • Disconnect: PCM C175b. • Key in ON position. • Measure the voltage between the PCM C175b pin 4, circuit 325 (DB/OG), harness side and ground.  A0049785 • **Is the voltage less than 8 volts?**	**Yes** DIAGNOSE the starting system. REFER to Section 303-06 . **No** GO to H2 .
H2 CHECK THE STARTING SYSTEM GROUND **NOTE:** When a new PCM is installed, the encoded ignition keys must be reprogrammed. • Measure the voltage between the PCM C175b pin 4, circuit 325 (DB/OG), harness side and ground.  A0049785 • **Is the voltage less than 2 volts?**	**Yes** DIAGNOSE the starting system. REFER to Section 303-06 . **No** GO to H3 .

H3 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all PCM connectors. • Check for: • corrosion • pushed-out pins • Connect all PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. Section 303-14 . REPROGRAM the encoded ignition keys. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Key Programming Using Two Programmed Keys

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool

NOTE: This procedure only works if two or more programmed ignition keys are available and it is desired to program additional key(s). If two keys are not available, follow the procedure in Key Programming—Erase All Key Codes and Program Two Keys.

NOTE: PID SPARE_KY must be enabled for this procedure to operate. If this Parameter Identification (PID) Index is not enabled, follow the security access procedure and select Spare Key Programming Switch: Enabled.

NOTE: If the programming procedure is successful, the new key(s) will start the vehicle and the THEFT INDICATOR will illuminate for approximately three seconds and the exit ignition proveout.

NOTE: If the programming procedure is not successful, the new key(s) will not start the vehicle and the THEFT INDICATOR will flash. If the programming procedure was not successful, repeat the key programming procedure from Step 1. If the failure repeats, check Circuit 729 (RD/WH) (hot at all times) in instrument cluster for proper battery voltage. Repair the circuit if voltage is not present. For additional information, refer to Diagnosis and Testing to review diagnostic trouble codes (DTCs) and perform pinpoint tests as required.

NOTE: Unless in unlimited key mode a maximum of eight ignition keys can be programmed to a passive anti-theft system (PATS) equipped vehicle. Use PID NUMKEYS to determine how many keys are programmed to the vehicle.

NOTE: If the steps are not performed as outlined, the programming procedure will end.

NOTE: Ignition keys must have correct mechanical key cut for the vehicle and must be a PATS encoded key. (Keys are different from previous model year)

1. Insert the first programmed ignition key into the ignition lock cylinder and turn the ignition switch from OFF to RUN (maintain the ignition switch in RUN for one second).

2. Turn the ignition switch to OFF and remove the first key from the ignition lock cylinder.

3. Within ten seconds of turning the ignition switch to OFF, insert the second programmed ignition key into the ignition lock cylinder and turn the ignition switch from OFF to RUN (maintain the ignition switch in RUN for one second).

4. Turn the ignition switch to OFF and remove the second key from the ignition lock cylinder.

5. Within 20 seconds of turning the ignition lock cylinder to OFF, insert the unprogrammed ignition key (new key) into the ignition lock cylinder and turn the ignition switch from OFF to RUN (maintain the ignition switch in RUN for 1 second).

6. If it is desired to program additional key(s), repeat the key programming procedure from the beginning.

Key Programming Using Diagnostic Equipment

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation Star (NGS) Tester 418-F052 or equivalent diagnostic tool

NOTE: This procedure is used when a customer needs keys programmed into the system and does not have two programmed ignition keys available. This procedure is also useful when programmed ignition key(s) have been lost or a new ignition switch assembly as been installed, and it is desired to erase key(s) from the passive anti-theft system (PATS) memory.

NOTE: This procedure will erase all programmed ignition keys from the vehicle memory and the vehicle will not start until two keys have been reprogrammed to the vehicle.

NOTE: Two PATS encoded keys with the correct mechanical cut must be available to carry out this procedure. One or both of them may be the customer's original keys.

NOTE: If additional keys are to be programmed, refer to Key Programming Using Two Programmed Keys . If the remaining keys are with the customer and are not available with the vehicle, then instruct the customer to refer to the Owner's Guide under the "Programming Spare (SecuriLock ® North America, Safeguard ® U.K. or PATS for all other markets) Keys Procedure" for instructions on programming the remaining keys.

1. Turn the ignition switch from OFF to RUN.
2. Using the diagnostic tool, follow the SECURITY ACCESS to obtain security access. For additional information, refer to Anti-Theft Security Access procedure in this section.
3. From the diagnostic tool menu, select IGNITION KEY CODE ERASE.
4. **NOTE:** Do NOT select any additional commands from this menu.

   Turn the ignition switch to OFF and disconnect the diagnostic tool.
5. Insert the first encoded key into the ignition lock cylinder and turn the ignition switch to RUN for three seconds.
6. Insert the second encoded key into the ignition lock cylinder and turn the switch to the RUN position for three seconds.
7. Remove the second encoded key from the ignition lock cylinder.
8. The vehicle should now start with both ignition keys.

Key Programming Switch State Control

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation Star (NGS) Tester 418-F052 or equivalent diagnostic tool

NOTE: The spare key programming switch is a diagnostic tool programmable switch which provides the capability to enable/disable the customer spare key programming procedure. This procedure is in the Owner's Literature spare key programming procedure or in this section under Key Programming Using Two Programmed Keys . This programmable switch is provided as a convenience for customers who may not want the spare key programming procedure available to the vehicle driver.

NOTE: The spare key programming switch state can be viewed by PCM PID SPARE_KY.

1. Insert a programmed ignition key into the ignition lock cylinder and turn the ignition switch to RUN.

2. Using the diagnostic tool Ford Service Function (FSF) card, select PCM from the menu. Follow SECURITY ACCESS to obtain security access. For additional information, refer to Anti-Theft Security Access procedure in this section.

3. **NOTE:** The default setting on delivery of all new vehicles is <ENABLE>.

   From the diagnostic tool menu, select SPARE KEY PROGRAMMING SWITCH selection to desired setting:
   <ENABLE> Spare key programming procedure is accessible.
   <DISABLE> spare key programming procedure is not accessible.

Unlimited Key Mode Programming

Enabling Unlimited Key Mode

NOTE: Unlimited Key Mode is intended for use by those customers who need more than eight keys for their vehicle.

4. The customer must choose a 4-digit, non-0000 number that will be programmed to all of their vehicles. All customer vehicles need to use the same number. Valid digits are 0-9 plus the letters A-F.

5. Note: If the PID: UNLIMITED TRANSPONDER KEY ID is not available, Unlimited Key Mode is turned on, and must be turned off before viewing the stored code. At this time, unlimited keys may be programmed to the vehicle. To view/change the stored code, follow the procedure for turning off Unlimited Key Mode below. Check the PID: UNLIMITED TRANSPONDER KEY ID and compare its value against the code chosen in Step 1.

6. Using the diagnostic tool, select PCM from the menu. Follow SECURITY ACCESS to obtain security access. For additional information, refer to Anti-Theft Security Access in this section.

7. If the Unlimited Transponder Security Key PID was 0000, select Active Command: SET UNLIMITED TRANSPONDER KEY. Enter the 4-digit code chosen by the user.

8. Select: ENABLE UNLIMITED KEY MODE.

9. Select: IGNITION CODE ERASE.

10. Disconnect the diagnostic tool and turn the ignition keys off.

11. Program in two ignition keys to enable the vehicle by inserting the first encoded key into the ignition lock cylinder and turn the switch to the RUN position for three seconds, then back to OFF.

12. Insert the second encoded key into the ignition lock cylinder and turn the switch to the RUN position, after three seconds the THEFT INDICATOR should extinguish.

13. Program any additional keys using either Key Programming Using Two Programmed Keys or Key Programming Using Diagnostic Equipment in this section.

Disabling Unlimited Key Mode

1. Using a diagnostic tool, select PCM from the menu. Follow SECURITY ACCESS to obtain security access. For additional information, refer to Anti-Theft Security Access in this section.

2. Select: DISABLE UNLIMITED KEY MODE.

3. Select: IGNITION KEY CODE ERASE.

4. Disconnect the diagnostic tool and turn the ignition key to OFF.

5. Program in two keys to enable the vehicle by inserting the first encoded key into the ignition lock cylinder and turning the switch to the RUN position for three seconds, then back to OFF.

6. Insert the second encoded key into the ignition lock cylinder and turn the switch to the RUN position, after three seconds the THEFT INDICATOR should extinguish.

7. Program any additional keys using either Key Programming Using Two Programmed Keys or Key Programming Using Diagnostic Equipment in this section.

Spare Key Programming

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation Star (NGS) Tester 418-F052 or equivalent diagnostic tool

NOTE: This procedure is used when a customer needs to have an additional key programmed into the vehicle without erasing stored key codes, but does not have two programmed keys available. This procedure is also useful when attempting to determine if an ignition key is defective, as a new key can be installed without erasing keys or without having two programmed keys available.

NOTE: Before programming, the new key must have the correct mechanical cut for the ignition lock.

NOTE: If eight keys are already programmed, this procedure will not allow any further ignition keys to be programmed without erasing all stored key codes first. The number of keys programmed into the system can be determined using the PCM PID NUMKEYS.

NOTE: If more than eight keys are needed, refer to Unlimited Key Mode Programming in Key Programming Switch State Control .

1. Turn the ignition switch from the OFF position to the RUN position using the new, unprogrammed ignition key.

2. Using the diagnostic tool Ford Service Function (FSF) card, select PCM from the menu. Follow Security Access to obtain security access. For additional information, refer to Anti-Theft Security Access in this section.

3. From the diagnostic tool menu select: IGNITION KEY CODE PROGRAM.

4. Turn the ignition switch to the OFF position and disconnect the diagnostic tool.

5. Attempt to start the engine with the new ignition key. The vehicle engine should start and run normally.

Anti-Theft Security Access

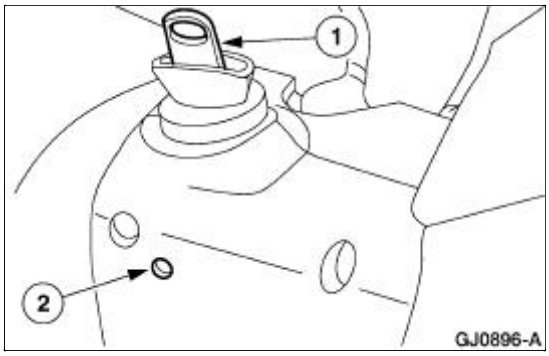
Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation Star (NGS) Tester 418-F052 or equivalent diagnostic tool

NOTE: The security access procedure is utilized to obtain passive anti-theft system (PATS) security access. PATS security access must be granted to erase ignition keys, enable/disable unlimited key mode, and enable/disable the spare key programming switch (PID SPARE_KEY). The security access procedure invokes an inherent 10 minute time delay prior to granting security access during which the diagnostic tool must remain connected to the vehicle. Once security access has been granted, a security access command menu is displayed which offers various command options. (For additional information, refer to Powertrain Control Module (PCM) Configuration Command Index).

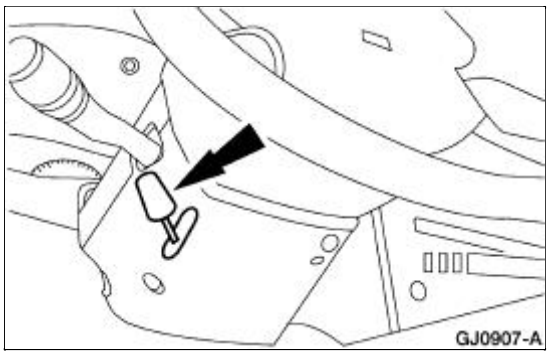
NOTE: Once security access has been granted, multiple security access commands should be executed (if necessary) prior to exiting the command menu. This avoids the carrying out of an additional security access procedure and the associated 10 minute time delay.

1. From the diagnostic tool Ford Service Function (FSF) card, enter PCM. Select SECURITY ACCESS. This procedure will take 10 minutes to carry out, during which the ignition switch must be in RUN and the diagnostic tool must be connected to the vehicle.



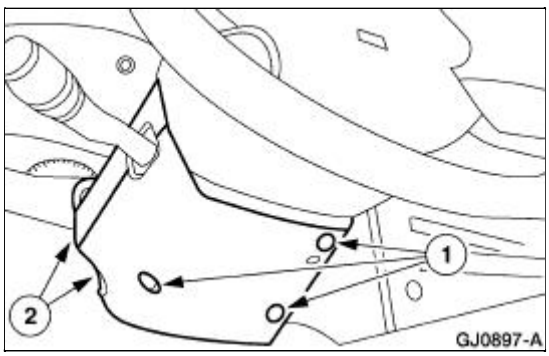
2. After the 10 minute security access procedure has been completed, a new menu will be displayed with command options. Select only those functions necessary before exiting out of this menu. Once exited out of this menu, the security access procedure must be repeated again to carry out additional commands.

Passive Anti-Theft System (PATS) Transceiver



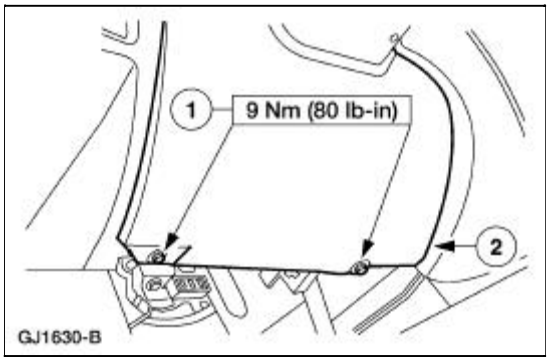
Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

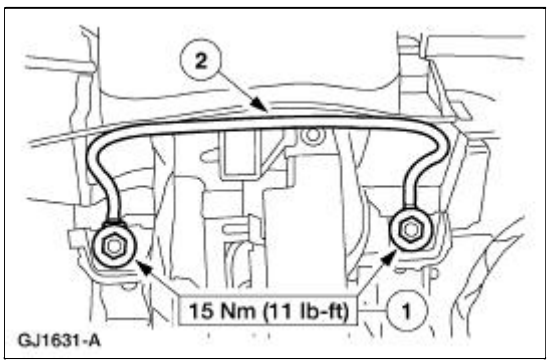


2. Remove the ignition switch lock cylinder.
    1. Insert the ignition key into the ignition switch lock cylinder and turn to the RUN position.
    2. Push the ignition switch lock cylinder release tab with a punch while pulling out the ignition switch lock cylinder.

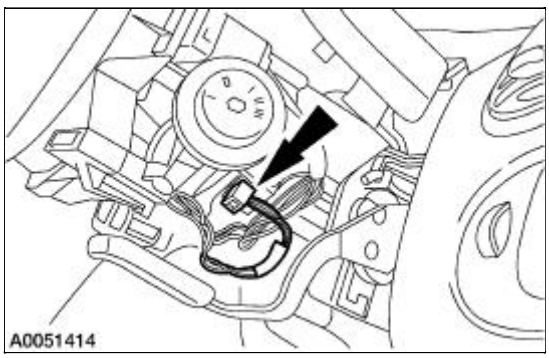
3. If equipped, remove the tilt wheel handle.



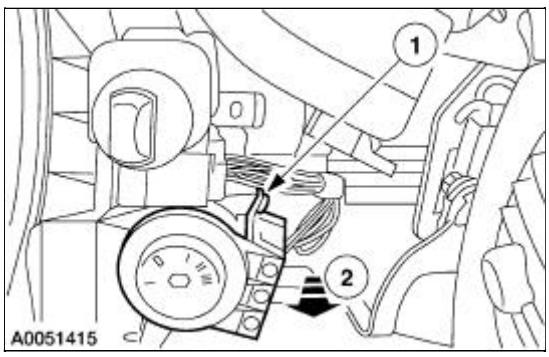
4. Remove the upper and lower steering column shrouds.
    1. Remove the screws.
    2. Remove the upper and lower steering column shrouds.



5. Remove the lower instrument panel steering column cover.
    1. Remove the screws.

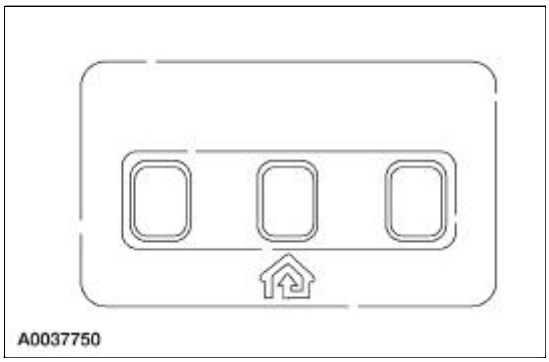


2. Remove the lower instrument panel steering column cover.



6. Remove the instrument panel steering column opening cover reinforcement.
    1. Remove the bolts.
    2. Remove the instrument panel steering column opening cover reinforcement.

7. Disconnect the passive anti-theft system (PATS) transceiver electrical connector.



8. Remove the PATS transceiver.
    1. Remove the PATS transceiver retaining screw.
    2. Remove the PATS transceiver.

9. To install, reverse the removal procedure.

Universal Transmitter

The HomeLink® universal transmitter provides a convenient way to substitute up to three hand-held transmitters with a single built-in device. The universal transmitter:

- will operate garage doors, gates and home/office lighting and security systems.
- will actually learn and transmit the radio frequency of up to three hand-held transmitters from any of the systems mentioned above.
- is an integral part of the left sun visor assembly and is powered by the vehicle battery and charging system.

Universal Transmitter

Refer to Wiring Diagrams Cell 89 , Courtesy Lamps for schematic and connector information.

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
● Damaged universal transmitter ● Damaged receiver

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the fault is not visually evident, verify the symptom and refer to the Symptom Chart.

Symptom Chart

Symptom Chart

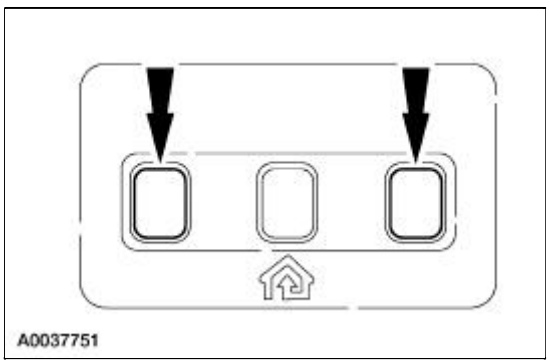
Condition	Possible Sources	Action
● The universal transmitter is inoperative	● Universal transmitter. ● Receiver unit.	● GO to Pinpoint Test A .

Pinpoint Tests

PINPOINT TEST A: THE UNIVERSAL TRANSMITTER IS INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK LEFT VANITY MIRROR OPERATION	
● Check the illumination of the left vanity mirror lamps. ● **Do the left vanity mirror lamps illuminate?**	**Yes** GO to A2 . **No**

	REFER to Section 417-02 .
A2 PROGRAM HAND-HELD TRANSMITTER INTO UNIVERSAL TRANSMITTER	
• **NOTE:** If the garage door is equipped with rolling codes, refer to Training a Garage Door Opener Equipped With "Rolling Codes." • Program the universal transmitter; Refer to Programming . • **Did the universal transmitter program successfully?**	**Yes** The universal transmitter is OK. VERIFY receiver operation. **No** INSTALL a new left sun visor assembly. TEST the system for normal operation.



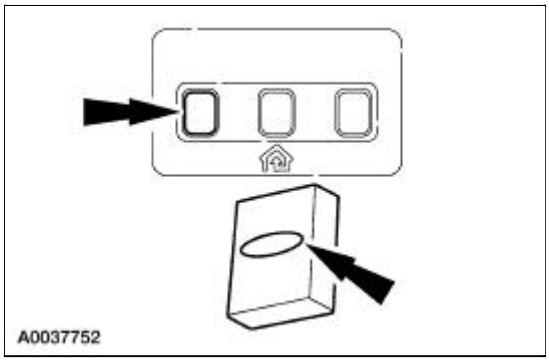
Programming

WARNING: A garage door opening system that cannot stop or reverse itself after detecting an object in its path does not meet current federal safety standards. To decrease the risk of serious injury or death, do not use this HomeLink® transmitter with a door opening system that lacks stop and reverse features as required by federal standards. This includes any garage door opening system manufactured before April 1, 1982. For more information, call HomeLink® customer assistance at 1-800-355-3515.

1. **CAUTION: During this procedure, the system that you are programming will be made to operate. Make sure that people or objects are clear of the garage door or gate being programmed.**

   Verify the hand-held transmitter is operative.

2. Prepare for programming the universal transmitter by erasing all three channels by holding down the two outside buttons until the red light begins to flash (20-30 seconds). Release both buttons.



3. Select one of the three universal transmitter channels to be programmed by pressing the desired button.

4. Hold the end of the hand-held transmitter 25-51mm (1-2 in) from the front surface of the universal transmitter so that the red light can still be seen.

5. **NOTE:** During programming, the hand-held transmitter may automatically stop transmitting after two seconds, which may not be long enough to program the universal transmitter. If programming this type of hand-held transmitter, continue to hold the button on the universal transmitter while re-pressing the hand-held transmitter button every two seconds (Canada only).

   Use both hands to press the hand-held transmitter button and the desired button on the universal transmitter. Do not release either button.

6. Hold down both buttons until the red light on the universal transmitter flashes, first slowly and then rapidly. Release both buttons when the rapid flashing begins. The universal transmitter has successfully learned the new frequency signal and can be used in place of the hand-held transmitter(s).

7. **NOTE:** If the hand-held transmitter appears to program the universal transmitter but does not open the garage door, the garage door opener may have a "code protected" or "rolling code" feature.

   To operate, simply press the appropriate button on the universal transmitter. The red light is on while the signal is being transmitted.

Training a Garage Door Opener Equipped With "Rolling Codes"

8. Program the hand-held transmitter to the universal transmitter. For additional information, refer to Programming in this section.

9. Train the garage door opener receiver to recognize the universal transmitter.
   1. Remove the cover panel from the garage door opener receiver.
   2. Locate the training button on the garage door opener receiver. Location and color of the button may vary by garage door opener manufacturer. Refer to the garage door opener instruction manual or call HomeLink® customer assistance at 1-800-355-3515.
   3. Press the training button on the garage door opener receiver for 1-2 seconds.
   4. Press the programmed universal transmitter button for as long as the universal transmitter red light flashes (1-2 seconds). Release the button and re-press the button to confirm that the universal transmitter is trained to the receiver.
   5. The garage door opener should recognize the universal transmitter.

Erasing Channels

1. **NOTE:** Individual channels cannot be erased, but can be reprogrammed using the procedures for programming; for additional information, refer to Programming in this section.

   To erase all three programmed channels, hold down the two outside buttons until the red light begins to flash (20-30 seconds). Release both buttons.

Navigation System —Navigator Built After 2/2003

The vehicle navigation system audibly and visually guides the user to any entered destination. The system utilizes a global positioning system (GPS) antenna, a vehicle speed input and other sensor information to accurately establish the vehicle position. The navigation system module carries out all route calculations and sends the digital versatile disc (DVD) vector map information to the audio unit. The audio unit display provides visual and audible instructions of the maneuvers required to arrive at the pre-entered destination.

Navigation System

The vehicle navigation system audibly and visually guides the user to any entered destination. The system utilizes a global positioning system (GPS) antenna, a vehicle speed input and other sensor information to accurately establish the vehicle position. The audio unit carries out all route calculations through a map compact disc (CD) stored in the audio unit. The audio unit provides the visual and audible instructions of the maneuvers required to arrive at the pre-entered destination.

Navigation System —Navigator Built After 2/2003

Refer to Wiring Diagrams Cell 32 for schematic and connector information.

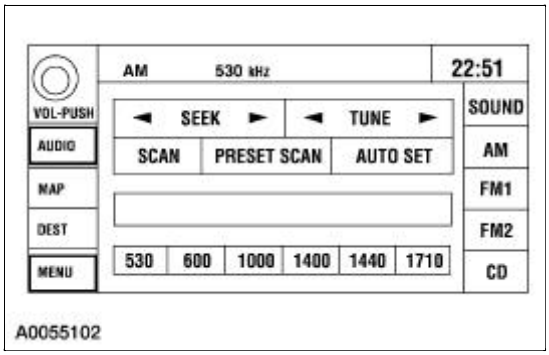
Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with appropriate adapter cable

Principles of Operation

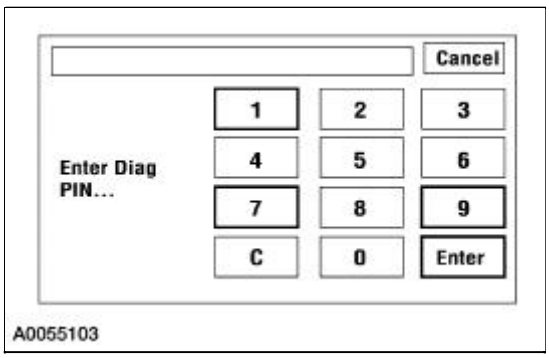
Navigation System

The navigation system module controls the operation and the interface between the user, the vehicle subsystems and the external components. The navigation system module is on the standard corporate protocol (SCP) network and can be diagnosed with a diagnostic tool. Communication through the controller area network (CAN) utilizes data transmitted and received between the navigation system module and the audio unit to control the video screen display through the video interface circuits.



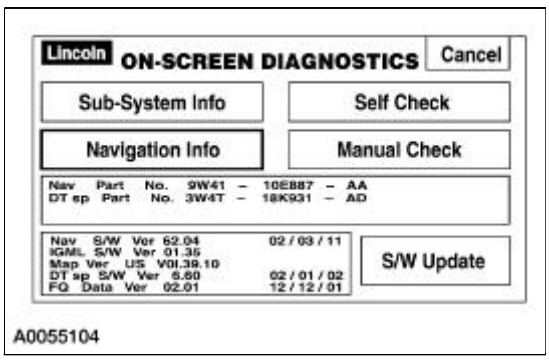
The vehicle navigation system will guide the user to a pre-entered destination. A map digital versatile disc (DVD) stored in the navigation system module sends route calculation data to the audio unit. The audio unit display will audibly and visually instruct the user of the maneuvers required to arrive at the destination entered.

A voice recognition system allows the user to interface with the system without using the touch screen. A microphone located in the rear view mirror provides a direct input to the navigation system module.



In order to calculate initial vehicle position, the GPS antenna is used to track several available satellites simultaneously. The GPS antenna only receives data and does not communicate with the satellites. A gyroscope integral to the navigation system module monitors the pitch and yaw of the vehicle created during cornering or turning. A hardwired vehicle speed input from the anti-lock brake system (ABS) module and a reverse input from the digital transmission range (TR) sensor through the SCP network are also used to detect vehicle speed and direction changes.

Self Diagnostics



Although on the SCP network, the navigation system provides internal diagnostics to assist with diagnosing vehicle concerns.

Press and hold the AUDIO and MENU buttons for 5 seconds.

Press 917 Enter.

- SELF CHECK provides internal self-test diagnostics. These DTCs are also accessible through the SCP network utilizing a diagnostic tool.
- NAVIGATION INFO provides access to speed signal, gyro, reverse input and GPS information.
- SUB-SYSTEM INFO provides the various component configurations.
- MANUAL CHECK provides access to several diagnostics input tests:
  - Voice Output will verify the audio signals from the navigation system module and audio unit.
  - Hard Switch Test will check the various switches.
  - Microphone Test will check the strength of the voice signal.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Antenna coaxial cable ● Global positioning system antenna ● Navigation system DVD	● Central junction box (CJB) fuse(s): ■ 4 (15A) ■ 22 (10A) ■ 31 (25A) ● Microphone ● Circuitry ● Navigation system module ● Audio unit

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before preceding to the next step.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:

- check that the program card is correctly installed.
- check the connections to the vehicle.
- check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the data link diagnostic test. If the diagnostic tool responds with:
   - SCP+, SCP-, or ISO circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
   - No response/not equipped for the navigation system module, Go To Pinpoint Test A .
   - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), clear the continuous DTCs and carry out self-test diagnostics for the navigation system module.

7. If the DTCs retrieved are related to the concern, go to the Navigation System Module Diagnostic Trouble Code (DTC) Index.

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Navigation System Module Diagnostic Trouble Code (DTC) Index

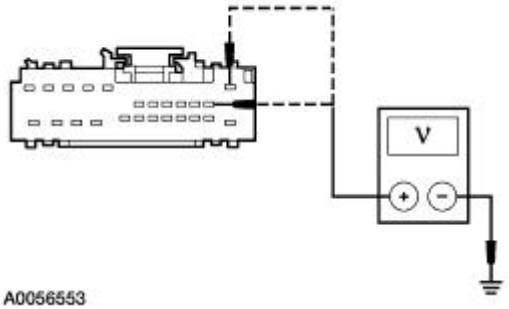
DTC	Audio Unit Display	Description	Source	Action
B1342	$9342	ECU is Defective	Navigation System Module	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new navigation system module. REFER to Navigation System Module—Navigator Built

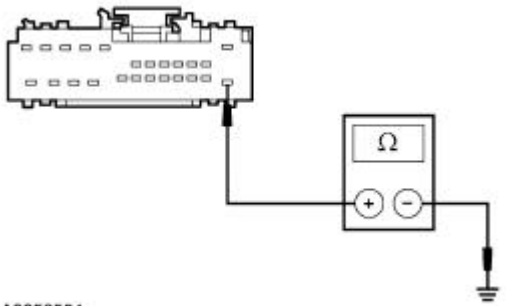
				After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-test.
B2139	$A139	Data Mismatch	Navigation System Module	CLEAR the DTCs. REPEAT the self-test. If DTC B2139 is retrieved again, REMOVE the navigation system module and SEND it to an authorized Ford audio system repair facility. REFER to Navigation System Module—Navigator Built After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-test.
B2204	$A204	GPS Antenna Connection Open or Short	Navigation System Module	Go To Pinpoint Test B .
B2208	$A208	Navigation to Head Unit Communication Error	Navigation System Module	Go To Pinpoint Test I .
B2477	$A477	Module Configuration Failure	Navigation System Module	CHECK the navigation system module configuration. REFER to Section 418-01 .
B2633	$A633	Driver — Front Microphone Circuit Failure	Navigation System Module	Go To Pinpoint Test J .
B2858	$A858	Satellite ECU is Defective	Navigation System Module	CLEAR the DTCs. REPEAT the self-test. If DTC B2858 is retrieved again, REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test.
C1192	$5992	Vehicle Speed Circuit Failure	Navigation System Module	Go To Pinpoint Test C .
U1016	$D016	SCP Invalid Data (PCM)	Navigation System Module	Go To Pinpoint Test K .

For a complete list of navigation system module DTCs, refer to Section 419-10 .

Symptom Chart

Symptom Chart

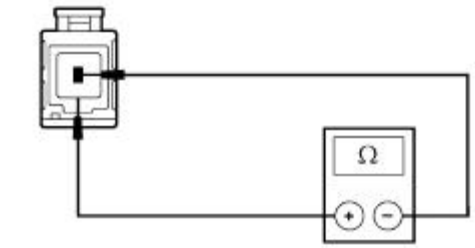


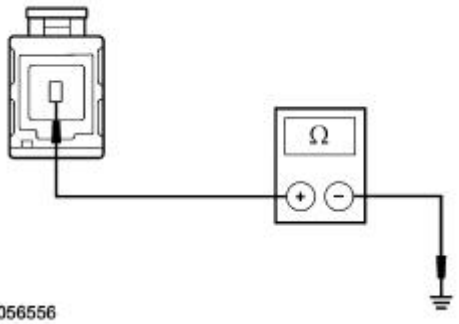


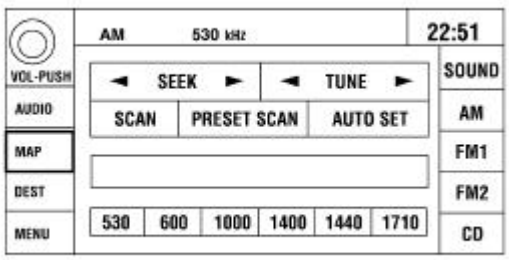
Condition	Possible Sources	Action
• No communication with the navigation system module	• Central junction box (CJB) fuse (s): ■ 4 (15A) ■ 22 (10A) • Circuitry. • Navigation system module.	• Go To Pinpoint Test A .
• Navigation system does not operate correctly — no global positioning system (GPS) antenna signal	• Circuitry. • GPS antenna. • Navigation	• Go To Pinpoint Test B .

	system module.	
• Navigation system does not operate correctly — the position cursor is inoperative	• Circuitry. • Navigation system module.	• Go To Pinpoint Test C .
• Navigation system does not operate correctly — the voice guidance is inoperative/does not operate correctly	• Circuitry. • Audio unit. • Navigation system module.	• Go To Pinpoint Test D .
• Navigation system does not operate correctly — the display screen is inoperative	• Circuitry. • Audio unit. • Navigation system module.	• Go To Pinpoint Test E .
• Navigation system does not operate correctly — the navigation screen is inoperative	• Circuitry. • Audio unit. • Navigation system module.	• Go To Pinpoint Test F .
• Navigation system does not operate correctly — the audible switches are inoperative	• Circuitry. • Audio unit. • Navigation system module.	• Go To Pinpoint Test G .
• Navigation system does not operate correctly — unable to insert or eject a map disc	• Circuitry. • Navigation system module.	• Go To Pinpoint Test H .
• Navigation system does not operate correctly — the audio unit is inoperative	• Central junction box (CJB) fuse (s): ■ 7 (7.5A) ■ 22 (10A) ■ 31 (25A) • Circuitry. • Audio unit. • Navigation system module.	• Go To Pinpoint Test I .

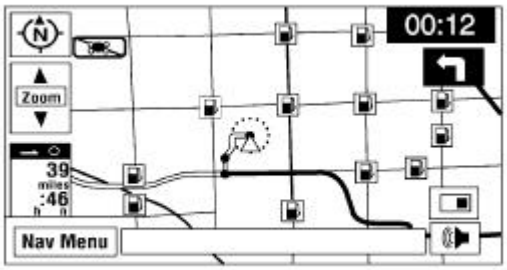
Pinpoint Tests







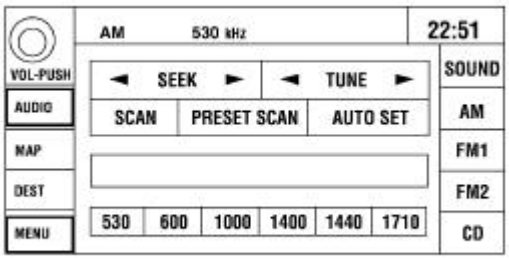
PINPOINT TEST A: NO COMMUNICATION WITH THE NAVIGATION SYSTEM MODULE

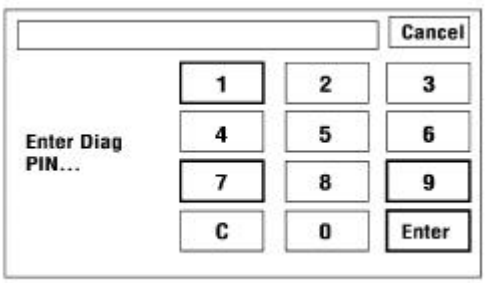


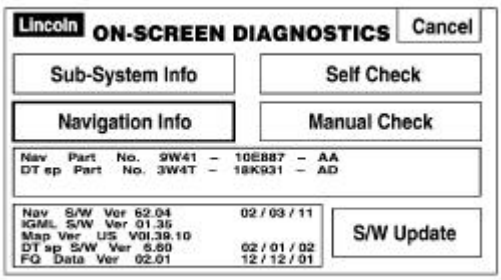
Test Step	Result / Action to Take
A1 CHECK CIRCUITS 720 (RD/YE) AND 194 (PK) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Navigation System Module C2279a. • Key in ON position. • Measure the voltage between the navigation system module C2279a pin 1, circuit 720 (RD/YE), harness side and ground; and between the navigation system module C2279a pin 2, circuit 194 (PK), harness side and ground.	**Yes** GO to A2 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

 A0056553 ● **Are the voltages greater than 10.5 volts?**	
A2 CHECK CIRCUIT 694 (BK/LG) FOR AN OPEN	**Yes** REFER to Section 418-00 to continue communication diagnostics. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
● Key in OFF position. ● Measure the resistance between the navigation system module C2279a pin 13, circuit 694 (BK/LG), harness side and ground.  A0056554 ● **Is the resistance less than 5 ohms?**	

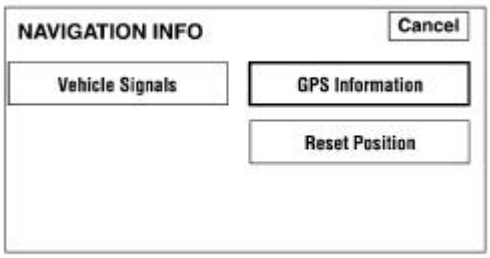
PINPOINT TEST B: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY — NO GLOBAL POSITIONING SYSTEM (GPS) ANTENNA SIGNAL





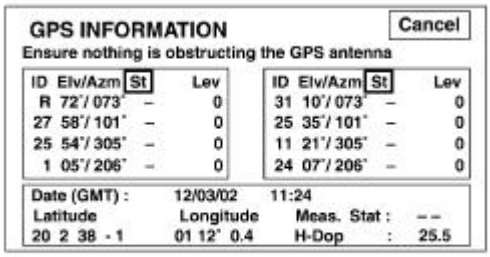


Test Step	Result / Action to Take
NOTE: The vehicle must be driven outside of any enclosed structure to an area that is unobstructed by trees, tall buildings, and bridges.	
B1 CHECK THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE NAVIGATION SYSTEM MODULE	
● Use the recorded results from the navigation system module self-test. ● **Are any DTCs recorded?**	**Yes** For DTC B2204, GO to B2 . For all other navigation system module DTCs, REFER to the Navigation System Module Diagnostic Trouble Code (DTC) Index in this section. **No** GO to B4 .
B2 CHECK THE GPS ANTENNA	
● Key in OFF position. ● Disconnect: GPS Antenna C2279b. ● Measure the resistance between the GPS antenna	**Yes** GO to B3 .



center conductor pin, component side and the GPS antenna shield, component side.  A0056767 • **Is the resistance between 80 and 125 ohms?**	**No** INSTALL a new GPS antenna. REFER to Global Positioning System (GPS) Antenna—Navigator Built After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-test.
B3 CHECK THE GPS ANTENNA CENTER CONDUCTOR FOR A SHORT TO GROUND	
• Measure the resistance between the GPS antenna center conductor pin, component side and ground.  A0056556 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B7 . **No** INSTALL a new GPS antenna. REFER to Global Positioning System (GPS) Antenna—Navigator Built After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-test.
B4 CHECK THE NAVIGATION SYSTEM	
• Move the vehicle outside of any enclosed structure to an area that is unobstructed by trees, tall buildings, and bridges. • Turn the audio unit on. • Press the MAP button.  A0065067 • Monitor the GPS icon.	**Yes** The system is operating correctly at this time. **No** GO to B5 .

A0057837

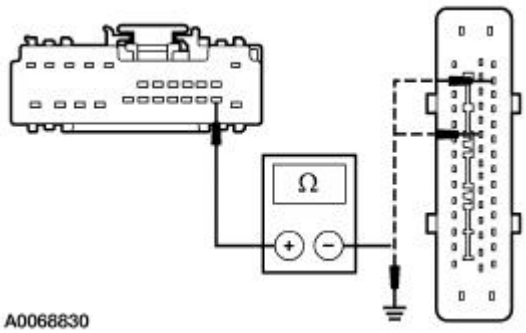


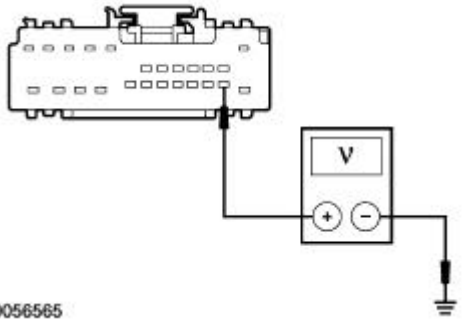
- **Does the GPS icon disappear?**

B5 CHECK THE GPS SIGNAL STATUS	
• Press and hold the AUDIO and MENU buttons for 5 seconds.  A0055102 • Press 917 Enter.  A0055103 • Select Navigation Info.  A0055104 • Select GPS Information.	**Yes** The system is operating correctly at this time. **No** GO to B6 .

A0055105

- Monitor the GPS status.

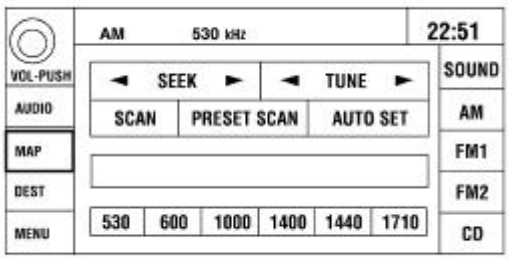


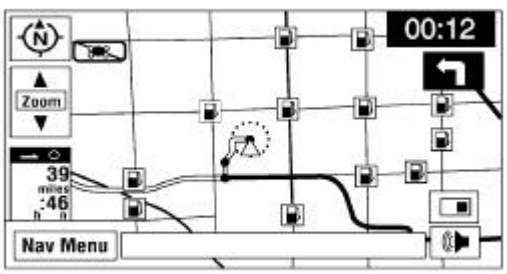


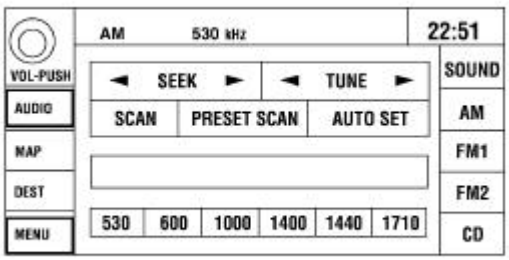
A0055106

- **After 10 minutes, does the ST (status) column of the GPS information display P (position) or T (tracking)?**

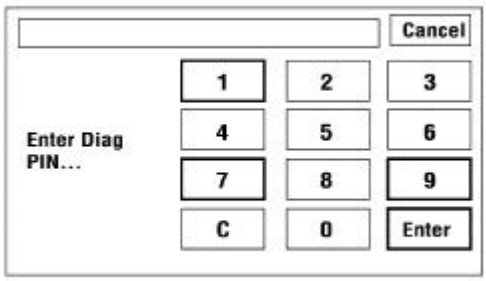
B6 SUBSTITUTE THE GPS ANTENNA	
• Substitute a known good GPS antenna. • **After 10 minutes, does the ST (status) column of the GPS information display P (position) or T (tracking)?**	**Yes** INSTALL a new GPS antenna. REFER to Global Positioning System (GPS) Antenna—Navigator Built After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-test. **No** REINSTALL the original antenna. GO to B7 .
B7 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	
• Disconnect all navigation system module connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all navigation system module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new navigation system module. REFER to Navigation System Module—Navigator Built After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.





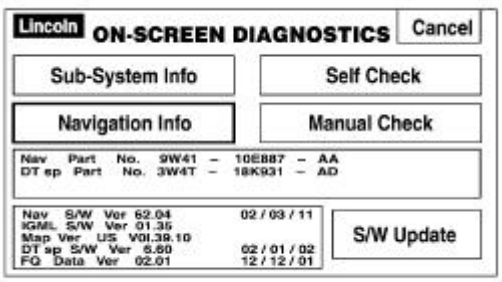


PINPOINT TEST C: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY — THE POSITION CURSOR IS INOPERATIVE



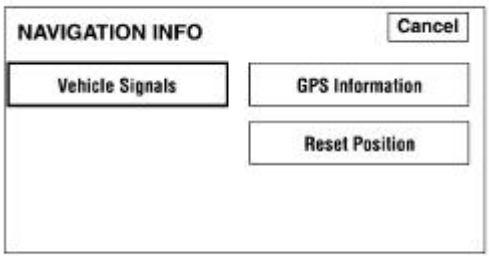
Test Step	Result / Action to Take
NOTE: Outdated map disc information may cause this symptom to recur at the same place.	
C1 CHECK THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE NAVIGATION SYSTEM MODULE • Use the recorded results from the navigation system module self-test. • **Are any DTCs recorded?**	**Yes** For DTC C1192, GO to C2. For all other navigation system module DTCs, REFER to the Navigation System Module Diagnostic Trouble Code (DTC) Index in this section. **No** GO to C4.
C2 CHECK CIRCUIT 565 (BK/WH) FOR AN OPEN AND A SHORT TO GROUND • Key in OFF position. • Disconnect: Anti-lock Brake System (ABS) Module C135. • Disconnect: Navigation System Module C2279a. • Measure the resistance between the navigation system module C2279a pin 14, circuit 565 (BK/WH), harness side and the ABS module C135 pin 22 (with stability assist) or pin 3 (without stability assist), circuit 565 (BK/WH), harness side; and between the navigation system module C2279a pin 14, circuit 565 (BK/WH), harness side and ground.  A0068830 • **Is the resistance less than 5 ohms between the ABS module and the navigation system module; and is the resistance greater than 10,000 ohms between the navigation system module and ground?**	**Yes** GO to C3. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C3 CHECK CIRCUIT 565 (BK/WH) FOR A SHORT TO VOLTAGE • Key in ON position. • Measure the voltage between the navigation system module C2279a pin 14, circuit 565 (BK/WH), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to C9.

A0056565



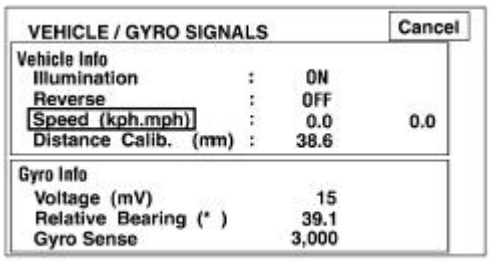
- **Is any voltage indicated?**

C4 CHECK THE NAVIGATION SYSTEM GPS INPUT	
• Move the vehicle outside of any enclosed structure to an area that is unobstructed by trees, tall buildings, and bridges. • Turn the audio unit on. • Press the MAP button.  A0065067 • Monitor the GPS icon.  A0057837 • **Does the GPS icon disappear?**	**Yes** GO to C5 . **No** Go To Pinpoint Test B to diagnose the GPS antenna.
C5 CHECK THE VEHICLE SPEED SIGNAL INPUT	
• Press and hold the AUDIO and MENU buttons for 5 seconds.  A0055102 • Press 917 Enter.	**Yes** GO to C7 . **No** If the speedometer is inoperative, REFER to Section 413-01 . If the speedometer is inaccurate, GO to C6 .



A0055103

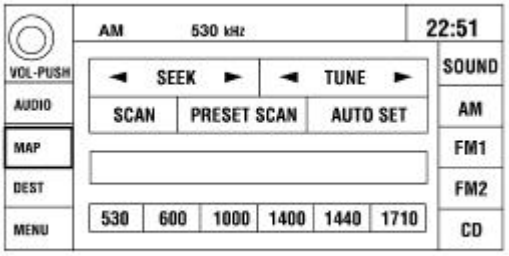
- Select Navigation Info.



A0055104

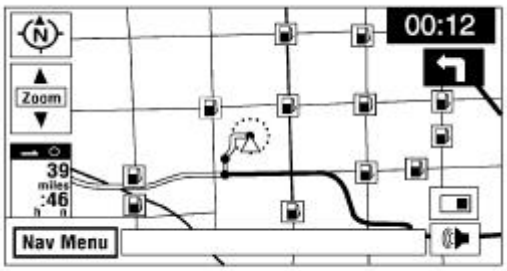
- Select Vehicle Signals.

A0055107



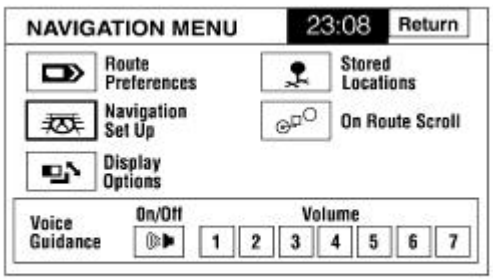
- Drive the vehicle at a minimum speed of 5 km/h (3 mph).

A0055108



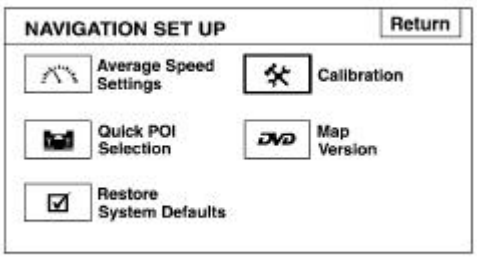
- **Does the vehicle SPEED signal correspond to the speed indicated on the vehicle speedometer?**

C6 CHECK THE VEHICLE SPEED SIGNAL CALIBRATION	
• Select Cancel to exit from the diagnostic screens. • Press the MAP button.	**Yes** The system is operating correctly at this time. Concern may have been caused by a speed signal calibration error. **No** GO to C8 .



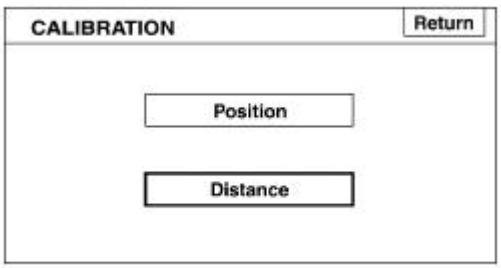
A0065067

- Select Nav Menu.



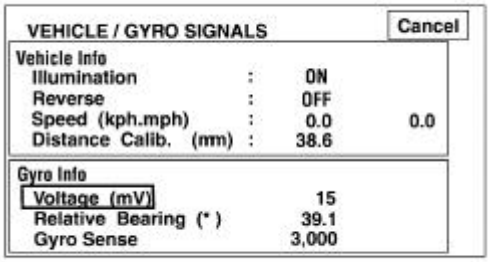
A0057838

- Select Navigation Set Up.



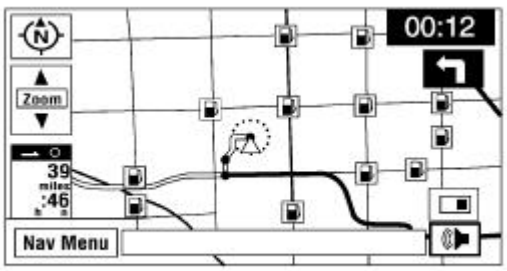
A0055110

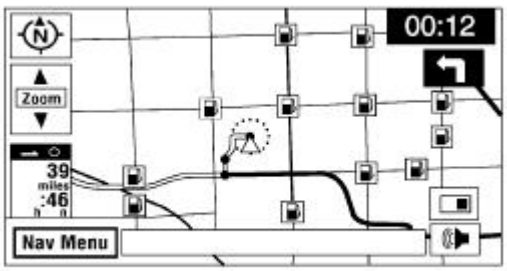
- Select Calibration.

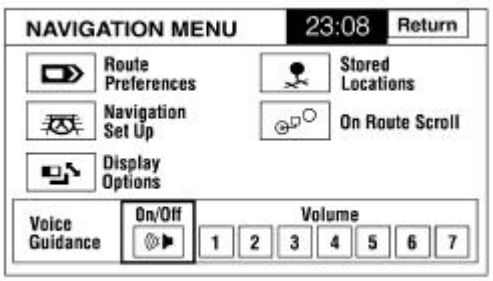


A0055111

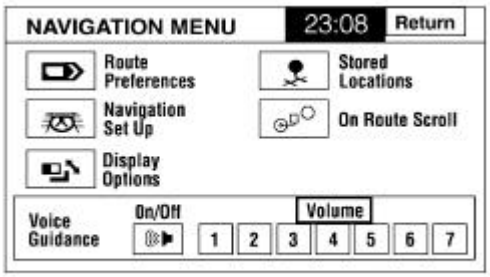
- Select Distance.







A0055112



- Drive the vehicle a minimum of 10 km (6.25 miles).

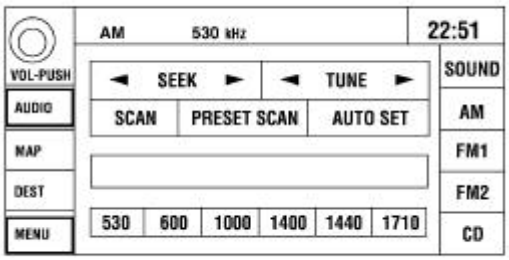
• **Does the position cursor operate correctly?**	
C7 CHECK THE GYROSCOPE SIGNAL	
• Monitor the gyro voltage.  A0055113 • Drive the vehicle turning left and right. • **Does the gyro voltage change when the vehicle turns left or right?**	**Yes** GO to C8 . **No** The gyroscope is integral to the navigation system module. INSTALL a new navigation system module. REFER to Navigation System Module—Navigator Built After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-test.
C8 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	
• Disconnect all navigation system module connectors. • Check for: • corrosion • pushed-out pins • Connect all navigation system module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new navigation system module. REFER to Navigation System Module—Navigator Built After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
C9 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect all ABS module connectors. • Check for: • corrosion • pushed-out pins • Connect all ABS module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09A or Section 206-09B . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST D: NAVIGATION SYSTEM DOES NOT OPERATE

CORRECTLY — THE VOICE GUIDANCE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
D1 CHECK THE SPEAKERS	
• Key in ON position. • Turn the audio unit on. • Carry out the speaker walk around self-test by pressing and holding the MAP and DEST buttons on the audio unit while in AM or FM mode for 5 seconds. • **Do the speakers operate correctly?**	**Yes** GO to D2 . **No** REFER to Section 415-00 to diagnose the audio system.
D2 CALCULATE A VEHICLE ROUTE	
• Calculate a vehicle route by setting a desired destination. • Press the voice icon on the present position screen.  A0057839 • **Does the voice guidance system operate correctly?**	**Yes** The system is operating correctly at this time. **No** GO to D3 .
D3 CHECK THE VOICE GUIDANCE SYSTEM	
• Select Nav Menu.  A0057838 • Select Voice Guidance.  A0055114 • **Is the voice guidance system on the navigation menu turned ON?**	**Yes** GO to D4 . **No** Turn the voice guidance system ON. CLEAR the DTCs. REPEAT the self-test.
D4 CHECK THE VOICE GUIDANCE VOLUME	
• Select Volume.	**Yes**

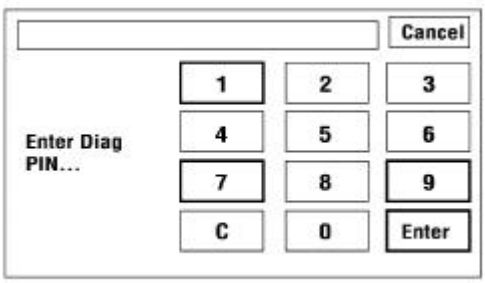
A0055115



- **Is the volume adjustment set to minimum?**

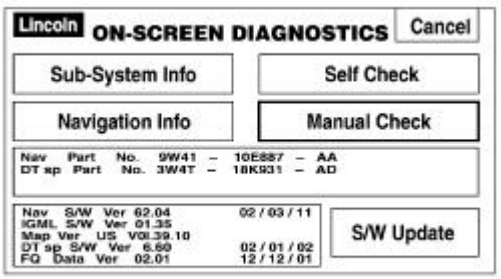
Increase the sound volume. CLEAR the DTCs. REPEAT the self-test.

No
GO to D5 .



D5 CHECK THE AUDIO UNIT OUTPUT

- Press and hold the AUDIO and MENU buttons for 5 seconds.

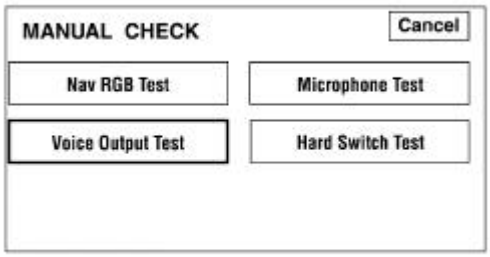


A0055102

- Press 917 Enter.

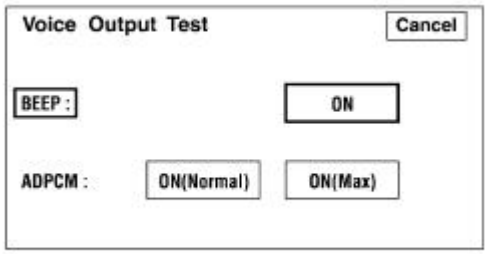
A0055103

- Select Manual Check.



A0055116

- Select Voice Output Test.

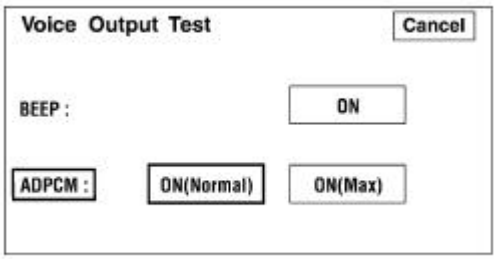


Yes
GO to D6 .

No
REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test.

A0055117

- Select BEEP On.



A0055118

- **Was a tone emitted by the audio unit?**

D6 CHECK THE NAVIGATION SYSTEM MODULE OUTPUT

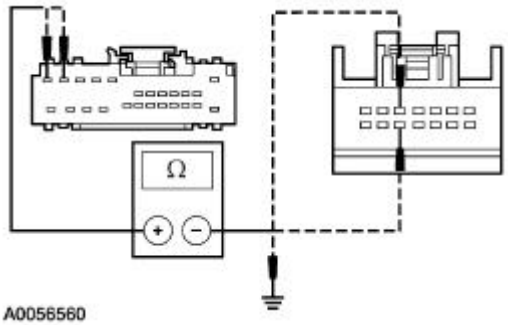
- Select ADPCM ON (Normal).

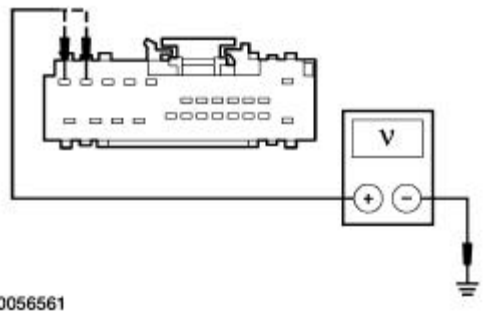
A0055119

- **Was a tone emitted by the navigation system module?**

Yes
GO to D9 .

No
GO to D7 .

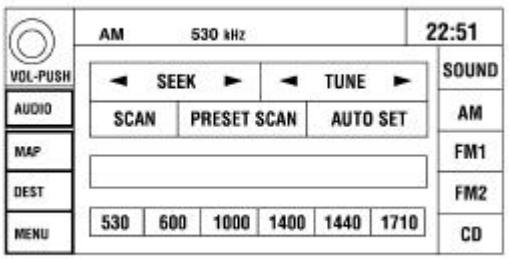




D7 CHECK CIRCUITS 1530 (LB) AND 1531 (LG) FOR AN OPEN AND A SHORT TO GROUND

- Key in OFF position.
- Disconnect: Audio Unit C2253c.
- Disconnect: Navigation System Module C2279a.
- Measure the resistances between the navigation system module C2279a pins, harness side and the audio unit C2253c pins, harness side; and between the navigation system module C2279a pins, harness side and ground as follows:

Navigation System Module	Audio Unit	Circuit
C2279a pin 11	C2253c pin 5	1530 (LB)
C2279a pin 12	C2253c pin 12	1531 (LG)

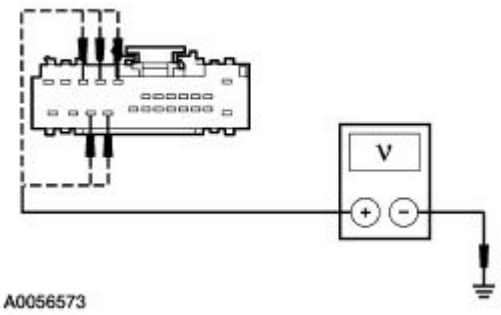


Yes
GO to D8 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

 A0056560 ● **Are the resistances less than 5 ohms between the navigation system module and the audio unit; and are the resistances greater than 10,000 ohms between the navigation system module and ground?**	
D8 CHECK CIRCUITS 1530 (LB) AND 1531 (LG) FOR A SHORT TO BATTERY	
● Key in ON position. ● Measure the voltage between the navigation system module C2279a pin 11, circuit 1530 (LB), harness side and ground; and between the navigation system module C2279a pin 12, circuit 1531 (LG), harness side and ground.  A0056561 ● **Is any voltage indicated?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** GO to D9 .
D9 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	
● Disconnect all navigation system module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all navigation system module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new navigation system module. REFER to Navigation System Module—Navigator Built After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

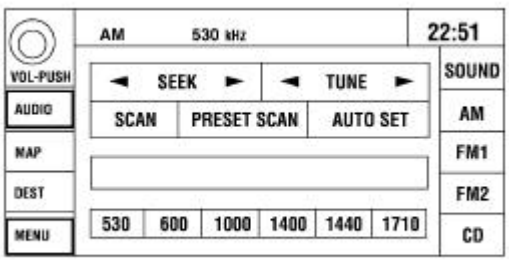
PINPOINT TEST E: NAVIGATION SYSTEM DOES NOT OPERATE

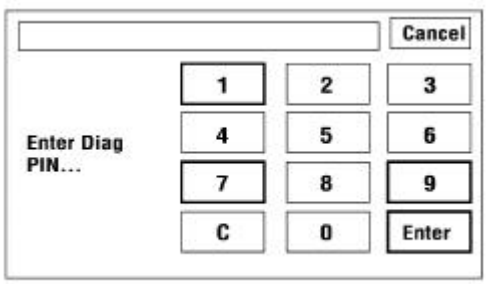


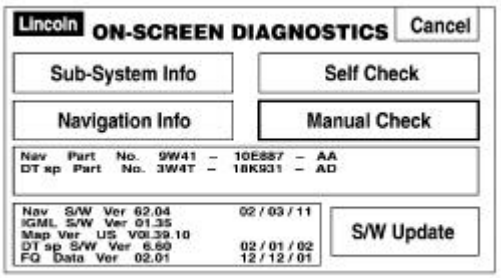
CORRECTLY — THE DISPLAY SCREEN IS INOPERATIVE

Test Step	Result / Action to Take
E1 CHECK THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE NAVIGATION SYSTEM MODULE ● Use the recorded results from the navigation system module self-test. ● **Are any DTCs recorded?**	**Yes** For DTC B2208, Go To Pinpoint Test I to diagnose the controller area network (CAN) circuits. For all other navigation system module DTCs, REFER to the Navigation System Module Diagnostic Trouble Code (DTC) Index in this section. **No** GO to E2 .
E2 CHECK THE AUDIO UNIT BUTTONS ● Press the MAP, AUDIO, DEST, and MENU buttons.  A0065066 ● **Does the display screen operate correctly?**	**Yes** The system is operating correctly at this time. Concern may have been caused by SCREEN OFF selection on MENU screen. **No** GO to E3 .
E3 CHECK THE VIDEO AND SYNCHRONIZATION CIRCUITS FOR AN OPEN AND A SHORT TO GROUND ● Key in OFF position. ● Disconnect: Audio Unit C2253c. ● Disconnect: Navigation System Module C2279a. ● Measure the resistances between the navigation system module C2279a pins, harness side and the audio unit C2253c pins, harness side; and between the navigation system module C2279a pins, harness side and ground as follows:	**Yes** GO to E4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

Navigation System Module	Audio Unit	Circuit
C2279a pin 8	C2253c pin 1	1534 (BK)
C2279a pin 9	C2253c pin 8	1536 (BK)
C2279a pin 10	C2253c pin 3	1538 (YE/RD)
C2279a pin 21	C2253c pin 2	1535 (BK)
C2279a pin 22	C2253c pin 9	1537 (RD)



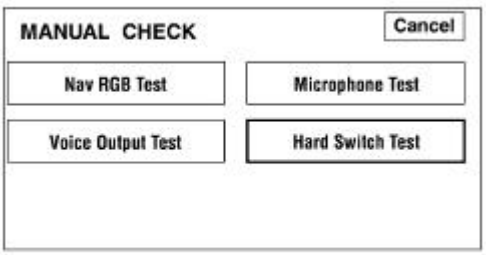




- **Are the resistances less than 5 ohms between the navigation system module and the audio unit; and are the resistances greater than 10,000 ohms between the navigation system module and ground?**

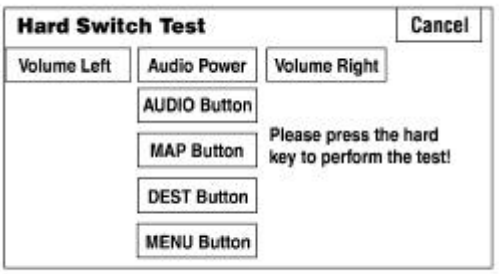
E4 CHECK THE VIDEO AND SYNCHRONIZATION CIRCUITS FOR A SHORT TO BATTERY	
• Key in ON position. • Measure the voltage between the navigation system module C2279a pins, harness side and ground as follows: **Navigation System Module** / **Circuit** C2279a pin 8 — 1534 (BK) C2279a pin 9 — 1536 (BK) C2279a pin 10 — 1538 (YE/RD) C2279a pin 21 — 1535 (BK) C2279a pin 22 — 1537 (RD)  • **Is any voltage indicated?**	**Yes** REPAIR the circuit the question. CLEAR the DTCs. REPEAT the self-test. **No** GO to E5 .
E5 SUBSTITUTE THE AUDIO UNIT	
• Substitute a known good audio unit. • **Does the screen display appear?**	**Yes** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test. **No** REINSTALL the original audio unit. GO to E6 .
E6 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE	

OPERATION	
• Disconnect all navigation system module connectors. • Check for: • corrosion • pushed-out pins • Connect all navigation system module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new navigation system module. REFER to Navigation System Module—Navigator Built After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.



PINPOINT TEST F: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY — THE NAVIGATION SCREEN IS INOPERATIVE

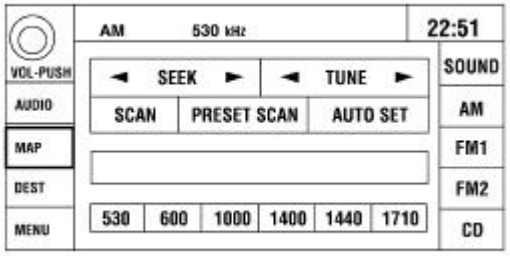
Test Step	Result / Action to Take
F1 CHECK THE SWITCH DISPLAY	
• Key in ON position. • Turn the audio unit on. • Press and hold the AUDIO and MENU buttons for 5 seconds.  A0055102 • Press 917 Enter.  A0055103 • Select Manual Check.	**Yes** GO to F2 . **No** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test.



A0055116

- Select Hard Switch Test.

A0055120

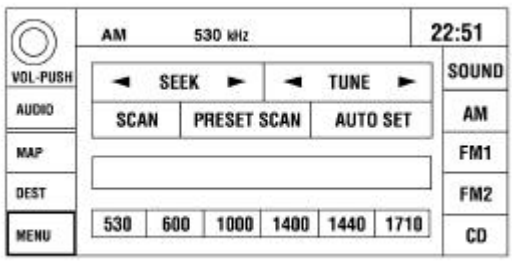


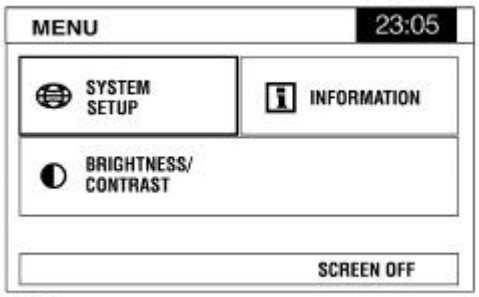
- Push each switch on the display.

A0055121

- **Are all of the switches operating correctly?**

F2 CHECK THE MAP DISC SURFACE	
• Key in OFF position. • Key in ON position. • Remove and visually inspect the map disc surface. • **Is the map disc dirty or scratched?**	**Yes** INSTALL a new map disc. CLEAR the DTCs. REPEAT the self-test. **No** REINSTALL the map disc. GO to F3.
F3 CHECK THE MAP DISPLAY	
• Key in OFF position. • Key in ON position. • Press the MAP button.	**Yes** The system is operating correctly at this time. **No** GO to F4.

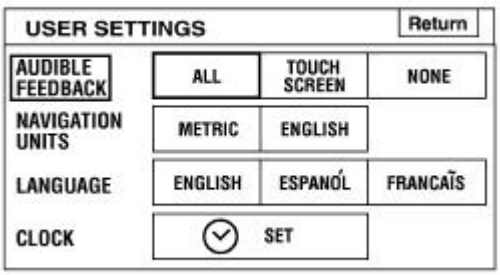




A0065067

- **Is the map displayed?**

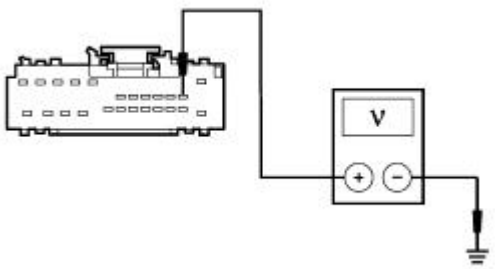
F4 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	
• Disconnect all navigation system module connectors. • Check for: • corrosion • pushed-out pins • Connect all navigation system module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new navigation system module. REFER to Navigation System Module—Navigator Built After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.



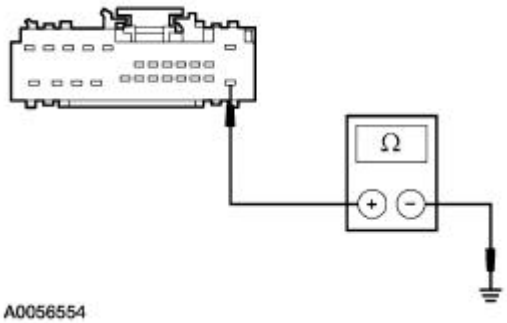
PINPOINT TEST G: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY — THE AUDIBLE SWITCHES ARE INOPERATIVE

Test Step	Result / Action to Take
G1 CHECK THE SWITCH DISPLAY	
• Key in ON position. • Turn the audio unit on. • Press the MENU button.  A0066586 • Select SYSTEM SETUP.	**Yes** Select ALL. CLEAR the DTCs. REPEAT the self-test. **No** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test.

A0055122



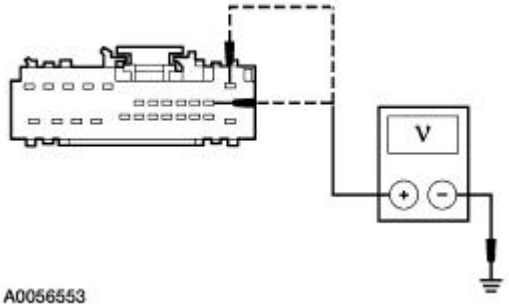
- Select AUDIBLE FEEDBACK.



A0067803

- **Is NONE highlighted on the audible feedback settings?**

PINPOINT TEST H: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY — UNABLE TO INSERT OR EJECT A MAP DISC



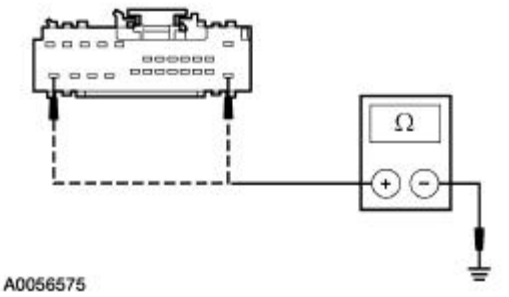
Test Step	Result / Action to Take
H1 CHECK CIRCUIT 194 (PK) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Navigation System Module C2279a. • Key in ON position. • Measure the voltage between the navigation system module C2279a pin 2, circuit 194 (PK), harness side and ground.  A0056574 • **Is the voltage greater than 10 volts?**	**Yes** GO to H2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
H2 CHECK CIRCUIT 694 (BK/LG) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the navigation system module C2279a pin 13, circuit 694 (BK/LG), harness side and ground.	**Yes** GO to H3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0056554 ● **Is the resistance less than 5 ohms?**	
H3 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	
● Disconnect all navigation system module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all navigation system module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new navigation system module. REFER to Navigation System Module—Navigator Built After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST I: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY — THE AUDIO UNIT IS INOPERATIVE

Test Step	Result / Action to Take
I1 CHECK THE RECORDED DTCS FROM THE NAVIGATION SYSTEM MODULE	
● Use the recorded results from the navigation system module self-test. ● **Are any DTCs recorded?**	**Yes** For DTC B2208, GO to I2 . For all other navigation system module DTCs, REFER to the Navigation System Module Diagnostic Trouble Code (DTC) Index in this section. **No** Go To Pinpoint Test E to diagnose the video circuits.
I2 CHECK CIRCUITS 797 (LG/VT) AND 194 (PK) FOR VOLTAGE	
● Key in OFF position. ● Disconnect: Audio Unit C2253a. ● Key in ON position.	**Yes** GO to I3 .

- Measure the voltage between the audio unit C2253a pin 1, circuit 797 (LG/VT), harness side and ground; and between the audio unit C2253a pin 2, circuit 194 (PK), harness side and ground.



- **Are the voltages greater than 10.5 volts?**

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

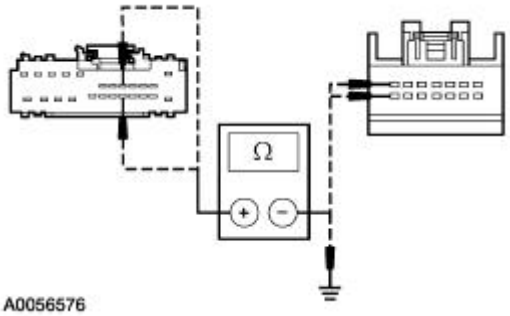
I3 CHECK CIRCUIT 694 (BK/LG) FOR AN OPEN

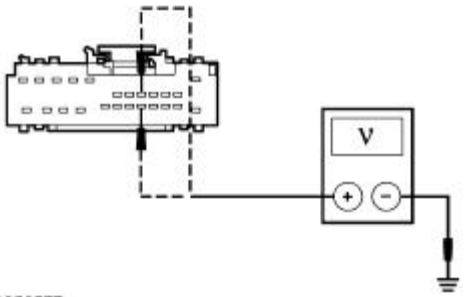
- Key in OFF position.
- Measure the resistance between the audio unit C2253a pin 13, circuit 694 (BK/LG), harness side and ground; and between the audio unit C2253a pin 24, circuit 694 (BK/LG), harness side and ground.

- **Are the resistances less than 5 ohms?**

Yes
GO to I4 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

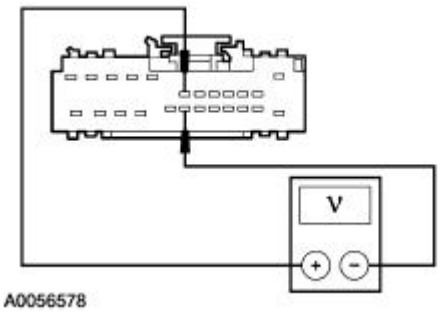


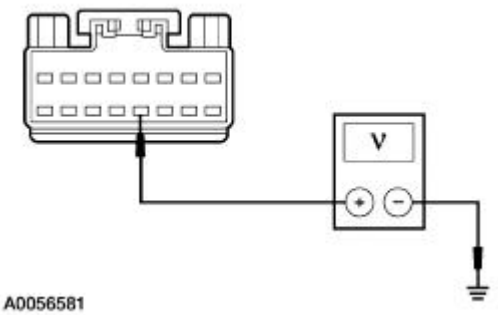


I4 CHECK CIRCUITS 1532 (DB/WH) AND 1533 (DG/OG) FOR AN OPEN AND A SHORT TO GROUND

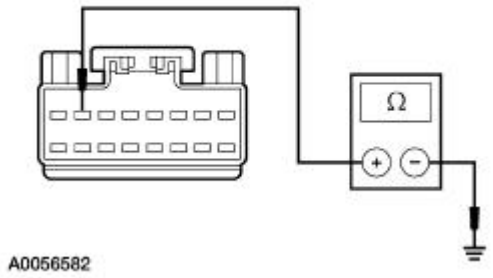
- Disconnect: Navigation System Module C2279a.
- Disconnect: Audio Unit C2253c.
- Measure the resistances between the navigation system module C2279a pins, harness side and the audio unit C2253c pins, harness side; and between the navigation system module C2279a pins, harness side and ground as follows:

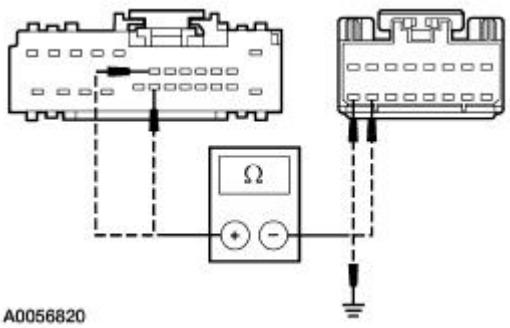
Navigation System Module	Audio Unit	Circuit
C2279a pin 5	C2253c pin 7	1532 (DB/WH)
C2279a pin 17	C2253c pin 14	1533 (DG/OG)





Yes
GO to I5 .



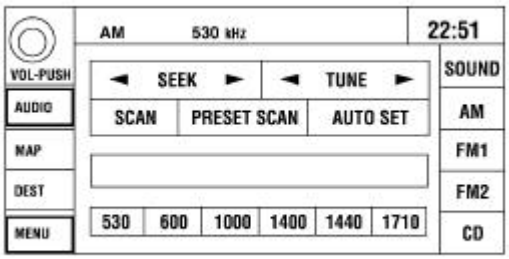


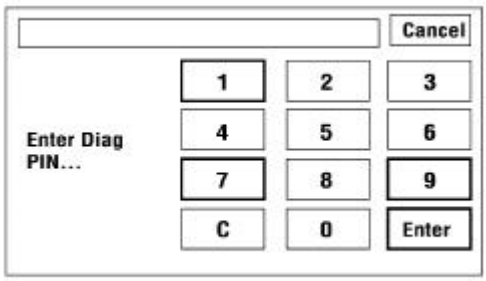
No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

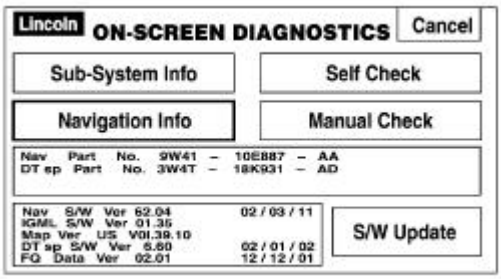
 A0056576 ● **Are the resistances less than 5 ohms between the navigation system module and the audio unit; and are the resistances greater than 10,000 ohms between the navigation system module and ground?**	
I5 CHECK CIRCUITS 1532 (DB/WH) AND 1533 (DG/OG) FOR A SHORT TO BATTERY	
● Key in ON position. ● Measure the voltage between the navigation system module C2279a pin 5, circuit 1532 (DB/WH), harness side and ground; and between the navigation system module C2279a pin 17, circuit 1533 (DG/OG), harness side and ground.  A0056577 ● **Is any voltage indicated?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** GO to I6 .
I6 SUBSTITUTE THE AUDIO UNIT	
● Substitute a known good audio unit. ● Repeat the navigation system module self-test. ● **Is DTC B2208 present?**	**Yes** REINSTALL the original audio unit. GO to I7 . **No** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test.
I7 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	
● Disconnect all navigation system module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all navigation system module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new navigation system module. REFER to Navigation System Module—Navigator Built After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-

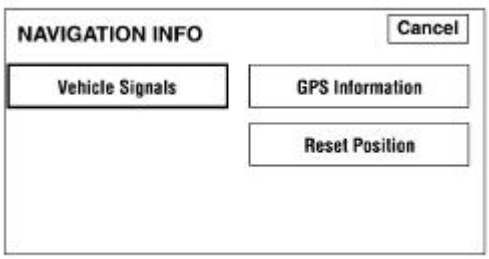
	test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST J: DTC B2633 DRIVER — FRONT MICROPHONE CIRCUIT FAILURE

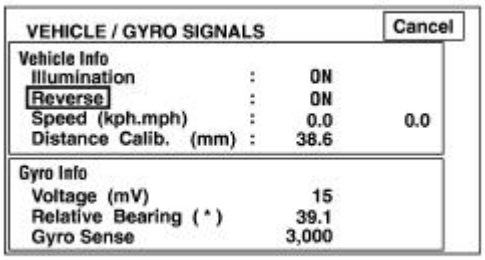








Test Step	Result / Action to Take
J1 CHECK THE VOICE SIGNAL INPUT	
• Key in OFF position. • Disconnect: Navigation System Module C2279a. • Key in ON position. • Measure the voltage between the navigation system module C2279a pin 7, circuit 714 (VT), harness side and between the navigation system module C2279a pin 19, circuit 713 (WH), harness side while speaking loudly into the rear view mirror microphone.  A0056578 • **Is any AC voltage indicated?**	**Yes** GO to J6 . **No** GO to J2 .
J2 CHECK CIRCUIT 194 (PK) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Rear View Mirror C9012. • Key in ON position. • Measure the voltage between the rear view mirror C9012 pin 13, circuit 194 (PK), harness side and ground.  A0056581 • **Is the voltage greater than 10 volts?**	**Yes** GO to J3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
J3 CHECK CIRCUIT 875 (BK/LB) FOR AN OPEN	



• Key in OFF position. • Measure the resistance between the rear view mirror C9012 pin 2, circuit 875 (BK/LB), harness side and ground.  A0056582 • **Is the resistance less than 5 ohms?**	**Yes** GO to J4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
J4 CHECK CIRCUITS 713 (WH) AND 714 (VT) FOR AN OPEN AND A SHORT TO GROUND	
• Measure the resistances between the navigation system module C2279a pins, harness side and the rear view mirror C9012 pins, harness side; and between the navigation system module C2279a pins, harness side and ground as follows: **Navigation System Module** / **Rear View Mirror** / **Circuit** C2279a pin 7 / C9012 pin 9 / 714 (VT) C2279a pin 19 / C9012 pin 10 / 713 (WH)  A0056820 • **Are the resistances less than 5 ohms between the navigation system module and the rear view mirror; and are the resistances greater than 10,000 ohms between the navigation system module and ground?**	**Yes** GO to J5 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
J5 CHECK CIRCUITS 713 (WH) AND 714 (VT) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between the navigation system module C2279a pin 7, circuit 714 (VT), harness side and ground; and between the navigation system module C2279a pin 19, circuit 713 (WH), harness side and ground.	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new rear view mirror. REFER to Section 501-09 . CLEAR the DTCs. REPEAT the self-test.

 A0056580 ● **Is any voltage indicated?**	
J6 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION ● Disconnect all navigation system module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all navigation system module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new navigation system module. REFER to Navigation System Module—Navigator Built After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST K: DTC U1016 — SCP INVALID DATA

Test Step	Result / Action to Take
K1 CHECK THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCS) FROM THE POWERTRAIN CONTROL MODULE (PCM) ● Use the recorded results from the PCM self-test. ● **Are any DTCs recorded?**	**Yes** For PXXX DTCs, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. For all other DTCs, REFER to Section 419-10 . **No** GO to K2 .
K2 CHECK THE PCM REVERSE SIGNAL ● Enter the following diagnostic mode on the diagnostic tool: PCM PID monitor. ● Monitor the transmission range (TR) sensor PID. ● Place the TR selector lever in reverse. ● **Does the TR sensor PID indicate correctly?**	**Yes** GO to K3 . **No** REFER to Section 307-01A or Section 307-01B to continue

	diagnosis of the reverse signal.
K3 CHECK THE NAVIGATION SYSTEM MODULE REVERSE SIGNAL ● Press and hold the AUDIO and MENU buttons for 5 seconds.  A0055102 ● Press 917 Enter.  A0055103 ● Select Navigation Info.  A0055104 ● Select Vehicle Signals.  A0055107 ● Monitor the reverse signal.	**Yes** CLEAR the DTCs. REPEAT the self-test. If DTC U1016 is retrieved again, GO to K4 . **No** GO to K4 .

A0068110

- **Does the reverse signal indicate ON?**

K4 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	
• Disconnect all navigation system module connectors. • Check for: • corrosion • pushed-out pins • Connect all navigation system module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new navigation system module. REFER to Navigation System Module—Navigator Built After 2/2003 in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Navigation System

Refer to Wiring Diagrams Cell 130 for schematic and connector information.

Principles of Operation

Navigation System

The navigation system is integral to the audio unit. The audio unit controls the operation and interface between the user, the vehicle subsystems and the external components. A map compact disc (CD) stored in the audio unit will visually guide the user of the maneuvers required to arrive at the destination entered.

In order to calculate initial vehicle position, a global positioning system (GPS) antenna is used to track several available satellites simultaneously. The GPS antenna only receives data and does not communicate with the satellites. A hardwired reverse input from the transmission range sensor and a hardwired vehicle speed input from the anti-lock brake system (ABS) module are also used to improve the accuracy of the navigation system.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● GPS antenna ● Navigation system CD ● Audio unit	● Central junction box (CJB) fuse(s): ■ 7 (7.5A) ■ 22 (10A) ■ 31 (25A) ● Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and GO to Symptom Chart .

Upgrading The Audio Unit Software

To perform an audio unit software upgrade the following steps must be taken:

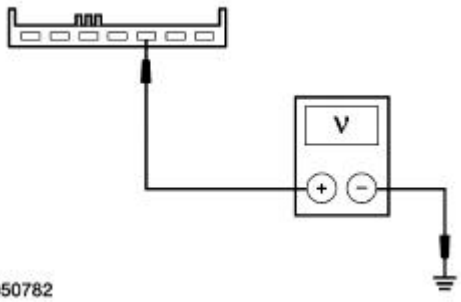
1. Turn the ignition switch to the ON or ACC position.
2. Turn the audio unit ON.
3. Install a new database CD.

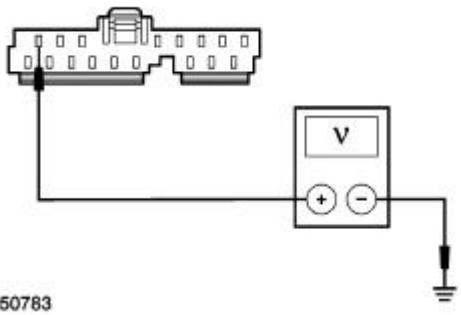
4. If the audio unit recognizes a revised level of software it will prompt the user to confirm whether they would like to carry out a software upgrade. When the Updating System Software screen is displayed, press the YES button on the display screen to accept the software update.

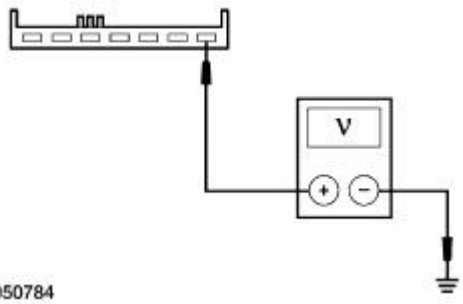
5. **CAUTION: Do not remove power from the audio unit during the software update.**

   The audio unit will perform a unit reset, upgrade the software and perform a second unit reset upon completion. When the audio unit returns to normal mode, the software upgrade is complete.

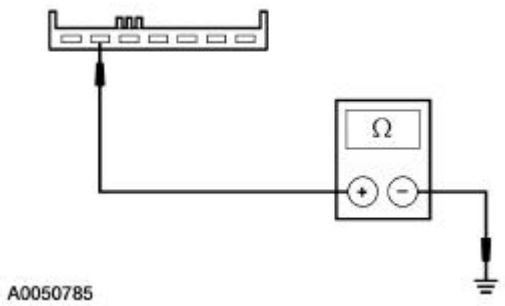
Symptom Chart







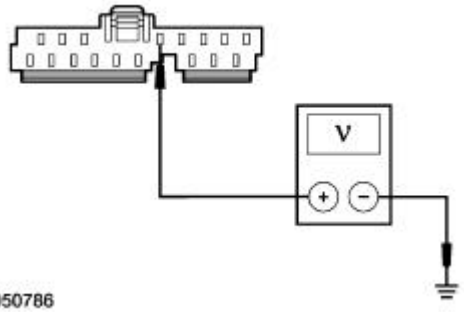
Symptom Chart



Condition	Possible Sources	Action
● Navigation system will not switch on.	● CJB fuse(s): ■ 7 (7.5A) ■ 22 (10A) ■ 31 (25A) ● Circuitry. ● Audio unit.	● Go To Pinpoint Test L .
● Navigation system does not operate correctly — no reverse tracking	● Circuitry. ● Transmission range (TR) sensor. ● Audio unit.	● Go To Pinpoint Test M .
● Navigation system does not operate correctly — no speedometer signal.	● Circuitry. ● Audio unit.	● Go To Pinpoint Test N .
● Navigation system does not operate correctly — no global positioning system (GPS) antenna signal	● Audio unit. ● Circuitry. ● GPS antenna.	● Go To Pinpoint Test O .

Pinpoint Tests

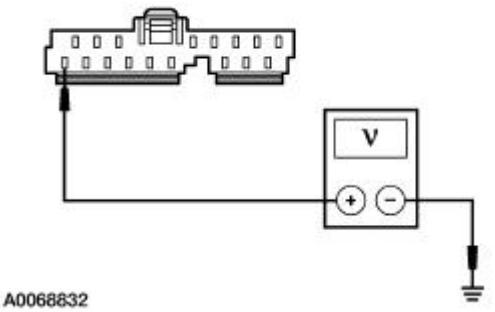
PINPOINT TEST L: NAVIGATION SYSTEM WILL NOT SWITCH ON



Test Step	Result / Action to Take
L1 CHECK CIRCUIT 1499 (PK/LG) FOR VOLTAGE	
● Key in OFF position. ● Disconnect: Audio Unit C2188a. ● Key in ON position. ● Measure the voltage between the audio unit C2188a pin 3, circuit 1499 (PK/LG), harness side and ground.	**Yes** GO to L2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0050782 ● **Is the voltage greater than 10 volts?**	
L2 CHECK CIRCUIT 1000 (RD/BK) FOR VOLTAGE ● Key in OFF position. ● Disconnect: Audio Unit C2188c. ● Key in START position. ● Measure the voltage between the audio unit C2188c pin 7, circuit 1000 (RD/BK), harness side and ground.  A0050783 ● **Is the voltage greater than 10 volts?**	**Yes** GO to L3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
L3 CHECK CIRCUIT 797 (LG/VT) FOR VOLTAGE ● Measure the voltage between the audio unit C2188a pin 1, circuit 797 (LG/VT), harness side and ground.  A0050784 ● **Is the voltage greater than 10 volts?**	**Yes** GO to L4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
L4 CHECK CIRCUIT 694 (BK/LG) FOR AN OPEN ● Key in OFF position. ● Measure the resistance between the audio unit C2188a pin 6, circuit 694 (BK/LG), harness side and ground.	**Yes** GO to L5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 ● **Is the resistance less than 5 ohms?**	
L5 CHECK FOR CORRECT AUDIO UNIT OPERATION	
● Disconnect all the audio unit connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the audio unit connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

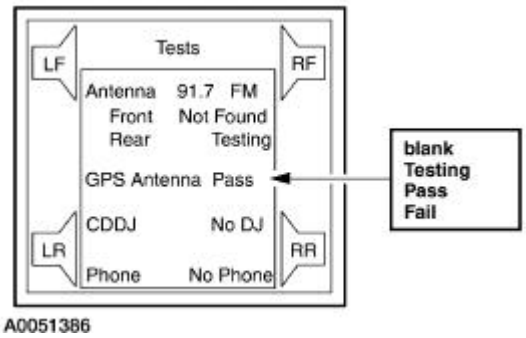


PINPOINT TEST M: THE NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY — NO REVERSE TRACKING

Test Step	Result / Action to Take
M1 CHECK THE REVERSE LAMP OPERATION	
● Key in ON position. ● Set the parking brake. ● Place the transmission range (TR) selector lever in reverse. ● **Do the reverse lamps operate?**	**Yes** GO to M2 . **No** REFER to Section 417-01 to continue diagnosis of the reverse lamps.
M2 CHECK CIRCUIT 1789 (VT/WH) FOR VOLTAGE	
● Key in OFF position. ● Disconnect: Audio Unit C2188c. ● Key in ON position. ● Place the TR selector lever in reverse. ● Measure the voltage between the audio unit C2188c pin 10, circuit 1789 (VT/WH), harness side and ground.	**Yes** GO to M3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0050786 ● **Is the voltage greater than 10 volts?**	
M3 CHECK FOR CORRECT AUDIO UNIT OPERATION	
● Disconnect all the audio unit connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all the audio unit connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST N: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY — NO SPEEDOMETER SIGNAL

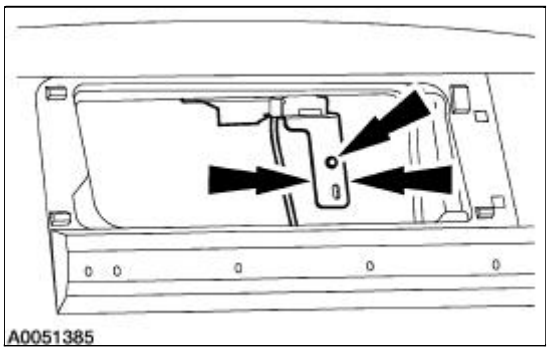


Test Step	Result / Action to Take
N1 CHECK CIRCUIT 565 (BK/WH) FOR AN OPEN AND A SHORT TO GROUND	
● Key in OFF position. ● Disconnect: ABS Module C135. ● Disconnect: Audio Unit C2188c. ● Measure the resistance between the audio unit C2188c pin 6, circuit 565 (BK/WH), harness side and the ABS module C135 pin 22 (with stability assist) or pin 3 (without stability assist), circuit 565 (BK/WH), harness side; and between the audio unit C2188c pin 6, circuit 565 (BK/WH), harness side and ground.  A0068831 ● **Is the resistance less than 5 ohms between the ABS module and the audio unit; and is the resistance greater than 10,000 ohms between the audio unit and ground?**	**Yes** GO to N2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

N2 CHECK CIRCUIT 565 (BK/WH) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between the audio unit C2188c pin 6, circuit 565 (BK/WH), harness side and ground.  • **Is any voltage indicated?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to N3 .
N3 SUBSTITUTE THE AUDIO UNIT	
• Substitute a known good audio unit. • **Is the concern still present?**	**Yes** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test. **No** REINSTALL the original audio unit.GO to N4 .
N4 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect all ABS module connectors. • Check for: • corrosion • pushed-out pins • Connect all ABS module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09A or Section 206-09B . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST O: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY — NO GLOBAL POSITIONING SYSTEM (GPS) ANTENNA SIGNAL

Test Step	Result / Action to Take
NOTE: To carry out the speaker walk around self-test the vehicle must be driven outside of any	



enclosed structure to an area that is unobstructed by trees, tall buildings, and bridges.

O1 CHECK THE GPS ANTENNA SIGNAL USING THE SPEAKER WALK AROUND SELF-TEST	
• Make sure the GPS antenna is correctly connected to the audio unit. • Key in ON position. • Turn the audio unit ON. • Carry out the speaker walk around self-test by pressing the audio preset buttons 3 and 6 on the audio unit.  A0051386 • **Does the GPS antenna indicate Pass?**	**Yes** The GPS system is operating correctly. GO to Symptom Chart for all other navigation system concerns. **No** INSTALL a new GPS antenna. REFER to Navigation System Antenna—Global Positioning Sensor (GPS) in this section. If the system is still inoperative, GO to O2 .
O2 CHECK FOR CORRECT AUDIO UNIT OPERATION	
• Disconnect all the audio unit connectors. • Check for: • corrosion • pushed-out pins • Connect all the audio unit connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Navigation System Antenna —Global Positioning Sensor (GPS)

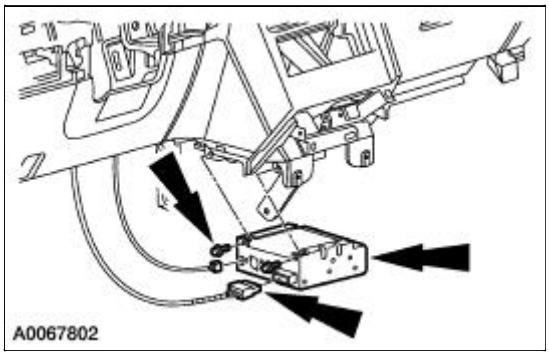
Removal and Installation

1. Disconnect the battery. For additional information, refer to Section 414-01 .
2. Remove the audio unit. For additional information, refer to Section 415-01 .
3. Remove the glove compartment. For additional information, refer to Section 501-12 .
4. Remove the GPS antenna.
   - Disconnect the electrical connector.
   - Remove the bolt.

5. To install, reverse the removal procedure.

Navigation System Module —Navigator Built After 2/2003

Removal and Installation



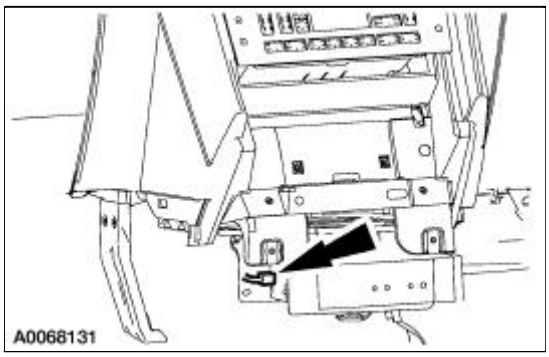
1. **CAUTION: Electronic modules are sensitive to electrical charges. If exposed to these charges, damage may result.**

   NOTE: Prior to removal of the navigation system module, it is necessary to remove the digital versatile disc (DVD) from the navigation system module and store it in the customer case.

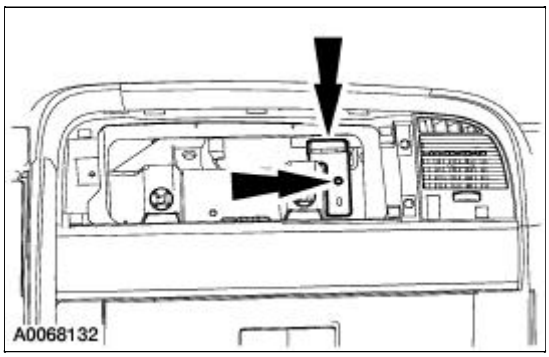
   Disconnect the battery. For additional information, refer to Section 414-01 .

2. Remove the lower LH and RH panels from the front floor console.

3. Remove the navigation system module.
   - Remove the electrical connectors.
   - Remove the two screws.



4. To install, reverse the removal procedure.



Global Positioning System (GPS) Antenna —Navigator Built After 2/2003

Removal and Installation

1. Disconnect the battery. For additional information, refer to Section 414-01 .
2. Remove the lower LH and RH panels from the front floor console.
3. Disconnect the GPS antenna.

4. Remove the passenger airbag module. For additional information, refer to Section 501-20B .
5. Remove the GPS antenna.
   - Remove the screw.

6. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-in
Instrument panel fuse junction panel bulkhead connector bolts	5.6	35
Vehicle security module nuts	7	62
Instrument panel fuse junction panel nuts	5.6	35

Module Controlled Functions

The multifunction electronic control modules consist of the following:

- driver seat module (DSM)
- vehicle security module

The DSM allows automatic positioning of the memory driver seat and the memory pedals to three programmable positions. For additional information, refer to Section 501-10 .

The vehicle security module controls the remote keyless entry system and the computer-operated lock system. For additional information, refer to Section 501-14 .

Multifunction Electronic Module

For driver seat module (DSM),

Refer to Wiring Diagrams Cell 123 for schematic and connector information.

For vehicle security module,

Refer to Wiring Diagrams Cell 117 for schematic and connector information.

Diagnostic Trouble Code (DTC) Chart

DTC	Description	Source	Action
B1201	Fuel Sender Circuit Failure	Instrument Cluster	REFER to Section 413-01 .
B1204	Fuel Sender Circuit Short to Ground	Instrument Cluster	REFER to Section 413-01 .
B1205	EIC Switch-1 Assembly Circuit Failure	Instrument Cluster	REFER to Section 413-08 .
B1209	EIC Switch-2 Assembly Circuit Failure	Instrument Cluster	REFER to Section 413-08 .
B1217	Horn Relay Coil Circuit Failure	Vehicle Security Module	REFER to Section 413-06 .
B1231	Longitudinal Acceleration Threshold Exceeded	RCM	REFER to Section 501-20B .
B1251	Air Temperature Internal Sensor Circuit Open	EATC Module	REFER to Section 412-00 .
B1253	Air Temperature Internal Sensor Circuit Short to Ground	EATC Module	REFER to Section 412-00 .
B1255	Air Temperature External Sensor Circuit Open	Instrument Cluster	REFER to Section 413-08 .
B1255	Air Temperature External Sensor Circuit Open	EATC Module	REFER to Section 412-00 .
B1257	Air Temperature External Sensor Circuit Short to Ground	Instrument Cluster	REFER to Section 413-08 .
B1257	Air Temperature External Sensor Circuit Short to Ground	EATC Module	REFER to Section 412-00 .
B1259	Solar Radiation Sensor Circuit Open	EATC Module	REFER to Section 412-00 .
B1261	Solar Radiation Sensor Circuit Short to Ground	EATC Module	REFER to Section 412-00 .
B1284	Oil Pressure Switch Failure	Instrument Cluster	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

B1299	Power Supply Sensor Circuit Short to Ground	Parking Aid Module	REFER to Section 413-13 .
B1300	Power Door Lock Circuit Failure	Vehicle Security Module	REFER to Section 501-14 .
B1311	Power Door Unlock Circuit Failure	Vehicle Security Module	REFER to Section 501-14 .
B1317	Battery Voltage High	Instrument Cluster	REFER to Section 414-01 .
B1317	Battery Voltage High	4WD Control Module	REFER to Section 414-01 .
B1317	Battery Voltage High	Vehicle Security Module	REFER to Section 414-01 .
B1317	Battery Voltage High	Fuel Fired Heater Module	REFER to Section 412-03B .
B1318	Battery Voltage Low	Instrument Cluster	REFER to Section 414-01 .
B1318	Battery Voltage Low	4WD Control Module	REFER to Section 414-01 .
B1318	Battery Voltage Low	Vehicle Security Module	REFER to Section 414-01 .
B1318	Battery Voltage Low	Fuel Fired Heater Module	REFER to Section 412-03B .
B1321	Driver Door Ajar Circuit Short to Battery	Vehicle Security Module	REFER to Section 417-02 .
B1328	Passenger Door Ajar Circuit Open	Instrument Cluster	REFER to Section 417-02 .
B1329	Passenger Door Ajar Circuit Short to Battery	Vehicle Security Module	REFER to Section 417-02 .
B1333	Decklid Ajar Rear Door Circuit Short to Battery	Vehicle Security Module	REFER to Section 417-02 .
B1337	Door Ajar RR Circuit Short to Battery	Vehicle Security Module	REFER to Section 417-02 .
B1342	ECU is Defective	Instrument Cluster	CLEAR the DTCs. REPEAT the Self-Test. If DTC B1342 is retrieved, INSTALL a new HEC module. REFER to Section 413-01 . CLEAR the DTCs. REPEAT the Self-Test.
B1342	ECU is Defective	Climate Controlled Seat Module	CLEAR the DTCs. REPEAT the Self-Test. If DTC B1342 is retrieved, INSTALL a new climate controlled seat module. REFER to Section 501-10 . CLEAR the DTCs. REPEAT the Self-Test.
B1342	ECU is Defective	4WD Control Module	CLEAR the DTCs. REPEAT the Self-Test. If DTC B1342 is retrieved, INSTALL a new 4x4 module. REFER to Section 308-07A . CLEAR the DTCs. REPEAT the Self-Test.
B1342	ECU is Defective	4-Wheel Anti-Lock Brake/Traction Control (ABS/TC) Module or Stability Assist Module	CLEAR the DTCs. REPEAT the Self-Test. If DTC B1342 is retrieved, INSTALL a new ABS/TC module. REFER to Section 206-09B . CLEAR the DTCs. REPEAT the Self-Test.
B1342	ECU is Defective	Vehicle Security Module	CLEAR the DTCs. REPEAT the Self-Test. If DTC B1342 is retrieved, INSTALL a new vehicle security

			module. REFER to Vehicle Security Module , in this section. CLEAR the DTCs. REPEAT the Self-Test.
B1342	ECU is Defective	Parking Aid Module	CLEAR the DTCs. REPEAT the Self-Test. If DTC B1342 is retrieved, INSTALL a new parking aid module. REFER to Section 413-13 . CLEAR the DTCs. REPEAT the Self-Test.
B1342	ECU is Defective	DSM	CLEAR the DTCs. REPEAT the Self-Test. If DTC B1342 is retrieved, INSTALL a new DSM. REFER to Section 501-10 . CLEAR the DTCs. REPEAT the Self-Test.
B1342	ECU is Defective	EATC Module	CLEAR the DTCs. REPEAT the Self-Test. If DTC B1342 is retrieved, INSTALL a new EATC module. REFER to Section 412-00 . CLEAR the DTCs. REPEAT the Self-Test.
B1342	ECU is Defective	Fuel Fired Heater Module	CLEAR the DTCs. REPEAT the Self-Test. If DTC B1342 is retrieved, INSTALL a new fuel fired heater module. REFER to Section 412-03B . CLEAR the DTCs. REPEAT the Self-Test.
B1342	ECU is Defective	Power Liftgate Module	CLEAR the DTCs. REPEAT the Self-Test. If DTC B1342 is retrieved, INSTALL a new power liftgate module. REFER to Section 501-03 . CLEAR the DTCs. REPEAT the Self-Test.
B1342	ECU is Defective	RCM	CLEAR the DTCs. REPEAT the Self-Test. If DTC B1342 is retrieved, INSTALL a new RCM. REFER to Section 501-20A or Section 501-20B . CLEAR the DTCs. REPEAT the Self-Test.
B1342	ECU is Defective	Tire Pressure Monitoring System Module	CLEAR the DTCs. REPEAT the Self-Test. If DTC B1342 is retrieved, INSTALL a new tire pressure monitoring system module. REFER to Section 204-04 . CLEAR the DTCs. REPEAT the Self-Test.
B1345	Heated Backlight Input Circuit Short to Ground	Instrument Cluster	REFER to Section 501-11 .
B1352	Ignition Key-In Circuit Failure	Instrument Cluster	REFER to Section 413-09 .
B1358	Ignition Switch or Blower Electronics Circuit Short to Ground	Climate Controlled Seat Module	REFER to Section 211-05 .
B1360	Ignition RUN/ACC Circuit Open	Instrument Cluster	REFER to Section 211-05 .
B1483	Brake Pedal Input Circuit Failure	4-Wheel Anti-Lock Brake/Traction Control (ABS/TC) Module or Stability Assist Module	REFER to Section 206-09A .
B1529	Memory Set Switch Circuit	DSM	REFER to Section 501-10 .

	Short to Ground		
B1534	Memory 1 Switch Circuit Short to Ground	DSM	REFER to Section 501-10 .
B1538	Memory 2 Switch Circuit Short to Ground	DSM	REFER to Section 501-10 .
B1573	Door Ajar LR Circuit Short to Battery	Vehicle Security Module	REFER to Section 417-02 .
B1663	Seat Driver Front Up/Down Motor Stalled	DSM	REFER to Section 501-10 .
B1664	Seat Driver Rear Up/Down Motor Stalled	DSM	REFER to Section 501-10 .
B1665	Seat Driver Forward/Backward Motor Stalled	DSM	REFER to Section 501-10 .
B1666	Seat Recline Forward/Rearward Motor Stalled	DSM	REFER to Section 501-10 .
C1667	Mirror Driver Up/Down Motor Stalled	DSM	REFER to Section 501-10 .
B1668	Mirror Driver Right/Left Motor Stalled	DSM	REFER to Section 501-10 .
B1669	Mirror Passenger Up/Down Motor Stalled	DSM	REFER to Section 501-10 .
B1670	Mirror Passenger Right/Left Motor Stalled	DSM	REFER to Section 501-10 .
B1676	Battery Pack Voltage Out of Range	4-Wheel Anti-Lock Brake/Traction Control (ABS/TC) Module or Stability Assist Module	REFER to Section 414-01 .
B1676	Battery Voltage Out of Range	DSM	REFER to Section 414-01 .
B1676	Battery Voltage Out of Range	EATC Module	REFER to Section 414-01 .
B1695	Autolamp On Circuit Failure	Vehicle Security Module	REFER to Section 417-01 .
B1697	Mirror Driver/Passenger Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1703	Seat Driver Recline Forward Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1707	Seat Driver Recline Rearward Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1711	Seat Driver Front Up Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1715	Seat Driver Front Down Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1719	Seat Driver Forward Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1723	Seat Driver Rearward Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1727	Seat Driver Rear Up Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .

B1731	Seat Driver Rear Down Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1735	Mirror Driver Vertical Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1739	Mirror Driver Horizontal Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1743	Mirror Passenger Vertical Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1747	Mirror Passenger Horizontal Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1792	Autolamp Sensor Input Circuit Short to Battery and Open	Vehicle Security Module	REFER to Section 417-01 .
B1793	Autolamp Sensor Input Circuit Short to Ground	Vehicle Security Module	REFER to Section 417-01 .
B1869	Lamp Air Bag Warning Indicator Open	RCM	REFER to Section 501-20B .
B1870	Lamp Air Bag Warning Indicator Short to Battery	RCM	REFER to Section 501-20B .
B1884	PAD Warning Lamp Inoperative	RCM	REFER to Section 501-20B .
B1890	PAD Warning Lamp Short to Battery	RCM	REFER to Section 501-20B .
B1891	Air Bag Tone Warning Indicator Circuit Short to Battery	RCM	REFER to Section 501-20B .
B1892	Air Bag Tone Warning Indicator Circuit Failure	RCM	REFER to Section 501-20B .
B1921	Air Bag Diagnostic Monitor Ground Circuit Open	RCM	REFER to Section 501-20B .
B1950	Seat Rear Up/Down Feedback Potentiometer Circuit Failure	DSM	REFER to Section 501-10 .
B1952	Seat Rear Up/Down Feedback Potentiometer Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1954	Seat Front Up/Down Feedback Potentiometer Circuit Failure	DSM	REFER to Section 501-10 .
B1956	Seat Front Up/Down Feedback Potentiometer Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1958	Seat Recline Forward/Rearward Feedback Potentiometer Circuit Failure	DSM	REFER to Section 501-10 .
B1961	Seat Recline Forward/Rearward Feedback Potentiometer Circuit Short to Ground	DSM	REFER to Section 501-10 .
B1962	Seat Horizontal Forward/Rearward Feedback Potentiometer Circuit Failure	DSM	REFER to Section 501-10 .
B1964	Seat Horizontal Forward/Rearward Feedback	DSM	REFER to Section 501-10 .

	Potentiometer Circuit Short to Battery		
B1987	Pedal Forward/Rearward Motor Stalled	DSM	REFER to Section 501-10 .
B1988	Pedal Position Forward Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1989	Pedal Position Rearward Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1990	Pedal Forward/Rearward Feedback Potentiometer Circuit Failure	DSM	REFER to Section 501-10 .
B1991	Pedal Forward/Rearward Feedback Potentiometer Circuit Short to Battery	DSM	REFER to Section 501-10 .
B2105	Throttle Position Input Out of Range Low	4WD Control Module	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
B2106	Throttle Position Input Out of Range High	4WD Control Module	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
B2143	NVM Memory Failure	Instrument Cluster	REFER to Section 413-01 .

Vehicle Security Module

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool

Principles of Operation

The vehicle security module controls the following systems:

- perimeter alarm
- remote keyless entry (and panic feature)
- computer-operated locks
- autolamp

For additional information, refer to Section 501-14 .

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
Central junction box (CJB) fuse: ■ 5 (7.5A) ■ 30 (30A)

Wiring harness Connector(s) Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cuse (if possible) before proceeding to the next step.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:

- check that the program card is correctly installed.
- check the connections to the vehicle.
- check the ignition switch position.

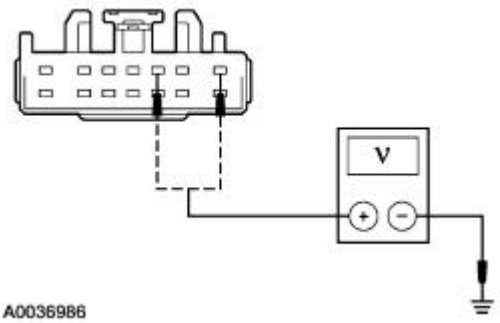
5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

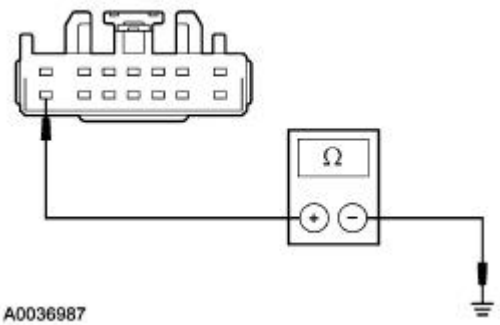
6. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:

- CKT914, CKT915, CKT693 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
- NO RESPONSE/NOT EQUIP for vehicle security module, go to Pinpoint Test A.
- SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the Self-Test diagnostics for the vehicle security module.

7. If the DTCs retrieved are related to the concern, go to the Diagnostic Trouble Code (DTC) Index.

8. If no DTCs related to the concern are retrieved, refer to the appropriate section of the Workshop Manual to continue diagnostics.





Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
● No communication with the vehicle security module	● Battery junction box (BJB) fuse: ■ 5 (7.5A) ■ 30 (30A) ● Circuitry ● Vehicle security module	● GO to Pinpoint Test A .

Pinpoint Tests

PINPOINT TEST A: NO COMMUNICATION WITH THE VEHICLE SECURITY MODULE

Test Step	Result / Action to Take
A1 CHECK THE VOLTAGE TO THE VEHICLE SECURITY MODULE ● **NOTE:** The battery must be disconnected before disconnecting the vehicle security module connectors to prevent triggering the anti-theft alarm. ● Disconnect the battery ground cable. Refer to Section 414-01 . ● Disconnect: Vehicle Security Module C2113b. ● Connect the battery ground cable. Refer to Section 414-01 . ● Key in ON position. ● Measure the voltage between the vehicle security module C2113b pin 3, circuit 729 (RD/WH), harness side and ground and between the vehicle security module C2113b pin 1, circuit 1523 (DG), harness side and ground.  A0036986 ● **Are the voltages greater than 10 volts?**	**Yes** GO to A2 . **No** REPAIR the power supply circuit(s). CARRY OUT the DATA LINK DIAGNOSTICS test.
A2 CHECK CIRCUIT 57 (BK) FOR AN OPEN ● Key in OFF position. ● Disconnect the negative battery cable. REFER to Section 414-01 . ● Disconnect: Vehicle Security Module C2113a. ● Measure the resistance between the vehicle security module C2113a pin 14, circuit 57 (BK), harness side and ground.  A0036987 ● **Is the resistance less than 5 ohms?**	**Yes** REFER to Section 418-00 . **No** REPAIR the circuit. CARRY OUT the DATA LINK DIAGNOSTICS test.

Driver Seat Module (DSM)

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool

Principles of Operation

The power driver seat and power outside rear view mirrors are controlled by the DSM only when the vehicle is equipped with the programmable/recall memory option. Refer to Section 501-14 .

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
Central junction box (CJB) fuse: ■ 109 (30A) ■ 3 (7.5A) Wiring harness Connector(s) Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cuse (if possible) before proceeding to the next step.
4. If the cause is not visually evident, connect the diagnostic tool to the data link connector (DLC)

located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:

- check that the program card is correctly installed.
- check the connections to the vehicle.
- check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

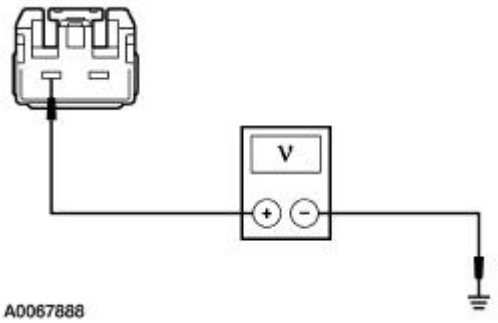
6. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:

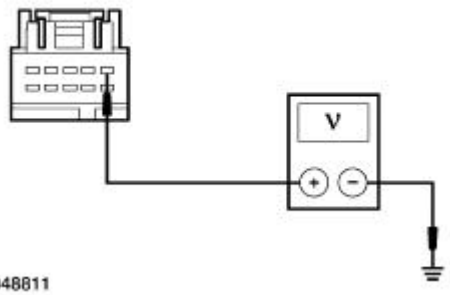
- CKT914, CKT915, CKT693 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
- NO RESPONSE/NOT EQUIP for vehicle security module, go to Pinpoint Test A.
- SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the Self-Test diagnostics for the vehicle security module.

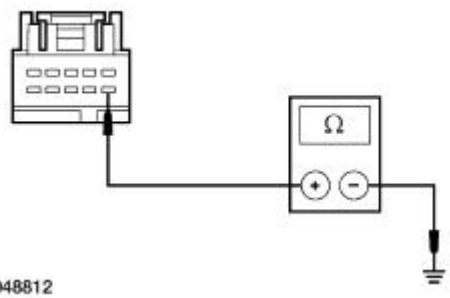
7. If the DTCs retrieved are related to the concern, go to the Diagnostic Trouble Code (DTC) Index.

8. If no DTCs related to the concern are retrieved, refer to the appropriate section of the Workshop Manual to continue diagnostics.

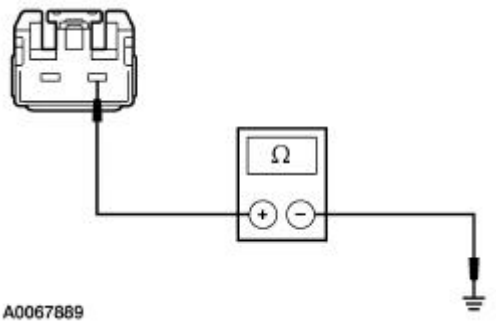
Symptom Chart







Symptom Chart



Condition	Possible Sources	Action
● No Communication With The Driver Seat Module (DSM)	● Battery junction box (BJB) fuses: ■ 109 (30A) ■ 3 (7.5A) ● Circuitry ● DSM	● Go To Pinpoint Test B .

Pinpoint Tests

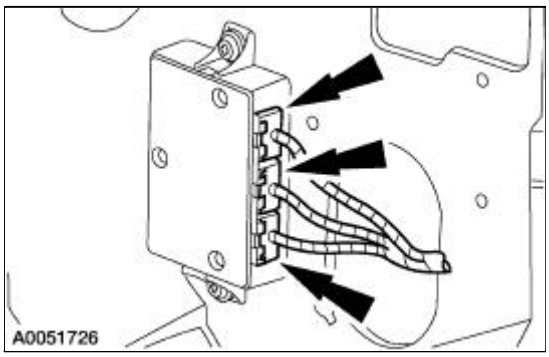
PINPOINT TEST B: NO COMMUNICATION WITH THE DRIVER SEAT MODULE (DSM)

Test Step	Result / Action to Take
B1 CHECK THE VEHICLE FOR MEMORY SEAT/MIRROR OPTION	
● **NOTE:** Driver seat modules are only used on vehicles with memory seat and memory mirror option. ● Check for memory seat and mirror option. ● **Is the vehicle equipped with memory seat and memory mirror option?**	**Yes** GO to B2 . **No** The system is OK. TEST the

	vehicle for normal operation.
B2 CHECK CIRCUIT 566 (DG) FOR VOLTAGE	
• Key in OFF position. • Disconnect: DSM C341a. • Key in ON position. • Measure the voltage between the DSM C341a pin 2, circuit 566 (DG) harness side and ground.  A0067888 • **Is the voltage greater than 10 volts?**	**Yes** GO to B3 . **No** REPAIR the supply circuit. CARRY OUT the DATA LINK DIAGNOSTICS test.
B3 CHECK CIRCUIT 956 (OG/LG) FOR VOLTAGE	
• Key in OFF position. • Disconnect: DSM C341c. • Key in ON position. • Measure the voltage between the DSM C341c pin 1, circuit 956 (OG/LG), harness side and ground.  A0048811 • **Is the voltage greater than 10 volts?**	**Yes** GO to B4 . **No** REPAIR the circuit. CARRY OUT the DATA LINK DIAGNOSTICS test.
B4 CHECK CIRCUIT 875 (BK/LB) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the DSM C341c pin 6, circuit 875 (BK/LB) harness side and ground.  A0048812 • **Is the resistance less than 5 ohms?**	**Yes** GO to B5 . **No** REPAIR the circuit. CARRY OUT the DATA LINK DIAGNOSTICS test.
B5 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Measure the resistance between the DSM C341a pin 1, circuit 57 (BK) harness side and ground.	**Yes** Section 418-00 .

 A0067889 ● **Is the resistance less than 5 ohms?**	**No** REPAIR the circuit. CARRY OUT the DATA LINK DIAGNOSTICS test.

Vehicle Security Module



Removal

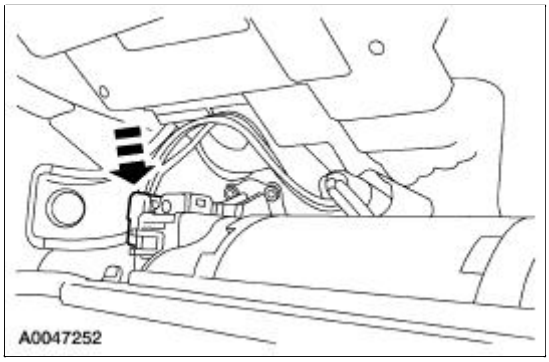
1. **NOTE:** Prior to removal of the vehicle security module, it is necessary to upload module configuration information to a diagnostic tool. This information needs to be downloaded into the new module once installed. For additional information, refer to Section 418-01 .

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Remove the pushpin and the RH interior kick panel.

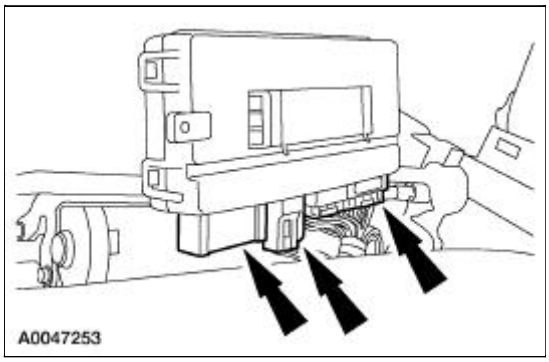
3. Disconnect the three vehicle security module electrical connectors.

4. Remove the two screws and the vehicle security module.



5. To install, reverse the removal procedure.

Module —Driver Seat



Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. **NOTE:** The module is accessed with the seat fully in the UP position.

   Slide the driver seat module forward to remove from bracket.

3. Disconnect the connectors and remove the DSM.

4. To install, reverse the removal procedure.

General Specifications

Silicone Gasket and Sealant F7AZ-19554-EA	WSK-M2G343-A4

Body

The body:

- Is a cab-forward design.
- Is constructed of lightweight, all steel welded material, with bolted removable front fenders (16005), and hinged doors.
- Has an aluminum liftgate and hood with gas lift cylinders (Expedition).
- Has SMC fenders and hood with gas lift cylinders (Navigator).
- Has roof and body side panels that are separate pieces.
- Is supported by a full frame.

Insulation

Insulation is installed:

- Under the roof.
- Above and below the instrument panel (04304).
- At the cowl sides.
- Over the transmission tunnel.
- Over the floorpan areas.
- Inside the quarter panels.

And has heat-bondable mastic deadeners for improved NVH characteristics (Navigator).

Body Sealer Types And Applications

Liquid Butyl Sealer

HB Fuller E709 or equivalent commercially available material meeting Ford specification ESB-M4G162-A:

- Does not run.
- Is fast-drying.
- Remains semi-elastic.
- Can be used for sealing seams in such areas as the floorpan, wheelhouse, bulkhead, door openings and drip rails.

Caulking Cord

3M Strip-Caulk — Black 051135-08578 or equivalent commercially available product meeting Ford specification ESB-M4G32-A:

- Has a plastic base with a filler.
- Is heavy-bodied.
- Is commonly known as perma-gum.
- Is used on spot-weld holes, around mounting clips and between surfaces not sealed by a gasket.

Weatherstrip Adhesive

Weatherstrip and Rubber Adhesive E8AZ-19552-A or equivalent meeting Ford specification ESB-M2G14-A:

- Is a quick-drying, strong adhesive designed to hold or repair weatherstripping on doors, bodies, and the surrounding metal.

Silicone Lubricant

Silicone Lubricant F7AZ-19G208-BA meeting Ford specification ESR-M13P4-A:

- Is used on the door and window weatherstrip.
- Should be applied to weatherstrip at every lubrication period.
- Makes doors easier to close.
- Avoids weatherstrip squeaks.
- Retards weatherstrip wear.
- Helps retain door window alignment by reducing friction between the glass frame and rubber weatherstrip.
- Should not be used prior to painting.

Body System

Inspection and Verification

Leaks

NOTE: Trim will reveal the location of most leaks. Use spray chalk and hose if necessary.

1. Remove any trim or carpet in the general area of the leak.
2. Road test or water hose test the vehicle.
3. Inspect for a dust pattern around the area in question. Inspect for water paths near and above the area in question.
4. Some leaks can be located by placing bright light under the vehicle, removing any necessary trim or carpet, and inspecting the interior of the body at joints and weld lines.

Noise

Wind noise, rattles and their sources are detected by driving the vehicle at highway speeds. The vehicle should be driven in four different directions, with all windows closed, radio off, blower motor off and all ventilation ducts open.

Most wind noise leaks will occur at the door and window seals or at the sheet metal joints in the door or the door opening.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Dust and Water Leaks	• Body sealer missing. • Opening in welding or body joints. • Components not fully installed. • Components missing. • Components damaged.	• REMOVE trim. CHECK for leaks and SEAL with appropriate sealer. ROAD TEST or WATER TEST for leaks. RECHECK trim for leaks; USE light under vehicle with trim removed. CHECK interior of body at joints and weld lines.
• Dust/Water Leaks at Floor Pan and Grommets	• Missing or damaged plugs and/or grommets.	• CHECK plugs for proper installation. REPLACE if necessary.
• Door Drain Holes Collecting Water	• Holes clogged with mud or road tar.	• CLEAN drain holes of dirt and foreign material with a punch or screwdriver. CHECK drain holes regularly.

• Wind Noise	• Leaks at door and window seals or sheet metal joints in doors or door openings.	• SEAL leaks with Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSK-M2G343-A4.
	• Loose/misaligned weatherstrip.	• Reattach weatherstrip. Replace any damaged pin-type retainers. Use weatherstrip adhesive E8AZ-19552-A or equivalent meeting Ford Specification ESB-M2G14-A as necessary.
	• Poor Door Fit.	• Adjust the striker or hinges as necessary. For additional information on the hinge adjustment, refer to Section 501-03 . Check for acceptable door efforts after repair.
• Rattles	• Loose objects in door wells, pillars, and quarter panels.	• CHECK doors by carefully STRIKING underside of door with a rubber mallet. LISTEN for loose objects in door. REPAIR. TIGHTEN body bolts and screws.
	• Misalignment (if tightening bolts does not eliminate rattle).	• REFER to Section 501-03 .
	• Loose weatherstripping and/or anti-squeak material.	• APPLY additional sealer. INSTALL in proper location to eliminate rattle.

Torque Specifications

Description	Nm	lb-ft	lb-in
Headlamp bolts	3	—	27
Secondary release handle bolt	3	—	27
Radiator grille opening panel reinforcement bolts	8	—	71
Fender splash shield screws	3	—	27
Fender to front bumper cover bolts	11	8	—
Fender bolts	12	9	—

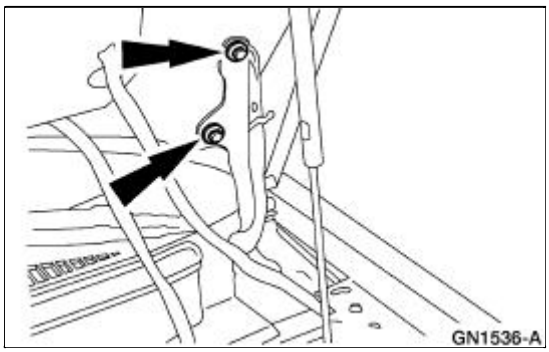
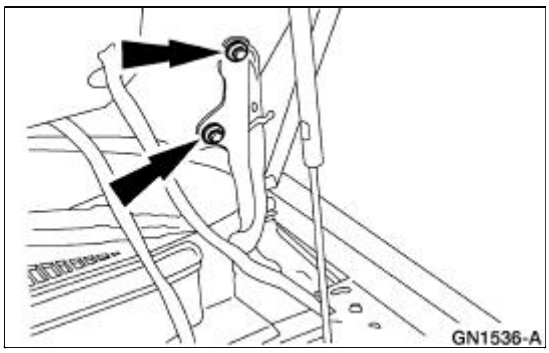
Front End Body Panels



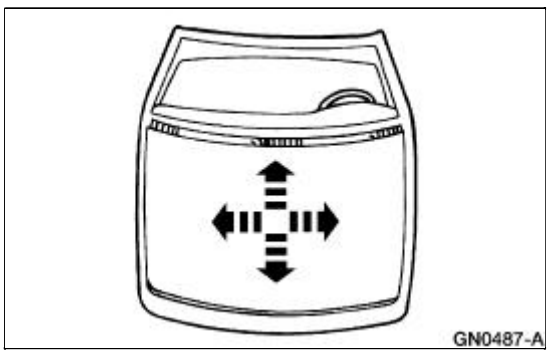
The front end body panels consist of:

- cowl panel grilles
- front fenders
- front fender splash shields
- radiator grille opening panel reinforcement
- air deflectors

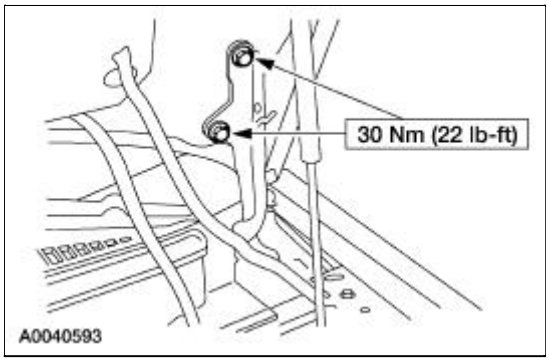


Hood Alignment

NOTE: Navigator shown, Expedition similar.

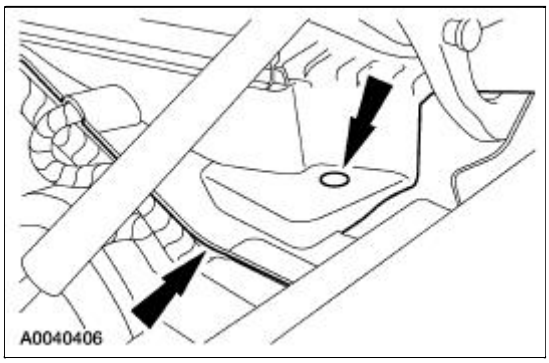


1. Raise and support the hood.
2. Loosen the hood hinge to hood bolts.



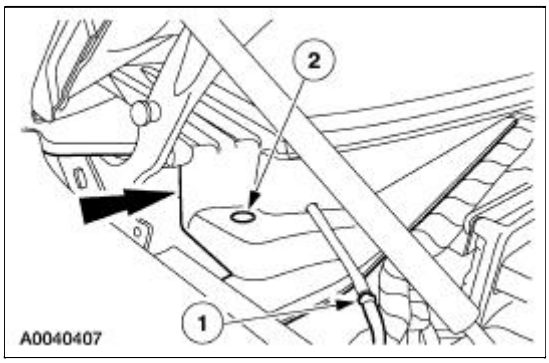
3. Adjust the hood.
4. Tighten the hood hinge to hood bolts enough to hold the hood in place.

5. Check the hood clearance.



6. Repeat Steps two through five until satisfactory alignment is achieved.
7. Tighten the hood hinge to hood bolts.

30 Nm (22 lb-ft)
A0040593

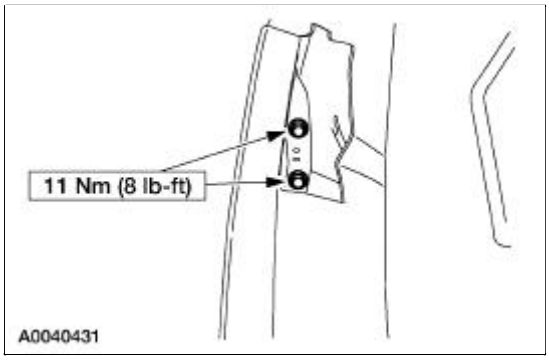


Cowl Panel Grille

Removal and Installation

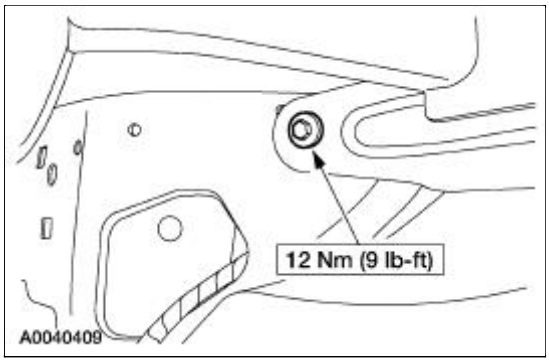
1. Remove the windshield wipers. For additional information, refer to Section 501-16 .
2. Remove the cowl grille seal.
3. Remove the pin-type retainer and left side cowl trim panel.
   - Disconnect the windshield washer tube.

4. Remove the right side cowl trim panel.
   1. Disconnect the windshield washer tube.
   2. Remove the pin-type retainer.



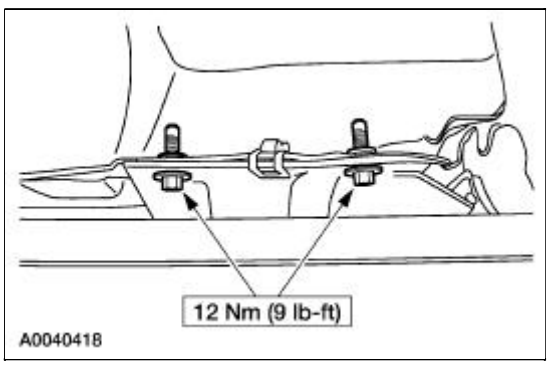
5. To install, reverse the removal procedure.

Fender —Expedition

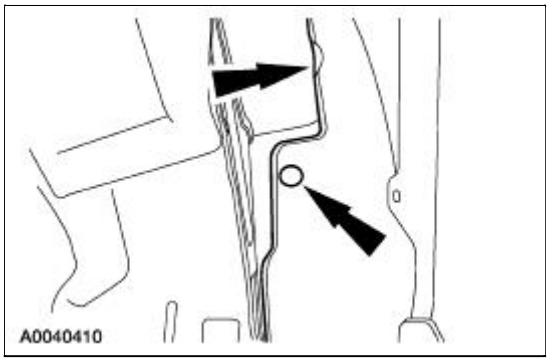


Removal and Installation

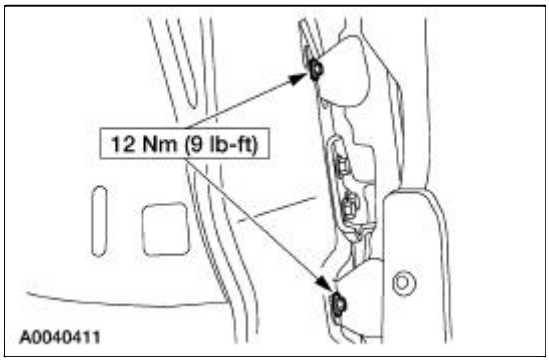
NOTE: Left side shown, right side similar.



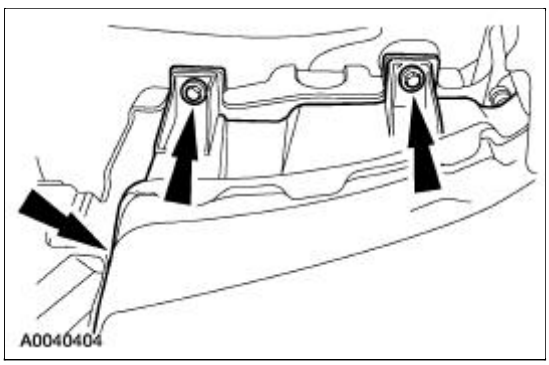
1. Remove the front fender splash shield.
2. Remove the front fender to front bumper cover bolts.



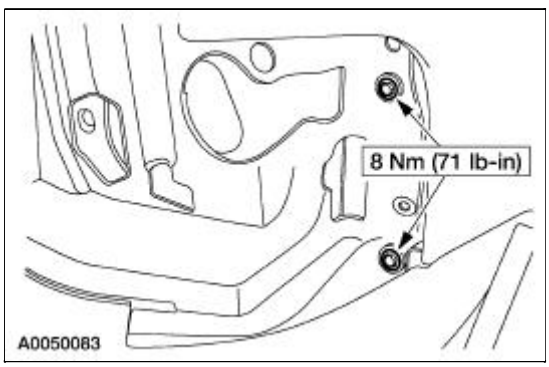
3. Remove the front fender to radiator support bolt.



4. Remove the front fender lower bolts.

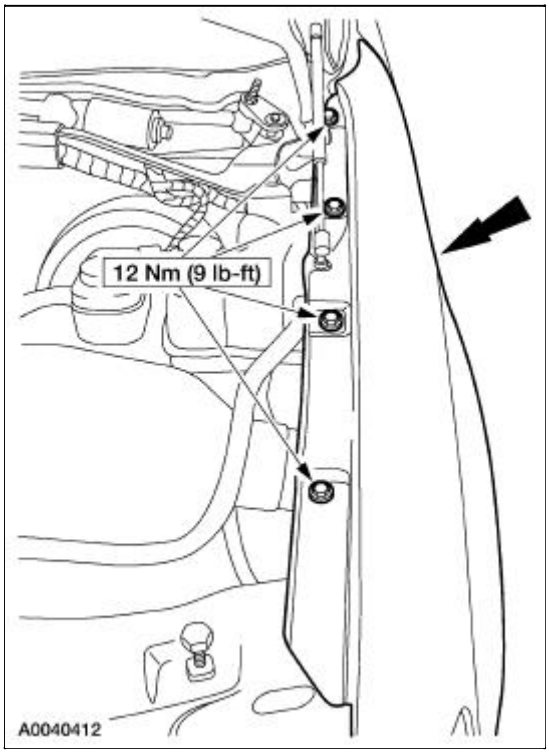


5. Remove the foam insulator.
   - Remove the pin-type retainer.



6. Remove the front fender inner bolts.

7. Remove the headlight.
   - Remove the bolts and disconnect the electrical connectors.

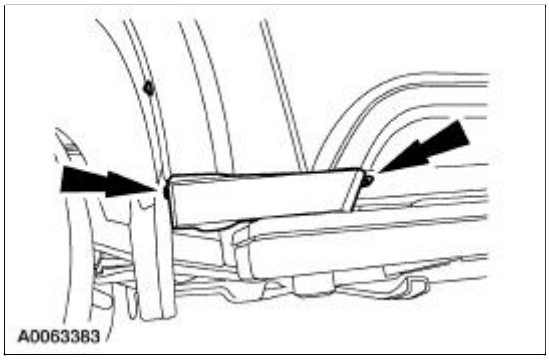


8. Remove the front fender front bolts.

9. Remove the cowl panel grille. For additional information, refer to Cowl Panel Grille in this section.

10. Remove the front fender.
    - Remove the bolts.

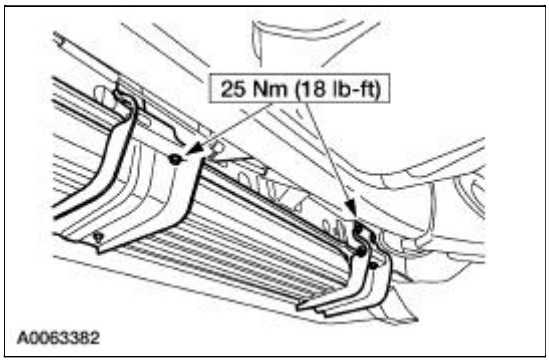
11. To install, reverse the removal procedure.



Fender —Navigator

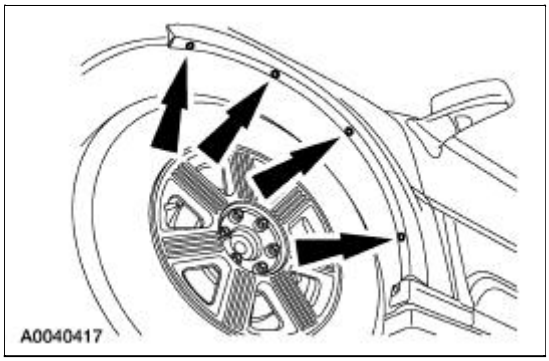
Removal and Installation

NOTE: Left side shown, right side similar.



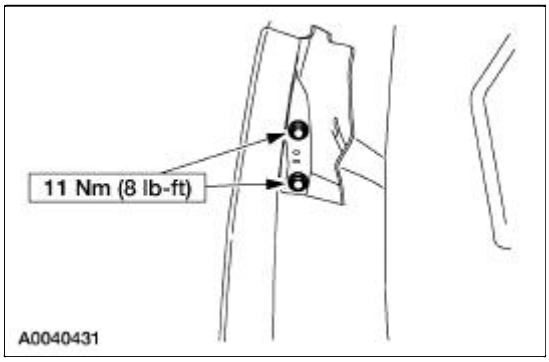
Vehicles with power running boards

1. Remove the lower fender moulding.

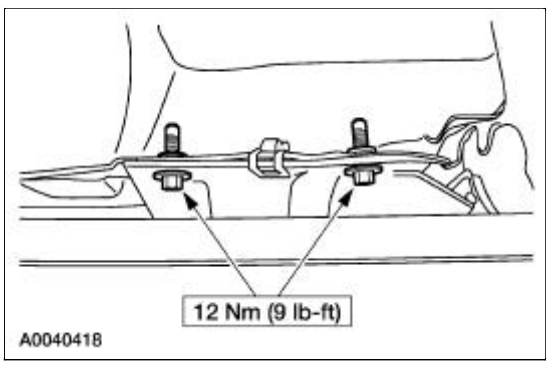


Vehicles without power running boards

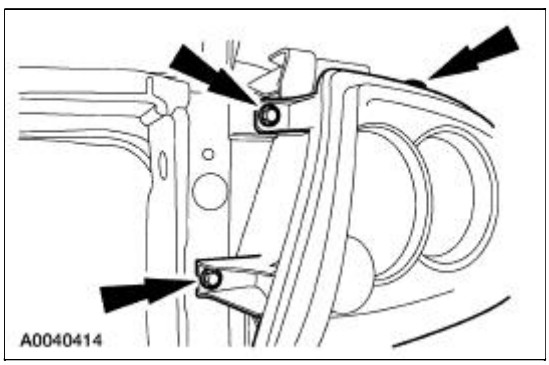
2. Lower the running board.
   - Remove the front and middle running board retainer bolts from the body.



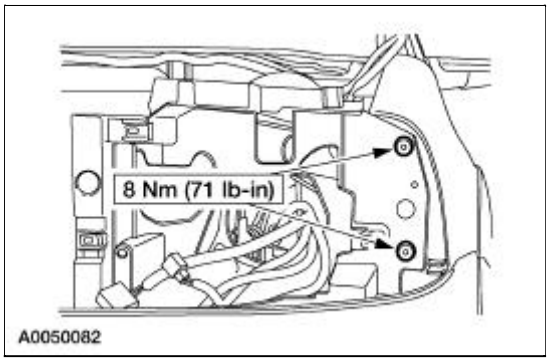
All vehicles



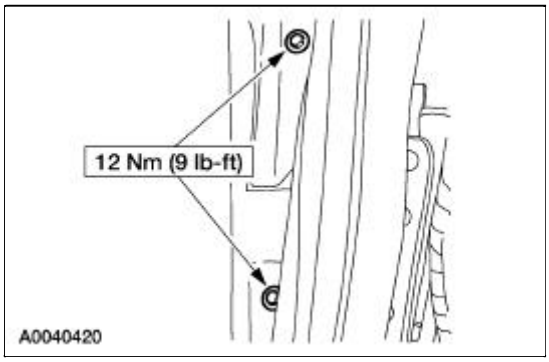
3. Remove the front fender splash shield screws.



4. Remove the front fender to front bumper cover bolts.

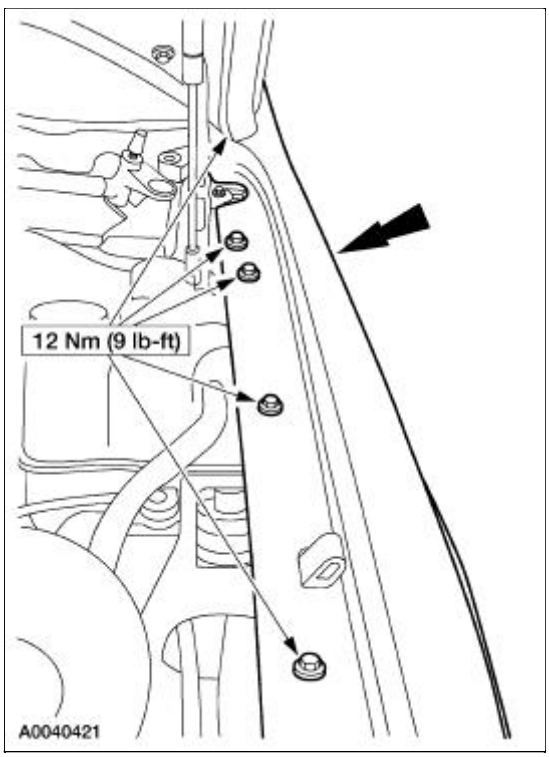


5. Remove the front fender lower bolts.



6. Remove the headlight.
    - Remove the bolts and disconnect the electrical connectors.

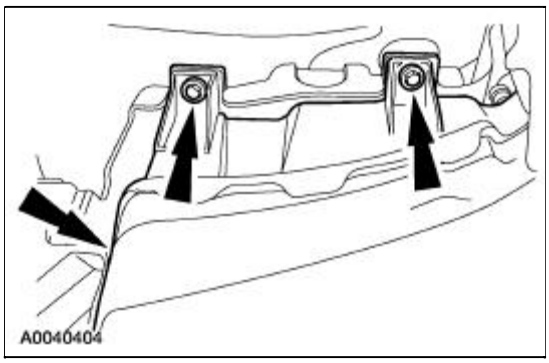
7. Remove the front fender front bolts.



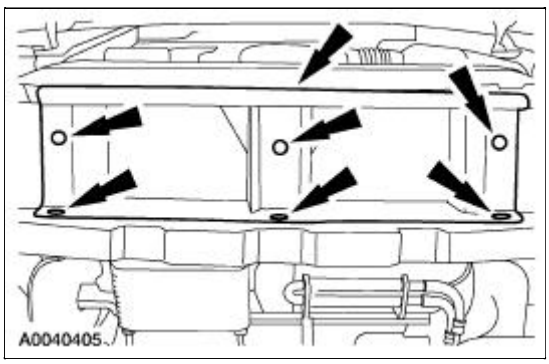
8. Remove the front fender inner bolts.

9. Remove the cowl panel grille. For additional information, refer to Cowl Panel Grille in this section.

10. Remove the front fender.
    - Remove the bolts.

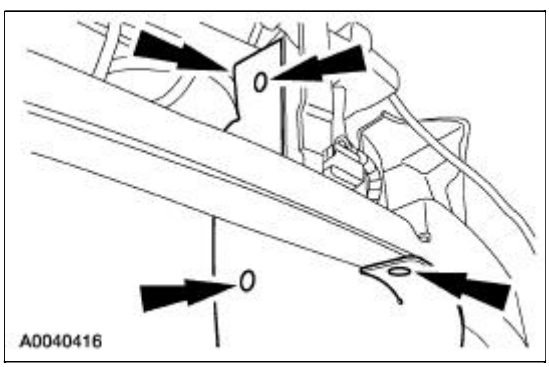


11. To install, reverse the removal procedure.



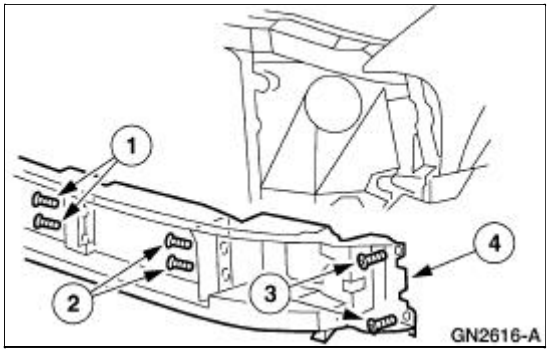
Radiator Grille Opening Panel Reinforcement —Expedition

Removal and Installation



1. Remove the front bumper cover. For additional information, refer to Section 501-19 .
2. Remove the headlights.
   - Remove the bolts and disconnect the electrical connectors.

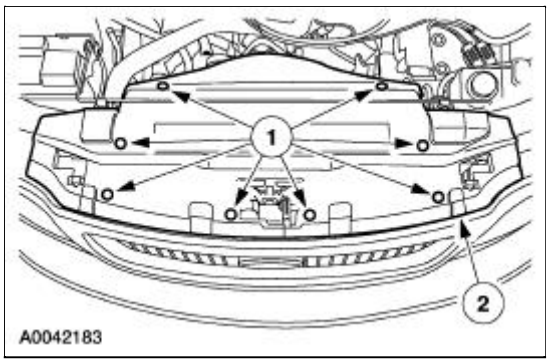
3. Remove the radiator opening panel.
   - Remove the pin-type retainers.



4. Position aside the left and right radiator air deflector shields.
   - Remove the pin-type retainers.

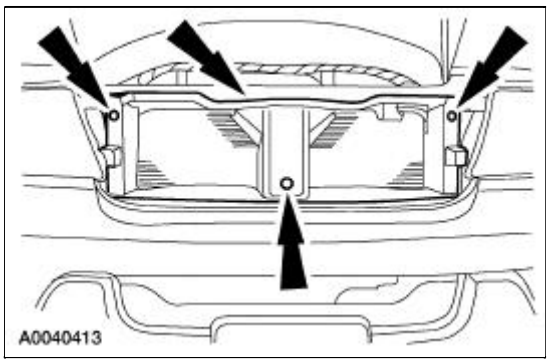
5. Remove the radiator grille opening panel reinforcement.

1. Remove the center bolts.
2. Remove the four reinforcement bolts (two each side).
3. Remove the four remaining bolts (two each side).
4. Remove the radiator grille opening panel reinforcement.



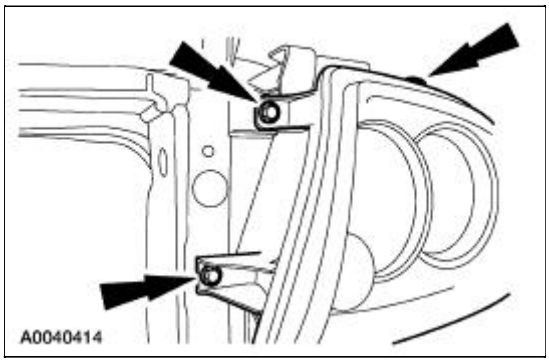
6. To install, reverse the removal procedure.

Radiator Grille Opening Panel Reinforcement —Navigator

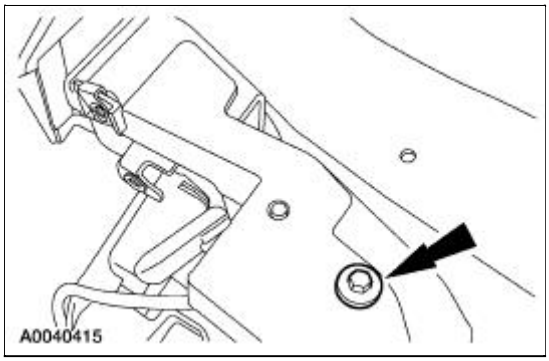


Removal and Installation

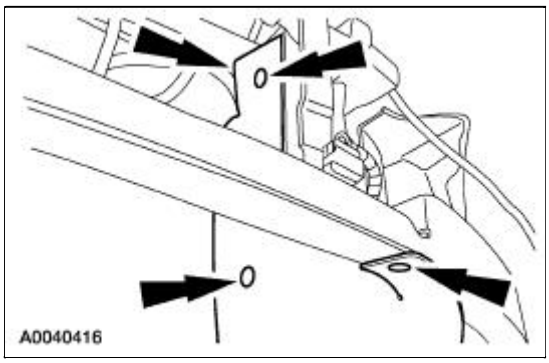
1. Remove the front bumper cover. For additional information, refer to Section 501-19 .



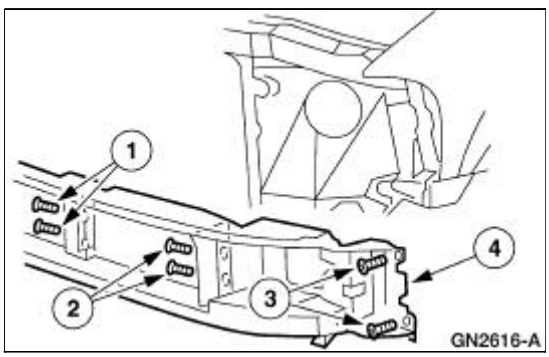
2. Remove the upper air deflector.
    1. Remove the pin-type retainers.
    2. Remove the upper air deflector.



3. Remove the radiator opening panel.
    - Remove the pin-type retainers.



4. Remove the headlights.
    - Remove the bolts and disconnect the electrical connectors.



5. Remove the secondary release handle bolts and position aside.

6. Position aside the left and right radiator air deflector shields.
    - Remove the pin-type retainers.

7. Remove the radiator grille opening panel reinforcement.
    1. Remove the center bolts.
    2. Remove the four reinforcement bolts (two each side).
    3. Remove the four remaining bolts (two each side).
    4. Remove the radiator grille opening panel reinforcement.

8. To install, reverse the removal procedure.

General Specifications

Item	Specification
Height Measurements for the Door Clearance Adjustment	
Door clearance; front and rear edge	3.0-7.0 mm (0.118-0.275 in) parallel top to bottom within 1.0 mm (0.04 in)
Door clearance; top of door to roof	3.0-7.0 mm (0.118-0.275 in) parallel top to bottom within 2.0 mm (0.08 in)

Body Closures

The body closures consist of:

- front door hinges
- rear door hinges
- front doors
- rear doors
- door weatherstrips
- liftgate
- liftgate hinges
- door weatherstrips
- liftgate weatherstrips
- liftgate assist cylinders

Power Liftgate

The power liftgate feature will allow the customer to automatically open or close the liftgate by activating the interior open/close switch, the remote keyless entry transmitter, or by manually initiating liftgate movement. The power liftgate uses a power cinch system to latch the liftgate.

The power liftgate system consists of:

- power liftgate control switch (located in the overhead console)
- power liftgate motors (located in the rear headliner area)
- optical sensor (located in the left power liftgate motor assembly)
- pinch strip switches (located on the body by the liftgate)
- home position switch (located on the cinch actuator)
- forkbolt switch (located on the cinching latch assembly)
- detent switch (located on the cinching latch assembly)

The forkbolt and detent switch are located on the cinch latch assembly and the home position switch is located on the cinch actuator assembly. For information on removal of the latch or cinch actuator assembly, refer to Section 501-14 .

The power liftgate may not operate under the following conditions:

- a low voltage or dead battery.
- a disconnected battery.
- a power liftgate that has been left open for more than six hours.
- a power liftgate that has been manually closed and left ajar.

If any of these conditions has occurred, the power liftgate must be reset before performing any pinpoint

tests. For additional information, refer to Power Liftgate Initialization .

Power Liftgate

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool with required communication adapter

Principles of Operation

The power liftgate feature allows the customer to automatically open or close the liftgate by activating the interior open/close switch, the remote keyless entry transmitter, or by manually initiating movement. The power liftgate uses a power cinching system to latch the liftgate.

The power liftgate system consists of the following components:

- power liftgate control switch (located in the overhead console).
- power liftgate motors (located in the rear headliner area).
- optical sensor (located on the left power liftgate motor assembly).
- pinch strip switches (located on the body above the taillamps).
- cinching latch (located in the middle lower portion of the liftgate).
- forkbolt switch (located in the cinching latch mechanism).
- detent switch (located in the cinching latch mechanism).
- liftgate latch remote control (located in the lower right-hand area of the liftgate).
- home position switch (located on the liftgate latch remote control).
- liftgate latch lock/unlock actuator (located in the lower left-hand area of the liftgate).
- power liftgate module (located behind the left rear quarter trim panel).

The power liftgate is controlled by the power liftgate module.

The power liftgate module receives inputs from:

- glass position switch (determines the ajar status of the liftgate glass).

- forkbolt switch (determines the primary position of the latch).
- detent switch (determines the secondary position of the latch).
- home switch (determines the power cinch status).
- power liftgate control switch (activates the power liftgate from the interior of vehicle).
- pinch strip switches (determines if an obstacle is between the pinch strip and liftgate).
- instrument cluster module (activates and sets the options for the power liftgate).
- optical sensor (determines the direction, travel speed and obstacle detection of the liftgate).
- UBP serial communication link.
- power deployable running boards (if equipped).

The power liftgate module sends outputs to:

- liftgate motors.
- power cinching latch system.
- liftgate chime module.
- body security module.
- power deployable running boards (if equipped).

The power liftgate may not operate under the following conditions:

- a low voltage or dead battery.
- a disconnected battery.
- a power liftgate that has been left open for more than six hours.
- a power liftgate that has been manually closed and left ajar.

If any of these conditions has occurred, the power liftgate must be reset before performing any pinpoint tests. For additional information, refer to Power Liftgate Initialization .

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical and electrical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical	Electrical
• Power liftgate motors • Power cinching latch and linkage • Power liftgate pinch strip switches • Liftgate and liftgate hinges • Liftgate assist cylinders • Liftgate strikers • Exterior release handle and linkage	• Battery junction box (BJB) fuse: ▪ 5 (7.5A) ▪ 105 (30A) • Power liftgate control switch • Wiring harness • Connectors

• Liftgate weatherstrip • Liftgate alignment to body and striker	

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If no continuous DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

5. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position (must be in RUN position).
   - check that liftgate latch is in the primary position (fully latched).

6. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool manual.

7. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:
   - SCP+, SCP- or UBP circuits = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
   - NO RESP/NOT EQUIP for power liftgate module, refer to Section 419-10 .
   - SYSTEM PASSED, retrieve and record the power liftgate module continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the power liftgate module.

8. If the DTCs retrieved are related to the concern, refer to Power Liftgate Module Diagnostic Trouble Code (DTC) Index to continue diagnostics.

9. If DTCs are retrieved that are not found in the following Power Liftgate Module Diagnostic Trouble Code (DTC) Index, refer to the master Power Liftgate Module Diagnostics Trouble Code (DTC) index in Section 419-10 .

Power Liftgate Module Diagnostic Trouble Code (DTC) Index

Power Liftgate Module Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Defective	Power Liftgate Module	INSTALL a new power liftgate module. REFER to Power Liftgate Module in this section.

Symptom Chart

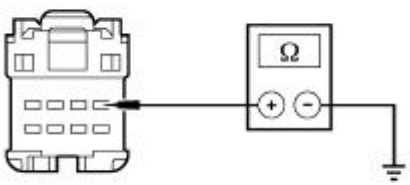
Symptom Chart

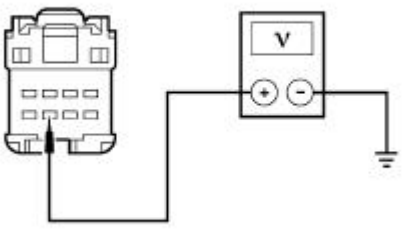
Condition	Possible Sources	Action
• No communication with power liftgate module	• BJB fuse 5 (7.5A). • Circuitry. • Power liftgate module.	• REFER to Section 419-10 .
• The power liftgate does not operate — using the keyless entry remote transmitter	• Keyless entry remote transmitter. • Batteries. • Power liftgate module. • Vehicle security module.	• Go To Pinpoint Test A .
• The power liftgate does not operate/does not operate correctly	• BJB fuse 105 (30A). • Circuitry. • Liftgate control switch. • Power liftgate module.	• Go To Pinpoint Test B .

	• Pinch strip switches. • Forkbolt/detent switch. • Home position switch. • Liftgate drive motor assembly. • Cinching actuator motor. • Unlatch actuator motor. • Glass position switch. • Liftgate optical sensor.	
• The power liftgate does not operate — liftgate close chime	• Circuitry. • Liftgate close chime. • Power liftgate module.	• Go To Pinpoint Test C .
• The interior lights remain on and the instrument cluster message center indicates liftgate ajar	• Liftgate latch is not in primary position	• Manually pull on the liftgate. If liftgate moves, open and close the liftgate to the primary latch position. Manually pull on liftgate glass. If liftgate glass moves, open and close the liftgate glass. If the liftgate ajar condition still exists, Go To Pinpoint Test B .
• The power liftgate stops during power open operation	• The vehicle was started or taken out of PARK during a power open operation. • Mechanical binding.	• Manually close the liftgate to the primary latch position and open the liftgate using the exterior handle or liftgate control switch with the vehicle in PARK and the ignition in the ON position. If the condition still exists and there is no mechanical binding, Go To Pinpoint Test B .
• The power liftgate reverses during power close operation (mid-travel)	• Power liftgate motor drive link alignment. • Mechanical binding.	• Turn the power liftgate OFF from the instrument cluster message center and manually operate the liftgate. If no mechanical binding exists and DTC B2825 is not present Go To Pinpoint Test B . If DTC B2825 is present, disconnect each power liftgate motor drive link from the liftgate and manually push drive link into the power liftgate motor housing. If the drive link moves easily into the housing, install a new power liftgate motor.
• The power liftgate opens when the lock/unlock control switches are	• Incorrect installation of the lock/unlock actuator rod into	• Remove the liftgate trim panel and inspect for correct installation of lock/unlock actuator rod. If installation is

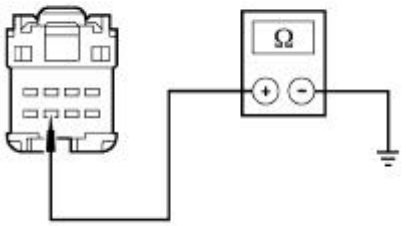
pressed	the cinch latch assembly.	correct Go To Pinpoint Test B .
• Intrument cluster message center indicates liftgate data error	• Fuse 5 (7.5A).	• Check fuse 5 (7.5A). If fuse is OK, refer to Section 418-00 to diagnose the comunication problem. If fuse is blown, install a new fuse and clear DTCs. If new fuse fails and condition still exists, refer to Section 418-00 .
• Instrument cluster message center indicates power liftgate mode status OFF and change to ON is inhibited	• Fuse 105 (30A).	• Check fuse 105 (30A). If fuse is OK, Go To Pinpoint Test B . If fuse is blown, install a new fuse and clear DTCs. If new fuse fails and condition still exists, Go To Pinpoint Test B .

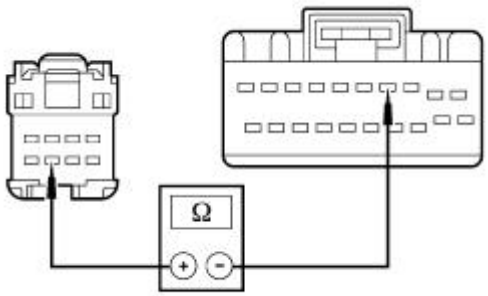
Pinpoint Tests



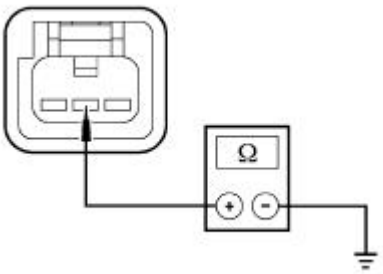


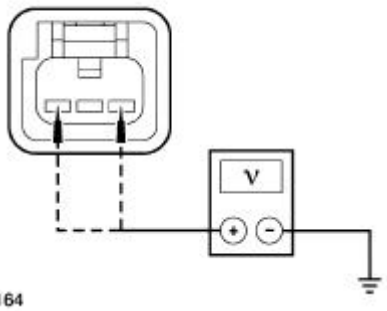
PINPOINT TEST A: THE POWER LIFTGATE DOES NOT OPERATE — USING THE KEYLESS ENTRY REMOTE TRANSMITTER

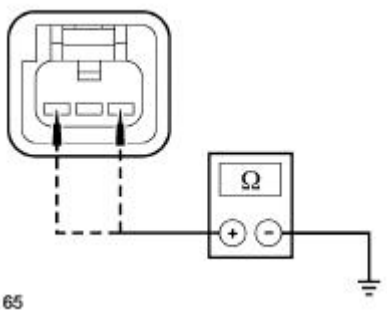




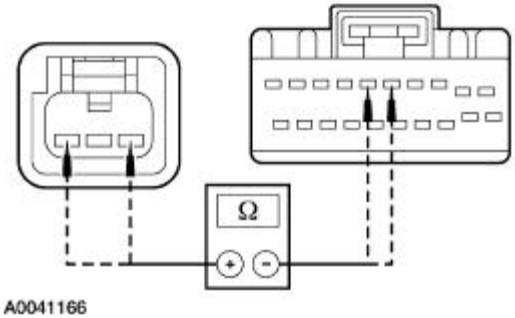
Test Step	Result / Action to Take
A1 CHECK THE KEYLESS ENTRY REMOTE TRANSMITTER FOR OPERATION OF LOCKS	
• Operate the power locks using the keyless entry remote transmitter. • **Do the power locks operate correctly?**	**Yes** GO to A2 . **No** REFER to Section 501-14 to diagnose the keyless entry remote transmitter.
A2 VERIFY POWER LIFTGATE OPERATION	
• Operate the power liftgate at the liftgate control switch. • **Does the power liftgate operate correctly?**	**Yes** INSTALL a new vehicle security module. REFER to Section 419-10 . TEST the system for normal operation. If still not working correctly, INSTALL a new power liftgate module. REFER to Power Liftgate Module in this section. TEST the system for normal operation. **No** Go To Pinpoint Test B to diagnose the inoperative power liftgate.

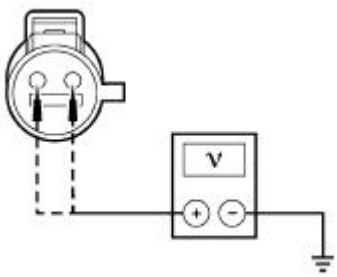




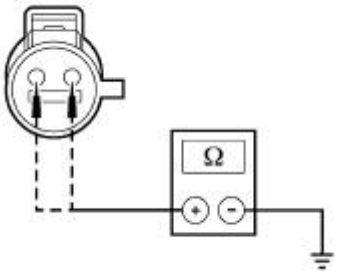


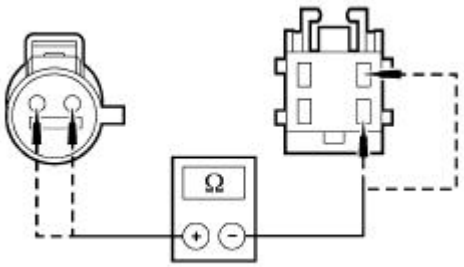
PINPOINT TEST B: THE POWER LIFTGATE DOES NOT OPERATE/DOES NOT OPERATE CORRECTLY





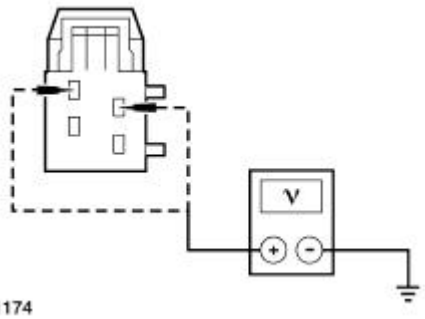
Test Step	Result / Action to Take

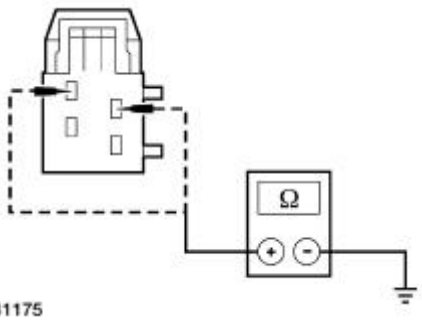




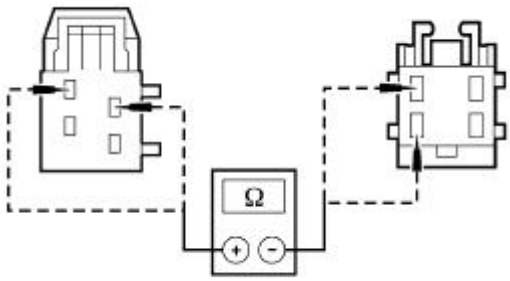
B1 RETRIEVE THE DTCs FROM POWER LIFTGATE MODULE	
• Use the recorded power liftgate module DTCs from the continuous and power liftgate module self-tests. • **Are any power liftgate module DTCs recorded?**	**Yes** If DTC B2699 or B2701, GO to B38 . If DTC B2700 or B2702, GO to B39 . If DTC B2703 or 2722, GO to B4 . If DTC B2704, B2705 or B2706, GO to B29 . If DTC B2709, B2710, B2711, B2712, B2819, B2825 or B2820, GO to B23 . If DTC B2713, GO to B19 . If DTC B2714, B2715, B2821 or B2822, GO to B15 . If DTC B2718 or B2721, GO to B44 . If DTC B2723, GO to B48 . If DTC B2724 or B2725, GO to B10 . If DTC B2726, GO to B33 . **No** GO to B2 .
B2 VERIFY POWER LIFTGATE OPERATION AT THE LIFTGATE CONTROL SWITCH	
• Operate the power liftgate at the power liftgate control switch. • **Does the power liftgate operate correctly?**	**Yes** GO to B3 . **No** GO to Symptom Chart and VERIFY the symptom. If sent back here from the Symptom Chart, GO to B3 .
B3 VERIFY POWER LIFTGATE OPERATION AT THE FORKBOLT/DETENT SWITCH	
• Operate the power liftgate at the power liftgate handle. • **Does the power liftgate operate correctly?**	**Yes** If the control switch and handle operated correctly, GO to Symptom Chart and VERIFY the symptom.

	If the control switch did not operate correctly, GO to B4 . **No** GO to B10 .
B4 VERIFY THE POWER LIFTGATE CONTROL SWITCH PID	
• Monitor the power liftgate OPEN/CLOSE switch PID while operating the power liftgate control switch. • **Do the PID values agree with the switch positions?**	**Yes** CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B5 .
B5 CHECK THE POWER LIFTGATE CONTROL SWITCH	
• Carry out the Power Liftgate Control Switch Component Test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Does the power liftgate control switch pass the component test?**	**Yes** GO to B6 . **No** INSTALL a new power liftgate control switch. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B6 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Measure the resistance between power liftgate control switch C9000-4 circuit 57 (BK) harness side and ground.  A0050101 • **Is the resistance less than 5 ohms?**	**Yes** GO to B7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B7 CHECK CIRCUIT 913 (GY/RD) FOR A SHORT TO POWER	
• Disconnect: Power Liftgate Module C4174d. • Key in ON position. • Measure the voltage between power liftgate control switch C9000-7, circuit 913 (GY/RD) harness side and ground.  A0041160	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B8 .





• **Is the voltage greater than 10 volts?**	
B8 CHECK CIRCUIT 913 (GY/RD) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between power liftgate control switch C9000-7, circuit 913 (GY/RD) harness side and ground.  A0041161 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B9 CHECK CIRCUIT 913 (GY/RD) FOR AN OPEN	
• Disconnect: Power Liftgate Module C9000. • Measure the resistance between power liftgate control switch C9000-7, circuit 913 (GY/RD) harness side and ground, and power liftgate module C4174d-4, circuit 913 (GY/RD) harness side.  A0041162 • **Are the resistances less than 5 ohms?**	**Yes** GO to B52 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B10 CHECK THE FORKBOLT/DETENT SWITCH IN THE CINCHING LATCH ASSEMBLY	
• Enter the following diagnostic mode on the diagnostic tool: Forkbolt and Detent Switch PIDs. • **NOTE:** The liftgate is in the primary position when the liftgate is in the fully closed position and in the unlatch position when the liftgate is open and completly out of the striker. The liftgate can be placed in the secondary latch position by opening the liftgate and closing the latch lever/pawl by hand and can be released back into the unlatched position by lifting up on the liftgate handle. • Move the liftgate into each of three positions specified by the table below. **Liftgate Latching Position** / **Forkbolt Switch PID** / **Detent Switch PID** Primary Latch / Not Active / Active Secondary Latch / Active / Active Unlatched / Not Active / Not Active • **Do the switch states agree with the table?**	**Yes** GO to B11 . **No** INSTALL a new forkbolt/detent switch. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



B11 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Measure the resistance between forkbolt/detent switch C4190-2, circuit 57 (BK) harness side and ground.  A0041163 • **Is the resistance less than 5 ohms?**	**Yes** GO to B12 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B12 CHECK CIRCUIT 1962 (LG/VT) AND 1963 (OG/LB) FOR A SHORT TO POWER	
• Disconnect: Power Liftgate Module C4174d. • Key in ON position. • Measure the voltage between forkbolt/detent switch C4190-1, circuit 1962 (LG/VT) harness side and ground, and forkbolt/detent switch C4190-3, circuit 1963 (OG/LB) harness side and ground.  A0041164 • **Are the voltages greater than 10 volts?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B13 .
B13 CHECK CIRCUIT 1962 (LG/VT) AND 1963 (OG/LB) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between forkbolt/detent switch C4190-1, circuit 1962 (LG/VT) harness side and ground, and forkbolt/detent switch C4190-3, circuit 1963 (OG/LB) harness side and ground.  A0041165 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to B14 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B14 CHECK CIRCUIT 1962 (LG/VT) AND 1963 (OG/LB) FOR AN OPEN	
• Measure the resistance between forkbolt/detent switch C4190-1, circuit 1962 (LG/VT) and liftgate module C4174d-5, circuit 1962 (LG/VT) harness side; and between forkbolt/detent switch C4190-	**Yes** GO to B52 .

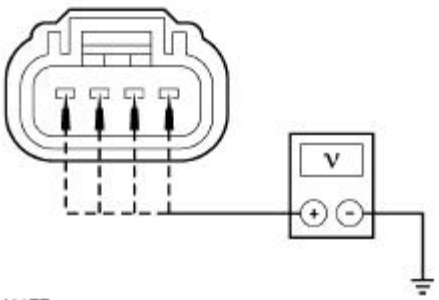
3, circuit 1963 (OG/LB) and power liftgate module C4174d-6, circuit 1963 (OG/LB) harness side.  A0041166 ● **Are the resistances less than 5 ohms?**	**No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B15 VERIFY CINCHING ACTUATOR MOTOR OPERATION	
● **NOTE:** The liftgate trim panel must be removed for this visual inspection. ● Visually monitor the cinching actuator assembly while activating the cinching actuator motor with the diagnostic tool power liftgate output command. ● **Does the cinch actuator assembly carry out the function requested?**	**Yes** GO to B19 . **No** GO to B16 .
B16 CHECK CIRCUIT 1604 (VT/OG) AND 1606 (DG/WH) FOR A SHORT TO POWER	
● Key in ON position. ● Disconnect: Cinching Actuator Motor C4188. ● Disconnect: Power Liftgate Module C4174a. ● Measure the voltage between cinching actuator motor C4188-2, circuit 1604 (VT/OG) harness side and ground, and cinching actuator motor C4188-1, circuit 1606 (DG/WH) harness side and ground.  A0041168 ● **Are the voltages greater than 10 volts?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B17 .
B17 CHECK CIRCUIT 1604 (VT/OG) AND 1606 (DG/WH) FOR A SHORT TO GROUND	
● Key in OFF position. ● Measure the resistance between cinching actuator motor C4188-2, circuit 1604 (VT/OG) harness side and ground, and cinching actuator motor C4188-1, circuit 1606 (DG/WH) harness side and ground.	**Yes** GO to B18 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

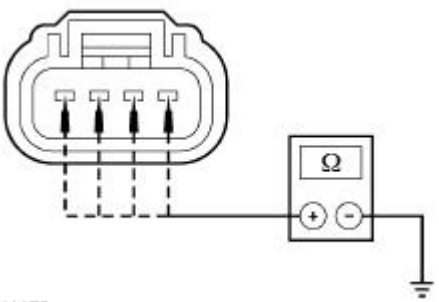
 A0041169 ● **Are the resistances greater than 10,000 ohms?**	
B18 CHECK CIRCUIT 1604 (VT/OG) AND 1606 (DG/WH) FOR AN OPEN	
● Measure the resistance between cinching actuator motor C4188-2, circuit 1604 (VT/OG) and power liftgate module C4174a-3, circuit 1604 (VT/OG) harness side; and between cinching actuator motor C4188-1, circuit 1606 (DG/WH) and power liftgate module C4174a-1, circuit 1606 (DG/WH) harness side.  A0041170 ● **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new cinching actuator motor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B19 VERIFY UNLATCHING ACTUATOR MOTOR OPERATION	
● **NOTE:** The liftgate must be in the primary latch position. The liftgate is in the primary position when the liftgate is in the fully closed position. ● Visually monitor the unlatch actuator assembly while activating the unlatch actuator with the diagnostic tool power liftgate module output command. ● **Does the unlatch actuator perform the operation?**	**Yes** GO to B23 . **No** GO to B20 .
B20 CHECK CIRCUIT 1247 (RD/LG) AND 1241 (GY/YE) FOR A SHORT TO POWER	
● Disconnect: Unlatching Actuator Motor C4189. ● Disconnect: Power Liftgate Module C4174a. ● Key in ON position. ● Measure the voltage between unlatching actuator motor C4189-1, circuit 1247 (RD/LG) harness side and ground, and unlatching actuator motor C4189-2, circuit 1241 (GY/YE) harness side and ground.	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B21 .

 A0041171 ● **Are the voltages greater than 10 volts?**	
B21 CHECK CIRCUIT 1247 (RD/LG) AND 1241 (GY/YE) FOR A SHORT TO GROUND	
● Key in OFF position. ● Measure the resistance between unlatching actuator motor C4189-1, circuit 1247 (RD/LG) harness side and ground, and unlatching actuator motor C4189-2, circuit 1241 (GY/YE) harness side and ground.  A0041172 ● **Are the resistances greater than 10,000 ohms?**	**Yes** GO to B22 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B22 CHECK CIRCUIT 1247 (RD/LG) AND 1241 (GY/YE) FOR AN OPEN	
● Measure the resistance between unlatching actuator motor C4189-1, circuit 1247 (RD/LG) and power liftgate module C4174a-4, circuit 1247 (RD/LG) harness side; and between unlatching actuator motor C4189-2, circuit 1241 (GY/YE) and power liftgate module C4174a-2, circuit 1241 (GY/YE) harness side.  A0041173 ● **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new liftgate latch control assembly. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B23 VERIFY LIFTGATE DRIVE MOTOR OPERATION	
● Open the liftgate to the full open position. ● Using the diagnostic tool, activate the power liftgate output command to the gate closed position. ● **Did the liftgate move in the closed direction?**	**Yes** GO to B27 . **No** GO to B24 .

B24 CHECK CIRCUIT 1601 (WH/PK) AND 1599 (TN/LB) FOR A SHORT TO POWER	
• Disconnect: Left Liftgate Drive Motor C997. • Disconnect: Right Liftgate Drive Motor C996. • Disconnect: Power Liftgate Module C4174b. • Key in ON position. • Measure the voltage between left liftgate drive motor C997-1, circuit 1601 (WH/PK) harness side and ground, and left liftgate drive motor C997-2, circuit 1599 (TN/LB) harness side and ground.  A0041174 • **Are the voltages greater than 10 volts?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B25 .
B25 CHECK CIRCUIT 1601 (WH/PK) AND 1599 (TN/LB) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between left liftgate drive motor C997-1, circuit 1601 (WH/PK) harness side and ground, and left liftgate drive motor C997-2, circuit 1599 (TN/LB) harness side and ground.  A0041175 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to B26 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B26 CHECK CIRCUIT 1601 (WH/PK) AND 1599 (TN/LB) FOR AN OPEN	
• Measure the resistance between left liftgate drive motor C997-1, circuit 1601 (WH/PK) and power liftgate module C4174b-3, circuit 1601 (WH/PK) harness side; and between left liftgate drive motor C997-2, circuit 1599 (TN/LB) and power liftgate module C4174b, circuit 1599 (TN/LB) harness side.	**Yes** GO to B27 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

A0041176

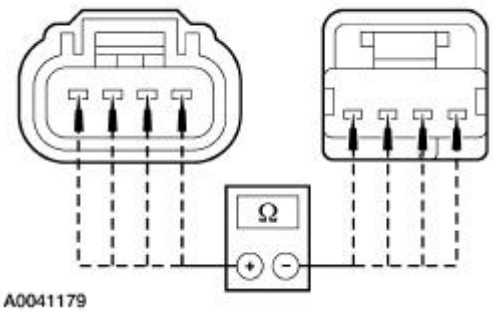




- Measure the resistance between right liftgate drive motor C996-2, circuit 1601 (WH/PK) and power liftgate module C4174b-3, circuit 1601 (WH/PK) harness side; and between right liftgate drive motor C996-1, circuit 1599 (TN/LB) and power liftgate module C4174b-4, circuit 1599 (TN/LB) harness side.

A0041176

- **Are the resistances less than 5 ohms?**



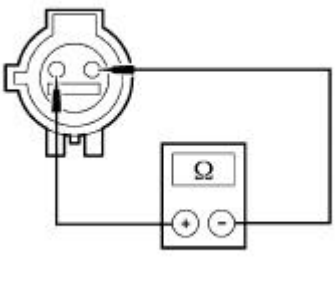
B27 CHECK LEFT LIFTGATE DRIVE MOTOR	
• Connect: Power Liftgate Module C4174b. • Disconnect: Right Liftgate Drive Motor C996. • Open the liftgate to the full open position. • Using the diagnostic tool, activate the power liftgate output command to the gate closed position. • **Did the liftgate move in the closed direction?**	**Yes** GO to B28 . **No** INSTALL a new left liftgate drive motor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B28 CHECK RIGHT LIFTGATE DRIVE MOTOR	
• Connect: Right Liftgate Drive Motor C996. • Disconnect: Left Liftgate Drive Motor C997. • Open the liftgate to the full open position. • Using the diagnostic tool, activate the power liftgate output command to the gate closed position. • **Did the liftgate move in the closed direction?**	**Yes** GO to B52 . **No** INSTALL a new right liftgate drive motor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B29 VERIFY THE LIFTGATE OPTICAL SENSOR OPERATION	
• Turn the power liftgate OFF from the instrument cluster message center. • Enter the following diagnostic mode on the diagnostic tool: Optical Sensor Feedback PID. • Monitor optical sensor 1 PID and optical sensor 2 PID while manually closing the liftgate. • **Does the optical sensor 1 PID and optical sensor 2 PID**	**Yes** GO to B52 . **No** GO to B30 .

change from inactive/active to active/inactive while the liftgate is manually moved?	
B30 CHECK CIRCUIT 1968 (YE), 1969 (WH/YE), 1970 (RD/LB), AND 1971 (LB/OG) FOR A SHORT TO POWER	
• Disconnect: Liftgate Optical Sensor C955. • Disconnect: Power Liftgate Module C4174c. • Key in ON position. • Measure the voltage between the following optical sensor circuits and ground: **Connector / Pin / Circuit** C955 / Pin 1 / 1968 (YE) C955 / Pin 2 / 1969 (WH/YE) C955 / Pin 3 / 1970 (RD/LB) C955 / Pin 4 / 1971 (LB/OG)  A0041177 • **Are the voltages greater than 10 volts?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B31 .
B31 CHECK CIRCUIT 1968 (YE), 1969 (WH/YE), 1970 (RD/LB), AND 1971 (LB/OG) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between following optical sensor circuits and ground: **Connector / Pin / Circuit** C955 / Pin 1 / 1968 (YE) C955 / Pin 2 / 1969 (WH/YE) C955 / Pin 3 / 1970 (RD/LB) C955 / Pin 4 / 1971 (LB/OG)  A0041178 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to B32 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B32 CHECK CIRCUIT 1968 (YE), 1969 (WH/YE), 1970 (RD/LB), AND 1971 (LB/OG) FOR AN OPEN

- Measure the resistance between optical sensor C955 harness side and power liftgate module C4174c harness side using the following table:

Optical Sensor	Circuit	Power Liftgate Module
C955-1	1968 (YE)	C4174c-1
C955-2	1969 (WH/YE)	C4174c-2
C955-3	1970 (RD/LB)	C4174c-3
C955-4	1971 (LB/OG)	C4174c-4



- **Are the resistances less than 5 ohms?**

Yes
INSTALL a new left power liftgate motor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

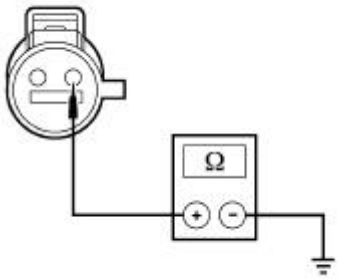
No
REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B33 CHECK THE HOME POSITION SWITCH

- Disconnect: Home Position Switch C4187.
- Measure the resistance between home position switch pin 1 and pin 2 component side while manually activating the home position switch.

- **Is the resistance less than 5 ohms when activated and greater than 10,000 ohms when not activated?**

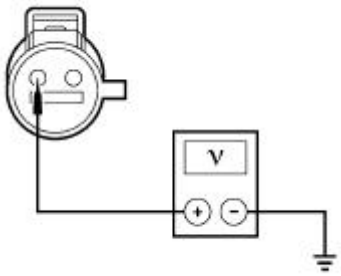
Yes
GO to B34 .

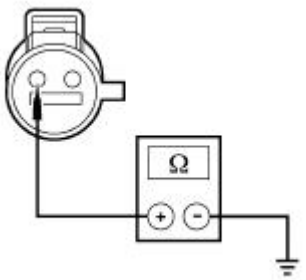


No
INSTALL a new liftgate latch control assembly. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

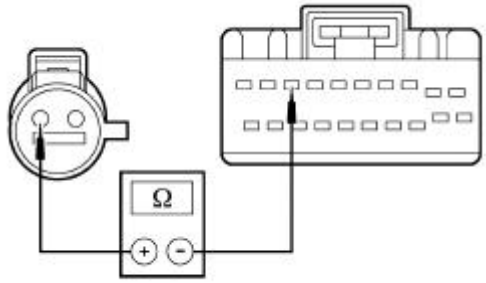
B34 CHECK CIRCUIT 57 (BK) FOR AN OPEN

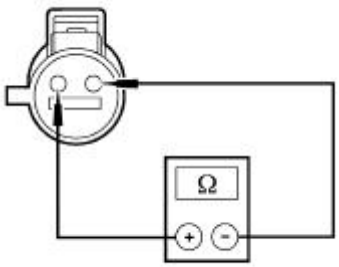
- Measure the resistance between home position switch C4187-2 circuit 57 (BK) harness side and ground.

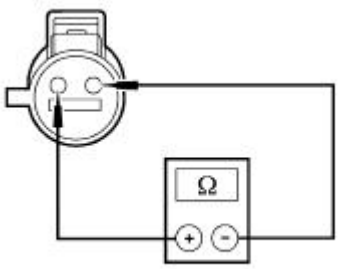




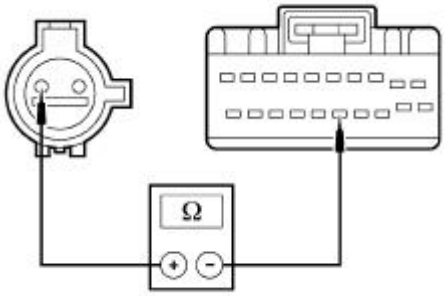
Yes
GO to B35 .

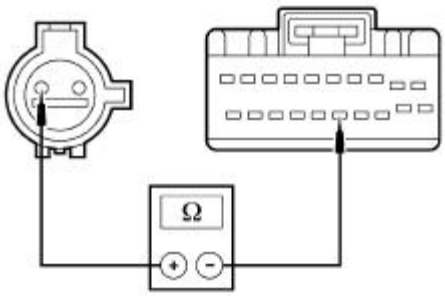


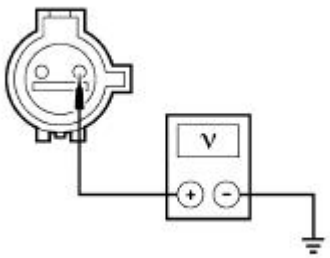


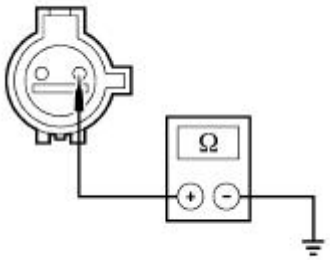


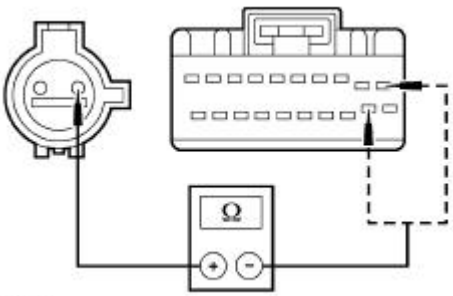
No
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

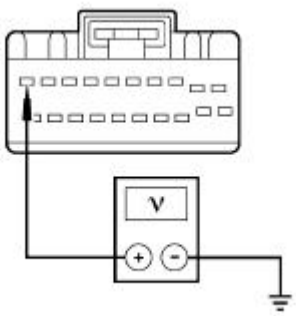




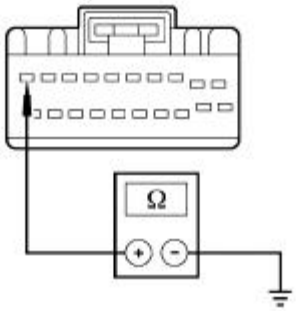


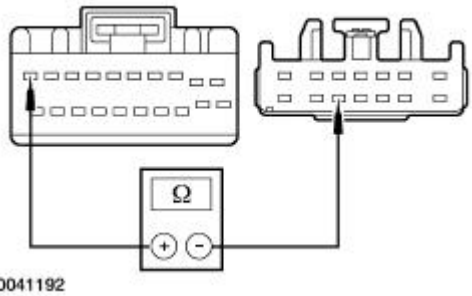


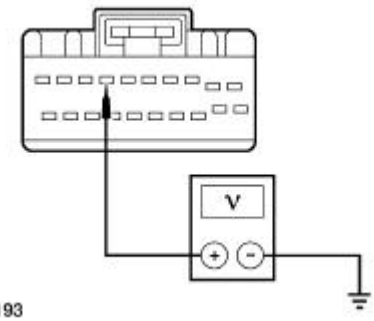




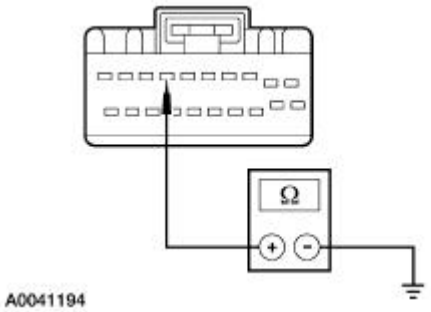
A0041182

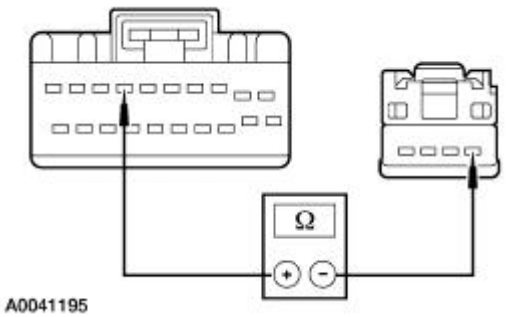






- **Is the resistance less than 5 ohms?**



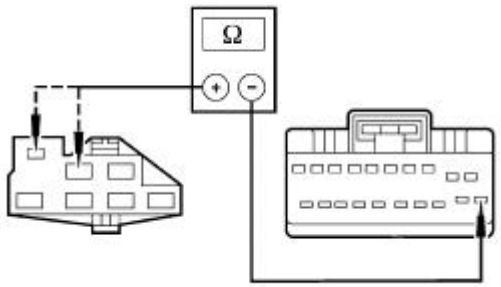


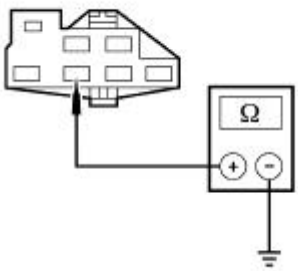
B35 CHECK CIRCUIT 1964 (DG/WH) FOR A SHORT TO POWER	
• Disconnect: Power Liftgate Module C4174d. • Key in ON position. • Measure the voltage between home position switch C4187-1, circuit 1964 (DG/WH) harness side and ground.  A0067609 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B36 .
B36 CHECK CIRCUIT 1964 (DG/WH) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between home position switch C4187-1, circuit 1964 (DG/WH) harness side and ground.  A0041180 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B37 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B37 CHECK CIRCUIT 1964 (DG/WH) FOR AN OPEN	
• Measure the resistance between home position switch C4187-1, circuit 1964 (DG/WH) and power liftgate module C4174d-8, circuit 1964 (DG/WH) harness side.	**Yes** GO to B52 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 A0041183 ● **Is the resistance less than 5 ohms?**	
B38 CHECK LEFT PINCH STRIP SWITCH	
● Disconnect: Left Pinch Strip Switch C4172. ● Measure the resistance between left pinch strip switch pin 1 and pin 2 component side while manually activating the left pinch strip switch.  A0042045 ● **Is the resistance less than 5 ohms when activated and greater than 5 ohms when not activated?**	**Yes** GO to B40 . **No** INSTALL a new left pinch strip switch. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B39 CHECK RIGHT PINCH STRIP SWITCH	
● Disconnect: Right Pinch Strip Switch C4173. ● Measure the resistance between right pinch strip switch pin 1 and pin 2 component side while manually activating the right pinch strip switch.  A0042045 ● **Is the resistance less than 5 ohms when activated and greater than 5 ohms when not activated?**	**Yes** GO to B40 . **No** INSTALL a new right pinch strip switch. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B40 CHECK CIRCUIT 1967 (GY/OG) FOR AN OPEN	
● Measure the resistance between right pinch strip switch C4173-2, circuit 1967 (GY/OG) and power liftgate module C4174d-15, circuit 1967 (GY/OG) harness side.	**Yes** GO to B41 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for

 A0041186 ● Measure the resistance between left pinch strip switch C4172-2, circuit 1967 (GY/OG) and power liftgate module C4174d-15, circuit 1967 (GY/OG) harness side.  A0041186 ● **Are the resistances less than 5 ohms?**	normal operation.
B41 CHECK CIRCUIT 1965 (VT) AND 1966 (LB/BK) FOR A SHORT TO POWER ● Measure the voltage between right pinch strip switch C4173-1, circuit 1965 (VT) and left pinch strip switch C4172-1, circuit 1966 (LB/BK) harness side and ground.  A0041187 ● **Are the voltages greater than 10 volts?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B42 .
B42 CHECK CIRCUIT 1965 (VT) AND 1966 (LB/BK) FOR A SHORT TO GROUND ● Measure the resistance between right pinch strip switch C4173-1, circuit 1965 (VT) and left pinch strip switch C4172-1, circuit 1966 (LB/BK) harness side and ground.	**Yes** GO to B43 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 A0041188 ● **Are the resistances greater than 10,000 ohms?**	
B43 CHECK CIRCUIT 1965 (VT) AND 1966 (LB/BK) FOR AN OPEN	
● Measure the resistance between right pinch strip switch C4173-1, circuit 1965 (VT) and power liftgate module C4174d-1, circuit 1965 (VT) harness side; and between left pinch strip switch C4172-1, circuit 1966 (LB/BK) and power liftgate module C4174d-12, circuit 1966 (LB/BK) harness side.  A0041189 ● **Are the resistances less than 5 ohms?**	**Yes** GO to B52 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B44 VERIFY THE LIFTGATE AJAR OPERATION	
● Monitor the power liftgate module liftgate ajar PID while opening and closing the liftgate. ● **Does the PID match the position of the liftgate?**	**Yes** GO to B52 . **No** GO to B45 .
B45 CHECK CIRCUIT 700 (WH/VT) FOR A SHORT TO POWER	
● Disconnect: Power Liftgate Module C4174d. ● Disconnect: Body Security Module C2113a. ● Key in ON position. ● Measure the voltage between power liftgate module C4174d-10, circuit 700 (WH/VT) harness side and ground.  A0041190 ● **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B46 .
B46 CHECK CIRCUIT 700 (WH/VT) FOR A SHORT TO GROUND	
● Key in OFF position.	**Yes**

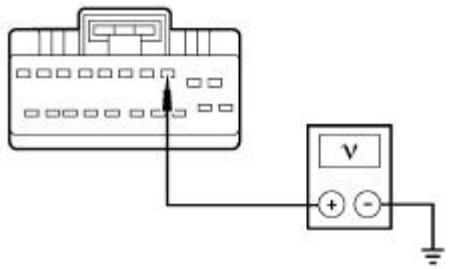


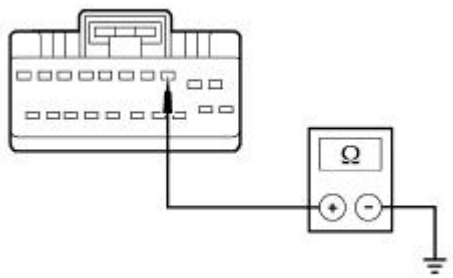


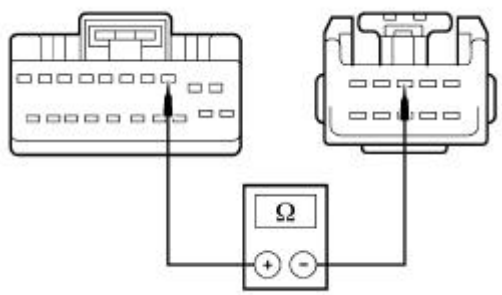
• Measure the resistance between power liftgate module C4174d-10, circuit 700 (WH/VT) harness side and ground.  A0041191 • **Is the resistance greater than 10,000 ohms?**	GO to B47 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B47 CHECK CIRCUIT 700 (WH/VT) FOR AN OPEN	
• Measure the resistance between power liftgate module C4174d-10, circuit 700 (WH/VT) and body security module C2113a-12, circuit 700 (WH/VT) harness side.  A0041192 • **Is the resistance less than 5 ohms?**	**Yes** GO to B52 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B48 VERIFY THE GLASS POSITION SWITCH OPERATION	
• Monitor the power liftgate module glass position PID while opening and closing the liftgate. • **Does the PID match the position of the liftgate glass?**	**Yes** CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B49 .
B49 CHECK CIRCUIT 1961 (BN/LB) FOR A SHORT TO POWER	
• Disconnect: Power Liftgate Module C4174d. • Disconnect: Liftgate Glass Release Motor C4040. • Measure the voltage between power liftgate module C4174d-7, circuit 1961 (BN/LB) harness side and ground.  A0041193 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B50 .
B50 CHECK CIRCUIT 1961 (BN/LB) FOR A SHORT TO GROUND	

• Measure the resistance between power liftgate module C4174d-7, circuit 1961 (BN/LB) harness side and ground.  A0041194 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B51 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B51 CHECK CIRCUIT 1961 (BN/LB) FOR AN OPEN	
• Measure the resistance between power liftgate module C4174d-7, circuit 1961 (BN/LB) and liftgate glass release motor C4040-1, circuit 1961 (BN/LB) harness side.  A0041195 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new liftgate glass position switch. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B52 CHECK THE POWER LIFTGATE MODULE FOR CORRECT OPERATION	
• Disconnect all power liftgate module connectors. • Check for: • corrosion. • pushed-out pins. • Connect all power liftgate module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new power liftgate module. REFER to Power Liftgate Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST C: THE POWER LIFTGATE DOES NOT OPERATE — LIFTGATE CLOSE CHIME





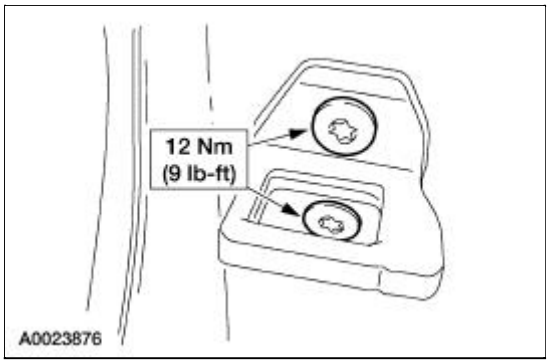


Test Step	Result / Action to Take
C1 VERIFY THE LIFTGATE CHIME OPERATION	

• Connect the diagnostic tool. • Using the diagnostic tool, activate the power liftgate chime output command. • **Does the power liftgate chime sound?**	**Yes** CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to C2.
C2 CHECK POWER LIFTGATE MODULE OUTPUT	
• Disconnect: Liftgate Close Chime Module C4186. • Measure the voltage between liftgate close chime module C4186-6, circuit 1972 (PK/BK) and liftgate close chime module C4186-7, circuit 1972 (PK/BK) harness side and ground while closing the liftgate.  A0050475 • **Is the voltage greater than 10 volts while closing and 0 volts when closed?**	**Yes** GO to C5. **No** If the voltage is greater than 10 volts when liftgate is closing and closed, REPAIR the circuit. TEST the system for normal operation. If there is no voltage present, GO to C3.
C3 CHECK CIRCUIT 1972 (PK/BK) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Power Liftgate Module C4174d. • Measure the resistance between liftgate close chime module C4186-6, circuit 1972 (PK/BK) and liftgate close chime module C4186-7, circuit 1972 (PK/BK) harness side and ground  A0050476 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C4. **No** REPAIR the circuit. TEST the system for normal operation.
C4 CHECK CIRCUIT 1972 (PK/BK) FOR AN OPEN	
• Measure the resistance between power liftgate module C4174d-11, circuit 1972 (PK/BK) harness side and liftgate close chime module C4186-6, circuit 1972 (PK/BK) and liftgate close chime module C4186-7, circuit 1972 (PK/BK) harness side.	**Yes** GO to C6. **No** REPAIR the circuit. TEST the system for normal operation.

 A0050477 ● **Is the resistance less than 5 ohms?**	
C5 CHECK LIFTGATE CLOSE CHIME GROUND	**Yes** INSTALL a new liftgate close chime module. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
● Measure the resistance between liftgate close chime module C4186-2, circuit 57 (BK) harness side and ground.  A0050478 ● **Is the resistance less than 5 ohms?**	
C6 CHECK THE POWER LIFTGATE MODULE FOR CORRECT OPERATION	**Yes** INSTALL a new power liftgate module. REFER to Power Liftgate Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
● Disconnect all power liftgate module connectors. ● Check for: ● corrosion. ● pushed-out pins. ● Connect all power liftgate module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	

PINPOINT TEST D: DTC U2528 — PRNDL DATA MISMATCH



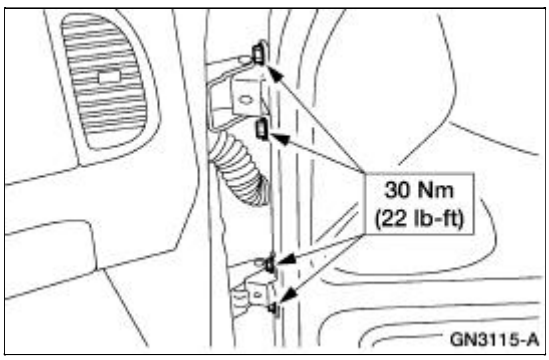
Test Step	Result / Action to Take
NOTE: Diagnose any other PRNDL DTCs before performing this pinpoint test.	
D1 CHECK CIRCUIT 3410 (YE) FOR A SHORT TO VOLTAGE	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for
● Disconnect: Power Liftgate Module C4174d. ● Disconnect: Floor Shifter C2096. ● Disconnect: Ignition Switch C250. ● Key in ON position.	

• Measure the voltage between power liftgate module C4174d-3, circuit 3410 (YE) harness side and ground.  A0062528 • **Is any voltage present?**	normal operation. **No** GO to D2 .
D2 CHECK CIRCUIT 3410 (YE) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between power liftgate module C4174d-3, circuit 3410 (YE) harness side and ground.  A0062527 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D3 CHECK CIRCUIT 3410 (YE) FOR AN OPEN	
• Measure the resistance between power liftgate module C4174d-3, circuit 3410 (YE) harness side and floor shifter C2096-3 harness side.  A0062526 • **Is the resistance less than 5 ohms?**	**Yes** GO to D4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D4 CHECK THE POWER LIFTGATE MODULE FOR CORRECT OPERATION	
• Disconnect all power liftgate module connectors. • Check for: • corrosion. • pushed-out pins. • Connect all power liftgate module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new power liftgate module. REFER to Power Liftgate Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating

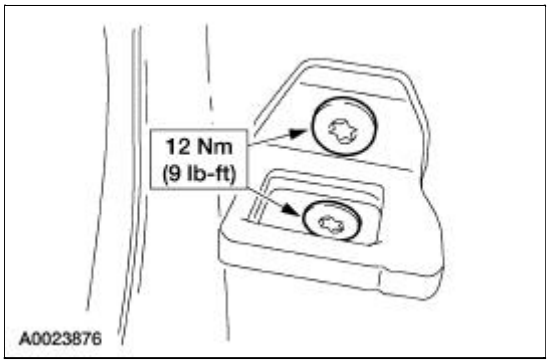
	correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Hinge Adjustment —Front Door, Horizontal and Vertical

1. Remove the door striker.

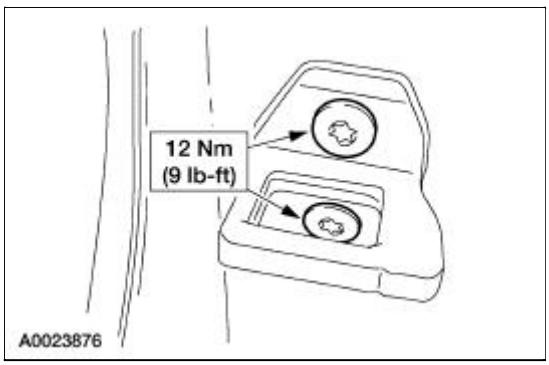


2. Loosen the front door hinge-to-front door bolts enough to permit movement of the door.



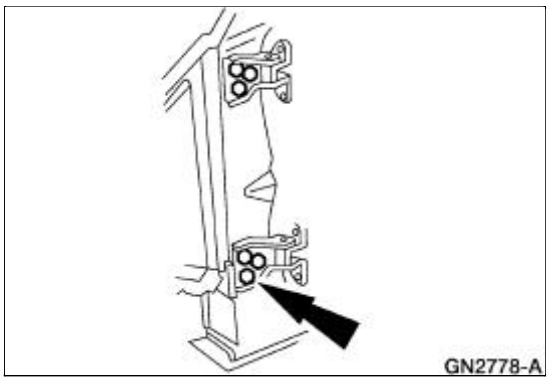
3. Adjust the front door alignment.

4. Tighten the front door hinge-to-front door bolts.



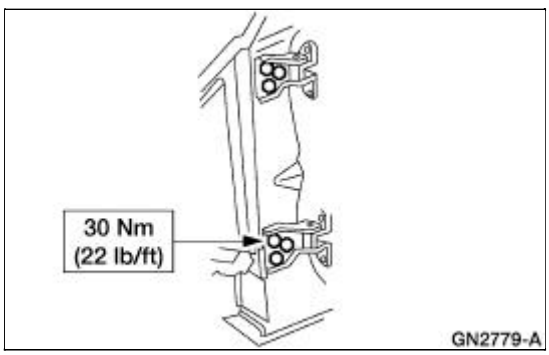
5. Install and adjust the door striker.

12 Nm
(9 lb-ft)
A0023876

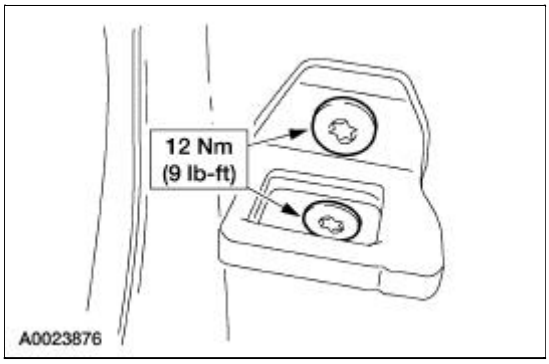


Hinge Adjustment —Front Door, Fore and Aft

NOTE: Check the rear door hinge adjustment before adjusting the front door hinge.

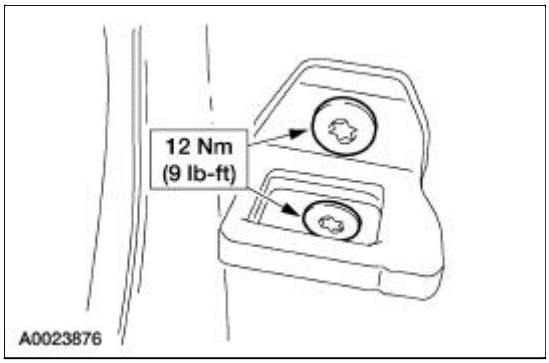


1. Remove the door striker.

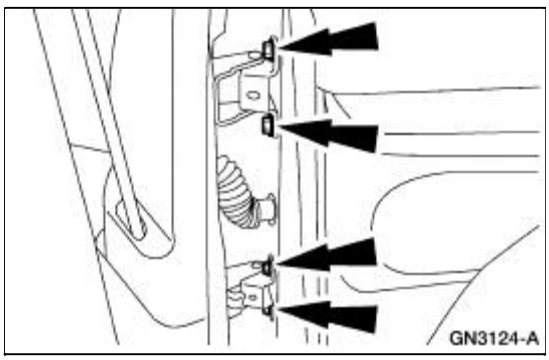


2. Remove the front fender. For additional information, refer to Section 501-02 .
3. Loosen the front door hinge-to-body bolts.

4. Adjust the front door alignment to specification.
5. Tighten the front door hinge-to-body bolts.

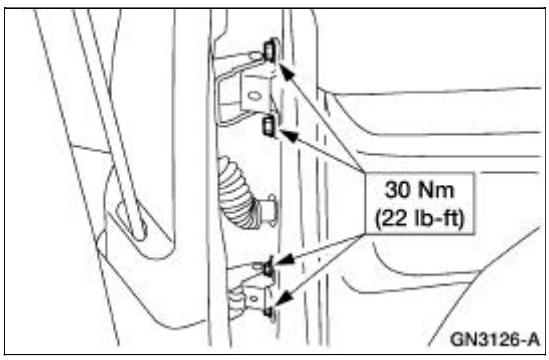


6. Install the front fender. For additional information, refer to Section 501-02 .
7. Install and adjust the door striker.

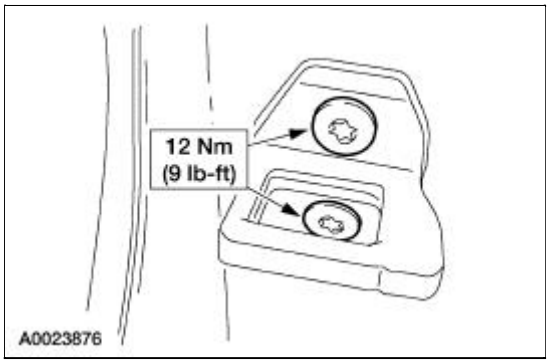


12 Nm
(9 lb-ft)
A0023876

Hinge Adjustment —Door, Rear, In, Out, Up and Down

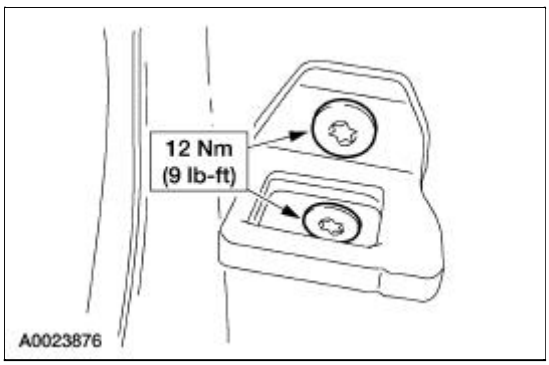


1. Remove the door striker.

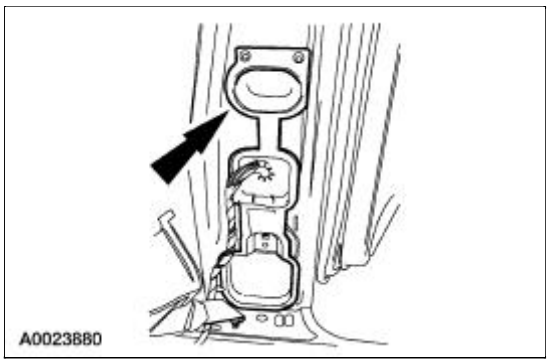


2. Loosen the hinge-to-door bolts enough to allow door movement.

3. Adjust the door until it is uniform to adjacent panels.
4. Tighten the hinge-to-door bolts.

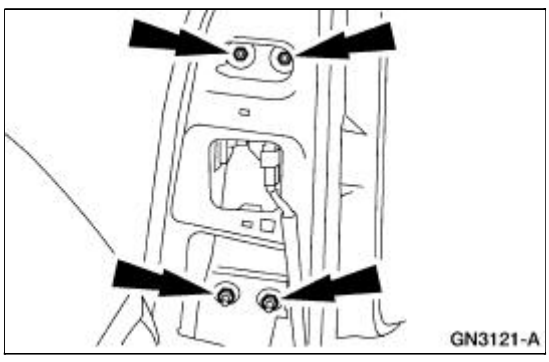


5. Install the door striker.

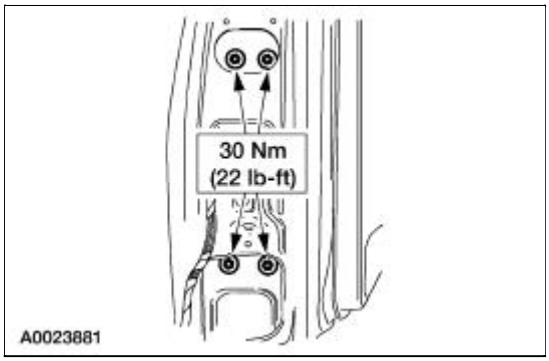


12 Nm
(9 lb-ft)
A0023876

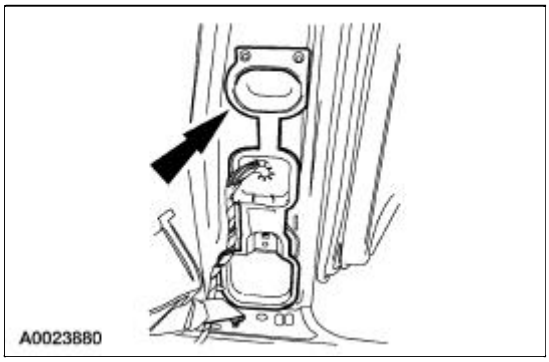
Hinge Adjustment —Door, Rear, Fore, Aft and Tilt



1. Position the front seat in the full forward position.
2. Remove the door striker.

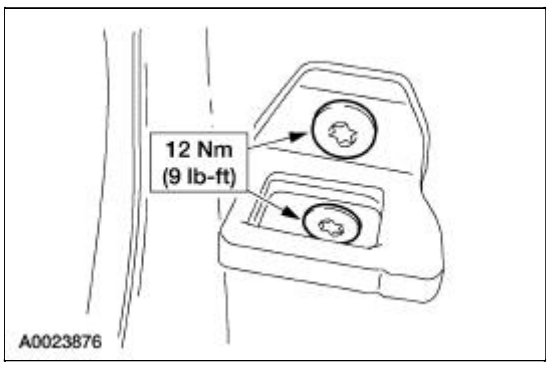


3. Remove the lower B-pillar trim panel. For additional information, refer to Section 501-05 .
4. Remove the B-pillar weathershield.

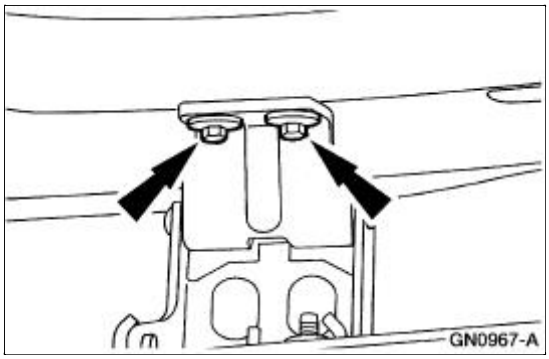


5. Loosen the hinge-to-B-pillar nuts enough to allow movement of the rear door.

6. Adjust the rear door until it is uniform to adjacent panels.
7. Tighten the hinge-to-B-pillar nuts.

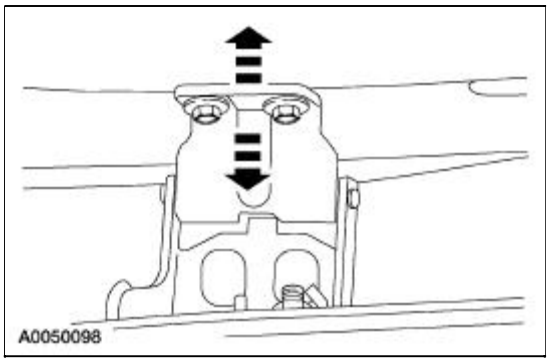


8. Install the B-pillar weathershield.



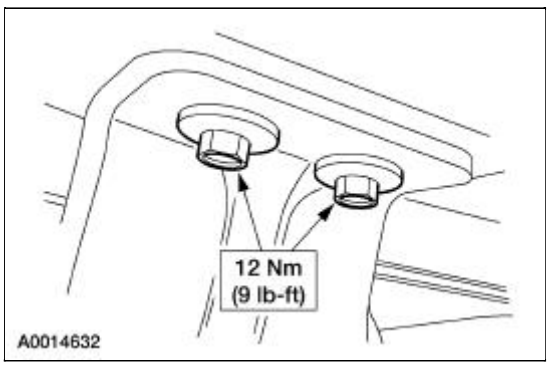
9. Install the lower B-pillar trim panel. For additional information, refer to Section 501-05 .

10. Install the door striker.



Hinge Adjustment —Liftgate

1. Loosen the liftgate hinge to liftgate bolts.



2. Adjust the liftgate alignment.

3. **NOTE:** The bolt washers must make full contact with the liftgate bracket when tightened.

   Tighten the liftgate hinge to liftgate bolts.

Power Liftgate Initialization

NOTE: If the power liftgate system is turned OFF in the message center, the system cannot be activated with any switches or with the liftgate handle. The system will need to be turned ON for any power operation to occur.

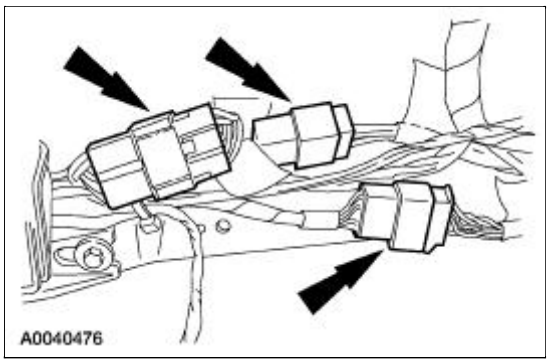
NOTE: The power liftgate may not operate under the following conditions:

- a low voltage or dead battery.
- a disconnected battery
- a power liftgate that has been left open for more than six hours.
- a power liftgate that has been manually closed and left ajar.

If any of these conditions has occurred, the power liftgate must be reset.

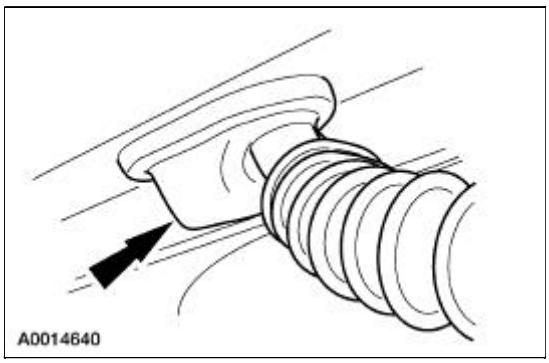
1. Manually close and fully latch the power liftgate.
2. **NOTE:** If the power liftgate does not open during this step, refer to the symptom chart to diagnose the power liftgate for no operation.

   Power open the power liftgate by using the keyfob or overhead console switch.
3. Once the power liftgate is fully open, close the power liftgate by using the keyfob or overhead console switch.



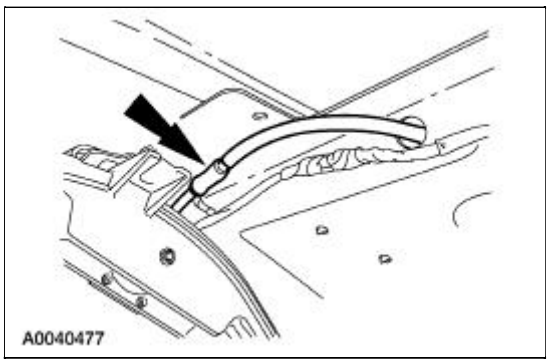
Liftgate

Removal and Installation

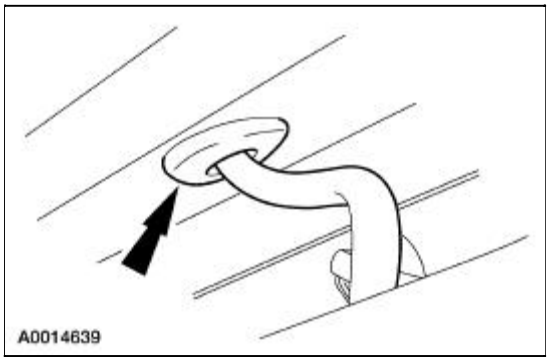


All vehicles

NOTE: Left side shown, right side similar.

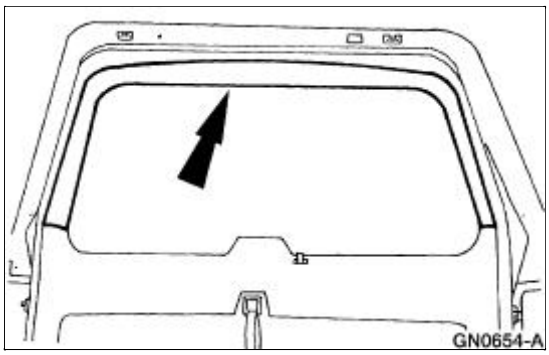


1. Remove the D-pillar trim panels. For additional information, refer to Section 501-05 .
2. Remove the headliner rear pin-type retainers and lower the rear of headliner.
3. Disconnect the liftgate electrical connectors.

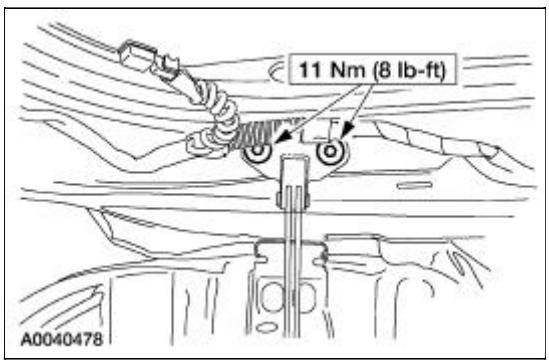


4. Remove the wire harness grommet and route the wire harness out from the roof.

5. Disconnect the rear washer tube.



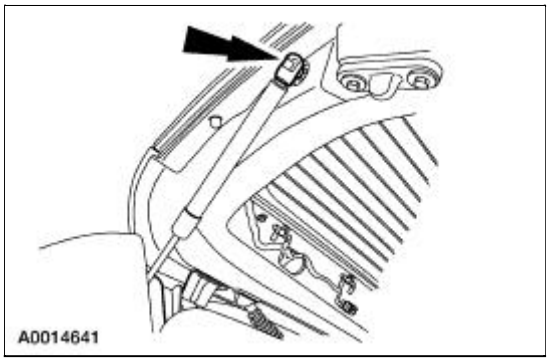
6. Remove the rear washer tube grommet and route the rear washer tube out from the roof.



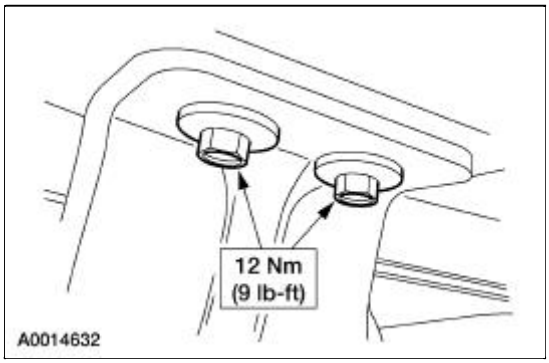
Vehicles with power liftgate

7. Remove the upper liftgate trim.

8. Remove the power liftgate motor to liftgate bolts.



All vehicles



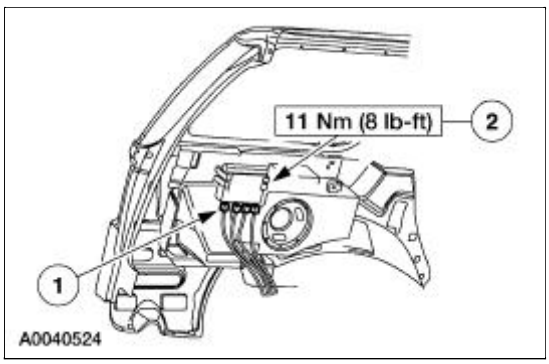
9. **NOTE:** Left side shown, right side similar.

   NOTE: An assistant is necessary for the removal of the liftgate.

   Disconnect the assist cylinders at the liftgate side.

10. Remove the four hinge bolts and remove the liftgate.

11. To install, reverse the removal procedure.



Power Liftgate Module

Removal and Installation

NOTE: Prior to removal of the power liftgate module, it is necessary to upload module configuration information to a diagnostic tool. This information needs to be downloaded into the new power liftgate module once installed. For additional information, refer to Section 418-01 .

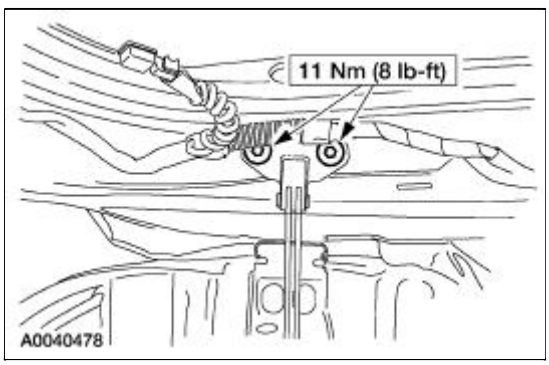
1. Remove the rear quarter trim panel. For additional information, refer to Section 501-05 .

2. Remove the power liftgate module.
   1. Disconnect the electrical connectors.
   2. Remove the bolts.

3. **NOTE:** Once the new power liftgate module is installed, it is necessary to download the module configuration information from the diagnostic tool into the new power liftgate module. For additional information, refer to Section 418-01 .

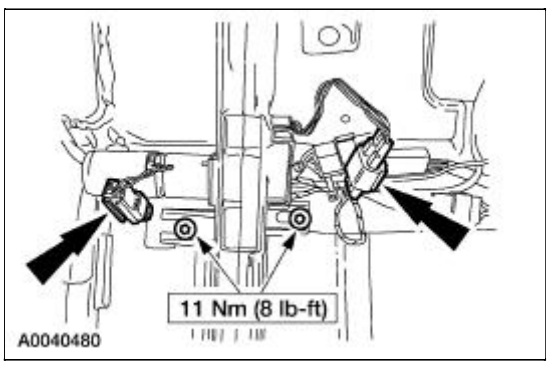
   To install, reverse the removal procedure.

Power Liftgate Motor

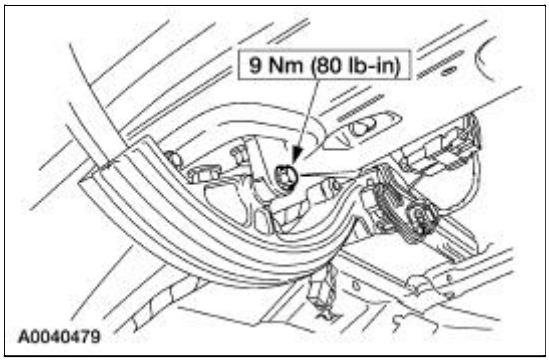


Removal and Installation

NOTE: Left side shown, right side similar.



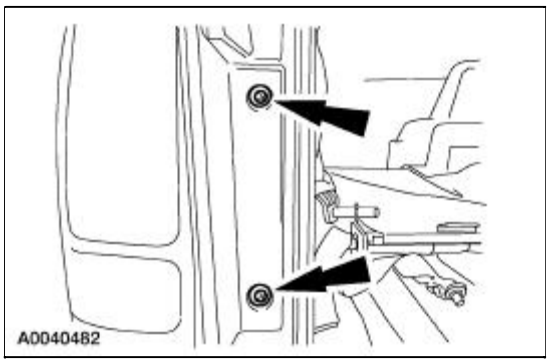
1. Remove the headliner. For additional information, refer to Section 501-05 .
2. Remove the upper liftgate trim.



3. Remove the power liftgate motor to liftgate bolts.

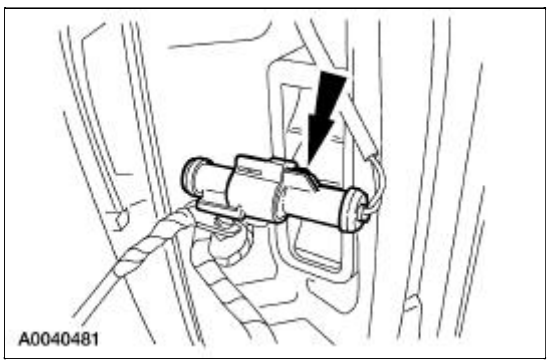
4. Disconnect the electrical connectors and remove the power liftgate motor bolts.

5. Remove the power liftgate motor pivot bolt.



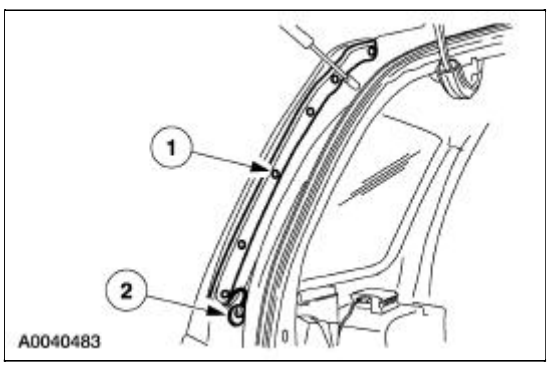
6. Slide the power liftgate motor assembly forward and remove the power liftgate motor.
7. To install, reverse the removal procedure.

Pinch Strip Switch



Removal and Installation

NOTE: Left side shown, right side similar.



1. Remove brake light.
   - Remove the screws.

2. Disconnect the pinch strip electrical connector.

3. Remove the pinch strip.
   1. Remove the pin-type retainers.
   2. Remove the grommet and route the harness out of the vehicle.

4. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in
A-pillar assist handle screws	5	—	44
Safety belt guide nuts	40	30	—
B-pillar and C-pillar trim panel bolts	8	—	71
Lower safety belt bolts	40	30	—
Door trim panel screws	1	—	9
Door trim panel armrest screws	2	—	18
Liftgate assist handle screws	5	—	44
Sun visor screws	2	—	18

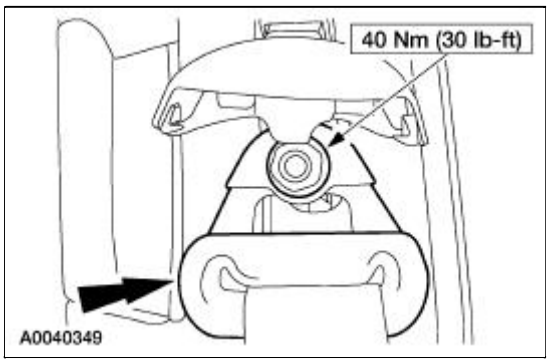
Interior Trim

The interior trim consists of the following components:

- A-pillar trim panels
- B-pillar trim panels
- C-pillar trim panels
- D-pillar trim panels
- front door trim panels
- rear door trim panels
- rear quarter trim panels
- door handle bezels
- liftgate trim panel
- headliner
- sun visors
- scuff plates
- coat hooks
- assist handles

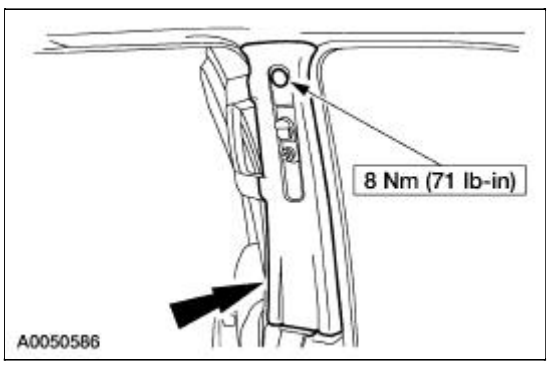
B-Pillar Trim Panel

Removal and Installation



NOTE: Left side shown, right side similar.

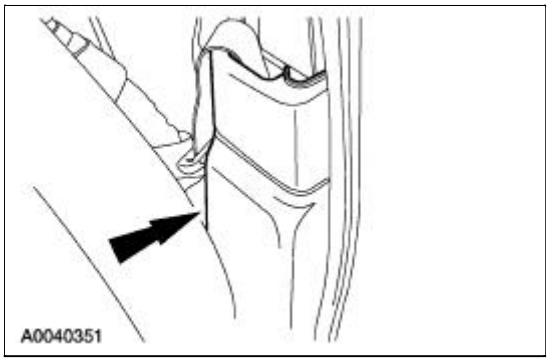
Upper and lower



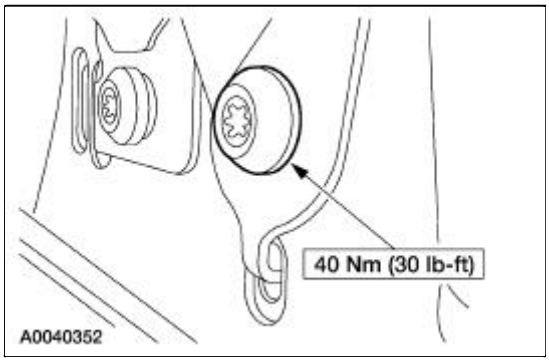
1. **NOTE:** Position the safety belt guide to the lowest position.

   NOTE: Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or cover does not remain closed, install a new shoulder safety belt guide cover.

   Remove the safety belt guide.
   - Lift up on the cover and remove the nut.



2. Remove the upper B-pillar trim panel.
   - Remove the bolt cover and bolt.
   - Remove the upper B-pillar trim panel by pulling outward to release the clips.



Lower

3. Remove the front and rear door scuff plates.

4. Position the lower B-pillar trim panel aside.

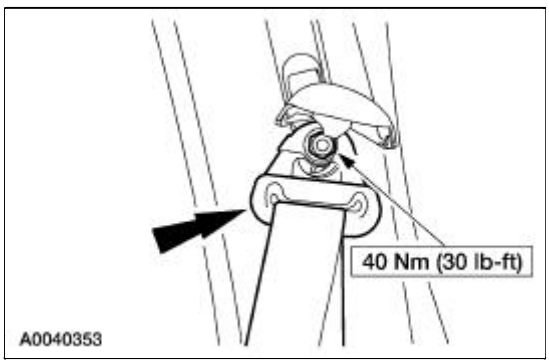
5. Remove the front safety belt anchor.

6. Feed the safety belt through the lower B-pillar trim panel and remove.

Upper and lower

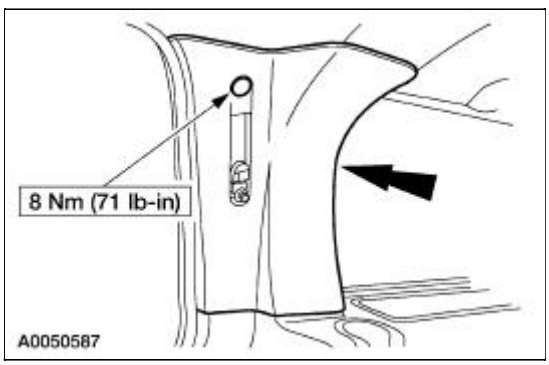
7. To install, reverse the removal procedure.
    - When installing the upper B-pillar trim panel, insert the safety belt guide slide into the upper B-pillar trim panel.

C-Pillar Trim Panel



Removal and Installation

NOTE: Right side shown, left side similar.



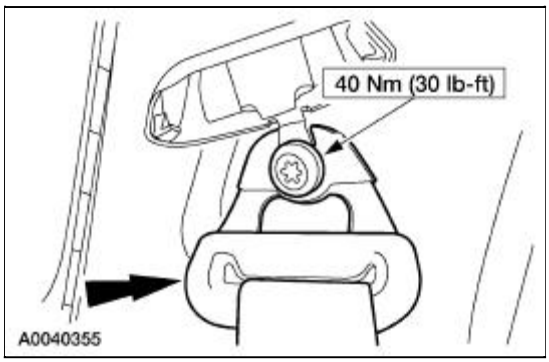
1. **NOTE:** Position the safety belt guide to the lowest position.

   NOTE: Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or cover does not remain closed, install a new shoulder safety belt guide cover.

   Remove the safety belt guide.
   - Lift up on the cover and remove the nut.

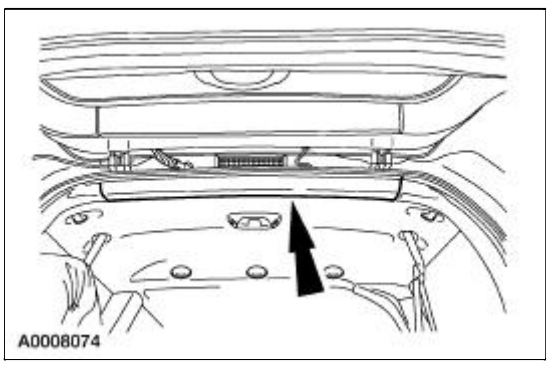
2. Remove the C-pillar trim panel.
   - Remove the bolt cover and bolt and pull outward to release the retainers.

3. To install, reverse the removal procedure.



D-Pillar Trim Panel

Removal and Installation



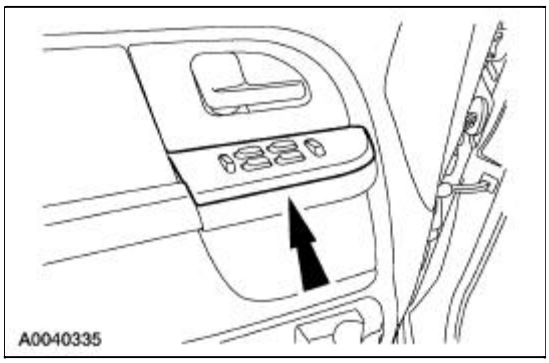
NOTE: Right side with power vent windows and power liftgate shown, all others similar.

1. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or cover does not remain closed, install a new shoulder safety belt guide cover.

   Remove the safety belt guide.
   - Lift up on the cover and remove the nut.

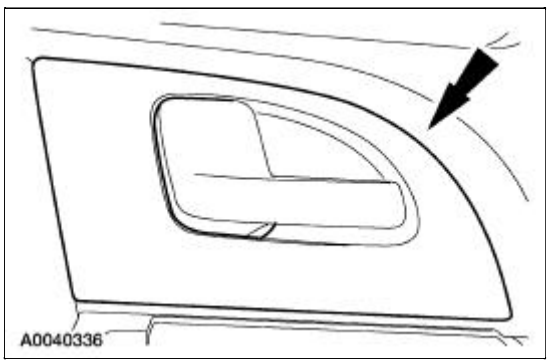
2. Remove rear upper headliner trim panel.

3. Remove the D-pillar trim panel.
   1. Disengage the upper clip by pulling downward.
   2. Unseat the D-pillar trim panel and rotate forward to remove.



4. To install, reverse the removal procedure.

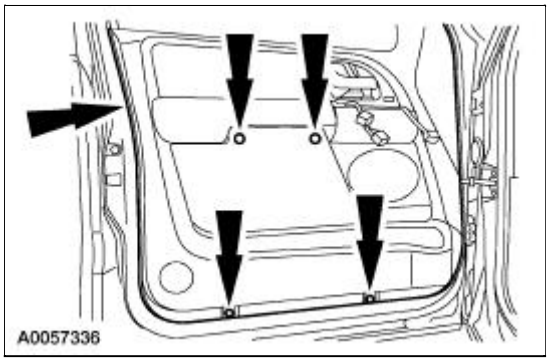
Front Door Trim Panel —Expedition



Removal and Installation

NOTE: Left front door shown, right front similar.

