- If the drive belt tensioner is worn or damaged.

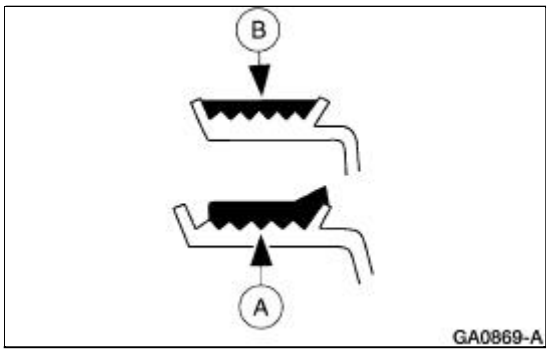
Belt Tension

NOTE: Drive belt tension is not adjustable.

The drive belt tensioner automatically adjusts drive belt tension.

Belt Tensioner, Automatic

Check the automatic drive belt tensioner.



1. With the engine off, check for correct drive belt routing. Refer to the procedure in this section. Service as required.

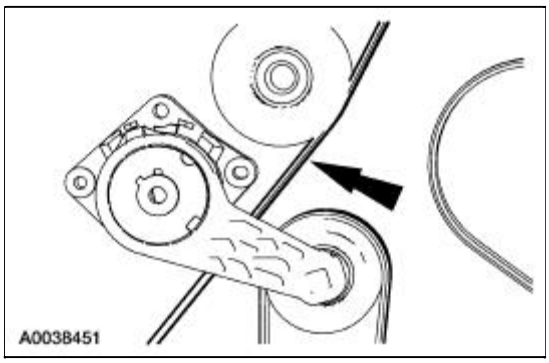
2. Rotate the drive belt tensioner and check for a binding or frozen condition. Install new components as required.

Drive Belt Misalignment

CAUTION: Incorrect drive belt installation will cause excessive drive belt wear and may cause the drive belt to come off the drive pulleys.

Non-standard replacement drive belts may track differently or incorrectly. If a replacement drive belt tracks incorrectly, replace it with an original equipment drive belt to avoid performance failure or loss of drive belt.

With the engine running, check drive belt tracking. If the (A) edge of the drive belt rides beyond the edge of the pulleys, noise and premature wear may occur. Make sure the (B) drive belt rides correctly on the pulley. If a drive belt tracking condition exists, proceed with the following:



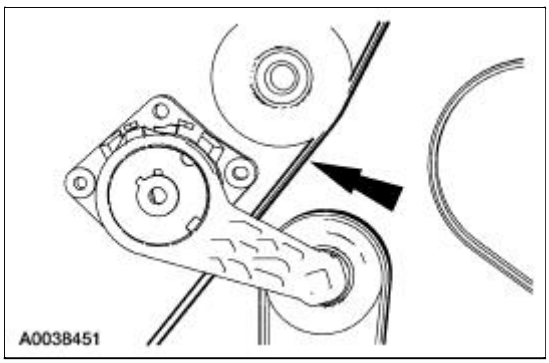
Visually check the drive belt tensioner for damage, especially the mounting pad surface. If the drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. This will result in chirp and squeal noises.

- With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Replace components as required.
- Check all accessories, mounting brackets and the drive belt tensioner for any interference that would prevent the component from mounting properly. Correct any interference condition and recheck the drive belt tracking.
- Tighten all accessories, mounting brackets, and drive belt tensioner retaining hardware to specification. Recheck the drive belt tracking.

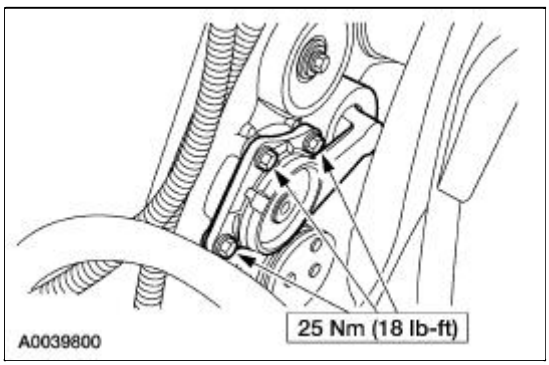
Accessory Drive Belt

Removal and Installation

1. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
2. Rotate the drive belt tensioner clockwise and remove the drive belt.



3. Refer to the Component Locations—4.6L, 5.4L(2V), 5.4L(4V) illustration for the drive belt routing.
4. To install, reverse the removal procedure.

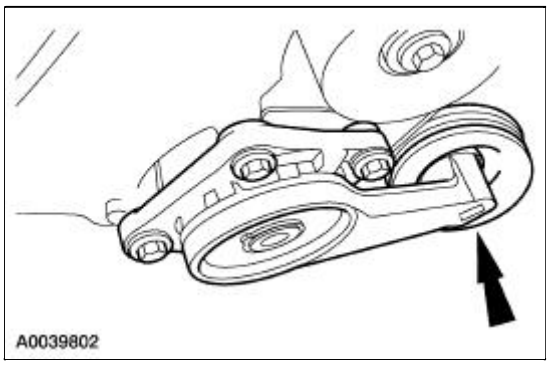


Accessory Drive Belt Tensioner

Removal and Installation

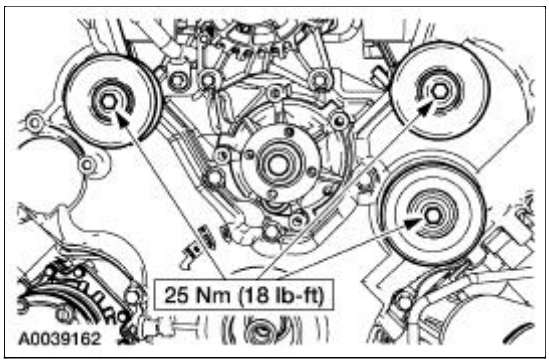
1. Rotate the drive belt tensioner clockwise and remove the drive belt.

2. Remove the bolts and the drive belt tensioner.



3. **NOTE:** Refer to the Component Locations—4.6L, 5.4L(2V), 5.4L(4V) illustration for the drive belt routing.

   To install, reverse the removal procedure.



Accessory Drive Belt Idler Pulley

Removal and Installation

1. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
2. Rotate the drive belt tensioner clockwise and remove the drive belt.

3. Remove the bolts and the belt idler pullies.

4. **NOTE:** Refer to the Component Locations—4.6L, 5.4L(2V), 5.4L(4V) illustration for the drive belt routing.

   To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in
Starter motor bolts	25	18	—
Starter motor stud bolt	25	18	—
Starter motor ground cable nut	20	15	—
Starter S terminal nut	8	—	71
Starter B+ terminal nut	13	10	—

Starting System

The starting system consists of the:

- starter motor.
- starter switch, part of the ignition switch.
- digital transmission range (TR) sensor (automatic transmission-equipped vehicles).
- starter motor solenoid relay switch.
- starter solenoid.
- starter drive.

The starter motor:

- is a permanent magnet, gear reduction, 12 V DC motor.
- has an integral starter solenoid.
- has an over-running clutch in the starter drive.
- is serviced as an assembly.

The starter motor solenoid relay switch:

- controls current to the starter solenoid.
- is engaged by the ignition switch.
- connects the battery to the starter motor.

The digital TR sensor on automatic transmission-equipped vehicles prevents starter motor engagement unless the transmission is in the NEUTRAL or PARK position.

The starter drive:

- is operated by the starter solenoid.
- engages the flywheel to turn the engine.
- has an internal over-running clutch to disengage the starter motor when the engine starts.

The starter solenoid:

- is an electromagnet.
- engages the starter drive to the flywheel.
- when energized, the contacts close, connecting the battery to the starter motor. This causes the starter motor to turn the starter drive.
- is kept in the energized condition by a hold-in winding until the starter switch is released.

When the ignition switch is turned to the START position, the starter motor solenoid relay switch is energized, connecting the battery to the starter solenoid. The starter solenoid moves the drive lever and pin to engage the starter drive with the flywheel ring gear and connects the battery to the starter

motor.

Starting System

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Special Tool(s)

 ST1137-A	73 Digital Multimeter 105-R0051 or equivalent
 ST2626-A	SABRE Premium Battery and Electrical System Tester 010-00736 or equivalent

Inspection and Verification

WARNING: When servicing starter motor or performing other underhood work in the vicinity of the starter motor, be aware that the heavy gauge battery input lead at the starter solenoid is "electrically hot" at all times. A protective cap or boot is provided over the terminal of this lead and must be installed after servicing.

WARNING: When working in area of the starter motor, be careful to avoid touching hot exhaust components.

NOTE: When working on the starter system, make sure the anti-theft system is deactivated, if equipped.

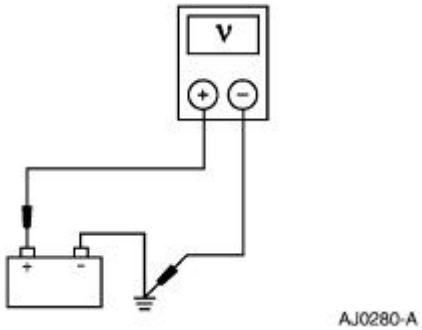
1. Verify the customer concern by operating the starting system.
2. Visually inspect for obvious signs of mechanical and electrical damage. Refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical
● Starter motor ● Brackets ● Anti-theft relay	● Battery ● Failed fuse 24 (10A) ● Damaged wiring harness ● Loose or corroded connections

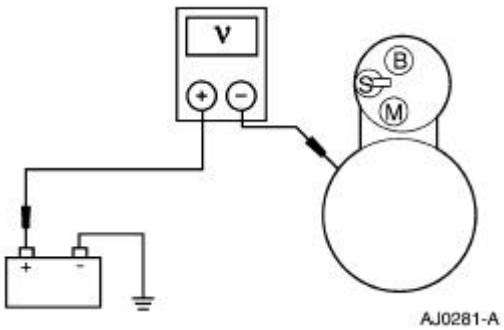
3. If the concern is not visually evident, verify the symptom. GO to Symptom Chart .

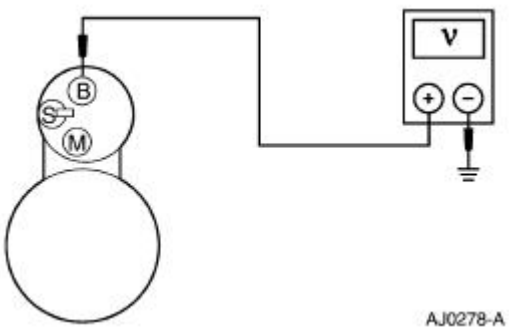
Symptom Chart



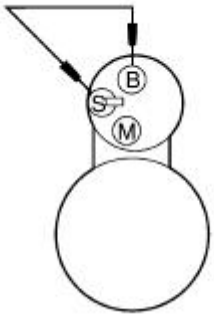
SYMPTOM CHART

Condition	Possible Sources	Action
• The engine does not crank or the relay clicks	• Battery. • Starter motor. • Starter motor relay. • Ignition switch. • Damaged fuse. • Anti-theft system. • Circuitry.	• Go To Pinpoint Test A .
• The engine cranks slowly	• Battery. • Starter motor. • Circuitry.	• CARRY OUT the Starter Motor—Voltage Drop Test Component Test.
• Unusual starter noise	• Starter mounting. • Flywheel/ring gear. • Starter motor.	• Go To Pinpoint Test B .
• The starter spins but the engine does not crank	• Starter motor. • Damaged flywheel/ring gear teeth.	• INSPECT the starter motor mounting and engagement. INSTALL a new starter motor. • INSPECT the flywheel/ring gear for damaged, missing or worn teeth. REPAIR as required.



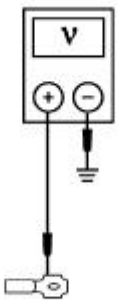


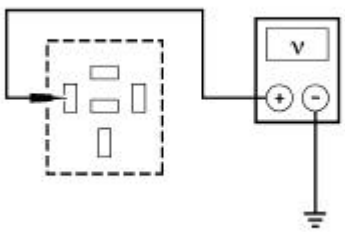
Pinpoint Tests



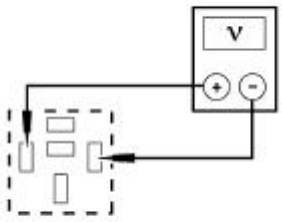
PINPOINT TEST A: THE ENGINE DOES NOT CRANK OR RELAY CLICKS

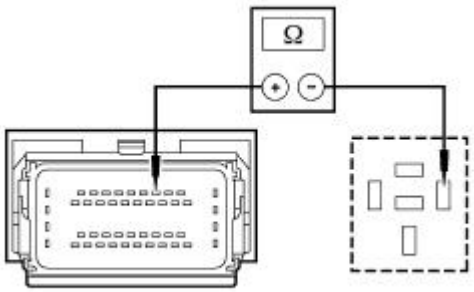
Test Step	Result / Action to Take
A1 CHECK THE BATTERY	
• Check the battery condition and charge. REFER to Section 414-00 . • **Is the battery OK?**	**Yes** GO to A2 . **No** CHARGE or INSTALL a new battery as required. TEST the system for normal operation.
A2 CHECK THE BATTERY GROUND CABLE	
• Measure the voltage between the positive battery post and the battery ground cable connection at the cylinder block.	**Yes** GO to A3 . **No** INSTALL a new the battery ground cable. TEST the system for normal operation.

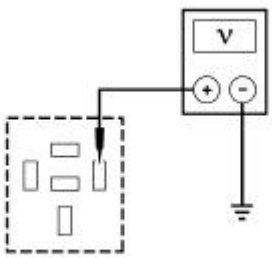




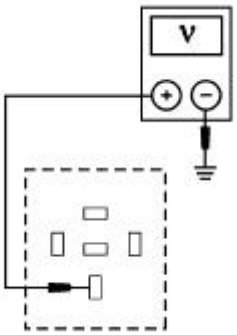
- **Is the voltage reading greater than 10 volts?**

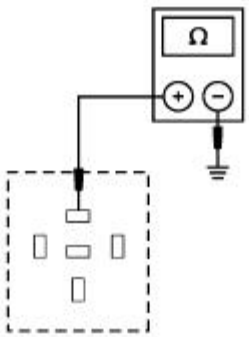


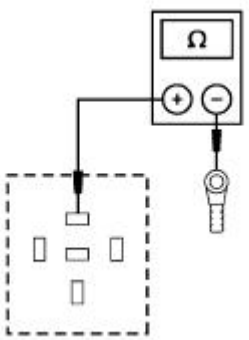


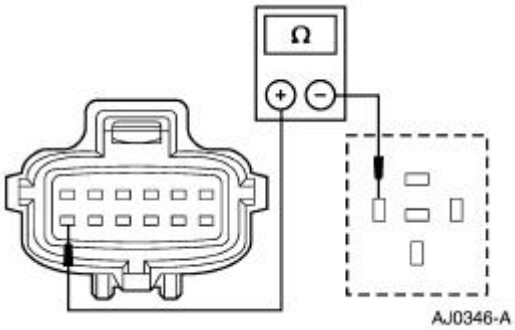


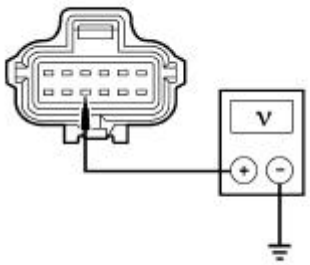
A3 CHECK THE STARTER MOTOR GROUND • Measure the voltage between the positive battery post and the starter motor case.  • **Is the voltage reading greater than 10 volts?**	**Yes** GO to A4 . **No** CLEAN the starter motor mounting flange and make sure the starter motor is correctly mounted. TEST the system for normal operation.
A4 CHECK THE POWER SUPPLY TO THE STARTER MOTOR • Key in OFF position. • Measure the voltage at the starter motor B terminal.  • **Is the voltage reading greater than 10 volts?**	**Yes** GO to A5 . **No** INSTALL a new the positive battery cable. TEST the system for normal operation.
A5 CHECK THE STARTER MOTOR • Connect one end of a jumper wire to the B terminal of the starter motor and momentarily connect the other end to the starter solenoid S-terminal.	**Yes** GO to A6 . **No** INSTALL a new starter motor. TEST the system for normal operation.

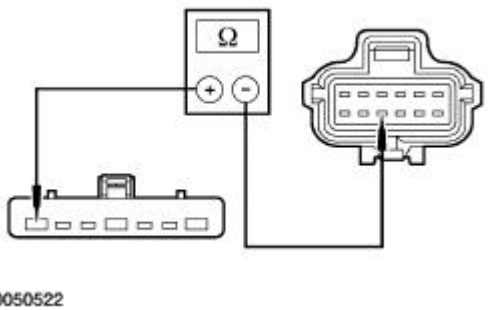




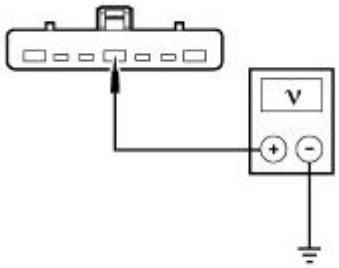








AJ0279-A



- **Does the starter motor engage and the engine crank?**

A6 CHECK START INPUT TO THE STARTER MOTOR	
• Disconnect: Starter S Connector. • Hold the ignition switch in the START position. • Measure the voltage at the starter motor solenoid S connector.  AJ0285-A • **Is the voltage reading greater than 10 volts?**	**Yes** CLEAN the starter solenoid S terminal and connector. CHECK the wiring and the starter motor for a loose or intermittent connection. TEST the system for normal operation. **No** GO to A7 .
A7 CHECK THE IGNITION SWITCH VOLTAGE TO THE STARTER RELAY	
• Key in OFF position. • Disconnect: Starter Relay. • Key in ACCESSORY position. • Place the transmission range selector in PARK or NEUTRAL. • Hold the ignition switch in the START position. • Measure the voltage at the starter relay connector pin 86, circuit 1093 (TN/RD).  A0052285 • **Is the voltage reading greater than 10 volts?**	**Yes** GO to A8 . **No** GO to A14 .
A8 CHECK THE PCM MODULE	
• Hold the ignition switch in the START position. • Measure the voltage between the starter relay socket, pin 86, circuit 1093 (TN/RD) and the starter relay socket, pin 85, circuit 325 (DB/OG).	**Yes** GO to A11 . **No**

 A0052286 ● **Is the voltage reading greater than 10 volts?**	GO to A9 .
A9 CHECK CIRCUIT 325 (DB/OG) FOR A SHORT TO GROUND ● Key in OFF position. ● Disconnect: PCM C1756. ● Measure the resistance between the PCM connector C1756 pin 4, circuit 325 (DB/OG) and the starter relay socket pin 85, circuit 325 (DB/OG).  A0052287 ● **Is the resistance less than 5 ohms?**	**Yes** GO to A10 . **No** REPAIR circuit 325 (DB/OG). TEST the system for normal operation.
A10 CHECK CIRCUIT 325 (DB/OG) FOR A SHORT TO VOLTAGE ● Disconnect: PCM C1756. ● Key in ON position. ● Measure the voltage between the starter motor relay socket pin 85, circuit 325 (DB/OG) and ground.  A0052288 ● **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit 325 (DB/OG). TEST the system for normal operation. **No** REFER to Section 419-01 to diagnose a passive anti-theft system (PATS) concern.
A11 CHECK THE BATTERY SUPPLY TO THE STARTER RELAY ● Key in OFF position. ● Measure the voltage at the starter relay connector pin 30.	**Yes** GO to A12 . **No** REPAIR the open circuit. TEST the system for normal operation.

 AJ0295-A ● **Is the voltage reading greater than 10 volts?**	
A12 CHECK CIRCUIT 113 (YE/LB) FOR A SHORT TO GROUND	**Yes** GO to A13 . **No** REPAIR circuit 113 (YE/LB). TEST the system for normal operation.
● Key in OFF position. ● Measure the resistance between the starter relay connector pin 87, circuit 113 (YE/LB) and ground.  AJ0297-A ● **Is the resistance greater than 10,000 ohms?**	
A13 CHECK CIRCUIT 113 (YE/LB) FOR AN OPEN	**Yes** INSTALL a new starter relay. TEST the system for normal operation. **No** REPAIR circuit 113 (YE/LB). TEST the system for normal operation.
● Measure the resistance of circuit 113 (YE/LB) between the starter relay connector pin 87 and the starter S connector.  AJ0298-A ● **Is the resistance less than 5 ohms?**	
A14 CHECK CIRCUIT 1093 (TN/RD) FOR AN OPEN	**Yes** GO to A15 . **No** REPAIR circuit 1093 (TN/RD) TEST the system for normal operation.
● Disconnect: Digital transmission range sensor C167. ● Measure the resistance of circuit 1093 (TN/RD) between the starter relay connector pin 86 and the digital transmission range sensor C167 pin 12.	

 ● **Is the resistance reading less than 5 ohms?**	
A15 CHECK VOLTAGE TO THE DIGITAL TRANSMISSION RANGE SENSOR	
● Key in ON position. ● Measure the voltage between the digital transmission range sensor C167 pin 10, circuit 33 (WH/PK) and ground.  ● **Is the voltage reading greater than 10 volts?**	**Yes** CHECK the digital transmission range sensor adjustment. REFER to Section 307-01A . If the digital transmission range sensor is adjusted correctly, INSTALL a new digital transmission range sensor. TEST the system for normal operation. **No** GO to A16 .
A16 CHECK CIRCUIT 33 (WH/PK) AND CIRCUIT 32 (RD/LB) FOR AN OPEN	
● Key in OFF position. ● Disconnect: Ignition switch C250. ● Measure the resistance between the digital transmission range sensor C167 pin 10, circuit 33 (WH/PK) and the ignition switch C250 pin 7, circuit 32 (RD/LB).  ● **Is the resistance less than 5 ohms?**	**Yes** GO to A17 . **No** REPAIR circuit 33 (WH/PK) or circuit 32 (RD/LB). TEST the system for normal operation.
A17 CHECK THE VOLTAGE AT THE IGNITION SWITCH	
● Key in ON position. ● Measure the voltage between the ignition switch C250, circuit 1050 (LG/VT) and ground.	**Yes** INSTALL a new ignition switch. TEST the system for normal operation. **No**

 A0050523 ● **Is the voltage greater than 10 volts?**	REPAIR circuit 1050 (LG/VT). TEST the system for normal operation.

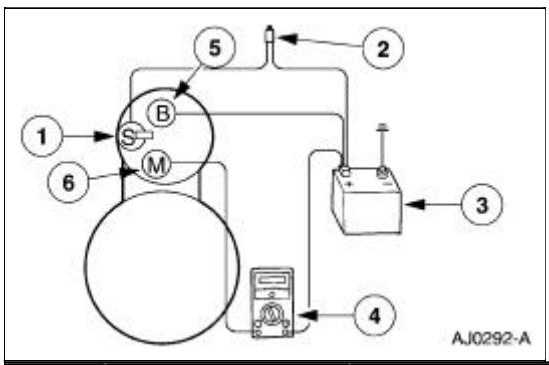
PINPOINT TEST B: UNUSUAL STARTER NOISE

Test Step	Result / Action to Take
B1 CHECK STARTER MOUNTING ● Inspect the starter mounting bolts and brackets for looseness, and the starter housing for a flush, tight fit to rear cover plate. ● **Is the starter motor mounted correctly?**	**Yes** GO to B2 . **No** INSTALL the starter motor correctly, REFER to Starter Motor in this section. TEST the system for normal operation.
B2 CHECK FOR ENGINE NOISE ● Key in OFF position. ● Connect a remote starter switch between the starter solenoid B and S terminals.  AJ0286-A ● Engage the starter motor and verify the noise is due to the starter operation. ● **Is the noise due to the starter motor engagement?**	**Yes** GO to B3 . **No** REFER to Section 303-00 to continue the diagnosis.
B3 CHECK FOR UNUSUAL WEAR ● Remove the starter motor. Refer to Starter Motor in this section. ● Inspect the ring gear for damaged or worn teeth. ● **Is the noise due to ring gear tooth damage?**	**Yes** INSTALL a new ring gear. EXAMINE the starter pinion teeth. If damaged, INSTALL a new starter motor. TEST the system for normal operation. **No** INSTALL a new starter motor. TEST the system for normal operation.

Component Tests

Starter Motor—Voltage Drop Test

WARNING: When servicing the starter motor or performing other underhood work in the vicinity of the starter motor, be aware that the heavy gauge battery input lead at the starter solenoid is "electrically hot" at all times.



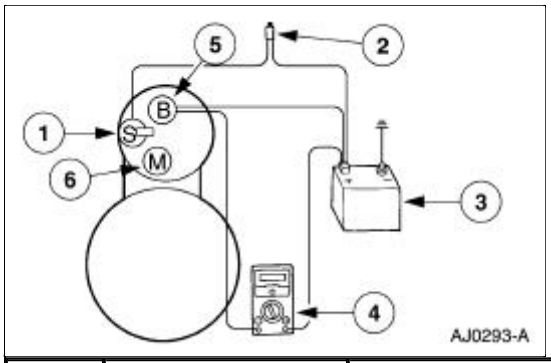
CAUTION: A protective cap or boot is provided over the battery input terminal on all vehicle lines and must be installed after servicing. Be sure to disconnect the battery ground cable before servicing the starter motor.

Always make the Rotunda 73 Digital Multimeter connections at the component terminal rather than at the wiring end connector. Making a connection at the wiring end connector could result in false readings because the meter will not pick up a high resistance between the wiring connector and the component.

Starter Motor—Motor Feed Circuit

1. Make sure the battery is fully charged. Refer to Section 414-00 .
2. Disconnect the inertia fuel shutoff (IFS) switch.
3. Connect a remote starter switch between the starter solenoid S-terminal and the battery positive (+) terminal.
4. Connect the Rotunda 73 Digital Multimeter positive lead to the battery positive (+) post. Connect negative lead to the starter solenoid M-terminal.

Motor Feed Circuit



Item	Part Number	Description
1	—	S-terminal (part of 11002)
2	—	Remote starter switch
3	10653	Battery
4	—	Rotunda 73 digital multimeter
5	—	B-terminal (part of 11002)
6	—	M-terminal (part of 11002)

5. Engage the remote starter switch. Read and record the voltage. The voltage reading should be 0.5 volt or less.

6. If the voltage reading is 0.5 volt or less, go to the Starter Motor—Motor Ground Circuit Component Test.

7. If the voltage reading is greater than 0.5 volt, indicating excessive resistance, move the Rotunda 73 Digital Multimeter negative lead to the starter solenoid B-terminal and repeat the test. If the voltage reading at the B-terminal is lower than 0.5 volt, the concern is either in the connections at the starter solenoid or in the solenoid contacts.

Motor Feed Circuit

Item	Part Number	Description
1	—	S-terminal (part of 11002)
2	—	Remote starter switch
3	10653	Battery
4	—	Rotunda 73 digital multimeter
5	—	B-terminal (part of 11002)
6	—	M-terminal (part of 11002)

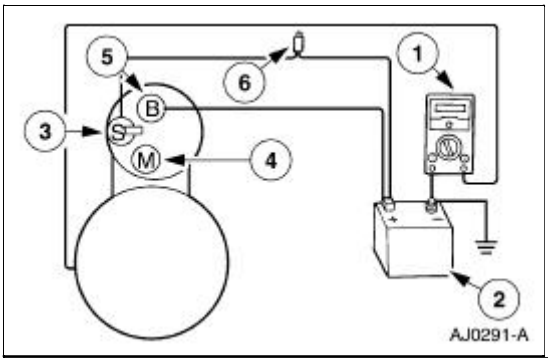
8. Remove the cables from solenoid B-, S- and M-terminals. Clean the cables and connections and reinstall the cables to the correct terminals. Repeat Steps 3 through 6. If the voltage drop reading is still greater than 0.5 volt when checked at the M-terminal or less than 0.5 volt when checked at the B-terminal, the concern is in the solenoid contacts. Install a new starter motor.

9. If the voltage reading taken at the solenoid B-terminal is still greater than 0.5 volt after cleaning the cables and connections at the solenoid, the concern is either in the positive (+) battery cable connection or in the positive battery cable itself.

10. By moving the Rotunda 73 Digital Multimeter negative lead toward the battery and checking each mechanical connection point, the excessive voltage drop can be located. When the high reading disappears, the last mechanical point that was checked is the concern. Repair or install a new connection as required.

Starter Motor—Motor Ground Circuit

A slow cranking condition can be caused by resistance in the ground or return portion of the cranking circuit. Check the voltage drop in the ground circuit as follows:



1. Disconnect the inertia fuel shutoff switch.

2. Connect a remote starter switch between the starter solenoid S-terminal and the battery positive

(+) terminal.

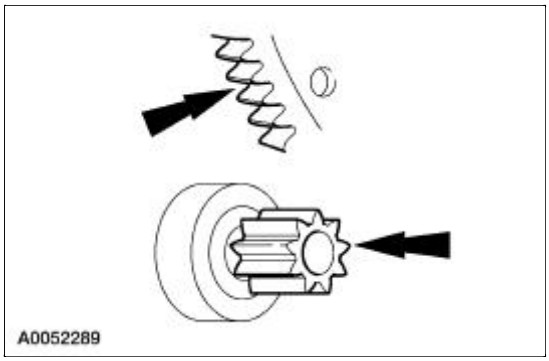
3. Connect the Rotunda 73 Digital Multimeter positive lead to the starter motor housing (the connection must be clean and free of rust or grease). Connect the negative lead to the negative (-) battery terminal.

Motor Ground Circuit

Item	Part Number	Description
1	—	Rotunda 73 digital multimeter
2	10653	Battery
3	—	S-terminal (part of 11002)
4	—	M-terminal (part of 11002)
5	—	B-terminal (part of 11002)
6	—	Remote starter switch

4. Engage the remote starter switch and crank the engine. Read and record the voltage reading. The reading should be 0.2 volt or less.

5. If the voltage drop is more than 0.2 volt, clean the negative cable connections at the battery and body connections, and retest.



6. If the voltage drop is greater than 0.2 volt, determine which way the current is flowing in the cable. Connect the Rotunda 73 Digital Multimeter positive lead to the end of the cable nearest battery positive.

7. Connect the multimeter negative lead to the terminal at the other end of the cable.

8. Crank the engine and observe the voltage reading. The voltage reading should be 0.2 volt or lower. If the voltage drop is too high, clean the terminal ends. Retest, and if still high, install a new cable. If the voltage reading is less than 0.2 volt and the engine still cranks slowly, install a new starter motor.

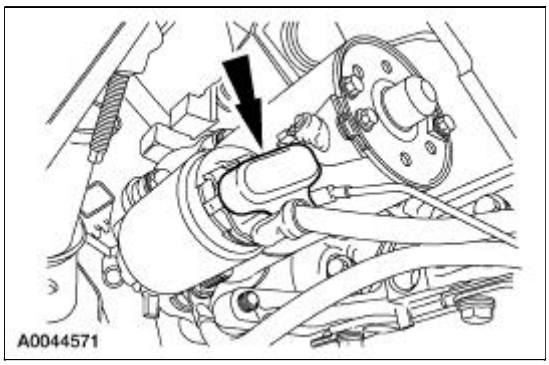
Starter Drive and Flywheel Ring Gear Inspection

1. Check the wear patterns on the starter drive and the flywheel ring gear. If the wear pattern is normal, install the starter motor. For additional information, refer to Starter Motor in this section.

2. If the starter drive gear and the flywheel ring gear are not fully meshing or the gears are milled or damaged, install a new starter motor. For additional information, refer to Starter Motor in this section. Install a new flywheel ring gear. For additional information, refer to Section 303-01A or Section 303-01B .

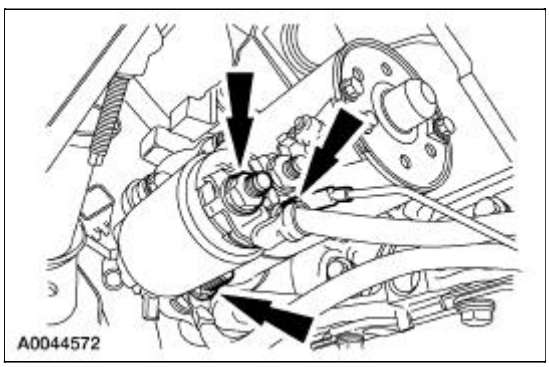
Starter Motor

Removal



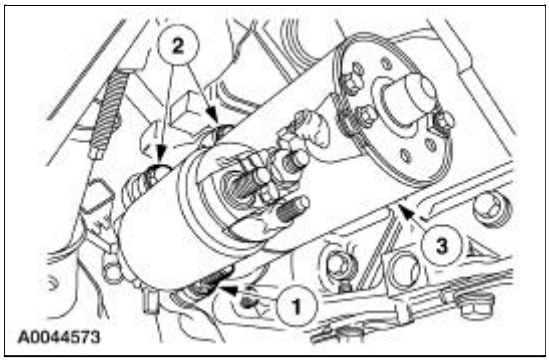
WARNING: When carrying out maintenance on the starting system be aware that heavy gauge leads are connected directly to the battery. Make sure protective caps are in place when maintenance is complete. Failure to follow these instructions may result in personal injury.

1. Disconnect the battery ground cable.



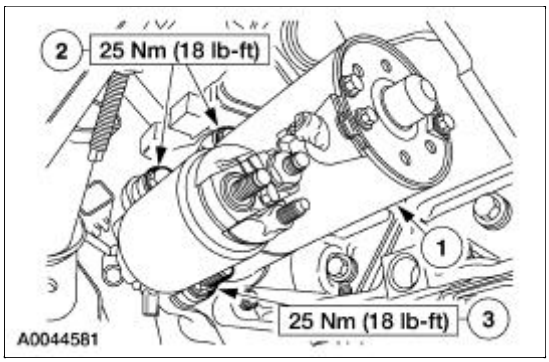
2. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so may result in unexpected inflation or deflation of the air springs which may result in shifting of the vehicle during these operations.**

   Raise and support the vehicle; refer to Section 100-02 .

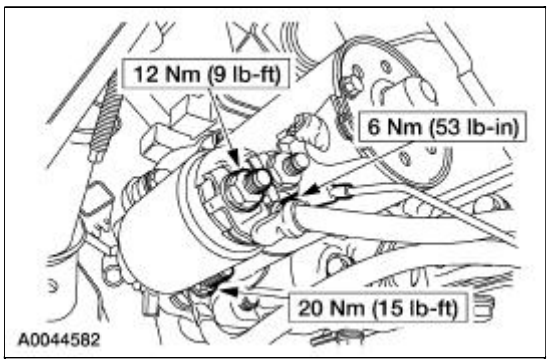


3. Remove the starter motor solenoid terminal cover.

4. Disconnect the starter motor electrical connections.

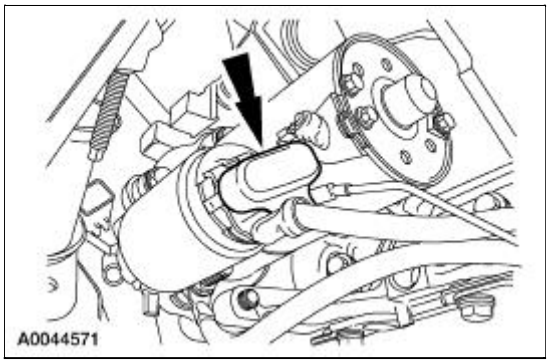


5. Remove the starter motor.
   1. Remove the stud bolts.
   2. Remove the two bolts.
   3. Remove the starter.



Installation

WARNING: When carrying out maintenance on the starting system be aware that heavy gauge leads are connected directly to the battery. Make sure protective caps are in place when maintenance is complete. Failure to follow these instructions may result in personal injury.



1. Install the starter motor.
    1. Position the starter.
    2. Install the two bolts.
    3. Install the stud bolt.

2. Connect the starter motor electrical connections.

3. Install the starter motor solenoid terminal cover.

4. Lower the vehicle.

5. **NOTE:** If equipped with air suspension, reactivate the system by turning on the air suspension switch.

   Connect the battery ground cable.

General Specifications

Item	Specification
Base ignition timing	Not adjustable
Firing order	1-3-7-2-6-5-4-8
Spark plug gap (4.6L and 5.4L)	1.32-1.42 mm (0.052-0.056 inch)
Spark plug type (4.6L)	AWSF-32P
Spark plug type (5.4L)	AWSF-22W

Torque Specifications

Description	Nm	lb-ft	lb-in
Ignition coil bolt	7	—	62
Spark plugs	11	—	89

Engine Ignition

The electronic ignition (EI) system is a coil-on-plug (COP) ignition system. The COP ignition system consists of the following components:

- crankshaft position (CKP) sensor
- ignition coils
- spark plugs

The CKP sensor:

- is a variable reluctance sensor.
- is triggered by a 36-minus-1 tooth trigger wheel mounted on the crankshaft.
- provides base timing and crankshaft speed (rpm) to the powertrain control module (PCM). For additional information, refer to Section 303-14 .

The eight separate ignition coils:

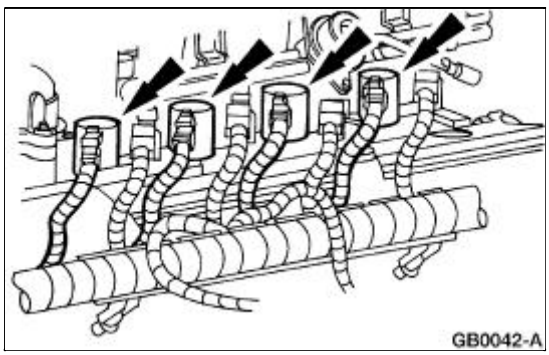
- change low voltage signals from the PCM to high voltage pulses.
- produce the high voltage pulses to the spark plugs.
- are connected directly to each spark plug.

The spark plugs:

- change a high voltage pulse into a spark which ignites the fuel and air mixture.
- originally equipped on the vehicle have a platinum-enhanced electrode for long life.

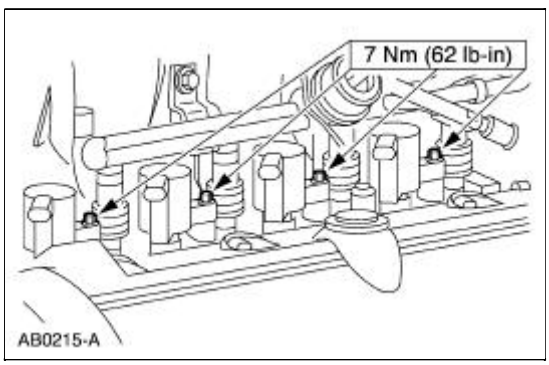
Engine Ignition

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.



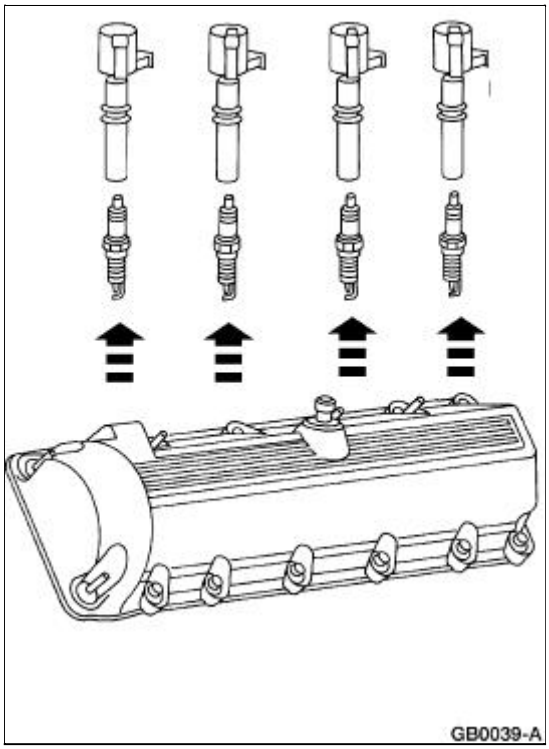
Ignition Coil

Material



Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound D9AZ-19A331-A	ESE-M1C171-A

Removal and Installation



1. Disconnect the coil on plug (COP) electrical connectors.

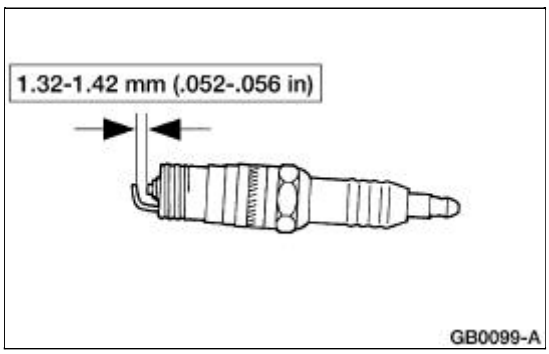
2. Remove the bolts.

3. Remove the coil on plugs.

4. **NOTE:** Apply silicone brake caliper grease and dielectric compound to the inside of the coil boots.

   To install, reverse the removal procedure.

Spark Plug



Removal and Installation

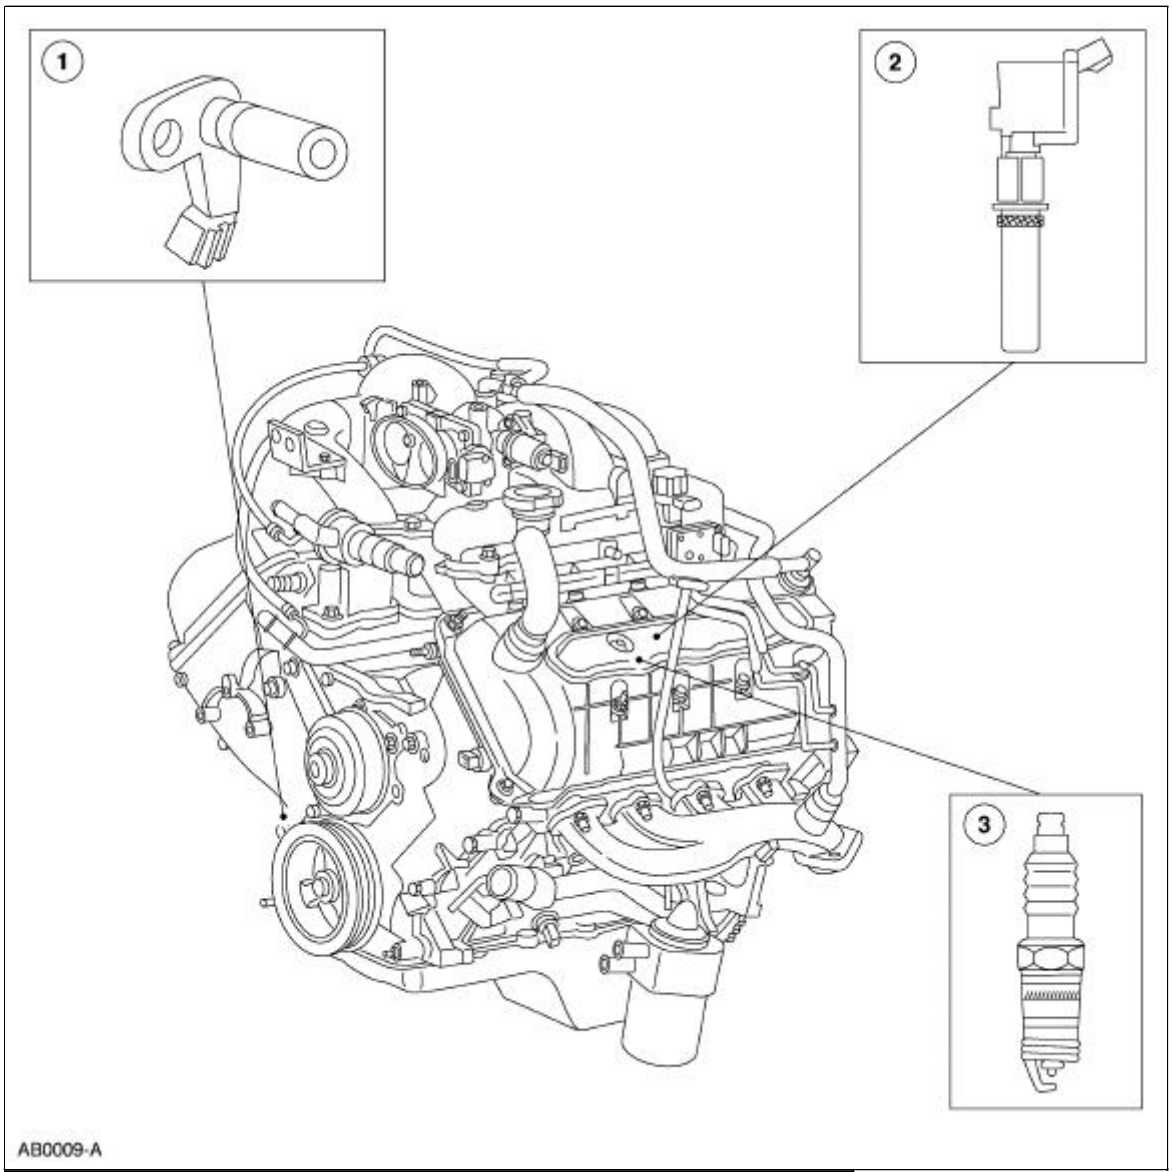
1. Remove the coil on plugs. For additional information, refer to Ignition Coil in this section.
2. **NOTE:** Remove any foreign material from the spark plug wells with compressed air before removing the spark plugs.

   Remove the spark plugs.

3. Inspect the spark plugs. For additional information, refer to Section 303-00 .
4. Adjust the spark plug gap as necessary.

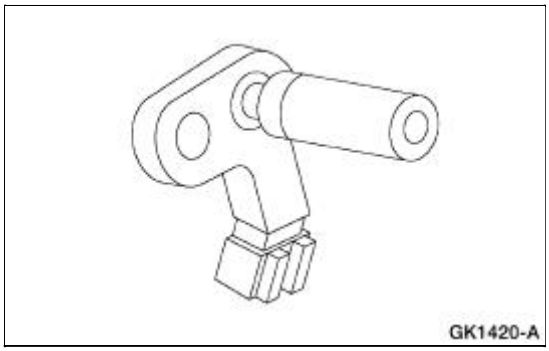
5. To install, reverse the removal procedure.

General Specifications



Item	Specification
Base ignition timing	10 degrees BTDC
Firing order	1-3-7-2-6-5-4-8
Spark plug gap	1.32-1.42 mm (0.052-0.056 inch)
Spark plug type—original	AWSF32P
Spark plug type—replacement	AWSF32P

Torque Specifications



Description	Nm	lb-ft	lb-in

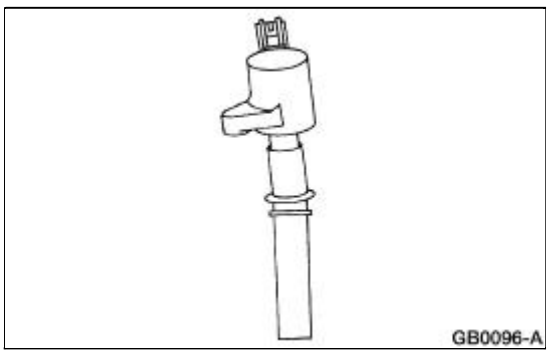
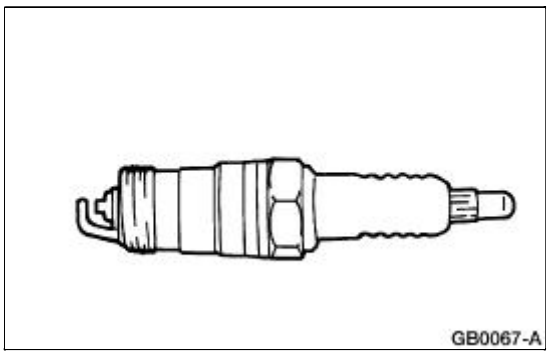
Ignition coil cover bolts	12	9	—

Engine Ignition

Component Locations



Item	Part Number	Description
1	6C315	Crankshaft position sensor (CKP)
2	12029	Ignition coil
3	12405	Spark plug



The crankshaft position sensor:

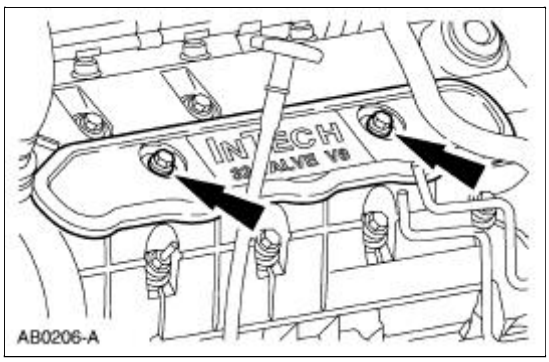
- is a variable reluctance sensor.
- is triggered by a 36-minus-1 tooth trigger wheel mounted on the crankshaft (6303).
- provides base timing and crankshaft speed (RPM) to the powertrain control module (PCM) (12A650). Refer to Section 303-14 for removal and installation of the crankshaft position sensor.

The eight separate ignition coils:

- change low voltage signals from the powertrain control module to high voltage pulses.
- produce the high voltage pulses to the spark plugs.
- are connected directly to each spark plug.

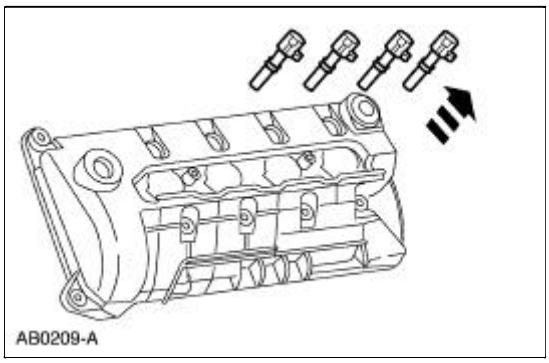
The spark plugs:

- change a high voltage pulse into a spark which ignites the fuel and air mixture.
- originally equipped on the vehicle have a platinum-enhanced electrode for long life.



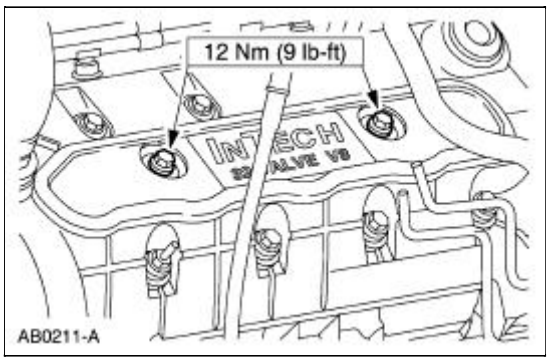
Engine Ignition

Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual.



Ignition Coil

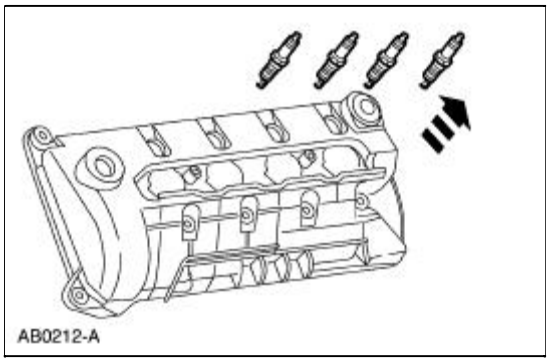
Removal and Installation



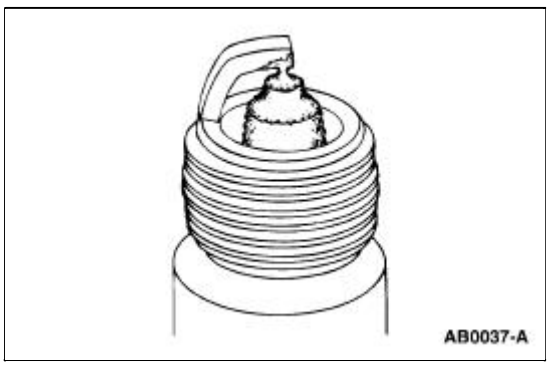
1. Remove the bolts and the ignition coil cover.

2. Disconnect the electrical connector from the ignition coil (12029).
3. Remove the ignition coils (12029).

4. To install, reverse the removal procedure.



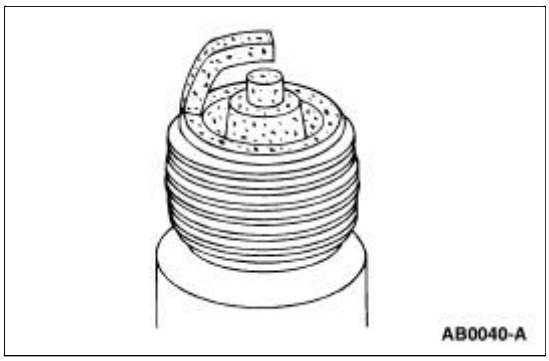
Spark Plug



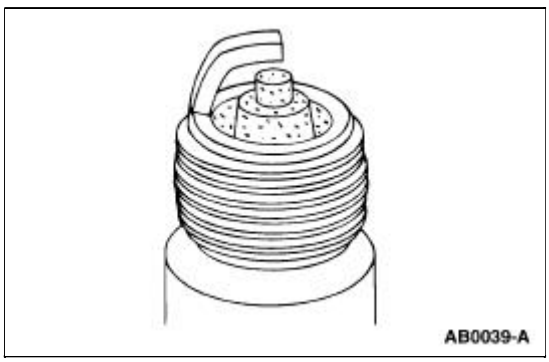
Removal

1. Remove the ignition coil (12029). For additional information, refer to Ignition Coil in this section.
2. **NOTE:** Remove any foreign material from the spark plug wells with compressed air before removing the spark plugs (12405).

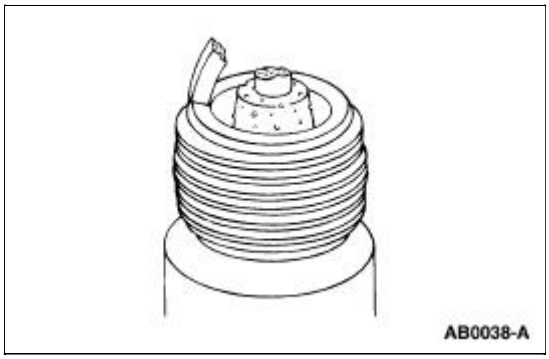
   Remove the spark plugs.



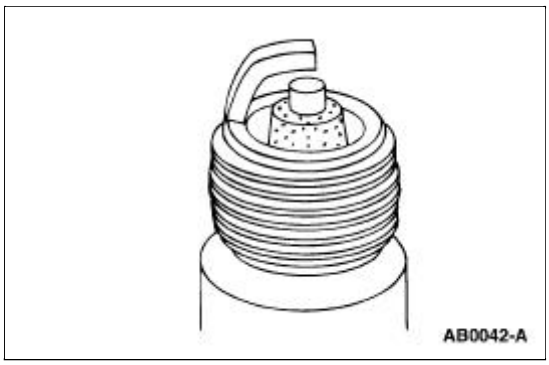
3. Inspect the spark plugs for a bridged gap.
   - Check for deposit build-up closing the gap between the electrodes. Deposits are caused by oil or carbon fouling.
   - Clean the spark plug.



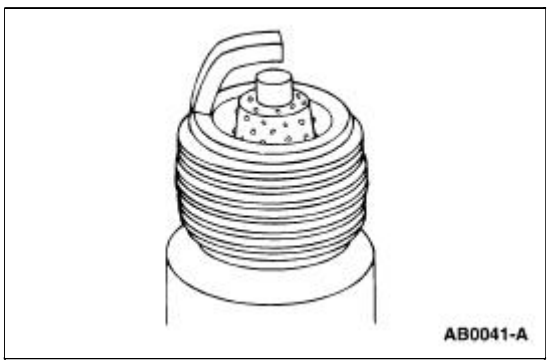
4. Check for oil fouling.
   - Check for wet, black deposits on the insulator shell bore electrodes, caused by excessive oil entering the combustion chamber through worn rings and pistons, excessive valve-to-guide clearance or worn or loose bearings.
   - Correct the oil leak concern.
   - Install a new spark plug.



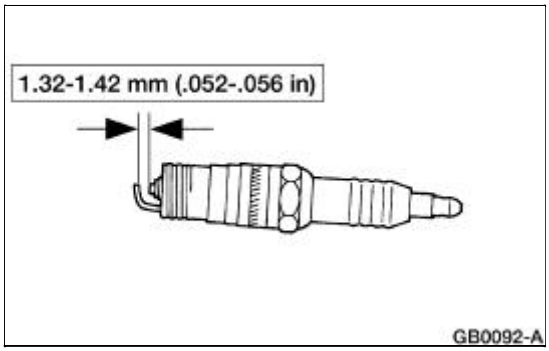
5. Inspect for carbon fouling. Look for black, dry, fluffy carbon deposits on insulator tips, exposed shell surfaces and electrodes, caused by a spark plug with an incorrect heat range, dirty air cleaner, too a rich fuel mixture or excessive idling.
    - Clean the spark plug.



6. Inspect for normal burning.
    - Check for light tan or gray deposits on the firing tip.

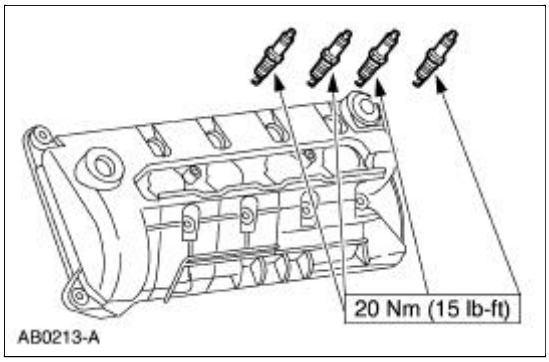


7. Inspect for pre-ignition, identified by melted electrodes and a possibly damaged insulator. Metallic deposits on the insulator indicate engine damage. This may be caused by incorrect ignition timing, wrong type of fuel or the installation of a heli-coil insert in place of the spark plug threads.
    - Install a new spark plug.



8. Inspect for overheating, identified by a white or light gray-brown spots and with bluish-burnt appearance of electrodes. This is caused by engine overheating, wrong type of fuel, loose spark plugs, spark plugs with an incorrect heat range, low fuel pump pressure or incorrect ignition timing.
    - Install a new spark plug.

9. Inspect for fused deposits, identified by melted or spotty deposits resembling bubbles or blisters. These are caused by sudden acceleration.
    - Clean the spark plug.



10. Adjust the spark plug gap as required.

Installation

1. To install, reverse the removal procedure.

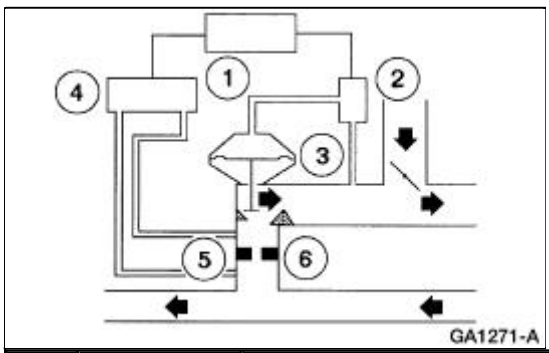
Engine Emission Control



CAUTION: Do not remove any part of the engine emission control system. Operating the engine without the engine emission control system will reduce fuel economy and engine ventilation. This will weaken engine performance and shorten engine life.

The engine emission control consists of the:

- positive crankcase ventilation (PCV) system.
- exhaust gas recirculation (EGR) system.

The PCV system uses intake manifold vacuum to ventilate the crankcase and return the fumes to the intake manifold (9424) for combustion.

EGR System Components

Item	Part Number	Description
1	12A650	Powertrain control module (PCM)
2	9J459	Exhaust gas recirculation (EGR) vacuum regulator solenoid
3	9D475	EGR valve
4	9J433	Differential pressure feedback EGR sensor
5	—	Metering orifice
6	9D477	EGR valve tube

The exhaust gas recirculation (EGR) system returns a portion of the exhaust gas to the intake manifold to reduce the combustion temperature. This results in lower nitrous oxide formation.

The powertrain control module (PCM) controls the EGR vacuum regulator solenoid. The EGR vacuum regulator solenoid controls the vacuum to the EGR valve. When the EGR valve opens, exhaust gas flows to the intake manifold. The EGR transducer measures the flow through the EGR valve to exhaust manifold tube and sends a signal to the powertrain control module. A metering orifice in the EGR valve to exhaust manifold tube restricts the flow rate when the EGR valve is open.

The PCV valve:

- controls the amount of ventilating air and blow-by gases going to the intake manifold.

- prevents a backfire from reaching the crankcase.

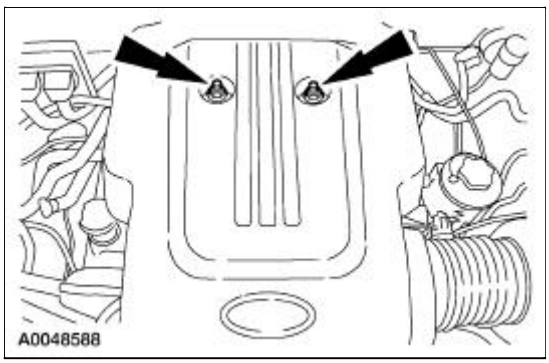
The EGR valve tube:

- connects the exhaust manifold (9430) to the EGR valve.
- has two tubes connecting to the differential pressure feedback EGR sensor for EGR flow monitoring.

The differential pressure feedback EGR sensor:

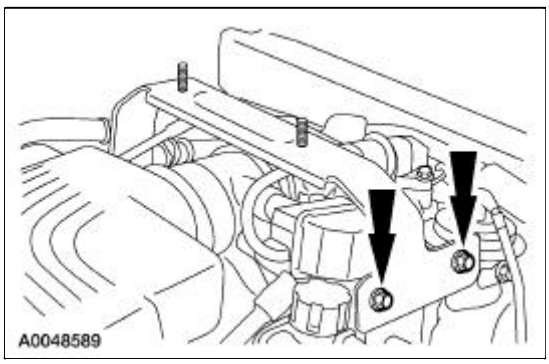
- monitors the EGR flow rate through the EGR valve tube.
- sends an EGR flow rate signal to the powertrain control module (PCM).

The EGR vacuum regulator solenoid uses input from the PCM to control the EGR valve flow.



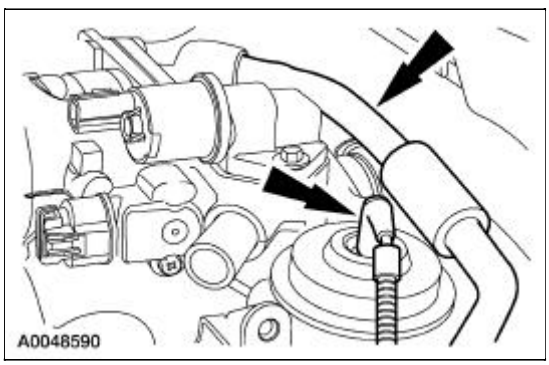
Engine Emission Control

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

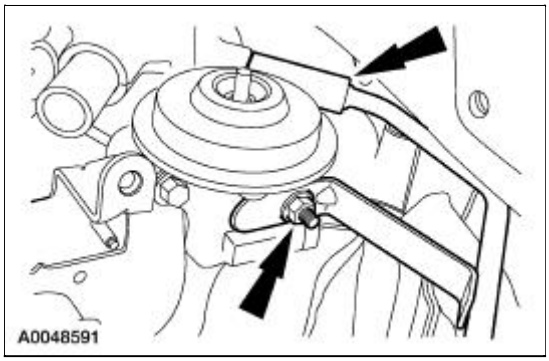


Exhaust Gas Recirculation (EGR) Valve —4.6L

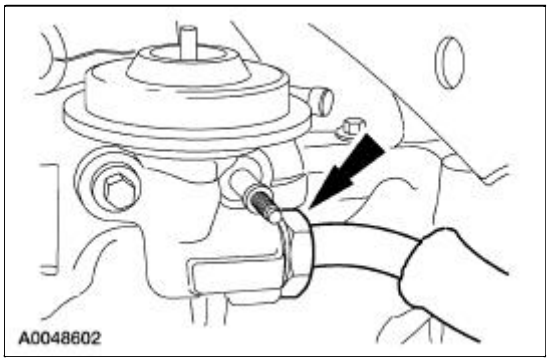
Removal



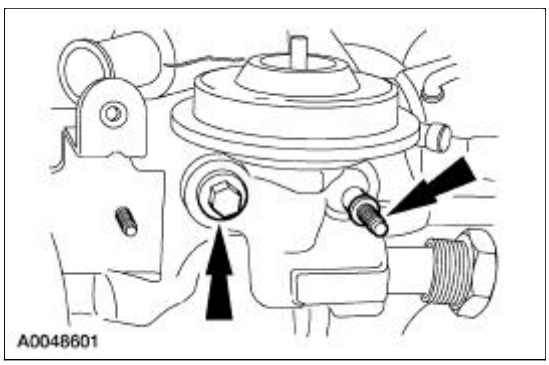
1. Remove the appearance cover.



2. Remove the appearance cover bracket.



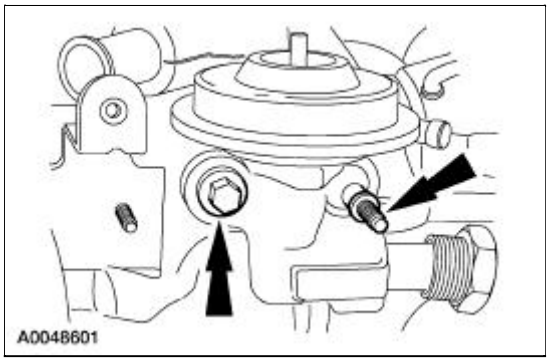
3. Disconnect the following:
   - Exhaust gas recirculation (EGR) valve vacuum hose.
   - Evaporative emissions (EVAP) canister purge solenoid vapor hose.



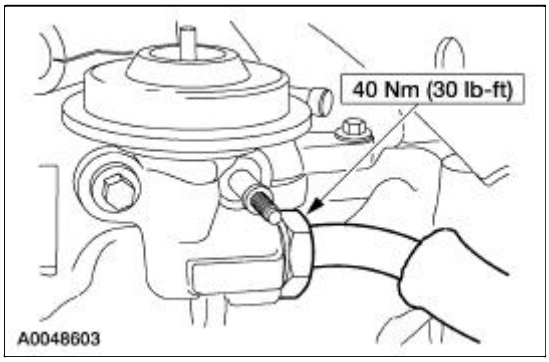
4. Remove the brake booster bracket and tube.

5. Disconnect the EGR valve tube upper fitting.

6. Remove the EGR valve. Discard the gasket.

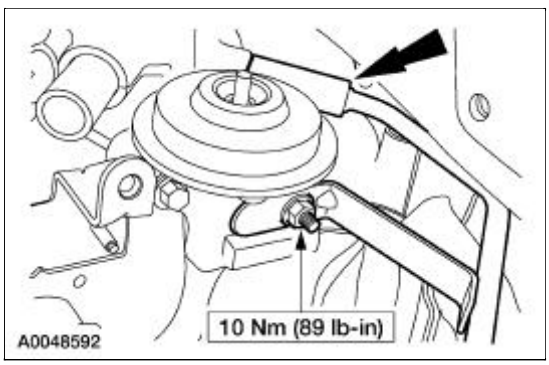


Installation

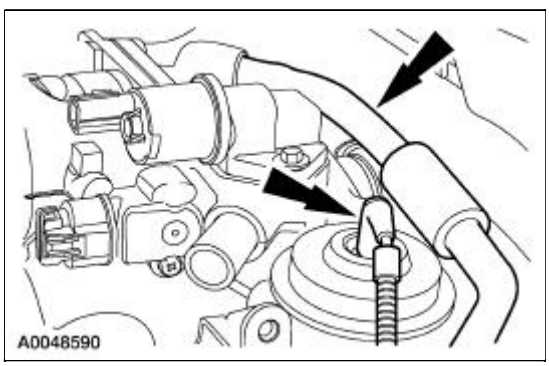


1. **NOTE:** The EGR valve sealing surfaces are soft metals.

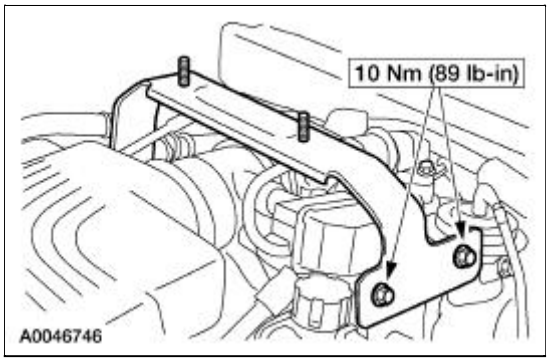
   Carefully clean both sealing surfaces.
   - Install a new gasket.



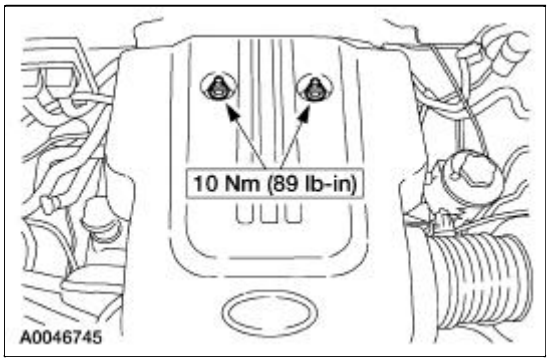
2. Install the EGR valve.
   Tighten the bolts in two stages:
   - Stage 1: Tighten to 20 Nm (15 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.



3. Connect the EGR valve tube upper fitting.

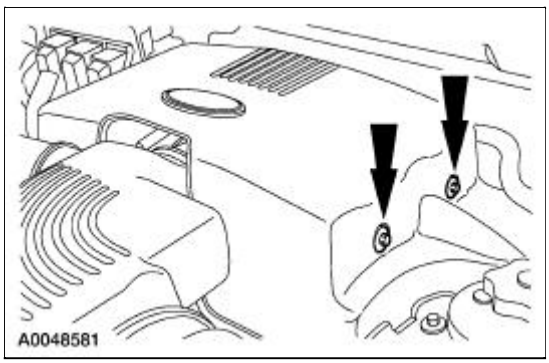


4. Install the brake booster bracket and tube.

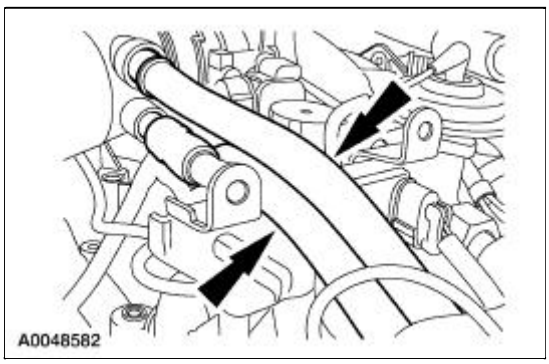


5. Connect the following:
    - EGR valve vacuum hose.
    - EVAP canister purge solenoid vapor hose.

6. Install the appearance cover bracket.

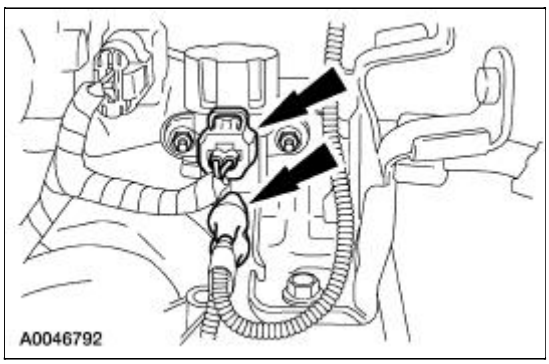


7. Install the appearance cover.

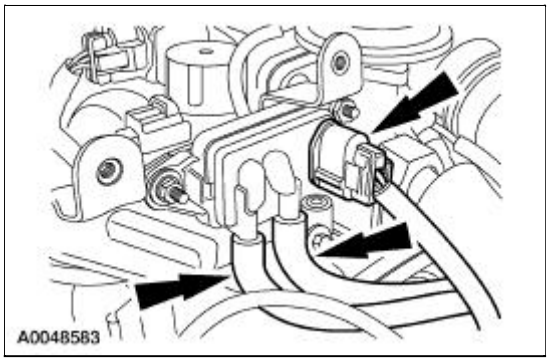


Exhaust Gas Recirculation (EGR) Valve —5.4L (2V)

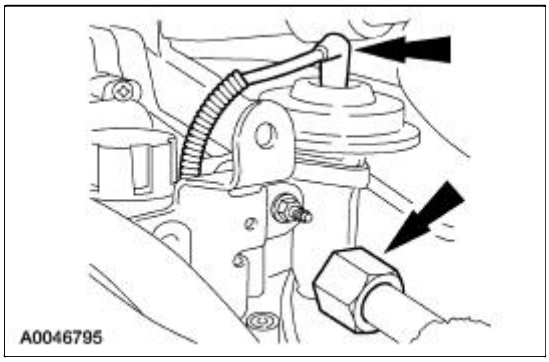
Removal



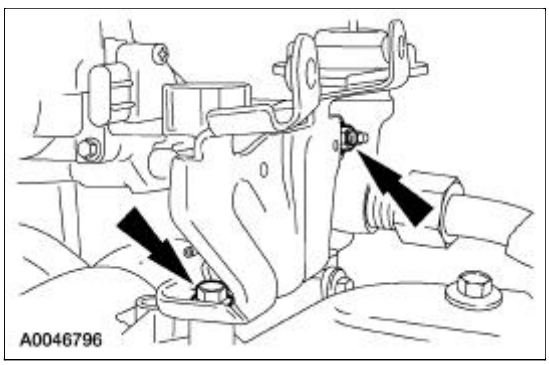
1. Remove the appearance cover.



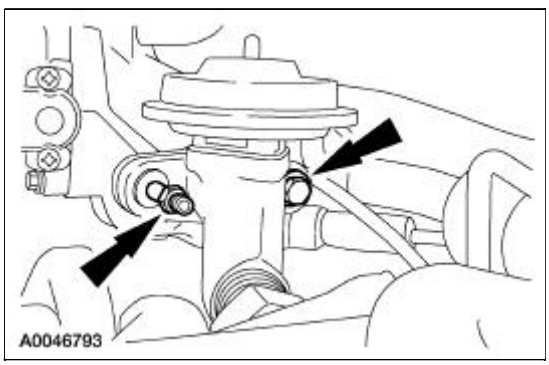
2. Remove the clean air tubes.



3. Disconnect the exhaust gas recirculation (EGR) vacuum regulator solenoid vacuum and electrical connections.



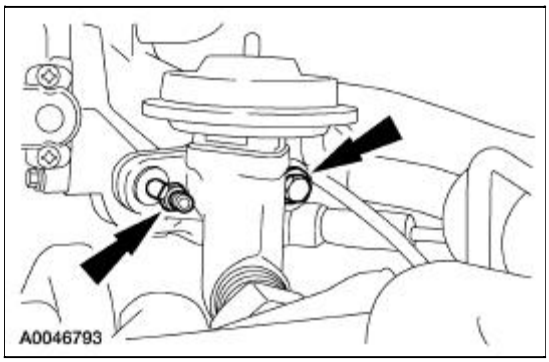
4. Disconnect the differential pressure feedback EGR system vacuum and electrical connections.



5. Disconnect the EGR valve vacuum hose and the EGR tube upper fitting.

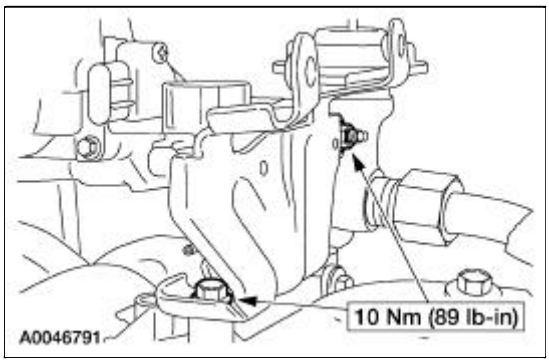
6. Remove the EGR vacuum regulator solenoid bracket.

7. Remove the bolts and the EGR valve.
    - Discard the gasket.



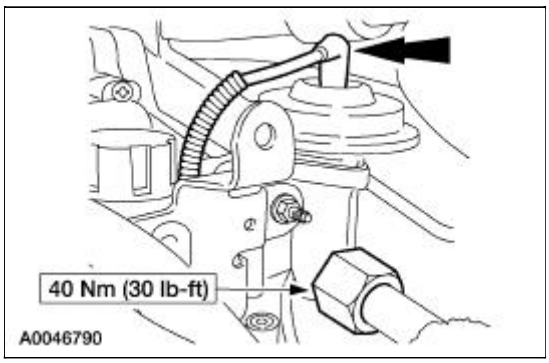
Installation

1. **NOTE:** The exhaust gas recirculation (EGR) valve sealing surfaces are soft metals.

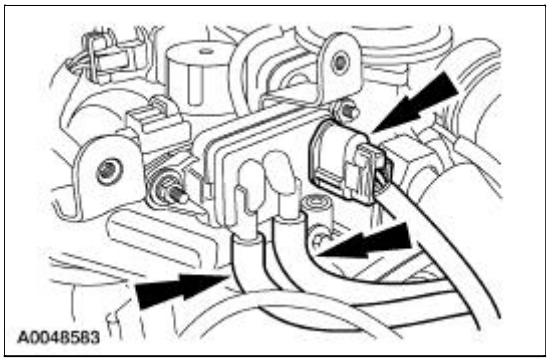


Carefully clean both of the sealing surfaces.

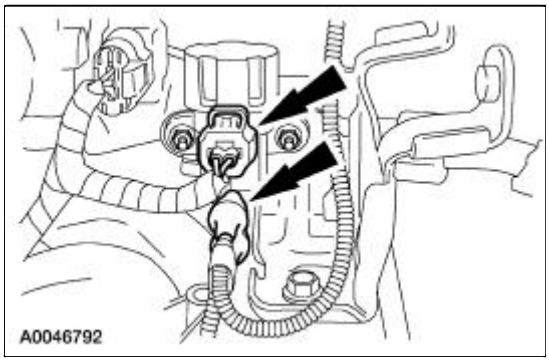
- Install a new gasket.



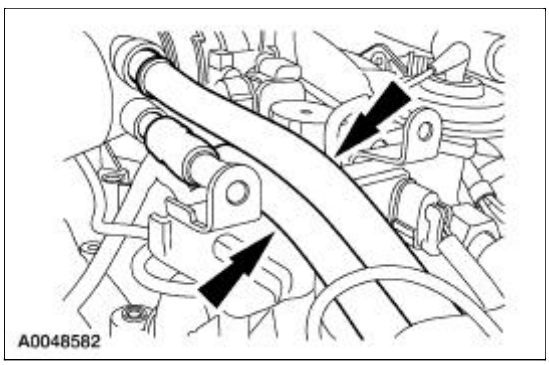
2. Install the EGR valve.
   Tighten the bolts in two stages:
   - Stage 1: Tighten to 20 Nm (15 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.



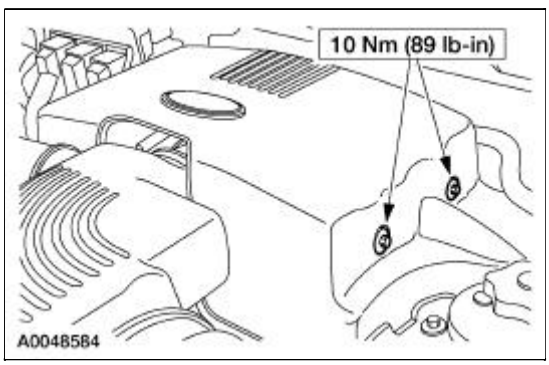
3. Install the EGR vacuum regulator solenoid bracket.



4. Connect the EGR valve vacuum hose and the EGR tube upper fitting.

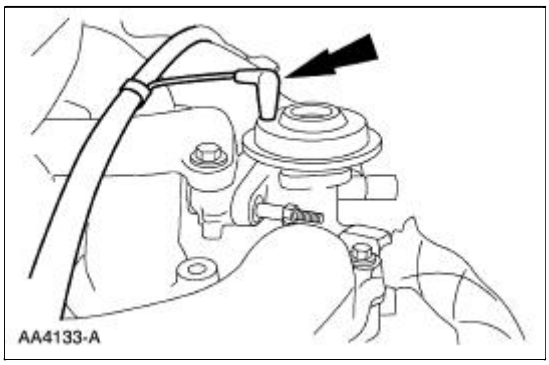


5. Connect the differential pressure feedback EGR system vacuum and electrical connections.

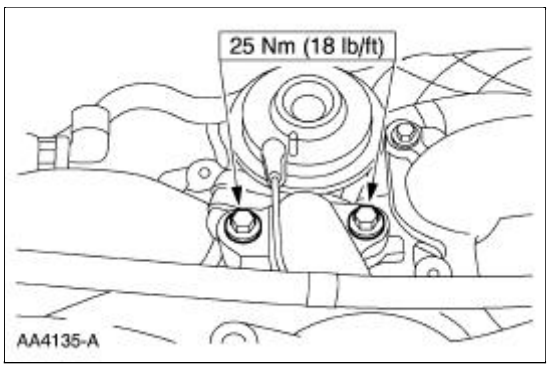


6. Connect the EGR vacuum regulator solenoid vacuum and electrical connections.

7. Install the clean air tubes.

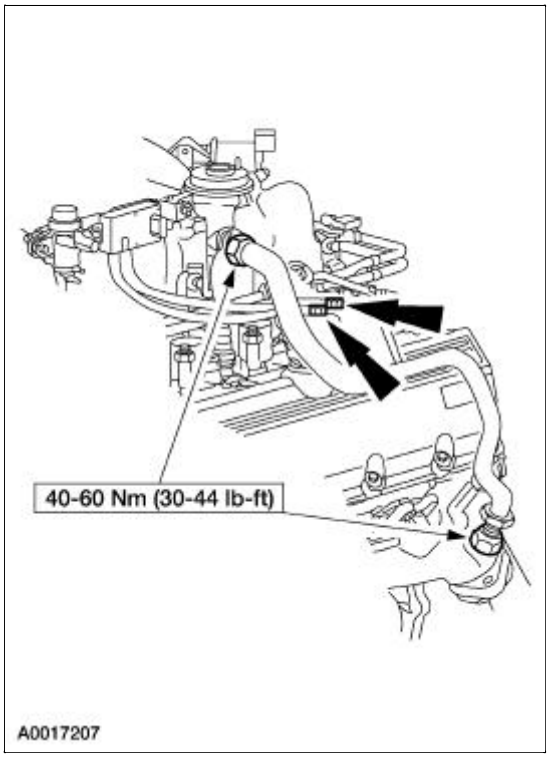


8. Install the appearance cover.



Exhaust Gas Recirculation (EGR) Valve —5.4L (4V) Valve and Tube

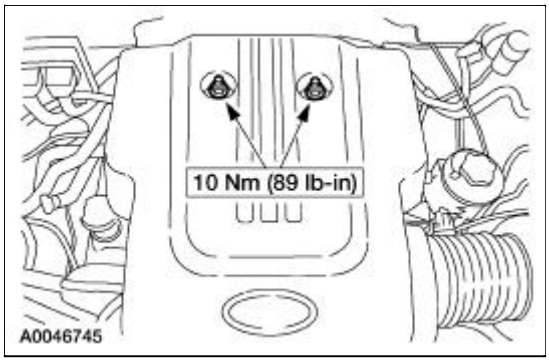
Removal and Installation



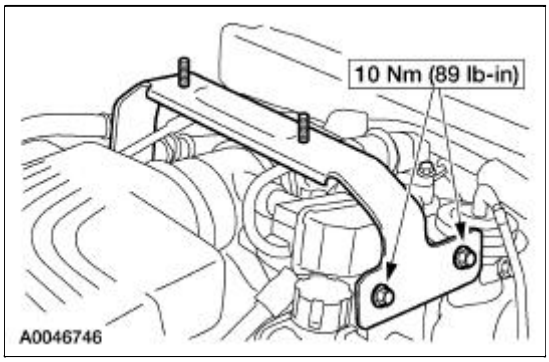
1. Remove the upper intake manifold. For additional information, refer to Section 303-01B .
2. Disconnect the exhaust gas recirculation (EGR) valve vacuum line.

3. Remove the bolts from the EGR adapter.

4. Disconnect the differential pressure feedback (EGR) hoses and the EGR valve tube fittings.

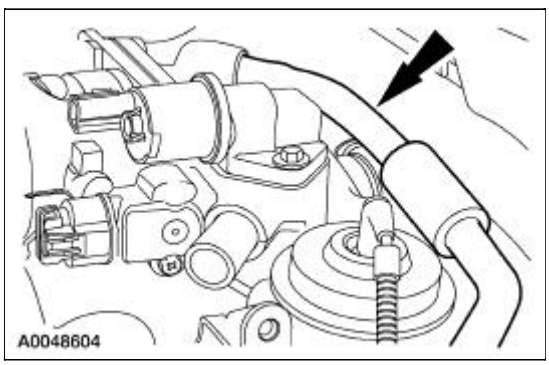


5. Remove the EGR valve and tube as an assembly.
6. To install, reverse the removal procedure.

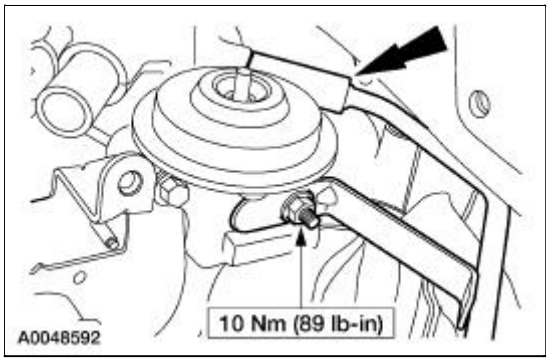


Exhaust Manifold to Exhaust Gas Recirculation (EGR) Valve Tube —4.6L

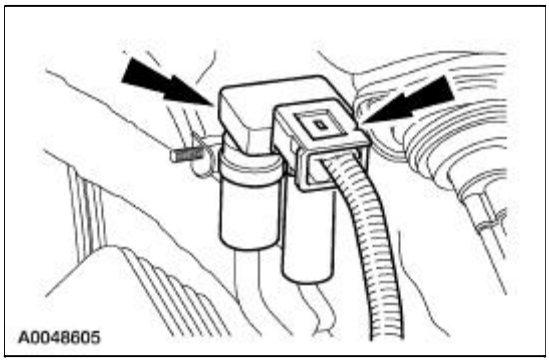
Removal and Installation



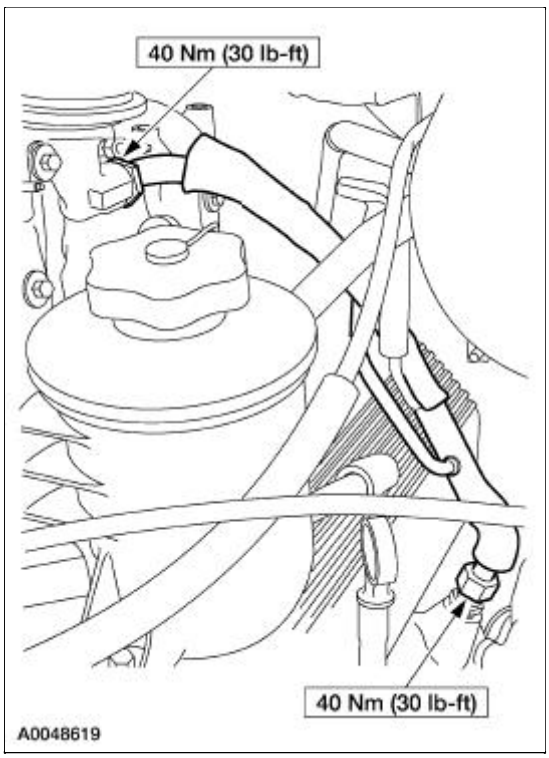
1. Remove the appearance cover.



2. Remove the appearance cover bracket.



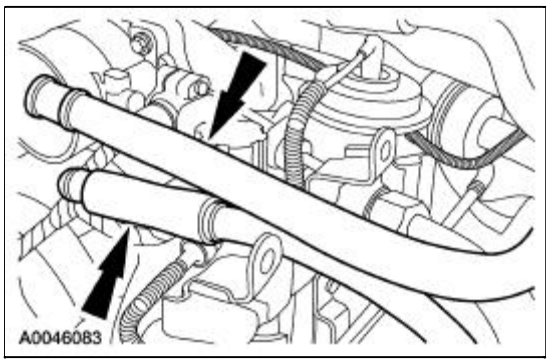
3. Disconnect the evaporative emission (EVAP) canister purge solenoid vapor hose.



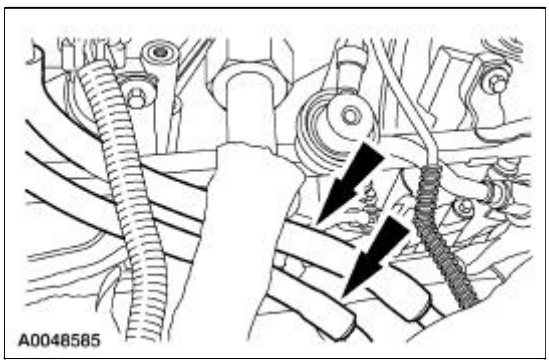
4. Remove the brake booster bracket and tube.

5. Disconnect the electrical connector and remove the differential pressure feedback EGR transducer from the tube.

6. Remove the EGR tube.

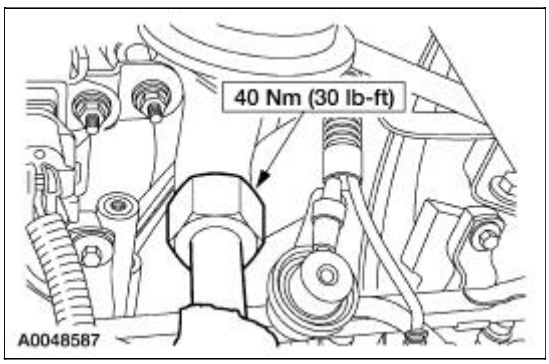


7. To install, reverse the removal procedure.

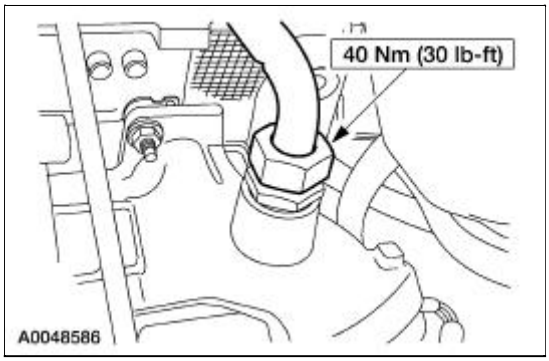


Exhaust Manifold to Exhaust Gas Recirculation (EGR) Valve Tube —5.4L (2V)

Removal and Installation



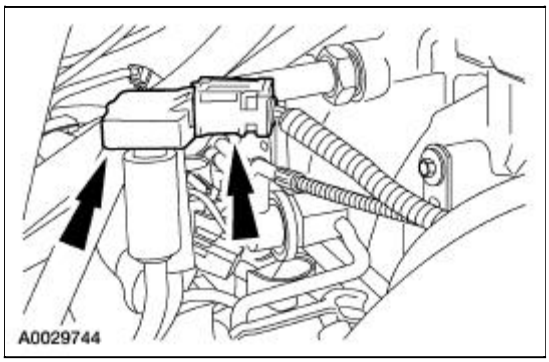
1. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
2. Remove the clean air tubes.



3. Detach differential pressure feedback (DPFE) exhaust gas recirculation (EGR) transducer vacuum hoses from the EGR tube.

4. Disconnect the EGR tube upper fitting from the EGR valve.

5. Disconnect the EGR tube lower fitting from the exhaust manifold and remove the EGR tube.

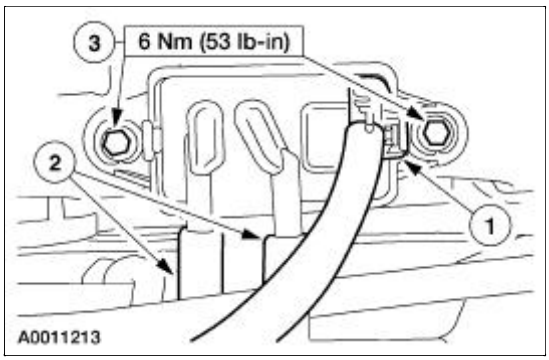


6. To install, reverse the removal procedure.

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) System —4.6L

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Disconnect the electrical connector and remove the differential pressure feedback EGR sensor from the EGR tube.



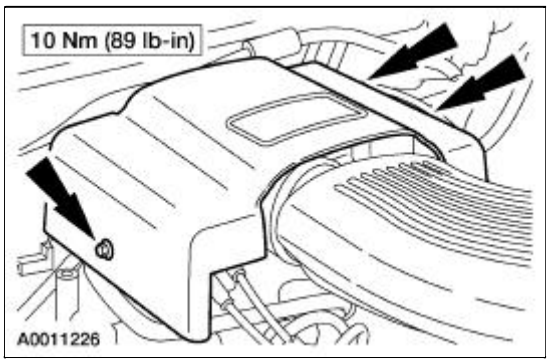
3. To install, reverse the removal procedure.

Differential Pressure Feedback Exhaust Gas Recirculation (EGR) System —5.4L (2V), 5.4L (4V)

Removal and Installation

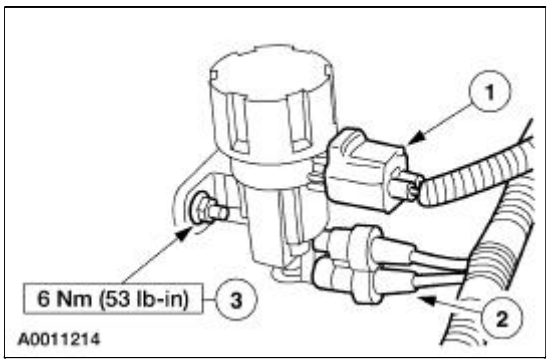
1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Remove the differential pressure feedback (EGR) sensor.
   1. Disconnect the electrical connector.
   2. Disconnect the hoses.
   3. Remove the bolts.



3. To install, reverse the removal procedure.

Exhaust Gas Recirculation (EGR) Vacuum Regulator Solenoid —4.6L, 5.4L (2V), 5.4L (4V)

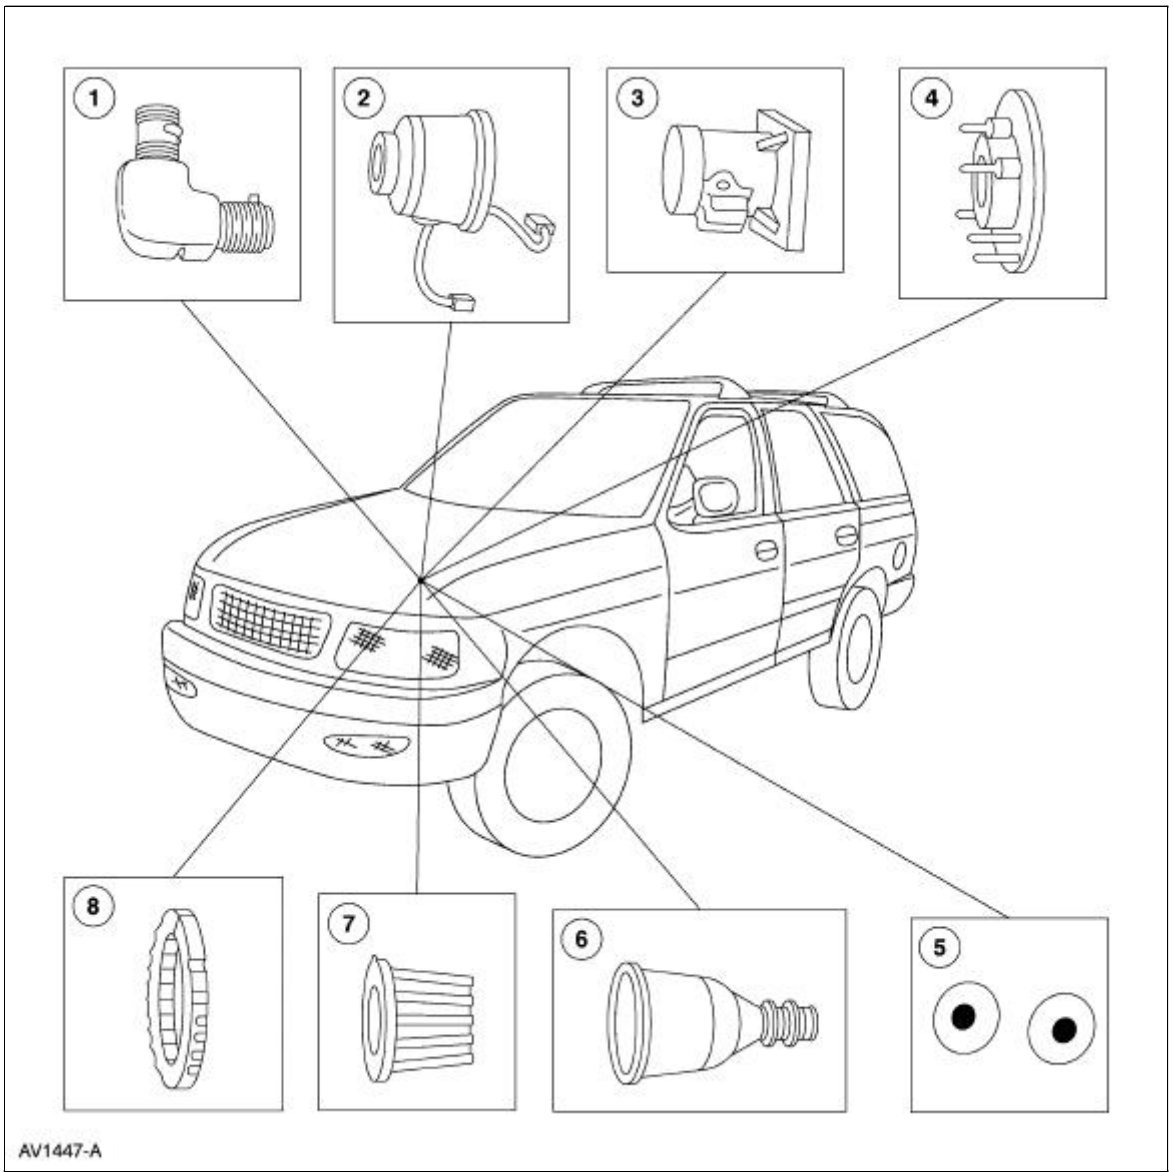


Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. **NOTE:** The 4.6L engine is shown, the 5.4L engines are similar.

   Remove the bolts and remove the engine appearance cover (if equipped).

3. Remove the exhaust gas recirculation (EGR) vacuum regulator solenoid.
   1. Disconnect the electrical connector.
   2. Disconnect the vacuum lines.
   3. Remove the bolts (nuts if applicable).



4. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-in
Engine appearance cover bolts	10	89

Intake Air Distribution And Filtering

Component Locations

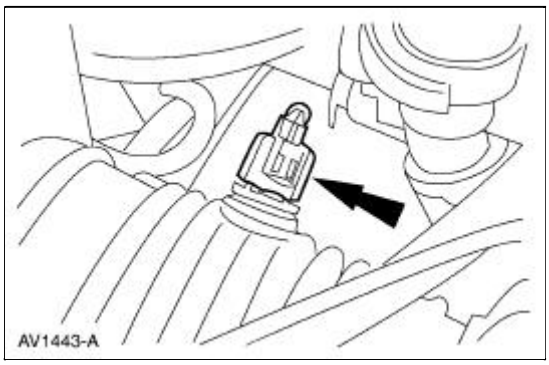
Item	Part Number	Description
1	9F805	Air cleaner outlet tube and resonator
2	9600	Air cleaner, outlet
3	12B579	Mass air flow sensor
4	—	Mass air flow sensor plate (part of 9600)
5	9P686	Air cleaner support insulator (2 req'd)
6	9600	Air cleaner, inlet
7	9601	Air cleaner element
8	9628	Air cleaner clamp

The air intake system consists of the:

- air cleaner (ACL) (9600) (inlet and outlet).
- air cleaner (ACL) element (9601)
- mass air flow (MAF) sensor (12B579).
- intake air (IAT) temperature (IAT) sensor (12A697).
- air cleaner outlet tube (9B659).
- engine control sensor extension wiring (12A690).

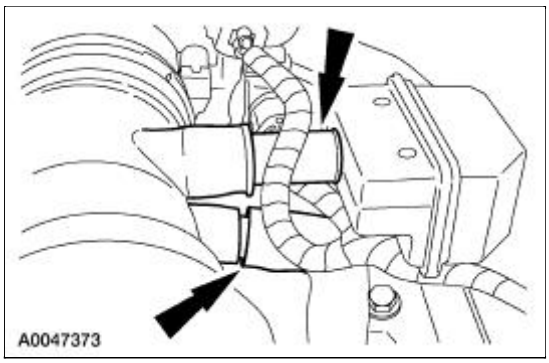
The air intake system:

- cleans intake air with a replaceable, air cleaner element.
- measures air flow with a mass air flow sensor. For additional information, refer to Section 303-14 .
- measures air temperature with an intake air temperature sensor.



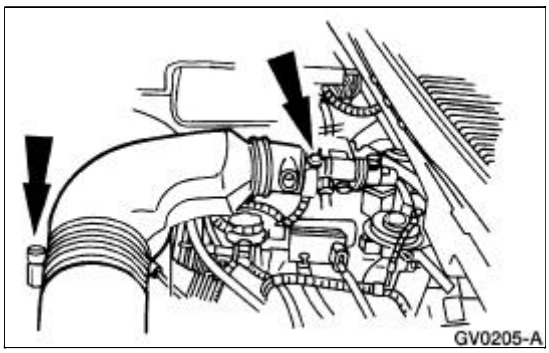
Intake Air Distribution And Filtering

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.



Air Cleaner Outlet Pipe

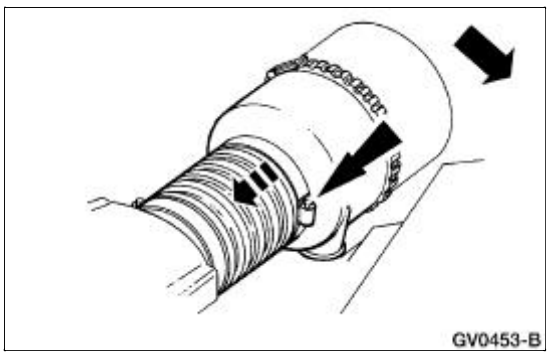
Removal and Installation



1. Remove the engine appearance cover.
2. Disconnect the intake air temperature (IAT) sensor electrical connector.

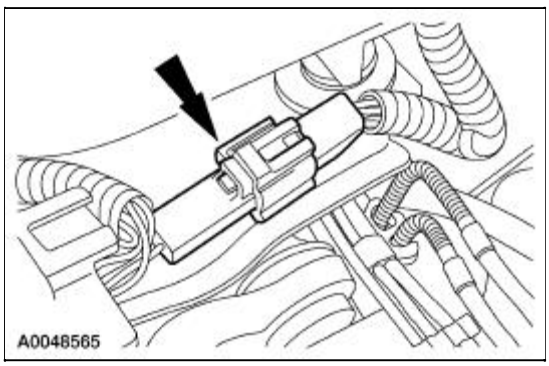
3. Disconnect the positive crankcase ventilation hose and the idle air control valve inlet tube.

4. Loosen the clamps and remove the air cleaner outlet pipe and resonator.



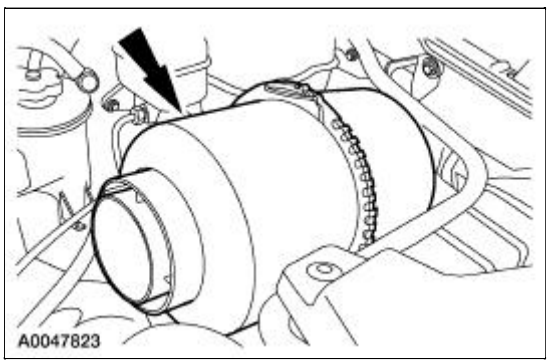
5. **CAUTION: The air cleaner outlet pipe should be securely sealed to prevent unmetered air from entering the engine.**

   To install, reverse the removal procedure.



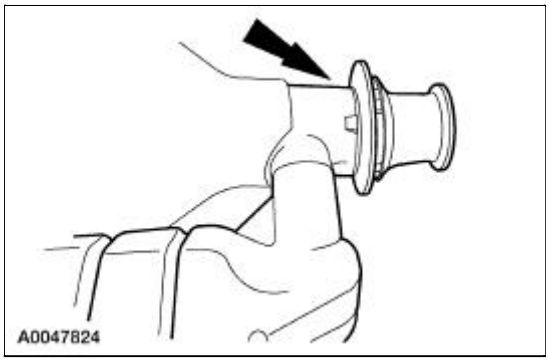
Air Cleaner

Removal and Installation



1. Loosen the clamp and separate the air cleaner outlet tube and resonator from the air cleaner.

2. Disconnect the mass air flow (MAF) sensor electrical connector.



3. Lift the air cleaner assembly from the air cleaner tray.

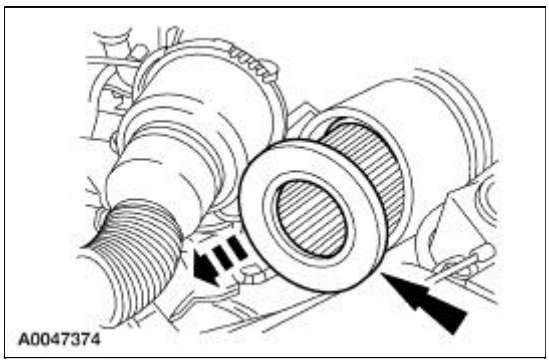
4. Remove the MAF sensor from the outlet side of the air cleaner. For additional information, refer to Section 303-14 .

5. Separate the air cleaner inlet resonator from the air cleaner assembly.

6. **CAUTION: The grommet used to seal the air cleaner housing at the extension must be fully seated. Failure to do so will result in unmetered air entering the engine.**

   NOTE: Use the alignment notch to correctly align the inlet side and outlet side of the air cleaner.

   To install, reverse the removal procedure.



Air Cleaner Element

Removal and Installation

1. Separate the air cleaner assembly.
    1. Open the air cleaner clamp.
    2. Position the air cleaner outlet aside.

2. Remove the air cleaner element from the open end of the air cleaner inlet.

3. **CAUTION: The grommet used to seal the air cleaner housing at the extension must be fully seated. Failure to do so will result in unmetered air entering the engine.**

   NOTE: Use the alignment notch to correctly align the inlet side and outlet side of the air cleaner.

   To install, reverse the removal procedure.

17	9C052	Fuel tank pressure sensor

The evaporative emissions (EVAP) system:

- prevents hydrocarbon emissions from reaching the atmosphere.
- stores fuel vapors in the evaporative emissions (EVAP) canister that are generated during vehicle operation or hot soak, until they can be consumed by the engine during normal engine operation.
- routes the stored fuel vapors to the engine during engine operation.
- is controlled by the powertrain control module (PCM), which uses various sensor inputs to calculate the desired amount of purge flow. The PCM regulates the purge flow, induced by the application of intake manifold vacuum, by varying the duty cycle applied to the EVAP canister purge valve.
- has an evaporative emissions (EVAP) test port for test purposes.

The fuel vapors are routed:

- from the fuel tank through the fuel vapor vent valves.
- to the (EVAP) canister through a vapor line.
- to the engine when the EVAP canister purge valve is opened by the PCM.

The fuel tank pressure (FTP) sensor:

- monitors the pressure levels in the fuel tank.
- communicates the pressure reading to the PCM during the OBD II leak test.

The evaporative emissions (EVAP) canister:

- is located above the spare tire carrier behind the fuel tank.
- contains activated carbon.
- stores fuel vapors.

The fuel tank filler cap:

- relieves system pressure above 14 kPa (56.21 inches H_2O).
- relieves system vacuum below 3.8 kPa (15.26 inches H_2O).

The canister vent solenoid:

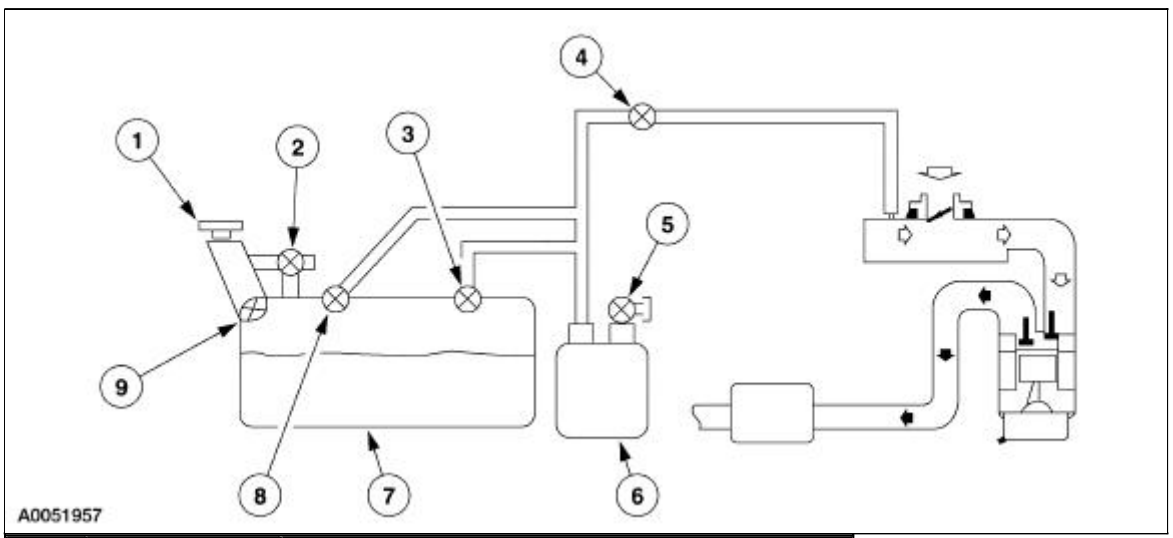
- is normally open.
- seals the evaporative emissions system for the OBD II leak and pressure tests.

- is mounted to the evaporative emissions canister.
- is repaired as a separate item.

The evaporative emissions (EVAP) canister purge valve:

- is normally closed.
- regulates the purging of the EVAP canister.
- is controlled by the PCM.

The evaporative emissions (EVAP) system test port:



- is located in the EVAP canister purge valve.
- is used to connect the Evaporative Emissions System Leak Tester to the EVAP system.

Evaporative Emissions

Special Tool(s)

 ST2116-A	Evaporative Emission System Leak Tester 310-F007 (134-00056) or equivalent

Evaporative Emission System

Item	Part Number	Description
1	9030	Fuel filler cap
2	9C052	Fuel tank pressure sensor
3	9B593	Fuel vapor vent valve
4	9C915	Evaporative emission canister purge valve
5	9F945	Canister vent solenoid
6	9D653	Evaporative emission canister
7	9002	Fuel tank
8	9B593	Fuel vapor vent valve
9	9189	Fuel filler pipe check valve

Principles of Operation

Evaporative Emissions (EVAP) Canister Purge Valve

The EVAP canister purge valve is controlled by the powertrain control module (PCM). The EVAP canister purge valve controls the flow of fuel vapors from the EVAP canister to the engine intake manifold during various engine-operating modes. The EVAP canister purge valve is normally closed.

Evaporative Emission (EVAP) Canister

Fuel vapors from the fuel tank are stored in the EVAP canister. When the engine is running, the vapors are purged from the EVAP canister for combustion.

Canister Vent Solenoid

During the Evaporative Emission Running Loss System Monitor Test, Evaporative Emissions Repair Verification Drive Cycle and the Evaporative Emission System Leak Test the canister vent solenoid is closed to allow either a vacuum to be drawn on the fuel tank or to hold a specified pressure in the system. The canister vent solenoid is normally open.

Fuel Tank Pressure (FTP) Sensor

The fuel tank pressure sensor is used to measure the fuel tank pressure during the Evaporative Emissions Monitor Test. It is also used to control excessive fuel tank pressures by forcing the system to purge. The FTP sensor is mounted on the tank vent hose.

Fuel Vapor Vent (FVV) Valve Assembly

The fuel vapor vent (FVV) valve assembly is mounted on the top of the fuel tank. It is used to control the flow of fuel vapors entering the EVAP system. The head portion of the assembly prevents the fuel tank from overfilling during refueling. The assembly also has a spring float, which prevents liquid fuel from entering the vapor delivery system under severe handling or vehicle rollover conditions. In the upright position the open bottom of the float will lift and shut off the orifice. Under severe handling conditions, the spring will push the float closed when angles allow liquid fuel to reach the orifice. In a rollover condition the weight of the open bottom float and spring pressure will close the orifice.

Fuel Filler Pipe Check Valve

The fuel filler pipe check valve is an intricate part of the fuel tank. It is intended to prevent liquid fuel from re-entering the fuel filler pipe from the fuel tank on refueling or rollover conditions.

Fuel Filler Cap

The fuel filler cap is used to prevent fuel spill and to close the EVAP system to the atmosphere.

Evaporative Emissions System Monitor

When a fault occurs, the EVAP System Monitor is reset to NO and a diagnostic trouble code (DTC) is set in the PCM memory. After the DTC is repaired the vehicle drive cycle must be completed to reset the monitor in preparation for inspection and maintenance testing.

EVAP Running Loss System Test

To start the testing, conditions of stable purging and vehicle speed must be satisfied. During the first stage, the EVAP canister vent solenoid is closed while the EVAP canister purge valve remains open, applying and building vacuum in the system as indicated by the FTP sensor. This phase checks for major leaks in the EVAP system.

In the second stage, the EVAP canister purge valve closes and the system looks for minimal decay

rate in the EVAP vacuum, indicating the absence of any small EVAP system leaks.

The last stage is entered only if stage two of the leak test has failed and checks whether the failed test was due to excess vapor generation. It monitors fuel vapor generation rate. Initially the canister vent solenoid is opened to equalize EVAP system pressure to atmosphere. Then the canister vent solenoid is closed allowing pressure to build, if vapor generation is present in sufficient quantity. If the rate of generation is found to be too high, the EVAP running loss system leak test is aborted. If not, then a small leak is diagnosed.

Inspection and Verification

1. Verify the customer concern is with the evaporative emission (EVAP) system.

2. Visually inspect for the following obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
● Fuel filler cap ● EVAP test port ● EVAP canister or vent solenoid ● EVAP lines or hoses ● Vacuum lines or hoses

3. If the concern remains after the inspection, connect the scan tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the scan tool menu. If the scan tool does not communicate with the vehicle:

- check that the program card is correctly installed.
- check the connections to the vehicle.
- check the ignition switch position.

4. If the scan tool still does not communicate with the vehicle, refer to the scan tool manual.

5. Carry out the DATA LINK DIAGNOSTICS test. If the scan tool responds with:

- CKT914, CKT915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
- NO RESP/NOT EQUIP for PCM, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
- SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the PCM KOEO self-test.

6. If the DTCs retrieved are related to the concern, go to the PCM Diagnostic Trouble Code (DTC) Index to continue diagnostics.

7. If the concern remains after the inspection, determine the symptom. GO to Symptom Chart .

PCM Diagnostics Trouble Code (DTC) Index

DTC	Description	Source	Action

P0442	Small Leak Detected in EVAP System (as small as 1.02 mm (0.040 inch).	PCM	Go To Pinpoint Test A .
P0455	Major Leak or No Flow Detected.	PCM	Go To Pinpoint Test B .
P0456	Very Small Leak Detected in EVAP System (as small as 0.51 mm (0.02 in) .	PCM	Go To Pinpoint Test A
P0457	Loose or Missing Fuel Cap.	PCM	Go To Pinpoint Test A
P1443	Very Small or No Purge Flow Detected.	PCM	Go To Pinpoint Test B .
P1450	Excessive Vacuum Detected in the Fuel Tank.	PCM	Go To Pinpoint Test C .
—	Any Other PCM DTC.	PCM	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart

SYMPTOM CHART

Condition	Possible Sources	Action
● Hiss when opening fuel cap	● Canister vent solenoid. ● Evaporative emissions canister. ● EVAP canister tube. ● EVAP canister purge outlet tube.	● Go To Pinpoint Test D .
● Excessive fuel odor	● Canister vent solenoid. ● Evaporative emissions canister. ● Evaporative emissions test port. ● EVAP canister purge outlet tube.	● Go To Pinpoint Test E .

Pinpoint Tests

PINPOINT TEST A: DTC P0442 SMALL LEAK IN EVAP SYSTEM, DTC P0456 VERY SMALL LEAK IN EVAP SYSTEM, DTC P0457 FUEL CAP LOOSE OR MISSING

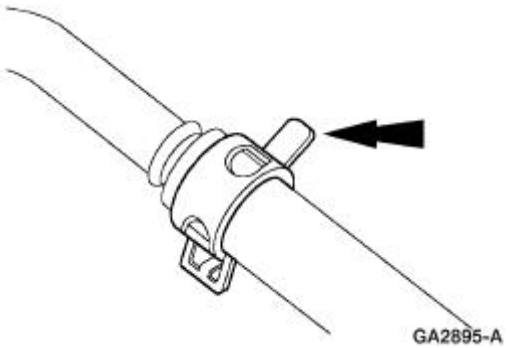
Test Step	Result / Action to Take
A1 VISUALLY INSPECT THE COMPONENTS FOR SMALL LEAKS ● Check for the presence of a fuel filler cap. Do not tighten or check for correct installation at this time. ● Verify the canister vent solenoid is correctly seated on the EVAP canister. ● Check for cut or loose	**Yes** REPAIR or INSTALL new components as necessary. GO to A2 . **No** GO to A2 .

connections to fuel vapor hoses, tubes and connections in the following locations: ● EVAP canister to EVAP canister purge valve ● EVAP canister to fuel vapor vent valve assembly ● Check the fuel filler pipe for damage. ● **Is a concern with a hose, tube, connection or valve visually evident?**	
A2 CHECK AT THE EVAP TEST PORT FOR SMALL SYSTEM LEAKS ● Disconnect and plug the evaporative emission return tube at the intake manifold. ● Complete the evaporative emission system leak test. Refer to Evaporative Emission System Leak Test in this section. ● **Does the system pass the leak test?**	**Yes** GO to A3 . **No** GO to A4 .
A3 VISUALLY INSPECT THE FUEL FILLER CAP ● Visually inspect the fuel filler cap for damage. ● **Is the fuel filler cap damaged?**	**Yes** INSTALL a new fuel filler cap. GO to A4 . **No** GO to A4 .
A4 CHECK FOR SMALL LEAKS AT THE FUEL FILLER CAP AND EVAP TEST PORT ● Connect the Evaporative Emission System Leak Tester to the fuel filler pipe. ● Key in ON position. ● Close the canister vent solenoid. Refer to Canister Vent Solenoid Closing Procedure in this section. ● Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). ● Using the ultrasonic leak detector, check the fuel filler cap and EVAP test port for leaks. ● **Is a leak detected?**	**Yes** REPAIR or INSTALL new components as necessary. GO to A5 . **No** INSTALL the fuel filler cap. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emissions repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section.
A5 CHECK FOR CONCERN OTHER THAN THE FUEL FILLER CAP ● Refer to previous test results. ● **Did the system pass the evaporative emission system leak test carried out in pinpoint test Step A2?**	**Yes** CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section. **No** INSTALL the fuel filler cap. GO to A6 .

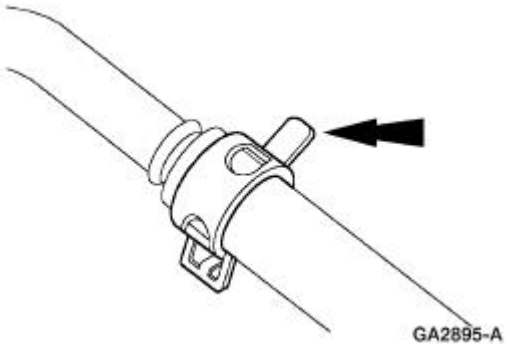
A6 CHECK FOR SMALL LEAK WITH TESTER SET AT FILL POSITION • Connect the Evaporative Emission System Leak Tester to the EVAP test port. • Key in ON position. • Close the canister vent solenoid. Refer to Canister Vent Solenoid Closing Procedure in this section. • Turn the selector on the Evaporative Emission System Leak Tester to the FILL position. • Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). • **Does the pressure on the EVAP system hold between 3.43 kPa and 3.53 kPa (13.80 inches and 14.20 inches H_2O)?**	**Yes** GO to A7. **No** DISCONTINUE pressurizing the system. GO to A8.
A7 CHECK FOR LEAKS IN THE COMPLETE EVAP SYSTEM • Connect the Evaporative Emission System Leak Tester to the EVAP test port. • Key in ON position. • Close the canister vent solenoid. Refer to Canister Vent Solenoid Closing Procedure in this section. • Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). • Using the ultrasonic leak detector, check the following EVAP system locations: ◦ EVAP return tube to EVAP canister purge valve ◦ EVAP canister purge valve to EVAP canister—canister vent solenoid assembly ◦ EVAP canister — canister vent solenoid assembly to fuel tank ◦ Fuel filler cap and fuel filler tube • **Is a leak detected at EVAP return tube, EVAP canister purge outlet tube or EVAP canister tube or associated hose?**	**Yes** REPAIR or INSTALL new components as necessary. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emissions repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section. **No** DISCONTINUE pressurizing the system. GO to A8.
A8 CHECK FOR SMALL LEAK FROM THE EVAP RETURN TUBE TO THE EVAP CANISTER • Disconnect the fuel tank vapor tube (9C047) at the fuel vapor tee. Plug the opening in the tee. • Connect the Evaporative Emission System Leak Tester to the EVAP test port. • Key in ON position. • Close the canister vent solenoid. Refer to Canister Vent Solenoid	**Yes** REPAIR or INSTALL new components as necessary. REPEAT Step A6 to verify the repair. GO to A9. **No** OPEN the canister vent solenoid. GO to A9.

Closing Procedure in this section. • Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). • Using the ultrasonic leak detector, check the EVAP system from the intake manifold to the EVAP canister vent solenoid. • **Is a leak detected?**	
A9 CHECK FOR SMALL LEAK BETWEEN FUEL TANK VAPOR TUBE (9C047) AND FUEL TANK FILLER PIPE • Connect the Evaporative Emission System Leak Tester to the fuel filler pipe. • Transfer the plug from the fuel vapor tee to the fuel tank vapor tube (9C047). • Turn the Evaporative Emission System Leak Tester selector to the FILL position. • Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). • Using the ultrasonic leak detector, check the fuel tank vapor tube to the fuel tank for leaks. Check the fuel tank pressure sensor, fuel tank vapor tube and the fuel filler pipe. • **Is a leak detected?**	**Yes** REPAIR or INSTALL new components as necessary. GO to A10. **No** GO to A10.
A10 CHECK EVAP SYSTEM AT FUEL FILLER PIPE • Reconnect the fuel tank vapor tube (9C047) to the fuel vapor tee. • Complete the evaporative emission system leak test. Refer to Evaporative Emission System Leak Test in this section. • **Does the EVAP system pass the leak test?**	**Yes** RESTORE the system to normal operation. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emissions repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section. **No** GO to A6.

PINPOINT TEST B: DTC P0455 MAJOR LEAK OR NO FLOW DETECTED OR DTC P1443 VERY SMALL OR NO PURGE FLOW DETECTED IN SYSTEM



Test Step	Result / Action to Take
NOTE: Condition DTC P0455 set: –1.74 kPa (-7.0 inches H_2O) over 30 seconds.	
NOTE: Condition DTC P1443 set: –1.74 kPa (-7.0 inches H_2O) over 30 seconds with more than 0.02 lb/min. vapor flow.	
B1 CHECK FOR DIAGNOSTIC TROUBLE CODE P0455 OR	



P1443 • Use the recorded results from the PCM DTCs. • **Is DTC P0455 present?**	**Yes** GO to B2 . **No** GO to B3 .
B2 VISUALLY CHECK FOR GROSS EVAP SYSTEM LEAKS • Check for the presence of a fuel filler cap. Do not tighten or check for correct installation at this time. • Check that the input port vacuum and EVAP return tube are connected to the EVAP canister purge valve. • Check that the canister vent solenoid is correctly attached to the EVAP canister. • Check for disconnected or cracked fuel vapor hoses or tubes between the intake manifold and following components: ◦ EVAP canister purge valve ◦ EVAP canister ◦ Fuel vapor vent valve assembly • Check for damaged fuel tank or fuel filler pipe. • **Is a concern with a hose, tube, connection or valve visually evident?**	**Yes** REPAIR or INSTALL new EVAP components as necessary. GO to B3 . **No** GO to B3 .
B3 CHECK FOR EVAP SYSTEM LEAKS • Disconnect the EVAP return tube from the intake manifold and plug the EVAP return tube. • Connect the Evaporative Emissions System Leak Tester to the EVAP test port. • Carry out the evaporative emissions system leak test. Refer to Evaporative Emission System Leak Test in this section. • **Does the system pressure stay above 1.99 kPa (8 inches H_2O)?**	**Yes** GO to B4 . **No** VERIFY that the fuel filler cap is installed correctly. REPAIR or INSTALL new components as necessary. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section.
B4 CHECK FOR BLOCKAGE BETWEEN THE EVAP CANISTER PURGE VALVE AND FUEL VAPOR TEE • Key in ON position. • Close the canister vent	**Yes** GO to B5 .

solenoid. Refer to Canister Vent Solenoid Closing Procedure in this section. • Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). • Open the canister vent solenoid. Refer to Canister Vent Solenoid Closing Procedure in this section. • **Does the pressure drop immediately?**	**No** INSTALL a new vapor line between the EVAP canister purge valve and the fuel vapor tee. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section.
B5 CHECK FOR BLOCKAGE BETWEEN FUEL FILLER PIPE AND THE FUEL VAPOR TEE	
• Connect the Evaporative Emissions System Leak Tester to the fuel filler pipe. • Pressurize the EVAP system to 6.47 to 6.97 kPa (26 to 28 inches H_2O). • **Does the pressure drop immediately?**	**Yes** GO to B6. **No** INSTALL new fuel tank vapor line(s). REPEAT pinpoint test step B5 to verify the repair. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section.
B6 CHECK FOR FAILED EVAP CANISTER PURGE VALVE OR FUEL TANK PRESSURE SENSOR	
• Use the recorded results from the PCM DTCs. • **Are DTC codes P0455 and P1443 present?**	**Yes** INSTALL a new EVAP canister purge valve. REFER to Evaporative Emission Canister Purge Valve in this section. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If no leak is detected, CARRY OUT the evaporative emissions repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section. **No** INSTALL a new fuel tank pressure sensor. REFER to Fuel Tank Pressure Sensor in this section. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY out the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section.

PINPOINT TEST C: DTC P1450 EXCESSIVE VACUUM DETECTED IN THE FUEL TANK

Test Step	Result / Action to Take
NOTE: Condition P1450 DTC set: More than -1.79 kPa (-7.2 inches H_2O) over 30 seconds.	
C1 CHECK FOR VISUAL CAUSES OF EXCESSIVE	

FUEL TANK VACUUM ● Check for kinks or bends in the fuel vapor hoses and tubes. ● Visually check the EVAP canister inlet port, canister vent solenoid filter or outlet hose for contamination or foreign material. ● Check the canister vent solenoid for blockage or contamination. ● **Is a concern with a hose, tube, connection or component visually evident?**	**Yes** REMOVE any contamination or foreign material around fuel vapor hoses and tubes. REPAIR the hoses, tubes or components as necessary. After all visual concerns are repaired, GO to C2 . **No** GO to C2 .
C2 CHECK FOR BLOCKAGE BETWEEN EVAP TEST PORT AND CANISTER VENT SOLENOID ● Disconnect and plug the EVAP return tube at the intake manifold. ● Connect the Evaporative Emissions System Leak Tester to the EVAP test port. ● Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). ● **Does the pressure drop immediately?**	**Yes** GO to C3 . **No** Go To Pinpoint Test D .
C3 CHECK FOR BLOCKAGE BETWEEN THE FUEL FILLER PIPE AND THE FUEL VAPOR TEE ● Connect the Evaporative Emission System Leak Tester to the fuel filler pipe. ● Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). ● **Does the pressure drop immediately?**	**Yes** GO to C4 . **No** Go To Pinpoint Test D .
C4 CHECK FOR FUEL TANK PRESSURE SENSOR PID WITHOUT PRESSURE APPLIED ● Disconnect the EVAP canister outlet tube at the EVAP canister.  ● Key in ON position. ● Access PCM PID FTP V. ● Record the reading. ● **Is PID FTP V reading between 2.40 and 2.80 volts?**	**Yes** GO to C5 . **No** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis.
C5 CHECK FOR STUCK OPEN EVAP CANISTER PURGE VALVE CONDITION AT IDLE ● Connect the EVAP canister outlet tube.	**Yes** INSTALL a new EVAP canister purge valve. REFER to Evaporative Emission Canister Purge Valve in this section. CARRY OUT an EVAP system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY

 ● Remove the plug from the EVAP return tube and reconnect the tube to the intake manifold. ● Verify that the fuel filler cap is correctly installed. ● Key in ON position. ● Access PCM PIDs FTP V and EVAPPDC. ● Start the engine and allow to idle. ● Monitor the FTP V and EVAPPDC PIDs. ● **When PID EVAPPDC is zero, is PID FTP V reading below 2.40 volts?**	OUT an evaporative emissions repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section. **No** CARRY OUT the EVAP system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emissions repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section.

PINPOINT TEST D: HISS WHEN OPENING FUEL CAP

Test Step	Result / Action to Take
D1 TEST FOR EVAP CANISTER, CANISTER VENT SOLENOID AND CANISTER VENT HOSE ASSEMBLY BLOCKAGE	
● Connect the Evaporative Emission System Leak Tester to the fuel filler cap. ● Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). ● **Does the pressure drop immediately?**	**Yes** The EVAP system has passed the EVAP canister and bracket assembly blockage test. GO to D6. **No** For vehicles equipped with a canister vent hose assembly, GO to D2. For vehicles equipped with a canister vent solenoid, GO to D3. For all others, GO to D4.
D2 TEST FOR CANISTER VENT HOSE ASSEMBLY BLOCKAGE	
● Disconnect the EVAP canister vent hose assembly from the EVAP canister. ● Connect the Evaporative Emission System Leak Tester to the fuel filler pipe. ● Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). ● **Does the pressure drop immediately?**	**Yes** INSTALL a new EVAP canister vent solenoid vent hose assembly. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section. **No** GO to D4.
D3 TEST FOR CANISTER VENT SOLENOID BLOCKAGE	
● Remove the canister vent	**Yes** INSTALL a new canister vent solenoid. REFER to

solenoid from the EVAP canister. • Connect the Evaporative Emission System Leak Tester to the fuel filler pipe. • Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). • **Does the pressure drop immediately?**	Evaporative Emission Canister Vent Solenoid in this section. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section. **No** GO to D4 .
D4 TEST FOR EVAP CANISTER BLOCKAGE • Disconnect the EVAP canister tube (from the fuel tank) at the F-fitting from the EVAP canister. • Connect the Evaporative Emission System Leak Tester to the fuel filler pipe. • Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). • **Does the pressure drop immediately?**	**Yes** INSTALL a new EVAP canister. REFER to Evaporative Emission Canister in this section. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section. **No** GO to D5 .
D5 TEST FOR EVAP CANISTER TUBE OR FUEL VAPOR VENT VALVE ASSEMBLY BLOCKAGE • Disconnect the fuel vapor vent valve assembly from the EVAP canister tube. • Connect the Evaporative Emission System Leak Tester to the fuel filler pipe. • Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). • **Does the pressure drop immediately?**	**Yes** INSTALL a new EVAP canister tube and/or fuel vapor tube (s) between the fuel tank and the EVAP canister and bracket assembly. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section. **No** INSTALL a new fuel vapor vent valve(s) or assembly. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section.
D6 TEST FOR BLOCKAGE BETWEEN THE EVAP CANISTER PURGE VALVE AND THE FUEL TANK • Remove the fuel vapor hose (from the fuel tank) at the EVAP canister purge valve. • Connect the Evaporative Emission System Leak Tester to the fuel filler pipe. • Key in ON position. • For vehicles equipped with a canister vent solenoid, close the canister vent solenoid.	**Yes** The EVAP system has passed all the blockage tests. RECONNECT all components. For vehicles equipped with a canister vent solenoid, CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive

Refer to Canister Vent Solenoid Closing Procedure in this section. ● For vehicles without a canister vent solenoid, plug the canister vent hose assembly or plug the canister vent cap. ● Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). ● **Does the pressure drop immediately?**	Cycle in this section. For vehicles without a canister vent solenoid, PLUG the canister vent hose assembly or the canister vent cap. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section. **No** INSTALL a new fuel vapor hose. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section.

PINPOINT TEST E: EXCESSIVE FUEL ODOR

Test Step	Result / Action to Take
E1 TEST THE EVAPORATIVE EMISSION (EVAP) RUNNING LOSS SYSTEM MONITOR	
● Complete the evaporative emission repair verification drive cycle. Refer to Evaporative Emission Repair Verification Drive Cycle in this section. ● **Are PCM DTCs retrieved?**	**Yes** For DTC P0442, P0455, P1443 or P1450, REFER to the Diagnostic Trouble Code Index in this section. For all other DTCs, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of DTCs. **No** GO to E2.
E2 TEST FOR RESTRICTIONS IN THE EVAP SYSTEM FROM THE EVAPORATIVE EMISSION TEST PORT THROUGH THE CANISTER VENT SOLENOID	
● Connect the Evaporative Emission System Leak Tester to the evaporative emissions test port. ● Attempt to pressurize the EVAP system to 3.48 kPa (14 inches H_2O). ● **Does the pressure drop immediately?**	**Yes** CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section. GO to E3. **No** Go To Pinpoint Test D.
E3 TEST FOR A RESTRICTED TUBE BETWEEN THE FUEL TANK AND THE EVAPORATIVE EMISSION CANISTER	
● Connect the Evaporative Emission System Leak Tester to the fuel filler pipe. ● Attempt to pressurize the	**Yes** CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER

EVAP system to 3.48 kPa (14 inches H_2O). • **Does the pressure drop immediately?**	to Evaporative Emission Repair Verification Drive Cycle in this section. **No** GO to E4 .
E4 TEST FOR EVAP CANISTER TUBE OR FUEL VAPOR VENT VALVE ASSEMBLY BLOCKAGE	
• Disconnect the fuel vapor vent valve assembly from the EVAP canister tube. • Connect the EVAP System Leak Tester to the fuel filler pipe. • Pressurize the EVAP system to 3.48 kPa (14 inches H_2O). • **Does the pressure drop immediately?**	**Yes** INSTALL a new EVAP canister tube and/or fuel vapor tube (s) between the fuel tank and the EVAP canister and bracket assembly. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section. **No** INSTALL a new fuel vapor vent valve(s) or assembly. CARRY OUT the evaporative emission system leak test. REFER to Evaporative Emission System Leak Test in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to Evaporative Emission Repair Verification Drive Cycle in this section.

Canister Vent Solenoid Closing Procedure

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool

CAUTION: The canister vent solenoid must not be energized for more than nine minutes at one time. Once the canister vent solenoid is energized and de-energized, adequate time must be allowed for the component to cool adequately. Failure to allow the component to cool may create a false failure in the diagnostics, causing unnecessary repairs.

1. Connect the scan tool and select the output test mode.
2. If PID monitors are not active, select PIDs.
3. Select the fuel tank pressure (FTP) and the volts (V) parameter identification (PID) for monitoring.
4. Select the ALL OFF mode.
5. Close the canister vent solenoid by pushing the START button on the scan tool.

Evaporative Emission System Leak Test

Special Tool(s)

 ST2116-A	Evaporative Emission System Tester 310-F007 (134-00056) or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool

CAUTION: The evaporative emission system must not be pressurized to more than 3.48 kPa (14 inches H_2O) or damage to the evaporative emission system may occur.

1. Connect the Evaporative Emission System Leak Tester to the evaporative emission test port.
2. Close the canister vent solenoid. For additional information, refer to Canister Vent Solenoid Closing Procedure in this section.
3. Pressurize the evaporative emission system to 3.48 kPa (14 inches H_2O).
4. Monitor the system for two minutes. The system fails the leak test if the pressure falls below 2.0 kPa (8 inches H_2O).
5. Repair any leaks as necessary.
6. Repeat the leak test until the system remains above 2.0 kPa (8 inches H_2O) after the two-minute test period.

Evaporative Emission Repair Verification Drive Cycle

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool

Drive Cycle Recommendations

NOTE: The following procedure is designed to execute and complete the evaporative emission repair verification drive cycle and to clear the Ford P1000, inspection and maintenance (I/M) readiness code. When the ambient air temperature is below 4.4°C (40°F) or above 37.8°C (100°F), or the altitude is above 2,438 meters (8,000 feet), the EVAP monitor will not run. If the P1000 must be cleared in these conditions, the powertrain control module (PCM) must detect them once (twice on some applications) before the EVAP monitor can be bypassed and the P1000 cleared. The EVAP bypassing procedure is described in the following drive cycle.

1. Most OBD II monitors will complete more readily using a steady foot driving style during cruise or acceleration modes. Operating the throttle in a smooth fashion will minimize the time necessary for monitor completion.

2. Fuel tank level should be between one-half and three-quarters full with three-quarters full being the most desirable.

3. The evaporative monitor can only operate during the first 30 minutes of engine operation. When executing the procedure for this monitor, stay in part throttle mode and drive in a smooth fashion to minimize fuel slosh.

Drive Cycle Preparation

NOTE: For best results, follow each of the following steps as accurately as possible.

4. **NOTE:** This step bypasses the engine soak timer and resets OBD II monitor status.

   Install the scan tool. Turn the key ON with the engine OFF. Cycle the key off, then on. Select the appropriate vehicle and engine qualifier. Clear all diagnostic trouble codes (DTCs) and carry out a PCM reset.

5. Begin to monitor the following PIDs: ECT, EVAPDC, FLI (if available) and TP MODE. Press Diagnostic Data Link, PCM, PID/Data monitor and record, press trigger to select each PID, then start.

6. Start the engine without returning the key to the OFF position.

Preparation for Monitor Entry

WARNING: Strict observance of posted speed limits and attention to driving conditions

are mandatory when proceeding through the following drive cycle.

7. **NOTE:** This step allows engine warm-up and provides intake air temperature (IAT) input to the PCM.

   Idle the vehicle for 15 seconds. Drive at 64 km/h (40 mph) until the ECT is at least 76.7°C (170° F).

8. Is IAT above 4.4°C (40°F) and below 37.8°C (100°F)? If not, continue with the following steps but note that the EVAP Monitor Bypass portion of the drive cycle (Step 13) will be required to bypass the EVAP monitor and clear the P1000.

9. **NOTE:** This step executes the heated oxygen sensor (HO2S) monitor.

   Cruise at 64 km/h (40 mph) for 60 seconds.

10. **NOTE:** This executes the EVAP monitor if IAT is above 4.4°C (40°F) and below 37.8°C (100°F).

    NOTE: To initiate the monitor, TP MODE should equal PT, EVAPDC must be greater than 75%, and FLI must be between 15 and 85%.

    NOTE: Avoid sharp turns and hills.

    Cruise at 72 to 104 km/h (45 to 65 mph) for 10 minutes.

11. **NOTE:** This step executes the ISC portion of the Secondary Air/CCM.

    Bring the vehicle to a stop. Idle with the transmission in DRIVE (for automatic transmission) or NEUTRAL (for manual transmission) for two minutes.

Pending Code and EVAP Monitor Bypass Check

12. **NOTE:** This determines if a pending code is preventing the clearing of P1000.

    NOTE: If the EVAP monitor is not complete and IAT was below 4.4°C (40°F) or above 37.8°C (100°F) temperature range in Step 8, or the altitude is above 2,438 meters (8,000 feet), the EVAP Monitor Bypass (Step 13) must be carried out.

    Using the scan tool, check for pending codes. Conduct normal repair procedures for any pending code concerns. Rerun any incomplete monitor.

EVAP Monitor Bypass

13. **NOTE:** This allows the bypass counter to increment to two.

    NOTE: Do not repeat Step 4.

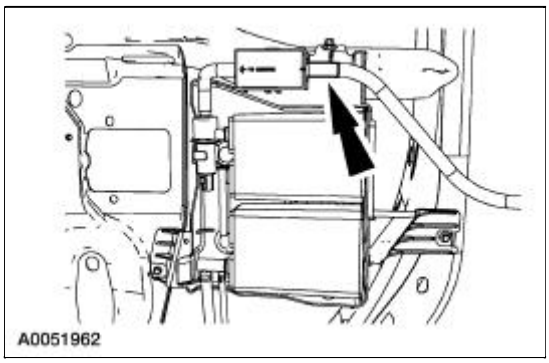
    Park the vehicle for a minimum of eight hours. Repeat Steps 5 through 12.

Evaporative Emission Canister

Material

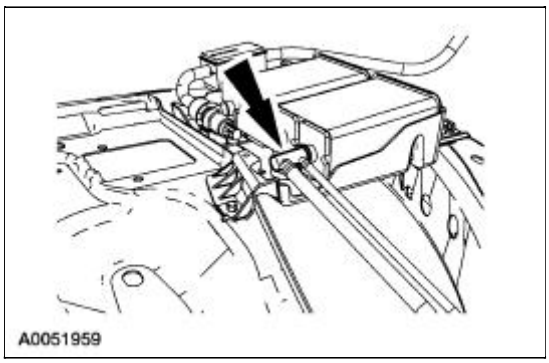
Item	Specification
MERPOL® —	ESE-M99B144-B

Removal and Installation



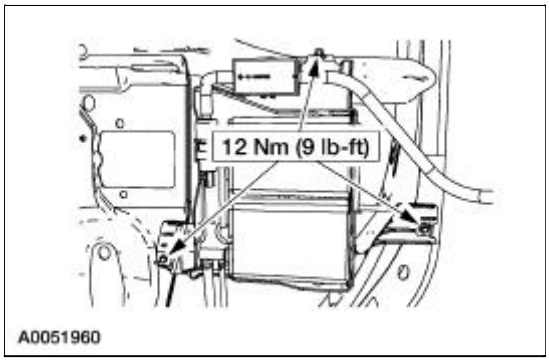
1. **WARNING: The evaporative emissions system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or liquid fuel are present in the area.**

   Disconnect the battery ground cable.

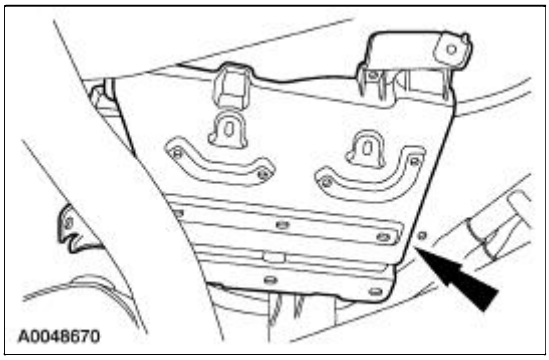


2. Raise and support the vehicle. For additional information, refer to Section 100-02 .

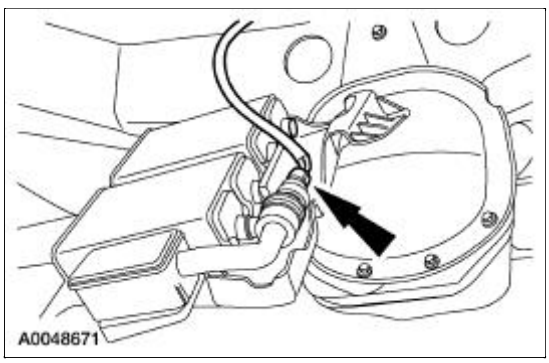
3. Remove the spare tire.



4. Disconnect the fuel filler pipe remote vapor hose.

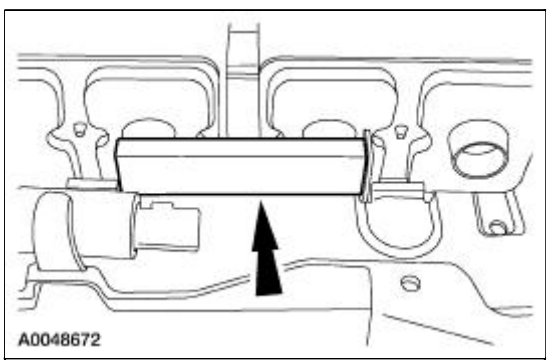


5. Disconnect the fuel vapor hoses from the evaporative emissions (EVAP) canister.

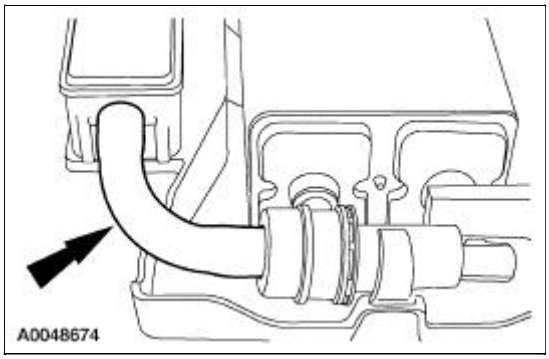


6. Remove the canister assembly mounting bolts.

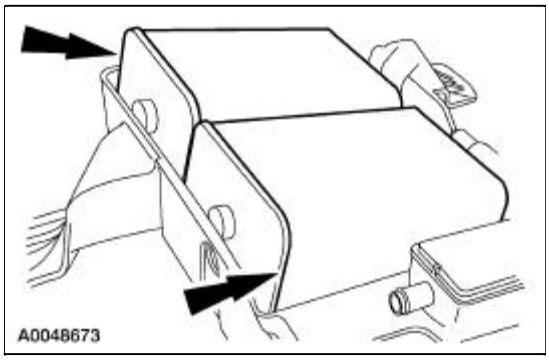
7. Remove the EVAP canister bracket assembly.



8. Disconnect the EVAP canister vent solenoid electrical connector.



9. Place the EVAP canister bracket assembly on a clean work surface.



10. Remove the vapor connector sleeve.

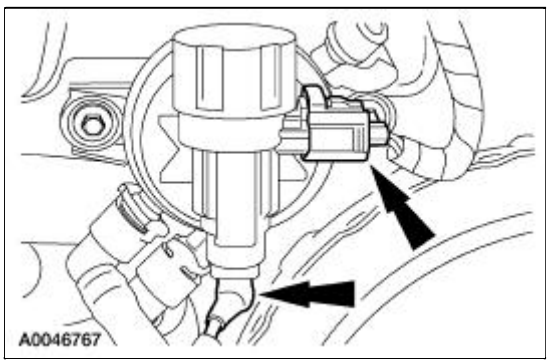
11. Disconnect the vapor hose from the EVAP canister vent solenoid.

12. Remove the EVAP canisters.

13. **NOTE:** Lubricate the O-rings with MERPOL®.

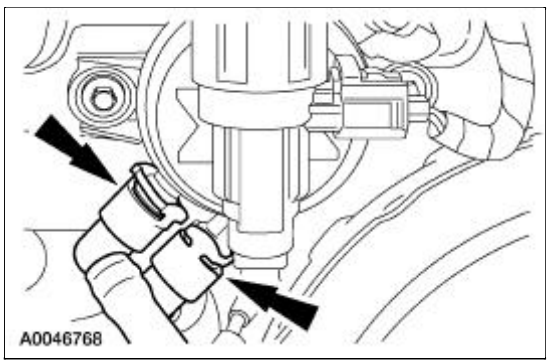
To install, reverse the removal procedure.

- Leak test the system. For additional information, refer to Evaporative Emission System Leak Test in this section.
- Carry out the evaporative emissions repair verification drive cycle. For additional information, refer to Evaporative Emission Repair Verification Drive Cycle in this section.



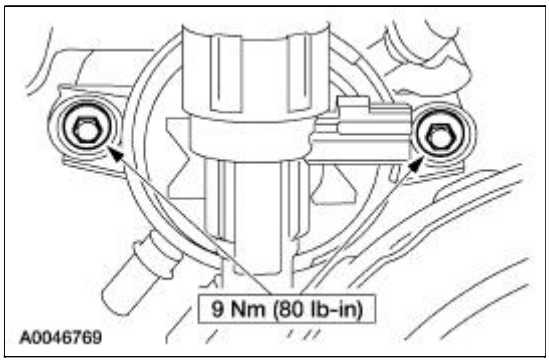
Evaporative Emission Canister Purge Valve

Removal and Installation



1. **WARNING: The evaporative emissions system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or liquid fuel are present in the area.**

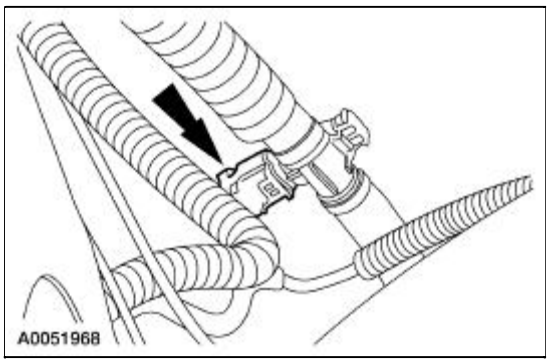
   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .



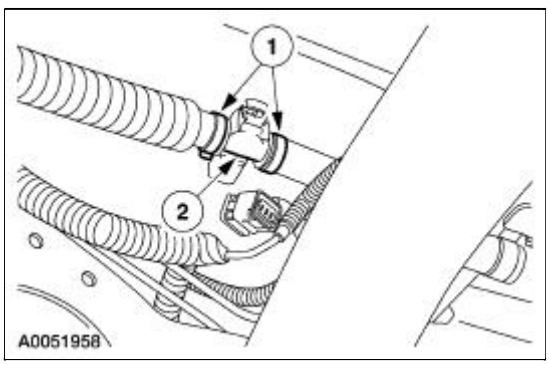
2. Disconnect the EVAP canister purge solenoid electrical connector and the vacuum hose.

3. Disconnect the two fuel vapor tubes.

4. Remove the bolts and the solenoid.



5. To install, reverse the removal procedure.
    - Leak Test the system. For additional information, refer to Evaporative Emission System Leak Test in this section.
    - Carry out the evaporative emissions repair verification drive cycle. For additional information, refer to Evaporative Emission Repair Verification Drive Cycle in this section.



Fuel Tank Pressure Sensor

Removal and Installation

1. Remove the fuel tank. For additional information, refer to Section 310-01 .
2. Disconnect the fuel tank pressure sensor (FTP) electrical connector.

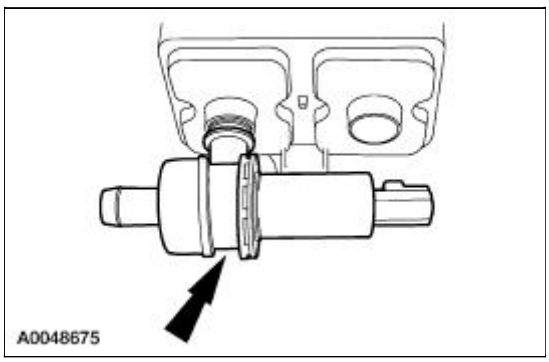
3. Remove the fuel tank pressure sensor:
   1. Remove the clamps.
   2. Remove the fuel tank pressure sensor.

4. To install, reverse the removal procedure.
   - Leak test the system. For additional information, refer to Evaporative Emission System Leak Test in this section.
   - Carry out the evaporative emission repair verification drive cycle. For additional information, refer to Evaporative Emission Repair Verification Drive Cycle in this section.

Evaporative Emission Canister Vent Solenoid

Material

Item	Specification
MERPOL® —	ESE-M99B144-B



Removal and Installation

1. Remove the evaporative emissions canister. For additional information, refer to Evaporative Emission Canister in this section.

2. **NOTE:** Inspect and install a new O-ring as necessary.

   NOTE: A twisting and pulling motion is required to remove the canister vent solenoid.

   Remove the evaporative emissions canister vent solenoid.

3. **NOTE:** Lubricate the O-rings with MERPOL®.

   To install, reverse the removal procedure.

   - Carry out the evaporative emission system leak test. For additional information, refer to Evaporative Emission System Leak Test in this section.
   - Carry out the evaporative emissions repair verification drive cycle. For additional information, refer to Evaporative Emission Repair Verification Drive Cycle in this section.

Torque Specifications

Description	Nm	lb-ft	lb-in
Accelerator splash shield bolts — 5.4L 4V	10	—	89
Accelerator splash shield bolts — 4.6L, 5.4L 2V	7	—	62
Cylinder head temperature (CHT) sensor	26	19	—
Engine coolant temperature (ECT) sensor	20	15	—
Heated oxygen sensor	46	34	—
Idle air control (IAC) valve bolts	a	a	a
Knock sensor (KS)	20	15	—
Powertrain control module (PCM) mounting bolts	7	—	62
PCM bracket mounting bolts to cowl	7	—	62
Camshaft position (CMP) sensor bolt	10	—	89
Mass air flow (MAF) sensor plate nuts	10	—	89
Crankshaft position (CKP) sensor bolt	10	—	89

[a] Refer to the procedure in this section.

Electronic Engine Controls

The electronic engine controls consist of the:

- powertrain control module (PCM)
- throttle position (TP) sensor
- idle air control (IAC) valve
- engine coolant temperature (ECT) sensor
- camshaft position
- camshaft position (CMP) sensor
- crankshaft position (CKP) sensor
- mass air flow (MAF) sensor
- intake air temperature (IAT) sensor
- heated oxygen sensor (HO2S)
- knock sensor (KS)
- vehicle speed sensor (VSS)
- cylinder head temperature (CHT) sensor

The PCM needs the following inputs to calibrate the engine correctly:

- camshaft position sensor (CMP)
- engine rpm
- engine coolant temperature
- amount of engine detonation
- crankshaft position
- air temperature
- throttle position
- cylinder head temperature
- mass air flow

The TP sensor:

- sends the PCM a signal indicating the throttle plate angle.
- is the main input to the PCM from the driver.

The IAC valve:

- controls bypass air around the throttle plate at low speeds.
- is controlled by the PCM.

The ECT sensor:

- sends the PCM a signal indicating engine temperature.
- resistance decreases as coolant temperature increases.

The CMP sensor:

- sends the PCM a signal indicating camshaft position used for fuel synchronization.

The CKP sensor:

- sends the PCM a signal indicating crankshaft position.
- is essential for calculating spark timing.

The MAF sensor:

- sends the PCM a signal indicating mass airflow rate of air entering the engine.

The IAT sensor:

- sends the PCM a signal indicating the temperature of the air entering the engine.
- resistance decreases as temperature increases.

The HO2S:

- has the ability to create a voltage signal dependent on exhaust oxygen content.
- provides feedback information to the PCM used to calculate fuel delivery.

The 4.6L KS is located in the lifter valley. The 5.4L has a unique linear KS located in the lifter valley.

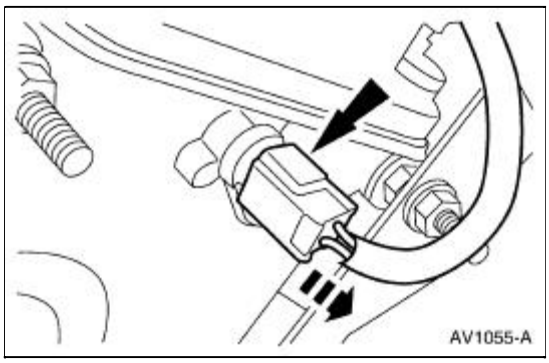
- The KS sends a signal to the PCM indicating engine detonation.