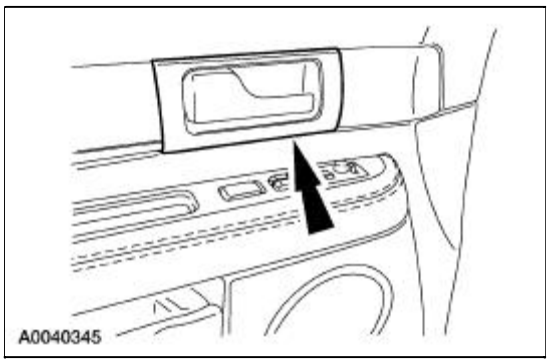
1. Remove the window control switch plate.
   - Use service notch and disconnect the electrical connectors.



2. Remove the door handle bezel.
   - Use service notch.

3. **CAUTION: To avoid damage to the door trim panel, lift the door trim panel by pulling directly upward on the armrest to disengage the panel clips.**

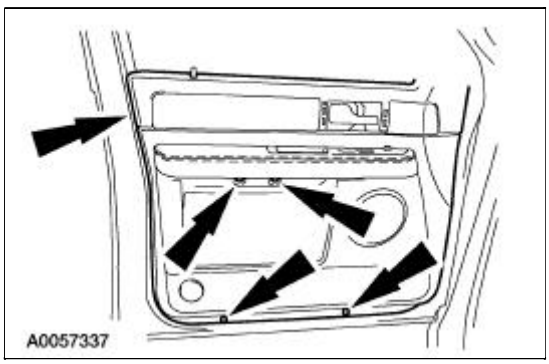
   Remove the two bolts and three screws, and remove the door trim panel.
   - Remove the finish cover to access the two center screws.
   - Disconnect the electrical connectors.



4. To install, reverse the removal procedure.

Front Door Trim Panel —Navigator

Removal and Installation

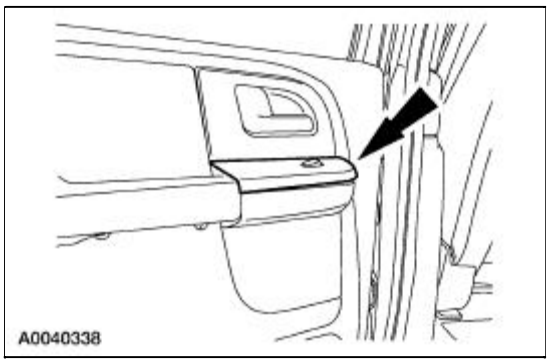


NOTE: Left front door shown, right front similar.

1. Remove the door handle bezel.
   - Use service notch.

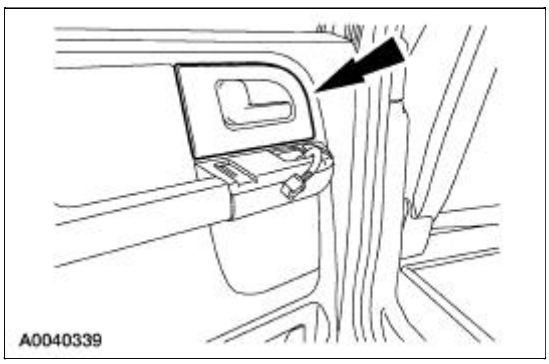
2. **CAUTION: To avoid damage to the door trim panel, lift the door trim panel by pulling directly upward on the armrest to disengage the panel clips.**

   Remove the two bolts and three screws, and remove the door trim panel.
   - Disconnect the electrical connectors.



3. To install, reverse the removal procedure.
   - Transfer components as necessary.

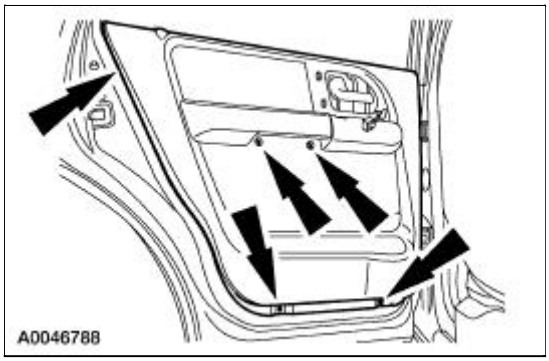
Rear Door Trim Panel —Expedition



Removal and Installation

NOTE: Left rear door shown, right rear similar.

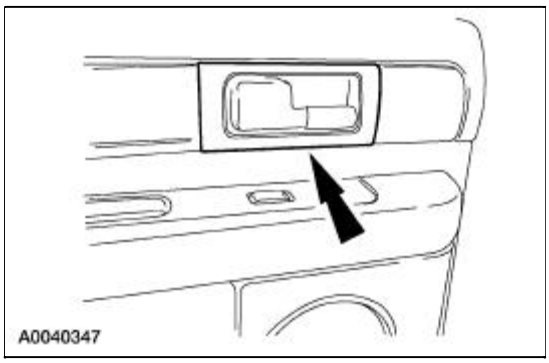
1. If equipped with power windows, remove the window control switch plate.
   - Use service notch.



2. Remove the door handle bezel.
   - Use service notch.

3. **CAUTION: To avoid damage to the door trim panel, lift the door trim panel by pulling directly upward on the armrest to disengage the panel clips.**

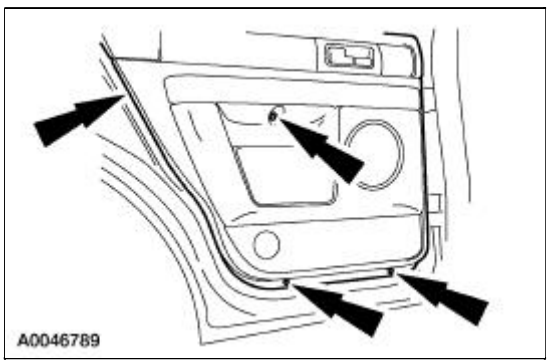
   Remove the two bolts and three screws, and remove the door trim panel.
   - Remove the finish cover to access the two center screws.
   - If equipped, disconnect the electrical connector.



4. To install, reverse the removal procedure.

Rear Door Trim Panel —Navigator

Removal and Installation

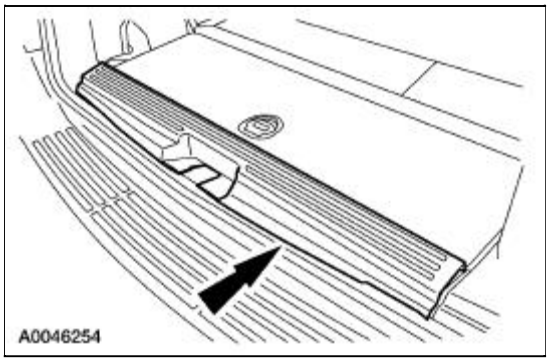


NOTE: Left rear door shown, right rear similar.

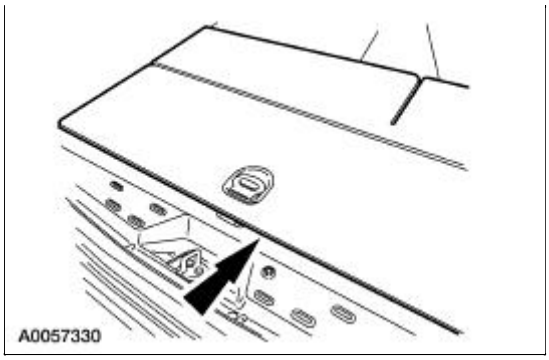
1. Remove the door handle bezel.
   - Use service notch.

2. **CAUTION: To avoid damage to the door trim panel, lift the door trim panel by pulling directly upward on the armrest to disengage the panel clips.**

   Remove the two bolts and two screws, and remove the door trim panel.
   - Disconnect the window switch electrical connector.

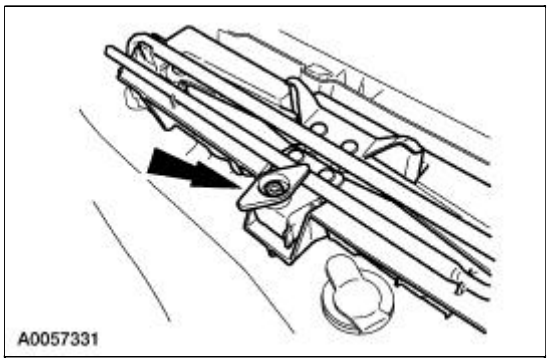


3. To install, reverse the removal procedure.

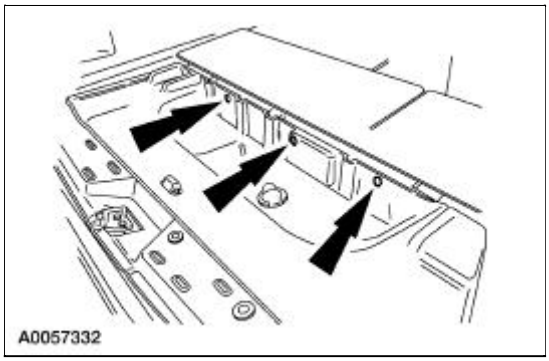


Rear Quarter Trim Panel

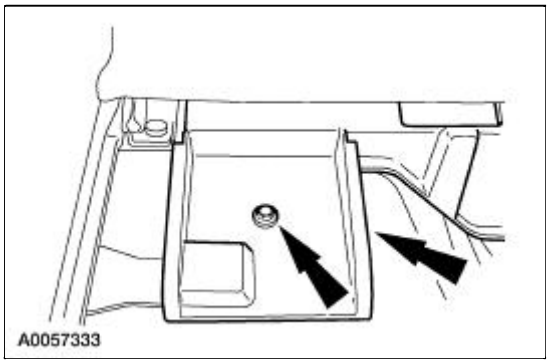
Removal and Installation



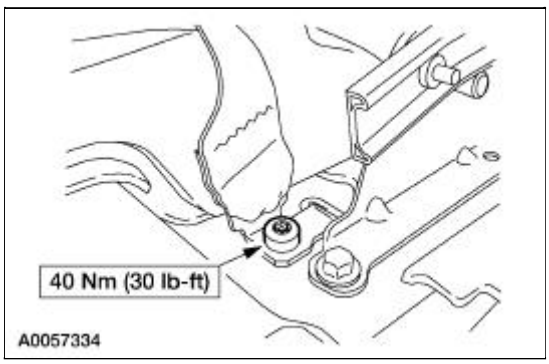
1. Remove the C-pillar trim panel. For additional information, refer to C-Pillar Trim Panel in this section.
2. Remove the D-pillar trim panel. For additional information, refer to D-Pillar Trim Panel in this section.
3. Remove the liftgate scuff plate by pulling upward.



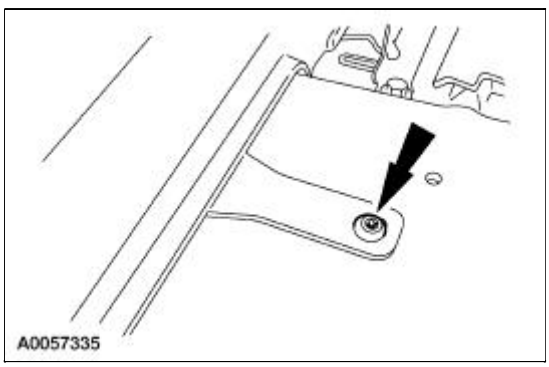
4. Remove the rear floor loadspace trim panel.



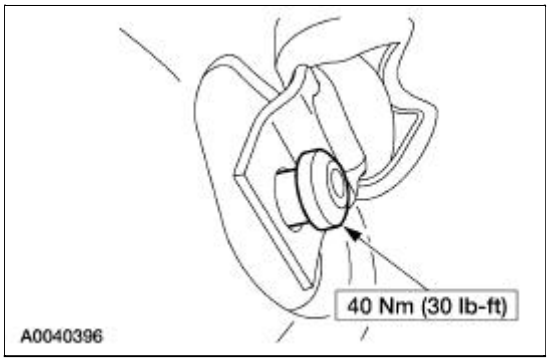
5. Remove the floor jack assembly.



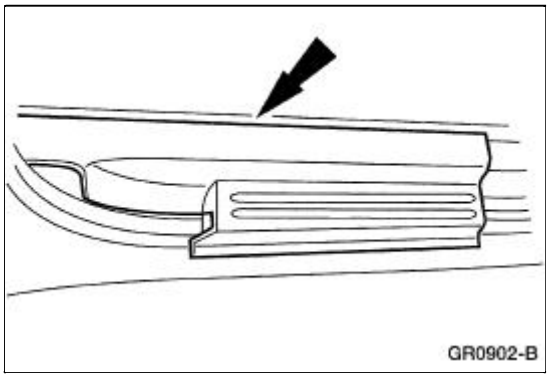
6. Remove the pin-type retainers and pull back the carpeting.



7. Remove the two bolts and the loadspace trim panel by pulling upward.

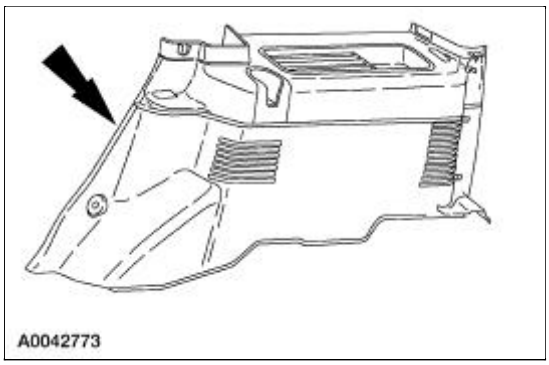


8. Remove the third row seat safety belt anchor bolt.



9. Remove the rear quarter trim panel pin-type retainer.

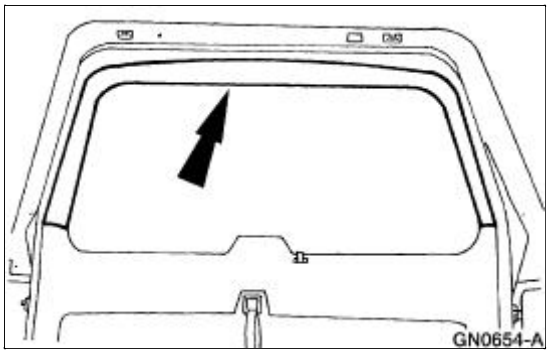
10. Remove the second row safety belt anchor.



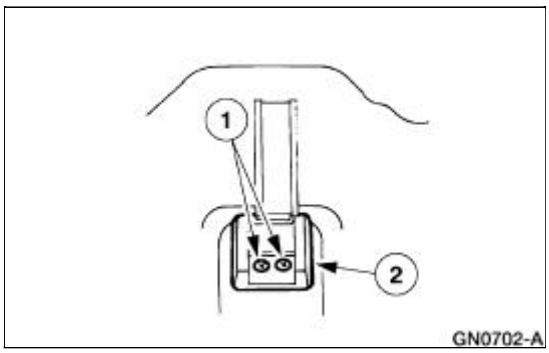
11. Remove the rear door scuff plate by pulling upward.

12. Fold the third row seat down.

13. Remove the rear quarter trim panel by pulling outward.
    - If equipped, disconnect the power point and power third row seat switch electrical connector at the rear.



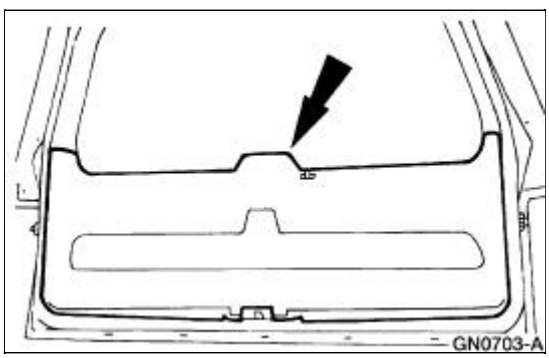
14. To install, reverse the removal procedure.



Liftgate Trim Panel

Removal and Installation

1. Remove the upper liftgate trim panel.
   - Pull lower corners toward the center on both sides and pull down along the top.

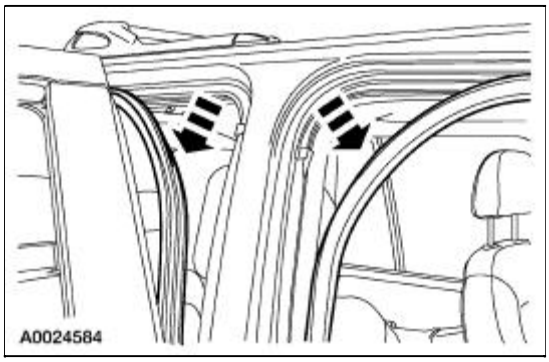


2. Remove the assist handle.
   1. Remove the screws.
   2. Remove the assist handle.

3. Open the tailgate glass.

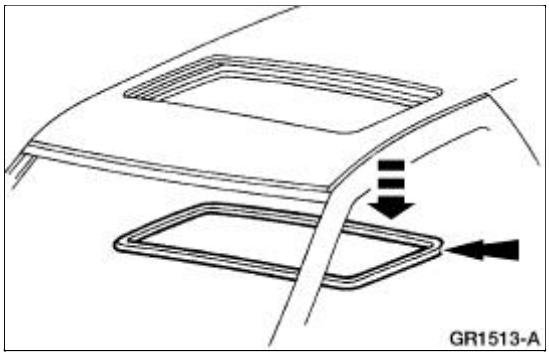
4. Remove the lower liftgate trim panel.
   - Remove the two pin-type retainers and slide liftgate trim panel upward to remove.

5. To install, reverse the removal procedure.



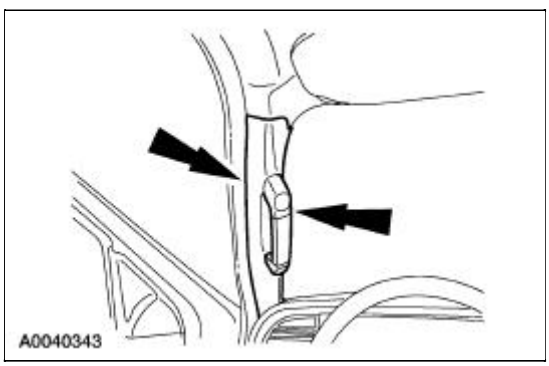
Headliner

Removal and Installation

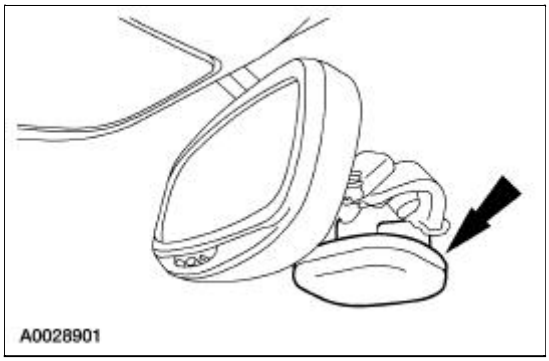


All vehicles

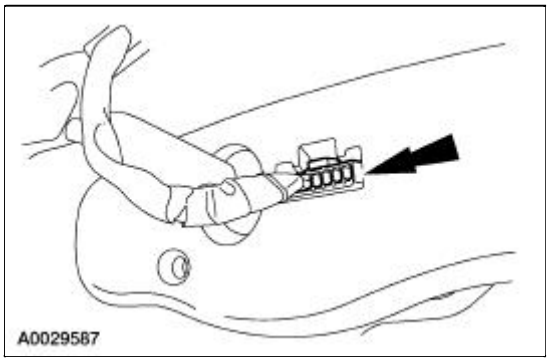
1. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .



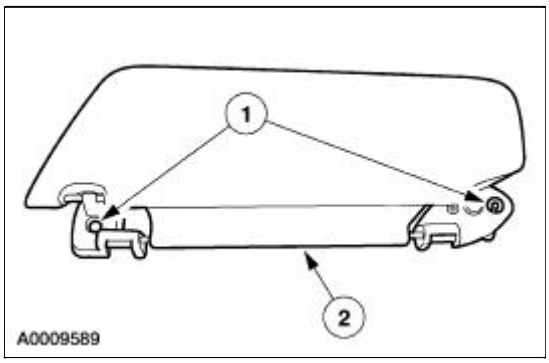
2. Position aside the front and rear door seals.



3. If equipped, remove the roof opening panel trim.



4. Remove the A-pillar trim panels.
    - Remove the bolt covers and bolts.



5. If equipped, remove the electronic compass sensor.

6. If equipped, disconnect the auto dimming mirror electrical connector.

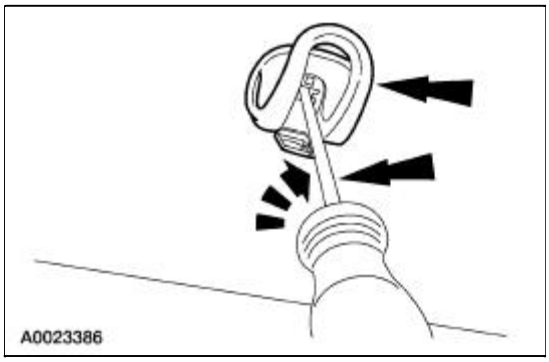
7. Remove the two sun visors and visor clips.
    1. Remove the eight screws.
    2. Remove the two sun visors and visor clips.
        - If equipped, disconnect the electrical connectors.

8. If equipped, remove the overhead console.

9. If equipped, remove the DVD player. For additional information, refer to Section 415-07 .

10. Remove the upper B-pillar trim panel. For additional information, refer to B-Pillar Trim Panel in this section.

11. Remove the C-pillar trim panel. For additional information, refer to C-Pillar Trim Panel in this section.

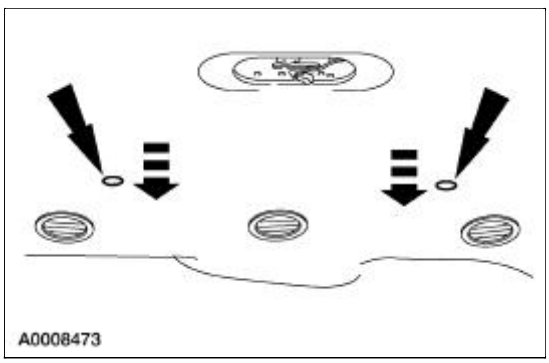


12. Remove the D-pillar trim panel. For additional information, refer to D-Pillar Trim Panel in this section.

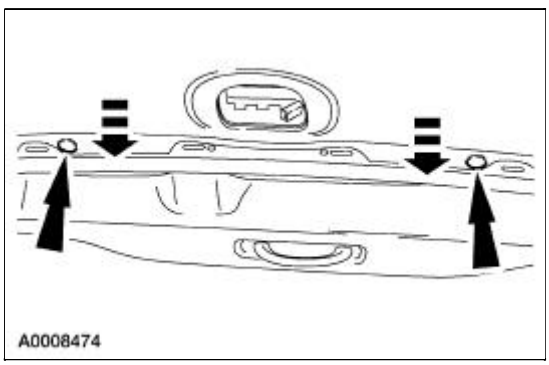
13. **CAUTION: To prevent damage to the coat hanger retainer, use a 3/16-inch flat-blade**

screwdriver for this step.

Remove the four coat hooks.

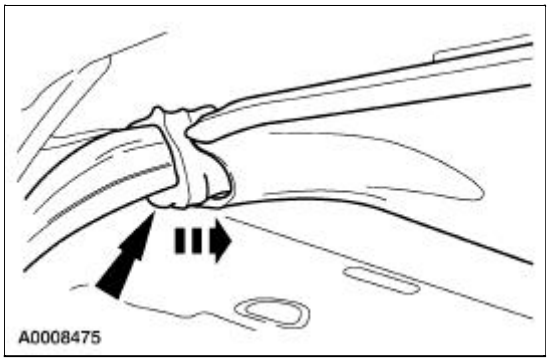


- Open the access cover.
- Insert a screwdriver into the slot and rotate.



14. Disconnect the two electrical connectors at the right side C-pillar and one electrical connector at the left side C-pillar.

Vehicles equipped with rear climate control



15. Remove the center pin-type retainers.

16. Remove the rear pin-type retainers.

17. Tilt the headliner to release the vent duct.

All vehicles

18. Remove the headliner.
19. To install, reverse the removal procedure.
    - Transfer parts as necessary.

Torque Specifications

Description	Nm	lb-ft	lb-in
Wheel opening moulding screws	2	—	18
Retractable running board bolts	11	8	—
Retractable running board motor bolts	5	—	44
Retractable running board sensor wiring harness bolts	2	—	18

Exterior Trim

The Expedition/Navigator exterior trim and ornamentation components consist of the:

- rear door finish panel (24736).
- body side opening moulding (291C20).
- front fender wheel opening moulding (16A074).
- grille assembly (8200).
- front fender side finish panel (16A066).
- front door side finish panel (20206).
- front door window outside rear moulding (20982).
- body side window outside front moulding (290A66).
- running boards.
- power running boards (if equipped).

Retractable Running Board

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool

Principles of Operation

The retractable running boards are controlled by the power liftgate module and retractable running board motor assembly. The retractable running board motors receive a ground signal from the power liftgate module to deploy and an open signal to retract.

When the power liftgate module is in self-test mode, the retractable running board motor sends a 200 ms pulse to the power liftgate module to verify a deploy/retract command was sent by the power liftgate module. When the retractable running board reaches the fully deployed/retracted position, the retractable running board motor assembly will send a 200 ms pulse to the power liftgate module to indicate the operation is complete.

The power liftgate module receives information from the instrument cluster module (ICM) regarding retractable running board system ON or OFF and set for AUTOMATIC/IN or MANUAL/OUT status.

When in AUTOMATIC/IN mode, the retractable running boards will deploy when a door on the same side of the vehicle is opened. When both doors on the same side are closed, the retractable running boards will retract. The power liftgate module receives door ajar status from the body security module through the UART based protocol (UBP) communications network.

When in MANUAL/OUT mode, both retractable running boards will stay deployed until MANUAL/OUT mode is deselected or vehicle speed is greater than 5 mph.

When an obstacle is detected, the retractable running board will reverse direction. If a second obstacle is detected the retractable running board will reverse direction again. If a third obstacle is detected the retractable running board will stop in its current position until the following conditions are met:

- Change in door ajar status.
- Change in manual (OUT) deploy status.
- Vehicle speed greater than 5 mph.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical and electrical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical	Electrical
● Retractable running board	● Battery junction box (BJB) fuse: ■ 5 (7.5A) ■ 105 (30A) ■ 110 (30A)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.
5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool manual.
6. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:
   - CKT930 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
   - NO RESP/NOT EQUIP for power liftgate module, refer to Section 419-10 .
   - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the power liftgate module.
7. If the DTCs retrieved are related to the concern, refer to power liftgate module Diagnostic Trouble Code (DTC) Index to continue diagnostics.
8. If DTCs are retrieved that are not found in the following power liftgate module Diagnostic Trouble Code (DTC) Index, refer to the master power liftgate module Diagnostics Trouble Code (DTC) index in Section 419-10 .
9. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

Power Liftgate Module Diagnostic Trouble Code (DTC) Index

Power Liftgate Module Diagnostic Trouble Code (DTC) Index

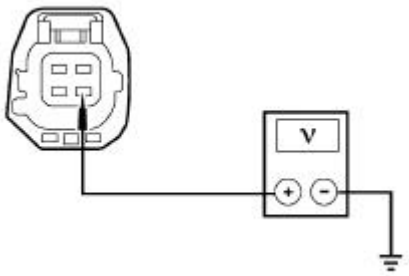
DTC	Description	Source	Action
B2716	Left Power Running Board Output Short To Battery	Power Liftgate Module	Go To Pinpoint Test B .
B2717	Right Power Running Board Output Short To Battery	Power Liftgate Module	Go To Pinpoint Test C .
B2719	eft Power Running Board Output Short To Ground Or Open	Power Liftgate Module	Go To Pinpoint Test B .
B2720	Right Power Running Board Output Short To Ground Or Open	Power Liftgate Module	Go To Pinpoint Test C .
B2812	Left Power Running Board Connection Failure	Power Liftgate Module	Go To Pinpoint Test B . If both running boards are inoperative, Go To Pinpoint Test A .
B2813	Left Power Running Board Stow Time Failure	Power Liftgate Module	Go To Pinpoint Test B . If both running boards are inoperative, Go To Pinpoint Test A .
B2814	Left Power Running Board Deploy Time Failure	Power Liftgate Module	Go To Pinpoint Test B . If both running boards are inoperative, Go To Pinpoint Test A .
B2815	Right Power Running Board Connection Failure	Power Liftgate Module	Go To Pinpoint Test C . If both running boards are inoperative, Go To Pinpoint Test A .
B2816	Right Power Running Board Stow Time Failure	Power Liftgate Module	Go To Pinpoint Test C . If both running boards are inoperative, Go To Pinpoint Test A .
B2817	Right Power Running Board Deploy Time Failure	Power Liftgate Module	Go To Pinpoint Test C . If both running boards are inoperative, Go To Pinpoint Test A .

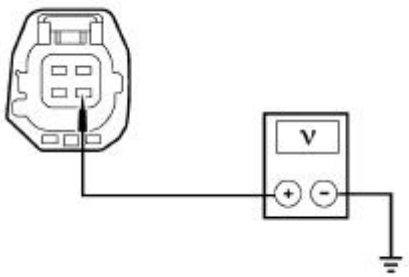
Symptom Chart

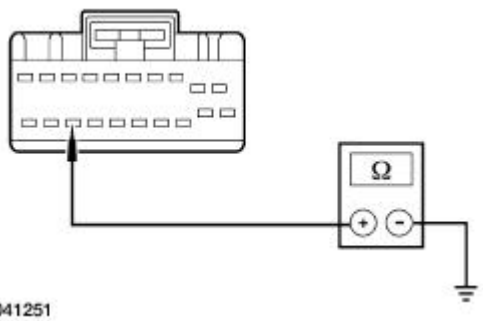
Symptom Chart

Condition	Possible Sources	Action
• No communication with the power liftgate module	• Battery junction box (BJB) fuse 5 (7.5A). • Circuitry. • Power liftgate module.	• REFER to Section 419-10 .
• The retractable running board does not operate correctly — both running boards	• Battery junction box (BJB) fuse 104 (30A). • Circuitry. • Body security module (BSM). • Power liftgate module (PLGM). • Powertrain control module (PCM). • Instrument cluster	• Go To Pinpoint Test A .

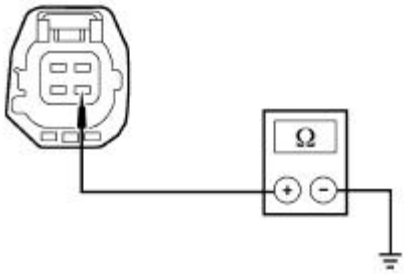
	module (ICM).	
• The retractable running board does not operate correctly — left running board	• Circuitry. • Retractable running board assembly. • Retractable running board sensor harness. • Retractable running board motor. • Power liftgate module (PLGM). • Door ajar switches.	• Go To Pinpoint Test B .
• The retractable running board does not operate correctly — right running board	• Circuitry. • Retractable running board assembly. • Retractable running board sensor harness. • Retractable running board motor. • Power liftgate module (PLGM). • Door ajar switches.	• Go To Pinpoint Test C .

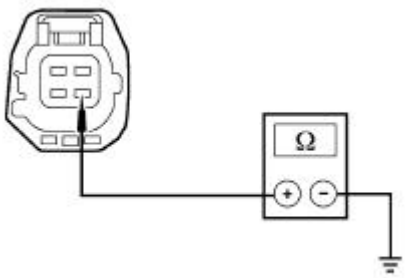


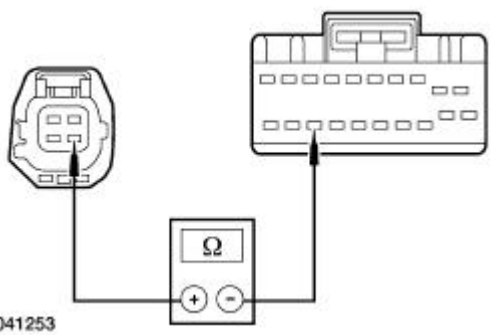




Pinpoint Tests





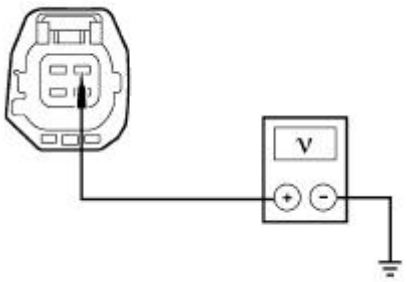


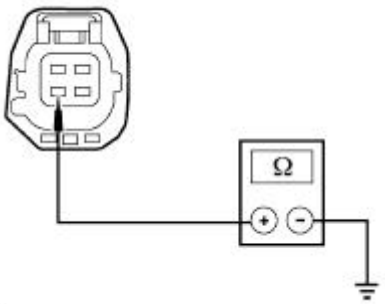
NOTE: If any door ajar or VSS related DTCs are present, diagnose the door ajar and VSS related DTCs before performing this pinpoint test.

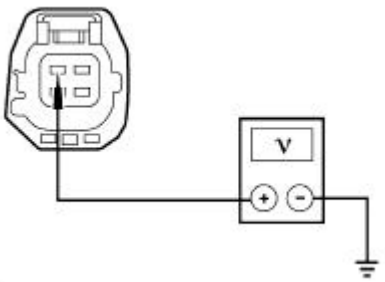
PINPOINT TEST A: THE RETRACTABLE RUNNING BOARD DOES NOT OPERATE CORRECTLY — BOTH RUNNING BOARDS

Test Step	Result / Action to Take
A1 VERIFY THE VEHICLE SPEED STATUS PID	
• Enter the following diagnostic mode on the diagnostic tool: Access the PCM Module VSS PID. • Operate the vehicle and verify the vehicle speed. • **Does the VSS PID read correctly?**	**Yes** GO to A2 . **No** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the VSS.
A2 VERIFY THE MESSAGE CENTER SWITCH PID	
• Enter the following diagnostic mode on the diagnostic tool: Access the Instrument Cluster Module (ICM) Retractable Running Board PID. • Operate the switch to the ENABLE, DISABLE and the MANUAL/OUT positions. • **Does the switch operate correctly?**	**Yes** GO to A3 . **No** REFER to Section 413-01 to diagnose the ICM.
A3 VERIFY THE DOOR AJAR OPERATION	
• Enter the following diagnostic mode on the diagnostic tool: Access the Body Security Module Door Ajar PIDs. • Monitor the PIDs while opening and closing each door one	**Yes** GO to A4 .

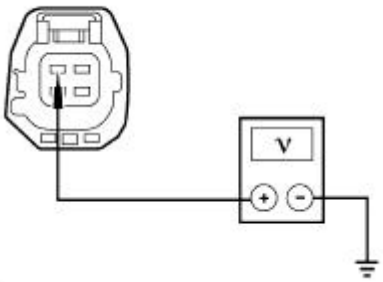
at a time. ● **Do the PIDs read correctly?**	**No** REFER to Section 417-02 to diagnose the door ajar system.
A4 CHECK THE OPERATION OF THE RETRACTABLE RUNNING BOARDS	
● Enter the following diagnostic mode on the diagnostic tool: Access the left and right retractable running board PIDs. ● Enter the following diagnostic mode on the diagnostic tool: Access the left and right retractable running board active commands. ● Monitor the PIDs while operating the left and right retractable running board active command to ENABLE and DISABLE positions. ● **Did the PIDs agree with the left and right retractable running board active commands?**	**Yes** GO to A13 . **No** GO to A5 .
A5 CHECK CIRCUIT 1943 (RD/WH) FOR VOLTAGE	
● Disconnect: Retractable Running Board Motor C3185/C3186. ● Key in ON position. ● Measure the voltage between retractable running board motor C3185-1, circuit 1943 (RD/WH) for LH, and retractable running board motor C3186-1, circuit 1943 (RD/WH) for RH, harness side and ground.  A0041246 ● **Are the voltages greater than 10 volts?**	**Yes** GO to A6 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.
A6 CHECK CIRCUIT 1975 (DG/YE) FOR A SHORT TO VOLTAGE	
● Connect: Retractable Running Board Motor C3185/C3186. ● Disconnect: Power Liftgate Module C4174d. ● Measure the voltage between power liftgate module C4174d-18, circuit 1975 (DG/YE) harness side and ground.  A0056067 ● **Is any voltage present**	**Yes** GO to A7 . **No** GO to A9 .
A7 CHECK THE LEFT RETRACTABLE RUNNING BOARD FOR A SHORT TO VOLTAGE	







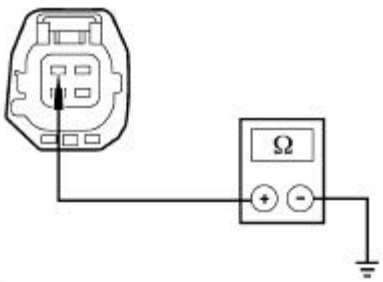
• Disconnect: Left Retractable Running Board Motor C3185. • Measure the voltage between left retractable running board motor C3185-3, circuit 1975 (DG/YE) harness side and ground.  A0056068 • **Is any voltage present?**	**Yes** GO to A8 . **No** INSTALL a new left retractable running board motor. REFER to Retractable Running Board Motor in this section. CLEAR the DTCs. REPEAT the self-test.
A8 CHECK THE RIGHT RETRACTABLE RUNNING BOARD FOR A SHORT TO VOLTAGE	
• Disconnect: Right Retractable Running Board Motor C3186. • Measure the voltage between right retractable running board motor C3186-3, circuit 1975 (DG/YE) harness side and ground.  A0056068 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new right retractable running board motor. REFER to Retractable Running Board Motor in this section. CLEAR the DTCs. REPEAT the self-test.
A9 CHECK CIRCUIT 1975 (DG/YE) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the power liftgate module C4174d-18, circuit 1975 (DG/YE) harness side and ground.  A0041251 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A12 . **No** GO to A10 .
A10 CHECK THE LEFT RETRACTABLE RUNNING BOARD FOR A SHORT TO GROUND	
• Disconnect: Left Retractable Running Board Motor C3185. • Measure the resistance between left retractable running	**Yes** INSTALL a new left

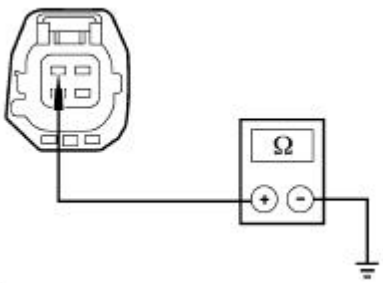


board motor C3185-3, circuit 1975 (DG/YE) harness side and ground.  A0041252 ● **Is the resistance greater than 10,000 ohms?**	retractable running board motor. REFER to Retractable Running Board Motor in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to A11.
A11 CHECK THE RIGHT RETRACTABLE RUNNING BOARD FOR A SHORT TO GROUND	
● Disconnect: Right Retractable Running Board Motor C3186. ● Measure the resistance between right retractable running board motor C3186-3, circuit 1975 (DG/YE) harness side and ground.  A0041252 ● **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new right retractable running board motor. REFER to Retractable Running Board Motor in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A12 CHECK CIRCUIT 1975 (DG/YE) FOR AN OPEN	
● Measure the resistance between the retractable running board motor C3185-3/ C3186-3, circuit 1975 (DG/YE) harness side and power liftgate module C4174d-18, circuit 1975 (DG/YE) harness side.  A0041253 ● **Is the resistance less than 5 ohms?**	**Yes** GO to A13. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A13 CHECK THE POWER LIFTGATE MODULE FOR CORRECT OPERATION	
● Disconnect all power liftgate module connectors. ● Check for: ● corrosion. ● pushed-out pins. ● Connect all power liftgate module connectors and make	**Yes** INSTALL a new power liftgate module. REFER to Section 501-03. CLEAR the DTCs. REPEAT the self-test.

sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST B: THE RETRACTABLE RUNNING BOARD DOES NOT OPERATE CORRECTLY — LEFT RUNNING BOARD

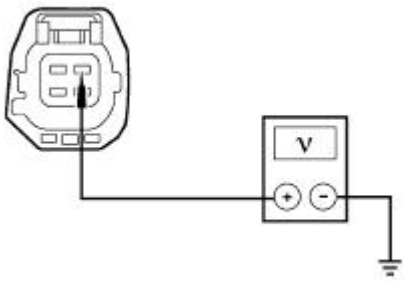




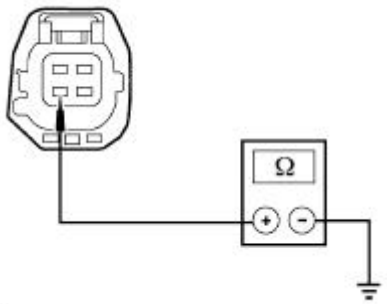
Test Step	Result / Action to Take
B1 CHECK FOR CORRECT OPERATION OF THE LEFT RETRACTABLE RUNNING BOARD	
● Operate the left retractable running board. ● **Does the left retractable running board falsely reverse, partially deploy or retract, or is noisy or jerky?**	**Yes** CARRY OUT the linkage component test in this section. TEST the system for normal operation. **No** GO to B2 .
B2 CHECK THE LEFT RETRACTABLE RUNNING BOARD FOR DEBRIS	
● **NOTE:** It may require as much as 150 lbs. of force to slip the running board motor clutch. ● Extend and retract the left running board by hand. ● **Does the retractable running board operate correctly now?**	**Yes** Hidden debris may have stopped correct operation of the retractable running board. TEST the system for normal operation. **No** GO to B3 .
B3 VERIFY THE DOOR AJAR OPERATION	
● Enter the following diagnostic mode on the diagnostic tool: Access the Body Security Module Door Ajar PIDs. ● Monitor the PIDs while opening and closing each door one at a time. ● **Do the PIDs read correctly?**	**Yes** GO to B4 . **No** REFER to Section 417-02 to diagnose the door ajar system.
B4 CHECK CIRCUIT 1943 (RD/WH) FOR VOLTAGE	
● Disconnect: Left Retractable Running Board Motor C3185. ● Key in ON position. ● Measure the voltage between left retractable running board motor C3185-1, circuit 1943 (RD/WH) harness side and ground.	**Yes** GO to B5 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.

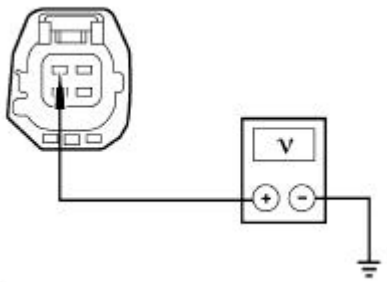
 A0041246 ● **Is the voltage greater than 10 volts?**	
B5 CHECK GROUND AT THE LEFT RETRACTABLE RUNNING BOARD MOTOR	
● Measure the resistance between left retractable running board motor C3185-4, circuit 57 (BK) harness side ground.  A0041247 ● **Is the resistance less than 5 ohms?**	**Yes** GO to B6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B6 CHECK CIRCUIT 1944 (BN/PK) FOR A SHORT TO VOLTAGE	
● Measure the voltage between left retractable running board motor C3185-2, circuit 1944 (BN/PK) harness side and ground.  A0041249 ● **Is voltage present?**	**Yes** GO to B7 . **No** GO to B8 .
B7 CHECK POWER LIFTGATE MODULE FOR A SHORT TO VOLTAGE	
● Disconnect: Power Liftgate Module C4174d. ● Measure the voltage between left retractable running board motor C3185-2, circuit 1944 (BN/PK) harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to B12 .

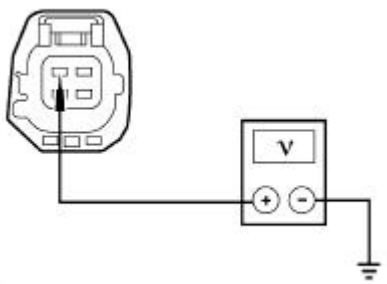
A0041249



- **Is voltage present?**

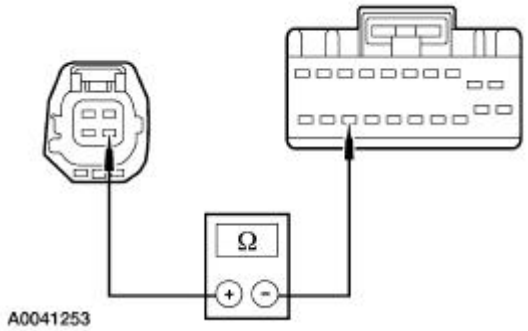






B8 CHECK CIRCUIT 1944 (BN/PK) FOR A SHORT TO GROUND	
• Measure the resistance between left retractable running board motor C3185-2, circuit 1944 (BN/PK) harness side ground.  A0041248 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B9 CHECK THE POWER LIFTGATE MODULE OUTPUT	
• Measure the resistance between left retractable running board motor C3185-2, circuit 1944 (BN/PK) harness side and ground while using the diagnostic tool to deploy and retract the retractable running board or by opening or closing a left side door.  A0041248 • **Is the resistance less than 5 ohms while deploying and greater than 10,000 ohms while retracting?**	**Yes** CARRY OUT the linkage component test in this section. TEST the system for normal operation. **No** GO to B10 .
B10 CHECK CIRCUIT 1944 (BN/PK) FOR AN OPEN	
• Measure the resistance between left retractable running board motor C3185-2, circuit 1944 (BN/PK) and power liftgate module C4174d-17, circuit 1944 (BN/PK) harness side.	**Yes** GO to B11 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 ● **Is the resistance less than 5 ohms?**	
B11 CHECK CIRCUIT 1975 (DG/YE) FOR AN OPEN	**Yes** GO to B12 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
● Measure the resistance between left retractable running board motor C3185-3, circuit 1975 (DG/YE) harness side and power liftgate module C4174d-18, circuit 1975 (DG/YE) harness side.  ● **Is the resistance less than 5 ohms?**	
B12 CHECK THE POWER LIFTGATE MODULE FOR CORRECT OPERATION	**Yes** INSTALL a new power liftgate module. REFER to Section 501-03 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
● Disconnect all power liftgate module connectors. ● Check for: ● corrosion. ● pushed-out pins. ● Connect all power liftgate module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	



PINPOINT TEST C: THE RETRACTABLE RUNNING BOARD DOES NOT OPERATE CORRECTLY — RIGHT RUNNING BOARD

Test Step	Result / Action to Take
C1 CHECK FOR CORRECT OPERATION OF THE RIGHT RETRACTABLE RUNNING BOARD	**Yes** CARRY OUT the linkage component test
● Operate the right retractable running board. ● **Does the right retractable running board falsely reverse, partially deploy or retract, or is noisy or jerky?**	

	in this section. TEST the system for normal operation. **No** GO to C2 .
C2 CHECK THE RIGHT RETRACTABLE RUNNING BOARD FOR DEBRIS ● **NOTE:** It may require as much as 150 lbs. of force to slip the running board motor clutch. ● Extend and retract the right running board by hand. ● **Does the retractable running board operate correctly now?**	**Yes** Hidden debris may have stopped correct operation of the retractable running board. TEST the system for normal operation. **No** GO to C3 .
C3 VERIFY THE DOOR AJAR OPERATION ● Enter the following diagnostic mode on the diagnostic tool: Access the Body Security Module Door Ajar PIDs. ● Monitor the PIDs while opening and closing each door one at a time. ● **Do the PIDs read correctly?**	**Yes** GO to C4 . **No** REFER to Section 417-02 to diagnose the door ajar system.
C4 CHECK CIRCUIT 1943 (RD/WH) FOR VOLTAGE ● Disconnect: Right Retractable Running Board Motor C3186. ● Key in ON position. ● Measure the voltage between right retractable running board motor C3186-1, circuit 1943 (RD/WH) harness side and ground.  A0041246 ● **Is the voltage greater than 10 volts?**	**Yes** GO to C5 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.
C5 CHECK GROUND AT THE RIGHT RETRACTABLE RUNNING BOARD MOTOR ● Measure the resistance between right retractable running board motor C3186-4, circuit 57 (BK) harness side ground.	**Yes** GO to C6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0041247 ● **Is the resistance less than 5 ohms?**	
C6 CHECK CIRCUIT 1945 (VT/WH) FOR A SHORT TO VOLTAGE	
● Measure the voltage between right retractable running board motor C3186-2, circuit 1945 (VT/WH) harness side and ground.  A0041249 ● **Is voltage present?**	**Yes** GO to C7 . **No** GO to C8 .
C7 CHECK POWER LIFTGATE MODULE FOR A SHORT TO VOLTAGE	
● Disconnect: Power Liftgate Module C4174d. ● Measure the voltage between right retractable running board motor C3186-2, circuit 1945 (VT/WH) harness side and ground.  A0041249 ● **Is voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to C12 .
C8 CHECK CIRCUIT 1945 (VT/WH) FOR A SHORT TO GROUND	
● Measure the resistance between right retractable running board motor C3186-2, circuit 1945 (VT/WH) harness side ground.	**Yes** GO to C9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0041248 ● **Is the resistance greater than 10,000 ohms?**	
C9 CHECK THE POWER LIFTGATE MODULE OUTPUT ● Measure the resistance between right retractable running board motor C3186-2, circuit 1945 (VT/WH) harness side and ground while using the diagnostic tool to deploy and retract the retractable running board or by opening or closing a left side door.  A0041248 ● **Is the resistance less than 5 ohms while deploying and greater than 10,000 ohms while retracting?**	**Yes** CARRY OUT the linkage component test in this section. TEST the system for normal operation. **No** GO to C10 .
C10 CHECK CIRCUIT 1945 (VT/WH) FOR AN OPEN ● Measure the resistance between right retractable running board motor C3186-2, circuit 1945 (VT/WH) and power liftgate module C4174d-17, circuit 1945 (VT/WH) harness side.  A0041250 ● **Is the resistance less than 5 ohms?**	**Yes** GO to C11 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C11 CHECK CIRCUIT 1975 (DG/YE) FOR AN OPEN ● Measure the resistance between right retractable running board motor C3186-3, circuit 1975 (DG/YE) harness side and power liftgate module C4174d-18, circuit 1975 (DG/YE) harness side.	**Yes** GO to C12 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 ● **Is the resistance less than 5 ohms?**	
C12 CHECK THE POWER LIFTGATE MODULE FOR CORRECT OPERATION	
● Disconnect all power liftgate module connectors. ● Check for: ● corrosion. ● pushed-out pins. ● Connect all power liftgate module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new power liftgate module. REFER to Section 501-03 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Component Tests

Linkage

NOTE: If the system has false bounce back, stops in mid travel, or will not stow completely, check to see if any foreign material is caught in the guide and pivot areas.

NOTE: If the retractable running board cannot be extended, extend the running board by hand. It may require as much as 150 lbs. of force to slip the running board motor clutch.

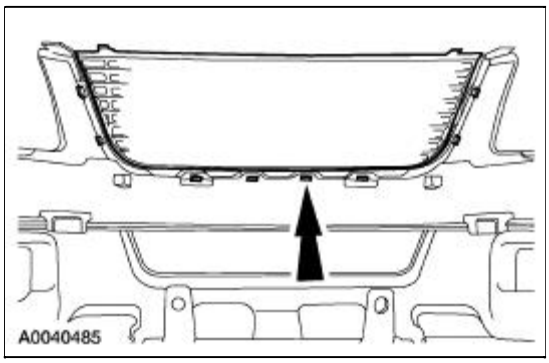
1. Extend the retractable running board.

2. Remove the retractable running board motor. For additional information, refer to Retractable Running Board Motor in this section.

3. Insert a 1/2-inch bit with a torque wrench into the worm gear. The system at ambient temperature should move between 0.5 to 4.0Nm.

4. If the torque required to move the system is less than 4.0Nm, install the retractable running board motor with the limit switches disconnected. Open and close one of the vehicle doors. If the retractable running board deploys-retracts-deploys or retracts-deploys-retracts with out stopping in between, install a new retractable running board sensor wiring harness. For additional information, refer to Retractable Running Board Sensor Wiring Harness in this section. If the retractable running board does not, install a new retractable running board motor. For additional information, refer to Retractable Running Board Motor in this section.

5. If the torque required to move the system is greater than 4.0Nm, the system has a binding condition.



6. Remove the two spool locks from the guide tracks and use the torque wrench to determine the torque required to move the system. If the torque required is less than 4.0Nm, install new spool locks.

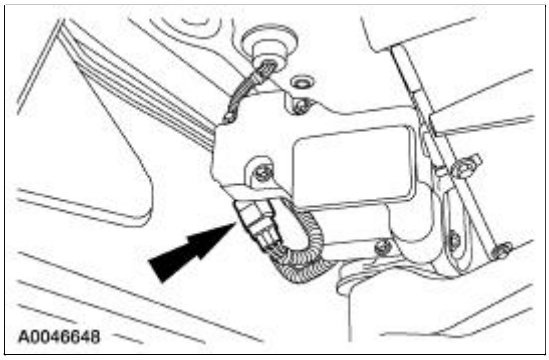
7. If the torque is greater than 4.0Nm, install a new retractable running board assembly. For additional information, refer to Retractable Running Board in this section.

Radiator Grille —Expedition

Removal and Installation

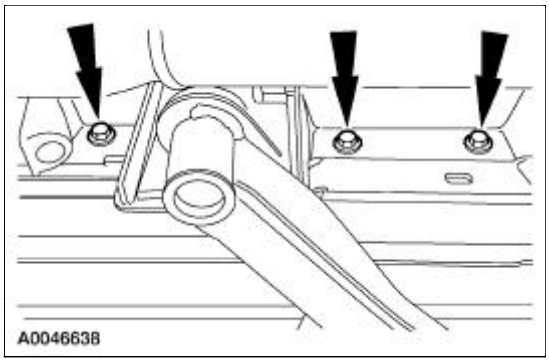
1. Remove the front bumper cover. For additional information, refer to Section 501-19 .
2. Remove the clips and remove the front grille.

3. To install, reverse the removal procedure.



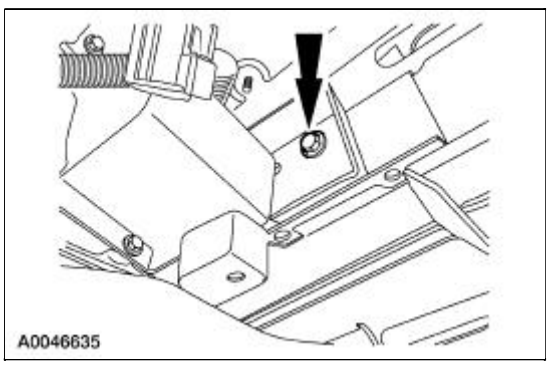
Retractable Running Board

Removal and Installation



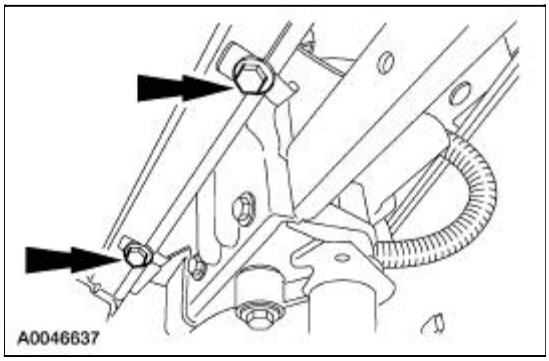
1. **NOTE:** If the retractable running board cannot be extended, extend the running board by hand.

   Extend the retractable running board.

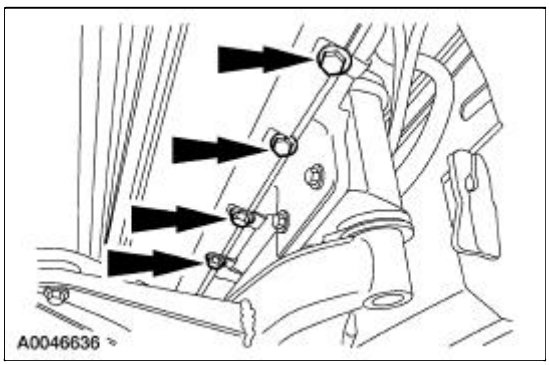


2. Disconnect the retractable running board motor electrical connector.

3. Remove the rear retractable running board bolts.



4. Remove the front retractable running board bolts.

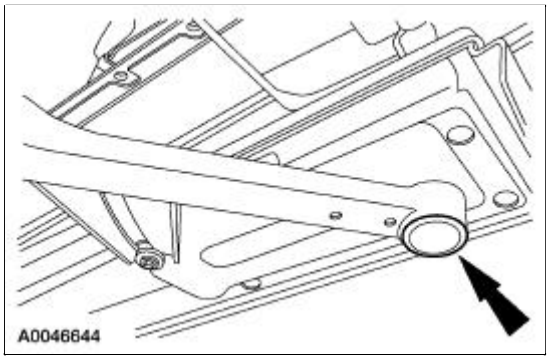


5. **CAUTION: An assistant is required to hold the retractable running board before removing the lower bolts.**

Remove the front retractable running board lower bolts.

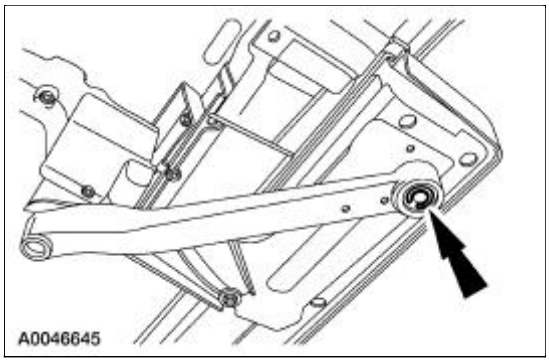
6. Remove the rear retractable running board lower bolts and remove the retractable running board.

7. To install, reverse the removal procedure.



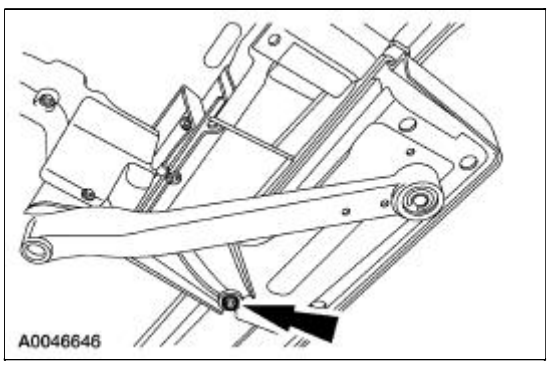
Retractable Running Board —Step

Removal and Installation

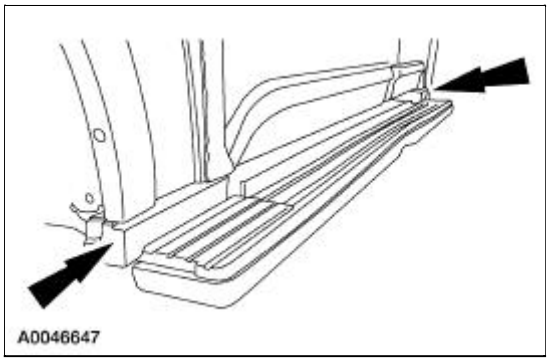


1. **NOTE:** If the retractable running board cannot be extended, extend the running board by hand.

   Extend the retractable running board.



2. Remove the front and rear retractable running board pivot arm covers.

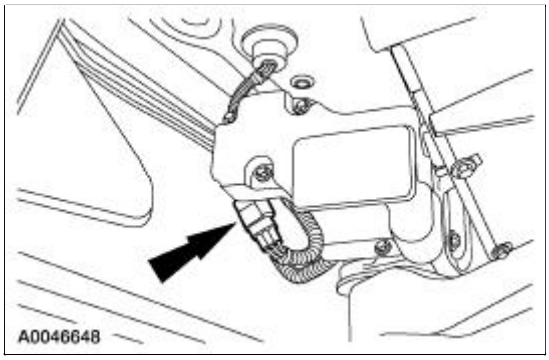


3. Remove the front and rear retractable running board pivot arm clips.

4. Remove the front and rear retractable running board bolts.

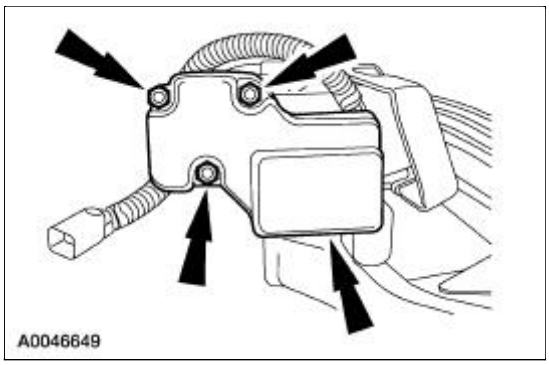
5. Remove the front fender and rear quarter panel trim.

6. Remove the retractable running board step.
7. To install, reverse the removal procedure.
    - Transfer the retractable running board trim pieces as necessary.



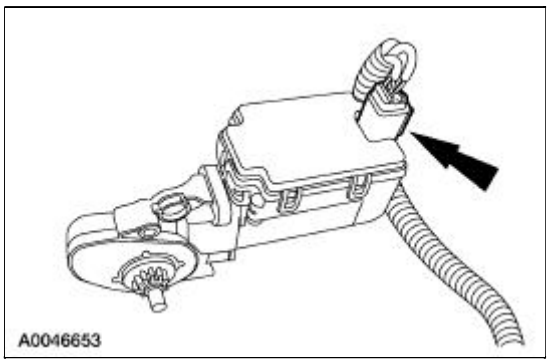
Retractable Running Board Motor

Removal and Installation



1. **NOTE:** If the retractable running board cannot be extracted, extend the running board by hand.

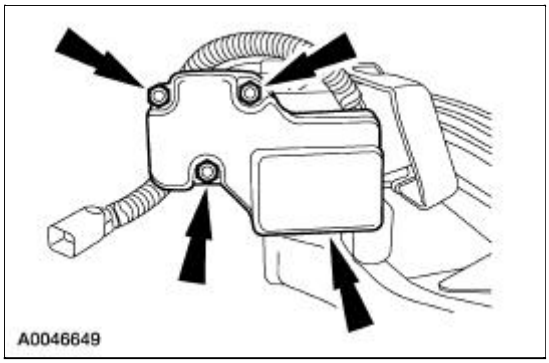
   Extend the retractable running board.



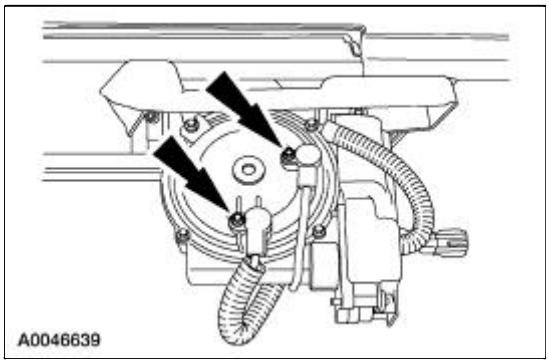
2. Disconnect the retractable running board motor electrical connector.

3. Remove the retractable running board motor.
   - Remove the bolts and remove the cover and retractable running board motor.

4. Disconnect the retractable running board sensor wiring harness.

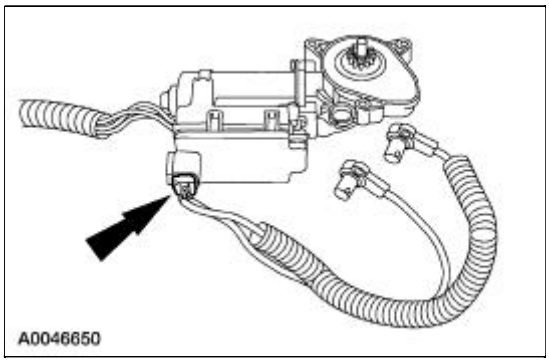


5. To install, reverse the removal procedure.



Retractable Running Board Sensor Wiring Harness

Removal and Installation



1. Remove the retractable running board motor.
   - Remove the bolts and remove the cover and retractable running board motor.

2. Remove the retractable running board sensor wiring harness bolts.

3. Disconnect the electrical connector and remove the retractable running board sensor wiring harness.

4. To install, reverse the removal procedure.

General Specifications

Item	Specification
Rear View Mirror Adhesive D9AZ-19554-CA	ESB-M2G176-A

Torque Specifications

Description	Nm	lb-in
Exterior mirror nuts	7	62

Rear View Mirrors

The rear view mirror components consist of:

- the interior mirror.
- the auto dimming mirror (optional).
- the exterior power folding mirror (optional).
- the exterior mirror (17682/17683).
- the exterior mirror glass (17K707).
- the exterior mirror cover (17D742/17D743).
- the exterior mirror motor (17D696).
- the exterior mirror control switch.
- the memory set switch.

The interior mirror:

- is windshield mounted.
- is a manual hand-set day/night or an optional auto dimming interior mirror.

The auto dimming interior mirror has two features:

- automatic dimming
- normal view state automatic lock-in when the vehicle is placed in R (reverse)

The automatic dimming feature darkens the interior mirror whenever the front ambient light sensor detects low outside light and glare reaches the light sensor (photo cell), which is located inside the interior mirror. The auto dimming interior mirror starts to return to the normal view once the glare goes away.

The exterior mirrors:

- are controlled by power controls on the LH front door trim panel.
- are of a foldaway design.
- may contain turn signal indicators.
- may be heated when the heated back window glass is activated.
- may have a programmable recall memory option.
- may have a reverse drive feature.

Driver Seat Module

The power driver seat and power exterior mirrors are controlled by the driver seat module (DSM) only when the vehicle is equipped with the programmable/recall memory option.

The DSM system consists of the following components:

- driver seat module (DSM)
- driver memory seat switch
- memory mirror switch
- memory set switch
- front vertical seat motor
- rear vertical seat motor
- driver horizontal seat motor
- LH heated memory mirror
- RH heated memory mirror

The DSM incorporates multiple functions into one module and offers diagnostics to easily locate and repair concerns affecting the subsystems that it controls.

Power Exterior Mirror Operation

The power exterior mirrors are controlled by the DSM and are operational all the time, whether the ignition switch is on or off. Using the power exterior mirror switch, the driver can adjust the driver and passenger exterior mirrors four ways.

Up/Down Motion

The power exterior mirrors can be moved up and down under motor control by actuating the power mirrors UP/DOWN switch. The DSM will power the driver or passenger mirror up/down motor until the switch is released or until the travel limit is reached.

Left/Right Motion

The power exterior mirrors can be moved left and right under motor control by actuating the power mirrors LEFT/RIGHT switch. The DSM will power the driver or passenger mirror left/right motor until the switch is released or until the travel limit is reached.

Mirror Selection — Driver/Passenger

The driver can select the driver or passenger mirror to be adjusted by setting the mirror select switch to the appropriate position.

Turn Signal Mirror

The exterior mirror may be equipped with a mirror-mounted turn signal assembly. For Diagnosis and Testing, refer to Section 417-01 .

Power Folding Mirrors

The power folding exterior mirrors are controlled by the power folding mirror switch. The power folding mirror switch has power at all times.

Memory Power Exterior Rear View Mirror Operation

The memory power exterior mirrors feature allows the driver to program personalized mirror positions that can be recalled using the memory switches or remote transmitter. There are three memory settings possible. The power driver seat positions are also stored, and recalled with the memory exterior mirrors positions.

Reverse Drive Rear View Mirror

The reverse drive rear view mirror function:

- tilts the exterior rear view mirror downward to improve the visibility in the rear bumper area.
- is operated by the driver seat module (DSM).
- is turned ON and OFF through the message center.

When the reverse drive rear view mirror function is enabled:

- The driver exterior rear view mirror tilts down three degrees and the passenger exterior rear view mirror tilts down five and a half degrees when the ignition switch is in RUN and REVERSE is selected.

The exterior rear view mirror will return to the original setting when the transmission is shifted out of reverse.

- Pressing the exterior rear view mirror control will cancel the reverse tilt or automatic mirror position return if it is operating.
- If the transmission is shifted out of REVERSE and then back into REVERSE within 10 seconds, the driver seat module will delay reverse tilt operation for 5 seconds.

Rear View Mirrors

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

Refer to Wiring Diagrams Cell 125 , Electronic Day/Night Mirror for schematic and connector information.

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool with required communication adapter
 ST1137-A	73III Automotive Meter 105-R0057

Inspection and Verification

1. Verify the customer concern by operating the power exterior mirrors or memory mirrors.
2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Exterior mirror(s) ● Interior mirror	● Central junction box (CJB) fuse ● Circuitry ● Exterior mirror control switch ● Exterior mirror motor ● Interior mirror ● Driver seat module (DSM) ● Memory set switch

3. If the vehicle is equipped with memory exterior mirrors and the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel. Select the vehicle to be tested from the diagnostic tool menu.
   - Check to make sure the program card is correctly installed.
   - Check the connections to the vehicle.

- Check the ignition switch position.

4. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool manual.

5. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:
   - SCP+, SCP- OR UBP = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
   - NO RESPONSE/NOT EQUIPPED for DSM, go to Section 419-10 .
   - SYSTEM PASSED for the DSM, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self test diagnostics for the DSM.

6. If the DTCs retrieved are related to the concern, go to DSM Diagnostic Trouble Code (DTC) Index.

7. If DTCs are retrieved that are not found in the following DSM Diagnostic Trouble Code (DTC) Index, refer to the master DSM Diagnostic Trouble Code (DTC) Index in Section 419-10 .

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart

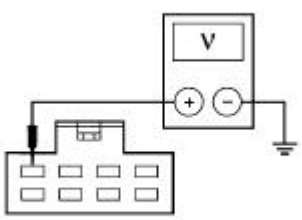
DSM Diagnostic Trouble Code (DTC) Index

DSM Diagnostic Trouble Code (DTC) Index

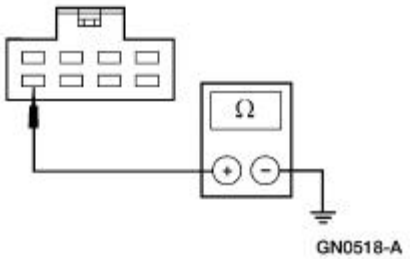
DTC	Description	Source	Action
B1342	ECU Is Defective	DSM	REFER to Section 419-10 .
B1529	Memory Set Switch Circuit Short to Ground	DSM	Go To Pinpoint Test F .
B1534	Memory 1 Switch Circuit Short to Ground	DSM	Go To Pinpoint Test F .
B1538	Memory 2 Switch Circuit Short to Ground	DSM	Go To Pinpoint Test F .
B1667	Mirror Driver Up/Down Motor Stalled	DSM	If the memory mirror is inoperative, Go To Pinpoint Test D . If the memory mirror is inoperative from the memory set switch, Go To Pinpoint Test F .
B1668	Mirror Driver Right/Left Motor Stalled	DSM	If the memory mirror is inoperative, Go To Pinpoint Test D . If the memory mirror is inoperative from the memory set switch, Go To Pinpoint Test F .
B1669	Mirror Passenger Up/Down Motor Stalled	DSM	If the memory mirror is inoperative, Go To Pinpoint Test D . If the memory mirror is inoperative from the memory set switch, Go To Pinpoint Test F .
B1670	Mirror Passenger Right/Left Motor Stalled	DSM	If the memory mirror is inoperative, Go To Pinpoint Test D . If the memory mirror is inoperative from the memory set switch, Go To Pinpoint Test F .
B1697	Mirror Driver/Passenger Switch Circuit Short to Battery	DSM	Go To Pinpoint Test D .
B1735	Mirror Driver Vertical Switch Circuit Short to Battery	DSM	Go To Pinpoint Test D .
B1739	Mirror Driver Horizontal Switch Circuit Short to Battery	DSM	Go To Pinpoint Test D .
B1743	Mirror Passenger Vertical	DSM	Go To Pinpoint Test D .

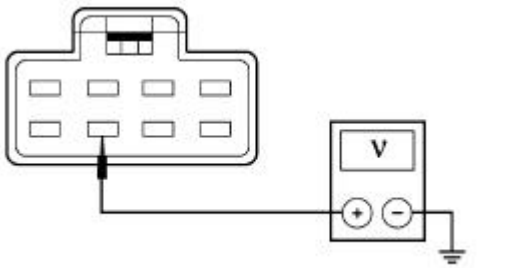
	Switch Circuit Short to Battery		
B1747	Mirror Passenger Horizontal Switch Circuit Short to Battery	DSM	Go To Pinpoint Test D .
B2312	Passenger Mirror Horizontal Feedback Pot. Circuit Failure	DSM	Go To Pinpoint Test F .
B2314	Passenger Mirror Horizontal Feedback Pot. Circuit Short to Battery	DSM	Go To Pinpoint Test F .
B2316	Passenger Mirror Vertical Feedback Pot. Circuit Failure	DSM	Go To Pinpoint Test F .
B2318	Passenger Mirror Vertical Feedback Pot. Circuit Short to Battery	DSM	Go To Pinpoint Test F .
B2320	Driver Mirror Horizontal Feedback Pot. Circuit Failure	DSM	Go To Pinpoint Test F .
B2322	Driver Mirror Horizontal Feedback Pot. Circuit Short to Battery	DSM	Go To Pinpoint Test F .
B2324	Driver Mirror Vertical Feedback Pot. Circuit Failure	DSM	Go To Pinpoint Test F .
B2326	Driver Mirror Vertical Feedback Pot. Circuit Short to Battery	DSM	Go To Pinpoint Test F .
U1950	UBP Communication Bus Fault	DSM	REPAIR all DTCs related to the concern first. If U1950 is still retrieved, GO to Section 418-00 to diagnose communication network.

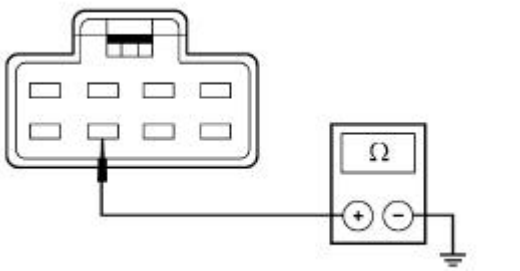
Symptom Chart



Symptom Chart



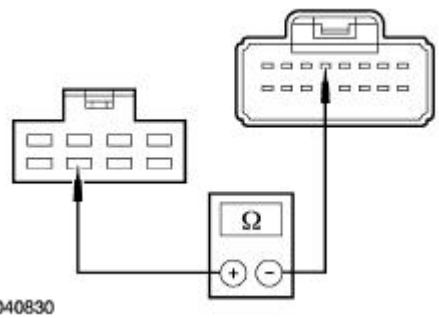




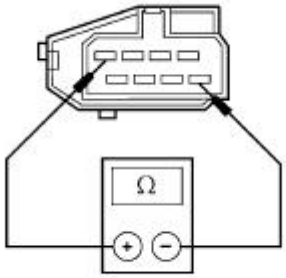
Condition	Possible Sources	Action
● The mirrors are inoperative	● Circuitry. ● Central junction box (CJB) fuse. ● Exterior mirror control switch.	● Go To Pinpoint Test A .
● A single mirror is inoperative	● Circuitry. ● Exterior mirror control switch. ● Exterior mirror motor.	● Go To Pinpoint Test B .
● A single mirror does not function with switch logic	● Exterior mirror control switch. ● Exterior mirror motor. ● Circuitry.	● Go To Pinpoint Test C .
● The memory mirror is inoperative	● Driver seat module (DSM). ● Circuitry. ● CJB fuse 3	● Go To Pinpoint Test D .

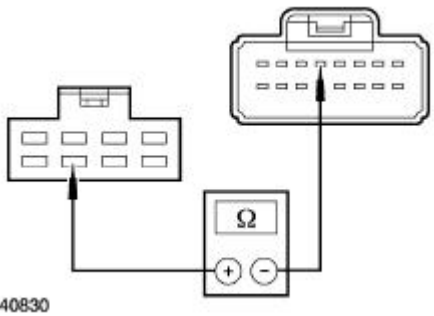
	(7.5A). ● Exterior mirror motor. ● Mirror control switch.	
● The power folding mirrors do not operate	● Circuitry. ● Power folding exterior mirror. ● CJB fuse.	● Go To Pinpoint Test E .
● The memory mirror is inoperative — does not operate from the memory set switch	● Circuitry. ● Driver seat module (DSM). ● Exterior mirror motor. ● Memory set switch.	● Go To Pinpoint Test F .
● The memory mirror is inoperative — the heated exterior mirrors do not defrost	● Circuitry. ● Exterior rear view mirror. ● CJB fuse.	● Go To Pinpoint Test G .
● The auto dimming mirror does not operate correctly	● Circuitry. ● CJB fuse. ● Auto dimming interior mirror.	● Go To Pinpoint Test H .
● The reverse drive rear view mirrors are inoperative	● DSM. ● Circuitry.	● Go To Pinpoint Test I .

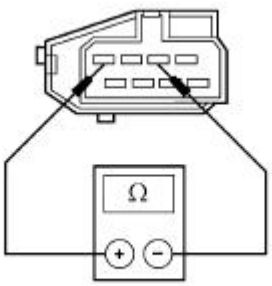
Pinpoint Tests



PINPOINT TEST A: THE MIRRORS ARE INOPERATIVE







Test Step	Result / Action to Take
A1 CHECK THE VOLTAGE TO THE EXTERIOR MIRROR CONTROL SWITCH — CIRCUIT 956 (OG/LG)	
● Key in OFF position. ● Disconnect: Exterior Mirror Control Switch C527. ● Measure the voltage between exterior mirror control switch C527-1, circuit 956 (OG/LG) harness side and ground.  GN0517-A ● **Is the voltage greater than 10 volts?**	**Yes** GO to A2 . **No** REPAIR the circuit. TEST the system for normal operation.
A2 CHECK CIRCUIT 57 (BK) FOR AN OPEN	

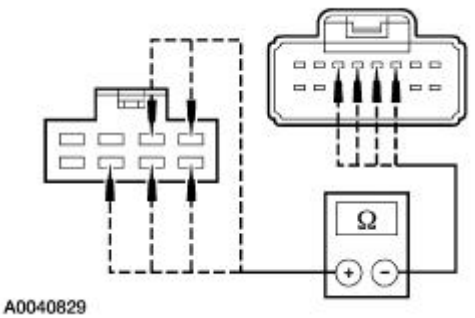
• Measure the resistance between exterior mirror control switch C527-5, circuit 57 (BK) harness side and ground.  GN0518-A • **Is the resistance less than 5 ohms?**	**Yes** GO to A3 . **No** REPAIR the circuit. TEST the system for normal operation.
A3 CHECK CIRCUIT 542 (YE) FOR A SHORT TO VOLTAGE	
• Measure the voltage between exterior mirror control switch C527-6, circuit 542 (YE) harness side and ground.  GN1956-A • **Is any voltage indicated?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to A4 .
A4 CHECK CIRCUIT 542 (YE) FOR A SHORT TO GROUND	
• Measure the resistance between exterior mirror control switch C527-6, circuit 542 (YE) harness side and ground.  GN1957-A • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A5 . **No** REPAIR the circuit. TEST the system for normal operation.
A5 CHECK CIRCUIT 542 (YE) FOR AN OPEN	
• Disconnect: LH Exterior Mirror C516. • Measure the resistance between exterior mirror control switch C527-6, circuit 542 (YE) and LH exterior mirror control switch C516-4, circuit 542 (YE) harness side.	**Yes** INSTALL a new exterior mirror control switch. REFER to Exterior Mirror Control Switch in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

 ● **Is the resistance less than 5 ohms?**	

PINPOINT TEST B: A SINGLE MIRROR IS INOPERATIVE

Test Step	Result / Action to Take
B1 CHECK THE LH AND RH EXTERIOR MIRRORS	
● Operate the exterior mirrors. ● **Do the LH exterior mirrors operate?**	**Yes** GO to B2 . **No** GO to B4 .
B2 CHECK CIRCUIT 542 (YE) FOR AN OPEN	
● Key in OFF position. ● Disconnect: RH Exterior Mirror C622. ● Disconnect: Exterior Mirror Control Switch C527. ● Measure the resistance between exterior mirror control switch C527-6, circuit 542 (YE) and RH exterior mirror C622-4, circuit 542 (YE) harness side.  ● **Is the resistance less than 5 ohms?**	**Yes** GO to B3 . **No** REPAIR the circuit. TEST the system for normal operation.
B3 CHECK THE EXTERIOR MIRROR CONTROL SWITCH IN THE RH POSITION	
● Place the exterior mirror control switch selector in the right exterior mirror position. ● Measure the resistance between exterior mirror control switch terminals 1 and 8 while holding the exterior mirror control switch in the UP position.	**Yes** INSTALL a new RH exterior mirror motor. REFER to Exterior Mirror Motor in this section. TEST the system for normal operation. **No** INSTALL a new exterior mirror control switch. REFER to Exterior Mirror Control Switch in this section. TEST the system

 A0014784 ● **Is the resistance less than 5 ohms?**	for normal operation.
B4 CHECK CIRCUIT 542 (YE) FOR AN OPEN	
● Key in OFF position. ● Disconnect: LH Exterior Mirror C516. ● Disconnect: Exterior Mirror Control Switch C527. ● Measure the resistance between exterior mirror control switch C527-6, circuit 542 (YE) and LH exterior mirror C516-4, circuit 542 (YE) harness side.  A0040830 ● **Is the resistance less than 5 ohms?**	**Yes** GO to B5 . **No** REPAIR the circuit. TEST the system for normal operation.
B5 CHECK THE EXTERIOR MIRROR CONTROL SWITCH IN THE LH POSITION	
● Place the exterior mirror control switch selector switch in the left exterior mirror position. ● Measure the resistance between exterior mirror control switch terminals 1 and 3 while holding the exterior mirror control in the UP position.  A0014785 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new LH exterior mirror motor. REFER to Exterior Mirror Motor in this section. TEST the system for normal operation. **No** INSTALL a new exterior mirror control switch. REFER to Exterior Mirror Control Switch in this section. TEST the system for normal operation.



PINPOINT TEST C: A SINGLE MIRROR DOES NOT FUNCTION WITH SWITCH LOGIC

Test Step	Result / Action to Take

C1 CHECK THE EXTERIOR MIRROR HARNESS

- Disconnect: Inoperative Exterior Mirror C516/C622.
- Use the following table to measure the resistance between the exterior mirror control switch C527 pins and the inoperative exterior mirror (C516 LH or C622 RH) harness side pins.

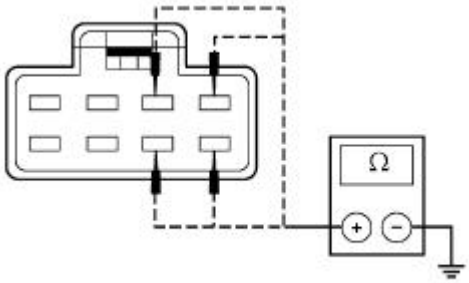
Circuit	LH Exterior Mirror	RH Exterior Mirror	Exterior Mirror Control Switch
540 (RD)	C516-5	—	C527-4
541 (DB)	C516-3	—	C527-7
542 (YE)	C516-4	C622-4	C527-6
543 (DG)	—	C622-5	C527-3
544 (PK)	—	C622-3	C527-8

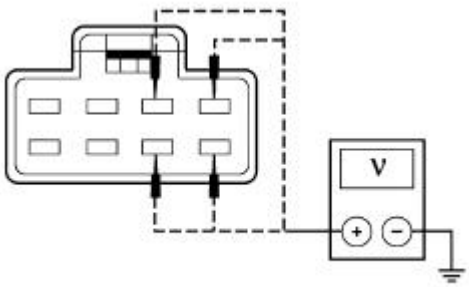
A0040829

- **Are the resistances less than 5 ohms?**

Yes
GO to C2 .

No
REPAIR the circuit(s) in question. TEST the system for normal operation.

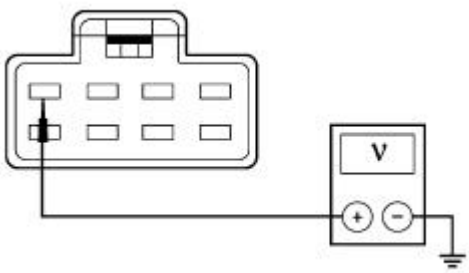




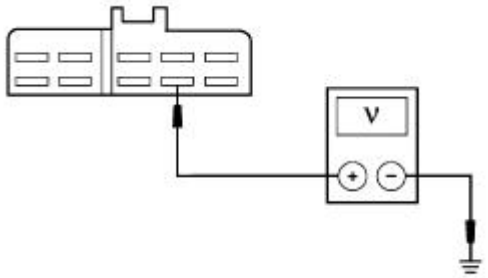
C2 CHECK CIRCUITS 544 (PK), 543 (DG), 541 (DB) AND 540 (RD) FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the following exterior mirror control C527 pins harness side and ground(s):

Connector	Circuit
C527-8	544 (PK)
C527-3	543 (DG)
C527-7	541 (DB)
C527-4	540 (RD)



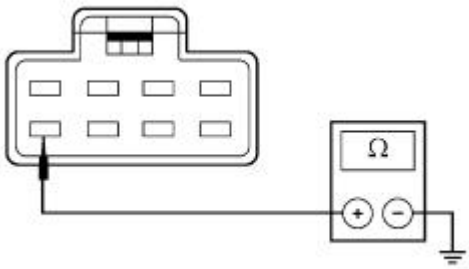
Yes
GO to C3 .

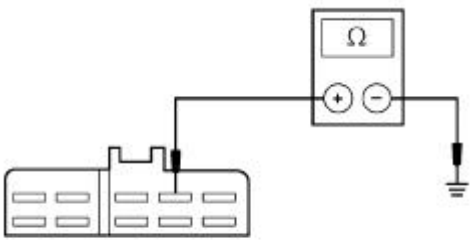


No
REPAIR the circuit(s) in question. TEST the system for normal operation.

 GN1961-A ● **Are the resistances greater than 10,000 ohms?**	
C3 CHECK CIRCUITS 544 (PK), 543 (DG), 541 (DB) AND 540 (RD) FOR A SHORT TO VOLTAGE ● Key in ON position. ● Measure the voltage between the following exterior rear view mirror control C527 pins harness side and ground: **Connector** / **Circuit** C527-8 / 544 (PK) C527-3 / 543 (DG) C527-7 / 541 (DB) C527-4 / 540 (RD)  GN1960-A ● **Is any voltage indicated?**	**Yes** REPAIR the circuit(s) in question. TEST the system for normal operation. **No** INSTALL a new exterior rear view mirror motor. REFER to Exterior Mirror Motor in this section. TEST the system for normal operation.

PINPOINT TEST D: THE MEMORY MIRROR IS INOPERATIVE



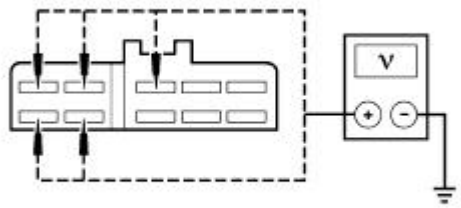


Test Step	Result / Action to Take
D1 RETRIEVE THE DTCs FROM DRIVER SEAT MODULE (DSM) ● Use the recorded DSM DTCs from the continuous and on-demand self tests. ● **Are any DTCs retrieved?**	**Yes** If DTC B1667, GO to D10 . If DTC B1668, GO to D10 . If DTC B1669, GO to D14 . If DTC B1670, GO to D14 .

	If DTC B1697, GO to D3 . If DTC B1735, GO to D3 . If DTC B1739, GO to D3 . If DTC B1743, GO to D3 . If DTC B1747, GO to D3 . **No** GO to D2 .
D2 CHECK THE DSM FOR CORRECT EXTERIOR MIRROR CONTROL SWITCH INPUTS ● **NOTE:** DSM PID MIR_SEL will not read PASSENGER until the exterior mirror control switch is moved horizontally or vertically. ● Monitor the DSM PIDs MIR_SEL, MIRV_SW and MIRH_SW while operating the exterior mirror control switch. ● **Do the PID values agree with the switch positions?**	**Yes** GO to D9 . **No** GO to D3 .
D3 CHECK THE EXTERIOR MIRROR CONTROL SWITCH ● Key in OFF position. ● Disconnect: Exterior Mirror Control Switch C527/C577. ● Check the exterior mirror control switch. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Is the exterior mirror control switch OK?**	**Yes** GO to D4 . **No** INSTALL a new exterior mirror control switch. REFER to Exterior Mirror Control Switch in this section. CLEAR the DTCs. REPEAT the self test.
D4 CHECK CIRCUIT 956 (OG/LG) FOR VOLTAGE ● If not equipped with power fold exterior mirrors, measure the voltage between exterior mirror control switch C527-1, circuit 956 (OG/LG) harness side and ground.  GN1941-A ● If equipped with power fold exterior mirrors, measure the voltage between exterior mirror control switch C577-7, circuit 956 (OG/LG) harness side and ground.	**Yes** GO to D5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self test.

A0015484

- **Is the voltage greater than 10 volts?**



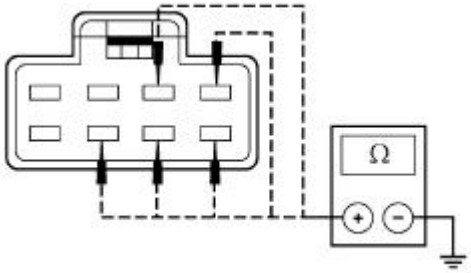
D5 CHECK CIRCUIT 875 (BK/LB) FOR AN OPEN	
• If not equipped with power fold mirrors, measure the resistance between exterior mirror control switch C527-5, circuit 875 (BK/LB) harness side and ground.  GN1942-A • If equipped with power fold mirrors, measure the resistance between exterior mirror control switch C577-2, circuit 875 (BK/LB) harness side and ground.  A0015485 • **Is the resistance less than 5 ohms?**	**Yes** GO to D6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self test.
D6 CHECK CIRCUITS 1475 (PK/OG), 1479 (DB/OG), 1478 (DG/OG), 1476 (RD/OG) AND 1477 (YE/BK) FOR A SHORT TO VOLTAGE	
• Disconnect: DSM C341d. • Key in ON position. • If not equipped with power fold exterior mirrors, measure the voltage between the following exterior mirror control switch C527 pins harness side and ground:	**Yes** REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test. **No** GO to D7 .

GN1943-A

- If equipped with power fold exterior mirrors, measure the voltage between the following exterior mirror control switch C577 pins harness side and ground:

Without Power Fold Exterior Mirrors, Connector	With Power Fold Exterior Mirror, Connector	Circuit
C527-3	C577-9	1478 (DG/OG)
C527-4	C577-10	1476 (RD/OG)
C527-6	C577-3	1477 (YE/BK)
C527-7	C577-4	1479 (DB/OG)
C527-8	C577-5	1475 (PK/OG)

A0040907

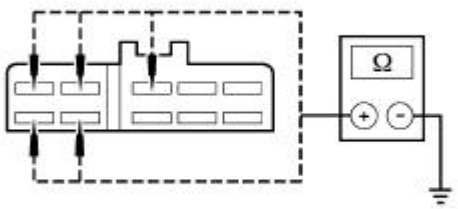


- **Is any voltage indicated?**

D7 CHECK CIRCUITS 1475 (PK/OG), 1479 (DB/OG), 1478 (DG/OG), 1476 (RD/OG) AND 1477 (YE/BK) FOR A SHORT TO GROUND

- Key in OFF position.
- If not equipped with power fold exterior mirrors, measure the resistance between the following exterior mirror control switch C527 pins harness side and ground:

Yes
GO to D8 .



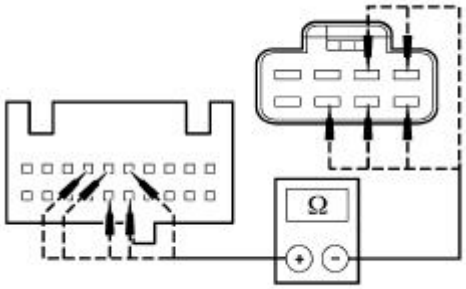
No
REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.

GN1944-A

- If equipped with power fold exterior mirrors, measure the resistance between the following exterior mirror control switch C577 harness side pins and ground:

Without Power Fold Exterior Mirrors, Connector	With Power Fold Exterior Mirror, Connector	Circuit
C527-3	C577-9	1478 (DG/OG)
C527-4	C577-10	1476 (RD/OG)
C527-6	C577-3	1477 (YE/BK)
C527-7	C577-4	1479 (DB/OG)
C527-8	C577-5	1475 (PK/OG)

A0040908

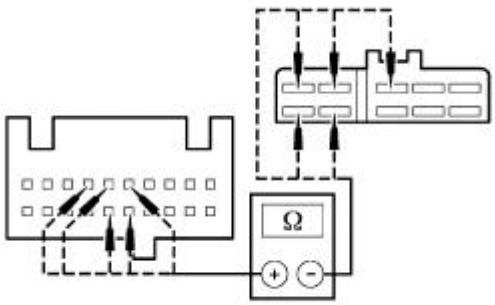


- **Are the resistances greater than 10,000 ohms?**

D8 CHECK CIRCUITS 1475 (PK/OG), 1479 (DB/OG), 1478 (DG/OG), 1476 (RD/OG) AND 1477 (YE/BK) FOR AN OPEN

- If not equipped with power fold exterior mirrors, measure the resistance between the following DSM C341d pins and exterior mirror control switch C527 harness side pins:

Yes
GO to D18 .



No
REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.

A0040910

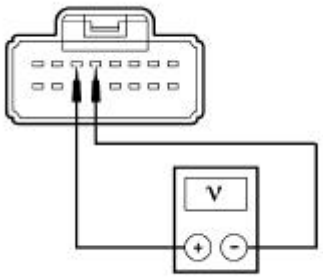
- If equipped with power fold exterior mirrors, measure the resistance between the following DSM C341d pins and exterior mirror control switch C577 harness side pins:

DSM	Circuit	Without Power Fold Exterior Mirrors, Connector	With Power Fold Exterior Mirror, Connector
C341d-7	1478 (DG/OG)	C527-3	C577-9
C341d-16	1476 (RD/OG)	C527-4	C577-10
C341d-6	1477 (YE/BK)	C527-6	C577-3
C341d-15	1479 (DB/OG)	C527-7	C577-4
C341d-5	1475 (PK/OG)	C527-8	C577-5

A0040909

- **Are the resistances less than 5 ohms?**

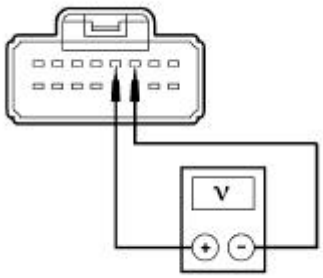
D9 CHECK THE DRIVER SEAT MODULE (DSM) FOR CORRECT OUTPUTS



- Toggle the DSM active command DR_UP to ON and OFF.
- Toggle the DSM active command DR_DOWN to ON and OFF.
- Toggle the DSM active command DR_LEFT to ON and OFF.
- Toggle the DSM active command DR_RIGHT to ON and OFF.
- Toggle the DSM active command PR_UP to ON and OFF.
- Toggle the DSM active command PR_DOWN to ON and OFF.
- Toggle the DSM active command PR_LEFT to ON and OFF.
- Toggle the DSM active command PR_RIGHT to ON and OFF.
- **Does the left mirror operate in all directions?**

Yes
GO to D14 .

No
GO to D10 .



D10 CHECK THE LH EXTERIOR MIRROR FOR VOLTAGE FROM THE DSM

- Key in OFF position.
- Disconnect: LH Exterior Mirror C516.
- Key in ON position.
- Measure the voltage between LH exterior mirror C516-4, circuit 1487 (DB) and C516-3, circuit 1486 (YE/LB) harness side while toggling the DSM active commands DR_UP and DR_DOWN to ON and OFF.

A0040911

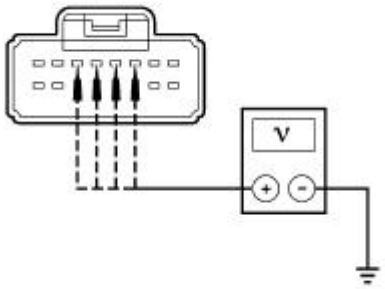
- Measure the voltage between LH exterior mirror C516-6, circuit 1485 (RD) and C516-5, circuit 1484 (YE/RD) harness side while toggling the DSM active commands DR_LEFT and DR_RIGHT to ON and OFF.

A0040912

- **Does the voltage swing from 0 volt to ± 12 volts when each active command is toggled on?**

Yes
INSTALL a new LH exterior mirror motor. REFER to Exterior Mirror Motor in this section. CLEAR the DTCs. REPEAT the self test.

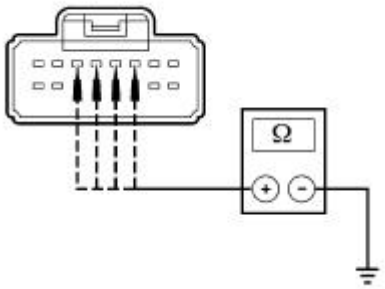
No
GO to D11 .



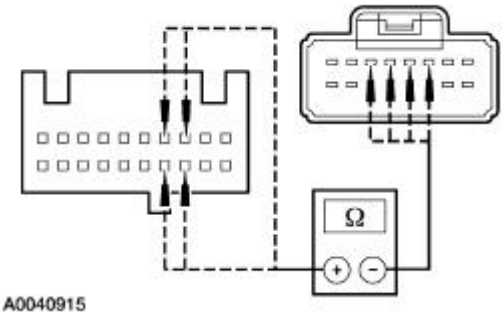
D11 CHECK CIRCUITS 1487 (DB), 1486 (YE/LB), 1485 (RD) AND 1484 (YE/RD) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C341d.
- Key in ON position.
- Measure the voltage between the following LH exterior mirror C516 pins harness side and ground:

Connector	Circuit
C516-4	1487 (DB)
C516-3	1486 (YE/LB)
C516-6	1485 (RD)
C516-5	1484 (YE/RD)

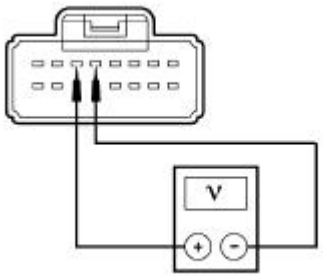


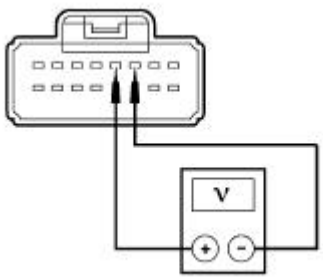
Yes
REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.



No
GO to D12 .

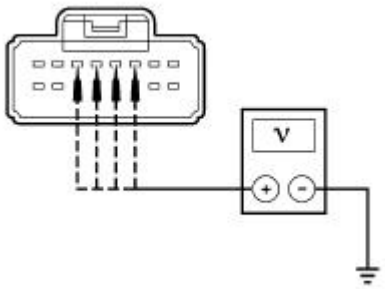
A0040913





- **Is any voltage indicated?**

D12 CHECK THE EXTERIOR MIRROR CIRCUITS FOR SHORT TO VOLTAGE	
• Key in OFF position. • Measure the resistance between the following LH exterior mirror C516 pins harness side and ground: **Connector** / **Circuit** C516-4 — 1487 (DB) C516-3 — 1486 (YE/LB) C516-6 — 1485 (RD) C516-5 — 1484 (YE/RD)  A0040914 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to D13 . **No** REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.
D13 CHECK CIRCUITS 1487 (DB), 1486 (YE/LB), 1485 (RD) AND 1484 (YE/RD) FOR AN OPEN	
• Measure the resistance between the following DSM C341d pins and LH exterior mirror C516 harness side pins: **DSM** / **Circuit** / **LH Exterior Mirror** C341d-4 — 1487 (DB) — C516-4 C341d-3 — 1486 (YE/LB) — C516-3 C341d-14 — 1485 (RD) — C516-6 C341d-13 — 1484 (YE/RD) — C516-5	**Yes** GO to D18 . **No** REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.



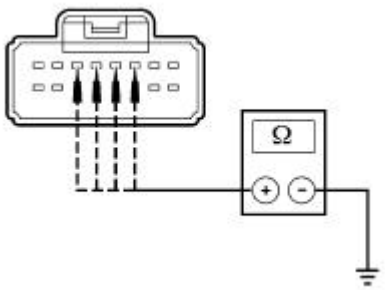
A0040915

- **Are the resistances less than 5 ohms?**

D14 CHECK THE RH EXTERIOR MIRROR FOR VOLTAGE FROM THE DSM	
• Key in OFF position. • Disconnect: RH Exterior Mirror C622. • Key in ON position. • Measure the voltage between the RH exterior mirror C622-3, circuit 1482 (PK) and C622-4 circuit 1483 (WH/PK) harness side while toggling the DSM active commands PR_UP and PR_DOWN to ON and OFF.  A0040911 • Measure the voltage between the RH exterior mirror C622-5, circuit 1480 (WH/LG) and C622-6 circuit 1481 (DG) harness side while toggling the DSM active commands PR_LEFT and PR_RIGHT to ON and OFF.  A0040912 • **Does the voltage swing from 0 volt to ± 12 volts when each active command is toggled ON?**	**Yes** INSTALL a new RH exterior mirror motor. REFER to Exterior Mirror Motor in this section. CLEAR the DTCs. REPEAT the self test. **No** GO to D15.
D15 CHECK CIRCUITS 1482 (PK), 1483 (WH/PK), 1480 (WH/LG) AND 1481 (DG) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: DSM C341d. • Key in ON position. • Measure the voltage between the following RH exterior mirror C622 harness side pins and ground: **Connector** | **Circuit**	**Yes** REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test. **No**

C622-3	1482 (PK)
C622-4	1483 (WH/PK)
C622-5	1480 (WH/LG)
C622-6	1481 (DG)

A0040913



- **Is any voltage indicated?**

GO to D16 .

D16 CHECK CIRCUITS 1482 (PK), 1483 (WH/PK), 1480 (WH/LG) AND 1481 (DG) FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the following RH exterior mirror C622 pins harness side and ground:

Connector	Circuit
C622-3	1482 (PK)
C622-4	1483 (WH/PK)
C622-5	1480 (WH/LG)
C622-6	1481(DG)

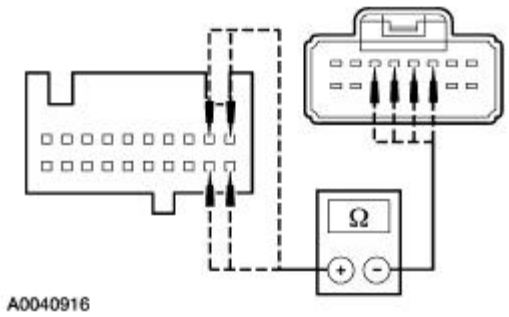
A0040914

- **Are the resistances greater than 10,000 ohms?**

Yes
GO to D17 .

No
REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.

D17 CHECK CIRCUITS 1482 (PK), 1483 (WH/PK), 1480 (WH/LG) AND 1481 (DG) FOR AN OPEN



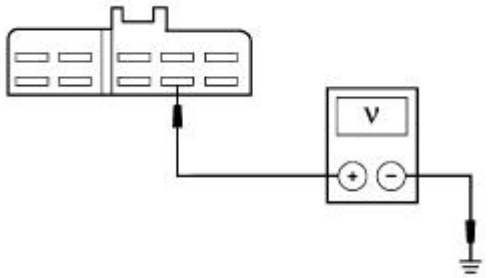
- Measure the resistance between the following DSM C341d pins and RH exterior mirror C622 harness side pins:

DSM	Circuit	RH Exterior Mirror
C341d-1	1482 (PK)	C622-3
C341d-2	1483 (WH/PK)	C622-4
C341d-12	1480 (WH/LG)	C622-5

Yes
GO to D18 .

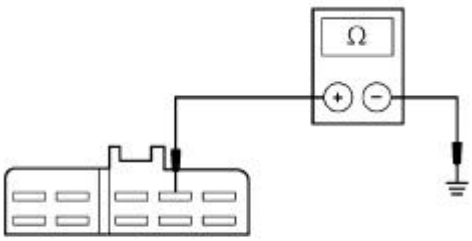
No
REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.

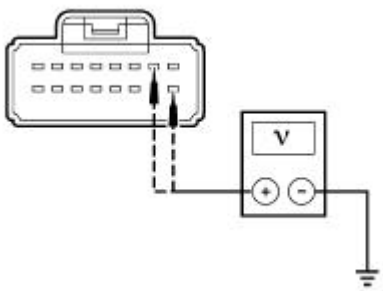
C341d-11	1481 (DG)	C622-6



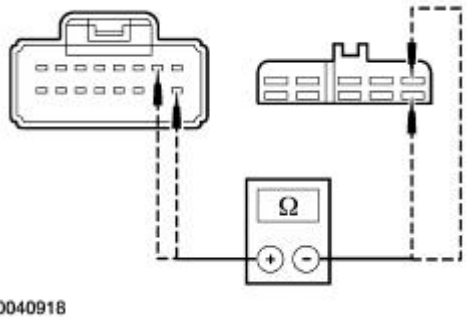
- **Are the resistances less than 5 ohms?**

D18 CHECK THE DSM FOR CORRECT OPERATION	
• Disconnect all DSM connectors. • Check for: • corrosion • pushed-out pins • Connect all DSM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DSM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self test.



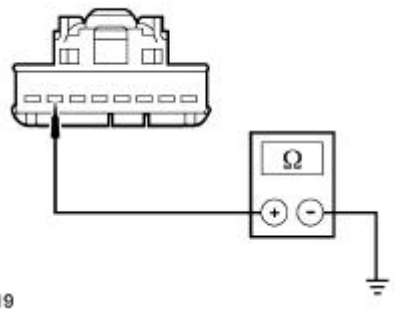


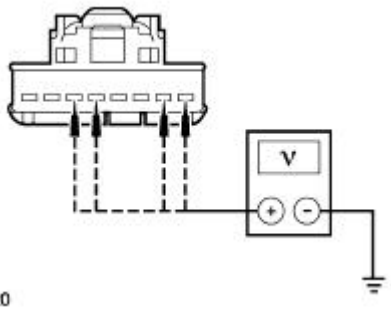
PINPOINT TEST E: THE POWER FOLDING MIRRORS DO NOT OPERATE



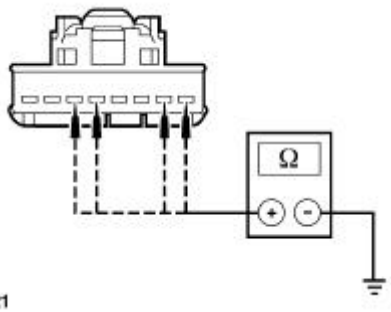
Test Step	Result / Action to Take
E1 CHECK THE OPERATION OF THE EXTERIOR MIRRORS	
• Activate the LH exterior mirror to the UP position. • **Does the LH exterior mirror operate correctly?**	**Yes** GO to E4 . **No** GO to E2 .
E2 CHECK CIRCUIT 956 (OG/LG) FOR VOLTAGE	
• Disconnect: Exterior Mirror Control Switch C577. • Measure the voltage between the exterior mirror control switch C577-7, circuit 956 (OG/LG), harness side and ground.	**Yes** GO to E3 . **No** REPAIR the circuit. TEST the system for normal operation.

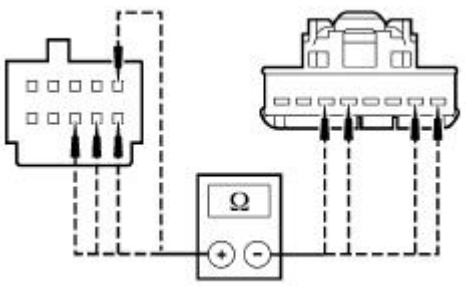
A0015484





- **Is the voltage greater than 10 volts?**





E3 CHECK CIRCUIT 875 (BK/LB) FOR AN OPEN	
• Measure the resistance between the exterior mirror control switch C577-2, circuit 875 (BK/LB), harness side and ground.  A0015485 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new exterior mirror control switch. REFER to Exterior Mirror Control Switch in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
E4 CHECK THE POWER FOLD EXTERIOR MIRROR FOR VOLTAGE	
• Disconnect: Inoperative Exterior Mirror Connector C516/C622. • Measure the voltage between the suspect power folding exterior mirror C516-16 (LH)/C622-16 (RH), circuit 1038 (PK/YE), harness side and ground while activating the exterior mirror control switch to the IN position; and between pin 7, circuit 1037 (PK/LG), harness side and ground while activating the exterior mirror control switch to the OUT position.  A0040917 • **Are the voltages greater than 10 volts?**	**Yes** INSTALL a new power folding mirror. REFER to Exterior Mirror in this section. TEST the system for normal operation. **No** GO to E5 .
E5 CHECK THE POWER FOLD EXTERIOR MIRROR FOR GROUND	
• Measure the resistance between the exterior mirror control switch C577-1 circuit 1037 (PK/LG), harness side and the suspect power folding mirror C516-7 (LH)/C622-7 (RH), circuit 1037 (PK/LG), harness side; and between exterior mirror control switch C577-6 circuit 1038 (PK/YE), harness side and the suspect power folding mirror C516-16 (LH)/C622-16 (RH), circuit 1038 (PK/YE), harness side.	**Yes** INSTALL a new exterior mirror control switch. REFER to Exterior Mirror Control Switch in this section. TEST the

 A0040918 ● **Are the resistances less than 5 ohms?**	system for normal operation. **No** REPAIR the circuit in question. TEST the system for normal operation.

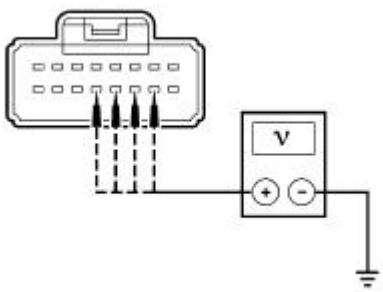
PINPOINT TEST F: THE MEMORY MIRROR IS INOPERATIVE — DOES NOT OPERATE FROM THE MEMORY SET SWITCH

Test Step	Result / Action to Take
F1 CHECK OPERATION OF THE REMOTE TRANSMITTER ONE	
● Adjust the driver seat to a new position and store for Memory 1. ● Adjust the driver seat to a different position. ● Press the UNLOCK button on the remote transmitter one. ● **Does the driver seat move to memory seat position one?**	**Yes** GO to F2 . **No** GO to Section 501-14 to diagnose the driver seat memory recall inoperative from the Remote Transmitter.
F2 RETRIEVE THE DTCs FROM DRIVER SEAT MODULE (DSM)	
● Use the recorded DSM DTCs from the continuous and on-demand self tests. ● **Are any DTCs retrieved or does the memory set LED fail to illuminate?**	**Yes** If DTCs B1667, B1668, B1669 and B1670 are all retrieved, GO to F9 . If DTCs B2312, B2314, B2316, B2318, B2320, B2322, B2324, or B2326, GO to F9 GO to F9 . If DTC B1529, GO to F7 . If DTC B1534, GO to F7 . If DTC B1538, GO to F7 . If DTC B1667, GO to F10 . If DTC B1668, GO to F10 . If DTC B1669, GO to F13 . If DTC B1670, GO to F13 . **No** GO to F3 .
F3 CHECK THE DSM FOR CORRECT MEMORY SET SWITCH INPUTS	

• Monitor the DSM PIDs MEM1_SW, MEM2_SW and MEM_SW while depressing each memory recall switch and the memory set switch. • **Do the PID values agree with the switch positions?**	**Yes** GO to F9 . **No** GO to F4 .
F4 CHECK THE MEMORY SET SWITCH • Key in OFF position. • Disconnect: Memory Set Switch C503. • Check the memory set switch. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the memory set switch OK?**	**Yes** GO to F5 . **No** INSTALL a new memory set switch. CLEAR the DTCs. REPEAT the self test.
F5 CHECK CIRCUIT 875 (BK/LB) FOR AN OPEN • Measure the resistance between memory set switch C503-7, circuit 875 (BK/LB) harness side and ground.  A0040919 • **Is the resistance less than 5 ohms?**	**Yes** GO to F6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self test.
F6 CHECK CIRCUITS 267 (BR/LG), 268 (BK/OG), 270 (BR/OG) AND 272 (WH/OG) FOR A SHORT TO VOLTAGE • Disconnect: DSM C341c. • Key in ON position. • Measure the voltage between the following memory set switch C503 pins harness side and ground: **Connector** / **Circuit** C503-2 — 267 (BR/LG) C503-6 — 268 (BK/OG) C503-5 — 270 (BR/OG) C503-1 — 272 (WH/OG)  A0040920 • **Is any voltage indicated?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to F7 .

F7 CHECK CIRCUITS 267 (BR/LG), 268 (BK/OG), 270 (BR/OG) AND 272 (WH/OG) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the following memory set switch C503 pins harness side and ground: **Connector** / **Circuit** C503-2 — 267 (BR/LG) C503-6 — 268 (BK/OG) C503-5 — 270 (BR/OG) C503-1 — 272 (WH/OG)  A0040921 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to F8 . **No** REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.
F8 CHECK CIRCUITS 267 (BR/LG), 268 (BK/OG), 270 (BR/OG) AND 272 (WH/OG) FOR AN OPEN	
• Measure the resistance between the following DSM C341c pins and memory set switch C503 harness side pins: **DSM** / **Circuit** / **Memory Set Switch** C341c-4 — 267 (BR/LG) — C503-2 C341c-3 — 268 (BK/OG) — C503-6 C341c-5 — 270 (BR/OG) — C503-5 C341c-10 — 272 (WH/OG) — C503-1  A0040922 • **Are the resistances less than 5 ohms?**	**Yes** GO to F16 . **No** REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.
F9 CHECK THE DSM FOR CORRECT OUTPUTS	
• Select PARK. • Monitor the DSM PIDs DMIR_R, DMIR_UP, PMIR_R and	**Yes** GO to F16 .

PMIR_UP during active commands.
- Toggle the DSM active command DR_UP to ON and OFF.
- Toggle the DSM active command DR_DOWN to ON and OFF.
- Toggle the DSM active command DR_LEFT to ON and OFF.
- Toggle the DSM active command DR_RIGHT to ON and OFF.
- Toggle the DSM active command PR_UP to ON and OFF.
- Toggle the DSM active command PR_DOWN to ON and OFF.
- Toggle the DSM active command PR_LEFT to ON and OFF.
- Toggle the DSM active command PR_RIGHT to ON and OFF.
- **Do the PIDs (position % of travel) values agree with the exterior rear view mirrors actual movement?**



No
If the LH exterior mirror is not operating correctly,GO to F10 .

If the RH exterior mirror is not operating correctly,GO to F13 .

F10 CHECK CIRCUITS 951 (DB/WH), 958 (GY/RD), 949 (RD/WH) AND 955 (GY) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C341d.
- Disconnect: LH Exterior Mirror C516.
- Key in ON position.
- Measure the voltage between the following LH exterior mirror C516 pins harness side and ground:

Connector	Circuit
C516-14	951 (DB/WH)
C516-12	958 (GY/RD)
C516-13	949 (RD/WH)
C516-15	955 (GY)

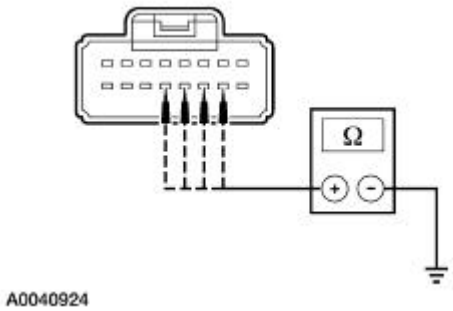
A0040923

- **Is any voltage indicated?**

Yes
REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.

No
GO to F11 .

F11 CHECK CIRCUITS 951 (DB/WH), 958 (GY/RD), 949 (RD/WH) AND 955 (GY) FOR A SHORT TO GROUND



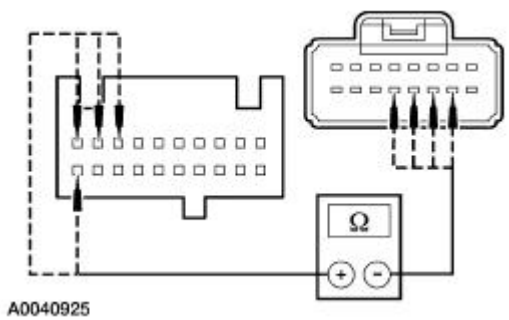
- Key in OFF position.
- Measure the resistance between the following LH exterior mirror C516 pins harness side and ground:

Connector	Circuit
C516-14	951 (DB/WH)

Yes
GO to F12 .

No
REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.

C516-12	958 (GY/RD)
C516-13	949 (RD/WH)
C516-15	955 (GY)



A0040924

- **Are the resistances greater than 10,000 ohms?**

F12 CHECK CIRCUITS 951 (DB/WH), 958 (GY/RD), 949 (RD/WH) AND 955 (GY) FOR AN OPEN

- Measure the resistance between the following DSM C341d pins and LH exterior mirror C516 harness side pins:

DSM	Circuit	LH Exterior Mirror
C341d-9	951 (DB/WH)	C516-14
C341d-20	958 (GY/RD)	C516-12
C341d-8	949 (RD/WH)	C516-13
C341d-10	955 (GY)	C516-15

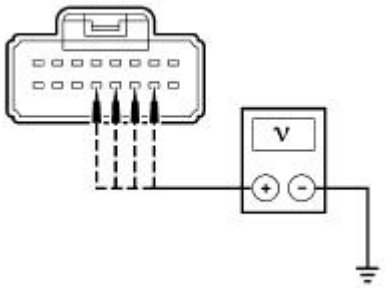
A0040925

- **Are the resistances less than 5 ohms?**

Yes
INSTALL a new LH exterior mirror motor. REFER to Exterior Mirror Motor in this section. CLEAR the DTCs. REPEAT the self test.

No
REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.

F13 CHECK CIRCUITS 955 (GY), 957 (PK/WH), 958 (GY/RD) AND 954 (DG/WH) FOR A SHORT TO VOLTAGE



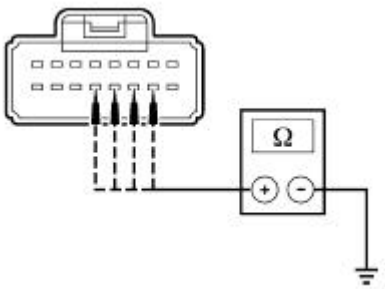
- Key in OFF position.
- Disconnect: DSM C341d.
- Disconnect: RH Exterior Mirror C622.
- Key in ON position.
- Measure the voltage between the following RH exterior mirror C622 pins harness side and ground:

Connector	Circuit
C622-15	955 (GY)

Yes
REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.

No
GO to F14 .

C622-14	957 (PK/WH)
C622-12	958 (GY/RD)
C622-13	954 (DG/WH)



A0040923

- **Is any voltage indicated?**

F14 CHECK CIRCUITS 955 (GY), 957 (PK/WH), 958 (GY/RD) AND 954 (DG/WH) FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the following RH exterior mirror C622 pins harness side and ground:

Connector	Circuit
C622-15	955 (GY)
C622-14	957 (PK/WH)
C622-12	958 (GY/RD)
C622-13	954 (DG/WH)

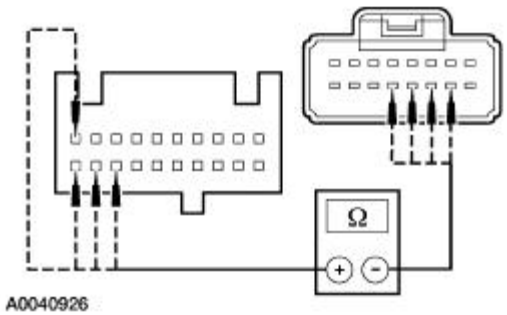
A0040924

- **Are the resistances greater than 10,000 ohms?**

Yes
GO to F15 .

No
REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.

F15 CHECK CIRCUITS 955 (GY), 957 (PK/WH), 958 (GY/RD) AND 954 (DG/WH) FOR AN OPEN



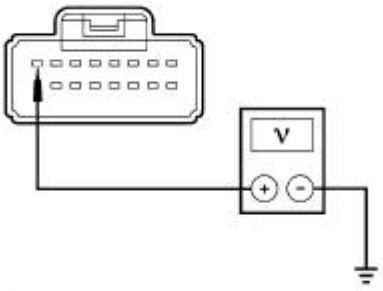
- Measure the resistance between the following DSM C341d pins and RH exterior mirror C622 harness side pins:

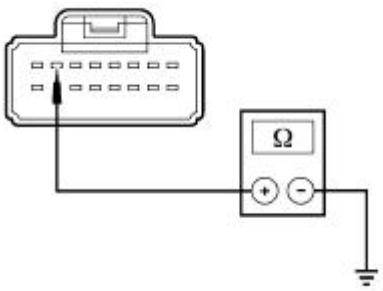
DSM	Circuit	RH Exterior Mirror
C341d-10	955 (GY)	C622-15
C341d-19	957 (PK/WH)	C622-14
C341d-20	958 (GY/RD)	C622-12

Yes
INSTALL a new RH exterior rear view mirror motor. REFER to Exterior Mirror Motor in this section. CLEAR the DTCs. REPEAT the self test.

No
REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self test.

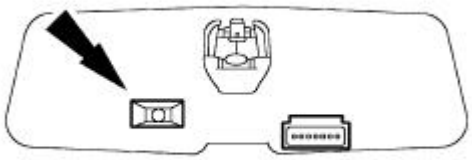
C341d-18	954 (DG/WH)	C622-13





- **Are the resistances less than 5 ohms?**

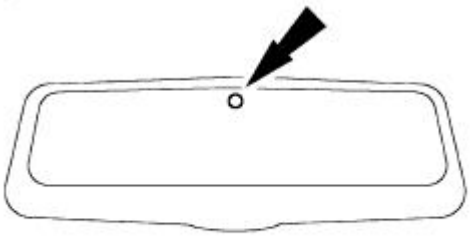
F16 CHECK THE DSM FOR CORRECT OPERATION	
• Disconnect all DSM connectors. • Check for: • corrosion • pushed-out pins • Connect all DSM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DSM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self test.



PINPOINT TEST G: THE MEMORY MIRROR IS INOPERATIVE — THE HEATED EXTERIOR MIRRORS DO NOT DEFROST

Test Step	Result / Action to Take
G1 CHECK THE HEATED REAR WINDOW OPERATION	
• Select PARK. • Key in ON position. • Depress the heated rear window switch to ON. • **Does the heated rear window defrost or warm up?**	**Yes** GO to G2 . **No** REFER to Section 501-11 to diagnose the heated rear window system.
G2 CHECK THE EXTERIOR MIRROR FOR POWER	
• Disconnect: Inoperative Exterior Mirror C516/C622. • Depress the heated rear window switch to ON. • Measure the voltage between the inoperative exterior mirror C516-1 (LH)/C622-1 (RH), circuit 59 (DG/PK) harness side and ground.	**Yes** GO to G3 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0040927 ● **Is the voltage greater than 10 volts?**	
G3 CHECK THE EXTERIOR REAR VIEW MIRROR GROUND CIRCUIT FOR AN OPEN	
● Measure the resistance between the inoperative exterior mirror C516-2 (LH)/C622-2 (RH), circuit 57 (BK) harness side and ground.  A0040928 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new exterior mirror glass. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

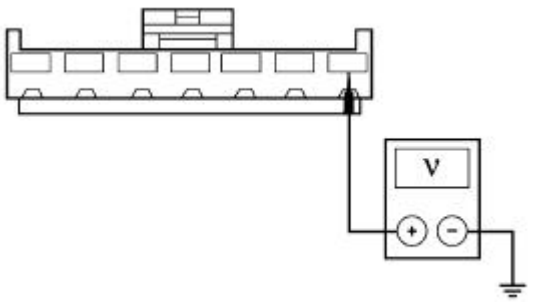


PINPOINT TEST H: THE AUTO DIMMING MIRROR DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
NOTE: If the transmission range (TR) sensor is malfunctioning and the backup lamps are on all the time or do not turn on, the auto dimming interior mirror will not darken or return to normal view.	
H1 CHECK OPERATION OF THE BACKUP LAMPS	
● Key in ON position. ● Move the shift control selector through the entire range. ● **Do the backup lamps illuminate only in REVERSE?**	**Yes** GO to H2 . **No** REFER to Section 417-01 .
H2 CHECK OPERATION OF THE INTERIOR REAR VIEW MIRROR	
● Select PARK. ● Cover the back sensor with dark tape.	**Yes** The interior mirror is OK. REVIEW the auto dimming interior mirror operation with the customer. **No** GO to H3 .

GN1964-A

- Use a flashlight to shine light into the sensor on the front of the auto dimming interior mirror.



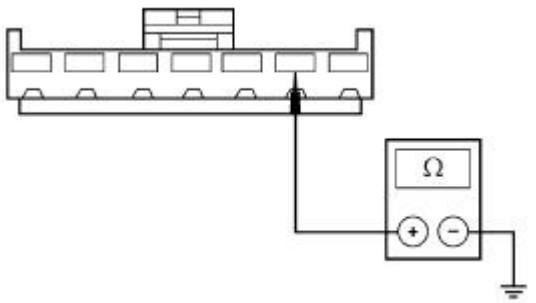
GN1965-A

- Select REVERSE.
- **Does the interior mirror glass darken with the vehicle in PARK (P) and then return to normal view with the vehicle in REVERSE (R)?**

H3 CHECK CIRCUIT 294 (WH/LB) FOR VOLTAGE

- Disconnect: Interior Mirror C911.
- Measure the voltage between interior mirror C911-1 circuit 294 (WH/LB) harness side and ground.

GN1966-A

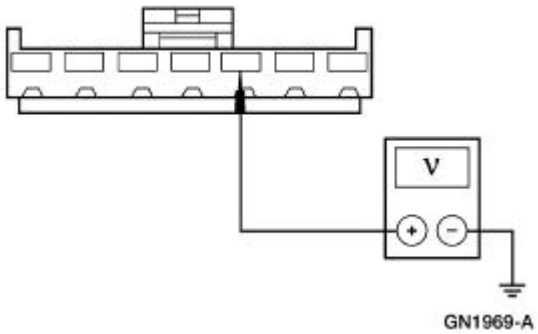


- **Is the voltage greater than 10 volts?**

Yes
GO to H4 .

No
REPAIR the circuit. TEST the system for normal operation.

H4 CHECK CIRCUIT 57 (BK) FOR AN OPEN



- Key in OFF position.
- Measure the resistance between interior mirror C911-6, circuit 57 (BK) harness side and ground.

GN1968-A

Yes
GO to H5 .

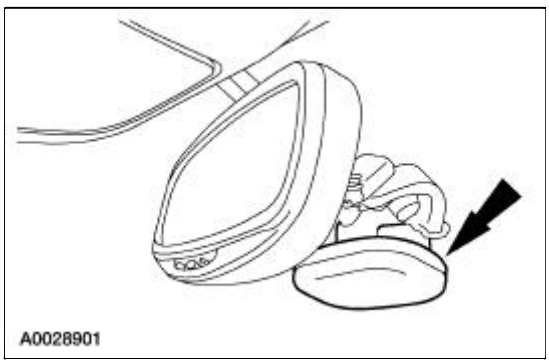
No
REPAIR the circuit. TEST the system for normal operation.

• **Is the resistance less than 5 ohms?**	
H5 CHECK CIRCUIT 1789 (PK/WH) FOR VOLTAGE	
• Key in ON position. • Select REVERSE. • Measure the voltage between interior mirror C911-3 circuit 1789 (PK/WH) harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new interior mirror. REFER to Auto-dimming Interior Mirror in this section. REPAIR the circuit. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST I: THE REVERSE DRIVE REAR VIEW MIRRORS ARE INOPERATIVE

Test Step	Result / Action to Take
I1 CHECK THE EXTERIOR REAR VIEW MIRROR OPERATION	
• Operate both exterior mirrors using the exterior rear view mirror control switch. • **Do the exterior rear view mirrors move through all positions?**	**Yes** GO to I2 . **No** REFER to the Symptom Chart to diagnose the inoperative exterior rear view mirror function.
I2 CHECK FOR REVERSE MIRRORS FEATURE ENABLED	
• Key in ON position. • Select the REVERSE MIRRORS feature from the message center. • **Is the REVERSE MIRRORS feature ON?**	**Yes** GO to I3 . **No** ENABLE the REVERSE MIRRORS feature. TEST the system for normal operation. INSTRUCT the customer on the systems correct operation.
I3 CHECK REVERSE DRIVE MIRRORS OPERATION	
• Key in ON position. • Set the vehicle parking brake. • Move the transmission range selector lever to REVERSE, wait 15 seconds, then return the selector lever to PARK. • **Do the exterior rear view mirrors move downward when the transmission selector lever is in REVERSE, and return to their original position when the selector lever is placed in PARK?**	**Yes** The system is operating correctly. INSTRUCT the customer on operation. **No** GO to I4 .
I4 CHECK FOR DTC FROM THE DRIVER SEAT MODULE (DSM)	

• Refer to the recorded results from the DSM self-test. • **Are any DSM DTCs recorded?**	**Yes** If DTCs B1667 and B2324 are retrieved, Go To Pinpoint Test F . If DTCs B1667 and B2326 are retrieved, Go To Pinpoint Test F . If DTCs B1669 and B2316 are retrieved, Go To Pinpoint Test F . If DTCs B1669 and B2318 are retrieved, Go To Pinpoint Test F . If DTC U1950 is retrieved, REFER to the DSM Diagnostic Trouble Code (DTC) Index. **No** GO to I5 .
I5 CHECK FOR DSM OPERATION	
• Key in OFF position. • Disconnect all DSM connectors. • Check for: ■ corrosion. ■ pushed-out pins. • Connect all DSM connectors and make sure they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DSM. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

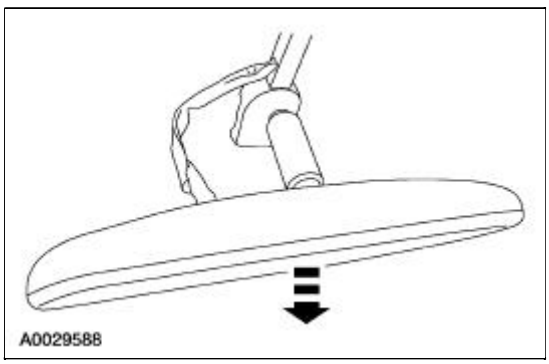


Interior Rear View Mirror

Special Tool(s)

 ST1793-A	Installer, Rear View Mirror 501-025 (T94P-17700-AH)

Removal



1. If equipped, position the electronic compass sensor aside.

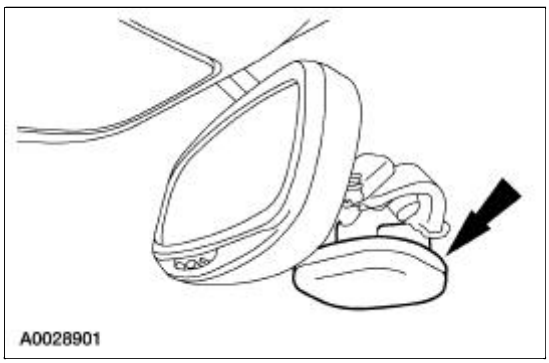
A0028901

2. **CAUTION: Do not use tools or other objects to pry the mount or interior mirror away from the windshield. Use of tools can damage the interior mirror/mount.**

   Remove the interior mirror.

   - Position the interior mirror in the full down position. Grasp the interior mirror and rotate, in a downward and toward the windshield direction, until it is released from the interior mirror windshield bracket.

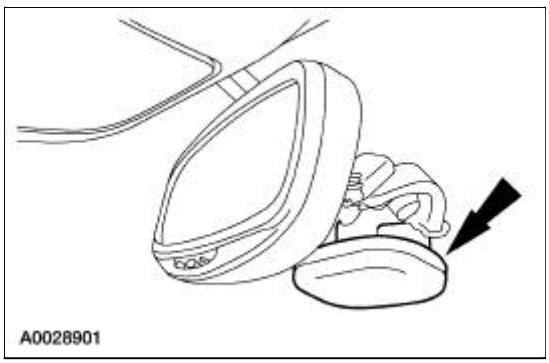
A0029588



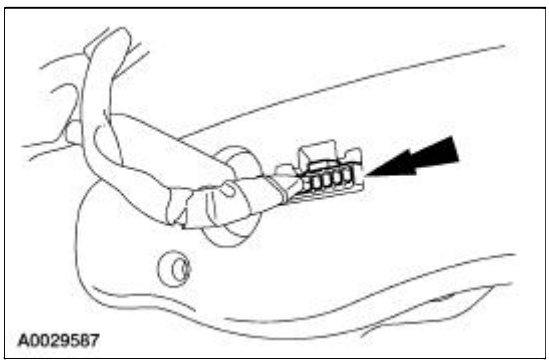
Installation

1. Install the interior mirror.
   1. Position the interior mirror on the windshield bracket.

2. Using the special tool, press the interior mirror in place until fully seated.

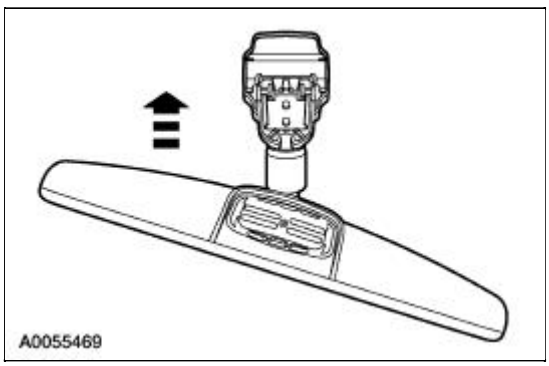


2. If equipped, install the electronic compass sensor.

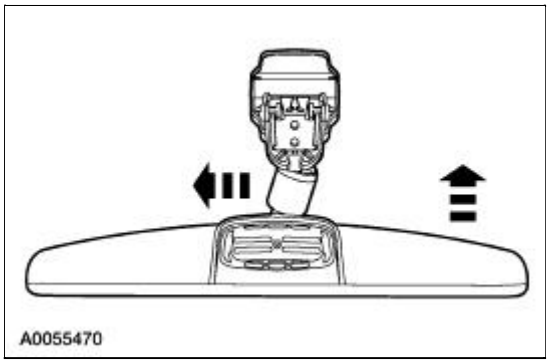


Auto-dimming Interior Mirror

Removal

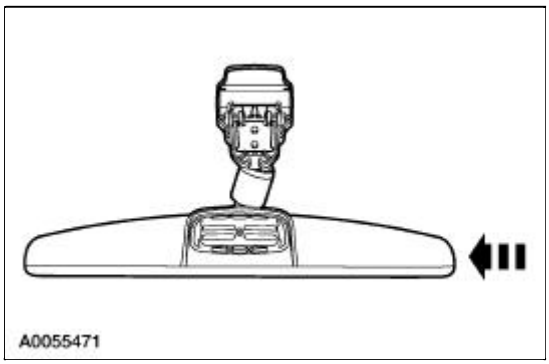


1. If equipped, position the electronic compass sensor aside.

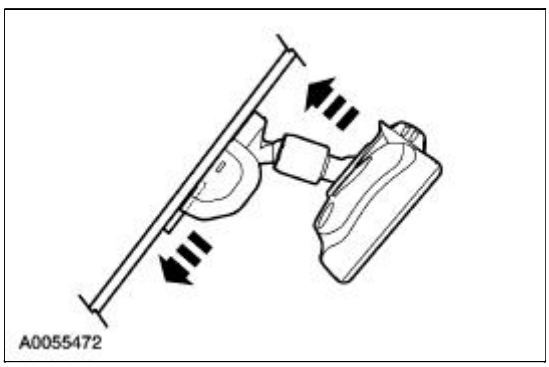


2. Disconnect the auto-dimming interior mirror electrical connector.

3. Position the auto-dimming interior mirror outboard (towards the driver door) to its full extension.

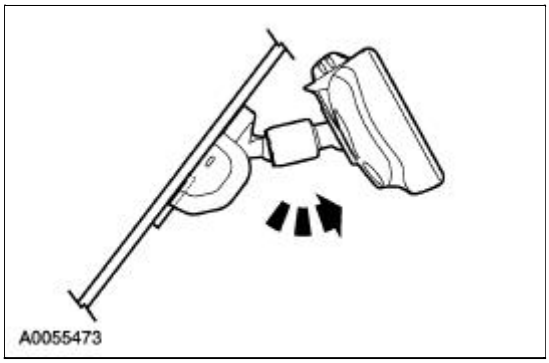


4. Rotate the auto-dimming interior mirror back until it is parallel with the windshield. The auto-dimming interior mirror mount is now locked between the two adjustment balls and joints.

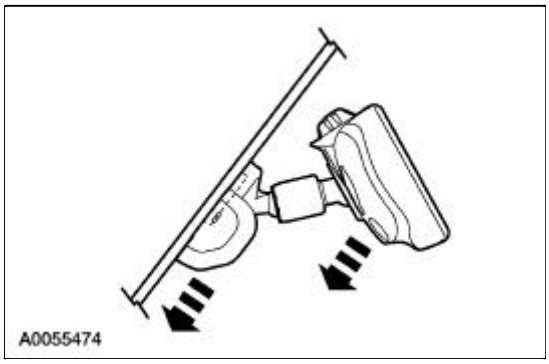


5. **NOTE:** It takes approximately ten pounds of force to remove the auto-dimming interior mirror from the windshield bracket.

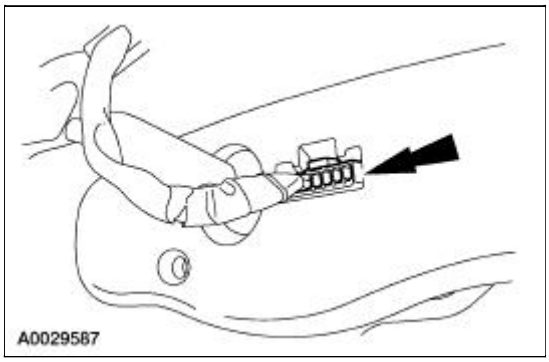
   Hold the auto-dimming interior mirror firmly in one hand and strike the auto-dimming interior mirror with the palm of an open hand.



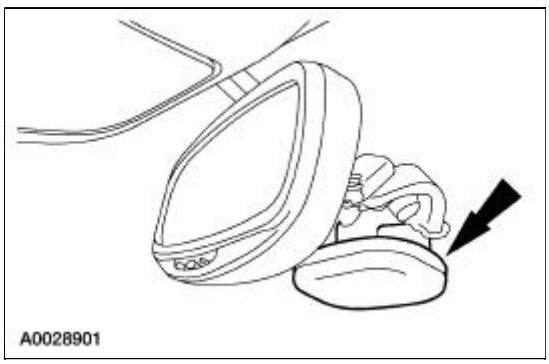
Installation



1. Seat the auto-dimming interior mirror base partially on the mounting button.

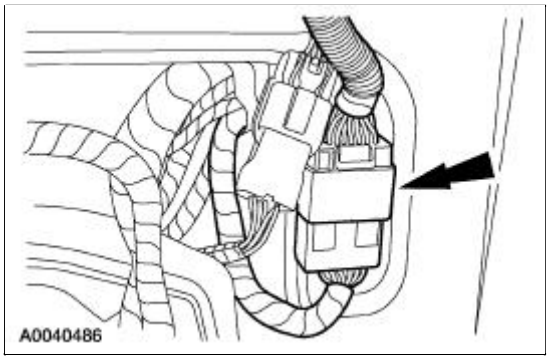


2. Rotate the auto-dimming interior mirror fully up.

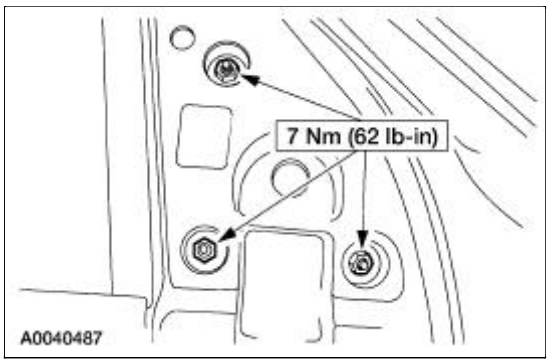


3. Slide the auto-dimming interior mirror base down on the mounting button until an audible **click** is heard.

4. Connect the auto-dimming interior mirror electrical connector.



5. If equipped, install the electronic compass sensor.

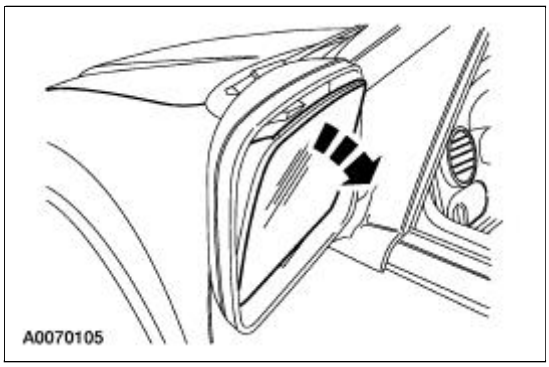


Exterior Mirror

Removal and Installation

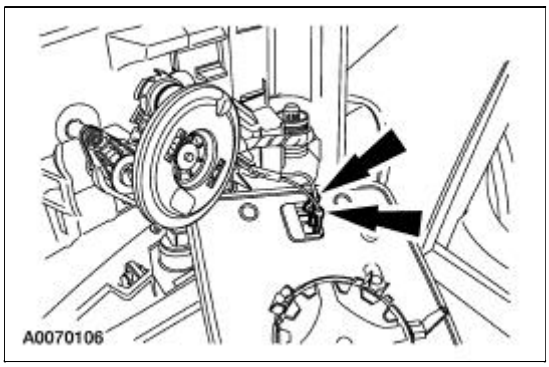
1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Remove the weather shield.
3. Disconnect the exterior mirror electrical connector.

4. Remove the exterior mirror.
   - Remove the nuts.



5. To install, reverse the removal procedure.
   - Install top nut first.

Exterior Mirror Motor



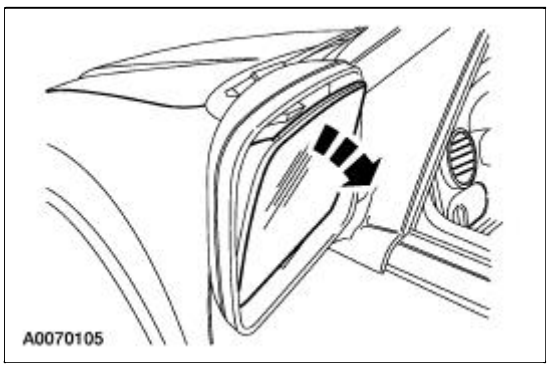
Removal and Installation

1. **WARNING: Place a shop towel between the exterior mirror glass and the hand to avoid personal injury in the instance of glass breakage.**

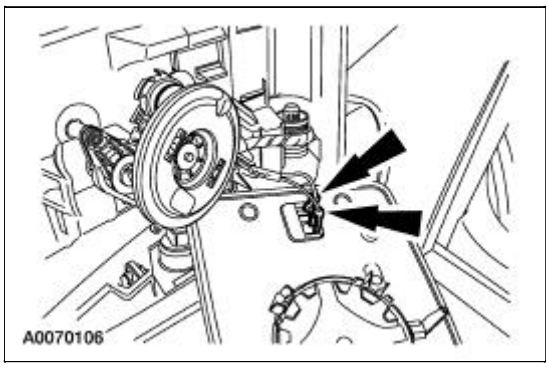
   Position the exterior mirror glass to obtain a gap at the top edge of the mirror and carefully pull the top edge of the glass away from the exterior mirror housing.

2. If equipped, disconnect the heated mirror electrical connectors.

3. Remove the exterior mirror motor screws and exterior mirror motor.
   - Disconnect the electrical connectors.



4. To install, reverse the removal procedure.

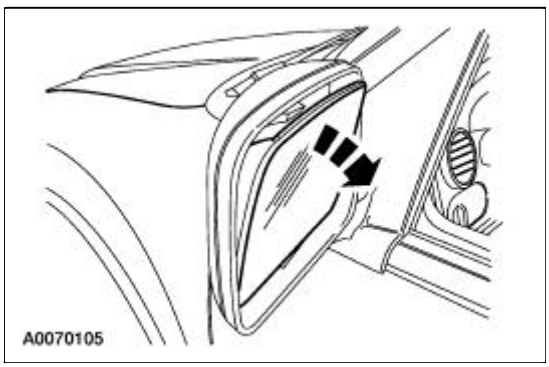


Exterior Mirror Glass

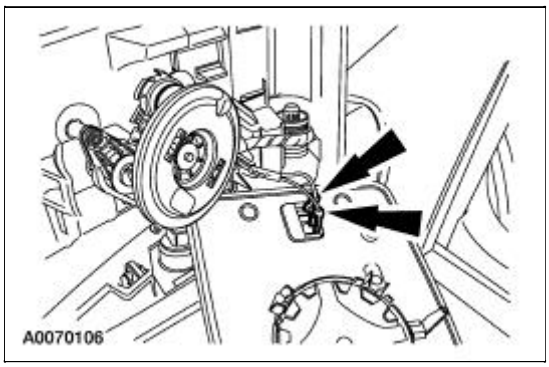
1. **WARNING: Place a shop towel between the exterior mirror glass and the hand to avoid personal injury in the instance of glass breakage.**

   Position the exterior mirror glass to obtain a gap at the edge of the mirror and carefully pull the top edge of the glass away from the exterior mirror housing.

2. If equipped, disconnect the heated mirror electrical connectors.



3. To install, reverse the removal procedure.
   - Rotate the exterior mirror glass in all directions after the installation to make sure all clips are completely attached.



Exterior Mirror Cover

1. **WARNING: Place a shop towel between the exterior mirror glass and the hand to avoid personal injury in the instance of glass breakage.**

   Position the exterior mirror glass to obtain a gap at the top edge of the mirror and carefully pull the top edge of the glass away from the exterior mirror housing.

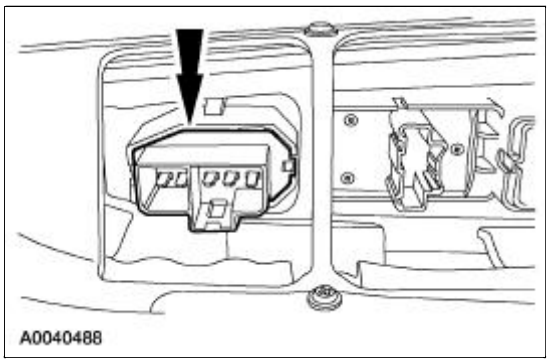
2. If equipped, disconnected the heated mirror electrical connectors.

3. Release the four retaining tabs and remove the exterior mirror cover.
   - The two outboard vertical tabs are released by moving them in the outboard direction. The two inboard horizonal tabs are released by moving them in the downward direction.

4. To install, reverse the removal procedure.
   - Rotate the exterior mirror glass in all directions after installation to make sure all clips are

completely attached.

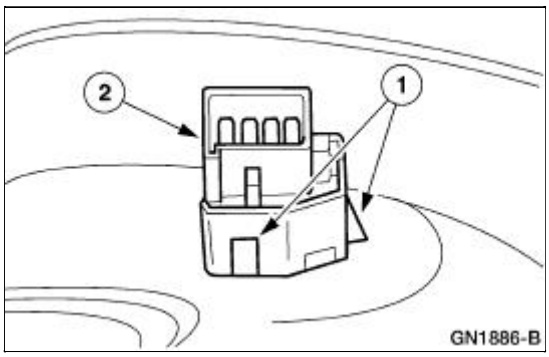
Exterior Mirror Control Switch



Removal and Installation

All vehicles

1. Remove the driver front door trim panel. For additional information, refer to Section 501-05 .



Navigator

2. Depress the locking tabs and remove the exterior mirror control switch.

Expedition

3. Remove the exterior mirror control switch.
    1. Depress the locking tabs.
    2. Remove the exterior mirror control switch.

All vehicles

4. To install, reverse the removal procedure.

Third row tether anchor bolt	28	21	—

Seats

Driver Seat Module

The power driver seat, power outside rear view mirrors and power adjustable pedals are controlled by the driver seat module (DSM) only when the vehicle is equipped with the programmable/recall memory option.

The DSM system consists of the following components:

- Driver seat module (DSM).
- Driver memory seat switch.
- Memory mirror switch.
- Memory set switch.
- Adjustable pedal switch.
- Front vertical seat motor.
- Rear vertical seat motor.
- Horizontal seat motor.
- Power recliner seat motor (Navigator only).
- LH heated memory mirror.
- RH heated memory mirror.
- Power adjustable memory pedals.
- Remote entry key fob.

The DSM incorporates multiple functions into one module and offers diagnostics to easily locate and repair concerns affecting the subsystems that it controls.

For additional information on the DSM, refer to Section 419-10 .

Memory Power Driver Seat Operation

The memory driver seat feature allows the driver to program a personalized seat position that can be recalled using the memory switches or remote entry key fob. There are two memory settings possible. The outside rear view mirror positions and the power adjustable pedals are also stored and recalled with the power driver seat positions.

Programming Seat Positions

- A power driver seat position can be stored at any time. The driver must move the seat to the desired position using the driver seat switch assembly. The driver must then depress the memory SET switch which activates the memory SET switch light emitting diode (LED). Within

five seconds (before the LED goes out), the driver must select a memory position. Memory 1 is selected by depressing memory switch 1. Memory 2 is selected by depressing memory switch 2.

- If no memory switch input is received within the five-second time limit, the operation is aborted and the memory SET switch LED is turned off. If one of the following inputs is received during the five-second programming limit, the operation is aborted and the memory SET switch LED is turned off:
  - Power driver seat switch.
  - Power outside rear view mirror switch.
  - Memory SET switch.
  - Power adjustable pedal switch.

Recalling a Stored Seat Position

NOTE: A memory recall can be initiated only if the vehicle is in PARK or NEUTRAL gear and the ignition switch is not in START. A memory recall in progress will not be affected by moving the ignition switch to START or by moving the gearshift lever out of PARK or NEUTRAL.

Once the driver has stored the driver seat position, the driver can recall the setting by depressing the corresponding memory switch or by using a programmed remote entry transmitter.

- The driver can recall the desired driver seat position by depressing one of the memory recall switches. Depressing memory switch 1 will initiate a recall of the power driver seat position stored in memory 1. Depressing memory switch 2 will initiate a recall of the power driver seat position stored in memory 2.
- A remote transmitter can be used to recall previously set memory positions. The transmitter that has been assigned with personality 1 is capable of recalling memory position 1 only. Similarly, the personality 2 transmitter can recall only memory position 2.
- Memory recall occurs when the UNLOCK switch is depressed on the transmitter. The second depression of the UNLOCK switch, which unlocks passenger doors, does not initiate a memory recall.
- A memory recall in progress does not prohibit the initiation of another memory recall; the most recently requested memory recall will be executed.

40 Percent Chairs

The Expedition 40 percent chairs:

- are divided by a center console.
- have a standard manual lumbar adjuster on the driver seat.
- have 6-way power adjusters (standard on driver seat, optional on passenger seat).
- have optional climate controlled seating.
- have an optional memory driver seat.

The Navigator 40 percent chairs:

- are a bucket design.

- are divided by a center console.
- have standard power lumbar.
- have a standard 8-way power adjuster.
- have a standard driver memory seat.
- have optional climate controlled seating.
    - With climate controlled seating, there is an air filter located in the fan motor housing under the seat. See the owner literature for additional service and scheduled maintenance interval information.

60/40 Split Bench

The 60/40 split bench seats:

- have a front seat center armrest that divides the front seat backs.
- are available with a manual passenger seat only.
- may have an optional storage bin center armrest with cupholder.

Seats — Second Row

Two different types of second row seat configurations are available:

40/20/40

The second row can have 40/20/40 seats:

- is equipped with a 40 percent E-Z entry seat that provides easy access to the third row.
- folds down for more cargo area.

40/Center Console/40

The second row can have 40/center console/40 seats:

- is equipped with a 40 percent E-Z entry seat that provides easy access to the third row.
- the 40 percent seat will fold down for more cargo area.
- the center console has storage bin and beverage holder.

Seats — Third Row

The third row seat:

- is three-passenger seat.
- a 60/40 bench seat.
- folds down for more cargo area.
- has optional power fold down seats.

Third Row Power-Fold Seat

CAUTION: To prevent possible damage to the third row seat or the safety belts, make sure that the safety belts are not fastened when moving the seat to the load floor position.

CAUTION: Make sure that no objects such as books, purses or briefcases are on the floor in front of the third row seats or on the seat cushion before lowering the backrest(s).

The third row power-fold seat consists of the following electrical components:

- right third row seat relay.
- left third row seat relay.
- right power-fold seat motor.
- left power-fold seat motor.
- right front third row seat switch.
- left front third row seat switch.
- right rear third row seat switch.
- left rear third row seat switch.

For the third row power-fold seat to operate, a shared ground is supplied by the body security module (BSM) to both of the power-fold seat relays, enabling the seats to then be moved by pressing one of the third row power-fold seat switches. The third row power-fold seat operates only when the vehicle is in PARK and the ignition switch is ON (or the battery saver yet tripped), and the liftgate glass or liftgate door must be open.

The third row power-fold seat motors transfer movement to a drive gear assembly to raise and lower the seat backrest. The power-fold seat motors rotate a short drive cable which is connected to the drive gear assembly.

Principles of Operation

Climate Controlled Seat System

Both the driver and front passenger seats have an independent climate controlled seat system installed. A climate controlled seat module mounted to the bottom of the seat cushion electronically controls the climate controlled seat system. The climate controlled seat system receives power from both the battery power and vehicle run circuits. The vehicle must be running and the climate controlled seat switch fan speed selector thumb wheel switch in position 1, 2, 3, 4 or 5 for the climate controlled seat system to activate.

Cabin air is drawn through the a fan motor and distributed to each of the thermo-electric device (TED) modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad B-surface. Channels in the A-surface of the foam pad are used to distribute the air along the surface of the seat.

Once the system is activated, the climate controlled seat module uses a set of flexible algorithms to control the heating/cooling modes, and the fan motor speed based on the climate controlled seat switch settings. These algorithms are designed to protect the user from potentially harmful prolonged exposure to temperature extremes.

The TED uses a "Peltier" circuit of p-type and n-type semiconductors connected in series, using copper electrical conductors. The semiconductors are sandwiched between two insulating ceramic plates. When current is applied to the TED, one side releases energy as heat, while the opposite side absorbs energy and gets cold. By reversing the current flow, the hot and cold sides reverse.

Heating Characteristics

- The climate controlled seat system draws approximately 7.5 amps until reaching the set point, and then the system draws approximately 2 amps to maintain the temperature setting.
- In HEAT mode, the TED can add up to 40-60°C (72-108°F) to the ambient air temperature entering the system.
- There are two HEAT mode settings based on the position of the climate controlled seat switch thumb wheel. Position one is the low setting and position five is the high setting
- In the low setting, the climate controlled seat module is set to maintain seat surface temperature at 37°C (99°F).
- In the high setting, the climate controlled seat module is set to maintain seat surface temperature at 43-45°C (109-113°F).
- If the temperature at one of the TEDs rises above 70°C (158°F), the climate controlled seat module will the go into an over temperature mode and shut down the TEDs. The fan motor will continue to operate during over temperature mode.
- In HEAT mode, there is no linear correlation between the thumb wheel position, seat fan motor speed, and TED supply voltage. The climate controlled seat module will independently vary the fan speed TED supply voltage in order to reach and maintain the temperature determined by the thumb wheel.

Cooling Characteristics

- The climate controlled seat system draws approximately seven amps until reaching the set point, and then the system draws approximately two amps to maintain the temperature setting.
- In COOL mode, the TED can remove up to 8-10°C (14-18°F) from the ambient air temperature entering the system.
- There are five COOL mode settings based on the position of the climate controlled seat switch thumb wheel. Position one is the low setting and position five is the high setting.
- If the temperature at one of the TEDs falls below 18°C (64°F), the climate controlled seat module will shut down the TEDs. If the temperature continues to drop below 12°C (54°F), the climate controlled seat module will shut down the fan motor.
- In COOL mode, there is a linear correlation between the climate controlled seat switch thumbwheel position, seat fan motor speed, and TED supply voltage. For additional information, refer to the following chart.

Climate Controlled Seat Switch Thumbwheel Position	Seat Fan Motor Supply Voltage	Thermo- Electric Device Supply Voltage
0	Off	Off
1	7 volts	0 volts
2	5.4 volts	2.1 volts
3	5.4 volts	3.5 volts
4	5.5 volts	4.1 volts
5	5.5 volts	4.1 volts

The climate controlled seat system is deactivated by one of the following actions:

- Setting the climate controlled seat switch to off.
- Cooling seats time-out after 30 minutes.
- Heated seats time-out after 15 minutes.
- Turning the vehicle off.

Inspection and Verification

1. Verify the customer concern by operating the power seat, memory seat or climate controlled seat functions.
2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Seat track • Climate controlled seat ducts	• Fuse(s) • Circuitry • Driver seat module (DSM) • Lumbar control switch

	• Memory set switch • Power seat motor • Seat control switch • Seat fan motor • Climate controlled seat module • Climate controlled seat switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern is with the power seat (non-memory seat) or the power lumbar and the cause is not visually evident, verify the symptom and GO to Symptom Chart .

5. If the concern is with the memory seat or climate controlled seat and the cause is not visually evident, connect the scan tool to the data link connector (DLC) and select the vehicle to be tested from the scan tool menu. If the scan tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

6. If the scan tool still does not communicate with the vehicle, refer to the scan tool manual.

7. Carry out the DATA LINK DIAGNOSTICS test. If the scan tool responds with:
   - CKT914, CKT915, or CKT70=ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
   - NO RESPONSE/NOT EQUIPPED for driver DSM, refer to Section 419-01 .
   - NO RESPONSE/NOT EQUIPPED for climate controlled seat module, Section 419-01 .
   - SYSTEM PASSED for the DSM, retrieve and record the continuous diagnostic trouble codes (DTCs), clear the continuous DTCs and carry out self-test diagnostics for the DSM.
   - SYSTEM PASSED for the climate controlled seat module, retrieve and record the continuous diagnostic trouble codes (DTCs), clear the continuous DTCs and carry out self-test diagnostics for the climate controlled seat module.

8. If the DTCs retrieved are related to the concern, go to DSM Diagnostic Trouble Code (DTC) Index or the climate controlled Seat Module Diagnostic Trouble Code (DTC) Index.

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

B2477	Module Configuration Failure	DSM	INSTALL a new DSM.

Climate Controlled Seat Module (CCSM) Diagnostic Trouble Code (DTC) Index

Climate Controlled Seat Module (CCSM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Faulted	CCSM	INSTALL a new CCSM. REFER to Climate Controlled Seat Module .
B1358	Ignition Switch or Blower Electronics Circuit Short to Ground	CCSM	Go To Pinpoint Test P .
B2477	Module Configuration Error	CCSM	RECONFIGURE the CCSM. CLEAR the DTC. If the DTC resets, INSTALL a new CCSM.
B2486	Climate Controlled Seat Module Voltage Out of Range	CCSM	CHECK circuit 294 (WH/LB) for a fault and REPAIR as needed. If okay, REFER to Section 414-00 .
B2488	Thumb-Wheel Switch Voltage Out of Range High	CCSM	Go To Pinpoint Test P .
B2521	Tach Circuit Failure	CCSM	Go To Pinpoint Test P .
B2729	Cushion Over-Temp Detected	CCSM	Go To Pinpoint Test P .
B2730	Back Over-Temp Detected	CCSM	Go To Pinpoint Test P .
B2731	Differential Temperature Fault	CCSM	Go To Pinpoint Test P .
B2792	Heat Switch Short to Ground	CCSM	Go To Pinpoint Test P .
B2793	Cool Switch Short to Ground	CCSM	Go To Pinpoint Test P .
U2362	UBP Invalid Data Node ID	CCSM	REFER to Section 418-00 .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The power seat is inoperative — Expedition	• PDJB Fuse 109 (30A) (driver). • PDJB Fuse 108 (30A) (passenger). • Seat control switch (14A701). • Circuitry.	• Go To Pinpoint Test A .
• The power seat is inoperative — Navigator — Passenger	• PDJB Fuse 108 (30A) (passenger). • Seat control switch (14A701). • Circuitry.	• Go To Pinpoint Test B .

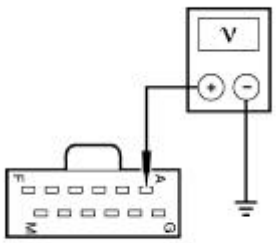
• The power seat moves but is noisy	• Seat tracks. • Fwd/Rwd drive cables. • Power seat motors.	• Go To Pinpoint Test C.
• The power seat moves but is loose	• Fastening hardware. • Seat tracks. • Power seat motors.	• Go To Pinpoint Test D.
• The power seat does not make full travel	• Track obstruction. • Seat tracks. • Fwd/Rwd drive cables. • Power seat motors.	• Go To Pinpoint Test E.
• The power seat does not move horizontally/vertically — Expedition	• Seat tracks. • Circuitry. • Seat control switch. • Power seat motors. • Fwd/Rwd drive cables.	• Go To Pinpoint Test F.
• The power seat does not move horizontally/vertically/recline — Navigator — Passenger	• Seat tracks. • Circuitry. • Seat control switch. • Power seat motors. • Fwd/Rwd drive cables.	• Go To Pinpoint Test G
• The memory seat is inoperative	• Circuitry. • Seat control switch. • Seat track. • DSM. • PDJB Fuse 109 (30A). • Power seat motor.	• Go To Pinpoint Test H (Navigator) or Go To Pinpoint Test I (Expedition).
• The memory seat does not operate correctly — does not operate using the memory set switch	• Memory set switch. • DSM. • Circuitry.	• Go To Pinpoint Test J.
• The memory seat does not operate correctly — does not operate using the remote transmitter	• Circuitry. • DSM. • Keyless entry transmitter. • RAP module.	• REFER to the DTC Index.
• No communication with the module — DSM	• Circuitry. • DSM. • Fuse(s).	• REFER to Section 419-01.
• No communication with the module — unable to carry out on-demand self-test with the DSM	• DSM. • Circuitry. • Fuse(s).	• REFER to Section 419-01.

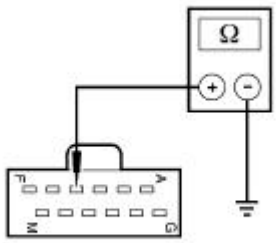
• The power lumbar is inoperative	• Circuitry. • Lumbar control switch. • Power lumbar assembly. • Power lumbar motor.	• Go To Pinpoint Test K (driver) or Go To Pinpoint Test L (passenger).
• The third row power fold seat is inoperative/does not operate correctly — Both	• Fuse(s). • Circuitry. • Body Security Module (BSM).	• Go To Pinpoint Test M .
• The third row power fold seat is inoperative/does not operate correctly — Left	• Fuse(s). • Circuitry. • Seat control switch(es). • Power seat motor. • Power seat relay. • Power seat motor drive cable.	• Go To Pinpoint Test N .
• The third row power fold seat is inoperative/does not operate correctly — Right	• Fuse(s). • Circuitry. • Seat control switch(es). • Power seat motor. • Power seat relay. • Power seat motor drive cable.	• Go To Pinpoint Test O .
• All climate controlled seats are inoperative	• CJB Fuse F1.118 (30A). • Circuitry.	• CHECK driver CCSM C3031b-4 (or passenger CCSM C3036b-4), circuit 1153 (RD/BK) for battery voltage, REPAIR as needed. If okay, REPAIR ground to driver CCSM C3016b-3 (or passenger CCSM C3036b-3 and C3036a-9), circuit 57 (BK).
• A single climate controlled seat is inoperative/does not operate correctly	• Circuitry. • Climate controlled seat ducts. • Climate controlled seat switch. • Seat fan	• Go To Pinpoint Test P .

	motor. ● Seat cushion TED. ● Seat backrest TED. ● CCSM.	
● No communication with the driver CCSM	● Circuitry. ● CCSM.	● CHECK driver CCSM C3031b-2 (or passenger CCSM C3036b-2), circuit 294 (WH/LB) for ignition voltage and C3031b-3 (or C3036b-3 and passenger CCSM C3031a-9), circuit 57 (BK) for ground, REPAIR as needed. If okay, REFER to Section 418-00 .

Pinpoint Tests

CAUTION: Electronic modules are sensitive to electrostatic discharge. If exposed to these charges, damage may result.





PINPOINT TEST A: THE POWER SEAT IS INOPERATIVE — EXPEDITION

Test Step	Result / Action to Take
A1 CHECK THE VOLTAGE TO THE SEAT SWITCH — CIRCUIT 566 (DG) OR (PASSENGER 1462 [RD/WH])	
WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards. NOTE: If a seat equipped with a seat-mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.** Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section. **NOTE:** Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors. **NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the supplemental restraint system (SRS). Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. ● Disconnect: Seat Control Switch C352 (C355 Passenger). ● Measure the voltage between driver seat control switch C352-7,	**Yes** GO to A2 . **No** REPAIR driver circuit 566 (DG) (or passenger circuit 1462 [RD/WH]). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

circuit 566 (DG) (or passenger seat control switch C355-7, circuit 1462 [RD/WH]), harness side and ground.  A0033450 • **Is the voltage greater than 10 volts?**	
A2 CHECK CIRCUIT 57 (BK) FOR OPEN	
• Measure the resistance between driver seat control switch C352-1, circuit 57 (BK) (or passenger seat control switch C355-1, circuit 57 [BK]), harness side and ground.  A0017417 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch—6-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR circuit 57 (BK). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

PINPOINT TEST B: THE POWER SEAT IS INOPERATIVE — NAVIGATOR — PASSENGER

Test Step	Result / Action to Take
B1 CHECK THE VOLTAGE TO THE SEAT SWITCH	
WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to	**Yes** GO to B2.

road use. Failure to remove could result in injury and possible violation of vehicle safety standards. NOTE: If a seat equipped with a seat-mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.** Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section. **NOTE:** Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors. **NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the supplemental restraint system (SRS). Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. ● Disconnect: Seat Control Switch C3026. ● Measure the voltage between seat control switch C3026-A, circuit 1462 (RD/WH), harness side and ground.  A0049730 ● **Is the voltage greater than 10 volts?**	**No** REPAIR circuit 1462 (RD/WH). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
B2 CHECK GROUND CIRCUIT FOR OPEN ● Measure the resistance between seat control switch C3026-D, circuit 57 (BK), harness side and ground.  A0049731 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch—8-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR circuit 57 (BK). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental

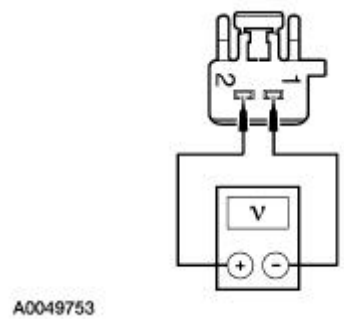
	Restraint System (SRS) Deactivation and Reactivation in this section.

PINPOINT TEST C: THE POWER SEAT MOVES BUT IS NOISY

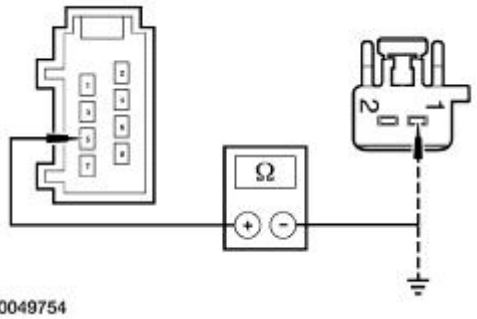
Test Step	Result / Action to Take
C1 CHECK THE TRACK ALIGNMENT	
WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards. NOTE: If a seat equipped with a seat-mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.** Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section. **NOTE:** Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors. **NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the supplemental restraint system (SRS). Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. ● Key in OFF position. ● Check the alignment of the track to the floor and the track to the seat. ● **Is the track out of alignment?**	**Yes** ALIGN the track to the seat and the floor. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** INSTALL a new seat track part. REFER to Seat Track—Power or Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

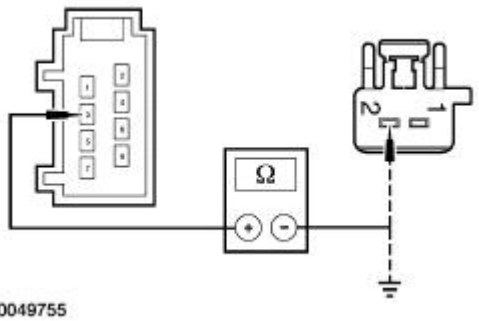
PINPOINT TEST D: THE POWER SEAT MOVES BUT IS LOOSE

Test Step	Result / Action to Take
D1 CHECK THE FASTENING HARDWARE	
WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards. NOTE: If a seat equipped with a seat-mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.** Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section. **NOTE:** Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors. **NOTE:** After diagnosing or	**Yes** TIGHTEN all fastening hardware to specifications. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** IDENTIFY the cause and

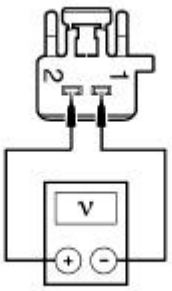


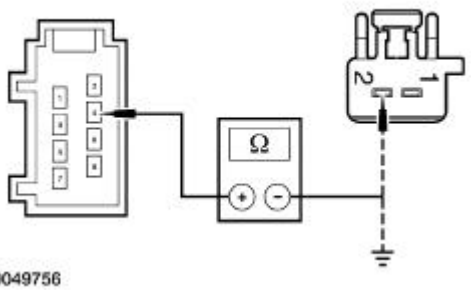
repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the supplemental restraint system (SRS). Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. ● Key in OFF position. ● **Is the fastening hardware loose?**	INSTALL a new seat track component. REFER to Seat Track—Power or Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.



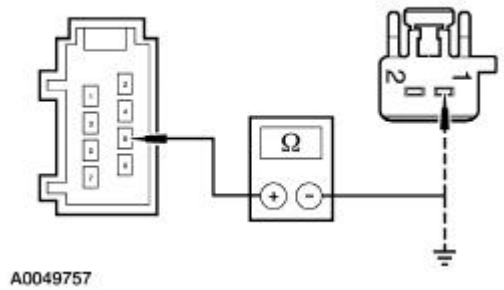


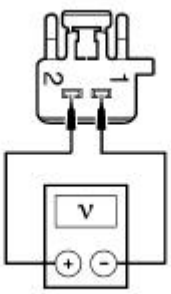
PINPOINT TEST E: THE POWER SEAT DOES NOT MAKE FULL TRAVEL



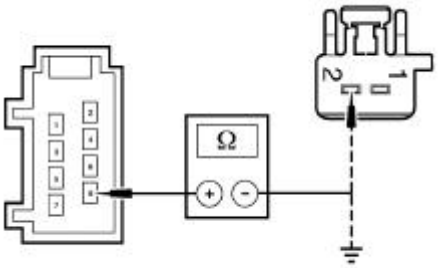


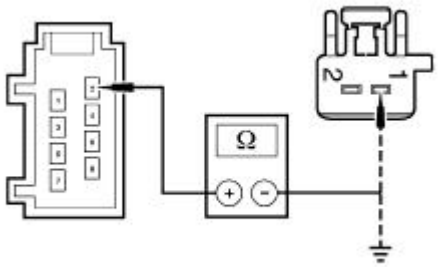
Test Step	Result / Action to Take
E1 CHECK FOR OBSTRUCTION IN THE SEAT TRACK	
WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards. NOTE: If a seat equipped with a seat-mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.** Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section. **NOTE:** Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors. **NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the supplemental restraint system (SRS). Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. ● Key in OFF position. ● Remove the seat. For additional information, refer to Front Seat—40 Percent in this section. ● **Are there any obstructions in the track?**	**Yes** REMOVE the obstruction(s) and GREASE the track(s). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** IDENTIFY the cause and INSTALL a new seat track component. REFER to Seat Track—Power or Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.



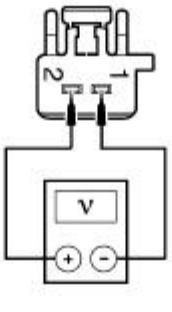


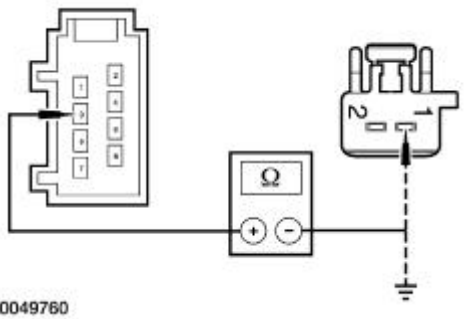
PINPOINT TEST F: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY — EXPEDITION

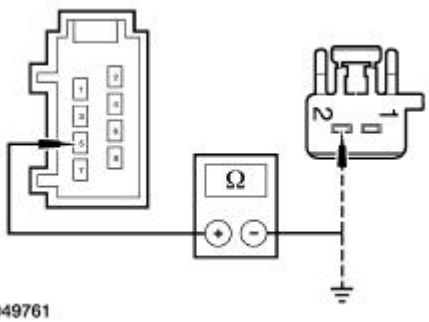




Test Step	Result / Action to Take
F1 DETERMINE WHICH POWER SEAT HAS FAILED	
WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to	**Yes** GO to F13.



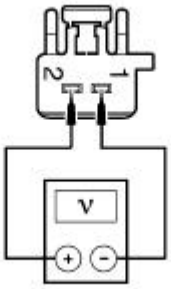


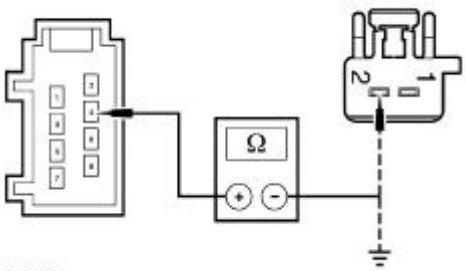


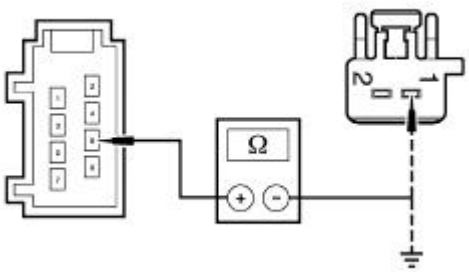
road use. Failure to remove could result in injury and possible violation of vehicle safety standards. NOTE: If a seat equipped with a seat-mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.** Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section. **NOTE:** Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors. **NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the supplemental restraint system (SRS). Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. ● Key in OFF position. ● **Does the driver power seat operate correctly?**	**No** GO to F2 .
F2 DETERMINE WHICH DIRECTION HAS FAILED	
● Operate the power seat forward and rearward. ● **Will the track move horizontally?**	**Yes** GO to F6 . **No** GO to F3 .
F3 CHECK THE VOLTAGE TO FORWARD/REVERSE SEAT MOTOR	
● Disconnect: Power Seat Motor C362. ● Measure the voltage between power seat motor assembly C362-1, circuit 980 (YE/WH), harness side and C362-2, circuit 981 (RD/WH), harness side while pushing the forward/reverse switch forward and backward.  A0049753 ● **Is the voltage greater than -10 volts when the forward/reverse switch is pressed forward, greater than +10 volts with the forward reverse switch is pressed backward and 0 volts when the switch is in the rest position?**	**Yes** INSTALL a new forward/reverse power seat motor. REFER to Front Seat Track Motor in this section. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to F4 .
F4 CHECK CIRCUIT 980 (YE/WH) FOR AN OPEN AND A SHORT TO GROUND	
● Disconnect: Seat Control Switch C352. ● Measure the resistance between seat control switch C352-5, circuit 980 (YE/WH), harness side and power seat motor C362-1, circuit 980 (YE/WH), harness side; and between seat control switch C352-5, circuit 980 (YE/WH), harness side and ground.	**Yes** GO to F5 . **No** REPAIR circuit 980 (YE/WH). TEST the system for normal operation. REACTIVATE the supplemental

 A0049754 ● **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
F5 CHECK CIRCUIT 981 (RD/WH) FOR AN OPEN AND A SHORT TO GROUND	
● Measure the resistance between seat control switch C352-3, circuit 981 (RD/WH), harness side and power seat motor C362-2, circuit 981 (RD/WH), harness side; and between seat control switch C352-3, circuit 981 (RD/WH), harness side and ground.  A0049755 ● **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch—6-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR circuit 981 (RD/WH). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
F6 DETERMINE SEAT TILTING FAILURE	
● Determine seat tilting failure. ● **Can the seat be tilted forward or backward?**	**Yes** If only the forward tilting operates, GO to F7. If only the rear tilting operates, GO to F10. **No** INSTALL a new seat

	control switch. REFER to Seat Control Switch—6-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
F7 CHECK THE VOLTAGE TO THE REAR HEIGHT MOTOR • Disconnect: Power Seat Motor C363. • Measure the voltage between power seat motor C363-2, circuit 983 (RD/LG), harness side and C363-1, circuit 982 (YE/LG), harness side while depressing the rear tilt switch up and down.  A0049753 • **Is the voltage greater than +10 volts when the rear tilt switch is pressed up, greater than -10 volts when the rear tilt switch is pressed down and 0 volts when the switch is in the rest position?**	**Yes** INSTALL a new rear height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to F8.
F8 CHECK CIRCUIT 983 (RD/LG) FOR AN OPEN AND A SHORT TO GROUND • Disconnect: Seat Control Switch C352. • Measure the resistance between seat control switch C352-4, circuit 983 (RD/LG), harness side and power seat motor C363-2, circuit 983 (RD/LG), harness side; and between seat control switch C352-4, circuit 983 (RD/LG), harness side and ground.  A0049756 • **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** GO to F9. **No** REPAIR circuit 983 (RD/LG). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
F9 CHECK CIRCUIT 982 (YE/LG) FOR AN OPEN AND A SHORT TO GROUND	





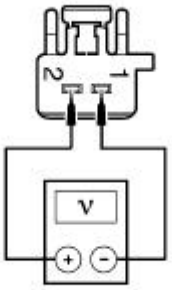


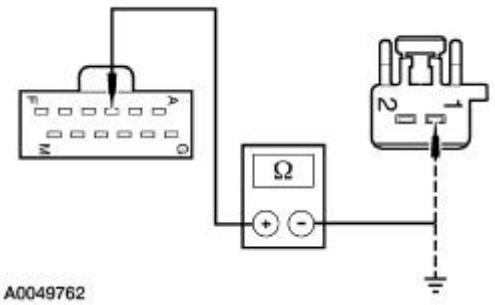
• Measure the resistance between seat control switch C352-6, circuit 982 (YE/LG), harness side and power seat motor assembly C363-1, circuit 982 (YE/LG), harness side; and between seat control switch C352-6, circuit 982 (YE/LG), harness side and ground.  A0049757 • **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch—6-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR circuit 982 (YE/LG). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
F10 CHECK THE VOLTAGE TO FRONT HEIGHT MOTOR	
• Disconnect: Power Seat Motor C382. • Measure the voltage between power seat motor C382-2, circuit 979 (RD/LB), harness side and C382-1, circuit 978 (YE/LB), harness side while pushing the rear tilting switch up and down.  A0049753 • **Is the voltage greater than +10 volts when the front tilt switch is pressed up, greater than -10 volts when the front tilt switch is pressed down and 0 volts when the switch is in the rest position?**	**Yes** INSTALL a new front height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to F11 .
F11 CHECK CIRCUIT 979 (RD/LB) FOR AN OPEN AND A SHORT TO GROUND	
• Disconnect: Seat Control Switch C352. • Measure the resistance between seat control switch C352-8, circuit 979 (RD/LB), harness side and power seat motor C382-2, circuit 979 (RD/LB), harness side; and between seat control switch C352-8, circuit 979 (RD/LB), harness side and ground.	**Yes** GO to F12 . **No** REPAIR circuit 979 (RD/LB). TEST the

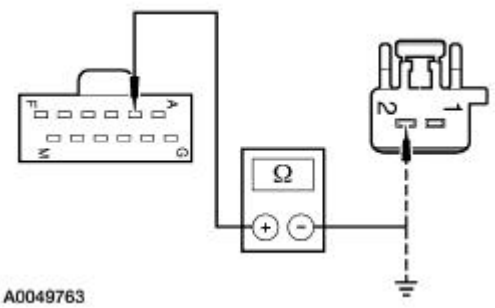
 A0049758 ● **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
F12 CHECK CIRCUIT 978 (YE/LB) FOR AN OPEN	
● Measure the resistance between seat control switch C352-2, circuit 978 (YE/LB), harness side and power seat motor C382-1, circuit 978 (YE/LB), harness side; and between seat control switch C352-2, circuit 978 (YE/LB), harness side and ground.  A0049759 ● **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch—6-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR circuit 978 (YE/LB). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
F13 DETERMINE WHICH DIRECTION HAS FAILED — PASSENGER SEAT	
● Operate the power seat forward and rearward. ● **Will the track move horizontally?**	**Yes** GO to F17. **No** GO to F14.
F14 CHECK THE VOLTAGE TO FORWARD REVERSE SEAT MOTOR — PASSENGER SEAT	
● Disconnect: Power Seat Motor C332. ● Measure the voltage between power seat motor C332-1, circuit 986 (YE/WH), harness side and C332-2, circuit 987 (RD/WH),	**Yes** INSTALL a new forward/reverse

harness side while pushing the forward/reverse switch forward and backward.  A0049753 • **Is the voltage greater than -10 volts when the forward/reverse switch is pressed forward, greater than +10 volts when the forward/reverse switch is pressed backward and 0 volts when the switch is in the rest position?**	power seat motor assembly. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to F15.
F15 CHECK CIRCUIT 986 (YE/WH) FOR AN OPEN AND A SHORT TO GROUND	
• Disconnect: Seat Control Switch C355. • Measure the resistance between seat control switch C355-3, circuit 986 (YE/WH), harness side and power seat motor C332-1, circuit 986 (YE/WH), harness side; and between seat control switch C355-3, circuit 986 (YE/WH), harness side and ground.  A0049760 • **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** GO to F16. **No** REPAIR circuit 986 (YE/WH). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
F16 CHECK CIRCUIT 987 (RD/WH) FOR AN OPEN AND A SHORT TO GROUND	
• Measure the resistance between seat control switch C355-5, circuit 987 (RD/WH), harness side and power seat motor C332-2, circuit 987 (RD/WH), harness side; and between seat control switch C355-5, circuit 987 (RD/WH), harness side and ground.  A0049761 • **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch—6-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No**

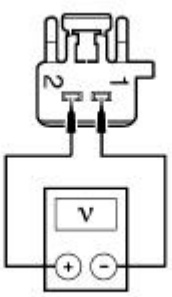
	REPAIR circuit 987 (RD/WH). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
F17 DETERMINE SEAT TILTING FAILURE — PASSENGER SEAT	
• Determine seat tilting failure. • **Can the seat be tilted forward or backward?**	**Yes** If only the forward tilting operates, GO to F18 . If only the rear tilting operates, GO to F21 . **No** INSTALL a new seat control switch. REFER to Seat Control Switch—6-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
F18 CHECK THE VOLTAGE TO THE REAR HEIGHT MOTOR — PASSENGER SEAT	
• Disconnect: Power Seat Motor C3075. • Measure the voltage between power seat motor C3075-2, circuit 989 (RD/LG), harness side and C3075-1, circuit 988 (YE/LG), harness side while depressing the rear tilt switch up and down.  A0049753 • **Is the voltage greater than +10 volts when the rear tilt switch is pressed up, greater than -10 volts when the rear tilt switch is pressed down and 0 volts when the switch is in the rest**	**Yes** INSTALL a new rear height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No**





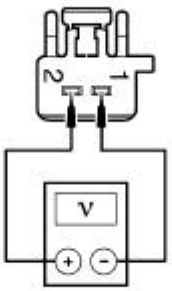


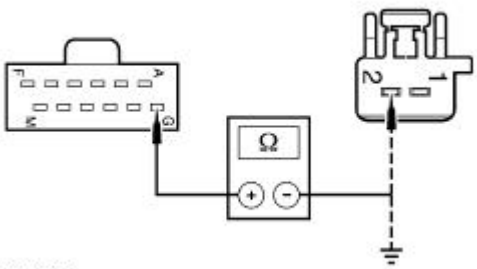
position?	GO to F19 .
F19 CHECK CIRCUIT 989 (RD/LG) FOR OPEN AND A SHORT TO GROUND	
• Disconnect: Seat Control Switch C355. • Measure the resistance between seat control switch C355-8, circuit 989 (RD/LG), harness side and power seat motor C3075-2, circuit 989 (RD/LG), harness side; and between seat control switch C355-8, circuit 989 (RD/LG), harness side and ground.  A0049758 • **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** GO to F20 . **No** REPAIR circuit 989 (RD/LG). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
F20 CHECK CIRCUIT 988 (YE/LG) FOR AN OPEN AND A SHORT TO GROUND	
• Measure the resistance between seat control switch C355-2, circuit 988 (YE/LG), harness side and power seat motor C3075-1, circuit 988 (YE/LG), harness side; and between seat control switch C355-2, circuit 988 (YE/LG), harness side and ground.  A0049759 • **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch—6-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR circuit 988 (YE/LG). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
F21 CHECK THE VOLTAGE TO FRONT HEIGHT MOTOR — PASSENGER SEAT	
• Disconnect: Power Seat Motor C3074.	**Yes**



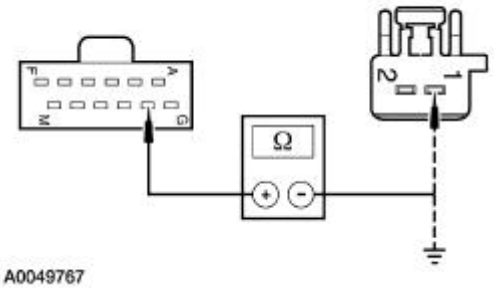
• Measure the voltage between power seat motor C3074-2, circuit 985 (RD/LB), harness side and C3074-1, circuit 984 (YE/LB), harness side while pushing the rear tilting switch up and down.  A0049753 • **Is the voltage greater than +10 volts when the front tilt switch is pressed up, greater than -10 volts when the front tilt switch is pressed down and 0 volts when the switch is in the rest position?**	INSTALL a new front height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to F22 .
F22 CHECK CIRCUIT 985 (RD/LB) FOR AN OPEN AND A SHORT TO GROUND	
• Disconnect: Seat Control Switch C355. • Measure the resistance between seat control switch C355-4, circuit 985 (RD/LB), harness side and power seat motor C3074-2, circuit 985 (RD/LB), harness; side and between seat control switch C355-4, circuit 985 (RD/LB), harness side and ground.  A0049756 • **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** GO to F23 . **No** REPAIR circuit 985 (RD/LB). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
F23 CHECK CIRCUIT 984 (YE/LB) FOR AN OPEN	
• Measure the resistance between seat control switch C355-6, circuit 984 (YE/LB), harness side and power seat motor C3074-1, circuit 984 (YE/LB), harness side; and between seat control switch C355-6, circuit 984 (YE/LB), harness side and ground.  A0049757 • **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch—6-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No**

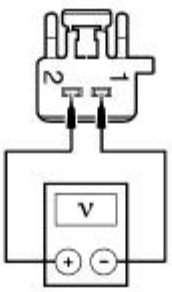
	REPAIR circuit 984 (YE/LB). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

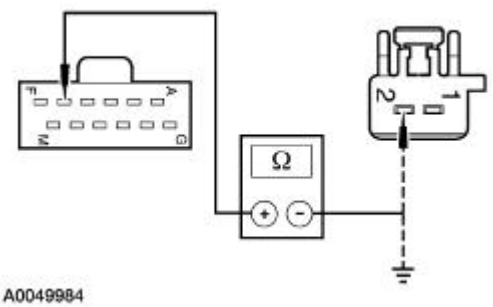




PINPOINT TEST G: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY/RECLINE — PASSENGER SIDE, NAVIGATOR







Test Step	Result / Action to Take
G1 DETERMINE WHICH DIRECTION HAS FAILED — PASSENGER SEAT	
WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards. NOTE: If a seat equipped with a seat-mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.** Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section. **NOTE:** Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors. **NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the supplemental restraint system (SRS). Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. ● Key in OFF position. ● Operate the power seat forward and rearward. ● **Will the track move horizontally?**	**Yes** GO to G5. **No** GO to G2.
G2 CHECK THE VOLTAGE TO THE FORWARD REVERSE SEAT MOTOR — PASSENGER SEAT	
● Disconnect: Power Seat Motor C332. ● Measure the voltage between power seat motor C332-1, circuit 986 (YE/WH), harness side and C332-2, circuit 987 (RD/WH), harness side while pushing the forward/reverse switch forward and backward.	**Yes** INSTALL a new forward/reverse power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental

 A0049753 ● **Is the voltage greater than -10 volts when the forward/reverse switch is pressed forward, greater than +10 volts when the forward/reverse switch is pressed backward and 0 volts when the switch is in the rest position?**	restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to G3.
G3 CHECK CIRCUIT 986 (YE/WH) FOR AN OPEN AND A SHORT TO GROUND	
● Disconnect: Seat Control Switch C3026. ● Measure the resistance between seat control switch C3026-C, circuit 986 (YE/WH), harness side and power seat motor C332-1, circuit 986 (YE/WH), harness side; and between seat control switch C3026-C, circuit 986 (YE/WH), harness side and ground.  A0049762 ● **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** GO to G4. **No** REPAIR circuit 986 (YE/WH). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
G4 CHECK CIRCUIT 987 (RD/WH) FOR AN OPEN AND A SHORT TO GROUND	
● Measure the resistance between seat control switch C3026-B, circuit 987 (RD/WH), harness side and power seat motor C332-2, circuit 987 (RD/WH), harness side; and between seat control switch C3026-B, circuit 987 (RD/WH), harness side and ground.  A0049763 ● **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch—8-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR circuit 987 (RD/WH). TEST the

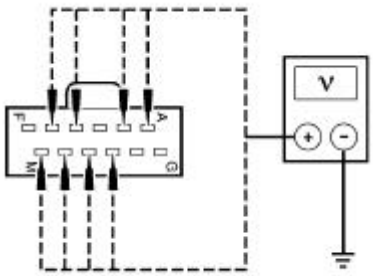
	system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
G5 DETERMINE SEAT TILTING FAILURE — PASSENGER SEAT	
• Determine seat tilting failure. • **Can the seat be tilted forward or backward or recline?**	**Yes** If the rear tilting does not operate, GO to G6. If the front tilting does not operate, GO to G9. If the recline does not operate, GO to G12. **No** INSTALL a new seat control switch. REFER to Seat Control Switch—8-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
G6 CHECK THE VOLTAGE TO THE REAR HEIGHT MOTOR — PASSENGER SEAT	
• Disconnect: Power Seat Motor C3075. • Measure the voltage between rear height power seat motor C3075-2, circuit 989 (RD/LG), harness side and C3075-1, circuit 988 (YE/LG), harness side while depressing the rear tilt switch up and down.  A0049753 • **Is the voltage greater than +10 volts when the rear tilt switch**	**Yes** INSTALL a new rear height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

is pressed up, greater than -10 volts when the rear tilt switch is pressed down and 0 volts when the switch is in the rest position?	**No** GO to G7 .
G7 CHECK CIRCUIT 989 (RD/LG) FOR AN OPEN AND A SHORT TO GROUND	
• Disconnect: Seat Control Switch C3026. • Measure the resistance between seat control switch C3026-J, circuit 989 (RD/LG), harness side and rear height power seat motor C3075-2, circuit 989 (RD/LG), harness side; and between seat control switch C3026-J, circuit 989 (RD/LG), and ground.  A0049764 • **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** GO to G8 . **No** REPAIR circuit 989 (RD/LG). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
G8 CHECK CIRCUIT 988 (YE/LG) FOR AN OPEN AND A SHORT TO GROUND	
• Measure the resistance between seat control switch C3026-K, circuit 988 (YE/LG), harness side and rear height power seat motor C3075-1, circuit 988 (YE/LG), harness side; and between seat control switch C3026-K, circuit 988 (YE/LG), harness side and ground.  A0049765 • **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch—8-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR circuit 988 (YE/LG). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
G9 CHECK THE VOLTAGE TO FRONT HEIGHT MOTOR — PASSENGER SEAT	

• Disconnect: Power Seat Motor C3074. • Measure the voltage between front height power seat motor C3074-2, circuit 985 (RD/LB), harness side and C3074-1, circuit 984 (YE/LB), harness side while pushing the rear tilting switch up and down.  A0049753 • **Is the voltage greater than +10 volts when the front tilt switch is pressed up, greater than -10 volts when the front tilt switch is pressed down and 0 volts when the switch is in the rest position?**	**Yes** INSTALL a new front height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to G10.
G10 CHECK CIRCUIT 985 (RD/LB) FOR AN OPEN AND A SHORT TO GROUND	
• Disconnect: Seat Control Switch C3026. • Measure the resistance between seat control switch C3026-G, circuit 985 (RD/LB), harness side and front height power seat motor C3074-2, circuit 985 (RD/LB), harness side; and between seat control switch C3026-G, circuit 985 (RD/LB), harness side and ground.  A0049766 • **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** GO to G11. **No** REPAIR circuit 985 (RD/LB). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
G11 CHECK CIRCUIT 984 (YE/LB) FOR AN OPEN	
• Measure the resistance between seat control switch C3026-H, circuit 984 (YE/LB), harness side and front height power seat motor C3074-1, circuit 984 (YE/LB), harness side; and between seat control switch C3026-H, circuit 984 (YE/LB), harness side and ground.	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch—8-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in

 A0049767 ● **Is the resistance less than 5 ohms between the power seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	this section. **No** REPAIR circuit 984 (YE/LB). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
G12 CHECK THE VOLTAGE TO THE RECLINER MOTOR — PASSENGER SEAT	
● Disconnect: Recliner Motor C3189. ● Measure the voltage between recliner motor C3189-2, circuit 919 (GY/BK), harness side and C3189-1, circuit 918 (GY), harness side while depressing the recliner switch up and down.  A0049753 ● **Is the voltage greater than +10 volts when the recliner switch is pressed up, greater than -10 volts when the recliner switch is pressed down and 0 volts when the switch is in the rest position?**	**Yes** INSTALL a new recliner power seat motor. REFER to Front Seat Recliner Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to G13 .
G13 CHECK CIRCUIT 919 (GY/BK) FOR AN OPEN AND A SHORT TO GROUND	
● Disconnect: Seat Control Switch C3026. ● Measure the resistance between seat control switch C3026-E, circuit 919 (GY/BK), harness side and power recliner seat motor C3189-2, circuit 919 (GY/BK), harness side; and between seat control switch C3026-E, circuit 919 (GY/BK), and ground.  A0049984 ● **Is the resistance less than 5 ohms between the power recliner seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** GO to G14 . **No** REPAIR circuit 919 (GY/BK). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
G14 CHECK CIRCUIT 918 (GY) FOR AN OPEN AND A SHORT TO	

GROUND	
• Measure the resistance between seat control switch C3026-F, circuit 918 (GY), harness side and power recline seat motor C3075-1, circuit 918 (GY), harness side; and between seat control switch C3026-F, circuit 918 (GY), harness side and ground.  • **Is the resistance less than 5 ohms between the power recline seat motor and the seat control switch, and greater than 10,000 ohms between the seat control switch and ground?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch—8-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR circuit 918 (GY). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.



PINPOINT TEST H: THE MEMORY SEAT IS INOPERATIVE — NAVIGATOR

Test Step	Result / Action to Take
H1 RETRIEVE THE DTCS	
WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards. NOTE: If a seat equipped with a seat-mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.** Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section. **NOTE:** Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors. **NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Deactivate the supplemental restraint system (SRS). Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.	**Yes** If DTCs B1663, B1664, and B1665 are all retrieved, GO to H10. If DTC B1663, GO to H18. If DTC B1664, GO to H21. If DTC B1665, GO to H24. If DTC B1711, GO to H3. If DTC B1715, GO to

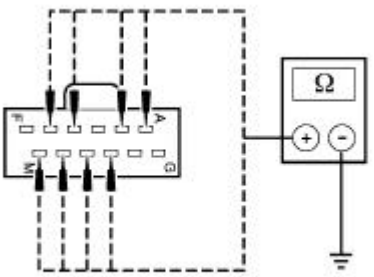
• Key in OFF position. • Connect the diagnostic tool. • Enter the following diagnostic mode on the diagnostic tool: Retrieve and Document Continuous DTCs. • Enter the following diagnostic mode on the diagnostic tool: Clear the Continuous DTCs. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self-Test. • **Are any DTCs retrieved?**	H3 . If DTC B1719, GO to H3 . If DTC B1723, GO to H3 . If DTC B1727, GO to H3 . If DTC B1731, GO to H3 . If DTC B1342, INSTALL a new DSM. REFER to Section 419-10 . TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to H2 .
H2 CHECK THE DSM FOR CORRECT MEMORY SEAT SWITCH INPUTS — MONITOR THE DSM PIDS SFNT_SW, SREARSW, SFWS_SW AND SRCL_SW	
• Enter the following diagnostic mode on the diagnostic tool: Monitor PIDs. • Monitor the PIDs SFNT_SW, SREARSW, SFWS_SW and SRCLSW while activating the seat switch. • **Do the PID values agree with the switch positions?**	**Yes** GO to H9 . **No** If Power Distribution Junction Box (PDJB) fuse 3 (7.5A) fails while operating the seat control switch, DISCONNECT the seat control switch C3016 and GO to H7 . If PDJB fuse 3 (7.5A) is OK, GO to H3 .
H3 CHECK THE SEAT CONTROL SWITCH	
• Key in OFF position. • Disconnect: Seat Control Switch C3016. • Check the seat control switch. For additional information, refer to Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the seat control switch OK?**	**Yes** GO to H4 . **No** INSTALL a new seat control switch. REFER to Seat Control Switch—8-Way in this section. TEST the system for normal operation.

	REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
H4 CHECK FOR VOLTAGE TO THE SEAT CONTROL SWITCH — CIRCUIT 956 (OG/LG) • Measure the voltage between seat control switch C3016-F, circuit 956 (OG/LG), harness side and ground.  A0050068 • **Is the voltage greater than 10 volts?**	**Yes** GO to H5 . **No** REPAIR circuit 956 (OG/LG). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
H5 CHECK CIRCUIT 875 (BK/LB) FOR AN OPEN • Measure the resistance between seat control switch C3016-C, circuit 875 (BK/LB), harness side and ground.  A0050069 • **Is the resistance less than 5 ohms?**	**Yes** GO to H6 . **No** REPAIR circuit 875 (BK/LB). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
H6 CHECK CIRCUITS 1468, 1467, 1466, 1463, 1465, 1464 456 AND 457 FOR A SHORT TO POWER • Disconnect: Driver Seat Module (DSM) C341b. • Key in ON position. • Measure the voltage between the following seat control switch C3016 pins, harness side and ground. **Connector C3016** / **Circuit** Pin M / 1463 (RD/WH) Pin D / 1466 (GY/OG) Pin J / 1467 (GY/WH)	**Yes** REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation

Pin E	1465 (GY/WH)
Pin K	1468 (GY/LB)
Pin L	1464 (YE)
Pin B	456 (DG/OG)
Pin A	457 (DB/YE)

A0050489

- **Is any voltage indicated?**



and Reactivation in this section.

No
GO to H7 .

H7 CHECK CIRCUITS 1468, 1467, 1466, 1463, 1465, 1464 456 AND 457 FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the following seat control switch C3016 pins, harness side and ground.

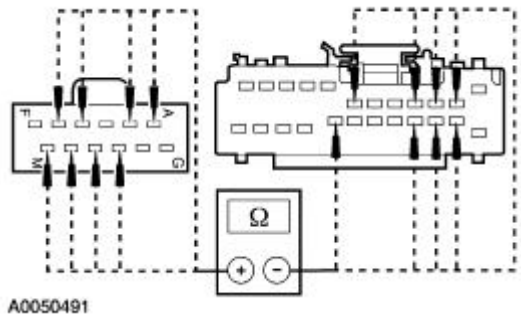
Connector C3016	Circuit
Pin M	1463 (RD/WH)
Pin D	1466 (GY/OG)
Pin J	1467 (GY/WH)
Pin E	1465 (GY/WH)
Pin K	1468 (GY/LB)
Pin L	1464 (YE)
Pin B	456 (DG/OG)
Pin A	457 (DB/YE)

A0050490

- **Are the resistances greater than 10,000 ohms?**

Yes
REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

No
GO to H8 .



H8 CHECK CIRCUITS 1468, 1467, 1466, 1463, 1465, 1464 456 AND 457 FOR AN OPEN

- Measure the resistance between the following seat control switch

Yes

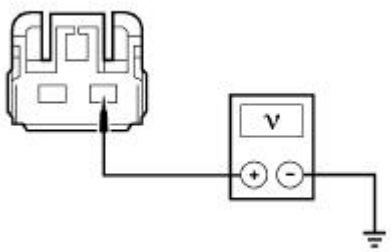
C3016 pins, harness side and driver seat module (DSM) C341b pins, harness side.

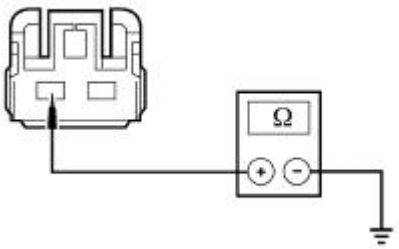
Seat Control Switch C3016	Circuit	Driver Seat Module (DSM) C341b
Pin M	1463 (RD/WH)	Pin 7
Pin D	1466 (GY/OG)	Pin 14
Pin J	1467 (GY/WH)	Pin 3
Pin E	1465 (GY/WH)	Pin 15
Pin K	1468 (GY/LB)	Pin 4
Pin L	1464 (YE)	Pin 16
Pin B	456 (DG/OG)	Pin 20
Pin A	457 (DB/YE)	Pin 2

- **Are the resistances less than 5 ohms?**

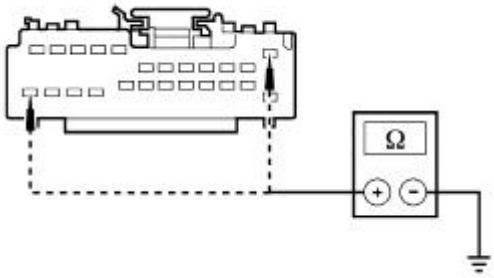
INSTALL a new DSM. REFER to Section 419-10 . TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

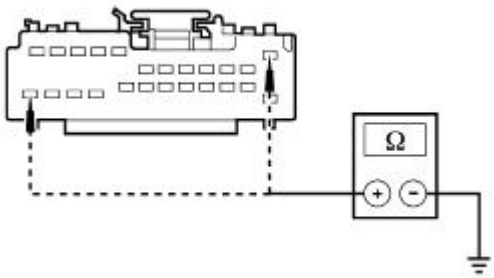
No
REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.



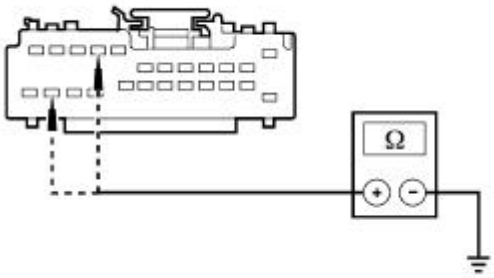


H9 CHECK THE DRIVER SEAT MODULE (DSM) FOR CORRECT OUTPUTS USING SCAN TOOL DSM ACTIVE COMMANDS





- Enter the following diagnostic mode on the diagnostic tool: Active Commands.
- Toggle the following DSM active commands:
  - FRONT UP on and off.
  - FRONT DWN on and off.
  - REAR UP on and off.
  - REAR DWN on and off.
  - HORZ FWD on and off.
  - HORZ RWD on and off.
  - RECL FWD on and off.
  - RECL RWD on and off.
- **Does the driver seat operate correctly?**



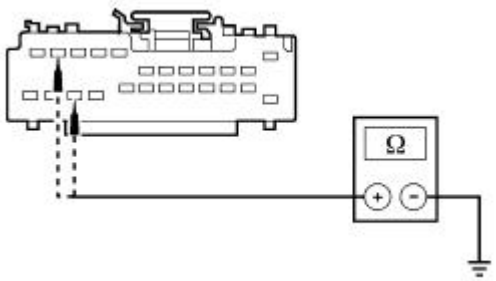
Yes
INSTALL a new DSM. REFER to Section 419-10 . TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

No
If no seat movement, GO to H10 .

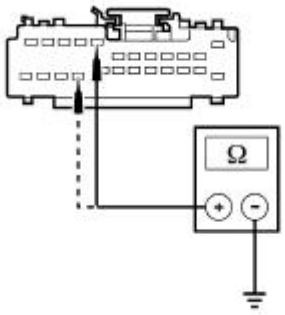
If no front vertical

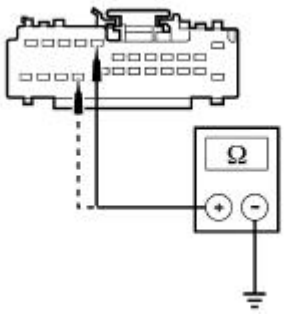
	seat movement, GO to H20 . If no rear vertical seat movement, GO to H23 . If no horizontal seat movement, GO to H26 . If no recline seat movement, GO to H29 .
H10 CHECK THE DRIVER SEAT MODULE (DSM) FOR VOLTAGE — CIRCUIT 566 (DG)	
• Key in OFF position. • Disconnect: Driver Seat Module (DSM) C341a. • Measure the voltage between driver seat module (DSM) C341a-1, circuit 566 (DG), harness side and ground.  A0042092 • **Is the voltage greater than 10 volts?**	**Yes** GO to H11 . **No** REPAIR circuit 566 (DG). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
H11 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Measure the resistance between driver seat module (DSM) C341a-2, circuit 57 (BK), harness side and ground.  A0042093 • **Is the resistance less than 5 ohms?**	**Yes** GO to H12 . **No** REPAIR circuit 57 (BK). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
H12 CHECK CIRCUITS 1469 (RD/LB) AND 1470 (YE/LB) FOR A SHORT TO GROUND	
• Disconnect: Driver Seat Module (DSM) C341b. • Measure the resistance between driver seat module (DSM) C341b-1, circuit 1469 (RD/LB), harness side and ground; and between DSM C341b-24, circuit 1470 (YE/LB), harness side and ground.	**Yes** GO to H14 . **No** GO to H13 .

 A0042094 ● **Are the resistances greater than 10,000 ohms?**	
H13 CHECK FRONT HEIGHT MOTOR FOR A SHORT TO GROUND — CIRCUITS 1469 (RD/LB) AND 1470 (YE/LB)	
● Disconnect: Driver Seat Module (DSM) C341b. ● Disconnect: Front Height Power Seat Motor C382. ● Measure the resistance between driver seat module (DSM) C341b-1, circuit 1469 (RD/LB), harness side and ground; and between DSM C341b-24, circuit 1470 (YE/LB), harness side and ground.  A0042094 ● **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new front height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
H14 CHECK CIRCUITS 1474 (RD/LG) AND 1473 (YE/LG) FOR A SHORT TO GROUND	
● Measure the resistance between driver seat module (DSM) C341b-9, circuit 1474 (RD/LG), harness side and ground; and between DSM C341b-23, circuit 1473 (YE/LG), harness side and ground.	**Yes** GO to H16 . **No** GO to H15 .

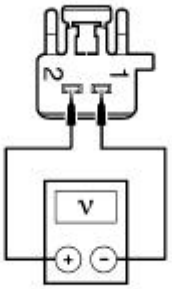


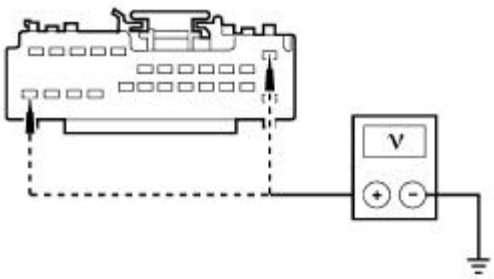
A0042095

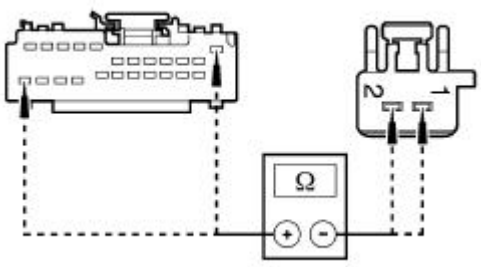




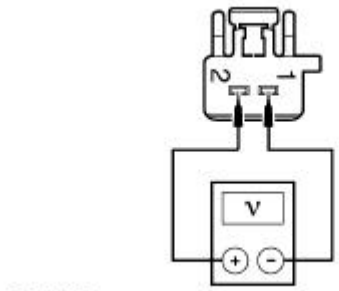
- **Are the resistances greater than 10,000 ohms?**

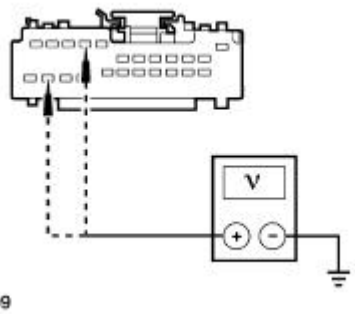


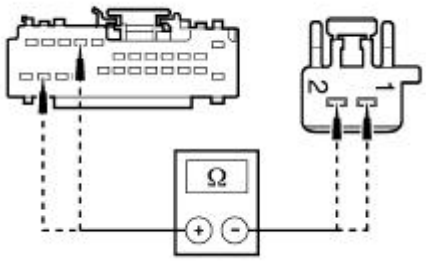


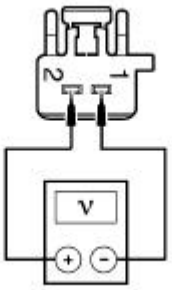


H15 CHECK THE REAR HEIGHT MOTOR FOR A SHORT TO GROUND — CIRCUITS 1474 (RD/LG) AND 1473 (YE/LG)	
• Disconnect: Rear Height Power Seat Motor C363. • Measure the resistance between driver seat module (DSM) C341b-9, circuit 1474 (RD/LG), harness side and ground; and between DSM C341b-23, circuit 1473 (YE/LG), harness side and ground.  A0042095 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new rear height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
H16 CHECK CIRCUITS 1472 (YE/WH) AND 1471 (RD/WH) FOR A SHORT TO GROUND	
• Measure the resistance between driver seat module (DSM) C341b-22, circuit 1472 (YE/WH), harness side and ground; and between DSM C341b-11, circuit 1471 (RD/WH), harness side and ground.	**Yes** GO to H18 . **No** GO to H17 .

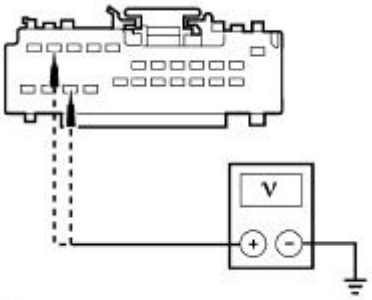








- **Are the resistances greater than 10,000 ohms?**



H17 CHECK THE HORIZONTAL MOTOR FOR A SHORT TO GROUND — CIRCUITS 1472 (YE/WH) AND 1471 (RD/WH)	
• Disconnect: Horizontal Power Seat Motor C362. • Measure the resistance between driver seat module (DSM) C341b-22, circuit 1472 (YE/WH), harness side and ground; and between DSM C341b-11, circuit 1471 (RD/WH), harness side and ground.  • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new horizontal power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
H18 CHECK CIRCUITS 918 (GY) AND 919 (GY/BK) FOR A SHORT TO GROUND	
• Measure the resistance between driver seat module (DSM) C341b-8, circuit 918 (GY), harness side and ground; and between DSM C341b-21, circuit 919 (GY/BK) harness side and ground.	**Yes** INSTALL a new DSM. REFER to Section 419-10 . TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System

 A0050492 ● **Are the resistances greater than 10,000 ohms?**	(SRS) Deactivation and Reactivation in this section. **No** GO to H19 .
H19 CHECK THE RECLINER MOTOR FOR A SHORT TO GROUND — CIRCUITS 918 (GY) AND 919 (GY/BK)	
● Disconnect: Power Recliner Seat Motor C3187. ● Measure the resistance between driver seat module (DSM) C341b-8, circuit 918 (GY), harness side and ground; and between DSM C341b-21, circuit 919 (GY/BK), harness side and ground.  A0050492 ● **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new recliner power seat motor. REFER to Front Seat Recliner Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
H20 CHECK THE FRONT HEIGHT MOTOR FOR CORRECT OPERATION	
● Key in OFF position. ● Disconnect: Front Height Power Seat Motor C382. ● Key in ON position. ● Measure the voltage between front height power seat motor C382-1, circuit 1469 (RD/LB), and C382-2, circuit 1470 (YE/LB), harness side while toggling DSM active commands FRONT UP and FRONT DOWN on and off.	**Yes** INSTALL a new front height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to

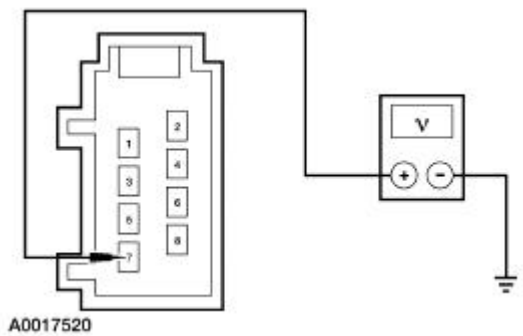
 A0049753 ● **Does the voltage change from zero volts?**	Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to H21.
H21 CHECK CIRCUITS 1469 (RD/LB) AND 1470 (YE/LB) FOR A SHORT TO POWER	
● Key in OFF position. ● Disconnect: Driver Seat Module (DSM) C341b. ● Key in ON position. ● Measure the voltage between driver seat module (DSM) C341b-1, circuit 1469 (RD/LB), harness side and ground; and between DSM C341b-24, circuit 1470 (YE/LB), harness side and ground.  A0042097 ● **Is any voltage indicated?**	**Yes** REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to H22.
H22 CHECK CIRCUITS 1469 (RD/LB) AND 1470 (YE/LB) FOR AN OPEN	
● Key in OFF position. ● Measure the resistance between driver seat module (DSM) C341b-1, circuit 1469 (RD/LB), harness side and front height power seat motor C382-1, circuit 1469 (RD/LB), harness side; and between DSM C341b-24, circuit 1470 (YE/LB), harness side and front height power seat motor C382-2 circuit 1470 (YE/LB), harness side.  A0050493 ● **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DSM. REFER to Section 419-10. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to

	Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
H23 CHECK THE REAR HEIGHT MOTOR FOR CORRECT OPERATION	
• Key in OFF position. • Disconnect: Rear Height Power Seat Motor C363. • Key in ON position. • Measure the voltage between rear height power seat motor C363-1, circuit 1474 (RD/LG), harness side and C363-2, circuit 1473 (YE/LG), harness side while toggling DSM active commands REAR UP and REAR DOWN ON and OFF.  A0049753 • **Does the voltage change from zero volts?**	**Yes** INSTALL a new rear height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to H24.
H24 CHECK CIRCUITS 1474 (RD/LG) AND 1473 (YE/LG) FOR A SHORT TO POWER	
• Key in OFF position. • Disconnect: Driver Seat Module (DSM) C341b. • Key in ON position. • Measure the voltage between driver seat module (DSM) C341b-9, circuit 1474 (RD/LG), harness side and ground; and between DSM C341b-23, circuit 1473 (YE/LG), harness side and ground.  A0042099 • **Is any voltage indicated?**	**Yes** REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to H25.
H25 CHECK CIRCUITS 1474 (RD/LG) AND 1473 (YE/LG) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between driver seat module (DSM) C341b-9, circuit 1474 (RD/LG), harness side and rear height power seat motor C363-1, circuit 1474 (RD/LG), harness side; and between DSM C341b-23, circuit 1473 (YE/LG), harness side and rear height power seat motor C363-2, circuit 1473 (YE/LG), harness side.	**Yes** INSTALL a new DSM. REFER to Section 419-10. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to

 A0050494 ● **Are the resistances less than 5 ohms?**	[Supplemental Restraint System (SRS) Deactivation and Reactivation] in this section. **No** REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to [Supplemental Restraint System (SRS) Deactivation and Reactivation] in this section.
H26 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION	
● Key in OFF position. ● Disconnect: Horizontal Power Seat Motor C362. ● Key in ON position. ● Measure the voltage between horizontal power seat motor C362-2, circuit 1472 (YE/WH), and C362-1, circuit 1471 (RD/WH), harness side while toggling DSM active commands HORZ FWD and HORZ RWD ON and OFF.  A0049753 ● **Does the voltage change from zero volts?**	**Yes** INSTALL a new horizontal power seat motor. REFER to [Front Seat Track Motor] in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to [Supplemental Restraint System (SRS) Deactivation and Reactivation] in this section. **No** GO to [H27].
H27 CHECK CIRCUITS 1472 (YE/WH) AND 1471 (RD/WH) FOR A SHORT TO POWER	
● Key in OFF position. ● Disconnect: Driver Seat Module (DSM) C341b. ● Key in ON position. ● Measure the voltage between driver seat module (DSM) C341b-22, circuit 1472 (YE/WH), harness side and ground; and between DSM C341b-11, circuit 1471 (RD/WH), harness side and ground.	**Yes** REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to [Supplemental Restraint System (SRS) Deactivation and Reactivation] in this section. **No** GO to [H28].

A0042101

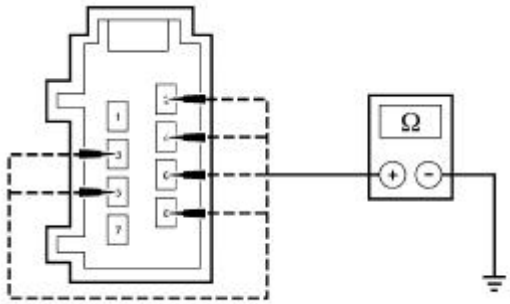
- **Is any voltage indicated?**



H28 CHECK CIRCUITS 1472 (YE/WH) AND 1471 (RD/WH) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between driver seat module (DSM) C341b-22, circuit 1472 (YE/WH), harness side and horizontal power seat motor C362-2, circuit 1472 (YE/WH), harness side; and between DSM C341b-11, circuit 1471 (RD/WH), harness side and horizontal power seat motor C362-1, circuit 1471 (RD/WH), harness side.  A0050495 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DSM. REFER to Section 419-10 . TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
H29 CHECK THE RECLINER MOTOR FOR CORRECT OPERATION	
• Key in OFF position. • Disconnect: Power Recliner Seat Motor C3187. • Key in ON position. • Measure the voltage between recliner power seat motor C3187-1, circuit 918 (GY), and C3187-2, circuit 919 (GY/BK), harness side while toggling DSM active commands RECLINE FWD and RECLINE RWD ON and OFF.	**Yes** INSTALL a new power recliner seat motor. REFER to Front Seat Recliner Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation

 A0049753 ● **Does the voltage change from zero volts?**	and Reactivation in this section. **No** GO to H30.
H30 CHECK CIRCUITS 918 (GY) AND 919 (GY/BK) FOR A SHORT TO POWER	
● Key in OFF position. ● Disconnect: Driver Seat Module (DSM) C341b. ● Key in ON position. ● Measure the voltage between driver seat module (DSM) C341b-8, circuit 918 (GY), harness side and ground; and between DSM C341b-21, circuit 919 (GY/BK), harness side and ground.  A0050496 ● **Is any voltage indicated?**	**Yes** REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to H31.
H31 CHECK CIRCUITS 918 (GY) AND 919 (GY/BK) FOR AN OPEN	
● Key in OFF position. ● Measure the resistance between driver seat module (DSM) C341b-8, circuit 918 (GY), harness side and recliner power seat motor C3187-1, circuit 918 (GY), harness side; and between DSM C341b-21, circuit 919 (GY/BK), harness side and recliner power seat motor C3187-2, circuit 919 (GY/BK), harness side.  A0050497 ● **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DSM. REFER to Section 419-10. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit(s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental

	Restraint System (SRS) Deactivation and Reactivation in this section.



PINPOINT TEST I: THE MEMORY SEAT IS INOPERATIVE — EXPEDITION

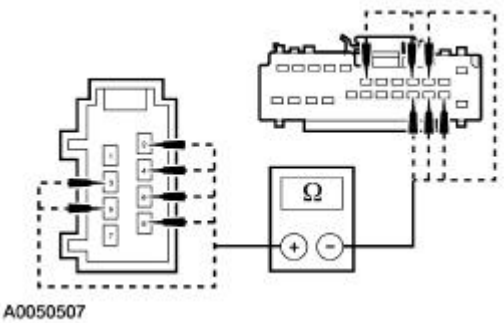
Test Step	Result / Action to Take
I1 RETRIEVE THE DTCS	
WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards. NOTE: If a seat equipped with a seat-mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.** Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section. **NOTE:** Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors. **NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Deactivate the supplemental restraint system (SRS). Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. ● Key in OFF position. ● Connect the diagnostic tool. ● Enter the following diagnostic mode on the diagnostic tool: Retrieve and Document Continuous DTCs. ● Enter the following diagnostic mode on the diagnostic tool: Clear the Continuous DTCs. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self-Test. ● **Are any DTCs retrieved?**	**Yes** If DTCs B1663, B1664, and B1665 are all retrieved, GO to I10 . If DTC B1663, GO to I18 . If DTC B1664, . If DTC B1665, GO to I24 . If DTC B1711, GO to I3 . If DTC B1715, GO to I3 . If DTC B1719, GO to I3 . If DTC B1723, GO to I3 . If DTC B1727, GO to I3 . If DTC B1731, GO to I3 . If DTC B1342, INSTALL a new DSM. REFER to Section 419-10 . TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

	No GO to I2 .
I2 CHECK THE DSM FOR CORRECT MEMORY SEAT SWITCH INPUTS — MONITOR THE DSM PIDS SFNT_SW, SREARSW AND SFWS_SW ● Enter the following diagnostic mode on the diagnostic tool: Monitor PIDs. ● Monitor the PIDs SFNT_SW, SREARSW and SFWS_SW while activating the seat switch. ● **Do the PID values agree with the switch positions?**	**Yes** GO to I9 . **No** If Power Distribution Junction Box (PDJB) fuse 3 (7.5A) fails while operating the seat control switch, GO to I7 . If PDJB fuse 3 (7.5A) is OK, GO to I3 .
I3 CHECK THE SEAT CONTROL SWITCH ● Key in OFF position. ● Disconnect: Seat Control Switch C352. ● Check the seat control switch. For additional information, Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Is the seat control switch OK?**	**Yes** GO to I4 . **No** INSTALL a new seat control switch. REFER to Seat Control Switch—6-Way in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
I4 CHECK FOR VOLTAGE TO THE SEAT CONTROL SWITCH — CIRCUIT 956 (OG/LG) ● Measure the voltage between seat control switch C352-7, circuit 956 (OG/LG), harness side and ground.  A0017520 ● **Is the voltage greater than 10 volts?**	**Yes** GO to I5 . **No** REPAIR circuit 956 (OG/LG). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

I5 CHECK CIRCUIT 875 (BK/LB) FOR AN OPEN	
• Measure the resistance between seat control switch C352-1, circuit 875 (BK/LB), harness side and ground.  A0017521 • **Is the resistance less than 5 ohms?**	**Yes** GO to I6 . **No** REPAIR circuit 875 (BK/LB). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
I6 CHECK CIRCUITS 1468, 1467, 1466, 1463, 1465, AND 1464 FOR A SHORT TO POWER	
• Disconnect: Driver Seat Module (DSM) C341b. • Key in ON position. • Measure the voltage between the following seat control switch C352 pins, harness side and ground. **Connector C352 / Circuit** Pin 2 — 1463 (RD/WH) Pin 3 — 1466 (GY/OG) Pin 4 — 1467 (GY/WH) Pin 5 — 1465 (GY/WH) Pin 6 — 1468 (GY/LB) Pin 8 — 1464 (YE)  A0017522 • **Is any voltage indicated?**	**Yes** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to I7 .
I7 CHECK CIRCUITS 1468, 1467, 1466, 1463, 1465, AND 1464 FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the following seat control switch C352 pins, harness side and ground. **Connector C352 / Circuit** Pin 2 — 1463 (RD/WH)	**Yes** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system

Pin 3	1466 (GY/OG)
Pin 4	1467 (GY/WH)
Pin 5	1465 (GY/WH)
Pin 6	1468 (GY/LB)
Pin 8	1464 (YE)

- **Are the resistances greater than 10,000 ohms?**



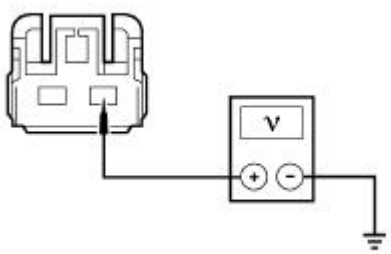
(SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

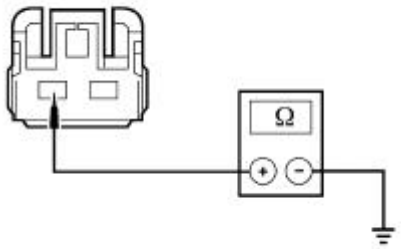
No
GO to I8.

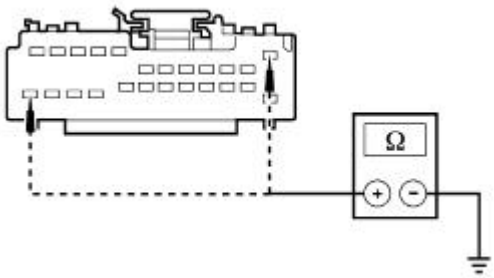
I8 CHECK CIRCUITS 1468, 1467, 1466, 1463, 1465, AND 1464 FOR AN OPEN

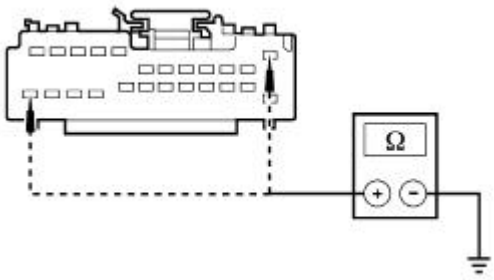
- Measure the resistance between the following seat control switch C352 pins harness side and driver seat module (DSM) C341b pins, harness side.

Seat Control Switch C352	Circuit	Driver Seat Module (DSM) C341b
Pin 2	1463 (RD/WH)	Pin 7
Pin 3	1466 (GY/OG)	Pin 14
Pin 4	1467 (GY/WH)	Pin 3
Pin 5	1465 (GY/WH)	Pin 15
Pin 6	1468 (GY/LB)	Pin 4
Pin 8	1464 (YE)	Pin 16

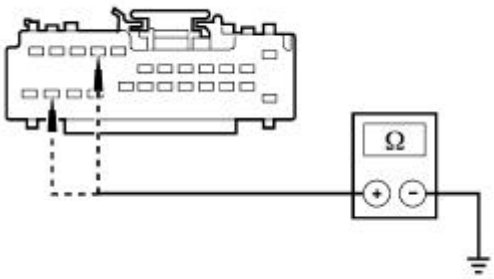


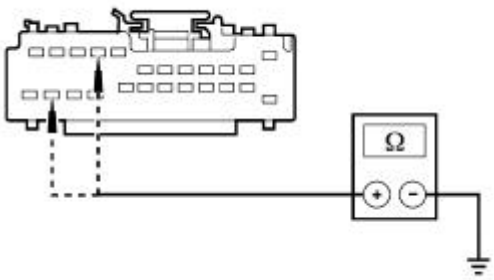




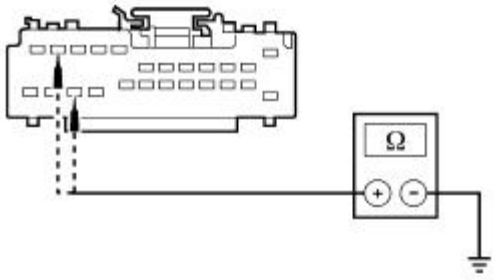


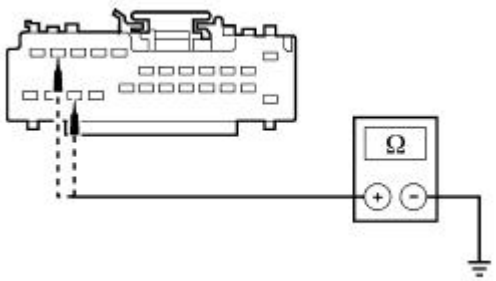
- **Are the resistances less than 5 ohms?**



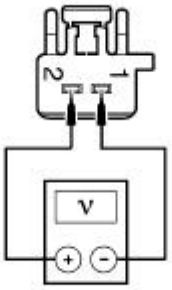


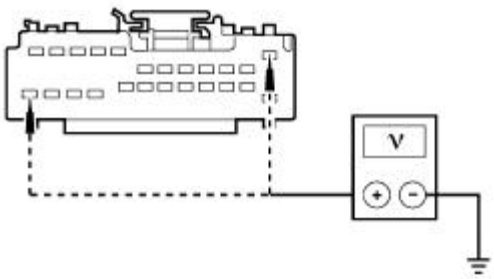
Yes
INSTALL a new DSM. REFER to Section 419-10. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

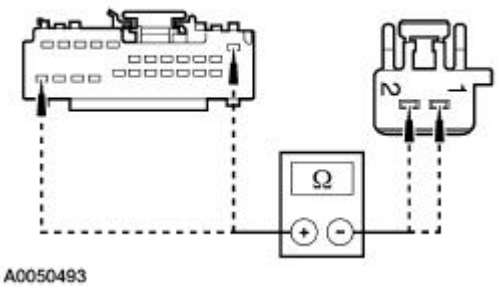




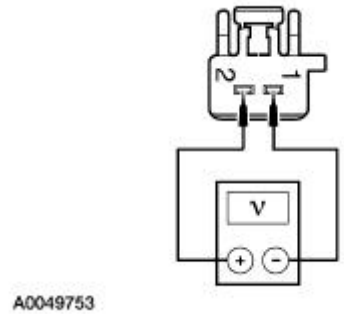
No
REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

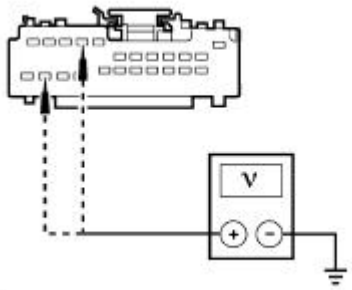






I9 CHECK THE DRIVER SEAT MODULE (DSM) FOR CORRECT





OUTPUTS USING SCAN TOOL DSM ACTIVE COMMANDS	
• Enter the following diagnostic mode on the diagnostic tool: Active Commands. • Toggle the following DSM active commands: ■ FRONT UP on and off. ■ FRONT DWN on and off. ■ REAR UP on and off. ■ REAR DWN on and off. ■ HORZ FWD on and off. ■ HORZ RWD on and off. • **Does the driver seat operate correctly?**	**Yes** INSTALL a new DSM. REFER to Section 419-10 . TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** If no seat movement, GO to I10 . If no front vertical seat movement, GO to I18 . If no rear vertical seat movement, GO to I21 . If no horizontal seat movement, GO to I24 .
I10 CHECK THE DRIVER SEAT MODULE (DSM) FOR VOLTAGE — CIRCUIT 566 (DG)	
• Key in OFF position. • Disconnect: Driver Seat Module (DSM) C341a. • Measure the voltage between driver seat module (DSM) C341a-1, circuit 566 (DG), harness side and ground.  A0042092 • **Is the voltage greater than 10 volts?**	**Yes** GO to I11 . **No** REPAIR circuit 566 (DG). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
I11 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Measure the resistance between driver seat module (DSM) C341a-2, circuit 57 (BK), harness side and ground.	**Yes** GO to I12 . **No** REPAIR circuit 57 (BK). TEST the system for normal operation.

 A0042093 ● **Is the resistance less than 5 ohms?**	REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
I12 CHECK CIRCUITS 1469 (RD/LB) AND 1470 (YE/LB) FOR A SHORT TO GROUND	
● Disconnect: Driver Seat Module (DSM) C341b. ● Measure the resistance between driver seat module (DSM) C341b-1, circuit 1469 (RD/LB), harness side and ground; and between DSM C341b-24, circuit 1470 (YE/LB), harness side and ground.  A0042094 ● **Are the resistances greater than 10,000 ohms?**	**Yes** GO to I14. **No** GO to I13.
I13 CHECK FRONT HEIGHT MOTOR FOR A SHORT TO GROUND — CIRCUITS 1469 (RD/LB) AND 1470 (YE/LB)	
● Disconnect: Driver Seat Module (DSM) C341b. ● Disconnect: Front Height Power Seat Motor C382. ● Measure the resistance between driver seat module (DSM) C341b-1, circuit 1469 (RD/LB), harness side and ground; and between DSM C341b-24, circuit 1470 (YE/LB), harness side and ground.  A0042094 ● **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new front height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to

	Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
I14 CHECK CIRCUITS 1474 (RD/LG) AND 1473 (YE/LG) FOR A SHORT TO GROUND	
• Measure the resistance between driver seat module (DSM) C341b-9, circuit 1474 (RD/LG), harness side and ground; and between DSM C341b-23, circuit 1473 (YE/LG), harness side and ground.  A0042095 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to I16 . **No** GO to I15 .
I15 CHECK THE REAR HEIGHT MOTOR FOR A SHORT TO GROUND — CIRCUITS 1474 (RD/LG) AND 1473 (YE/LG)	
• Disconnect: Rear Height Power Seat Motor C363. • Measure the resistance between driver seat module (DSM) C341b-9, circuit 1474 (RD/LG), harness side and ground; and between DSM C341b-23, circuit 1473 (YE/LG), harness side and ground.  A0042095 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new rear height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
I16 CHECK CIRCUITS 1472 (YE/WH) AND 1471 (RD/WH) FOR A SHORT TO GROUND	
• Measure the resistance between driver seat module (DSM) C341b-	**Yes**

22, circuit 1472 (YE/WH), harness side and ground; and between DSM C341b-11, circuit 1471 (RD/WH), harness side and ground.  A0042096 ● **Are the resistances greater than 10,000 ohms?**	INSTALL a new DSM. REFER to Section 419-10 . TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to I17 .
I17 CHECK THE HORIZONTAL MOTOR FOR A SHORT TO GROUND — CIRCUITS 1472 (YE/WH) AND 1471 (RD/WH)	
● Disconnect: Horizontal Power Seat Motor C362. ● Measure the resistance between driver seat module (DSM) C341b-22, circuit 1472 (YE/WH), harness side and ground; and between DSM C341b-11, circuit 1471 (RD/WH), harness side and ground.  A0042096 ● **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new horizontal power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
I18 CHECK THE FRONT HEIGHT MOTOR FOR CORRECT OPERATION	
● Key in OFF position. ● Disconnect: Front Height Power Seat Motor C382. ● Key in ON position. ● Measure the voltage between front height power seat motor C382-1, circuit 1469 (RD/LB), and C382-2, circuit 1470 (YE/LB), harness side while toggling DSM active commands FRONT UP and FRONT DOWN on and off.	**Yes** INSTALL a new front height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation.

 A0049753 ● **Does the voltage change from zero volts?**	REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to I19.
I19 CHECK CIRCUITS 1469 (RD/LB) AND 1470 (YE/LB) FOR A SHORT TO POWER	
● Key in OFF position. ● Disconnect: Driver Seat Module (DSM) C341b. ● Key in ON position. ● Measure the voltage between driver seat module (DSM) C341b-1, circuit 1469 (RD/LB), harness side and ground; and between DSM C341b-24, circuit 1470 (YE/LB), harness side and ground.  A0042097 ● **Is any voltage indicated?**	**Yes** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to I20.
I20 CHECK CIRCUITS 1469 (RD/LB) AND 1470 (YE/LB) FOR AN OPEN	
● Key in OFF position. ● Measure the resistance between driver seat module (DSM) C341b-1, circuit 1469 (RD/LB), harness side and front height power seat motor C382-1, circuit 1469 (RD/LB), harness side; and between DSM C341b-24, circuit 1470 (YE/LB), harness side and front height power seat motor C382-2, circuit 1470 (YE/LB), harness side.  A0050493 ● **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DSM. REFER to Section 419-10. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to

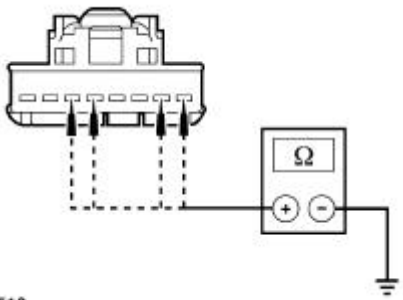
	Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
I21 CHECK THE REAR HEIGHT MOTOR FOR CORRECT OPERATION	
• Key in OFF position. • Disconnect: Rear Height Power Seat Motor C363. • Key in ON position. • Measure the voltage between rear height power seat motor C363-1, circuit 1474 (RD/LG), harness side and C363-2, circuit 1473 (YE/LG), harness side while toggling DSM active commands REAR UP and REAR DOWN ON and OFF.  A0049753 • **Does the voltage change from zero volts?**	**Yes** INSTALL a new rear height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to I22.
I22 CHECK CIRCUITS 1474 (RD/LG) AND 1473 (YE/LG) FOR A SHORT TO POWER	
• Key in OFF position. • Disconnect: Driver Seat Module (DSM) C341b. • Key in ON position. • Measure the voltage between driver seat module (DSM) C341b-9, circuit 1474 (RD/LG), harness side and ground; and between DSM C341b-23, circuit 1473 (YE/LG), harness side and ground.  A0042099 • **Is any voltage indicated?**	**Yes** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to I23.
I23 CHECK CIRCUITS 1474 (RD/LG) AND 1473 (YE/LG) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between driver seat module (DSM) C341b-9, circuit 1474 (RD/LG), harness side and rear height power seat motor C363-1, circuit 1474 (RD/LG), harness side; and between DSM C341b-23, circuit 1473 (YE/LG), harness side and rear height power seat motor C363-2, circuit 1473 (YE/LG), harness side.	**Yes** INSTALL a new DSM. REFER to Section 419-10. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental

 A0050494 ● **Are the resistances less than 5 ohms?**	Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
I24 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION	
● Key in OFF position. ● Disconnect: Horizontal Power Seat Motor C362. ● Key in ON position. ● Measure the voltage between horizontal power seat motor C362-2, circuit 1472 (YE/WH), and C362-1, circuit 1471 (RD/WH), harness side while toggling DSM active commands HORZ FWD and HORZ RWD ON and OFF.  A0049753 ● **Does the voltage change from zero volts?**	**Yes** INSTALL a new horizontal power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to I25.
I25 CHECK CIRCUITS 1472 (YE/WH) AND 1471 (RD/WH) FOR A SHORT TO POWER	
● Key in OFF position. ● Disconnect: Driver Seat Module (DSM) C341b. ● Key in ON position. ● Measure the voltage between driver seat module (DSM) C341b-22, circuit 1472 (YE/WH), harness side and ground; and between DSM C341b-11, circuit 1471 (RD/WH), harness side and ground.  A0042101 ● **Is any voltage indicated?**	**Yes** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to I26.

I26 CHECK CIRCUITS 1472 (YE/WH) AND 1471 (RD/WH) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between driver seat module (DSM) C341b-22, circuit 1472 (YE/WH), harness side and horizontal power seat motor C362-2, circuit 1472 (YE/WH), harness side; and between DSM C341b-11, circuit 1471 (RD/WH), harness side and horizontal power seat motor C362-1, circuit 1471 (RD/WH), harness side.  A0050495 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DSM. REFER to Section 419-10 . TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

PINPOINT TEST J: THE MEMORY SEAT DOES NOT OPERATE CORRECTLY — DOES NOT OPERATE USING THE MEMORY SET SWITCH

Test Step	Result / Action to Take
J1 RETRIEVE THE DTCS	
WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards. NOTE: If a seat equipped with a seat-mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.** Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section. **NOTE:** Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors. **NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Deactivate the supplemental restraint system (SRS). Refer to Supplemental Restraint System (SRS) Deactivation and	**Yes** If the memory set LED fails to illuminate during the On-Demand Self-Test, GO to J5 . If DTCs B1950, B1954, and B1962 are all retrieved, GO to J8 . If DTC B1530, GO to J3 . If DTC B1534, GO to J3 .