The CHT sensor:

- is mounted into the wall of the cylinder head and is not connected to any coolant passages.
- sends a signal to the PCM indicating cylinder head temperature.
    - If the temperature exceeds 126°C (258°F) 5.4L, 130°C (265°F) 4.6L, the PCM disables four fuel injectors at a time. The PCM will alternate which four fuel injectors are disabled every 32 engine cycles. The four cylinders that are not being fuel injected act as air pumps to aid in cooling the engine.
    - If the temperature exceeds 154°C (310°F) 5.4L, 166°C (330°F) 4.6L, the PCM disables all of the fuel injectors until the engine temperature drops below 154°C (310°F) 5.4L, 153°C (308°F) 4.6L.

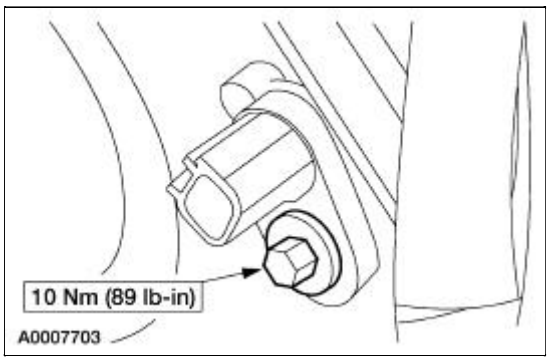
The VSS:

- is gear driven by the transmission.
- sends a signal to the PCM indicating vehicle speed. For additional information, refer to Section 307-01A R4100 and/or Section 307-01B 4R70W.



Electronic Engine Controls

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

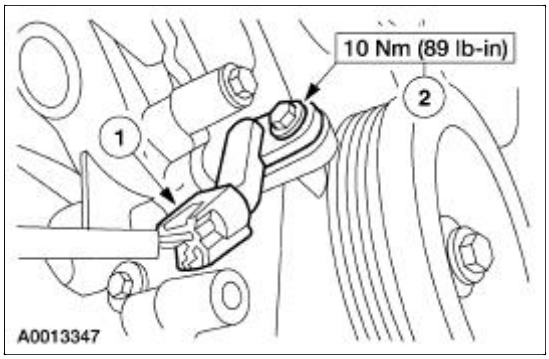


Camshaft Position (CMP) Sensor

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Disconnect the camshaft position (CMP) sensor electrical connector.

3. Remove the bolt and the CMP sensor.



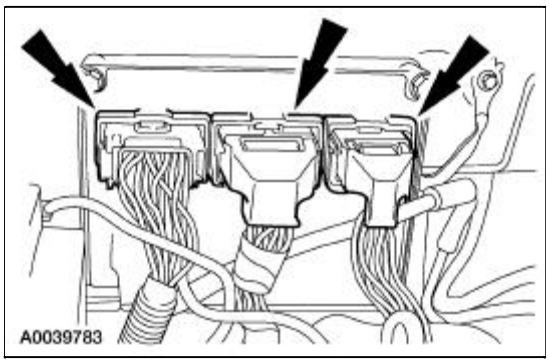
4. To install, reverse the removal procedure.

Crankshaft Position (CKP) Sensor

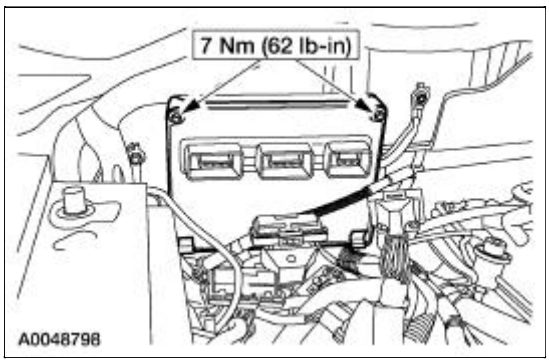
Removal and Installation

1. Remove the A/C compressor. For additional information, refer to Section 412-03A or Section 412-03B .

2. Remove the crankshaft position (CKP) sensor.
   1. Disconnect the electrical connector.
   2. Remove the bolt and the sensor.



3. To install, reverse the removal procedure.



Powertrain Control Module (PCM)

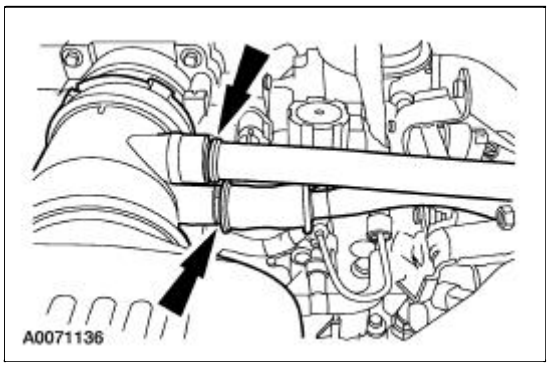
Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-00 .
2. Disconnect the powertrain control module (PCM) electrical connectors.

3. Remove the bolts and the PCM.

4. To install, reverse the removal procedure.

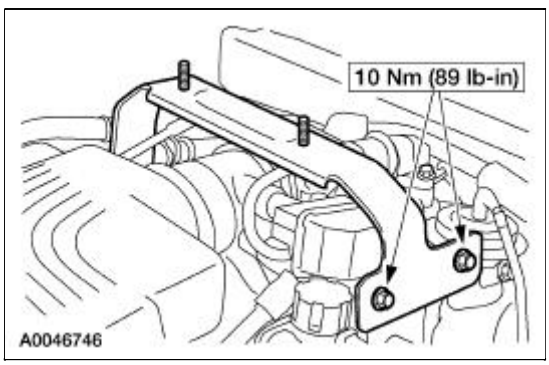
Throttle Position (TP) Sensor —4.6L and 5.4L (2V)



Removal and Installation

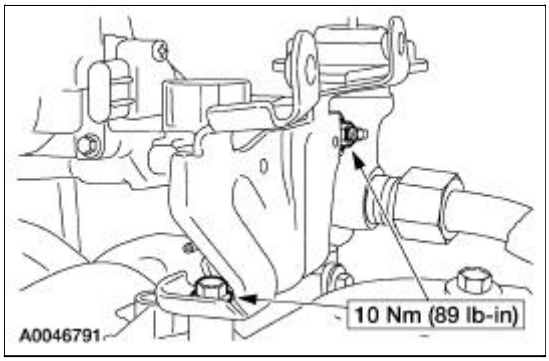
All vehicles

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .



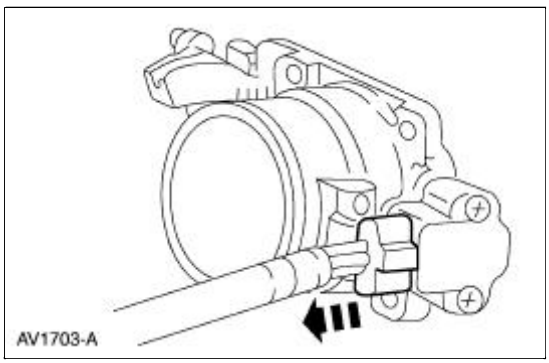
2. **NOTE:** 5.4L shown, 4.6L similar.

   Disconnect the engine breather hose and the idle air control (IAC) valve hose, and position aside.



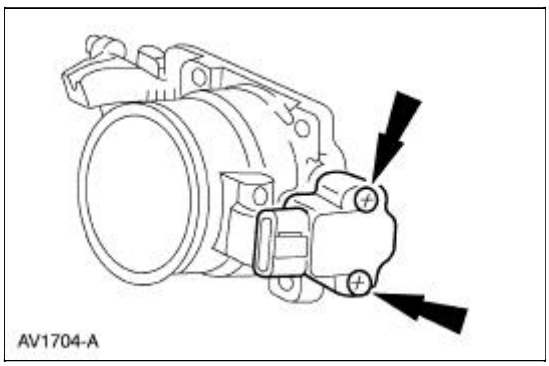
4.6L vehicles

3. Remove the engine appearance cover bolts and bracket.



5.4L vehicles

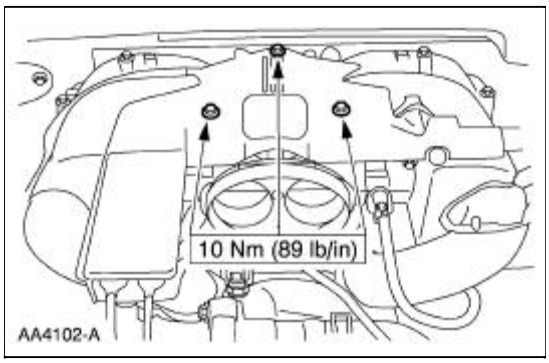
4. Remove the differential pressure feedback exhaust gas recirculation (EGR) system bracket nut and bolt, and position the bracket aside.



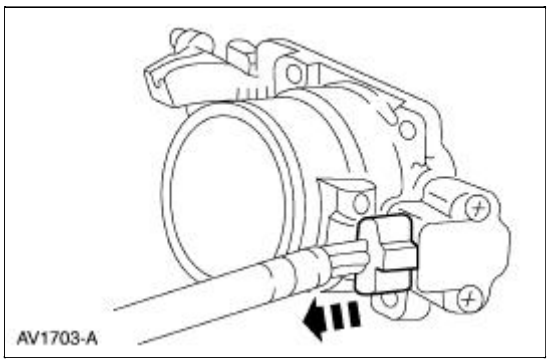
All vehicles

5. Disconnect the throttle position (TP) sensor electrical connector.

6. Remove the screws and the TP sensor.

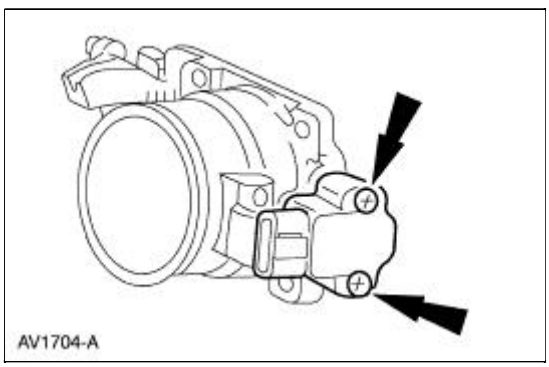


7. To install, reverse the removal procedure.



Throttle Position (TP) Sensor —5.4L (4V)

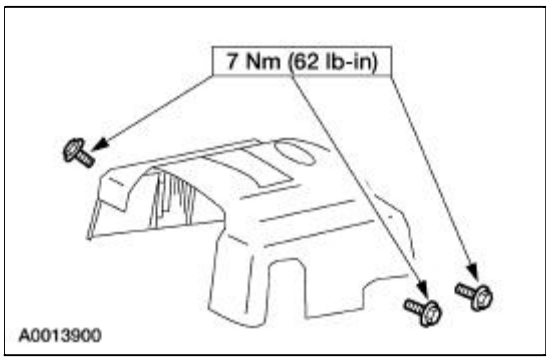
Removal and Installation



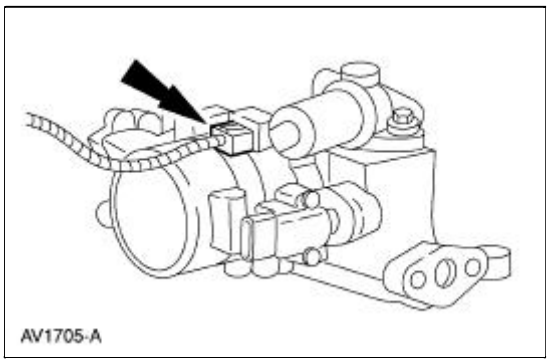
1. Disconnect the battery ground cable. For additional information, refer to Section 414-00 .
2. Remove the bolts and the accelerator splash shield.

3. Disconnect the throttle position (TP) sensor electrical connector.

4. Remove the screws and the TP sensor.

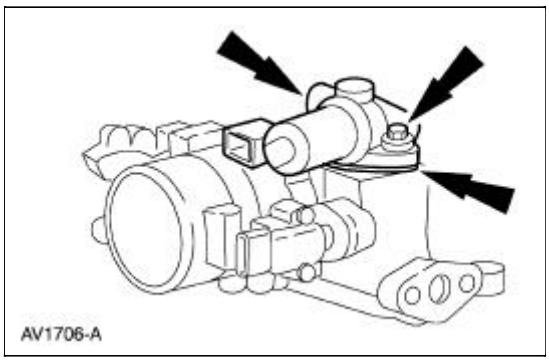


5. To install, reverse the removal procedure.

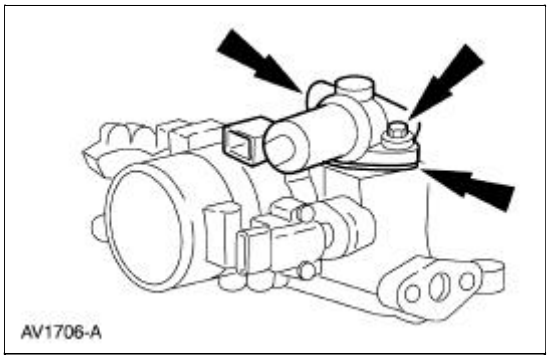


Idle Air Control (IAC) Valve —4.6L and 5.4L (2V)

Removal and Installation

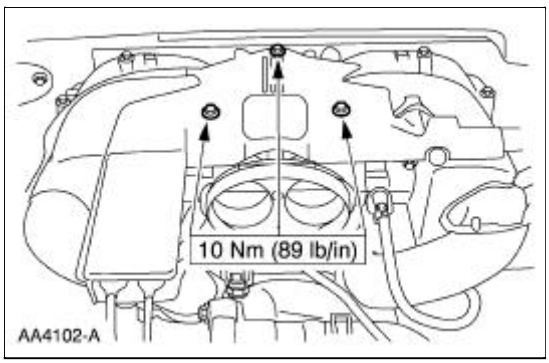


1. Disconnect the battery ground cable. For additional information, refer to Section 414-00 .
2. Remove the bolts and the accelerator splash shield.



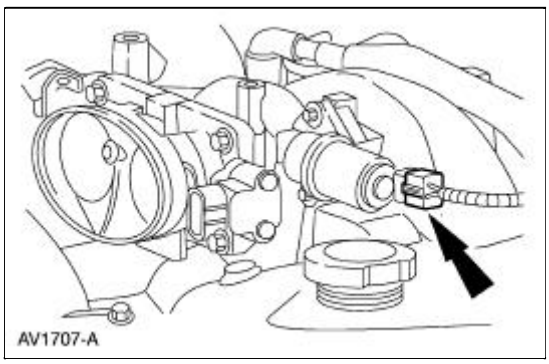
3. Disconnect the idle air control (IAC) valve electrical connector.

4. Remove the two bolts and the IAC valve.



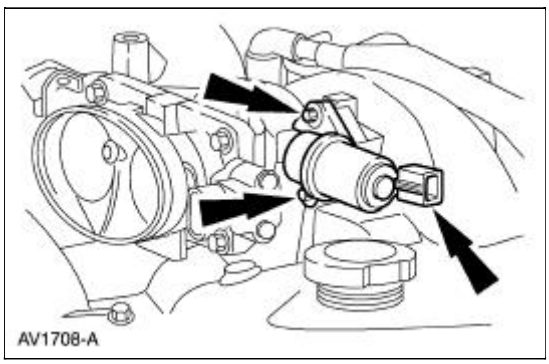
5. To install, reverse the removal procedure. Install a new IAC valve gasket. Tighten the two bolts in 2 stages.
   - Stage 1: Tighten to 10 Nm (89 lb-in).
   - Stage 2: Rotate 90 degrees.

AV1706-A



Idle Air Control (IAC) Valve —5.4L (4V)

Removal and Installation



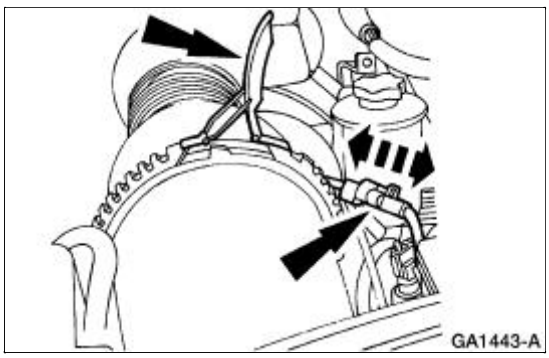
1. Remove the bolts and the accelerator control snow shield.

2. Disconnect the idle air control (IAC) valve electrical connector.

3. Remove the bolts, IAC valve and gasket.

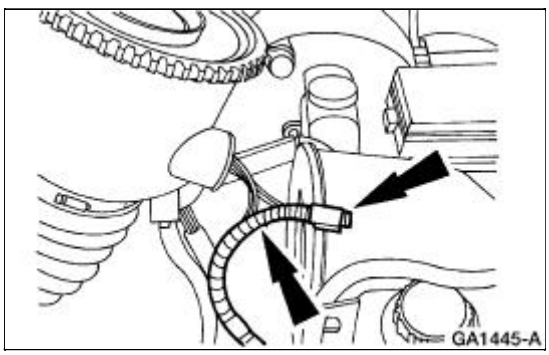
4. To install, reverse the removal procedure. Install a new IAC gasket. Tighten the bolts in two stages.
    - Stage 1: Tighten to 10Nm (89 lb-in).
    - Stage 2: Rotate an additional 90 degrees.

Mass Air Flow (MAF) Sensor



Removal and Installation

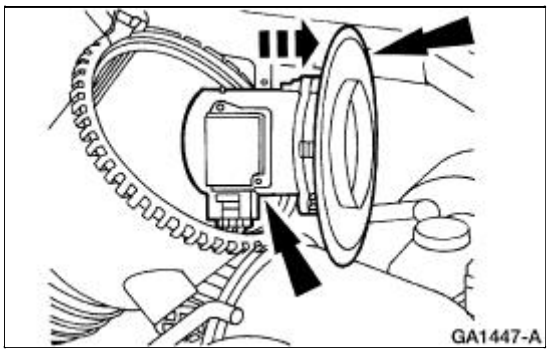
1. Disconnect the battery ground cable. For additional information, refer to Section 414-00 .



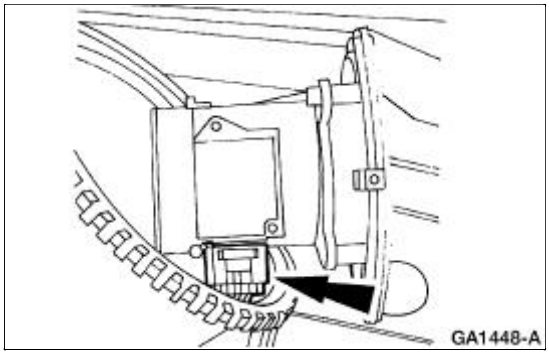
2. **CAUTION: Do not tamper with the sensing elements located in the mass air flow (MAF) sensor. Tampering may result in unit failure.**

   NOTE: The MAF sensor module and body are calibrated and serviced as a unit.

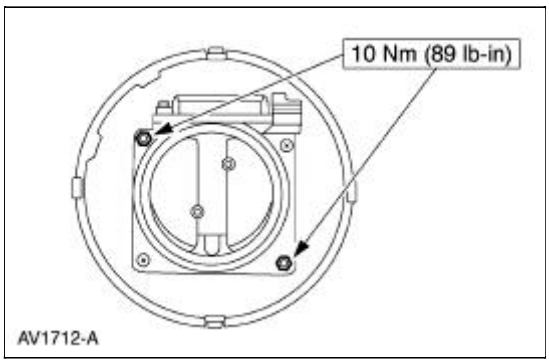
   Open the air cleaner.
   - Disconnect the MAF sensor extension harness connector from the wiring harness.
   - Release the air cleaner clamp.
   - Separate the inlet side of the air cleaner from the outlet side of the air cleaner.



3. Cut the tape on the wire loom of the extension harness.
   - Peel back the wire loom from the extension harness near the grommet in the air cleaner.



4. Remove the grommet from the outlet side of the air cleaner and slide the grommet down the extension harness.

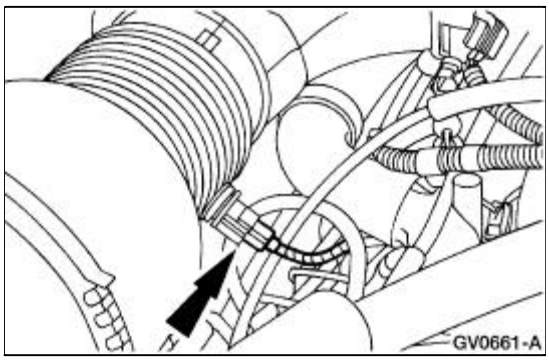


5. Remove the MAF sensor plate and the MAF sensor from the outlet side of the air cleaner.

6. Disconnect the MAF sensor electrical connector from the extension harness.

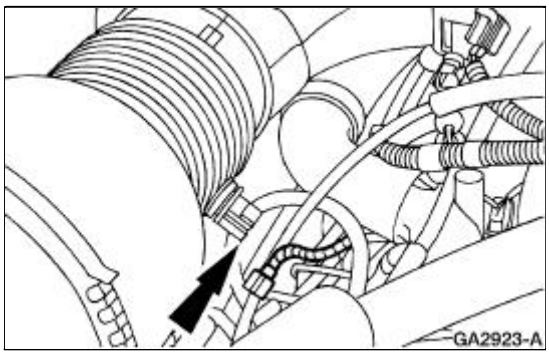
7. Separate the MAF sensor plate from the MAF sensor.
   - Remove the nuts from the MAF sensor plate.

8. **CAUTION: The grommet used to seal the engine air cleaner housing at the extension harness must be fully seated. Failure to do so will result in unmetered air entering the engine.**



NOTE: Use the alignment notch to correctly align the inlet side and the outlet side of the air cleaner.

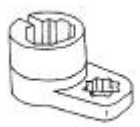
To install, reverse the removal procedure.



Intake Air Temperature (IAT) Sensor

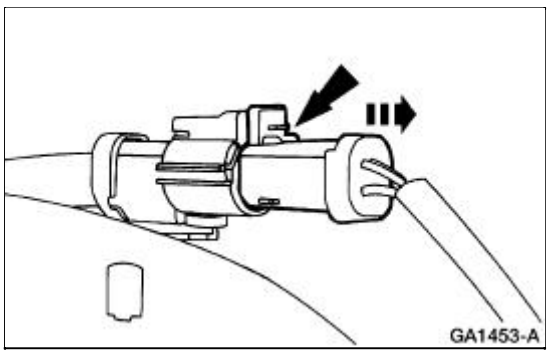
Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-00 .
2. Disconnect the intake air temperature (IAT) sensor electrical connector.



3. Remove the IAT sensor.

4. To install, reverse the removal procedure.



Heated Oxygen Sensor (HO2S)

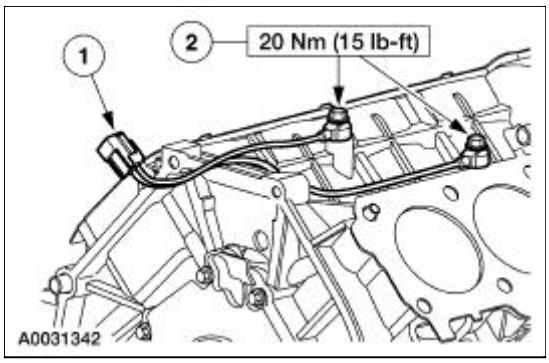
Special Tool(s)

 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Raise and support the vehicle. For additional information, refer to Section 100-02 .
3. Disconnect the heated oxygen sensor (HO2S) electrical connector.

4. Using the special tool, remove the HO2S.



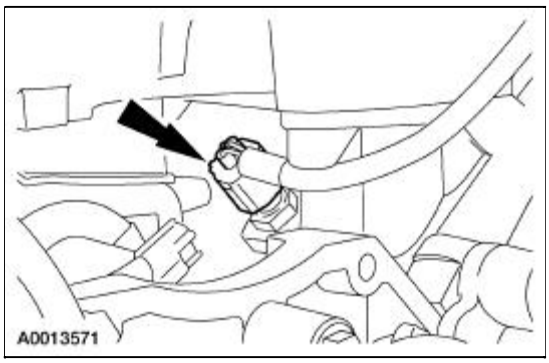
5. To install, reverse the removal procedure.

Knock Sensor (KS) —4.6L, 5.4L

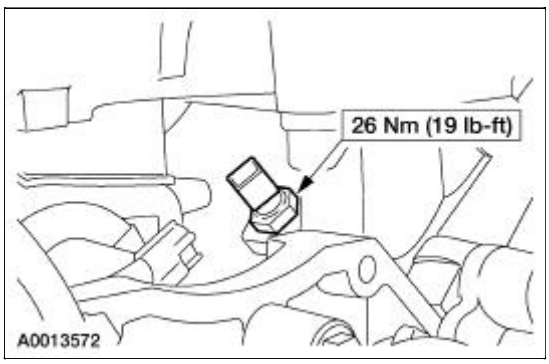
Removal and Installation

1. Remove the intake manifold. For additional information, refer to Section 303-01A .

2. Remove the knock sensor (KS).
    1. Disconnect the electrical connector.
    2. Remove the bolts and the KS.



3. To install, reverse the removal procedure.

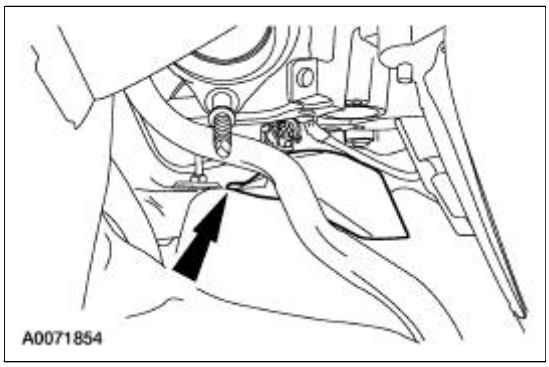


Cylinder Head Temperature (CHT) Sensor —4.6L and 5.4L (2V)

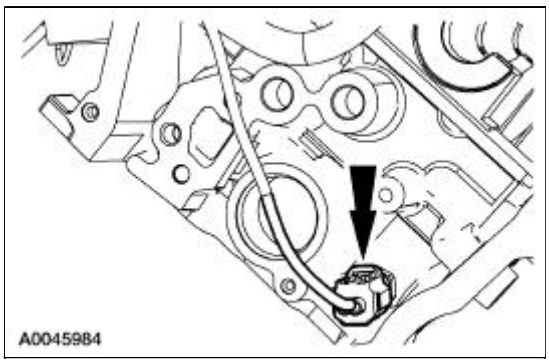
Removal and Installation

1. Remove the intake manifold. For additional information, refer to Section 303-01A .
2. Disconnect the cylinder head temperature (CHT) sensor.

3. Remove the CHT sensor.



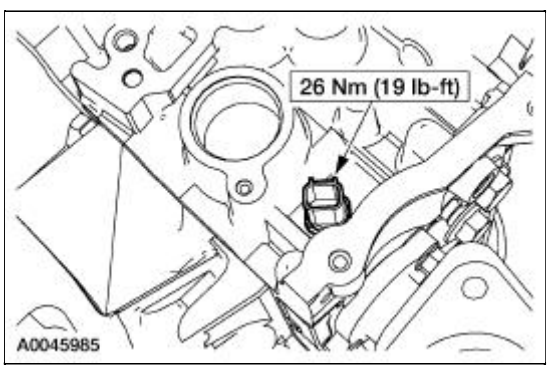
4. To install, reverse the removal procedure.



Cylinder Head Temperature (CHT) Sensor —5.4L (4V)

Removal and Installation

1. Drain the engine coolant. For additional information, refer to Section 303-03 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the RH catalytic converter. For additional information, refer to Section 309-00 .
4. Remove the air conditioning water deflector retainer and position the deflector aside.



5. Disconnect the cylinder head temperature (CHT) sensor electrical connector.

6. **NOTE:** The CHT sensor is located at the back of the right side cylinder head.

   Remove the CHT sensor.

7. To install, reverse the removal procedure.

General Specifications

[a] CAUTION: Using a transmission fluid that indicates a dual usage MERCON ® and MERCON V® in a transmission application requiring MERCON®, may cause transmission damage. Use of any fluid other than the recommended fluid may cause transmission damage. NOTE: Refer to the transmission fluid level indicator and the Owner's Guide for the type of transmission fluid required. Some fluid labels may indicate dual usage such as MERCON® and MERCON V®. These dual-usage fluids are not to be used in transmissions that use only the MERCON®-type fluid. These dual-usage fluids may be used in transmissions that require MERCON V® use.

[b] The fluid capacities are approximate dry fill capacity and include fluid coolers and fluid cooler tubes. Fluid level indicator should be used to determine actual fluid requirement and fluid specifications. Check level at operating temperature. DO NOT OVERFILL. The transmission fluid should be changed every 30,000 miles (48,000 km) regardless of normal or special operating conditions.

Band/Clutch Application Chart A

	Friction Elements						
Gear	**Intermediate Band**	**Coast**	**Overdrive**	**Intermediate**	**Direct**	**Forward**	**Reverse**
(D) first	—	a b	—	—	—	apply	—

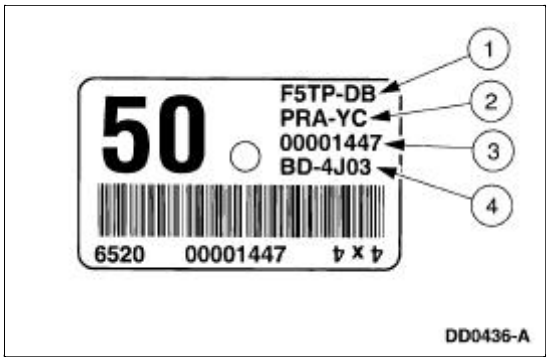
Transmission Description

The 4R100 features include:

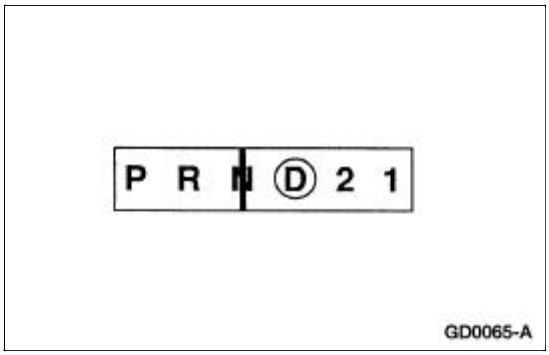
- four speeds.
- fully automatic.
- electronically controlled.



The main operating components include:

- Torque converter clutch.
- Six multiple-disc friction clutches.
- One band.
- One sprag one-way clutch.
- Two roller one-way clutches that provide for the desired function of three planetary gearsets.

Identification Tags



An identification tag is located on the left side of the transmission, rearward of the transmission range digital (TR) sensor.

Item	Description
1	Assembly part number prefix and suffix
2	Transmission model
3	Serial
4	Build date (year, month and day).

Range Selection

The transmission has six range positions: P, R, N, (D), 2 and 1.

Park

In the PARK position:

- there is no powerflow through the transmission.
- the parking pawl locks the output shaft to the case.
- the engine may be started.
- the ignition key may be removed.

Reverse

In the REVERSE position:

- the vehicle may be operated in a rearward direction, at a reduced gear ratio.

Neutral

In the NEUTRAL position:

- there is no powerflow through the transmission.
- the output shaft is not held and is free to turn.
- the engine may be started.

Overdrive

Overdrive is the normal position for most forward driving.

The OVERDRIVE position provides:

- automatic shifts.
- apply and release of the torque converter clutch.

- maximum fuel economy during normal operation.

Second Position

This position provides:

- second gear start and hold.
- the torque converter clutch to apply and release.
- improved traction and engine braking on slippery roads.

First Position

If this position is selected at normal road speeds, the transmission will shift into second gear, then into first when the vehicle reaches a speed within first gear range.

This position provides:

- first gear operation only.
- engine braking for descending steep grades.

Shift Patterns

Upshifts

NOTE: This vehicle has been equipped with a special cold weather shift strategy. This was designed to maximize heater output. This new strategy operates under the following conditions: ambient air temperature at start-up is -4°C (25°F) or below and the engine coolant temperature at start-up is 38°C (100°F) or below. During this condition, the vehicle may experience slightly delayed shifts under light throttle. Medium and heavy throttle shifts will be normal. Once the engine coolant reaches 71°C (160° F) or above, normal shift scheduling will resume. If, during the diagnosing of a delayed shift concern, the concern goes away after the engine coolant reaches 71°C (160°F) or above, this is a normal operation of the special cold weather shift strategy. If this condition does not go away after the engine coolant reaches 71°C (160°F), refer to Diagnosis By Symptom in this section.

NOTE: All gasoline vehicles will have new adaptive shift strategies. Whenever the vehicles battery has been disconnected for any type of service or repair, the strategy parameters that are stored in the keep alive memory (KAM) will be lost. The strategy will start to relearn once the battery is reconnected and the vehicle is driven. This is a temporary condition and will return to normal operating condition once the powertrain control module (PCM) relearns all the parameters from the driving operating conditions. There is no time frame set for this process. If this concern is present during downshifts or converter clutch apply, it is not the shift strategy and will require diagnosis as outlined in the workshop manual.

The customer must be notified that they may experience slightly different upshifts (either soft or firm) and that this condition is temporary and will eventually return to normal operating condition.

Transmission upshifting is controlled by the PCM. The PCM receives inputs from various engine or vehicle sensors and driver demands to control shift scheduling, shift feel and torque converter clutch (TCC) operation.

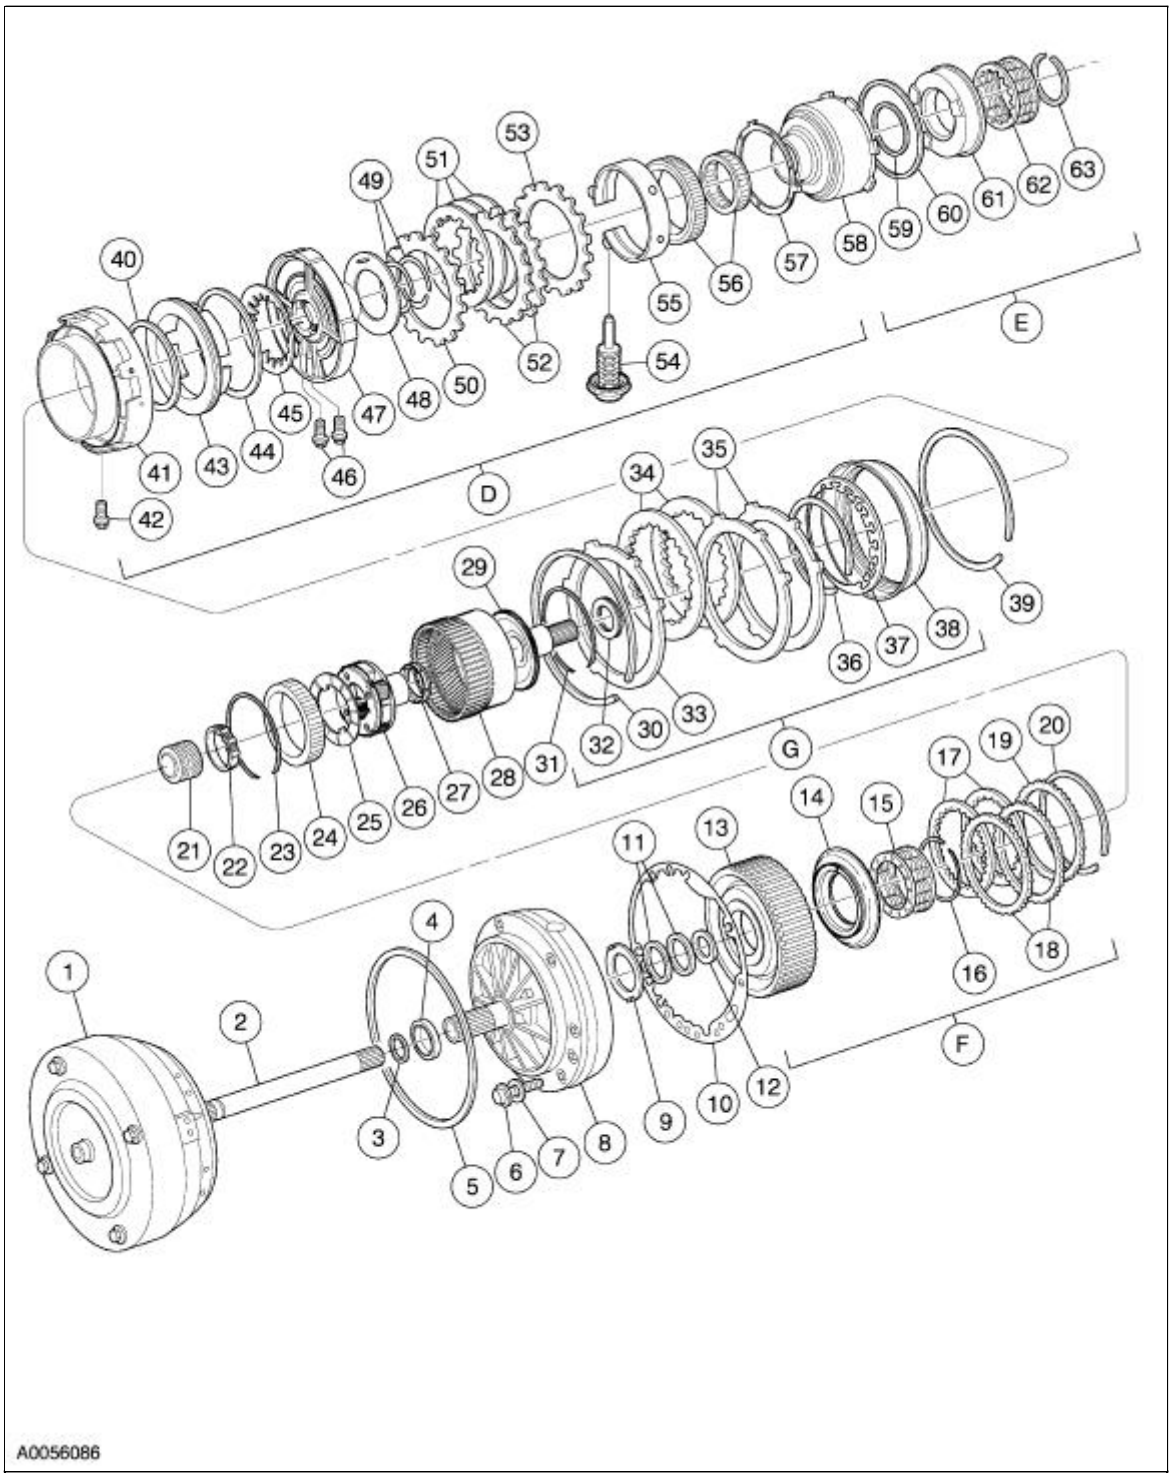
Downshifts

Under certain conditions the transmission will downshift automatically to a lower gear range (without moving the transmission range selector lever). There are three categories of automatic downshifts: Coastdown, Torque Demand and Forced or Kickdown shifts.

Coastdown

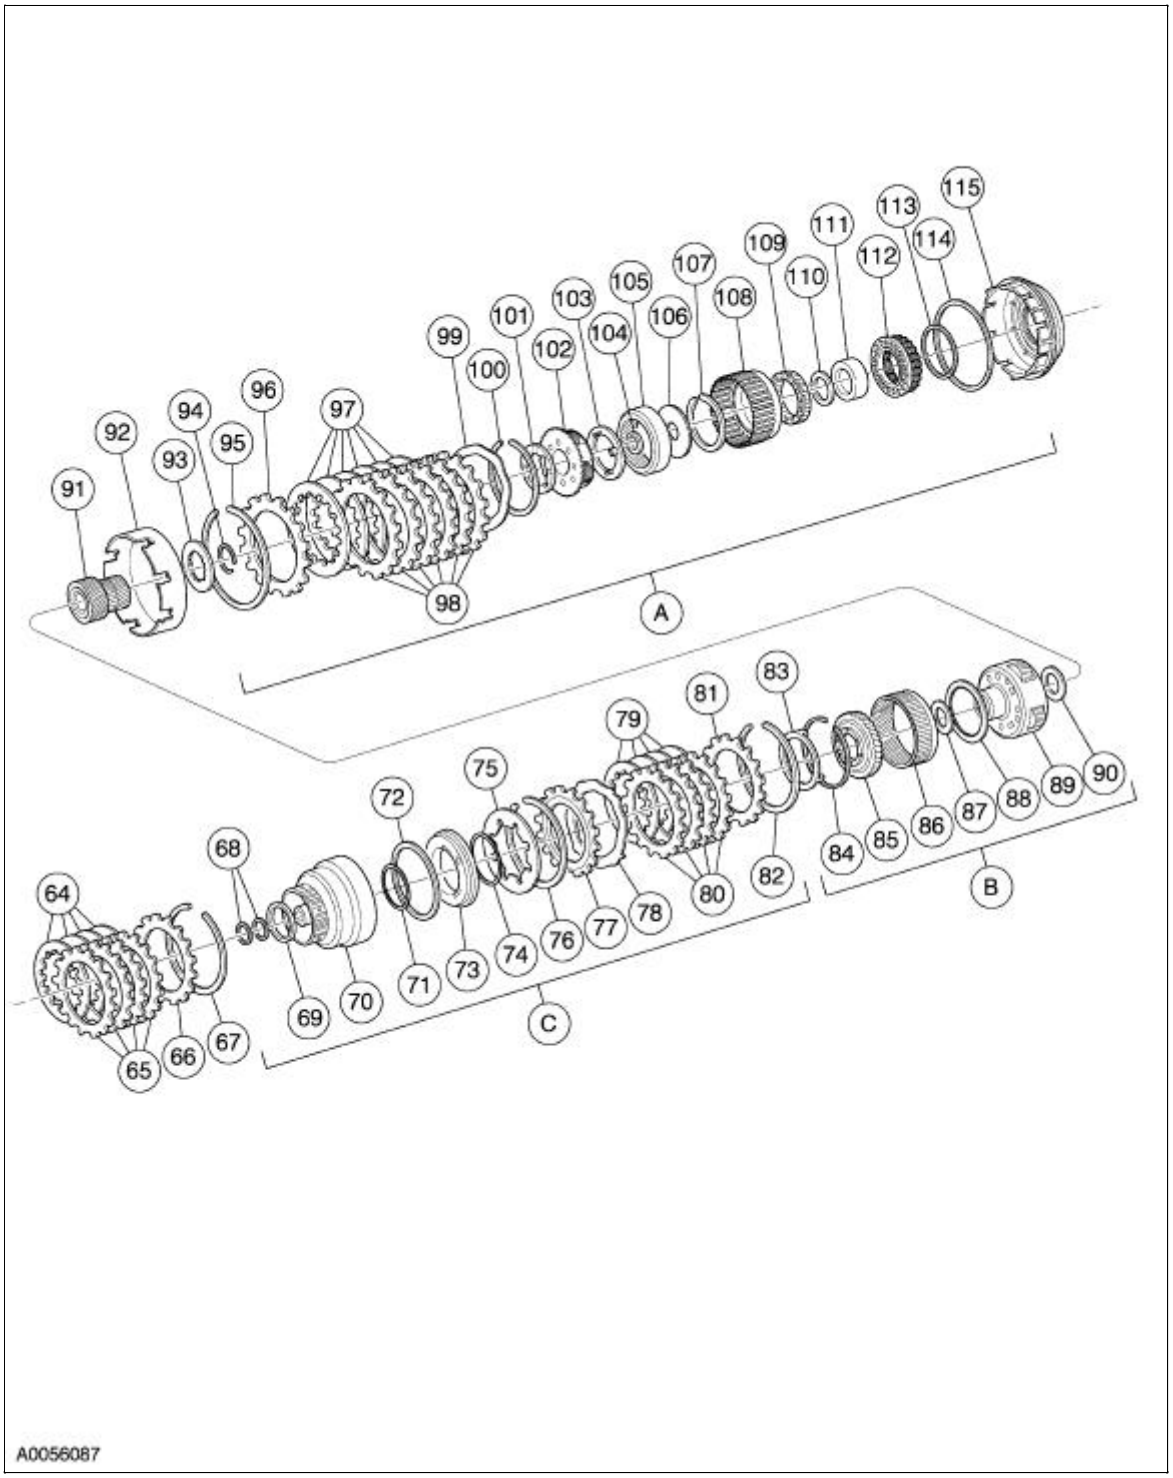
The coastdown downshift occurs when the vehicle is coasting down to a stop.

Torque Demand



The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide at that gear ratio.

Kickdown



For maximum acceleration, the driver can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear is possible below calibrated speeds. Specifications for downshift speeds are subject to variations due to tire size, engine, axle ratio and transmission calibration requirements.

Torque Converter

The torque converter transmits and multiplies torque. The torque converter is a four-element device:

- Impeller assembly
- Turbine assembly
- Reactor assembly
- Clutch and damper assembly

The standard torque converter components operate as follows:

- Rotation of the converter housing and impeller set the fluid in motion.
- The turbine reacts to the fluid motion from the impeller, transferring rotation to the geartrain through the input shaft.
- The reactor redirects fluid going back into the impeller, providing for torque multiplication.
- The clutch and damper assembly dampens powertrain torsional vibration and provides a direct mechanical connection for improved efficiency.
- Power is transmitted from the torque converter to the planetary gearsets and other components through the input shaft.

Item	Part Number	Description

2	—	Reactor (part of 7902)
3	—	Turbine (part of 7902)

4	—	Impeller (part of 7902)
5	—	Fluid motion
6	—	Transmission input rotation
7	—	Input shaft
8	—	Engine rotation

Geartrain

Power is transmitted from the torque converter to the geartrain components through the input shaft and forward clutch cylinder.

- By holding or driving certain members of the gearset, four forward ratios and one reverse ratio are obtained and transmitted to the output shaft. The ratios are as follows:

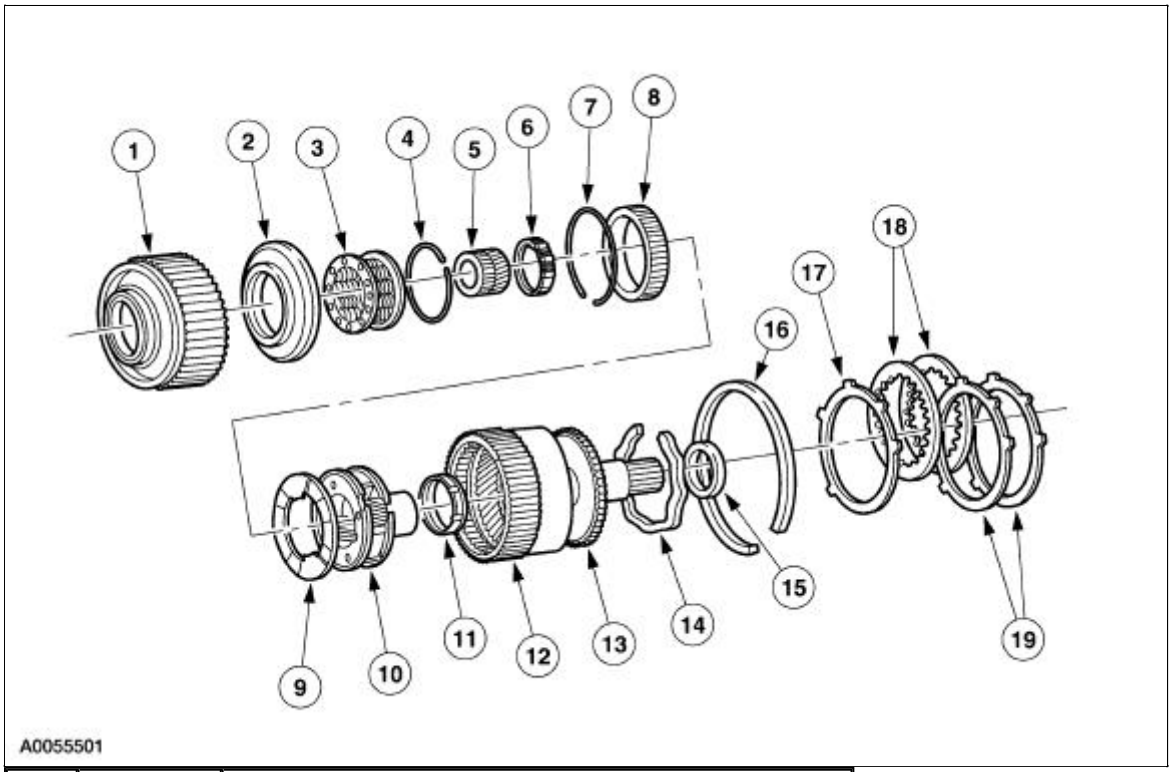
Gear Ratio	
1ST	2.71 to 1
2ND	1.54 to 1
3RD	1.00 to 1
4TH	0.71 to 1
REVERSE	2.18 to 1

Input Shaft

The input shaft is supported by two bushings in the stator support. End positioning of the input shaft is controlled by the splines in the converter turbine and the overdrive planet assembly.

Output Shaft

The output shaft is supported by two bushings in the case and by the slip-yoke and bushing in the extension housing. End positioning is controlled by the parking pawl gear and snap ring or shoulder and by the reverse ring gear hub and snap ring.



Overdrive System

The overdrive planetary system consists of the overdrive planet assembly, overdrive sun gear, overdrive ring gear, coast clutch cylinder, overdrive one-way clutch assembly and the center shaft, as shown in the following illustration. The overdrive planet assembly is splined to the input shaft. The overdrive sun gear is centered by a bushing on the input shaft and held in place laterally by needle bearings on the reactor support and the overdrive planet assembly. The overdrive sun gear is splined to the coast clutch cylinder, which in turn is splined to the overdrive one-way clutch inner race.

The outer race of the one-way clutch is splined to the overdrive ring gear, which is splined to the center shaft. The center shaft is centered by the forward planetary assembly and is laterally held by needle bearings on the center support and the overdrive planet assembly. The center shaft is splined into the forward clutch cylinder.

The coast clutch is splined between the coast clutch cylinder and the overdrive ring gear. The coast clutch is activated to carry out engine braking in MANUAL 1, MANUAL 2 and third gear with the transmission control switch engaged.

The overdrive clutch steel plates are splined to the case, the friction plates are splined to the coast clutch cylinder. The overdrive clutch holds the coast clutch cylinder and, in turn, the overdrive sun gear, to permit the planet assembly to overdrive the ring gear.

Center Support and Intermediate/Overdrive Clutch Cylinder

The center support provides a pilot for the forward clutch and direct clutch cylinders. It also provides fluid for clutch application and lube flow. The center support is held radially and laterally by the case. Fluid supply enters through feed bolts into the center support and supplies the forward clutch and the intermediate lube circuits. The direct clutch is fed by the center support.

The intermediate/overdrive clutch cylinder is radially supported by the case. Laterally, the cylinder is held in the case by a snap ring. The overdrive circuit is fed through a feed bolt into the cylinder. The intermediate clutch circuit is fed through nearby orifices.

Item	Part Number	Description

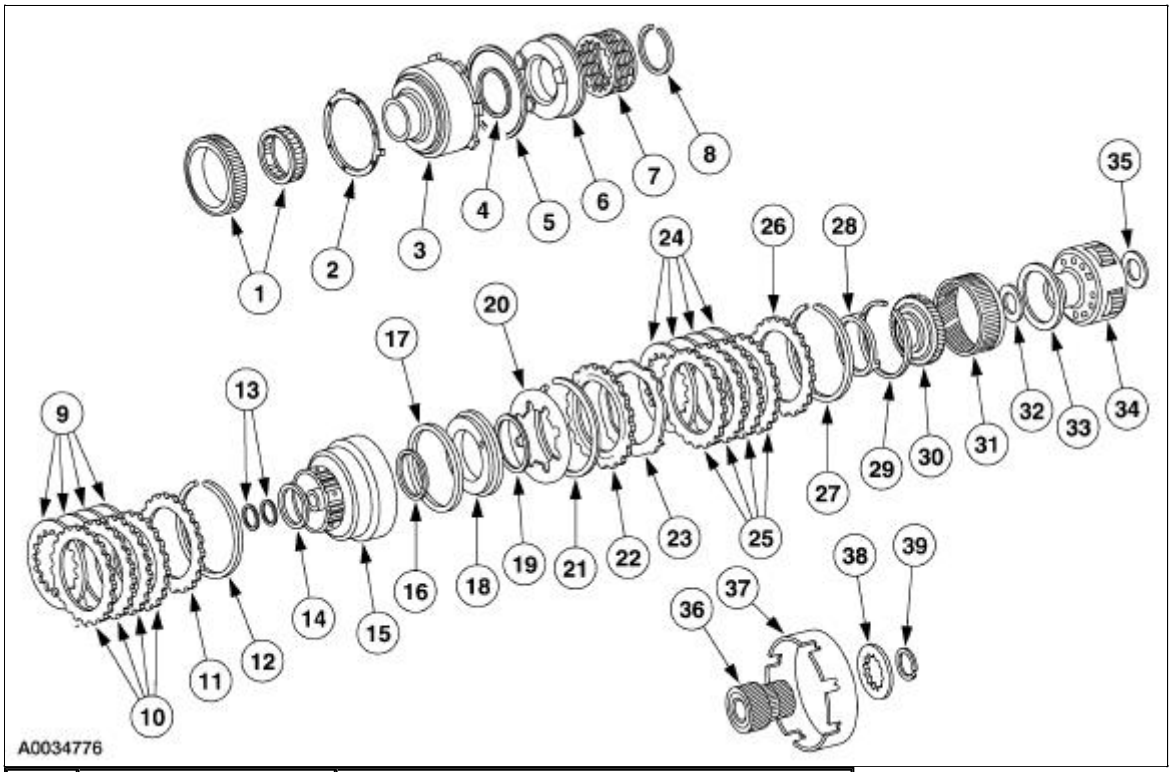
19	7A130	Support assembly — center
20	7L326	Washer — center support thrust No. 6
21	7B066	Plate — intermediate clutch pressure apply
22	7B066	Plate — intermediate clutch external spline steel

Forward Drive System

The forward drive system consists of the forward clutch cylinder, intermediate brake drum, intermediate one-way clutch, input shell, forward ring gear, forward ring gear hub, forward/reverse sun gear and the forward planetary carrier and forward planetary gears.



The forward clutch cylinder is splined on the center shaft. The forward ring gear is piloted on the forward ring gear hub. Thrust bearings on the forward planet assembly and forward clutch cylinder hold the forward ring gear hub in place.

The intermediate brake drum is radially supported by bushings on the center support and is laterally controlled by a thrust washer on the forward clutch cylinder and center support. The intermediate brake drum has the inner race of the intermediate one-way clutch press-fitted on its pilot. The intermediate one-way clutch's outer race is splined to the intermediate friction clutch, which is splined to the case. The intermediate brake drum has lugs that are slotted into the input shell to form a mechanical connection. The input shell is splined into the forward/reverse sun gear. The forward/reverse sun gear is common to two planetary gearsets. The forward planet is splined to the output shaft and is laterally positioned by needle bearings on the sun gear and on the forward clutch cylinder, as shown in the following illustration.

Two friction clutch assemblies, the direct clutch and the forward clutch, are shown with the forward planetary assembly. The direct clutch assembly splines the forward clutch cylinder to the intermediate brake drum. The forward clutch assembly splines the forward clutch cylinder to the forward ring gear. The forward clutch is activated during all forward gears. While in third or fourth gear, both the direct and forward clutches are applied to hold the forward planetary assembly and enable it to act as a solid shaft.

In second gear, the intermediate clutch assembly holds the forward/reverse sun gears. It is applied, along with the intermediate one-way clutch, to hold the intermediate brake drum, input shell and forward/reverse sun gear. In higher gears, the one-way clutch overruns.

Forward Drive System Components

Item	Part Number	Description
1	7A089	Clutch assembly — intermediate one-way
2	7G401	Washer — intermediate one-way clutch thrust No. 7
3	7D044	Drum assembly — intermediate brake
4	7A548	Seal — direct clutch piston — inner

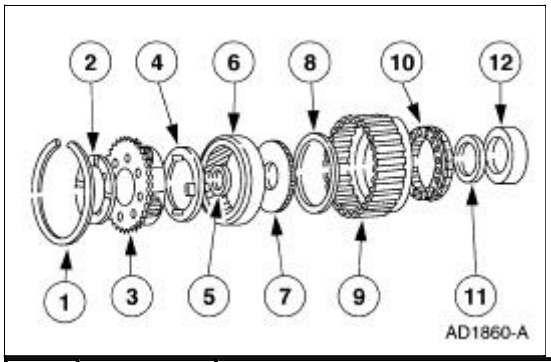
9	7B164	Plate — direct clutch internal spline — friction
10	7B442	Plate — direct clutch external spline — steel
11	7B066	Plate — direct clutch pressure
12	377126-S, 377127-S, 377128-S, 377437-S	Ring — direct clutch pressure plate retaining (selective fit)
13	7D019	Seal — forward clutch cylinder (2 req'd)
14	7F374	Bearing assembly — forward clutch cylinder thrust No. 8B
15	7A360	Cylinder assembly — forward clutch
16	7A548	Seal — forward clutch piston inner
17	7A548	Seal — forward clutch piston outer
18	7A262	Piston assembly— forward clutch

19	7D256	Ring — piston apply
20	7B070	Spring — piston return
21	377127-S	Ring — forward clutch spring (forward clutch piston spring to forward clutch cylinder assembly)
22	7B066	Plate — forward clutch pressure
23	7E085	Spring — forward clutch pressure
24	7B164	Plate — forward clutch internal spline friction
25	7B442	Plate — forward clutch external spline steel
26	7B066	Plate — forward clutch pressure rear
27	377127-S, 377437-S, 377444-S, 386841-S, 386842-S	Ring — forward clutch pressure plate retaining (selective fit)
28	7D090	Washer — forward clutch hub thrust No. 8C
29	377132-S	Ring — forward hub retaining (forward ring gear hub to forward ring gear)
30	7B067	Hub — forward ring gear
31	7D392	Gear — forward ring
32	7D234	Bearing assembly — forward clutch thrust (between forward ring gear and forward planet assembly) No. 9A
33	7A166	Bearing assembly — forward planet carrier — thrust No. 10A
34	7A398	Planet assembly — forward
35	7D234	Bearing assembly— forward clutch thrust (between forward planet assembly and forward sun gear assembly) No. 9B
36	7D063	Gear assembly — forward/reverse sun
37	7D064	Shell — input
38	7D066	Washer — input shell thrust No. 14
39	377300-S	Ring — retaining (attaches forward/reverse sun gear assembly to input shell)



Low and Reverse Drive System

The reverse planetary assembly consists of the reverse planetary carrier, reverse planet gears, the reverse ring gear, the reverse ring gear hub, the reverse clutch hub and the low-reverse one-way clutch assembly.

The reverse ring gear hub is splined to the output shaft and to the reverse ring gear. The reverse ring gear hub is laterally held by a needle bearing on the inner race of the low-reverse one-way clutch and a snap ring on the output shaft. The reverse planet assembly is splined to the low-reverse clutch hub. The low-reverse clutch hub is connected by the reverse clutch to the case. The inner race of the one-way clutch is bolted to the case.

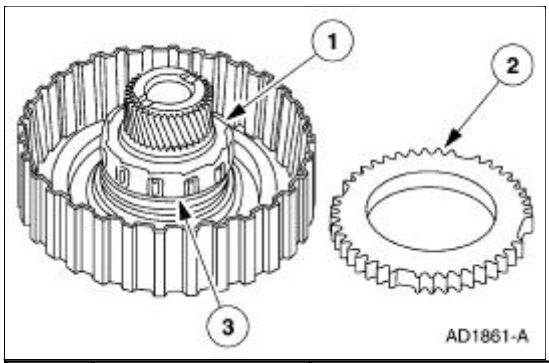
The reverse clutch assembly is activated in REVERSE gear and in MANUAL 1. The reverse clutch

bypasses the reverse one-way clutch during coast and MANUAL 1. The reverse clutch holds the reverse planet assembly in REVERSE gear to enable the sun gear to drive the reverse ring gear in the opposite direction.

Item	Part Number	Description
1	377155-S	Ring — reverse planet retaining (vehicle dependent)
2	7A166	Washer — planet carrier thrust (between reverse planet assembly and input shell) No. 10B (vehicle dependent)
3	7D006	Planet assembly— reverse (vehicle dependent)
4	7A166	Washer — planet carrier — thrust (between reverse planet assembly and output shaft hub) No. 11 (vehicle dependent)
5	387031-S	Ring — retaining (retaining output shaft hub to output shaft assembly) (vehicle dependent)
6	7A153	Gear — output shaft ring (vehicle dependent)
7	7D164	Hub — output shaft (vehicle dependent)
8	377132-S	Ring — retaining (retaining output shaft hub to output shaft ring gear) (vehicle dependent)
9	7B067	Hub assembly— reverse clutch (vehicle dependent)
10	7A089	Clutch assembly— reverse one-way (vehicle dependent)
11	7G178	Thrust bearing assembly No. 12 (vehicle dependent)
12	7G178	Low/reverse one-way clutch inner race (vehicle dependent)

Apply Components

The following information describes the operation of the three one-way clutches.



One-Way Clutch—Overdrive

The overdrive one-way clutch, shown in the following illustration, transmits engine torque from the overdrive sun gear to the overdrive ring gear in first, second and third gear range. The overdrive one-way clutch transmits power when the sprags are engaged between the inner and outer races. The inner race is splined to the coast clutch cylinder, which in turn is splined to the overdrive sun gear. The outer race is splined to the overdrive ring gear.

The overdrive one-way clutch engages whenever the overdrive planetary system attempts to drive the overdrive sun gear clockwise when the overdrive ring gear has a counterclockwise torque from the vehicle. When tightened counterclockwise, the overdrive one-way clutch engages and acts as a wedge to lock the sun gear and the ring gear together. During coast, the overdrive one-way clutch enables the ring gear to overrun or spin at a faster rate than the sun gear.

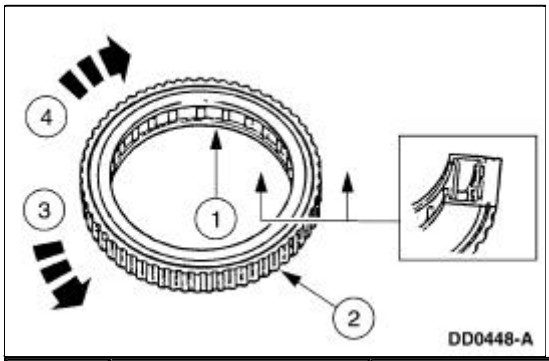
The overdrive one-way clutch overruns when in overdrive (fourth gear). In overdrive, the coast clutch cylinder is held by the overdrive one-way clutch, which in turn holds the overdrive sun gear. This causes the overdrive planet assembly to walk around the sun gear and overdrive the overdrive ring gear. The inner race of the overdrive one-way clutch is thus held stationary while the outer race is allowed to overrun clockwise.

One-Way Clutch—Overdrive (Roller Design)

Item	Part Number	Description
1	—	Overdrive one-way clutch inner race
2	—	Overdrive one-way outer race
3	—	Overdrive one-way clutch

One-Way Clutch Intermediate

The intermediate one-way clutch, shown in the following illustration, holds the forward/reverse sun gear stationary relative to the case in second gear. The outer race of the intermediate one-way clutch is splined to the intermediate clutch, which in turn is splined to the case. The inner race is part of the intermediate brake drum, which is connected to the sun shell. The sun shell is splined to the forward/reverse sun gear.



In second gear, the intermediate clutch holds the outer race of the intermediate one-way clutch. Torque from the vehicle acts counterclockwise on the output shaft, and in turn on the forward planetary carrier and the reverse ring gear. Torque from the center shaft is counterclockwise.

This combination applies a counterclockwise torque on the sun gear and likewise the intermediate one-way clutch. The intermediate one-way clutch engages, causing the forward ring gear to turn the forward planetary carrier clockwise at reduced speed. During coast, the intermediate one-way clutch allows the sun gear to spin clockwise as the engine rpm coasts down.

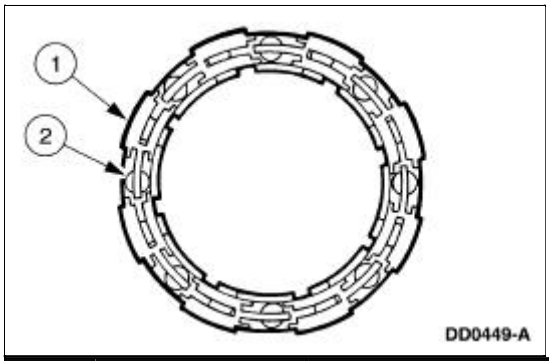
The intermediate one-way clutch overruns in third, fourth and REVERSE gears. The direct clutch is engaged, causing the intermediate brake drum to rotate clockwise with the center shaft. With the intermediate drum rotating clockwise, the inner race also rotates clockwise, causing the intermediate one-way clutch to overrun.

In first gear, the outer race of the intermediate one-way clutch is not held, and the intermediate one-way clutch is overrunning.

One-Way Clutch, Intermediate (Sprag Design)

Item	Part Number	Description
1	—	Sprags (part of 7A089)
2	—	Outer race (part of 7A089)
3	—	Overrunning
4	—	Engaged

One-Way Clutch Low-Reverse



The low-reverse one-way clutch, shown in the following illustration, holds the reverse planetary carrier stationary to the case in first gear. The inner race of the low-reverse one-way clutch is bolted directly to the case. The outer race is splined to the reverse clutch hub, which is splined to the reverse planetary carrier.

In first gear, the center shaft drives the forward ring gear clockwise by way of the forward clutch. With the forward planetary carrier providing a counterclockwise resisting torque, the forward/reverse sun gear is driven counterclockwise.

As the sun gear is turned counterclockwise and the reverse ring gear is turned counterclockwise by the resistance of the vehicle, the reverse planetary carrier is also turned counterclockwise. Because the reverse planetary carrier is prevented from turning counterclockwise by the low-reverse one-way clutch, the torque is transferred from the sun gear to the reverse ring gear and the output shaft. During coast, the planetary carrier is allowed to overrun and spin clockwise.

The low-reverse one-way clutch overruns in second, third and fourth gears. In these cases the forward/reverse sun gear is stationary while the reverse ring gear turns clockwise with the output shaft. This turns the reverse planetary carrier clockwise, causing the low-reverse one-way clutch to run clockwise and overrun.

One-Way Clutch Low-Reverse

2	—	Roller (part of 7A089)

Transmission Electronic Control System

Electronic System Description

The powertrain control module (PCM) and its input/output network control the following transmission operations:

- shift timing
- line pressure (shift feel)
- torque converter clutch (TCC) operation

The transmission control is separate from the engine control strategy in the PCM, although some of the input signals are shared. When determining the best operating strategy for transmission operation, the PCM uses input information from certain engine-related and driver-demand related sensors and switches.

Using all of these input signals, the PCM can determine when the time and conditions are right for a shift, or when to apply or release the torque converter clutch (TCC). It will also determine the best line pressure needed to optimize shift feel. To accomplish this, the PCM uses six output solenoids to control transmission operation.

The following provides a brief description of each of the sensors and actuators used by the PCM for transmission operation.

Mass Air Flow (MAF) Sensor

The mass air flow (MAF) sensor measures the mass of air flowing into the engine. The MAF sensor output signal is used by the powertrain control module (PCM) to calculate injector pulse width. For transmission strategies the MAF sensor is used to regulate electronic pressure control (EPC), shift and torque converter clutch (TCC) scheduling.

Throttle Position (TP) Sensor

The throttle position (TP) sensor is a potentiometer mounted on the throttle body. The TP sensor detects the position of the throttle plate and sends this information to the powertrain control module (PCM). The TP sensor is used for shift scheduling, electronic pressure control and torque converter clutch (TCC) control.

Intake Air Temperature (IAT) Sensor

The IAT sensor is installed in the air cleaner outlet tube. The IAT sensor is also used in determining electronic pressure control (EPC) pressures.

Powertrain Control Module (PCM)

The operation of the transmission is controlled by the powertrain control module (PCM). Many input sensors provide information to the PCM. The PCM then controls actuators which determine transmission operation.

Transmission Control Switch (TCS) and Transmission Control Indicator Lamp (TCIL)

The transmission control switch (TCS) is a momentary contact switch. When the switch is pressed, a signal is sent to the powertrain control module (PCM) to allow automatic shifts from first through fourth

gears or first through third gears only. The PCM energizes the transmission control indicator lamp (TCIL) when the switch is off. The TCIL indicates overdrive cancel mode activated (lamp on) and electronic pressure control (EPC) circuit shorted (lamp flashing) or monitored sensor failure.

Anti-Lock Brake Speed Sensor

The programmable speedometer/odometer module (PSOM) receives input from the rear brake anti-lock sensor. After processing the signal, the PSOM relays it to the powertrain control module (PCM) and the speed control module.

Turbine Shaft Speed (TSS) Sensor

The turbine shaft speed (TSS) sensor is a magnetic pickup that sends the powertrain control module (PCM) information on the rotation speed of the coast clutch cylinder assembly. The TSS sensor is mounted externally on the top of the transmission case. The PCM uses TSS sensor signals to help determine electronic pressure control (EPC) pressure, shift scheduling the torque converter clutch (TCC) operation.

Output Shaft Speed (OSS) Sensor

The output shaft speed (OSS) sensor is a magnetic pickup that provides transmission output shaft rotation speed information to the powertrain control module (PCM).

The OSS sensor is mounted externally on the top of the transmission extension housing. The PCM uses the OSS sensor signal to help determine electronic pressure control (EPC) pressure, shift scheduling and torque converter clutch (TCC) operation.

Transmission Solenoid Body Assembly

The powertrain control module (PCM) controls the transmission operation through three on/off shift solenoids, one pulse width modulated (PWM) shift solenoid, and one variable force shift solenoid. These solenoids and transmission fluid temperature (TFT) sensor are housed in the transmission solenoid body assembly. All are part of the transmission solenoid body and are not replaced individually.

Transmission Fluid Temperature (TFT) Sensor

The transmission fluid temperature (TFT) sensor is located on the solenoid body assembly in the transmission sump. It is a temperature-sensitive device called a thermistor. The resistance value of the TFT sensor will vary with temperature change.

The powertrain control module (PCM) monitors voltage across the TFT sensor to determine the temperature of the transmission fluid.

The PCM uses this signal to determine whether a cold start shift schedule is necessary. The cold start shift schedule lowers shift speeds to allow for better cold engine operation. The PCM also uses the TFT sensor input to adjust electronic pressure control (EPC) pressure for temperature effects and to inhibit torque converter clutch (TCC) operation during the warm-up period.

Coast Clutch Solenoid (CCS)

The coast clutch solenoid (CCS) provides coast clutch control by shifting the coast clutch shift valve. The solenoid is activated by pressing the transmission control switch (TCS) or by selecting the 1 or 2 range with the transmission range selector lever. In MANUAL 1 and 2, the coast clutch is controlled by the solenoid and also hydraulically as a fail-safe to ensure engine braking. In REVERSE, the coast clutch is controlled hydraulically and the solenoid is not on.

Torque Converter Clutch (TCC) Solenoid

The torque converter clutch (TCC) solenoid provides torque converter clutch control by shifting the converter clutch control valve to apply or release the TCC.

Electronic Pressure Control (EPC) Solenoid

CAUTION: The electronic pressure control (EPC) solenoid pressure output from the variable force solenoid is NOT adjustable. Any modification to the electronic pressure control solenoid may void the transmission warranty.

The EPC solenoid is a variable force solenoid. The variable-force type solenoid is an electrohydraulic actuator combining a solenoid and a regulating valve. It supplies electronic pressure control that regulates transmission line pressure and line modulator pressure. This is done by producing resisting forces to the main regulator and the line modulator circuits. These two pressures control clutch application pressures.

Shift Solenoids SSA and SSB

Shift solenoids SSA and SSB provide gear selection of first through fourth gears by controlling the pressure to the three shift valves.

Digital Transmission Range (TR) Sensor

The digital transmission range (TR) sensor is located on the outside of the transmission at the manual lever. The sensor completes the start circuit in PARK and NEUTRAL, the back-up lamp circuit in REVERSE and a neutral sense circuit for GEM control of 4x4 low engagement. The sensor also opens/closes a set of four switches that are monitored by the powertrain control module (PCM) to determine the position of the manual lever (P, R, N, (D), 2, 1).

4x4 Low (4x4L) Switch

The 4x4 low (4x4L) range switch is located on the transfer case cover. It provides an indication of when the 4x4 transfer case gear system is in the low range. The powertrain control module (PCM) then modifies shift schedule for 4x4L operation.

Brake Pedal Position (BPP) Switch

The brake pedal position switch (BPP) tells the powertrain control module (PCM) when the brakes are applied. The torque converter clutch (TCC) disengages when the brakes are applied. The BPP switch closes when the brakes are applied and opens when they are released.

Electronic Ignition (EI) System

The electronic ignition consists of a crankshaft position sensor, two four tower ignition coils and the powertrain control module (PCM). The ignition control module operates by sending crankshaft position information from the crankshaft position sensor to the ignition control module. The ignition control module generates a profile ignition pickup (PIP) signal (engine rpm) and sends it to the PCM. The PIP is one of the inputs that the PCM uses to determine transmission strategy, wide-open throttle (WOT) shift control, torque converter clutch control and EPC pressure.

Distributor Ignition (DI) System

The profile ignition pickup sensor sends a signal to the powertrain control module (PCM) indicating the engine rpm and the crankshaft position.

Air Conditioning (A/C) Clutch

An electromagnetic clutch is energized when the clutch cycling pressure switch closes. The switch is located on the suction accumulator/drier. The closing of the switch completes the circuit to the clutch and draws it into engagement with the compressor driveshaft. When the A/C clutch is engaged,

electronic pressure control (EPC) is adjusted by the powertrain control module (PCM) to compensate for additional load on the engine.

Manifold Absolute Pressure (MAP) Sensor

The manifold absolute pressure (MAP) sensor senses atmospheric pressure to produce an electrical signal. The frequency of this signal varies with intake manifold pressure. The powertrain control module (PCM) monitors this signal to determine altitude. The PCM then adjusts the transmission shift schedule and EPC pressure for altitude. On diesel engines, the MAP sensor measures boost pressure. The PCM monitors this signal and adjusts EPC pressure.

Diagnostic Strategy

NOTE: Do not take short cuts or assume that critical checks or adjustments have already been made.

Troubleshooting an electronically controlled automatic transmission is simplified by using the proven method of diagnosis. One of the most important things to remember is that there is a definite procedure to follow.

Follow the procedures as written to avoid missing critical components or steps.

To diagnose a concern correctly, the technician should have the following publications available:

- Transmission Reference Manual.
- Powertrain Control/Emissions Diagnosis (PC/ED) manual.
- OASIS messages.
- Technical Service Bulletins (TSBs).
- Wiring Diagram.

These publications provide the information required when diagnosing transmission concerns.

Using the Diagnostic Flowchart as a guide, follow the steps as indicated.

Preliminary Inspection

- Know and understand the customer's concern.
- Check the fluid level and condition.
- Verify the concern by operating the vehicle.
- Check for non-factory add-on items.
- Check shift linkages for correct adjustment.
- Check TSBs and OASIS messages for the concern.

Diagnostics

- Carry out on-board diagnostic procedures key on/engine off (KOEO) and key on/engine running (KOER).
- Record all diagnostic trouble codes (DTCs).
- Repair all non-transmission codes first.
- Repair all transmission codes second.
- Erase all continuous codes and attempt to repeat them.
- Repair all continuous codes which reappear.
- If only pass codes are obtained, proceed to Diagnosis By Symptom in this section for further information and diagnosis.

Follow the diagnostic sequence to diagnose and repair the concern the first time.

Diagnostic Flow Chart

Diagnostic Flow Chart

Diagnostic Flow Chart		
• Know and understand the customer concerns. • Check the fluid level and condition. • Verify the concern by operating the vehicle. • Check for non-factory-installed items and verify correct installation. • Check the shift linkage adjustments. • Check TSBs and OASIS messages for vehicle concerns. • Carry out quick test, both KOER and KOEO. • Record all codes. 1) Did you record any Diagnostic Trouble Codes?	Yes	· Repair all hard Diagnostic Trouble Codes. Follow the pinpoint tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first, then this workshop manual.
	No	· Refer to Diagnosis By Symptom in this section, then GO to Step 5.
2) Are any continuous test memory codes present?	Yes	· Clear codes and carry out drive cycle test.
	No	· GO to Step 4.
3) Did the continuous test memory codes reappear?	Yes	· Repair all continuous test memory codes. Follow the pinpoint tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual then the transmission reference manual, then this workshop manual, then GO to Step 4.
	No	· GO to Step 4.
4) Is the concern repaired?	Yes	· Carry out the final quick test to verify that no Diagnostic Trouble Codes are present. Clear memory codes.
	No	· Refer to Diagnosis By Symptom in this section.
5) Are there any electrical concerns?	Yes	· Install the scan tool and carry out output state control test, then GO to Step 6.
	No	· Refer to the hydraulic and mechanical routine to diagnose and repair the concern, then GO to Step 7.
6) Was the transmission concern corrected when the scan tool was installed?	Yes	· Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, intermittent fault diagnosis section and use the scan tool or WDS to diagnose cause of concern in the

		processor, vehicle harness or external inputs (sensors or switches).
	No	・Refer to the hydraulic and mechanical routine to diagnose the concern, then GO to Step 7.
7) Is the concern repaired?	Yes	・Carry out the final quick test to verify that no diagnostic trouble codes are present. Clear memory codes.
	No	・Get assistance from Technical Hotline.

Preliminary Inspection

The following items must be checked prior to beginning the diagnostic procedure:

Know/Understand the Concern

In order to diagnose a concern correctly, you must first understand the customer complaint or condition. Customer contact may be required in order for the technician to begin to verify the concern. You must also understand the conditions when the concern occurs, for example:

- Hot or cold vehicle temperature.
- Hot or cold ambient temperature.
- Vehicle driving conditions.

After understanding when and how the concern occurs, proceed to verify the condition.

Verification of Condition

This section provides information that must be used in both determining the actual cause of customer concerns and carrying out the appropriate procedures.

The following procedures must be used when verifying customer concerns for the transmission:

Determine Customer Concern

NOTE: Some transmission conditions can cause engine concerns. An electronic pressure control short circuit can cause engine misfiring. The torque converter clutch not disengaging will stall the engine.

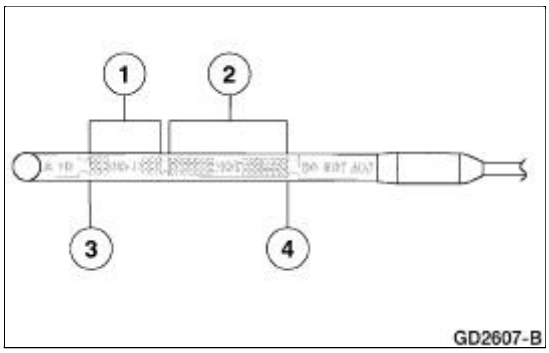
Determine customer concerns relative to vehicle use and dependent driving conditions, paying attention to the following items:

- Hot or cold vehicle operating temperature.
- Hot or cold ambient temperatures.
- Type of terrain.
- Vehicle loaded/unloaded.
- City/highway driving.
- Upshift.
- Downshift.
- Coasting.
- Engagement.
- Noise/vibration — check for dependencies, either rpm dependent, vehicle speed dependent, shift dependent, gear dependent, range dependent, or temperature dependent.

Check Fluid Level and Condition

CAUTION: The vehicle should not be driven if the fluid level indicator shows the fluid

below the DO NOT DRIVE mark or internal failure could result.



NOTE: If the vehicle has been operated for an extended period of time at highway speeds, in city traffic, in hot weather, or while pulling a trailer, the fluid needs to cool down to obtain an accurate reading.

NOTE: The fluid level reading on the indicator will differ depending on operating and ambient temperatures. The correct reading should be within the normal operating temperature range.

Under normal circumstances, the fluid level should be checked during normal maintenance. If the transmission starts to slip, shifts slowly, or shows of leaking, the fluid level should be checked.

Fluid Level Check

1. With the transmission in (P) PARK, the engine at idle and the brake pedal depressed, move the selector lever through each gear and allow engagement of each gear. Place the selector lever in the PARK position.
2. Wipe the fluid level indicator cap and remove the indicator.
3. Wipe the indicator with a clean cloth.
4. Install the indicator back in the filler tube until it is fully seated, then remove the indicator. The fluid level should be within the normal operating temperature range.

Item	Description
1	Cold Temperature Range
2	Normal Operating Temperature Range
3	DO NOT DRIVE IF BELOW THIS LEVEL AND OUTSIDE TEMPERATURE IS ABOVE 10°C (50°F) (Underfill). Recheck fluid level at normal operating temperature and adjust as required.
4	DO NOT DRIVE LEVEL (Overfill). Remove excess fluid. Recheck fluid level at normal operating temperature and adjust as required.

High Fluid Level

A fluid level that is too high may cause the fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of fluid from the vent tube and possible transmission malfunction and or damage. If an overfill reading is indicated refer to Transmission Fluid Drain and Refill in this section.

Low Fluid Level

A fluid level that is too low may also cause the fluid to become aerated due to the churning action of the rotating internal parts.

A low fluid level can result in poor transmission engagement, slipping, malfunction and/or damage. This can also indicate a leak in one of the transmission seals or gaskets.

Adding Fluid

CAUTION: The use of any other type of transmission fluid than specified can result in transmission malfunction and/or damage.

If fluid must be added, add fluid in 0.25L (1/2 pint) increments through the filler tube. Do not overfill the fluid. For fluid type, refer to the Fluid Type specification chart.

Fluid Condition Check

1. Check the fluid level.
2. Observe the color and the odor. The color under normal circumstances should be dark reddish, not brown, pink, black or have a burnt odor.
3. Hold the fluid level indicator over a white facial tissue and allow the fluid to drop onto the facial tissue and examine the stain.
4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.
5. If the stain is a foamy pink color, this may indicate coolant or water in the transmission. The engine cooling system should also be inspected at this time.
6. If fluid contamination or transmission failure is confirmed by the sediment in the bottom of the fluid pan, the transmission must be disassembled and completely cleaned. This includes the torque converter, coolers, cooler lines and cooler bypass valve.
7. Carry out diagnostic checks and adjustments; refer to Diagnosis By Symptom in this section.

Road Testing Vehicle

The following Shift Point Road Test and Torque Converter Clutch Operation Test provide diagnostic information on transmission shift controls and torque converter operation.

Shift Point Road Test

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

This test verifies that the shift control system is operating correctly.

1. Bring engine and transmission up to normal operating temperature.

2. Operate the vehicle with the transmission range selector lever in (D).

3. Apply minimum throttle and observe the speeds at which the upshift occurs and the torque converter engages. Refer to Automatic Transmission Special Specification Bulletin Issue available from Ford Customer Service Division.

4. With the transmission in OVERDRIVE (fourth gear), depress the transmission control switch. The transmission should downshift to third gear. Remove foot from accelerator pedal; engine braking should occur.

5. Press the accelerator pedal to floor (wide-open throttle). The transmission should shift from third to second gear or third to first, depending on vehicle speed. Torque converter clutch should disengage and then reapply.

6. With vehicle (D) range above 80 km/h (50 mph) and less than half throttle, move the transmission range selector lever from (D) range to MANUAL 2 range and remove foot from the accelerator pedal. The transmission should immediately downshift into second gear. With the vehicle remaining in MANUAL 2 range, move the transmission range selector lever into MANUAL 1 range. Transmission should downshift into first gear at speeds BELOW 48-56 km/h (30-35 mph).

7. If the transmission fails to upshift/downshift or the torque converter clutch does not apply and release, refer to Diagnosis By Symptom in this section for concern diagnosis.

Shift Speed Application Charts

NOTE: This vehicle has been equipped with a special cold weather shift strategy. This was designed to maximize heater output. This new strategy operates under the following conditions: ambient air temperature at start-up is -4°C (25°F) or below and the engine coolant temperature at start-up is 38°C (100°F) or below. During this condition, the vehicle may experience slightly delayed shifts under light throttle. Medium and heavy throttle shifts will be normal. Once the engine coolant reaches 71°C (160° F) or above, normal shift scheduling will resume. If, during the diagnosing of a delayed shift concern, the concern goes away after the engine coolant reaches 71°C (160°F) or above, this is a normal operation of the special cold weather shift strategy. If this condition does not go away after the engine coolant reaches 71°C (160°F), refer to Diagnosis By Symptom in this section.

NOTE: All gasoline vehicles will have new adaptive shift strategies. Whenever the vehicles battery has been disconnected for any type of service or repair, the strategy parameters that are stored in the keep alive memory (KAM) will be lost. The strategy will start to relearn once the battery is reconnected and the vehicle is driven. This is a temporary condition and will return to normal operating condition once the powertrain control module (PCM) relearns all the parameters from the driving operating conditions. There is no time frame set for this process. If this concern is present during downshifts or converter clutch apply, it is not the shift strategy and will require diagnosis as outlined in the workshop manual.

The customer must be notified that they may experience slightly different upshifts (either soft or firm) and that this condition is temporary and will eventually return to normal operating condition.

Applications Shift Speeds — Approximate* Km/h (mph) 5.4L 4V Engine

NOTE: "D" is the same as (D) with the transmission control switch actuated (light on).

Throttle Opening	Range	Shift	Vehicle Speed (1) Km/h (mph) [1] Axle Ratio 3.73
Closed	(D)	4-3	42-47 (26-29)
Throttle	(D), D	3-2	27-31 (17-19)
	(D), D	2-1	11-14 (7-9)
Light	(D), D	1-2	18-21 (11-13)
Throttle	(D), D	2-3	29-32 (18-20)
TP	(D)	3-4	43-48 (27-30)

	(D), D	2-1	51 (32)	56 (35)	58 (36)	63 (39)

[1] Nominal shift speed at sea level is shown. Actual shift speed will depend on tire size, brand and altitude.

Torque Converter Diagnosis

Prior to torque converter replacement, all diagnostic procedures must be followed. This is to prevent the unnecessary installation of new or remanufactured torque converters. Only after a complete diagnostic evaluation can the decision be made to install new or remanufactured torque converter.

Begin with the normal diagnostic procedures as follows:

1. Preliminary Inspection.
2. Know and Understand the Customer's Concern.
3. Verify the Concern—Carry out the Torque Converter Clutch Operation Test in this section.
4. Carry out Diagnostic Procedures.
    - Run on-board diagnostics, refer to On-Board Diagnostics with scan tool in this section.
        - Repair all non-transmission-related DTCs first.
        - Repair all transmission DTCs.
        - Rerun on-board diagnostics to verify repair.
    - Carry out Line Pressure Test in this section.
    - Carry out Stall Speed Test in this section.
    - Carry out Diagnostic Routines in this section.
        - Use the Diagnosis by Symptom Index to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed; diagnose and repair as required, before repairing the torque converter.

Torque Converter Operation Test

This test verifies that the torque converter clutch control system and the torque converter are operating correctly.

5. Carry out Quick Test; refer to On-Board Diagnostics with scan tool in this section. Check for DTCs; Refer to the Diagnostic Trouble Code Chart.
6. Connect a tachometer to the engine.
7. Bring the engine to normal operating temperature by driving the vehicle at highway speeds for approximately 15 minutes in (D) position.
8. **NOTE:** The TCC will disengage during a 4-3 coast downshift.

   The correct operation of the TCC can be verified by using a scan tool and monitoring the TCC during the 4-3 coast downshift.

   Engine rpm should increase when brake pedal is tapped and decrease about five seconds after pedal is released. If this does not occur, refer to Diagnosis By Symptom — Torque Converter Clutch Operation Concerns in this section.
9. If the vehicle stalls in (D) or MANUAL 2 at idle with vehicle at a stop, move the transmission

range selector lever to MANUAL 1 position. If the vehicle stalls, refer to Diagnosis By Symptom — Torque Converter Clutch Operation Concerns in this section. Repair as required. If the vehicle does not stall in (D), refer to Diagnosis By Symptom in this section.

Visual Inspection

This inspection will identify modifications or additions to the vehicle operating system that may affect diagnosis and transmission operation.

Inspect vehicle for non-Ford approved add-on devices such as:

- Electronic add-on items
  - Air conditioning.
  - Generators (alternators).
  - Engine turbos.
  - Cellular telephones.
  - Cruise controls.
  - CB radios.
  - Linear amplifiers.
  - Backup alarm signals.
  - Electronic brakes for trailer towing.
  - Computers.
- Vehicle modifications.

These items, if not installed correctly, will affect powertrain control module (PCM) or transmission function. Pay particular attention to add-on wiring splices in the PCM harness or transmission wiring harness, abnormal tire size or axle ratio changes.

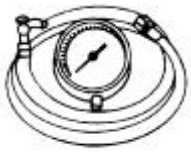
Leaks; refer to Leakage Inspection in this section.

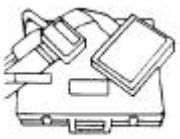
Shift Linkage Check

Check for a misadjustment in shift linkage by matching the detents in the transmission range selector lever with those in the transmission. If they match, the misadjustment is in the indicator. Do not adjust the shift linkage.

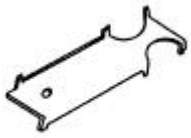
Hydraulic leakage at the manual control valve can cause delay in engagements and/or slipping while operating if the linkage is not correctly adjusted; refer to Section 307-05 for shift linkage adjustment.

Check TSBs and OASIS





Refer to all Technical Service Bulletins and OASIS messages that pertain to the transmission concerns, and follow the procedure outlined.



Carry Out On-Board Diagnostics (KOEO, KOER)

After a road test, with the vehicle warm and before disconnecting any connectors, carry out the Quick Test using the scan tool. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the powertrain control system.

Diagnostics

Special Tool(s)

 ST1300-A	UV Leak Detector Kit 164-R0756 or equivalent
 ST1565-A	Pressure Gauge, Transmission Fluid 307-004 (T57L-77820-A)
 ST1137-A	73 III Automotive Meter 105-R0057 or equivalent

Diagnosing an electronically controlled automatic transmission is simplified by using the following procedures. One of the most important things to remember is that there is a definite procedure to follow. DO NOT TAKE SHORTCUTS OR ASSUME THAT CRITICAL CHECKS OR ADJUSTMENTS HAVE ALREADY BEEN MADE. Follow the procedures as written to avoid missing critical components or steps. By following the diagnostic sequence, the technician will be able to diagnose and repair the concern the first time.

On-Board Diagnostics with Diagnostic Tool

NOTE: For detailed instruction and other diagnostic methods using the scan tool, refer to the scan tool tester manual and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

These Quick Tests should be used to diagnose the powertrain control module (PCM) and should be carried out in order.

- Quick Test 1.0-Visual Inspection
- Quick Test 2.0-Set Up
- Quick Test 3.0-Key On, Engine Off
- Quick Test 4.0-Continuous Memory
- Quick Test 5.0-Key On, Engine Running
- Special Test Mode
    - Wiggle Test
    - Output Test Mode
- PCM Reset Mode
- Clearing DTCs
- OBD II Drive Cycle
- Other Scan tool Features
- For further information on other diagnostic testing features using the scan tool, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. Other diagnostic methods include the following.
    - Parameter Identification (PID) Access Mode

- Freeze Frame Data Access Mode
- Oxygen Sensor Monitor Mode

Output State Control (OSC) Mode

NOTE: In order to operate OSC, a KOEO On-Demand Self Test and a KOER On-Demand Self Test may need to be carried out to verify that no diagnostic trouble codes (DTCs) related to the digital transmission range (TR) sensor or the vehicle speed sensor (VSS) are present.

Output state control (OSC) allows the technician to operate the main components of the transmission quickly and easily and provides accurate information to correctly diagnose the transmission. OSC allows the technician to take control of certain parameters to operate the transmission. For example, OSC allows the technician to shift the transmission only when commanding a gear change. If the technician commands first gear in OSC, the transmission will remain in first gear until the technician commands the next gear. For another example, the technician can command a shift solenoid to turn on or off while carrying out an electrical circuit check. OSC has two modes of operation for transmission, the BENCH MODE and the DRIVE MODE. Each mode/parameter has a unique set of vehicle operating requirements that the technician is required to meet before being allowed to operate OSC.

OSC — Transmission BENCH MODES

The BENCH MODE is functional only when the vehicle range selector is in PARK or NEUTRAL. The BENCH MODE may be used when the engine is either ON (running) or OFF (not running).

The BENCH MODE allows the technician to operate the following components:

- SSA - Commands the PCM to turn Shift Solenoid 1 OFF or ON.
- SSB - Commands the PCM to turn Shift Solenoid 2 OFF or ON.
- CCS - Commands the PCM to turn Coast Clutch Solenoid OFF or ON.
- TCC - Commands the PCM to turn Torque Converter Solenoid OFF or ON.
- EPC - Commands the PCM to control the Electronic Pressure Control Solenoid to OSC value.

SSA, SSB, CCS and TCC in BENCH MODE:

These OSC functions are used to turn SSA, SSB, CCS and TCC solenoids OFF and ON when carrying out an electrical check.

These OSC functions for parameters SSA, SSB, CCS and TCC allow the technician to choose the following options:

- OFF - turns solenoid OFF.
- ON - turns solenoid ON.
- XXX - cancels OSC value sent.

The vehicle requirements for sending an OSC value for SSA, SSB, CCS and TCC are as follows:

- Key ON and engine OFF (not running).
- Range selector lever in PARK or NEUTRAL.

The vehicle requirements must be met when sending the OSC value for SSA, SSB, CCS and TCC. If the vehicle requirements are not met when sending the OSC value, an error message will appear.

When the error is received, OSC is aborted and must be restarted. After sending the OSC value, if the vehicle requirements are no longer met the error message will not appear but the OSC value will be canceled by the powertrain control module (PCM) (monitor corresponding PID). The OSC value XXX may be sent anytime to cancel OSC.

EPC in BENCH MODE:

The BENCH MODE is used to test the functionality of the transmission's electronic pressure control. During BENCH MODE the EPC solenoid can ramp in increments of 15 psi, from 0 to 90 psi and 90 to 0 psi. The technician should run the engine at approximately 1,500 rpm. The installation of a hydraulic pressure gauge is required to actually test whether the EPC solenoid and associated mechanical and hydraulic components are working correctly.

The OSC functions for the parameter EPC allow the technician to choose the following options:

- 00 - sets EPC pressure to 0 psi.
- 16 - sets EPC pressure to 15 psi.
- 30 - sets EPC pressure to 30 psi.
- 45 - sets EPC pressure to 45 psi.
- 60 - sets EPC pressure to 60 psi.
- 75 - sets EPC pressure to 75 psi.
- 90 - sets EPC pressure to 90 psi.
- XXX - cancels OSC for EPC.

The vehicle requirements for sending an OSC value for EPC in BENCH MODE are as follows:

- Key ON and engine ON (running at approximately 1,500 rpm).
- Range selector lever in PARK or NEUTRAL.

The vehicle requirements must be met when sending the OSC value for SSA, SSB, CCS and TCC. If the vehicle requirements are not met when sending the OSC value, an error message will appear. When the error is received, OSC is aborted and must be restarted. After sending the OSC value, if the vehicle requirements are no longer met the error message will not appear but the OSC value will be canceled by the powertrain control module (PCM) (monitor corresponding PID). The OSC value XXX may be sent anytime to cancel OSC.

OSC — Transmission DRIVE MODES:

The DRIVE MODE allows control of three transmission parameters. Each parameter has a unique set of vehicle operating requirements that the technician is required to meet before being allowed to operate OSC. The recommended procedure, when using the DRIVE MODE, is to control one parameter at a time.

The DRIVE MODE allows the technician to carry out the following functions on the transmission:

- GEAR - Commands the PCM to upshift or downshift.
- TCC - Commands the PCM to lock or unlock the torque converter clutch.
- EPC - Commands a high pressure value during an upshift or downshift.

GEAR in DRIVE MODE:

This OSC function is used to test the transmission gear changes. The advantage of using OSC for changing gears is to allow the technician to exactly duplicate the vehicle condition for the customer

complaint. For example, if the customer complains of 3-4 shift up a steep grade the technician can drive a vehicle up a steep grade and command a 3-4, 4-3 shift over and over again. Also, during the shift change the pressure is the exact pressure the vehicle normally produces. The transmission will stay in the gear that OSC has commanded until OSC commands another gear or OSC is canceled.

The OSC functions for the GEAR parameter allow the technician to choose the following options:

- 1 - PCM selects 1st gear.
- 2 - PCM selects 2nd gear.
- 3 - PCM selects 3rd gear.
- 4 - PCM selects 4th gear.
- XXX - Cancels OSC for GEAR and returns GEAR to normal mode.

The vehicle requirements must be met when sending the OSC value for GEAR. If the vehicle requirements are not met when sending the OSC value, an error message will appear. When the error is received, OSC is aborted and must be restarted. After sending the OSC value, if the vehicle requirements are no longer met the error message will not appear but the OSC value will be canceled by the powertrain control module (PCM) (monitor corresponding PID). The OSC value XXX may be sent anytime to cancel OSC.

Use the TCC parameter in OSC to first turn off the converter clutch before testing the transmission gear changes. This will allow evaluation of just the gear changes. If the torque converter clutch is not turned off, then the PCM may command the torque converter clutch to lock during a shift. This will make it difficult for the technician to tell whether a bad shift is the result of the torque converter clutch or the gear change itself.

The vehicle requirements for sending a GEAR value are as follows:

- Engine is running.
- Range selector lever is in OVERDRIVE.
- Vehicle speed is greater than 3km/h (2 mph).

TCC in DRIVE MODE:

This OSC function is used to test whether the torque converter clutch is engaging and disengaging correctly.

The OSC functions for the TCC parameter allow the technician to choose the following:

- ON - Commands TCC solenoid ON to lock the converter clutch.
- OFF - Commands TCC solenoid OFF to unlock the converter clutch.
- XXX - Cancels OSC for TCC and returns TCC to normal mode.

The vehicle requirements must be met when sending the OSC value for TCC. If the vehicle requirements are not met when sending the OSC value, an error message will appear. When the error is received, OSC is aborted and must be restarted. After sending the OSC value, if the vehicle requirements are no longer met the error message will not appear but the OSC value will be canceled by the powertrain control module (PCM) (monitor corresponding PID). The OSC value XXX may be sent anytime to cancel OSC.

The vehicle requirements for sending the TCC value OFF are as follows:

- Engine is running.

- Range selector lever is in OVERDRIVE.
- Vehicle speed is greater than 3 km/h (2 mph).

The vehicle requirements for sending the TCC value ON are as follows:

- Engine is running.
- Range selector lever is in OVERDRIVE.
- Vehicle speed is greater than 3 km/h (2 mph).
- Transmission fluid temperature (TFT) is between 16°C - 135°C (60°F - 275°F).
- Brake is off when vehicle speed is below 32 km/h (20 mph).
- No excessive load on the engine.

EPC in DRIVE MODE:

This OSC function is used to increase pressures during an upshift or downshift to determine whether the pressure control system is functioning correctly. Harsher shifts indicate that the pressure control system works at higher pressures. The best way to isolate pressure control system problems, is to control the EPC in the bench mode and monitor a pressure gauge.

The OSC functions for the parameter EPC allow the technician to choose the following options:

- 00 - sets EPC pressure to 0 psi.
- 16 - sets EPC pressure to 15 psi.
- 30 - sets EPC pressure to 30 psi.
- 45 - sets EPC pressure to 45 psi.
- 60 - sets EPC pressure to 60 psi.
- 75 - sets EPC pressure to 75 psi.
- 90 - sets EPC pressure to 90 psi.
- XXX - Cancels OSC for EPC.

The vehicle requirements for sending the EPC value in drive mode are as follows:

- Engine is running.
- Range selector lever is in OVERDRIVE.
- Vehicle speed is greater than 3 km/h (2 mph).
- OSC value being sent is greater than what the normal strategy is commanding.

For example: If the PCM is commanding a pressure of 344.75 kPa (50 psi), an OSC value greater than 50 must be sent, sending a value of 60 or 75 would work. If the PCM is commanding 517.125 kpa (75 psi), sending a value of 60 would not work, but sending a value of 90 would. This will make sure that OSC will only send a value greater than what the PCM is commanding, to prevent wear to the transmission due to inadequate pressures.

The vehicle requirements must be met when sending the OSC value for EPC. If the vehicle requirements are not met when sending the OSC value, an error message will appear. When the error is received, OSC is aborted and must be restarted. After sending the OSC value, if the vehicle requirements are no longer met the error message will not appear but the OSC value will be canceled by the powertrain control module (PCM) (monitor corresponding PID). The OSC value XXX may be sent anytime to cancel OSC.

Using Output State Control (OSC) and Monitoring PIDs

To confirm that the OSC value was sent by the Scan Tool and the powertrain control module (PCM) has accepted the OSC substitution, a corresponding PID for each OSC parameter must be monitored. After sending the OSC value the corresponding PID value should equal the OSC value. Additional PIDs should be monitored to help the technician adequately diagnose the transmission. The following is a list of PIDs to monitor while using OSC.

OSC Parameter	Corresponding PID	Additional PIDs
SSA	SSA	SS1F
SSB	SSB	SS2F
SSC	SSC	SS3F
CCS	CCS	CCSF
EPC	EPC	—
TCC	TCC	TCCF, TCCCMD, TCCACT
GEAR	GEAR	TP, RPM, TSS, OSS, TR, TFT, TRANRAT and VS

PID Name	PID description
CCS	Coast clutch solenoid commanded state (not actual state) — ON or OFF
CSSF	Coast clutch solenoid circuit fault — YES or NO
EPC	Electronic pressure control commanded pressure (not actual) — PSI
GEAR	GEAR commanded state (not actual) 1st, 2nd, 3rd or 4th
OSS	Output shaft speed sensor input — RPM
RPM	Engine speed sensor input — RPM
SSA	Shift solenoid No. 1 commanded state (not actual) — ON or OFF
SSB	Shift solenoid No. 2 commanded state (not actual) — ON or OFF
SSC	Shift solenoid No. 3 commanded state (not actual) — ON or OFF
SS1F	Shift solenoid No. 1 circuit fault — YES or NO
SS2F	Shift solenoid No. 2 circuit fault — YES or NO
SS3F	Shift solenoid No. 3 circuit fault — YES or NO
TCCACT	Torque converter clutch slippage (engine speed minus turbine speed) — RPM
TCCCMD	Torque converter clutch solenoid commanded state — duty cycle
TCCF	Torque converter clutch solenoid fault — YES or NO
TFT	Transmission fluid temperature — degrees F° or voltage
TP	Throttle position — voltage
TR	Transmission range sensor — PARK, NEUTRAL, OVERDRIVE
TRANRAT	Actual transmission gear ratio — unitless
TSS	Turbine shaft speed sensor input — RPM
VS	Vehicle speed sensor input — RPM

To confirm that the OSC substitution occurred, SEND the OSC value and monitor the corresponding PID value. If no ERROR MESSAGE was received and the value of the corresponding PID is the same as the value sent from OSC, the OSC substitution was successful.

Transmission Drive Cycle Test

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: The Transmission Cycle Test must be followed exactly. Malfunctions must occur four times consecutively for the shift error DTC code to be set and five times consecutively for the continuous torque converter clutch code to set.

NOTE: When carrying out the Transmission Drive Cycle Test refer to the Solenoid Operation Chart for correct solenoid operation.

After carrying out the Quick Test, use the Transmission Drive Cycle Test for checking continuous codes.

1. Record and then erase the Quick Test codes.
2. Warm the engine to normal operating temperature.
3. Make sure the transmission fluid level is correct.
4. With the transmission in OVERDRIVE, moderately accelerate from stop to 80 km/h (50 mph). This allows the transmission to shift into fourth gear. Hold speed and throttle open steady for a minimum of 15 seconds.
5. With transmission in OVERDRIVE, press transmission control switch (TCS) (transmission control illuminator lamp [TCIL] should illuminate) and moderately accelerate from stop to 64 km/h (40 mph). This allows the transmission to shift into third gear. Hold speed and throttle open steady for a minimum of 15 seconds (30 seconds above 4,000 ft altitude).
6. Press TCS (TCIL should turn off) and accelerate from 64 km/h (40 mph) to 80 km/h (50 mph). This allows transmission to shift into fourth gear. Hold speed and throttle position steady for a minimum of 15 seconds.
7. With transmission in fourth gear and maintaining steady speed and throttle opening, lightly apply and release brake to operate stoplamps. Then hold speed and throttle steady for an additional 5 seconds (minimum).
8. Brake to a stop and remain stopped for a minimum of 20 seconds.
9. Repeat Steps 4 through 8 at least five times.
10. Carry out Quick Test and record continuous codes.

After On-Board Diagnostics

NOTE: The vehicle wiring harness, powertrain control module and non-transmission sensors can affect transmission operations. Repair these concerns first.

After the On-Board Diagnostics procedures are completed, repair all DTCs.

Repair all non-transmission-related DTCs first, then repair any transmission-related DTCs. Refer to the following Diagnostic Trouble Code Chart for information on condition and symptoms. This chart will be helpful in referring to the proper manual(s) and to aid in diagnosing internal transmission concerns and

external non-transmission inputs. The pinpoint tests are used in diagnosing electrical concerns of the transmission. Make sure the vehicle wiring harness and the powertrain control module (PCM) are diagnosed as well. The Powertrain Control/Emissions Diagnosis (PC/ED) manual will aid in diagnosing non-transmission-related electronic components.

Before Pinpoint Tests

NOTE: Prior to entering pinpoint tests, check the powertrain control module (PCM) wiring harness for correct connections, bent or broken pins, corrosion, loose wires, correct routing, proper seals and their condition. Check the PCM, sensors and actuators for damage. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

NOTE: If a concern still exists after electrical diagnosis has been carried out, refer to Diagnosis By Symptom in this section.

If DTCs appear while carrying out the on-board diagnostics, refer to the Diagnostic Trouble Code Chart for the appropriate procedure. Prior to entering pinpoint tests, refer to any TSBs and OASIS messages for transmission concerns.

Diagnostic Trouble Code Charts

Diagnostic Trouble Code Chart

Diagnostic Trouble Code	Component	Description	Condition	Symptom	Action
P1111	System	Pass	No concern detected.	Concern not detected by PCM.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0340, P0341, P0344	DI	DI system concern.	Engine rpm circuit failure.	CKP sensor failure/engine will stall or not run. May flash TCIL. [b]	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0237	Manifold Absolute Pressure (MAP) Sensor	MAP sensor out of On-Board Diagnostics range.	MAP sensor signal higher or lower than expected or no response during Dynamic Response (Goose) Test.	—	Rerun On-Board Diagnostics.
P0236	Manifold Absolute Pressure (MAP) Sensor	MAP sensor vacuum circuit failure.	MAP sensor signal higher or lower than expected or no response due to vacuum hose, circuit damaged, disconnected or restricted.	Firm shift feel, late shifts at altitude.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0235	Manifold Absolute Pressure (MAP) Sensor	MAP sensor inactive.	MAP sensor or circuit open, shorted to ground or 5V.	Firm shift feel, late shift at altitude.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1124	Throttle Position (TP) Sensor	TP sensor out of On-Board Diagnostics range.	TP sensor (gasoline engines) not at idle position during KOEO.	—	Rerun at appropriate TP sensor position per the engine application.
P0500, P1502	VSS/ABS	Insufficient or intermittent vehicle speed input.	PCM detected a loss of vehicle speed signal during operation.	Harsh engagements, firm shift feel, abnormal shift schedule, unexpected downshifts may occur at closed throttle, abnormal TCC operation or engages only	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

				at wide open throttle (WOT). May flash TCIL.	
P0500, P1502	VSS/ABS	Insufficient or intermittent vehicle speed input.	PCM detected a loss of vehicle speed signal during operation.	Harsh engagements, firm shift feel, abnormal shift schedule, unexpected downshifts may occur at closed throttle, abnormal TCC operation or engages only at WOT. May flash MIL.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0503	VSS/ABS	Vehicle speed sensor intermittent.	PCM detected a loss, or an unrealistic change of vehicle speed signal during operation.	Possible fluctuation in the speedometer. May flash TCIL.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0781, P0731 [a]	SSA, SSB or Internal Transmission Components	1-2 shift error.	Engine rpm drop not detected when 1-2 shift was commanded by PCM.	Incorrect gear selection depending on failure mode and transmission range selector lever position. Refer to the Solenoid Operation Chart. Shift errors may also be due to other internal transmission concerns such as stuck valves or damaged friction material. May flash TCIL.	Go To Pinpoint Test A .
P0782, P0732, P0733 [a]	SSA, SSB or Internal Transmission Components	2-3 shift error.	Engine rpm drop not detected when 2-3 shift was commanded by PCM.	Incorrect gear selection depending on failure mode and transmission range selector lever position. Refer to the Solenoid Operation Chart. Shift errors may also be due to other internal	Go To Pinpoint Test A .

				transmission concerns such as stuck valves or damaged friction material. May flash TCIL.	
P0783 [a]	SSA, SSB or Internal Transmission Components	3-4 shift error.	Engine rpm drop not detected when 3-4 shift was commanded by PCM.	Incorrect gear selection depending on failure mode and transmission range selector lever position. Refer to the Solenoid Operation Chart. Shift errors may also be due to other internal transmission concerns such as stuck valves or damaged friction material. May flash TCIL.	Go To Pinpoint Test A .
P0122	TP or AP Sensor	TP or AP sensor circuit below minimum voltage (open/shorted to ground).	Voltage above or below specification for On-Board Diagnostics or during normal vehicle operation.	Harsh engagements, firm shift feel, abnormal shift schedule, abnormal TCC operation or does not engage. May flash MIL.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0123	TP or AP Sensor	TP or AP sensor circuit above maximum voltage (short to vehicle power).	Voltage above or below specification for On-Board Diagnostics or during normal vehicle operation.	Harsh engagements, firm shift feel, abnormal shift schedule, abnormal TCC operation or does not engage. May flash MIL.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1120	Throttle Position (TP) Sensor	TP sensor voltage lower than expected.	Voltage below specification.	Harsh engagements, firm shift feel, abnormal shift schedule, abnormal TCC operation or does not engage.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1780	TCS	TCS not changing state.	TCS not cycled during On-Board	No overdrive cancel when	Rerun diagnostics and cycle switch.

			Diagnostics/circuit open or shorted.	switch is cycled.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0712	TFT Sensor	157°C (315°F) indicated, TFT sensor circuit grounded.	Voltage drop across TFT sensor exceeds scale set for temperature of 157°C (315°F).	TCC and stabilized shift schedule may be enabled sooner after cold start. May flash TCIL.	Go To Pinpoint Test B .
P0713	TFT Sensor	-40°C (-40°F) indicated, TFT sensor circuit open.	Voltage drop across TFT sensor exceeds scale set for temperature -40°C (-40°F).	TCC and stabilized shift schedule may be enabled sooner after cold start. May flash TCIL.	Go To Pinpoint Test B .
P1711	TFT Sensor	TFT sensor out of On-Board Diagnostics range.	Transmission not at operating temperature during On-Board Diagnostics.	—	Warm vehicle to normal operating temperature and rerun On-Board Diagnostics.
P1713	TFT	No change in TFT - Low range.	PCM has detected no TFT change at low range during operation.	May flash TCIL.	Go To Pinpoint Test B .
P1718	TFT	No change in TFT - High range.	PCM has detected no TFT change at high range during operation.	May flash TCIL.	Go To Pinpoint Test B .
P1783	TFT Sensor	Transmission overtemp condition.	Transmission fluid temperature exceeded 132°C (270°F).	Slight increase in electronic pressure control pressure when rpms are greater than 2,500. May flash TCIL.	Go To Pinpoint Test B .
P1460 P1463 P1464	A/C	A/C switch error.	DTC can result from A/C being ON during On-Board Diagnostics.	Failed on — electronic pressure control pressure slightly low with A/C OFF. Failed off — electronic pressure control pressure slightly low with A/C ON.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0705	Digital TR Sensor	Digital TR circuit failure.	Digital TR circuits, indicating an invalid pattern in TR_D. Condition	Increase in EPC pressure (harsh shifts). Defaults to (D)	Go To Pinpoint Test D .

			caused by a short to ground or an open in TR4, TR3A, TR2, and/or TR1 circuits.	or D for all gear positions. In (D) position transmission stuck in D or MANUAL 2. May flash MIL.	
P0708	Digital TR	Digital TR sensor circuit TR3A open.	Digital TR sensor circuit TR3A reading 2.6v - 5.0v (open circuit).	Increase in EPC pressure. Defaults to (D) or D for all gear ranges. May flash MIL.	Go To Pinpoint Test D .
P1702	Digital TR	Intermittent DTC codes P0705 or P0708.	Refer to DTC codes P0705 or P0708 condition.	Refer to DTC codes P0705 or P0708 symptom. May flash TCIL.	Go To Pinpoint Test D .
P1704	Digital TR	Digital TR circuit reading in between gear position during KOEO.	Digital TR sensor or shift cable incorrectly adjusted, or digital TR circuit failure.	Wrong commanded EPC pressure. Digital TR reading the wrong gear position.	Go To Pinpoint Test D .
P1705	Digital TR Sensor	Digital TR sensor circuits not reading PARK or NEUTRAL during KOEO/KOER.	KOEO/KOER not run in PARK or NEUTRAL, or Digital TR circuit failure.	Rerun on-board diagnostic in Park. KOEO/KOER.	Go To Pinpoint Test D .
P0102, P0103, P1100, P1101	MAF Sensor	MAF sensor DTC.	MAF sensor system fails to operate in a normal manner, which may cause a transmission concern.	High electronic pressure control pressure. Firm shifts and engagements. May flash TCIL.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0107	BARO	BARO circuit failure.	BARO signal lower than expected.	Firm shift feel, late shifts at altitude.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0108	BARO	BARO circuit failure.	BARO signal higher or lower than expected.	Firm shifts, late shifts at altitude.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1703	BPP Switch	Brake not actuated during On-Board Diagnostics.	Brake not cycled during KOER.	Failed on or not connected — TCC will not engage at less than one-third throttle.	Rerun On-Board Diagnostic and activate BPP switch. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

P0730, P0751	BPP	BPP switch circuit failed.	BPP circuit failure.	Failed off — TCC will not disengage when brake is applied.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0750 [b]	SSA	Shift solenoid circuit failure.	SSA circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during KOEO.	Incorrect gear selection depending on failure mode and transmission range selector lever position. Refer to the Solenoid Operation Chart. May flash MIL.	Go To Pinpoint Test A .
P0753	SSA	Shift solenoid circuit failure.	SSA circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during KOEO.	Incorrect gear selection depending on failure mode and transmission range selector lever position. Refer to the Solenoid Operation Chart. May flash TCIL.	Go To Pinpoint Test A .
P0755 [b]	SSB	SSB circuit failure.	SSB circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during KOEO.	Incorrect gear selection depending on failure mode and transmission range selector lever position. Refer to the Shift Solenoid Operation Chart. May flash MIL.	Go To Pinpoint Test A .
P0758	SSB	SSB circuit failure.	SSB circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during KOEO.	Incorrect gear selection depending on failure mode and transmission range selector lever position. Refer to the Shift Solenoid Operation Chart. May flash TCIL.	Go To Pinpoint Test A .
P1714	SSA	SSA malfunction.	Mechanical failure of the solenoid detected.	Incorrect gear selection depending on	Go To Pinpoint Test H .

				condition, mode and manual lever position. Refer to Solenoid Operation Chart. May flash TCIL. May flash MIL.	
P1715	SSB	SSB malfunction.	Mechanical failure of the solenoid detected.	Incorrect gear selection depending on condition, mode and manual lever position. Refer to Solenoid Operation Chart. May flash MIL.	Go To Pinpoint Test H .
P1636	SSA, SSB	Inductive signature chip communication error.	PCM has detected an internal error.	Incorrect gear selection depending on condition, mode and manual lever position. Refer to Solenoid Operation Chart. May flash MIL.	Go To Pinpoint Test H .
P1754 [b]	CCS	CCS circuit failure.	CCS failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during KOEO.	Failed off — no third gear engine braking in overdrive cancel. Failed on — third gear engine braking in OVERDRIVE range. Coast clutch may be damaged causing eventual failure. May flash TCIL.	Go To Pinpoint Test G .
P0740 [b]	TCC Solenoid	TCC solenoid circuit failure.	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during KOEO.	Short circuit — engine stalls in DRIVE or MANUAL 2 at idle with brake applied. Open circuit — TCC never engaged. May flash TCIL.	Go To Pinpoint Test C .
P0741 [a]	TCC	TCC slippage detected.	The PCM picked up an excessive amount of TCC slippage during	TCC slippage erratic or no torque converter	Refer to Diagnosis By Symptom in this section.

			normal vehicle operation.	clutch operation. May flash TCIL.	
P0743 [b]	TCC Solenoid	TCC solenoid circuit failure.	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during KOEO.	Short circuit — engine stalls in DRIVE or MANUAL 2 at idle with brake applied. Open circuit — TCC never engaged. May flash MIL.	Go To Pinpoint Test C .
P1740	TCC	TCC malfunction.	Mechanical failure of the solenoid detected.	Harsh shift, may flash TCIL.	Go To Pinpoint Test H .
P1744 [a]	TCC	TCC slippage detected.	The PCM picked up an excessive amount of TCC slippage during normal vehicle operation.	TCC slippage erratic or no torque converter clutch operation. May flash MIL.	Refer to Diagnosis By Symptom in this section.
P1746 [b]	EPC	PCM failure — electronic pressure control driver.	Current through EPC circuit is checked and compared after a time delay. An error will be noted if tolerance is exceeded during KOEO and continuous On-Board Diagnostics.	Open circuit — causes maximum electronic pressure control, harsh engagements and shifts. May flash TCIL.	Go To Pinpoint Test E .
P1747 [b]	EPC	EPC circuit failure, shorted circuit or PCM.	Current through EPC circuit is checked and compared after a time delay. An error will be noted if tolerance is exceeded during KOEO and continuous On-Board Diagnostics.	Short circuit — causes minimum electronic pressure control pressure (minimum capacity). Limits engine torque (partial fuel shut-off, heavy misfire). May flash MIL.	Go To Pinpoint Test E .
P1760	EPC	EPC Signal Intermittent Short.	PCM has detected an intermittent short.	Short circuit causes minimum EPC pressure (minimum capacity). May flash TCIL.	Go To Pinpoint Test E .
P1280	ICP Sensor	ICP sensor circuit failure. Out of range low.	Open/grounded circuit, biased sensor or PCM.	May result in firm shifts.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

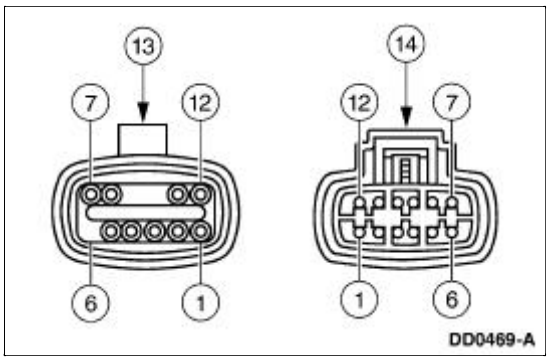
P1281	ICP Sensor	ICP sensor circuit failure. Out of range high.	Short circuit to 5 volt reference, biased sensor or PCM.	May result in firm shifts.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0715	TSS	Insufficient Input from TSS sensor.	PCM Has detected a loss of TSS signal during operation.	Harsh shifts. Set DTC, May flash TCIL, May flash MIL Schedule Operation.	Go To Pinpoint Test F .
P0717	TSS	TSS Signal Intermittent	PCM has detected an intermittent TSS signal	Harsh shifts, or erratic shifts. Set DTC, May flash TCIL.	Go To Pinpoint Test F .
P0718	TSS	TSS Signal Noisy.	PCM has detected a noisy TSS sensor signal.	Harsh shifts, or erratic shifts. Set DTC May flash TCIL.	Go To Pinpoint Test F .
P0720	OSS	Insufficient Input from OSS Sensor.	PCM has detected a loss of OSS signal during operation.	Set DTC, Flash TCIL. May flash MIL.	Go To Pinpoint Test F .
P0721	OSS	OSS Signal Noisy.	PCM has detected a noisy OSS sensor signal.	Set DTC. May flash TCIL.	Go To Pinpoint Test F .
P0722	OSS	Insufficient Input from OSS Sensor.	PCM has detected a loss of OSS signal during operation.	Set DTC, Flash TCIL. May flash TCIL.	Go To Pinpoint Test F .
P1781	4x4L	4x4 low switch failure.	Switch closed or shorted during KOEO.	Early or delayed shifts.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1729	4x4L	4x4 low switch failure.	Circuit open/closed. Shorted during KOEO.	Early or delayed shifts.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

[b] Distributor ignition (DI) system.
[a] May also be generated by other non-electronic-related transmission hardware condition.
[b] Output circuit check, generated only by electrical conditions.

Rotunda Transmission Tester

The Transmission Tester is used to diagnose the electronically controlled transmission and is used in conjunction with the pinpoint tests. The tests should be carried out in order. Installing the Transmission Tester allows separation of the vehicle electronics from transmission electronics, refer to the Transmission Tester manual for these tests and instructions.

- Bench Testing—Engine Off
- Resistance/Continuity Test
- Solenoid Voltage Test
- Dynamic Testing—Engine On



- EPC Solenoid
- Transmission Engagements
- Upshifts/Downshifts
- Torque Converter Clutch (TCC) Engagement
- Coast Clutch
- Digital Transmission Range (TR) Sensor Testing
- Resistance/Continuity Test
- Sensor Tests
- Switch Test—PARK/NEUTRAL, Backup Lamp and Optional Circuits

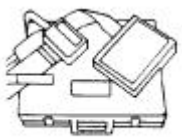
Digital Transmission Range (TR) Sensor Diagnosis Chart

Selector Position	PID: TR	PID: TR_D				PID: TR_V (volts)
		TR4	TR3A	TR2	TR1	TR3A (PCM pin 64 to SIG RTN)
PARK	P/N	0	0	0	0	0.0 volts
In Between	REV	0	1	0	0	1.3 - 1.8 Volts
REVERSE	REV	1	1	0	0	1.3 - 1.8 Volts
In Between	REV	0	1	0	0	1.3 - 1.8 Volts
NEUTRAL	NTRL	0	1	1	0	1.3 - 1.8 Volts
In Between	O/D [a]	1	1	1	0	1.3 - 1.8 Volts
OVERDRIVE	O/D [a]	1	1	1	1	1.3 - 1.8 Volts
In Between	MAN 2	1	0	1	1	0.0 Volts
MANUAL 2	MAN 2	1	0	0	1	0.0 Volts
In Between	MAN 2	1	0	1	1	0.0 Volts
MANUAL 1	MAN 1	0	0	1	1	0.0 Volts

[a] Will read DRIVE if O/D is canceled



A. TR_V is the voltage at the PCM pin 64 (TR3A Circuit) to signal return.
B. "In Between" reading could be caused by a shift cable or digital TR sensor misaligned or a digital TR sensor circuit failure of TR1, TR2, TR3A, or TR4.
C. TR_D: 1= Open digital TR switch, 0= Closed digital TR switch.
D. EEC-V Control System Breakout Box Readings: Taken from PCM signal pins for TR1, TR2, TR3A, TR4 to signal return.
    - **Voltages for TR1, TR2, TR4:**
    - 0 = 0.0 volts.
    - 1 = 9.0 - 14.0 volts.
    - **Voltage for TR3A:**
    - 0 = 0.0 volts.
    - 1 = 1.3 - 1.8 volts.
    - 1.8 - 5.0 volts = Invalid Reading (open in wires or bad resistor in digital TR sensor).

Wiggle Test Information for Open/Shorts

A. TR4, TR3A, TR2, and TR1 are all closed in PARK. PARK is a good position to check for intermittent open circuits (with scan tool monitoring TR_D).
B. TR4, TR3A, TR2, and TR1 are all open in OVERDRIVE, so OVERDRIVE is a good position to check for shorts to ground. To determine the shorted components while observing TR_D, unplug the TR and see if the short goes away. If the short is still present, unplug the transaxle harness and see if the short goes away. If the short is still present, it is in the PCM or vehicle harness. Remove the suspect circuit(s) wire terminal from the PCM connector. If the short is still present, the PCM has an internal failure, otherwise the failure is in the vehicle harness.

Any time an electrical connector or solenoid body is disconnected, inspect the connector for terminal condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install a new connector as required.

Shift Solenoids Pre-Diagnosis

Use the following shift solenoid operation information when carrying out Pinpoint Test A.

Solenoid Operation Chart

Transmission Range Selector Lever Position	PCM Commanded Gear	SSA	SSB	TCC	CCS
P/R/N	1	ON	OFF	OFF	OFF

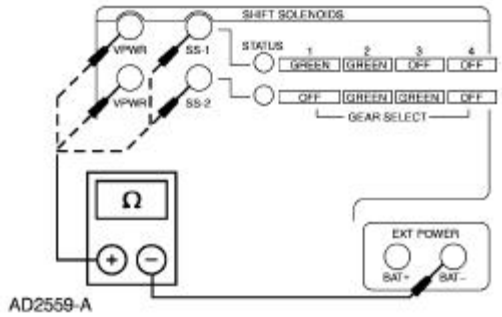
PINPOINT TEST A: SHIFT SOLENOID



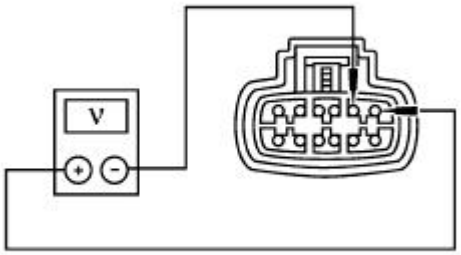
Test Step	Result / Action to Take
NOTE: Refer to the Transmission Connector Layouts preceding these pinpoint tests.	
A1 ELECTRONIC DIAGNOSTICS ● Check to make sure the transmission harness connector is fully seated, terminals are engaged in the connector and in good condition before proceeding. ● Install Scan Tool. ● Carry out the KOEO Test until continuous DTCs have been displayed.	**Yes** REMAIN in OTM. GO to A2 . **No** PRESS START. If the

• Enter the Output Test Mode (OTM). • Select the ALL ON Mode. Push START to turn outputs on. Push STOP to turn outputs off. • **Does the vehicle enter OTM?**	vehicle does not enter OTM, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
A2 CHECK THE ELECTRICAL SIGNAL OPERATION	
• Disconnect: Transmission Connector. • **CAUTION: Remove the heat shield, if so equipped, from the transmission before removing the connector. Remove the solenoid body connector by pushing on the center tab and pulling on the harness connector. Do not attempt to pry the tab with a screwdriver. Always install the heat shield when the procedure is completed.** • Use a mirror to inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals. • Connect a VOM positive lead to the VPWR pin 1 and the negative test lead to the appropriate solenoid signal circuit pins 2 and 3 of the transmission vehicle harness connector.  DD0531-A • Place VOM on the 20-volt scale. • While observing the VOM, press START and STOP to cycle the solenoid output on and off. • **Is the solenoid output voltage changed to approximately battery voltage?**	**Yes** GO to A5 . **No** GO to A3 .
A3 CHECK THE CONTINUITY OF THE SOLENOID SIGNAL AND VPWR CIRCUITS	
• Key in OFF position. • Disconnect: Powertrain Control Module (PCM). • Inspect for damaged or pushed-out pins, corrosion or loose wires. • Install the EEC-V Control System Breakout Box. • Measure the resistance between the PCM signal test pins 11 and 6 at the EEC-V Control System Breakout Box and the signal pins 2 and 3 at the transmission harness connector.  AD1493-A • Measure the resistance between the VPWR test pins 71 or	**Yes** GO to A4 . **No** REPAIR the open circuit (s). REMOVE the EEC-V Control System Breakout Box. RECONNECT all of the components. REPEAT the Quick Tests.

97 at the EEC-V Control System Breakout Box and the VPWR pin 1 at the transmission harness connector.  ● **Is each resistance less than 5 ohms?**	
A4 CHECK THE SHIFT SOLENOID CIRCUITS FOR SHORTS TO POWER AND GROUND	
● Measure the resistance between PCM signal test pins 11 and 6 and the VPWR test pins 71 and 97 at the EEC-V Control System Breakout Box.  ● Measure the resistance between PCM signal test pins 11 and 6 and test pins 51, 76, 77, 103 and 91 at the EEC-V Control System Breakout Box and chassis ground.  ● **Is each resistance greater than 10,000 ohms?**	**Yes** GO to A5 . **No** REPAIR the short circuit (s). REMOVE the EEC-V Control System Breakout Box. RECONNECT all of the components. REPEAT the Quick Tests.
A5 SOLENOID FUNCTIONAL TEST	
● Install the Transmission Tester to the transmission connector. ● **NOTE:** The LED will turn GREEN when the solenoid activates and turn off when deactivated. The LED will turn RED if an ACTIVATED solenoid is shorted to battery positive. The LED will remain off if an ACTIVATED solenoid is shorted to ground or no continuity (open circuit). ● Carry out the Solenoid Voltage Test. ● **Does the solenoid (LED GREEN) activate?**	**Yes** GO to A6 . **No** GO to A7 .
A6 TRANSMISSION DRIVE TEST	
● Connect: Powertrain Control Module (PCM). ● Carry out the Dynamic Testing — Engine ON.	**Yes** INSTALL a new PCM.

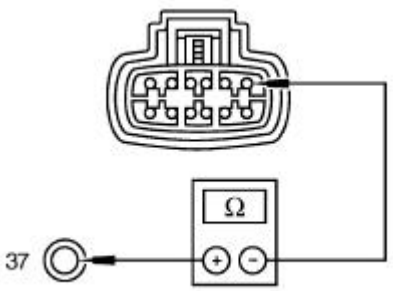
• **Does the vehicle upshift when commanded by the tester?**	ERASE all codes and CARRY OUT the Transmission Drive Cycle Test. RERUN the Quick Tests. If DTCs are still present, REFER to Diagnosis By Symptom in this section. **No** GO to A7 .
A7 CHECK THE RESISTANCE OF THE SOLENOIDS	
NOTE: Refer to the Transmission Tester for terminal locations. • Place the bench/drive switch to the BENCH mode. • Rotate the gear select switch to the OHMS CHECK position. • Connect the ohmmeter negative lead to the SS1 jack and the positive lead to the VPWR jack on the tester. This is to test SSA.  AD2284-A • Record the resistance. The resistance should be between 17 and 22 ohms within a temperature range of 4°C - 66°C (40°F - 150°F). • Connect the ohmmeter negative lead to the SS2 jack and the positive lead to the VPWR jack on the tester. This to test SSB.  AD2282-A • Record the resistance. The resistance should be between 17 and 22 ohms within a temperature range of 4°C - 66°C (40°F - 150°F). • **Is the resistance for each solenoid between 17 and 22 ohms?**	**Yes** GO to A8 . **No** INSTALL a new solenoid body assembly. RECORD and ERASE the codes. REPEAT the Quick Tests.
A8 CHECK THE SOLENOIDS FOR SHORT TO GROUND	
• Check for continuity between the BAT(-) jack (engine ground) and the appropriate jack with a digital ohmmeter or other low current tester (less than 200 milliamps). Connection should show infinite resistance (no continuity). **Solenoid** | **Tester Jack**	**Yes** INSTALL a new solenoid body assembly. RECORD and ERASE the codes. REPEAT the Quick Tests. **No**

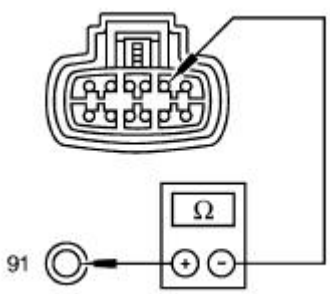
SSA	SS1/VPWR
SSB	SS2/VPWR



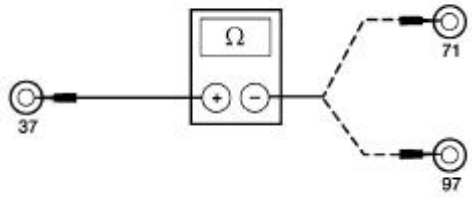
- **Does the connection show continuity?**

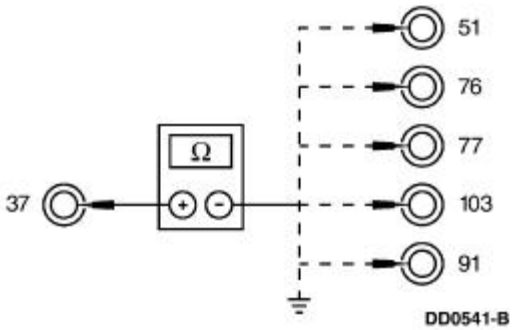
GO to Diagnosis By Symptom in this section.

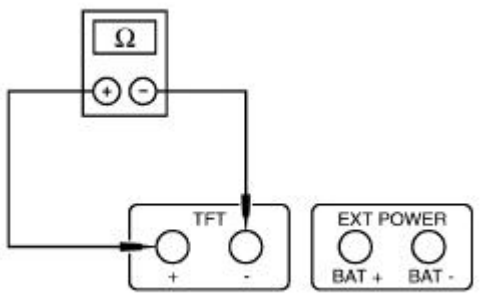




PINPOINT TEST B: TRANSMISSION FLUID TEMPERATURE (TFT) SENSOR







Test Step	Result / Action to Take
NOTE: Refer to the Transmission Connector Layouts preceding these pinpoint tests.	
B1 ELECTRONIC DIAGNOSTICS	
• Check to make sure the transmission harness connector is fully seated, terminals are fully engaged in the connector and in good condition before proceeding. • **Have the above items been checked?**	**Yes** GO to B2. **No** Carry out checks. ERASE the codes. REPEAT the Quick Tests.
B2 CHECK THE ELECTRICAL SIGNAL OPERATION	
• Key in OFF position. • Disconnect: Transmission Connector. • **CAUTION: Remove the heat shield, if so equipped, from transmission before removing the connector. Remove the solenoid body connector by pushing on the center tab and pulling on the harness connector. Do not attempt to pry the tab with a screwdriver. Always install the heat shield when the procedure is completed.** • Use a mirror to inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals. • Connect a VOM positive lead to the TFT signal circuit pin 7 and the negative test lead to the SIG RTN circuit pin 8 of the transmission harness connector.	**Yes** GO to B6. **No** GO to B3.

DD0537-A

- Place the VOM on the 20-volt scale.
- Key in ON position.
- **Is the voltage between 4.75 and 5.25 volts?**

B3 CHECK THE CONTINUITY OF THE TFT SIGNAL AND SIG RTN CIRCUITS	
• Key in OFF position. • Disconnect: Powertrain Control Module (PCM). • Inspect for damaged or pushed-out pins, corrosion or loose wires. • Install the EEC-V Control System Breakout Box. • Measure the resistance between the PCM signal test pin 37 at the EEC-V Control System Breakout Box and the signal pin 7 at the transmission harness connector.  DD0538-B • Measure the resistance between the PCM SIG RTN test pin 91 at the EEC-V Control System Breakout Box and the SIG RTN pin 8 at the transmission harness connector.  DD0539-B • **Is each resistance less than 5 ohms?**	**Yes** GO to B4 . **No** REPAIR the open circuits. REMOVE the EEC-V Control System Breakout Box. RECONNECT all of the components. REPEAT the Quick Tests.
B4 CHECK THE TFT SIGNAL CIRCUIT FOR SHORT TO VPWR AND GROUND	
• Measure the resistance between the PCM signal test pin 37 and VPWR test pins 71 and 97 at the EEC-V Control System Breakout Box.	**Yes** GO to B5 . **No** REPAIR the short circuit(s). REMOVE the EEC-V Control System

 D17682-A ● Measure the resistance between the PCM signal test pin 37 and test pins 51, 76, 77, 103, 91 at the EEC-V Control System Breakout Box and chassis ground.  DD0541-B ● **Is each resistance greater than 10,000 ohms?**	Breakout Box. RECONNECT all of the components. REPEAT the Quick Tests.
B5 CHECK THE RESISTANCE OF THE TFT SENSOR ● Install the Transmission Tester to the transmission connector. ● Set the bench/drive switch to the BENCH mode. ● Rotate the gear select switch to the OHMS CHECK position. ● **NOTE:** While carrying out Tests 1 and 2 below, observe resistance. DTC P0713 is set if the resistance value exceeds 1,062 k ohms (open circuit). DTC P0712 is set if the resistance value falls below 597 k ohms (short circuit). ● Connect the ohmmeter negative lead to the -TFT jack and the positive lead to the +TFT jack on the tester.  DD0542-A ● **TEST 1** ● Record the resistance. Resistance should be approximately in the following ranges: **Transmission Fluid Temperature** **°C** / **°F** / **Resistance (Ohms)** -40 to -20 / -40 to -4 / 1,062 k-284 k -19 to -1 / -3-31 / 284 k-100 k 0-20 / 32-68 / 100 k-37 k	**Yes** GO to B6 . **No** INSTALL a new solenoid assembly. RECORD and ERASE the codes. REPEAT the Quick Tests.

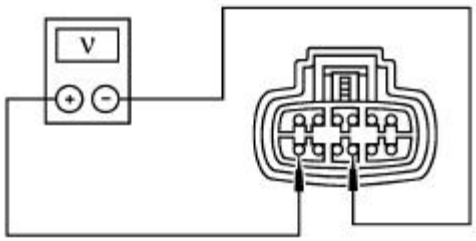
21-40	69-104	37 k-16 k
41-70	105-158	16 k-5 k
71-90	159-194	5 k-2.7 k
91-110	195-230	2.7 k-1.5 k
111-130	231-266	1.5 k-0.8 k
131-150	267-302	0.8 k-0.54 k

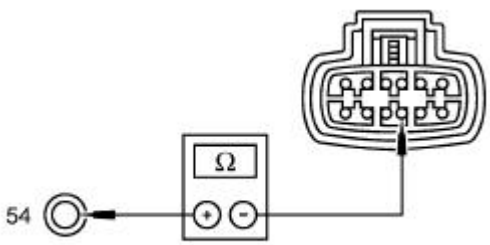
- **TEST 2**
- Check for an intermittent short or open.
- If the resistance was between 0.8k and 100k ohms, carry out the following test. If the transmission is cold, start and run the engine until transmission reaches its normal operating temperature. If the transmission is warm, allow the transmission to cool. Check the TFT sensor resistance again. Compare the resistance with the initial resistance. The resistance should decrease if the transmission was warmed and should increase if the transmission was allowed to cool. If the correct change in resistance occurs, repeat the Quick Test.
- **Is the resistance in the specified range?**

B6 CHECK THE TFT SENSOR FOR SHORT TO GROUND

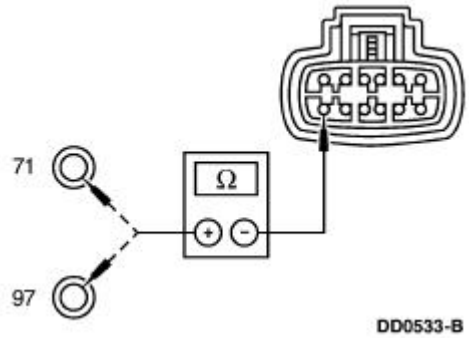
- Check for continuity between the BAT(-) jack (engine ground) and the appropriate jack (-TFT or +TFT) with a digital ohmmeter or other low current tester (less than 200 milliamps). Connection should show infinite resistance (no continuity).

DD0543-A



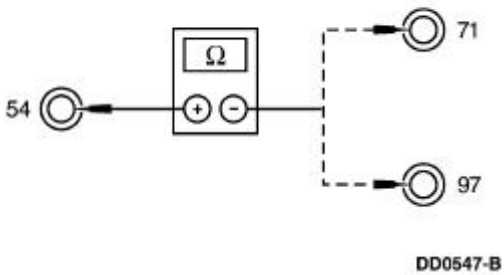


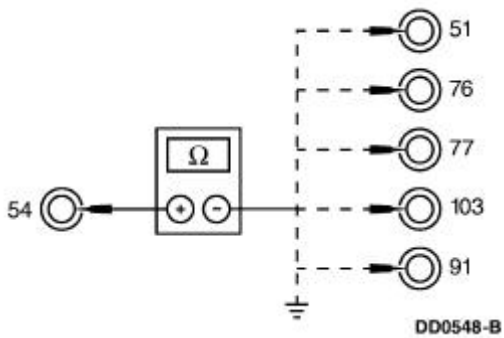
- **Does the connection show continuity?**



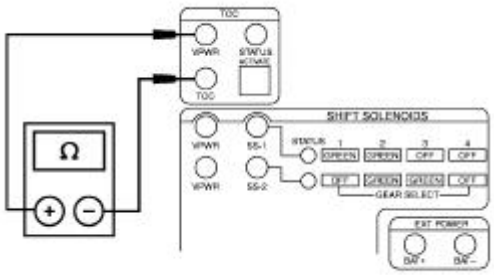
Yes
INSTALL a new solenoid assembly. REPEAT the Quick Tests.

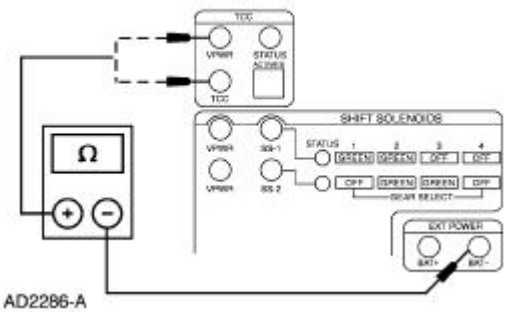
No
INSTALL a new PCM. REPEAT the Quick Tests. If the DTC is still present and overtemp condition exists, CHECK the fluid condition. CHECK the overheat condition. REFER to Diagnosis By Symptom in this section. REPAIR as required. REPEAT the Quick Tests.





PINPOINT TEST C: TORQUE CONVERTER CLUTCH (TCC) SOLENOID



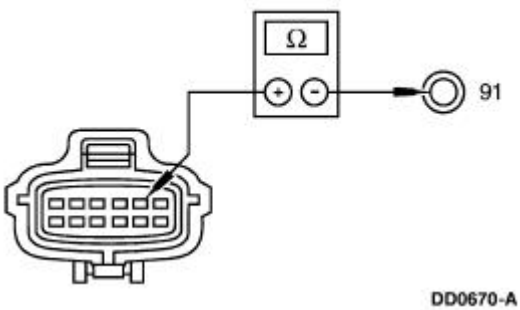


Test Step	Result / Action to Take
NOTE: Refer to the Transmission Connector Layouts preceding these pinpoint tests.	
C1 ELECTRONIC DIAGNOSTICS ● Check to make sure the transmission harness connector is fully seated, terminals are engaged in the connector and in good condition before proceeding. ● Install Scan Tool. ● Carry out KOEO Test until continuous DTCs have been displayed. ● Enter Output Test Mode (OTM).	**Yes** REMAIN in OTM. GO to C2 . **No** PRESS START. If vehicle does not enter OTM,

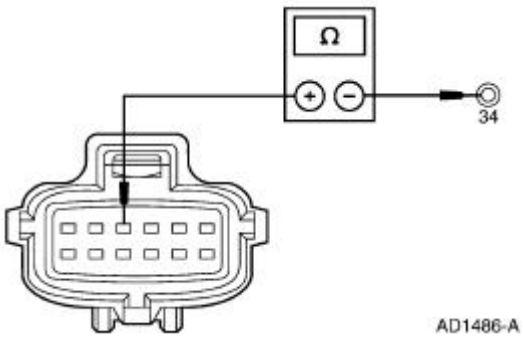
• Select the ALL ON Mode. Push START to turn the outputs on. Push STOP to turn the outputs off. • **Does the vehicle enter OTM?**	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
C2 CHECK THE ELECTRICAL SIGNAL OPERATION	
• Disconnect: Transmission Connector. • **CAUTION: Remove the heat shield, if so equipped, from the transmission before removing the connector. Remove the solenoid body connector by pushing on the center tab and pulling on the harness connector. Do not attempt to pry the tab with a screwdriver. Always install the heat shield when the procedure is completed.** • Use a mirror to inspect both ends of the connector for damaged or pushed-out pins, corrosion, loose wires and missing or damaged seals. • Connect a VOM positive lead to the VPWR circuit pin 1 and the negative test lead to the TCC signal circuit pin 4 of the transmission vehicle harness connector.  DD0545-A • Place the VOM on the 20-volt scale. • While observing the VOM, press start and stop to cycle the solenoid output on and off. • **Does the solenoid output voltage change to approximately battery voltage?**	**Yes** GO to C6 . **No** GO to C3 .
C3 CHECK THE CONTINUITY OF THE TCC SIGNAL AND VPWR CIRCUITS	
• Key in OFF position. • Disconnect: Powertrain Control Module (PCM). • Inspect for damaged or pushed-out pins, corrosion or loose wires. • Install the EEC-V Control System Breakout Box. • Measure the resistance between the PCM signal test pin 54 at the EEC-V Control System Breakout Box and the signal pin 4 at the transmission harness connector.  DD0546-B • Measure the resistance between the VPWR test pin 71 or 97 at the EEC-V Control System Breakout Box and the VPWR pin 1 at the transmission harness connector.	**Yes** GO to C4 . **No** REPAIR the open circuits. REMOVE the EEC-V Control System Breakout Box. RECONNECT all of the components. REPEAT the Quick Tests.

- **Is each resistance less than 5 ohms?**

C4 CHECK THE TCC CIRCUIT FOR SHORT TO POWER	
• Measure the resistance between the PCM signal test pin 54 and VPWR test pins 71 and 97 at the EEC-V Control System Breakout Box.  • **Is each resistance greater than 10,000 ohms?**	**Yes** GO to C5 . **No** REPAIR the open circuits. REMOVE the EEC-V Control System Breakout Box. RECONNECT all of the components. REPEAT the Quick Tests.
C5 CHECK THE TCC CIRCUIT FOR SHORT TO GROUND	
• Measure the resistance between the PCM signal test pin 54 and test pins 51, 76, 77, 103 and 91 at the EEC-V Control System Breakout Box and chassis ground.  • **Is each resistance greater than 10,000 ohms?**	**Yes** GO to C6 . **No** REPAIR the short circuit (s). REMOVE the EEC-V Control System Breakout Box. RECONNECT all of the components. REPEAT the Quick Tests.
C6 SOLENOID FUNCTIONAL TEST	
• Install the Transmission Tester to the transmission connector. • **NOTE:** The LED will turn GREEN when the TCC solenoid activates and turn off when deactivated. The LED will turn RED if an ACTIVATED solenoid is shorted to battery positive. The LED will remain off if an ACTIVATED solenoid is shorted to ground or no continuity (open circuit). • Carry out the Solenoid Voltage Test. • **Does the solenoid (LED GREEN) activate when tester switch is pressed?**	**Yes** GO to C7 . **No** GO to C8 .
C7 TRANSMISSION DRIVE TEST	



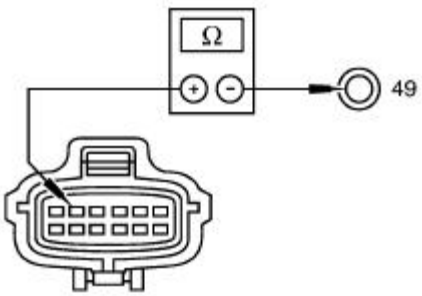
• Connect: Powertrain Control Module (PCM). • Carry out the Dynamic Testing. • **Does the torque converter clutch solenoid activate (LED GREEN) and does the engine rpm drop?**	**Yes** INSTALL a new PCM. ERASE all DTCs. CARRY OUT the Transmission Drive Cycle Test. REPEAT the Quick Tests. If the symptoms are still present, REFER to Diagnosis By Symptom in this section. **No** GO to C8.
C8 CHECK THE RESISTANCE OF THE SOLENOID	
NOTE: Refer to the Transmission Tester for terminal locations. • Place the bench/drive switch to the BENCH mode. • Rotate the gear select switch to the OHMS CHECK position. • Connect the ohmmeter negative lead to the TCC jack and the positive lead to the VPWR jack on the tester.  AD2285-A • Record the resistance. The resistance should be between 13 and 20 ohms within a temperature range of 4°C - 66°C (40°F - 150°F). • **Is the resistance between 13 and 20 ohms?**	**Yes** GO to C9. **No** INSTALL a new solenoid body assembly.
C9 CHECK THE SOLENOID FOR SHORT TO GROUND	
• Check for continuity between the BAT(-) jack (engine ground) and the appropriate jack with a digital ohmmeter or other low current tester (less than 200 milliamps). Connection should show infinite resistance (no continuity).  AD2286-A • **Does the connection show continuity?**	**Yes** INSTALL a new solenoid body assembly. **No** REFER to Diagnosis By Symptom in this section.



PINPOINT TEST D: DIGITAL TRANSMISSION RANGE (TR) SENSOR

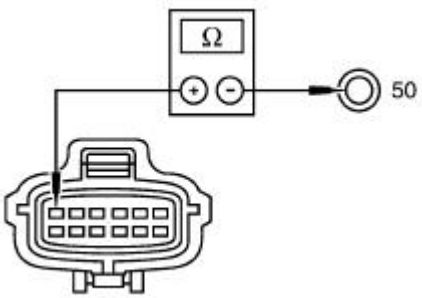
Test Step	Result / Action to Take
NOTE: Refer to the Transmission Connector Layouts preceding these pinpoint tests.	

NOTE: Refer to the Digital Transmission Range (TR) Sensor Diagnosis Chart preceding these pinpoint tests.



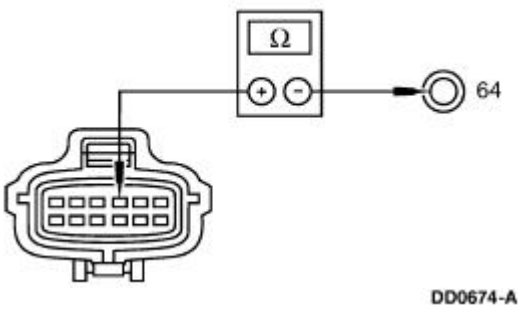
D1 VERIFY DIAGNOSTIC TROUBLE CODES	
• Key in OFF position. • Vehicle in park. • Carry out On-Board Diagnostic Test. DTC codes P0705 and P0708 cannot be set by a incorrectly adjusted digital TR sensor. • **Are only DTC codes P0705, P0708 present?**	**Yes** GO to D4 . **No** GO to D2 .
D2 VERIFY DIGITAL TRANSMISSION RANGE SENSOR ALIGNMENT	
• Key in OFF position. • Vehicle in park. • Check to make sure the digital TR sensor harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding. • Apply the parking brake. • Vehicle in neutral. • Disconnect the shift cable/linkage from the manual lever. • Verify that the TR Sensor Alignment Gauge fits in the appropriate slots. • **Is the digital TR sensor correctly adjusted?**	**Yes** GO to D3 . **No** ADJUST the digital TR sensor. PLACE transmission range selector lever into PARK and CLEAR DTCs. RERUN OBD Tests.GO to D3 .
D3 VERIFY SHIFT CABLE/LINKAGE ADJUSTMENT	
• Place the manual lever in the overdrive position. • Reconnect the shift cable/linkage. • Verify that the shift cable/linkage is properly adjusted. REFER to Section 307-05 . • **Is the shift cable/linkage correctly adjusted?**	**Yes** GO to D4 . **No** ADJUST the shift cable/linkage. REFER to Section 307-05 . GO to D4 .
D4 CHECK ELECTRICAL SIGNAL OPERATION	
• Vehicle in park. • Disconnect: Digital TR Sensor. • **CAUTION: Do not pry on connector. This will damage the connector and result in a transmission concern.** • Press the button and pull out on the digital TR harness connector. • Inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals. • **Is there damage to the connector, pins or harness?**	**Yes** REPAIR as required. CLEAR DTCs and RERUN OBD Tests. **No** If diagnosing a DTC, GO to D5 . If diagnosing a starting concern or a backup lamp concern,GO to D10 .
D5 CHECK ELECTRICAL SYSTEM OPERATION (DIGITAL TR AND PCM)	
• Key in OFF position. • Install Scan Tool. • Connect: Digital TR Sensor. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: TR PIDS TR, TR_D, TR_V. • Move transmission range selector lever into each gear and stop. • Observe any of the following PIDs, TR and TR_D, TR_V (vehicle dependent) while wiggling harness, tapping on sensor, and/or driving the vehicle. Use PIDs TR, and TR_D for DTCs P0705, P1704, and P1705. Use PIDs TR, and TR_V for DTC P0708.	**Yes** The problem is not in the digital TR sensor system. REFER to Diagnosis By Symptom in this section for further diagnosis. **No** If TR_D changes when wiggling harness, tapping on the sensor, or driving the vehicle, the problem may be intermittent.

• Compare the PIDs to the Digital Transmission Range (TR) Sensor Diagnosis Chart. • **Do the PIDs TR, TR_D and TR_V match the Digital Transmission Range (TR) Sensor Diagnosis Chart, and does the TR_D PID remain steady when the harness is wiggled, the sensor is tapped, or the vehicle driven?**	GO to D6 .
D6 CHECK THE DIGITAL TRANSMISSION RANGE SENSOR OPERATION	
• Disconnect: Digital TR Sensor. • **CAUTION: Do not pry on the connector. This will damage the connector and result in a transmission concern. Press the button and pull out on the harness connector.** • Connect the MLP-TR cable to the Transmission Tester. • Connect the MLP-TR cable (black connector marked DIGITAL) to the digital TR sensor. • Place the Trans Tester TR/MLP Overlay onto the Transmission Tester. • Carry out the sensor test as instructed on the Trans Tester TR/MLP Overlay. • **Do the status lamps on the tester MLP-TR cable match the selected gear positions?**	**Yes** The concern is not in the digital TR sensor. GO to D7 . **No** INSTALL a new and ADJUST the digital TR sensor. CLEAR the DTCs. REPEAT the Quick Tests.
D7 CHECK THE PCM HARNESS CIRCUITS FOR OPENS	
• Key in OFF position. • Disconnect: Powertrain Control Module. • Inspect for damaged or pushed-out pins, corrosion or loose wires. • Disconnect: Digital TR Sensor. • **CAUTION: Do not pry on the connector. This will damage the connector and result in a transmission concern. Press the button and pull out on the digital TR sensor harness connector.** • Disconnect digital TR sensor connector. • Install the EEC-V Control System Breakout Box. • Measure the resistance between PCM test pin 91 at the EEC-V Control System Breakout Box and the signal return circuit pin 2 at the vehicle harness connector.  DD0670-A • Measure the resistance between PCM test pin 34 at the EEC-V Control System Breakout Box, and TR1 circuit pin 4 at the vehicle harness connector.	**Yes** GO to D8 . **No** REPAIR the open circuit(s). RECONNECT all of the components. CLEAR the DTCs. REPEAT the Quick Tests.



AD1486-A

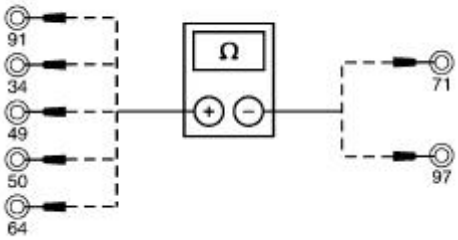
- Measure the resistance between PCM test pin 49 at the EEC-V Control System Breakout Box and TR2 circuit pin 5 at the vehicle harness connector.



DD0672-A

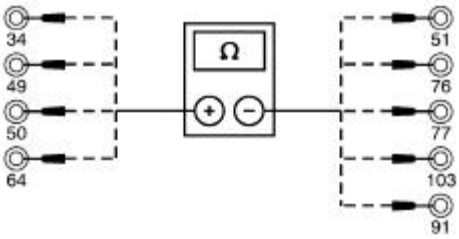
- Measure the resistance between PCM test pin 50 at the EEC-V Control System Breakout Box and TR4 circuit pin 6 at the vehicle harness connector.

DD0673-A



- Measure the resistance between PCM test pin 64 at the EEC-V Control System Breakout Box and TR3A circuit pin 3 at the vehicle harness connector.

DD0674-A

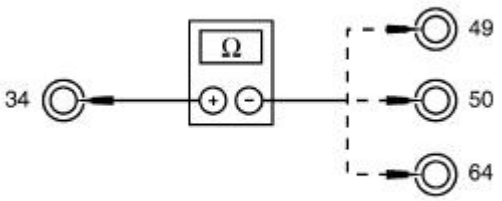


- **Is each resistance less than 5 ohms?**

D8 CHECK THE PCM HARNESS CIRCUITS FOR A SHORT TO GROUND OR TO POWER	
• Measure the resistance between PCM test pins 91, 34, 49, 50 and 64, and VPWR test pins 71 and 97 at the EEC-V Control System Breakout Box.	**Yes** GO to D9 .

AD1487-A

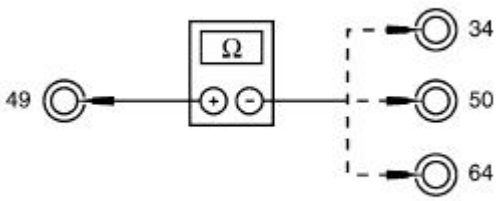
- Measure the resistance between PCM test pins 34, 49, 50 and 64, and test pins 51, 76, 77, 103 and 91 at the EEC-V Control System Breakout Box.



AD1488-A

- **Is each resistance greater than 10,000 ohms?**

No
REPAIR the short circuit(s). RECONNECT all of the components. CLEAR the DTCs. REPEAT the Quick Tests.

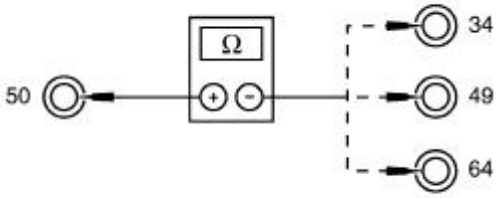


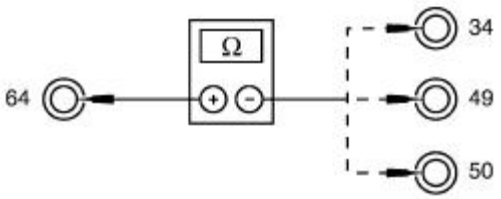
D9 CHECK FOR A SHORT BETWEEN THE TR/PCM INPUT SIGNAL CIRCUITS

- Measure the resistance between test pin 34 and test pins 49, 50 and 64 at the EEC-V Control System Breakout Box.

DD0677-A

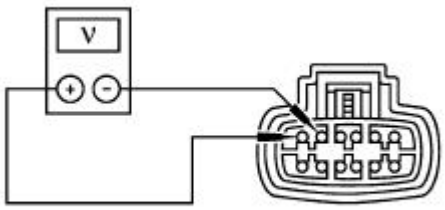
- Measure the resistance between test pin 49 and test pins 34, 50 and 64 at the EEC-V Control System Breakout Box.

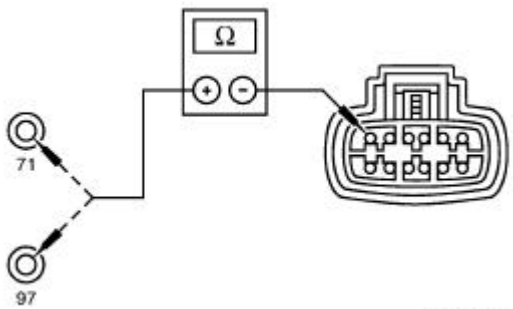




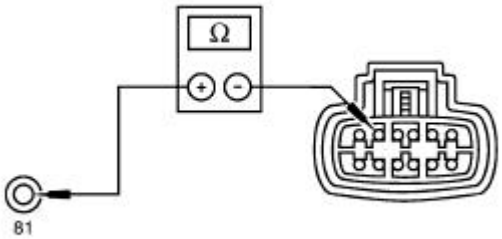
DD0678-A

- Measure the resistance between test pin 50 and Test pins 34, 49 and 64 at the EEC-V Control System Breakout Box.





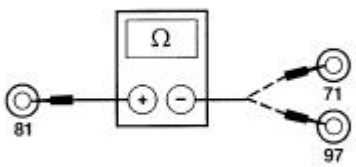
Yes
INSTALL a new PCM. RECONNECT all of the components. CLEAR the DTCs. RERUN the Quick Tests.

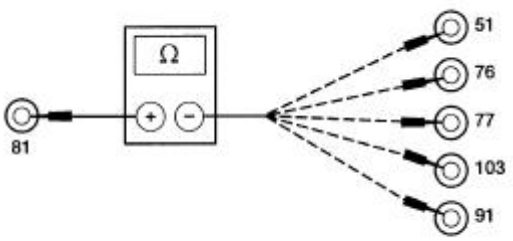


No
REPAIR shorts on the circuits having less than 10,000 ohms resistance between other TR/PCM input signal circuits. RECONNECT all of the components. CLEAR the DTCs. REPEAT the Quick Tests.

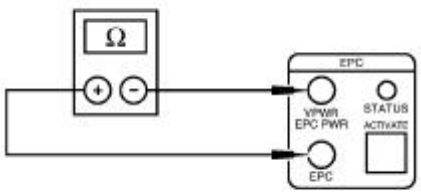
 DD0679-A ● Measure the resistance between test pin 64 and test pins 34, 49 and 50 at the EEC-V Control System Breakout Box.  DD0680-A ● **Is each resistance greater than 10,000 ohms?**	
D10 CHECK THE NON-PCM INTERNAL CIRCUITS OF SENSOR ● Connect the MLP-TR cable to the Transmission Tester. ● Connect the MLP-TR cable (black connector marked DIGITAL) to the digital TR sensor. ● Place the Trans Tester TR/MLP Overlay onto the Transmission Tester. ● Carry out the switch test as instructed on the Trans Tester TR/MLP Overlay. ● **Does the status lamp on the tester indicate RED for the correct gear position?**	**Yes** The concern is not in the digital TR sensor. For starter system concerns, REFER to Section 303-06 . For backup lamp concerns, REFER to Section 417-01 . **No** INSTALL a new and ADJUST the digital TR sensor. CLEAR the DTCs. REPEAT the Quick Tests.

PINPOINT TEST E: ELECTRONIC PRESSURE CONTROL (EPC) SOLENOID

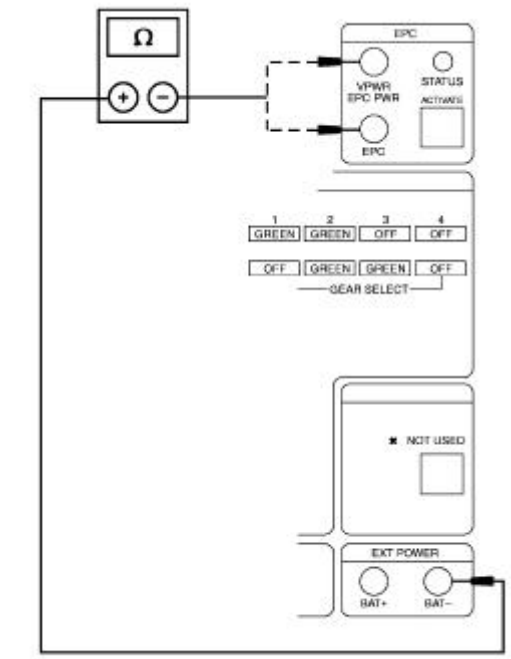




Test Step	Result / Action to Take
NOTE: Refer to the Transmission Connector Layouts preceding these pinpoint tests.	
E1 ELECTRONIC DIAGNOSTICS ● Check to make sure the transmission harness connector is fully seated, terminals are engaged in the connector and in good condition before proceeding. ● Install Scan Tool. ● Carry out KOEO Test until continuous DTCs have been displayed. ● ENTER Output Test Mode (OTM). ● Select the ALL ON Mode. Push START to turn the outputs on. Push STOP to turn the outputs off.	**Yes** REMAIN in OTM. GO to E2 . **No** PRESS START. If the vehicle does not enter OTM, REFER to the Powertrain



• **Does the vehicle enter OTM?**	Control/Emissions Diagnosis (PC/ED) manual.
E2 CHECK THE ELECTRICAL SIGNAL OPERATION	
• Disconnect: Transmission Connector. • **CAUTION: Remove the heat shield, if so equipped, from the transmission before removing the connector. Remove the solenoid body connector by pushing on the center tab and pulling on the harness connector. Do not attempt to pry the tab with a screwdriver. Always install the heat shield when the procedure is completed.** • Use a mirror to inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals. • Connect a VOM positive lead to the EPC PWR pin 12 and the negative test lead to the EPC signal circuit pin 11 of the transmission vehicle harness connector.  DD0552-B • Place the VOM on the 20-volt scale. • While observing the VOM, press START and STOP to cycle the solenoid output on and off. • **Is the solenoid output voltage changed to approximately battery voltage?**	**Yes** GO to E5 . **No** GO to E3 .
E3 CHECK THE CONTINUITY OF THE SOLENOID SIGNAL AND VPWR CIRCUITS	
• Key in OFF position. • Disconnect: Powertrain Control Module (PCM). • Inspect for damaged or pushed-out pins, corrosion or loose wires. • Install the EEC-V Control System Breakout Box. • Measure the resistance between the VPWR test pins 71 and 97 at the EEC-V Control System Breakout Box and the EPC PWR circuit pin 12 at the transmission harness connector.  DD0553-A • Measure the resistance between the PCM signal test pin 81 at the EEC-V Control System Breakout Box and the EPC signal pin 11 at the transmission harness connector.	**Yes** GO to E4 . **No** REPAIR the open circuit (s). REMOVE the EEC-V Control System Breakout Box. RECONNECT all of the components. ERASE the codes. REPEAT the Quick Tests.

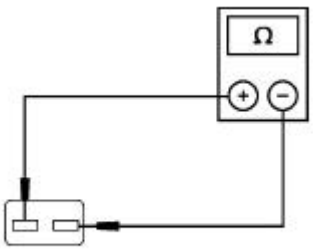


DD0554-A

- **Is each resistance less than 5 ohms?**

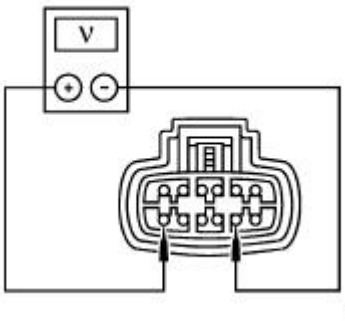
E4 CHECK THE HARNESS FOR SHORTS TO POWER AND GROUND	
• Measure the resistance between the PCM signal test pin 81 and VPWR test pins 71 and 97 at the EEC-V Control System Breakout Box.  D17329-A • Measure the resistance between the PCM signal test pin 81 and test pins 51, 76, 77, 103 and 91 at the EEC-V Control System Breakout Box.  D17330-A • **Is each resistance greater than 10,000 ohms?**	**Yes** GO to E5 . **No** REPAIR the short circuit (s). REMOVE the EEC-V Control System Breakout Box. RECONNECT all of the components. ERASE the codes. REPEAT the Quick Tests.
E5 TRANSMISSION FUNCTIONAL TEST	
• Connect: Powertrain Control Module (PCM). • Install the Transmission Fluid Pressure Gauge at the line tap on the case. • Install the Transmission Tester to transmission connector. • Set the bench/drive switch to the DRIVE mode. • Rotate the gear select switch to the first gear position. • **NOTE:** The LED will turn GREEN when the EPC solenoid activates and turn off when deactivated. The LED will turn RED if an ACTIVATED solenoid is shorted to battery positive. The LED will remain off if an ACTIVATED solenoid is shorted to ground or no continuity (open circuit). • Carry out the EPC Solenoid Functional Test. • Observe line pressure on the gauge while pressing the EPC switch (engine must be running). • **Does the EPC (GREEN LED) activate and line pressure**	**Yes** INSTALL a new PCM. REPEAT the Quick Tests. **No** GO to E6 .

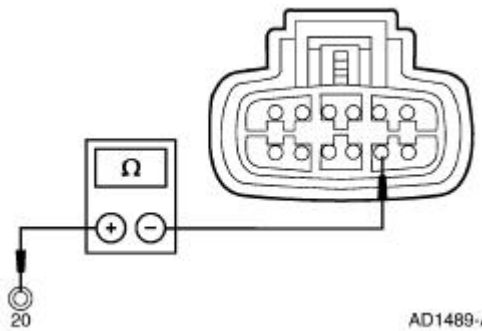
drop when the EPC switch is pressed?	
E6 CHECK THE RESISTANCE OF THE SOLENOID	
NOTE: Refer to the Transmission Tester for terminal locations. ● Set the bench/drive switch to the BENCH mode. ● Rotate the gear select switch to the OHMS CHECK position. ● **CAUTION: Make sure the tester power is off or damage to the ohmmeter can result.** ● Connect the ohmmeter negative lead to the VPWR jack and the positive lead to the EPC jack on the tester.  DD0557-A ● Record the resistance. The resistance should be between 3.0 and 5.0 ohms. ● **Is the resistance between 3.0 and 5.0 ohms?**	**Yes** GO to E7 . **No** INSTALL a new solenoid body assembly. RECORD and ERASE all codes. REPEAT the Quick Tests.
E7 CHECK THE SOLENOID FOR SHORT TO GROUND	
● Check for continuity between the BAT(-) jack (engine ground) and the appropriate jack with a digital ohmmeter or other low current tester (less than 200 milliamps). The connection should show infinite resistance (no continuity). **Solenoid** / **Tester Jack** EPC / VPWR, EPC PWR	**Yes** INSTALL a new solenoid body assembly. RECORD and ERASE codes. REPEAT the Quick Tests. **No** GO to Diagnosis By Symptom in this section.



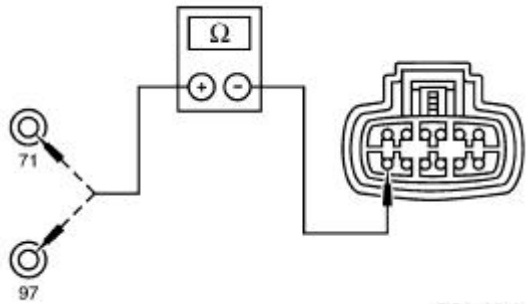
AD2287-A

- **Does the connection show continuity?**





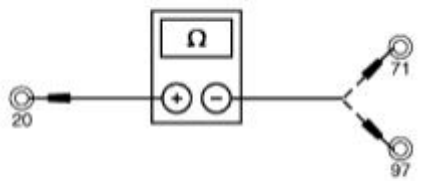
PINPOINT TEST F: TURBINE SHAFT SPEED (TSS) AND OUTPUT SHAFT SPEED (OSS) SENSORS

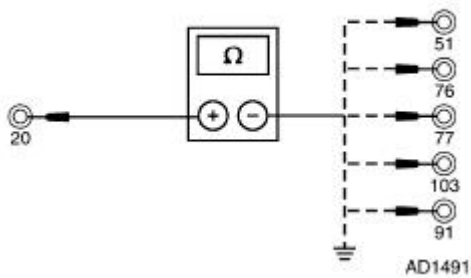


Test Step	Result / Action to Take
NOTE: Refer to the Transmission Connector Layouts preceding these pinpoint tests.	
F1 ELECTRONIC DIAGNOSTICS • Check to make sure the transmission harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding. • Install Scan Tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Diagnostic Data Link. • Enter the following diagnostic mode on the diagnostic tool: PCM. • Select PID/Data Monitor and Record. • Select the following PIDs: TSS, OSS. • **Does vehicle enter PID/Data Monitor and Record?**	**Yes** REMAIN in PID/Data. GO to F2 . **No** REPEAT procedure to ENTER PID. If vehicle did not enter PID, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM or NGS.
F2 DRIVE CYCLE TEST • While monitoring the appropriate sensor PID, drive the vehicle so that the transmission upshifts and downshifts through all gears. • **Does the TSS, or OSS Speed PID increase and decrease with engine and vehicle speed or is the sensor signal erratic (drop to zero or near zero and return to normal operation)?**	**Yes** If the TSS or OSS Speed PID increase and decrease with engine and vehicle speed, CLEAR all DTCs. ROAD TEST to verify if concern is still present. If concern is still present, REFER to Diagnosis By Symptom in this section for diagnosis. If the sensor signal is erratic, INSPECT for intermittent

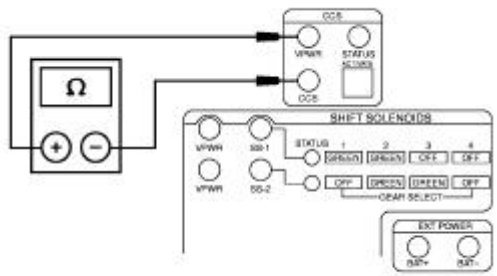
	concern in the internal/external harness, sensor, or connector. **No** If the TSS, or OSS Speed PID does not increase and decrease with engine and vehicle speed, INSPECT for open or short in vehicle harness, sensor, a PCM concern, or internal hardware concern. If the sensor signal is steady, GO to F3 .
F3 CHECK RESISTANCE OF TSS OR OSS SENSOR ● Disconnect the appropriate vehicle harness connector from the TSS and or OSS sensor. ● For TSS or OSS: Connect ohmmeter negative lead to one pin of the sensor and the positive lead to the other pin on the sensor.  AD1084-B ● Record the resistance. Resistance should be as follows: **Sensor** / **Resistance (ohms)** TSS Application: 781-1,979 OSS-All Application: 781-1,979 ● **Is the resistance within specification for the appropriate sensor?**	**Yes** REFER to Diagnosis By Symptom in this section for concern diagnosis. **No** For TSS and OSS, INSTALL a new sensor.

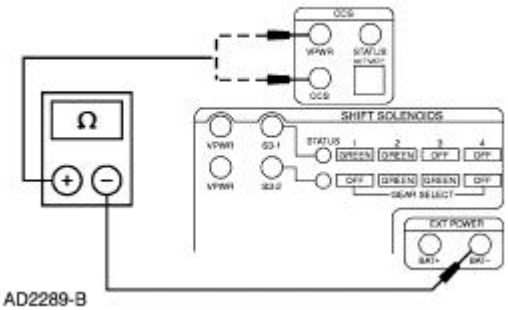
PINPOINT TEST G: COAST CLUTCH SOLENOID (CCS)





Test Step	Result / Action to Take
NOTE: Refer to the Transmission Connector Layouts preceding these pinpoint tests.	
G1 ELECTRONIC DIAGNOSTICS ● Check to make sure the transmission harness connector is fully seated, terminals are engaged in the connector and in good condition before proceeding. ● Install Scan Tool. ● Carry out the KOEO Test until continuous DTCs have been displayed. ● Enter the Output Test Mode (OTM). ● Select the ALL ON mode. Push START to turn the outputs on. Push STOP to turn the outputs off.	**Yes** REMAIN in OTM. GO to G2 . **No** PRESS START. If the vehicle does not enter OTM, REFER to the Powertrain





• **Does the vehicle enter OTM?**	Control/Emissions Diagnosis (PC/ED) manual.
G2 CHECK THE ELECTRICAL SIGNAL OPERATION	
• Disconnect: Transmission Connector. • **CAUTION: Remove the heat shield, if so equipped, from the transmission before removing the connector. Remove the solenoid body connector by pushing on the center tab and pulling on the harness connector. Do not attempt to pry the tab with a screwdriver. Always install the heat shield when the procedure is completed.** • Use a mirror to inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals. • Connect a VOM positive lead to the VPWR circuit pin 1 and the negative test lead to the CCS signal circuit pin 5 of the transmission vehicle harness connector.  DD0560-A • Place the VOM on the 20-volt scale. • While observing the VOM, press start and stop to cycle the solenoid output on and off. • **Is the solenoid output voltage changed to approximately battery voltage?**	**Yes** GO to G5 . **No** GO to G3 .
G3 CHECK THE CONTINUITY OF THE CCS SIGNAL AND VPWR CIRCUITS	
• Key in OFF position. • Disconnect: Powertrain Control Module (PCM). • Inspect for damaged or pushed-out pins, corrosion or loose wires. • Install the EEC-V Control System Breakout Box. • Measure the resistance between the PCM signal test pin 20 at the EEC-V Control System Breakout Box and the signal pin 5 at the transmission harness connector.  AD1489-A • Measure the resistance between the VPWR test pin 71 or 97 at the EEC-V Control System Breakout Box and the VPWR pin 1 at the transmission harness connector.	**Yes** GO to G4 . **No** REPAIR the open circuits. REMOVE the EEC-V Control System Breakout Box. RECONNECT all of the components. REPEAT the Quick Tests.

DD0562-A

- **Is each resistance less than 5 ohms?**

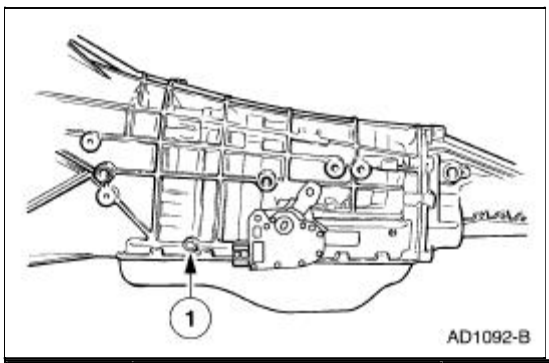
G4 CHECK THE CCS CIRCUIT FOR SHORTS TO POWER AND GROUND	
• Measure the resistance between the PCM signal test pin 20 and VPWR test pins 71 and 97 at the EEC-V Control System Breakout Box.  AD1490-A • Measure the resistance between the PCM signal test pin 20 and test pins 51, 76, 77, 103 and 91 at the EEC-V Control System Breakout Box and chassis ground.  AD1491-A • **Is each resistance greater than 10,000 ohms?**	**Yes** GO to G5 . **No** REPAIR the short circuit (s). REMOVE the EEC-V Control System Breakout Box. RECONNECT all of the components. REPEAT the Quick Tests.
G5 SOLENOID FUNCTIONAL TEST	
• Connect: Powertrain Control Module (PCM). • Install the Transmission Tester to the transmission connector. • **NOTE:** The LED will turn GREEN when the CCS activates and turn off when deactivated. The LED will turn RED if an ACTIVATED solenoid is shorted to battery positive. The LED will remain off if an ACTIVATED solenoid is shorted to ground or no continuity (open circuit). • Carry out the Solenoid Voltage Test. • **Does the solenoid (LED GREEN) activate when the tester switch is pressed?**	**Yes** GO to G6 . **No** GO to G7 .
G6 TRANSMISSION DRIVE TEST	
• Carry out the Dynamic Testing.	**Yes**

• **Does the CCS activate (LED GREEN) and engine braking occur?**	INSTALL a new PCM. ERASE all DTCs. CARRY OUT the Transmission Drive Cycle Test. REPEAT the Quick Tests. If symptoms are still present, REFER to Diagnosis By Symptom in this section. **No** GO to G7 .
G7 CHECK THE RESISTANCE OF THE SOLENOID	
NOTE: Refer to the Transmission Tester for terminal locations. • Place the bench/drive switch to the BENCH mode. • Rotate the Gear Select switch to the OHMS CHECK position. • Connect the ohmmeter negative lead to the CCS jack and the positive lead to the VPWR jack on the tester.  AD2288-A • Record the resistance. (The resistance should be between 17 and 22 ohms within a temperature range of 4°C - 66°C (40°F - 150°F). • **Is the resistance between 17 and 22 ohms?**	**Yes** GO to G8 . **No** INSTALL a new solenoid body assembly.
G8 CHECK THE SOLENOID FOR SHORT TO GROUND	
• Check for continuity between the BAT(-) jack (engine ground) and the appropriate jack with a digital ohmmeter or other low current tester (less than 200 milliamps). Connection should show infinite resistance (no continuity).  AD2289-B • **Does the connection show continuity?**	**Yes** INSTALL a new solenoid body assembly. **No** REFER to Diagnosis By Symptom in this section.

PINPOINT TEST H: SOLENOID MECHANICAL FAILURE

Test Step	Result / Action to Take
NOTE: Repair all other DTCs before repairing the following DTCs: P1714, P1715, P1740	
H1 ELECTRONIC DIAGNOSIS	

• Install Scan Tool. • Carry out the KOEO Test until continuous DTCs have been displayed. • If any of the following DTCs are present, continue with this test: P1714, P1715, P1740. • **Are other DTCs present for TFT or shift solenoids?**	**Yes** REPAIR the DTCs for TFT or shift solenoids first. CLEAR DTCs and CARRY OUT the transmission Drive Cycle Test. RERUN Quick Test. **No** INSTALL a new solenoid and or body. REFER to the Diagnostic Trouble Code chart for code description. GO to H2 .
H2 TRANSMISSION DRIVE CYCLE TEST	
• Carry out Transmission Drive Cycle Test. • Carry out the On-Board Diagnostic Test. • **Does the vehicle upshift and downshift OK?**	**Yes** GO to H3 . **No** REFER to Diagnosis By Symptom to diagnose shift concerns.
H3 RETRIEVE DTCS	
• Install Scan Tool. • Carry out KOEO Test until continuous DTCs have been displayed. • **Are DTCs P1714, P1715, P1740 still present?**	**Yes** INSTALL a new PCM. Road test and RERUN Quick Test. **No** Testing completed. If a concern still exists, REFER to Diagnosis By Symptom for concern diagnosis.



Special Testing Procedures

The special tests are designed to aid the technician in diagnosing the hydraulic and mechanical portions of the transmission.

Engine Idle Speed Check

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the engine idle speed.

Line Pressure Test

Item	Part Number	Description
1	—	Line Pressure Tap

CAUTION: Carry out the Line Pressure Test prior to carrying out the Stall Speed Test. If line pressure is low at stall, do not carry out the Stall Speed Test or further transmission damage will occur. Do not maintain wide-open throttle (WOT) in any transmission range for more than five seconds or transmission damage may occur.

NOTE: Carry out shift linkage check prior to carrying this test; refer to Section 307-05 .

This test verifies the line pressure is within specifications.

1. Connect the Transmission Fluid Pressure Gauge to the line pressure tap.
2. Start the engine and check the line pressures. Refer to the Line Pressure Chart to determine if the line pressure is within specification.
3. If the line pressure is not within specification, carry out On-Board Diagnostics and Go To Pinpoint Test E , air pressure check, and clean, inspect and install a new main control system or pump as required.

Line Pressure Chart

Gear	Line Pressure — Idle		Line Pressure — Stall	
	kPa	psi	kPa	psi

P, N	345-448	50-65	—	—
R	483-690	70-100	1,689-2,000	245-290
(D), 2	345-448	50-65	1,138-1,276	165-185
1	483-690	70-100	1,207-1,448	175-210

Line Pressure Diagnosis Chart

Low at Idle in All Ranges			**High at Idle in All Ranges**		
Check for low fluid level, restricted inlet filter, loose main body, solenoid body or accumulator body-to-case bolts, excessive leakage in pump, case, control bodies, sticking main regulator valve, damaged filter assembly and seal, damaged gaskets or valve body separating plate.			Check the main regulator valve, solenoid body and wiring harness. Run the Quick Test referred to in the Diagnostic portion of this section.		
Low Only in					
P	**R**	**N**	**(D)**	**2**	**1**
Check valve bodies 7A100	Check separator reinforcing plate, coast clutch, low/reverse clutch or direct clutch. Valve bodies 7A100, 7G422	Check valve bodies 7A100	Check forward clutch. Valve bodies 7A100, 7G422	Check forward clutch, coast clutch or intermediate clutch, band, servo assembly. Valve bodies 7A100, 7G422	Check forward clutch, low/reverse clutch or coast clutch. Valve bodies 7A100, 7G422

Stall Speed Test

WARNING: Apply the service and parking brakes firmly while carrying out each stall test.

CAUTION: Carry out the Line Pressure Test prior to carrying out the Stall Speed Test. If line pressure is low at stall, do not carry out the Stall Speed Test or further transmission damage will occur.

NOTE: The stall test should only be carried out with the engine and transmission at normal operating temperatures.

The stall test checks the operation of the following items:

- Torque converter one-way clutch.
- Forward clutch.
- Low one-way clutch.
- Reverse clutch.
- Overdrive one-way clutch.
- Direct clutch.
- Engine driveability concerns.

1. Connect a tachometer to the engine.

2. After testing each of the following ranges, (D), 2, 1 and R, move the transmission range selector lever to N (NEUTRAL) and run the engine for about 15 seconds to allow the torque converter to cool before testing the next range.

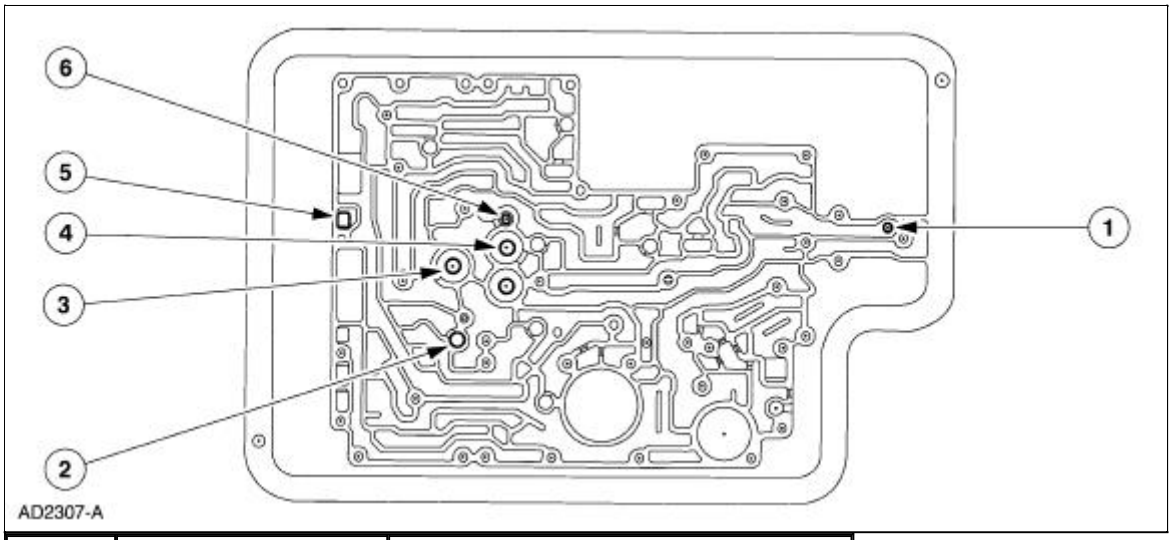
3. **CAUTION: If the engine rpm recorded by the tachometer exceeds the maximum specified rpm, release the accelerator pedal immediately. Clutch or band slippage is indicated.**

   CAUTION: Do not maintain wide-open throttle (WOT) in any gear range for more than 5 seconds or damage to the transmission may occur.

   Press the accelerator pedal to floor (WOT) in each range. Record the rpm reached in each range. Stall speeds should be in the appropriate range.

Stall Speed Chart

Series	Engine	Min.	Max.
Expedition/Navigator	5.4L 2V	2,297	2,725
Navigator	5.4L 4V	2,274	2,736



If the stall speeds were too high, refer to the following Stall Speed Diagnosis Chart. If the stall speeds were too low, check engine tune-up. If the engine is OK, remove the torque converter and check the torque converter reactor one-way clutch for slippage.

Stall Speed Diagnosis Chart

Range	Possible Source
(D)	• Forward Clutch • Overdrive One-Way Clutch • Low One-Way Clutch
R	• Direct Clutch • Overdrive One-Way Clutch and Coast Clutch • Reverse Clutch
2	• Forward Clutch • Overdrive One-Way Clutch and Coast Clutch
1	• Forward Clutch • Reverse Clutch and Low One-Way Clutch • Coast Clutch and Overdrive One-Way Clutch

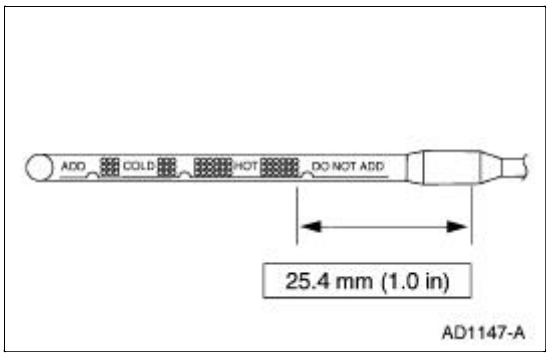
Air Pressure Test

Air Pressure Test Port Locations

Item	Part Number	Description
1	—	Reverse clutch feed
2	—	Intermediate clutch feed
3	—	Overdrive clutch feed
4	—	Forward clutch feed
5	—	Coast clutch feed
6	—	Direct clutch feed

A no-drive condition can exist, even with correct transmission fluid pressure, because of inoperative clutches or bands. Refer to the Band/Clutch Application Chart to determine the appropriate elements. A clutch concern can be located through a series of checks by substituting air pressure for fluid pressure to determine the location of the concern.

Example: When the transmission range selector lever is in a forward gear range ((D), 2, 1), a no-drive condition may be caused by an inoperative forward clutch.



1. Drain the transmission fluid. Remove the transmission fluid pan.
2. Remove the filter and seal assembly, the solenoid body, the control assemblies and separator plate, upper/lower gaskets.
3. The inoperative clutches can be located by applying air pressure into the appropriate clutch port. See the Air Pressure Test Port Locations illustration for clutch port locations.
4. Apply air pressure to the appropriate clutch port (see diagram). A dull thud may be heard or movement felt when a clutch piston is applied. If the clutch seals or check ball are leaking, a hissing may be heard.
5. If the clutches fail to operate during the air check:
   - the piston seals are not seated, damaged, not installed.
   - plugged feed holes for clutch apply in the case and/or clutch cylinder.
   - damaged piston and/or clutch cylinder.
6. Service as required and recheck.

Torque Converter Drainback Test

7. Drive the vehicle for 30-60 minutes to attain normal operating temperature.

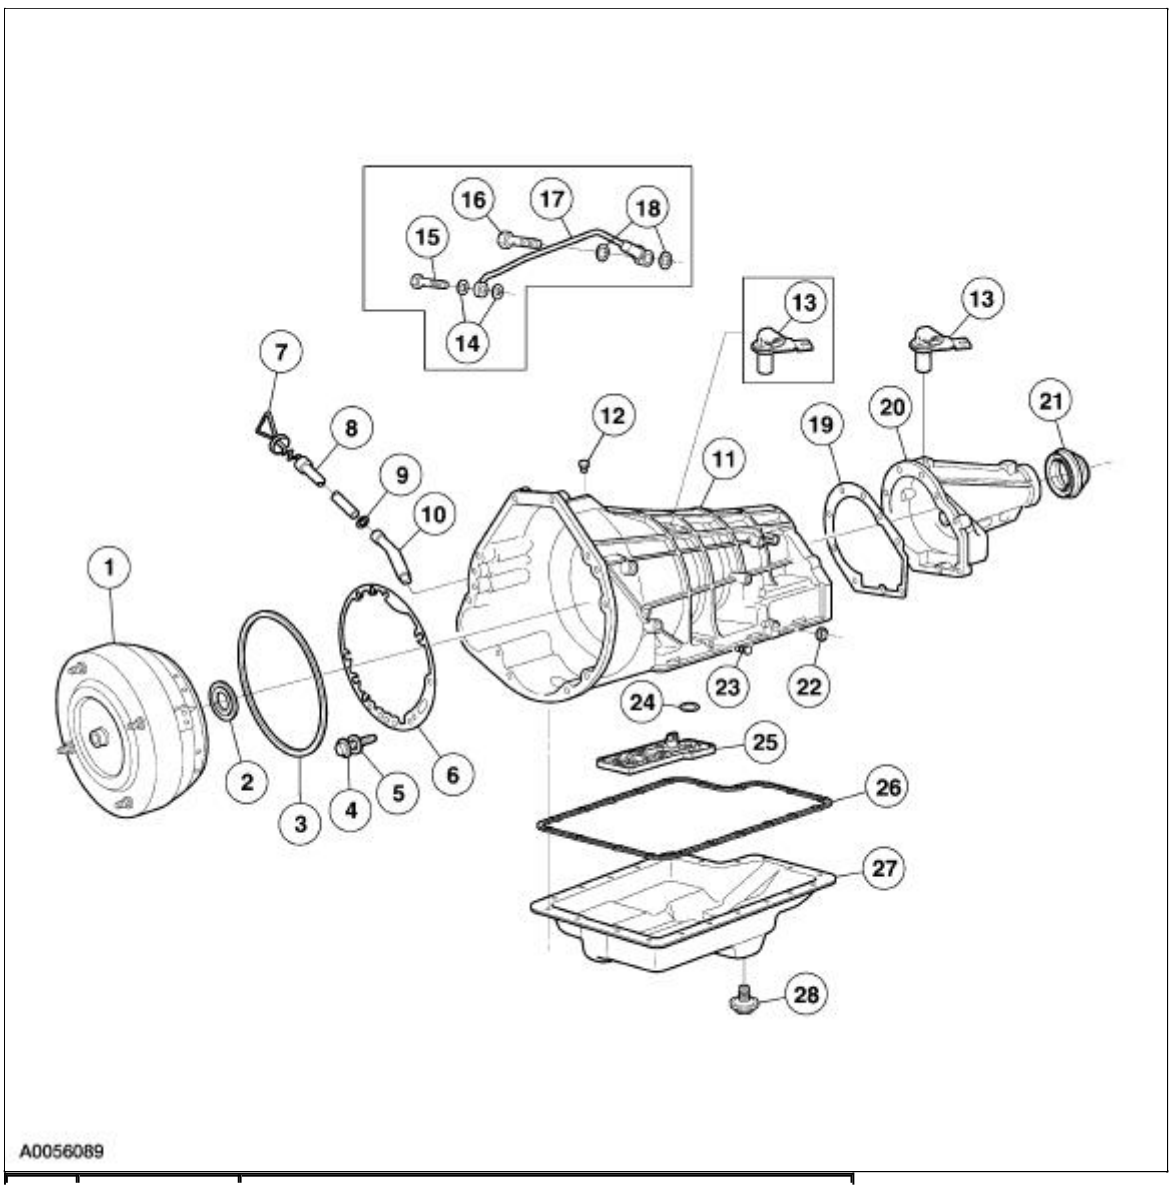
8. Check the transmission fluid level. Add fluid only if required.

9. Drive the vehicle through 8 to 10 cycles of 1/2 throttle, 1-2 upshifts to elevate the transmission temperature. Then proceed as follows:
    - Park the vehicle on level ground.
    - Allow the vehicle to sit for 30-60 minutes.
    - Check and note the fluid level on the fluid level indicator with the engine off, in PARK. The following example shows the fluid level after 45 minutes.

10. Allow the vehicle to sit for a minimum of 24 hours. Check and note the fluid level.

11. If the fluid has risen 25.4 mm (1 in) or more above the level in the first check, excessive converter drainback has occurred.

12. If excessive drainback has occurred:
    - stuck open check ball in rear cooler line case fitting.
    - no check ball in rear cooler line case fitting.
    - incorrect case cooler line case fitting (without check ball) installed.



13. Service as required and recheck.

Leakage Inspection

The transmission has the following parts to prevent external fluid leakage:

- Gaskets
- Lip-type seals
- O-ring seals
- Seal rings
- Seal grommets
- Thread sealant
- Cooler bypass valve (CBV) sealing washers

External Sealing — 4R100

Item	Part Number	Description
1	7902	Torque converter assembly
2	7A248	Front pump seal
3	7A248	Front pump seal square-cut O.D. seal
4	N805260-S	Bolt and washer assembly
5	7G379	Washer
6	7A136	Pump gasket
7	7A020	Fluid level indicator
8	7A228	Fluid filler tube assembly
9	391308-S	Filler tube O-ring
10	7A160	Short fluid inlet tube assembly
11	7005	Case
12	7034	Case vent assembly
13	7M101	Turbine/output shaft speed (TSS/OSS) sensor (vehicle-dependent)
14	7H183	Plug assembly — case (vehicle-dependent)
15	7Z152	Cooler line — case fitting (part of 7H332 CBV assembly)
16	391933-S100	Sealing washers
17	7G118	Cooler line — case fitting (part of 7H332 CBV assembly)
18	7H322	Transmission cooler bypass valve assembly
19	391932-S100	Sealing washers
20	7052	Extension housing seal
21	7A039	Extension housing
22	7086	Extension housing gasket
23	7B498	Manual control lever seal
24	390685-S	Plug — test port 1/8-27 hex head
25	7G391	Solenoid valve body assembly
26	7A191	Transmission fluid pan gasket
27	7A194	Transmission fluid pan
28	7D479	Fluid pan drain plug assembly

Leakage at the transmission pan-to-case gasket often can be stopped by tightening the retaining bolts to specification. Refer to Torque Specifications in this section. If necessary, install a new pan-to-case gasket only if gasket is damaged.

If leakage is found by the solenoid body connector, refer to Main Control Valve Body—Accumulator Body Check in this section.

Check the transmission sealing washers on the cooler bypass valve (CBV), fluid filler tube connection at the transmission case. If leakage is found, install a new short fluid inlet tube.

Check the transmission sealing washers on the cooler bypass valve (CBV), fluid lines and fittings

between the transmission and the fluid inlet short tube in the radiator tank for looseness, wear or damage. If leakage cannot be stopped by tightening a fluid line tube nut, install new cooler lines. When fluid is found to be leaking between the case and the cooler line fitting, tighten the fitting to maximum specification. Refer to Section 307-02 .

CAUTION: Do not try to stop the fluid leak by increasing the torque beyond specification. This can cause damage to the case threads and/or case fittings.

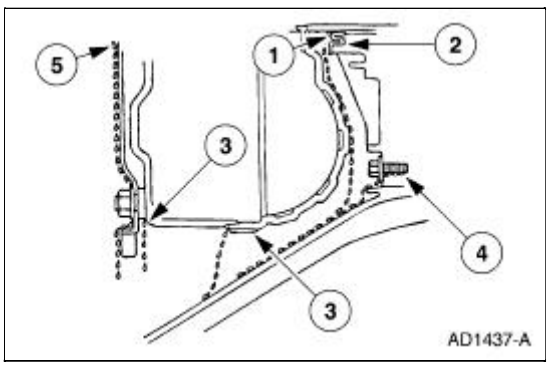
If the leak continues, install a new cooler line fitting and/or sealing washers on cooler bypass valve and tighten to specification. The same procedure should be followed for fluid leaks between the radiator cooler and cooler line fittings.

Check the engine coolant in the radiator. If transmission fluid is present in the coolant, the transmission fluid cooler in the radiator is leaking.

The transmission fluid cooler can be further checked for leaks by disconnecting the lines from the cooler fittings and applying no more than 344.75 kPa (50 psi) air pressure to the fittings. Remove the radiator cap to relieve the pressure buildup at the exterior of the fluid cooler tank. If the transmission fluid cooler is leaking, will not hold pressure, or both, install a new transmission fluid cooler in the radiator.

If leakage is found at the manual control lever shaft, install a new seal.

When a converter drain plug leaks, remove the drain plug. Install and tighten a new drain plug to specification. Refer to Torque Specifications in this section.



Check for fluid leaking from the end of the extension housing. Leakage can result from a damaged seal, missing garter spring or worn extension bushing, or damaged speed sensor plug. Install a new seal assembly, bushing, or both, as necessary.

Inspect the line pressure plug for leakage. Make sure it is tightened to specification. Refer to Torque Specifications in this section. If tightening the plug does not stop the leak the case threads and/or plug could be damaged. Remove the plug and inspect the plug and case thread for damage. Repair as necessary.

Check for leakage on or around the cooler bypass valve (CBV). Repair as required.

Fluid Leakage in Torque Converter Area

In diagnosing and correcting fluid leaks in the front pump assembly and torque converter area, use the following procedures to locate the exact cause of the leakage. Leakage at the front of transmission, as evidenced by fluid around the torque converter housing, may have several sources. By careful observation it is possible, in many instances, to pinpoint the source of leak before removing the transmission from the vehicle. The paths which the fluid takes to reach the bottom of the torque converter housing are shown in the illustration. The following five steps correspond with the numbers in the illustration.

1. Fluid leaking by the front pump seal lip will tend to move along the impeller hub and onto the back of the impeller housing. Except in the case of a total seal failure, fluid leakage by the lip of the seal will be deposited on the inside of the torque converter housing only, near the outside diameter of the housing.

2. Fluid leakage by the outside diameter of the front pump seal and front pump body will follow the same path that leaks by the inside diameter of the front pump seal follow.

3. Fluid leakage from the converter drain plug, converter seal weld or converter-to-flexplate stud weld will appear at the outside diameter of the torque converter, on the back face of the flexplate, and in the converter housing only near the flexplate. Fluid leaks from the torque converter will leave a ring of fluid around the inside of the torque converter housing.

4. Fluid that leaks by a front pump to case bolt or pump gasket will be deposited on the inside of the torque converter housing only. Fluid will not be deposited on the back of the torque converter.

5. **NOTE:** White facial tissue may aid in determining the color (red is transmission fluid) and source of the leaking fluid.

   Engine oil leaks are sometimes incorrectly diagnosed as transmission pump gasket leaks. The following areas of possible leakage should also be checked to determine if engine oil leakage is causing the concern.

   - Leakage at the valve cover gasket may allow oil to flow over the torque converter housing or seep down between the torque converter housing and cylinder block, causing oil to be present in or at the bottom of the torque converter housing.
   - Oil galley plug leaks will allow oil to flow down the rear face of the cylinder block to the bottom of the torque converter housing.
   - Leakage at the crankshaft rear oil seal will work back to the flexplate, and then into the torque converter housing.
   - Leakage at oil pressure sensor.

Leak Check Test

Determine the cause of the leakage before repair.

1. Remove the fluid level indicator and note the color of the fluid. Original factory fill fluid is dyed red to aid in determining if leakage is from the engine or transmission. The red color should assist in pinpointing the leak.

2. Remove the torque converter housing cover. Clean off any fluid from the top and bottom of the torque converter housing, front of the case, and rear face of the engine and oil pan. Clean the torque converter area by washing with a suitable non-flammable solvent, and blow dry with compressed air.

3. Wash out the torque converter housing, the front of the flexplate and the converter drain plug. The torque converter housing may be washed out using clean solvent and a squirt-type oil can. Blow-dry all washed areas with compressed air.

4. Start and run the engine until the transmission reaches its normal operating temperature. Observe the back of the cylinder block and top of the torque converter housing for evidence of fluid leakage. Raise the vehicle on a hoist and run the engine at fast idle, then at engine idle, occasionally shifting to the OVERDRIVE and REVERSE ranges to increase pressure within the transmission. Observe the front of the flexplate, back of the cylinder block (in as far as possible), and inside the torque converter housing and front of the case. Run the engine until fluid leakage is evident and the probable source of leakage can be determined.

Leak Check Test with Black Light

Oil-soluble aniline or fluorescent dyes premixed at the rate of 2.5 ml (1/2 teaspoon) of dye powder to 0.24 L (0.5 pint) of automatic transmission fluid have proven helpful in locating the source of fluid leakage. Such dyes can be used to determine whether an engine fluid or transmission fluid leak is present, or if the fluid in the transmission fluid cooler hose leaks into the engine coolant system. An ultraviolet light must be used to detect the fluorescent dye solution.

Transmission Fluid Cooler

CAUTION: Prior to this test, the in-line service filter (if equipped) must be removed. Failure to remove the in-line filter may result in a incorrect reading/diagnosis during this test.

CAUTION: Whenever a transmission has been disassembled to install new parts, the cooler bypass valve (CBV), all transmission fluid coolers (in tank and auxiliary) and transmission fluid cooler lines must be cleaned and backflushed. Use a torque converter/oil cooler cleaner.

NOTE: Cleaning and backflushing the transmission fluid cooling system, along with following all the normal cleaning and inspection procedures during disassembly and reassembly, will keep contaminants from entering the transmission, causing a repeat repair.

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material, or band material may have been carried into the torque converter and transmission fluid cooler. These contaminants are a major cause of recurring transmission troubles and must be removed from the system before the transmission is put back into use.

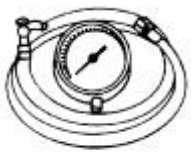
Transmission Fluid Cooler Flow Test

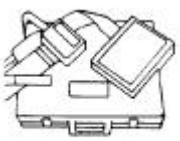
NOTE: The transmission linkage/cable adjustment, fluid level and line pressure must be within specification before carrying out this test. Refer to Fluid Level Check under Verification of Condition in this section. Refer to Line Pressure Test under Special Testing Procedures in this section. For shift linkage/cable adjustment procedures, refer to Section 307-05 .

1. Remove the fluid level indicator from the fluid filler tube.
2. Place a funnel in the fluid filler tube.
3. Raise and support the vehicle.
4. Disconnect the cooler return tube (rear fitting) from the transmission cooler bypass valve (CBV). Refer to Section 307-02 .
5. Connect one end of a hose to the cooler return tube and route the other end of the hose up to a point where it can be inserted into the funnel at the fluid filler tube.
6. Remove the supports and lower the vehicle.
7. Insert the end of a hose into the funnel.
8. Start the engine and run at idle with the transmission in the NEUTRAL range.
9. Once a steady flow of fluid (without air bubbles) is observed, remove the hose from the funnel and place the hose in a measuring container for 15 seconds. After 15 seconds place the hose back into the funnel and turn the engine off. Measure the amount of fluid in the container. If adequate flow was observed, approximately 946.24 ml (32 oz) will be in the measuring container; the test is now complete.
10. If adequate flow is not observed, turn off the engine. Disconnect the hose from the cooler return line (transmission inlet).

11. Disconnect the fluid cooler line from the front case fitting and connect the hose to the case fitting (converter out) and repeat Steps 7, 8 and 9.

12. If adequate flow is observed from the transmission, look for a plugged cooler line and/or fluid cooler. Refer to Section 307-02 for diagnosis of the transmission fluid cooler.





13. If adequate flow is still not observed, repair and/or installation of a new pump and/or torque converter may be required.

Transmission Fluid Cooler Tube Replacement

For installation of new transmission fluid cooler tube, refer to Section 307-02 .

Diagnosis By Symptom

Special Tool(s)

 ST1300-A	UV Leak Detector Kit 164-R0756 or equivalent

The Diagnosis by Symptom Charts give the technician diagnostic information and direction and list possible components, using a SYMPTOM as a starting point.

The Diagnosis by Symptom Charts are divided into two categories: electrical routines, indicated by 200 series numbers, and hydraulic/mechanical routines, indicated by 300 series numbers. The electrical routines list the possible electrical components that could have caused or contributed to the symptom described. The hydraulic/mechanical routines list the possible hydraulic or mechanical components that could cause or contribute to the symptom described.

Diagnosis by Symptom Chart Directions

1. Using the Diagnosis by Symptom Index, select the concern/symptom that best describes the condition.

2. Refer to the routine indicated in the diagnosis by symptom index.

3. Always begin diagnosis of a symptom with:
   - Preliminary inspections.
   - Verification of condition.
   - Check the fluid level.
   - Carry out other test procedures as directed.

4. **NOTE:** Not all concerns and conditions with electrical components will set a diagnostic trouble code (DTC). Be aware that the components listed may still be the cause. Verify correct function of those components prior to proceeding to the hydraulic/mechanical routine listed.

   Begin with the electrical routine if indicated. Follow the reference or action required statements. Always carry out the On-Board Diagnostic Tests as required. NEVER SKIP STEPS. Repair as required. If the concern is still present after electrical diagnosis, proceed to the hydraulic/mechanical routine listed.

5. The hydraulic/mechanical routines list possible hydraulic or mechanical components that could cause the concern. These components are listed in the removal sequence and by most likely cause. You must inspect all components listed to make a correct repair.

● No forward and no REVERSE only	207	307
● Harsh forward and REVERSE	208	308
● Delayed/soft forward and REVERSE	209	309
Shift Concerns		
● Some or all shifts missing	210	310
● Timing concerns	211	311
■ Early/late (some/all)	212	312
■ Erratic/hunting (some/all)	213	313
● Feel concerns	214	314
■ Soft/slipping (some/all)	215	315
■ Harsh (some/all)	216	316
● No 1st gear in drive, engages in higher gear	217	317
● No MANUAL 1st gear		
● No MANUAL 2nd gear		
Torque Converter Clutch Operation Concerns		
● No apply	240	340
● Always applied/stalls vehicle	241	341
● Cycling/shudder/chatter	242	342
Other Concerns		
● Shift lever efforts high	251	351
● External leaks	252	352
● Driveability concerns	253	353
● Noise/vibration — forward or REVERSE	254	354
● Engine will not crank	255	355
● No PARK range	256	356
● Overheating	257	357
● No engine braking in MANUAL 2 position only	258	358
● No engine braking in MANUAL 1 position only	259	359
● No engine braking with OVERDRIVE cancelled	260	360
● No engine braking in MANUAL 1, 2 and 3	261	361
● Fluid venting or foaming	262	362

[a] Carry out electrical routines first.

Diagnostic Routines

Engagement Concern: No Forward Only

Possible Component	Reference/Action
201 — ELECTRICAL ROUTINE	
● No electrical concerns	
301 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
● Incorrect Level	● Adjust fluid to correct level.
● Condition	● Inspect according to instructions under Fluid Condition Check.

Shift Linkage (Internal/External) or Cable ● Damaged, incorrectly adjusted, disconnected	● Inspect and repair as required. Verify linkage adjustment. After linkage repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission Range (TR) Sensor in this section.
Incorrect Pressures ● Line Pressure — low	● Check pressure at line tap. Carry out Line Pressure and Stall Speed Tests. Refer to the Line Pressure Chart for specification. If pressures are low, check the following possible components: Pump inlet filter and seal assembly, main controls, pump assembly, forward clutch assembly.
Filter Assembly and Seal ● Plugged, damaged ● Filter Seal — damaged, cut	● Inspect filter assembly and seal for damage. Install new as required.
Main Controls	
● Manual Valve — stuck, damaged	● Inspect for damage. Repair as required.
● Control Body Housing — leaking	
● Bolts not tightened to specification	● Tighten bolts to specification.
● Gaskets — damaged	● Inspect gasket for damage. Install new as required.
Forward Clutch Assembly	
● Assembly	● Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
● Piston, Seal, Check Ball — damaged, missing, not seating	● Inspect seals for damage, check ball seating, location. Install new piston assembly as required.
● Feed Bolt — loose, missing	● Install new feed bolts and tighten to specification.
● Center Support — damaged, holes blocked/missing	● Inspect for damage. Repair as required.
● Forward Clutch Sealing Rings — damaged	● Inspect for damage. Install new as required.
● Forward Clutch Ring Gear — damaged	● Inspect for damage. Install new as required.
● Friction Elements — damaged, worn; spline teeth damaged, missing	● Check for abnormal wear, damage. Install new as required.
Forward/Reverse Sun Gear Damaged	● **Inspect for damage. Install new as required.**
Front Planet Assembly Damaged	● **Inspect for damage. Install new as required.**
Output Shaft ● Splines — damaged	● Inspect for damage. Install new as required.
Low One-Way Clutch Assembly (Planetary) ● Worn, damaged or misassembled	● Inspect for damage. Install new as required.

Engagement Concern: No Reverse Only

Possible Component	Reference/Action
202 — ELECTRICAL ROUTINE	
● No electrical concerns	
302 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
● Incorrect Level ● Condition	● Adjust fluid to correct level. ● Inspect per instructions under Fluid Condition Check.
Shift Linkage (Internal/External) or Cable ● Damaged or incorrectly adjusted	● Inspect and repair as required. Verify linkage adjustment. After linkage repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission Range (TR) Sensor in this section.
Incorrect Pressures ● Line Pressure — low	● Check pressure at line pressure tap. Carry out Line Pressure and Stall Speed Tests. Refer to the Line Pressure Chart for specifications. If pressures are low, check the following possible components: Pump inlet filter and seal assembly, main control, pump assembly, reverse clutch assembly, coast clutch assembly, direct clutch assembly.
Filter Assembly and Seal ● Damaged or seal missing	● Inspect filter assembly and seal for damage. Install new as required.
Main Controls	
● Bolts not tightened to specification	● Tighten bolts to specification.
● Gaskets — damaged	● Inspect for damage and install a new gasket.
● Valve Springs, Main Control Valve Body, Direct Clutch Accumulator Valve — damaged, stuck, missing, or misassembled	● Inspect for damage. Repair as required.
● Reinforcing Plate — incorrectly installed; bolts not torqued to specification	● Inspect for correct installation. Tighten bolts to specification.
Direct Clutch Assembly	
NOTE: Only if third gear also is inoperative	
● Assembly	● Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
● Seals or Piston — damaged	● Inspect for damage. Install new as required.
● Clutch Plates — burnt, missing	● Inspect for damage. Install new as required.
● Check Ball — damaged, missing	● Inspect for damage. Install new as required.

• Center Support — damaged or holes blocked • Center Support Hub — damaged	• Inspect for damage. Repair as required. • Inspect for damage. Install new as required.
Reverse Clutch Assembly	
• Assembly	• Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
• Seals or Piston — damaged	• Inspect for damage. Install new as required.
• Piston Bore — damaged	• Inspect for damage. Install new as required.
• Friction Elements — damaged, worn; missing plates • Feed Hole — damaged, plugged, missing	• Inspect for damage. Install new as required. • Inspect for damage. Repair as required.

Engagement Concern: Harsh Reverse Only

Possible Component	Reference/Action
203 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Throttle Position Sensor, TSS, OSS, ABS Electronic Pressure Control	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Carry out Engagement Test and Electronic Pressure Control Test. Go To Pinpoint Test E using the Transmission Tester and Cable and Overlay as outlined in this section. Repair as required. Clear codes, road test, rerun On-Board Diagnostics.
303 — HYDRAULIC/MECHANICAL ROUTINE	
Incorrect Pressures • Line Pressure — high	• Check pressure at line pressure tap. Carry out Line Pressure and Stall Speed Tests. Refer to the Line Pressure Chart for specification. If high, check the main controls.
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gasket — damaged	• Inspect for damage and install a new gasket.
• EPC Solenoid — stuck or damaged • Stuck Low Reverse Modular valve	• Carry out Electronic Pressure Control Tests described in routine No. 203. Install new as required. • Inspect for damage. Repair or install a new as required.
Pump Assembly	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged • Main Regulator/Booster Valve — stuck, damaged, misassembled	• Inspect for damage and install a new gasket. • Inspect for damage. Repair as required.

Engagement Concern: Harsh Forward Only

NOTE: This vehicle has been equipped with a special cold weather shift strategy. This was designed to maximize heater output. This new strategy operates under the following conditions: ambient air temperature at start-up is -4°C (25°F) or below and the engine coolant temperature at start-up is 38°C (100°F) or below. During this condition, the vehicle may experience slightly delayed shifts under light throttle. Medium and heavy throttle shifts will be normal. Once the engine coolant reaches 71°C (160°F) or above, normal shift scheduling will resume. If, during the diagnosing of a delayed shift concern, the concern goes away after the engine coolant reaches 71°C (160°F) or above, this is a normal operation of the special cold weather shift strategy. If this condition does not go away after the engine coolant reaches 71°C (160°F), refer to Diagnosis By Symptom in this section.

NOTE: All gasoline vehicles will have new adaptive shift strategies. Whenever the vehicles battery has been disconnected for any type of service or repair, the strategy parameters that are stored in the keep alive memory (KAM) will be lost. The strategy will start to relearn once the battery is reconnected and the vehicle is driven. This is a temporary condition and will return to normal operating condition once the powertrain control module (PCM) relearns all the parameters from the driving operating conditions. There is no time frame set for this process. If this concern is present during downshifts or converter clutch apply, it is not the shift strategy and will require diagnosis as outlined in the workshop manual.
The customer must be notified that they may experience slightly different upshifts (either soft or firm) and that this condition is temporary and will eventually return to normal operating condition.

Possible Components	Reference/Action
204 — ELECTRICAL ROUTINE	
Powertrain Control System ● Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Throttle Position Sensor, TSS, OSS, ABS Electronic Pressure Control	● Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Carry out Engagement Test and Electronic Pressure Control Test. Go To Pinpoint Test E using the Transmission Tester and Cable and Overlay as outlined in this section. Repair as required. Clear codes, road test, rerun On-Board Diagnostics.
304 HYDRAULIC/MECHANICAL ROUTINE	
Incorrect Pressures ● Line Pressure — high	● Check pressure at line pressure tap. Carry out Line Pressure and Stall Speed Tests. Refer to the Line Pressure Chart for specification. If pressures are high, check main controls.
Main Controls	
● Bolts not tightened to specification	● Tighten bolts to specification.
● Gaskets — damaged	● Inspect for damage and install a new gasket.
● Electronic Pressure Control Solenoid — stuck or damaged ● Engagement Control Valve, Springs — damaged, stuck, misassembled, contaminated	● Carry out Electronic Pressure Control Tests described in routine No. 204. Install new as required. ● Inspect for damage. Repair as required.
Pump Assembly	
● Bolts not tightened to specification	● Tighten bolts to specification.
● Gaskets — damaged ● Main Regulator/Booster Valve	● Inspect for damage and install a new gasket. ● Inspect for damage. Repair as required.

— stuck, damaged, misassembled	
Forward Clutch Assembly	
• Assembly • Plates —burnt, missing. Check Ball — missing, damaged. Hub — damaged	• Air Check Clutch Assembly; refer to Air Pressure Tests in this section. • Inspect for damage. Install new as required.

Engagement Concern: Delayed/Soft Reverse Only

Possible Component	Reference/Action
205 — ELECTRICAL ROUTINE	
• No electrical concerns	
305 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage or Cable • Damaged, incorrectly adjusted	• Inspect and repair as required. Verify linkage adjustment. After linkage repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission Range (TR) Sensor in this section.
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged	• Inspect for damage and install a new gasket.
• Direct Clutch Accumulator Regulator Valve, Low Reverse Modulator Valve, Springs — stuck, damaged, missing, misassembled	• Inspect for damage. Repair as required.
• Check Ball (BS1 BS3) — missing, damaged • Reinforcing Plate — incorrectly installed, bolts not tightened to specification	• Inspect for damage. Install new as required. • Inspect for correct installation. Tighten bolts to specification.
Coast Clutch Assembly	
• Assembly • Piston Seals — damaged, missing • Stator Support Seals — damaged	• Air Check Clutch Assembly, refer to Air Pressure Tests in this section. • Inspect for damage. Install new assembly as required. • Inspect for damage. Install new piston seals as required. • Inspect for damage. Install new stator support seals as required.
Reverse Clutch Assembly	
• Assembly	• Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
• Seals, Piston — damaged	• Inspect for damage. Install new as required.
• Friction Elements — damaged, worn • Assembly leakage	• Inspect for damage. Install new as required. • Inspect for damage. Repair as required.

Engagement Concern: Delayed/Soft Forward Only

NOTE: This vehicle has been equipped with a special cold weather shift strategy. This was designed to maximize heater output. This new strategy operates under the following conditions: ambient air temperature at start-up is -4°C (25°F) or below and the engine coolant temperature at start-up is 38°C (100°F) or below. During this condition, the vehicle may experience slightly delayed shifts under light throttle. Medium and heavy throttle shifts will be normal. Once the engine coolant reaches 71°C (160°F) or above, normal shift scheduling will resume. If, during the diagnosing of a delayed shift concern, the concern goes away after the engine coolant reaches 71°C (160°F) or above, this is a normal operation of the special cold weather shift strategy. If this condition does not go away after the engine coolant reaches 71°C (160°F), refer to Diagnosis By Symptom in this section.

NOTE: All gasoline vehicles will have new adaptive shift strategies. Whenever the vehicles battery has been disconnected for any type of service or repair, the strategy parameters that are stored in the keep alive memory (KAM) will be lost. The strategy will start to relearn once the battery is reconnected and the vehicle is driven. This is a temporary condition and will return to normal operating condition once the powertrain control module (PCM) relearns all the parameters from the driving operating conditions. There is no time frame set for this process. If this concern is present during downshifts or converter clutch apply, it is not the shift strategy and will require diagnosis as outlined in the workshop manual.
The customer must be notified that they may experience slightly different upshifts (either soft or firm) and that this condition is temporary and will eventually return to normal operating condition.

Possible Component	Reference/Action
206 — ELECTRICAL ROUTINE	
• No electrical concerns	
306 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Incorrect Level • Condition	• Adjust fluid to correct level. • Inspect according to instructions under Fluid Condition Check.
Shift Linkage or Cable • Damaged, incorrectly adjusted	• Inspect and repair as required. Verify linkage adjustment. After linkage repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission Range (TR) Sensor in this section.
Incorrect Pressures • Line Pressure — low	• Check pressure at line tap. Carry out Line Pressure and Stall Speed Tests. Refer to the Line Pressure Chart for specification. If pressures are low, check the following possible components: pump inlet filter and seal assembly, main controls, pump assembly.
Filter Assembly and Seal • Plugged, damaged • Filter Seal — damaged	• Inspect filter assembly and seal for damage. Install new as required.
Main Controls	
• Bolt not tightened to specification	• Tighten bolts to specification.
• Gaskets —	• Inspect for damage and install a new gasket.

damaged	
Center Support Assembly	
• Feed Bolts — missing, incorrectly tightened	• Install new feed bolts and tighten to specification.
• Hub — damaged, holes blocked or missing	• Inspect for damage. Repair as required.
Forward Clutch Assembly	
• Assembly	• Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
• Seals or Piston — damaged	• Inspect seals for damage. Install new as required.
• Check Balls — damaged, missing	• Inspect for mislocation, poor seating, damage. Install new cylinder as required.
• Clutch Hub — damaged	• Inspect for damage. Install new as required.
• Friction Elements — damaged, missing	• Inspect for damage. Install new as required.
• Forward Clutch Cylinder Seals — damaged	• Inspect for damage. Install new as required.

Engagement Concern: No Forward and No Reverse Only

Possible Component	Reference/Action
207 — ELECTRICAL ROUTINE	
• Electrical Connectors — not seated	• Check the electrical connectors for correct seating.
307 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Incorrect Level • Condition	• Adjust fluid to correct level. Inspect according to instructions under Fluid Condition Check.
• Converter Drainback Valve • Inspect converter drainback valve. Carry out Torque Converter Drainback Test. Install new as required. • Flow — restricted (case lube holes restricted, leaking, plugged, or missing cooler lines)	• Inspect, clean, or install new as required.
Shift Linkage (Internal/External) or Cable • Damaged, incorrectly adjusted or disconnected	• Inspect for damage. Repair as required. Verify linkage adjustment. After linkage repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission

	Range (TR) Sensor in this section.
Incorrect Pressures ● Line Pressure — low	● Check pressure at line tap. Carry out Line Pressure Test. Refer to the Line Pressure Chart for specification. If pressures are low, check the following possible components: pump inlet filter and seal assembly, main controls, pump assembly, forward clutch assembly.
Filter Assembly and Seal ● Filter — not correctly installed, loose, or seal missing ● Plugged, damaged ● Filter Seal — damaged or cut	● Inspect filter assembly and seal for damage, or correct installation. Install new as required.
Main Controls	
● Solenoids — damaged or stuck from contamination	● Inspect, install new solenoids as required. Go To Pinpoint Test A .
● Manual Valve — stuck, damaged ● Control Body Housing — leaking	● Inspect for damage. Repair as required.
● Bolts not tightened to specification ● Gaskets — damaged	● Tighten bolts to specification. ● Inspect for damage and install a new gasket.
Pump Assembly	
● Damaged from contamination	● Clean and inspect, install new pump as required.
● Valves — stuck from contamination	● Clean and inspect, install new valves as required.
● Bolts not tightened to specification	● Tighten bolts to specification.
● Gaskets — damaged	● Inspect for damage and install a new gasket.
● Main Regulator/Booster Valve — damaged, missing, misassembled	● Inspect for damage. Repair as required.
● Pump Gear End Clearance — excessive	● Carry out pump gear end clearance check.
Center Support Assembly	
● Damaged, holes blocked	● Inspect for damage. Repair as required.
● Feed Bolts — missing or incorrectly tightened	● Install new bolts and tighten to specification.
Forward/Reverse Sun Gear ● Damaged	● Inspect for damage. Install new as required.
Forward Planet Assembly ● Damaged	● Inspect for damage. Install new as required.
Input Shaft /Center Shaft/ Output Shaft ● Splines — damaged	● Inspect for damage. Install new as required.
Overdrive Carrier ● Damaged	● Inspect for damage. Install new as required.
Overdrive OWC	
● Misassembled, damaged	● Inspect for damage. Repair as required.
● Sprags or Races — damaged	● Inspect for damage. Install new as required.

Converter ● Damaged (not seated correctly in the engine crankshaft pilot)	● Inspect for damage. Install new or remanufactured as required.

Engagement Concern: Harsh Forward and Reverse

Possible Components	Reference/Action
208 — ELECTRICAL ROUTINE	
Powertrain Control System ● Electrical Inputs/Outputs, Vehicle Wiring Harnesses, Powertrain Control Module, Electronic Pressure Control, Throttle Position Sensor	● Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Carry out Engagement Test and Electronic Pressure Control Test. Go To Pinpoint Test E using the Transmission Tester and Cable and Overlay. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
308 — HYDRAULIC/MECHANICAL ROUTINE	
Incorrect Pressures ● Line Pressure — high	● Check pressure at line pressure tap. Carry out Line Pressure Test. Refer to the Line Pressure Chart for specification. If high, check main controls.
Main Controls ● Bolts not tightened to specification ● Gasket — damaged ● EPC Solenoid — stuck or damaged ● Engagement Control Valve — stuck, damaged, contaminated, misassembled ● Main Control or Separator Plate — installed incorrectly	● Tighten bolts to specification. ● Inspect for damage and install a new gasket. ● Carry out Electronic Pressure Control Tests described in routine No. 208. Install new as required. ● Inspect for damage, contamination. Repair as required. ● Check the parts catalog for the correct parts used by vehicle application or year, install new components as required.
Pump Assembly ● Bolts not tightened to specification ● Gaskets — damaged ● Main Regulator/Booster Valve — stuck, damaged, misassembled	● Tighten bolts to specification. ● Inspect for damage and install a new gasket. ● Inspect for damage. Repair or install new as required.

Engagement Concern: Delayed/Soft Forward and Reverse

Possible Component	Reference/Action
209 — ELECTRICAL ROUTINE	
● No electrical concerns	
309 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage or Cable ● Damaged, incorrectly adjusted	● Inspect and repair as required. Verify linkage adjustment. After linkage repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission Range (TR) Sensor in this section.

Fluid ● Incorrect Level	● Adjust to correct level.
Incorrect Pressures ● Line Pressure — low	● Check pressure at line tap. Refer to the Line Pressure Chart for specification. If low check the following components: pump inlet filter/seal assembly, main control, pump assembly.
Filter Assembly and Seal ● Plugged, damaged ● Seal — damaged, cut	● Inspect filter assembly and seal for damage. Install new as required.
Main Controls	
● Bolts not tightened to specification	● Tighten bolts to specification.
● Gaskets — damaged	● Inspect for damage and install a new gasket.
● Springs — stuck, damaged, missing, misassembled	● Inspect for damage. Repair as required.
Torque Converter Drainback (Initial Engagement Only)	● Refer to Torque Converter Drainback Test procedures in this section for diagnosis.

Shift Concerns: Some or All Shifts Missing

Possible Component	Reference/Action
210 — ELECTRICAL ROUTINE	
Powertrain Control System ● Electrical Inputs/Outputs, Vehicle Wiring Harness, PCM, Throttle Position Sensor, Digital TR Sensor, TSS, OSS, ABS, SSA, SSB	● Carry out Shift Point Road Test. ● Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test A and Go To Pinpoint Test D using the Transmission Tester, Cable and Overlay and the TRS-E Cable. Repair as required. Clear code, road test, rerun On-Board Diagnostics.
310 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid ● Incorrect Level ● Condition	● Adjust fluid to correct level. Inspect according to instructions under Fluid Condition Check.
Shift Linkage (Internal/External) or Cable ● Damaged, incorrectly adjusted, disconnected	● Inspect and repair as required. Verify linkage adjustment. After linkage repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission Range (TR) Sensor in this section.
Filter Assembly and Seal ● Plugged, damaged ● Filter Seal — damaged	● Inspect filter assembly and seal for damage. Install new as required.
Main Controls	
● Accumulator Valves — stuck, damaged, misassembled	● Inspect for damage. Repair as required.
For diagnosis related to a specific	● To diagnose specific No Shift, refer to the appropriate

shift, see Reference/Action.	shift routine. ■ No Shift 1-2, Routine 220/320 ■ No Shift 2-3, Routine 221/321 ■ No Shift 3-4, Routine 222/322 ■ No Shift 4-3, Routine 223/323 ■ No Shift 3-2, Routine 224/324 ■ No Shift 2-1, Routine 225/325

Shift Concerns: Shift Timing — Early/Late (Some/All)

Possible Component	Reference/Action
211 — ELECTRICAL ROUTINE	
Powertrain Control System ● Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Throttle Position Sensor, TFT Sensor, TSS, OSS, ABS, SSA, SSB	● Carry out Shift Point Road Test. ● Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test A and Go To Pinpoint Test B using the Transmission Tester and Cable and Overlay. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
Other Electrical Concerns ● No power to PCM, keep-alive memory erased from PCM	● Restore memory by carrying out Transmission Drive Cycle Test.
311 — HYDRAULIC/MECHANICAL ROUTINE	
Other	
● Tire size change	● Refer to the specification decal on door panel and verify that vehicle has original equipment. Changes in tire size or axle ratio may affect shift timing.
● Speedometer — gear change (vehicle-dependent) ● Axle Ratio — change	
Engine Driveability Concerns— Engine Runs Poor	● Refer to Routine No. 253/353.
Main Controls	
● Valves, Accumulators — stuck or damaged	● Inspect for damage, contamination. Repair as required.
● Gaskets — damaged	● Inspect for damage and install a new gasket.
● Bolts not tightened to specification	● Tighten bolts to specification.
For diagnosis related to a specific shift or if all above are OK, see Reference/Action.	● To diagnose specific shift/timing concern refer to Soft/Slipping routines: ■ Soft/Slipping Shift 1-2, Routine 226/326 ■ Soft/Slipping Shift 2-3, Routine 227/327 ■ Soft/Slipping Shift 3-4, Routine 228/328 ■ Downshifts, 229/329

Shift Concerns: Timing — Erratic/Hunting (Some/All)

Possible Component	Reference/Action

· 212 — ELECTRICAL ROUTINE	
· Powertrain Control System	
· Vehicle Wiring Harnesses, PCM, TP Sensor, TFT Sensor, SSA, SSB, Digital TR Sensor, TCC Solenoid	· Carry out Shift Point Road Test and Torque Converter Clutch Operation Tests. · Run On-Board Diagnostics. Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test A , Go To Pinpoint Test B , Go To Pinpoint Test C and Go To Pinpoint Test D using the Transmission Tester, Cable and Overlay and the TRS-E Cable. Install new as required. Clear codes, road test and rerun On-Board Diagnostics.
· With Speed Control On	
· Torque Converter Cycling	· Re-evaluate with speed control off or depress TCS (overdrive cancelled). If condition still exists, proceed with diagnosis.
· Shift Cycling (3-4 / 4-3 shifts)	· Re-evaluate with speed control off or depress TCS (overdrive cancelled). If condition still exists, proceed with diagnosis.
· 312 — HYDRAULIC/MECHANICAL ROUTINE	
· Fluid	
· Incorrect Level	· Adjust fluid to correct level.
· Filter Assembly and Seal	
· Plugged, damaged	· Inspect filter assembly and seal for damage. Install a new filter assembly and seal as required.
· Filter Seal — damaged	· Inspect filter assembly and seal for damage. Install a new filter assembly and seal as required.
· Main Control	
· Valves, Accumulators — damaged, stuck	· Inspect for damage. Repair or install new as required.
· Bolts not tightened to specification	· Tighten bolts to specification.
· Gaskets — damaged	· Inspect for damage and install new gasket.
· Wrong parts used in rebuild	· Verify that correct parts were used.
· Torque Converter Clutch	· Refer to Torque Converter Clutch Operation Concern: Cycling/Shudder/Chatter (No. 342).
· For further diagnosis of timing issues, refer to Reference/Action	· Refer to the following shift routine(s) for further diagnosis: ● No 1-2 shift see Routine 220/330 ● No 2-3 shift see Routine 221/331 ● No 3-4 shift see Routine 222/332 ● No 4-3 shift see Routine 233/323 ● No 3-2 shift see Routine 224/324 ● No 2-1 shift see Routine 225/325 ● Soft/Slip 1-2 shift see Routine 226/326 ● Soft/Slip 2-3 shift see Routine 227/327 ● Soft/Slip 3-4 shift see Routine 228/328 ● Soft/Slip 4-3 shift see Routine 229/329 ● Soft/Slip 3-2 shift see Routine 229/329 ● Soft/Slip 2-1 shift see Routine 229/329 ● Harsh 1-2 shift see Routine 232/332 ● Harsh 2-3 shift see Routine 233/333 ● Harsh 3-4 shift see Routine 224/334 ● Harsh 4-3 shift see Routine 235/335

	• Harsh 3-2 shift see Routine 236/336 • Harsh 2-1 shift see Routine 237/337

Shift Concerns: Feel — Soft/Slipping (Some/All)

NOTE: This vehicle has been equipped with a special cold weather shift strategy. This was designed to maximize heater output. This new strategy operates under the following conditions: ambient air temperature at start-up is -4°C (25°F) or below and the engine coolant temperature at start-up is 38°C (100°F) or below. During this condition, the vehicle may experience slightly delayed shifts under light throttle. Medium and heavy throttle shifts will be normal. Once the engine coolant reaches 71°C (160°F) or above, normal shift scheduling will resume. If, during the diagnosing of a delayed shift concern, the concern goes away after the engine coolant reaches 71°C (160°F) or above, this is a normal operation of the special cold weather shift strategy. If this condition does not go away after the engine coolant reaches 71°C (160°F), refer to Diagnosis By Symptom in this section.

NOTE: All gasoline vehicles will have new adaptive shift strategies. Whenever the vehicles battery has been disconnected for any type of service or repair, the strategy parameters that are stored in the keep alive memory (KAM) will be lost. The strategy will start to relearn once the battery is reconnected and the vehicle is driven. This is a temporary condition and will return to normal operating condition once the powertrain control module (PCM) relearns all the parameters from the driving operating conditions. There is no time frame set for this process. If this concern is present during downshifts or converter clutch apply, it is not the shift strategy and will require diagnosis as outlined in the workshop manual.
The customer must be notified that they may experience slightly different upshifts (either soft or firm) and that this condition is temporary and will eventually return to normal operating condition.

Possible Component	Reference/Action
213 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, TP Sensor, Electronic Pressure Control, TFT Sensor	• Carry out Shift Point Road Test. • Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test E and Go To Pinpoint Test B using the Transmission Tester and Cable and Overlay. Repair as required. Clear codes, road test, rerun On-Board Diagnostics.
313 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Incorrect Level • Adjust fluid to correct level. • Condition	• Inspect according to instructions in this section under Fluid Condition Check.
Incorrect Pressures • Line Pressure — low	• Check pressures at line pressure tap. Carry out Line Pressure Tests. Refer to the Line Pressure Chart for specifications. If pressures are low or all shifts are soft/slipping, go to Main Controls.
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged	• Inspect for damage and install a new gasket.
• Line Modulator Valve Springs	• Inspect for damage, contamination. Repair as required.

— damaged, stuck, misassembled	
• EPC Solenoid — failure to operate in a normal manner • Accumulator Assembly — damaged or wrong assembly	• Refer to Electrical Routine No. 213. • Inspect for damage. Install new as required. Verify correct assembly is used.
Pump Assembly	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged	• Inspect for damage and install a new gasket.
• Main Regulator/Booster Valve — damaged, misassembled	• Inspect for damage. Repair as required.
• Electronic Pressure Control Air Bleed Check Valve — damaged or missing For diagnostics related to specific shifts, see Reference/Action.	• Inspect for damage. Install new as required. • Refer to the following Shift Routine(s) for further diagnosis: ■ Soft/Slipping Shift 1-2, Routine 226/326 ■ Soft/Slipping Shift 2-3, Routine 227/327 ■ Soft/Slipping Shift 3-4, Routine 228/328 ■ Downshifts, 229/329

Shift Concerns: Feel — Harsh (Some/All)

NOTE: This vehicle has been equipped with a special cold weather shift strategy. This was designed to maximize heater output. This new strategy operates under the following conditions: ambient air temperature at start-up is -4°C (25°F) or below and the engine coolant temperature at start-up is 38°C (100°F) or below. During this condition, the vehicle may experience slightly delayed shifts under light throttle. Medium and heavy throttle shifts will be normal. Once the engine coolant reaches 71°C (160°F) or above, normal shift scheduling will resume. If, during the diagnosing of a delayed shift concern, the concern goes away after the engine coolant reaches 71°C (160°F) or above, this is a normal operation of the special cold weather shift strategy. If this condition does not go away after the engine coolant reaches 71°C (160°F), refer to Diagnosis By Symptom in this section.

NOTE: All gasoline vehicles will have new adaptive shift strategies. Whenever the vehicles battery has been disconnected for any type of service or repair, the strategy parameters that are stored in the keep alive memory (KAM) will be lost. The strategy will start to relearn once the battery is reconnected and the vehicle is driven. This is a temporary condition and will return to normal operating condition once the powertrain control module (PCM) relearns all the parameters from the driving operating conditions. There is no time frame set for this process. If this concern is present during downshifts or converter clutch apply, it is not the shift strategy and will require diagnosis as outlined in the workshop manual.
The customer must be notified that they may experience slightly different upshifts (either soft or firm) and that this condition is temporary and will eventually return to normal operating condition.

Possible Component	Reference/Action
214 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Electronic Pressure Control, TFT Sensor, TP Sensor, Digital TR Sensor	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test B , Go To Pinpoint Test D and Go To Pinpoint Test E using the Transmission Tester, Cable and Overlay and the TRS-

	E Cable. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
Engine Driveability Concerns	• Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis.
314 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Incorrect Level • Condition	• Adjust fluid to correct level. • Inspect according to instructions in this section under Fluid Condition Check.
Incorrect Pressures • Line Pressure — high	• Check pressures at line pressure tap. Carry out Line Pressure and Stall Speed Tests. Refer to the Line Pressure Chart for specifications. If pressures are high or all shifts are harsh, go to Main Controls.
Main Controls	
• Main Control or Separator Plate — installed incorrectly	• Check the parts catalog for the correct parts used by vehicle application or year, install new components as required.
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged	• Inspect for damage and install a new gasket.
• Line Modulator Valve/Spring — misassembled, stuck, damaged	• Inspect for damage, contamination.
• EPC Solenoid — failure to operate in a normal manner	• Install new as required.
• Accumulator Assembly — damaged or wrong assembly	• Refer to Electrical Routine No. 214. • Inspect for damage. Install new as required. Verify correct assembly is used.
Pump Assembly	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged	• Inspect for damage and install a new gasket.
• Main Regulator/Booster Valve — damaged, misassembled	• Inspect for damage. Repair as required.
For diagnostics related to a specific shift, see Reference/Action.	• Refer to the following Shift Routine(s) for further diagnosis: ■ Harsh Shift 1-2, Routine 232/332 ■ Harsh Shift 2-3, Routine 233/333 ■ Harsh Shift 3-4, Routine 234/334 ■ Harsh Shift 4-3, Routine 235/335 ■ Harsh Shift 3-2, Routine 236/336 ■ Harsh Shift 2-1, Routine 237/337

Shift Concerns: No 1st Gear in Drive, Engages in Higher Gear

Possible Component	Reference/Action
215 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical Inputs/Outputs, Vehicle Wiring Harnesses,	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for

PCM, SSA, SSB, Digital TR Sensor	diagnosis. Go To Pinpoint Test A and Go To Pinpoint Test D using the Transmission Tester, Cable and Overlay and the TRS-E Cable. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
315 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage (Internal/External) or Cables, Digital Transmission Range (TR) Sensor ● Damaged, not connected, incorrectly adjusted	● Inspect and repair as required. Verify linkage adjustment. After linkage repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission Range (TR) Sensor in this section.
Main Controls	
● Bolts not tightened to specification	● Tighten bolts to specification.
● Gaskets — damaged, misaligned	● Inspect for damage and install a new gasket.
● SSA, SSB — stuck or damaged	● Refer to Electrical Routine No. 215.
● Solenoid Regulator Valve, 2-3 Shift Valve, 3-4 Shift Valve, D2 Valve — stuck, missing, misassembled, damaged	● Inspect for damage. Repair as required.
● Air Bleeds for S1-S2 Circuits — missing	● Inspect for damage. Install new case.
● Wrong components used in rebuild	● Verify that correct components were used. Install new as required.
Mechanical	
● Band Servo, Clutches — damaged	● Refer to correct disassembly procedures in this section.
For diagnosis related to a specific gear, use Transmission Tester to determine gear.	Refer to the following routine(s) for further diagnosis: No Shift 1-2, Routine 220/320 No Shift 2-3, Routine 221/321 No Shift 3-4, Routine 222/322.
Reverse Ring Gear ● Gear Lugs to Reverse Carrier — damaged	● Inspect for damage. Install new as required.
Low One-Way Clutch ● Damaged, misassembled	● Inspect for damage, correct assembly. Repair as required.

Shift Concerns: No Manual 1st Gear

Possible Component	Reference/Action
216 — ELECTRICAL ROUTINE	
Powertrain Control System ● Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, SSA, SSB, Digital TR Sensor	● Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test A and Go To Pinpoint Test D using the Transmission Tester, Cable and Overlay and the TRS-E Cable. Repair

	as required. Clear codes, road test and rerun On-Board Diagnostics.
316 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage (Internal/External) or Cable • Damaged, incorrectly adjusted, not connected	• Inspect for damage. Repair as required. Verify linkage adjustment. After linkage repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission Range (TR) Sensor in this section.
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged	• Inspect for damage and install a new gasket.
• Manual Control Lever Outer and Shaft Assembly, Manual Valve, Low Reverse Modulator Valve, 1-2 Shift Valve, 2-3 Shift Valve, BS1 Check Ball, 4-3-2 Timing Valve — stuck, damaged	• Inspect for damage. Repair as required.
• SSA — failure to operate in a normal manner	• Refer to Electrical Routine No. 216.
• Air Bleed for SSA Circuit — damaged or missing	• Inspect for damage. Install new case.
• Wrong parts used in rebuild	• Verify that correct parts were used.
Low One-Way Clutch Assembly • Damaged, misassembled	• Inspect for damage. Repair as required.

Shift Concerns: No Manual 2nd Gear

Possible Component	Reference/Action
217 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, SSA, SSB, Digital TR Sensor	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test A and Go To Pinpoint Test D using the Transmission Tester, Cable and Overlay and the TRS-E Cable. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
317 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage (Internal/External) or Cable • Damaged, incorrectly adjusted	• Inspect for damage. Repair as required. Verify linkage/cable adjustment. After linkage/cable repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission Range (TR) Sensor in this section.
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.

• Gaskets — damaged	• Inspect for damage and install a new gasket.
• 2-3 Shift Valve, 3-4 Shift Valve, 1-2 Shift Valve Manual 1-2 Transition Valve, Spring BS1, BS3— stuck, damaged, missing, misassembled	• Inspect for damage. Repair as required.
• BS2 — missing, leaks or seats damaged	• Inspect for damage. Install new as required.
• Incorrect parts used in rebuild	• Verify that correct parts were used.
Intermediate Clutch Assembly	
• Assembly	• Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
• Seals or Piston — damaged	• Inspect for damage. Install new as required.
• Friction Elements — worn, missing, damaged, misassembled	• Inspect for damage. Install new as required.
• Ball Check — stuck/missing	• Inspect for damage. Repair as required.
• Feed Bolt — torque incorrect, leaks, missing	• Inspect and tighten bolts as required.
• Cylinder Assembly Outer Diameter/Case Bore — damaged, leaking	• Inspect for damage. Repair as required.
Intermediate One-Way Clutch Assembly • Housing — damaged	• Inspect for damage. Install new as required (a clicking sound heard when rotated by hand is normal).

Shift Concerns: No 1-2 Shift (Automatic)

Possible Component	Reference/Action
220 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, TP Sensor, TSS, OSS, ABS, SSA, SSB	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test A using the Transmission Tester and Cable and Overlay. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
320 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage (Internal/External) or Cable • Damage, incorrectly adjusted • Digital TR Sensor — damaged, incorrectly adjusted	• Inspect for damage. Repair as required. Verify linkage adjustment. After linkage repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission Range (TR) Sensor in this section.
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged, misaligned	• Inspect for damage and install a new gasket.
• SSB — failure to operate in a	• Refer to Electrical Routine No. 220.

normal manner	
• D2 Valve, 1-2 Shift Valve, 1-2 Manual Transition Valve, Intermediate Clutch Accumulator Regulator Valves, Springs BS2 — stuck, damaged, missing or misassembled	• Inspect for damage. Repair as required.
• Air Bleed for SSB — circuit damaged or missing • Wrong parts used in rebuild	• Inspect for damage. Install new case. • Verify that correct parts were used.
Intermediate Clutch Assembly	
• Assembly	• Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
• Seals or Piston — damaged	• Inspect for damage. Install new as required.
• Friction Elements — worn, missing, damaged, misassembled	• Inspect for damage. Repair as required.
• Ball Check — stuck/missing	• Inspect for damage. Repair as required.
• Feed Bolt — torque incorrect, leaks, missing • Cylinder Assembly Outer Diameter/Case Bore — damaged, leaking	• Inspect and tighten bolts as required. • Inspect for damage. Install new as required.
Intermediate One-Way Clutch Assembly • Housing — damaged	• Inspect for damage. Install new as required.

Shift Concerns: No 2-3 Shift (Automatic)

Possible Component	Reference/Action
221 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical Inputs/Outputs, Vehicle Wiring Harness, PCM, TP Sensor, TSS, OSS, ABS, SSA, SSB	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test A using the Transmission Tester and Cable and Overlay. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
321 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged	• Inspect for damage and install a new gasket.
• SSA — failure to operate in a normal manner	• Refer to Electrical Routine No. 221.
• Direct Clutch Accumulator Regulator Valve, 2-3 Shift Valve, Springs — stuck, missing, damaged, misassembled	• Inspect for damage. Repair as required.
• Air Bleed for SSB Circuit — damaged or missing	• Inspect for damage. Install new case.

• Incorrect components used in rebuild	• Verify that correct components are used.
Center Support Assembly	
• Feed Bolts — missing, not tightened to specification	• Inspect, install new feed bolts and tighten to specification.
• Seal Rings — damaged	• Inspect for damage. Install new as required.
• Assembly damaged	• Inspect for damage. Install new as required.
• Outside Diameter or Case Bore — damaged or leaking	• Inspect for damage. Install new as required.
Direct Clutch Assembly	
• Assembly	• Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
• Center Support Hub Seals — damaged	• Inspect for damage. Install new as required.
• Seals, Piston, Cylinder — damaged	• Inspect for damage. Install new as required.
• Friction Elements — missing or damaged	• Inspect for damage. Install new as required.
• Ball Check — missing, damaged	• Inspect for damage. Install new as required.

Shift Concerns: No 3-4 Shift (Automatic)

Possible Component	Reference/Action
222 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, TP Sensor, TSS, OSS, ABS, SSA, SSB	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test A using the Transmission Tester and Cable and Overlay. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
322 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged or misaligned	• Inspect for damage and install a new gasket.
• SSA, SSB — failure to operate in a normal manner	• Refer to Electrical Routine No. 222.
• Overdrive Accumulator Regulator Valve and Spring, 3-4 Shift Valve and Spring — damaged, stuck, misassembled, missing	• Inspect for damage. Repair as required.
• Incorrect components used in rebuild	• Verify that correct components were used in the rebuild.
Overdrive Clutch Assembly	
• Assembly	• Air Check Clutch Assembly; refer to Air Pressure Tests in this section.

• Clutch Plates — burnt, missing	• Inspect for damage. Install new as required.
• Cylinder — damaged	• Inspect for damage. Install new as required.
• Feed Bolts — loose, missing, leaking, seals damaged	• Install new feed bolts and tighten to specification.
• Cylinder Check Ball — missing	• Inspect for damage. Install new as required.
Overdrive One-Way Clutch Assembly	
• Damaged	• Inspect for damage. Install new as required.
Overdrive Planet Assembly	
• Damaged	• Inspect for damage. Install new as required.

Shift Concerns: No 4-3 Shift (Automatic)

Possible Component	Reference/Action
223 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, TP Sensor, TSS, OSS, ABS, SSB	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test A using the Transmission Tester and Cable and Overlay. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
323 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged, misaligned	• Inspect for damage and install a new gasket.
• SSB — failure to operate in a normal manner	• Refer to Electrical Routine No. 223.
• BS2, 3-4 Shift Valve — damaged, missing, misassembled, stuck	• Inspect for damage. Repair as required.

Shift Concerns: No 3-2 Shift (Automatic)

Possible Component	Reference/Action
224 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, TP Sensor, TSS, OSS, ABS, SSA	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test A and Go To Pinpoint Test D using the Transmission Tester and Cable and Overlay. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
324 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.

• Gaskets — damaged, misaligned	• Inspect for damage and install a new gasket.
• SSA — failure to operate in a normal manner	• Refer to Electrical Routine No. 224.
• 2-3 Shift Valve — stuck, damaged	• Inspect for damage. Repair as required.

Shift Concerns: No 2-1 Shift (Automatic)

Possible Component	Reference/Action
225 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, TP Sensor, TSS, OSS, ABS, SSB	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test A using the Transmission Tester and Cable and Overlay. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
325 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets, Separator Plate — damaged, misaligned	• Inspect for damage and install a new gasket.
• SSB — failure to operate in a normal manner	• Refer to Electrical Routine No. 225.
• D2 Shift Valve — damaged, stuck	• Inspect for damage. Repair as required.

Shift Concerns: Soft/Slipping 1-2 Only (Automatic)

Possible Component	Reference/Action
226 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Repair as required.
326 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged, misaligned	• Inspect for damage and install a new gasket.
• Intermediate Clutch Accumulator Regulator Valve or Plunger, Springs — stuck, damaged, missing or misassembled	• Inspect for damage. Repair as required.
• Wrong parts used in rebuild	• Verify that correct parts were used.
Intermediate Clutch Assembly	
• Assembly	• Air Check Clutch Assembly; refer to Air

	Pressure Tests in this section.
• Seals or Piston — damaged	• Inspect for damage. Install new as required.
• Friction Elements — worn, missing, misassembled or damaged	• Inspect for damage. Repair as required.
• Feed Bolts — torque incorrect, missing	• Inspect and install new feed bolts and tighten to specification.
• Ball Check — missing, not seating • Cylinder Assembly Outer Diameter/Case Bore — damaged	• Inspect for damage. Repair as required. • Inspect for damage. Install new as required.

Shift Concerns: Soft/Slipping 2-3 Only (Automatic)

Possible Component	Reference/Action
227 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Repair as required.
327 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged	• Inspect for damage and install a new gasket.
• Direct Clutch Accumulator Regulator Valve, Plunger, Springs — stuck, missing, damaged, misassembled	• Inspect for damage. Repair as required.
• Incorrect parts used in rebuild	• Verify that correct parts were used.
Center Support Assembly	
• Feed Bolts — missing, not tightened to specification	• Inspect, install new feed bolts and tighten to specification.
• Seal Rings — damaged	• Inspect for damage. Install new as required.
• Assembly — damaged	• Inspect for damage. Install new as required.
• Outside Diameter or Case Bore — damaged or leaking	• Inspect for damage. Install new as required.
Direct Clutch Assembly	
• Assembly	• Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
• Center Support Hub Seals — damaged	• Inspect for damage. Install new as required.
• Seals, Piston, Cylinder — damaged	• Inspect for damage. Install new as required.
• Friction Elements — burnt, missing	• Inspect for damage. Repair as required.
• Plates — incorrect quantity installed	• Inspect for correct quantity. Repair as required.
• Ball Check — missing, not seating • Intermediate Brake Drum Inner Diameter — damaged	• Inspect for damage. Repair as required. • Inspect for damage. Install new as required.

Shift Concerns: Soft/Slipping 3-4 Only (Automatic)

Possible Component	Reference/Action
228 — ELECTRICAL ROUTINE	
Powertrain Control System	
● Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM	● Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Repair as required.
328 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
● Bolts not tightened to specification	● Tighten bolts to specification.
● Gaskets — damaged or misaligned	● Inspect for damage and install a new gasket.
● Overdrive Accumulator Regulator Valve and Spring, Overdrive Accumulator Plunger and Springs — damaged, misassembled, stuck, missing	● Inspect for damage. Repair as required.
● Incorrect parts used in rebuild	● Verify that correct parts were used.
Overdrive Clutch Assembly	
● Assembly	● Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
● Friction Elements — burnt, missing	● Inspect for damage. Install new as required.
● Cylinder —damaged; Seals — damaged	● Inspect for damage. Install new as required.
● Feed Bolts — loose, missing, leaking, not tightened to specification	● Install new feed bolts and tighten to specification.
● Cylinder Check Ball — not seating, missing	● Inspect for damage. Repair as required.

Shift Concerns: Soft/Slipping Downshifts (Automatic)

Possible Component	Reference/Action
229 — ELECTRICAL ROUTINE	
Powertrain Control System	
● Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM	● Run On-Board Diagnostics. Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Repair as required.
329 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
● Bolts not tightened to specification	● Tighten bolts to specification.
● Gaskets — damaged, misaligned	● Inspect for damage and install a new gasket.
● Valve Body Separator Plate — damaged	● Inspect for damage. Install new as required.
● Incorrect parts used in rebuild (wrong separator plates, main controls, or gaskets)	● Verify that correct parts were used, refer to TSBs and the parts catalog.

Shift Concerns: Harsh 1-2 Shift Only (Automatic)

Possible Component	Reference/Action
232 — ELECTRICAL ROUTINE	
Powertrain Control System	
● Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM	● Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Repair as required.
332 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
● Bolts not tightened to specification	● Tighten bolts to specification.
● Gaskets — damaged, misaligned	● Inspect for damage and install a new gasket.
● Intermediate Clutch Accumulator Regulator Valve or Plunger Springs — stuck, damaged, missing or misassembled	● Inspect for damage. Repair as required.
● Wrong parts used in rebuild	● Verify that correct parts were used.
Intermediate Clutch Assembly	
● Assembly	● Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
● Friction Plates — installed incorrectly	● Inspect the friction plates. Verify that the correct parts were used, refer to the parts catalog and TSBs.
● Seals or Piston — damaged	● Inspect for damage. Repair as required.
● Friction Elements — missing or misassembled, damaged or incorrect quantity of plates installed	● Inspect for damage. Repair as required.

Shift Concerns: Harsh 2-3 Shift Only (Automatic)

Possible Component	Reference/Action
233 — ELECTRICAL ROUTINE	
Powertrain Control System	
● Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM	● Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Repair as required.
333 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
● Bolts not tightened to specification	● Tighten bolts to specification.
● Gaskets — damaged	● Inspect for damage and install a new gasket.
● Direct Clutch Accumulator Regulator Valve, Plungers, Springs — stuck, missing, damaged, misassembled	● Inspect for damage. Repair as required.
● Wrong parts used in rebuild	● Verify that correct parts were used.
Center Support Assembly	
● Seal Rings — damaged	● Inspect for damage. Install new as required.

• Outside Diameter or Case Bore — damaged or leaking	• Inspect for damage. Install new as required.
Direct Clutch Assembly	
• Assembly	• Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
• Seals, Piston, Cylinder — damaged • Friction Elements — damaged, missing or incorrect quantity of plates were installed	• Inspect for damage. Install new as required. • Inspect for damage. Repair as required.

Shift Concerns: Harsh 3-4 Shift Only (Automatic)

Possible Component	Reference/Action
234 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Repair as required.
334 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged or misaligned	• Inspect for damage and install a new gasket.
• Overdrive Accumulator Regulator Valve and Spring, Overdrive Accumulator Plunger and Springs — stuck, damaged, misassembled, missing	• Inspect for damage. Repair as required.
• Incorrect parts used in rebuild	• Verify that correct parts were used.
Overdrive Clutch Assembly	
• Assembly	• Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
• Friction Elements — burnt, missing	• Inspect for damage. Install new as required.
• Cylinder — damaged, Seals — damaged, Retaining Ring — not seated	• Inspect for damage. Repair as required.

Shift Concerns: Harsh 4-3 Shift Only (Automatic)

Possible Component	Reference/Action
235 — ELECTRICAL ROUTINE	
Powertrain Control System • Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Repair as required.
335 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to	• Tighten bolts to specification.

specification	
• Gaskets — damaged, misaligned	• Inspect for damage and install a new gasket.
• CB7 Check Ball — missing	• Inspect for damage. Install new as required.
• Separator Plate — damaged	• Inspect for damage. Install new as required.

Shift Concerns: Harsh 3-2 Shift Only (Automatic)

Possible Component	Reference/Action
236 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Repair as required.
336 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged, misaligned	• Inspect for damage and install a new gasket.
• CB6 Check Ball — missing	• Inspect for damage. Install new as required.
• Separator Plate — damaged	• Inspect for damage. Install new as required.

Shift Concerns: Harsh 2-1 Shift Only (Automatic)

Possible Component	Reference/Action
237 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Repair as required.
337 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged, misaligned	• Inspect for damage and install a new gasket.
• CB14 Check Ball — missing	• Inspect for damage. Install new as required.
• Separator Plate — damaged	• Inspect for damage. Install new as required.

Torque Converter Clutch Operation Concern: No Apply

Possible Component	Reference/Action
240 — ELECTRICAL ROUTINE	
Powertrain Control System	• **Carry out Torque Converter Clutch Operation Test.**

• Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, TCC Solenoid, BPP Switch, TP Sensor, TFT Sensor	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Carry out Torque Converter Engagement Test. Go To Pinpoint Test B and Go To Pinpoint Test C using the Transmission Tester and Cable and Overlay. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
340 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• TCC Solenoid or TFT Sensor — failure to operate in a normal manner	• Refer to Electrical Routine No. 240.
• Gaskets — damaged	• Inspect gasket for damage and install a new gasket.
Pump Assembly	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Cross leaks, cup plugs missing	• Inspect for porosity/leaks, cup plugs missing, install a new pump as required.
• Gaskets — damaged	• Inspect and install new gaskets.
• Converter Clutch Control Valve and Regulator Valve — stuck, misassembled, damaged	• Inspect for damage. Install new pump.
Stator Support • Teflon® Seals — damaged, leaking	• Inspect for damage. Install new as required.
Torque Converter Assembly • Leakage, Friction Material — damaged, Internal Seals — damaged	• Inspect Torque Converter. For additional information, refer to Torque Converter in this section.

Torque Converter Clutch Operation Concern: Always Applied/Stalls Vehicle (See Note in No. 241 Before Proceeding)

Possible Component	Reference/Action
241 — ELECTRICAL ROUTINE	
NOTE: Stalls in DRIVE and MANUAL 2 only (MANUAL 1 and REVERSE are OK)	• Go to Hydraulic/Mechanical No. 341. • Carry out Torque Converter Clutch Operation Test.
Powertrain Control System • Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, TCC Solenoid • Stalls in any range.	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Carry out Torque Converter Engagement Test. Go To Pinpoint Test C using the Transmission Tester and Cable and Overlay. Repair as required. Clear codes, road test and rerun On-Board Diagnostics. • Refer to 341 Fluid Filter.
341 — HYDRAULIC/MECHANICAL ROUTINE	
Incorrect Pressures	

• Line Pressure — low	• Check line pressure at line tap. Carry out Line Pressure and Stall Speed Tests. Refer to the Line Pressure Chart for specification.
Fluid Filter • Filter or Seal — damaged • Filter/Seal — disengaged from pump inlet bore	• Install new filter and seal assembly.
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Torque Converter Clutch Solenoid — failure to operate in a normal manner	• Refer to Electrical Routine No. 241.
• Gaskets — damaged	• Inspect for damage and install new gaskets.
Pump Assembly	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Converter Clutch Control Valve — misassembled, stuck, damaged	• Inspect for damage. Repair as required.
• Porosity/cross leaks	• Inspect for porosity/leaks, valve damaged. Install new pump as required.
• Gaskets — damaged • Pump Gear End Clearance — excessive, wear	• Inspect for damage and install new gaskets. • Carry out pump gear end clearance check; refer to Pump Assembly in this section, or refer to any TSBs. Install new pump as required.
Torque Converter Assembly	
• End Play (none)	• Carry out End Play Check in this section.
• Piston Plate — damaged/stuck to cover	• Inspect for damage. Repair as required. • Inspect transmission cooling system for correct lube flow. Follow the procedures in this section.
• Internal Converter — wear • Install new or remanufactured torque converter, refer to TSBs.	

Torque Converter Clutch Operation Concern: Cycling/Shudder/Chatter

Possible Component	Reference/Action
242 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical Inputs/Outputs, Vehicle Harnesses, PCM, TCC Solenoid, Digital TR Sensor, BPP Switch, PCM	• Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Carry out Torque Converter Engagement Test. Go To Pinpoint Test C and Go To Pinpoint Test D using the Transmission Tester, Cable and Overlay and TRS-E Cable. Clear codes, road test and rerun

	On-Board Diagnostics.
Speed Control Equipped Vehicles	NOTE: Refer to Routine No. 212 before you proceed to No. 342.
342 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid Condition ● Fluid (water, dirt, metal, or particles) — contamination	● Inspect fluid condition. If burnt or contaminated drain fluid from the transmission assembly and converter assembly. Check control attaching bolts for correct torque. Tighten as required. Record and erase On-Board Diagnostics codes. Bring vehicle to normal operating temperature. Carry out Transmission Drive Cycle in this section. Carry out On-Board Diagnostics. If condition still exists, continue diagnosis.
Main Controls	
● Bolts not tightened to specification	● Tighten bolts to specification.
● Torque Converter Clutch Solenoid — failure to operate in a normal manner	● Refer to Electrical Routine No. 242.
● Gaskets — damaged	● Inspect for damage and install new gaskets.
Pump Assembly	
● Bolts not tightened to specification	● Tighten bolts to specification.
● Cross leaks	● Inspect for porosity/leaks, valve damage; install new pump as required.
● Gaskets — damaged	● Inspect for damage and install new gaskets.
● Converter Clutch Regulator Valve — damaged	● Inspect for damage. Install new as required.
Stator Support ● Teflon® Seal on Nose of Stator — damaged, cut, leaking	● Inspect for damage. Install new as required.
Torque Converter Assembly ● End Play — (excessive), internal leakage	● Inspect Torque Converter. For additional information, refer to Torque Converter One-Way Clutch Check in this section. Repair as required.

Other Concerns: Shift Lever Efforts High

Possible Component	Reference/Action
251 — ELECTRICAL ROUTINE	
● No electrical concerns	
351 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage (Internal/External) or Cable ● Damaged, incorrectly adjusted	● Inspect and repair as required. Verify linkage adjustment. After linkage repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission Range (TR) Sensor in this section.

Manual Control Lever Outer and Shaft Assembly ● Retaining Pin — damaged, Nut — loose, Detent Spring — bent/damaged, Park Mechanism — damaged	● Inspect for damage. Repair as required. Inspect locking nuts for correct torque, tighten to correct specification as required.
Main Controls	
● Manual Valve — sticking ● Bolts not tightened to specification	● Inspect for damage. Repair as required. ● Tighten bolts to specification.

Other Concerns: External Leaks

Possible Component	Reference/Action
252 — ELECTRICAL ROUTINE	
● No electrical concerns	
352 — HYDRAULIC/MECHANICAL ROUTINE	
Engine Rear Seal	● **Locate source and install new as required.**
Seals/Gaskets ● Torque Converter Assembly, Pump, Transmission Fluid Pan, Transmission Connector, Extension Housing — Gasket Seal, Manual Lever, Fluid Level Indicator, Fluid Filler Tube, Pump Bolts	● Locate source and repair as required.
Other	
● Cooler Fitting, Pressure Taps, Converter Drain Plug, Band Anchor Pins, Cooler Tubes — case porosity, case cracked	● Locate source and repair as required.
● Vent — blocked or damaged	● Check case vent assembly for damage or blockage. Repair as required.
● Overfilled Transmission	● Check level and adjust as required.
● Overheating	● Refer to routines No. 257/357.
● Pump assembly	● Locate source and repair as required.

Other Driveability Concerns:

NOTE: Check for engine running poor. It is possible that the transmission is functioning correctly based on input from the PCM. All non-transmission related DTCs should be repaired prior to any transmission repair.

Possible Component	Reference/Action
253 — ELECTRICAL ROUTINE	
Powertrain Control System ● Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Other Engine-Related Items, TCC Solenoid, TP	● **Carry out Torque Converter Clutch Operation Test.** ● Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test B , Go To Pinpoint Test C and Go To Pinpoint Test D using the Transmission

Sensor, Digital (TR) Sensor, TFT Sensor	Tester, Cable and Overlay and TRS-E Cable. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
353 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage (Internal/External) or Cable ● Damaged, incorrectly adjusted	● Inspect for damage. Repair as required. Verify linkage adjustment. After linkage repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission Range (TR) Sensor in this section.
Shift Scheduling ● Incorrect	● Carry out Shift Point Road Test in this section. ● Go to the appropriate diagnostic routines for shift concerns No. 210-211.
Engagements ● Gear Selection — incorrect	● Go to the appropriate diagnostic routines for shift concerns No. 215/315.
Converter Clutch Always Applied	● Go to routine No. 341.
Converter One-Way Clutch ● Damaged	● Go to Torque Converter One-Way Clutch Check in this section.

Other Concerns: Noise/Vibration — Forward or Reverse

Possible Component	Reference/Action
254 — ELECTRICAL ROUTINE	
● No electrical concerns	
354 — HYDRAULIC/MECHANICAL ROUTINE	
For Noises/Vibrations that change with engine speed: ● Torque Converter Components ● Fluid Level (Low) Pump — cavitation ● Pump assembly ● Engine drive accessories ● Transmission fluid cooler lines grounding out ● Flexplate ● Fluid filler tube grounding out	● Locate source of disturbance. Repair as required.
For Noise/Vibrations that change with vehicle speed: ● Engine mounts ■ Loose, damaged ● Driveline concerns ● U-joints ● Rear axle assembly ● Suspension ● Modifications/misalignment ● First gear ■ one-way clutch, gear set ■ friction elements ■ torque converter assembly ● Second gear ■ intermediate OWC	● Locate source of disturbance. Repair as required. ● For specific shifts or torque converter concern, refer to appropriate routines: ■ No Shift 1-2, Routine 320 ■ No Shift 2-3, Routine 321 ■ No Shift 3-4, Routine 322 ■ No Shift 4-3, Routine 323 ■ No Shift 3-2, Routine 324 ■ No Shift 2-1, Routine 325 ■ No Converter Cycling, Routine 242/342

■ friction elements ■ torque converter assembly ● Third gear ■ one-way clutch ■ torque converter assembly ■ friction elements ● Fourth gear ■ one-way clutch ■ gear set ■ friction elements ■ torque converter assembly ● REVERSE ■ gear set ■ friction elements ■ torque converter assembly ● Shaft spline fit ● Slip yoke, park gear	
Other Noises/Vibrations: ● Main controls ● Valve resonance ● Shift cable ● Vibration, grounding ■ Transmission fluid cooler lines or fluid filler tube	● Locate source of disturbance. Repair as required.

Other Concerns: Engine Will Not Crank

Possible Component	Reference/Action
255 — ELECTRICAL ROUTINE	
Powertrain Control System ● Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, Digital TR Sensor	● Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test D using the Transmission Tester, Cable and Overlay and TRS-E Cable. Repair as required. Clear codes, and rerun On-Board Diagnostics.
355 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage (Internal or External), Cable, or Digital TR Sensor ● Damaged, incorrectly adjusted	● Inspect and repair as required. Verify linkage adjustment. After linkage repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission Range (TR) Sensor in this section.
Pump Assembly ● Seized	● Inspect for damage, repair or install new as required. For additional information, refer to Pump Assembly in this section.
Flexplate ● Damaged	● Inspect for damage. Install new as required.

Other Concerns: No Park Range

Possible Component	Reference/Action

256 — ELECTRICAL ROUTINE	
● No electrical concerns	
356 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage (Internal/External) or Cable ● Damaged, incorrectly adjusted	● Inspect for damage. Repair as required. Verify linkage adjustment. After linkage repair/adjustment, verify that the digital TR sensor is correctly adjusted. For additional information, refer to Digital Transmission Range (TR) Sensor in this section.
Park Mechanism ● Park Gear, Parking Pawl, Parking Pawl Return Spring, Park Guide Plate, Parking Pawl Shaft, Parking Pawl Actuating Rod, Manual Control Lever Outer and Shaft Assembly, Inner Manual Valve Detent Lever — damaged, misassembled	● Inspect for damage. Repair as required.
Super Duty Only ● Parking Brake Drum— damaged	● Inspect for damage. Install new as required.

Other Concerns: Transmission Overheating

Possible Component	Reference/Action
257 — ELECTRICAL ROUTINE	
Powertrain Control System ● Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, TCC Solenoid	● Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test C using the Transmission Tester and Cable and Overlay. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
357 — HYDRAULIC/MECHANICAL ROUTINE	
Excessive Vehicle or Towing Loads, Severe Vehicle Usage	● Refer to the vehicle specification manual for load and GVW/GCW information. Refer to owner guide. ● NOTE: If auxiliary cooler is desired, use only Ford original factory equipment installed to factory specifications.
Fluid ● Incorrect Level ● Condition	● Adjust fluid to correct level. Inspect according to instructions under Fluid Condition Check.
Transmission Cooling System ● Damaged, blocked, restricted, or incorrectly installed ● Cooler Bypass Valve (CBV) — damaged, blocked, restricted or incorrectly installed	● Carry out Transmission Fluid Cooler Flow Test. ● Inspect for damage, restrictions. Repair as required.
Vehicle Concerns Causing Engine Overheating	● Refer to Section 303-03 .
Torque Converter Clutch ● Not engaging	● See Routine No. 240/340.

Other Concerns: No Engine Braking in MANUAL 2 Position Only

Possible Component	Reference/Action
258 — ELECTRICAL ROUTINE	
• No electrical concerns	
358 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• BS1, BS2, BS3, and CB1 Check Balls — missing, seat damaged	• Inspect for damage. Install new as required.
• Valve Body Separator Plate — damaged	• Inspect for damage. Install new as required.
• 4-3-2 Timing Valve, D2 Valve, 2-3 Shift Valve, Coast Clutch Shift Valve, 1-2 Manual Transition Valve, 3-4 Shift Valve — damaged, stuck, misassembled	• Inspect for damage. Repair as required.
Coast Clutch Assembly	
• Assembly	• Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
• Seals or Piston — damaged	• Inspect for damage. Install new as required.
• Stator Support — damaged or holes blocked. Seal Rings — damaged	• Inspect for damage. Repair as required.
• Cylinder Hub — damaged or holes blocked	• Inspect for damage. Repair as required.
• Friction Elements — damaged, burnt	• Inspect for damage. Install new as required.
Intermediate Servo/Band Assembly	
• Servo Piston or Bore — damaged	• Inspect for damage. Install new as required.
• Band or Drum — burnt, damaged	• Inspect for damage. Install new as required.

Other Concerns: No Engine Braking in MANUAL 1 Position Only

Possible Component	Reference/Action
259 — ELECTRICAL ROUTINE	
• No electrical concerns	
359 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged	• Inspect for damage and install new gasket.
• 3-4 Shift Valve, Low Reverse Clutch Modulator Valve, D2 Valve, 4-3-2 Timing Valve, 2-3 Shift Valve, Coast Clutch Shift Valve — damaged, misassembled, stuck	• Inspect for damage. Repair as required.
• BS3, BS1, CB16, and CB1 Check Ball — damaged,	• Inspect for damage. Install

missing	new as required.
• Valve Body Separator Plate — damaged	• Inspect for damage. Install new as required.
• Reinforcing Plate — bolts loose	• Tighten bolts to specification.
Coast Clutch Assembly	
• Assembly	• Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
• Seal or Piston — damaged	• Inspect for damage. Install new as required.
• Stator Support — damaged or holes blocked, Seal Rings — damaged	• Inspect for damage. Repair as required.
• Cylinder Hub — damaged or holes blocked	• Inspect for damage. Repair as required.
• Friction Elements — damaged, burnt	• Inspect for damage. Install new as required.
Low One-Way Clutch Assembly	
• Assembly	• Air Check Clutch Assembly; refer to Air Pressure Tests in this section.
• Seals or Piston — damaged	• Inspect for damage. Install new as required.
• Friction Elements — damaged, worn	• Inspect for damage. Install new as required.
• Sealing Area in Case — damaged	• Inspect for damage. Install new case.

Other Concerns: No Engine Braking with Overdrive Cancelled (MANUAL 1st and MANUAL 2nd Have Engine Braking)

Possible Component	Reference/Action
260 — ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical Inputs/Outputs, Vehicle Wiring Harnesses, PCM, CCS	• Run On-Board Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test G using the Transmission Tester and Cable and Overlay. Repair as required. Clear codes, road test and rerun On-Board Diagnostics.
360 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gaskets — damaged	• Inspect for damage and install a new gasket.
• CCS — damaged, stuck	• Refer to electrical routine No. 260.
• BS3 Check Balls — missing, Valve Body Separator Plate Seat — damaged	• Inspect for damage. Install new as required.
• 3-4 Shift Valve — stuck, damaged or	• Inspect for damage. Repair as required.

misassembled ● Coast Clutch Shift Valve — damaged or misassembled	● Inspect for damage. Repair as required.

No Engine Braking in Manual 1, 2 and 3

Possible Component	Reference/Action
261 — ELECTRICAL ROUTINE	
● No electrical concerns	
362 — HYDRAULIC/MECHANICAL ROUTINE	
Main Controls	
● Bolts not tighten to specification	● Tighten to specification.
● Valve body separator plate damaged	● Inspect for damage. Install new as required.
● Gaskets damaged	● Inspect for damage or missing gasket. Install new as required.
Coast Clutch Assembly	
● Coast clutch cylinder snap ring grove damaged	● Inspect cylinder for damage. Install new as required. Inspect flatness of grove. Install new cylinder as required.
● Not machined flat	● Inspect cylinder and snap ring for damage.
● Coast clutch cylinder snap ring loose installed	● Inspect new as required. Inspect for flatness of grove. Install new as required.

Other Concerns: Fluid Venting/Foaming

Possible Component	Reference/Action
262 — ELECTRICAL ROUTINE	
● No electrical concerns	
362 — HYDRAULIC/MECHANICAL ROUTINE	
● Case Vent Assembly — blocked or damaged	● Check case vent assembly for damage or blockage. Repair as required.
● Overfilled Transmission	● Check level and adjust as required.
● Fluid — contaminated (coolant, water)	● Check for contamination, locate source of contamination. Repair as required.
● Overheating	● Refer to Routine No. 257/357.
● Filter Assembly and Seal — damaged or misassembled	● Inspect filter assembly and seal for damage. Install new as required.
● Pump-to-Case Gasket — damaged, misaligned	● Inspect for damage and install a new gasket.

Transmission Fluid Cooler — Backflushing and Cleaning

1. Using a suitable torque converter/fluid cooler cleaner, flush the fluid cooler and lines.

2. **NOTE:** Rubber hoses must be attached to the ends of the fluid cooler tubes, to aid in connecting them to the cleaner.

   Connect the cleaner pressure and return lines appropriately.
   1. Connect the pressure line to fluid cooler inlet tube.
   2. Connect the return line to fluid cooler outlet tube.
   3. Place the outlet end of the return line in the solvent tank reservoir.

3. **NOTE:** Cycling the solvent pump on and off will help dislodge contaminants in the cooler system.

   Switch the solvent pumps on. Allow the solvent to circulate a minimum of five minutes.

4. Switch the solvent pump off.

5. Disconnect the cleaner pressure line at the fluid cooler tube.

6. Using compressed air, blow through the fluid cooler inlet tube until all solvent is removed.

7. Remove the rubber hoses from fluid cooler tubes.

Transmission Fluid Drain and Refill

Special Tool(s)

 ST2654-A	Automatic Transmission Flush and Fill Machine 211-00018
 ST2654-A	Automatic Transmission Flush and Fill Machine 199-00010 or equivalent

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

1. **CAUTION: Always refer to the instructions supplied with the flush and fill machine.**

   CAUTION: Do not use any supplemental transmission fluid additives or cleaning agents. The use of these products could cause internal transmission components to fail; this will affect the operation of the transmission.

   NOTE: Draining fluid from the transmission by removing only the fluid pan is acceptable for vehicles that do not have a torque converter drain plug and for normal or severe duty fluid maintenance.

   A new procedure for draining and adding transmission fluid using a suitable transmission flush and fill machine has been added. The following is list of different methods for draining and refilling the transmission fluid:

   - All vehicles using a suitable flush and fill machine.
   - Vehicles equipped with a fluid pan and torque converter drain plug.
   - Vehicles not equipped with a fluid pan or a torque converter drain plug.
   - Vehicles equipped with a torque converter drain plug and without a fluid pan drain plug. Use the method that is applicable to your vehicle.

All vehicles using a suitable flush and fill machine

Draining

2. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .

3. Use a suitable flush and fill machine to change the fluid

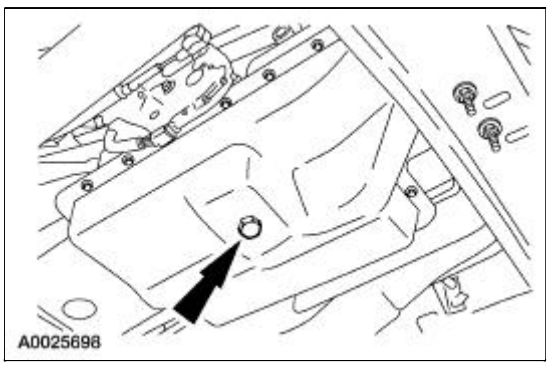
4. When connecting the flush and fill machine, connect the machine to the fluid cooler line after the cooler on the cooler return line. This will help remove any debris trapped in the fluid coolers.

Refill

5. Use only clean automatic transmission fluid.

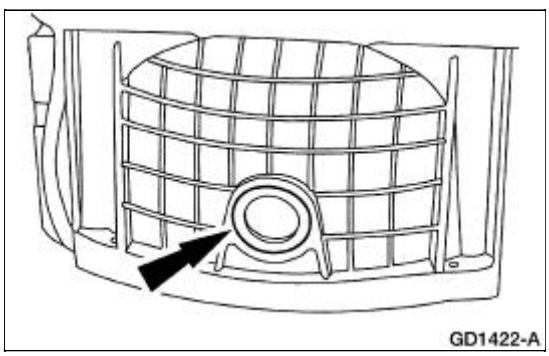
6. Once the fluid exchange has been completed, disconnect the flush and fill machine. Reconnect any disconnected fluid cooler lines.

7. Lower the vehicle. For additional information, refer to Section 100-02 .



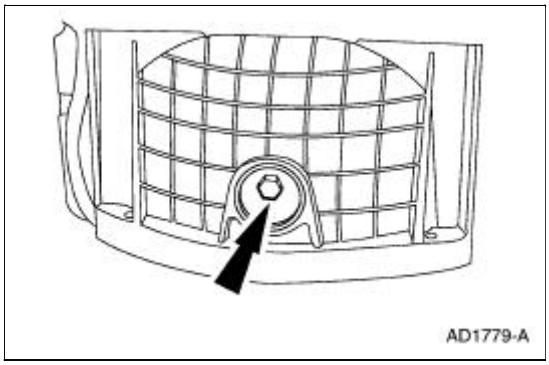
8. With the engine running and the transmission at normal operating temperature 66-77°C (150-170°F), check and adjust the transmission fluid level and check for any leaks. If fluid is needed, add fluid in increments of 0.24-liter (0.5-pint) until the correct level is achieved (fluid in the cross-hatched area of the fluid level indicator).

Vehicles equipped with a fluid pan and torque converter drain plug



Draining

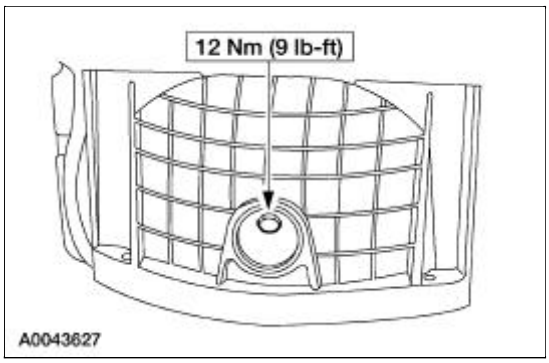
1. Raise the vehicle on a hoist. For additional information, refer to Section 100-02 .



2. Remove the drain plug and allow the fluid to drain.

3. Remove the torque converter drain plug cover.

4. Remove the torque converter drain plug and discard.

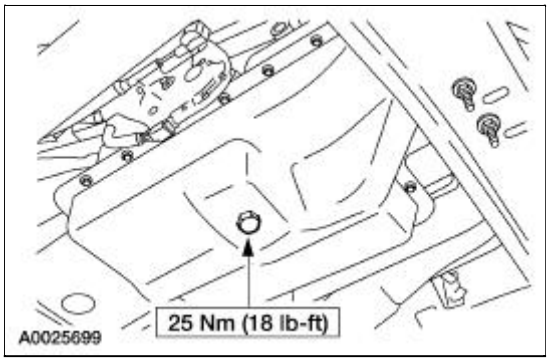


5. Allow the fluid to drain.

6. **NOTE:** If equipped with a radiator in-tank transmission fluid cooler, or an auxiliary cooler, the coolers will need to be flushed.

   Only flush the cooler lines, fluid coolers and the bypass valve if carrying out a transmission overhaul. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.

Refill



7. After the torque converter has drained, install a new drain plug.

8. Install the torque converter drain plug cover.

9. Install the drain plug.

10. Lower the vehicle. For additional information, refer to Section 100-02 .

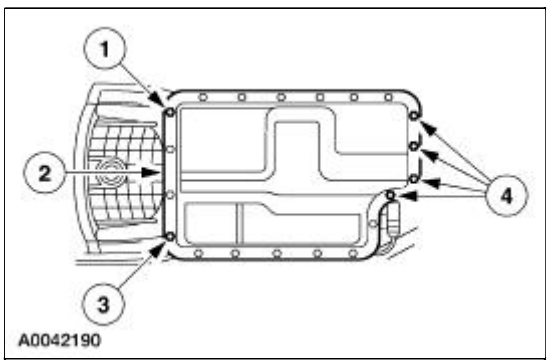
11. **CAUTION: The use of any other fluids can result in the transmission failing to operate in a normal manner or failure.**

    Fill the transmission.

    - Add 6.2 liters (6.5 qts) of clean automatic transmission fluid to the transmission through the fluid filler tube.

12. Start the engine. Move the transmission range selector lever through all the gear ranges, checking for engagements.

13. With the engine running and the transmission at normal operating temperature 66-77°C (150-170°F) check and adjust the transmission fluid level and check for any leaks. If fluid is needed, add fluid in increments of 0.24-liter (0.5-pint) until the correct level is achieved (fluid in the cross-hatched area of the fluid level indicator).



Vehicles not equipped with a fluid pan or a torque converter drain plug

Draining

1. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .

2. **NOTE:** Do not discard the fluid pan gasket unless damaged. This is a reusable gasket.

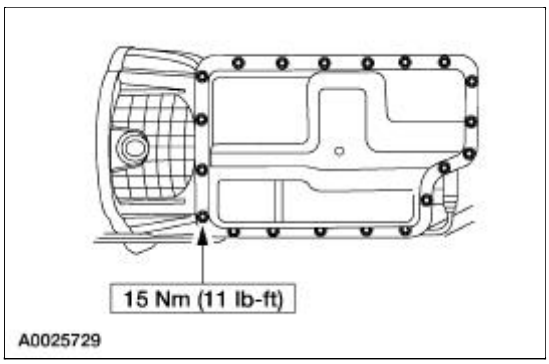
   Remove the transmission fluid pan and gasket.
   1. Loosen, but do not remove the bolts.
   2. Remove the front and side bolts.
   3. Lower the front of the fluid pan and allow the fluid to drain.
   4. Remove the remaining fluid pan bolts and the fluid pan.

3. Do not remove or install a new fluid filter.

4. **NOTE:** If equipped with a radiator in-tank transmission fluid cooler, or an auxiliary cooler, the coolers will need to be flushed.

   Only flush the cooler lines, fluid coolers and the bypass valve if carrying out a transmission overhaul. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.

Refill



5. **NOTE:** Do not discard the gasket unless damaged. This is a reusable gasket.

   NOTE: Apply a light coat of petroleum jelly to hold the gasket to the fluid pan.

   Position the gasket onto the clean fluid pan. Make sure the magnet is positioned over the dimple in the fluid pan.

6. Install the pan with gasket. Alternately tighten the bolts.

7. Lower the vehicle. For additional information, refer to Section 100-02 .

8. **CAUTION: The use of any other fluids can result in the transmission failing to operate in a normal manner or failure.**

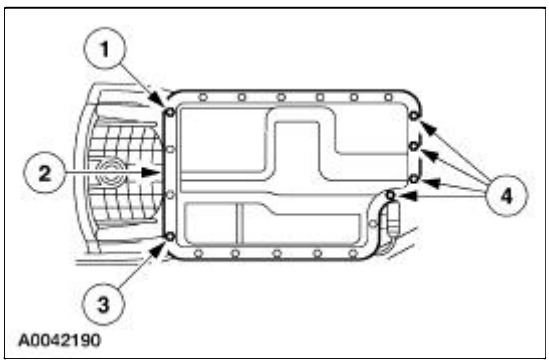
   Fill the transmission.

   - Add 6.2 liters (6.5 qts) of clean automatic transmission fluid to the transmission through the fluid filler tube.

9. Start the engine. Move the transmission range selector lever through all the gear ranges, checking for engagements.

10. With the engine running and the transmission at normal operating temperature 66-77°C (150-170°F), check and adjust the transmission fluid level and check for any leaks. If fluid is needed, add fluid in increments of 0.24-liter (0.5-pint) until the correct level is achieved (fluid in the cross-

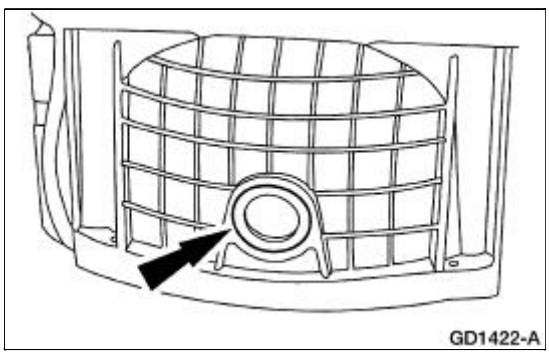
hatched area of the fluid level indicator).



Vehicles equipped with a torque converter drain plug and without a fluid pan drain plug

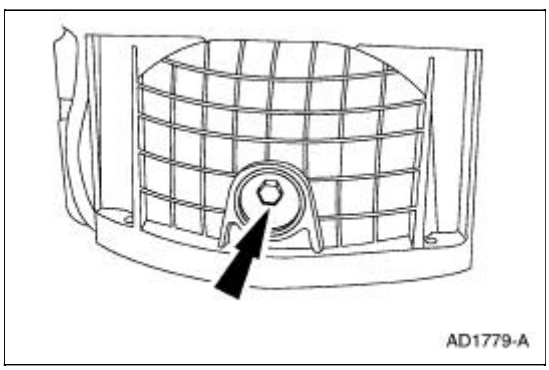
Draining

1. Raise the vehicle on a hoist. For additional information, refer to Section 100-02 .



2. **NOTE:** Do not discard the fluid pan gasket unless damaged. This is a reusable gasket.

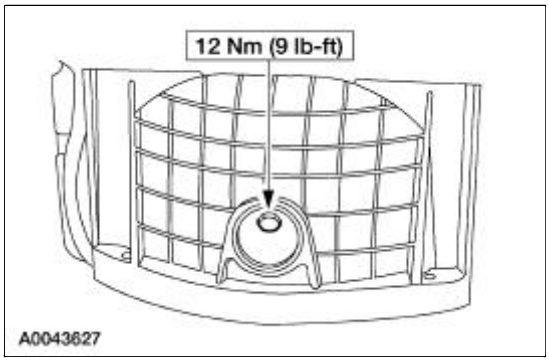
   Remove the transmission fluid pan and gasket.
   1. Loosen, but do not remove the bolts.
   2. Remove the front and side bolts.
   3. Lower the front of the fluid pan and allow the fluid to drain.
   4. Remove the remaining fluid pan bolts and the fluid pan.



3. Do not remove or install a new fluid filter.

4. Remove the torque converter drain plug cover.

5. Remove the torque converter drain plug and discard.

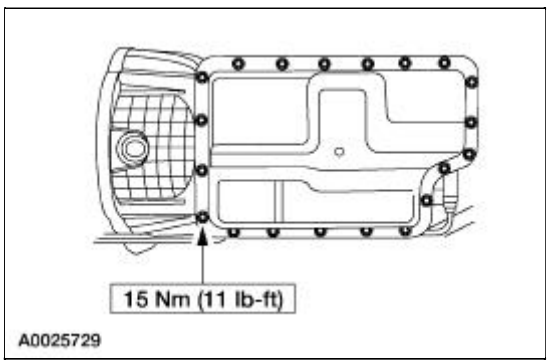


6. Allow the fluid to drain.

7. **NOTE:** If equipped with a radiator in-tank transmission fluid cooler, or an auxiliary cooler, the coolers must be flushed.

   Only flush the cooler lines, fluid coolers and the bypass valve if carrying out a transmission overhaul. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.

Refill



8. After the torque converter has drained, install a new drain plug.

9. Install the torque converter drain plug cover.

10. Install the pan with gasket. Alternately tighten the bolts.

11. Lower the vehicle. For additional information, refer to Section 100-02 .

12. **CAUTION: The use of any other fluids can result in the transmission failing to operate in a normal manner or failure.**

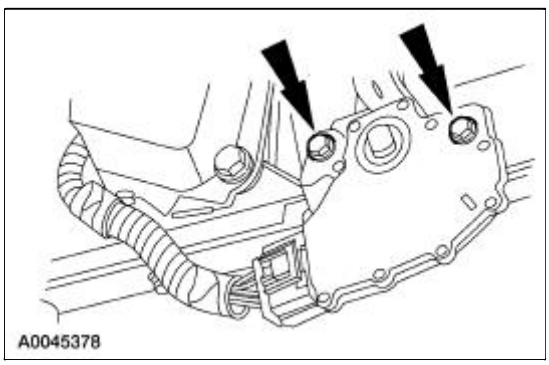
Fill the transmission.

- Add 6.2 liters (6.5 qts) of clean automatic transmission fluid to the transmission through the fluid filler tube.

13. Start the engine. Move the transmission range selector lever through all the gear ranges, checking for engagements.

14. With the engine running and the transmission at normal operating temperature 66-77°C (150-170°F), check and adjust the transmission fluid level and check for any leaks. If fluid is needed, add fluid in increments of 0.24-liter (0.5-pint) until the correct level is achieved (fluid in the cross-hatched area of the fluid level indicator).

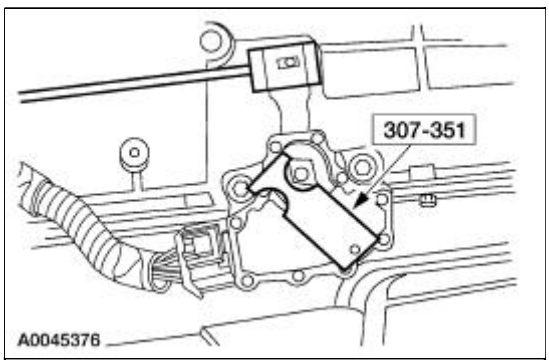
Transmission Range (TR) Sensor Adjustment



Special Tool(s)

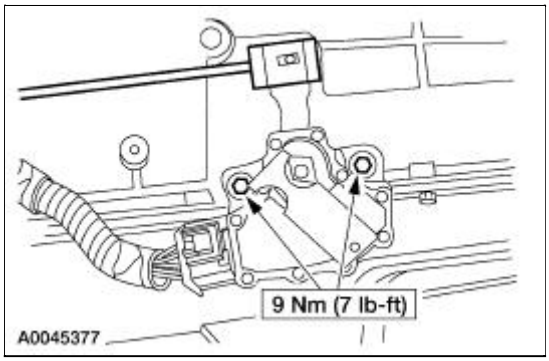
 ST1633-A	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)

Adjustment



1. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .

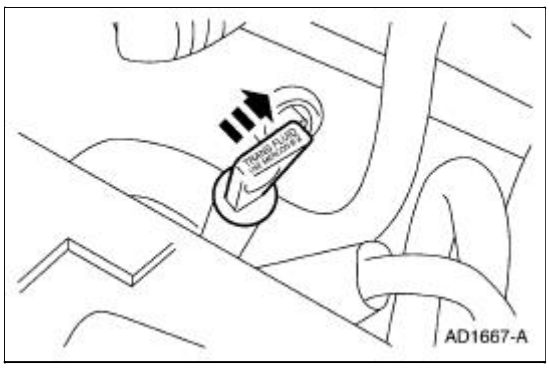
2. Loosen the digital TR sensor bolts.



3. **NOTE:** Make sure that the manual control lever is in the NEUTRAL position.

   Using the special tool, align the digital TR sensor.

4. Tighten the bolts.



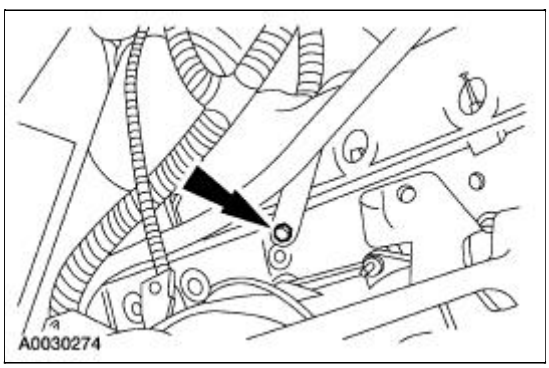
5. Lower the vehicle.

Transmission Filler Tube

Removal

1. Remove the fluid level indicator.

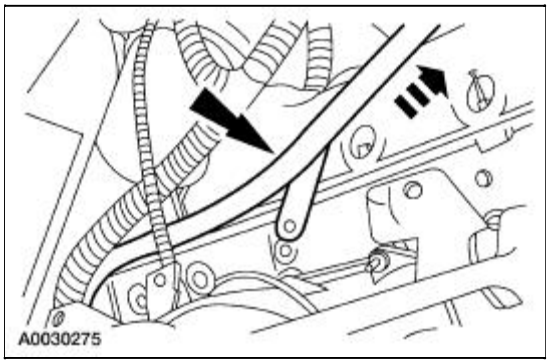
2. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .



3. **NOTE:** All gasoline vehicles will have new adaptive shift strategies. Whenever the vehicles battery has been disconnected for any type of service or repair, the strategy parameters that are stored in the keep alive memory (KAM) will be lost. The strategy will start to relearn once the battery is reconnected and the vehicle is driven. This is a temporary condition and will return to normal operating condition once the powertrain control module (PCM) relearns all the parameters from the driving operating conditions. There is no time frame set for this process. If this concern is present during downshifts or converter clutch apply, it is not the shift strategy and will require diagnosis as outlined in the workshop manual.

   The customer must be notified that they may experience slightly different upshifts (either soft or firm) and that this condition is temporary and will eventually return to normal operating condition.

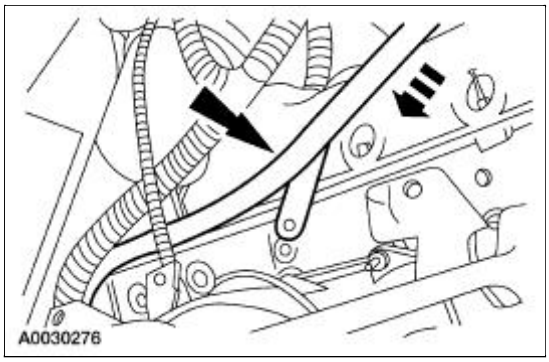
   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .



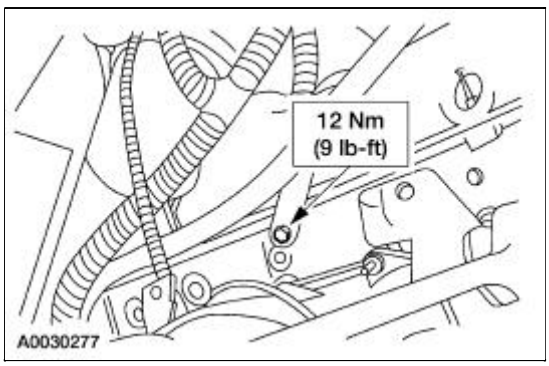
4. Remove the RH front wheel. For additional information, refer to Section 204-04 .

5. Remove the fluid filler tube bolt.

6. **NOTE:** It may be necessary to disconnect the wiring harness from the starter motor to remove the fluid filler tube.



Remove the fluid filler tube.



Installation

1. **NOTE:** Coat the O-ring seal at the bottom of the fluid filler tube with transmission fluid. If removed, install the starter wiring harness.

   Install the fluid filler tube.

2. Install the fluid filler tube bolt.

3. Install the RH front wheel. For additional information, refer to Section 204-04 .
4. Lower the vehicle.
5. Reconnect the battery ground cable.
6. Install the fluid level indicator.

AD1669-A

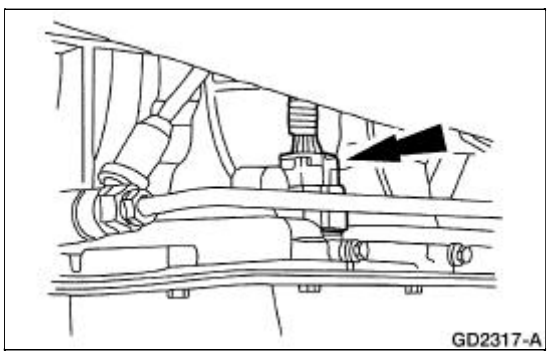
Main Control Valve Body —Accumulator Body, Solenoid Body

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound D7AZ-19A331-A	ESE-M1C171-A
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

Removal

NOTE: If the transmission has been disassembled to install new parts, and the valves in the main control valve body stick repeatedly from foreign material, the torque converter must be removed and cleaned by using a suitable torque converter/fluid cooler cleaner.

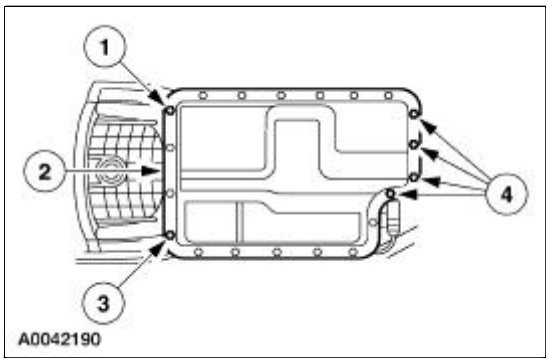


1. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .

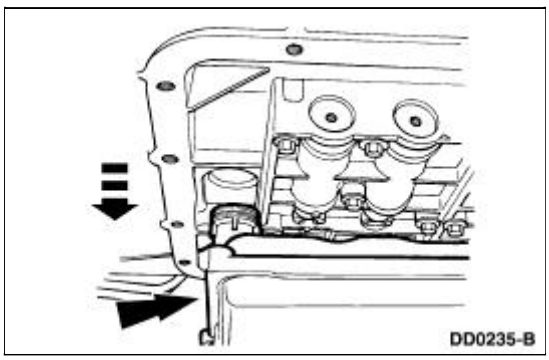
2. **NOTE:** All gasoline vehicles will have new adaptive shift strategies. Whenever the vehicles battery has been disconnected for any type of service or repair, the strategy parameters that are stored in the keep alive memory (KAM) will be lost. The strategy will start to relearn once the battery is reconnected and the vehicle is driven. This is a temporary condition and will return to normal operating condition once the powertrain control module (PCM) relearns all the parameters from the driving operating conditions. There is no time frame set for this process. If this concern is present during downshifts or converter clutch apply, it is not the shift strategy and will require diagnosis as outlined in the workshop manual.

   The customer must be notified that they may experience slightly different upshifts (either soft or firm) and that this condition is temporary and will eventually return to normal operating condition.

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

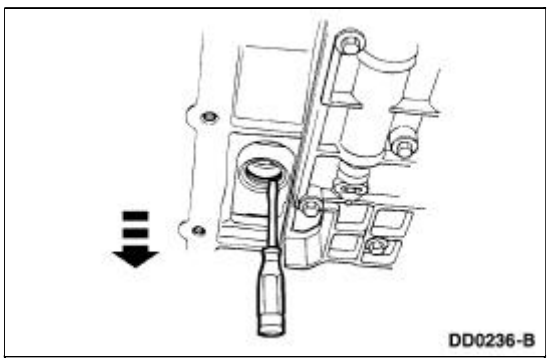


3. Disconnect the solenoid body electrical connector.

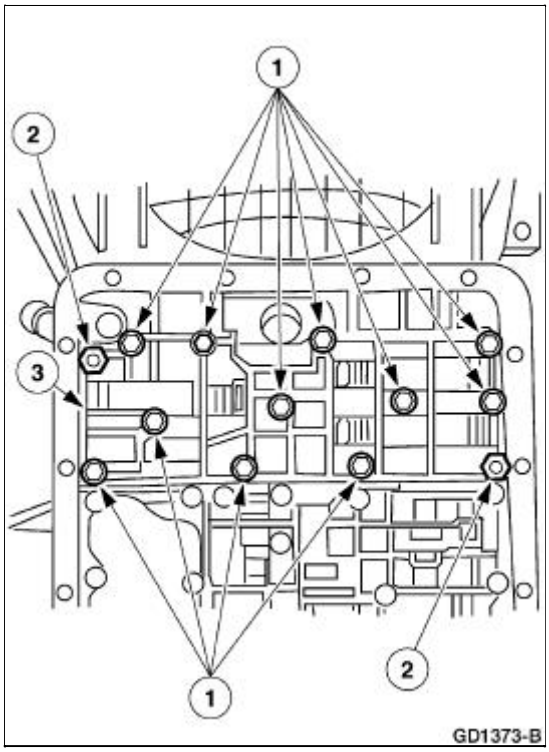


4. **NOTE:** Do not discard the fluid pan gasket unless damaged. This is a reusable gasket.

Remove the transmission fluid pan and gasket.

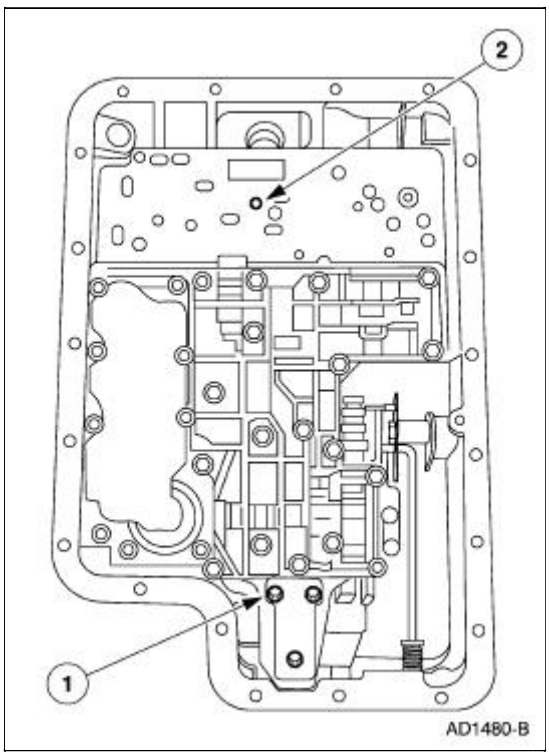


1. Loosen, but do not remove the bolts.
2. Remove the front and side bolts.
3. Lower the front of the fluid pan and allow the fluid to drain.
4. Remove the remaining fluid pan bolts and the fluid pan.

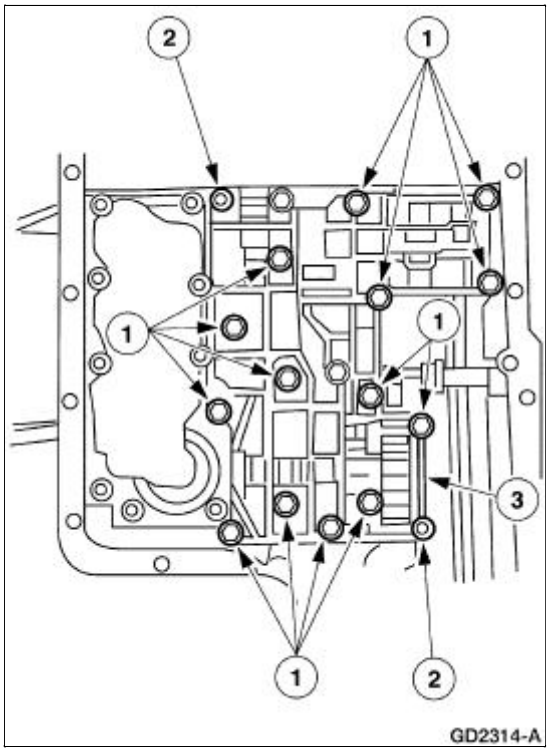


5. Remove and discard the fluid filter.
   - Remove the fluid filter and seal assembly by pulling and rotating the filter.

6. If the fluid filter seal remains in the pump bore, remove it carefully with a small screwdriver so as to not to scratch or damage the aluminum bore.

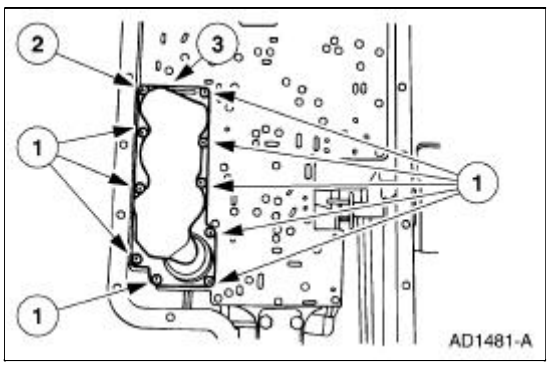


7. Remove the accumulator body.
   1. Remove the bolts.
   2. Remove the nuts.
   3. Remove the accumulator body.

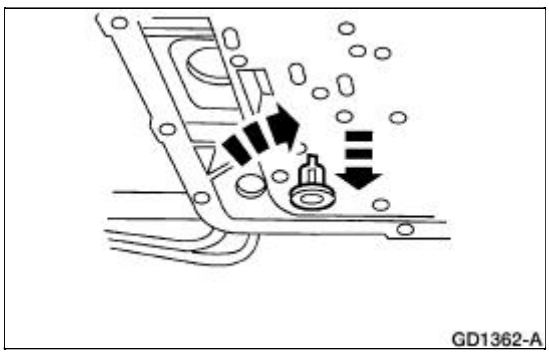


8. **CAUTION: Prevent the front of the valve body separator plate from sagging and displacing the check balls.**

   If the valve body separator plate is not being serviced:
   1. Remove the bolt.
   2. Install the bolt into any case-threaded bolt hole on the opposite end of the separator plate.

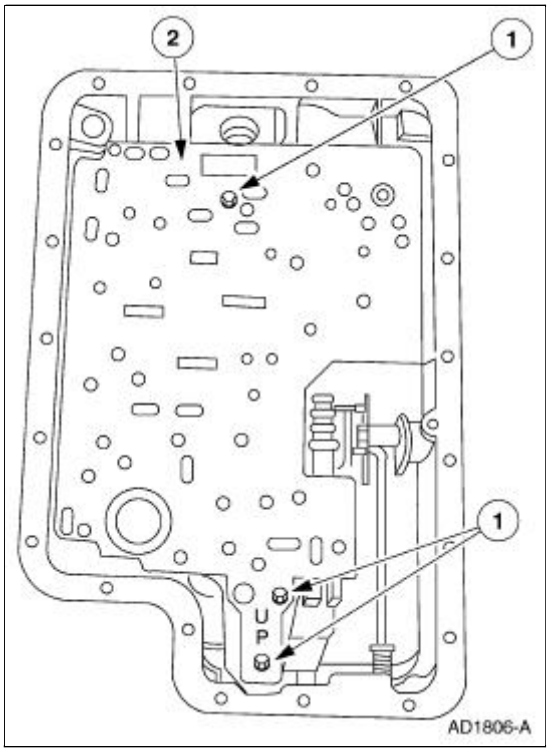


9. Remove the main control valve body assembly.
   1. Remove the bolts.



2. Remove the nuts.
3. Remove the main control valve body.

10. Remove the solenoid body assembly.
    1. Remove the bolts.
    2. Remove the nut.
    3. Remove the solenoid body assembly.



11. Remove the solenoid screen assembly by rotating and pulling.

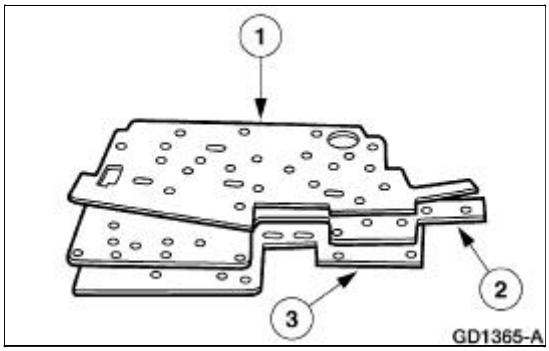
12. **CAUTION: The steel electronic pressure control (EPC) check ball is spring-loaded under the valve body separator plate.**

    NOTE: If the valve body separator plates are not to be serviced, proceed to installation procedure.

    Remove the valve body separator plate reinforcement.
    1. Remove the bolts.
    2. Remove the separator plate reinforcement.

13. Lower and remove the valve body separator plate and gaskets.
    - The rubber check balls and the steel EPC check ball and spring assembly will fall out and may become lost or stick to the worm trail of the case.
    - Remove and discard separator plate gaskets.

Installation



CAUTION: Using the incorrect gaskets can cause damage to the transmission.

1. **NOTE:** Refer to parts catalog for correct gasket usage.

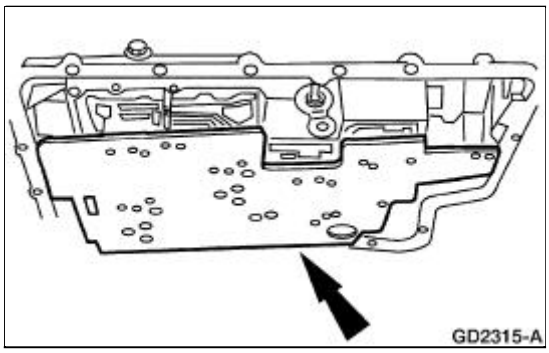
   NOTE: If the valve body separator plate was not removed, proceed to Step 6.