Reactivation in this section. ● Key in OFF position. ● Connect the diagnostic tool. ● Enter the following diagnostic mode on the diagnostic tool: Retrieve and Document Continuous DTCs. ● Enter the following diagnostic mode on the diagnostic tool: Clear Continuous DTCs. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self-Test. ● **NOTE:** During the On-Demand Self-Test, document when the memory set LED illuminates and turns off. ● **Are any DTCs retrieved or does the memory set LED fail to illuminate during the On-Demand Self-Test?**	If DTC B1538, GO to J3. If DTC B1663, GO to J9. If DTC B1664, GO to J13. If DTC B1665, GO to J15. If DTC B1950, GO to J12. If DTC B1952, GO to J12. If DTC B1954, GO to J9. If DTC B1956, GO to J9. If DTC B1962, GO to J15. If DTC B1964, GO to J15. If DTC B1342, INSTALL a new DSM. REFER to Section 419-10. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to J2.
J2 CHECK THE DSM FOR CORRECT MEMORY SET SWITCH INPUTS — MONITOR THE DSM PIDS MEM1_SW, MEM2_SW AND MEMS_SW	
● Enter the following diagnostic mode on the diagnostic tool: Monitor PIDs. ● Monitor the DSM PIDs MEM1_SW, MEM2_SW and MEMS_SW while activating the seat switch. ● **Do the PID values agree with the switch positions?**	**Yes** GO to J8. **No** GO to J3.
J3 CHECK THE MEMORY SET SWITCH	
● Key in OFF position. ● Disconnect: Memory Set Switch C503. ● Carry out the Memory Set Switch Component Test. ● **Is the memory set switch OK?**	**Yes** GO to J4. **No** INSTALL a new

	memory set switch. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
J4 CHECK GROUND CIRCUIT TO THE MEMORY SET SWITCH — CIRCUIT 875 (BK/LB) • Key in ON position. • Measure the resistance between memory set switch C503-7, circuit 875 (BK/LB), harness side and ground.  A0042473 • **Is the resistance less than 5 ohms?**	**Yes** GO to J5 . **No** REPAIR circuit 875 (BK/LB). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
J5 CHECK CIRCUITS 267 (BN/LG), 268 (BK/OG), 270 (BN/OG), AND 272 (WH/OG) FOR A SHORT TO POWER • Disconnect: DSM C341c. • Key in ON position. • Measure the voltage between the following memory set switch C503 pins, harness side and ground: **Connector C503** / **Circuit** Pin 2 — 267 (BN/LG) Pin 6 — 268 (BK/OG) Pin 5 — 270 (BN/OG) Pin 1 — 272 (WH/OG)  A0050509 • **Is any voltage indicated?**	**Yes** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to J6 .

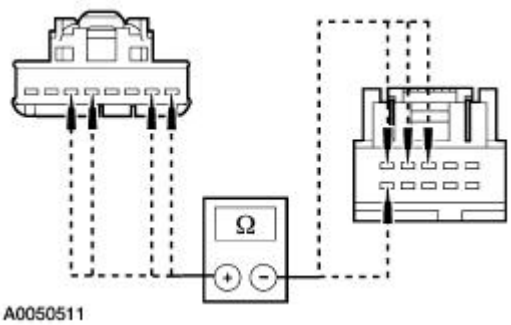
J6 CHECK CIRCUITS 267 (BN/LG), 268 (BK/OG), 270 (BN/OG), AND 272 (WH/OG) FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the following memory set switch C503 pins, harness side and ground:

Connector C503	Circuit
Pin 2	267 (BN/LG)
Pin 6	268 (BK/OG)
Pin 5	270 (BN/OG)
Pin 1	272 (WH/OG)

A0050510

- **Are the resistances greater than 10,000 ohms?**



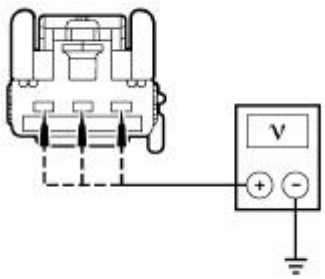
Yes
GO to J7 .

No
REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

J7 CHECK CIRCUITS 267 (BN/LG), 268 (BK/OG), 270 (BN/OG), AND 272 (WH/OG) FOR AN OPEN

- Measure the resistance between the following memory set switch C503 pins and DSM C341c pins:

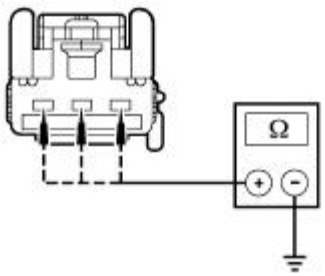
Memory Set Switch C503	Circuit	DSM C341c
Pin 2	267 (BN/LG)	Pin 4
Pin 6	268 (BK/OG)	Pin 3
Pin 5	270 (BN/OG)	Pin 5
Pin 1	272 (WH/OG)	Pin 10

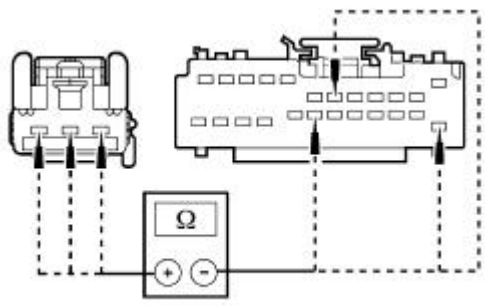


A0050511

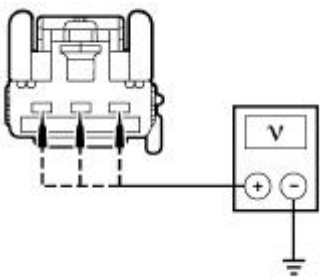
- **Are the resistances less than 5 ohms?**

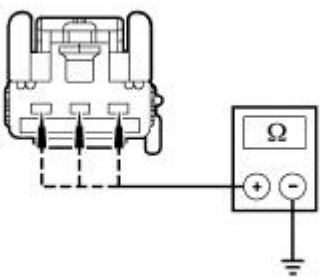
Yes
INSTALL a new DSM. REFER to Section 419-10 . TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.



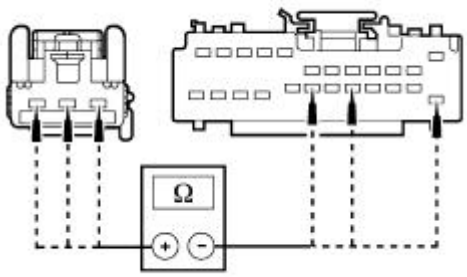


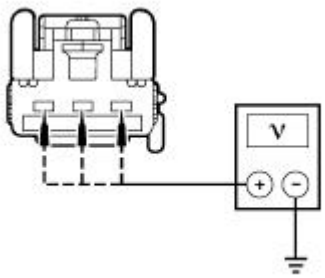
No
REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

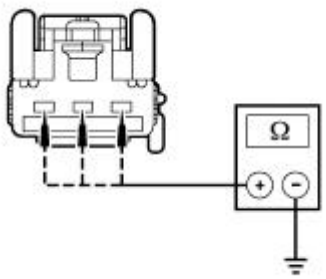


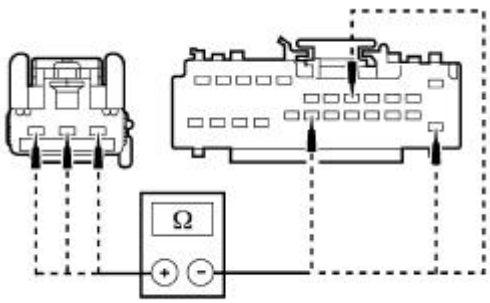


J8 CHECK THE DSM FOR CORRECT OUTPUTS — MONITOR THE DSM PIDS SFWD_P, SFNT_P, SREAR_P AND SEATRCN	
• Place the seat in a central position, using the seat control switch. • Enter the following diagnostic mode on the diagnostic tool: Monitor PIDs. • Monitor the following DSM PIDs ■ SFWD_P while operating the seat control switch forward/rearward switch. ■ SFNT_P while operating the seat control switch front up/down switch. ■ SREAR_P while operating the seat control switch rear up/down switch. ■ SRCL_SW while operating the seat control switch recline forward/rearward switch. • **Do the PID (position % of travel) values increase with forward/down movement and decrease with rearward/up movement throughout entire travel?**	**Yes** INSTALL a new DSM. REFER to Section 419-10 . TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** If the PID SFWD_P values do not increase or decrease, GO to J15 . If the PID SFNT_P values do not increase or decrease, GO to J9 . If the PID SREAR_P values do not increase or decrease, GO to J12 . If the PID SRCL_SW values do not increase or decrease GO to J18 .
J9 CHECK CIRCUITS 443 (LG/RD), 447 (OG/RD) AND 446 (OG/WH) FOR A SHORT TO POWER	
• Key in OFF position. • Disconnect: DSM C341b. • Disconnect: Front Height Position Sensor C383. • Key in ON position. • Measure the voltage between front height position sensor C383, circuit 443 (LG/RD), harness side and ground; and between front height position sensor C383, circuit 447 (OG/RD), harness side and ground; and between front height position sensor C383, circuit 446 (OG/WH), harness side and ground.	**Yes** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to J10 .

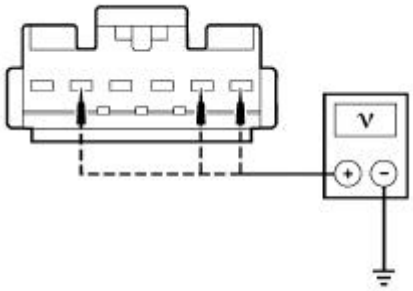


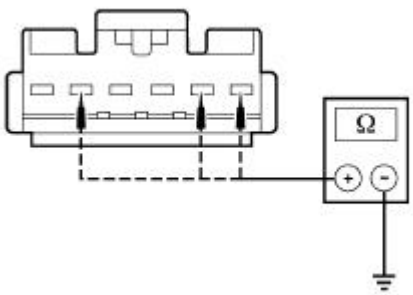


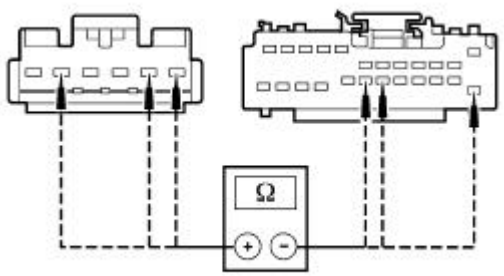




A0050512







- **Is any voltage indicated?**

J10 CHECK CIRCUITS 443 (LG/RD), 447 (OG/RD) AND 446 (OG/WH) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between front height position sensor C383, circuit 443 (LG/RD), harness side and ground; and between front height position sensor C383, circuit 447 (OG/RD), harness side and ground; and between front height position sensor C383, circuit 446 (OG/WH), harness side and ground.  A0050513 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to J11 . **No** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
J11 CHECK CIRCUITS 443 (LG/RD), 447 (OG/RD) AND 446 (OG/WH) FOR AN OPEN	
• Measure the resistance between front height position sensor C383, circuit 443 (LG/RD), harness side and DSM C341b-6, circuit 443 (LG/RD), harness side; between front height position sensor C383, circuit 447 (OG/RD), harness side and DSM C341b-13, circuit 447 (OG/RD), harness side; and between front height position sensor C383, circuit 446 (OG/WH), harness side and DSM C341b-19, circuit 446 (OG/WH), harness side.  A0050514 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new front height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental

	restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
J12 CHECK CIRCUITS 444 (LG/BK), 447 (OG/RD) AND 446 (OG/WH) FOR A SHORT TO POWER ● Key in OFF position. ● Disconnect: DSM C341b. ● Disconnect: Rear Height Position Sensor C373. ● Measure the voltage between rear height position sensor C373, circuit 444 (LG/BK), harness side and ground; between rear height position sensor C373, circuit 447 (OG/RD), harness side and ground; and between rear height position sensor C373, circuit 446 (OG/WH), harness side and ground.  A0050512 ● **Is any voltage indicated?**	**Yes** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to J13 .
J13 CHECK CIRCUITS 444 (LG/BK), 447 (OG/RD) AND 446 (OG/WH) FOR A SHORT TO GROUND ● Key in OFF position. ● Measure the resistance between rear height position sensor C373, circuit 444 (LG/BK), harness side and ground; between rear height position sensor C373, circuit 447 (OG/RD), harness side and ground; and between rear height position sensor C373, circuit 446 (OG/WH), harness side and ground.  A0050513 ● **Are the resistances greater than 10,000 ohms?**	**Yes** GO to J14 . **No** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
J14 CHECK CIRCUITS 444 (LG/BK), 447 (OG/RD) AND 446 (OG/WH) FOR OPEN ● Measure the resistance between rear height position sensor C373, circuit 444 (LG/BK), harness side and DSM C341b-17, circuit 444 (LG/BK), harness side; between rear height position sensor C373, circuit 447 (OG/RD), harness side, and DSM C341b-13, circuit 447 (OG/RD), harness side; and between rear height position sensor C373, circuit 446 (OG/WH), harness side, and DSM C341b-19, circuit 446 (OG/WH), harness side.	**Yes** INSTALL a new rear height power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for

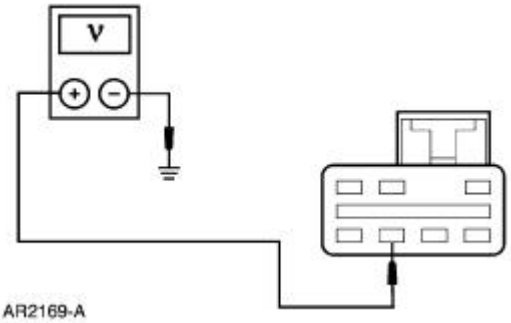
 A0050515 ● **Are the resistances less than 5 ohms?**	normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
J15 CHECK CIRCUITS 442 (LG/OG), 447 (OG/RD) AND 446 (OG/WH) FOR A SHORT TO POWER	
● Key in OFF position. ● Disconnect: DSM C341b. ● Disconnect: Forward/Rearward Position Sensor C372. ● Measure the voltage between forward/rearward position sensor C372, circuit 442 (LG/OG), harness side and ground; between forward/rearward position sensor C372, circuit 447 (OG/RD), harness side and ground; and between forward/rearward position sensor C372, circuit 446 (OG/WH), harness side and ground.  A0050512 ● **Is any voltage indicated?**	**Yes** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to J16.
J16 CHECK CIRCUITS 442 (LG/OG), 447 (OG/RD) AND 446 (OG/WH) FOR A SHORT TO GROUND	
● Key in OFF position. ● Measure the resistance between forward/rearward position sensor C372, circuit 442 (LG/OG), harness side and ground; between forward/rearward position sensor C372, circuit 447 (OG/RD), harness side and ground; and between forward/rearward position sensor C372, circuit 446 (OG/WH), harness side and ground.	**Yes** GO to J17. **No** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system

 A0050513 ● **Are the resistances greater than 10,000 ohms?**	(SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
J17 CHECK CIRCUITS 442 (LG/OG), 447 (OG/RD) AND 446 (OG/WH) FOR AN OPEN	
● Measure the resistance between forward/rearward position sensor C372, circuit 442 (LG/OG), harness side and DSM C341b-5, circuit 442 (LG/OG), harness side; between forward/rearward position sensor C372, circuit 447 (OG/RD), harness side and DSM C341b-13, circuit 447 (OG/RD), harness side; and between forward/rearward position sensor C372, circuit 446 (OG/WH), harness side, and DSM C341b-19, circuit 446 (OG/WH), harness side.  A0050516 ● **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new horizontal power seat motor. REFER to Front Seat Track Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
J18 CHECK CIRCUITS 445 (OG/LB), 447 (OG/RD) AND 446 (OG/WH) FOR A SHORT TO POWER	
● Key in OFF position. ● Disconnect: DSM C341b. ● Disconnect: Recliner Position Sensor C3188. ● Measure the voltage between recliner position sensor C3188, circuit 445-2 (OG/LB), harness side and ground; between recliner position sensor C3188, circuit 447-6 (OG/RD), harness side and ground; and between recliner position sensor C3188, circuit 446-5 (OG/WH), harness side and ground.	**Yes** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation

 A0050517 ● **Is any voltage indicated?**	and Reactivation in this section. **No** GO to J19.
J19 CHECK CIRCUITS 445 (OG/LB), 447 (OG/RD) AND 446 (OG/WH) FOR A SHORT TO GROUND	
● Key in OFF position. ● Measure the resistance between recliner position sensor C3188, circuit 445-2 (OG/LB), harness side and ground; between recliner position sensor C3188, circuit 447-6 (OG/RD), harness side and ground; and between recliner position sensor C3188, circuit 446-5 (OG/WH), harness side and ground.  A0050518 ● **Are the resistances greater than 10,000 ohms?**	**Yes** GO to J20. **No** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
J20 CHECK CIRCUITS 445 (OG/LB), 447 (OG/RD) AND 446 (OG/WH) FOR AN OPEN	
● Measure the resistance between recliner position sensor C3188, circuit 445 (OG/LB), harness side and DSM C341b-18, circuit 445 (OG/LB), harness side; between recliner position sensor C3188, circuit 447 (OG/RD), harness side and DSM C341b-13, circuit 447 (OG/RD), harness side; and between recliner position sensor C3188, circuit 446 (OG/WH), harness side and DSM C341b-19, circuit 446 (OG/WH), harness side.  A0050519 ● **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new recline power seat motor. REFER to Front Seat Recliner Motor in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit (s) in question. TEST the system for normal operation. REACTIVATE the supplemental

	restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

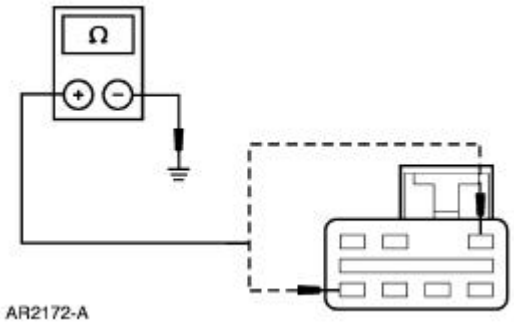
PINPOINT TEST K: THE POWER LUMBAR IS INOPERATIVE—DRIVER

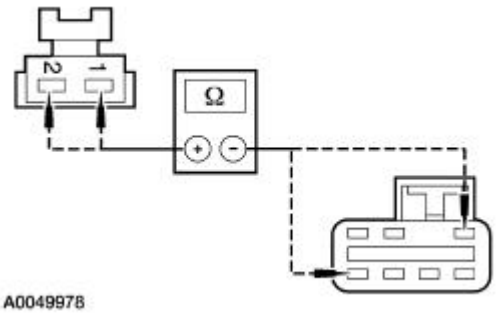


Test Step	Result / Action to Take
K1 CHECK CIRCUIT 566 (DG) FOR AN OPEN	
WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards. NOTE: If a seat equipped with a seat-mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.** Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section. **NOTE:** Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors. **NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the supplemental restraint system (SRS). Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. ● Disconnect: Lumbar Switch C361. ● Measure the voltage between driver power lumbar switch C361 pin 2, circuit 566 (DG), harness side and ground.  ● **Is the voltage greater than 10 volts?**	**Yes** GO to R2 . **No** **No** REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
K2 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
● Measure the resistance between driver power lumbar switch C361 pin 3, circuit 57 (BK), harness side and ground; and between driver power lumbar switch C361 pin 6, circuit 57 (BK), harness side and ground.	**Yes** GO to R3 . **No** REPAIR the circuit. TEST the system for normal operation.

 AR2170-A ● **Are both resistances less than 5 ohms?**	REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
K3 CHECK THE LUMBAR MOTOR	
● Connect: Lumbar Switch C361. ● Disconnect: Lumbar Motor C366. ● Measure the voltage between driver power lumbar motor C366, circuit 1097 (BN), harness side and driver power lumbar motor C366, circuit 1094 (PK), harness side.  A0049979 ● Operate the driver power lumbar switch in both directions. ● **Is the voltage less than 10 volts in both directions?**	**Yes** INSTALL a new driver power lumbar motor. REFER to Lumbar Motor in this section. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to R4 .
K4 CHECK CIRCUIT 1094 (PK) AND CIRCUIT 1097 (BN) FOR A SHORT TO GROUND	
● Disconnect: Lumbar Switch C361. ● Measure the resistance between driver power lumbar switch C361 pin 1, circuit 1094 (PK), harness side and ground; and between driver power lumbar switch C361 pin 7, circuit 1097 (BN), harness side and ground.  AR2172-A ● **Are the resistances greater than 10,000 ohms?**	**Yes** GO to R5 . **No** REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
K5 CHECK CIRCUIT 1094 (PK) AND CIRCUIT 1097 (BN) FOR AN OPEN	
● Measure the resistance between driver power lumbar switch C361, pin 7, circuit 1097 (BN), harness side and driver power lumbar motor C366, circuit 1097 (BN), harness side; and between driver power lumbar switch C361, pin 1, circuit 1094 (PK), harness side and driver power lumbar motor C366, circuit 1094 (PK), harness side.	**Yes** INSTALL a new power lumbar switch. REFER to Lumbar Control

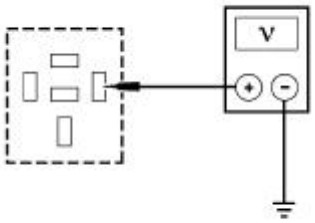
 ● **Are the resistances less than 5 ohms?**	Switch in this section. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

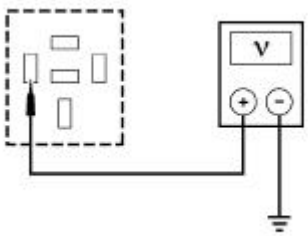


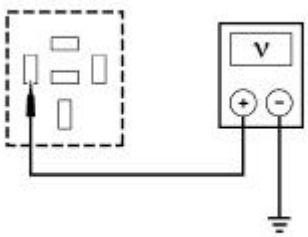


PINPOINT TEST L: THE POWER LUMBAR IS INOPERATIVE—PASSENGER

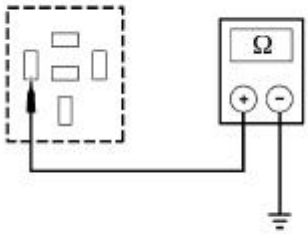
Test Step	Result / Action to Take
L1 CHECK CIRCUIT 1462 (RD/WH) FOR AN OPEN	
WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards. NOTE: If a seat equipped with a seat-mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.** Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section. **NOTE:** Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors. **NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the supplemental restraint system (SRS). Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. ● Disconnect: Lumbar Switch C331. ● Measure the voltage between driver power lumbar switch C331 pin 2, circuit 1462 (RD/WH), harness side and ground.	**Yes** GO to S2 . **No** REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.







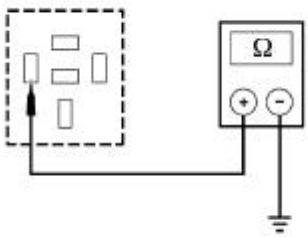
- **Is the voltage greater than 10 volts?**

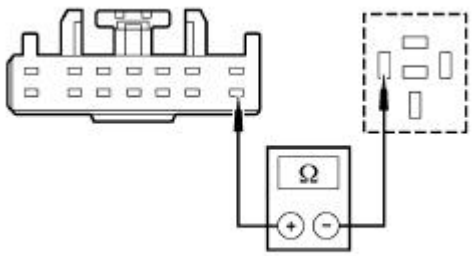


L2 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Measure the resistance between driver power lumbar switch C331 pin 3, circuit 57 (BK), harness side and ground; and between driver power lumbar switch C331 pin 6, circuit 57 (BK), harness side and ground.  • **Are both resistances less than 5 ohms?**	**Yes** GO to S3 . **No** REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
L3 CHECK THE LUMBAR MOTOR	
• Connect: Driver Lumbar Switch C331. • Disconnect: Lumbar Motor C336. • Measure the voltage between driver power lumbar motor C336, circuit 1097 (BN), harness side and driver power lumbar motor C336, circuit 1094 (PK), harness side.  • Operate the driver power lumbar switch in both directions. • **Is the voltage less than 10 volts in both directions?**	**Yes** INSTALL a new power lumbar motor. REFER to Lumbar Motor in this section. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to S4 .
L4 CHECK CIRCUIT 1094 (PK) AND CIRCUIT 1097 (BN) FOR A SHORT TO GROUND	
• Disconnect: Lumbar Switch C331. • Measure the resistance between driver power lumbar switch C331 pin 7, circuit 1094 (PK), harness side and ground; and between driver power lumbar switch C331 pin 1, circuit 1097 (BN), harness side and ground.	**Yes** GO to S5 . **No** REPAIR the circuit. TEST the system for normal

 AR2172-A ● **Are the resistances greater than 10,000 ohms?**	operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
L5 CHECK CIRCUIT 1094 (PK) AND CIRCUIT 1097 (BN) FOR AN OPEN	
● Measure the resistance between driver power lumbar switch C331, pin 1, circuit 1097 (BN), harness side and driver power lumbar motor C336, circuit 1097 (BN), harness side; and between driver power lumbar switch C331, pin 7, circuit 1094 (PK), harness side and driver power lumbar motor C336, circuit 1094 (PK), harness side.  A0049978 ● **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new power lumbar switch. REFER to Lumbar Control Switch in this section. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

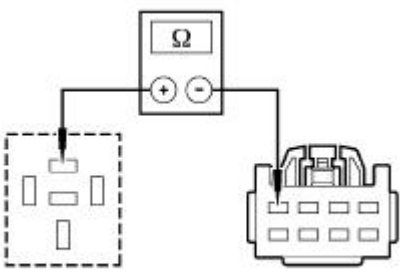
PINPOINT TEST M: THE THIRD ROW POWER FOLD SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY — BOTH



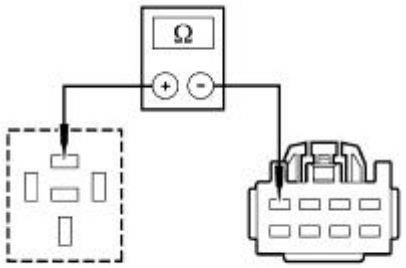


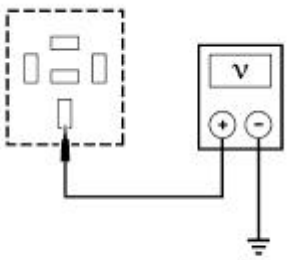
Test Step	Result / Action to Take
M1 CHECK CIRCUIT 729 (RD/WH) FOR AN OPEN	
● Key in ON position. ● Disconnect: Left Third Row Seat Relay C4183. ● Measure the voltage between left third row relay C4183-86, circuit 729 (RD/WH), harness side and ground.	**Yes** GO to M2 . **No** REPAIR the circuit. TEST the system for

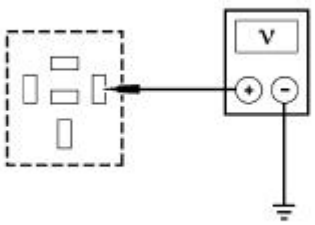
 A0050607 ● **Is the voltage greater than 10 volts?**	normal operation.
M2 CHECK CIRCUIT 1951 (BK/WH) FOR POWER	
● Key in OFF position. ● Disconnect: Right Third Row Seat Relay C4184. ● Key in ON position. ● Measure the voltage between left third row seat relay C4183-85, circuit 1951 (TN), harness side and ground.  A0050608 ● **Is the voltage greater than 10 volts?**	**Yes** GO to M3 . **No** GO to M4 .
M3 CHECK CIRCUIT 1951 (BK/WH) FOR A SHORT TO POWER	
● Key in OFF position. ● Disconnect: Body Security Module (BSM) C2113c. ● Key in ON position. ● Measure the voltage between left third row seat relay C4183-85, circuit 1951 (TN), harness side and ground.  A0050608 ● **Is the voltage less than 10 volts in both directions?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new BSM. REFER to Section 501-14 . Test the system for normal operation.
M4 CHECK CIRCUIT 1951 (TN) FOR GROUND	
● Key in ON position. ● Measure the resistance between left third row seat relay C4183-85, circuit 1951 (TN), harness side and ground.	**Yes** GO to M5 . **No** GO to M6 .



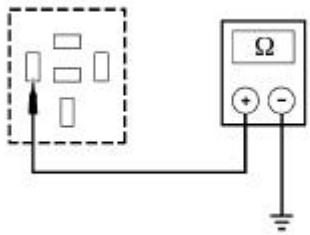
A0050609

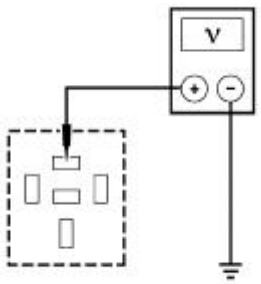


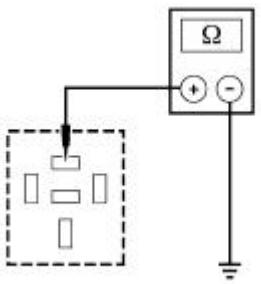




- **Is the resistance less than 5 ohms?**

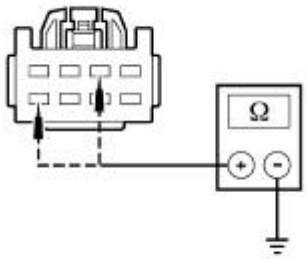


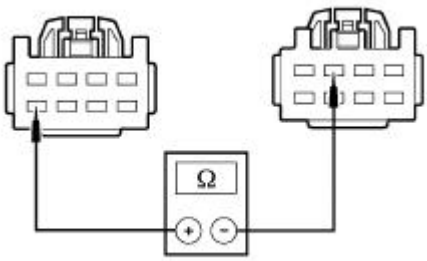


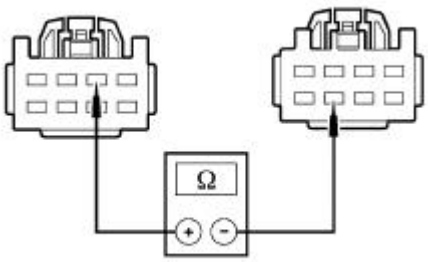


M5 CHECK CIRCUIT 1951 (TN) FOR A SHORT TO GROUND - Key in OFF position. - Disconnect: Body Security Module C2113c. - Measure the resistance between left third row seat relay C4183-85, circuit 1951 (TN), harness side and ground.  A0050609 - **Is the resistance greater than 10,000 ohms?**	**Yes** GO to M7 . **No** REPAIR the circuit. TEST the system for normal operation.
M6 CHECK CIRCUIT 1951 (TN) FOR AN OPEN - Key in OFF position. - Disconnect: Body Security Module C2113c. - Measure the resistance between BSM C2113c-8, circuit 1951 (TN), harness side and left third row seat relay C4183-85, circuit 1951 (TN), harness side.  A0050610 - **Is the resistance less than 5 ohms?**	**Yes** REFER to Section 501-14 to determine the BSM fault. Test the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
M7 CHECK CIRCUIT 57 (BK) FOR AN OPEN - Key in OFF position. - Disconnect: Left Rear Third Row Seat Switch C4179. - Measure the resistance between left rear third row seat switch C4179-2, circuit 57 (BK), harness side and ground.	**Yes** REPLACE the BSM. REFER to Section 501-14 . Test the system for normal operation. **No** REPAIR the circuit. TEST the system for

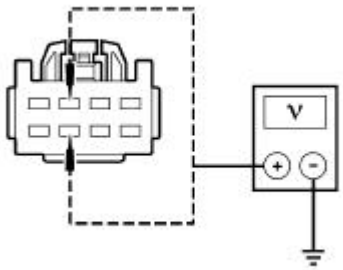
 A0050611 ● **Is the resistance less than 5 ohms?**	normal operation.

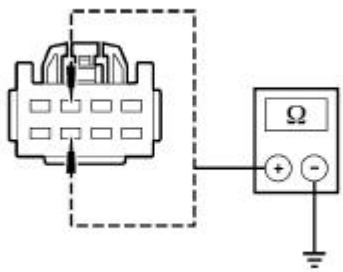


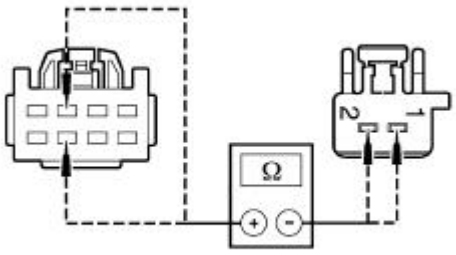




PINPOINT TEST N: THE THIRD ROW POWER FOLD SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY — LEFT







Test Step	Result / Action to Take
N1 VERIFY LEFT THIRD ROW SEAT SYMPTOM	
● Verify if the third row seat is not operating properly at both switches or at a single switch. ● **Is the left third row seat inoperative from both switches?**	**Yes** GO to N4. **No** If the left front switch does not operate GO to N2. If the left rear does not operate GO to N3.
N2 CHECK CIRCUIT 51 (BK/WH) FOR AN OPEN	
● Key in OFF position. ● Disconnect: Left Front Third Row Seat Switch C3199. ● Disconnect: Left Third Row Seat Relay C4183. ● Measure the resistance between left third row seat relay C4183-87, circuit 51 (BK/WH), harness side and the left front third row seat switch C3199-4, circuit 51 (BK/WH), harness side.  A0050616 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new left front third row seat switch. TEST system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
N3 CHECK CIRCUIT 51 (BK/WH) FOR AN OPEN	
● Key in OFF position. ● Disconnect: Left Rear Third Row Seat Switch C4179. ● Disconnect: Left Third Row Seat Relay C4183. ● Measure the resistance between left third row seat relay C4183-87, circuit 51 (BK/WH), harness side and the left front third row seat switch	**Yes** INSTALL a new left rear third row seat switch. TEST system for

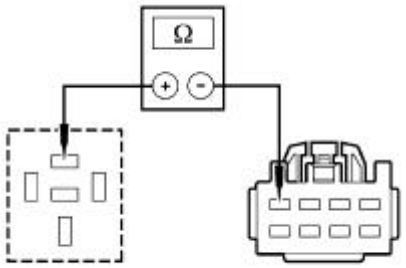
C4179-4, circuit 51 (BK/WH), harness side.  A0050612 • **Is the resistance less than 5 ohms?**	normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
N4 CHECK CIRCUIT 2115 (OG) FOR AN OPEN	
• Key in ON position. • Measure the voltage between left third row seat relay C4183-30, circuit 2115 (OG), harness side and ground.  A0050613 • **Is the voltage greater than 10 volts?**	**Yes** GO to N5 . **No** REPAIR the circuit. TEST the system for normal operation.
N5 CHECK CIRCUIT 729 (RD/WH) FOR AN OPEN	
• Measure the voltage between left third row seat relay C4183-86, circuit 729 (RD/WH), harness side and ground.  A0050607 • **Is the voltage greater than 10 volts?**	**Yes** GO to N6 . **No** REPAIR the circuit. TEST the system for normal operation.
N6 CHECK LEFT THIRD ROW SEAT RELAY	
• Key in OFF position. • Perform component test on the left third row seat relay. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the relay pass?**	**Yes** GO to N7 . **No** INSTALL a new left third row seat relay. TEST the system for normal operation.
N7 CHECK CIRCUIT 1951 (TN) FOR AN OPEN	

• Key in ON position. • Measure the resistance between left third row seat relay C4183-85, circuit 1951 (TN), harness side and ground.  A0050609 • **Is the resistance less than 5 ohms?**	**Yes** GO to N8 . **No** REPAIR the circuit. TEST the system for normal operation.
N8 CHECK CIRCUIT 51 (BK/WH) FOR A SHORT TO POWER	
• Key in OFF position. • Disconnect: Left Front and Left Rear Third Row Seat Switches C3199 and C4179. • Key in ON position. • Measure the voltage between left rear third row seat relay C4183-87, circuit 51 (BK/WH), harness side and ground.  A0050614 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to N9 .
N9 CHECK CIRCUIT 51 (BK/WH) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between left third row seat relay C4183-87, circuit 51 (BK/WH), harness side and ground.  A0050615 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to N10 . **No** REPAIR the circuit. TEST the system for normal operation.
N10 CHECK CIRCUIT 51 (BK/WH) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between left third row seat relay C4183-87, circuit 51 (BK/WH), harness side and left front third row seat switch C3199-4, circuit 51 (BK/WH), harness side.	**Yes** GO to N11 . **No** REPAIR the circuit. TEST the

 A0050616 ● **Is the resistance less than 5 ohms?**	system for normal operation.
N11 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
● Key in OFF position. ● Measure the resistance between left rear third row seat switch C4179-8, circuit 57 (BK), harness side and ground and between C4179-2 circuit 57 (BK), harness side and ground.  A0050617 ● **Is the resistance less than 5 ohms?**	**Yes** GO to N12 . **No** REPAIR the circuit. TEST the system for normal operation.
N12 CHECK CIRCUIT 2112 (OG/BK) AND 2111 (OG/WH) FOR A SHORT TO POWER	
● Key in ON position. ● Measure the voltage between left front third row seat switch C3199-8, circuit 2112 (OG/BK), harness side and ground and between C3199-2, circuit 2111 (OG/WH), harness side and ground.  A0050618 ● **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit(s). TEST the system for normal operation. **No** GO to N13 .
N13 CHECK CIRCUIT 2112 (OG/BK) AND 2111 (OG/WH) FOR A SHORT TO GROUND	
● Key in OFF position. ● Measure the resistance between left front third row seat switch C3199-8, circuit 2112 (OG/BK), harness side and ground and between C3199-2, circuit 2111 (OG/WH), harness side and ground.	**Yes** GO to N14 . **No** REPAIR the circuit(s). TEST the system for normal

 A0050619 ● **Is the resistance greater than 10,000 ohms?**	operation.
N14 CHECK CIRCUIT 2112 (OG/BK) FOR AN OPEN	
● Key in OFF position. ● Measure the resistance between left front third row seat switch C3199-8, circuit 2112 (OG/BK), harness side and ground and between left rear third row seat switch C4179-3, circuit 2112 (OG/BK), harness side and ground.  A0050620 ● **Is the resistance less than 5 ohms?**	**Yes** GO to N15 . **No** REPAIR the circuit. TEST the system for normal operation.
N15 CHECK CIRCUIT 2111 (OG/WH) FOR AN OPEN	
● Key in OFF position. ● Measure the resistance between left front third row seat switch C3199-2, circuit 2111 (OG/WH), harness side and ground and between left rear third row seat switch C4179-7, circuit 2111 (OG/WH), harness side and ground.  A0050621 ● **Is the resistance less than 5 ohms?**	**Yes** GO to N16 . **No** REPAIR the circuit. TEST the system for normal operation.
N16 CHECK LEFT FRONT AND LEFT REAR THIRD ROW SEAT SWITCHES	
● Perform component test on both switches. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Did the switches pass?**	**Yes** GO to N17 . **No** INSTALL a new switch(es). TEST the system for

	normal operation.
N17 CHECK CIRCUIT 1948 (LB/WH) AND 1947 (DG/WH) FOR A SHORT TO POWER	
• Disconnect: Left Front Third Row Seat Switch C3199. • Key in ON position. • Measure the voltage between left front third row seat switch C3199-7, circuit 1948 (LB/WH), harness side and ground and between C3199-3, circuit 1947 (DG/WH), harness side and ground.  A0050622 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit(s). TEST the system for normal operation. **No** GO to N18 .
N18 CHECK CIRCUIT 1948 (LB/WH) AND 1947 (DG/WH) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between left front third row seat switch C3199-7, circuit 1948 (LB/WH), harness side and ground and between C3199-3, circuit 1947 (DG/WH), harness side and ground.  A0050623 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to N19 . **No** REPAIR the circuit(s). TEST the system for normal operation.
N19 CHECK CIRCUIT 1948 (LB/WH) AND 1947 (DG/WH) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between left front third row seat switch C3199-7, circuit 1948 (LB/WH), harness side and left third row seat motor C4181-2, circuit 1948 (LB/WH) harness side; and between left third row seat switch, C3199-3, circuit 1947 (DG/WH), harness side and left third row seat motor C4181-1, circuit 1947 (DG/WH), harness side.  A0050624	**Yes** INSTALL a new left third row power seat motor. TEST the system for normal operation. **No** REPAIR the circuit(s). TEST the system for normal operation.

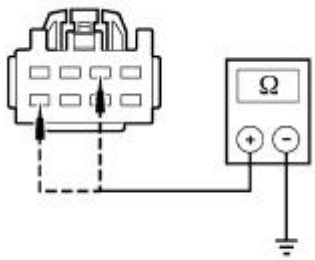


• **Is the resistance less than 5 ohms?**	

PINPOINT TEST O: THE THIRD ROW POWER FOLD SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY — RIGHT

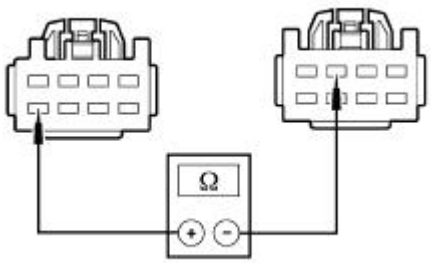
Test Step	Result / Action to Take
O1 VERIFY RIGHT THIRD ROW SEAT SYMPTOM	
• Verify if the third row seat is not operating properly at both switches or at a single switch. • **Is the right third row seat inoperative from both switches?**	**Yes** GO to O4. **No** If the right front switch does not operate, GO to O2. If the right rear switch does not operate, GO to O3.
O2 CHECK CIRCUIT 1946 (OG/LB) FOR AN OPEN	
• Key in OFF position. • Disconnect: Right Front Third Row Seat Switch C3200. • Disconnect: Right Third Row Seat Relay C4184. • Measure the resistance between right third row seat relay C4184-87, circuit 1946 (OG/LB), harness side and the right front third row seat switch C3200-4, circuit 1946 (OG/LB), harness side.  A0050612 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new right front third row seat switch. TEST system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
O3 CHECK CIRCUIT 1946 (OG/LB) FOR AN OPEN	
• Key in OFF position. • Disconnect: Right Rear Third Row Seat Switch C4180. • Disconnect: Right Third Row Seat Relay C4184. • Measure the resistance between right third row seat relay C4184-87, circuit 1946 (OG/LB), harness side and the right rear third row seat switch C4180-4, circuit 1946 (OG/LB), harness side.	**Yes** INSTALL a new right front third row seat switch. TEST system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

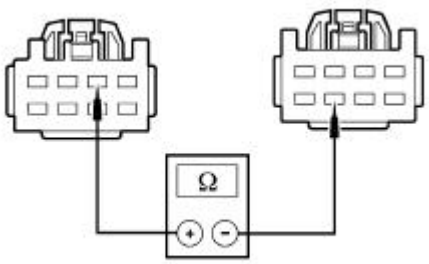
 A0050616 ● **Is the resistance less than 5 ohms?**	
O4 CHECK CIRCUIT 2116 (YE) FOR AN OPEN	
● Key in ON position. ● Measure the voltage between right third row seat relay C4184-30, circuit 2116 (YE), harness side and ground.  A0050613 ● **Is the voltage greater than 10 volts?**	**Yes** GO to O5 . **No** REPAIR the circuit. TEST the system for normal operation.
O5 CHECK CIRCUIT 729 (RD/WH) FOR AN OPEN	
● Measure the voltage between right third row seat relay C4184-86, circuit 729 (RD/WH), harness side and ground.  A0050607 ● **Is the voltage greater than 10 volts?**	**Yes** GO to O6 . **No** REPAIR the circuit. TEST the system for normal operation.
O6 CHECK RIGHT THIRD ROW SEAT RELAY	
● Key in OFF position. ● Perform component test on the right third row seat relay. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Did the relay pass?**	**Yes** GO to O7 . **No** INSTALL a new right third row seat relay. TEST the system for normal operation.
O7 CHECK CIRCUIT 1951 (TN) FOR AN OPEN	
● Key in ON position. ● Measure the resistance between right third row seat relay C4184-85,	**Yes** GO to O8 .



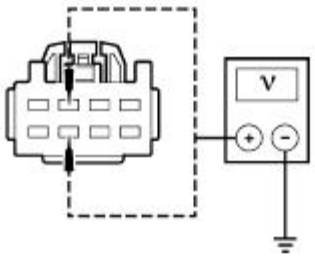
circuit 1951 (TN), harness side and ground.  A0050609 ● **Is the resistance less than 5 ohms?**	**No** REPAIR the circuit. TEST the system for normal operation.
O8 CHECK CIRCUIT 1946 (OG/LB) FOR A SHORT TO POWER	
● Key in OFF position. ● Disconnect: Right Front and Right Rear Third Row Seat Switches C3200 and C4180. ● Key in ON position. ● Measure the voltage between right rear third row seat relay C4184-87, circuit 1946 (OG/LB), harness side and ground.  A0050614 ● **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to O9 .
O9 CHECK CIRCUIT 1946 (OG/LB) FOR A SHORT TO GROUND	
● Key in OFF position. ● Measure the resistance between right third row seat relay C4184-87, circuit 1946 (OG/LB), harness side and ground.  A0050615 ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to O10 . **No** REPAIR the circuit. TEST the system for normal operation.
O10 CHECK CIRCUIT 1946 (OG/LB) FOR AN OPEN	
● Key in OFF position. ● Measure the resistance between right third row seat relay C4184-87, circuit 1946 (OG/LB), harness side and right front third row seat switch C3200-4, circuit 1946 (OG/LB), harness side.	**Yes** GO to O11 . **No** REPAIR the circuit. TEST the system for normal operation.

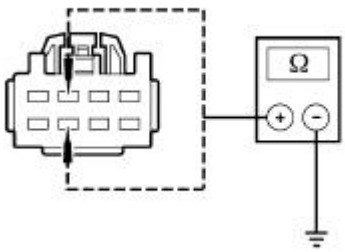
A0050612

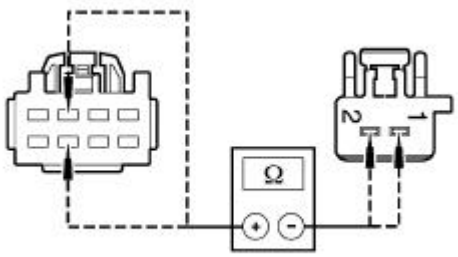




- **Is the resistance less than 5 ohms?**

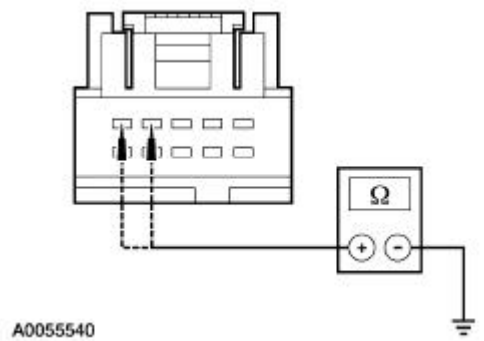




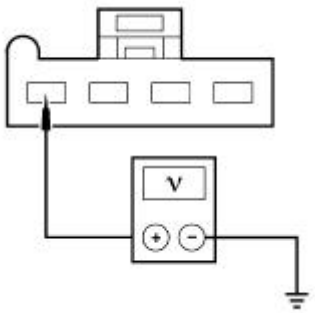


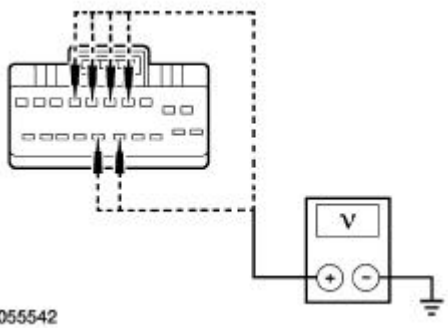
O11 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between right rear third row seat switch C4180-8, circuit 57 (BK), harness side and ground and between C4180-2 circuit 57 (BK), harness side and ground.  A0050619 • **Is the resistance less than 5 ohms?**	**Yes** GO to O12 . **No** REPAIR the circuit. TEST the system for normal operation.
O12 CHECK CIRCUIT 2113 (YE/WH) AND 2114 (YE/BK) FOR A SHORT TO POWER	
• Key in ON position. • Measure the voltage between right front third row seat switch C3200-8, circuit 2113 (YE/WH), harness side and ground and between C3200-2, circuit 2114 (YE/BK), harness side and ground.  A0050625 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit(s). TEST the system for normal operation. **No** GO to O13 .
O13 CHECK CIRCUIT 2113 (YE/WH) AND 2114 (YE/BK) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between right front third row seat switch C3200-8, circuit 2113 (YE/WH), harness side and ground and between C3200-2, circuit 2114 (YE/BK), harness side and ground.	**Yes** GO to O14 . **No** REPAIR the circuit(s). TEST the system for normal operation.

A0050617



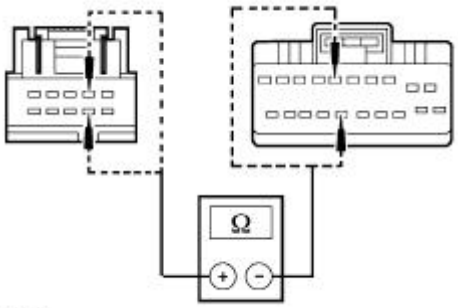
- **Is the resistance greater than 10,000 ohms?**

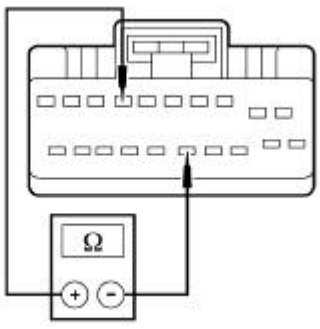




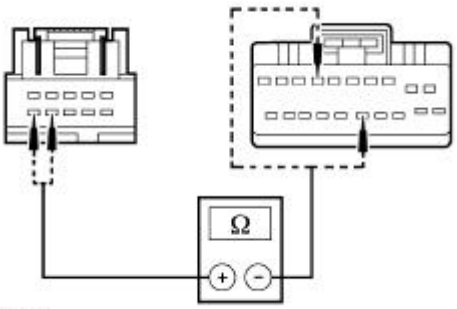
O14 CHECK CIRCUIT 2113 (YE/WH) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between right front third row seat switch C3200-8, circuit 2113 (YE/WH), harness side and ground and between right rear third row seat switch C4180-3, circuit 2113 (YE/WH), harness side and ground.  A0050626 • **Is the resistance less than 5 ohms?**	**Yes** GO to O15 . **No** REPAIR the circuit. TEST the system for normal operation.
O15 CHECK CIRCUIT 2114 (YE/BK) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between right front third row seat switch C3200-2, circuit 2114 (YE/BK), harness side and ground and between right rear third row seat switch C4180-7, circuit 2114 (YE/BK), harness side and ground.  A0050627 • **Is the resistance less than 5 ohms?**	**Yes** GO to O16 . **No** REPAIR the circuit. TEST the system for normal operation.
O16 CHECK RIGHT FRONT AND RIGHT REAR THIRD ROW SEAT SWITCHES	
• Perform component test on both switches. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the switches pass?**	**Yes** GO to O17 . **No** INSTALL a new switch(es). TEST the system for

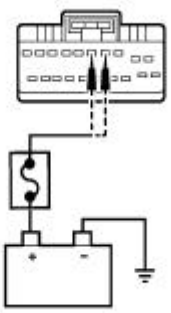
	normal operation.
O17 CHECK CIRCUIT 1949 (OG/BK) AND 1950 (PK/DB) FOR A SHORT TO POWER	
• Disconnect: Right Front Third Row Seat Switch C3200. • Key in ON position. • Measure the voltage between right front third row seat switch C3200-7, circuit 1949 (OG/BK), harness side and ground and between C3200-3, circuit 1950 (PK/DB), harness side and ground.  A0050628 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit(s). TEST the system for normal operation. **No** GO to O18 .
O18 CHECK CIRCUIT 1949 (OG/BK) AND 1950 (PK/DB) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between right front third row seat switch C3200-7, circuit 1949 (OG/BK), harness side and ground and between C3200-3, circuit 1950 (PK/DB) harness side and ground.  A0050629 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to O19 . **No** REPAIR the circuit(s). TEST the system for normal operation.
O19 CHECK CIRCUIT 1949 (OG/BK) AND 1950 (PK/DB) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between right front third row seat switch C3200-7, circuit 1949 (OG/BK), harness side and right third row seat motor C4182-1, circuit 1949 (OG/BK) harness side; and between right third row seat switch, C3200-3, circuit 1950 (PK/DB), harness side and right third row seat motor C4182-2, circuit 1950 (PK/DB), harness side.  A0050630	**Yes** INSTALL a new right third row power seat motor. TEST the system for normal operation. **No** REPAIR the circuit(s). TEST the system for normal operation.



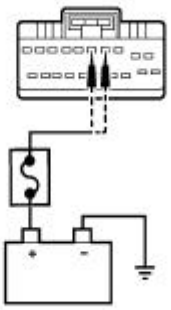


• **Is the resistance less than 5 ohms?**	





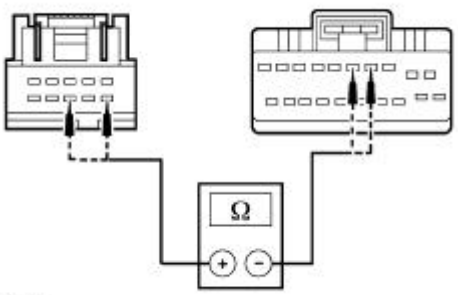
PINPOINT TEST P: A SINGLE CLIMATE CONTROLLED SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

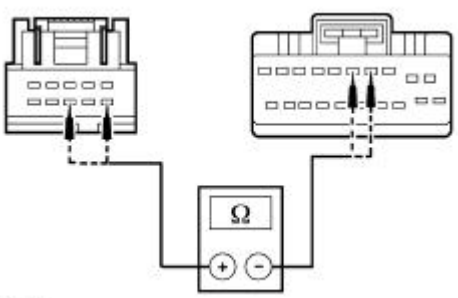


Test Step	Result / Action to Take
P1 CHECK FOR DTCS	
WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards. NOTE: If a seat equipped with a seat-mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.** Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section. **NOTE:** Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors. **NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the supplemental restraint system (SRS). Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Were any DTCs retrieved?**	**Yes** If DTC B1358 was retrieved, GO to P13 . If DTC B2488 was retrieved, GO to P2 . If DTC B2521 was retrieved, GO to P3 . If DTC B2729 was received, GO to P23 . If DTC B2730 was retrieved, GO to P23 . If DTC B2731 was received, GO to P23 . If DTC B2792 was received, GO to P5 . If DTC B2793 was retrieved, GO to P5 . **No** GO to P2 .
P2 CHECK CIRCUIT 57 (BK)	
• Key in OFF position. • Disconnect: Driver Climate Controlled Seat Switch C3032 or Passenger Climate Controlled Seat Switch C3037. • Measure the resistance between the driver climate controlled seat switch C3032-4 (or passenger climate controlled seat switch C3037-4), circuit 57 (BK), harness side and ground and between the driver climate controlled seat switch C3032-5 (or passenger climate controlled seat switch C3037-5), circuit 57 (BK), harness side and ground.  • **Are the resistances less than 5 ohms?**	**Yes** GO to P3 . **No** REPAIR circuit 57 (BK). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P3 CHECK CIRCUIT 1153 (RD/BK)	

• Key in OFF position. • Disconnect: Driver CCSM C3031b or Passenger CCSM C3036b. • Key in ON position. • Measure the voltage between the driver CCSM C3031b-4 (or passenger CCSM C3036b-4), circuit 1153 (RD/BK), harness side and ground.  A0055541 • **Is the voltage greater than 10 volts?**	**Yes** GO to P4 . **No** REPAIR circuit 1153 (RD/BK). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P4 CHECK THE CLIMATE CONTROLLED SEAT SWITCH CIRCUITS FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Connect: Driver CCSM C3031b or Passenger CCSM C3036b. • Disconnect: Driver Climate Controlled Seat Switch C3032 or Passenger Climate Controlled Seat Switch C3037 (as needed). • Disconnect: Driver CCSM C3031a or Passenger CCSM C3036a. • Key in ON position. • Measure the voltage between the driver CCSM C3031a (or passenger CCSM C3036a): ■ pin 4, circuit 1973 (RD), harness side and ground (Navigator and Expedition driver side only). ■ pin 5, circuit 1974 (LB), harness side and ground (Navigator and Expedition driver side only). ■ pin 4, circuit 1255 (WH/OG), harness side and ground (Expedition passenger side only). ■ pin 5, circuit 1256 (WH/YE), harness side and ground (Expedition passenger side only). ■ pin 6, circuit 1551 (VT/WH), harness side and ground. ■ pin 7, circuit 1018 (LG/OG), harness side and ground. ■ pin 15, circuit 1019 (TN/LB), harness side and ground. ■ pin 16, circuit 1550 (WH/OG), harness side and ground.  A0055542 • **Is voltage greater than 10 volts on any circuit?**	**Yes** REPAIR the affected circuits. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to P5 .
P5 CHECK THE CLIMATE CONTROLLED SEAT SWITCH CIRCUITS FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the driver CCSM C3031a (or	**Yes** GO to P6 .

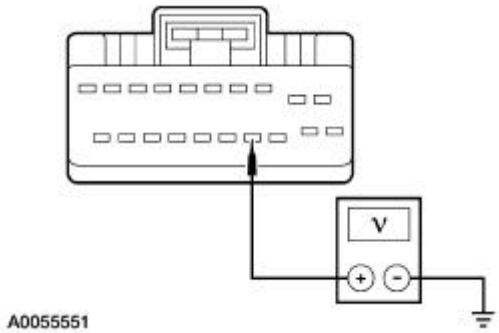
passenger CCSM C3036a): ■ pin 4, circuit 1973 (RD), harness side and ground (Navigator and Expedition driver side only). ■ pin 5, circuit 1974 (LB), harness side and ground (Navigator and Expedition driver side only). ■ pin 4, circuit 1255 (WH/OG), harness side and ground (Expedition passenger side only). ■ pin 5, circuit 1256 (WH/YE), harness side and ground (Expedition passenger side only). ■ pin 6, circuit 1551 (VT/WH), harness side and ground. ■ pin 7, circuit 1018 (LG/OG), harness side and ground. ■ pin 15, circuit 1019 (TN/LB), harness side and ground. ■ pin 16, circuit 1550 (WH/OG), harness side and ground.  ● **Are the resistances greater than 10,000 ohms?**	**No** REPAIR the affected circuit(s). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P6 CHECK THE CLIMATE CONTROLLED SEAT SWITCH OUTPUTS	
● Measure the resistance between the driver CCSM C3031a-6 (or passenger C3036a-6), circuit 1551 (VT/WH), harness side and ground while pressing the HEAT button.  ● Measure the resistance between the driver CCSM C3031a-16 (or passenger C3036a-16), circuit 1550 (WH/OG), harness side and ground while pressing the COOL button.  ● **Are the resistances less than 5 ohms when a button is pressed and greater than 10,000 ohms when a button is released?**	**Yes** GO to P8 . **No** GO to P7 .

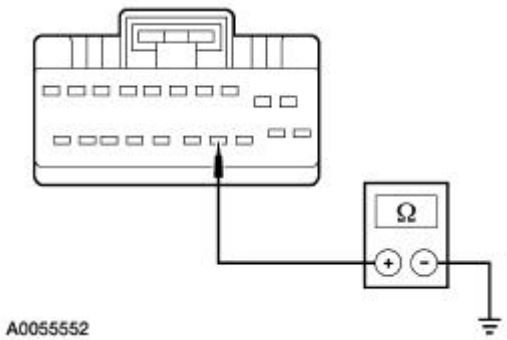


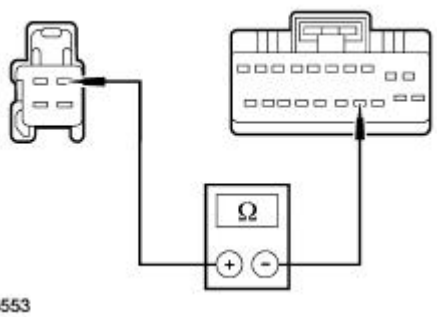


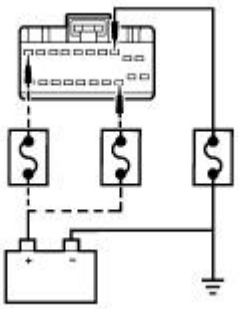
P7 CHECK CIRCUIT 1550 (WH/OG) AND CIRCUIT 1551 (VT/WH)	
• Disconnect: Driver Climate Controlled Seat Switch C3032 or Passenger Climate Controlled Seat Switch C3037. • Measure the resistance between the driver climate controlled seat switch C3032-7 (or passenger climate controlled seat switch C3037-7), circuit 1550 (WH/OG), harness side and the driver CCSM C3031a-16 (or passenger CCSM C3036a-16), circuit 1550 (WH/OG), harness side; and between the driver climate controlled seat switch C3032-2 (or passenger climate controlled seat switch C3037-2), circuit 1551 (VT/WH), harness side and the driver CCSM C3031a-6 (or passenger CCSM C3036a-6), circuit 1551 (VT/WH), harness side.  A0055546 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new climate controlled seat switch. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the affected circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P8 CHECK THE CLIMATE CONTROLLED SEAT SWITCH THUMBWHEEL RESISTANCE	
• Measure the resistance between the driver CCSM C3031a-7 (or passenger C3036a-7), circuit 1018 (LG/OG), harness side and between the driver CCSM C3031a-15 (or passenger C3036a-15), circuit 1019 (TN/LB), harness side. Set the thumbwheel at each position and compare the resistance to values in the following table. **Position** / **Resistance [a]** 1 — 2,364 ohms 2 — 1,100 ohms 3 — 618 ohms 4 — 394 ohms 5 — 239.1 ohms [a] Acceptable tolerance is ± 4%.  A0055547 • **Is the resistance for each thumbwheel position within the**	**Yes** GO to P10 . **No** GO to P9 .

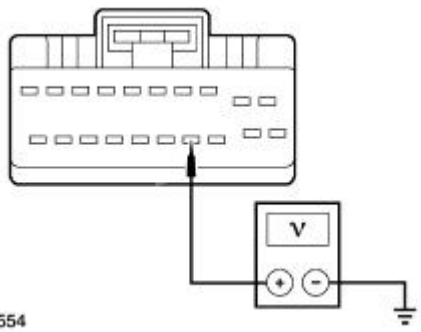
tolerance?	
P9 CHECK CIRCUIT 1018 (LG/OG) AND CIRCUIT 1019 (TN/LB)	
• Disconnect: Driver Climate Controlled Seat Switch C3032 or Passenger Climate Controlled Seat Switch C3037. • Measure the resistance between the driver climate controlled seat switch C3032-10 (or passenger climate controlled seat switch C3037-10), circuit 1018 (LG/OG), harness side and the driver CCSM C3031a-7 (or passenger CCSM C3036a-7), circuit 1018 (LG/OG), harness side; and between the driver climate controlled seat switch C3032-9 (or passenger climate controlled seat switch C3037-9), circuit 1019 (TN/LB), harness side and the driver CCSM C3031a-15 (or passenger CCSM C3036a-15), circuit 1019 (TN/LB), harness side.  A0055548 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new climate controlled seat switch. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** REPAIR the affected circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P10 CHECK THE CLIMATE CONTROLLED SEAT SWITCH LED INDICATORS	
• Key in ON position. • For Navigator and Expedition driver side only, connect a fused (5A) jumper lead between battery positive and the driver CCSM C3031a-4 (or passenger CCSM C3036a-4), circuit 1973 (RD), harness side; and connect a second fused (5A) jumper lead between battery positive and the driver CCSM C3031a-5 (or passenger CCSM C3036a-5), circuit 1974 (LB), harness side.  A0055549 • For Expedition passenger side only, connect a fused (5A) jumper lead between battery positive and the passenger CCSM C3036a-4, circuit 1255 (WH/OG), harness side; and between connect a second fused (5A) jumper lead battery positive and the passenger CCSM C3036a-5, circuit 1256 (WH/YE), harness side.	**Yes** GO to P13 . **No** If a jumper lead fuse (5A) opens, REPAIR the affected circuit. If the jumper lead fuse does not open, GO to P11 .

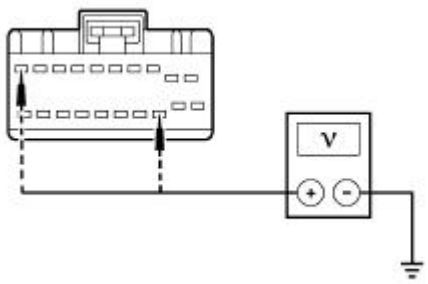




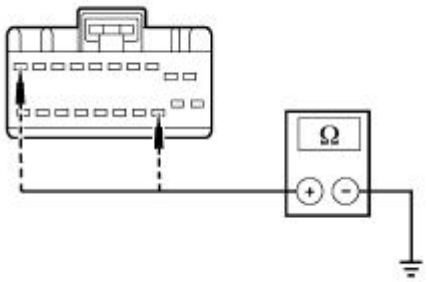


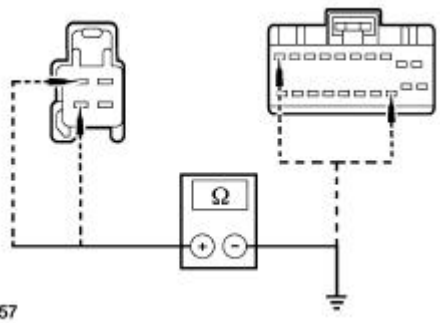




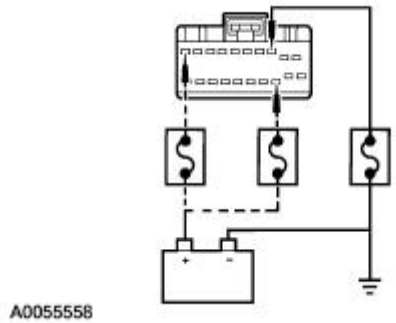


A0055549





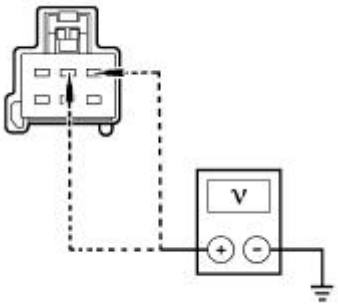
- **Did the climate control seat switch LED indicators illuminate?**



P11 CHECK THE LED INDICATOR CIRCUITS	
• Key in OFF position. • For Navigator and Expedition driver side only, measure the resistance between the driver climate controlled seat switch C3032-6 (or passenger climate controlled seat switch C3037-6), circuit 1974 (LB), harness side and the driver CCSM C3031a-5 (or passenger CCSM C3036a-5), circuit 1974 (LB), harness side; and between the driver climate controlled seat switch C3032-8 (or passenger climate controlled seat switch C3037-8), circuit 1973 (RD), harness side and the driver CCSM C3031a-4 (or passenger CCSM C3036a-4), circuit 1973 (RD), harness side.  A0055550 • For Expedition passenger side only, measure the resistance between the passenger climate controlled seat switch C3037-6, circuit 1256 (WH/YE), harness side and the passenger CCSM C3036a-5, circuit 1256 (WH/YE), harness side; and between the passenger climate controlled seat switch C3037-8, circuit 1255 (WH/OG), harness side and the passenger CCSM C3036a-4, circuit 1255 (WH/OG), harness side.  A0055550 • **Are the resistances less than 5 ohms?**	**Yes** GO to P12 . **No** REPAIR the affected circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P12 CHECK THE LED INDICATOR OUTPUTS FROM THE CCSM	
• Connect: Driver Climate Controlled Seat Switch C3032 or Passenger Climate Controlled Seat Switch C3037.	**Yes** REPAIR the affected

• Connect: Driver CCSM C3031a or Passenger CCSM C3036a. • Key in START position. • For Navigator and Expedition driver side only, measure the voltage between the driver climate controlled seat switch C3032-6 (or passenger climate controlled seat switch C3037-6), circuit 1974 (LB), harness side and ground by back-probing the driver climate controlled seat switch C3032 (or passenger climate controlled seat switch C3037); and between the driver climate controlled seat switch C3032-8 (or passenger climate controlled seat switch C3037-8), circuit 1973 (RD), harness side and ground by back-probing driver climate controlled seat switch C3032 (or passenger climate controlled seat switch C3037). • For Expedition passenger side only, measure the voltage between the passenger climate controlled seat switch C3037-6, circuit 1256 (WH/YE), harness side and ground by back-probing the passenger climate controlled seat switch C3037; and between the passenger climate controlled seat switch C3037-8, circuit 1255 (WH/OG), harness side and ground by back-probing the passenger climate controlled seat switch C3037. • **Are the voltages greater than 7 volts?**	circuits. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** INSTALL a new climate controlled seat switch. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P13 CHECK THE FAN MOTOR RPM INPUT	
• Key in OFF position. • Connect: Driver CCSM C3031a or Passenger CCSM C3036a (if needed). • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: CCSM Active Command Menu TURN BLOWER FULL POWER. • **NOTE:** After the active command FULL BLOW to is commanded to the ON state, the climate controlled seat blower fan will operate for 15 seconds then turn off. • **NOTE:** The CCSM is not the source of the fault if the active command mode is operational. • Monitor the PID BLWRRPM while commanding the FULL BLOW active command ON then OFF. • **Does the PID value change when the climate controlled seat blower fan was commanded ON and OFF?**	**Yes** GO to P23 . **No** GO to P14 .
P14 VERIFY THE CLIMATE CONTROLLED SEAT BLOWER FAN OPERATION	
• **NOTE:** After the active command FULL BLOW to is commanded to the ON state, the climate controlled seat blower fan will operate for 15 seconds then turn off. • **NOTE:** The CCSM is not the source of the fault if the active command mode is operational. • Command the FULL BLOW active command ON then OFF and note the climate controlled seat blower fan operation. • **Does the climate controlled seat blower fan operate?**	**Yes** GO to P15 . **No** GO to P19 .
P15 CHECK CIRCUIT 1554 (WH) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Driver CCSM C3031a or Passenger CCSM C3036a. • Key in ON position. • Measure the voltage between the driver CCSM C3031a-14 (of passenger CCSM C3036a-14), circuit 1554 (WH), harness side and ground.	**Yes** REPAIR circuit 1554 (WH). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental

 A0055551 ● **Is the voltage greater than 10 volts?**	Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to P16 .
P16 CHECK CIRCUIT 1554 (WH) FOR SHORT TO GROUND	
● Key in OFF position. ● Measure the resistance between the driver CCSM C3031a-14 (or passenger CCSM C3036a-14), circuit 1554 (WH), harness side and ground.  A0055552 ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to P17 . **No** REPAIR circuit 1554 (WH). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P17 CHECK CIRCUIT 1554 (WH) FOR AN OPEN	
● Disconnect: Driver Climate Controlled Seat Blower Fan C3033 or Passenger Climate Controlled Seat Blower Fan C3038. ● Measure the resistance between the driver CCSM C3031a-14 (or passenger CCSM C3036a-14), circuit 1554 (WH), harness side and the driver climate controlled seat blower fan C3033-2 (or passenger climate controlled seat blower fan C3038-2), circuit 1554 (WH), harness side.  A0055553 ● **Is the resistance less than 5 ohms?**	**Yes** GO to P18 . **No** REPAIR circuit 1554 (WH). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P18 CHECK THE CLIMATE CONTROLLED SEAT BLOWER FAN OUTPUT	
● Connect: Driver Climate Controlled Seat Blower Fan C3033 or Passenger Climate Controlled Seat Blower Fan C3038. ● Connect fused (5A) jumper leads between the driver CCSM C3031a (or passenger CCSM C3036a) as follows: ■ driver CCSM C3031a-10 (or passenger CCSM C3036a-10), circuit 1565 (VT), harness side and battery positive.	**Yes** INSTALL a new CCSM. TEST the system for normal operation. REACTIVATE the supplemental restraint



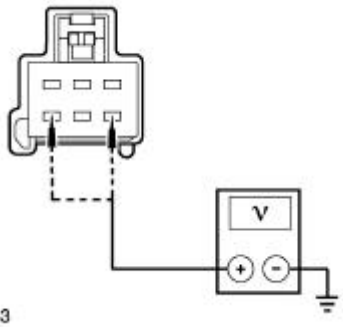
■ driver CCSM C3031a-13 (or passenger CCSM C3036a-13), circuit 1552 (RD), harness side and battery positive. ■ driver CCSM C3031a-3 (or passenger CCSM C3036a-3), circuit 1553 (BK), harness side and ground.  A0055558 ● Measure the voltage between the driver CCSM C3031a-14 (or passenger CCSM C3036a-14), circuit 1554 (WH), harness side and ground.  A0055554 ● **Is voltage present?**	system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** INSTALL a new climate controlled seat blower fan. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P19 CHECK CIRCUIT 1552 (RD) AND CIRCUIT 1565 (VT) FOR A SHORT TO VOLTAGE	
● Key in OFF position. ● Disconnect: Driver CCSM C3031a or Passenger CCSM C3036a. ● Disconnect: Driver Climate Controlled Seat Blower Fan C3033 or Passenger Climate Controlled Seat Blower Fan C3038. ● Key in ON position. ● Measure the voltage between the driver CCSM C3031a-10 (or passenger CCSM C3036a-10), circuit 1565 (VT), harness side and ground and between the driver CCSM C3031a-13 (or passenger CCSM C3036a-13), circuit 1552 (RD), harness side and ground.  A0055555 ● **Is the voltage greater than 10 volts on either circuit?**	**Yes** REPAIR the affected circuits. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to P20 .
P20 CHECK CIRCUIT 1552 (RD) AND CIRCUIT 1565 (VT) FOR A SHORT TO GROUND	

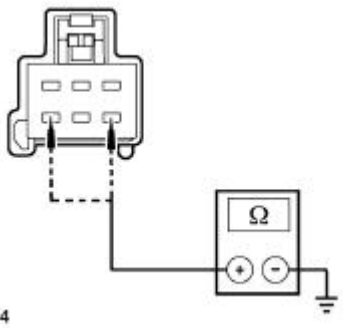
• Key in OFF position. • Measure the resistance between the driver CCSM C3031a-10 (or passenger CCSM C3036a-10), circuit 1565 (VT), harness side and ground and between the driver CCSM C3031a-13 (or passenger CCSM C3036a-13), circuit 1552 (RD), harness side and ground.  A0055556 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to P21 . **No** REPAIR the affected circuit(s). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P21 CHECK CIRCUIT 1552 (RD) AND CIRCUIT 1565 (VT) FOR AN OPEN	
• Measure the resistance between the driver CCSM C3031a-10 (or passenger CCSM C3036a-10), circuit 1565 (VT), harness side and the driver climate controlled seat blower fan C3033-1 (or passenger climate controlled seat blower fan C3038-1), circuit 1565 (VT), harness side; and between the driver CCSM C3031a-13 (or passenger CCSM C3036a-13), circuit 1552 (RD), harness side and the driver climate controlled seat blower fan C3033-3 (or passenger climate controlled seat blower fan C3038-3), circuit 1552 (RD), harness side and ground.  A0055557 • **Are the resistances less than 5 ohms?**	**Yes** GO to P22 . **No** REPAIR the affected circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P22 CHECK THE CLIMATE CONTROLLED BLOWER FAN OPERATION	
• Connect: Driver Climate Controlled Seat Blower Fan C3033 or Passenger Climate Controlled Seat Blower Fan C3038. • Connect fused (5A) jumper leads between the driver CCSM C3031a (or passenger CCSM C3036a) as follows: ■ driver CCSM C3031a-10 (or passenger CCSM C3036a-10), circuit 1565 (VT), harness side and battery positive. ■ driver CCSM C3031a-13 (or passenger CCSM C3036a-13), circuit 1552 (RD), harness side and battery positive. ■ driver CCSM C3031a-3 (or passenger CCSM C3036a-3), circuit 1553 (BK), harness side and ground.	**Yes** INSTALL a new CCSM. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** INSTALL a new climate controlled seat blower

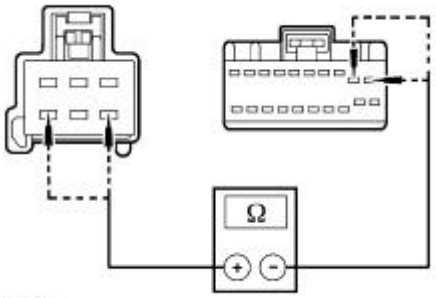
 A0055558 ● **Does the climate controlled seat blower fan operate?**	fan. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P23 CHECK THE SEAT CUSHION TED EXHAUST NOZZLE FOR WASTE AIRFLOW	
● Check for air exhausting from the seat cushion TED exhaust nozzle and compare it to the air exhausting from the opposite seat. ● **Is air exhausting from the seat cushion TED exhaust nozzle comparable to the air exhausting from the opposite seat?**	**Yes** GO to P26 . **No** GO to P24 .
P24 INSPECT THE SEAT CUSHION DUCTS	
● Inspect the seat cushion ducts for damaged, restricted, or disconnected ducts. ● **Are any duct(s) damaged, restricted, or disconnected?**	**Yes** REPAIR or INSTALL new duct(s) as needed. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to P25 .
P25 INSPECT THE SEAT CUSHION TED FOR CORRECT INSTALLATION	
● Inspect the TED for correct installation to the seat cushion. ● **Is the seat cushion TED correctly installed?**	**Yes** REMOVE the seat and the seat cushion trim cover. INSPECT for a worn, damaged, or incorrectly installed foam wedge, cushion foam, or seat cushion trim cover. INSPECT for collapsed airflow channels in the seat cushion foam. REPAIR or INSTALL a new foam wedge, seat cushion foam, or seat cushion trim cover as needed. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER

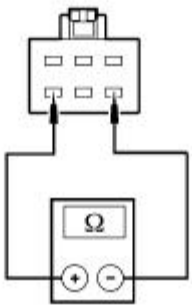
	to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** INSTALL the seat cushion TED correctly. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P26 CHECK THE SEAT BACKREST TED EXHAUST NOZZLE FOR WASTE AIRFLOW	
• Check for air exhausting from the seat backrest TED exhaust nozzle and compare it to the air exhausting from the opposite seat. • **Is air exhausting from the seat backrest TED exhaust nozzle comparable to the air exhausting from the opposite seat?**	**Yes** GO to P29 . **No** GO to P27 .
P27 INSPECT THE SEAT BACKREST DUCTS	
• Inspect the seat backrest ducts for damaged, restricted, or disconnected ducts. • **Are any duct(s) damaged, restricted, or disconnected?**	**Yes** REPAIR or INSTALL new duct(s) as needed. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to P28 .
P28 INSPECT THE SEAT BACKREST TED FOR CORRECT INSTALLATION	
• Inspect the TED for correct installation to the seat cushion. • **Is the seat backrest TED correctly installed?**	**Yes** REMOVE the seat and the seat backrest trim cover. INSPECT for a worn, damaged, or incorrectly installed foam wedge, backrest foam, or seat backrest trim cover. INSPECT for collapsed airflow channels in the seat backrest foam. REPAIR or INSTALL a new foam wedge, seat backrest

	foam, or seat backrest trim cover as needed. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** INSTALL the seat backrest TED correctly. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P29 CHECK THE SEAT CUSHION AND SEAT BACKREST TEMPERATURE PIDS	
• Enter the following diagnostic mode on the diagnostic tool: CCSM Active Command Menu TED HEAT MODE. • **NOTE:** After the active command TED HEAT is commanded to the ON state, the climate controlled seat TED will operate for 15 seconds then turn off. • **NOTE:** The CCSM is not the source of the fault if the active command mode is operational. • Monitor the PIDs CSHTEMP and BK_TEMP while commanding the TED HEAT active command ON. • **Are both PIDs greater than 185° F (85° C)?**	**Yes** If the only the PID CSHTEMP is greater than 185° F (85° C), GO to P30. If the only the PID BK_TEMP is greater than 185° F (85° C), GO to P39. **No** GO to P34.
P30 CHECK THE SEAT CUSHION TED TEMPERATURE SENSOR CIRCUITS 1548 (DG/LG) AND 1060 (BK/LB) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Driver Seat Cushion TED C3035 or Passenger Seat Cushion TED C3040. • Measure the voltage between the driver seat cushion TED C3035-3 (or passenger seat cushion TED C3040-3), circuit 1548 (DG/LG), harness side and ground; and between the driver seat cushion TED C3035-2 (or passenger seat cushion TED C3040-2), circuit 1060 (BK/LB), harness side an ground.	**Yes** REPAIR the affected circuits. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to P31.

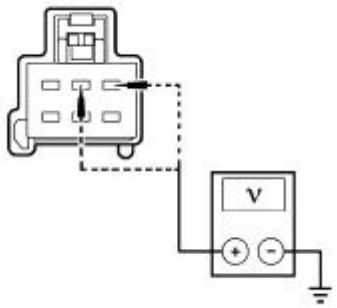


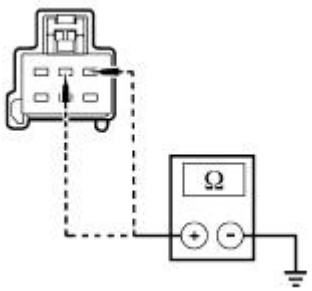


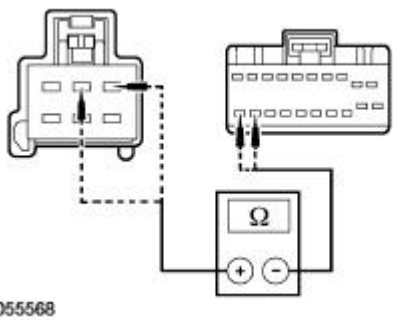




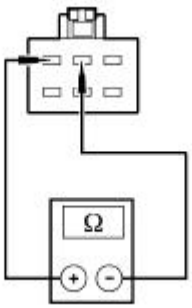
A0055559

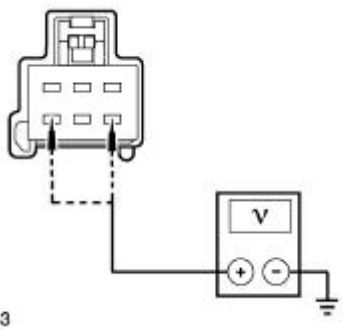




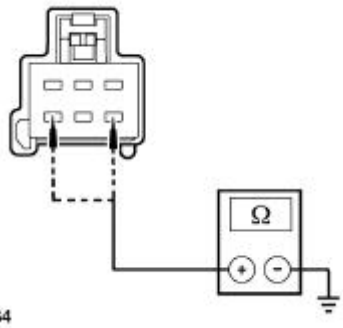


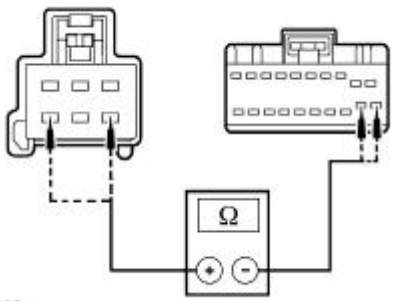
- **Is the voltage greater than 10 volts?**

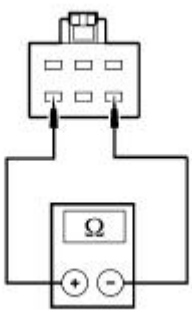




P31 CHECK THE SEAT CUSHION TED TEMPERATURE SENSOR CIRCUITS 1548 (DG/LG) AND 1060 (BK/LB) FOR A SHORT TO GROUND	
• Measure the resistance between the driver seat cushion TED C3035-3 (or passenger seat cushion TED C3040-3), circuit 1548 (DG/LG), harness side and ground; and between the driver seat cushion TED C3035-2 (or passenger seat cushion TED C3040-2), circuit 1060 (BK/LB), harness side an ground.  A0055560 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to P32 . **No** REPAIR the affected circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P32 CHECK THE SEAT CUSHION TED TEMPERATURE SENSOR CIRCUITS 1548 (DG/LG) AND 1060 (BK/LB) FOR AN OPEN	
• Disconnect: Driver CCSM C3031a or Passenger CCSM C3036a. • Measure the resistance between the driver seat cushion TED C3035-3 (or passenger seat cushion TED C3040-3), circuit 1548 (DG/LG), harness side and the driver CCSM C3031a-18 (or passenger CCSM C3036a-18), circuit 1548 (DG/LG), harness side; and between the driver seat cushion TED C3035-2 (or passenger seat cushion TED C3040-2), circuit 1060 (BK/LB), harness side and the driver CCSM C3031a-17 (or passenger CCSM C3036a-17), circuit 1060 (BK/LB), harness side.  A0055561 • **Are the resistances less than 5 ohms?**	**Yes** GO to P33 . **No** REPAIR the affected circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P33 CHECK THE SEAT CUSHION TED	







• Measure the resistance between the seat cushion TED pin 3 and pin 2, component side.  A0055562 • **Is the resistance greater than 1,000 ohms?**	**Yes** INSTALL a new CCSM. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** INSTALL a new seat cushion TED. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P34 CHECK THE SEAT CUSHION AND SEAT BACKREST TEMPERATURE PIDS	
• Enter the following diagnostic mode on the diagnostic tool: CCSM Active Command Menu TED HEAT MODE. • **NOTE:** After the active command TED HEAT is commanded to the ON state, the climate controlled seat TED will operate for 15 seconds then turn off. • **NOTE:** The CCSM is not the source of the fault if the active command mode is operational. • Monitor the PIDs CSHTEMP and BK_TEMP while commanding the TED HEAT active command ON. • **Did the PID values change?**	**Yes** REPAIR the climate controlled seat for airflow leaks. INSPECT the fan, TEDs, ducts, foam wedges, foam pads, trim covers and their connection points and REPAIR as needed. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** If the PID CSHTEMP does not change, GO to P35. If the PID BK_TEMP does not change, GO to P43.
P35 CHECK THE SEAT CUSHION TED HEATING ELEMENT CIRCUITS 1064 (YE/LB) AND 1065 (WH/LB) FOR A SHORT TO VOLTAGE	
• Key in OFF position.	**Yes**

• Disconnect: Driver Seat Cushion TED C3035 or Passenger Seat Cushion TED C3040. • Measure the voltage between the driver seat cushion TED C3035-4 (or passenger seat cushion TED C3040-4), circuit 1065 (WH/LB), harness side and ground; and between the driver seat cushion TED C3035-6 (or passenger seat cushion TED C3040-6), circuit 1064 (YE/LB), harness side an ground.  A0055563 • **Is the voltage greater than 10 volts?**	REPAIR the affected circuits. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to P36 .
P36 CHECK THE SEAT CUSHION TED HEATING ELEMENT CIRCUITS 1064 (YE/LB) AND 1065 (WH/LB) FOR A SHORT TO GROUND	
• Measure the resistance between the driver seat cushion TED C3035-4 (or passenger seat cushion TED C3040-4), circuit 1065 (WH/LB), harness side and ground; and between the driver seat cushion TED C3035-6 (or passenger seat cushion TED C3040-6), circuit 1064 (YE/LB), harness side and ground.  A0055564 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to P37 . **No** REPAIR the affected circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P37 CHECK THE SEAT CUSHION TED HEATING ELEMENT CIRCUITS 1064 (YE/LB) AND 1065 (WH/LB) FOR AN OPEN	
• Disconnect: Driver CCSM C3031a or Passenger CCSM C3036a. • Measure the resistance between the driver seat cushion TED C3035-4 (or passenger seat cushion TED C3040-4), circuit 1065 (WH/LB), harness side and the driver CCSM C3031a-2 (or passenger CCSM C3036a-2), circuit 1065 (WH/LB), harness side; and between the driver seat cushion TED C3035-6 (or passenger seat cushion TED C3040-6), circuit 1064 (YE/LB), harness side and the driver CCSM C3031a-1 (or passenger CCSM C3036a-1), circuit 1064 (YE/LB), harness side.	**Yes** GO to P38 . **No** REPAIR the affected circuit. TEST the system for normal operation.

 A0055565 ● **Are the resistances less than 5 ohms?**	
P38 CHECK THE SEAT CUSHION TED	
● Measure the resistance between the seat cushion TED pin 4 and pin 6, component side.  A0055566 ● **Is the resistance greater than 1,000 ohms?**	**Yes** INSTALL a new CCSM. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** INSTALL a new seat cushion TED. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P39 CHECK THE SEAT BACKREST TED TEMPERATURE SENSOR CIRCUITS 1549 (DB/OG) AND 1062 (RD/LB) FOR A SHORT TO VOLTAGE	
● Key in OFF position. ● Disconnect: Driver Seat Backrest TED C3034 or Passenger Seat Backrest TED C3039. ● Measure the voltage between the driver seat backrest TED C3034-3 (or passenger seat backrest TED C3039-3), circuit 1549 (DB/OG), harness side and ground; and between the driver seat backrest TED C3034-2 (or passenger seat backrest TED C3039-2), circuit 1062 (RD/LB), harness side and ground.	**Yes** REPAIR the affected circuits. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to P40 .

 A0055567 ● **Is the voltage greater than 10 volts?**	
P40 CHECK THE SEAT BACKREST TED TEMPERATURE SENSOR CIRCUITS 1549 (DB/OG) AND 1062 (RD/LB) FOR A SHORT TO GROUND	
● Measure the resistance between the driver seat backrest TED C3034-3 (or passenger seat backrest TED C3039-3), circuit 1549 (DB/OG), harness side and ground; and between the driver seat backrest TED C3034-2 (or passenger seat backrest TED C3039-2), circuit 1062 (RD/LB), harness side and ground.  A0055560 ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to P41 . **No** REPAIR the affected circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P41 CHECK THE SEAT BACKREST TED TEMPERATURE SENSOR CIRCUITS 1549 (DB/OG) AND 1062 (RD/LB) FOR AN OPEN	
● Disconnect: Driver CCSM C3031a or Passenger CCSM C3036a. ● Measure the resistance between the driver seat backrest TED C3034-3 (or passenger seat backrest TED C3039-3), circuit 1549 (DB/OG), harness side and the driver CCSM C3031a-19 (or passenger CCSM C3036a-19), circuit 1549 (DB/OG), harness side; and between the driver seat backrest TED C3034-2 (or passenger seat backrest TED C3039-2), circuit 1062 (RD/LB), harness side and the driver CCSM C3031a-20 (or passenger CCSM C3036a-20), circuit 1062 (RD/LB), harness side.  A0055568 ● **Are the resistances less than 5 ohms?**	**Yes** GO to P42 . **No** REPAIR the affected circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

P42 CHECK THE SEAT BACKREST TED	
• Measure the resistance between the seat backrest TED pin 2 and pin 3, component side.  A0055562 • **Is the resistance greater than 1,000 ohms?**	**Yes** INSTALL a new CCSM. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** INSTALL a new seat backrest TED. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P43 CHECK THE SEAT BACKREST TED HEATING ELEMENT CIRCUITS 1066 (GY/LB) AND 1067 (VT/LB) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Driver Seat Backrest TED C3034 or Passenger Seat Backrest TED C3039. • Measure the voltage between the driver seat backrest TED C3034-4 (or passenger seat backrest TED C3039-4), circuit 1067 (VT/LB), harness side and ground; and between the driver seat backrest TED C3034-6 (or passenger seat backrest TED C3039-6), circuit 1066 (GY/LB), harness side an ground.  A0055563 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR the affected circuits. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** GO to P44 .
P44 CHECK THE SEAT BACKREST TED HEATING ELEMENT CIRCUITS 1066 (GY/LB) AND 1067 (VT/LB) FOR A SHORT TO GROUND	
• Measure the resistance between the driver seat backrest TED C3034-4 (or passenger seat backrest TED C3039-4), circuit 1067 (VT/LB), harness side and ground; and between the driver seat backrest TED C3034-6 (or passenger seat backrest TED C3039-6), circuit 1066 (GY/LB), harness side an ground.	**Yes** GO to P45 . **No** REPAIR the affected circuit. TEST the system for normal

 A0055564 ● **Is the resistance greater than 10,000 ohms?**	operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.
P45 CHECK THE SEAT BACKREST TED HEATING ELEMENT CIRCUITS 1066 (GY/LB) AND 1067 (VT/LB) FOR AN OPEN	
● Disconnect: Driver CCSM C3031a or Passenger CCSM C3036a. ● Measure the resistance between the driver seat backrest TED C3034-4 (or passenger seat backrest TED C3039-4), circuit 1067 (VT/LB), harness side and the driver CCSM C3031a-12 (or passenger CCSM C3036a-12), circuit 1067 (VT/LB), harness side; and between the driver seat backrest TED C3034-6 (or passenger seat backrest TED C3039-6), circuit 1066 (GY/LB), harness side and the driver CCSM C3031a-11 (or passenger CCSM C3036a-11), circuit 1066 (GY/LB), harness side.  A0055569 ● **Are the resistances less than 5 ohms?**	**Yes** GO to P46 . **No** REPAIR the affected circuit. TEST the system for normal operation.
P46 CHECK THE SEAT BACKREST TED	
● Measure the resistance between the seat backrest TED pin 4 and pin 6, component side.  A0055566 ● **Is the resistance greater than 1,000 ohms?**	**Yes** INSTALL a new CCSM. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. **No** INSTALL a new seat backrest TED. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental

	Restraint System (SRS) Deactivation and Reactivation in this section.

Component Test

Switch — Memory Set

Memory Set Switch

Remove the memory set switch.

Measure the resistance between the following indicated terminals while pressing the requested switches.

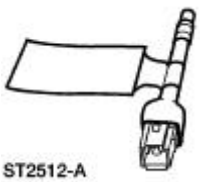
Switch	Terminals
Memory Switch 1	6 and 4
Memory Switch 2	6 and 3
Memory Set Switch	6 and 1

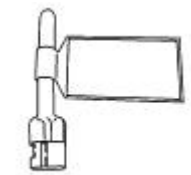
The resistance should be less than 5 ohms for each switch position.

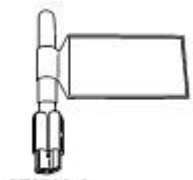
If the resistance is not less than 5 ohms for each switch, install a new switch; otherwise, return to the calling pinpoint test.

Switch	Terminals
Memory Switch LED	8 and 9

NOTE: Refer to multimeter user's manual for testing diodes.







To check the memory set switch LED, connect the positive meter lead to terminal 8 and the negative lead to terminal 9. The meter should indicate greater than 0.3 volts. Reversing the leads, the meter

should read O L.

If the meter readings are not as indicated above, install a new switch; otherwise, return to the calling pinpoint test.

Supplemental Restraint System (SRS) Deactivation and Reactivation

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 req'd) 418-F088 (105-R0012)

Deactivation

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an airbag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Never probe the connectors on the safety canopy module. Doing so can result in safety canopy module deployment.

WARNING: Vehicle sensor orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and properly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.

NOTE: If a seat equipped with a seat mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.**

NOTE: Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors.

NOTE: Diagnostics or repairs are not to be carried out on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

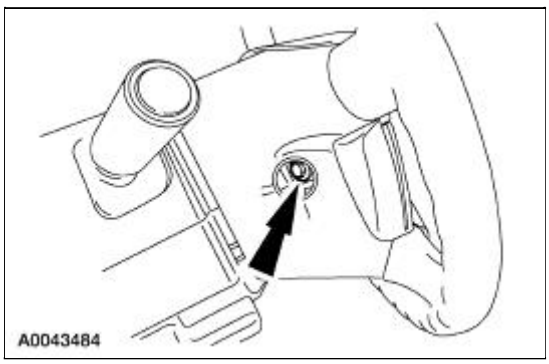
All vehicles

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

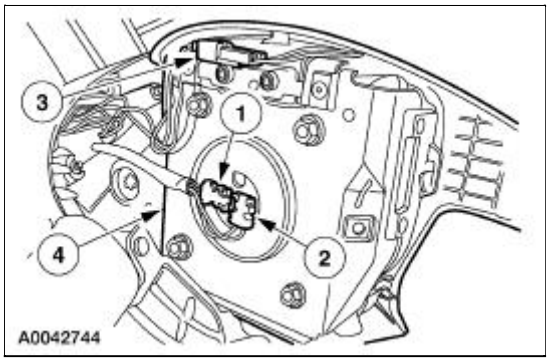
The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.



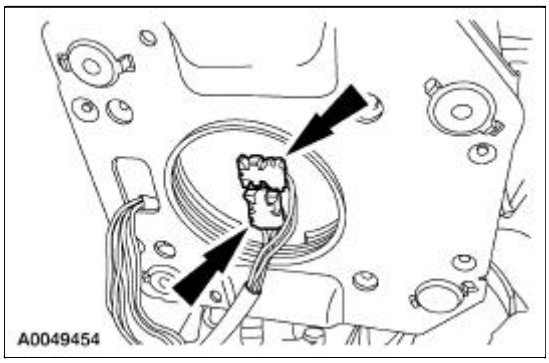
To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. Remove the two steering wheel back cover plugs (one shown).

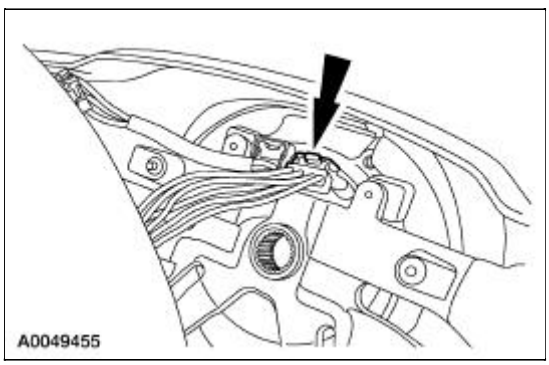


3. Remove the two driver air bag module bolts (one shown).



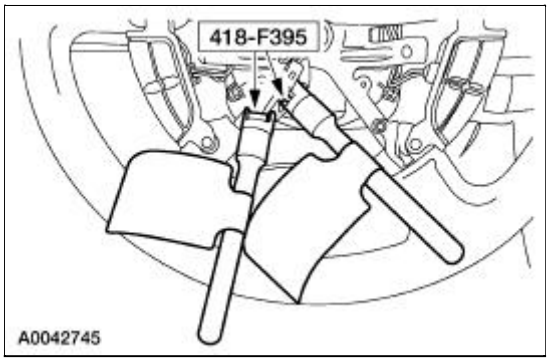
Expedition vehicles

4. Remove the driver air bag module.
    1. Release the two retaining tabs. Disconnect the driver air bag module electrical connector.
        - Label the driver air bag module squib number on the driver air bag module electrical connector before disconnecting.
    2. Release the two retaining tabs. Disconnect the driver air bag module electrical connector.
        - Label the driver air bag module squib number on the driver air bag module electrical connector before disconnecting.
    3. Disconnect the horn switch electrical connector.
    4. Remove the driver air bag module.

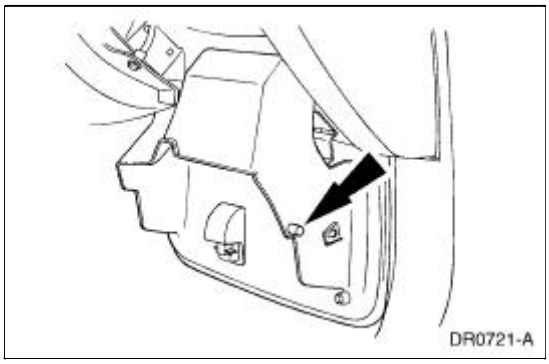


Navigator vehicles

5. Disconnect the driver air bag module
    - Release the two tabs on each driver air bag module electrical connector and disconnect them.
        - Label each driver air bag module electrical connector before disconnecting.

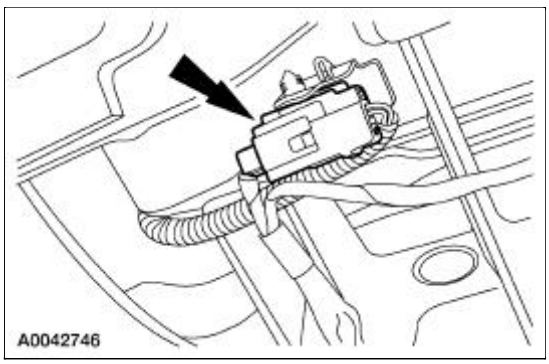


6. Release the tab and disconnect the driver air bag module accessories electrical connector at the top of the clockspring and remove the driver air bag module.

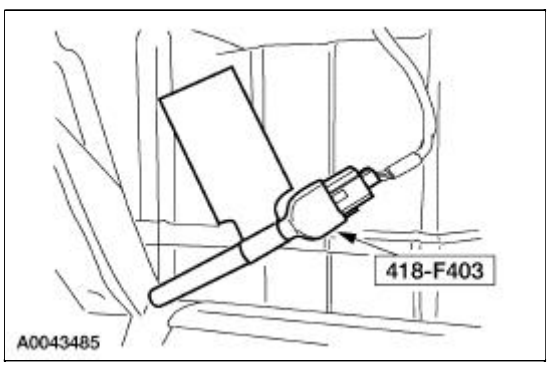


All vehicles

7. Attach the restraint system diagnostic tools to the clockspring electrical connectors at the top of the steering column.



8. While pushing in on the two glove compartment door tabs, position the glove compartment downward.

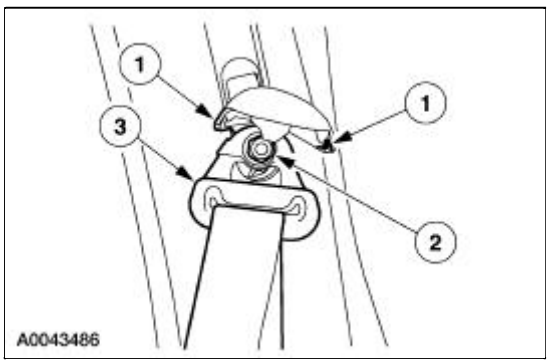


9. **NOTE:** The Expedition is shown, the Navigator is similar.

   Through the glove compartment opening, release the tab and disconnect the passenger air bag module electrical connector.

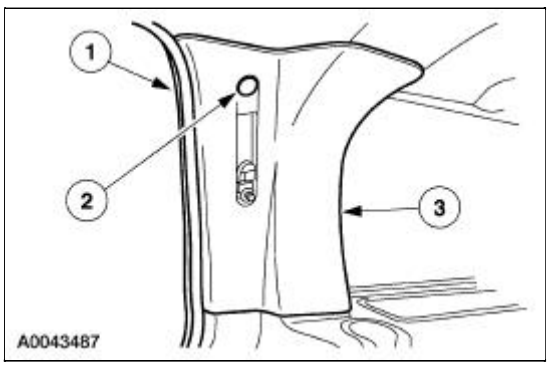
10. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag module electrical connector.

Vehicles without safety canopies



11. **CAUTION: Do not deactivate the safety canopy module circuit by removing the safety canopy bridge resistor from the safety canopy electrical connector.**

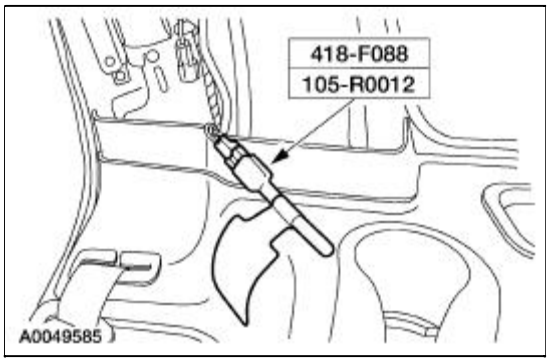
    If the safety canopy bridge resistor is removed, an open circuit fault will be generated by the restraints control module (RCM).
    If a restraint system diagnostic tool is installed at the safety canopy electrical connector, a low resistance fault will be generated by the RCM.



Vehicles with safety canopies

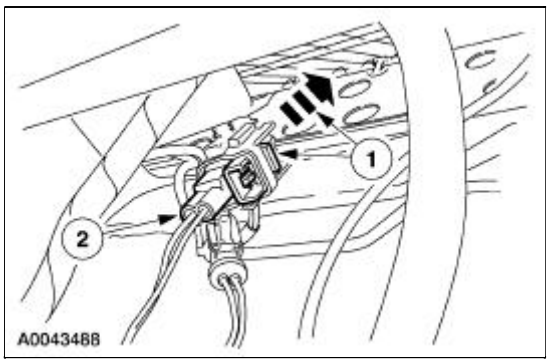
12. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

    Remove the second row passenger side safety belt guide.
    1. Release the retaining tab at each side and open the safety belt guide cover.
    2. Remove the nut.
    3. Remove the second row passenger side safety belt guide.

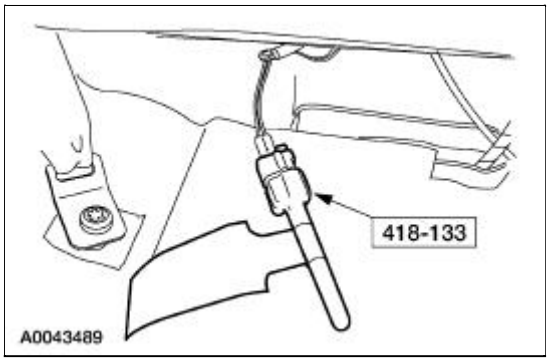


13. Remove the passenger side C-pillar trim panel.
    1. Separate the weather-stripping along the passenger side C-pillar trim panel.
    2. Remove the bolt cover and bolt.
    3. Pull out to release the retainers and remove the passenger side C-pillar trim panel.

14. Disconnect the passenger side safety canopy electrical connector.

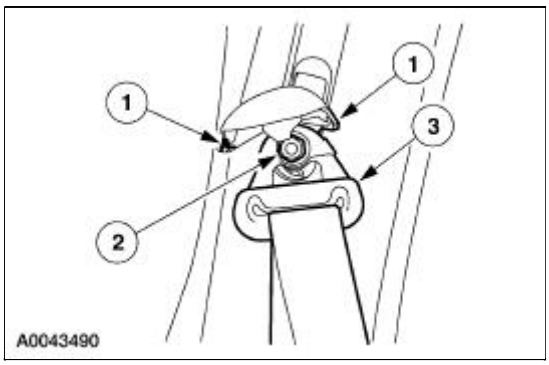


15. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger side safety canopy electrical connector.

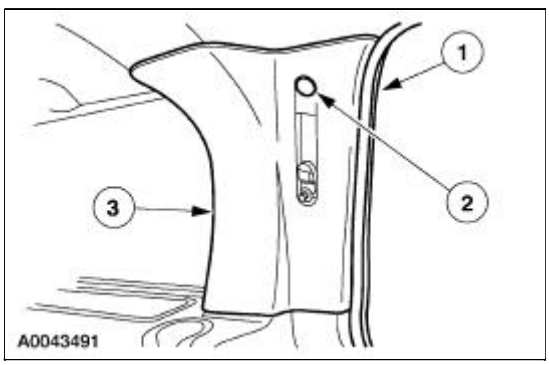


All vehicles

16. Disconnect the passenger seat safety belt buckle pretensioner electrical connector.
    1. Slide and disengage the passenger seat safety belt buckle pretensioner electrical connector locking clip.
    2. Push in to release the tab and disconnect the passenger seat safety belt buckle pretensioner electrical connector.



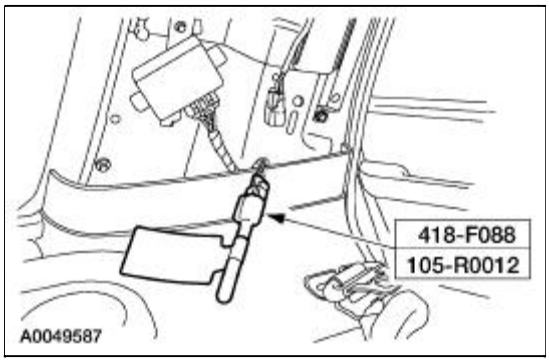
17. Attach the restraint system diagnostic tool to the passenger seat safety belt buckle pretensioner floor electrical connector.



Vehicles with safety canopies

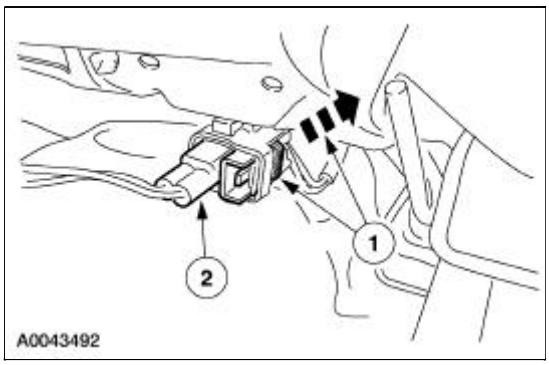
18. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

    Remove the second row driver side safety belt guide.
    1. Release the retaining tab at each side and open the safety belt guide cover.
    2. Remove the nut.
    3. Remove the second row driver side safety belt guide.

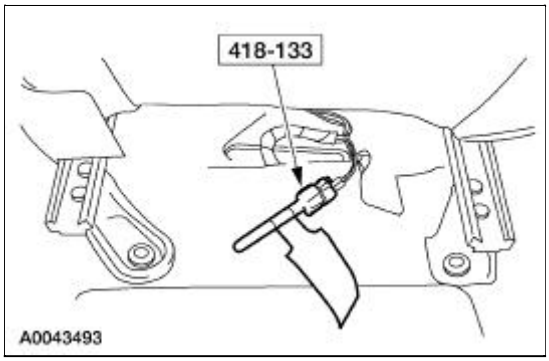


19. Remove the driver side C-pillar trim panel.
    1. Separate the weather-stripping along the driver side C-pillar trim panel.
    2. Remove the bolt cover and bolt.
    3. Pull out to release the retainers and remove the driver side C-pillar trim panel.

20. Disconnect the driver side safety canopy electrical connector.



21. Attach the restraint system diagnostic tool to the vehicle harness side of the driver side safety canopy electrical connector.



All vehicles

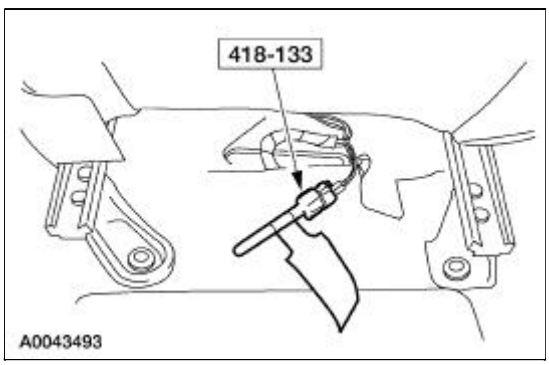
22. Disconnect the driver seat safety belt buckle pretensioner electrical connector.
    1. Slide and disengage the driver seat safety belt buckle pretensioner electrical connector locking clip.
    2. Push in to release the tab and disconnect the driver seat safety belt buckle pretensioner electrical connector.

23. Attach the restraint system diagnostic tool to the driver seat safety belt buckle pretensioner floor electrical connector.

24. Connect the battery ground cable. For additional information, refer to Section 414-01 .

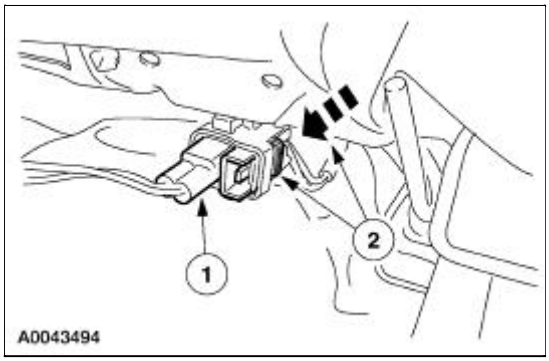
25. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of Section 501-20B .

26. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .



Reactivation

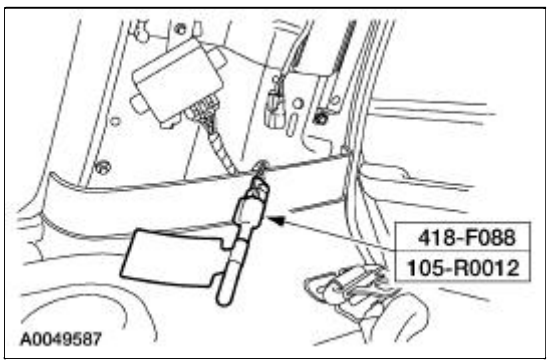
WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the deactivation procedure.



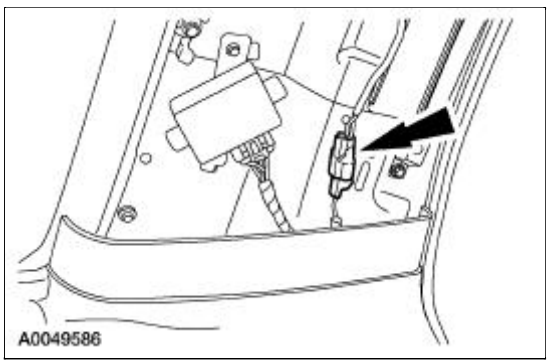
All vehicles

1. **NOTE:** Make sure the battery negative cable is still disconnected before proceeding with the reactivation portion of this procedure.

   Remove the restraint system diagnostic tool from the driver seat safety belt buckle pretensioner floor electrical connector.

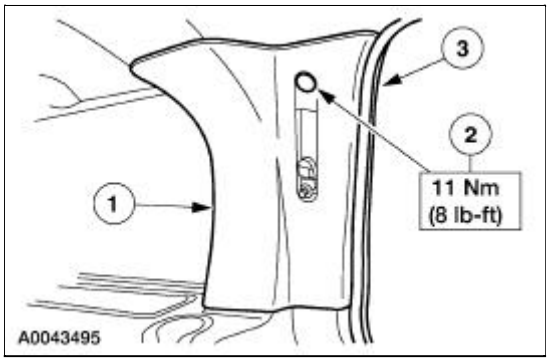


2. Connect the driver seat safety belt buckle pretensioner electrical connector.
   1. Connect the driver seat safety belt buckle pretensioner electrical connector.
   2. Slide and engage the driver seat safety belt buckle pretensioner electrical connector locking clip.



Vehicles with safety canopies

3. Remove the restraint system diagnostic tool from the vehicle harness side of the driver side safety canopy electrical connector.



4. Connect the driver side safety canopy electrical connector.

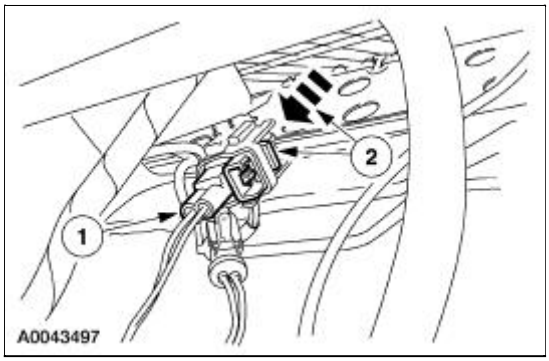
5. **WARNING: Anytime the safety canopy module has deployed, the headliner, and all A, B, and C pillar upper trim panels and attaching hardware must be replaced along with any other damaged components and hardware. Failure to do so may result in personal injury in the event of a safety canopy module deployment.**

   Install the driver side C-pillar trim panel.
   1. Position the driver side C-pillar trim panel and push in, engaging the retainers.
   2. Install the bolt and bolt cover.
   3. Install the weather-stripping along the driver side C-pillar trim panel.

6. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

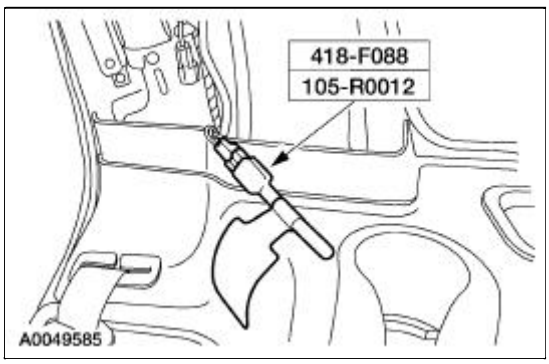
   NOTE: Make sure the safety belt is not twisted prior to installation.

   Install the second row driver side safety belt guide.
   1. Position the second row driver side safety belt guide.
   2. Install the nut.
   3. Close the safety belt guide cover.

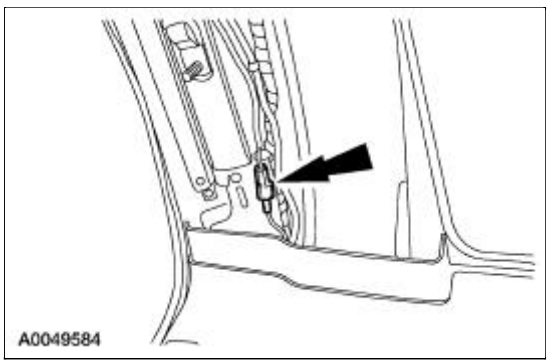


All vehicles

7. Remove the restraint system diagnostic tool from the passenger seat safety belt buckle pretensioner floor electrical connector.

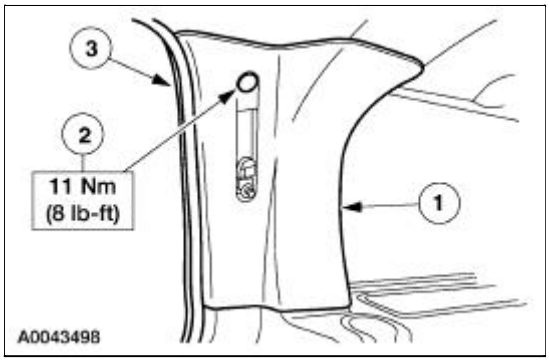


8. Connect the passenger seat safety belt buckle pretensioner electrical connector.
   1. Connect the passenger seat safety belt buckle pretensioner electrical connector.
   2. Slide and engage the passenger seat safety belt buckle pretensioner electrical connector locking clip.



Vehicles with safety canopies

9. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger side safety canopy electrical connector.



10. Connect the passenger side safety canopy electrical connector.

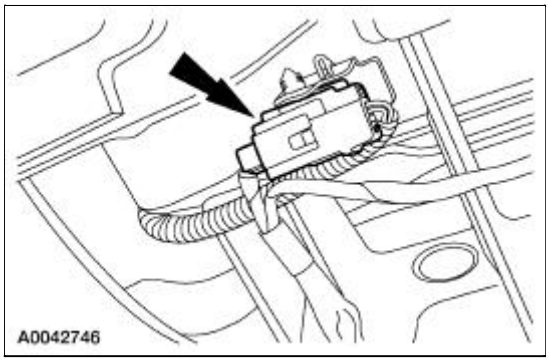
11. **WARNING: Anytime the safety canopy module has deployed, the headliner, and all A, B, and C pillar upper trim panels and attaching hardware must be replaced along with any other damaged components and hardware. Failure to do so may result in personal injury in the event of a safety canopy module deployment.**

    Install the passenger C-pillar trim panel.
    1. Position the passenger side C-pillar trim panel and push in, engaging the retainers.
    2. Install the bolt and bolt cover.
    3. Install the weather-stripping along the passenger side C-pillar trim panel.

12. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

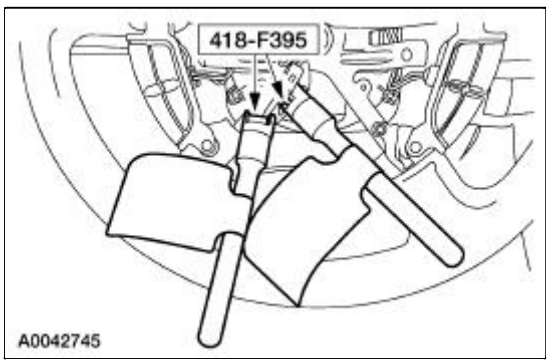
    NOTE: Make sure the safety belt is not twisted prior to installation.

    Install the second row passenger side safety belt guide.
    1. Position the second row passenger side safety belt guide.
    2. Install the nut.
    3. Close the safety belt guide cover.



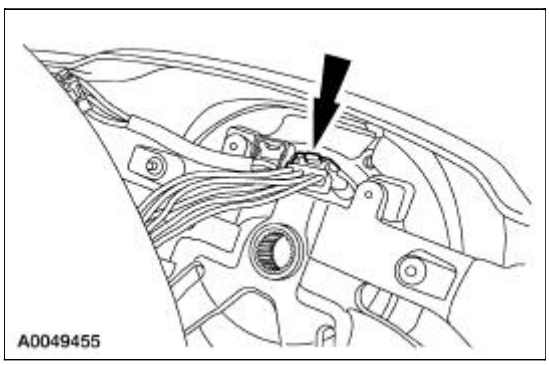
All vehicles

13. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag module electrical connector.



14. **NOTE:** The Expedition is shown, the Navigator is similar.

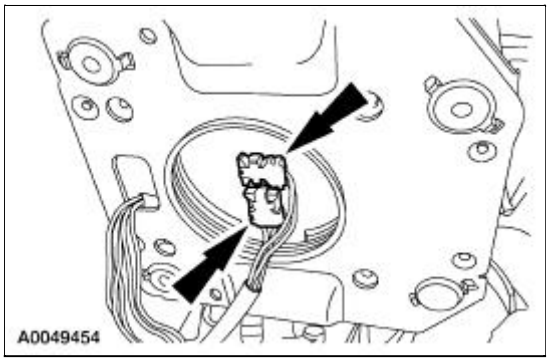
    Connect the passenger air bag module electrical connector.



15. Close the glove compartment.

16. Remove the restraint system diagnostic tools from the clockspring electrical connector at the top of the steering column.

Navigator vehicles



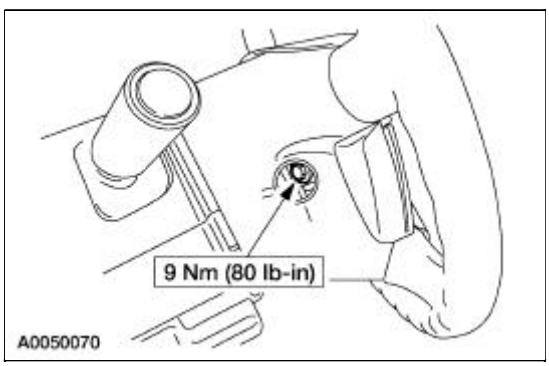
17. Connect the driver air bag module accessories electrical connector to the connector end at the top of the clockspring.

18. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

    Connect the driver air bag module electrical connectors as noted during removal.

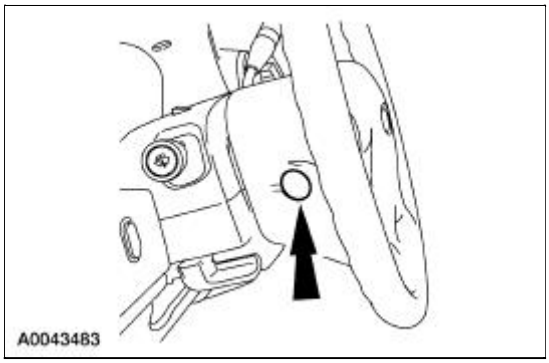
    - Position the driver air bag module to the steering wheel.

Expedition vehicles



19. Position the driver air bag module to the steering wheel.
    1. Connect the horn switch electrical connector.
    2. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

       Connect the driver air bag module electrical connectors as noted during removal.
    3. Position the driver air bag module to the steering wheel.



All vehicles

20. Install the two driver air bag module bolts (one shown).

21. Install the two steering wheel back cover plugs (one shown).

22. Connect the battery ground cable. For additional information, refer to Section 414-01 .

23. **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of Section 501-20B .

Vehicles with safety canopies

24. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A .

Front Seat —40 Percent

Special Tool(s)

 ST2512-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F403
 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395 (014-R1079)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F088 (105-00012)

Removal

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

NOTE: Driver side shown, passenger side similar.

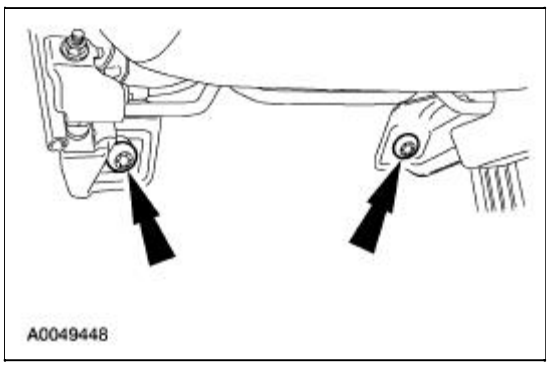
1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

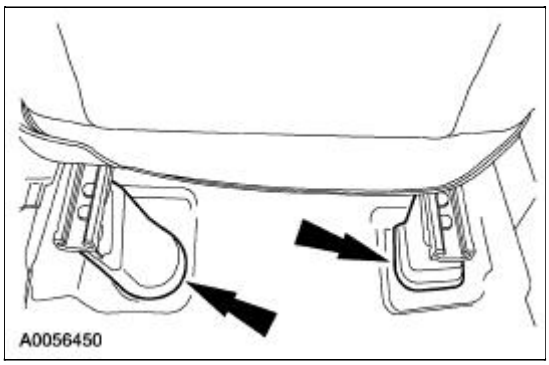
The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).



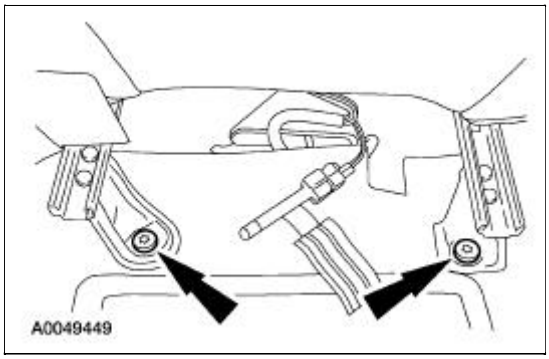
NOTE: Before disconnecting the battery in vehicles with power seats, adjust the seat position to allow for access to the necessary components.

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .



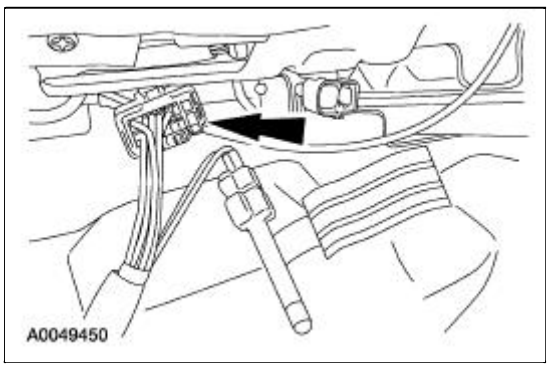
2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.



3. Remove the front bolts.

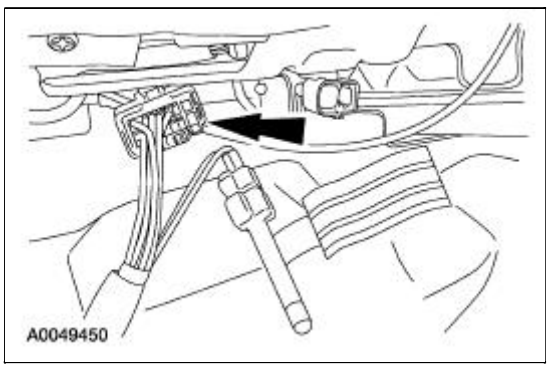
4. Remove the rear bolt covers.



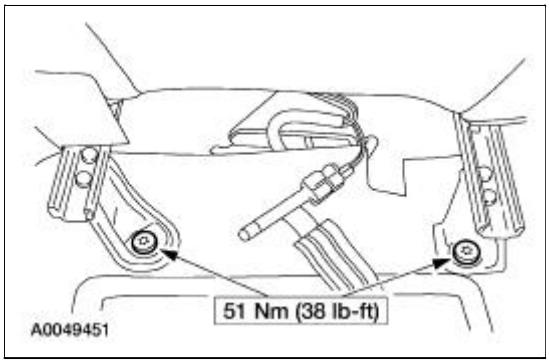
5. Remove the rear bolts.

6. **NOTE:** Some component connectors may not exist due to vehicle options.

   Disconnect the electrical connector.



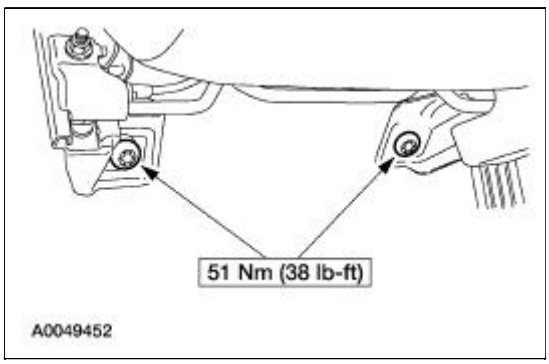
Installation



WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

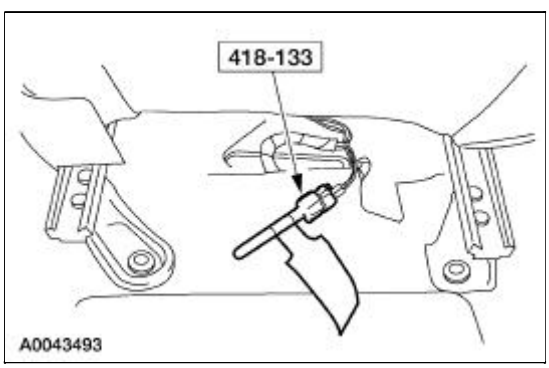
1. **NOTE:** Some component connectors may not exist due to vehicle options.

   Connect the electrical connector.

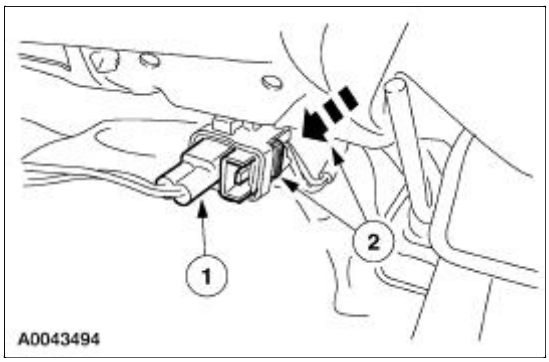


2. Install the rear inboard bolt first, then the rear outboard bolt.

3. Install the rear bolt covers.



4. Install the front bolts.



5. **NOTE:** Make sure the negative battery cable is still disconnected before proceeding with the reactivation portion of this procedure.

   Remove the restraint system diagnostic tool from the driver seat safety belt buckle pretensioner floor electrical connector.

6. Connect the driver seat safety belt buckle pretensioner electrical connector.
    1. Connect the driver seat safety belt buckle pretensioner electrical connector.
    2. Slide and engage the driver seat safety belt buckle pretensioner electrical connector locking clip.

7. Connect the battery ground cable. For additional information, refer to Section 414-01 .

8. With the restraint system diagnostic tools still installed at the remaining deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B , in the Diagnosis and Testing portion of that section.

9. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

    The front impact severity sensor is located at the bottom of the hood latch support bracket.

    The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

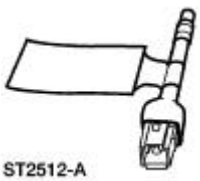
    The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

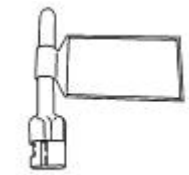
    To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

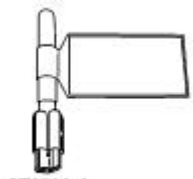
    Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

10. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.







11. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B in this section.

12. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A .

Front Seat —60 Percent

Removal

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

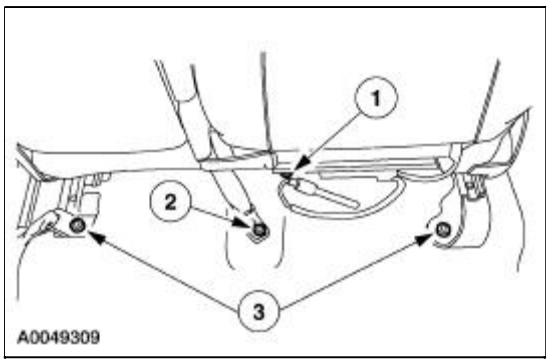
   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the

C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

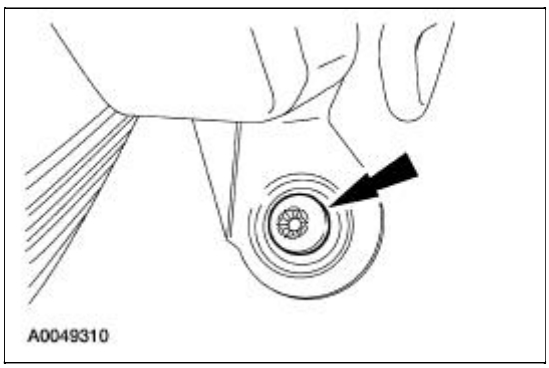
NOTE: Before disconnecting the battery in vehicles with power seats, adjust the seat position to allow for access to the necessary components.



Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.



3. Remove the front seat rear floor bolt covers.

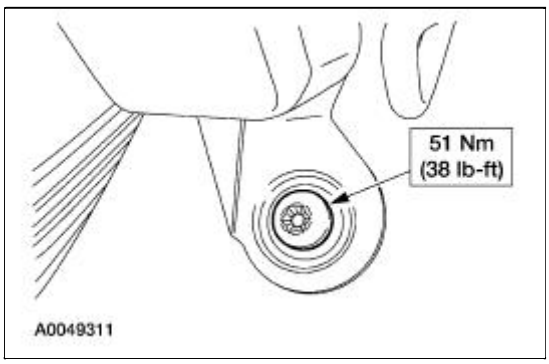
4. Remove the 60 percent front seat rear bolts.
   1. Disconnect the usage detection electrical connector.
   2. Remove the center seat belt anchor bolt.
   3. Remove the two seat-to-floor bolts.

5. Move the 60 percent seat to its rearmost position.

6. Remove the two front seat-to-floor bolts (one shown).

7. **NOTE:** Removing the 60 percent front seat requires more than one technician.

   Remove the 60 percent seat from the vehicle.

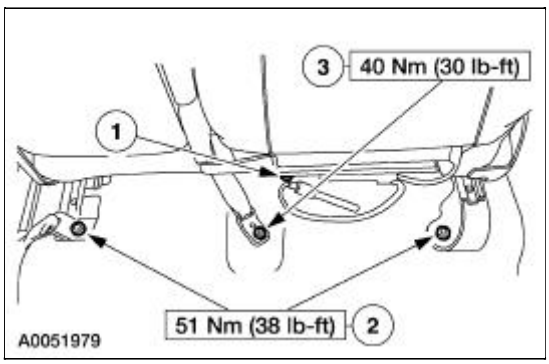


Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

1. **NOTE:** Installing the 60 percent front seat requires more than one technician.

   Install the 60 percent seat in the vehicle.



2. Install the front seat-to-floor bolts (one shown).
   - Make sure the safety belt webbing is not twisted prior to installation.

3. Move the 60 percent seat to its most forward position.

4. **NOTE:** Make sure the LH rear seat belt anchor is located before securing the seat.

   Install the front seat rear bolts.
   1. Connect the usage detection electrical connector.
   2. Install the two seat-to-floor bolts.
   3. Install the center seat belt anchor bolt.

5. **NOTE:** Make sure the negative battery cable is still disconnected before proceeding with the reactivation portion of this procedure.

   Remove the restraint system diagnostic tool from the passenger seat safety belt buckle pretensioner floor electrical connector.

6. Connect the passenger seat safety belt buckle pretensioner electrical connector.
   1. Connect the passenger seat safety belt buckle pretensioner electrical connector.
   2. Slide and engage the passenger seat safety belt buckle pretensioner electrical connector locking clip.

7. Connect the battery ground cable. For additional information, refer to Section 414-01 .

8. With the restraint system diagnostic tools still installed at the remaining deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B , in the Diagnosis and Testing portion of that section.

9. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

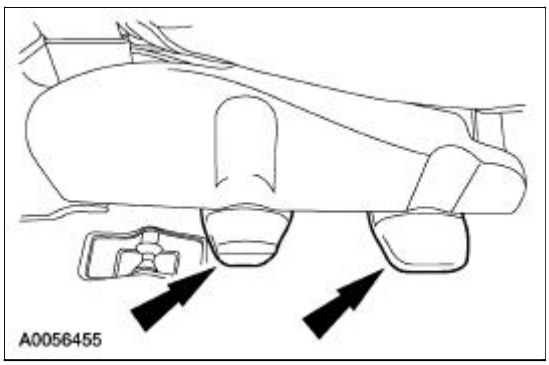
   The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

   To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

   Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

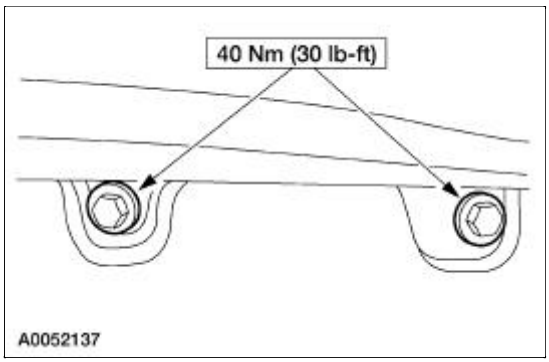
10. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .



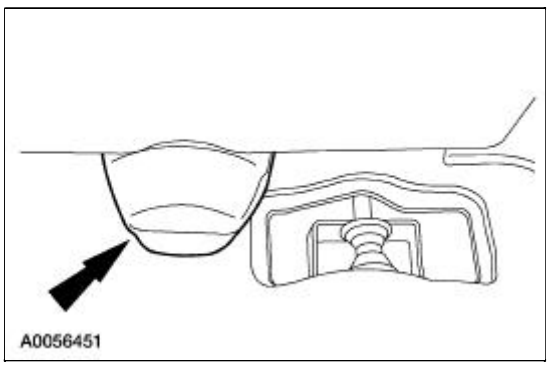
11. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

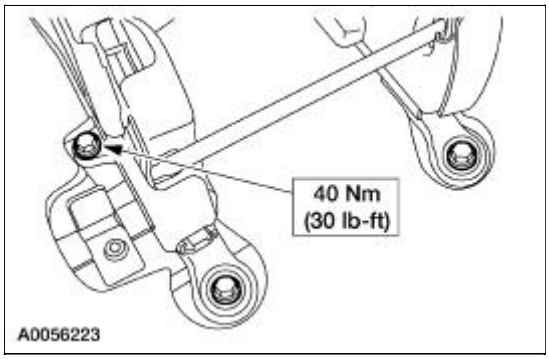


12. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A .

Rear Seat —Second Row, 20 Percent

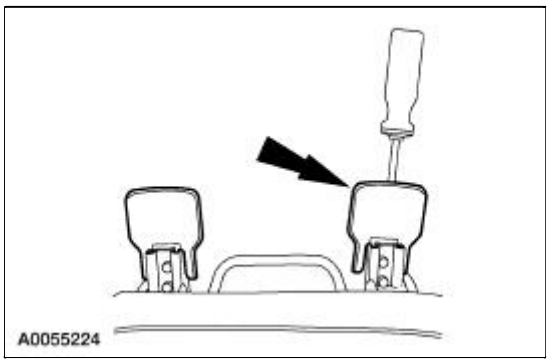


1. Fold both 40 percent seats up to the E-Z entry position.
2. Remove the right side seat-to-floor bolt covers.

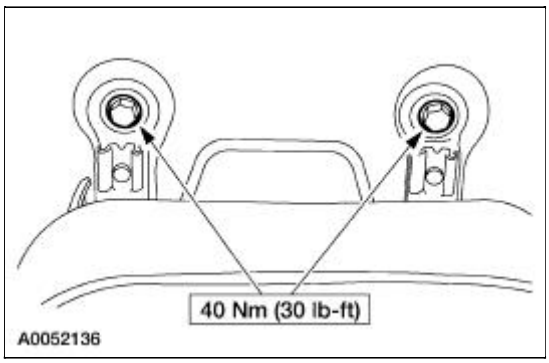


3. Remove the right side seat-to-floor bolts.

4. Remove the left side seat-to-floor bolt cover.



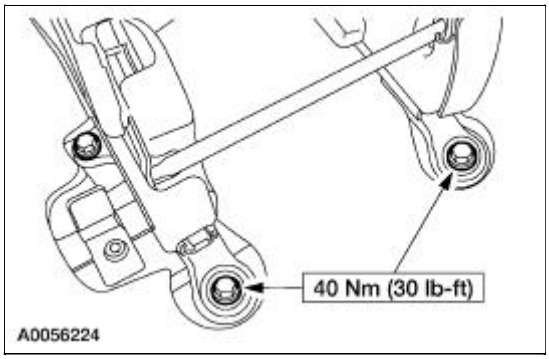
5. Remove the left side seat-to-floor bolt.



6. Fold the seats down to normal seating position.

7. **CAUTION: Use a screwdriver to pry beneath the attaching metal clips.**

   Remove the 20 percent front and rear seat-to-floor bolt covers (front shown).

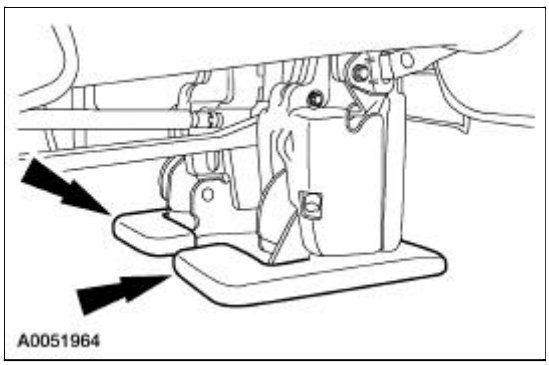


8. Remove the front seat-to-floor bolts.

9. Fold both 40 percent seats up to the E-Z entry position.

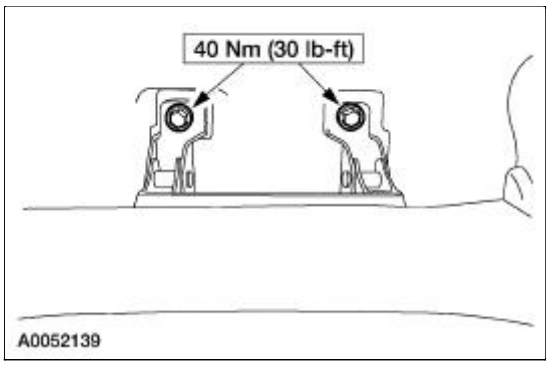
10. Remove the left rear bolt and then the right rear bolt.

11. Remove the 20 percent seat from the vehicle.



12. To install, reverse the removal procedure.
    - Install the fasteners as follows:
        - Install the right rear bolt.
        - Install the left rear bolt.
        - Install the two front bolts.
        - Install the side (3) shoulder bolts (note, shoulder bolts do not tighten to seat brackets).

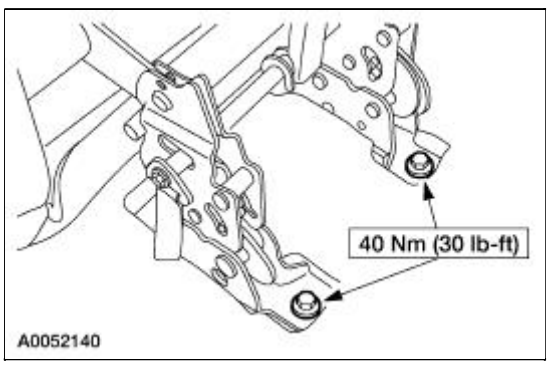
13. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A .



Rear Seat —Second Row, 40 Percent

Removal

1. Remove the two seat-to-floor bolt covers.

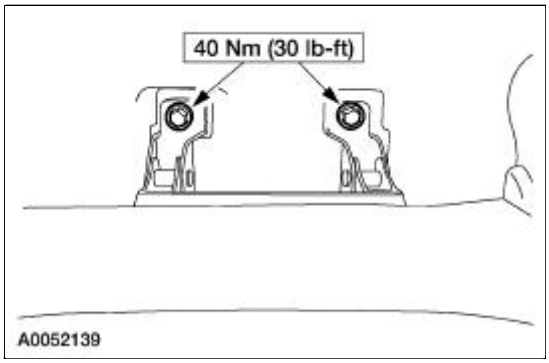


2. Remove the front seat-to-floor bolts.

3. Fold the seat up to the E-Z entry position.

4. Remove the rear seat-to-floor bolts.

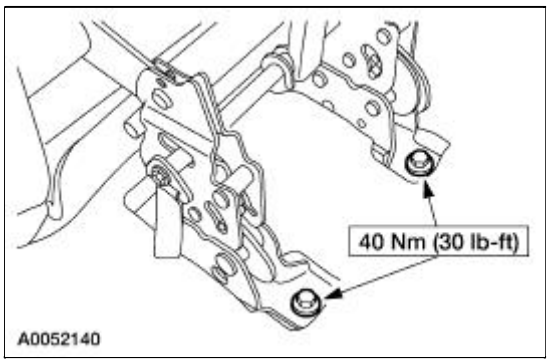
5. Remove the 40 percent seat from the vehicle.



Installation

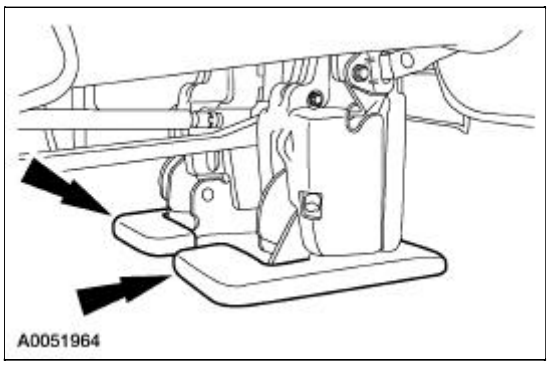
1. Install the seat in the vehicle.

2. Install both locator pins into the locator holes in the floor pan.



3. Latch the rear latches to strikers.

4. Install the front outboard seat-to-floor bolt and then the inboard seat-to-floor bolt.



5. Fold the seat up into E-Z entry position.

6. Install the rear seat-to-floor bolts.

7. **NOTE:** Make sure the seat latches when allowed to free fall from the E-Z entry position (if the seat does not completely latch after free fall, raise the seat back. The seat must latch prior to the seat backrest locking in the upright position).

   Install the two second row seat-to-floor bolt covers.

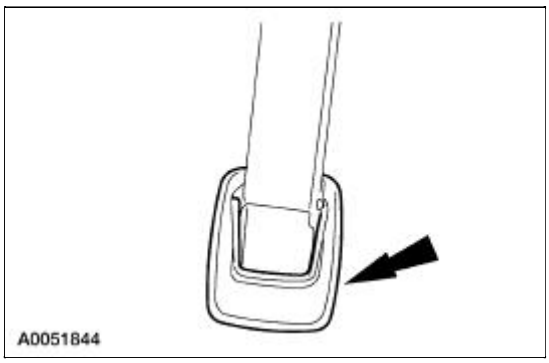
8. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A .

Rear Seat —Third Row

Removal and Installation

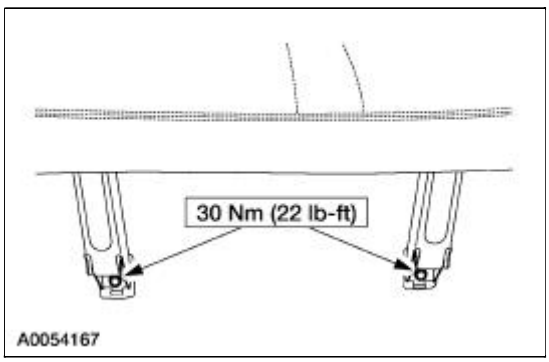
CAUTION: To prevent possible damage to the third row seat or the safety belts, make sure that the safety belts are not fastened when moving the seat to the load floor position.

CAUTION: Make sure that no objects such as books, purses or briefcases are on the floor in front of the third row seats or on the seat cushion before lowering the backrest(s).



NOTE: The third row seat backrests need to be in the raised position for removal of the third row seats.

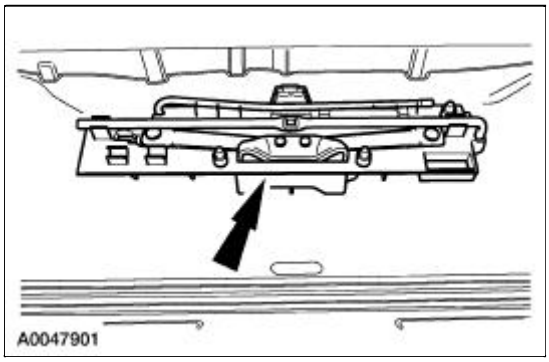
NOTE: If a third row power-fold seat motor (if equipped) is inoperative and the backrest is locked in the down position, refer to Power-Fold Seat Motor in this section.



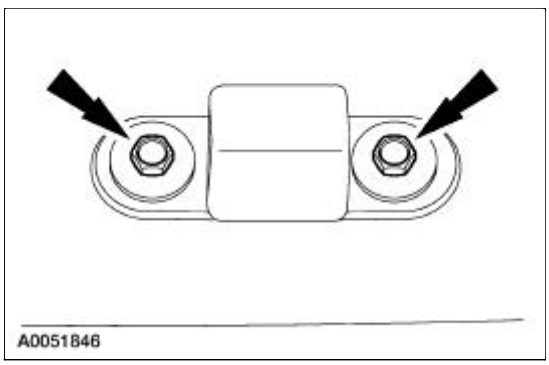
All vehicles

1. **NOTE:** 60 percent seat shown, 40 percent seat similar.

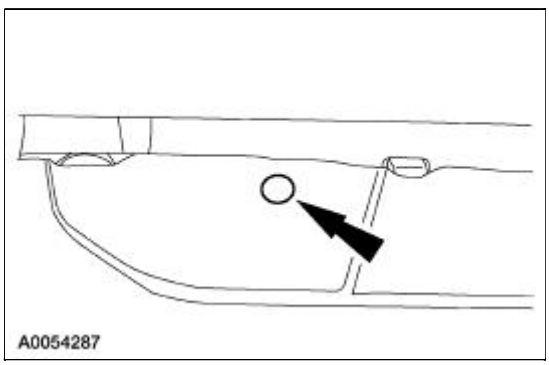
   Remove the third row front seat-to-floor bolt covers (one shown) by opening rear tabs and slide cover forward.



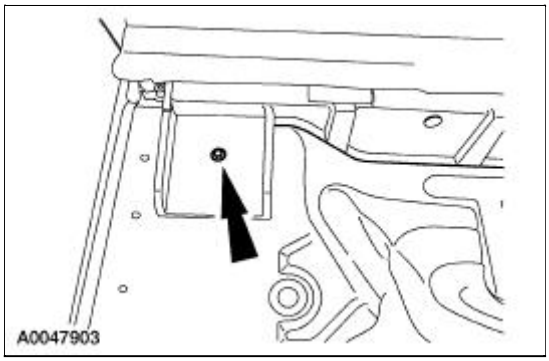
2. Remove the seat riser-to-floor front bolts.



3. Remove the rear load floor panel.

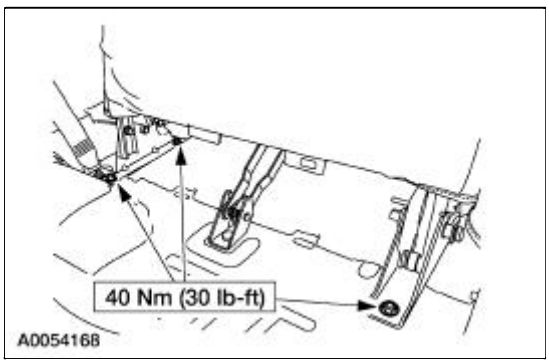


4. Remove the jack assembly.

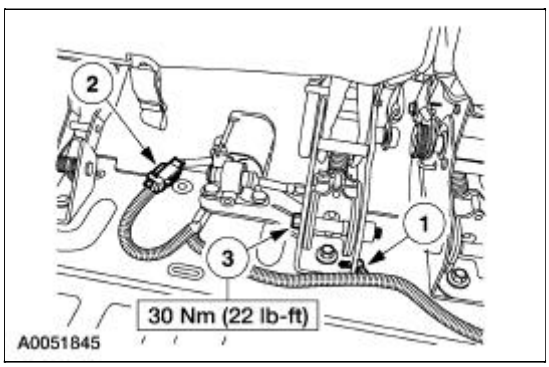


5. Remove the load floor panel latch striker bolts and the striker latch.

6. Remove the three pin-type retainers (one shown) and the jack storage compartment liner.

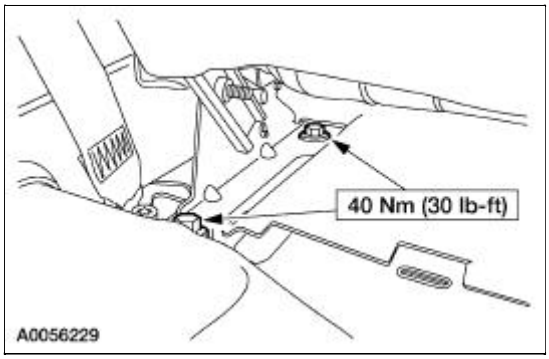


7. Remove the two bolts in mid-floor panel support (one shown).



8. Lift on the front of mid-floor panel support to release the three retainer clips and remove the support panel.

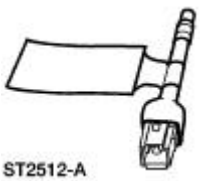
9. Remove the four seat-to-floor bolts (three shown).

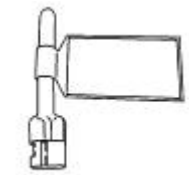


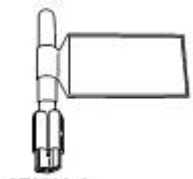
Vehicles with power fold seats

10. Remove the rear power seat attachments.
    1. Detach the pin-type retainer.
    2. Disconnect the electrical connector.
    3. Remove the pivot bolt.

11. Remove the four seat-to-floor bolts (two shown).







12. **NOTE:** Check location of the 60 percent safety belt buckle for correct location while installing the 60 percent seat.

    To install, reverse the removal procedure.

13. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A .

Seat Control Switch —8-Way

Special Tool(s)

 ST2512-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F403
 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395 (014-R1079)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F088 (105-00012)

Removal

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

NOTE: Driver side shown, passenger side similar.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

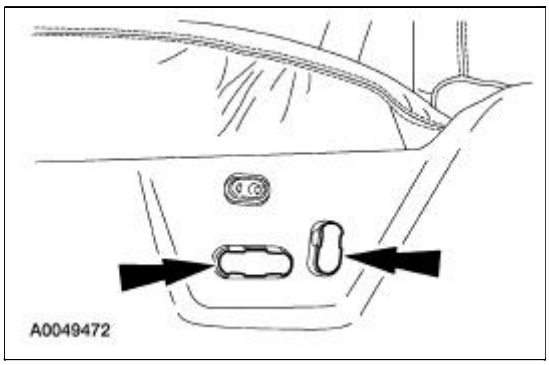
   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

NOTE: Before disconnecting the battery in vehicles with power seats, adjust the seat position to allow for access to the necessary components.

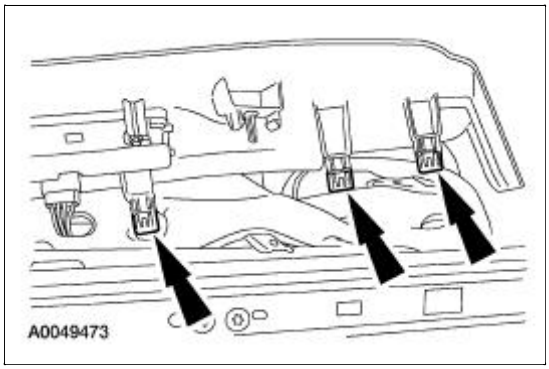


Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .

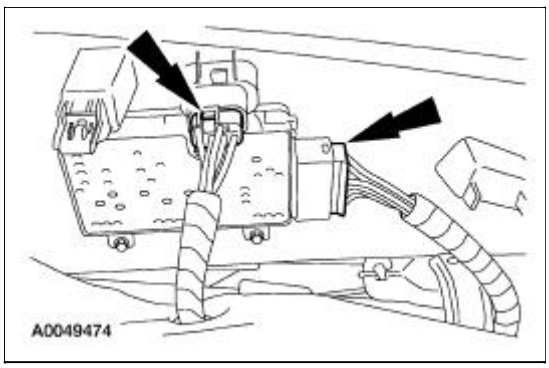
2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

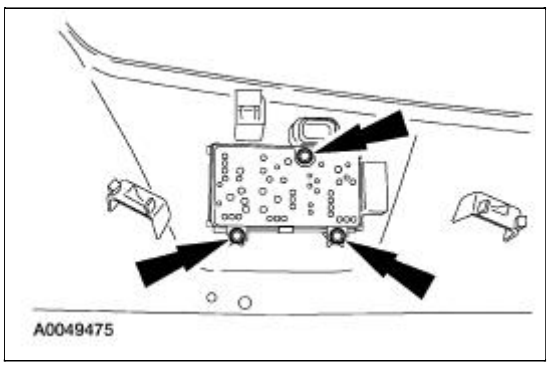
3. Remove the affected seat. For additional information, refer to Front Seat—40 Percent in this section.



4. Pry to remove the two power seat knobs and remove the knobs.

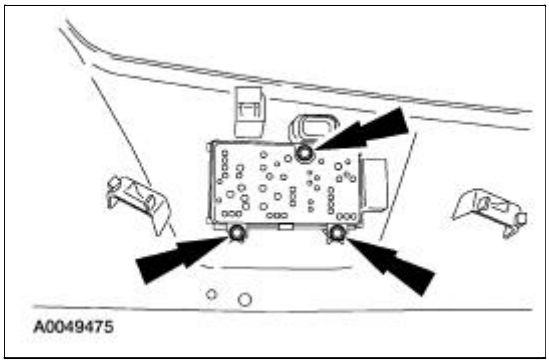


5. Access and remove the front side shield screw.

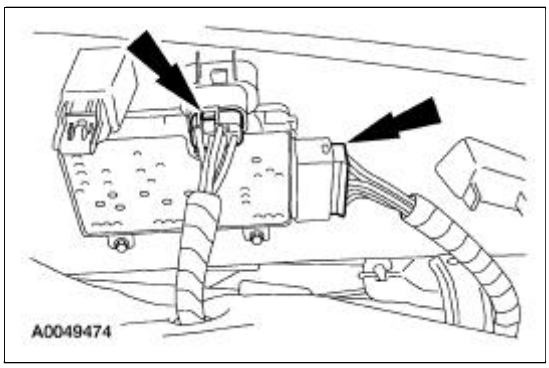


6. Pull out from the bottom and rear side of side shield to release the three retainer clips.

7. Disconnect the power lumbar switch and 8-way power seat switch electrical connectors.

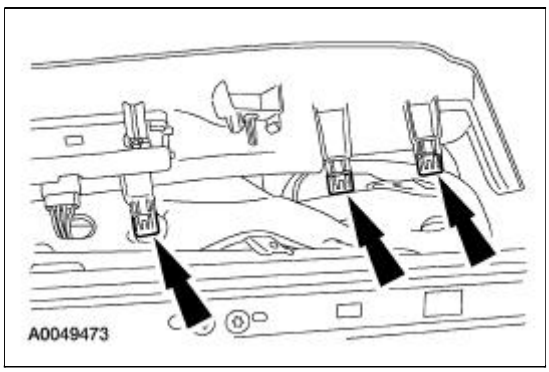


8. Remove the three screws and remove the power seat switch.

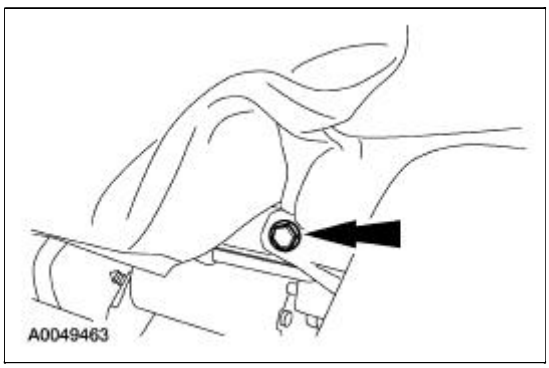


Installation

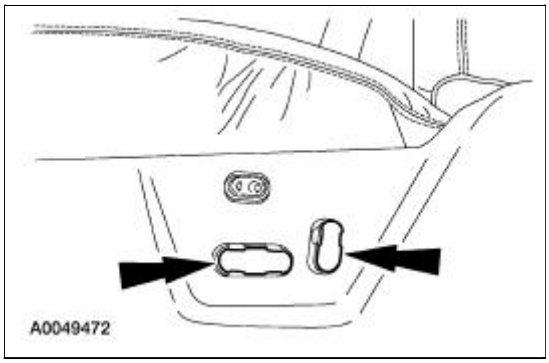
WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes at the beginning of the removal procedure.



1. Install the power seat switch and install the three screws.



2. Connect the 8-way power seat and power lumbar switch electrical connectors.



3. Push to install the three side shield retainers onto the seat frame.

4. Access and install the front side shield screw.

5. Install the two power seat knobs.

6. Install the affected seat. For additional information, refer to Front Seat—40 Percent in this section.

7. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .

8. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

   With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

Removal

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

NOTE: Driver seat is shown, passenger is similar.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

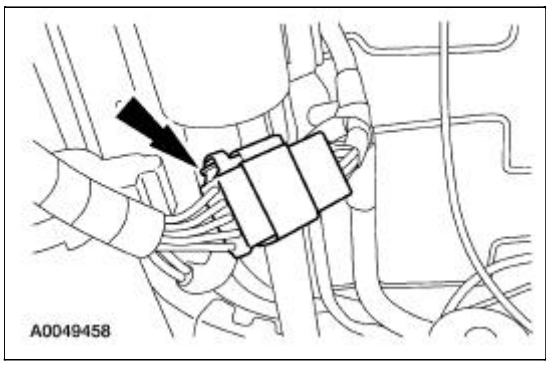
   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

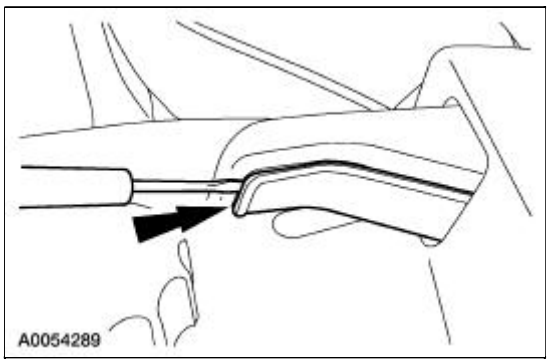
To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .



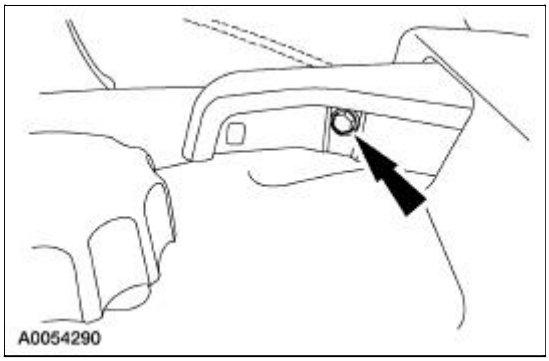
2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.



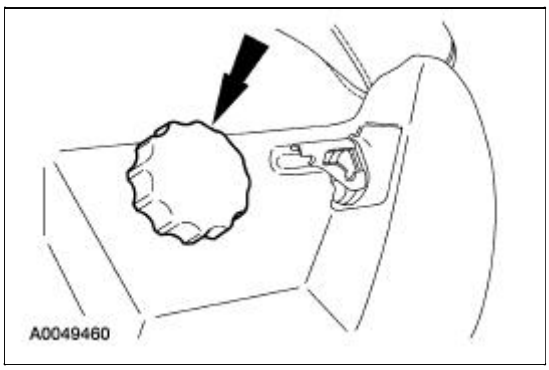
3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

   Remove the affected seat. For additional information, refer to Front Seat—40 Percent in this section.

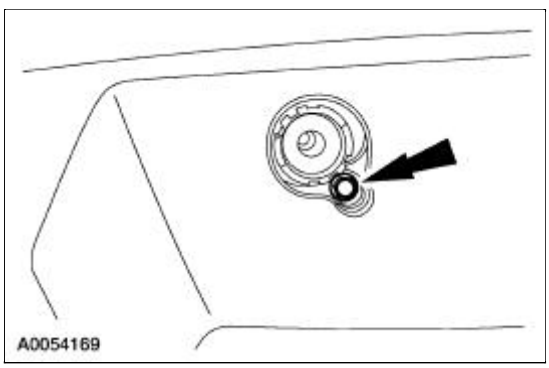


4. Disconnect the 6-way power seat switch electrical connector.

5. Remove the recliner handle screw cover.

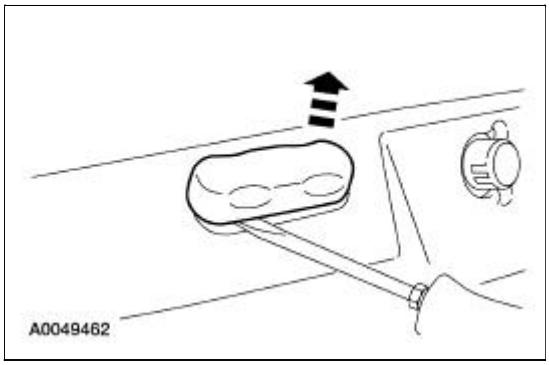


6. Remove the recliner handle screw and the recliner handle.

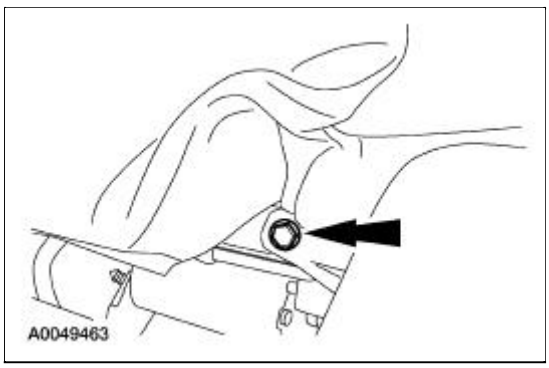


7. **CAUTION: Use care when removing the lumbar knob. Using both hands, pull with even pressure on both sides of the knob to remove.**

   Pull out to remove the lumbar knob.

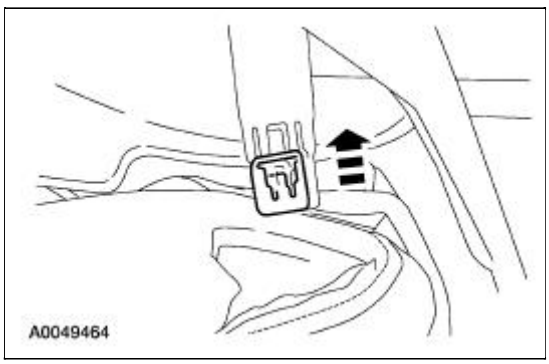


8. Remove the screw from the side shield under the lumbar knob.



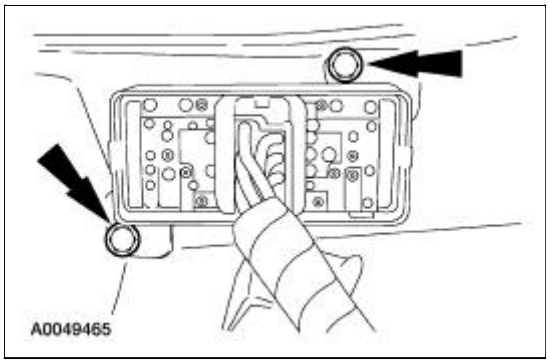
9. **CAUTION: Use care not to scratch the side shield when removing the power seat knob.**

   Pry the power seat knob off.



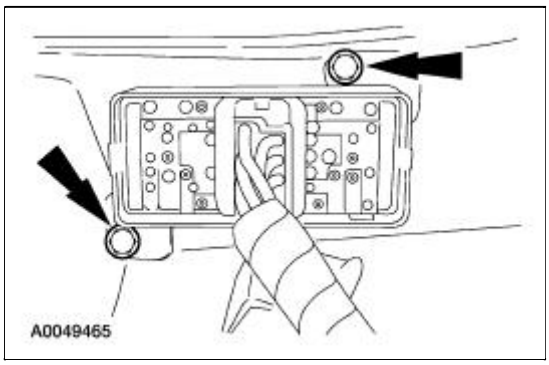
10. Access and remove the front side shield screw.

11. Pull to release the center retainer on side shield.

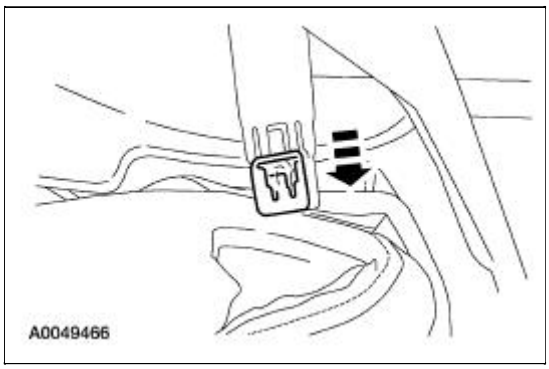


12. Pull to release the retainer clip on the rear of side shield.

13. Remove the side shield from the seat.

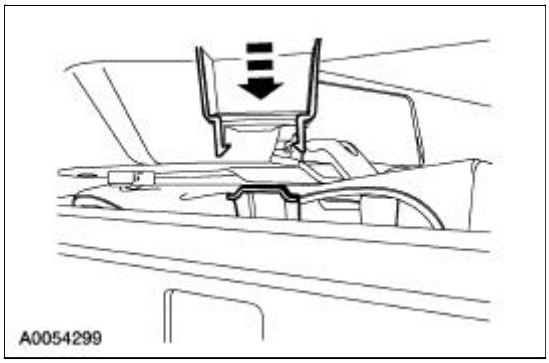


14. Remove the two screws and remove the 6-way power seat switch from the side shield.

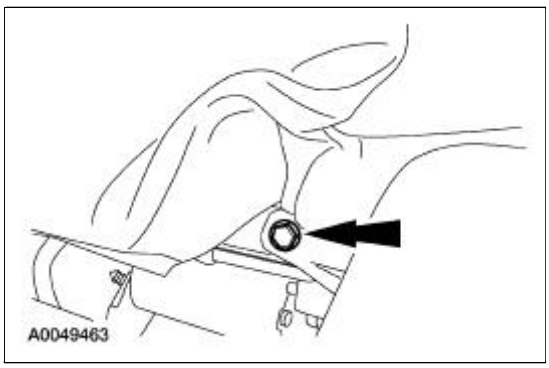


Installation

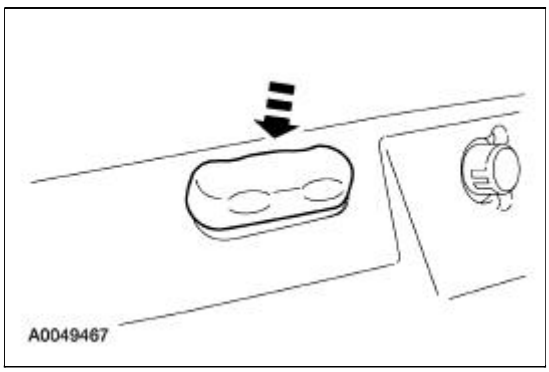
WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.



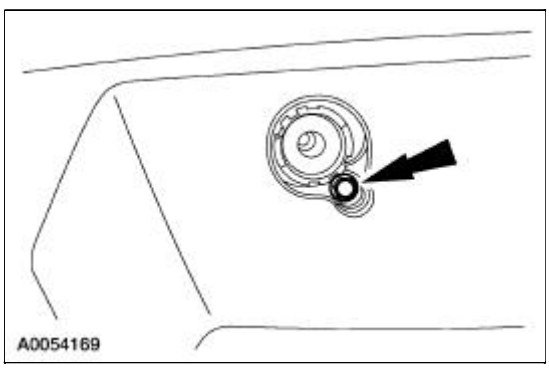
1. Install the 6-way power seat switch on the side shield and install the two screws.



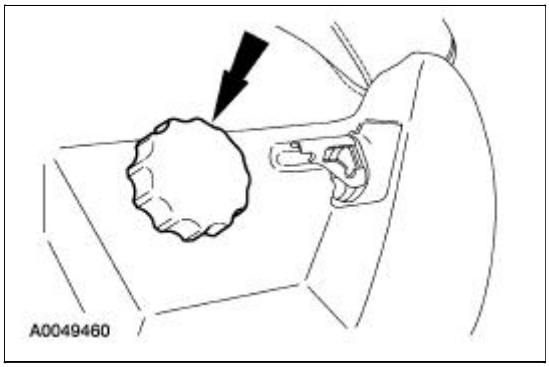
2. Push to install the rear side shield retainer on seat frame.



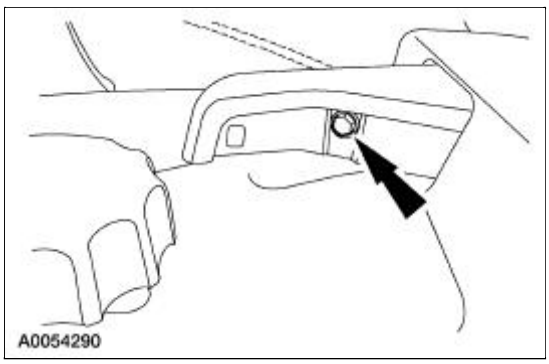
3. Push to install the middle side shield retainer on the seat.



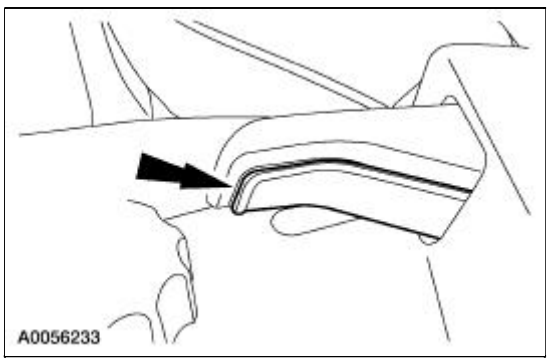
4. Access and install the front side shield screw.



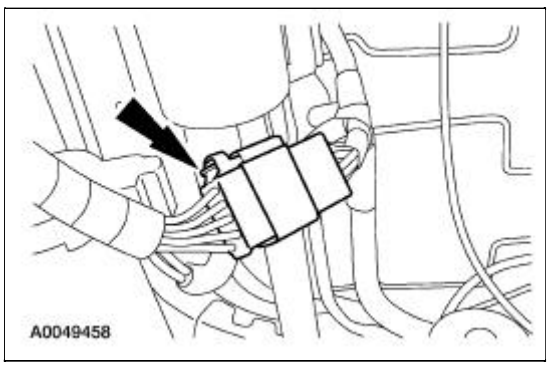
5. Install the 6-way power seat knob.



6. Install the screw on the side shield under the lumbar knob.



7. Align and install the lumbar knob.



8. Install the recliner handle and install the screw.

9. Install the recliner handle cover.

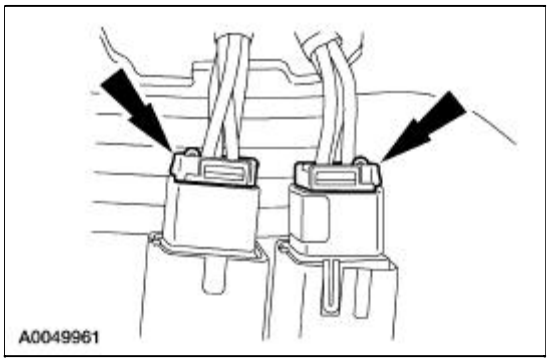
10. Connect the 6-way power seat switch electrical connector.

11. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

Install the affected seat. For additional information, refer to Front Seat—40 Percent .

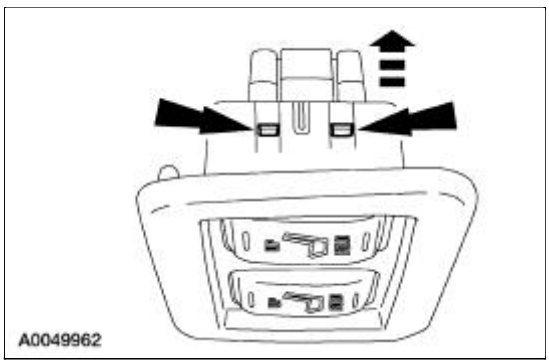
12. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .



13. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

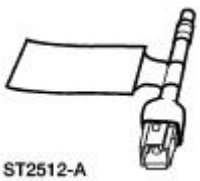
    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

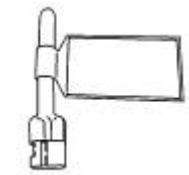


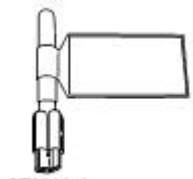
Seat Control Switch —Third Row

Removal and Installation

1. Partially remove the right rear quarter trim panel for access to the third row power seat switches. For additional information, refer to Section 501-05 .
2. Remove the retainer nuts on the back side of the power seat switch housing.
3. Disconnect the power seat switch electrical connectors.







4. Release the four locking tabs (two shown) on the affected switch, and remove the switch.

5. To install, reverse the removal procedure.

Removal

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

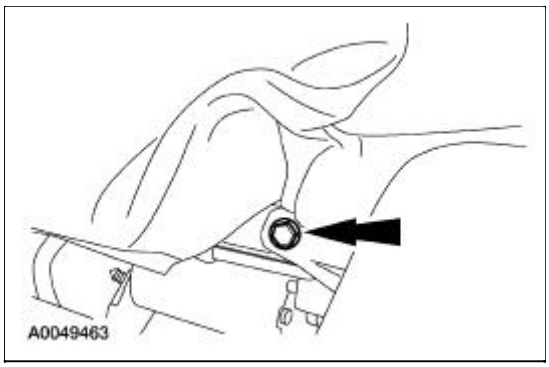
   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the

C-pillars.

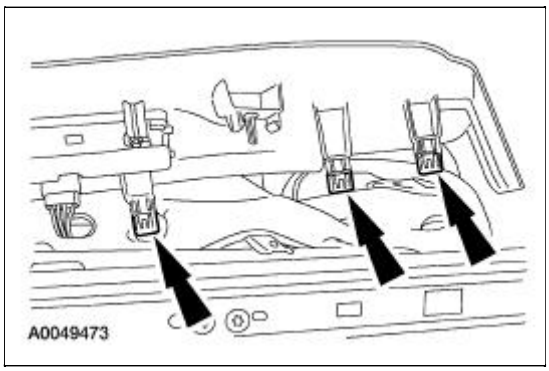
To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .



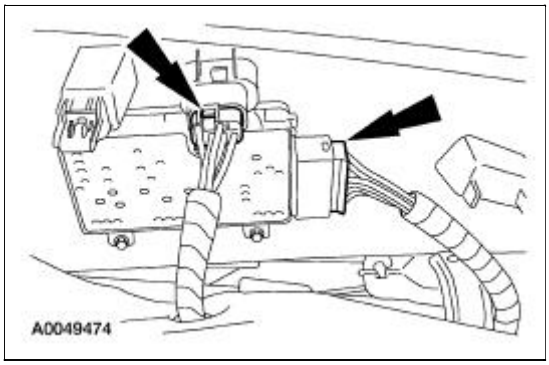
2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

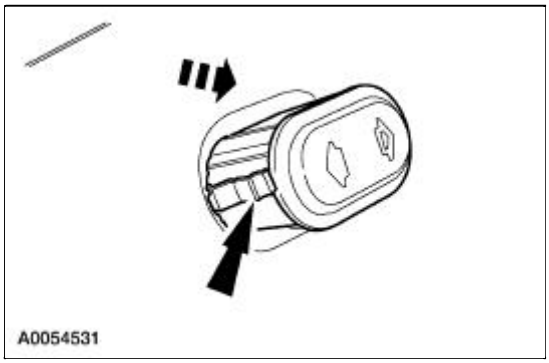


3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

   Remove the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section

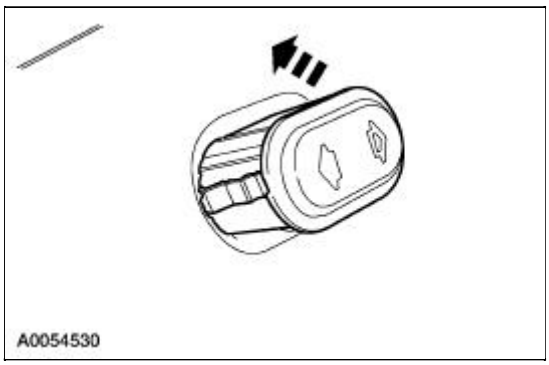


4. Access and remove the front side shield screw.

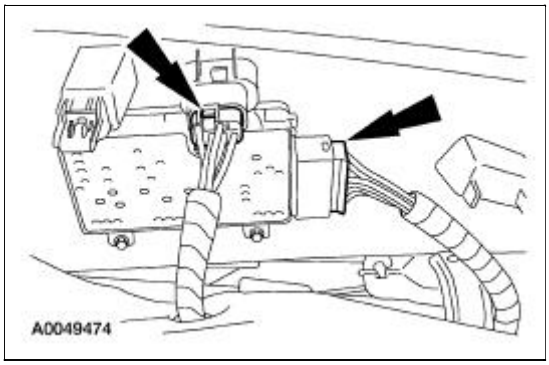


5. Pull out from the bottom and rear side of side shield to release the three retainer clips.

6. Disconnect the power lumbar switch and 8-way power seat switch electrical connectors.

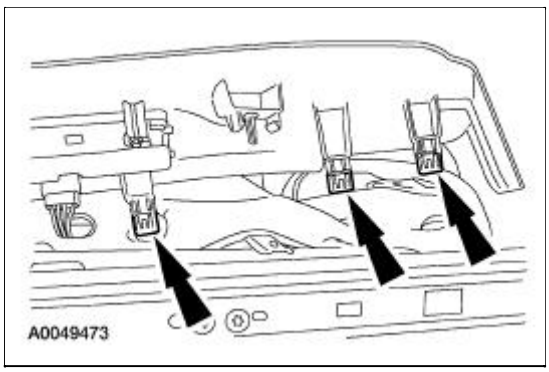


7. Pinch retainer in and push from the rear of power lumbar switch to remove the switch from the side shield.

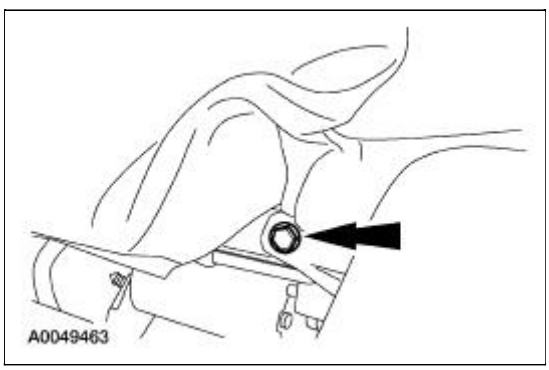


Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.



1. Install the power lumbar switch into the side shield.



2. Connect the 8-way power seat and power lumbar switch electrical connectors.

3. Push to install the three side shield retainers onto the seat frame.

4. Access and install the front side shield screw.

5. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

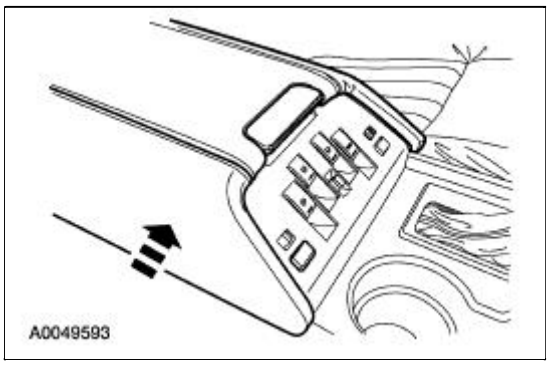
   Install the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

6. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .

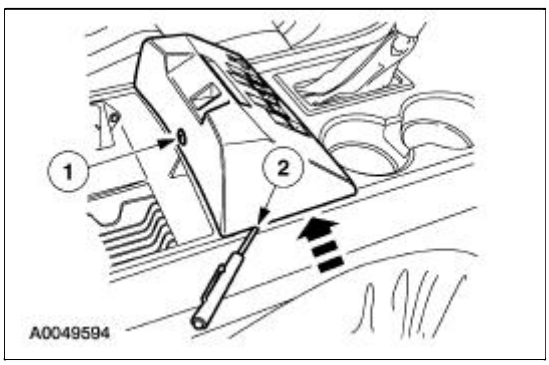
7. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and**

possible violation of vehicle safety standards.



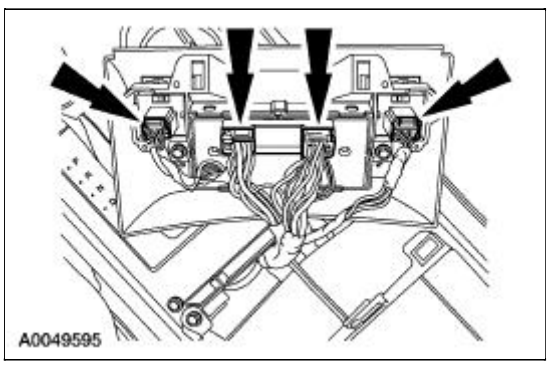
With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

Climate Controlled Seat Switch

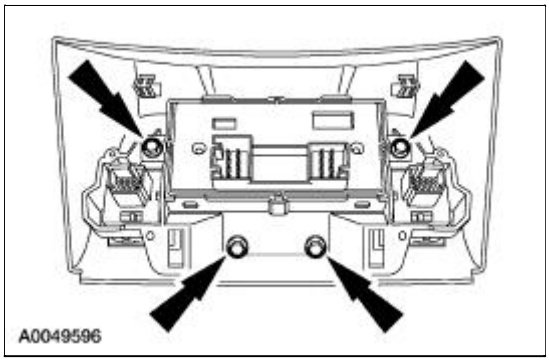


Removal and Installation

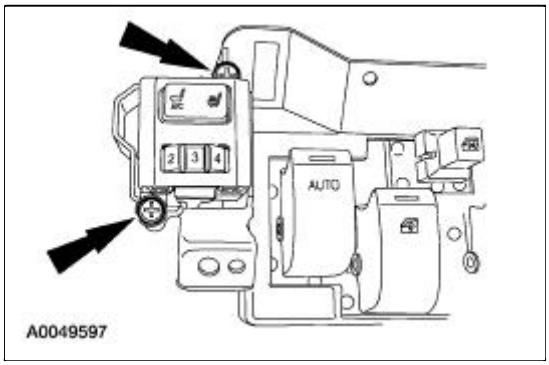
Navigator



1. Open the center console lid.

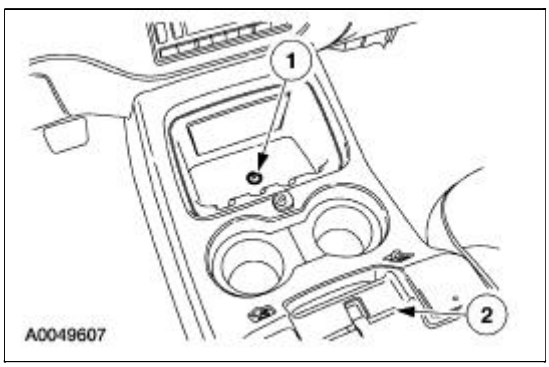


2. Remove the temperature controlled seat switch housing.
    1. Remove the scrivet.
    2. Pry the switch housing up from the retaining clips.

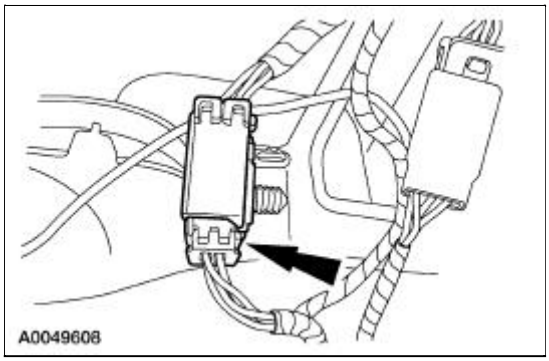


3. Disconnect the electrical connectors.

4. Remove the screws and remove the switches from the switch housing.

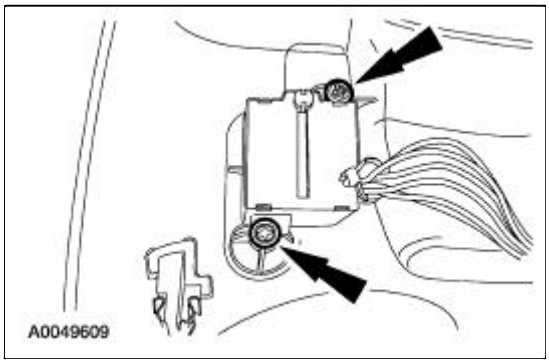


5. Remove the screws and remove the temperature controlled switch (passenger side shown).



Expedition

6. Open the center console lid.



7. Remove the temperature controlled switch housing.
    1. Remove the screw.
    2. Pry up on the back of the switch housing and release the retaining clips.

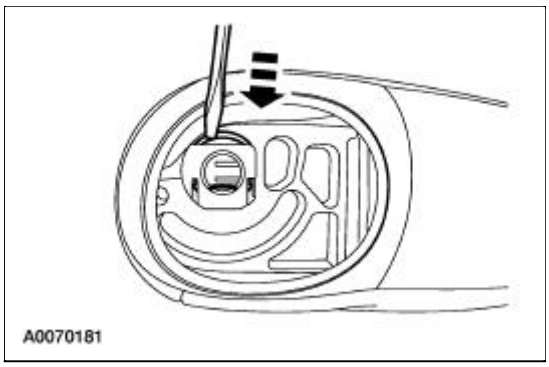
8. Detach and disconnect the electrical connector.

9. Remove the screws and remove the temperature controlled switch.

All vehicles

10. To install, reverse the removal procedure.

Seat Armrest —Second Row



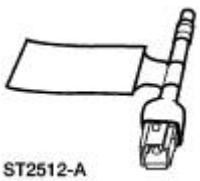
Removal and Installation

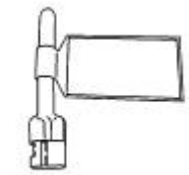
1. To access the armrest locking metal clip, pull the armrest material back on the top side of the armrest for access to the release clip.

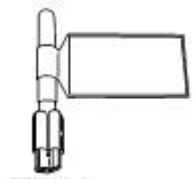
2. **CAUTION: To remove armrests, do not pull them off with force. The locking metal clip will be damaged and a new armrest will need to be installed.**

   NOTE: Armrest removed to show detail of release button mechanism.

   Use a tool such as a flat-bladed screwdriver to push the release button at the hinge point. The clip will release and the armrest will slide off the pin.







3. **CAUTION: To install armrests, do not push them on with force. The locking metal clip will be damaged and a new armrest will need to be installed.**

   To install, reverse the removal procedure.

   - To install the armrest, push the release button and slide the armrest on the pin.

Front Seat Backrest —60 Percent

Special Tool(s)

 ST2506-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F088 (105-00012)

Removal

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

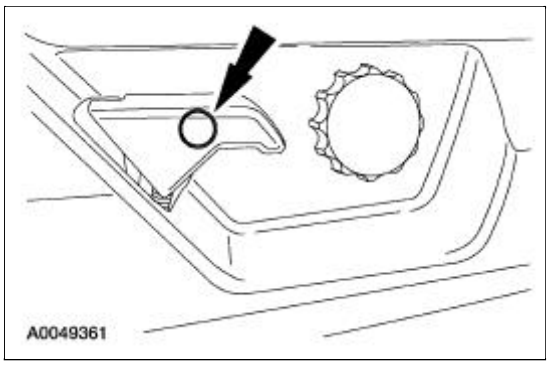
   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the

C-pillars.

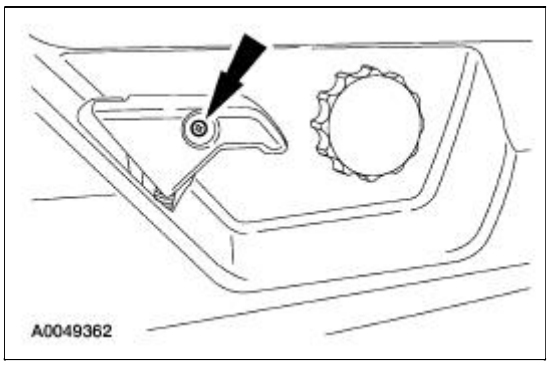
To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .



2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

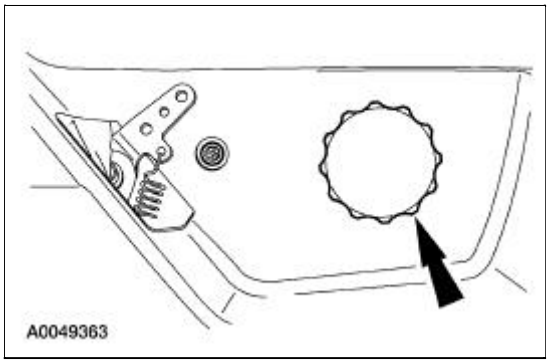
   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.



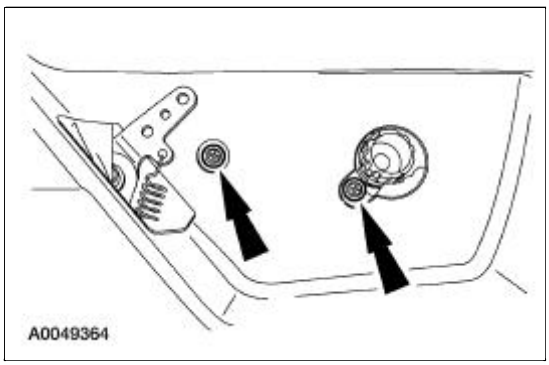
3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

   Remove the 60 percent seat. For additional information, refer to Front Seat—60 Percent in this section.

4. Remove the cover on the recliner handle.

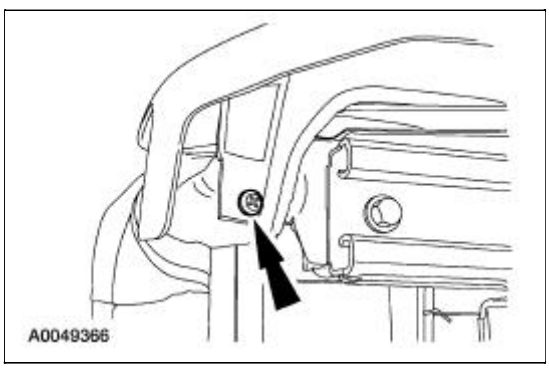


5. Remove the screw from the recliner handle.

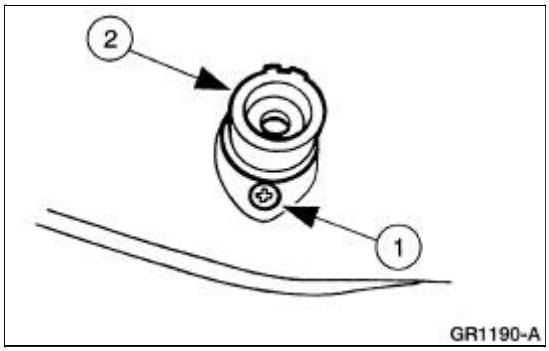


6. **CAUTION: Use care when removing the lumbar knob. Using both hands, pull with even pressure on both sides of the knob to remove.**

   Remove the lumbar control knob.

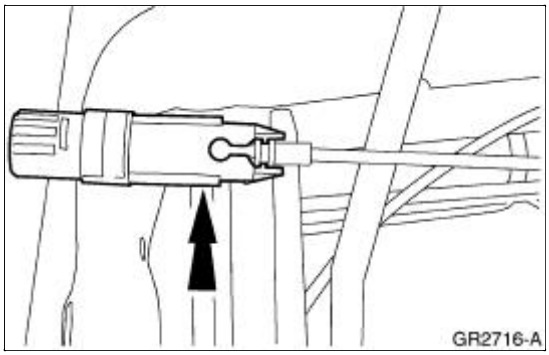


7. Remove the two screws from the side shield.

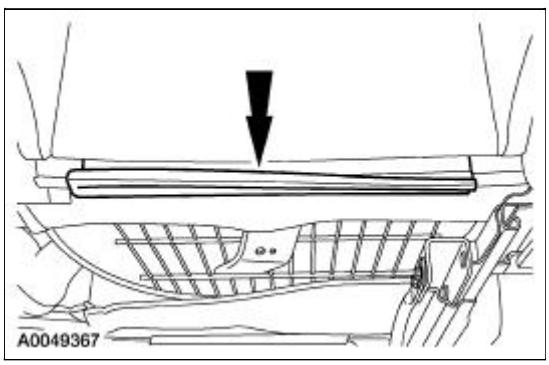


8. Remove the screw from front side of shield.

9. Remove the screw from rear side of shield.

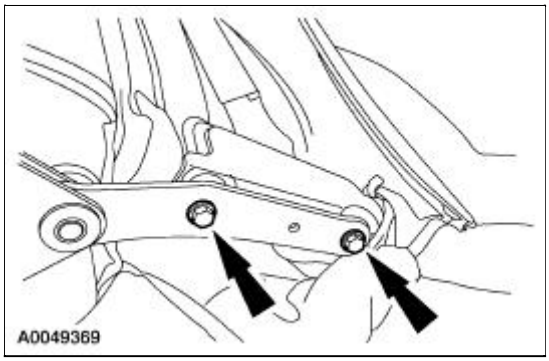


10. Remove the front seat back pad adjuster.
    1. Remove the two screws.
    2. Remove the front seat back pad adjuster.



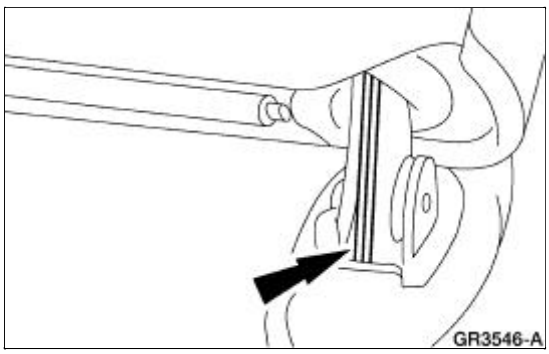
11. **NOTE:** The lumbar support assembly must be fully relaxed.

    Separate the lumbar support adjuster from the adjuster cable.



12. Release the J-clip.

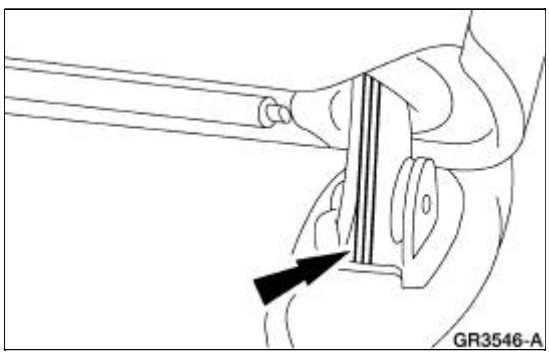
13. Release the inner J-clip.



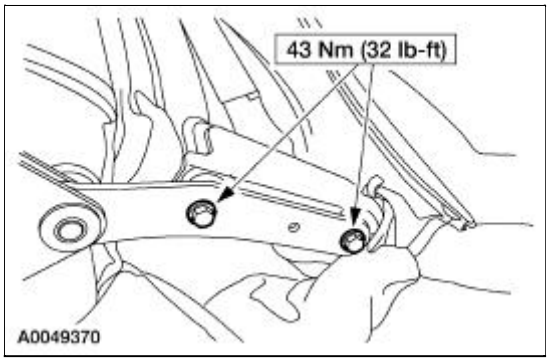
14. Invert the seat backrest cover to expose the bolts and remove the outboard seat back bolts.

15. **CAUTION: Do not damage the plastic pivot bushing when removing the seat back frame.**

    Pull the front seat back frame away from the inboard front seat hinge, and feed the lumbar support cable through the seat cushion opening to remove the front seat back.



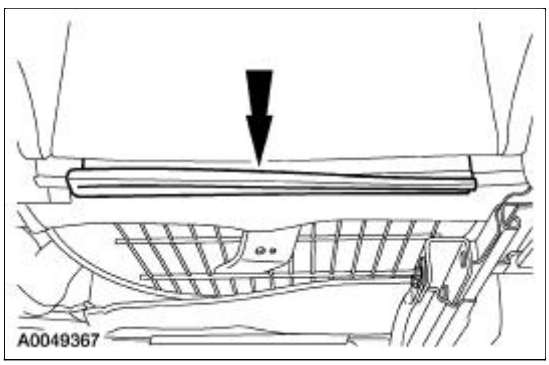
Installation



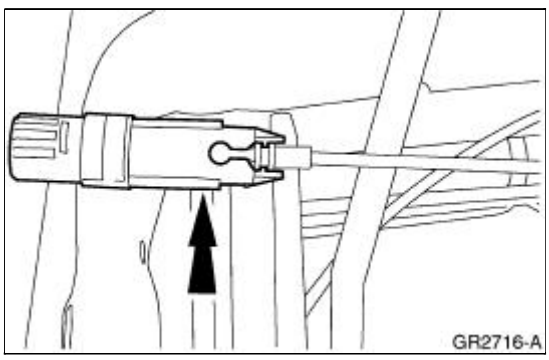
WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

1. **CAUTION: Do not damage the plastic pivot bushing when installing the seat back frame.**

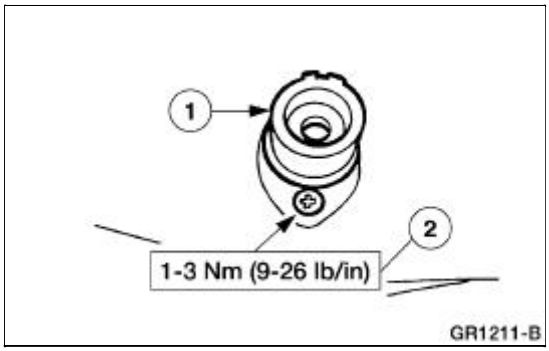
   Install the front seat back frame into the inboard front seat hinge and feed the lumbar support cable through the seat cushion opening to install the front seat back.



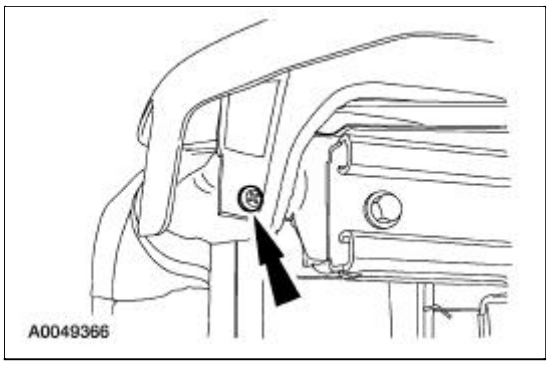
2. Install the seat backrest bolts.



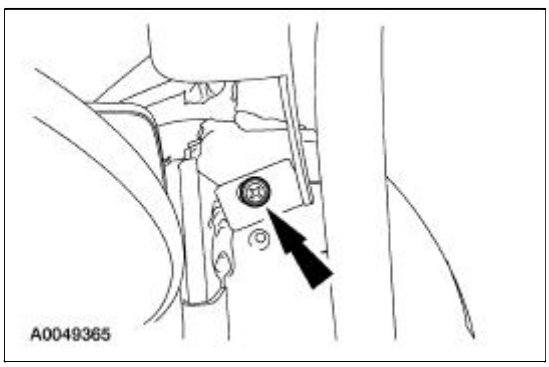
3. Connect the inner J-clip.



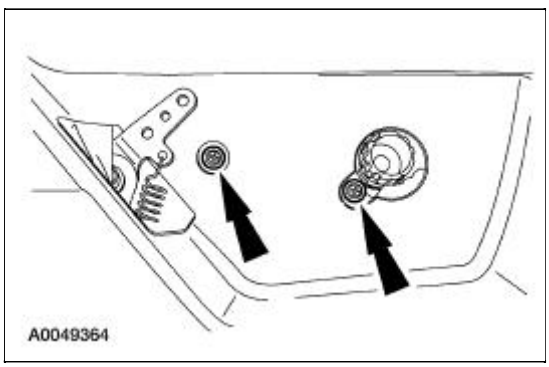
4. Connect the J-clip.



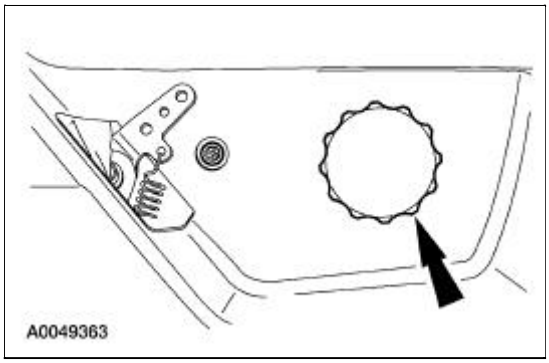
5. Connect the lumbar support adjuster to the adjuster cable.



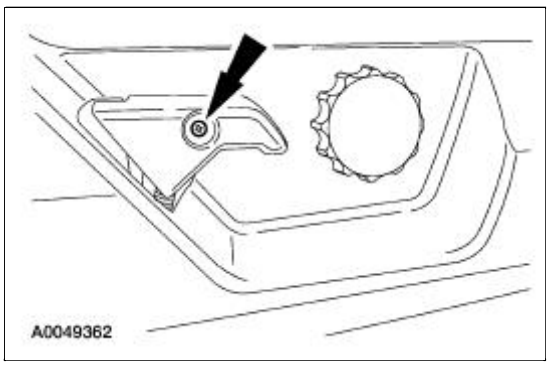
6. Install the front seat back pad adjuster.
    1. Position the front seat back pad adjuster.
    2. Install the two screws.



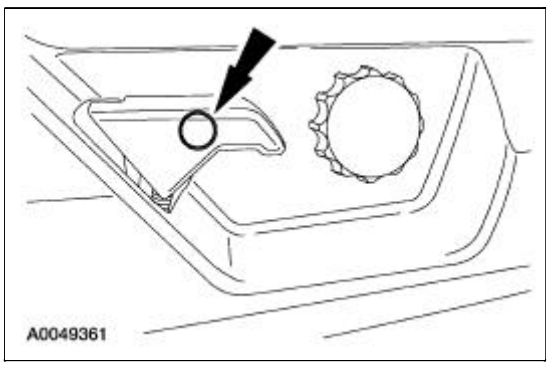
7. Install the rear side shield screw.



8. Install the front side shield screw.



9. Install the two side shield screws.



10. Align and install the lumbar control knob.

11. Install the recliner handle screw.

12. Install the recliner handle screw cover.

13. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

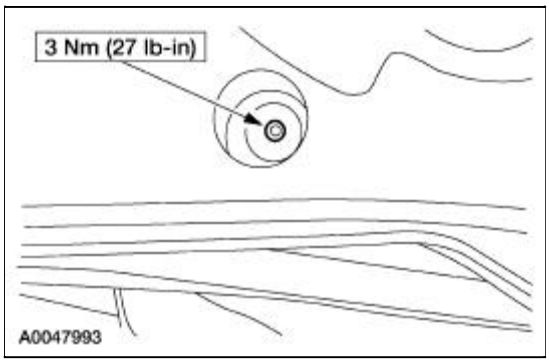
    Install the 60 percent seat. For additional information, refer to Front Seat—60 Percent in this section.

14. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .

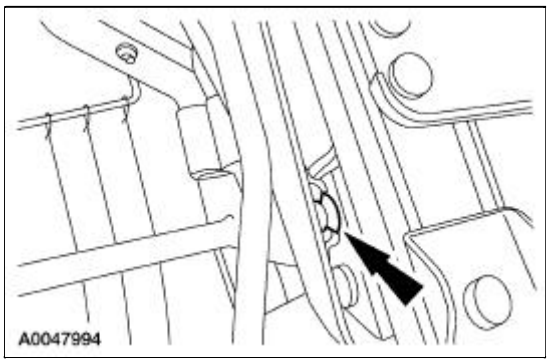
15. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and**

possible violation of vehicle safety standards.



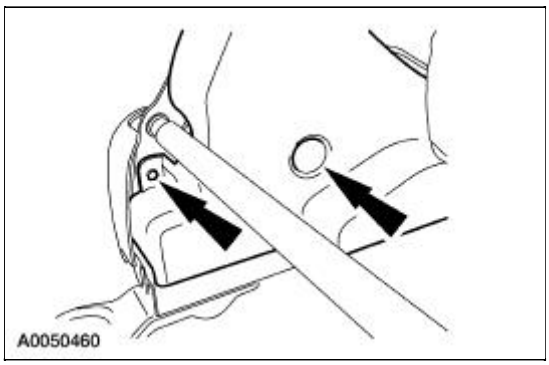
With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

Rear Seat Backrest —Second Row, 20 Percent

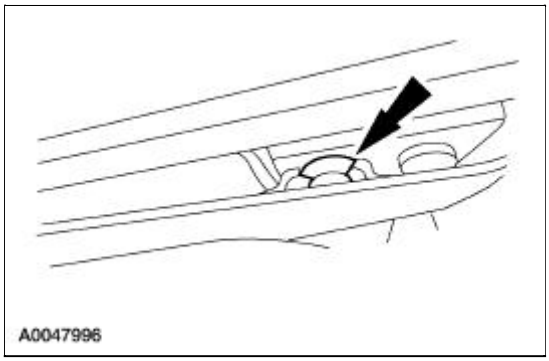


Removal and Installation

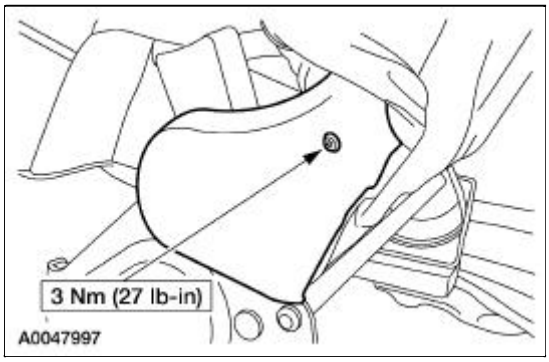
1. Remove the 20 percent seat from the vehicle. For additional information, refer to Rear Seat—Second Row, 20 Percent in this section.



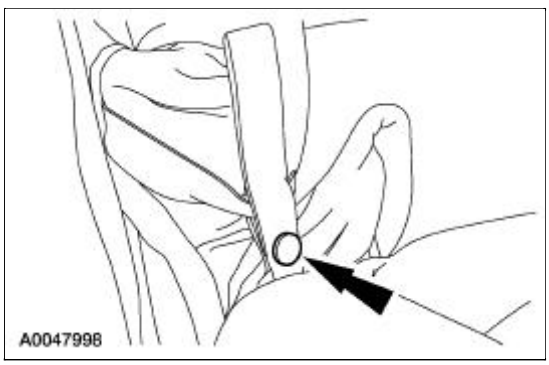
2. Remove the two screws (one shown) from inside of the right side shield.



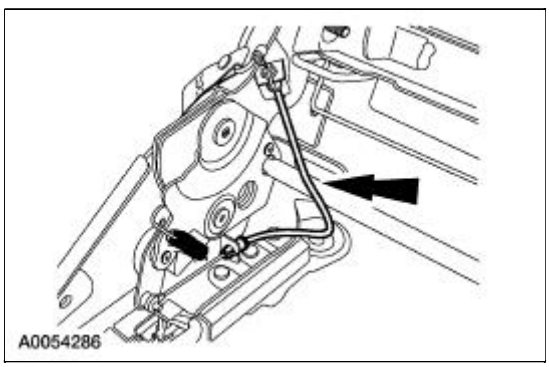
3. Release the pin-type retainer and remove the side shields.



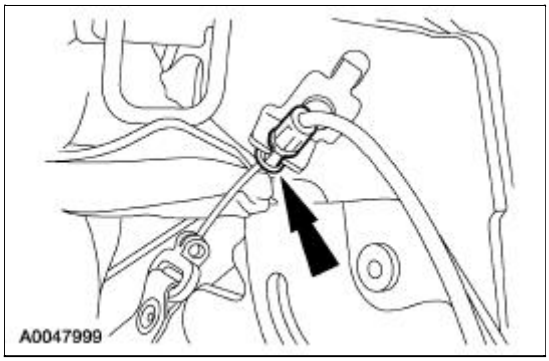
4. Remove the two screws (one shown) from inside of the left side shield.



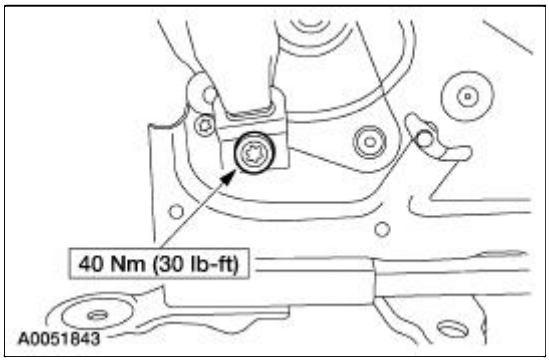
5. Release the pin-type retainer and remove the side shields.



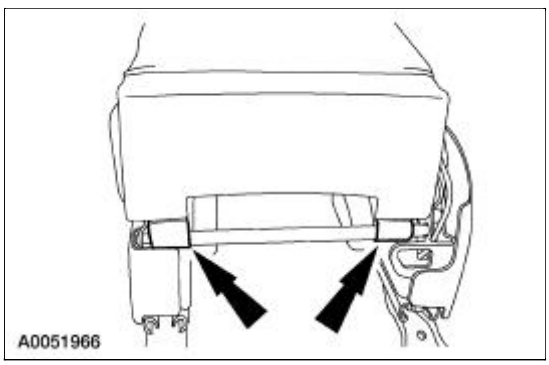
6. Remove the left hinge side shield screw and remove the side shield.



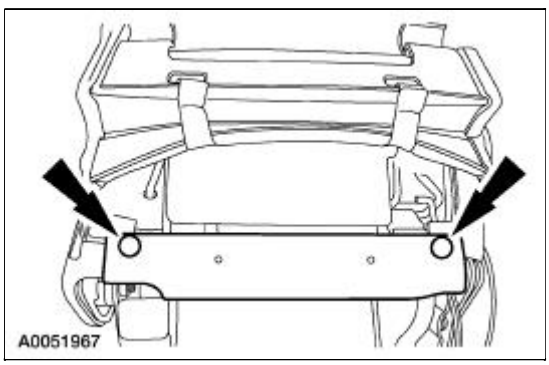
7. Unsnap the recliner pull strap handle and pull the handle through the seat.



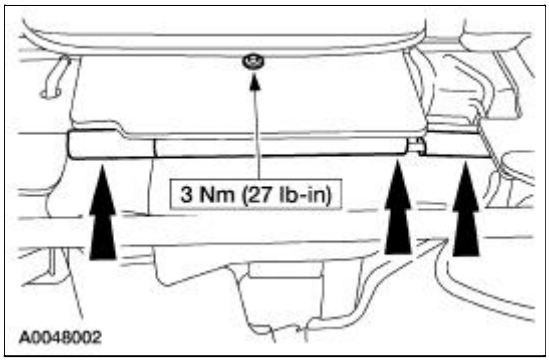
8. Note the location and routing of the recliner cable for installation. The cable needs to be routed in front of the crosstube.



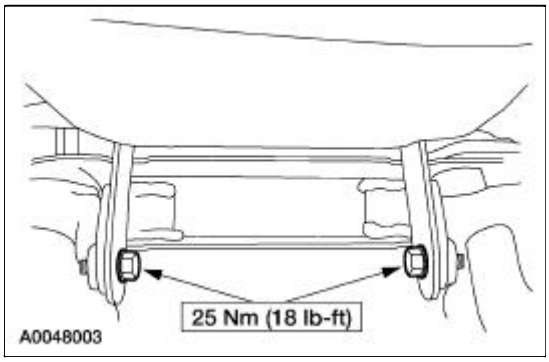
9. Pinch the tabs on the recliner cable end and release the cable from the retainer.



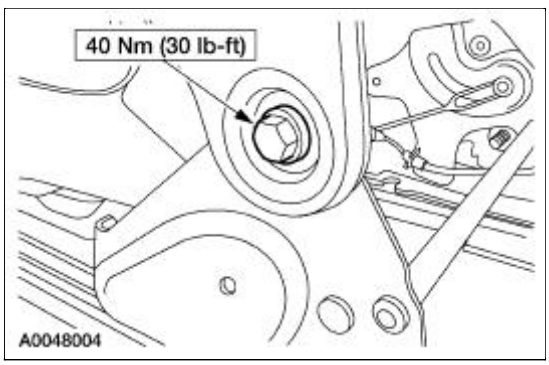
10. Remove the safety belt anchor bolt.



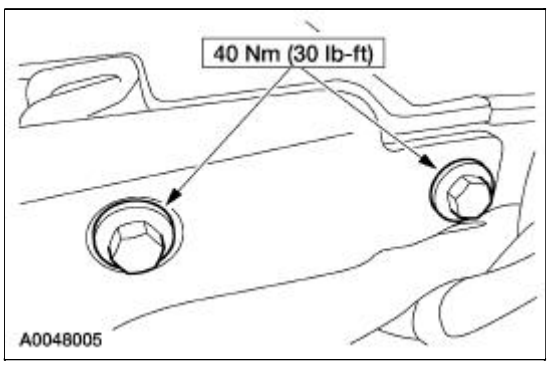
11. Release the J-clips.



12. Remove the two pin-type retainers and remove the panel.



13. Remove the screw from the seat backrest support panel and release the J-clips under seat backrest support panel.

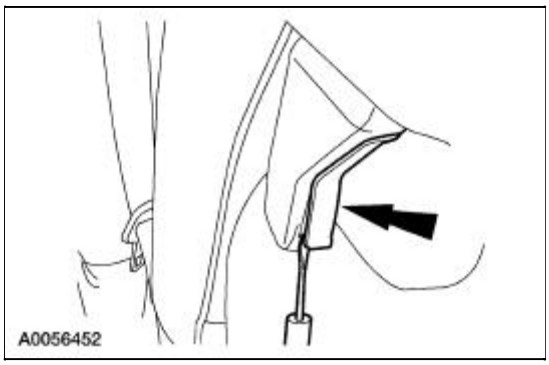


14. Invert the seat backrest cover up to expose the inner swivel bolts and remove the swivel bolts.

15. Remove the left-side pivot bolt.

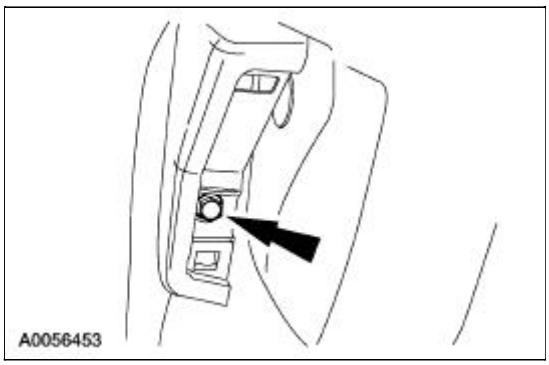
16. Remove the right-side bolts.

17. Remove the seat backrest.



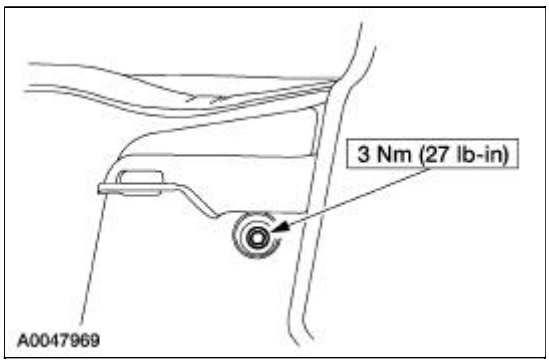
18. To install, reverse the removal procedure.

Rear Seat Backrest —Second Row, 40 Percent

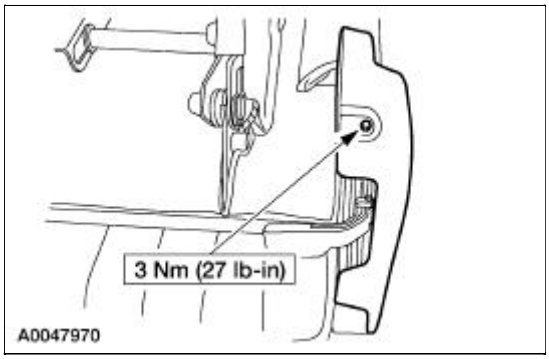


Removal and Installation

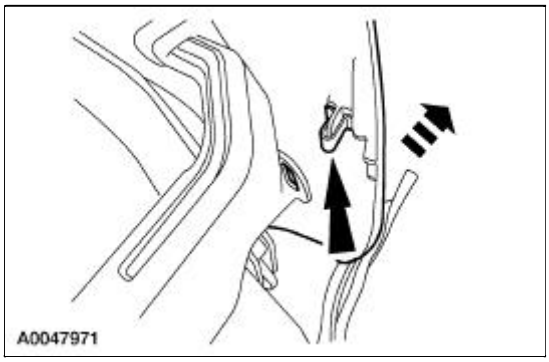
1. Remove the 40 percent seat from the vehicle. For additional information, refer to Rear Seat—Second Row, 40 Percent in this section.



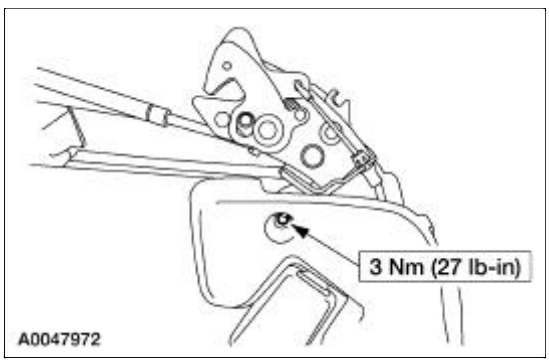
2. Remove the recliner handle screw cover.



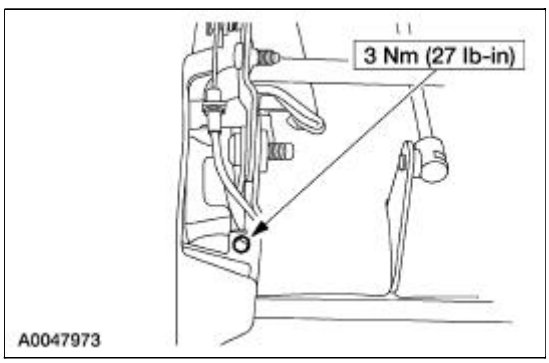
3. Remove the recliner handle screw and the recliner handle.



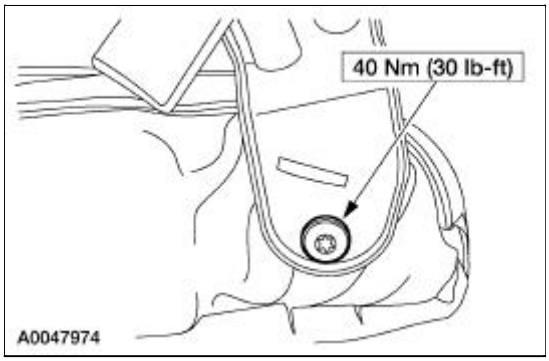
4. Remove the screw from the side shield.



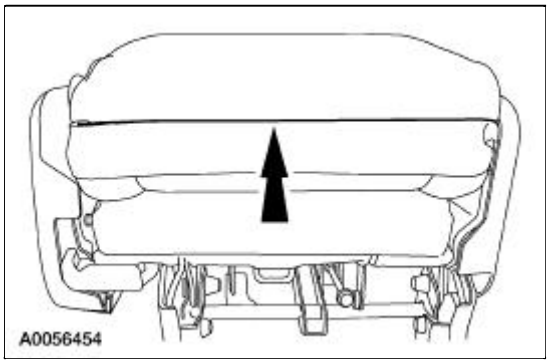
5. Remove the screw from bottom of the side shield.



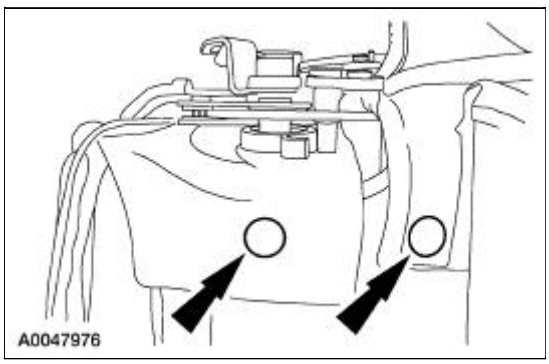
6. Release the retainer on the side shield and remove the side shield.



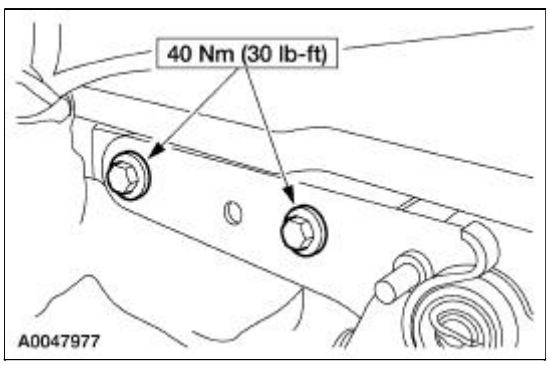
7. Remove the screw from the side of the side shield.



8. Remove the screw from bottom of the side shield.



9. Remove the backrest bolt.



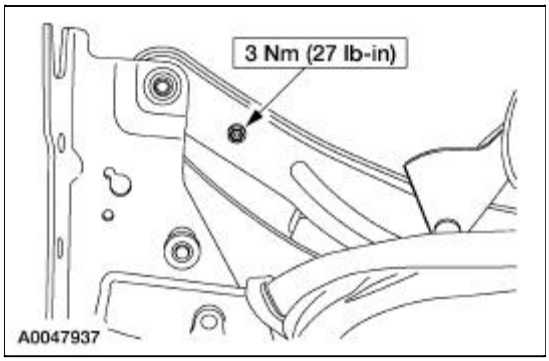
10. Release the J-clip and invert the seat backrest cover to expose the pin-type retainers.

11. Remove the four pin-type retainers (two shown).

12. Invert the seat backrest cover to expose the seat backrest bolts and remove the bolts.

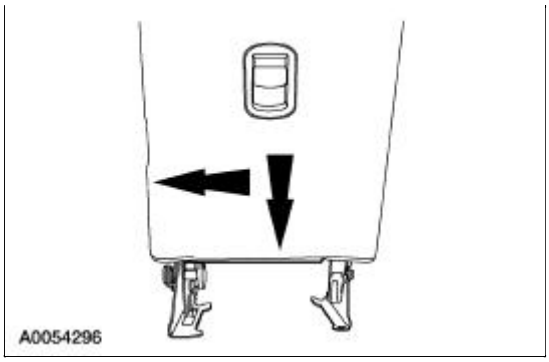
13. Remove the seat backrest from the cushion.

14. To install, reverse the removal procedure.



Rear Seat Backrest —Third Row, 40 Percent

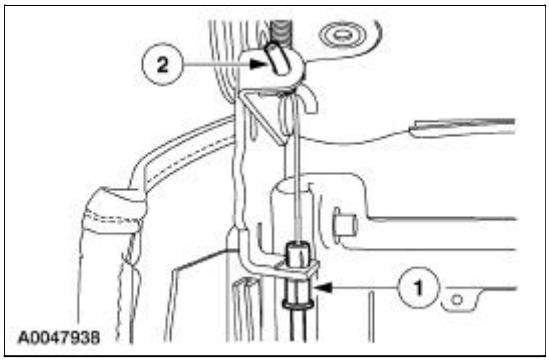
Removal and Installation



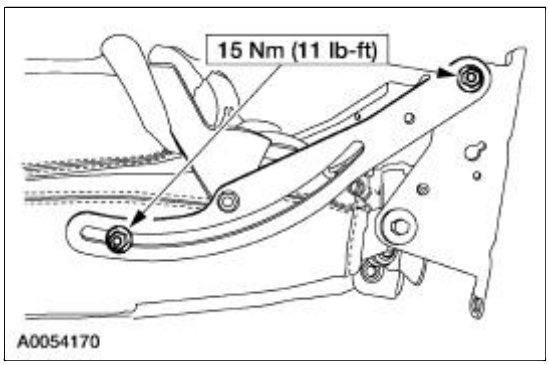
All vehicles

1. Remove the third row 40 percent seat. For additional information, refer to Rear Seat—Third Row in this section.

2. Remove the screws from the outboard and inboard side shields and remove the side shields (outboard shown).

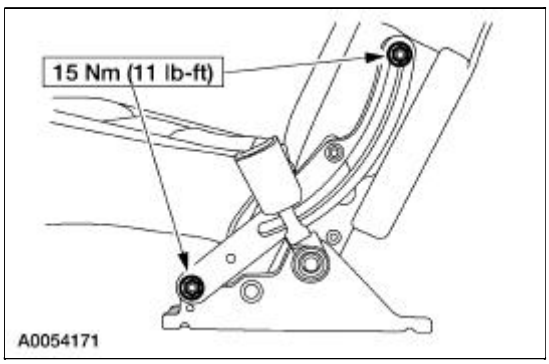


3. Release the J-clips.



Manual fold seat

4. Remove the manual seat cable.
    1. Pinch the cable end and remove the cable from the retainer.
    2. Release the cable end hook from the retaining hole.



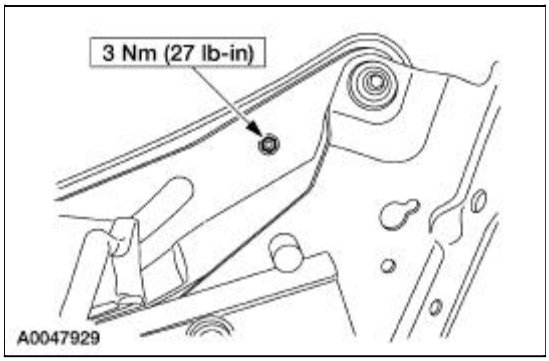
All vehicles

5. Remove the outboard slide bracket nuts.

6. Remove the inboard slide bracket nuts.

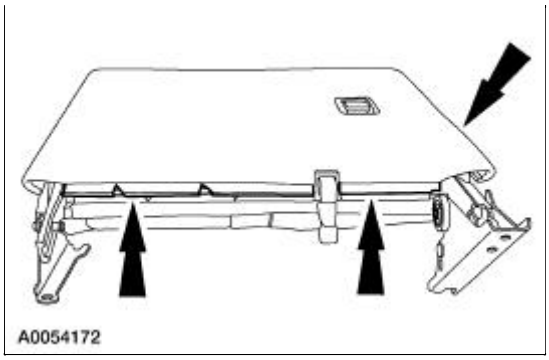
7. Remove the rear seat backrest from the cushion.

8. To install, reverse the removal procedure.



Rear Seat Backrest —Third Row, 60 Percent

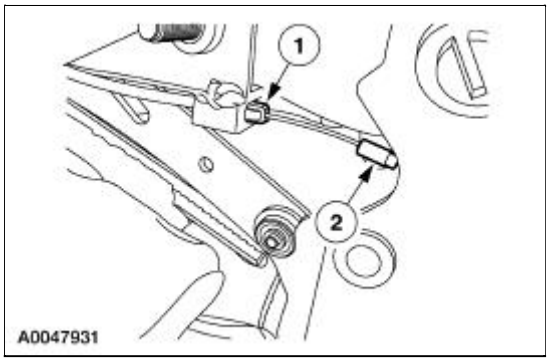
Removal and Installation



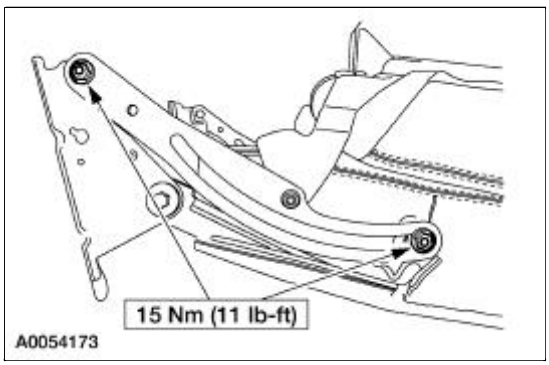
All vehicles

1. Remove the third row 60 percent seat. For additional information, refer to Rear Seat—Third Row in this section.

2. Remove the screws from the outboard and inboard side shields and remove the side shields (outboard shown).

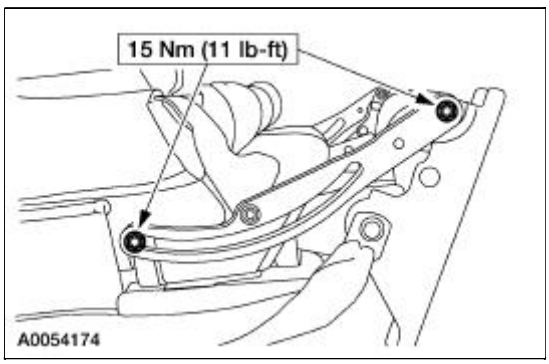


3. Release the J-clips.



Manual fold seats

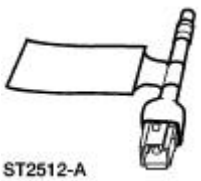
4. Remove the manual seat cable.
    1. Pinch the cable end and remove the cable from retainer.
    2. Release the cable end hook from the retaining hole.

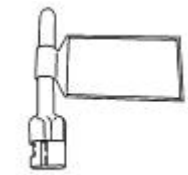


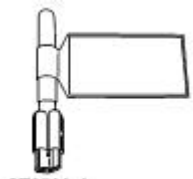
All vehicles

5. Remove the outboard slide bracket nuts.

6. Remove the inboard slide bracket nuts.







7. Remove the rear seat backrest from the cushion.

8. To install, reverse the removal procedure.

Seat Backrest Thermo-Electric Device

Special Tool(s)

 ST2512-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F403
 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395 (014-R1079)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F088 (105-00012)

Removal

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

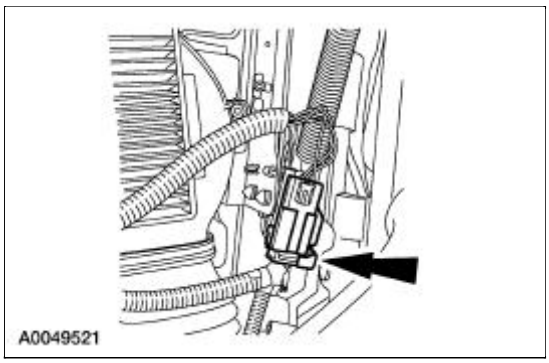
   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the

C-pillars.

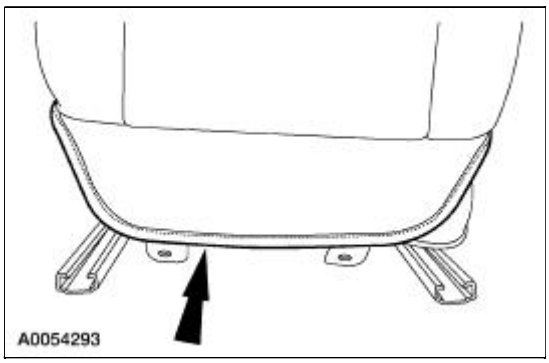
To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .



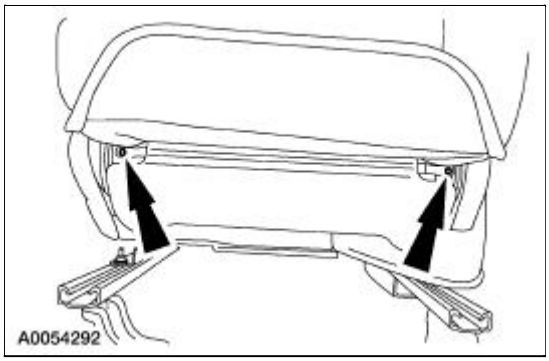
2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

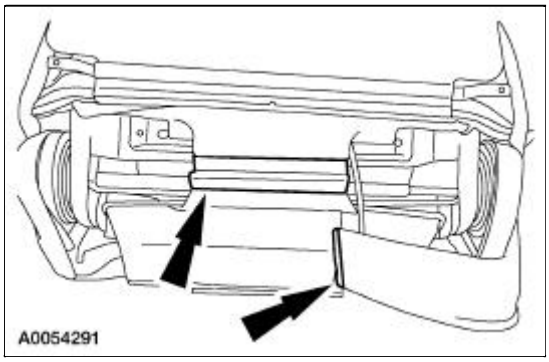


3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

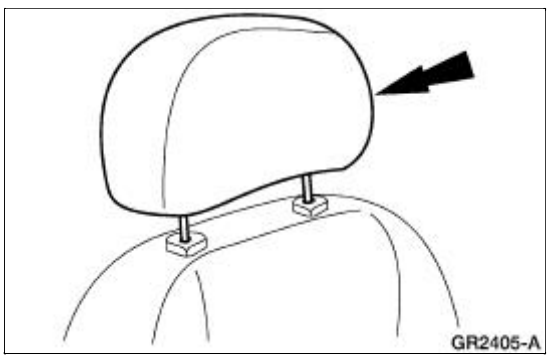
   Remove the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.



4. Disconnect the seat backrest thermo-electric device (TED) electrical connector at the seat cushion frame.

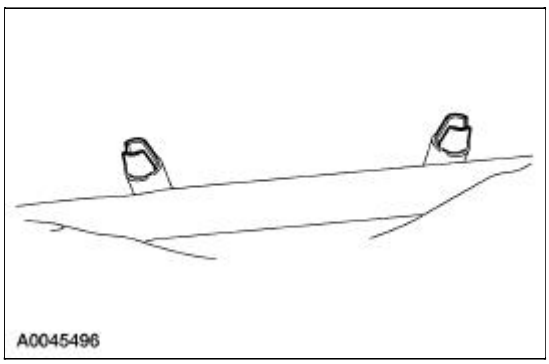


5. Remove lower seat backrest cover.



6. Remove the two screws from support rod.

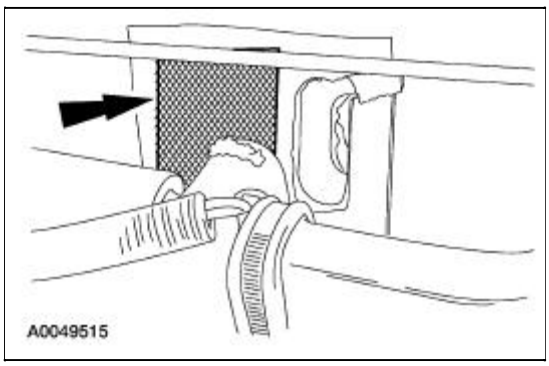
7. Release the one hook-and-loop strip and the one J-clip.



8. Depress tab and remove the head restraint.

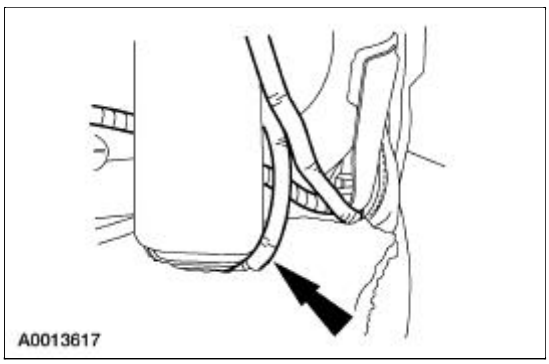
9. **NOTE:** The head restraint sleeve pins are not interchangeable. Note location for installation.

   Reach up into the seat backrest and squeeze the head restraint sleeve ends together to release the sleeves and pull the head restraint sleeves out.



10. **CAUTION: Use care when separating the seat backrest trim cover from the hook-**

and-loop strip, or the hook-and-loop strip can be torn from the seat backrest foam.

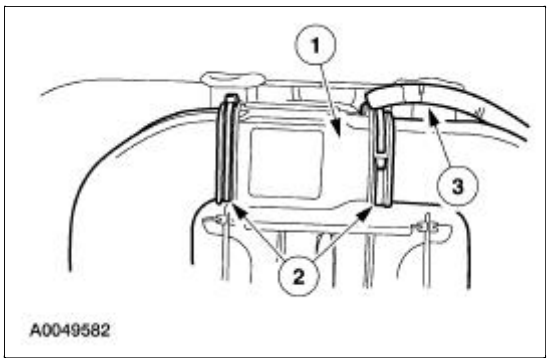


Invert the seat backrest trim cover and remove.

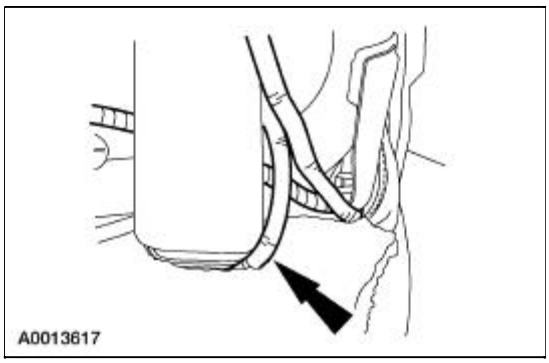
11. **CAUTION: Use care when removing the seat backrest foam pad from the frame. The foam pad has hook and loop fasteners holding the TED to the seat backrest foam pad.**

    Remove the seat backrest foam pad from the TED and remove the seat backrest foam pad.