   NOTE: Apply a light film of petroleum jelly to the valve body separator plate prior to assembling the new gaskets.

   Assemble the new gaskets to the valve body separator plate.
   1. Main control-to-case gasket
   2. Valve body separator plate
   3. Main control-to-separator plate gasket

2. **NOTE:** Apply a small amount of petroleum jelly to each check ball prior to positioning them on the valve body separator plate.

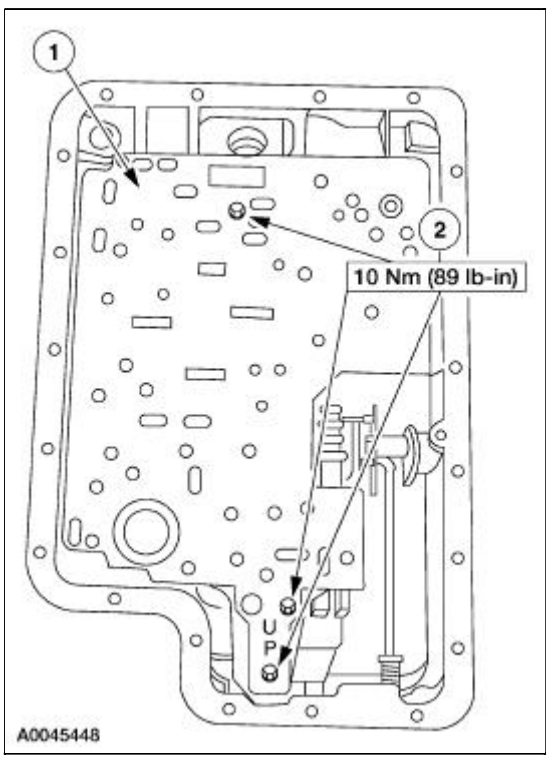
   Install eight rubber and one steel EPC check balls.



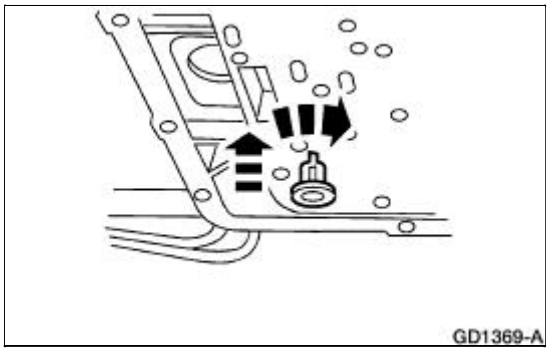
Item	Part Number	Description
1	—	EPC steel check ball
2	CB6	Check ball
3	BS1	Ball shuttle
4	CB9	Check ball
5	CB14	Check ball
6	CB1	Check ball
7	BS3	Ball shuttle
8	CB8	Check ball
9	CB7	Check ball

3. **NOTE:** Apply petroleum jelly to the EPC check ball spring prior to installing it into the case.

   Install the EPC check ball spring.

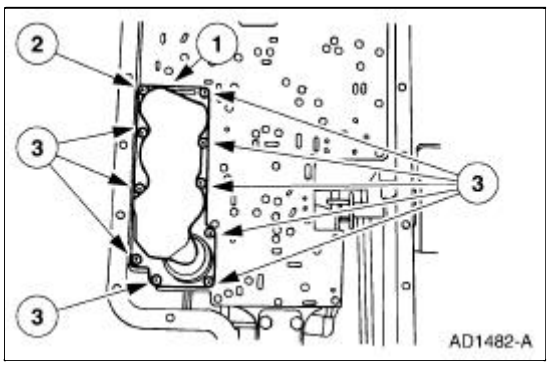


4. Position the valve body separator plate and the gaskets to the case carefully to retain the check balls.

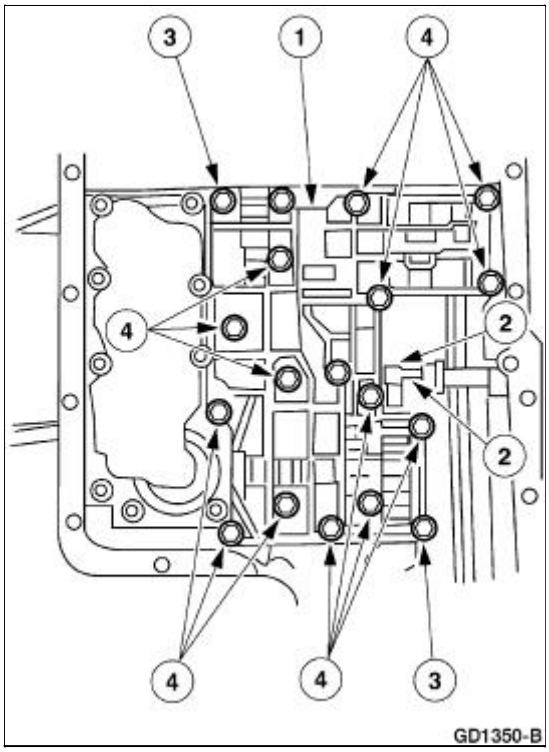


5. **NOTE:** The word "UP" stamped on the separator plate reinforcement must be visible when installed.

   Install the separator plate reinforcement plate.
   1. Position the separator plate reinforcement plate.
   2. Install the bolts.

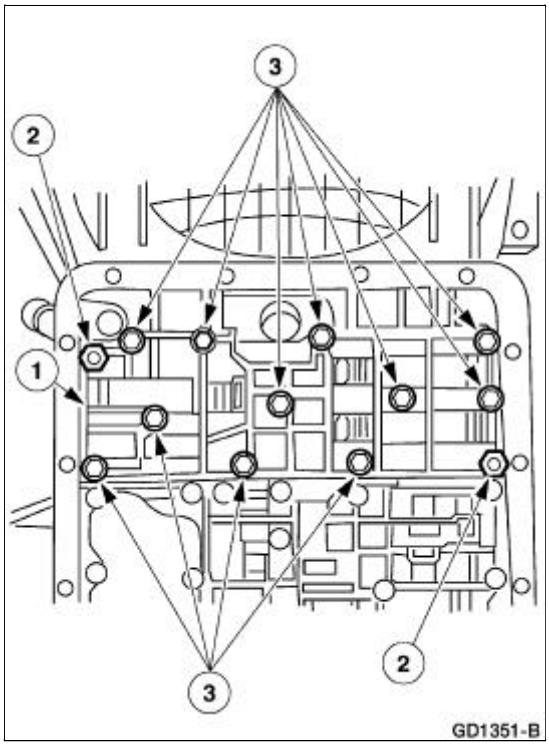


6. Install the solenoid screen assembly by pushing it in and rotating it to lock.

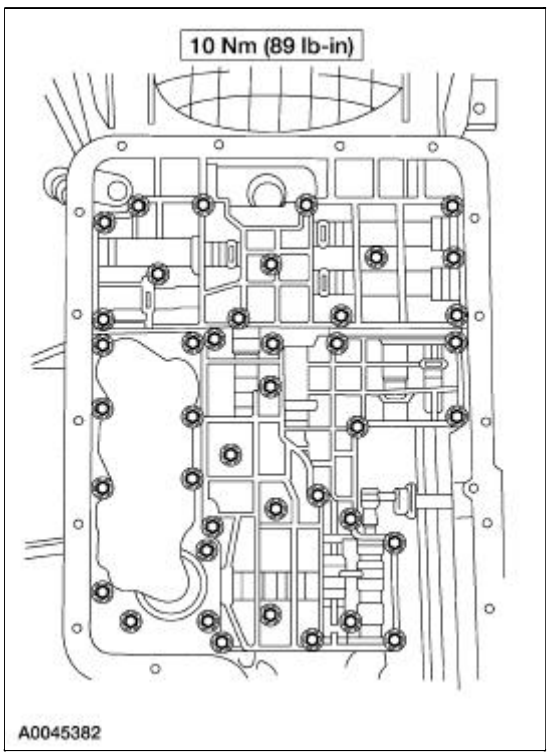


7. **NOTE:** Prior to installing the solenoid body assembly, coat the case connector bore with silicone grease.

   Install the solenoid body assembly.
   1. Install the solenoid body assembly.
   2. Install the nut.
   3. Install the bolts and nut finger-tight.

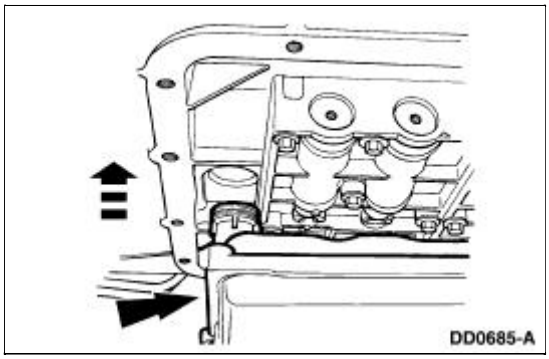


8. Install the main control valve body.
   1. Install the main control valve body.
   2. Aligning the manual shift valve with the manual valve detent lever.
   3. Install the nuts finger-tight.
   4. Install the bolts finger-tight.



9. If previously installed, remove, then reinstall the bolt into the separator plate reinforcing plate.
    1. Remove the bolt.
    2. Install the bolt.

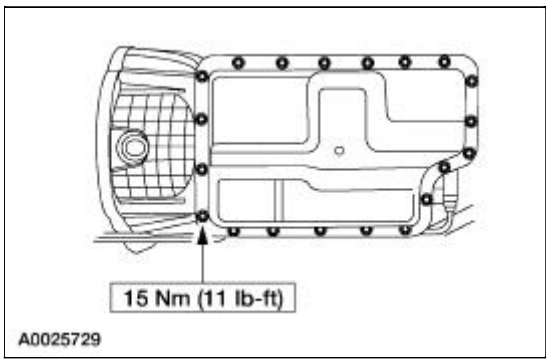
10. Install the accumulator body.
    1. Install the accumulator body.
    2. Install the nuts finger-tight.
    3. Install the bolts finger-tight.



11. Tighten all the accumulator body, main control valve body, and solenoid body nuts and bolts. Tighten the bolts, working from the center to the outside.

12. **CAUTION: Make sure that the pump bore is clean and the old fluid filter seal has been removed. Damage to the new filter can occur.**

    Lubricate the new seal with clean automatic transmission fluid and install the new fluid filter and seal assembly.



13. **NOTE:** Do not discard the gasket unless damaged. This is a reusable gasket.

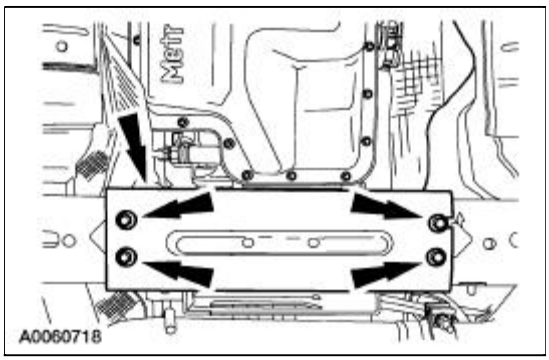
    NOTE: Apply a light coat of petroleum jelly to hold the gasket to the fluid pan.

    Position the gasket onto the clean fluid pan. Make sure the magnet is positioned over the dimple in the fluid pan.

14. Install the pan with gasket. Alternately tighten the bolts.

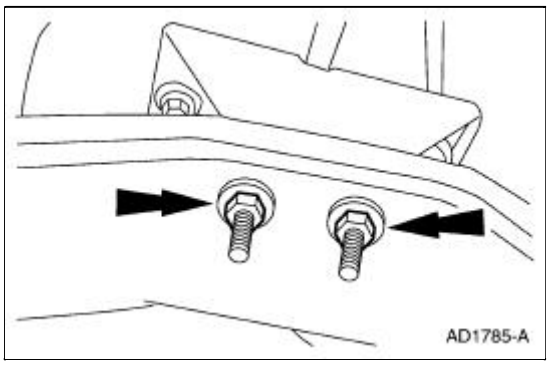
15. Connect the solenoid body electrical connector.

16. Lower the vehicle.
17. Connect the battery ground cable.



Turbine Shaft Speed (TSS) Sensor and Output Shaft Speed (OSS) Sensor

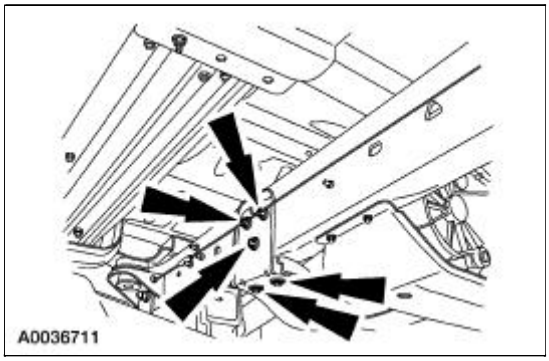
Removal



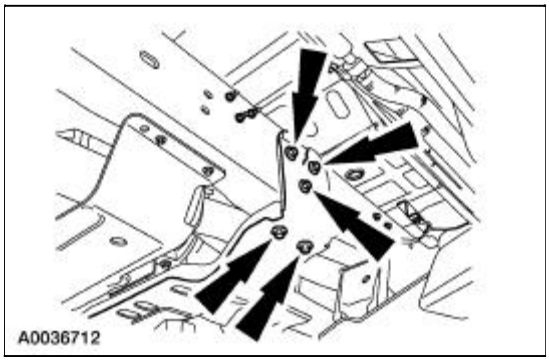
1. **NOTE:** The 4x2 application and the 4x4 application are similar.

   With the vehicle in NEUTRAL, position on a hoist. For additional information, refer to Section 100-02 .

2. Remove the bolts and remove the dampener.

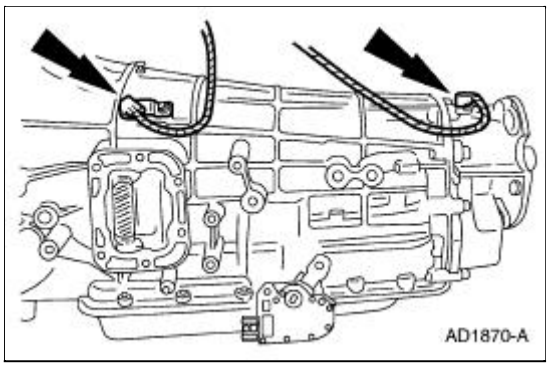


3. Remove the transmission insulator-to-crossmember support nuts.

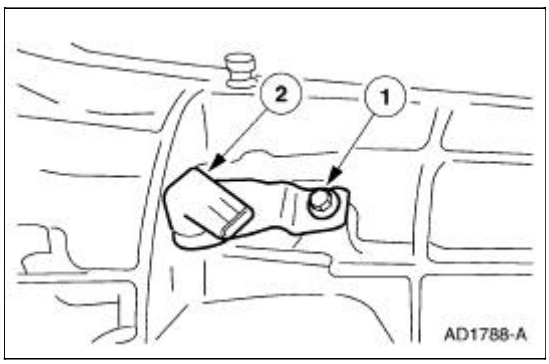


4. Attach a suitable high-lift transmission jack to the transmission.

5. Remove the crossmember bolts.

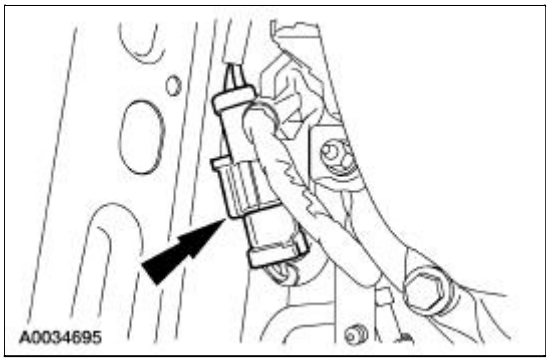


6. Remove the crossmember bolts and the crossmember.



7. Lower the rear of the transmission to gain access to the sensors.

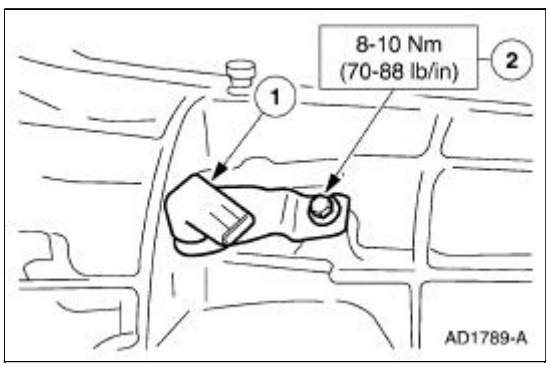
8. Disconnect the electrical connector of the affected sensor.



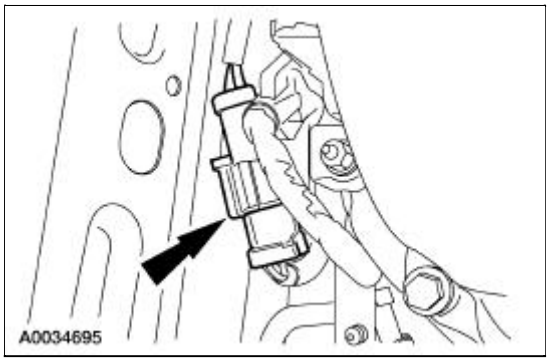
9. **CAUTION: Use care not to induce contamination in the form of dirt or foreign material when removing either of the sensors.**

   If necessary, remove the turbine shaft speed (TSS) sensor.
   1. Remove the bolt.
   2. Remove the TSS.

10. Position the heated oxygen sensor (HO2S) connector aside.



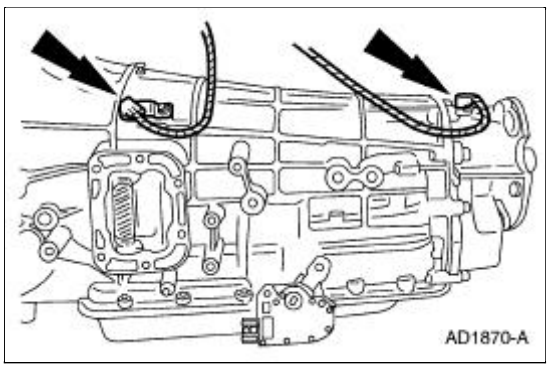
11. If necessary, remove the output shaft speed (OSS) sensor.
    1. Remove the bolt.
    2. Remove the OSS.



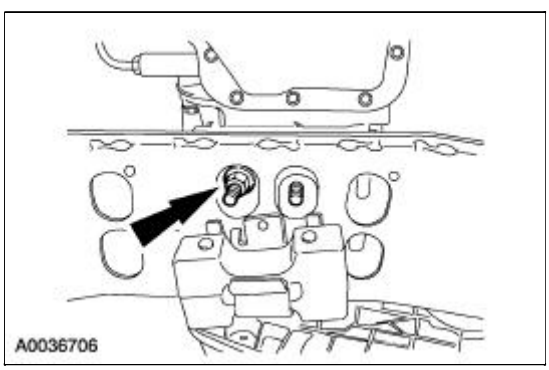
Installation

1. **CAUTION: Use care not to induce contamination in the form of dirt or foreign material when installing either of the sensors.**

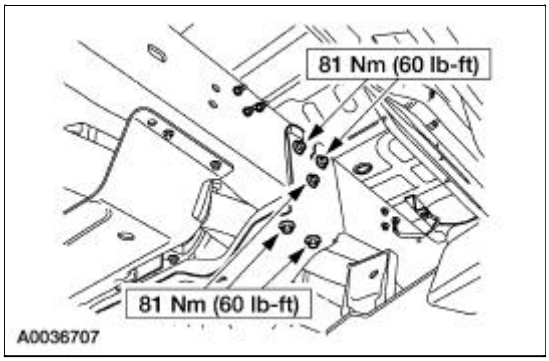
   If removed, install the OSS.
   1. Lubricate the O-ring and install the OSS.
   2. Install the bolt.



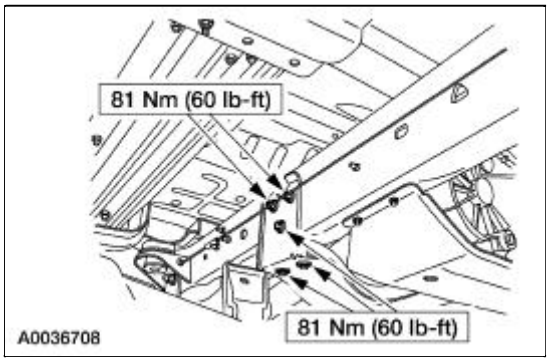
2. Position the heated oxygen sensor (HO2S) connector back in place.



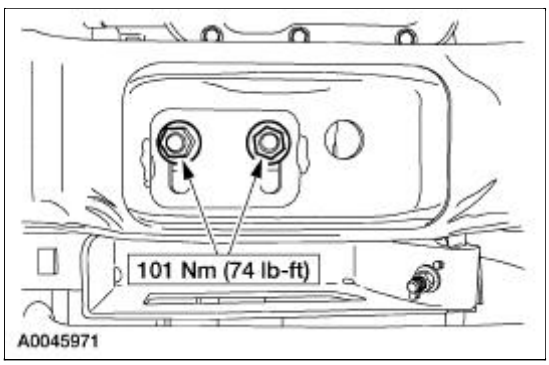
3. If removed, install the TSS.
    1. Lubricate the O-ring and install the TSS.
    2. Install the bolt.



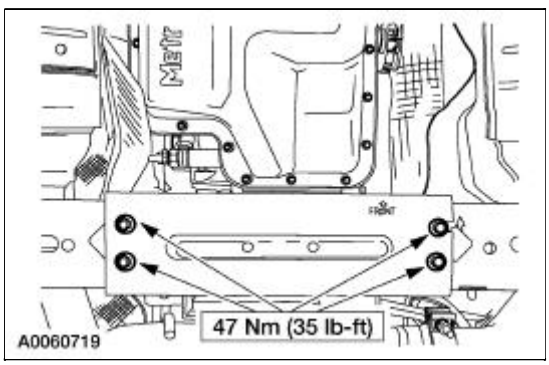
4. Connect the electrical connector to the affected sensor.



5. Install the crossmember to the transmission mount, using one nut to hold the crossmember in place. Raise the transmission and align the crossmember bolt holes.



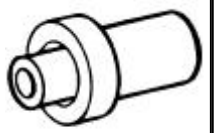
6. Install the bolts.

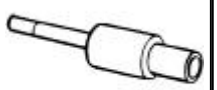


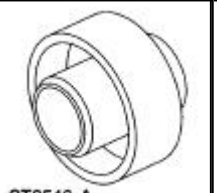
7. Install the bolts.

8. Install the remaining nut and tighten both nuts.

9. Install the dampener and install the bolts.







10. Remove the high-lift transmission jack.

11. Lower the vehicle.

Extension Housing Seal and Bushing

Special Tool(s)

 ST1185-A	Slide Hammer 100-001 (T50T-100-A)
 ST1740-A	Installer, Transmission Extension Housing Fluid Seal 307-013 (T61L-7657-B)
 ST1192-A	Remover, Transmission Fluid Seal 307-048 (T74P-77248-A)
 ST1745-A	Installer, Transmission Extension Housing Bushing 307-063 (T77L-7697-C)
 ST2546-A	Installer, Output Shaft Fluid Seal 307-380
 ST2547-A	Installer, Output Shaft Bushing 307-381
 ST1746-A	Remover, Transmission Extension Housing Bushing 307-064 (T77L-7697-D) Remover, Output Shaft Bushing 307-382

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

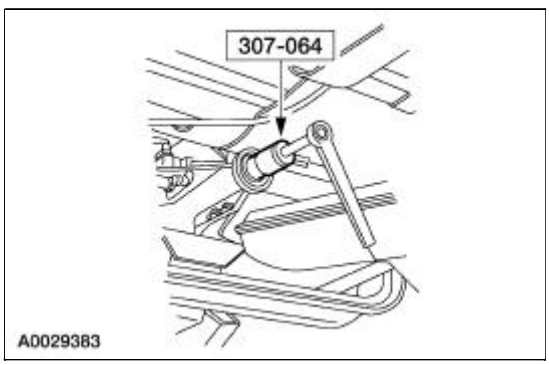
Removal

1. **NOTE:** All gasoline vehicles will have new adaptive shift strategies. Whenever the vehicles battery has been disconnected for any type of service or repair, the strategy parameters that are stored in the keep alive memory (KAM) will be lost. The strategy will start to relearn once the battery is reconnected and the vehicle is driven. This is a temporary condition and will return to normal operating condition once the powertrain control module (PCM) relearns all the parameters from the driving operating conditions. There is no time frame set for this process. If this concern is present during downshifts or converter clutch apply, it is not the shift strategy and will require diagnosis as outlined in the workshop manual.

   The customer must be notified that they may experience slightly different upshifts (either soft or firm) and that this condition is temporary and will eventually return to normal operating condition.

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .

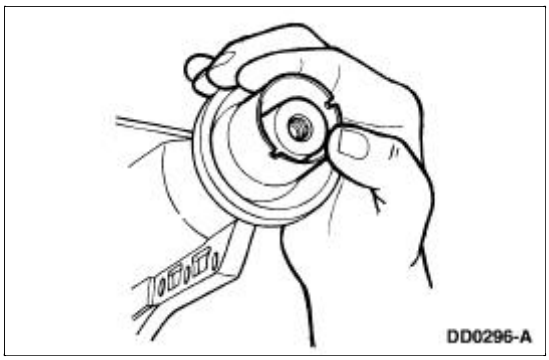


3. Remove the rear driveshaft. For additional information, refer to Section 205-01 .

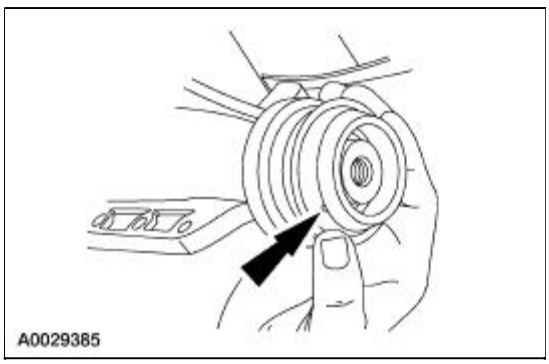
4. Using the special tools, remove the extension housing seal.

5. **CAUTION: Do not damage any machined surfaces. Damage can cause the new seal to leak.**

   Using the special tool, remove the extension housing bushing.



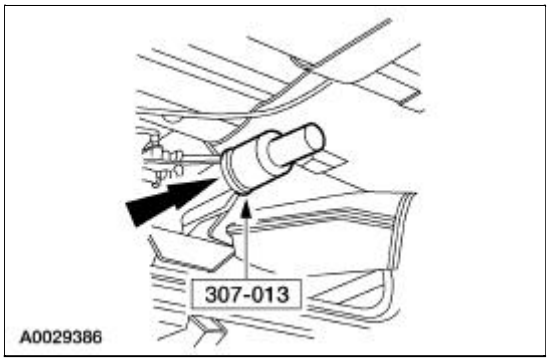
Installation



1. **CAUTION: Prior to installing the extension housing bushing, inspect the extension housing counterbore for burrs. If necessary, remove the burrs with an oil stone or damage to new bushing may occur.**

   NOTE: The extension housing bushing is model dependent.

   Align the extension housing bushing in the extension housing so that the slots are in the 2 o'clock and 7 o'clock positions.



2. Using the special tool, install the extension housing bushing.

3. Align the extension housing seal in the extension housing, with the drain hole positioned downward.

4. Using the special tool, seat the extension housing seal.

5. Install the rear driveshaft. For additional information, refer to Section 205-01 .
6. Lower the vehicle.
7. Reconnect the battery ground cable.
8. Fill the transmission to the specified level with clean automatic transmission fluid. For additional information, refer to the Fluid Capacity chart in the Specifications portion of this section.

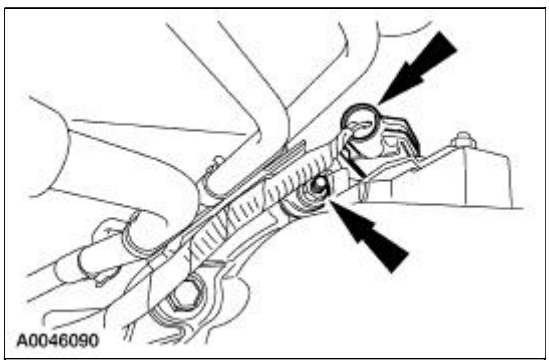
Extension Housing Gasket —4x2

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

Removal

1. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .

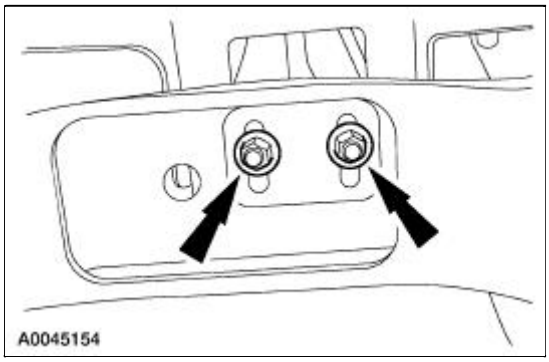


2. **NOTE:** All gasoline vehicles will have new adaptive shift strategies. Whenever the vehicles battery has been disconnected for any type of service or repair, the strategy parameters that are stored in the keep alive memory (KAM) will be lost. The strategy will start to relearn once the battery is reconnected and the vehicle is driven. This is a temporary condition and will return to normal operating condition once the powertrain control module (PCM) relearns all the parameters from the driving operating conditions. There is no time frame set for this process. If this concern is present during downshifts or converter clutch apply, it is not the shift strategy and will require diagnosis as outlined in the workshop manual.

   The customer must be notified that they may experience slightly different upshifts (either soft or firm) and that this condition is temporary and will eventually return to normal operating condition.

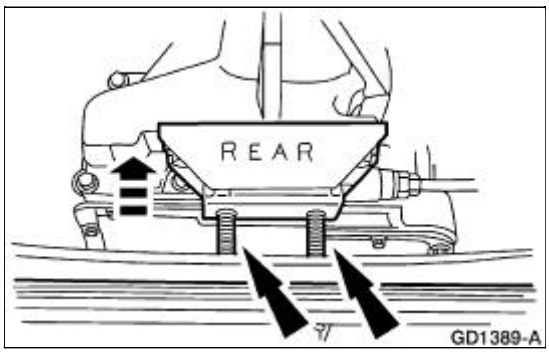
   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the rear driveshaft. For additional information, refer to Section 205-01 .

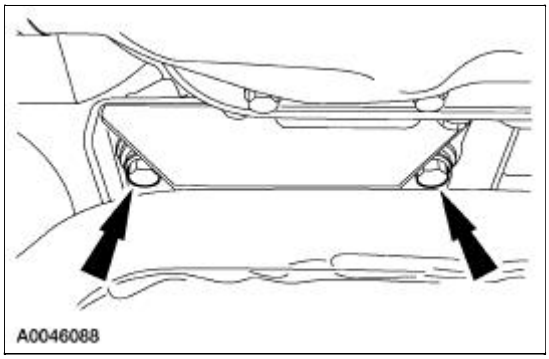


4. Disconnect the OSS sensor connector and remove the bolt for the fuel line bracket. Position the fuel line bracket out of the way.

5. Remove the bolts and remove the dampener.



6. Remove the transmission insulator to crossmember support nuts.

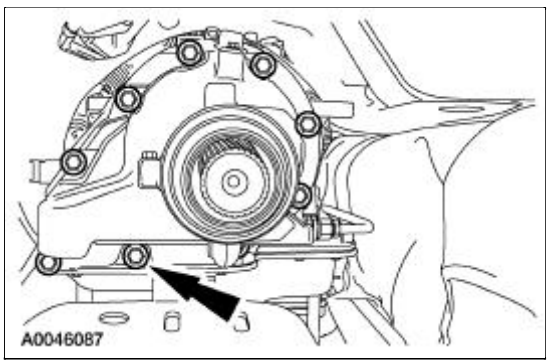


7. Install a suitable transmission jack.

8. **CAUTION: Be sure not to raise the back of the transmission too high. If it makes contact with the underbody, damage to the TSS and OSS sensors will occur.**

   Slightly raise the transmission up off the rear crossmember support.

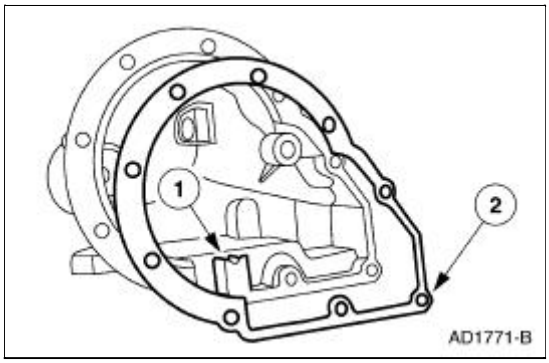
9. Remove the bolts for the rear transmission support insulator and remove the transmission support insulator.



10. Remove the bolt for the exhaust bracket hanger and remove the hanger.

11. **NOTE:** As the fasteners are removed, note the size of each for correct location during installation.

    Remove the transmission extension housing bolts.



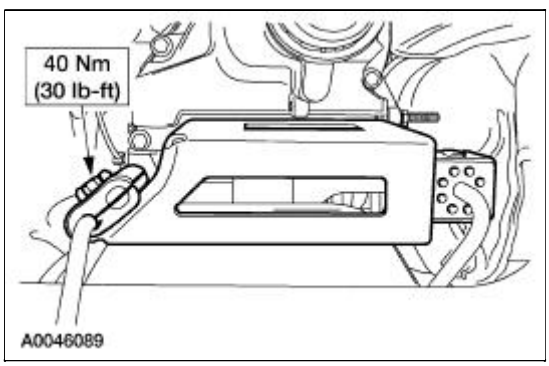
12. Remove and discard the extension housing gasket.

Installation

1. **CAUTION: The extension must have a shoulder or a boss cast in it to hold the orifice lube plug in the back of the case. If the wrong extension housing is used, the plug can become loose and/or fall out and cause transmission damage.**

   NOTE: Lightly lubricate the gasket with petroleum jelly to hold it in place during assembly.

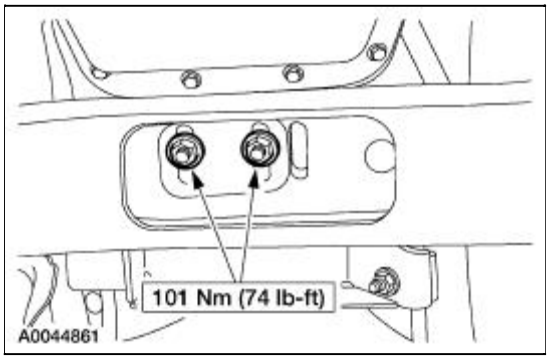
   Install the new extension housing gasket.
   1. Verify that the extension has a shoulder cast in it.
   2. Install the new extension housing gasket.



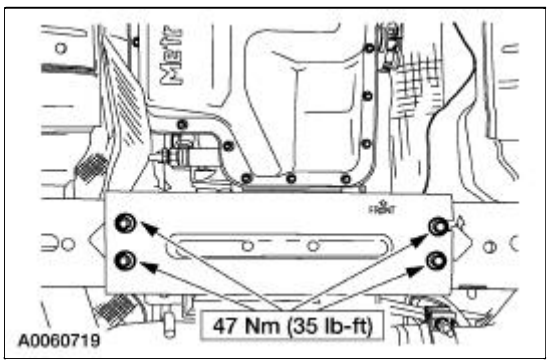
2. **NOTE:** Make sure the fasteners are installed in their correct locations as noted during removal.

   Install the extension housing and bolts.

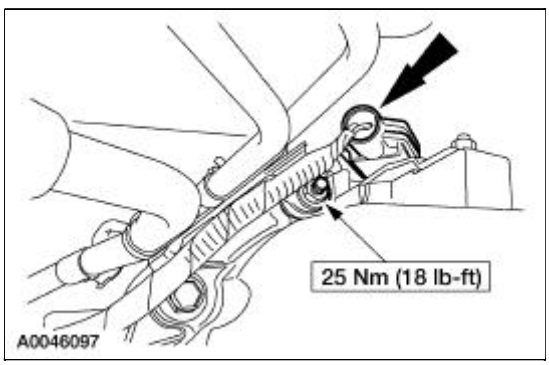
3. Position the exhaust bracket hanger on the exhaust and install the bolt.



4. Install the rear transmission insulator and the bolts.



5. Lower the transmission onto the transmission support crossmember.



6. Install the transmission insulator and retainer-to-crossmember retaining nuts.

7. Install the dampener and install the bolts.

8. Remove the transmission jack.
9. Position the fuel line bracket on the stud and install the nut. Connect the OSS sensor connector.

10. Install the rear driveshaft. For additional information, refer to Section 205-01 .
11. Lower the vehicle.
12. Reconnect the battery ground cable.
13. Check fluid level, fill with clean automatic transmission fluid.
14. Check for correct operation.

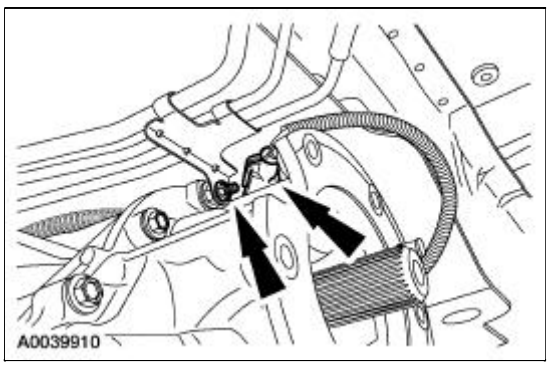
Extension Housing Gasket —4x4

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

Removal

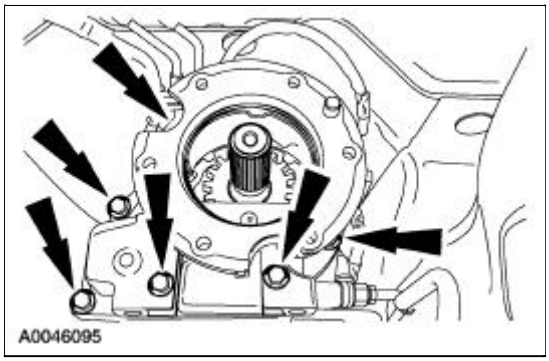
1. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .



2. **NOTE:** All gasoline vehicles will have new adaptive shift strategies. Whenever the vehicles battery has been disconnected for any type of service or repair, the strategy parameters that are stored in the keep alive memory (KAM) will be lost. The strategy will start to relearn once the battery is reconnected and the vehicle is driven. This is a temporary condition and will return to normal operating condition once the powertrain control module (PCM) relearns all the parameters from the driving operating conditions. There is no time frame set for this process. If this concern is present during downshifts or converter clutch apply, it is not the shift strategy and will require diagnosis as outlined in the workshop manual.

   The customer must be notified that they may experience slightly different upshifts (either soft or firm) and that this condition is temporary and will eventually return to normal operating condition.

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

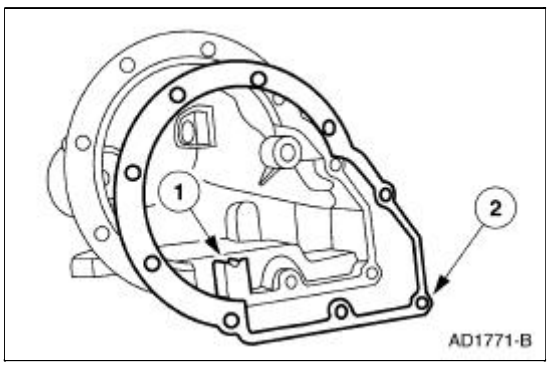


3. Remove the transfer case. For additional information, refer to Section 308-07B .

4. Disconnect the fuel lines and the output shaft speed sensor (OSS).

5. **NOTE:** As the fasteners are removed, note the size of each for correct location during installation.

   Remove the eight transmission extension housing bolts and the housing.



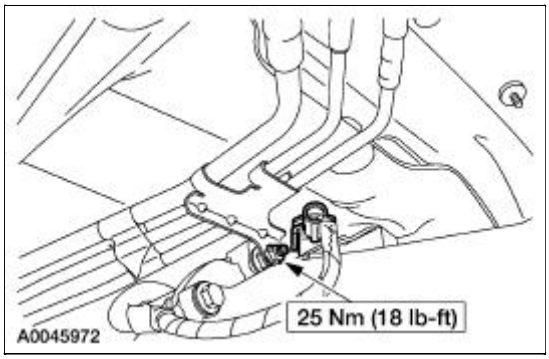
6. Remove and discard the extension housing gasket.

Installation

1. **CAUTION: The extension must have a shoulder or a boss cast in it to hold the orifice lube plug in the back of the case. If the wrong extension housing is used, the plug can become loose and/or fall out and cause transmission damage.**

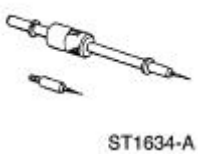
   NOTE: Lightly lubricate the gasket with petroleum jelly to hold it in place during assembly.

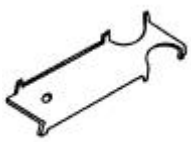
   Install the new extension housing gasket.
   1. Verify that the extension has a shoulder cast in it.
   2. Install the new extension housing gasket.



2. **NOTE:** Make sure the fasteners are installed in their correct locations as noted during removal.

   Install the eight extension housing bolts.





3. Install the fuel line bracket and connect the output shaft speed (OSS) sensor connector.

4. Install the transfer case. For additional information, refer to Section 308-07B .
5. Lower the vehicle.
6. Reconnect the battery ground cable.
7. Check fluid level, fill with clean automatic transmission fluid.
8. Check for correct operation.

Manual Control Lever Shaft and Seal

Special Tool(s)

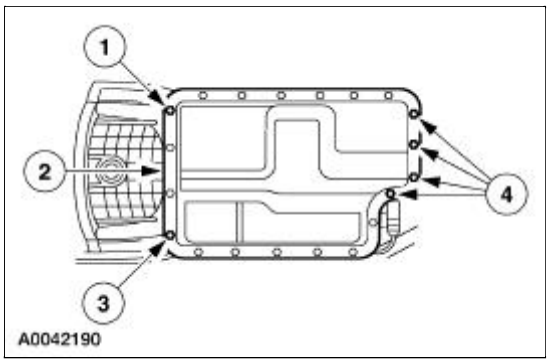
 ST1634-A	Roll Pin Set 211-S060 (T78P-3504-N)
 ST1282-A	Remover, Pilot Bearing 308-001 (T58L-101-B)
 ST1199-A	Installer, Shift Shaft Fluid Seal 307-050 (T74P-77498-A)
 ST1633-A	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

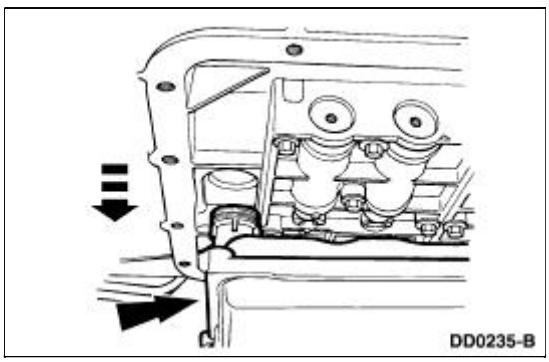
Removal

1. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .



2. **NOTE:** All gasoline vehicles will have new adaptive shift strategies. Whenever the vehicles battery has been disconnected for any type of service or repair, the strategy parameters that are stored in the keep alive memory (KAM) will be lost. The strategy will start to relearn once the battery is reconnected and the vehicle is driven. This is a temporary condition and will return to normal operating condition once the powertrain control module (PCM) relearns all the parameters from the driving operating conditions. There is no time frame set for this process. If this concern is present during downshifts or converter clutch apply, it is not the shift strategy and will require diagnosis as outlined in the workshop manual.

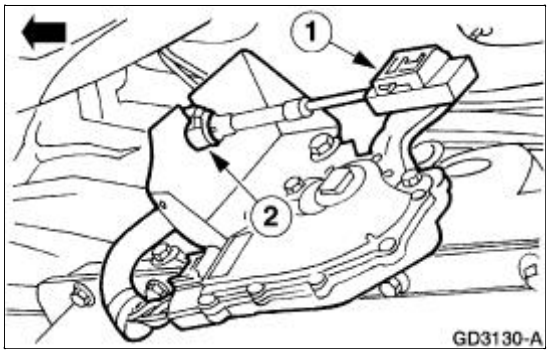
The customer must be notified that they may experience slightly different upshifts (either soft or firm) and that this condition is temporary and will eventually return to normal operating condition.



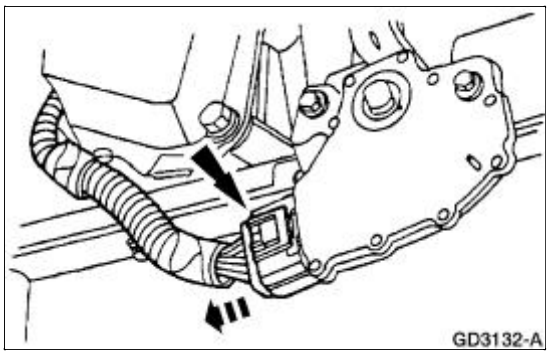
Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. **NOTE:** Do not discard the fluid pan gasket unless damaged. This is a reusable gasket.

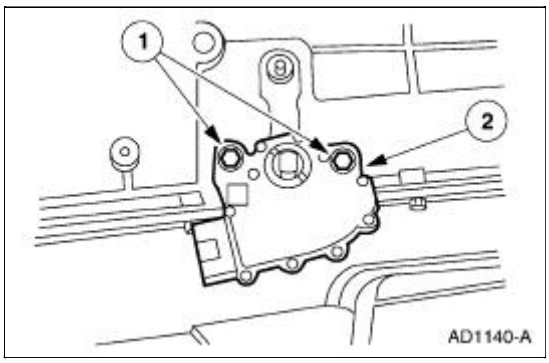
   Remove the transmission fluid pan and gasket.
   1. Loosen, but do not remove the bolts.
   2. Remove the front and side bolts.
   3. Lower the front of the fluid pan and allow the fluid to drain.
   4. Remove the remaining fluid pan bolts and the fluid pan.



4. Remove and discard the fluid filter.
   - Remove the fluid filter and seal assembly by pulling and rotating the filter.

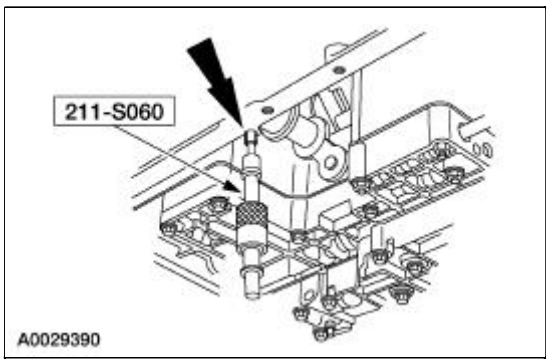


5. If the fluid filter seal remains in the pump bore, remove it carefully with a small screwdriver so as to not to scratch or damage the aluminum bore.



6. Disconnect the shift cable.
   1. Disconnect the shift cable from the manual lever.
   2. Disconnect the cable housing from the bracket and position aside.

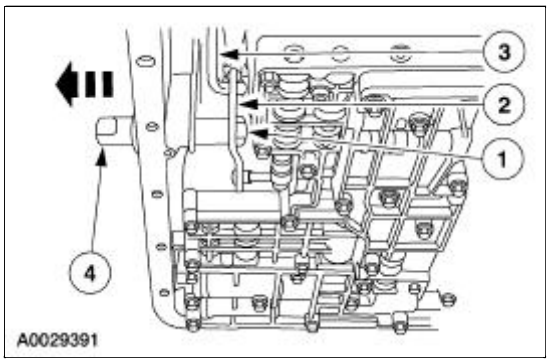
7. Disconnect the digital transmission range (TR) sensor electrical connector.



8. Remove the digital transmission (TR) sensor.
    1. Remove the bolts.
    2. Remove the digital transmission range (TR) sensor.

9. **NOTE:** A No. 53 drill bit (1/16 inch) can be used instead to remove the manual lever shaft retaining pin.

    Using the special tool, remove the manual lever shaft retaining pin.

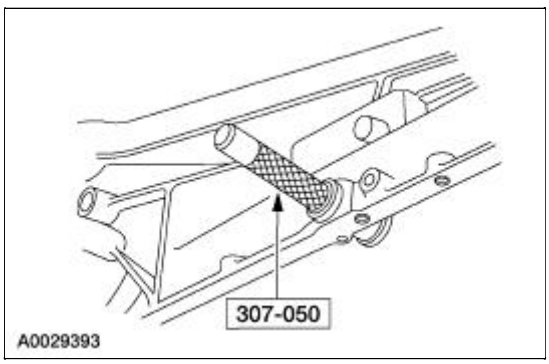


10. **CAUTION: Be careful not to damage the manual control lever bore.**

    NOTE: The manual control lever and manual control lever shaft are one piece.

    NOTE: Use a crescent wrench on the manual control lever or outer flats of manual control lever shaft assembly when removing the inner manual valve detent lever nut.

    Remove the manual control lever shaft assembly.
    1. Remove the inner manual valve nut.
    2. Remove the inner manual valve detent lever.
    3. Remove the parking pawl actuating rod.
    4. Remove the manual control lever shaft assembly.

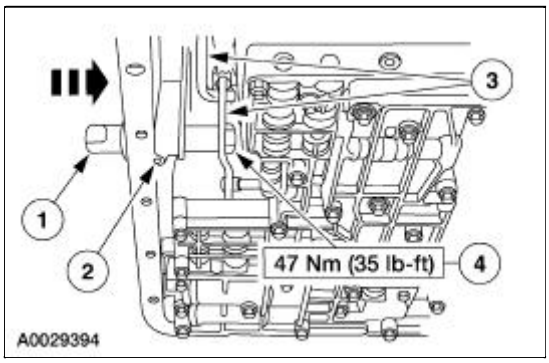


11. Using the special tool, remove the manual control lever seal.

Installation

1. **NOTE:** Prior to installing the manual control lever seal, clean the bore opening with mineral spirits.

   Using the special tool, install the manual control lever seal.



2. Install the manual control lever shaft assembly.
    1. Install the manual control lever shaft assembly.
    2. Install and seat the manual lever shaft retaining pin below the case surface.
    3. **NOTE:** The inner manual valve detent lever must be seated on the flats of the manual control lever shaft assembly, and the parking pawl actuating rod must be through the guide plate.

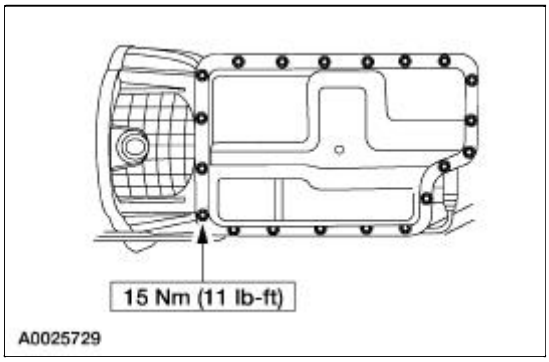
       NOTE: The manual control valve detent lever spring must be on the inner manual valve detent lever, and the detent lever pin must align with the manual shift valve.

       Install the parking pawl actuating rod and the inner manual valve detent lever.
    4. **NOTE:** Use a crescent wrench on the manual control lever or the outer flats of the manual control lever shaft assembly when installing the inner manual valve detent lever nut.

       Install the inner manual valve detent lever nut.

3. **CAUTION: Make sure that the pump bore is clean and the old fluid filter seal has been removed. Damage to the new filter can occur.**

   Lubricate the new seal with clean automatic transmission fluid and install the new fluid filter and seal assembly.

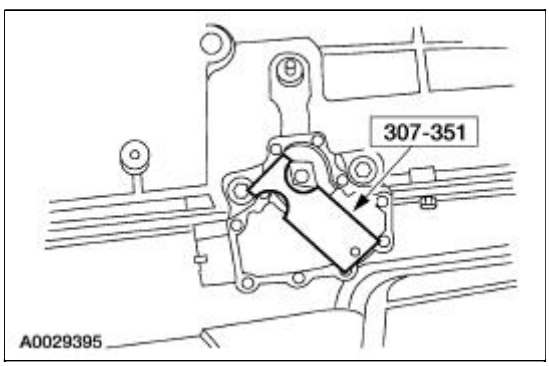


4. **NOTE:** Do not discard the gasket unless damaged. This is a reusable gasket.

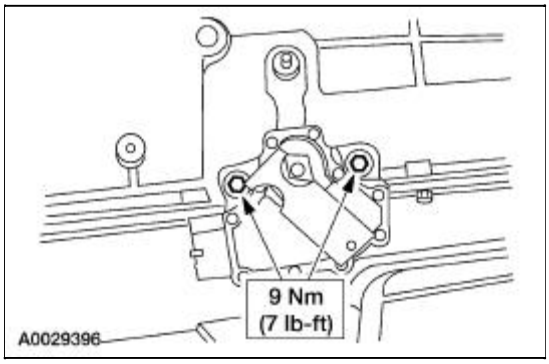
   NOTE: Apply a light coat of petroleum jelly to hold the gasket to the fluid pan.

   Position the gasket onto the clean fluid pan. Make sure the magnet is positioned over the dimple in the fluid pan.

5. Install the pan with gasket. Alternately tighten the bolts.

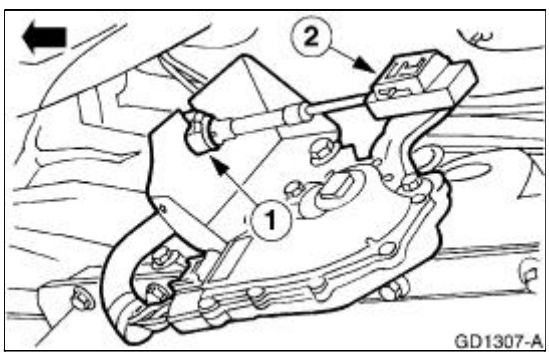


6. Install the digital transmission range (TR) sensor.
    1. Install the digital transmission range sensor.
    2. Loosely install the bolts.



7. **NOTE:** Make sure that the manual control lever is in the NEUTRAL position.

    Using the special tool, align the digital TR sensor. The tool is designed to fit snug.



8. Tighten the bolts.

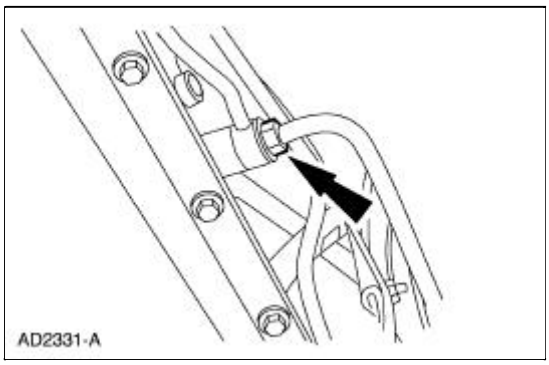
9. Connect the digital transmission range (TR) sensor electrical connector.

10. Connect the shift cable.
    1. Install the cable housing to the bracket.
    2. Install the shift cable to the manual lever.

11. Check fluid level, fill with clean automatic transmission fluid.

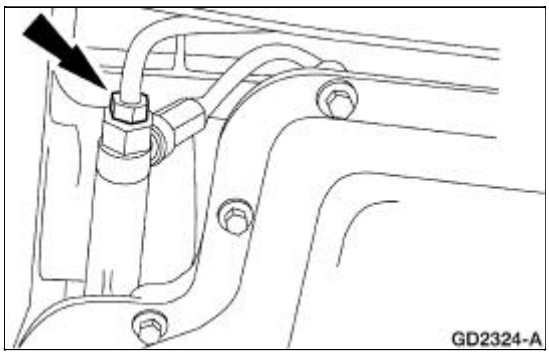
12. Check for correct operation.

Cooler Bypass Valve



Material

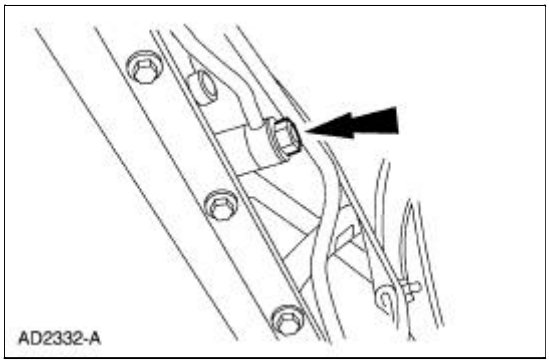
Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®



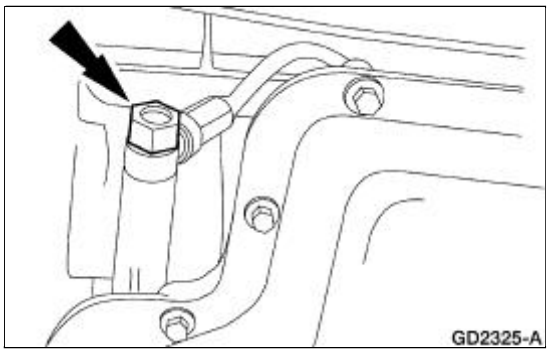
Removal

1. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .

2. Remove the front cooler tube from the front cooler bypass valve (CBV) fitting.



3. Remove the rear cooler tube from the rear CBV fitting.

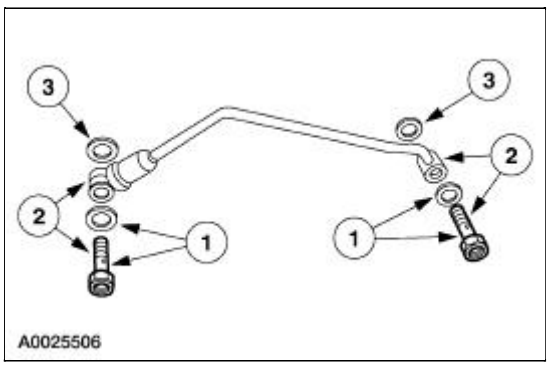


4. **NOTE:** The rubber-coated sealing washers can fall off during removal of the front CBV bolt cooler line case fitting.

   Remove the front CBV bolt cooler case fitting.

5. **NOTE:** The rubber-coated sealing washers can fall off during removal of the rear CBV bolt cooler line case fitting.

   Remove the rear CBV bolt cooler line case fitting.

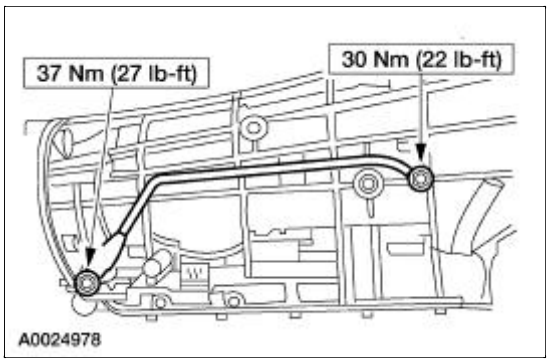


6. Remove, clean and flush the CBV. For additional information, refer to Cooler Bypass Valve Assembly in this section.

Installation

1. **CAUTION: Failure to correctly install the new rubber-coated sealing washers will result in transmission fluid leaks.**

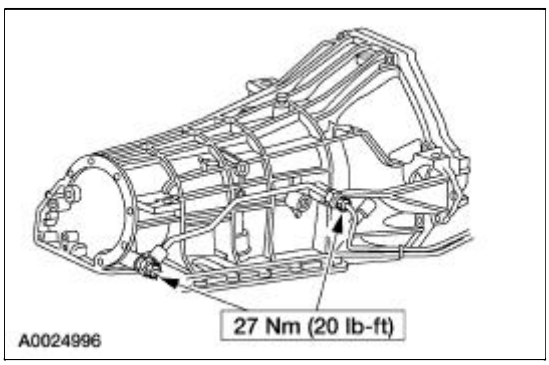
   Install the new rubber-coated sealing washers and the new cooler line case fittings.
   1. Install one rubber-coated sealing washer on each cooler line case fitting.
   2. Install both cooler line case fittings into their respective ends of the CBV assembly.
   3. Install one rubber-coated sealing washer on each cooler line case fitting.



2. **CAUTION: Make sure the cooler bypass valve (CBV) is correctly backflushed. Use dry compressed air to remove solvent.**

CAUTION: If the cooler line case fitting is overtightened, the rubber-coated sealing washers and/or cooler line case fittings can be damaged, causing a transmission fluid leak.

NOTE: The CBV has a check ball in the rear fitting and will only allow flow in one direction. Make sure check ball moves freely.



NOTE: Align the two rubber-coated sealing washers while assembling the rear cooler line case fitting.

Install the CBV fitting.

3. **NOTE:** The cooler lines must be flushed out at this time.

   Tighten the cooler tube nuts.

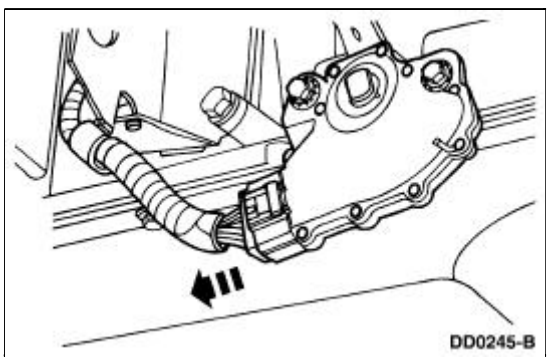
4. Lower the vehicle.
5. Fill the transmission with clean automatic transmission fluid. Check for correct operation.

Digital Transmission Range (TR) Sensor

Special Tool(s)

 ST1633-A	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)

Removal

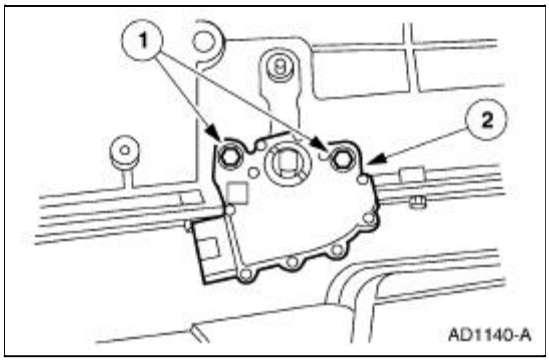


1. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .

2. **NOTE:** All gasoline vehicles will have new adaptive shift strategies. Whenever the vehicles battery has been disconnected for any type of service or repair, the strategy parameters that are stored in the keep alive memory (KAM) will be lost. The strategy will start to relearn once the battery is reconnected and the vehicle is driven. This is a temporary condition and will return to normal operating condition once the powertrain control module (PCM) relearns all the parameters from the driving operating conditions. There is no time frame set for this process. If this concern is present during downshifts or converter clutch apply, it is not the shift strategy and will require diagnosis as outlined in the workshop manual.

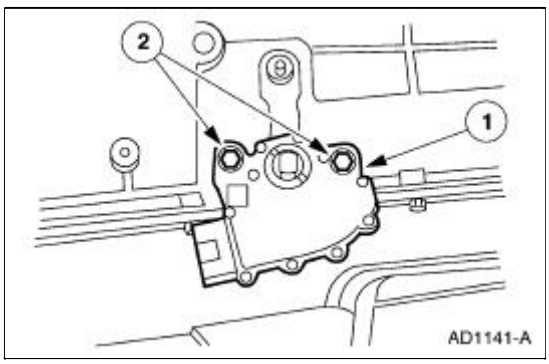
   The customer must be notified that they may experience slightly different upshifts (either soft or firm) and that this condition is temporary and will eventually return to normal operating condition.

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

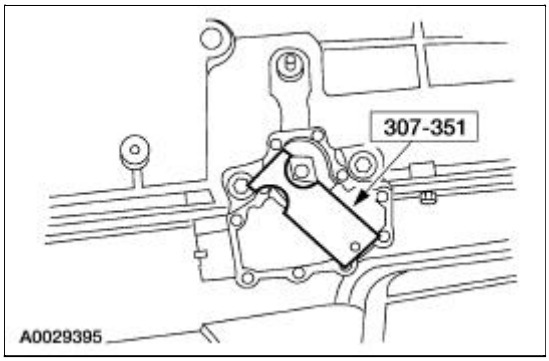


3. Disconnect the connector.

4. Disconnect the shift cable at the manual control lever.

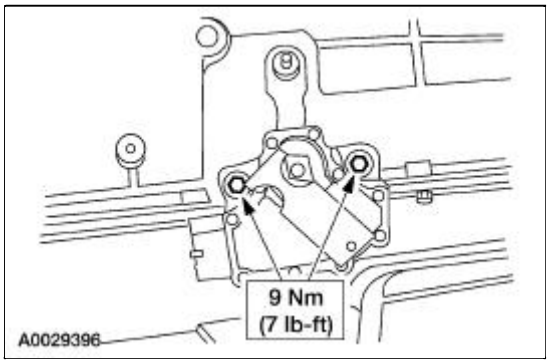


5. Remove the digital transmission range (TR) sensor.
    1. Remove the bolts.
    2. Remove the digital transmission range (TR) sensor.



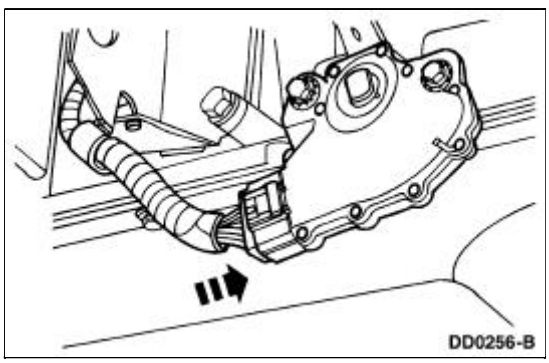
Installation

1. Install the digital transmission range (TR) sensor.
    1. Install digital transmission range (TR) sensor.
    2. Loosely install the bolts.



2. **NOTE:** Make sure that the manual control lever is in the NEUTRAL position.

    Using the special tool, align the digital TR sensor.



3. Tighten the bolts.

4. Reconnect the shift cable at the manual control lever.

5. Reconnect the connector.

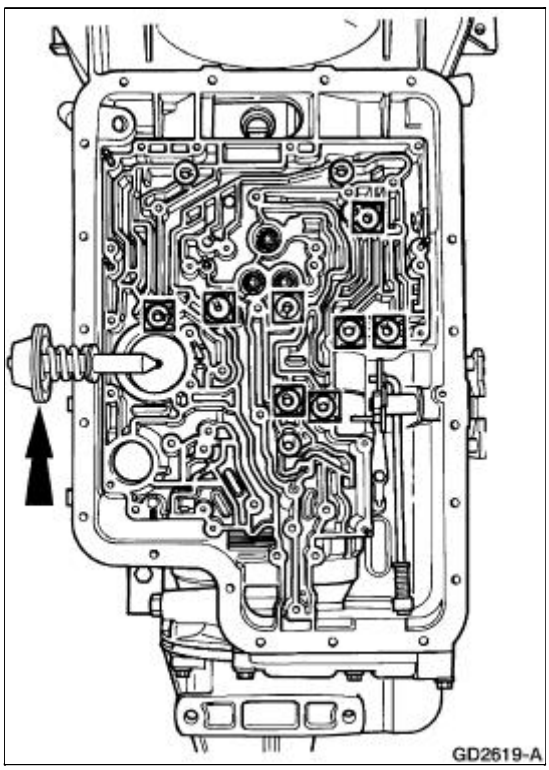
6. Lower the vehicle.

7. Reconnect the battery ground cable.

Intermediate Servo

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®



Removal

1. Remove the main control valve body. For additional information, refer to Main Control Valve Body—Accumulator Body, Solenoid Body in this section.

2. **WARNING: The intermediate servo is under spring pressure, care should be taken when removing it. It could cause bodily harm.**

   NOTE: Gently tap on the servo cover with a rubber mallet to compress and allow servo assembly to pop up.

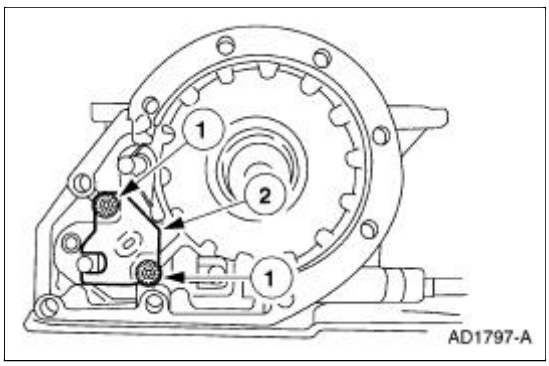
   Remove the intermediate servo.

Installation

1. **NOTE:** Lubricate the servo seal with clean automatic transmission fluid.

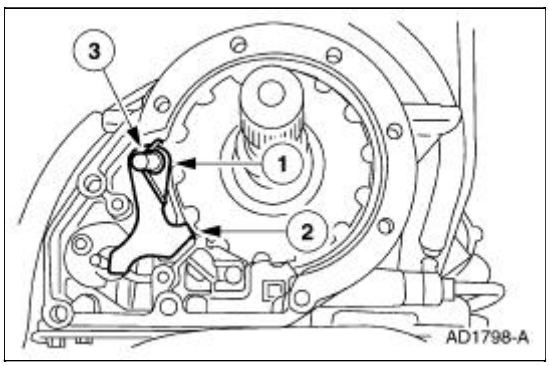
Install the intermediate band servo.

2. Install the main control valve body.



Park System

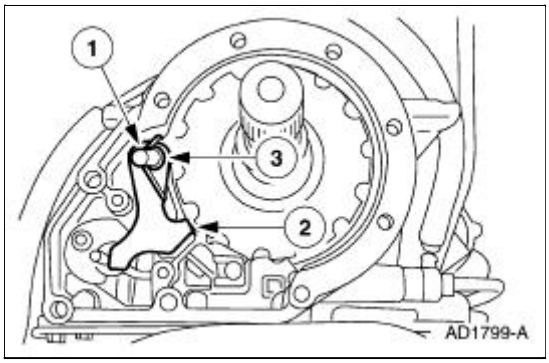
Removal



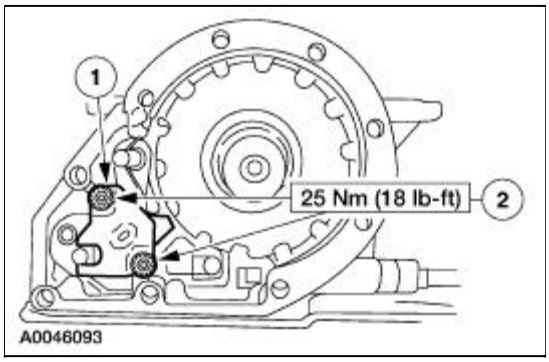
NOTE: For internal park mechanism service, refer to Manual Control Lever Shaft and Seal in this section.

1. Remove the extension housing and the extension housing gasket. For additional information, refer to Extension Housing Gasket—4x2 or Extension Housing Gasket—4x4 in this section.

2. Remove the parking rod guide plate.
    1. Remove the bolts.
    2. Remove the parking rod guide plate.



3. Remove the park pawl shaft.
    1. Remove the park pawl return spring.
    2. Remove the park pawl.
    3. Remove the park pawl shaft.

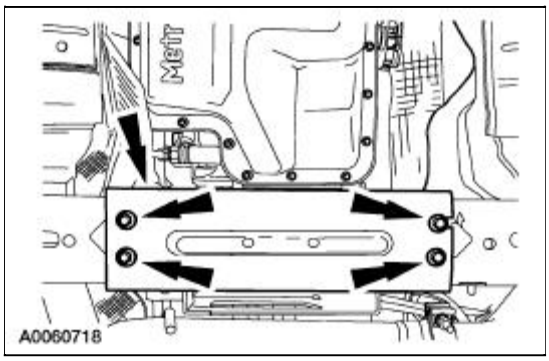


Installation

1. **NOTE:** If a new park gear needs to be installed, refer to Output Shaft—Check in this section.

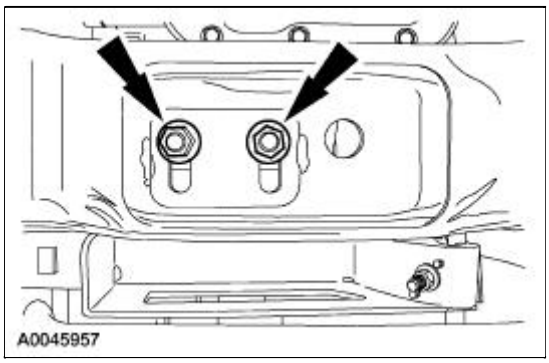
   Install the park pawl shaft.
    1. Install the park pawl shaft.
    2. Install the park pawl.
    3. Install the park pawl return spring.

2. Install the parking rod guide plate.
    1. Install the parking rod guide plate.
    2. Install the bolts.



3. Install the extension housing gasket and the extension housing. For additional information, refer to Extension Housing Gasket—4x2 or Extension Housing Gasket—4x4 in this section.

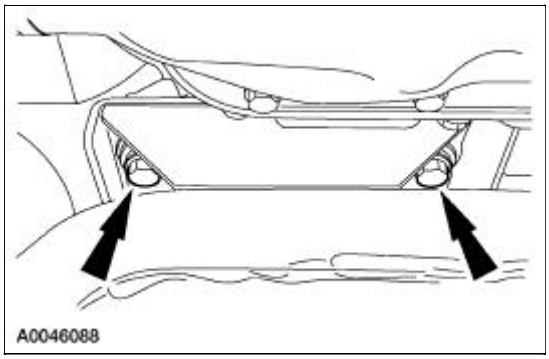
Transmission Insulator and Retainer



Removal

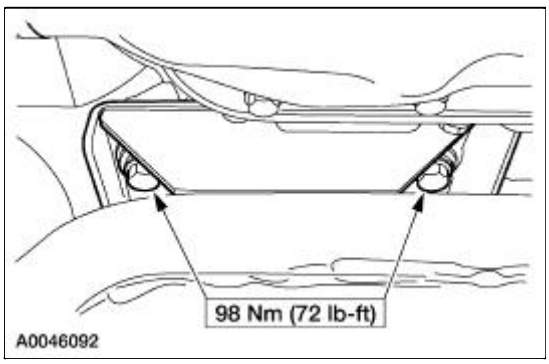
1. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .

2. Remove the bolts and remove the dampener.



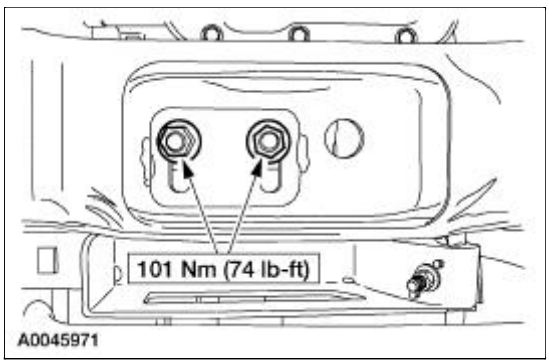
3. Remove the rear transmission support nuts.

4. Install a suitable transmission jack.

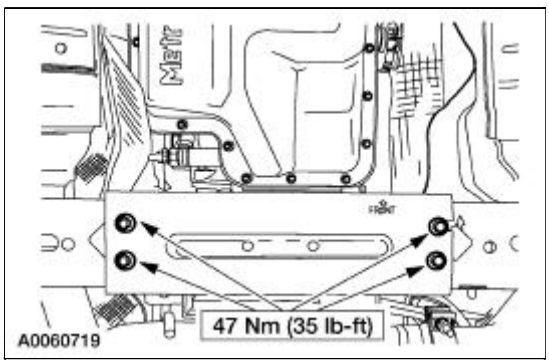


5. **CAUTION: Be sure not to raise the back of the transmission too high, if it makes contact with the underbody, damage to the TSS and OSS sensors will occur.**

   Slightly raise the rear of the transmission and remove the bolts. Remove the rear transmission mount.



Installation



1. Install the rear transmission mount and the bolts.

2. Lower the transmission onto the crossmember and install the nuts.

3. Install the dampener and install the bolts.

4. Remove the high-lift transmission jack.

5. Lower the vehicle.

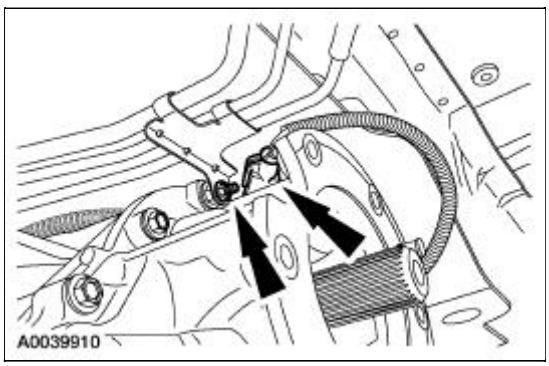
Transmission —4x4

Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97L-7902-A)

Removal

NOTE: If the transmission is to be removed for an extended period of time, support the engine with a safety stand and a wood block.

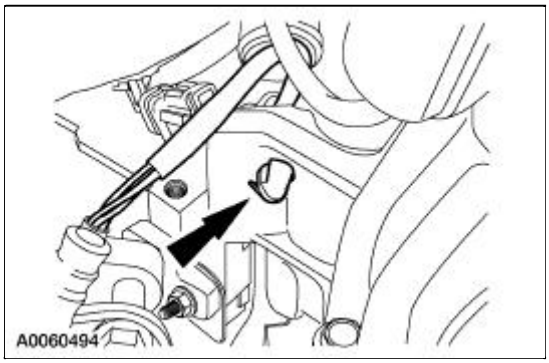


1. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .

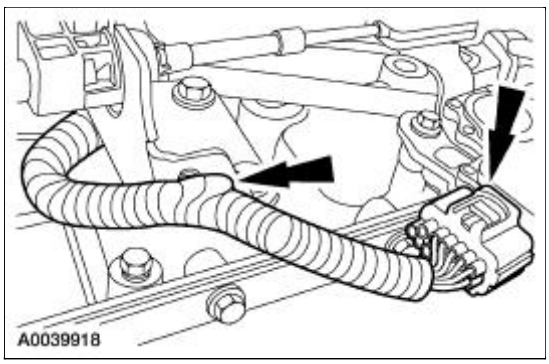
2. **NOTE:** When the battery has been disconnected and reconnected, some abnormal drive symptoms can occur while the vehicle relearns its adaptive strategy. The customer must be notified that they may experience slightly different upshifts (either soft or firm) and this is a temporary condition that will eventually return to normal operating condition.

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

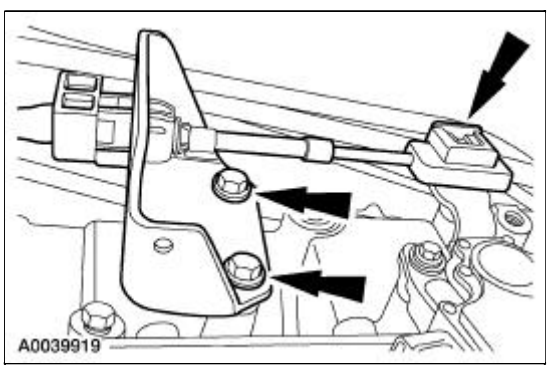
3. Remove the transfer case. For additional information, refer to Section 308-07B .



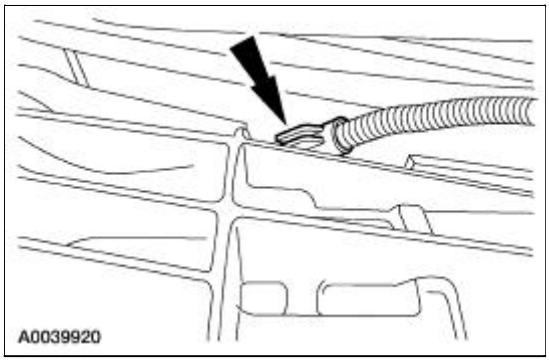
4. Disconnect the fuel lines and the output shaft speed sensor (OSS).



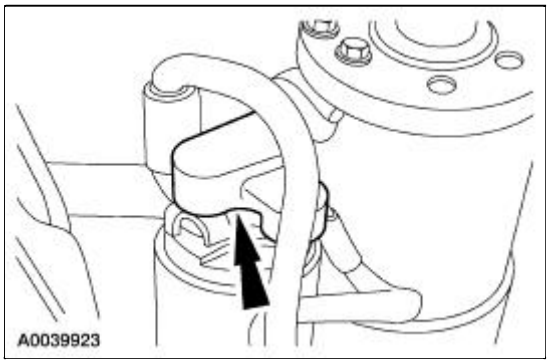
5. Disconnect the LH HO2S.



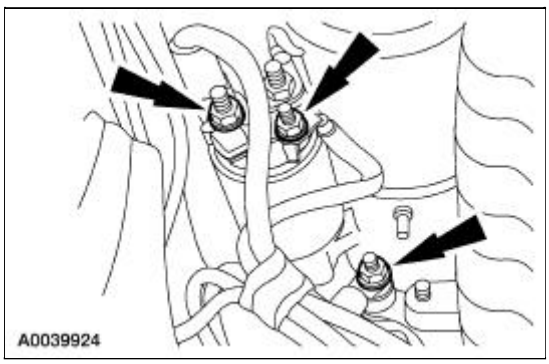
6. Disconnect the HO2S sensor clip from the transmission.



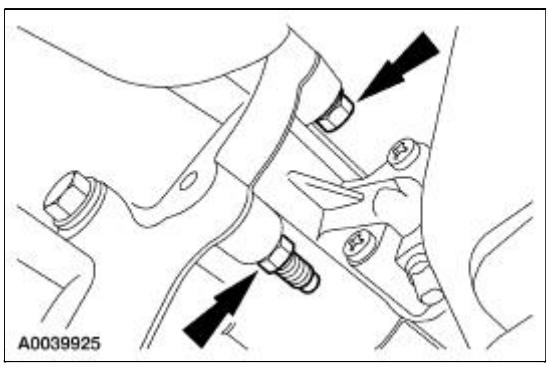
7. Disconnect the digital TR sensor electrical connector and the wire harness from the TR sensor bracket.



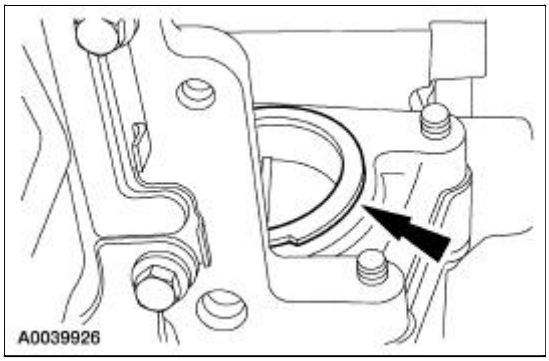
8. Disconnect the shift cable from the manual control lever and remove the shift cable and bracket from the transmission.



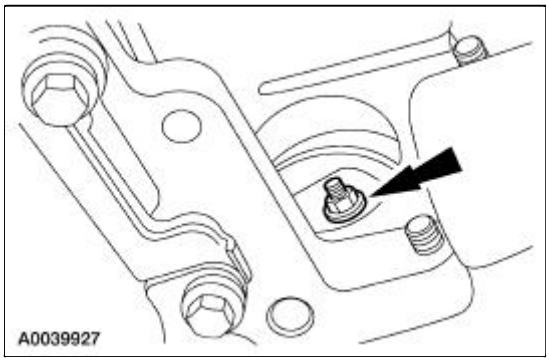
9. Disconnect the turbine shaft speed (TSS) sensor electrical connector.



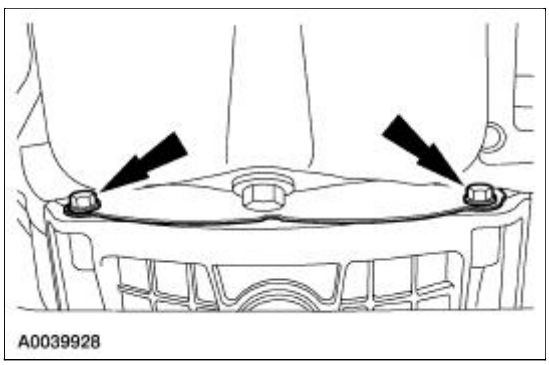
10. Remove the plastic cover from the starter motor electrical connector.



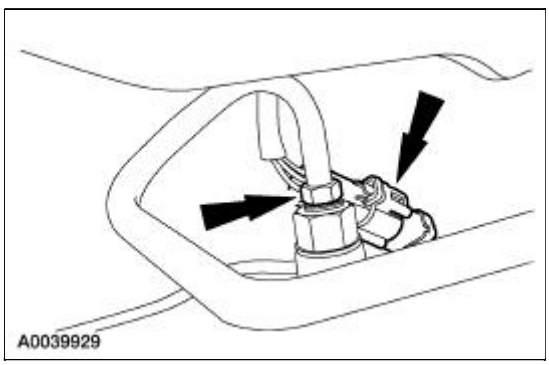
11. Remove the battery cables from the starter motor and disconnect the ground cable.



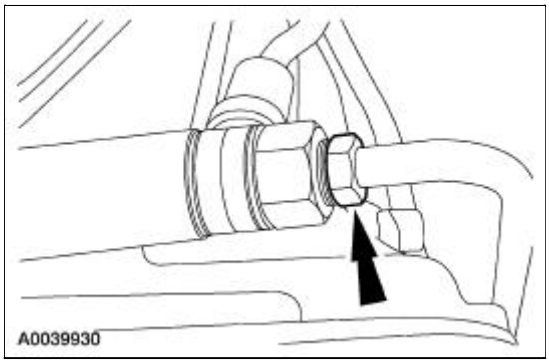
12. Remove three starter bolts and remove the starter motor.



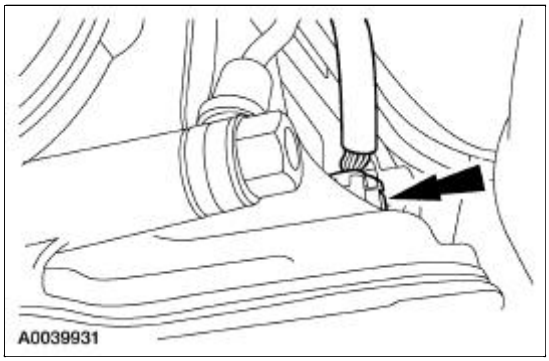
13. Remove the torque converter access cover.



14. Remove and discard the four torque converter nuts.

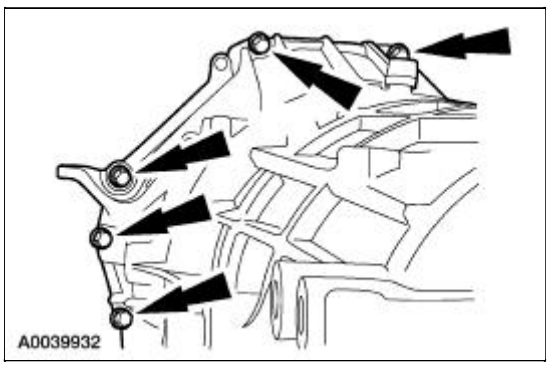


15. Remove the bolts and remove the shield.



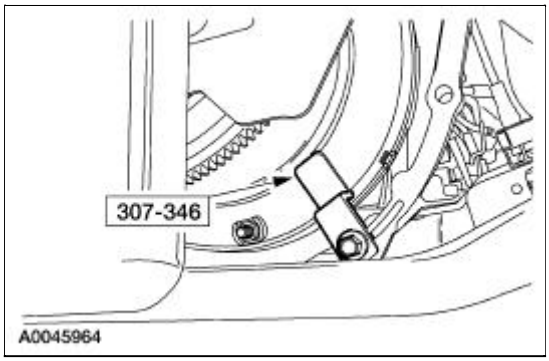
16. Disconnect the front transmission cooler line and the HO2S connector.

17. Disconnect the rear transmission cooler line.



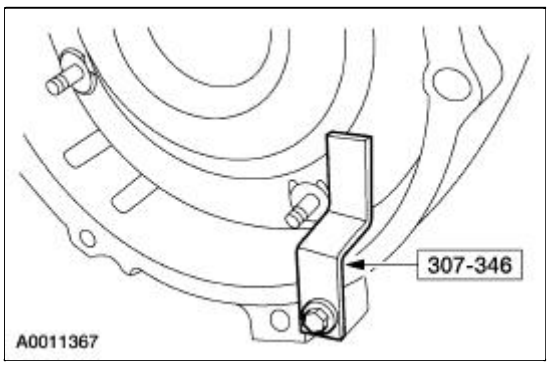
18. Disconnect the transmission harness connector.

19. Install a suitable transmission jack and secure the transmission to the jack. Remove the jack stand that was installed during the removal of the transfer case.



20. Remove the bolts from the LH side of the transmission.

21. Remove the bolts from the RH side of the transmission.



22. Separate and lower the transmission from the vehicle a small amount to gain access to the top of the transmission, and disconnect the wire harness from the top of the transmission.

23. Keeping the transmission in a horizontal position, slide the transmission back enough to install the special tool.

24. It will be necessary to tilt the transmission in a nose-down position in order for the transmission to clear the flexplate and the exhaust.

25. Remove the transmission from under the vehicle and remove the special tool.

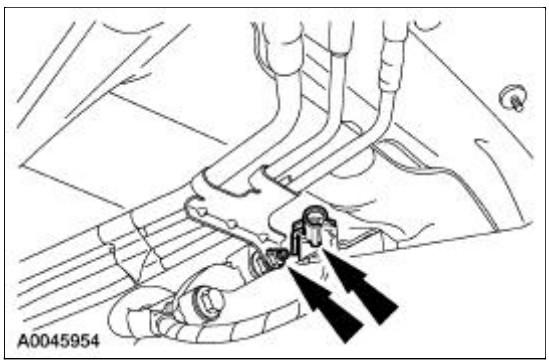
26. Carry out the transmission fluid cooler-backflushing and cleaning if the transmission is being overhauled or install a new or remanufactured transmission. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.

Transmission —4x2

Removal

NOTE: If the transmission is to be removed for a period of time, support the engine with a safety stand and a wood block.

1. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .

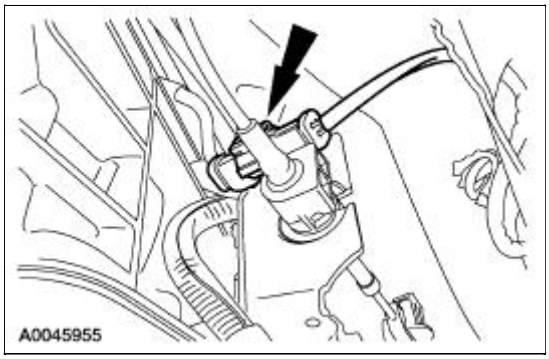


2. **NOTE:** When the battery has been disconnected and reconnected, some abnormal drive symptoms can occur while the vehicle relearns its adaptive strategy.

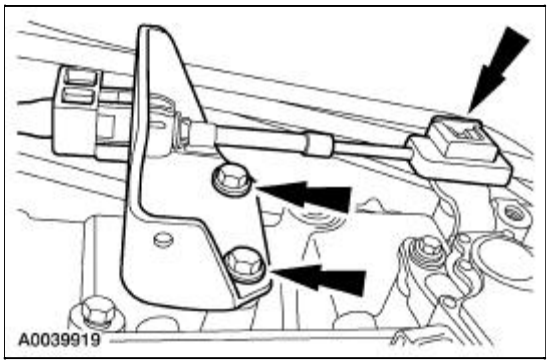
   The customer must be notified that they may experience slightly different upshifts (either soft or firm) and that this condition is temporary and will eventually return to normal operating condition.

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

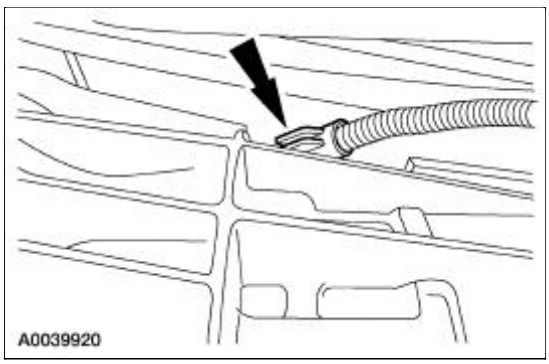
3. Remove the rear driveshaft. For additional information, refer to Section 205-01 .



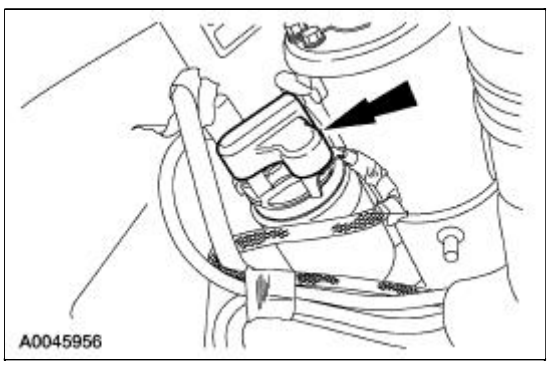
4. Disconnect the fuel line bracket and the output shaft speed sensor (OSS).



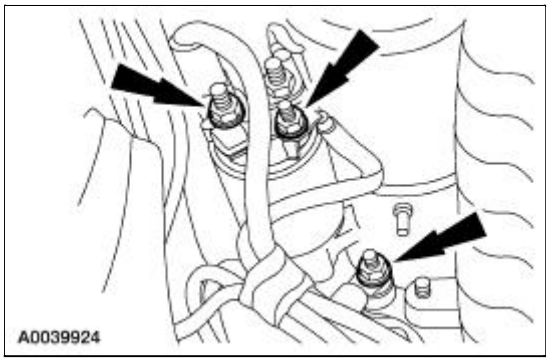
5. Disconnect the digital TR sensor electrical connector and the wire harness from the TR sensor bracket.



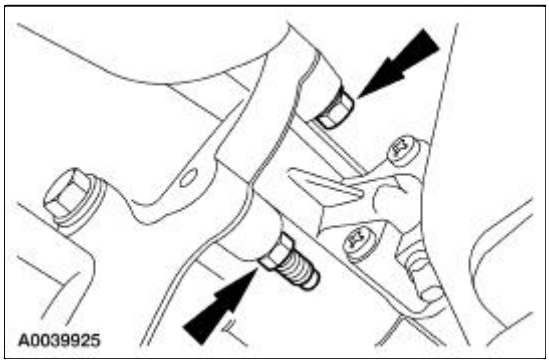
6. Disconnect the LH catalyst monitor sensor connector from the shift cable bracket.



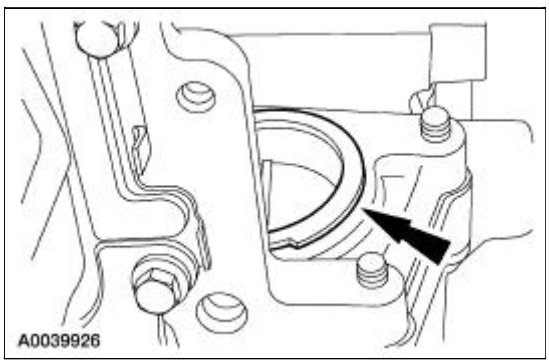
7. Disconnect the shift cable from the manual control lever and remove the shift cable and bracket from the transmission.



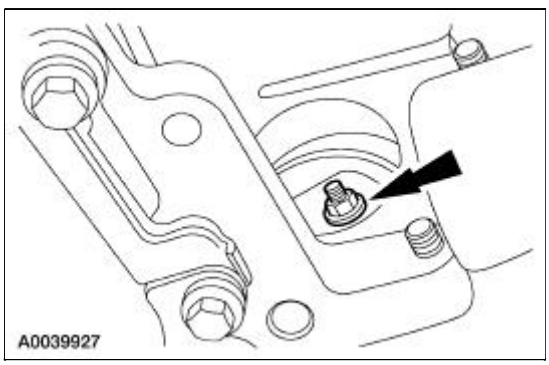
8. Disconnect the turbine shaft speed (TSS) sensor electrical connector.



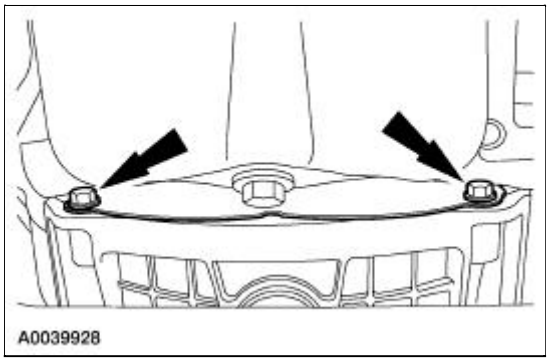
9. Remove the plastic cover from the starter motor electrical connector.



10. Remove the battery cables from the starter motor and disconnect the ground cable.

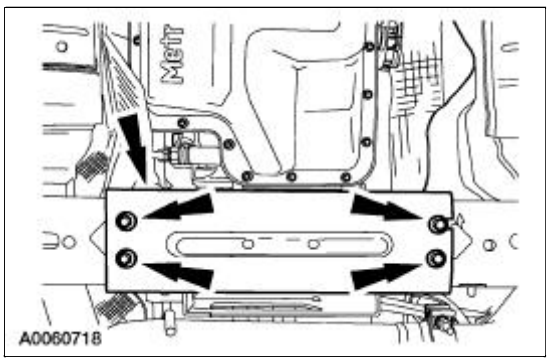


11. Remove the three starter bolts and the starter motor.

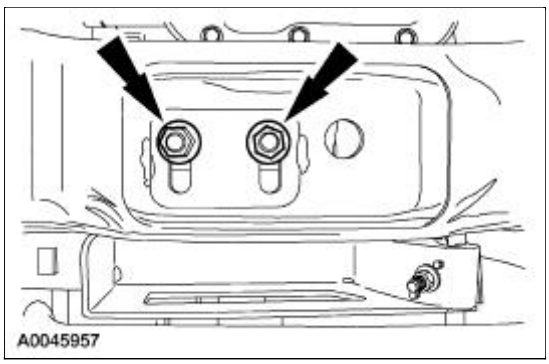


12. Remove the torque converter access cover.

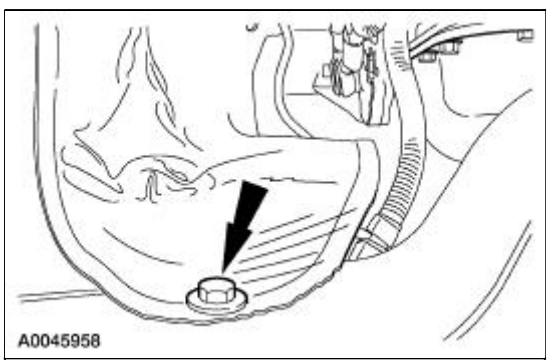
13. Remove and discard the four torque converter nuts.



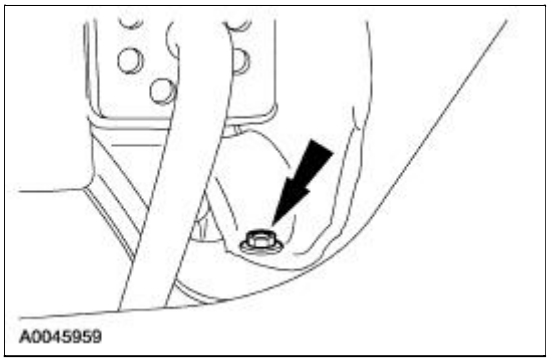
14. Remove the bolts and remove the shield.



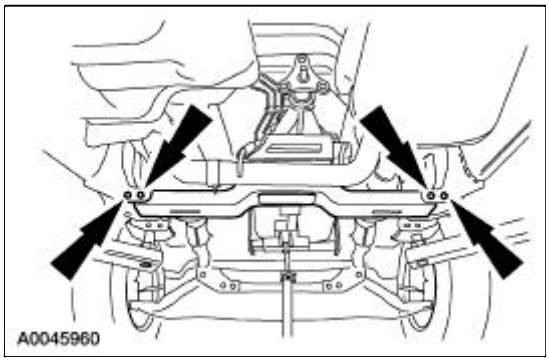
15. Install a suitable transmission jack.



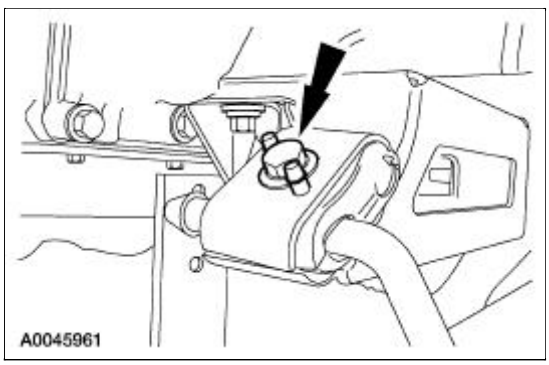
16. Remove the bolts and remove the dampener.



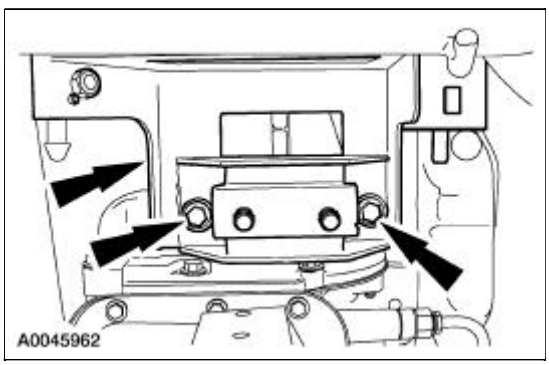
17. Remove the rear transmission support nuts.



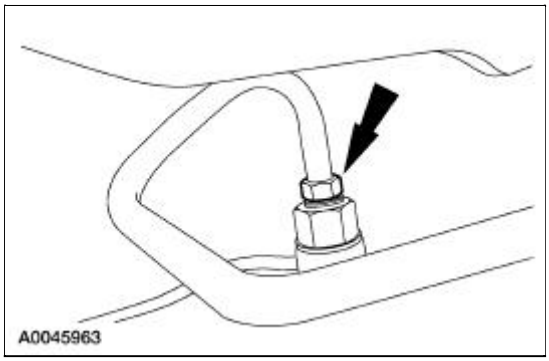
18. Remove the LH heat shield bolt.



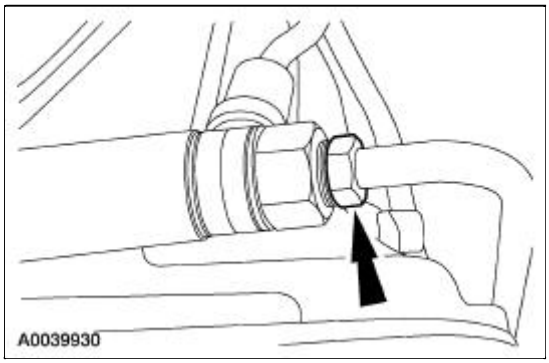
19. Remove the RH heat shield bolt.



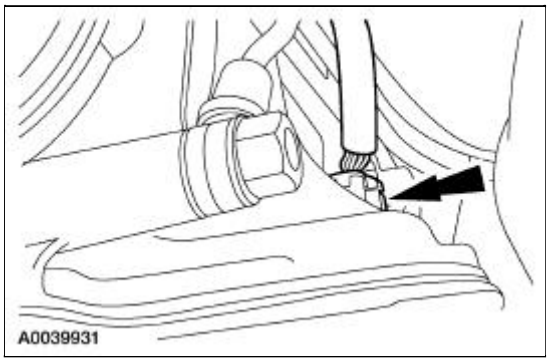
20. Remove the crossmember bolts and the crossmember.



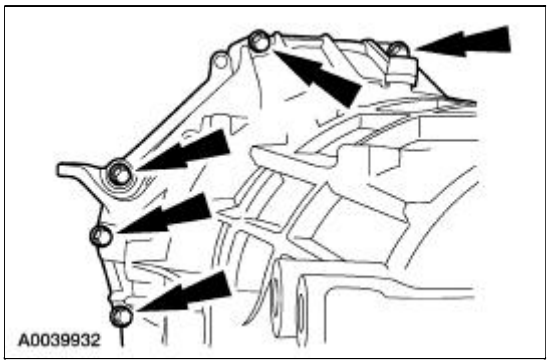
21. Remove the bolt for the exhaust bracket.



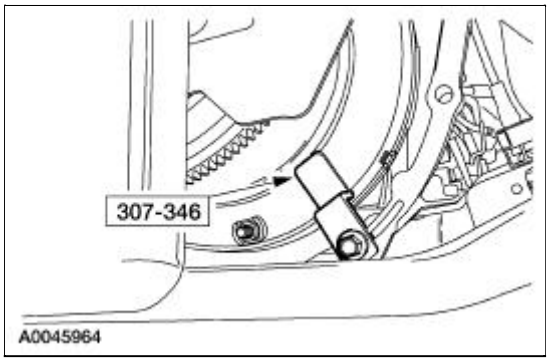
22. Remove the rear transmission support bolts and remove the support and the exhaust hanger bracket.



23. Disconnect the front transmission cooler line.



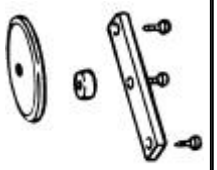
24. Disconnect the rear transmission cooler line.



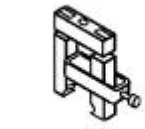
25. Disconnect the transmission harness connector.

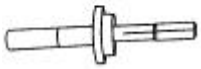
26. Remove eight bolts from the transmission.

27. Keeping the transmission in a horizontal position, slide the transmission back enough to install the special tool.



28. Lower the transmission from the vehicle a small amount to gain access to the top of the transmission, disconnect the wire from the top of the transmission.

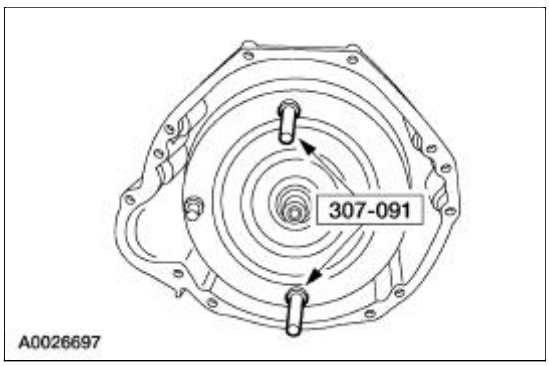




29. It will be necessary to tilt the transmission in a nose-down position in order for the transmission to clear the flexplate and the exhaust.

30. Carry out the transmission fluid cooler-backflusing and cleaning if the transmission is being overhauled or install a new or remanufactured transmission. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.

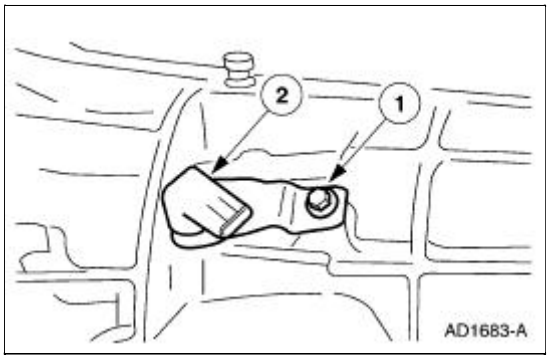
Transmission



Special Tool(s)

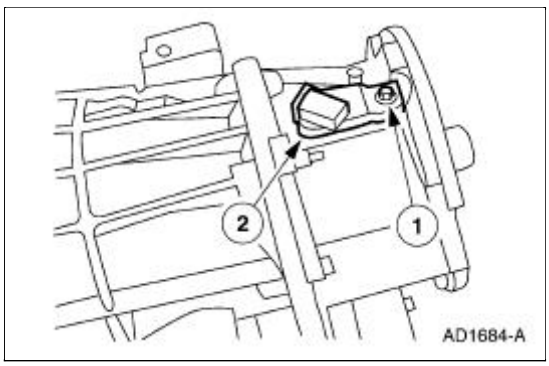
 ST2544-A	Installer, Transmission Forward Clutch Assembly 307-436
 ST1851-A	Service Set, Clutch Spring 307-S223 (T89T-70010-C)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)
 ST1187-A	Slide Hammer 307-005 (T59L-100-B)
 ST1738-A	Roll Pin Set 211-S060 (T78P-3504-N)
 ST1282-A	Remover, Pilot Bearing 308-001 (T58L-101-B)
 ST1208-A	Remover, Transmission Fluid Pump 307-221 (T89T-70010-A)
	Remover, Transmission Fluid Seal

 ST1192-A	307-048 (T74P-77248-A)
 ST2159-B	Loading Fixture, Clutch 307-S383
 ST1631-A	Handle, Torque Converter 307-091 (T81P-7902-C)
 ST1746-A	Remover, Transmission Extension Housing Bushing 307-064 (T77L-7697-D) Remover, Output Shaft Bushing 307-382



NOTE: Refer to the Disassembled Views for component location and orientation.

1. Using the special tools, remove the torque converter from the transmission.



2. **CAUTION: The turbine shaft speed sensor (TSS) must be removed or damage to the sensors will occur.**

   Remove the turbine shaft sensor (TSS).
   1. Remove the bolt.
   2. Remove the turbine shaft sensor (TSS).

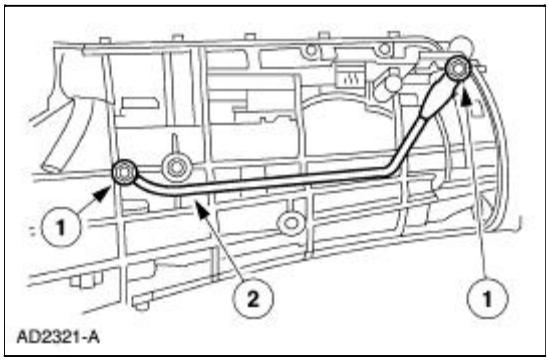
3. **CAUTION: The output shaft speed sensor (OSS) will need to be removed or damage to the sensors will occur.**

   Remove the output shaft speed sensor (OSS).
   1. Remove the bolt.
   2. Remove the output shaft speed sensor (OSS).

4. Mount the transmission to a suitable stand.

5. **CAUTION: The input shaft and overdrive planet assembly are replaced as mating components.**

   Remove the input shaft.

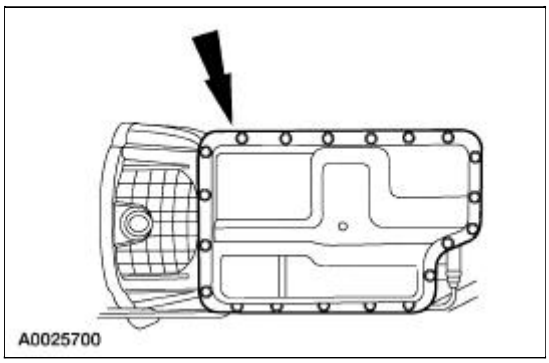


6. **CAUTION: The sealing washers may fall off the cooler line case fittings.**

   NOTE: The bolts are part of the cooler bypass valve (CBV) assembly.

   Remove the cooler bypass valve.
   1. Remove the cooler line case fittings.

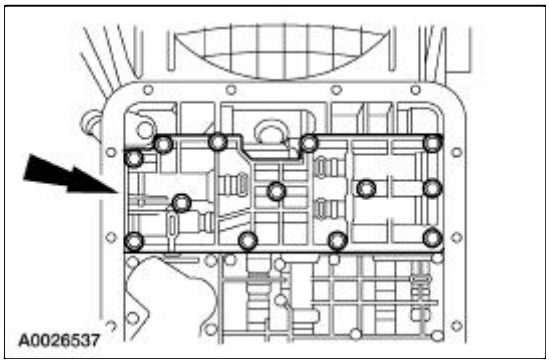
2. Remove the cooler bypass valve.



7. Remove the transmission range (TR) sensor.
   1. Remove the bolts.
   2. Remove the transmission range (TR) sensor.

8. **NOTE:** Do not discard the gasket unless damaged. This is a reusable gasket.

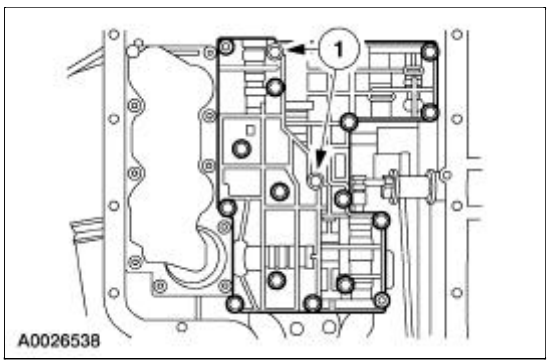
   Remove the transmission fluid pan and the gasket.



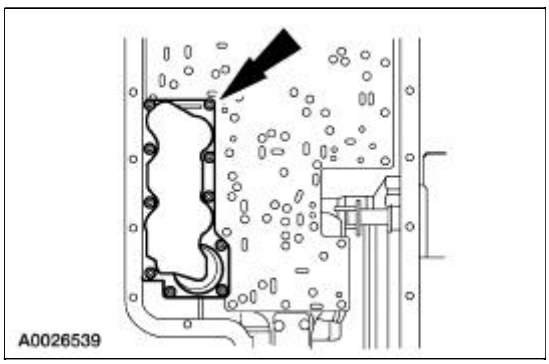
9. **CAUTION: If the seal remains in the pump bore, remove it carefully with a small screwdriver so as not to scratch or damage the aluminum bore.**

   NOTE: After removal, discard the filter and seal assembly.

   Remove the filter and seal assembly by carefully pulling and rotating the filter as necessary.



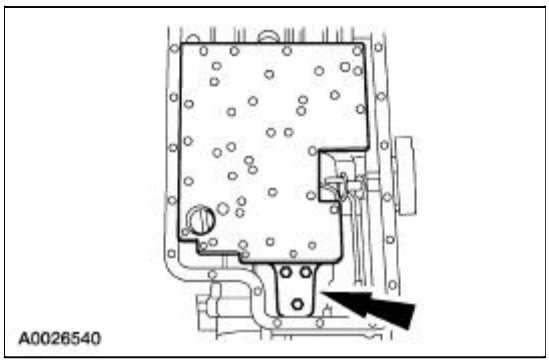
10. Remove the bolts, nuts and the accumulator body.



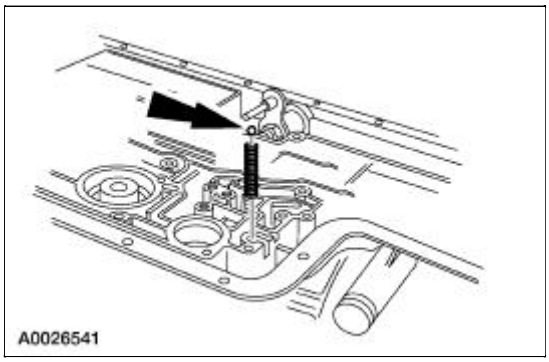
11. **NOTE:** Do not remove the lower-to-upper main control valve body assembly bolts. Keep the main control valve bodies attached as an assembly.

    Remove the main control valve body.
    1. Do not remove the two lower-to-upper main control valve body assembly bolts.

12. Remove the bolts, nut and the solenoid body assembly, by pushing the solenoid body connector upward to help separate the assembly from the case bore.

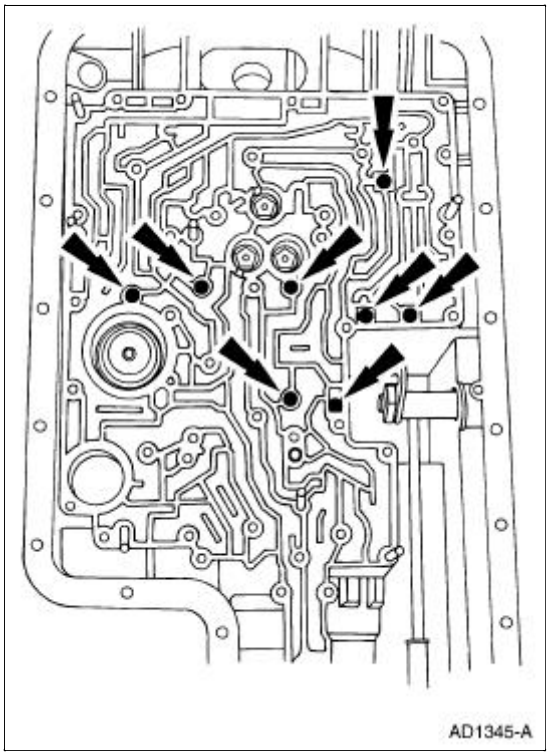


13. Remove the solenoid screen assembly by rotating and pulling.



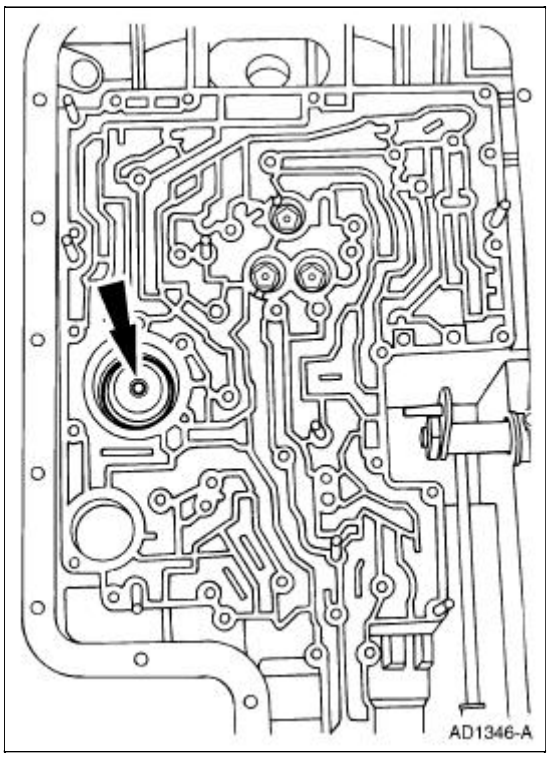
14. **CAUTION: The steel electronic pressure control (EPC) check ball is spring-loaded under the valve body separator plate.**

    Remove the separator plate reinforcing plate and the valve body separator plate with the two gaskets. Discard both gaskets.



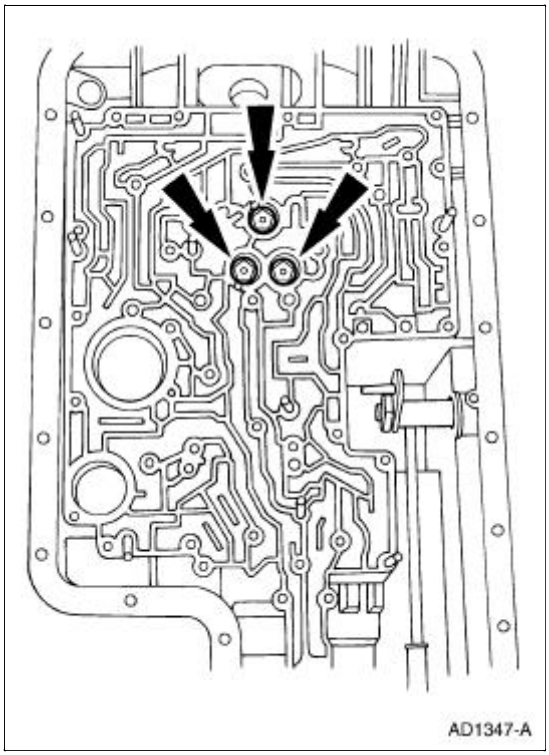
15. **NOTE:** The steel EPC check ball has a 0.5 mm (0.02 in) diameter and is smaller than the other check balls.

    Remove the steel EPC check ball and spring.

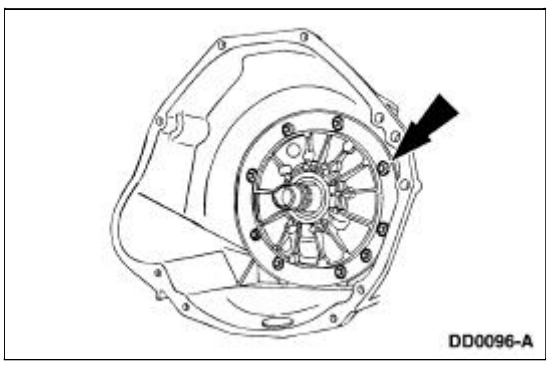


16. **CAUTION: Use care not to damage the rubber check balls. Transmission shift problems can occur.**

    Using a small screwdriver, carefully remove the eight rubber check balls.

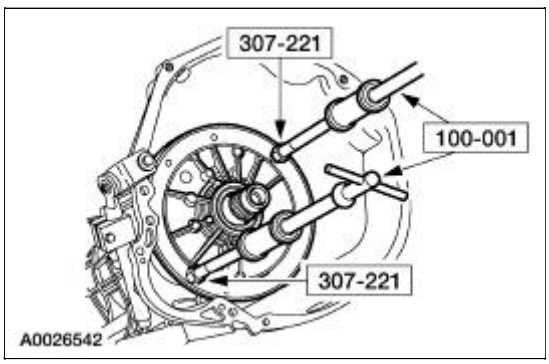


17. Using a plastic or rubber-headed hammer, tap gently on the intermediate band servo assembly piston. The downward force will compress the spring. The upward momentum of the spring will force the assembly to be released from the case bore.



18. **CAUTION: After removal, discard the feedbolts. The bolts will not retain torque specification if reused.**

    Remove and discard the feedbolts.



19. Remove the pump bolts and discard the washers.

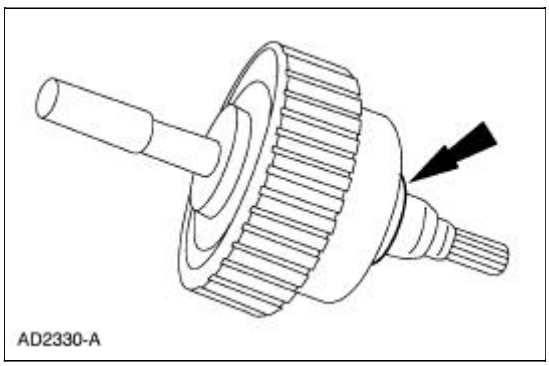
20. **NOTE:** The special tools should be installed into the pump threaded holes as shown.

    Using the special tools, remove the pump.

21. **NOTE:** The No. 1 pump thrust washer and the No. 2A overdrive sun gear thrust bearing may stay with the pump.

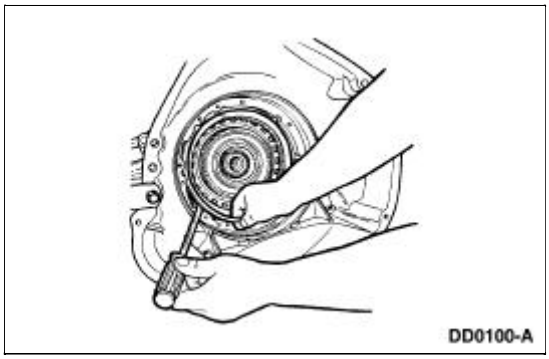
    Remove the No. 1 pump thrust washer.

1. Remove the No. 1 pump thrust washer.
2. Remove the No. 2A overdrive sun gear thrust bearing.
3. Remove the pump gasket and discard.



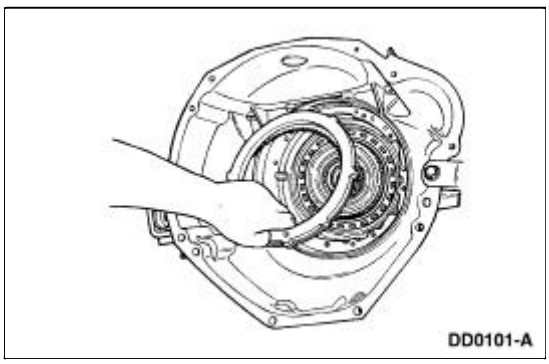
22. **CAUTION: The coast clutch, overdrive ring gear, centershaft assembly must be removed as an assembly, using special service tool or damage to the overdrive one-way clutch can occur.**

    Using the special tool remove the coast clutch, overdrive ring gear, centershaft assembly.

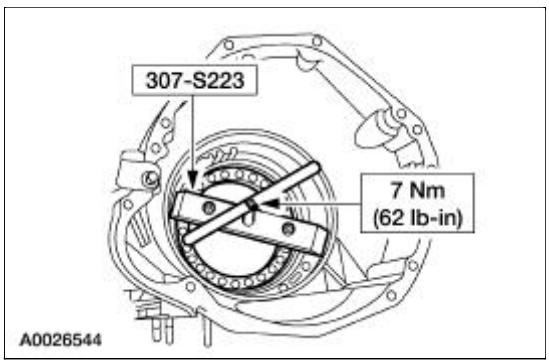


23. **NOTE:** The No. 5 thrust bearing may remaining on the center shaft or the center support.

    Remove the No. 5 overdrive center shaft thrust bearing assembly.

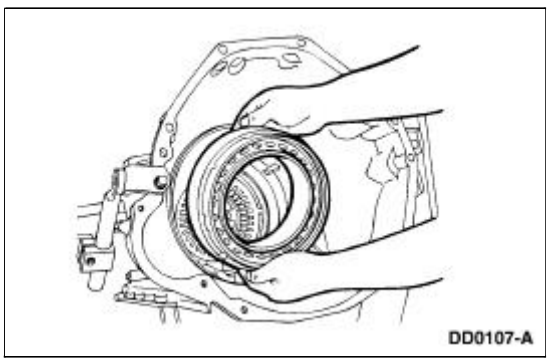


24. Remove the overdrive clutch pressure plate retainer snap ring.

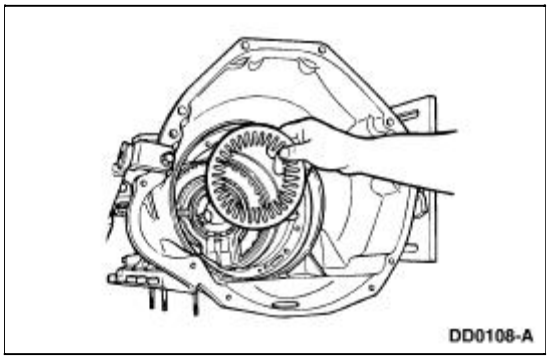


25. **NOTE:** Tag the parts for identification during installation.

    Remove the overdrive clutch pressure plate and the clutch pack.

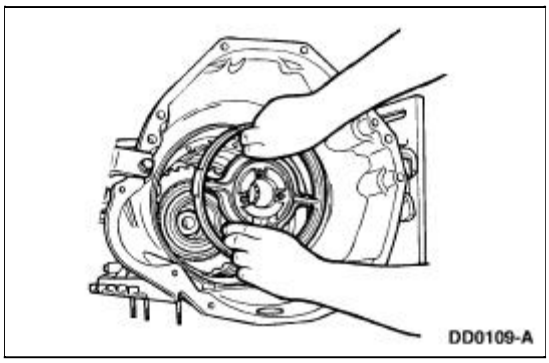


26. Using the special tool, remove the intermediate/overdrive cylinder retaining ring.

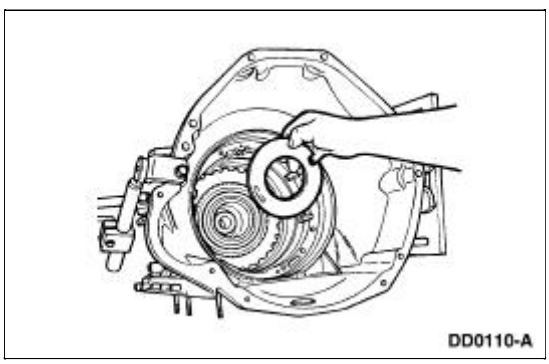


27. **CAUTION: During removal, do not misalign the intermediate/overdrive cylinder assembly in the case bore. This can damage the case bore.**

    Remove the intermediate/overdrive cylinder assembly.

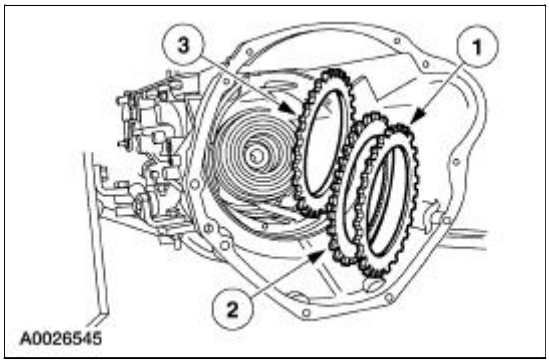


28. Remove the intermediate clutch piston return spring.

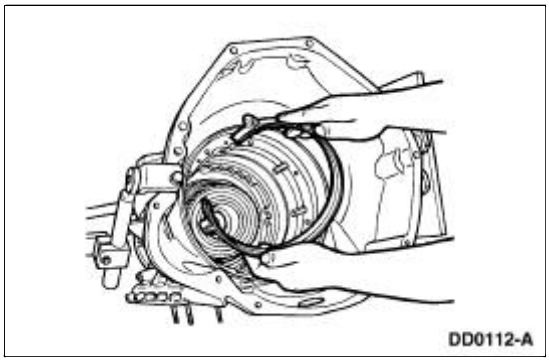


29. **CAUTION: During removal, do not misalign the center support in the case bore. This can damage the case bore.**

    Carefully remove the center support assembly.

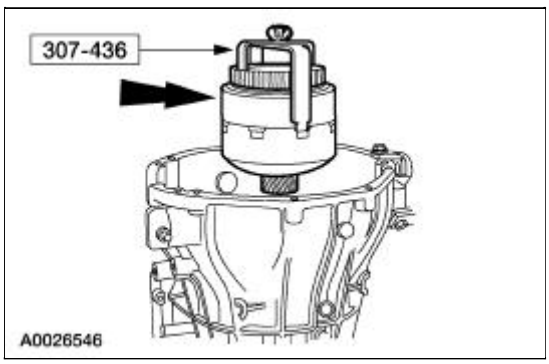


30. Remove the No. 6 center support thrust washer.

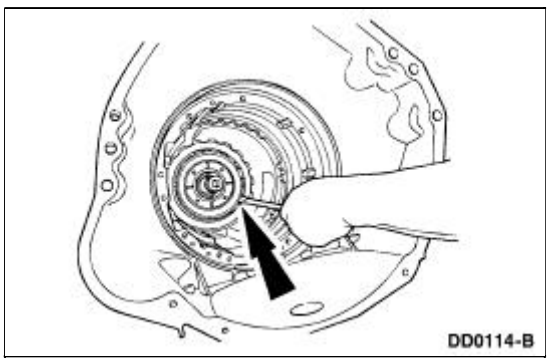


31. **NOTE:** Tag the parts for identification during installation.

    Remove the intermediate clutch rear pressure plate.
    1. Remove the intermediate clutch pressure apply plate.
    2. Remove the intermediate clutch pack.
    3. Remove the intermediate clutch rear pressure plate.

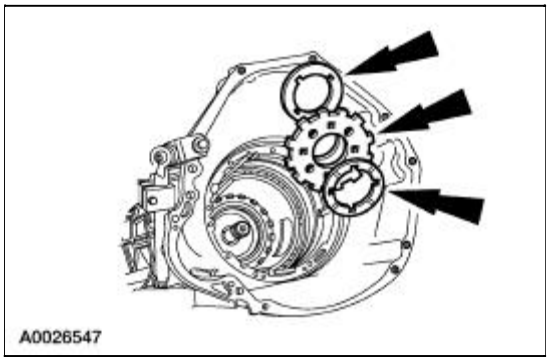


32. Remove the intermediate band.

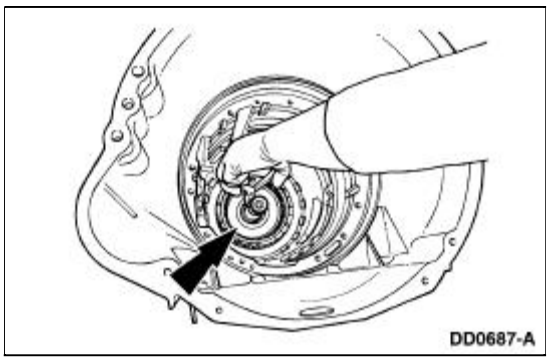


33. **NOTE:** When installing the special tool, each leg of the tool must be rotated separately to engage notches on the input shell prior to tightening the top cross bar.

    Using the special tool, remove the direct clutch, forward clutch and input shell as an assembly.

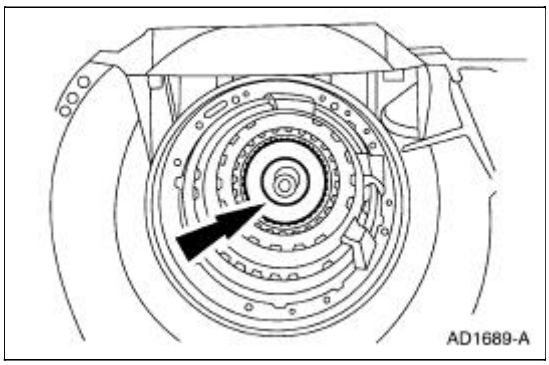


34. Remove the reverse planet retaining ring.



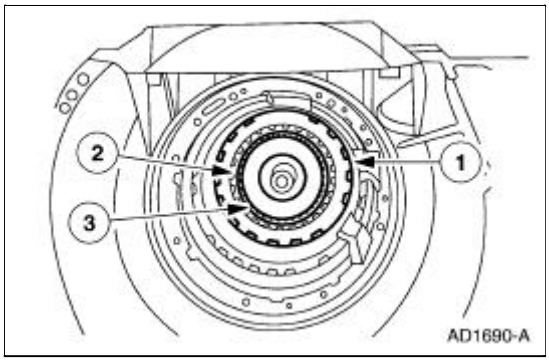
35. Remove the reverse planet assembly, No. 10B, and the No. 11 reverse planet carrier thrust

washers.

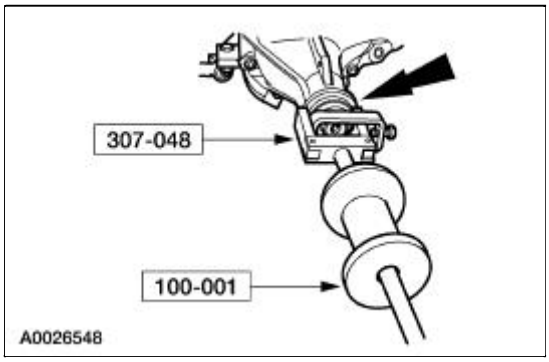


36. **WARNING: Use care when removing the output shaft retaining ring. The output shaft can fall out. Do not reuse the output shaft retaining ring.**

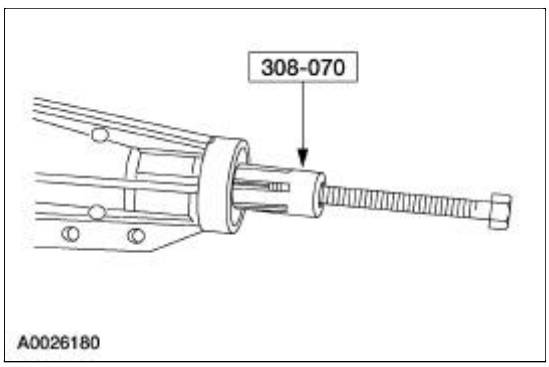
Remove the output shaft retaining ring.



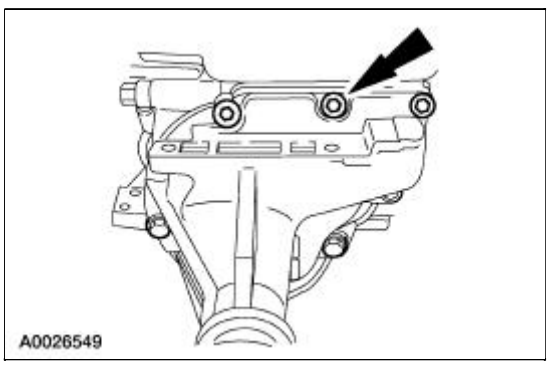
37. Remove the output shaft ring gear and hub assembly.



38. **WARNING: Use care not to drop the output shaft while rotating the transmission.**

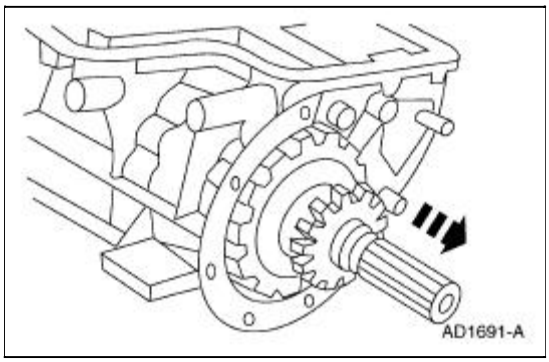


Remove the following parts as an assembly.
1. Reverse clutch pack (pressure plate, friction plate and seals).
2. Reverse clutch hub.
3. Low/reverse one way clutch assembly.

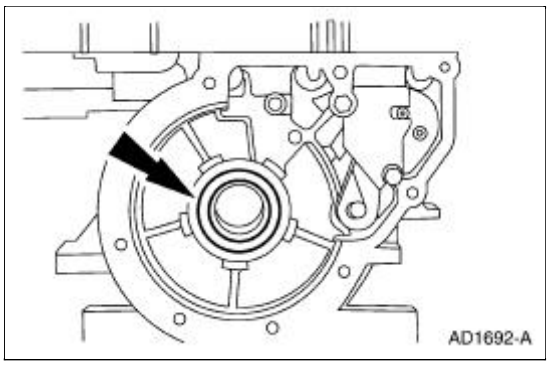


39. Using the special tools, remove the extension housing seal.

40. Using the special tool, remove the extension housing bushing.

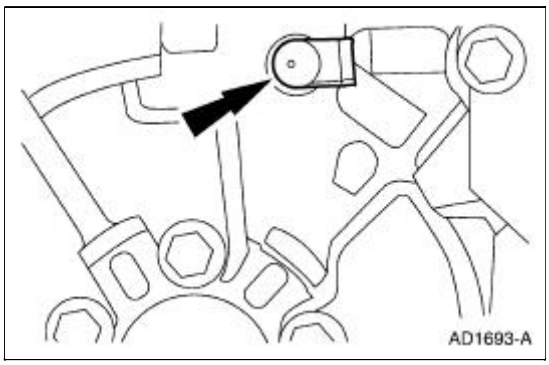


41. Remove the eight bolts, one stud and the extension housing. Remove and discard the extension housing gasket.

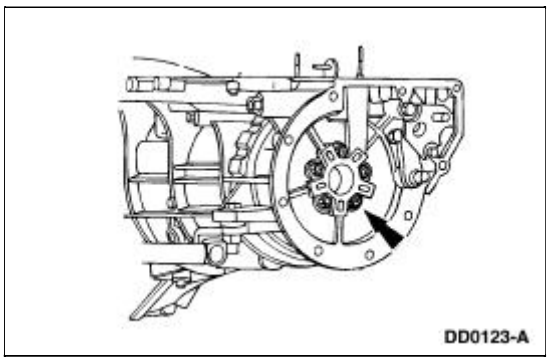


42. **NOTE:** Be sure not to damage the output shaft drive sprocket speed sensor wheel or the park gear.

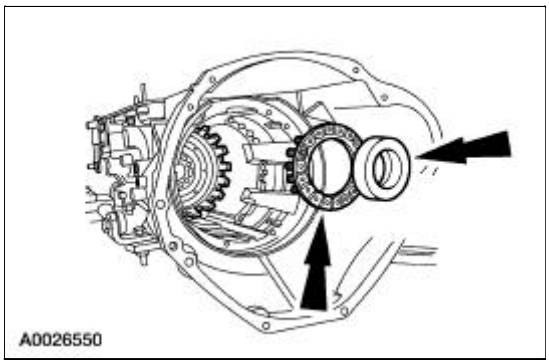
NOTE: The parking gear and output shaft drive sprocket speed sensor wheel are a press fit to the output shaft.



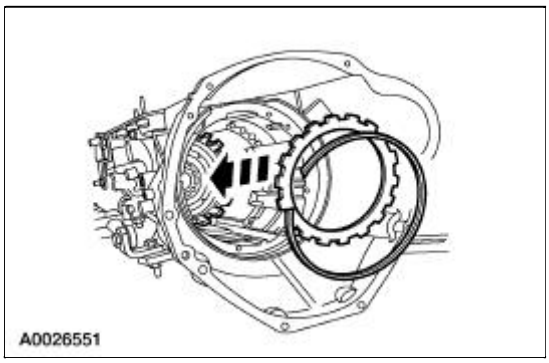
Remove the output shaft.



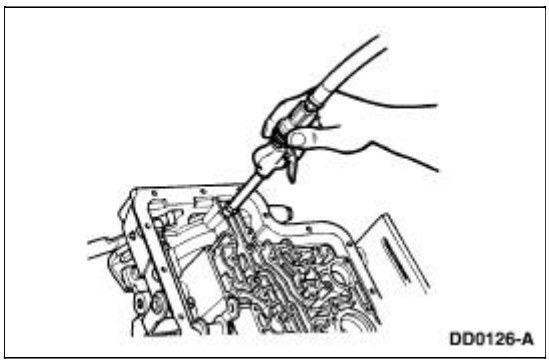
43. Remove the No. 13 thrust bearing.



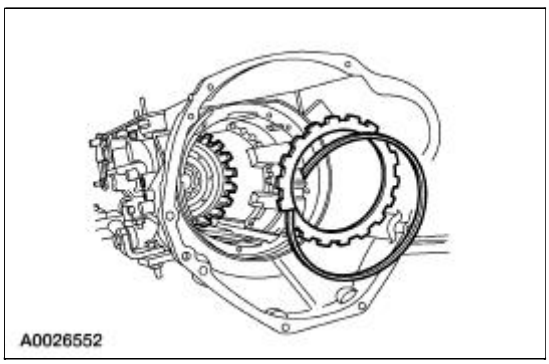
44. Remove the plastic orifice lube plug form the rear of the case and discard.



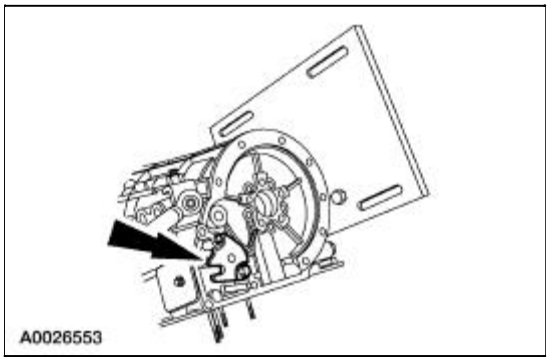
45. Remove the five bolts retaining the low/reverse one-way clutch inner race to the case.



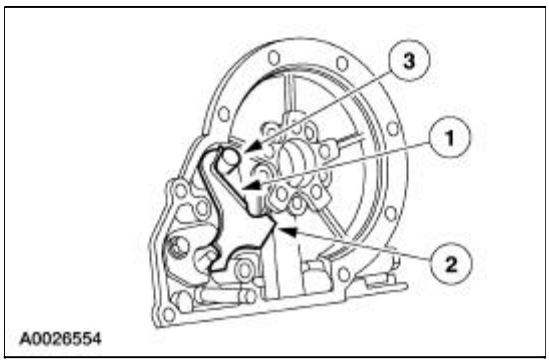
46. Remove the low/reverse one-way clutch inner race and the reverse clutch return spring assembly.



47. To remove the reverse clutch piston, reinstall the reverse clutch pressure plate and the reverse clutch pressure plate retainer snap ring to retain the reverse clutch piston.

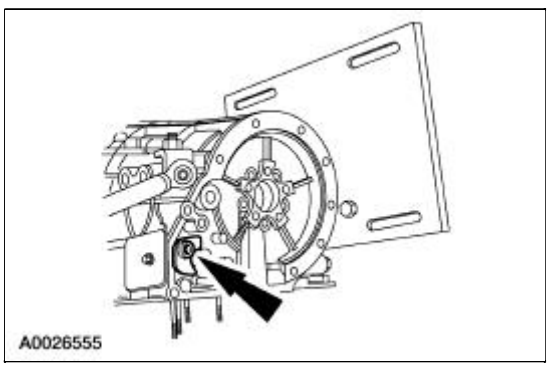


48. Using compressed air, blow into the reverse clutch feed port to blow out the reverse clutch piston against the reverse clutch pressure plate.

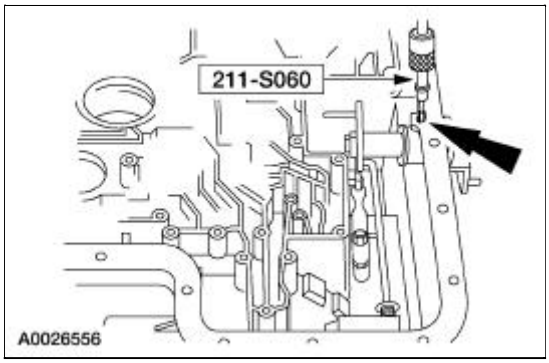


49. Remove the reverse clutch pressure plate retainer snap ring, the reverse clutch pressure plate and the reverse clutch piston.

50. If required, remove the parking rod guide plate.



51. If required, remove the parking pawl.
    1. Remove the parking pawl return spring.
    2. Remove the parking pawl.
    3. Remove the parking pawl shaft.

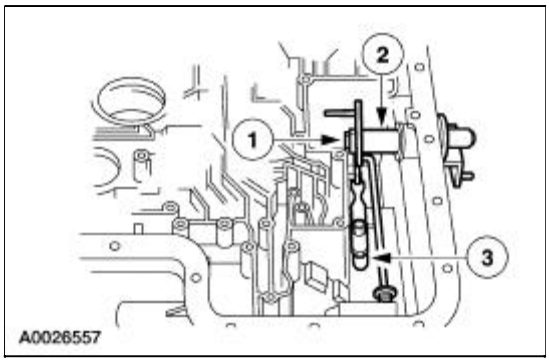


52. **CAUTION: The Torx®-head screw has a threadlocking compound and should be removed only if the case is being replaced. If the bolt is removed, it must be discarded and a new one installed.**

    If required, remove the parking pawl abutment.

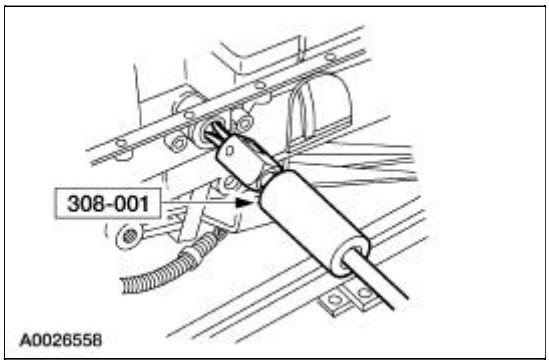
53. **NOTE:** A No. 53 drill bit (1/16-inch) can be used instead to capture and remove the manual lever shaft retaining pin.

    Using the special tool, remove the manual lever shaft retaining pin.



54. **CAUTION: Use care not to damage the manual control lever bore.**

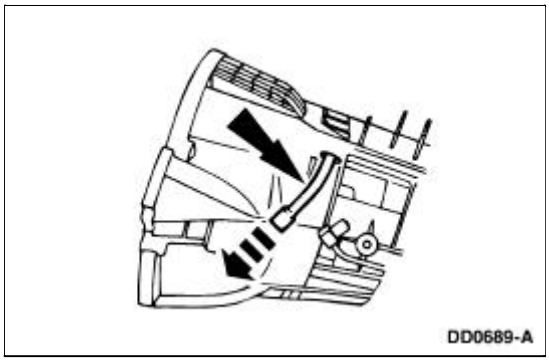
NOTE: The manual control lever and manual control lever shaft are one piece.



Remove the manual control lever shaft assembly.

1. **NOTE:** Use a crescent wrench on the manual control lever or outer flats of the manual control lever shaft assembly when removing the inner manual valve detent lever nut.

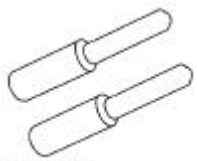
   Remove the nut, the inner manual valve detent lever and the parking pawl actuating rod.
2. Remove the manual control lever shaft assembly.
3. Remove the bolt and the manual control valve detent lever spring.



55. Using the special tool, remove the manual control lever seal.

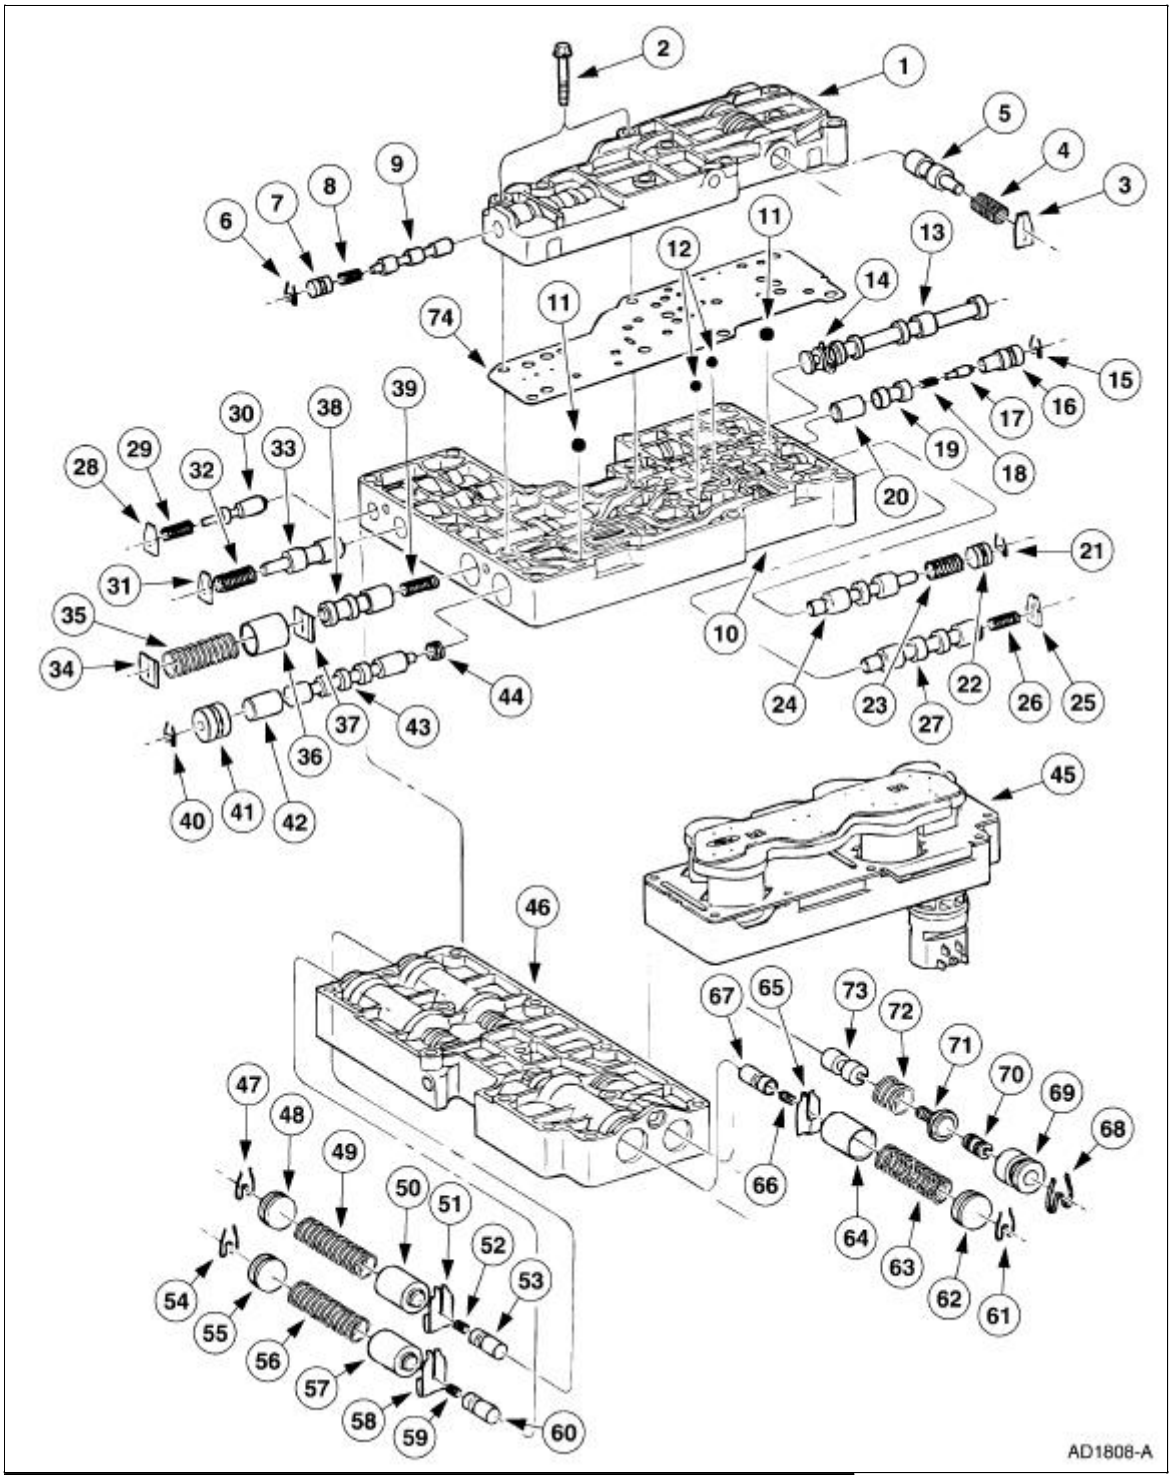
56. **NOTE:** The short fluid inlet tube should be removed only if it is loose or damaged.

If required, remove the short fluid inlet tube.



57. Inspect the case assembly for cracks and stripped threads. Inspect the gasket surfaces and mating surfaces for burrs. Check the case vent assembly for obstructions and check all fluid passages for obstructions.

58. Inspect the case assembly bushing for scores. Check all parking linkage parts for wear or damage.



59. If the transmission case assembly thread is damaged, repair kits (helicoil) can be purchased from local jobbers. To repair a damaged thread, follow procedures furnished in the helicoil kit.

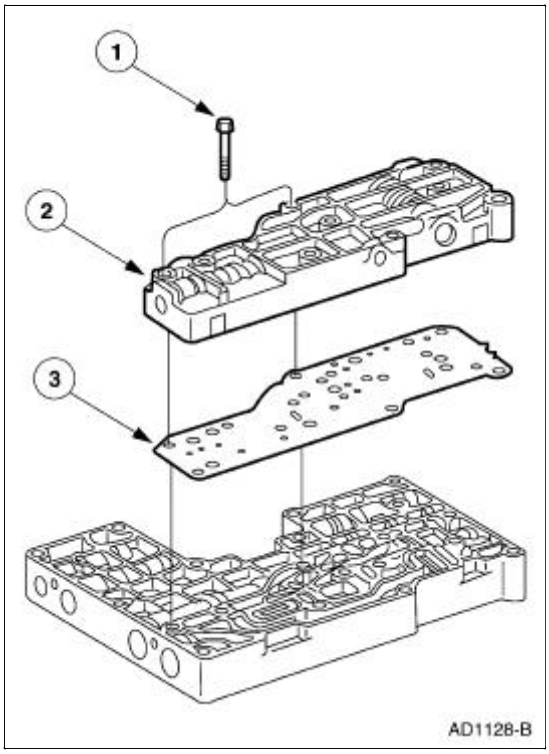
Main Control Valve Body —Disassembly and Assembly

Special Tool(s)

 ST2113-C	Aligner, Valve Body 307-359

Upper, Lower, Accumulator and Solenoid Bodies, Disassembled View

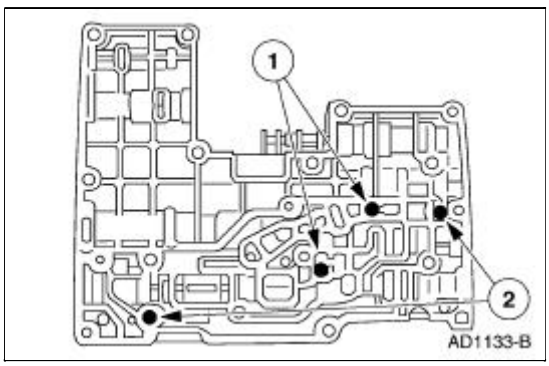
Item	Part Number	Description
1	—	Body control valve — lower
2	—	Bolt, M1-1x36 hex flange head (2 req'd)
3	—	Plate, spring retaining
4	—	Spring, shift valve
5	—	Valve, manual 1-2 transition
6	—	Retainer, valve plug
7	—	Plug, valve retainer
8	—	Spring, engagement valve



9	—	Valve, control engagement
10	—	Body, control valve — upper
11	7E195	Ball, 5/16-inch shuttle (2 req'd)
12	7E195	Ball, 1/4-inch shuttle (2 req'd)
13	—	Valve, control manual
14	—	Ring, retaining
15	—	Retainer, valve plug
16	—	Sleeve, low/reverse modulator valve
17	—	Plunger, low/reverse modulator valve
18	—	Spring, low servo modulator
19	—	Valve, low servo modulator
20	—	Valve, low/reverse modulator
21	—	Retainer, valve plug
22	—	Plug, valve retaining
23	—	Spring, shift valve
24	—	Valve, 3-4 shift
25	—	Plate, spring retaining
26	—	Spring, 2-3 shift valve
27	—	Valve, 2-3 shift
28	—	Plate, spring retaining
29	—	Spring solenoid regulator valve
30	—	Solenoid, regulator valve
31	—	Plate, spring retaining
32	—	Spring, shift valve
33	—	Valve, coast clutch shift
34	—	Plate, spring retaining
35	—	Spring, 4-3-2 shift timing
36	—	Plunger, control valve shift timing
37	—	Plate, spring retaining
38	—	Valve, 4-3-2 timing
39	—	Spring, 4-3-2 shift timing
40	—	Retainer, valve plug
41	—	Plug, valve retaining
42	—	Valve, 1-2 shift
43	—	Valve, drive 2
44	—	Spring, 1-2 shift valve
45	7G391	Solenoid body assembly (model-dependent)
46	7G422	Accumulator valve body control (model-dependent)
47	—	Retainer, valve plug
48	—	Plug, valve retainer
49	—	Spring, accumulator valve — outer

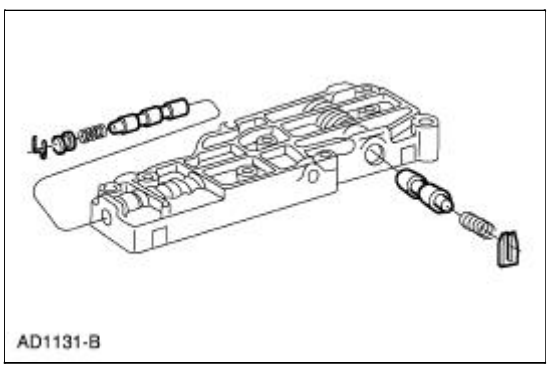
50	—	Plunger, accumulator regulator
51	—	Retainer, accumulator spring
52	—	Spring, accumulator regulator valve
53	—	Valve, accumulator regulator
54	—	Retainer, valve plug
55	—	Plug, valve retaining
56	—	Spring, accumulator valve — outer
57	—	Plunger, accumulator regulator
58	—	Retainer, accumulator spring
59	—	Spring, accumulator regulator valve
60	—	Valve, accumulator regulator
61	—	Retainer, valve plug
62	—	Plug, valve retaining
63	—	Spring, accumulator valve — outer
64	—	Plunger, accumulator regulator
65	—	Retainer, accumulator spring
66	—	Spring, accumulator regulator valve
67	—	Valve, accumulator regulator
68	—	Retainer, valve plug
69	—	Sleeve, line press modulator
70	—	Plunger, line press modulator
71	—	Spring and retainer assembly, press modulator
72	—	Spring, throttle press line modulator
73	—	Valve, line press modulator
74	7A008	Control valve body separator plate

Disassembly



NOTE: If main control is being replaced, refer to the parts catalog for correct parts. The main control is model-dependent.

1. Remove the lower control valve body.
    1. Remove the bolts.
    2. Remove the lower control valve body.
    3. Remove the control valve body separator plate.

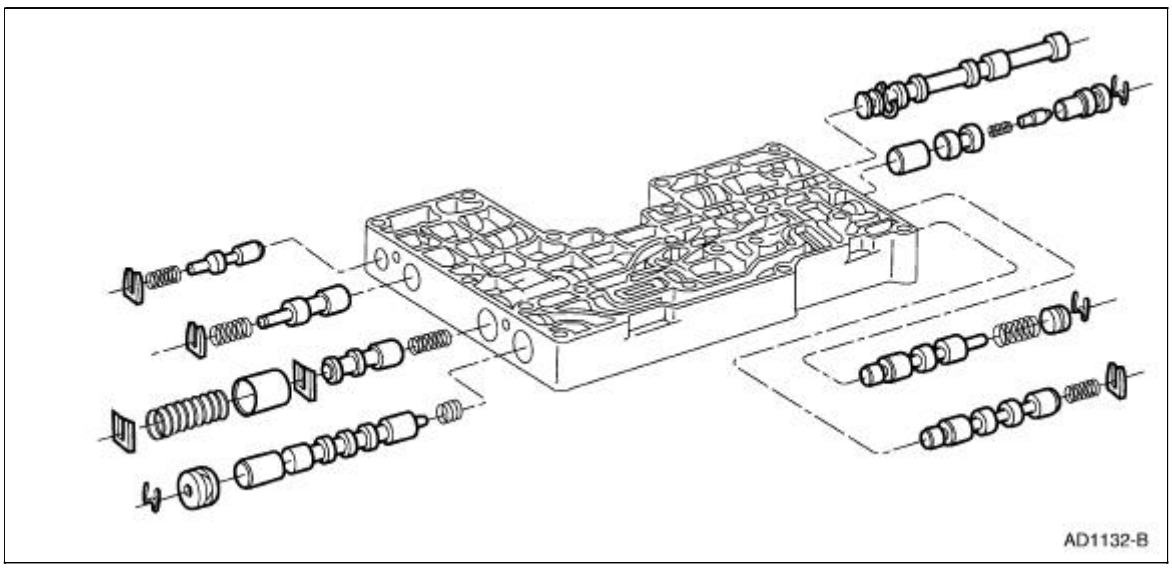


2. **CAUTION: Note the location of the check balls prior to removal. If the check balls are not installed in their correct location, shift problems will occur.**

   Remove the check balls.
   1. Remove two small check balls.
   2. Remove two large check balls.

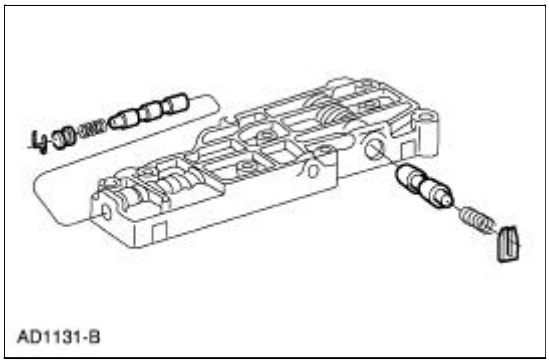
3. Remove the control valves and springs from the lower main control valve body. Inspect the valves for nicks and burrs. If the valves are damaged the main control valve body will need to be replaced.

4. Remove the control valves and springs from the upper main control valve body. Inspect the valves for nicks and burrs. If the valves are damaged, the main control valve body will need to be replaced.



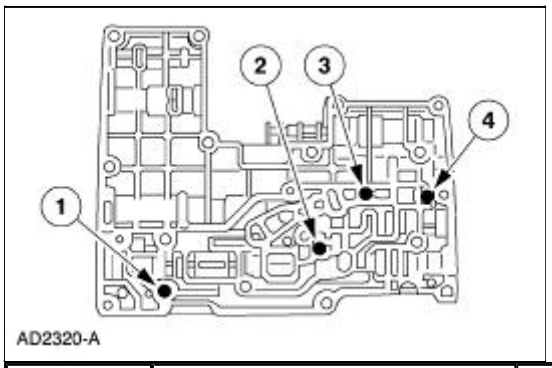
5. Inspect all valves, valve sleeves and valve bores for scores, nicks or burrs. Check all fluid passages for obstructions. Inspect all mating surfaces for burrs and scores.

6. Inspect all springs for distortion. Check all valves and plungers for free movement in their respective bores. When dry all the components must fall from their own weight in their respective bores.



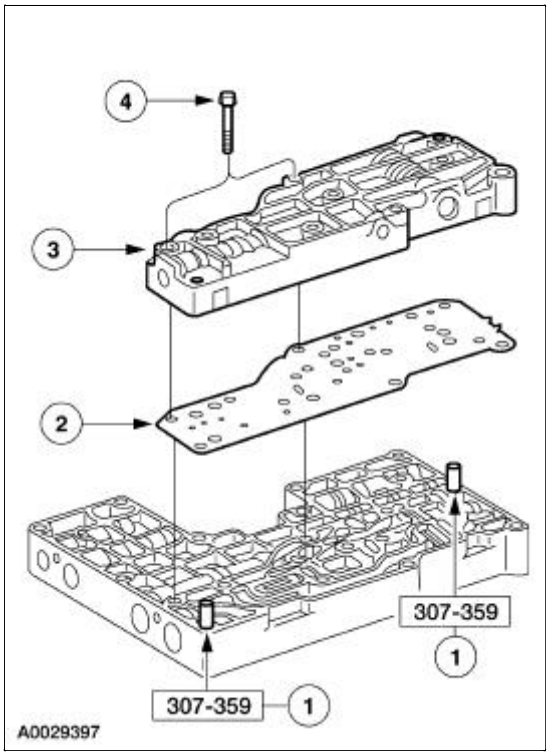
7. Roll the valves on a flat surface to check for bent or out-of-round condition.

Assembly



1. Install the control valves and springs from the lower main control valve body.

2. Install the control valves and springs from the upper main control valve body.



3. Install the check balls.

Item	Part Number	Description
1	CB13	Check ball
2	BS2	Ball shuttle
3	CB16	Check ball
4	CB15	Check ball

4. Using the special tools, install the lower control valve body.
    1. Install the special tools.
    2. Install the control valve body separator plate.
    3. Install the lower control valve body.
    4. Install the bolts.

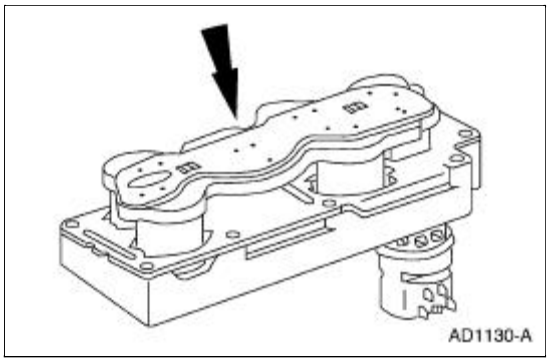
Main Control Valve Body —Solenoid Body Check



Disassembly

1. **NOTE:** Inspect and test the shift solenoids. Go To Pinpoint Test A .

   NOTE: The solenoid body cannot be disassembled to clean and to inspect for contamination. Contamination is a major source of solenoid body failure. Install a new solenoid body anytime contamination is evident.

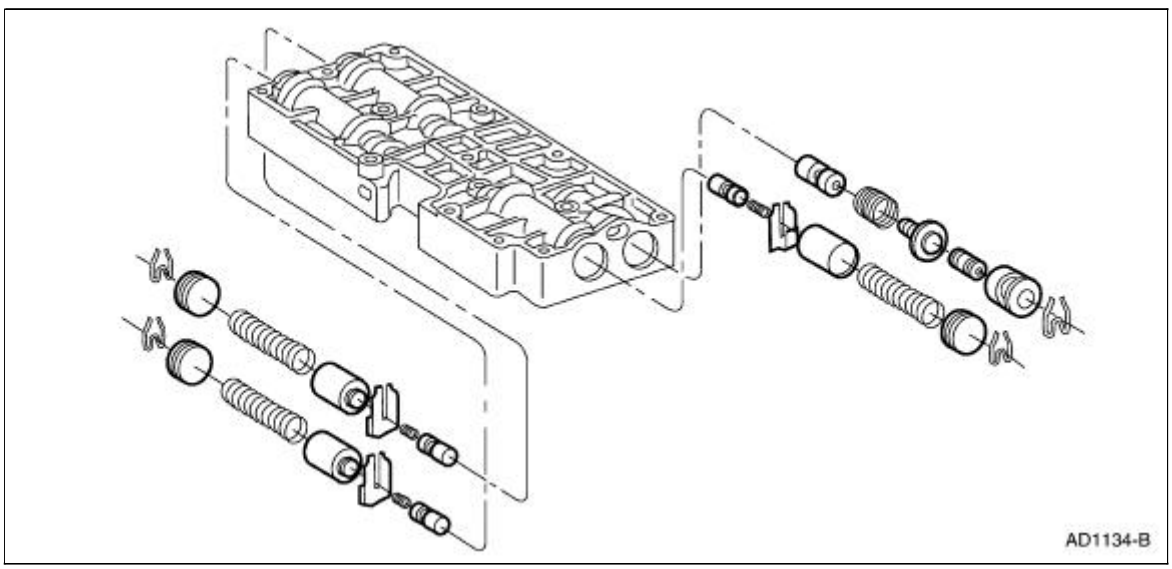
   Clean and inspect the solenoid body.

   - Check the connector pins for corrosion and possible bent condition.
   - If large amounts of contamination are present, a new solenoid body will need to be installed.
   - Remove O-ring and discard.
   - Install new O-ring and lubricate with petroleum jelly or equivalent.

Main Control Valve Body —Accumulator Body Check

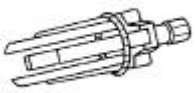
Disassembly

1. Remove the control valves and springs. Inspect the valves for nicks and burrs. If the valves are damaged, the accumulator body will need to be replaced.



2. Inspect all valves, valve sleeves and valve bores for scores, nick or burrs. Check all fluid passages for obstructions. Inspect all mating surfaces for burrs and scores.

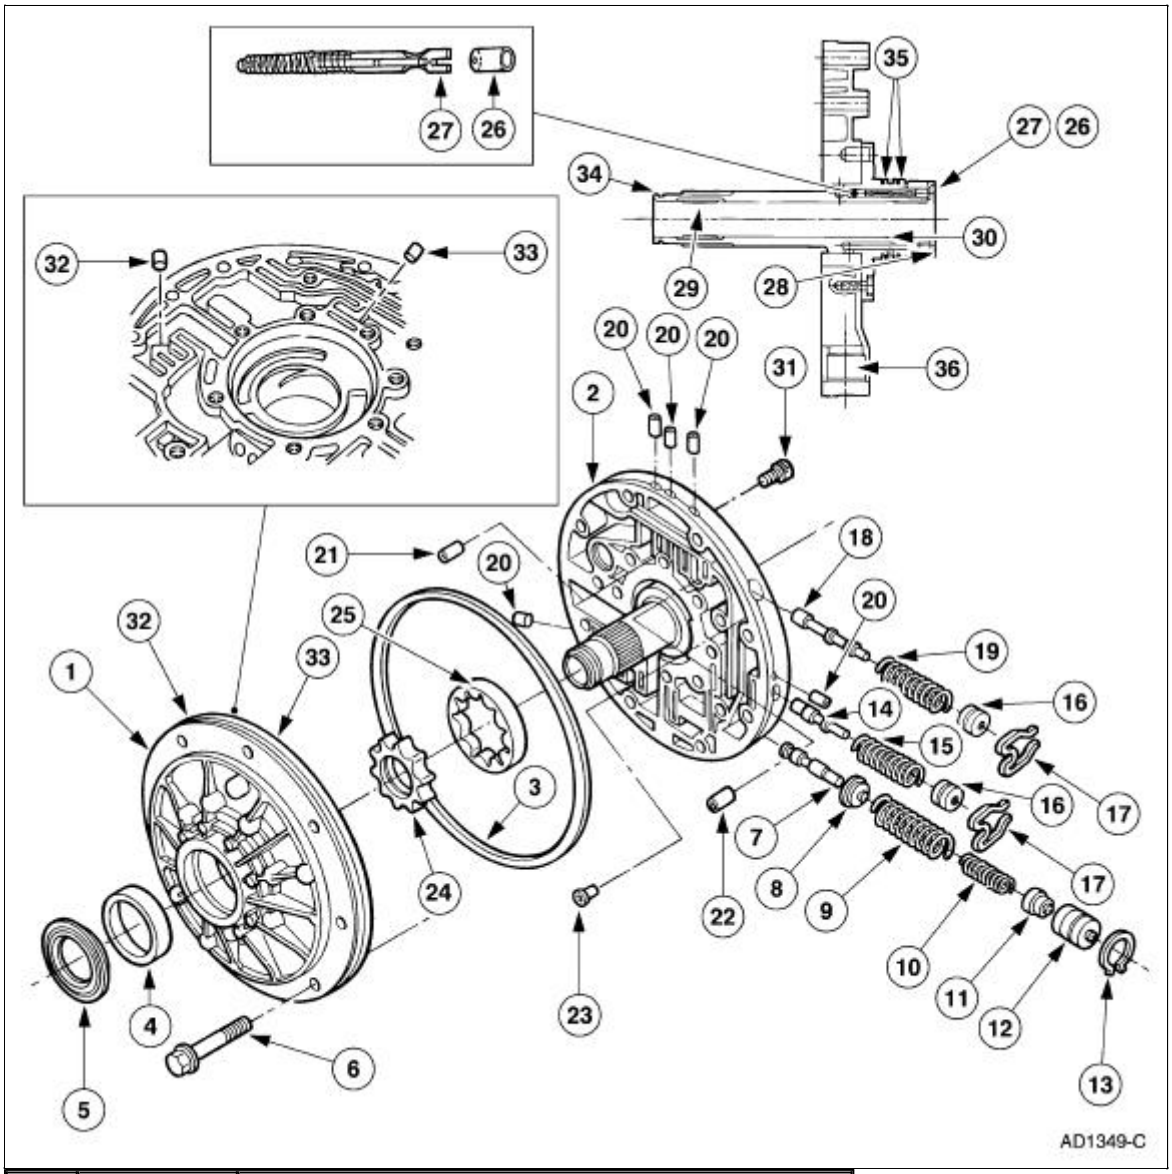
3. Inspect all springs for distortion. Check all valves and plungers for free movement in their respective bores. When dry, all the components must fall from their own weight in their respective bores.



Assembly

1. Install the control valves and springs.

Pump Assembly



Special Tool(s)

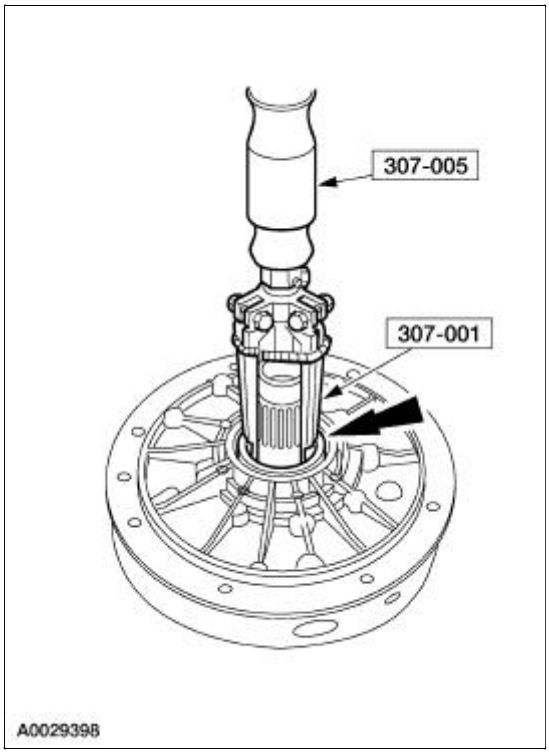
 ST1189-A	Installer, Front Pump Fluid Seal 307-014 (T63L-77837-A)
 ST1187-A	Slide Hammer 307-005 (T59L-100-B)
 ST1664-A	Banding Tool, Transmission Pump 307-D004 (D89L-77000-A) or equivalent
 ST1213-A	Remover, Bushing 307-001 (TOOL-1175-AC) or equivalent
 ST1274-A	Depth Micrometer 303-D026 (D80P-4201-A) or equivalent

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

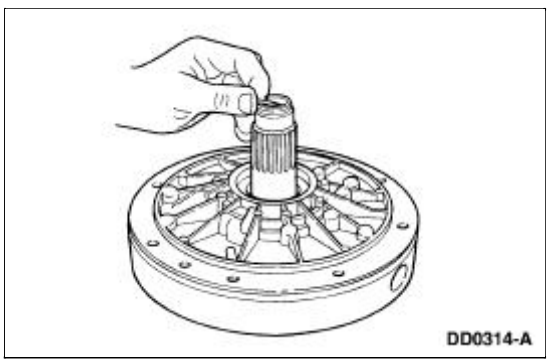
Pump Assembly, Disassembled View

Item	Part Number	Description
1	—	Pump body (part of 7A103)
2	—	Control body (part of 7A103)
3	7A248	Square-cut front pump seal
4	—	Converter hub bushing
5	7A248	Front pump seal
6	N805260-S	Bolt and washer assembly (9 req'd)
7	—	Main regulator valve (part of 7A103)
8	—	Spring retainer (part of 7A103)
9	—	Outer spring (part of 7A103)
10	—	Inner spring (part of 7A103)
11	7D003	Main regulator booster valve
12	—	Main regulator booster sleeve (part of 7D003)
13	—	Retainer clip (part of 7A103)
14	—	Converter regulator valve (part of 7A103)



15	—	Spring (part of 7A103)
16	—	End plug (part of 7A103)
17	—	Retainer clip (part of 7A103)
18	—	Converter clutch control valve (part of 7A103)
19	—	Spring (part of 7A103)
20	—	Solid cup plug (part of 7A103)
21	—	Orificed cup plug (part of 7A103)
22	—	Orificed cup plug (part of 7A103)
23	—	Air bleed check valve assembly (part of 7A103)
24	—	Inner gerotor gear (part of 7A103)
25	—	Outer gerotor gear (part of 7A103)
26	—	Orifice cup plug (part of 7H132)
27	7H132	Spring and stop assembly
28	—	Orifice cup plug (part of 7A103)
29	—	Front input shaft bushing (part of 7A103)
30	—	Rear input shaft bushing (part of 7A103) or bearing (vehicle-dependent)
31	—	Bolt, M8 (11 req'd) (part of 7A103)
32	—	Orificed cup plug (part of 7A103)
33	—	Orificed cup plug (part of 7A103)
34	7L323	Front pump stator support seal
35	7G402	Coast clutch seal (2 req'd)
36	—	Inlet tube bore (part of 7A103)

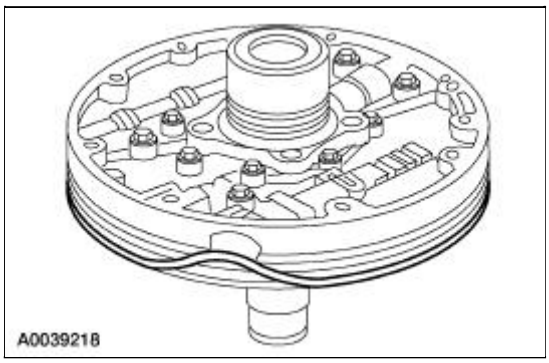
Disassembly



CAUTION: The pump assembly is vehicle-dependent. Failure to use the correct pump may cause transmission assembly damage. For additional information, refer to the parts catalog for the correct pump.

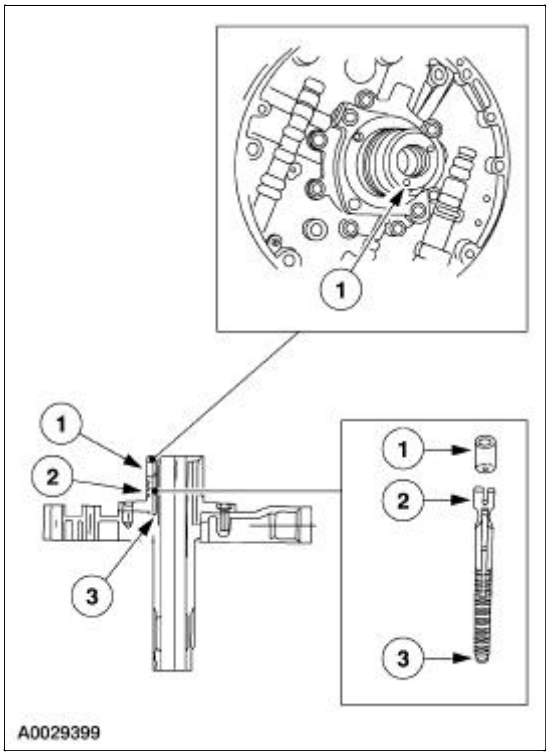
1. **NOTE:** Inspect and install a new front pump seal, if damaged.

   Using the special tools, remove the front pump seal.

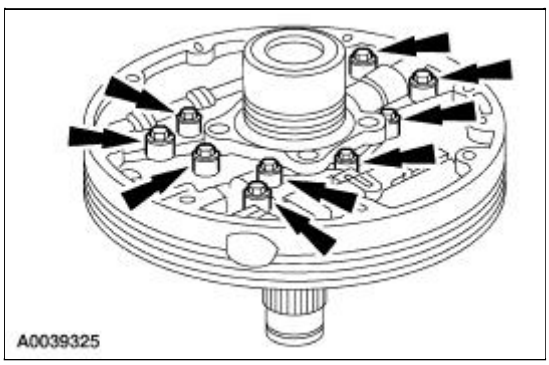


2. Remove the front pump stator support seal.

3. Remove the two Teflon® coast clutch seals.



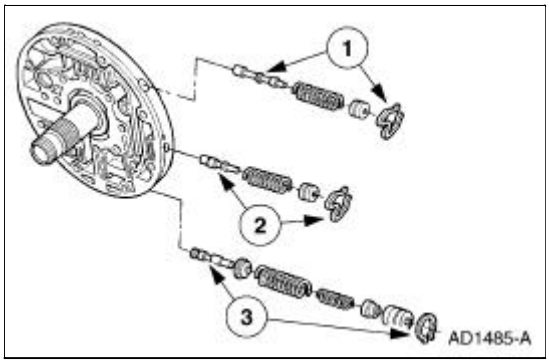
4. Remove the pump outer diameter square-cut front pump seal.



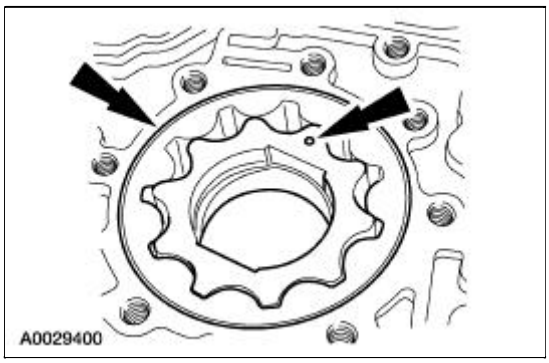
5. **CAUTION: Do not reuse the orifice cup plug or spring and stop assembly. Failure to install new parts may cause repeat repairs. Make sure the old rubber stop is removed (it may become separated from the spring assembly).**

   CAUTION: Use care not to damage any machined surfaces of the stator support.

   Remove and discard the orifice cup plug and the spring and stop assembly. Clean and inspect the bore, making sure it is clean of any debris.
   1. Remove the orifice cup plug.
   2. Remove the spring and stop assembly.
   3. Remove the old rubber stop.



6. Remove 12 bolts and separate the pump control body from the pump body.

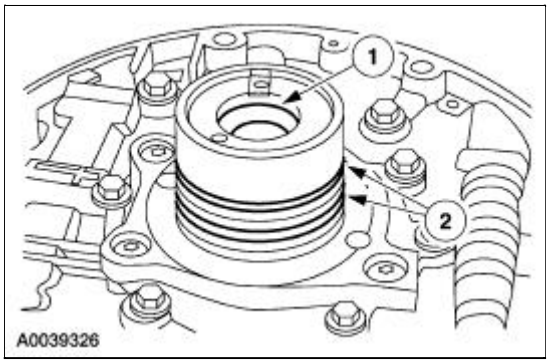


7. **CAUTION: Do not remove any of the remaining cup plugs unless directed to do so in other steps. Do not remove the stator support from the control body. This can distort the surface of the control body.**

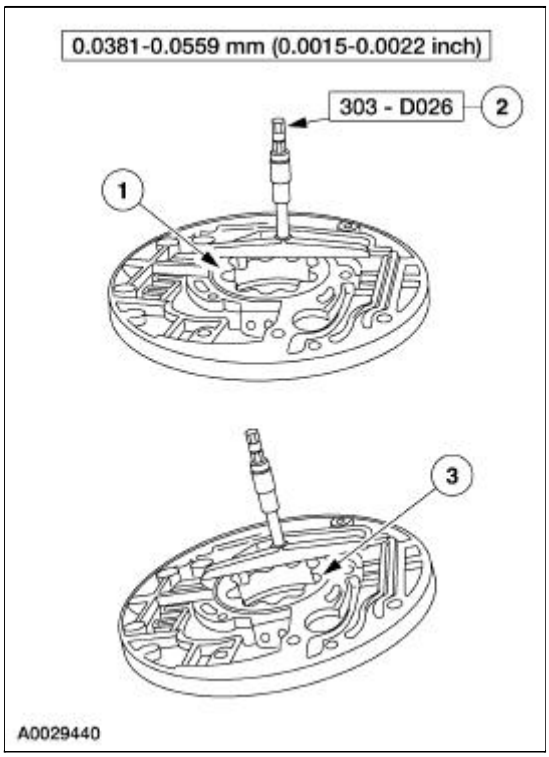
   NOTE: Inspect the main regulator booster valve and sleeve assembly. If the pump valve bore is not damaged but the valve and sleeve are worn, install a new valve and sleeve. For additional information, refer to Pump Assembly , Disassembled View.

   Remove the converter clutch shift valve assembly, converter regulator valve assembly, and main regulator boost valve and sleeve assembly.
   1. Remove the retainer clip with a small screwdriver or tweezers, then remove the converter clutch shift valve assembly.
   2. Remove the retainer clip with a small screwdriver or tweezers, then remove the converter regulator valve assembly.
   3. Remove the retainer clip with a small screwdriver or tweezers, then remove the main regulator valve assembly.

8. Remove and inspect the inner and the outer gerotor gears.
    - Clean all pump parts in solvent.
    - Dry the parts with compressed air.
    - Inspect the pump gears, faces, gear teeth, pump housing and mating surfaces for damage or scoring.
    - Replace the entire pump if any part is damaged or worn.



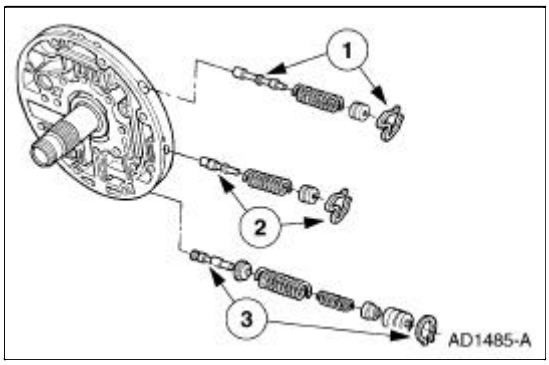
9. Inspect the converter hub bushing. If scored or excessively worn, replace the entire pump. Note the orientation of the lube groove.



10. **NOTE:** The pump assemblies are model-dependent. Refer to the parts catalog for correct usage.

    Remove the coast clutch seals and discard.
    1. Inspect the bushing for wear. If scored or worn, replace the entire pump.
    2. Remove the coast clutch seals.

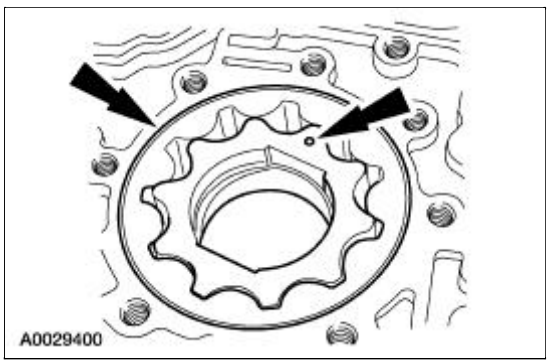
11. Measure and record the depth of the inner, then the outer, pump gerotor gear face-to-pump body machined surface.
    1. Place the pump gerotor gearset into the pump gear pocket and center it to the pump bushing diameter.
    2. Using the special tool, measure and record the depth of the inner gerotor gear face to the pump body machined surface. Repeat measurement for a total of three readings in equally spaced locations on the gear face. If the reading is not within specification, install a new front pump assembly.
    3. Remove the inner gear and reinstall the outer gear. Repeat Substep 2 for the outer gerotor gear face.



12. Inspect the following:
    - All valve and plug bores for scoring or damage.
    - All passages for obstructions.
    - Mating surfaces for burrs and scoring.
    - All springs for distortion.
    - When dry, check all valves and plugs for free movement in their respective bores.

Assembly

1. Install the main regulator valve and sleeve assembly, converter clutch shift valve assembly, and



the converter regulator valve assembly.

1. Install the converter clutch control valve assembly. Then apply pressure to the end plug and install the retainer, making sure it is correctly seated.
2. Install the converter regulator valve assembly. Then apply pressure to the end plug and install the retainer, making sure it is correctly seated.
3. Install the main regulator boost valve and sleeve assembly. Then apply pressure to the main regulator booster sleeve and install the retainer, making sure it is correctly seated.

2. **NOTE:** Prior to installation, lightly lubricate the gerotor gears with clean automatic transmission fluid.

   Install the gerotor gearset, with the dot facing the control body assembly.

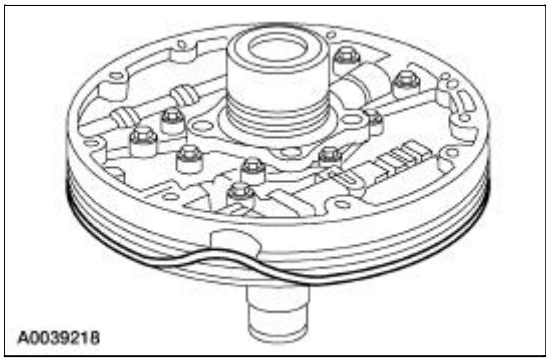
3. **CAUTION: Prior to pump assembly, make sure all cup plugs are installed.**

   CAUTION: Inspect mating surfaces of the pump body and the control body to make sure they are clean and free of nicks and burrs.

   Assemble the control body and stator assembly onto the pump body, aligning the 28 mm (1.12 in) hole in each body.

4. **NOTE:** Make sure that the outer edges of the pump body and the outer bolt holes are aligned during assembly.

   Using the special tool, assemble the pump and loosely install 11 bolts.
   1. Install the 10 mm (0.4 in) alignment bolt.
   2. Tighten the bolts.

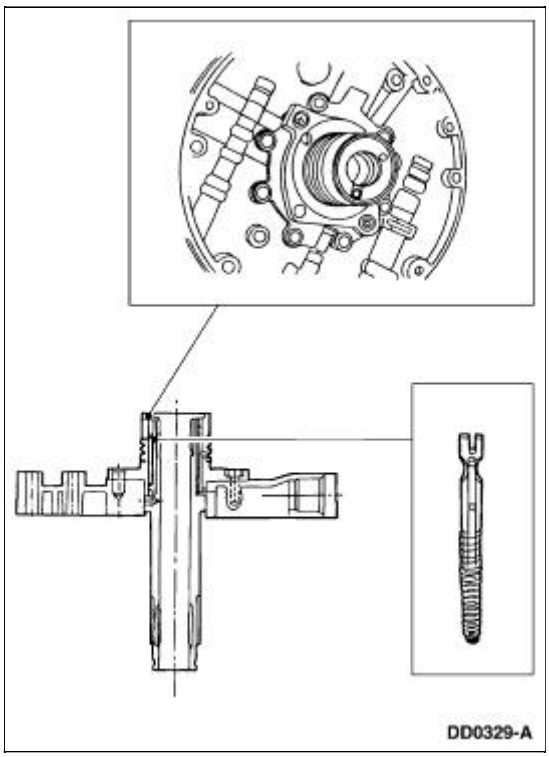


5. **CAUTION: Make sure the seal grooves in the stator support are clean and free of burrs.**

   CAUTION: Make sure the seal ends are correctly positioned together and not separated.

   Install the 2 coast clutch Teflon® seals. Make sure the seals are fully seated in the stator support seal grooves and the seal ends are oriented 180 degrees apart.
   1. Correct position of the seal ends.
   2. Incorrect position of the seal ends.
   3. Seals need to be installed 180 degrees apart.

6. Install the pump outer diameter square-cut front pump seal.

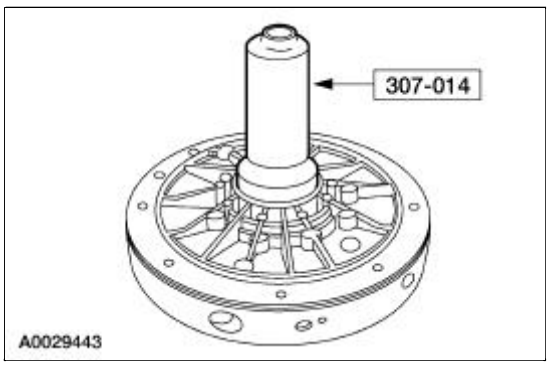


7. Install the front pump stator support seal.

8. **CAUTION: Failure to install new parts may cause repeat repairs.**

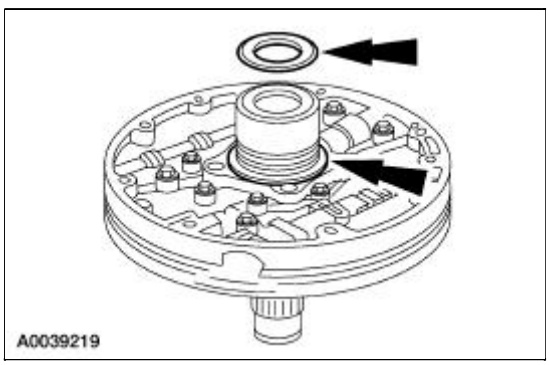
   NOTE: Install the rubber stop end into the bore first.

   Install the new spring and stop assembly.

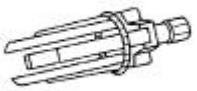


9. **NOTE:** Make sure the edge of the cup plug is seated just below the stator support surface that mates with the No. 2 needle bearing assembly.

Using a small drift and mallet, install the new orifice cup plug.

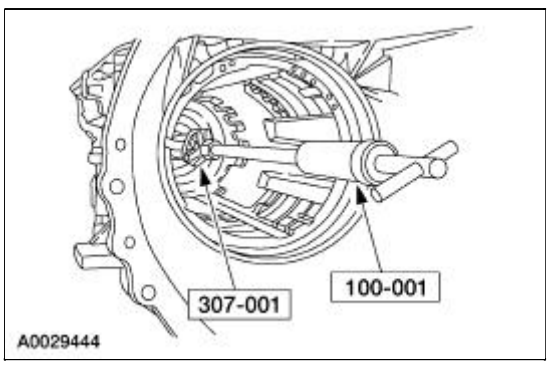


10. If removed, install the front pump seal, using the special tool.



11. **NOTE:** Lightly lubricate the thrust washer and the bearing with petroleum jelly to hold them in place during assembly.

    Install the No. 1 pump thrust washer and the No. 2A overdrive sun gear thrust bearing.

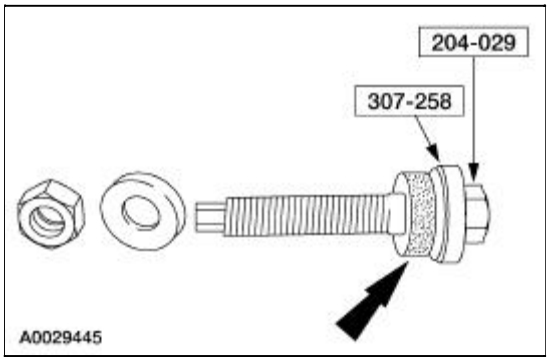


Front Case Bushings

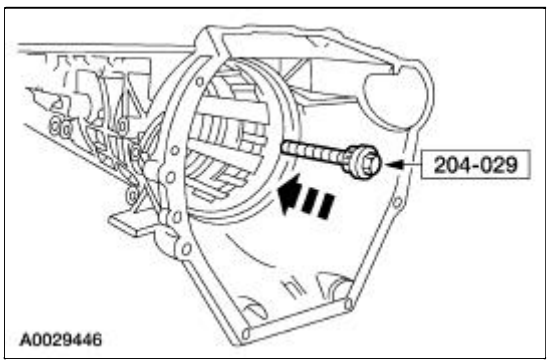
Special Tool(s)

 ST1185-A	Slide Hammer 100-001 (T50T-100-A)
 ST1360-A	Drawbar, (Heavy Duty Threaded) 204-029 (T77F-1176-A)
 ST1213-A	Remover, Bushing 307-001 (TOOL-1175-AC) or equivalent
 ST1856-A	Installer, Transmission Extension Housing Bushing 307-258 (T92T-77110-AH)

Disassembly



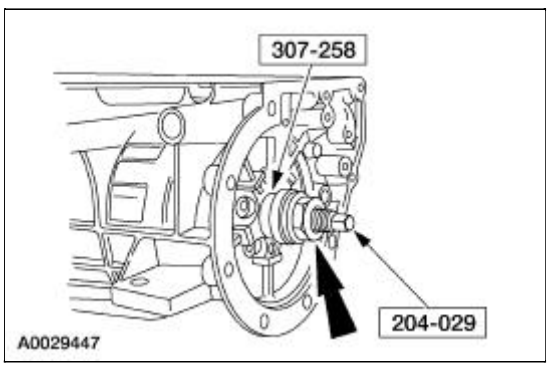
1. Using the special tools, remove the front case bushing.



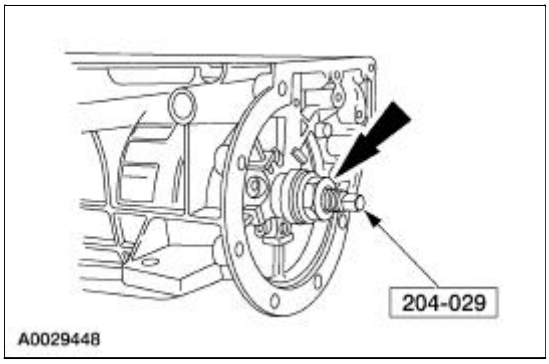
Assembly

1. **NOTE:** The front case bushing has three lube grooves. The rear case bushing has one lube groove.

Install the front case bushing onto the special tool.

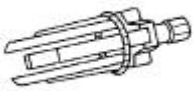


2. Place the special tool with the front case bushing through the case and into the rear case bushing.



3. **CAUTION: Make sure the bushing and tool are centered in the bore.**

   Install the special tool, then install the washer and the nut hand-tight.



4. Hold the special tool while turning the nut until the front case bushing is fully seated. Remove the tools.

204-029

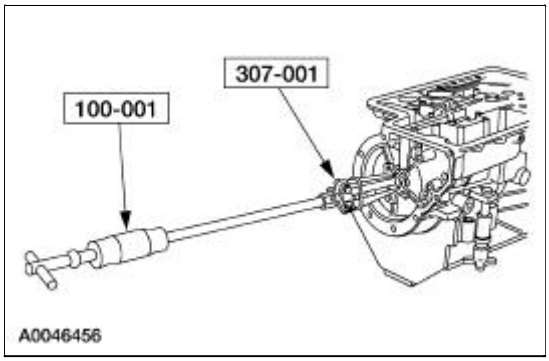
 ST1213-A	Remover, Bushing 307-001 (TOOL-1175-AC) or equivalent
 ST1856-A	Installer, Transmission Extension Housing Bushing 307-258 (T92T-77110-AH)

Disassembly



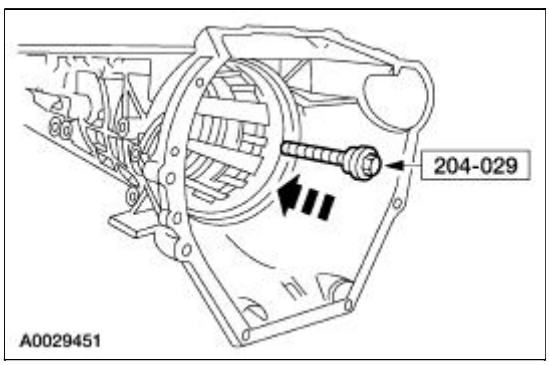
1. **NOTE:** Remove any minor nicks or burrs using a fine oil stone. Remove the case bushings only if they show signs of excessive wear or scoring.

   Inspect the case bushing bores for nicks or burrs.

2. **CAUTION: Be careful not to damage the case bore while removing the bushing.**

   NOTE: Always replace both bushings when either bushing is replaced. However, remove and replace only one bushing at a time. Use the other bushing in the case to help align the tool and replacement bushing during installation.

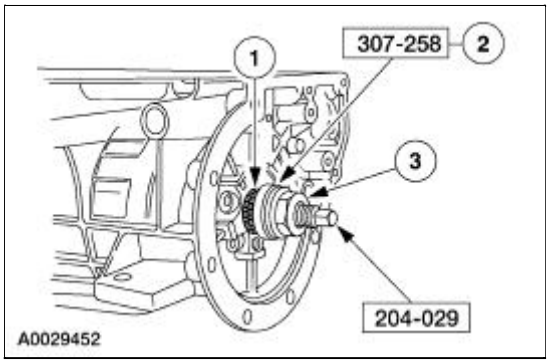
   Using the special tools, remove the rear case bushing.



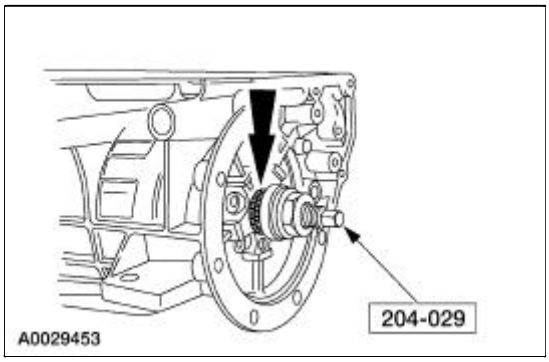
Assembly

1. **NOTE:** The rear case bushing has one lube groove. The front case bushing has three lube grooves.

   Assemble the special tools.



2. Place the assembled special tools through the case and into the front case bushing.

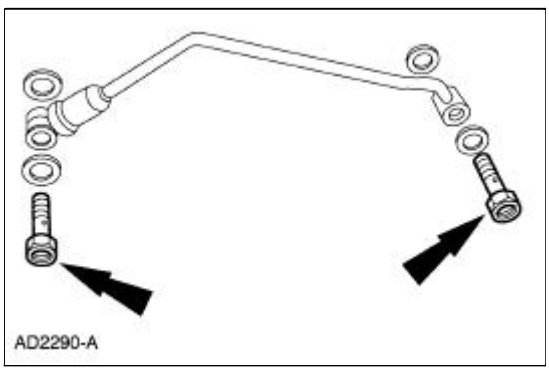


3. **CAUTION: Make sure the bushing and tool are centered in the bore.**

   Install the rear case bushing.
   1. Install the rear case bushing over the special tool into the case.
   2. Install the special tool.
   3. Install the washer and the nut hand-tight.

4. Hold the special tool while turning the nut until the rear case bushing is fully seated. Remove the tools.

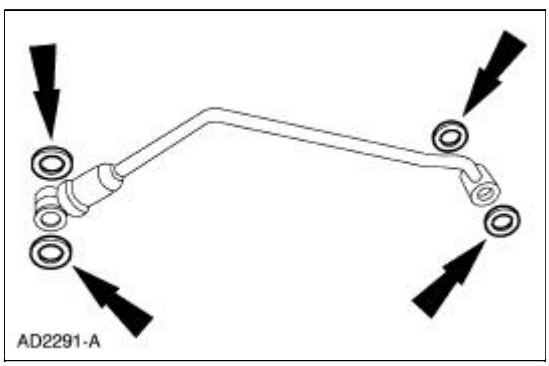
Cooler Bypass Valve Assembly



Special Tool(s)

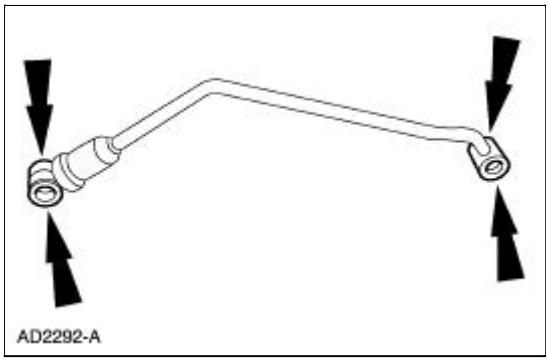
 ST1859-A	Oil Flusher Cooler Kit 303-F053 (014-00752) or equivalent

Disassembly



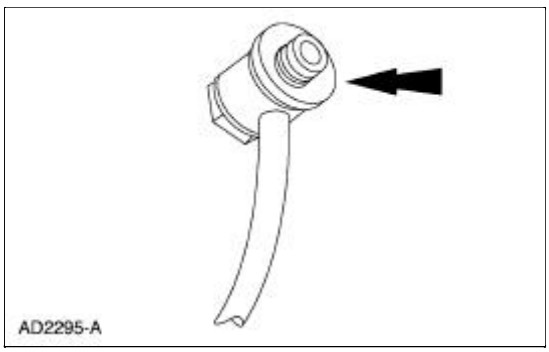
NOTE: The cooler bypass valve (CBV) needs to be thoroughly cleaned and flushed out at this time.

1. Remove and inspect the cooler line case fittings. If the cooler line case fittings are damaged, install new cooler line case fittings.

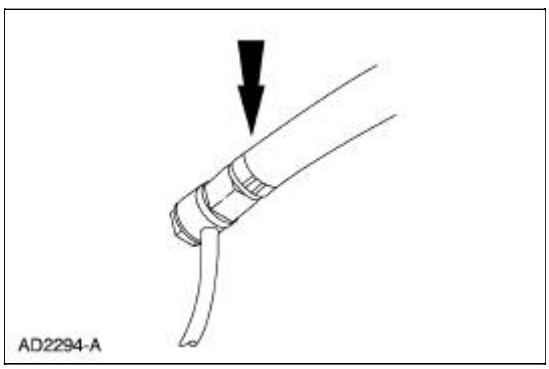


2. **NOTE:** Damaged sealing washers will cause transmission fluid to leak at the CBV.

   Remove the rubber-coated sealing washers. Inspect the sealing washers. Install new as required.

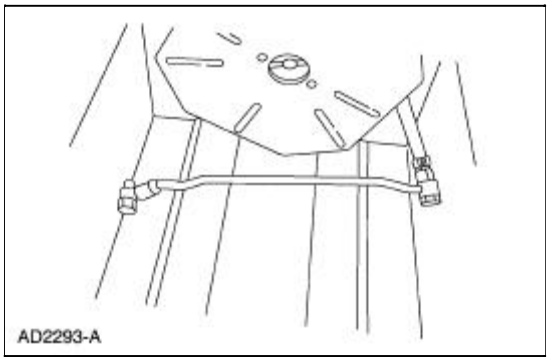


3. Inspect the sealing ends of the CBV. If the valve assembly is damaged, install a new CBV assembly.

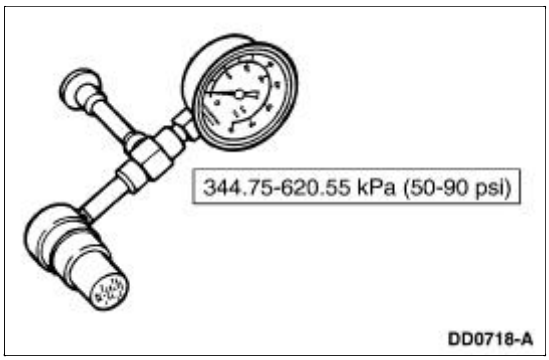


4. Assemble the CBV and plug the converter-out-to-cooler inlet with a 13 x 1.5 mm (0.06 in) plug.

5. Place a 0.5-inch flatwasher over the case converter-out fitting threads over the rubber coated sealing washer.

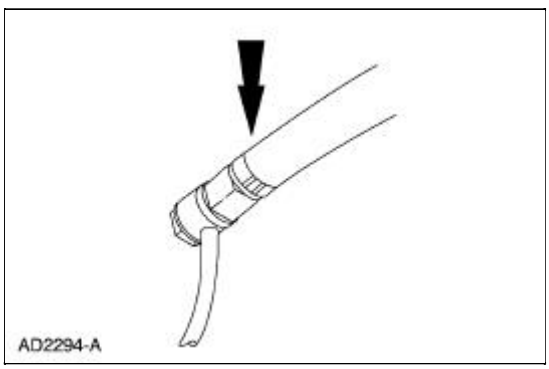


6. Connect the cleaner pressure line to the case converter-out fitting.



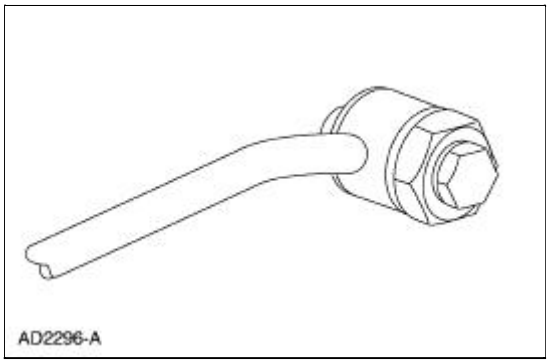
7. **CAUTION: Make sure the CBV is in the solvent tank before switching on the solvent pump. Also make sure the CBV fitting is pointing downward so the solvent does not spray up out of the tank.**

Place the CBV into the solvent tank.



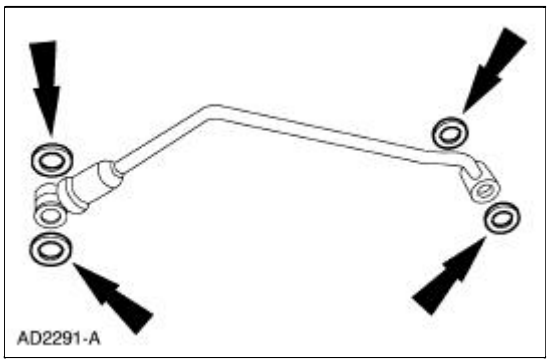
8. **CAUTION: The solvent pressure must be at least 344.75 kPa (50 psi) (minimum) to overcome the valve inside the CBV and let the solvent pass through it. Do not, however, exceed 620.55 kPa (90 psi) (maximum) solvent pressure.**

   Regulate the solvent pressure as specified. Switch on the solvent pump allowing the solvent to circulate through the CBV for 5 minutes. During this time, cycle the solvent pump on and off to help dislodge contaminants.

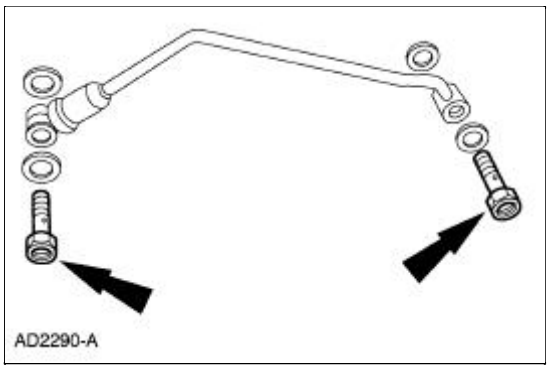


9. Disconnect the cleaner pressure line from the case converter-out fitting. Remove the 0.5-inch washer.

10. Using 344.75-620.55 kPa (50-90 psi) of regulated compressed air, blow through the CBV until all solvent is removed.



11. Remove the plug from the CBV converter-out-to-cooler inlet.

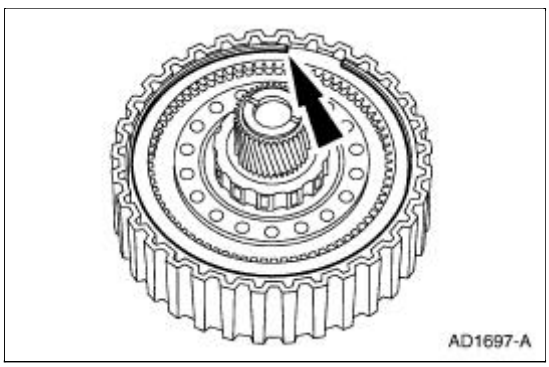


Assembly

1. **CAUTION: Failure to correctly install the new rubber-coated sealing washers will result in transmission fluid leaks.**

   Install new rubber-coated sealing washers.

2. Install new cooler line case fittings.

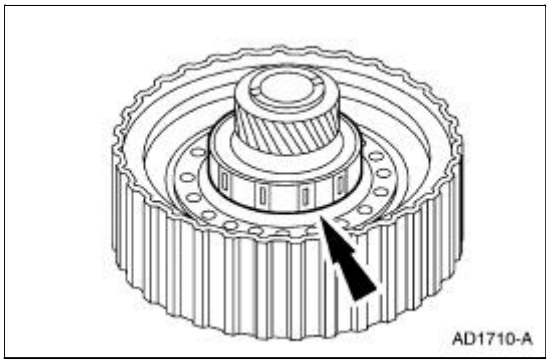


Coast Clutch Assembly

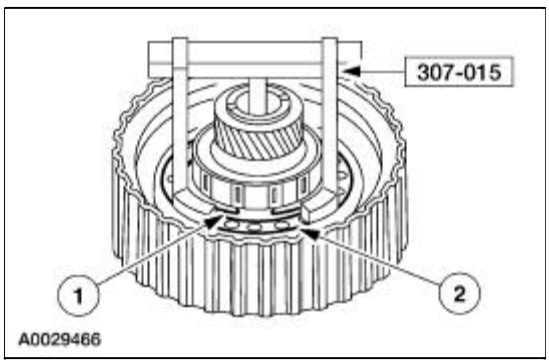
Special Tool(s)

 ST1190-A	Compressor, Clutch Spring 307-015 (T65L-77515-A)
 ST1204-A	Protector, Clutch Piston Seal 307-387

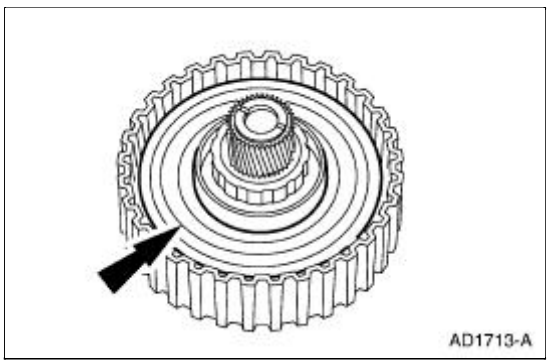
Disassembly



1. Remove the retaining ring.

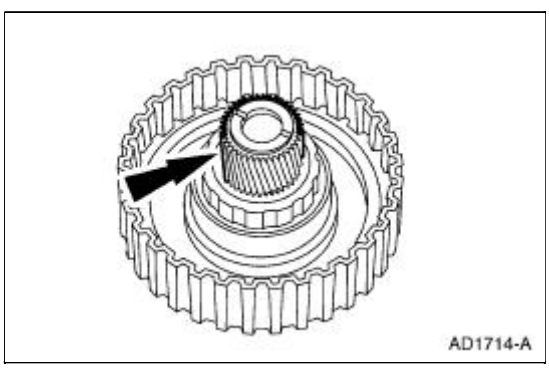


2. Remove the coast clutch pressure plate and the clutch plates.

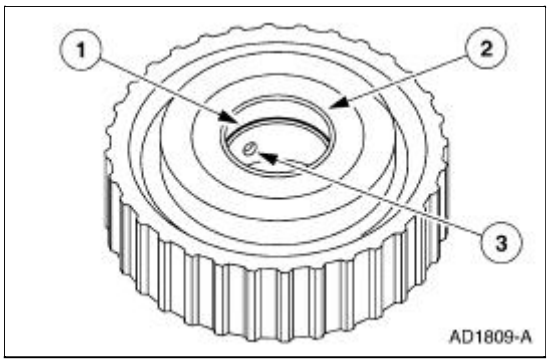


3. Inspect the overdrive one-way clutch (OWC) for damage to the plastic cage, springs, and rollers. Replace as necessary. Remove the overdrive one-way clutch.

4. Using the special tool, remove the coast clutch return spring.
    1. Remove the retaining ring.
    2. Remove the return spring.

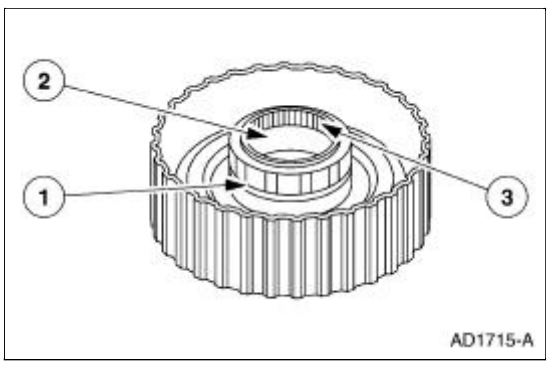


5. Remove the coast clutch piston and seal assembly.



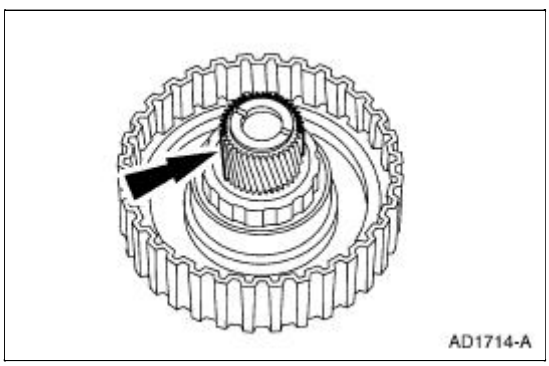
6. **NOTE:** If the teeth and/or bushing are damaged, the sun gear will need to be replaced.

   If required, use an arbor press to remove the sun gear.

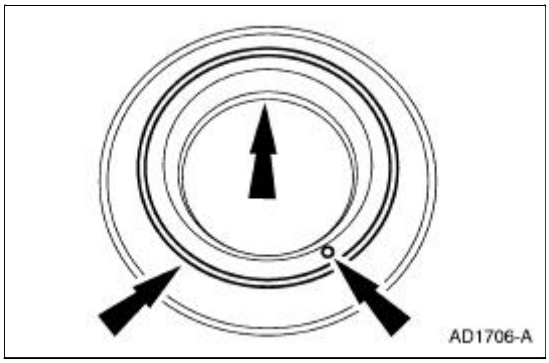


7. **NOTE:** If the coast clutch cylinder shows any signs of damage it will need to be replaced.

   Inspect the coast clutch assembly.
   1. Inspect the bushing.
   2. Inspect the No. 1 thrust washer.
   3. Inspect the lube hole.

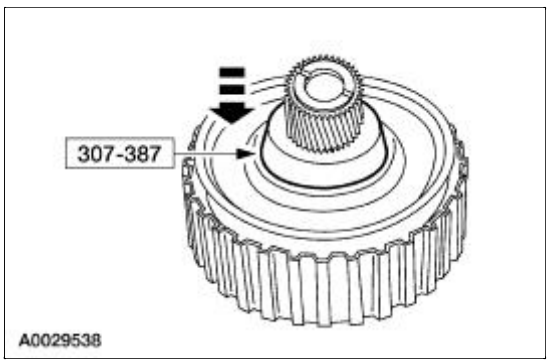


8. Inspect the OWC inner race.
   1. Inspect the coast clutch hub overdrive OWC inner race.
   2. Inspect all the sealing surfaces.
   3. Inspect the sun gear splines.

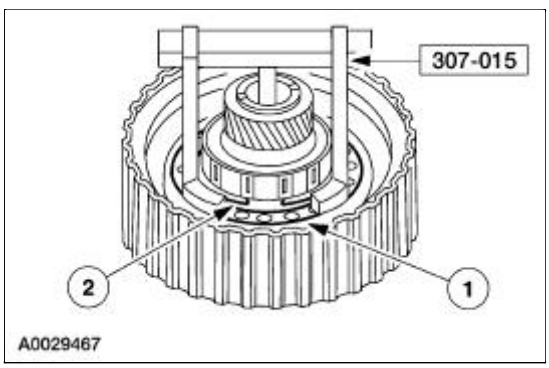


Assembly

1. If the sun gear was removed, install the sun gear.

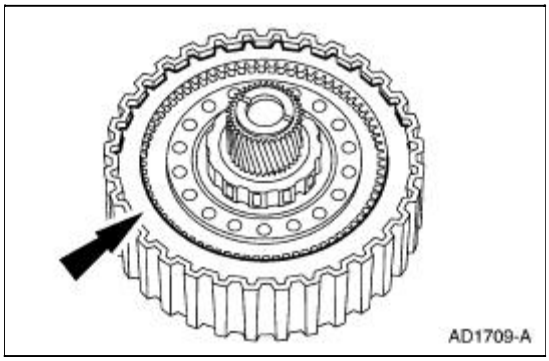


2. Inspect the coast clutch piston and seal assembly for damage and the check ball for free movement.
   Install a new clutch piston and seal assembly if damaged.

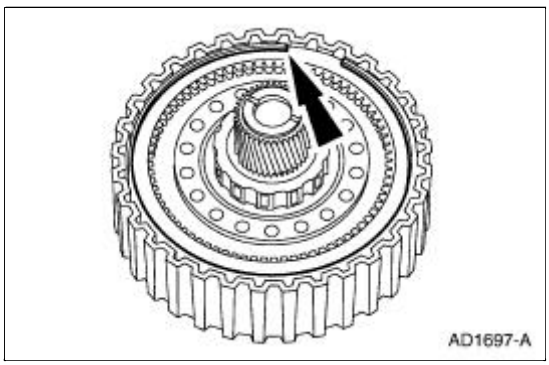


3. **NOTE:** Prior to installing the coast clutch piston, lubricate the piston seal with petroleum jelly.

   Using the special tool, install the coast clutch piston.

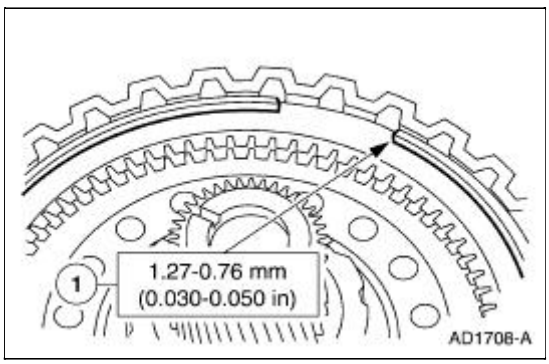


4. Using the special tool, install the coast clutch retaining ring.
   1. Install the return spring.
   2. Install the retaining ring.

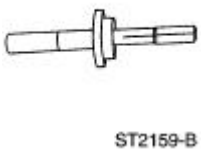


5. Make sure that the OWC is locked in place. Turn counterclockwise to lock in place. Install the overdrive one way clutch.

6. Install the coast clutch pressure plate and the clutch plates.

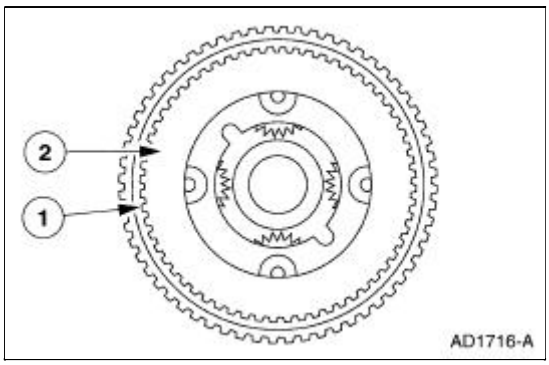


7. Install the retaining ring.



8. Check the stack-up clearance.
    1. Using a feeler gauge, measure the stack up clearance in three places, 120 degrees apart, between the snap ring and the coast clutch pressure plate.

    - If the clearance is not within specification, install the correct coast clutch pressure plate retainer snap ring and recheck the clearance.

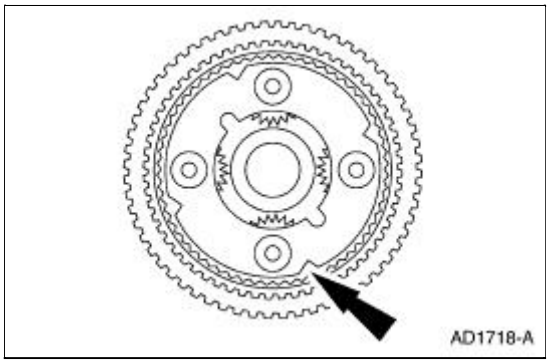


Overdrive Ring Gear and Center Shaft Assembly

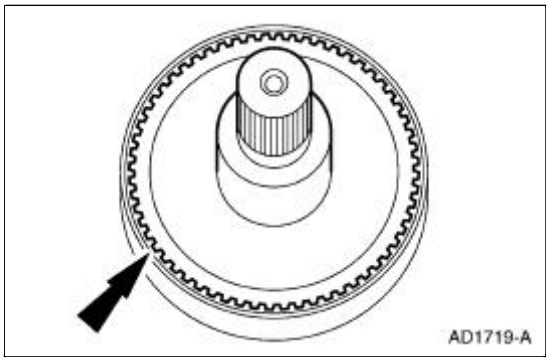
Special Tool(s)

 ST2159-B	Loading Fixture, Clutch 307-S383

Disassembly



1. Remove the overdrive one-way clutch (OWC) outer race.
    1. Remove the retaining ring.
    2. Remove the overdrive OWC outer race.

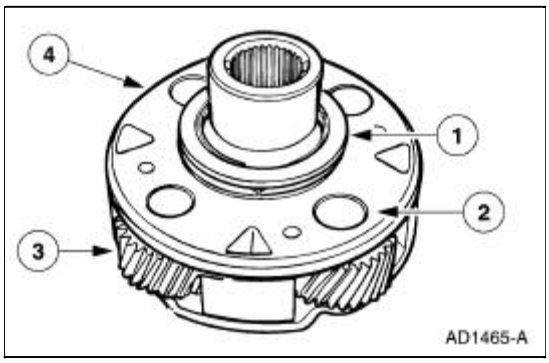


2. Remove the No. 3 overdrive overrunning clutch plastic thrust washer.

3. The No. 4 overdrive planet thrust bearing may stay in the ring gear. Remove the overdrive planet assembly.

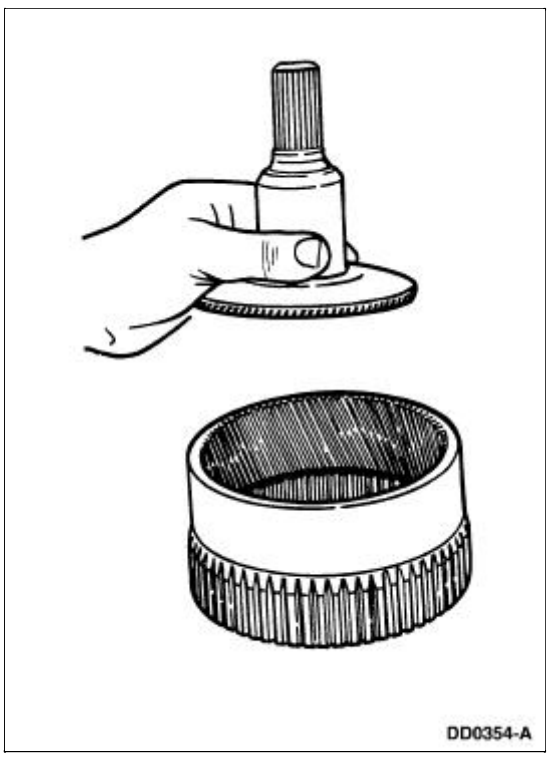
4. Remove the wave retaining ring.

5. Remove the overdrive center shaft.



6. **CAUTION: Use care not to damage the thrust bearing or damage to transmission may occur.**

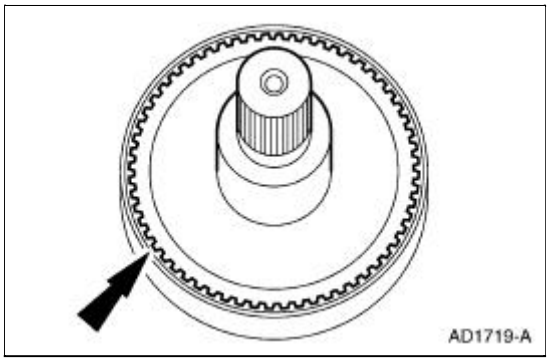
NOTE: The individual parts of the planet assemblies are not repairable.



Inspect the No. 4 overdrive planet thrust bearing assembly.

1. Remove the No. 4 overdrive planet thrust bearing assembly. Wash the thrust bearing thoroughly in cleaning solvent. Blow dry the bearing with compressed air and lubricate with clean transmission fluid. Replace any bearing and race that show any sign of wear.
2. Inspect the pinion shafts in the planet assembly. Check for looseness and damage.
3. Inspect the pinion gears for damage and free rotation.
4. Inspect the planet carrier for damage.

Assembly



1. Install the overdrive center shaft.

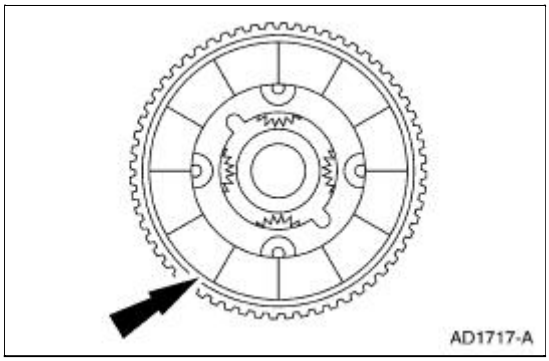
2. **CAUTION: Make sure that the retaining ring is fully seated in the ring gear groove or transmission failure could occur.**

   NOTE: The retaining ring is used to hold the center shaft in the ring gear.

   Install the wavy retaining ring.

3. **NOTE:** Make sure the bearing outer lip faces the rear of the overdrive planet assembly.

   Install the No. 4 overdrive planet thrust bearing assembly.

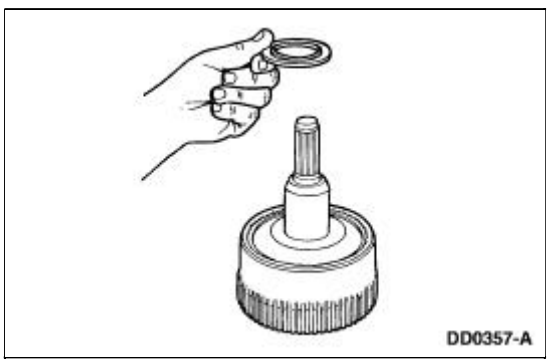


4. **CAUTION: The input shaft and overdrive planet assembly are repaired as mating components.**

   NOTE: The planet assemblies are model-dependent. Refer to the parts catalog for correct part.

   Install the overdrive planet assembly.

5. Install the No. 3 overdrive overrunning clutch thrust washer. Make sure that the tab on the backside is locked down in place on the planet assembly.



6. Install the retaining ring.
    1. Install the overdrive OWC outer race with the beveled edge facing up.
    2. Install the retaining ring; make sure that the ring is fully seated.

7. **NOTE:** Lightly lubricate the thrust bearing with petroleum jelly to hold it in place during assembly.

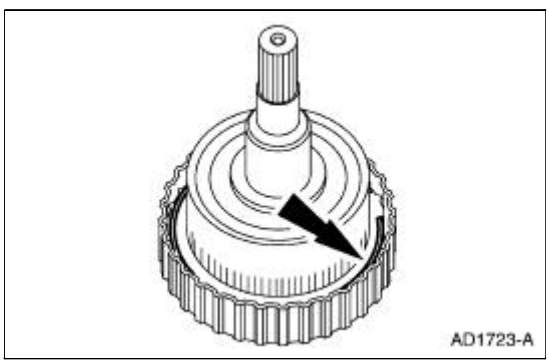
    NOTE: The inner bearing race lip must face upward.

    Install the No. 5 overdrive center shaft thrust bearing assembly.

8. **CAUTION: Do not damage the overdrive OWC or damage to the transmission may occur.**

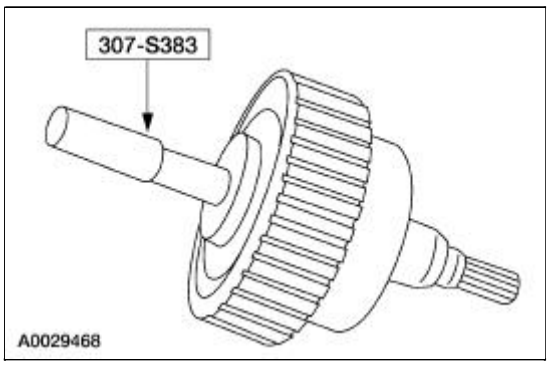
    NOTE: When the overdrive center shaft is correctly assembled, the overdrive center shaft and the ring gear should rotate counterclockwise and lock when rotated clockwise.

    Assemble the overdrive center shaft assembly into the coast clutch cylinder.



9. **NOTE:** The number of plates are model-dependent.

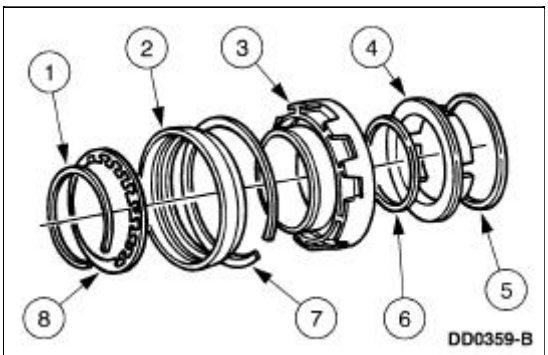
   Install the clutch pack and pressure plate.



10. Install the retaining ring; make sure that the ring is fully seated.

11. **CAUTION: Not using the special tool can cause damage to the overdrive OWC assembly.**

    Install the special tool for use during assembly.

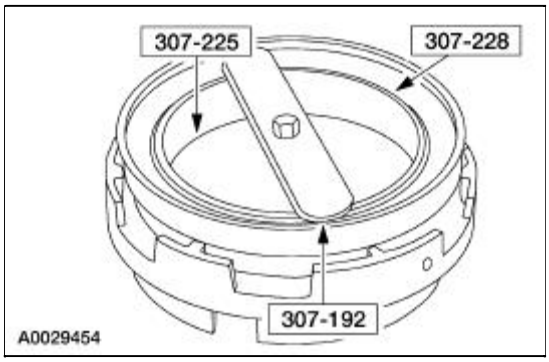


Intermediate/Overdrive Cylinder Assembly

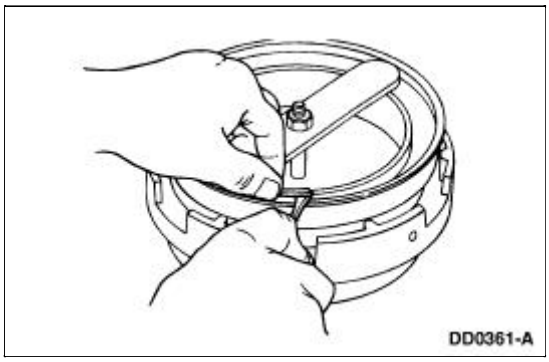
Special Tool(s)

 ST1219-A	Remover, O-Ring Seal 100-010 (T71P-19703-C)
 ST1666-A	Compressor Plate, Clutch Spring 307-192 (T88C-77000-AH2)
 ST1665-A	Compressor Plate, Clutch Spring 307-225 (T89T-70010-C2)
 ST1853-A	Compressor Plate, Clutch Spring 307-228 (T89T-70010-F)

Intermediate/Overdrive Cylinder Assembly, Disassembled View

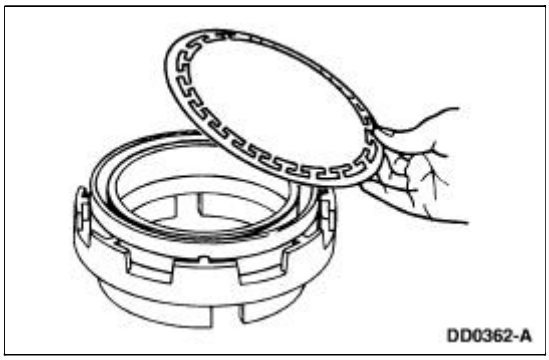


Item	Part Number	Description
1	7A527	Overdrive clutch piston return spring retainer
2	7A262	Overdrive clutch piston and (bonded) seal assembly
3	7G384	Intermediate/overdrive cylinder



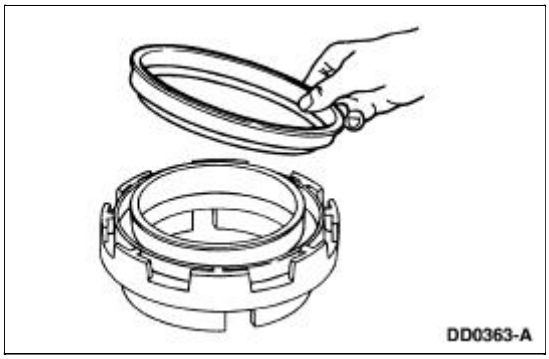
4	7E005	Intermediate clutch piston
5	7F224	Intermediate clutch piston outer seal
6	7F225	Intermediate clutch piston inner seal
7	7D483	Intermediate cylinder retaining ring
8	7B070	Overdrive clutch piston return spring

Disassembly

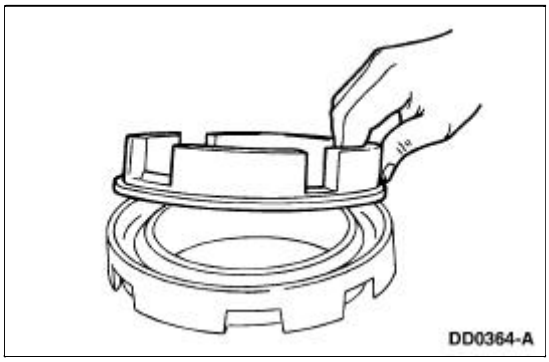


1. Using the special tools, compress the overdrive clutch piston return spring.

2. Remove the overdrive clutch piston return spring retainer. Remove the special tools.

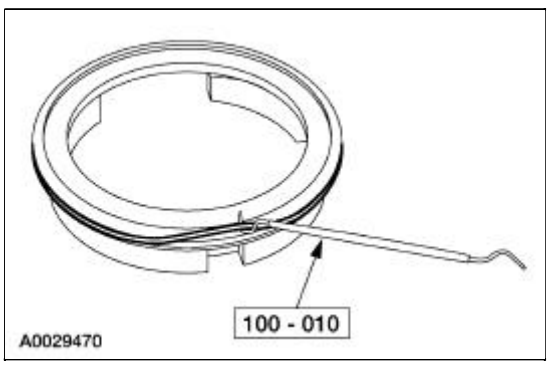


3. Remove the overdrive clutch piston return spring.



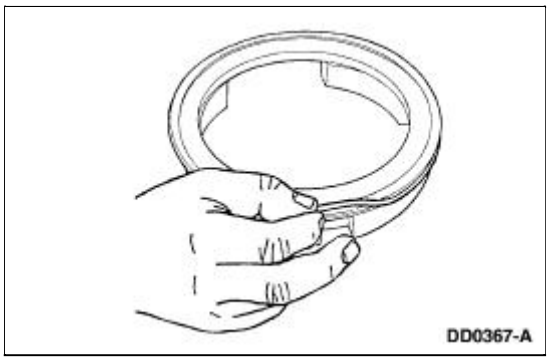
4. **NOTE:** The overdrive piston seals are bonded to the piston. If the seals are damaged, replace the piston assembly.

   Remove the overdrive clutch piston and seal assembly.

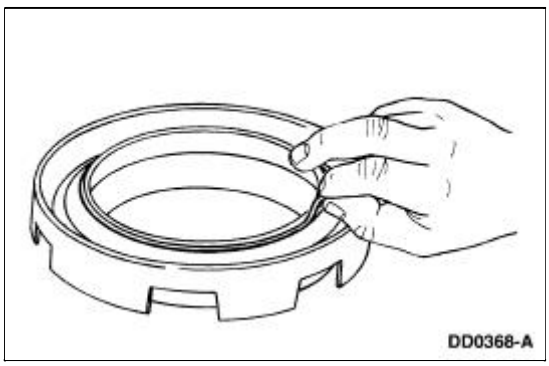


5. Remove the intermediate clutch piston.

6. Using the special tool, remove the intermediate clutch piston inner seal.



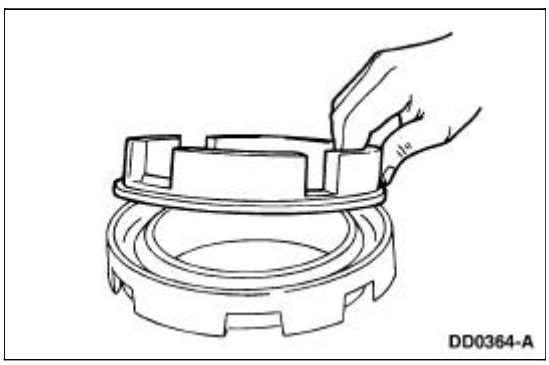
7. Using the special tool, remove the intermediate clutch piston outer seal.



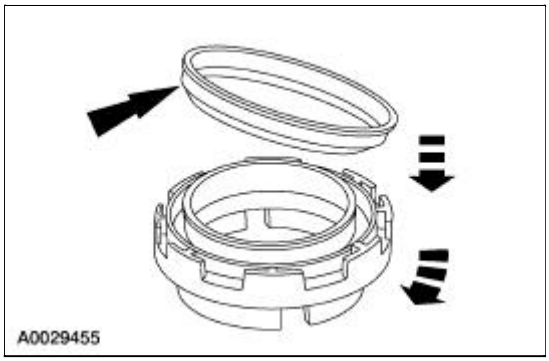
Assembly

1. **NOTE:** Prior to reassembly, inspect the check ball, the cup plugs and the feedbolt threads for contamination or damage. Clean or install new as necessary.

Lubricate with petroleum jelly or equivalent. Install the intermediate clutch piston outer seal, with the lip seal facing upward.

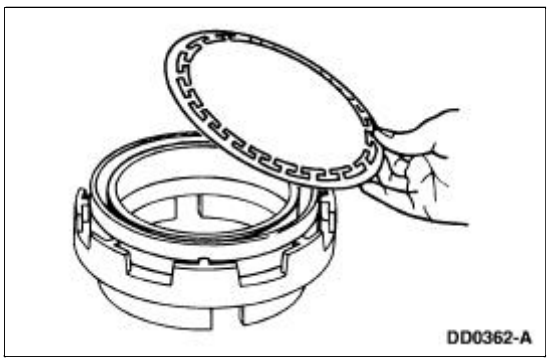


2. Lubricate with petroleum jelly or equivalent. Install the intermediate clutch piston inner seal, with the lip seal facing downward toward the cylinder.



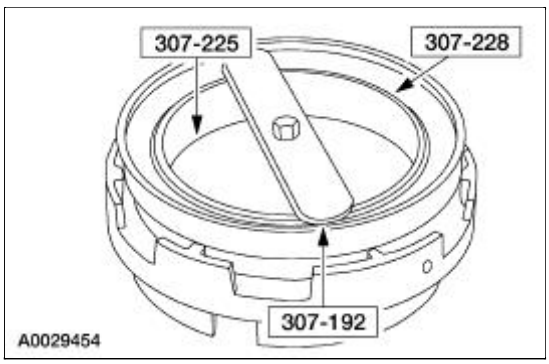
3. **NOTE:** The piston should rotate freely in the cylinder.

   Install the intermediate clutch piston.



4. **CAUTION: The overdrive piston lip seals are bonded to the piston. Use care not to damage or roll the lip seal over.**

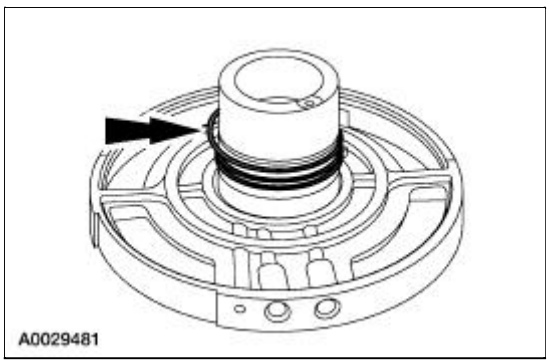
   Lubricate seal with petroleum jelly or equivalent. Position the overdrive clutch piston and seal assembly onto the intermediate/overdrive cylinder at a slight angle. Then, rotate the piston while pressing it down until fully seated onto the cylinder.



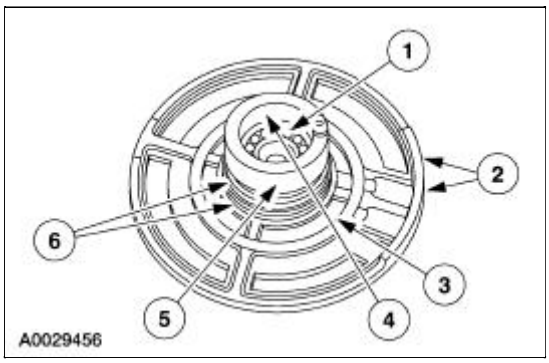
5. **NOTE:** The overdrive clutch piston return spring must be installed with fingers facing upward.

   Install the overdrive clutch piston return spring.

6. Using the special tools, compress the overdrive clutch piston return spring.



7. Install the overdrive clutch piston return spring retainer. Make sure the retainer is fully seated, then remove the tools.

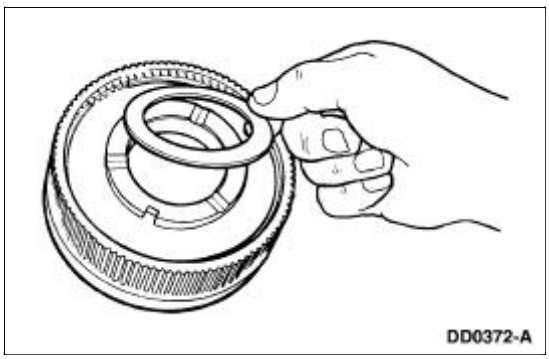


Center Support

Disassembly

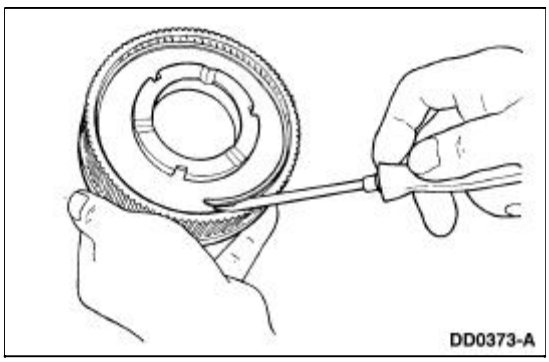
1. Remove and discard the direct clutch seal rings.

2. Inspect the following for contamination or damage. Clean or install as necessary.
    1. Inspect the ball bearing.
    2. Inspect the feedbolt threads.
    3. Remove and inspect the No. 6 center support thrust washer.
    4. Inspect the inner hub diameter.
    5. Inspect the outer hub diameter.
    6. Inspect the seal ring grooves.



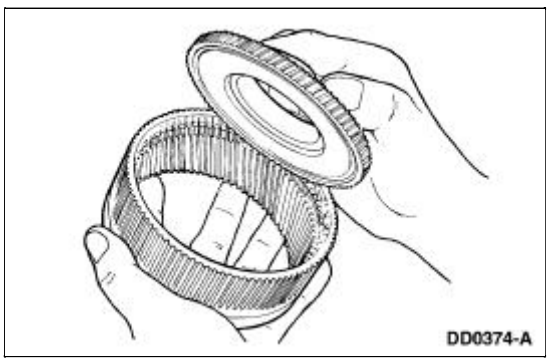
Assembly

1. Follow the disassembly procedure in reverse order.
    - Lightly lubricate the thrust washer with petroleum jelly to hold it in place during assembly.
    - Install new seals.



Forward Hub and Ring Gear

Disassembly



1. Remove the No. 8C forward clutch hub thrust washer.

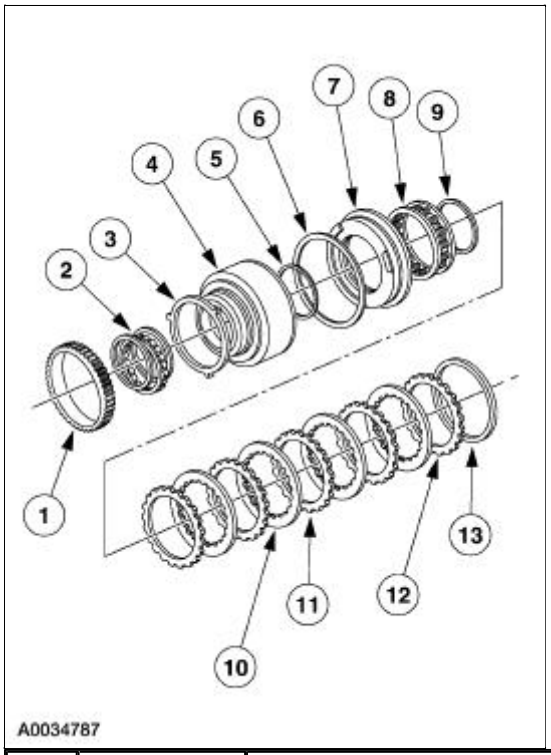
2. Remove the forward hub retaining ring.

3. Remove the forward hub.

Assembly

1. Follow the disassembly procedure in reverse order.
   - Lightly lubricate the thrust washer with petroleum jelly to hold it in place during assembly.
   - When installed, make sure the retaining ring is fully seated in the forward ring gear ring groove.

Direct Clutch Assembly and Intermediate Brake Drum

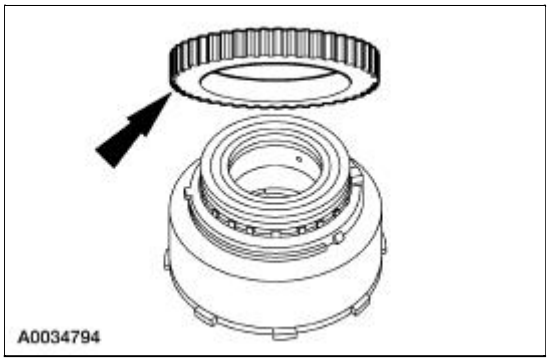


Special Tool(s)

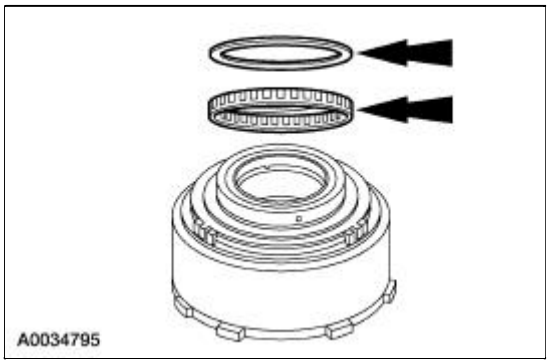
 ST1190-A	Compressor, Clutch Spring 307-015 (T65L-77515-A)
 ST1219-A	Remover, O-Ring Seal 100-010 (T71P-19703-C)

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

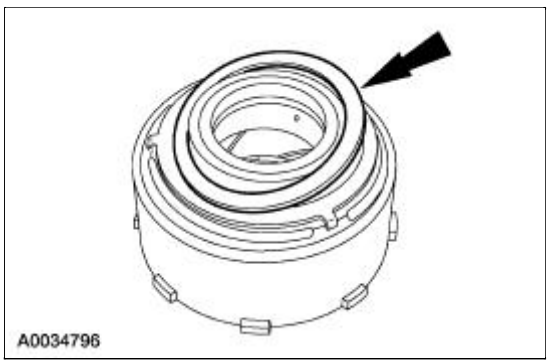


Direct Clutch Assembly and Intermediate Brake Drum, Disassembled View

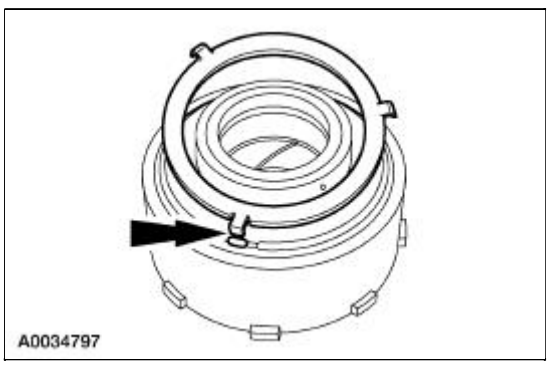


Item	Part Number	Description
1	—	Intermediate one-way clutch outer race (part of 7A089)
2	—	Intermediate one-way clutch inner race (part of 7A089)
3	7G401	Intermediate one-way clutch thrust washer No. 7
4	7D044	Intermediate brake drum
5	7A548	Direct clutch piston inner seal
6	7A548	Direct clutch piston outer seal
7	7A262	Direct clutch piston
8	7F235	Direct clutch return spring assembly
9	7C122	Direct clutch return spring retaining ring
10	7B164	Direct clutch internal spline plates — friction
11	7B442	Direct clutch external spline plates — steel
12	7B066	Direct clutch pressure plate
13	377126-S	Direct clutch pressure plate retaining ring (selective)

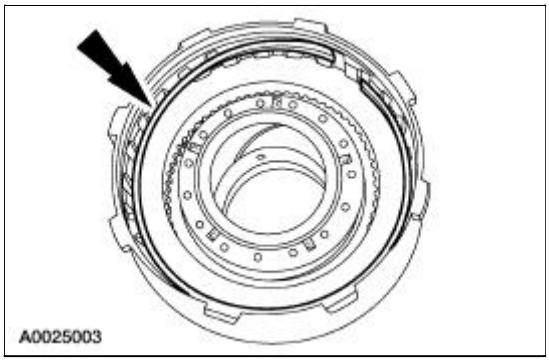
Disassembly



1. Remove the intermediate one-way clutch (OWC) outer race, and inspect for damage.

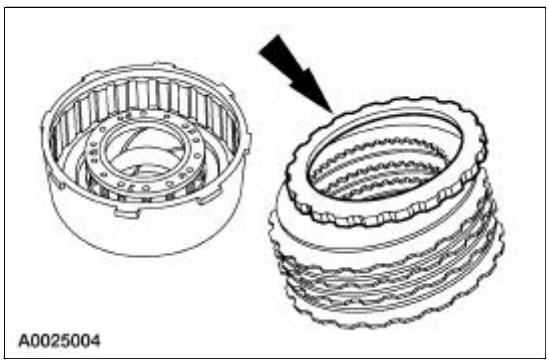


2. Remove the top end cap and the intermediate OWC. Inspect the sprags, cage, and top end cap for excessive wear or damage.

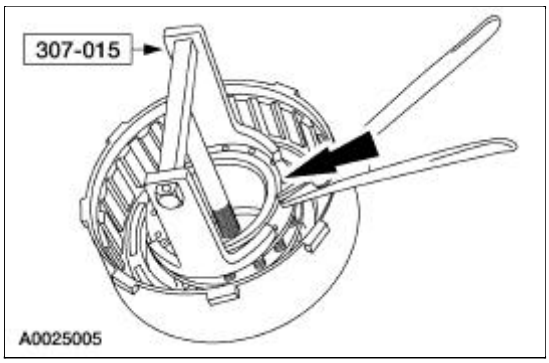


3. Remove the bottom end cap and inspect for damage.

4. Remove the No. 7 intermediate OWC thrust washer.

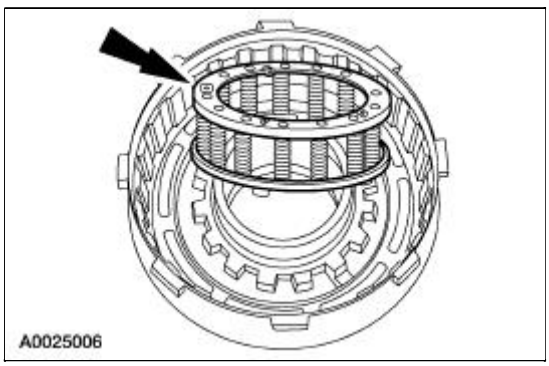


5. Remove the direct clutch pressure plate retaining ring.



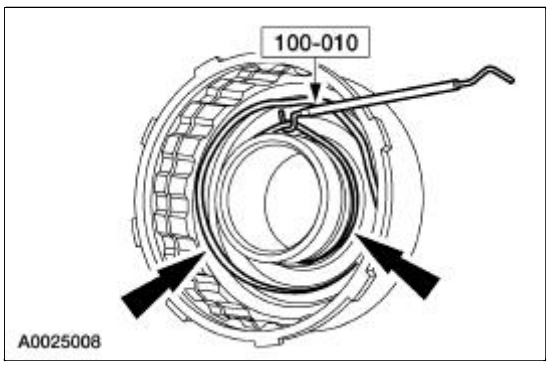
6. **NOTE:** Tag the parts for identification during installation.

   Remove the direct clutch pressure plate and the clutch pack.



7. **CAUTION: Do not fully compress the return springs or the spring may break.**

   Using the special tool, remove the direct clutch return spring retaining ring. Remove the tool.



8. Remove the direct clutch return spring assembly.

9. Remove the direct clutch piston.

10. Using the special tool, remove the direct clutch piston inner and outer seals.

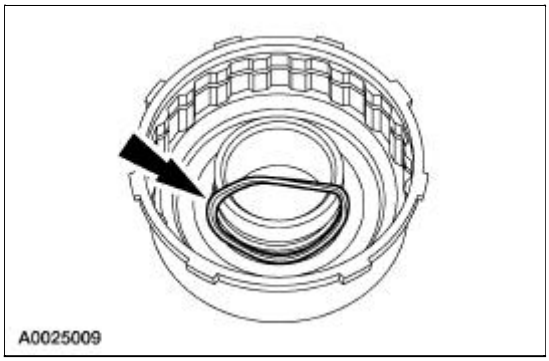
11. Inspect the clutch cylinder thrust surfaces, piston bore, and clutch plate splines for scores, burrs or wear. Install a new clutch cylinder if it is badly scored or damaged.

12. Check the fluid passage in the clutch cylinder for obstructions. Clean out all fluid passages. Inspect clutch piston for scores and install new if necessary. Inspect the check balls for freedom of movement.

13. Check the clutch release spring for distortion and cracks. Install a new spring if it is distorted or cracked.

14. Inspect the friction clutch plates, steel clutch plates, and clutch pressure plate for worn or scored surfaces. Install new parts that are scored, burred or burnt.

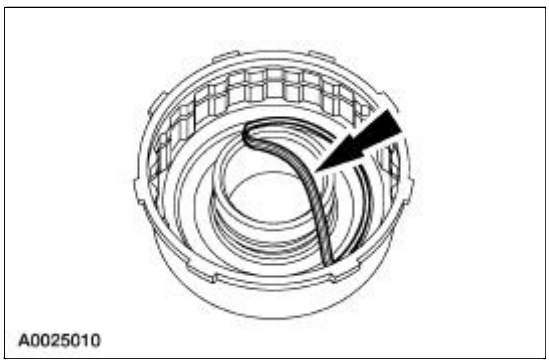
15. Check the clutch plates for flatness and wear on the clutch hub splines. Discard any plate that does not slide freely on the splines or is not flat.



16. Check the clutch hub thrust surfaces for scores and the clutch hub splines for wear. Install new parts that are worn.

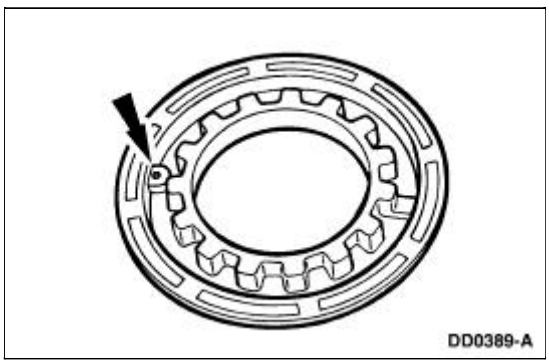
Assembly

NOTE: Soak the clutch plates for 15 minutes in clean automatic transmission fluid.



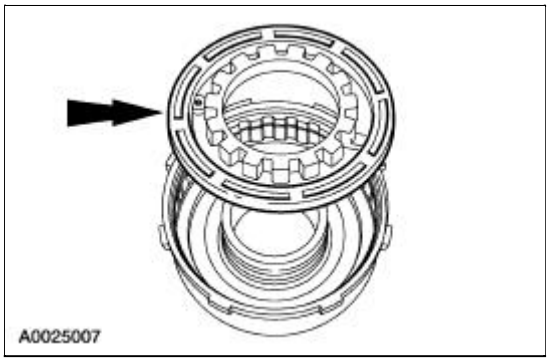
1. **NOTE:** The seal lip must face downward.

   Install the direct clutch piston inner seal.

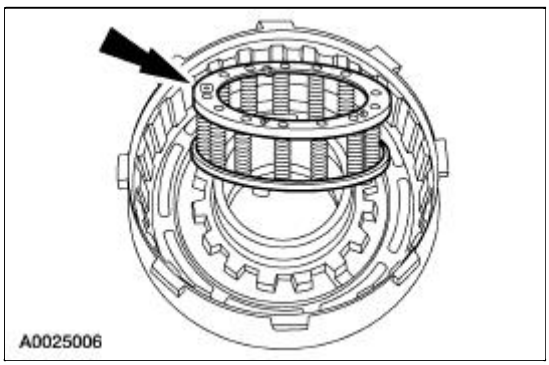


2. **NOTE:** The seal lip must face downward.

   Install the direct clutch piston outer seal.

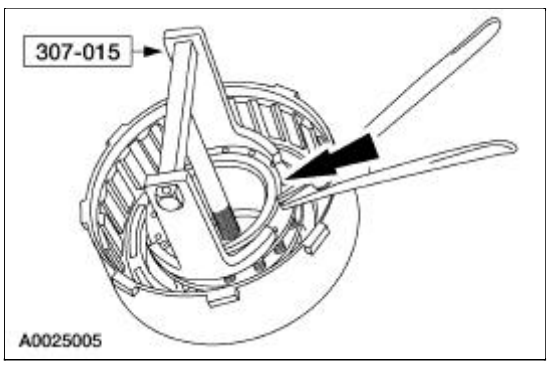


3. Inspect the direct clutch piston check ball.
   - Check for freedom of movement and correct seating.
   - Clean the direct clutch piston with solvent if necessary.
   - Install a new direct clutch piston if damaged.



4. **NOTE:** The piston should rotate freely in the drum.

   Install the direct clutch piston.

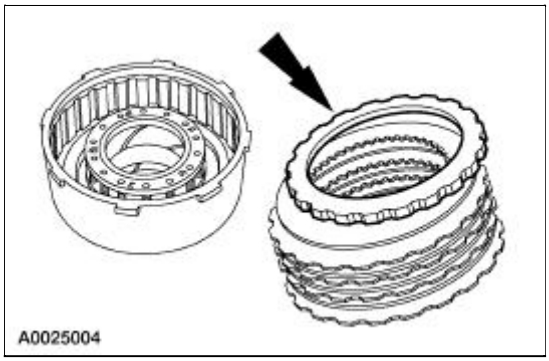


5. **NOTE:** Make sure the protrusions on the bottom of the direct clutch return spring assembly are correctly engaged with the lugs on the direct clutch piston.

   Install the direct clutch return spring assembly.

6. **CAUTION: Do not fully compress the return springs or damage to spring may occur.**

   Using the special tool, install the direct clutch return spring retaining ring. Remove the tool.



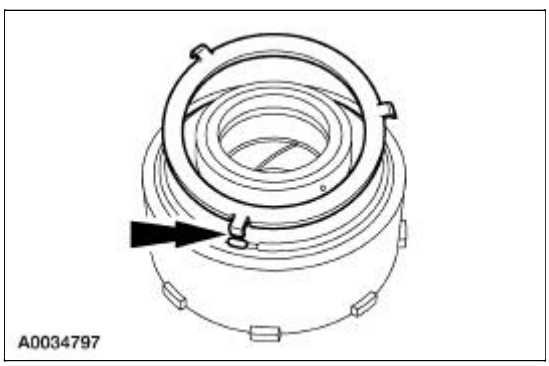
7. **CAUTION: Mixing or using friction plates without the grooves will cause shift concerns and can cause damage.**

   NOTE: Soak the clutch plates for 15 minutes in clean automatic transmission fluid.

   NOTE: The direct clutch friction plates have lube grooves in the friction material.

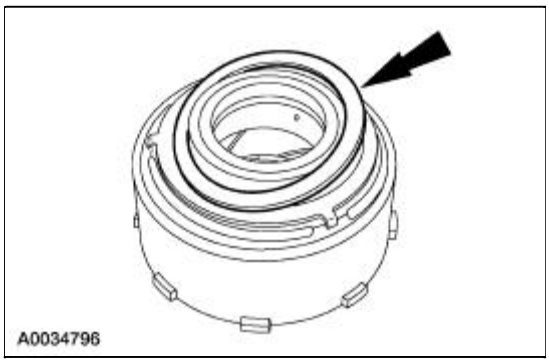
   NOTE: The number of plates are model dependent.

   Alternately install the steel and the friction clutch plates, beginning with a steel plate and ending with the direct clutch pressure plate.

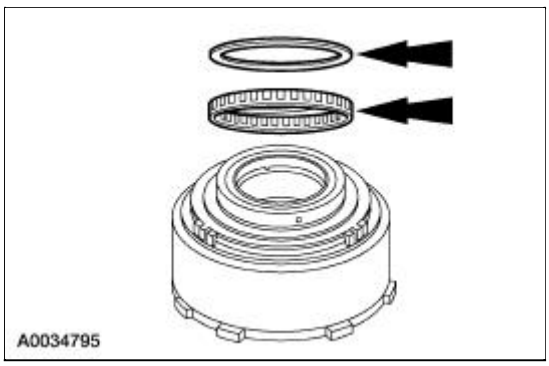


8. Install the selective direct clutch pressure plate retaining ring.

9. Check the stack-up clearance.
    1. Using a feeler gauge, check the stack-up clearance in three places, 120 degrees apart.
    2. If the clearance is not to specification, install the correct selective direct clutch pressure plate retaining ring and recheck the clearance. Refer to the Clutch Plate Usage and Clearance Specification Chart for selective snap ring thicknesses and part numbers.



10. Install the No. 7 intermediate one-way clutch thrust washer. Make sure the tabs on the No. 7 intermediate one-way clutch thrust washer are aligned with the notches in the intermediate brake drum.



11. **NOTE:** The top and bottom end caps are identical.

    Install the bottom end cap.

12. **NOTE:** The lip on the intermediate one-way clutch must face upward.

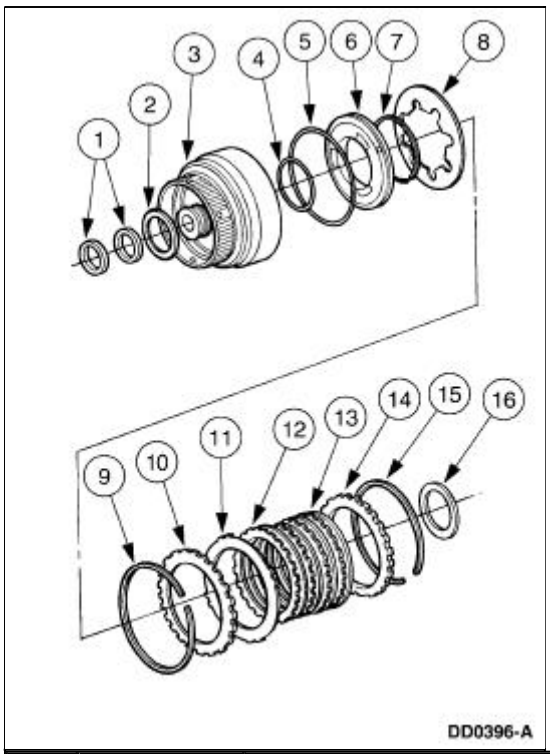
    Install the intermediate one-way clutch over the inner race and install the top end cap.

13. **NOTE:** The shoulder on the outer race must face upward.

    NOTE: When installed correctly, the outer race must rotate counterclockwise.

    Install the intermediate one-way clutch outer race.

Forward Clutch Assembly

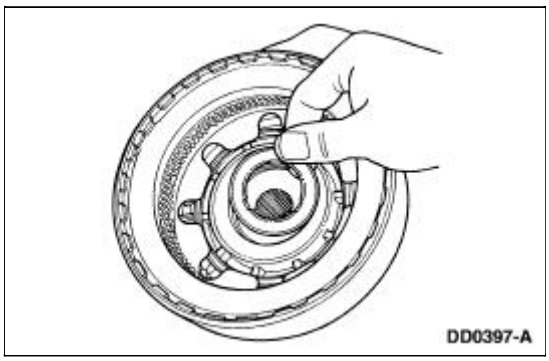


Special Tool(s)

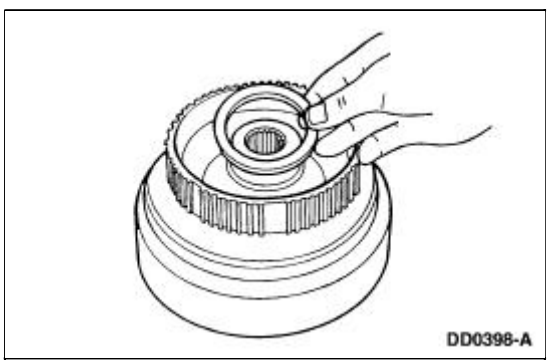
 ST1219-A	Remover, O-Ring Seal 100-010 (T71P-19703-C)
 ST1747-A	Protector, Piston Seal 307-068 (T77L-77548-A)

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

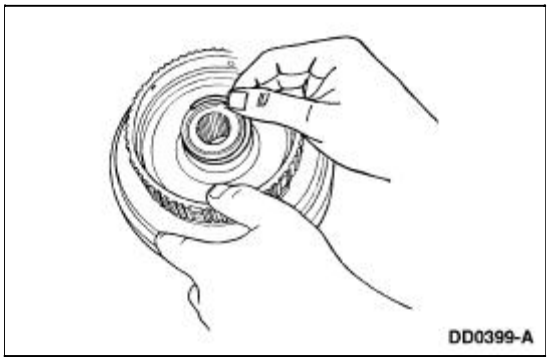


Forward Clutch Assembly, Disassembled View

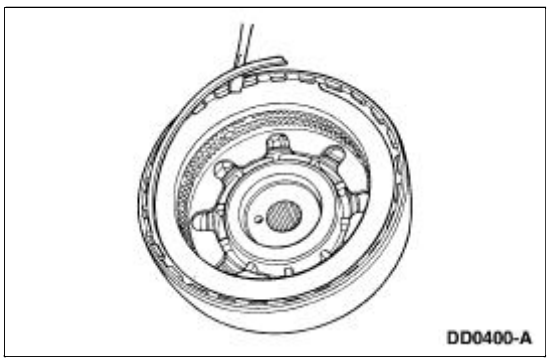


Item	Part Number	Description
1	7D019	Forward clutch cylinder seals
2	7F374	Forward clutch needle thrust bearing assembly (No. 8B)
3	7A360	Forward clutch cylinder
4	7A548	Forward clutch piston, inner seal
5	7A548	Forward clutch piston, outer seal
6	7A262	Forward clutch piston
7	7D256	Forward clutch piston apply ring
8	7B070	Forward clutch piston return spring
9	377127-S	Forward clutch piston return spring retaining ring
10	7B066	Forward clutch pressure plate — bottom
11	7E085	Forward clutch pressure spring
12	7B442	Forward clutch external spline, plate — steel
13	7B164	Forward clutch internal spline plates — friction
14	7B066	Forward clutch pressure plate — top
15	377127-S	Forward clutch pressure plate retaining ring (selective fit)
16	7D234	Forward clutch thrust bearing No. 9A)

Disassembly

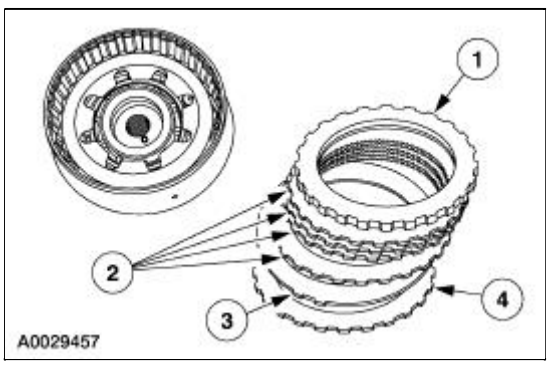


1. Remove the No. 9A forward clutch thrust bearing.

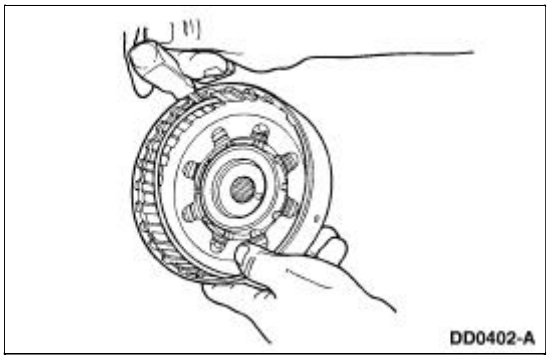


2. Remove the No. 8B forward clutch needle bearing assembly.

3. Remove the 2 interlocking cast iron forward clutch cylinder seals.

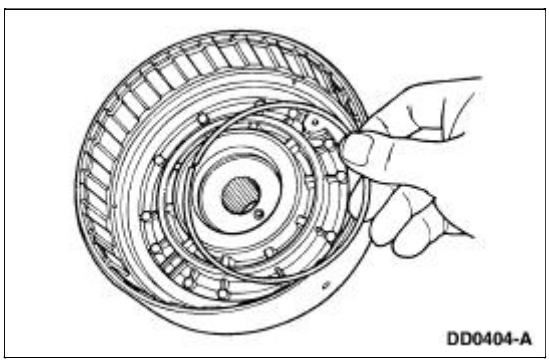


4. Remove the selective forward clutch pressure plate retaining ring.

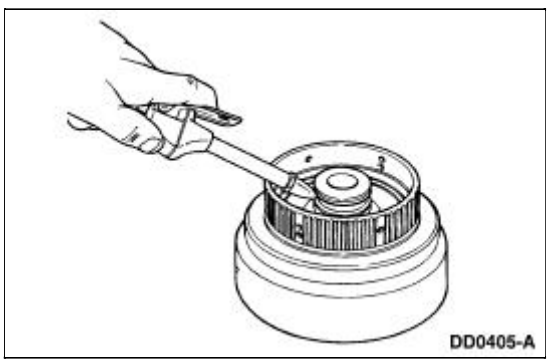


5. **NOTE:** Tag the parts for identification during installation.

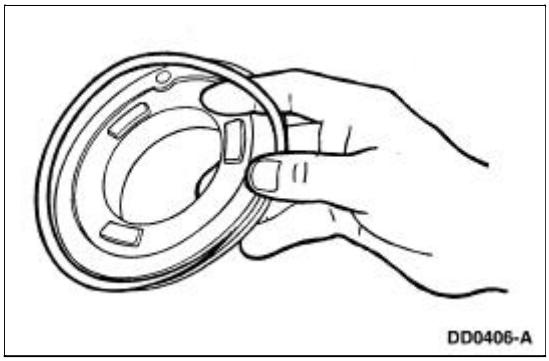
   Remove the forward clutch pressure plates.
   1. Remove the top forward clutch pressure plate.
   2. Remove the clutch plates.
   3. Remove the forward clutch pressure spring.
   4. Remove the bottom forward clutch pressure plate.



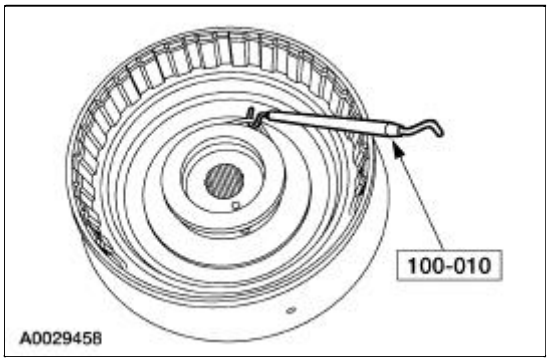
6. Remove the forward clutch piston return spring retaining ring.



7. Remove the forward clutch piston return spring.



8. Remove the forward clutch piston apply ring.



9. Using compressed air, remove the forward clutch piston.

10. Remove the outer forward clutch piston seal.

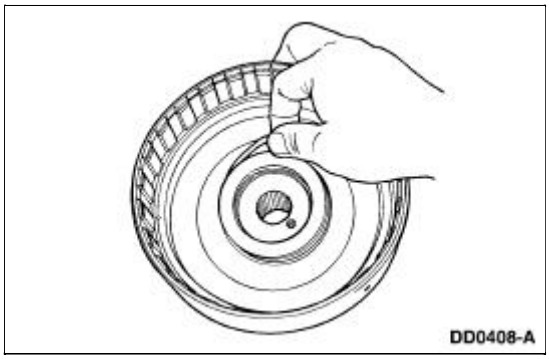
11. Using the special tool, remove the forward clutch piston inner seal.

12. Inspect the clutch cylinder thrust surfaces, piston bore, and clutch plate splines for scores, burrs or wear. Install a new clutch cylinder if it is badly scored or damaged.

13. Check the fluid passage in the clutch cylinder for obstructions. Clean out all fluid passages. Inspect clutch piston for scores and install new if necessary. Inspect the check balls for freedom of movement.

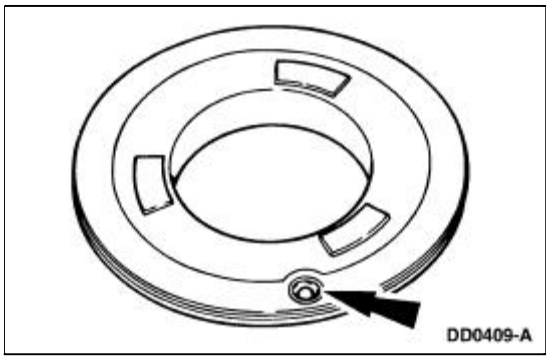
14. Check the clutch release spring for distortion and cracks. Install a new spring if it is distorted or cracked.

15. Inspect the friction clutch plates, steel clutch plates, and clutch pressure plate for worn or scored surfaces. Install new parts that are scored, burred or burnt.



16. Check the clutch plates for flatness and wear on the clutch hub splines. Discard any plate that does not slide freely on the splines or that is not flat.

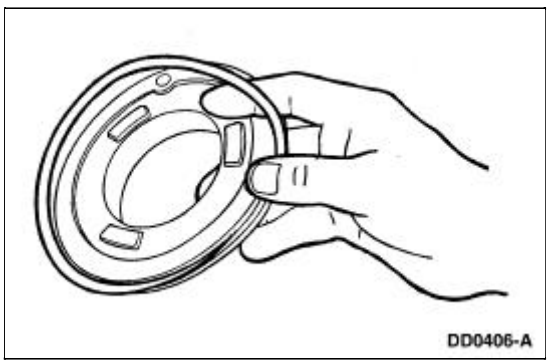
17. Check the clutch hub thrust surfaces for scores and the clutch hub splines for wear. Install new parts that are worn.



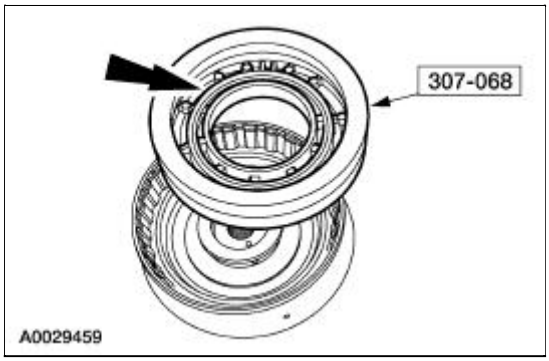
Assembly

NOTE: Soak the clutch plates for 15 minutes in clean automatic transmission fluid.

1. Install the forward clutch piston inner seal.



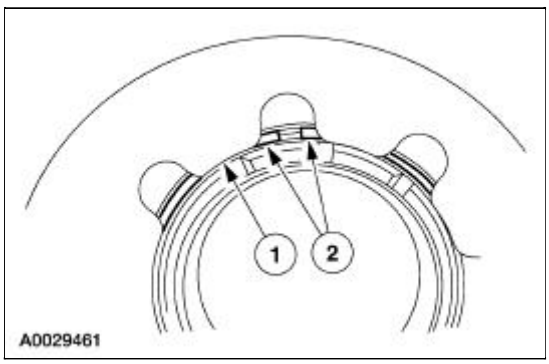
2. Inspect the forward clutch piston check ball.
    - Check for freedom of movement and correct seating.
    - Clean with a suitable solvent, if necessary.
    - Replace the forward clutch piston assembly, if necessary.



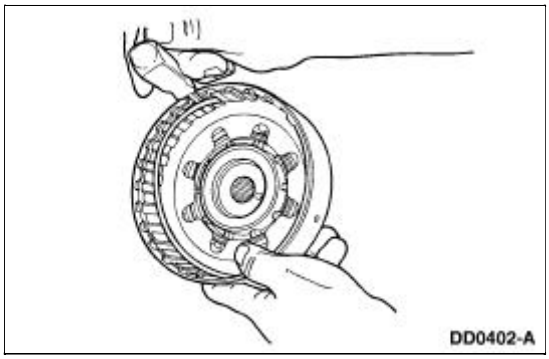
3. **NOTE:** Make sure the seal lip is facing upward.

    Install the forward clutch piston outer seal.

4. Using the special tool, install the forward clutch piston.

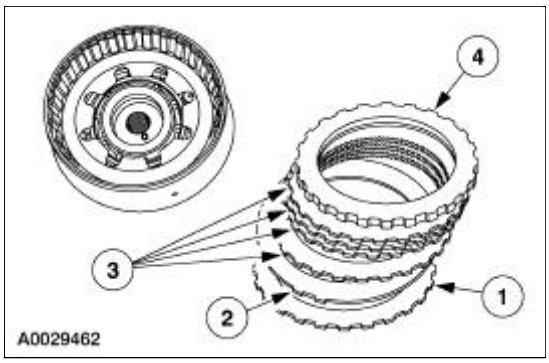


5. Install the steel forward clutch piston apply ring into the forward clutch piston groove.

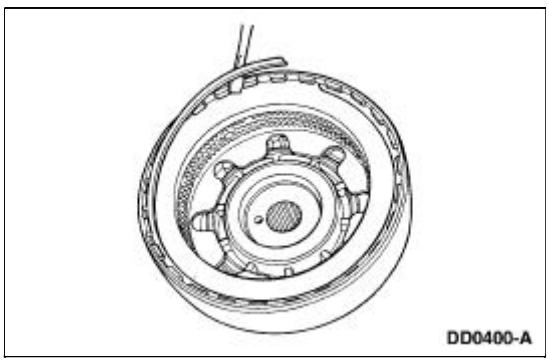


6. **CAUTION: To ensure durability, the notch between the spring fingers must be positioned so that both ends of the forward clutch piston apply ring are visible.**

   Install the forward clutch piston return spring.
   1. Install the forward clutch piston return spring, with the spring fingers against the forward clutch piston apply ring.
   2. Make sure the notch is positioned so that both ends of the forward clutch piston apply ring are visible.



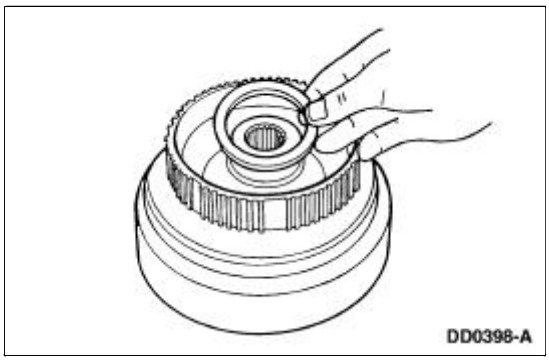
7. Install the forward clutch piston return spring retaining ring. Make sure it is correctly seated in the groove.



8. **NOTE:** Soak the clutch plates for 15 minutes in clean automatic transmission fluid.

   Install the forward clutch pressure plates.
   1. Install the bottom forward clutch pressure plate.
   2. Install the forward clutch pressure spring.
   3. Install the forward clutch pressure plates.
   4. Install the top forward clutch pressure plate.

9. Install the selective forward clutch pressure plate retaining ring.



10. Check the stack-up clearance.
    - Using a feeler gauge, check the stack-up clearance in three places, 120 degrees apart.
    - If the clearance is not to specification, install the correct selective forward clutch pressure plate retaining ring and recheck the clearance. Refer to the Clutch Plate Usage and Clearance Specification Chart for selective snap ring thicknesses and part numbers.

11. **NOTE:** Lightly lubricate the needle bearing with petroleum jelly to hold it in place during assembly.

    NOTE: The bearing large inner diameter radius must face inward.

    Install the No. 8B forward clutch needle bearing.

12. **NOTE:** Stagger the interlocking opening on the seals 180 degrees apart.

    Install the two new cast iron forward clutch cylinder seals in the grooves.

13. **NOTE:** Lightly lubricate the thrust bearing with petroleum jelly to hold it in place during assembly.

    NOTE: The black side of the bearing must face upward.

    Install the No. 9A forward clutch thrust bearing.

DD0397-A

Output Shaft —Check

Special Tool(s)

 ST2163-A	Remover/Installer, Bearing Tube 308-025 (T75L-7025-C)
 ST2161-A	Spacer, Output Shaft Speed Sensor 307-388

Disassembly

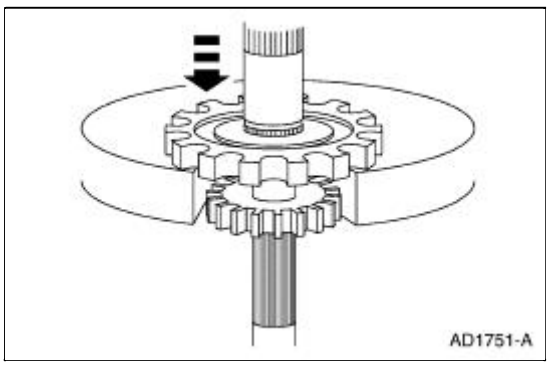
1. **CAUTION: Build-up of contamination can block the flow of lubricant behind the cup plug and cause transmission assembly damage.**

   NOTE: The anti-seepage seal is intended for shipping purposes only. It is not necessary to remove and reuse this seal when installing a new output shaft.

   NOTE: The output shaft cannot be disassembled. A new output shaft must be installed if damaged.

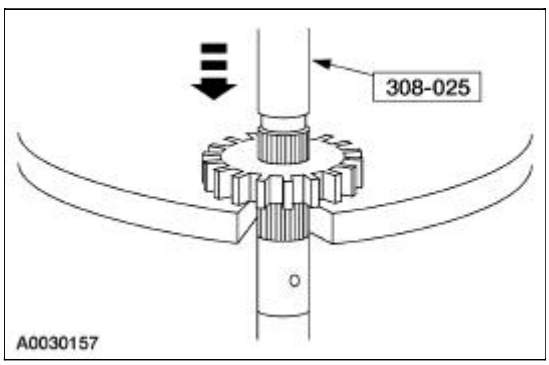
   Inspect the output shaft for wear. Make sure the cup plug orifice and lube passages through the output shaft are clean and free of debris. Install new as required.

2. Inspect the bearing surfaces of the output shaft for wear or scores. If excessive wear or scores are found, install a new output shaft and inspect mating components.



3. Check the splines on the output shaft for wear. Install a new output shaft if the splines are excessively worn. Inspect all the bushings for wear. Install new if worn or damaged.

4. Inspect the output shaft for damage. If damage is found, refer to the next two steps.
   1. Inspect the output shaft.
   2. Inspect the edges and the top of the output shaft drive sprocket speed sensor wheel.
   3. Inspect the park gear.

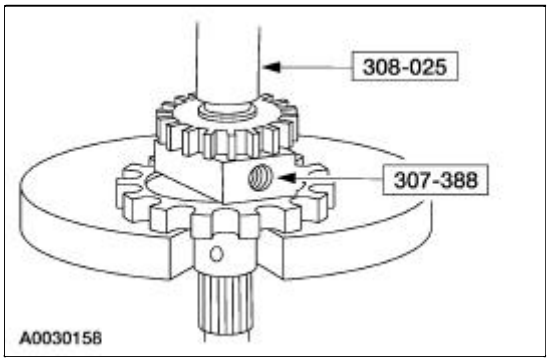


5. **NOTE:** The park gear and output shaft drive sprocket speed sensor wheel will only require removal or replacement if they are damaged.

   Using an arbor press, remove the park gear.

6. **NOTE:** If replacing the output shaft drive sprocket speed sensor wheel, the park gear will need to be removed first.

   If required, use an arbor press and the special tool to remove the park gear. Remove the park gear.

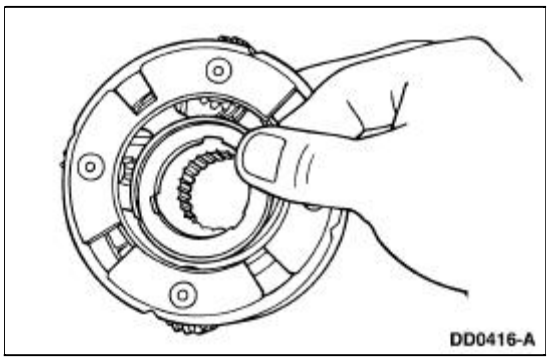


Assembly

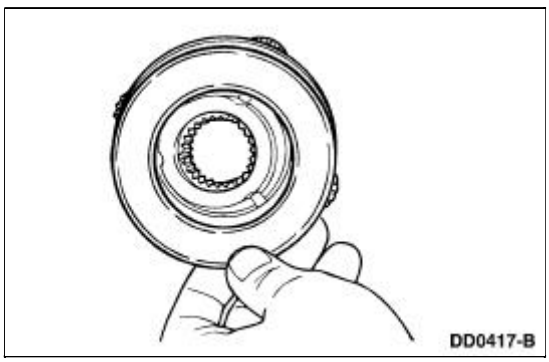
1. **NOTE:** If any damage is found to the output shaft drive sprocket speed sensor wheel, a new output shaft drive sprocket speed sensor wheel will need to be installed.

   If removed, use the arbor press and the special tool to install the park gear. Press the park gear onto the output shaft until it stops at the shoulder on the output shaft.

2. If removed, install the output shaft drive sprocket speed sensor wheel using the special tool.



Forward Planet Assembly

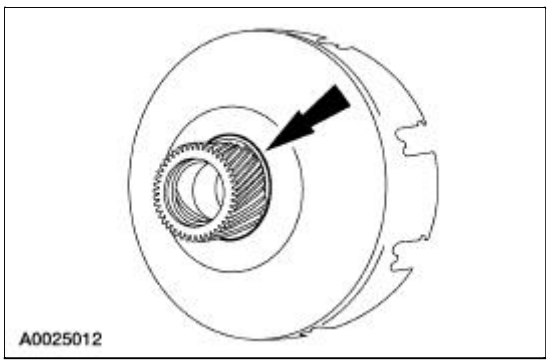


Disassembly

NOTE: Individual parts of the planet assemblies are not repairable.

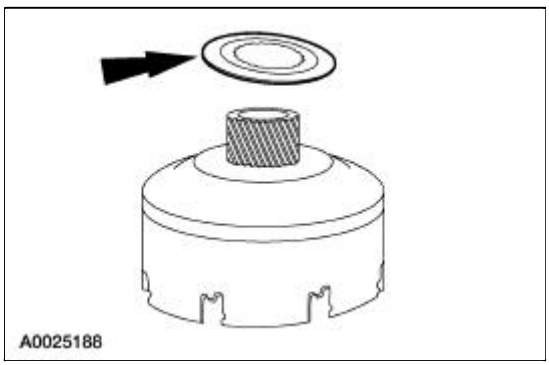
1. Remove the No. 9B forward clutch thrust bearing.

2. Remove the No. 10A forward planet assembly thrust bearing.
   - The pins and shafts in the plant assemblies should be checked for loose fit/damage. Use a new planet assembly if either condition exists.
   - Inspect the pinion gears for damaged or excessively worn teeth.
   - Check for free rotation of the pinion gears.
   - Check for damage in the overdrive planet assembly.



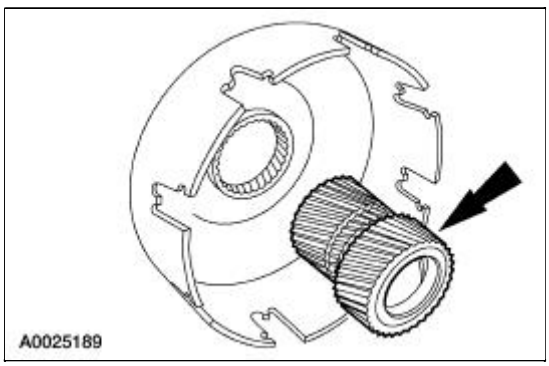
Assembly

1. Follow the disassembly procedure in reverse order.
   - Lightly lubricate the thrust bearing with petroleum jelly to hold it in place during assembly.
   - The No. 9B thrust bearing must be installed with the notched inner race facing outward.



Input Shell

Disassembly

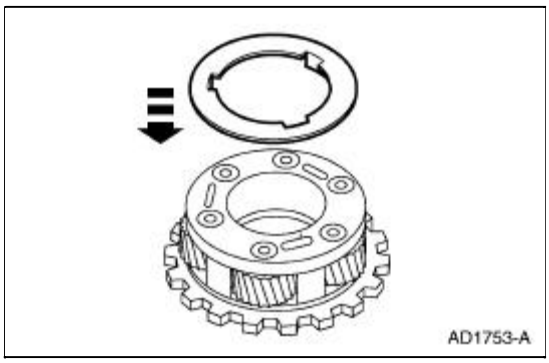


1. Remove and discard the forward/reverse sun gear retaining ring.

2. Remove the No. 14 input shell thrust washer.

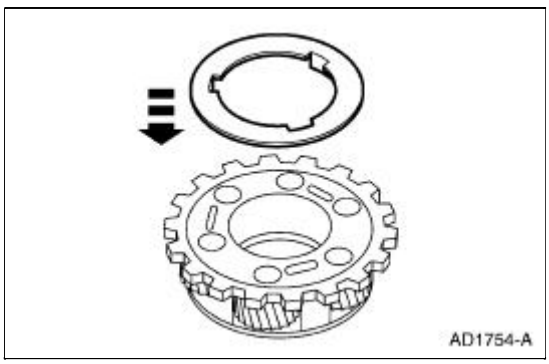
3. Remove the forward/reverse sun gear.

Assembly



1. Follow the disassembly procedure in reverse order.
    - Install the sun gear with the lube hole between the stand-off pads on the input shell.
    - Use care not to overextend the new retaining ring.

Reverse Planet Assembly

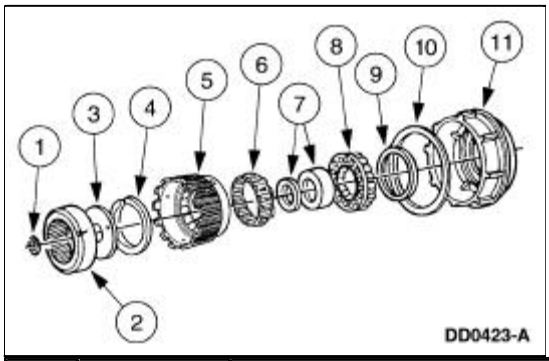


Disassembly

NOTE: Individual parts of the planet assemblies are not repairable.

1. Remove the No. 11 rear reverse planet thrust washer.

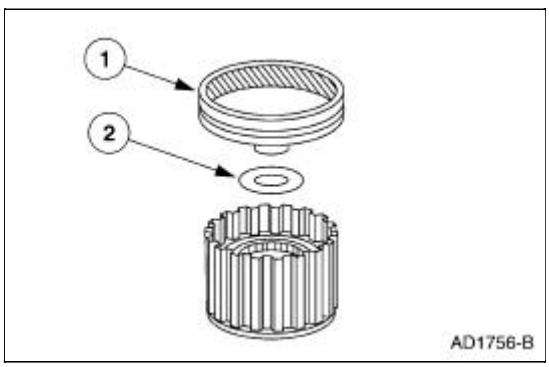
2. Remove the No. 10B front reverse planet thrust washer.
   - The pins and shafts in the planet assemblies should be checked for loose fit/damage. Use a new planet assembly if either condition exists.
   - Inspect the pinion gears for damaged or excessively worn teeth.
   - Check for free rotation of the pinion gears.
   - Check for damage in the overdrive planet assembly.



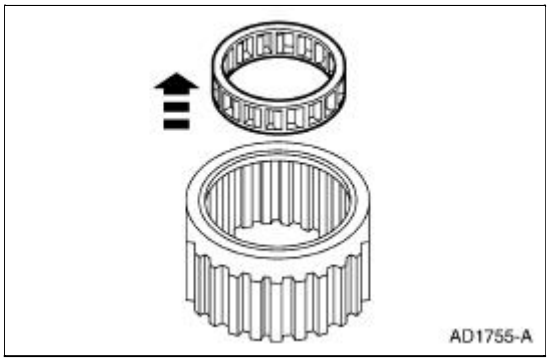
Assembly

1. Follow the disassembly procedure in reverse order.
   - Lightly lubricate the thrust washers with petroleum jelly to hold them in place during assembly.
   - The tabs on the thrust washers must engage the slots on the reverse planet assembly when installed.

Low One-Way Clutch Assembly



Low/Reverse One-Way Clutch Assembly and Piston, Disassembled View

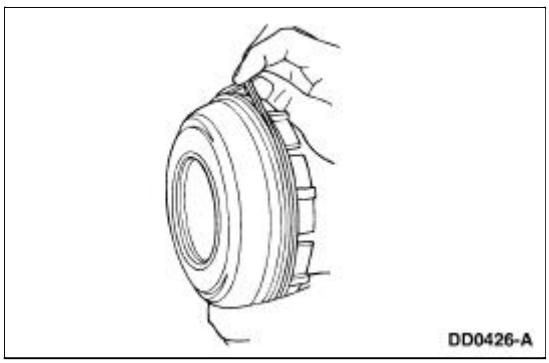


Item	Part Number	Description
1	387031-S	Output shaft retaining ring
2	7A153	Output shaft ring gear
3	7D164	Output shaft hub
4	377132-S	Retaining ring
5	7B067	Reverse clutch hub
6	7A089	Low one-way clutch assembly
7	7G178	Low/reverse one-way clutch inner race and thrust bearing assembly No. 12
8	7D406	Reverse clutch return spring assembly
9	7D404	Reverse clutch piston inner lip seal
10	7D403	Reverse clutch piston outer lip seal
11	7D402	Reverse clutch piston

Disassembly and Assembly

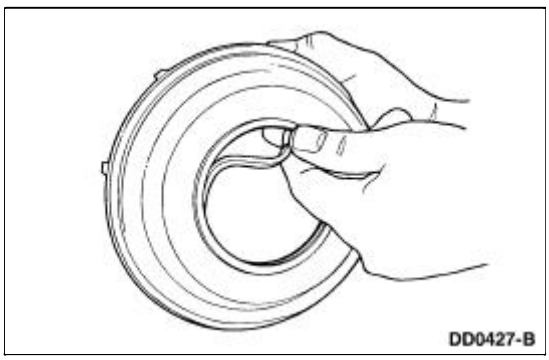
1. Remove the output shaft ring gear and the No. 12 thrust bearing.
    1. Remove the ring gear.
    2. Remove the bearing.

2. If necessary, remove the low one-way clutch (17 roller) assembly by rotating it counterclockwise to unlock the tabs.



3. Inspect the following:
    - Reverse clutch hub thrust surfaces for scores.
    - Reverse clutch hub splines for wear.
    - Outer and inner low/reverse one-way clutch race for scores and damaged surface areas where rollers contact races.
    - Rollers and springs for excessive wear or damage.
    - Spring and cage.

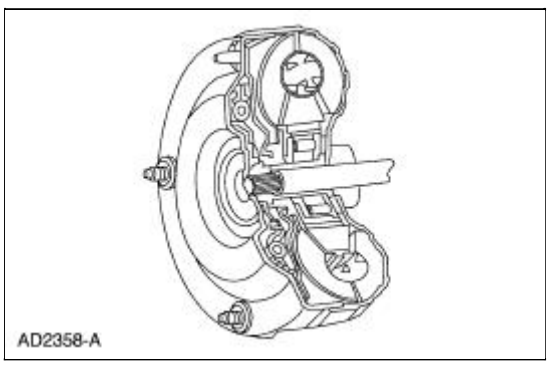
4. For assembly, follow the disassembly procedure in reverse order.



Reverse Clutch Piston

Disassembly and Assembly

1. Remove the reverse clutch piston outer lip seal.



2. Remove the reverse clutch piston inner lip seal.

3. For assembly, follow the disassembly procedure in reverse order.
    - Make sure the lip on the seal faces the back side of the piston.

Torque Converter

1. The torque converter must be replaced if one or more of the following statements are true:
   - A torque converter malfunction has been determined based on the complete diagnostic procedures.
   - Converter stud(s), impeller hub or bushing is damaged.
   - Discoloration of the torque converter (due to overheating).
   - The torque converter is found to be out of specification when carrying out one of the following torque converter checks:
     - One-Way Clutch Check
     - End Play Check
     - Stator to Turbine Interference Check
     - Stator to Impeller Interference Check
     - Torque Converter Leak Check
   - Evidence of transmission assembly or fluid contamination due to the following transmission or converter failure modes:
     - major metallic failure
     - multiple clutches or clutch plate failures
     - sufficient component wear which results in metallic contamination

Torque Converter Cleaning And Inspection

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

1. If installing a new torque converter, continue with sub-step 2 of Step 2.

2. If not installing a new torque converter, the following procedures must be carried out:
    1. The torque converter must be thoroughly cleaned.
        - Torque converter with drain plugs may be cleaned by using a suitable torque converter/transmission fluid cooler cleaner.
        - Torque converter without drain plugs may be cleaned by hand. Partially fill the torque converter using only the recommended transmission fluid for the applicable transmission. Hand-agitate the torque converter and then thoroughly drain the fluid. Refill the torque converter with new fluid specified for the transmission, and install.
    2. The in-tank and auxiliary coolers must be thoroughly cleaned by forward and backward flushing. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.
    3. The cooler lines must be thoroughly cleaned by backward and forward flushing. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.
    4. All cooler bypass valves (CBV), if equipped, must be thoroughly cleaned.
    5. Carry out the Transmission Fluid Cooler Flow Test.
    6. If the transmission cooling system fails the Transmission Fluid Cooler Flow Test, the auxiliary fluid cooler, cooler bypass valve, and or cooler lines may require installation of new components. For additional information, refer to Section 307-02 .
    7. If the internal cooler needs to be replaced, refer to Section 303-03 . If a new auxiliary cooler needs to be installed, refer to Section 307-05 . If a new CBV needs to be installed, use only factory-approved service parts.

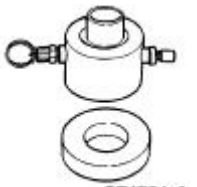
Torque Converter Flushing

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

1. **CAUTION: Mineral spirits used to clean the torque converter must be fresh, non-chlorinated and non-halogenated.**

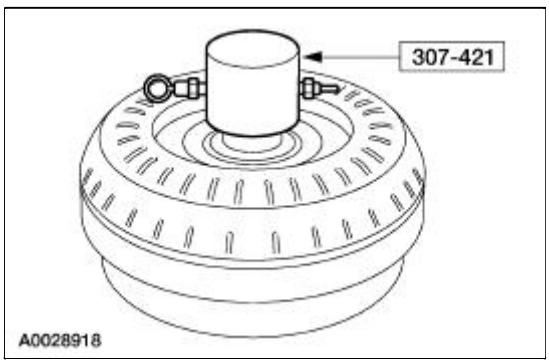
   Following the instructions included with a suitable torque converter/transmission fluid cooler cleaner, flush the torque converter.



2. After flushing, drain the remainder of the solvent through the converter drain plug.

3. Add 1.9 liter (2 qt.) of clean automatic transmission fluid into the converter fluid filler tube and agitate by hand.

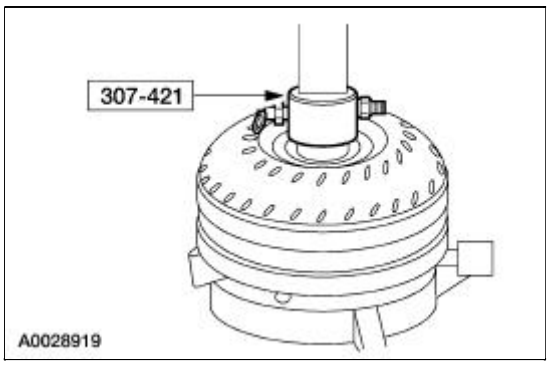
4. Thoroughly drain the solution.



Torque Converter Leak Check

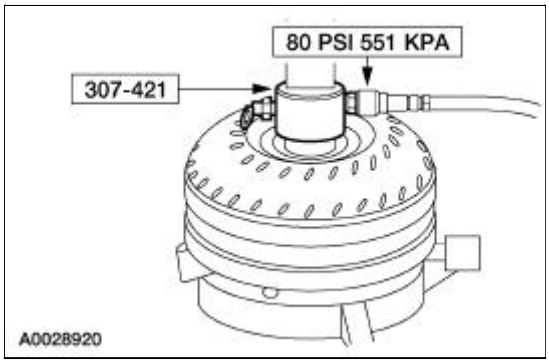
Special Tool(s)

 ST1731-A	Leak Tester, Torque Converter 307-421



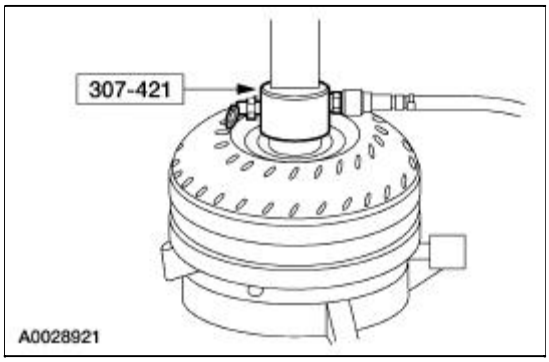
1. Clean the outside surface of the torque converter.

2. Install the special tool into the converter hub.



3. **WARNING: Always follow correct safety procedures while using the press.**

   Install the torque converter with the special tool into the Arbor press.
   Secure the press. Apply enough force from the press to seal the special tool into the torque converter.

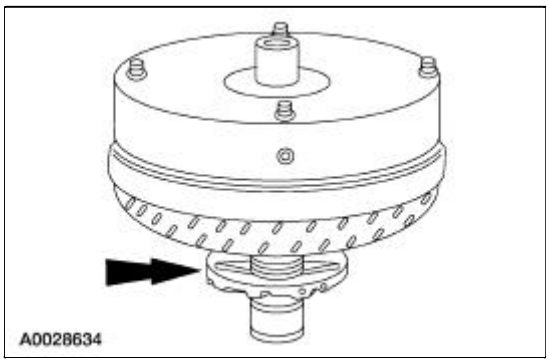


4. **NOTE:** Use clean, dry shop air.

   Apply air pressure to the valve on the special tool.

5. With air pressure applied to the special tool, inspect for leaks at the converter hub, the seams and the studs. A soap bubble solution can be applied around those areas to aid in the diagnosis. If any leaks are present, install a new or remanufactured torque converter.

6. Remove the air hose. Release the pressure, and then slowly release the press. Remove the converter. Remove the special tool.



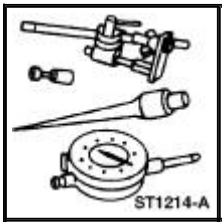
Torque Converter Impeller to Pump Stator Interference Check

1. **CAUTION: To carry out this check, do not use the pump stator support which will be installed in the transmission. Damage to the pump stator support, front pump seal or front pump stator seal may occur.**

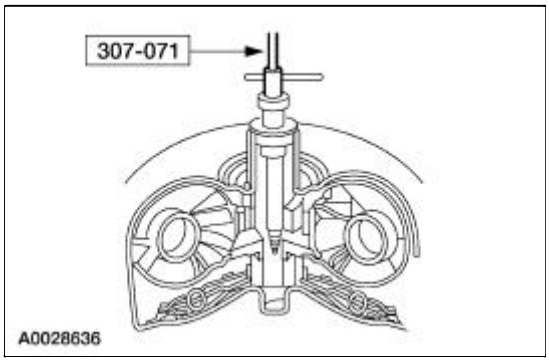
   NOTE: Obtain a scrapped pump. Remove the stator support. This can be used as a permanent tool to carry out this check.

   Position the stator support with the splines up.

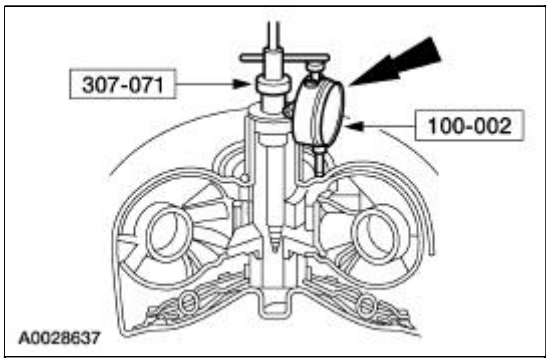
2. Mount the torque converter on the stator support so that the splines on the one-way clutch inner race engage the mating splines of the stator support.



3. Hold the stator support stationary and rotate the torque converter counterclockwise.
   - The torque converter should rotate freely, with no signs of scraping.
   - If there are signs of scraping, install a new or remanufactured torque converter.



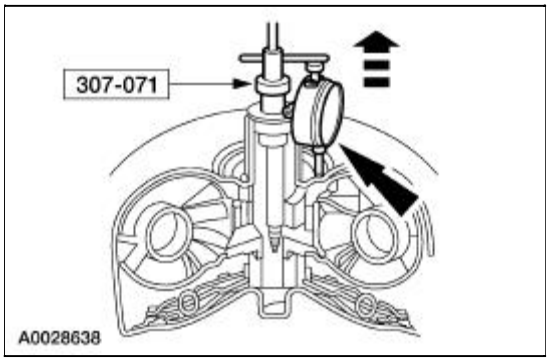
Torque Converter End Play Check



Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or Equivalent
 ST1196-A	End Play Gauge, Torque Converter 307-071 (T80L-7902-A)

1. Install the special tool into the torque converter pump drive.
   - Tighten the inner post until the tool is securely locked.