12. Route the seat backrest TED wire harness back through the seat cushion and trim cover.

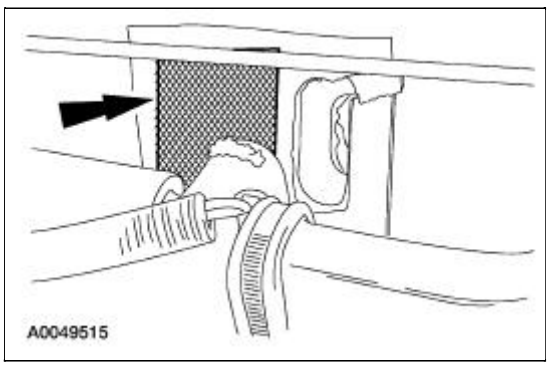


13. Remove the seat backrest TED.
    1. Remove the seat backrest TED wire harness pin-type retainers.
    2. Cut the zip-ties and separate the ducts from the seat backrest TED.
    3. Remove the seat backrest TED.



Installation

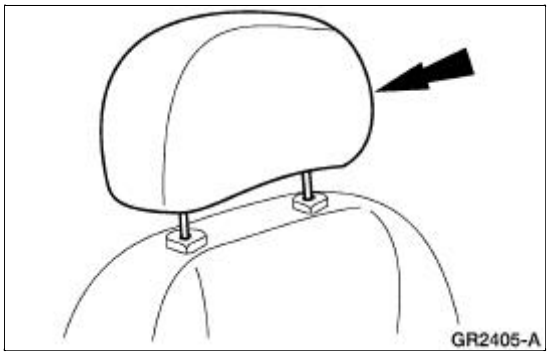
WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.



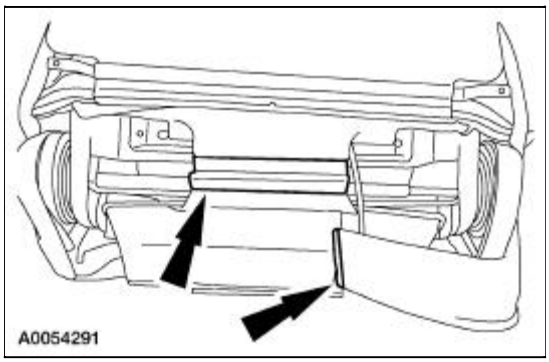
1. Install the seat backrest TED.
    1. Install the seat backrest TED.
    2. Install the seat backrest TED to the ducts and install the zip-ties.
    3. Attach the pin-type retainer for the seat backrest TED wire harness.

2. Route the seat backrest TED wire harness through the seat cushion and trim cover.

3. Install the seat backrest foam pad and attach the seat backrest TED to the foam pad.

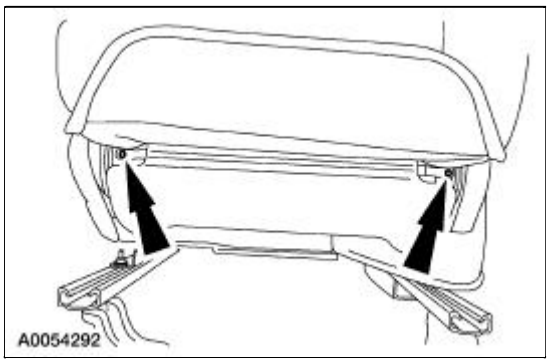


4. Install the seat backrest trim cover and attach the hook and loop fasteners.

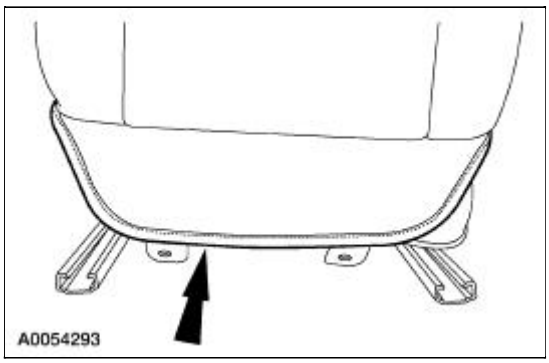


5. **NOTE:** The head restraint sleeve pins are not interchangeable.

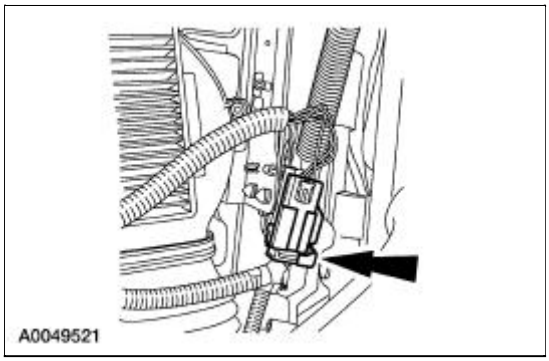
   Install the head restraint sleeves.



6. Install the head restraint.



7. Connect the one hook-and-loop strip and the one J-clip.



8. Install the two screws in support rod.

9. Install the lower backrest cover.

10. Connect the seat backrest TED electrical connector.

11. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

    Install the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

12. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .

13. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

Removal

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the

C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

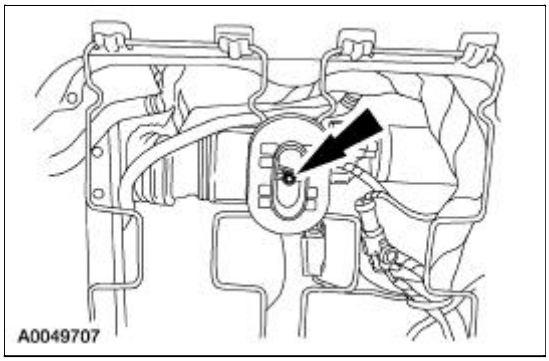
   Remove the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

4. Remove the seat side shield. For additional information, refer to Seat Control Switch—8-Way or Seat Control Switch—6-Way in this section.

5. Remove the seat fan motor. For additional information, refer to Seat Fan Motor in this section.

6. Remove the front height power seat motor. For additional information, refer to Front Seat Track Motor in this section.

7. Release the J-clips (six shown).

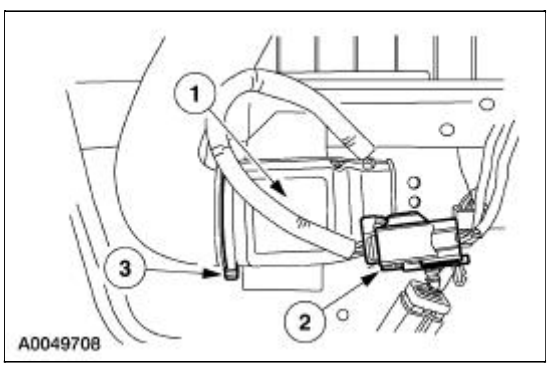


8. **CAUTION: Use care when separating the seat cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat cushion.**

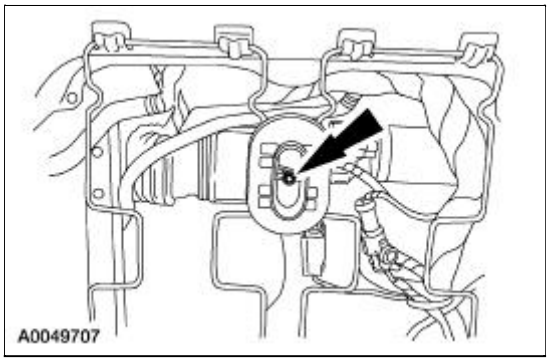
   Remove the seat cushion trim cover.

9. Remove the seat cushion foam pad.

10. Remove the screw and separate the seat cushion thermo-electric device (TED) from the mounting bezel.

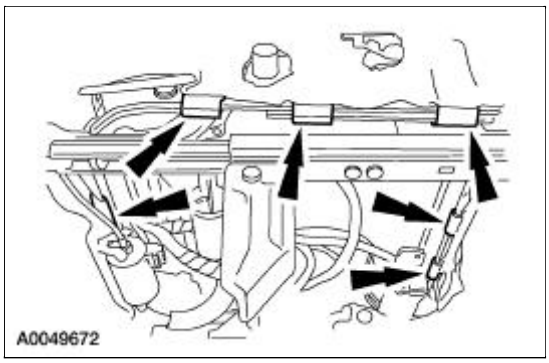


11. Remove the seat cushion TED.
    1. Cut the zip-tie, separate and remove the duct.
    2. Disconnect the seat cushion TED electrical connector.
    3. Remove the seat cushion TED.



Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.



1. Install the seat cushion TED.
    1. Install the seat cushion TED.
    2. Connect the seat cushion TED electrical connector.
    3. Install the duct and zip-tie the duct to the TED.

2. Install the TED to the mounting bezel, and install the screw.

3. Install the seat cushion foam pad.
4. Install the seat cushion trim cover.
5. Attach the J-clips (six shown).

6. Install the front height power seat motor. For additional information, refer to Front Seat Track Motor in this section.
7. Install the seat fan motor. For additional information, refer to Seat Fan Motor in this section.
8. Install the seat side shield. For additional information, refer to Seat Control Switch—8-Way or Seat Control Switch—6-Way in this section.
9. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

   Install the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.
10. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .
11. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

Removal

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

Inboard and outboard seat tracks

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

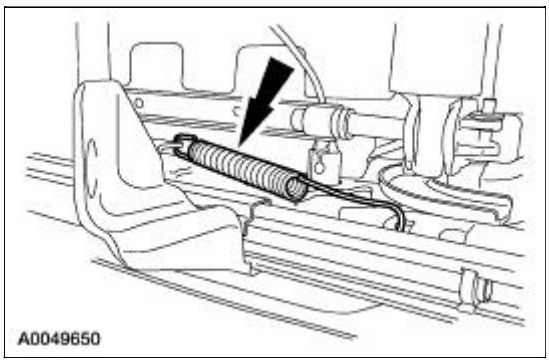
   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .

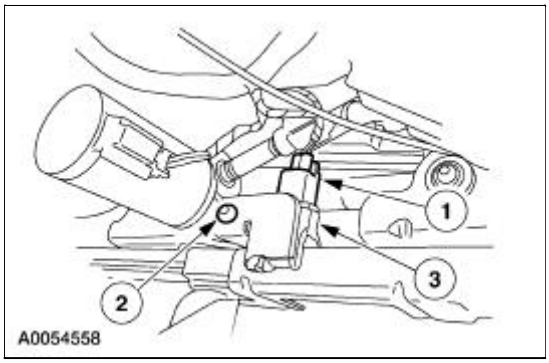


2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

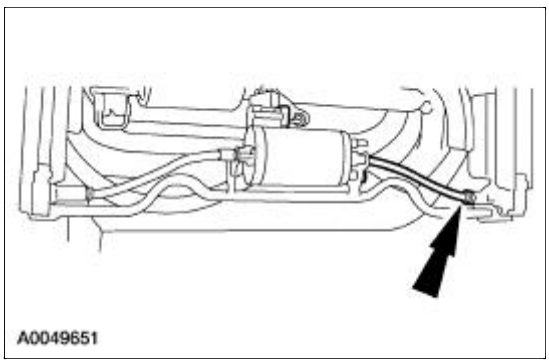
3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

   Remove the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.



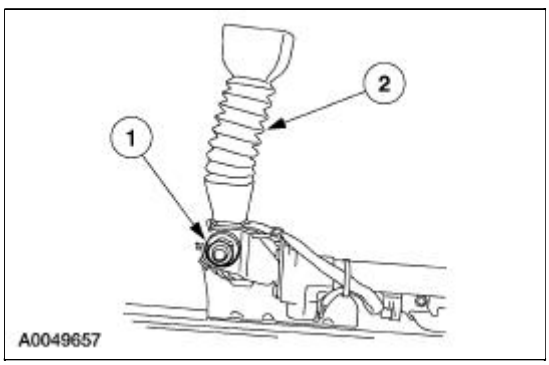
4. Remove the spring.

Driver seat



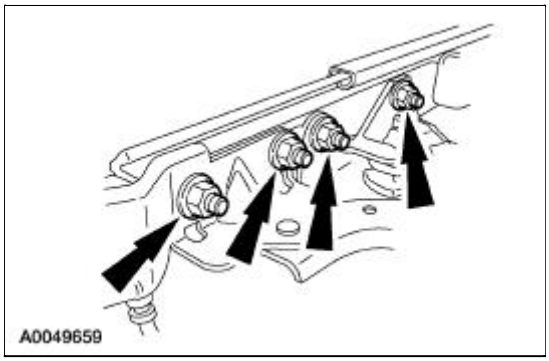
5. **CAUTION: Make sure to remove all metal chips from seat position sensor and surrounding areas after drilling out rivet.**

   Remove the seat position sensor.
   1. Disconnect the seat position sensor electrical connector.
   2. Drill out rivet.
   3. Remove the seat position sensor.

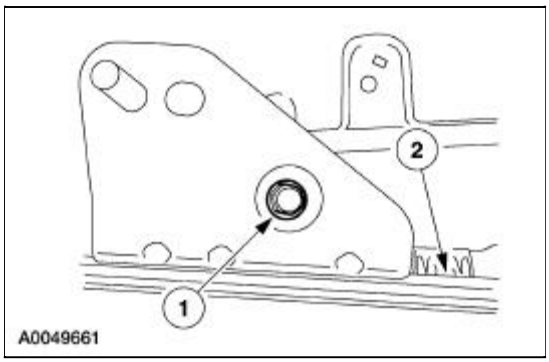


Inboard seat track

6. Pull to remove the inboard forward/reverse motor drive cable from inboard seat track.

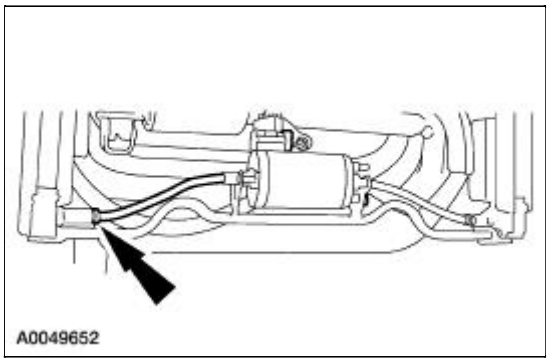


7. Disconnect the safety belt buckle pretensioner and usage detection electrical connectors.

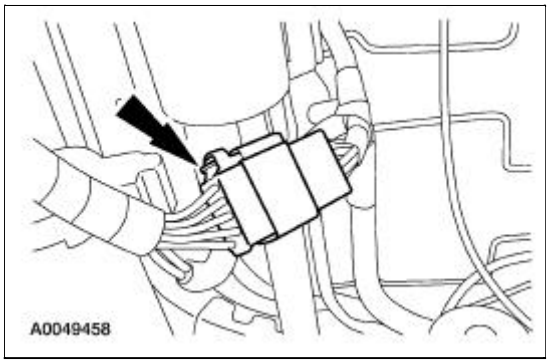


8. Remove the safety belt buckle pretensioner.
    1. Remove the nut.
    2. Remove the safety belt buckle pretensioner.

9. Remove the four inboard seat track nuts.

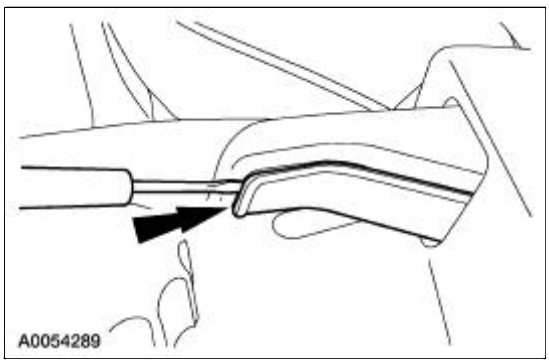


10. Remove the rear inboard seat track and bracket.
    1. Remove the bolt.
    2. Remove the seat track and bracket.
       - Remove the two remaining nuts (not shown) that hold the bracket to seat track.

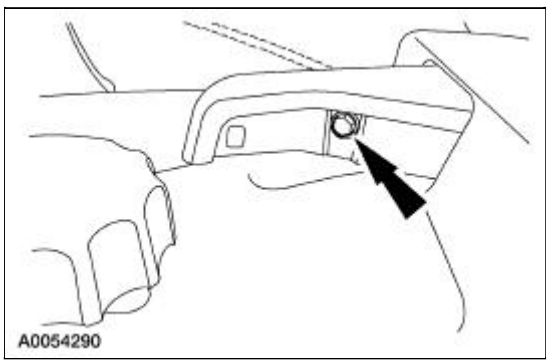


Outboard seat track

11. Pull to remove the outboard forward/reverse motor drive cable from outboard seat track.

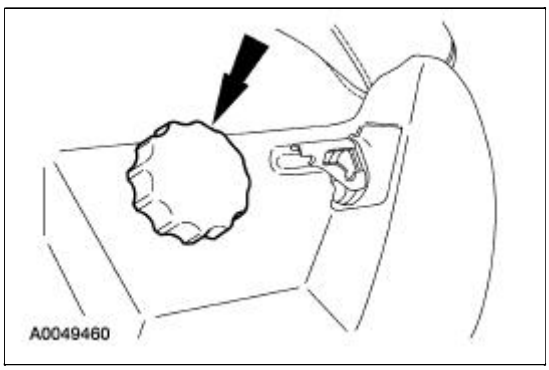


Vehicles with 6-way power seat

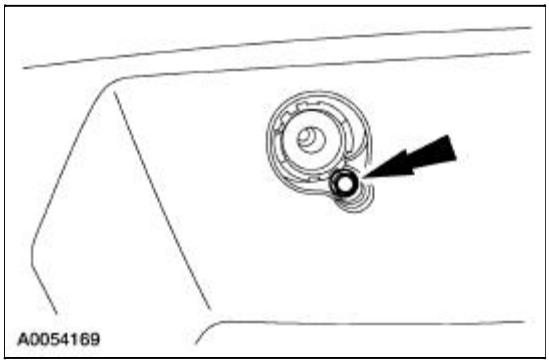


12. Disconnect the 6-way power seat switch electrical connector.

13. Remove recliner handle cover.

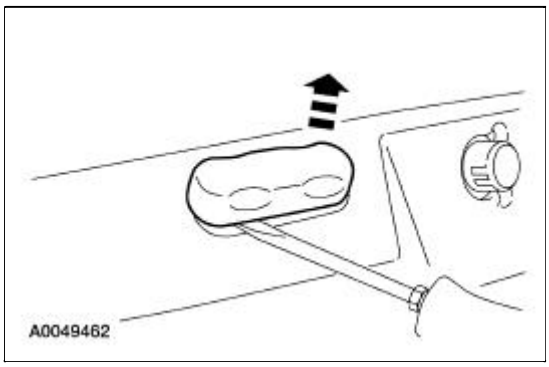


14. Remove the recliner handle screw and remove handle.

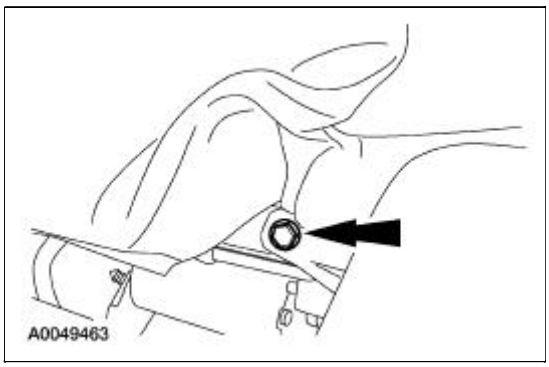


15. **CAUTION: Use care when removing the lumbar knob. Using both hands, pull with even pressure on both sides of the knob to remove.**

    Remove the lumbar knob.



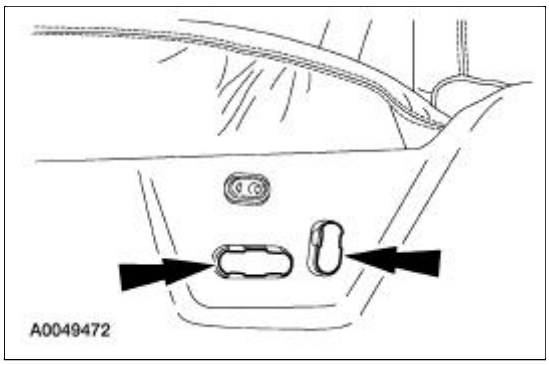
16. Remove the screw from side shield under the lumbar knob.



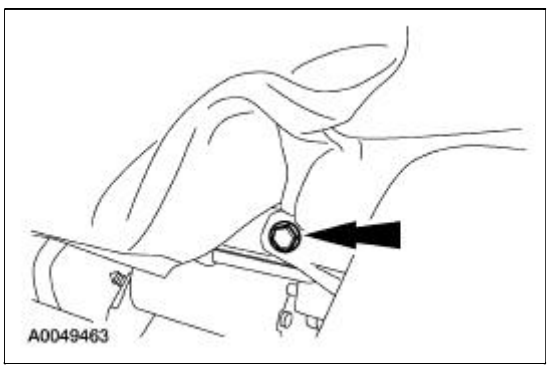
17. **CAUTION: Use care not to scratch the side shield when removing the power seat knob.**

    Pry the power seat knob off.

18. Access and remove the front side shield screw.

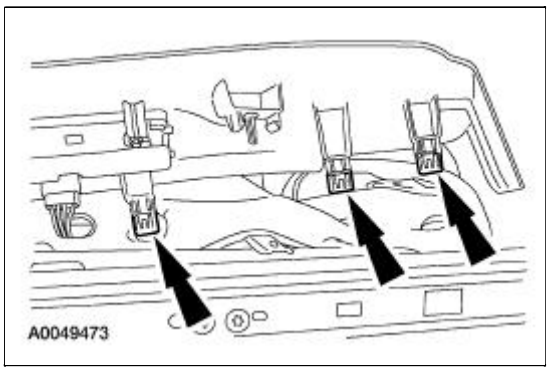


19. Pull to release the retainer clip on the rear of side shield.

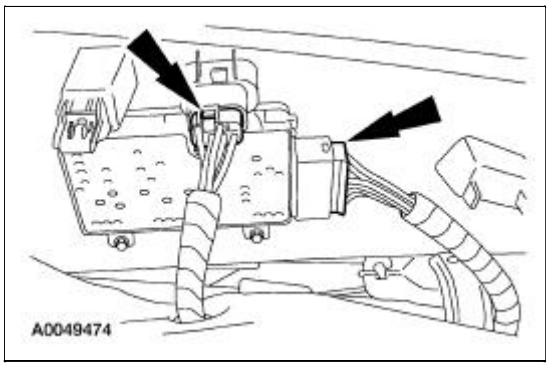


20. Remove the side shield from the seat.

Vehicles with 8-way power seat

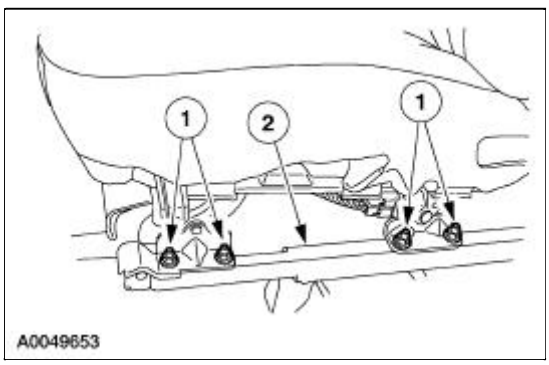


21. Pry to remove the two power seat knobs and remove the knobs.



22. Access and remove the front side shield screw.

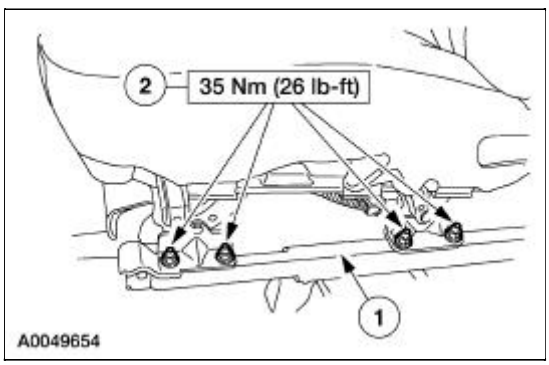
23. Pull out from the bottom and rear side of side shield to release the three retainer clips.



24. Disconnect the power lumbar switch and 8-way power seat switch electrical connectors and remove the side shield.

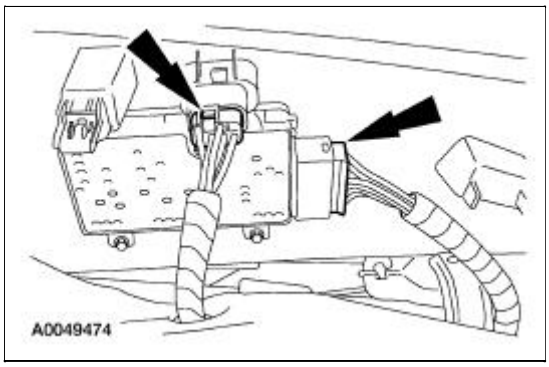
Outboard seat track

25. Remove the outboard seat track.
    1. Remove the nuts.
    2. Remove the seat track.



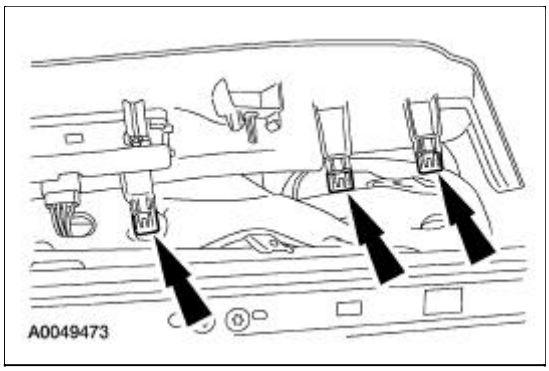
Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

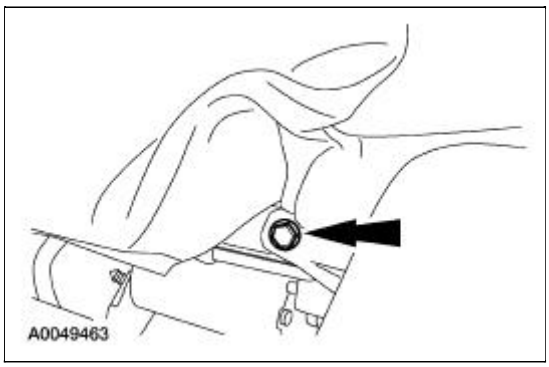


Outboard seat track

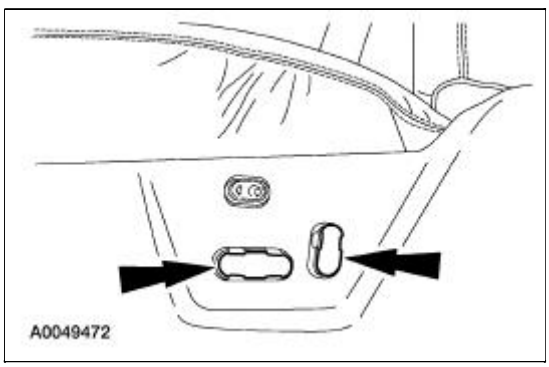
1. Install the outboard seat track.
    1. Install the seat track.
    2. Install the nuts.



Vehicles with 8-way power seat

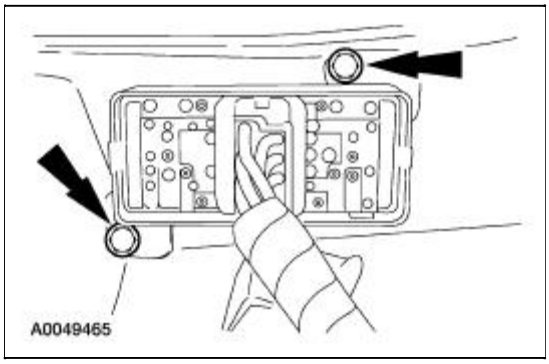


2. Install side shield and connect the 8-way power seat and power lumbar switch electrical connectors.

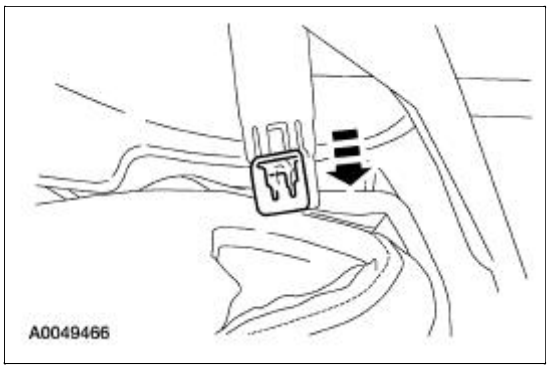


3. Push to install the three side shield retainers onto the seat frame.

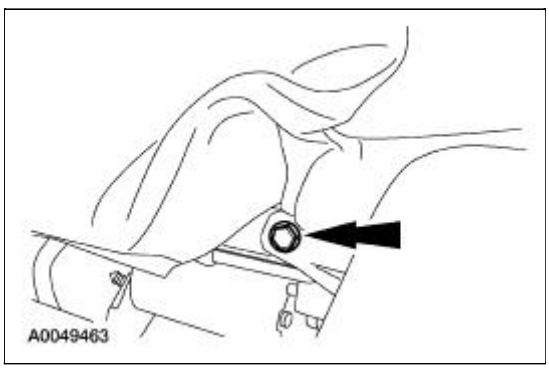
4. Access and install the front side shield screw.



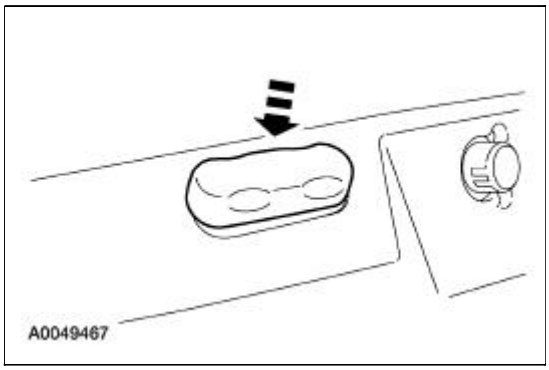
5. Install the two power seat knobs.



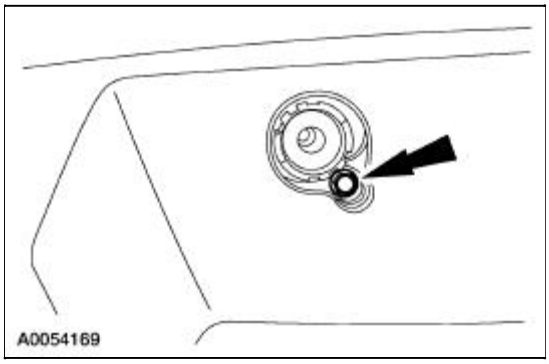
Vehicles with 6-way power seat



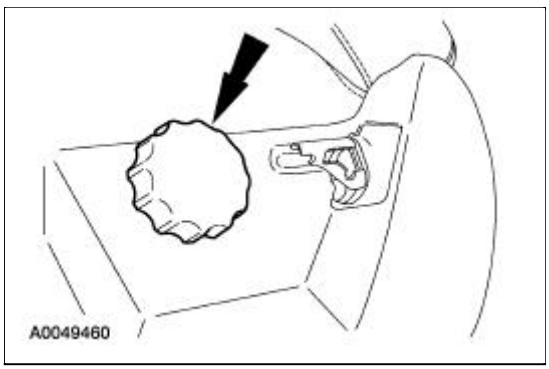
6. Install the 6-way power seat switch on the side shield and install the two screws.



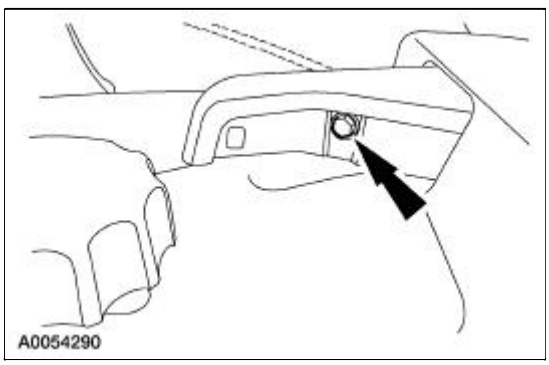
7. Install the side shield on the seat
8. Push to install the rear side shield retainer onto the seat frame.



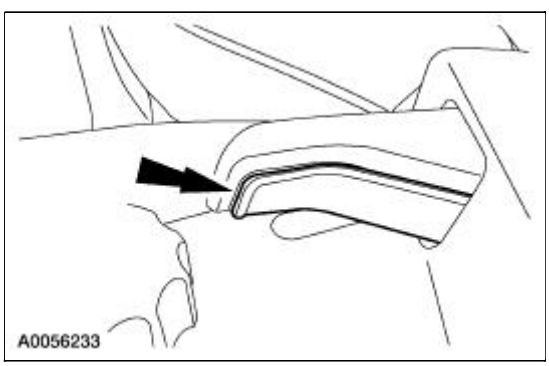
9. Access and install the front side shield screw.



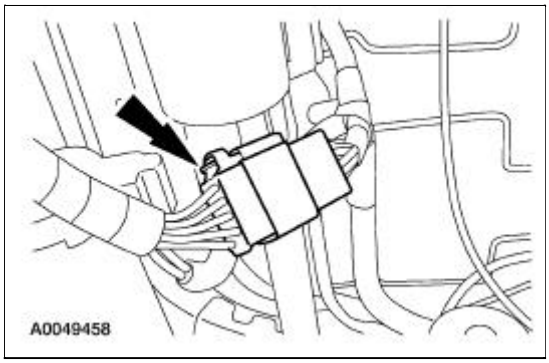
10. Install the 6-way power seat knob.



11. Install the screw on the side shield.

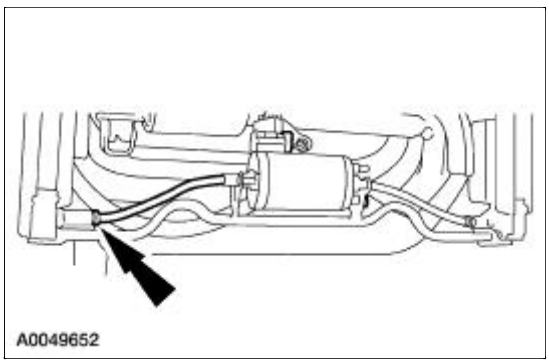


12. Align and install the lumbar knob.



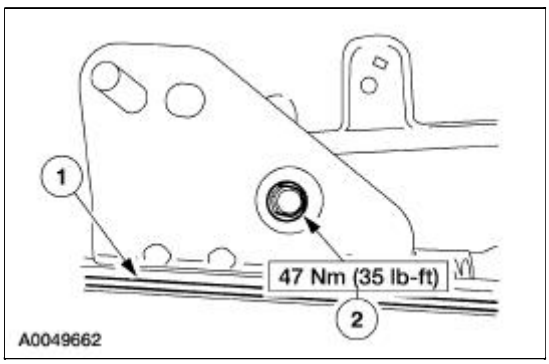
13. Install recliner handle and install the screw.

14. Install the recliner handle cover.

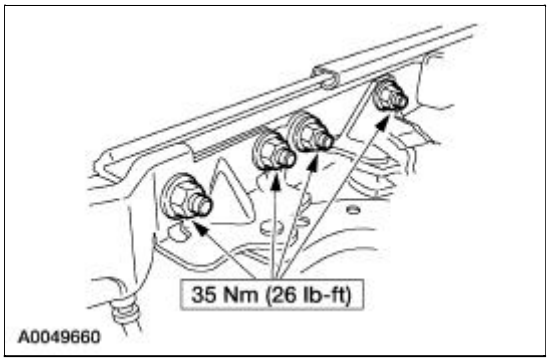


15. Connect the 6-way power seat switch electrical connector.

Outboard seat track

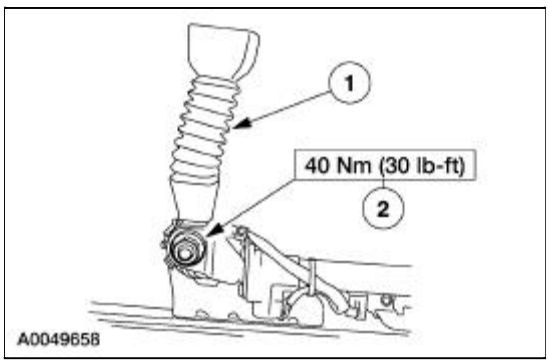


16. Install the outboard forward/reverse motor drive cable to outboard seat track.



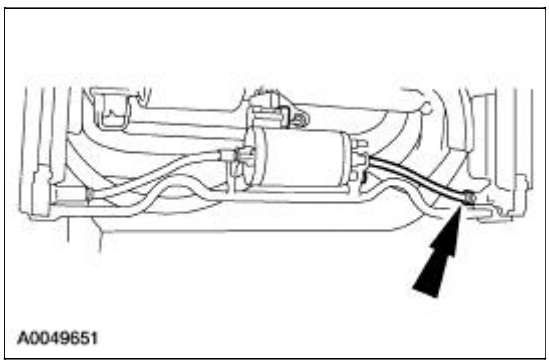
Inboard seat track

17. Install the bracket to the seat track and install the two nuts.



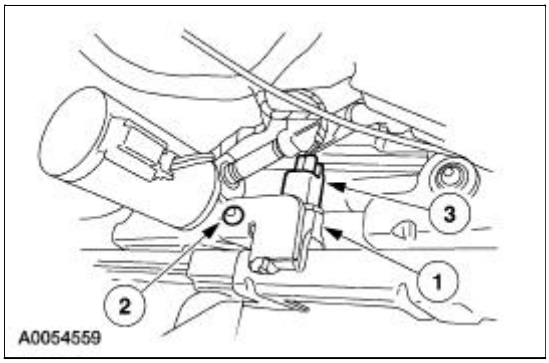
18. Install the rear inboard seat track and bracket.
    1. Install the seat track and bracket.
    2. Install the bolt.

19. Install the four inboard seat track nuts.



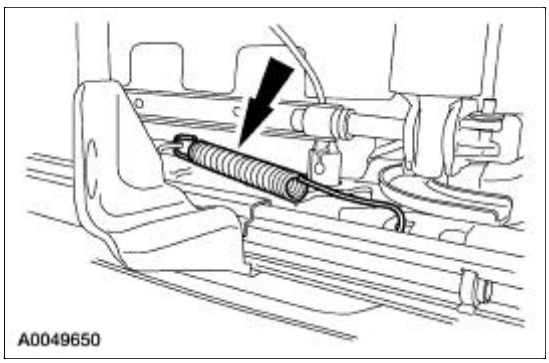
20. Install the safety belt buckle pretensioner.
    1. Install the safety belt buckle pretensioner.
    2. Install the nut.

21. Connect the safety belt buckle pretensioner and usage detection electrical connectors.



22. Install the inboard forward/reverse motor drive cable to seat track.

Driver seat



23. **CAUTION: Make sure to remove all metal chips from seat position sensor and surrounding areas.**

    Install the seat position sensor.
    1. Install the seat position sensor.
    2. Install the rivet.
    3. Connect the seat position sensor electrical connector.

Inboard and outboard seat tracks

24. Install the spring.

25. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

    Install the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

26. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .

27. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)
 ST2506-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F088 (105-00012)

Removal

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the

C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

NOTE: Before disconnecting the battery in vehicles with power seats, adjust the seat position to allow for access to the necessary components.

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

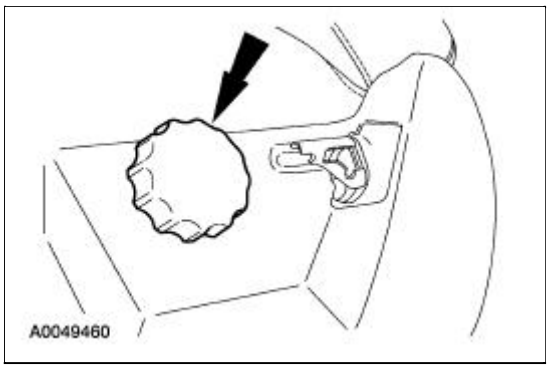
   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

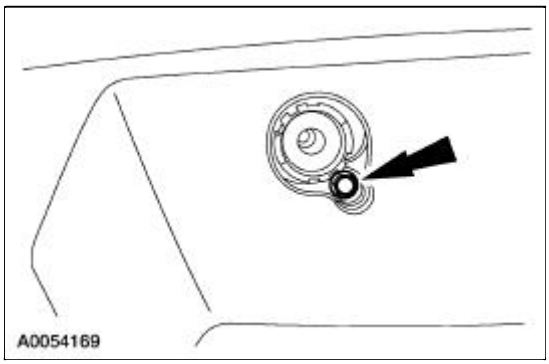
   NOTE: 60 percent seat shown, the 40 percent seat similar.

   Remove the affected seat. For additional information, refer to Front Seat—60 Percent or Front Seat—40 Percent in this section.

4. Remove recliner handle cover.

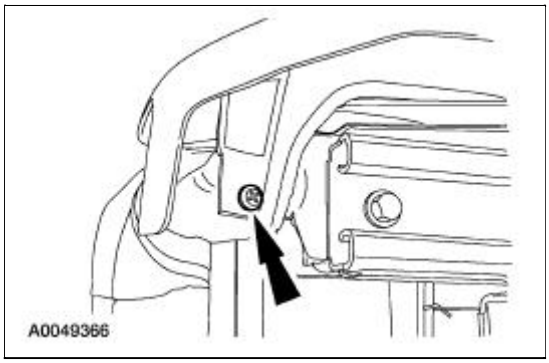


5. Remove the recliner handle screw and remove handle.

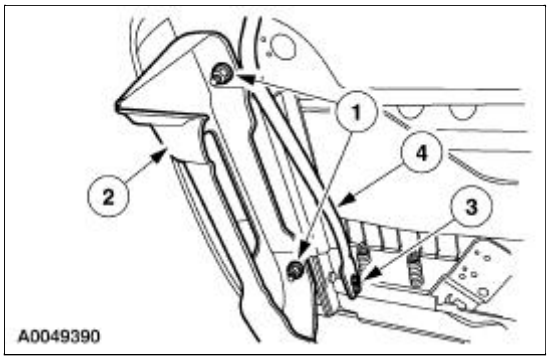


6. **CAUTION: Use care when removing the lumbar knob. Using both hands, pull with even pressure on both sides of the knob to remove.**

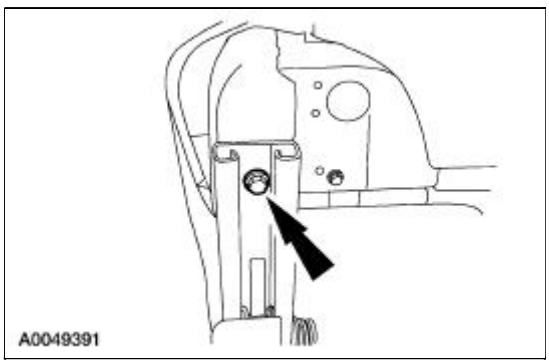
   Remove the lumbar knob.



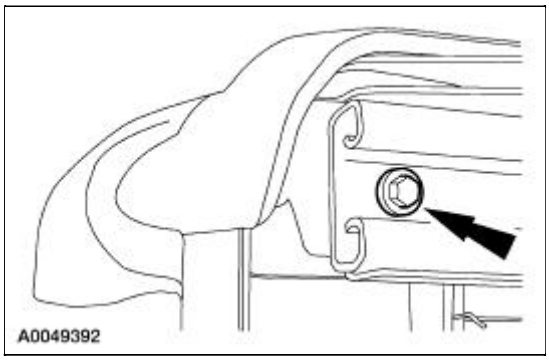
7. Remove the screw from the side shield under lumbar knob.



8. Remove the screw from the front of the side shield.



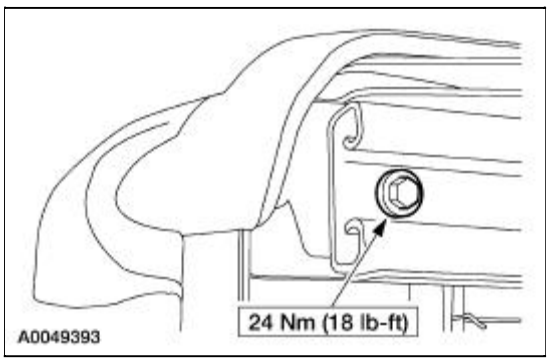
9. Remove the screw from the back of the side shield.



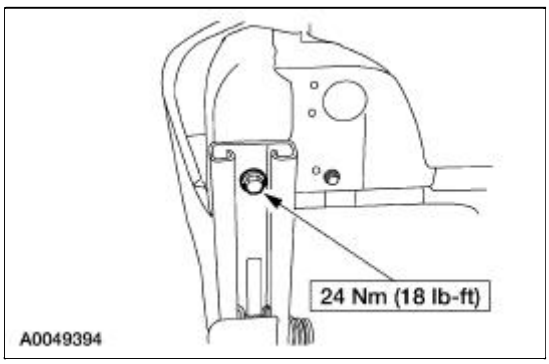
10. Remove the manual seat track riser and adjust handle.
    1. Remove the four seat riser nuts (two shown).
    2. Remove the seat riser.
    3. Remove the four adjust handle bolts (two shown).
    4. Remove the manual seat track handle.

11. Remove the two front manual seat track-to-cushion frame bolts (one shown).

12. Remove the two rear manual seat track-to-cushion frame bolts (one shown).

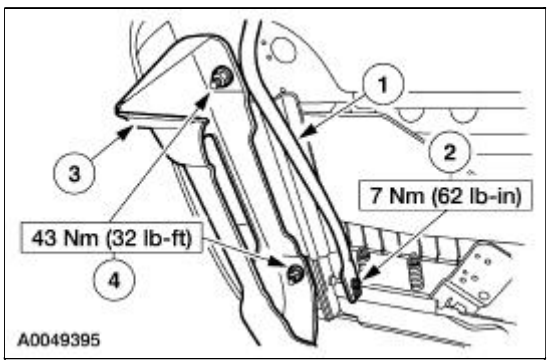


13. Remove the manual seat track.

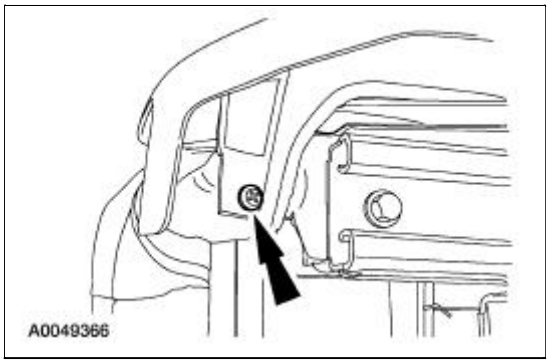


Installation

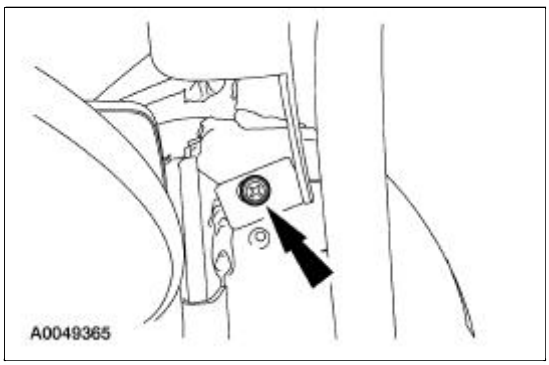
WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.



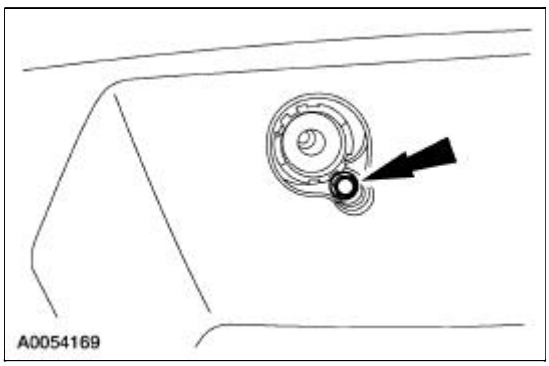
1. Install the manual seat track.
2. Install the two rear manual seat track-to-cushion frame bolts (one shown).



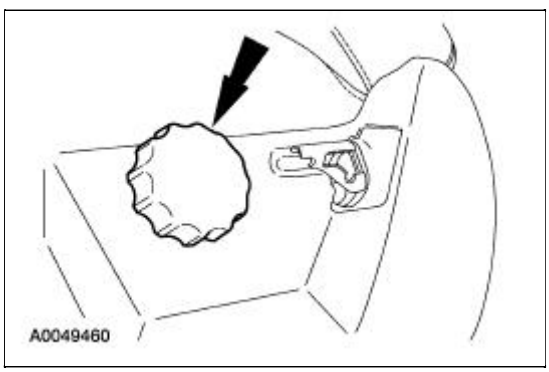
3. Install the two front manual seat track-to-cushion frame bolts (one shown).



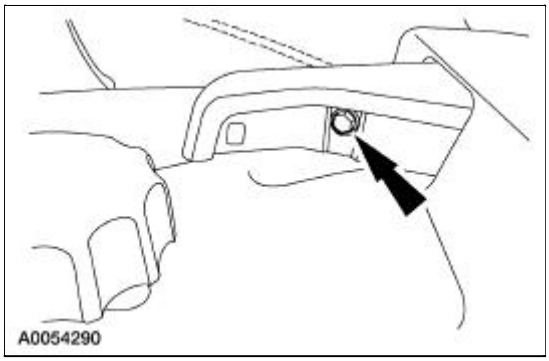
4. Install the seat track riser and adjust handle.
    1. Install the manual seat track adjust handle.
    2. Install the four seat track adjust handle bolts (two shown).
    3. Install the manual seat track risers.
    4. Install the four seat riser to seat track nuts (two shown).



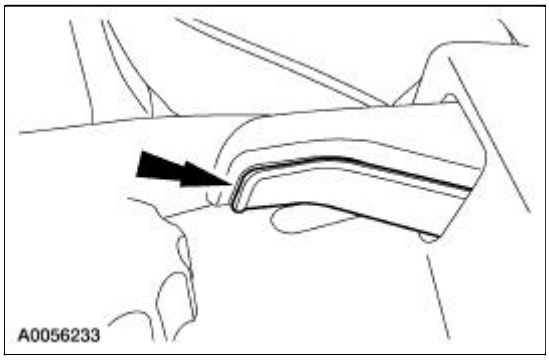
5. Install the screws on the back of the side shield.



6. Install the screw on the front of side shield.



7. Install the screw on side shield.



8. Align and install the lumbar knob.

9. Install recliner handle and install the screw.

10. Install the recliner handle cover.

11. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

    Install the affected seat. For additional information, refer to Front Seat—40 Percent or Front Seat—60 Percent in this section.

12. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .

13. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

Removal

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

All motors

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

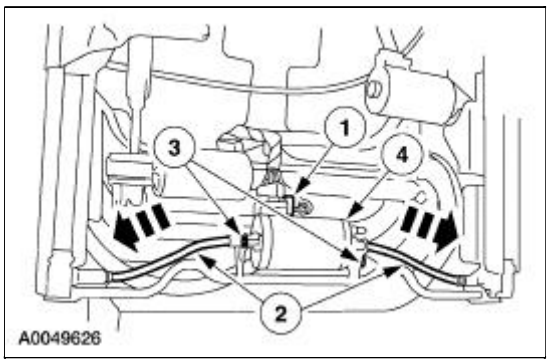
The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.



3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

   Remove the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

Forward/Reverse motor

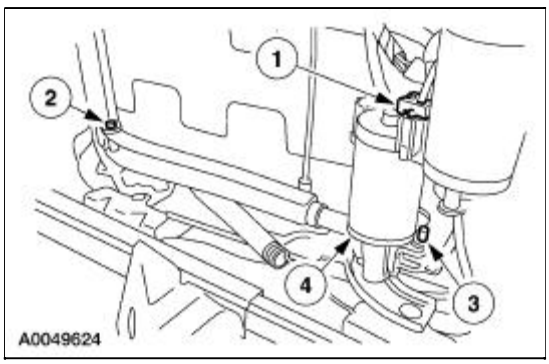
4. **NOTE:** If equipped with memory seat, disconnect the memory seat motor sensor electrical connector and remove sensor from the motor.

   Remove the forward/reverse motor.
   1. Disconnect the electrical connector.
   2. Pull to release the power seat drive cables from the motor.
   3. Remove the four screws (two shown).
   4. Remove the power seat motor.

Rear height motor

5. **NOTE:** If equipped with memory seat, disconnect the memory seat motor sensor electrical connector and remove sensor from the motor.

   Remove the rear height motor.
   1. Disconnect the rear height motor electrical connector.
   2. Remove the roll pin.
   3. Remove the bolt and nut.
   4. Remove the rear height power seat motor.

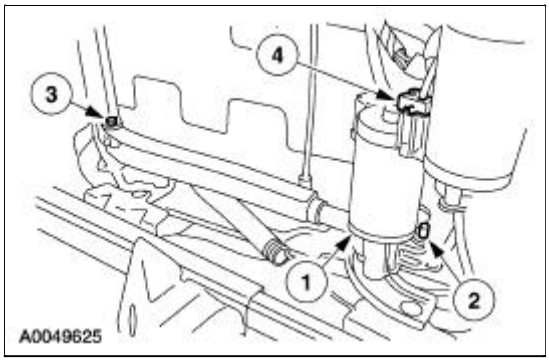


Front height motor

6. If equipped, remove the temperature controlled seat fan motor. For additional information, refer to Seat Fan Motor in this section.

7. **NOTE:** If equipped with memory seat, disconnect the memory seat motor sensor electrical connector and remove sensor from the motor.

   Remove the front height motor.
   1. Disconnect the front height motor electrical connector.
   2. Remove the roll pin.
   3. Remove the roll pin
   4. Remove the front height power seat motor.



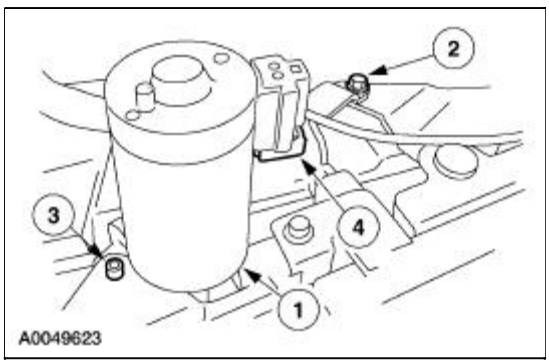
Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

Front height motor

1. **NOTE:** If equipped with memory seat, install the sensor to the motor and connect the memory seat motor sensor electrical connector.

   Install the front height motor.
   1. Install the front height motor.
   2. Install the roll pin.
   3. Install the roll pin.
   4. Connect the front height motor electrical connector.



2. If equipped, install the temperature controlled seat fan motor. For additional information, refer to Seat Fan Motor in this section.

Rear height motor

3. **NOTE:** If equipped with memory seat, install sensor to the motor and connect the memory seat motor sensor electrical connector .

   Install the rear height motor.
   1. Install the rear power seat motor.
   2. Install the bolt and nut.
   3. Install the roll pin.
   4. Connect the rear height motor electrical connector.

Forward/Reverse motor

4. **NOTE:** If equipped with memory seat, install sensor to the motor and connect the memory seat motor sensor electrical connector .

   Install the forward/reverse motor.
   1. Install the forward/reverse power seat motor.
   2. Install the four screws (two shown).
   3. Install the power seat motor cables.
   4. Connect the forward/reverse motor electrical connector.

All motors

5. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

   Install the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

6. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .

7. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

   With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

Front Seat Recliner Motor

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395 (014-R1079)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F088 (105-00012)

Removal

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

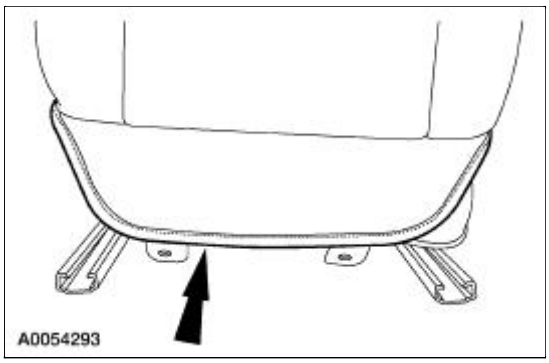
   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the

C-pillars.

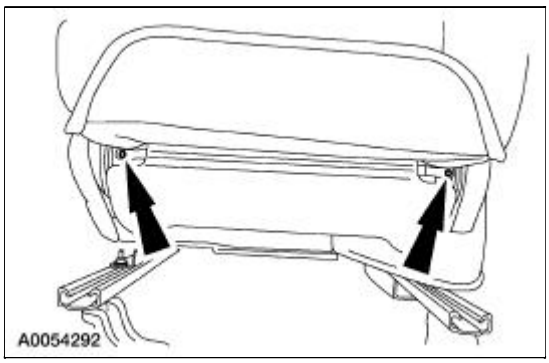
To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .



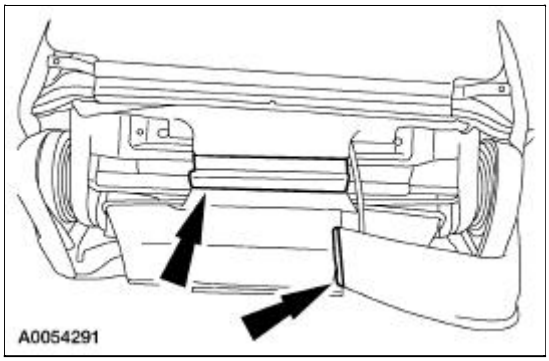
2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

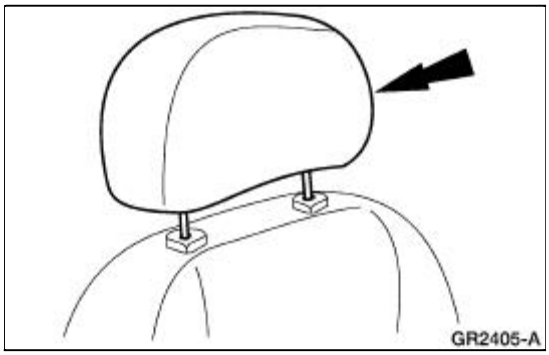


3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

   Remove the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

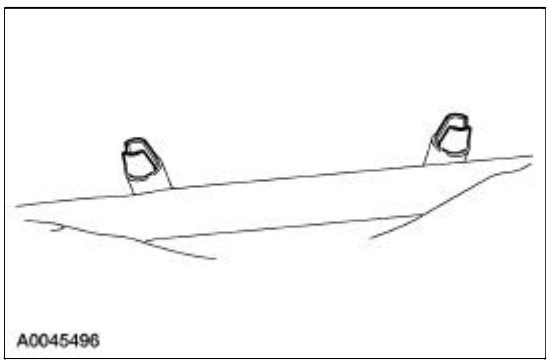


4. Remove lower seat backrest cover.



5. Remove the two screws from support rod.

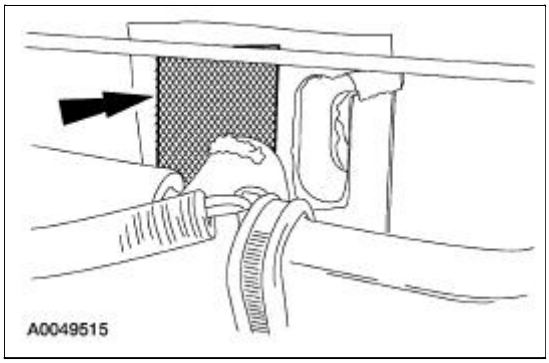
6. Release the one hook-and-loop strip and the one J-clip.



7. Depress tab and remove the head restraint.

8. **NOTE:** The head restraint sleeve pins are not interchangeable. Note location for installation.

   Reach up into seat backrest and squeeze the head restraint sleeve ends together to release the sleeves, and pull the head restraint sleeves out.

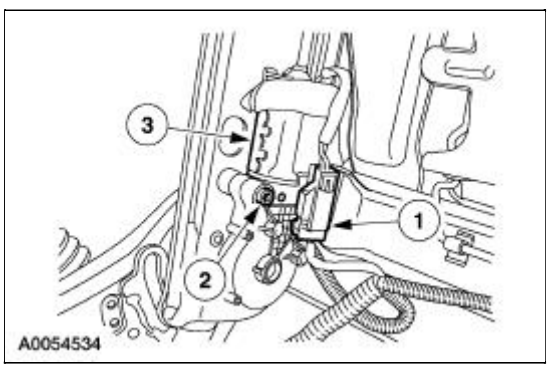


9. **CAUTION: Use care when separating the seat backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat backrest foam.**

   Invert the seat backrest trim cover and remove.

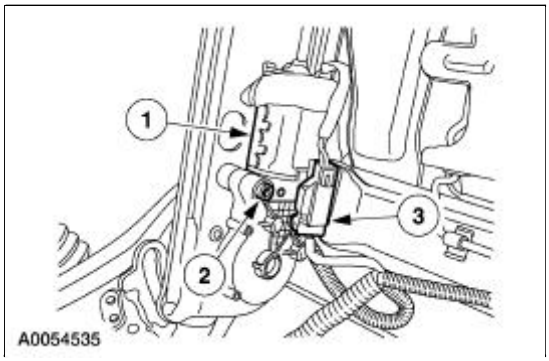
10. **CAUTION: Use care when removing the seat backrest foam pad from the frame. The foam pad has hook and loop fasteners holding the thermo-electric device to the seat backrest foam pad.**

    Remove the seat backrest foam pad from the thermo-electric device and remove the seat backrest foam pad.

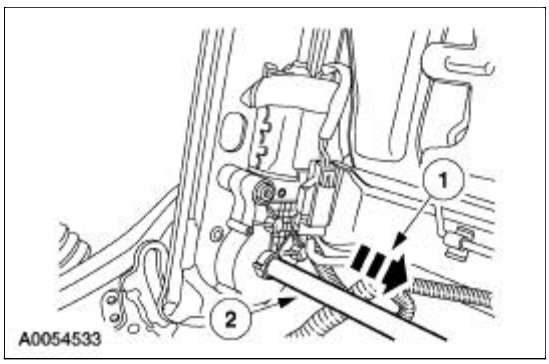


11. Remove the retainer clip on the end of the power recliner motor shaft.

12. Remove the power recliner motor shaft.
    1. Remove the power recliner motor shaft cover.
    2. Slide the power recliner motor shaft out from the power recliner motor.

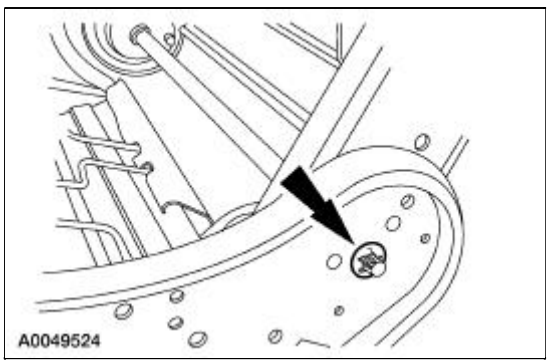


13. Remove the power recliner motor.
    1. Disconnect the power recliner motor electrical connector.
    2. Remove the power recliner motor bolt.
    3. Remove the power recliner motor.

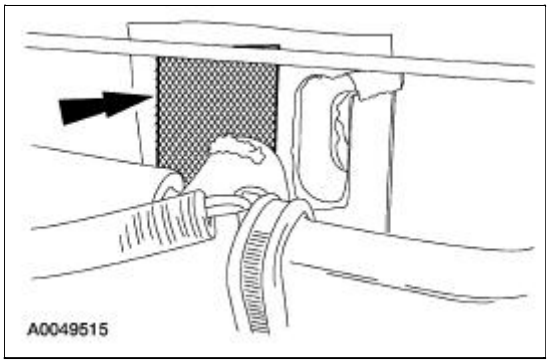


Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

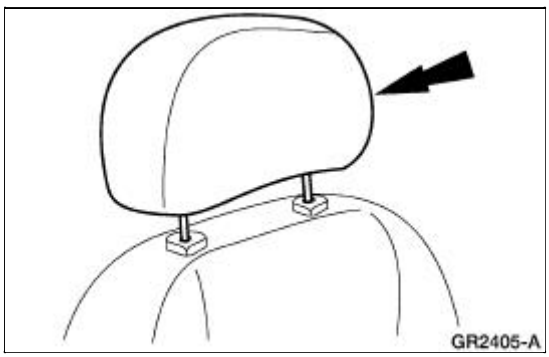


1. Install the power recliner motor.
    1. Install the power recliner motor.
    2. Install the power recliner motor bolt.
    3. Connect the power recliner motor electrical connector.

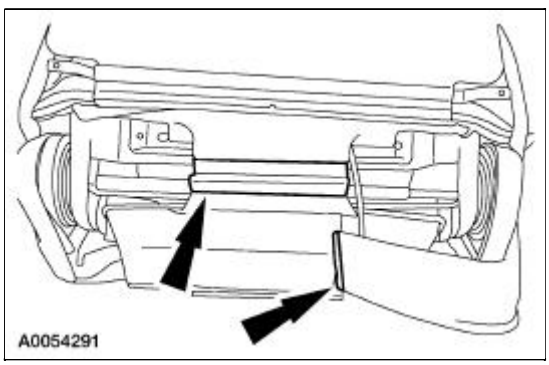


2. Install the power recliner shaft.
    1. Slide the power recliner shaft into the motor and through the seat.
    2. Install the power recliner shaft cover.

3. Install the retainer clip onto the end of the power recliner shaft.

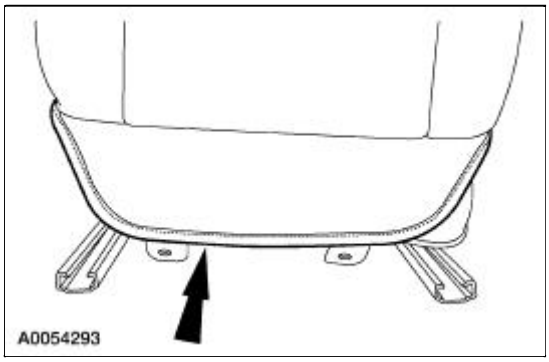


4. Install the seat backrest foam pad and attach the seat backrest thermo-electric device to the foam pad



5. Install the seat backrest trim cover and attach the hook-and-loop fasteners.
6. **NOTE:** The head restraint sleeve pins are not interchangeable.

   Install the head restraint sleeves.
7. Install the head restraint.



8. Connect the one hook-and-loop strip and the one J-clip.

9. Install the two screws in support rod.

10. Install the lower backrest cover.

11. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

    Install the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

12. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .

13. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

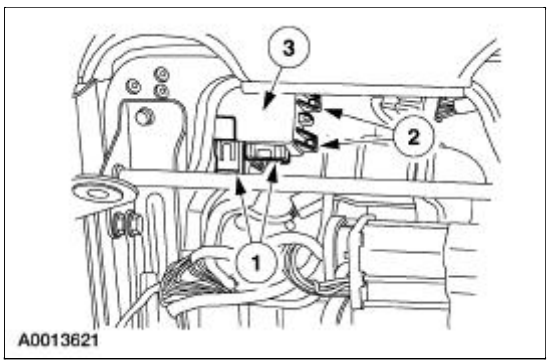
WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The side impact sensors (if equipped) are located at or near the base of the B-pillars and C-pillars.

   To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .

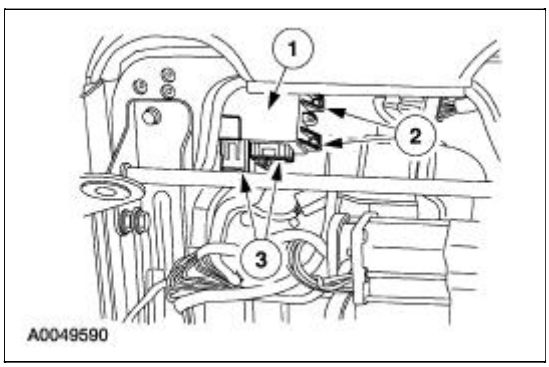


2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

   Remove the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.



4. Remove the temperature controlled seat module.
   1. Disconnect the temperature controlled seat module electrical connectors.
   2. Remove the screws.
   3. Remove the temperature controlled seat module.

Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

1. Install the temperature controlled seat module.
   1. Install the temperature controlled seat module.
   2. Install the screws.
   3. Connect the temperature controlled seat module electrical connectors.

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

   Install the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .

4. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

   With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

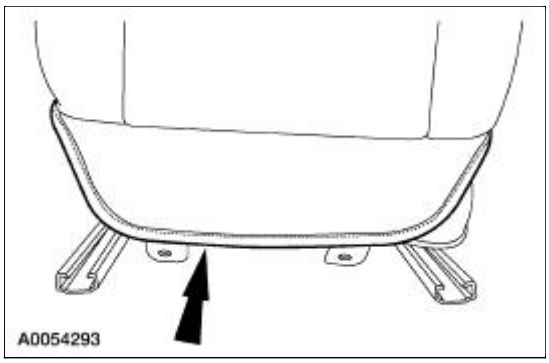
   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the

C-pillars.

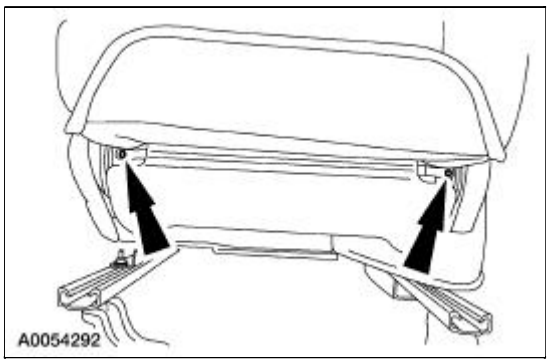
To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .



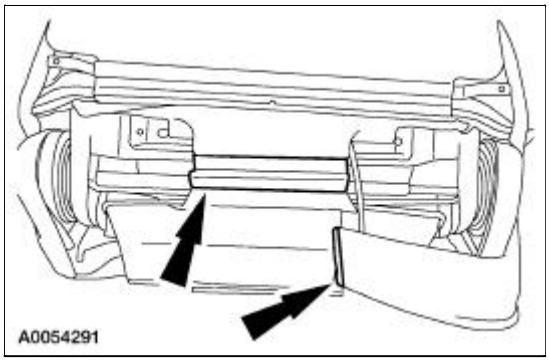
2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

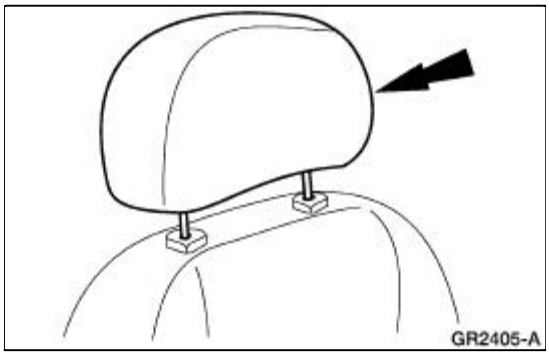


3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

   Remove the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

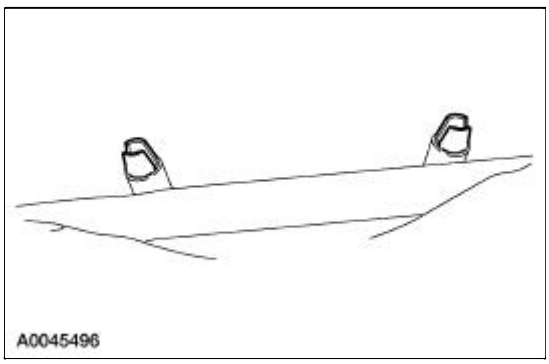


4. Remove lower seat backrest cover.



5. Remove the two screws from support rod.

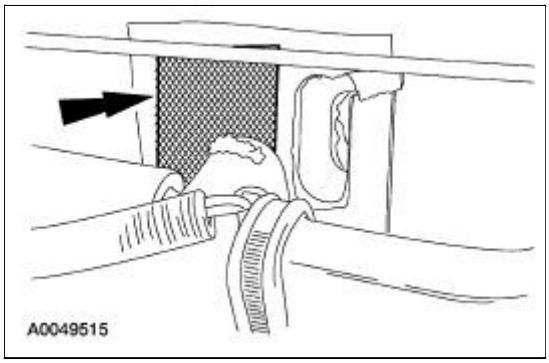
6. Release the one hook-and-loop strip and the one J-clip.



7. Depress tab and remove the head restraint.

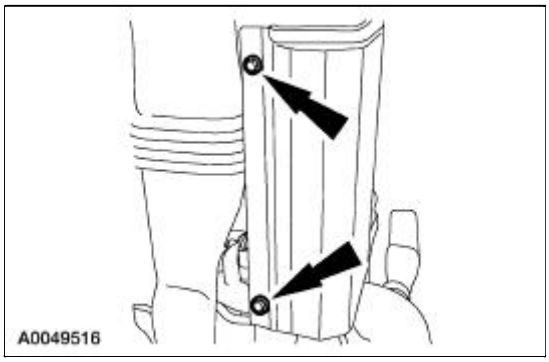
8. **NOTE:** The head restraint sleeve pins are not interchangeable. Note location for installation.

   Reach up into seat backrest and squeeze the head restraint sleeve ends together to release the sleeves and pull the head restraint sleeves out.



9. **CAUTION: Use care when separating the seat backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat backrest foam.**

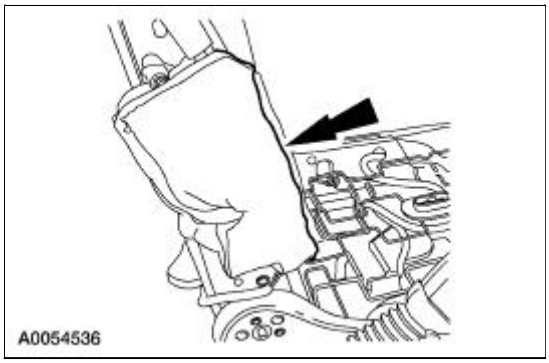
   Invert the seat backrest trim cover and remove.



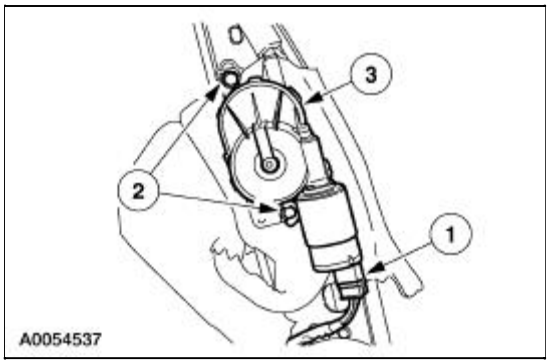
10. **CAUTION: Use care when removing the seat backrest foam pad from the frame. The foam pad has hook-and-loop fasteners holding the thermo-electric device to the seat backrest foam pad.**

    NOTE:

    Remove the seat backrest foam pad from the thermo-electric device (TED) and remove the seat backrest foam pad.

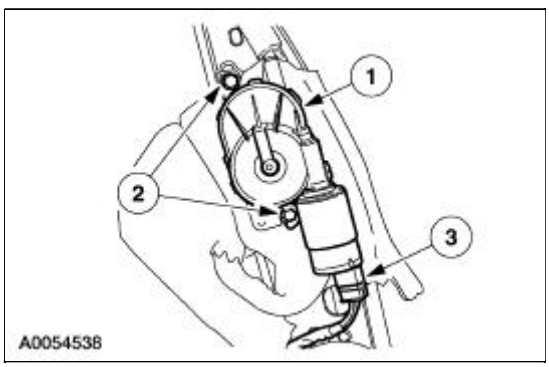


11. Remove the screws from the lumbar motor support cover and remove support cover (two shown).

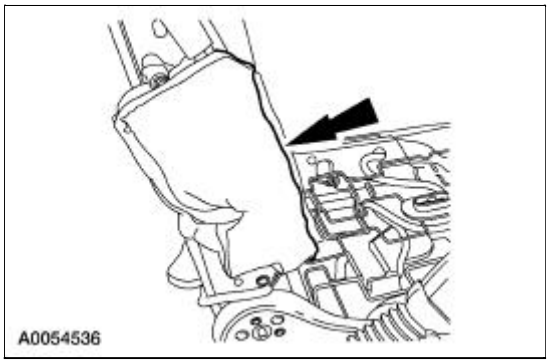


12. Remove the lumbar motor cable from the lumbar support.
    1. Flex the lumbar support.
    2. Separate the lumbar support adjusting cable from the positioning spring.
    3. Unhook the lumbar support adjusting cable from the lumbar support.

13. Remove the staples and open dampening bag.

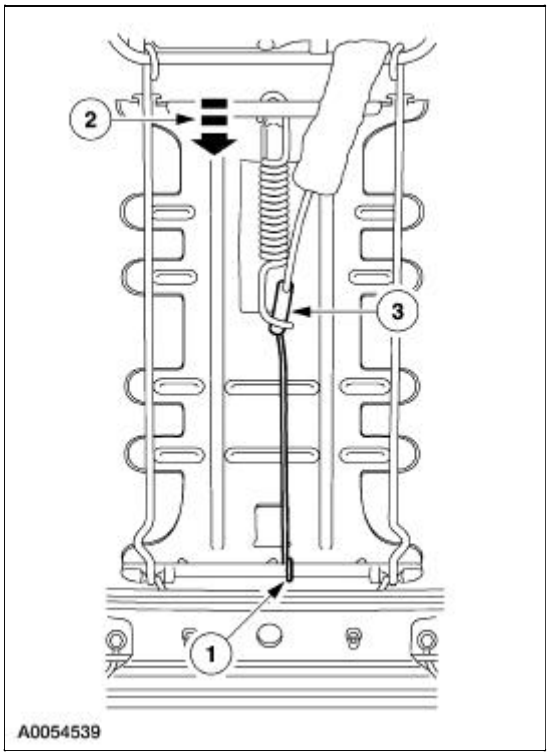


14. Remove the power lumbar support motor.
    1. Disconnect the power lumbar motor electrical connector.
    2. Remove the screws.
    3. Remove the power lumbar support motor.

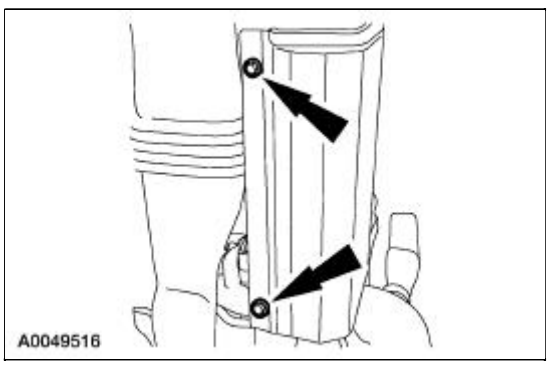


Installation

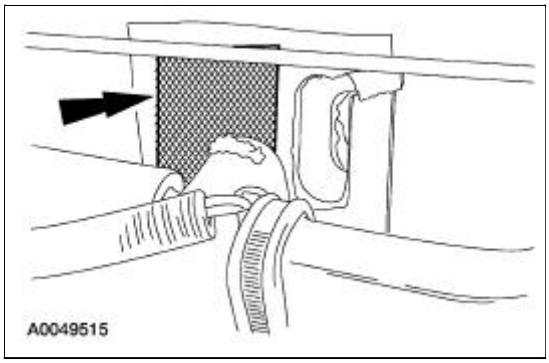
WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.



1. Install the power lumbar support motor.
    1. Install the dampening bag and install the power lumbar support motor.
    2. Install the screws.
    3. Connect the power lumbar electrical connector.

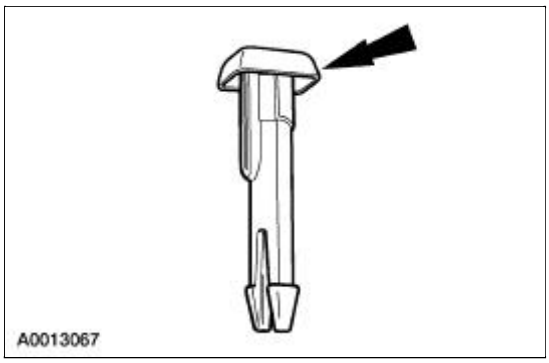


2. Close the dampening bag and staple.

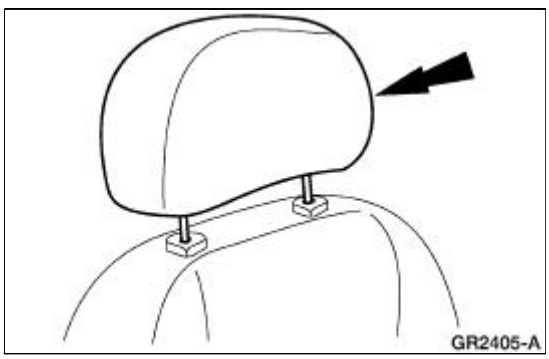


3. Install the lumbar motor cable to the lumbar support.
    1. Hook the lumbar support adjusting cable to the lumbar support.
    2. Flex the lumbar support.
    3. Install the lumbar support adjusting cable to the positioning spring.

4. Install the lumbar motor support cover and install the screws for the support cover (two shown).

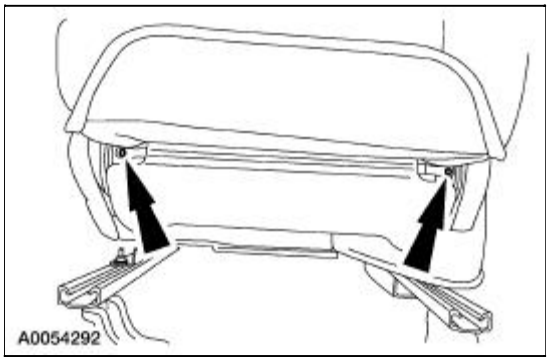


5. Install the seat backrest foam pad and attach the seat backrest TED to the foam pad.

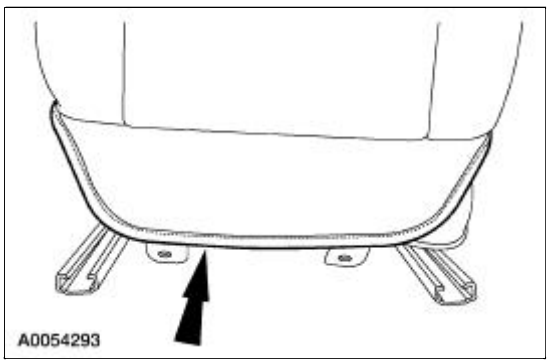


6. Install the seat backrest trim cover and attach the hook-and-loop fasteners to the foam pad.
7. **NOTE:** The head restraint sleeve pins are not interchangeable.

   Install the head restraint sleeves.



8. Install the head restraint.



9. Connect the one hook-and-loop strip and the one J-clip.

10. Install the two screws in the support rod.

11. Install the lower backrest cover.

12. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

    Install the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

13. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .

14. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

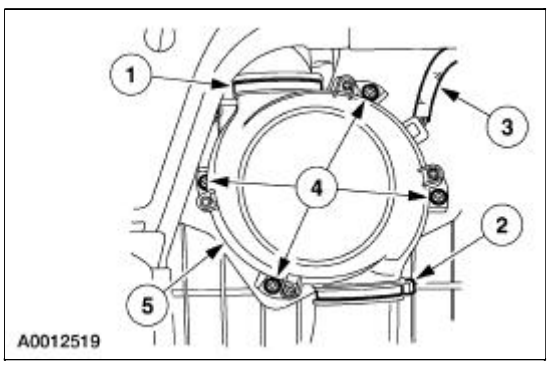
   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the

C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .

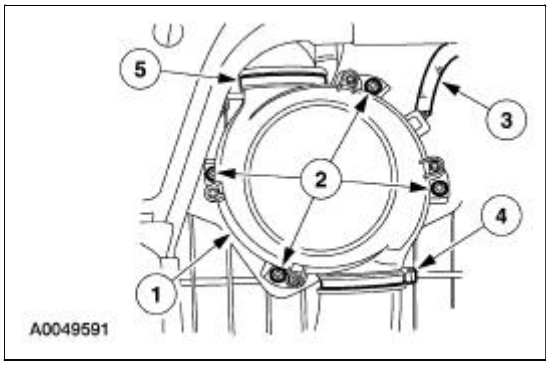


2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

   Remove the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.



4. Remove the seat fan motor.
   1. Cut the zip-tie and separate the duct from the seat fan motor.
   2. Cut the zip-tie and separate the duct from the seat fan motor.
   3. Disconnect the seat fan motor wire harness electrical connector.
   4. Remove the screws.
   5. Remove the fan motor.

Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

1. Install the seat fan motor.
   1. Install the seat fan motor.
   2. Install the screws.
   3. Connect the seat fan motor wire harness electrical connector.
   4. Install the duct to seat fan motor and install zip-tie.
   5. Install the duct to seat fan motor and install zip-tie.

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

   Install the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .

4. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

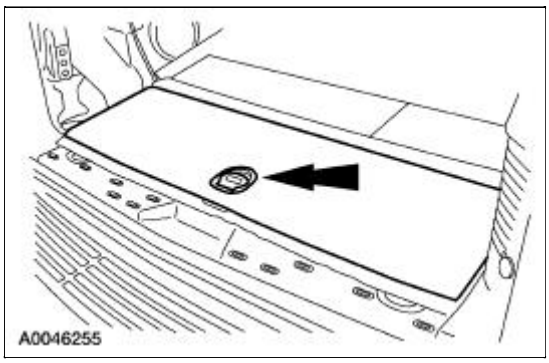
   With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

Power-Fold Seat Motor

Removal

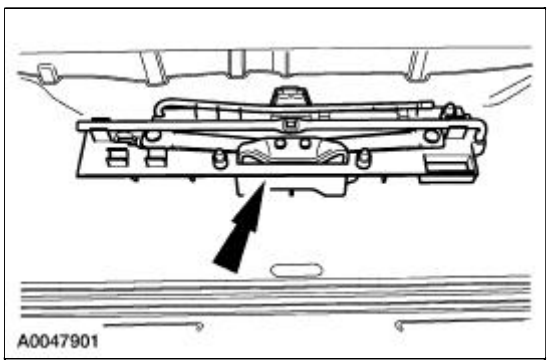
CAUTION: To prevent possible damage to the third row seat or the safety belts, make sure that the safety belts are not fastened when moving the seat to the load floor position.

CAUTION: Make sure that no objects such as books, purses or briefcases are on the floor in front of the third row seats or on the seat cushion before lowering the backrest(s).



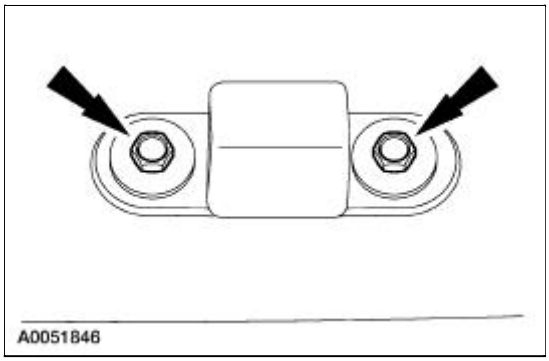
NOTE: The third row seat backrests need to be in the raised position for removal of the third row seats.

NOTE: Their are two service kits available for the third row power-fold seat motor. One kit contains one motor, one drive cable, two bushings and two attachment nuts and bolts. The other kit contains one drive cable, two bushings and two attachment nuts and bolts.

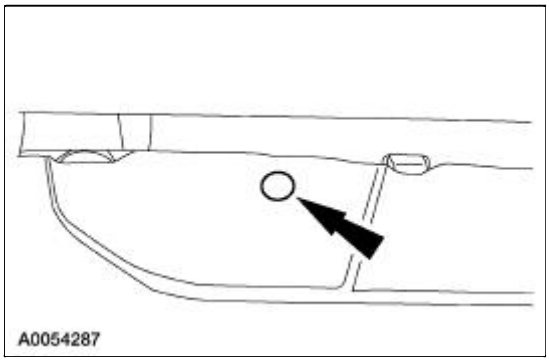


NOTE: 60 percent seat shown, 40 percent similar.

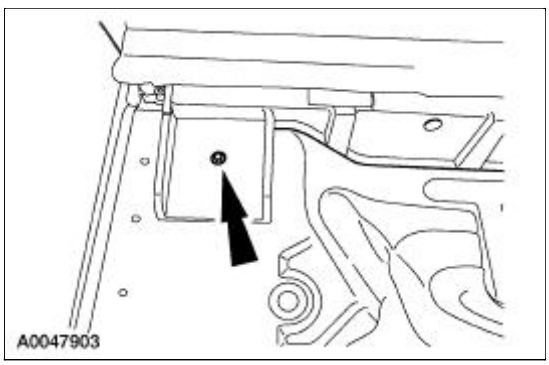
All vehicles



1. Remove the rear load floor panel.

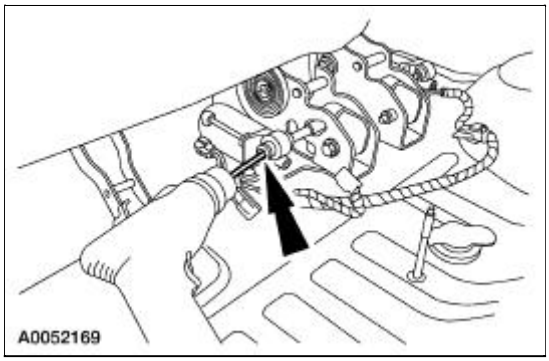


2. Remove the jack assembly.



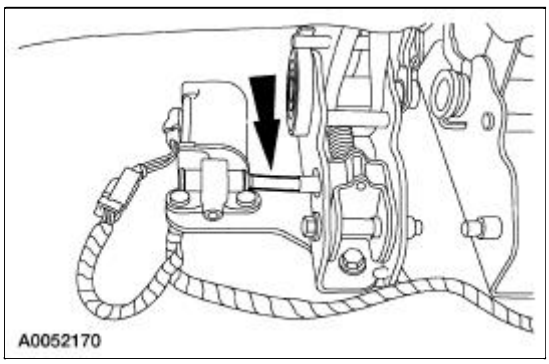
3. Remove the load floor panel latch striker bolts and latch.

4. Remove the three pin-type retainers (one shown) and the jack storage compartment liner.



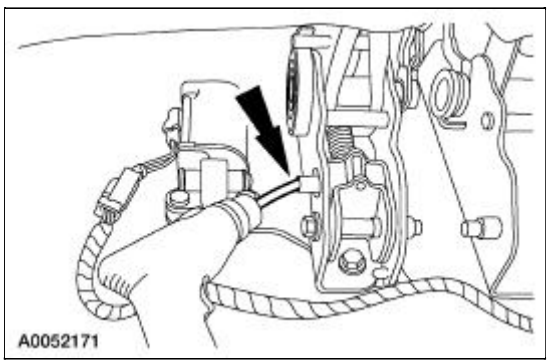
5. Remove the two bolts in mid-floor support (one shown).

6. Lift on the front of the mid-floor panel support to release the three retainer clips and remove the support panel.



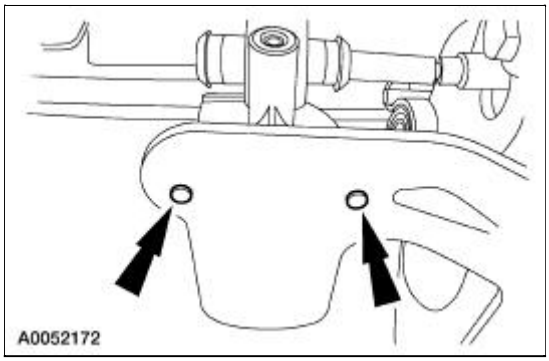
Vehicles with inoperative motor, backrest in down position

7. Using the drive cable supplied in the service kit, install the drive cable into a suitable tool and insert in the outboard side of the third row power seat motor. Raise the seat backrest.



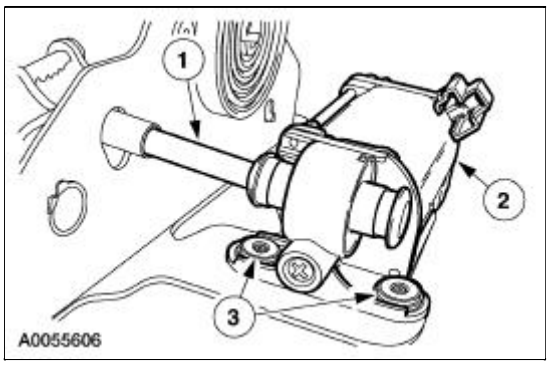
Vehicles with inoperative motor, backrest in down position and motor seized or drive cable damaged

8. Cut the power seat drive cable and discard the cut cable.



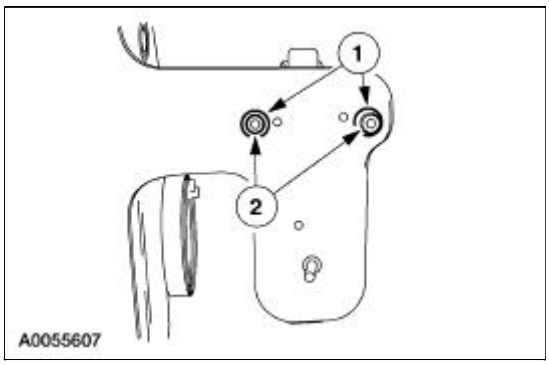
9. Using the drive cable supplied in the service kit, install the drive cable into a suitable tool and insert into the drive gear assembly. Raise the seat backrest.

All vehicles



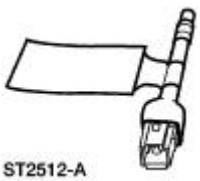
10. Remove the affected third row seat. For additional information, refer to Rear Seat—Third Row in this section.

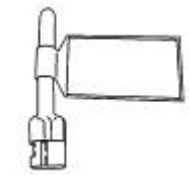
11. Turn the affected seat over to expose the rivets on the bottom of the seat. Grind off the bottom of the rivets, or drill and punch out the rivets. Remove the power-fold seat motor.

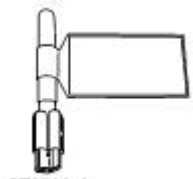


Installation

1. Install the power fold motor.
    1. Align and install the drive cable and sleeve.
    2. Align and install the power fold motor.
    3. Install the sleeved nuts.







2. Install the power fold motor bolts.
    1. Install the two washers on the two bolts.
    2. Install the bolts and tighten.

3. Install the affected third row seat. For additional information, refer to Rear Seat—Third Row in this section.

Front Seat Cushion —40 Percent

Special Tool(s)

 ST2512-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F403

 ST2506-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F088 (105-00012)

Disassembly

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

All vehicles

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

   Remove the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

4. Remove the side shield. For additional information, refer to Seat Control Switch—8-Way or Seat Control Switch—6-Way in this section.

5. Release the J-clips on the pivot covers (inboard shown, outboard similar).

6. Release the J-clips (six shown).

7. **CAUTION: Use care when separating the seat cushion trim cover from the hook-**

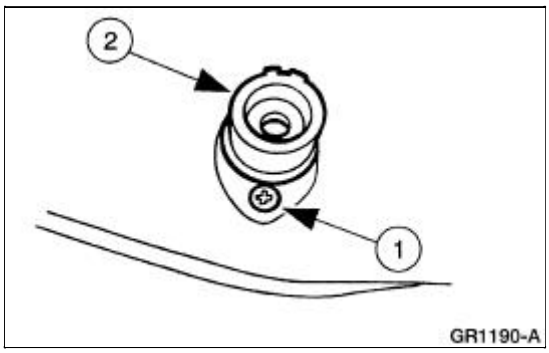
and-loop strip, or the hook-and-loop strip can be torn from the seat cushion.

Remove the seat cushion cover.

8. Remove the seat cushion foam pad.

Vehicles with power seats

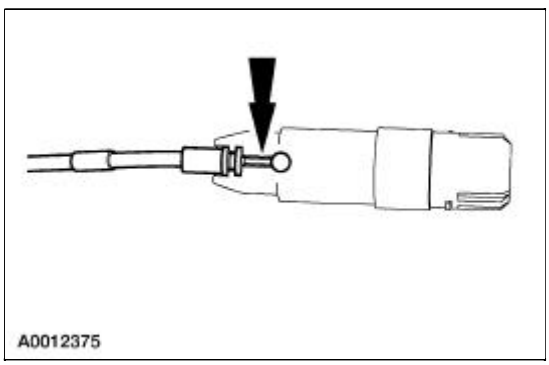
9. Remove the power seat motors. For additional information, refer to Front Seat Track Motor in this section.



10. Remove the power seat tracks. For additional information, refer to Seat Track—Power in this section.

Vehicles with manual seat

11. Remove the manual seat track. For additional information, refer to Seat Track—Manual in this section.

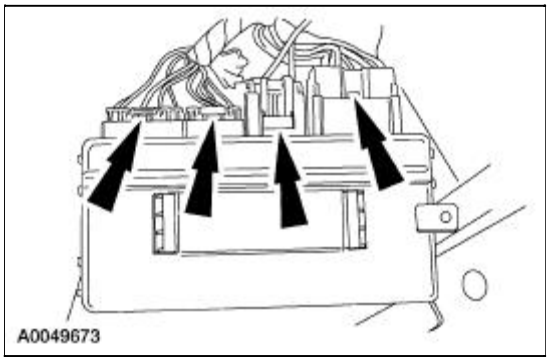


Vehicles with manual lumbar

12. Remove the front seat back lumbar adjuster.
    1. Remove the two screws.
    2. Remove the front seat back lumbar adjuster.

13. **NOTE:** The lumbar support assembly must be fully relaxed.

    Separate the lumbar support adjuster from the adjuster cable.



Vehicles with memory seats

14. Slide the memory seat module from the seat frame bracket.

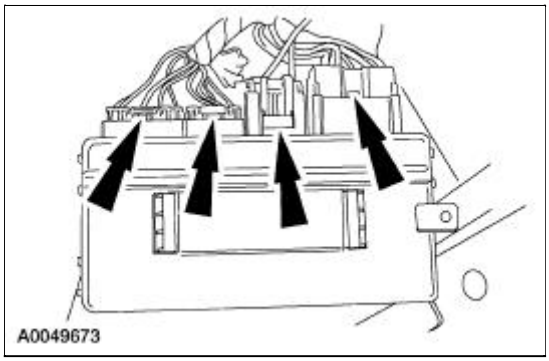
15. Disconnect the memory seat module electrical connectors and remove the memory seat

module.

Vehicles with climate controlled seats

16. Remove the seat fan motor. For additional information, refer to Seat Fan Motor in this section.
17. Remove the climate controlled seat module. For additional information, refer to Climate Controlled Seat Module in this section.
18. Remove the seat cushion thermo-electric device. For additional information, refer to Seat Cushion Thermo-Electric Device in this section.
19. Remove the climate controlled seat cushion ducts.
20. Unclip and remove the TED mounting bezel

Assembly

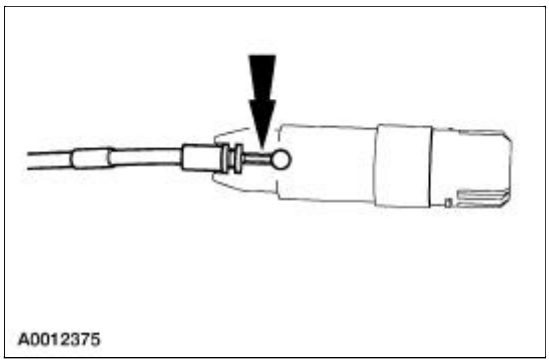


WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

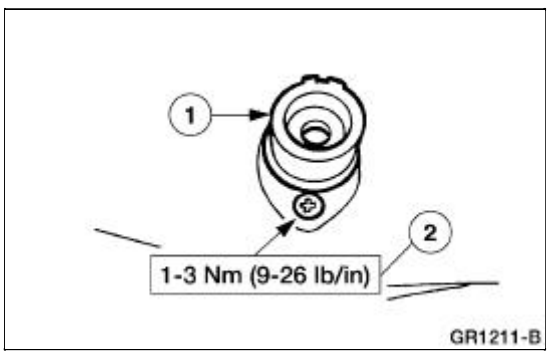
Vehicles with climate controlled seats

1. Clip the TED mounting bezel to the seat cushion support.
2. Install the climate controlled seat cushion ducts.
3. Install the seat cushion thermo-electric device. For additional information, refer to Seat Cushion Thermo-Electric Device in this section.
4. Install the climate controlled seat module. For additional information, refer to Climate Controlled Seat Module in this section.
5. Install the seat fan motor. For additional information, refer to Seat Fan Motor in this section.

Vehicles with memory seats



6. Connect the memory seat module electrical connectors and install the memory seat module.



7. Slide the memory seat module onto the seat frame bracket.

Vehicles with manual lumbar

8. Connect the lumbar support adjuster from the adjuster cable.

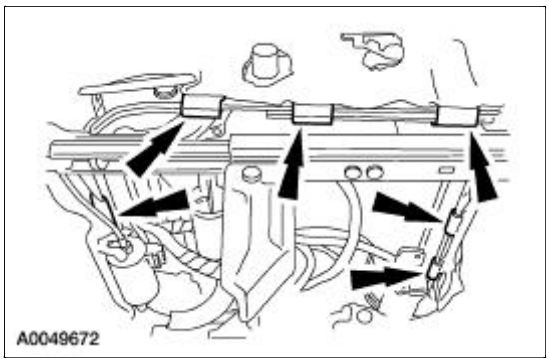
9. Install the front seat back lumbar adjuster.
    1. Install the front seat back lumbar adjuster.
    2. Install the two screws.

Vehicles with manual seat

10. Install the manual seat track. For additional information, refer to Seat Track—Manual in this section.

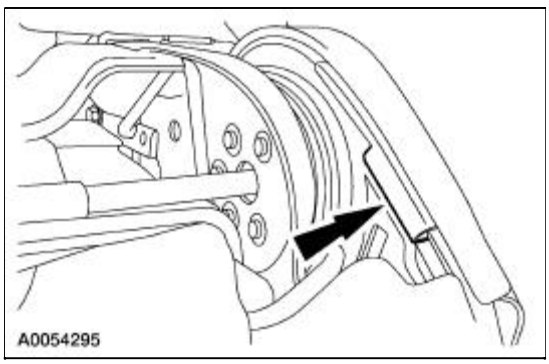
Vehicles with power seats

11. Install the power seat tracks. For additional information, refer to Seat Track—Power in this section.



12. Install the power seat motors. For additional information, refer to Front Seat Track Motor in this section.

All vehicles



13. Install the seat cushion foam pad.

14. Install the seat cushion cover.

15. Attach the J-clips (six shown).

16. Install the J-clips on the pivot covers (inboard shown, outboard similar).

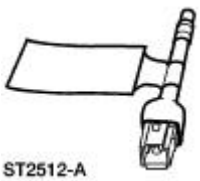
17. Install the side shield. For additional information, refer to Seat Control Switch—8-Way or Seat Control Switch—6-Way in this section.

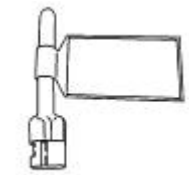
18. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

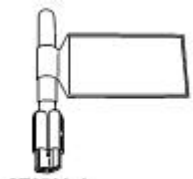
    Install the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

19. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .







20. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint

system (SRS). For additional information, refer to Section 501-20B .

Disassembly

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

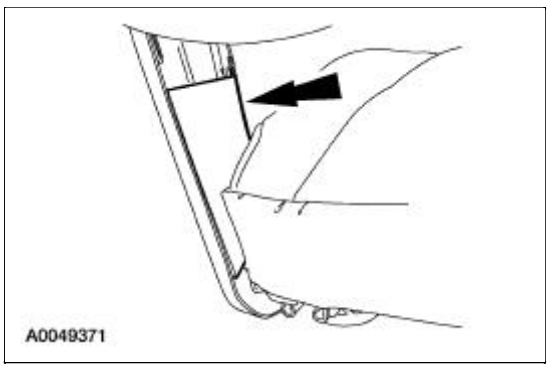
   The second row side impact sensors (if equipped) are located at or near the base of the

C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

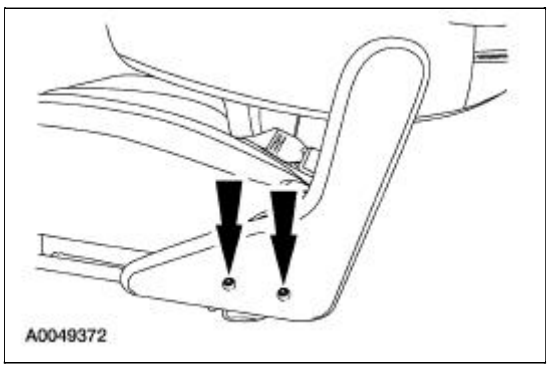
NOTE: Before disconnecting the battery in vehicles with power seats, adjust the seat position to allow for access to the necessary components.

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .



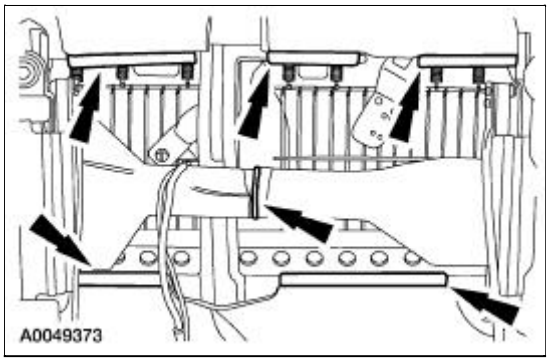
2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

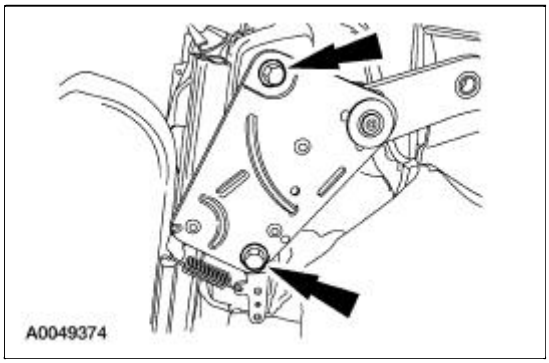


3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

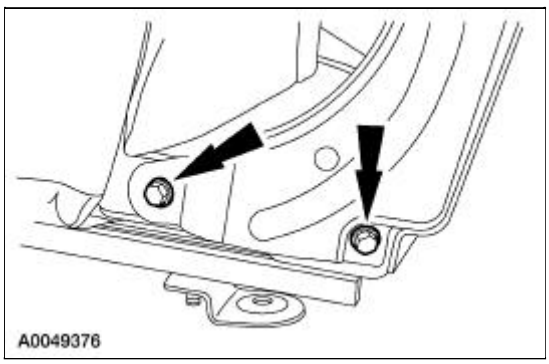
   Remove the 60 percent seat backrest. For additional information, refer to Front Seat Backrest—60 Percent in this section.



4. Remove the inner side shield.

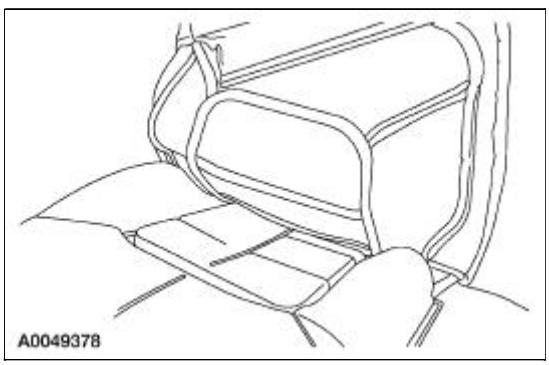


5. Remove the two side shield screws.

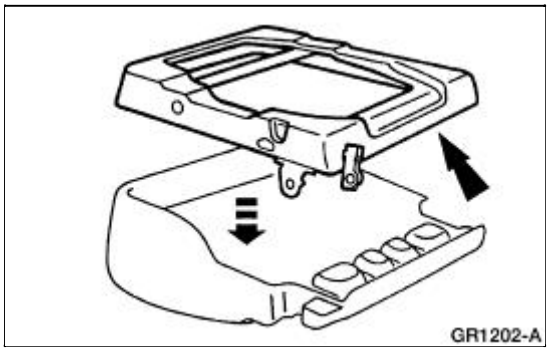


6. Release the front seat cushion cover J-clips.

7. Remove the two recliner bolts.



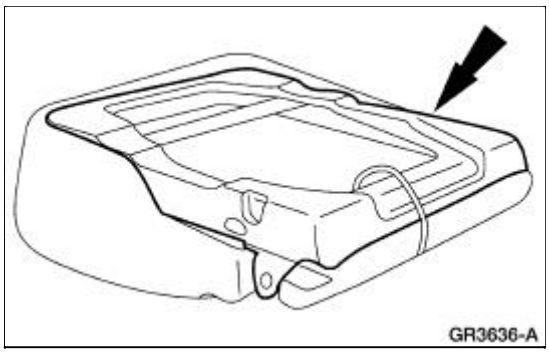
8. Remove the bolts.



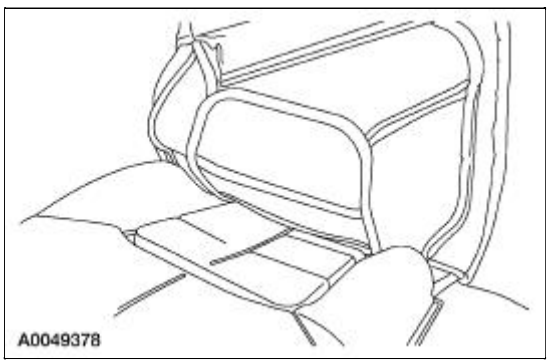
9. Remove the seat track. For additional information, refer to Seat Track—Manual in this section.

10. **CAUTION: Use care when separating the seat cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat cushion foam.**

    Invert the seat cushion cover and remove from the cushion foam pad.

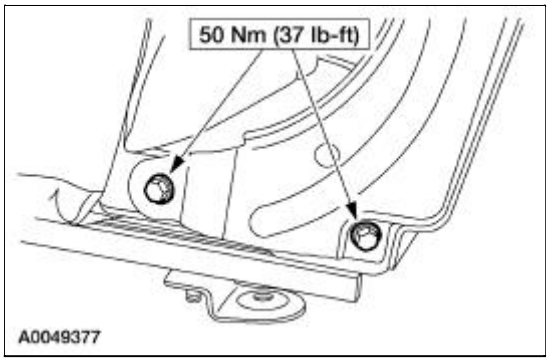


11. Remove the front seat cushion foam pad from the front seat cushion frame.

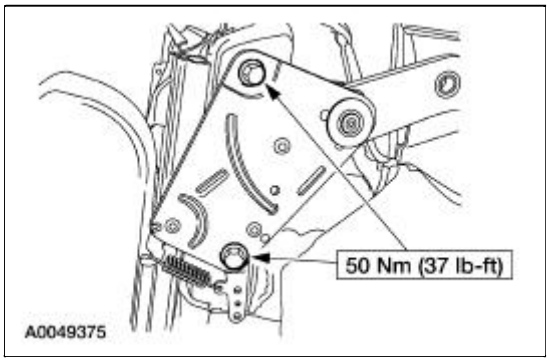


Assembly

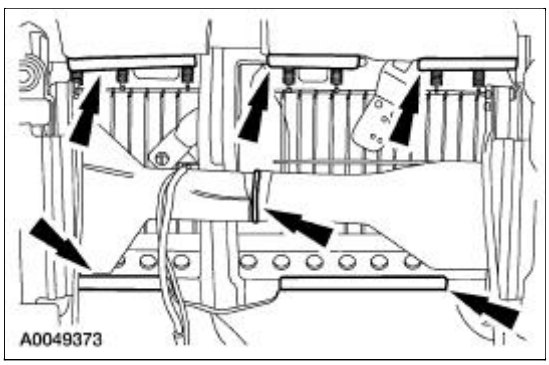
WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.



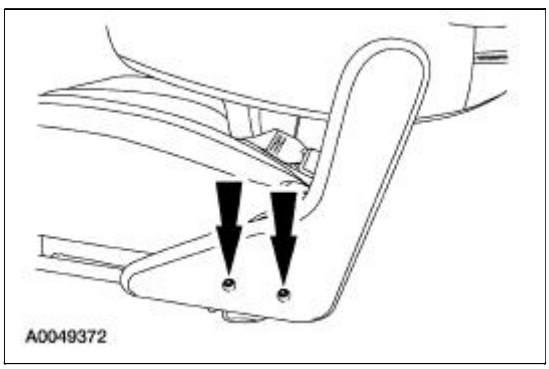
1. Insert the front seat cushion foam pad into the front seat cushion frame.



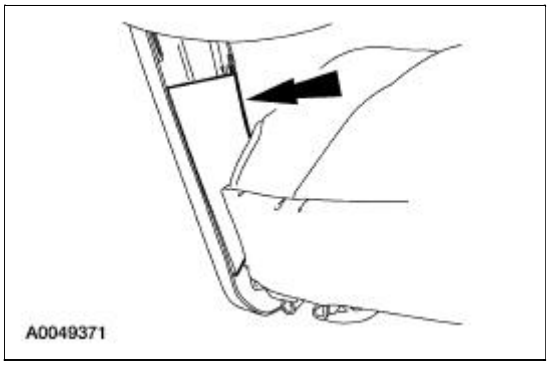
2. Install the seat cushion cover on the seat cushion foam pad.



3. Install the seat track. For additional information, refer to Seat Track—Manual in this section.
4. Install the bolts.



5. Install the recliner bolts.



6. Fasten the seat cushion cover J-clips.

7. Install the two screws in the side shield.

8. Install the inner side shield.

9. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

   Install the 60 percent seat backrest. for additional information, refer to Front Seat Backrest—60 Percent in this section.

10. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .

11. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

All vehicles

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

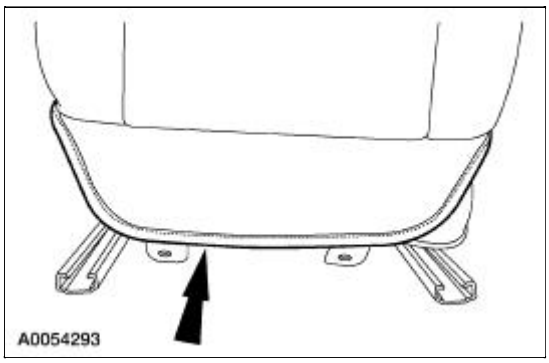
   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

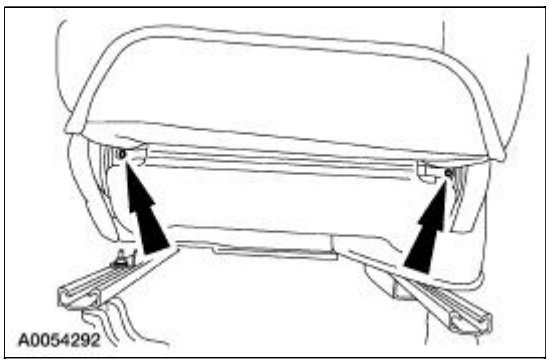
To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .



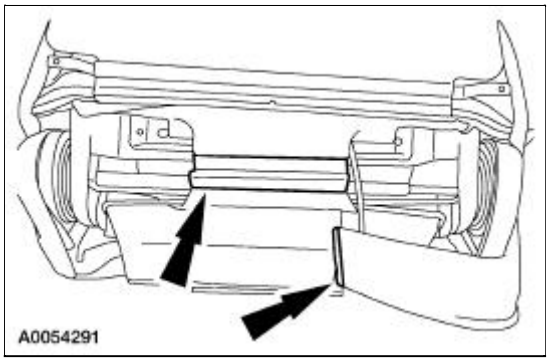
2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

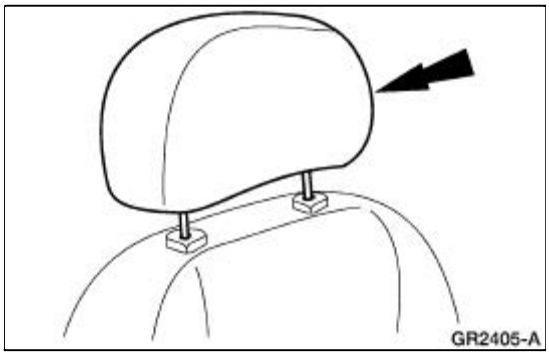


3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

   Remove the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

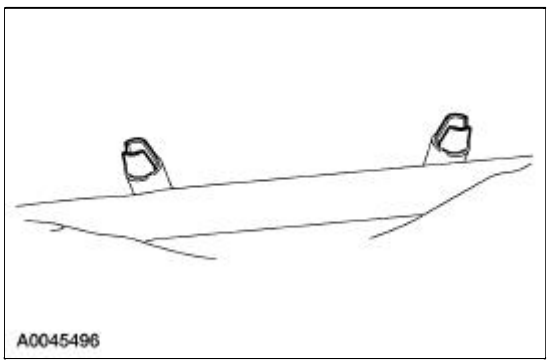


4. Remove lower seat backrest cover.



5. Remove the two screws from the support rod.

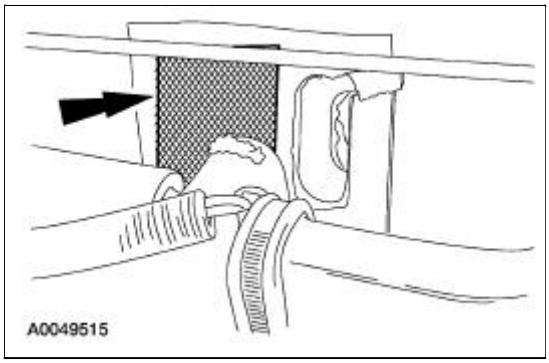
6. Release the one hook-and-loop strip and the one J-clip.



7. Depress tab and remove the head restraint.

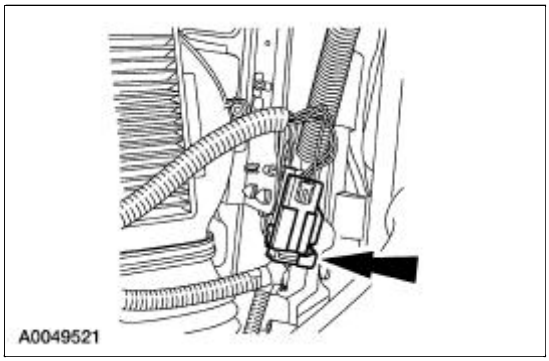
8. **NOTE:** The head restraint sleeve pins are not interchangeable. Note location for installation.

   Reach up into seat backrest and squeeze the head restraint sleeve ends together to release the sleeves and pull the head restraint sleeves out.



9. **CAUTION: Use care when separating the seat backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat backrest foam.**

   Invert the seat backrest trim cover and remove.

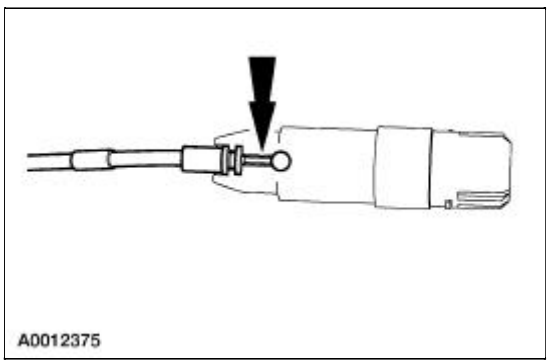


Vehicles with temperature controlled seats

10. **CAUTION: Use care when removing the seat backrest foam pad from the frame. The foam pad has hook and loop fasteners holding the thermo-electric device (TED) to the seat backrest foam pad.**

    Remove the seat backrest foam pad from the thermo-electric device (TED).

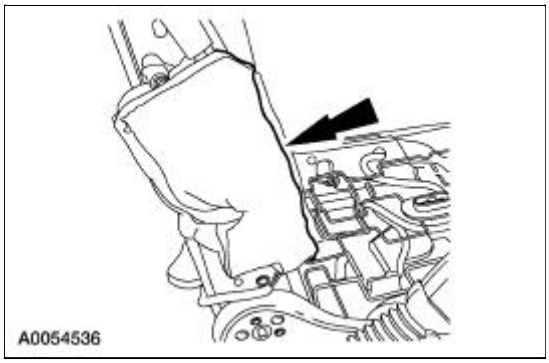
11. Disconnect the seat backrest TED electrical connector.



All vehicles

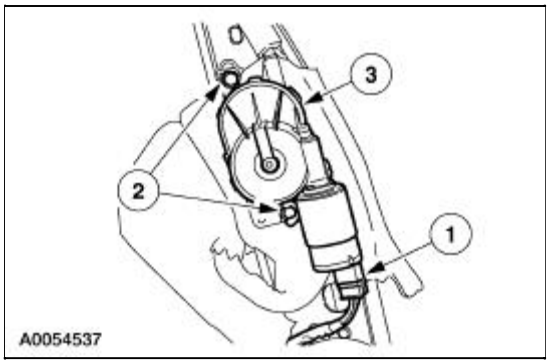
12. Remove the seat backrest foam pad from the frame.

Vehicles with manual lumbar



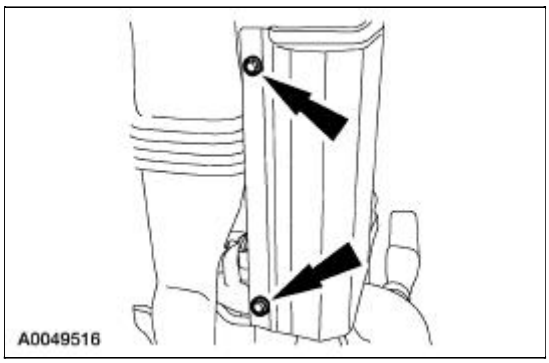
13. **NOTE:** The lumbar support assembly must be fully relaxed.

    Separate the adjuster cable from the lumbar support adjuster.

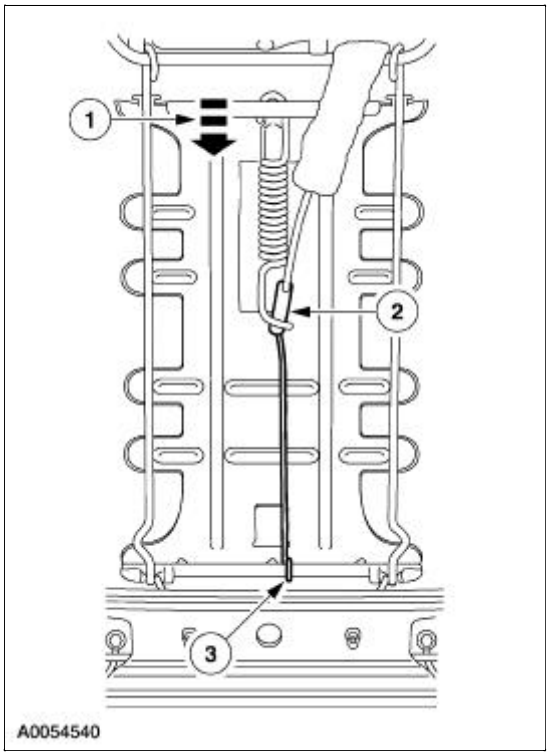


Vehicles with power lumbar

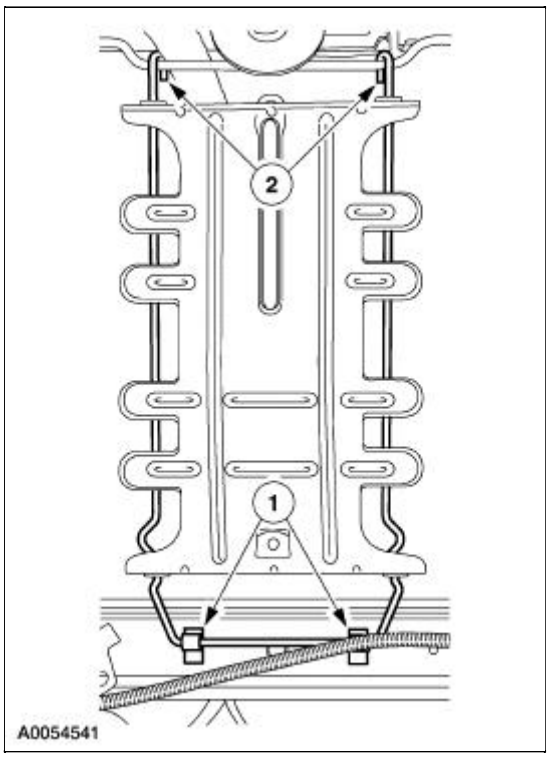
14. Remove the staples and open dampening bag.



15. Remove the power lumbar support motor.
    1. Disconnect the power lumbar motor electrical connector.
    2. Remove the screws.
    3. Remove the power lumbar support motor.

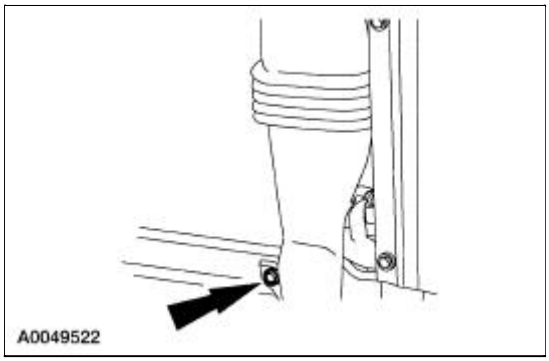


All vehicles

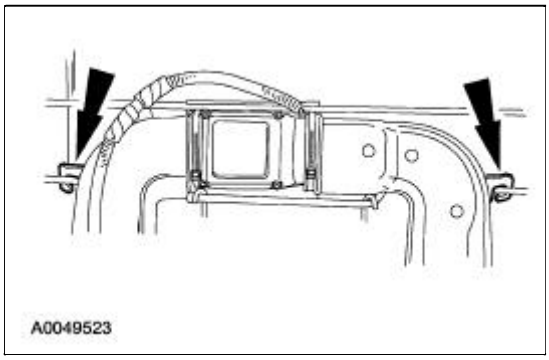


16. Remove the screws from the two support covers (one side shown) and remove support covers (two shown).

17. Remove the lumbar motor cable from the lumbar support.
    1. Flex the lumbar support.
    2. Separate the lumbar support adjusting cable from the positioning spring.
    3. Unhook the lumbar support adjusting cable from the lumbar support.

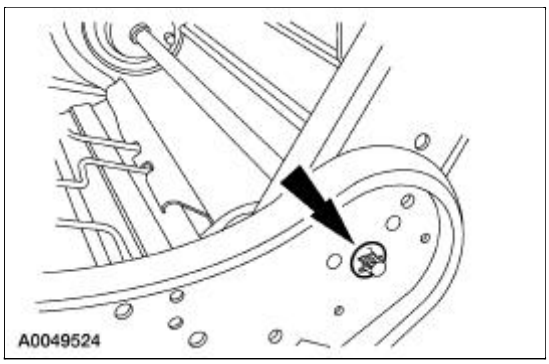


18. Remove the lumbar support.
    1. Remove the pin-type retainers.
    2. Unhook the upper lumbar support bracket.

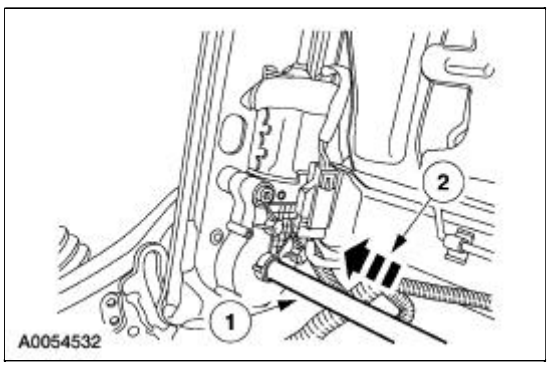


Vehicles with temperature controlled seats

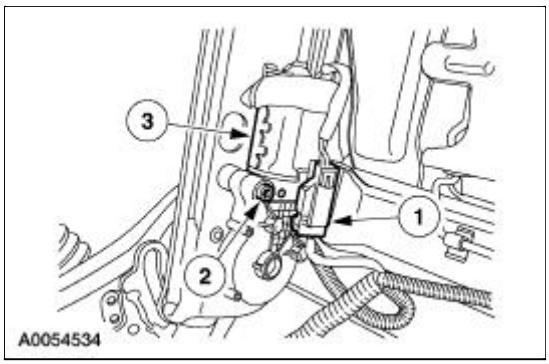
19. Remove the screw at bottom of the two TED ducts (one shown).



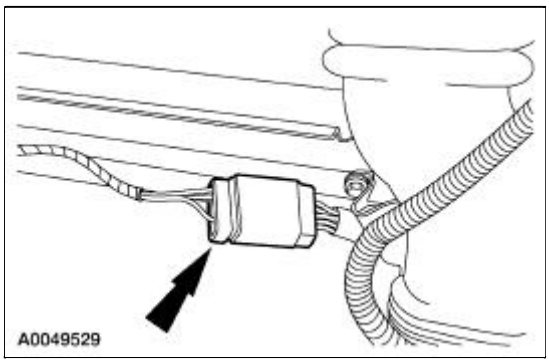
20. Unhook the TED and ducts from support rod.



Vehicles with power recliner

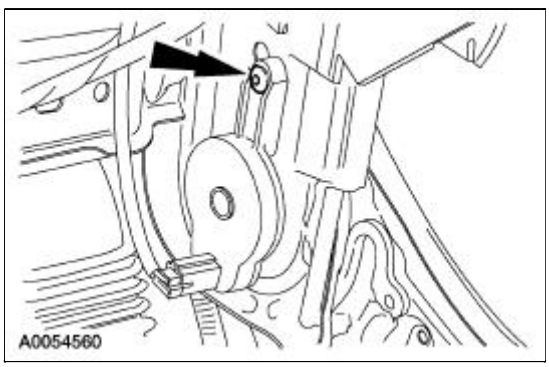


21. Remove the retainer clip on the end of power recliner motor shaft.



22. Remove the power recliner motor shaft.
    1. Remove the power recliner motor shaft cover.
    2. Slide the power recliner motor shaft out from the power recliner motor.

23. Remove power recliner motor.
    1. Disconnect the power recliner motor electrical connector.
    2. Remove the power recliner motor bolt.
    3. Remove the power recliner motor.

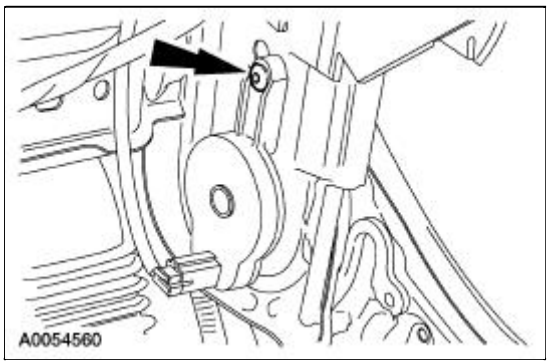


24. Disconnect the power recliner position sensor electrical connector.

25. **CAUTION: Make sure to remove all the rivet metal chips from sensor and surrounding areas.**

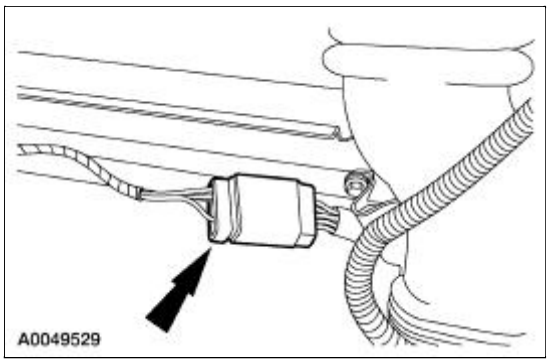
    Remove the rivet and remove the power recliner position sensor.

Assembly



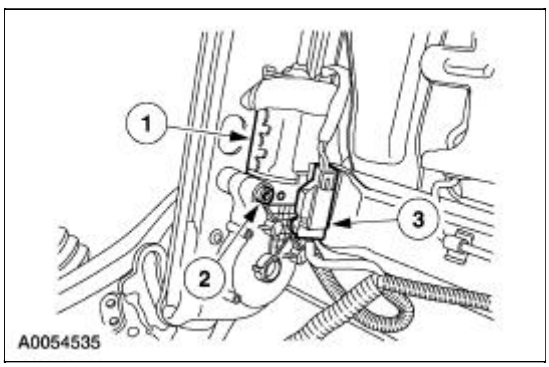
WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

Vehicles with power recliner

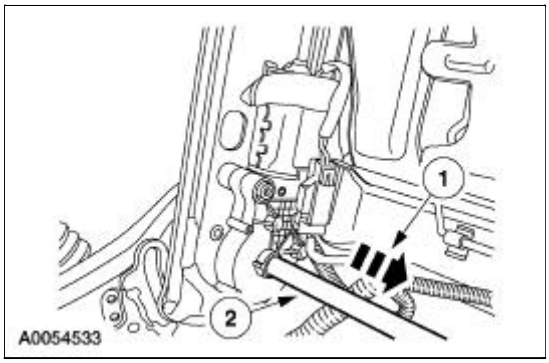


1. **CAUTION: Make sure to remove all the rivet metal chips from sensor and**

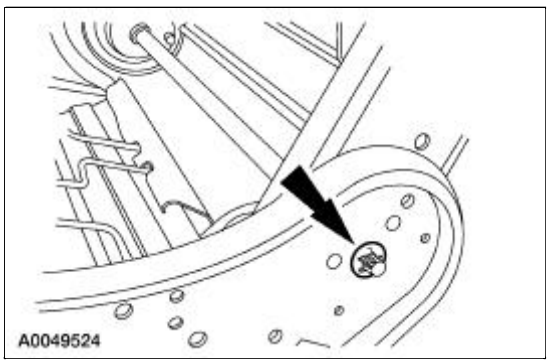
surrounding areas.



Install the power recliner position sensor and install the rivet.

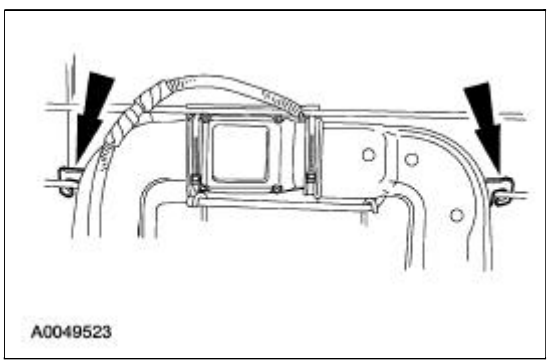


2. Connect the power recliner position sensor electrical connector.

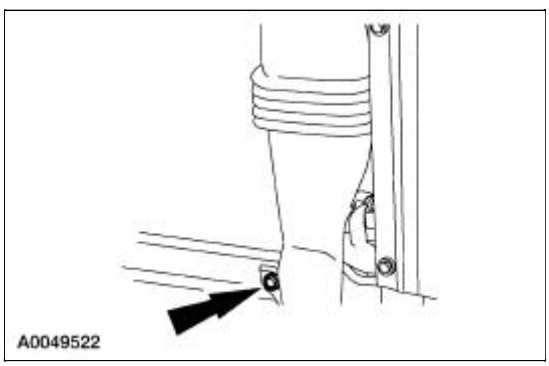


3. Install the power recliner motor.
    1. Install the power recliner motor.
    2. Install the power recliner motor bolt.
    3. Connect the power recliner motor electrical connector.

4. Install the power recliner shaft.
    1. Slide the power recliner shaft into the motor and through the seat.
    2. Install the power recliner shaft cover.

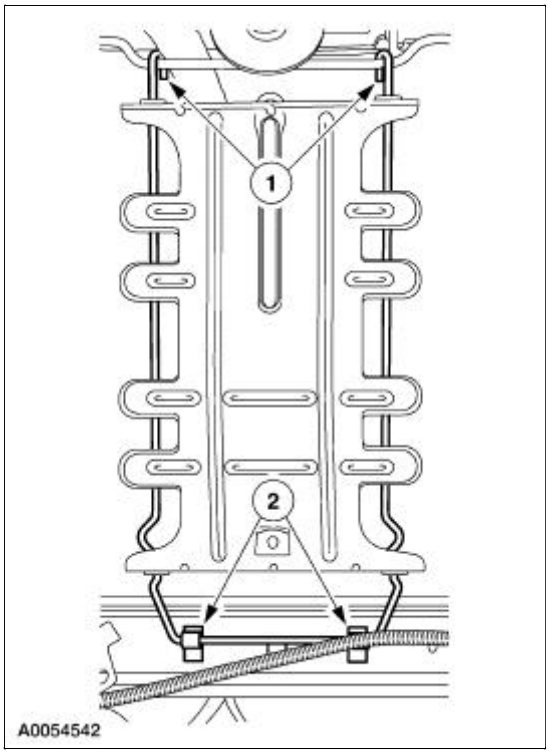


5. Install the retainer clip on end of power recliner shaft.

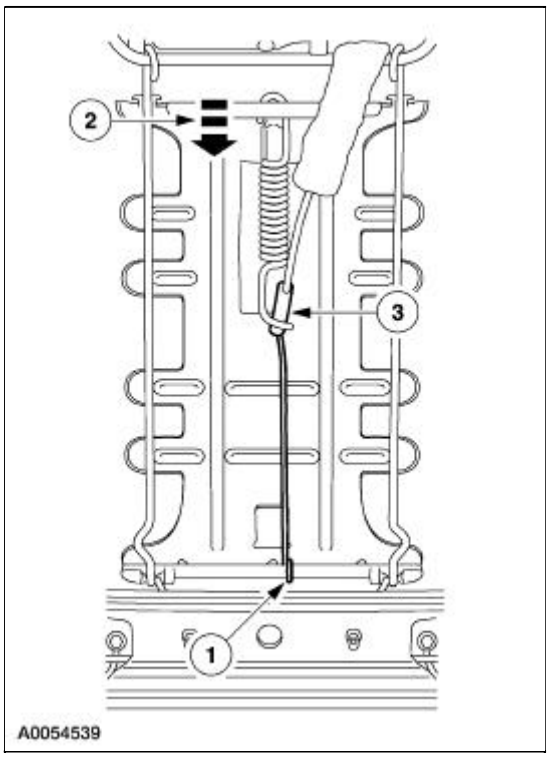


Vehicles with temperature controlled seats

6. Install the TED and ducts on support rod.

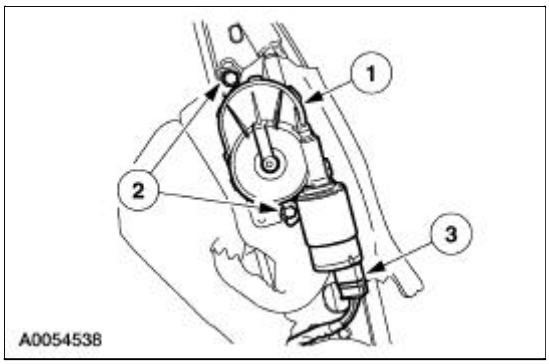


7. Install the screw at the bottom of the two TED ducts (one shown).



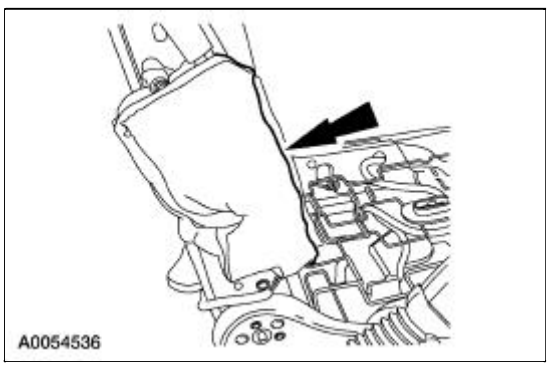
All vehicles

8. Install the lumbar support.
    1. Hook the upper lumbar support bracket.
    2. Install the pin-type retainers.



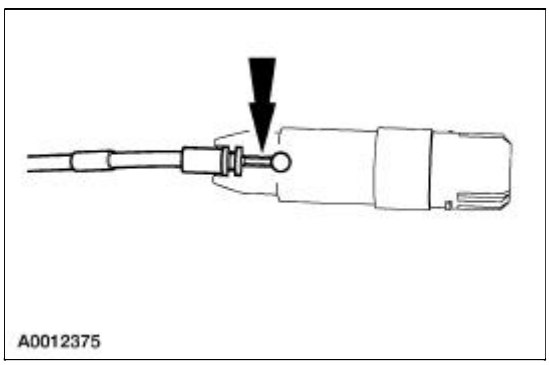
9. **NOTE:** The lumbar support assembly must be fully relaxed.

    Install the lumbar motor cable to the lumbar support.
    1. Hook the lumbar support adjusting cable to the lumbar support.
    2. Flex the lumbar support.
    3. Install the lumbar support adjusting cable to the positioning spring.



Vehicles with power lumbar

10. Install the power lumbar support motor.
    1. Install the power lumbar support motor.
    2. Install the screws.
    3. Connect the power lumbar electrical connector.

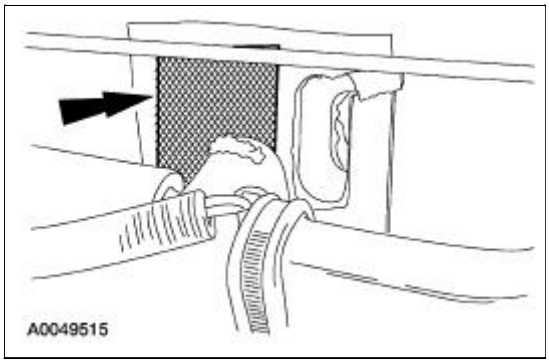


11. Close the dampening bag and staple.

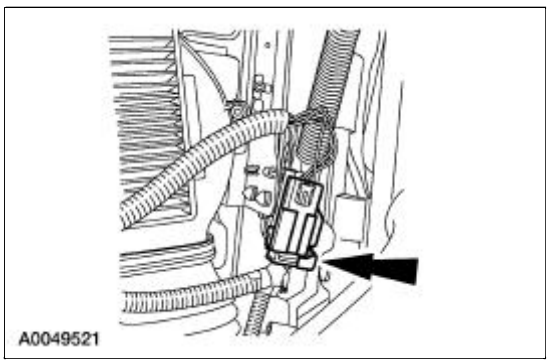
Vehicles with manual lumbar

12. **NOTE:** The lumbar support assembly must be fully relaxed.

    Install the adjuster cable to the lumbar support adjuster.



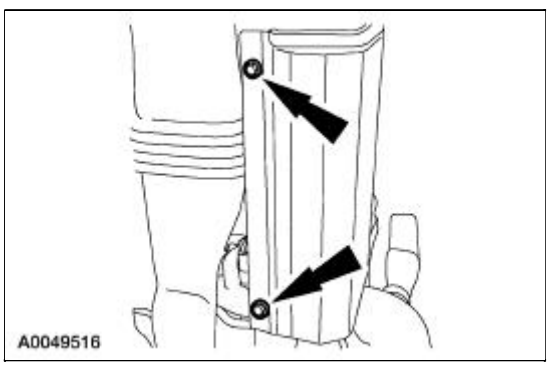
All vehicles



13. Install the seat backrest foam pad.

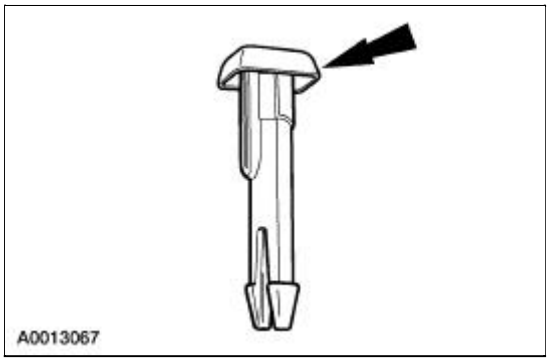
Vehicles with temperature controlled seats

14. Attach the seat backrest TED to the foam pad

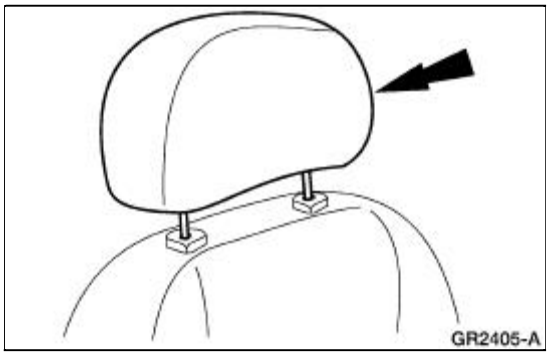


15. Connect the seat backrest TED electrical connector.

All vehicles



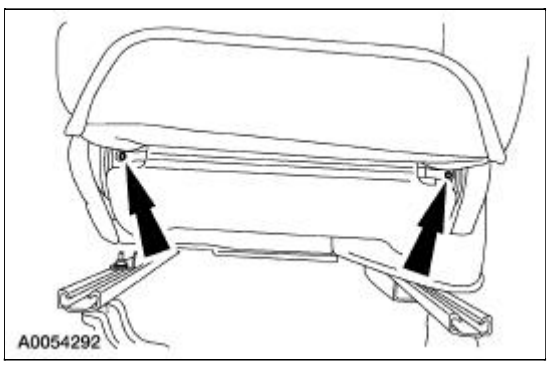
16. Install the two support covers and install the screws for the support covers (one side shown).



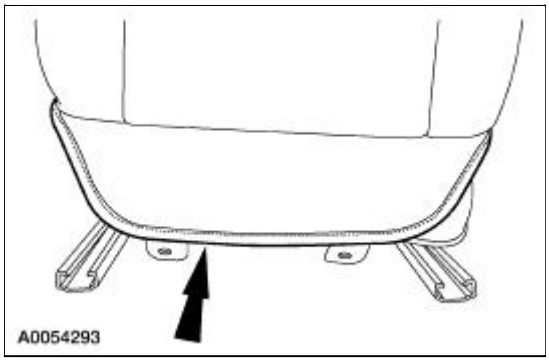
17. Install the seat backrest trim cover and attach the hook-and-loop fasteners.

18. **NOTE:** The head restraint sleeve pins are not interchangeable.

    Install the head restraint sleeves.



19. Install the head restraint.



20. Connect the one hook-and-loop strip and the one J-clip.

21. Install the two screws in the support rod.

22. Install the lower backrest cover.

23. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the front seat removal and installation procedure.**

    Install the 40 percent seat. For additional information, refer to Front Seat—40 Percent in this section.

24. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .

25. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

Disassembly

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe pretensioner electrical connectors. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the

C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

NOTE: Before disconnecting the battery in vehicles with power seats, adjust the seat position to allow for access to the necessary components.

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

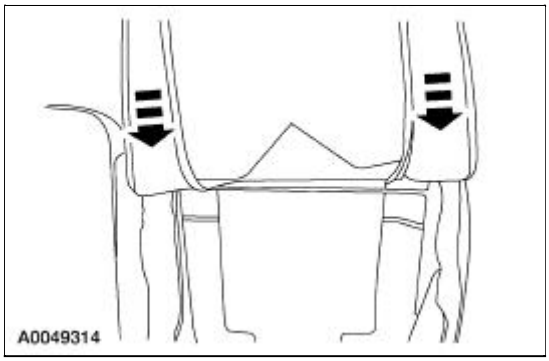
   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

   Remove the 60 percent seat backrest. For additional information, refer to Front Seat Backrest—60 Percent in this section.

4. **CAUTION: Use care when separating the seat backrest covering from the hook-and-loop fasteners to avoid tearing the fastener off the seat foam.**

   Invert the seat backrest trim cover and remove.



5. Remove the seat backrest foam pad.

Assembly

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the disassembly procedure.

1. Install the seat backrest foam pad.
2. Install the seat backrest trim cover.

3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

   Install the 60 percent seat backrest. For additional information, refer to Front Seat Backrest—60 Percent in this section.

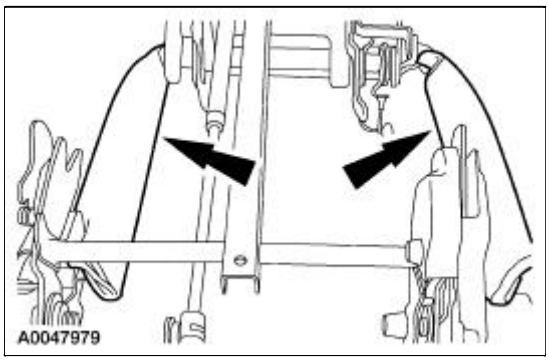
4. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .

5. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

   With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

Rear Seat Cushion —Second Row, 40 Percent

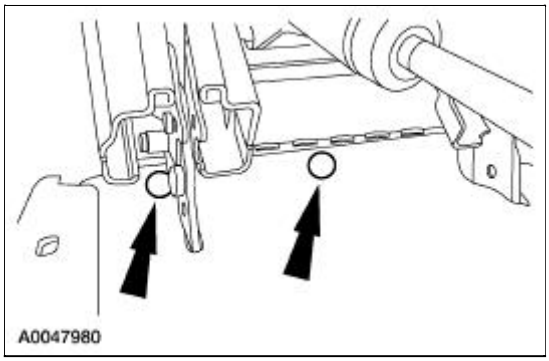


Disassembly and Assembly

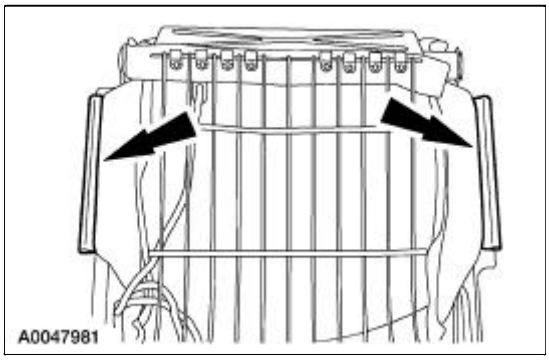
1. Remove the 40 percent seat backrest. For additional information, refer to Rear Seat Backrest—Second Row, 40 Percent in this section.

2. Unsnap the pull strap retainer.

3. Release the four J-clips (two shown).

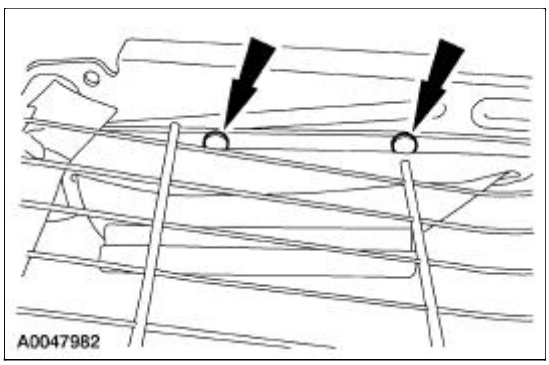


4. Remove the seat cushion cover and cushion foam pad from the seat cushion frame.



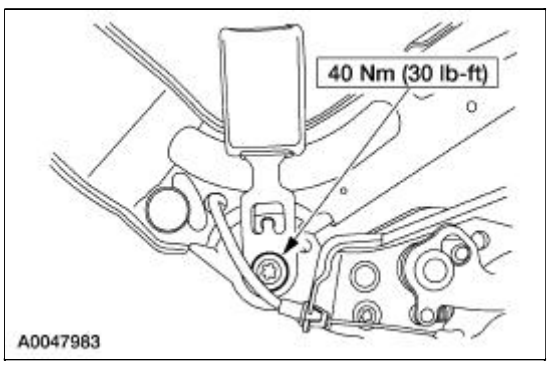
5. **CAUTION: Use care when separating the seat cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat cushion foam.**

   Remove the seat cushion cover from the seat cushion foam pad.



6. Remove the three pin-type retainers from the seat bottom cover (two shown).

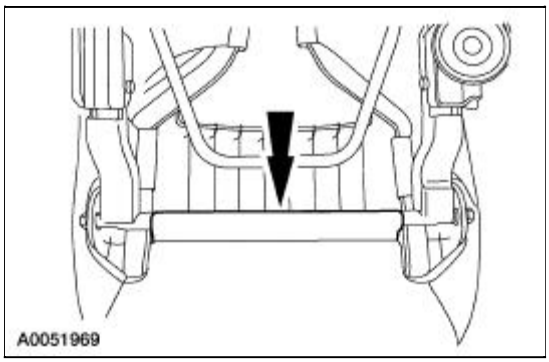
7. Release the two J-clips for the bottom cover.



8. Remove the four pin-type retainers from the sides of bottom cover (two shown).

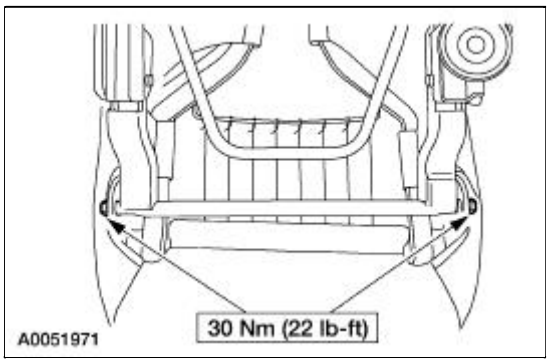
9. Remove the bottom cover.

10. Remove the seat belt buckle bolt and remove the seat belt buckle.
    - To aid installation, note the location of locating tab.



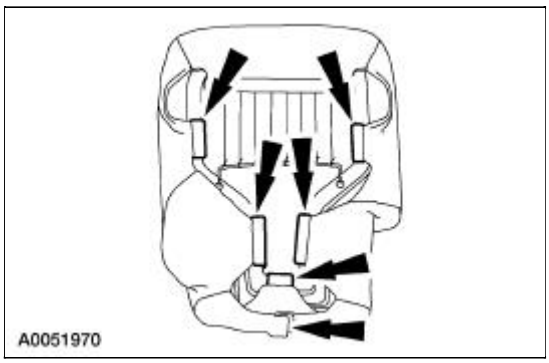
11. To assemble, reverse the disassembly procedure.

Rear Seat Cushion —Second Row, 20 Percent



Disassembly and Assembly

1. Remove the 20 percent seat backrest. For additional information, refer to Rear Seat Backrest—Second Row, 20 Percent in this section.



2. Release the J-clip.

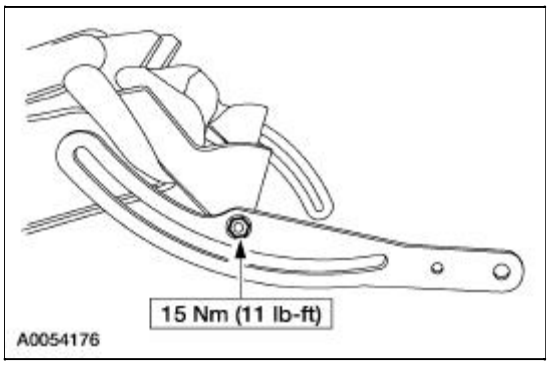
3. Remove the two seat riser-to-cushion bolts.

4. Release the J-clips.

5. Remove the seat cushion frame from the foam pad.

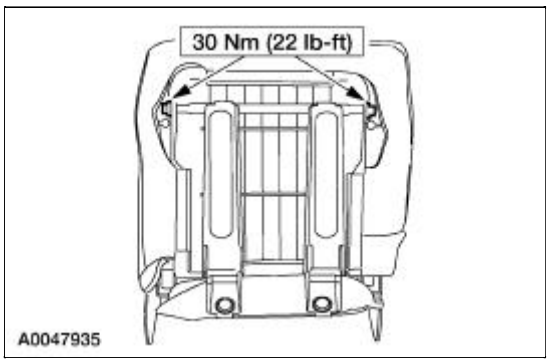
6. **CAUTION: Use care when separating the seat cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat cushion foam.**

Remove the seat cushion cover from the foam pad.



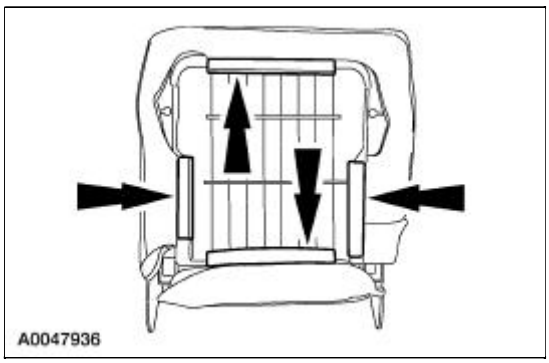
7. To assemble, reverse the disassembly procedure.

Rear Seat Cushion —Third Row, 40 Percent



Disassembly and Assembly

1. Remove the third row 40 percent seat backrest. For additional information, refer to Rear Seat Backrest—Third Row, 40 Percent in this section.



2. Remove the nut from slide bracket from both sides of the seat cushion.

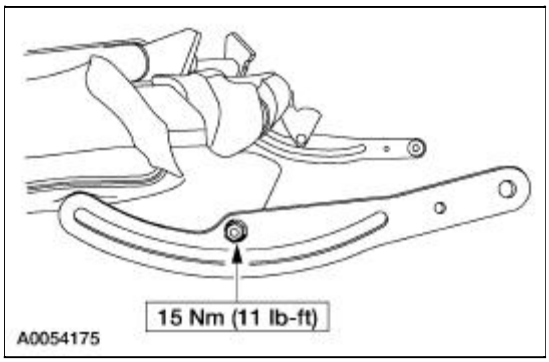
3. Remove the bolts from seat riser to cushion.

4. Release the J-clips.

5. Remove the frame from the seat cushion foam.

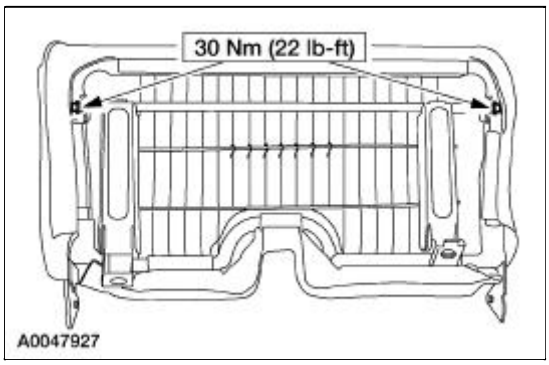
6. **CAUTION: Use care when separating the seat cushion trim cover from the hook and loop strip, or the hook and loop strip can be torn from the seat cushion foam.**

Remove the cushion trim cover from the foam pad.



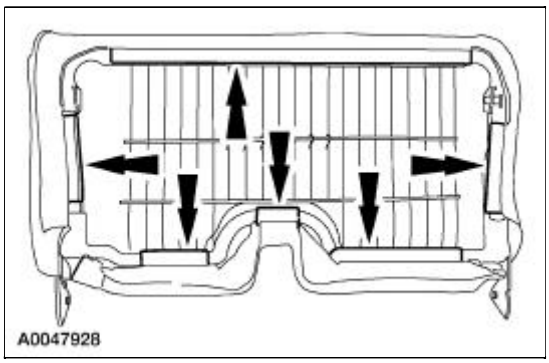
7. To assemble, reverse the disassembly procedure.

Rear Seat Cushion —Third Row, 60 Percent



Disassembly and Assembly

1. Remove the third row 60 percent seat backrest. For additional information, refer to Rear Seat Backrest—Third Row, 60 Percent in this section.



2. Remove the nut from the slide bracket on both sides of the seat cushion.

3. Remove the bolts from seat riser to cushion.

4. Release the J-clips.

5. Remove the frame from the seat cushion foam.

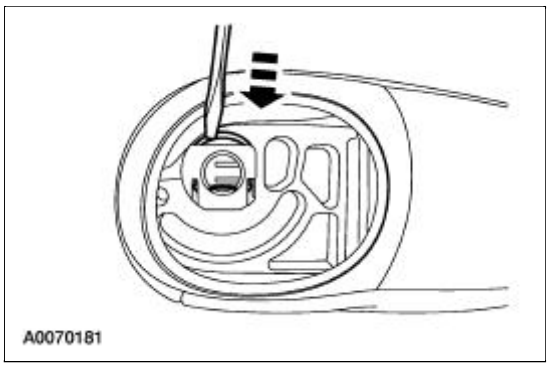
6. **CAUTION: Use care when separating the seat cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat cushion foam.**

Remove the cushion trim cover from the foam pad.

7. To assemble, reverse the disassembly procedure.

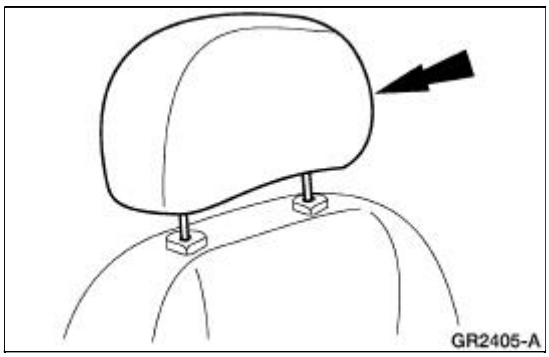
Rear Seat Backrest —Second Row, 40 Percent

Disassembly and Assembly



1. Remove the 40 percent seat backrest. For additional information, refer to Rear Seat Backrest—Second Row, 40 Percent in this section.

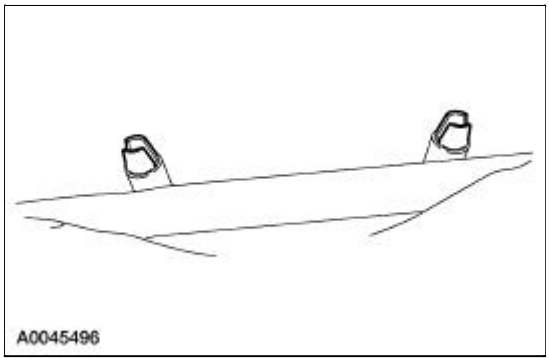
2. To access the armrest locking metal clip, pull the armrest material back on the top side of the armrest for access to the release clip.



3. **CAUTION: To remove armrests, do not pull them off with force. The locking metal clip will be damaged and a new armrest will need to be installed.**

   NOTE: Armrest removed to show detail of release button mechanism.

   If equipped, use a tool such as a flat-bladed screwdriver to push the release button at the hinge point. The clip will release and the armrest will slide off the pin.



4. Depress the tab and remove the head restraint.

5. **NOTE:** The head restraint sleeve pins are not interchangeable, note location for installation.

   Reach up into seat backrest and squeeze the head restraint sleeve ends together to release the sleeves and pull the head restraint sleeves out.

6. **CAUTION: Use care when separating the seat backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat backrest foam.**

   Invert the seat backrest trim cover and remove.

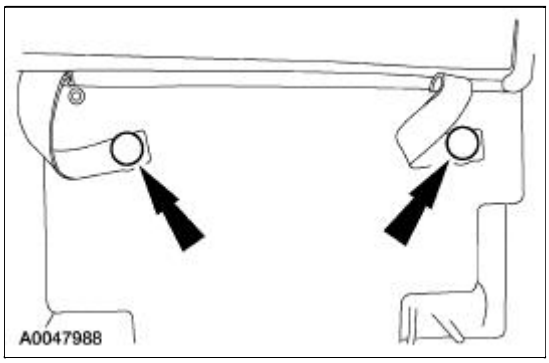
7. Remove the screws from the rear seat backrest support panel.

8. **CAUTION: To install armrests, do not push them on with force. The locking metal clip will be damaged and a new armrest will need to be installed.**

   To assemble, reverse the disassembly procedure.

   - To install the armrest, push the release button and slide the armrest on the pin.

Rear Seat Backrest —Second Row, 20 Percent

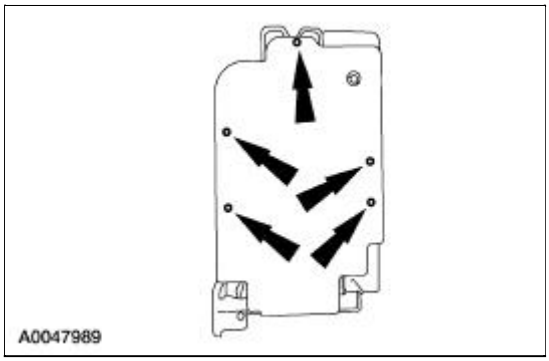


Disassembly and Assembly

1. Remove the 20 percent seat backrest. For additional information, refer to Rear Seat Backrest—Second Row, 20 Percent in this section.

2. Remove the seat belt guide cover.

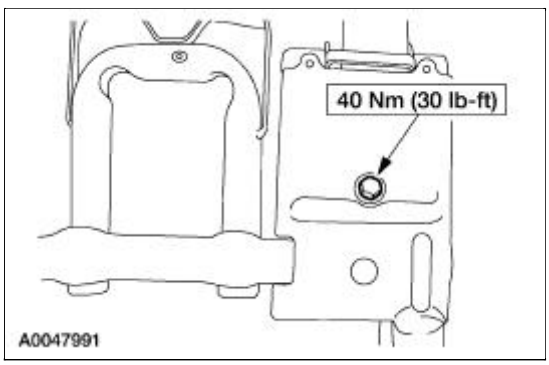
3. Invert the seat backrest cover and remove the two pin-type retainers.



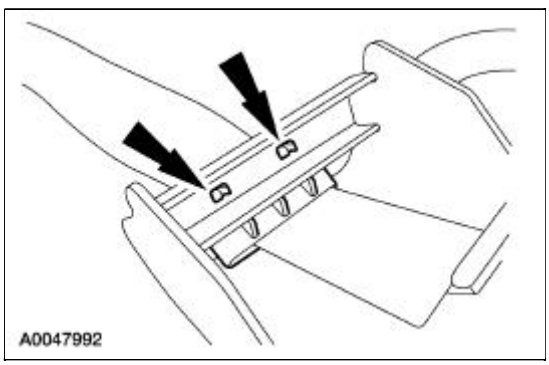
4. **CAUTION: Use care when separating the seat backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat backrest foam.**

   Remove the seat backrest cover.

5. Remove the seat backrest foam pad.



6. Remove the seat backrest support panel screws.

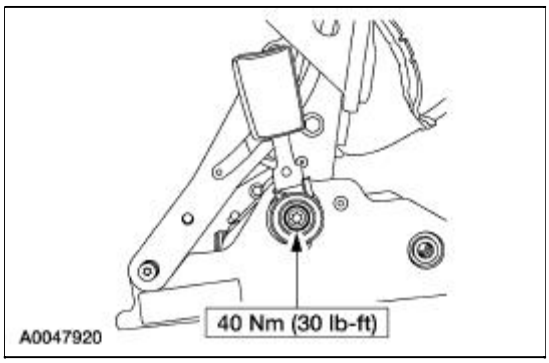


7. Remove the seat belt retractor cover screws and remove the cover.

8. Remove the seat belt retractor bolt.

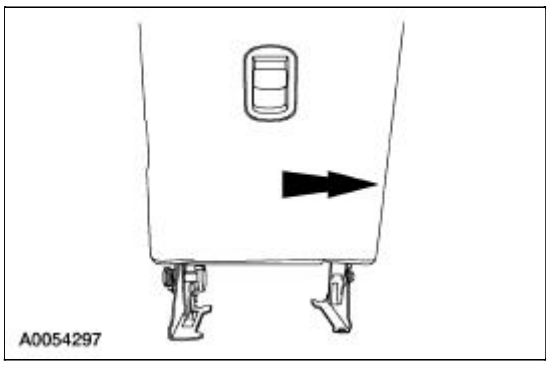
9. Pinch and release the seat belt retractor guide from the seat backrest frame and remove the seat belt retractor.

10. To assemble, reverse the disassembly procedure.



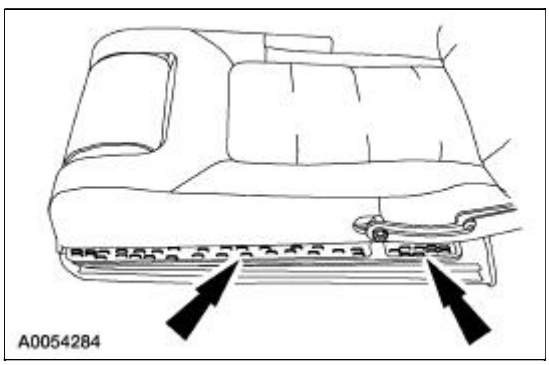
Rear Seat Backrest —Third Row, 40 Percent

Disassembly and Assembly

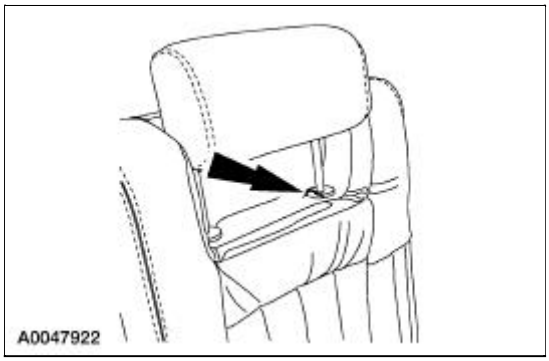


All vehicles

1. Remove the third row 40 percent seat backrest. For additional information, refer to Rear Seat Backrest—Third Row, 40 Percent in this section.

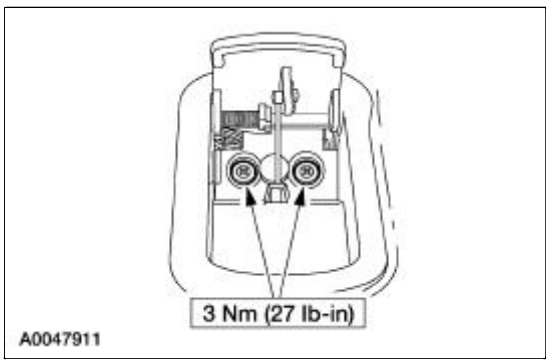


2. Remove the safety belt buckle bolt and remove the safety belt buckle.
   - During assembly make sure anti-rotation tab is engaged into seat locator.



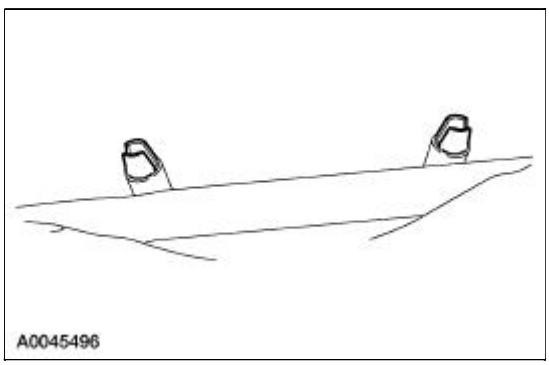
3. Release the J-clip.

4. Remove all the staples.



5. Depress the tab for head restraint and remove the head restraint.

Manual seat

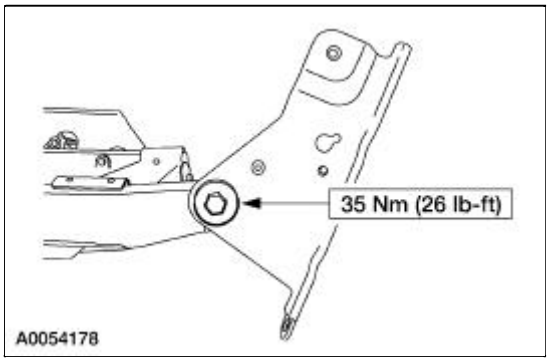


6. Remove the seat backrest release handle screws and remove the handle and cable assembly.

All vehicles

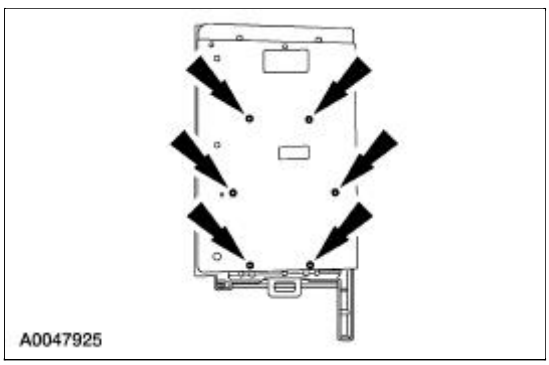
7. **NOTE:** The head restraint sleeve pins are not interchangeable. Note location for installation.

   Reach up into seat backrest and squeeze the head restraint sleeve ends together to release the sleeves and pull the head restraint sleeves out.



8. **CAUTION: Use care when separating the seat backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat backrest foam.**

   Invert the seat backrest trim cover and remove.

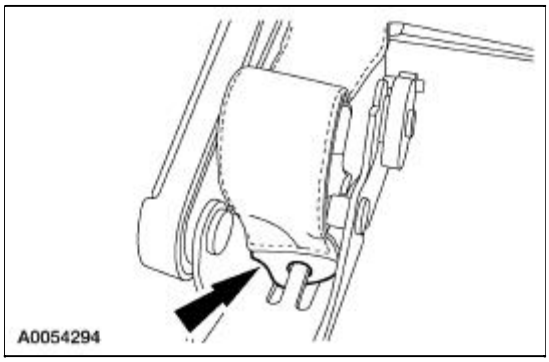


9. Remove the two bolts and remove the seat base.

10. Remove the bolt and remove the seat base.

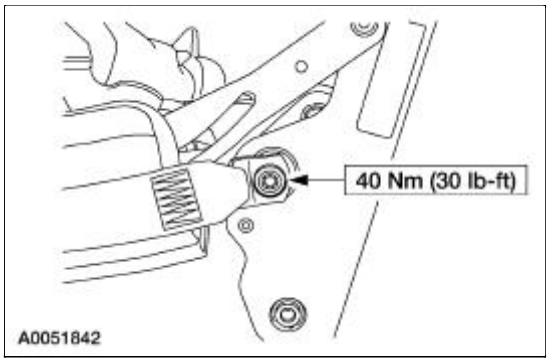
11. Remove the screws from the rear seat backrest support panel.

12. To assemble, reverse the disassembly procedure.



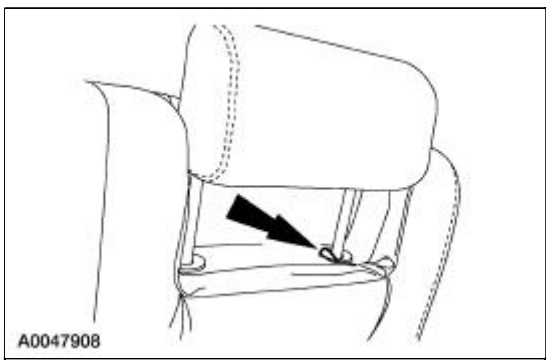
Rear Seat Backrest —Third Row, 60 Percent

Disassembly and Assembly

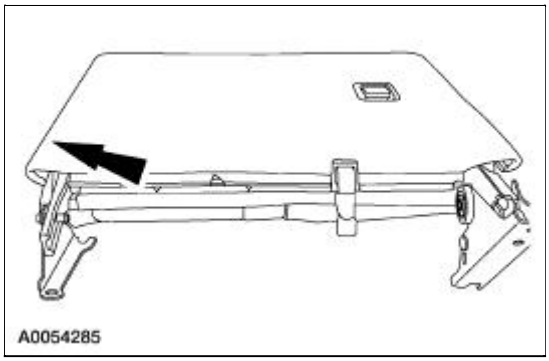


All vehicles

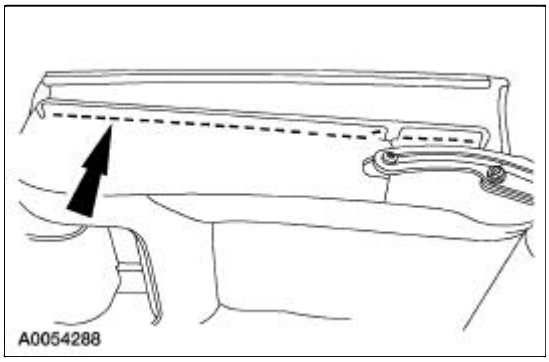
1. Remove the third row 60 percent seat backrest. For additional information, refer to Rear Seat Backrest—Third Row, 60 Percent in this section.



2. Remove latch trim cover (inboard side).

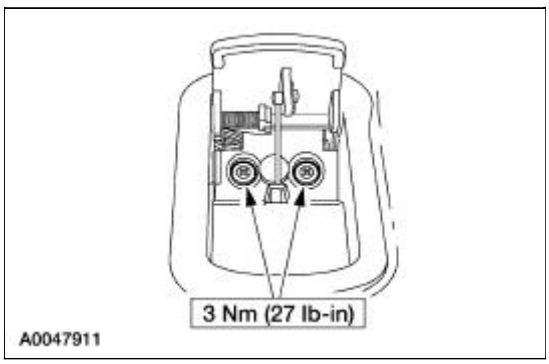


3. Remove the safety belt anchor bolt.

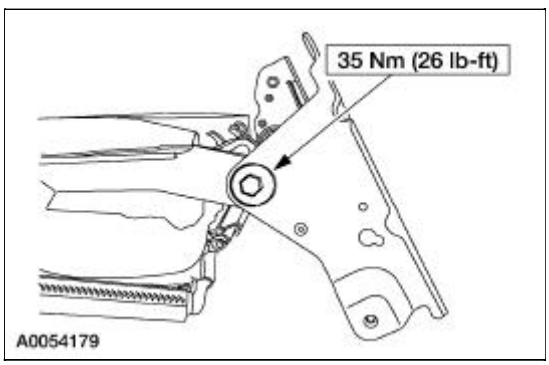


4. Depress the tab and remove the head restraint.

5. Release the J-clip.

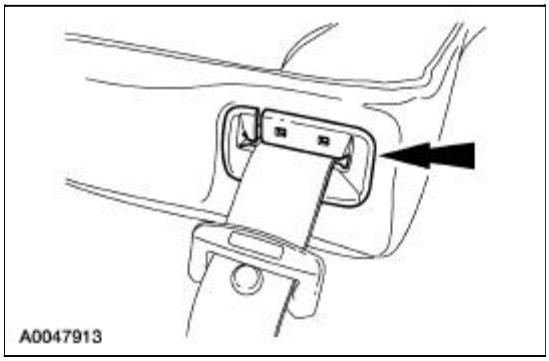


6. Remove all the staples.



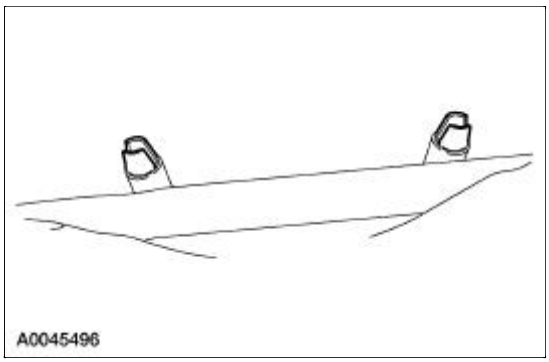
Manual seat

7. Remove the seat backrest release handle screws and remove the handle and cable assembly.



All vehicles

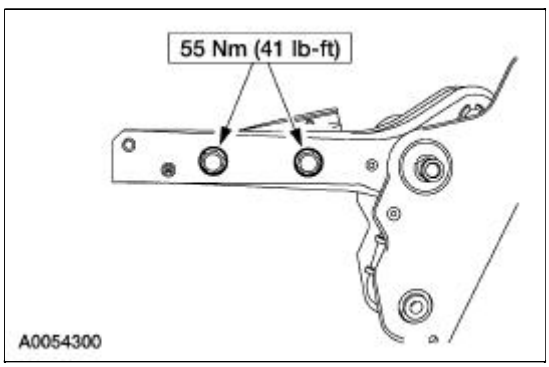
8. Remove the bolt and remove the seat base.



9. Remove the safety belt guide.

10. **NOTE:** The head restraint sleeve pins are not interchangeable. Note location for installation.

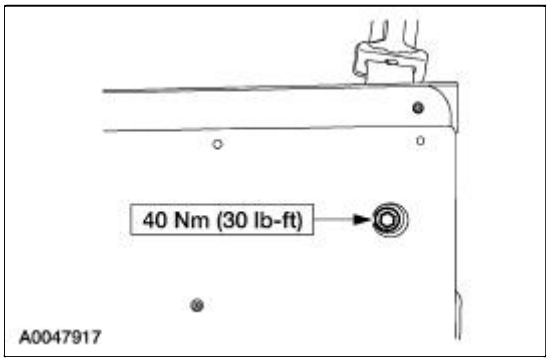
    Reach up into seat backrest and squeeze the head restraint sleeve ends together to release the sleeves and pull the head restraint sleeves out.



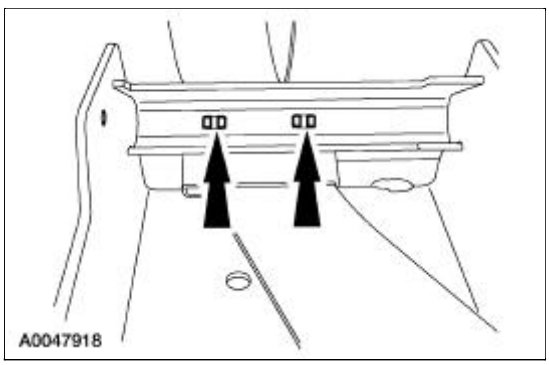
11. **CAUTION: Use care when separating the seat backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat backrest foam.**

    Invert the seat backrest trim cover and remove.

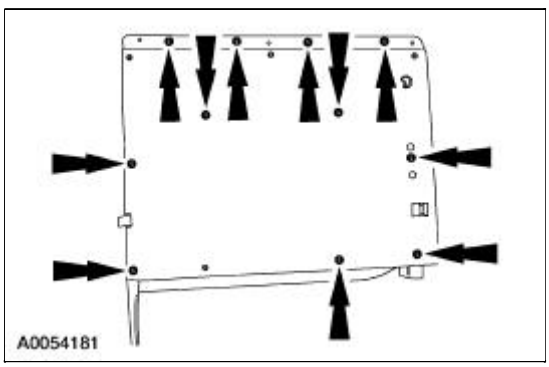
12. Remove the seat backrest foam pad.



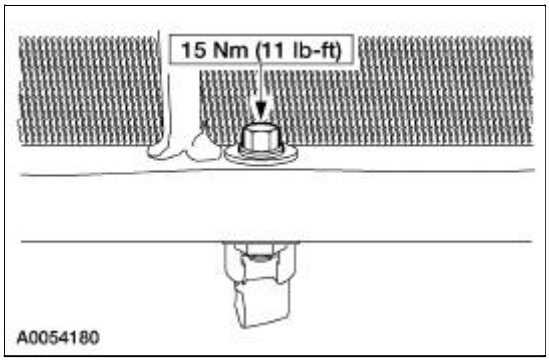
13. Remove the two bolts and remove the seat base.



14. Remove the four screws in seat belt cover (two shown).



15. Remove the seat belt bolt.



16. Pinch to release the seat belt guide and remove the seat belt assembly.

17. Remove the screws in the rear seat backrest support panel.

18. Remove the seat backrest tether anchor bolt.

19. To assemble, reverse the disassembly procedure.

Glass, Frames and Mechanisms

The glass, frames and mechanisms consists of:

- front door window glass
- front door window motor
- front door window regulator
- rear quarter window glass
- rear quarter window glass frame
- rear quarter motor and window regulator
- rear door window glass
- rear door window motor
- rear door window regulator
- liftgate glass
- windshield glass

The glass, frames and mechanisms include:

- standard plastic and laminate safety glass
- liftgate glass which houses the rear defrost grid and rear wiper arm
- windshield glass which is bonded to the opening flange with a urethane sealant
- on Expedition, standard power windows which include one-touch down (LF only) and lock out feature
- on Navigator, standard power windows which include one-touch up/down (LF only) and lock out feature
- power vented rear quarter windows
- fixed rear quarter windows (Expedition only)
- RH quarter window glass antenna

The window regulator control switch:

- on Expedition, is located on each door trim panel.
- on Navigator, is located in the center floor console for front seats and on each door panel for the rear doors.
- may be used to raise or lower all windows from the master control on the driver side, or the individual side window from the individual door switch.
- includes a double detent feature (LF only).
- can manually lower the driver side window when the master control is depressed halfway (first detent).
- will completely lower the driver side window when the master control is fully depressed and then released (second detent).
- on Navigator, will completely raise the driver side window when the master control is pulled up

and then released (second detent).

- can lock out passenger front (Expedition only) and rear control switches.

The rear quarter glass regulator control switches:

- are located in the overhead console.
- may be used to open and close the RH or LH rear quarter windows.
- stop the rear quarter glass in any position when released.

The power window system will operate if the ignition switch is in the RUN or ACC position, or the delayed accessory feature is active.

Passenger windows may be raised or lowered using the LF master control switches or the appropriate passenger window switch. Passenger window switches receive power when the delayed accessory relay is active and the LF remote lock-out switch is in the UNLOCK position. When in the LOCK-OUT position, the passenger windows are deactivated.

The delayed accessory relay provides power for the operation of the power windows and the power moon roof. The delayed accessory feature is active when the ignition switch is in the RUN or the ACC position, or when the ignition switch is changed from RUN or ACC to the OFF/LOCK position and the LF and RF doors are closed.

The delayed accessory feature will deactivate when:

- the LF door is ajar and the ignition switch is in the OFF/LOCK or KEY-OUT position.
- the RF door is ajar and the ignition switch is in the OFF/LOCK or KEY-OUT position.
- 10 minutes have elapsed since the ignition switch was changed from ACC or RUN to the OFF/LOCK position.

Feature inputs:

- LF door open warning switch (open circuit with door closed, grounded with door ajar)
- RF door open warning switch (open circuit with door closed, grounded with door ajar)
- ignition switch RUN position (battery potential on both the RUN and RUN/ACC inputs)
- ignition switch ACC position (battery potential on the RUN/ACC input)
- ignition switch OFF/LOCK position (absence of battery potential on the RUN, RUN/ACC, and START inputs)

Feature outputs:

- delayed accessory relay (grounded when activated, open circuit when deactivated)

The instrument cluster module (ICM) controls the rear window defrost grid and heated mirrors by controlling the state of the rear window defrost/mirror relay. When the rear window defrost switch is pressed, the ICM will activate the heated grid relay. When the heated grid relay is active, both the rear window defrost grid and heated mirror elements will be energized.

The ICM will deactivate the heated grid relay when one of the following conditions is met:

- The rear window defrost switch is pressed when the feature is active.
- Ignition switch state is changed from RUN to OFF/LOCK.

- The 10 minute timing function is completed.

Feature inputs:

- ignition switch RUN position (12V on both RUN and RUN/ACC inputs)
- rear window defrost switch (momentary contact to ground when switch is pressed)

Feature outputs:

- rear window defrost relay control (grounded when activated, open circuit when deactivated)

Glass, Frames and Mechanisms

Refer to Wiring Diagrams Cell 59 , Generic Electronic Module (GEM) for schematic and connector information.

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Refer to Wiring Diagrams Cell 101 , Power Moonroof/Vent Windows for schematic and connector information.

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool

Principles of Operation

Navigator — One Touch Up/Down

NOTE: The LF window motor is not on the multiplex link.

The LF window motor is an eight-pin motor with integral electronics. The front window control switch sends three separate signals to the LF window motor: up, down and AUTO. The front window control switch provides a 12-volt signal to the motor to request an up or down operation. When AUTO up or AUTO down are requested, the front window control switch provides a 12-volt signal on the up or down line and a ground signal on the AUTO line simultaneously. The up and down contacts are tied to ground and the AUTO contact is floating within the front window control switch when the switch is in the neutral position. The up, down and AUTO feeds to the motor are all low current.

The LF window motor plastic pinion gear is mated to the drum housing of a dual rail drum and cable window regulator. The motor is attached to the drum housing (plastic) by three screws. The motor uses internal Hall-effect sensor feedback coupled to the microprocessor to determine window position and operate the window. If the Hall-effect pulses are not being received by the microprocessor, the motor will run for approximately 1/10 second each switch press. The motor contains a thermal breaker to protect the motor windings from overcurrent/overtemperature operation. Continued successive operation of the motor will cause the thermal breaker to open, causing a loss of function until the motor cools.

The LF window motor operates with the ignition switch in the RUN/ACC positions only (and delayed accessory) and is sensed via the delayed accessory and logic ground inputs. The motor is supplied

with B+ power and draws a key-off load of approximately 3/4 mA. All of the high current required to move the window is supplied through the B+ and motor ground inputs. The loss of either logic or motor ground will cause this system to become inoperative. For correct functionality, both power feeds and both ground feeds must be intact at the motor.

During an AUTO up or AUTO down function, movement of the window can be stopped by actuating the switch to any position (up, down, AUTO up, AUTO down). The switch must then be released before the window will perform the next commanded movement.

When an obstacle has been detected in the window opening as the window is moving upward, the window will automatically reverse direction and move toward the fully open position (in both proportional up and one-touch up modes). This is known as "bounce-back". Once the window stops at its bounce-back position, and within 2 seconds the switch is released, then held in the AUTO up position, the window will travel up with no bounce-back protection (security override). If the switch is released before the window reaches fully closed, the window will stop with bounce-back automatically re-enabled for the next window up movement. If the ignition switch is turned to OFF or START (without delayed accessory), the window will stop. The only exception is when an obstacle is detected while delayed accessory is lost. In this case the window will bounce back, then stop. Ice, contaminant buildup, and environmentally induced tight spots in the window seals are all possible uses for the security override feature. If an obstruction occurs between 4 and 200 mm (0.15 - 7.9 inch) of window opening, the bounce-back position will be 250 mm (9.8 inch) of window opening. If an obstruction occurs at a position greater than 200 mm (7.9 inch) of window opening, the bounce-back position will be 50 mm (2 inch) below where the obstruction occurred.

The LF window motor will retain its initialization (memory) if power (B+) is removed while the window is not in motion. If power (B+) is disconnected from the LF window motor while the window is in motion, the motor will enter position recovery mode when power is restored (AUTO up and AUTO down functions are disabled). Position recovery mode allows proportional up (and down) movement of the window until the LF window motor stalls the window glass into the upper header seal. If no internal or external faults are present, the motor will automatically resume normal (full) operation.

The front window control switch is supplied with illumination and illumination ground inputs used to illuminate the switch when the headlamp switch is turned to the PARK or ON position (the AUTOLAMP position may also energize this input). These switch inputs do not directly affect operation of the LF window. The front window control switch uses the delayed accessory power input which is transferred to the up or down outputs via closing of a switch contact. The front window control switch uses the main switch ground input which is transferred to the AUTO output via closing of a switch contact. If the delayed accessory feed to the front window control switch is missing, none of the windows will function. If the main ground signal is missing, the LF AUTO functions will be inoperative and the remaining three windows will also be inoperative.

If the front window control switch, or its associated wiring, develops an open circuit, that function will become inoperative. If the up contact or associated wiring develops an open circuit, the LF window will only move down or one touch down. If the down contact or associated wiring develops an open circuit, the LF window will only move up or one touch up. If the auto contact or associated wiring develops an open circuit, the LF window will only move proportionally up or down.

The LF window motor will suspend window operation if a switch error exists. A switch error is defined as up and down, AUTO without up or down, or up and down and AUTO energized at the same time. The LF window will appear to be inoperative if a switch error is present.

A new LF window motor will be in proportional up/down mode prior to initialization. The motor will respond to a proportional up or down switch actuation only and bounce back is disabled. If the switch is actuated to the AUTO up or AUTO down position and released, window movement will stop when the up or down contact in the front window control switch is released. If the LF window motor is removed from the window regulator drum housing, or if a new LF window motor is installed, the LF window motor must be initialized. Refer to Door Window Motor Initialization in the General Procedures portion of this section.

The LF window motor will automatically adjust to system changes throughout its life: changes in seal drag and slight changes in the fully open position will occur and are automatically compensated for. Once initialized, for the most part, the LF window motor will soft stall into the upper and lower positions

contributing to extended durability of the system. If the LF window does not seal completely in the full up position (very small gaps/non bounce-back events only), the LF window switch can be actuated to the proportional up position and the window will be energized long enough to fully seal (for a small fraction of a second) and this new position will be learned.

Expedition — One Touch Down

The one touch down feature for the Expedition is controlled by the driver window control switch.

Rear Window Defrost

The instrument cluster module (ICM) receives a signal from the rear window defrost switch. The ICM then grounds the rear window defrost relay to turn ON and time the rear window defrost grid.

Inspection and Verification

1. Verify the customer concern by operating the power window system.

2. Visually inspect for obvious signs of mechanical and electrical damage. Refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical
● Window regulator assembly ● Window glass ● Window control switch	● Fuse(s) ● Circuitry ● Window control switch ● Relay(s)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool manual.

6. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:
   - CKT930 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
   - NO RESP/NOT EQUIP for instrument cluster module (ICM), refer to Section 419-10 .
   - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the ICM.

7. If the DTCs retrieved are related to the concern, refer to power ICM Diagnostic Trouble Code (DTC) Index to continue diagnostics.

8. If DTCs are retrieved that are not found in the following ICM Diagnostic Trouble Code (DTC) Index, refer to the master ICM Diagnostics Trouble Code (DTC) index in Section 419-10 .

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

Instrument Cluster Module (ICM) Diagnostic Trouble Code (DTC) Index

Instrument Cluster Module (ICM) Diagnostic Trouble Code (DTC) Index

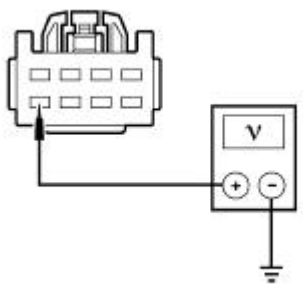
DTC	Description	Source	Action
B1345	Heated Backlite Input Short To Ground	Instrument Cluster Module (ICM)	Go To Pinpoint Test K.

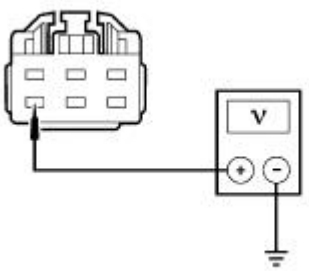
Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• All power windows are inoperative	• Central junction box (CJB) circuit breaker 401 (30A). • CJB fuse 22 (10A). • Delayed accessory relay. • Circuitry. • LF/front window control switch.	• Go To Pinpoint Test A .
• The LF power window is inoperative — Expedition	• Circuitry. • LF window control switch. • LF power window motor.	• Go To Pinpoint Test B .
• The LF power window is inoperative — Navigator	• CJB fuse 22 (10A). • CJB fuse 30 (30A). • Circuitry. • Front window control switch. • LF power window motor.	• Go To Pinpoint Test C .
• The LF power window will not close (bounces back) — Navigator	• The window system was repaired and the LF motor was not reinitialized. • Glass runs are not fully seated.	• REINITIALIZE the LF motor. REFER to Door Window Motor Initialization . • Carefully use a rubber mallet to reseat the glass runs, then REINITIALIZE the LF motor. REFER to Door Window Motor Initialization .

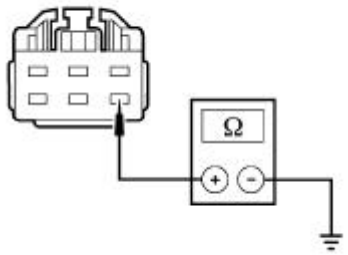
	• Dirt or contaminants are present in the glass runs or beltline moulding.	• REMOVE/CLEAN the glass runs or beltlines, then REINITIALIZE the LF motor. REFER to Door Window Motor Initialization .
	• Binding in the inner/outer beltline moulding.	• REMOVE and REINSTALL the inner/outer beltlines, INSTALL new if necessary, then REINITIALIZE the LF motor. REFER to Door Window Motor Initialization .
	• Window regulator is out of position.	• Using the security override function, POSITION the glass in the full up position. REFER to the Description and Operation portion of this section. LOOSEN the four window regulator rail bolts. TIGHTEN the four window regulator rail bolts. REINITIALIZE the LF motor. REFER to Door Window Motor Initialization .
	• Front glass channel (lower portion) is out of position.	• LOWER the glass to the full down position. LOOSEN the glass channel bolt. TIGHTEN the glass channel bolt. REINITIALIZE the LF motor. REFER to Door Window Motor Initialization .
	• Window system components are loose.	• CHECK the torque on the LF motor screws, window glass to regulator bolts, regulator rail bolts, glass channel bolt, and the door carrier fasteners. REINITIALIZE the LF motor. REFER to Door Window Motor Initialization .
• The RF power window is inoperative — Expedition	• Circuitry. • LF window control switch. • RF window control switch. • RF power window motor.	• Go To Pinpoint Test D .
• The RF power window is inoperative — Navigator	• Circuitry. • Front window control switch. • RF power window motor.	• Go To Pinpoint Test E .
• The LR or RR power window is inoperative — Expedition	• Circuitry. • LF window control switch. • LR window control switch. • LR power window motor. • RR window control switch. • RR power window motor.	• Go To Pinpoint Test F .
• The LR or RR	• Circuitry.	• Go To Pinpoint Test G .





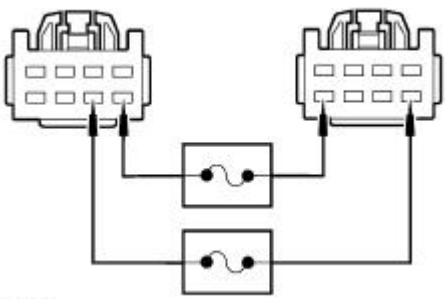
power window is inoperative — Navigator	• Front window control switch. • LR window control switch. • LR power window motor. • RR window control switch. • RR power window motor.	
• The one-touch down (OTD) feature is inoperative — Expedition	• LF window control switch.	• INSTALL a new LF window control switch. REFER to Window Control Switch in this section.
• The one-touch up/down feature is inoperative — Navigator	• LF power window motor. • Circuitry. • LF power window motor is not initialized. • Power (B+) was lost while LF window was moving.	• Go To Pinpoint Test H.
• The vent power windows are inoperative — Expedition	• Fuse. • Power vent window motor. • Power vent window switch. • Circuitry.	• Go To Pinpoint Test I.
• The vent power windows are inoperative — Navigator	• Fuse. • Relay. • Power vent window motor. • Power vent window switch. • Circuitry.	• Go To Pinpoint Test J.
• The defrost system is inoperative	• Fuse(s). • Circuitry. • Rear window defrost switch. • Rear window defrost relay. • Instrument cluster module (ICM).	• Go To Pinpoint Test K.
• The defrost system will not shut off automatically	• Circuitry. • Rear window defrost switch. • Rear window defrost relay. • Instrument cluster module (ICM).	• Go To Pinpoint Test L.
• The delayed accessory is inoperative	• CJB circuit breaker 401 (30A). • CJB fuse 22	• Go To Pinpoint Test M.

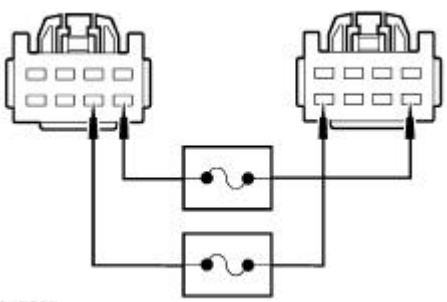
	(10A). ● CJB. ● Circuitry. ● Delayed accessory relay. ● Instrument cluster module (ICM).	



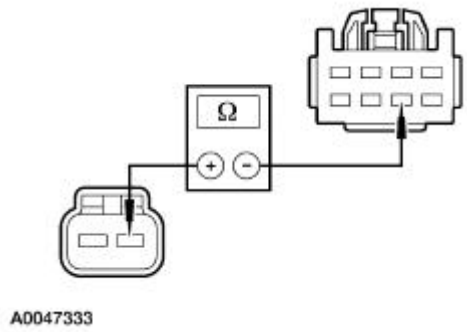
Pinpoint Tests

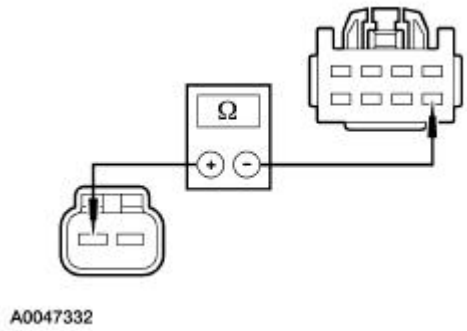
CAUTION: Be careful when probing the CJB, battery junction box or any connectors. Damage will result to the connector receptacle if the probe being used is too large.





PINPOINT TEST A: ALL POWER WINDOWS ARE INOPERATIVE

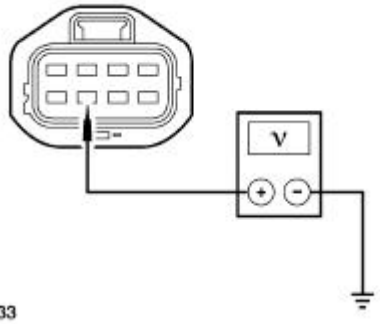


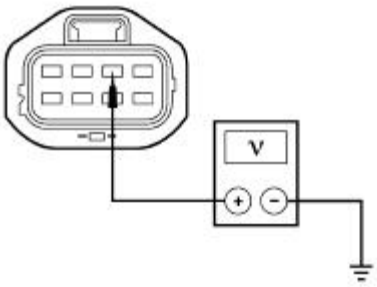


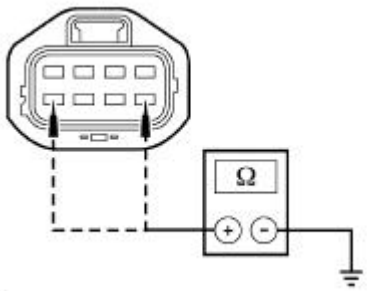
Test Step	Result / Action to Take
A1 CHECK CIRCUIT 400 (LB/BK) FOR VOLTAGE	
● Disconnect: LF Window Control Switch C504b (Expedition) or C3193a (Navigator). ● Key in ON position. ● **NOTE:** Expedition only. ● Measure the voltage between LF window control switch C504b-8, circuit 400 (LB/BK) and ground.  A0047329 ● **NOTE:** Navigator only. ● Measure the voltage between front window control switch C3193a-6, circuit 400 (LB/BK) and ground.  A0047391 ● **Is the voltage greater than 10 volts?**	**Yes** GO to A3 . **No** GO to A2 .
A2 CHECK CIRCUIT 400 (LB/BK) FOR AN OPEN	
● Key in OFF position. ● Disconnect: Accessory Delay Relay.	**Yes** Go To Pinpoint Test M

• **NOTE:** Expedition only. • Measure the resistance between LF window control switch C504b-8, circuit 400 (LB/BK) and accessory delay relay socket pin 87.  A0047330 • **NOTE:** Navigator only. • Measure the resistance between LF window control switch C3193a-6, circuit 400 (LB/BK) and accessory delay relay socket pin 87, circuit 400 (LB/BK).  A0047392 • **Is the resistance less than 5 ohms?**	to diagnose the accessory delay relay system. **No** REPAIR circuit 400 (LB/BK) for an open. TEST the system for normal operation.
A3 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Key in OFF position. • **NOTE:** Expedition only. • Measure the resistance between LF window control switch C504b-5, circuit 57 (BK) and ground.  A0047331 • **NOTE:** Navigator only. • Measure the resistance between LF window control switch C3193a-4, circuit 57 (BK) and ground.	**Yes** INSTALL a new LF window control switch. REFER to Window Control Switch in this section. **No** REPAIR circuit 57 (BK) for an open. TEST the system for normal operation.

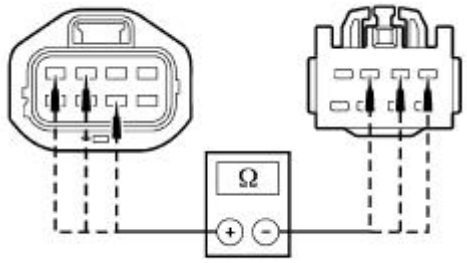
 A0054332 ● **Is the resistance less than 5 ohms?**	





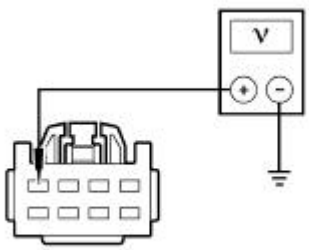


PINPOINT TEST B: THE LF POWER WINDOW IS INOPERATIVE — EXPEDITION

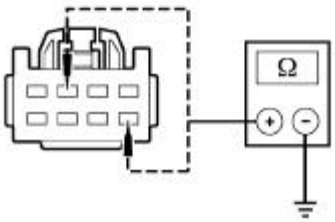


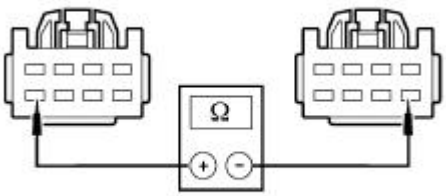
Test Step	Result / Action to Take
B1 CHECK THE POWER WINDOW SWITCH	
● Key in ON position. ● Disconnect: LF Window Control Switch C504a/C504b. ● Connect a fused jumper wire between C504b-5, circuit 57 (BK) and C504a-6, circuit 991 (TN/LB) and connect a second fused jumper wire between C504b-8, circuit 400 (LB/BK) and C504a-5, circuit 992 (WH/BK). The window should operate in the up direction.  A0047334 ● Connect a fused jumper wire between C504b-5, circuit 57 (BK) and C504a-5, circuit 992 (WH/BK) and connect a second fused jumper wire between C504b-8, circuit 400 (LB/BK) and C504a-6, circuit 991 (TN/LB). The window should operate in the down direction.  A0047335 ● **Does the window operate correctly?**	**Yes** INSTALL a new LF window control switch. REFER to Window Control Switch in this section. **No** GO to B2 .
B2 CHECK CIRCUIT 991 (TN/LB) FOR AN OPEN	

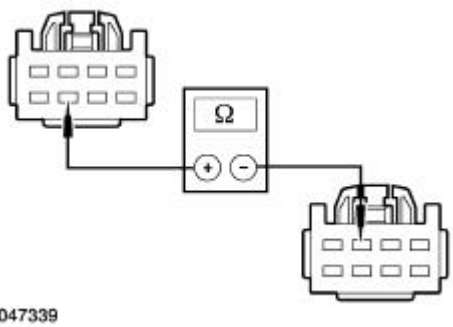
• Key in OFF position. • Disconnect: LF Power Window Motor C518. • Measure the resistance between power window motor C518-1, circuit 991 (TN/LB) harness side, and LF window control switch C504a-6, circuit 991 (TN/LB) harness side.  A0047333 • **Is the resistance less than 5 ohms?**	**Yes** GO to B3 . **No** REPAIR circuit 991 (TN/LB) for an open. TEST the system for normal operation.
B3 CHECK CIRCUIT 992 (WH/BK) FOR AN OPEN	
• Measure the resistance between LF power window motor C518-2, circuit 992 (WH/BK) harness side, and LF window control switch C504a-5, circuit 992 (WH/BK) harness side.  A0047332 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new LF window regulator motor. REFER to Front Door Window Regulator Motor . TEST the system for normal operation. **No** REPAIR the circuit 992 (WH/BK) for an open. TEST the system for normal operation.



PINPOINT TEST C: THE LF POWER WINDOW IS INOPERATIVE — NAVIGATOR





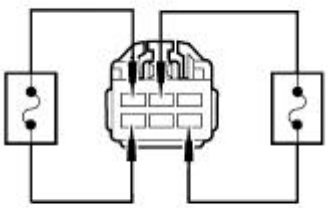


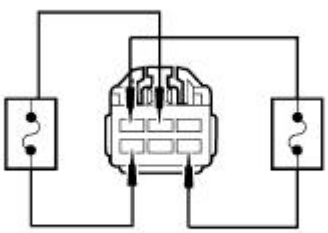
Test Step	Result / Action to Take
NOTE: The LF power window motor is not on the multiplex link.	
NOTE: A new LF power window motor will be in proportional up/down mode until initialized. Refer to Door Window Motor Initialization in this section.	
NOTE: The LF power window motor must be reinitialized whenever: the motor is removed from the window regulator drum housing, a new motor is installed, a new window regulator is installed, a new window glass is installed, a new top run is installed, and any operation in which grease or lubricants are applied to the window system.	
C1 CHECK THE POWER TO THE WINDOW MOTOR	
• Key in OFF position. • Disconnect: LF Window Power Window Motor C540. • Measure the voltage between LF power window motor C540-7, circuit 1523 (DG) harness side and ground.	**Yes** GO to C2 . **No** REPAIR circuit 1523 (DG) for an open. REINITIALIZE the LF power window motor. REFER to Door Window Motor Initialization

 A0054333 ● **Is the voltage greater than 10 volts?**	in this section. TEST the system for normal operation.
C2 CHECK THE LF WINDOW MOTOR DELAYED ACCESSORY FEED	
● Key in ON position. ● Measure the voltage between LF power window motor C540-2, circuit 194 (PK) harness side and ground.  A0054334 ● **Is the voltage greater than 10 volts?**	**Yes** GO to C3 . **No** REPAIR circuit 194 (PK) for an open. REINITIALIZE the LF power window motor. REFER to Door Window Motor Initialization in this section. TEST the system for normal operation.
C3 CHECK THE LF MOTOR GROUNDS	
● Key in OFF position. ● Measure the resistance between LF power window motor C540-5, circuit 875 (BK/LB) and C540-8, circuit 57 (BK) harness side and ground.  A0054335 ● **Are the resistances less than 5 ohms?**	**Yes** GO to C4 . **No** REPAIR circuit 57 (BK) or circuit 875 (BK/LB) for an open. REINITIALIZE the LF power window motor. REFER to Door Window Motor Initialization in this section. TEST the system for normal operation.
C4 CHECK THE FRONT WINDOW SWITCH TO LF MOTOR FEEDS	
● Disconnect: Front Window Control Switch C3193b. ● Measure the resistance between LF power window motor C540-3, circuit 992 (WH/BK) and front window control switch C3193b-3, circuit 992 (WH/BK); C540-4, circuit 991 (TN/LB) and C3193b-2, circuit 991 (TN/LB); C540-6, circuit 2018 (OG/YE) or (LG/OG) and C3193b-1, circuit 2018 (OG/YE)/ (LG/OG) or 1007 (YE/RD) harness side.	**Yes** GO to C5 . **No** REPAIR circuit 992 (WH/BK), circuit 991 (TN/LB), circuit 2018 (OG/YE)/(LG/OG) or 1007 (YE/RD) for an open.

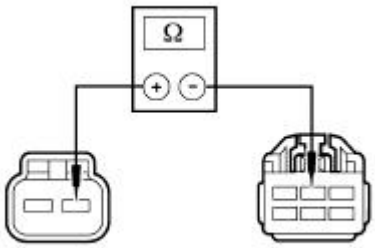
 A0054336 ● **Are the resistances less than 5 ohms?**	REINITIALIZE the LF power window motor. REFER to Door Window Motor Initialization in this section. TEST the system for normal operation.
C5 CHECK THE FRONT WINDOW CONTROL SWITCH ● Carry out the window control switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Did the window control switch pass the component test?**	**Yes** INSTALL a new LF power window motor. REFER to Front Door Window Regulator Motor in this section. REINITIALIZE the LF door window motor. REFER to Door Window Motor Initialization in this section. TEST the system for normal operation. **No** INSTALL a new front window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation.

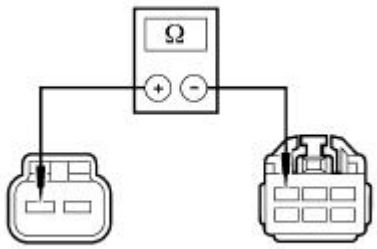
PINPOINT TEST D: THE RF POWER WINDOW IS INOPERATIVE — EXPEDITION





Test Step	Result / Action to Take
D1 CHECK THE VOLTAGE TO THE PASSENGER WINDOW REGULATOR CONTROL SWITCH ● Disconnect: RF Window Control Switch C624. ● Key in ON position. ● **NOTE:** Set the window lock switch to the UNLOCK position. ● Measure the voltage between RF window control switch C624-4, circuit 193 (YE/LG) and ground.  A0047336	**Yes** GO to D2. **No** REPAIR circuit 193 (YE/LG) for an open. TEST the system for normal operation.

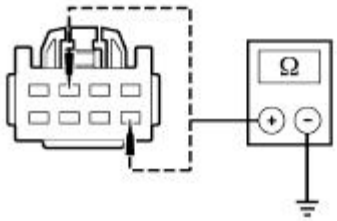


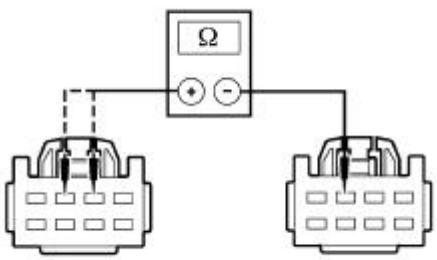


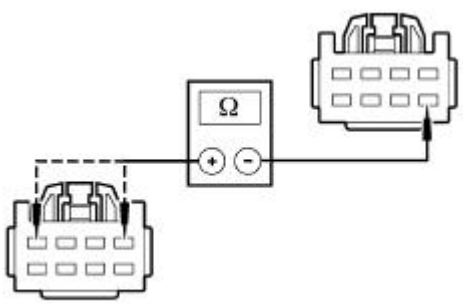
• **Is the voltage greater than 10 volts?**	
D2 CHECK CIRCUITS 313 (WH/YE) AND 314 (TN/LB) FOR CONTINUITY TO GROUND	
• Key in OFF position. • Measure the resistance between ground and RF window control switch C624: ■ pin 5, circuit 313 (WH/YE). ■ pin 3, circuit 314 (TN/LB)  A0047337 • **Are the resistances less than 5 ohms?**	**Yes** GO to D4 . **No** GO to D3 .
D3 CHECK CIRCUITS 313 (WH/YE) AND 314 (TN/LB) FOR AN OPEN	
• Disconnect: LF Window Control Switch C504a. • Measure the resistance between LF window control switch C504a-8, circuit 313 (WH/YE) and RF window control switch C624-5, circuit 313 (WH/YE) harness side.  A0047338 • Measure the resistance between LF window control switch C504a-7, circuit 314 (TN/LB) and RF window control switch C624-3, circuit 314 (TN/LB) harness side.  A0047339 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new LF window control switch. REFER to Window Control Switch . TEST the system for normal operation. **No** REPAIR circuit 313 (WH/YE) or 314 (TN/LB) for an open. TEST the system for normal operation.
D4 CHECK THE RF POWER WINDOW SWITCH	
• Key in ON position. • Connect a fused jumper wire between C624-5, circuit 313 (WH/YE) and C624-6, circuit 333 (YE/RD) and connect a second fused jumper wire between C624-4, circuit 193 (YE/LG) and C624-	**Yes** INSTALL a new RF window regulator control switch.

2, circuit 334 (RD/YE). The window should operate in the up direction.  A0047340 • Connect a fused jumper wire between C624-3, circuit 314 (TN/LB) and C624-2, circuit 334 (RD/YE) and connect a second fused jumper wire between C624-4, circuit 193 (YE/LG) and C624-6, circuit 333 (YE/RD). The window should operate in the down direction.  A0047341 • **Does the window operate correctly?**	REFER to Window Control Switch . TEST the system for normal operation. **No** GO to D5 .
D5 CHECK CIRCUITS 333 (YE/RD) AND 334 (RD/YE) FOR AN OPEN	
• Key in OFF position. • Disconnect: RF Window Motor C608. • Measure the resistance between RF window control switch C624-6, circuit 333 (YE/RD) harness side, and between and RF window motor C608-1, circuit 333 (YE/RD) harness side.  A0047333 • Measure the resistance between RF window control switch C624-2, circuit 334 (RD/YE) harness side, and between and RF window motor C608-2, circuit 334 (RD/YE) harness side.	**Yes** INSTALL a new RF window regulator motor. REFER to Front Door Window Regulator Motor . TEST the system for normal operation. **No** REPAIR circuit 333 (YE/RD) or 334 (RD/YE) for an open. TEST the system for normal operation.

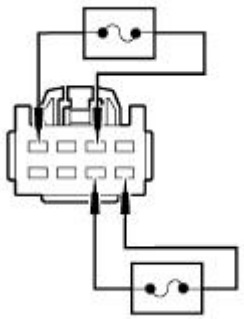
 A0047342 ● **Are the resistances less than 5 ohms?**	

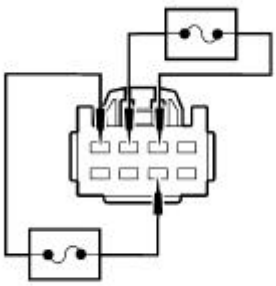


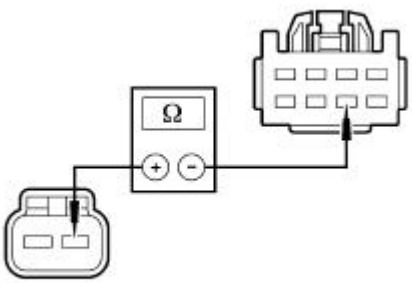




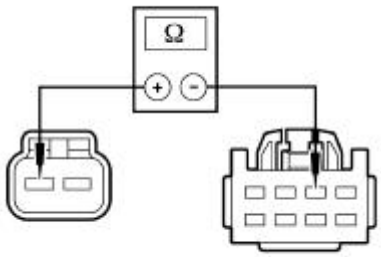
PINPOINT TEST E: THE RF POWER WINDOW IS INOPERATIVE — NAVIGATOR





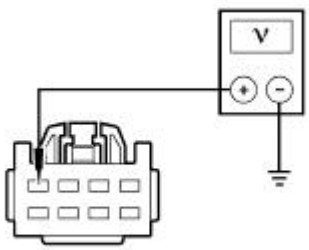


Test Step	Result / Action to Take
E1 CHECK THE RF POWER WINDOW MOTOR	
● Disconnect: Window Control Switch C3193a and 3193b. ● Key in ON position. ● Connect a fused jumper wire between C3193a-2, circuit 313 (WH/YE) and C3193a-4, circuit 57 (BK) and connect a second fused jumper wire between C3193a-6, circuit 400 (LB/BK) and C3193a-3, circuit 314 (TN/LB). The window should operate in the up direction.  A0047349 ● Connect a fused jumper wire between C3193a-3, circuit 314 (TN/LB) and C3193a-4, circuit 57 (BK) and connect a second fused jumper wire between C3193a-6, circuit 400 (LB/BK) and C3193a-2, circuit 313 (WH/YE). The window should operate in the down direction.  A0047350 ● **Does the window operate correctly?**	**Yes** INSTALL a new front window regulator control switch. REFER to Window Control Switch . TEST the system for normal operation. **No** GO to E2 .
E2 CHECK CIRCUITS 313 (WH/YE), 333 (YE/RD), 314 (TN/LB) AND 334 (RD/YE) FOR AN OPEN	

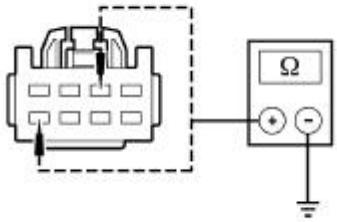


• Key in OFF position. • Disconnect: RF Window Motor C608. • Measure the resistance between front window control switch C3193a-2, circuit 313 (WH/YE) and between and RF window motor C608-1, circuit 333 (YE/RD) harness side.  A0047351 • Measure the resistance between RF power window control switch C3193a-3, circuit 314 (TN/LB) and between and RF window motor C608-2, circuit 334 (RD/YE) harness side.  A0047352 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new RF window regulator motor. REFER to Front Door Window Regulator Motor . TEST the system for normal operation. **No** REPAIR circuit 313 (WH/YE), 314 (TN/LB), 333 (YE/RD) or 334 (RD/YE) for an open. TEST the system for normal operation.

PINPOINT TEST F: THE LR OR RR POWER WINDOW IS INOPERATIVE — EXPEDITION



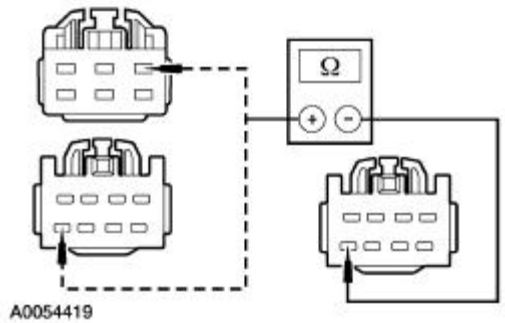
Test Step	Result / Action to Take
F1 CHECK THE VOLTAGE TO THE LR OR RR WINDOW CONTROL SWITCH	
• Disconnect: Inoperative Rear Window Control Switch C701/C801. • Key in ON position. • **NOTE:** Set the window lock switch to the UNLOCK position. • Measure the voltage between the inoperative rear window connector pin 4, circuit 193 (YE/LG) and ground.  A0047336 • **Is the voltage greater than 10 volts?**	**Yes** GO to F2 . **No** REPAIR circuit 193 (YE/LG) for an open. TEST the system for normal operation.

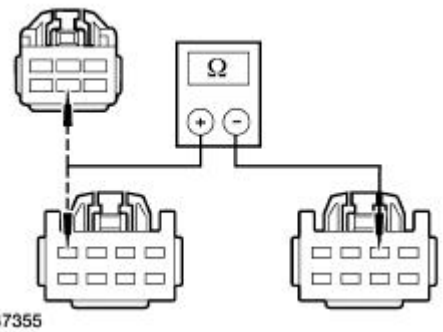


F2 CHECK THE GROUNDS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH	
• Key in OFF position. • Measure the resistance between ground and the inoperative window control switch C701/C801: ■ pin 3, circuit 320 (RD/BK). ■ pin 5, circuit 319 (YE/BK).  A0047337 • **Are the resistances less than 5 ohms?**	**Yes** GO to F4 . **No** GO to F3 .
F3 CHECK THE CIRCUITS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH FOR AN OPEN	
• Key in OFF position. • Disconnect: LF Window Control Switch C504a. • Measure the resistance between LF window control switch C504a-2, circuit 316 (YE/LB) and LR window control switch C701-3, circuit 320 (RD/BK) or, between LF window control switch C504a-3, circuit 320 (RD/BK) and RR window control switch C801-3, circuit 320 (RD/BK) harness side.  A0047343 • Measure the resistance between LF window control switch C504a-1, circuit 317 (GY/OG) and LR window control switch C701-5, circuit 319 (YE/BK) or, between LF window control switch C504a-4, circuit 319 (YE/BK) and RR window control switch C801-5, circuit 319 (YE/BK) harness side.  A0047344 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new LF window control switch. REFER to Window Control Switch . TEST the system for normal operation. **No** REPAIR circuit 316 (YE/LB), 317 (GY/OG), 319 (YE/BK) or 320 (RD/BK) for an open. TEST the system for normal operation.
F4 CHECK THE INOPERATIVE WINDOW CONTROL SWITCH	

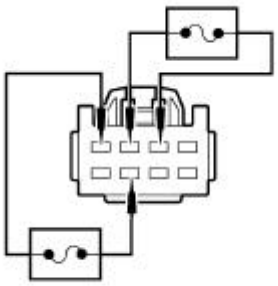
• Connect: LF Window Control Switch C504a. • Key in ON position. • Connect a fused jumper wire between inoperative power window switch C701/C801-5, circuit 319 (YE/BK) and C701/C801-6, circuit 881 (BN) and connect a second fused jumper wire between C701/C801-4, circuit 193 (YE/LG) and C701/C801-2, circuit 882 (BN/YE). The window should operate in the up direction.  A0047340 • Connect a jumper wire between inoperative power window switch C701/C801-3, circuit 320 (RD/BK) and C701/C801-2, circuit 882 (BN/YE) and connect a second fused jumper wire between C701/C801-4, circuit 193 (YE/LG) and C701/C801-6, circuit 881 (BN). The window should operate in the down direction.  A0047341 • **Does the window operate correctly?**	**Yes** INSTALL a new rear window regulator control switch. REFER to Window Control Switch . TEST the system for normal operation. **No** GO to F5 .
F5 CHECK POWER WINDOW MOTOR CIRCUITS	
• Key in OFF position. • Disconnect: Inoperative Power Window Motor C703/C803. • Measure the resistance between inoperative window control switch C701/C801-6, circuit 881 (BN), and inoperative power window motor C703/C803-1, circuit 881 (BN) harness side.  A0047333 • Measure the resistance between inoperative window control switch C701/C801-2, circuit 882 (BN/YE), and inoperative power window motor C703/C803-2, circuit 882 (BN/YE) harness side.	**Yes** INSTALL a new rear window regulator motor. REFER to Rear Door Window Regulator Motor . TEST the system for normal operation. **No** REPAIR the circuit (s) for an open. TEST the system for normal operation.

 A0047342 ● **Are the resistances less than 5 ohms?**	



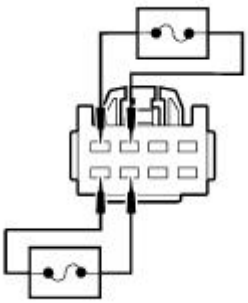


PINPOINT TEST G: THE LR OR RR POWER WINDOW IS INOPERATIVE — NAVIGATOR



Test Step	Result / Action to Take
G1 CHECK THE VOLTAGE TO THE LR OR RR WINDOW CONTROL SWITCH	
● Disconnect: Inoperative Rear Window Control Switch C717/C819. ● Key in ON position. ● **NOTE:** Set the window lock switch to the UNLOCK position. ● Measure the voltage between the inoperative rear window connector pin 4, circuit 193 (YE/LG) and ground.  A0047336 ● **Is the voltage greater than 10 volts?**	**Yes** GO to G2 . **No** REPAIR circuit 193 (YE/LG) for an open. TEST the system for normal operation.
G2 CHECK THE GROUNDS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH	
● Key in OFF position. ● Measure the resistance between ground and inoperative window control switch C717/C819: ■ pin 8, circuit 320 (RD/BK). ■ pin 2, circuit 319 (YE/BK).	**Yes** GO to G4 . **No** GO to G3 .

A0047353



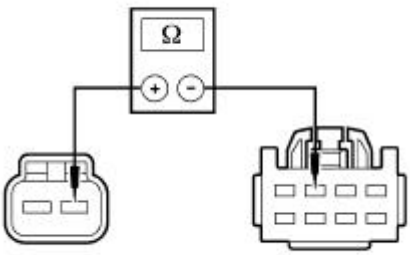
- **Are the resistances less than 5 ohms?**

G3 CHECK THE CIRCUITS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH FOR AN OPEN	
• Key in OFF position. • Disconnect: Front Window Control Switch C3193a/C3193b. • Measure the resistance between front window control switch C3193b-8, circuit 316 (YE/LB) and LR window control switch C717-8, circuit 320 (RD/BK) or, between front window control switch C3193a-1, circuit 320 (RD/BK) and RR window control switch C819-8, circuit 320 (RD/BK) harness side.  A0054419 • Measure the resistance between front window control switch C3193b-4, circuit 317 (GY/OG) and LR window control switch C717-2, circuit 319 (YE/BK) or, between front window control switch C3193a-5, circuit 319 (YE/BK) and RR window control switch C819-2, circuit 319 (YE/BK) harness side.  A0047355 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new front window control switch. REFER to Window Control Switch . TEST the system for normal operation. **No** REPAIR the circuit (s) for an open. TEST the system for normal operation.
G4 CHECK THE INOPERATIVE WINDOW CONTROL SWITCH	
• Connect: Front Window Control Switch C3193a/C3193b. • Key in ON position. • Connect a fused jumper wire between inoperative power window switch C717/C819-2, circuit 319 (YE/BK) and C717/C819-3, circuit 881 (BN) and connect a second fused jumper wire between C717/C819-4, circuit 193 (YE/LG) and C717/C819-7, circuit 882 (BN/YE). The window should operate in the up direction.	**Yes** INSTALL a new rear window regulator control switch. REFER to Window Control Switch . TEST the system for normal

A0047356

- Connect a fused jumper wire between inoperative power window switch C717/C819-8, circuit 320 (RD/BK) and C717/C819-7, circuit 882 (BN/YE) and connect a second fused jumper wire between C717/C819-4, circuit 193 (YE/LG) and C717/C819-3, circuit 881 (BN). The window should operate in the down direction.

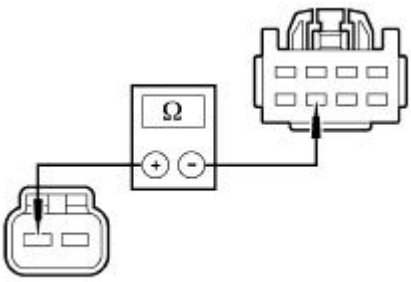
A0047357



- **Does the window operate correctly?**

operation.

No
GO to G5 .



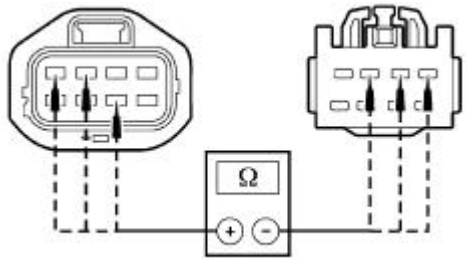
G5 CHECK THE POWER WINDOW MOTOR CIRCUITS

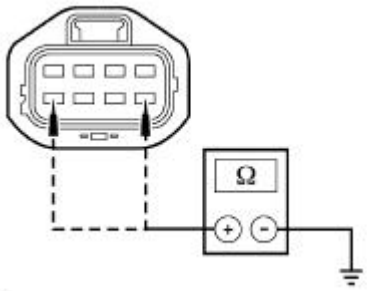
- Key in OFF position.
- Disconnect: Inoperative Power Window Motor C703/C803.
- Measure the resistance between inoperative window control switch C717/C819-3, circuit 881 (BN), and inoperative power window motor C703/C803-1, circuit 881 (BN) harness side.

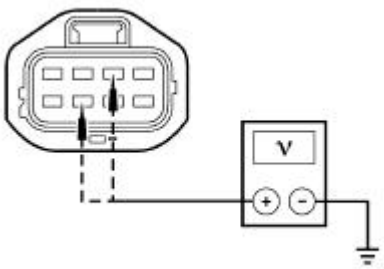
A0047358

- Measure the resistance between inoperative window control switch C717/C819-7, circuit 882 (BN/YE), and inoperative power window motor C703/C803-2, circuit 882 (BN/YE) harness side.

A0047359



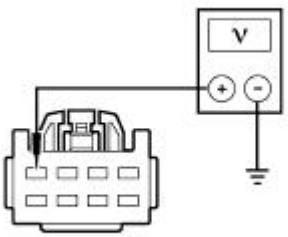


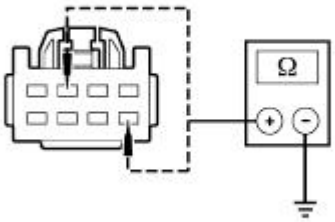


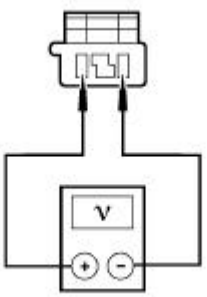
Yes
INSTALL a new window motor. REFER to Front Door Window Regulator Motor . TEST the system for normal operation.

No
REPAIR circuit 881 (BN) or 882 (BN/YE) for an open. TEST the system for normal operation.

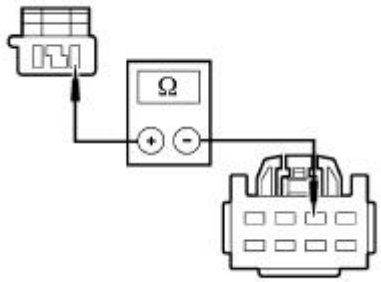
• **Are the resistances less than 5 ohms?**	

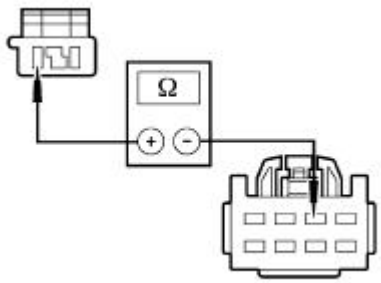


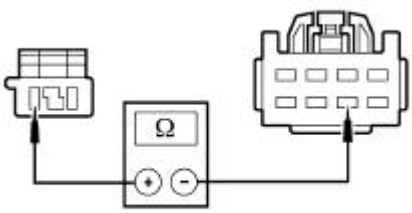




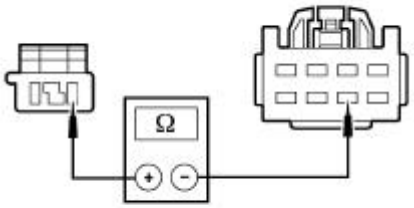
PINPOINT TEST H: THE ONE-TOUCH UP/DOWN FEATURE IS INOPERATIVE — NAVIGATOR





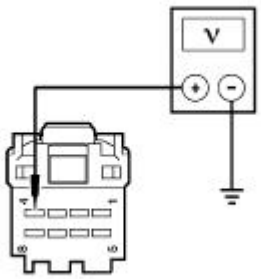


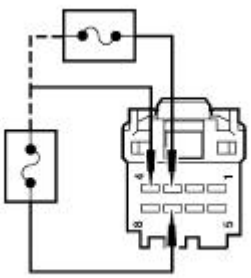
Test Step	Result / Action to Take
NOTE: The LF power window motor is not on the multiplex link.	
NOTE: A new LF power window motor will be in proportional up/down mode until initialized. Refer to Door Window Motor Initialization in this section.	
NOTE: The LF power window motor must be reinitialized whenever: the motor is removed from the window regulator drum housing, a new motor is installed, a new window regulator is installed, a new window glass is installed, a new top run is installed, and when carrying out any operation in which grease or lubricants are applied to the window system.	
H1 CHECK FOR POWER (B+) LOSS DURING LF WINDOW OPERATION	
• Verify if power (B+) was lost during LF window operation. • **Was power (B+) lost while LF window was in operation?**	**Yes** RAISE the LF window to the fully closed position. MAKE SURE the window glass stalls into the upper header seal. Normal functionality should resume. TEST the system for normal operation. **No** GO to H2.
H2 INITIALIZE THE LF MOTOR	
• Carry out the LF window motor initialization procedure. Refer to Door Window Motor Initialization in this section. • **Are the one-touch up/down functions operating correctly?**	**Yes** Repair is complete. TEST the system for normal operation. **No** GO to H3.
H3 CHECK THE FRONT WINDOW CONTROL SWITCH	
• Carry out the front window switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the front window switch pass the component test?**	**Yes** GO to H4. **No** INSTALL a new front window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation.
H4 CHECK THE FRONT WINDOW SWITCH TO LF MOTOR FEEDS	
• Key in OFF position. • Disconnect: Power Window Switch C3193b. • Disconnect: LF Power Window Motor C540. • Measure the resistance between LF power window motor C540-3, circuit 992 (WH/BK) and front window control switch C3193b-3, circuit 992 (WH/BK); C540-4, circuit 991 (TN/LB)	**Yes** GO to H5. **No** REPAIR circuit 992 (WH/BK), circuit 991



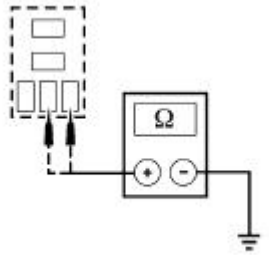
and C3193b-2, circuit 991 (TN/LB); C540-6, circuit 2018 (OG/YE) or (LG/OG) and C3193b-1, circuit 2018 (OG/YE)/ (LG/OG) or 1007 (YE/RD) harness side.  A0054336 ● **Are the resistances less than 5 ohms?**	(TN/LB), circuit 2018 (OG/YE)/(LG/OG) or 1007 (YE/RD) for an open. REINITIALIZE the LF power window motor. REFER to Door Window Motor Initialization in this section. TEST the system for normal operation.
H5 CHECK FOR INTERMITTENT GROUND CONNECTIONS	
● Key in OFF position. ● Measure the resistance between LF power window motor C540-5, circuit 875 (BK/LB) and C540-8, circuit 57 (BK) harness side and ground.  A0054335 ● Wiggle the harness while measuring the resistances. ● **Are the resistances less than 5 ohms?**	**Yes** GO to H6 . **No** REPAIR circuit 875 (BK/LB) or circuit 57 (BK) for an open. REINITIALIZE the LF power window motor. REFER to Door Window Motor Initialization Initialization in this section. TEST the system for normal operation.
H6 CHECK FOR INTERMITTENT POWER CONNECTIONS	
● Key in ON position. ● Measure the voltage between LF power window motor C540-7, circuit 1523 (DG) and C540-2, circuit 194 (PK) harness side and ground.  A0054422 ● Wiggle the harness while measuring the voltages. ● **Are the voltages greater than 10 volts?**	**Yes** INSTALL a new LF power window motor. REFER to Front Door Window Regulator Motor in this section. REINITIALIZE the LF power window motor. REFER to Door Window Motor Initialization in this section. TEST the system for normal operation. **No** REPAIR circuit 1523 (DG) or circuit 194 (PK) for an open. REINITIALIZE the LF power window motor. REFER to Door Window Motor Initialization in this section. TEST the system for normal operation.

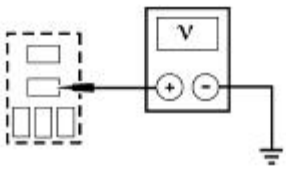
PINPOINT TEST I: THE VENT POWER WINDOWS ARE

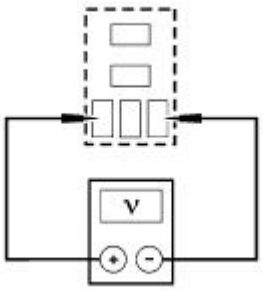




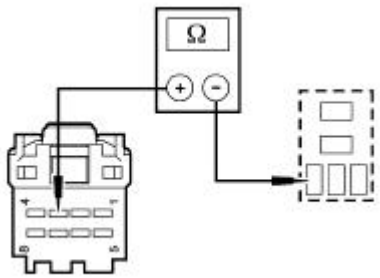
INOPERATIVE — EXPEDITION

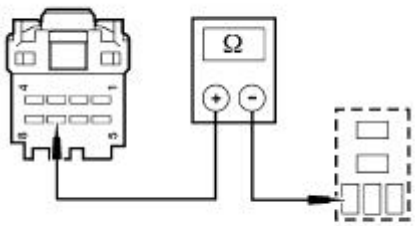


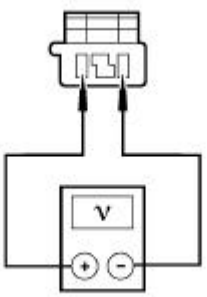




Test Step	Result / Action to Take
I1 CHECK FOR POWER TO THE VENT WINDOW SWITCH	
• Disconnect: Power Vent Window Switch C998. • Key in ON position. • Measure the voltage between power vent window switch C998-4, circuit 194 (PK) and ground.  A0047360 • **Is the voltage greater than 10 volts?**	**Yes** GO to I2 . **No** REPAIR circuit 194 (PK) for an open. TEST the system for normal operation.
I2 CHECK THE POWER VENT WINDOW SWITCH GROUND	
• Key in OFF position. • Measure the resistance between inoperative power vent window switch C998-3 and C998-1, circuit 57 (BK) and ground.  A0047337 • **Are the resistances less than 5 ohms?**	**Yes** GO to I3 . **No** REPAIR circuit 57 (BK) for an open. TEST the system for normal operation.
I3 CHECK THE POWER VENT WINDOW SWITCH OPERATION	
• Connect: Power Vent Window Switch C998. • Disconnect: Power Vent Window Motor C4047 (LH)/C4090 (RH). • Measure the voltage between inoperative power vent window motor C4047-1, circuit 1942 (RD/YE) and C4047-2, circuit 1941 (YE/LB) for the LH; or between inoperative power vent window motor C4090-1, circuit 1941 (YE/LB) and C4090-2, circuit 1942 (RD/YE) for the RH while activating the power vent window switch from OPEN to CLOSE.  A0043665	**Yes** INSTALL a new power vent window regulator motor. REFER to Rear Quarter Window Regulator Motor . TEST the system for normal operation. **No** GO to I4 .





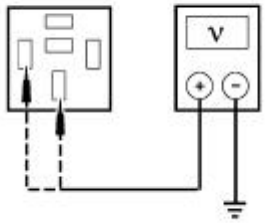


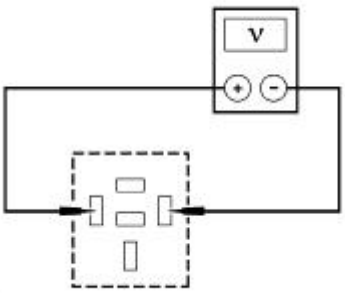
• **Did the voltage change from greater than +10 volts to -10 volts?**	
I4 CHECK CIRCUIT 1942 (RD/YE) FOR AN OPEN	
• **NOTE:** For LH side. • Measure the resistance between power vent window motor C4047-1, circuit 1942 (RD/YE) and power vent window switch C998-2, circuit 1942 (RD/YE).  A0047363 • **NOTE:** For RH side. • Measure the resistance between power vent window motor C4090-2, circuit 1942 (RD/YE) and power vent window switch C998-2, circuit 1942 (RD/YE).  A0047364 • **Is the resistance less than 5 ohms?**	**Yes** GO to I5 . **No** REPAIR circuit 1942 (RD/YE) for an open. TEST the system for normal operation.
I5 CHECK CIRCUIT 1941 (YE/LB) FOR AN OPEN	
• **NOTE:** For LH side. • Measure the resistance between power vent window motor C4047-2, circuit 1941 (YE/LB) and power vent window switch C998-6, circuit 1941 (YE/LB).  A0047361 • **NOTE:** For RH side. • Measure the resistance between power vent window motor C4090-1, circuit 1941 (YE/LB) and power vent window switch C998-6, circuit 1941 (YE/LB).	**Yes** INSTALL a new vent power window switch. REFER to Window Control Switch . TEST the system for normal operation. **No** REPAIR circuit 1941 (YE/LB) for an open. TEST the system for normal operation.

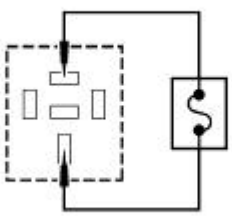
 A0047362 ● **Is the resistance less than 5 ohms?**	

PINPOINT TEST J: THE VENT POWER WINDOWS ARE INOPERATIVE — NAVIGATOR

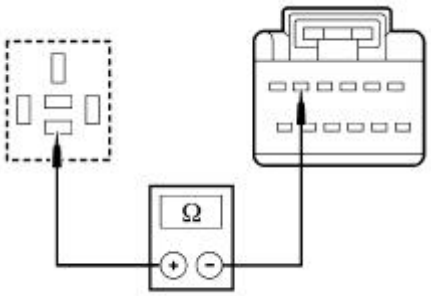
Test Step	Result / Action to Take
J1 CHECK FOR POWER TO THE VENT WINDOW SWITCH	
● Disconnect: Power Vent Window Switch C999. ● Key in ON position. ● Measure the voltage between power vent window switch C999-4, circuit 194 (PK) and ground.  A0047365 ● **Is the voltage greater than 10 volts?**	**Yes** GO to J2 . **No** REPAIR circuit 194 (PK) for an open. TEST the system for normal operation.
J2 CHECK THE POWER VENT WINDOW SWITCH	
● Connect a fused jumper wire between power vent window switch C999-4, circuit 194 (PK) and C999-3, circuit 1942 (RD/YE). Remove the fused jumper wire and connect it between power vent window switch C999-4, circuit 194 (PK) and C999-7, circuit 1941 (YE/LB). The vent power window should operate open and closed.  A0047366 ● **Did the vent power window operate correctly?**	**Yes** INSTALL a new power vent window switch. REFER to Window Control Switch . TEST the system for normal operation. **No** GO to J3 .
J3 CHECK THE POWER VENT WINDOW RELAY GROUND CIRCUITS	







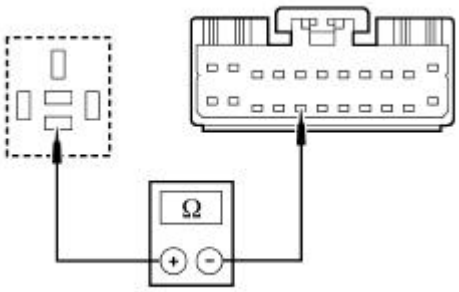
• Key in OFF position. • Disconnect: Power Vent Window Relays C4175 and C4176. • Measure the resistance between power vent window relays C4175/C4176-2, and C4175/C4176-4, circuit 57 (BK) and ground.  A0047367 • **Are the resistances less than 5 ohms?**	**Yes** GO to J4 . **No** REPAIR circuit 57 (BK) for an open. TEST the system for normal operation.
J4 CHECK THE POWER VENT WINDOW RELAY POWER CIRCUITS	
• Key in ON position. • Measure the voltage between power vent window relays C4175/C4176-5, circuit 194 (PK) and ground.  A0047368 • **Is the voltage greater than 10 volts?**	**Yes** GO to J5 . **No** REPAIR circuit 194 (PK) for an open. TEST the system for normal operation.
J5 CHECK THE POWER VENT WINDOW RELAY POWER CIRCUITS	
• Key in OFF position. • Connect: Power Vent Window Switch C999. • Key in ON position. • While switching the power vent window switch from open to close, measure the voltage between power vent window relay: ■ C4176-1, circuit 1942 (RD/YE) and C4176-2, circuit 57 (BK). ■ C4175-1, circuit 1941 (YE/LB) and C4175-2, circuit 57 (BK).  A0040189 • **Is the voltage greater than 10 volts?**	**Yes** GO to J7 . **No** GO to J6 .
J6 CHECK CIRCUIT 1942 (RD/YE) AND CIRCUIT 1941 (YE/LB) FOR AN OPEN	
• Key in OFF position. • Disconnect: Power Vent Window Switch C999.	**Yes** INSTALL a new



• Measure the resistance between power vent window relay C4176-1, circuit 1942 (RD/YE) and power vent window switch C999-3, circuit 1942 (RD/YE).  A0047369 • Measure the resistance between power vent window motor C4175-1, circuit 1941 (YE/LB) and power vent window switch C999-7, circuit 1941 (YE/LB).  A0047370 • **Are the resistances less than 5 ohms?**	vent power window switch. REFER to Window Control Switch . TEST the system for normal operation. **No** REPAIR circuit 1941 (YE/LB) for an open. TEST the system for normal operation.
J7 CHECK THE VOLTAGE TO THE MOTOR • Key in OFF position. • Connect: Power Vent Window Relays C4175 and C4176. • Disconnect: Power Vent Window Motor C4047 (LH)/C4090 (RH). • Key in ON position. • Measure the voltage between inoperative power vent window motor C4047-1, circuit 1157 (WH/LB) and C4047-2, circuit 1156 (YE/RD) for the LH; or between inoperative power vent window motor C4090-1, circuit 1156 (YE/RD) and C4090-2, circuit 1157 (WH/LB) for the RH while activating the power vent window switch from OPEN to CLOSE.  A0043665 • **Did the voltage change from greater than +10 volts to -10 volts?**	**Yes** INSTALL a new power vent window regulator motor. REFER to Rear Quarter Window Regulator Motor . TEST the system for normal operation. **No** GO to J8 .
J8 CHECK THE MOTOR CIRCUITS • Key in OFF position. • Disconnect: Power Vent Window Relays C4175 and C4176. • Measure the resistance between power vent window relay C4175-3, circuit 1156 (YE/RD) and power vent window motor: ▪ (RH) C4090-1, circuit 1156 (YE/RD).	**Yes** INSTALL a new power vent window relay. TEST the system for normal

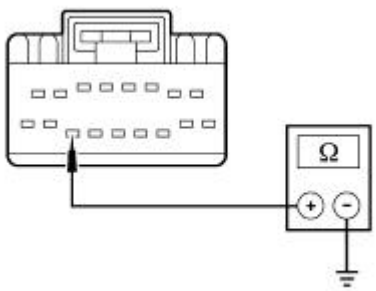
■ (LH) C4047-2, circuit 1156 (YE/RD).  A0047371 ● Measure the resistance between power vent window relay C4176-3, circuit 1157 (WH/RD) and power vent window motor: ■ (RH) C4090-2, circuit 1157 (WH/RD). ■ (LH) C4047-1, circuit 1157 (WH/RD).  A0047371 ● **Are the resistances less than 5 ohms?**	operation. **No** REPAIR circuit(s). TEST the system for normal operation.

PINPOINT TEST K: THE DEFROST SYSTEM IS INOPERATIVE

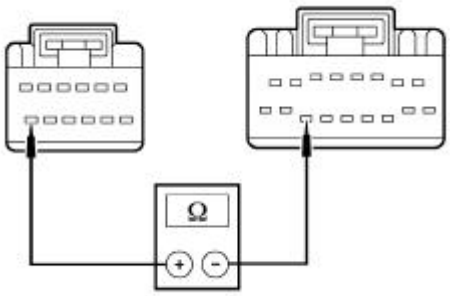


Test Step	Result / Action to Take
K1 CHECK THE POWER TO THE INDICATOR LIGHT	
● Key in ON position. ● Depress the rear window defrost switch to ON. ● **Is the rear window defrost switch indicator ON?**	**Yes** GO to K11 . **No** GO to K2 .
K2 CHECK THE DIAGNOSTIC TROUBLE CODES (DTCS)	
● Refer to the results from the previous instrument cluster module (ICM) self-test. ● **Was DTC B1345 retrieved?**	**Yes** GO to K13 . **No** GO to K3 .
K3 CHECK THE POWER TO THE RELAY	
● Key in OFF position. ● Disconnect: Rear Window Defrost Relay. ● Key in ON position. ● Measure the voltage between rear window defrost relay socket pin 85 and pin 30 harness side and ground.	**Yes** GO to K4 . **No** REPAIR the circuit(s). TEST the system for normal operation.

 A0043704 ● **Is the voltage greater than 10 volts?**	
K4 CHECK THE ICM OUTPUT	
● Measure the voltage between rear window defrost relay socket pin 85 and pin 86, circuit 1009 (OG/YE).  A0038291 ● **Is the voltage greater than 10 volts?**	**Yes** GO to K5 . **No** GO to K7 .
K5 CHECK THE RELAY	
● Connect a fused jumper between rear window defrost relay socket pin 30 and pin 87, circuit 59 (DG/VT).  A0032587 ● **Is the rear window defrost switch indicator ON?**	**Yes** INSTALL a new rear window defrost relay. TEST the system for normal operation. **No** GO to K6 .
K6 CHECK CIRCUIT 59 (DG/VT)	
● Key in OFF position. ● Disconnect: Mode Switch C294c or EATC Module C228b. ● **NOTE:** Manual climate control only. ● Measure the resistance between rear window defrost relay socket pin 87, circuit 59 (DG/VT) and mode switch C294c-5, circuit 59 (DG/VT).	**Yes** INSTALL a new mode switch or EATC module. REFER to Section 412-04 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

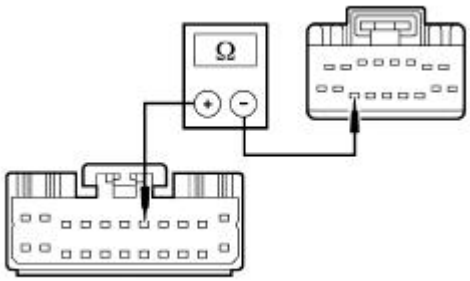


A0047428



- **NOTE:** EATC only.
- Measure the resistance between rear window defrost relay socket pin 87, circuit 59 (DG/VT) and EATC module C228b-16, circuit 59 (DG/VT).

A0047429

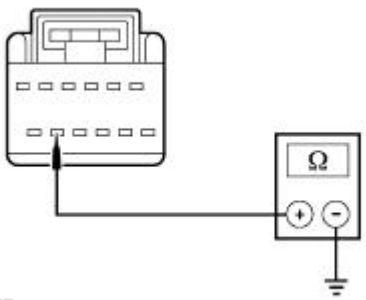


- **Is the resistance less than 5 ohms?**

K7 CHECK THE REAR WINDOW DEFROST SWITCH	
• Key in OFF position. • Disconnect: ICM C220b. • Depress the rear window defrost switch to ON. • Measure the resistance between ICM C220b-15, circuit 1010 (DB/OG) harness side and ground.  A0047594 • **Is the resistance less than 5 ohms when the switch is depressed?**	**Yes** GO to K10 . **No** GO to K8 .
K8 CHECK CIRCUIT 1010 (DB/OG) FOR AN OPEN	
• Disconnect: Mode Switch C294c or EATC Module C228a/C228b. • **NOTE:** Manual climate control only. • Measure the resistance between ICM C220b-15, circuit 1010 (DB/OG) and mode switch C294c-12, circuit 1010 (DB/OG).	**Yes** GO to K9 . **No** REPAIR the circuit. TEST the system for normal operation.

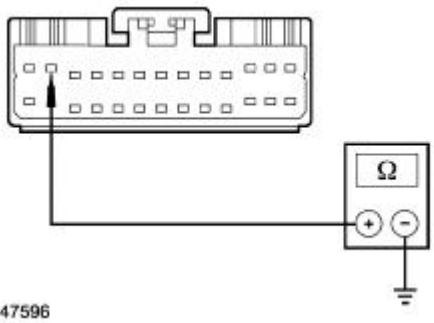
A0047433

- **NOTE:** EATC only.
- Measure the resistance between ICM C220b-15, circuit 1010 (DB/OG) and EATC module C228b-7, circuit 1010 (DB/OG).



A0047434

- **Is the resistance less than 5 ohms?**

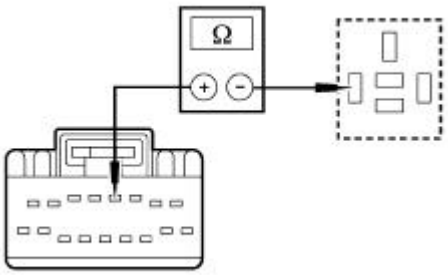


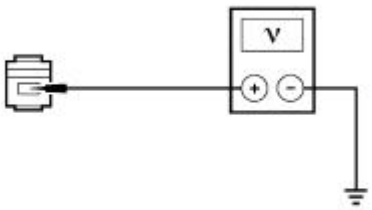
K9 CHECK THE REAR WINDOW DEFROST SWITCH GROUND

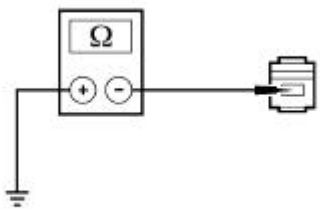
- **NOTE:** Manual climate control only.
- Measure the resistance between mode switch C294c-11, circuit 875 (BK/LB) harness side and ground.

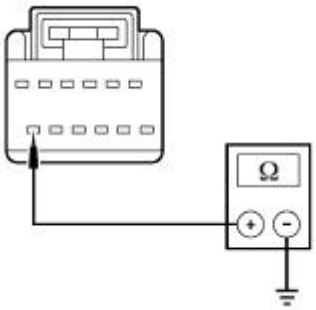
A0067637

- **NOTE:** EATC only.
- Measure the resistance between EATC module C228a-2, circuit 875 (BK/LB) harness side and ground.





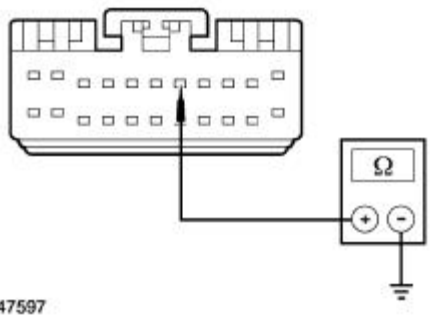




A0047596

- **Is the resistance less than 5 ohms?**

Yes
INSTALL a new mode switch or EATC module. REFER to Section 412-04 . TEST the system for normal operation.

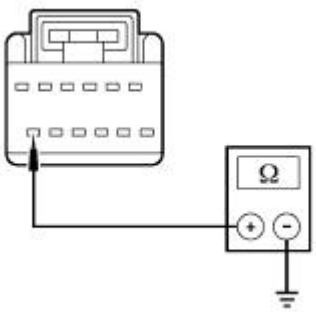


No
REPAIR the circuit. TEST the system for normal operation.

K10 CHECK CIRCUIT 1009 (OG/YE) FOR AN OPEN	
• Measure the resistance between ICM C220b-4, circuit 1009 (OG/YE) and rear window defrost relay socket pin 85, circuit 1009 (OG/YE).  A0047432 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new ICM. REFER to Section 413-01 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
K11 CHECK THE REAR WINDOW DEFROST GRID VOLTAGE	
• Disconnect: Rear Window Defrost Grid Power C402a. • Key in ON position. • Measure the voltage between rear window defrost grid power C402a, circuit 186 (BR/LB) and ground.  A0010207 • **Is the voltage greater than 10 volts?**	**Yes** GO to K12 . **No** REPAIR the circuit. TEST the system for normal operation.
K12 CHECK THE REAR WINDOW DEFROST GRID GROUND	
• Key in OFF position. • Disconnect: Rear Window Defrost Grid Ground C402b. • Measure the resistance between rear window defrost grid ground C402b, circuit 57 (BK) and ground.  A0010216 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the rear window defrost grid or INSTALL a new liftgate glass. REFER to Heated Window Grid Wire Repair . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
K13 CHECK THE ICM INPUT FOR A SHORT TO GROUND	
• Disconnect: Mode Switch C294c or EATC Module C228b. • **NOTE:** Manual climate control only. • Measure the resistance between mode switch C294c-12, circuit 1010 (DB/OG) harness side and ground.	**Yes** INSTALL a new mode switch or EATC module. REFER to Section 412-04 . TEST the system for normal operation.

A0047598

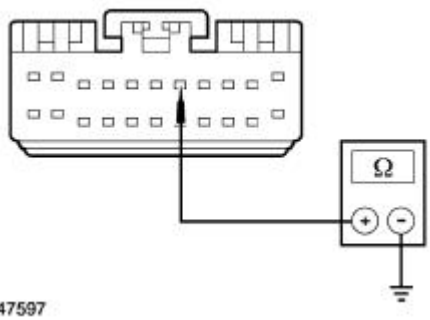
- **NOTE:** EATC only.
- Measure the resistance between EATC module C228b-7, circuit 1010 (DB/OG) harness side and ground.



A0047597

- **Is the resistance greater than 10,000 ohms?**

No
GO to K14 .

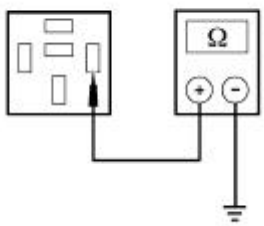


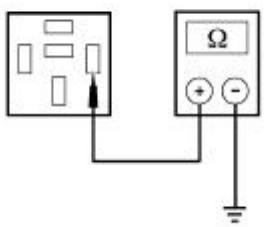
K14 CHECK THE ICM FOR AN INTERNAL SHORT

- Disconnect: ICM C220b.
- **NOTE:** Manual climate control only.
- Measure the resistance between mode switch C294c-12, circuit 1010 (DB/OG) harness side and ground.

A0047598

- **NOTE:** EATC only.
- Measure the resistance between EATC module C228b-7, circuit 1010 (DB/OG) harness side and ground.

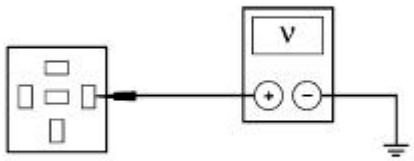


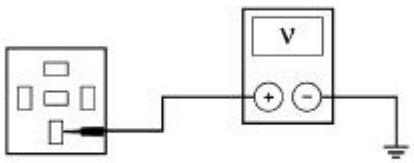


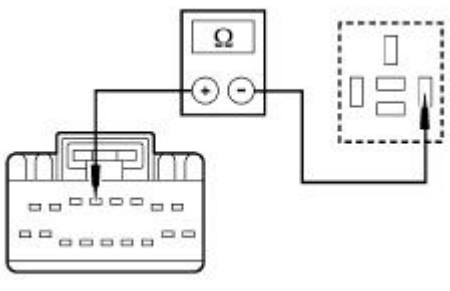
A0047597

- **Is the resistance greater than 10,000 ohms?**

Yes
INSTALL a new ICM. REFER to Section 413-01 . TEST the system for normal operation.







No
REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST L: THE DEFROST SYSTEM WILL NOT SHUT OFF AUTOMATICALLY

Test Step	Result / Action to Take
L1 CHECK CIRCUIT 186 (BN/LB) FOR A SHORT TO VOLTAGE	
• Disconnect: Rear Window Defrost Relay. • Key in ON position. • **Is the rear window defrost ON?**	**Yes** REPAIR circuit 186 (BN/LB) for a short to voltage. TEST the system for normal operation. **No** GO to L2 .
L2 CHECK THE REAR WINDOW DEFROST RELAY	
• Key in OFF position. • Measure the resistance between rear window defrost relay socket pin 85, circuit 1009 (OG/YE) and ground.  A0043703 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new rear window defrost relay. TEST the system for normal operation. **No** GO to L3 .
L3 CHECK THE INSTRUMENT CLUSTER MODULE (ICM)	
• Disconnect: ICM C220b. • Measure the resistance between rear window defrost relay socket pin 85, circuit 1009 (OG/YE) and ground.  A0043703 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new ICM. REFER to Section 413-01 . TEST the system for normal operation. **No** REPAIR circuit 1009 (OG/YE) for an open. TEST the system for normal operation.

PINPOINT TEST M: THE DELAYED ACCESSORY IS INOPERATIVE

Test Step	Result / Action to Take
M1 CHECK THE DELAYED ACCESSORY RELAY	
• Disconnect: Delayed Accessory Relay. • Carry out the delayed accessory relay component test. Refer to wiring Diagrams Cell 149 for schematic and connector	**Yes** GO to M2 .

information. ● **Did the delayed accessory relay pass the component test?**	**No** INSTALL a new delayed accessory relay. TEST the system for normal operation.
M2 CHECK THE POWER TO THE RELAY COIL ● Key in ON position. ● Measure the voltage between ground and delayed accessory relay socket pin 86  GN1438-A ● **Is the voltage greater than 10 volts?**	**Yes** GO to M3 . **No** REPAIR the central junction box (CJB). TEST the system for normal operation.
M3 CHECK THE POWER TO THE RELAY ● Measure the voltage between accessory delay relay socket pin 30 and ground.  GN1437-A ● **Is the voltage greater than 10 volts?**	**Yes** GO to M4 . **No** REPAIR the CJB. TEST the system for normal operation.
M4 CHECK CIRCUIT 1332 (LB) FOR AN OPEN ● Key in OFF position. ● Disconnect: Instrument Cluster Module (ICM) C220b. ● Measure the resistance between accessory delay relay socket pin 85, and ICM C220b-5, circuit 1332 (LB).  A0055245 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new ICM. REFER to Section 413-01 . TEST the system for normal operation. **No** REPAIR circuit 1332 (LB) for an open. TEST the system for normal operation.

Door Window Motor Initialization

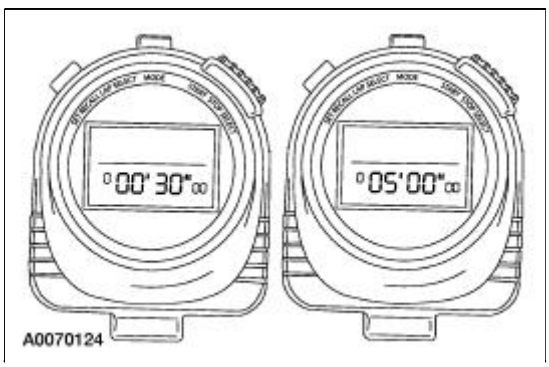
CAUTION: Make sure that no obstructions are present in the window system when carrying out this procedure.

NOTE: The LF window motor is in error mode when shipped and will be inoperative until initialized.

NOTE: The LF window motor must be reinitialized whenever: the motor is removed from window regulator drum housing, a new motor is installed, a new window regulator is installed, new window glass is installed, glass top run removal or installation, or when carrying out any operation in which grease or lubricants are applied to the window system.

NOTE: All LF window components (window glass, window regulator, window motor, and glass top run) must be installed and tightened to specification before carrying out this procedure.

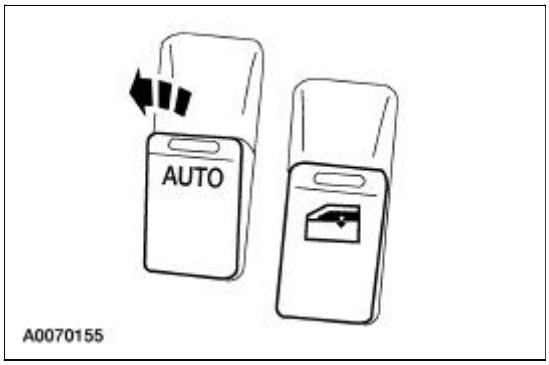
NOTE: If this procedure is only partially completed, the LF window motor will remain un-initialized and only the proportional up/down functions will operate.



NOTE: Once the ignition key is turned to the ON position in Step 6, it must remain on until the entire procedure is completed.

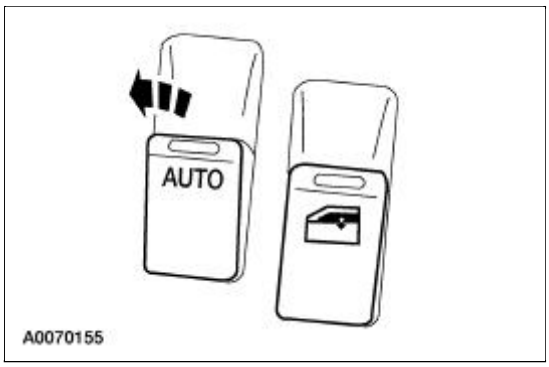
NOTE: Step 7 requires that the master control switch (LF) be held in the UP position until the LF window motor stalls the window glass into the upper header seal. Step 8 requires that the master control switch (LF) be momentarily actuated to the DOWN position.

NOTE: Step 9 requires that the master control switch (LF) be held in the UP position until the LF window motor stalls the window glass into the upper header seal and the window carries out its down-up sequence, indicating successful completion of initialization.



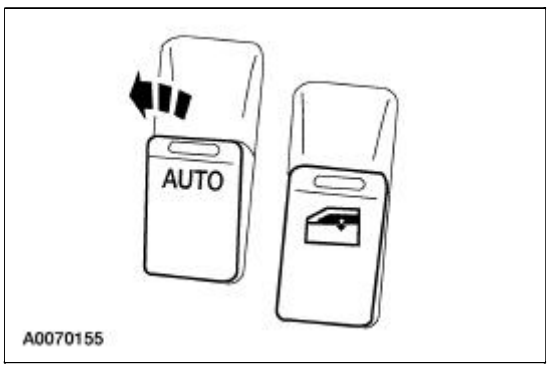
1. **NOTE:** Steps 1 through 6 must be completed within 30 seconds. The entire procedure must be completed within five minutes.

   Start with the ignition key in the OFF position with the LF door open.



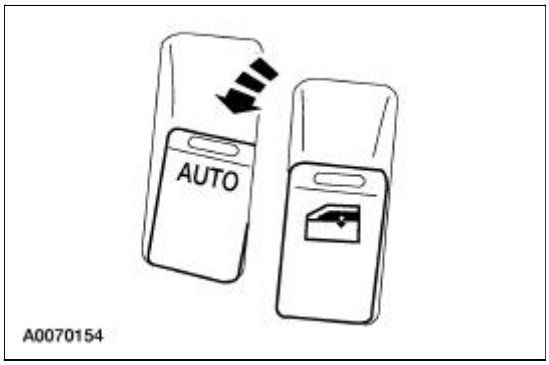
2. Turn the ignition key to the ON position.

3. Press the front window control switch (LF) to the AUTO position six times (AUTO up or AUTO down).

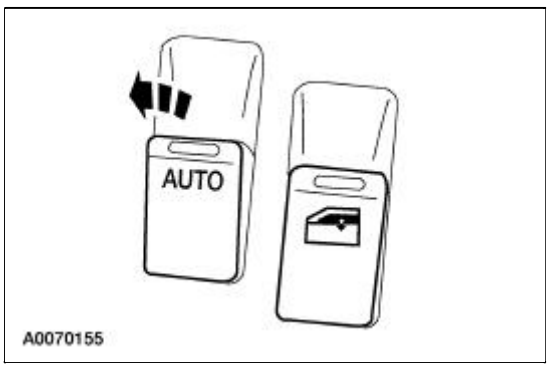


4. Turn the ignition key to the OFF position and make sure the LF door is open.

5. Press the front window control switch (LF) to the AUTO position six times (AUTO up or AUTO down).



6. Turn the ignition key to the ON position and close the LF door. The LF window glass will move down-up-down-up approximately 2-3 mm (0.1 in). This down-up-down-up movement indicates that the LF window motor has entered initialization mode.



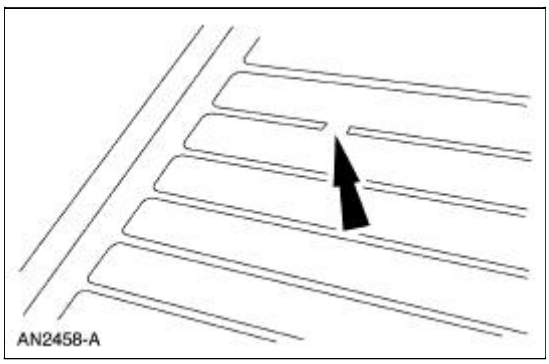
7. Pull and hold the front window control switch (LF) to the UP position until the window glass stalls into the upper header seal.

8. Momentarily press the front window control switch (LF) to the DOWN position and release. The window will carry out a one-touch down operation until the window glass stalls at the bottom of travel stop designed into the window regulator.

9. Pull and hold the front window control switch (LF) to the UP position. Continue to hold the switch until after the window glass stalls into the upper header seal and carries out the down-up movement. This down-up movement approximately 2-3 mm (0.1 in.) indicates that the LF window motor has been successfully initialized.

10. Verify correct operation of the LF window by carrying out a one-touch down, one-touch up, proportional down, and proportional up. If the window does not operate correctly, carefully repeat this procedure.

Heated Window Grid Wire Repair



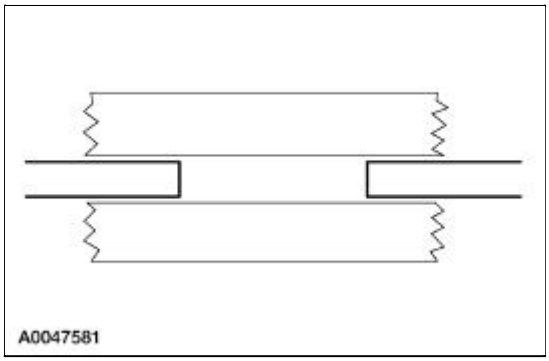
Material

Item	Specification
Dark Walnut Metallic Acrylic Lacquer Touch-up Paint ALBZ-19500-5858A or equivalent	—
Rear Window Defroster Repair D8AZ-19562-AA or equivalent	ESB-M4J58-B

1. **NOTE:** A single break or any breaks which exceed 25 mm (1 inch) in one grid cannot be repaired. Install a new rear window glass.

   NOTE: If the first layer of the heated rear window grid (brown) is damaged or missing, it will be necessary to apply touch-up paint on the glass prior to applying the silver rear window defroster repair.

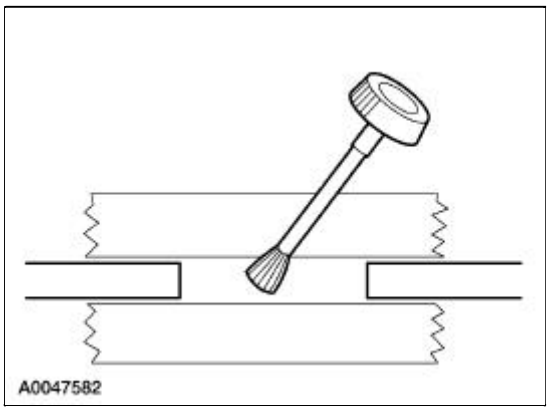
   Repair any inoperative grid wires using rear window defroster repair.



2. Bring the vehicle up to room temperature of at least 16° C (60° F) or above.

3. Clean the entire grid line repair area with a non-alcohol based window cleaner.

4. Mark the location of the grid break on the exterior of the rear window glass.



5. Using cellulose tape, mask the area directly above and below the grid break. The break area should be at the center of the mask.

6. **NOTE:** If the brown layer is not broken or missing, apply only the silver grid repair compound to the break.

   NOTE: Allow at least five minutes of drying time between applications.

   Apply the repair coating to the grid break area in several smooth, continuous strokes. Extend the repair coating at least 6.35 mm (0.25 inch) on both sides of the break area.

7. **NOTE:** If both the brown and silver layers of the grid are broken or missing, apply a coating of the brown touch-up paint across the break area first. Several applications may be necessary to achieve a color match.

   NOTE: Extend the repair coating at least 6.35 mm (0.25 inch) on both sides of the break area.

   Apply three applications of the grid repair compound.

8. After five minutes or after the repair area has dried completely, remove the mask.

9. **CAUTION: Be careful not to damage the grid line with the razor blade. If this occurs,**

additional repair may be necessary.

Remove any excess repair compound above or below the grid line with a razor blade.

10. **NOTE:** The repair coating will air-dry in approximately one minute and can be energized within three minutes.

    NOTE: Optimum adhesion occurs after approximately 24 hours.

    After optimum hardness is achieved, clean the repaired area with a non-alcohol based window cleaner.

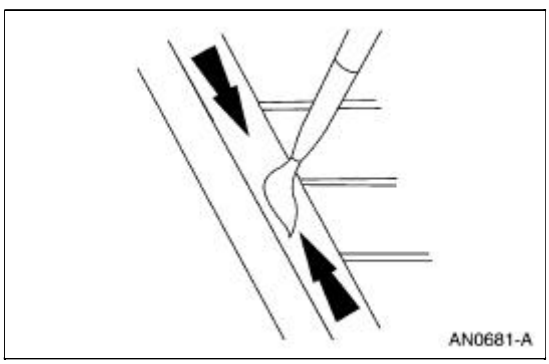
Lead Terminal Repair

Special Tool(s)

 ST1110-A	Heat Gun 107-R0300 or equivalent

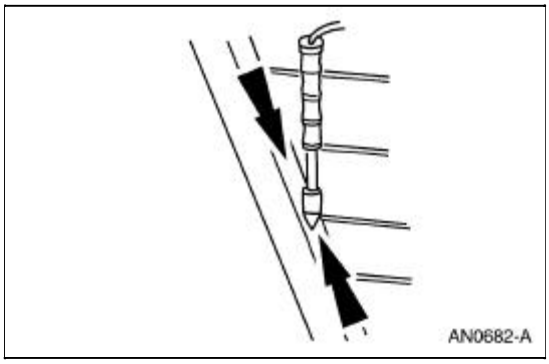
Material

Item	Specification
Rear Window Defroster Repair D8AZ-19562-AA or equivalent	ESB-M4J58-B



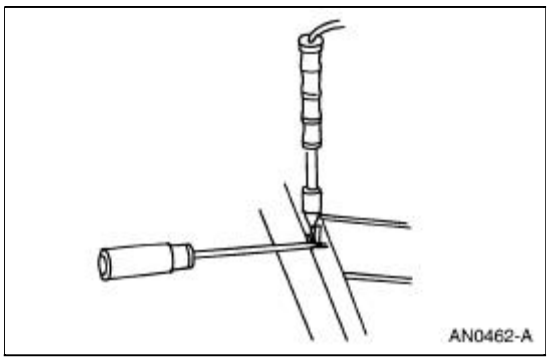
1. **NOTE:** The rear window glass must be at room temperature at the time of the repair.

   Clean the bus bar in the area to be serviced with steel wool (3/0 to 4/0 grade).



2. **NOTE:** Allow 10 minutes of drying time between the coats.

   Apply three coats of rear window defroster repair.



3. **CAUTION: Do not overheat the rear window glass or damage to the rear window glass may occur.**

Tin the bus bar repair area with solder.

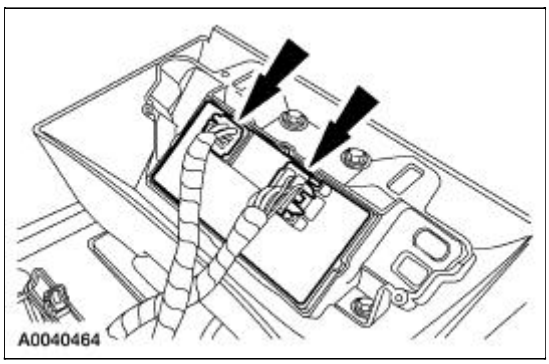
4. **CAUTION: To prevent overheating the rear window glass, remove the soldering gun as soon as the solder flows.**

   Preheat the rear window glass in the area to be serviced using the special tool and solder the terminal to the bus bar.

5. **NOTE:** Turn the heated rear window switch ON for five minutes prior to the final inspection of the repair.

   Apply rear window defroster repair to the repair area as needed.

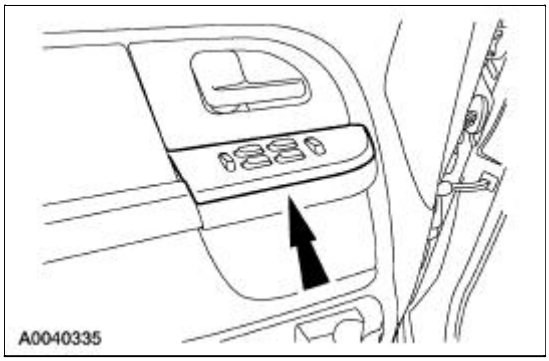
Window Control Switch



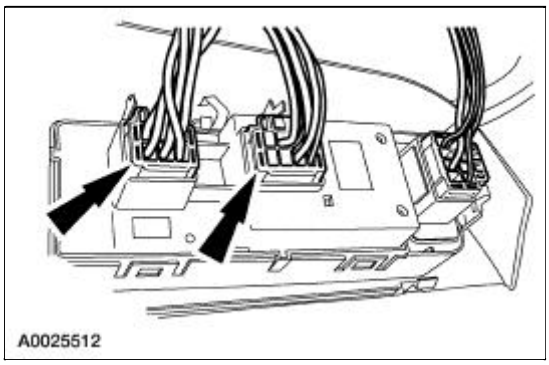
Removal

Navigator front

1. Lift up on the center console armrest.
2. Remove the center console window control switch panel.
   - Remove the pin-type retainer.



3. Disconnect the electrical connectors and remove the window control switch.
   - Release the locking tabs.



Expedition front and Expedition passenger rear

NOTE: Driver side Expedition shown, all others similar.

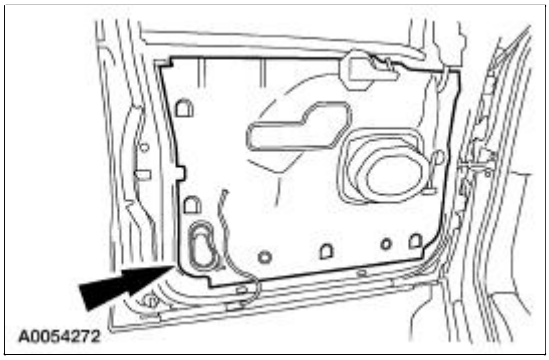
4. Remove the window control switch panel.

5. Disconnect the electrical connector(s) and remove the window control switch.
    - Release the locking tabs.

Navigator passenger rear

6. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
7. Remove the window control switch from the door trim panel.

All vehicles

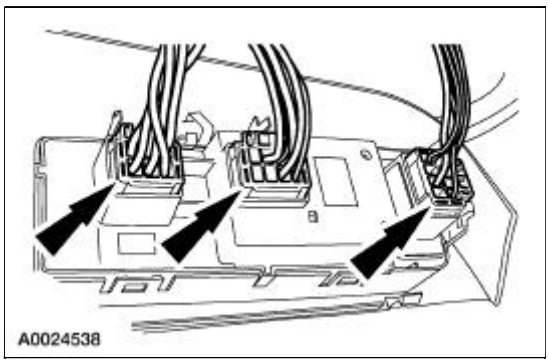


8. To install, reverse removal procedure.

Front Door Window Glass

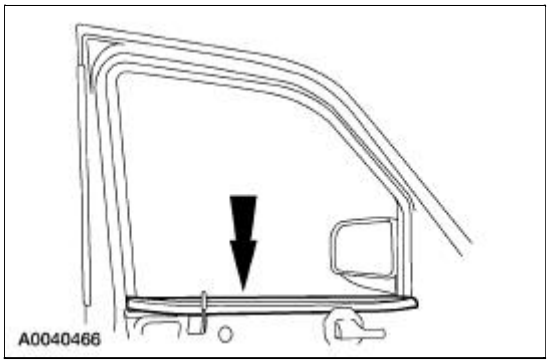
Removal and Installation

All vehicles



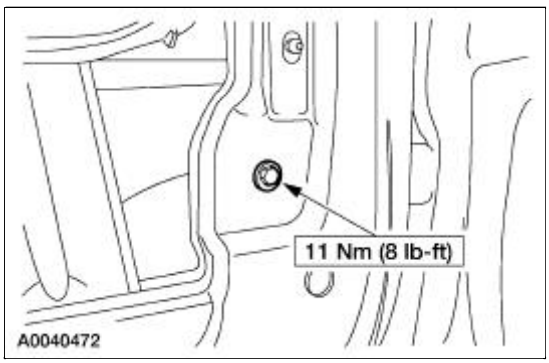
1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Remove the front door weathershield.

Expedition

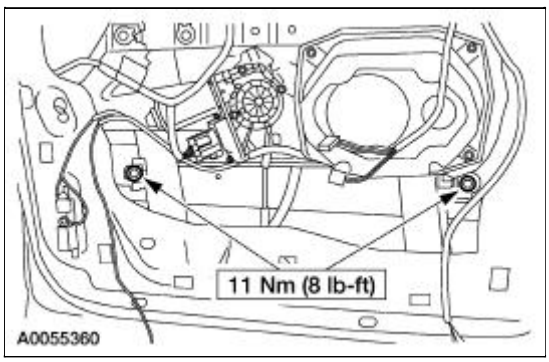


3. **NOTE:** Driver side shown, passenger side similar.

   Connect the window control switch.



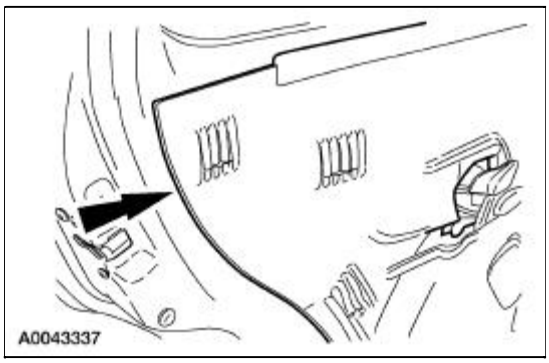
All vehicles



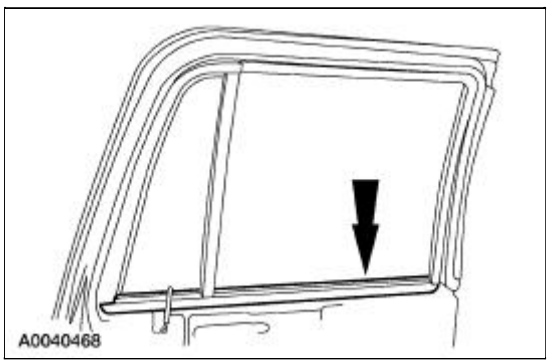
4. Lower the window glass to access the two window glass to regulator bolts.
5. Remove the inside glass weatherstrip.

6. Remove the front door glass channel bolt and position aside the channel.

7. Remove the window glass to regulator bolts and front door window glass.

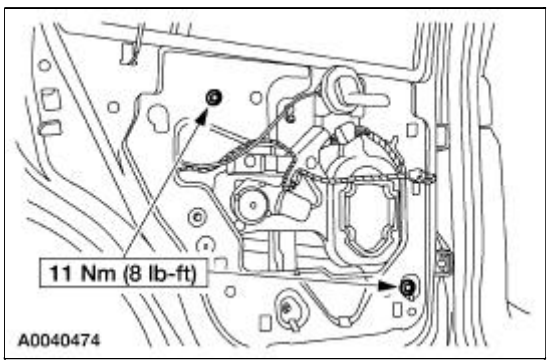


8. To install, reverse the removal procedure.

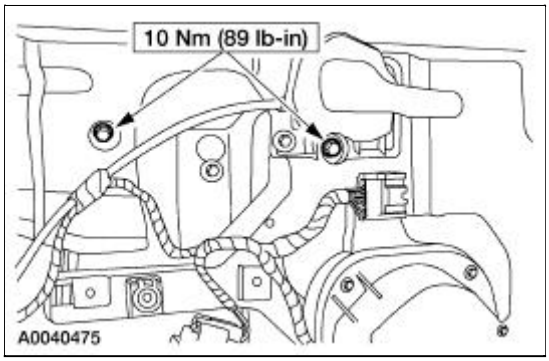


Rear Door Window Glass

Removal and Installation



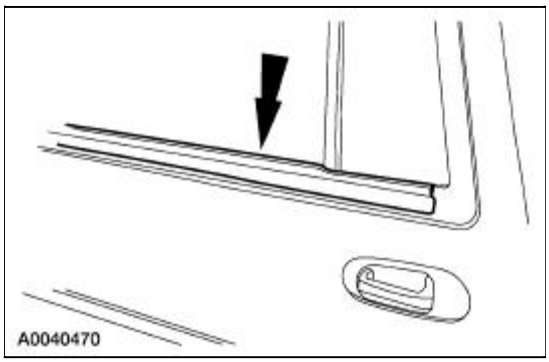
1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. Position back the rear door weathershield.



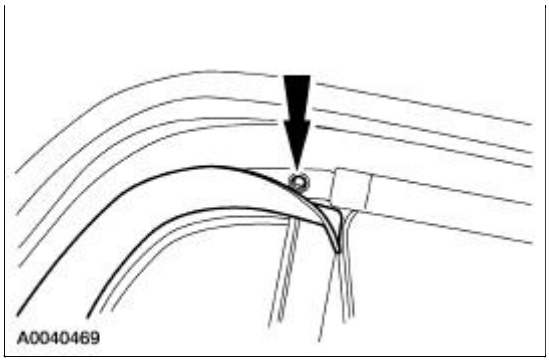
3. Connect the window control switch.
4. Lower the window glass to access the two window glass to regulator bolts.
5. Remove the inside glass weatherstrip.

6. Remove the rear door glass channel bolts.

7. Remove the window glass to regulator bolts and rear door window glass.

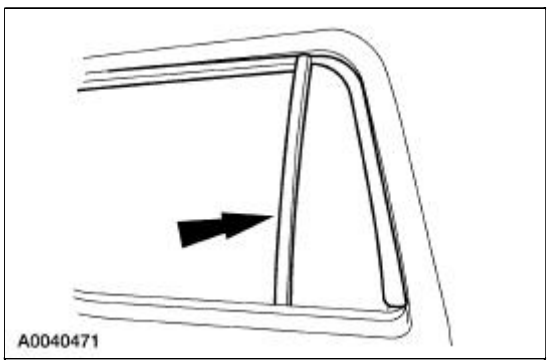


8. To install, reverse the removal procedure.



Rear Door Window Glass —Stationary

Removal and Installation



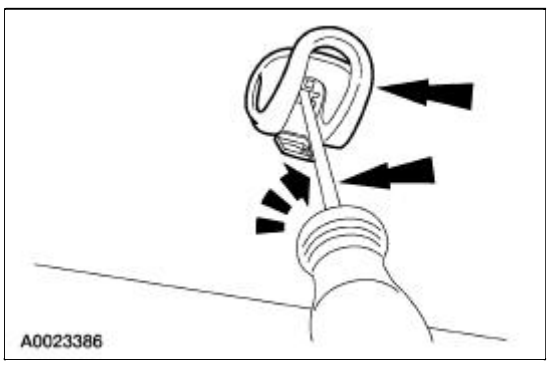
1. Remove the rear door window glass. For additional information, refer to Rear Door Window Glass in this section.
2. Remove the rear door exterior glass moulding.

3. Remove the rear door glass top run. For additional information, refer to Rear Door Glass Top Run in this section.
4. Remove the rear door stationary glass screw.

5. Remove the stationary rear door glass.

6. To install, reverse the removal procedure.

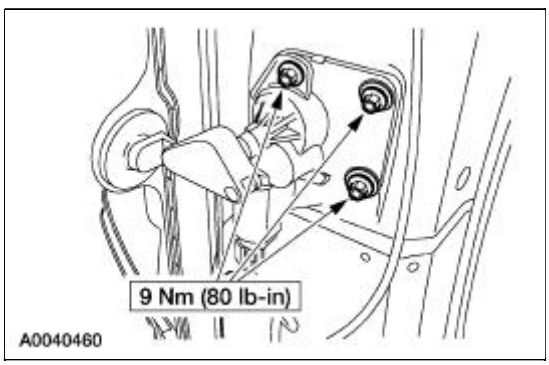
Rear Quarter Window Glass



Removal

All vehicles

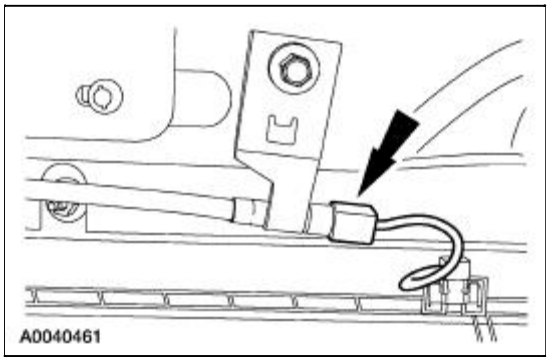
1. Remove the rear quarter trim panel. For additional information, refer to Section 501-05 .



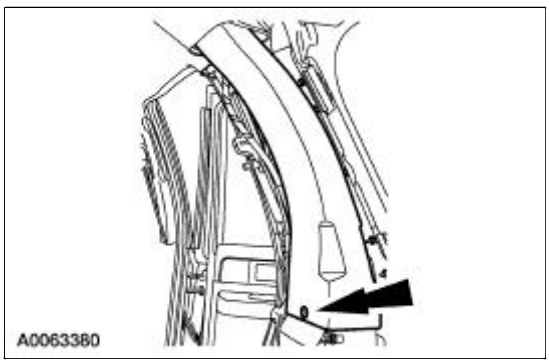
2. **CAUTION: To prevent damage to the coat hanger retainer, use a 3/16-inch flat-blade screwdriver for this step.**

   Remove the front and rear coat hooks and lower the headliner over the rear quarter window glass.
   - Open the access cover.
   - Insert a screwdriver into the coat hook slot and turn the screwdriver 90 degrees so that it engages in the plastic component slot. This will spread the steal attachment clip wings to allow the plastic component to disengage.

Vehicles with power vent window



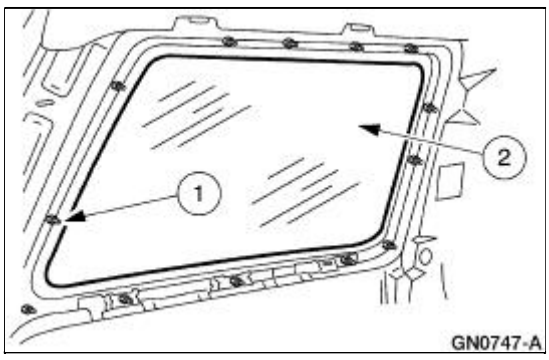
3. Remove the bolts and rear quarter window regulator motor.
   - Disconnect the electrical connector.



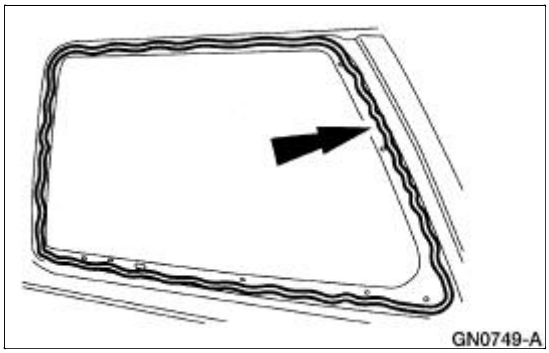
4. Disconnect the rear quarter window regulator.

All vehicles

5. Disconnect the audio antenna.



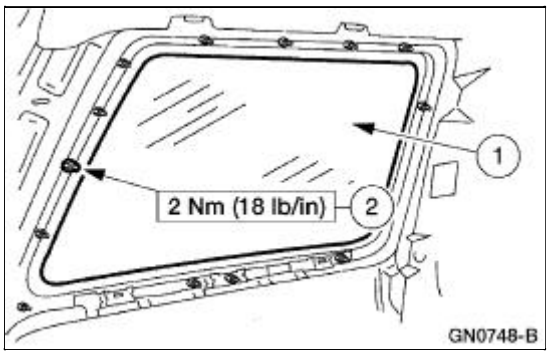
6. If equipped, remove the air duct.
    - Remove the pin-type retainer.



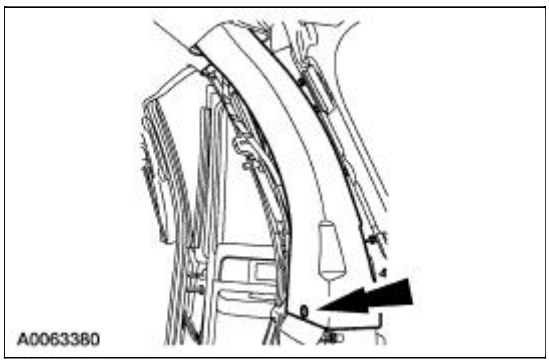
7. **CAUTION: Have an assistant hold the rear quarter window glass.**

    Remove the rear quarter window glass.
    1. Remove the nuts.
    2. Remove the rear quarter window glass.

8. Remove the excess foam butyl from the window opening.

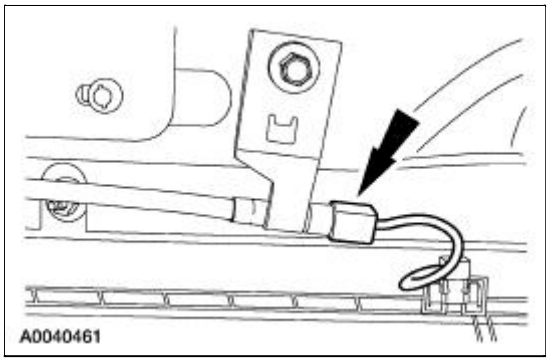


Installation



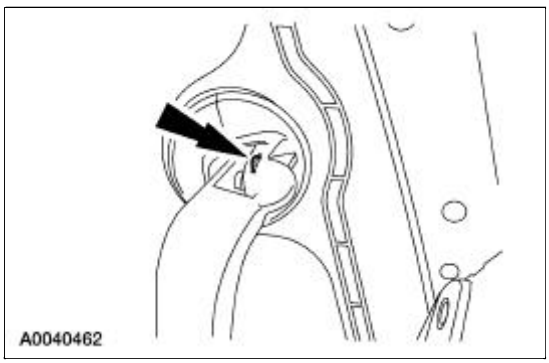
All vehicles

1. Apply 8 mm (0.32 in) Foam Butyl of equivalent meeting Ford specification WSB-M4GB45-A to the rear quarter window glass frame.
    - Start at the bottom middle and work around the frame.

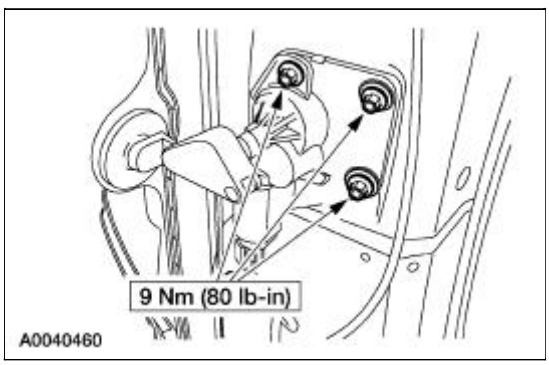


2. Install the rear quarter window glass.
    1. Position the rear quarter window glass.
    2. Install the rear quarter window glass nuts.

3. If equipped, install the air duct.
    - Install the pin-type retainer.



4. Connect the audio antenna.

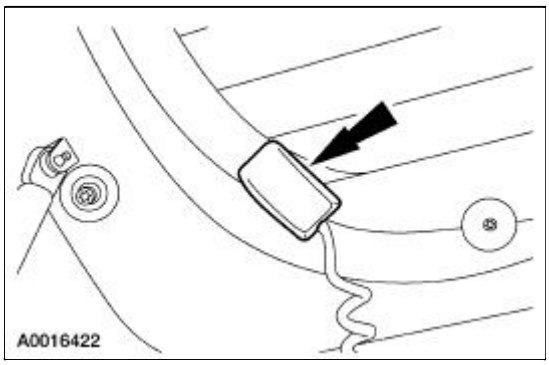


Vehicles with power vent windows

5. Install the rear quarter window regulator.

6. Install the bolts and rear quarter window regulator motor.
    - Connect the electrical connector.

All vehicles

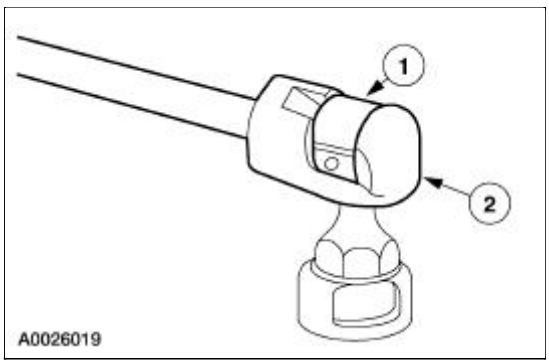


7. Position the headliner and install the coat hooks.

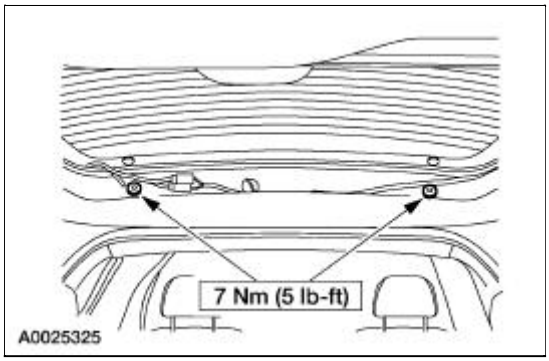
8. Install the rear quarter trim panel. For additional information, refer to Section 501-05 .

Liftgate Window Glass

Removal and Installation



1. Remove the liftgate wiper motor arm. For additional information, refer to Section 501-16 .
2. Disconnect the rear window defrost electrical connectors.

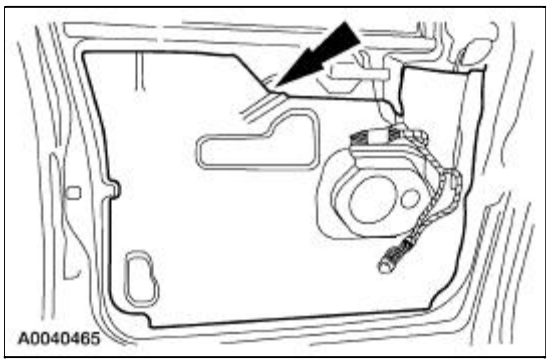


3. **CAUTION: The liftgate must be supported when removing and installing the liftgate assist cylinders.**

   CAUTION: Do not extend the socket clips more than 2.0 mm (0.08 in) or failure of the socket can occur.

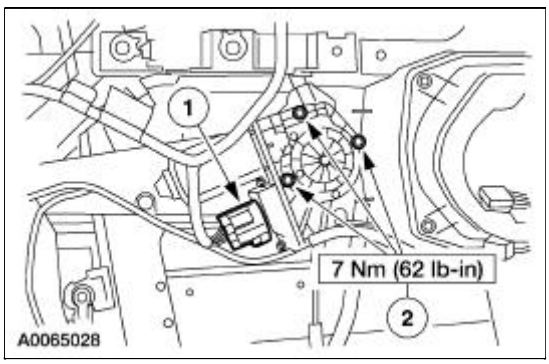
   Disconnect the two liftgate glass assist cylinders.
   1. Insert a screwdriver blade under the socket clip and lift.
   2. Gently pull the socket off the ball stud.

4. Remove the liftgate hinge bolts and remove the glass.



5. To install, reverse the removal procedure.

Front Door Window Regulator Motor

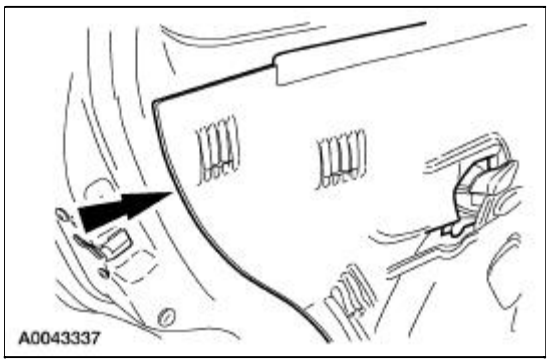


Removal and Installation

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Position the front door weathershield aside.

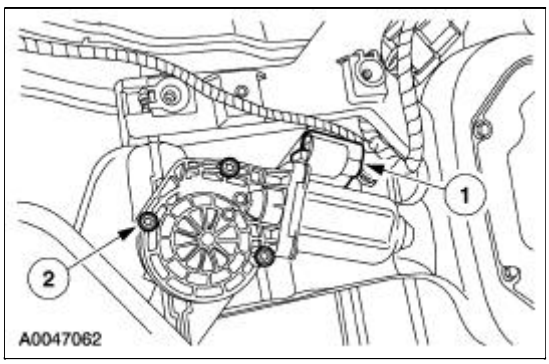
3. **NOTE:** Use a flat-blade screwdriver between the window regulator motor and window regulator assembly to hold the window regulator assembly drum in place.

   Remove the bolts and the front door window regulator motor.
   1. Disconnect the electrical connector.
   2. Remove the bolts.



4. To install, reverse the removal procedure.
   - Cycle the window glass to make sure the gears engage.

Rear Door Window Regulator Motor

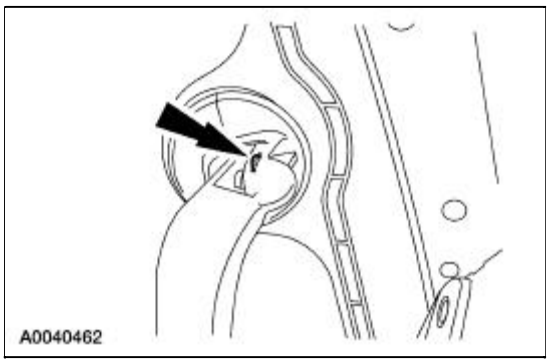


Removal and Installation

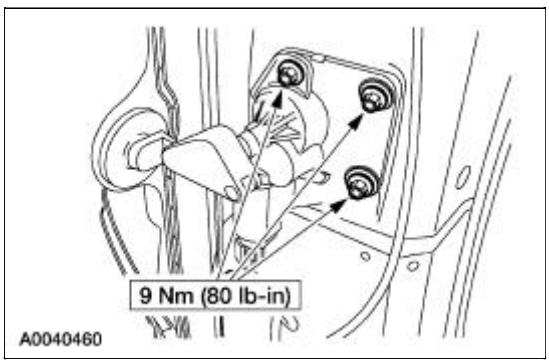
1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. Position the rear door weathershield aside.

3. **NOTE:** Use a flat-blade screwdriver between the window regulator motor and the window regulator assembly to hold the window regulator assembly drum in place.

   Remove the rear door window regulator motor.
   1. Disconnect the electrical connector.
   2. Remove the bolts.



4. To install, reverse the removal procedure.
   - Cycle the door glass to make sure of gear engagement.

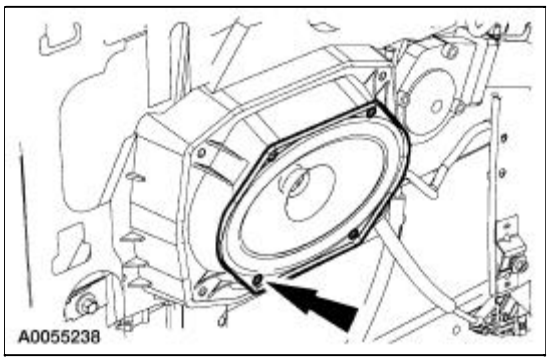


Rear Quarter Window Regulator Motor

Removal

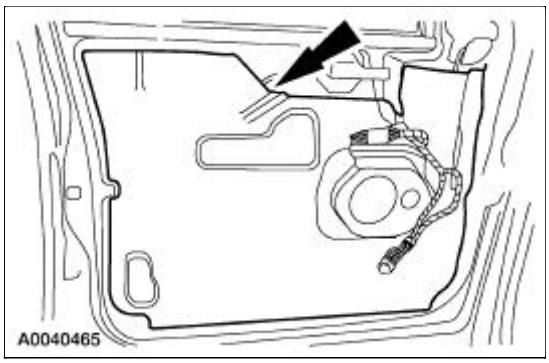
1. Remove the D-pillar trim panel. For additional information, refer to Section 501-05 .
2. Disconnect the rear quarter window regulator motor.
   - Remove the retaining clip.

3. Remove the bolts and rear quarter window regulator motor.
   - Disconnect the electrical connector.



4. To install, reverse the removal procedure.

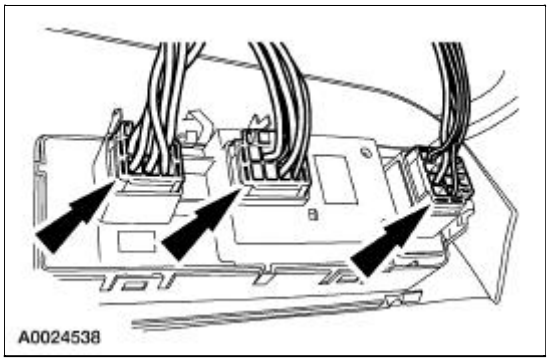
Front Door Window Regulator



Removal and Installation

All vehicles

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Remove the screws and the front door speaker.
   - Disconnect the electrical connector.

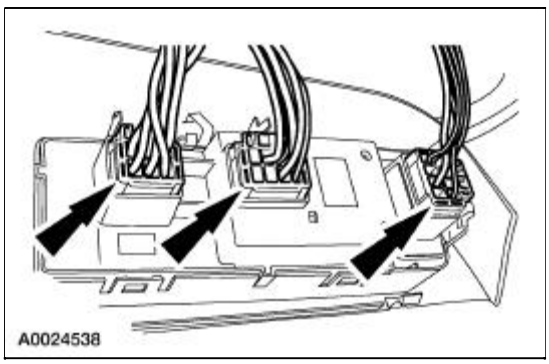


3. Remove the front door weathershield.

Expedition

4. **NOTE:** Driver side shown, passenger side similar.

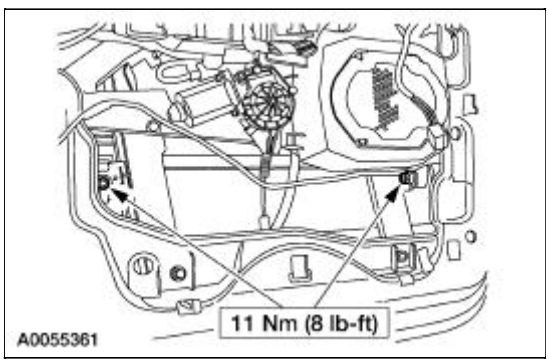
   Connect the window control switch.



All vehicles

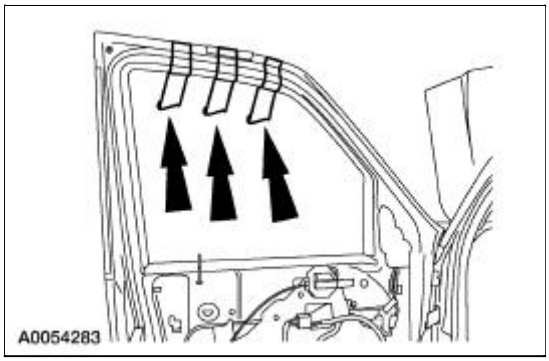
5. Lower the window glass to access the two window glass-to-regulator bolts.

Expedition



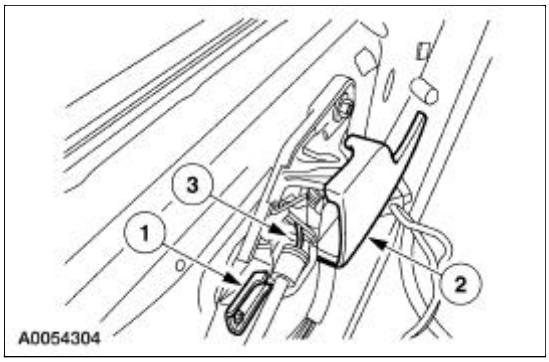
6. **NOTE:** Driver side shown, passenger side similar.

   Disconnect the window control switch.



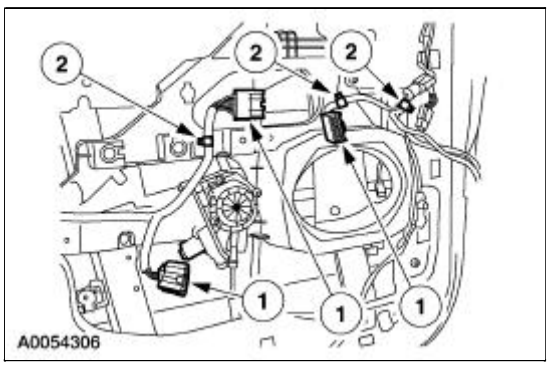
All vehicles

7. Remove the window glass-to-regulator bolts and front door window glass.

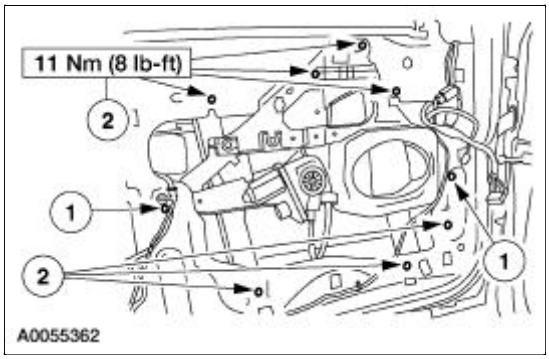


8. **NOTE:** Secure the front window glass in the full up position.

   Secure the front window glass with tape to the front door frame.



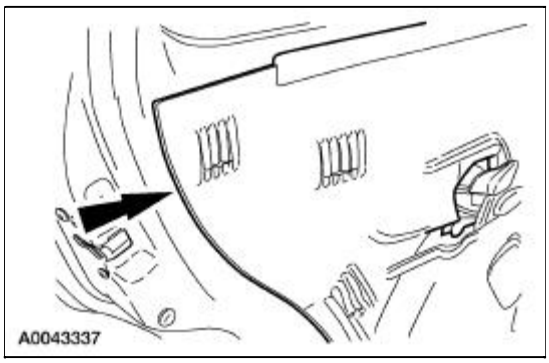
9. Position the interior door handle aside.
    1. Remove the cable conduit fitting from the carrier assembly.
    2. Lift upward on the interior door handle retaining bracket and pivot the interior door handle out of the bracket.
    3. Remove the cable from the door handle.



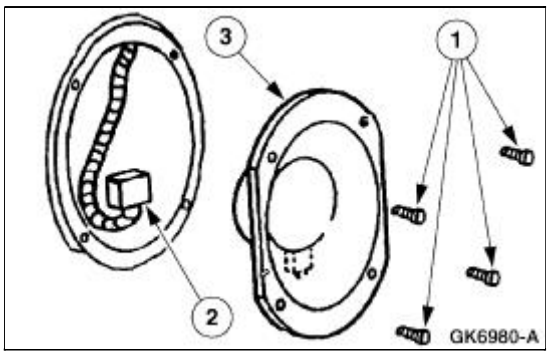
10. Release the crash sensor harness pin-type retainers.

11. Position the front door window regulator harness aside.
    1. Disconnect the electrical connectors.
    2. Release the pin-type retainers.

12. Remove the front window regulator.
    1. Loosen the two hanger bolts.
    2. Remove the front window regulator bolts and front top run channel bolt.

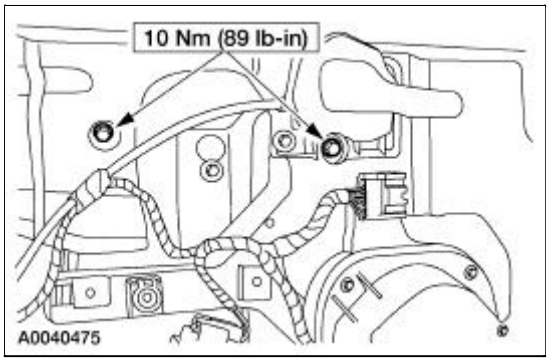


13. To install, reverse the removal procedure.



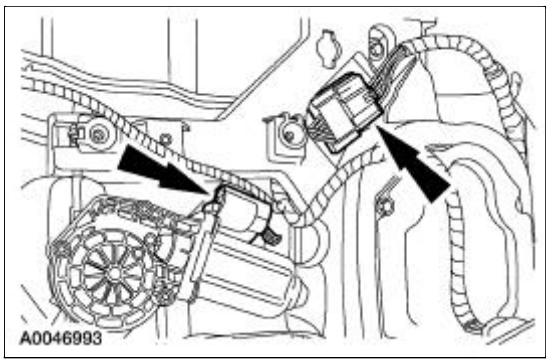
Rear Door Window Regulator

Removal and Installation

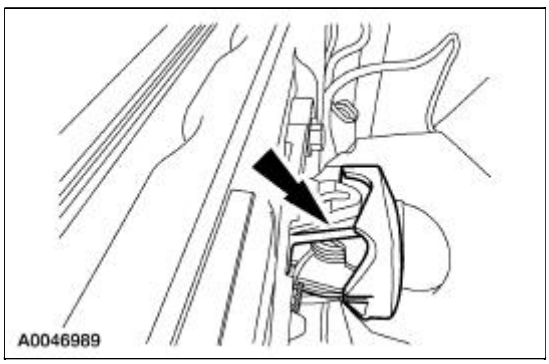


1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. Remove the rear door weathershield.

3. Remove the rear door speaker.
    1. Remove the screws.
    2. Disconnect the electrical connector.
    3. Remove the speaker.

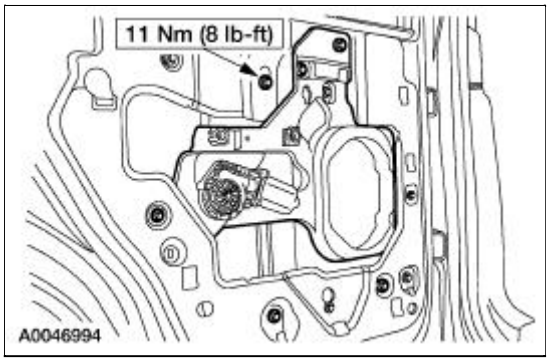


4. Connect the window control switch.
5. Lower the window glass to access the two window glass-to-regulator bolts.
6. Disconnect the window control switch.
7. Remove the window glass-to-regulator bolts and rear door window glass.



8. **NOTE:** Secure the rear window glass in the full up position.

   Secure the rear window glass with tape to the front door frame.



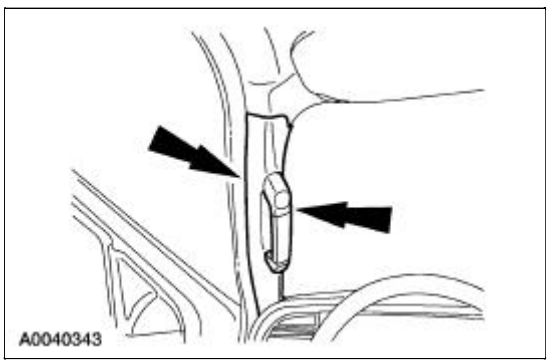
9. Disconnect the rear door window regulator electrical connectors.

10. Position the interior door handle aside.
    - Lift upward on the interior door handle retaining bracket and pivot the interior door handle out of the bracket.

11. Remove the rear door window regulator assembly.
    - Remove the bolts.

12. To install, reverse the removal procedure.

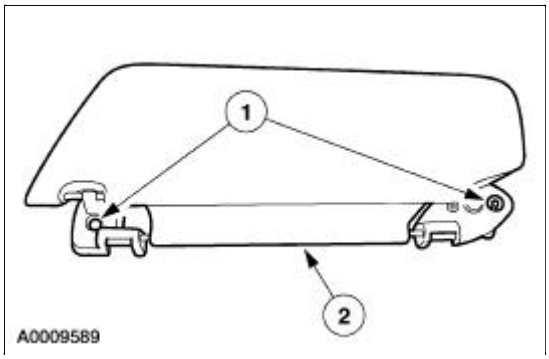
Windshield Glass



Special Tool(s)

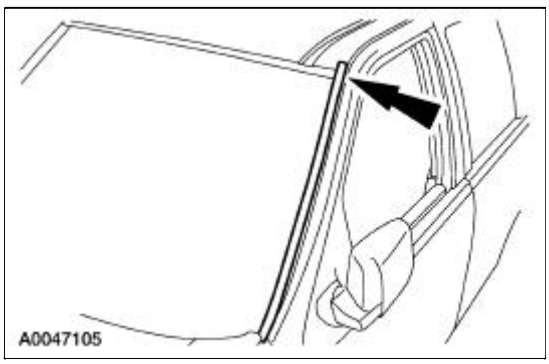
 ST1109-A	Rotunda Pneumatic Knife with Offset Blade 107-R1511 or equivalent
 ST2085-A	The Pumper 164-R2459 or equivalent
 ST1320-A	Rotunda Interior Auto Glass Cut-Out Knife Kit 164-R2450 or equivalent

Removal



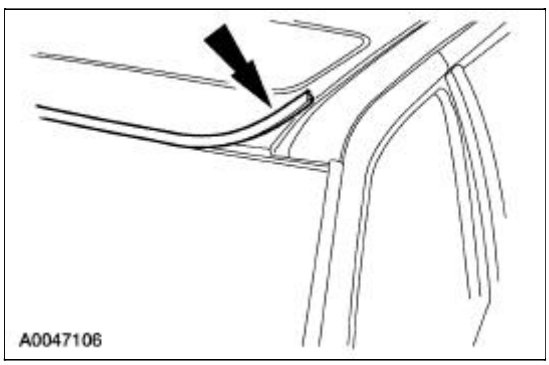
WARNING: To prevent glass splinters from entering eyes or cutting hands, wear safety glasses and heavy gloves when cutting glass from the vehicle.

1. Remove the cowl grille. For additional information, refer to Section 501-02 .
2. Remove the A-pillar trim panels.
   - Remove the bolt covers and bolts.



3. If equipped, remove the overhead console.
4. Remove the interior rear view mirror (17700). For additional information, refer to Section 501-09 .

5. Remove the sun visors.
    1. Remove the four screws
    2. Remove the two sun visor and visor arm clips
        - If equipped, disconnect the electrical connectors.

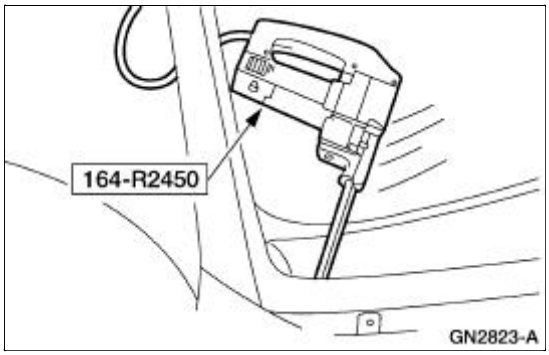


6. Lower the front portion of the headliner.

7. Remove the windshield side mouldings.
    - Pull out starting at the top corner.

8. Remove the upper windshield weatherstrip.
    - Pull out starting at the corner.

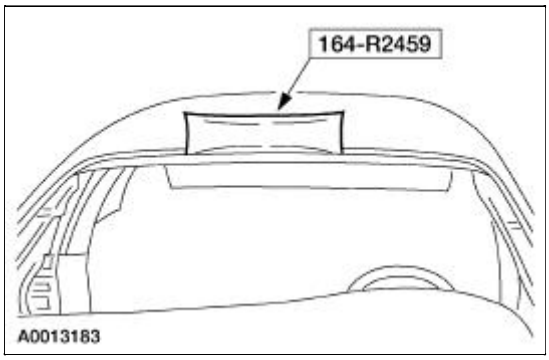
9. Mark the outside of the windshield glass with a wax pencil to avoid damaging the glass stops when cutting the urethane.



10. Using a soft brush or vacuum, remove any dirt and foreign material from the pinch weld.

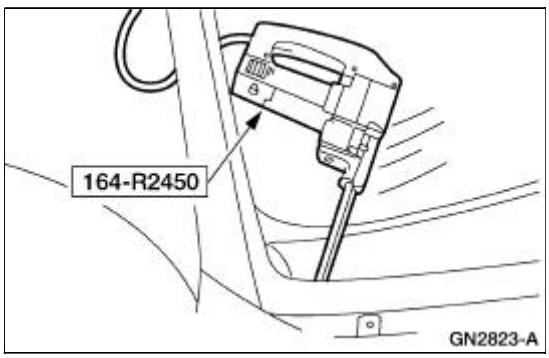
11. **CAUTION: Care must be taken to avoid scratching the pinchweld.**

NOTE: Lubricate the urethane adhesive with water to aid the special tool while cutting.



Using the special tool, cut the urethane adhesive from the windshield glass.

- Insert the blade into the urethane at the top middle of the glass and work toward the top corners.
- Insert the blade at the top corners and work down each side of the glass toward the bottom.



12. **CAUTION: Pump special tool 164-R2459 or equivalent slowly as cowl adhesive is cut to avoid breaking glass.**

    Using the special tool, distance the windshield from the body.

13. **NOTE:** Removing the windshield glass requires an assistant.

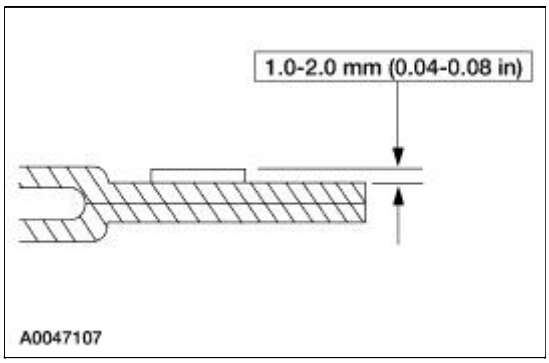
    Using the special tool, cut the remaining urethane adhesive and remove the windshield glass.

14. Using a soft brush or vacuum, remove any dirt and foreign material from the pinch weld.

Installation

CAUTION: Do not drive the vehicle after installing windshield glass until the urethane adhesive has cured. Inadequate curing of the urethane adhesive adversely affects the strength of the urethane adhesive bond.

CAUTION: If using Urethane Adhesive Essex 400, the curing time at temperatures above 13°C (55°F) and relative humidity above 50% is 12-24 hours. Curing time decreases at higher temperatures and/or lower humidities.



CAUTION: If a vehicle is to be driven within 24 hours of urethane adhesive application, Urethane Adhesive Essex U-216 meeting Ford specification WSB-M2G316-B must be used, due to its one hour cure time.

1. Dry-fit the windshield glass by centering it side-to-side and by adjusting the setting blocks (if equipped) to get the correct position of the part top to bottom. Make the alignment marks with tape or non-staining grease pencil on both the glass and the vehicle body.

2. **CAUTION: Care must be taken to avoid scratching the pinch weld.**

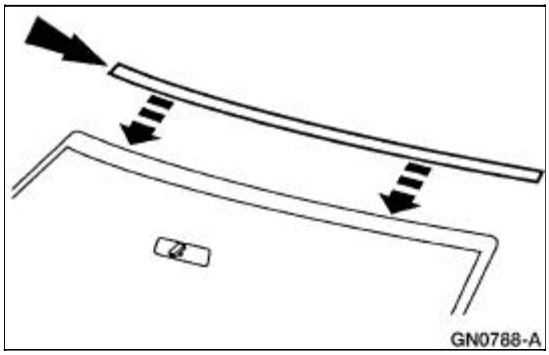
   Trim the remaining urethane adhesive on the pinch weld to within specification.

   - The old urethane surface should be smooth and free of cuts and contamination.

3. Use the wool applicator to apply Urethane Metal Primer Essex U-413, meeting Ford specification WSB-M2G234-C to any exposed metal on the pinch weld. Allow six to ten minutes to dry.

4. If reinstalling the original windshield, remove excess urethane adhesive from the windshield glass.

5. If installing a new windshield glass, clean the inside of the glass surface with an alcohol-free cleaner to make sure the ceramic-coated area is clean.



6. **CAUTION: Wipe off Urethane Glass Prep Essex U-401 immediately after each application because it flash dries.**

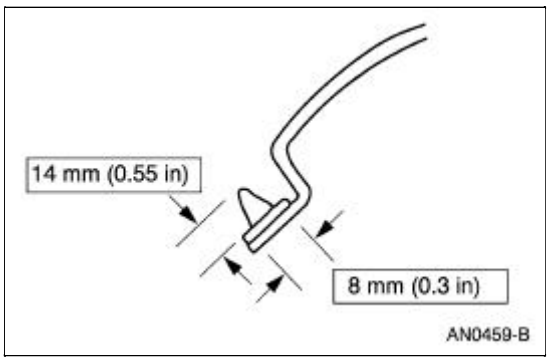
   NOTE: Apply with deliberate strokes, making sure not to overlap applied area.

   Apply Urethane Glass Prep Essex U-401 or equivalent meeting Ford specification WSB-M2G314-B twice around the glass surface to be prepped.

7. Apply Urethane Glass Primer Essex U-402 meeting Ford specification WSB-M5B280-C to the same area that was in the previous step. Allow five minutes to dry.

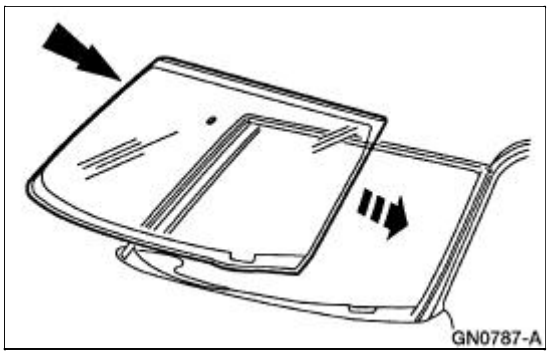
8. Install the upper windshield weatherstrip.

9. Cut the urethane applicator tip to specification.



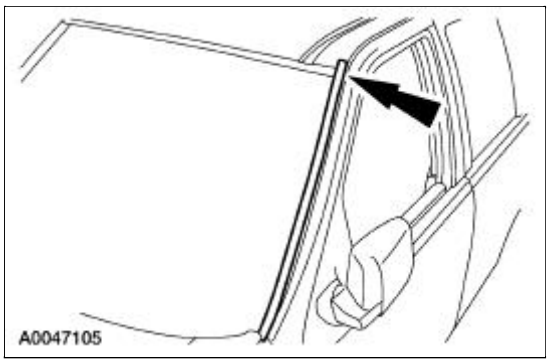
10. **CAUTION: Do not drive the vehicle after installing windshield glass until the urethane adhesive has cured. Inadequate curing of the urethane adhesive adversely affects the strength of the urethane adhesive bond.**

CAUTION: If using Urethane Adhesive Essex 400-HV, the curing time at temperatures above 13°C (55°F) and relative humidity above 50% is 12-24 hours. Curing time decreases at higher temperatures and/or lower humidities.



CAUTION: If a vehicle is to be driven within 24 hours of urethane adhesive application, Urethane Adhesive Essex U-216 meeting Ford specification WSB-M2G316-B must be used, due to its one hour cure time.

Apply a bead of Urethane Adhesive Essex 400-HV or Essex U-216 meeting Ford specification WSB-M2G316-B to the pinch weld just outside the foam butyl dam over the top of the existing urethane bed.

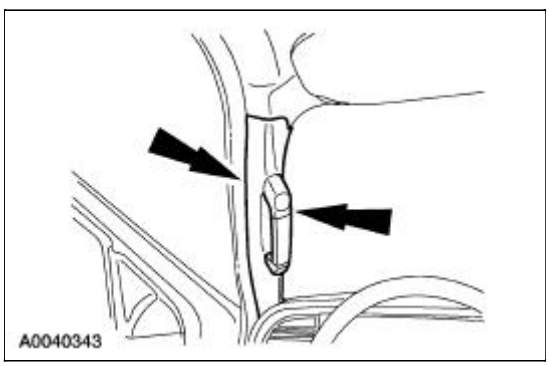


11. **CAUTION: Open the windows to prevent the windshield glass from being pushed out by air pressure if a door is closed.**

    Using the alignment marks, install the windshield glass.

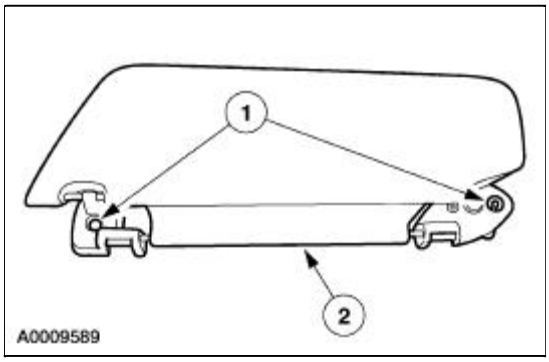
12. Install the windshield side mouldings.

    NOTE: Be sure the moldings seat completely.



13. Install the headliner.

14. Install the interior rear view mirror. For additional information, refer to Section 501-09 .

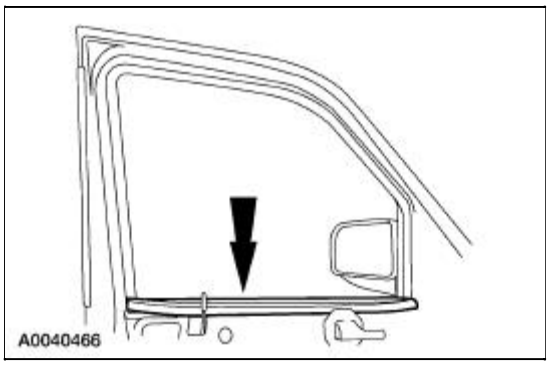


15. Install the overhead console.

16. Install the A-pillar trim panels.
    - Install the bolts and covers.

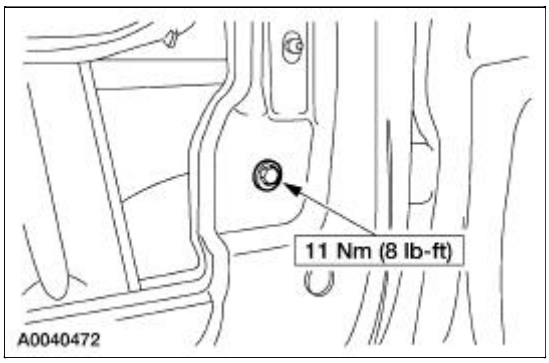
17. Install the sun visors.
    1. Position the sun visors.
    2. Install the four screws.

- If equipped, connect the electrical connectors.



18. Install the cowl grille. For additional information, refer to Section 501-02 .

19. Run the blower motor on defrost HIGH to check for glass that may have fallen into the defroster vents.

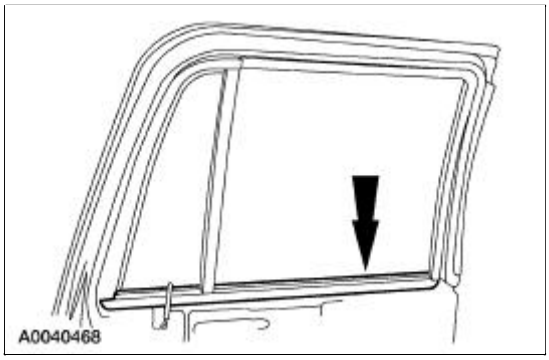


Front Door Glass Top Run

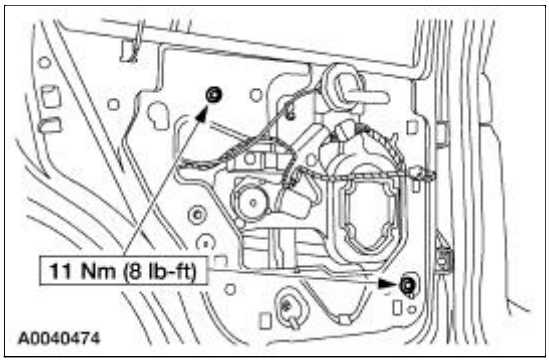
Removal and Installation

1. Remove the front door window glass. For additional information, refer to Front Door Window Glass in this section.
2. Remove the inside glass weatherstrip.

3. Remove the front door glass channel bolt and front door glass top run.



4. To install, reverse the removal procedure.



Rear Door Glass Top Run

Removal and Installation

1. Lower the rear door window glass.
2. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
3. Remove the inside glass weatherstrip.

4. Remove the rear door glass channel bolts.

5. Remove the rear door glass top run.
6. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in
Assist handle bolts	6	—	53
Bulkhead electrical connector bolts	5	—	44
Front floor console bracket bolts (Navigator)	20	15	—
Front floor console bolts (Navigator)	7	—	62
Glove compartment bolts	3	—	27
Ground wire bolts	3	—	27
Hood release handle bolts	9	—	80
Instrument panel bolts	30	22	—
Instrument panel finish panel screws	2	—	18
Front floor console bolts (Expedition)	12	9	—
Instrument panel floor brace bolts	9	—	80
Instrument panel steering column cover screws	3	—	27
Steering column reinforcement panel bolts	9	—	80
Parking brake release handle bolts	9	—	80
Rear floor console bolts	12	9	—
Intermediate shaft pinch bolt	30	22	—
Front floor console mounting bracket bolts	55	41	—
Rear floor console mounting bracket bolts	47	35	—
Front console screws (Navigator)	3	—	27

Instrument Panel

The instrument panel consists of the following components:

- instrument panel cluster finish panel
- instrument panel defroster grille (Navigator)
- instrument panel side finish panels
- glove compartment
- instrument panel center finish panel (Navigator)
- instrument panel steering column cover
- instrument panel fuse door
- steering column reinforcement panel
- instrument panel upper covers (Expedition)

Console —Floor, Front

The front floor console may consist of the following components:

- A/C integral control assembly
- A/C register (upper)
- auxiliary A/C controls
- auxiliary power point
- center console finish panel
- console finish panel mat
- compact disc player mounting bracket
- compact disc player compartment trim panel
- digital audio compact disc player
- shift lever (Navigator)
- window control switch panel (Navigator)
- navigation system display module
- navigation system module
- video cassette player

Console —Floor, Rear

The rear console consists of the following components:

- armrest
- cup holders
- storage bin

Console —Overhead

There are two versions of the overhead console, with and without the roof opening panel.

The overhead console with the roof opening panel may contain the following:

- climate controls (optional)
- map lamps/switches
- roof opening panel switch
- rear quarter window switches (optional)

The overhead console without the roof opening panel may contain the following:

- climate controls (optional)
- glasses storage bin
- map lamps/switches
- rear quarter window switches (optional)
- storage bin

Instrument Panel

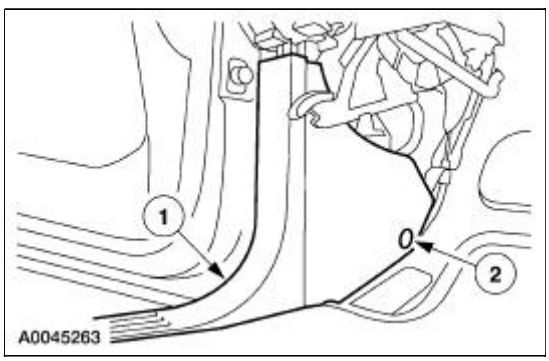
Removal

CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

All vehicles

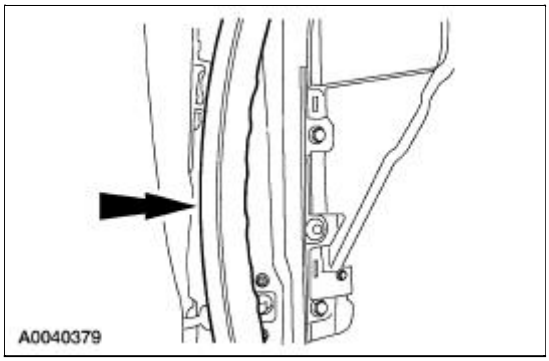
1. If equipped with adjustable pedals, move the pedals to the full forward position.
2. If equipped, remove the front floor console. For additional information, refer to Floor Console—Front, Navigator or Floor Console—Front, Expedition in this section.

Navigator only



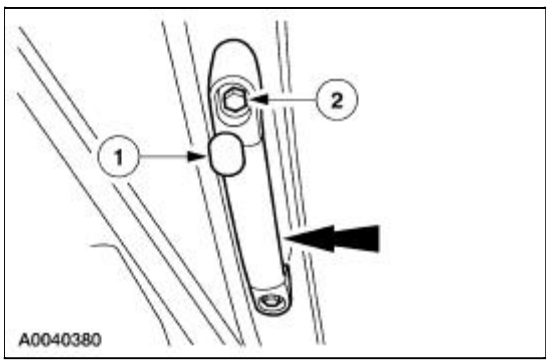
3. Remove the driver air bag module. For additional information, refer to Section 501-20B .

Expedition only



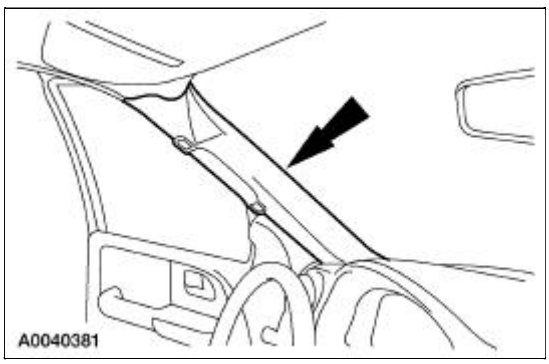
4. Remove the steering wheel. For additional information, refer to Section 211-04 .

All vehicles

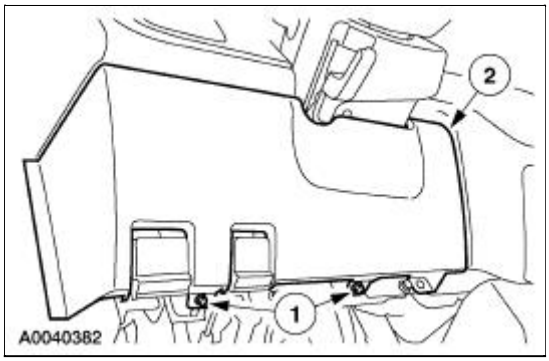


5. Remove the passenger air bag module. For additional information, refer to Section 501-20B .
6. If equipped, remove the RH instrument panel insulator.
   - Disconnect the instrument panel insulator lamp.
7. Remove the LH and RH A-pillar lower trim panels.
   1. Remove the scuff plate.
   2. Remove the pin-type retainer.

8. Position the LH and RH door weatherstrip seals aside.

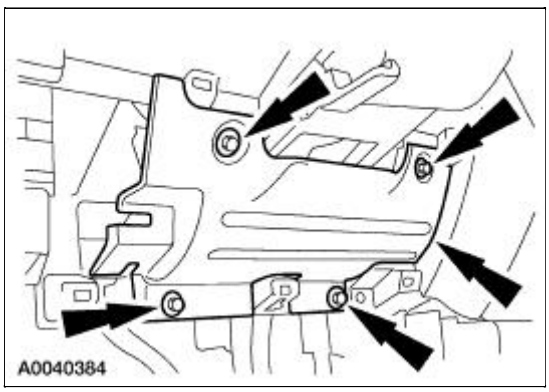


9. Remove the LH and RH assist handles.
    1. Remove the covers.
    2. Remove the bolts.

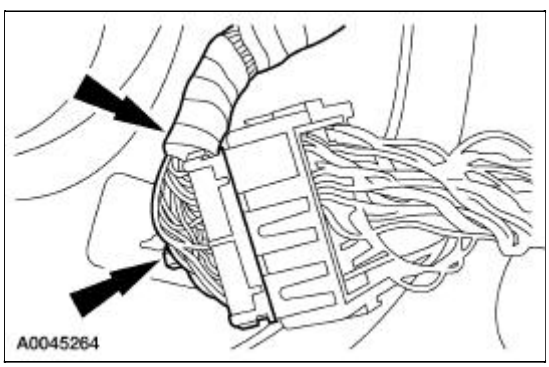


10. **NOTE:** Release the top attachments by pulling inboard first and then upward to release the lower hook.

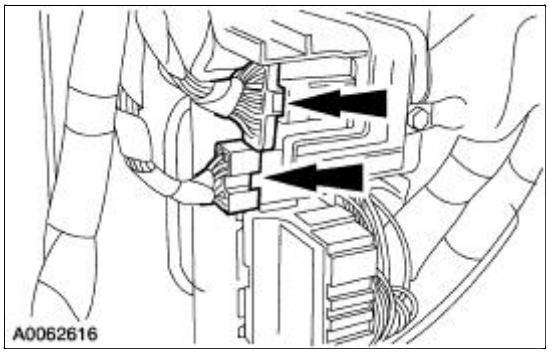
    Remove the LH and RH windshield side garnish mouldings.



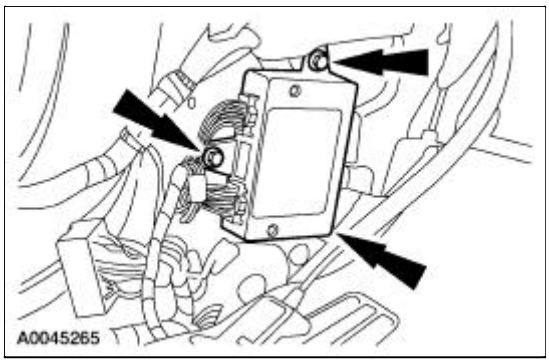
11. Remove the instrument panel steering column cover.
    1. Remove the screws.
    2. Release the cover from the instrument panel.



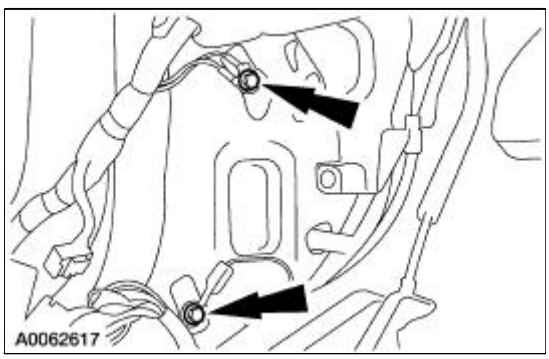
12. Position the hood release and parking brake release handles aside.
    1. Remove the bolts.
    2. Position the release handles aside.



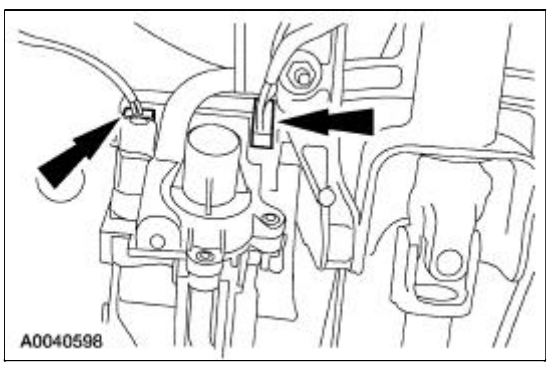
13. Remove the bolts and the steering column reinforcement panel.



14. Loosen the bolt and disconnect the LH instrument panel bulkhead connector.



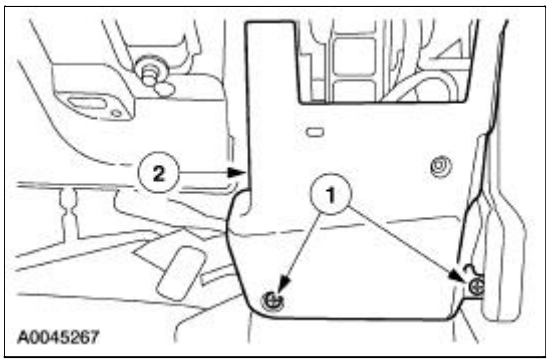
15. Disconnect the LH electrical connectors.



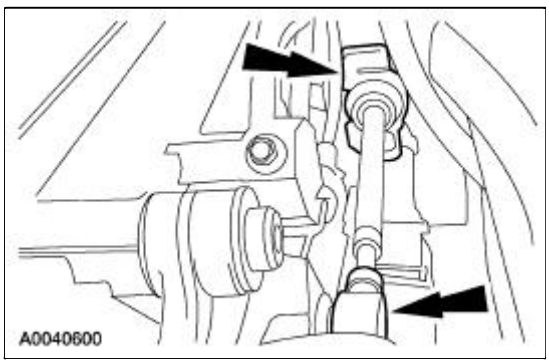
16. Remove the bolts and position the vehicle security module aside.

17. Remove the bolt and position the ground wires aside.

18. Disconnect the cruise control deactivator and the brake on/off switch electrical connectors.

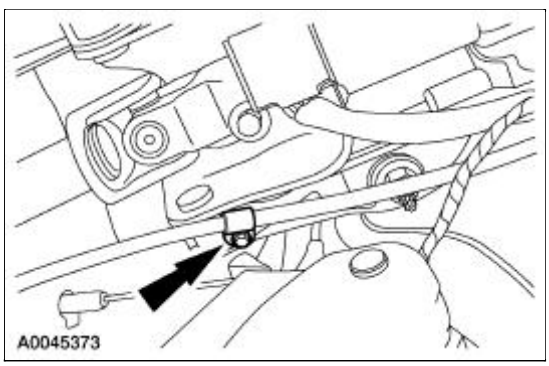


19. If equipped, disconnect the adjustable pedal motor connector.



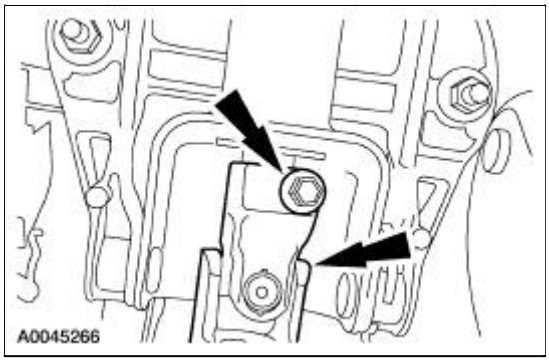
Expedition only

20. Remove the steering column shrouds.

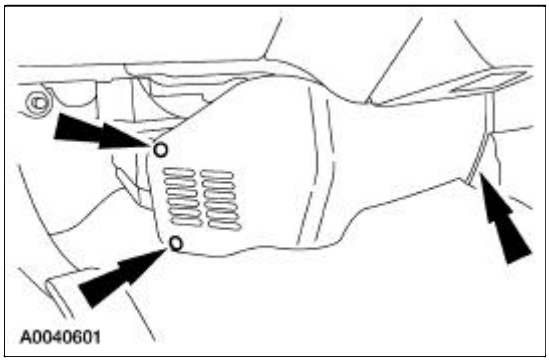


1. Remove the screws.
2. Remove the upper and lower shrouds.

21. Disconnect the steering column shift cable.



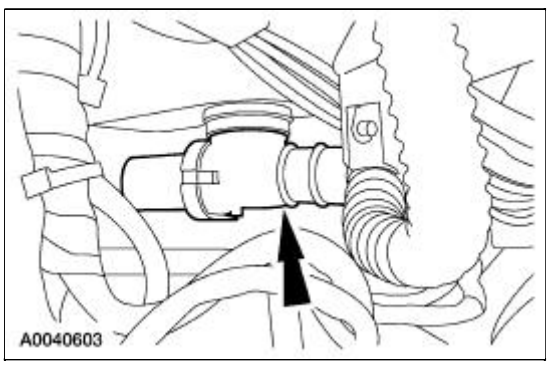
22. Remove the screw and position the steering column shift cable bracket aside.



All vehicles

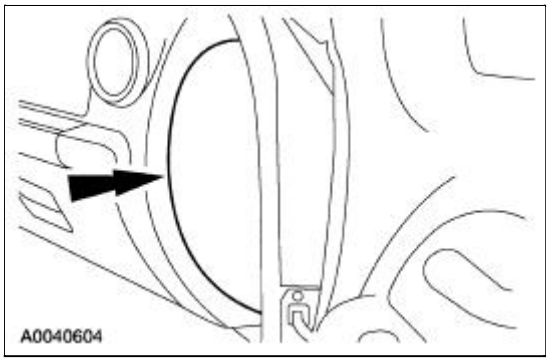
23. **CAUTION: Secure the steering wheel to prevent any rotation or damage to the clockspring.**

    Remove the pinch bolt and separate the intermediate shaft from the steering column.

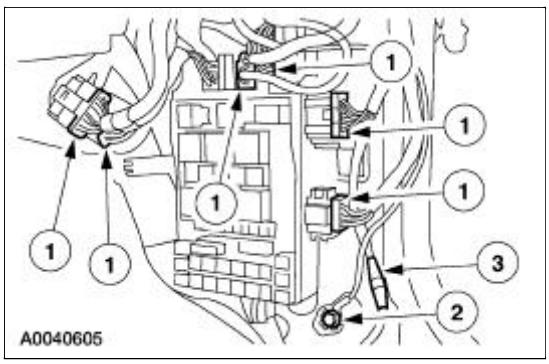


24. If equipped, remove the three pin-type retainers and the valance panel.

25. Disconnect the climate control head vacuum harness and the electrical connector.



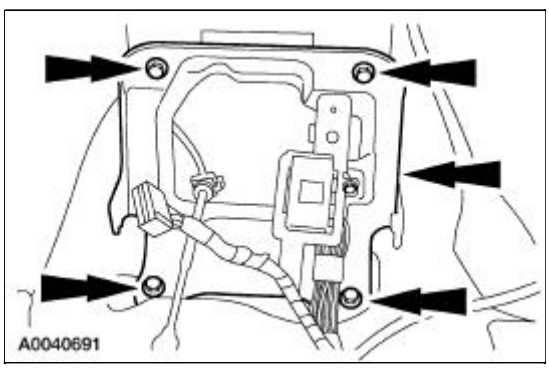
26. If equipped, disconnect the electronic automatic temperature control (EATC) hose from the evaporator case.



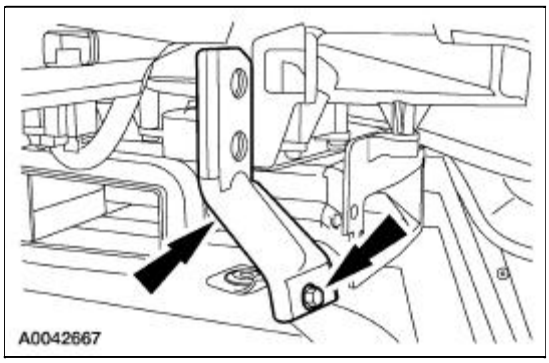
27. **NOTE:** Expedition shown; Navigator similar.

    Remove the RH instrument panel side finish panel.

28. Disconnect the RH instrument panel electrical connectors.
    1. Disconnect the electrical connectors
    2. Remove the RH ground bolt.
    3. Disconnect the in-line antenna connector.

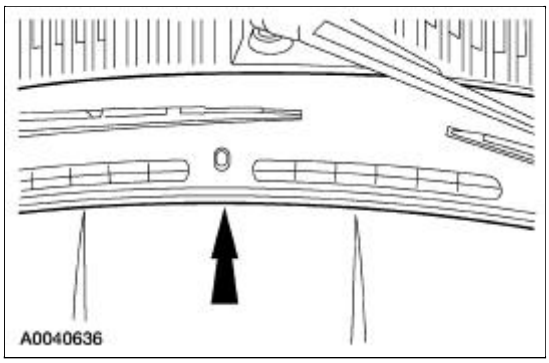


29. Remove the instrument panel floor brace bolts.



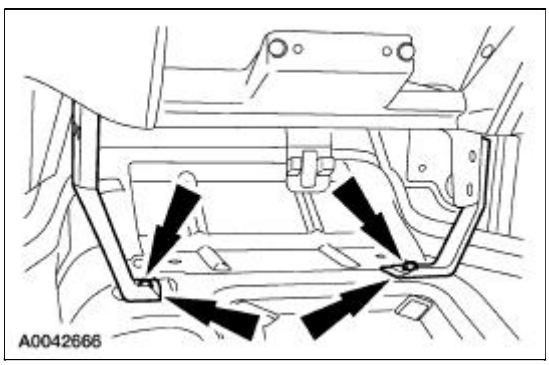
Navigator only

30. Remove the bolts and position the floor console bracket aside.

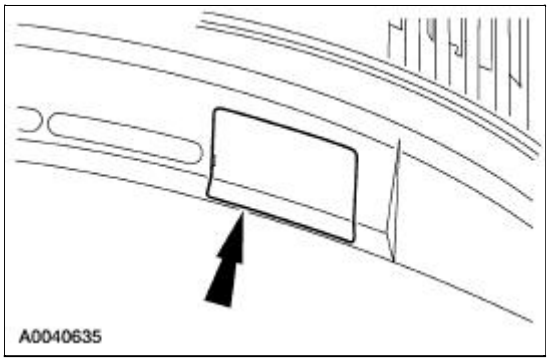


31. **NOTE:** The LH brace is similar to Expedition; RH brace shown.

    Position the carpet aside, remove the bolts and the instrument panel floor braces.

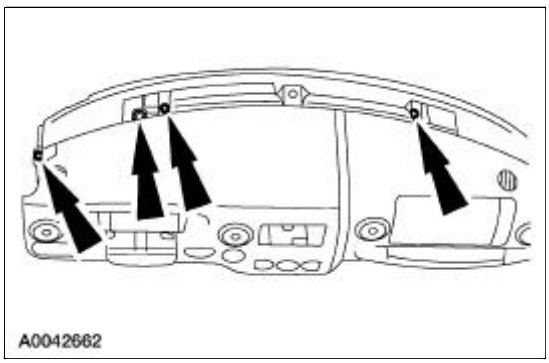


32. Remove the instrument panel defroster grille.

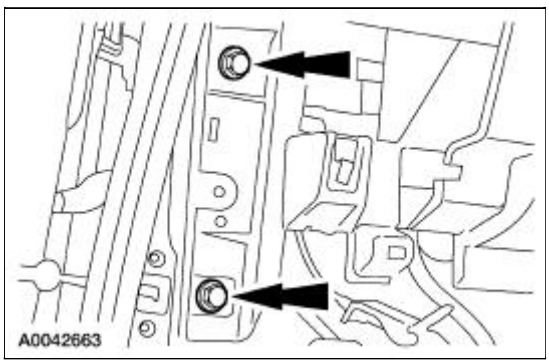


Expedition only

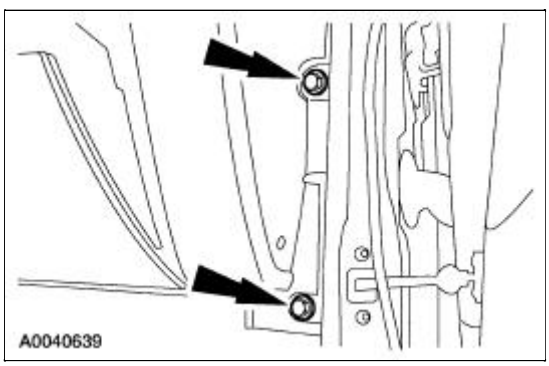
33. Position the carpet aside, remove the bolts and the instrument panel floor brace.



34. Remove the instrument panel cowl top bolts covers.



All vehicles



35. Remove the instrument panel bolts.

36. Remove the LH instrument panel bolts.

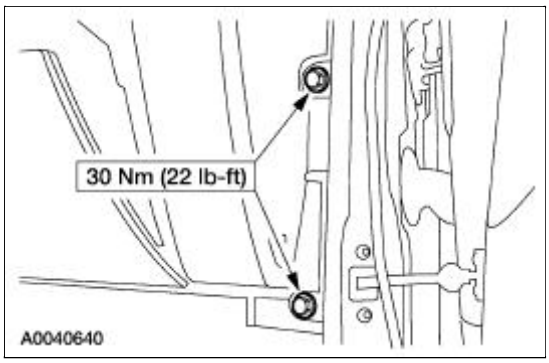
37. Remove the RH instrument panel bolts.

38. **NOTE:** This step requires an assistant.

NOTE: Two bullet connectors align the instrument panel to the bulkhead.

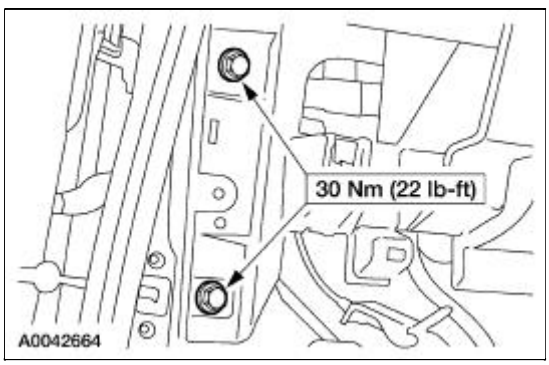
Remove the instrument panel.

Installation



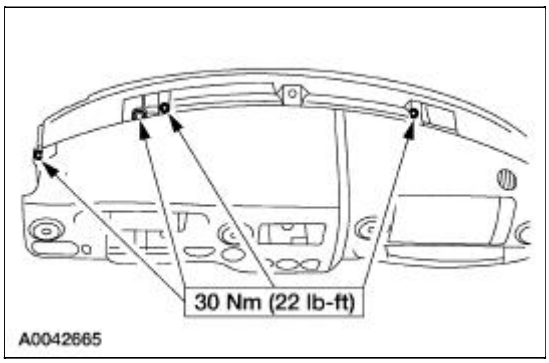
CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

All vehicles



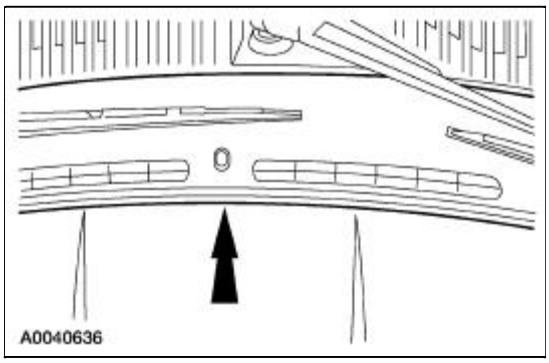
1. **NOTE:** This step requires an assistant.

   Align and position the instrument panel in the vehicle.

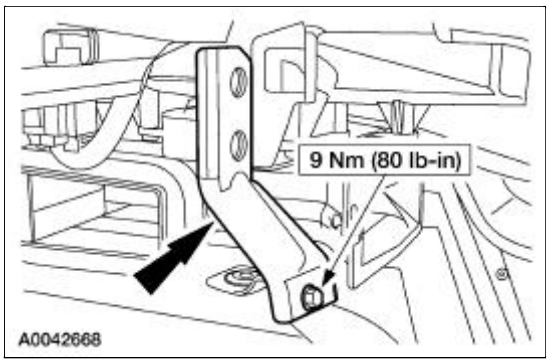


2. Install the RH instrument panel bolts.

3. Install the LH instrument panel bolts.

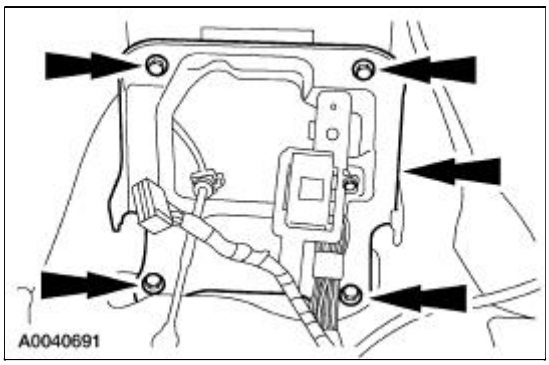


4. Install the instrument panel bolts.



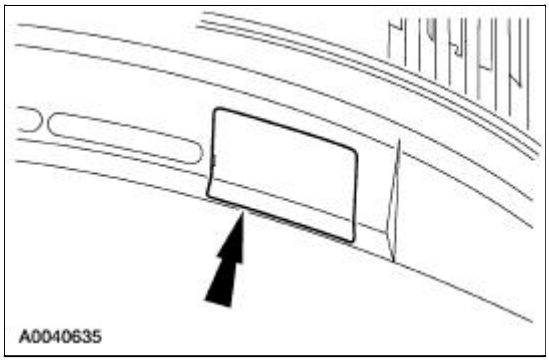
Navigator only

5. Install the instrument panel defroster grille.

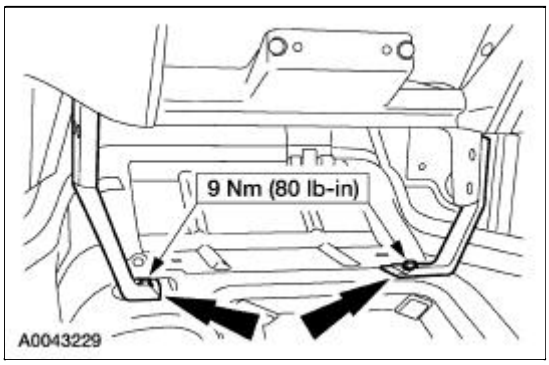


6. **NOTE:** The LH brace is similar to Expedition; RH brace shown.

   Position the instrument panel floor braces and install the bolts.
   - Position the carpet aside.

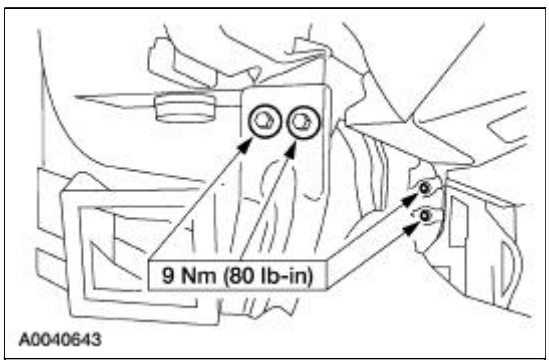


7. Position the floor console bracket and loosley install the bolts.

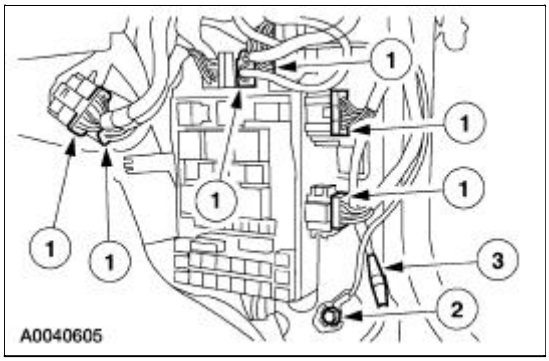


Expedition only

8. Install the instrument panel cowl top bolt covers.

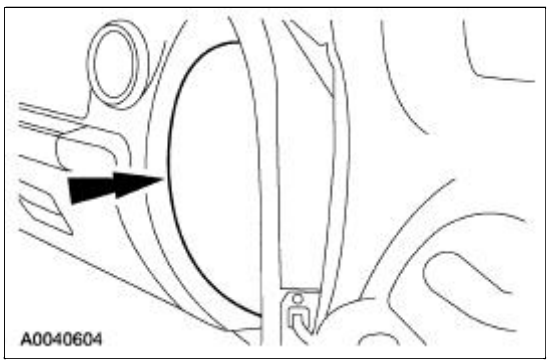


9. Position the instrument panel floor braces and the install bolts.
    - Position the carpet aside.

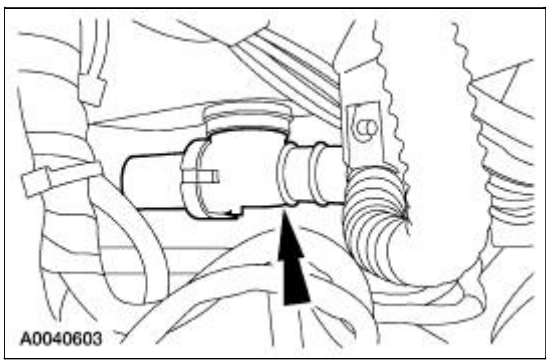


All vehicles

10. Install the instrument panel floor brace bolts.

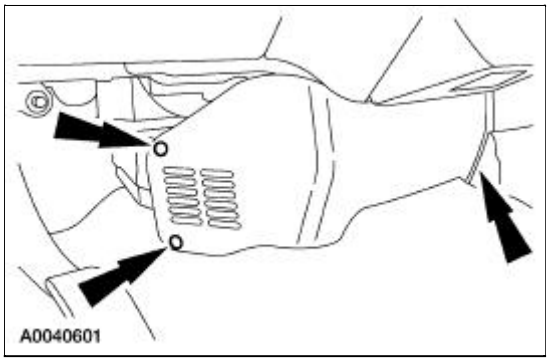


11. Connect the RH instrument panel electrical connectors.
    1. Connect the electrical connectors.
    2. Install the RH ground wire and bolt.
    3. Connect the in-line antenna connector.



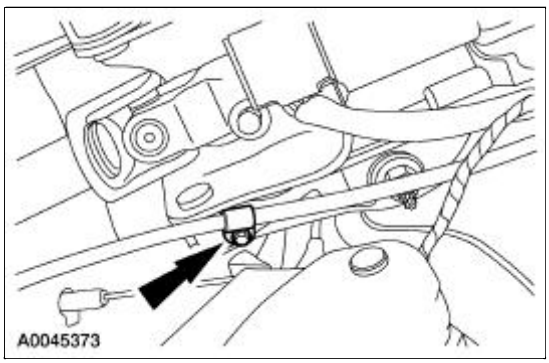
12. **NOTE:** Expedition shown; Navigator similar.

    Install the RH instrument panel side finish panel.

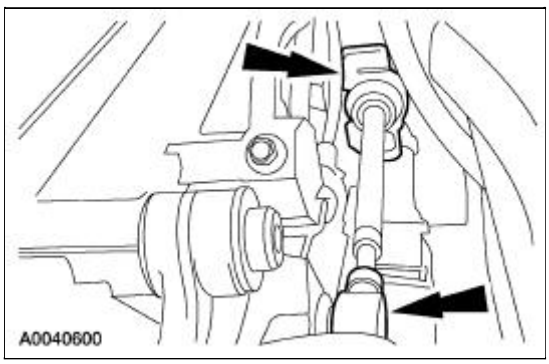


13. If equipped, connect the EATC hose to the evaporator case.

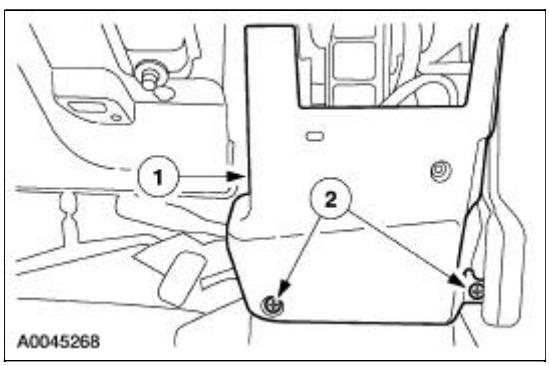
14. Connect the climate control head vacuum harness and the electrical connector.



15. If equipped, position the valance panel and install the three pin-type retainers.

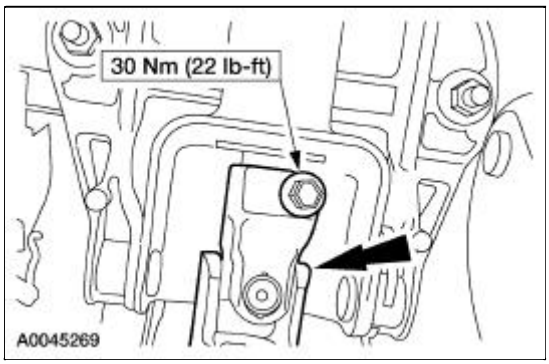


Expedition only

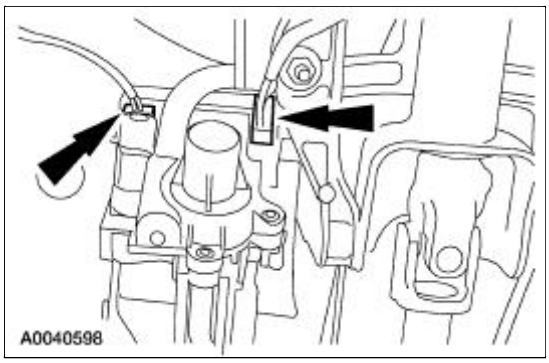


16. Position the steering column shift cable bracket and install the screw.

17. Connect the steering column shift cable.

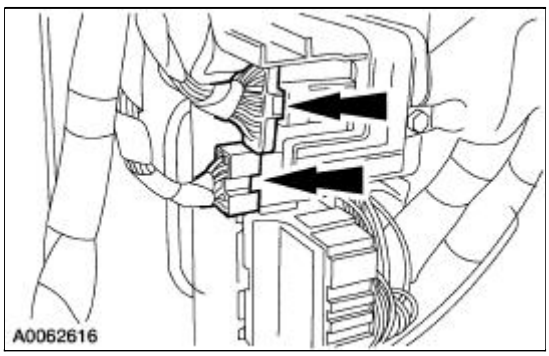


18. Install the steering column shrouds.
    1. Position the upper and lower shrouds on the column.
    2. Install the screws.

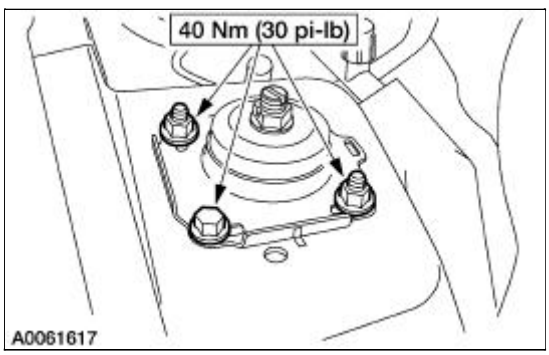


All vehicles

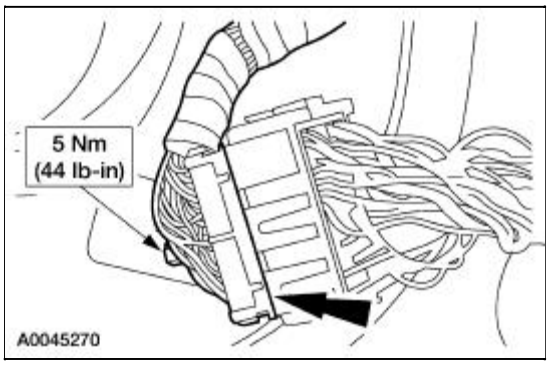
19. Connect the intermediate shaft to the steering column and install the pinch bolt.



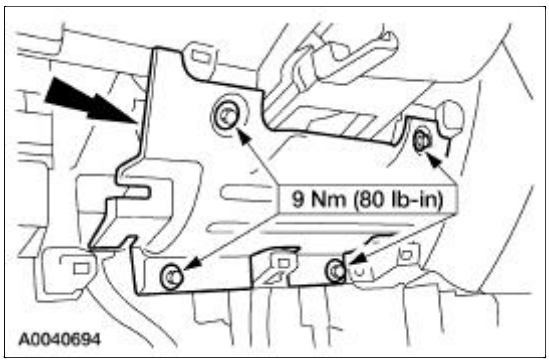
20. Connect the cruise control deactivator and the brake on/off switch electrical connectors.



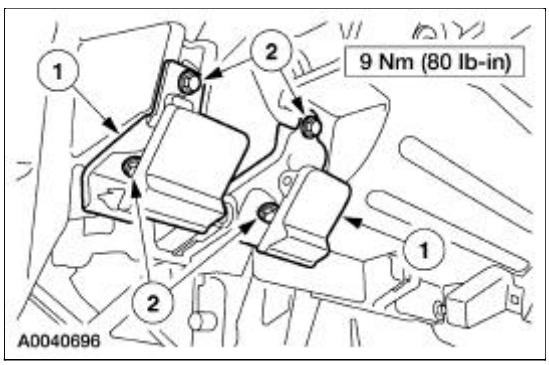
21. If equipped, connect the adjustable pedal motor harness electrical connector.



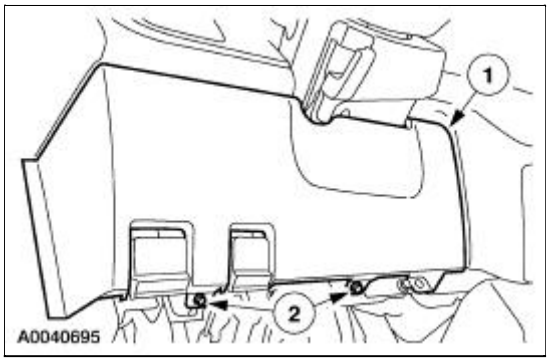
22. Install the RH ground wire and bolt.



23. Connect the two electrical connectors.

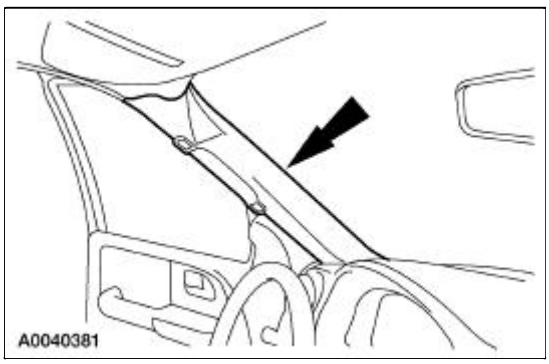


24. Connect the LH instrument panel electrical connectors and the bulkhead connector.
    - Tighten the bolt.
    - Insert the main wiring harness locators.

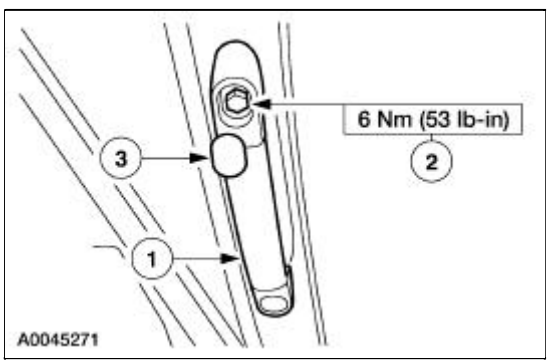


25. Position the steering column reinforcement panel and install the bolts.

26. Install the hood release and parking brake release handle.
    1. Position the release handles.
    2. Install the bolts.

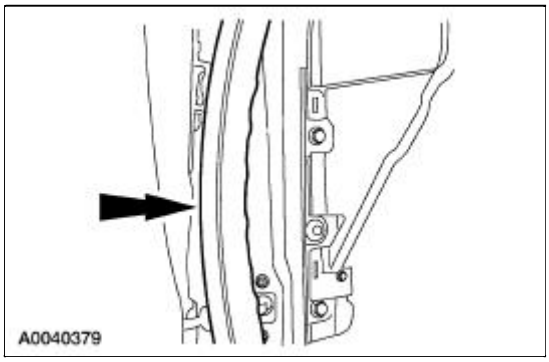


27. Install the instrument panel steering column cover.
    1. Position the cover on the instrument panel.
    2. Install the screws.



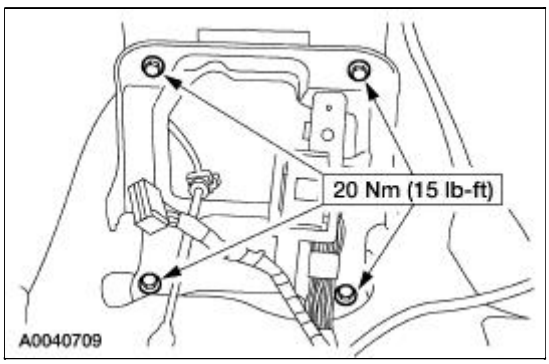
28. **NOTE:** Make sure that the locator tabs on the windshield side garnish mouldings locate in the slots on the instrument panel.

    Install the LH and RH windshield side garnish mouldings.



29. Install the LH and RH assist handles.
    1. Position the assist handle.
    2. Install the bolts.
    3. Install the covers.

30. Install the LH and RH A-pillar lower trim panels.
    1. Position the A-pillar lower trim panel.
    2. Install the pin-type retainer.
    3. Install the scuff plate.



31. Install the LH and RH door weatherstrip seals.

32. If equipped, install the RH instrument panel insulator.
    - Connect the instrument panel insulator lamp.

Navigator only

33. Tighten the floor console bracket bolts.

All vehicles

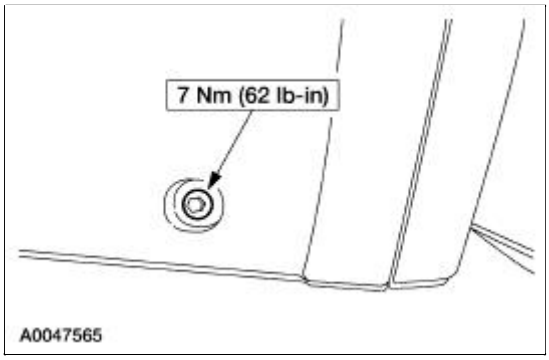
34. Install the passenger air bag module. For additional information, refer to Section 501-20B .

Navigator only

35. Install the driver airbag module. For additional information, refer to Section 501-20B .

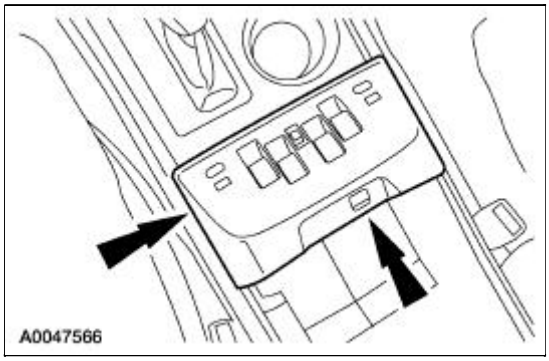
Expedition only

36. Install the steering wheel. For additional information, refer to Section 211-04 .



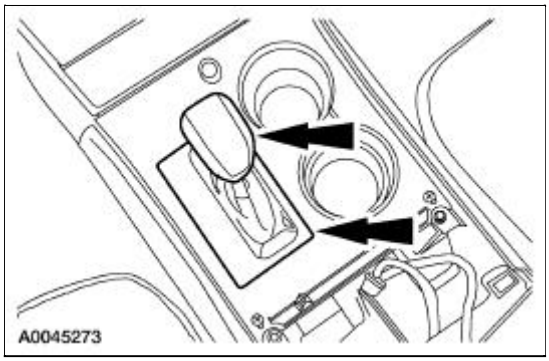
All vehicles

37. If equipped, install the floor console. For additional information, refer to Floor Console—Front, Navigator or Floor Console—Front, Expedition in this section.

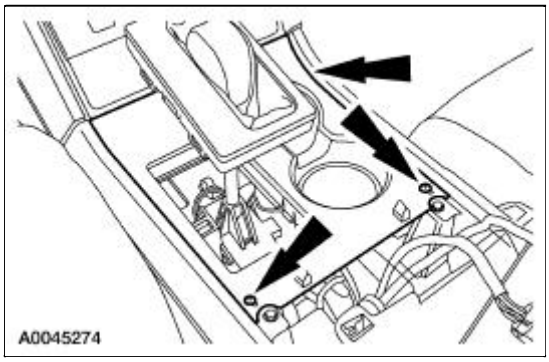


Floor Console —Front, Navigator

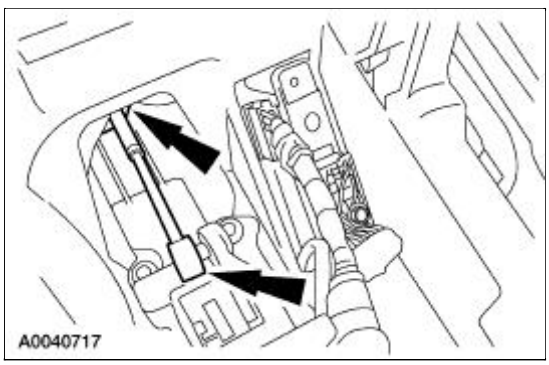
Removal and Installation



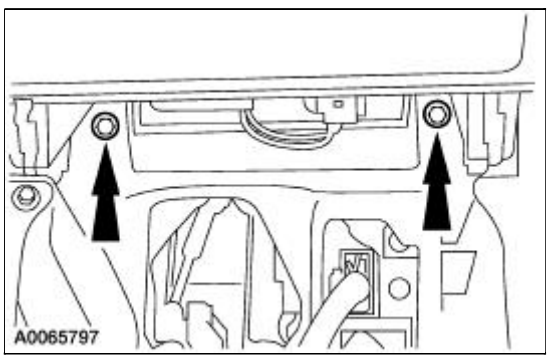
1. Apply the parking brake.
2. Position the front seat forward.
3. Remove the two front floor console rear bolts.



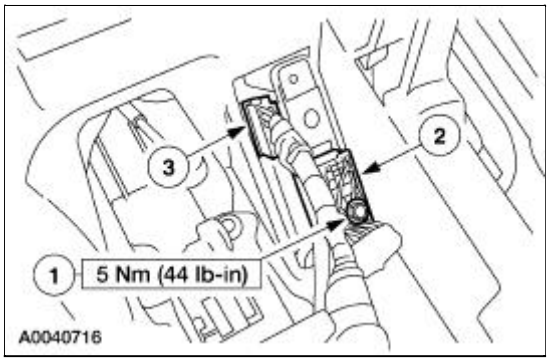
4. Position the front seats rearward.
5. Disconnect the battery. For additional information, refer to Section 414-01 .
6. Remove the pin-type retainer and the window control switch panel.
   - Disconnect the electrical connectors.



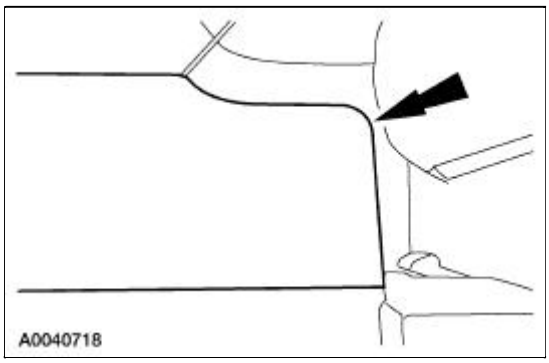
7. Move the shift lever to NEUTRAL and position the shift indicator bezel aside.



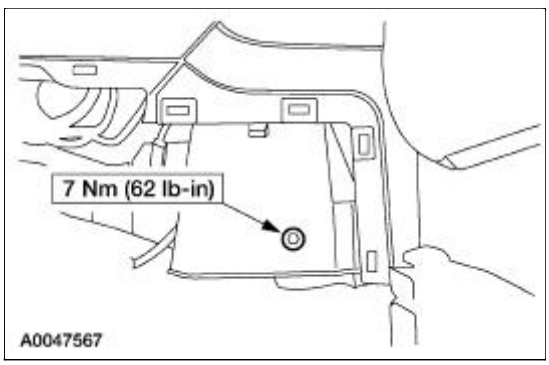
8. Remove the screws and the center console finish panel.



9. Disconnect the shift cable.



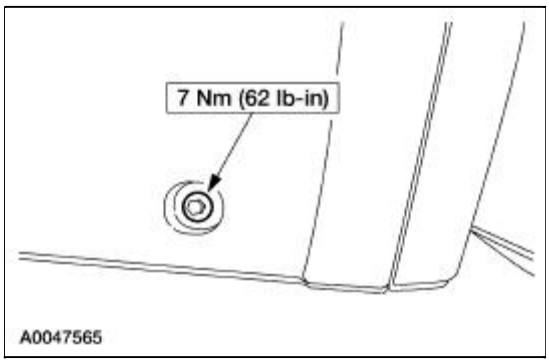
10. Remove the floor console front screws.



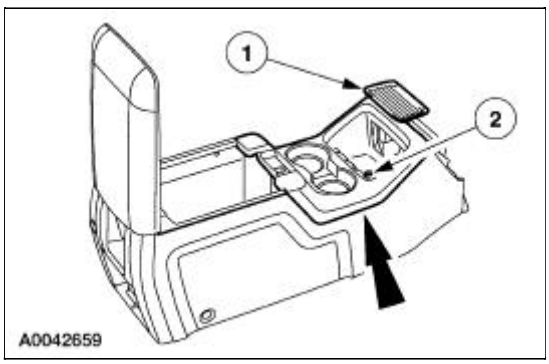
11. Disconnect the front floor console electrical connectors.
    1. Loosen the electrical connector bolt.
    2. Disconnect the connector.
    3. Disconnect the electrical connector.

12. Remove the LH and RH front floor console side finish panels.
    - If equipped, disconnect the electrical connector.

13. Remove the LH and RH front floor console front bolts and the floor console.

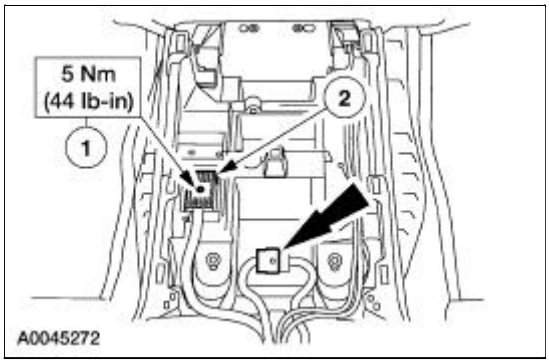


14. To install, reverse the removal procedure.

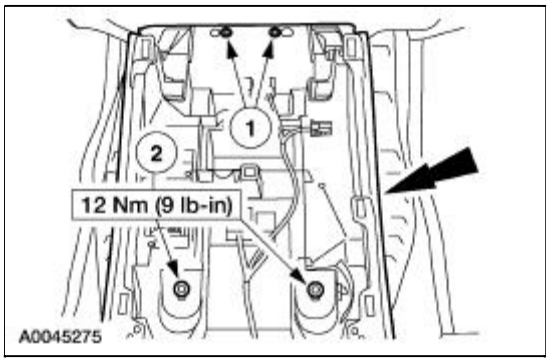


Floor Console —Front, Expedition

Removal and Installation



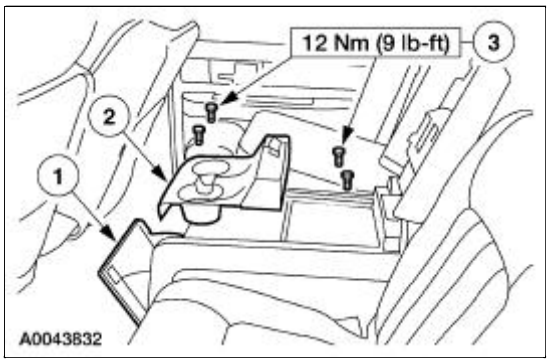
1. Position the front seat forward.
2. Remove the two front floor console rear bolts.



3. Position the front seats rearward.
4. Disconnect the battery. For additional information, refer to Section 414-01 .
5. Remove the console finish panel.
   1. Remove the mat.
   2. Remove the screw.
   - Disconnect the electrical connectors.

6. Disconnect the front floor console electrical connectors.
   1. Loosen the electrical connector bolt.
   2. Disconnect the electrical connector.

7. Remove the floor console.
    1. Remove the screws.
    2. Remove the bolts.



8. To install, reverse the removal procedure.

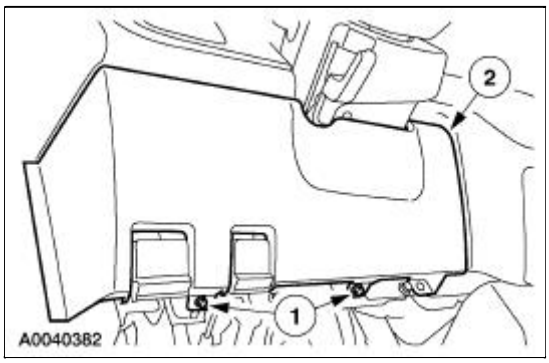
Floor Console —Rear

Removal and Installation

1. Remove the rear floor console.
    1. Open the front bin.
    2. Remove the cup holder.
    3. Remove the bolts.

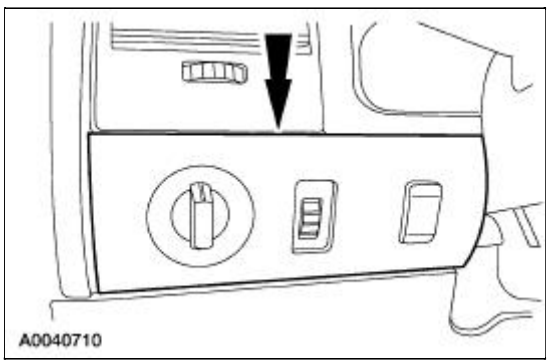
2. To install, reverse the removal procedure.

Instrument Cluster Finish Panel



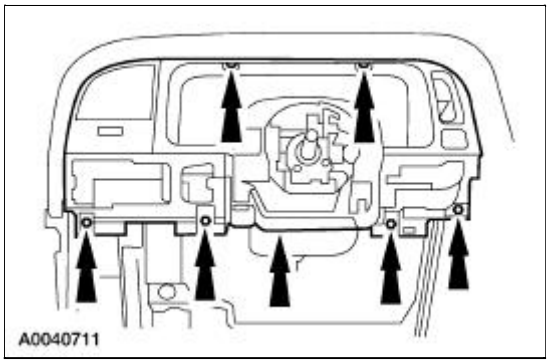
Removal and Installation

Vehicles with floor shift



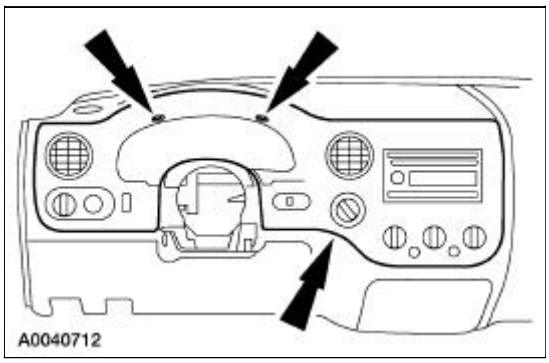
NOTE: Steering wheel removed for clarity.

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .



2. Remove the instrument panel steering column cover.
   1. Remove the screws.
   2. Release the cover from the instrument panel.

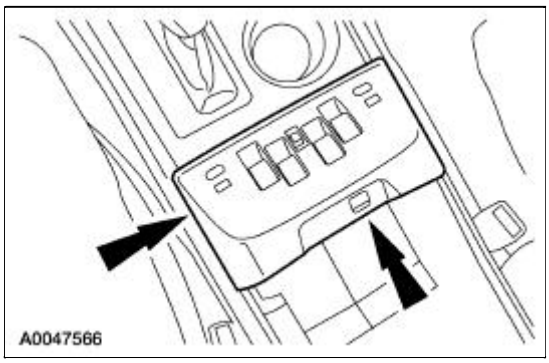
3. Remove the LH and RH instrument panel cluster finish panel trim panels.
   - Disconnect the electrical connectors.



4. Remove the screws and the instrument cluster finish panel.
   - Disconnect the electrical connectors.

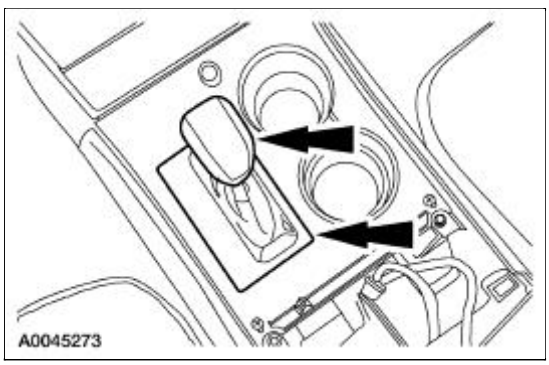
Vehicles with column shift

5. Apply the parking brake and move the shift lever to the 1 position.
6. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
7. Remove the screws and the instrument cluster finish panel.
   - Disconnect the electrical connectors.



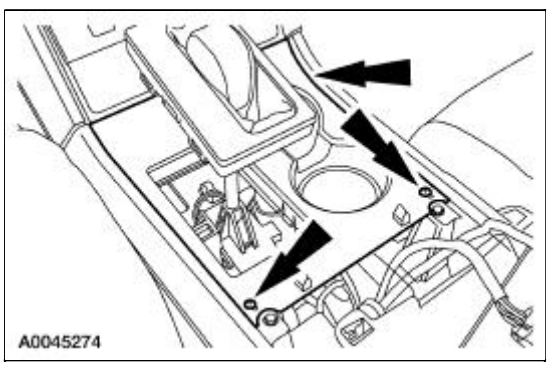
All vehicles

8. To install, reverse the removal procedure.

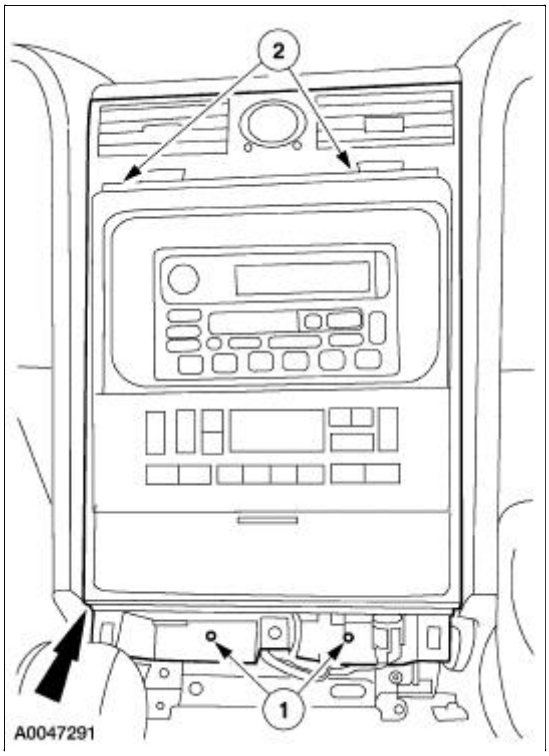


Instrument Cluster Center Finish Panel

Removal and Installation



1. Apply the parking brake and move the shift lever to NEUTRAL.
2. Disconnect the battery. For additional information, refer to Section 414-01 .
3. Remove the pin-type retainer and the window control switch panel.
   - Disconnect the electrical connectors.

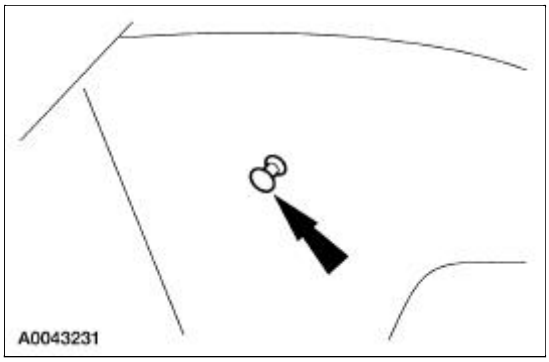


4. Position the shift indicator bezel aside.

5. Remove the screws and the center console finish panel.
   - Disconnect the electrical connectors.

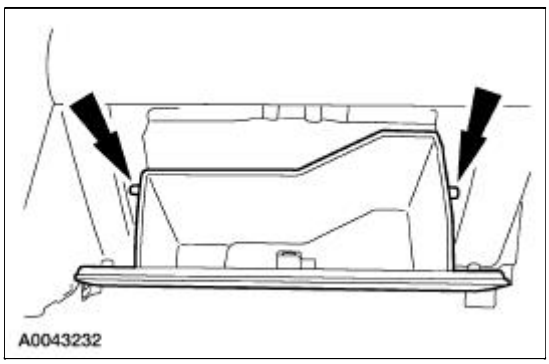
6. Remove the instrument panel center finish panel.
    1. Remove the screws.
    2. Pull out on the panel under the air vents to disengage the clips.
    - Disconnect the electrical connectors.

7. To install, reverse the removal procedure.



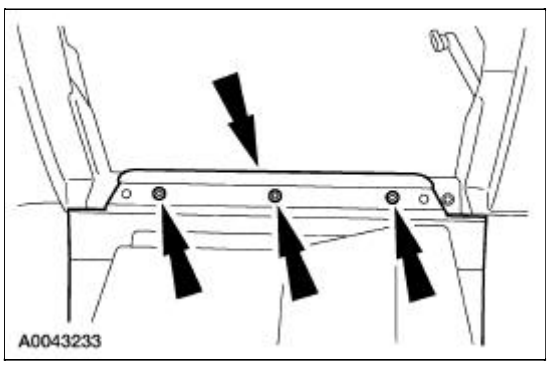
Glove Compartment

Removal and Installation



1. **CAUTION: Forcing the glove compartment past the stops will damage the dampener.**

   Open the glove compartment.



2. Disconnect the dampener.

3. Release the stops.

4. Remove the screws and the glove compartment.

5. To install, reverse the removal procedure.

General Specifications

Item	Specification
Multi-Purpose Grease Spray F5AZ-19G209-AA	ESR-M1C159-A

Lock Repair/Replacement Specifications

Part Number	Lock Repair Package Name
F85Z-11582-AA	Ignition Cylinder Kit
F85Z-1521990-BA	Door Lock Cylinder Kit

Torque Specifications

Description	Nm	lb-ft	lb-in
Exterior door handle nuts	9	—	80
Front door latch bolts	9	—	80
Hood latch bolts	12	9	—
Hood latch release handle screws	5	—	44
Liftgate remote control bolts	11	8	—
Liftgate latch ajar switch	8	—	71
Liftgate latch screws	12	9	—
Liftgate window glass latch bolts	8	—	71
Rear door latch bolts	9	—	80
Liftgate release handle nuts	5	—	44

Handles, Locks, Latches and Entry Systems

The hood consists of the following components:

- hood latch
- hood latch striker
- hood latch control handle and cable
- secondary hood latch release handle

The front doors consist of the following components:

- front door latch push button rods
- exterior door handles
- door lock cylinder
- front door latches
- door lock actuators
- door ajar switches
- front door carrier assembly
- interior door handles
- door lock control switches

The rear doors consist of the following components:

- exterior door handles
- rear door latches
- child lock bezels
- door lock actuators
- door ajar switches
- rear door carrier assembly
- interior door handles
- rear door latch push button rods

The liftgate consists of the following components:

- liftgate window glass latch
- door lock actuator (power liftgate only)
- liftgate latch
- liftgate handle
- liftgate latch remote control (power liftgate only)

- liftgate ajar switch
- chime module (power liftgate only)

The keyless entry system consists of the following components:

- vehicle security module
- keyless entry keypad
- keyless entry remote transmitter

The door locks are controlled by the vehicle security module.

The keyless entry remote transmitter initiates the following electronic door lock system functions:

- unlock the driver door
- unlock all doors
- lock all doors
- enable the panic alarm
- issue the interior lamps on (when unlocking) and off (when locking) commands to the vehicle security module
- sound the horn once when LOCK on keyless entry remote transmitter is pressed twice, and doors are closed
- sound the horn twice when LOCK on the keyless entry remote transmitter is pressed twice, and any door or the liftgate window is ajar
- allow up to four keyless entry remote transmitters to be programmed

NOTE: The remote entry features will not function when the ignition switch is in the RUN or ACC position.

The keyless entry remote transmitters are reprogrammable and must be set at the same time.

To confirm that the doors have been locked and that the anti-theft system has been armed, press the LOCK button again, within five seconds of the first press. The horn will sound once if the doors have locked and all doors are closed.

To activate the panic alarm:

- Press the red PANIC button on the keyless entry remote transmitter. The horn will sound and the parking lamps will flash for a maximum of 2 minutes and 45 seconds.

To deactivate the panic alarm:

- Press the red PANIC button again on the remote transmitter.
- Turn the ignition switch to RUN/ACC.

The keyless entry keypad can be used to unlock the driver door or lock and unlock all the doors and the liftgate. It also lights the keypad lamp, allows one user code to be programmed and issues illuminated entry on/off requests to the vehicle security module when locking and unlocking.

The system (permanent) entry code is located on the owner's wallet card in the glove box; it is also electronically accessible using a diagnostic tool, and it is on the receiver assembly housing.

The receiver assembly is programmed at the factory with a five-digit entry code. A new receiver assembly includes a new owner's code card.

To turn on the interior lamps and light all illuminated components, press any button on the keyless entry keypad.

Locks, Latches and Entry Systems

Refer to Wiring Diagrams Cell 117 for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418–F224, New Generation STAR (NGS) Tester 418–F052, or equivalent diagnostic tool

Principles of Operation

Power Lock

The power lock/unlock feature requests all of the vehicle doors, including the liftgate, be locked or unlocked upon a customer request from any interior door lock switch in the vehicle. The power door locking system functions independently of ignition status or vehicle speed. When the vehicle security module receives an unlock/lock command from any door lock control switch, the vehicle security module will activate relays internal to the module to supply the correct power and grounds for the door lock actuators.

Power Unlock Inhibit

With the ignition off, 20 seconds after electrically locked (remote transmitter, keypad, door lock control switch locked with door ajar) and all doors are closed, the door unlock switch will be inhibited if this feature is enabled. (The lock function will still operate.)

Deactivating/Activating Power Door Unlock Switch Inhibit

This is customer configurable. Steps one through three must be completed within 30 seconds.

1. Turn the key to ON, then press UNLOCK three times.
2. Turn the key to OFF, then press UNLOCK three times.
3. Turn the key to ON, within five seconds press LOCK two times.

The user should receive two horn chirps to indicate the system has been disabled or two chirps followed by a horn honk to indicate the system has been enabled.

Pressing LOCK two times again will toggle the door lock control switch inhibit feature state.

Turn the key to OFF to exit programming mode.

This feature can also be enabled/disabled using a diagnostic tool.

Auto-locking

The auto-locking feature locks all doors when all doors, including the liftgate, are closed, the brake pedal was pressed with the key in ON, then vehicle speed of 8 kph (5 mph) or higher was achieved. This feature relocks the doors (if any doors were open) after the brake pedal is pressed, once all doors are read as closed and vehicle speed exceeds 8 kph (5 mph). Door ajar switches are wired directly to the vehicle security module. The auto-locking feature can be enabled/disabled through module configuration, diagnostics, keyless entry keypad and the ignition switch.

Auto-lock Enable/Disable — Using the keypad

A manual enable/disable mode allows the auto-lock feature to be turned off and on.

To enable or disable auto-lock using the keyless entry keypad:

1. Enter the five-digit permanent entry code into the keyless entry keypad.
2. Within five seconds of entering the code, press and hold the 7/8 button on the keypad.
3. Within five seconds of Step 2, and while holding the 7/8 button, press the 3/4 button on the keypad and release it.
4. Within five seconds of Step 3, release the 7/8 button on the keypad.

If the auto-lock feature is disabled, the horn will chirp once. If the auto-lock feature is enabled, the horn will chirp once shortly and then sound a second time for a longer sound of the horn once the above sequence is completed.

Auto-lock Enable/Disable — Using the Ignition Switch

Another way to turn the auto-lock feature off/on is by following this series of steps:

1. Close all doors.
2. Confirm that the key is in the OFF position.
3. Turn the key from OFF to ON.
4. **NOTE:** Steps 4 through 8 must be carried out within 30 seconds.

   Press UNLOCK three times.
5. Turn the key from ON to OFF.
6. Press UNLOCK three times.
7. Turn the ignition switch from OFF to ON.
8. Verify that the horn chirps. This indicates the enable/disable mode and now is ready to accept program changes.
9. Press UNLOCK once to command the vehicle security module to toggle the auto-lock/relock

feature OFF.

10. Press LOCK once to enter the command.

11. Verify that the horn chirps one time. There should only be one chirp indicating that the auto-lock/relock feature has been disabled. If one chirp is heard followed by a longer sound of the horn, the auto-lock/relock feature has just been enabled. Return to Step 10.

12. Turn the key to the OFF position to exit the enable/disable mode.

13. Exit the vehicle and verify that the horn chirps once to indicate that a feature has been changed and that auto-lock/relock has been disabled.

Smart Unlock

The smart unlock feature prevents the driver door from locking with the key in the ignition lock cylinder. When the vehicle security module receives a LOCK command from a door lock switch with the key in the ignition lock cylinder and the driver door open the vehicle security module will command the driver door to UNLOCK.

Remote Transmitter Lock/Unlock Control — Unlock

The remote control feature provides lock/unlock functions independently of ignition status, vehicle speed or transmission position. The remote control feature provides a two-step process for unlocking the doors. Upon receipt of the first requests for unlocking the doors, the remote control feature requests the vehicle security module to unlock the driver door only. If another unlock request is received within three seconds of the first, the remote control feature will request that all doors be unlocked.

Remote Transmitter Lock/Unlock Control — Lock

The remote control feature requests that all the doors be locked when the LOCK button is pressed. On any press of the lock button with all doors closed, the remote control feature will request one flash of the parking lamps. If any door is ajar, no flash will occur, indicating it locked all the doors but one or more doors are ajar. As soon as the last door is closed, one flash of the parking lamps occurs. If two presses of the lock button are received within two seconds, the horn will chirp once, the parking lamps will flash twice to indicate that all the doors are closed and locked. If any door is ajar when the second lock request is received within three seconds of the first, the remote control feature will request the horn chirp twice without flashing the parking lamps to indicate it locked all the doors but one or more doors are ajar. When the ignition is in the ON or START position, no parking lamp flashes or horn chirp confirmations will occur.

Panic Alarm

The panic alarm feature controls activation of the panic alarm providing audible and visual alarms which are evident from the exterior of the vehicle. The panic alarm feature requests that the parking lamps and horn are flashed until deactivation. The flashing of the outputs occurs synchronously. Activation of the panic alarm is accomplished by pressing the PANIC button on a remote transmitter whenever the key is OFF. At all other times this feature is disabled. Deactivation of an active PANIC alarm is accomplished by: a second press of the remote transmitter PANIC button, the ignition is switched out of the OFF or ACC position or a period of 2.75 minutes has elapsed since the initial activation.

Keyless Entry Keypad

The keyless entry keypad, located on the exterior of the driver door, provides a method for the customer to access their vehicle without a key or remote transmitter. The keyless entry keypad feature:

- locks all doors and inhibits the door lock control switch UNLOCK capability after 20 seconds (if

the inhibit feature is enabled).

- unlocks only the driver door.
- unlocks all doors.
- programs/erases customer key code.
- enables/disables auto-locking.

The keyless entry keypad feature operates independently of ignition status, vehicle speed, or transmission position. When a keypad button is depressed, the keypad buttons illuminate to provide better visibility. If 7/8 and 9/0 are pressed or five seconds have elapsed since the last button press, the illumination is turned off.

Each vehicle equipped with a keyless entry keypad is programmed with a five-digit entry code. This code is provided to the customer on a wallet card in the Owner literature package. In addition, this code is available through a diagnostic tool and is also printed on the vehicle security module label. When entering codes each digit must be entered within five seconds of the previous button press.

Programming/Erasing Personal Code

A unique personal five-digit code can be programmed by following these steps:

1. Enter the factory set five-digit code (the keypad will illuminate when pressed).
2. Press 1/2 within five seconds of Step 1.
3. Enter the unique five-digit code.

The personal code does not substitute for the permanent factory set code. Either code can be used to access the vehicle. In addition, if a second personal code is programmed, it will simply overwrite the previous personal code. To erase a personal code, carry out the following procedure:

4. Enter factory set five-digit code.
5. Press 1/2 within five seconds of Step 1.
6. Press 7/8 and 9/0 at the same time within five seconds of Step 2.

The system will now only respond to the factory set code.

Anti-Scan Feature

To provide added security, the keyless entry pad is disabled for one minute after 35 button presses without a valid entry code being entered. The keypad will flash during this one-minute mode with all functionality disabled except for 7/8 and 9/0 still being allowed to lock the vehicle.

Anti-Scan will be turned off after any of the following events:

- one minute of keypad inactivity
- the remote transmitter UNLOCK button is pressed
- the key is turned to the ON position.

Unlocking the Doors with the Keyless Entry Keypad System

To unlock the driver door, enter either the factory set code or the personal code (each digit must be pressed within five seconds of the prior digit). The interior lamps will illuminate.

To unlock all doors, enter either the factory set code or the personal code (driver door unlocks) and press the 3/4 button within five seconds.

Locking the Doors with the Keyless Entry Keypad System

It is not necessary to enter the factory set or personal code prior to locking all doors. To lock all doors, press the 7/8 and 9/0 buttons at the same time.

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

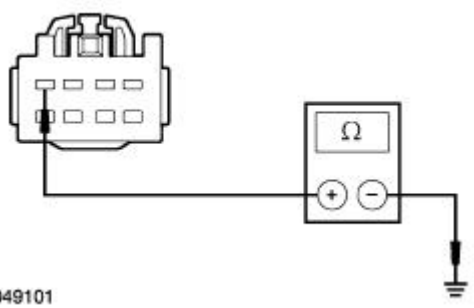
Mechanical	Electrical
● Binding latches	● Central junction box (CJB) fuse(s): ■ 5 (7.5A) ■ 30 (30A) ● Circuitry ● Damaged relays ● Remote transmitter ● Keyless entry keypad ● Vehicle security module

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the diagnostic tool does not power up, refer to the diagnostic tool manual.
5. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:
   - CKT693 (OG), CKT914, CKT915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
   - NO RESP/NOT EQUIP for vehicle security module, refer to Section 419-10 .
   - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs, and carry out the self-test diagnostics for the vehicle security module.
6. If the DTCs retrieved are related to the concern, go to the Vehicle Security Module Diagnostic Trouble Code (DTC) Index to continue diagnostics.
7. If DTCs are retrieved that are not found in the following Vehicle Security Module Diagnostic Trouble Code (DTC) Index, refer to the Master Vehicle Security Module Diagnostic Trouble Code (DTC) Index in Section 419-10 .
8. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart to continue diagnostics.

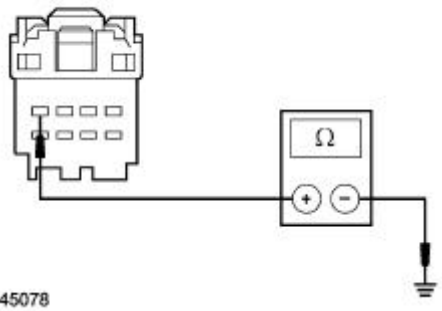
Vehicle Security Module Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1300	Power Door Lock Circuit Failure	Vehicle Security Module	Go To Pinpoint Test A .
B1311	Power Door Unlock Circuit Failure	Vehicle Security Module	Go To Pinpoint Test A .
B1321	Driver Door Ajar Circuit Short to Battery	Vehicle Security Module	Go To Pinpoint Test D .
B1333	Liftgate Ajar Circuit Short to Battery	Vehicle Security Module	Go To Pinpoint Test D .
B1337	Door Ajar RR Circuit Short to Battery	Vehicle Security Module	Go To Pinpoint Test D .
B1573	Door Ajar LR Circuit Short to Battery	Vehicle Security Module	Go To Pinpoint Test D .
B2425	Remote Transmitter Out of Sync	Vehicle Security Module	Go To Pinpoint Test E .
B2675	Keypad_B Switch Circuit Failure	Vehicle Security Module	Go To Pinpoint Test B .
B2676	Keypad _C Switch Circuit Failure	Vehicle Security Module	Go To Pinpoint Test B .
B2695	Keypad_A Switch Circuit Failure	Vehicle Security Module	Go To Pinpoint Test B .

Symptom Chart



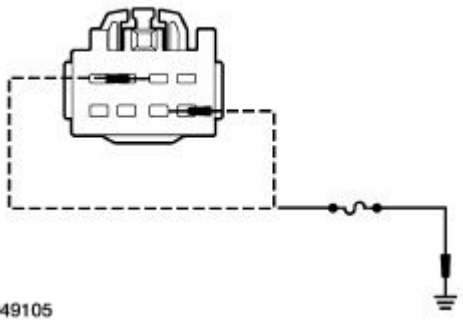
Symptom Chart

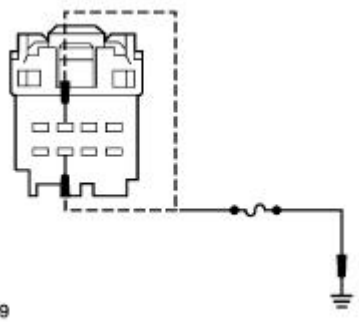


Condition	Possible Sources	Action
• A single/more than one door lock is inoperative	• Door lock control switches (trim panel switches). • Door lock motor. • Door lock hardware. • Circuitry. • Vehicle security module.	• Go To Pinpoint Test A .
• The doors do not lock/unlock using the keyless entry keypad	• Keyless entry keypad. • Remote transmitter. • Vehicle security module.	• Go To Pinpoint Test B .
• The doors do not lock/unlock using the remote transmitter	• Remote transmitter battery. • Remote transmitter. • Vehicle security module.	• Go To Pinpoint Test C .
• The auto-lock does not operate correctly	• Door ajar switches. • UART based protocol (UBP) communications network. • Vehicle security module.	• Go To Pinpoint Test D
• Remote keyless entry transmitter out of synchronization	• Remote transmitter. • Vehicle security module.	• Go To Pinpoint Test E .
• Panic feature is inoperative/does not operate correctly	• Remote transmitter. • Circuitry. • Vehicle security module.	• Go To Pinpoint Test F .
• The keyless entry keypad illumination is	• Keyless entry keypad. • Remote transmitter.	• Go To Pinpoint Test G .

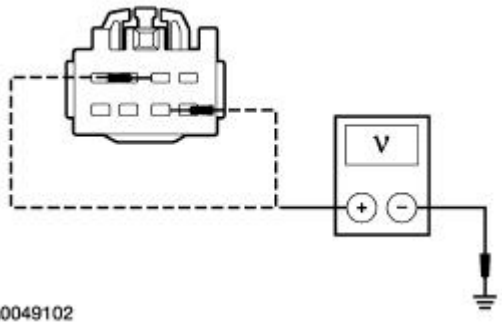
inoperative	• Vehicle security module.	
• The power door unlock inhibit feature is inoperative	• Feature not enabled. • Vehicle security module.	• Install a new vehicle security module. Refer to Section 419-10 .
• The smart unlock does not operate correctly	• Door lock control switches. • Driver door ajar switch • UBP communications network. • Vehicle security module.	• Go To Pinpoint Test H .

Pinpoint Tests



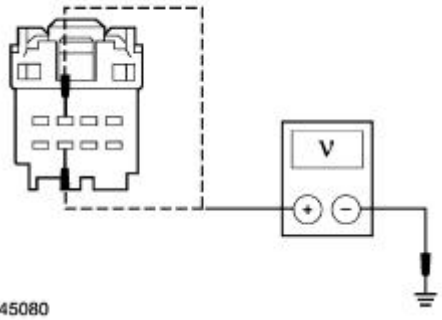


PINPOINT TEST A: A SINGLE/MORE THAN ONE DOOR LOCK IS INOPERATIVE



Test Step	Result / Action to Take
A1 CHECK THE DOOR LOCK ACTUATOR OPERATION	
• Verify the power door unlock inhibit feature is disabled. • Activate the door lock and unlock active commands. • **Do all doors lock and unlock correctly?**	**Yes** GO to A2 . **No** GO to A13 .
A2 ISOLATE DRIVER OR PASSENGER CONTROL SWITCH FAULT	
• Operate the door locks using the driver door lock control switch. • **Do all doors lock with the driver door lock control switch?**	**Yes** GO to A3 . **No** GO to A8 .
A3 CHECK GROUND CIRCUIT 57 (BK)	
• Disconnect: Passenger Door Lock Control Switch C605 (Expedition) C632 (Navigator). • For Expedition, measure the resistance between the passenger door lock control switch C605 pin 4, circuit 57 (BK), harness side and ground.  A0049101 • For Navigator, measure the resistance between the passenger door lock control switch C632 pin 4, circuit 57 (BK), harness side and ground.	**Yes** GO to A4 . **No** REPAIR the circuit. TEST the system for normal operation.

A0045078

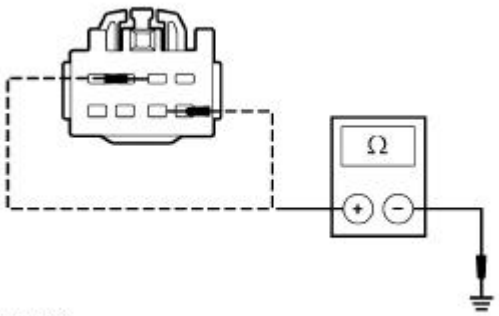


- **Is the resistance less than 5 ohms?**

A4 CHECK CIRCUITS 120 (PK/LG) AND 119 (PK/YE) TO VEHICLE SECURITY MODULE	
• For Expedition, connect a 5A fused jumper wire between the passenger door lock control switch C605 pin 6, circuit 120 (PK/LG), harness and ground; and between the passenger door lock control switch C605 pin 2, circuit 119 (PK/YE), harness side and ground.  A0049105 • For Navigator, connect a 5A fused jumper wire between the passenger door lock control switch C632 pin 7, circuit 120 (PK/LG), harness side and ground; and between the passenger door lock control switch C632 pin 3, circuit 119 (PK/YE), harness side and ground.  A0045079 • **Do the door locks unlock and lock?**	**Yes** INSTALL a new passenger door lock control switch. TEST the system for normal operation. **No** GO to A5 .
A5 CHECK CIRCUITS 120 (PK/LG) AND 119 (PK/YE) FOR SHORT TO BATTERY	
• Key in OFF position. • Disconnect: Vehicle Security Module C2113a. • For Expedition, measure the voltage between the passenger door lock control switch C605 pin 6, circuit 120 (PK/LG), harness side and ground; and between the passenger door lock control switch C605 pin 2, circuit 119 (PK/YE), harness side and ground.	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to A6 .

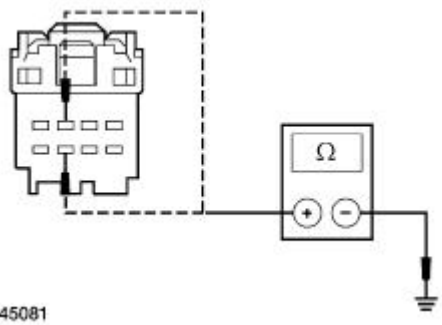
A0049102

- For Navigator, measure the voltage between the passenger door lock control switch C632 pin 7, circuit 120 (PK/LG), harness side and ground; and between the passenger door lock control switch C632 pin 3, circuit 119 (PK/YE), harness side and ground.



A0045080

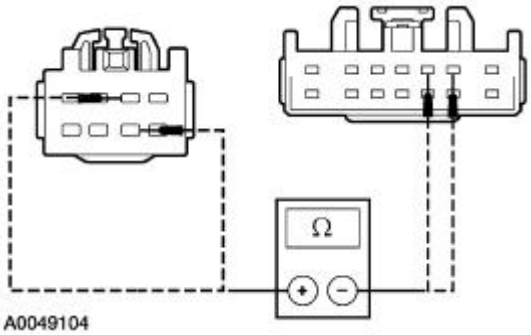
- **Is the voltage greater than 10 volts?**

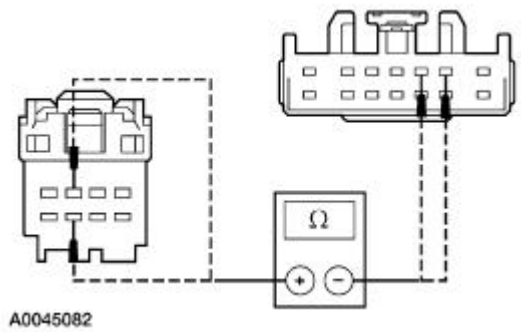


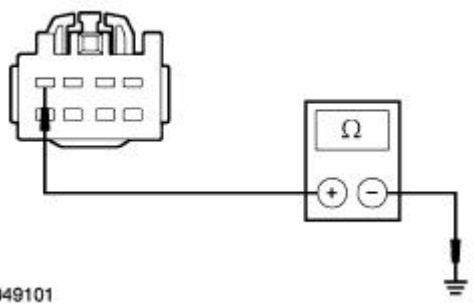
A6 CHECK CIRCUITS 120 (PK/LG) AND 119 (PK/YE) FOR SHORT TO GROUND

- For Expedition, measure the resistance between the passenger door lock control switch C605 pin 6, circuit 120 (PK/LG), harness side and ground; and between the passenger door lock control switch C605 pin 2, circuit 119 (PK/YE), harness side and ground.

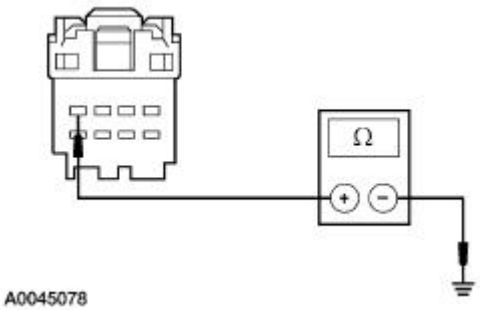
A0049103

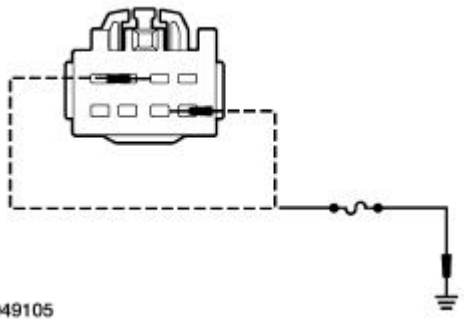


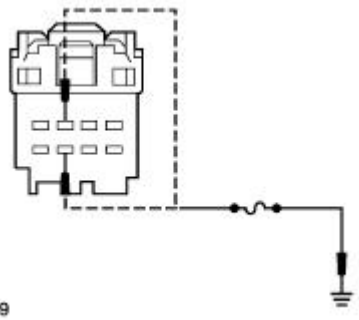


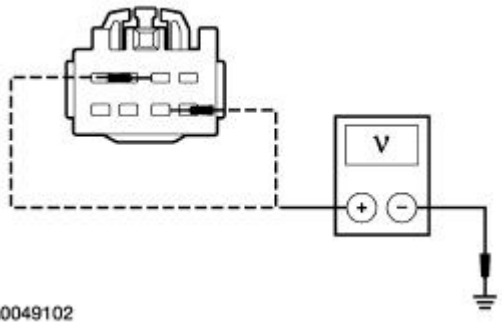


- For Navigator, measure the resistance between the passenger door lock control switch C632 pin 7, circuit 120 (PK/LG), harness side and ground; and between the passenger door lock control switch C632 pin 3, circuit 119 (PK/YE), harness side and ground.





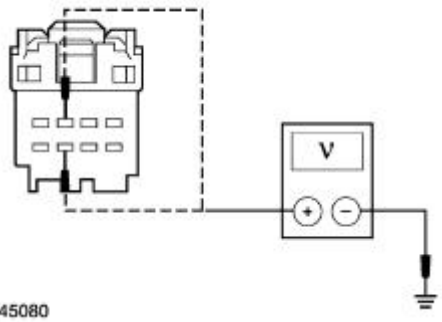




A0045081

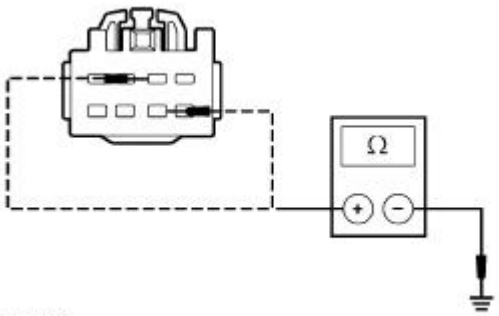
Yes
GO to A7 .

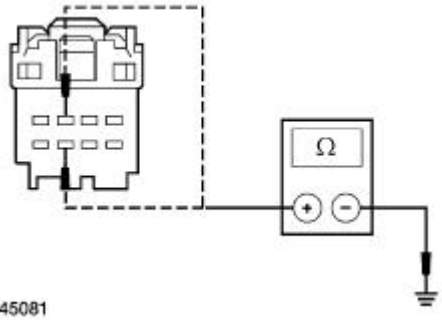
No
REPAIR the circuit in question. TEST the system for normal operation.



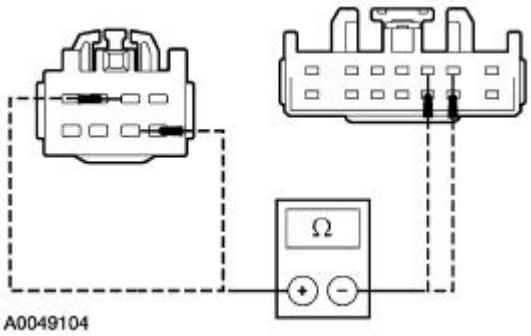
• **Are the resistances greater than 10,000 ohms?**	
A7 CHECK CIRCUIT 120 (PK/LG) AND 119 (PK/YE) FOR OPEN CIRCUIT	
• For Expedition, measure the resistance between the passenger door lock control switch C605 pin 6, circuit 120 (PK/LG), harness side and the vehicle security module C2113a pin 2, circuit 120 (PK/LG), harness side; and between the passenger door lock control switch C605 pin 2, circuit 119 (PK/YE), harness side and the vehicle security module C2113a pin 3, circuit 119 (PK/YE), harness side.  A0049104 • For Navigator, measure the resistance between the passenger door lock control switch C632 pin 7, circuit 120 (PK/LG), harness side and the vehicle security module C2113a pin 2, circuit 120 (PK/LG), harness side; and between the passenger door lock control switch C632 pin 3, circuit 119 (PK/YE), harness side and the vehicle security module C2113a pin 3, circuit 119 (PK/YE), harness side.  A0045082 • **Are the resistances less than 5 ohms?**	**Yes** GO to A16 . **No** REPAIR the circuit in question. TEST the system for normal operation.
A8 CHECK CIRCUIT 57 (BK) FOR OPEN	
• Disconnect: Driver Door Lock Control Switch C505 (Expedition) C541 (Navigator). • For Expedition, measure the resistance between the driver door lock control switch C505 pin 4, circuit 57 (BK), harness side and ground.  A0049101 • For Navigator, measure the resistance between the driver door lock control switch C541 pin 4, circuit 57 (BK), harness side and	**Yes** GO to A9 . **No** REPAIR the circuit. TEST the system for normal operation.

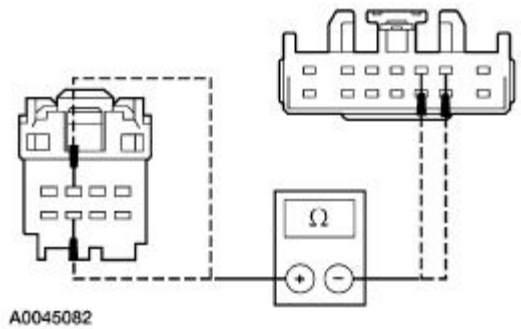
ground.  A0045078 ● **Is the resistance less than 5 ohms?**	
A9 CHECK CIRCUITS 120 (PK/LG) AND 119 (PK/YE) TO THE VEHICLE SECURITY MODULE	
● For Expedition, connect a 5A fused jumper wire between the driver door lock control switch C505 pin 6, circuit 120 (PK/LG), harness side and ground; and between the driver door lock control switch C505 pin 2, circuit 119 (PK/YE), harness side and ground.  A0049105 ● For Navigator, connect a 5A fused jumper wire between the driver door lock control switch C541 pin 7, circuit 120 (PK/LG), harness side and ground; and between the driver door lock control switch C541 pin 3, circuit 119 (PK/YE), harness side and ground.  A0045079 ● **Do the door locks unlock and lock?**	**Yes** INSTALL a new driver door lock control switch. TEST the system for normal operation. **No** GO to A10 .
A10 CHECK CIRCUITS 120 (PK/LG) AND 119 (PK/YE) FOR SHORT TO POWER	
● Disconnect: Vehicle Security Module C2113a. ● For Expedition, measure the voltage between the driver door lock control switch C505 pin 6, circuit 120 (PK/LG), harness side and ground, and between the driver door lock control switch C505 pin 2, circuit 119 (PK/YE), harness side and ground.	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to A11 .



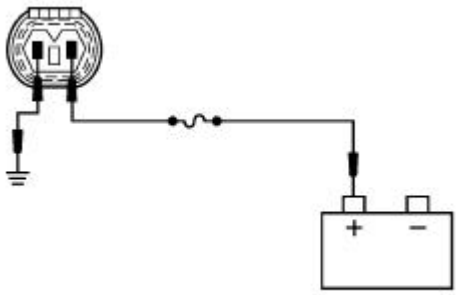


A0049102



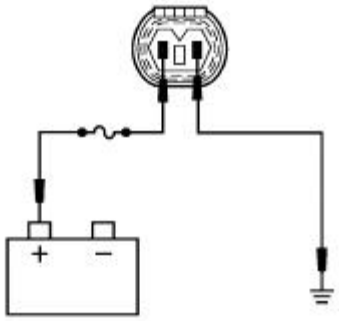


- For Navigator, measure the voltage between the driver door lock control switch C541 pin 7, circuit 120 (PK/LG), harness side and ground; and between the driver door lock control switch C541 pin 3, circuit 119 (PK/YE), harness side and ground.



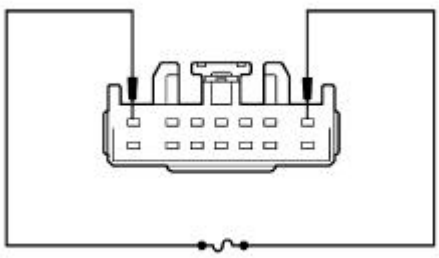
A0045080

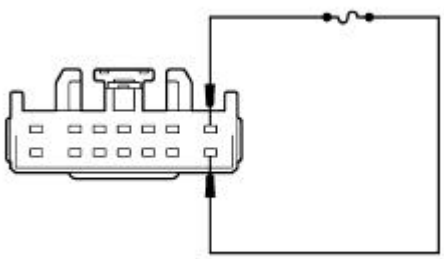
- **Is the voltage greater than 10 volts?**



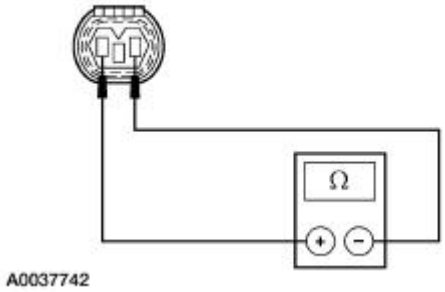
A11 CHECK CIRCUITS 120 (PK/LG) AND 119 (PK/YE) FOR SHORT	
- For Expedition, measure the resistance between the driver door lock control switch C505 pin 6, circuit 120 (PK/LG), harness side and ground; and between the driver door lock control switch C505 pin 2, circuit 119 (PK/YE), harness side and ground.  A0049103 - For Navigator, measure the resistance between the driver door lock control switch C541 pin 7, circuit 120 (PK/LG), harness side and ground; and between the driver door lock control switch C541 pin 3, circuit 119 (PK/YE), harness side and ground.  A0045081 - **Are the resistances greater than 10,000 ohms?**	**Yes** GO to A12 . **No** REPAIR the circuit in question. TEST the system for normal operation.

A12 CHECK CIRCUIT 120 (PK/LG) AND 119 (PK/YE) FOR AN OPEN	
• For Expedition, measure the resistance between the driver door lock control switch C505 pin 6, circuit 120 (PK/LG), harness side and the vehicle security module C2113a pin 2; and between the driver door lock control switch C505 pin 2, circuit 119 (PK/YE), harness side and the vehicle security module C2113a pin 2, circuit 119 (PK/YE), harness side.  A0049104 • For Navigator, measure the resistance between the driver door lock control switch C541 pin 7, circuit 120 (PK/LG), harness side and the vehicle security module C2113a pin 2, circuit 120 (PK/LG), harness side; and between the driver door lock control switch C541 pin 3, circuit 119 (PK/LG), harness side and vehicle security module C2113a pin 3, circuit 119 (PK/YE), harness side.  A0045082 • **Are the resistances less than 5 ohms?**	**Yes** GO to A16 . **No** REPAIR the circuit in question. TEST the system for normal operation.
A13 CHECK THE MANUAL OPERATION OF THE SUSPECT DOOR LOCK	
• Manually operate the suspect door lock while checking for a binding or stuck condition. • **Is the lock stuck or binding?**	**Yes** REPAIR the binding components. TEST the system for normal operation. **No** GO to A14 .
A14 CHECK SUSPECT DOOR LOCK ACTUATOR	
• Disconnect: Suspect Door Lock Actuator Connector. • Connect a 5A fused jumper wire between the suspect door lock actuator connector pin 1, component side and the battery positive terminal; and between the suspect door lock actuator connector pin 2, component side and ground.	**Yes** GO to A15 . **No** INSTALL a new door lock actuator. REFER to Front Door Lock Actuator in this section. TEST the system for normal operation.





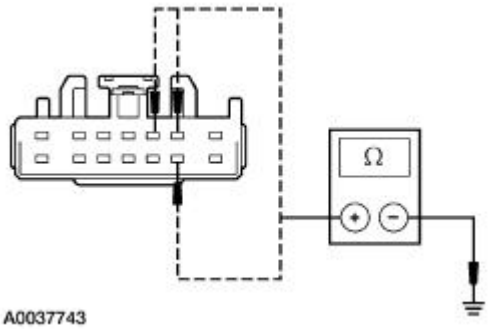
A0051367



- Connect a 5A fused jumper wire between the suspect door lock actuator connector pin 2, component side and the battery positive terminal; and between the suspect door lock actuator connector pin 1, component side and ground.

A0051368

- **Does the door lock actuator operate correctly?**



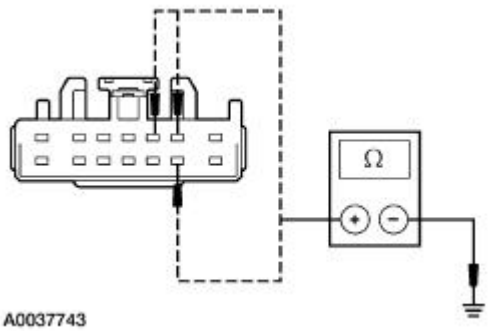
A15 CHECK DOOR LOCK ACTUATOR CIRCUITS	
• Disconnect: Vehicle Security Module C2113a. • If the driver door lock is inoperative, connect a 15A fused jumper wire between the vehicle security module C2113a pin 1, circuit 117 (PK/BK), harness side and the vehicle security module 2113a pin 7, circuit 163 (RD/OG), harness side.  A0037740 • If any door lock is inoperative other than the driver door, connect a 15A fused jumper wire between the vehicle security module C2113a pin 1, circuit 117 (PK/BK), harness side and the vehicle security module 2113a pin 8, circuit 118 (PK/OG), harness side.  A0037741	**Yes** GO to A16 . **No** REPAIR the circuit in question. TEST the system for normal operation.

• Measure the resistance between the suspect door lock actuator connector pin 1, harness side and the suspect door lock actuator connector pin 2, circuit 117 (PK/BK), harness side.  A0037742 • **Is the resistance less than 5 ohms?**	
A16 CHECK FOR CORRECT VEHICLE SECURITY MODULE OPERATION	
• Disconnect all vehicle security module connectors. • Check for: • corrosion • pushed-out pins • Connect all vehicle security module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new vehicle security module. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.

PINPOINT TEST B: THE DOORS DO NOT LOCK/UNLOCK USING THE KEYLESS ENTRY KEYPAD

Test Step	Result / Action to Take
B1 CHECK THE VEHICLE SECURITY MODULE KEYPAD SWITCH PIDS	
• Enter the following diagnostic mode on the diagnostic tool: Vehicle Security Module KEYPAD PIDS. • Press each keypad button while viewing vehicle security module KEYPAD PIDS. • **Do the PID values agree with the keypad button positions?**	**Yes** GO to B5 . **No** GO to B2 .
B2 CHECK CIRCUITS 78 (LB/YE), 79 (LG/RD) AND 121 (YE/BK) FOR RESISTANCE TO GROUND	
• Key in OFF position. • Disconnect: Vehicle Security Module C2113c. • Using the following table, measure the resistance between the vehicle security module C2113c harness side and ground:	**Yes** GO to B3 . **No** GO to B4 .

Vehicle Security Module C2113c	Circuit
pin 2	78 (LB/YE)
pin 3	121 (YE/BK)
pin 9	79 (LG/RD)



- **Is any resistance less than 10,000 ohms?**

B3 CHECK CIRCUITS 78 (LB/YE), 79 (LG/RD) AND 121 (YE/BK) FOR A SHORT TO GROUND

- Disconnect: Keyless Entry Keypad C500.
- Using the following table, measure the resistance between the vehicle security module C2113c harness side and ground:

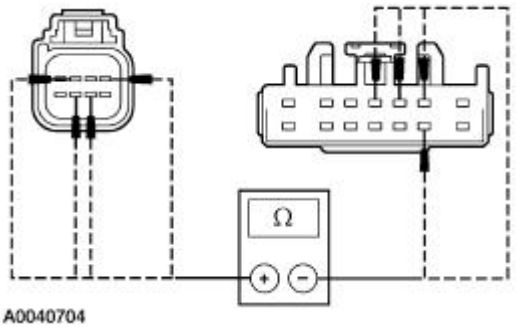
Vehicle Security Module C2113c	Circuit
pin 2	78 (LB/YE)
pin 3	121 (YE/BK)
pin 9	79 (LG/RD)

- **Is any resistance less than 10,000 ohms?**

Yes
REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.

No
INSTALL a new keyless entry keypad. REFER to Keyless Entry Keypad in this section. TEST the system for normal operation.

B4 CHECK CIRCUITS 121 (YE/BK), 78 (LB/YE), 79 (LG/RD) AND 124 (BR) FOR AN OPEN



- Disconnect: Keyless Entry Keypad C500.
- Using the following table, measure the resistance between the vehicle security module C2113c, harness side and keyless entry keypad C500 harness side:

Vehicle Security Module C2113c	Circuit	Keyless entry keypad C500
pin 2	78	pin 1

Yes
INSTALL a new keyless entry keypad. REFER to Keyless Entry Keypad in this section. TEST the system for normal operation.

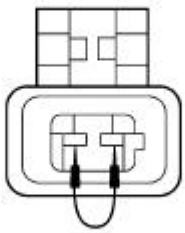
No
REPAIR the circuit(s). CLEAR the DTCs. REPEAT

	(LB/YE)	
pin 3	121 (YE/BK)	pin 7
pin 4	124 (BR)	pin 6
pin 9	79 (LG/RD)	pin 3

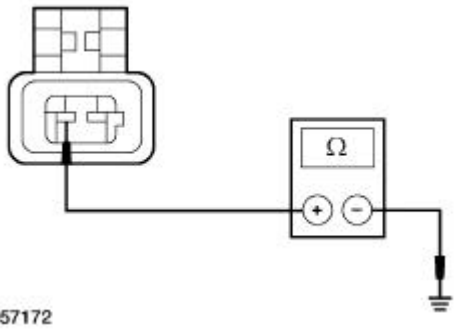
- **Are the resistances less than 5 ohms?**

the self-test.

B5 CHECK FOR CORRECT VEHICLE SECURITY MODULE OPERATION	
• Disconnect all vehicle security module connectors. • Check for: • corrosion • pushed-out pins • Connect all vehicle security module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new vehicle security module. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the vehicle security module self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.



PINPOINT TEST C: THE DOORS DO NOT LOCK/UNLOCK USING THE REMOTE TRANSMITTER



Test Step	Result / Action to Take
C1 VERIFY CORRECT OPERATION OF POWER LOCKING FUNCTION	
• Operate the door locks using the driver door lock control switch. • **Do all the doors lock and unlock correctly?**	**Yes** GO to C2 . **No** Go To Pinpoint Test A .
C2 CHECK REMOTE TRANSMITTER INPUT TO VEHICLE SECURITY MODULE	
• Unlock all the doors. • Monitor vehicle security module remote transmitter lock and unlock PIDS while	**Yes** GO to C5 .

pressing remote transmitter lock and unlock button. ● **Do the PID values agree with button presses?**	**No** GO to C3 .
C3 CHECK REMOTE TRANSMITTER BATTERY	
● Check the remote transmitter battery. ● **Is the battery OK?**	**Yes** GO to C4 . **No** INSTALL a new battery. TEST the system for normal operation.
C4 CHECK THE TRANSMITTER IDENTIFICATION CODE (TIC)/DATA FOR TIC MATCH	
● From the diagnostic tool FUNCTION TEST, monitor the vehicle security module LAST TIC RECEIVED while pressing and releasing the remote transmitter lock and unlock buttons. ● **Does TIC under LAST TIC RECEIVED match TIC 1, TIC 2, TIC 3 or TIC 4?**	**Yes** GO to C5 . **No** PROGRAM all the remote transmitters. REFER to Remote Transmitter Programming in this section. CLEAR the DTCs. REPEAT the self-test. If still not working, INSTALL a new remote transmitter. TEST the system for normal operation.
C5 CHECK FOR CORRECT VEHICLE SECURITY MODULE OPERATION	
● Disconnect all vehicle security module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all vehicle security module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new vehicle security module. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the vehicle security module self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST D: THE AUTO-LOCK DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
D1 VERIFY THE AUTO-LOCK FEATURE IS ENABLED	
● Verify auto-lock feature is enabled. ● **Is the auto-lock/relock feature enabled?**	**Yes** GO to D2 . **No** Turn feature ON with any configuration method.
D2 CHECK THE DOOR LOCK CONTROL SWITCH	
● Disconnect: Door Lock Control Switch. ● Carry out the door lock control switch component test. Refer to Wiring Diagrams Cell 149 for schematic and	**Yes** GO to D3 . **No**

connector information. ● **Is the door lock control switch OK?**	INSTALL a new door lock control switch. TEST the system for normal operation.
D3 CHECK ALL THE VEHICLE SECURITY MODULE DOOR AJAR PIDS FOR CORRECT READINGS ● Key in ON position. ● Monitor all vehicle security module door ajar PIDS while opening and closing all doors. ● **Do the PID values agree with the door positions?**	**Yes** GO to D15 . **No** If the liftgate ajar circuit PID does not agree with the liftgate status, GO to D7 . For all others, GO to D4 .
D4 CHECK THE SUSPECT DOOR AJAR SWITCH CIRCUIT ● Key in OFF position. ● Disconnect: Suspect Door Ajar Switch Connector. ● Connect a jumper wire between the pins of the suspect door ajar switch. Refer to the following chart: **Door** / **Connector** LF / C526 RF / C602 LR / C715 RR / C820  GK2923-A ● **Do the courtesy lamps turn off?**	**Yes** INSTALL a new door ajar switch. REFER to Door Ajar Switch in this section. TEST the system for normal operation. **No** GO to D5 .
D5 CHECK THE SUSPECT DOOR AJAR SWITCH CIRCUIT 57 (BK) FOR AN OPEN ● Measure the resistance between the suspect door ajar switch connector, harness side and ground. Refer to the following chart: **Door Ajar Switch** / **Circuit** C526 (LF) / 57 (BK) C602 (RF) / 57 (BK) C715 (LR) / 57 (BK) C820 (RR) / 57 (BK)	**Yes** GO to D6 . **No** REPAIR the circuit in question. TEST the system for normal operation.

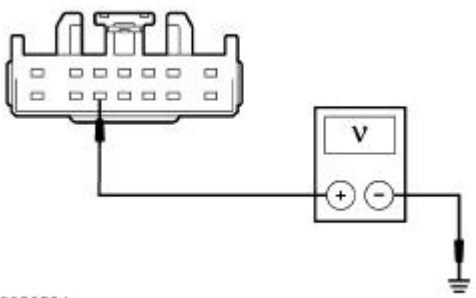
A0057172

- **Is the resistance less than 5 ohms?**

D6 CHECK THE CIRCUIT BETWEEN THE VEHICLE SECURITY MODULE AND THE SUSPECT DOOR AJAR SWITCH FOR AN OPEN

- Disconnect: Vehicle Security Module C2113a.
- Measure the resistance between the suspect door ajar switch connector, harness side and the vehicle security module C2113a, harness side. Refer to the following chart:

Door Ajar Switch	Vehicle Security Module	Circuit
C526 (LF)	C2113a-4	344 (BK/YE)
C602 (RF)	C2113a-5	345 (BK/PK)
C715 (LR)	C2113a-11	346 (BK/WH)
C820 (RR)	C2113a-6	346 (BK/WH)/363 (BK/LB)



- **Is the resistance less than 5 ohms?**

Yes
GO to D15 .

No
REPAIR the circuit in question. TEST the system for normal operation.

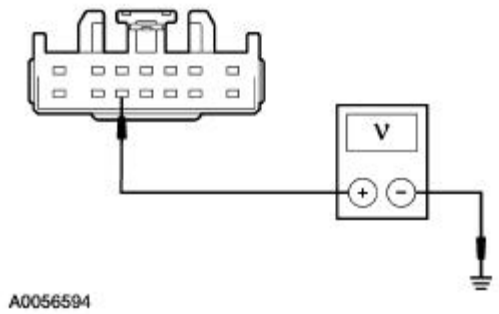
D7 CHECK CIRCUIT 700 (WH/VT) FOR SHORT TO VOLTAGE

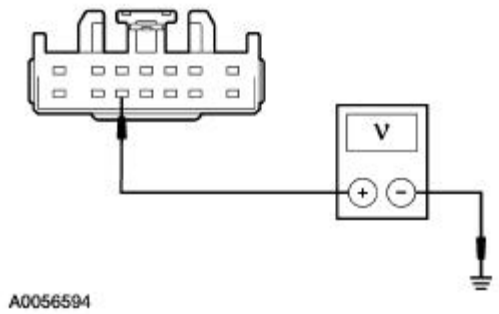
- Key in OFF position.
- Disconnect: Vehicle Security Module C2113a.
- Key in ON position.
- Measure the voltage between the vehicle security module C2113a pin 12, circuit 700 (WH/VT), harness side and ground.

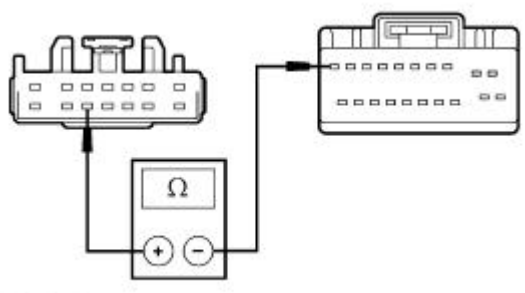
A0056594

- **Is any voltage present?**

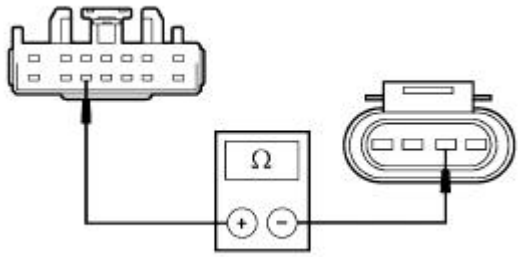
Yes
GO to D8 .

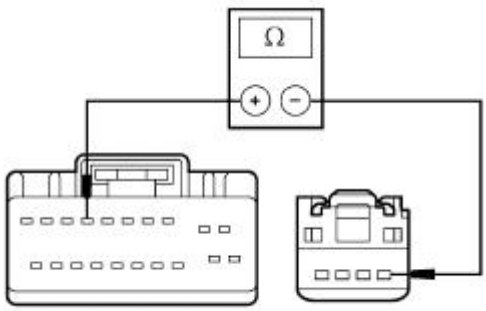


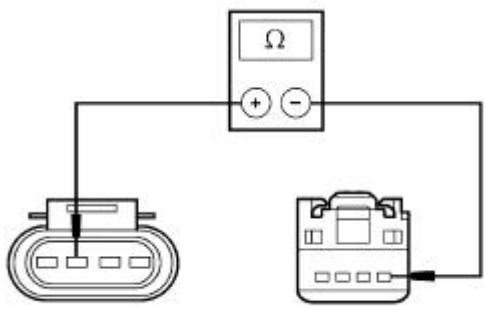




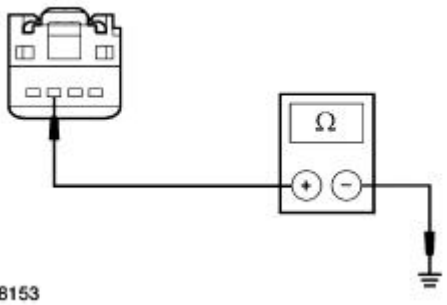
No
GO to D10 .







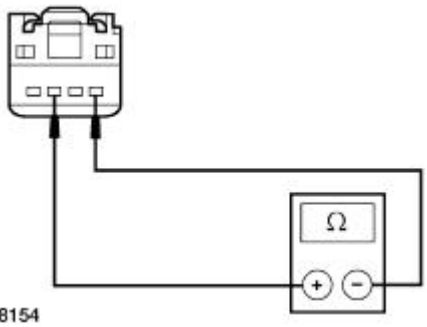
D8 ISOLATE THE SHORT TO VOLTAGE

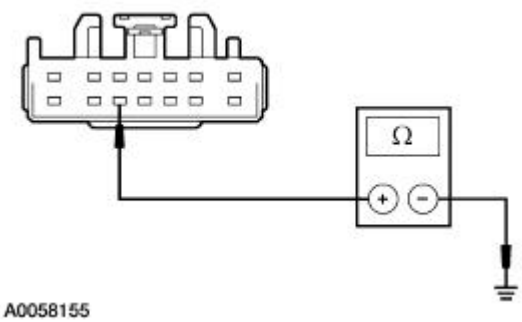


- Key in OFF position.
- Disconnect: Power Liftgate Module C4174d (if equipped with power liftgate).
- Disconnect: Liftgate Ajar Switch C479 (if not equipped with power liftgate).
- Key in ON position.
- Measure the voltage between the vehicle security module

Yes
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

No
If the vehicle is equipped





C2113a pin 12, circuit 700 (WH/VT), harness side and ground.  A0056594 ● **Is any voltage present?**	with a power liftgate, INSTALL a new power liftgate module. REFER to Section 501-03 . TEST the system for normal operation. If the vehicle is not equipped with a power liftgate, GO to D9 .
D9 CHECK THE LIFTGATE GLASS RELEASE ACTUATOR FOR SHORT TO VOLTAGE	
● Key in OFF position. ● Connect: Liftgate Ajar Switch C479. ● Disconnect: Liftgate Glass Release Actuator C4040. ● Measure the voltage between the vehicle security module C2113a pin 12, circuit 700 (WH/VT), harness side and ground.  A0056594 ● **Is any voltage present?**	**Yes** REPAIR circuit 1961 (BU/LB). CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new liftgate glass release actuator. REFER to Liftgate Latch—Window Glass . CLEAR the DTCs. REPEAT the self-test.
D10 CHECK CIRCUIT 700 (WH/VT) FOR AN OPEN	
● Key in OFF position. ● Disconnect: Power Liftgate Module C4174d (if equipped with power liftgate). ● Disconnect: Liftgate Ajar Switch C479 (if not equipped with power liftgate). ● If the vehicle is equipped with a power liftgate, measure the resistance between the vehicle security module C2113a pin 12, circuit 700 (WH/VT), harness side and the power liftgate module C4174d pin 10, circuit 700 (WH/VT), harness side.  A0058156 ● If the vehicle is not equipped with a power liftgate, measure the resistance between the vehicle security module C2113a pin 12, circuit 700 (WH/VT), harness side and the liftgate	**Yes** GO to D11 . **No** REPAIR the circuit. TEST the system for normal operation.

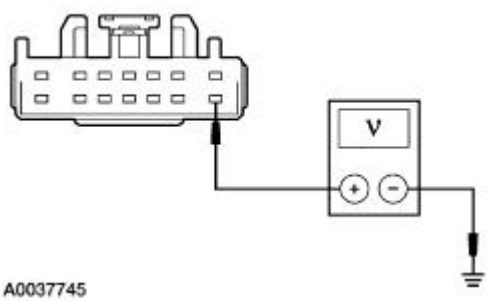
ajar switch C479 pin B, circuit 700 (WH/VT), harness side.  A0058157 ● **Is the resistance less than 5 ohms?**	
D11 CHECK CIRCUIT 1961 (BU/LB) FOR AN OPEN	
● Disconnect: Liftgate Glass Release Actuator C4040. ● If the vehicle is equipped with a power liftgate, measure the resistance between the power liftgate module C4174d pin 7, circuit 1961 (BU/LB), harness side and the liftgate glass release actuator C4040 pin 1, circuit 1961 (BU/LB), harness side.  A0053295 ● If the vehicle is not equipped with a power liftgate, measure the resistance between the liftgate ajar switch C479 pin C, circuit 1961 (BU/LB), harness side and the liftgate glass release actuator C4040 pin 1, circuit 1961 (BU/LB), harness side.  A0053296 ● **Is the resistance less than 5 ohms?**	**Yes** GO to D12 . **No** REPAIR the circuit. TEST the system for normal operation.
D12 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
● Measure the resistance between the liftgate glass release actuator C4040 pin 3, circuit 57 (BK), harness side and ground.	**Yes** GO to D13 . **No** REPAIR the circuit. TEST the system for normal operation.

A0058153

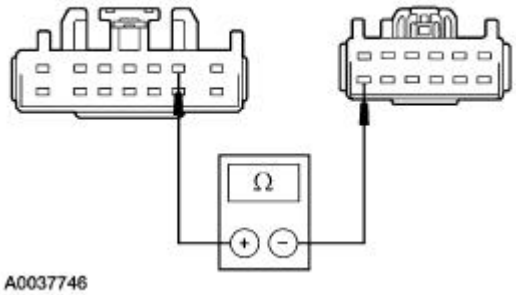
- **Is the resistance less than 5 ohms?**

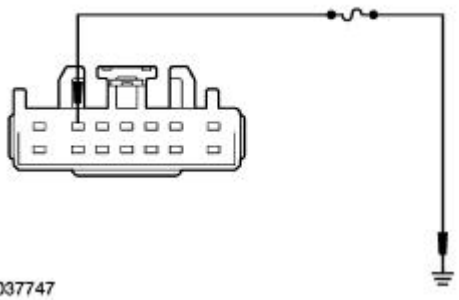
D13 CHECK THE LIFTGATE GLASS RELEASE ACTUATOR	
• Measure the resistance between the liftgate glass release actuator C4040 pin 1, component side and the liftgate glass release actuator C4040 pin 3, component side while opening and closing the liftgate glass.  A0058154 • **Does the resistance switch between less than 5 ohms to greater than 10,000 ohms?**	**Yes** GO to D14 . **No** INSTALL a new liftgate glass release actuator. REFER to Liftgate Latch—Window Glass . CLEAR the DTCs. REPEAT the selft-test.
D14 CHECK THE VEHICLE SECURITY MODULE	
• Connect: Liftgate Glass Release Actuator C4040. • Connect: Power Liftgate Module C4174d (if equipped with power liftgate). • Connect: Liftgate Ajar Switch C479 (if not equipped with power liftgate). • Key in ON position. • Measure the resistance between the vehicle security module C2113a pin 12, circuit 700 (WH/VT), harness side and ground while opening and closing the liftgate.  A0058155 • **Does the resistance switch from less than 5 ohms to greater than 10,000 ohms?**	**Yes** GO to D16 . **No** If the vehicle is equipped with a power liftgate, GO to D17 . If the vehicle is not equipped with a power liftgate, INSTALL a new liftgate ajar switch. TEST the system for normal operation.
D15 CHECK THE PCM, INSTRUMENT CLUSTER AND ABS PIDS	
• Enter the following diagnostic mode on the diagnostic tool: Monitor the PCM vehicle speed PID. • Enter the following diagnostic mode on the diagnostic tool:	**Yes** GO to D16 .

Monitor the instrument cluster ignition switch status PID. ● Enter the following diagnostic mode on the diagnostic tool: Monitor the anti-lock brake system (ABS) module brake ON/OFF PID. ● **Are the correct values received?**	**No** To diagnose for an incorrect vehicle speed PID, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual. To diagnose for an incorrect ignition switch status PID, REFER to Section 413-09 . To diagnose for an incorrect brake ON/OFF PID, REFER to Section 206-09A .
D16 CHECK FOR CORRECT VEHICLE SECURITY MODULE OPERATION	
● Disconnect all vehicle security module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all vehicle security module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new vehicle security module. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the vehicle security module self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
D17 CHECK FOR CORRECT POWER LIFTGATE MODULE OPERATION	
● Disconnect all power liftgate module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all power liftgate module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new power liftgate module. REFER to Section 501-03 . CLEAR the DTCs. REPEAT the power liftgate module self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.



PINPOINT TEST E: REMOTE KEYLESS ENTRY TRANSMITTER OUT OF SYNCHRONIZATION

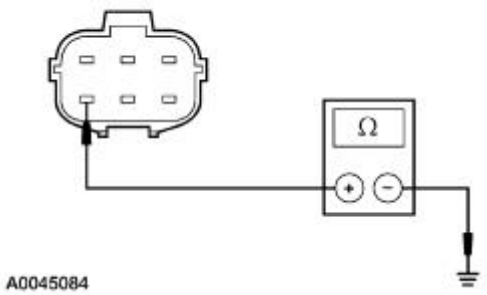


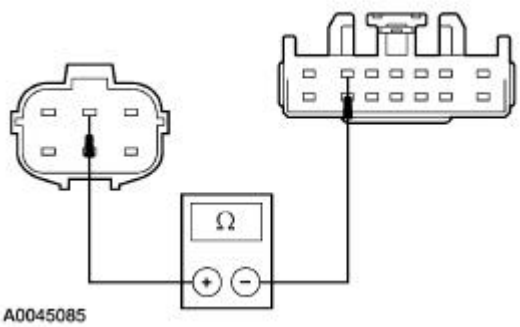


Test Step	Result / Action to Take
E1 CHECK THE DIAGNOSTIC TROUBLE CODES (DTCS)	
● Refer to the recorded results from the previous self-test.	**Yes** GO to E4 .

• **Was DTC B2425 retrieved?**	**No** GO to E2 .
E2 RESYNCHRONIZE THE REMOTE TRANSMITTER	
• Press any button on the inoperative remote transmitter four times consecutively. • **Does the keyless entry transmitter operate correctly?**	**Yes** CLEAR the DTCs. REPEAT the self-test. **No** GO to E3 .
E3 CHECK FOR THE SECOND REMOTE TRANSMITTER	
• Check for another remote transmitter that works with the vehicle. • **Is there another remote transmitter that works with the vehicle?**	**Yes** GO to E4 . **No** GO to E5 .
E4 RESYNCHRONIZE THE INOPERATIVE REMOTE TRANSMITTER USING THE SECOND REMOTE TRANSMITTER.	
• Press any button on the operational remote transmitter. • Within 30 seconds press a button on the inoperative remote transmitter. • Check the inoperative remote transmitter for correct operation. • **Does the remote transmitter in question operate correctly?**	**Yes** TEST the system for normal operation. **No** GO to E5 .
E5 REPROGRAM THE INOPERATIVE REMOTE TRANSMITTER	
• Reprogram all remote transmitters. Refer to Remote Transmitter Programming in this section. • **Does the remote transmitter operate correctly?**	**Yes** INFORM the customer that any additional remote transmitters not present during the programming mode will not operate with the vehicle. All remote transmitters must be programmed at the same time. TEST the system for normal operation. **No** Go To Pinpoint Test C .

PINPOINT TEST F: PANIC FEATURE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY



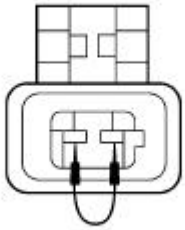


Test Step	Result / Action to Take
F1 VERIFY OPERATION OF THE HORN	
• Key in ON position. • Operate the horn through the steering wheel switch. • **Does the horn operate correctly?**	**Yes** GO to F2 . **No** REFER to Section 413-06 .

F2 VERIFY THE PARKING LAMP OPERATION • Key in ON position. • Turn on the parking lamps with headlamp switch. • **Do the parking lamps operate correctly?**	**Yes** GO to F3 . **No** REFER to Section 417-01 .
F3 CHECK THE HORN OPERATION FROM THE VEHICLE SECURITY MODULE • Key in ON position. • Activate the horn active command for one second. • **Does the horn operate?**	**Yes** GO to F4 . **No** GO to F9 .
F4 CHECK THE PARKING LAMP OPERATION FROM THE VEHICLE SECURITY MODULE • Key in ON position. • Activate the parking lamps active command for five seconds. • **Do the parking lamps operate?**	**Yes** GO to F5 . **No** GO to F7 .
F5 CHECK THE REMOTE TRANSMITTER OPERATION • Key in ON position. • Unlock and lock the doors using the remote transmitter buttons. • **Do the doors lock and unlock correctly?**	**Yes** GO to F6 . **No** Go To Pinpoint Test C .
F6 CHECK THE REMOTE TRANSMITTER SIGNAL TO THE VEHICLE SECURITY MODULE • Read the vehicle security module remote transmitter panic button PID while pressing the PANIC button. • **Does the PID value agree with the button press?**	**Yes** GO to F10 . **No** INSTALL a new remote transmitter. TEST the system for normal operation.
F7 CHECK CIRCUIT 195 (TN/WH) FOR AN OPEN • Disconnect: Vehicle Security Module C2113b. • Measure the voltage between the vehicle security module C2113b pin 8, circuit 195 (TN/WH), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to F8 . **No** REPAIR the circuit. TEST the system for normal operation.
F8 CHECK CIRCUIT 14 (BN) FOR AN OPEN • Disconnect: Vehicle Security Module C2113b. • Disconnect: Headlamp Switch C205a.	**Yes** GO to F10 .

• Measure the resistance between the vehicle security module C2113b pin 2, circuit 14 (BN), harness side and the headlamp switch C205a pin 12, circuit 14 (BN), harness side.  A0037746 • **Is the resistance less than 5 ohms?**	**No** REPAIR the circuit. TEST the system for normal operation.
F9 CHECK CIRCUIT 1 (DB) FOR AN OPEN	
• Disconnect: Vehicle Security Module C2113b. • Connect a 15A fused jumper wire between the vehicle security module C2113b pin 6, circuit 1 (DB), harness side and ground.  A0037747 • **Does the horn operate?**	**Yes** GO to F10 . **No** REPAIR the circuit. TEST the system for normal operation.
F10 CHECK FOR CORRECT VEHICLE SECURITY MODULE OPERATION	
• Disconnect all vehicle security module connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all vehicle security module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new vehicle security module. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the vehicle security module self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

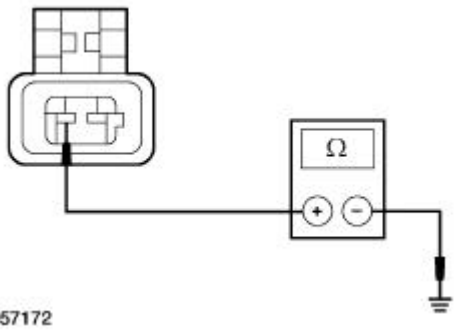
PINPOINT TEST G: THE KEYLESS ENTRY KEYPAD ILLUMINATION IS INOPERATIVE



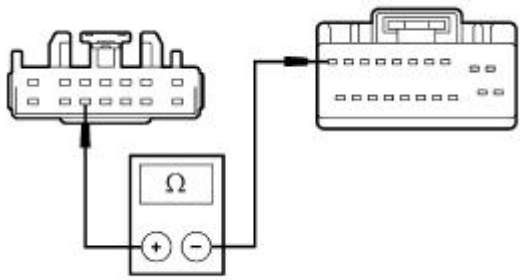
Test Step	Result / Action to Take

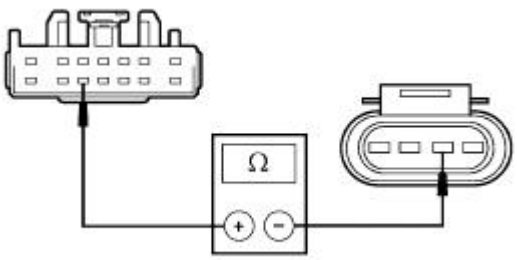
G1 CHECK THE KEYPAD SWITCH PIDS	
• Enter the following diagnostic mode on the diagnostic tool: Vehicle Security Module KEYPAD PIDS. • Press each keypad button while viewing vehicle security module KEYPAD PIDS. • **Do the PID values agree with the keypad button positions?**	**Yes** GO to G2 . **No** Go To Pinpoint Test B .
G2 CHECK THE VEHICLE SECURITY MODULE OUTPUT FUNCTION	
• Activate the keypad backlighting on and off active commands. • Trigger LIGHT ON then OFF. • **Does the keypad backlighting turn on and off when commanded?**	**Yes** GO to G5 . **No** GO to G3 .
G3 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Key in OFF position. • Disconnect: Keyless Entry Keypad C500. • Measure the resistance between the keyless entry keypad C500 pin 4, circuit 57 (BK), harness side and ground.  A0045084 • **Is the resistance less than 5 ohms?**	**Yes** GO to G4 . **No** REPAIR the circuit. TEST the system for normal operation.
G4 CHECK CIRCUIT 66 (LB) FOR AN OPEN	
• Key in OFF position. • Disconnect: Keyless Entry Keypad C500. • Disconnect: Vehicle Security Module C2113c. • Measure the resistance between the keyless entry keypad C500 pin 2, circuit 66 (LB), harness side and the vehicle security module C2113c pin 6, circuit 66 (LB), harness side.  A0045085 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new keyless entry keypad. REFER to Keyless Entry Keypad in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
G5 CHECK FOR CORRECT VEHICLE SECURITY MODULE OPERATION	
• Disconnect all vehicle security module connectors. • Check for: ◦ for corrosion ◦ for pushed-out pins • Connect all vehicle security module connectors and make	**Yes** INSTALL a new vehicle security module. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the

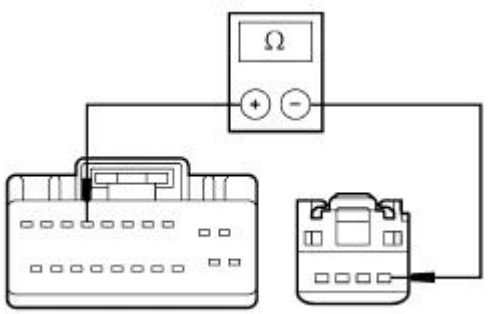
sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	vehicle security module self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.



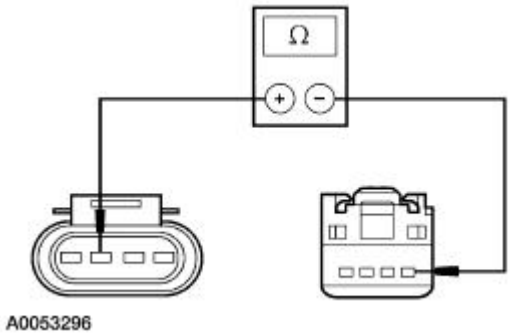
PINPOINT TEST H: THE SMART UNLOCK DOES NOT OPERATE CORRECTLY

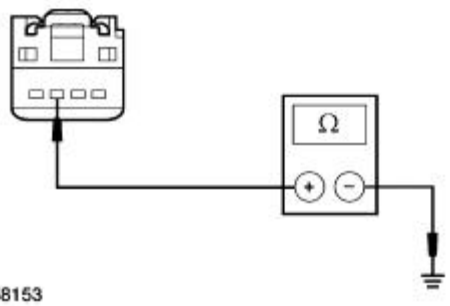


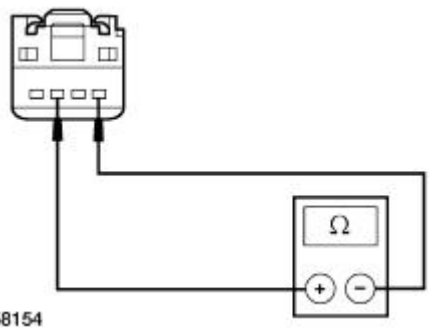


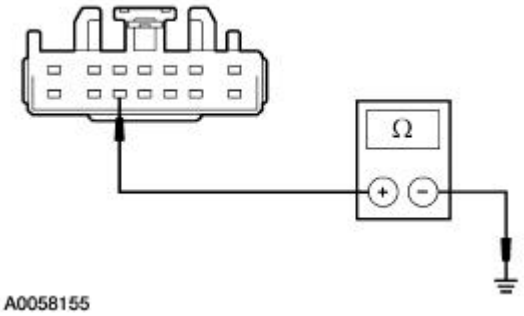


Test Step	Result / Action to Take
H1 CHECK THE DOOR LOCK CONTROL SWITCH	
● Disconnect: Door Lock Control Switch. ● Carry out the door lock control switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Is the door lock control switch OK?**	**Yes** GO to H2 . **No** INSTALL a new door lock control switch. TEST the system for normal operation.
H2 CHECK ALL VEHICLE SECURITY MODULE DOOR AJAR PIDS FOR CORRECT READINGS	
● Key in ON position. ● Monitor all vehicle security module door ajar PIDS while opening and closing all doors. ● **Do the PID values agree with the door positions?**	**Yes** GO to H11 . **No** If the liftgate ajar circuit PID does not agree with the liftgate status, GO to H6 . For all others, GO to H3 .
H3 CHECK SUSPECT DOOR AJAR SWITCH CIRCUIT	
● Key in OFF position. ● Disconnect: Suspect Door Ajar Switch Connector. ● Connect a jumper wire between the pins of the suspect door ajar switch. Refer to the following chart: **Door** / **Connector** LF / C526 RF / C602 LR / C715 RR / C820	**Yes** INSTALL a new door ajar switch. REFER to Door Ajar Switch in this section. TEST the system for normal operation. **No** GO to H4 .









GK2923-A

- **Do the courtesy lamps turn off?**

H4 CHECK THE SUSPECT DOOR AJAR SWITCH CIRCUIT 57 (BK) FOR AN OPEN	
• Measure the resistance between the suspect door ajar switch connector, harness side and ground. Refer to the following chart: **Door Ajar Switch** / **Circuit** C526 (LF) / 57 (BK) C602 (RF) / 57 (BK) C715 (LR) / 57 (BK) C820 (RR) / 57 (BK)  A0057172 • **Is the resistance less than 5 ohms?**	**Yes** GO to H5 . **No** REPAIR the circuit in question. TEST the system for normal operation.
H5 CHECK THE CIRCUIT BETWEEN THE VEHICLE SECURITY MODULE AND THE SUSPECT DOOR AJAR SWITCH FOR AN OPEN	
• Disconnect: Vehicle Security Module C2113a. • Measure the resistance between the suspect door ajar switch connector, harness side and the vehicle security module C2113a, harness side. Refer to the following chart: **Door Ajar Switch** / **Vehicle Security Module** / **Circuit** C526 (LF) / C2113a-4 / 344 (BK/YE) C602 (RF) / C2113a-5 / 345 (BK/PK) C715 (LR) / C2113a-11 / 346 (BK/WH)/363 (BK/LB) C820 (RR) / C2113a-6 / 346 (BK/WH) • **Is the resistance less than 5 ohms?**	**Yes** GO to H11 . **No** REPAIR the circuit in question. TEST the system for normal operation.

H6 CHECK CIRCUIT 700 (WH/VT) FOR AN OPEN • Key in OFF position. • Disconnect: Power Liftgate Module C4174d (if equipped with power liftgate). • Disconnect: Liftgate Ajar Switch C479 (if not equipped with power liftgate). • If the vehicle is equipped with a power liftgate, measure the resistance between the vehicle security module C2113a pin 12, circuit 700 (WH/VT), harness side and the power liftgate module C4174d pin 10, circuit 700 (WH/VT), harness side.  A0058156 • If the vehicle is not equipped with a power liftgate, measure the resistance between the vehicle security module C2113a pin 12, circuit 700 (WH/VT), harness side and the liftgate ajar switch C479 pin B, circuit 700 (WH/VT), harness side.  A0058157 • **Is the resistance less than 5 ohms?**	**Yes** GO to H7 . **No** REPAIR the circuit. TEST the system for normal operation.
H7 CHECK CIRCUIT 1961 (BU/LB) FOR AN OPEN • Disconnect: Liftgate Glass Release Actuator C4040. • If the vehicle is equipped with a power liftgate, measure the resistance between the power liftgate module C4174d pin 7, circuit 1961 (BU/LB), harness side and the liftgate glass release actuator C4040 pin 1, circuit 1961 (BU/LB), harness side.  A0053295 • If the vehicle is not equipped with a power liftgate, measure the resistance between the liftgate ajar switch C479 pin C, circuit 1961 (BU/LB), harness side and the liftgate glass release actuator C4040 pin 1, circuit 1961 (BU/LB), harness	**Yes** GO to H8 . **No** REPAIR the circuit. TEST the system for normal operation.

side.  A0053296 ● **Is the resistance less than 5 ohms?**	
H8 CHECK CIRCUIT 57 (BK) FOR AN OPEN ● Measure the resistance between the liftgate glass release actuator C4040 pin 3, circuit 57 (BK), harness side and ground.  A0058153 ● **Is the resistance less than 5 ohms?**	**Yes** GO to H9 . **No** REPAIR the circuit. TEST the system for normal operation.
H9 CHECK THE LIFTGATE GLASS RELEASE ACTUATOR ● Measure the resistance between the liftgate glass release actuator C4040 pin 1, component side and the liftgate glass release actuator C4040 pin 3, component side while opening and closing the liftgate glass.  A0058154 ● **Does the resistance switch between less than 5 ohms to greater than 10,000 ohms?**	**Yes** GO to H10 . **No** INSTALL a new liftgate glass release actuator. REFER to Liftgate Latch—Window Glass . CLEAR the DTCs. REPEAT the self-test.
H10 CHECK THE VEHICLE SECURITY MODULE ● Connect: Liftgate Glass Release Actuator C4040. ● Connect: Power Liftgate Module C4174d (if equipped with power liftgate). ● Connect: Liftgate Ajar Switch C479 (if not equipped with power liftgate). ● Key in ON position. ● Measure the resistance between the vehicle security module C2113a pin 12, circuit 700 (WH/VT), harness side and ground while opening and closing the liftgate.	**Yes** GO to H12 . **No** If the vehicle is equipped with a power liftgate, GO to H13 . If the vehicle is not equipped with a power

 A0058155 ● **Does the resistance switch from less than 5 ohms to greater than 10,000 ohms?**	liftgate, INSTALL a new liftgate ajar switch. TEST the system for normal operation.
H11 CHECK THE PCM, INSTRUMENT CLUSTER AND ABS PIDS ● Enter the following diagnostic mode on the diagnostic tool: Monitor the PCM vehicle speed PID. ● Enter the following diagnostic mode on the diagnostic tool: Monitor the instrument cluster ignition switch status PID. ● Enter the following diagnostic mode on the diagnostic tool: Monitor the anti-lock brake system (ABS) module brake ON/OFF PID. ● **Are the correct values received?**	**Yes** GO to H12 . **No** To diagnose for an incorrect vehicle speed PID, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual. To diagnose for an incorrect ignition switch status PID, REFER to Section 413-09 . To diagnose for an incorrect brake ON/OFF PID, REFER to Section 206-09A .
H12 CHECK FOR CORRECT VEHICLE SECURITY MODULE OPERATION ● Disconnect all vehicle security module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all vehicle security module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new vehicle security module. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the vehicle security module self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
H13 CHECK FOR CORRECT POWER LIFTGATE MODULE OPERATION ● Disconnect all power liftgate module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all power liftgate module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new power liftgate module. REFER to Section 501-03 . CLEAR the DTCs. REPEAT the power liftgate module self-test. **No**

	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Remote Transmitter Programming

NOTE: All keyless entry remote transmitters must be programmed at the same time.

1. Turn the ignition switch from OFF to RUN 8 times within 10 seconds, ending in RUN. If the module has successfully entered program mode, it will lock and then unlock all doors.

2. Within 20 seconds, press any button on a keyless entry remote transmitter, and the doors will lock and then unlock to confirm that each keyless entry remote transmitter has been programmed. Repeat this step for each transmitter.

3. If the door locks do not respond for any keyless entry remote transmitter, wait several seconds and press the button again. If the door locks still fail to respond, refer to Inspection and Verification.

4. Turn the ignition switch to the OFF position, or wait up to 20 seconds after Step 2 to exit program mode. If a keyless entry remote transmitter has been programmed (or reprogrammed), the doors will lock and unlock one last time to confirm.

Keyless Entry Keypad Code Programming

1. Enter the permanent factory keyless entry keypad code.

2. Press the 1/2 button within five seconds to activate the programming mode. Holding the 1/2 button for more than two seconds after activation will erase the stored customer code. The door locks will lock, then unlock, confirming the code is erased. The existing code will not need to be erased to program new a code.

3. Within five seconds, enter the new five-digit keyless entry keypad code. The door locks will lock and unlock to confirm the new code is programmed.

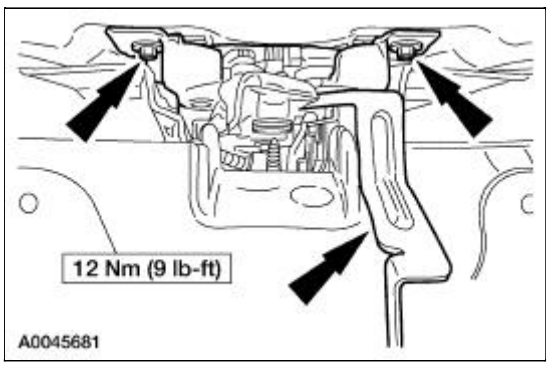
Autolock and Horn Chirp Programming

1. Close all the doors.
2. Confirm that the ignition switch is in the OFF position.
3. Turn the ignition switch from OFF to RUN.
4. **NOTE:** Steps 4 through 8 must be carried out within 30 seconds.

   Press the power door lock UNLOCK button three times.
5. Turn the ignition switch from RUN to OFF.
6. Press the power door lock UNLOCK button three times.
7. Turn the ignition switch from OFF to RUN.
8. Verify that the horn chirps. This indicates the system is in the enable/disable mode is ready to accept program changes.
9. Press the power door lock UNLOCK button one time to toggle the autolock/relock feature OFF.
10. Press the power door lock LOCK button once to enter the command.
11. Verify that the horn chirps one time. There should only be one chirp indicating that autolock/relock feature has been disabled. If one chirp is heard, followed by a longer sound of the horn, the autolock/relock feature has just been enabled. Return to Step 9.
12. Turn the ignition switch to the OFF position to exit the enable/disable mode.
13. Exit the vehicle and verify that the horn chirps once to indicate that a feature has been changed and that autolock/relock has been disabled.

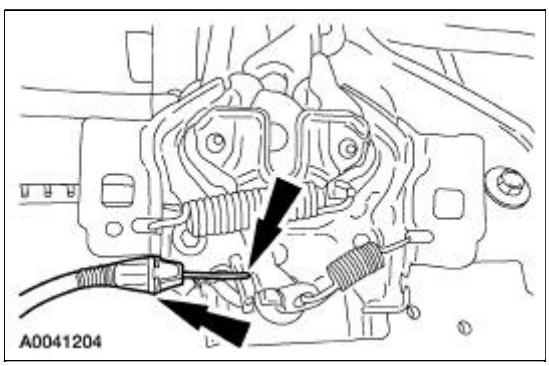
Hood Latch

Removal and Installation



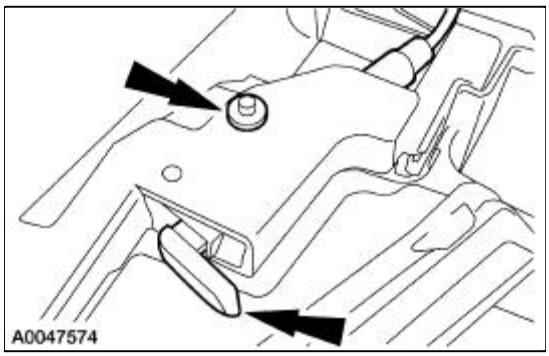
All vehicles

1. Raise and support the hood.
2. Remove the pin-type retainers and the upper radiator sight shield.

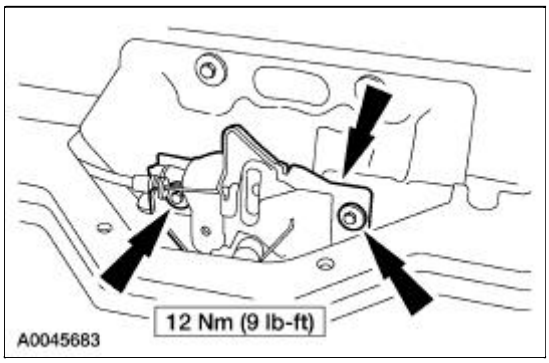


Expedition

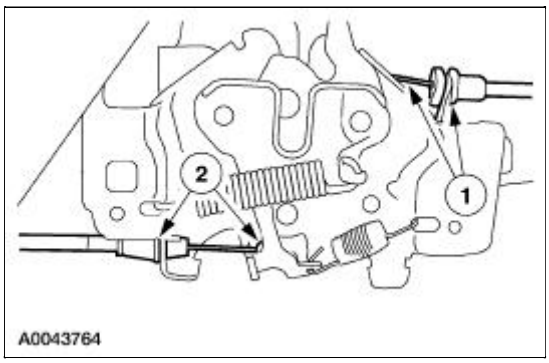
3. Remove the bolts and the hood latch.



4. Release the hood latch cable from the hood latch.



Navigator



5. Remove the screw and secondary hood release cable.

6. Remove the bolts and the hood latch.

7. Remove the hood latch cables.
    1. Release the primary hood latch cable.
    2. Release the secondary hood latch cable.

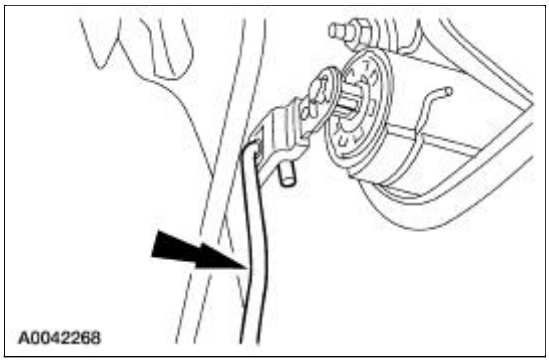
All vehicles

8. To install, reverse the removal procedure.
    - Verify the hood latch engages the striker in the latched position (secondary).
    - Verify the hood latch engages the striker in the fully latched position (primary).
    - Adjust the hood latch as necessary.