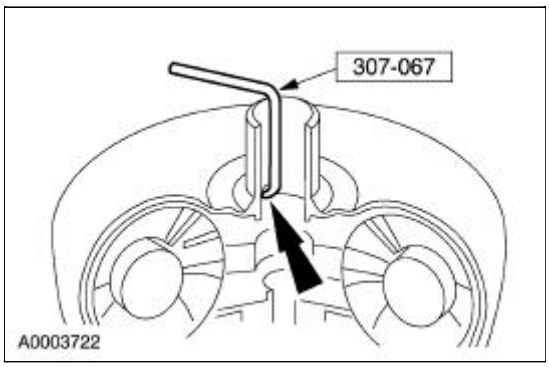


2. Install the special tool on the converter pump drive hub and zero the dial indicator.

3. Lift up on the special tool as far as it will move and note the dial indicator reading.
   - If the reading exceeds end play limits, replace the torque converter.

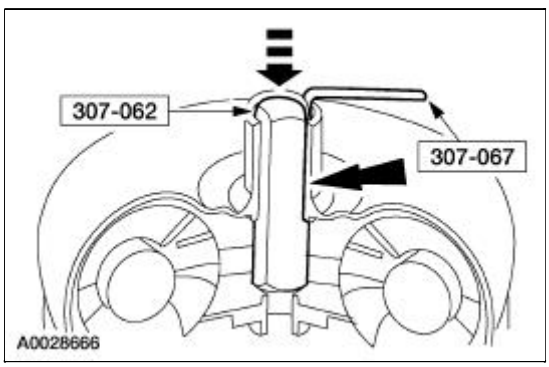
Torque Converter End Play

Engine	New or Rebuilt Torque Converter		Used Torque Converter	
	mm	Inch	mm	Inch
Gas	0.35- 0.96	0.014- 0.038	1.8 Max.	0.071 Max.



4. Remove the special tool.

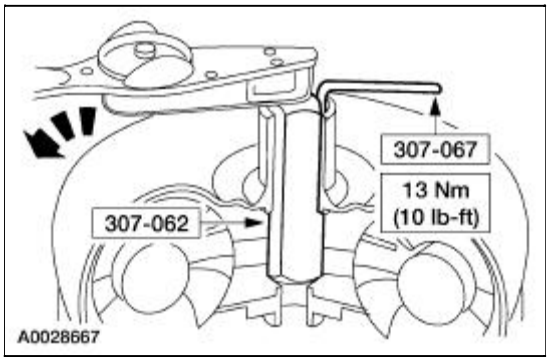
Torque Converter One-Way Clutch Check



Special Tool(s)

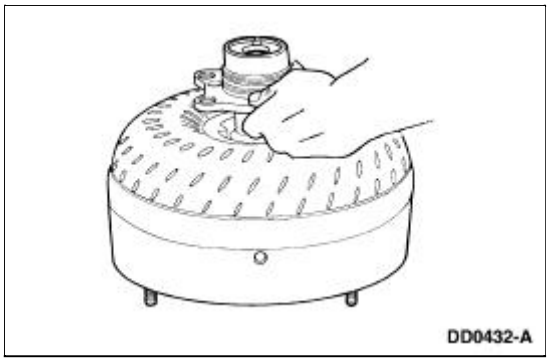
 ST1193-A	Holding Tool, One-Way Clutch 307-062 (T76L-7902-C) or equivalent
 ST1195-A	Holding Tool, Torque Converter Clutch 307-067 (T77L-7902-R) or equivalent

1. Insert the special tool in one of the grooves in the stator thrust washer.

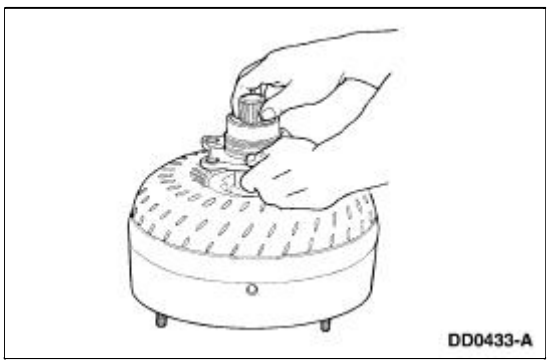


2. Install the special tool in the converter pump drive.

3. Using a torque wrench, turn the special tool counterclockwise while holding the special tool stationary.
   - The converter one-way clutch should lock up and hold the specified torque.
   - The torque converter one-way clutch should rotate freely in the clockwise direction.
   - Try the clutch for lockup and hold in at least five positions.

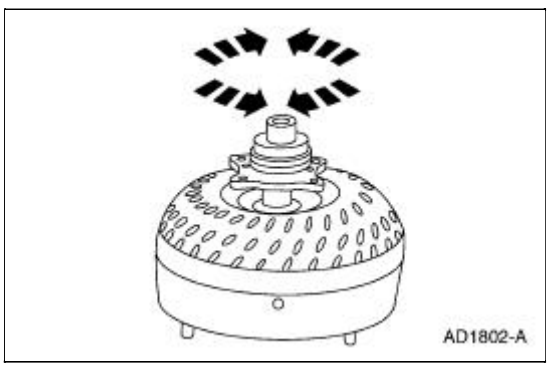


- If the clutch fails to lock up and hold the specified torque, install a new or remanufactured torque converter.



Torque Converter Turbine to Pump Stator Interference Check

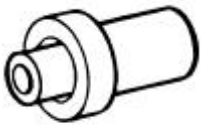
1. Position the torque converter with the converter hub up.

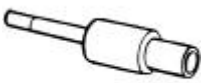


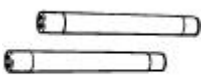
2. Install a pump stator support, engaging the mating splines of the stator support shaft.

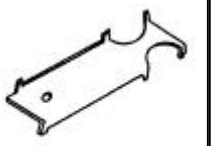
3. Install the input shafts, engaging the splines with the turbine hub.

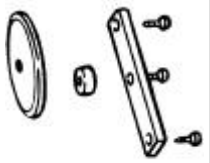
4. Hold the stator support stationary and attempt to rotate the turbine with the input shafts.
   - The turbine and lockup clutch assemblies should rotate in both directions, without any signs of interference or metallic scraping noise.

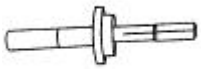












5. If interference exists, the stator front thrust washer may be worn, allowing the stator to hit the turbine. In such cases, a new or remanufactured torque converter must be installed.
   - Check the converter crankshaft pilot for nicks or damaged surfaces that could cause

interference when installing the torque converter into the crankshaft pilot. Check the converter front impeller hub for nicks or sharp edges that would damage the pump seal.

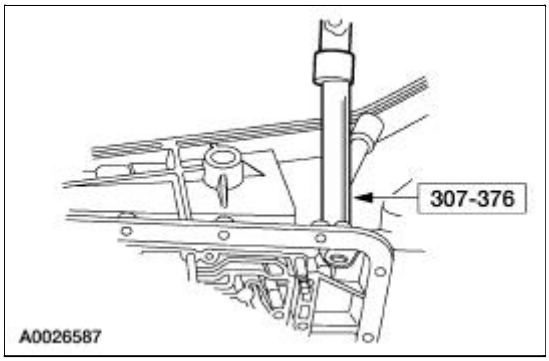
Transmission

Special Tool(s)

 ST1274-A	Depth Micrometer 303-D026 (D80P-4201-A) or equivalent
 ST1740-A	Installer, Transmission Extension Housing Fluid Seal 307-013 (T61L-7657-B)
 ST1190-A	Compressor, Clutch Spring 307-015 (T65L-77515-A)
 ST1199-A	Installer, Shift Shaft Fluid Seal 307-050 (T74P-77498-A)
 ST1745-A	Installer, Transmission Extension Housing Bushing 307-063 (T77L-7697-C)
 ST1748-A	Handle, Torque Converter 307-091 (T81P-7902-C)
 ST2549-A	Aligner, Transmission Fluid Pump 307-222 (T89T-70010-B)
	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)

 ST1633-A	
 ST1854-A	Installer, Fluid Filler Tube 307-376
 ST2547-A	Installer, Output Shaft Bushing 307-381 (Vehicle Dependent)
 ST2544-A	Installer, Transmission Forward Clutch Assembly 307-436
 ST1851-A	Service Set, Clutch Spring 307-S223 (T89T-70010-C)
 ST2159-B	Loading Fixture, Clutch 307-S383

Material

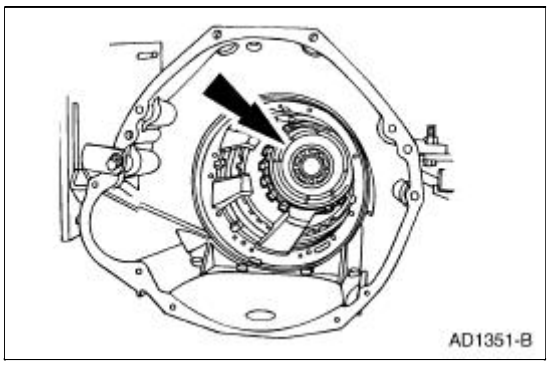


Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

NOTE: Soak all friction clutch plates in clean automatic transmission fluid.

NOTE: Prior to installation, lightly lubricate all O-ring seals with clean automatic transmission fluid.

NOTE: Lightly lubricate all thrust washers with petroleum jelly to hold them in place during assembly.

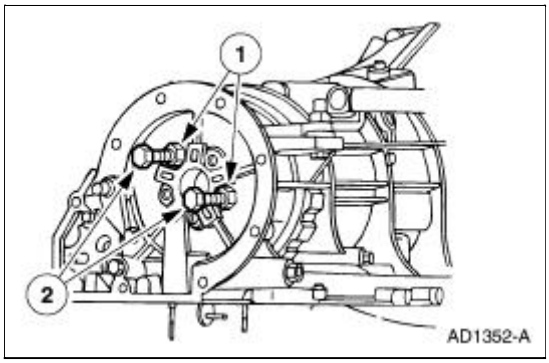


1. Mount the transmission case into suitable stand.
2. If removed, use the special tool to install the short fluid inlet tube.

3. **CAUTION: If equipped, use care not to misalign the reverse clutch piston in the case bore.**

   NOTE: Coat the reverse clutch piston seals with petroleum jelly.

   Install the reverse clutch piston in the case until it is fully seated in the case.

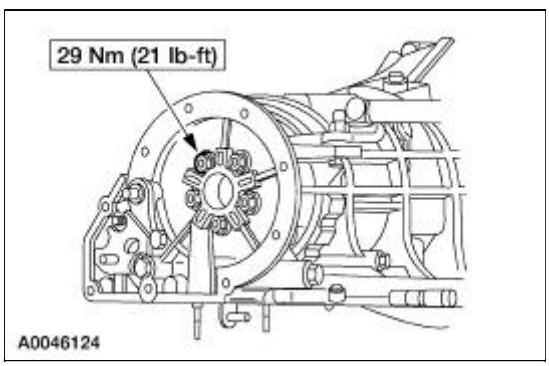


4. **CAUTION: The low/reverse clutch inner race is vehicle-dependent. Refer to parts catalog for the correct parts.**

   NOTE: Clock position is viewed looking into the converter housing with the top of the transmission in the 12 o'clock position.

   Install the reverse clutch return spring assembly.
   1. Install the reverse clutch return spring assembly.
   2. Install the low/reverse one-way clutch inner race.
   3. Make sure that the lubrication hole on the face is in the 5 o'clock position.

5. Install two 5/16-24 x 3 inch bolts with nuts in to the low/reverse one-way clutch inner race.
   1. Hold the nut.
   2. Turn the bolt to compress the low/reverse piston return spring.



6. Install three of the one-way clutch inner race bolts and remove the two 5/16-24 x 3 bolts.

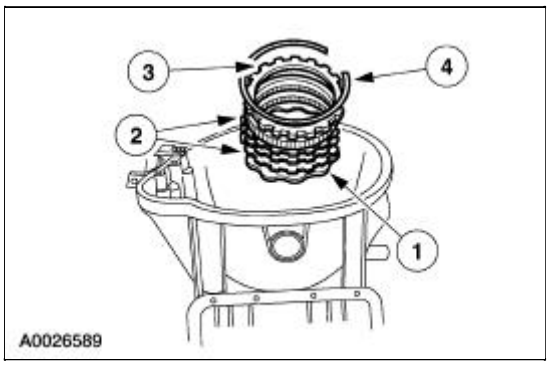
7. **NOTE:** Alternate tightening bolts from one side to the other (not in a circle).

   Install the remaining bolts retaining the low/reverse one-way clutch inner race to the case.

8. **CAUTION: The low/reverse clutch, one-way clutch is vehicle-dependent. Refer to parts catalog for the correct parts.**

   NOTE: When the reverse clutch and the low one-way clutch are installed, the reverse clutch should rotate clockwise. The one-way clutch will hold and not let the clutch hub rotate counterclockwise.

   Install the reverse clutch hub and the low one-way clutch assembly over the low/reverse one-way clutch inner race by pressing the hub inward and rotating it clockwise to seat fully.



9. **CAUTION: The number of plates is vehicle-dependent.**

   NOTE: No stack-up clearance measurement is required.

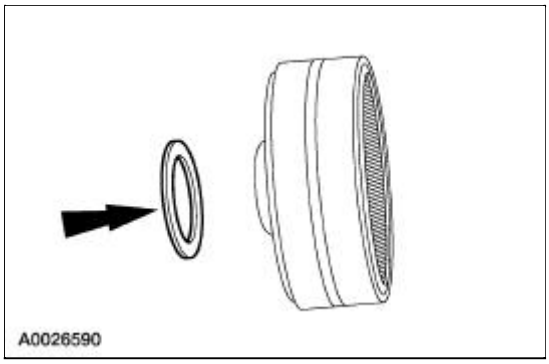
   NOTE: Clock position is viewed looking into the converter housing with the top of the transmission in the 12 o'clock position.

   Install the reverse clutch pack assembly.
   1. Install the cushion spring.
   2. Install the reverse clutch plates starting with an external spline steel plate and alternating with internal splined friction plates.
   3. Install the reverse clutch pressure plate.
   4. Install the reverse clutch pressure plate retainer snap ring with the ring opening between the 12 o'clock and 3 o'clock positions.

10. **NOTE:** Apply petroleum jelly to the No. 13 parking gear bearing to hold it in place.

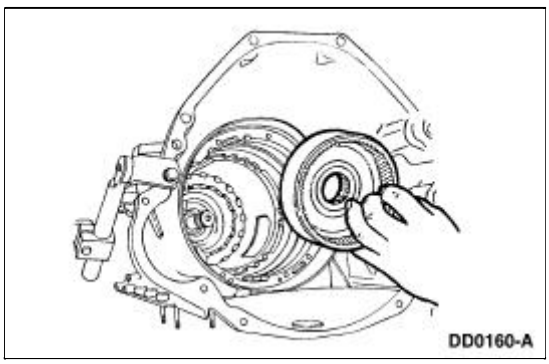
    Install the No. 13 parking gear bearing.

11. **CAUTION: Use care not to damage the output shaft drive sprocket speed sensor wheel. This will cause an incorrect reading at the output shaft speed (OSS) sensor, which**



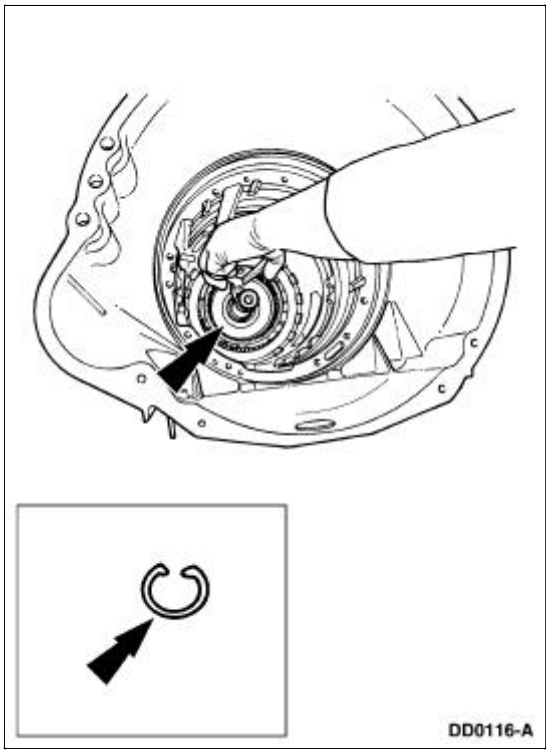
will cause a repeat repair.

Install the output shaft.

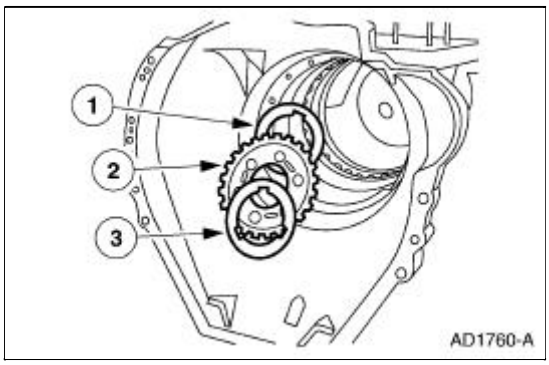


12. **NOTE:** Lubricate the thrust bearing with petroleum jelly to hold it in place during assembly.

    Install the No. 12 thrust bearing onto the rear surface of the hub assembly.



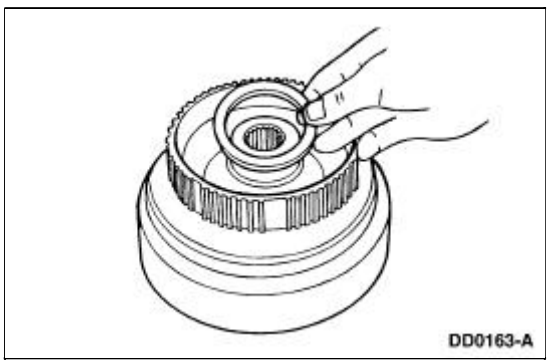
13. Install the output shaft ring gear assembly.



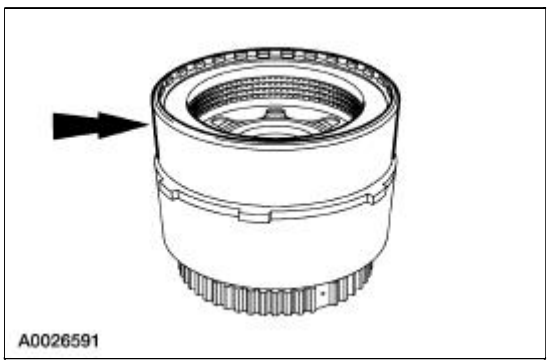
14. **WARNING: Do not overextend the output shaft retaining ring during installation. Make sure the output shaft retaining ring is securely seated in the groove. Failure to follow these instructions may result in personal injury.**

    Install the new output shaft retaining ring onto the output shaft.

15. Install the reverse planet assembly.
    1. Install the No. 11 thrust washer.
    2. Install the reverse planet.
    3. Install the No. 10B thrust washer.



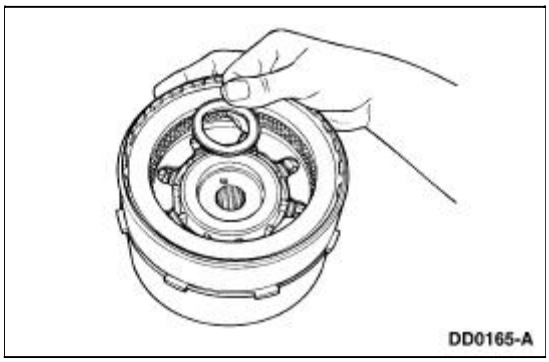
16. Install the reverse planet retaining ring into the reverse clutch hub, making sure the retaining ring is fully seated.



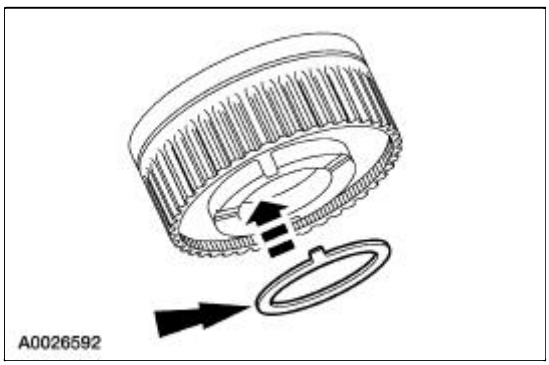
17. **NOTE:** The large outer diameter radius of the needle bearing must be installed facing inward.

    NOTE: Lightly lubricate the needle bearing with petroleum jelly to hold it in place during assembly.

    Verify the No. 8B forward clutch needle bearing is installed.

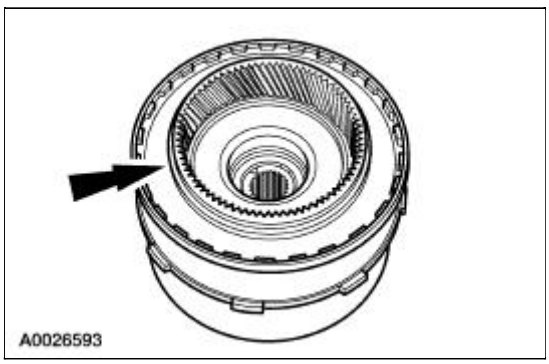


18. Install the forward clutch cylinder assembly onto the intermediate brake drum by rotating it until fully seated.



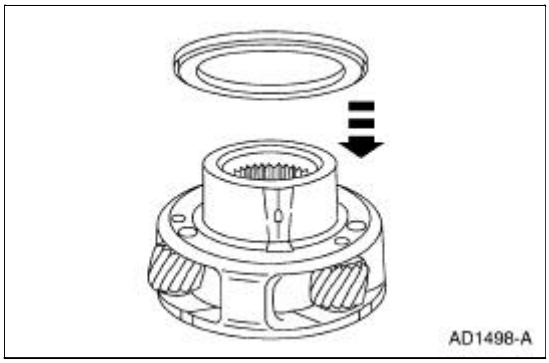
19. **NOTE:** Lightly lubricate the thrust bearing with petroleum jelly to hold it in place during assembly.

    Verify the No. 9A forward clutch thrust bearing is installed (black side facing up).

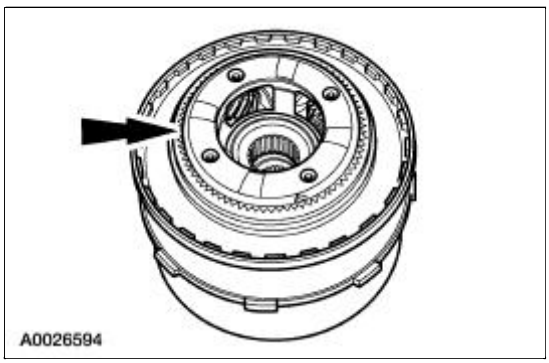


20. **NOTE:** Lightly lubricate the thrust washer with petroleum jelly to hold it in place during assembly.

    Place the No. 8C forward clutch hub thrust washer onto the forward hub and ring gear assembly.

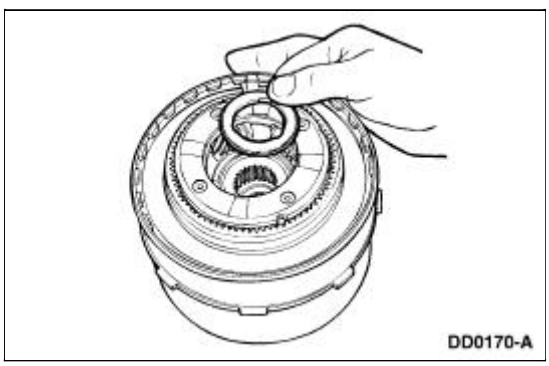


21. Place the forward hub and ring gear assembly into the intermediate brake drum and forward clutch cylinder assemblies.

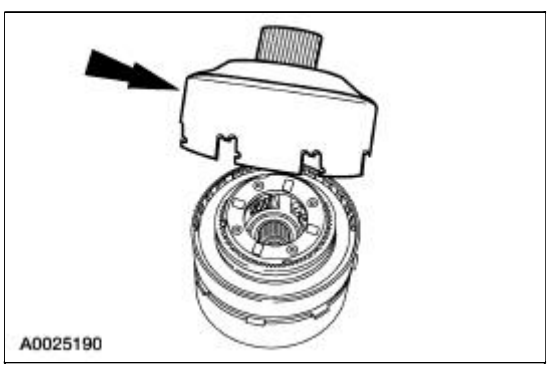


22. **NOTE:** Lightly lubricate the thrust bearing with petroleum jelly to hold it in place during assembly.

    Verify the No. 10A forward planet assembly thrust bearing is installed.

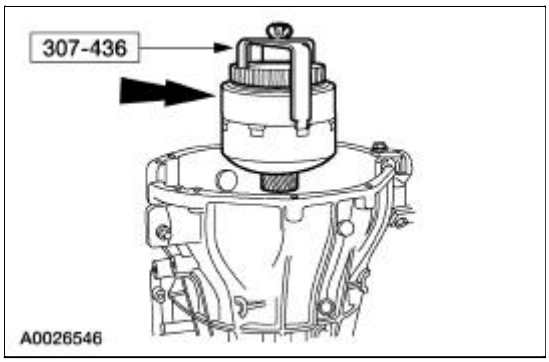


23. Place the forward planet assembly into the forward hub and ring gear assembly.

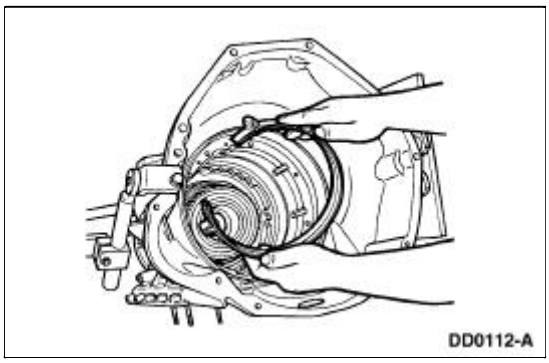


24. **NOTE:** The thrust bearing notched inner race must face outward and the large outer diameter radius must face inward.

    Verify the No. 9B forward clutch thrust bearing is installed.

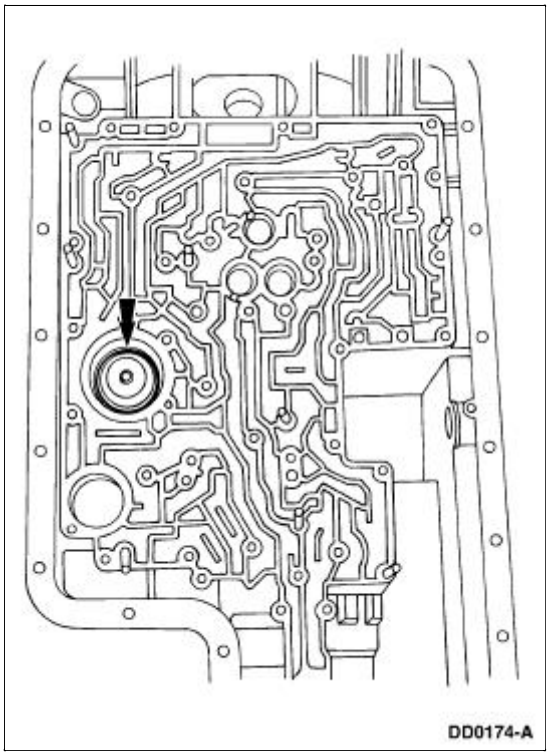


25. Align the notches with the lugs and position the input shell onto the intermediate brake drum. Rotate the input shell until fully seated.

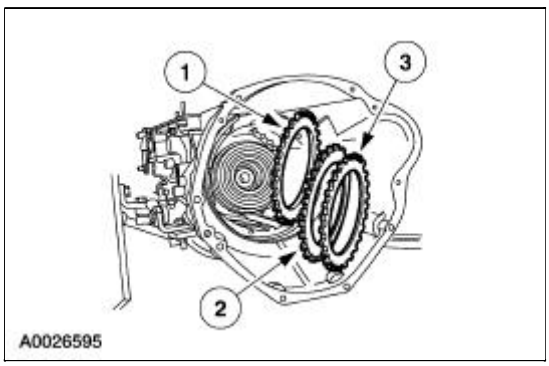


26. **NOTE:** When installing the special tool, each leg of the tool must be rotated separately to engage notches on the input shell, prior to tightening the top cross bar.

    Using the special tool, lower the direct clutch, forward clutch and input shell as an assembly into the case.

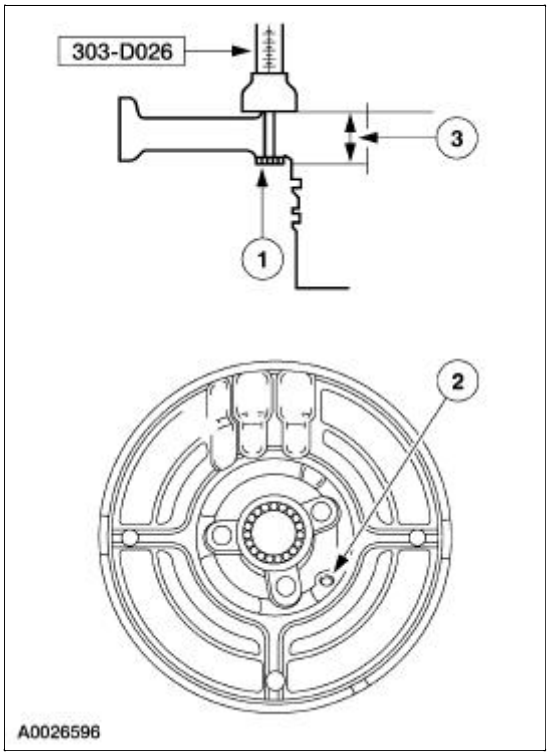


27. Install the intermediate band with the ear resting on the anchor pin.



28. **NOTE:** Prior to installation, lightly lubricate the piston seal with clean automatic transmission fluid.

    Gently press the intermediate band servo assembly piston into the case bore.



29. **NOTE:** Clock position is viewed looking into the converter housing with the top of the transmission in the 12 o'clock position.

    Install the intermediate clutch pack.
    1. Install the intermediate clutch pressure plate.
    2. Install the intermediate clutch pack starting with an internal spline plate and alternating with external spline plates.
    3. Install the intermediate clutch pressure apply plate with blank area (no teeth) in the 6 o'clock and 12 o'clock positions.

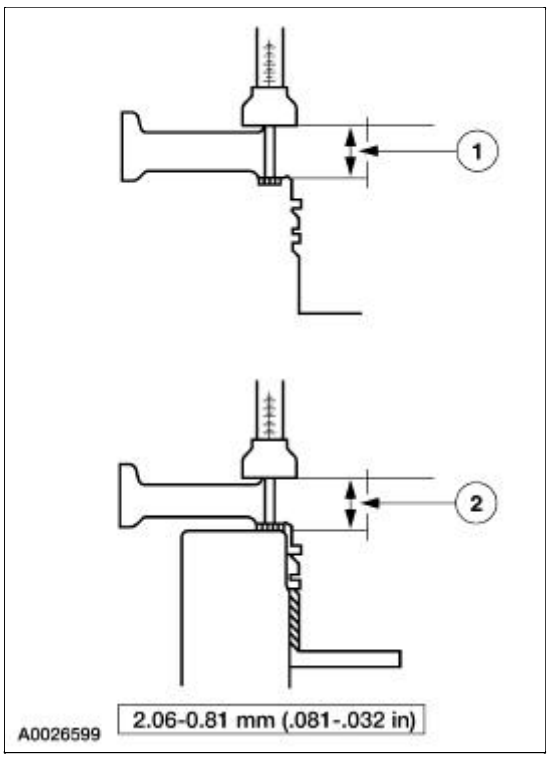
30. **NOTE:** The following stack-up check measurement indicates not only the amount of space existing between the center support assembly and the intermediate brake drum, it also will indicate if the unit has been correctly built to this point.

    Measure the stack up.
    1. Hold the thrust washer against the center support assembly.
    2. Extend the probe of the special tool into the hole until flush with the No. 6 center support thrust washer surface.
    3. Record this as reading 1.

31. **CAUTION: Do not misalign the center support in the case bore. This can cause case bore damage.**

    NOTE: Make sure the No. 6 center support thrust washer is on the center support prior to installation.

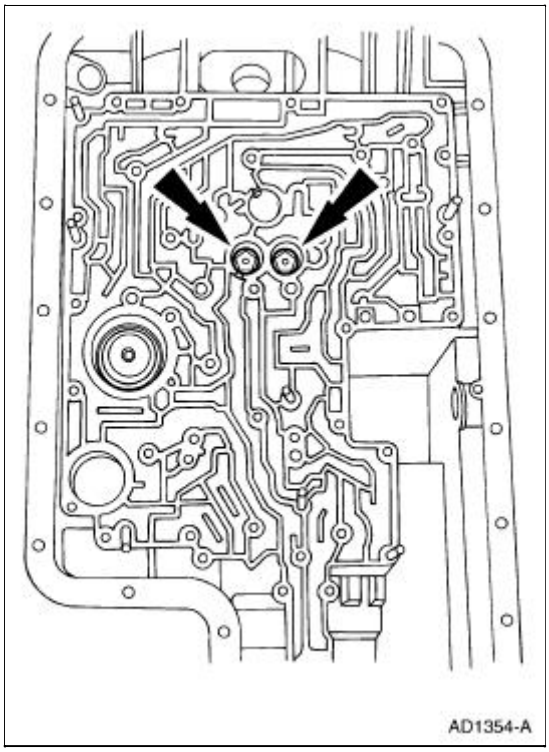
    Install the center support assembly with the feed holes aligned in the case.



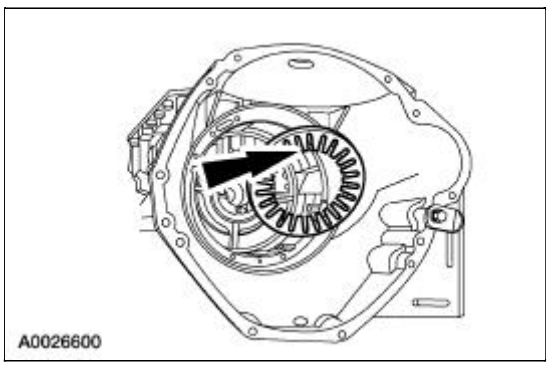
32. Make a second measurement after installation of the center support.
    1. Extend the probe of the special tool into the hole in the center support assembly until

flush with the No. 6 center support thrust washer.

2. Record this as reading 2.

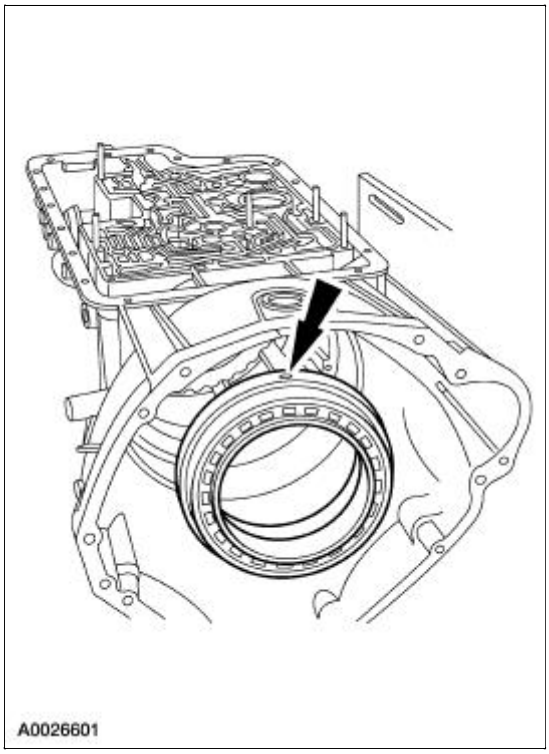


33. Subtract reading 1 from reading 2. Record this as reading 3. If the final dimension is outside specified limits, this indicates that the transmission has been assembled incorrectly.



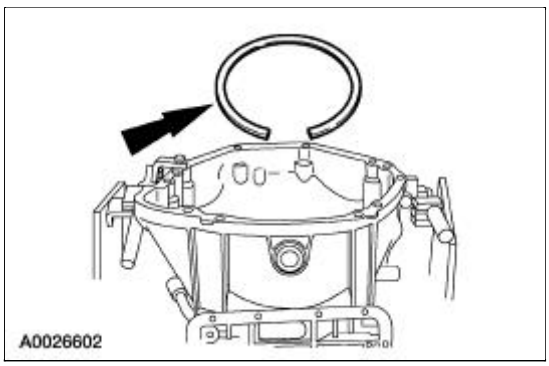
34. **CAUTION: Do not tighten the bolts at this time. This could cause transmission failure.**

Loosely install two new feedbolts.



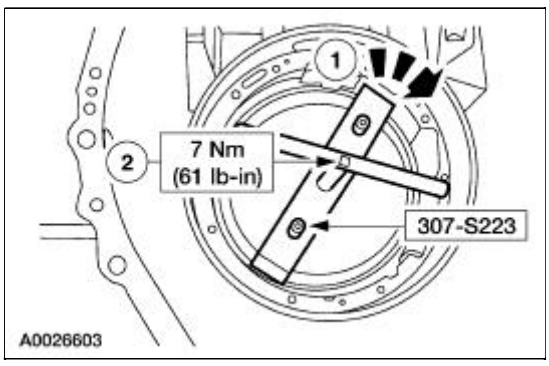
35. **NOTE:** Clock position is viewed looking into the converter housing with the top of the transmission in the 12 o'clock position.

    Install the intermediate clutch return spring with the dished surface inward and one spring leg in the 6 o'clock position.



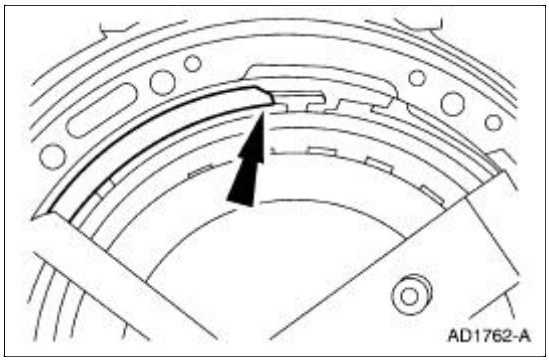
36. **CAUTION: Do not misalign the intermediate/overdrive cylinder assembly. This can damage the case bore.**

    Install the intermediate/overdrive cylinder assembly with the feed holes aligned with the holes in the case.



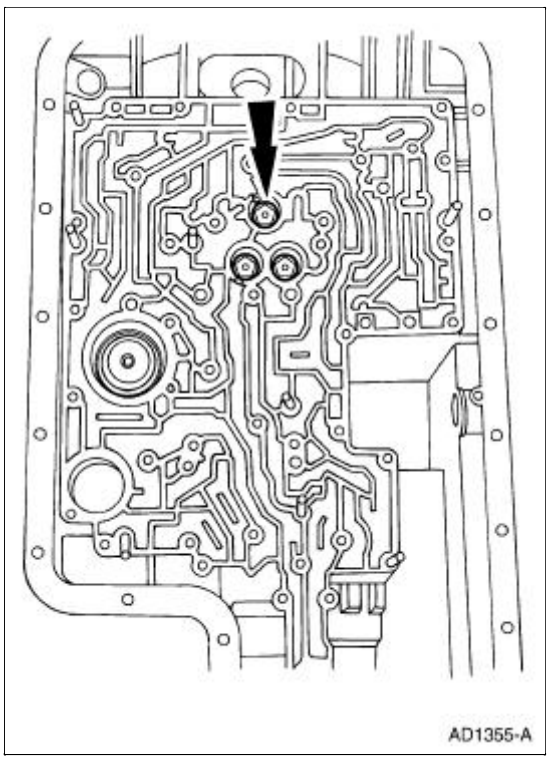
37. **NOTE:** Clock position is viewed looking into the converter housing with the top of the transmission in the 12 o'clock position.

    Install the intermediate/overdrive cylinder retaining ring over the intermediate/overdrive cylinder with the ring opening in the 6 o'clock position to allow for the correct fluid drainback.



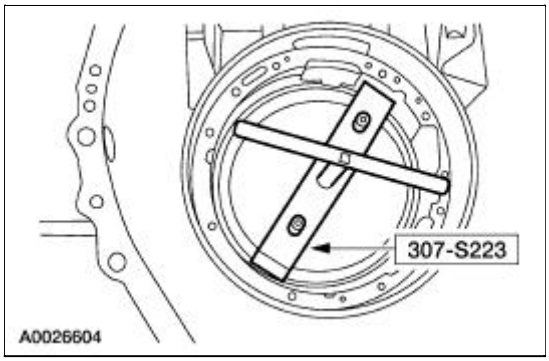
38. Install the special tool.
    1. Rotate the special tool clockwise to lock in place.
    2. Tighten the handle.

39. **CAUTION: Make sure the snap ring is fully seated into the case. Transmission failure could occur.**



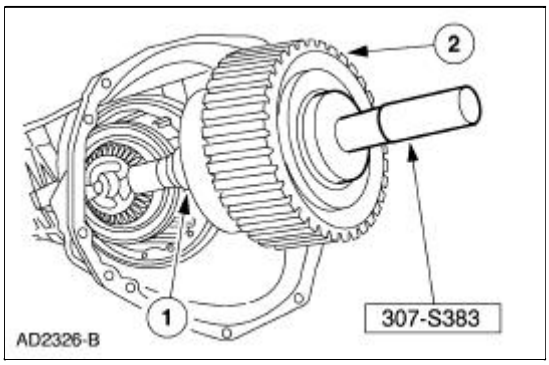
NOTE: Clock position is viewed looking into the converter housing with the top of the transmission in the 12 o'clock position.

Seat the intermediate/overdrive cylinder retaining ring into the case ring groove with the ring opening in the 6 o'clock position.



40. **CAUTION: Do not tighten the bolts at this time. Transmission failure could occur.**

Loosely install a new intermediate/overdrive cylinder feedbolt.



41. Loosen the center bolt and remove the special tool.

42. **NOTE:** The special tool must be used to install the coast clutch assembly or damage to the overdrive one-way clutch may occur.

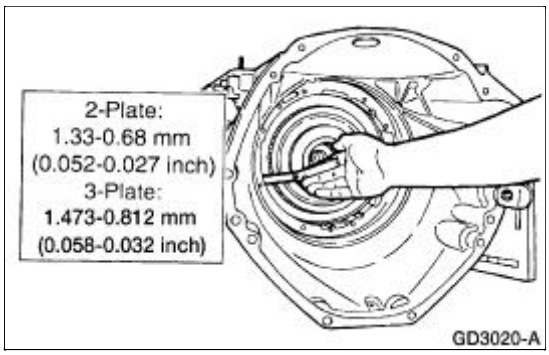
    NOTE: Use petroleum jelly to hold the No. 5 thrust bearing on the center shaft during assembly.

    Using the special tool, install the coast clutch and No. 5 thrust bearing assembly.
    1. Install the No. 5 thrust bearing.
    2. Install the coast clutch assembly.

43. **NOTE:** The number of plates in the clutch pack is vehicle-dependent.

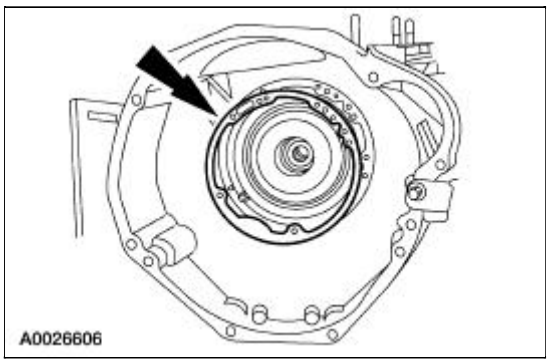
    NOTE: Clock position is viewed looking into the converter housing with the top of the transmission in the 12 o'clock position.

    Install the overdrive clutch pack.
    1. Install the overdrive clutch pack starting with a steel plate and alternating with friction plates.
    2. Install the overdrive clutch pressure plate with the dot facing outward and in the 12 o'clock position.

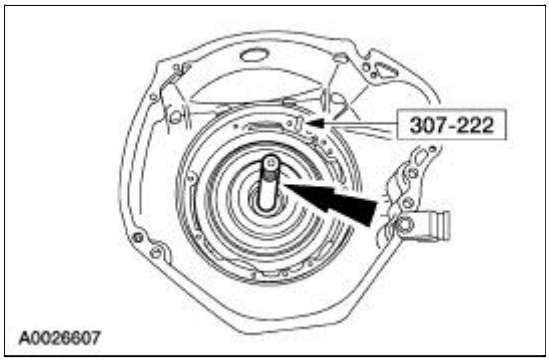


44. **NOTE:** Clock position is viewed looking into the converter housing with the top of the transmission in the 12 o'clock position.

Install the overdrive clutch pressure plate retainer snap ring with the ring opening in the 6 o'clock position.

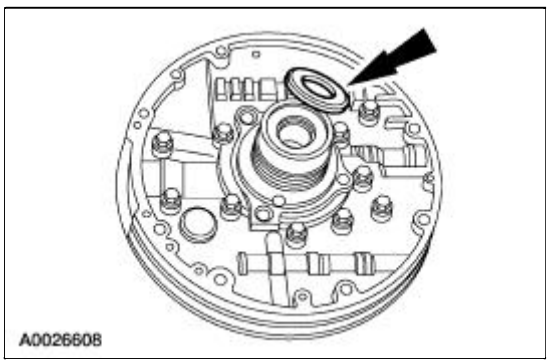


45. Check the stack-up clearance.
    - Using a feeler gauge, check the stack-up clearance in 3 places, 120 degrees apart.
    - If the clearance is not to specification, install the correct selective overdrive clutch pressure plate retainer snap ring and recheck the clearance. Refer to the Clutch Plate Usage and Clearance Specification Chart for selective snap ring thicknesses and part numbers.



46. **NOTE:** Lightly lubricate the gasket with petroleum jelly to hold it in place during assembly.

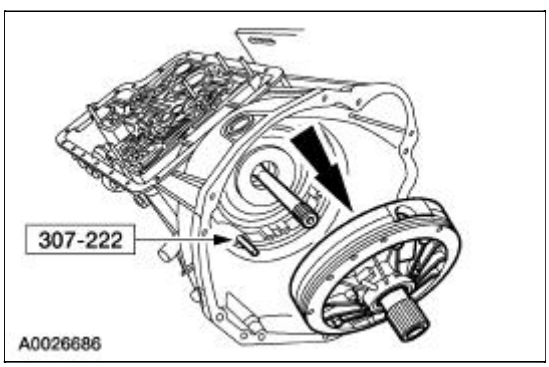
    Install the new pump gasket. Aligning the holes in the gasket with the holes in the case.



47. Install the input shaft with long splined end first and install the special tool.

48. **NOTE:** Lightly lubricate the thrust washer and bearing with petroleum jelly to hold it in place during assembly.

    Install the No. 1 pump thrust washer and the No. 2A overdrive sun gear thrust bearing.



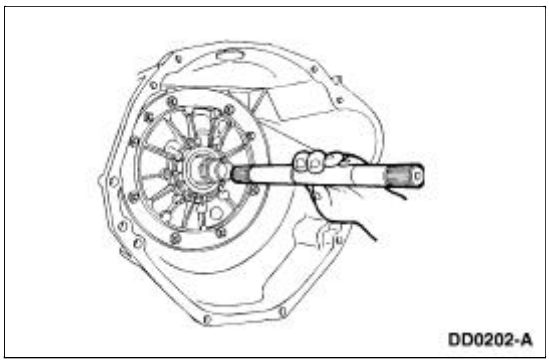
49. **CAUTION: Pump assemblies are vehicle-dependent. Using the wrong pump will cause transmission failure.**

    CAUTION: Fully seat the front pump assembly using hand pressure only. Do not use bolts to draw the front pump assembly into the case.

    CAUTION: Tighten the bolts alternately to avoid possible damage.

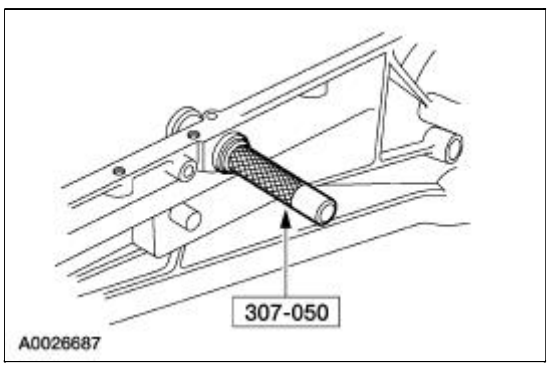
    NOTE: Clock position is viewed looking into the converter housing with the top of the transmission in the 12 o'clock position.

    Install the front pump assembly with the filter inlet tube bore in the 6 o'clock position. Fully seat the front pump assembly using hand pressure only. When the pump is fully seated, remove the special tool.



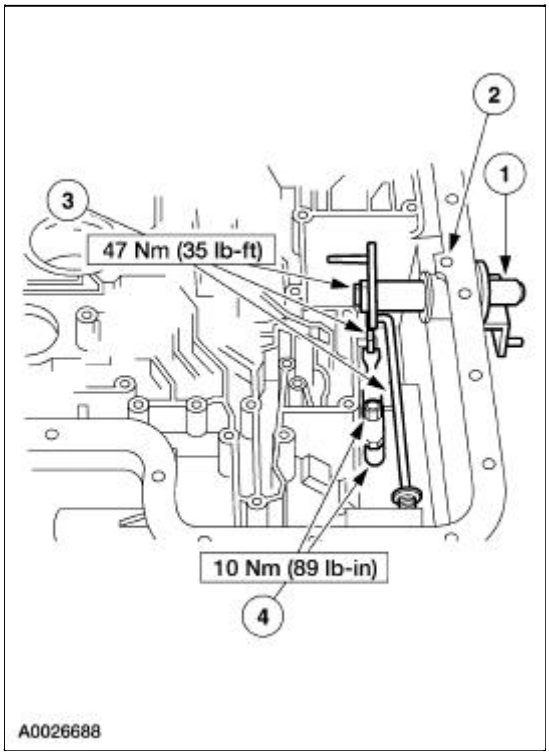
50. **CAUTION: Discard the old washers.**

Install the bolts with new rubber-coated washers. Tighten the bolts alternately in a crisscross pattern.

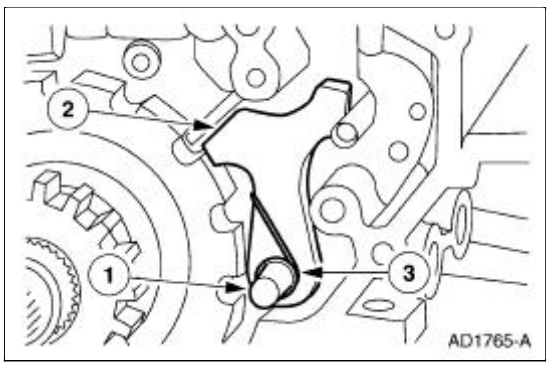


51. **CAUTION: Remove the input shaft prior to rotating the transmission.**

Remove the input shaft.



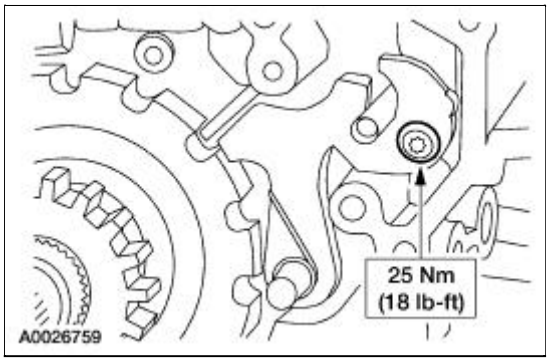
52. Using the special tool, install the manual control lever seal.



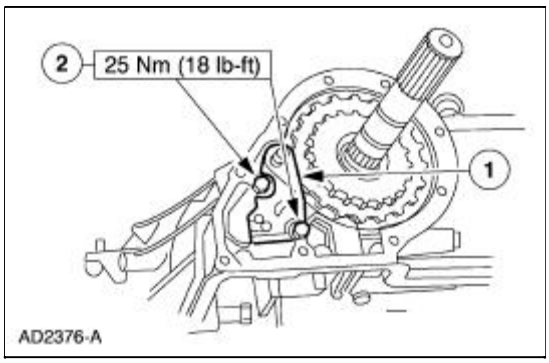
53. Install the manual control lever shaft assembly.
    1. Install the manual control lever shaft assembly.
    2. Install and seat the manual lever shaft retaining pin below the case surface.
    3. **NOTE:** Use a crescent wrench on the manual control lever or outer flats of the manual control lever shaft assembly when installing the inner manual valve detent lever nut.

       Install the parking pawl actuating rod, the inner manual valve detent lever and the nut onto the manual control lever shaft assembly.
    4. **NOTE:** The manual control valve detent lever spring must be on the inner manual valve detent lever and the detent lever pin must align with the manual shift valve.

Install the manual control valve detent lever spring and the bolt.

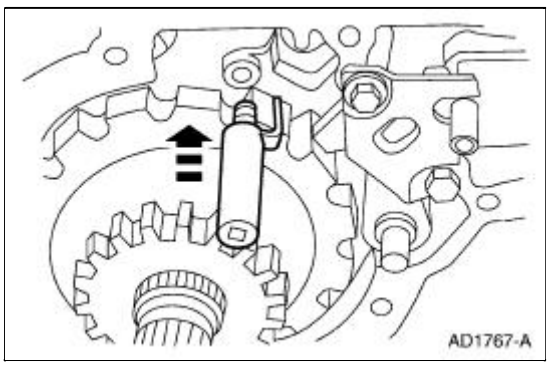


54. Install the park pawl.
    1. Install the parking pawl shaft.
    2. Install the parking pawl.
    3. Install the parking pawl return spring.



55. **CAUTION: The Torx® screw has a thread-locking compound. If the screw is removed, it must be discarded and a new one installed.**

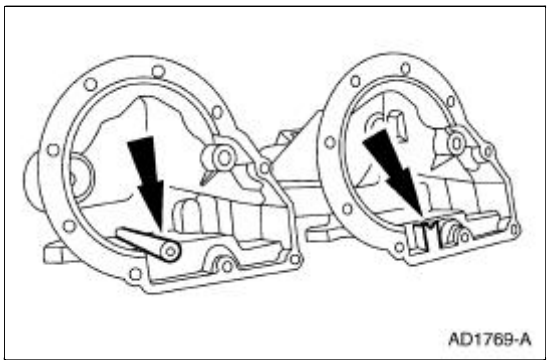
    If removed, install the parking pawl abutment with a new Torx® screw.



56. **NOTE:** Make sure the dimple on the parking guide support plate is facing inward and the parking pawl actuating rod is in the parking rod support plate slot.

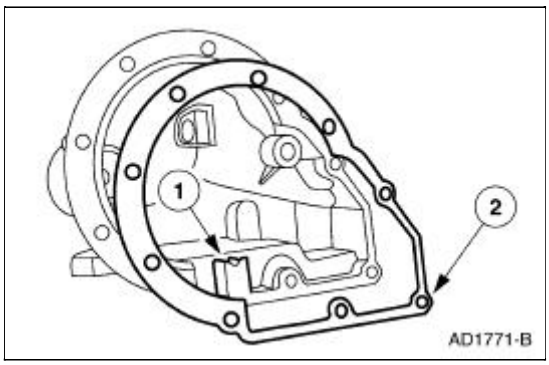
    Install the parking rod guide plate.
    1. Install the parking rod guide plate.
    2. Install the bolts.

57. Install a new orifice lube plug in the rear of the case. Using a 12 mm (0.48 in) socket, tap the orifice lube plug into the back of the transmission.

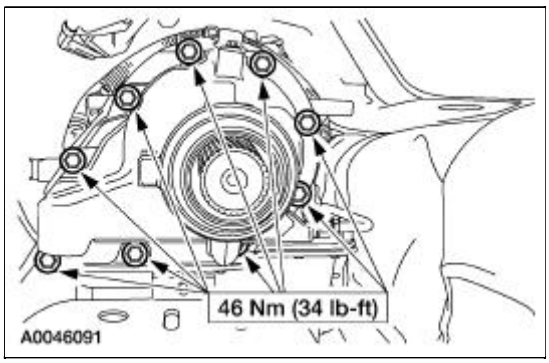


58. Check to make sure that the orifice lube plug is fully seated into the back of the transmission.

59. **CAUTION: The extension must have a shoulder or a boss cast in it to hold the orifice lube plug in the back of the case. If the wrong extension housing is used the plug will fall out and cause transmission failure.**



Inspect the extension housing for the correct application.

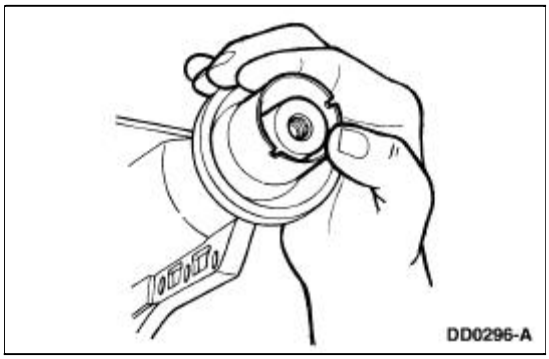


60. **CAUTION: The extension must have a shoulder or a boss cast in it to hold the orifice lube plug in the back of the case. If the wrong extension housing is used the plug may become loose and/or fall out and cause transmission damage.**

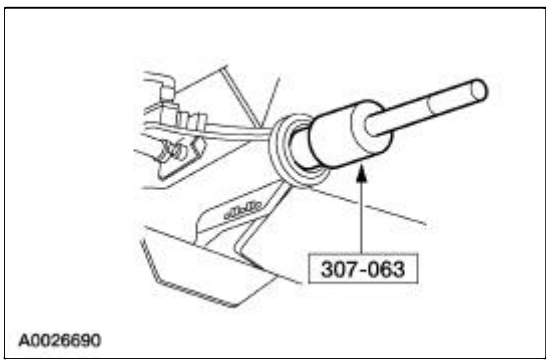
NOTE: Lightly lubricate the gasket with petroleum jelly to hold it in place during assembly.

Install the new extension housing gasket.
1. Verify that the extension has a shoulder cast in it.
2. Install the new extension housing gasket.

61. Install the extension housing, the eight bolts, and the stud.



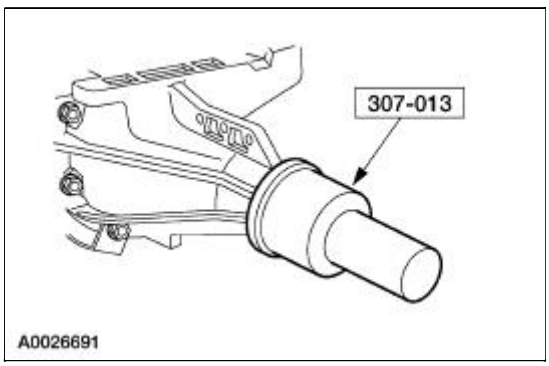
62. **CAUTION: Prior to installing the extension housing bushing, inspect the extension housing counter bore for burrs. If necessary, remove the burrs with an oil stone. Damage**



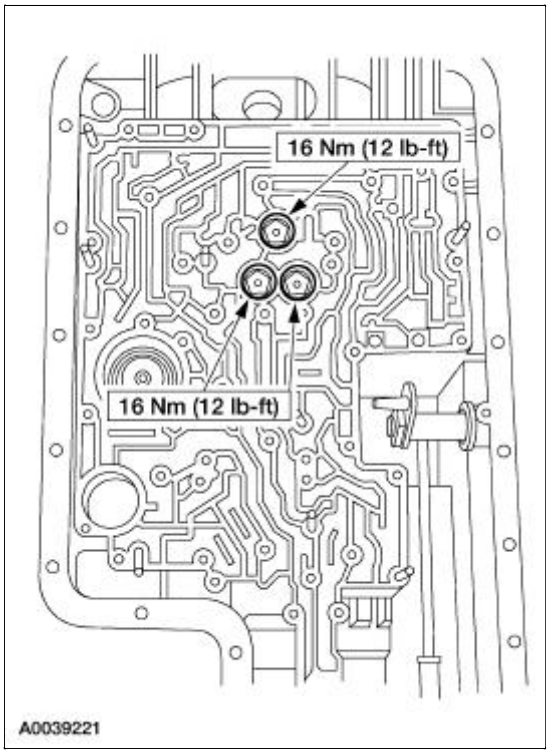
to the new bushing may occur.

NOTE: Extension housing bushing is vehicle-dependent. Refer to the parts catalog for correct part.

Align the extension housing bushing in the extension housing so that the slots are in the 2 o'clock and 7 o'clock position.

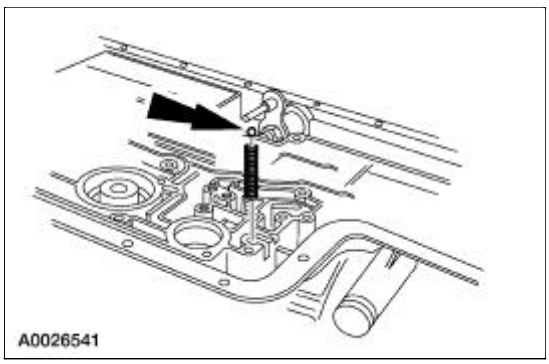


63. Using the special tool, install the extension housing bushing.

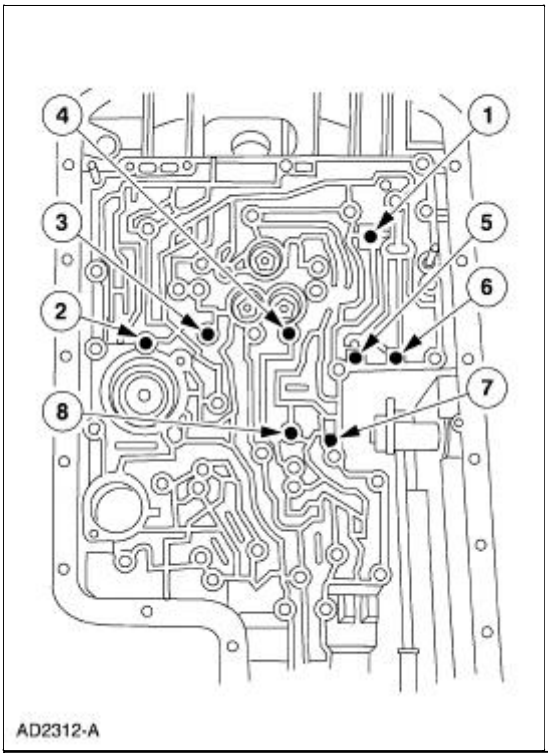


64. **NOTE:** Extension seal is vehicle-dependent. Refer to the parts catalog for correct part.

Using the special tool, install a new extension housing seal.



65. Tighten the center support assembly, and the intermediate/overdrive cylinder assembly feedbolts.



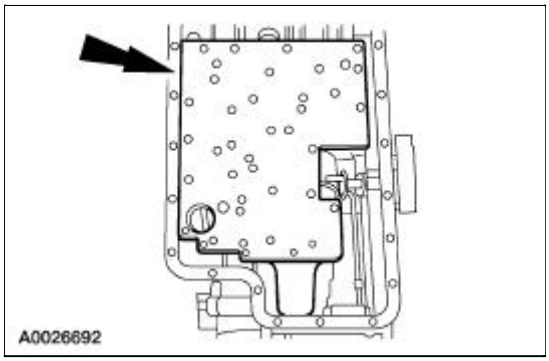
66. **NOTE:** The steel EPC check ball has a 6.35 mm (0.25 in) diameter and is smaller than the other check balls.

    Install the spring and the steel EPC check ball.

67. **CAUTION: Use care not to damage the rubber check balls.**

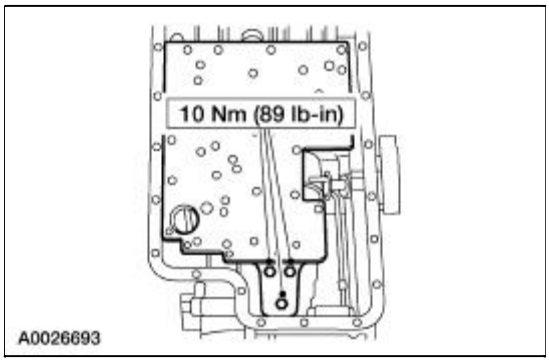
    Install the rubber check balls.

Item	Part Number	Description
1	CB7	Check ball
2	CB9	Check ball
3	CB14	Check ball
4	CB1	Check ball
5	BS3	Ball shuttle
6	CB8	Check ball
7	CB6	Check ball
8	BS1	Ball shuttle



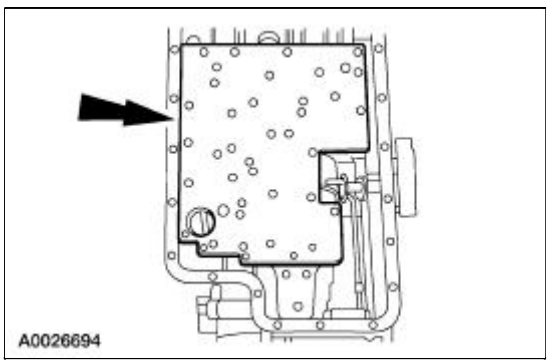
68. **CAUTION: Refer to the parts catalog for correct gasket. Using the incorrect gasket will cause damage to transmission.**

    Install a new separating plate-to-case gasket on the separating plate.

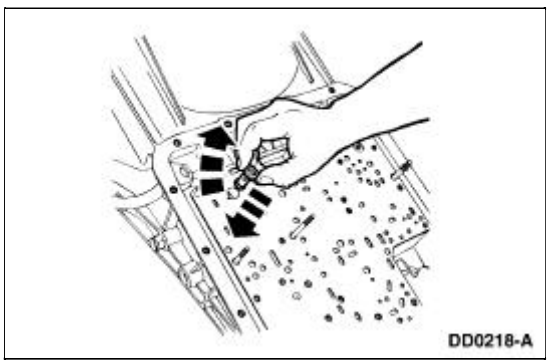


69. **NOTE:** Check the placement of the steel EPC check ball under separator plate.

    Install the valve body separator plate.

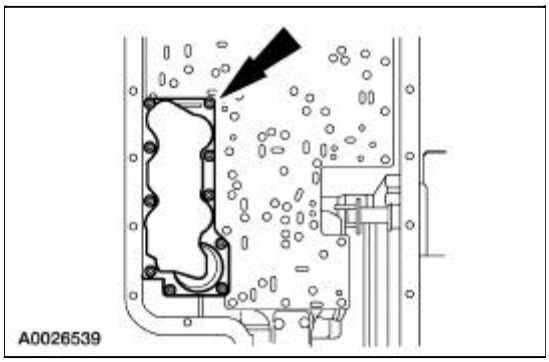


70. Install the separating plate reinforcing plate, with the stamped word UP visible, and install the bolts.

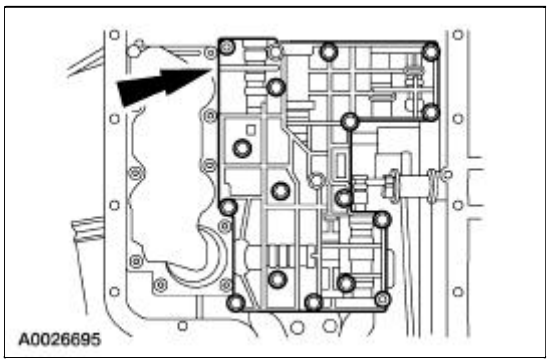


71. **CAUTION: Refer to the Parts Catalog for the correct gasket. Using the incorrect gasket will cause damage to the transmission.**

Install a new main control-to-separating plate gasket.

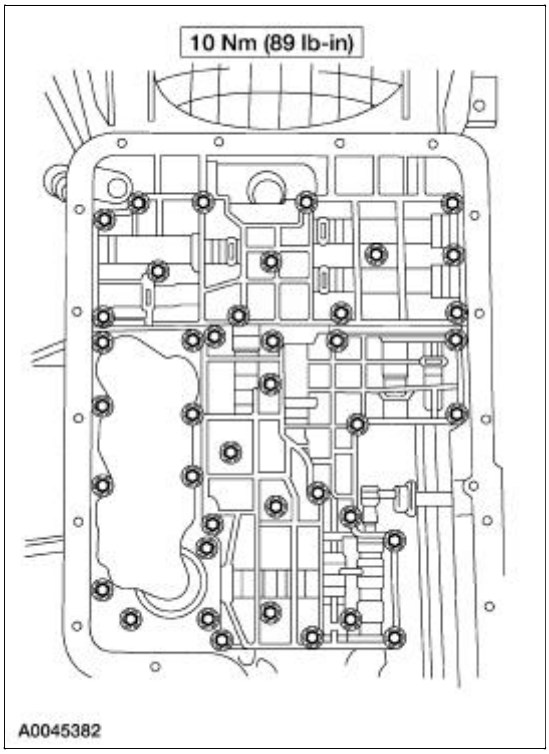


72. Install the solenoid screen assembly by pushing it in and rotating it to lock.



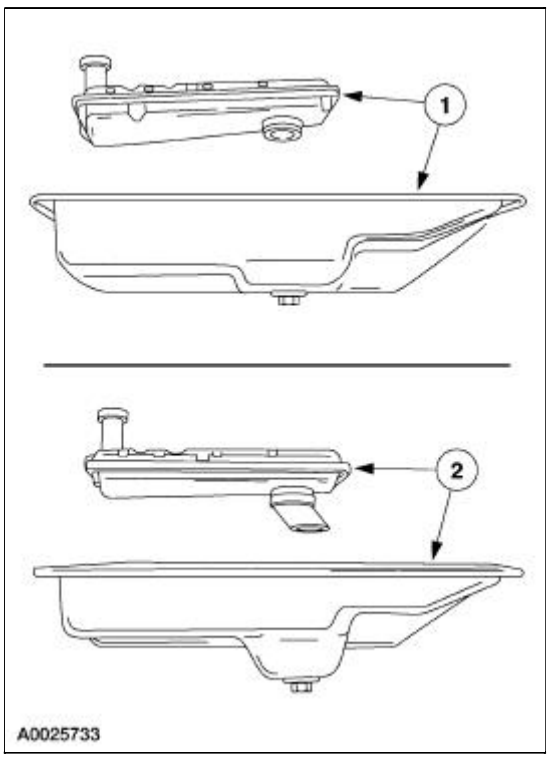
73. **NOTE:** Prior to installing the solenoid body assembly, coat the case connector bore with petroleum jelly or equivalent.

    Install the solenoid body assembly with the nut and the Torx® bolts finger-tight.



74. Install the main control valve body, aligning the manual shift valve with the inner manual valve detent lever. Install the nuts and the bolts finger-tight.

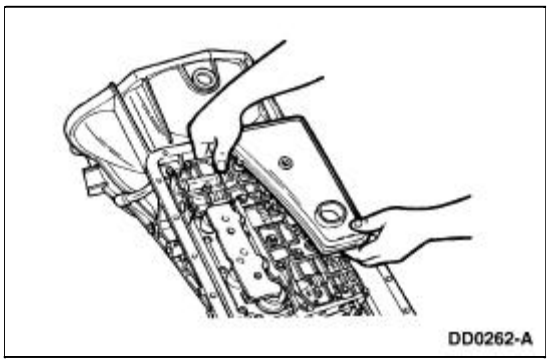
75. Install the accumulator body with the nuts and the bolts finger-tight.



76. Tighten all accumulator body, upper and lower control body and solenoid body nuts and bolts.

77. **CAUTION: Mixing the 4x2-style and 4x4-style transmission fluid filters and transmission pan assembly components can cause transmission damage.**

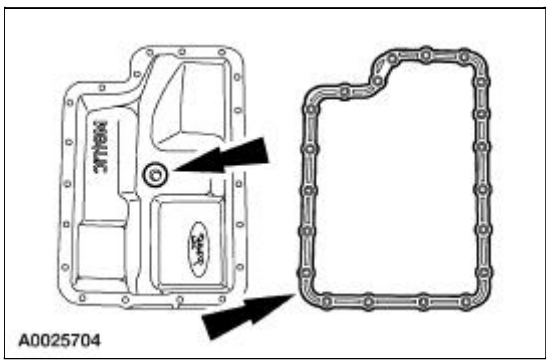
Select the appropriate 4x2-style or 4x4-style filter assembly and transmission pan.



1. 4x2 filter and pan application.
2. 4x4 filter and pan application.

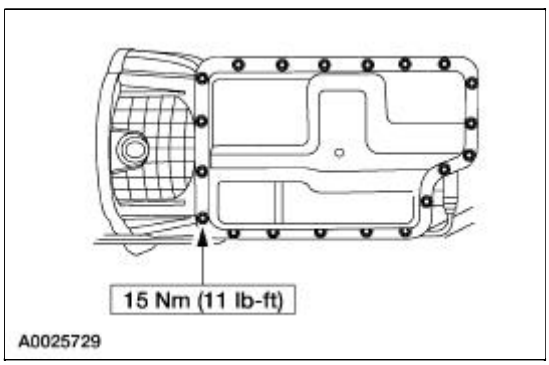
78. **CAUTION: Make sure the pump bore is clean and the oil filter seal has been removed. Damage to new filter and seal can occur.**

NOTE: Prior to installation, lightly lubricate the seal with clean automatic transmission fluid.



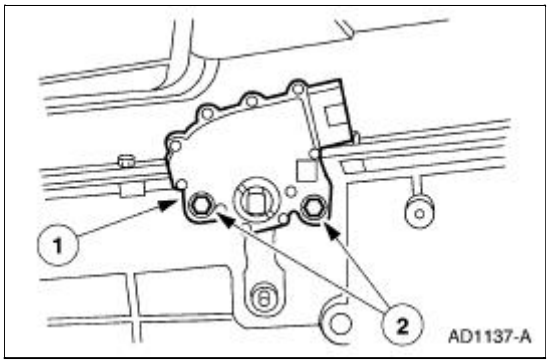
Install a new fluid filter and seal assembly into the pump bore until seated.

79. **NOTE:** Do not discard the gasket unless damaged. This is a reusable gasket.

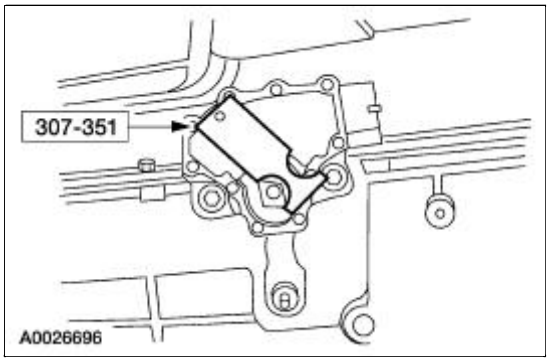


NOTE: Apply a light coat of petroleum jelly to hold the gasket to the fluid pan.

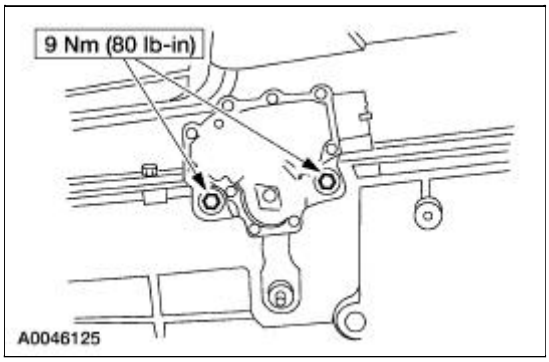
Position the gasket onto the clean fluid pan. Make sure the magnet is positioned over the dimple in the fluid pan.



80. **CAUTION: Mixing the 4x2-style and 4x4-style transmission fluid filters and transmission pan assembly components can cause transmission damage.**



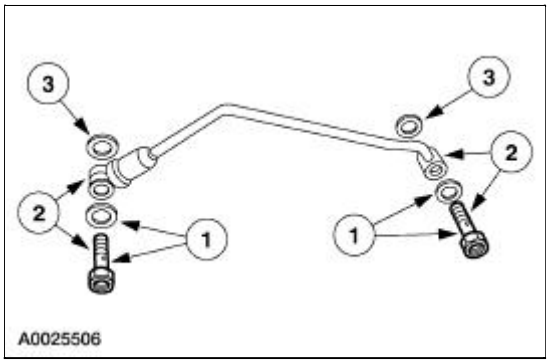
Install the correct pan with gasket for this application. Alternately tighten the bolts.



81. With the transmission in NEUTRAL, install and adjust the digital transmission range (TR) sensor.
    1. Install the digital TR sensor.
    2. Loosely install the bolts.

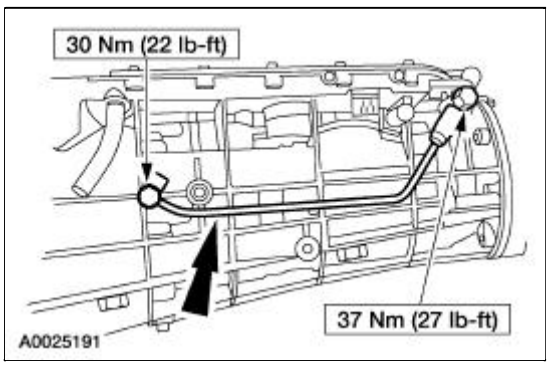
82. Using the special tool, align the TR sensor.

83. Tighten the bolts and remove the special tool.



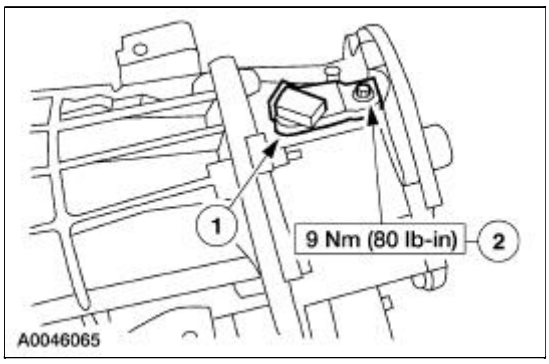
84. Make sure that the cooler bypass valve (CBV) has been cleaned and flushed. For additional information, refer to Cooler Bypass Valve Assembly in this section.

85. **CAUTION: Failure to correctly install the new rubber-coated sealing washers will result in transmission fluid leaks.**



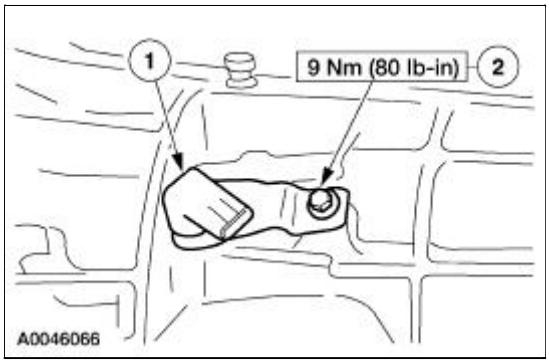
Install the new rubber-coated sealing washers and the new cooler line case fittings.

1. Install one rubber-coated sealing washers on each cooler line case fittings.
2. Install new cooler line case fittings into their respective ends of the CBV assembly.
3. Install one rubber-coated sealing washers on each cooler line case fittings.



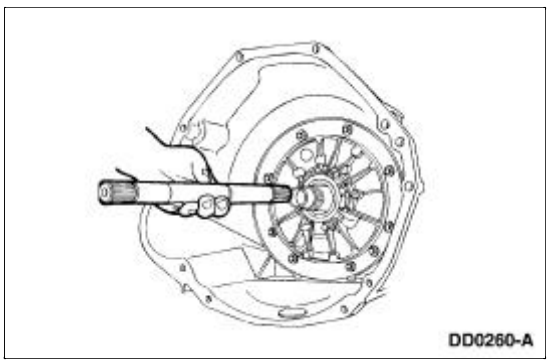
86. **CAUTION: Do not overtighten. Damage to the sealing washers can occur.**

Install the CBV with the front (inlet) and the rear (outlet) cooler line case fitting.



87. **CAUTION: Use care when installing the sensor, damage to the O-ring seal can result in a leak.**

Install the output shaft speed (OSS) sensor.
1. Lubricate O-ring seal and install the OSS.
2. Install the bolt.

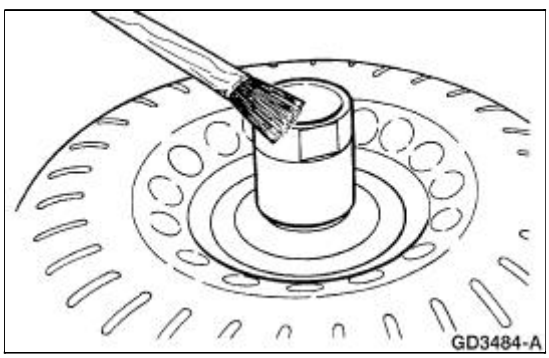


88. **CAUTION: Use care when installing the sensor, damage to the O-ring could result in a leak.**

If removed, install the turbine shaft speed (TSS) sensor.
1. Lubricate O-ring and install the TSS.
2. Install the bolt.

89. **NOTE:** The input shaft is vehicle-dependent. Refer to the parts catalog for correct part.

    With the fluid pan facing down, install the input shaft with the long splined end first.

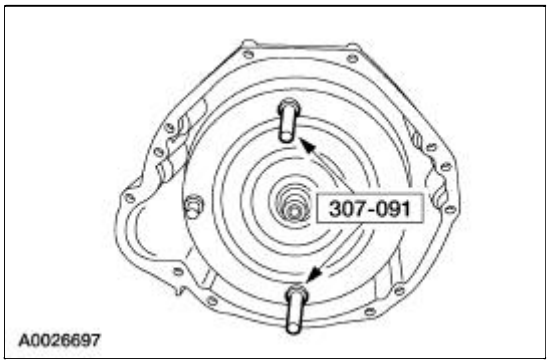


90. **CAUTION: Do not damage the fluid pump gear O-ring when installing torque converter.**

    CAUTION: Make sure the converter hub is fully engaged in the front pump support and gear and rotates freely. Do not damage the hub seal.

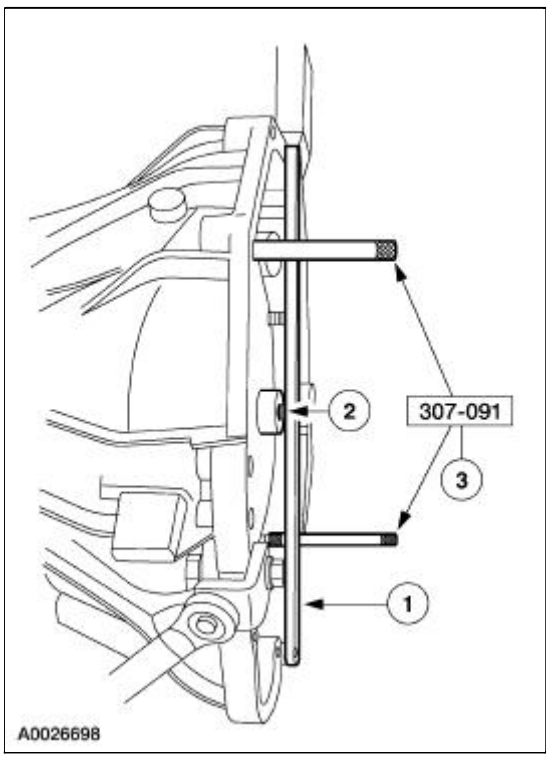
    CAUTION: If the torque converter slides out, the hub seal may be damaged.

    Lubricate the converter hub with clean automatic transmission fluid.



91. **CAUTION: Use care when installing the torque converter to avoid damage to the front pump stator support seal.**

    NOTE: Check the converter crankshaft pilot for nicks or damaged surfaces that can cause interference when installing the transmission to the engine. Check the converter impeller hub for



nicks or sharp edges that can damage the pump seal.

NOTE: Carry the torque converter with the Torque Converter Handles held in the 6 o'clock and 12 o'clock positions.

Using the special tools, install the torque converter. Push and rotate the converter onto the front pump assembly until it bottoms out.

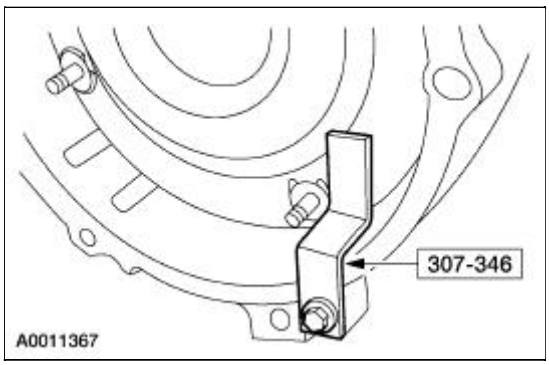
92. Check the seating of the torque converter.
    1. Place the straightedge across the converter housing.
    2. Make sure there is a gap between the converter pilot face and the straightedge.
    3. Remove the special tools.

Transmission —4x4

Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

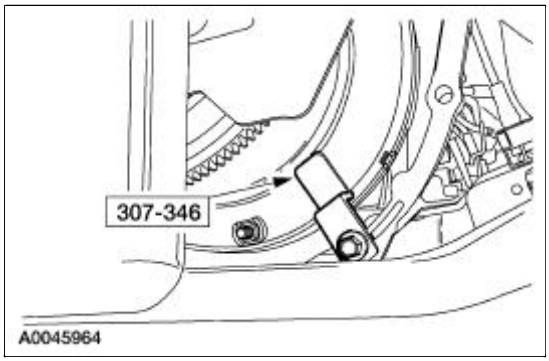
Material



Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®
Multi-Purpose Grease XG-4	ESR-M1C159-A

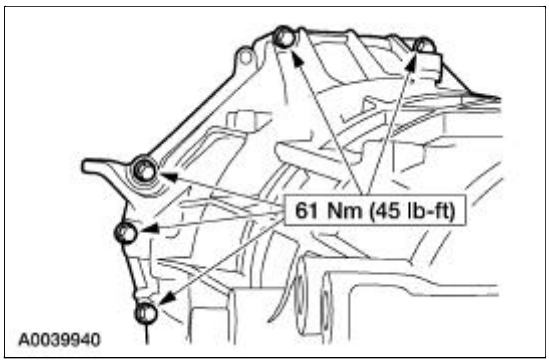
Installation

1. Lubricate the torque convertor pilot hub with multi-purpose grease.



2. Install the special tool for installation of the transmission.

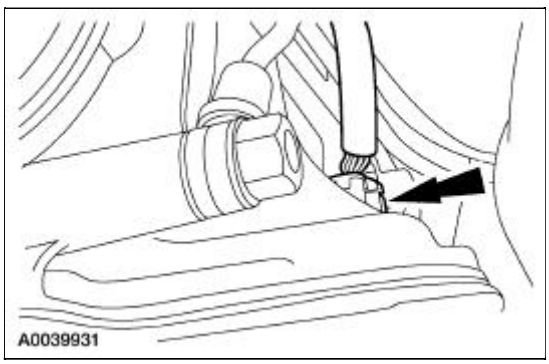
3. The transmission will need to be put in a nose-down position so the rear of the transmission will clear the exhaust. Partially raise the transmission up into the vehicle.



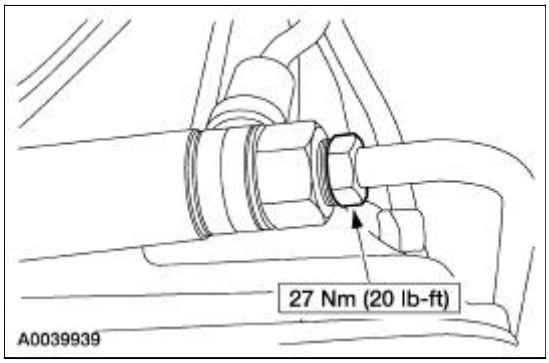
4. Connect the wire harness to the top of the transmission.

5. With the transmission in a horizontal position, remove the special tool.

6. Position the transmission to the back of the engine and install the bolts to the RH side of the transmission.

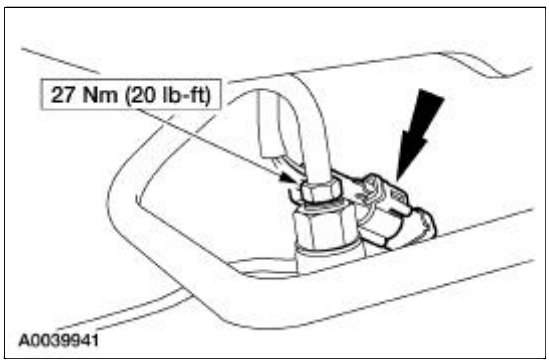


7. Install the bolts to the LH side of the transmission.

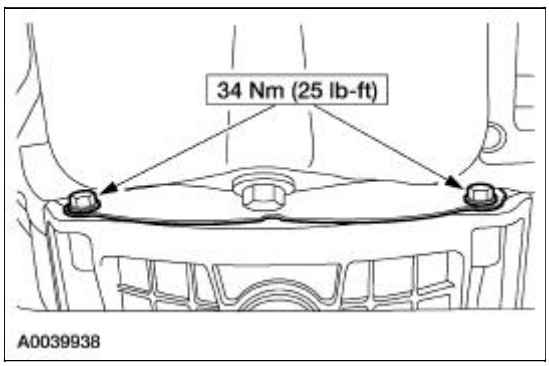


8. Install a jack stand under the bellhousing with a block of wood.

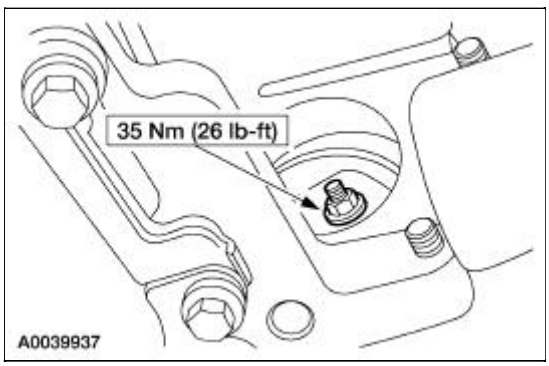
9. Remove the transmission jack.



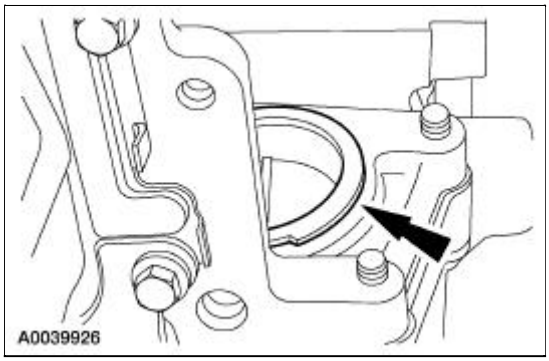
10. Connect the transmission harness connector.



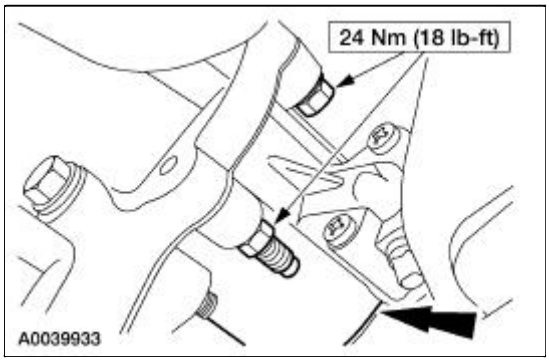
11. Connect the rear transmission cooler line.



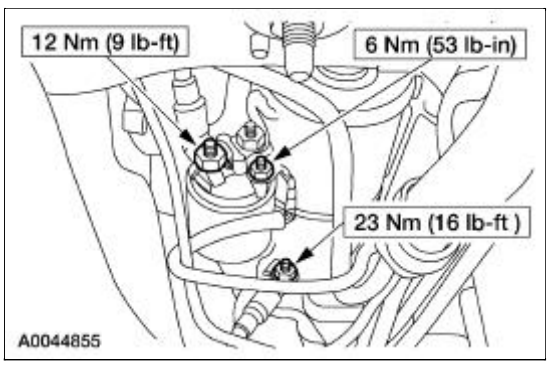
12. Connect the front transmission cooler line and the HO2S connector.



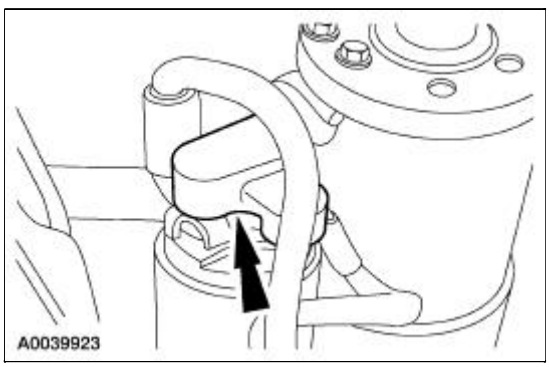
13. Install the shield and install the bolts.



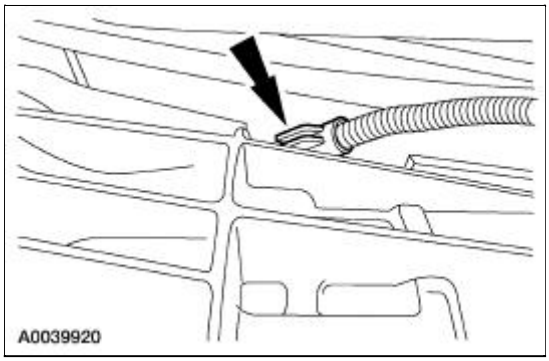
14. Install four new torque converter nuts.



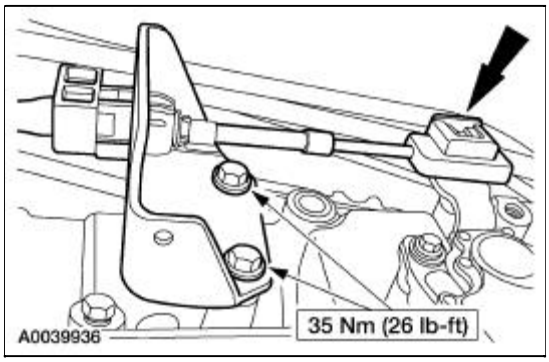
15. Install the torque converter access cover.



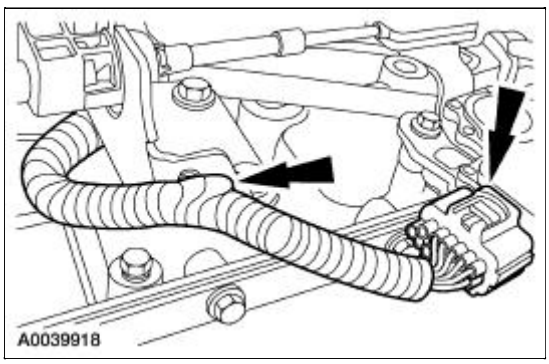
16. Install the starter motor and the three starter bolts.



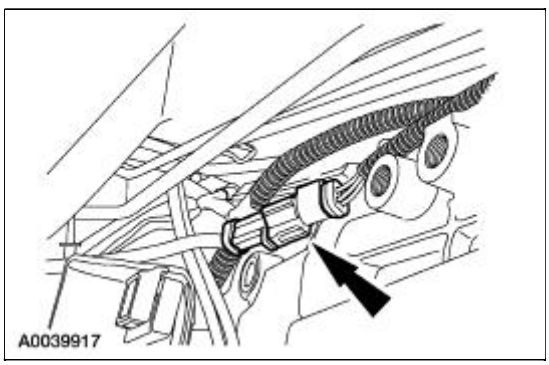
17. Install the battery cables to the starter motor and connect the ground cable.



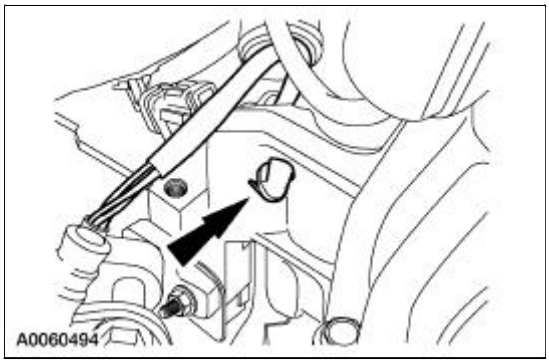
18. Install the plastic cover to the starter motor electrical connector.



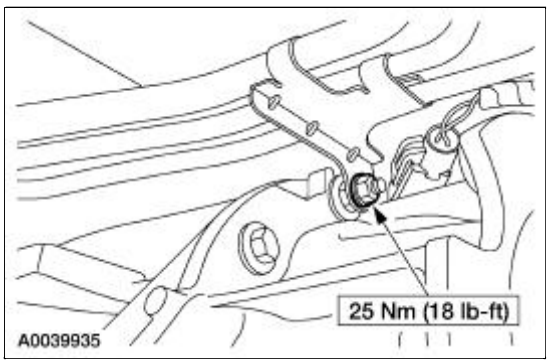
19. Connect the turbine shaft speed (TSS) sensor connector.



20. Install the shift cable and bracket to the transmission and connect the shift cable to the manual control lever.

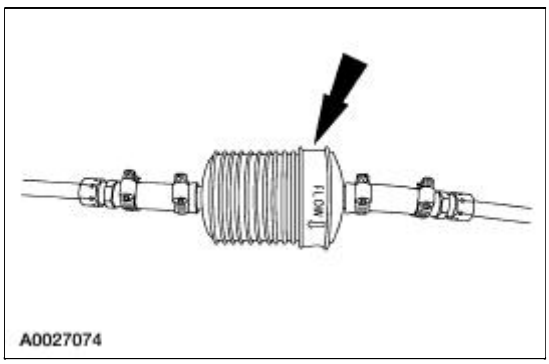


21. Connect the wire harness to the TR sensor bracket and connect the digital TR sensor connector.



22. Connect the LH HO2S.

23. Connect the HO2S sensor clip from the transmission.



24. Install the fuel line bracket and connect the output shaft speed (OSS) sensor connector.

25. **NOTE:** Use the following guidelines for the in-line transmission fluid filter:
    - If the transmission was overhauled and the vehicle was equipped with an in-line fluid filter, install a new in-line fluid filter.
    - If the transmission was overhauled and the vehicle was not equipped with an in-line fluid filter, install a new in-line fluid filter kit.
    - If the transmission is being installed for a non-internal repair, do not install an in-line filter or filter kit.
    - If installing a Ford-authorized remanufactured transmission, install the in-line transmission fluid filter that is supplied.

    Install a new in-line transmission filter or a filter kit.

26. Install the transfer case. For additional information, refer to Section 308-07B .

27. **NOTE:** When the battery has been disconnected and reconnected, some abnormal drive symptoms can occur while the vehicle relearns its adaptive strategy. The customer needs to be notified that they may experience slightly different upshifts (either soft or firm) and this is a temporary condition that will eventually return to normal operating condition.

Connect the battery ground cable. For additional information, refer to Section 414-01 .

28. **CAUTION: The use of any other fluids can result in the transmission failing to operate in a normal manner or failure.**

    Fill the transmission.

    - Add 6.2 liters (6.5 qts) of clean automatic transmission fluid to the transmission through the fluid fuller tube.

29. Start the engine. Move the transmission range selector lever through all the gear ranges, checking for engagements.

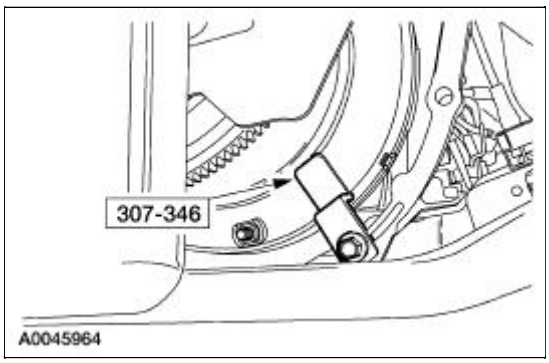
30. With the engine running and the transmission at normal operating temperature 66-77°C (150-170°F), check and adjust the transmission fluid level and check for any leaks. If fluid is needed, add fluid in increments of 0.24-liter (0.5-pint) until the correct level is achieved (fluid should be in the cross-hatched area of the fluid level indicator.)

Transmission —4x2

Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

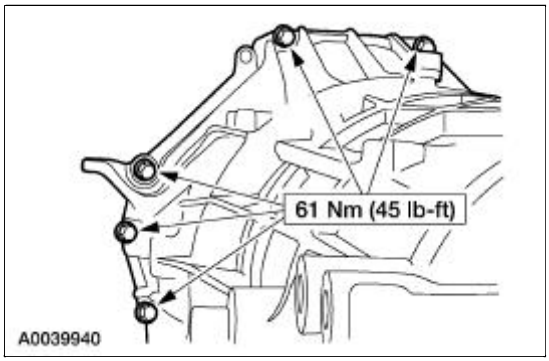
Material



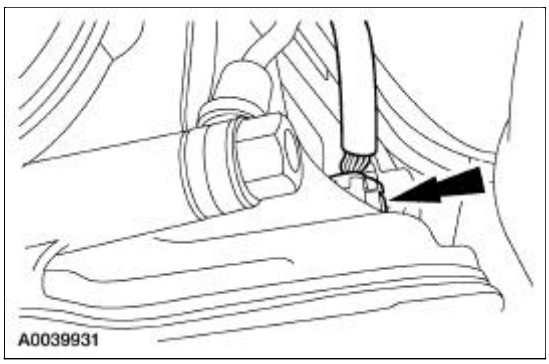
Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®
Multi-Purpose Grease XG-4	ESR-M1C159-A

Installation

1. Lubricate the torque converter pilot hub with multi-purpose grease.

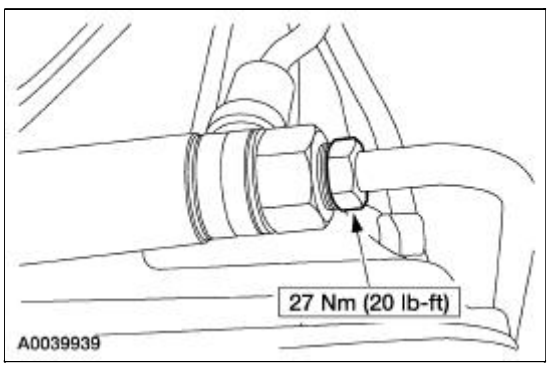


2. Install the special tool for installation of the transmission.

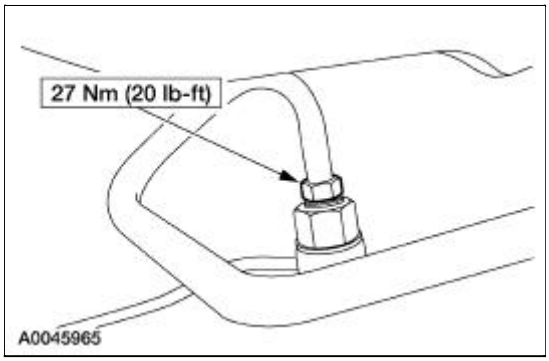


3. The transmission will need to be put in a nose down position so the rear of the transmission will clear the exhaust. Partially raise the transmission up into the vehicle.

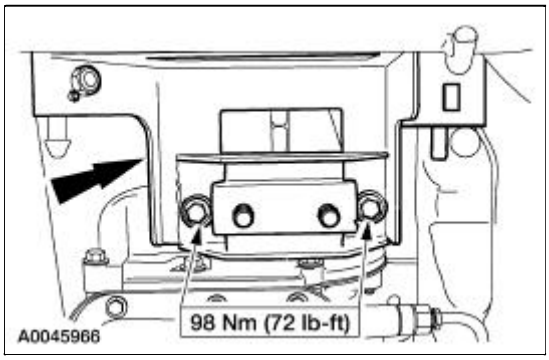
4. Connect the wire harness to the top of the transmission.



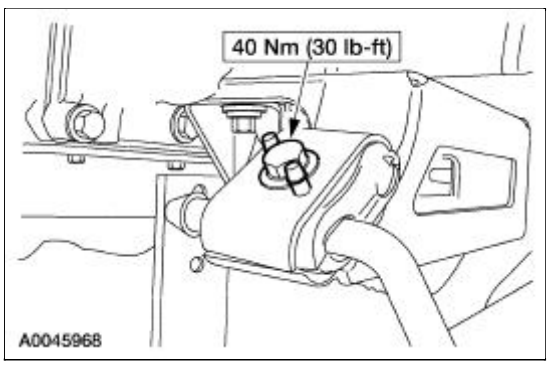
5. Position the transmission to the back of the engine and install the bolts.



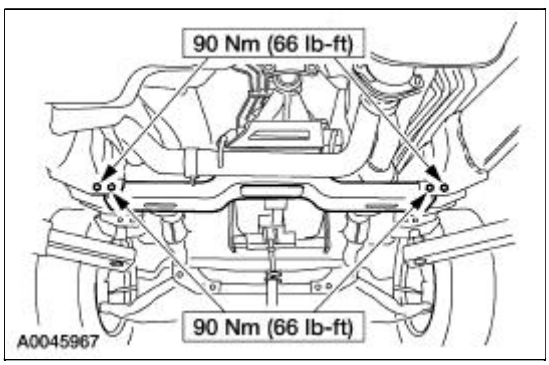
6. Connect the transmission harness connector.



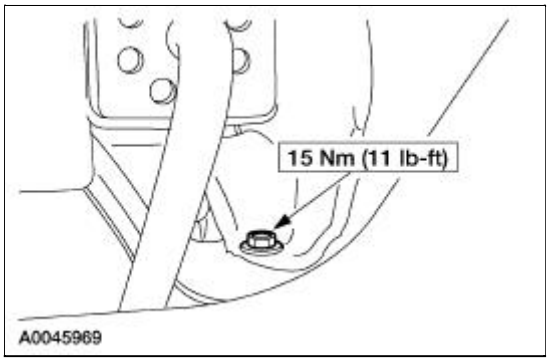
7. Connect the rear transmission cooler line.



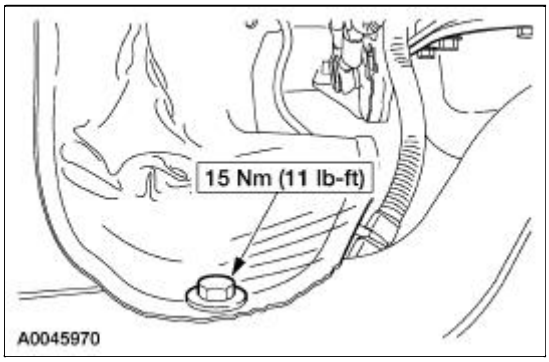
8. Connect the front transmission cooler line.



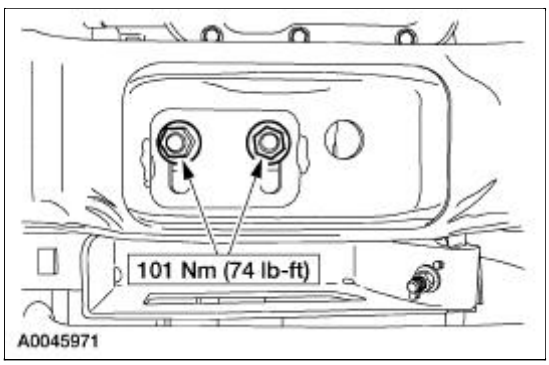
9. Install the rear exhaust hanger, transmission support and the bolts.



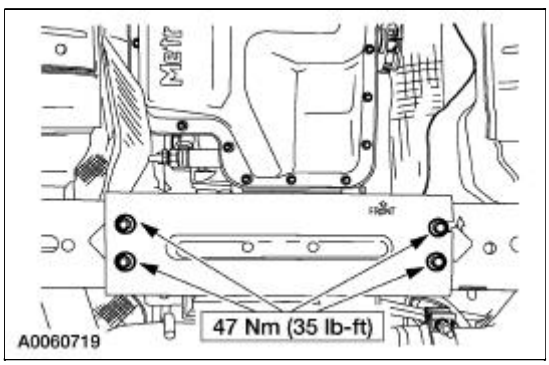
10. Install the exhaust hanger bolt.



11. Install the crossmember and the bolts.

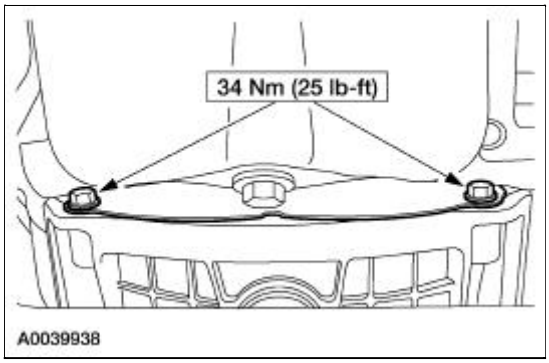


12. Install the RH heat shield bolt.

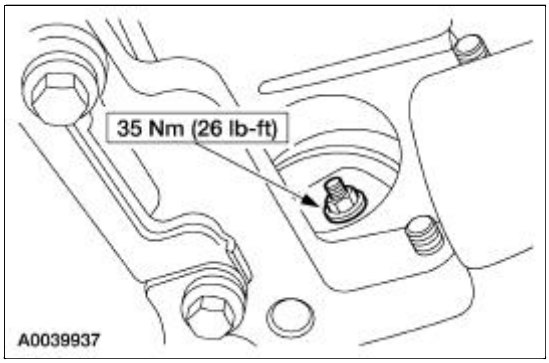


13. Install the LH heat shield bolt.

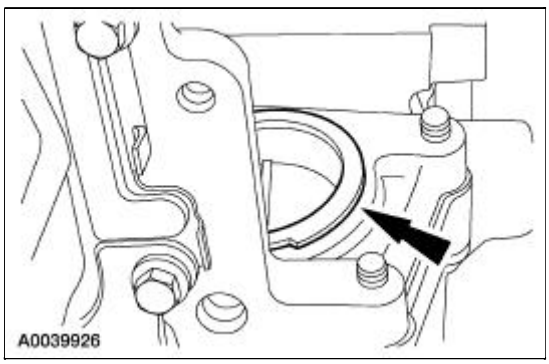
14. Install the rear transmission support nuts.



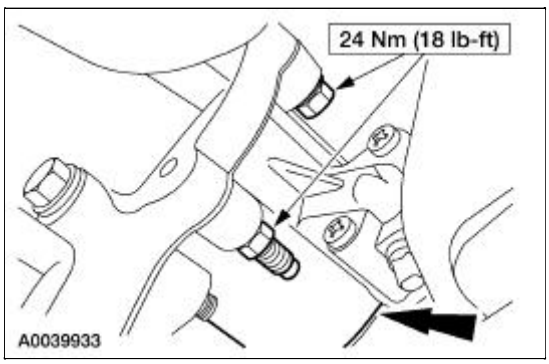
15. Install the dampener and install the bolts.



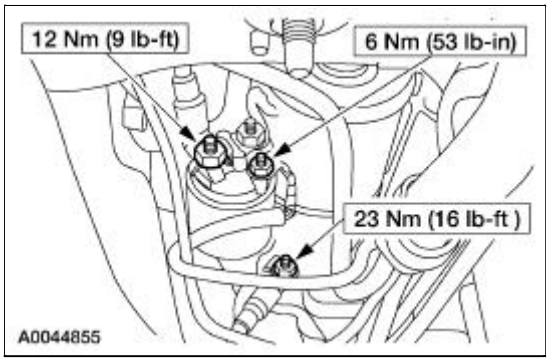
16. Remove the transmission jack.



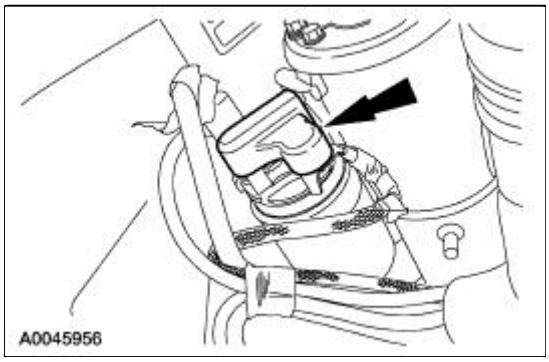
17. Install the shield and install the bolts.



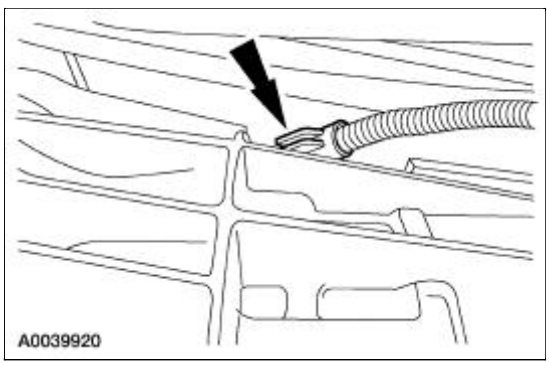
18. Install four new torque converter nuts.



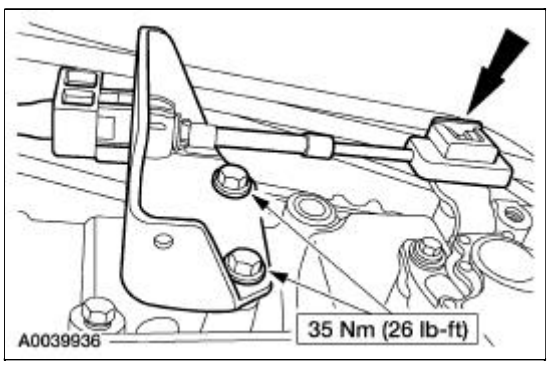
19. Install the torque converter access cover.



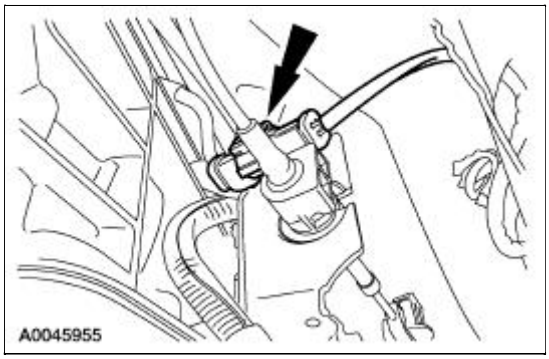
20. Install the starter motor and the three starter bolts.



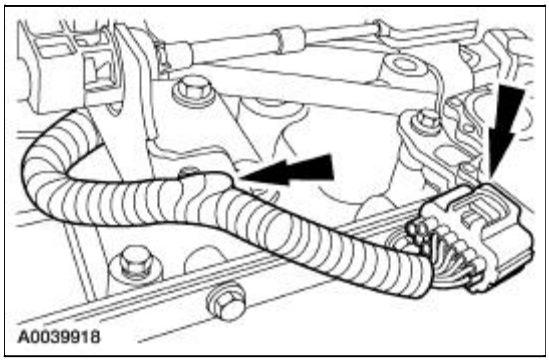
21. Install the battery cables to the starter motor and connect the ground cable.



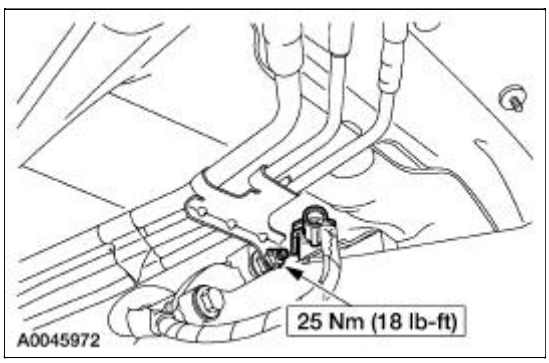
22. Install the plastic cover to the starter motor electrical connector.



23. Connect the turbine shaft speed (TSS) sensor connector.

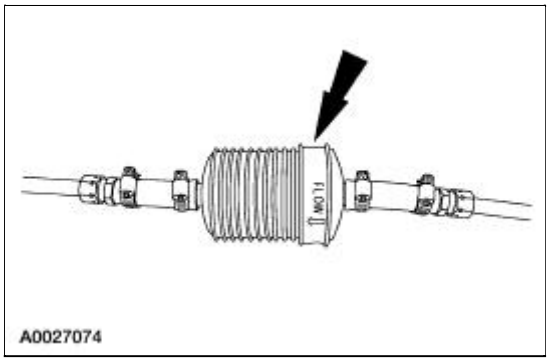


24. Install the shift cable and bracket to the transmission and connect the shift cable to the manual control lever.



25. Connect the LH catalyst monitor sensor connector to the shift cable bracket.

26. Connect the wire harness to the TR sensor bracket and connect the digital TR sensor connector.



27. Install the fuel line bracket and connect the output shaft speed (OSS) sensor connector.

28. Install the rear drive shaft. For additional information, refer to Section 205-01 .

29. **NOTE:** Use the following guidelines for the in-line transmission fluid filter:
    - If the transmission was overhauled and the vehicle was equipped with an in-line fluid filter, install a new in-line fluid filter.
    - If the transmission was overhauled and the vehicle was not equipped with an in-line fluid filter, install a new in-line fluid filter kit.
    - If the transmission is being installed for a non-internal repair, do not install an in-line filter or filter kit.
    - If installing a Ford-authorized remanufactured transmission, install the in-line transmission fluid filter that is supplied.

    Install a new in-line transmission fluid filter or filter kit.

30. Lower the vehicle.

31. **NOTE:** When the battery has been disconnected and reconnected, some abnormal drive symptoms can occur while the vehicle relearns its adaptive strategy. The customer needs to be notified that they may experience slightly different upshifts (either soft or firm) and this is a temporary condition that will eventually return to normal operating condition.

    Connect the battery ground cable. For additional information, refer to Section 414-01 .

32. **CAUTION: The use of any other fluids can result in the transmission failing to operate in a normal manner or failure.**

    Fill the transmission.

    - Add 6.2 liters (6.5 qts) of clean automatic transmission fluid to the transmission through the fluid filler tube.

33. Start the engine. Move the transmission range selector lever through all the gear ranges, checking for engagements.

34. With the engine running and the transmission at normal operating temperature 66-77°C (150-170°F), check and adjust the transmission fluid level and check for any leaks. If fluid is needed, add fluid in increments of 0.24-liter (0.5-pint) until the correct level is achieved (fluid should be in the cross-hatched area of the fluid level indicator)

General Specifications

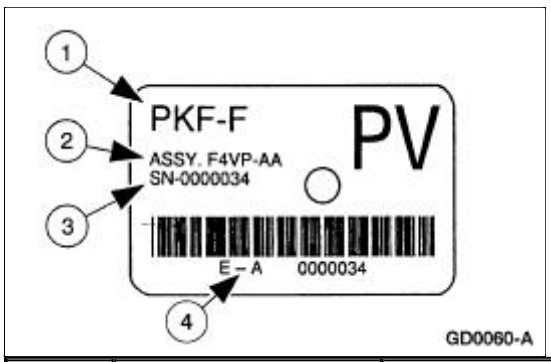
Transmission Description

The 4R70W has the following features:

- Wide ratio gears
- Four speeds
- Rear wheel drive
- Automatic
- Electronic shift
- Torque converter clutch control
- Line pressure controls

The transmission uses Ravigneaux-style double-pinion gearset with two bands, one one-way roller clutch, one mechanical diode and four friction clutches to produce four forward gears and Reverse.

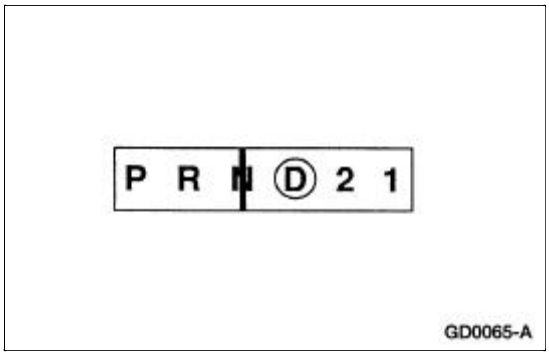
4R70W Automatic Transmission



Identification Tags

All vehicles are equipped with a Vehicle Certification Label, located on the driver side door lock post. For correct transmission identification, refer to the code in the space marked TR.

For model, service ID level or build date information, refer to the transmission service ID tag located on the transmission case.



Identification Tag

Item	Part Number	Description
1	—	Model number
2	—	Assembly number
3	—	Serial number
4	—	Model and serial number

Range Selection

The transmission has six range positions: P, R, N, (D), 2 and 1.

Park

In the PARK position:

- there is no powerflow through the transmission.
- the parking pawl locks the output shaft to the case.
- the engine can be started.
- the ignition key can be removed.

Reverse

In the REVERSE position:

- the vehicle can be operated in a rearward direction, at a reduced gear ratio.
- engine braking will occur.

Neutral

In the NEUTRAL position:

- there is no powerflow through the transmission.
- the output shaft is not held and is free to turn.
- the engine can be started.

Overdrive

Overdrive is the normal position for most forward driving.

The OVERDRIVE position provides:

- Automatic shifts.

- Apply and release of the torque converter clutch.
- Maximum fuel economy during normal operation.

Second Position

This position provides:

- Second gear start and hold.
- The torque converter clutch can apply and release.
- Improved traction and engine braking on slippery roads.
- Engine braking for descending steep grades.

First Position

If this position is selected at normal road speeds, the transmission will shift into second gear, then into first when the vehicle reaches a speed below approximately 45 km/h (28 mph).

This position provides:

- First gear operation only.
- Engine braking for descending steep grades.

Shift Patterns

Upshifts

Transmission upshifting is controlled by the powertrain control module (PCM). The PCM receives inputs from various engine or vehicle sensors and driver demands to control shift scheduling, shift feel and torque converter clutch (TCC) operation.

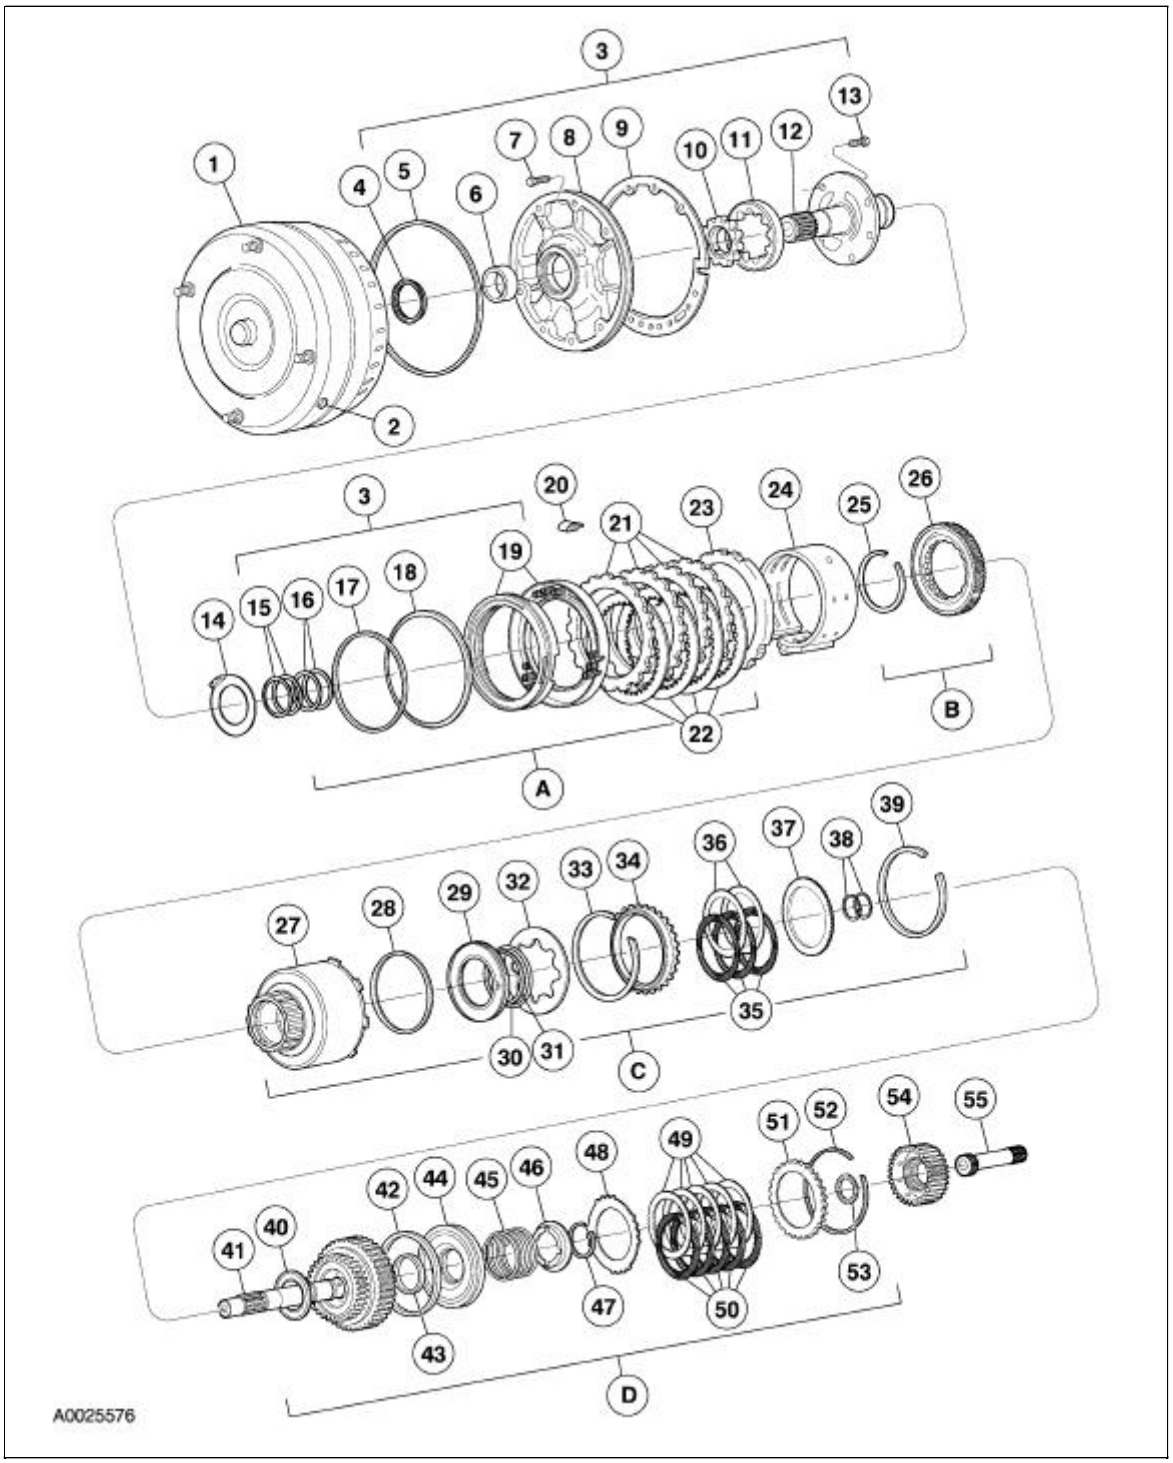
Downshifts

Under certain conditions the transmission will downshift automatically to a lower gear range (without moving the gearshift lever). There are three categories of automatic downshifts; Coastdown, Torque Demand and Forced or Kickdown shifts.

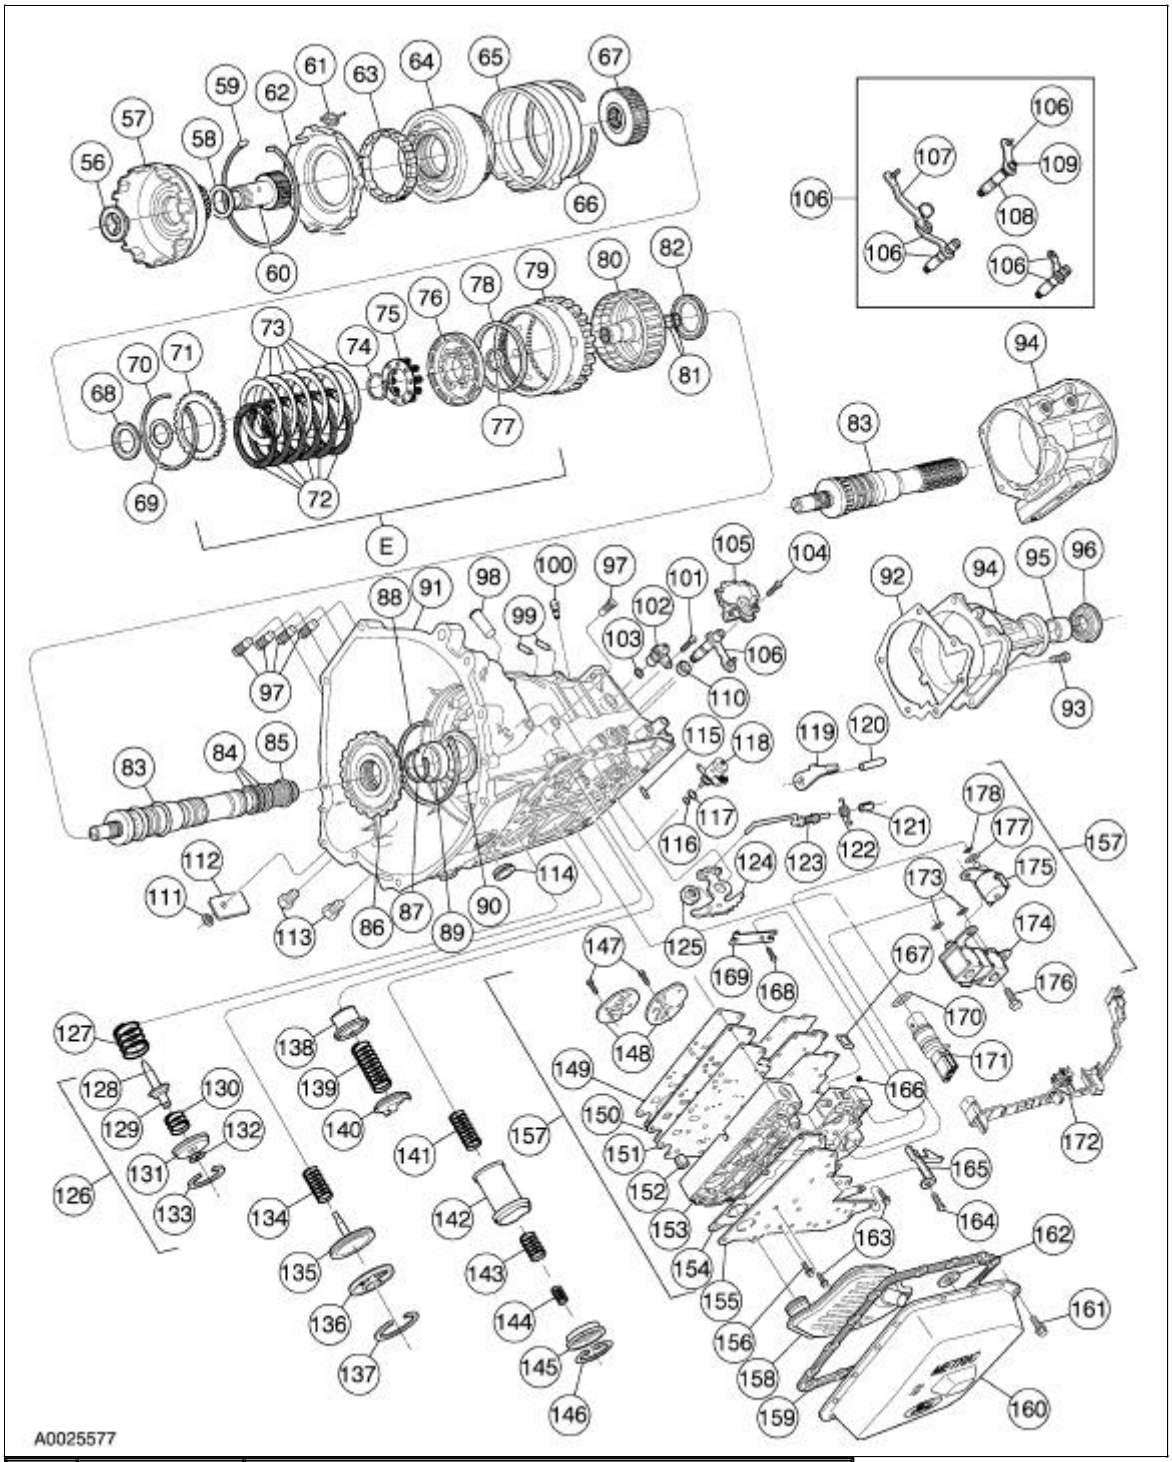
Coastdown

The coastdown downshift occurs when the vehicle is coasting down to a stop.

Torque Demand



The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide at that gear ratio. If applied, the transmission will disengage the TCC to provide added acceleration.



Kickdown

For maximum acceleration, the driver can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear is possible below calibrated speeds. Specifications for downshift speeds are subject to variations due to tire size, engine and transmission calibration requirements.

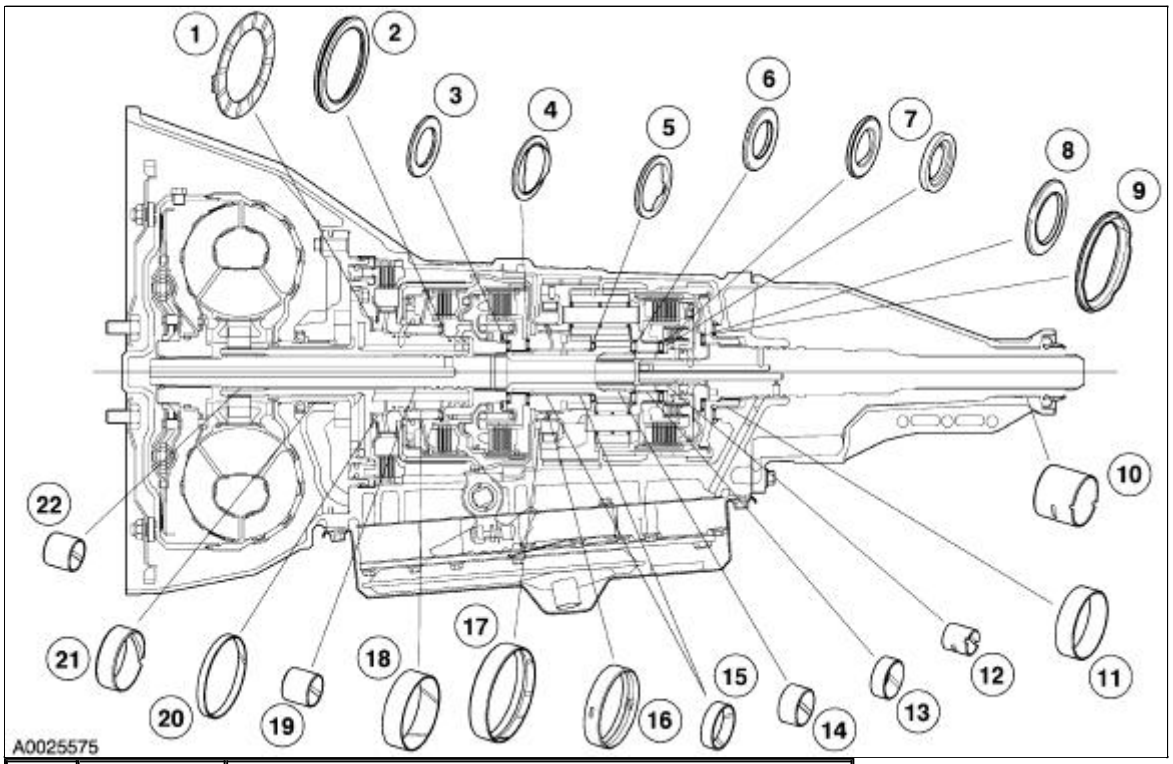
60	7A399	Gear assembly — forward clutch sun
61	7F277	Spring — case to planet support
62	7A130	Support assembly — planetary gear
63	7A089	OWC cage spring and roller assembly — planetary
64	7A398	Planetary assembly (model dependent)
65	7D095	Band assembly — reverse
66	377437-S	Retaining ring — 0.58 thick (locates reverse band during assembly)
67	7F236	Hub — direct clutch
68	7F243	Bearing and race assembly — direct clutch inner No. 7
69	7F237	Support — direct clutch inner bearing
70	7D483	Retaining ring — direct clutch pressure plate (select fit)
71	7B066	Plate — direct clutch pressure
72	7B164	Plate — direct clutch internal spline (friction)
73	7B442	Plate — direct clutch external spline (steel)
74	388104-S	Retainer ring — 1-19/32 (retains 7F235 to 7F283)
75	7F235	Retainer and spring assembly — direct clutch
76	7A262	Piston assembly — direct clutch
77	7C099	Seal — direct clutch piston inner



78	7A233	Seal — direct clutch piston outer
79	7A153	Gear — output shaft ring
80	7F283	Cylinder assembly — direct clutch
81	7F274	Seals — output shaft small — direct clutch (2 req'd)
82	7F240	Bearing and race assembly — direct clutch outer No. 8
83	7060	Shaft assembly — output (model dependent)
84	7F273	Seal — output to case shaft large (3 req'd)
85	87054-S94	Seal — O-ring (piloted output shaft only) (model dependent)
86	7D164	Hub — output shaft
87	97713-S	Snap ring — 1-13/16 retaining (retains 7D164 to 7060)
88	7C122	Snap ring — retaining (retains 7D164 to 7A153)
89	7025	Bushing — rear case
90	7F242	Bearing and race assembly — case rear No. 9
91	7005	Case assembly
92	7086	Gasket — extension (model dependent)
93	N803747-S1101	Bolt — M8-1.25 x 30 (6-attaches 7A039 to 7005) (model dependent)
94	7A039	Extension housing assembly (model dependent)
95	—	Bushing — extension housing (part of 7A039)
96	7052	Seal assembly — extension housing (model dependent)
97	390318-S100	Pipe plug — 1/8-27 Dryseal tapered (5 req'd)
98	7F295	Pin — overdrive band anchor
99	388142-S	Pin — reverse band anchor (part of 7005)
100	7034	Vent assembly — case
101	N605771-S427	Bolt — M6-1.0 x 14 hex head (attaches output shaft speed sensor to case)
102	7H103	Sensor assembly — transmission output shaft speed
103	N811757-S100	Seal — 14.0 x 1.78 O-ring (2 req'd)
104	N806933-S102	Bolt and washer assembly — M6-1.0 x 25 mm (1 in) (2-attaches 7F293 to 7005) (model dependent)
105	7F293	Sensor — transmission range
106	7A256	Lever assembly — manual control (model dependent)
107	7H296	Link assembly — manual control (model dependent)

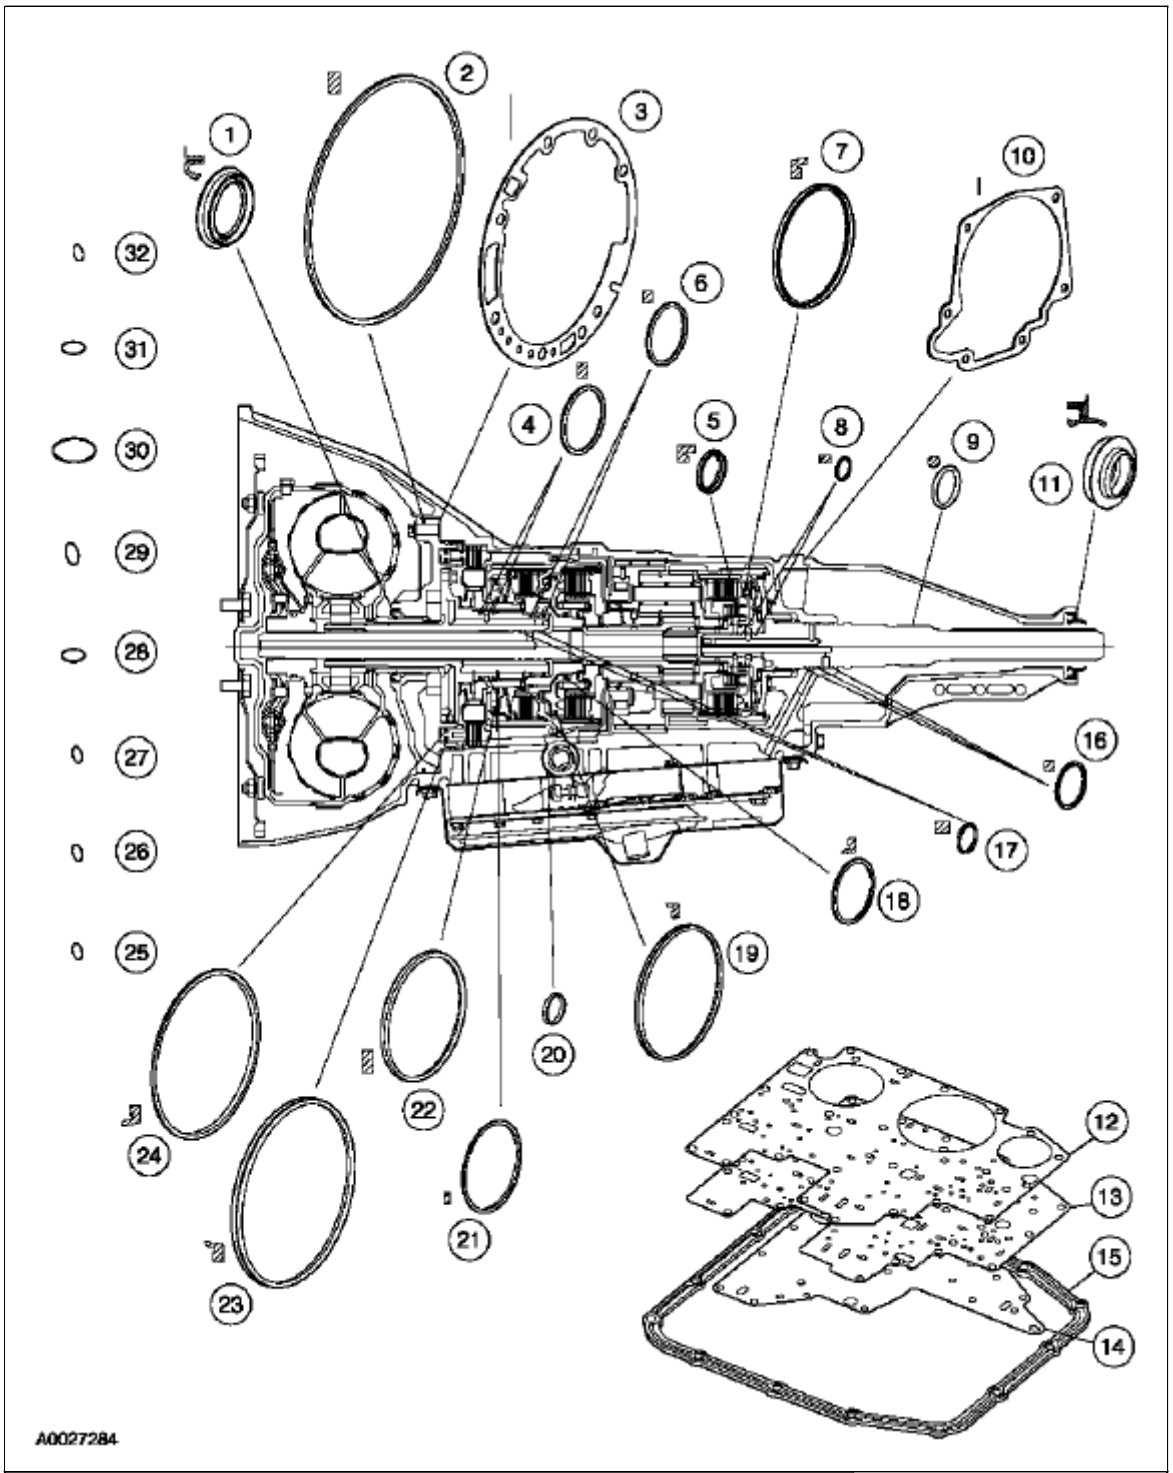
109	N808737-	Nut — M10-1.5 (attaches 7A256 to 7C493)

	S427	
110	7B498	Seal assembly — manual control lever
111	373907-S2	Nut — 1/4 spring (retains identification tag to 7000)
112	7B148	Tag — identification (part of 7005)
113	7D273	Connector assembly — fluid tube (2 req'd)
114	7N171	Plug — converter housing access
115	7B210	Pin — manual lever shaft retainer
116	391131	Seal — 0.426 x 0.070 O-ring
117	N805862-S	Seal — 14.0 x 1.78 O-ring
118	7G383	Solenoid valve — transmission pressure control
119	7A441	Pawl — parking pawl
120	7D071	Shaft — parking pawl
121	7D419	Cup — park rod guide (part of 7A039)
122	7D070	Spring — parking pawl return
123	7A232	Rod assembly — park pawl actuating
124	7A115	Lever assembly — manual valve detent lever
125	N800287-S536	Nut — M14 x 1.5 hex intermediate detent lever (attaches 7A115 to 7A256)
126	7H188	Piston assembly — overdrive servo
127	7F201	Spring — overdrive servo piston
128	7F203	Rod — overdrive servo actuating (part of 7H188)
129	7H179	Washer — backup overdrive servo (part of 7H188)
130	7G277	Spring — overdrive cushion spring (part of 7H188)
131	7F200	Piston assembly — overdrive servo (part of 7H188)
132	97411-S	Ring — retaining (part of 7H188)
133	7384	Ring — 2.85 retaining type TVP "H" internal (retains 7H188 to 7005)
134	7D031	Spring — reverse band servo piston
135	7D189	Piston assembly — reverse band servo
136	7D036	Cover assembly — reverse band servo piston
137	388215-S100	Retaining ring internal — 3-13/16
138	7H292	Piston — 2-3 accumulator (bonded seals)
139	7F285	Spring — 2-3 shift accumulator piston (model dependent)
140	7B264	Retainer — 2-3 shift accumulator spring
141	7F284	Spring — 1-2 shift accumulator (model dependent)
142	7F251	Piston — 1-2 shift accumulator (bonded seals)
143	7F284	Spring — 1-2 shift accumulator

144	7G326	Nested spring — 1-2 (inner spring) (vehicle dependent)
145	7F247	Cover and seal assembly — 1-2 accumulator
146	7384	Ring — 2-1/16 retaining type HU internal (retains 7H300 to 7005)
147	N807178-S1000	Bolt — M6-1.0 x 18 hex head (12-attaches reinforcing plate to valve body)
148	7F282	Plate — valve body reinforcing (part of 7A100)
149	7C155	Gasket — valve body separator upper
150	7A008	Plate — control valve body separator (part of 7A100)
151	7D100	Gasket — valve body separator lower
152	7D174	Valve — converter drainback
153	7A091	Body assembly — main control
154	7H173	Gasket — valve body cover plate
155	7C034	Plate — valve body cover (part of 7A100)
156	N807178-S1000	Bolt — M6-1.0 x 18 hex head (11-attaches 7C034 to 7A100 (part of 7A100)
157	7A100	Control assembly — main (model dependent)
158	7A098	Filter and seal assembly — fluid
159	7A191	Gasket — transmission pan
160	7A194	Pan — transmission
161	N605785-S1036	Bolt — M8-1.25 x 18 hex flange head (14-attaches 7A194 to 7005)
162	7L027	Magnet — ceramic case (part of 7A194)
163	N808947-S1300	Bolt — M8-1.25 x 46 hex shoulder pilot (2-attaches 7C034 to 7A100)
164	N807179-S1000	Bolt — M6-1.0 x 52 hex flange head (12-attaches 7A100 to 7005)
165	7H111	Retainer — solenoid
166	7E195	Ball — 1/4 diameter coast booster valve shuttle (8 req'd)
167	7H187	Screen — solenoid pressure supply
168	N800670-S1000	Bolt — M6-1.0 x 40 hex flange head (13-attaches 7A100 to 7005)
169	7E332	Spring assembly — manual valve detent
170	7Z276	Seal — 0.864 x 0.070 O-ring (2 req'd)
171	7G276	Bulkhead assembly — wiring connector
172	7G276	Bulkhead assembly — connector (molded lead frame)
173	7Z484	Seal — 6.07 x 1.70 O-ring (2 req'd)
174	7G484	Solenoid valve — transmission shift
175	7G136	Solenoid valve — transmission torque converter clutch
176	N807178-S1000	Bolt — M6-1.0 x 16 hex head (retains 7D136 and 7G484 to 7A100)

177	7Z136	Seal — 0.489 x 0.070 O-ring
178	7Z484	Seal — 0.176 x 0.070 O-ring
A	—	Intermediate clutch assembly
B	—	Intermediate one-way clutch
C	—	Reverse clutch assembly
D	—	Forward clutch assembly
E	—	Direct clutch assembly



Bushings, Bearing and Thrust Washer Locator

Item	Part Number	Description
1	7D014	Pump No.1 thrust washer (select fit)
2	7A166	Forward clutch No. 2 bearing and race assembly
3	7F231	Forward clutch bearing and race assembly — front No. 3
4	7F244	Forward clutch hub bearing and race assembly No. 4
5	7F244	Forward clutch sun gear bearing and race assembly No. 5
6	7F241	Planet assembly bearing and race No. 6
7	7F243, 7F237	Direct clutch inner bearing, race assembly No. 7 and direct clutch inner bearing support No. 7

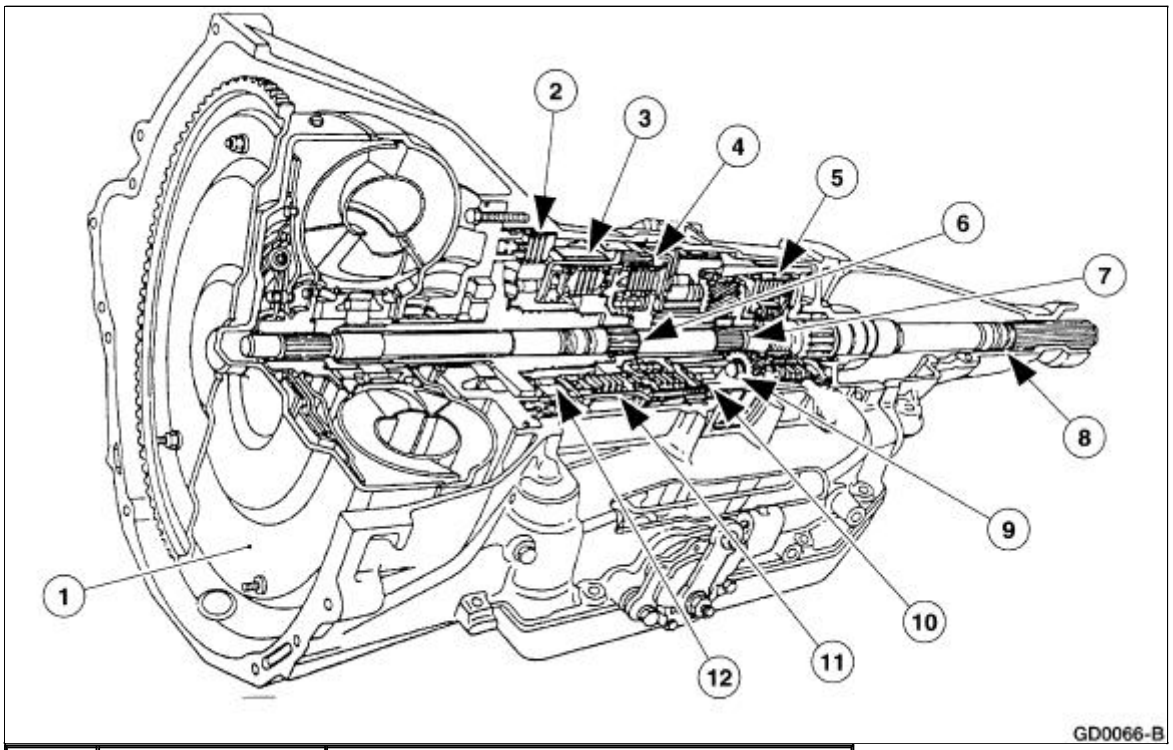
9	7F242	Outer bearing and race assembly — rear No. 9
10	—	Extension bushing (part of 7A039)
11	7025	Case bushing
12	7B233	Output shaft bushing
13	7B375	Planet carrier bushing — rear
14	7F209	Forward clutch sun gear bushing
15	7N193	Reverse clutch sun gear bushing

16	7B374	Carrier bushing — front
17	7A132	Planetary support bushing
18	7F218	Reverse clutch drum bushing — rear
19	7B261	Front pump support bushing
20	7F217	Reverse clutch drum bushing — front
21	7B258	Front pump bushing
22	7B261	Front pump support bushing

Seals, Rings and Gasket Locator



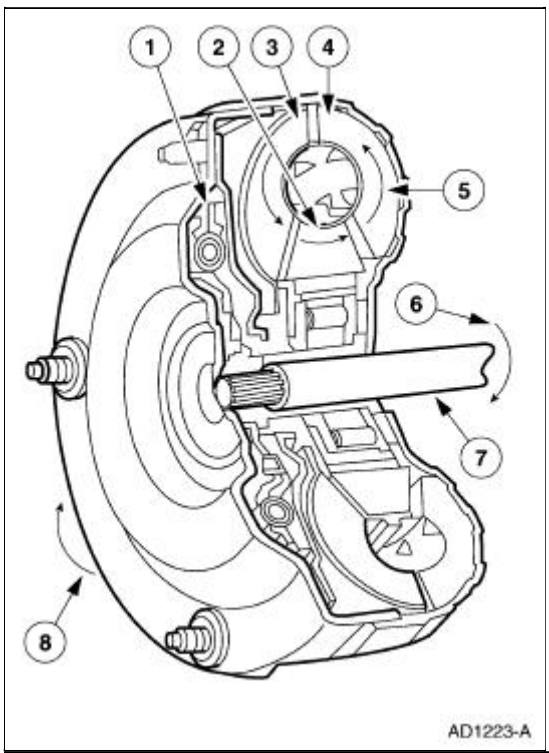
Item	Part Number	Description
1	7A248	Front pump seal assembly
2	7A248	Front pump seal
3	7A136	Front pump gasket

4	7D020	Reverse clutch cylinder seal (2 req'd)
5	7C099	Direct clutch piston inner seal
6	7D019	Forward clutch cylinder
7	7A548	Direct clutch piston outer seal
8	7F274	Output shaft to direct clutch cylinder seal (2 req'd)
9	87054-S94	O-ring seal (piloted) (model dependent)
10	7086	Extension gasket
11	7052	Extension housing seal assembly
12	7C155	Control valve body upper gasket
13	7D100	Valve body separator plate lower gasket
14	7H173	Valve body cover plate gasket
15	7A191	Transmission pan to case gasket
16	7F273	Output shaft to case seal (3 req'd)
17	7B497	Input shaft seal (2 req'd)
18	7C099	Forward clutch piston inner seal
19	7A548	Forward clutch piston outer seal
20	7B498	Manual control lever seal assembly
21	7D403	Reverse clutch piston outer seal
22	7D404	Reverse clutch piston inner seal
23	7F224	Intermediate clutch piston outer seal
24	7F225	Intermediate clutch piston inner seal
25	391308-S	Fill tube level indicator seal
26	7Z484	TCC solenoid seal (large)
27	7Z136	TCC solenoid seal (small)
28	7Z484	Shift solenoid seal (2 req'd)
29	N811757-S100	Output shaft speed sensor seal
30	7Z276	Bulkhead seal (1 req'd)
31	N805862-S	Pressure control solenoid seal (large)
32	391131	Pressure control solenoid seal (small)

Main Components and Functions

Transmission Main Components — Sectional View

Item	Part Number	Description
1	7902	Torque converter
2	7B164	Intermediate clutch (friction)
3	7B164	Reverse clutch (friction)
4	7B164	Forward clutch (friction)
5	7B164	Direct clutch (friction)
6	7F207	Forward clutch cylinder and shaft
7	7F351	Shaft — intermediate stub
8	7060	Output shaft
9	7A089	Planetary one-way clutch
10	7D095	Reverse clutch band
11	7F196	Overdrive band
12	7A089	Intermediate one-way clutch



Torque Converter

The torque converter transmits and multiplies torque. The torque converter is a four-element device:

- impeller assembly
- turbine assembly
- reactor assembly
- clutch and damper assembly

The standard torque converter components operate as follows:

- Rotation of the converter housing and impeller set the fluid in motion.
- The turbine reacts to the fluid motion from the impeller, transferring rotation to the geartrain through the input shaft.
- The reactor redirects fluid going back into the impeller, allowing for torque multiplication.
- The clutch and damper assembly dampens powertrain torsional vibration and provides a direct mechanical connection for improved efficiency.
- Power is transmitted from the torque converter to the planetary gearsets and other components through the input shaft.