Front Door Latch

Material

Item	Specification
Multi-Purpose Grease Spray F5AZ-19G209-AA	ESR-M1C159-A

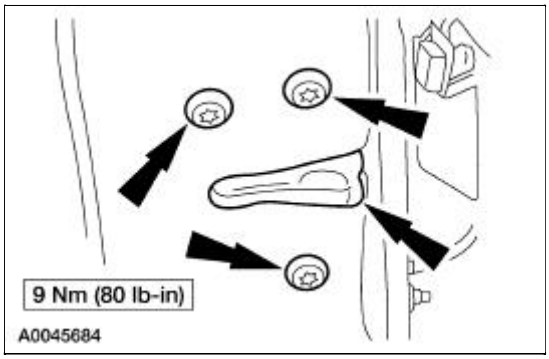


Removal and Installation

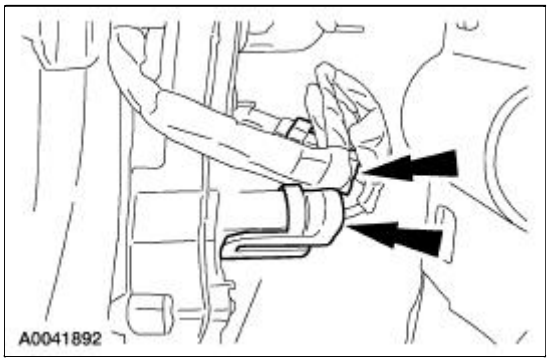
1. **NOTE:** The door glass must be completely raised.

   Remove the front door trim panel. For additional information, refer to Section 501-05 .

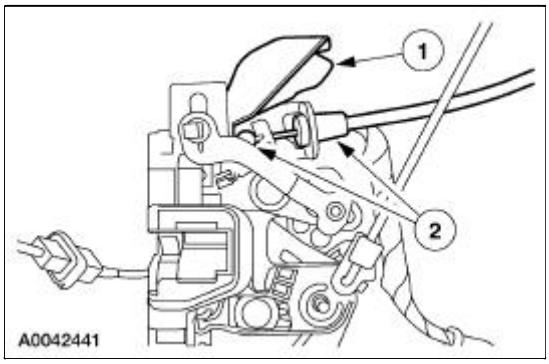
2. Position the watershield aside.



3. If equipped, disconnect the lock cylinder rod.



4. Disconnect the exterior door handle actuating rod.



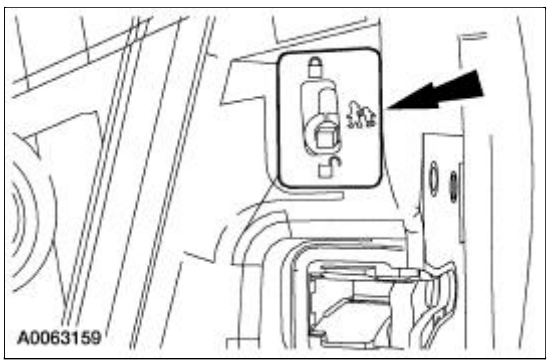
5. Remove the bolts and position the front door latch aside.
   - Discard the bolts.

6. Disconnect the electrical connectors.

7. Release the interior door handle cable and remove the front door latch.
    1. Position the cable cover aside.
    2. Release the conduit and the interior door handle cable.

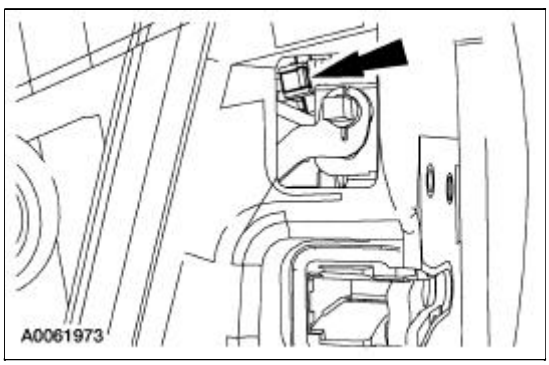
8. To install, reverse the removal procedure.
    - Transfer parts as necessary.
    - If necessary, use multi-purpose grease to lubricate the latch.

Rear Door Latch



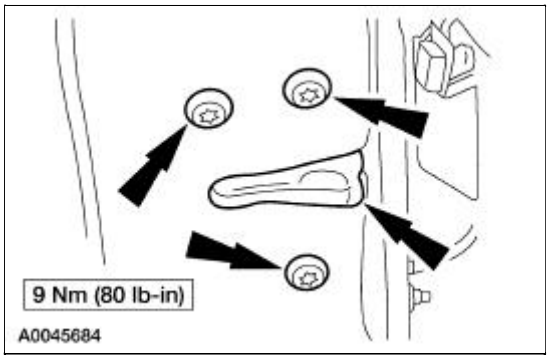
Material

Item	Specification
Multi-Purpose Grease Spray F5AZ-19G209-AA	ESR-M1C159-A

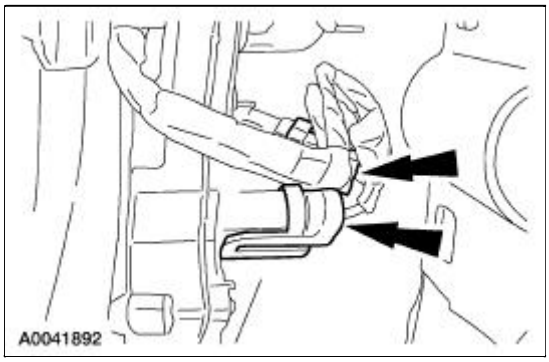


Removal and Installation

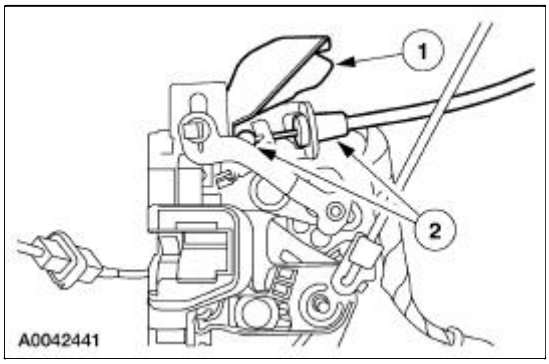
NOTE: The rear door window glass must be completely raised.



1. Remove rear door trim panel. For additional information, refer to Section 501-05 .
2. Position the watershield aside.
3. Remove the childproof door lock cover.



4. Disconnect the exterior door handle actuating rod.
   - Open the clip.



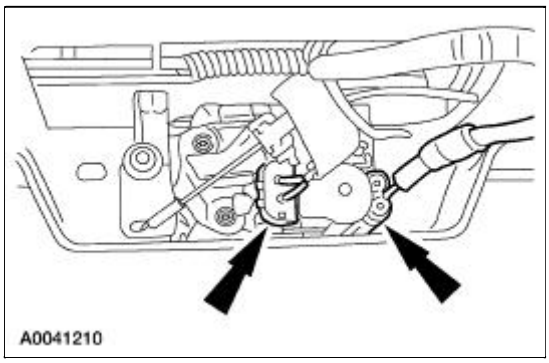
5. Remove the bolts and position the rear door latch aside.
   - Discard the bolts.

6. Disconnect the electrical connectors.

7. Release the interior door cable and remove the rear door latch.
    1. Position the cable cover aside.
    2. Release the conduit and the interior door cable.

8. To install, reverse the removal procedure.
    - Transfer parts as necessary.
    - If necessary, use multi-purpose grease to lubricate the latch.

Liftgate Latch

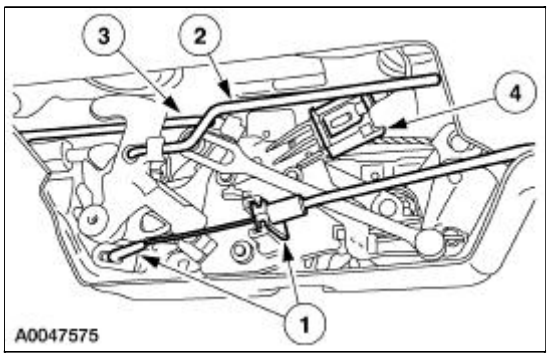


Removal and Installation

All vehicles

1. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .
2. Position the watershield aside.

Vehicles with manual liftgate



3. Disconnect the electrical connectors.

Vehicles with power liftgate

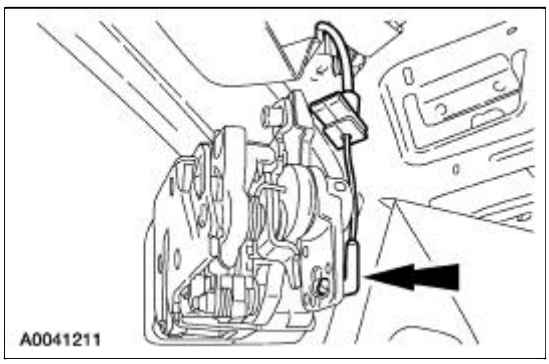
4. **CAUTION: Be careful not to kink the liftgate latch control cable while disconnecting it.**

   Disconnect the liftgate latch.
   1. Disconnect the liftgate latch control cable.
   2. Release the door lock actuator rod.
   3. Release the actuating rod.
   4. Disconnect the electrical connector.

All vehicles

5. Remove the screws and position the liftgate latch aside.

- Discard the screws.

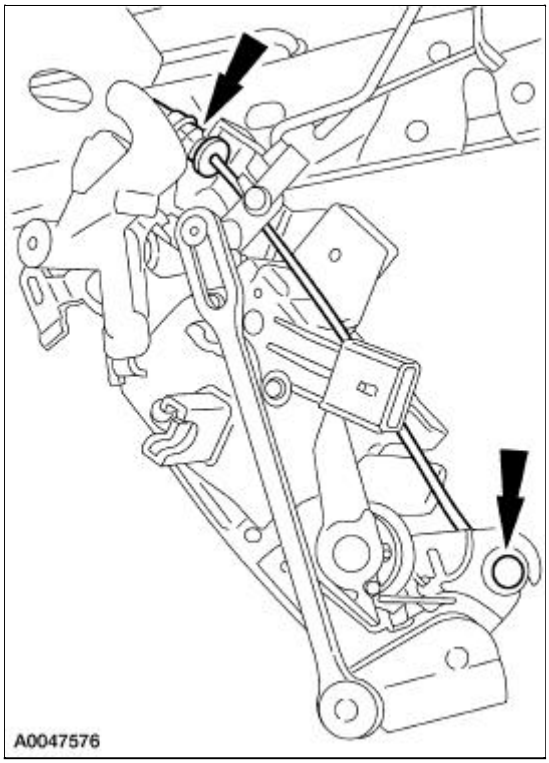


Vehicles with manual liftgate

6. **CAUTION: Be careful not to kink the liftgate latch control cable while disconnecting it from the latch.**

   Disconnect the liftgate latch control cable.

   - Remove the latch.

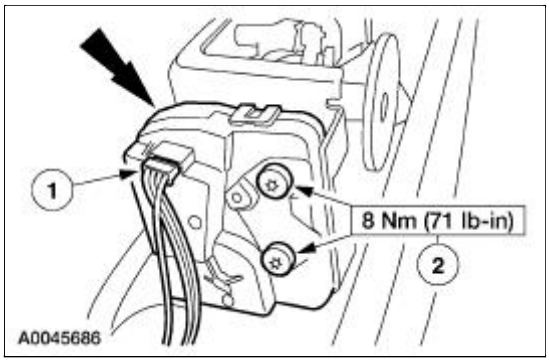


Vehicles with power liftgate

7. **CAUTION: Be careful not to kink the liftgate latch control cable while disconnecting it from the latch.**

   Disconnect the liftagte latch control cable.

   - Remove the liftgate latch.



All vehicles

8. To install, reverse the removal procedure.

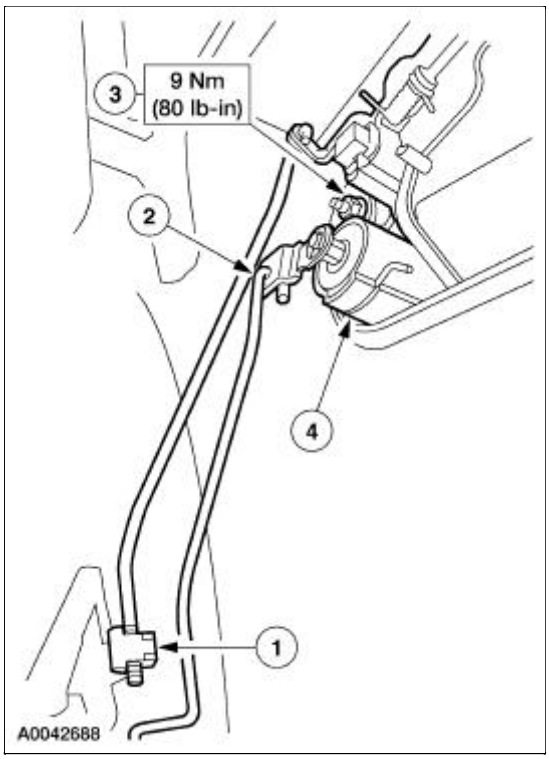
Liftgate Latch —Window Glass

Removal

1. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .
2. Open the liftgate window glass.
3. Remove the liftgate window glass latch.
    1. Disconnect the electrical connector.
    2. Remove the bolts.

4. To install, reverse the removal procedure.

Exterior Front Door Handle



Removal and Installation

NOTE: The front door window glass must be completely raised.

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .

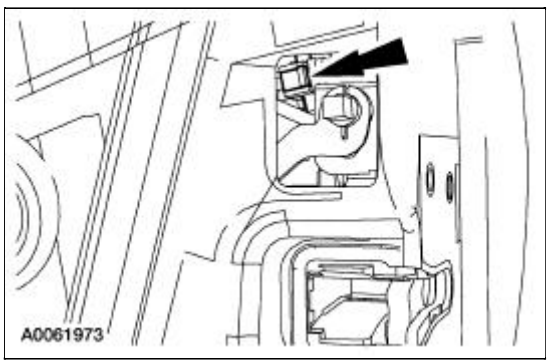
2. Position the watershield aside.

3. Remove the exterior front door handle.
    1. Disconnect the exterior door handle actuating rod.
    2. If equipped, disconnect the door lock cylinder rod.
    3. Remove the two nuts.
    4. Push the exterior door handle out from the bottom surface of the handle.

4. **NOTE:** Make sure the door handle and the front door handle rod is in a relaxed position and that the front door handle rod is all the way up before closing the clips.

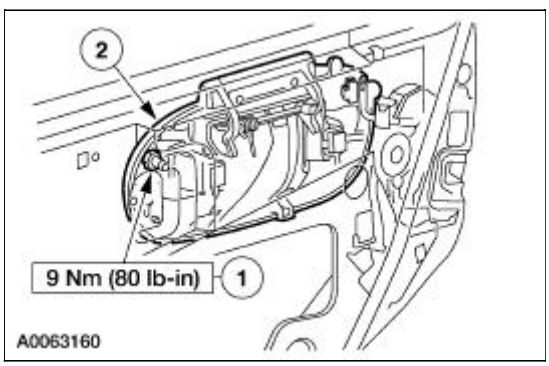
    To install, reverse the removal procedure.

Exterior Rear Door Handle



Removal and Installation

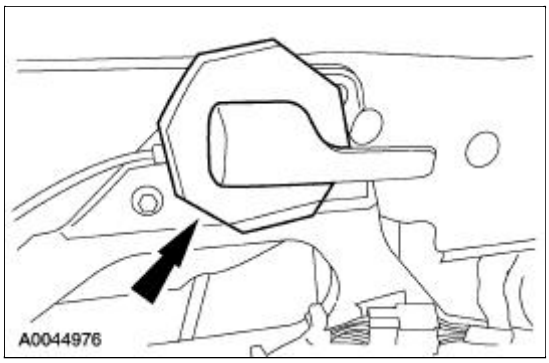
NOTE: The rear door window glass must be completely raised.



1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. Position the watershield aside.
3. Remove the childproof door lock cover.

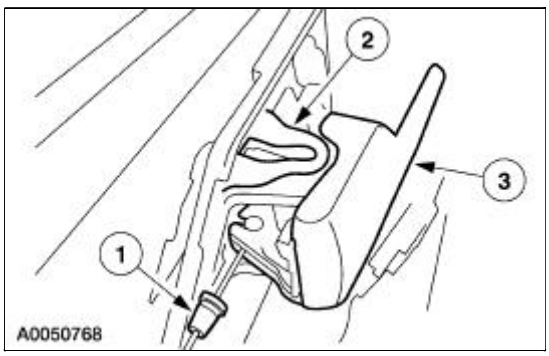
4. Disconnect the exterior door handle actuation rod.

5. Remove the exterior rear door handle.
    1. Remove the two nuts.
    2. Push the exterior door handle out from the bottom surface of the handle.



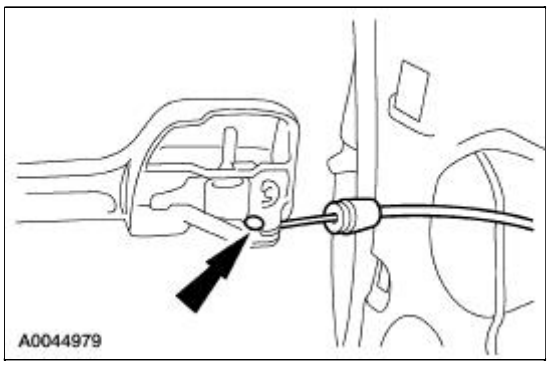
6. **NOTE:** Make sure the door handle and the rear door handle rod is in a relaxed position and that the rear door handle rod is all the way up before closing the clips.

   To install, reverse the removal procedure.



Interior Door Handle —Rear

Removal and Installation



1. Remove the front or rear door trim panel. For additional information, refer to Section 501-05 .
2. Remove the door handle insulator.

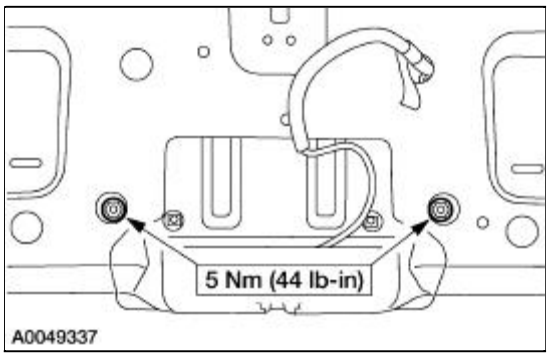
3. Position the watershield aside.
4. Remove the interior door handle.
    1. Release the door handle cable from the door carrier.
    2. Release the door carrier retaining clip.
    3. Position aside the interior door handle.

5. Release the cable from the handle.

6. **NOTE:** Make sure the interior door handle spring has been realigned before installation of the door handle. Check for normal operation.

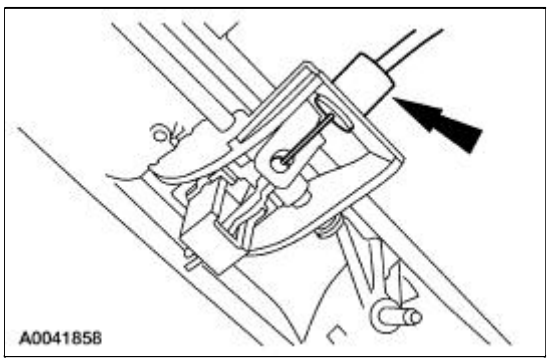
   To install, reverse the removal procedure.

Liftgate Release Handle



Removal and Installation

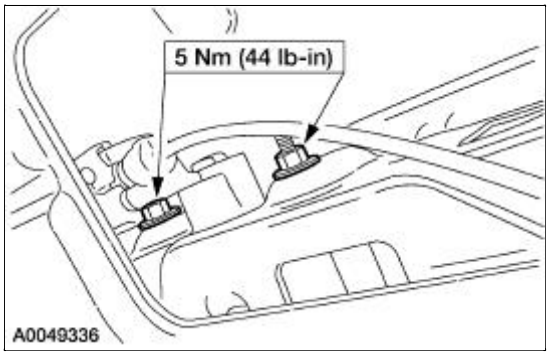
All Vehicles



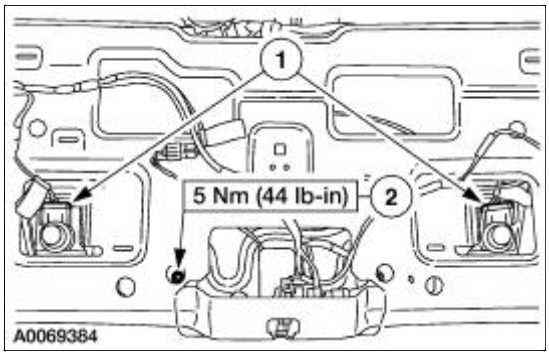
1. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .
2. Position the watershield aside.

Expedition

3. Remove the nuts and position the liftgate release handle aside.

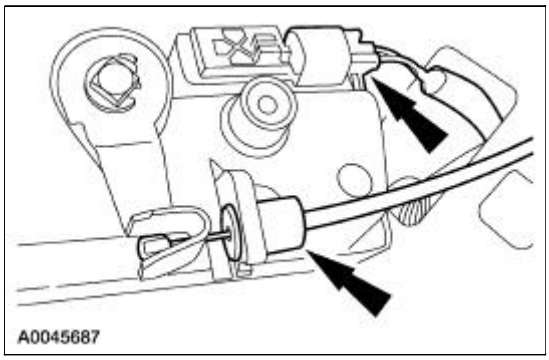


4. Release the cable from the liftgate release handle and remove the handle.



Navigator

5. Remove the liftgate release handle nuts.

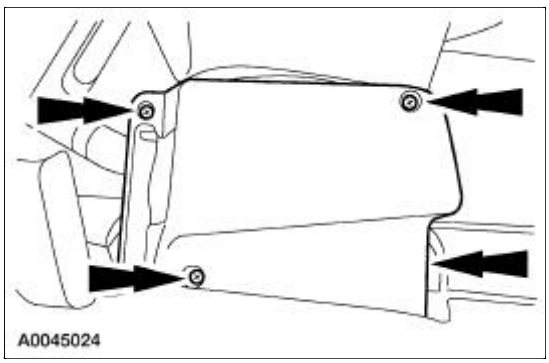


6. **NOTE:** Release the clips on the inside of license plate housing.

   Remove the license plate housing.
   1. Disconnect the electrical connectors.
   2. Remove the six nuts.

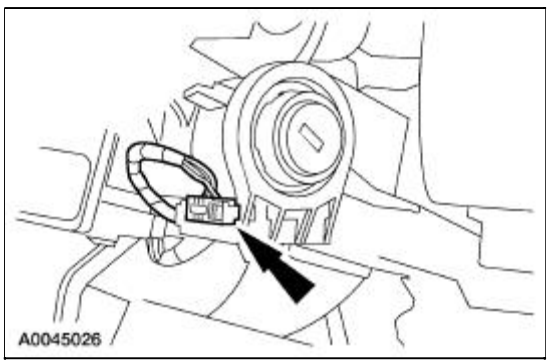
7. Release the liftgate release handle from the liftgate.

8. Disconnect the electrical connector and release the cable from the liftgate handle and remove the handle.



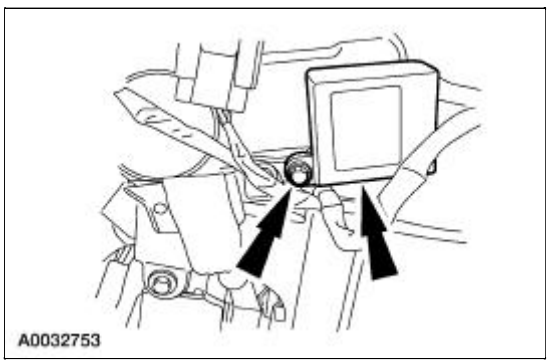
All vehicles

9. To install, reverse the removal procedure.



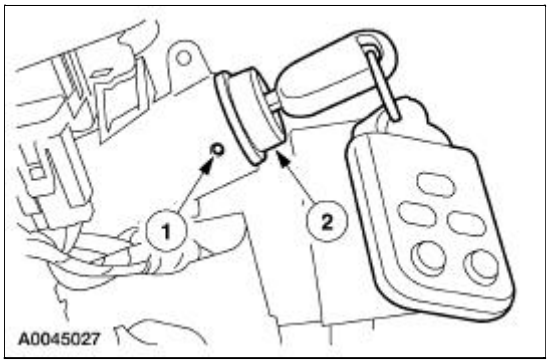
Ignition Lock Cylinder —Functional Lock Cylinder

Removal and Installation



1. Remove the screws and the steering column cover.

2. Disconnect the PATS transceiver electrical connector.

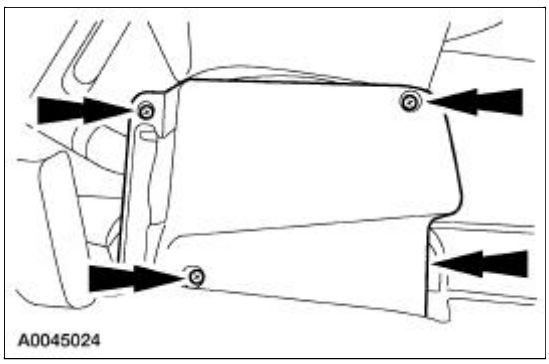


3. Remove the bolt and the PATS transceiver.

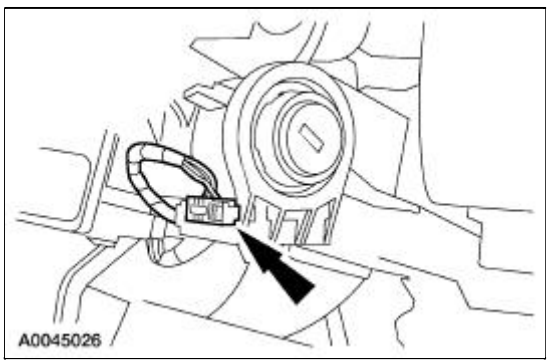
4. **NOTE:** The ignition lock cylinder must be in the accessory position.

   Remove the ignition lock cylinder.
   1. Depress the release pin.
   2. Remove the lock cylinder.

   - Verify the ignition switch lock operation.

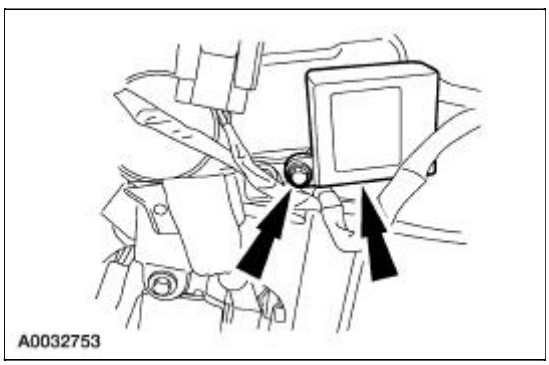


5. To install, reverse the removal procedure.



Ignition Lock Cylinder —Non-functional Lock Cylinder

Removal and Installation



1. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .
2. Remove the steering wheel. For additional information, refer to Section 211-04 .
3. Remove the screws and the steering column cover.

4. disconnect the PATS tranceiver electrical connector.

5. Remove the bolt and the PATS tranceiver.

6. Remove the ignition lock cylinder.

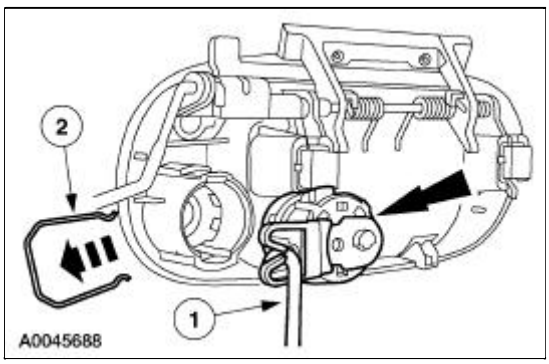
- Use a 1/8-inch diameter drill bit to drill out the lock cylinder retaining pin.
- Use a 3/8-inch diameter drill to drill down the middle of the ignition lock key slot until the ignition lock cylinder breaks loose.
- Remove and discard the ignition lock cylinder and drill shavings from the steering column.

7. Remove the bearing retainer.

8. Remove the steering column lock housing bearing and steering column lock gear.
   - Thoroughly clean all drill shavings from the steering column and inspect it for damage.

9. **NOTE:** Use a new ignition lock cylinder.

   To install, reverse the removal peocedure.
   - Verify ignition switch lock cylinder operation.



Door Lock Cylinder

Removal and Installation

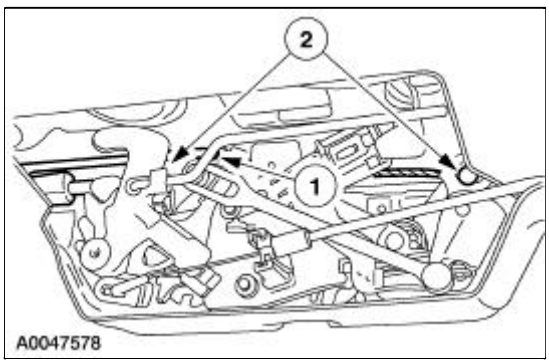
NOTE: Individual lock cylinders are repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current code of the vehicle.

1. Remove the exterior front door handle. For additional information, refer to Exterior Front Door Handle in this section.

2. Remove the front door lock cylinder.
    1. Disconnect the lock cylinder rod.
    2. Remove the retainer.

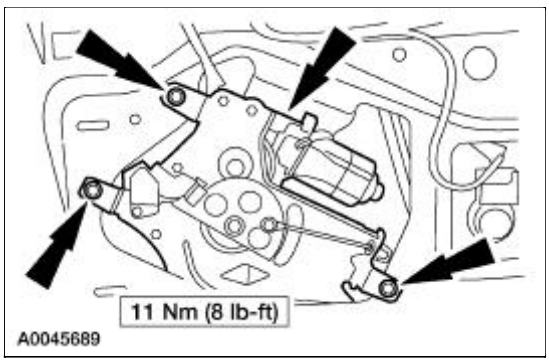
3. To install, reverse the removal procedure.

Liftgate Latch Remote Control



Removal and Installation

1. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .



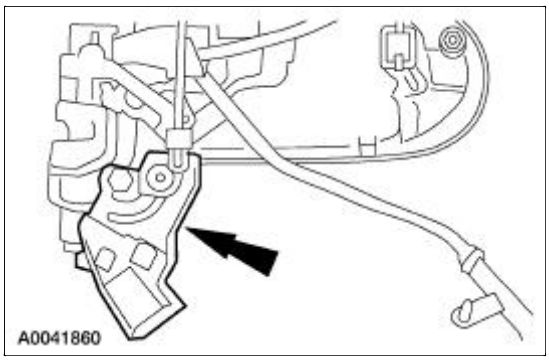
2. Position the watershield aside.

3. **CAUTION: Be careful not to kink the liftgate latch control cable while disconnecting it from the latch.**

   Disconnect the liftgate latch.
   1. Release the actuating rod.
   2. Disconnect the liftgate latch control cable.

4. Remove bolts and postion the liftgate remote control aside.

5. Disconnect the electrical connectors and remove the liftgate latch remote control.

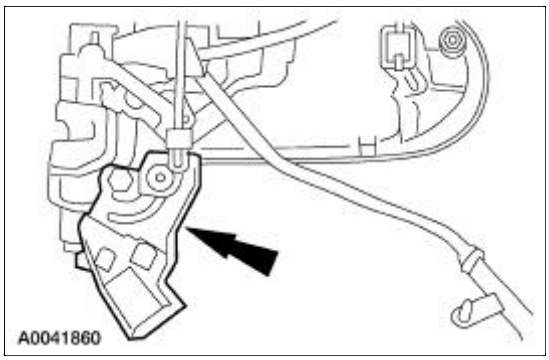


6. To install, reverse the removal procedure.

Front Door Lock Actuator

Removal and Installation

1. Remove the front door latch. For additional information, refer to Front Door Latch in this section.
2. Release the locking tab and remove the front door lock actuator.



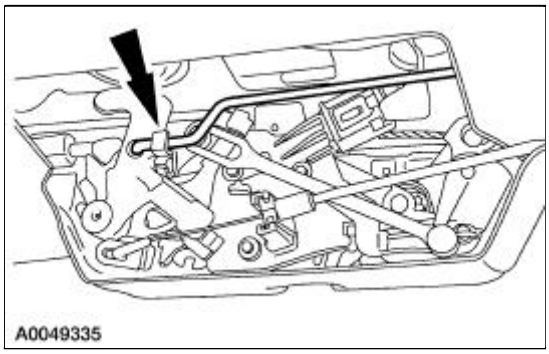
3. To install, reverse the removal procedure.

Rear Door Lock Actuator

Removal and Installation

1. Remove the rear door latch. For additional information, refer to Rear Door Latch in this section.
2. Release the locking tab and remove the rear door lock actuator.

3. To install, reverse the removal procedure.



Liftgate Latch Actuator

Special Tool(s)

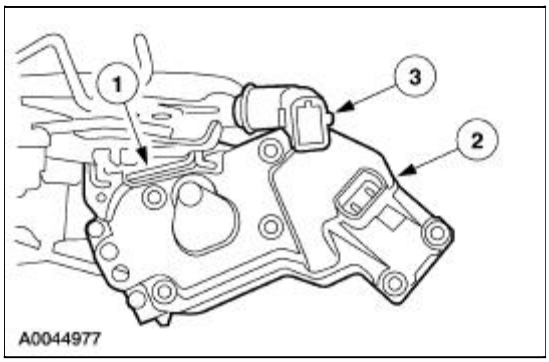
 ST1132-A	Heavy Duty Riveter 501-D011 (D80L-23200-A) or equivalent.

Removal and Installation

1. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .
2. Position the watershield aside.
3. Releast the actuating rod.

A0049335

4. Remove the liftgate actuator.
    1. Disconnect the electrical connector.
    2. Remove the rivet.
    3. Remove the liftgate actuator.



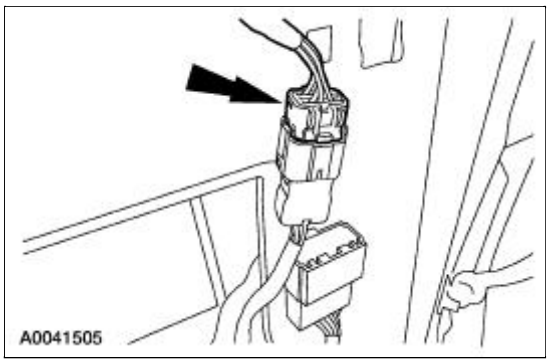
A0049334

5. To install, reverse the removal procedure.
    - Use the Heavy Duty Riveter to install the new rivet.

Door Ajar Switch

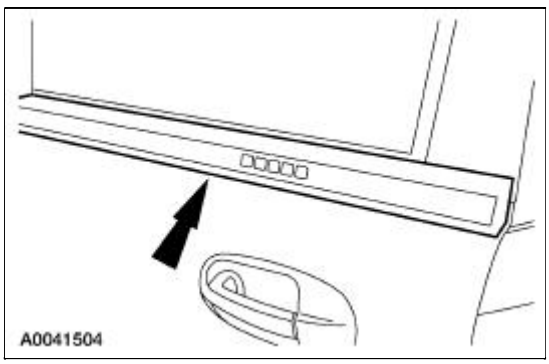
1. Remove the door latch. For additional information, refer to Front Door Latch or Rear Door Latch in this section.

2. Remove the door ajar switch.
    1. Release the door lock actuator locking tab.
    2. Remove the door lock actuator.
    3. Release the locking tab and remove the door ajar switch.



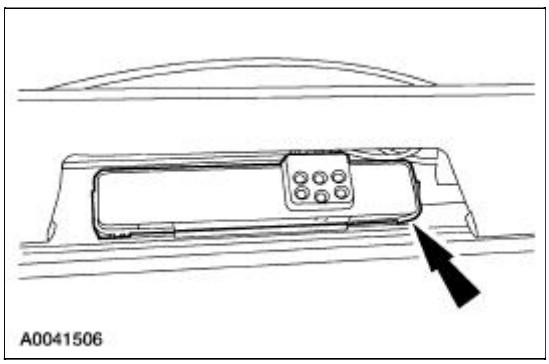
3. To install, reverse the removal procedure.

Keyless Entry Keypad



Removal and Installation

1. Remove the exterior mirror. For additional information, refer to Section 501-09 .
2. Disconnect the electrical connector.



3. Remove the front door window glass. For additional information, refer to Section 501-11 .
4. **CAUTION: Damage to the base moulding may occur during the removal procedure.**

   Remove the front door window base molding.

5. Remove the keyless entry keypad.

6. To install, reverse the removal procedure.

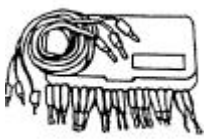
Wipers and Washers

The wiper and washer system consists of the following components:

- front windshield wiper motor
- windshield wiper blades
- windshield wiper pivot arms
- windshield wiper mounting arm and pivot shaft
- rear window wiper blade
- rear window wiper motor
- rear window wiper striker and wiper pivot shaft assembly
- rear window wiper pivot arm
- windshield washer fluid reservoir
- windshield washer fluid pump
- windshield wiper/washer switch (part of multifunction switch)

Windshield Wiper/Washer Switch

The windshield wiper/washer switch is an integral component of the steering column multifunction switch. For additional information, refer to Section 211-05 .



Wipers and Washers

Refer to Wiring Diagrams Cell 81 , Interval Wiper/Washer for schematic and connector information.

Refer to Wiring Diagrams Cell 82 , Liftgate Wiper/Washer for schematic and connector information.

Refer to Wiring Diagrams Cell 149 for schematic and connector information.

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool
 ST1137-A	73III Digital Multimeter or equivalent 105-R0051
 ST1138-A	Flex Probe Kit 105-R025B or equivalent
 ST1453-A	SABRE Premium Battery and Electrical System Tester 010-00736 or equivalent

Principles of Operation

The wiper motors receive inputs from the following:

- multifunction switch
- powertrain control module (PCM)
- ignition switch
- battery junction box (BJB)

The following components are integrated in the wiper motors:

- windshield wiper motor module
- hi/lo speed relay
- run/park sense (Hall effect)
- washer pump relay

High Speed Windshield Wipers

High speed is activated when the multifunction switch supplies ground to the windshield wiper motor module inputs. The windshield wiper motor module then supplies ground to the run/park sense and high/low relay coil, activating the relay with voltage supplied from the battery through the central junction box (CJB). When the windshield wiper motor module receives voltage from the run/park sense, it removes ground from the run/park sense, deactivating it. The windshield wiper motor continues to operate from voltage connected through the run/park sense until the Hall effect senses magnet in the motor. When the Hall effect senses magnet in the motor, the windshield wiper motor returns to the park position, the internal run/park sense grounds the windshield wiper motor module input and the windshield wiper motor module removes ground from the windshield wiper high/low relay coil, deactivating the high/low relay and windshield wiper motor. The windshield wiper motor module continues to cycle the windshield wipers until the inputs from the multifunction switch are changed from the high speed position.

Low Speed Windshield Wipers

Low speed is activated when the multifunction switch supplies a specific ground to the speed inputs of the windshield wiper motor module. The windshield wiper motor module then supplies ground to only the windshield wiper run/park relay coil, activating it. When the windshield wiper run/park relay is activated, the deactivated windshield high/low relay connects voltage to the windshield wiper motor low input, activating the wiper motor. The windshield wiper motor module continues to operate the windshield wiper motor in the same manner as in high speed, but in low speed with the wiper motor connected to the low speed input.

Intermittent Speed Windshield Wipers

The intermittent wiper speed is activated with grounds controlled by the multifunction switch inputs to the windshield wiper motor module. The windshield wiper motor module then activates the windshield wiper run/park relay coil and switches voltage through the windshield wiper high/low relay. The high/low relay remains deactivated, supplying the voltage to the wiper motor low speed input, and activates the windshield wiper motor. When the windshield wiper motor module receives the grounded input, the motor continues to operate until Hall effect senses magnet, which turns off the run/park sense output to the windshield wiper run/park software, deactivating the relay and disconnecting voltage to the wiper motor. The windshield wipers remain parked until the windshield wiper motor module completes a time-out and then repeats the intermittent windshield wiper cycle.

Speed-Dependent Windshield Wipers

The windshield wiper motor module responds to the windshield wiper control commands by interpreting inputs from the PCM system. The speed-dependent wipers will compensate for the extra moisture that accumulates on the windshield at higher speeds, except when the multifunction switch is in the INT 1 position. At higher speeds, the speed-dependent feature shortens the delay between wipes when using the variable interval wipers. Delays will automatically adjust at speeds between 16 and 105 km/h (10 and 65 mph).

Intermittent Rear Window Wiper System

The rear window wiper intermittent speed is activated when the rear window wiper motor module receives ground controlled by the multifunction switch inputs to the rear window wiper motor module. The rear window wiper motor module then activates the rear window wiper relay (internal). This activates the rear window wiper motor by providing voltage from the battery junction box (BJB). Once the rear window wiper motor is activated, its internal run/park switch connects voltage to the motor, keeping it operating. When the rear window wiper motor returns to the park position, the run/park

switch disconnects voltage internally from the wiper motor input. The rear window wiper remains parked until the rear window wiper motor module completes a time-out and then repeats the cycle.

Washer System

The windshield washer and the rear window washer are activated by the internal wiper motor modules when it receives a ground from the multifunction switch between the washer inputs. Depending on the correct ground, the internal wiper motor modules activate either the windshield washer or rear window washer relays (internal) by grounding the respective relay coil. When either module is activated, it connects voltage to the washer pump while the deactivated module provides ground to the washer pump. In this manner, voltage polarity is reversible to achieve directional change of the washer pump and washer fluid.

Default Mode

The windshield wiper motor defaults to this mode when the RUN/PARK sense does not sense the Hall effect magnet inside the wiper motor. This can be caused by obstruction of windshield wipers or binding linkage. The windshield wiper motor will continue to operate in a HI/LO speed condition for a period of 60 seconds.

Inspection and Verification

1. Verify the customer concern by operating the system.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

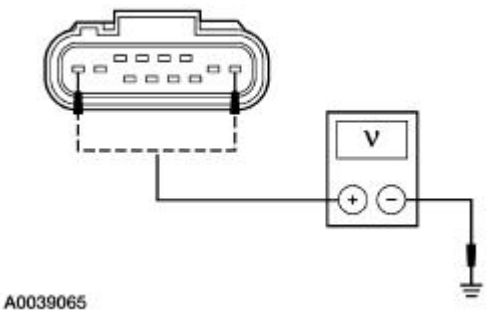
Mechanical	Electrical
● Windshield washer hoses ● Wiper linkage ● Multifunction switch	● CJB fuses: ■ 1 (10A) ■ 38 (25A) ■ 113 (30A) ● Circuitry ● Windshield wiper motor

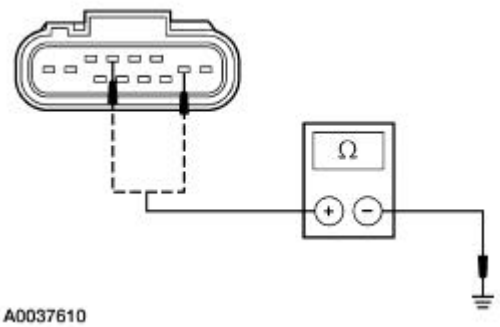
3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If cause is not visually evident, verify the symptom and refer to the Symptom Chart

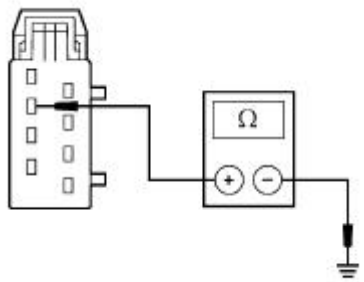
Symptom Chart

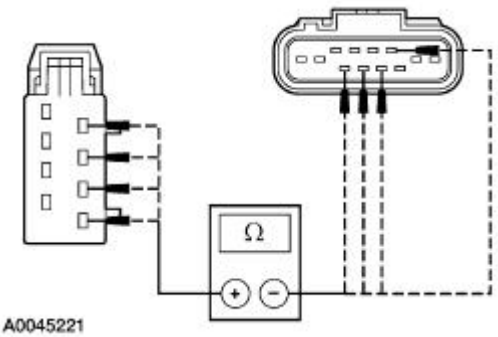
Symptom Chart





Condition	Possible Sources	Action
● The windshield wipers are inoperative	● Multifunction switch. ● Circuitry. ● Ignition switch. ● Windshield wiper motor.	● Go To Pinpoint Test A .

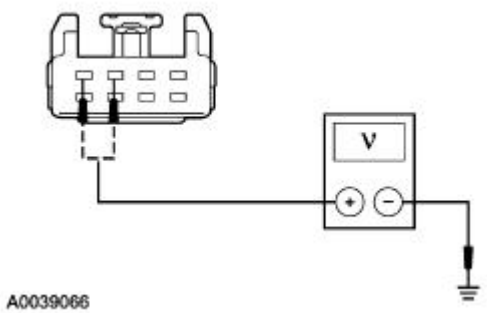




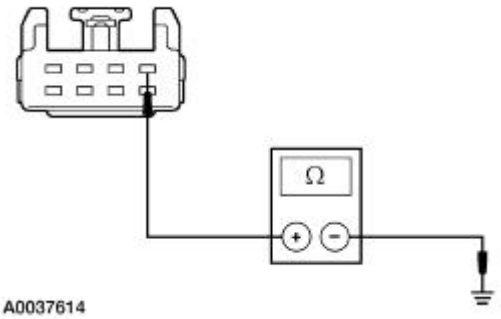
• The rear window wiper is inoperative	• Multifunction switch. • Circuitry. • Ignition switch. • Rear window wiper motor.	• Go To Pinpoint Test B .
• The windshield wipers stay on continuously	• Windshield wiper motor. • Multifunction switch. • Circuitry.	• Go To Pinpoint Test C .
• The rear window wiper stays on continuously	• Rear window wiper motor. • Multifunction switch. • Circuitry.	• Go To Pinpoint Test D .
• The high/low windshield wiper speeds do not operate correctly (intermittent wiper mode OK)	• Multifunction switch. • Circuitry. • Windshield wiper motor.	• Go To Pinpoint Test E .
• The intermittent windshield wiper speed does not operate correctly (high/low speeds OK)	• Multifunction switch. • Circuitry. • Windshield wiper motor.	• Go To Pinpoint Test F .
• The intermittent rear window wiper speed does not operate correctly	• Multifunction switch. • Circuitry. • Rear window wiper motor.	• Go To Pinpoint Test G .
• The windshield wipers do not operate correctly in the MIST position	• Multifunction switch. • Circuitry. • Washer pump. • Windshield wiper motor.	• Go To Pinpoint Test H .
• The rear window wiper wash and wipe function does not operate	• Multifunction switch. • Circuitry. • Washer pump. • Rear window wiper motor.	• Go To Pinpoint Test I .
• The washer pump is inoperative	• Washer pump. • Multifunction switch. • Windshield wiper motor. • Rear window wiper motor. • Circuitry.	• Go To Pinpoint Test J .
• The windshield wiper speed dependent interval mode does not operate correctly	• Windshield wiper motor. • Circuitry. • Powertrain control module (PCM).	• Go To Pinpoint Test K .
• The wipers will not park at	• Pivot arm	• REFER to Windshield

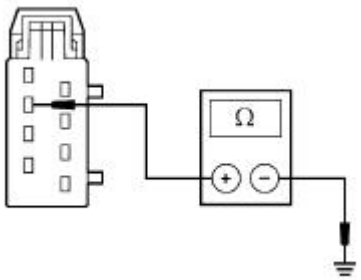
correct position	adjustment. ● Linkage.	Wiper Blade and Pivot Arm Adjustment in this section.

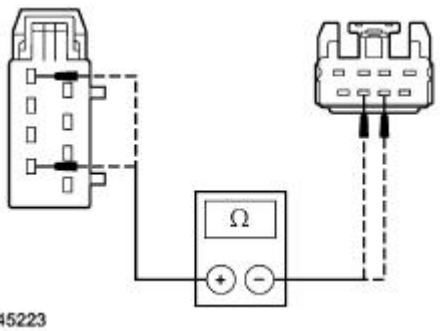
Pinpoint Tests



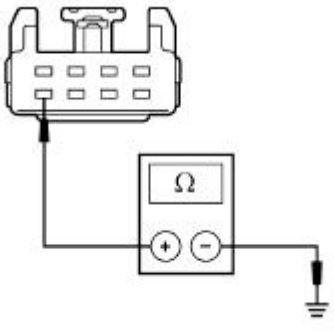
PINPOINT TEST A: THE WINDSHIELD WIPERS ARE INOPERATIVE







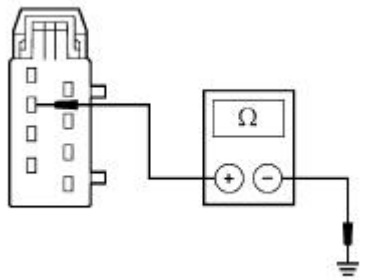
Test Step	Result / Action to Take
A1 CHECK CIRCUITS 65 (DG) AND 1002 (BK/PK) FOR VOLTAGE	
● Key in OFF position. ● Disconnect: Windshield Wiper Motor C125. ● Key in ON position. ● Measure the voltage between windshield wiper C125 pin 5, circuit 65 (DG), harness side and ground; and between windshield wiper motor C125 pin 8, circuit 1002 (BK/PK), harness side and ground.  A0039065 ● **Are the voltages greater than 10 volts?**	**Yes** GO to A2. **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
A2 CHECK CIRCUITS 57 (BK) AND 875 (BK/LB) FOR OPENS	
● Key in OFF position. ● Measure the resistance between windshield wiper C125 pin 6, circuit 57 (BK), harness side and ground; and between windshield wiper motor C125 pin 3, circuit 875 (BK/LB), harness side and ground.  A0037610 ● **Are the resistances less than 5 ohms?**	**Yes** GO to A3. **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
A3 CHECK THE MULTIFUNCTION SWITCH	
● Disconnect: Multifunction Switch C202a. ● Carry out the multifunction switch component test.	**Yes** GO to A4.

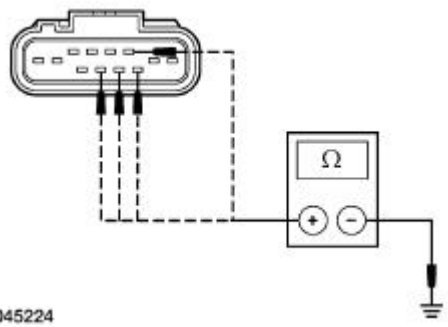


Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Did the multifunction switch pass the component test?**	**No** INSTALL a new multifunction switch. REFER to Section 211-05 .
A4 CHECK CIRCUIT 57 (BK) FOR OPEN	
● Measure the resistance between C202a pin 4, circuit 57 (BK), harness side and ground.  A0045222 ● **Is the resistance less than 5 ohms?**	**Yes** GO to A5 . **No** REPAIR the circuit. TEST the system for normal operation.
A5 CHECK CIRCUITS 56 (DB/OG), 58 (WH), 61 (YE/RD), AND 63 (RD) FOR OPENS	
● Using the following table, measure the resistance between the multifunction switch C202a harness side and the windshield wiper motor C125 harness side: **Multifunction Switch C202a** / **Windshield Wiper Motor C125** pin 7, circuit 56 (DB/OG) / pin 10, circuit 56 (DB/OG) pin 3, circuit 58 (WH) / pin 11, circuit 58 (WH) pin 5, circuit 61 (YE/RD) / pin 1, circuit 61 (YE/RD) pin 1, circuit 63 (RD) / pin 9, circuit 63 (RD)  A0045221 ● **Is the resistance less than 5 ohms?**	**Yes** GO to A6 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
A6 CHECK FOR CORRECT WIPER MOTOR OPERATION	
● Disconnect all wiper motor connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all wiper motor connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** GO to A7 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

	TEST the system for normal operation.
A7 CHECK THE WINDSHIELD WIPER MOTOR	
• Key in OFF position. • Disconnect: Windshield Wiper Motor C125. • Carry out the windshield wiper motor component test as described in this section. • **Did the windshield wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Windshield Wiper Blade and Pivot Arm Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new windshield wiper motor. REFER to Windshield Wiper Motor in this section.

PINPOINT TEST B: THE REAR WIPER IS INOPERATIVE

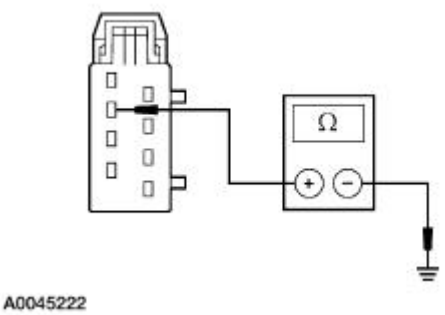




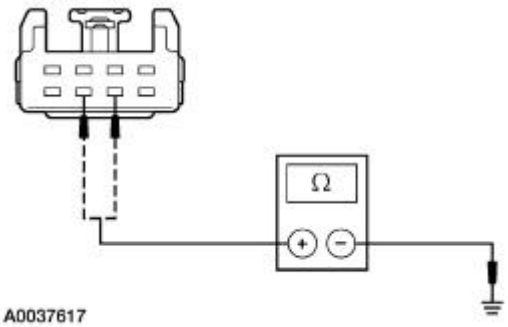
Test Step	Result / Action to Take
B1 CHECK CIRCUITS 1002 (BK/PK) AND 406 (BN/WH) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Rear Wiper Motor C476. • Key in ON position. • Measure the voltage between rear wiper motor C476 pin 3, circuit 1002 (BK/PK), harness side and ground; and between rear wiper motor C476 pin 4, circuit 406 (BN/WH), harness side and ground.  A0039066 • **Are the voltages greater than 10 volts?**	**Yes** GO to B2. **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
B2 CHECK CIRCUIT 57 (BK) FOR OPEN	
• Key in OFF position. • Measure the resistance between rear wiper C476 pin 1, circuit 57 (BK), harness side and ground.	**Yes** GO to B3. **No** REPAIR the circuit(s) in question. TEST the system for normal operation.

 A0037614 ● **Is the resistance less than 5 ohms?**	
B3 CHECK THE MULTIFUNCTION SWITCH ● Key in OFF position. ● Disconnect: Multifunction Switch C202a. ● Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Did the multifunction switch pass the component test?**	**Yes** GO to B4 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 .
B4 CHECK CIRCUIT 57 (BK) FOR OPEN ● Measure the resistance between C202a pin 4, circuit 57 (BK), harness side and ground.  A0045222 ● **Is the resistance less than 5 ohms?**	**Yes** GO to B5 . **No** REPAIR the circuit. TEST the system for normal operation.
B5 CHECK CIRCUITS 485 (PK/BK) AND 1413 (VT/LB) FOR OPENS ● Measure the resistance between the multifunction switch C202a pin 8, circuit 485 (PK/BK) harness side and the rear wiper motor C476 pin 6, circuit 485 (PK/BK) harness side: and between the multifunction switch C202a pin 2, circuit 1413 (VT/LB) harness side and the rear wiper motor C476 pin 7, circuit 1413 (VT/LB) harness side.  A0045223 ● **Are the resistances less than 5 ohms?**	**Yes** GO to B6 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.

B6 CHECK CIRCUIT 586 (RD/PK) FOR OPEN	
• The lifgate glass must be closed. • Measure the resistance between C476 pin 8, circuit 586 (RD/PK), harness side and ground.  A0051365 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B7 . **No** REPAIR the circuit. TEST the system for normal operation.
B7 CHECK FOR CORRECT WIPER MOTOR OPERATION	
• Disconnect all wiper motor connectors. • Check for: • liftgate glass open • corrosion • pushed-out pins • Connect all wiper motor connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** GO to B8 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.
B8 CHECK THE REAR WINDOW WIPER MOTOR	
• Carry out the rear widow wiper motor component test as described in this section. • **Did the rear window wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Rear Window Wiper Blade and Pivot Arm Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new rear window wiper motor. REFER to Rear Window Wiper Motor in this section.



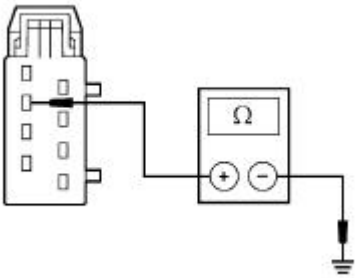
PINPOINT TEST C: THE WINDSHIELD WIPERS STAY ON CONTINUOUSLY

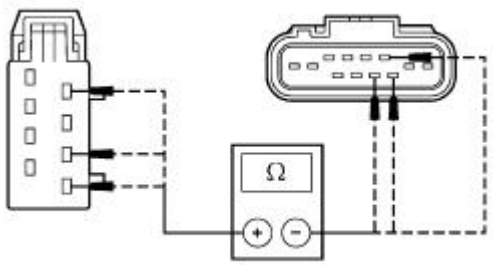


Test Step	Result / Action to Take
C1 CHECK THE MULTIFUNCTION SWITCH	
• Key in OFF position. • Disconnect: Multifunction Switch C202a.	**Yes** GO to C2 .

• Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the multifunction switch pass the component test?**	**No** INSTALL a new multifunction switch. REFER to Section 211-05 .
C2 CHECK CIRCUIT 57 (BK) FOR OPEN	
• Measure the resistance between C202a pin 4, circuit 57 (BK), harness side and ground.  A0045222 • **Is the resistance less than 5 ohms?**	**Yes** GO to C3 . **No** REPAIR the circuit. TEST the system for normal operation.
C3 CHECK CIRCUITS 56 (DB/OG), 58 (WH), 61 (YE/RD), AND 63 (RD) FOR SHORTS	
• Disconnect: Windshield Wiper Motor C125. • Using the following table, measure the resistance between the windshield wiper motor C125 harness side and ground: **Windshield Wiper Motor C125** / **Ground** pin 10, circuit 56 (DB/OG) / ground pin 11, circuit 58 (WH) / ground pin 1, circuit 61 (YE/RD) / ground pin 9, circuit 63 (RD) / ground  A0045224 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C4 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
C4 CHECK FOR CORRECT WIPER MOTOR OPERATION	
• Disconnect all wiper motor connectors. • Check for: • corrosion • pushed-out pins • Connect all wiper motor connectors and make sure	**Yes** GO to C5 . **No** The system is operating correctly at

they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.
C5 CHECK THE WINDSHIELD WIPER MOTOR ● Key in OFF position. ● Disconnect: Windshield Wiper Motor C125. ● Carry out the windshield wiper motor component test as described in this section. ● **Did the windshield wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Windshield Wiper Blade and Pivot Arm Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new windshield wiper motor. REFER to Windshield Wiper Motor in this section.

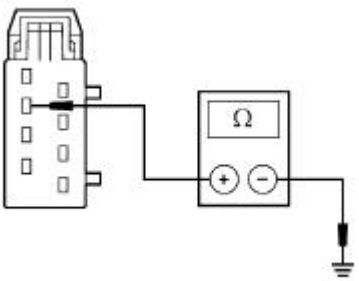




PINPOINT TEST D: THE REAR WIPER STAYS ON CONTINUOUSLY

Test Step	Result / Action to Take
D1 CHECK THE MULTIFUNCTION SWITCH ● Key in OFF position. ● Disconnect: Multifunction Switch C202a. ● Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Did the multifunction switch pass the component test?**	**Yes** GO to D2. **No** INSTALL a new multifunction switch. REFER to Section 211-05.
D2 CHECK CIRCUIT 57 (BK) FOR OPEN ● Measure the resistance between C202a pin 4, circuit 57 (BK), harness side and ground.  A0045222 ● **Is the resistance less than 5 ohms?**	**Yes** GO to D3. **No** REPAIR the circuit. TEST the system for normal operation.
D3 CHECK CIRCUITS 485 (PK/BK) AND 1413 (VT/LB) FOR SHORTS ● Disconnect: Rear Window Wiper Motor C476. ● Measure the resistance between the rear window wiper motor C476 pin 6, circuit 485 (PK/BK), harness side and ground; and between the rear wiper motor C476 pin 7, circuit 1413 (VT/LB), harness side and ground.	**Yes** GO to D4. **No** REPAIR the circuit(s) in

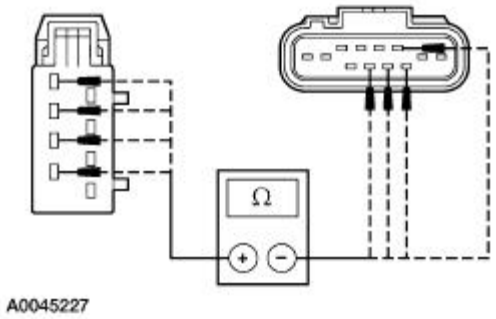
 ● **Are the resistances greater than 10,000 ohms?**	question. TEST the system for normal operation.
D4 CHECK FOR CORRECT WIPER MOTOR OPERATION	
● Disconnect all wiper motor connectors. ● Check for: ● liftgate glass open ● corrosion ● pushed-out pins ● Connect all wiper motor connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** GO to D5 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.
D5 CHECK THE REAR WINDOW WIPER MOTOR	
● Carry out the rear widow wiper motor component test as described in this section. ● **Did the rear window wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Rear Window Wiper Blade and Pivot Arm Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new rear window wiper motor. REFER to Rear Window Wiper Motor in this section.



PINPOINT TEST E: THE HIGH/LOW WINDSHIELD WIPER SPEEDS DO NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
E1 CHECK THE MULTIFUNCTION SWITCH	
● Key in OFF position. ● Disconnect: Multifunction Switch C202a. ● Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Did the multifunction switch pass the component test?**	**Yes** GO to E2 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.

E2 CHECK CIRCUIT 57 (BK) FOR OPEN ● Measure the resistance between C202a pin 4, circuit 57 (BK), harness side and ground.  A0045222 ● **Is the resistance less than 5 ohms?**	**Yes** GO to E3 . **No** REPAIR the circuit. TEST the system for normal operation.
E3 CHECK CIRCUITS 56 (DB/OG), 61 (YE/RD), AND 63 (RD) FOR OPENS ● Disconnect: Windshield Wiper Motor C125. ● Using the following table, measure the resistance between the multifunction switch C202a harness side and the windshield wiper motor C125 harness side: **Multifunction Switch C202a** / **Windshield Wiper Motor C125** pin 7, circuit 56 (DB/OG) / pin 10, circuit 56 (DB/OG) pin 5, circuit 61 (YE/RD) / pin 1, circuit 61 (YE/RD) pin 1, circuit 63 (RD) / pin 9, circuit 63 (RD)  A0045225 ● **Is the resistance less than 5 ohms?**	**Yes** GO to E4 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
E4 CHECK FOR CORRECT WIPER MOTOR OPERATION ● Disconnect all wiper motor connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all wiper motor connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** GO to E5 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.
E5 CHECK THE WINDSHIELD WIPER MOTOR ● Key in OFF position. ● Disconnect: Windshield Wiper Motor C125. ● Carry out the windshield wiper motor component test	**Yes** The system is operating correctly at this time. Concern may have



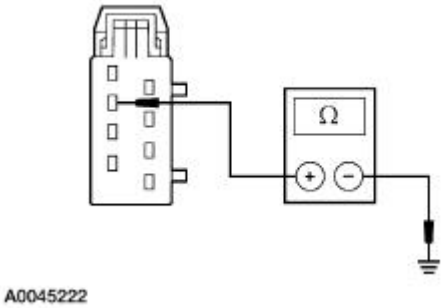
as described in this section. ● **Did the windshield wiper motor pass the component test?**	been caused by binding or incorrect pivot arm adjustment. REFER to Windshield Wiper Blade and Pivot Arm Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new windshield wiper motor. REFER to Windshield Wiper Motor in this section.

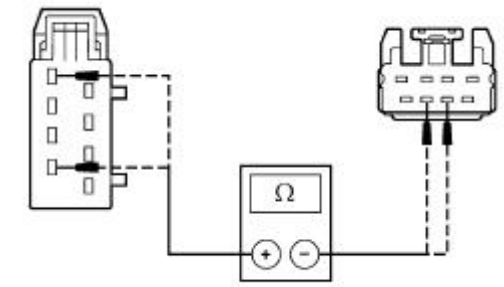
PINPOINT TEST F: THE INTERMITTENT WINDSHIELD WIPER SPEED DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
F1 CHECK THE MULTIFUNCTION SWITCH	
● Key in OFF position. ● Disconnect: Multifunction Switch C202a. ● Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Did the multifunction switch pass the component test?**	**Yes** GO to F2. **No** INSTALL a new multifunction switch. REFER to Section 211-05. TEST the system for normal operation.
F2 CHECK CIRCUIT 57 (BK) FOR OPEN	
● Measure the resistance between C202a pin 4, circuit 57 (BK), harness side and ground.  A0045222 ● **Is the resistance less than 5 ohms?**	**Yes** GO to F3. **No** REPAIR the circuit. TEST the system for normal operation.
F3 CHECK CIRCUITS 56 (DB/OG), 61 (YE/RD), AND 63 (RD) FOR OPENS	
● Disconnect: Windshield Wiper Motor C125. ● Using the following table, measure the resistance between the multifunction switch C202a harness side and the windshield wiper motor C125 harness side:	**Yes** GO to F4. **No** REPAIR the circuit(s) in question. TEST the system for normal operation.

Multifunction Switch C202a	Windshield Wiper Motor C125
pin 7, circuit 56 (DB/OG)	pin 10, circuit 56 (DB/OG)
pin 5, circuit 61 (YE/RD)	pin 1, circuit 61 (YE/RD)
pin 1, circuit 63 (RD)	pin 9, circuit 63 (RD)

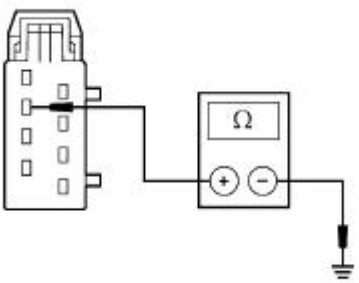
pin 3, circuit 58 (WH)	pin 11, circuit 58 (WH)



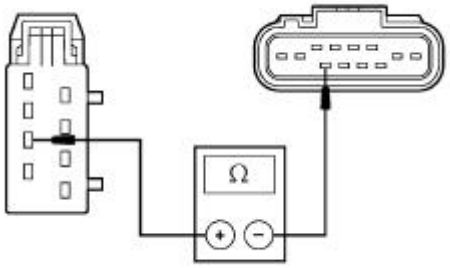


- **Is the resistance less than 5 ohms?**

F4 CHECK FOR CORRECT WIPER MOTOR OPERATION	
• Disconnect all wiper motor connectors. • Check for: • corrosion • pushed-out pins • Connect all wiper motor connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** GO to F5 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.
F5 CHECK THE WINDSHIELD WIPER MOTOR	
• Key in OFF position. • Disconnect: Windshield Wiper Motor C125. • Carry out the windshield wiper motor component test as described in this section. • **Did the windshield wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Windshield Wiper Blade and Pivot Arm Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new windshield wiper motor. REFER to Windshield Wiper Motor in this section.



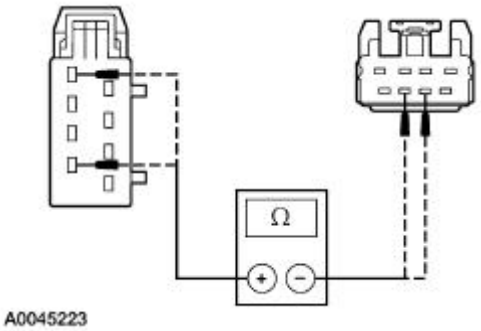
PINPOINT TEST G: THE INTERMITTENT REAR WIPER SPEED DOES NOT OPERATE CORRECTLY

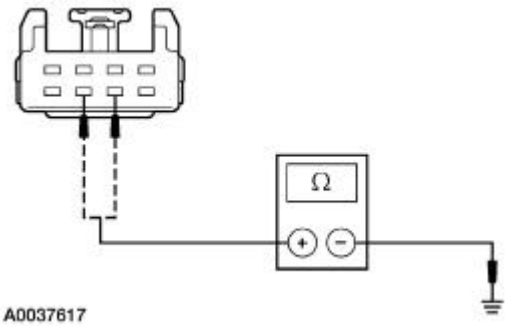


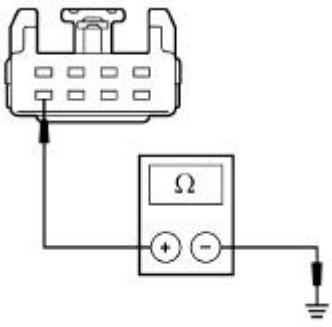
Test Step	Result / Action to Take
G1 CHECK THE MULTIFUNCTION SWITCH	
• Key in OFF position. • Disconnect: Multifunction Switch C202a. • Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the multifunction switch pass the component test?**	**Yes** GO to G2 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 .

G2 CHECK CIRCUIT 57 (BK) FOR OPEN	
• Measure the resistance between C202a pin 4, circuit 57 (BK), harness side and ground.  A0045222 • **Is the resistance less than 5 ohms?**	**Yes** GO to G3 . **No** REPAIR the circuit. TEST the system for normal operation.
G3 CHECK CIRCUITS 485 (PK/BK) AND 1413 (VT/LB) FOR OPENS	
• Disconnect: Rear Window Wiper Motor C476. • Measure the resistance between the multifunction switch C202a pin 8, circuit 485 (PK/BK) harness side and the rear wiper motor C476 pin 6, circuit 485 (PK/BK) harness side; and between the multifunction switch C202a pin 2, circuit 1413 (VT/LB) harness side and the rear wiper motor C476 pin 7, circuit 1413 (VT/LB) harness side.  A0045226 • **Are the resistances less than 5 ohms?**	**Yes** GO to G4 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
G4 CHECK FOR CORRECT WIPER MOTOR OPERATION	
• Disconnect all wiper motor connectors. • Check for: • liftgate glass open • corrosion • pushed-out pins • Connect all wiper motor connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** GO to G5 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.
G5 CHECK THE REAR WINDOW WIPER MOTOR	
• Carry out the rear widow wiper motor component test as described in this section. • **Did the rear window wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Rear Window Wiper Blade and Pivot Arm

	Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new rear window wiper motor. REFER to Rear Window Wiper Motor in this section.



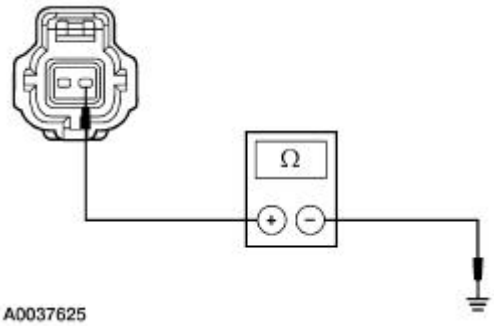


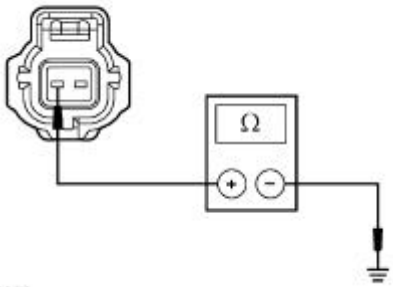


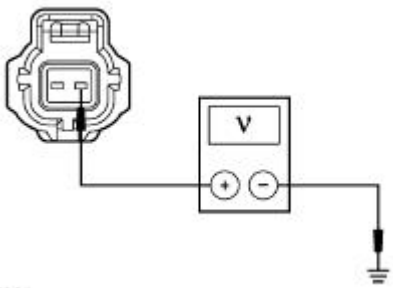
PINPOINT TEST H: THE WINDSHIELD WIPERS DO NOT OPERATE CORRECTLY IN THE MIST POSITION

Test Step	Result / Action to Take
H1 CHECK THE MULTIFUNCTION SWITCH	
• Key in OFF position. • Disconnect: Multifunction Switch C202a. • Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the multifunction switch pass the component test?**	**Yes** GO to H2. **No** INSTALL a new multifunction switch. REFER to Section 211-05.
H2 CHECK CIRCUIT 57 (BK) FOR OPEN	
• Measure the resistance between C202a pin 4, circuit 57 (BK), harness side and ground.  A0045222 • **Is the resistance less than 5 ohms?**	**Yes** GO to H3. **No** REPAIR the circuit. TEST the system for normal operation.
H3 CHECK CIRCUIT 680 (LB/OG) FOR OPEN	
• Disconnect: Windshield Wiper Motor C125. • Measure the resistance between C202a pin 6, circuit 680 (LB/OG), harness side and C125 pin 12, circuit 680 (LB/OG), harness side.	**Yes** Go To Pinpoint Test K. **No** REPAIR the circuit. TEST the system for normal operation.

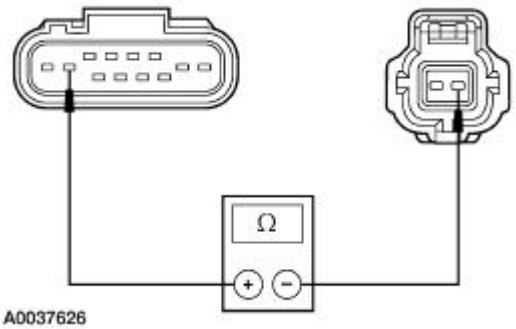
 A0045228 ● **Is the resistance less than 5 ohms?**	





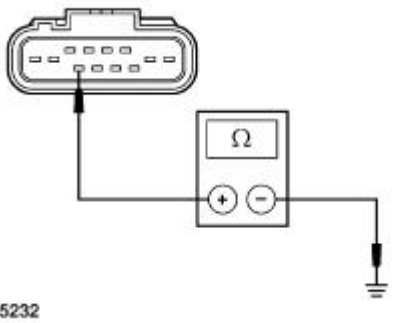


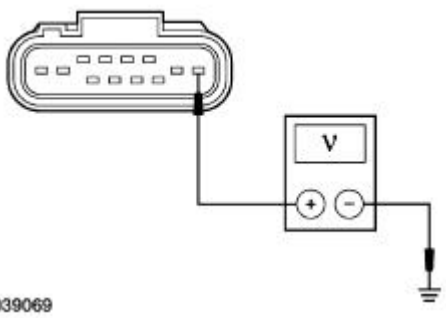
PINPOINT TEST I: THE REAR WINDOW WIPER WASH AND WIPE FUNCTION DOES NOT OPERATE



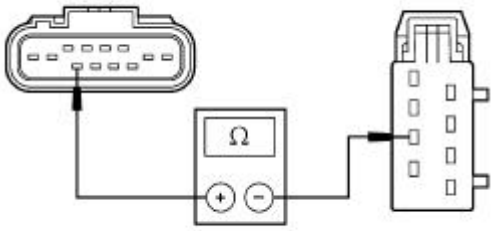
Test Step	Result / Action to Take
I1 CHECK THE MULTIFUNCTION SWITCH	
● Key in OFF position. ● Disconnect: Multifunction Switch C202a. ● Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Did the multifunction switch pass the component test?**	**Yes** GO to I2 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 .
I2 CHECK CIRCUIT 57 (BK) FOR OPEN	
● Measure the resistance between C202a pin 4, circuit 57 (BK), harness side and ground.  A0045222 ● **Is the resistance less than 5 ohms?**	**Yes** GO to I3 . **No** REPAIR the circuit. TEST the system for normal operation.
I3 CHECK CIRCUITS 485 (PK/BK) AND 1413 (VT/LB) FOR OPENS	
● Key in OFF position. ● Disconnect: Rear Window Wiper Motor C476. ● Measure the resistance between the multifunction switch C202a pin 8, circuit 485 (PK/BK) harness side and the rear wiper motor C476 pin 6, circuit 485 (PK/BK) harness side: and between the multifunction switch C202a pin 2, circuit 1413 (VT/LB) harness side and the rear wiper motor C476 pin 7, circuit 1413 (VT/LB) harness side.	**Yes** GO to I4 . **No** REPAIR the circuit. TEST the system for normal operation.

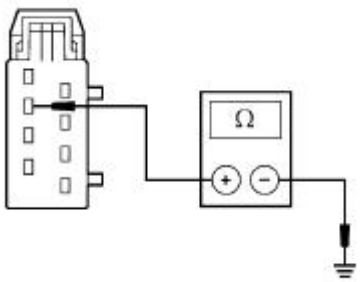
 A0045223 ● **Are the resistances less than 5 ohms?**	
I4 CHECK CIRCUITS 485 (PK/BK) AND 1413 (VT/LB) FOR SHORTS	
● Disconnect: Rear Window Wiper Motor C476. ● Measure the resistance between the rear window wiper motor C476 pin 6, circuit 485 (PK/BK), harness side and ground; and between the rear wiper motor C476 pin 7, circuit 1413 (VT/LB), harness side and ground.  A0037617 ● **Are the resistances greater than 10,000 ohms?**	**Yes** GO to I5 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
I5 CHECK CIRCUIT 586 (RD/PK) FOR OPEN	
● The lifgate glass must be closed. ● Measure the resistance between C476 pin 8, circuit 586 (RD/PK), harness side and ground.  A0051365 ● **Is the resistance greater than 10,000 ohms?**	**Yes** Go To Pinpoint Test J . **No** REPAIR the circuit. TEST the system for normal operation.

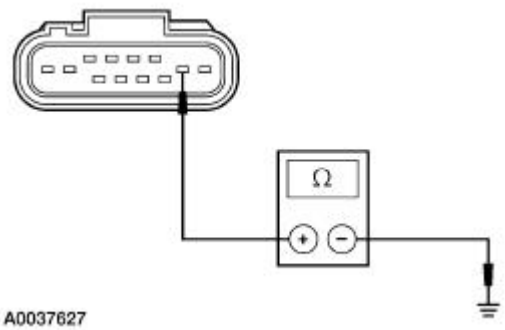




PINPOINT TEST J: THE WASHER PUMP IS IN OPERATIVE



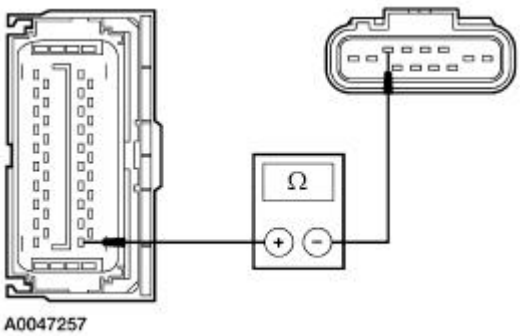




Test Step	Result / Action to Take
J1 CHECK CIRCUIT 941 (BK/WH) FOR GROUND	
● Key in OFF position. ● Disconnect: Washer Pump Motor C1357. ● Measure the resistance between C1357 pin 2, circuit 941 (BK/WH) harness side and ground.	**Yes** GO to J2 . **No**

 A0037625 ● **Is the resistance less than 5 ohms?**	GO to J10 .
J2 CHECK CIRCUIT 941 (VT/LG) FOR GROUND ● Measure the resistance between C1357 pin 1, circuit 946 (VT/LG) harness side and ground.  A0045230 ● **Is the resistance less than 5 ohms?**	**Yes** GO to J3 . **No** GO to J11 .
J3 CHECK CIRCUIT 941 (BK/WH) FOR VOLTAGE ● Key in ON position. ● Measure the voltage between C1357 pin 2, circuit 941 (BK/WH) harness side and ground while depressing the multifunction switch to the wash position.  A0045231 ● **Is the voltage greater than 10 volts?**	**Yes** GO to J13 . **No** GO to J4 .
J4 CHECK CIRCUIT 941 (BK/WH) FOR OPEN ● Key in OFF position. ● Disconnect: Windshield Wiper Motor C125. ● Measure the resistance between C125 pin 7, circuit 941 (BK/WH), harness side and C1357 pin 2, circuit 941 (BK/WH), harness side.	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to J5 .

- **Is the resistance less than 5 ohms?**



J5 CHECK CIRCUIT 680 (LB/OG) FOR GROUND - Key in ON position. - Measure the resistance between C125 pin 12, circuit 680 (LB/OG), harness side and ground while depressing the multifunction switch to the wash position  - **Is the resistance less than 5 ohms?**	**Yes** GO to J6 . **No** GO to J7 .
J6 CHECK CIRCUIT 65 (DG) FOR VOLTAGE - Measure the voltage between C125 pin 5, circuit 65 (DG) harness side and ground.  - **Is the voltage greater than 10 volts?**	**Yes** GO to J13 . **No** REPAIR the supply circuit. TEST the system for normal operation.
J7 CHECK CIRCUIT 680 (LB/OG) FOR OPEN - Key in OFF position. - Disconnect: Windshield Wiper Motor C125. - Disconnect: Multifunction Switch C202a. - Measure the resistance between C125 pin 12, circuit 680 (LB/OG), harness side and C202a pin 6, circuit 680 (LB/OG), harness side.	**Yes** GO to J8 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0045233 ● **Is the resistance less than 5 ohms?**	
J8 CHECK CIRCUIT 57 (BK) FOR OPEN	
● Measure the resistance between C202a pin 4, circuit 57 (BK), harness side and ground.  A0045222 ● **Is the resistance less than 5 ohms?**	**Yes** GO to J9 . **No** REPAIR the circuit. TEST the system for normal operation.
J9 CHECK THE MULTIFUNCTION SWITCH	
● Key in OFF position. ● Disconnect: Multifunction Switch C202a. ● Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Did the multifunction switch pass the component test?**	**Yes** GO to J13 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 .
J10 CHECK CIRCUIT 57 (BK) FOR OPEN	
● Measure the resistance between C125 pin 6, circuit 57 (BK) harness side and ground.  A0037627 ● **Is the resistance less than 5 ohms?**	**Yes** GO to J13 . **No** REPAIR the circuit. TEST the system for normal operation.
J11 CHECK CIRCUIT 57 (BK) FOR OPEN	
● Key in OFF position. ● Measure the resistance between C476 pin 1, circuit 57 (BK) harness side and ground.	**Yes** GO to J12 .

 A0037614 ● **Is the resistance less than 5 ohms?**	**No** REPAIR the circuit. TEST the system for normal operation.
J12 CHECK CIRCUIT 946 (PK/LG) FOR OPEN	
● Disconnect: Rear Window Wiper Motor C476. ● Measure the resistance between C476 pin 5, circuit 946 (VT/LG), harness side and C1357 pin 1, circuit 946 (VT/LG), harness side.  A0037624 ● **Is the resistance less than 5 ohms?**	**Yes** GO to J13 . **No** REPAIR the circuit. TEST the system for normal operation.
J13 CHECK FOR CORRECT WIPER MOTOR OPERATION	
● Disconnect all wiper motor connectors. ● Check for: ● liftgate glass open ● corrosion ● pushed-out pins ● Connect all wiper motor connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** For the windshield wiper motor GO to J14 . For the rear window wiper motor GO to J15 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.
J14 CHECK THE WINDSHIELD WIPER MOTOR	
● Key in OFF position. ● Disconnect: Windshield Wiper Motor C125. ● Carry out the windshield wiper motor component test as described in this section. ● **Did the windshield wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Windshield Wiper Blade and Pivot Arm Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new windshield wiper motor. REFER to Windshield Wiper Motor in this section.
J15 CHECK THE REAR WINDOW WIPER MOTOR	

• Carry out the rear widow wiper motor component test as described in this section. • **Did the rear window wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Rear Window Wiper Blade and Pivot Arm Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new rear window wiper motor. REFER to Rear Window Wiper Motor in this section.

PINPOINT TEST K: THE WINDSHIELD WIPER SPEED DEPENDENT INTERVAL MODE DOES NOT OPERATE CORRECTLY

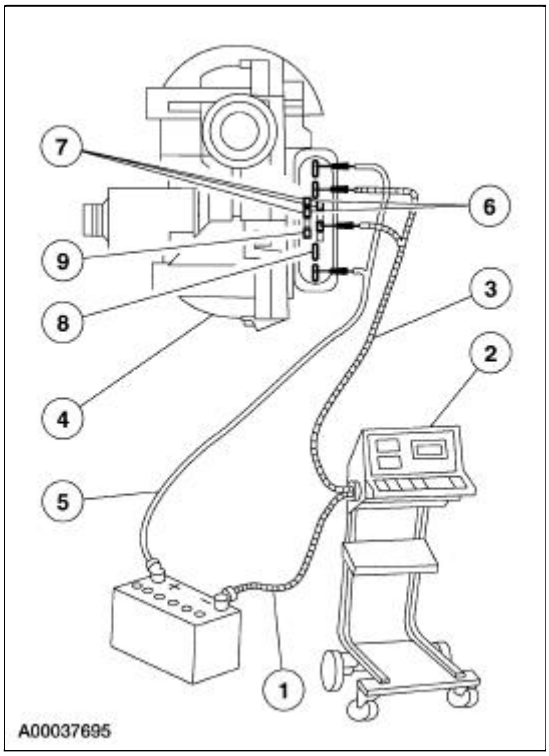
Test Step	Result / Action to Take
K1 CHECK THE PCM — MONITOR THE VSS	
• Monitor the VSS while driving the vehicle from 0 to 88.5 kph (55 mph). • **Does the VSS agree with the PCM PIDs?**	**Yes** GO to K2. **No** REFER to Section 206-09A.
K2 CHECK CIRCUIT 679 (GY/BK) FOR AN OPEN	
• Disconnect: PCM C175b. • Disconnect: Windshield Wiper Motor C125. • Measure the resistance between PCM C175b pin 13, circuit 679 (GY/BK), harness side and windshield wiper motor C125 pin 4, circuit 679 (GY/BK), harness side.  A0047257 • **Is the resistance less than 5 ohms?**	**Yes** GO to K3. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
K3 CHECK CIRCUIT 679 (GY/BK) FOR A SHORT TO GROUND	
• Measure the resistance between PCM C175b pin 13, circuit 679 (GY/BK), harness side and ground.	**Yes** GO to K4. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 ● **Is the resistance greater than 10,000 ohms?**	
K4 CHECK FOR CORRECT WIPER MOTOR OPERATION	
● Disconnect all wiper motor connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all wiper motor connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** GO to K5 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.
K5 CHECK THE WINDSHIELD WIPER MOTOR	
● Key in OFF position. ● Disconnect: Windshield Wiper Motor C125. ● Carry out the windshield wiper motor component test as described in this section. ● **Did the windshield wiper motor pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by binding or incorrect pivot arm adjustment. REFER to Windshield Wiper Blade and Pivot Arm Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new windshield wiper motor. REFER to Windshield Wiper Motor in this section.

Component Test — Windshield Wiper Motor

CAUTION: Do not handle the windshield wiper motor abusively when diagnosing the wiper operations. Failure to follow this caution may result in damage to the motor magnets and will make the windshield wiper motor inoperative. Rough handling of new windshield wiper motors may also damage the motor magnets.

NOTE: Windshield wiper motor component test is carried out to determine if windshield wiper motor and module are functional and not in for default mode. Refer to Principles of Operation in this section.



NOTE: Battery voltage must remain within 10 to 15 VDC to carry out test and keep windshield wiper motor from entering its software safe mode.

NOTE: When connecting the power and ground test leads to the windshield wiper motor terminals, care must be taken to not short terminals between power and ground, as well as making sure the logic ground, pin 3, is always securely connected to prevent permanent windshield wiper motor module

damage.

If the windshield wiper motor does not pass any of the following tests, install a new windshield wiper motor. Refer to Windshield Wiper Motor in this section.

Use SABRE Premium Battery and Electrical System Tester 010-00736 or equivalent to test the windshield wiper motor.

To test the windshield wiper motor, remove the windshield wiper mounting arm and pivot shaft from the windshield wiper motor. Refer to Windshield Wiper Blade and Pivot Arm Adjustment in this section.

Disconnect the wiper motor. Connect the (1) green lead from the (2) SABRE to the battery negative (-) post. Connect the red lead (3) from the SABRE to the wiper motor (4) component side connector ground and logic ground pins 6 and 3 (3). Connect battery positive cable (5) to windshield wiper motor (4) component side connector battery and logic positive pins 5 and 8 (5).

Low Speed

Test the low speed mode by connecting a separate set of test leads from battery ground (-) post to windshield wiper motor (4) component side pins 9 and 10 (6). When these pins are grounded, the windshield wiper motor operation should now be in low speed mode.

High Speed

Test the high speed mode by connecting a separate set of test leads from battery ground (-) post to windshield wiper motor (4) component side pins 1, 9, and 10 (7). When these pins are grounded, the windshield wiper motor operation should now be in high speed mode.

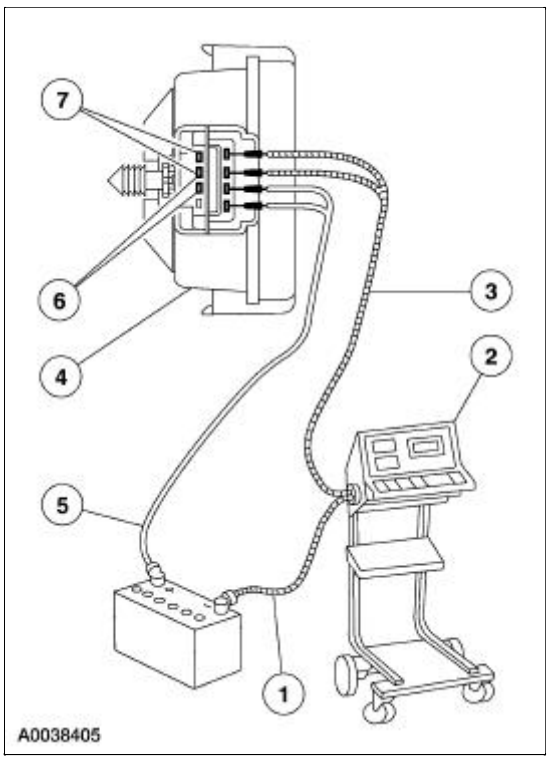
Washer Pump Relay (Integral)

Test the windshield wiper motor internal washer relay function by measuring the voltage between windshield wiper motor (4) component side pin 7 (8), and ground while grounding the windshield wiper motor (4) component side pin 12 (9). When wash command input pin 12 is grounded, measured

voltage should read 10 volts or greater.

Component Test — Rear Window Wiper Motor

CAUTION: Do not handle the rear window wiper motor abusively when diagnosing the wiper operations. Failure to follow this caution may result in damage to the motor magnets and will make the rear window wiper motor inoperative. Rough handling of new rear window wiper motors may also damage the motor magnets.



NOTE: The Rear window wiper motor component test is carried out to determine if wiper motor and module are functional.

NOTE: Battery voltage must remain within 10 to 15 VDC to carry out test and keep wiper motor from entering its software safe mode.

NOTE: When connecting the power and ground test leads to the rear wiper motor terminals, care must be taken to not short terminals between power and ground, as well as insuring the logic ground, pin 3, is always securely connected to prevent permanent rear window wiper motor module damage.

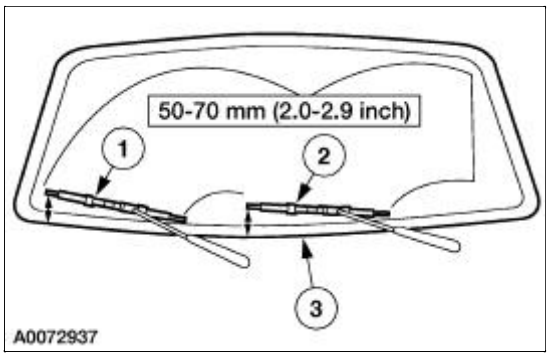
If the rear window wiper motor does not pass any of the following tests, install a new rear window wiper motor. Refer to Rear Window Wiper Motor in this section.

Use the SABRE Premium Battery and Electrical System Tester 010-00736 or equivalent to test the rear window wiper motor.

Disconnect the rear window wiper motor. Connect the (1) green lead from the (2) SABRE to the battery negative (-) post. Connect the red lead (3) from the SABRE to the wiper motor (4) component side connector ground pins 1 an 2 (3). Connect battery positive cable (5) to wiper motor (4) component side connector battery and logic positive pins 3 and 4 (5).

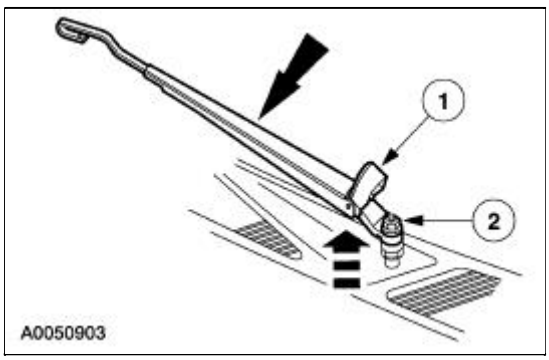
On Mode

Test the on mode by connecting a separate set of test leads from battery ground (-) post to windshield wiper motor (4) component side pins 6 and 7 (6). When these pins are grounded, the rear window wiper motor operation should now be in on mode.



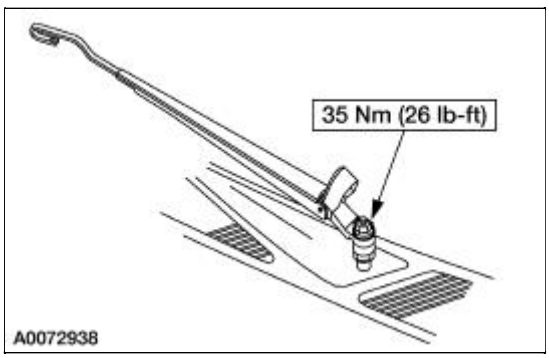
Washer Pump Relay (Integral)

Test the rear window wiper motor internal washer relay function by measuring the voltage between wiper motor (4) component side pin 5 (7), and ground. When wash command input pin 6 (7) is grounded, measured voltage should read 10 volts or greater.



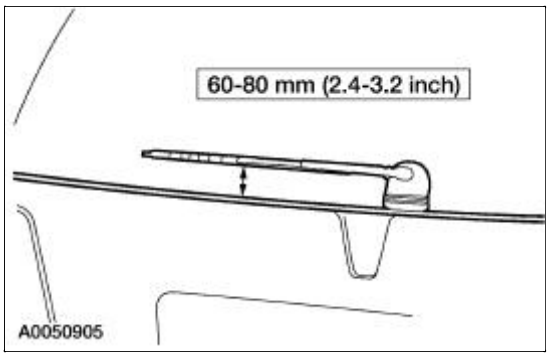
Windshield Wiper Blade and Pivot Arm Adjustment

1. Cycle and park the windshield wipers.



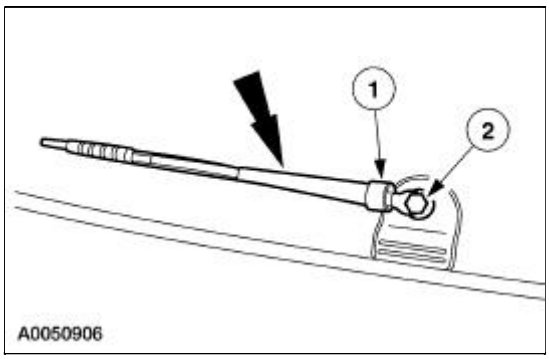
2. Verify the distance between the outer tip of the (1) RH windshield wiper blade and the (3) bottom of the windshield glass and between the outer tip of the (2) LH windshield wiper blade and the (3) bottom of the windshield glass are within specifications.

3. If the distance is not within specification, remove the windshield wiper pivot arm and reposition to specification.
    1. Lift the pivot arm nut cover.
    2. Remove the nut.



4. Tighten the windshield wiper pivot arm nuts.

Rear Window Wiper Blade and Pivot Arm Adjustment



1. Cycle and park the rear window wiper pivot arm and blade.

2. Check the rear window wiper park measurement. If not within specification the rear window wiper pivot arm will need to be removed.

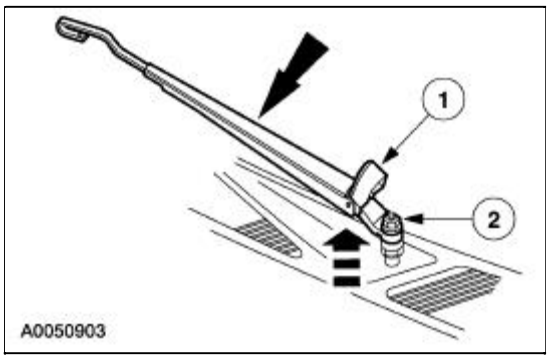
3. **CAUTION: Use a shop towel or similar device to protect the vehicle finish when carrying out the procedure.**

   Remove the rear window wiper pivot arm.
   1. Lift the pivot arm nut cover.
   2. Remove the nut.

4. **NOTE:** This step makes sure that the wiper motor is in the PARK position.

   Turn the rear window wiper switch on and allow the motor to operate for at least one cycle. Turn the rear window wiper switch to OFF.

5. Install the rear window wiper pivot arm onto the rear window wiper motor shaft.
   1. Position the wiper pivot arm within specification.
   2. Tighten the nut.
   3. Install the cover.



1
60-80 mm (2.4-3.2 inch)
2
15 Nm (11 lb-ft)

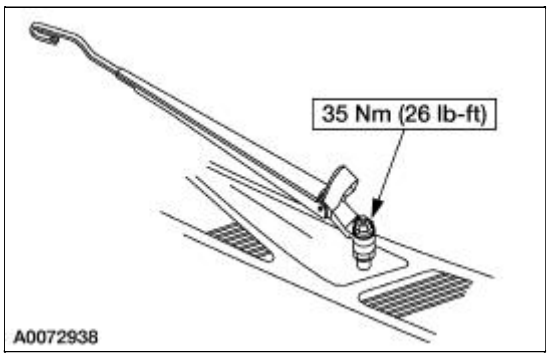
Wiper Pivot Arm —Windshield Wiper

Removal

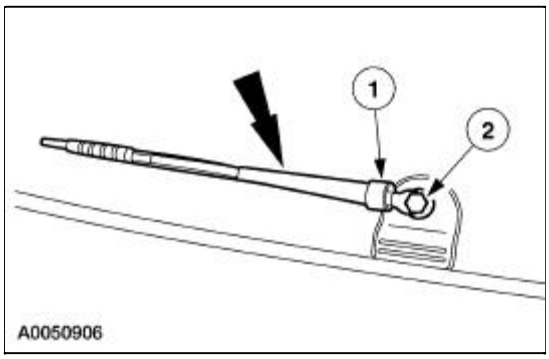


NOTE: The windshield wiper pivot arms must be in the highest position to remove them.

1. Turn the ignition switch to the ON position.
2. Turn the windshield wiper on.
3. Stop the windshield wiper pivot arms at the highest position by turning the ignition switch OFF.
4. Remove the windshield wiper pivot arm.
    1. Lift the pivot arm nut cover.
    2. Remove the nut.

Installation

1. To install, reverse the removal procedure.
    - Adjust the windshield wiper pivot arms. For additional information, refer to Windshield Wiper Blade and Pivot Arm Adjustment in this section.

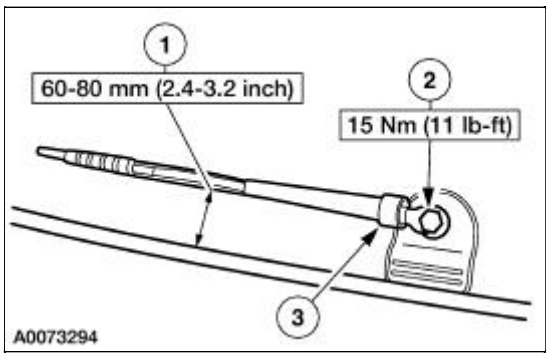


Wiper Pivot Arm —Rear

Removal

1. **CAUTION: Use a shop towel or similar device to protect the vehicle finish when carrying out the procedure.**

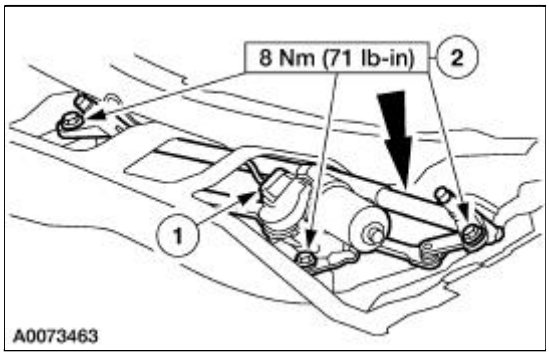
   Remove the rear window wiper pivot arm.
   1. Lift the pivot arm nut cover.
   2. Remove the nut.



Installation

1. **NOTE:** This step makes sure that the wiper motor is in the PARK position.

   Turn the rear window wiper switch on and allow the motor to operate for at least one cycle. Turn the rear window wiper switch to OFF.

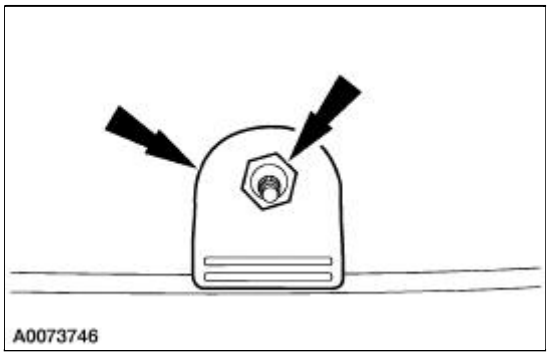


2. Install the rear window wiper pivot arm onto the rear window wiper motor shaft.
   1. Position the wiper pivot arm within specification.
   2. Tighten the nut.
   3. Install the cover.

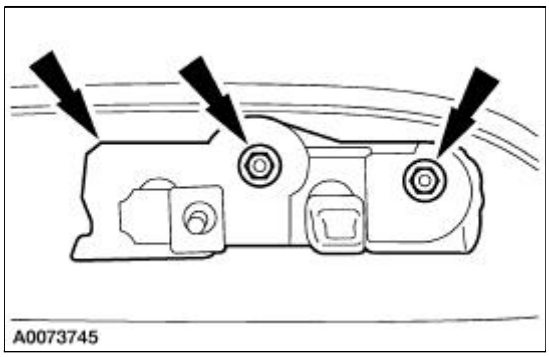
Wiper Mounting Arm and Pivot Shaft —Windshield

Removal and Installation

1. Remove the cowl grille panel. For additional information, refer to Section 501-02 .
2. Disconnect and position the hood light harness aside.
3. Remove the hood struts.
   - Using a suitable tool support the hood.
4. Remove the mounting arm and pivot shaft assembly.
   1. Disconnect the electrical connector and position the wiring harness aside.
   2. Remove the bolts.



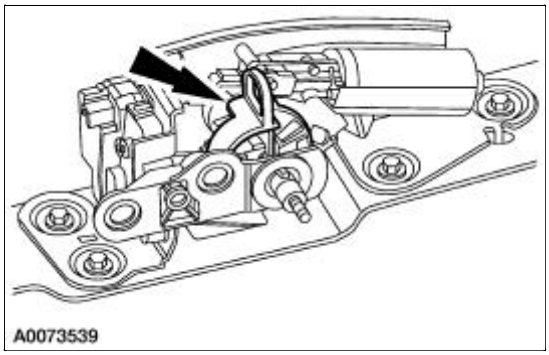
5. To install, reverse the removal procedure.



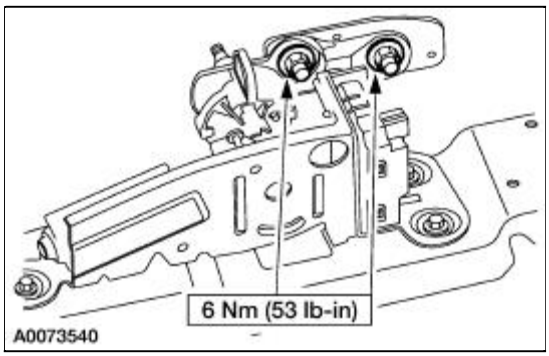
Rear Window Striker and Wiper Pivot Shaft Assembly

Removal

1. Remove the rear wiper pivot arm. For additional information, refer to Wiper Pivot Arm—Rear in this section.
2. Remove the dust boot cover.
3. Remove the nut and the rear window glass handle.



4. Remove the nuts and the rear window striker and wiper pivot shaft assembly.

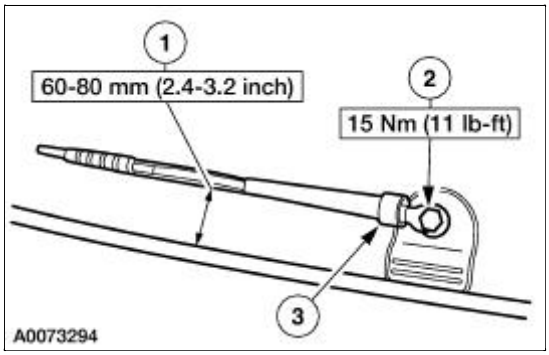


Installation

1. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .
2. **NOTE:** An audible click should be heard as the striker engages the latch.

   Install the rear window striker and pivot shaft assembly into the wiper motor.
3. Install the alignment clip.

4. Slowly close liftgate window glass.
5. Open the liftgate.
6. Install the rear window striker and wiper pivot arm mounting assembly nuts.



7. Remove the alignment clip.
8. Install the rear window glass handle and nut.

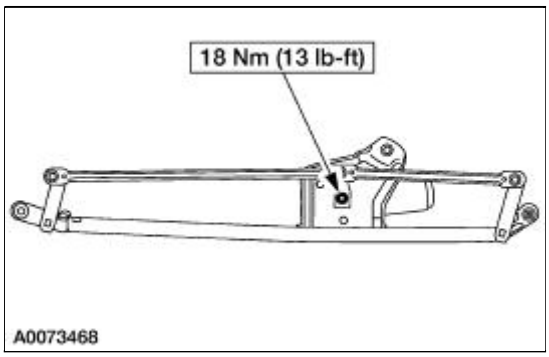
9. **NOTE:** This step makes sure that the wiper motor is in the PARK position.

   Turn the rear window wiper switch on and allow the motor to operate for at least one cycle. Turn the rear window wiper switch to OFF.

10. Install the rear window wiper pivot arm onto the rear window wiper motor shaft.
    1. Position the wiper pivot arm within specification.
    2. Tighten the nut.
    3. Install the cover.

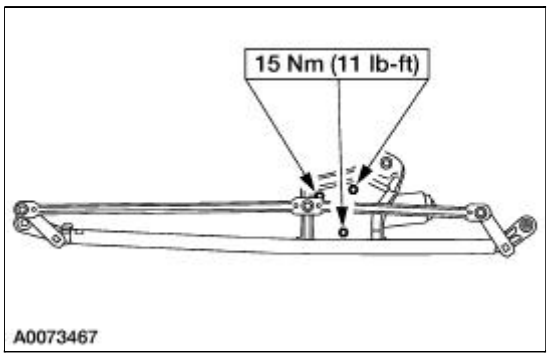
11. Install the liftgate trim panel. For additional information refer to Section 501-05 .

Windshield Wiper Motor



Removal and Installation

1. Remove the mounting arm and pivot shaft. For additional information, refer to Wiper Mounting Arm and Pivot Shaft—Windshield in this section.

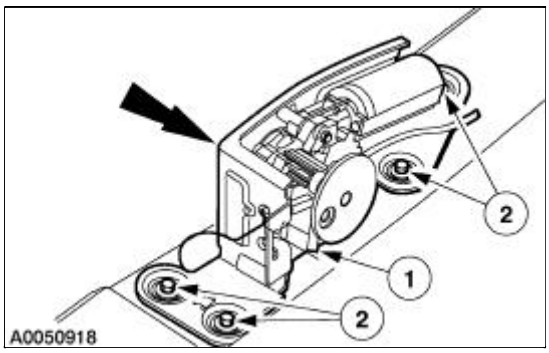


2. **NOTE:** Mark the position of the windshield wiper motor crank before it is disconnected.

   Disconnect the windshield wiper motor crank.

   - Remove the bolt.

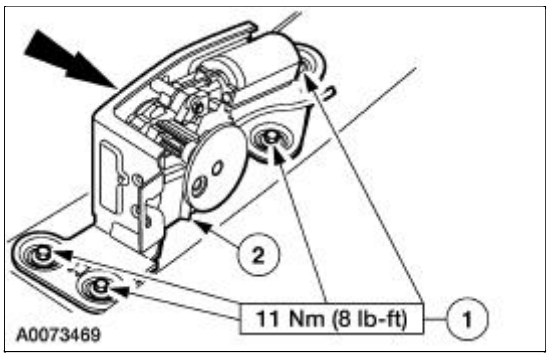
3. Remove the bolts and the windshield wiper motor.



4. **NOTE:** The windshield wiper motor crank must be set to the same location for the windshield wiper mounting arm and pivot shaft to be installed properly. Refer to component test in this section.

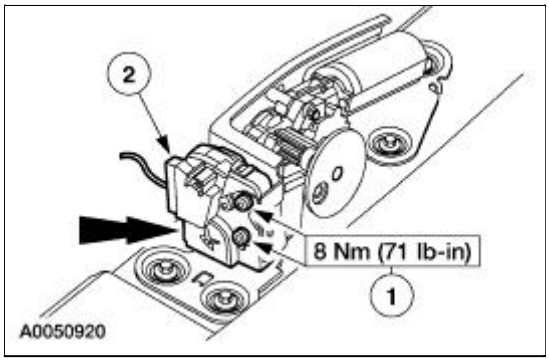
   To install reverse the removal procedure.

Rear Window Wiper Motor



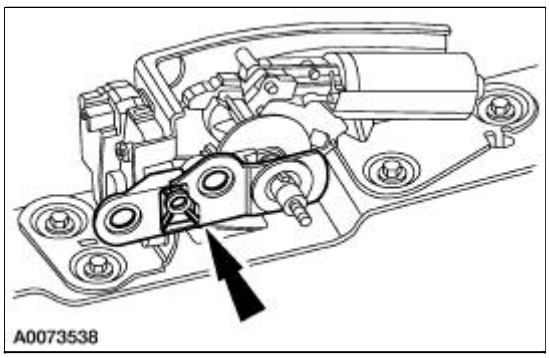
Removal

1. Remove the rear window striker and wiper pivot shaft assembly. For additional information, refer to Rear Window Striker and Wiper Pivot Shaft Assembly in this section.
2. Remove the liftgate window glass latch. For additional information refer to Section 501-14 .
3. Remove the liftgate watershield.
4. Remove the rear window wiper motor.
    1. Disconnect the electrical connector.
    2. Remove the bolts.

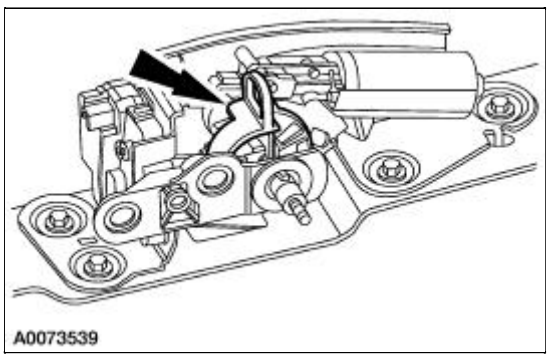


Installation

1. Install the rear window wiper motor.
    1. Install the bolts.
    2. Connect the electrical connector.



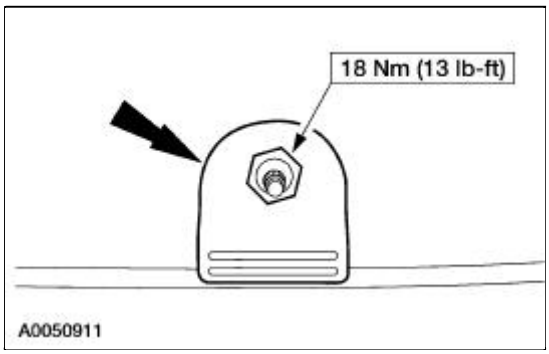
2. Install the liftgate window glass latch.
    1. Install the bolts.
    2. Connect the electrical connector.



3. **NOTE:** An audible click should be heard as the striker engages the latch.

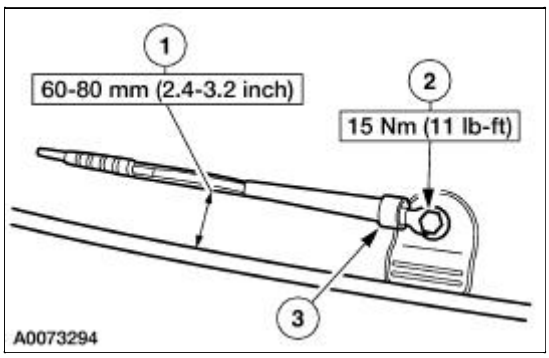
   Install the rear window wiper striker and pivot shaft assembly into the wiper motor.

4. Install the alignment clip provided with rear window wiper motor.



5. Slowly close liftgate window glass.
6. Open liftgate.
7. Install the rear window wiper striker and wiper pivot arm mounting assembly nuts.

8. Remove the alignment clip.



9. Install the rear window glass handle and nut.

10. **NOTE:** This step makes sure that the wiper motor is in the PARK position.

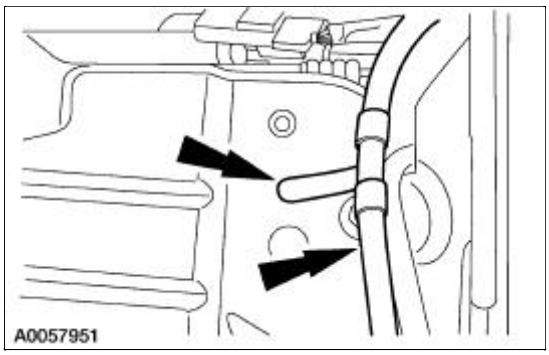
    Turn the rear window wiper switch on and allow the motor to operate for at least one cycle. Turn the rear window wiper switch to OFF.

11. Install the rear window wiper pivot arm onto the rear window wiper motor shaft.
    1. Position the wiper pivot arm within specification.
    2. Tighten the nut.
    3. Install the cover.

12. Install the liftgate watershield.

13. Install the liftgate trim panel. For additional information refer to Section 501-05 .

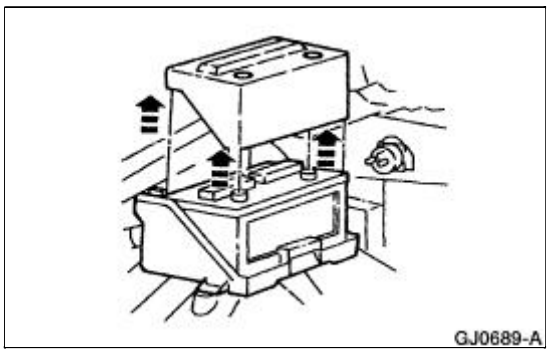
Windshield Washer Pump and Reservoir



Material

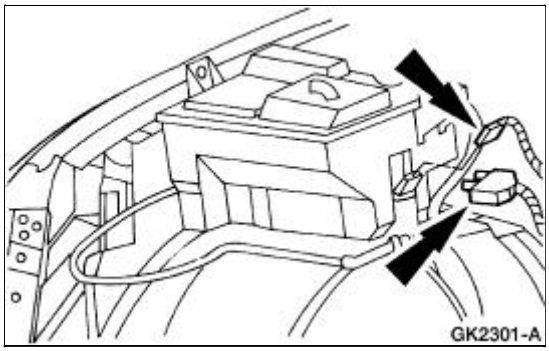
Item	Specification
Ultra-Clear Windshield Washer Concentrate F6AZ-19550-AA	ESR-M17P5-A

Removal



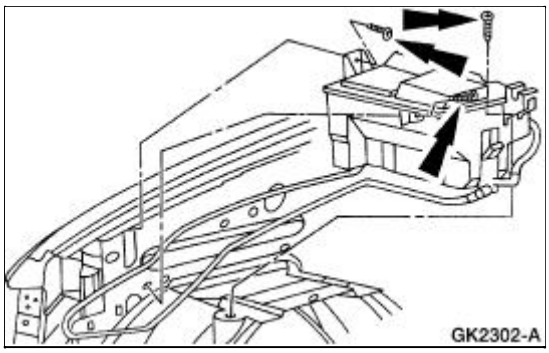
4x4 vehicles only

1. Remove the battery tray. For additional information, refer to Section 414-01 .
2. Position the front differential vent hose aside.
   - Release the retainer.



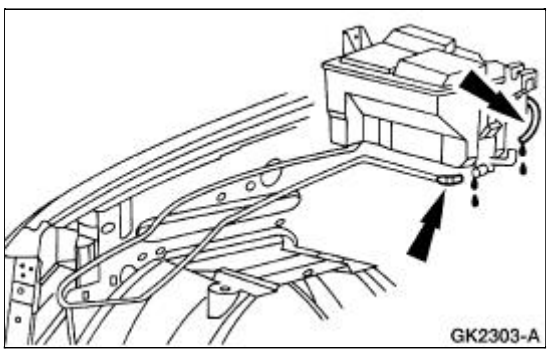
4x2 vehicles only

3. Disconnect the battery cables. For additional information, refer to Section 414-01 .
4. Remove the battery heat shield.

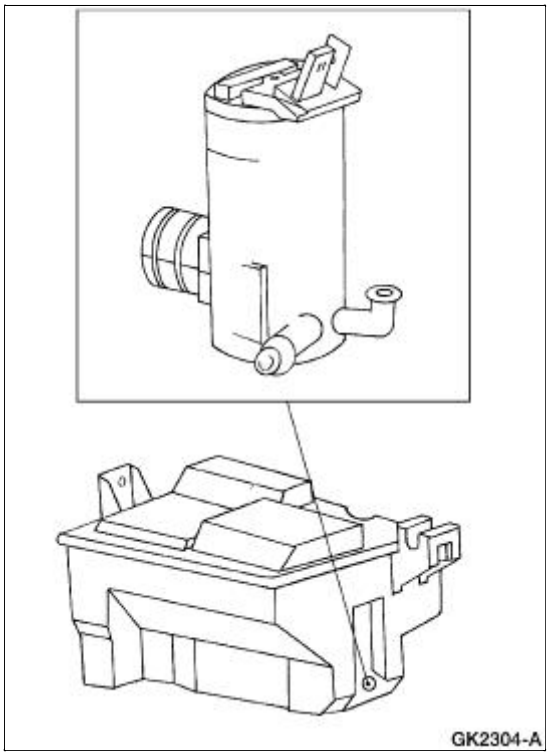


All vehicles

5. Disconnect the electrical connectors.



6. Remove the windshield washer reservoir screws.

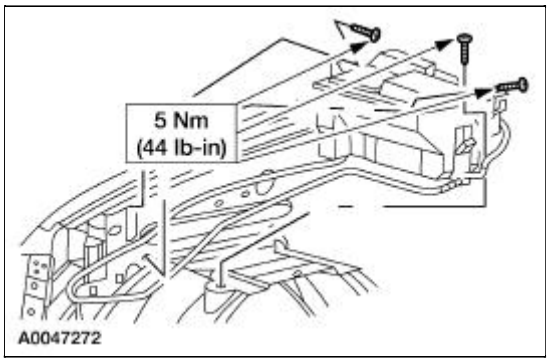


7. **NOTE:** Windshield washer fluid should be collected in a container after the windshield washer hoses are disconnected.

   Disconnect the windshield washer hoses.

8. Remove the windshield washer reservoir.

9. Remove the windshield washer pump if necessary.



Installation

1. **CAUTION: Do not operate the windshield washer pump prior to filling the windshield washer reservoir.**

   To install, reverse the removal procedure.

   - Fill the windshield washer reservoir with windshield washer concentrate.

General Specifications

Item	Specification
Roof Opening Panel Alignment	
Height adjustment (front)	-1.5 - 0 mm (-0.059 - 0 in)
Height adjustment (rear)	0 - 1.5 mm (0 - 0.059 in)

Torque Specifications

Description	Nm	lb-in
Roof opening panel frame bolts	10	89
Roof opening panel bolts	5	44
Roof opening panel motor bolts	5	44
Roof opening panel water trough bolts	5	44

Roof Opening Panel

The roof opening panel system consists of:

- roof opening panel motor
- roof opening panel module
- roof opening panel
- overhead console
- roof opening panel frame
- roof opening panel frame drain hose
- roof opening panel water trough
- roof opening panel shield
- roof opening panel air deflector
- roof opening panel lifter assembly

Roof Opening Panel

Refer to Wiring Diagrams Cell 101 , Roof Opening Panel for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter or equivalent 105-R0057

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Roof opening panel ● Roof opening panel frame ● Roof opening panel drain hoses ● Roof opening panel lifter assemblies ● Roof opening panel water trough ● Roof opening panel air deflector assembly ● Roof opening panel seal ● Roof opening panel shield	● Battery junction box (BJB) fuse ● Circuitry ● Accessory delay relay ● Roof opening panel switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom and refer to Symptom Chart.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
● The roof opening panel has excessive wind noise	● Roof opening panel adjustment. ● Roof opening panel seal.	● Go To Pinpoint Test A .

• The roof opening panel leaks	• Roof opening panel adjustment. • Front rail seal. • Drain tube attachment points. • Roof opening panel water trough and seal. • Roof opening panel drain hose. • Roof opening panel seal. • Roof opening panel.	• Go To Pinpoint Test B .
• The roof opening panel rattles	• Roof opening panel. • Roof opening panel tracks. • Roof opening panel air deflector assembly. • Roof opening panel water trough. • Roof opening panel lifter assemblies. • Roof opening panel water trough guide. • Headliner. • Motor pad. • Rear side brackets.	• Go To Pinpoint Test C .
• The roof opening panel is noisy during operation	• Roof opening panel. • Roof opening panel tracks. • Roof opening panel lifter assemblies. • Roof opening panel adjustment. • Roof opening panel motor assembly.	• Go To Pinpoint Test D .
• The roof opening panel does not open or close	• Roof opening panel adjustment. • Battery junction box (BJB) fuse. • Circuitry. • Roof opening panel switch. • Roof opening panel motor assembly. • Roof opening panel lifter assemblies.	• Go To Pinpoint Test E .
• The express open is inoperative	• Circuitry. • Roof opening panel switch. • Roof opening panel motor assembly.	• Go To Pinpoint Test F .
• The roof opening panel does not open or close — one direction only	• Circuitry. • Roof opening panel switch. • Roof opening panel motor assembly.	• Go To Pinpoint Test F .

Pinpoint Tests

PINPOINT TEST A: THE ROOF OPENING PANEL HAS EXCESSIVE WIND NOISE

Test Step	Result / Action to Take
A1 CHECK THE ROOF OPENING PANEL SEAL ● **NOTE:** Make sure the seals are not loose, cracked, pinched or obstructed. ● Check the roof opening panel seal. ● **Is the roof opening panel seal OK?**	**Yes** GO to A2 . **No** REPAIR or INSTALL a new seal. TEST the system for normal operation.
A2 CHECK THE ROOF OPENING PANEL ADJUSTMENT ● Key in ON position. ● Open and close the roof opening panel. ● Check the adjustment when the roof opening panel closes. ● **Is the adjustment OK?**	**Yes** CHECK for correct installation of the roof opening panel motor. REFER to Roof Opening Panel Motor in this section. TEST the system for normal operation. **No** ADJUST the roof opening panel. REFER to Roof Opening Panel Alignment in this section. TEST the system for normal operation.

PINPOINT TEST B: THE ROOF OPENING PANEL LEAKS

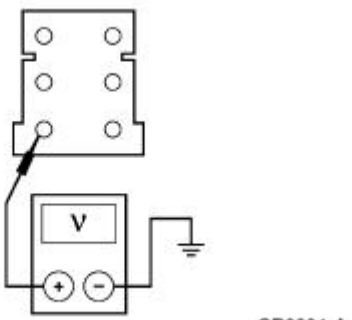
Test Step	Result / Action to Take
B1 CHECK THE ADJUSTMENT OF THE ROOF OPENING PANEL ● **NOTE:** Make sure the roof opening panel seal is not cracked or loose. ● Check the roof opening panel seal. ● **Does the roof opening panel seal correctly?**	**Yes** GO to B2 . **No** ADJUST the roof opening panel. REFER to Roof Opening Panel Alignment in this section. TEST the system for normal operation.
B2 CHECK THE ROOF OPENING PANEL DRAIN HOSES ● **NOTE:** Make sure the roof opening panel drain hoses are not cracked, slit, pinched or obstructed. ● Check the four roof opening panel drain hoses for correct operation. ● **Are the roof opening panel drain hoses OK?**	**Yes** GO to B3 . **No** REPAIR or INSTALL a new roof opening panel drain hose(s). TEST the system for normal operation.
B3 CHECK THE ROOF OPENING PANEL DRAIN HOSE ATTACHMENT POINTS ● **NOTE:** Make sure the roof opening panel drain hose attachment points are not damaged or obstructed. ● Check the roof opening panel drain	**Yes** GO to B4 . **No**

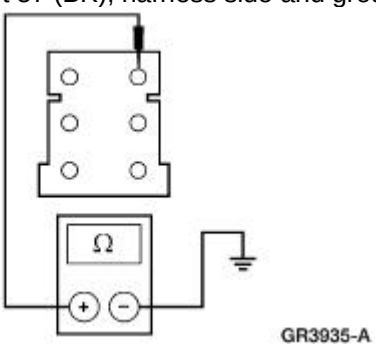
hose attachment points for correct attachment. ● **Are the roof opening panel drain hose attachment points OK?**	REPAIR or INSTALL a new roof opening panel. REFER to Roof Opening Panel in this section. TEST the system for normal operation.
B4 CHECK THE ROOF OPENING PANEL WATER TROUGH CONDITION	
● Check the roof opening panel water trough and the roof opening panel water trough seal for damage. ● **Are the roof opening panel water trough and seal OK?**	**Yes** GO to B5 . **No** REPAIR the roof opening panel water trough and seal. TEST the system for normal operation.
B5 CHECK THE CONDITION OF THE ROOF SLIDING GLASS PANEL	
● Check the roof opening panel frame for damage that may cause the roof opening panel seal to seat incorrectly. ● **Is the roof opening panel frame OK?**	**Yes** INSTALL a new roof opening panel. REFER to Roof Opening Panel in this section. TEST the system for normal operation. **No** REPAIR or INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation.

PINPOINT TEST C: THE ROOF OPENING PANEL RATTLES

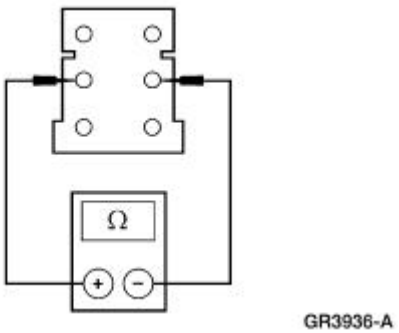
Test Step	Result / Action to Take
C1 CHECK THE ROOF OPENING PANEL OPERATION	
● Check the roof opening panel during operation. ● **Is the roof opening panel loose?**	**Yes** ADJUST the roof opening panel. REFER to Roof Opening Panel Alignment in this section. TEST the system for normal operation. **No** GO to C2 .
C2 CHECK THE ROOF OPENING PANEL TRACKS	
● Open the roof opening panel. ● Check the roof opening panel tracks for obstructions and damage. ● **Are the roof opening panel tracks OK?**	**Yes** GO to C3 . **No** REMOVE all the roof opening panel track obstructions and REPAIR the roof opening panel tracks. TEST the system for normal operation.
C3 CHECK THE ROOF OPENING PANEL WATER TROUGH AND TROUGH GUIDES	
● Check the water roof opening panel water trough and trough guides for any loose fasteners or obstructions. ● **Are the roof opening panel water trough and trough guides**	**Yes** GO to C4 . **No** REMOVE all obstructions from the roof opening panel water trough and install securely. SECURE the trough

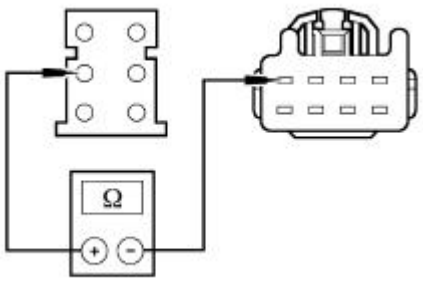
installed securely and free from obstructions?	guides or INSTALL new roof opening panel water trough guides if damaged. TEST the system for normal operation.
C4 CHECK THE ROOF OPENING PANEL SHIELD • Check the roof opening panel shield for correct installation. • **Is the roof opening panel shield installed correctly?**	**Yes** GO to C5 . **No** INSTALL the roof opening panel shield correctly. TEST the system for normal operation.
C5 CHECK THE ROOF OPENING PANEL AIR DEFLECTOR ASSEMBLY • Check the roof opening panel air deflector assembly for obstructions and damage. • **Is the roof opening panel air deflector assembly OK?**	**Yes** GO to C6 . **No** REMOVE all obstructions and REPAIR or INSTALL a new roof opening panel air deflector assembly. TEST the system for normal operation.
C6 CHECK THE ROOF OPENING PANEL • Verify the roof opening panel is free from obstruction and damage, and is securely fastened. • **Is the roof opening panel OK?**	**Yes** GO to C7 . **No** REPAIR or INSTALL a new roof opening panel. REFER to Roof Opening Panel in this section. TEST the system for normal operation.
C7 CHECK THE ROOF OPENING PANEL LIFTER ASSEMBLIES • Verify the roof opening panel lifter assemblies are free from obstructions and damage. • **Are the roof opening panel lifter assemblies OK?**	**Yes** INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation. **No** REMOVE all obstructions from the roof opening panel lifter assemblies and REPAIR any damage. TEST the system for normal operation.





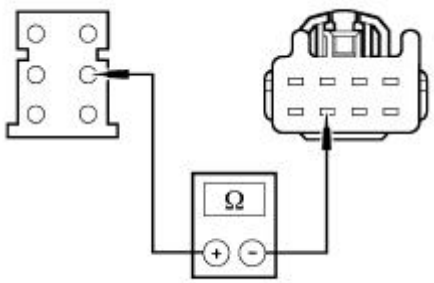
PINPOINT TEST D: THE ROOF OPENING PANEL IS NOISY DURING OPERATION

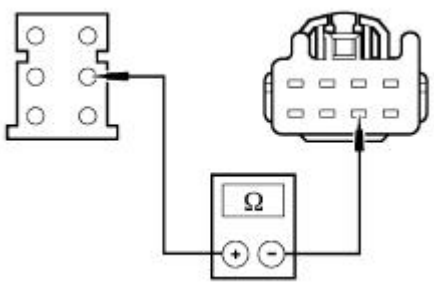




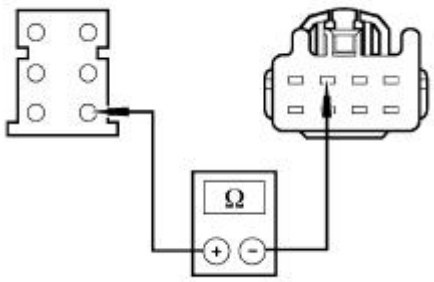
Test Step	Result / Action to Take
D1 CHECK THE ROOF OPENING PANEL FOR OBSTRUCTIONS OR DAMAGE • Check the roof opening panel for any obstructions and damage. • **Are there any obstructions and/or damage?**	**Yes** REMOVE all obstructions. REPAIR any damage or INSTALL a new roof opening panel. REFER to Roof Opening Panel in this section. TEST the system for normal operation. **No**

	GO to D2 .
D2 CHECK THE ROOF OPENING PANEL OPERATION	
• Check the roof opening panel during operation. • **Is the roof opening panel loose or incorrectly adjusted?**	**Yes** ADJUST the roof opening panel. REFER to Roof Opening Panel Alignment in this section. TEST the system for normal operation. **No** GO to D3 .
D3 CHECK THE ROOF OPENING PANEL TRACKS	
• Open the roof. • Check the roof opening panel tracks for obstructions and damage. • **Are the roof opening panel tracks OK?**	**Yes** GO to D4 . **No** REMOVE all obstructions and REPAIR any damage. TEST the system for normal operation.
D4 CHECK THE ROOF OPENING PANEL SHIELD	
• Check the roof opening panel shield for correct movement. • **Is the roof opening panel shield moving correctly?**	**Yes** GO to D5 . **No** REMOVE and REINSTALL the roof opening panel shield. REFER to Roof Opening Panel Shield in this section. TEST the system for normal operation.
D5 CHECK THE ROOF OPENING PANEL LIFTER ASSEMBLIES	
• Check the roof opening panel lifter assemblies for obstructions and damage. • **Are the roof opening panel lifter assemblies OK?**	**Yes** GO to D6 . **No** REMOVE all obstructions and REPAIR any damage. TEST the system for normal operation.
D6 CHECK THE ROOF OPENING PANEL MOTOR	
• Gain access to the roof opening panel motor. • Open the roof opening panel. • **Does the motor make excessive noise?**	**Yes** INSTALL a new roof opening panel motor. REFER to Roof Opening Panel Motor in this section. TEST the system for normal operation. **No** ADJUST the roof opening panel. REFER to Roof Opening Panel Alignment in this section. TEST the system for normal operation.





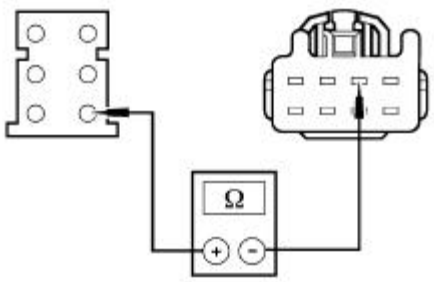
PINPOINT TEST E: THE ROOF OPENING PANEL DOES NOT OPEN OR CLOSE



Test Step	Result / Action to Take
E1 VERIFY THE ROOF OPENING PANEL ADJUSTMENT	
• Verify the roof opening panel is adjusted correctly. • **Is the roof opening panel adjusted correctly?**	**Yes** GO to E2 .

	No ADJUST the roof opening panel. REFER to Roof Opening Panel Alignment in this section. TEST the system for normal operation.
E2 CHECK THE ROOF OPENING PANEL LIFTER ASSEMBLIES FOR OBSTRUCTIONS OR DAMAGE ● Check the roof opening panel lifter assemblies for obstructions and damage. ● **Are the roof opening panel lifter assemblies OK?**	**Yes** GO to E3 . **No** REMOVE all obstructions and REPAIR any damage. TEST the system for normal operation.
E3 VERIFY POWER WINDOWS ARE OPERATIONAL ● Operate the power windows. ● **Do the power windows operate?**	**Yes** GO to E4 . **No** REFER to Section 501-11 .
E4 CHECK CIRCUIT 400 (LB/BK) FOR VOLTAGE ● Key in OFF position. ● Disconnect: Roof Opening Panel Motor C920. ● Key in ON position. ● Measure the voltage between roof opening panel motor C920-4, circuit 400 (LB/BK), harness side and ground.  GR3934-A ● **Is the voltage greater than 10 volts?**	**Yes** GO to E5 . **No** REPAIR the circuit. TEST the system for normal operation.
E5 CHECK CIRCUIT 57 (BK) FOR AN OPEN ● Key in OFF position. ● Measure the resistance between roof opening panel motor C920-1, circuit 57 (BK), harness side and ground.  GR3935-A	**Yes** GO to E6 . **No** REPAIR the circuit. TEST the system for normal operation.

• **Is the resistance less than 5 ohms?**	
E6 CHECK ROOF OPENING PANEL MOTOR	
• Measure the resistance between roof opening panel motor C920-5, circuit 1173 (BN/OG), harness side and C920-2, circuit 1174 (WH/RD), harness side while depressing the open button.  GR3936-A • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new roof opening panel motor. REFER to Roof Opening Panel Motor in this section. TEST the system for normal operation. **No** GO to E7.
E7 CHECK CIRCUIT 1173 (BN/OG) FOR OPEN	
• Disconnect: Roof Opening Panel Switch C912 (Expedition)/C9001 (Navigator). • Measure the resistance between roof opening panel motor C920-5, circuit 1173 (BN/OG), harness side and roof opening panel switch C912/C9001-4, circuit 1173 (BN/OG), harness side.  A0040942 • **Is the resistance less than 5 ohms?**	**Yes** GO to E8. **No** REPAIR the circuit. TEST the system for normal operation.
E8 CHECK THE ROOF OPENING PANEL SWITCH	
• Test the roof opening panel switch. Refer to the component test in this section. • **Is the roof opening panel switch OK?**	**Yes** INSTALL a new roof opening panel motor. REFER to Roof Opening Panel Motor in this section. TEST the system for normal operation. **No** INSTALL a new roof opening panel switch. TEST the system for normal operation.



PINPOINT TEST F: THE ROOF OPENING PANEL DOES NOT OPEN OR CLOSE — ONE DIRECTION ONLY

Test Step	Result / Action to Take
F1 CHECK THE ROOF OPENING PANEL SWITCH	
• Disconnect: Roof Opening Panel Switch C912 (Expedition)/C9001 (Navigator). • Test the roof opening panel switch. Refer to the component test in this section. • **Is the roof opening panel switch OK?**	**Yes** GO to F2 . **No** INSTALL a new roof opening panel switch. TEST the system for normal operation.
F2 CHECK CIRCUIT 1174 (WH/RD) FOR AN OPEN	
• Disconnect: Roof Opening Panel Motor C920. • On Navigator, measure the resistance between roof opening panel motor C920-2, circuit 1174 (WH/RD), harness side and roof opening panel switch C9001-7, circuit 1174 (WH/RD), harness side.  A0040944 • On Expedition, measure the resistance between roof opening panel motor C920-2, circuit 1174 (WH/RD), harness side and roof opening panel switch C912-6, circuit 1174 (WH/RD), harness side.  A0040943 • **Is the resistance less than 5 ohms?**	**Yes** GO to F3 . **No** REPAIR the circuit. TEST the system for normal operation.
F3 CHECK CIRCUIT 1175 (TN/RD) FOR AN OPEN	
• On Navigator, measure the resistance between roof opening panel motor C920-3, circuit 1175 (TN/RD), harness side and roof opening panel switch C9001-3, circuit 1175 (TN/RD), harness side.	**Yes** INSTALL a new roof opening panel motor. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

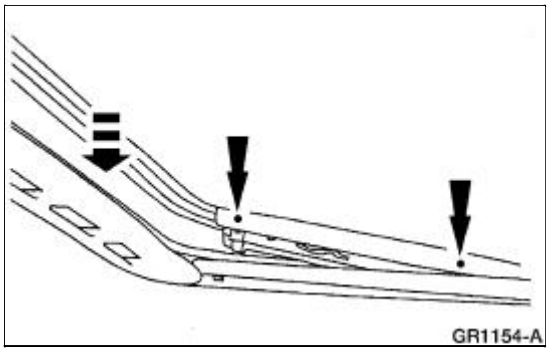
A0040945

- On Expedition, measure the resistance between roof opening panel motor C920-3, circuit 1175 (TN/RD), harness side and roof opening panel switch C912-2, circuit 1175 (TN/RD), harness side.

A0040946

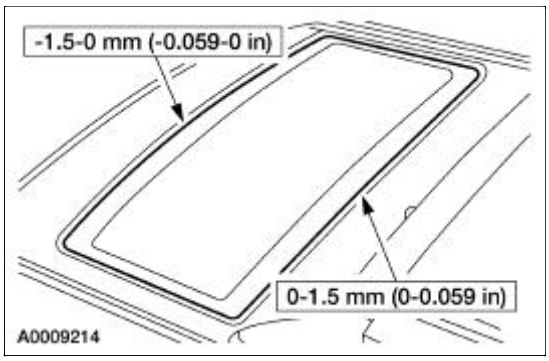
- **Is the resistance less than 5 ohms?**

Component Test



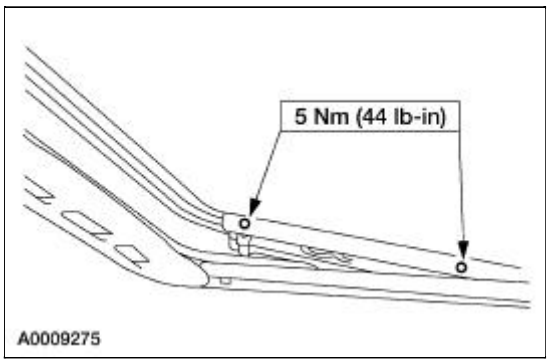
Switch

Measure the resistance between the following roof opening panel switch C912 (Expedition)/C9001 (Navigator) pins (component side) as follows:



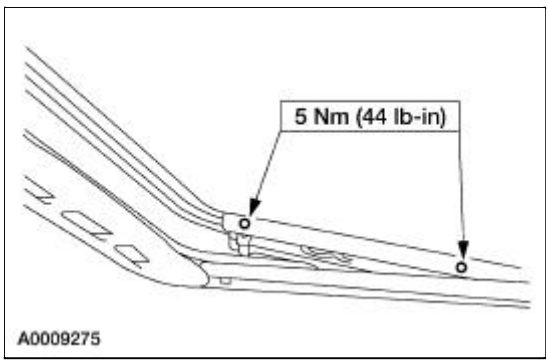
Switch position	Pin	Resistance value
Off	2 and 4, 4 and 6 for Expedition. 3 and 4, 4 and 7 for Navigator.	Greater than 10,000 ohms.
Up or Closed	4 and 2 for Expedition. 4 and 3 for Navigator.	Less than 5 ohms.
Down or Open	6 and 4 for Expedition. 7 and 4 for Navigator.	Less than 5 ohms.

Roof Opening Panel Alignment

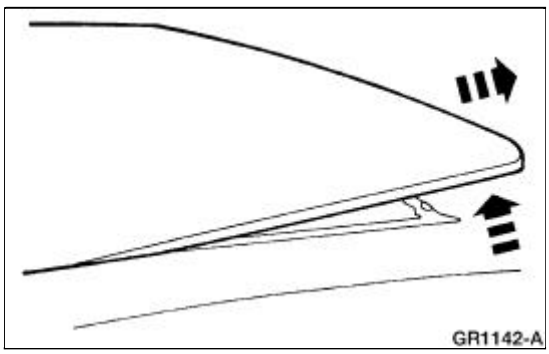


1. Loosen the four roof opening panel bolts.

2. Position the roof opening panel to the roof panel as specified.



3. Maintain the roof opening panel position and tighten the four roof opening panel bolts.



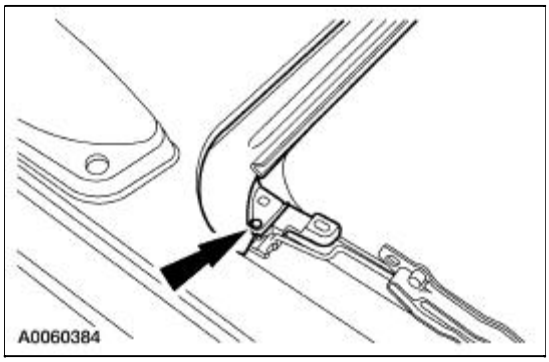
Roof Opening Panel

Removal and Installation

1. Remove the four roof opening panel bolts.

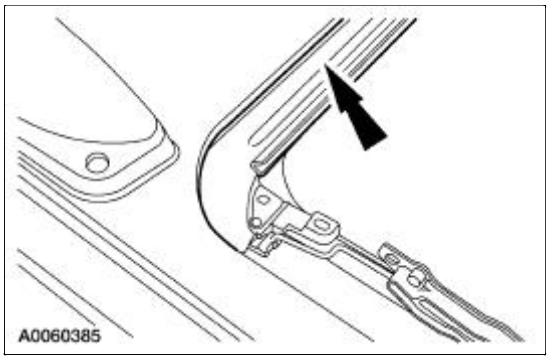
2. Remove the roof opening panel from the outside of the vehicle by lifting up and out.

3. To install, reverse the removal procedure.
    - If necessary, adjust the roof opening panel. For additional information, refer to Roof Opening Panel Alignment in this section.



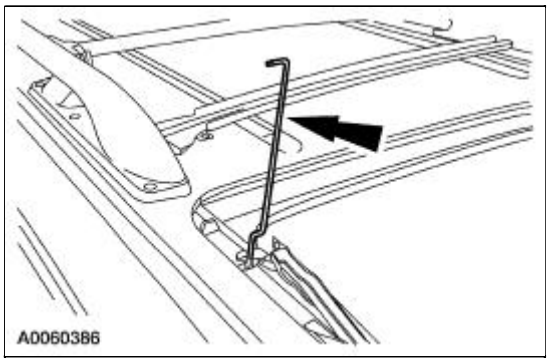
Roof Opening Panel Rear Trough Guide

Removal and Installation

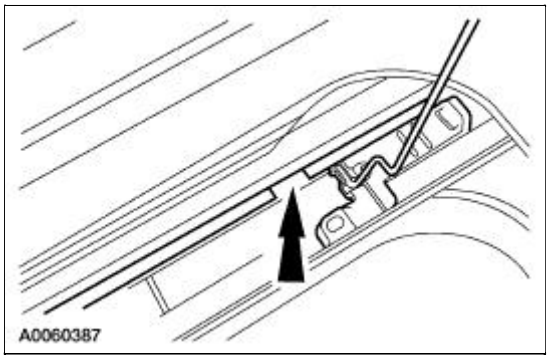


1. **NOTE:** This procedure does not pertain to vehicles built before October 1999.

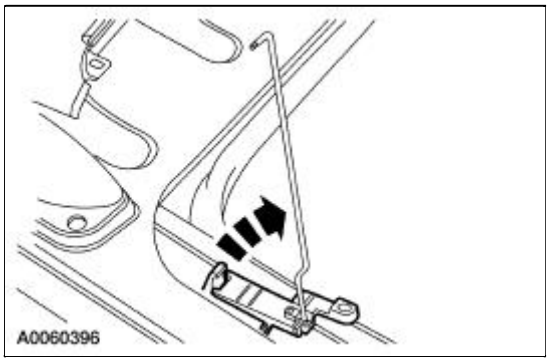
   Remove the roof opening panel. For additional information, refer to Roof Opening Panel in this section.



2. Remove the two trough guide retaining screws.



3. Remove the trough from the trough guide assembly.



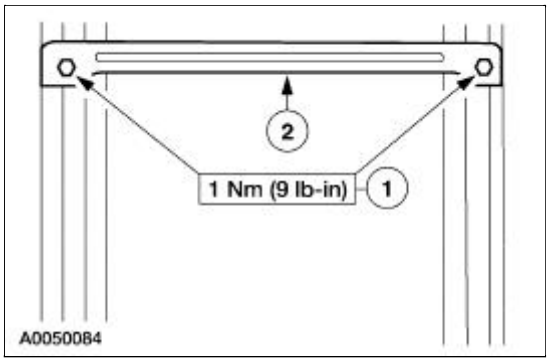
4. Disconnect the trough guide rods from the lifter arm assemblies.

5. Slide the trough guide back to the slot (approx. 15 mm [0.6 in]) cut in track.

6. Carefully twist trough guide through the slot in the track to remove.

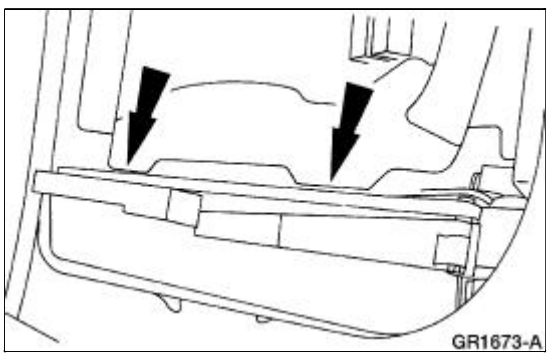
7. Inspect the trough guide assembly for damage. If damage is found, inspect the track for broken pieces and remove them.

8. To install, reverse the removal procedure.



9. If necessary, adjust roof opening panel. For additional information, refer to Roof Opening Panel Alignment in this section.

Roof Opening Panel Shield

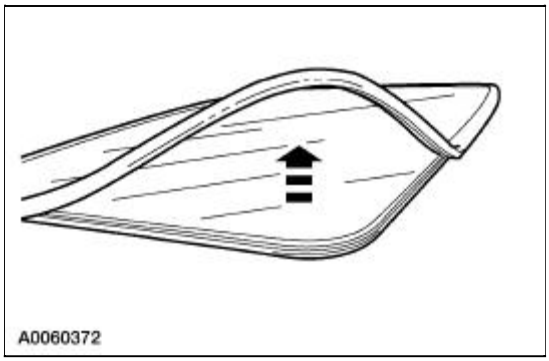


Removal and Installation

1. Remove the roof opening panel. For additional information, refer to Roof Opening Panel in this section.

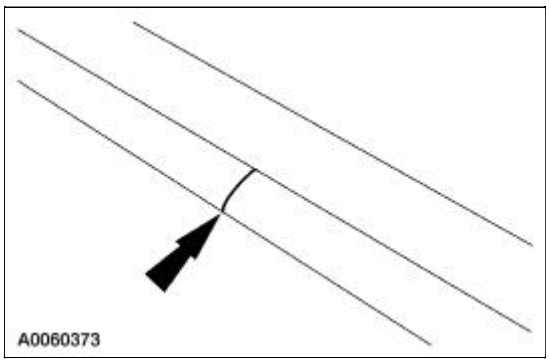
2. Remove the water trough.
    1. Remove the bolts.
    2. Remove the water trough.

3. Flex the opening shield to remove the guides from the tracks and remove the roof opening panel shield.



4. To install, reverse the removal procedure.

Roof Opening Panel Weatherstrip

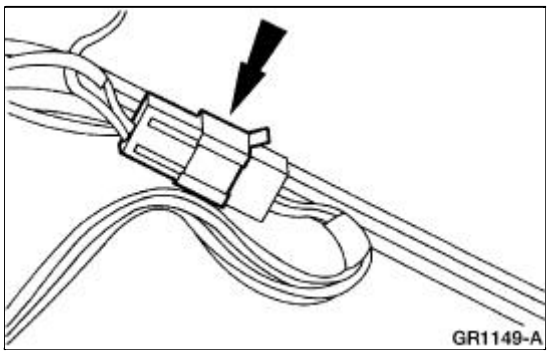


Removal

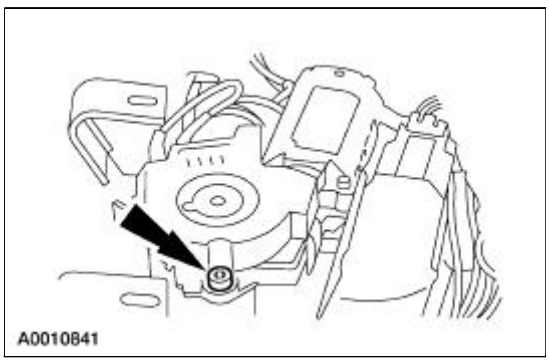
1. Remove the roof opening panel. For additional information, refer to Roof Opening Panel in this section.
2. Place roof opening panel, topside up, on a worktable. Take care to support the glass assembly from below to prevent damaging the mounting tabs.
3. Remove the old roof opening panel weatherstrip by pulling up on the weatherstrip.

Installation

1. Place a new weatherstrip into position on the glass assembly, with the splice (seam) on the passenger side.



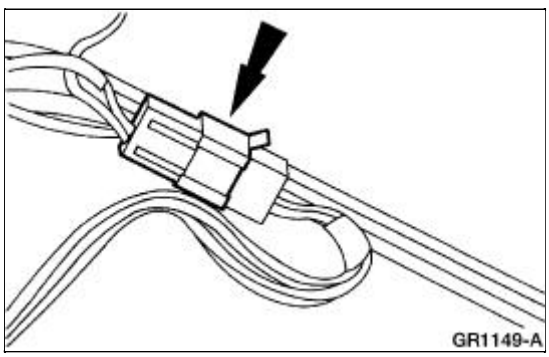
2. Starting with the corners, push the weatherstrip into position. Continue pushing the weatherstrip into position around the glass assembly until complete. Use a plastic or rubber hammer if necessary.
3. Install the roof opening panel. For additional information, refer to Roof Opening Panel in this section.
4. If necessary, adjust the roof panel. For additional information, refer to Roof Opening Panel Alignment in this section.



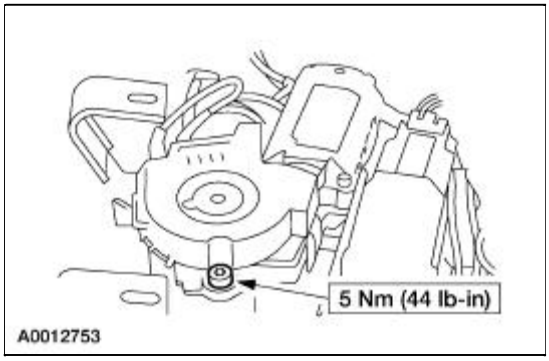
Roof Opening Panel Motor

Removal

1. Remove the headliner. For additional information, refer to Section 501-05 .
2. Disconnect the roof opening panel motor electrical connector.



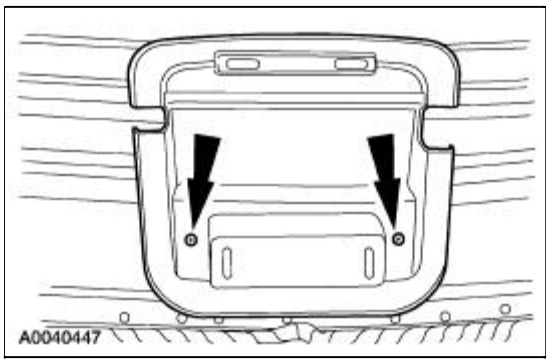
3. Remove the roof opening panel motor.
   - Remove the three bolts.



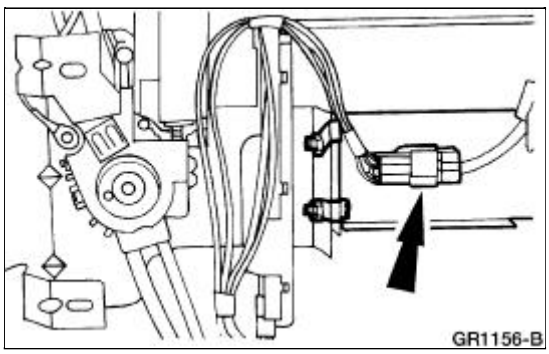
Installation

1. Make sure the roof opening panel is in the closed position.
2. Connect the roof opening panel motor electrical connector.

3. Cycle the roof opening panel motor until it stops in the closed position.
4. Install the roof opening panel motor.
    - Install the three bolts.

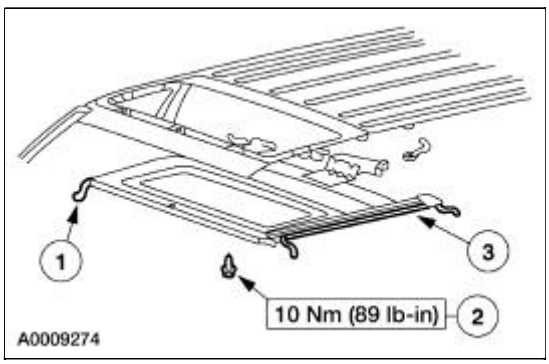


5. Install the headliner. For additional information, refer to Section 501-05 .



Roof Opening Panel Frame

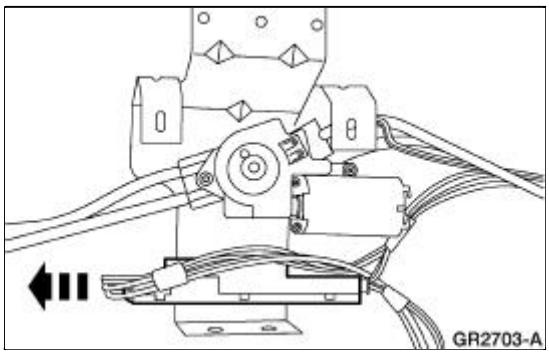
Removal and Installation



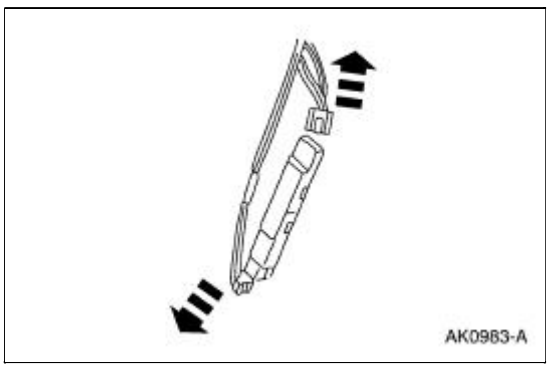
1. Remove the headliner. For additional information, refer to Section 501-05 .
2. Remove the overhead console bracket.
   - Remove the screws.

3. Disconnect the electrical connector.

4. Remove the roof opening panel frame.
   1. Disconnect the four roof opening panel drain hoses.
   2. Remove the nine bolts.
   3. Remove the roof opening panel frame.



5. To install, reverse the removal procedure.

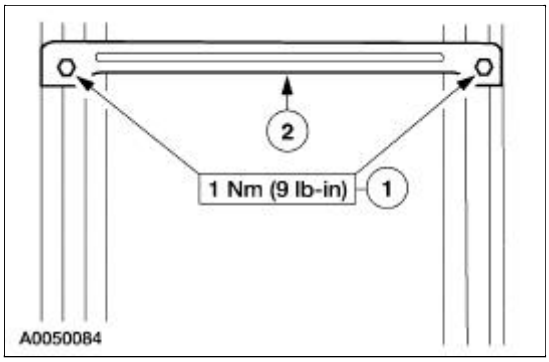


Roof Opening Panel Module

Removal and Installation

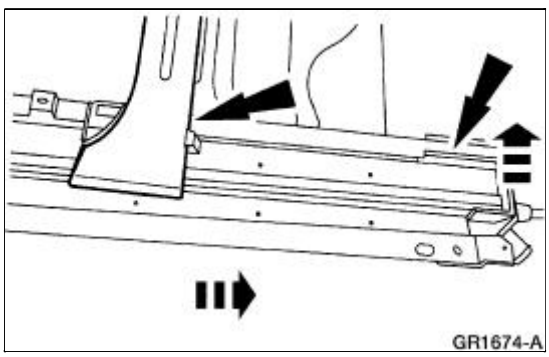
1. Remove the headliner. For additional information, refer to Section 501-05 .
2. Slide the roof opening panel module from the retaining bracket.

3. Disconnect the electrical connectors and remove the roof opening panel module.



4. To install, reverse the removal procedure.

Drive Cables and Guide Rails



Disassembly and Assembly

1. Remove the roof opening panel frame. For additional information, refer to Roof Opening Panel Frame in this section.

2. Remove the roof opening panel water trough.
   1. Remove the bolts.
   2. Remove the roof opening panel water trough.

3. Remove the roof opening panel water trough guide by sliding it back and lifting it outward at the notch in the roof opening panel tracks.

4. To assemble, reverse the disassembly procedure.

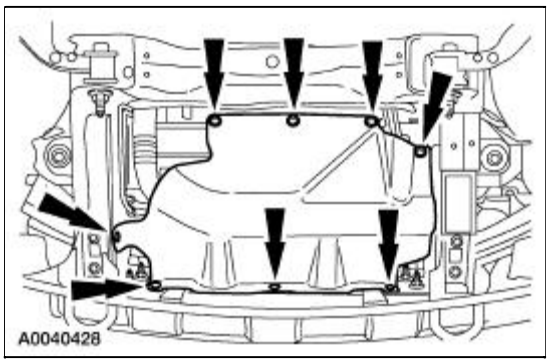
Torque Specifications

Description	Nm	lb-ft	lb-in
Fender splash shield screws	3	—	27
Bumper cover to fender bolts	8	—	71
Bumper cover torx bolts	3	—	27
Rear bumper cover nuts and bolts	8	—	71
Front bumper nuts	90	66	—

Bumpers

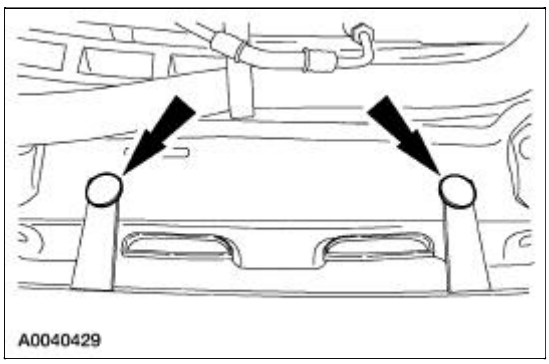
The bumper components consist of the following:

- front bumper
- front bumper cover
- grille (Expedition)
- foam
- fog lamps (if equipped)
- rear bumper cover hitch cover
- rear bumper cover
- step pad



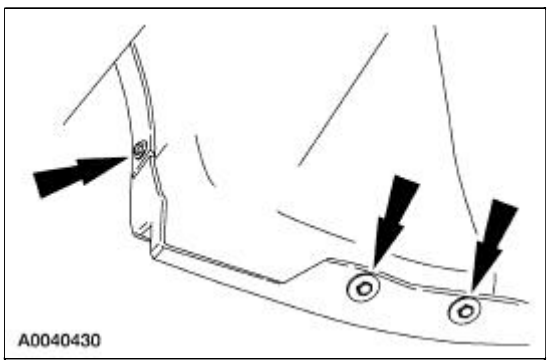
The trailer hitch is the rear bumper. For additional information on removal and installation, refer to Section 502-02 .

Front Bumper Cover

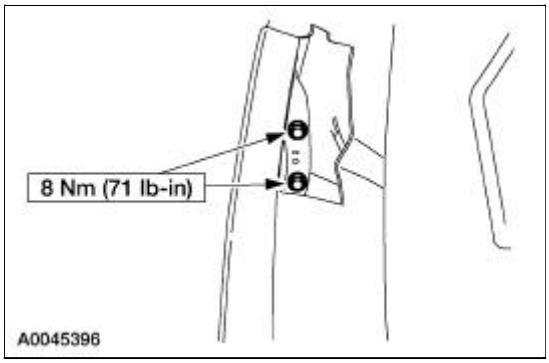


Removal and Installation

All vehicles

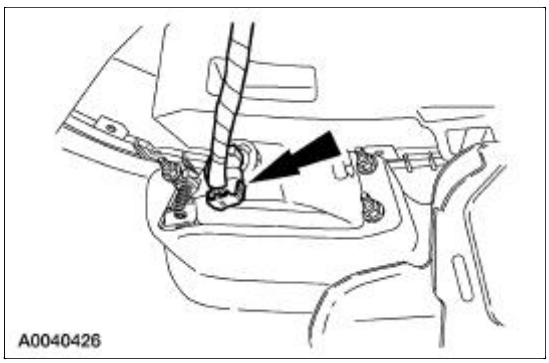


1. Remove the lower air deflector.
   - Remove the pin-type retainers.

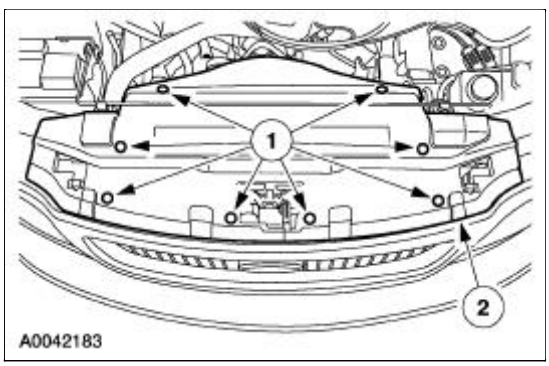


2. Remove the front bumper cover lower pin-type retainers.

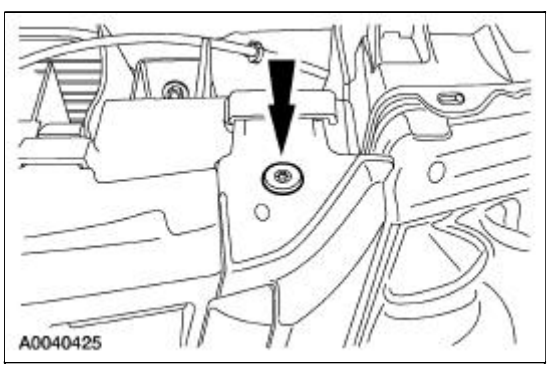
3. Remove the front fender splash shield screws.



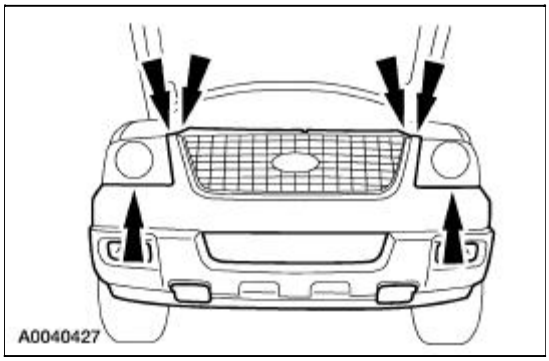
4. Remove the front fender to front bumper cover bolts.



Expedition

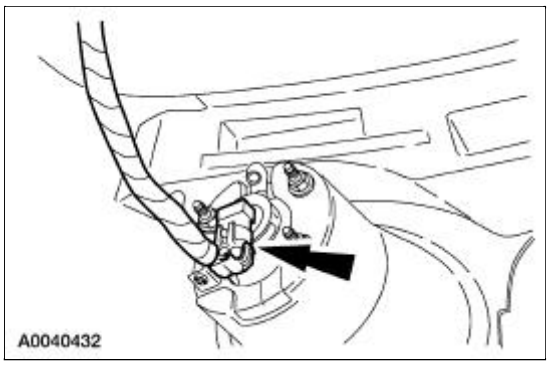


5. Disconnect the fog lamp electrical connectors.

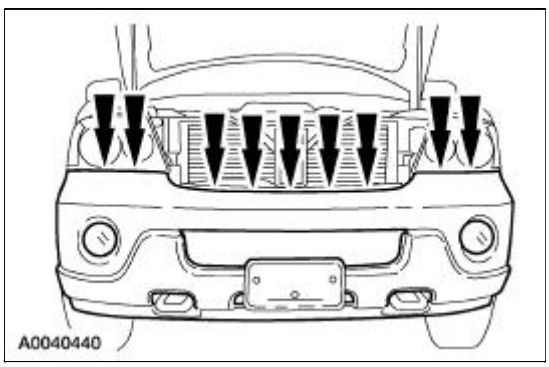


6. Remove the upper air deflector.
    1. Remove the pin-type retainers.
    2. Remove the upper air deflector.

7. Remove the two torx bolts.



8. Release the front bumper cover clips and remove the front bumper cover.

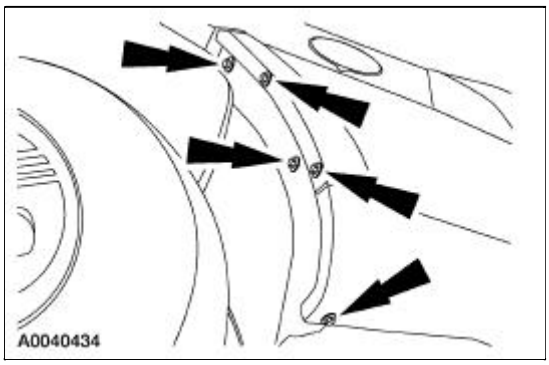


Navigator

9. Disconnect the fog lamp electrical connectors.

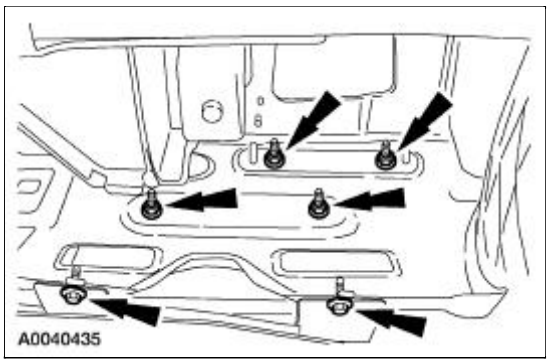
10. Release the front bumper cover clips and remove the front bumper.

All vehicles



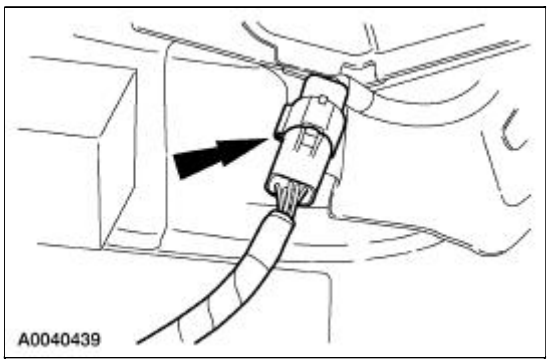
11. To install, reverse the removal procedure.

Rear Bumper Cover

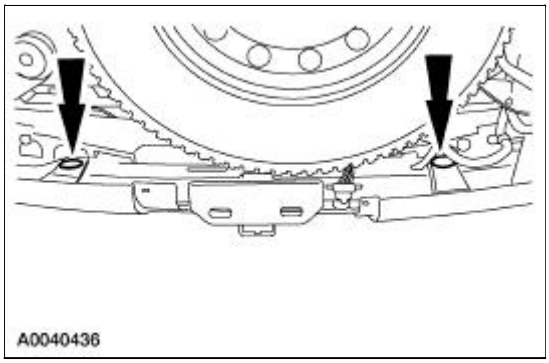


Removal and Installation

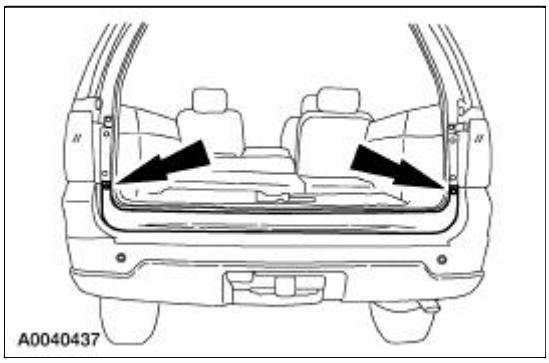
NOTE: Navigator shown, Expedition similar.



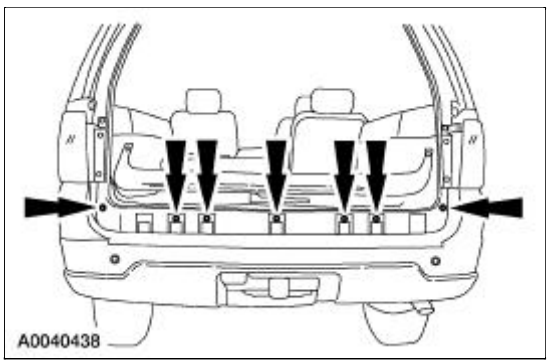
1. Remove the rear fender splash shield bolts.



2. Remove the rear bumper cover nuts and bolts.



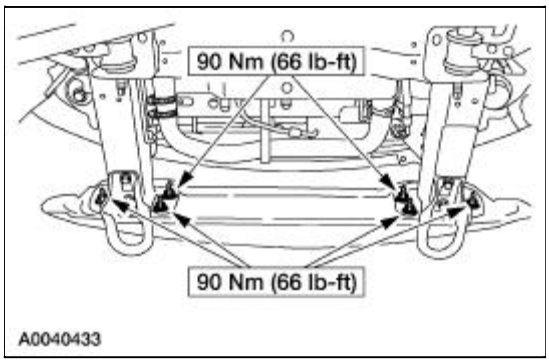
3. If equipped, disconnect the reverse parking aid electrical connector.



4. Remove the rear bumper cover lower pin-type retainers.

5. Remove the liftgate trim.
    - Remove the pin-type retainers.

6. Remove the rear bumper cover.
    - Remove the pin-type retainers and bolts.



7. To install, reverse the removal procedure.

Bumper

Removal and Installation

1. Remove the front bumper cover. For additional information, refer to Front Bumper Cover in this section.
2. Remove the front bumper.
   - Remove the bolts.

3. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in

Safety belt shoulder height adjuster bolt	40	30	—
Safety belt buckle and pretensioner bolt	40	30	—
Safety belt buckle-to-seat bolts	40	30	—
Safety belt buckle-to-seat nuts	40	30	—
Safety belt anchor-to-floor	40	30	—
Third row 60 percent backrest handle release screws	3	—	27
Third row child safety seat tether anchor bolt	28	21	—

Safety Belt System

WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters, child safety seat tether attachments (if equipped), and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds that the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or incorrect operation is noted.

WARNING: Each seating position in the vehicle has a specific safety belt assembly which consists of one buckle and one tongue. The safety belt assembly is designed to be used as a pair and is not to be used across seating positions.

WARNING: Rear facing child seats or infant carriers should never be placed in the front seats. If you must use a forward facing child seat, move the seat all the way back.

All outboard safety belts, and second and third row center safety belts (if equipped) are continuous-loop, three-point systems. The combination lap and shoulder belt (continuous-loop) uses a common slip tongue and retractor.

The shoulder harness retractor is designed to let the webbing move freely in and out at all times, except during vehicle hard braking, hard cornering or impact of 8 km/h (5 mph) or more, when it is automatically locked by a mechanically actuated inertia sensor.

When replacing safety belt buckles and/or retractor assemblies, use only the replacement parts specified in the Ford Customer Service Division Master Parts and Accessories Catalog.

Active Restraint System Components

The active restraint system consists of the following components in the locations described.

- Driver and front row outboard passenger safety belt buckle pretensioners, attached to the front seats.
- Front row outboard safety belt retractor, attached to the B-pillar sheet metal behind the trim panel.
- Front row center safety belt, with 60/40 bench seat, attached on top of the rear inboard 60 percent seat riser.
- Front row center safety belt buckle, with 60/40 bench seat, attached to the floor pan behind the 60 percent seat.
- Front row safety belt shoulder height adjuster, attached to the B-pillar sheet metal behind the trim panel.
- Second row outboard safety belt retractor, attached to the quarter panel sheet metal behind the trim panel.
- Second row inboard safety belt retractor, with 20 percent seat, attached to the seat backrest frame.
- Second row inboard safety belt buckle, with 20 percent seat, attached to the side of the seat.

- Second row outboard safety belt buckle, attached to the side of the seat.
- Second row safety belt shoulder height adjuster, attached to the C-pillar sheet metal behind the trim panel.
- Second row 40/20/40 seating, having child safety seat tether anchors welded to the seat cushion frame at all seating positions.
- Second row 40 percent bucket seats, having child safety seat tether anchors welded to the seat cushion frame at both seating positions.
- Second row 40/20/40 seating, having LATCH welded to the seat at all three seating positions.
- Second row 40 percent bucket seats, having LATCH welded to the seat cushion frame at both seating positions.
- Third row outboard safety belt retractor, attached to the D-pillar sheet metal behind the trim panel.
- Third row inboard safety belt retractor, attached to the 60 percent seat backrest frame.
- Third row RH safety belt buckle, attached to the side of the seat.
- Third row LH and center safety belt buckle assembly, attached to the floor pan under the 60 percent third row seat.
- Third row center child safety seat tether anchor, bolted to the 60 percent seat backrest frame.

Pretensioner System

All Expeditions and Navigators have a pretensioner system used with the front outboard safety belt buckles. This works in conjunction with the front air bag system mounted in the steering wheel and instrument panel.

If the vehicle is involved in a collision that results in deployment of the front air bags and safety belt pretensioners, the driver and passenger seat belt system (including safety belt buckle and pretensioners, safety belt retractors, and height adjusters), must be replaced.

For diagnostic information, refer to Section 501-20B.

For pretensioner buckle disposal information, refer to Section 501-20B.

Safety Belt Buckle and Pretensioner

The safety belt buckle and pretensioners are for the front outboard occupants, located on the inboard side of the seats. This allows the front safety belt buckle end to move with the front seat.

The safety belt buckle and pretensioner is a pyrotechnic device that removes excess webbing from the safety belt system. When the front air bag system is deployed, the pretensioner in the buckle deploys, causing the buckle to move downward, pulling excess webbing from the lap and shoulder safety belts.

Dual Locking Mode Retractors

WARNING: After any vehicle collision, the safety belt system at all outboard seating positions (except driver, which has no "automatic locking retractor" feature) must be checked by a qualified technician to verify that the "automatic locking retractor" feature for child seats is still functioning correctly, in addition to other checks for correct safety belt system function.

A belt and retractor assembly must be replaced if the safety belt assembly's "automatic locking retractor" feature or any other safety belt function is not operating correctly when checked according to the procedures in the workshop manual. Failure to replace the Belt and Retractor assembly could increase the risk of injury in collisions.

NOTE: When replacing a dual locking mode retractor, the retractor should be checked to make sure it is not in the automatic locking retractor (ALR) mode after installation in the stowed position.

All outboard continuous-loop, three-point retractor systems, except the driver position, are equipped with the dual locking mode system.

The emergency locking retractor (ELR) mode will allow the occupant freedom of movement, locking tight only on hard braking, hard cornering, or an impact of approximately 8 km/h (5 mph). The ELR mode helps to reduce the forward movement of the driver and passengers. The ELR mode is continuously in operation at all seating positions.

The ALR portion of this system does not allow the occupant freedom of movement. The ALR mode is used when locking a child seat in at a seating position or when a tight belt fit is desired. The ALR mode is automatically engaged when the webbing is fully extracted from the retractor and then allowed to retract. As the webbing is retracted back onto the spool, an audible clicking sound is made, indicating that the retractor is in ALR mode. The ALR mode is automatically disengaged when most of the webbing is retracted back onto the spool.

The automatic locking mode must be used when installing a child safety seat in the front or rear passenger seating positions where dual locking mode retractors are provided.

Energy Management Retractor

This vehicle has a safety belt system with an energy management feature at the front seating positions to help further reduce the risk of injury in the event of a head-on collision.

The energy management retractor feature is designed to pay out webbing in a controlled manner. This feature is designed to help reduce the belt force acting on the occupant's chest.

Fastening Safety Belts

 **WARNING: Do not introduce slack into the safety belt system because the belt locks upon impact where it is positioned. Use the shoulder safety belt on the outside shoulder only. Never wear the shoulder safety belt under the arm. Never swing the shoulder safety belt around the neck over the inside shoulder. Never use a single belt for more than one person. Make sure the lap portion of the belt is fitted snugly and as low as possible around the hips, not the waist. Failure to follow these precautions could increase the chance and severity of injury in a collision.**

Always follow the preceding safety precautions when fastening the safety belts.

Safety Belt Extension Assembly

In certain cases, the safety belt may be too short, even when it is fully extended. About 20 cm (8 in) can be added to the belt length by using a safety belt extension. Safety belt extensions are available through any Ford or Lincoln Mercury dealer parts department at no cost. Safety belt extensions are only available with black webbing. There are two extension assemblies available, one for the front seating positions and one for the rear seating positions. They are not interchangeable. Only use

extensions manufactured by the same supplier as the safety belt. Manufacturer identification is located at the end of the webbing on the label. Also, use the safety belt extension only if the safety belt is too short for you when fully extended. Do not use the extension to change the fit of the shoulder belt across the torso.

Attaching Safety Seats With Tether Straps

Some manufacturers make child safety seats that include a tether strap that goes over the back of the vehicle seat and attaches to an anchoring point. Other manufacturers offer the tether strap as an accessory. Contact the manufacturer of the child safety seat for information about ordering a tether strap.

Child safety seat tether anchors are manufactured into the vehicle. See the active restraint system component location at the beginning of this section or the Owners Literature for locations.

For removal and installation of child safety seat tether anchors, refer to the appropriate procedure in this section or Section 501-10 for seat cushion frame replacement.

Lower Anchors and Tethers for Children (LATCH)

The lower anchors and tethers for children (LATCH) system is a standardized and uniform attachment system for installing child safety seats in passenger vehicles. LATCH-equipped child safety seats have two lower attachments that connect to the vehicle portion of the LATCH system.

The vehicle portion of the system consists of two attachment points (6mm wires) welded to the rear seat cushion frame. The attachment points protrude from the bite line between the seat cushion and seat backrest.

If a child safety seat was in use during a collision, inspect the vehicle portion of the system for damage. If any of the attachment points (6mm wires) are damaged, install a new seat cushion frame.

Warning System — Driver Safety Belt

The driver safety belt incorporates a safety belt warning indicator switch, warning indicator and chime. The warning indicator and chime are reminders to fasten the safety belt.

- If the driver safety belt is not buckled before the ignition key is turned to ON, the safety belt warning light illuminates for one to two minutes and the warning chime sounds for four to eight seconds.
- If the driver side safety belt is buckled while the indicator light is illuminated and the warning chime is sounding, the safety belt warning light and warning chime turn off.
- If the safety belt is buckled before the key is turned to the ON position, the warning indicator will come on for four to eight seconds with no chime.

Belt Minder (if equipped)

The Belt Minder feature is a supplemental warning to the safety belt warning function. This feature provides additional reminders to the driver that the driver's safety belt is unbuckled by intermittently sounding a chime and illuminating the safety belt warning lamp in the instrument cluster.

If...	Then...
The driver's safety belt is not buckled approximately 5 seconds after the safety belt warning light has turned off...	The Belt Minder feature is activated — the safety belt warning light illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until safety belt is buckled.
The driver's safety belt is buckled while the safety belt indicator light is illuminated and the safety belt warning chime is sounding...	The Belt Minder feature will not activate.
The driver's safety belt is buckled before the ignition switch is turned to the ON position...	The Belt Minder feature will not activate.

Safety Belt System

Inspection and Verification

1. Verify the customer's concern by operating the active restraint system to duplicate the condition.
2. Inspect to determine if any of the following mechanical or electrical concerns apply:

Visual Inspection Chart

Mechanical	Electrical
● Safety belt webbing integrity ● Safety belt buckle and tongue assembly ● Safety belt retractor	● Open fuse ● Bare, broken or disconnected wire ● Connector not tightly engaged ● Safety belt warning indicator lamp burned out or broken

3. If the inspection reveals an obvious concern(s) that can be readily identified, service as required. With the exception of removing a twist from the safety belt webbing, do not attempt to repair a component of the safety belt system; new components must be installed.
4. If the concern remains after the inspection, determine the symptom. GO to Symptom Chart .
5. To check the active restraint system for correct operation, carry out the appropriate Functional Test(s).

Symptom Chart

SYMPTOM CHART

Condition	Possible Sources	Action
● The safety belt warning indicator lamp does not operate, the safety belt warning chime is OK	● Burned-out bulb. ● Circuitry. ● Instrument cluster.	● REFER to Section 413-01 .
● Neither the safety belt warning chime nor the safety belt warning indicator lamp operates	● Safety belt switch. ● Lighting control module. ● Restraint control module. ● Circuitry.	● REFER to Section 501-20B .

• Excessive pressure on the occupant during normal wear, the webbing cannot be extracted, excessive slack in webbing does not retract	• Front safety belt retractor and tongue. • Rear safety belt retractor and tongue.	• CARRY out the component Functional Test in this section. INSTALL a new retractor if necessary.

Component Test

Carry out the appropriate Functional Test(s) as determined in Inspection and Verification.

Functional Test I (Buckle and Tongue)

The safety belt buckle and tongue assembly must operate freely during the latching and unlatching function. Fasten the safety belt by inserting the tongue (male portion) into the buckle (female portion).

1. Verify the following during the latching sequence:
   - Tongue insertion is not hindered by excessive effort.
   - A "click" is heard when the buckle latches the tongue.
2. Verify the system integrity by forcefully pulling on the belt webbing.
3. Unlatch the belt by fully depressing the buckle release button, and allowing the belt to release and retract.
4. Verify the following during the unlatching process:
   - Push-button depression does not require excessive effort.
   - Tongue can be removed easily from the buckle.
   - Repeat the above steps three times.
5. If the inspection reveals an obvious concern(s) that can be readily identified, service as required. Do not attempt to perform any repair on the buckle and tongue assembly. If a concern exists with either component, a new safety belt buckle and safety belt and retractor assembly must be installed.

Functional Test II (Retractor)

The safety belt and retractor assembly must be freely operational for extraction and retraction of the safety belt webbing between full extension and in-vehicle stowed positions.

1. Extract and retract the safety belt between the full extension and stowed positions.
2. Verify the retractor operates without excessive effort or binding.
3. Install a new safety belt buckle retractor and tongue assembly if no obvious concerns are noticed and the complaint has been verified.

Functional Test III (System Road Test Inspection)

1. **NOTE:** If the RH or the rear safety belts are to be tested, a passenger must be used.

   Fasten the safety belts and proceed to a safe area.

2. Attain a speed of 8 km/h (5 mph).

3. **WARNING: The driver and passenger must be prepared to brace themselves if the retractor does not lock.**

   Test the safety belts.
   1. Grasp the shoulder harness and prepare to lean forward.
   2. **WARNING: The maximum brake application should be on dry concrete or equivalent hard surface, NEVER on wet pavement or gravel.**

      WARNING: The driver and passenger must be prepared to brace themselves in the event the retractor does not lock.

      NOTE: Do not jerk on the safety belt webbing when carrying out this test. Lean forward slightly when the brake application is made.

      Make a maximum brake application without a skid.

4. The safety belts should lock up with minimum webbing extension.

5. If there is a lockup of both shoulder straps, the safety belt assemblies are functioning correctly. Should either or both retractors fail to lock up at the 8 km/h (5 mph) speed, repeat the test at a constant 24 km/h (15 mph) speed. (This test must be carried out with a RH front or rear passenger if the RH front or rear outboard safety belts are to be tested).

6. **CAUTION: Before installing a new safety belt assembly, inspect the mounting area for damage and distortion. If the retractor of a new safety belt assembly has been bolted into a damaged or distorted mounting area, the retractor could be warped and may not function. If this is the case, remove the retractor, return the sheet metal to the original configuration and install another complete safety belt assembly.**

   If either or both retractors do not lock up at the 24 km/h (15 mph) test, return the vehicle for service of malfunctioning safety belts.

Functional Test IV (Automatic Locking Retractor)

WARNING: After any vehicle collision, the safety belt system at all outboard seating positions (except driver, which has no "automatic locking retractor" feature) must be checked by a qualified technician to verify that the "automatic locking" feature for child seats is still functioning correctly, in addition to other checks for correct safety belt system function. A safety belt and retractor assembly must be replaced if the safety belt assembly's "automatic locking retractor" feature or any other safety belt function is not operating correctly when checked according to the procedures in the workshop manual. Failure to replace the safety belt and retractor assembly could increase the risk of injury in collisions.

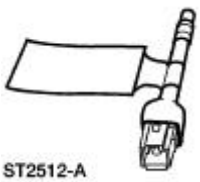
1. Position the seat back into the full up position.

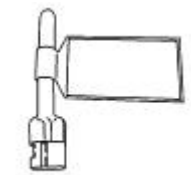
2. Position the height adjuster in the full down or up position.

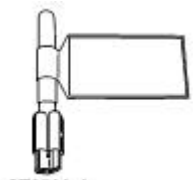
3. Latch the seat belt buckle and tongue assembly.

4. Pull the shoulder belt out until the automatic locking retractor (ALR) feature is activated.

5. Release the shoulder belt and allow it to retract until it stops.







6. Pull on the shoulder belt to check that the belt has remained in the ALR mode. If the belt is not locked, install a new safety belt and retractor assembly.

7. Unlatch the safety belt tongue from the buckle and allow the safety belt to retract to its stowed position.

8. Pull the shoulder belt to verify the retractor assembly has converted automatically out of the ALR mode. If the shoulder belt remains locked in the stowed position, install a new safety belt and retractor assembly.

Supplemental Restraint System (SRS) Deactivation and Reactivation

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 req'd) 418-F088 (105-R0012)

Deactivation

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an airbag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Never probe the connectors on the safety canopy module. Doing so can result in safety canopy module deployment.

WARNING: Vehicle sensor orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and properly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.

NOTE: If a seat equipped with a seat mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.**

NOTE: Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors.

NOTE: Diagnostics or repairs are not to be carried out on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

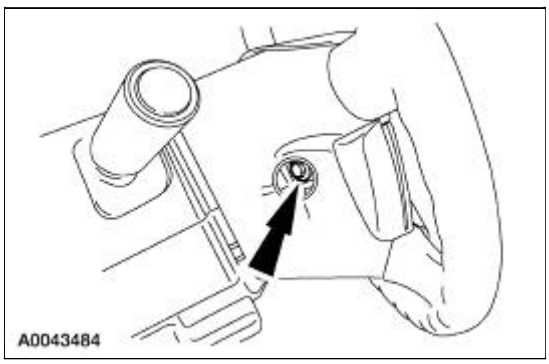
All vehicles

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

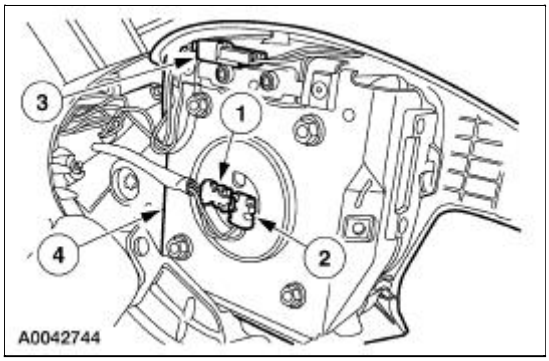
The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.



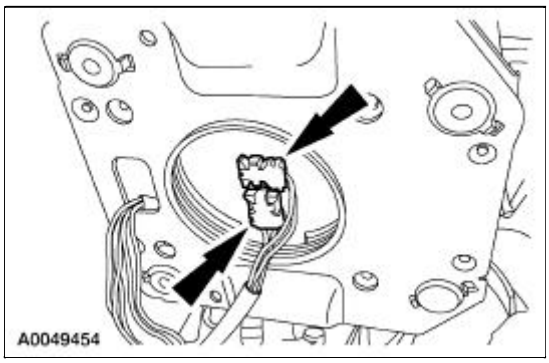
To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. Remove the two steering wheel back cover plugs (one shown).

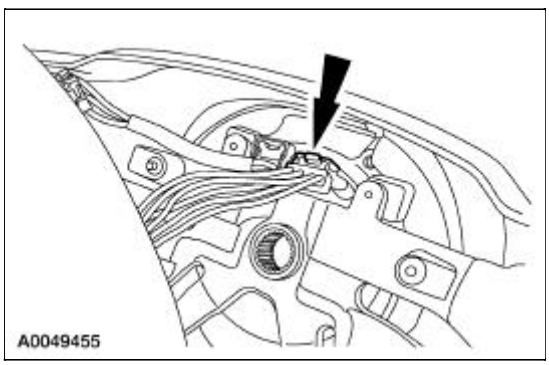


3. Remove the two driver air bag module bolts (one shown).



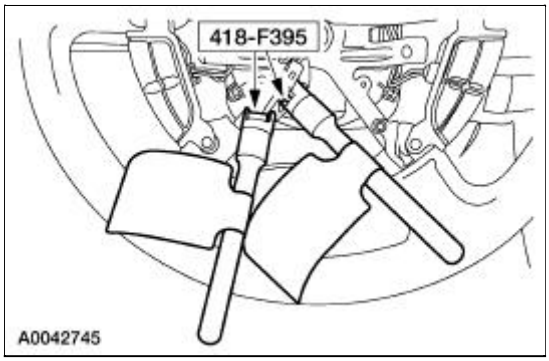
Expedition vehicles

4. Remove the driver air bag module.
    1. Release the two retaining tabs. Disconnect the driver air bag module electrical connector.
        - Label the driver air bag module squib number on the driver air bag module electrical connector before disconnecting.
    2. Release the two retaining tabs. Disconnect the driver air bag module electrical connector.
        - Label the driver air bag module squib number on the driver air bag module electrical connector before disconnecting.
    3. Disconnect the horn switch electrical connector.
    4. Remove the driver air bag module.

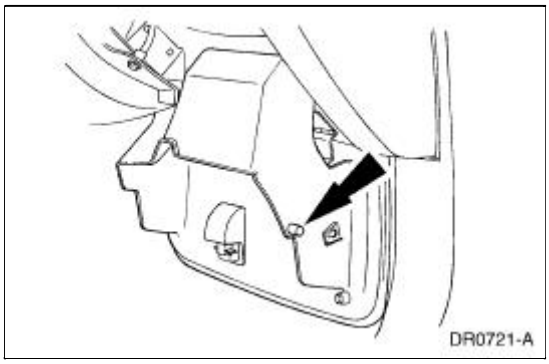


Navigator vehicles

5. Disconnect the driver air bag module
    - Release the two tabs on each driver air bag module electrical connector and disconnect them.
        - Label each driver air bag module electrical connector before disconnecting.

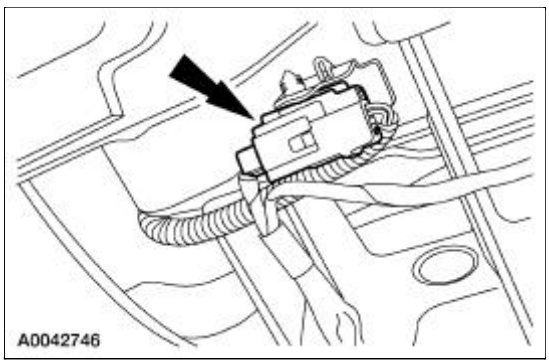


6. Release the tab and disconnect the driver air bag module accessories electrical connector at the top of the clockspring and remove the driver air bag module.

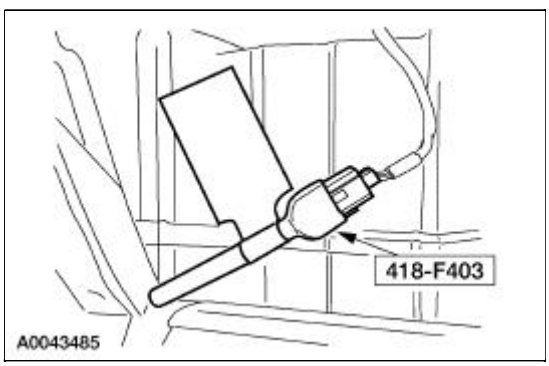


All vehicles

7. Attach the restraint system diagnostic tools to the clockspring electrical connectors at the top of the steering column.



8. While pushing in on the two glove compartment door tabs, position the glove compartment downward.

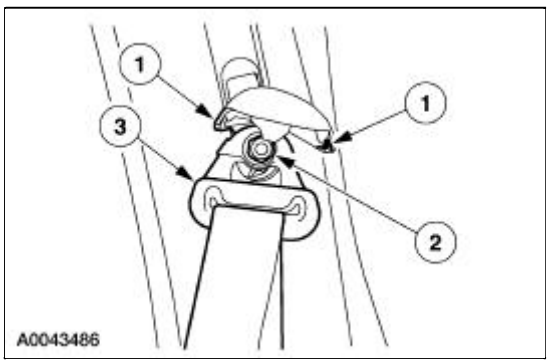


9. **NOTE:** The Expedition is shown, the Navigator is similar.

   Through the glove compartment opening, release the tab and disconnect the passenger air bag module electrical connector.

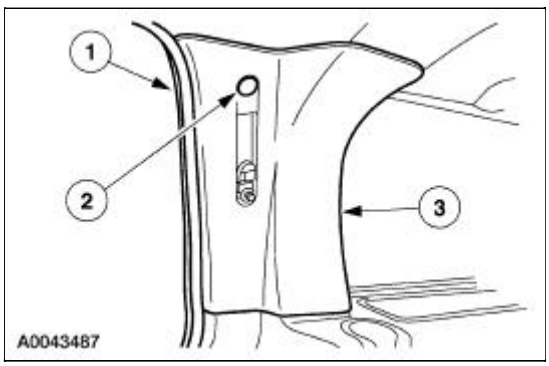
10. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag module electrical connector.

Vehicles without safety canopies



11. **CAUTION: Do not deactivate the safety canopy module circuit by removing the safety canopy bridge resistor from the safety canopy electrical connector.**

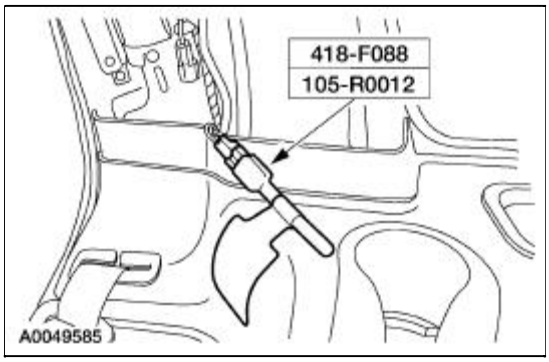
    If the safety canopy bridge resistor is removed, an open circuit fault will be generated by the restraints control module (RCM).
    If a restraint system diagnostic tool is installed at the safety canopy electrical connector, a low resistance fault will be generated by the RCM.



Vehicles with safety canopies

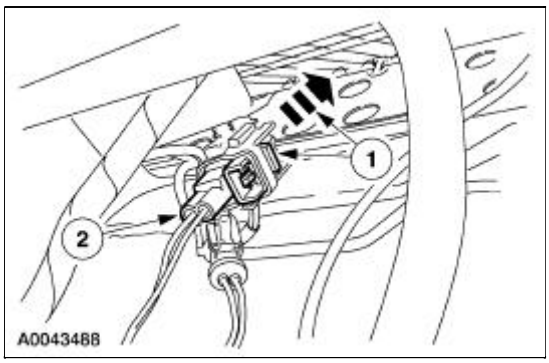
12. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

    Remove the second row passenger side safety belt guide.
    1. Release the retaining tab at each side and open the safety belt guide cover.
    2. Remove the nut.
    3. Remove the second row passenger side safety belt guide.

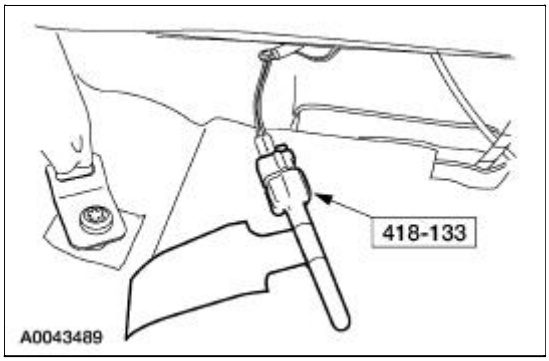


13. Remove the passenger side C-pillar trim panel.
    1. Separate the weather-stripping along the passenger side C-pillar trim panel.
    2. Remove the bolt cover and bolt.
    3. Pull out to release the retainers and remove the passenger side C-pillar trim panel.

14. Disconnect the passenger side safety canopy electrical connector.

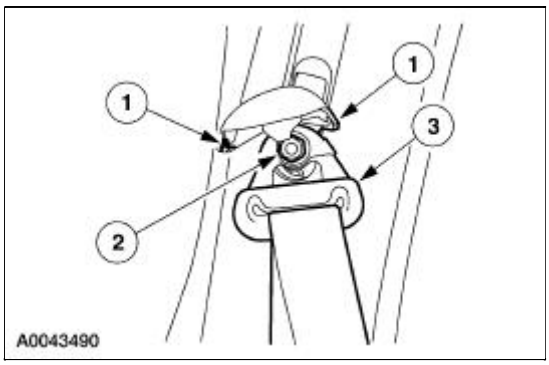


15. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger side safety canopy electrical connector.

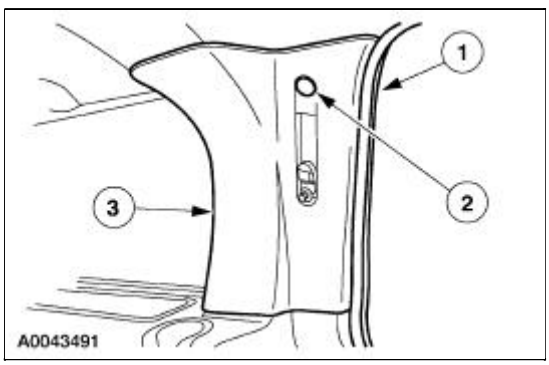


All vehicles

16. Disconnect the passenger seat safety belt buckle pretensioner electrical connector.
    1. Slide and disengage the passenger seat safety belt buckle pretensioner electrical connector locking clip.
    2. Push in to release the tab and disconnect the passenger seat safety belt buckle pretensioner electrical connector.



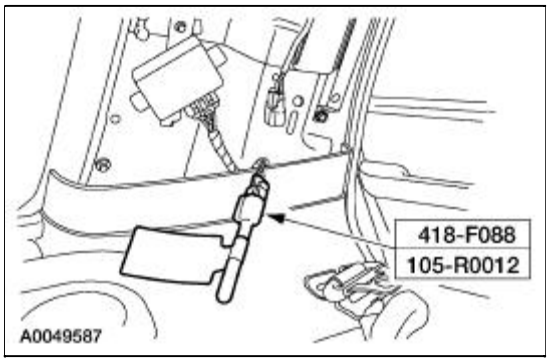
17. Attach the restraint system diagnostic tool to the passenger seat safety belt buckle pretensioner floor electrical connector.



Vehicles with safety canopies

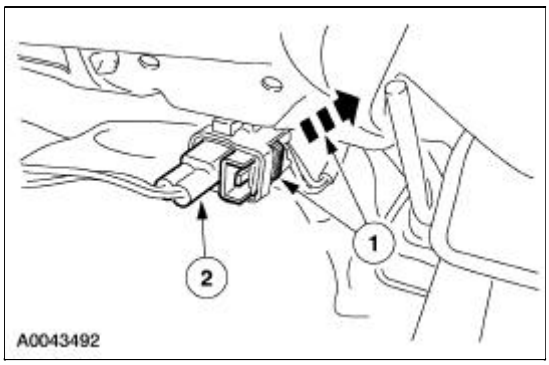
18. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

    Remove the second row driver side safety belt guide.
    1. Release the retaining tab at each side and open the safety belt guide cover.
    2. Remove the nut.
    3. Remove the second row driver side safety belt guide.

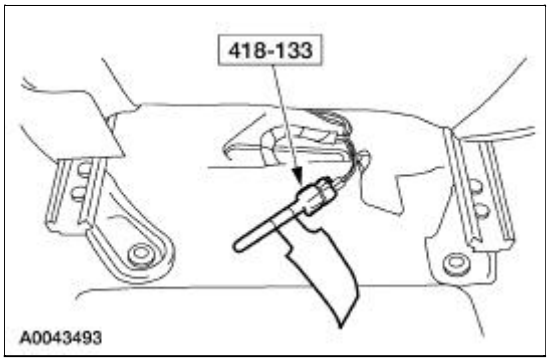


19. Remove the driver side C-pillar trim panel.
    1. Separate the weather-stripping along the driver side C-pillar trim panel.
    2. Remove the bolt cover and bolt.
    3. Pull out to release the retainers and remove the driver side C-pillar trim panel.

20. Disconnect the driver side safety canopy electrical connector.



21. Attach the restraint system diagnostic tool to the vehicle harness side of the driver side safety canopy electrical connector.



All vehicles

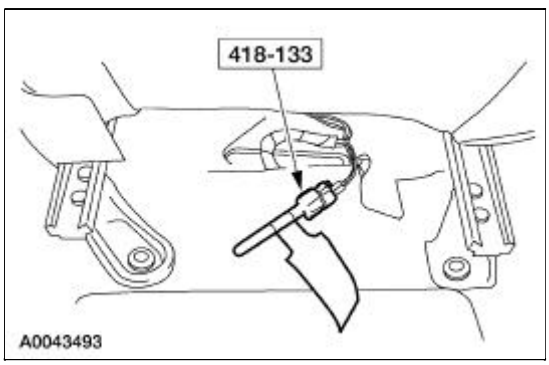
22. Disconnect the driver seat safety belt buckle pretensioner electrical connector.
    1. Slide and disengage the driver seat safety belt buckle pretensioner electrical connector locking clip.
    2. Push in to release the tab and disconnect the driver seat safety belt buckle pretensioner electrical connector.

23. Attach the restraint system diagnostic tool to the driver seat safety belt buckle pretensioner floor electrical connector.

24. Connect the battery ground cable. For additional information, refer to Section 414-01 .

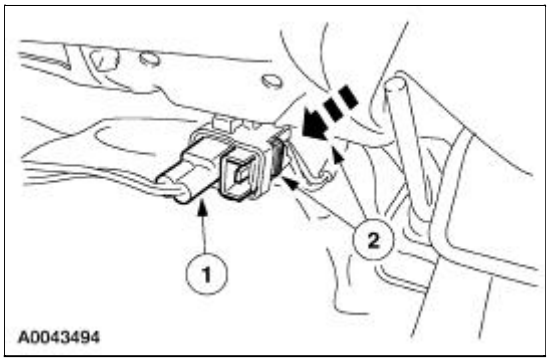
25. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of Section 501-20B .

26. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .



Reactivation

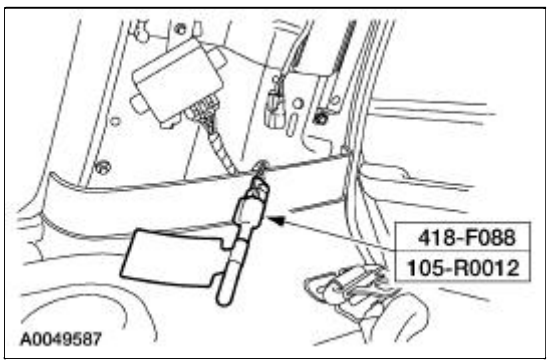
WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the deactivation procedure.



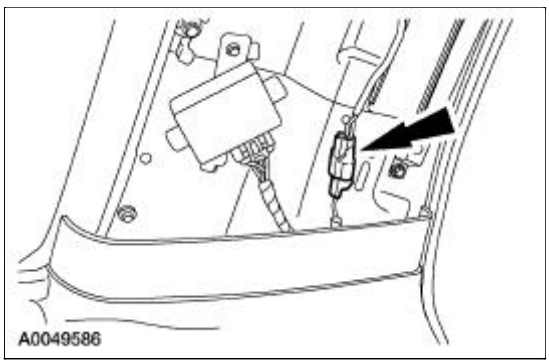
All vehicles

1. **NOTE:** Make sure the battery negative cable is still disconnected before proceeding with the reactivation portion of this procedure.

   Remove the restraint system diagnostic tool from the driver seat safety belt buckle pretensioner floor electrical connector.

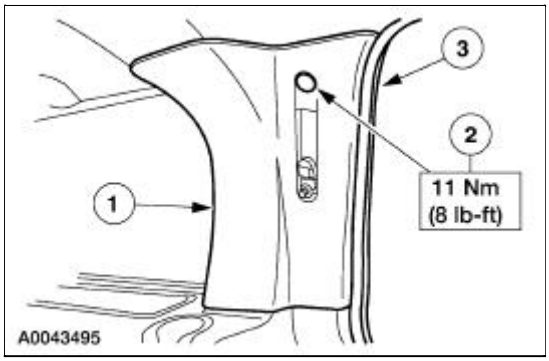


2. Connect the driver seat safety belt buckle pretensioner electrical connector.
   1. Connect the driver seat safety belt buckle pretensioner electrical connector.
   2. Slide and engage the driver seat safety belt buckle pretensioner electrical connector locking clip.



Vehicles with safety canopies

3. Remove the restraint system diagnostic tool from the vehicle harness side of the driver side safety canopy electrical connector.



4. Connect the driver side safety canopy electrical connector.

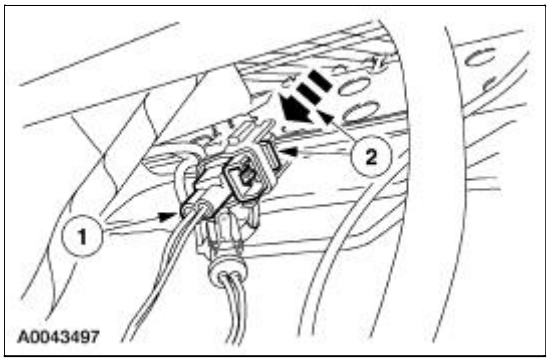
5. **WARNING: Anytime the safety canopy module has deployed, the headliner, and all A, B, and C pillar upper trim panels and attaching hardware must be replaced along with any other damaged components and hardware. Failure to do so may result in personal injury in the event of a safety canopy module deployment.**

   Install the driver side C-pillar trim panel.
   1. Position the driver side C-pillar trim panel and push in, engaging the retainers.
   2. Install the bolt and bolt cover.
   3. Install the weather-stripping along the driver side C-pillar trim panel.

6. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

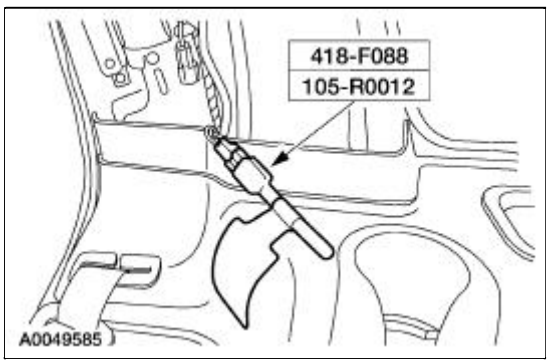
   NOTE: Make sure the safety belt is not twisted prior to installation.

   Install the second row driver side safety belt guide.
   1. Position the second row driver side safety belt guide.
   2. Install the nut.
   3. Close the safety belt guide cover.

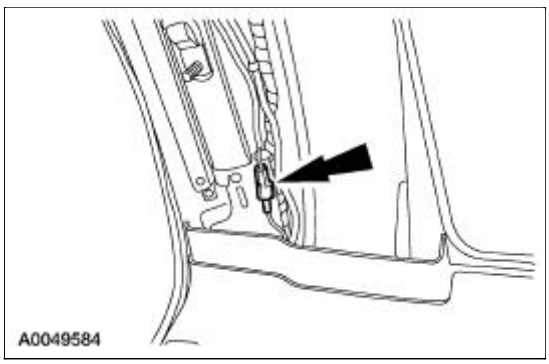


All vehicles

7. Remove the restraint system diagnostic tool from the passenger seat safety belt buckle pretensioner floor electrical connector.

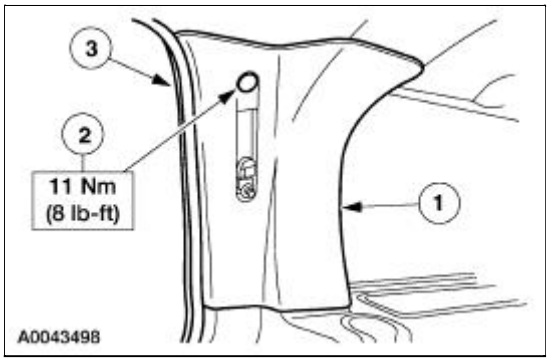


8. Connect the passenger seat safety belt buckle pretensioner electrical connector.
   1. Connect the passenger seat safety belt buckle pretensioner electrical connector.
   2. Slide and engage the passenger seat safety belt buckle pretensioner electrical connector locking clip.



Vehicles with safety canopies

9. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger side safety canopy electrical connector.



10. Connect the passenger side safety canopy electrical connector.

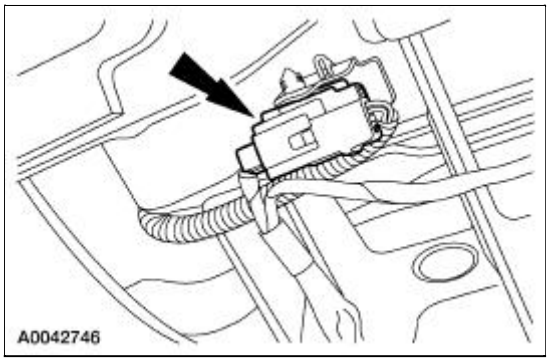
11. **WARNING: Anytime the safety canopy module has deployed, the headliner, and all A, B, and C pillar upper trim panels and attaching hardware must be replaced along with any other damaged components and hardware. Failure to do so may result in personal injury in the event of a safety canopy module deployment.**

    Install the passenger C-pillar trim panel.
    1. Position the passenger side C-pillar trim panel and push in, engaging the retainers.
    2. Install the bolt and bolt cover.
    3. Install the weather-stripping along the passenger side C-pillar trim panel.

12. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

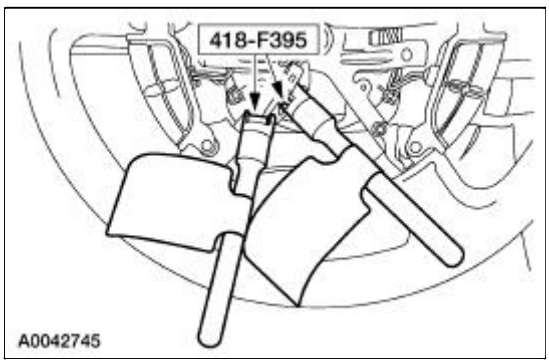
    NOTE: Make sure the safety belt is not twisted prior to installation.

    Install the second row passenger side safety belt guide.
    1. Position the second row passenger side safety belt guide.
    2. Install the nut.
    3. Close the safety belt guide cover.



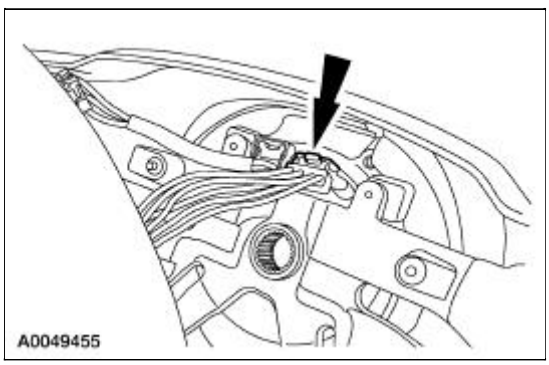
All vehicles

13. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag module electrical connector.



14. **NOTE:** The Expedition is shown, the Navigator is similar.

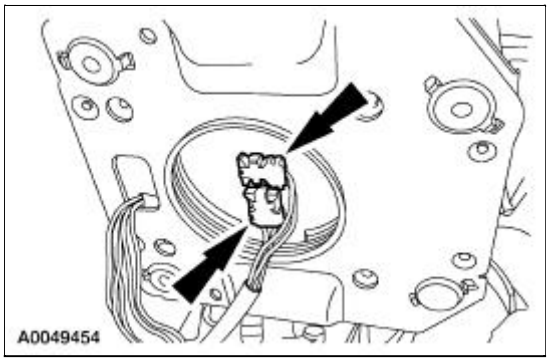
    Connect the passenger air bag module electrical connector.



15. Close the glove compartment.

16. Remove the restraint system diagnostic tools from the clockspring electrical connector at the top of the steering column.

Navigator vehicles



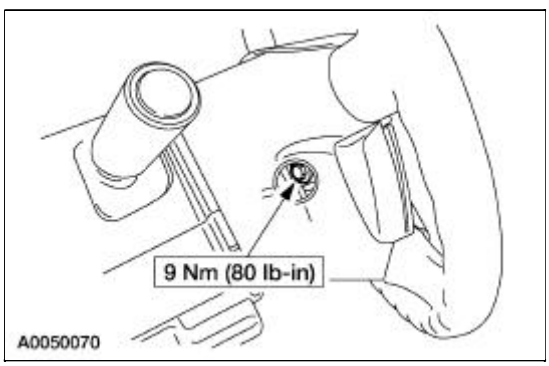
17. Connect the driver air bag module accessories electrical connector to the connector end at the top of the clockspring.

18. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

    Connect the driver air bag module electrical connectors as noted during removal.

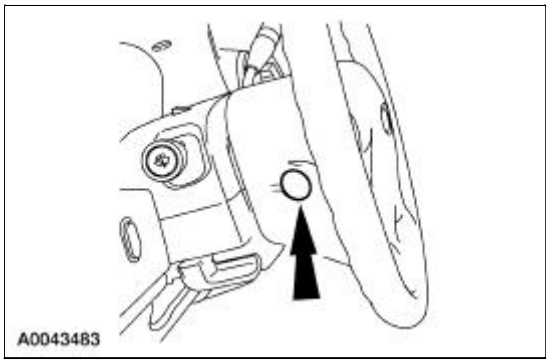
    - Position the driver air bag module to the steering wheel.

Expedition vehicles



19. Position the driver air bag module to the steering wheel.
    1. Connect the horn switch electrical connector.
    2. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

       Connect the driver air bag module electrical connectors as noted during removal.
    3. Position the driver air bag module to the steering wheel.



All vehicles

20. Install the two driver air bag module bolts (one shown).

21. Install the two steering wheel back cover plugs (one shown).

22. Connect the battery ground cable. For additional information, refer to Section 414-01 .

23. **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of Section 501-20B .

Vehicles with safety canopies

24. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A .

Safety Belt Procedure After a Collision

1. **WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters, if so equipped, child safety seat tether attachments, and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or improper operation is noted.**

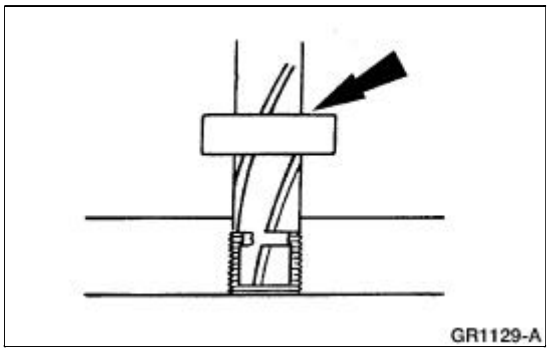
   NOTE: Safety belt assemblies should be periodically inspected to make sure they have not become damaged and that they remain in correct operating condition, particularly if they have been subjected to severe stress.

   Before installing the new safety belt assembly, the safety belt attaching areas must be inspected for damage and distortion. If the attaching points are damaged and distorted, the sheet metal must be reworked back to its original shape and structural integrity.

   Install the new safety belt(s) using the appropriate instructions. Perform the Functional Test.

Safety Belt With Anchor Plate Thread Damage

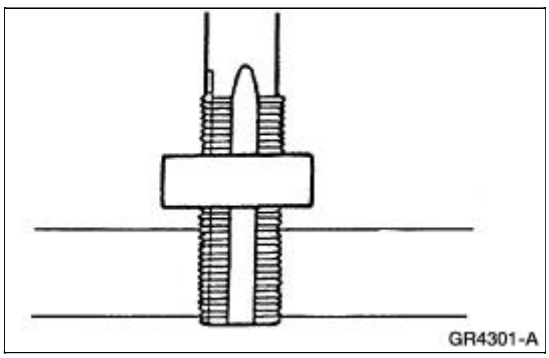
1. Remove the broken or stripped bolt and discard.
2. Drill out the internal threads in the safety belt anchor plate with a 10.7 mm (27/64 in) drill.
3. Rethread the anchor plate with a 1/2-13 tap (seat belt).
4. Clean out the chips.
5. Install the attachment parts. Original parts are to be replaced with the repair parts indicated in the Safety Belt Parts Replacement Guidelines.
6. When repairing a multiple belt and attachment, install the nut to the bolt in the tunnel area from the underside of the floorpan.



Safety Belt Shoulder Height Adjuster With Stripped Weld Nuts

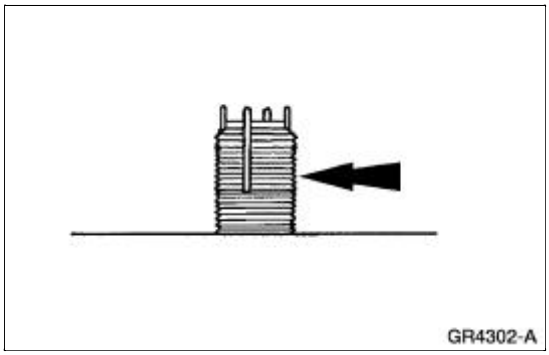
Special Tool(s)

 ST1640-A	D-Ring Installation Kit or equivalent 100-F012 (134-00018)



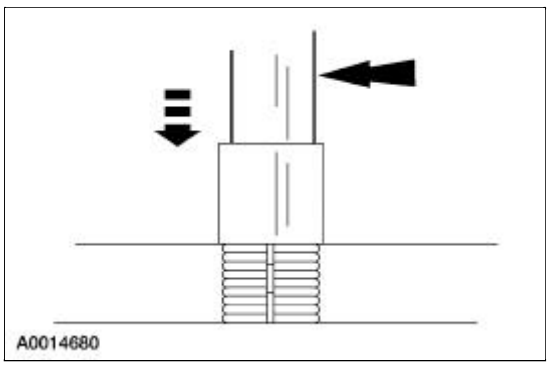
1. Remove the height adjuster; refer to Safety Belt Shoulder Height Adjuster—Front Row or Safety Belt Shoulder Height Adjuster—Second Row .

2. Use the half-inch drill with integral stop provided in D-Ring Installation Kit to drill out the damaged threads in the upper pillar structure.



3. **NOTE:** After each rotation, back off tap slightly to remove new cuttings and be sure to blow out any chips before proceeding.

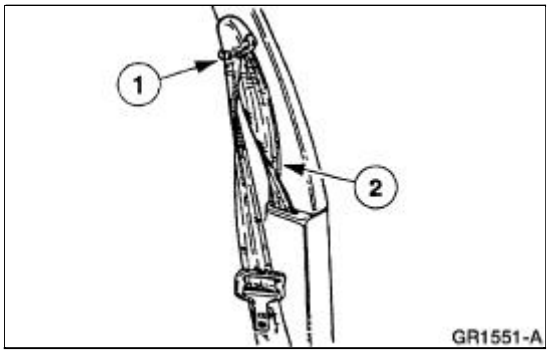
   Apply a suitable lubricant to the M14x1.5 tap with integral stop provided in D-Ring Installation Kit and tap new threads.



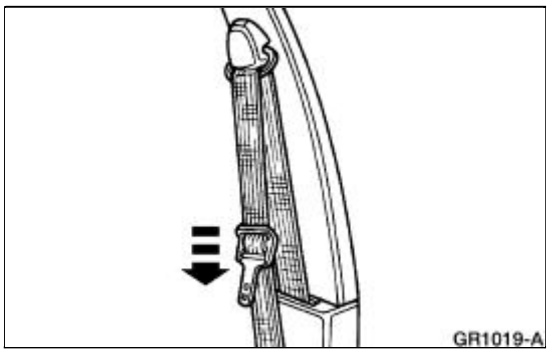
4. Use a threaded insert (part number N807170-5190) provided in D-Ring Installation Kit and screw it into the retapped hole until it is slightly below the surface.

5. **NOTE:** If the two bolts on the height adjuster are not stripped, refer to Safety Belt Shoulder Height Adjuster—Front Row or Safety Belt Shoulder Height Adjuster—Second Row . If the bolts are stripped, replace the height adjuster.

   Use a hammer to lightly tap the installation tool provided in D-Ring Installation Kit several times to seat the insert keys.



Replacement of the Weld Nut and Reinforcement

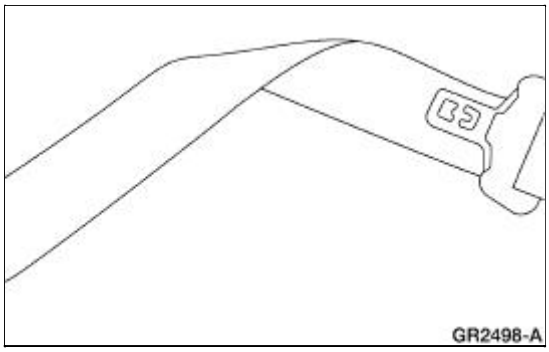


1. Remove the interior trim panel to expose the suspect anchor point. For additional information, refer to Section 501-05 .
2. Determine if the weld nut only or the weld nut and reinforcement and weld nut are missing. If the B- or C- or D-pillar safety belt anchor nuts or reinforcements are stripped or missing, a new nut or reinforcement should be installed. To install a missing weld nut only, proceed to Step 3.
3. Obtain the correct M12 weld nut and a standard washer to perform the procedure.
4. Drill out two 8 mm (5/16 in) diameter holes adjacent to the clearance hole.
5. Obtain a length of copper welding wire and feed through clearance hole in door frame opening until it becomes visible at the access hole.
6. Pull the wire through so that it may be secured to the weld nut and washer.
7. Pull the wire back up to the weld nut clearance hole.
8. Hold the weld nut securely in place. Use the MIG Wire Feed Welder 106-00053 to plug weld the nut in place at the two 8 mm (5/16 in) diameter holes previously drilled.
9. Metal finish as required.
10. Verify the nut is securely in place.

Safety Belt Twisted at the Safety Belt Guide —Outboard

1. Straighten the twisted belt webbing.
    1. Grasp webbing at the safety belt guide.
    2. Feed twisted portion of webbing up through safety belt guide.

2. Pull straightened belt downward to check for proper operation.



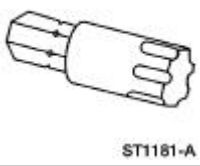
Safety Belt Cleaning

1.  **WARNING: Do not bleach or re-dye the webbing, as the webbing may weaken.**

   Clean the safety belt webbing only with a mild soap solution recommended for cleaning upholstery or carpets. Follow the instructions provided with the soap.

Safety Belt Tongue Rotated on Belt

1. Fold the safety belt as indicated.



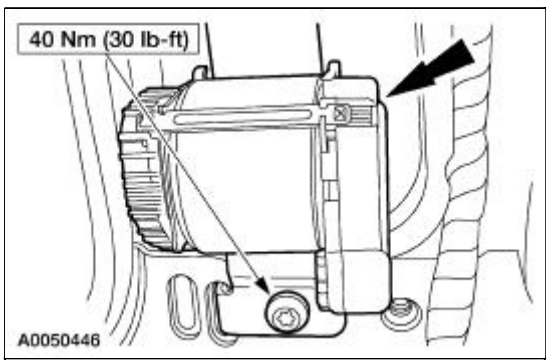
2. Pull the safety belt tongue over the fold in the safety belt.

Front Safety Belt Retractor

Special Tool(s)

 ST1181-A	Torx Bit, Safety Belt Bolt 501-010 (T77L-2100-A)

Removal and Installation



WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters (if so equipped) child safety seat tether attachments and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or incorrect operation is noted.

NOTE: The RH side is shown, the LH side is similar.

1. Remove the B-pillar trim panel. For additional information, refer to Section 501-05 .
2. Release the two pin-type retainers and the safety belt guide.

3. Remove the bolt and the safety belt retractor.

4. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

   NOTE: Make sure to tighten all nuts and bolts to specification.

   To install, reverse the removal procedure.

   - When installing the safety belt retractor, make sure to engage the anti-rotation tab to the sheet metal.
   - Remove the shipping clip after safety belt retractor installation.

5. Check the active restraint system for correct operation.

Rear Safety Belt Retractor —Second and Third Row

Special Tool(s)

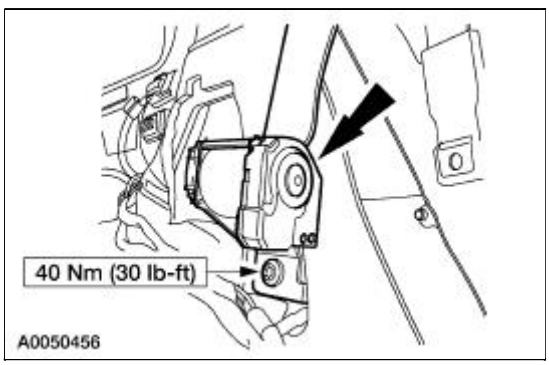
 ST1181-A	Torx Bit, Safety Belt Bolt 501-010 (T77L-2100-A)

Removal and Installation

WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters (if so equipped) child safety seat tether attachments and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or incorrect operation is noted.

NOTE: The LH side is shown, the RH side is similar.

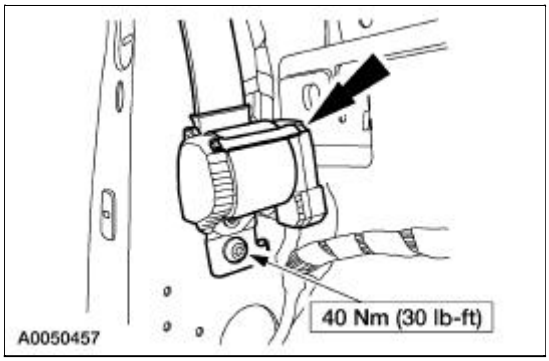
Both retractors



1. Remove the rear quarter trim panel. For additional information, refer to Section 501-05 .
   - Before installing the third row safety belt anchor, make sure the floor slotted plastic insert is still present. If it is not, another insert must be installed.

Third row retractor, driver side

2. Remove the vehicle jack.



Second row retractor

3. Remove the bolt and the second row safety belt retractor.

Third row retractor

4. Remove the bolt and the third row safety belt retractor.

Both retractors

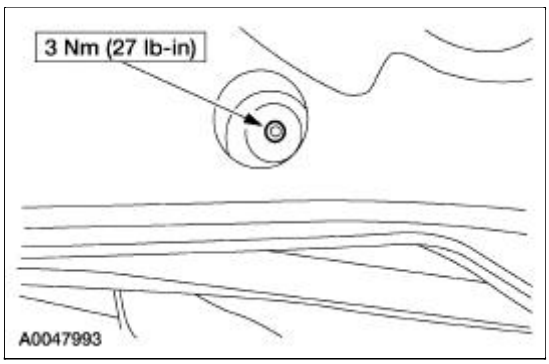
5. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

   NOTE: Make sure to tighten all nuts and bolts to specification.

   To install, reverse the removal procedure.
   1. When installing the safety belt retractor, make sure to engage the anti-rotation tab to the sheet metal.
   2. Remove the shipping clip after safety belt retractor installation.

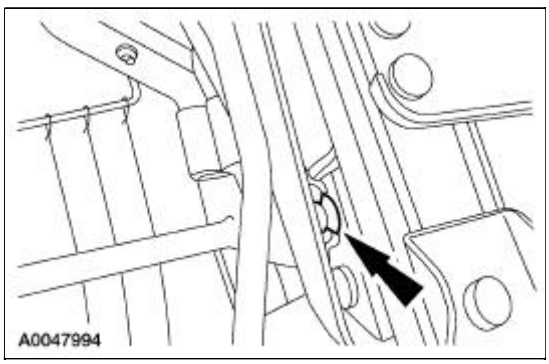
6. Check the active restraint system for correct operation.

Rear Center Safety Belt Retractor —Second Row



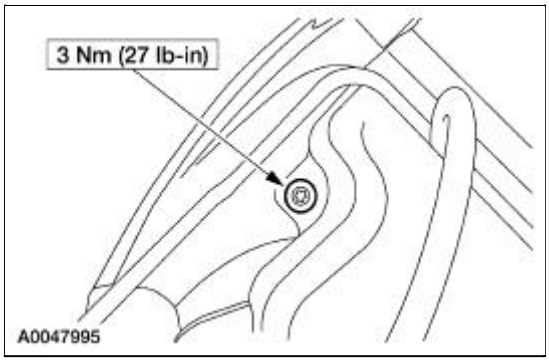
Special Tool(s)

 ST1181-A	Torx Bit, Safety Belt Bolt 501-010 (T77L-2100-A)

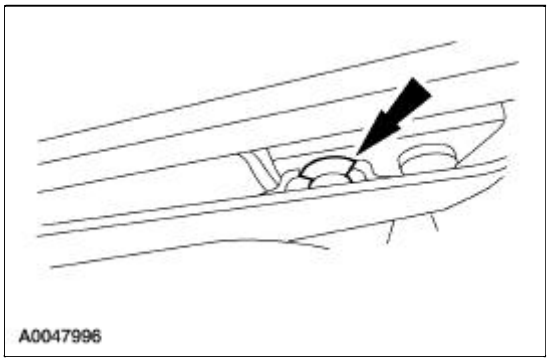


Removal and Installation

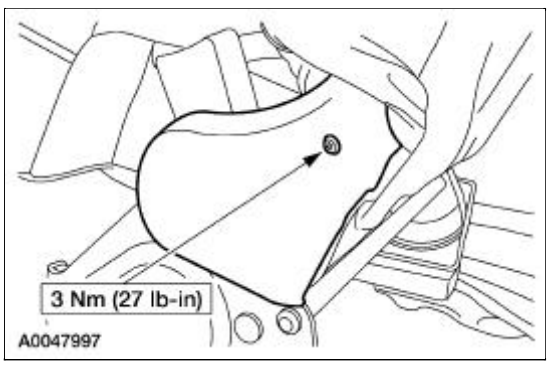
WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters (if so equipped) child safety seat tether attachments and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or incorrect operation is noted.



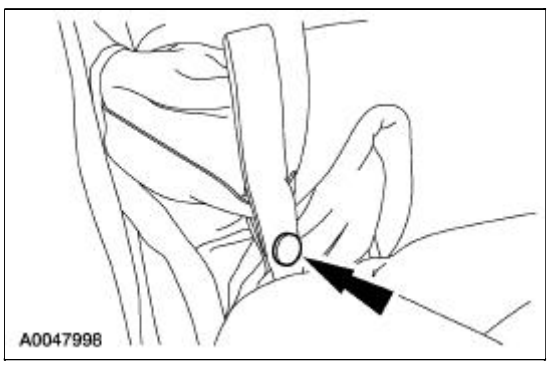
1. Remove the second row 20 percent seat. For additional information, refer to Section 501-10 .
2. Remove the two screws (one shown) on the inside of the RH side shield.



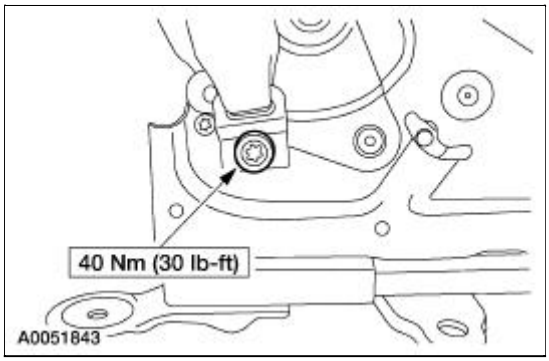
3. Release the pin-type retainer and remove the side shields.



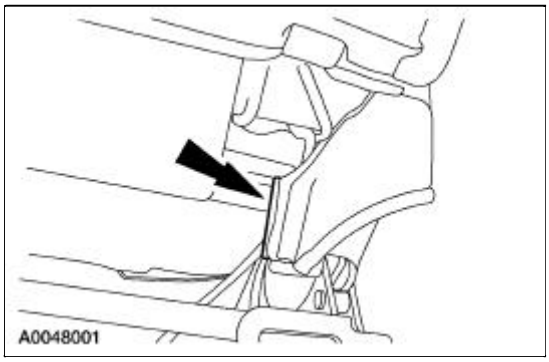
4. Remove the screw on the inside of the LH side shield.



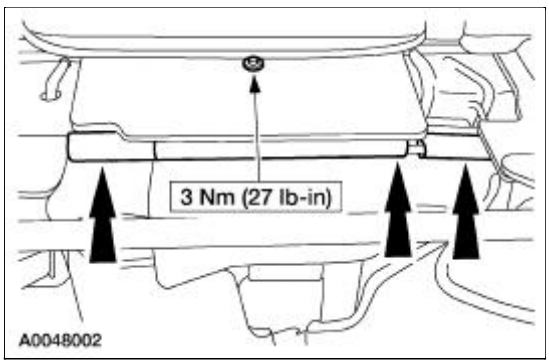
5. Release the pin-type retainer and remove the side shields.



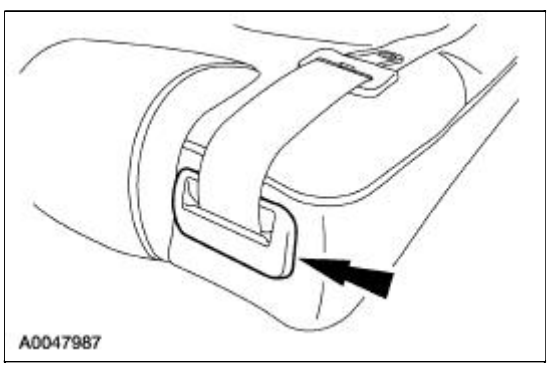
6. Remove the left hinge side shield screw and remove the side shield.



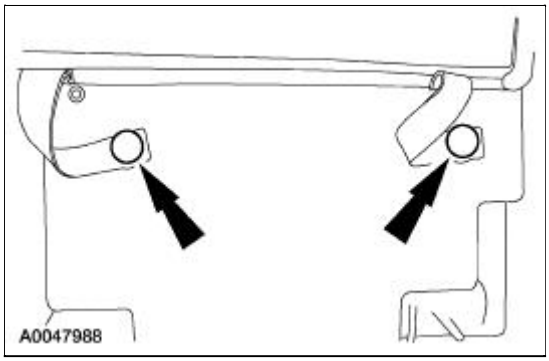
7. Unsnap the recliner pull strap handle and pull the handle through the seat.



8. Remove the seat belt anchor bolt.



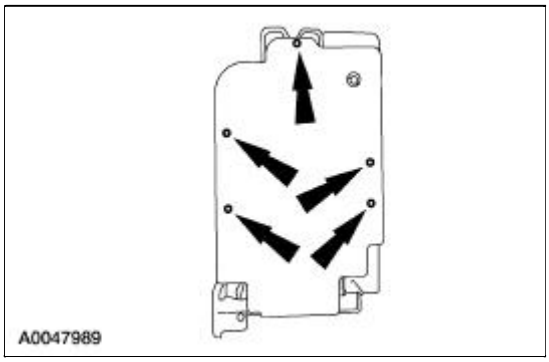
9. Release the J-clip.



10. Remove the screw from the seat backrest support panel and release the J-clips under seat backrest support panel.

11. Remove the seat belt guide cover.

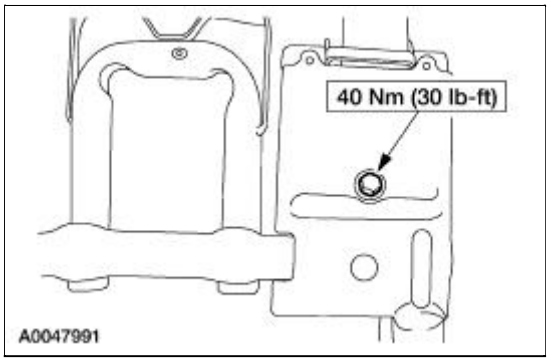
12. Invert the seat backrest cover and remove the two pin-type retainers.



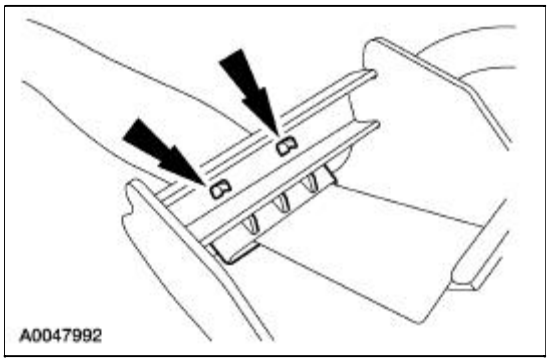
13. **CAUTION: Use care when separating the seat backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat backrest foam.**

    Remove the seat backrest cover.

14. Remove the seat backrest foam pad.



15. Remove the seat backrest support panel screws.



16. Remove the seat belt retractor cover screws and remove the cover.

17. Remove the seat belt retractor bolt.

18. Pinch and release the seat belt retractor guide from the seat backrest frame and remove the safety belt retractor.

19. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

    NOTE: Make sure to tighten all nuts and bolts to specification.

    To install, reverse the removal procedure.
    1. When installing the safety belt retractor, make sure to engage the anti-rotation tab to the sheet metal.
    2. Remove the shipping clip after safety belt retractor installation.

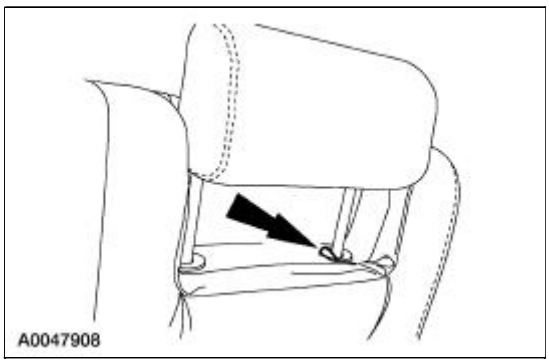
20. Check the active restraint system for correct operation.

Rear Center Safety Belt Retractor —Third Row

Special Tool(s)

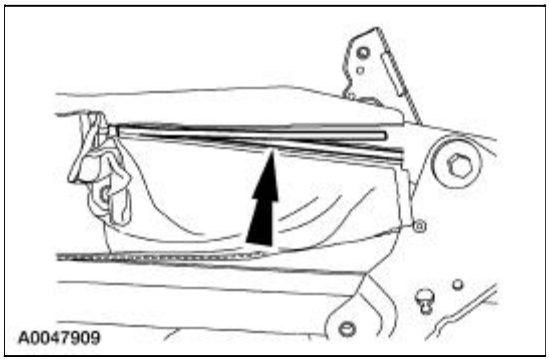
 ST1181-A	Torx Bit, Safety Belt Bolt 501-010 (T77L-2100-A)

Removal and Installation

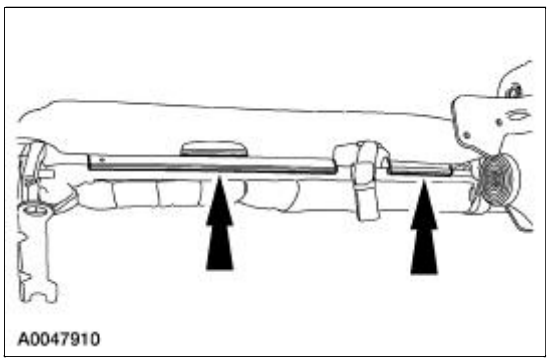


WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters (if so equipped) child safety seat tether attachments and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or incorrect operation is noted.

All vehicles

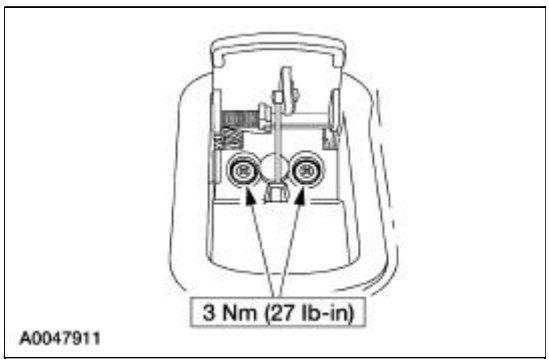


1. Remove the third row 60 percent seat backrest. For additional information, refer to Section 501-10 .
2. Remove the seat belt anchor bolt.

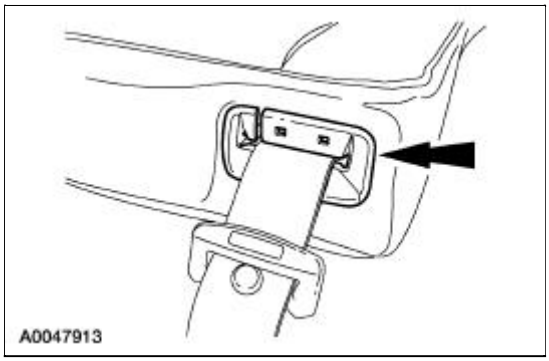


3. Depress the tab and remove the head restraint.

4. Release the J-clip.

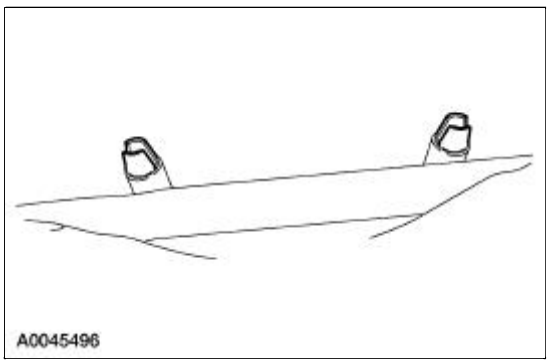


5. Release the two J-clips.



Manual seat

6. Remove the seat backrest release handle screws and remove the handle and cable assembly.

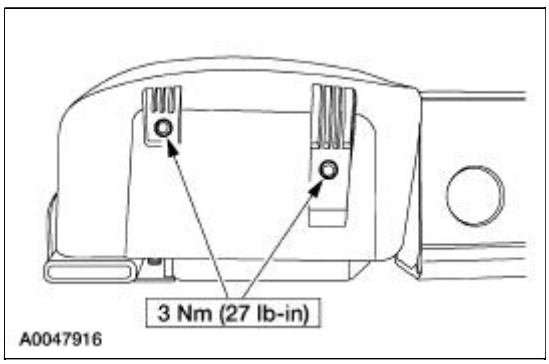


All vehicles

7. Remove the seat belt guide.

8. **NOTE:** The head restraint sleeve pins are not interchangeable, note location for installation.

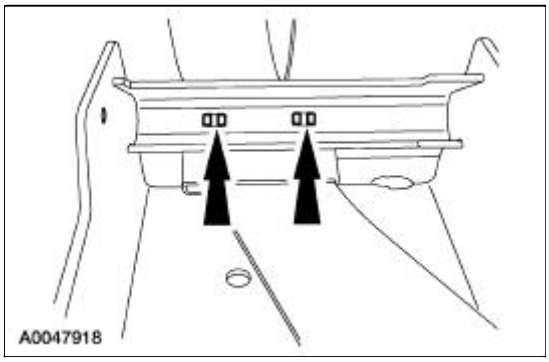
   Reach up into seat backrest, squeeze, release, and remove the head restraint sleeves.



9. **CAUTION: Use care when separating the seat backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat backrest foam.**

   Invert the seat backrest trim cover and remove.

10. Remove the seat backrest foam pad.



11. Remove the four screws from the seat belt cover (two shown).

12. Remove the safety belt retractor bolt.

13. Pinch to release the seat belt guide and remove the seat belt assembly.

14. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

    NOTE: Make sure to tighten all nuts and bolts to specification.

    To install, reverse the removal procedure.

    - Remove the shipping clip after safety belt retractor installation.

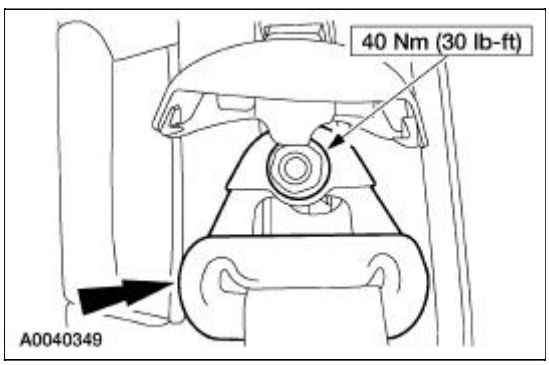
15. Check the active restraint system for correct operation.

Safety Belt Shoulder Height Adjuster —Front Row

Special Tool(s)

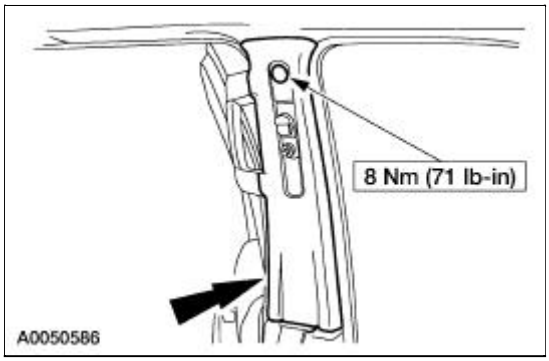
 ST1181-A	Torx Bit, Safety Belt Bolt 501-010 (T77L-2100-A)

Removal and Installation



WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters (if so equipped) child safety seat tether attachments and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or incorrect operation is noted.

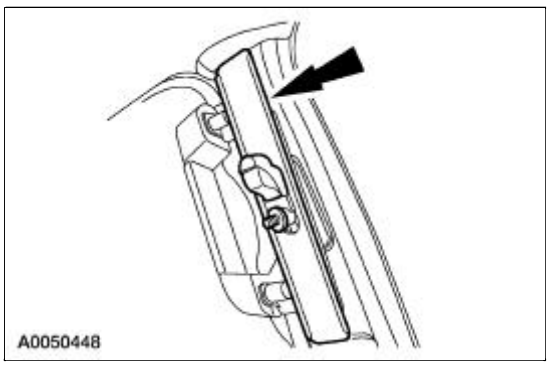
NOTE: The LH side is shown, the RH side is similar.



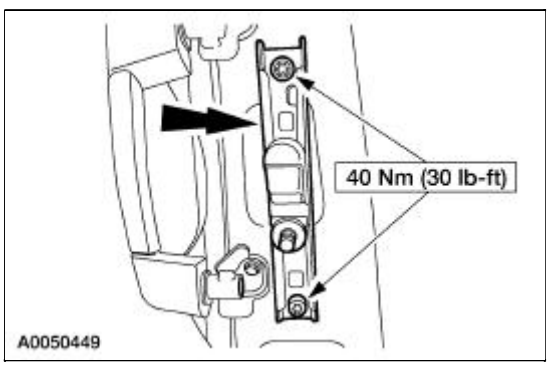
1. **NOTE:** Position the safety belt guide to the lowest position.

   NOTE: Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or cover does not remain closed, install a new shoulder safety belt guide cover.

   Remove the safety belt guide.
   - Lift up on the cover and remove the nut.



2. Remove the upper B-pillar trim panel.
   - Remove the bolt cover and bolt.
   - Remove the upper B-pillar trim panel by releasing the clips and sliding the upper B-pillar panel downward.



3. Remove the B-pillar trim panel. For additional information, refer to Section 501-05 .

4. Remove the safety belt height adjuster trim cover.

5. Remove the bolts and the safety belt shoulder height adjuster.

6. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

   NOTE: Make sure to tighten all nuts and bolts to specification.

   To install, reverse the removal procedure.

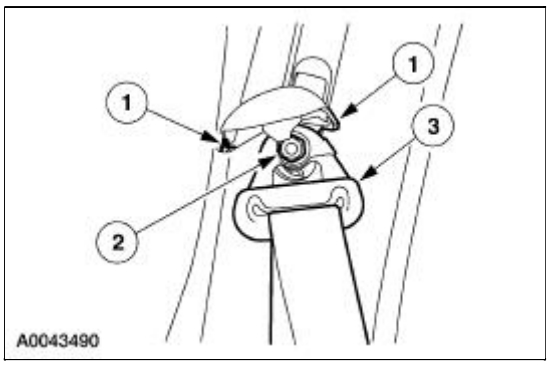
   - When installing the upper B-pillar trim panel, insert the safety belt guide slide into the upper B-pillar trim panel.

7. Check the active restraint system for correct operation.

Safety Belt Shoulder Height Adjuster —Second Row

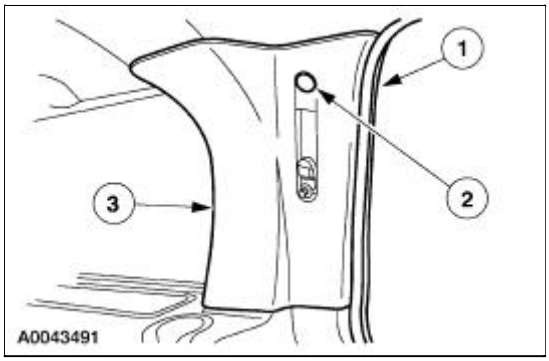
Special Tool(s)

 ST1181-A	Torx Bit, Safety Belt Bolt 501-010 (T77L-2100-A)



Removal and Installation

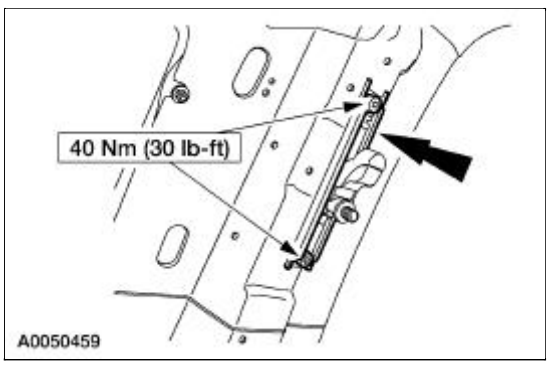
WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters (if so equipped) child safety seat tether attachments and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or incorrect operation is noted.



NOTE: The LH side is shown, the RH side is similar.

1. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

   Remove the second row LH side safety belt guide.
   1. Release the retaining tab at each side and open the safety belt guide cover.
   2. Remove the nut.
   3. Remove the second row LH side safety belt guide.



2. Remove the LH C-pillar trim panel.
   1. Separate the weatherstripping along the LH C-pillar trim panel.
   2. Remove the bolt cover and bolt.
   3. Pull out to release the retainers and remove the LH C-pillar trim panel.

3. Remove the safety belt height adjuster trim cover.

4. Remove the bolts and the safety belt shoulder height adjuster.

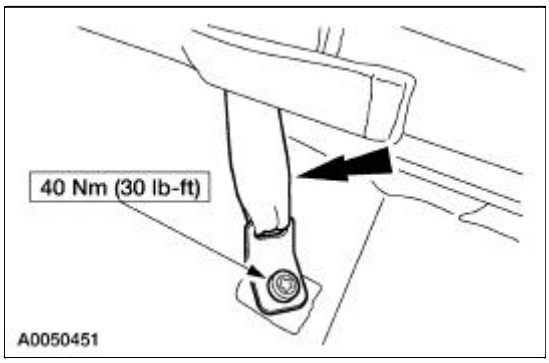
5. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

   NOTE: Make sure to tighten all nuts and bolts to specification.

   To install, reverse the removal procedure.

6. Check the active restraint system for correct operation.

Front Safety Belt Buckle —Center



Special Tool(s)

 ST1181-A	Torx Bit, Safety Belt Bolt 501-010 (T77L-2100-A)

Removal and Installation

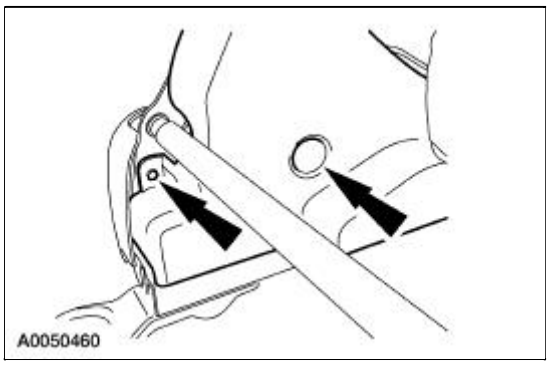
WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters (if so equipped) child safety seat tether attachments and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or incorrect operation is noted.

1. Remove the safety belt buckle bolt and route the safety belt buckle out of the seat.

2. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

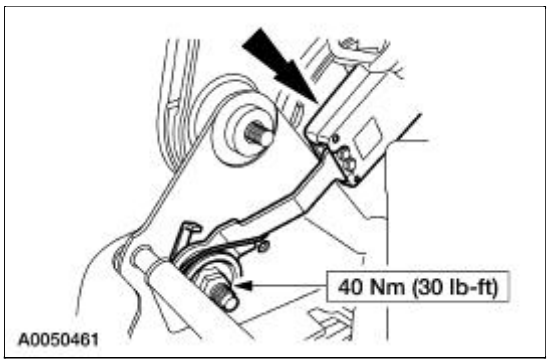
   NOTE: Make sure to tighten all nuts and bolts to specification.

   To install, reverse the removal procedure.
   - Make sure the safety belt buckle is accessible to the occupant after installation.



3. Check the active restraint system for correct operation.

Rear Safety Belt Buckle —Second Row, 20 Percent Seat

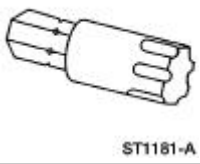


Removal and Installation

WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters (if so equipped) child safety seat tether attachments and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or incorrect operation is noted.

1. Remove the second row 20 percent seat. For additional information, refer to Section 501-10 .
2. Remove the screws and the pin-type retainer (not shown), and remove the inboard side shield.
   - It may be necessary to fold the seat to remove the side shield.

3. Remove the nut and the safety belt buckle.



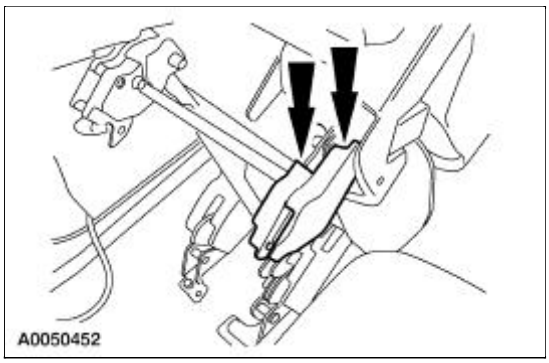
4. **NOTE:** Make sure to tighten all nuts and bolts to specification.

   To install, reverse the removal procedure.
   - When installing the safety belt buckle, make sure to engage the anti-rotation tab to the seat frame.
5. Check the active restraint system for correct operation.

Rear Safety Belt Buckle —Second Row, 40 Percent Seat

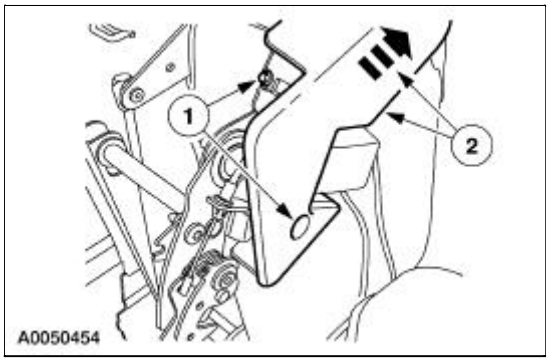
Special Tool(s)

 ST1181-A	Torx Bit, Safety Belt Bolt 501-010 (T77L-2100-A)



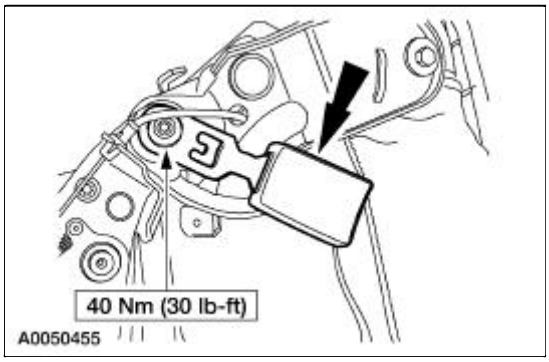
Removal and Installation

WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters (if so equipped) child safety seat tether attachments and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or incorrect operation is noted.



NOTE: The LH side 40 percent seat is shown, the RH side is similar.

1. Pivot the 40 percent seat up.



2. Remove the screws and the lower pedestal cover.

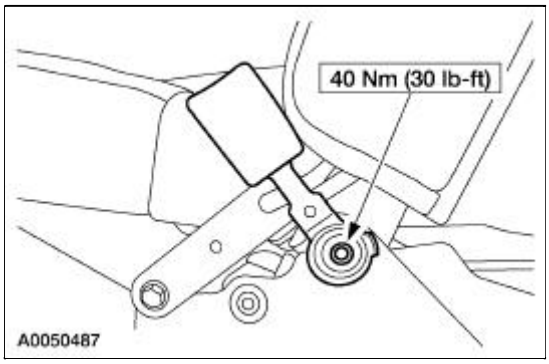
3. Remove the seat side shield.
    1. Remove the two screws.
    2. Slide up and remove the side shield.

4. Remove the safety belt buckle bolt and the safety belt buckle.

5. **NOTE:** Make sure to tighten all nuts and bolts to specification.

   To install, reverse the removal procedure.

   - When installing the safety belt buckle, make sure to engage the anti-rotation tab to the seat frame.



6. Check the active restraint system for correct operation.

Rear Safety Belt Buckle —Third Row, 40 Percent Seat

Removal and Installation

WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters (if so equipped) child safety seat tether attachments and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or incorrect operation is noted.

1. Remove the 40 percent third row seat. For additional information, refer to Section 501-10 .
2. Remove the bolt and the safety belt buckle.

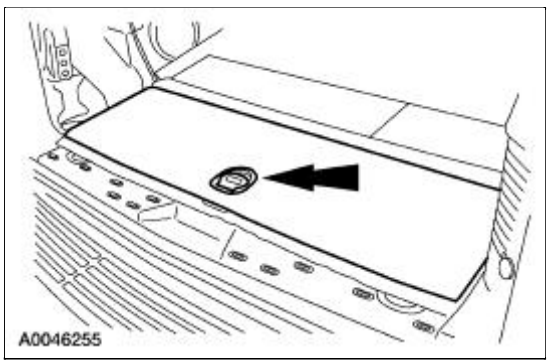
3. **NOTE:** Make sure to tighten all nuts and bolts to specification.

   To install, reverse the removal procedure.

   - When installing the safety belt buckle, make sure to engage the anti-rotation tab to the sheet metal.
   - Make sure the safety belt buckle is accessible to the passenger after installation.

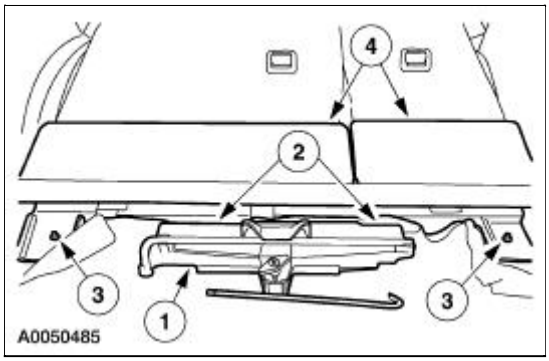
4. Check the active restraint system for correct operation.

Rear Safety Belt Buckle —Third Row, 60 Percent Seat



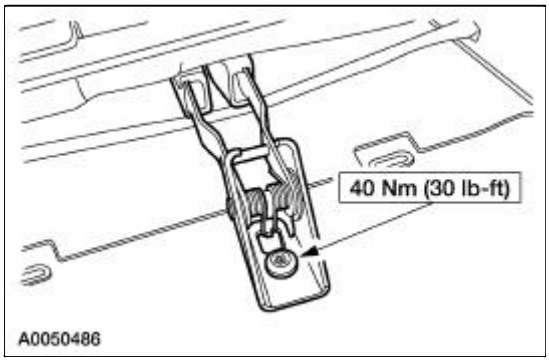
Special Tool(s)

 ST1181-A	Torx Bit, Safety Belt Bolt 501-010 (T77L-2100-A)



Removal and Installation

WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters (if so equipped) child safety seat tether attachments and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or incorrect operation is noted.



1. Position the third row seats down.
2. Remove the rear load floor panel.

3. Remove the mid-floor panel support.
    1. Remove the jack assembly.
    2. Remove the two pin-type retainers (not shown).
    3. Remove the two bolts.
    4. Position the load floor panels up, lift on the front of the mid-floor panel support to release the three retaining clips (not shown) and remove the support panel.

4. Remove the bolt and the safety belt buckle assembly.

5. **NOTE:** Make sure to tighten all nuts and bolts to specification.

   To install, reverse the removal procedure.

   - When installing the safety belt buckle assembly, make sure to engage the anti-rotation tab to the sheet metal.
   - Make sure the safety belt buckles are accessible to the passengers after installation.

6. Check the active restraint system for correct operation.

Safety Belt Buckle and Pretensioner —40 Percent Seat

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F088 (105-R0012)

Removal

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: After deployment, the air bag surface could contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so could result in air bag deployment which could result in personal injury.

NOTE: The LH forty percent seat is shown, the RH forty percent seat is similar.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air**

bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

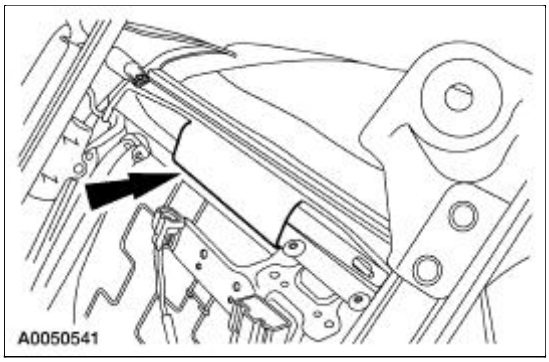
The front impact severity sensor is located at the bottom of the hood latch support bracket.

The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

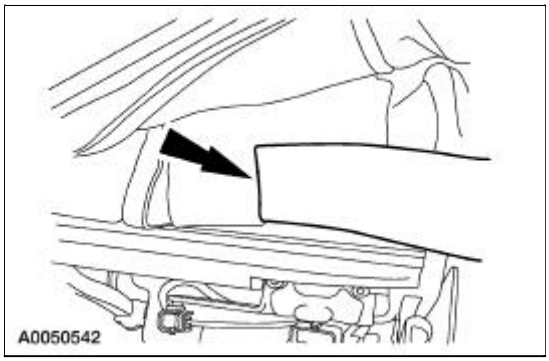
To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .



2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

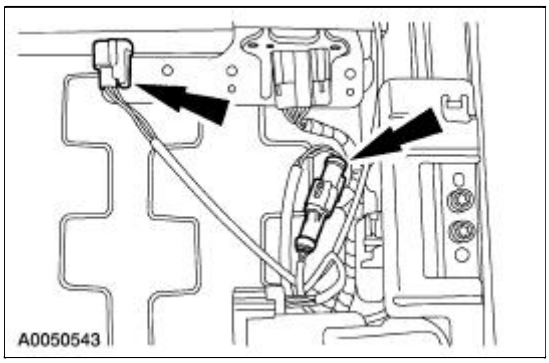
   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation .



3. **NOTE:** The seat must be positioned to its highest and most forward position to service the safety belt buckle and pretensioner.

   Remove the 40 percent front seat on the side with the affected safety belt buckle and pretensioner. For additional information, refer to Section 501-10 .

4. Release the J-clip.



5. Release the hook-and-loop strip and pull the seat cushion trim cover up enough to expose the safety belt buckle and pretensioner.

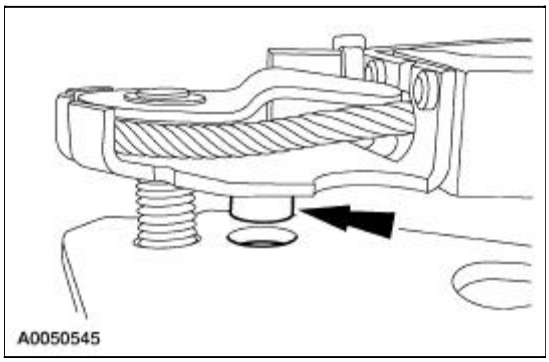
6. **NOTE:** Make note of the wire harness routing for installation.

   Remove the safety belt buckle and pretensioner electrical connectors from the seat cushion frame.

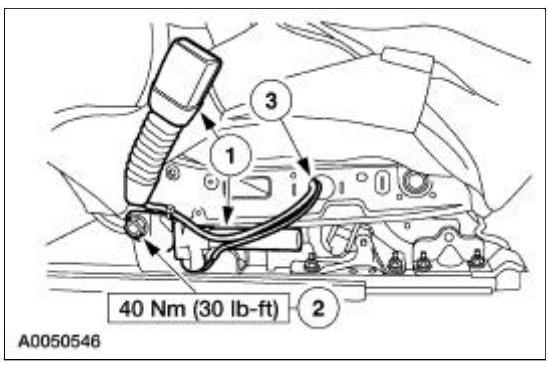
   - Disconnect the usage detection switch electrical connector.
   - Separate the safety belt buckle pretensioner electrical connector from the pin-type retainer.

7. **NOTE:** Make note of the wire harness routing for installation.

   Remove the safety belt buckle and pretensioner.
   1. Route out the safety belt buckle and pretensioner usage detection switch and pretensioner electrical connectors.
   2. Remove the nut.
   3. Remove the safety belt buckle and pretensioner.



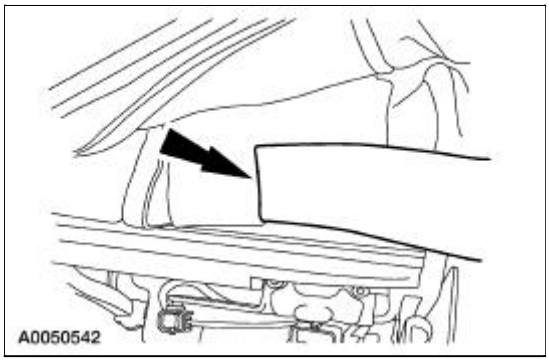
Installation



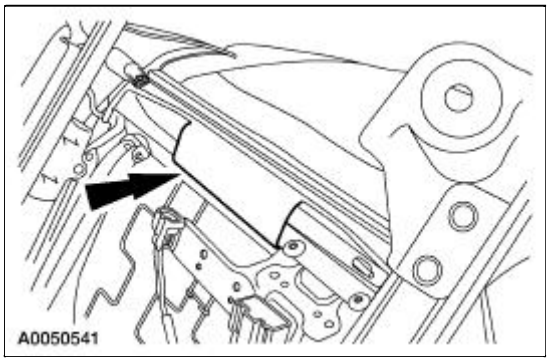
WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

1. **NOTE:** Make sure the battery negative cable is still disconnected before proceeding with the installation portion of this procedure.

   Align the safety belt buckle and pretensioner anti-rotation tab to the seat bracket.



2. Install the safety belt buckle and pretensioner.
   1. With the anti-rotation tab aligned, position the safety belt buckle and pretensioner to the seat.
   2. Install the nut.
   3. Route the safety belt buckle and pretensioner usage detection switch and pretensioner electrical connectors as noted in removal.



3. Reposition the safety belt buckle and pretensioner electrical connectors to the seat cushion frame.
   - Connect the usage detection switch electrical connector.
   - Reposition the pin-type retainer to the safety belt buckle pretensioner electrical connector and install it under the seat.

4. Reposition the seat cushion trim cover over the safety belt buckle and pretensioner and attach the hook-and-loop strip.

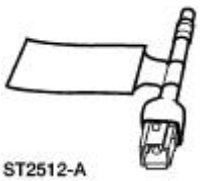
5. Attach the seat backrest J-clip to the seat cushion frame.

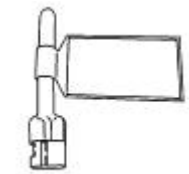
6. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

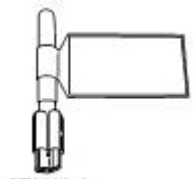
   Install the 40 percent front seat on the side with the affected safety belt buckle and pretensioner. For additional information, refer to Section 501-10 .

7. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section.







8. **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

   With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of Section 501-20B .

9. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in the Diagnosis and Testing portion of this section.

Safety Belt Buckle and Pretensioner —60 Percent Seat

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F088 (105-R0012)

Removal

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: After deployment, the air bag surface could contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so could result in air bag deployment which could result in personal injury.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors,**

instrument panel, console, door latches, strikers, seats and hood latches.

The front impact severity sensor is located at the bottom of the hood latch support bracket.

The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation , in the General Procedures portion of this section.

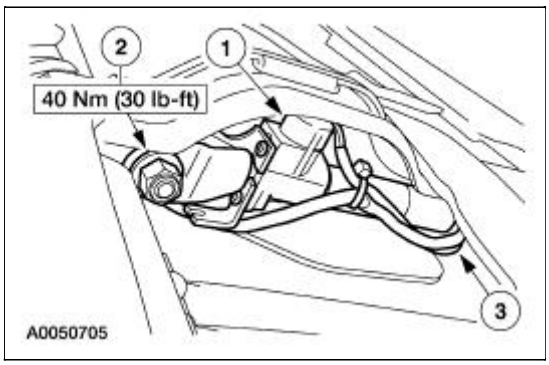
3. **NOTE:** To access the safety belt buckle and pretensioner bolts, the seat must be positioned forward.

   Remove the 60 percent front seat. For additional information, refer to Section 501-10 .

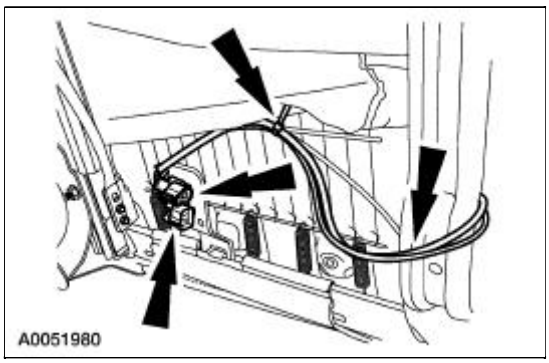
4. **NOTE:** Make note of the wire harness routing for installation.

   Detach the electrical connectors and route out the wire harnesses.

5. Remove the safety belt buckle and pretensioner.
   1. Remove the nut.
   2. Pull the buckle end back through the seat cushion and remove the safety belt buckle and pretensioner.



Installation



WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

1. **NOTE:** Make sure the battery negative cable is still disconnected before proceeding with the installation portion of this procedure.

   Install the safety belt buckle and pretensioner.
   1. Position the safety belt buckle and pretensioner to the seat.
      - Align the safety belt buckle and pretensioner locator tab to the hole in the seat frame.
      - Check that the safety belt buckle end is accessible after positioning.
   2. Install the nut.
   3. Route the safety belt buckle and pretensioner usage detection switch and pretensioner electrical connectors as noted in removal.

2. Attach the electrical connectors and route the wire harnesses as noted in removal.

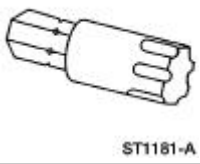
3. **WARNING: To reduce the risk of serious personal injury, read and follow all**

warnings, cautions, notes, and instructions in the seat removal and installation procedure.

Install the 60 percent front seat. For additional information, refer to Section 501-10 .

4.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section.

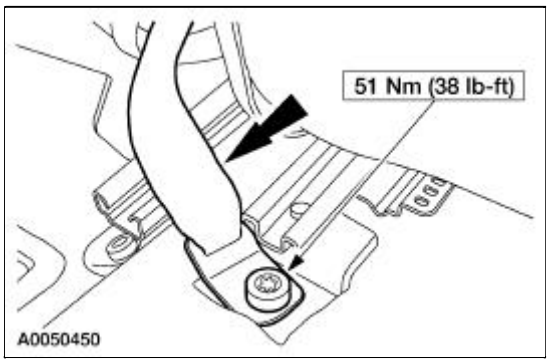


5.  **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

   With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of Section 501-20B .

6. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in the Diagnosis and Testing portion of this section.

Safety Belt —Front Row, Center



Special Tool(s)

 ST1181-A	Torx Bit, Safety Belt Bolt 501-010 (T77L-2100-A)

Removal and Installation

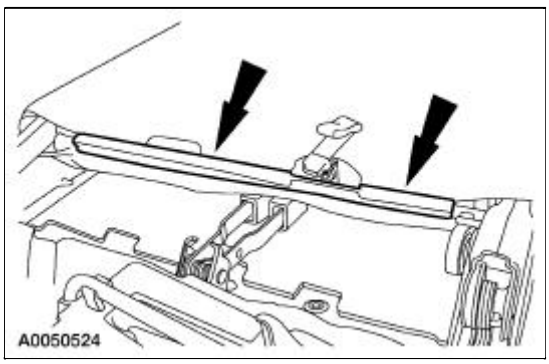
WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters (if so equipped) child safety seat tether attachments and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or incorrect operation is noted.

1. Remove the safety belt bolt and route the safety belt out from the seat.

2. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

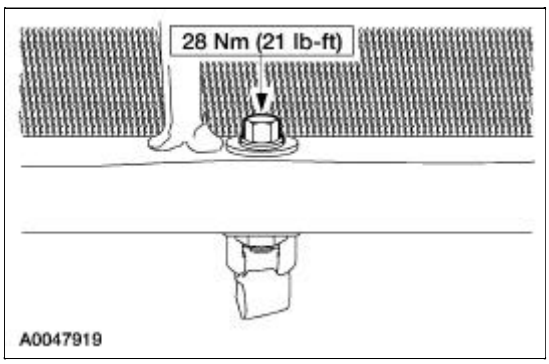
   NOTE: Make sure to tighten all nuts and bolts to specification.

   To install, reverse the removal procedure.
   1. When installing, make sure the safety belt anchor is on top of the seat bracket.
   2. Make sure the safety belt is accessible to the occupant after installation.



3. Check the active restraint system for correct operation.

Child Safety Seat Tether Anchor



Removal and Installation

WARNING: All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), shoulder belt height adjusters (if so equipped) child safety seat tether attachments and attaching hardware should be inspected after any collision. All belt assemblies should be replaced unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected and replaced if either damage or incorrect operation is noted.

1. Position the third row seat backrest down.
2. Release the seat back J-clips.

3. With the seat backrest trim cover and cushion positioned out of the way, remove the bolt and the child safety seat tether anchor.

4. **WARNING: It is important that the bolt/anchor be securely tightened to specification. Otherwise, the child's safety seat may not be correctly secured, and the child could be injured in case of a sudden stop or accident.**

   NOTE: Inspect the seat for damage. If the seat is found to be damaged, install new seat components.

   NOTE: Make sure to tighten the bolts to specification.

   To install, reverse the removal procedure.

5. Check the active restraint system for correct operation.

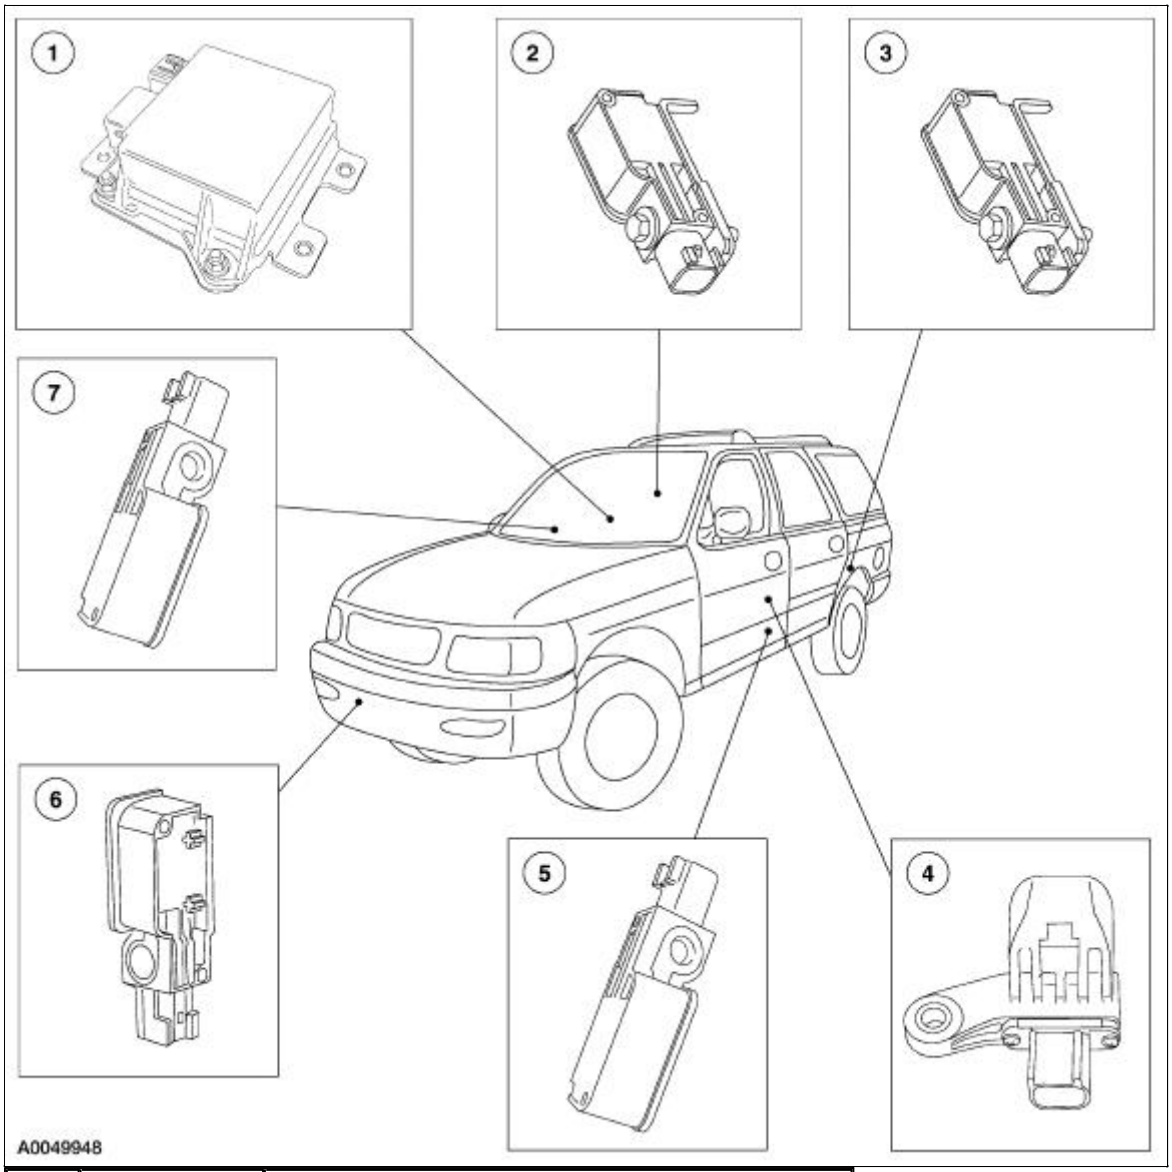
Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

The air bag supplemental restraint system (SRS) is designed to provide increased collision protection for front seat and second row outboard occupants in addition to that provided by the three-point safety belt system. Safety belt use is necessary to obtain the best occupant protection and to receive the full advantage of the SRS.

This vehicle line contains dual stage deployment (advanced restraint system) driver and front passenger air bag modules. These vehicles can also be equipped with optional safety canopies that deploy from the A-pillar to the C-pillar upon a side impact or if a rollover condition is detected. If equipped with safety canopies, a unique restraints control module (RCM) is used.

See the following illustration for deployable component location.



Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) Deployable Components

Item	Part Number	Description
1	611D10	Passenger air bag module
2	042D94	Passenger side safety canopy module
3	042D95	Driver side safety canopy module
4	61203	Driver safety belt buckle and pretensioner
5	043B13	Driver air bag module
6	14A664	Clockspring
7	61202	Passenger safety belt buckle and pretensioner

See the following illustration for sensor component location.

Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) Sensor Components

Item	Part Number	Description
1	14B321	Restraints control module (RCM)
2	14B345	Second row, C-pillar side impact sensor
3	14B345	Second row, C-pillar side impact sensor
4	14B416	Driver seat track position sensor
5	14B345	Front row, driver door, side impact sensor
6	14B006	Front impact severity sensor
7	14B345	Front row, passenger door, side impact sensor

Driver Air Bag Module

The driver air bag module:

- is installed new as an assembly.
- is mounted in the center of the steering wheel.
- cannot be interchanged between Expedition and Navigator vehicles.

Clockspring

The clockspring:

- is mounted on the steering column, behind the steering wheel.
- allows for continuous electrical connections between the driver air bag module and the restraints control module (RCM) when the steering wheel is turned.

Passenger Air Bag Module

The passenger air bag module:

- is installed new as an assembly.
- is mounted in the passenger side of the instrument panel.
- cannot be interchanged between Expedition and Navigator vehicles.

Safety Canopy Module

Some vehicles can be equipped with optional safety canopies for protection during side impacts or rollovers.

Vehicles equipped with safety canopies require a specific headliner. When installing a new headliner on a vehicle equipped with safety canopies, make sure a headliner for safety canopies is being used. The word "AIRBAG" will appear on the headliner where it meets each B-pillar trim panel.

The safety canopy module:

- is installed as an assembly.
- is mounted above the headliner.
- attaches from the A-pillar frame to the C-pillar frame.
- is standard equipment on the Navigator and optional on the Expedition.
- cannot be interchanged from side to side.

Safety Canopy Bridge Resistor

 **CAUTION: Do not deactivate the safety canopy module circuit by removing the bridge resistor from the electrical connector.**

If the safety canopy bridge resistor is removed, an open circuit fault will be generated by the restraints control module (RCM).

If a restraint system diagnostic tool is installed at the safety canopy electrical connector, a low resistance fault will be generated.

The safety canopy bridge resistor:

- is equipped only on Expedition, without optional safety canopy modules.
- must not be removed during deactivation.
- can be accessed with the headliner dropped and is located just behind the RH side second row courtesy light.

Safety Belt Pretensioners

As part of the SRS, the driver and front outboard passenger safety belt buckles are equipped with pretensioners. The safety belt buckle pretensioners remove excess slack from the safety belt webbing. The pretensioners are activated by the restraints control module (RCM) when the module detects a crash event force exceeding a programmed limit.

Safety Belt Buckle Switches

As part of the supplemental restraint system (SRS), the driver and front outboard passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckle switches indicate to the restraints control module (RCM) whether the safety belts are connected or disconnected. The RCM uses this information in determining the deployment rate of the dual-stage driver and passenger air bag modules.

Seat Track Position Sensor

The seat track position sensor is mounted to a bracket attached to the inboard side of the seat track. The seat track position sensor informs the restraints control module (RCM) of the driver seat position. The RCM uses this information in determining the deployment rate of the dual-stage driver air bag module.

Restraints Control Module (RCM)

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: The restraints control module (RCM) orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) has been involved in a collision in which the center tunnel area has been damaged, inspect the mounting and bracket for deformation. If damaged, the RCM must be replaced whether or not the air bags have deployed. In addition, make sure the area of the RCM mounting is restored to its original condition.

NOTE: When installing a new restraints control module (RCM), always make sure the correct RCM is being installed. If an incorrect RCM is installed, erroneous DTCs will result.

The restraints control module (RCM) carries out the following functions:

- deploys the air bag(s) in the event of a deployable crash.
- activates the safety belt buckle pretensioners to remove slack from the safety belt.
- monitors the SRS for faults.
- illuminates the air bag indicator if a fault is detected.
- flashes the air bag indicator to indicate the lamp fault code (LFC) detected.
- communicates through the data link connector (DLC) the current or historical Diagnostic Trouble Codes (DTCs).
- signals the instrument cluster module to activate a chime if the air bag indicator is not available and another SRS fault exists.

The RCM monitors the SRS for possible faults. If a fault is detected while the ignition switch is in the ON position, the RCM will illuminate the air bag indicator located in the instrument cluster.

When the ignition is cycled (turned off and then on), the air bag indicator will prove out by lighting for six seconds and then off for two seconds. After the prove out, the air bag indicator will then flash the two-digit LFC. If an SRS fault exists, the air bag indicator will flash the LFC five times, then it will remain illuminated for the rest of the key cycle. The RCM will also communicate the current and historical DTCs through the DLC, to the scan tool. If the air bag indicator does not function, and the system detects a fault condition, the RCM will signal the instrument cluster module to activate an audible chime. The chime is a series of five sets of five tone bursts. If the chime is heard, the SRS and the air bag indicator require repair.

LFCs are prioritized. If two or more faults occur at the same time, the fault having the highest priority will be displayed. After that fault has been corrected, the next highest priority fault will be displayed.

The RCM includes a backup power supply. This feature provides sufficient backup power to deploy the front air bags and safety belt pretensioners in the event that the ignition circuit is lost or damaged during impact. The backup power supply will deplete its stored energy approximately one minute after the battery ground cable is disconnected.

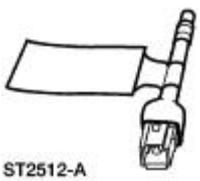
Electrical System

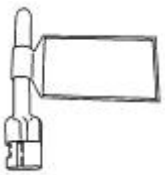
The electrical system that supports the air bag SRS:

- is powered from the battery through the ignition circuit.
- provides the electrical path from the restraints control module (RCM) to the SRS components.
- provides the electrical path from the RCM to the air bag indicator.
- provides the electrical path from the RCM to the data link connector (DLC).
- provides the electrical path from the RCM to the instrument cluster module.

Sensors

 **WARNING: The restraints control module (RCM) orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) has been involved in a collision in which the center tunnel area has been damaged, inspect the mounting and bracket for deformation. If damaged, the RCM must be replaced whether or not the air bags have deployed. In addition, make sure the area of the RCM mounting is restored to its original condition.**





WARNING: Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and correctly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

For these vehicles, the SRS uses up to eight sensors. Within the RCM there can be up to three safing sensors which are not separately serviced. The RCM will always have at least one safing sensor for front impact. Two more safing sensors are used if the vehicle is equipped with safety canopy modules. The RCM is mounted to the center tunnel beneath the console or bench seat. All vehicles will have a front impact severity sensor that is located in the front-center of the vehicle, mounted near the bottom of the hood latch support bracket. If the vehicle is equipped with safety canopy modules, there are four additional side impact sensors external to the RCM. One front row side impact sensor is located behind each of the front door interior trim panels. One second row side impact sensor is located at the base of each C-pillar. Mounting orientation is critical for correct operation of all impact and rollover sensors.

Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

Refer to Wiring Diagrams Cell 46 for schematic and connector information.

Special Tool(s)

 ST1137-A	FLUKE 73III Automotive Meter 105-R0057 or equivalent

 ST2512-A	Diagnostic Tool, Restraint System (1 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 req'd) 418-F088 (105-R0012)
 ST2332-A	Worldwide Diagnostic System (WDS) 418-FS317 New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool

Restraint System Diagnostic Tool Warning

WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.

Diagnosing Customer Concerns Without Hard DTCs

If a lamp fault code (LFC) is reported by the customer but is not present when the vehicle comes in for service, follow the Diagnostic Instruction procedures in this section to identify the intermittent DTC.

Once the DTC is known, read the Normal Operation section of the pinpoint test for the DTC involved.

- Follow the deactivation procedure in this section.
- Determine the location of components involved in creating the DTC.
- Carry out a thorough visual inspection of:
  - components.
  - connectors.
  - splices and wiring harnesses.
  - insulation on conductors.

Refer to the Possible Causes section of the pinpoint test for the DTC involved, which lists the common concerns that relate to the DTC. Concerns are listed according to priority.

Diagnosing Customer Concerns with Hard DTCs

All Supplemental Restraint System (SRS) diagnostic procedures will require deactivation and reactivation of the system. Deactivation and reactivation require the disconnection of most SRS components and the installation of restraint system diagnostic tools. This reduces the risk of inadvertent deployment of SRS components while diagnostic procedures are being carried out.

Restraint system diagnostic tools are required for the diagnosis and testing of the SRS. It is not acceptable to short-circuit the air bag module connections with a jumper wire. If a jumper wire is used to short-circuit the air bag module connections, a lamp fault code (LFC) will be displayed.

Deactivation Procedure

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Never probe the connectors on a safety canopy module. Doing so can result in safety canopy module deployment.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. **WARNING: To avoid accidental deployment and possible personal injury, the RCM backup power supply must be depleted before repairing or replacing any front or side air bag (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

   Disconnect the battery ground cable (14301) and wait for one minute. For additional information, refer to Section 414-01 .

2. Remove the driver air bag module. For additional information, refer to Driver Air Bag Module in this section.

3. Attach restraint system diagnostic tools 418-F395 (2 required) to the clockspring side of the driver air bag module electrical connectors.

4. Open the glove compartment to its fullest extent by pushing in on the tabs and releasing the glove compartment.

5. Disconnect the passenger air bag module electrical connector.

6. Attach restraint system diagnostic tool 418-F403 to the harness side of the passenger air bag

module electrical connector.

7. **NOTE:** For vehicles without safety canopies, do not deactivate the safety canopy module circuit by removing the safety canopy bridge resistor from the safety canopy bridge resistor electrical connector.

   If the safety canopy bridge resistor is removed, an open circuit fault will be generated by the RCM.

   If a restraint system diagnostic tool is installed at the safety canopy electrical connector, a low resistance fault will be generated by the RCM.

   The safety canopy bridge resistor is located on the RH side of the vehicle above the headliner.

   Do not disconnect the safety canopy bridge resistor.

8. Vehicles with safety canopies:
   1. Separate the passenger side C-pillar trim panel. For additional information, refer to Section 501-05 .
   2. Disconnect the passenger side safety canopy electrical connector, located on the C-pillar behind the second row safety belt shoulder height adjuster.
   3. Attach a restraint system diagnostic tool 418-F088 (105-R0012) to the vehicle harness side of the passenger side safety canopy electrical connector.

9. From under the passenger front seat, disconnect the safety belt buckle pretensioner electrical connector.

10. Attach restraint system diagnostic tool 418-133 to the passenger front seat safety belt buckle pretensioner electrical connector.

11. Vehicles with safety canopies:
    1. Separate the driver side C-pillar trim panel. For additional information, refer to Section 501-05 .
    2. Disconnect the driver side safety canopy electrical connector, located on the C-pillar behind the second row safety belt shoulder height adjuster.
    3. Attach a restraint system diagnostic tool 418-F088 (105-R0012) to the vehicle harness side of the driver side safety canopy electrical connector.

12. From under the driver front seat, disconnect the safety belt buckle pretensioner electrical connector.

13. Attach restraint system diagnostic tool 418-133 to the driver front seat safety belt buckle pretensioner electrical connector.

14. Reconnect the battery ground cable. For additional information, refer to Section 414-01 .

15. Prove out the system.

Reactivation Procedure

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the deactivation procedure.

1. Disconnect the battery ground cable and wait one minute. For additional information, refer to Section 414-01 .

2. From under the driver front seat, disconnect the restraint system diagnostic tool and connect the

driver front seat safety belt buckle pretensioner electrical connector.

3. Vehicles with safety canopies:
    1. Remove the restraint system diagnostic tool from the driver side safety canopy electrical connector.
    2. Connect the driver side safety canopy electrical connector.
    3. Install the driver side C-pillar trim panel. For additional information, refer to Section 501-05 .
4. From under the passenger front seat, disconnect the restraint system diagnostic tool and connect the passenger front seat safety belt buckle pretensioner electrical connector.
5. Vehicles with safety canopies:
    1. Remove the restraint system diagnostic tool from the passenger side safety canopy electrical connector.
    2. Connect the passenger side safety canopy electrical connector.
    3. Install the passenger side C-pillar trim panel. For additional information, refer to Section 501-05 .
6. Remove the restraint system diagnostic tool from the passenger air bag module electrical connector.
7. Connect the passenger air bag module electrical connector.
8. Remove the restraint system diagnostic tools from the driver air bag module electrical connectors.
9. Install the driver air bag module. For additional information, refer to Driver Air Bag Module .
10. Reconnect the battery ground cable. For additional information, refer to Section 414-01 .
11. Prove out the system.

Prove Out Procedure

Turn the ignition switch from the OFF to the ON position and visually monitor the air bag indicator with all SRS components connected or restraint system diagnostic tools installed. The air bag indicator will light continuously for approximately six seconds and then turn off. If an SRS fault is present, the air bag indicator will either:

- fail to light.
- remain lit continuously.
- flash.

The flashing might not occur until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the restraints control module (RCM) to complete the testing of the SRS. If the air bag indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of five sets of five beeps. If this occurs, the air bag indicator will need to be repaired before diagnosis can continue.

Glossary

Secondary Air Bag Warning

The secondary air bag warning is an audible fault format that consists of five sets of five tone bursts, with each set of five tone bursts separated by a five second quiet period. One tone burst cycle will

consist of one second ON and one second OFF. This series of five activations is repeated every 30 minutes.

Air Bag/Pretensioner Restraint System Diagnostic Tools

Air bag/pretensioner restraint system diagnostic tools are used to simulate the equivalent resistance of an air bag module or safety belt pretensioner during certain diagnostic procedures.

Disconnect the Component

Disconnect the component means disconnect the component vehicle harness connector. It does not mean remove the component. Do not reconnect a disconnected component unless instructed to do so.

Deactivate the System

Deactivate the system means to carry out a deactivation procedure. For additional information, refer to Deactivation Procedure in this section.

Prove Out the System

Prove out the system means to turn the ignition switch from the OFF to the ON position and visually monitor the air bag indicator with the air bag modules and safety belt pretensioners or restraint system diagnostic tools installed. For additional information, refer to Prove Out Procedure in this section.

Reactivate the System

Reactivate the system means to carry out the reactivation procedure. For additional information, refer to Reactivation Procedure in this section.

Reconnect the System

Reconnect the system means to reconnect all system components. For additional information, refer to Air Bag System Reconnect Checklist in this section.

Install a New Component

Install a new component means to remove the existing component and install a new authorized part obtained from Ford Customer Service Division.

Verify the System

Verify the system means to prove out the system with restraint system diagnostic tools installed in place of the SRS components.

Air Bag Reconnect Checklist

The checklist below should be completed following diagnosis or repair of any air bag system concern:

- All restraint system diagnostic tools removed?
- All in-seat harness connectors connected?
- All air bag modules connected?
- Safety belt pretensioner connectors connected?
- Restraints control module (RCM) connected?

- All sensors (front and side impact sensors) connected?
- Battery connected?

Diagnostic Instructions —Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-FS317 New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool

The symptom chart can be used to help locate supplemental restraint system (SRS) concerns if no diagnostic trouble codes (DTCs) are retrieved and the listed symptoms are observed. Whether or not the listed symptoms are observed, always carry out the following:

1. Retrieve all DTCs stored in the restraints control module (RCM) memory. For additional information, refer to Retrieve/Clear Continuous DTCs in this section.

2. Run the On-Demand Self Test to determine what DTCs are currently being sensed by the RCM. Refer to On-Demand Self Test in this section.

3. If the stored DTCs are different than the current DTCs, always repair the current DTCs first.

4. If memory displays different continuous DTCs than the On-Demand Self Test, carry out in the following order:

- On-Demand Self Test
- Memory (Retrieve/Clear Continuous DTCs)

A DTC can indicate several concerns. The DTCs are to assist in system diagnosis and are not to be considered definitive. Always refer to the pinpoint test corresponding to the DTC to determine where the concern lies and to repair the concern correctly.

The SRS diagnostics can be divided into three sections:

- diagnostic test modes
- PID/data monitor and record
- active command modes

Diagnostic Test Modes

Two menu options are available under the diagnostic test modes:

- Retrieve/Clear Continuous DTCs

- On-Demand Self Test

Retrieve/Clear Continuous DTCs

During vehicle operation, the restraints control module (RCM) will detect and store both intermittent and hard failure DTCs in nonvolatile memory. The DTC strategy employed by the RCM incorporates a time-out scheme for determining when a concern exists in the system. This requires a concern to exist for up to one minute in the system before the RCM will detect it. For the RCM to determine that a concern no longer exists, the concern must be absent for up to one minute. The actual detection time-outs vary with each DTC. The DTCs can be retrieved with a scan tool using the retrieve/clear continuous DTCs option. Any DTCs stored in the RCM will be displayed on the scan tool along with a brief description of the DTC. If no DTCs are present, the scan tool will display a SYSTEM PASSED message. This option can also be used to clear DTCs from the RCM memory, as long as the concern no longer exists. Once 128 key cycles have been recorded since the concern was last detected, the DTC will automatically be removed from memory.

To retrieve or clear DTCs, follow these steps:

5. Connect the scan tool to the data link connector (DLC).
6. Turn the ignition switch to the ON position.
7. Follow the manufacturer's instructions for the scan tool being used.
8. **NOTE:** Before proceeding with the clearing operation, make note of the DTCs displayed. Once cleared, DTCs cannot be retrieved.

   All continuous DTCs will be displayed on the screen.
9. Clear the DTCs. After clearing the DTCs, cycle the key OFF, then ON.
   - Continuous DTCs that have been cleared will **not** re-occur as "Continuous" in the same key cycle. Only new DTCs which were **not** present before clearing can occur as "Continuous" after clearing.

On-Demand Self Test

The On-Demand Self Test option is used to verify that no electrical concerns exist with the air bag SRS. Upon entering the self-test, the restraints control module (RCM) will make an electrical check of each electrical component in the system. If a concern is detected, a DTC is displayed on the scan tool with a brief description of the DTC. Concerns detected during the self-test are not stored in memory, unless the same concern was also detected during normal vehicle operation. The self-test should always be run after any repair to verify that the repair was successful.

To run the On-Demand Self Test, follow these steps:

1. Connect the scan tool to the data link connector (DLC).
2. Turn the ignition switch to the ON position.
3. Follow the manufacturer's instructions for the scan tool being used.
4. The RCM will run the On-Demand Self Test and display on-demand DTCs (reflecting hard system concerns) on the screen.

Bit-Mapped Diagnostic Trouble Codes (DTCs)

Many of the continuous and on-demand DTCs that can be present in the RCM are bit-mapped DTCs that utilize PIDs (flagged faults). Bit-mapped DTCs are conceptually different from the previous style of DTCs. Previously, DTCs identified a specific concern for a given component and pointed to a particular diagnostic path. In the diagnostic path, PIDs are sometimes used to determine the root cause. Bit-mapped DTCs do not identify the specific concern. A bit-mapped DTC identifies the component(s) in which the concern exists. The next level (PIDs or flagged faults) identifies the specific concern.

A scan tool must be used to view the PIDs (flagged faults) of a bit-mapped DTC. Once a scan tool has retrieved a bit-mapped DTC, the scan tool will provide the option to "FLAG" that DTC. When the option to "FLAG" the DTC is available, it must be carried out to identify the specific concern that is present. When the option to "FLAG" the DTC has been carried out, the scan tool will then display the PIDs (flagged faults) for that DTC, including the status or state that exists (on-demand DTC) or existed (continuous DTC).

To view and flag bit-mapped DTCs, follow these steps:

1. Connect the scan tool to the data link connector (DLC).
2. Turn the ignition switch to the ON position.
3. Follow the manufacturer's instructions for the scan tool being used.
4. Carry out an On-Demand Self Test or retrieve continuous DTCs.
5. Select the DTC and the "FLAG" option on the scan tool.
6. The scan tool will display PIDs for the DTC. Record all flagged faults.

PID/Data Monitor and Record

The PID/Data Monitor and Record option allows the scan tool operator to read the state of several parameter IDs (PIDs) to aid in diagnosing the system. PIDs are real time measurements of parameters such as voltages, resistances, etc., calculated by the restraints control module (RCM) and sent to the scan tool for display. Many of the PIDs supported by the RCM are calculated periodically and are, therefore, not true real time readings.

To retrieve PIDs, follow these steps:

1. Connect the scan tool to the data link connector (DLC).
2. Turn the ignition switch to the ON position.
3. Follow the manufacturer's instructions for the scan tool being used.
4. Record all PIDs that are to be retrieved and initiate PID retrieval. PIDs are updated continuously on the display.

Active Commands

Instrument Cluster Module

These commands allow the technician to verify the operation of instrument cluster module components and sub-systems.

Restraints Control Module

These commands allow the technician to verify operation of the supplemental restraint system (SRS) indicator lamps.

Lamp Fault Codes

When the restraints control module (RCM) detects a system fault, it will cause the air bag indicator to flash a coded sequence: a lamp fault code (LFC). The code is two digits. The first digit is flashed with a 0.5 second interval between pulses. There is a 2 second pause before the second digit is flashed, which also has a 0.5 second interval between pulses. There is a 5 second pause between each display of an LFC.

Each LFC is flashed five times after which the air bag indictor will remain lit for the remainder of the key-on cycle. If there are multiple LFCs, each LFC will flash in order of priority.

Diagnostic Trouble Codes (DTCs)

While the lamp fault codes (LFCs) are an indication of a general concern in the passive restraints system, the diagnostic trouble codes (DTCs) are more specific. The DTCs can be retrieved from the restraints control module (RCM) with a scan tool via the data link connector (DLC).

Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table

DTC [a]	LFC [b]	Description	Action To Take
—	Continuous	The Air Bag Indicator is Illuminated Continuously, RCM Disconnected or Inoperative, Loss of Battery Feed, or Loss of Signal Ground	Go To Pinpoint Test A .
B1231	13	Crash Data Memory Full	Install a new RCM and impact sensors. REFER to Inspection and Repair After a Supplemental Restraint System (SRS) Deployment .
B1317	Continuous	Battery Voltage High	CHECK battery voltage; to be below 16 volts. REFER to Section 414-00 .
B1318	Continuous	Battery Voltage Low	CHECK battery voltage; to be above 9.0 volts. REFER to Section 414-00 .
B1342	12	RCM Is Faulted	Install a new RCM.
B1869	NONE Continuous lamp	Lamp Air Bag Warning Indicator Circuit Open or Short to Ground	Go To Pinpoint Test B .

	Secondary air bag warning sounds if another fault is present		
B1870	NONE Secondary air bag warning sounds if another fault is present	Air Bag Warning Indicator Circuit Short to Battery	Go To Pinpoint Test C .
B1891	53	Air Bag Tone Warning Indicator Circuit Short to Battery	Go To Pinpoint Test D .
B1892	53	Air Bag Tone Warning Indicator Circuit Open or Shorted to Ground	Go To Pinpoint Test E .
B1921	14	Air Bag Diagnostic Monitor Ground Circuit Open	Go To Pinpoint Test F .
B2292	33	Restraint System — Safety Belt Pretensioner Status (Driver Pretensioner Circuit Fault)	Go To Pinpoint Test G .
B2292	34	Restraint System — Safety Belt Pretensioner Status (Passenger Pretensioner Circuit Fault)	Go To Pinpoint Test G .
B2293	19	Restraint System — Air Bag Status (Driver Front Air Bag Circuit Fault)	Go To Pinpoint Test H .
B2293	21	Restraint System — Air Bag Status (Passenger Front Air Bag Circuit Fault)	Go To Pinpoint Test H .
B2294	24	Restraint System — Safety Canopy Module Status (Driver Side Safety Canopy Circuit Fault)	Go To Pinpoint Test I .
B2294	25	Restraint System — Safety Canopy Module Status (Passenger Side Safety Canopy Circuit Fault)	Go To Pinpoint Test I .
B2296	42	Restraint System — Impact Sensor Status (Front Impact Severity Sensor Circuit Fault)	Go To Pinpoint Test J .
B2296	43	Restraint System — Impact Sensor Status (Driver Side Front Row Impact Sensor Circuit Fault)	Go To Pinpoint Test J .
B2296	45	Restraint System — Impact Sensor Status (Driver Side Second Row Impact Sensor Circuit Fault)	Go To Pinpoint Test J .
B2296	44	Restraint System — Impact Sensor Status (Passenger Side Front Row Impact Sensor Circuit Fault)	Go To Pinpoint Test J .
B2296	46	Restraint System — Impact Sensor Status (Passenger Side Second Row Impact Sensor Circuit Fault)	Go To Pinpoint Test J .
B2691	51	Driver Safety Belt Buckle Switch Circuit Fault	Go To Pinpoint Test K .
B2434	51	Driver Safety Belt Buckle Switch Circuit Short To Ground	Go To Pinpoint Test L .
B2435	51	Driver Safety Belt Buckle Switch Circuit Resistance Out Of Range	Go To Pinpoint Test M .

B2692	52	Passenger Safety Belt Buckle Switch Circuit Fault	Go To Pinpoint Test N .
B2438	52	Passenger Safety Belt Buckle Switch Circuit Short To Ground	Go To Pinpoint Test O .
B2439	52	Passenger Safety Belt Buckle Switch Circuit Resistance Out Of Range	Go To Pinpoint Test P .
B2477	Continuous	Module Configuration Error	INSTALL a new RCM
C1414	15	Incorrect Vehicle ID	Go To Pinpoint Test Q .
C1947	49	Seat Track Position Sensor Circuit Short to Ground	Go To Pinpoint Test R .
C1948	49	Seat Track Position Sensor Circuit Resistance Out Of Range	Go To Pinpoint Test S .
C1981	49	Seat Track Position Sensor Circuit Fault	Go To Pinpoint Test T .
—	—	No Communication with the restraints control module.	REFER to Symptom Chart in this section.

[a] DTC: Diagnostic trouble code, retrieved using scan tool.
[b] LFC: Lamp fault code, flashed on air bag indicator.

Inspection and Verification

1. Verify the customer concern by checking the air bag indicator in the instrument cluster. For additional information, refer to Prove Out the System in this section.

2. Visually inspect for obvious signs of mechanical and electrical damage using the following chart.

Visual Inspection Chart

Mechanical	Electrical
● Damaged restraints control module (RCM) bracket ● Damaged front impact severity sensor or bracket ● Damaged side impact sensor or bracket	● Open fuse(s) ● Damaged wiring harness ● Loose or corroded connectors ● Circuitry open/shorted ● Damaged shorting bars

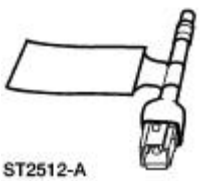
3. If the concern is not visually evident, use the scan tool to retrieve diagnostic trouble codes (DTCs) and carry out the on-demand self test.

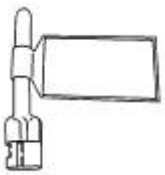
4. If the on-demand self test is passed and no DTCs are retrieved, GO to Symptom Chart .

5. If DTCs are retrieved, refer to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table.

Symptom Chart

Symptom Chart





Condition	Possible Sources	Action

• Air bag warning indicator is illuminated continuously	• Fuse to RCM. • Damaged wiring, terminals, or connectors. • A faulty diagnostic connector. • A faulted RCM.	• Go To Pinpoint Test A .
• Air bag indicator flashing	• Air bag/pretensioner supplemental restraint system (SRS) fault.	• REFER to DTC Priority Table.
• Audible tone — DTCs retrieved	• Air bag SRS system fault.	• REFER to DTC Priority Table.
• No communication with the restraints control module (RCM)	• Scan tool. • Data link connector (DLC). • RCM • Circuitry.	• Go To Pinpoint Test U .

Pinpoint Tests —Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

Refer to Wiring Diagrams Cell 46 for schematic and connector information.

Restraint System Diagnostic Tool Warning

WARNING: Restraint system diagnostic tools are for service only. Tools must be removed

prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.

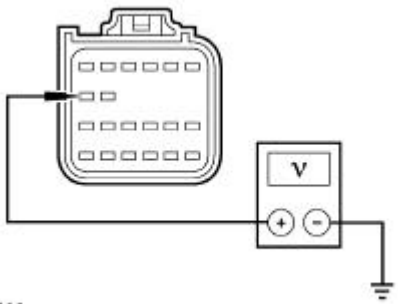
Pinpoint Test A: The Air Bag Warning Indicator Is Illuminated Continuously — RCM Disconnected or Inoperative, Loss of Battery Feed, or Loss of Signal Ground

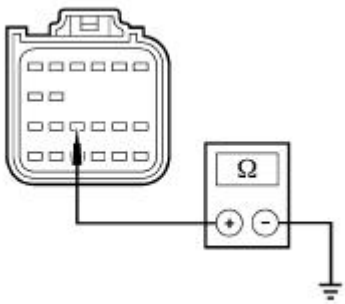
Normal Operation

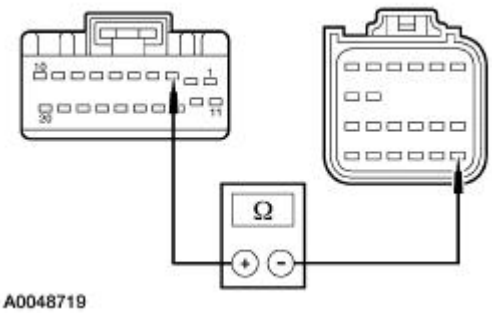
NOTE: During normal operation, the air bag indicator will illuminate continuously for 6 seconds after the ignition switch is placed to the ON or START position and after five cycles of a lamp fault code (LFC), if a fault exists. Be sure to cycle the ignition switch and look for a 6 second indicator prove-out without LFCs.

The restraints control module (RCM) will communicate diagnostic trouble codes (DTCs) to the scan tool through the data link connector (DLC). If the scan tool displays NO COMMUNICATION when retrieving continuous DTCs, Go To Pinpoint Test U to troubleshoot the system.

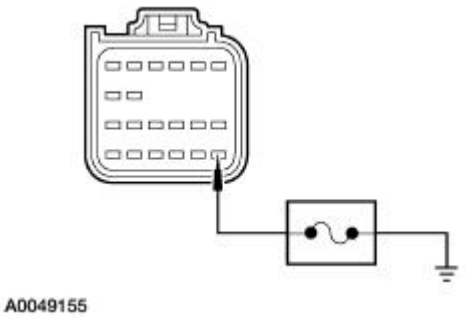
Possible Causes







An air bag indicator that is illuminated continuously can be caused by one of the following:



- damaged ignition circuit.
- RCM disconnected from the vehicle harness.
- a loss of RCM signal ground.
- a faulted RCM.
- damaged wiring, terminals, or connectors.
- a loss of RCM battery feed.
- a faulted instrument cluster

PINPOINT TEST A: THE AIR BAG WARNING INDICATOR IS ILLUMINATED CONTINUOUSLY — RCM DISCONNECTED OR INOPERATIVE, LOSS OF BATTERY FEED, OR LOSS OF SIGNAL GROUND

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
A1 CHECK FOR CONTINUOUS OR ON-DEMAND SELF TEST DTCs ● Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. ● Retrieve and record any continuous DTCs for use later in this pinpoint test. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **Were any continuous or on-demand self test DTCs retrieved?**	**Yes** If continuous DTCs were retrieved, GO to A2 . If on-demand DTCs were retrieved, GO to the Restraints

	Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** GO to A2 .
A2 CHECK THE RCM CONNECTION	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury. WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. • Connect: RCM C310a. • Make sure RCM C310a is connected and fully seated. • **Is RCM C310a fully connected and the connector locking tab engaged?**	**Yes** GO to A3 . **No** CONNECT C310a and ENGAGE the locking tab. GO to A7 .

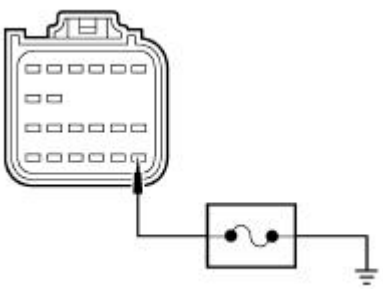
A3 CHECK CIRCUIT 609 (OG/YE) FOR AN OPEN	
• For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310a. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Key in ON position. • Measure the voltage between RCM C310a pin 12, circuit 609 (OG/YE), harness side and ground.  A0039638 • **Is the voltage between 9 and 16 volts?**	**Yes** GO to A4 . **No** REPAIR circuit 609 (OG/YE).
A4 CHECK CIRCUIT 649 (BK/OG) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between RCM C310a pin 16, circuit 649 (BK/OG), harness side and ground.  A0039639 • **Is the resistance less than 5 ohms?**	**Yes** GO to A5 . **No** REPAIR circuit 649 (BK/OG). GO to A7 .
A5 CHECK CIRCUIT 608 (BK/YE) FOR AN OPEN	
• Disconnect: Instrument Cluster C220a. • Measure the resistance between instrument cluster module C220a pin 3, circuit 608 (BK/YE), harness side and RCM C310a pin 19, circuit 608 (BK/YE), harness side.  A0048719 • **Is the resistance less than 5 ohms?**	**Yes** GO to A6 . **No** REPAIR circuit 608 (BK/YE).GO to A7 .
A6 CHECK THE INDICATOR LAMP OPERATION (DRIVE LAMP OFF)	
• Connect: Instrument Cluster C220a.	**Yes**

• Key in ON position. • Connect a fused jumper between the RCM C310a pin 19, circuit 608 (BK/YE), harness side and ground.  A0049155 • **Is the indicator lamp off ?**	INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to A7 . **No** REPAIR or INSTALL a new instrument cluster module. REFER to Section 413-01 . GO to A7 .
A7 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous DTCs recorded during Step A1. • **Were any continuous DTCs retrieved during Step A1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. CLEAR all DTCs.

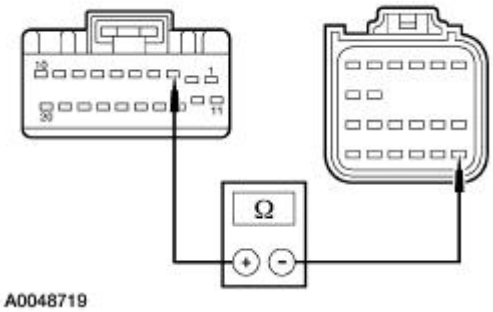
Pinpoint Test B: DTC B1869 — Lamp Air Bag Warning Indicator Circuit Open or Short to Ground

Normal Operation

If the restraints control module (RCM) detects an open or short to ground on the air bag warning indicator circuit, it will store diagnostic trouble code (DTC) B1869 in memory.



Possible Causes



An air bag indicator circuit failure can be caused by:

- damaged wiring, terminals, or connectors.
- a faulted RCM.
- a faulty indicator bulb.
- an instrument cluster module internal concern.

PINPOINT TEST B: DTC B1869 — LAMP AIR BAG WARNING INDICATOR CIRCUIT OPEN OR SHORT TO GROUND

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
B1 CHECK FOR A HARD OR INTERMITTENT DTC • Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. • Retrieve and record any continuous DTCs for use later in this pinpoint test. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B1869 retrieved during the on-demand self test?**	**Yes** If the air bag indicator lamp **does** illuminate,GO to B2 . If the air bag indicator **does not** illuminate,GO to B4 . **No** This is an intermittent fault. The fault condition is not present at this time. GO to B5 .
B2 CHECK THE INDICATOR LAMP OPERATION (DRIVE LAMP OFF) **WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.** **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal**	**Yes** INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to B6 . **No** GO to B3 .

injury. **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.** **WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.** **WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310a. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Key in ON position. • Connect a fused jumper between the RCM C310a pin 19, circuit 608 (BK/YE), harness side and ground.  A0049155 • **Is the indicator lamp off?**	
B3 CHECK CIRCUIT 608 (BK/YE) FOR AN OPEN	
• Key in OFF position. • Disconnect: Instrument Cluster Module C220a. • Measure the resistance between instrument cluster module C220a pin 3, circuit 608 (BK/YE), harness side and RCM C310a pin 19, circuit 608 (BK/YE), harness side.	**Yes** REPAIR or INSTALL a new instrument cluster module. REFER to Section 413-01 . GO to B6 . **No**

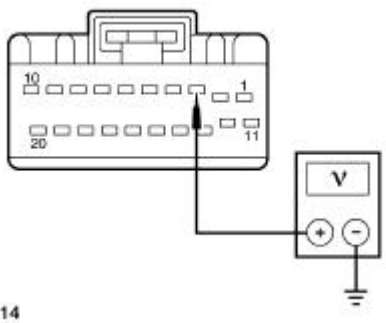
 A0048719 • **Is the resistance less than 5 ohms?**	REPAIR circuit 608 (BK/YE).GO to B6 .
B4 CHECK THE INDICATOR LAMP OPERATION (DRIVE LAMP ON)	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310a. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Key in ON position. • **Is the indicator lamp on?**	**Yes** INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to B6 . **No** REPAIR circuit 608 (BK/YE). GO to B6 .
B5 CHECK FOR AN INTERMITTENT FAULT	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury. WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools	**Yes** GO to B2 . **No** CHECK for causes of intermittent open or short to ground on circuit 608 (BK/YE). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to B6 .

must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **Was DTC B1869 retrieved during the on-demand self test?**	
B6 CHECK FOR ADDITIONAL DTCs	
● Refer to the continuous DTCs recorded during Step B1. ● **Were any continuous DTCs retrieved during Step B1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. CLEAR all DTCs.

Pinpoint Test C: DTC B1870 — Air Bag Warning Indicator Circuit Short to Battery

Normal Operation

If the restraints control module detects an open or short to battery on the air bag warning indicator circuit, it will store diagnostic trouble code (DTC) B1870 in memory. If any other DTCs are detected with this DTC active, the secondary air bag warning will be activated.



Possible Causes

An air bag indicator circuit short to battery can be caused by:

- damaged wiring, terminals, or connectors.
- a faulted RCM.

PINPOINT TEST C: DTC B1870 — AIR BAG INDICATOR CIRCUIT SHORT TO BATTERY

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
C1 CHECK FOR A HARD OR INTERMITTENT DTC • Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. • Retrieve and record any continuous DTCs for use later in this pinpoint test. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B1870 retrieved during the on-demand self test?**	**Yes** GO to C2. **No** This is an intermittent fault. The fault condition is not present at this time. GO to C4.
C2 CHECK CIRCUIT 608 (BK/YE) FOR A SHORT TO BATTERY **WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.** **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury. WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safey canopy module. Doing so can**	**Yes** GO to C3. **No** REPAIR circuit 608 (BK/YE). GO to C5.

result in safety canopy deployment. NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. **NOTE:** Any DTCs for air bag indicator faults associated with the instrument cluster module will be logged by the RCM. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: Instrument Cluster Module C220a. ● Disconnect: RCM C310a. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Key in ON position. ● Measure the voltage between C220a pin 3, circuit 608 (BK/YE), harness side and ground.  A0049214 ● **Is the voltage less than 0.2 volt?**	
C3 CHECK THE RCM	
● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Connect: RCM C310a. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **NOTE:** DTC B1869 should be retrieved when carrying out the on-demand self test due to an open on circuit 608 (BK/YE), DTC B1870 should not be retrieved at this time. ● **Was DTC B1870 retrieved during the on-demand self test?**	**Yes** INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to C5 . **No** REPAIR or INSTALL a new instrument cluster module. REFER to Section 413-01 . GO to C5 .

C4 CHECK FOR AN INTERMITTENT FAULT	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury. WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B1870 retrieved during the on-demand self test?**	**Yes** GO to C2 . **No** CHECK for causes of intermittent short to battery on circuit 608 (BK/YE). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire bundle. REPAIR any intermittent concerns found. GO to C5 .
C5 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous DTCs recorded during Step C1. • **Were any continuous DTCs retrieved during Step C1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code

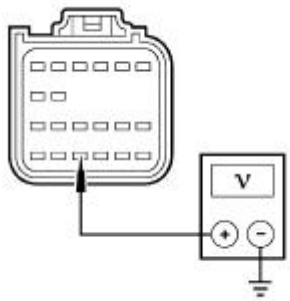
	(DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. CLEAR all DTCs.

Pinpoint Test D: DTC B1891 — Air Bag Tone Warning Indicator Circuit Short to Battery

Normal Operation

The restraints control module (RCM) monitors its connection to the instrument cluster module at C310a pin 22. This connection is used to signal a chime if the air bag indicator is inoperative and another SRS fault exists. If the RCM detects a short to battery on the connection to the instrument cluster module, it will store diagnostic trouble code (DTC) B1891 in memory.

Possible Causes



An air bag tone warning circuit short to battery or ignition can be caused by:

- damaged wiring, terminals, or connectors.
- a damaged or inoperative instrument cluster module.
- a faulted RCM.

PINPOINT TEST D: DTC B1891 — AIR BAG TONE WARNING INDICATOR CIRCUIT SHORT TO BATTERY

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
D1 CHECK FOR A HARD OR INTERMITTENT DTC ● Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. ● Retrieve and record any continuous DTCs for use later in this pinpoint test. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand	**Yes** This is a hard fault. The fault condition is still present. This

Self Test. ● **Was DTC B1891 retrieved during the on-demand self test?**	fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to D2 . **No** This is an intermittent fault. The fault condition is not present at this time. GO to D4 .
D2 CHECK THE AIR BAG TONE WARNING INDICATOR CIRCUIT FOR A SHORT TO BATTERY	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury. WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner	**Yes** GO to D3 . **No** REPAIR circuit 1083 (LB/BK).GO to D5 .

Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310a. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Disconnect: Instrument Cluster Module C220a. • Key in ON position. • Measure the voltage between RCM C310a pin 22, circuit 1083 (LB/BK), harness side and ground. D4 CHECK FOR AN INTERMITTENT FAULT	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury. WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can**	**Yes** GO to D2 . **No** CHECK for causes of intermittent short to voltage on circuit 1083 (LB/BK). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently.

result in personal injury.  **WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.**  **WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **Was DTC B1891 retrieved during the on-demand self test?**	REPAIR any intermittent concerns found. GO to D5 .
D5 CHECK FOR ADDITIONAL DTCs	
● Refer to the continuous DTCs recorded during Step D1. ● **Were any continuous DTCs retrieved during Step D1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

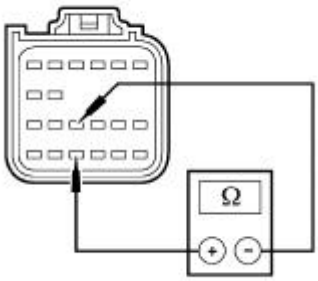
	CLEAR all DTCs.

Pinpoint Test E: LFC 53/DTC B1892 — Air Bag Tone Warning Indicator Circuit Short to Ground or Open

Normal Operation

The restraints control module (RCM) monitors its connection to the instrument cluster module at C310a pin 22. This connection is used to signal a chime if the air bag indicator is inoperative and another SRS fault exists. If the RCM detects a short to ground or open on the connection to the cluster, it will store diagnostic trouble code (DTC) B1892 in memory and flash lamp fault code (LFC) 53 (or a higher priority code if one exists) on the air bag indicator.

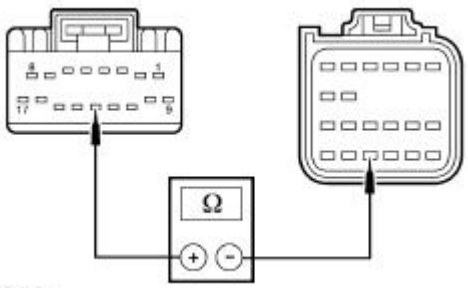
Possible Causes

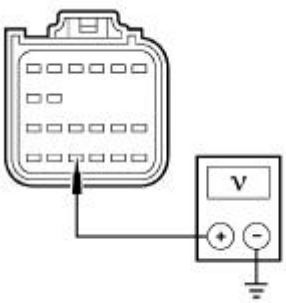


An air bag tone warning indicator circuit short to ground or open can be caused by:

- damaged wiring, terminals, or connectors.
- a damaged or inoperative instrument cluster module.
- a faulted RCM.

PINPOINT TEST E: LFC 53/DTC B1892 — AIR BAG TONE WARNING INDICATOR CIRCUIT SHORT TO GROUND OR OPEN





Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
E1 CHECK FOR A HARD OR INTERMITTENT DTC • Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. • Retrieve and record any continuous DTCs for use later in this pinpoint test. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B1892 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to E2 . **No** This is an intermittent fault. The fault condition is not present at this time. GO to E5 .

E2 CHECK THE AIR BAG TONE WARNING INDICATOR CIRCUIT FOR A GROUND SHORT	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury. WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310a. • Disconnect: Instrument Cluster Module C220a. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between RCM C310a pin 22, circuit 1083 (LB/BK), harness side and RCM C310a pin 16, circuit 649 (BK/OG), harness side.	**Yes** GO to E3 . **No** REPAIR circuit 1083 (LB/BK). GO to E6 .

A0049256

- **Is the resistance greater than 1,000,000 ohms?**

E3 CHECK THE AIR BAG TONE WARNING INDICATOR CIRCUIT FOR AN OPEN	
• Key in OFF position. • Measure the resistance between RCM C310a pin 22, circuit 1083 (LB/BK), harness side and instrument cluster module C220b pin 13, circuit 1083 (LB/BK), harness side.  A0049257 • **Is the resistance less than 5 ohms?**	**Yes** GO to E4 . **No** REPAIR circuit 1083 (LB/BK). GO to E6 .
E4 CHECK THE AIR BAG TONE WARNING INDICATOR	
• Connect: Instrument Cluster Module C220b. • Key in ON position. • Measure the voltage at RCM C310a pin 22, circuit 1083 (LB/BK). REFER to Section 413-01 . GO to E6 .
E5 CHECK FOR AN INTERMITTENT FAULT	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in**	**Yes** GO to E2 . **No** CHECK for causes of intermittent short to ground or open on circuit 1083 (LB/BK).

possible personal injury. **WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.** **WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.** **WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **Was DTC B1892 retrieved during the on-demand self test?**	ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to E6 .
E6 CHECK FOR ADDITIONAL DTCs	
● Refer to the continuous DTCs recorded during Step E1. ● **Were any continuous DTCs retrieved during Step E1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER

	to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. CLEAR all DTCs.

Pinpoint Test F: LFC 14/DTC B1921 — Air Bag Diagnostic Monitor Ground Circuit Open

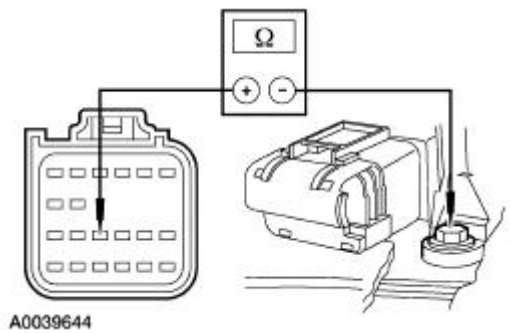
Normal Operation

WARNING: The tightening torque of the restraints control module (RCM) retaining bolts is critical for correct air bag supplemental restraint system (SRS) operation. Refer to Restraints Control Module (RCM) in this section for correct torque values.

NOTE: A resistance difference as low as 10 ohms may set the LFC.

The restraints control module (RCM) monitors the resistance between the ground connections at the mounting bracket and the reference ground at C310a pin 16, circuit 649 (BK/OG). If the RCM detects a difference in resistance, it will store diagnostic trouble code (DTC) B1921 in memory and flash lamp fault code (LFC) 14 (or higher priority code if one exists) on the air bag indicator.

Possible Causes



A resistance difference between the RCM bracket ground and harness ground can be caused by:

- RCM or RCM bracket not securely mounted.
- damaged wiring, terminals, or connectors.
- a faulted RCM.

PINPOINT TEST F: LFC 14/DTC B1921 — AIR BAG DIAGNOSTIC MONITOR CIRCUIT OPEN

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
F1 CHECK FOR A HARD OR INTERMITTENT DTC ● Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. ● Retrieve and record any continuous DTCs for use later in this pinpoint test. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **Was DTC B1921 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no

	longer retrieved during the on-demand self test. GO to F2 . **No** This is an intermittent fault. The fault condition is not present at this time. GO to F5 .
F2 INSPECT THE RCM MOUNTING, MOUNTING BRACKET AND MOUNTING SURFACE	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury. WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. • Inspect the RCM retainers and RCM bracket mounting bolts and make sure they are fully seated and tightened correctly.	**Yes** CLEAN and TIGHTEN the bolts. REPAIR the mounting surface as necessary. REINSTALL the RCM and mounting bracket to the mounting surface. GO to F6 . **No** GO to F3 .

• Remove the RCM. Refer to Restraints Control Module (RCM) in this section. • Visually inspect the RCM, mounting bracket and mounting surface for damage, corrosion or dirt. • **Was a significant amount of corrosion or dirt found, or was the RCM mounting bracket attached to the mounting surface incorrectly or were the RCM bolts not fully seated and tightened correctly?**	
F3 INSTALL THE RCM AND CARRY OUT THE ON-DEMAND SELF TEST	
• Clean the RCM mounting surfaces and bolts. • Install the RCM. Refer to Restraints Control Module (RCM) in this section. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B1921 retrieved during the on-demand self test?**	**Yes** GO to F4 . **No** Fault corrected. GO to F6 .
F4 CHECK GROUND CIRCUIT 649 (BK/OG) FOR HIGH RESISTANCE	
• Key in OFF position. • Measure the resistance between RCM C310a pin 16, circuit 649 (BK/OG), harness side and the RCM case ground.  A0039644 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to F6 . **No** REPAIR circuit 649 (BK/OG). GO to F6 .
F5 CHECK FOR AN INTERMITTENT FAULT	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury. WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the**	**Yes** GO to F2 . **No** CHECK for causes of intermittent high resistance on circuit 649 (BK/OG) or the chassis ground. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to F6 .

electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **Was DTC B1921 retrieved during the on-demand self test?**	
F6 CHECK FOR ADDITIONAL DTCs	
● Refer to the continuous DTCs recorded during Step F1. ● **Were any continuous DTCs retrieved during Step F1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. CLEAR all DTCs.

Pinpoint Test G: LFC 33 and 34/DTC B2292 — Restraint System Safety Belt Pretensioner Status

Normal Operation

The restraints control module (RCM) checks all of the safety belt pretensioners for faults. If the RCM detects one of the following faults on any of the safety belt pretensioner circuits, it will store diagnostic trouble code (DTC) B2292 in memory and flash, depending on the fault indicator, either lamp fault

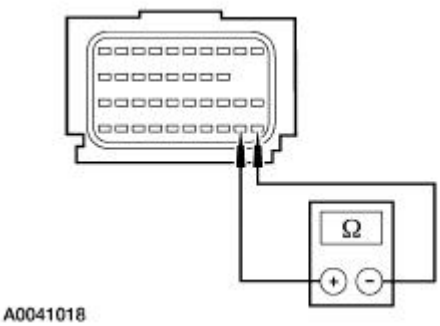
code (LFC) 33 or 34 depending on the fault (or higher priority code if one exists) on the air bag indicator.

Fault Conditions

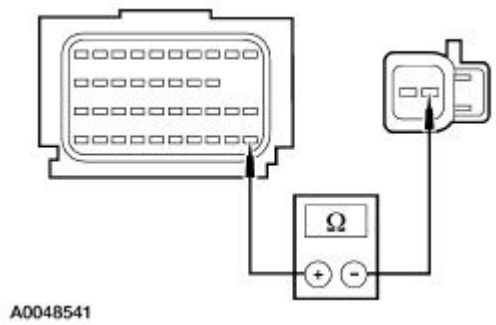
The RCM monitors for the following fault conditions:

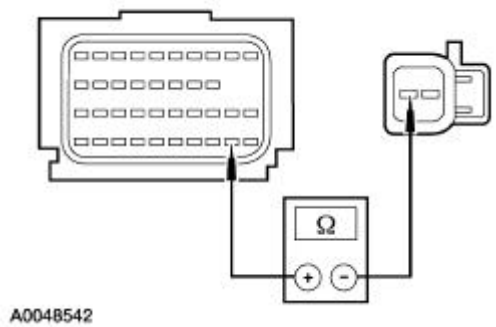
- low resistance.
- circuit open.
- circuit short to voltage.
- circuit short to ground.

Possible Causes

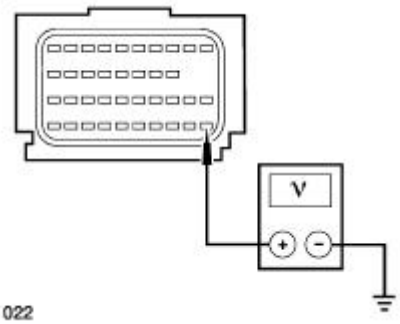


A safety belt pretensioner status fault can be caused by:





- damaged wiring, terminals, or connectors.
- a faulted pretensioner.
- a faulted RCM.

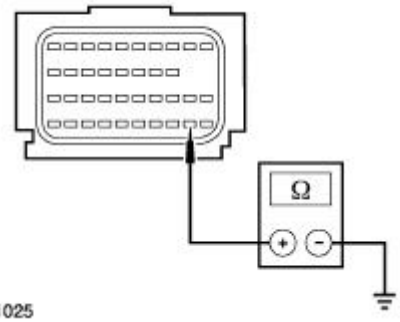


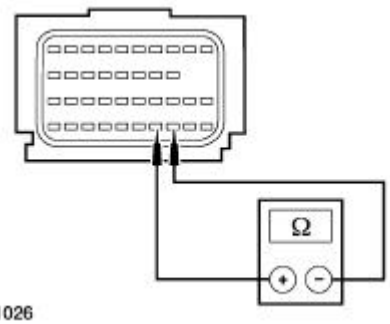
PINPOINT TEST G: LFC 33 AND 34/DTC B2292 — RESTRAINT SYSTEM SAFETY BELT PRETENSIONER STATUS

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
G1 CHECK FOR A HARD OR INTERMITTENT DTC • Enter the following diagnostic mode on the diagnostic tool: Retrieve/Flag Continuous DTCs. • Retrieve, flag and record any continuous DTCs for use later in this pinpoint test. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2292. • Retrieve and record any flagged faults for use later in this pinpoint test. • **Was DTC B2292 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to G2 . **No** This is an intermittent fault. The fault condition is not present at this time. GO to

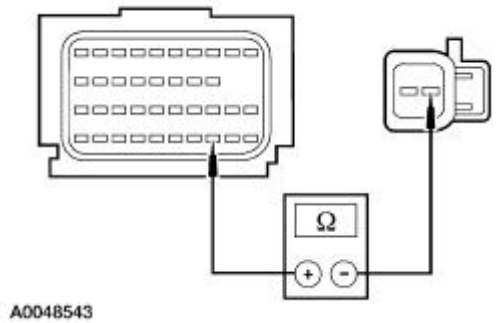
	G18 .
G2 CHECK THE PRETENSIONER	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury. WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B2292 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Using the flagged faults recorded in the Step G1, GO to the appropriate pinpoint test step. If a flagged fault of **"?"** was recorded, multiple faults exist and the entire pinpoint test must be carried out before installing a new RCM. For driver safety belt pretensioner (DF_PRT) with a low resistance (LOWRES) fault, GO to G3 . For DF_PRT with an open circuit (O_CIR) fault, GO to G4 . For DF_PRT with a short to battery (STB) fault, GO to G6 . For DF_PRT with a short to ground (STG) fault, GO to G8 .

	For passenger safety belt pretensioner (PF_PRT) with a low resistance (LOWRES) fault, GO to G10. For PF_PRT with an open circuit (O_CIR) fault, GO to G11. For PF_PRT with a short to battery (STB) fault, GO to G13. For PF_PRT with a short to ground (STG) fault, GO to G15. **No** INSTALL a new driver or passenger safety belt pretensioner. REFER to Section 501-20A. GO to G19.
G3 CHECK THE DRIVER SAFETY BELT PRETENSIONER CIRCUIT 1079 (LG/RD) AND CIRCUIT 1080 (LG/BK) FOR LOW RESISTANCE ● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01. ● Disconnect: Driver Safety Belt Pretensioner Restraint System Diagnostic Tool. ● Disconnect: RCM C310b. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01. ● Measure the resistance between RCM C310b pin 32, circuit 1080 (LG/BK), and pin 31, circuit 1079 (LG/RD), harness side.  A0041018	**Yes** GO to G17. **No** REPAIR circuit 1079 (LG/RD) and circuit 1080 (LG/BK). GO to G19.



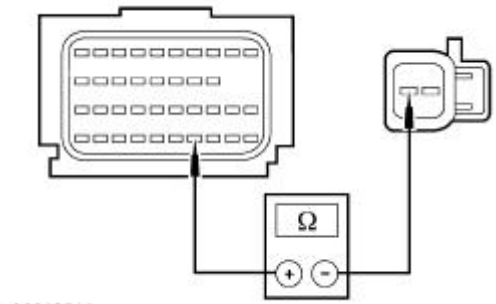


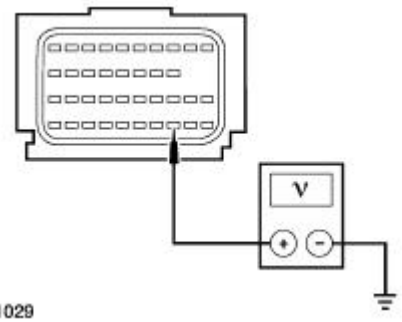
• **Is the resistance greater than 1,000,000 ohms?**	
G4 CHECK CIRCUIT 1079 (LG/RD) FOR AN OPEN	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: Driver Safety Belt Pretensioner Restraint System Diagnostic Tool. • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between RCM C310b pin 31, circuit 1079 (LG/RD), harness side and driver safety belt buckle pretensioner C3201 pin 1, circuit 1079 (LG/RD), harness side.  A0048541 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to G5 . **No** REPAIR circuit 1079 (LG/RD). GO to G19 .
G5 CHECK CIRCUIT 1080 (LG/BK) FOR AN OPEN	
• Measure the resistance between RCM C310b pin 32, circuit 1080 (LG/BK), harness side and driver safety belt buckle pretensioner C3201 pin 2, circuit 1080 (LG/BK), harness side.  A0048542 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to G17 . **No** REPAIR circuit 1080 (LG/BK). GO to G19 .
G6 CHECK CIRCUIT 1079 (LG/RD) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: Driver Safety Belt Pretensioner Restraint System Diagnostic Tool. • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Key in ON position. • Measure the voltage between RCM C310b pin 31, circuit 1079 (LG/RD), harness side and ground.	**Yes** GO to G7 . **No** REPAIR circuit 1079 (LG/RD). GO to G19 .



A0041022

- **Is the voltage less than 0.2 volt?**





G7 CHECK CIRCUIT 1080 (LG/BK) FOR A SHORT TO VOLTAGE	
• Measure the voltage between RCM C310b pin 32, circuit 1080 (LG/BK), harness side and ground.  A0041023 • **Is the voltage less than 0.2 volt?**	**Yes** GO to G17 . **No** REPAIR circuit 1080 (LG/BK). GO to G19 .
G8 CHECK CIRCUIT 1079 (LG/RD) FOR A SHORT TO GROUND	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: Driver Safety Belt Pretensioner Restraint System Diagnostic Tool. • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between RCM C310b pin 31, circuit 1079 (LG/RD), harness side and ground.  A0041024 • **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to G9 . **No** REPAIR circuit 1079 (LG/RD). GO to G19 .
G9 CHECK CIRCUIT 1080 (LG/BK) FOR A SHORT TO GROUND	
• Measure the resistance between RCM C310b pin 32, circuit 1080 (LG/BK), harness side and ground.	**Yes** GO to G17 . **No** REPAIR circuit

 A0041025 ● **Is the resistance greater than 1,000,000 ohms?**	1080 (LG/BK). GO to G19 .
G10 CHECK THE PASSENGER SAFETY BELT PRETENSIONER CIRCUIT 1081 (YE/RD) AND CIRCUIT 1082 (YE/BK) FOR LOW RESISTANCE	
● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: Passenger Safety Belt Pretensioner Restraint System Diagnostic Tool. ● Disconnect: RCM C310b. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Measure the resistance between RCM C310b pin 34, circuit 1082 (YE/BK), and pin 33, circuit 1081 (YE/RD), harness side.  A0041026 ● **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to G17 . **No** REPAIR circuit 1082 (YE/BK) and circuit 1081 (YE/RD).GO to G19 .
G11 CHECK CIRCUIT 1081 (YE/RD) FOR AN OPEN	
● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: Passenger Safety Belt Pretensioner Restraint System Diagnostic Tool. ● Disconnect: RCM C310b. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Measure the resistance between RCM C310b pin 33, circuit 1081 (YE/RD), harness side and passenger safety belt buckle pretensioner C3202 pin 1, circuit 1081 (YE/RD), harness side.	**Yes** GO to G12 . **No** REPAIR circuit 1081 (YE/RD). GO to G19 .

A0048543

- **Is the resistance less than 0.5 ohm?**

G12 CHECK CIRCUIT 1082 (YE/BK) FOR AN OPEN	
• Measure the resistance between RCM C310b pin 34, circuit 1082 (YE/BK), harness side and passenger safety belt buckle pretensioner C3202 pin 2, circuit 1082 (YE/BK), harness side.  A0048544 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to G17 . **No** REPAIR circuit 1082 (YE/BK). GO to G19 .
G13 CHECK CIRCUIT 1081 (YE/RD) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: Passenger Safety Belt Pretensioner Restraint System Diagnostic Tool. • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Key in ON position. • Measure the voltage between RCM C310b pin 33, circuit 1081 (YE/RD), harness side and ground.  A0041029 • **Is the voltage less than 0.2 volt?**	**Yes** GO to G14 . **No** REPAIR circuit 1081 (YE/RD). GO to G19 .

A0041261 ● **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to G16 . **No** REPAIR circuit 1081 (YE/RD). GO to G19 .
G16 CHECK CIRCUIT 1082 (YE/BK) FOR A SHORT TO GROUND	
● Measure the resistance between RCM C310b pin 34, circuit 1082 (YE/BK), harness side and ground.  A0041262 ● **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to G17 . **No** REPAIR circuit 1082 (YE/BK). GO to G19 .
G17 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system diagnostic tools, sensor electrical connectors and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. ● Key in OFF position.	**Yes** If a **"?"** was flagged by the scan tool, CARRY OUT

• For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Connect: Restraint System Diagnostic Tools. • Connect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2292. • Retrieve and record any flagged faults. • **Was DTC B2292 retrieved during the on-demand self test?**	the entire pinpoint test before installing a new RCM. INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to G19 . **No** Fault corrected. GO to G19 .
G18 CHECK FOR AN INTERMITTENT FAULT **WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.** **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing	**Yes** Check for causes of the intermittent fault at or near the affected safety belt pretensioner electrical connector. REPAIR any intermittent concern found. If an intermittent concern **was** found and repaired, GO to G19 If an intermittent concern **was not** found and repaired, USE the flagged faults recorded and GO to the appropriate pinpoint test step. If a flagged fault of **"?"** was recorded, multiple faults exist and the entire pinpoint test must be carried out before installing a new RCM. For driver safety belt pretensioner

portion of this section. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2292. ● If DTC B2292 is retrieved during the on-demand self test, retrieve and record any flagged faults ● **Was DTC B2292 retrieved during the on-demand self test?**	(DF_PRT) with a low resistance (LOWRES) fault, GO to G3 . For DF_PRT with an open circuit (O_CIR) fault, GO to G4 . For DF_PRT with a short to battery (STB) fault, GO to G6 . For DF_PRT with a short to ground (STG) fault, GO to G8 . For passenger safety belt pretensioner (PF_PRT) with a low resistance (LOWRES) fault, GO to G10 . For PF_PRT with an open circuit (O_CIR) fault, GO to G11 . For PF_PRT with a short to battery (STB) fault, GO to G13 . For PF_PRT with a short to ground (STG) fault, GO to G15 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently.

	REPAIR any intermittent concerns found. GO to G19 .
G19 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous DTCs recorded during Step G1. • **Were any continuous DTCs retrieved during Step G1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. CLEAR all DTCs.

Pinpoint Test H: LFC 19 and 21 /DTC B2293 — Restraint System - Airbag Status

Normal Operation

The restraints control module (RCM) checks all of the front air bag circuits for faults. If the RCM detects one of the following faults on any of the front air bag circuits, it will store diagnostic trouble code (DTC) B2293 in memory, and depending on the fault, flash either lamp fault code (LFC) 19 or 21 depending on the fault (or higher priority code if one exists) on the air bag indicator.

Fault Conditions

The RCM monitors for the following fault conditions:

- low resistance.
- circuit open.
- circuit short to voltage.
- circuit short to ground.

Possible Causes

A driver air bag status fault can be caused by:

- damaged wiring, terminals, or connectors.
- driver air bag sub-harness.
- a faulty clockspring.
- a faulty driver air bag module.
- a faulted RCM.

A passenger air bag status fault can be caused by:

- damaged wiring, terminals, or connectors.
- a faulty passenger air bag module.
- a faulted RCM.

PINPOINT TEST H: LFC 19 AND 21/DTC B2293 — RESTRAINT SYSTEM - AIR BAG STATUS

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
H1 CHECK FOR A HARD OR INTERMITTENT DTC	
• Enter the following diagnostic mode on the diagnostic tool: Retrieve/Flag Continuous DTCs. • Retrieve, flag and record any continuous DTCs for use later in this pinpoint test. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2293. • Retrieve and record any flagged faults for use later in this pinpoint test. • **Was DTC B2293 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.GO to H2 . **No** This is an intermittent fault. The fault condition is not present at this time. GO to H38 .
H2 CHECK THE DRIVER AND PASSENGER AIR BAG MODULES	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint	**Yes** This is a hard fault. The fault

system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

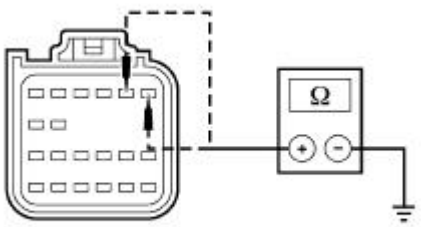
- Key in OFF position.
- Deactivate the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test.
- **Was DTC B2293 retrieved during the on-demand self test?**

condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

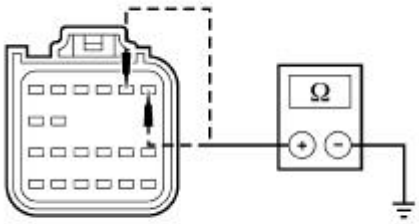
Using the flagged faults recorded in the Step H1, GO to the appropriate pinpoint test step.

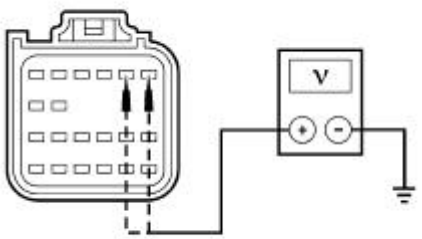
If a flagged fault of **"?"** was recorded, multiple faults exist and the entire pinpoint test must be carried out before installing a new RCM.

For driver air bag module squib 1 (D_ABAG) with a short to ground (STG) fault, GO to H3 .

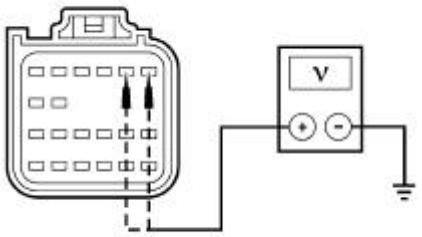


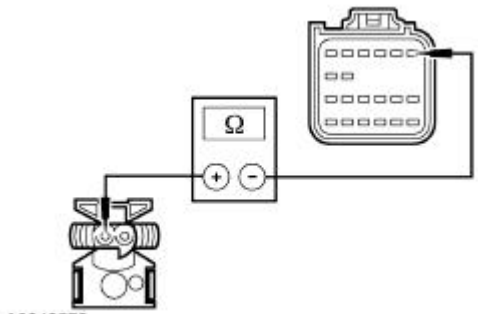
For driver air bag module squib 1 (D_ABAG) with a short to battery (STB) fault, GO to H5 .

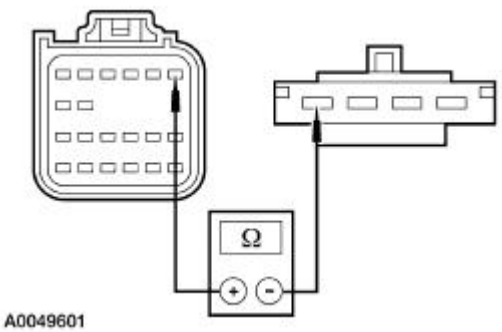




For driver air bag module squib 1 (D_ABAG) with an open circuit (O_CIR) fault, GO to H7 .







For driver air bag module squib 1 (D_ABAG) with a low resistance (LOWRES) fault, GO to

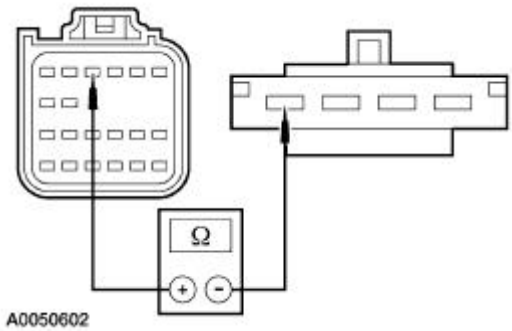
	H11 . For passenger air bag module squib 1 (P_ABAG) with a short to ground (STG) fault, GO to H14 . For passenger air bag module squib 1 (P_ABAG) with a short to battery (STB) fault, GO to H15 . For passenger air bag module squib 1 (P_ABAG) with an open circuit (O_CIR) fault, GO to H16 . For passenger air bag module squib 1 (P_ABAG) with a low resistance (LOWRES) fault, GO to H18 . For driver air bag module squib 2 (D_ABAG2) with a short to ground (STG) fault, GO to H20 . For driver air bag module squib 2 (D_ABAG2) with a short to battery (STB) fault, GO to H22 . For driver air bag module squib 2 (D_ABAG2) with an open circuit (O_CIR) fault, GO to H24 .

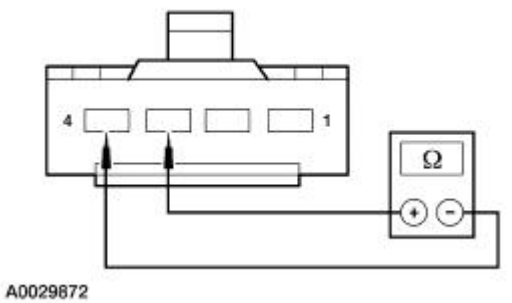
	For driver air bag module squib 2 (D_ABAG2) with a low resistance (LOWRES) fault, GO to H28 . For passenger air bag module squib 2 (P_ABAG2) with a short to ground (STG) fault, GO to H31 . For passenger air bag module squib 2 (P_ABAG2) with a short to battery (STB) fault, GO to H32 . For passenger air bag module squib 2 (P_ABAG2) with an open circuit (O_CIR) fault, GO to H33 . For passenger air bag module squib 2 (P_ABAG2) with a low resistance (LOWRES) fault, GO to H35 . **No** If a flagged fault of **"?"** was recorded in Step H1, multiple faults exist and the entire pinpoint test must be carried out before installing a new driver or passenger air bag module. If a fault was flagged against driver air bag module in Step

	H1, INSTALL a new driver air bag module. REFER to Driver Air Bag Module in this section. GO to H39. If a fault was flagged against passenger air bag module in Step H1, INSTALL a new passenger air bag module. REFER to Passenger Air Bag Module in this section. GO to H39.
H3 CHECK CIRCUIT 614 (GY/OG) AND CIRCUIT 615 (GY/WH) FOR A SHORT TO GROUND BETWEEN THE RCM AND THE DRIVER AIR BAG MODULE ● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01. ● Disconnect: RCM C310a. ● Disconnect: Driver Air Bag Module Squib 1 Restraint System Diagnostic Tool. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01. ● Measure the resistance between RCM C310a pin 1, circuit 614 (GY/OG), harness side and ground; and between RCM C310a pin 2, circuit 615 (GY/WH), harness side and ground.  A0041212 ● **Are the resistances greater than 1,000,000 ohms?**	**Yes** GO to H37. **No** GO to H4.
H4 CHECK CIRCUIT 614 (GY/OG) AND CIRCUIT 615 (GY/WH) FOR A SHORT TO GROUND BETWEEN THE RCM AND THE CLOCKSPRING ● Disconnect: Clockspring C218a. ● Measure the resistance between RCM C310a pin 1, circuit 614 (GY/OG), harness side and ground; and between RCM C310a pin 2, circuit 615 (GY/WH), harness side and ground.	**Yes** INSTALL a new clockspring. REFER to Clockspring in this section. GO to H39. **No**

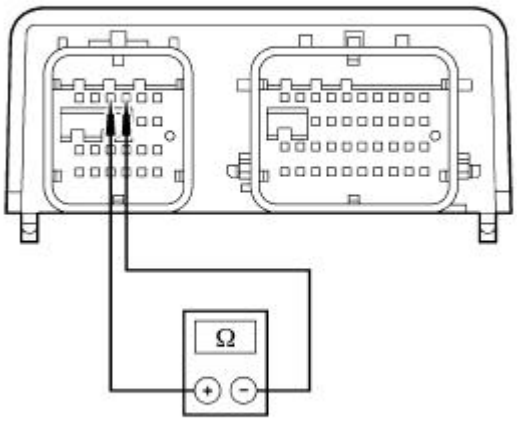
 A0041212 ● **Are the resistances greater than 1,000,000 ohms?**	Due to the shorting bar feature in the electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit 614 (GY/OG) or circuit 615 (GY/WH). GO to H39 .
H5 CHECK CIRCUIT 614 (GY/OG) AND CIRCUIT 615 (GY/WH) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND THE DRIVER AIR BAG MODULE	
● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: Driver Air Bag Module Squib 1 Restraint System Diagnostic Tool. ● Disconnect: RCM C310a. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Key in ON position. ● Measure the voltage between RCM C310a pin 1, circuit 614 (GY/OG), harness side and ground; and between RCM C310a pin 2, circuit 615 (GY/WH), harness side and ground.  A0041263 ● **Are the voltages less than 0.2 volt?**	**Yes** GO to H37 . **No** GO to H6 .
H6 CHECK CIRCUIT 614 (GY/OG) AND CIRCUIT 615 (GY/WH) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND THE CLOCKSPRING	
● Key in OFF position. ● Disconnect: Clockspring C218a. ● Key in ON position. ● Measure the voltage between RCM C310a pin 1, circuit 614 (GY/OG), harness side and ground; and between RCM C310a pin 2, circuit 615 (GY/WH), harness side and ground.	**Yes** INSTALL a new clockspring. REFER to Clockspring in this section. GO to H39 . **No** Due to the shorting bar feature in the electrical connector, the fault can exist in

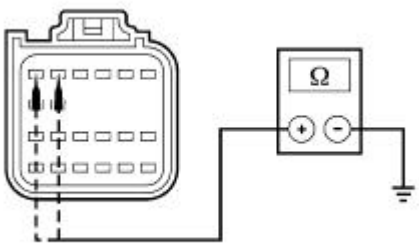
 A0041263 ● **Are the voltages less than 0.2 volt?**	either circuit. Do not remove or defeat the shorting bar. REPAIR circuit 614 (GY/OG) or 615 (GY/WH). GO to H39 .
H7 CHECK CIRCUIT 614 (GY/OG) AND CIRCUIT 615 (GY/WH) FOR AN OPEN BETWEEN THE RCM AND THE DRIVER AIR BAG MODULE	
● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: Driver Air Bag Module Squib 1 Restraint System Diagnostic Tool. ● Disconnect: RCM C310a. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Measure the resistance between RCM C310a pin 1, circuit 614 (GY/OG), harness side and driver air bag module squib 1, circuit 614 (GY/OG), harness side.  A0048570 ● **Is the resistance less than 0.5 ohm?**	**Yes** GO to H9 . **No** GO to H8 .
H8 CHECK CIRCUIT 614 (GY/OG) FOR AN OPEN BETWEEN THE RCM AND THE CLOCKSPRING	
● Disconnect: Clockspring C218a. ● Measure the resistance between RCM C310a pin 1, circuit 614 (GY/OG), harness side and clockspring C218a pin 4, circuit 614 (GY/OG), harness side.  A0049601 ● **Is the resistance less than 0.5 ohm?**	**Yes** INSTALL a new clockspring. REFER to Clockspring in this section. GO to H39 . **No** REPAIR circuit 614 (GY/OG). GO to H39 .
H9 CHECK CIRCUIT 615 (GY/WH) FOR AN OPEN BETWEEN THE RCM AND THE DRIVER AIR BAG MODULE	



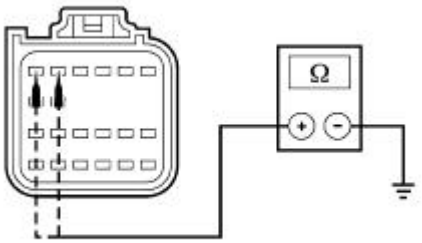


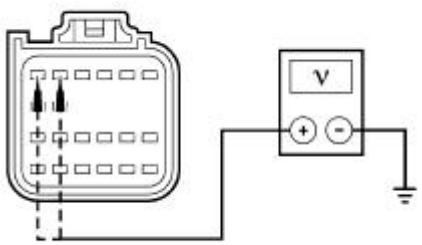
• Measure the resistance between RCM C310a pin 2, circuit 615 (GY/WH), harness side and driver air bag module squib 1, circuit 615 (GY/WH), harness side.  • **Is the resistance less than 0.5 ohm?**	**Yes** GO to H37 . **No** GO to H10 .
H10 CHECK CIRCUIT 615 (GY/WH) FOR AN OPEN BETWEEN THE RCM AND THE CLOCKSPRING	
• Disconnect: Clockspring C218a. • Measure the resistance between RCM C310a pin 2, circuit 615 (GY/WH), harness side and clockspring C218a pin 3, circuit 615 (GY/WH), harness side.  • **Is the resistance less than 0.5 ohm?**	**Yes** INSTALL a new clockspring. REFER to Clockspring in this section. GO to H39 . **No** REPAIR circuit 615 (GY/WH). GO to H39 .
H11 CHECK CIRCUIT 614 (GY/OG) AND CIRCUIT 615 (GY/WH) FOR LOW RESISTANCE BETWEEN THE DRIVER AIR BAG MODULE AND THE RCM	
• Key in OFF position. • Disconnect: Driver Air Bag Module Squib 1 Restraint System Diagnostic Tool. • Measure the resistance between driver air bag module squib 1, circuit 614 (GY/OG) and circuit 615 (GY/WH), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H37 . **No** GO to H12 .
H12 MEASURE RESISTANCE BETWEEN RCM CIRCUIT 614 (GY/OG) AND CIRCUIT 615 (GY/WH)	
• For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .	**Yes** GO to H13 .



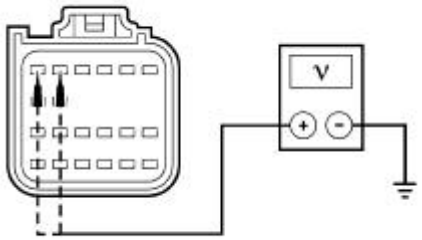


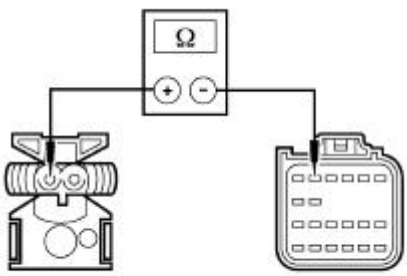
• Disconnect: RCM C310a. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between RCM C310a pin 1, circuit 614 (GY/OG), and pin 2, circuit 615 (GY/WH), component side.  A0041266 • **Is the resistance greater than 10,000 ohms?**	**No** GO to H37 .
H13 CHECK CIRCUIT 614 (GY/OG) AND CIRCUIT 615 (GY/WH) FOR LOW RESISTANCE BETWEEN THE CLOCKSPRING AND THE RCM	
• Connect: RCM C310a. • Disconnect: Clockspring C218a. • Measure the resistance between clockspring C218a pin 4, circuit 614 (GY/OG) and pin 3, circuit 615 (GY/WH), harness side.  A0029872 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new clockspring. REFER to Clockspring in this section. GO to H39 . **No** REPAIR circuit 614 (GY/OG) and circuit 615 (GY/WH). GO to H39 .
H14 CHECK CIRCUIT 607 (LB/OG) AND CIRCUIT 616 (PK/BK) FOR A SHORT TO GROUND BETWEEN THE RCM AND THE PASSENGER AIR BAG MODULE	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: Passenger Air Bag Module Restraint System Diagnostic Tool. • Disconnect: RCM C310a. • For vehicles equipped with a 60/40 split bench seat, connect the battery	**Yes** GO to H37 . **No** Due to the shorting bar feature in the electrical

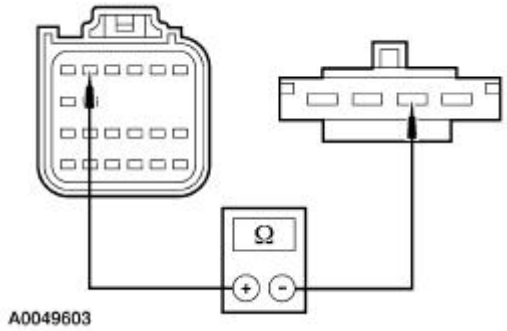




ground cable. For additional information, refer to Section 414-01 . ● Measure the resistance between RCM C310a pin 3, circuit 607 (LB/OG), harness side and ground; and between RCM C310a pin 4, circuit 616 (PK/BK), harness side and ground.  A0041267 ● **Are the resistances greater than 1,000,000 ohms?**	connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit 607 (LB/OG) or 616 (PK/BK). GO to H39 .
H15 CHECK CIRCUIT 607 (LB/OG) AND CIRCUIT 616 (PK/BK) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND THE PASSENGER AIR BAG MODULE	
● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: Passenger Air Bag Module Restraint System Diagnostic Tool. ● Disconnect: RCM C310a. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Key in ON position. ● Measure the voltage between RCM C310a pin 3, circuit 607 (LB/OG), harness side and ground; and between RCM C310a pin 4, circuit 616 (PK/BK), harness side and ground.  A0041268 ● **Are the voltages less than 0.2 volt?**	**Yes** GO to H37 . **No** Due to the shorting bar feature in the electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit 607 (LB/OG) or circuit 616 (PK/BK). GO to H39 .
H16 CHECK CIRCUIT 607 (LB/OG) FOR AN OPEN BETWEEN THE RCM AND THE PASSENGER AIR BAG MODULE	
● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: Passenger Air Bag Module Restraint System Diagnostic Tool. ● Disconnect: RCM C310a. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Measure the resistance between RCM C310a pin 3, circuit 607 (LB/OG), harness side and passenger air bag module C256 pin 3, circuit 607 (LB/OG), harness side.	**Yes** GO to H17 . **No** REPAIR circuit 607 (LB/OG). GO to H39 .

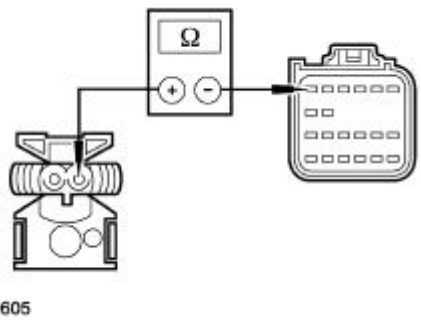


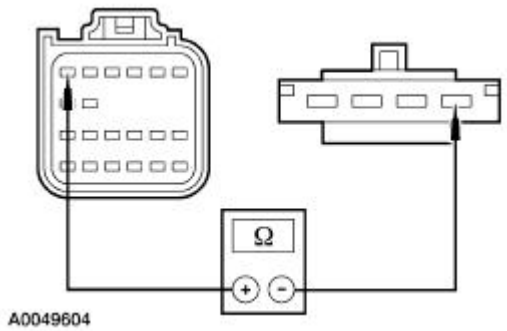




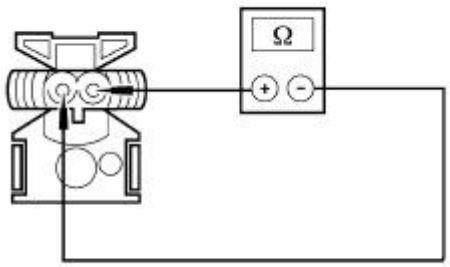
- **Is the resistance less than 0.5 ohm?**

H17 CHECK CIRCUIT 616 (PK/BK) FOR AN OPEN BETWEEN THE RCM AND THE PASSENGER AIR BAG MODULE	
• Measure the resistance between RCM C310a pin 4, circuit 616 (PK/BK), harness side and passenger air bag module C256 pin 4, circuit 616 (PK/BK), harness side.  • **Is the resistance less than 0.5 ohm?**	**Yes** GO to H37 . **No** REPAIR circuit 616 (PK/BK). GO to H39 .
H18 CHECK CIRCUIT 607 (LB/OG) AND CIRCUIT 616 (PK/BK) FOR LOW RESISTANCE BETWEEN THE PASSENGER AIR BAG MODULE AND THE RCM	
• Key in OFF position. • Disconnect: Passenger Air Bag Module Restraint System Diagnostic Tool. • Measure the resistance between passenger air bag module C256 pin 3, circuit 607 (LB/OG), and pin 4, circuit 616 (PK/BK), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H37 . **No** GO to H19 .
H19 MEASURE THE RESISTANCE BETWEEN RCM CIRCUITS 607 (LB/OG) AND CIRCUIT 616 (PK/BK)	
• For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310a. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 .	**Yes** REPAIR circuit 607 (LB/OG) and circuit 616 (PK/BK). GO to H22 .



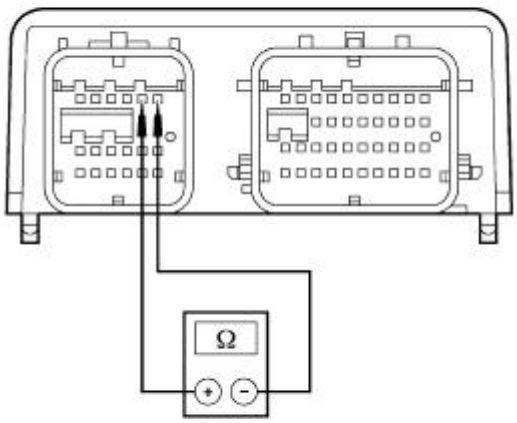


• Measure the resistance between RCM C310a pin 3, circuit 607 (LB/OG), and pin 4, circuit 616 (PK/BK), component side.  A0041271 • **Is the resistance greater than 10,000 ohms?**	**No** GO to H37 .
H20 CHECK CIRCUIT 1516 (YE/WH) AND CIRCUIT 1517 (RD/OG) FOR A SHORT TO GROUND BETWEEN THE RCM AND THE DRIVER AIR BAG MODULE	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310a. • Disconnect: Driver Air Bag Module Squib 2 Restraint System Diagnostic Tool. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between the RCM C310a pin 5, circuit 1516 (YE/WH), harness side and ground; and between the RCM C310a pin 6, circuit 1517 (RD/OG), harness side and ground.  A0041272 • **Are the resistances greater than 1,000,000 ohms?**	**Yes** GO to H37 . **No** GO to H21 .
H21 CHECK CIRCUIT 1516 (YE/WH) AND CIRCUIT 1517 (RD/OG) FOR A SHORT TO GROUND BETWEEN THE RCM AND THE CLOCKSPRING	
• Disconnect: Clockspring C218a. • Measure the resistance between the RCM C310a pin 5, circuit 1516 (YE/WH), harness side and ground; and between the RCM C310a pin	**Yes** INSTALL a new clockspring.

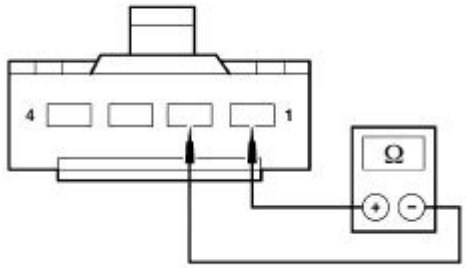


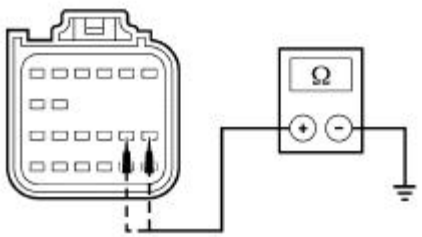
6, circuit 1517 (RD/OG), harness side and ground.  A0041272 ● **Are the resistances greater than 1,000,000 ohms?**	REFER to Clockspring in this section. GO to H39 . **No** Due to the shorting bar feature in the electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit 1516 (YE/WH) or 1517 (RD/OG). GO to H39 .
H22 CHECK CIRCUIT 1516 (YE/WH) AND CIRCUIT 1517 (RD/OG) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND THE DRIVER AIR BAG MODULE	
● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: Driver Air Bag Module Squib 2 Restraint System Diagnostic Tool. ● Disconnect: RCM C310a. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Key in ON position. ● Measure the voltage between the RCM C310a pin 5, circuit 1516 (YE/WH), harness side and ground; and between the RCM C310a pin 6, circuit 1517 (RD/OG), harness side and ground.  A0041273 ● **Are the voltages less than 0.2 volt?**	**Yes** GO to H37 . **No** GO to H23 .
H23 CHECK CIRCUIT 1516 (YE/WH) AND CIRCUIT 1517 (RD/OG) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND THE CLOCKSPRING	
● Key in OFF position. ● Disconnect: Clockspring C218a. ● Key in ON position. ● Measure the voltage between the RCM C310a pin 5, circuit 1516 (YE/WH), harness side and ground; and between the RCM C310a pin 6, circuit 1517 (RD/OG), harness side and ground.	**Yes** INSTALL a new clockspring. REFER to Clockspring in this section. GO to H39 .

 A0041273 ● **Are the voltages less than 0.2 volt?**	**No** Due to the shorting bar feature in the electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit 1516 (YE/WH) or 1517 (RD/OG). GO to H39 .
H24 CHECK CIRCUIT 1516 (YE/WH) FOR AN OPEN BETWEEN THE RCM AND THE DRIVER AIR BAG MODULE	
● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: Driver Air Bag Module Squib 2 Restraint System Diagnostic Tool. ● Disconnect: RCM C310a. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Measure the resistance between the RCM C310a pin 5, circuit 1516 (YE/WH), harness side and the driver air bag module squib 2, circuit 1516 (YE/WH), harness side.  A0049606 ● **Is the resistance less than 0.5 ohm?**	**Yes** GO to H26 . **No** GO to H25 .
H25 CHECK CIRCUIT 1516 (YE/WH) FOR AN OPEN BETWEEN THE RCM AND THE CLOCKSPRING	
● Disconnect: Clockspring C218a. ● Measure the resistance between the RCM C310a pin 5, circuit 1516 (YE/WH), harness side and the clockspring C218a pin 2, circuit 1516 (YE/WH), harness side.	**Yes** INSTALL a new clockspring. REFER to Clockspring . GO to H39 . **No** REPAIR circuit 1516 (YE/WH). GO to H39 .

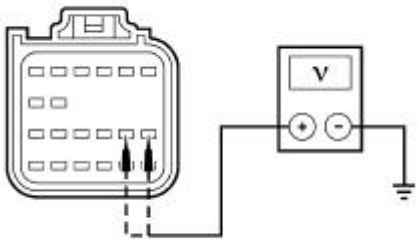


- **Is the resistance less than 0.5 ohm?**



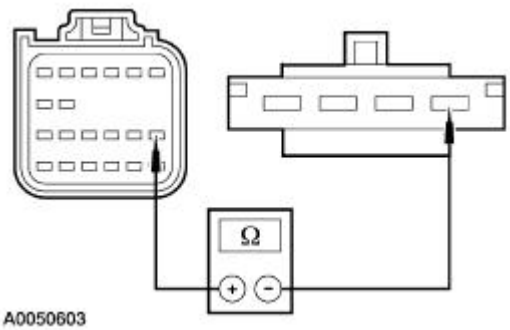


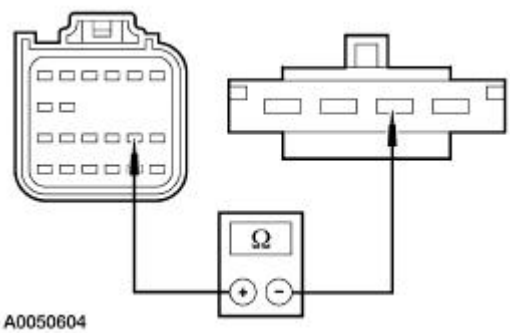
H26 CHECK CIRCUIT 1517 (RD/OG) FOR AN OPEN BETWEEN THE RCM AND THE DRIVER AIR BAG MODULE	
• Measure the resistance between the RCM C310a pin 6, circuit 1517 (RD/OG), harness side and the driver air bag module squib 2, circuit 1517 (RD/OG), harness side.  • **Is the resistance less than 0.5 ohm?**	**Yes** GO to H37 . **No** GO to H27 .
H27 CHECK CIRCUIT 1517 (RD/OG) FOR AN OPEN BETWEEN THE RCM AND THE CLOCKSPRING	
• Disconnect: Clockspring C218a. • Measure the resistance between the RCM C310a pin 6, circuit 1517 (RD/OG), harness side and the clockspring C218a pin 1, circuit 1517 (RD/OG), harness side.  • **Is the resistance less than 0.5 ohm?**	**Yes** INSTALL a new clockspring. REFER to Clockspring in this section. GO to H39 . **No** REPAIR circuit 1517 (RD/OG). GO to H39 .
H28 CHECK FOR LOW RESISTANCE ON CIRCUITS 1516 (YE/WH) AND 1517 (RD/OG) BETWEEN THE RCM AND THE DRIVER AIR BAG MODULE	
• Key in OFF position. • Disconnect: Driver Air Bag Module Squib 2 Restraint System Diagnostic Tool. • Measure the resistance between the driver air bag module squib 2, circuit 1516 (YE/WH), harness side and circuit 1517 (RD/OG), harness side.	**Yes** GO to H37 . **No** GO to H29 .



A0030495

- **Is the resistance greater than 10,000 ohms?**





H29 MEASURE THE RESISTANCE BETWEEN THE RCM CIRCUIT 1516 (YE/WH) AND CIRCUIT 1517 (RD/OG)	
• For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310a. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between the RCM C310a pin 5, circuit 1516 (YE/WH), component side and pin 6, circuit 1517 (RD/OG), component side.  A0041276 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H30 . **No** GO to H37 .
H30 CHECK FOR LOW RESISTANCE ON CIRCUIT 1516 (YE/WH) AND CIRCUIT 1517 (RD/OG) BETWEEN THE DRIVER AIR BAG MODULE AND THE CLOCKSPRING	
• Connect: RCM C310a. • Disconnect: Clockspring C218a. • Measure the resistance between the clockspring C218a pin 2, circuit 1516 (YE/WH), harness side and pin 1, circuit 1517 (RD/OG), harness side.	**Yes** INSTALL a new clockspring. REFER to Clockspring in this section. GO to H39 .

 A0029882 ● **Is the resistance greater than 10,000 ohms?**	**No** REPAIR circuit 1516 (YE/WH) and circuit 1517 (RD/OG). GO to H39 .
H31 CHECK CIRCUIT 1518 (RD/WH) AND CIRCUIT 1519 (LG/RD) FOR A SHORT TO GROUND BETWEEN THE RCM AND THE PASSENGER AIR BAG MODULE	
● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: Passenger Air Bag Module Restraint System Diagnostic Tool. ● Disconnect: RCM C310a. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Measure the resistance between the RCM C310a pin 13, circuit 1518 (RD/WH), harness side and ground; and between the RCM C310a pin 14, circuit 1519 (LG/RD), harness side and ground.  A0041277 ● **Are the resistances greater than 1,000,000 ohms?**	**Yes** GO to H37 . **No** Due to the shorting bar feature in the electrical connector, the fault can exist in either circuit. REPAIR circuit 1518 (RD/WH) or circuit 1519 (LG/RD). GO to H39 .
H32 CHECK CIRCUIT 1518 (RD/WH) AND CIRCUIT 1519 (LG/RD) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND THE PASSENGER AIR BAG MODULE	
● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: Passenger Air Bag Module Restraint System Diagnostic Tool. ● Disconnect: RCM C310a. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Key in ON position. ● Measure the voltage between the RCM C310a pin 13, circuit 1518 (RD/WH), harness side and ground; and between the RCM C310a pin 14, circuit 1519 (LG/RD), harness side and ground.	**Yes** GO to H37 . **No** Due to the shorting bar feature in the electrical connector, the fault can exist in either circuit. REPAIR circuit 1518 (RD/WH) or circuit 1519 (LG/RD). GO to H39 .

A0041278

- **Are the voltages less than 0.2 volt?**

H33 CHECK CIRCUIT 1518 (RD/WH) FOR AN OPEN BETWEEN THE RCM AND THE PASSENGER AIR BAG MODULE	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: Passenger Air Bag Module Restraint System Diagnostic Tool. • Disconnect: RCM C310a. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between the RCM C310a pin 13, circuit 1518 (RD/WH), harness side and the passenger air bag module C256 pin 1, circuit 1518 (RD/WH), harness side.  A0050603 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to H34 . **No** REPAIR circuit 1518 (RD/WH). GO to H39 .
H34 CHECK CIRCUIT 1519 (LG/RD) FOR AN OPEN BETWEEN THE RCM AND THE PASSENGER AIR BAG MODULE	
• Measure the resistance between the RCM C310a pin 14, circuit 1519 (LG/RD), harness side and the passenger air bag module C256 pin 2, circuit 1519 (LG/RD), harness side.  A0050604 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to H37 . **No** REPAIR circuit 1519 (LG/RD). GO to H39 .
H35 CHECK FOR LOW RESISTANCE ON CIRCUIT 1518 (RD/WH) AND CIRCUIT 1519 (LG/RD) BETWEEN THE RCM AND THE PASSENGER AIR BAG MODULE	

• Key in OFF position. • Disconnect: Passenger Air Bag Module Restraint System Diagnostic Tool. • Measure the resistance between the passenger air bag module C256 pin 1, circuit 1518 (RD/WH), harness side and pin 2, circuit 1519 (LG/RD), harness side.  A0029882 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H37 . **No** GO to H36 .
H36 MEASURE THE RESISTANCE BETWEEN THE RCM CIRCUIT 1518 (RD/WH) AND CIRCUIT 1519 (LG/RD)	
• For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310a. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between the RCM C310a pin 13, circuit 1518 (RD/WH), component side and pin 14, circuit 1519 (LG/RD), component side.  A0041281 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit 1518 (RD/WH) and circuit 1519 (LG/RD). GO to H39 . **No** GO to H37 .
H37 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system diagnostic tools, sensor electrical connectors and the RCM electrical connector are connected before carrying out the on-demand self-test. If not, erroneous DTCs will be recorded	**Yes** If a **"?"** was flagged by the scan tool,

• Key in OFF position. • Connect: Restraint System Diagnostic Tools. • Connect: RCM C310a. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • Retrieve and record any flagged faults. • **Was DTC B2293 retrieved during the on-demand self test?**	CARRY OUT the entire pinpoint test before installing a new RCM. INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to H39 . **No** Fault corrected. GO to H39 .
H38 CHECK FOR AN INTERMITTENT FAULT **WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.** **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner	**Yes** CHECK for causes of the intermittent fault at or near the affected air bag module connector. REPAIR any intermittent concerns found. If an intermittent concern **was** found and repaired, GO to H39 . If an intermittent concern **was not** found and repaired, USE the flagged faults recorded and GO to the appropriate pinpoint test step. If a flagged fault of **"?"** was recorded multiple faults exist and the entire pinpoint test must be carried out before installing a new RCM. For driver air bag module squib 1

Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2293. ● If the DTC B2293 is retrieved during the on-demand self test, retrieve and record any flagged faults. ● **Was the DTC B2293 retrieved during the on-demand self test?**	(D_ABAG) with a short to ground (STG) fault, GO to H3 . For driver air bag module squib 1 (D_ABAG) with a short to battery (STB) fault, GO to H5 . For driver air bag module squib 1 (D_ABAG) with an open circuit (O_CIR) fault, GO to H7 . For driver air bag module squib 1 (D_ABAG) with a low resistance (LOWRES) fault, GO to H11 . For passenger air bag module squib 1 (P_ABAG) with a short to ground (STG) fault, GO to H14 . For passenger air bag module squib 1 (P_ABAG) with a short to battery (STB) fault, GO to H15 . For passenger air bag module squib 1 (P_ABAG) with an open circuit (O_CIR) fault, GO to H16 . For passenger air bag module squib 1 (P_ABAG) with a low resistance

		(LOWRES) fault, GO to H18 . For driver air bag module squib 2 (D_ABAG2) with a short to ground (STG) fault, GO to H20 . For driver air bag module squib 2 (D_ABAG2) with a short to battery (STB) fault, GO to H22 . For driver air bag module squib 2 (D_ABAG2) with an open circuit (O_CIR) fault, GO to H24 . For driver air bag module squib 2 (D_ABAG2) with a low resistance (LOWRES) fault, GO to H28 . For passenger air bag module squib 2 (P_ABAG2) with a short to ground (STG) fault, GO to H31 . For passenger air bag module squib 2 (P_ABAG2) with a short to battery (STB) fault, GO to H32 . For passenger air bag module squib 2 (P_ABAG2) with an open circuit (O_CIR) fault,

	GO to H33 . For passenger air bag module squib 2 (P_ABAG2) with a low resistance (LOWRES) fault, GO to H35 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to H39 .
H39 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous DTCs recorded during Step H1. • **Were any continuous DTCs retrieved during Step H1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) . CLEAR all DTCs.

Normal Operation

The restraints control module (RCM) checks all safety canopy module circuits for faults. If the RCM detects one of the following faults on any of the safety canopy module circuits, it will store diagnostic trouble code (DTC) B2294 in memory and flash, depending on the fault, either lamp fault code (LFC) 24 or 25 depending on the fault (or higher priority code if one exists) on the air bag indicator.

Fault Conditions

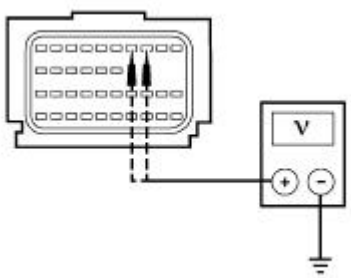
The RCM monitors for the following fault conditions:

- low resistance.
- circuit open.
- circuit short to voltage.
- circuit short to ground.

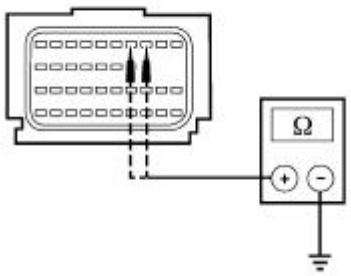
Possible Causes

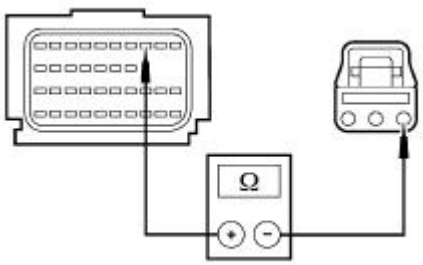
A safety canopy module status fault can be caused by:

- damaged wiring, terminals, or connectors.
- a faulty safety canopy module.
- a faulted RCM.



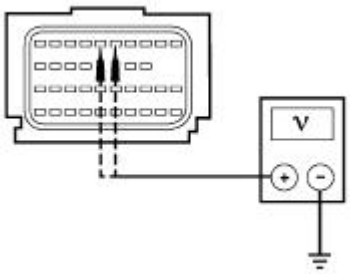
PINPOINT TEST I: LFC 24 AND 25/DTC B2294 — RESTRAINT SYSTEM SAFETY CANOPY MODULE STATUS

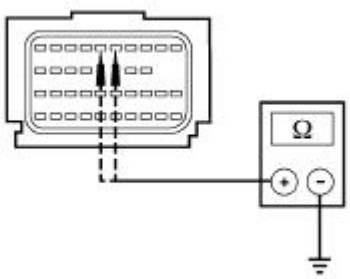




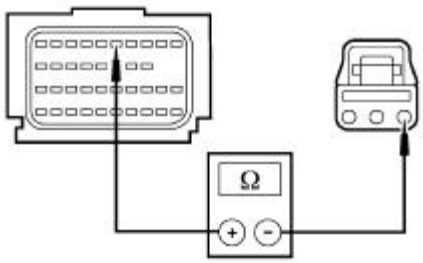
Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
I1 CHECK FOR A HARD OR INTERMITTENT DTC	
• Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. • Retrieve, flag and record any continuous DTCs for use later in this pinpoint test. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • Enter the following diagnostic mode on the diagnostic tool: Flag B2294. • Retrieve and record any flagged faults for use later in this pinpoint test. • **Was DTC B2294 retrieved during the on-demand self test?**	**Yes** **For vehicles with safety canopy modules:** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self

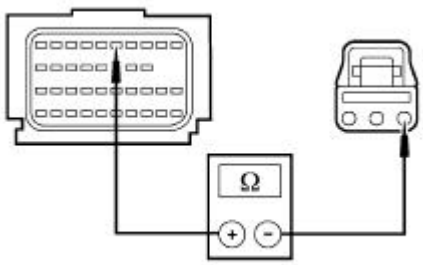
	test.GO to I3 . **For vehicles without safety canopy modules:** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.GO to I2 . **No** This is an intermittent fault. The fault condition is not present at this time. GO to I17 .
I2 CHECK THE SAFETY CANOPY MODULE BRIDGE RESISTOR	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint**	**Yes** Using the flagged faults recorded Step I1, GO to the appropriate pinpoint test step. If a flagged fault of **"?"** was recorded in Step I1, multiple faults exist and the entire pinpoint test must be carried out before installing a new RCM. For passenger safety canopy module (PFCURTN) with a short to battery (STB) fault, GO to I10 . For passenger safety canopy module (PFCURTN)

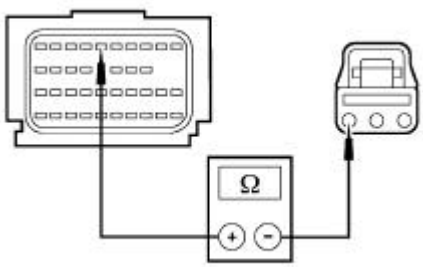




system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Disconnect: RH Side Safety Canopy Bridge Resistor. ● Install a known good safety canopy bridge resistor. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2294. ● **Was DTC B2294 retrieved during the on-demand self test?**	with a short to ground (STG) fault, GO to I11 . For passenger safety canopy module (PFCURTN) with an open circuit (O_CIR) fault, GO to I12 . For passenger safety canopy module (PFCURTN) with a low resistance (LOWRES) fault, GO to I14 . **No** Fault Corrected. GO to I18 .
I3 CHECK THE DRIVER AND PASSENGER SAFETY CANOPY MODULES	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint**	**Yes** Using the flagged faults recorded in Step I1, GO to the appropriate pinpoint test step. If a flagged fault of **"?"** was recorded in Step I1, multiple faults exist and the entire pinpoint test must be carried out before installing a new RCM. For driver safety canopy module (DFCURTN) with a short to battery (STB) fault, GO to I4 . For driver safety canopy module (DFCURTN) with a short to ground (STG) fault, GO to I5 .

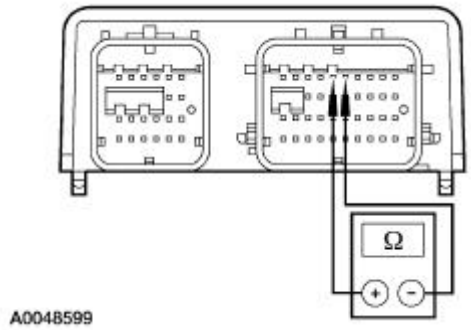






system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B2294 retrieved during the on-demand self test?**	For driver safety canopy module (DFCURTN) with an open circuit (O_CIR) fault, GO to I6 . For driver safety canopy module (DFCURTN) with a low resistance (LOWRES) fault, GO to I8 . For passenger safety canopy module (PFCURTN) with a short to battery (STB) fault, GO to I10 . For passenger safety canopy module (PFCURTN) with a short to ground (STG) fault, GO to I11 . For passenger safety canopy module (PFCURTN) with an open circuit (O_CIR) fault, GO to I12 . For passenger safety canopy module (PFCURTN) with a low resistance (LOWRES) fault, GO to I14 . **No** If a flagged fault of **"?"** was recorded in Step I1, multiple faults exist and the entire pinpoint test must be carried out before

	installing a new safety canopy module. If a fault was flagged against the driver safety canopy module in Step I1, INSTALL a new driver safety canopy module. REFER to Safety Canopy Module in this section. GO to I18 . If a fault was flagged against the passenger safety canopy module in Step I1, INSTALL a new passenger safety canopy module. REFER to Safety Canopy Module in this section. GO to I18 .
I4 CHECK CIRCUIT 1257 (WH/LB) AND CIRCUIT 1258 (BN/LB) FOR A SHORT TO BATTERY BETWEEN THE RCM AND THE DRIVER SAFETY CANOPY MODULE	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: Driver Side Safety Canopy Restraint System Diagnostic Tool. • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Key in ON position. • Measure the voltage between RCM C310b pin 3, circuit 1257 (WH/LB), harness side and ground; and between RCM C310b pin 4, circuit 1258 (BN/LB), harness side and ground.  A0048593 • **Are the voltages less than 0.2 volt?**	**Yes** GO to I16 . **No** Due to the shorting bar feature in the electrical connector, the fault can exist in either circuit. REPAIR circuit 1257 (WH/LB) or circuit 1258 (BN/LB). GO to I18 .
I5 CHECK CIRCUIT 1257 (WH/LB) AND CIRCUIT 1258 (BN/LB) FOR A SHORT TO GROUND BETWEEN THE RCM AND THE DRIVER SAFETY	



CANOPY MODULE	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: Driver Safety Canopy Restraint System Diagnostic Tool. • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between RCM C310b pin 3, circuit 1257 (WH/LB), harness side and ground; and between RCM C310b pin 4 circuit 1258 (BN/LB), harness side and ground.  A0048594 • **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to I16 . **No** Due to the shorting bar feature in the electrical connector, the fault can exist in either circuit. REPAIR circuit 1257 (WH/LB) or circuit 1258 (BN/LB). GO to I18 .
I6 CHECK CIRCUIT 1257 (WH/LB) FOR AN OPEN BETWEEN THE RCM AND THE DRIVER SAFETY CANOPY MODULE	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: Driver Safety Canopy Restraint System Diagnostic Tool. • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between RCM C310b pin 3, circuit 1257 (WH/LB), harness side and driver safety canopy module C9006 pin 1, circuit 1257 (WH/LB), harness side.  A0048600 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to I7 . **No** REPAIR circuit 1257 (WH/LB). GO to I18 .
I7 CHECK CIRCUIT 1258 (BN/LB) FOR AN OPEN BETWEEN THE RCM AND THE DRIVER SAFETY CANOPY MODULE	
• Measure the resistance between RCM C310b pin 4, circuit 1258 (BN/LB), harness side and driver safety canopy module C9006 pin 3, circuit 1258 (BN/LB), harness side.	**Yes** GO to I16 . **No** REPAIR circuit 1258 (BN/LB). GO to I18 .

 A0048574 ● **Is the resistance less than 0.5 ohm?**	
I8 CHECK FOR LOW RESISTANCE ON CIRCUIT 1257 (WH/LB) AND CIRCUIT 1258 (BN/LB) BETWEEN THE DRIVER SAFETY CANOPY MODULE AND THE RCM	
● Key in OFF position. ● Disconnect: Driver Safety Canopy Restraint System Diagnostic Tool. ● Measure the resistance between driver side safety canopy module C9006, circuit 1257 (WH/LB) and circuit 1258 (BN/LB), harness side.  DR1050-A ● **Is the resistance greater than 10, 000 ohms?**	**Yes** GO to I16 . **No** GO to I9 .
I9 MEASURE RESISTANCE BETWEEN RCM CIRCUIT 1257 (WH/LB) AND CIRCUIT 1258 (BN/LB)	
● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: RCM C310b. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Measure the resistance between RCM C310b pin 3, circuit 1257 (WH/LB), and pin 4, circuit 1258 (BN/LB), component side.  A0048575 ● **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit 1257 (WH/LB) and circuit 1258 (BN/LB). GO to I18 . **No** GO to I16 .
I10 CHECK CIRCUIT 1259 (YE/WH) AND CIRCUIT 1260 (BN/YE) FOR A SHORT TO BATTERY BETWEEN THE RCM AND THE PASSENGER SAFETY CANOPY MODULE	
● Key in OFF position.	**Yes**

• For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: Passenger Safety Canopy Restraint System Diagnostic Tool. • Vehicles with safety canopies. • Disconnect: RH Side Safety Canopy Bridge Resistor C9003. • Vehicles without safety canopies. • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Key in ON position. • Measure the voltage between RCM C310b pin 5, circuit 1259 (YE/WH), harness side and ground; and between RCM C310b pin 6, circuit 1260 (BN/YE), harness side and ground.  A0048595 • **Are the voltages less than 0.2 volt?**	GO to I16 . **No** Due to the shorting bar feature in the electrical connector, the fault can exist in either circuit. REPAIR circuit 1259 (YE/WH) or circuit 1260 (BN/YE). GO to I18 .
I11 CHECK CIRCUIT 1259 (YE/WH) AND CIRCUIT 1260 (BN/YE) FOR A SHORT TO GROUND BETWEEN THE RCM AND THE PASSENGER SAFETY CANOPY MODULE	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: Passenger Safety Canopy Module Restraint System Diagnostic Tool. • Vehicles with safety canopies. • Disconnect: RH Side Safety Canopy Bridge Resistor C9003. • Vehicles without safety canopies. • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between RCM C310b pin 5, circuit 1259 (YE/WH), harness side and ground; and between RCM C310b pin 6, circuit 1260 (BN/YE), harness side and ground.  A0048596 • **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to I16 . **No** Due to the shorting bar feature in the electrical connector, the fault can exist in either circuit. REPAIR circuit 1259 (YE/WH) or circuit 1260 (BN/YE). GO to I18 .
I12 CHECK CIRCUIT 1259 (YE/WH) FOR AN OPEN BETWEEN THE RCM AND THE PASSENGER SAFETY CANOPY MODULE	

• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: Passenger Safety Canopy Module Restraint System Diagnostic Tool. • Vehicles with safety canopies. • Disconnect: RH Side Safety Canopy Module Bridge Resistor C9003. • Vehicles without safety canopies. • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • **For vehicles with safety canopies** , measure the resistance between RCM C310b pin 5, circuit 1259 (YE/WH), harness side and passenger safety canopy module C9007 pin 1, circuit 1259 (YE/WH), harness side.  A0048597 • **For vehicles without safety canopies** , measure the resistance between RCM C310b pin 5, circuit 1259 (YE/WH), harness side and RH side safety canopy bridge resistor C9003 pin 1, circuit 1259 (YE/WH), harness side.  A0048597 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to I13 . **No** REPAIR circuit 1259 (YE/WH). GO to I18 .
I13 CHECK CIRCUIT 1260 (BN/YE) FOR OPEN BETWEEN THE RCM AND THE PASSENGER SAFETY CANOPY MODULE	
• **For vehicles with safety canopies** , measure the resistance between RCM C310b pin 6, circuit 1260 (BN/YE), harness side and passenger safety canopy module C9007 pin 3, circuit 1260 (BN/YE), harness side.  A0048598	**Yes** GO to I14 . **No** REPAIR circuit 1260 (BN/YE). GO to I18 .

• **For vehicles without safety canopies** , measure the resistance between RCM C310b pin 6, circuit 1260 (BN/YE), harness side and RH side safety canopy bridge resistor C9003 pin 3, circuit 1260 (BN/YE), harness side.  A0048598 • **Is the resistance less than 0.5 ohm?**	
I14 CHECK FOR LOW RESISTANCE ON CIRCUIT 1259 (YE/WH) AND CIRCUIT 1260 (BN/YE) BETWEEN THE PASSENGER SAFETY CANOPY MODULE AND THE RCM	
• Key in OFF position. • Disconnect: Passenger Safety Canopy Module Restraint System Diagnostic Tool. • Vehicles with safety canopies. • Disconnect: RH Side Safety Canopy Module Bridge Resistor. • Vehicles without safety canopies. • **For vehicles with safety canopies** , measure the resistance between passenger safety canopy module C9007, circuit 1259 (YE/WH), and circuit 1260 (BN/YE), harness side.  DR1050-A • **For vehicles without safety canopies** , measure the resistance between RH safety canopy bridge resistor C9003, circuit 1259 (YE/WH), and circuit 1260 (BN/YE), harness side.  DR1050-A • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I16 . **No** GO to I15 .
I15 MEASURE RESISTANCE BETWEEN RCM CIRCUIT 1259 (YE/WH) AND CIRCUIT 1260 (BN/YE)	
• For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional	**Yes** REPAIR circuit

information, refer to Section 414-01 . • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between RCM C310b pin 5, circuit 1259 (YE/WH), and pin 6, circuit 1260 (BN/YE), component side.  • **Is the resistance greater than 10,000 ohms?**	1259 (YE/WH) and circuit 1260 (BN/YE).GO to I18 . **No** GO to I16 .
I16 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system diagnostic tools, sensor electrical connectors and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Connect: Restraint System Diagnostic Tools. • Vehicles with safety canopies. • Connect: RH Side Safety Canopy Bridge Resistor C9003. • Vehicles without safety canopies. • Connect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • Retrieve and record any flagged faults. • **Was DTC B2294 retrieved during the on-demand self test?**	**Yes** If a **"?"** was flagged by the scan tool, CARRY OUT the entire pinpoint test before installing a new RCM. INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to I18 . **No** Fault corrected. GO to I18 .
I17 CHECK FOR AN INTERMITTENT FAULT	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can**	**Yes** CHECK for causes of the intermittent fault at or near the affected safety canopy module connector. REPAIR any intermittent concerns found. If an intermittent concern **was** found and repaired, GO to I18 .

result in personal injury.  **WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.**  **WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Key in OFF position.
- Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test.
- Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2294.
- If the DTC B2294 is retrieved during the on-demand self test, retrieve and record any flagged faults.
- **Was DTC B2294 retrieved during on-demand self test?**

If an intermittent concern **was not** found and repaired, USE the flagged faults recorded and GO to the appropriate pinpoint test step.

If a flagged fault of **"?"** was recorded in Step I1, multiple faults exist and the entire pinpoint test must be carried out before installing a new RCM.

For driver safety canopy module (DFCURTN) with a short to battery (STB) fault, GO to I4 .

For driver safety canopy module (DFCURTN) with a short to ground (STG) fault, GO to I5 .

For driver safety canopy module (DFCURTN) with an open circuit (O_CIR) fault, GO to I6 .

For driver safety canopy module (DFCURTN) with a low resistance (LOWRES) fault, GO to I8 .

For passenger safety canopy module (PFCURTN) with a short to battery (STB) fault, GO to I10 .

For passenger safety canopy

	module (PFCURTN) with a short to ground (STG) fault, GO to I11 . For passenger safety canopy module (PFCURTN) with an open circuit (O_CIR) fault, GO to I12 . For passenger safety canopy module (PFCURTN) with a low resistance (LOWRES) fault, GO to I14 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to I18 .
I18 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous DTCs recorded during Step I1. • **Were any continuous DTCs retrieved during Step I1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system.

	REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. CLEAR all DTCs.

Pinpoint Test J: LFC 42, 43, 44, 45 and 46/DTC B2296 — Restraint System - Impact Sensor Status

Normal Operation

The restraints control module (RCM) checks all of the impact sensor circuits for faults. If the RCM detects one of the following faults on any of the impact sensor circuits, it will store diagnostic trouble code (DTC) B2296 in memory and flash either lamp fault code (LFC) 42, 43, 44, 45 or 46 depending on the fault (or higher priority code if one exists) on the air bag indicator.

Fault Conditions

The RCM monitors for the following fault conditions:

- low resistance.
- circuit open.
- circuit short to voltage.
- circuit short to ground.

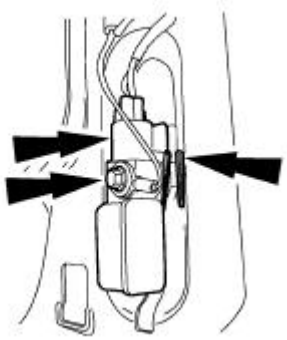
Possible Causes

A impact sensor status fault can be caused by:

- damaged wiring, terminals, or connectors.
- a faulty impact sensor.
- incorrect sensor mounting.
- a faulted RCM.

PINPOINT TEST J: LFC 42, 43, 44, 45 AND 46/DTC B2296 — RESTRAINT SYSTEM IMPACT SENSOR STATUS

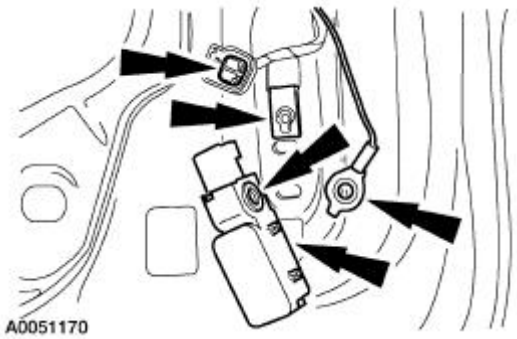
Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module	



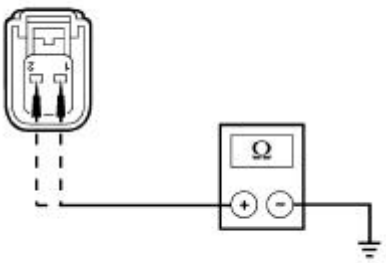
(RCM) in this section.

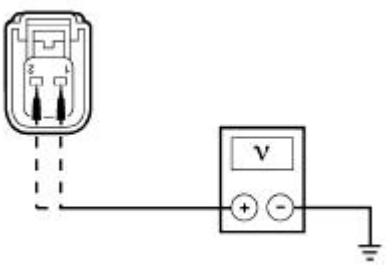
J1 CHECK FOR A HARD OR INTERMITTENT DTC	
• Enter the following diagnostic mode on the diagnostic tool: Retrieve/Flag Continuous DTCs. • Retrieve, flag and record any continuous DTCs for use later in this pinpoint test. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. • Retrieve and record any flagged faults for use later in this pinpoint test. • **Was DTC B2296 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. If a flagged fault of **"?"** was recorded, multiple faults exist and the entire pinpoint test must be carried out before installing a new RCM. For first row driver side impact (F_D_SEN) sensor with a mounting/communications (COMM) fault, GO to J2 . For first row driver side impact sensor (F_D_ SEN) with an internal fault (INT) fault, INSTALL a new first row driver side impact sensor. REFER to Side Impact Sensor—Front Row in this section. GO to J54 . For first row passenger side impact sensor (F_P_ SEN) with a mounting/communications (COMM) fault, GO to J12 . For first row passenger side impact sensor (F_P_ SEN) with an internal fault (INT) fault, INSTALL a new first row passenger side impact sensor. REFER to Side Impact Sensor—Front Row in this section. GO to J54 . For second row driver side impact sensor(D_2_SEN) with a mounting/communication (COMM) fault, GO to J22 . For second row driver side impact sensor (D_2_ SEN) with an internal (INT) fault, INSTALL a new second row driver side impact sensor. REFER to Side Impact Sensor—Second Row in this section. GO to J54 .

	For second row passenger side impact sensor (P_2_ SEN) with a mounting /communications (COMM) fault, GO to J32 . For second row passenger side impact sensor (P_2_SEN) with an internal (INT) fault, INSTALL a new second row passenger side impact sensor. REFER to Side Impact Sensor—Second Row in this section. GO to J54 . For front impact severity sensor (FNT_SEN) with a mounting/communications (COMM) fault, GO to J42 . For front impact severity sensor (FNT_SEN) with an internal fault (INT) fault, INSTALL a new front impact severity sensor. REFER to Front Impact Severity Sensor in this section. GO to J54 . **No** This is an intermittent fault. The fault condition is not present at this time. GO to J53 .
J2 INSPECT THE FIRST ROW DRIVER SIDE IMPACT SENSOR MOUNTING, AND MOUNTING SURFACE	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.** **WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped**	**Yes** CLEAN and TIGHTEN the bolt. REPAIR the mounting surface as necessary. REINSTALL the first row driver side impact sensor. GO to J54 . **No** GO to J3 .

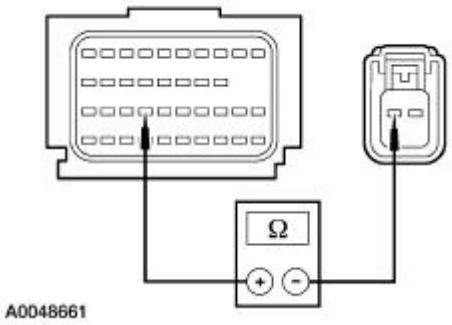


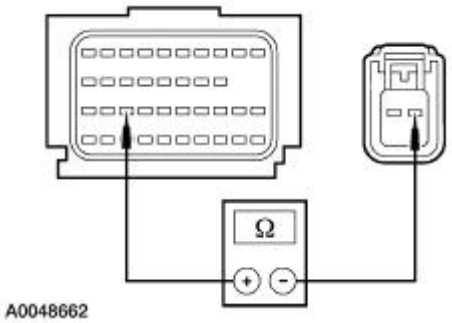
vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. **WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

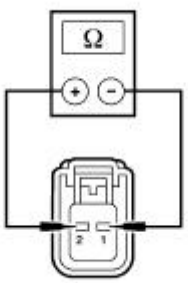




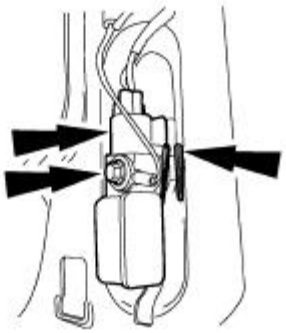
- Key in OFF position.
- Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.
- Access the first row driver side impact sensor located behind the front door trim panel. For additional information, refer to Side Impact Sensor—Front Row in this section.
- Inspect the first row driver side impact sensor for:
    - loose electrical connector and ground wire.
    - damaged J-clip.
    - loose sensor mounting bolt.

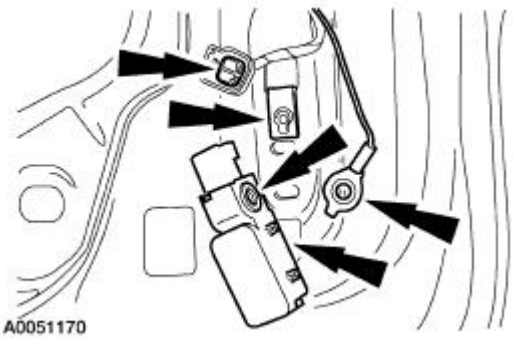






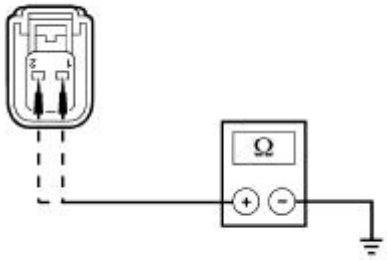
A0051169

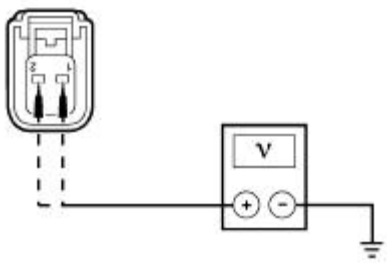


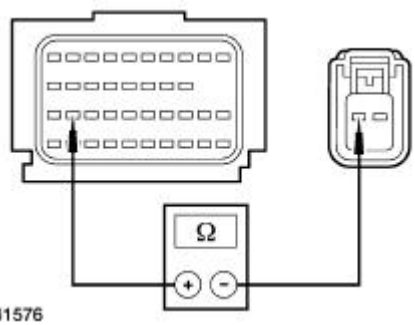


- **CAUTION: The ground wire must be placed between the bolt head and the sensor. Never position the ground wire between the J-clip retaining nut and the sensor.**
- **CAUTION: Always replace the J-clip retaining nut whenever installing a side impact sensor.**
- Remove the first row driver side impact sensor.
- Visually inspect the first row driver side impact sensor, alignment tabs, electrical connectors, J-clip and mounting surface for damage, corrosion or dirt.

 A0051170 ● **Was a significant amount of corrosion or dirt found, or was the first row driver side impact sensor attached to the mounting surface incorrectly or was the impact sensor bolt not fully seated and tightened correctly?**	
J3 INSTALL THE FIRST ROW DRIVER SIDE IMPACT SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST	**Yes** GO to J4 . **No** Fault corrected. GO to J54 .
CAUTION: The ground wire must be placed between the bolt head and the sensor. Never position the ground wire between the J-clip retaining nut and the sensor. CAUTION: Always replace the J-clip retaining nut whenever installing a side impact sensor. ● Clean and repair the mounting surface as necessary. ● Clean the first row driver side impact sensor mounting bolt. ● Install the first row driver side impact sensor. ● Key in ON position. ● Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. ● Retrieve and record any flagged faults for use later in this pinpoint test. ● **Was DTC B2296 retrieved during the on-demand self test?**	
J4 CHECK THE FIRST ROW DRIVER SIDE IMPACT SENSOR GROUND CIRCUIT 1262 (BN/LG) FOR HIGH RESISTANCE	**Yes** GO to J6 . **No** GO to J5 .
● Key in OFF position. ● Disconnect: First Row Driver Side Impact Sensor C539. ● Measure the resistance between first row driver side impact sensor C539 pin 1, circuit 1262 (BN/LG), harness side and the first row driver side impact sensor case ground. ● **Is the resistance less than 100 ohms?**	
J5 CLEAN THE FIRST ROW DRIVER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT THE ON-DEMAND SELF TEST	**Yes** GO to J6 . **No** Fault corrected. GO to J54 .
CAUTION: The ground wire must be placed between the bolt head and the sensor. Never position the ground wire between the J-clip retaining nut and the sensor. CAUTION: Always replace the J-clip retaining nut whenever installing a side impact sensor. ● Remove the first row driver side impact sensor. ● Clean and repair the mounting surface as necessary. ● Clean the first row driver side impact sensor mounting bolt. ● Install the first row driver side impact sensor. ● Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. ● Retrieve and record any flagged faults for use later in this	





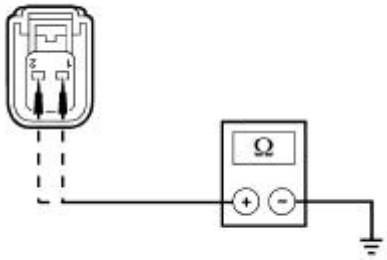


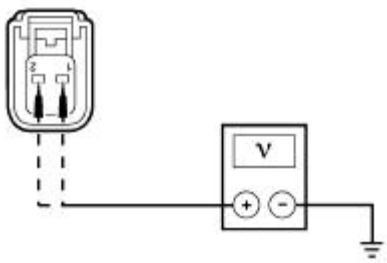
pinpoint test. ● **Was DTC B2296 retrieved during the on-demand self test?**	
J6 CHECK CIRCUIT 1261 (WH/LG) AND CIRCUIT 1262 (BN/LG) FOR A SHORT TO GROUND BETWEEN THE FIRST ROW DRIVER SIDE IMPACT SENSOR AND THE RCM	
● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: RCM C310a. ● Disconnect: RCM C310b. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Measure the resistance between first row driver side impact sensor C539 pin 1, circuit 1262 (BN/LG), harness side and ground; and between pin 2, circuit 1261 (WH/LG), harness side and ground.  A0029893 ● **Are the resistances greater than 1,000,000 ohms?**	**Yes** GO to J7 . **No** REPAIR circuit 1261 (WH/LG) or circuit 1262 (BN/LG). GO to J54 .
J7 CHECK CIRCUIT 1261 (WH/LG) AND CIRCUIT 1262 (BN/LG) FOR A SHORT TO VOLTAGE BETWEEN THE FIRST ROW DRIVER SIDE IMPACT SENSOR AND THE RCM	
● Key in ON position. ● Measure the voltage between first row driver side impact sensor C539 pin 1, circuit 1262 (BN/LG), harness side and ground; and between pin 2, circuit 1261 (WH/LG), harness side and ground.  A0029894 ● **Are the voltages less than 0.2 volt?**	**Yes** GO to J8 . **No** REPAIR circuit 1261 (WH/LG) or circuit 1262 (BN/LG). GO to J54 .
J8 CHECK CIRCUIT 1261 (WH/LG) FOR AN OPEN BETWEEN THE RCM AND THE FIRST ROW DRIVER SIDE IMPACT SENSOR	
● Key in OFF position. ● Measure the resistance between RCM C310b pin 27, circuit 1261 (WH/LG), harness side and first row driver side impact sensor C539 pin 2, circuit 1261 (WH/LG), harness side.	**Yes** GO to J9 . **No**

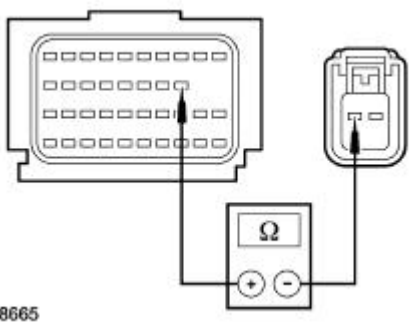
 A0048661 ● **Is the resistance less than 0.5 ohm?**	REPAIR circuit 1261 (WH/LG). GO to J54 .
J9 CHECK CIRCUIT 1262 (BN/LG) FOR AN OPEN BETWEEN THE RCM AND FIRST ROW DRIVER SIDE IMPACT SENSOR	
● Measure the resistance between RCM C310b pin 28, circuit 1262 (BN/LG), harness side and first row driver side impact sensor C539 pin 1, circuit 1262 (BN/LG), harness side.  A0048662 ● **Is the resistance less than 0.5 ohm?**	**Yes** GO to J10 . **No** REPAIR circuit 1262 (BN/LG). GO to J54 .
J10 CHECK CIRCUIT 1261 (WH/LG) FOR A SHORT TO CIRCUIT 1262 (BN/LG) BETWEEN THE RCM AND THE FIRST ROW DRIVER SIDE IMPACT SENSOR	
● Measure the resistance between first row driver side impact sensor C539 pin 2, circuit 1261 (WH/LG), harness side and pin 1, circuit 1262 (BN/LG), harness side.  A0049598 ● **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to J11 . **No** REPAIR circuit 1261 (WH/LG) and circuit 1262 (BN/LG). GO to J54 .
J11 CHECK THE FIRST ROW DRIVER SIDE IMPACT SENSOR	
● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Connect: RCM C310a. ● Connect: RCM C310b. ● Install a known good first row driver side impact sensor. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 .	**Yes** INSTALL the original first row driver side impact sensor. GO to J52 . **No** Fault corrected. GO to J54 .

• Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. • Retrieve and record any flagged faults for use later in this pinpoint test. • **Were any faults flagged against the first row driver side impact sensor?**	
J12 INSPECT THE FIRST ROW PASSENGER SIDE IMPACT SENSOR MOUNTING, AND MOUNTING SURFACE **WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.** **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.** **WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.	**Yes** CLEAN and TIGHTEN the bolt. REPAIR the mounting surface and electrical connections as necessary. REINSTALL the first row passenger side impact sensor. GO to J54 . **No** GO to J13 .

• Access the first row passenger side impact sensor located behind the front door trim panel. For additional information, refer to Side Impact Sensor—Front Row in this section. • Inspect the first row passenger side impact sensor for: • loose electrical connector and ground wire. • damaged J-clip. • loose sensor mounting bolt.  A0051169 • **CAUTION: The ground wire must be placed between the bolt head and the sensor. Never position the ground wire between the J-clip retaining nut and the sensor.** • **CAUTION: Always replace the J-clip retaining nut whenever installing a side impact sensor.** • Remove the first row passenger side impact sensor. • Visually inspect the first row passenger side impact sensor, alignment tabs, electrical connectors, J-clip and mounting surface for damage, corrosion or dirt.  A0051170 • **Was a significant amount of corrosion or dirt found, or was the passenger side impact sensor attached to the mounting surface incorrectly or was the sensor bolt not fully seated and tightened correctly?**	
J13 INSTALL THE FIRST ROW PASSENGER SIDE IMPACT SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST	
CAUTION: The ground wire must be placed between the bolt head and the sensor. Never position the ground wire between the J-clip retaining nut and the sensor. CAUTION: Always replace the J-clip retaining nut whenever installing a side impact sensor. • Clean and repair the mounting surface as necessary. • Clean the first row passenger side impact sensor mounting bolt. • Install the first row passenger side impact sensor. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool:	**Yes** GO to J14 . **No** Fault corrected. GO to J54 .





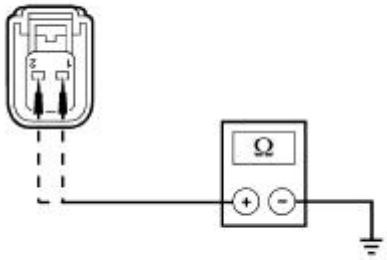


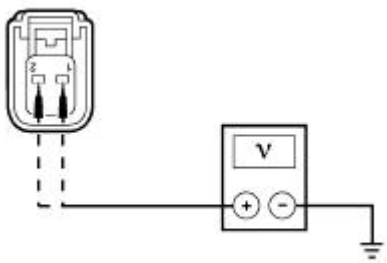
On-Demand Self Test. ● Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. ● Retrieve and record any flagged faults for use later in this pinpoint test. ● **Was DTC B2296 retrieved during the on-demand self test?**	
J14 CHECK THE FIRST ROW PASSENGER SIDE IMPACT SENSOR GROUND CIRCUIT 1264 (BN) FOR HIGH RESISTANCE	
● Key in OFF position. ● Disconnect: First Row Passenger Side Impact Sensor C631. ● Measure the resistance between first row passenger side impact sensor C631 pin 1, circuit 1264 (BN), harness side and first row passenger side impact sensor case ground. ● **Is the resistance less than 100 ohms?**	**Yes** GO to J16 . **No** GO to J15 .
J15 CLEAN FIRST ROW PASSENGER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT ON-DEMAND SELF TEST	
CAUTION: The ground wire must be placed between the bolt head and the sensor. Never position the ground wire between the J-clip retaining nut and the sensor. CAUTION: Always replace the J-clip retaining nut whenever installing a side impact sensor. ● Remove the first row passenger side impact sensor. ● Clean and repair the mounting surface as necessary. ● Clean the first row passenger side impact sensor mounting bolts. ● Install the first row passenger side impact sensor. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. ● Retrieve and record any flagged faults for use later in this pinpoint test. ● **Was DTC B2296 retrieved during the on-demand self test?**	**Yes** GO to J16 . **No** Fault corrected. GO to J54 .
J16 CHECK CIRCUIT 1263 (WH) AND CIRCUIT 1264 (BN) FOR A SHORT TO GROUND BETWEEN THE FIRST ROW PASSENGER SIDE IMPACT SENSOR AND THE RCM	
● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: RCM C310a. ● Disconnect: RCM C310b. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Measure the resistance between first row passenger side impact sensor C631 pin 2, circuit 1263 (WH), harness side and ground; and between pin 1, circuit 1264 (BN), harness side and ground.	**Yes** GO to J17 . **No** REPAIR circuit 1263 (WH) or circuit 1264 (BN).GO to J54 .

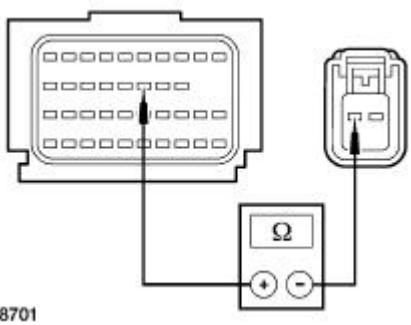
 A0029893 ● **Are the resistances greater than 1,000,000 ohms?**	
J17 CHECK CIRCUIT 1263 (WH) AND CIRCUIT 1264 (BN) FOR A SHORT TO BATTERY BETWEEN THE FIRST ROW PASSENGER SIDE IMPACT SENSOR AND THE RCM	
● Key in ON position. ● Measure the voltage between first row passenger side impact sensor C631 pin 2, circuit 1263 (WH), harness side and ground; and between pin 1, circuit 1264 (BN), harness side and ground.  A0029894 ● **Are the voltages less than 0.2 volt?**	**Yes** GO to J18 . **No** REPAIR circuit 1263 (WH) or circuit 1264 (BN). GO to J54 .
J18 CHECK CIRCUIT 1263 (WH) FOR AN OPEN BETWEEN THE RCM AND THE FIRST ROW PASSENGER SIDE IMPACT SENSOR	
● Key in OFF position. ● Measure the resistance between RCM C310b pin 29, circuit 1263 (WH), harness side and first row passenger side impact sensor C631 pin 2, circuit 1263 (WH), harness side.  A0041576 ● **Is the resistance less than 0.5 ohm?**	**Yes** GO to J19 . **No** REPAIR circuit 1263 (WH). GO to J54 .
J19 CHECK CIRCUIT 1264 (BN) FOR AN OPEN BETWEEN THE RCM AND THE FIRST ROW PASSENGER SIDE IMPACT SENSOR	
● Measure the resistance between RCM C310b pin 30, circuit 1264 (BN), harness side and first row passenger side impact sensor C631 pin 1, circuit 1264 (BN), harness side.	**Yes** GO to J20 .

 A0048663 ● **Is the resistance less than 0.5 ohm?**	**No** REPAIR circuit 1264 (BN). GO to J54 .
J20 CHECK CIRCUIT 1263 (WH) FOR A SHORT TO CIRCUIT 1264 (BN) BETWEEN THE RCM AND THE FIRST ROW PASSENGER SIDE IMPACT SENSOR	
● Measure the resistance between first row passenger side impact sensor C631 pin 2, circuit 1263 (WH), harness side pin 1, circuit 1264 (BN), harness side.  A0049598 ● **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to J21 . **No** REPAIR short between circuit 1263 (WH) and circuit 1264 (BN). GO to J54 .
J21 CHECK THE FIRST ROW PASSENGER SIDE IMPACT SENSOR	
● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Connect: RCM C310a. ● Connect: RCM C310b. ● Install a known good first row passenger side impact sensor. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. ● Retrieve and record any flagged faults for use later in this pinpoint test. ● **Were any faults flagged against the first row passenger side impact sensor?**	**Yes** INSTALL the original first row passenger side impact sensor. GO to J52 . **No** Fault corrected. GO to J54 .
J22 INSPECT THE SECOND ROW DRIVER SIDE IMPACT SENSOR MOUNTING, AND MOUNTING SURFACE	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.	**Yes** CLEAN and TIGHTEN the bolt. REPAIR the mounting surface as necessary. REINSTALL the second row driver side impact sensor. GO to J54 .

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. **WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. • Access the second row side impact sensor. For additional information, refer to Side Impact Sensor—Second Row in his section. • Inspect the second row driver side impact sensor for: • a loose electrical connector. • a loose sensor mounting bolt. • a loose sensor mounting bracket. • Remove the second row driver side impact sensor. • Visually inspect the second row driver side impact sensor, electrical connector, mounting bracket and mounting surface for damage, corrosion or dirt. • **Was a significant amount of corrosion or dirt found, or was the second row driver side impact sensor mounting bracket attached to the mounting surface incorrectly or was the second row driver side impact sensor bolt not fully seated and tightened correctly?**	**No** GO to J23 .
J23 INSTALL THE SECOND ROW DRIVER SIDE IMPACT	





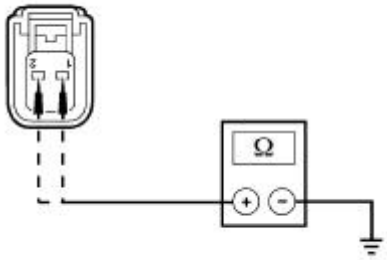


SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST	
• Clean and repair the mounting surface as necessary. • Clean the second row driver side impact sensor mounting bolt. • Install the second row driver side impact sensor. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. • Retrieve and record any flagged faults for use later in this pinpoint test. • **Was DTC B2296 retrieved during the on-demand self test?**	**Yes** GO to J24 . **No** Fault corrected. GO to J54 .
J24 CHECK THE SECOND ROW DRIVER SIDE IMPACT SENSOR GROUND CIRCUIT 1642 (DG/WH) FOR HIGH RESISTANCE	
• Key in OFF position. • Disconnect: Second Row Driver Side Impact Sensor C9004. • Measure the resistance between second row driver side impact sensor C9004 pin 1, circuit 1642 (DG/WH), harness side and the second row driver side impact sensor case ground. • **Is the resistance less than 100 ohms?**	**Yes** GO to J26 . **No** GO to J25 .
J25 CLEAN THE SECOND ROW DRIVER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT THE ON-DEMAND SELF TEST	
• Remove the second row driver side impact sensor. • Clean and repair the mounting surface as necessary. • Clean the second row driver side impact sensor mounting bolt. • Install the second row driver side impact sensor. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. • Retrieve and record any flagged faults for use later in this pinpoint test. • **Was DTC B2296 retrieved during the on-demand self test?**	**Yes** GO to J26 . **No** Fault corrected. GO to J54 .
J26 CHECK CIRCUIT 1641 (PK) AND CIRCUIT 1642 (DG/WH) FOR A SHORT TO GROUND BETWEEN THE SECOND ROW DRIVER SIDE IMPACT SENSOR AND THE RCM	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310a. • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between second row driver side impact sensor C9004 pin 1, circuit 1642 (DG/WH), harness side and ground; and between pin 2, circuit 1641 (PK), harness side and ground.	**Yes** GO to J27 . **No** REPAIR circuit 1641 (PK) or circuit 1642 (DG/WH). GO to J54 .

 A0029893 ● **Are the resistances greater than 1,000,000 ohms?**	
J27 CHECK CIRCUIT 1641 (PK) AND CIRCUIT 1642 (DG/WH) FOR A SHORT TO BATTERY BETWEEN THE SECOND ROW DRIVER SIDE IMPACT SENSOR AND THE RCM	
● Key in ON position. ● Measure the voltage between second row driver side impact sensor C9004 pin 2, circuit 1641 (PK), harness side and ground; and between pin 1, circuit 1642 (DG/WH), harness side and ground.  A0029894 ● **Are the voltages less than 0.2 volt?**	**Yes** GO to J28 . **No** REPAIR circuit 1641 (PK) or circuit 1642 (DG/WH). GO to J54 .
J28 CHECK CIRCUIT 1641 (PK) FOR AN OPEN BETWEEN THE RCM AND THE SECOND ROW DRIVER SIDE IMPACT SENSOR	
● Key in OFF position. ● Measure the resistance between RCM C310b pin 13, circuit 1641 (PK), harness side and second row driver side impact sensor C9004 pin 2, circuit 1641 (PK), harness side.  A0048665 ● **Is the resistance less than 0.5 ohm?**	**Yes** GO to J29 . **No** REPAIR circuit 1641 (PK). GO to J54 .
J29 CHECK CIRCUIT 1642 (DG/WH) FOR AN OPEN BETWEEN THE RCM AND THE SECOND ROW DRIVER SIDE IMPACT SENSOR	
● Measure the resistance between RCM C310b pin 14, circuit 1642 (DG/WH), harness side and second row driver side impact sensor C9004 pin 1, circuit 1642 (DG/WH), harness	**Yes** GO to J30 .

side.  ● **Is the resistance less than 0.5 ohm?**	**No** REPAIR circuit 1642 (DG/WH). GO to J54 .
J30 CHECK CIRCUIT 1641 (PK) FOR A SHORT TO CIRCUIT 1642 (DG/WH) BETWEEN THE RCM AND SECOND ROW DRIVER SIDE IMPACT SENSOR	
● Measure the resistance between second row driver side impact sensor C9004 pin 2, circuit 1641 (PK), harness side and pin 1, circuit 1642 (DG/WH), harness side.  ● **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to J31 . **No** REPAIR circuit 1641 (PK) or circuit 1642 (DG/WH). GO to J54 .
J31 CHECK THE SECOND ROW DRIVER SIDE IMPACT SENSOR	
● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Connect: RCM C310a. ● Connect: RCM C310b. ● Install a known good second row driver side impact sensor. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. ● Retrieve and record any flagged faults for use later in this pinpoint test. ● **Were any faults flagged against the second row driver side impact sensor?**	**Yes** INSTALL the original second row driver side impact sensor. GO to J52 . **No** Fault corrected. GO to J54 .
J32 INSPECT THE SECOND ROW PASSENGER SIDE IMPACT SENSOR MOUNTING, MOUNTING BRACKET AND MOUNTING SURFACE	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner	**Yes** CLEAN, TIGHTEN the bolt or REPAIR the mounting surface as necessary. REINSTALL the second

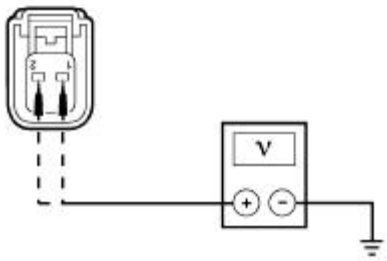
Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.** **WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Inspect the second row passenger side impact sensor mounting and make sure that the retaining bolt is fully seated and tightened correctly. ● Remove the second row passenger side impact sensor. ● Visually inspect the second row passenger side impact sensor, mounting bracket and mounting surface for damage, corrosion or dirt. ● **Was a significant amount of corrosion or dirt found, or was the second row passenger side impact sensor mounting bracket attached to the mounting surface incorrectly or were the impact sensor bolts not fully seated and tightened correctly?**	row passenger side impact sensor. GO to J54 . **No** GO to J33 .
J33 INSTALL THE SECOND ROW PASSENGER SIDE IMPACT SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST	
● Clean and repair the mounting surface as necessary.	**Yes**

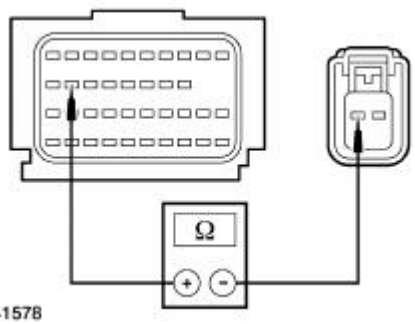


• Clean the second row passenger side impact sensor mounting bolt. • Install the second row passenger side impact sensor. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. • Retrieve and record any flagged faults for use later in this pinpoint test. • **Was DTC B2296 retrieved during the on-demand self test?**	GO to J34 . **No** Fault corrected. GO to J54 .
J34 CHECK THE SECOND ROW PASSENGER SIDE IMPACT SENSOR GROUND CIRCUIT 1644 (LB/WH) FOR HIGH RESISTANCE	
• Key in OFF position. • Disconnect: Second Row Passenger Side Impact Sensor C9005. • Measure the resistance between second row passenger side impact sensor C9005 pin 1, circuit 1644 (LB/WH), harness side and the second row passenger side impact sensor case ground. • **Is the resistance less than 100 ohms?**	**Yes** GO to J36 . **No** GO to J35 .
J35 CLEAN THE SECOND ROW PASSENGER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT THE ON-DEMAND SELF TEST	
• Remove the second row passenger side impact sensor. • Clean and repair the mounting surface as necessary. • Clean the second row passenger side impact sensor mounting bolt. • Install the second row passenger side impact sensor. • Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. • Retrieve and record any flagged faults for use later in this pinpoint test. • **Was DTC B2296 retrieved during the on-demand self test?**	**Yes** GO to J36 . **No** Fault corrected. GO to J54 .
J36 CHECK CIRCUIT 1643 (WH/RD) AND CIRCUIT 1644 (LB/WH) FOR A SHORT TO GROUND BETWEEN THE SECOND ROW PASSENGER SIDE IMPACT SENSOR AND THE RCM	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310a. • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between second row passenger side impact sensor C9005 pin 2, circuit 1643 (WH/RD), harness side and ground; and between pin 1, circuit 1644 (LB/WH), harness side and ground.	**Yes** GO to J37 . **No** REPAIR circuit 1643 (WH/RD) or circuit 1644 (LB/WH).GO to J54 .

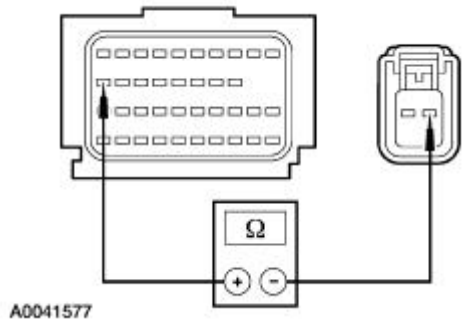
 A0029893 ● **Are the resistances greater than 1,000,000 ohms?**	
J37 CHECK CIRCUIT 1643 (WH/RD) AND CIRCUIT 1644 (LB/WH) FOR A SHORT TO VOLTAGE BETWEEN THE SECOND ROW PASSENGER SIDE IMPACT SENSOR AND THE RCM	
● Key in ON position. ● Measure the voltage between second row passenger side impact sensor C9005 pin 2, circuit 1643 (WH/RD), harness side and ground; and between pin 1, circuit 1644 (LB/WH), harness side and ground.  A0029894 ● **Are the voltages less than 0.2 volt?**	**Yes** GO to J38 . **No** REPAIR circuit 1643 (WH/RD) or circuit 1644 (LB/WH). GO to J54 .
J38 CHECK CIRCUIT 1643 (WH/RD) FOR AN OPEN BETWEEN THE RCM AND THE SECOND ROW PASSENGER SIDE IMPACT SENSOR	
● Key in OFF position. ● Measure the resistance between RCM C310b pin 15, circuit 1643 (WH/RD), harness side and second row passenger side impact sensor C9005 pin 2, circuit 1643 (WH/RD), harness side.  A0048701 ● **Is the resistance less than 0.5 ohm?**	**Yes** GO to J39 . **No** REPAIR circuit 1643 (WH/RD). GO to J54 .
J39 CHECK CIRCUIT 1644 (LB/WH) FOR AN OPEN BETWEEN THE RCM AND THE SECOND ROW PASSENGER SIDE IMPACT SENSOR	
● Measure the resistance between RCM C310b pin 16, circuit	**Yes**

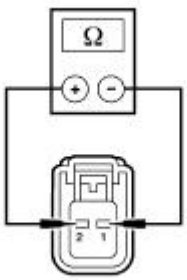
1644 (LB/WH), harness side and second row passenger side impact sensor C9005 pin 1, circuit 1644 (LB/WH), harness side.  • **Is the resistance less than 0.5 ohm?**	GO to J40 . **No** REPAIR circuit 1644 (LB/WH). GO to J54 .
J40 CHECK CIRCUIT 1643 (WH/RD) FOR A SHORT TO CIRCUIT 1644 (LB/WH) BETWEEN THE RCM AND THE SECOND ROW PASSENGER SIDE IMPACT SENSOR	
• Measure the resistance between second row passenger side impact sensor C9005 pin 2, circuit 1643 (WH/RD), harness side and pin 1, circuit 1644 (LB/WH), harness side.  • **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to J41 . **No** REPAIR circuit 1643 (WH/RD) and circuit 1644 (LB/WH). GO to J54 .
J41 CHECK THE SECOND ROW PASSENGER SIDE IMPACT SENSOR	
• For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Connect: RCM C310a. • Connect: RCM C310b. • Install a known good second row passenger side impact sensor. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. • Retrieve and record any flagged faults for use later in this pinpoint test. • **Were any faults flagged against the second row passenger side impact sensor?**	**Yes** INSTALL the original second row passenger side impact sensor. GO to J52 . **No** Fault corrected. GO to J54 .
J42 INSPECT THE FRONT IMPACT SEVERITY SENSOR MOUNTING, MOUNTING BRACKET AND MOUNTING SURFACE	
WARNING: If the supplemental restraint system	**Yes** CLEAN, TIGHTEN bolt or





(SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.** **WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Key in OFF position. ● Inspect the front impact severity sensor mounting and make sure that the retaining bolt is fully seated and tightened correctly. ● Remove the front impact severity sensor. Refer to Front Impact Severity Sensor in this section. ● Visually inspect the front impact severity sensor, mounting bracket and mounting surface for damage, corrosion or dirt. ● **Was a significant amount of corrosion or dirt found, or was the front impact severity sensor mounting bracket attached to the mounting surface incorrectly or were the front impact severity sensor bolts not fully seated and tightened correctly?**	REPAIR the mounting surface as necessary. REINSTALL the front impact severity sensor. GO to J54 . **No** GO to J43 .





J43 INSTALL THE FRONT IMPACT SEVERITY SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST	
• Clean and repair the mounting surface as necessary. • Clean the front impact severity sensor mounting bolt. • Install the front impact severity sensor. Refer to Front Impact Severity Sensor . • Key in OFF position. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. • Retrieve and record any flagged faults for use later in this pinpoint test. • **Was DTC B2296 retrieved during the on-demand self test?**	**Yes** GO to J44 . **No** Fault corrected. GO to J54 .
J44 CHECK THE FRONT IMPACT SEVERITY SENSOR GROUND CIRCUIT 618 (VT/LG) FOR HIGH RESISTANCE	
• Key in OFF position. • Disconnect: Front Impact Severity Sensor C177. • Measure the resistance between front impact severity sensor C177 pin 1, circuit 618 (VT/LG), harness side and front impact severity sensor case ground. • **Is the resistance less than 100 ohms?**	**Yes** GO to J46 . **No** GO to J45 .
J45 CLEAN THE FRONT IMPACT SEVERITY SENSOR MOUNTING SURFACE AND CARRY OUT THE ON-DEMAND SELF-TEST	
• Remove the front impact severity sensor. Refer to Front Impact Severity Sensor . • Clean and repair the mounting surface as necessary. • Clean the front impact severity sensor mounting bolt. • Install the front impact severity sensor. Refer to Front Impact Severity Sensor . • Key in OFF position. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. • Retrieve and record any flagged faults for use later in this pinpoint test. • **Was DTC B2296 retrieved during the on-demand self test?**	**Yes** GO to J46 . **No** Fault corrected. GO to J54 .
J46 CHECK CIRCUIT 617 (PK/OG) AND CIRCUIT 618 (VT/LG) FOR A SHORT TO GROUND BETWEEN THE RCM AND THE FRONT IMPACT SEVERITY SENSOR	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310a. • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between front impact severity sensor C177 pin 2, circuit 617 (PK/OG), harness side and ground; and between front impact severity sensor C177 pin 1, circuit 618 (VT/LG), harness side and ground.	**Yes** GO to J47 . **No** REPAIR circuit 617 (PK/OG) or circuit 618 (VT/LG).GO to J54 .

A0029893

- **Are the resistances greater than 1,000,000 ohms?**

J47 CHECK CIRCUIT 617 (PK/OG) AND CIRCUIT 618 (VT/LG) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND THE FRONT IMPACT SEVERITY SENSOR	
• Key in ON position. • Measure the voltage resistance between front impact severity sensor C177 pin 2, circuit 617 (PK/OG), harness side and ground; and between front impact severity sensor C177 pin 1, circuit 618 (VT/LG), harness side and ground.  A0029894 • **Are the voltages less than 0.2 volt?**	**Yes** GO to J48 . **No** REPAIR circuit 617 (PK/OG) or circuit 618 (VT/LG). GO to J54 .
J48 CHECK CIRCUIT 617 (PK/OG) FOR AN OPEN BETWEEN THE RCM AND THE FRONT IMPACT SEVERITY SENSOR	
• Key in OFF position. • Measure the resistance between RCM C310b pin 19, circuit 617 (PK/OG), harness side and front impact severity sensor C177 pin 2, circuit 617 (PK/OG), harness side.  A0041578 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to J49 . **No** REPAIR circuit 617 (PK/OG). GO to J54 .
J49 CHECK CIRCUIT 618 (VT/LG) FOR AN OPEN BETWEEN THE RCM AND THE FRONT IMPACT SEVERITY SENSOR	
• Measure the resistance between RCM C310b pin 20, circuit 618 (VT/LG), harness side and front impact severity sensor C177 pin 1, circuit 618 (VT/LG), harness side.	**Yes** GO to J50 . **No** REPAIR circuit 618

 ● **Is the resistance less than 0.5 ohm?**	(VT/LG). GO to J54 .
J50 CHECK CIRCUIT 617 (PK/OG) FOR A SHORT TO CIRCUIT 618 (VT/LG) BETWEEN THE RCM AND THE FRONT IMPACT SEVERITY SENSOR	
● Measure the resistance between C177 pin 2, circuit 617 (PK/OG), harness side and the front impact severity sensor C177 pin 1, circuit 618 (VT/LG), harness side.  ● **Is the resistance greater than 1,000,000 ohms?**	**Yes** GO to J51 . **No** REPAIR circuits 617 (PK/OG) and circuit 618 (VT/LG). GO to J54 .
J51 CHECK THE FRONT IMPACT SEVERITY SENSOR	
● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Connect: RCM C310a. ● Connect: RCM C310b. ● Install a known good front impact severity sensor. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Key in ON position. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. ● Retrieve and record any flagged faults for use later in this pinpoint test. ● **Were any faults flagged against the front impact severity sensor?**	**Yes** INSTALL the original front impact severity sensor. GO to J52 . **No** Fault corrected. GO to J54 .
J52 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system diagnostic tools, sensor electrical connectors, and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. ● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .	**Yes** If a **"?"** was flagged by the scan tool, CARRY OUT the entire pinpoint test before installing a new RCM. INSTALL a new RCM. GO to J54 .

• Connect: Impact Sensors. • Connect: RCM C310a. • Connect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. • Retrieve and record any flagged faults. • **Was DTC B2296 retrieved during the on-demand self test?**	**No** Fault corrected. GO to J54 .
J53 CHECK FOR AN INTERMITTENT FAULT	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.** **WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of	**Yes** This is a hard fault. The fault condition is still present. The fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. If a flagged fault of **"?"** was recorded, multiple faults exist and the entire pinpoint test must be carried out before installing a new RCM. For first row driver side impact (F_D_SEN) sensor with a mounting/communications (COMM) fault, GO to J2 . For first row driver side impact sensor (F_D_ SEN) with an internal fault (INT) fault, INSTALL a new first row driver side impact sensor. REFER to Side Impact Sensor—Front Row in this section. GO to J54 . For first row passenger side impact sensor (F_P_ SEN) with a mounting/communications (COMM) fault, GO to J12 . For first row passenger side impact sensor (F_P_ SEN) with an internal fault (INT) fault, INSTALL a new first row passenger side impact sensor. REFER to Side Impact Sensor—Front Row in this section. GO to J54 . For second row driver side

faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● Enter the following diagnostic mode on the diagnostic tool: Flag DTC B2296. ● If DTC B2296 is retrieved during the on-demand self test, retrieve and record any flagged faults. ● **Was DTC B2296 retrieved during the on-demand self test?**	impact sensor (D_2_SEN) with a mounting/communication (COMM) fault, GO to J22 . For second row driver side impact sensor (D_2_ SEN) with an internal (INT) fault, INSTALL a new second row driver side impact sensor. REFER to Side Impact Sensor—Second Row in this section. GO to J54 . For second row passenger side impact sensor (P_2_ SEN) with a mounting /communications (COMM) fault, GO to J32 . For second row passenger side impact sensor (P_2_SEN) with an internal (INT) fault, INSTALL a new second row passenger side impact sensor. REFER to Side Impact Sensor—Second Row in this section. GO to J54 . For front impact severity sensor (FNT_SEN) with a mounting/communications (COMM) fault, GO to J42 . For front impact severity sensor (FNT_SEN) with an internal fault (INT) fault, INSTALL a new front impact severity sensor. REFER to Front Impact Severity Sensor in this section. GO to J54 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found.
J54 CHECK FOR ADDITIONAL DTCs	
● Refer to the continuous DTCs recorded during Step J1. ● **Were any continuous DTCs retrieved during Step J1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction.

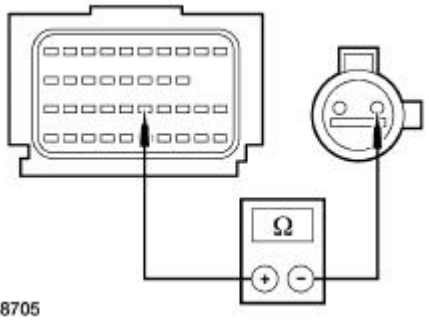
	No RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. CLEAR all DTCs.

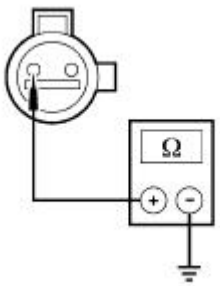
Pinpoint Test K: LFC 51/DTC B2691 — Driver Safety Belt Buckle Switch Circuit Fault

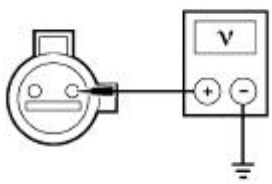
Normal Operation

The restraints control module (RCM) checks the safety belt buckle switch circuits for faults. If the RCM detects an open circuit or short to voltage fault, it will store diagnostic trouble code (DTC) B2691 in memory and flash lamp fault code (LFC) 51 (or higher priority code if one exists) on the air bag indicator.

Possible Causes







A driver safety belt buckle switch open circuit or short to voltage fault can be caused by:

- damaged wiring, terminals, or connectors.
- a faulty driver safety belt buckle switch.
- a faulted RCM.

PINPOINT TEST K: LFC 51/DTC B2691 — DRIVER SAFETY BELT BUCKLE SWITCH CIRCUIT FAULT

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
K1 CHECK FOR A HARD OR INTERMITTENT DTC	
• Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. • Retrieve and record any continuous DTCs for use later in this pinpoint test. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was the DTC B2691 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to K2 . **No**

	This is an intermittent fault. The fault condition is not present at this time. GO to K7 .
K2 CHECK CIRCUIT 85 (BN/LB) FOR AN OPEN BETWEEN THE RCM AND THE DRIVER SAFETY BELT BUCKLE SWITCH	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing a SRS **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. • Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310b. • Disconnect: Driver Safety Belt Buckle Switch C3065. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 .	**Yes** GO to K3 . **No** REPAIR circuit 85 (BN/LB). GO to K8 .

• Measure the resistance between RCM C310b pin 25, circuit 85 (BN/LB), harness side and driver safety belt buckle switch C3065 pin 2, circuit 85 (BN/LB), harness side.  A0048705 • **Is the resistance less than 0.5 ohm?**	
K3 CHECK CIRCUIT 649 (BK/OG) FOR AN OPEN	
• Measure the resistance between driver safety belt buckle switch C3065 pin 1, circuit 649 (BK/OG), harness side and ground.  A0048711 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to K4 . **No** REPAIR circuit 649 (BK/OG). GO to K8 .
K4 CHECK CIRCUIT 85 (BN/LB) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between driver safety belt buckle switch C3065 pin 2, circuit 85 (BN/LB), harness side and ground.  A0048712 • **Is the voltage less than 0.2 volt?**	**Yes** GO to K5 . **No** REPAIR circuit 85 (BN/LB). GO to K8 .
K5 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH	
• Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Connect: RCM C310b. • Install a known good driver safety belt buckle assembly. REFER to Section 501-20A . • Connect: Driver Safety Belt Buckle Switch C3065. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 .	**Yes** GO to K6 . **No** Fault corrected. GO to K8 .

• Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B2691 retrieved during the on-demand self test?**	
K6 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system diagnostic tools, sensor electrical connectors, and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Reinstall the original driver safety belt buckle assembly. REFER to Section 501-20A . • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B2691 retrieved during the on-demand self test?**	**Yes** INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to K8 . **No** Fault corrected. GO to K8 .
K7 CHECK FOR AN INTERMITTENT FAULT	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing a SRS **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner	**Yes** GO to K2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to K8 .

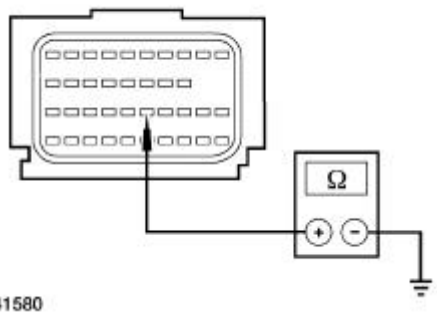
Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **Was DTC B2691 retrieved during the on-demand self test?**	
K8 CHECK FOR ADDITIONAL DTCs	
● Refer to the continuous DTCs recorded during Step K1. ● **Were any continuous DTCs retrieved during Step K1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) . CLEAR all DTCs.

Pinpoint Test L: LFC 51/DTC B2434 — Driver Safety Belt Buckle Switch Circuit Short to Ground

Normal Operation

The restraints control module (RCM) checks the driver safety belt buckle switch circuits for faults. If the RCM detects a short to ground fault, it will store diagnostic trouble code (DTC) B2434 in memory and flash lamp fault code (LFC) 51 (or higher priority code if one exists) on the air bag indicator.

Possible Causes



A driver safety belt buckle switch circuit fault can be caused by:

- damaged wiring, terminals, or connectors.
- a faulty driver safety belt buckle switch.
- a faulted RCM.

PINPOINT TEST L: LFC 51/DTC B2434 — DRIVER SAFETY BELT

BUCKLE SWITCH CIRCUIT SHORT TO GROUND

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
L1 CHECK FOR A HARD OR INTERMITTENT DTC ● Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. ● Retrieve and record any continuous DTCs for use later in this pinpoint test. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **Was DTC B2434 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to L2. **No** This is an intermittent fault. The fault condition is not present at this time. GO to L5.
L2 CHECK CIRCUIT 85 (BN/LB) FOR A SHORT TO GROUND BETWEEN THE RCM AND THE DRIVER SAFETY BELT BUCKLE SWITCH **WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.** **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and**	**Yes** GO to L3. **No** REPAIR circuit 85 (BN/LB). GO to L6.

could result in personal injury. **WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing a SRS **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: Driver Safety Belt Buckle Switch C3065. ● Disconnect: RCM C310b. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Measure the resistance between the RCM C310b pin 25, circuit 85 (BN/LB), harness side and ground.  A0041580 ● **Is the resistance greater than 1,000,000 ohms?**	
L3 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH	
● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Connect: RCM C310b. ● Install a known good driver safety belt buckle assembly. REFER to Section 501-20A . ● Connect: Driver Safety Belt Buckle Switch C3065. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **Was DTC B2434 retrieved during the on-demand self test?**	**Yes** GO to L4 . **No** Fault corrected.GO to L6 .
L4 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system diagnostic tools, sensor electrical connectors, and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.	**Yes** INSTALL a new RCM. REFER to Restraints

• Key in OFF position. • Reinstall the original driver safety belt buckle assembly. REFER to Section 501-20A . • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B2434 retrieved during the on-demand self test?**	Control Module (RCM) in this section. GO to L6 . **No** Fault corrected. GO to L6 .
L5 CHECK FOR AN INTERMITTENT FAULT	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury. WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing a SRS **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B2434 retrieved during the on-demand self test?**	**Yes** GO to L2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to L2 .
L6 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous DTCs recorded during Step L1. • **Were any continuous DTCs retrieved during Step L1?**	**Yes** Do not clear any

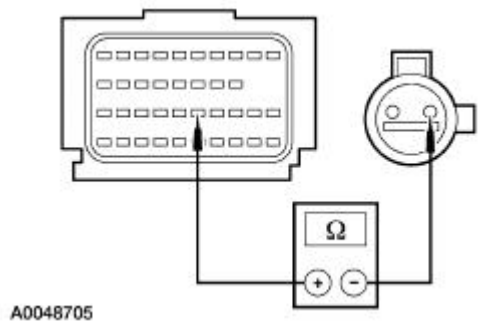
	DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) . CLEAR all DTCs.

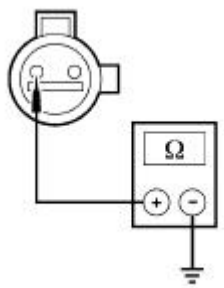
Pinpoint Test M: LFC 51/DTC B2435 — Driver Safety Belt Buckle Switch Resistance Out of Range

Normal Operation

The restraints control module (RCM) checks the driver safety belt buckle switch circuits for faults. If the RCM detects a current out of range fault, it will store diagnostic trouble code (DTC) B2435 in memory and flash lamp fault code (LFC) 51 (or higher priority code if one exists) on the air bag indicator.

Possible Causes





A driver safety belt buckle switch current out of range fault can be caused by:

- damaged wiring, terminals, or connectors.
- a faulty driver safety belt buckle and pretensioner assembly.
- a faulted RCM.

PINPOINT TEST M: LFC 51/DTC B2435 — DRIVER SAFETY BELT BUCKLE SWITCH RESISTANCE OUT OF RANGE

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after	

connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
M1 CHECK FOR A HARD OR INTERMITTENT DTC • Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. • Retrieve and record any continuous DTCs for use later in this pinpoint test. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B2435 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to M2 . **No** This is an intermittent fault. The fault condition is not present at this time. GO to M6 .
M2 CHECK CIRCUIT 85 (BN/LB) FOR AN OPEN BETWEEN THE RCM AND THE DRIVER SAFETY BELT BUCKLE SWITCH **WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.** **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint**	**Yes** GO to M3 . **No** REPAIR circuit 85 (BN/LB). GO to M7 .

system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE: After diagnosing or repairing a SRS **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: RCM C310b. ● Disconnect: Driver Safety Belt Buckle Switch C3065. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Measure the resistance between RCM C310b pin 25, circuit 85 (BN/LB), harness side and driver safety belt buckle switch C3065 pin 2, circuit 85 (BN/LB), harness side.  A0048705 ● **Is the resistance less than 0.5 ohm?**	
M3 CHECK CIRCUIT 649 (BK/OG) FOR AN OPEN	
● Measure the resistance between driver safety belt buckle switch C3065 pin 1, circuit 649 (BK/OG), harness side and ground.  A0048711 ● **Is the resistance less than 0.5 ohm?**	**Yes** GO to M4 . **No** REPAIR circuit 649 (BK/OG). GO to M7 .
M4 CHECK THE SAFETY BELT BUCKLE SWITCH	
● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Connect: RCM C310b. ● Install a known good driver safety belt buckle assembly. REFER to Section 501-20A . ● Connect: Driver Safety Belt Buckle Switch C3065. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 .	**Yes** GO to M5 . **No** Fault corrected. GO to M7 .

• Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B2435 retrieved during the on-demand self test?**	
M5 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system diagnostic tools, sensor electrical connectors, and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Reinstall the original driver safety belt buckle assembly. REFER to Section 501-20A . • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B2435 retrieved during the on-demand self test?**	**Yes** INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to M7 . **No** Fault corrected. GO to M7 .
M6 CHECK FOR AN INTERMITTENT FAULT	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. Pinpoint Test N: LFC 52/DTC B2692 — Passenger Safety Belt Buckle Switch Circuit Fault

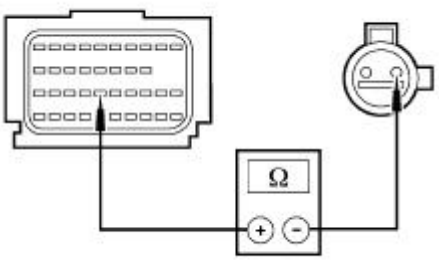
Normal Operation

The restraints control module (RCM) checks the passenger safety belt buckle switch circuits for faults. If the RCM detects an open circuit or short to voltage fault, it will store diagnostic trouble code (DTC) B2692 in memory and flash lamp fault code (LFC) 52 (or higher priority code if one exists) on the air bag indicator.

Possible Causes

A passenger safety belt buckle switch open circuit or short to voltage fault can be caused by:



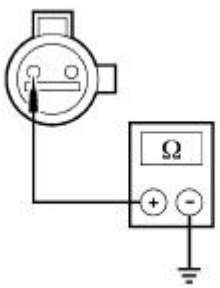
- damaged wiring, terminals, or connectors.
- a faulty passenger safety belt buckle switch.
- a faulted RCM.

PINPOINT TEST N: LFC 52/DTC B2692 — PASSENGER SAFETY BELT BUCKLE SWITCH CIRCUIT FAULT

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
N1 CHECK FOR A HARD OR INTERMITTENT DTC ● Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. ● Retrieve and record any continuous DTCs for use later in this pinpoint test. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **Was DTC B2692 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to N2. **No** This is an intermittent fault. The fault condition is not present at this time. GO to N7.
N2 CHECK CIRCUIT 1514 (RD/BK) FOR AN OPEN BETWEEN THE RCM AND THE PASSENGER SAFETY BELT BUCKLE SWITCH **WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.** **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and**	**Yes** GO to N3. **No** REPAIR circuit 1514 (RD/BK). GO to N8.

could result in personal injury. **WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing a SRS **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Key in OFF position.
- Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.
- For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .
- Disconnect: RCM C310b.
- Disconnect: Passenger Safety Belt Buckle Switch C3066.
- For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 .
- Measure the resistance between RCM C310b pin 26, circuit 1514 (RD/BK), harness side and passenger safety belt buckle switch C3066 pin 1, circuit 1514 (RD/BK), harness side.

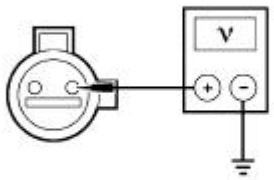


A0048715

- **Is the resistance less than 0.5 ohm?**

N3 CHECK CIRCUIT 649 (BK/OG) FOR AN OPEN

- Measure the resistance between passenger safety belt buckle switch C3066 pin 1, circuit 649 (BK/OG), harness side and ground.



A0048711

- **Is the resistance less than 0.5 ohm?**

Yes
GO to N4 .

No
REPAIR circuit 649 (BK/OG).
GO to N8 .

N4 CHECK CIRCUIT 1514 (RD/BK) FOR A SHORT TO VOLTAGE

• Key in ON position. • Measure the voltage between passenger safety belt buckle switch C3066 pin 2, circuit 1514 (RD/BK), harness side and ground.  A0048712 • **Is the voltage less than 0.2 volt?**	**Yes** GO to N5 . **No** REPAIR circuit 1514 (RD/BK). GO to N8 .
N5 CHECK THE SAFETY BELT BUCKLE SWITCH	
• Key in OFF position. • Connect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Install a known good passenger safety belt buckle assembly. REFER to Section 501-20A . • Connect: Passenger Safety Belt Buckle Switch C3066. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B2692 retrieved during the on-demand self test?**	**Yes** GO to N6 . **No** Fault corrected. GO to N8 .
N6 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system diagnostic tools, sensor electrical connectors, and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Reinstall the original passenger safety belt buckle assembly. REFER to Section 501-20A . • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B2692 retrieved during the on-demand self test?**	**Yes** INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to N8 . **No** Fault corrected. GO to N8 .
N7 CHECK FOR AN INTERMITTENT FAULT	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.**	**Yes** GO to N2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing a SRS **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **Was DTC B2692 retrieved during the on-demand self test?**	intermittent concerns found. GO to N8 .
N8 CHECK FOR ADDITIONAL DTCs	
● Refer to the continuous DTCs recorded during Step N1. ● **Were any continuous DTCs retrieved during Step N1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner

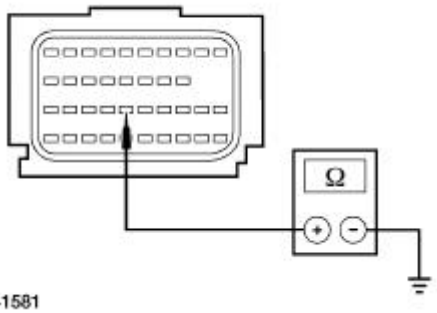
	Supplemental Restraint System (SRS) . CLEAR all DTCs.

Pinpoint Test O: LFC 52/DTC B2438 — Passenger Safety Belt Buckle Switch Circuit Short to Ground

Normal Operation

The restraints control module (RCM) checks the passenger safety belt buckle switch circuits for faults. If the RCM detects a short to ground fault, it will store diagnostic trouble code (DTC) B2438 in memory and flash lamp fault code (LFC) 52 (or higher priority code if one exists) on the air bag indicator.

Possible Causes



A passenger safety belt buckle switch circuit fault can be caused by:

- damaged wiring, terminals, or connectors.
- a faulty passenger safety belt buckle switch.
- a faulted RCM.

PINPOINT TEST O: LFC 52/DTC B2438 — PASSENGER SAFETY BELT BUCKLE SWITCH CIRCUIT SHORT TO GROUND

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
O1 CHECK FOR A HARD OR INTERMITTENT DTC • Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. • Retrieve and record any continuous DTCs for use later in this pinpoint test. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC B2438 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to O2 . **No** This is an intermittent fault. The fault condition is not present at this

	time. GO to O5 .
O2 CHECK CIRCUIT 1514 (RD/BK) FOR A SHORT TO GROUND BETWEEN THE RCM AND THE PASSENGER SAFETY BELT BUCKLE SWITCH	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury. WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing a SRS **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: Passenger Safety Belt Buckle Switch C3066. • Disconnect: RCM C310b. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Measure the resistance between the RCM C310b pin 26, circuit 1514 (RD/BK), harness side and ground.	**Yes** GO to O3 . **No** REPAIR circuit 1514 (RD/BK). GO to O6 .

- **Is the resistance greater than 1,000,000 ohms?**

O3 CHECK THE PASSENGER SAFETY BELT BUCKLE SWITCH - For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . - Connect: RCM C310b. - Install a known good passenger safety belt buckle assembly. REFER to Section 501-20A . - Connect: Passenger Safety Belt Buckle Switch C3066. - For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . - Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. - **Was DTC B2438 retrieved during the on-demand self test?**	**Yes** GO to O4 . **No** Fault corrected. GO to O6 .
O4 CONFIRM THE RCM FAULT **NOTE:** Make sure all restraint system diagnostic tools, sensor electrical connectors, and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. - Key in OFF position. - Reinstall the original passenger safety belt buckle assembly. REFER to Section 501-20A . - Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. - **Was DTC B2438 retrieved during the on-demand self test?**	**Yes** INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to O6 . **No** Fault corrected. GO to O6 .
O5 CHECK FOR AN INTERMITTENT FAULT **WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.** **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt**	**Yes** GO to O2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to O6 .

pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.  **WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing a SRS **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. O6 CHECK FOR ADDITIONAL DTCs	
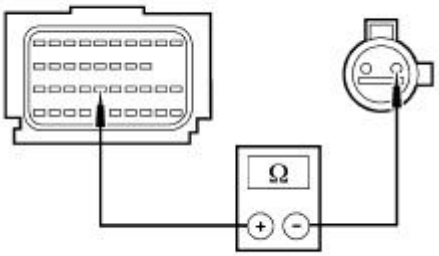
● Refer to the continuous DTCs recorded during Step O1. ● **Were any continuous DTCs retrieved during Step O1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) . CLEAR all DTCs.

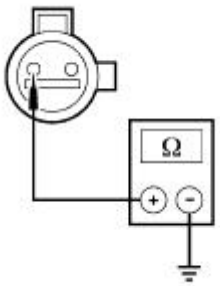
Pinpoint Test P: LFC 52/DTC B2439 — Passenger Safety Belt Buckle Switch Resistance Out of Range

Normal Operation

The restraints control module (RCM) checks the passenger safety belt buckle switch circuits for faults. If the RCM detects a current out of range fault, it will store diagnostic trouble code (DTC) B2439 in memory and flash lamp fault code (LFC) 52 (or higher priority code if one exists) on the air bag indicator.

Possible Causes





A passenger safety belt buckle switch current out of range fault can be caused by:

- damaged wiring, terminals, or connectors.
- a faulty passenger safety belt buckle switch.
- a faulted RCM.

PINPOINT TEST P: LFC 52/DTC B2439 — PASSENGER SAFETY BELT BUCKLE SWITCH RESISTANCE OUT OF RANGE

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.

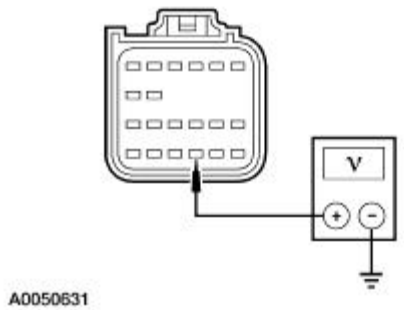
Pinpoint Test Q: LFC 15/DTC C1414 — Incorrect Vehicle ID

Normal Operation

The restraint control module (RCM) monitors the electrical condition at C310a pins 20 and 21 to detect the vehicle identification code. The RCM compares the pin state with a preprogrammed code. If the RCM detects an unexpected condition at either of these pins, it will store diagnostic trouble code (DTC) C1414 in memory and flash lamp fault code (LFC) 15 (or higher priority code if one exists) on the air bag indicator.

Possible Causes



An incorrect vehicle identification code can be caused by:

- incorrect RCM for vehicle.
- wiring concern at RCM C310a pins 20 or 21.
- a faulted RCM.

PINPOINT TEST Q: LFC 15/DTC C1414 — INCORRECT VEHICLE ID

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
Q1 CHECK FOR A HARD OR INTERMITTENT DTC	
• Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. • Retrieve and record any continuous DTCs for use later in this pinpoint test. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC C1414 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is

	corrected and the DTC is no longer retrieved during the on-demand self test.GO to Q2 . **No** This is an intermittent fault. The fault condition is not present at this time. GO to Q6 .
Q2 CHECK THE VEHICLE IDENTIFICATION PIN NO. 20	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. **NOTE:** For this application, RCM C310a pin 20 must have no connection. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.	**Yes** DETERMINE the cause of incorrect harness configuration. REPAIR as necessary.GO to Q7 . **No** GO to Q3 .

• For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310a. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Inspect C310a harness side. Make sure there is no wire attached to pin cavity 20. • **Is a wire attached at C310a pin cavity 20?**	
Q3 CHECK FOR VOLTAGE AT THE VEHICLE IDENTIFICATION PIN 21 CIRCUIT 609 (OG/YE)	
NOTE: For this application, RCM C310a pin 21 must have ignition voltage. • Key in ON position. • Measure the voltage between RCM C310a pin 21, circuit 609 (OG/YE), harness side and ground,  • **Is the voltage greater than 10 volts?**	**Yes** GO to Q4 . **No** REPAIR circuit 609 (OG/YE).GO to Q7 .
Q4 CHECK RCM PART NUMBER	
• Check the part number on the RCM against the part number listed in the master parts catalog. • **Did the part number on the RCM match the part number listed in the master parts catalog?**	**Yes** GO to Q5 . **No** INSTALL a new RCM with the correct part number. REFER to Restraints Control Module (RCM) in this section. GO to Q7 .
Q5 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system diagnostic tools, sensor electrical connectors, and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Connect: RCM C310a. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was the DTC C1414 retrieved during the on-demand self test?**	**Yes** INSTALL a new RCM. GO to Q7 . **No** Fault corrected. GO to Q7 .
Q6 CHECK FOR INTERMITTENT FAULTS	

• Refer to the continuous DTCs recorded during Step Q1. • **Was the continuous DTC retrieved during Step Q1 an intermittent fault?**	**Yes** GO to Q2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found.GO to Q7 .
Q7 CHECK FOR ADDITIONAL DTCs	
• Refer to the continuous DTCs recorded during Step Q1. • **Were any continuous DTCs retrieved during Step Q1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. CLEAR all DTCs.

Pinpoint Test R: LFC 49/DTC C1947 — Seat Track Position Sensor Circuit Short to Ground

Normal Operation

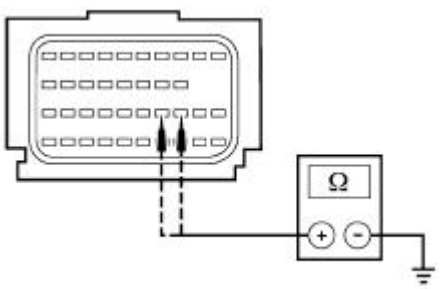
The restraints control module (RCM) monitors the driver seat track position sensor circuits. If the RCM detects a short to ground, it will store diagnostic trouble code (DTC) C1947 in memory and flash lamp

fault code (LFC) 49 (or higher priority code if one exists) on the air bag indicator.

Possible Causes

A driver seat track position sensor short to ground fault can be caused by:

- damaged wiring, terminals, or connectors.
- a faulty driver seat track position sensor.
- a faulted RCM.



PINPOINT TEST R: LFC 49/DTC C1947 — SEAT TRACK POSITION SENSOR CIRCUIT SHORT TO GROUND

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
R1 CHECK FOR A HARD OR INTERMITTENT DTC • Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. • Retrieve and record any continuous DTCs for use later in this pinpoint test. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC C1947 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and DTC is no longer retrieved during the on-demand self test. GO to R2. **No** This is an intermittent fault. The fault condition is not present at this time. GO to R5.
R2 CHECK CIRCUIT 1520 (LG) AND CIRCUIT 1558 (TN/BK) FOR A SHORT TO GROUND BETWEEN THE RCM AND THE DRIVER SEAT **WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.** **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal**	**Yes** GO to R3. **No** REPAIR circuit 1520 (LG) or circuit 1558 (TN/BK). GO to R6.

injury. **WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.**

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. **WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.** **WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Key in OFF position.
- Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.
- Key in OFF position.
- For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .
- Disconnect: RCM C310b.
- Disconnect: Seat Track Position Sensor C356.
- For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 .
- Measure the resistance between RCM C310b pin 23, circuit 1520 (LG), harness side and ground; and between pin 24, circuit 1558 (TN/BK), harness side and ground.

- **Are the resistances greater than 1,000,000 ohms?**

R3 CHECK THE SEAT TRACK POSITION SENSOR	
• For vehicles equipped with a 60/40 split bench seat, disconnect the	**Yes**

battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Connect: RCM C310b. • Install a known good seat track position sensor. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC C1947 retrieved during the on-demand self test?**	GO to R4 . **No** Fault corrected. GO to R6 .
R4 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system diagnostic tools, sensor electrical connectors, and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • Reinstall the original seat track position sensor. • Connect: Seat Track Position Sensor C356. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self-Test. • **Was DTC C1947 retrieved during the on-demand self test?**	**Yes** INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to R6 . **No** Fault corrected. GO to R6 .
R5 CHECK FOR AN INTERMITTENT FAULT	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or	**Yes** GO to R2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to R6 .

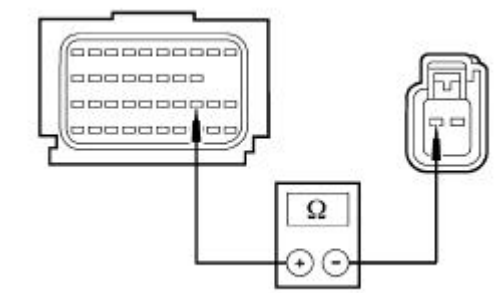
repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **Was DTC C1947 retrieved during the on-demand self test?**	
R6 CHECK FOR ADDITIONAL DTCs	
● Refer to the continuous DTCs recorded during Step R1. ● **Were any continuous DTCs retrieved during Step R1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. CLEAR all DTCs.

Pinpoint Test S: LFC 49/DTC C1948 — Seat Track Position Sensor Circuit Resistance Out of Range

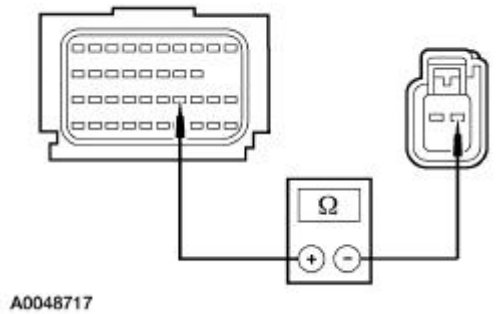
NOTE: Due to the seat track position sensor being a hall-effect type sensor, this pinpoint test will be diagnosing a current out of range fault instead of the current DTC definition for a resistance out of range fault.

Normal Operation

The restraints control module (RCM) monitors the driver seat track position sensor circuits. If the RCM detects a current out of range condition, it will store diagnostic trouble code (DTC) C1948 in memory and flash lamp fault code (LFC) 49 (or higher priority code if one exists) on the air bag indicator.



Possible Causes



A driver safety belt buckle and pretensioner switch current out of range fault can be caused by:

- damaged wiring, terminals, or connectors.
- a faulty driver seat track position sensor.
- a faulted RCM.

PINPOINT TEST S: LFC 49/DTC C1948 — SEAT TRACK POSITION SENSOR CIRCUIT RESISTANCE OUT OF RANGE

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
S1 CHECK FOR A HARD OR INTERMITTENT DTC • Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. • Retrieve and record any continuous DTCs for use later in this pinpoint test. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC C1948 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and DTC is no longer retrieved during the on-demand self test. GO to S2. **No** This is an intermittent fault. The fault condition is not present at this time. GO to S6.
S2 CHECK CIRCUIT 1520 (LG) FOR AN OPEN **WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.** **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.**	**Yes** GO to S3. **No** REPAIR circuit 1520 (LG). GO to S7.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Key in OFF position. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Disconnect: RCM C310b. ● Disconnect: Seat Track Position Sensor C356. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Measure the resistance between RCM C310b pin 23, circuit 1520 (LG), harness side and driver seat track position sensor C356 pin 2, circuit 1520 (LG), harness side.  A0048716 ● **Is the resistance less than 0.5 ohm?**	
S3 CHECK CIRCUIT 1558 (TN/BK) FOR AN OPEN	
● Measure the resistance between RCM C310b pin 24, circuit 1558 (TN/BK), harness side and driver seat track position sensor C356 pin 1, circuit 1558 (TN/BK), harness side.	**Yes** GO to S4 . **No** REPAIR circuit 1558 (TN/BK). GO to S7 .

- **Is the resistance less than 0.5 ohm?**

S4 CHECK THE SEAT TRACK POSITION SENSOR - For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . - Connect: RCM C310b. - Install a known good seat track position sensor. - Connect: Seat Track Position Sensor C356. - For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . - Key in ON position. - Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. - **Was DTC C1948 retrieved during the on-demand self test?**	**Yes** GO to S5 . **No** Fault corrected. GO to S7 .
S5 CONFIRM THE RCM FAULT **NOTE:** Make sure all restraint system diagnostic tools, sensor electrical connectors, and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. - Key in OFF position. - Reinstall the original seat track position sensor. - Connect: Seat Track Position Sensor C356. - Key in ON position. - Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. - **Was DTC C1948 retrieved during the on-demand self test?**	**Yes** INSTALL a new RCM. REFER to Restraints Control Module (RCM) in this section. GO to S7 . **No** Fault corrected. GO to S7 .
S6 CHECK FOR AN INTERMITTENT FAULT **WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.** **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt**	**Yes** GO to S2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to S7 .

pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.  **WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **Was DTC C1948 retrieved during the on-demand self test?**	
S7 CHECK FOR ADDITIONAL DTCs	
● Refer to the continuous DTCs recorded during Step S1. ● **Were any continuous DTCs retrieved during Step S1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) . CLEAR all DTCs.

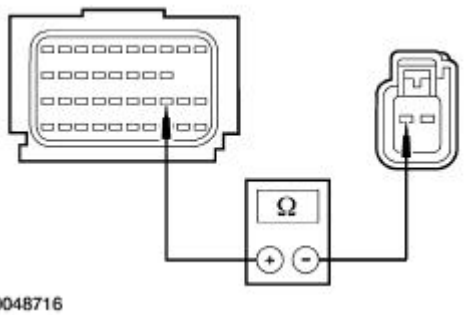
Pinpoint Test T: LFC 49/DTC C1981 — Seat Track Position Sensor Circuit Fault

Normal Operation

The restraints control module (RCM) monitors the driver seat track position sensor circuits. If the RCM detects an open or short to battery, it will store diagnostic trouble code (DTC) C1982 in memory and flash lamp fault code (LFC) 49 (or higher priority code if one exists) on the air bag indicator.

Possible Causes

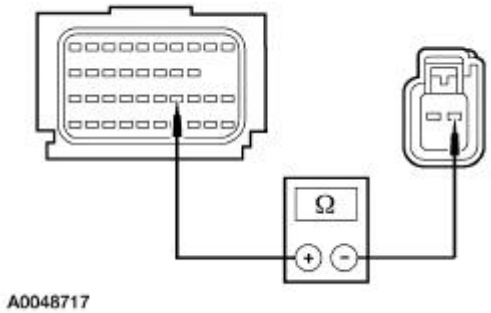
A driver seat track position sensor open circuit or short to battery fault can be caused by:

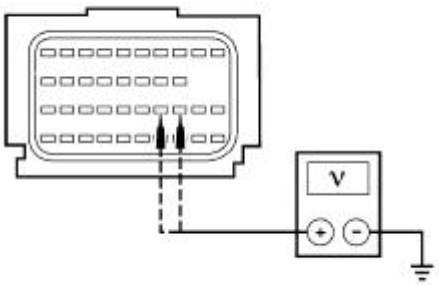


- damaged wiring, terminals, or connectors.
- a faulted RCM.

PINPOINT TEST T: LFC 49/DTC C1982 — SEAT TRACK POSITION SENSOR CIRCUIT FAULT

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
T1 CHECK FOR A HARD OR INTERMITTENT DTC • Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous DTCs. • Retrieve and record any continuous DTCs for use later in this pinpoint test. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC C1982 retrieved during the on-demand self test?**	**Yes** This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and DTC is no longer retrieved during the on-demand self test. GO to T2. **No** This is an intermittent fault. The fault condition is not present at this time. GO to T6.
T2 CHECK CIRCUIT 1520 (LG) FOR AN OPEN **WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.**	**Yes** GO to T3. **No** REPAIR circuit 1520 (LG). GO to T7.





The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. **WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.** **WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.** **WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.** **WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE:** Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- Key in OFF position.
- Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.
- Key in OFF position.
- For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .
- Disconnect: RCM C310b.
- Disconnect: Seat Track Position Sensor C356.
- For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 .
- Measure the resistance between RCM C310b pin 23, circuit 1520 (LG), harness side and driver seat track position sensor C356 pin 2, circuit 1520 (LG), harness side.

A0048716

- **Is the resistance less than 0.5 ohm?**

• Measure the resistance between RCM C310b pin 24, circuit 1558 (TN/BK), harness side and driver seat track position sensor C356 pin 1, circuit 1558 (TN/BK), harness side.  A0048717 • **Is the resistance less than 0.5 ohm?**	**Yes** GO to T4 . **No** REPAIR circuit 1558 (TN/BK). GO to T7 .
T4 CHECK CIRCUITS 1520 (LG) AND CIRCUIT 1558 (TN/BK) FOR A SHORT TO BATTERY	
• Key in ON position. • Measure the voltage between RCM C310b pin 23, circuit 1520 (LG), harness side and ground; and between pin 24, circuit 1558 (TN/BK), harness side and ground.  A0048718 • **Are the voltages less than 0.2 volt?**	**Yes** GO to T5 . **No** REPAIR circuit 1520 (LG) or circuit 1558 (TN/BK). GO to T7 .
T5 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system diagnostic tools, sensor electrical connectors, and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. • Key in OFF position. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Connect: RCM C310b. • Connect: Seat Track Position Sensor C356. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. • **Was DTC C1982 retrieved during the on-demand self test?**	**Yes** INSTALL a new RCM. REFER to Driver Air Bag Module in this section. GO to T7 . **No** Fault corrected. GO to T7 .
T6 CHECK FOR AN INTERMITTENT FAULT	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.	**Yes** GO to T2 . **No** CHECK for causes of the

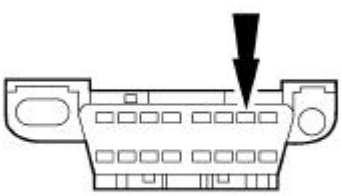
The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury. WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. ● Key in OFF position. ● Deactivate the system. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to T7 .
T7 CHECK FOR ADDITIONAL DTCs	
● Refer to the continuous DTCs recorded during Step T1. ● **Were any continuous DTCs retrieved during Step T1?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Table in this section for pinpoint test direction. **No** RECONNECT

	the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. CLEAR all DTCs.

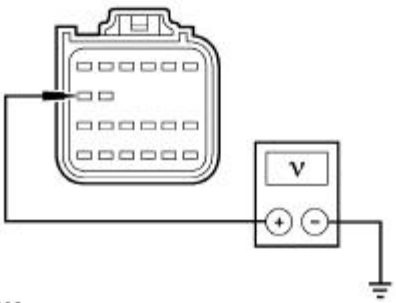
Pinpoint Test U: No Communication With The Restraints Control Module (RCM)

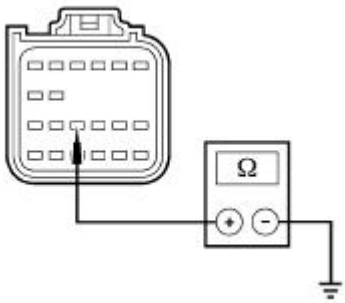
Normal Operation

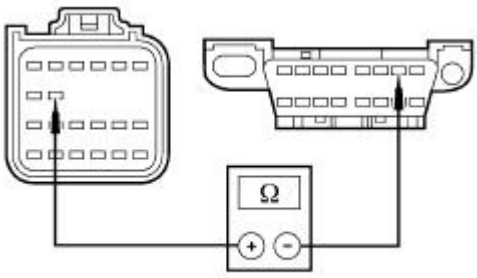
The scan tool communicates with the restraints control module (RCM) monitors through the data link connector (DLC) C251 pin 7, 70 (LB/WH).