Item	Part Number	Description
1	—	Converter clutch and damper (part of 7902)
2	—	Reactor (part of 7902)
3	—	Turbine (part of 7902)

4	—	Impeller (part of 7902)
5	—	Fluid motion
6	—	Transmission input rotation
7	—	Input shaft
8	—	Engine rotation

Geartrain

Power is transmitted from the torque converter to the Ravigneaux geartrain components through the input shaft and forward clutch cylinder.

- The geartrain contains a Ravigneaux planetary set connected by dual pinion gears.
- By holding or driving certain components of the gearset, four forward ratios and one reverse ratio are obtained and transmitted to the output shaft. The ratios are as follows:

Gear Ratio	
1st	2.84 to 1
2nd	1.55 to 1
3rd	1.00 to 1
4th	0.70 to 1
Reverse	2.32 to 1

- Components of the geartrain can be held by bands or clutches and driven by clutches only.

The 4R70W uses:

- two bands.
- two one-way clutches (one roller, one mechanical diode).
- four friction clutches.

Planetary Gearset

The planetary gearset in the transmission is a Ravigneaux-type set consisting of the following components:

- forward clutch sun gear
- reverse clutch sun gear
- a pinion carrier
- long and short pinions
- output ring gear

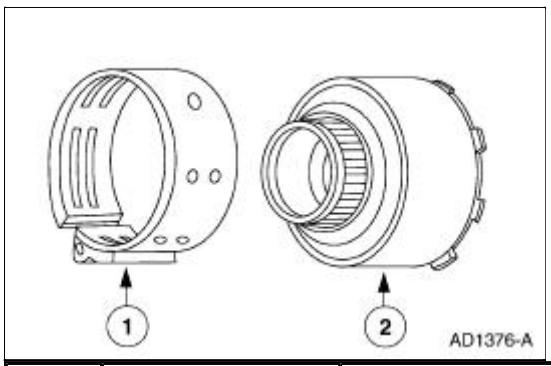
Components are held or driven to produce forward and reverse gear ratios.

Input Shaft

The forward clutch cylinder and shaft transfers speed and torque from the converter turbine to the geartrain. This shaft is splined to the turbine on one end and to the forward clutch sun gear and stub shaft on the other end.

Stub Shaft

The stub shaft transfers power from the input shaft to the planet carrier (through the direct clutch) during third and fourth gear operation.

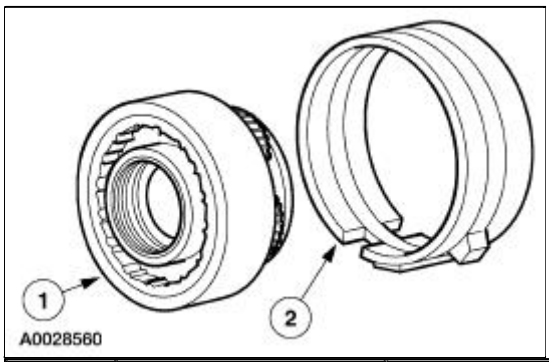


Output Shaft

The output shaft provides torque to the driveshaft and rear axle assembly. It is driven by the ring gear of the planetary gearset.

Apply Components

There are eight apply components used to drive or hold the planetary gearset components.

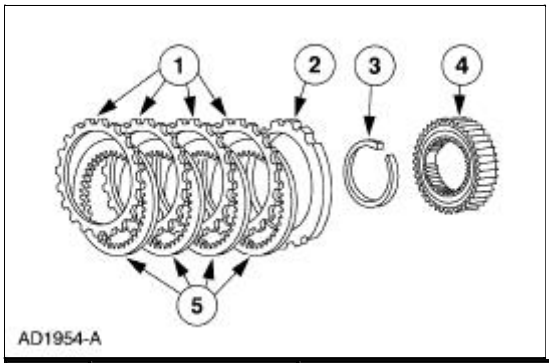


Band—Overdrive

Item	Part Number	Description
1	7F196	Overdrive band assembly
2	7D044	Reverse clutch drum assembly

The overdrive band holds the reverse clutch drum stationary in fourth gear and manual 2. This action causes the reverse sun gear to be held in these ranges.

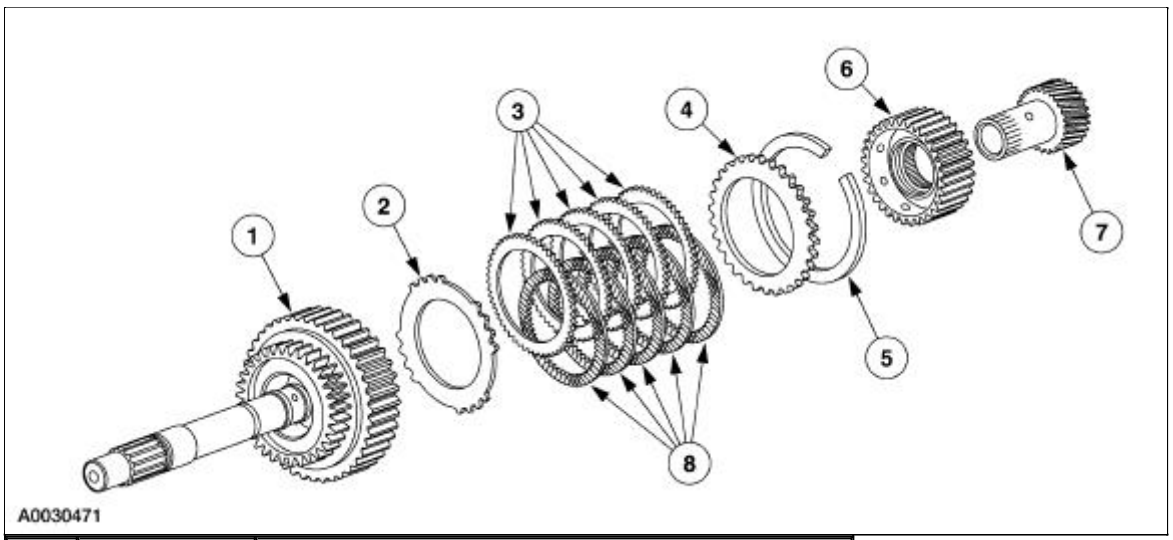
Band—Low and Reverse



Item	Part Number	Description
1	7A398	Planetary assembly
2	7D095	Reverse band assembly

The low and reverse band holds the pinion carrier in reverse. The reverse band also applies in manual 1 position to provide engine braking.

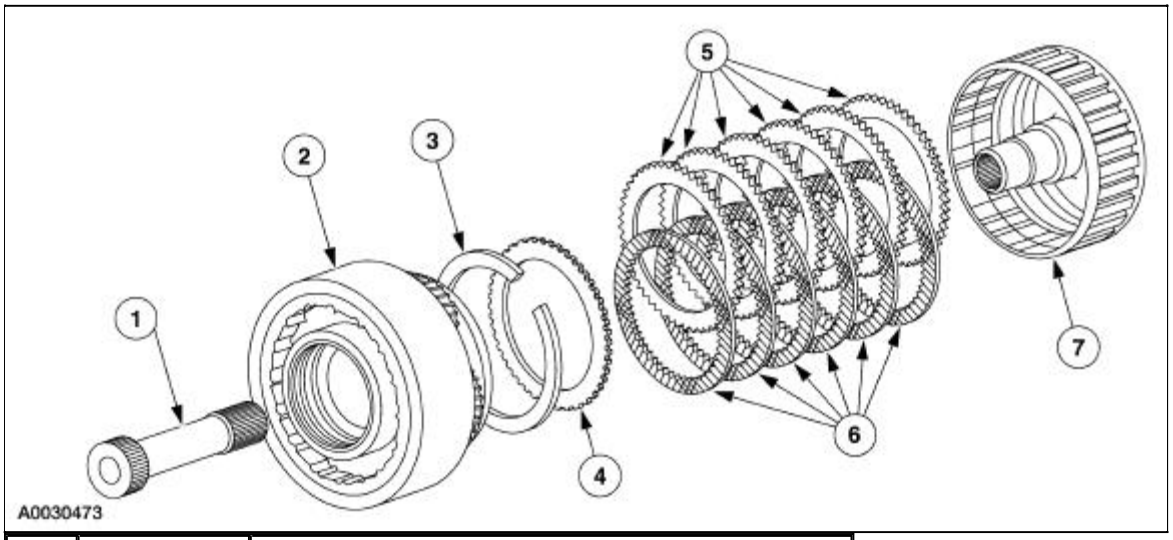
Clutch—Intermediate



Intermediate Clutch Disassembled View

Item	Part Number	Description
1	7B442	Intermediate clutch plates (steel)
2	7B066	Intermediate clutch pressure plate
3	391267-S	Retaining ring
4	7A089	Intermediate one-way clutch assembly
5	7B164	Intermediate clutch plates (friction)

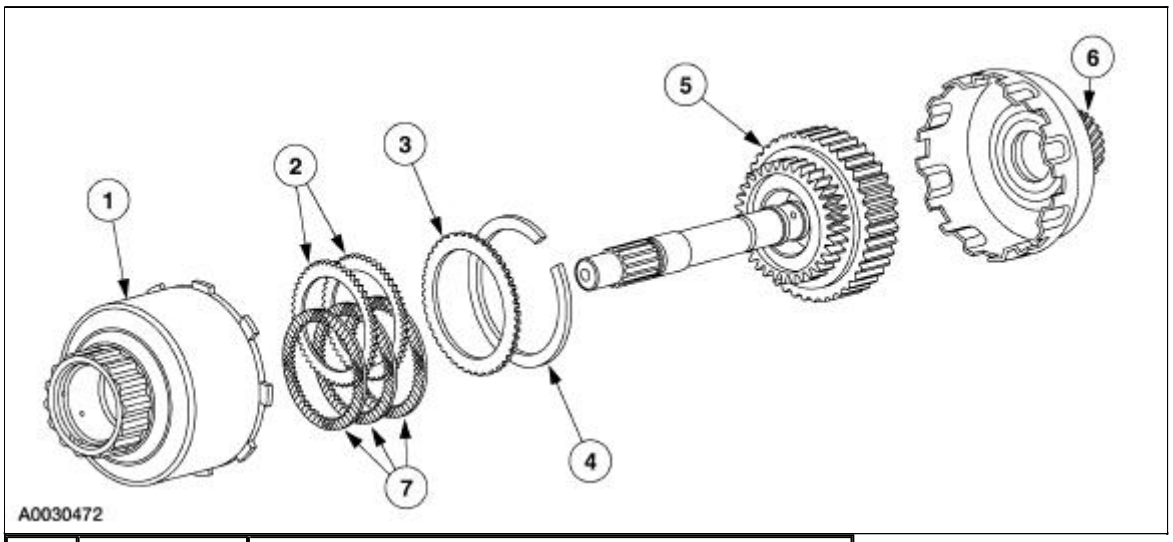
The intermediate clutch works with the intermediate one-way clutch to hold the reverse sun gear stationary in second gear. The intermediate clutch remains applied in third and fourth gears, but does not transmit power.



Clutch—Forward

Item	Part Number	Description
1	7F207	Forward clutch cylinder and input shaft assembly
2	7E085	Rear clutch pressure plate spring
3	7B442	Forward clutch plate external spline (steel)
4	7B066	Forward clutch pressure plate
5	7D483	Snap ring — retaining (select fit)
6	7B067	Forward clutch hub
7	7A399	Forward clutch sun gear assembly
8	7B164	Forward clutch plate internal spline (friction)

The forward clutch couples the forward clutch cylinder and input shaft to the forward sun gear in first, second, and third gears. The forward clutch is not applied in fourth gear.

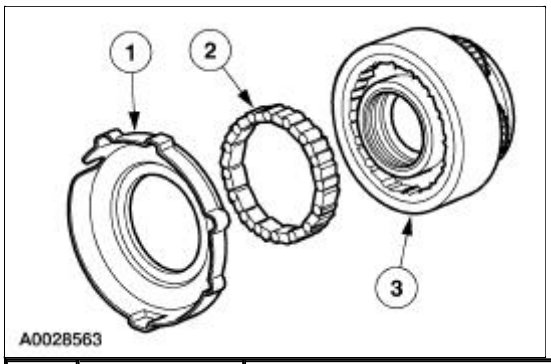


Clutch—Direct

Item	Part Number	Description
1	7F351	Intermediate stub shaft
2	7A398	Planetary assembly
3	7D483	Direct clutch pressure plate retaining ring (select fit)
4	7B066	Direct clutch pressure plate
5	7B442	Direct clutch plates external splined (steel)
6	7B164	Direct clutch plates internal splined (friction)
7	7F283	Direct clutch cylinder assembly

The direct clutch couples the input shaft to the planet carrier through the stub shaft in third and fourth gears.

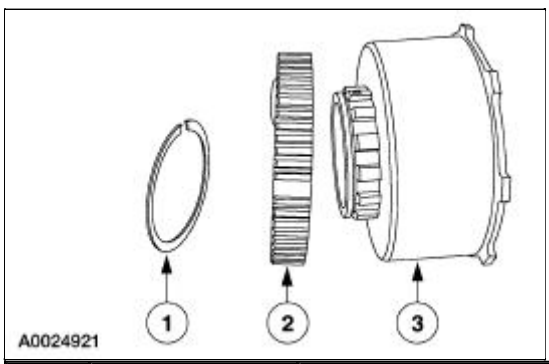
Clutch—Reverse



Item	Part Number	Description
1	7D044	Reverse clutch drum assembly

2	7B442	Reverse clutch plate external splined (steel)
3	7B066	Reverse clutch pressure plate (rear)
4	7D483	Reverse clutch pressure plate retaining ring (select fit)
5	7F207	Forward clutch cylinder and input shaft assembly
6	7A019	Reverse clutch sun gear assembly
7	7B164	Reverse clutch plate internal splined (friction)

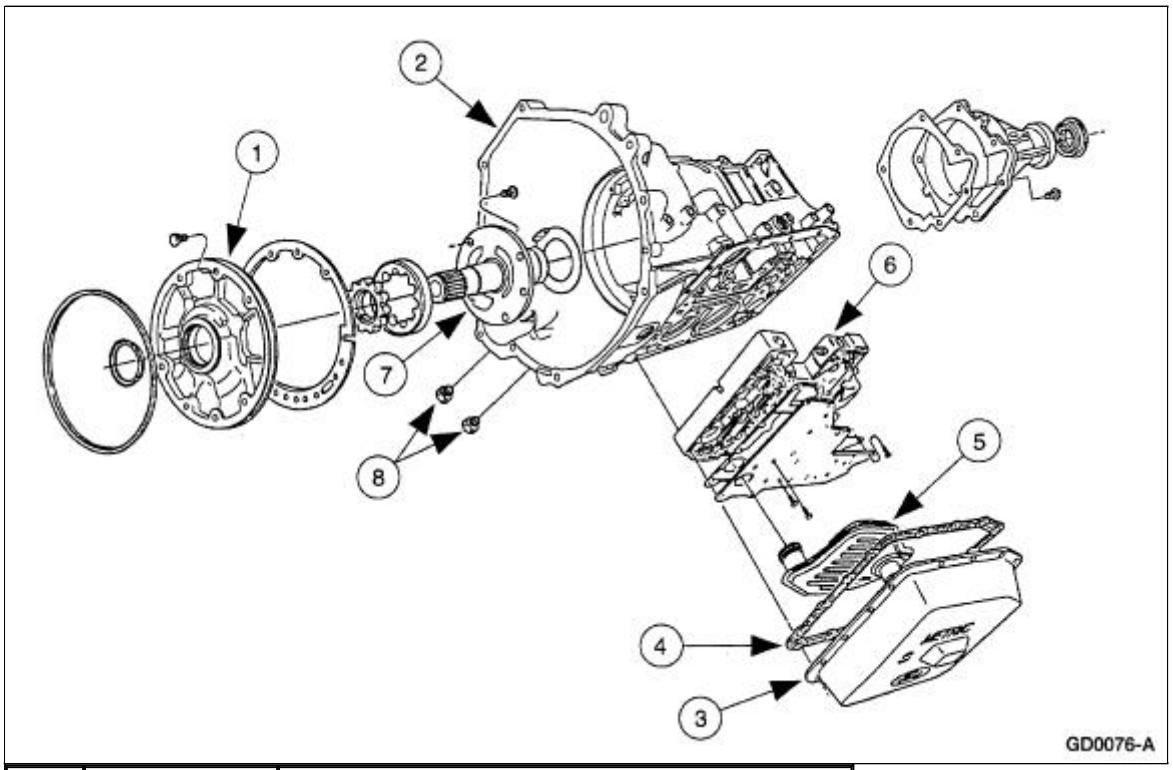
The reverse clutch couples the input shaft to the reverse sun gear, applied in reverse range only.



One-Way Clutch—Planetary (Low)

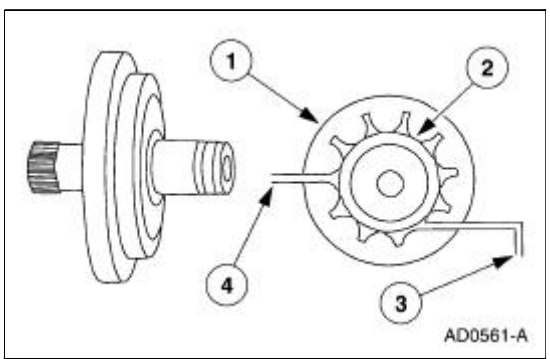
Item	Part Number	Description
1	7A130	Planetary gear support assembly
2	7A089	Planetary one-way clutch cage and spring roller assembly
3	7A398	Planetary assembly

The planetary (low) one-way clutch is a roller clutch that holds the planetary gearset in first gear, (D) and D ranges. During automatic coasting downshifts into first gear ((D) and D ranges), the planetary one-way clutch freewheels so there is no engine braking.



One-Way Clutch—Intermediate

Item	Part Number	Description
1	391267-S	Retaining ring
2	7A089	Intermediate one-way clutch assembly
3	7D044	Reverse clutch drum assembly



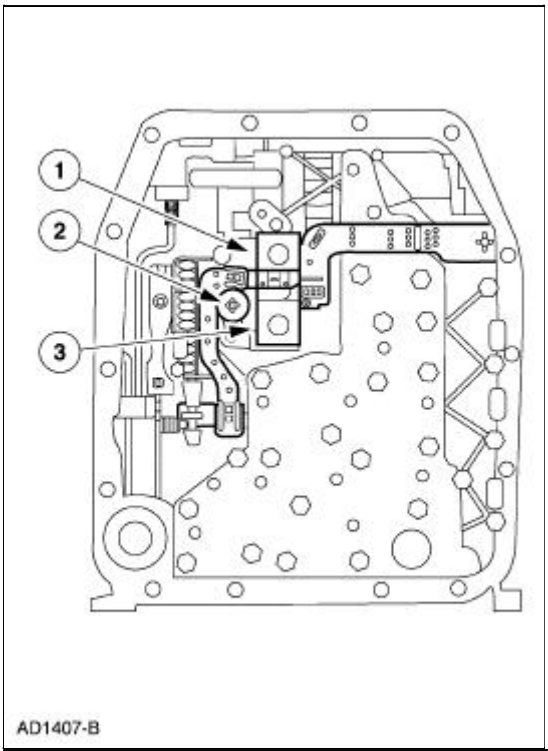
The intermediate one-way clutch works with the intermediate friction clutch to hold the reverse clutch drum and reverse sun gear stationary in second gear during acceleration. The intermediate one-way clutch freewheels in third gear and during coasting in second gear, (D) and D ranges.

Hydraulic System

Item	Part Number	Description
1	7A106	Front pump body assembly
2	7005	Case assembly
3	7A194	Transmission pan
4	7A191	Transmission pan gasket
5	7A098	Fluid filter and seal assembly
6	7A100	Main control assembly
7	7A108	Front pump support assembly
8	7D273	Fluid tube connector assembly (2 required)

Fluid Pump

Item	Part Number	Description



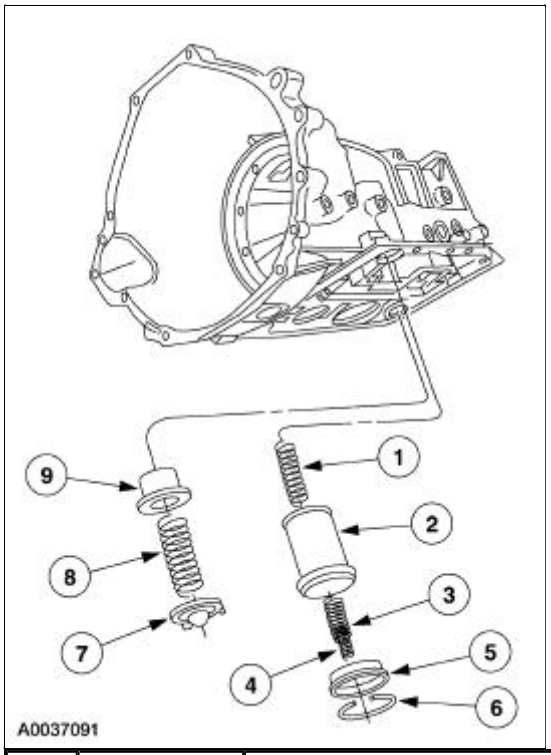
1	—	Outer rotor (part of 7A103)
2	—	Inner rotor (part of 7A103)
3	—	Outlet
4	—	Inlet

The transmission uses a gerotor-type design front pump support and gear. The pump provides the volume of fluid needed to charge the torque converter, main control assembly, cooling system and lube system. Pump pressure is regulated by the main regulator valve. The pump has an internal boost circuit which is more efficient at lower engine speeds.

Filter

All fluid drawn from the transmission pan by the pump passes through the filter. The filter and its accompanying seal are part of the fluid path from the sump (pan) to the fluid pump.

Main Control



Item	Part Number	Description
1	—	Shift solenoid A (part of 7G484)
2	7G136	Torque converter clutch solenoid
3	—	Shift solenoid B (part of 7G484)

The main control valve body houses three electronic solenoids:

- two shift solenoids
- one torque converter clutch solenoid (TCC solenoid)

Accumulators

Item	Part Number	Description
1	7F284	Spring — 1-2 shift accumulator (model dependent)
2	7F251	Piston — 1-2 shift accumulator
3	7F284	Spring — outer 1-2 shift accumulator (model dependent)
4	7G326	Spring — inner 1-2 shift accumulator (model dependent)
5	7F247	Cover and seal assembly — 1-2 accumulator
6	7384	Ring — 2-1/16 retaining type HU internal
7	7B264	Retainer — 2-3 shift accumulator piston
8	7F285	Spring — 2-3 shift accumulator piston
9	7H292	Piston — 2-3 shift accumulator

The transmission uses two accumulators:

- 1-2 Accumulator — The 1-2 accumulator is used to soften the 1-2 shift by absorbing some of the pressure directed to the intermediate clutch. Constant line pressure is applied to the middle section of the 1-2 accumulator piston, opposing the intermediate clutch pressure, until the pressure is high enough to overcome line pressure. The top of the piston is exhausted to the sump.
- 2-3 Accumulator — The 2-3 accumulator is used to soften the 2-3 shift by absorbing some of the direct clutch pressure. Forward clutch pressure is applied to the top side of the 2-3 accumulator piston, holding the piston down until clutch pressure is high enough to overcome it. The middle section of the piston is exhausted to the sump.

Transmission Electronic Control System

Electronic System Description

The powertrain control module (PCM) and its input/output network control the following transmission operations:

- shift timing
- line pressure (shift feel)
- torque converter clutch

The transmission control is separate from the engine control strategy in the PCM, although some of the input signals are shared. When determining the best operating strategy for transmission operation, the PCM uses input information from certain engine-related and driver-demand related sensors and switches.

In addition, the PCM receives input signals from certain transmission-related sensors and switches. The PCM also uses these signals when determining transmission operating strategy.

Using all of these input signals, the PCM can determine when the time and conditions are right for a shift, or when to apply or release the torque converter clutch. It will also determine the best line pressure needed to optimize shift feel. To accomplish this the PCM uses hydraulic solenoids to control transmission operation.

The following provides a brief description of each of the sensors and actuators used to control transmission operation.

Mass Air Flow (MAF) Sensor

The mass air flow sensor (MAF) measures the mass of air flowing into the engine. The MAF sensor output signal is used by the powertrain control module (PCM) to calculate injector pulse width. For transmission strategies the MAF sensor is used to regulate electronic pressure control EPC, shift and torque converter clutch scheduling.

Powertrain Control Module (PCM)

The operation of the transmission is controlled by the powertrain control module (PCM). Many input sensors provide information to the PCM. The PCM then controls actuators which determine transmission operation.

Transmission Control Switch (TCS) and Transmission Control Indicator Lamp (TCIL)

The transmission control switch (TCS) is a momentary contact switch. When the switch is pressed, a signal is sent to the PCM to allow automatic shifts from first through fourth gears or first through third gears only. The PCM energizes the transmission control indicator lamp (TCIL) when the switch is off. The TCIL indicates overdrive cancel mode activated (lamp on) and electronic pressure control (EPC) circuit shorted (lamp flashing) or a monitored sensor failure.

Output Shaft Speed (OSS) Sensor

The output shaft speed (OSS) sensor is a magnetic pickup, located at the output shaft ring gear, that sends a signal to the powertrain control module to indicate transmission output shaft speed. The OSS is used for torque converter clutch control, shift scheduling and to determine electronic pressure

control.

Digital Transmission Range (TR) Sensor

The digital transmission range (TR) sensor is located on the outside of the transmission at the manual lever. The digital TR sensor completes the start circuit in PARK and NEUTRAL, the back-up lamp circuit in REVERSE and the neutral sense circuit (4x4 only) in NEUTRAL. The digital TR sensor also opens and closes a set of four switches that are monitored by the powertrain control module (PCM) to determine the position of the manual lever (P, R, N, D, 2, 1).

Transmission Fluid Temperature (TFT) Sensor

The transmission fluid temperature (TFT) sensor is located on the lead frame assembly near the shift solenoids on the main control valve body. It is a temperature sensitive device called a thermistor. It sends a voltage signal to the PCM. The voltage signal varies with transmission fluid temperature. The PCM uses this signal to determine whether a cold start shift schedule is necessary. The shift schedule is compensated when the transmission fluid temperature is cold. The PCM also inhibits (TCC) operation at low transmission fluid temperatures and corrects electronic pressure control.

Vehicle Speed Sensor (VSS)

The vehicle speed sensor (VSS) is model dependent. Possible sources of vehicle speed input are, anti-lock brake sensor (ABS), a gear-driven vehicle speed sensor (VSS), or the transmission output shaft speed (OSS) sensor. On 4x4 applications with a manual shift transfer case, the transfer case speed sensor is the source of vehicle speed. The VSS signal is either an AC signal whose frequency changes with vehicle speed, or an SCP data message depending on the source. Some vehicles have both. The vehicle speed signal is an input to various vehicle sub-systems such as the powertrain control module (PCM), instrument cluster (speedometer and odometer), speed control systems, etc. The vehicle speed source must be operational to enter output state control mode for diagnostics.

Electronic Pressure Control (EPC) Solenoid

The electronic pressure control (EPC) solenoid regulates transmission pressure. EPC valve pressure is used to control line pressure.

Shift Solenoid — SSA, SSB

Two on/off shift solenoids provide gear selection of first through fourth gears by controlling the pressure to the three shift valves. One unit containing the two shift solenoids is located in the main control valve body. The shift solenoids are two-way normally open style.

Solenoid Operation Chart

		Solenoids		
Gear Lever Position	**PCM Commanded Gear**	**SSA**	**SSB**	**TCC**
P/R/N	1	ON	OFF	HD
(D)	1	ON	OFF	HD
(D)	2	OFF	OFF	EC
(D)	3	OFF	ON	EC
(D)	4	ON	ON	EC
w/OD OFF				
1	1	ON	OFF	HD
2	2	OFF	OFF	EC

3	3	OFF	ON	EC
Manual 2	2	OFF	OFF	EC
Manual 1	1	ON	OFF	HD
1 [a]	2	OFF	OFF	EC

[a] When a manual pull-in occurs above a calibrated speed, the transmission will not downshift from the higher gear until the vehicle speed drops below this calibrated speed.

EC = Electronically Controlled.

HD = Hydraulically Disabled.

Torque Converter Clutch (TCC) Solenoid

The torque converter clutch (TCC) solenoid is used to control the apply and release of the TCC.

4x4 Low (4x4L) Switch

The 4x4 low (4x4L) range switch is located on the transfer case cover. It provides an indication of when the 4x4 transfer case gear system is in the low range. The PCM then modifies shift schedule for 4x4L operation.

Brake Pedal Position (BPP) Switch

The brake pedal position (BPP) switch tells the powertrain control module (PCM) when the brakes are applied. The torque converter clutch disengages when the brakes are applied. The BPP switch closes when the brakes are applied and opens when they are released.

Electronic Ignition (EI) System

The electronic ignition consists of a crankshaft position sensor, two four tower ignition coils and the powertrain control module (PCM). The ignition control module operates by sending crankshaft position information from the crankshaft position sensor to the ignition control module. The ignition control module generates a profile ignition pickup (PIP) signal (engine rpm) and sends it to the PCM. The PCM uses PIP signal in the transmission strategy, wide-open throttle (WOT) shift control, torque converter clutch control and EPC pressure.

Air Conditioning (A/C) Clutch

An electromagnetic clutch is energized when the clutch cycling pressure switch closes. The switch is located on the suction accumulator/drier. The closing of the switch completes the circuit to the clutch and draws it into engagement with the compressor driveshaft. When the A/C clutch is engaged, electronic pressure control (EPC) is adjusted by the PCM to compensate for additional load on the engine.

Intake Air Temperature (IAT) Sensor

The intake air temperature (IAT) sensor provides the sequential fuel injection (SFI) system mixture temperature information. The IAT sensor is used both as a density corrector for air flow calculation and to proportion cold enrichment fuel flow. The IAT sensor is installed in the air cleaner outlet tube. The IAT sensor is also used in determining electronic pressure control (EPC) pressures.

Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor detects temperature of engine coolant and supplies the information to the powertrain control module (PCM). The ECT sensor is used to control torque converter clutch (TCC) operation. The ECT is installed in the heater outlet fitting or cooling passage on

the engine. For engine control applications, the ECT signal is used to modify ignition timing, EGR flow and air-to-fuel ratio as a function of engine coolant temperature.

Throttle Position (TP) Sensor

The throttle position (TP) sensor is a potentiometer mounted on the throttle body. The TP sensor detects the position of the throttle plate and sends this information to the powertrain control module (PCM). The TP sensor is used for shift scheduling, electronic pressure control and torque converter clutch (TCC) control.

Diagnostic Strategy

Troubleshooting an electronically controlled automatic transmission is simplified by using the proven method of diagnosis. One of the most important things to remember is that there is a definite procedure to follow.

NOTE: Do not take any short cuts or assume that critical checks or adjustments have already been made.

Follow the procedures as written to avoid missing critical components or steps.

To properly diagnose a concern have the following publications available:

- Transmission Reference Manual.
- Powertrain Control/Emissions Diagnosis (PC/ED) manual.
- TSBs and OASIS Messages.
- Wiring Diagram.

These publications provide the information required when diagnosing transmission concerns.

Use the Diagnostic Flow Chart as a guide and follow the steps as indicated.

Preliminary Inspection

- Know and understand the customer's concern.
- Verify the concern by operating the vehicle.
- Check the fluid levels and condition.
- Check for non-factory add-on items.
- Check shift linkages for proper adjustment.
- Check TSBs and OASIS messages regarding the concern.

Diagnostics

- Carry out on-board diagnostic procedures key on engine off (KOEO) and key on engine running (KOER).
- Record all diagnostic trouble codes (DTCs).
- Repair all non-transmission codes first.
- Repair all transmission codes second.
- Erase all continuous codes and attempt to repeat them.
- Repair all continuous codes.
- If only pass codes are obtained, refer to Diagnosis By Symptom for further information and diagnosis.

Follow the diagnostic sequence to diagnose and repair the concern the first time.

Diagnostic Flow Chart

Diagnostic Flow Chart		
• Know and understand the customer concerns • Check the fluid level and condition • Verify the concern by operating the vehicle • Check for non-factory-installed items and verify correct installation • Check the shift linkage adjustments • Check TSBs and OASIS messages for vehicle concerns • Carry out quick test both KOER and KOEO • Record all codes 1) Did you record any diagnostic trouble codes?	Yes	· REPAIR all hard diagnostic trouble codes. FOLLOW the pinpoint tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first, then this Workshop Manual.
	No	· REFER to Diagnosis By Symptom in this section, then GO to Step 5.
2) Are any continuous test memory codes present?	Yes	· CLEAR codes and CARRY OUT drive cycle test.
	No	· GO to Step 4.
3) Did the continuous test memory codes reappear?	Yes	· REPAIR all continuous test memory codes. FOLLOW the pinpoint tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual then the transmission reference manual, then this workshop manual, then GO to Step 4.
	No	· GO to Step 4.
4) Is the concern repaired?	Yes	· CARRY OUT the final quick test to verify that no diagnostic trouble codes are present. CLEAR memory codes.
	No	· REFER to Diagnosis By Symptom in this section.
5) Are there any electrical concerns?	Yes	· INSTALL the scan tool and CARRY OUT the output state control test, then GO to Step 6.
	No	· REFER to the hydraulic and mechanical routine to diagnose and REPAIR the concern, then GO to Step 7.
6) Was the transmission concern corrected when the scan tool was installed?	Yes	· REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, intermittent fault diagnosis section and use the scan tool to diagnose cause of concern in the processor, vehicle harness or external inputs (sensors or switches).

	No	・REFER to the hydraulic and mechanical routine to diagnose the concern, then GO to Step 7.
7) Is the concern repaired?	Yes	・CARRY OUT the final quick test to verify that no diagnostic trouble codes are present. CLEAR memory codes.
	No	・Get assistance from technical hotline.

Preliminary Inspection

The following items must be checked prior to beginning the diagnostic procedures:

Know and Understand the Concern

In order to correctly diagnose a concern, first understand the customer complaint or condition. Customer contact may be required in order to begin to verify the concern. Understand the conditions as to when the concern occurs, for example:

- Hot or cold vehicle temperature.
- Hot or cold ambient temperature.
- Vehicle driving conditions.
- Vehicle loaded/unloaded.

After understanding when and how the concern occurs, proceed to Verification of Condition.

Verification of Condition

This section provides information that must be used in both determining the actual cause of customer concerns and carrying out the appropriate procedures.

The following procedures must be used when verifying customer concerns for the transmission.

Determine Customer Concern

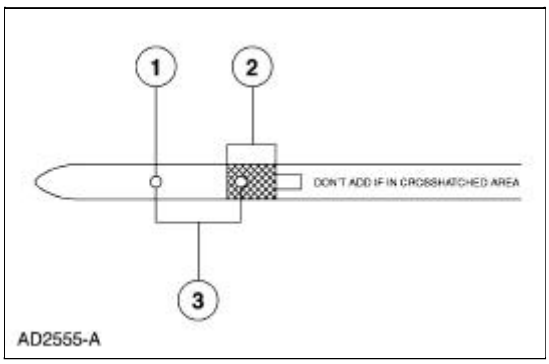
NOTE: Some transmission conditions can cause engine concerns. An electronic pressure control short circuit can cause engine misfiring. The torque converter clutch not disengaging will stall the engine.

Determine customer concerns relative to vehicle use and dependent driving conditions, paying attention to the following items:

- Hot or cold vehicle operating temperature.
- Hot or cold ambient temperatures.
- Type of terrain.
- Vehicle loaded/unloaded.
- City/highway driving.
- Upshift.
- Downshift.
- Coasting.
- Engagement.
- Noise/vibration — check for dependencies, either rpm dependent, vehicle speed dependent, shift dependent, gear dependent, range dependent, or temperature dependent.

Check Fluid Level and Condition

Fluid Level Check



CAUTION: The vehicle should not be driven if the fluid level indicator shows the fluid below the DO NOT DRIVE mark or internal failure could result.

NOTE: If vehicle has been operated for an extended period of time at highway speeds, in city traffic, in hot weather, or when pulling a trailer, the fluid needs to cool down to obtain an accurate reading.

NOTE: The fluid level reading on the indicator will differ from operating and ambient temperatures. The correct reading should be within the normal operating temperature range.

Under normal circumstances, the fluid level should be checked during normal maintenance. If the transmission starts to slip, shifts slowly, or has signs of fluid leaking, the fluid level should be checked.

1. With the transmission in (P) PARK, the engine at idle, foot pressed on the brake, move the range selector lever through each gear and allow engagement of each gear. Place the range selector lever in the PARK position.
2. Wipe the fluid level indicator cap and remove the indicator.
3. Wipe the indicator with a clean cloth.
4. Install the indicator back in the filler tube until it is fully seated, then remove the indicator. The fluid level should be within the normal operating temperature range.

Item	Description
1	Do not drive if below mark
2	Fluid Level at Operating Temperature 66°C-77°C (150°F-170°F)
3	Fluid Level at Room Temperature 21°C-35°C (70°-95°F)

High Fluid Level

A fluid level that is too high may cause the fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of fluid from the vent tube and possible transmission malfunction and/or damage. If an overfill reading is indicated drain and refill the transmission.

Low Fluid Level

A low fluid level could result in poor transmission engagement, slipping, malfunction and/or damage. This could also indicate a leak in one of the transmission seals or gaskets.

Adding Fluid

CAUTION: The use of any type of transmission fluid other than specified could result in transmission malfunction and/or damage.

If fluid needs to be added, add fluid in 0.25L (1/2 pint) increments through the filler tube. Do not overfill the fluid. For fluid type, refer to the General Specifications chart.

Fluid Condition Check

1. Check the fluid level.
2. Observe the color and the odor. The color under normal circumstances should be dark reddish, not brown or black or have a burnt odor.
3. Hold the fluid level indicator over a white facial tissue and allow the fluid to drip onto the facial tissue and examine the stain.
4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.
5. If the stain is a foamy pink color, this may indicate coolant in the transmission. The engine cooling system should also be inspected at this time.
6. If fluid contamination or transmission failure is confirmed by the sediment in the bottom of the fluid pan, the transmission must be disassembled and completely cleaned. This includes the torque converter, coolers, and cooler lines.
7. Carry out diagnostic checks and adjustments; refer to Diagnosis By Symptom in this section.

Road Testing Vehicle

NOTE: Always drive the vehicle in a safe manner according to the driving conditions and obey all traffic laws.

The shift point road test and torque converter operation tests provide diagnostic information on transmission shift controls and torque converter operation.

Shift Point Road Test

This test verifies that the shift control system is operating correctly.

1. Bring engine and transmission up to normal operating temperature.

2. Operate vehicle with transmission range selector lever in (D) position.

3. **NOTE:** Shift speed ranges are approximate for all applications. For specific applications (engine, axle ratio and application) refer to the Automatic Transmission Specification Issue, available from Ford Customer Service Division.

   Apply minimum throttle and observe speeds at which upshift occurs and torque converter engages; refer to the 4R70W Shift Speeds chart in this section.

4. With the transmission in Overdrive (fourth gear), press the transmission control switch. The transmission should downshift to third gear. Release the accelerator pedal; engine braking should occur.

5. Press accelerator pedal to floor, wide open throttle (WOT). Transmission should shift from third to second gear, or third to first, depending on vehicle speed. Torque converter clutch should disengage and then reapply.

6. With the transmission in (D) position and speed above 80 km/h (50 mph) and less than half throttle, move the transmission range selector lever from (D) position to manual 2 position and remove pressure from the accelerator pedal. Transmission should immediately downshift into second gear. With vehicle remaining in manual 2 position, move the transmission range selector lever into manual 1 position, and release accelerator pedal. Transmission should downshift into first gear at speeds approximately below 45-56 km/h (28-35 mph).

7. If transmission fails to upshift/downshift or torque converter clutch does not apply and release, refer to Diagnosis By Symptom in this section.

Shift Speeds 4.6L (3:27:1 Axle Ratio)

Throttle Position	Shift	MPH	Km/H
Light Throttle	1-2	10-17	16-27
TP Voltage	2-3	17-32	27-51
1.25 Volts	3-4	40-49	64-79
Closed Throttle	4-3	25-23	40-37
	3-2	17-14	27-22
	2-1	10-8	16-13
Wide Open Throttle	1-2	38-43	61-70
	2-3	69-72	111-116
	3-4	105	169
	4-3	96-72	154-116
	3-2	72-70	116-113
	2-1	34-24	55-39

Shift Speeds 5.4L (3:73:1 Axle Ratio)

Throttle Position	Shift	MPH	Km/H
Light Throttle	1-2	11-23	17-37
TP Voltage	2-3	19-34	31-55
1.25 Volts	3-4	22-47	35-76
Closed Throttle	4-3	20-18	32-29
	3-2	18-16	29-26
	2-1	9-7	14-11
Wide Open Throttle	1-2	38-40	61-64
	2-3	73-75	117-120
	4-3	90-96	145-154
	3-2	60-66	97-106
	2-1	25-32	40-51

Torque Converter Diagnosis

Prior to installing a new or remanufactured torque converter, all diagnostic procedures must be followed. This is to prevent the unnecessary installation of good torque converters. Only after a complete diagnostic evaluation can the decision be made to install a new torque converter.

Begin with the normal diagnostic procedures as follows:

1. Preliminary inspection.
2. Know and understand the customer's concern.
3. Verify the condition — carry out the torque converter operation test.
4. Carry out diagnostic procedures.

- Carry out on-board diagnostics; refer to Diagnostics.
  - Repair all non-transmission related DTCs first.
  - Repair all transmission DTCs.
  - Rerun on-board diagnostic to verify repair.
- Carry out Line Pressure Test. For additional information, refer to Special Testing Procedures in this section.
- Carry out Stall Speed Test. For additional information, refer to Special Testing Procedures in this section.
- Carry out Diagnostic Routines. For additional information, refer to Diagnosis By Symptom in this section.
  - Use the Diagnosis by Symptom Index to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed; diagnose and repair as required before changing the torque converter.

Torque Converter Operation Test

This test verifies that the torque converter clutch control system and the torque converter are operating correctly.

5. Carry out Quick Test with scan tool. For additional information, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. Check for DTCs.
6. Connect a tachometer to the engine.
7. Bring the engine to normal operating temperature by driving the vehicle at highway speeds for approximately 15 minutes in (D) position.
8. After normal operating temperature is reached, maintain a constant vehicle speed of about 80 km/h (50 mph) and tap brake pedal with the left foot.
9. Engine rpm should increase when brake pedal is tapped, and decrease about five seconds after pedal is released. If this does not occur, see torque converter operation concerns. For additional information, refer to Diagnosis By Symptom in this section.

10. If the vehicle stalls in (D) or manual 2 at idle with vehicle at a stop, move the transmission range selector lever to manual 1 position. If the vehicle stalls, see torque converter operation concerns. For additional information, refer to Diagnosis By Symptom in this section. If the vehicle does not stall in (D), refer to Diagnosis By Symptom in this section.

11. If the vehicle exhibits a vibration during the road test, complete the Road Test Evaluation Form. This form will aid the technician in determining the source of the vibration.

NOTE: The following is a list of common vehicle concerns that have been misdiagnosed as torque converter clutch shudder. For diagnosis of the following items refer to the appropriate sections of the workshop manual and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

- Spark plugs — check for cracks, high resistance or broken insulators
- Plug wires
- Fuel injector — filter may be plugged
- Fuel contamination — engine runs poor
- EGR valve — valve may let in too much exhaust gas and cause engine to run lean
- Vacuum leak — engine will not get correct air/fuel mixture
- MAP/MAF sensor — improper air/fuel mixture
- HO2S sensor — too rich/lean air/fuel mixture
- Fuel pressure — may be too low
- Engine mounts — loose/damaged mounts can cause vibration concerns
- Axle joints — check for vibration

Torque Converter Road Evaluation Form		
1) Does the torque converter engage/disengage?	Yes	GO to Step 2.
	No	REFER to Diagnosis By Symptom — Torque Converter No Apply Routine 240/340 and Always Applied Routine 241/341 in this section for further diagnosis information. Repair as required, verify converter operation and then continue.
2) Does vibration occur during 3-4 or 4-3 shift at: light, medium, or heavy throttle?	Light	May be torque converter clutch shudder. GO to Step 3.
	Medium	May be torque converter clutch shudder. GO to Step 3.
	Heavy	Not torque converter clutch shudder — converter does not engage due to PCM strategy. REFER to Section 100-04 and Diagnosis By Symptom — Noise/Vibration Routine 254/354 in this section for further diagnosis.
3) Is the problem vehicle speed dependent (operating at steady speed, i.e. 64 km/h (40 mph)	Yes	Not torque converter clutch shudder — REFER to Section 100-04 and

regardless of transmission range. Verify by manually selecting 2nd, OD cancel, and OD.		Diagnosis By Symptom — Noise/Vibration Routine 254/354 in this section for further diagnosis.
	No	GO to Step 4.
4) Is the problem engine-rpm dependent? (Occurs at the same engine rpm independent of transmission gear. Verify by holding same rpm in each transmission gear.)	Yes	Not torque converter clutch shudder — REFER to Section 100-04 and Diagnosis By Symptom — Noise/Vibration Routine 254/354 in this section for further diagnosis.
	No	GO to Step 5.
5) Does the problem occur in coast, steady speed, or reverse range?	Yes	Not torque converter clutch shudder — REFER to Section 100-04 and Diagnosis By Symptom — Noise/Vibration Routine 254/354 in this section for further diagnosis.
	No	GO to Step 6.
6) Does vibration occur during extended light brake application?	Yes	Not torque converter clutch shudder — REFER to Section 100-04 , Section 206-00 and Diagnosis By Symptom — Noise/Vibration Routine 254/354 in this section for further diagnosis.
	No	GO to Step 7.
7) If one of the driving modes in Step 2 identifies a vibration which was not present in steps 3-6, then there is a strong possibility that the vibration is caused by the torque converter clutch function. Carry out the repair procedures as found under Disassembly/Assembly.		

Visual Inspection

This inspection will identify modifications or additions to the vehicle operating system that may affect diagnosis. Inspect the vehicle for non-Ford factory add-on devices such as:

- electronic add-on items:
  - air conditioning
  - generator (alternator)
  - engine turbo
  - cellular telephone
  - cruise control
  - CB radio
  - linear booster
  - backup alarm signal
  - computer
- Vehicle modification:

These items, if not installed correctly, will affect the powertrain control module (PCM), or transmission function. Pay particular attention to add-on wiring splices in the PCM harness or transmission wiring harness, abnormal tire size, or axle ratio changes.

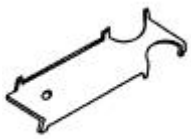
- Leaks; refer to Leak Inspection.
- Correct linkage adjustments; refer to Section 307-05 .

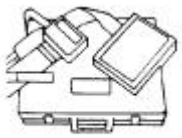
Shift Linkage Check

Check for a misadjustment in shift linkage by matching the detents in the transmission range selector lever with those of the manual lever in the transmission. If they match, the misadjustment is in the indicator. Do not adjust the shift linkage.

Hydraulic leakage at the manual control valve can cause delay in engagements and/or slipping while operating if the linkage is not correctly adjusted. Refer to Section 307-05 for shift linkage adjustment.

Check TSBs and OASIS





Refer to all technical service bulletins (TSB) and OASIS messages which pertain to the transmission concern and follow the procedure as described.

Carry Out On-Board Diagnostics (KOEO, KOER)

After a road test, with the vehicle warm and before disconnecting any connectors, carry out the Quick Test using the scan tool. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Diagnostics

Special Tool(s)

 ST1565-A	Transmission Fluid Pressure Gauge 307-004 (T57L-77820-A)
 ST1392-A	Air Test Plate, Transmission 307-246 (T92P-7006-A)
 ST1633-A	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)
 ST1391-A	Breakout Box, EEC-V Control System 418-049 (T94L-50-EEC-V) or equivalent
 ST1632-A	MLP-TR Cable 418-F107 (007-00111) or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052 or equivalent scan tool

	Trans Tester TR/MLP Overlay

	and Manual 007-00131 or equivalent
 ST1137-A	73 III Automotive Meter 105-R0057 or equivalent
 ST1300-A	UV Leak Detector Kit 164-R0756 or equivalent

Diagnosing an electronically controlled automatic transmission is simplified by using the following procedures. One of the most important things to remember is that there is a definite procedure to follow. DO NOT TAKE SHORT CUTS OR ASSUME THAT CRITICAL CHECKS OR ADJUSTMENTS HAVE ALREADY BEEN MADE. Follow the procedures as written to avoid missing critical components or steps. By following the diagnostic sequence, the technician will be able to diagnose and repair the concern the first time.

On-Board Diagnostics With Diagnostic Tool

NOTE: For detailed instruction and other diagnostic methods using the scan tool, refer to the scan tool tester manual and the Powertrain Control/Emissions Diagnosis (PC/ED) manual. These quick tests should be used to diagnose the powertrain control module (PCM) and should be carried out in order.

- **Quick Test 1.0 - Visual Inspection**
- **Quick Test 2.0 - Set Up**
- **Quick Test 3.0 - Key On, Engine Off (KOEO)**
- **Quick Test 4.0 - Continuous Memory**
- **Quick Test 5.0 - Key On, Engine Running (KOER)**
  - Special Test Mode
  - Wiggle Test
  - Output Test Mode
  - PCM Reset Mode
  - Clearing DTCs
  - OBD II Drive Cycle
- **Other Scan Tool Features**

For further information on other diagnostic testing features using the scan tool, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. Other diagnostic methods include the following:

- Parameter Identification (PID) Access Mode
- Freeze Frame Data Access Mode

- Oxygen Sensor Monitor Mode

Output State Control (OSC) Mode

Output State Control (OSC) allows the technician to take control of certain parameters to function the transmission. For example, OSC allows the technician to shift the transmission only when he/she commands a gear change. If the technician commands 1st gear in OSC, the transmission will remain in 1st gear until the technician commands the next gear. Another example, the technician can command a shift solenoid to turn on or off when carrying out an electrical circuit check. OSC has two modes of operation for transmission, the BENCH MODE and the DRIVE MODE. Each mode/parameter has a unique set of vehicle operating requirements that the technician is required to meet before being allowed to operate OSC.

NOTE: To operate OSC the digital transmission range (TR) sensor must be operational. No Diagnostic Trouble Codes (DTCs) related to the digital TR sensor can be present.

To operate OSC the vehicle speed source must be operational. No diagnostic codes (DTCs) related to this source can be present. The vehicle speed source can vary depending on vehicle configuration. Technicians should verify which input source is applicable for their vehicle application. The following are potential vehicle speed sources:

- anti-lock braking system (ABS)
- rear anti-lock braking system (RABS)
- output shaft speed (OSS) sensor

For manual 4x4 applications, the vehicle speed source is from the transfer case speed sensor.

- The vehicle requirements MUST BE MET when SENDING the OSC value. Refer to individual test modes for vehicle requirements.
- If the vehicle requirements are NOT MET when SENDING the OSC value, an ERROR MESSAGE will appear. When the ERROR MESSAGE is received, OSC is aborted and must be restarted.
- If AFTER SENDING an OSC value, and the vehicle requirements are no longer met, the PCM will cancel the OSC value and NO ERROR message will appear. Once the vehicle requirements are met again, the PCM will automatically SEND the previous OSC value without any additional actions required by the service technician.
- The OSC value XXX may be sent anytime to cancel OSC.

Output State Control (OSC) Procedures

- Carry out visual inspection and vehicle preparation as required.
- Select "Vehicle and Engine Selection" menu.
- Select appropriate vehicle and engine.
- Select "Diagnostic Data Link."
- Select "Powertrain Control Module."
- Select "Output Test Mode."
- Select "KOEO On-Demand Self Test and KOER On-Demand Self Tests."
- Carry out test and record DTCs.
- Repair all NON-Transmission DTCs.

- Repair all digital TR Sensor DTCs.
- Repair all vehicle speed DTCs.
- Ensure that the vehicle speed sensor and digital TR Sensors are functional.
- Select "Active Command Modes."
- Select "Trans - Bench Mode or Trans - Drive Mode."

OSC — Transmission Bench Modes

The following Transmission Bench Modes may be used or required during diagnostics.

SSA, SSB and TCC in BENCH MODE

The BENCH MODE allows the technician to carry out electrical circuit checks on the following components:

- SSA - Activates SSA OFF or ON.
- SSB - Activates SSB OFF or ON.
- Transmission Converter clutch (TCC) - Activates TCC OFF or ON.

OSC "SSA, SSB, TCC" BENCH MODE Operates ONLY when:

- digital TR sensor is operational and no digital TR sensor DTCs present.
- vehicle speed sensor is operational and no VSS sensor DTCs present.
- transmission range selector lever is in P.
- key is ON.
- engine is OFF.

OSC Command Values

- OFF - turns solenoid OFF.
- ON - turns solenoid ON.
- XXX - cancels OSC value sent.
- SEND - sends the values to PCM.

BENCH MODE Procedure for SSA, SSB and TCC

Follow operating instructions from the scan tool menu screen:

- Select "Output State Control."
- Select "Trans - Bench Mode."
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - SSA, SSB or TCC."
- Select "ON" to turn solenoid ON.
- Press "SEND" to send command ON.
- Select "OFF" to turn solenoid OFF.

- Press "SEND" to send command OFF.
- Select "XXX" to cancel at any time.
- Press "SEND."

EPC in BENCH MODE

The BENCH MODE is also used to test the functionality of the transmission's electronic pressure control. During BENCH MODE, the electronic pressure control (EPC) solenoid can ramp in increments of 103 kPa (15 psi) from zero to 620 kPa (90 psi) and 620 kPa (90 psi) to zero psi.

The OSC functions for the parameter EPC allows the technician to choose the following options:

- EPC - Activates EPC to selected values.
- 00 - sets EPC pressure to 00 kPa (00 psi).
- 15 - sets EPC pressure to 103 kPa (15 psi).
- 30 - sets EPC pressure to 206 kPa (30 psi).
- 45 - sets EPC pressure to 310 kPa (45 psi).
- 60 - sets EPC pressure to 411 kPa (60 psi).
- 75 - sets EPC pressure to 517 kPa (75 psi).
- 90 - sets EPC pressure to 620 kPa (90 psi).

To carry out an EPC BENCH MODE pressure functionality test, install a pressure gauge in the EPC port. The following requirements are required to carry out this test:

- VSS and digital TR sensor operational.
- no VSS and digital TR sensor DTCs.
- transmission range selector lever in P.
- key ON.
- engine ON.
- engine speed at least 1,500 rpm for accurate EPC pressure measurement.

To carry out an EPC BENCH MODE solenoid circuit pinpoint test, the following requirements are required:

- VSS and digital TR sensor operational.
- no VSS and digital TR sensor DTCs.
- key ON.
- engine OFF.

OSC Command Values

- 00 - sets EPC pressure to 00 kPa (00 psi).
- 15 - sets EPC pressure to 103 kPa (15 psi).
- 30 - sets EPC pressure to 206 kPa (30 psi).
- 45 - sets EPC pressure to 310 kPa (45 psi).
- 60 - sets EPC pressure to 411 kPa (60 psi).

- 75 - sets EPC pressure to 517 kPa (75 psi).
- 90 - sets EPC pressure to 620 kPa (90 psi).
- XXX - cancels OSC value sent.
- SEND - sends the values to PCM.

BENCH MODE Procedure for EPC

Following operating instructions from the scan tool menu screen:

- Select "Output State Control."
- Select "Trans - Bench Mode."
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - EPC."
- Select Value "0-620 kPa (0-90 psi)."
- Press "SEND" to send command.
- Select "XXX" to cancel at any time.
- Press "SEND."

OSC — Transmission DRIVE MODES

The DRIVE MODE allows control of three transmission parameters. Each mode/parameter has a unique set of vehicle operating requirements that the technician is required to meet before being allowed to operate OSC. The recommended procedure, when using the DRIVE MODE, is to control one parameter at a time.

The DRIVE MODE allows the technician to carry out the following functions on the transmission:

- GR_CM - allows upshifts or downshifts.
- TCC - engages or disengages the torque converter clutch.
- EPC - increases/decreases EPC pressure.

GR_CM in DRIVE MODE

This OSC function is used to test the transmission shift functions.

The OSC functions for the GR_CM parameter allows the technician to choose the following options:

- 1 - PCM selects 1st gear.
- 2 - PCM selects 2nd gear.
- 3 - PCM selects 3rd gear.
- 4 - PCM selects 4th gear.

OSC "GR_CM" Mode operates ONLY when:

- digital TR sensor is operational and no digital TR sensor DTCs present.
- vehicle speed sensor is operational and no VSS sensor DTCs present.

- engine is ON.
- TCC is OFF.
- transmission range selector lever is in O/D.
- vehicle speed is greater than 3.2 km/h (2 mph).

OSC Command Values

- 1 - PCM selects 1st gear.
- 2 - PCM selects 2nd gear.
- 3 - PCM selects 3rd gear.
- 4 - PCM selects 4th gear.
- XXX - cancels OSC value sent.
- SEND - sends the values to PCM.

DRIVE MODE Procedure for GR_CM

Follow operating instructions from the scan tool menu screen.

- Select "Output State Control."
- Select "Trans - DRIVE MODE."
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - GR_CM."
- Select Value "1-4."
- Press "SEND" to send command.
- Re-Select Value "1-4."
- Press "SEND" to send command.
- Select "XXX" to cancel at any time.
- Press "SEND."

TCC in DRIVE MODE

This OSC function is used to test whether the torque converter clutch is engaging and disengaging correctly.

The OSC functions for the TCC parameter allows the technician to choose the following:

- TCC - activates TCC OFF and ON.
- ON - turns TCC solenoid ON.
- OFF - turns TCC solenoid OFF.

OSC "TCC OFF" DRIVE MODE operates ONLY when:

- digital TR sensor is operational and no digital TR sensor DTCs present.
- vehicle speed sensor is operational and no VSS sensor DTCs present.

- engine is ON.
- transmission range selector lever is in O/D.
- vehicle speed is greater than 3.2 km/h (2 mph).

OSC "TCC ON" DRIVE MODE operates ONLY when:

- digital TR sensor is operational and no digital TR sensor DTCs present.
- vehicle speed sensor is operational and no VSS sensor DTCs present.
- engine is ON.
- transmission range selector lever is in O/D.
- vehicle speed is greater than 3.2 km/h (2 mph).
- transmission is in 2nd gear or higher.
- TFT is between 15 and 135°C (60 and 275°F).
- brake is not applied "OFF" below 32 km/h (20 mph).
- Not an excessive load on engine (engine lugging).

OSC Command Values

- OFF - turns TCC OFF.
- ON - turns TCC ON.
- XXX - cancels OSC value sent.
- SEND - sends the values to PCM.

Drive Mode Procedures for TCC

Follow operating instructions from the scan tool menu screen.

- Select "Output State Control."
- Select "Trans - Drive Mode."
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - TCC."
- Select "ON" to turn solenoid ON.
- Press "SEND" to send command ON.
- Select "OFF" to turn solenoid OFF.
- Press "SEND" to send command OFF.
- Select "XXX" to cancel at any time.
- Press "SEND."

EPC in DRIVE MODE

This OSC function is used to increase the EPC pressure while testing the transmission shift functions. This OSC function can only increase the EPC pressure greater than what the PCM normally commands. If an OSC value, such as (75) or (90) psi is sent, the upshifts and downshifts should exhibit a firmer shift. Firmer shifts would indicate that the EPC pressure control works at higher

pressures. The best test for the EPC is to use the BENCH MODE and a hydraulic pressure gauge. Using EPC in the BENCH MODE will confirm that the EPC works at both the higher and lower pressures.

The OSC functions for the parameter EPC allows the technician to choose the following options:

- EPC - Activates EPC to selected
  - 00 - sets EPC pressure to 00 kPa (00 psi).
  - 15 - sets EPC pressure to 103 kPa (15 psi).
  - 30 - sets EPC pressure to 206 kPa (30 psi).
  - 45 - sets EPC pressure to 310 kPa (45 psi).
  - 60 - sets EPC pressure to 411 kPa (60 psi).
  - 75 - sets EPC pressure to 517 kPa (75 psi).
  - 90 - sets EPC pressure to 620 kPa (90 psi).

OSC "EPC" DRIVE MODE operates ONLY when:

- digital TR sensor is operational and no digital TR sensor DTCs present.
- vehicle speed sensor is operational and no VSS sensor DTCs present.
- transmission range selector lever is in O/D.
- pressure gauge is installed.
- key is ON.
- engine is ON.
- vehicle speed is greater than 3.2 km/h (2 mph).
- OSC value for EPC must be greater than what the PCM commands (see EPC PID).

OSC Command Values

- 00 - sets EPC pressure to 00 kPa (00 psi).
- 15 - sets EPC pressure to 103 kPa (15 psi).
- 30 - sets EPC pressure to 206 kPa (30 psi).
- 45 - sets EPC pressure to 310 kPa (45 psi).
- 60 - sets EPC pressure to 411 kPa (60 psi).
- 75 - sets EPC pressure to 517 kPa (75 psi).
- 90 - sets EPC pressure to 620 kPa (90 psi).
- XXX - cancels OSC value sent.
- SEND - sends the values to PCM.

DRIVE MODE Procedure for EPC.

Follow operating instructions from the scan tool menu screen.

- Select "Output State Control."
- Select "Trans - Drive Mode."
- Select "PIDs" to be monitored.

- Monitor all selected PIDs during test.
- Select "Parameters - EPC."
- Select Value "0-620 kPa (0-90 psi)."
- Press "SEND" to send command.
- Re-Select Value "0-620 kPa (0-90 psi)."
- Press "SEND" to send command.
- Select "XXX" to cancel at any time.
- Press "SEND."

Using Output State Control and Accessing PIDs

To confirm that the OSC value was sent by the scan tool and the EEC has accepted the OSC substitution, a corresponding PID for each OSC parameter must be monitored. Additional PIDs should be monitored to help the technician adequately diagnose the transmission.

The following is a list of OSC parameters and their corresponding PID:

OSC PARAMETER CHART

OSC Parameter	PID	Additional PIDs
SSA	SSA	SS1F
SSB	SSB	SS2F
TCC	TCC	TCCF, TCCMACT (do not use PID TCCMCMD during OSC)
EPC	EPC	—
GR_CM	GEAR	TRANRAT

To confirm that the OSC substitution occurred, SEND the OSC value and monitor the corresponding PID value. If no ERROR MESSAGE was received and the value of the corresponding PID remains the same as the value sent from OSC, then the OSC substitution was successful.

Transmission Drive Cycle Test

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: The Transmission Drive Cycle Test must be followed exactly. Malfunctions must occur four times consecutively for shift error DTC code to be set, and five times consecutively for continuous TCC code to set.

NOTE: When carrying out the Transmission Drive Cycle Test, refer to the Solenoid Application Chart for correct solenoid operation.

After carrying out the Quick Test, use the Transmission Drive Cycle Test for checking continuous codes.

1. Record and then erase Quick Test codes.
2. Warm engine to normal operating temperature.
3. Make sure transmission fluid level is correct.
4. With transmission in OVERDRIVE, moderately accelerate from stop to 80 km/h (50 mph). This allows the transmission to shift into fourth gear. Hold speed and throttle open steady for a minimum of 15 seconds.
5. With transmission in fourth gear and maintaining steady speed and throttle opening, lightly apply and release brake to operate stoplamps. Then hold speed and throttle steady for a minimum of five seconds.
6. Brake to a stop and remain stopped for a minimum of 20 seconds.
7. Repeat steps 4 through 6 at least five times.
8. Carry out Quick Test and record continuous DTCs.
    - If the DTCs are still present, refer to the Diagnostic Trouble Code Chart. Repair all non transmission DTCs first as they can directly affect the operation of the transmission. Repeat the Quick Test and the Road Test to verify the correction. Erase the DTCs, carry out the Drive Cycle Test and repeat the Quick Test after completing repair on the DTC.
    - If the continuous test passes and a concern is still present, refer to Diagnosis By Symptom in this section, OASIS messages, and TSBs for concerns.

After On-Board Diagnostic

NOTE: The vehicle wiring harness, PCM and non-transmission sensors may affect transmission operations. Repair these concerns first.

After the on-board diagnostic procedures are completed, repair all DTCs.

Begin with non-transmission related DTCs, then repair any transmission related DTCs. Use the diagnostic trouble code chart for information on condition and symptoms. This chart will be helpful in referring to the correct manual(s) and aids in diagnosing internal transmission concerns and external non-transmission inputs. The pinpoint tests are used in diagnosing transmission electrical concerns. Make sure that the vehicle wiring harness and the PCM are diagnosed as well. The Powertrain

Control/Emissions Diagnosis (PC/ED) manual will aid in diagnosing non-transmission electronic components.

Before Pinpoint Tests

NOTE: Prior to entering pinpoint tests, check the PCM wiring harness for tight connections, bent or broken pins, corrosion, loose wires, correct routing, correct seals and their condition. Check the PCM, sensors and actuators for damage. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

NOTE: If a concern still exists after electrical diagnosis has been carried out, refer to Diagnosis By Symptom in this section.

If DTCs appear while carrying out the on-board diagnostics, refer to the Diagnostic Trouble Code Charts for the appropriate repair procedure. Prior to entering pinpoint tests, refer to any TSBs and OASIS messages for transmission concerns.

Diagnostic Trouble Code Charts

Diagnostic Trouble Code Chart

Five Digit DTC	Component	Description	Condition	Symptom	Action
P0102 P0103 P1100 P1101	MAF	MAF concerns	MAF system has a malfunction which may cause a transmission concern.	High or low EPC pressure, incorrect shift schedule. Incorrect torque converter clutch engagement scheduling. Symptoms similar to a throttle position (TP) failure.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0112	IAT	IAT indicates 125°C (257°F) (grounded)	Voltage drop across IAT exceeds scale set for temperature 125°C (257°F).	Incorrect EPC pressure, either high or low, results in harsh or soft shifts.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0113	IAT	IAT indicates -40°C (-40°F) (open circuit)	Voltage drop across IAT exceeds scale set for temperature -40°C (-40°F).	Incorrect EPC pressure, either high or low, results in harsh or soft shifts.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0114	IAT	IAT out of on-board diagnostic range	IAT temperature higher or lower than expected during KOEO and KOER.	Rerun on-board diagnostic at normal operating temperature.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0117	ECT	ECT indicates 125°C (257°F)	Voltage drop across ECT exceeds scale set for temperature 125°C (257°F) (grounded).	Torque converter clutch will always be off, resulting in reduced fuel economy.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0118	ECT	ECT indicates -40°C (-40°F)	Voltage drop across ECT exceeds scale set for temperature -40°C (-40°F) (open circuit).	Torque converter clutch will always be off, resulting in reduced fuel economy.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0122 P0123 P1120	TP	TP concern	PCM has detected an error that may cause a transmission concern.	Harsh engagements, firm shift feel, abnormal shift schedule, torque converter clutch does not engage, torque converter clutch cycling.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0300-	Electronic	EI systems	EI system has a	Harsh	Refer to the

P0308 P0320 P0340 P1351- P1364	Ignition (EI)	concerns	malfunction which may cause a transmission concern.	engagements and shifts, late WOT shifts, no torque converter clutch engagement.	Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1702	Digital TR	Intermittent DTC codes P0705 or P0708	Refer to DTC codes P0705 or P0708 condition.	Refer to DTC codes P0705 or P0708 symptom.	Go To Pinpoint Test C .
P1704	Digital TR	Digital TR circuit reading in between gear position during KOEO/KOER	Digital TR sensor or shift cable incorrectly adjusted; or digital TR circuit failure.	Wrong commanded EPC pressure. Digital TR reading the wrong gear position.	Go To Pinpoint Test C .
P0705	Digital TR	Digital TR circuit failure	Digital TR circuits, indicating an invalid pattern in TR_D. Condition caused by a short to ground or an open in TR4, TR3A, TR2, and or TR1 circuits. This DTC cannot be set by an incorrectly adjusted digital TR sensor.	Increase in EPC pressure (harsh shifts). Defaults to (D) or D for all gear positions. In (D) position trans, stuck in D or manual 2.	Go To Pinpoint Test C .
P0708	Digital TR	Digital TR sensor circuit TR3A open	Digital TR sensor circuit TR3A reading 2.6v - 5.0v (open circuit). This DTC cannot be set by an incorrectly adjusted digital TR sensor.	Increase in EPC pressure. Defaults to (D)or D for all gear ranges.	Go To Pinpoint Test C .
P1705	Digital TR	Digital TR self test was not carried out in PARK or NEUTRAL	Vehicle not in PARK or NEUTRAL during on-board diagnostic.	Rerun on-board diagnostic in PARK or NEUTRAL.	Go To Pinpoint Test C .
P0720	OSS	Insufficient input from output shaft speed sensor	PCM detected a loss of OSS signal during operation.	Harsh shifts, abnormal shift schedule, no torque converter clutch activation.	Go To Pinpoint Test E .
P0721	OSS	OSS sensor signal noisy	PCM has detected an erratic OSS signal.	Harsh shifts, abnormal shift schedule, no torque converter clutch engagement.	Go To Pinpoint Test E .
P0722	OSS wiring	Insufficient input from OSS	PCM has detected a loss of OSS signal.	Harsh shifts, abnormal shift schedule, no torque converter clutch engagement.	Go To Pinpoint Test E .

P0741 **	TCC, internal components	TCC slippage detected	The PCM picked up an excessive amount of slippage during normal vehicle operation.	TCC slippage/erratic or no torque converter clutch operation. Flashing Transmission Control Indicator Lamp (TCIL).	Refer to Diagnosis By Symptom in this section.
P0743 *	TCC, wiring, PCM	TCC solenoid circuit failure during on-board diagnostic	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Short circuit: engine stalls in second (OD, 2 range) at low idle speeds with brake applied. Open circuit: torque converter clutch never engages.	Go To Pinpoint Test A .
P0750 *	SSA, wiring, PCM	SSA solenoid circuit failure	SSA circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Incorrect gear selection depending on condition mode and manual lever position. See Solenoid On/Off Chart.	Go To Pinpoint Test A .
P0751	SSA, wiring, PCM	Shift solenoid A functional failure	Mechanical or hydraulic failure of the shift solenoid.	Incorrect gear selection depending on failure mode manual lever position.	Refer to Solenoid Operation Chart, then Go To Pinpoint Test A .
P0753	SSA, wiring, PCM	SSA electrical failure	SSA circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Incorrect gear depending on condition mode and manual lever position. See Solenoid On/Off Chart. May flash TCIL.	Go To Pinpoint Test A .
P0755 *	SSB, wiring, PCM	SSB solenoid circuit failure	SSB circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Incorrect gear selection depending on condition mode and manual lever position. See Solenoid On/Off Chart.	Go To Pinpoint Test A .
P0758 *	SSB, wiring, PCM	SSB electrical circuit failure	SSB circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Incorrect gear depending on condition mode and manual lever position. See Solenoid On/Off Chart. May flash TCIL.	Go To Pinpoint Test A .
P1714	SSA, internal components	SSA malfunction	Mechanical failure of the solenoid detected.	Incorrect gear selection depending on condition, mode and manual lever position. See	Go To Pinpoint Test F .

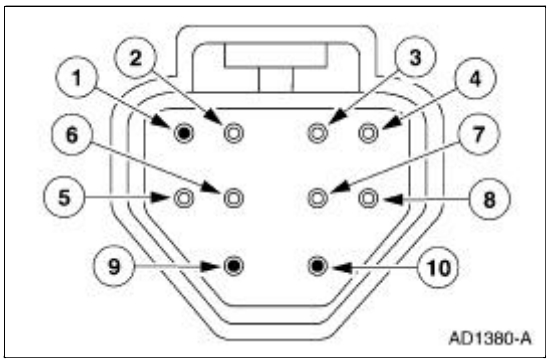
				Solenoid Operation Chart.	
P1715	SSB	SSB malfunction	Mechanical failure of the solenoid detected.	Incorrect gear selection depending on condition, mode and manual lever position. See Solenoid Operation Chart.	Go To Pinpoint Test F .
P0756	SSB	SSB functional failure	Mechanical or hydraulic failure of the shift solenoid.	Incorrect gear selection depending on failure mode and manual lever position.	Refer to Solenoid Operation Chart, then Go To Pinpoint Test A .
P0781 **	SSA or internal parts	1-2 shift error	Engine rpm drop not detected when 1-2 shift was commanded by PCM.	Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material).	Refer to Solenoid Operation Chart, then Go To Pinpoint Test A .
P0782 **	SSA, SSB or internal parts	2-3 shift error	Engine rpm drop not detected when 2-3 shift was commanded by PCM.	Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material).	Refer to Solenoid Operation Chart, then Go To Pinpoint Test A .
P0783 **	SSA, SSB or internal parts	3-4 shift error	Engine rpm drop not detected when 3-4 shift was commanded by PCM.	Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material).	Refer to Solenoid Operation Chart, then Go To Pinpoint Test A .
—	TCIL	TCIL circuit failure	TCIL circuit open or shorted.	Failed on, OD cancel mode on. No flashing TCIL for EPC failure or sensor. Failed off, OD cancel mode never indicated. No flashing TCIL for EPC sensor failure.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1116	ECT	ECT out of on-board diagnostic	ECT temperature higher or lower than expected	Rerun on-board diagnostic at normal operating	Refer to the Powertrain Control/Emissions

		range	during KOEO and KOER.	temperature.	Diagnosis (PC/ED) manual.
P1124	TP	TP voltage high/low for on-board diagnostic	TP was not in the correct position for on-board diagnostic.	Rerun at appropriate throttle position per application.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1460	A/C	A/C clutch cycling pressure switch error	A/C or defrost on condition may result from A/C clutch being on during on-board diagnostic.	DTC set during on-board diagnostic, repeat with A/C off. Failed on, EPC pressure slightly low with A/C off.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1636	PCM	PCM detected internal error	—	—	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1703	BPP	BPP switch circuit failed	Brake ON/OFF circuit failure.	Failed on or not connected — torque converter clutch will not engage at less than 1/3 throttle. Failed off or not connected — torque converter clutch will not disengage when brake is applied.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1703	BPP	Brake not actuated during on-board diagnostic	Brake not cycled during KOER.	Failed off or not connected — torque converter clutch will not engage at less than 1/3 throttle. Failed off or not connected — torque converter clutch will not disengage when brake is applied.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0713	TFT, wiring, PCM	-40°C (-40°F) indicated TFT sensor circuit open	Voltage drop across TFT sensor exceeds scale set for temperature -40°C (-40°F).	Firm shift feel.	Go To Pinpoint Test B .
P1711	TFT	TFT out of on-board diagnostic range	Transmission not at operating temperature during on-board diagnostic.	Warm vehicle to normal operating temperature.	Go To Pinpoint Test B .
P0712	TFT, wiring, PCM	157°C (315°F) indicated TFT sensor circuit grounded	Voltage drop across TFT sensor exceeds scale set for temperature of 157°C (315°F).	Firm shift feel.	Go To Pinpoint Test B .
P1713	TFT wiring PCM	TFT continually reading cold	TFT sensor in range low failure.	Firm shift feel. Substitute ECT for TFT	Go To Pinpoint Test B .

P1783	TFT	Transmission over temperature condition indicated	Transmission fluid temperature exceeded 127°C (270°F).	Increase in EPC pressure.	Go To Pinpoint Test B .
P1718	TFT, wiring, PCM	TFT continually reading hot	TFT sensor in range high failure.	Firm shift feel. Substitute ECT for TFT.	Go To Pinpoint Test B .
P0740	TCC, wiring, PCM	TCC electrical failure	TCC circuit fails to provide voltage drop across solenoid. Circuit open, shorted or PCM driver failure during on-board diagnostics.	Short circuit, engine stalls in SECOND ((D), 2 range) at low speeds with brake applied. Open circuit, torque converter clutch never engages. May flash TCIL.	Go To Pinpoint Test A .
P1740	TCC	TCC malfunction	Mechanical failure of the solenoid detected.	Failed on — Engine stalls in 2nd (O/D, Manual 2 ranges) at low idle speeds with brake applied. Failed off — Torque Converter never applies.	Go To Pinpoint Test F .
P1741 **	TCC, internal components	Excessive torque converter clutch engagement error	Excessive variations in slip (engine speed surge) across the torque converter clutch.	Engine rpm oscillation is present in 3rd gear.	Go To Pinpoint Test A .
P1742	TCC, internal components	TCC solenoid failed on	TCC solenoid has failed on by electric, mechanical or hydraulic concern.	Harsh shifts.	Go To Pinpoint Test A .
P1743	TCC, internal components	TCC solenoid failed on	TCC solenoid has failed on by electric, mechanical or hydraulic concern.	Harsh shifts.	Go To Pinpoint Test A .
P1744	TCC	TCC	The PCM picked up an excessive amount of TCC slippage during normal vehicle operation.	TCC slippage/erratic or no torque converter clutch operation.	Refer to Diagnosis By Symptom in this section.
P1746 *	EPC, wiring, PCM	EPC solenoid open circuit	Voltage through EPC solenoid is checked. An error will be noted if tolerance is exceeded.	Open circuit causes maximum EPC pressure, harsh engagements and shifts.	Go To Pinpoint Test D .
P1747 *	EPC, wiring, PCM	EPC solenoid circuit failure, shorted circuit or output driver	Voltage through EPC solenoid is checked. An error will be noted if tolerance is	Short circuit causes minimum EPC pressure (minimum capacity) and limits engine torque	Go To Pinpoint Test D .

			exceeded.	(alternate firm).	
P1760	EPC, wiring, PCM	EPC solenoid circuit failure, shorted circuit or output driver	PCM detected a loss of EPC during operation.	Unexpected reduction in engine torque.	Go To Pinpoint Test D .
P1780	TCS	TCS not changing states	TCS not cycled during self-test. TCS circuit open or shorted.	Rerun on-board diagnostic and cycle switch. No OD cancel when switch is cycled.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1781 [1]	4x4 low switch	4x4 low switch closed	4x4 low switch closed or 4x4 low indicator lamp circuit open.	Failed on — early shift schedules in 4x2 and 4x4 HI range. Failed off — shifts delayed in 4x4 low. [1]	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1729	4x4L	4x4 low switch failure	4x4 low switch failure during normal vehicle operation.	Early shifts, harsh shifts, increase in electronic pressure control valve.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1728	Trans	Transmission slip error	The PCM has detected an excessive amount of slippage during normal operation.	Transmission slippage erratic or no torque converter clutch operation.	Refer to Diagnosis By Symptom in this section.

* Output circuit check, generated only by electrical symptoms.
** May also be generated by some other non-electric transmission hardware system.
[1] If the 4x4 low indicator light fuse is blown, the transmission will shift according to the 4x4 low shift scheduling regardless of the transfer case position.



Rotunda Transmission Tester

The Rotunda Transmission Tester is used to diagnose the digital transmission range sensor and is used in conjunction with the pinpoint tests. The tests should be carried out in order. Installing the Rotunda Transmission Tester allows separation of the vehicle electronics from transmission electronics. For additional information, refer to the Rotunda Transmission Tester manual for these tests.

- Digital Transmission Range (TR) Sensor Testing
- Resistance/Continuity Test
- Voltage Test - PARK/NEUTRAL, REVERSE Lamp, and Optional Circuits

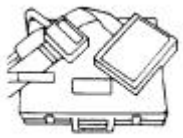
Digital Transmission Range (TR) Sensor Diagnosis Chart

Selector Position	PID: TR	PID: TR_D				PID: TR_V (volts)
		TR4	TR3A	TR2	TR1	TR3A (PCM Pin 64 to sigrtn)
PARK	P/N	0	0	0	0	0.0 Volts
In Between	REV	0	1	0	0	1.3 - 1.8 Volts
REVERSE	REV	1	1	0	0	1.3 - 1.8 Volts
In Between	REV	0	1	0	0	1.3 - 1.8 Volts
NEUTRAL	NTRL	0	1	1	0	1.3 - 1.8 Volts
In Between	O/D [a]	1	1	1	0	1.3 - 1.8 Volts
OVERDRIVE	O/D [a]	1	1	1	1	1.3 - 1.8 Volts
In Between	Man 2	1	0	1	1	0.0 Volts

Manual 2	Man 2	1	0	0	1	0.0 Volts
In Between	Man 2	1	0	1	1	0.0 Volts
Manual 1	Man 1	0	0	1	1	0.0 Volts

[a] Will read "Drive" if O/D is canceled.



A. TR_V is the voltage at the PCM pin 64 (TR3A Circuit) to signal return.
B. "In Between" reading could be caused by a shift cable or digital TR sensor misaligned or a digital TR sensor circuit failure of TR1, TR2, TR3A, or TR4.
C. TR_D: 1= Open Digital TR switch, 0= Closed Digital TR switch.
D. EEC-V Control System Breakout Box Readings: Taken from PCM signal pins for TR1, TR2, TR3A, TR4 to signal return.
    - **Voltages for TR1, TR2, TR4:**
    - 0 = 0.0 volts.
    - 1 = 9.0 - 14.0 volts.
    - **Voltage for TR3A:**
    - 0 = 0.0 volts.
    - 1 = 1.3 - 1.8 volts.

Wiggle Test Information For Open/Shorts

- TR4, TR3A, TR2, and TR1 are all closed in PARK. PARK is a good position to check for intermittent open circuits (with scan tool monitoring TR_D).
- TR4, TR3A, TR2, and TR1 are all open in OVERDRIVE, so OVERDRIVE is a good position to check for shorts to ground. To determine the shorted components while observing TR_D, unplug the TR and see if the short goes away. If the short is still present, unplug the transmission harness and see if the short goes away. If the short is still present, then the short is in the PCM or vehicle harness. Remove the suspect circuit(s) wire from the PCM vehicle harness. If the short is still present, then the PCM has an internal failure. Otherwise the failure is in the vehicle harness.

Pinpoint Tests — OSC Equipped Vehicles

Special Tool(s)

 ST1391-A	Breakout Box, EEC-V Control System 418-049 (T94L-50 EEC-V) or equivalent
 ST1632-A	MLP TR Cable 418-F107 (007-00111) or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052 or equivalent scan tool
 ST1389-A	Transmission Tester 307-F016 (007-00130) or equivalent
	Trans Tester TR/MLP Overlay and Manual 007-00131 or equivalent
 ST1137-A	73 III Digital Multimeter 105-R0057 or equivalent
 ST2545-A	Gauge, Transmission Solenoid Connectors 307-426

Any time an electrical connector or solenoid body is disconnected, inspect the connector for pin condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install a new connector as required.

Shift Solenoids Pre-Diagnosis

Use the following shift solenoid operation information when carrying out Pinpoint Test A.

Solenoid Operation Chart

Gear Lever Position	PCM Commanded Gear	Solenoids		
		SSA	SSB	TCC
P/R/N	1	ON	OFF	HD
(D)	1	ON	OFF	HD
(D)	2	OFF	OFF	EC
(D)	3	OFF	ON	EC
(D)	4	ON	ON	EC
(D)				
w/OD OFF				
1	1	ON	OFF	HD
2	2	OFF	OFF	EC
3	3	OFF	ON	EC
Manual 2	2	OFF	OFF	EC
Manual 1	1	ON	OFF	HD
[a] 1	2	OFF	OFF	EC

[a] When a manual pull-in occurs above a calibrated speed the transmission will downshift from the higher gear until the vehicle speed drops below this calibrated speed.

EC = Electronically controlled.

HD = Hydraulically disabled.

Shift Solenoid Failure Mode Chart "Always Off"

Failed off due to powertrain control module (PCM) and or vehicle wiring concerns, shift solenoid electrically or hydraulically stuck off.

SSA ALWAYS OFF	Gear Lever Position		
	(D)	2	1
PCM Gear Commanded	Actual Gear Obtained		
1	2	2	2
2	2	2	2
3	3	2*	2*
4	3	2*	2*

*No engine braking.

SSB ALWAYS OFF	Gear Lever Position		
	(D)	2	1
PCM Gear Commanded	Actual Gear Obtained		
1	1	1	1
2	2	2	2
3	2	2	2
4	1	1	1

Shift Solenoid Failure Mode Chart "Always On"

Failed on due to powertrain control module (PCM) and or vehicle wiring concerns, shift solenoid electrically or hydraulically stuck on.

SSA ALWAYS ON	Gear Lever Position		
	(D)	2	1
PCM Gear Commanded	Actual Gear Obtained		
1	1	1	1
2	1	1	1
3	4	2*	2*
4	4	2*	2*

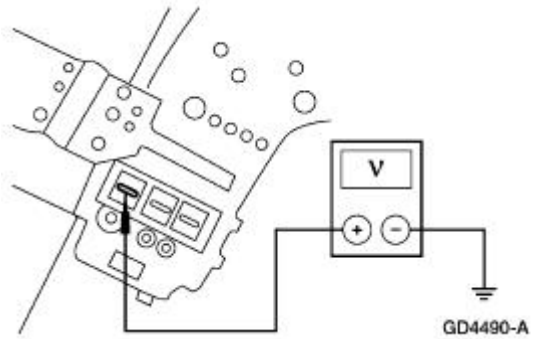
*No engine braking.

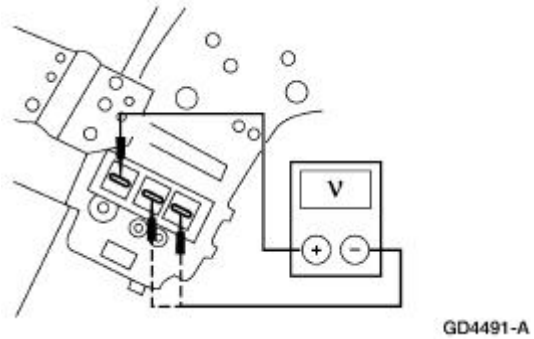
SSB ALWAYS ON	Gear Lever Position		
	(D)	2	1
PCM Gear Commanded	Actual Gear Obtained		
1	4	2*	2*
2	3	2*	2*
3	3	2*	2*
4	4	2*	2*

*No engine braking.

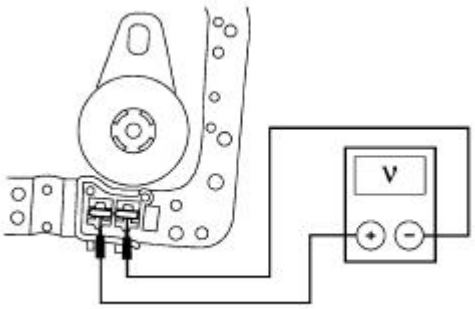
Pinpoint Tests

PINPOINT TEST A: SHIFT AND TORQUE CONVERTER CLUTCH





SOLENOIDS



<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td colspan="2">NOTE: Read and record all DTCs. All Digital TR Sensor and VSS DTCs must be repaired before entering Output State Control (OSC).</td></tr>

No
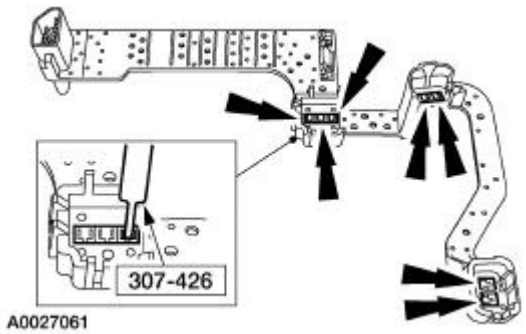
GO to A5 .</td></tr>
<tr><td>A4 OSC TRANS-DRIVE MODE (GR_CM OR TCC)
● Carry out OSC Trans-Drive Mode.
● Select GR_CM for Shift Solenoids or follow procedures for GR_CM as listed.
● Select TCC for Torque Converter Clutch Solenoid. Follow procedures of TCC in Drive Mode as listed.</td><td>Yes
CLEAR all DTCs. ROAD TEST to verify if concern is still present. If concern is still present, REFER to Diagnosis</td></tr>
</table>

• **Does the transmission upshift and downshift or torque converter engage/disengage when commanded?**	By Symptom in this section to diagnose shift or torque converter concern. **No** GO to A5 .
A5 CHECK FOR BATTERY VOLTAGE	
• Remove transmission fluid pan. • Visually inspect the lead frame and connectors for damage. • Key in ON position. • Measure the voltage with the positive lead to VPWR solenoid pin and negative lead to a good ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to A6 . **No** CHECK for open or short circuit in harness, or solenoid.
A6 ELECTRICAL SIGNAL CHECK	
• Measure the voltage with the positive lead connected to VPWR solenoid pin and the negative lead to the signal pin of the appropriate solenoid.  • Select Parameter SSA, SSB or TCC. • Select "ON". • Press "SEND". • Turn the solenoids ON and OFF, while monitoring the voltage, solenoid state on the scan tool (ON and OFF), and listen for the solenoid to activate (click). • Measure the voltage with the positive lead to VPWR pin and the negative lead to the TCC pin.	**Yes** GO to A7 . **No** CHECK for open or short circuit in harness, solenoid or a PCM concern.



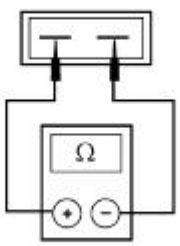
GD4492-A

- Select Parameter TCC.
- Select "ON".
- Press "SEND".
- Turn the solenoid ON and OFF, while monitoring the voltage, solenoid state on the scan tool (ON and OFF), and listen for the solenoid to activate (click).
- Select "OFF", press "SEND".
- **Does the voltage and solenoid state change?**

A7 CHECK LEAD FRAME SOLENOID CONNECTIONS

- Key in OFF position.
- Disconnect the lead frame.
- Inspect the lead frame for damage.
- Using the special tool, check all lead frame solenoid connections.

A0027061

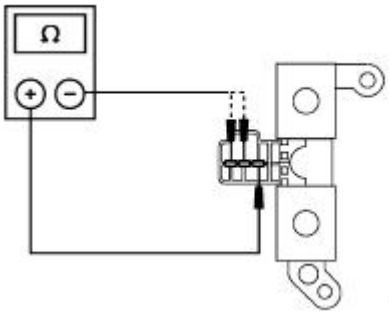


- **Does the special tool go through any of the lead frame solenoid connector pins?**

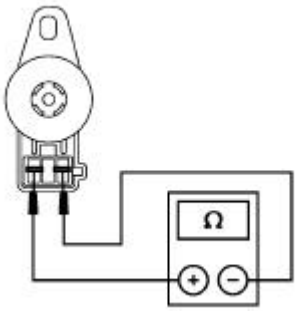
Yes
INSTALL a new lead frame and GO to A8 .

No
GO to A8 .

A8 CHECK SOLENOID RESISTANCE AT SOLENOID



- Measure the solenoid resistance between the pins of the solenoid.



GD3386-A

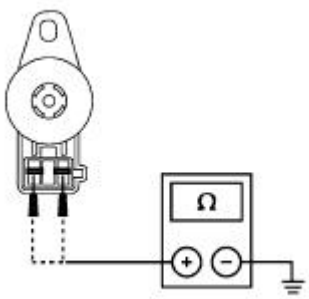
Yes
GO to A9 .

No
INSTALL a new solenoid.

AD1391-A

AD1392-A

- Measure the resistance for each solenoid (SSA, SSB or TCC) as follows:

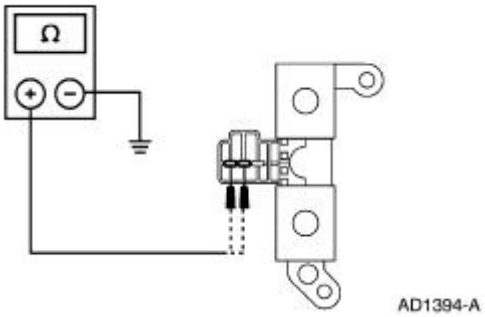


Solenoid	Resistance (ohms)
SSA	20-30
SSB	20-30
TCC	10-16

- **Are the resistances correct?**

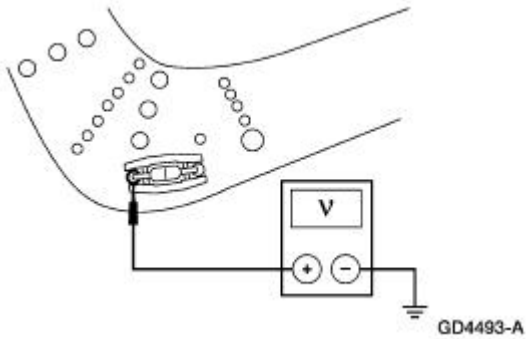
A9 CHECK SOLENOID FOR SHORT TO GROUND

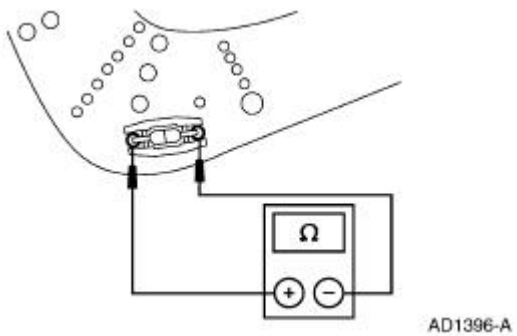
- Check for continuity between engine ground and appropriate solenoid pin with ohmmeter or other low current tester. Connection should show infinite resistance (no continuity).



Solenoid	Terminal
SSA	+/-
SSB	+/-
TCC	+/-

AD1393-A



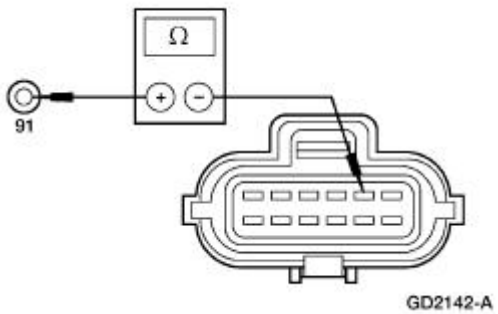


Yes
INSTALL a new solenoid.

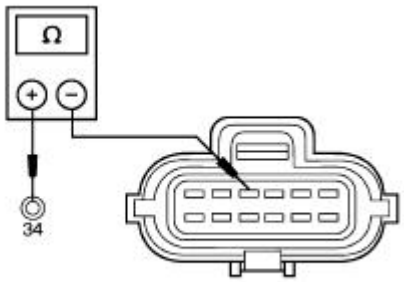
No
REFER to Diagnosis By Symptom for diagnosis of shift or torque converter concerns.

 ● **Is there continuity?**	

PINPOINT TEST B: TRANSMISSION FLUID TEMPERATURE (TFT) SENSOR



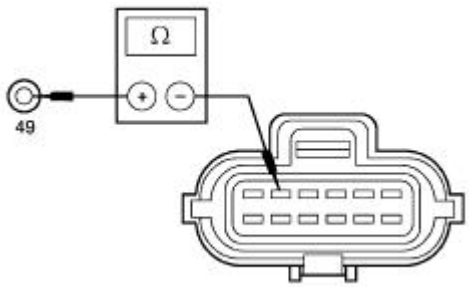
Test Step	Result / Action to Take
NOTE: Refer to the Transmission Connector layouts preceding these pinpoint tests.	
B1 ELECTRONIC DIAGNOSTICS	
● Check to make sure the transmission harness connector is fully seated, pins are fully engaged in connector and in good condition before proceeding. ● Install Scan Tool ● Key in ON position. ● Select Diagnostic Data Link. ● Select PCM. ● Select PID/Data Monitor and Record. ● Enter the following diagnostic mode on the diagnostic tool: PIDs; TFT, TFTV. ● **Does the vehicle enter PID/Data Monitor and Record?**	**Yes** GO to B2 . **No** REPEAT procedure to enter PID. If vehicle did not enter PID, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM.
B2 WARM-UP/COOL-DOWN CYCLE	
● While monitoring the TFT PIDs, carry out the following test: If transmission is cold, run transmission to warm it up. If transmission is warm, allow transmission to cool down. ● **Do the TFT PIDs increase as the transmission is warmed up or decrease as the transmission is cooled or does the TFT or TFTV drop in and out of range?**	**Yes** If the TFT PIDs increase as the transmission is warmed or decrease as the transmission is cooled, CLEAR all DTCs. ROAD TEST to verify if concern is still present. If concern is still present, REFER to Diagnosis By Symptom in this section to diagnose transmission overheating. If the TFT or TFTV drop in and out of range, INSPECT for intermittent concern in the internal/external harness, sensor or connector. **No** GO to B3 .
B3 ELECTRICAL SIGNAL CHECK	
● Key in ON position. ● Remove transmission fluid pan. ● Visually inspect the lead frame and connectors for damage.	**Yes** GO to B4 . **No** CHECK for open or short circuit in



• Measure the voltage with the positive lead to positive TFT at sensor pin and negative lead to a good ground.  • **Is the voltage present?**	vehicle harness, internal harness or a PCM concern.
B4 CHECK RESISTANCE OF TFT SENSOR • Disconnect: Transmission Harness. • Measure the resistance between the positive TFT and negative TFT pins at transmission connector, using the following: **Transmission Fluid Temperature** **°C** / **°F** / **Resistance (Ohms)** -40 to -20 / -40 to -4 / 967K - 284K -19 to -1 / -3 - 31 / 284K - 100K 0 - 20 / 32 - 68 / 100K - 37K 21 - 40 / 69 - 104 / 37K - 16K 41 - 70 / 105 - 158 / 16K - 5K 71 - 90 / 159 - 194 / 5K - 2.7K 91 - 110 / 195 - 230 / 2.7K - 1.5K 111 - 130 / 231 - 266 / 1.5K - 0.8K 131 - 150 / 267 - 302 / 0.8K - 0.54K  • **Is the resistance correct?**	**Yes** REFER to Diagnosis By Symptom in this section to diagnose an overheating concern. **No** INSTALL a new internal harness (sensor is part of harness).

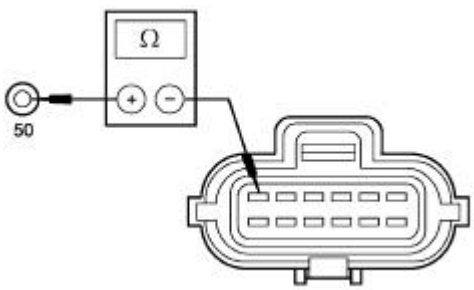
PINPOINT TEST C: DIGITAL TRANSMISSION RANGE (TR) SENSOR

Test Step	Result / Action to Take
NOTE: Refer to the Digital Transmission Range (TR) Sensor Connector illustration preceding	



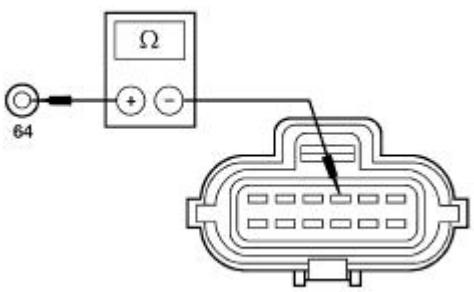
these pinpoint tests.	
NOTE: Refer to the Digital Transmission Range (TR) Sensor Diagnosis Chart preceding these pinpoint tests.	
C1 VERIFY DIAGNOSTIC TROUBLE CODES ● Select PARK. ● Key in OFF position. ● **NOTE:** DTC codes P0705 and P0708 cannot be set by an incorrectly adjusted digital TR sensor. ● Carry out on board diagnostic test. ● **Are only DTC codes P0705, P0708 present?**	**Yes** GO to C4 . **No** GO to C2 .
C2 VERIFY DIGITAL TRANSMISSION RANGE SENSOR ALIGNMENT ● Check to make sure the digital TR sensor harness connector is fully seated, pins are fully engaged in connector and in good condition before proceeding. ● Apply the parking brake. ● Select NEUTRAL. ● Disconnect the shift cable/linkage from the manual lever. ● Verify that the digital TR Sensor Alignment Tool fits in the appropriate slots. ● **Is the digital TR sensor adjustment OK?**	**Yes** GO to C3 . **No** ADJUST the digital TR sensor. PLACE transmission range selector lever in P and CLEAR DTCs. REPEAT OBD Tests. GO to C3 .
C3 VERIFY SHIFT CABLE/LINKAGE ADJUSTMENT ● Place the manual lever in the overdrive position. ● Reconnect the shift cable/linkage. ● Verify that the shift cable/linkage is adjusted OK. REFER to Section 307-05 . ● **Is the shift cable/linkage adjusted OK?**	**Yes** GO to C4 . **No** ADJUST the shift cable/linkage. REFER to Section 307-05 .
C4 CHECK ELECTRICAL SIGNAL OPERATION ● Select PARK. ● Disconnect: Digital TR Sensor. ● **CAUTION: Do not pry on connector. This will damage the connector and result in a transmission concern.** ● Press the button and pull out on the digital TR harness connector. ● Inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals. ● **Are the connector, pins and harness damaged?**	**Yes** REPAIR as required. CLEAR DTCs and REPEAT OBD Tests. **No** If diagnosing a DTC, GO to C5 . If diagnosing a starting concern or a reversing lamp concern, GO to C10 .
C5 CHECK ELECTRICAL SYSTEM OPERATION (DIGITAL TR AND PCM) ● Key in OFF position. ● Install Scan Tool ● Connect: Digital TR Sensor. ● Key in ON position. ● Enter the following diagnostic mode on the diagnostic tool: TR PIDS TR, TR_D, TR_V. ● Move transmission range selector lever into each gear and stop. ● Observe any of the following PIDs, TR and TR_D, TR_V (vehicle dependent) while wiggling harness, tapping on sensor, or driving the vehicle. Use PIDs TR, and TR_D for DTCs P0705, P1704, and P1705. Use PIDs TR, and TR_V for DTC P0708. ● Compare the PIDs to the Digital Transmission Range	**Yes** The problem is not in the digital TR sensor system. REFER to Diagnosis By Symptom in this section for further diagnosis. **No** If TR_D changes when wiggling harness, tapping on the sensor, or driving the vehicle, the problem may be intermittent. GO to C6 .

(TR) Sensor Diagnosis Chart. ● **Do the PIDs TR, TR_D and TR_V match the Digital Transmission Range (TR) Sensor Diagnosis chart, and does the TR_D PID remain steady when the harness is wiggled, the sensor is tapped, or the vehicle driven?**	
C6 CHECK DIGITAL TRANSMISSION RANGE SENSOR OPERATION	
● Disconnect: Digital TR Sensor. ● **CAUTION: Do not pry on connector. This will damage the connector and result in a transmission concern.** ● Connect: TR-E Cable to Transmission Tester. ● Connect: TR-E Cable to Digital TR Sensor. ● Place the Digital TR Overlay onto Transmission Tester. ● Carry out Sensor Test as instructed on the Digital TR Overlay. ● **Does the status lamp on the tester TRS-E cable match the selected gear positions?**	**Yes** Concern is not in the digital TR sensor, GO to C7 . **No** INSTALL a new digital TR sensor. CLEAR DTCs and REPEAT OBD Tests.
C7 CHECK PCM HARNESS CIRCUITS FOR OPENS	
● Key in OFF position. ● Disconnect: Powertrain Control Module (PCM). ● Inspect for damaged or pushed-out pins, corrosion or loose wires. ● Disconnect: Digital TR Sensor. ● **CAUTION: Do not pry the connector. This will damage the connector and result in a transmission concern.** ● Disconnect the digital TR sensor connector. ● Install the EEC-V Control System Breakout Box. ● Measure the resistance between the PCM Test Pin 91 at the EEC-V Control System Breakout Box and signal return circuit Pin 2 at digital TR sensor connector harness side.  ● Measure the resistance between the PCM Test Pin 34 at the EEC-V Control System Breakout Box and TR1 circuit Pin 4 at digital TR sensor connector harness side.	**Yes** GO to C8 . **No** REPAIR open circuit(s). RECONNECT all components. CLEAR DTCs. REPEAT OBD Tests.



AD1665-A

- Measure the resistance between the PCM Test Pin 49 at the EEC-V Control System Breakout Box and TR2 circuit Pin 5 at digital TR sensor connector harness side.

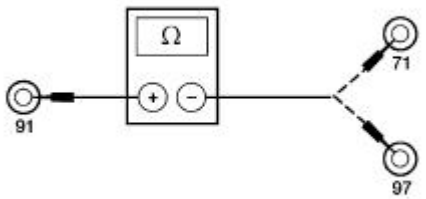


GD2144-A

- Measure the resistance between the PCM Test Pin 50 at the EEC-V Control System Breakout Box and TR4 circuit Pin 6 at digital TR sensor connector harness side.

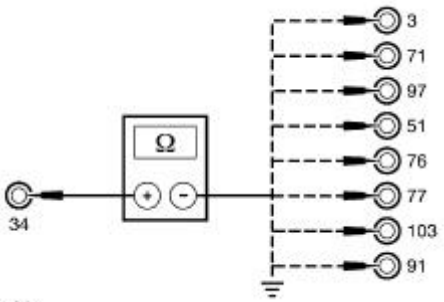
GD2145-A

- Measure the resistance between the PCM Test Pin 64 at the EEC-V Control System Breakout Box and TR3A circuit Pin 3 at digital TR sensor connector harness side.



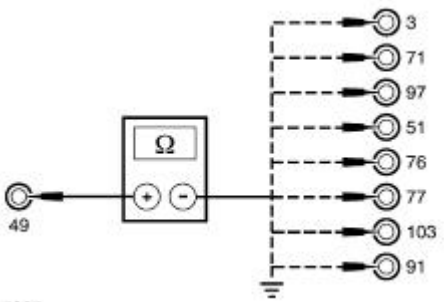
GD2146-A

- **Are all resistances less than 5 ohms?**



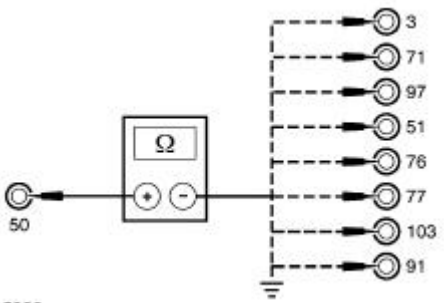
C8 CHECK PCM HARNESS CIRCUITS FOR SHORT TO GROUND OR POWER	
• Measure the resistance between PCM Test Pin 91 and Test Pins 71 and 97 at the EEC-V Control System	**Yes** GO to C9 .

Breakout Box.



GD2254-A

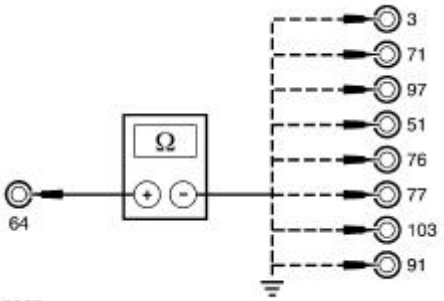
- Measure the resistance between PCM Test Pin 34 and Test Pins 3, 71, 97, 51, 76, 77, 103, and 91 at the EEC-V Control System Breakout Box and chassis ground.



A0015064

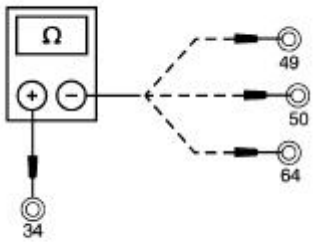
- Measure the resistance between PCM Test Pin 49 and Test Pins 3, 71, 97, 51, 76, 77, 103, and 91 at the EEC-V Control System Breakout Box and chassis ground.

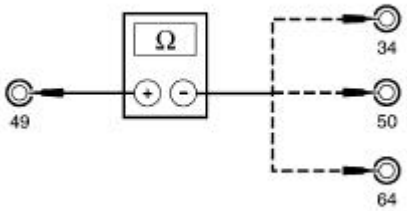
A0015065

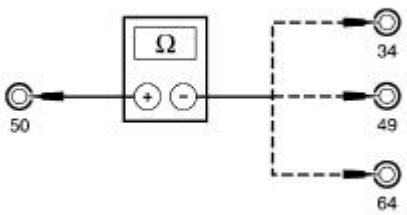


- Measure the resistance between PCM Test Pin 50 and Test Pins 3, 71, 97, 51, 76, 77, 103, and 91 at the EEC-V Control System Breakout Box and chassis ground.

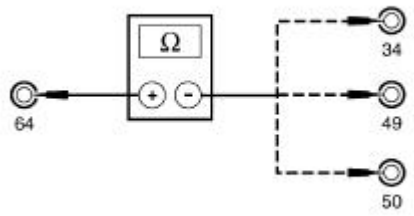
A0015066





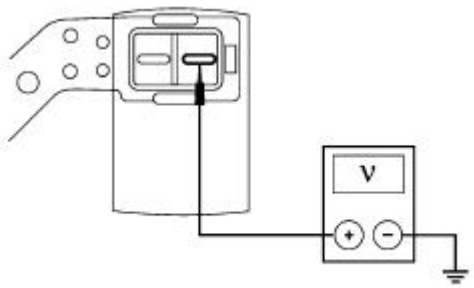


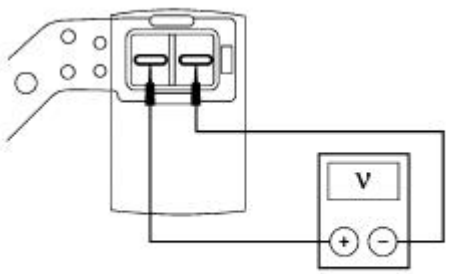
- Measure the resistance between PCM Test Pin 64 and Test Pins 3, 71, 97, 51, 76, 77, 103, and 91 at the EEC-V Control System Breakout Box and chassis ground.



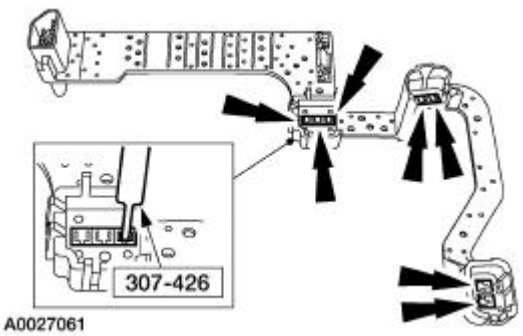
No
REPAIR short circuit(s). RECONNECT all components. CLEAR DTCs. REPEAT OBD Tests.

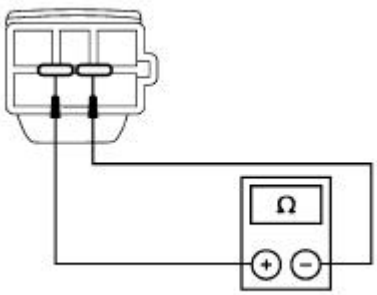
A0015067

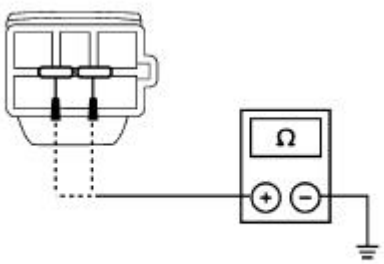




- **Are all resistances greater than 10,000 ohms?**

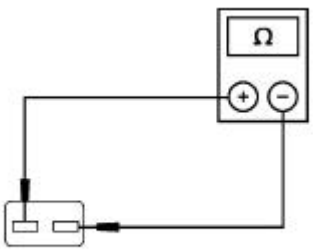






C9 CHECK FOR SHORT BETWEEN TR/PCM INPUT SIGNAL CIRCUITS	
• Measure the resistance between Test Pin 34 and Pins 49, 50, and 64 at the EEC-V Control System Breakout Box.  AD1666-A • Measure the resistance between Test Pin 49 and Pins 34, 50, and 64 at the EEC-V Control System Breakout Box.  A0008659 • Measure the resistance between Test Pin 50 and Pins 34, 49, and 64 at the EEC-V Control System Breakout Box.  A0008657 • Measure the resistance between Test Pin 64 and Pins 34, 49, and 50 at the EEC-V Control System Breakout	**Yes** INSTALL a new PCM. REFER to Section 303-14 . RECONNECT all components. CLEAR DTCs. REPEAT OBD Tests. **No** REPAIR shorts on circuits having less than 10,000 ohms between other TR/PCM input signal circuits. RECONNECT all components. CLEAR DTCs. REPEAT OBD Tests.

Box.  A0008658 ● **Are all the resistances greater than 10,000 ohms?**	
C10 CHECK THE NON-PCM INTERNAL CIRCUITS OF SENSOR	
● Connect: TRS-E Cable to Transmission Tester. ● Connect: TRS-E Cable to Digital TR Sensor. ● Place the Digital TR Overlay onto Transmission Tester. ● Carry out Switch Test as instructed on the Digital TR Overlay. ● **Does the status lamp on the tester indicate RED for the correct gear position?**	**Yes** Concern is not in the digital TR sensor. For starting system concerns, REFER to Section 303-06 . For reversing lamp concerns, REFER to Section 417-01 . For optional circuits, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. **No** INSTALL a new digital TR sensor. Clear DTCs. REPEAT OBD Tests.



PINPOINT TEST D: ELECTRICAL PRESSURE CONTROL (EPC) SOLENOID

Test Step	Result / Action to Take
NOTE: Refer to the Transmission Internal Harness illustration preceding these pinpoint tests.	
NOTE: Read and record all DTCs. All Digital TR Sensor and VSS DTCs must be repaired before entering Output State Control (OSC).	
D1 ELECTRONIC DIAGNOSTICS	
● Key in OFF position. ● Select PARK. ● Check to make sure the transmission harness connector is fully seated, pins are fully engaged in the connector and in good condition before proceeding. ● Install Scan Tool ● Key in ON position. ● Enter the following diagnostic mode on the diagnostic tool: Diagnostic Data Link. ● Enter the following diagnostic mode on the diagnostic tool: PCM. ● Enter the following diagnostic mode on the diagnostic tool: Active Command Modes. ● Enter the following diagnostic mode on the diagnostic tool: Output State Control (OSC). ● Enter the following diagnostic mode on the diagnostic tool: Trans-Bench Mode.	**Yes** GO to D2 . **No** REPEAT procedure to ENTER Trans-Bench Mode. If vehicle did not enter OSC, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM.

• **Does the vehicle enter the Trans-Bench Mode?**	
D2 SOLENOID FUNCTIONAL TEST	
• Install 2,060 kPa (300 psi) pressure gauge into EPC tap. • Monitor pressure gauge. • Enter the following diagnostic mode on the diagnostic tool: Parameter; EPC. • Select value - 15, 30, 45, 60, 70 or 90 psi. • Press "SEND". • Select another value "0-90 psi". • Press "SEND". • Enter the following diagnostic mode on the diagnostic tool: XXX. • Press "SEND". • **Does the pressure reading match the commanded pressure?**	**Yes** CLEAR DTCs. REPEAT OBD Tests. **No** GO to D3 .
D3 CHECK FOR BATTERY VOLTAGE	
• Remove transmission fluid pan. • Visually inspect the lead frame connectors for damage. • Key in ON position. • Measure the voltage with positive lead to VPWR solenoid pin and negative lead to a good ground.  GD4494-A • **Is voltage greater than 10 volts?**	**Yes** GO to D4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the OBD Tests.
D4 ELECTRICAL SIGNAL CHECK	
• Measure the voltage with positive lead connected to VPWR solenoid pin and connect negative lead to the signal pin of the EPC solenoid.  GD4495-A • Turn the solenoids ON and OFF, while monitoring the voltage reading, solenoid state on the scan tool (ON and OFF), listen for the solenoid to activate (click). • Enter the following diagnostic mode on the diagnostic tool: Trans-Bench Mode. • Enter the following diagnostic mode on the diagnostic tool: Parameter EPC. • Select a value "0-90 psi". • Press "SEND". • Select another value "0-90 psi".	**Yes** GO to D5 . **No** CHECK for open or short circuit in harness or PCM.

• Press "SEND". • Enter the following diagnostic mode on the diagnostic tool: XXX. • Press "SEND". • **Does the voltage and solenoid state change?**	
D5 CHECK LEAD FRAME SOLENOID CONNECTIONS	**Yes** INSTALL a new lead frame and GO to D6 . **No** GO to D6 .
• Key in OFF position. • Disconnect the lead frame. • Inspect lead frame for damage. • Using the special tool, check all the lead frame solenoid connections.  A0027061 • **Does the special tool go through any of the lead frame solenoid connector pins?**	
D6 CHECK SOLENOID RESISTANCE AT SOLENOID	**Yes** GO to D7 . **No** INSTALL a new solenoid. CLEAR the DTCs. REPEAT the OBD Tests.
• Measure the resistance of the EPC solenoid.  AD1399-A • **Is the resistance between 2.48 and 5.66 ohms?**	
D7 CHECK SOLENOID FOR SHORT TO GROUND	**Yes** INSTALL a new solenoid. CLEAR the DTCs. REPEAT the OBD Tests. **No** REFER to Diagnosis By Symptom in this section for diagnosis of pressure concerns.
• Check for continuity between engine GROUND and the EPC solenoid terminals with ohmmeter or other low current tester (less than 200 milliamps). Connection should show infinite resistance (no continuity).  AD1400-A • **Is there continuity?**	

PINPOINT TEST E: OUTPUT SHAFT SPEED (OSS) SENSORS

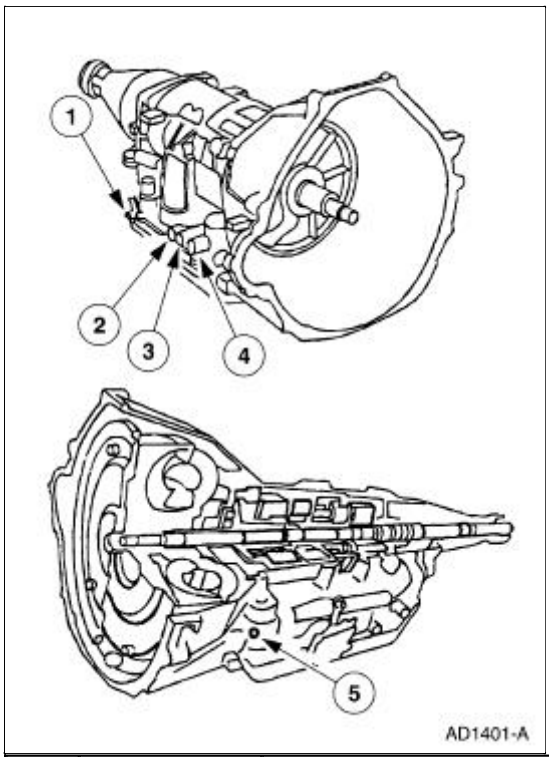
Test Step	Result / Action to Take
NOTE: Refer to the Output Shaft Speed (OSS) Sensor Harness Connector illustration preceding these pinpoint tests.	
E1 ELECTRONIC DIAGNOSTICS ● Check to make sure the transmission harness connector is fully seated, pins are fully engaged in connector and in good condition before proceeding. ● Install Scan Tool ● Key in ON position. ● Enter the following diagnostic mode on the diagnostic tool: Diagnostic Data Link. ● Enter the following diagnostic mode on the diagnostic tool: PCM. ● Select PID/Data Monitor and Record. ● Select the PID OSS. ● **Does vehicle enter PID/Data Monitor and Record?**	**Yes** GO to E2 . **No** REPEAT procedure to ENTER PID. If vehicle did not enter PID, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM.
E2 DRIVE CYCLE TEST ● While monitoring the OSS Speed PID, drive the vehicle so that the transmission upshifts and downshifts through all gears. ● **Does the OSS Speed PID increase and decrease with engine and vehicle speed?**	**Yes** CLEAR all DTCs. ROAD TEST to verify if concern is still present. If concern is still present, REFER to Diagnosis By Symptom in this section. **No** If the OSS Speed PID does not increase and decrease with engine and vehicle speed, INSPECT for open or short in vehicle harness, sensor, a PCM concern, or internal hardware concern. If the sensor signal is erratic, INSPECT for intermittent concern in the internal/external harness, sensor, or connector. If the sensor signal is steady, GO to E3 .
E3 CHECK RESISTANCE OF OSS SENSOR ● Disconnect the vehicle harness connector from the OSS sensor. ● Measure the resistance between the OSS sensor pins.  AD1084-B	**Yes** REFER to Diagnosis by Symptom Index for concern diagnosis. **No** INSTALL a new OSS sensor.

- Record the resistance.

Sensor	Resistance (ohms)	Temperature
OSS	791 to 1,795	-40°C to 160°C (-40°F to 320°F)

- **Is the resistance within specification?**

PINPOINT TEST F: SOLENOID MECHANICAL FAILURE



Test Step	Result / Action to Take
NOTE: Repair all other DTCs before repairing the following DTCs: P1714, P1715, P1740.	
F1 ELECTRONIC DIAGNOSIS - Install Scan Tool - Carry out KOEO test. - **Are only DTCs P1714, P1715, P1740 present?**	**Yes** REPAIR the other DTCs first. CLEAR DTCs and CARRY OUT Transmission Drive Cycle Test. REPEAT Quick Test. **No** INSTALL a new solenoid and or body. REFER to the Diagnostic Trouble Code Charts in this section for code description. GO to F2 .
F2 TRANSMISSION DRIVE CYCLE TEST - Carry out transmission drive cycle test. - Carry out On-Board Diagnostic Test. - **Does the vehicle upshift and downshift OK?**	**Yes** GO to F3 . **No** REFER to Diagnosis By Symptom in this section to diagnose shift concerns.
F3 RETRIEVE DTCS - Install Scan Tool - Carry out KOEO test until continuous DTCs have been displayed. - **Are DTCs P1714, P1715, P1740 still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . ROAD TEST and REPEAT Quick Test. **No** Testing completed. If a concern still exists, REFER to Diagnosis By Symptom in this section for concern diagnosis.

Special Testing Procedures

The special tests are designed to aid the technician in diagnosing the hydraulic and mechanical portion of the transmission.

Engine Idle Speed Check

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the engine idle speed.

Item	Part Number	Description
1	—	Direct clutch pressure tap
2	—	Forward clutch pressure tap
3	—	Electronic pressure control (EPC) pressure tap
4	—	Intermediate clutch pressure tap
5	—	Line pressure tap

Line Pressure Test

CAUTION: Carry out the line pressure test prior to carrying out the stall speed test. If the line pressure is low at stall, do not carry out stall speed test or further transmission damage will occur. Do not maintain WOT in any transmission range for more than five seconds.

This test verifies that the line pressure is within specification.

1. Connect pressure gauge to line pressure tap.

2. Start engine and check line pressures. Refer to the Line Pressure Chart to determine if line pressure is within specification.

Line Pressure Chart

Application	Range	Idle		WOT Stall	
		EPC	Line Pressure	EPC	Line Pressure
4.6L	P, N, OD, 2, 1	207-276 kPa (30-40 psi)	552-689 kPa (80-100 psi)	689-758 kPa (100-110 psi)	1,310-1,448 kPa (190-210 psi)
4.6L	R	138-207 kPa (20-30 psi)	552-689 kPa (80-100 psi)	586-655 kPa (85-95 psi)	1,723-2,068 kPa (250-300 psi)
5.4L	P, N, OD, 2, 1	207-276 kPa (30-40 psi)	552-689 kPa (80-100 psi)	689-793 kPa (100-115 psi)	1,172-1,861 kPa (170-270 psi)
5.4L	R	138-207 kPa (20-30 psi)	552-689 kPa (80-100 psi)	586-655 kPa (85-95 psi)	1,723-2,068 kPa (250-300 psi)

Clutch Pressure Chart

Transmission Pressures with TP at 1.5 Volts and Vehicle Speed Above 8 Km/h (5 MPH)					
Gear	EPC Tap [1]	Line Pressure Tap	Forward Clutch Tap	Intermediate Clutch Tap	Direct Clutch Tap
M1	172-241 kPa (25-35 psi)	517-655 kPa (75-95 psi)	448-586 kPa (65-85 psi)	0-34 kPa (0-5 psi)	0-34 kPa (0-5 psi)
M2	276-345 kPa (40-50 psi)	689-814 kPa (100-118 psi)	620-745 kPa (90-108 psi)	648-779 kPa (94-113 psi)	0-34 kPa (0-5 psi)
1	172-241 kPa (25-35 psi)	517-655 kPa (75-95 psi)	448-586 kPa (65-85 psi)	0-34 kPa (0-5 psi)	0-34 kPa (0-5 psi)
2	276-345 kPa (40-50 psi)	689-814 kPa (100-118 psi)	620-745 kPa (90-108 psi)	641-779 kPa (93-113 psi)	0-34 kPa (0-5 psi)
3	310-345 kPa (45-50 psi)	731-869 kPa (106-126 psi)	662-800 kPa (96-116 psi)	689-827 kPa (100-120 psi)	655-800 kPa (95-116 psi)
4	241-310 kPa (35-45 psi)	620-758 kPa (90-110 psi)	0-34 kPa (0-5 psi)	586-724 kPa (85-105 psi)	551-689 kPa (80-100 psi)

[1] EPC readings will vary due to EEC strategy. These values are approximate pressures. Actual clutch pressures should be within 69-103 kPa (10-15 psi) of line pressure. For additional information on testing, refer to the Clutch Pressure Test in this section.

3. Place the ignition switch in the OFF position. If line pressure is not within specification, check EPC pressure.

4. Connect pressure gauge to EPC pressure tap.

5. Start engine and check EPC pressure. Use the line pressure chart for specifications.

6. If EPC pressure is not within specification, carry out Pinpoint Test E to diagnose EPC operation. If EPC operation is OK, see the line pressure diagnosis chart for line pressure concern causes.

Line Pressure Diagnosis Chart

Test Results	Possible Source
High At Idle — In All Positions	Wiring Harnesses
	Run Quick Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	EPC Solenoid Main Regulator Valve
Low At Idle — In All Positions	Low Fluid Level
	Control Bodies
	Leakage in Pump
	Damaged Gaskets on Separator Valve
	Damaged Separator Plate
	Restricted Inlet Filter
	Case Bolts
	Loose Main Control Valve Body
	VSS O-Ring
	VSS Bracket
	Case
	Sticking Main Regulator Valve Damaged Inlet Tube Seal on Inlet Filter
Low In Park Only	Valve Body Low/Reverse Servo
Low In Reverse Only	Separator Plate
	Low/Reverse Servo or Valve Bodies Reverse Clutch
Low In Neutral Only	Valve Body
Low In Overdrive Only	Forward Clutch Valve Body
Low In 1st Position Only	Forward Clutch
	Valve Body Low/Reverse Servo
Low In 2nd Only	Intermediate Clutch
	Valve Bodies Forward Clutch

Stall Speed Test

WARNING: Apply the parking brake firmly while carrying out each stall test.

CAUTION: Carry out line pressure test prior to carrying out stall test. If the line pressure is low at stall, do not carry out stall test or further transmission damage will occur.

The stall speed test checks:

- torque converter clutch operation and installation.
- holding ability of the forward clutch.
- reverse clutch (the low-reverse bands).
- planetary one-way clutch.
- engine driveability.

Conduct this test with the engine coolant and transmission fluid at correct levels and at normal operating temperature.

Apply the parking brake firmly for each stall speed test.

1. Find the specified stall rpm for the vehicle; see the stall speed diagnosis chart. Use a grease pencil to mark the rpm on the dial of a tachometer.

Stall Speed Chart

Engine	Stall Speed RPM
4.6L	2,121-2,459
5.4L (2V)	1,816-2,200

2. Connect a tachometer to the engine.

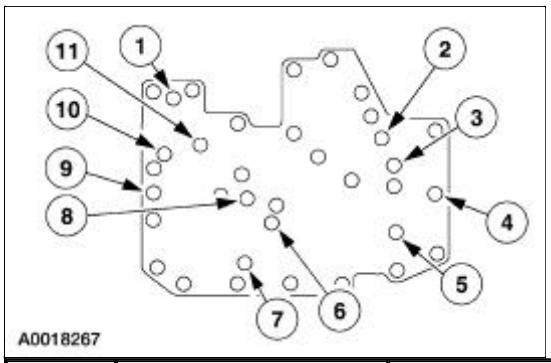
3. **NOTE:** If the rpm recorded by the tachometer exceeds the maximum limits, release the accelerator pedal immediately because clutch or band slippage is indicated.

   In each of the following ranges (D), 2, 1, R, press the accelerator pedal to the floor and hold it just long enough to let the engine get to wide open throttle (WOT). While making this test, do not hold the throttle open for more than 5 seconds at a time.

4. Note the results in each range.

5. After each range, move the shift control selector lever to Neutral and run the engine at 1,000 rpm for about 15 seconds to cool the torque converter before making the next test.

6. Refer to the stall speed diagnosis chart for corrective actions.



Stall Speed Diagnosis Chart

Selector Position	Stall Speeds High	Stall Speeds Low
(D)	Planetary One-Way Clutch	
(D), 2 and 1	Forward Clutch or Intermediate	

	Clutch	
(D), 2, 1 and R	Carry Out Pressure Test	Torque Converter Stator One-Way Clutch or Engine Driveability Concerns
R	Reverse Clutch or Low Reverse Band or Servo	

Air Pressure Tests

Transmission Air Test Plate

Item	Part Number	Description
1	—	Converter bypass
2	—	Direct clutch
3	—	Forward clutch
4	—	2-3 accumulator top
5	—	2-3 accumulator bottom
6	—	Reverse servo
7	—	Overdrive servo apply
8	—	Overdrive servo release
9	—	Intermediate clutch
10	—	Reverse clutch
11	—	1-2 accumulator apply

A no-drive condition can exist even with correct transmission fluid pressure because of inoperative clutches or bands. An erratic shift can be located through a series of checks by substituting air pressure for fluid pressure to determine the location of the malfunction.

Follow the procedure to determine the location of the inoperative clutch or band by introducing air pressure into the various test plate passages.

NOTE: Use only dry, regulated 276 kPa (40 psi) maximum air pressure.

Apply air to the appropriate passage(s). A dull thud should be felt or heard or movement could be observed when the clutch component applies. There should be no hissing sound when the component is applied.

Cover the vent hole in the test plate with a clean, lint-free shop towel to prevent spray when the air is applied. Plugging the vent hole during testing will result in inaccurate results.

1. Drain transmission fluid and remove the transmission fluid pan.

2. Remove the main control valve body.

3. Install transmission test plate and gasket. Tighten bolts to 10 Nm (89 lb-in).

4. **NOTE:** Do not apply air to the test plate vent hole.

   Apply air to the appropriate clutch port (refer to the Transmission Air Test Plate illustration). A dull thud may be heard or movement felt when the component is applied or released. If clutch seals or check balls are leaking a hissing sound may be heard.

If the servos do not operate, disassemble, clean and inspect them to locate the source of the concern.

If air pressure applied to the clutch passages fails to operate a clutch, or operates clutches simultaneously, inspect the fluid passages in the case.

If air pressure applied to the accumulator fails to operate an accumulator, remove and inspect case passages and piston.

Clutch Pressure Test

The Clutch Pressure Test will diagnose a low-pressure condition or leakage in a clutch circuit. A difference of 103 kPa (15 psi) or more between the clutch pressure and line pressure will prevent a normal shift.

1. **CAUTION: Pressure gauges affect the shift quality of the transmission. Care must be taken not to accelerate or decelerate rapidly. Possible transmission failure can result.**

   Attach 0-2,068 kPa (0-300 psi) pressure gauges to the line pressure tap and the appropriate clutch pressure tap according to Band/Clutch Application Chart. Gauges must be accurate enough to distinguish a 103 kPa (15 psi) difference. (If this test is done in conjunction with a control pressure test, pressure gauges will be attached to all pressure taps.) Have sufficient flexible hose available to read the gauges in the vehicle.

2. Drive the vehicle. When pressure is applied to the clutch, note the difference between the line pressure gauge and the corresponding clutch pressure gauge.

3. If the difference in pressures is less than 103 kPa (15 psi), the corresponding clutch circuit does not have a pressure loss. The gauges on the line pressure tap and appropriate clutch pressure tap can be switched to confirm that gauge calibration differences are not the cause.

4. If the difference is greater than 103 kPa (15 psi), there is a leak in the corresponding clutch pressure circuit. The gauges on the line pressure tap and clutch pressure tap can be switched to confirm that gauge calibration differences are not the cause. Carry out the appropriate procedure to correct the clutch leak problem.

Leakage Inspection

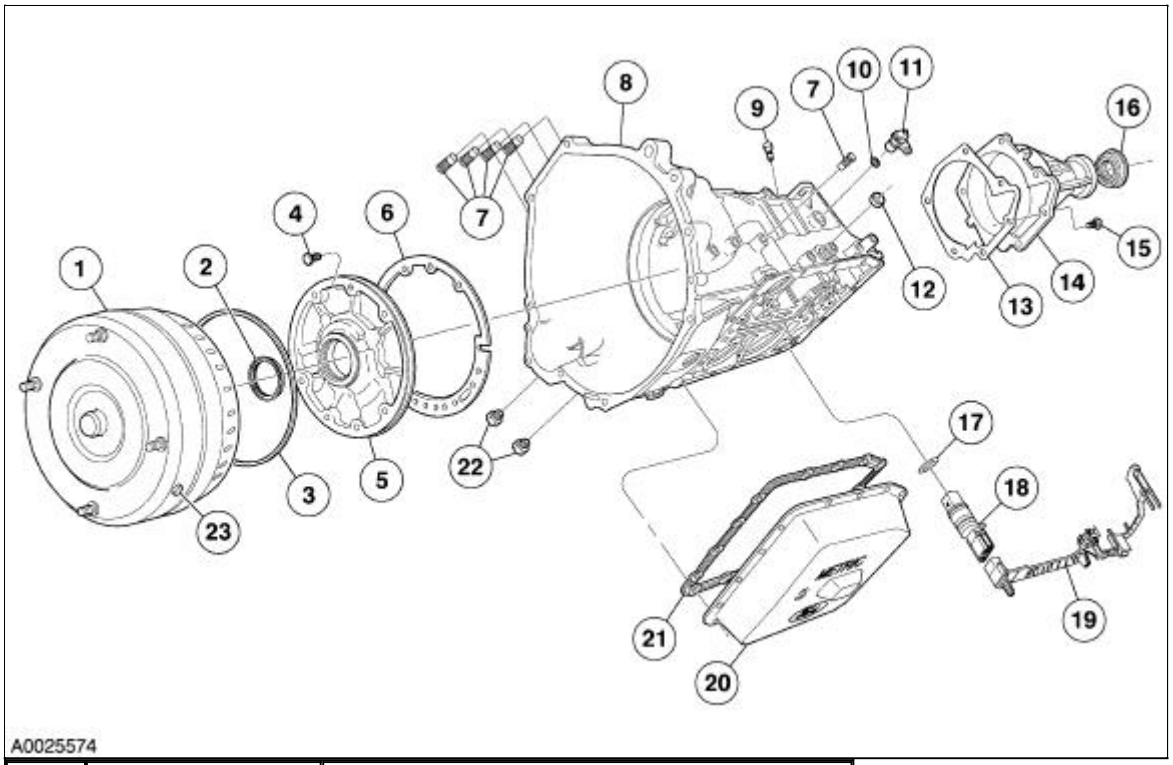
CAUTION: Do not try to stop the fluid leak by increasing the torque beyond specifications. This may cause damage to the case threads.

Check the fluid filler tube connection at the transmission case. If leakage is found here, install a new grommet.

Check the VSS plug or VSS sensor O-ring (model dependent). If leakage is found install a new O-ring.

Check fluid lines and fittings between the transmission and the cooler in the radiator tank for looseness, wear, or damage. If leakage cannot be stopped by tightening a fluid tube nut, install new parts. When fluid is found leaking between the case and cooler line fitting, check for missing or damaged O-ring, then tighten the fitting to maximum specification.

If the leak continues, install a new cooler line fitting and tighten to specification. The same procedure should be followed for fluid leaks between the radiator cooler and the cooler line fittings in this section; refer to Section 307-02 .



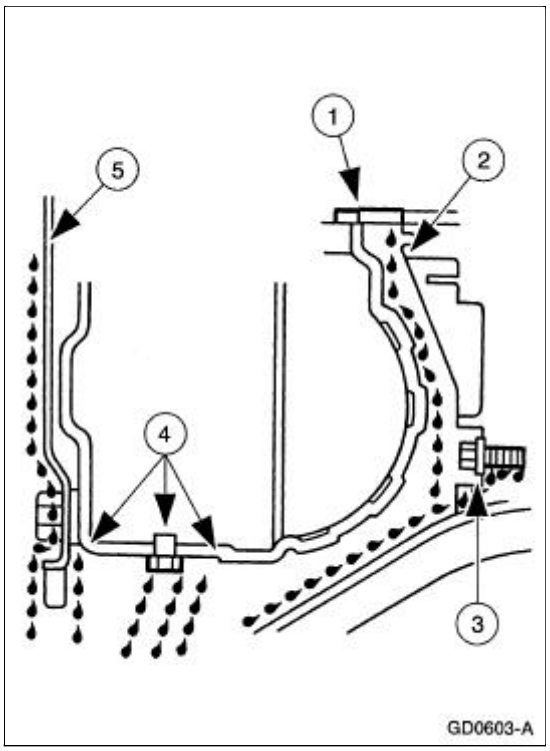
Check the engine coolant in the radiator. If transmission fluid is present in the coolant, the cooler in the radiator is probably leaking.

The cooler can be further checked for leaks by disconnecting the lines for the cooler fittings and applying no more than 345 kPa (50 psi) air pressure to the fittings. Remove the radiator cap to relieve the pressure buildup at the exterior of the oil cooler tank. If the cooler is leaking and or will not hold pressure, install a new cooler.

If leakage is found at the transmission range selector lever, install a new seal.

If leakage is found at the transmission internal harness connector, install a new O-ring.

4R70W External Sealing



Item	Part Number	Description
1	7902	Torque converter
2	7A248	Front pump seal
3	7A248	Front pump seal
4	N605789-S101	Bolt
5	7A106	Front pump body assembly
6	7A136	Pump gasket
7	390318-S2	Pipe plug — 1/8 — 27 Dryseal tapered
8	7005	Case
9	7034	Vent
10	N811757-S100	Speed sensor seal
11	7H103	Output shaft speed (OSS) sensor
12	7B498	Manual control lever seal assembly
13	7086	Extension housing gasket
14	7A039	Extension housing
15	N803737-S1101	Bolt — M8-1.25 x 30
15	N606047-S101	Bolt — M8-1.25 x 70
15	N803521-S1101	Bolt — M8-1.25 x 1.25 x 0.54
15	N811524-S101	Bolt — M8-1.25 x 42
16	7052	Oil seal
17	7Z276	Seal — bulkhead assembly
18	7G276	Bulkhead assembly wiring connector
19	7G276	Molded lead frame
20	7A194	Transmission fluid pan
21	7A191	Gasket

22	7D273	Fluid tube connector
23	87650-S2	Converter drain plug

Fluid Leakage in Torque Converter Area

In diagnosing and correcting fluid leaks in the front pump support and gear and torque converter area, use the following procedures to locate the exact cause of the leakage. Leakage at the front of transmission, as evidenced by fluid around the torque converter housing, may have several sources. By careful observation it is possible, in many instances, to pinpoint the source of leak before removing the transmission from the vehicle. The paths which the fluid takes to reach the bottom of the torque converter housing are shown in the illustration. The five steps following correspond with the numbers in the illustration.

1. Fluid leaking by the front pump seal lip will tend to move along the impeller hub and onto the back of the impeller housing. Except in the case of a total seal failure, fluid leakage by the lip of the seal will be deposited on the inside of the torque converter housing only, near the outside diameter of the housing.

2. Fluid leakage by the outside diameter of the front pump seal and front pump body will follow the same path that leaks by the inside diameter of the front pump seal follow.

3. Fluid that leaks by a front pump to case bolt or pump gasket will be deposited on the inside of the torque converter housing only. Fluid will not be deposited on the back of the torque converter.

4. Fluid leakage from the converter drain plug, (model dependent) converter seal weld or converter to flexplate stud weld will appear at the outside diameter of the torque converter on the back face of the flexplate and in the converter housing only near the flexplate. Fluid leaks from the torque converter will leave a ring of fluid around the inside of the torque converter housing.

5. **NOTE:** White facial tissue paper may aid in determining the color (red is transmission fluid) and source of the leaking fluid.

   Engine oil leaks are sometimes incorrectly diagnosed as transmission pump gasket leaks. The

following areas of possible leakage should also be checked to determine if engine oil leakage is causing the concern.

a. Leakage at the engine valve cover gasket may allow oil to flow over the torque converter housing or seep down between the torque converter housing and cylinder block causing oil to be present in or at the bottom of the torque converter housing.
b. Oil galley plug leaks will allow oil to flow down the rear face of the cylinder block to the bottom of the torque converter housing.
c. Leakage at the crankshaft rear oil seal will work back to the flexplate, and then into the torque converter housing.
d. Leakage at engine oil pressure sensor.

Leak Check Test

1. Remove the fluid level indicator and note the color of the fluid. Original factory fill fluid is dyed red to aid in determining if leakage is from the engine or transmission. Unless a considerable amount of makeup fluid has been added or the fluid has been changed, the red color should assist in pinpointing the leak.

2. Remove the torque converter housing cover. Clean off any fluid from the top and bottom of the torque converter housing, front of the case and rear face of the engine and oil pan. Clean the torque converter area by washing with a suitable nonflammable solvent and blow dry with compressed air.

3. Wash out the torque converter housing, the front of the flexplate and the converter drain plugs. The torque converter housing may be washed out using cleaning solvent and a squirt-type oil can. Blow all washed areas dry with compressed air.

4. Start and run the engine until the transmission reaches its normal operating temperature. Observe the back of the cylinder block and top of the torque converter housing for evidence of fluid leakage. Raise the vehicle on a hoist; refer to Section 100-02 and run the engine at fast idle, then at engine idle, occasionally shifting to the Overdrive and Reverse ranges to increase pressure within the transmission. Observe the front of the flexplate, back of the cylinder block (in as far as possible), and inside the torque converter housing and front of the case. Run the engine until fluid leakage is evident and the probable source of leakage can be determined.

Leak Check Test With Black Light Used With 12 Volt Master UV Diagnostic Inspection Kit

Oil soluble aniline or fluorescent dyes premixed at the rate of 2.5ml (1/2 teaspoon) of dye powder to 0.235L (1/2 pint) of transmission fluid have proved helpful in locating the source of fluid leakage. Such dyes may be used to determine whether an engine oil or transmission fluid leak is present, or if the fluid in the fluid cooler leaks into the engine cooling system. A black light must be used with the fluorescent dye solution.

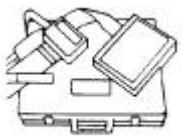
Transmission Fluid Cooler

CAUTION: Whenever a transmission has been disassembled to install new parts, the cooler bypass valve (CBV), all transmission fluid coolers (in tank and auxiliary) and transmission fluid cooler lines must be cleaned and backflushed. Use a suitable the torque converter/fluid cooler cleaner.

NOTE: Cleaning and backflushing the transmission fluid cooling system along with following all the normal cleaning and inspection procedures in this section during disassembly and reassembly will keep contamination from reentering the transmission and causing a repeat repair.

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material, or band material may have been carried into the torque converter and transmission fluid cooler. These contaminants are a major cause of recurring transmission troubles and must be removed from the system before the transmission is put back into use.

Transmission Fluid Cooler Flow Test



NOTE: The transmission linkage/cable adjustment, fluid level and line pressure must be within specification before carrying out this test. Refer to Section 307-05 for adjustments.

1. Remove fluid level indicator from fluid filler tube.
2. Place funnel in fluid filler tube.
3. Position the vehicle on a hoist. For additional information, refer to Section 100-02 .
4. Remove the cooler return line (top fitting) from the fitting on the transmission case.
5. Connect one end of a hose to the cooler return line and route other end of the hose up to a point where it can be inserted into the funnel at the fluid filler tube.
6. Remove the safety stands and lower the vehicle. Insert end of hose into the funnel.
7. Start the engine and run it at idle with the transmission in NEUTRAL.
8. When fluid flows from the hose in a steady stream, a liberal amount of fluid should be observed. "Liberal" is about 1 liter (1 quart) delivered in 15 seconds. If a liberal flow is observed, the test is complete.
9. If the flow is not liberal, stop the engine. Disconnect the hose from the cooler return line and connect it to the converter outlet fitting (bottom fitting) on the transmission case.
10. Repeat steps 6 and 7. If flow is now approximately 1 liter (1 quart) in 15 seconds, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section. If the flow is still not approximately 1 liter (1 quart) in 15 seconds, repair or install pump and or converter.

For the installation of new transmission fluid cooler or tubes, refer to Section 307-02 .

Diagnosis By Symptom

Special Tool(s)

 ST1565-A	Transmission Fluid Pressure Gauge 307-004 (T57L-77820-A)
 ST1392-A	Air Test Plate, Transmission 307-246 (T92P-7006-A)
 ST1391-A	Breakout Box, EEC-V Control System 418-049 (T94L-50-EEC-V) or equivalent
 ST1632-A	MLP-TR Cable 418-F107 (007-00111) or equivalent

 ST1300-A	UV Leak Detector Kit 164-R0756 or equivalent

The Diagnosis by Symptom charts give the technician diagnostic information, direction, and suggest possible components, using a symptom as a starting point.

The Diagnosis by Symptom charts are divided into two categories: Electrical Routines, indicated by 200 series numbers, and Hydraulic/Mechanical Routines, indicated by 300 series numbers. The Electrical Routines list the possible electrical components that could cause or contribute to the symptom described. The Hydraulic/Mechanical Routines list the possible hydraulic or mechanical components that could cause or contribute to the symptom described.

Diagnosis by Symptom Chart Directions

1. Using the Diagnosis by Symptom Index, select the Concern/Symptom that best describes the condition.

2. Refer to the routine indicated in the Diagnosis by Symptom Index.

3. Always begin diagnosis of a symptom with:

a. preliminary inspections.
b. verifications of condition.
c. checking the fluid levels.
d. carrying out other test procedures as directed.

4. **NOTE:** Not all concerns and conditions with electrical components will set a diagnostic trouble code (DTC). Be aware that the components listed may still be the cause. Verify correct function of these components prior to proceeding to the Hydraulic/Mechanical Routine listed.

   Begin with the Electrical Routine, if indicated. Follow the reference or action required statements. Always carry out the on-board diagnostic tests as required. Never skip steps. Repair as required. If the concern is still present after electrical diagnosis, then proceed to the Hydraulic/Mechanical Routine listed.

5. The Hydraulic/Mechanical Routines list possible hydraulic or mechanical components that could cause the concern. These components are listed in the removal sequence and by most probable cause. All components listed must be inspected to ensure correct repair.

Diagnosis by Symptom Index

Title	Routines	
	Electrical [a]	Hydraulic/ Mechanical

Engagement Concerns		
No Forward	201	301
No REVERSE	202	302
Harsh REVERSE	203	303
Harsh Forward	204	304
Delayed/Soft Reverse	205	305
Delayed/Soft Forward	206	306
Shift Concerns		
Some/All Shifts Missing	210	310
Timing Concerns		
—Early/Late	211	311
—Erratic/Hunting	212	312
Feel		
—Soft/Slipping	213	313
—Harsh	214	314
No 1st Gear, Engages in Higher Gear	215	315
No Manual 1st Gear	216	316
No Manual 2nd Gear	217	317
Torque Converter Operation Concerns		
No Apply	240	340
Always Applied/Stalls Vehicle	241	341
Cycling/Shudder/Chatter	242	342
Other Concerns		
No Engine Braking in 2nd Gear, Manual 2nd or Manual 1st Position	250	350
Gearshift Lever Efforts High	251	351
External Leaks	252	352
Vehicle Driveability Concerns	253	353
Noise/Vibration in Forward or Reverse	254	354
Engine Will Not Crank	255	355
No PARK (P) Range	256	356
Overheating	257	357

[a] Carry out electrical routine first.

Diagnostic Routines

Engagement Concern: No Forward

Possible Component	Reference/Action
201 — ELECTRICAL ROUTINE	
· No Electrical Concerns	
301 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
· Incorrect level	· Adjust fluid to correct level.
· Condition	· Inspect as under Fluid Condition Check; refer to Verification of

	Condition.
Shift Linkage	
· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify the digital transmission range (TR) sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
Incorrect Pressures	
· Low forward clutch pressure, low line pressure	· Check pressure at line and forward clutch tap. Refer to Line Pressure Chart for specification. If pressures are low, check the following components: oil filter and seal assembly, main controls, pump assembly, forward clutch assembly.
Fluid Filter and Seal Assembly	
· Plugged, damaged	· Install a new filter and seal assembly.
· Filter seal damaged	
Main Controls	
· 3-4 shift valve, main regulator valve, manual valve — stuck, damaged	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· Gaskets damaged	· Inspect gaskets for damage and install a new gasket.
· 2-3 accumulator and seals damaged	· Inspect piston, seals and bore for damage. Repair as required.
· Pressure regulator valve	· Inspect the diameter for wear.
Pump Assembly	
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· Porosity/cross leaks/ball missing or leaking, plugged hole	· Inspect for porosity and leaks. Repair as required.
· No. 3 and No. 4 seal rings damaged	· Inspect seals for damage. Repair as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
Forward Clutch Assembly	
· Seals, piston damaged	· Inspect seals for damage. Repair as required.
· Check balls damaged, missing, mislocated, not seating correctly	· Inspect for mislocation, poor seating, damage. Install a new cylinder as required.
· Friction elements damaged or worn	· Check for abnormal wear, damage. Repair as required.
One-Way Clutch Assembly (Planetary)	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as required.
Output Shaft	

· Damaged	· Inspect for damage. Install new components as required.

Engagement Concern: No Reverse

Possible Component	Reference/Action
202 — ELECTRICAL ROUTINE	
· No Electrical Concerns	
302 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
· Incorrect level	· Adjust fluid to correct level.
· Condition	· Inspect condition of fluid.
Shift Linkage	
· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
Incorrect Pressures	
· Low reverse clutch pressure, low reverse band pressure, low line pressure	· Check pressure at line pressure tap; refer to Line Pressure Chart for specifications. If pressures are low, check the following components: oil filter and seal assembly, main controls, reverse servo, pump assembly, reverse clutch assembly.
Fluid Filter and Seal Assembly	
· Plugged, damaged	· Install a new filter and seal assembly.
Main Controls	
· No. 6 shuttle ball, manual valve, main regulator valve, 1-2 accumulator seals stuck or damaged	· Inspect for damage. Repair as required.
· Loose bolts	· Tighten bolts to specifications.
· Gasket damaged	· Inspect for damage and install a new gasket.
Low/Reverse Servo	
· Seals (piston and cover) damaged	· Inspect for damage. Repair as required.
· Servo cover retaining ring damaged	
· Anchor pins (case) damaged	
Pump Assembly	
· Loose bolts	· Tighten bolts to specifications.
· Porosity/cross leaks/ball missing or leaking, plugged hole	· Inspect pump assembly. Install new as required.
· Gasket damaged	· Inspect for damage and install a new gasket.
· No. 1 and 2 seal rings damaged	· Inspect for damage. Repair as required.
Reverse Clutch Assembly	

· Seals, piston damaged	· Inspect for damage. Repair as required.
· Check ball missing or damaged	
· Friction elements damaged or worn	
Low/Reverse Band	· Inspect for damage. Repair as required.
· Band, servo, anchor pins damaged or worn	

Engagement Concern: Harsh Reverse

Possible Component	Reference/Action
203 — ELECTRICAL ROUTINE	
Powertrain Control System	· Carry out Self-Test; refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Carry out engagement test, EPC test and Go To Pinpoint Test B or Go To Pinpoint Test D . Check idle speed. Repair as required. Clear DTCs, road test and repeat Self-Test.
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, TFT sensor, EPC solenoid	
303 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
· Incorrect level	· Adjust fluid to correct level.
· Condition	· Inspect condition of fluid.
Engine Driveline	· Repair as required.
· Looseness in the driveshaft, U-joints or the engine mounts	
Shift Linkage	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
· Damaged or incorrectly adjusted	
Incorrect Pressures	· Check pressure at line and EPC pressure taps; refer to Line Pressure Chart for specifications. If high, check the following components: main controls, oil filter and seal assembly.
· High line pressure, high EPC pressure	
Fluid Filter and Seal Assembly	
· Plugged or damaged	· Install a new filter and seal assembly.
· Filter seal damaged	
Main Controls	
· No. 6 shuttle ball, No. 5 check ball, manual valve, main regulator valve stuck, damaged or missing	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.

· Gasket damaged	· Inspect for damage and install a new gasket.
· EPC solenoid stuck or damaged	· Inspect for damage, contamination. Carry out EPC test in Routine No. 203. Repair as required.
Low Reverse Servo	
· Seals (piston and cover) damaged	· Inspect for damage. Repair as required.
· Servo cover retaining ring assembled incorrectly	
· Anchor pins (case) damaged	
Pump Assembly	
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· Porosity/cross leaks	· Inspect pump assembly. Install new as required.
· Gasket damaged	· Inspect for damage and install a new gasket.
· No. 1 and No. 2 seal rings damaged	· Inspect for damage. Repair as required.
Reverse Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as required.
· Check ball missing or damaged	
· Friction elements damaged, worn	
· Return spring piston damaged, worn	
Low Reverse Band	
· Band, servo, anchor pin damaged or worn	· Inspect for damage. Repair as required.

Engagement Concern: Harsh Forward

Possible Component	Reference/Action
204 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, TFT sensor, EPC solenoid	· Carry out Self-Test; refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Carry out engagement test and EPC test. Go To Pinpoint Test B or Go To Pinpoint Test D . Check idle speed. Repair as required. Clear DTCs, road test and repeat Self-Test.
304 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
· Incorrect level	· Adjust fluid to correct level.
· Condition	· Inspect condition of fluid.
Engine Driveline	
· Looseness in the driveshaft, U-joints or	· Repair as required.

the engine mounts	
Incorrect Pressures	
· High forward clutch pressure, high line pressure, high EPC pressure	· Check pressure at line, EPC and forward pressure taps. Refer to Line Pressure Chart for specifications. If pressures are high, check the following possible components: main controls, pump assembly.
Main Controls	
· Main regulator valve stuck, damaged	· Inspect and repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· Gaskets damaged	· Inspect for damage and install a new gasket.
· EPC solenoid stuck or damaged	· Inspect for damage or contamination. Carry out EPC test in Routine 204. Repair as required.
Case	
· 2-3 accumulator seal/retainer stuck, damaged	· Inspect for damage. Repair as required.
Pump Assembly	
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· Porosity/cross leaks	· Inspect for porosity/leaks. Install a new pump as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
Forward Clutch Assembly	
· Check balls missing or damaged	· Inspect for mislocation, poor seating, damage. Install a new forward clutch cylinder.
· Friction element damaged or worn	· Inspect for damage. Repair as required.
· Forward clutch wave spring damaged	· Inspect for damage. Repair as required.
· Forward clutch return spring damaged	· Inspect for damage. Repair as required.