Possible Causes







A no communication fault with the RCM can be caused by:

- damaged wiring, terminals, or connectors.
- a faulty data link connector (DLC).
- a faulted RCM.

PINPOINT TEST U: NO COMMUNICATION WITH THE RESTRAINTS CONTROL MODULE (RCM)

Test Step	Result / Action to Take
NOTE: Vehicles equipped with a 60/40 split bench seat require removal of the RCM to allow the electrical connectors to be disconnected. It will be necessary to reinstall the RCM after connecting the RCM electrical connectors before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. For additional information, refer to Restraints Control Module (RCM) in this section.	
U1 CHECK THE RCM C310a PIN 11 FOR DAMAGE	
WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury. WARNING: Do not handle, move or**	**Yes** GO to U2 . **No** REPAIR RCM C310a or RCM C310a pin 11 as necessary. RETEST the communication to the RCM. REACTIVATE

change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury. WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury. WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury. WARNING: Never probe the electrical connector on a safety canopy module. Doing so can result in safety canopy deployment. NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road. NOTE:** After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road. NOTE:** The SRS must be fully operational and free of faults before releasing the vehicle to the customer. • Key in OFF position. • Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section. • For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . • Disconnect: RCM C310a. • For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . • Inspect the RCM C310a, harness side and RCM C310a, component side, pin 11 for damage. • **Are RCM C310a and RCM C310a pin 11 OK?**	the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.
U2 CHECK THE DLC C251 PIN 7 FOR DAMAGE • Inspect the DLC C251 and DLC C251 pin 7 for damage.  A0030459 • **Are DLC C251 and DLC C251 pin 7 OK?**	**Yes** GO to U3 . **No** REPAIR DLC C251 or DLC C251 pin 7 as necessary. RETEST the communication to the RCM. REACTIVATE the system. REFER to Air Bag and Safety Belt Pretensioner

	Supplemental Restraint System (SRS) in this section.
U3 CHECK THE IGNITION CIRCUIT 609 (OG/YE) FOR AN OPEN ● Key in ON position. ● Measure the voltage between RCM C310a pin 12, circuit 609 (OG/YE), harness side and ground.  A0039638 ● **Is the voltage greater than 10 volts?**	**Yes** GO to U4 . **No** REPAIR circuit 609 (OG/YE). RETEST the communication to the RCM. REACTIVATE the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.
U4 CHECK THE GROUND CIRCUIT 649 (BK/OG) FOR AN OPEN ● Key in OFF position. ● Measure the resistance between RCM C310a pin 16, circuit 649 (BK/OG), harness side and a sheet metal ground near the RCM.  A0039639 ● **Is the resistance less than 5 ohms?**	**Yes** GO to U5 . **No** REPAIR circuit 649 (BK/OG). RETEST the communication to the RCM. REACTIVATE the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.
U5 CHECK CIRCUIT 70 (LB/WH) FOR AN OPEN ● Measure the resistance between RCM C310a pin 11, circuit 70 (LB/WH), harness side and the DLC C251 pin 7, circuit 70 (LB/WH), harness side.  A0041599 ● **Is the resistance less than 5 ohms?**	**Yes** GO to U6 . **No** REPAIR circuit 70 (LB/WH). RETEST the communication to the RCM. REACTIVATE the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this

	section.
U6 CONFIRM THE RCM FAULT	
NOTE: Make sure the safety belt pretensioner restraint system diagnostic tools, sensor electrical connectors, and the RCM electrical connector are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded. ● For vehicles equipped with a 60/40 split bench seat, disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 . ● Connect: RCM C310a. ● For vehicles equipped with a 60/40 split bench seat, connect the battery ground cable. For additional information, refer to Section 414-01 . ● Enter the following diagnostic mode on the diagnostic tool: On-Demand Self Test. ● **Did the scan tool communicate with the RCM?**	**Yes** Fault corrected. REACTIVATE the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section. **No** INSTALL a new RCM. RETEST the communication to the RCM. REACTIVATE the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

Inspection and Repair After a Supplemental Restraint System (SRS) Deployment

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be carried out on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

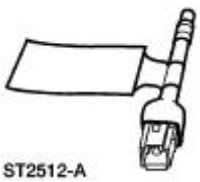
NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

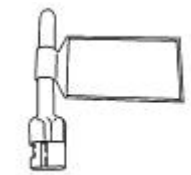
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

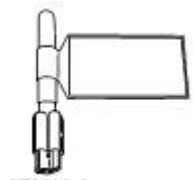
1. When any deployable device (driver air bag, passenger air bag, seat side air bag, safety belt pretensioner, etc.) or combination of devices are deployed and/or the RCM has the DTC B1231 (Crash Data Memory Full) in memory, the repair of the vehicle's supplemental restraint system (SRS) is to include the removal of all deployed devices and the installation of new deployable devices, the removal and installation of new impact sensors, and the removal and installation of a new RCM.

2. When any damage to the impact sensor mounting points or mounting hardware has occurred, repair or install new mounting points and mounting hardware as needed.

3. When the driver air bag module has deployed a new clockspring must be installed.







4. Inspect the entire vehicle for damage, including the following components:
   - steering column.
   - instrument panel knee bolsters and mounting points.
   - instrument panel braces and brackets.
   - instrument panel and mounting points.
   - seats and seat mounting points.
   - safety belts, safety belt buckles, and safety belt retractors. For additional information, refer to Section 501-20A .
   - supplemental restraint system (SRS) wiring, wiring harnesses, and connectors.

5. After carrying out the review and inspection of the entire vehicle for damage, repair or install

new components as needed.

Supplemental Restraint System (SRS) Deactivation and Reactivation

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 req'd) 418-F088 (105-R0012)

Deactivation

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an airbag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Never probe the connectors on the safety canopy module. Doing so can result in safety canopy module deployment.

WARNING: Vehicle sensor orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and properly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.

NOTE: If a seat equipped with a seat mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.**

NOTE: Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors.

NOTE: Diagnostics or repairs are not to be carried out on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

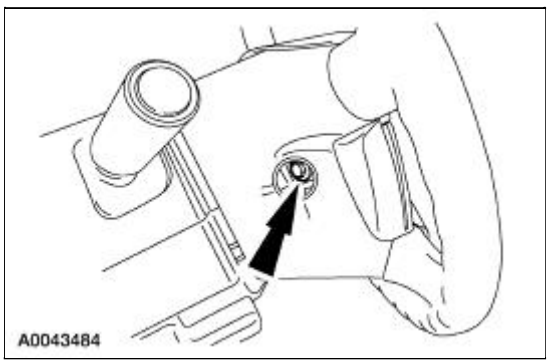
All vehicles

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

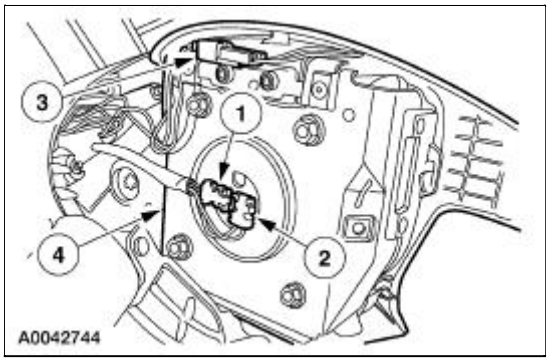
The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.



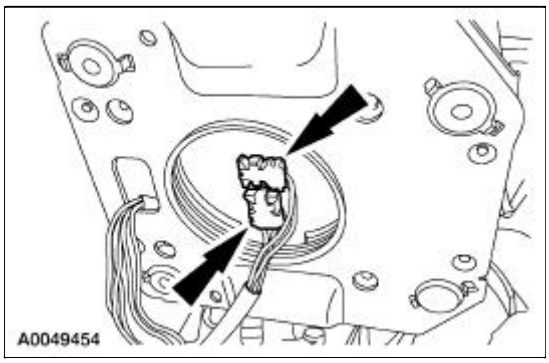
To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. Remove the two steering wheel back cover plugs (one shown).

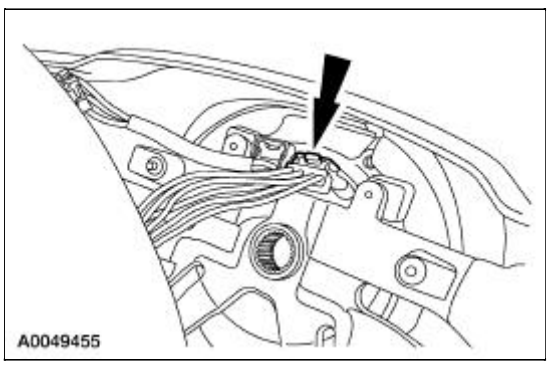


3. Remove the two driver air bag module bolts (one shown).



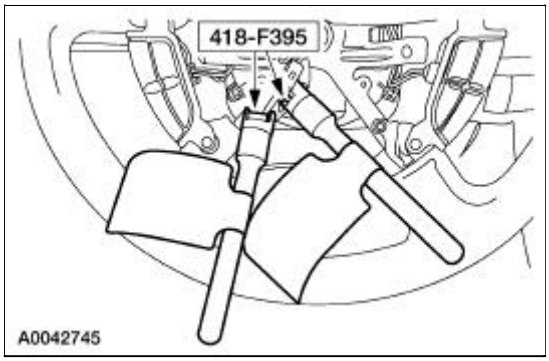
Expedition vehicles

4. Remove the driver air bag module.
    1. Release the two retaining tabs. Disconnect the driver air bag module electrical connector.
        - Label the driver air bag module squib number on the driver air bag module electrical connector before disconnecting.
    2. Release the two retaining tabs. Disconnect the driver air bag module electrical connector.
        - Label the driver air bag module squib number on the driver air bag module electrical connector before disconnecting.
    3. Disconnect the horn switch electrical connector.
    4. Remove the driver air bag module.

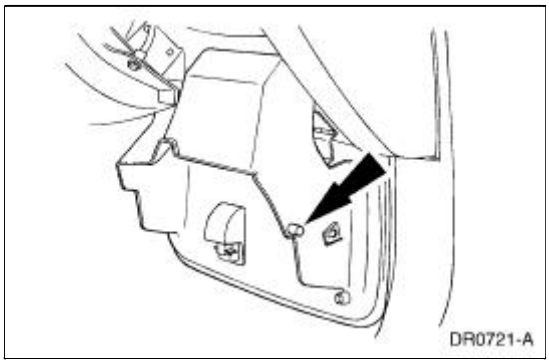


Navigator vehicles

5. Disconnect the driver air bag module
    - Release the two tabs on each driver air bag module electrical connector and disconnect them.
        - Label each driver air bag module electrical connector before disconnecting.

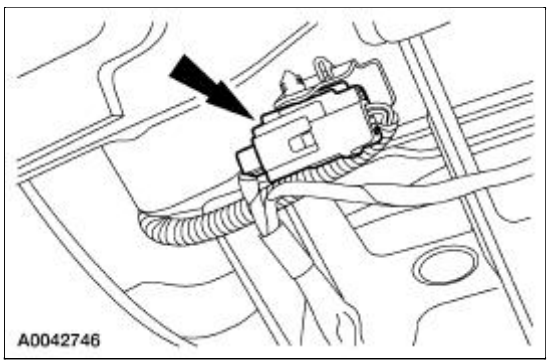


6. Release the tab and disconnect the driver air bag module accessories electrical connector at the top of the clockspring and remove the driver air bag module.

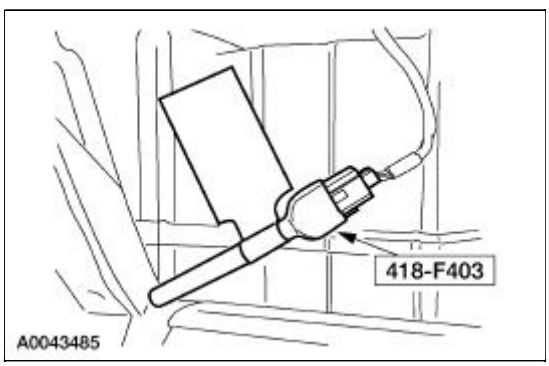


All vehicles

7. Attach the restraint system diagnostic tools to the clockspring electrical connectors at the top of the steering column.



8. While pushing in on the two glove compartment door tabs, position the glove compartment downward.

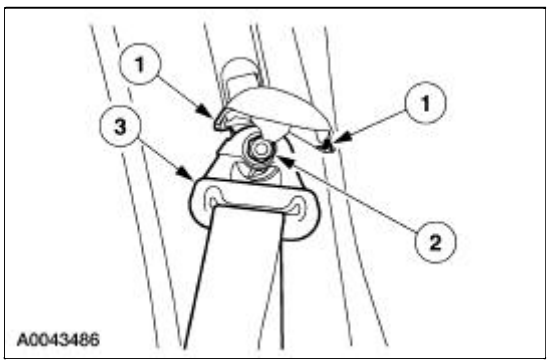


9. **NOTE:** The Expedition is shown, the Navigator is similar.

   Through the glove compartment opening, release the tab and disconnect the passenger air bag module electrical connector.

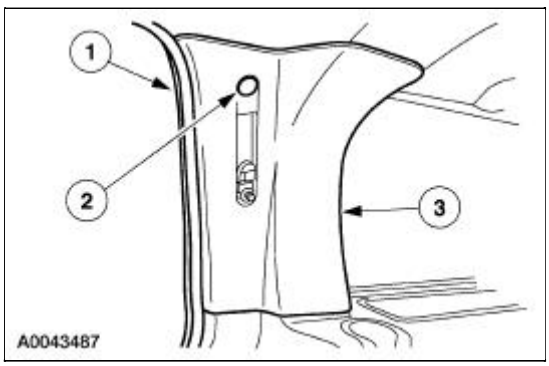
10. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag module electrical connector.

Vehicles without safety canopies



11. **CAUTION: Do not deactivate the safety canopy module circuit by removing the safety canopy bridge resistor from the safety canopy electrical connector.**

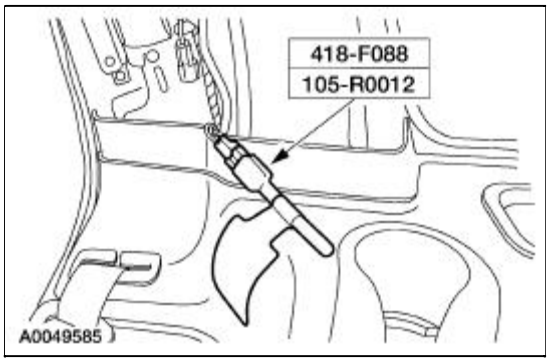
    If the safety canopy bridge resistor is removed, an open circuit fault will be generated by the restraints control module (RCM).
    If a restraint system diagnostic tool is installed at the safety canopy electrical connector, a low resistance fault will be generated by the RCM.



Vehicles with safety canopies

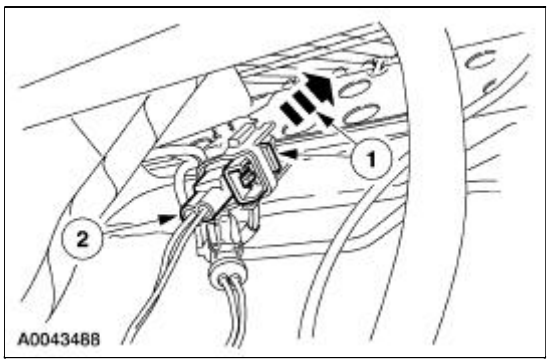
12. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

    Remove the second row passenger side safety belt guide.
    1. Release the retaining tab at each side and open the safety belt guide cover.
    2. Remove the nut.
    3. Remove the second row passenger side safety belt guide.

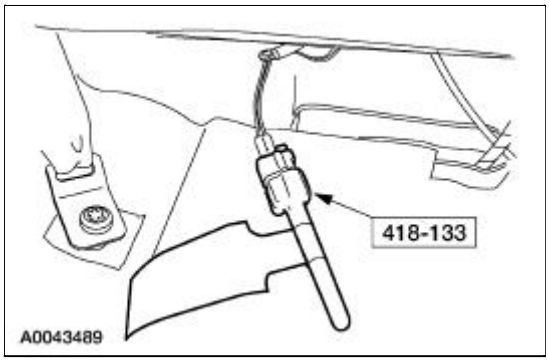


13. Remove the passenger side C-pillar trim panel.
    1. Separate the weather-stripping along the passenger side C-pillar trim panel.
    2. Remove the bolt cover and bolt.
    3. Pull out to release the retainers and remove the passenger side C-pillar trim panel.

14. Disconnect the passenger side safety canopy electrical connector.

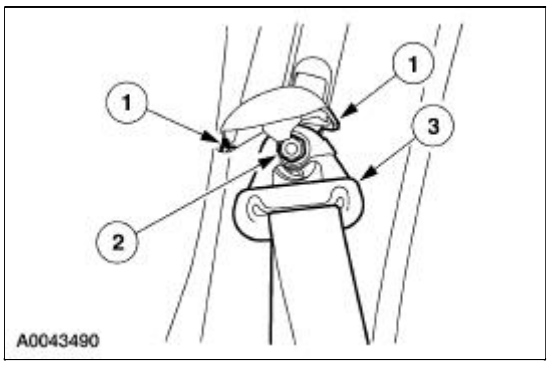


15. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger side safety canopy electrical connector.

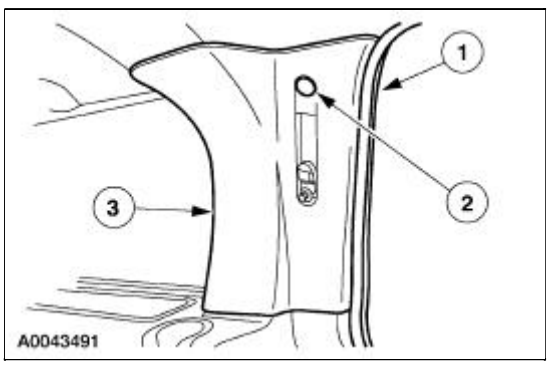


All vehicles

16. Disconnect the passenger seat safety belt buckle pretensioner electrical connector.
    1. Slide and disengage the passenger seat safety belt buckle pretensioner electrical connector locking clip.
    2. Push in to release the tab and disconnect the passenger seat safety belt buckle pretensioner electrical connector.



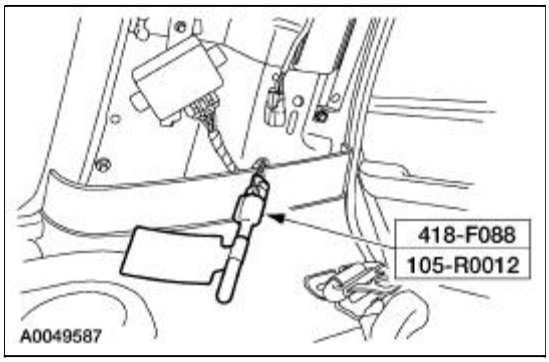
17. Attach the restraint system diagnostic tool to the passenger seat safety belt buckle pretensioner floor electrical connector.



Vehicles with safety canopies

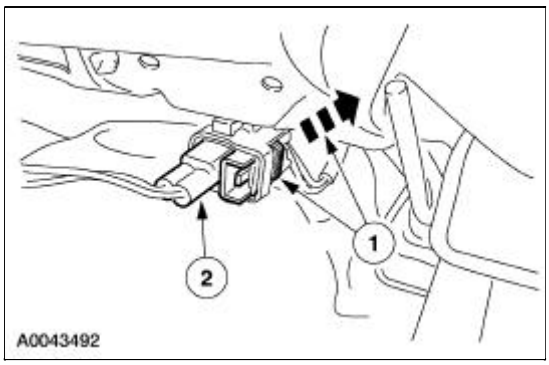
18. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

    Remove the second row driver side safety belt guide.
    1. Release the retaining tab at each side and open the safety belt guide cover.
    2. Remove the nut.
    3. Remove the second row driver side safety belt guide.

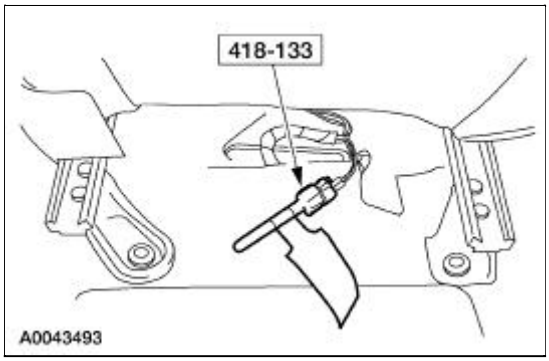


19. Remove the driver side C-pillar trim panel.
    1. Separate the weather-stripping along the driver side C-pillar trim panel.
    2. Remove the bolt cover and bolt.
    3. Pull out to release the retainers and remove the driver side C-pillar trim panel.

20. Disconnect the driver side safety canopy electrical connector.



21. Attach the restraint system diagnostic tool to the vehicle harness side of the driver side safety canopy electrical connector.



All vehicles

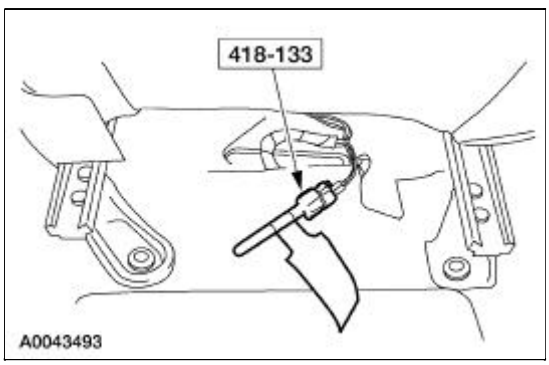
22. Disconnect the driver seat safety belt buckle pretensioner electrical connector.
    1. Slide and disengage the driver seat safety belt buckle pretensioner electrical connector locking clip.
    2. Push in to release the tab and disconnect the driver seat safety belt buckle pretensioner electrical connector.

23. Attach the restraint system diagnostic tool to the driver seat safety belt buckle pretensioner floor electrical connector.

24. Connect the battery ground cable. For additional information, refer to Section 414-01 .

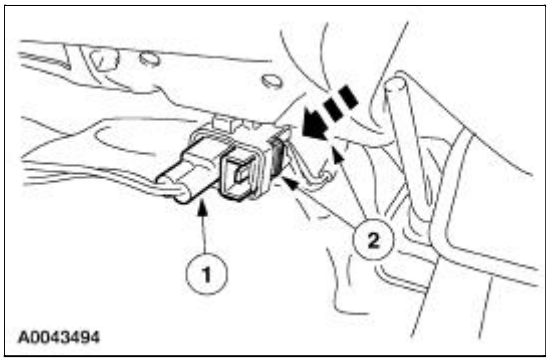
25. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of Section 501-20B .

26. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .



Reactivation

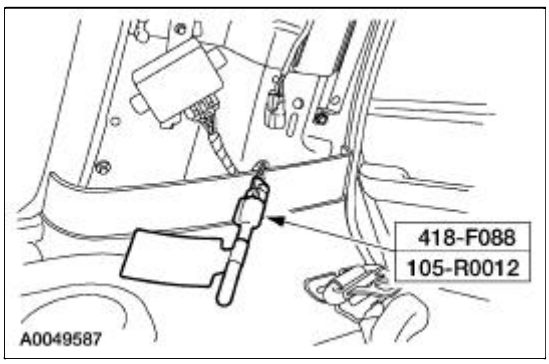
WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the deactivation procedure.



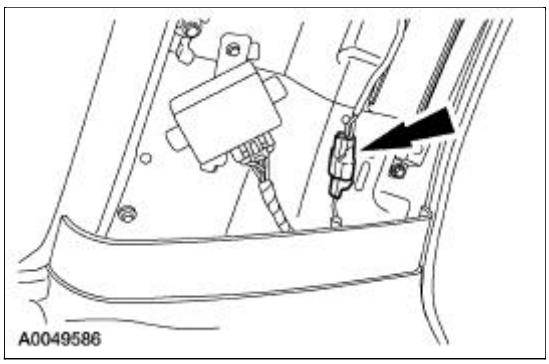
All vehicles

1. **NOTE:** Make sure the battery negative cable is still disconnected before proceeding with the reactivation portion of this procedure.

   Remove the restraint system diagnostic tool from the driver seat safety belt buckle pretensioner floor electrical connector.

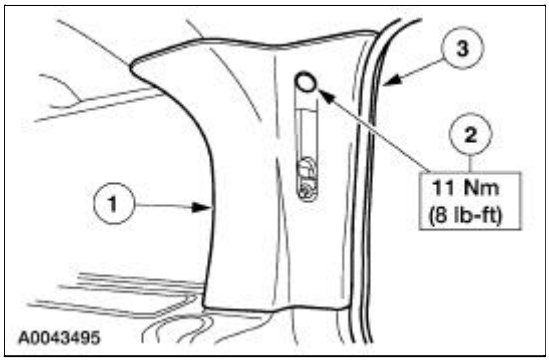


2. Connect the driver seat safety belt buckle pretensioner electrical connector.
   1. Connect the driver seat safety belt buckle pretensioner electrical connector.
   2. Slide and engage the driver seat safety belt buckle pretensioner electrical connector locking clip.



Vehicles with safety canopies

3. Remove the restraint system diagnostic tool from the vehicle harness side of the driver side safety canopy electrical connector.



4. Connect the driver side safety canopy electrical connector.

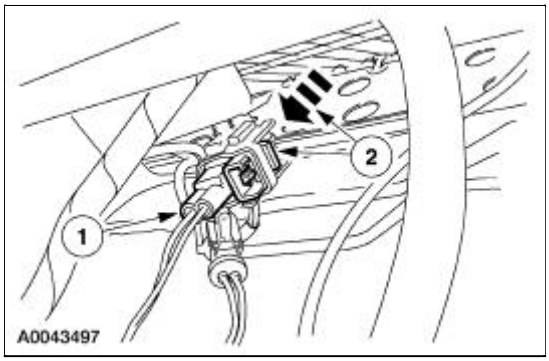
5. **WARNING: Anytime the safety canopy module has deployed, the headliner, and all A, B, and C pillar upper trim panels and attaching hardware must be replaced along with any other damaged components and hardware. Failure to do so may result in personal injury in the event of a safety canopy module deployment.**

   Install the driver side C-pillar trim panel.
   1. Position the driver side C-pillar trim panel and push in, engaging the retainers.
   2. Install the bolt and bolt cover.
   3. Install the weather-stripping along the driver side C-pillar trim panel.

6. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

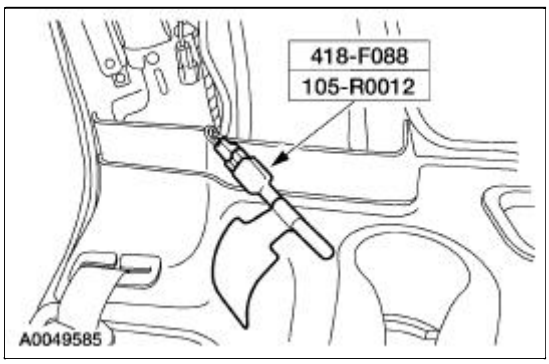
   NOTE: Make sure the safety belt is not twisted prior to installation.

   Install the second row driver side safety belt guide.
   1. Position the second row driver side safety belt guide.
   2. Install the nut.
   3. Close the safety belt guide cover.

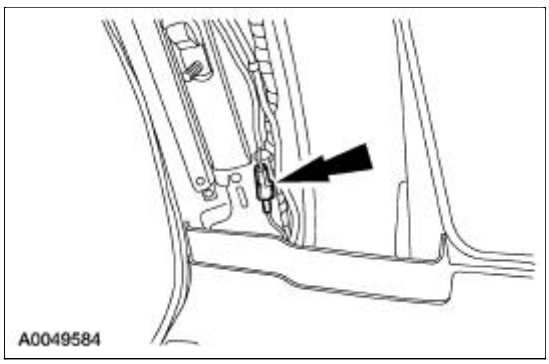


All vehicles

7. Remove the restraint system diagnostic tool from the passenger seat safety belt buckle pretensioner floor electrical connector.

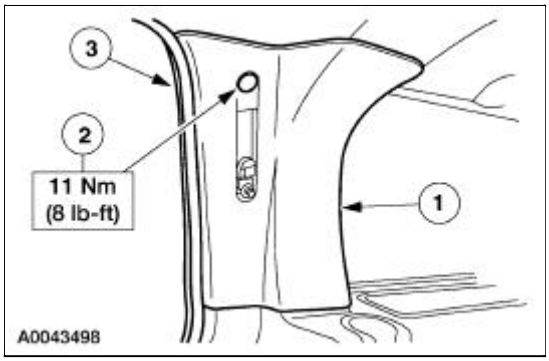


8. Connect the passenger seat safety belt buckle pretensioner electrical connector.
   1. Connect the passenger seat safety belt buckle pretensioner electrical connector.
   2. Slide and engage the passenger seat safety belt buckle pretensioner electrical connector locking clip.



Vehicles with safety canopies

9. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger side safety canopy electrical connector.



10. Connect the passenger side safety canopy electrical connector.

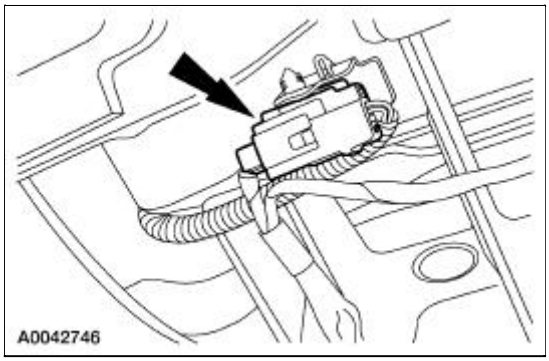
11. **WARNING: Anytime the safety canopy module has deployed, the headliner, and all A, B, and C pillar upper trim panels and attaching hardware must be replaced along with any other damaged components and hardware. Failure to do so may result in personal injury in the event of a safety canopy module deployment.**

    Install the passenger C-pillar trim panel.
    1. Position the passenger side C-pillar trim panel and push in, engaging the retainers.
    2. Install the bolt and bolt cover.
    3. Install the weather-stripping along the passenger side C-pillar trim panel.

12. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

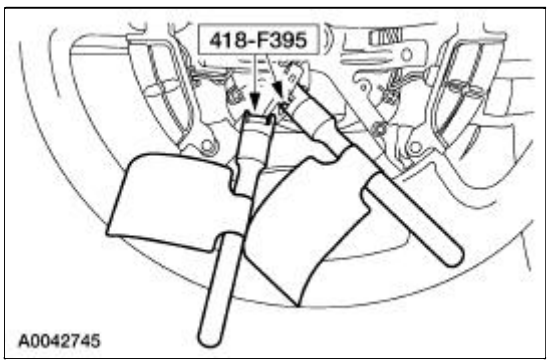
    NOTE: Make sure the safety belt is not twisted prior to installation.

    Install the second row passenger side safety belt guide.
    1. Position the second row passenger side safety belt guide.
    2. Install the nut.
    3. Close the safety belt guide cover.



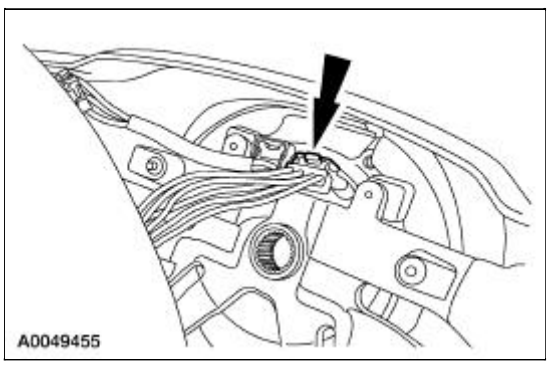
All vehicles

13. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag module electrical connector.



14. **NOTE:** The Expedition is shown, the Navigator is similar.

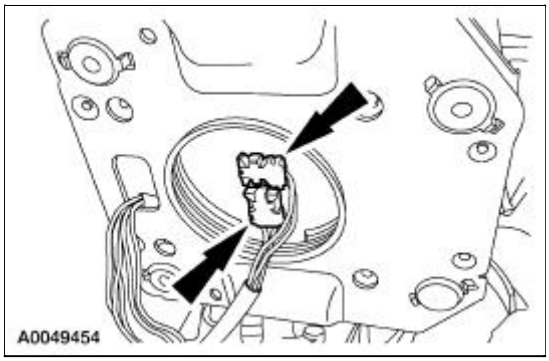
    Connect the passenger air bag module electrical connector.



15. Close the glove compartment.

16. Remove the restraint system diagnostic tools from the clockspring electrical connector at the top of the steering column.

Navigator vehicles



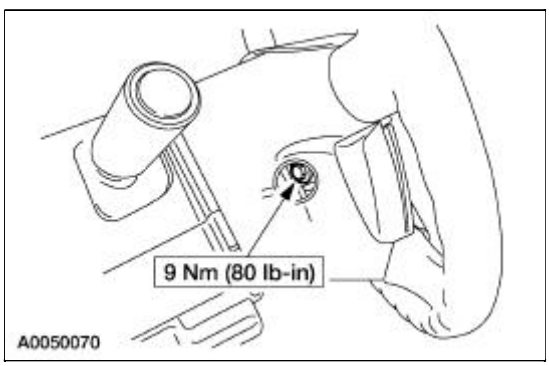
17. Connect the driver air bag module accessories electrical connector to the connector end at the top of the clockspring.

18. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

    Connect the driver air bag module electrical connectors as noted during removal.

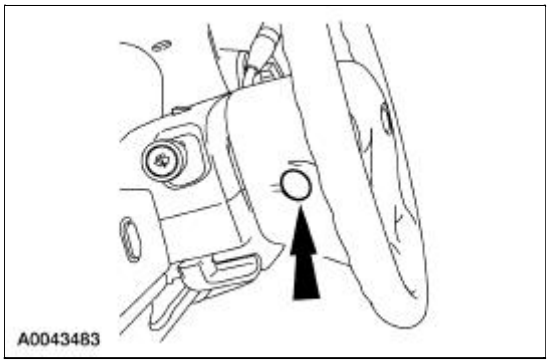
    - Position the driver air bag module to the steering wheel.

Expedition vehicles



19. Position the driver air bag module to the steering wheel.
    1. Connect the horn switch electrical connector.
    2. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

       Connect the driver air bag module electrical connectors as noted during removal.
    3. Position the driver air bag module to the steering wheel.



All vehicles

20. Install the two driver air bag module bolts (one shown).

21. Install the two steering wheel back cover plugs (one shown).

22. Connect the battery ground cable. For additional information, refer to Section 414-01 .

23. **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of Section 501-20B .

Vehicles with safety canopies

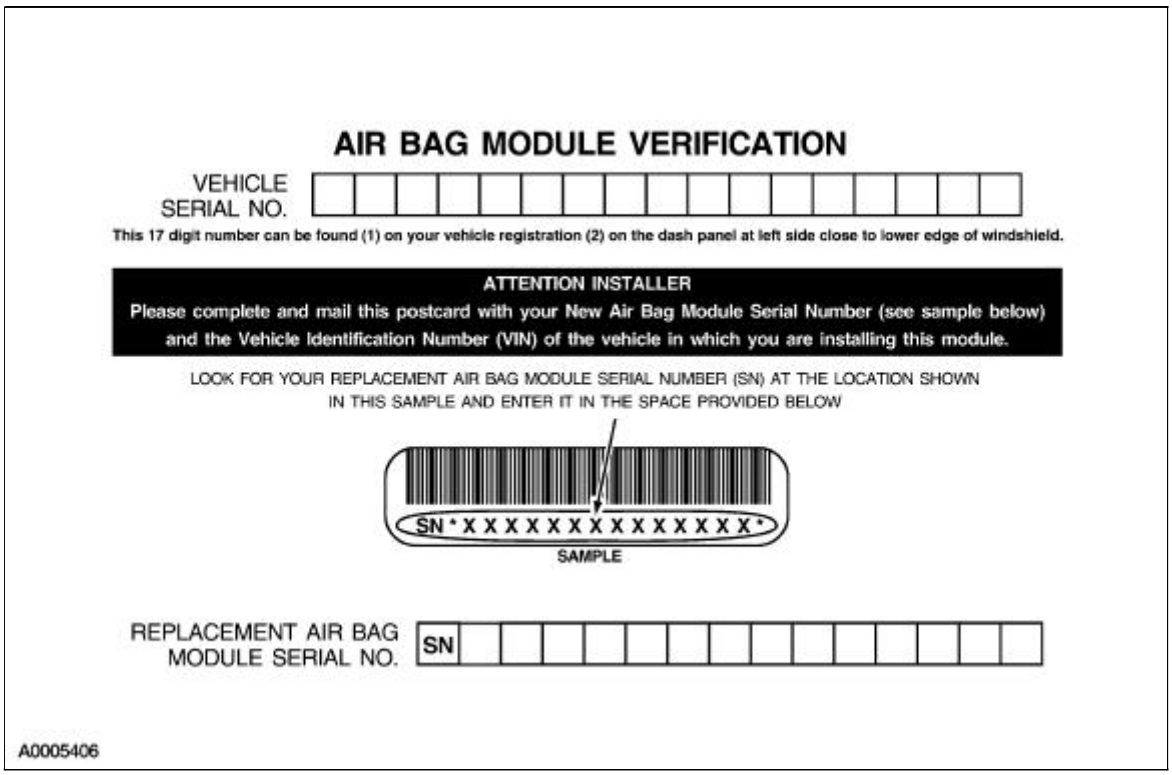
24. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A .

Air Bag Disposal —Deployed

1.  **WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.**

   Dispose of the deployed air bag modules and safety belt pretensioners in the same manner as any other part to be scrapped.

Air Bag Disposal —Undeployed Inoperative



WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: Carry a live air bag module with the air bag and trim cover or deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

NOTE: All inoperative air bag modules and safety belt pretensioners have been placed on the Mandatory Return List. All discolored or damaged air bag modules must be treated the same as any inoperative live air bag being returned.

1. Remove the inoperative component from the vehicle. For additional information, refer to the appropriate air bag procedure in this section.

2. **NOTE:** When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the vehicle identification number (VIN) must be recorded and sent to Ford Motor Company.

   If installing a new air bag module, record the necessary information and return the inoperative air bag module to Ford Motor Company.

Air Bag Disposal —Driver, Undeployed, Scrapped Vehicle

Remote Deployment

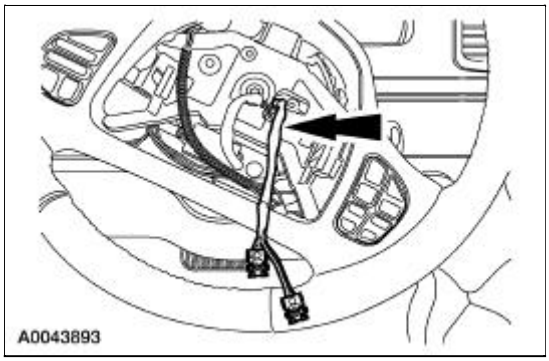
WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

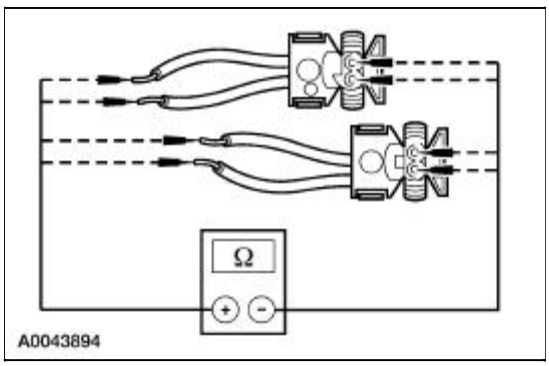
WARNING: Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Remote deployment is to be carried out outdoors with all personnel at least 6.1 meters (20 feet) away to ensure personal safety. Due to the loud report which occurs when the air bag is deployed, hearing protection is required.



WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

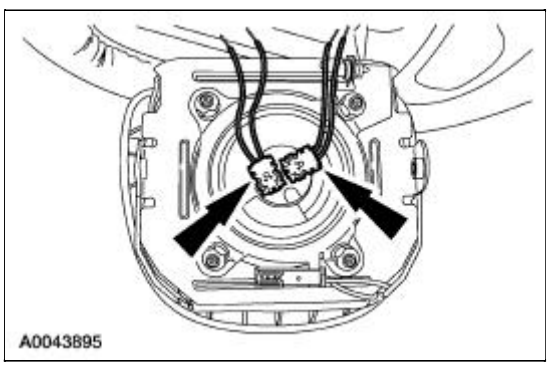
NOTE: A typical driver air bag disposal is shown that is similar for all vehicles.



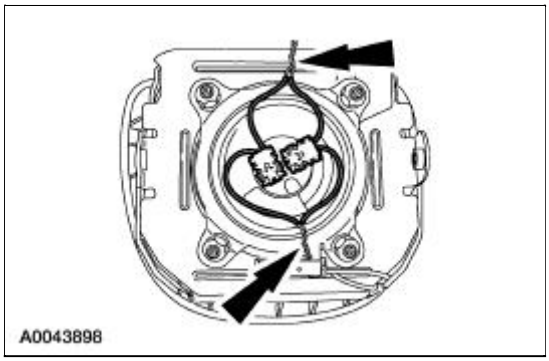
1. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the driver air bag module removal and installation procedure.**

   Remove the driver air bag module from the vehicle. For additional information, refer to Driver Air Bag Module in this section.

2. Cut the clockspring wire harness. Remove the sheathing over the wires.



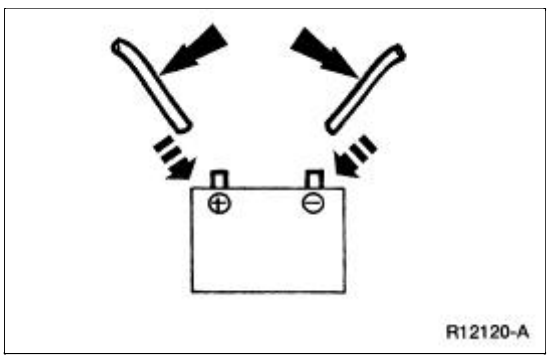
3. Strip the insulation from all four wires. Carry out an ohms check from the stripped end of each wire to the connector end. If any of the four wires reads more than 0.5 ohm use another connector.



4. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

   Match the driver air bag module electrical connector key to the keyway in the driver air bag module. Connect the two driver air bag module electrical connectors to the driver air bag module.

5. Twist together one wire from each pair.



6. Obtain two wires (20 gauge minimum) at least 6.1 meters (20 feet) long and attach one end of each wire to each twisted splice.

7. Place the air bag module on a flat surface in an open outdoor area with the trim cover and air bag facing up.

8. Remain at least 6.1 meters (20 feet) away from the air bag module.

9. Deploy the air bag module by touching the other ends of the two wires to the terminals of a 12-volt battery.

10. To allow for cooling, wait at least ten minutes before approaching the deployed air bag.

11. Dispose of the deployed air bag module in the same manner as any other part to be scrapped.

Air Bag Disposal —Passenger, Undeployed, Scrapped Vehicle

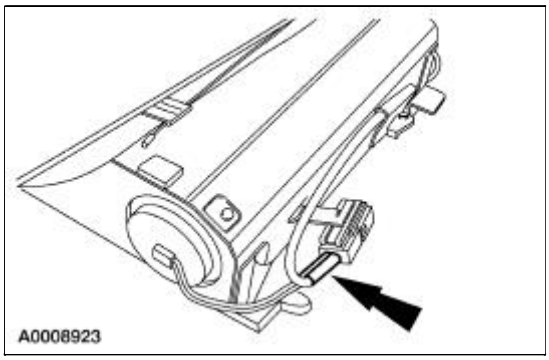
Remote Deployment

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module or safety belt retractor/pretensioner assembly. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

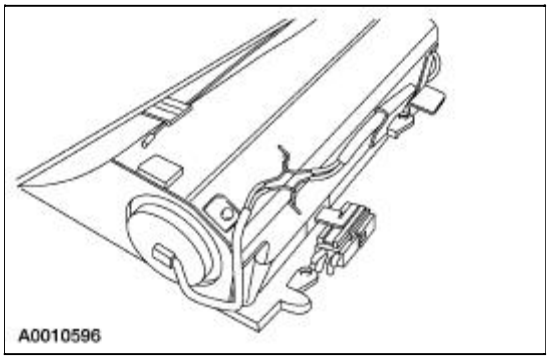
WARNING: Carry a live air bag module with the air bag and trim cover or deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Remote deployment is to be carried out outdoors with all personnel at least 6.1 meters (20 feet) away to ensure personal safety. Due to the loud report which occurs when the air bag is deployed, hearing protection is required.



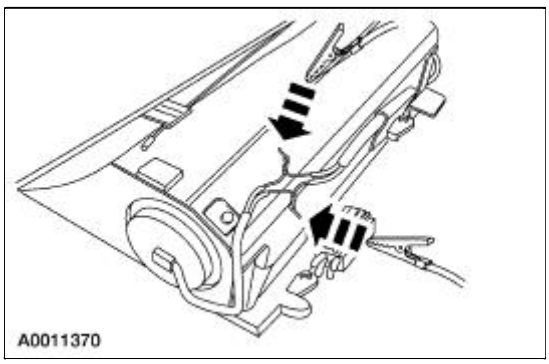
WARNING: Do not place the driver or passenger air bag module with the trim cover or deployment door facing down, as the forces of the deploying air bag could cause it to ricochet and cause personal injury.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.



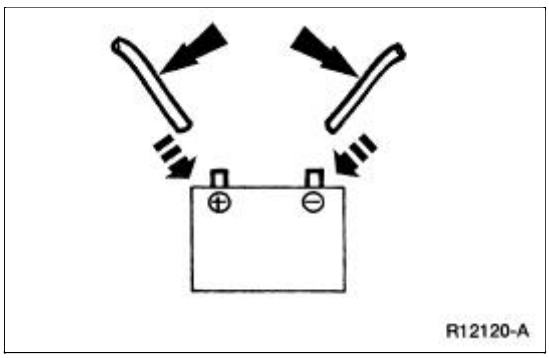
NOTE: A typical passenger air bag disposal is shown that is similar for all vehicles.

1. Remove the passenger air bag from the vehicle. For additional information, refer to Passenger Air Bag Module in this section.



2. Cut and strip all four wires at the air bag electrical connector.

3. Twist together one wire from each pair.



4. Obtain two wires (20 gauge minimum) at least 6.1 meters (20 feet) long and attach one end of each wire to each twisted splice.

5. Place the air bag module on a flat surface in an open outdoor area with the trim cover facing upward.

6. Remain at least 6.1 meters (20 feet) away from the air bag module.

7. Deploy the air bag module by touching the other ends of the two wires to the terminals of a 12-volt battery.

8. To allow for cooling, wait at least ten minutes before approaching the deployed air bag.

9. Dispose of the deployed air bag module in the same manner as any other part to be scrapped.

Air Bag Disposal —Safety Canopy, Undeployed, Scrapped Vehicle

Remote Deployment

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Remote deployment is to be performed outdoors with all personnel at least 6.1 meters (20 feet) away to ensure personal safety. Due to the loud report which occurs when the air bag is deployed, hearing protection is required.

NOTE: A typical safety canopy disposal is shown that is similar for all vehicles.

NOTE: The safety canopy module deployment for a scrapped vehicle will occur in its installed position in the vehicle.

NOTE: The left hand side is shown, the right hand side is similar.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

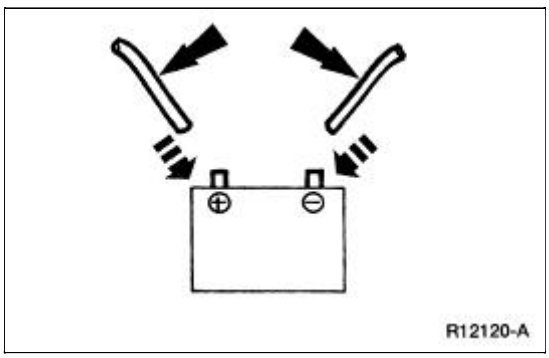
   The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

   To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

   Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. Remove the C-pillar trim panel from the same side as the safety canopy to be disposed. For additional information, refer to Section 501-05 .

3. Cut and strip the wires near the electrical connector.



4. Obtain two wires (20 gauge minimum) at least 9.1 meters (30 feet) long and attach one end of each wire to the stripped wires on the safety canopy module.

5. Remain at least 6.1 meters (20 feet) away from the vehicle.

6. Deploy the safety canopy module by touching the other ends of the two wires to the terminals of a 12-volt battery.

7. To allow for cooling, wait at least ten minutes before approaching the deployed safety canopy module.

8. Dispose of the deployed safety canopy module in the same manner as any other part to be scrapped.

Safety Belt Pretensioner Disposal —Deployed

1. **WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.**

   Dispose of the deployed safety belt pretensioner in the same manner as any other part to be scrapped.

Safety Belt Pretensioner Disposal —Undeployed, Inoperative

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Carry a live safety belt retractor pretensioner or safety belt buckle pretensioner so as to keep fingers and clothing away from moveable parts. This will reduce the risk of injury in the event of an accidental deployment.

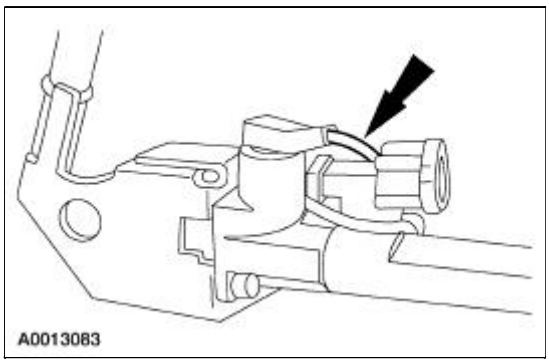
NOTE: All inoperative safety belt buckle pretensioners and safety belt retractor pretensioners have been placed on the Mandatory Return List. All damaged safety belt buckle pretensioners and safety belt retractor pretensioners must be treated the same as any inoperative live safety belt buckle pretensioner or safety belt retractor pretensioner being returned.

1. Remove the inoperative safety belt buckle pretensioner or safety belt retractor pretensioner from the vehicle. For additional information, refer to Section 501-20A .

2. Package and return the inoperative safety belt buckle pretensioner or safety belt retractor pretensioner to Ford Motor Company.

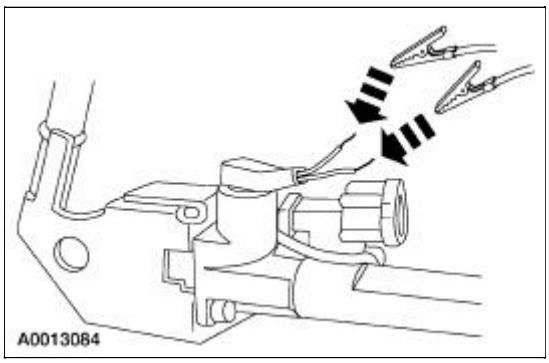
Safety Belt Pretensioner Disposal —Undeployed, Scrapped Vehicle

Remote Deployment



WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

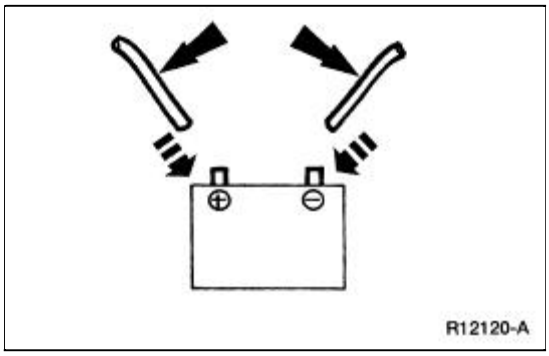
WARNING: Remote deployment is to be performed outdoors with all personnel at least 6.1 meters (20 feet) away to ensure personal safety. Due to the loud report which occurs when the safety belt pretensioner is deployed, hearing protection is required.



WARNING: Do not position the safety belt buckle pretensioner or safety belt retractor pretensioner so that moveable parts contact the support surface, as the forces of the deploying pretensioner can cause it to ricochet and cause personal injury.

1. Remove the safety belt buckle pretensioner assembly from the vehicle. For additional information, refer to Section 501-20A .

2. Cut and strip the wires near the electrical connector.



3. Obtain two wires (20 gauge minimum) at least 6.1 meters (20 feet) long and attach one end of each wire to the safety belt buckle pretensioner wires.

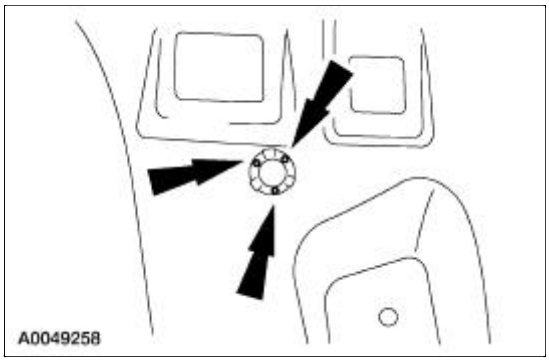
4. Position the safety belt buckle pretensioner assembly on a flat surface in an open outdoor area so that moveable parts do not contact the support surface.

5. Remain at least 6.1 meters (20 feet) away from the safety belt buckle pretensioner assembly.

6. Deploy the safety belt buckle pretensioner by touching the other ends of the two wires to the terminals of a 12–volt battery.

7. To allow for cooling, wait at least ten minutes before approaching the deployed safety belt buckle pretensioner.

8. Dispose of the deployed safety belt buckle pretensioner in the same manner as any other part to be scrapped.

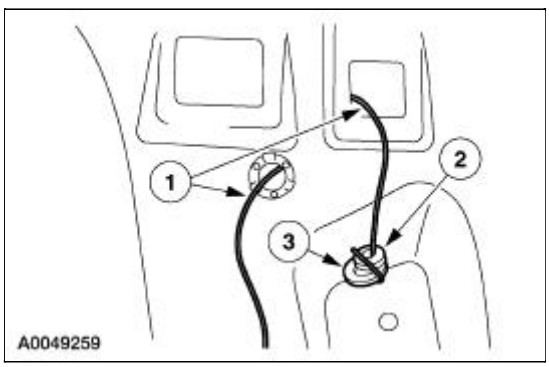


Weld Nut Repair —Missing Weld Nut

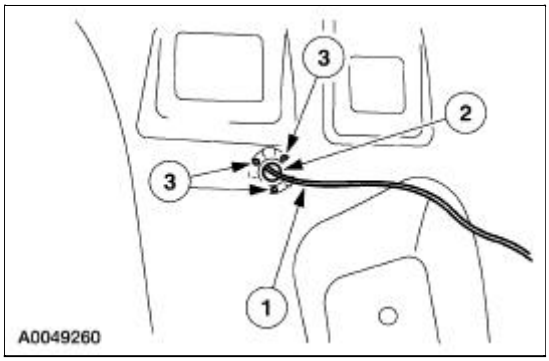
CAUTION: Installing a J-nut in place of a weld nut is not a recommended repair.

NOTE: C-pillar repair shown, others similar.

1. Remove the component from where the weld nut is to be repaired. Refer to the appropriate removal and installation procedure in this section.



2. Drill three equally spaced 5/64 in (1.75 mm) holes in close proximity to where the weld nut face will be plug welded back to the sheet metal.



3. Obtain the appropriate 6 mm (0.24 in) or 8 mm (0.32 in) weld nut.

4. Obtain the appropriate 6 mm (0.24 in) by 1.0 or 8 mm (0.32 in) by 1.25 grounding screw (self-tapping).

5. Set up for the positioning of the weld nut.
    1. Route a sufficient length of wire through the weld nut clearance hole and back out an adjacent access hole.
    2. Position a weld nut, shoulder end up, onto the wire.
    3. Position a flat washer onto the wire and secure it so it cannot be pulled off.

6. Plug weld the weld nut into position.
    1. Pull the welding wire back through the clearance hole, allowing the weld nut and flat washer to follow the welding wire through and stop against the sheet metal.
    2. Make sure the weld nut shoulder is aligned through the clearance hole in the sheet metal.
    3. With the weld nut firmly held in position, plug weld the weld nut at the three holes drilled previously.

7. Metal finish as required.
8. Verify the nut is securely in place.
9. Install the component with the previously obtained screw.
10. Tighten the attaching screws to specification. For additional information, refer to Specifications in this section.

Weld Nut Repair —Stripped Weld Nut

1. Remove the component from where the weld nut is to be repaired. Refer to the appropriate removal and installation procedure in this section.

2. Inspect the weld nut and surrounding area for repair.
   - If there is not enough clearance for a larger bolt stud to go through or a larger bolt head to turn, then a threaded insert will have to be installed. Follow the instructions with the thread insert repair kit.

3. If a 6 mm weld nut is stripped, drill out the hole using a letter "H" or 0.26 in (6.5 mm) drill bit. Then tap, using an 8 mm by 1.25 bit.
   - Do not oversize a 6 mm weld nut by more than 8 mm.

4. If an 8 mm weld nut is stripped, drill the hole using a letter "R" or 0.3990 in (9.75 mm) drill bit. Then tap, using a 10 mm by 1.50 bit.
   - Do not oversize an 8 mm weld nut by more than 10 mm.

5. Obtain the appropriate oversized screw.

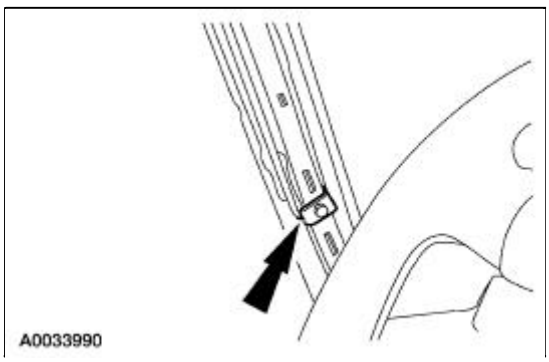
6. Install the attaching screw(s) to the component.

7. Tighten the attaching screws to specification. For additional information, refer to Specifications in this section.

Rivet Nut Replacement

CAUTION: If the safety canopy module has deployed, the tether cord rivet nut must be inspected and replaced if damaged before installing a new safety canopy.

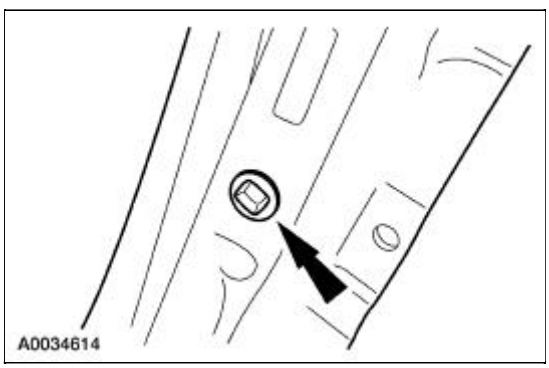
NOTE: A typical rivet nut replacement is shown that is similar for all vehicles.



NOTE: The left-hand drive driver side is shown, all others are similar.

1. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section.



2. Remove the A-pillar trim panel. For additional information, refer to Section 501-05 .

3. Remove the bolt and bracket for the tether cord from the A-pillar.

4. Position and secure the side air curtain tether cord and bracket assembly out of the way.

5. Using the appropriate service tool, sand the rivet nut shoulder until the shoulder surface is removed.

6. Punch the remaining portion of the rivet nut through the rivet nut hole.

7. **NOTE:** Use only Ford Motor Company factory-authorized replacement parts for rivet nut repair procedure.

   Obtain the correct square shank rivet nut for the vehicle application from the Ford Master Parts Catalog, and insert it into the rivet nut hole.

8. Using a suitable rivet nut installing tool, install the rivet nut. For additional information, refer to the tool manufacturer's operating instructions.

9. Position the A-pillar tether cord. Install the bolt. See the appropriate component removal and installation procedure or Specifications for the correct torque specification.

10. **NOTE:** The tether cord must be positioned correctly in place before installing the A-pillar trim panel.

    Install the A-pillar trim panel. For additional information, refer to Section 501-05 .

11. **WARNING: To reduce the risk of serious injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedure portion of this section.

12. **WARNING: The restraint system diagnostic tools are for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

Side Impact Sensor —Front Row

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 req'd) 418-F088 (105-R0012)

Removal

WARNING: Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and correctly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

NOTE: The driver side is shown, the passenger side is similar.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

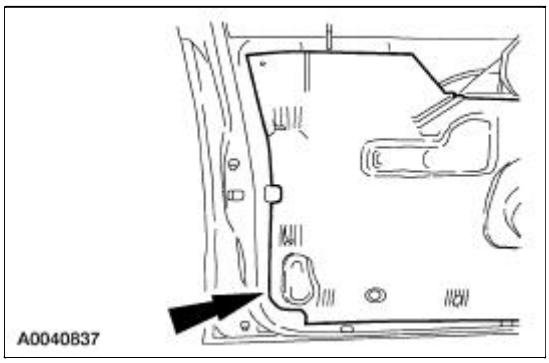
1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).



Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

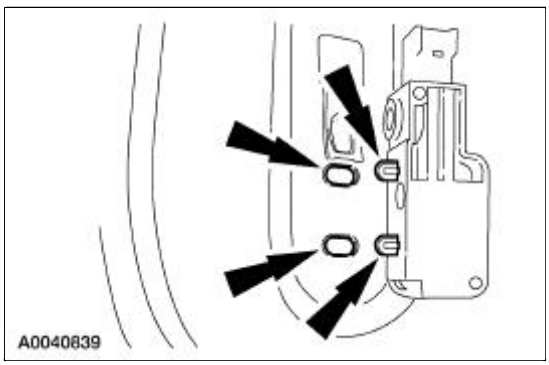
2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section.

3. Remove the front interior door trim panel on the side with the affected side impact sensor. For additional information, refer to Section 501-05 .

4. Separate the weathershield enough to access the side impact sensor.

5. Remove the side impact sensor.
   1. Remove the bolt.
   2. Disconnect the electrical connector.
   3. Remove the side impact sensor.



Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

1. **CAUTION: Always replace the J-clip retaining nut whenever installing a side impact sensor.**

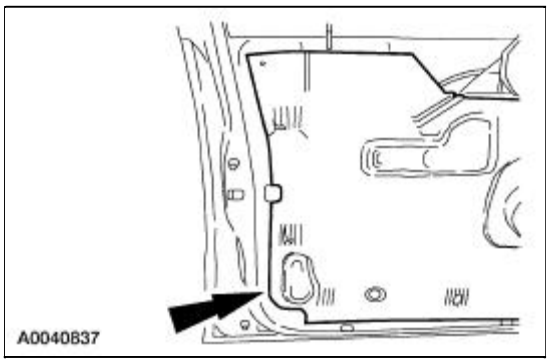
   NOTE: Make sure the battery negative cable is still disconnected before continuing with the installation portion of this procedure.

   Align the locator tabs to the openings in the door.

2. **CAUTION: The ground wire must be placed between the bolt head and the sensor. Never position the ground wire between the J-clip retaining nut and the sensor.**

   CAUTION: Always replace the J-clip retaining nut whenever installing a side impact sensor.

   Install the side impact sensor.
   1. Connect the electrical connector.
   2. With the locator tabs aligned to the openings in the door, position the side impact sensor to the door.
   3. Position the ground wire between the bolt head and the sensor.
   4. Install the bolt.



3. Connect the battery ground cable. For additional information, refer to Section 414-01 .

4. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

5. Disconnect the battery ground cable and wait at least one minute. For additional information,

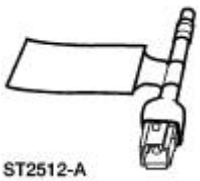
refer to Section 414-01 .

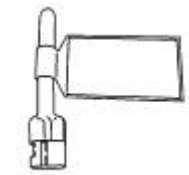
6. Position back the weathershield.

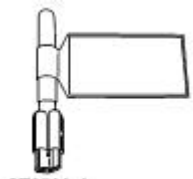
7. Install the front interior door trim panel on the side with the affected side impact sensor. For additional information, refer to Section 501-05 .

8. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section.







9. Connect the battery ground cable. For additional information, refer to Section 414-01 .

10. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

Side Impact Sensor —Second Row

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 req'd) 418-F088 (105-R0012)

Removal

WARNING: Vehicle sensor orientation is critical for correct system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and correctly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

NOTE: The driver side is shown, the passenger side is similar.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

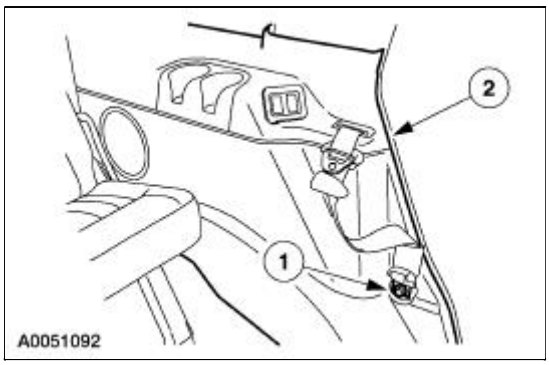
1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).



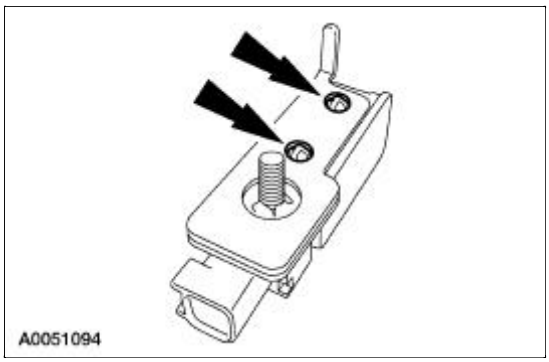
Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation , in the General Procedures portion of this section.

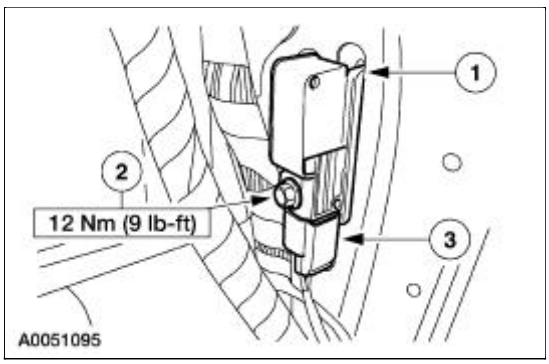
3. Remove the rear door scuff plate.

4. Separate the rear quarter trim panel.
   1. Remove the safety belt anchor.
   2. Pull out at the front of the rear quarter trim panel, releasing the retaining clips, allowing access to the side impact sensor.



5. Remove the side impact sensor.
   1. Remove the bolt.
   2. Disconnect and remove the side impact sensor.

Installation

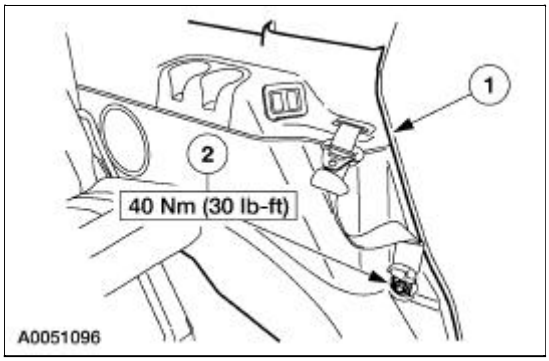


WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

1. Make sure the second row side impact sensor tabs are aligned to the bracket.

2. **NOTE:** Make sure the battery negative cable is still disconnected before proceeding with the installation procedure.

   Install the second row side impact sensor with bracket.
   1. Align and insert the second row side impact sensor bracket locator pin to the opening in the quarter panel sheet metal.
   2. Install the bolt.
   3. Connect the electrical connector.



3. Connect the battery ground cable. For additional information, refer to Section 414-01 .

4. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

5. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

6. **NOTE:** Make sure the safety belt webbing is not twisted prior to installation.

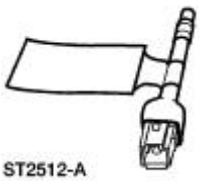
   Install the rear quarter trim panel.
   1. Align the rear quarter trim panel and push in, seating the retaining clips.
   2. Install the safety belt anchor.

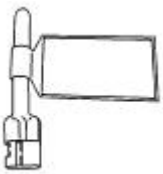
7. Install the rear door scuff plate.

8. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation , in the General Procedures portion of this section.

9. Connect the battery ground cable. For additional information, refer to Section 414-01 .





10. **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

11. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A .

Front Impact Severity Sensor

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 req'd) 418-F088 (105-R0012)

Removal

WARNING: Vehicle sensor orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and properly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

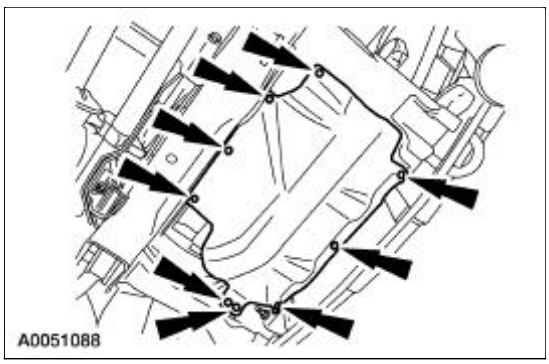
1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind

the door trim panel.

The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.



To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

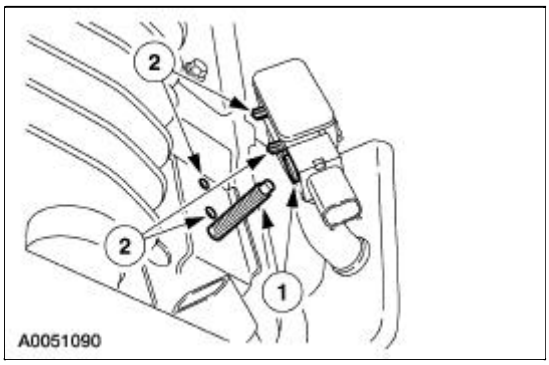
   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation , in the General Procedures portion of this section.

3. Remove the pin-type retainers and the front lower splash shield.

4. **NOTE:** The front impact severity sensor is mounted on the bottom of the hood latch support bracket.

   Remove the front impact severity sensor.
   1. Remove the nut.
   2. Disconnect and remove the front impact severity sensor.

Installation



WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

1. **CAUTION: If the hood latch support bracket or weld stud are damaged in any way that would affect the way the front impact severity sensor mounts to its original manufactured position, a new hood latch support bracket must be installed.**

   NOTE: Make sure the battery negative cable is still disconnected before continuing with the installation portion of this procedure.

   NOTE: Make sure the hood latch support bracket and front impact severity sensor mating surfaces are clean and debris free.

   Position the front impact severity sensor.
   1. Position the front impact severity sensor onto the hood latch support bracket stud.
   2. While sliding the front impact severity sensor onto the stud, align the locator tabs to the hood latch support bracket alignment holes.

2. Install the front impact severity sensor.
   1. With the front impact severity sensor sitting flat up against the hood latch support bracket, install the nut.
   2. Connect the front impact severity sensor.

3. Position the front lower splash shield and install the pin-type retainers.

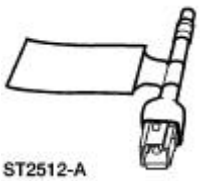
4. Connect the battery ground cable. For additional information, refer to Section 414-01 .

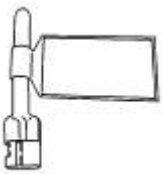
5. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

6. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

7. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation , in the General Procedures portion of this section.





8. Connect the battery ground cable. For additional information, refer to Section 414-01 .

9. **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

   With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

Restraints Control Module (RCM)

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 req'd) 418-F088 (105-R0012)

Removal

WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.

WARNING: The restraints control module (RCM) orientation is critical for proper air bag supplemental restraint system (SRS) operation. If a vehicle equipped with an SRS system has been involved in a collision in which the center tunnel area has been damaged, inspect the mounting and bracket for deformation. If damaged, the RCM must be replaced whether or not the air bags have deployed. In addition, make sure the area of the RCM mounting is restored to its original condition.

WARNING: Vehicle sensor orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and properly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage can result.

NOTE: When installing a new restraints control module (RCM), always make sure the correct RCM is being installed. If an incorrect RCM is installed, erroneous DTCs will result.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

All vehicles

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

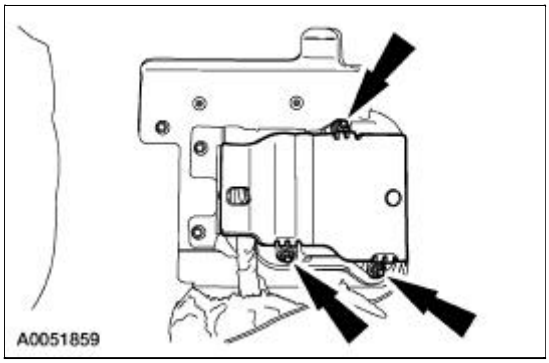
   The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

   To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

   Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

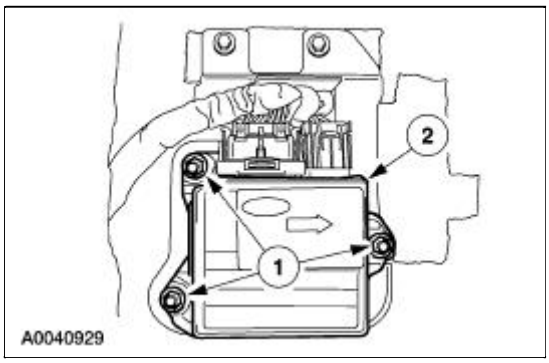
   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section.



Vehicles with a center console

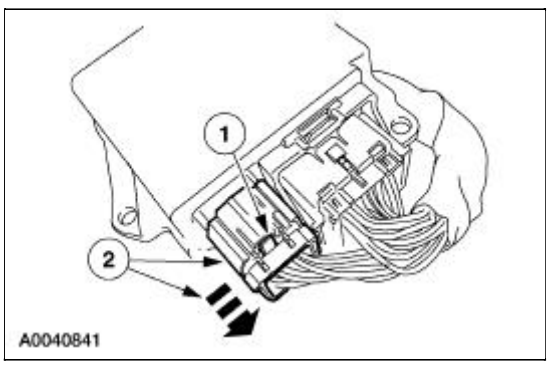
3. Remove the center console. For additional information, refer to Section 501-12 .

Vehicles with 60/40 front bench seat



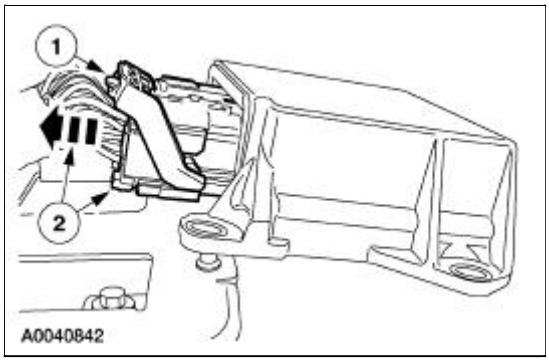
4. Remove the 60 percent portion of the front bench seat. For additional information, refer to Section 501-10 .

5. Remove the nuts and the restraints control module (RCM) top bracket.



6. **WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.**

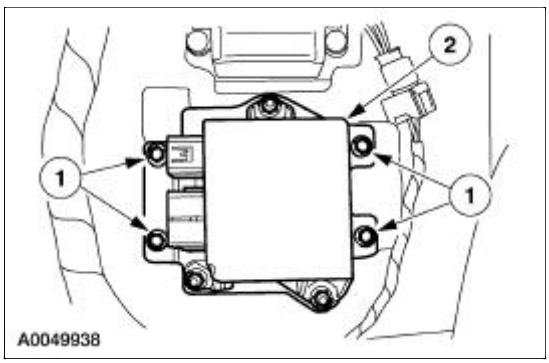
   Separate the RCM from the bracket.
   1. Remove the nuts.
   2. Separate the RCM from the bracket.



All vehicles

7. Disconnect the small restraints control module (RCM) electrical connector.
   1. Push down to release the retaining tab.
   2. While releasing the retaining tab, pull out and disconnect the small RCM electrical connector.

8. Disconnect the large RCM electrical connector.
   1. Pinch the thumb tab and pivot the connector position assurance lever away from the RCM, disengaging the lever.
   2. Pull out and disconnect the large RCM electrical connector.



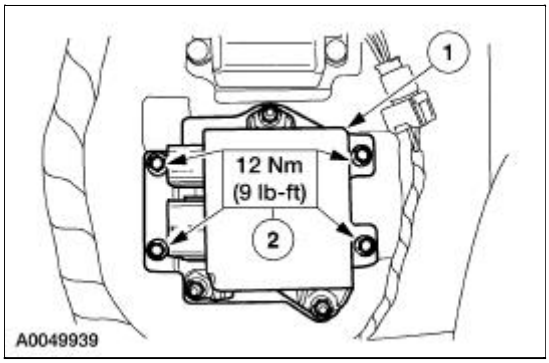
Vehicles with 60/40 front bench seat

9. Remove the RCM.

Vehicles with a center console

10. Remove the RCM.
    1. Remove the RCM bracket bolts.
    2. Remove the RCM with bracket.

Installation



WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

Vehicles with a center console

1. **WARNING: The tightening torque of the air bag restraints control module (RCM) bracket retaining bolts is critical for correct system operation.**

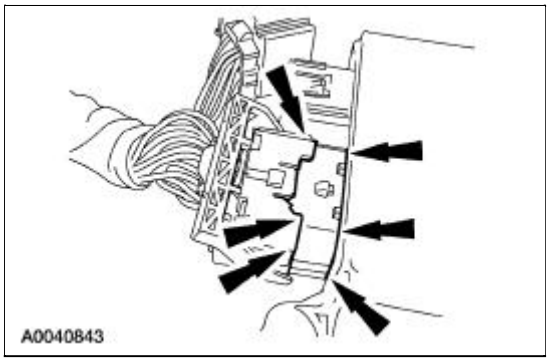
   NOTE: Make sure the battery negative cable is still disconnected before continuing with the installation portion of this procedure.

   Install the RCM.
   1. Position the RCM with bracket.
   2. Install the bolts.

All vehicles

2. **NOTE:** Make sure the battery negative cable is still disconnected before continuing with the installation portion of this procedure.

   Make sure the connector position assurance lever is in the full release position before attempting to connect the connector.



3. **WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow these instructions may result in the inadvertent deployment of the safety canopy and risk of personal injury.**

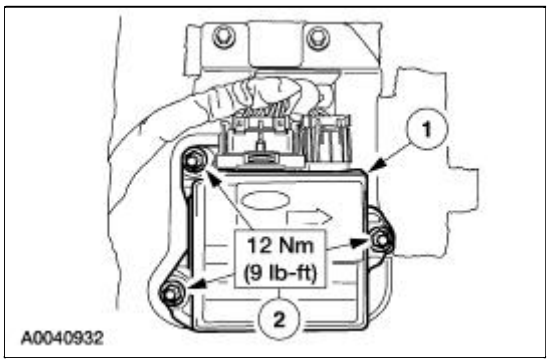
   CAUTION: Putting the large RCM electrical connector into the RCM on an angle can cause bad electrical connections and damage components.

   Position the large RCM electrical connector into the RCM.

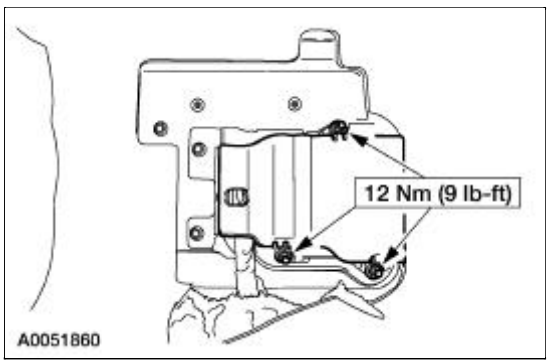
   - **CAUTION: Do not push the connector on to where the lever pivots and seats itself. Light pressure is needed to get the connector into position on the RCM before using the lever to fully seat the connector.**

     With the large RCM electrical connector uniformly aligned to the RCM, lightly push in until a subtle audible click is heard and slight resistance is felt.

4. Connect the RCM electrical connector.
    - Pivot the connector position assurance lever toward the RCM, drawing the connector in to the RCM.
        - Make sure the thumb tab is engaged to the retainer on the RCM and locked in place.



5. Connect the small RCM electrical connector.



Vehicles with 60/40 front bench seat

6. **WARNING: The tightening torque of the air bag restraints control module (RCM) to bracket retaining nuts is critical for correct system operation.**

   Install the RCM.
   1. Position the RCM to the bracket.
      - While positioning the RCM onto the bracket, make sure the wire harness is positioned between the RCM and the bracket shield.
   2. Install the nuts.

7. Position the RCM top bracket and install the nuts.

All vehicles

8. Connect the battery ground cable. For additional information, refer to Section 414-01 .

9. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

10. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

Vehicles with a center console

11. Install the center console. For additional information, refer to Section 501-12 .

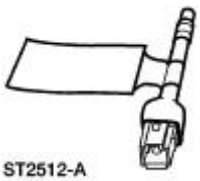
Vehicles with 60/40 front bench seat

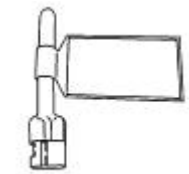
12. Install the 60 percent portion of the front bench seat. For additional information, refer to Section 501-10 .

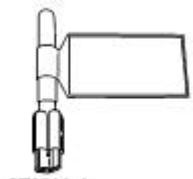
All vehicles

13. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation , in the General Procedures portion of this section.







14. Connect the battery ground cable. For additional information, refer to Section 414-01 .

15. **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

Driver Air Bag Module

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 req'd) 418-F088 (105-R0012)

Removal

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt buckle pretensioner and safety belt retractor pretensioner are pyrotechnic devices. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Never probe the connectors on the safety canopy module. Doing so can result in safety canopy module deployment.

WARNING: Vehicle sensor orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and properly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.

NOTE: If a seat equipped with a seat mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.**

NOTE: Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

All vehicles

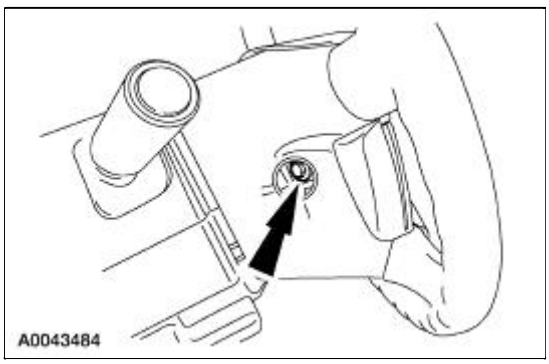
1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the

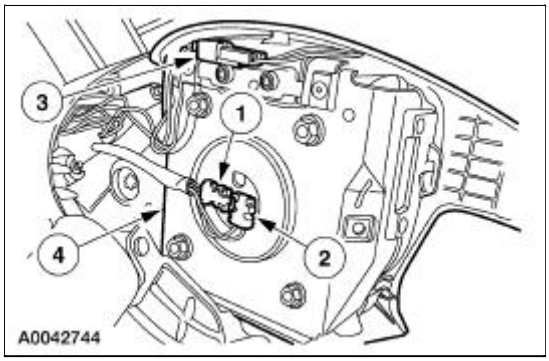
C-pillars.



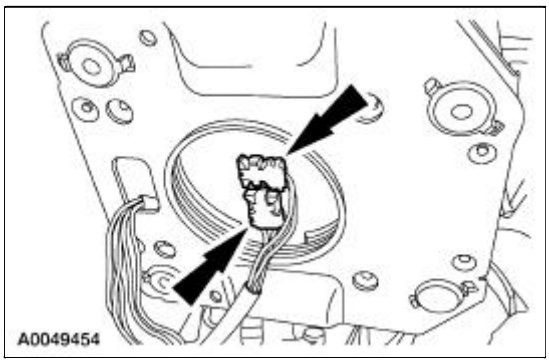
To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. Remove the two steering wheel back cover plugs (one shown).

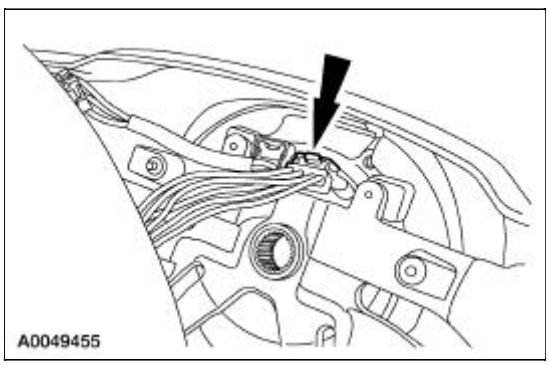


3. Remove the two driver air bag module bolts (one shown).



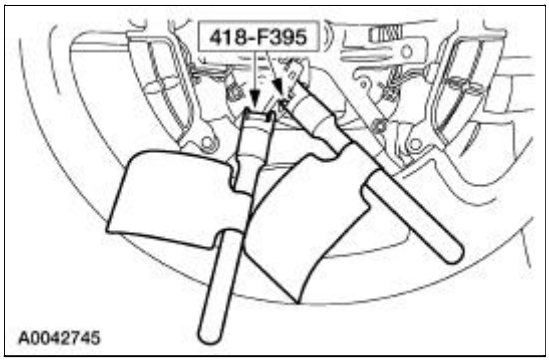
Expedition vehicles

4. Remove the driver air bag module.
    1. Release the two retaining tabs. Disconnect the driver air bag module electrical connector.
        - Label the driver air bag module squib number on the driver air bag module electrical connector before disconnecting.
    2. Release the two retaining tabs. Disconnect the driver air bag module electrical connector.
        - Label the driver air bag module squib number on the driver air bag module electrical connector before disconnecting.
    3. Disconnect the horn switch electrical connector.
    4. Remove the driver air bag module.

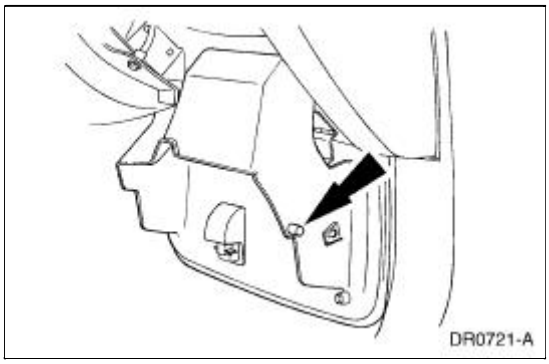


Navigator vehicles

5. Disconnect the driver air bag module
    - Release the two tabs on each driver air bag module electrical connector and disconnect them.
        - Label each driver air bag module electrical connector before disconnecting.

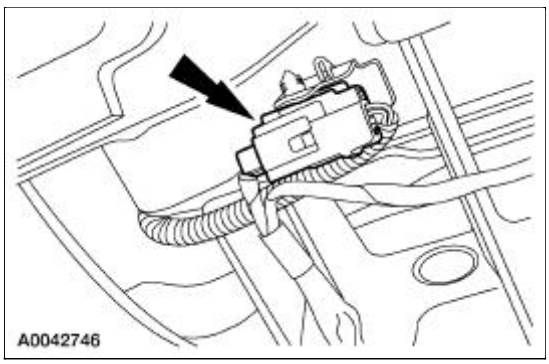


6. Release the tab and disconnect the driver air bag module accessories electrical connector at the top of the clockspring and remove the driver air bag module.

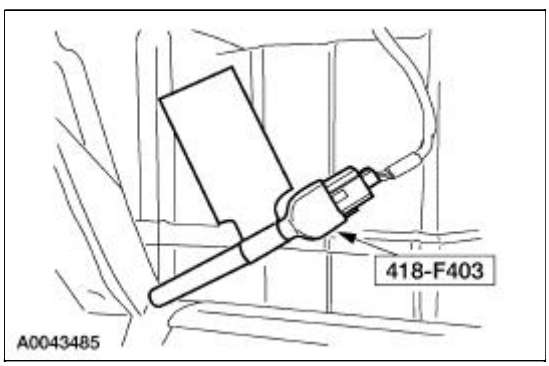


All vehicles

7. Attach the restraint system diagnostic tools to the clockspring electrical connectors at the top of the steering column.



8. While pushing in on the two glove compartment door tabs, position the glove compartment downward.

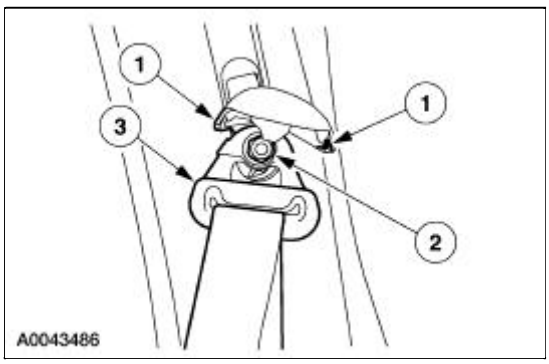


9. **NOTE:** Expedition is shown, Navigator is similar.

   Through the glove compartment opening, release the tab and disconnect the passenger air bag module electrical connector.

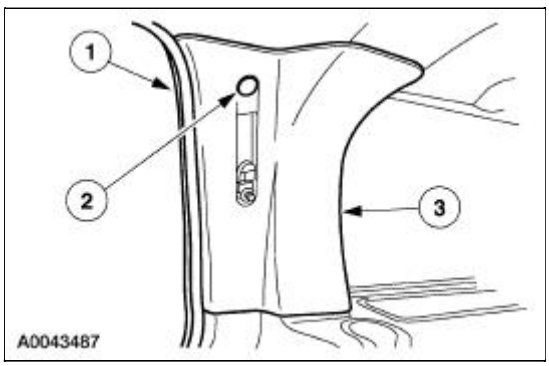
10. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag module electrical connector.

Vehicles without safety canopies



11. **CAUTION: Do not deactivate the safety canopy module circuit by removing the safety canopy bridge resistor from the safety canopy electrical connector.**

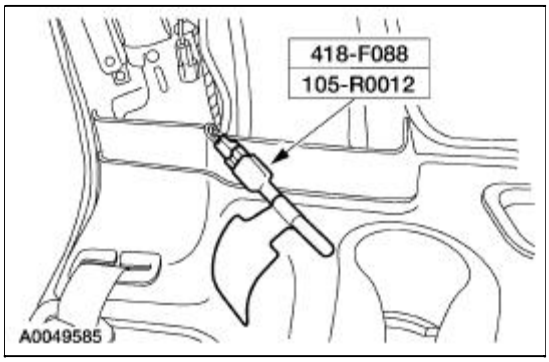
    If the safety canopy bridge resistor is removed, an open circuit fault will be generated by the restraints control module (RCM).
    If a restraint system diagnostic tool is installed at the safety canopy electrical connector, a low resistance fault will be generated by the RCM.



Vehicles with safety canopies

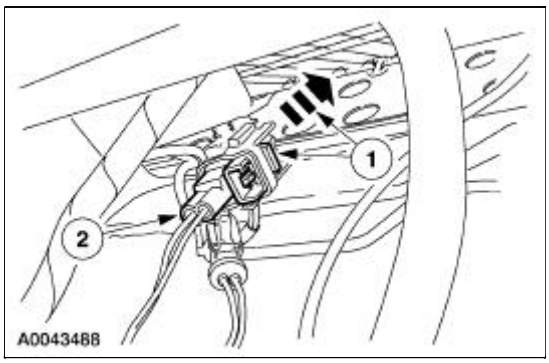
12. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

    Remove the second row passenger side safety belt guide.
    1. Release the retaining tab at each side and open the safety belt guide cover.
    2. Remove the nut.
    3. Remove the second row passenger side safety belt guide.

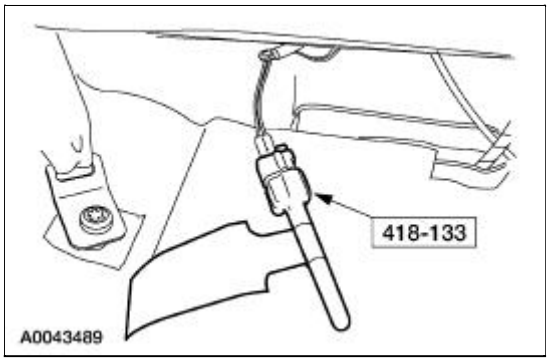


13. Remove the passenger side C-pillar trim panel.
    1. Separate the weather-stripping along the passenger side C-pillar trim panel.
    2. Remove the bolt cover and bolt.
    3. Pull out to release the retainers and remove the passenger side C-pillar trim panel.

14. Disconnect the passenger side safety canopy electrical connector.

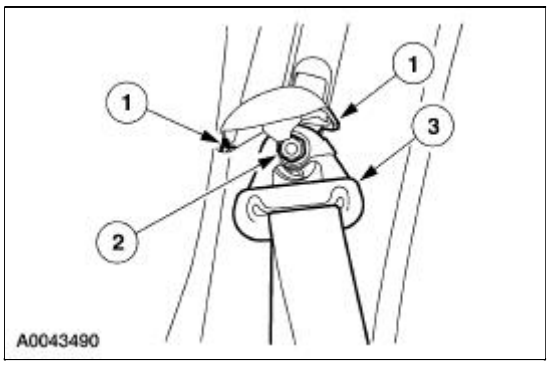


15. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger side safety canopy electrical connector.

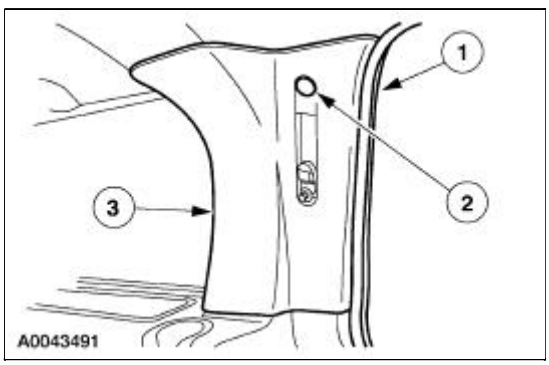


All vehicles

16. Disconnect the passenger seat safety belt buckle pretensioner electrical connector.
    1. Slide and disengage the passenger seat safety belt buckle pretensioner electrical connector locking clip.
    2. Push in to release the tab and disconnect the passenger seat safety belt buckle pretensioner electrical connector.



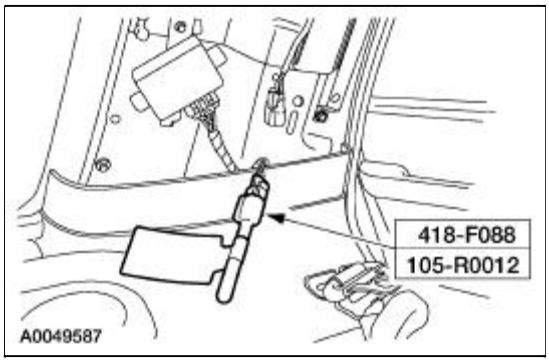
17. Attach the restraint system diagnostic tool to the passenger seat safety belt buckle pretensioner floor electrical connector.



Vehicles with safety canopies

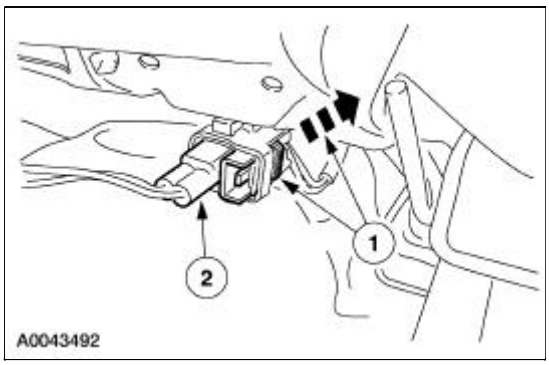
18. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

    Remove the second row driver side safety belt guide.
    1. Release the retaining tab at each side and open the safety belt guide cover.
    2. Remove the nut.
    3. Remove the second row driver side safety belt guide.

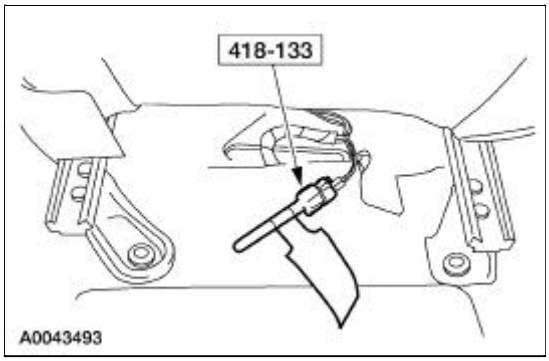


19. Remove the driver side C-pillar trim panel.
    1. Separate the weather-stripping along the driver side C-pillar trim panel.
    2. Remove the bolt cover and bolt.
    3. Pull out to release the retainers and remove the driver side C-pillar trim panel.

20. Disconnect the driver side safety canopy electrical connector.



21. Attach the restraint system diagnostic tool to the vehicle harness side of the driver side safety canopy electrical connector.



All vehicles

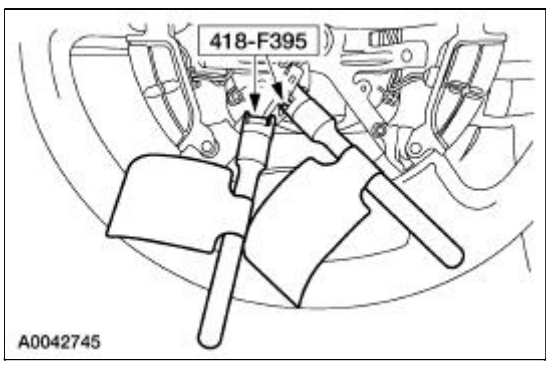
22. Disconnect the driver seat safety belt buckle pretensioner electrical connector.
    1. Slide and disengage the driver seat safety belt buckle pretensioner electrical connector locking clip.
    2. Push in to release the tab and disconnect the driver seat safety belt buckle pretensioner electrical connector.

23. Attach the restraint system diagnostic tool to the driver seat safety belt buckle pretensioner floor electrical connector.

24. Connect the battery ground cable. For additional information, refer to Section 414-01 .

25. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

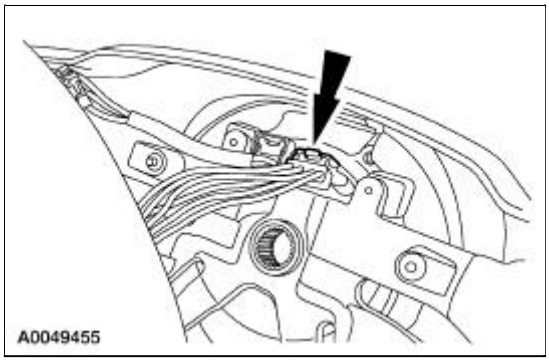
26. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .



Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

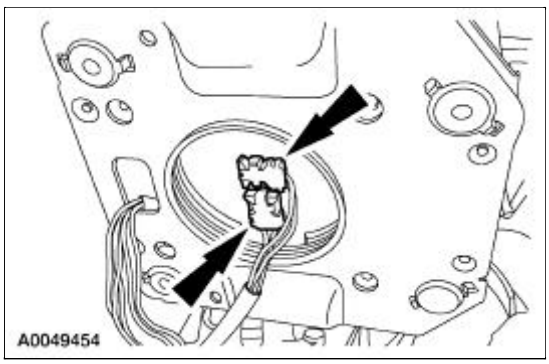
All vehicles



1. **NOTE:** Make sure the battery negative cable is still disconnected before continuing with the installation procedure.

   Remove the restraint system diagnostic tools from the clockspring electrical connector at the top of the steering column.

Navigator vehicles



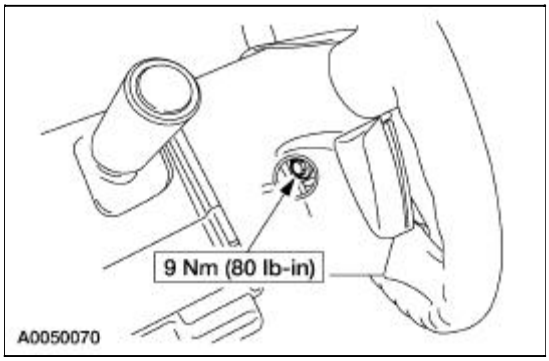
2. Connect the driver air bag module accessories electrical connector to the connector end at the top of the clockspring.

3. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

   Connect the driver air bag module electrical connectors as noted during removal.

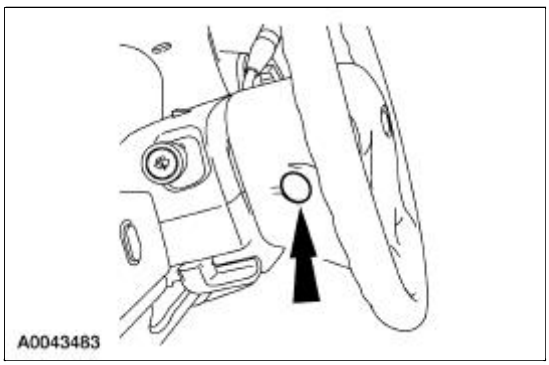
   - Position the driver air bag module to the steering wheel.

Expedition vehicles



4. Position the driver air bag module to the steering wheel.
   1. Connect the horn switch electrical connector.
   2. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

      Connect the driver air bag module electrical connectors as noted during removal.
   3. Position the driver air bag module to the steering wheel.



All vehicles

5. Install the two driver air bag module bolts (one shown).

6. Install the two steering wheel back cover plugs (one shown).

7. Connect the battery ground cable. For additional information, refer to Section 414-01 .

8. With the restraint system diagnostic tools still installed at the remaining deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

9. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

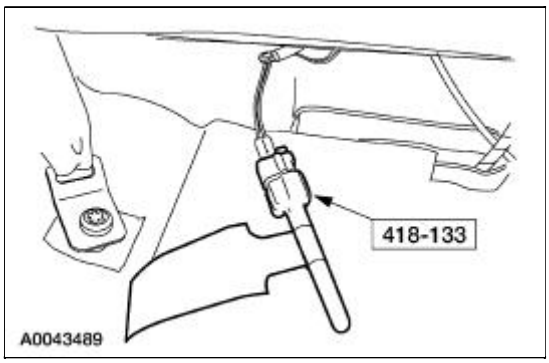
   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

   To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

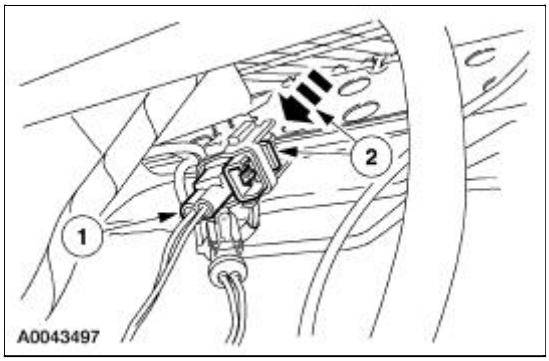
   Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

10. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag module electrical connector.



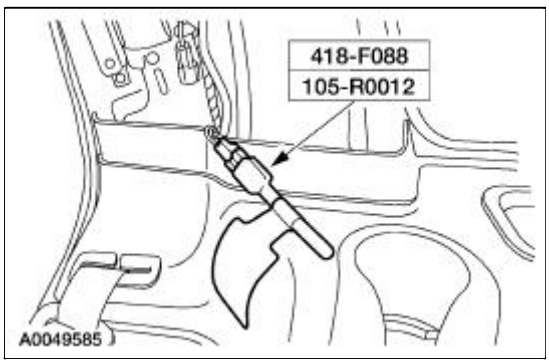
11. **NOTE:** Expedition is shown, Navigator is similar.

    Connect the passenger air bag module electrical connector.

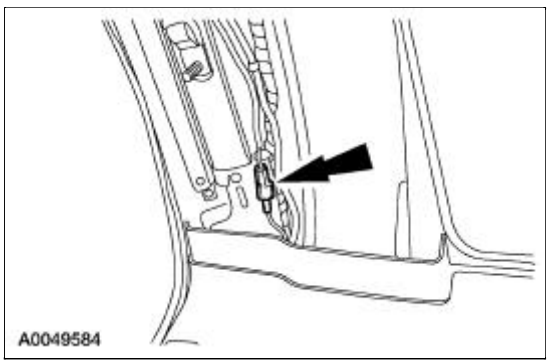


12. Close the glove compartment.

13. Remove the restraint system diagnostic tool from the passenger seat safety belt buckle pretensioner floor electrical connector.

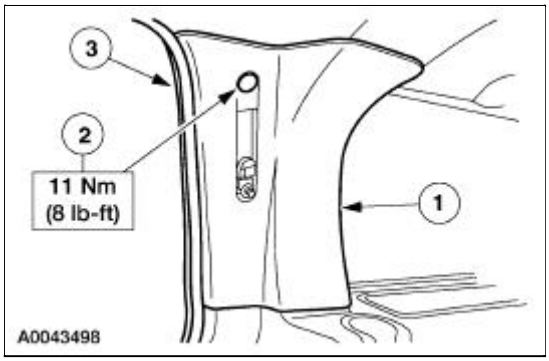


14. Connect the passenger seat safety belt buckle pretensioner electrical connector.
    1. Connect the passenger seat safety belt buckle pretensioner electrical connector.
    2. Slide and engage the passenger seat safety belt buckle pretensioner electrical connector locking clip.



Vehicles with safety canopies

15. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger side safety canopy electrical connector.



16. Connect the passenger side safety canopy electrical connector.

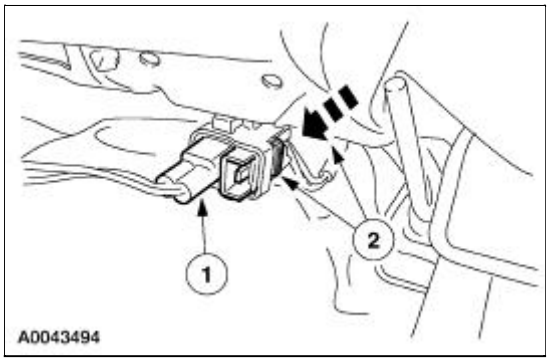
17. **WARNING: Anytime the safety canopy module has deployed, the headliner, and all A, B, and C pillar upper trim panels and attaching hardware must be replaced along with any other damaged components and hardware. Failure to do so may result in personal injury in the event of a safety canopy module deployment.**

    Install the passenger C-pillar trim panel.
    1. Position the passenger side C-pillar trim panel and push in, engaging the retainers.
    2. Install the bolt and bolt cover.
    3. Install the weather-stripping along the passenger side C-pillar trim panel.

18. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

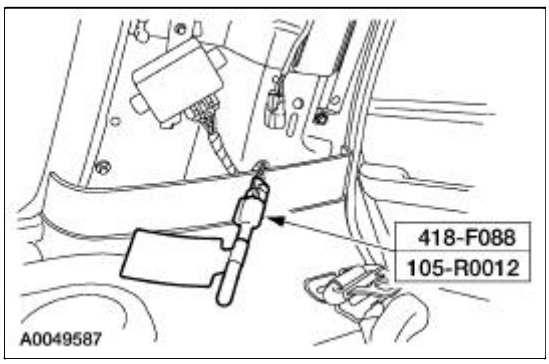
    NOTE: Make sure the safety belt is not twisted prior to installation.

    Install the second row passenger side safety belt guide.
    1. Position the second row passenger side safety belt guide.
    2. Install the nut.
    3. Close the safety belt guide cover.

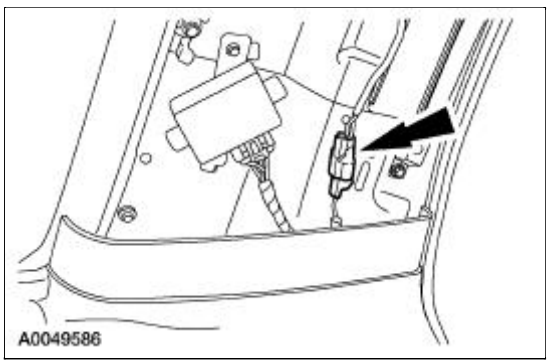


All vehicles

19. Remove the restraint system diagnostic tool from the driver seat safety belt buckle pretensioner floor electrical connector.

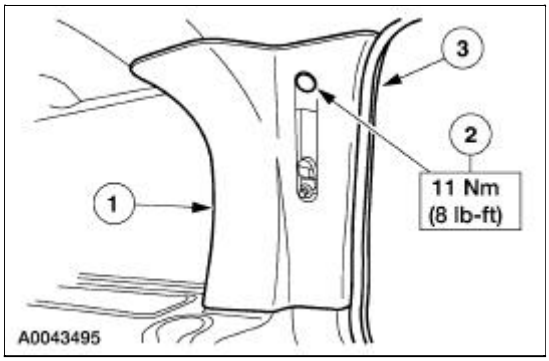


20. Connect the driver seat safety belt buckle pretensioner electrical connector.
    1. Connect the driver seat safety belt buckle pretensioner electrical connector.
    2. Slide and engage the driver seat safety belt buckle pretensioner electrical connector locking clip.



Vehicles with safety canopies

21. Remove the restraint system diagnostic tool from the vehicle harness side of the driver side safety canopy electrical connector.



22. Connect the driver side safety canopy electrical connector.

23. **WARNING: Anytime the safety canopy module has deployed, the headliner, and all A, B, and C pillar upper trim panels and attaching hardware must be replaced along with any other damaged components and hardware. Failure to do so may result in personal injury in the event of a safety canopy module deployment.**

    Install the driver side C-pillar trim panel.
    1. Position the driver side C-pillar trim panel and push in, engaging the retainers.
    2. Install the bolt and bolt cover.
    3. Install the weather-stripping along the driver side C-pillar trim panel.

24. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

    NOTE: Make sure the safety belt is not twisted prior to installation.

    Install the second row driver side safety belt guide.
    1. Position the second row driver side safety belt guide.
    2. Install the nut.
    3. Close the safety belt guide cover.

All vehicles

25. Connect the battery ground cable. For additional information, refer to Section 414-01 .

26. **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

Vehicles with safety canopies

27. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A .

Passenger Air Bag Module

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 req'd) 418-F088 (105-R0012)

Removal

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Carry a live air bag module with the air bag and deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live air bag module down with the deployment door face down. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: Air bag modules with discolored or damaged trim covers must be replaced, not repainted.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

All vehicles

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

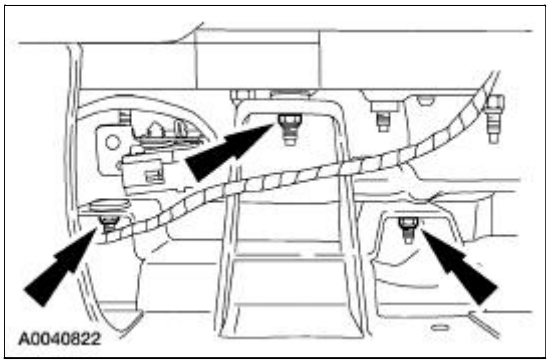
   The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

   To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

   Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation , in the General Procedures portion of this section.

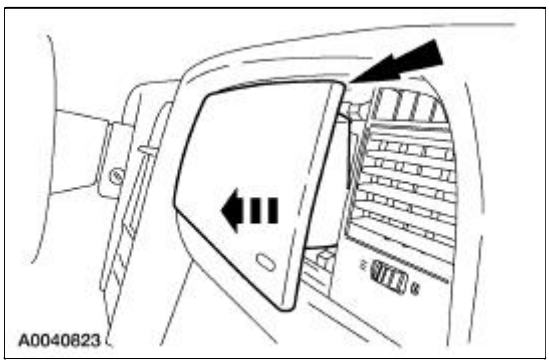


Expedition vehicles

3. Through the glove box opening, remove the passenger air bag module bolts.

Navigator vehicles

4. Through the glove box opening, remove the passenger air bag module nuts.



All vehicles

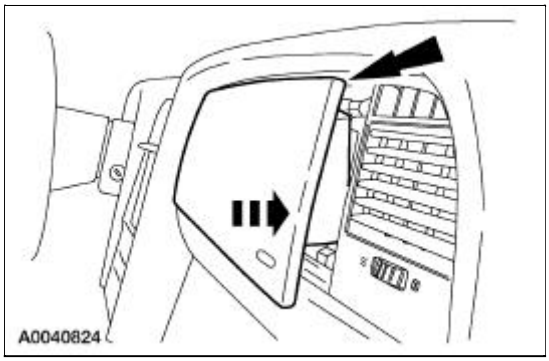
5. **CAUTION: Do not handle the passenger air bag module by grabbing the edges of the deployment door.**

   NOTE: The Expedition is shown, the Navigator is similar.

   Reaching one hand into the glove box opening, push out on the passenger air bag module and remove the passenger air bag module from the instrument panel.

Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.



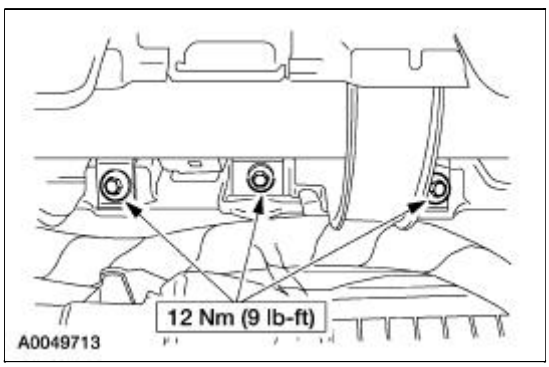
All vehicles

1. **CAUTION: Do not handle the passenger air bag module by grabbing the edges of the deployment door.**

   NOTE: Make sure the battery negative cable is still disconnected before proceeding with the installation portion of this procedure.

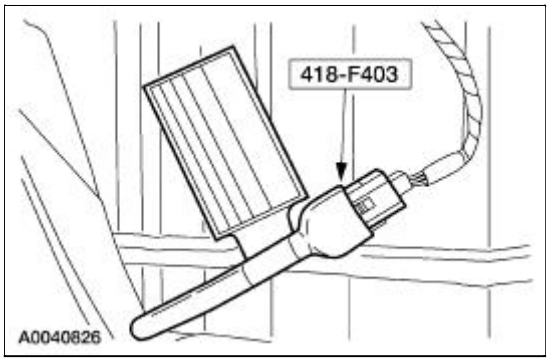
   NOTE: The Expedition is shown, the Navigator is similar.

   Position the passenger air bag module into the instrument panel.



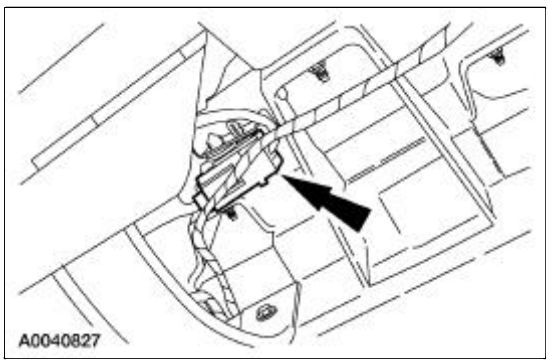
Navigator vehicles

2. Install the passenger air bag module nuts.



Expedition vehicles

3. Install the passenger air bag module bolts.



All vehicles

4. Remove the restraint system diagnostic tool from the vehicle harness.

5. **NOTE:** Expedition is shown, Navigator is similar.

   Connect the passenger air bag module electrical connector.

6. Close the glove box.

7. Connect the battery ground cable. For additional information, refer to Section 414-01 .

8. With the restraint system diagnostic tools still installed at the remaining deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

9. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

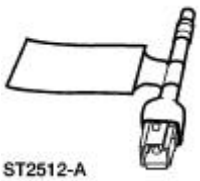
   The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

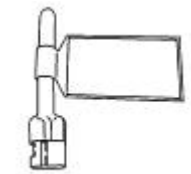
   To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

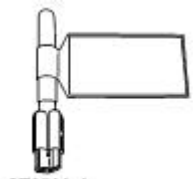
   Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

10. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in the General Procedures portion of this section.







11. Connect the battery ground cable. For additional information, refer to Section 414-01 .

12. **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

Safety Canopy Module

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 req'd) 418-F088 (105-R0012)

Removal

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: To reduce the risk of personal injury from an accidental deployment, always carry or place a live safety canopy module with the safety canopy and tear seam pointed away from your body. Failure to do so can result in personal injury in the event of a safety canopy module deployment.

WARNING: After deployment, the surface of the safety canopy can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connector on the safety canopy module. Doing so can result in safety canopy deployment which can result in personal injury.

WARNING: Anytime the safety canopy has deployed, the headliner, and all A, B, and C pillar upper trim panels and attaching hardware must be replaced along with any other damaged components and hardware. Failure to do so can result in personal injury in the event of a safety canopy deployment.

WARNING: Vehicles equipped with safety canopy modules require a specific headliner. When installing a new headliner on a vehicle equipped with safety canopy modules, make sure a headliner for safety canopy modules is being used. The word "AIRBAG" will appear on the headliner where it meets each B-pillar trim panel. Failure to do so can result in personal injury in the event of a safety canopy module deployment.

WARNING: Before installing the safety canopy module, inspect the roofline for any damage. If necessary, the sheet metal must be reworked to its original condition and structural integrity. All damaged fasteners must be replaced and any foreign objects removed. Failure to do so may result in personal injury in the event of a safety canopy deployment.

WARNING: Inspect the safety canopy before installation. If the safety canopy is damaged or the cover has separated or safety canopy material has been exposed, a new safety canopy module must be installed. Do not attempt to repair the safety canopy module. Failure to follow these instructions can result in personal injury in the event of a safety canopy module deployment.

WARNING: To reduce the risk of injury, do not obstruct or place objects in the deployment path of the safety canopy module. Failure to follow these instructions can result in personal injury in the event of a safety canopy module deployment.

WARNING: Never put any type of fastener or tie strap around any part of the safety canopy module or interior trim panel. This will prevent the safety canopy module from deploying correctly. Failure to do so can result in personal injury in the event of a safety canopy module deployment.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

NOTE: The passenger side safety canopy module is shown, the driver side is similar.

All vehicles

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

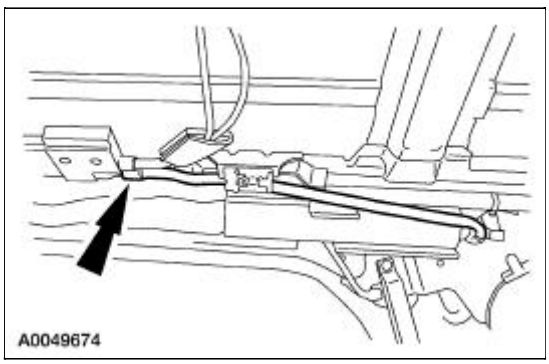
   To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if

equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation , in the General Procedures portion of this section.

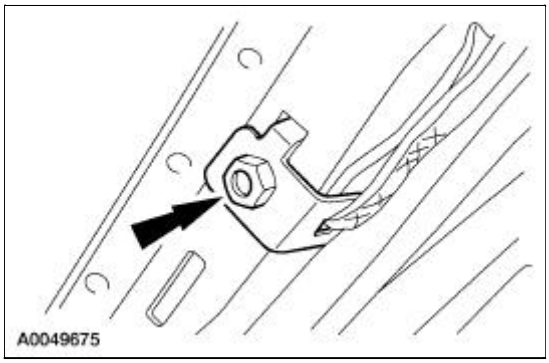


3. **WARNING: Anytime the safety canopy has deployed, the headliner, and all A, B, and C pillar upper trim panels and attaching hardware must be replaced along with any other damaged components and hardware. Failure to do so may result in personal injury in the event of a safety canopy deployment.**

   WARNING: Vehicles equipped with safety canopy modules require a specific headliner. When installing a new headliner on a vehicle equipped with safety canopy modules, make sure a headliner for safety canopy modules is being used. The word "AIRBAG" will appear on the headliner where it meets each B-pillar trim panel. Failure to do so can result in personal injury in the event of a safety canopy module deployment.

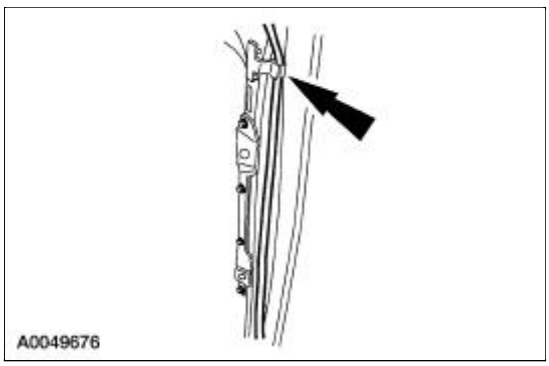
   Remove the headliner. For additional information, refer to Section 501-05 .

Vehicles with a moonroof



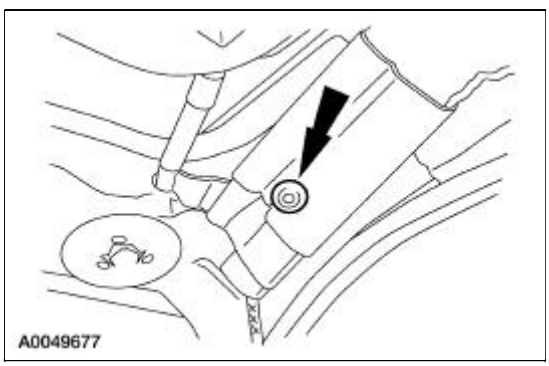
4. Separate the moonroof drain tube and position to the side.

All vehicles



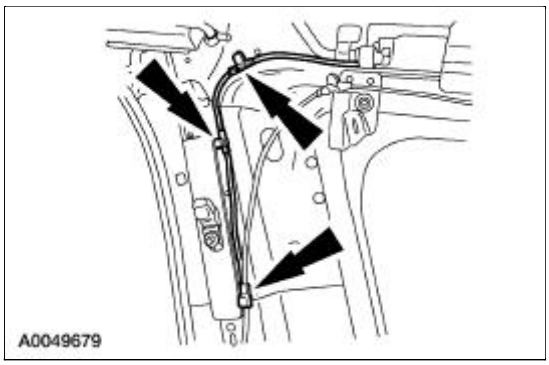
5. **CAUTION: Inspect the rivet nut and A-pillar sheet metal for damage. Install a new rivet nut if necessary. For additional information, refer to Rivet Nut Replacement .**

   Remove the tether cord bolt and bracket from the A-pillar.

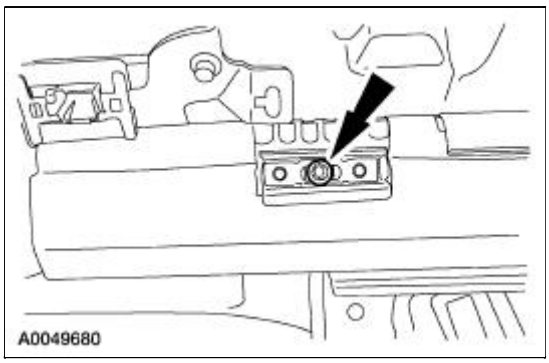


6. **NOTE:** If not installing a new safety canopy module, the pin-type retainer can remain installed.

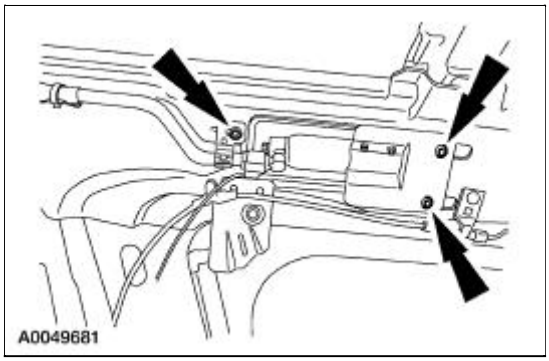
   Remove the tether cord and pin-type retainer from the A-pillar.



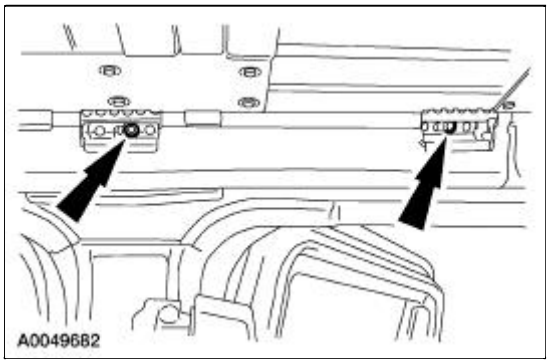
7. Remove the screw at the roofline near the A-pillar.



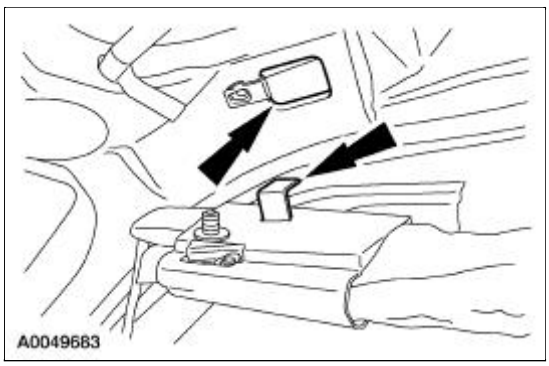
8. Separate the rear tether bracket assembly from the C-pillar.
   1. Remove the bolts.
   2. Slide up and rotate the hook out, separating the tether bracket assembly from the C-pillar.



9. Remove the safety canopy wire harness and electrical connector pin-type retainers at the C-pillar.



10. Remove the screw at the rear ramp.



11. Remove the screws at the canister.

12. Remove the two screws at the front ramp.

13. Slide the front of the safety canopy up and rotate the hook out of the roofline sheet metal and remove the safety canopy.

Installation

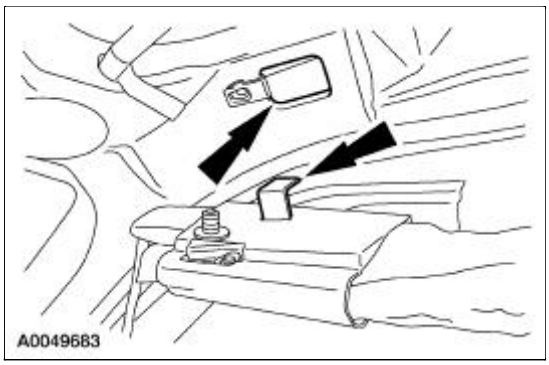
WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

All vehicles

1. **WARNING: Before installing the safety canopy module, inspect the roofline for any damage. If necessary, the sheet metal must be reworked to its original condition and structural integrity. All damaged fasteners must be replaced and any foreign objects removed. Failure to do so may result in personal injury in the event of a safety canopy module deployment.**

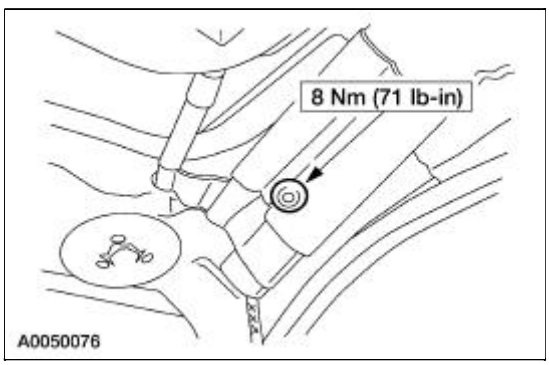
   WARNING: Before installing the safety canopy module, if the module is damaged or the cover has separated or the safety canopy material has been exposed, install a new

safety canopy module. Do not attempt to repair the safety canopy. Failure to follow these instructions could result in personal injury in the event of a safety canopy deployment.

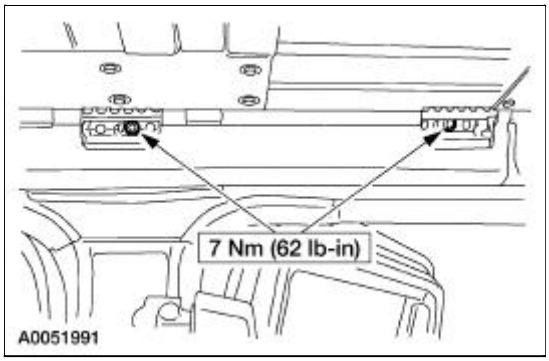


WARNING: Never put any type of fastener or tie strap around any part of the safety canopy module or interior trim panel. This will prevent the safety canopy module from deploying correctly. Failure to do so can result in personal injury in the event of a safety canopy module deployment.

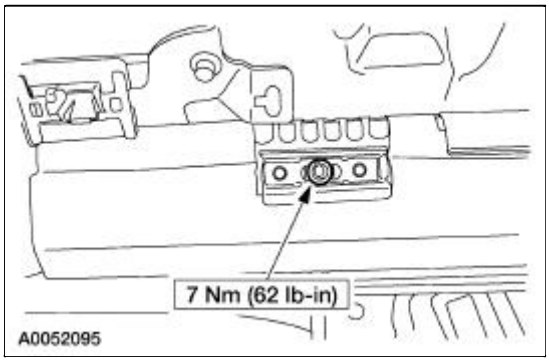
NOTE: Make sure the battery negative cable is still disconnected before proceeding with the installation portion of this procedure.



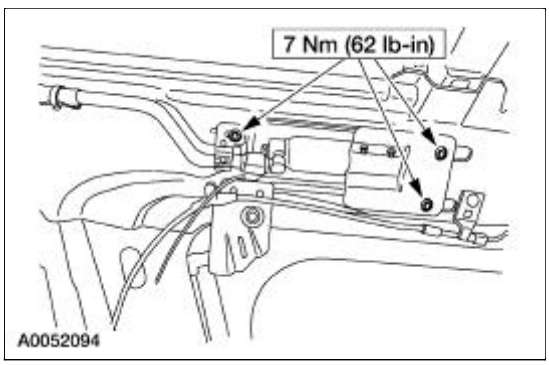
With the safety canopy module positioned in the vehicle as shown, angle the rear of the safety canopy module to the sheet metal, so that the deployment canister can be inserted into the sheet metal opening.



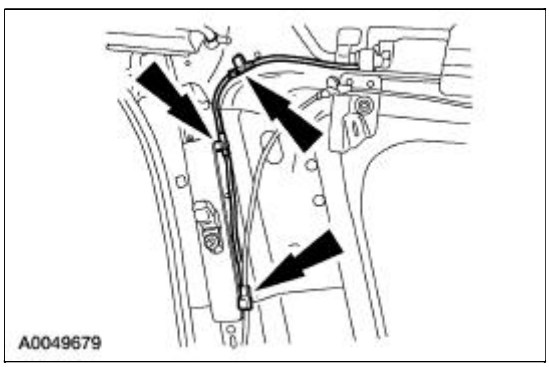
2. Position the safety canopy and engage the front hook to the roofline sheet metal.



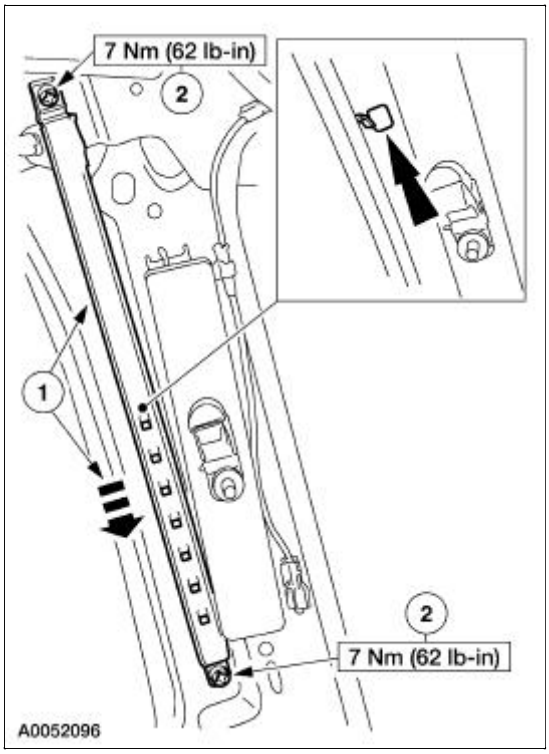
3. Install the screw at the roofline near the A-pillar.



4. Install the two screws at the front ramp.

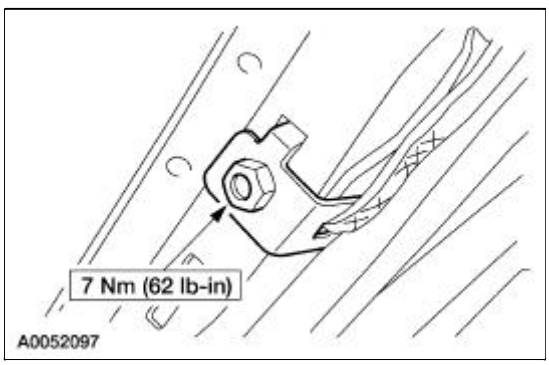


5. Install the screw at the rear ramp.

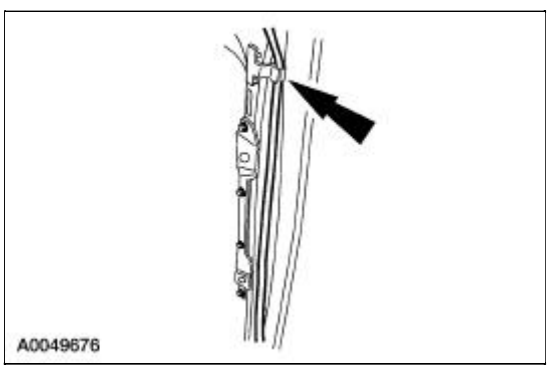


6. Install the screws at the canister.

7. Route and install the safety canopy wire harness and electrical connector pin-type retainers at the C-pillar.

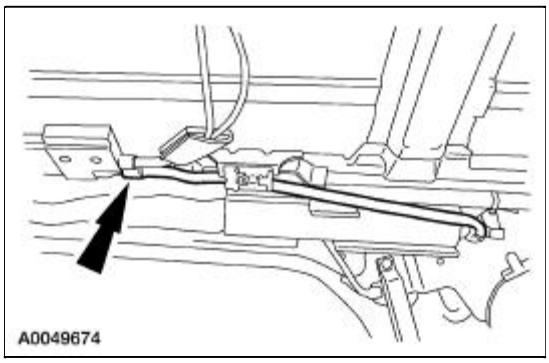


8. Install the rear tether bracket assembly to the C-pillar.
    1. Rotate and slide down the tether bracket assembly hook, engaging it to the C-pillar sheet metal.
    2. Install the bolts.

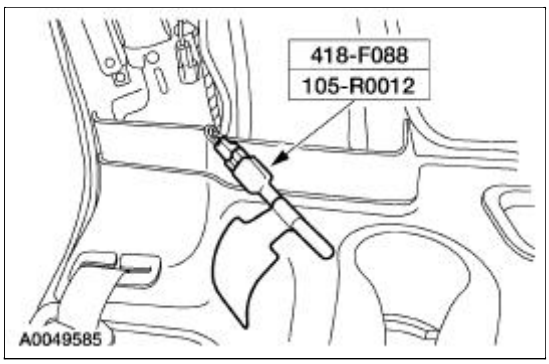


9. **CAUTION: Inspect the rivet nut and A-pillar sheet metal for damage. Install a new rivet nut if necessary. For additional information, refer to Rivet Nut Replacement .**

   Position the bracket and install the bolt for the tether cord to the A-pillar.

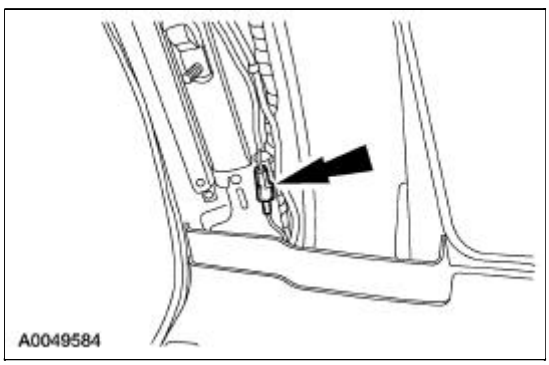


10. Make sure the tether is securely engaged into the pin-type retainer and install the pin-type retainer to the A-pillar.
    - If a new safety canopy module was not installed, route the tether and securely engage it into the pin-type retainer at the A-pillar.



Vehicles with a moonroof

11. Route and connect the moonroof drain tube.



All vehicles

12. Remove the restraint system diagnostic tool from the vehicle harness side of the safety canopy electrical connector.

13. Connect the safety canopy electrical connector.

14. Connect the battery ground cable. For additional information, refer to Section 414-01 .

15. With the restraint system diagnostic tools still installed at the remaining deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

16. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors,**

instrument panel, console, door latches, strikers, seats and hood latches.

The front impact severity sensor is located at the bottom of the hood latch support bracket.

The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

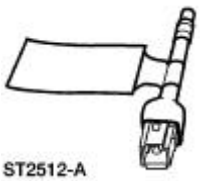
17. **WARNING: Anytime the safety canopy has deployed, the headliner, and all A, B, and C pillar upper trim panels and attaching hardware must be replaced along with any other damaged components and hardware. Failure to do so may result in personal injury in the event of a safety canopy deployment.**

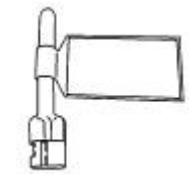
    WARNING: Vehicles equipped with safety canopy modules require a specific headliner. When installing a new headliner on a vehicle equipped with safety canopy modules, make sure a headliner for safety canopy modules is being used. The word "AIRBAG" will appear on the headliner where it meets each B-pillar trim panel. Failure to do so can result in personal injury in the event of a safety canopy module deployment.

    Install the headliner. For additional information, refer to Section 501-05 .

18. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation , in the General Procedures portion of this section.





19. Connect the battery ground cable. For additional information, refer to Section 414-01 .

20. **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

Safety Canopy Bridge Resistor

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)

Removal

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

NOTE: There is only one safety canopy bridge resistor. The bridge resistor can be accessed with the headliner dropped and is located just behind the RH side second row courtesy light.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

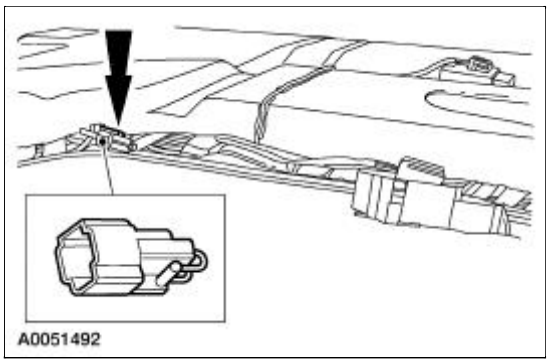
   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

   To deplete the backup power supply energy, disconnect the battery ground cable and

wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).



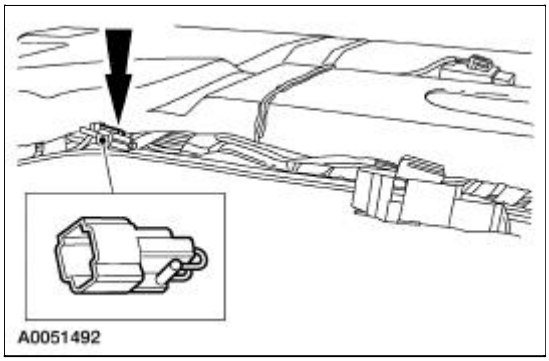
Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation , in the General Procedures portion of this section.

3. Lower but do not remove the headliner. For additional information, refer to Section 501-12 .

4. Remove the safety canopy bridge resistor.
   - Release the safety canopy bridge resistor from the adhesive.
   - Disconnect and remove the safety canopy bridge resistor.



Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

1. **NOTE:** Make sure the battery negative cable is still disconnected before continuing with the installation procedure.

   Install the safety canopy bridge resistor.
   - Connect the electrical connector.
   - Position the safety canopy bridge resistor.
     - Apply an appropriate adhesive to hold the safety canopy bridge resistor in place.

2. Install the headliner. For additional information, refer to Section 501-12 .

3. Connect the battery ground cable. For additional information, refer to Section 414-01 .

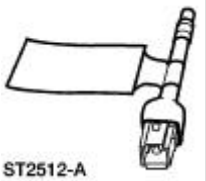
4. With the restraint system diagnostic tools still installed at the remaining deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

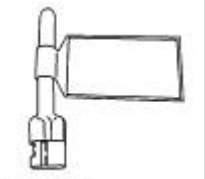
5. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

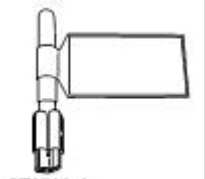
6. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

   Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation , in the General Procedures portion of this section.

7. Connect the battery ground cable. For additional information, refer to Section 414-01 .







8. **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

   With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

9. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A .

Clockspring

 ST2502-A	Diagnostic Tool, Restraint System (2 req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (2 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 req'd) 418-F088 (105-R0012)

Removal

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: Air bag modules with discolored or damaged trim covers must be replaced, not repainted.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

   The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

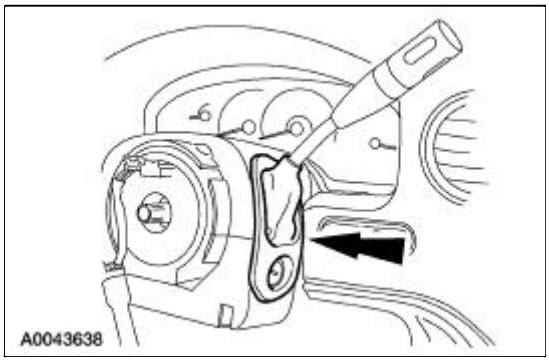
   To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

   Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

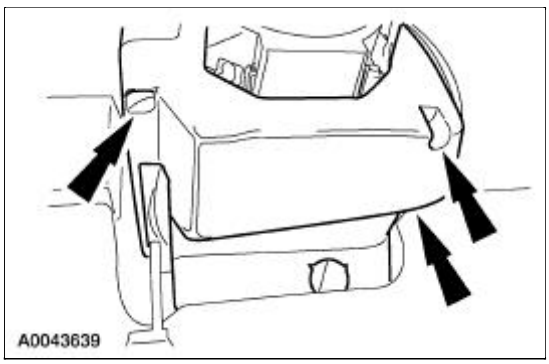
   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation , in the General Procedures portion of this section.

3. Make sure the road wheels are in the straight-ahead position.

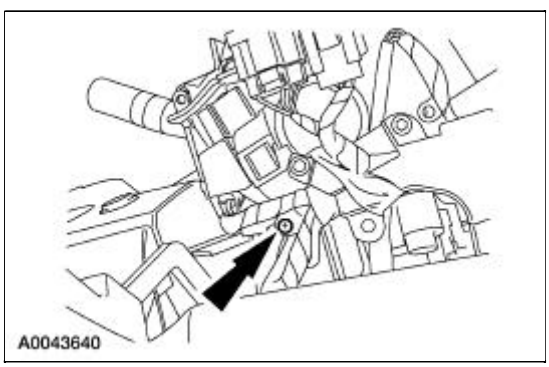


4. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the steering wheel removal and installation procedure.**

   Remove the steering wheel. For additional information, refer to Section 211-04 .

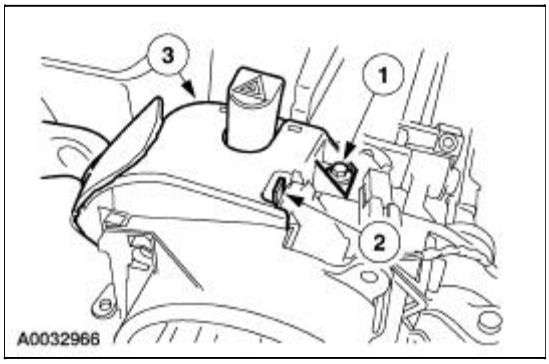


5. Apply two strips of masking tape across the clockspring to prevent accidental rotation when the clockspring is removed.

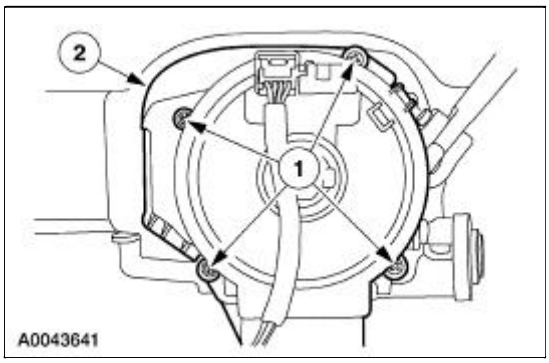


6. Release the tabs and slide the gear selector cover away from the steering column shrouds.

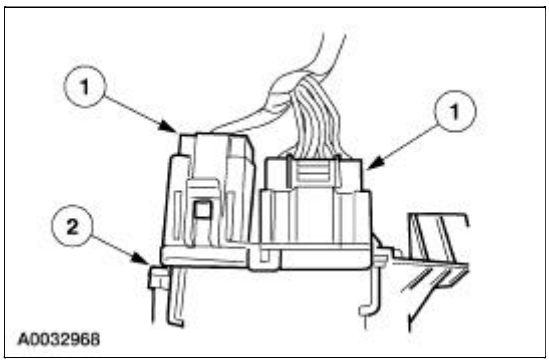
7. From under the steering column, remove the three screws and the lower steering column shroud.



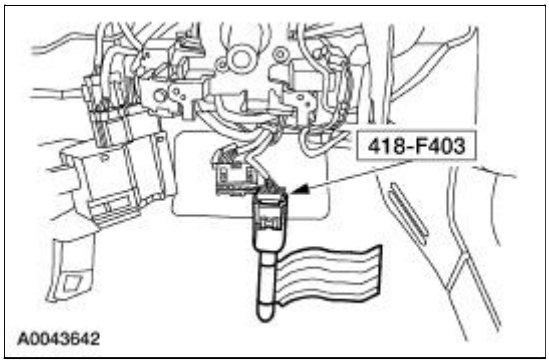
8. From under the steering column remove the screw and then remove the upper steering column shroud.



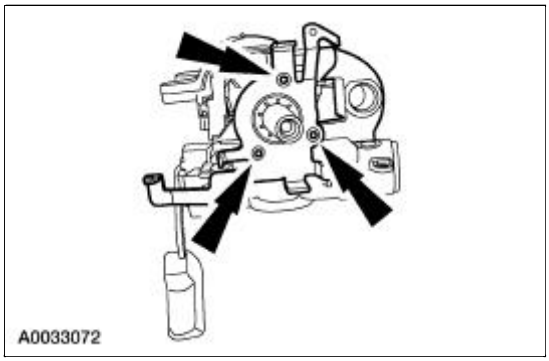
9. Separate the multi-function switch from the clockspring.
    1. Remove the screw.
    2. Release the tab.



3. While releasing the retaining tab, slide the multi-function switch up and out of the way.



10. Separate the clockspring from the steering column.
    1. Remove the screws.
    2. Slide the clockspring off the steering column shaft.



11. Remove the clockspring.
    1. Disconnect the clockspring electrical connectors.
    2. Remove the clockspring.

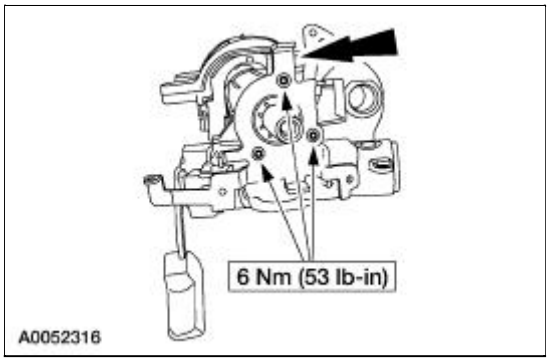
12. Attach the restraint system diagnostic tool to the vehicle harness side of the clockspring electrical connector.

13. Inspect the clockspring bracket for damage and remove as necessary.

14. Connect the battery ground cable. For additional information, refer to Section 414-01 .

15. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

16. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .



17. Remove the restraint system diagnostic tools from the clockspring electrical connectors if not reusing the same clockspring .

Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

Vehicles to receive a new clockspring bracket

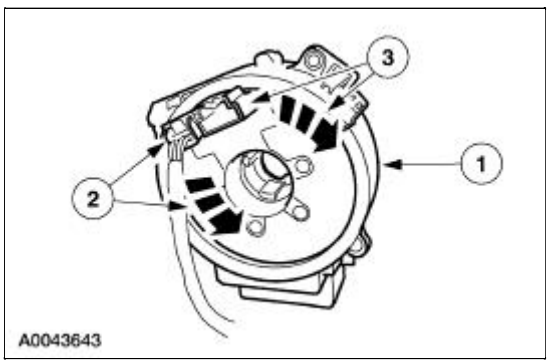
1. Install the clockspring bracket and screws.

Vehicles receiving a new clockspring

2. **NOTE:** A new clockspring is supplied in a centralized position and held there with a key.

   Remove the key from the clockspring, holding the rotor in its centralized position.
   - Do not allow the clockspring rotor to turn.

Vehicles needing clockspring recentering



3. **WARNING: Incorrect centralization may result in premature component failure. If in doubt when centralizing the clockspring, repeat the centralizing procedure. Failure to follow this instruction may result in personal injury.**

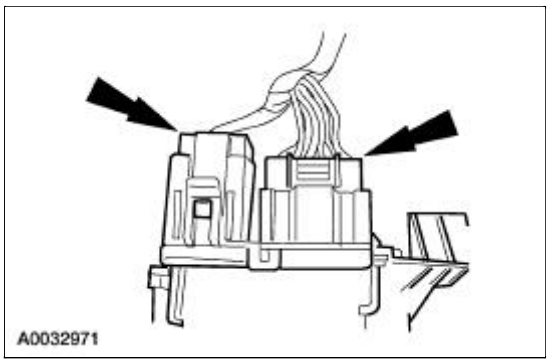
   CAUTION: Make sure the road wheels are in the straight-ahead position.

   NOTE: If a clockspring has rotated out of center, follow through with this step.

   Centralize the clockspring.
   1. Hold the clockspring outer housing stationary.
   2. **CAUTION: Overturning will destroy the clockspring. The internal ribbon wire acts as the stop and can be broken from its internal connection.**

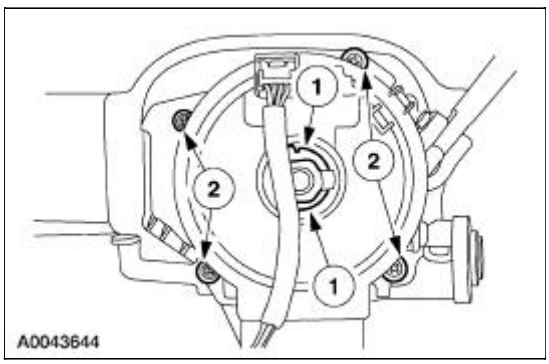
      While turning the rotor counterclockwise, carefully feel for the ribbon wire to run out of length. Stop turning when a slight resistance is felt.
   3. Turn the clockspring clockwise approximately 2.75 turns. This is the center point of the clockspring.
      - Do not allow the rotor to turn from this position.

All vehicles



4. Remove the restraint system diagnostic tool from the vehicle harness side of the clockspring

electrical connector.

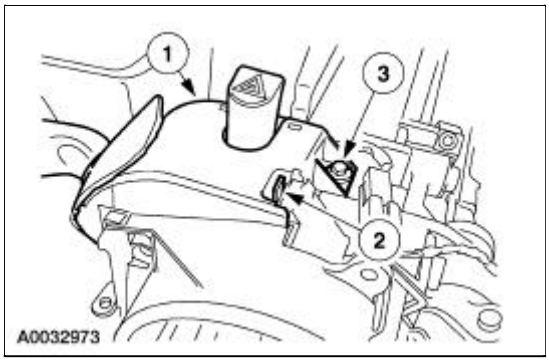


5. **NOTE:** Make sure the battery negative cable is disconnected before continuing with the installation procedure.

   Connect the clockspring electrical connectors.

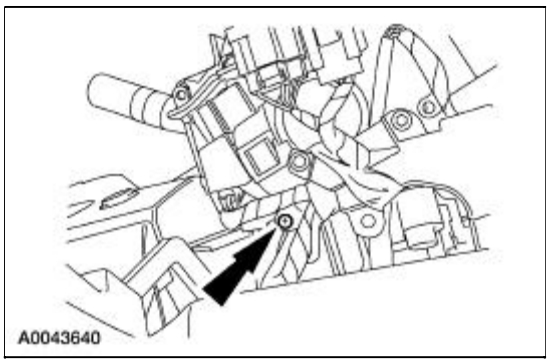
6. **NOTE:** Slight turning of the clockspring rotor is allowable for alignment purposes to the steering column.

   Install the clockspring onto the steering column.
   1. With the flats of the clockspring aligned to the flats of the steering column, slide the clockspring onto the steering column.
   2. Install the screws.



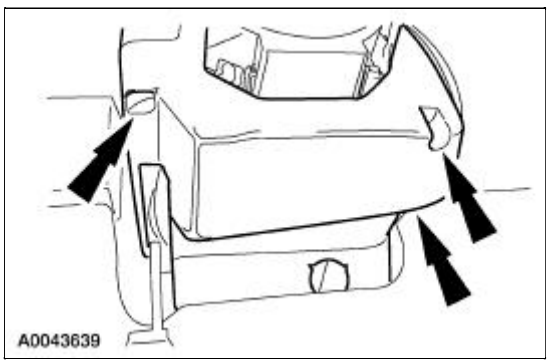
Vehicle repairs using the same clockspring

7. Remove the tape applied during clockspring removal.

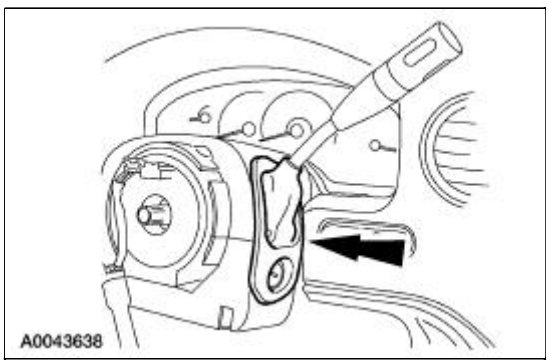


All vehicles

8. Install the multi-function switch.

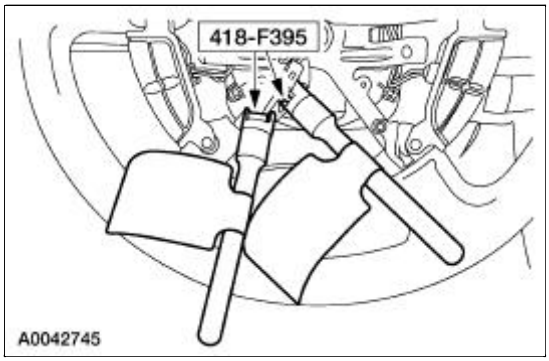


1. Align the multi-function switch and slide it down into position.
2. Check that the retaining tab is engaged.
3. Install the screw.



9. Position the upper steering column shroud, and from under the steering column, install the screw.

10. Position the lower steering column shroud and install the three screws.

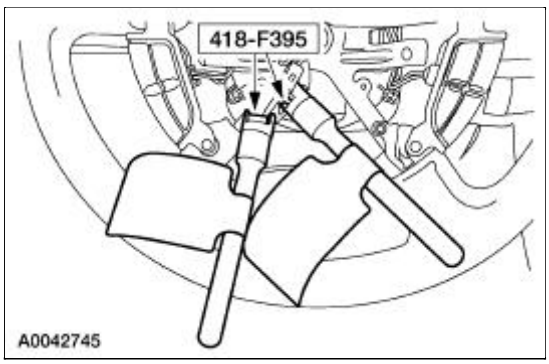


11. Reposition the gear selector cover to the steering column shrouds and engage the tabs.

12. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the steering wheel removal and installation procedure.**

    Install the steering wheel. Do not install the driver air bag module at this time. For additional information, refer to Section 211-04 .

13. Attach the restraint system diagnostic tools to the clockspring electrical connectors at the top of the steering column.

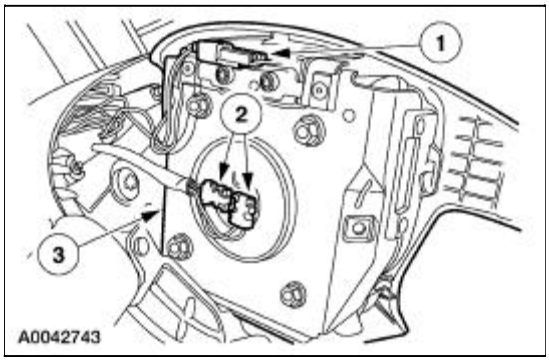


14. Connect the battery ground cable. For additional information, refer to Section 414-01 .

15. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

16. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

17. Remove the restraint system diagnostic tools from the clockspring electrical connectors at the top of the steering column.



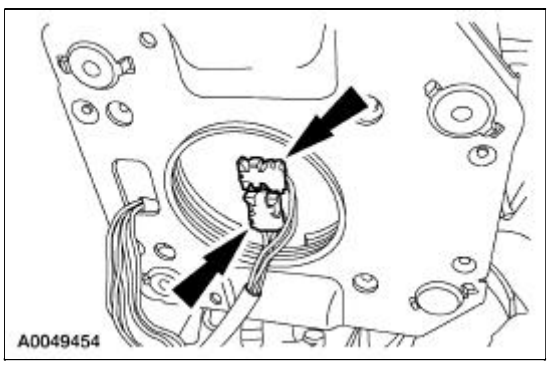
Expedition vehicles

18. Position the driver air bag module to the steering wheel.
    1. Connect the horn switch electrical connector.
    2. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

       Connect the driver air bag module electrical connectors as noted during the deactivation procedure.

3. Position the driver air bag module to the steering wheel.

Navigator vehicles

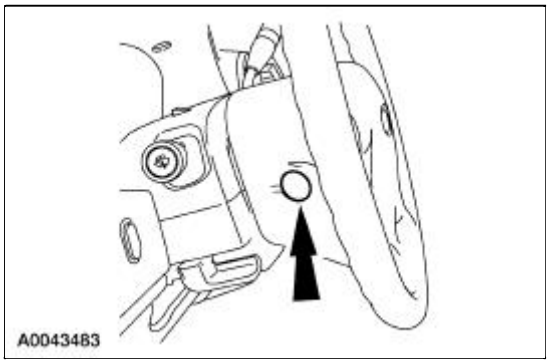


19. Connect the driver air bag module accessories electrical connector to the connector end at the top of the clockspring.

20. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

    Connect the driver air bag module electrical connectors as noted during removal.

    - Position the driver air bag module to the steering wheel.



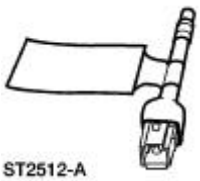
All vehicles

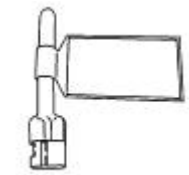
21. Install the two driver air bag module bolts (one shown).

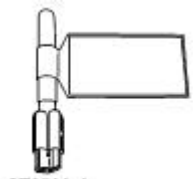
22. Install the two steering wheel back cover plugs (one shown).

23. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation , in the General Procedures portion of this section.







24. Connect the battery ground cable. For additional information, refer to Section 414-01 .

25. **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

Seat Position Sensor

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 req'd) 418-F088 (105-R0012)

Removal

WARNING: Always wear safety glasses when repairing a supplemental restraint system (SRS) vehicle and when handling an airbag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

The front impact severity sensor is located at the bottom of the hood latch support bracket.

The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system deactivation/reactivation procedure.**

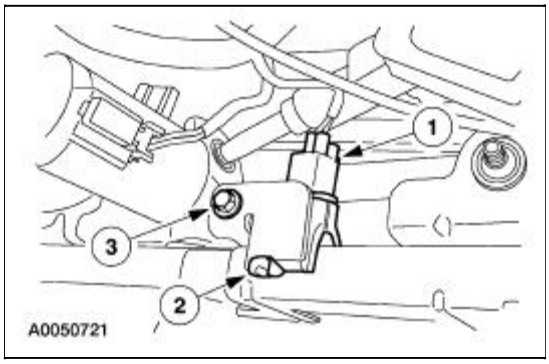
   Deactivate the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) , in the Diagnosis and Testing portion of this section.

3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

   NOTE: Before removing the seat, position it to access the seat position sensor.

   Remove the 40 percent driver front seat. For additional information, refer to Section 501-10 in the Removal and Installation portion of that section.

4. Remove the seat position sensor.
   1. Remove the bolt.
   2. Release the tab and separate the seat position sensor from the seat.
   3. Disconnect and remove the seat position sensor.



Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

1. Install the seat position sensor.
   1. Connect the seat position sensor.
   2. Position the seat position sensor to the seat, engaging the tab to the seat bracket.

3. Install the bolt.

2. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

   Install the 40 percent driver front seat. For additional information, refer to Section 501-10 , in the Removal and Installation portion of that section.

3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system deactivation/reactivation procedure.**

   Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation , in the General Procedures portion of this section.

4. **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

   With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

5. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A .

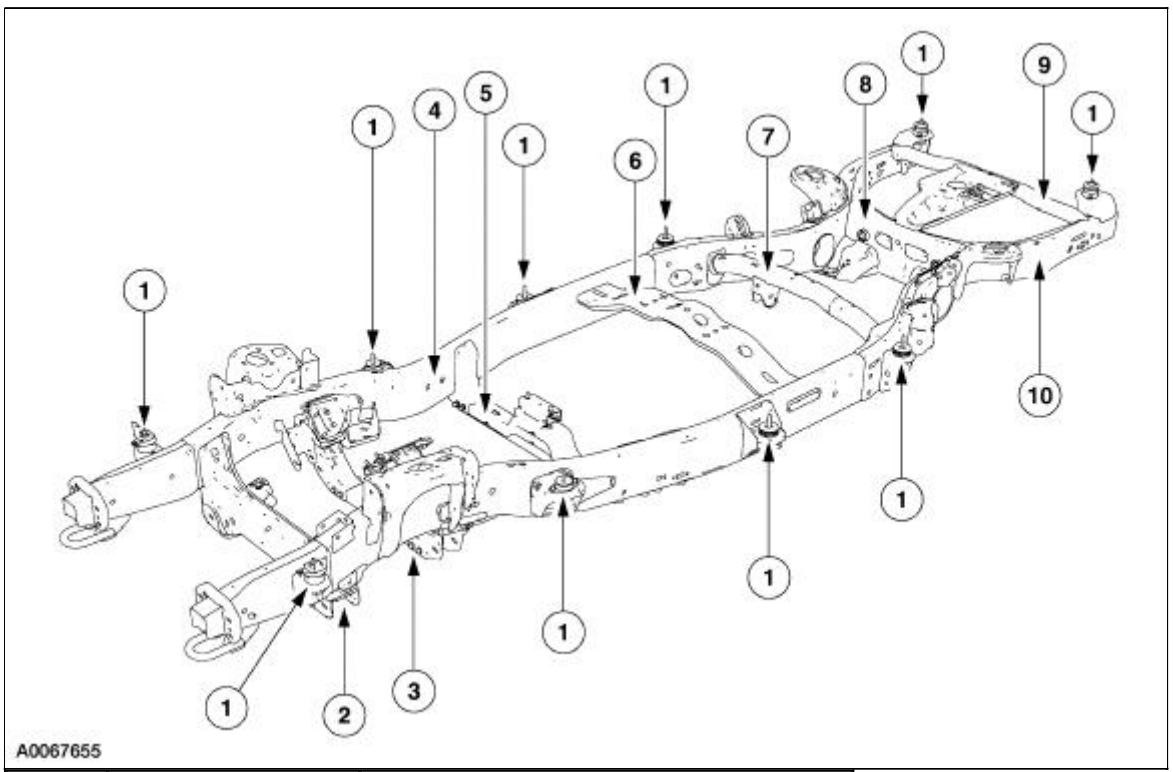
Torque Specifications

Description	Nm	lb-ft
Body mount bolts	80	59
Radiator body mount bolts	80	59
Body mount bolts to frame	55	41
Number 4 body mount nut	55	41
Transmission mount nuts	103	76
Transmission crossmember bolts	90	66
Spare tire winch bolts	25	18
Frame mounted heat shield bolts	15	11

Frame and Body Mounting

The frame (5005) is made up of two steel boxed side rails and crossmembers, which are welded to the two side rails. The transmission crossmember is bolted to the side rails. The side welded rails and crossmembers are not replaced separately.

The service kits available for the frame are:

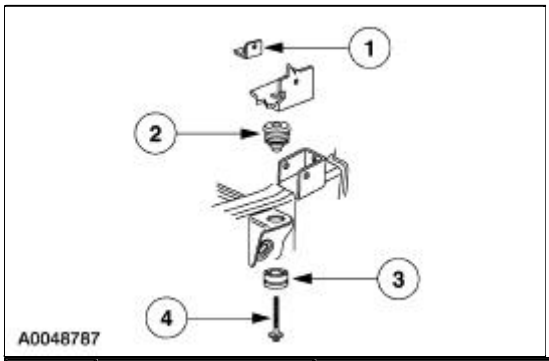


- RH front horn replacement kit (5D058).
- LH front horn replacement kit (5D059).
- Front bumper bracket replacement kit (17N775).
- 1B crossmember replacement kit (5C075).
- Transmission crossmember replacement kit (5059).

Refer to the instructions included in the kits for installation instructions.

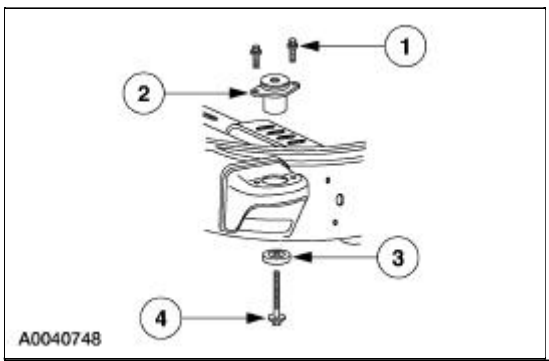
Frame Mounted Heat Shields

All frame mounted heat shields are torqued to 15Nm (11 lb-ft).



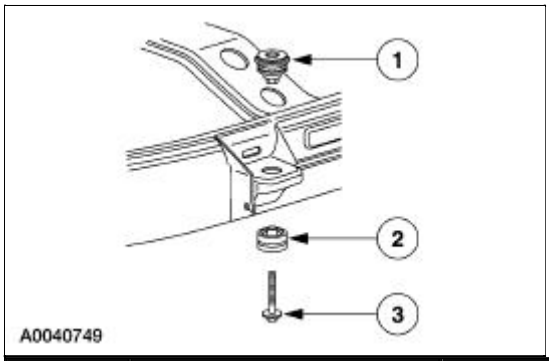
Frame Components

Item	Part Number	Description
1	—	Body to frame mounts
2	—	Front crossmember No. 1



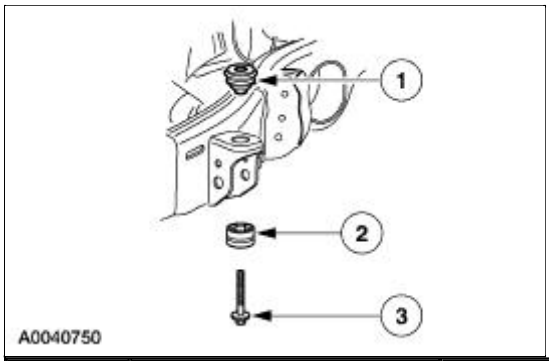
3	—	1B crossmember
4	—	RH frame rail
5	—	Transmission crossmember
6	—	Crossmember No. 3
7	—	Crossmember No. 4
8	—	Crossmember No. 5
9	—	Crossmember No. 6
10	—	LH frame rail

Radiator Support Mount



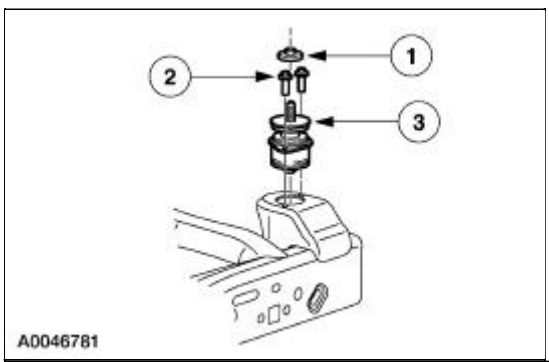
Item	Part Number	Description
1	8052 (RH)	Bracket assembly
	8053 (LH)	Bracket assembly
2	7800192	Upper radiator support body mount
3	7800193	Lower radiator support body mount
4	78001B39	Radiator support body mount bolt

No. 1 Body Mount



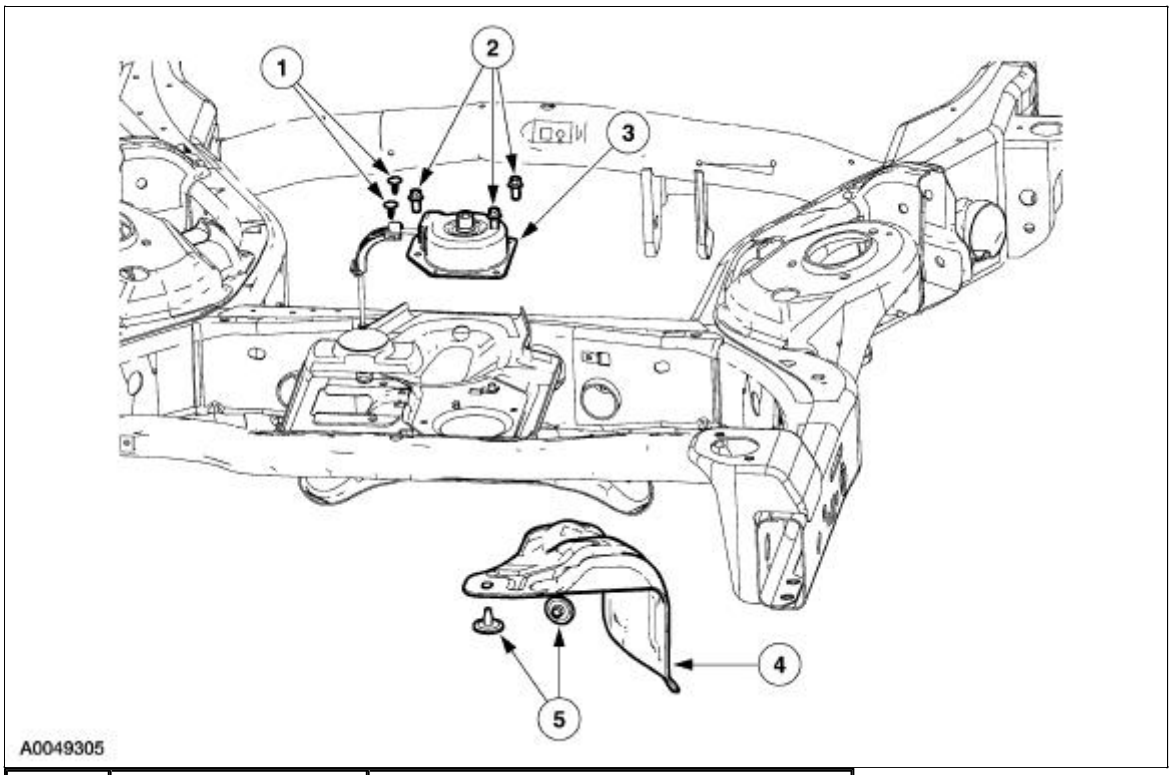
Item	Part Number	Description
1	W506433	Bolts
2	7800192	Body mount
3	W708210	Washer
4	W708330	Body mount bolt

No. 2 Body Mount



Item	Part Number	Description
1	7800192	Upper body mount
2	7800193	Lower body mount
3	W708330	Body mount bolt

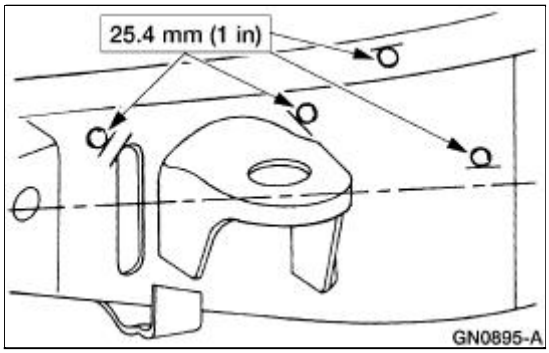
No. 3 Body Mount



Item	Part Number	Description
1	7800192	Upper body mount
2	7800193	Lower body mount
3	W708330	Body mount bolt

No. 4 Body Mount

Item	Part Number	Description
1	W708109	Body mount nut and washer
2	W506433	Body mount bolts
3	7800192	Body mount



Spare Tire Winch

Item	Part Number	Description
1	W705589	Pin-type retainers
2	W505263	Spare tire winch bolts
3	1A131	Spare tire winch assembly
4	1A484	Spare tire heat shield
5	W707959	Spare tire heat shield bolts

Frame Maintenance —Drilling Precautions

1. If a hole must be drilled in the frame, make sure the hole meets the following requirements:
   - The hole is at least the specified distance from the edge of the nearest hole.
   - The edge of the drilled hole is at least the specified distance from the edge of the flange.
   - The drilled hole is at least the specified distance from any other existing bracket or component of the frame.

Frame Maintenance —Welding Precautions

1. If welding must be done on a frame, make sure the following requirements are met:
    - If the frame is attached to the vehicle, the battery ground cable (14301) must be disconnected before using any electrical welding equipment. For additional information, refer to 414-01.
    - Do not use gas welding equipment; arc welding is the only approved method.
    - Use a temperature-indicating crayon to make sure that the temperature does not exceed 750°C (1,400°F).
    - Install new spot-welded components by spot welding where possible. If spot welding is not possible, use puddle welding.

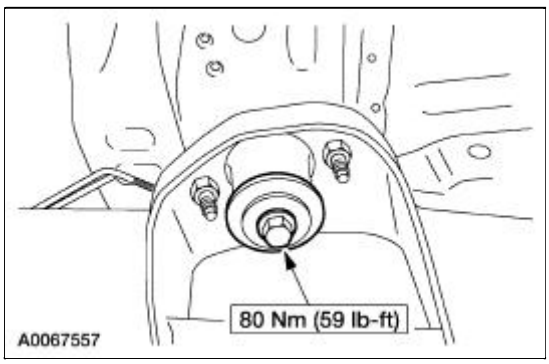
Frame Maintenance —Frame Straightening

1. **WARNING: Straightening of front frame rail convolute is prohibited. Failure to follow these instructions may result in personal injury.**

   When straightening the frame, make sure the following requirements are met:

   - **CAUTION: Reposition and/or shield any fuel lines, brake lines, or wiring harness or component in the heated area.**

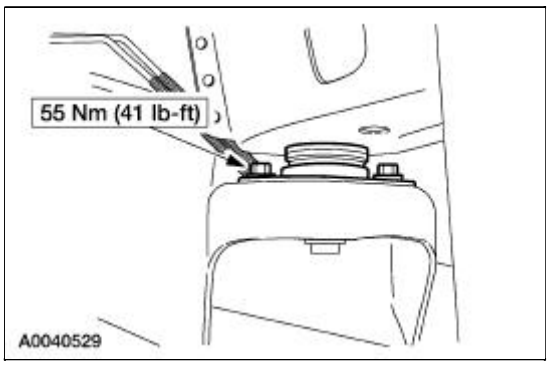
     If heat is needed to straighten a frame member, keep the temperature below 650° C (1,200° F) (a dull red glow). A temperature sensitive thermal melt crayon should be used to monitor heat buildup.
   - Heat should be kept to a minimum area so that the hardness of the metal will not be affected.
   - Straightening should only be attempted on frames that fail to meet specifications of the diagonal checking method or where damage is apparent.
   - Straightening should be limited to parts which are not severely bent.
   - Reposition and/or shield any fuel lines, brake lines, or wiring harnesses or components in heated area.



Body Support —Number 1

Removal and Installation

WARNING: If equipped with air suspension, the electrical power to the air suspension system must be shut down prior to hoisting, jacking or towing an air suspension equipped vehicle. This can be accomplished by turning off the air suspension switch located at the left rear interior of the vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.



NOTE: Left side shown, right side similar.

1. Remove the body mount bolt.

2. Loosen the remaining body mount bolts.

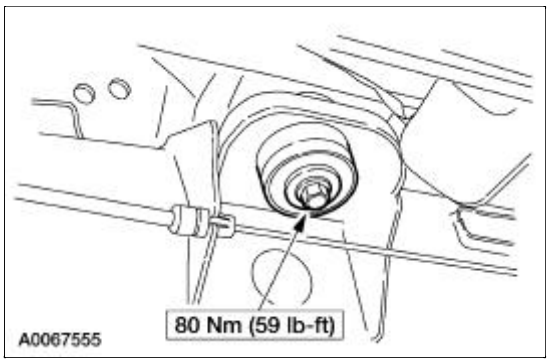
3. Raise the vehicle body enough to remove the body mount bolts and body mount.

4. **NOTE:** No lubricants of any kind are to be used during body mount installation.

   NOTE: Do not reuse body mount fasteners. New fasteners must be installed for each fastener that has been removed or loosened.

   To install, reverse the removal procedure.

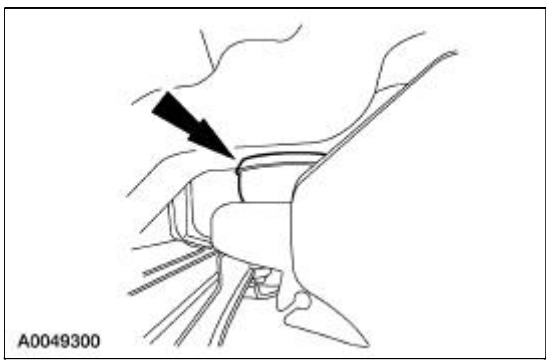
Body Support —Number 2 and Number 3



Removal and Installation

WARNING: If equipped with air suspension, the electrical power to the air suspension system must be shut down prior to hoisting, jacking or towing an air suspension equipped vehicle. This can be accomplished by turning off the air suspension switch located at the left rear interior of the vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

NOTE: Body mount number two, left side shown, all others similar.



Upper and lower body mount

1. Remove the body mount bolt and lower body mount.

Upper body mount

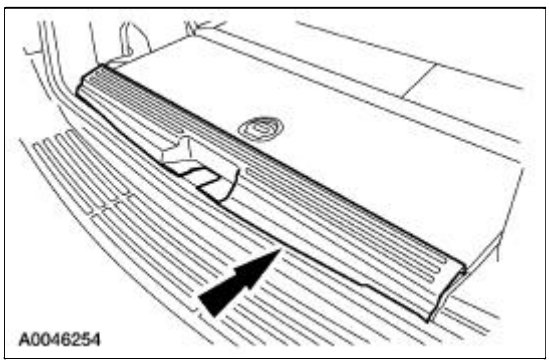
2. Loosen the remaining body mount bolts.
3. Raise the vehicle body enough to remove the upper body mount.

Upper and lower body mount

4. **NOTE:** No lubricants of any kind are to be used during body mount installation.

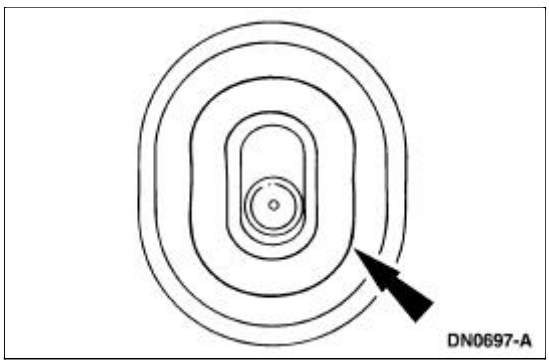
   NOTE: Do not reuse body mount fasteners. New fasteners must be installed for each fastener that has been removed or loosened.

To install, reverse the removal procedure.



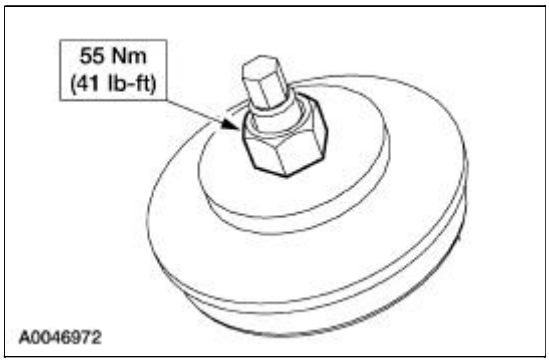
Body Support —Number 4

Removal and Installation



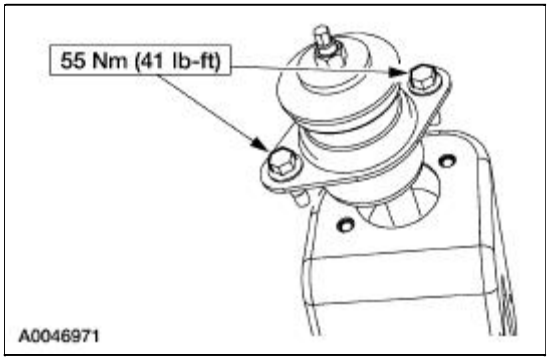
WARNING: If equipped with air suspension, the electrical power to the air suspension system must be shut down prior to hoisting, jacking or towing an air suspension equipped vehicle. This can be accomplished by turning off the air suspension switch located at the left rear interior of the vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

NOTE: Left side shown, right side similar.



1. Remove the liftgate scuff plate.

2. Remove the body mount bolt cover.



3. Remove the body mount nut.

4. Loosen the remaining body mount bolts.

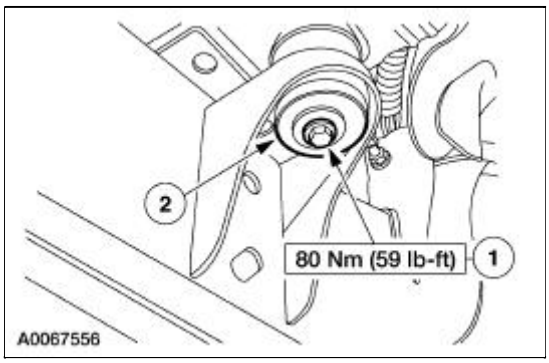
5. Raise the vehicle body enough to remove the body mount bolts.

6. **NOTE:** No lubricants of any kind are to be used during body mount installation.

   NOTE: Do not reuse body mount fasteners. New fasteners must be installed for each fastener that has been removed or loosened.

   To install, reverse the removal procedure.

Body Support —Radiator Support

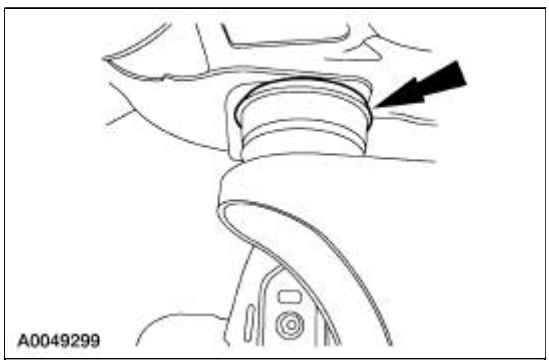


Removal and Installation

WARNING: If equipped with air suspension, the electrical power to the air suspension system must be shut down prior to hoisting, jacking or towing an air suspension equipped vehicle. This can be accomplished by turning off the air suspension switch located at the left rear interior of the vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

NOTE: Left side shown, right side similar.

Upper and lower body mount



1. Remove the lower radiator body mount.
    1. Remove the lower radiator body mount bolt.
    2. Remove the lower radiator body mount.

Upper body mount

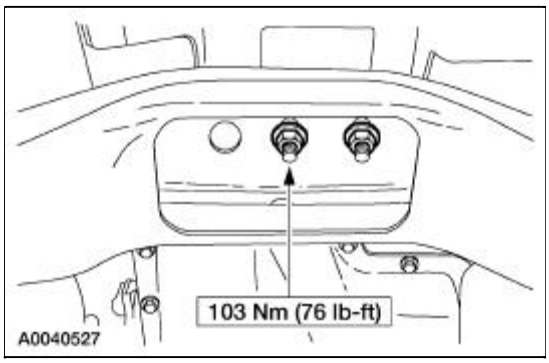
2. Loosen the remaining body mount bolts.

3. Raise the vehicle body enough to remove the upper body mount.

Upper and lower body mount

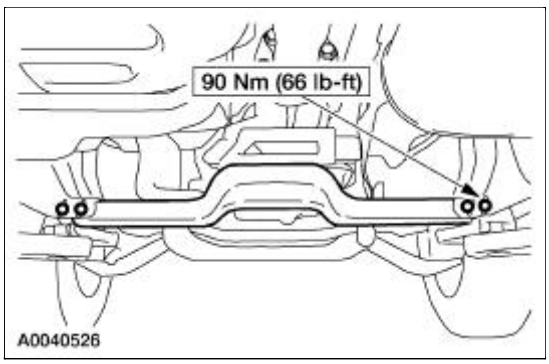
4. **NOTE:** No lubricants of any kind are to be used during body mount installation.

   NOTE: Do not reuse body mount fasteners. New fasteners must be installed for each fastener



that has been removed or loosened.

To install, reverse the removal procedure.

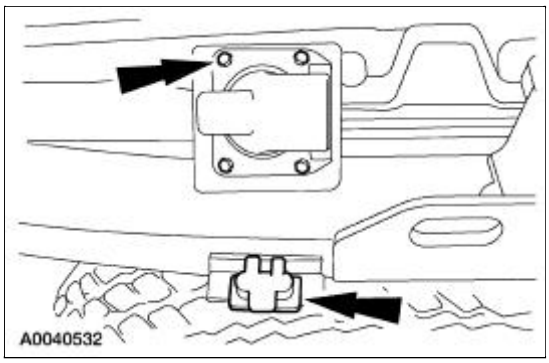


Crossmember —Transmission

Removal and Installation

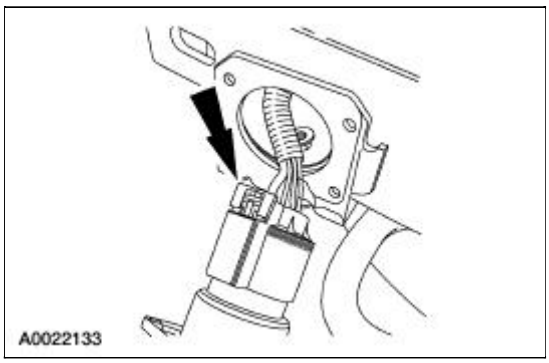
1. Raise and support the vehicle. For additional information, refer to Section 100-02 .
2. Remove the transmission mount nuts.

3. Support the transmission.
4. Remove the transmission crossmember bolts and transmission crossmember.



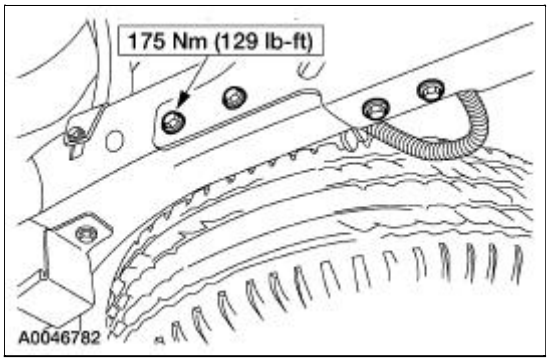
5. To install, reverse the removal procedure.

Trailer Hitch



Removal and Installation

WARNING: Do not permanently remove the trailer hitch. Always reinstall the hitch before delivery of the vehicle to the customer. Failure to follow this warning could increase the risk of injury in a rear end collision.



1. Raise and support the vehicle. For additional information, refer to Section 100-02 .
2. Remove the trailer hitch rear bumper cover trim panel.
3. Remove the trailer lighting plug cover and disconnect the electrical connector.

4. Remove the trailer lighting plug.
    1. Position the plug away from the trailer hitch.
    2. Disconnect the electrical connector.
    3. Remove the trailer lighting plug.

5. Remove the trailer hitch.
    - Remove the eight bolts.

6. **NOTE:** Do not reuse body support mounting fasteners. New fasteners must be installed for each fastener that has been removed or loosened.

   To install, reverse the removal procedure.

GENERAL INFORMATION

INTRODUCTION

In the past, when cars were simpler, diagrams were simpler. All components were connected by wires, and diagrams seldom exceeded 4 pages in length. Today, some wiring diagrams require more than 16 pages. It would be impractical to expect a service technician to trace a wire from page 1 across every page to page 16.

Components shown with a dashed line instead of a solid line indicate not all circuits are shown in this particular diagram (circuits shown in system diagrams are typically applicable to that system only). The remaining circuits connected to that component will be shown in the appropriate system that they apply to.

Today, the wiring diagram necessary to support a given repair procedure is included within that article or a link is provided to the appropriate SYSTEM WIRING DIAGRAM article. For example, the wiring diagram for a Ford EEC-IV system may be included in ENGINE PERFORMANCE and WIRING DIAGRAMS articles for Ford Motor Co. The wiring diagram for a cruise control system may be included in ACCESSORIES & EQUIPMENT section for the specific vehicle manufacturer, and the wiring diagram for an anti-lock brake system may be included in BRAKES and WIRING DIAGRAMS for the specific manufacturer.

WIRING DIAGRAMS contains all wiring diagrams not included in STARTING & CHARGING SYSTEMS and ACCESSORIES & EQUIPMENT. This includes: Data Link Connectors, Ground Distribution, Power Distribution, Engine Performance, Electric Cooling Fans, Anti-Lock Brakes, Electronic Suspension and Electronic Steering wiring diagrams. The Data Link Connectors wiring diagrams show the circuits by which the various on-board computers exchange information, and the diagnostic connectors used for diagnosis and their location. The Ground Distribution wiring diagrams show all vehicle ground points, their location, and the components common to those ground points. The Power Distribution wiring diagrams show the power feed circuits and the components common to those power feeds.

Wiring diagrams used to support the information in ACCESSORIES & EQUIPMENT are drawn in a "top-down" format. The diagrams are drawn with the power source at the top of the diagram and the ground point at the bottom of the diagram. Component locations are identified on the wiring diagrams. Any wires that do not connect directly to a component are identified on the diagram to indicate where they go.

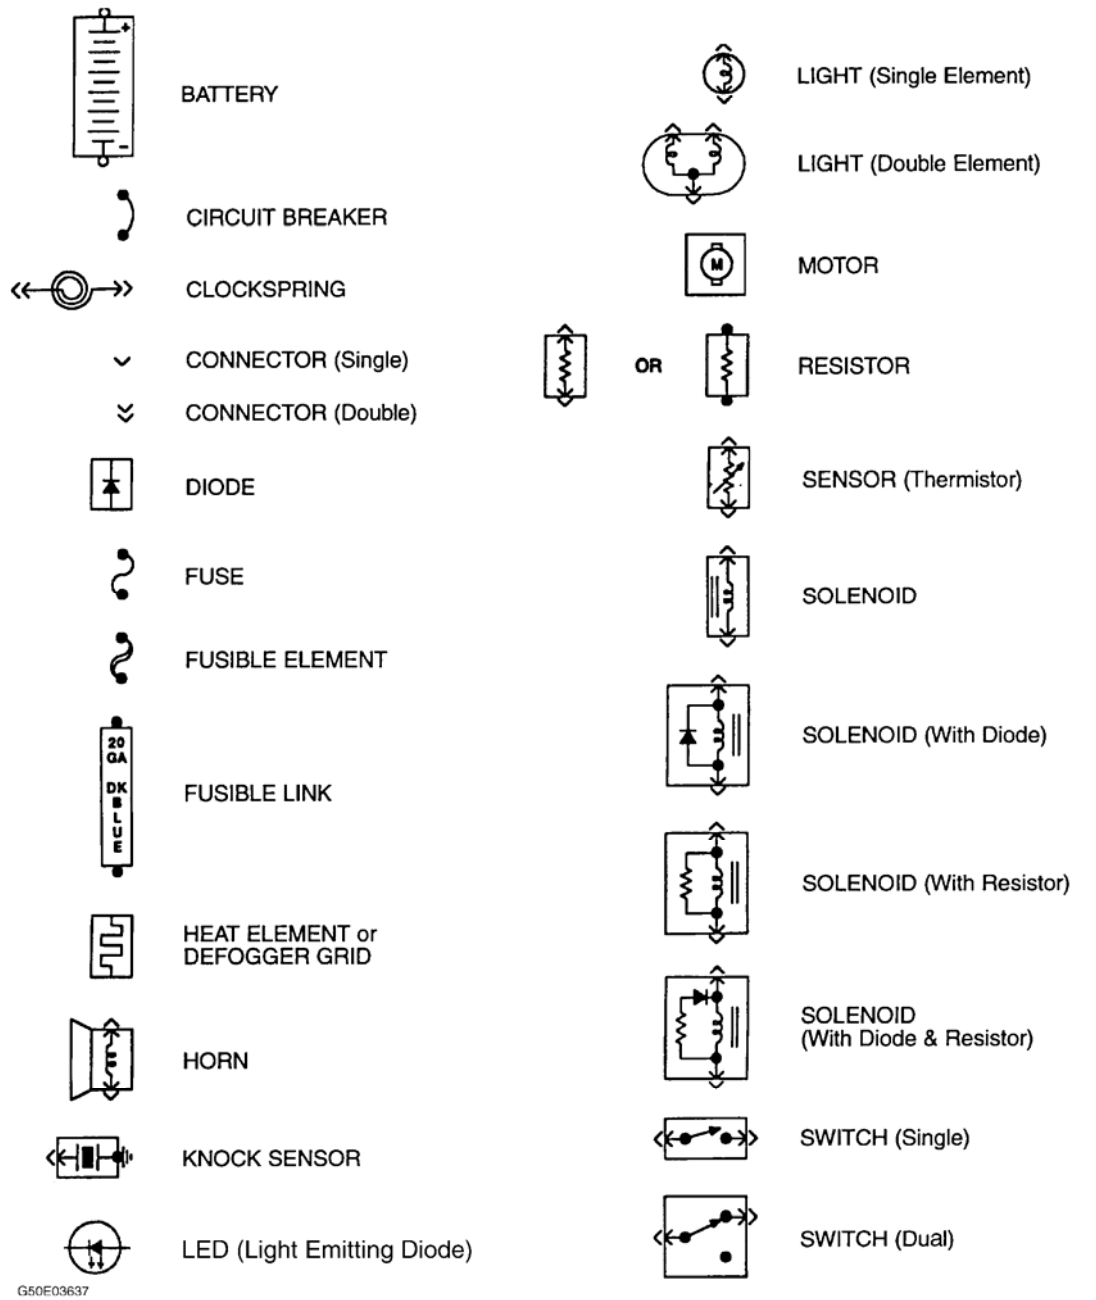
WIRING DIAGRAM SYMBOLS

NOTE: Standard wiring symbols are used on all wiring diagrams. The list below will help clarify any symbols that are not easily understood at a glance. Most components are labeled "Motor", "Switch" or "Relay" in addition to being drawn with the standard symbol.



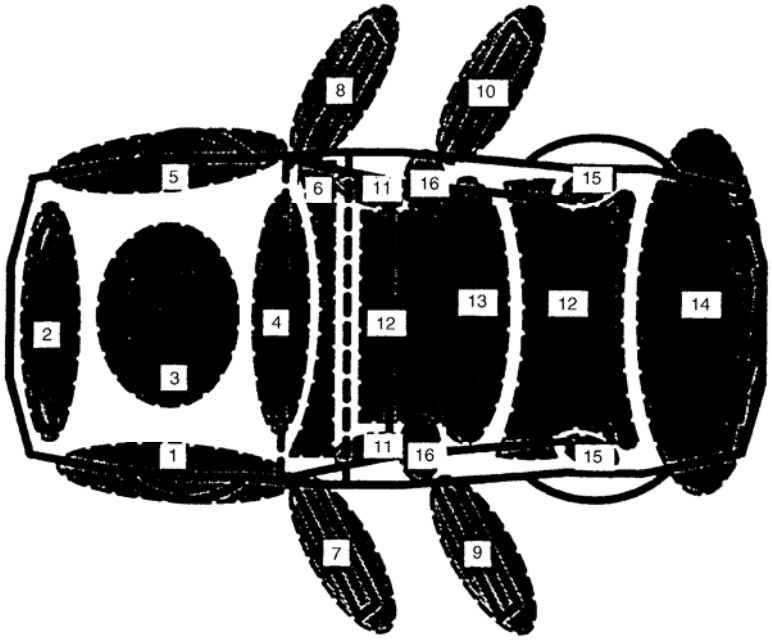


Fig. 1: Identifying Standard Wiring Diagram Symbols

WIRING DIAGRAM GROUND NUMBER LOCATIONS

NOTE: **The following illustration depicts standardized ground numbers and locations to be used in conjunction with wiring diagrams applying to 2001 and prior model years only. See Fig. 2 . Wiring diagrams applying to newer model years depict manufacturer-specified ground numbers and locations. Do not utilize the illustration with 2002 and newer**

model year wiring diagrams.

Fig. 2: Ground Numbers & Locations (2001 & Prior Model Years)

WIRING DIAGRAM COMPONENT LOCATIONS

When trying to locate a component in a wiring diagram and you don't know the specific system where it is located, use this handy component locator to find the system wiring diagram in which the component is located. Then, go to that system and locate the component within the wiring diagram.

For example, if you don't know the specific system in which the ignition switch is located, look up ignition switch in the wiring diagram component location tables and go to the appropriate wiring diagram(s) which contain either full or partial views of the ignition switch. The full view of the ignition switch is located in Power Distribution.

The first listing for the component will be the full or most complete view of the component. Additional listings will be partial views of the component. Not all components are used on all models.

All components will have a partial view in Ground Distribution and Power Distribution. Data Link Connectors show connecting circuits between modules. Alternate names for components may be listed in wiring diagram component locations tables.

WIRING DIAGRAM COMPONENT LOCATIONS

Component	Wiring Diagram
ABS Electronic Control Unit	Anti-Lock Brakes; Data Link Connectors
ABS Hydraulic Unit	Anti-Lock Brakes
Acceleration Sensor	Anti-Lock Brakes
Accessory Delay Relay	Power Windows
A/C Compressor Clutch Relay	Engine Performance
A/C Sensor	Engine Performance
A/C Pressure Switch	Engine Performance
Adaptive Lamp Control Module	Exterior Lights
Air Bag(s)	Air Bag Restraint System
Air Bag Module	Air Bag Restraint System
Air Bag Sensor(s)	Air Bag Restraint System
Air Injection Pump Relay	Engine Performance
Air Temperature Sensor	Overhead Console
Alternator (Generator)	Generators & Regulators
Anti-Theft Control Module	Anti-Theft System; Starters
Autolamp Control Relay	Headlight Systems; Daytime Running Lights
Automatic Shutdown (ASD) Relay	Engine Performance; Generators & Regulators
Autostick Switch	Engine Performance
Auxiliary Battery Relay	Generators & Regulators
Back-Up Lights	Back-Up Lights; Exterior Lights
Barometric (BARO) Pressure Sensor	Engine Performance
Battery	Power Distribution
Battery Temperature Sensor	Engine Performance
Body Control Module	Body Control Computer; Anti-Theft System; Daytime Running Lights; Engine Performance; Headlight Systems; Warning Systems
Boost Control Solenoid	Engine Performance
Boost Sensor	Engine Performance
Brake Fluid Level Switch	Analog Instrument Panels
Brake On/Off (BOO) Switch	Cruise Control Systems; Engine Performance; Shift Interlock Systems
Buzzer Module	Warning Systems

Camshaft Position (CMP) Sensor	Engine Performance
Central Control Module	Anti-Theft System
Clockspring	Air Bag Restraint System; Cruise Control Systems; Steering Column Switches
Clutch Pedal Position Switch	Starters
Clutch Start Switch	Starters
Combination Meter	Analog Instrument Panels
Constant Control Relay Module (CCRM)	Engine Performance; Electric Cooling Fans
Convenience Center	Power Distribution; Illumination/Interior Lights
Convertible Top Motor	Power Convertible Top
Convertible Top Switch	Power Convertible Top
Crankshaft Position (CKP) Sensor	Engine Performance
Cruise Control Module	Cruise Control Systems
Cruise Control Switch	Cruise Control Systems
Condenser Fan Relay(s)	Electric Cooling Fans
Data Link Connector (DLC)	Engine Performance
Daytime Running Lights Module	Daytime Running Lights; Exterior Lights
Defogger Relay	Rear Window Defogger
Diagnostic Energy Reserve Module (DERM)	Air Bag Restraint System
Discriminating Sensor (Air Bag)	Air Bag Restraint System
Distributor	Engine Performance
Door Lock Actuators	Power Door Locks; Remote Keyless Entry
Door Lock Relay(s)	Power Door Locks
Electrochromic Mirror	Power Mirrors
Electronic Level Control (ELC) Height Sensor	Electronic Suspension
Electronic Level Control (ELC) Module	Electronic Suspension
Engine Coolant Temperature (ECT) Sending Unit	Analog Instrument Panels
Engine Coolant Temperature (ECT) Sensor	Engine Performance
Engine Control Module	Engine Performance; Generators & Regulators; Starters
ETACS ECU	Warning Systems; Power Windows; Remote Keyless Entry
Evaporative (EVAP) Emissions Canister	Engine Performance
EVAP Canister Purge Solenoid	Engine Performance
EVAP Canister Vent Solenoid	Engine Performance
Exhaust Gas Recirculation (EGR) Valve	Engine Performance
Fuel Tank Vacuum Sensor	Engine Performance
Fog Lights	Headlight Systems; Daytime Running Lights
Fog Light Relay	Headlight Systems; Daytime Running Lights
Fuel Door Release Solenoid	Power Fuel Door Release
Fuel Gauge Sending Unit	Analog Instrument Panels
Fuel Injectors	Engine Performance
Fuel Pump	Engine Performance
Fuel Pump Relay	Engine Performance; Power Distribution

Fuse/Relay Block	Power Distribution
Fusible Links	Power Distribution; Generators & Regulators; Starters
Generator	Generators & Regulators; Engine Performance; Power Distribution
Generic Electronic Module (GEM)	Body Control Modules; Electronic Suspension
Glow Plug Relay	Engine Performance
Glow Plugs	Engine Performance
Grounds	Ground Distribution
Headlight Door Module	Headlight Doors
Headlight Relay	Headlight Systems; Daytime Running Lights
Headlights	Headlight Systems; Daytime Running Lights
Heated Oxygen Sensor(s) (HO2S)	Engine Performance
Heated Windshield Control Module	Heated Windshields
Height Sensor	Electronic Suspension
Horns	Steering Column Switches
Horn Relay	Steering Column Switches
Idle Air Control (IAC) Motor/Valve	Engine Performance
Ignition Coil(s)	Engine Performance
Ignition Key Lock Cylinder	Anti-Theft System
Ignition Module	Engine Performance
Ignition Switch	Power Distribution; Engine Performance; Generators & Regulators; Starters
Illuminated Entry Module	Illumination/Interior Lights
Illumination Lights	Illumination/Interior Lights
Impact Sensor	Air Bag Restraint System
Inertia Fuel Shutoff Switch	Engine Performance
Inhibit Relay	Starters
Instrument Cluster	Analog Instrument Panels
Intake Air Temperature (IAT) Sensor	Engine Performance
Interior Lights	Illumination/Interior Lights
Interlock Switch	Starters
Junction Block	Power Distribution
Keyless Entry Receiver	Remote Keyless Entry
Key Reminder Switch	Starters
Knock Sensor	Engine Performance
Lamp Control Module	Exterior Lights
License Plate Lamp	Exterior Lights
Lighting Control Module	Lighting Control Modules; Anti-Theft System; Daytime Running Lights; Headlight Systems
Lower Relay	Power Convertible Top
Malfunction Indicator Light (MIL)	Engine Performance; Instrument Panels
Manifold Absolute Pressure (MAP) Sensor	Engine Performance
Mass Airflow (MAF) Sensor	Engine Performance

Mega Fuse	Generators & Regulators
Memory Seat/Mirror Module	Memory Systems
Mirror Defogger	Rear Window Defogger
Moon Roof Motor	Power Moon Roof
Moon Roof Relay	Power Moon Roof
Multi-Function Control Module	Warning Systems
Neutral Safety Switch	Starters
Oil Level Switch	Engine Performance
Oil Pressure Switch/Sending Unit	Analog Instrument Panels; Engine Performance
Overhead Console	Overhead Console
Oxygen Sensor(s) (O2S)	Engine Performance
Parking Brake Switch	Analog Instrument Panels
Park Lights	Exterior Lights
Park/Neutral Position Switch	Starters; Engine Performance; Anti-Theft System; Body Control Module
Perimeter Lighting Control Relay	Exterior Lights
Power Amplifier	Power Antennas
Power Antenna Module	Power Antennas
Power Antenna Motor	Power Antennas
Power Distribution Center	Power Distribution; Generators & Regulators; Starters
Power Door Lock Motors	Power Door Locks
Power Mirror Motors	Power Mirrors; Memory Systems
Power Sliding Door Controller	Power Sliding Side Door
Power Seat Motors	Power Seats; Memory Systems
Power Steering Pressure Switch	Engine Performance
Power Top Motor	Power Convertible Top
Power Top Relay(s)	Power Convertible Top
Powertrain Control Module	Engine Performance; Analog Instrument Panels; Cruise Control Systems; Data Link Connectors; Generators & Regulators; Starters
Power Window Motors	Power Windows
Power Window Relay(s)	Power Windows
Radiator Fan Motor(s)	Electric Cooling Fans
Radiator Fan Relay(s)	Engine Performance; Electric Cooling Fans;
Rainsense Module	Wiper/Washer Systems
Raise Relay	Power Convertible Top
Remote Anti-Theft Personality (RAP) Module	Anti-Theft System; Starters; Warning Systems
Seat Belt Pretensioners	Air Bag Restraint System
Seat Belt Retractor Solenoid	Passive Restraints
Seat Belt Switch	Air Bag Restraint System; Passive Restraints
Shift Interlock Solenoid	Shift Interlock Systems
Shift Lock Actuator	Shift Interlock Systems
Side Marker Lights	Exterior Lights

SIR Coil Assembly (Clockspring)	Air Bag Restraint System
Slip Ring (Clockspring)	Air Bag Restraint System; Steering Column Switches
SRS Control Module	Air Bag Restraint System
Starter Motor	Starters
Starter Interrupt Relay	Starters
Starter Solenoid	Starters
Starter Relay	Starters
Steering Wheel Position Sensor	Anti-Lock Brakes
Stoplights	Exterior Lights
Stoplight Switch	Engine Performance; Cruise Control Systems; Anti-Lock Brakes
Sun Roof ECU	Power Sun Roof
Sun Roof Motor	Power Sun Roof
Sun Roof Position Sensor	Power Sun Roof
Taillights	Exterior Lights
Throttle Position (TP) Sensor	Engine Performance
Torque Converter Clutch Solenoid/Switch	Engine Performance
Traction Control Switch	Anti-Lock Brakes
Trailer Tow Connector	Exterior Lights
Trailer Tow Relay	Exterior Lights
Transmission/Transaxle	Engine Performance
Transmission Control Module (TCM)	Engine Performance; Starters
Transmission Range Sensor	Starters; Back-Up Lights; Engine Performance
Transmission Range Switch	Back-Up Lights; Engine Performance; Anti-Theft System
Turn Signal Flasher	Exterior Lights
Turn Signal Lights	Exterior Lights
Twilight Sentinel Switch	Headlight Systems; Daytime Running Lights
Vapor Canister Leak Detection Pump	Engine Performance
Vehicle Control Module (VCM)	Engine Performance
Vehicle Dynamic Module	Electronic Suspension
Vehicle Speed Control Servo	Cruise Control Systems
Vehicle Speed Sensor	Data Link Connectors; Analog Instrument Panels; Cruise Control Systems; Electronic Suspension
Voltage Regulator	Generators & Regulators
Water-In-Fuel Sensor	Engine Performance; Analog Instrument Panels
Wheel Speed Sensors	Anti-Lock Brakes
Window Timer Module	Power Convertible Top
Windshield Intermittent Wiper Relay	Wiper/Washer Systems
Windshield Washer Motor	Wiper/Washer Systems
Wiper Motor	Wiper/Washer Systems

Fuse	Amps	Circuits protected
F1.1	10	Instrument cluster, Low tire pressure module, Windshield wiper motor (17508), Rear wiper motor assembly
F1.2	20	IVD stop lamp relay, Brake pedal position switch (13480), Indicator flasher relay (13350)
F1.3	7.5	Exterior rear view mirror switch (17B676), Power seat switch, left, Driver seat module (14C718)
F1.4	15	CD changer (18D806), Rear Integrated Control Panel (RICP) (19980), DVD player
F1.5	7.5	Powertrain Control Module (PCM) (12A650), Deactivator switch, Third row folding seat relay, left, Third row folding seat relay, right, Power liftgate module, Brake pedal position switch (13480), Sunload sensor (19E663), Clock (15000), Function selector switch assembly, front, Electronic Auto matic Temperature Control (EATC) module (19980)
F1.6	15	Vehicle Security Module (VSM), Main light switch (11654), Floor shifter
F1.7	7.5	Radio (18806), Exterior rear view mirror, left, Exterior rear view mirror, right
F1.8	10	Electronic Automatic Temperature Control (EATC) module (19980), Exteri or rear view mirror, left, Exterior rear view mirror, right
F1.9	10	Generator
F1.10	20	Trailer tow relay, parking lamp, Trailer tow relay, reversing lamp
F1.11	10	A/C clutch relay, Integrated wheel ends solenoid
F1.12	10	Speed control fan clutch relay
F1.13	10	Electronic Automatic Temperature Control (EATC) module (19980), Rear window defrost relay, Trailer tow relay, battery charge, A/C high pressure switch (19D594), Function selector switch assembly
F1.14	10	Digital Transmission Range (DTR) sensor (7F293), Daytime Running Lamps (DRL) ignition relay, Daytime Running Lamps (DRL) park brake relay, Temperature blend door actuator (19E616)
F1.15	5	Instrument cluster, Traction control switch
F1.16	10	ABS control module (2C219)
F1.17	15	Fog lamp relay
F1.18	10	Electrochromatic inside mirror unit (17700), Climate controlled seat module, passenger side, Climate controlled seat module, driver side, Indicator flasher relay (13350), Electronic park brake release relay, Electronic park brake reset relay, Blend door actuator, rear (19E616), Auxiliary function selector switch assembly, front
F1.19	10	Restraints control module (14B321)
F1.20	30	Four–wheel drive control module, Air suspension module (3C142)
F1.21	15	Instrument cluster, Low tire pressure module, Electronic park brake re lease relay, Electronic park brake reset relay
F1.22	10	Radio (18806), Electronic Hidden Antenna Module (EHAM), Quarter win dow open relay, Quarter window close relay, Power window motor, left front, Door lock switch, driver side (14028), Roof opening panel switch (15B691), Power quarter window switch
F1.23	10	Low beam lamp, right front
F1.24	15	Battery saver relay
F1.25	10	Low beam lamp, left front
F1.26	20	Horn relay
F1.27	5	Parking Aid Module (PAM) (15T850), Electronic Compass (19A548), Air suspension module (3C142), Overdrive cancel switch (7G550), Floor shifter, Brake shift interlock
F1.28	5	Passive anti–theft transceiver, PCM power relay, Speed control fan clutch relay, PCM power diode
F1.29	30	Trailer electronic brake control connector
F1.30	30	Vehicle Security Module (VSM), Power window motor, left front
F1.31	25	Radio (18806), Subwoofer amplifier (18C804)
F1.32	15	4R70W transmission, Heated Oxygen Sensor (HO2S) #22 (9G444), Heated Oxygen Sensor (HO2S) #12 (9G444)
F1.33	20	EVAP canister vent control solenoid, Vapor management valve, EGR vacuum regulator solenoid (9J459), Heated Oxygen Sensor (HO2S) #21 (9F472), Heated Oxygen Sensor (HO2S) #11 (9F472)
F1.34	20	Mass Air Flow (MAF) sensor (12B579), Powertrain Control Module (PCM) (12A650), Fuel injectors, Idle Air Control (IAC) valve (9F715), Fuel pump relay
F1.35	10	Fog lamp relay, Main light switch (11654), Daytime Running Lamps (DRL) ignition relay, High beam lamp, left front, High beam lamp, right front
F1.36	10	Trailer tow connector, 4–pin, Trailer tow connector, 7–pin
F1.37	20	Power point, rear (19G247)
F1.38	25	Rear wiper motor assembly
F1.39	20	Power point, instrument panel (19N236), Power point, console 1, Power point, console 2
F1.40	20	Daytime Running Lamps (DRL) ignition relay
F1.41	20	Data Link Connector (DLC) (14489), Cigar lighter, front (15055)
F1.42	10	Trailer tow connector, 4–pin, Trailer tow connector, 7–pin
F1.101	30	Starter relay (11450)

Expedition & Navigator

BUZZERS, RELAYS & TIMERS

BUZZERS, RELAYS & TIMERS LOCATION

Component	Location
Accessory Delay Relay	In central junction box.
A/C Clutch Relay	At left front of engine compartment.
Air Suspension Solid State Relay	At right front of engine compartment.
Battery Charge Trailer Tow Relay	In central junction box.
Daytime Running Lamps Headlamp Relay	At left front of engine compartment.
Daytime Running Lamps Ignition Relay	At left front of engine compartment.
Electronic Park Brake Release Relay	Behind left kick panel.
Electronic Park Brake Reset Relay	Behind left kick panel.
Foglamp Relay	In central junction box.
Front Blower Motor Relay	In central junction box.
High Beam Relay	In central junction box.
Indicator Flasher Relay	Behind left side of dash. See **Fig. 5**.
IVD Stoplamp Relay	At left front of engine compartment.
Parking Lamp Trailer Tow Relay	In central junction box.
PCM Power Relay	In central junction box.
Quarter Window Close Relay	At right side of cargo area, behind trim.
Quarter Window Open Relay	At right side of cargo area, behind trim.
Rear Blower Motor Relay	At right side of cargo area, behind trim.
Rear Window Defrost Relay	In central junction box.
Starter Relay	In central junction box.
Third Row Folding Seat Relay (Left)	At right "C" pillar.
Third Row Folding Seat Relay (Right)	At right "C" pillar.

CIRCUIT PROTECTION DEVICES

CIRCUIT PROTECTION DEVICES LOCATION

Component	Location
A/C Compressor Clutch Diode	At left front of engine compartment.
Auxiliary Relay Box 1	At left front of engine compartment.
Auxiliary Relay Box 2	At right side of cargo area, behind trim.
Auxiliary Relay Box 3	Behind left side of dash. See **Fig. 5**.
Central Junction Box	Behind right kick panel. See **Fig. 7**.

CONTROL UNITS

CONTROL UNITS LOCATION

Component	Location

ABS Control Module	At left side of engine compartment.
Air Suspension Module	Under left side of dash.
Climate Controlled Seat Module (Driver's/Passenger's)	Under respective seat.
Driver Seat Module	Under driver's seat.
Electronic Automatic Temperature Control Module	In center of dash. See **Fig. 5**.
Electronic Hidden Antenna Module	At right "C" pillar.
Four Wheel Drive Control Module	At left "B" pillar.
Heater Blower Control Module	Behind dash.
Inlet Manifold Runner Control Module (5.4L 4V)	On top front of engine. See **Fig. 2**.
Liftgate Chime Module	In left side of liftgate.
Low Tire Pressure Module	At left "C" pillar.
Parking Aid Module	At left side of cargo area, behind trim.
Passive Anti-Theft Transceiver	Behind left side of dash, near steering column.
Power Liftgate Module	At left side of cargo area, behind trim. See **Fig. 8**.
Powertrain Control Module	On right side of firewall.
Restraints Control Module	Below center console or under seat.
Roof Opening Panel Module	In roof panel.
Vehicle Security Module	Under right side of dash.

MOTORS

MOTORS LOCATION

Component	Location
Adjustable Pedal Motor	On accelerator pedal support.
Air Suspension Compressor Assembly	At right front of engine compartment.
Auxiliary Blower Motor	At right side of cargo area, behind trim.
Blend Door Actuator (Rear)	At right side of cargo area, behind trim.
Fuel Tank Unit	In fuel tank.
Heater Blower Motor	Behind dash.
Liftgate Cinching Motor	In right side of liftgate.
Liftgate Drive Motor Assembly (Left/Right)	At rear of roof.
Liftgate Glass Actuator	In liftgate.
Liftgate Lock Actuator	In liftgate.
Liftgate Unlatch Motor	In right side of liftgate.
Mode Door Actuator (Rear)	At right side of cargo area, behind trim.
Rear Wiper Motor Assembly	In liftgate.
Roof Opening Panel Motor Assembly	In roof panel.
Running Board Motor (Left/Right)	Under respective side of vehicle.
Speed Control Servo	On left side of engine compartment. See **Fig. 4**.
Temperature Blend Door Actuator (Driver's/Passenger's) (Dual Zone A/C)	Behind dash.
Temperature Blend Door Actuator (Manual A/C)	Behind dash.
	On right side of engine compartment, on washer

Washer Pump Motor (Front & Rear)	fluid reservoir. See **Fig. 3**.
Windshield Wiper Motor	On left side of firewall. See **Fig. 4**.

SENDING UNITS & SENSORS

SENDING UNITS & SENSORS LOCATION

Component	Location
Adjustable Pedal Memory Potentiometer	On accelerator pedal support.
Ambient Air Temperature Sensor	Behind radiator grille.
Brake Booster Sensor	At left rear of engine compartment.
Camshaft Position Sensor (5.4L 2V)	On front of left cylinder head. See **Fig. 1**.
Camshaft Position Sensor (5.4L 4V)	On front of left cylinder head. See **Fig. 2**.
"C" Pillar Safety Canopy Sensor (Left/Right)	On respective "C" pillar, behind trim.
Crankshaft Position Sensor (5.4L 2V)	On lower front of engine. See **Fig. 1**.
Crankshaft Position Sensor (5.4L 4V)	On lower front of engine.
Cylinder Head Temperature Sensor (5.4L 2V)	On left front of engine.
Cylinder Head Temperature Sensor (5.4L 4V)	On left rear of engine.
Differential Pressure Feedback EGR Sensor (5.4L 2V)	On top left side of engine. See **Fig. 1**.
Differential Pressure Feedback EGR Sensor (5.4L 4V)	On top left side of engine. See **Fig. 2**.
Digital Transmission Range Sensor	On left side of transmission.
Door Safety Canopy Sensor (Left/Right)	At bottom rear of respective front door.
Driver Seat Position Sensor	Under driver's seat.
Engine Coolant Temperature Sensor (5.4L 2V)	On top front of engine.
Engine Coolant Temperature Sensor (5.4L 4V)	On top front of engine. See **Fig. 2**.
Forward Crash Sensor	On left front of vehicle.
Front Height Sensor (Left/Right)	At respective shock tower.
Fuel Tank Pressure Transducer Sensor	In fuel tank.
Heated Oxygen Sensor No. 11	On right exhaust downpipe.
Heated Oxygen Sensor No. 12	On rear of exhaust system.
Heated Oxygen Sensor No. 21	On left exhaust downpipe.
Heated Oxygen Sensor No. 22	On rear of exhaust system.
Intake Air Temperature Sensor (5.4L 2V)	In intake system, near left front of engine. See **Fig. 1**.
Intake Air Temperature Sensor (5.4L 4V)	In intake system, near front of engine. See **Fig. 2**.
In-Vehicle Temperature/Humidity Sensor (Navigator)	In center of dash.
In-Vehicle Temperature Sensor (Expedition)	In left side of dash.
Knock Sensor (5.4L 2V)	On rear of engine.
Knock Sensor (5.4L 4V)	On right rear of engine.

Liftgate Obstacle Detection Strip (Left)	At lower left side of cargo area. See **Fig. 8**.
Liftgate Obstacle Detection Strip (Right)	At lower right side of cargo area.
Mass Airflow Sensor	In intake system.
Output Shaft Speed Sensor	On rear of transmission.
Parking Aid Radar Sensor	At center rear of vehicle.
Parking Aid Ultrasonic Sensor (Left/Right)	On respective rear side of vehicle.
Primary Brake Pressure Sensor	At left rear of engine compartment, on brake master cylinder. See **Fig. 4**.
Rear Height Sensor	Under rear of vehicle, near axle.
Secondary Brake Pressure Sensor	At left rear of engine compartment, on brake master cylinder booster. See **Fig. 4**.
Steering Position Sensor	On steering column.
Sunload Sensor	On top center of dash, near windshield. See **Fig. 5**.
Throttle Position Sensor (5.4L 2V)	On throttle body. See **Fig. 1**.
Throttle Position Sensor (5.4L 4V)	On throttle body. See **Fig. 2**.
Yaw Velocity Sensor	Under center console.

SOLENOIDS & SOLENOID VALVES

SOLENOIDS & SOLENOID VALVES LOCATION

Component	Location
Auto Park Brake Release Solenoid	At driver's footwell. See **Fig. 6**.
Brake Shift Interlock	Near steering column.
EGR Vacuum Regulator Solenoid (5.4L 2V)	On left side of engine. See **Fig. 1**.
EGR Vacuum Regulator Solenoid (5.4L 4V)	On left side of engine. See **Fig. 2**.
EVAP Canister Vent Control Solenoid	Under rear of vehicle, above rear axle.
Front Shock Absorber Solenoid Valve (Left/Right)	On respective shock tower.
Idle Air Control Valve (5.4L 2V)	On throttle body. See **Fig. 1**.
Idle Air Control Valve (5.4L 4V)	On left front of engine. See **Fig. 2**.
Integrated Wheel Ends Solenoid	At right rear of engine compartment. See **Fig. 3**.
Power Steering Valve Solenoid	On front of engine.
Rear Shock Absorber Solenoid Valve (Left/Right)	Under respective rear side of vehicle, near shock mount.
Remote Solenoid Assembly	Behind center of dash.
Vapor Management Valve	At left rear of engine compartment. See **Fig. 4**.

SWITCHES

SWITCHES LOCATION

Component	Location
A/C High Pressure Switch	At right front of engine compartment.
Air Suspension Service Switch	Behind access panel, on left rear quarter trim panel, near the liftgate.
Brake Fluid Level Switch	In brake fluid reservoir, near firewall. See **Fig. 4**.

Brake Pedal Position Switch	On brake pedal support.
Deactivator Switch	On brake pedal support.
Inertia Fuel Shut-Off Switch	At left rear corner of cargo area, behind trim. See **Fig. 8**.
Liftgate Home Position Switch	In right side of liftgate.
Oil Pressure Switch (5.4L 2V)	On left front of engine. See **Fig. 1**.
Oil Pressure Switch (5.4L 4V)	On left front of engine. See **Fig. 2**.
Parking Brake Switch	Above left kick panel.
Power Steering Pressure Switch (5.4L 2V)	On left front of engine. See **Fig. 1**.
Safety Belt Buckle Switch (Driver's/Passenger's)	In respective safety belt buckle assembly.
Thermostatic Expansion Valve Switch Assembly	On right side of engine compartment. See **Fig. 3**.
Washer Fluid Level Switch	On right side of engine compartment, on washer fluid reservoir. See **Fig. 3**.

MISCELLANEOUS

MISCELLANEOUS LOCATION

Component	Location
Auxiliary Blower Motor Resistor Assembly	At right side of cargo area, behind trim.
Blower Motor Resistor	Behind dash.
Data Link Connector	Under left side of dash. See **Fig. 5**.
Electronic Fan Clutch	At right front of engine compartment.
Fuel Tank Unit	In fuel tank.
Ignition Transformer Capacitor 1 (5.4L 2V)	On top right front of engine. See **Fig. 1**.
Ignition Transformer Capacitor 1 (5.4L 4V)	On top rear of engine.
Ignition Transformer Capacitor 2 (5.4L 2V)	On top left front of engine. See **Fig. 1**.
Ignition Transformer Capacitor 2 (5.4L 4V)	On top rear of engine.
Safety Belt Buckle Pretensioner (Driver's/Passenger's)	In respective safety belt buckle assembly.
Safety Canopy Delete Resistor	On right side of roof.
Subwoofer Amplifier	At left side of cargo area, behind trim. See **Fig. 8**.
Trailer Electronic Brake Control Connector	Behind left center of dash. See **Fig. 5**.
Trailer Tow Connector (4 Pin)	Near rear bumper.
Trailer Tow Connector (7 Pin)	Near rear bumper.

CONNECTORS

CONNECTORS LOCATION

Component	Location
C110 (Black, 16 Pin)	At right front of engine compartment.
	At left front

C133 (Black, 7 Pin)	of vehicle.
C134 (Black, 7 Pin)	At right front of vehicle.
C139 (Black, 4 Pin)	At left side of engine compartment. See **Fig. 4**.
C144 (5.4L 2V) (Black, 4 Pin)	On left front side of engine. See **Fig. 1**.
C145 (Black, 12 Pin)	At right side of engine compartment.
C146 (Black, 8 Pin)	At right side of engine compartment.
C192 (Black, 4 Pin)	At right side of engine compartment. See **Fig. 3**.
C210 (White, 20 Pin)	Behind right kick panel. See **Fig. 7**.
C211 (Gray, 14 Pin)	Behind right kick panel.
C212 (Gray, 16 Pin)	Behind left kick panel.
C213 (Green, 20 Pin)	Behind left kick panel.
C214 (Green, 20 Pin)	Behind right kick panel. See **Fig. 7**.
C215 (Gray, 4 Pin)	Behind right side of dash.
C219 (Gray, 6 Pin)	Behind left side of dash.
C237 (Black/Gray, 8 Pin)	Behind right side of dash.
C238 (Gray, 66 Pin)	Behind left kick panel. See **Fig. 6**.
C248 (Black, 12 Pin)	Behind left kick panel. See **Fig. 6**.
C260 (Green, 20 Pin)	Behind center of dash.
	Behind

C263 (Gray, 10 Pin)	center of dash.
C264 (Green, 20 Pin)	Under center of dash. See **Fig. 5**.
C265 (Gray, 10 Pin)	Under center of dash.
C268 (Black, 12 Pin)	Under center of dash.
C275 (Gray, 12 Pin)	Behind right side of dash.
C291 (Gray, 13 Pin)	Behind right side of dash.
C311 (Green, 20 Pin)	Under driver's seat.
C312 (White, 20 Pin)	Under driver's seat.
C313 (Black, 14 Pin)	Under driver's seat.
C314 (Gray, 66 Pin)	Below center console.
C315 (Black, 4 Pin)	Below center console.
C316 (Black, 14 Pin)	Under passenger's seat.
C327 (Gray, 16 Pin)	Below rear seats, under left rear of vehicle.
C328 (Black, 12 Pin)	Below rear seats, under left rear of vehicle.
C339 (Black, 12 Pin)	At left "C" pillar.
C340 (Gray, 16 Pin)	At right "C" pillar.
C405 (Gray, 12 Pin)	At left "C" pillar.
C406 (Gray, 12 Pin)	At right "C" pillar.
C410 (Black, 12 Pin)	At right side of cargo area, behind trim.
C411 (Black, 12 Pin)	At right side of cargo area, behind trim.

C422 (Black, 2 Pin)	In right side of liftgate.
C465 (Gray, 16 Pin)	At left "C" pillar.
C494 (Black, 8 Pin)	At left rear of vehicle. See **Fig. 8**.
C495 (Black, 4 Pin)	In liftgate.
C510 (Gray, 12 Pin)	In left front door.
C610 (Gray, 8 Pin)	In right front door.
C700 (Black, 12 Pin)	In left rear door.
C800 (Black, 12 Pin)	In right rear door.
C913 (Gray, 6 Pin)	In roof panel.
C919 (Black, 3 Pin)	At right "C" pillar.
C922 (Gray, 6 Pin)	In roof panel.
C934 (Gray, 10 Pin)	At left rear of roof.
C935 (Black, 8 Pin)	At left rear of roof.
C991 (Gray, 8 Pin)	At rear of roof.
C1026 (Black, 1 Pin)	At right side of engine compartment.
C2108 (1 Pin)	Behind right kick panel. See **Fig. 7**.

GROUNDS

GROUNDS LOCATION

Component	Location
G100	Near left side of radiator.
G101	Near right side of radiator.
G102	On right rear of engine compartment. See **Fig. 3**.
G103	On right side of engine compartment, on fender.
G104	On right side of engine compartment, on frame rail.
G105	On right side of engine.
G200	Behind right kick panel. See **Fig. 7**.
G201	Behind right kick panel.
G202	Behind left kick panel. See **Fig. 6**.
G300	On left "B" pillar, behind trim.

G301	Behind left kick panel.
G400	Under rear of vehicle.
G401	On left side of luggage compartment, behind trim. See **Fig. 8**.
G402	On left side of luggage compartment, behind trim. See **Fig. 8**.
G404	On right side of luggage compartment, behind trim.
G500	On bottom of left front door, behind trim.
G600	On bottom of right front door, behind trim.

SPLICES

SPLICES LOCATION

Component	Location
S100	In engine control sensor harness, near breakout to C133.
S101	In engine control sensor harness, in breakout to ABS control module.
S102	In engine control sensor harness, near breakout to speed control servo.
S103	In engine control sensor harness, near breakout to left front wheel speed sensor.
S104	In engine control sensor harness, near breakout to deactivator switch.
S105	In engine control sensor harness, near breakout to brake fluid level switch.
S106	In engine control sensor harness, near breakout to vapor management valve.
S107	In engine control sensor harness, near breakout to vapor management valve.
S108	In engine control sensor harness, in breakout to powertrain control module.
S109	In engine control sensor harness, near breakout to thermostatic expansion valve switch assembly.
S110	In engine control sensor harness, near breakout to thermostatic expansion valve switch assembly.
S111	In engine control sensor harness, near breakout to thermostatic expansion valve switch assembly.
S112	In engine control sensor harness, near breakout to thermostatic expansion valve switch assembly.
S113	In engine control sensor harness, near breakout to right front wheel speed sensor.
S114	In engine control sensor harness, near breakout to right front wheel speed sensor.
S115	In engine control sensor harness, near breakout to right front wheel speed sensor.
S116	In engine control sensor harness, near breakout to G101.
S117	In engine control sensor harness, near breakout to deactivator switch.
S118	In engine control sensor harness, near breakout to G101.
S119	In air spring suspension pressure indicator switch harness, in breakout to C110.
S120	In air spring suspension pressure indicator switch harness, in breakout to C110.
S121	In air spring suspension pressure indicator switch harness, in breakout to C110.
S122	In engine control sensor harness, near breakout to vapor management valve.
S123	In engine control sensor harness, near breakout to auxiliary relay box 1.
S124	In engine control sensor & fuel charge harness, near breakout to heated oxygen sensor No. 21.
S125	In engine control sensor & fuel charge harness, near breakout to intake air temperature sensor.
S126	In engine control sensor & fuel charge harness, near breakout to idle air control

	valve.
S127	In engine control sensor & fuel charge harness, near breakout to fuel injector No. 7.
S128	In engine control sensor & fuel charge harness, near breakout to heated oxygen sensor No. 11.
S129	In engine control sensor & fuel charge harness, near breakout to coil on plug No. 4.
S131	In engine control sensor & fuel charge harness, near breakout to ignition transformer capacitor No. 2.
S132	In engine control sensor & fuel charge harness, near breakout to heated oxygen sensor No. 11.
S133	In engine control sensor harness, near breakout to thermostatic expansion valve switch assembly.
S135	In headlamps harness, in breakout to C133.
S136	In headlamps harness, in breakout to C134.
S138	In back-up lamp switch to rear lamp feed harness, near breakout to powertrain control module.
S140	In back-up lamp switch to rear lamp feed harness, near breakout to powertrain control module.
S200	In front heater blower motor harness, in breakout to C237.
S201	In main harness, near breakout to instrument cluster.
S202	In main harness, near breakout to instrument cluster.
S203	In main harness, near breakout to glove box lamp.
S205	In console panel harness, near breakout to power point, console 1.
S208 (Expedition)	In main harness, near breakout to data link connector.
S208 (Navigator)	In main harness, near breakout to G202.
S212 (Expedition)	In main harness, near breakout to central junction box.
S212 (Navigator)	In main harness, near breakout to instrument cluster.
S221	In main harness, near breakout to C210.
S224	In main harness, near breakout to instrument cluster.
S227	In main harness, near breakout to central junction box.
S228	In main harness, near breakout to C219.
S229	In main harness, in breakout to C213.
S230	In main harness, near breakout to C210.
S231	In main harness, near breakout to brake pedal position switch.
S232	In main harness, near breakout to C215.
S238	In main harness, near breakout to instrument cluster.
S241 (Expedition)	In main harness, near breakout to electronic automatic temperature control module.
S241 (Navigator)	In main harness, near breakout to central junction box.
S242	In main harness, near breakout to trailer electronic brake control connector.
S244	In main harness, near breakout to instrument cluster.
S246	In main harness, near breakout to P113.
S247	In main harness, near breakout to radio.
S262	In main harness, near breakout to front function selector switch assembly.
S264	In main harness, near breakout to instrument cluster.

S266	In main harness, in breakout to instrument cluster.
S277	In main harness, near breakout to instrument cluster.
S279	In body main harness, in breakout to C214.
S280	In main harness, in breakout to C214.
S281	In main harness, in breakout to C210.
S282	In main harness, near breakout to instrument cluster.
S283	In main harness, in breakout to radio.
S284	In main harness, near breakout to sunload sensor.
S285	In main harness, near breakout to sunload sensor.
S290 (Expedition)	In main harness, near breakout to G202.
S290 (Navigator)	In main harness, near breakout to CD changer.
S291	In front heater blower motor harness, in breakout to heater blower motor.
S293	In main harness, near breakout to instrument cluster.
S294	In body main harness, in breakout to C214.
S303	In console panel harness, near breakout to C314.
S306	In console panel harness, near breakout to power point, console 2.
S308	In body main harness, near breakout to restraints control module.
S309	In power seats harness, near breakout to C311.
S310	In power seats harness, in breakout to left front lumbar adjust switch.
S311	In power seats harness, near breakout to C316.
S312	In body main harness, near breakout to C465.
S313	In body main harness, near breakout to left "C" pillar safety canopy sensor.
S314	In body main harness, near breakout to C327.
S315	In body main harness, near breakout to right "C" pillar safety canopy sensor.
S316	In body main harness, near breakout to C327.
S317	In body main harness, near breakout to C700.
S318	In body main harness, near breakout to C316.
S319	In body main harness, near breakout to C800.
S320	In body main harness, near breakout to restraints control module.
S321	In body main harness, near breakout to restraints control module.
S323	In console panel harness, near breakout to C314.
S324	In body main harness, near breakout to C800.
S329	In power seats harness, near breakout to right front lumbar adjust switch.
S342	In body main harness, near breakout to C800.
S343	In body main harness, near breakout to G201.
S344	In body main harness, near breakout to G201.
S345	In body main harness, near breakout to G201.
S346	In body main harness, near breakout to G301.
S347	In body main harness, near breakout to G301.
S348	In body main harness, near breakout to G301.
S349	In body main harness, near breakout to G301.
S350	In console panel harness, near breakout to power point, console 2.
S355	In body main harness, near breakout to G301.

S356	In body main harness, near breakout to central junction box.
S357	In body main harness, near breakout to central junction box.
S358	In body main harness, near breakout to C214.
S359	In body main harness, near breakout to C214.
S361	In body main harness, near breakout to parking brake switch.
S362	In body main harness, near breakout to parking brake switch.
S369	In body main harness, near breakout to G301.
S370	In body main harness, near breakout to right "C" pillar safety canopy sensor.
S371	In power seats harness, near breakout to C800.
S372	In body main harness, near breakout to restraints control module.
S373	In body main harness, near breakout to C214.
S374	In body main harness, near breakout to C327.
S375	In body main harness, near breakout to C316.
S376	In body main harness, near breakout to C316.
S377	In body main harness, near breakout to C316.
S378	In body main harness, near breakout to transfer case assembly.
S379	In body main harness, near breakout to C800.
S380	In body main harness, near breakout to C316.
S381	In body main harness, near breakout to C316.
S382	In power seats harness, near breakout to driver's safety belt buckle switch.
S383	In power seats harness, near breakout to driver's side climate controlled seat fan.
S384	In power seats harness, near breakout to driver's side climate controlled seat fan.
S385	In power seats harness, near breakout to driver's seat module.
S386	In power seats harness, near breakout to driver's side climate controlled seat module.
S387	In console panel harness, in breakout to traction control switch.
S388	In console panel harness, in breakout to C314.
S389	In console panel harness, near breakout to power point, console 2.
S390	In console panel harness, in breakout to rear integrated control panel.
S391	In body main harness, near breakout to right running board motor.
S392	In body main harness, near breakout to central junction box.
S393	In body main harness, near breakout to transfer case assembly.
S394	In body main harness, near breakout to C700.
S395	In body main harness, near breakout to G301.
S396	In console panel harness, in breakout to power point, console 2.
S397	In console panel harness, near breakout to rear auxiliary function selector switch assembly.
S400	In right rear window regulator control switch & wiring assembly, in breakout to liftgate chime module.
S402	In right rear window regulator control switch & wiring assembly, near breakout to rear window defrost grid.
S403	In rear lamp connector harness, near breakout to subwoofer amplifier.
S412	In rear lamp connector harness, near breakout to rear blend door actuator.
S414	In rear lamp connector harness, near breakout to G401.
S415	In rear license plate lamp harness, near breakout to right license plate lamp.

S416	In rear license plate lamp harness, near breakout to right license plate lamp.
S423	In rear lamp connector harness, near breakout to auxiliary blower motor resistor assembly.
S424	In rear lamp connector harness, near breakout to C410.
S427	In right rear window regulator control switch & wiring assembly, near breakout to rear window defrost grid.
S431	In rear lamp connector harness, near breakout to rear blend door actuator.
S432	In rear lamp connector harness, near breakout to auxiliary blower motor resistor assembly.
S436	In rear lamp connector harness, near breakout to G404.
S440	In back-up alarm jumper harness, near breakout to left parking aid ultrasonic sensor.
S445	In back-up alarm jumper harness, near breakout to left parking aid ultrasonic sensor.
S446	In rear lamp connector harness, near breakout to C410.
S447	In rear lamp connector harness, near breakout to C410.
S448	In rear lamp connector harness, near breakout to C410.
S449	In rear lamp connector harness, near breakout to C410.
S450	In taillamp harness, near breakout to trailer tow connector.
S451	In taillamp harness, near breakout to trailer tow connector.
S452	In taillamp harness, near breakout to trailer tow connector.
S453	In taillamp harness, near breakout to trailer tow connector.
S454	In taillamp harness, near breakout to C327.
S455	In rear lamp connector harness, near breakout to C410.
S456	In rear lamp connector harness, near breakout to C410.
S457	In rear lamp connector harness, near breakout to C410.
S458	In rear lamp connector harness, near breakout to air suspension service switch.
S460	In rear lamp connector harness, near breakout to subwoofer amplifier.
S462	In right rear window regulator control switch & wiring assembly, near breakout to C422.
S463	In right rear window regulator control switch & wiring assembly, near breakout to liftgate glass actuator.
S464 (Expedition)	In rear lamp connector harness, near breakout to C405.
S464 (Navigator)	In right rear window regulator control switch & wiring assembly, near breakout to C422.
S465	In right rear window regulator control switch & wiring assembly, near breakout to liftgate glass actuator.
S468	In rear lamp connector harness, near breakout to C410.
S469	In rear lamp connector harness, near breakout to C410.
S501	In body main harness, near breakout to left exterior rearview mirror.
S502	In body main harness, near breakout to left exterior rearview mirror.
S505	In body main harness, near breakout to left exterior rearview mirror.
S506	In left front door harness, near breakout to driver's side front power window motor.
S600	In body main harness, near breakout to right exterior rearview mirror.
S700	In door lock feed harness, near breakout to left rear window adjust switch.

S800	In door lock feed harness, near breakout to right rear window adjust switch.
S900	In interior illumination harness, near breakout to left side rail lamp.
S901	In interior illumination harness, near breakout to right side rail lamp.
S902	In interior illumination harness, near breakout to right side rail lamp.
S903	In interior illumination harness, near breakout to front auxiliary function selector switch assembly.
S904	In interior illumination harness, near breakout to front auxiliary function selector switch assembly.
S905	In interior illumination harness, near breakout to right vanity mirror lamp.
S906	In interior illumination harness, near breakout to right front map reading lamp.
S907	In interior illumination harness, near breakout to right front map reading lamp.
S908	In interior illumination harness, near breakout to front auxiliary function selector switch assembly.
S910	In rear lamp connector harness, near breakout to left side rear quarter window motor.
S914	In rear lamp connector harness, near breakout to left side rear quarter window motor.
S1001	In generator rectifier system harness, in breakout to battery.
S1002	In generator rectifier system harness, in breakout to battery.
S2001 (Expedition)	In main harness, near breakout to brake pedal position switch.
S2001 (Navigator)	In main harness, near breakout to glove box lamp.
S2003	In main harness, near breakout to brake pedal position switch.
S2005	In main harness, near breakout to radio.
S2006	In main harness, near breakout to data link connector.
S2007	In main harness, near breakout to data link connector.
S2008	In main harness, near breakout to data link connector.
S2013	In main harness, near breakout to C210.
S2018	In cigar lighter lamp wiring & socket assembly, in breakout to front cigar lighter.
S2019	In main harness, near breakout to illumination dimmer.
S2023	In main harness, near breakout to radio.
S2024	In main harness, near breakout to instrument cluster.
S2025	In front heater blower motor harness, near breakout to passenger's temperature blend door actuator.
S2026	In front heater blower motor harness, near breakout to driver's temperature blend door actuator.