Engagement Concern: Delayed/Soft Reverse

Possible Component	Reference/Action
205 — ELECTRICAL ROUTINE	
	· No Electrical Concerns
305 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
· Incorrect level	· Adjust fluid to correct level.
· Condition	· Inspect condition of fluid.
Shift Linkage	
· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor

	as necessary.
Incorrect Pressures	
· Low reverse clutch pressure, low reverse band pressure, low line pressure	· Check pressure at line tap; refer to Line Pressure Chart for specifications. If pressures are low, check the following components: main controls, pump assembly, reverse clutch assembly, reverse servo.
Fluid Filter and Seal Assembly	
· Plugged, damaged	· Install a new filter and seal assembly.
	· Filter seal damaged
Main Controls	
· No. 6 shuttle ball, manual valve, main regulator valve stuck or damaged	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· Gaskets damaged	· Inspect for damage and install a new gasket.
Case	
· 1-2 accumulator seals stuck or damaged	· Inspect for damage. Repair as required.
Low Reverse Servo	
· Seals (piston and cover) damaged	· Inspect for damage. Repair as required.
· Servo cover retaining ring assembled incorrectly	
Pump Assembly	
· Bolts not tightened to specification	· Tighten bolts to specification.
· Porosity/cross leaks/ball missing or leaking	· Inspect pump assembly. Install new as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
· No. 1 and No. 2 seal rings damaged	· Inspect for damage. Repair as required.
Reverse Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Install new components as required.
· Check ball missing or damaged	
· Friction elements damaged, worn	
· Return spring and piston damaged, worn	
Low Reverse Band	
· Damaged, worn	· Inspect for damage. Repair as required.

Engagement Concern: Delayed/Soft Forward

Possible Component	Reference/Action
206 — ELECTRICAL ROUTINE	
	· No Electrical Concerns
306 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
· Incorrect level	· Adjust fluid to correct level.
· Condition	· Inspect condition of fluid.
Shift Linkage	
· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
Incorrect Pressures	
· Low forward clutch pressure, low line pressure, low EPC pressure	· Check pressure at line, forward clutch and EPC taps; refer to Line Pressure Chart for specifications. If pressures are low, check the following components: oil filter and seal assembly, main controls and pump assembly.
Fluid Filter and Seal Assembly	
· Plugged, damaged	· Install a new filter and seal assembly.
· Filter seal damaged	
Main Controls	
· 3-4 shift valve, main regulator valve stuck or damaged	· Inspect and repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· Gaskets damaged	· Inspect for damage and repair as required.
Case	
· 2-3 or 1-2 accumulator, bore damaged or stuck	· Inspect for damage. Repair as required.
Pump Assembly	
· Bolts not tightened to specification	· Tighten bolts to specifications.
· Porosity/cross leaks	· Inspect pump assembly. Repair as required.
· Gaskets damaged	· Inspect for damage. Repair as required.
· No. 3 and No. 4 seal rings damaged	· Inspect for damage. Repair as required.
Forward Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as required.
· Check balls missing, damaged	· Inspect for mislocation, poor seating, damage. Install a new cylinder as required.
· Friction elements damaged, worn	· Check for damage. Repair as required.

Shift Concerns: Some/All Shifts Missing

Possible Component	Reference/Action
210 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, shift solenoids, output shaft speed (OSS) sensor, digital TR sensor	· Carry out Self-Test; refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test A , Go To Pinpoint Test C or Go To Pinpoint Test E . Repair as required. Clear DTCs, road test and repeat Self-Test.
310 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
· Incorrect level	· Adjust fluid to correct level.
· Condition	· Inspect condition of fluid.
Shift Linkage, Digital TR Sensor	
· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
	· Refer to the following shift routine(s) for further diagnosis: ■ Shift 1-2, Routine 220/320 ■ Shift 2-3, Routine 221/321 ■ Shift 3-4, Routine 222/322 ■ Shift 4-3, Routine 223/323 ■ Shift 3-2, Routine 224/324 ■ Shift 2-1, Routine 225/325

Shift Concerns: Timing Concerns — Early/Late

Possible Component	Reference/Action
211 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, shift solenoids, EPC solenoid, TFT sensor, OSS	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test A , Go To Pinpoint Test C or Go To Pinpoint Test E . Repair as required. Clear DTCs, road test and repeat Self-Test.
311 — HYDRAULIC/MECHANICAL ROUTINE	
Other	
· Tire size change, axle ratio change	· Verify vehicle has original equipment. Refer to Certification Label and Safety Standard Certification Label. Changes in tire size or axle ratio will affect shift timing.
Fluid	
· Incorrect level	· Adjust fluid to correct level.
· Condition	· Inspect condition of fluid.
Powertrain Control System	
· Engine driveability concerns	· Refer to Routine 253.

Incorrect Pressures	
· Line pressure, EPC pressure	· Check pressure at line and EPC taps; refer to Line Pressure Chart for specifications. If not OK, check the main controls. If OK, refer to the shift routine(s) for further diagnosis: ■ Shift 1-2, Routine 320 ■ Shift 2-3, Routine 321 ■ Shift 3-4, Routine 322 ■ Shift 4-3, Routine 323 ■ Shift 3-2, Routine 324 ■ Shift 2-1, Routine 325
Main Controls	
· EPC solenoid, stuck or damaged hydraulically or mechanically	· Inspect for damage, contamination. Carry out EPC tests in Routine No. 211. Repair as required.
· Valves, accumulators, seals stuck or damaged or assembled incorrectly	· Inspect for damage. Repair as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
· Solenoid screen blocked or damaged	· Clean or install a new screen.

Shift Concerns: Timing Concerns — Erratic/Hunting

Possible Component	Reference/Action
212 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, shift solenoids, torque converter clutch (TCC) solenoid, digital TR sensor, output shaft speed (OSS)	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. Go To Pinpoint Test A , Go To Pinpoint Test C or Go To Pinpoint Test E . Repair as required. Clear DTCs, road test and repeat Self-Test.
· Poor engine performance	· Refer to Routine 253.
312 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
· Incorrect level	· Adjust fluid to correct level.
· Condition	· Inspect condition of fluid.
Main Controls	
· Valves, accumulators, seals, assembled wrong, stuck or damaged	· Inspect for damage. Repair as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
· Solenoid screen blocked or damaged	· Clean or install a new screen.
Torque Converter Clutch	
· Torque converter	· Refer to Torque Converter Operation Concerns: Cycling/Shudder/Chatter Hydraulic/Mechanical Routine 342.
Specific Shifts	
	· Refer to the following shift routine(s) for further diagnosis:

	■ Shift 1-2, Routine 320 ■ Shift 2-3, Routine 321 ■ Shift 3-4, Routine 322 ■ Shift 4-3, Routine 323 ■ Shift 3-2, Routine 324 ■ Shift 2-1, Routine 325

Shift Concerns: Feel — Soft/Slipping

Possible Component	Reference/Action
213 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, EPC solenoid, OSS	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test D or Go To Pinpoint Test E . Repair as required. Clear DTCs, road test and repeat Self-Test.
· Engine driveability concerns	· Refer to Routine 253.
313 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
· Incorrect level	· Adjust fluid to correct level.
· Condition	· Inspect condition of fluid.
Incorrect Pressures	
· Low line pressure, low EPC pressure	· Check pressures at line and EPC taps; refer to Line Pressure Chart for specifications. If pressures are low or all shifts are soft/slipping, go to main controls. If pressures are OK and a specific shift is soft/slipping, refer to the following routine(s) for further diagnosis: ■ Shift 1-2, Routine 320 ■ Shift 2-3, Routine 321 ■ Shift 3-4, Routine 322 ■ Shift 4-3, Routine 323 ■ Shift 3-2, Routine 324 ■ Shift 2-1, Routine 325
Main Controls	
· Main regulator valve, overdrive servo regulator valve stuck, damaged or assembled incorrectly	· Inspect for damage. Repair as required.
· EPC solenoid stuck or damaged	· Inspect for damage and contamination. Carry out EPC tests in Routine 213. Repair as required.
Case	
· 1-2 accumulator stuck or damaged	· Inspect for damage. Repair as required.
Filter and Seal Assembly	
· Filter plugged, damaged	· Inspect for damage. Install a new filter as required.
· Seal damaged or cut	· Inspect for damage. Replace as required.

Shift Concerns: Feel — Harsh

Possible Component	Reference/Action
214 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, EPC solenoid, OSS	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test D or Go To Pinpoint Test E . Repair as required. Clear DTCs, road test and repeat Self-Test.
· Engine driveability concerns	· Refer to Routine 253.
314 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
· Incorrect level	· Adjust fluid to correct level.
· Condition	· Inspect condition of fluid.
Incorrect Pressures	
· High line pressure, high EPC pressure	· Check pressures at line and EPC taps. See the to Line Pressure Chart for specifications. If pressures are high or all shifts are harsh, go to Main Controls. If pressures are OK and a specific shift is harsh, refer to the following shift routine(s) for further diagnosis: ■ Shift 1-2, Routine 320 ■ Shift 2-3, Routine 321 ■ Shift 3-4, Routine 322 ■ Shift 4-3, Routine 323 ■ Shift 3-2, Routine 324 ■ Shift 2-1, Routine 325
Main Controls	
· Main regulator valve, overdrive servo regulator valve stuck, damaged or assembled incorrectly	· Inspect for damage. Repair as required.
· EPC solenoid stuck or damaged	· Inspect for damage or contamination. Carry out EPC tests in Routine 214. Repair as required.

Shift Concerns: No 1st Gear, Engages In Higher Gear

Possible Component	Reference/Action
215 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, shift solenoids, digital transmission range TR sensor	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test A or Go To Pinpoint Test C . Repair as required. Clear DTCs, road test and repeat Self-Test.
315 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage, Digital TR Sensor	
· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment. Refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted.

	Adjust the digital TR sensor as necessary.
Incorrect Pressures	
・Low reverse clutch pressure, low reverse band pressure, low line pressure ● Forward Off, Intermediate Off, Direct X ● Forward Off, Intermediate X, Direct Off ● Forward Off, Intermediate X, Direct X ● Forward X, Intermediate Off, Direct X ● Forward X, Intermediate X, Direct Off ● Forward X, Intermediate X, Direct X ● Forward X, Intermediate Off, Direct Off	・Check for which pressures are on and refer to Band/Clutch Application Chart 601 and corresponding routines. ■ 324, 301 ■ 325, 301 ■ 323, 324, 325, 301 ■ 324 ■ 325 ■ 323, 324, 325 ■ Refer to appropriate mechanical diagnosis.
Mechanical	
・Bands, clutches or seals damaged or worn	・Refer to Transmission Disassembly and Assembly.

X = pressure applied

Shift Concerns: No Manual 1st Gear

Possible Component	Reference/Action
216 — ELECTRICAL ROUTINE	
Powertrain Control System	
・Electrical inputs/outputs, vehicle wiring harnesses, PCM, shift solenoids, digital TR sensor	・Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test A or Go To Pinpoint Test C . Repair as required. Clear DTCs, road test and repeat Self-Test.
316 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage, Cable, Digital TR Sensor	
・Damaged or incorrectly adjusted	・Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
Incorrect Pressures	
・Low reverse clutch pressure, low reverse band pressure, low line pressure, low EPC pressure	・Check pressure at line and EPC pressure taps; refer to Line Pressure Chart for specifications. If pressures are low, check the following components: oil filter and seal assembly, main controls, reverse clutch assembly and reverse servo assembly.
Fluid Filter and Seal Assembly	
・Plugged or damaged	・Install a new filter and seal assembly.

Main Controls	
· No. 6 shuttle ball, manual valve, main regulator valve, low servo modulator valve stuck, damaged or assembled incorrectly	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· Gaskets damaged	· Inspect for damage and install a new gasket.
Low Reverse Servo	
· Seals (piston and cover) damaged	· Inspect for damage. Repair as required.
	· Servo cover retaining ring assembled incorrectly.
	· Anchor pins (case) damaged.

Shift Concerns: No Manual 2nd Gear

Possible Component	Reference/Action
217 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, shift solenoids, digital TR sensor	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test A or Go To Pinpoint Test C . Repair as required. Clear DTCs, road test and repeat Self-Test.
317 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage, Cable, Digital TR Sensor	
· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
Main Controls	
· 3-4 shift valve, 1-2 and 2-3 shift valve, 3-4 capacity modulator valve stuck, damaged or assembled incorrectly	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· Gaskets damaged	· Inspect for damage and install a new gasket.

Shift Concerns: 1-2 Shift (Automatic)

Possible Component	Reference/Action
220 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs,	· Carry out Self-Test. Refer to the Powertrain Control/Emissions

vehicle wiring harnesses, PCM, shift solenoids, OSS	Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test A or Go To Pinpoint Test E . Repair as required. Clear DTCs, road test and repeat Self-Test.
· Poor engine performance	· Refer to Routine 253.
320 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage, Digital TR Sensor	
· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
Incorrect Pressures	
· Intermediate clutch pressure, line pressure	· Check pressure at line and intermediate clutch taps; see the line pressure chart for specifications. If not OK, check the main controls.
Main Controls	
· 1-2 shift valve, stuck or damaged	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specification.
· Shift solenoid SSA malfunction	· Activate solenoid using scan tool. If solenoid operation cannot be felt when placing hand on solenoid, install a new solenoid. Inspect O-rings for damage. Repair as required.
· Gasket damaged	· Inspect for damage and install a new gasket.
· No. 8 ball not seating	· Inspect for damage. Repair as required.
Case	
· 1-2 accumulator stuck or damaged	· Inspect for damage. Repair as required.
Pump	
· Porosity/cross leaks, balls missing, damaged or leaking	· Inspect for porosity/leaks, balls missing. Install a new pump as required.
· Gasket damaged	· Inspect for damage and install a new gasket.
Intermediate Clutch Assembly	
· Seals damaged	· Inspect for damage. Repair as required.
· Piston damaged	· Inspect for damage. Repair as required.
· Friction elements damaged or worn	· Inspect for damage. Repair as required.
Intermediate One-Way Clutch Assembly	
· Not holding or damaged	· Inspect for damage. Repair as required.
Planetary One-Way Clutch Assembly	
· Not overrunning or damaged	· Inspect for damage. Repair as required.
1-2 Accumulator	
· Damaged accumulator	· Inspect for damage. Repair as required.

piston	
· Springs damaged or broken	· Inspect for damage. Repair as required.
· Case bore scored	· Inspect for damage. Repair as required.

Shift Concerns: 2-3 Shift (Automatic)

Possible Component	Reference/Action
221 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, shift solenoids, OSS	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test A or Go To Pinpoint Test E . Repair as required. Clear DTCs, road test and repeat Self-Test.
· Engine driveability concerns	· Refer to Routine 253.
321 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage	
· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment. Refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
Incorrect Pressures	
· Direct clutch pressure	· Check pressure at direct clutch tap; refer to Line Pressure Chart for specifications. If not OK, check the main controls.
Main Controls	
· 2-3 shift valve, check ball No. 9 or No. 3, solenoid pressure regulator valve, damaged or assembled incorrectly	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· Shift solenoid SSB malfunction	· Activate solenoid using scan tool. If solenoid operation cannot be felt when placing hand on solenoid, install a new solenoid. Inspect O-rings for damage. Repair as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
· Output shaft seals damaged or cup plug leaking or missing	· Inspect for damage and repair as required.
· 2-3 accumulator damaged or stuck	· Inspect piston seal and bore for damage. Repair as required.
· Solenoid screen (in main control) blocked or damaged	· Clean or install a new screen.
Intermediate One-Way Clutch Assembly	
· Not overrunning or damaged	· Inspect for damage. Repair as required.
Output Shaft	
· Seal rings damaged	· Inspect for damage. Repair as required.
· Cup plug damaged or missing	

Direct Clutch Assembly	
· Seals or piston damaged	· Inspect for damage. Repair as required.
· Friction elements worn or damaged	· Inspect for damage. Repair as required.
· Check ball not seating	· Inspect for damage. Repair as required.
· Return spring assembly damaged	· Inspect for damage. Repair as required.
Case	
· Output shaft rear seals leaking or damaged	· Inspect for damage. Repair as required. Inspect case for damaged seal area. If damaged, install a new case.
2-3 Accumulator	
· Damaged accumulator piston	· Inspect for damage. Repair as required.
· Springs damaged or broken	· Inspect for damage. Repair as required.
· Case bore scored	· Inspect for damage. Repair as required.

Shift Concerns: 3-4 Shift (Automatic)

Possible Component	Reference/Action
222 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, shift solenoids, OSS, transmission control switch (TCS)	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test A or Go To Pinpoint Test E . Repair as required. Clear DTCs, road test and repeat Self-Test.
· Engine driveability concerns	· Refer to Routine 253.
322 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage, Digital TR Sensor	
· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
Incorrect Pressures	
· Forward clutch pressure, direct clutch pressure, line pressure	· Check line, direct and forward clutch pressures at appropriate taps; refer to Line Pressure Chart for specifications. If pressures are out of specification, check main controls.
Main Controls	
· 3-4 shift valve, solenoid pressure regulator valve, OD servo regulator, 3-4 capacity modulator valve, 1-2 and 2-3 shift valves stuck, damaged or assembled incorrectly	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· SSA or SSB malfunction	· Activate solenoid using scan tool. If solenoid operation cannot be felt when placing hand on solenoid, install a new solenoid. Inspect O-rings for damage. Repair as

	required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
· OD servo rod and piston cushion spring or seals damaged	· Inspect for damage. Repair as required.
· Worn or damaged OD servo anchor pins	· Inspect for damage. Repair as required.
· No. 2, No. 4, No. 7 and No. 9 check balls damaged or missing	· Inspect for damage. Repair as required.
· Solenoid screen blocked or damaged	· Clean or install a new screen.
Pump	
· Porosity/cross leaks, balls missing, damaged or leaking	· Inspect for porosity/leaks, balls missing. Install a new pump as required.
· Gaskets damaged	· Inspect for damage. Install new gaskets as required.
OD Band	
· OD band and reverse clutch drum assembly damaged, worn or assembled incorrectly	· Inspect for damage. Repair as required.
· Intermediate one-way clutch assembly damaged	· Inspect for damage. Repair as required.
Forward Clutch Assembly	
· Seals or piston damaged	· Inspect for damage. Repair as required.
· Friction elements worn or damaged	· Inspect for damage. Repair as required.
· Check ball stuck, damaged or not seating correctly	· Inspect for damage. Repair as required.
Input Shaft	
· Seals damaged	· Inspect for damage. Repair as required.

Shift Concerns: 4-3 Shift (Automatic)

Possible Component	Reference/Action
223 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, shift solenoids, transmission control switch (TCS)	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test A . Repair as required. Clear DTCs, road test and repeat Self-Test.
323 — HYDRAULIC/MECHANICAL ROUTINE	
Incorrect Pressures	
· Forward clutch pressure, line pressure	· Check line and forward clutch at pressure taps; refer to Line Pressure Chart for specifications. If out of specification, check the main controls.
Main Controls	
· 3-4 shift valve, solenoid pressure regulator valve, OD servo regulator, 3-4 capacity modulator, 1-2 and 2-3 shift valves stuck, damaged or assembled	· Inspect for damage. Repair as required.

incorrectly	
· Check balls No. 2, No. 7, No. 9 damaged, missing or not seating correctly	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specification.
· SSA malfunction	· Activate solenoid using scan tool. If solenoid operation cannot be felt when placing hand on solenoid, install a new solenoid. Inspect O-rings for damage. Repair as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
· OD servo, seal, rod damaged	· Inspect for damage. Repair as required.
· Solenoid screen blocked or damaged	· Clean or install a new screen.
Pump	
· Porosity/cross leaks, balls missing, damaged or leaking	· Inspect for porosity/leaks, balls missing. Install a new pump as required.
· Seal rings damaged	· Inspect for damage. Repair as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
Overdrive Band	
· OD band and reverse clutch assembly damaged, worn or assembled incorrectly	· Inspect for damage. Repair as required.
· Intermediate one-way clutch assembly damaged	· Inspect for damage. Repair as required.
Forward Clutch Assembly	
· Seals or piston damaged	· Inspect for damage. Repair as required.
· Friction elements damaged, worn	· Inspect for damage. Repair as required.
· Check ball stuck, damaged or not seating correctly	· Inspect for damage. Repair as required.
· Forward clutch piston and return spring damaged	· Inspect for damage. Repair as required.
Input Shaft	
· Seals damaged	· Inspect for damage. Repair as required.

Shift Concerns: 3-2 Shift (Automatic)

Possible Component	Reference/Action
224 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, shift solenoids	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test A . Repair as required. Clear DTCs, road test and repeat Self-Test.
324 — HYDRAULIC/MECHANICAL ROUTINE	
Incorrect Pressures	
· Direct clutch	· Check pressure at direct clutch tap; refer to Line Pressure Chart for specifications. If not within specification, check the main controls.
Main Controls	

· 2-3 shift valve stuck or damaged	· Inspect for damage. Repair as required.
· Check balls damaged or missing	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· SSB malfunction	· Activate solenoid using scan tool. If solenoid operation cannot be felt when placing hand on solenoid, install a new solenoid. Inspect O-rings for damage. Repair as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
Intermediate One-Way Clutch	
· Not holding or damaged	· Inspect for damage. Repair as required.
· Intermediate one-way retaining clutch snap ring not seated	· Inspect for damage. Repair as required.
Direct Clutch Assembly	
· Seals or piston damaged	· Inspect for damage. Repair as required.
· Friction element damaged, worn	· Inspect for damage. Repair as required.
· Check ball stuck, damaged or not seating correctly	· Inspect for damage. Repair as required.

Shift Concerns: 2-1 Shift (Automatic)

Possible Component	Reference/Action
225 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, shift solenoids	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test A . Repair as required. Clear DTCs, road test and repeat Self-Test.
325 — HYDRAULIC/MECHANICAL ROUTINE	
Incorrect Pressures	
· Intermediate clutch	· Check pressure at intermediate clutch tap; refer to Line Pressure Chart for specifications. If not within specifications, check main controls and pump.
Main Controls	
· 1-2 shift valve, 1-2 accumulator solenoid pressure regulator valve stuck, damaged or assembled wrong	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· SSA malfunction	· Activate solenoid using scan tool. If solenoid operation cannot be felt when placing hand on solenoid, install a new solenoid. Inspect O-rings for damage; repair as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.

Pump	
· Gaskets damaged	· Inspect for damage and install a new gasket.
· Porosity/cross leaks	· Inspect for leak/porosity. Install a new pump as required.
Intermediate Clutch Assembly	
· Piston damaged	· Inspect for damage. Repair as required.
· Friction elements damaged, worn	· Inspect for damage. Repair as required.
· End clearance incorrect	· Inspect and correct; refer to Transmission Assembly.
Intermediate One-Way Clutch	
· Damaged	· Inspect for damage. Repair as required.
· Intermediate one-way clutch retaining snap ring not seated	· Inspect for damage. Repair as required.
Planetary One-Way Clutch	
· Not holding or damaged	· Inspect for damage. Repair as required.

Torque Converter Clutch Operation Concerns: No Apply

Possible Component	Reference/Action
240 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, torque converter clutch (TCC) solenoid, TFT sensor, OSS	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test B or Go To Pinpoint Test E . Repair as required. Clear codes, road test and repeat Self-Test.
340 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage	
· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
Incorrect Pressures	
· Low line pressure, low EPC pressure	· Check pressure at line and EPC taps; refer to Line Pressure Chart for specifications. If pressure is low, check EPC and main regulator valve. If within specifications, check the main controls.
Main Controls	
· Solenoid pressure regulator valve, manual valve, bypass clutch control valve and plunger, converter pressure limit valve, drain back valve stuck, damaged or assembled incorrectly	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· Solenoid screen blocked or damaged	· Clean or install a new screen.
· TCC solenoid malfunction	· Activate solenoid using scan tool. If solenoid operation

	cannot be felt when placing hand on solenoid, install a new solenoid. Inspect O-rings for damage. Repair as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
Pump Assembly	
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· Porosity/cross leaks, balls leaking	· Inspect for porosity/leaks, ball missing. Install a new pump as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
Input Shaft	
· Seals damaged	· Inspect for damage. Repair as necessary.
Torque Converter Assembly	
· Leakage, friction material damaged, internal seals damaged	· Inspect torque converter. Repair or install a new or remanufactured torque converter as required.

Torque Converter Clutch Operation Concerns: Always Applied/Stalls Vehicle

Possible Component	Reference/Action
241 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, torque converter clutch (TCC) solenoid, TFT sensor	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test B or Go To Pinpoint Test A . Repair as required. Clear DTCs, road test and repeat Self-Test.
341 — HYDRAULIC/MECHANICAL ROUTINE	
Main Control	
· Drain back valve, torque converter clutch (TCC) and plunger stuck, damaged or assembled incorrectly	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· TCC solenoid malfunction	· Activate solenoid using scan tool. If solenoid operation cannot be felt when placing hand on solenoid, install a new solenoid. Inspect O-rings for damage. Repair as required.
· No. 7 ball incorrect seating	· Inspect for damage. Repair as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
Pump Assembly	
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· Ball missing, leaking, porosity/cross leaks	· Inspect for porosity/leaks, balls missing. Install a new pump as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
Input Shaft	
· Seals damaged	· Inspect for damage. Repair as required.
Torque Converter Assembly	

· No end clearance	· Inspect converter and install a new or remanufactured torque converter as required.
· Piston plate damaged or stuck to cover	· If cover is heat-stained, install a new converter and determine the cause of the overheat condition.

Torque Converter Clutch Operation Concerns: Cycling/Shudder/Chatter

Possible Component	Reference/Action
242 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, PCM, torque converter clutch (TCC) solenoid, OSS	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test E . Repair as required. Clear DTCs, road test and repeat Self-Test.
· Speed control equipped vehicles	· Evaluate with speed control off.
342 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
· Condition	· Inspect fluid condition. If burnt, drain fluid and converter. Install a new fluid and filter assembly. Bring vehicle to normal operating temperature. Carry out Transmission Drive Cycle Test. Carry out Transmission Self-Test. If condition still exists, continue diagnostics.
Main Controls	
· Solenoid pressure regulator valve, No. 7 check ball, bypass clutch control valve and plunger, converter pressure limit valve stuck, damaged or assembled incorrectly	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.
· Solenoid screen blocked or damaged	· Clean or install a new screen.
· TCC solenoid malfunction	· Activate solenoid using scan tool. If solenoid operation cannot be felt when placing hand on solenoid, install a new solenoid. Inspect O-rings for damage. Repair as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
Pump Assembly	
· Bolts not tightened to specification	· Tighten bolts to specification.
· Porosity/cross leaks, missing balls or leaking	· Inspect for porosity/leaks or missing balls. Install a new pump as required.
· Gaskets damaged	· Inspect for damage and install a new gasket.
Input Shaft	
· Seals damaged	· Inspect for damage. Repair as required.
Torque Converter	
· Excessive end clearance	· Inspect converter. Install a new or re-manufactured torque converter as required.

Other Concerns: No Engine Braking In Manual 2nd Or Manual 1st Position

Possible Component	Reference/Action
250 — ELECTRICAL ROUTINE	
	· No Electrical Concerns
350 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage	
· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
Main Controls	
· 3-4 shift valve, 1-2 and 2-3 shift valve, gaskets, 3-4 capacity modulator valve, stuck or damaged or assembled incorrectly	· Inspect for damage. Repair as required.
· OD servo assembly damaged or stuck in manual 2nd only.	· Inspect cover, piston and seal for damage. Repair as required.
· Low/Reverse servo assembly damaged or stuck in manual 1st only	· Inspect cover, piston and seal for damage. Repair as required.
Overdrive	
· Reverse band, manual 1st (only) damaged	· Inspect for damage. Repair as required.
· OD band, reverse clutch drum assembly worn or damaged (manual 2nd only)	· Inspect for damage. Repair as required.
Reverse Band (Manual 1st Only)	
· Damaged or incorrectly adjusted	· Inspect for damage. Repair as required.

Other Concerns: Shift Lever Efforts High

Possible Component	Reference/Action
251 — ELECTRICAL ROUTINE	
	· No Electrical Concerns
351 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage, Digital TR Sensor	
· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
· Brake shift interlock system, solenoid damaged	· Refer to the appropriate brake section in the workshop manual.
Manual Lever	
· Retaining pin damaged, nut loose, detent spring bent or damaged or Park	· Inspect for damage. Repair as required.

mechanism damaged	
Main Controls	
· Manual valve stuck or damaged	· Inspect for damage. Repair as required.
· Bolts not tightened to specifications	· Tighten bolts to specifications.

Other Concerns: External Leaks

Possible Component	Reference/Action
252 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, sensor seals leaking (digital TR, OSS, vehicle speed sensor VSS, if equipped, or transmission connector)	· Inspect for leakage and repair as required.
352 — HYDRAULIC/MECHANICAL ROUTINE	
Case	
· Case vent, case porosity, case cracked	· Check the vent for free breathing. Check the fluid level. Check the transmission for overheat conditions. Repair as required.
Seals/Gaskets	
· Leakage at gaskets, seals, etc. (refer to external sealing illustration for potential leak locations)	· Remove all traces of lubricant on exposed surfaces of the transmission. Check the vent for free breathing. Operate the transmission at normal temperatures and perform fluid leakage check. Repair as required.
Other	
· Cooler fitting, cooler lines pressure tap, converter drain plug, band anchor pins	· Locate the source of the leak. Repair as required.

Other Concerns: Poor Vehicle Performance

Possible Component	Reference/Action
253 — ELECTRICAL ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, vehicle wiring harnesses, shift solenoids, digital TR sensor, torque converter clutch (TCC) solenoid, transmission fluid temperature (TFT) sensor	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test A , Go To Pinpoint Test B or Go To Pinpoint Test C . Repair as required. Clear codes, road test and repeat Self-Test. Also refer to Routines 241/341 Torque Converter Operation Concern: Always Applied.
· Engine driveability concerns	· Inspect air intake/air filter system. Check the fuel system and fuel pressure. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. Inspect the exhaust system for restriction. Refer to Section 309-00 .
353 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage, Digital TR Sensor	

· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
Verify Correct Shift Scheduling and Engagements	
· See Reference/Action	· Go to the appropriate diagnostic routines.
Torque Converter Clutch Always Applied	
· See Reference/Action	· Go to Hydraulic/Mechanical Routine 241/341.
Torque Converter Clutch	
· Damaged	· Inspect torque converter. Install a new converter as outlined.

Other Concerns: Noise/Vibration — Forward Or Reverse

Possible Component	Reference/Action
254 — ELECTRICAL ROUTINE	
	· No Electrical Concerns
354 — HYDRAULIC/MECHANICAL ROUTINE	
For Noises/Vibrations That Change With Engine Speed	
· Converter components/balance weight	· Locate source of disturbance. Repair as required.
· Fluid level (low) pump cavitation	
· Pump assembly	
· Engine drive accessories	
· Cooler lines grounding out	
· Flexplate	
For Noises/Vibrations That Change With Vehicle Speed	
· Engine mounts loose or damaged	· Locate source of disturbance and repair as required.
· Driveline concerns: ■ U-joints ■ Rear axle ■ Suspension ■ Modifications 1st Gear: ■ Low one-way clutch ■ Gearset ■ Friction elements	· Refer to the following shift routine(s) for further diagnosis: ■ Shift 1-2, Routine 320 ■ Shift 2-3, Routine 321 ■ Shift 3-4, Routine 322 ■ Shift 4-3, Routine 323 ■ Shift 3-2, Routine 324 ■ Shift 2-1, Routine 325 ■ Torque Converter Cycling 242/342
· 2nd Gear: ■ Intermediate one-way clutch ■ Intermediate clutch piston bleed hole out of	

12 o'clock position ■ Friction elements	
· 3rd Gear: ■ Torque converter ■ Case to planet support spring ■ Friction elements	
· 4th Gear: ■ Gear set ■ Friction elements ■ Torque converter	
· Reverse: ■ Gear set ■ Friction elements	
· Output shaft splines worn or damaged	
Other Noises/Vibrations	
· Main controls, valve resonance	· Locate source of disturbance and repair as required.
· Shift cable: ■ Vibration ■ Grounding ■ Cooler lines ■ Grounding	

Other Concerns: Engine Will Not Crank

Possible Component	Reference/Action
255 — ELECTRICAL ROUTINE	
Powertrain Control System	· Carry out Self-Test. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the Powertrain Control System. Go To Pinpoint Test C . Repair and adjust as required.
· Electrical inputs/outputs, vehicle wiring harnesses, engine starting system hardware, digital TR sensor	
355 — HYDRAULIC/MECHANICAL ROUTINE	
Shift Linkage, Digital TR Sensor	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
· Damaged or incorrectly adjusted	

Other Concerns: No Park (P) Range

Possible Component	Reference/Action
256 — ELECTRICAL ROUTINE	
· No Electrical Concerns	
356 — HYDRAULIC/MECHANICAL ROUTINE	

Shift Linkage, Digital TR Sensor	
· Damaged or incorrectly adjusted	· Inspect and repair as required. Verify transmission shift cable adjustment; refer to Section 307-05 . Adjust transmission shift cable as necessary. After repairing transmission shift cable, verify that the digital TR sensor is correctly adjusted. Adjust the digital TR sensor as necessary.
Park Mechanism	
· Output shaft ring, parking brake pawl, parking pawl return spring, park rod guide cup, parking pawl shaft, parking pawl actuating rod, manual lever detent spring damaged or assembled incorrectly	· Inspect for damage or incorrect assembly and repair as required.

Other Concerns: Overheating

Possible Component	Reference/Action
257 — ELECTRICAL ROUTINE	
Refer to Routine 240/340, Torque Converter Operation Concern: No Apply	
357 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
· Incorrect level	· Adjust fluid to correct level.
· Condition	· Inspect condition of fluid.
Other	
· Damaged, blocked or reversed cooler lines or restriction in the transmission oil cooler	· Inspect for damage and correct installation. Repair as required.
Vehicle Concerns Causing Engine Overheating	
	· Refer to the appropriate engine cooling section.
Main Controls	
· Drain back valve, torque clutch control valve, converter limit valve stuck, damaged or assembled incorrectly	· Inspect for damage and repair as required.
Torque Converter Clutch	
· No apply	· Refer to Routine 240/340.

Transmission Fluid Cooler — Backflushing and Cleaning

1. **CAUTION: Do not use any supplemental transmission fluid additives or cleaning agents. The use of these products could cause internal transmission components to fail; this will effect the operation of the transmission.**

   Conduct backflushing with a suitable torque converter/fluid cooler cleaner. Test your equipment to make sure that a vigorous fluid flow is present before proceeding. Install a new filter in the flush equipment if flow is weak or contaminated.

2. To aid in attaching the cleaner to the transmission steel cooler lines, connect two additional rubber hoses to the transmission end of the steel transmission cooler lines as described below.
   - Connect the cleaner tank pressure line to the steel transmission cooler return line (longest line).
   - Connect a tank return hose to the steel transmission cooler pressure line (shorter line). Place the outlet end of this hose in the solvent tank reservoir.

3. Turn on solvent pump and allow the solvent to circulate a minimum of 5 minutes (cycling switch on and off will help dislodge contaminants in cooler system).

4. Switch off the solvent pump and disconnect the solvent pressure hose from the transmission cooler return line.

5. Use compressed air to blow out the cooler(s) and lines (blow air into the transmission cooler return line) until all solvent is removed.

6. Remove the rubber return hose from the remaining steel cooler line.

Transmission Fluid Drain and Refill

Special Tool(s)

 ST2654-A	Automatic Transmission Flush and Fill Machine 211-00018 Automatic Transmission Flush and Fill Machine 199-00010 or equivalent

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM	MERCON®V

Draining

CAUTION: Always refer to the instructions supplied with the flush and fill machine.

NOTE: Draining fluid from the transmission by removing only the fluid pan is acceptable for vehicles that do not have a torque converter drain plug, for normal or severe duty fluid maintenance.

NOTE: A new procedure for draining and adding transmission fluid using a suitable transmission flush and fill machine has been added. The following procedure has different methods for draining and refilling the listed vehicles:

- All vehicles using a suitable flush and fill machine.
- Vehicles equipped with a torque converter drain plug.
- Vehicles without a torque converter drain plug.

Use the method that is applicable to your vehicle.

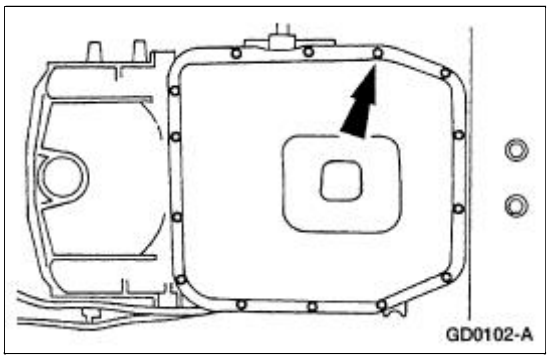
All vehicles using a suitable flush and fill machine

1. With the vehicle in NEUTRAL, position on a hoist. For additional information, refer to Section 100-02 .
2. Use a suitable flush and fill machine to change the fluid.
3. When connecting the flush and fill machine, connect the machine to the fluid cooler tube after the fluid cooler on the cooler return line. This will help remove any foreign material trapped in the fluid coolers.

Refill

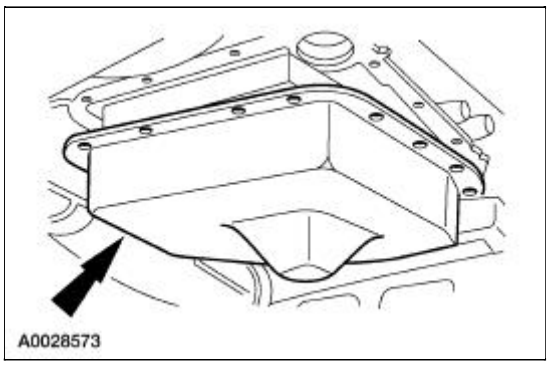
4. Use only clean automatic transmission fluid.

5. Once the fluid exchange has been completed, disconnect the flush and fill machine. Reconnect any disconnected fluid cooler tubes.



6. With the engine running and the transmission at normal operating temperature 66-77°C (150-170°F), check and adjust the transmission fluid level, and check for any leaks. If fluid is needed, add fluid in increments of 0.24-liter (0.5-pint) until the correct level is achieved (fluid should be in the cross-hatched area of the fluid level indicator).

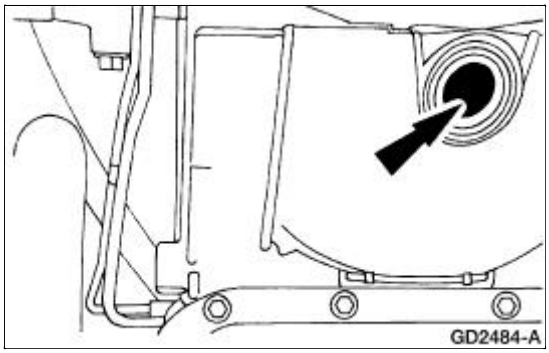
Draining



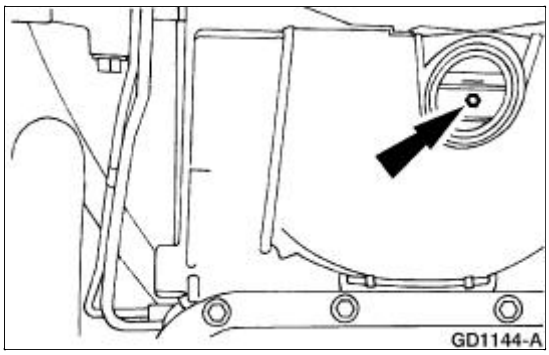
Vehicles equipped with a torque converter drain plug

1. With the vehicle in NEUTRAL, position on a hoist. For additional information, refer to Section 100-02 .

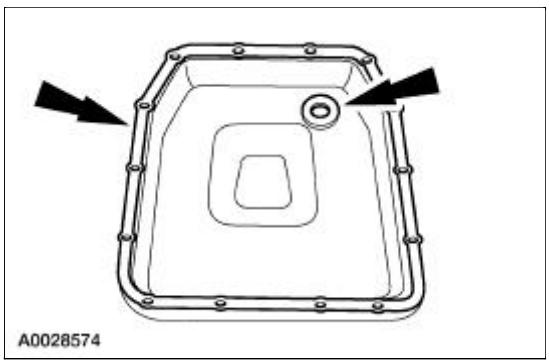
2. Loosen the transmission fluid pan bolts and allow the fluid to drain.



3. After the fluid has drained, remove the transmission fluid pan.

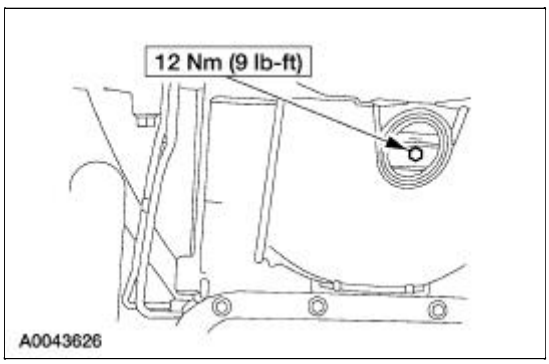


4. Do not remove the fluid filter. It is not necessary to change the fluid filter during a normal maintenance fluid change.

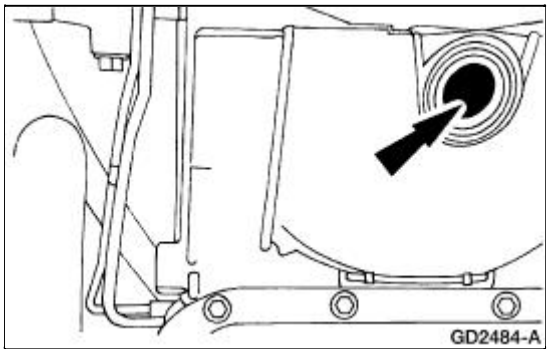


5. Remove the torque converter drain plug cover.

6. Remove the torque converter drain plug and discard.

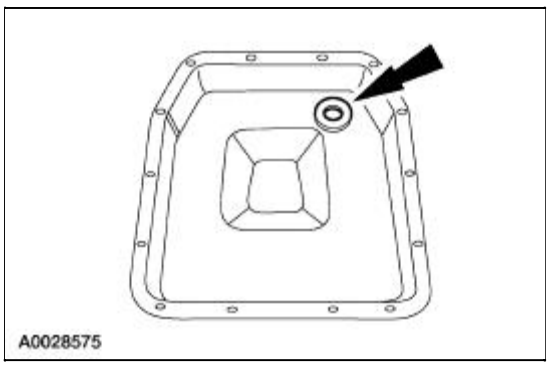


7. Clean and inspect the transmission fluid pan, transmission fluid pan gasket and magnet.



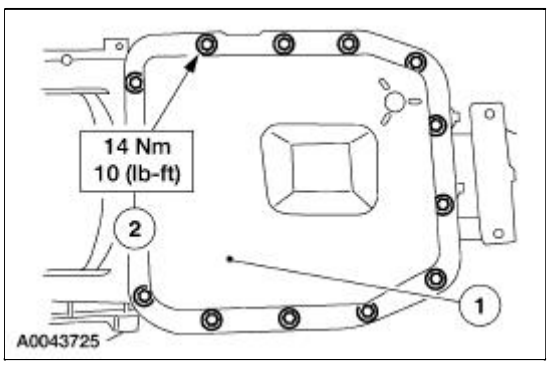
8. Thoroughly flush the cooler tubes. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.

Refill



9. After the torque converter has drained, install a new drain plug.

10. Install the torque converter drain plug cover.



11. Position the magnet into the transmission fluid pan.

12. **NOTE:** The fluid pan gasket is reusable, clean and inspect for damage. If not damaged, the gasket should be reused.

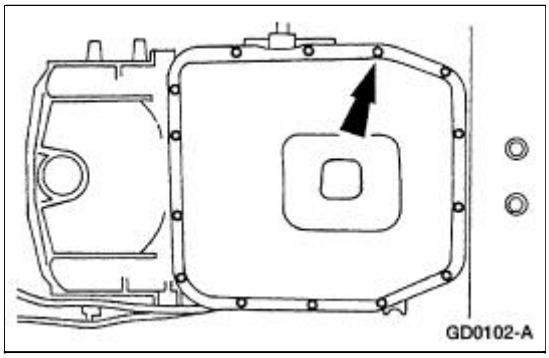
    Install the fluid pan and gasket.
    1. Position the fluid pan with the gasket in place.
    2. Install the bolts.

13. **CAUTION: The use of any other transmission fluid than specified can result in the transmission failing to operate in a normal manner or transmission failure.**

    Fill the transmission.
    - Add 4.7 liters (5 qts) of clean automatic transmission fluid to the transmission through the fluid filler tube.

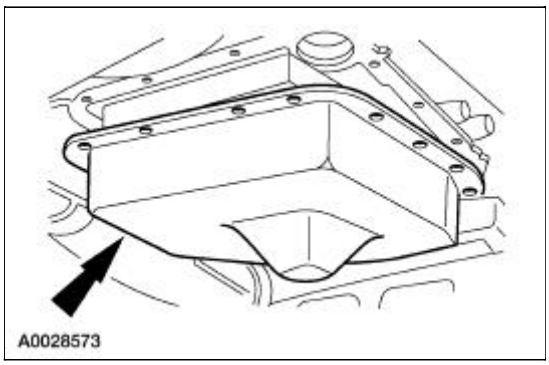
14. Start the engine. Move the transmission range selector lever through all the gear ranges, checking for engagements.

15. With the engine running and the transmission at normal operating temperature 66-77°C (150-



170°F), check and adjust the transmission fluid level, and check for any leaks. If fluid is needed, add fluid in increments of 0.24-liter (0.5-pint) until the correct level is achieved (fluid should be in the cross-hatched area of the fluid level indicator).

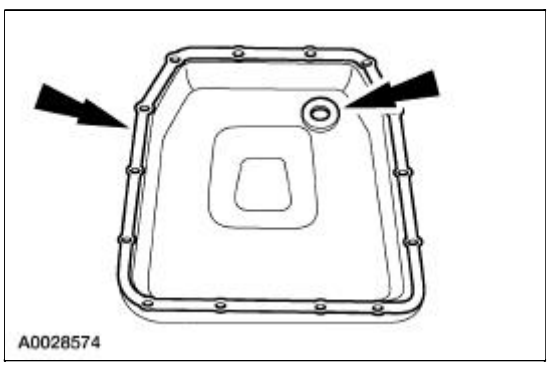
Draining



Vehicles without a torque converter drain plug

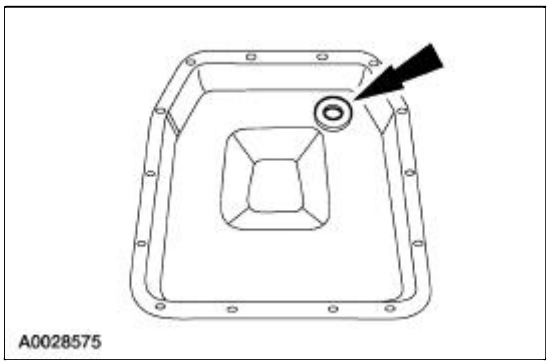
1. With the vehicle in NEUTRAL, position on a hoist. For additional information, refer to Section 100-02 .

2. Loosen the transmission fluid pan bolts and allow the fluid to drain.



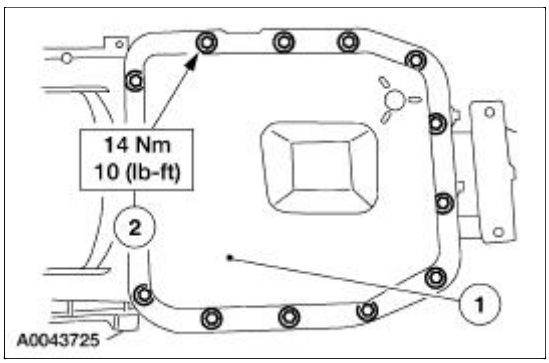
3. After the fluid has drained, remove the transmission fluid pan.

4. Do not remove the fluid filter. It is not necessary to change the fluid filter during a normal maintenance fluid change.



5. Clean and inspect the transmission fluid pan, transmission fluid pan gasket and magnet.

6. Thoroughly flush the cooler tubes. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.



Refill

7. Position the magnet into the transmission fluid pan.

8. **NOTE:** The fluid pan gasket is reusable, clean and inspect for damage. If not damaged, the gasket should be reused.

   Install the fluid pan and gasket.
   1. Position the fluid pan with the gasket in place.
   2. Install the bolts.

9. **CAUTION: The use of any other transmission fluid than specified can result in the transmission failing to operate in a normal manner or transmission failure.**

   Fill the transmission.
   - Add 4.7 liters (5 qts) of clean automatic transmission fluid to the transmission through the fluid filler tube.

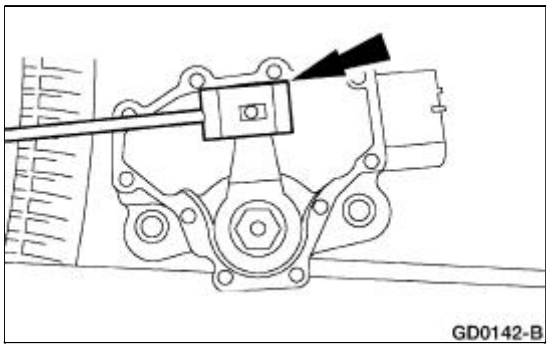
10. Start the engine. Move the transmission range selector lever through all the gear ranges, checking for engagements.

11. With the engine running and the transmission at normal operating temperature 66-77°C (150-170°F), check and adjust the transmission fluid level, and check for any leaks. If fluid is needed, add fluid in increments of 0.24-liter (0.5-pint) until the correct level is achieved (fluid should be in the cross-hatched area of the fluid level indicator).

Transmission Range (TR) Sensor Adjustment

Special Tool(s)

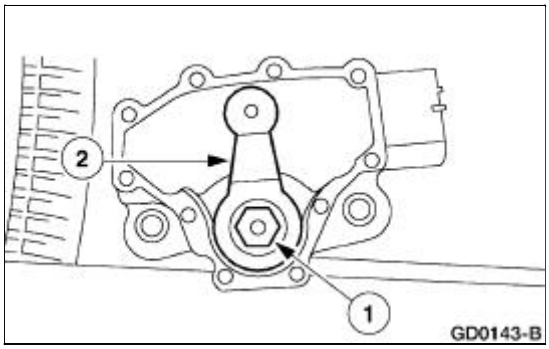
 ST1633-A	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)



Material

Item	Specification
Threadlock 262 E2FZ-19554-B	WSK-M2G351-A6

1. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .



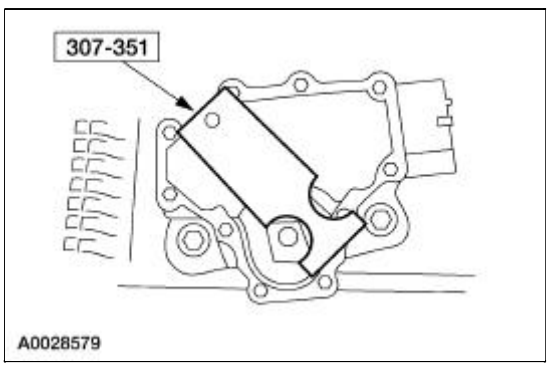
2. **CAUTION: Do not pry on the swivel tube to disconnect the transmission shift linkage.**

   Disconnect the manual lever shift control cable.

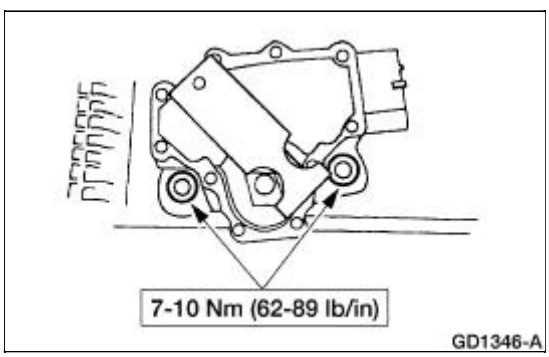
   
   GD0142-B

3. **CAUTION: Discard the outer manual control lever shaft nut. Do not reuse. The old nut will not retain the torque specification.**

   Remove the manual control lever.
   1. Remove the nut.
   2. Remove the lever.

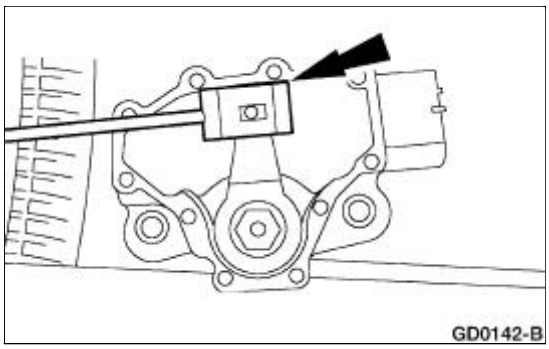


4. Loosen the digital TR sensor bolts.



5. **NOTE:** The manual lever must be in the NEUTRAL position.

   Using the special tool, align the digital TR sensor slots. The tool is designed to fit snug.



6. Tighten the digital TR sensor bolts.

7. Install the manual control lever.
   1. Position the manual control lever.
   2. Install a new manual control lever outer nut.

8. With the manual lever in overdrive connect the shift lever control cable.

9. Lower the vehicle.

Fluid Pan, Gasket and Filter

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM, XT-5-DM	MERCON® V

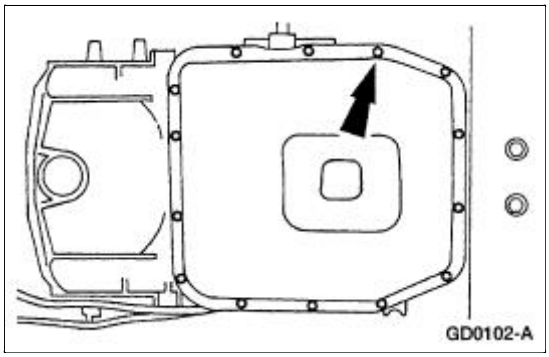
1. Normal maintenance requires periodic automatic transmission fluid changes. If a major repair, such as a clutch, band, bearing, etc., is required, the automatic transmission will also have to be removed for repair. At this time, the torque converter, transmission cooler and tubes must be thoroughly flushed to remove any dirt. The transmission fluid needs to be changed if evidence of fluid contamination is found. When used under continuous or severe conditions, the transmission and torque converter should be drained and refilled with fluid as specified.

2. **CAUTION: Do not use any supplemental transmission fluid additives or cleaning agents. The use of these products could cause internal transmission components to fail; this will effect the operation of the transmission.**

   CAUTION: Use of a fluid other than specified could result in transmission failure.

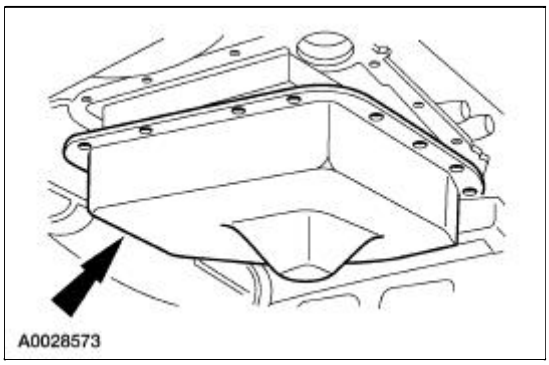
   Refer to the vehicle certification label affixed to the LH front door lock face panel or door pillar for the transmission code.

3. When filling a dry transmission and torque converter, refer to General Specifications chart in this section for capacity. Check the fluid level.



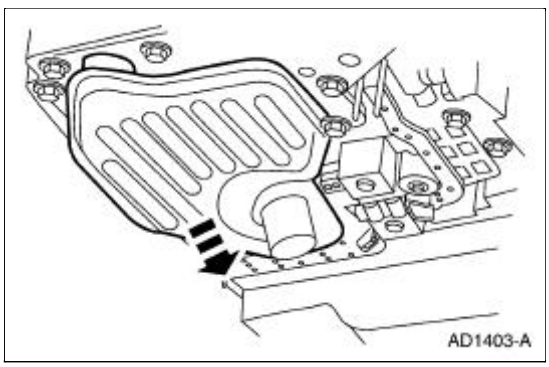
Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

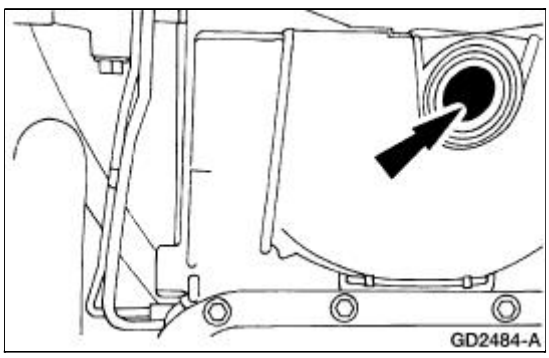


2. Raise and support the vehicle. For additional information, refer to Section 100-02 .

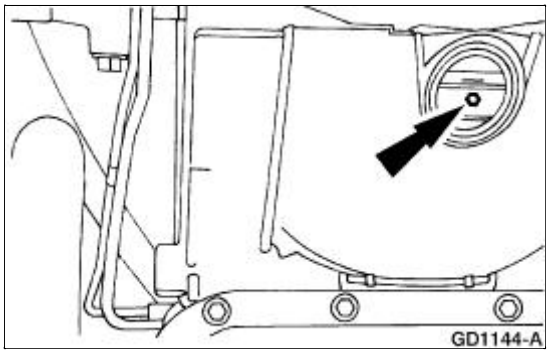
3. Place a drain pan under the transmission fluid pan.



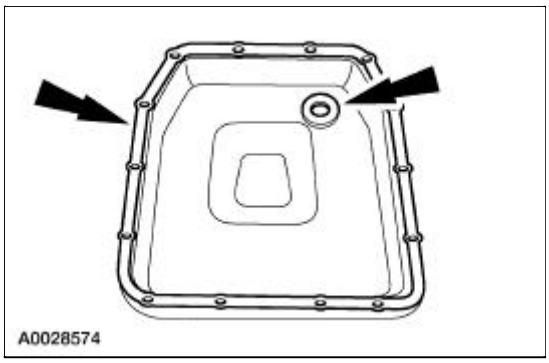
4. Drain transmission fluid.
   - Loosen the transmission fluid pan bolts and allow fluid to drain. After fluid is drained remove the bolts.



5. Remove the transmission fluid pan and transmission fluid pan gasket.



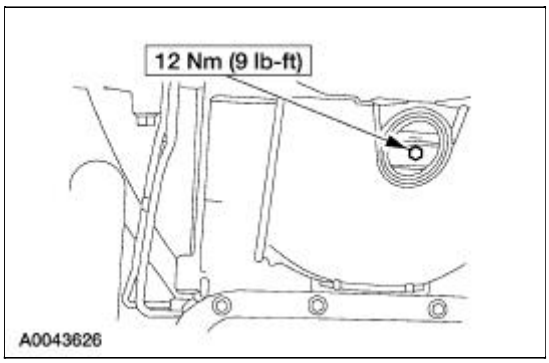
6. Pull down evenly and remove the transmission fluid filter and seal.



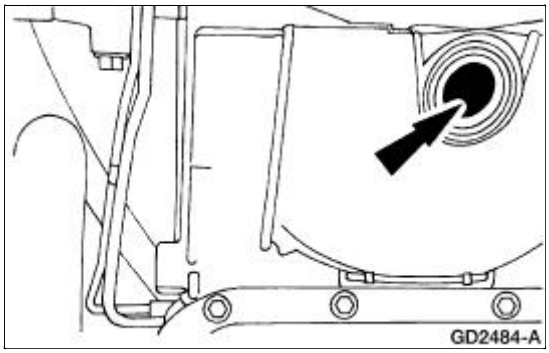
7. Remove torque converter housing plug.

8. Remove the torque converter drain plug and drain the torque converter.
    - Rotate the crankshaft to access the drain plug.

9. Clean and inspect the transmission fluid pan, gasket and magnet.



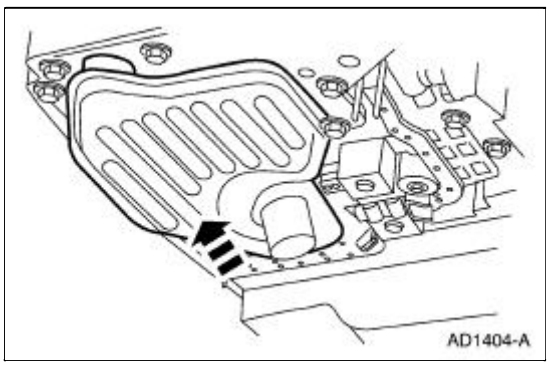
10. Flush the fluid cooler tubes. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.



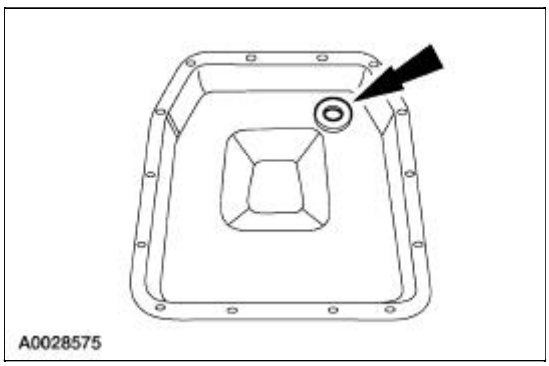
Installation

1. **NOTE:** A new torque converter drain plug must be used.

   Install the torque converter drain plug.



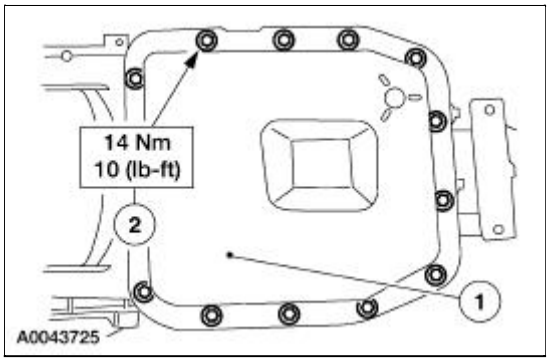
2. Install the torque converter housing plug.



3. **CAUTION: If installing a new filter, and the seal remains in the main control bore, carefully use a small screwdriver to remove the seal. Use care not to damage the main control bore.**

   NOTE: If transmission is being repaired for a contamination-related failure, use a new filter and seal. The filter may be reused if no excessive contamination is present.

   Install a new fluid filter and seal as required.



4. Position the pan magnet into the transmission fluid pan.

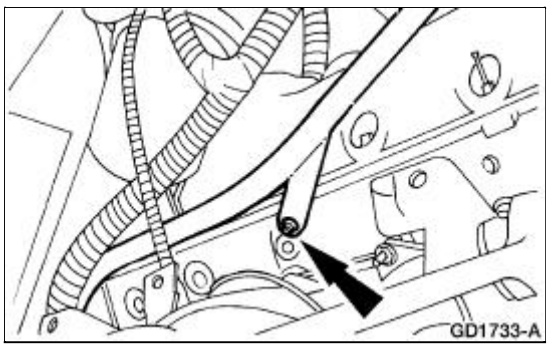
5. **NOTE:** The transmission fluid pan gasket is reusable. Clean and inspect for damage; if not damaged, the gasket should be reused.

   Install the transmission fluid pan and gasket.
   1. Position the transmission fluid pan and gasket.
   2. Install the transmission fluid pan bolts.

6. Lower the vehicle.

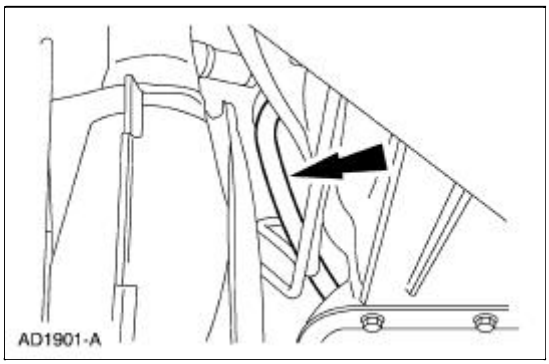
7. **NOTE:** When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

   Connect the battery ground cable. For additional information, refer to Section 414-01 .



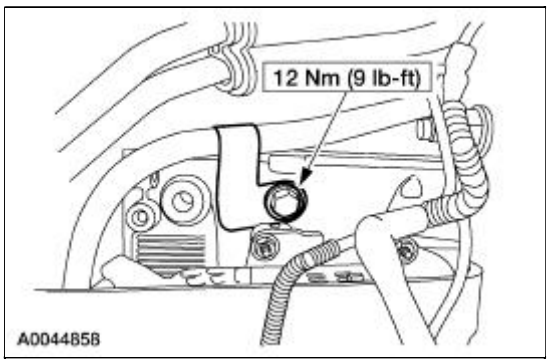
8. **NOTE:** When filling a dry transmission and converter, start with a minimum of 4.7 liters (5 quarts).

   Fill the transmission to the correct level with clean automatic transmission fluid.



Transmission Filler Tube

Removal and Installation



1. Remove the transmission fluid filler tube bolt from the side of the RH cylinder head.

2. Remove the fluid filler tube.

3. To install, reverse the removal procedure.

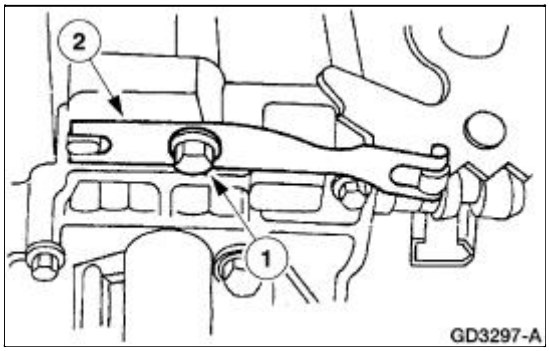
Main Control Valve Body

Special Tool(s)

 ST2545-A	Gauge, Transmission Solenoid Connectors 307-426

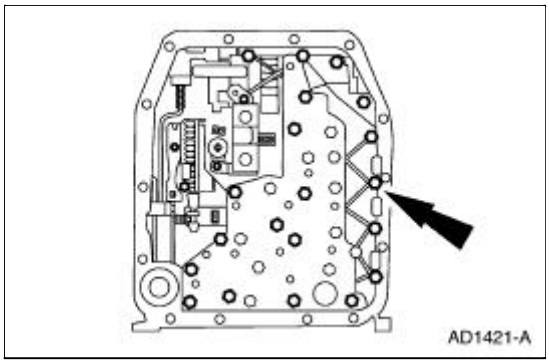
Removal

1. Drain transmission fluid and remove the transmission fluid pan and filter. For additional information, refer to Fluid Pan, Gasket and Filter .

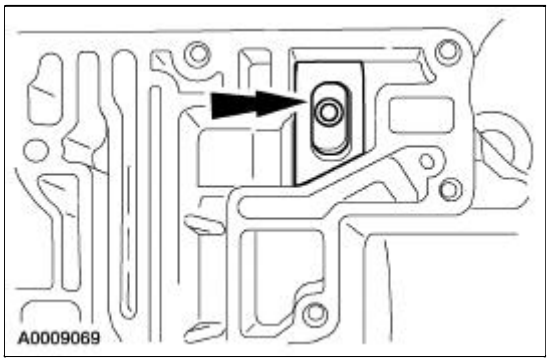


2. **CAUTION: Do not pull on the molded lead frame. This may cause damage to the connector ends. Carefully pry up on the locking tabs to disconnect the solenoids. Disconnect the molded lead frame from the solenoids.**

   Disconnect the molded lead frame from the solenoids.
   1. Disconnect the shift solenoid SSA and SSB.
   2. Disconnect the torque converter clutch (TCC).
   3. Disconnect the electronic pressure control (EPC) solenoid.
   4. Disconnect the bulkhead inter-connector.

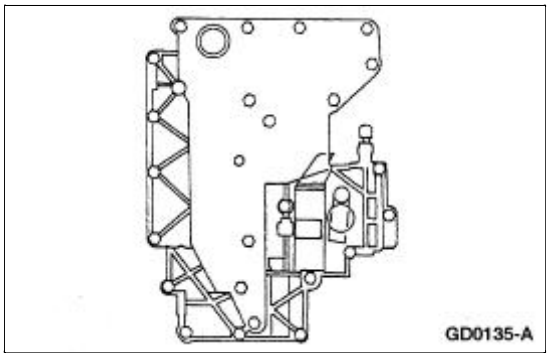


3. Remove the manual control valve detent lever spring.
   1. Remove the bolt.



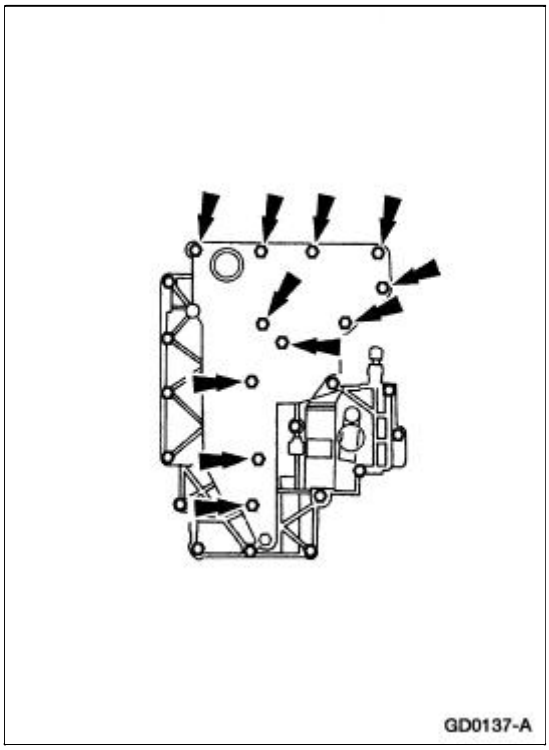
2. Remove the manual control valve detent lever spring.

4. Remove the 24 valve body-to-case bolts.



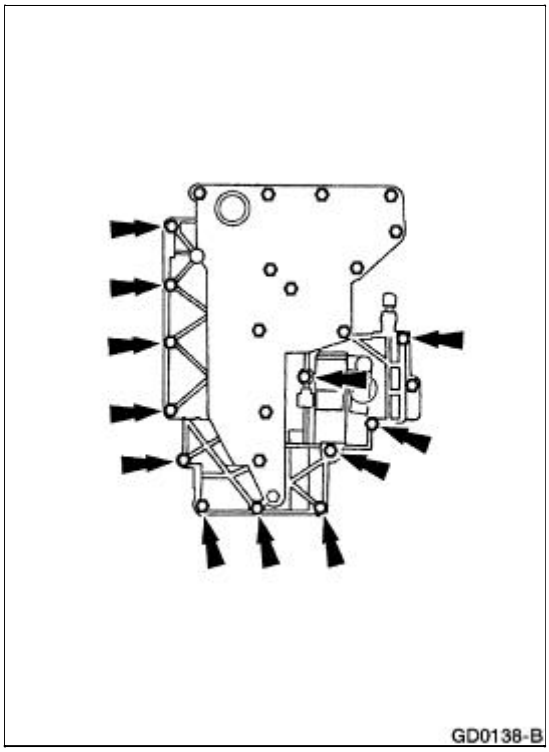
5. Remove the main control valve body and discard the pump outlet screen.

Installation



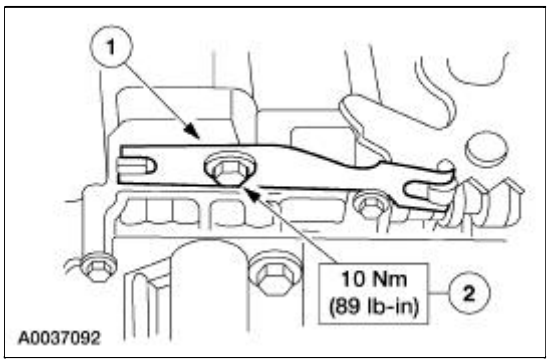
1. **NOTE:** Make sure that the drive pin of the manual valve detent lever assembly engages the manual valve in the correct location prior to installing the bolts.

   Position the main control valve body gasket and main control valve body using the two alignment bolts as a guide.



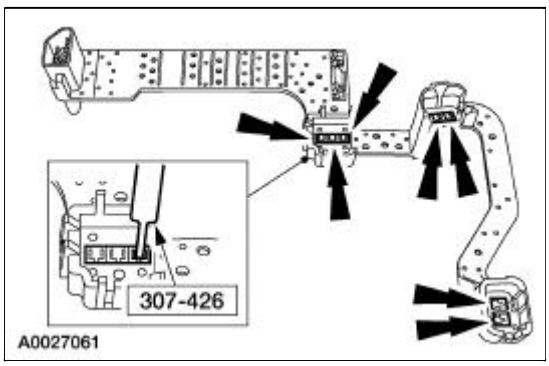
2. **NOTE:** The main control valve body bolts will be tightened in later steps.

   Loosely install the bolts.

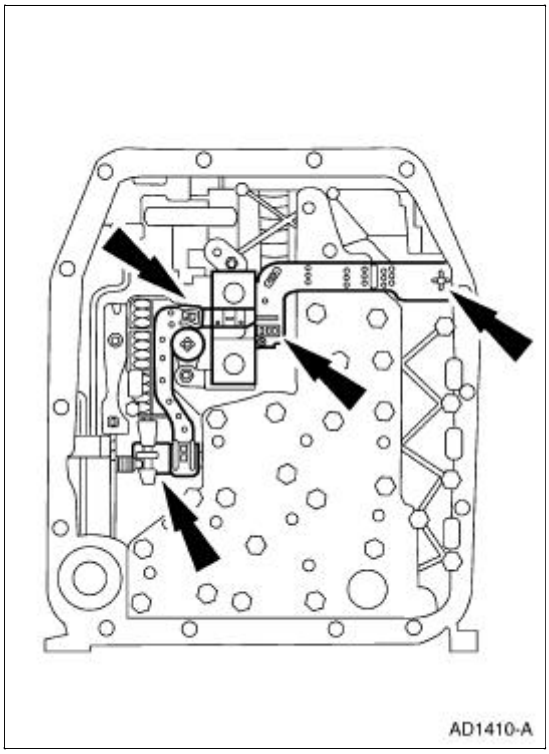


3. **NOTE:** The main control valve body bolts will be tightened in later steps.

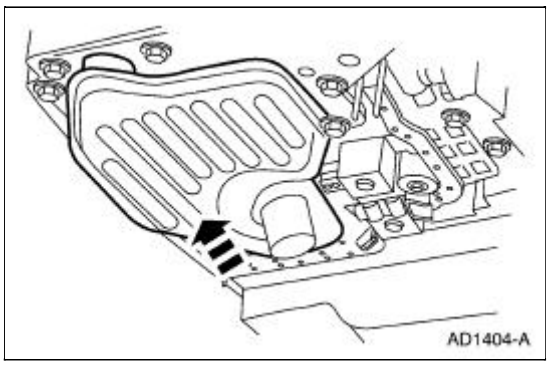
   Loosely install the bolts.



4. Install the manual control valve detent lever spring.
    1. Position the manual control valve detent lever spring.
    2. Install the bolt.



5. Tighten the main control valve body bolts in the sequence shown.

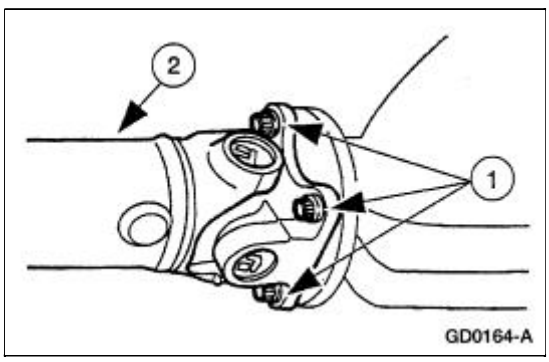


6. Inspect the lead frame for damage.
    - Using the special tool, check all lead frame solenoid connections. The gauge should fit tightly and not fall out after being inserted.
    - If the special tool passes through any lead frame connector pins or does not feel like it makes a good contact, install a new lead frame.

7. Connect the molded lead frame to the solenoids.
    - Connect the bulkhead inter-connector by pressing it in place by hand and fully seating the connector in place.
    - Connect the EPC solenoid by pressing it in place by hand and fully seating the connector in place. Make sure that the terminals pass fully through the connector slots.
    - Connect the TCC by pressing it in place by hand and fully seating the connector in place. Make sure that the terminals pass fully through the connector slots.
    - Connect the shift solenoid SSA and SSB by pressing it in place by hand and fully seating the connector in place. Make sure that the terminals pass fully through the connector slots.

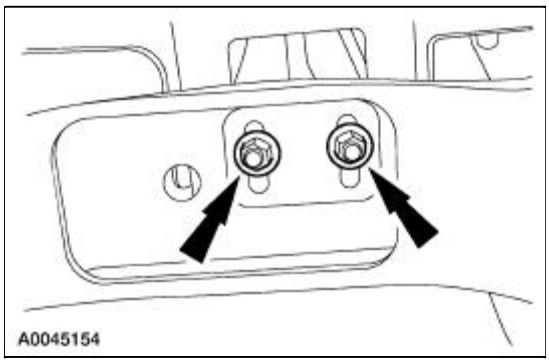
8. Install the transmission filter and pan. For additional information, refer to Fluid Pan, Gasket and Filter in this section.

Extension Housing Oil Seal and Gasket



Special Tool(s)

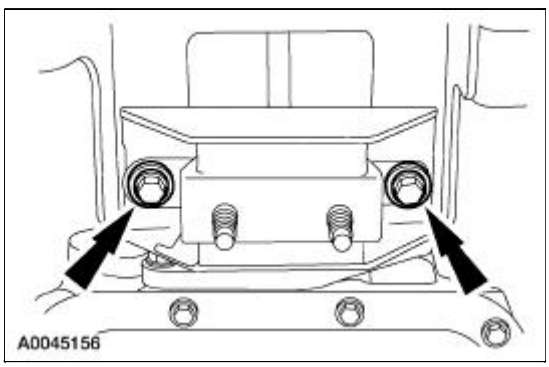
 ST1188-A	Installer, Transmission Extension Housing Fluid Seal 308-002 (T61L-7657-A)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)
 ST1192-A	Remover, Transmission Fluid Seal 307-048 (T74P-77248-A)



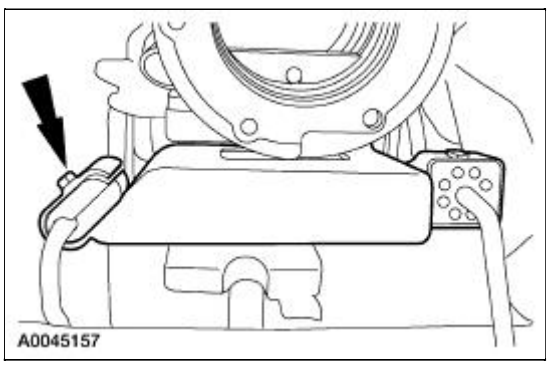
Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Raise and support the vehicle. For additional information, refer to Section 100-02 .
3. Drain the transmission fluid. For additional information, refer to Fluid Pan, Gasket and Filter in this section.
4. **NOTE:** To maintain initial driveshaft balance, mark the rear driveshaft yoke and axle flange so they can be installed in their original positions.

   Remove the rear driveshaft.
   1. Remove the four bolts.
   2. Remove the rear driveshaft.

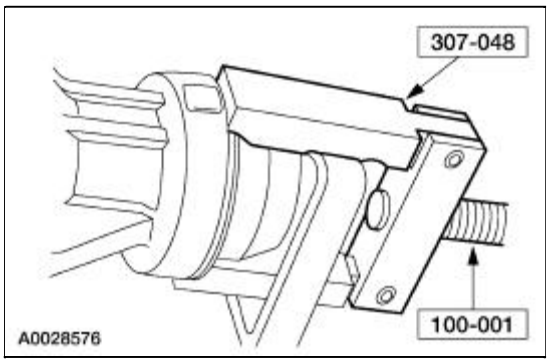


5. Use a high-lift jack to support the transmission.
6. Remove the rear crossmember bolts.

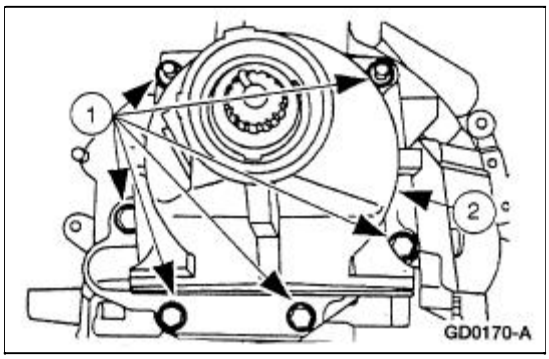


7. Remove the rear transmission retainer nuts and remove the crossmember.

8. Remove the rear transmission support.

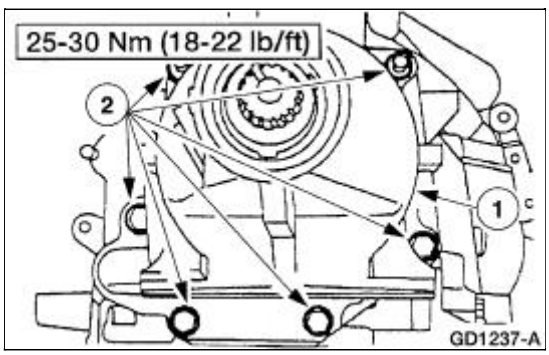


9. Remove the exhaust hanger.

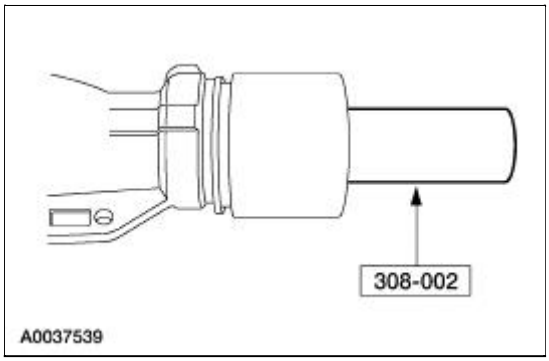


10. Lower the transmission to access the extension housing bolts.

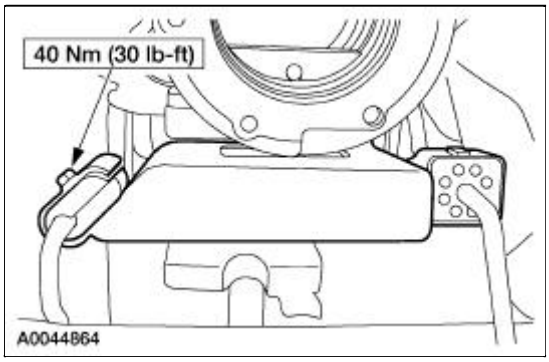
11. Using the special tool, remove the extension housing seal.



12. Remove the extension housing and gasket.
    1. Remove the bolts and nuts.
    2. Remove the extension housing and gasket.

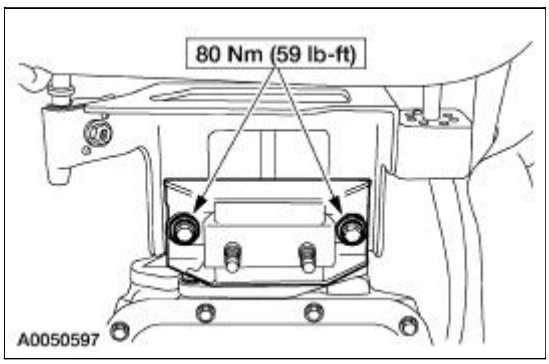


Installation

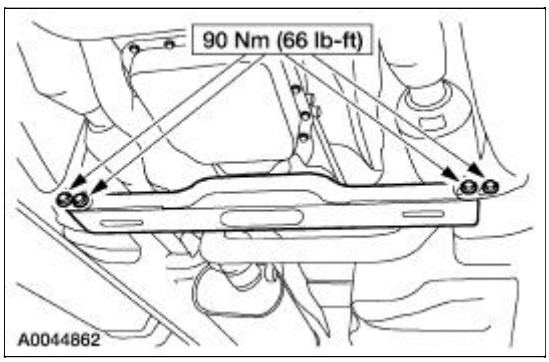


1. Install the extension housing and gasket.
    1. Position the extension housing gasket and the extension housing.
    2. Install the bolts and nuts.

2. Using the special tool, install the new extension housing seal.

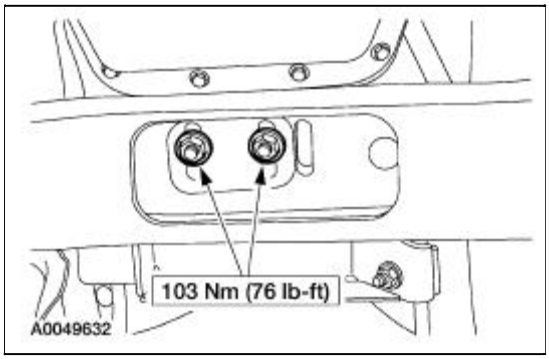


3. Install the exhaust hanger.

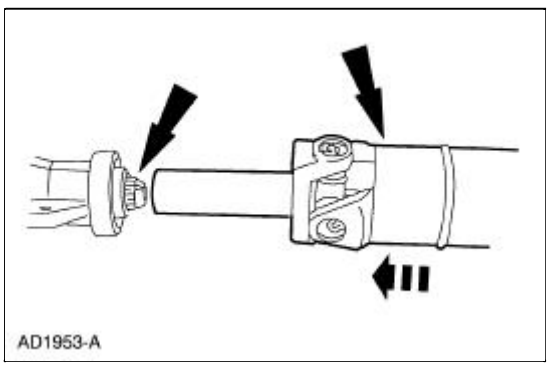


4. Raise and position the transmission.

5. Install the rear transmission support.

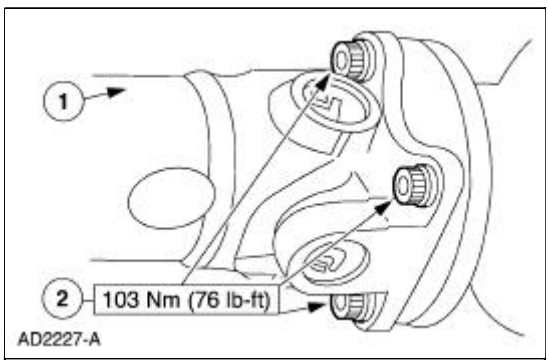


6. Install the transmission crossmember and the bolts.



7. Remove the high-lift transmission jack.

8. Install the rear transmission support nuts.



9. **NOTE:** The output shaft and the driveshaft are a balanced assembly.

   Install the driveshaft.
   - Align the yellow dots and position the driveshaft on the transmission.
   - Position the driveshaft to the rear differential.

10. **NOTE:** To maintain initial driveshaft balance, align the index marks made during removal.

    Install the rear driveshaft.
    1. Position the driveshaft.
    2. Install the four bolts.

11. Lower the vehicle.

12. Connect the battery ground cable.

13. Fill the transmission with clean automatic transmission fluid and inspect for correct operation. For additional information, refer to Fluid Pan, Gasket and Filter in this section.

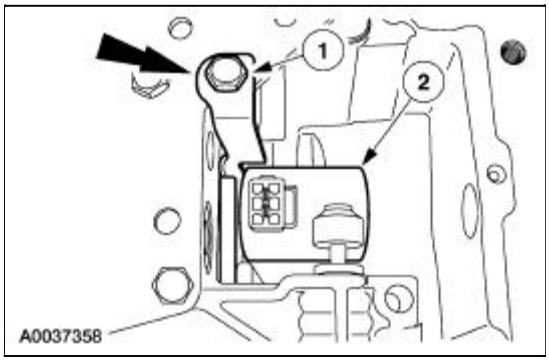
Electronic Pressure Control (EPC) Solenoid

Special Tool(s)

 ST2545-A	Gauge, Transmission Solenoid Connectors 307-426

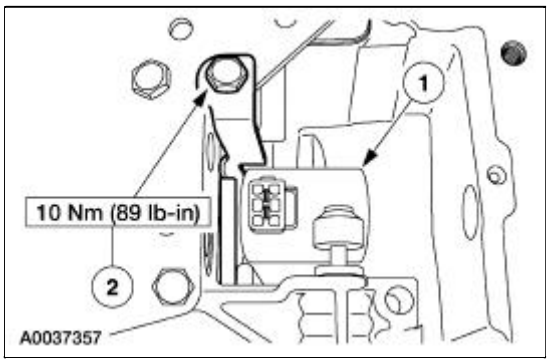
Removal

1. Remove the manual control lever. For additional information, refer to Manual Control Lever Shaft and Seal in this section.



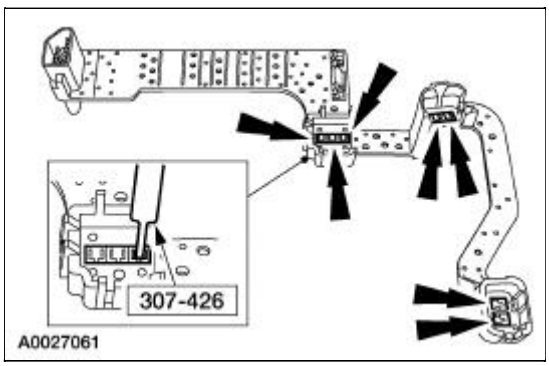
2. **CAUTION: Do not pull on the molded lead frame. This may cause damage to the connector ends. Carefully pry up on the locking tabs to disconnect the solenoids. Disconnect the molded lead frame from the solenoids.**

   Disconnect the molded lead frame from the solenoids.
   1. Disconnect the shift solenoid SSA and SSB.
   2. Disconnect the torque converter clutch (TCC).
   3. Disconnect the electronic pressure control (EPC) solenoid.
   4. Disconnect the bulkhead inter-connector.



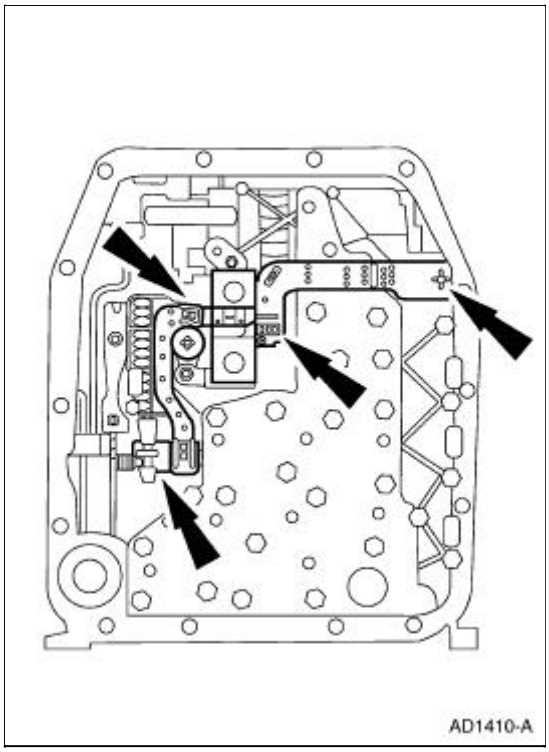
3. Remove the EPC solenoid.
   1. Remove the bolt and EPC solenoid bracket.

2. Remove the EPC solenoid.



Installation

1. Install the EPC solenoid.
    1. Install the EPC solenoid.
    2. Install the EPC solenoid bracket and bolt.



2. Inspect the lead frame for damage.
    - Using the special tool, check all lead frame solenoid connections. The gauge should fit tightly and not fall out after being inserted.
    - If the special tool passes through any lead frame connector pins or does not feel like it makes a good contact, install a new lead frame.

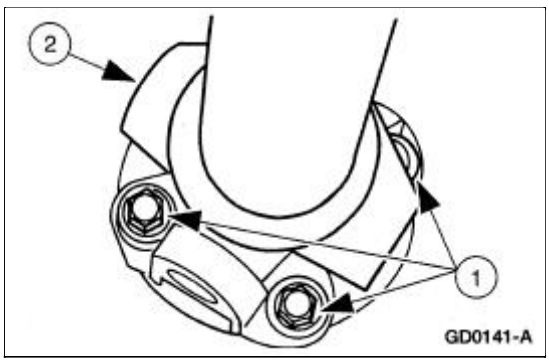
3. Connect the molded lead frame to the solenoids.
    - Connect the bulkhead inter-connector by pressing it in place by hand and fully seating the connector in place.
    - Connect the EPC solenoid by pressing it in place by hand and fully seating the connector in place. Make sure that the terminals pass fully through the connector slots.
    - Connect the TCC by pressing it in place by hand and fully seating the connector in place.

Make sure that the terminals pass fully through the connector slots.

- Connect the shift solenoid SSA and SSB by pressing it in place by hand and fully seating the connector in place. Make sure that the terminals pass fully through the connector slots.

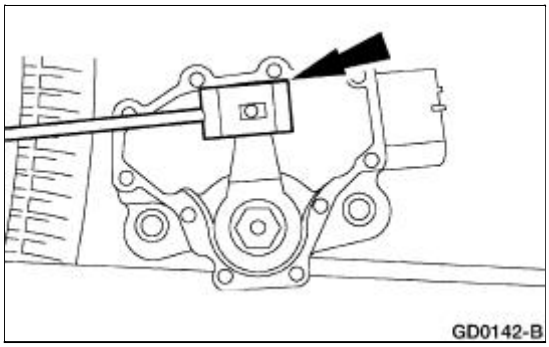
4. Install the manual control lever. For additional information, refer to Manual Control Lever Shaft and Seal in this section.

Manual Control Lever Shaft and Seal



Special Tool(s)

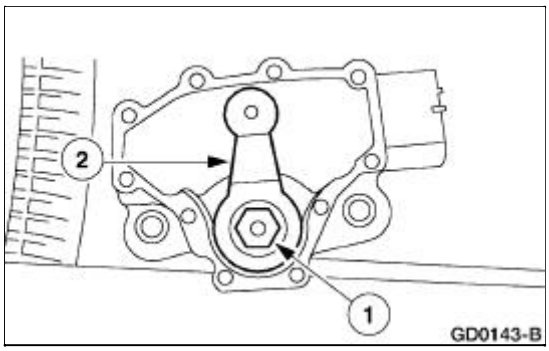
 ST1633-A	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)
 ST1199-A	Installer, Shift Shaft Fluid Seal 307-050 (T74P-77498-A)



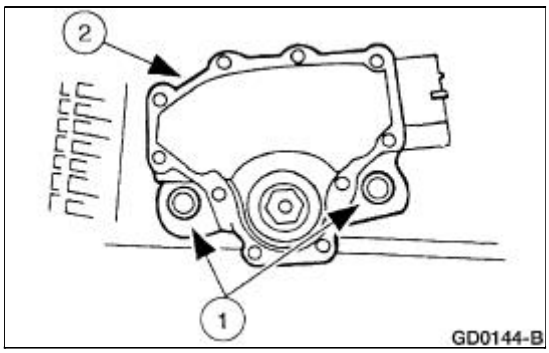
Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Raise and support the vehicle. For additional information, refer to Section 100-02 .
3. **NOTE:** Mark the driveshaft flange and rear axle pinion flange for correct alignment during installation.

   On 4x4 vehicles, remove the front driveshaft.
   1. Remove the eight front driveshaft bolts (four each end).
   2. Remove the front driveshaft.



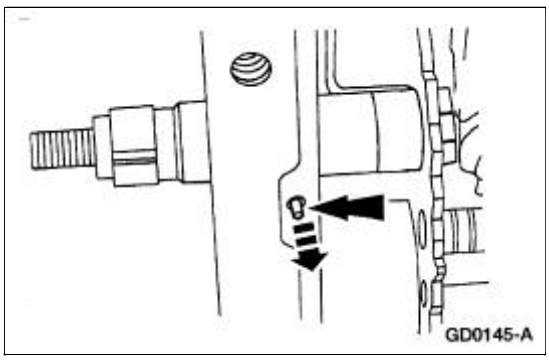
4. Drain the transmission fluid and remove the fluid pan and filter. For additional information, refer to Fluid Pan, Gasket and Filter in this section.
5. Disconnect digital TR sensor electrical connector.
6. Disconnect the transmission shift linkage.



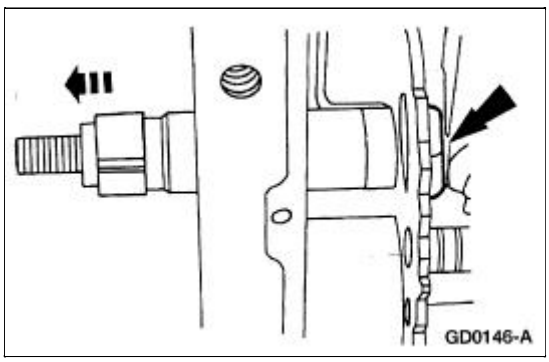
7. **CAUTION: Discard outer manual control lever shaft nut. Do not reuse. The old nut will not retain torque specification.**

   Remove the manual control lever.
   1. Remove the outer manual control lever shaft nut.
   2. Remove the manual control lever.

8. Remove the digital transmission range TR sensor.
   1. Remove the two bolts.
   2. Remove the digital TR sensor.



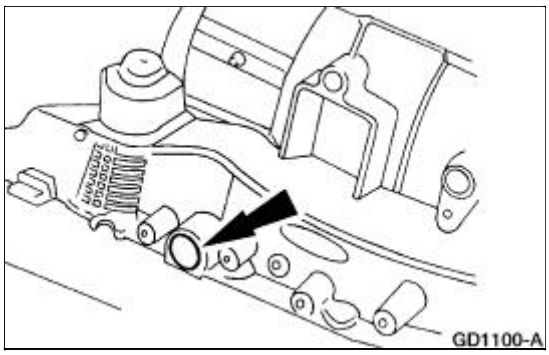
9. Remove the manual control valve detent lever spring.
   1. Remove the bolt.
   2. Remove the manual control valve detent lever spring.



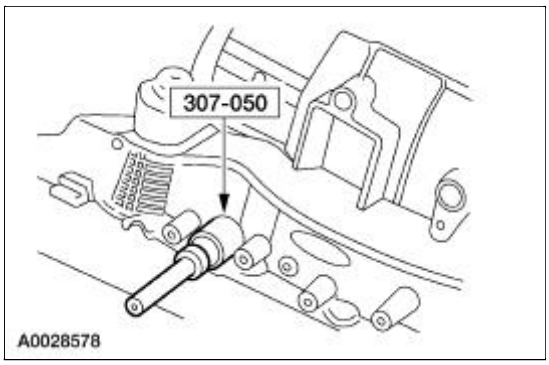
10. **NOTE:** Use a shop cloth to protect the transmission case surface.

    Remove the manual lever shaft retaining pin.

11. Remove the inner manual control lever shaft nut and slide the manual control lever shaft out of the case.

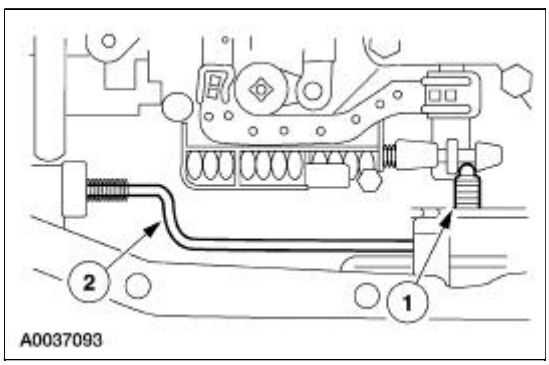


12. Remove the parking lever actuating rod.
    1. Remove the manual valve detent lever.
    2. Remove the parking lever actuating rod.

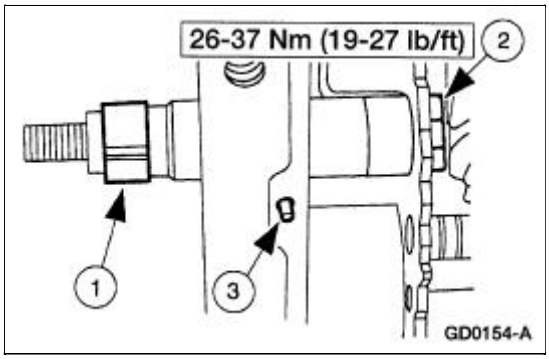


13. **CAUTION: Use care not to damage the manual control lever shaft bore. The new seal can leak.**

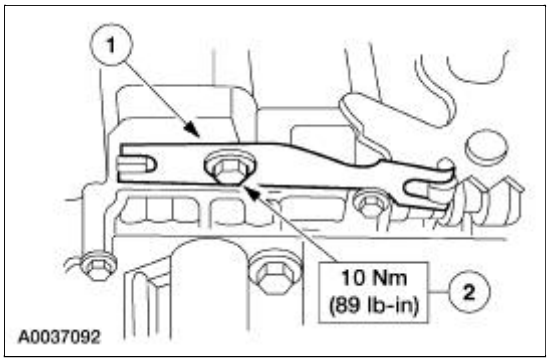
    Remove the manual control lever shaft seal.



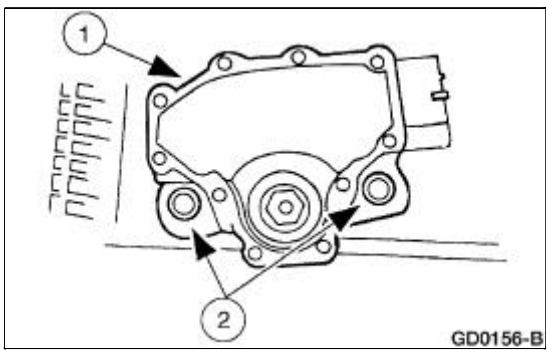
Installation



1. Using the special tool, install the manual control lever seal.

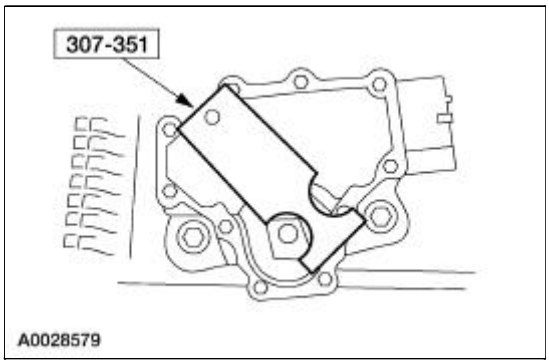


2. Install the parking lever actuating rod.
    1. Install the manual valve detent lever.
    2. Install the parking lever actuating rod.

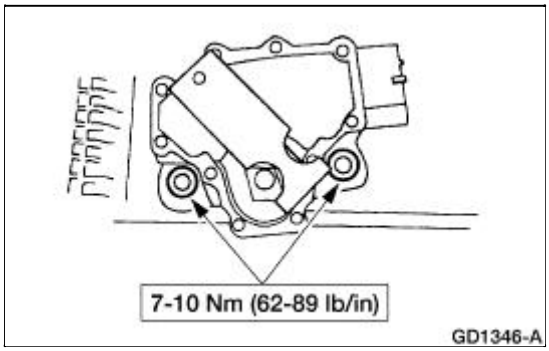


3. Install the manual control lever shaft.
    1. Install the manual control lever shaft.
    2. Install the inner manual control lever shaft nut.
    3. Install the manual lever shaft retaining pin.

4. Install the manual valve detent lever spring.
    1. Position the manual valve detent lever spring.
    2. Install the manual valve detent lever spring bolt.

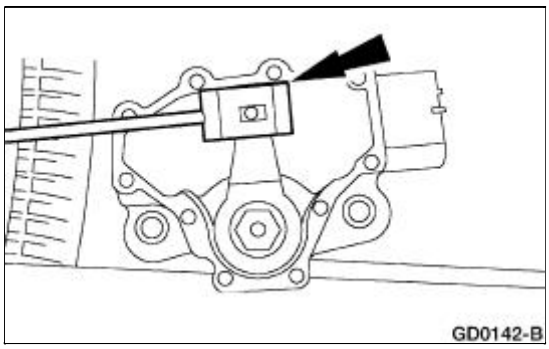


5. Install the digital TR sensor.
    1. Install the digital TR sensor.
    2. Loosely install the bolts.



6. **NOTE:** Manual shift lever must be in the neutral position.

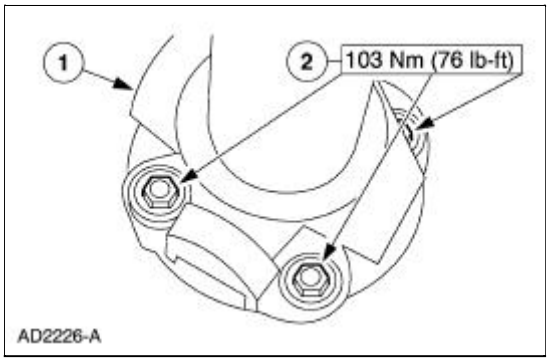
    Using the special tool, align the digital TR sensor slots. The tool is designed to fit snug.



7. Tighten the bolts.

8. Install the manual control lever.
    1. Position the manual control lever.
    2. Install a new manual lever shaft outer nut.

9. With manual lever in overdrive, connect the shift control cable.



10. Install digital TR sensor electrical connector.

11. Install the filter and transmission fluid pan.

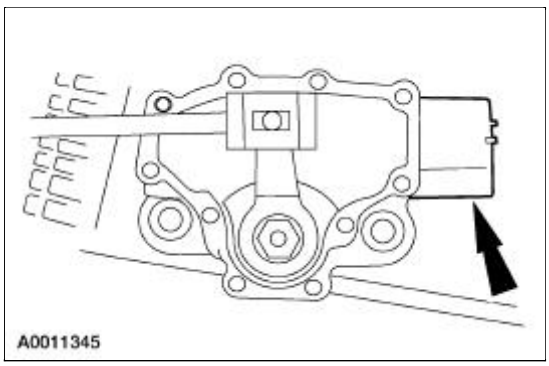
12. **NOTE:** To maintain initial driveshaft balance, align the index marks made during removal.

    On 4x4 vehicles, install the front driveshaft.
    1. Position the front driveshaft.
    2. Install the eight front driveshaft bolts (four each end).

13. Lower the vehicle.

14. Connect the battery ground cable.

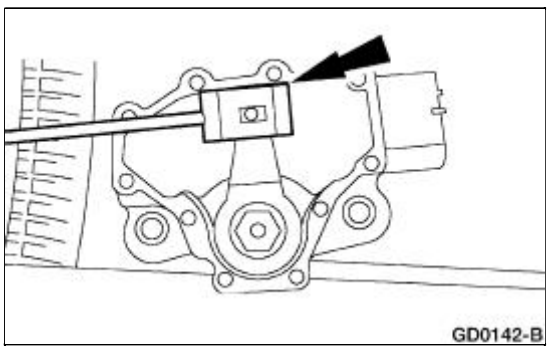
15. Fill the transmission with clean automatic transmission fluid and inspect for correct operation. For additional information, refer to Fluid Pan, Gasket and Filter in this section.



Digital Transmission Range (TR) Sensor

Special Tool(s)

 ST1633-A	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)

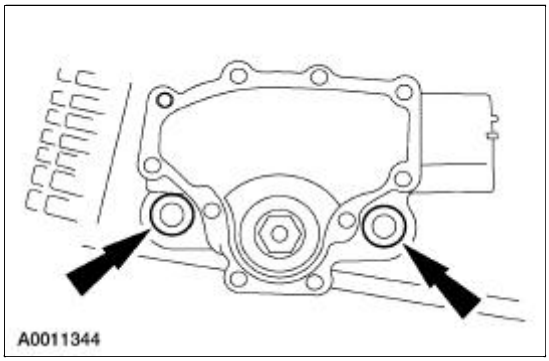


Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Raise and support the vehicle. For additional information, refer to Section 100-02 .
3. Disconnect the digital TR electrical connector.

4. **CAUTION: Do not pry on the swivel tube to disconnect the transmission shift linkage.**

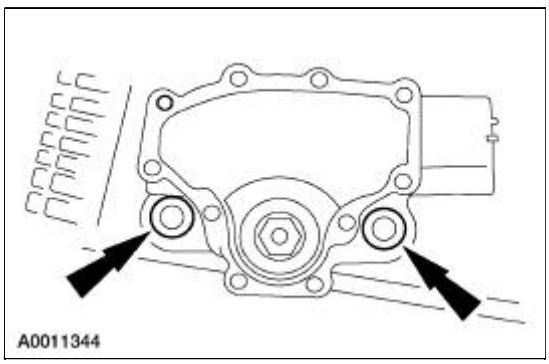
   Disconnect the manual lever shift control cable.



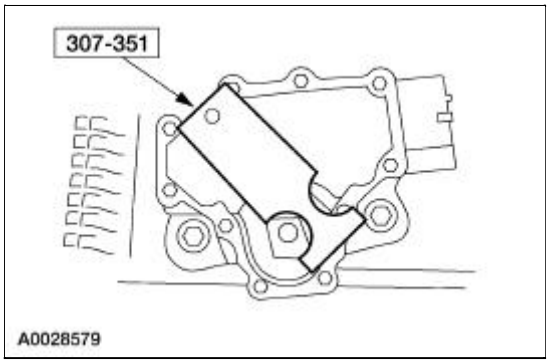
5. **CAUTION: Discard outer manual control lever shaft nut. Do not reuse. The old nut will not retain torque specification.**

Remove the manual control lever.

1. Remove the nut.
2. Remove the lever.

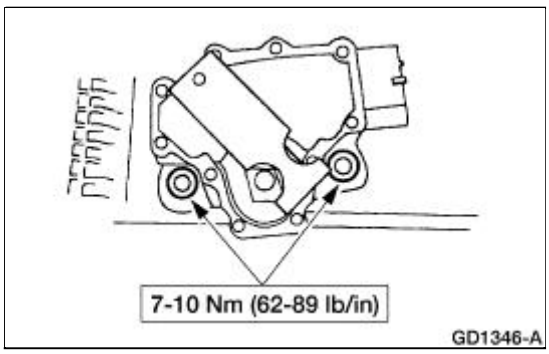


6. Remove the digital TR sensor bolts and the TR sensor.



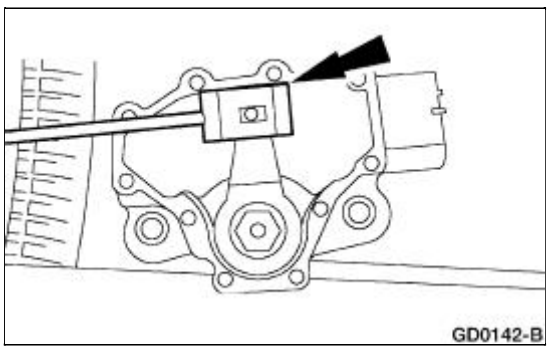
Installation

1. Install the digital TR sensor and loosely install the bolts.

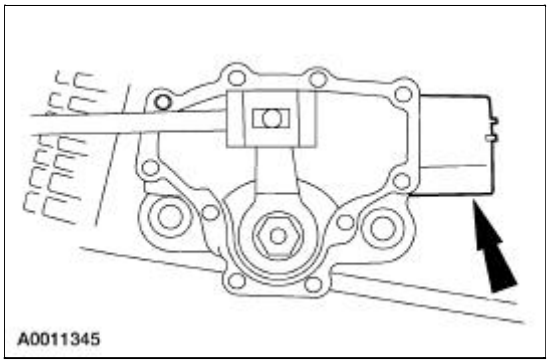


2. **NOTE:** Manual shift lever must be in the neutral position.

   Using the special tool, align the digital TR sensor slots. The tool is designed to fit snug.



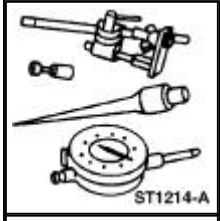
3. Tighten the bolts.

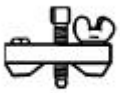


4. Install the manual control lever.
    1. Position the manual control lever.
    2. Install a new manual lever shaft outer nut.

5. With the manual lever in overdrive connect the shift lever control cable.

6. Install the digital TR sensor electrical connector.



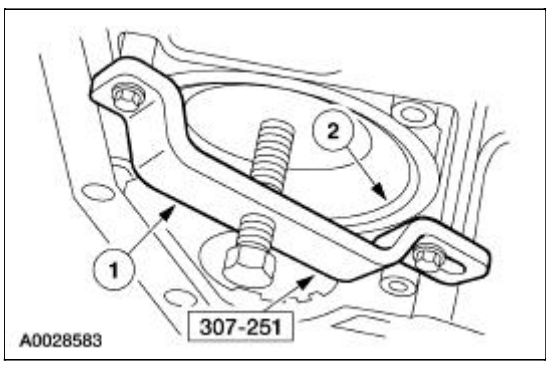


7. Lower the vehicle.

8. **NOTE:** When the battery is disconnect and reconnected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

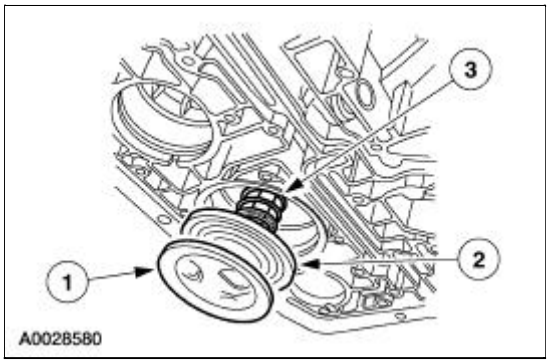
   Connect the battery ground cable. For additional information, refer to Section 414-01 .

Reverse Servo Assembly



Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C)
 ST1210-A	Remover/Installer, Servo Piston 307-251 (T92P-70023-A)
 ST1202-A	Installer, Servo Piston 307-073 (T80L-77030-A)

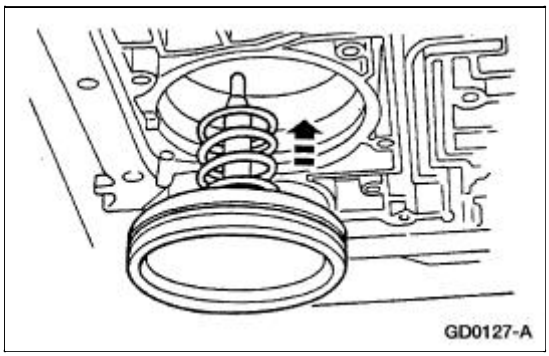


Removal

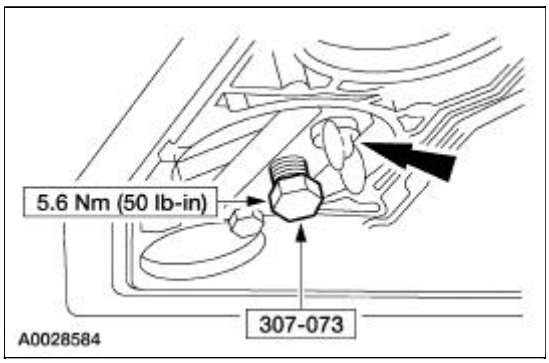
1. Remove the main control valve body. For additional information, refer to Main Control Valve Body in this section.

2. Using the special tool, remove the reverse band servo retaining ring.
   1. Compress the servo spring.
   2. Remove the reverse band servo retaining ring.

3. Remove the reverse servo assembly.
   1. Remove the reverse band servo cover.
   2. Remove the reverse band servo piston and rod.
   3. Remove the reverse band servo spring.



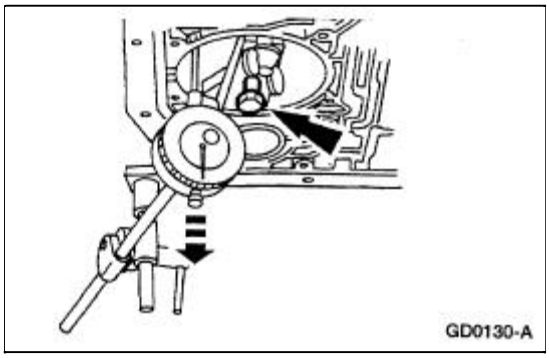
Installation



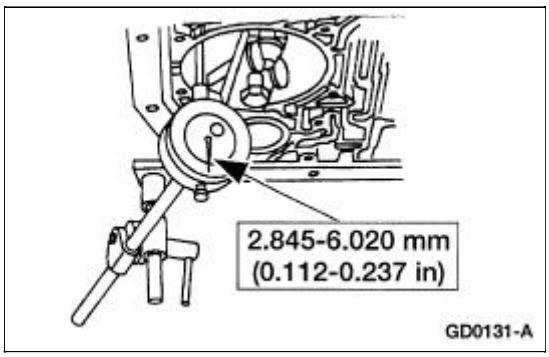
NOTE: This is not an ordinary installation procedure and does not compensate for band wear.

1. **NOTE:** Lubricate the reverse piston seal to facilitate assembly and prevent damage to the seal.

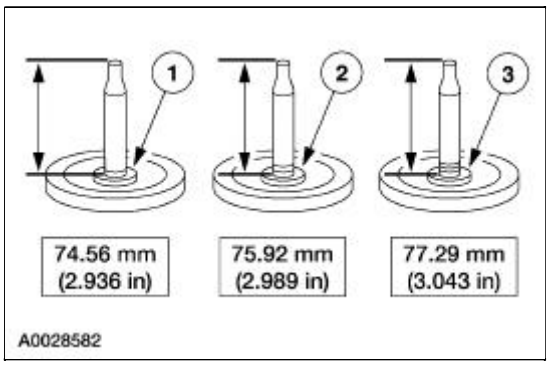
   Install the reverse servo return spring and piston.
   - Do not install the piston cover.



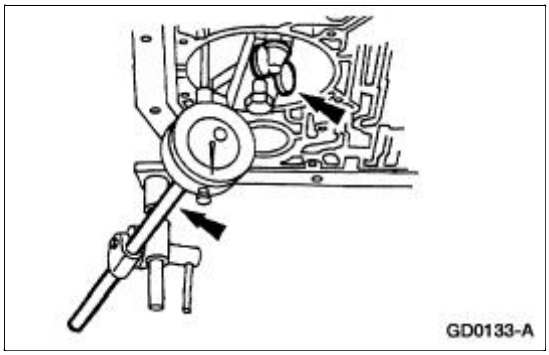
2. Install the special tool and tighten the band apply bolt.



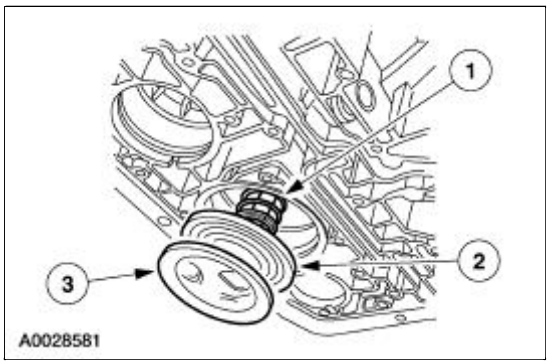
3. Attach the special tool to the transmission.
   - Position the indicator stem on the flat portion of the reverse servo piston and zero the dial indicator.



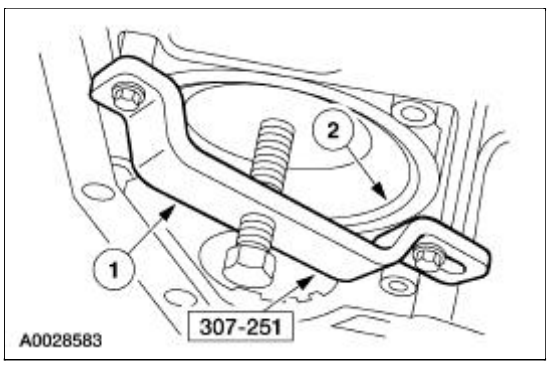
4. Loosen the bolt until the piston stops against the tool.



5. Verify that the amount of piston travel on the dial indicator is within specification.



6. If piston travel is not within specification, select and install the correct servo piston assembly to bring the servo piston travel within specification.
    1. One groove
    2. Two groove
    3. Three groove



7. Remove the dial indicator and servo selection tool.

8. Install the correct reverse servo assembly.
    1. Install the reverse band servo spring.
    2. Install the reverse band servo piston and rod.
    3. Install the reverse band servo cover.

9. Using the special tool, install the reverse servo retaining ring.
    1. Compress the servo spring.
    2. Install the reverse band servo retaining ring.

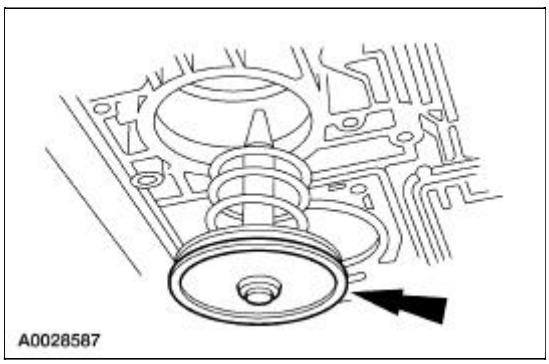
10. Install the main control valve body. For additional information, refer to Main Control Valve Body in this section.

Overdrive Servo

Special Tool(s)

 ST1210-A	Remover/Installer, Servo Piston 307-251 (T92P-70023-A)

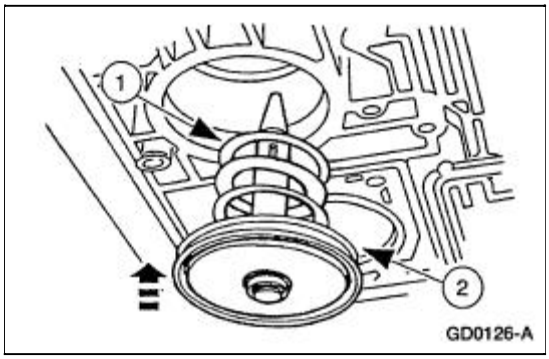
Removal



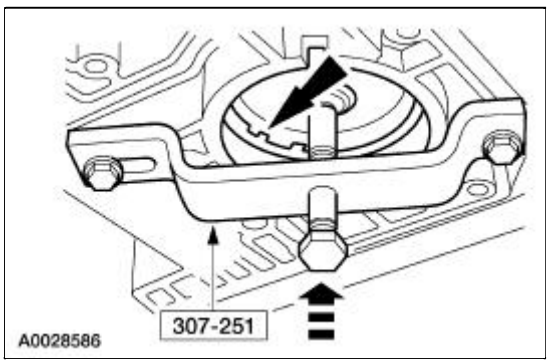
1. Remove the main control valve body. For additional information, refer to Main Control Valve Body in this section.

2. **NOTE:** If the tool is not available, extreme care must be taken. Spring pressure will force overdrive servo piston assembly out of case. Case bore damage may result from trying to pry on overdrive servo internal retaining ring.

   Using the special tool, compress the servo spring to remove the overdrive servo retaining ring.



3. Remove the overdrive servo piston and return spring.

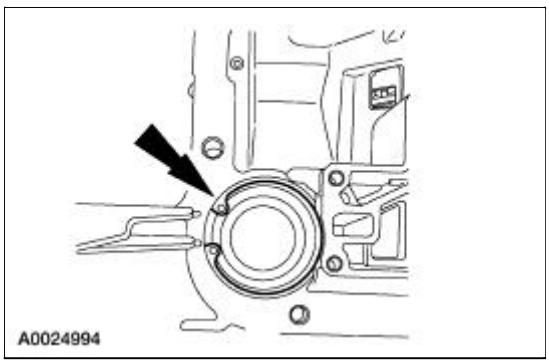


Installation

1. Install the overdrive servo piston assembly.
   1. Install the overdrive servo piston return spring.

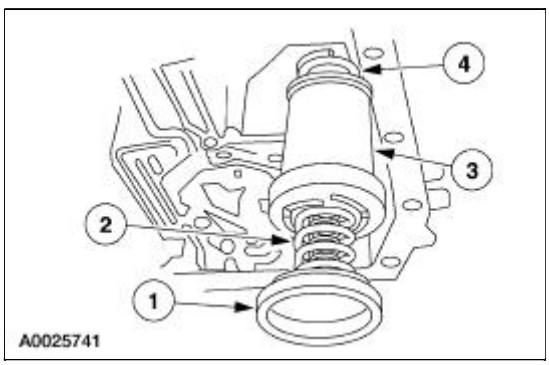
2. Install the overdrive servo piston assembly.

2. Use the special tool to install the overdrive servo piston retaining ring.



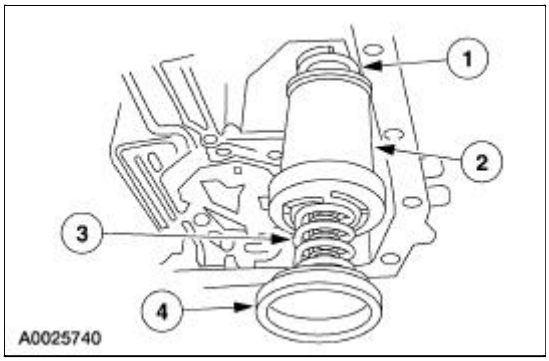
3. Install the main control valve body. For additional information, refer to Main Control Valve Body in this section.

1-2 Accumulator



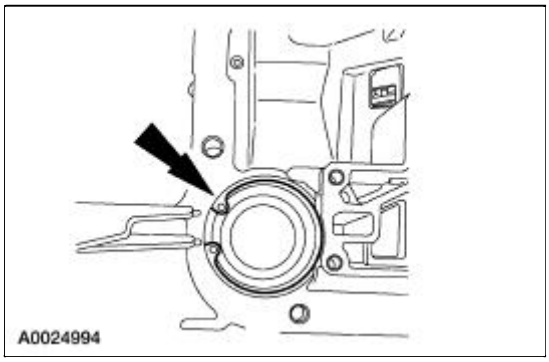
Removal

1. Compress the 1-2 accumulator cover and remove the accumulator piston retaining ring.



2. **NOTE:** Note the location of the 1-2 accumulator springs for reference during assembly.

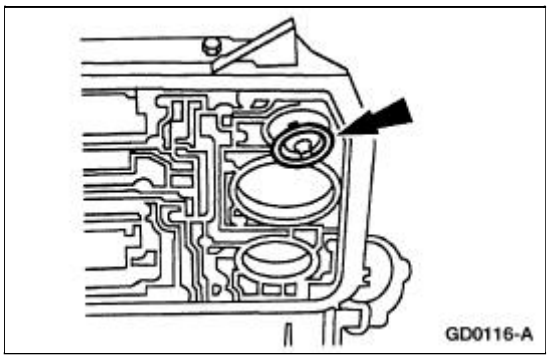
   Remove the 1-2 accumulator.
   1. Remove the 1-2 accumulator cover.
   2. Remove the inner and outer 1-2 accumulator springs.
   3. Remove the accumulator piston.
   4. Remove the upper 1-2 accumulator spring.



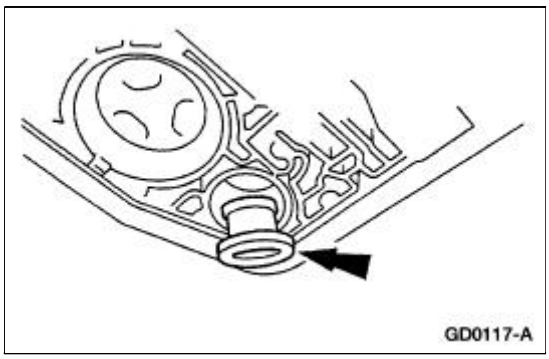
Installation

1. Install the 1-2 accumulator.
   1. Install the 1-2 accumulator upper spring.
   2. Install the accumulator piston.
   3. Install the inner and outer 1-2 accumulator springs.
   4. Install the cover and seal assembly.

2. Compress the 1-2 accumulator springs and install the accumulator piston retaining ring.



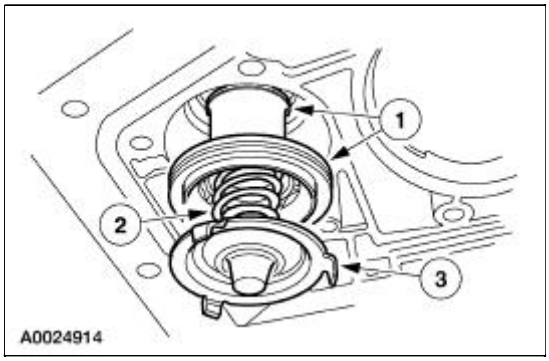
2-3 Accumulator



Removal

1. Remove the main control valve body. For additional information, refer to Main Control Valve Body in this section.

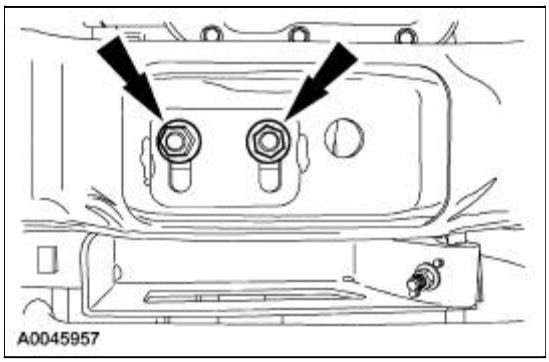
2. Remove the 2-3 accumulator piston retainer.



3. Remove the accumulator piston and spring.

Installation

1. Install the 2-3 accumulator assembly.
    1. Install the accumulator piston.
    2. Install the accumulator piston spring.
    3. Install the accumulator spring retainer.

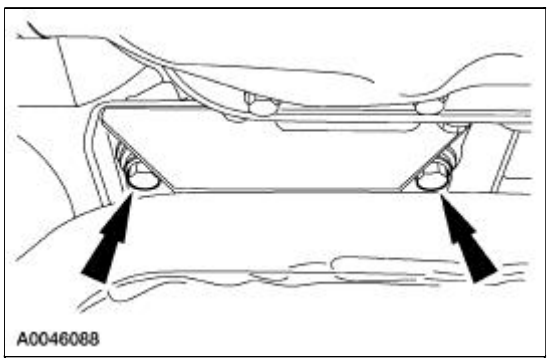


2. Install the main control valve body. For additional information, refer to Main Control Valve Body in this section.

Transmission Insulator and Retainer

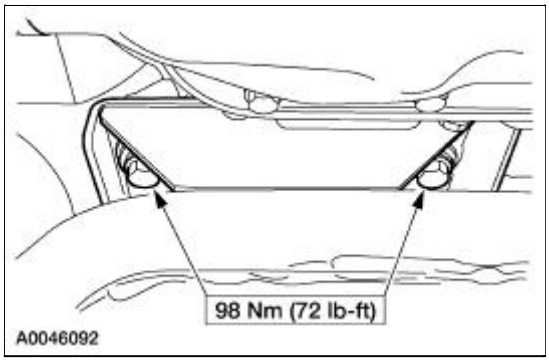
Removal

1. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .



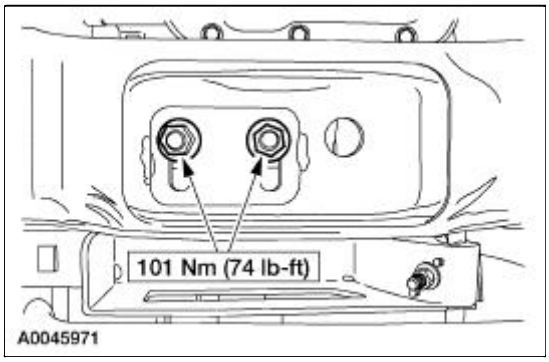
2. Remove the rear transmission support nuts.

3. Install a suitable transmission jack.



4. **CAUTION: Be sure not to raise the back of the transmission too high, if it makes contact with the underbody, damage to the TSS and OSS sensors will occur.**

   Slightly raise the rear of the transmission and remove the bolts. Remove the rear transmission mount.



Installation

1. Install the rear transmission mount and the bolts.

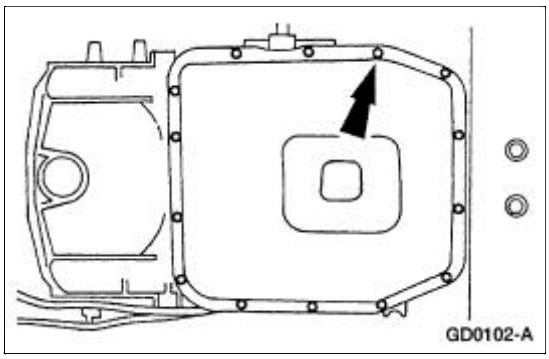
2. Lower the transmission onto the crossmember and install the nuts.

3. Remove the high lift transmission jack.
4. Lower the vehicle.
5. Connect the battery ground cable.

Transmission —4x2

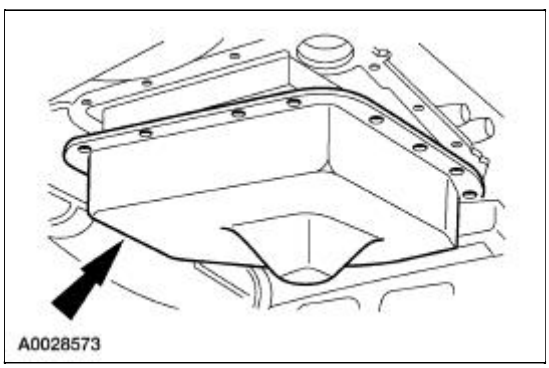
Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)



Removal

1. Position the vehicle on a hoist. Place in NEUTRAL. For additional information, refer to Section 100-02 .



2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. **NOTE:** If transmission disassembly is required, drain the transmission fluid.

   Loosen the transmission fluid pan bolts and allow the fluid to drain.

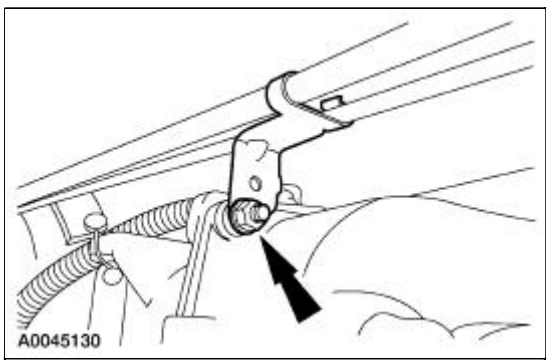
   
   GD0102-A

4. After the fluid has drained, remove the transmission fluid pan and drain the remaining fluid from the pan.

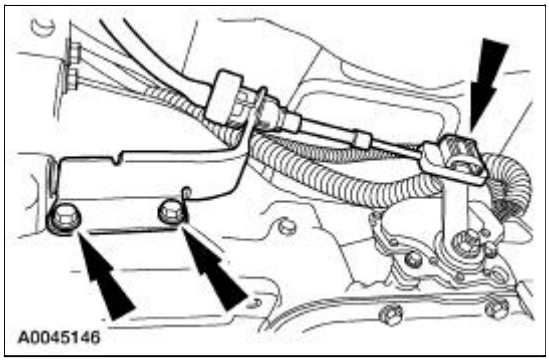
   
   A0028573

5. **NOTE:** It is not necessary to torque the transmission fluid pan bolts in this step.

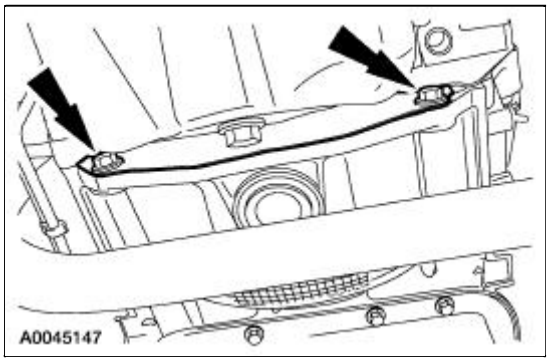
   Install the transmission fluid pan.



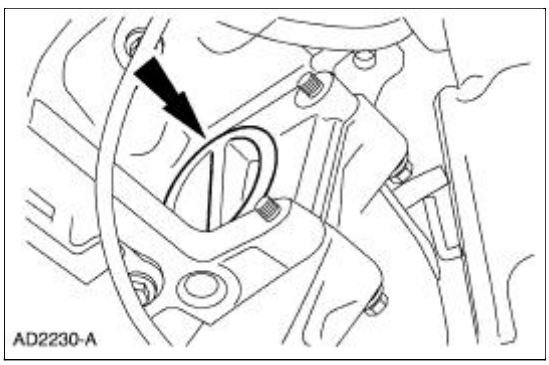
6. Mark the driveshaft flange and rear axle pinion flange for correct alignment during installation.



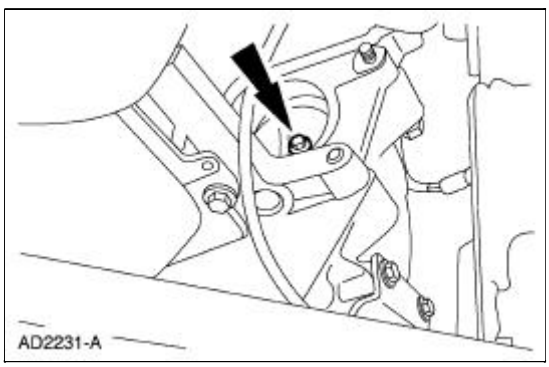
7. Remove the rear driveshaft.
    1. Remove the four bolts.
    2. Remove the driveshaft.



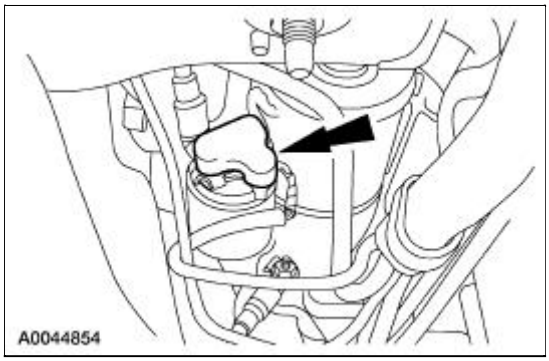
8. Remove the fuel line bracket from the extension bolt.



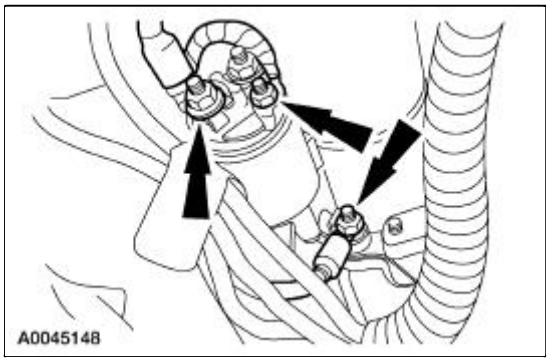
9. Disconnect the shift cable end and remove the shift cable bracket.



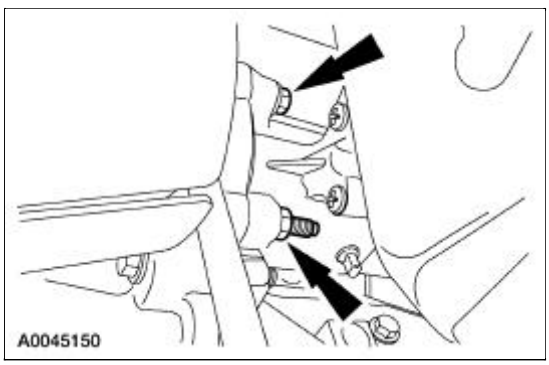
10. Remove the flexplate inspection cover.



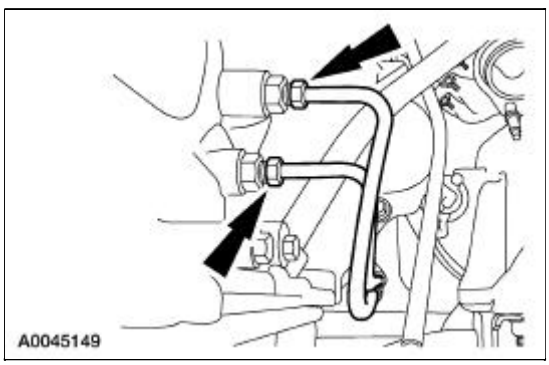
11. Remove the rubber access plug.



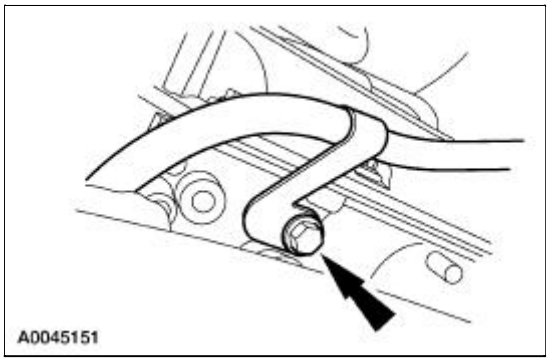
12. Remove and discard the four flexplate-to-torque converter nuts.



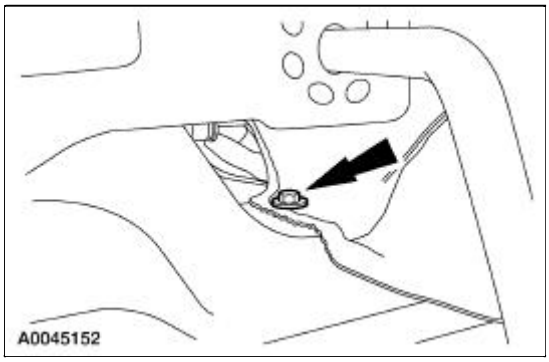
13. Remove the plastic starter motor electrical connector cap.



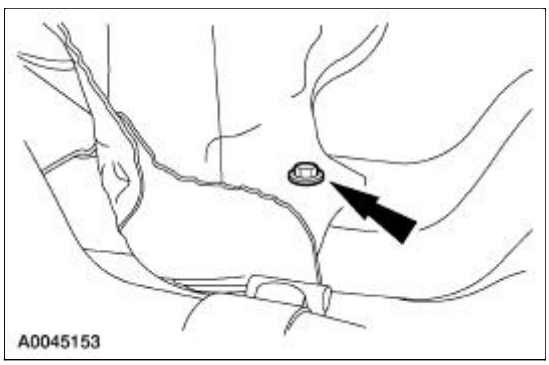
14. Remove the starter motor electrical connectors and the ground wire.



15. Remove the three bolts and the starter motor.

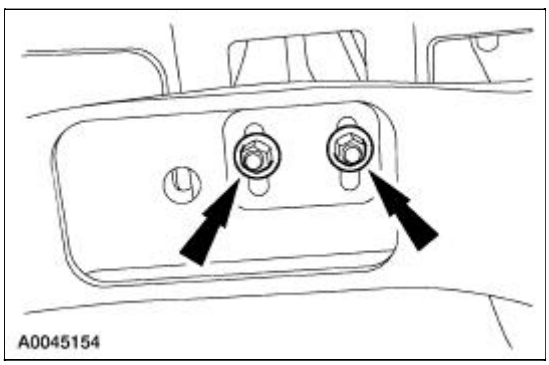


16. Disconnect the transmission cooler lines and position them aside.

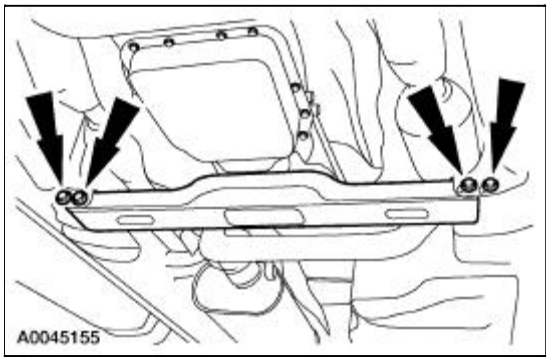


17. Remove the bolt from the RH cylinder head for the transmission filler tube and position the filler tube aside.

18. Remove the RH exhaust shield bolt.

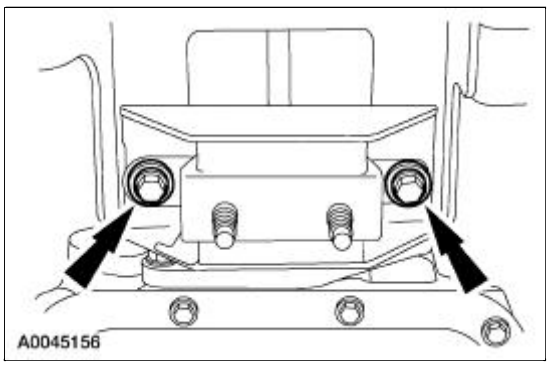


19. Remove the LH exhaust shield bolt.

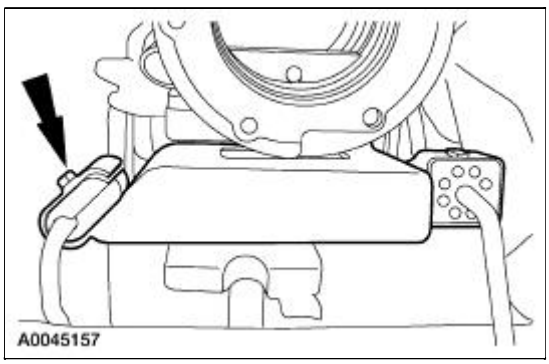


20. **NOTE:** Make sure that the transmission is securely fastened to the transmission jack.

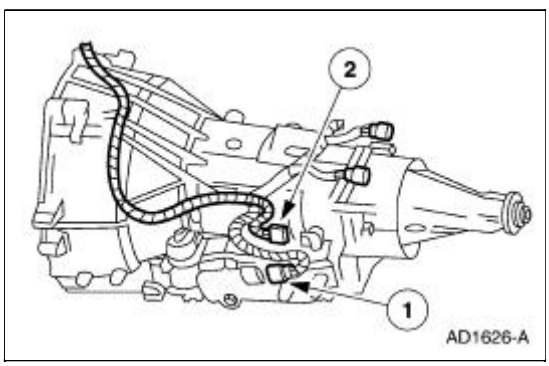
    Position a suitable high-lift transmission jack under the transmission.



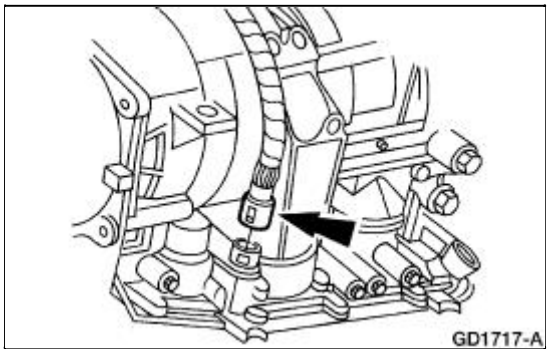
21. Remove the rear crossmember bolts.



22. Remove the rear transmission retainer nuts and remove the crossmember.

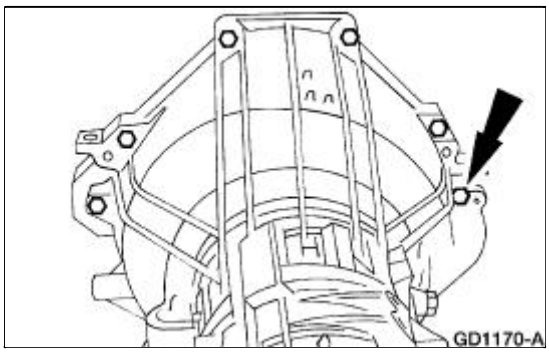


23. Remove the rear transmission support.



24. Remove the exhaust hanger.

25. Disconnect the transmission electrical connectors.
    1. Disconnect the digital transmission range (TR) sensor.
    2. Disconnect the output shaft speed (OSS) sensor.



26. Disconnect the solenoid body assembly electrical connector.

27. **NOTE:** If the transmission fluid has not been drained, position a drain pan and install a suitable plug into the transmission.

    NOTE: Note the length and the location of the bolts during removal.

    Remove the seven transmission-to-engine bolts.

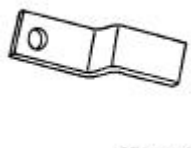
28. **WARNING: The torque converter is heavy and can result in injury if it falls out of the transmission. Secure the torque converter in the transmission.**

    Leaving the transmission in a horizontal position, slide it back far enough to install the special tool. Install the special tool.

29. **CAUTION: To remove the transmission from the vehicle, it will be necessary to put the transmission into a nose-down position to clear the flexplate and the exhaust system.**

    NOTE: Make sure that the special tool is in place and the transmission is securely fastened to the transmission jack before tilting the transmission.

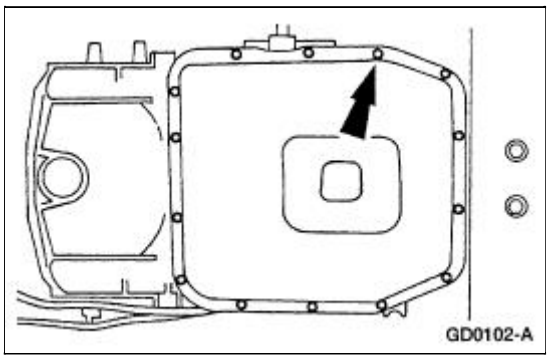
Lower the transmission from the vehicle.



30. If the transmission is to be overhauled or if installing a new transmission, carry out transmission backflushing and cleaning. Carry out transmission fluid cooler backflushing and cleaning. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.

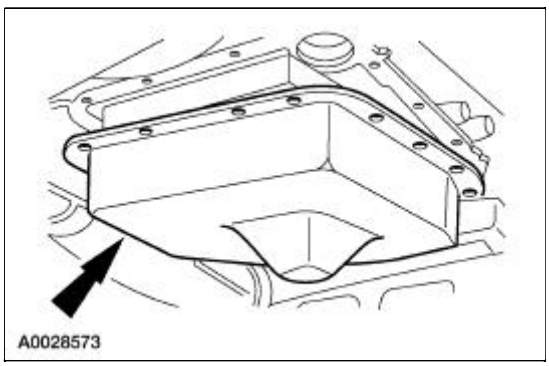
31. Remove the special tool.

Transmission —4x4



Special Tool(s)

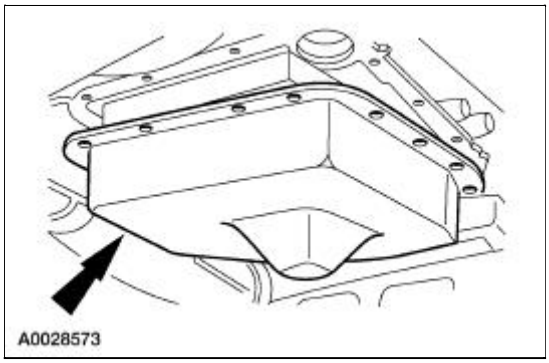
 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)



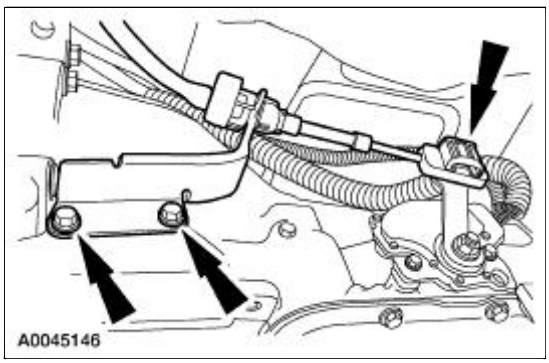
Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the transfer case. For additional information, refer to Section 308-07B .
3. **NOTE:** If transmission disassembly is required, drain the transmission fluid.

   Loosen the transmission fluid pan bolts and allow the fluid to drain.

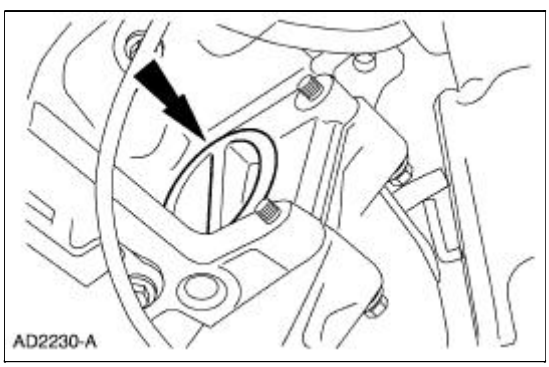


4. After the fluid has drained, remove the transmission fluid pan and drain the remaining fluid from the pan.

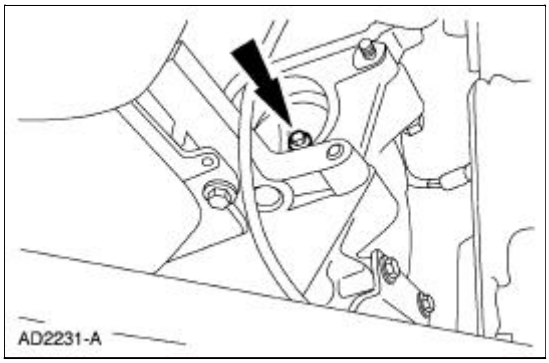


5. **NOTE:** It is not necessary to torque the transmission fluid pan bolts in this step.

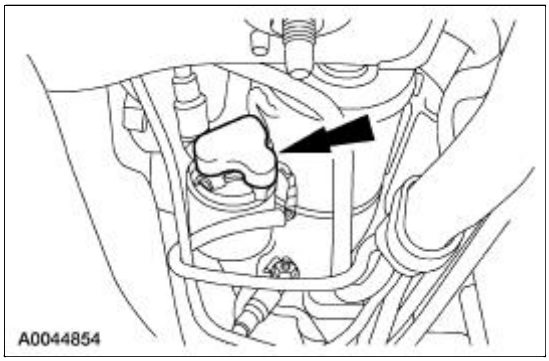
   Install the transmission fluid pan.



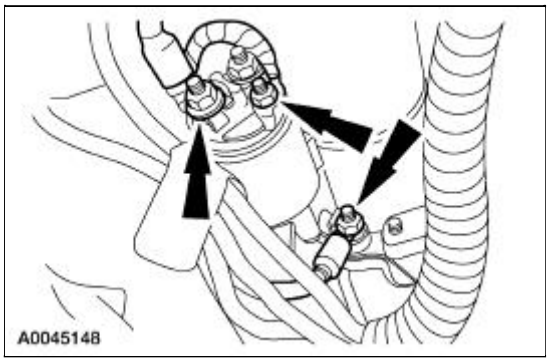
6. Disconnect the shift cable end and remove the shift cable bracket.



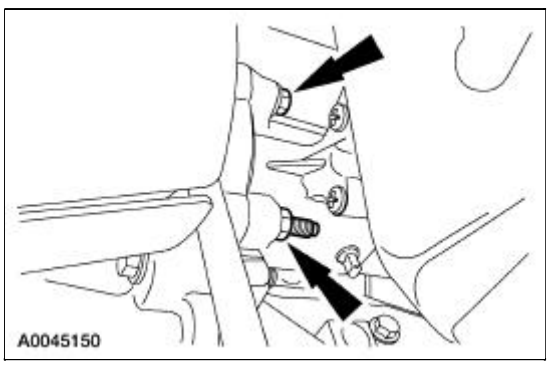
7. Remove the flexplate inspection cover.



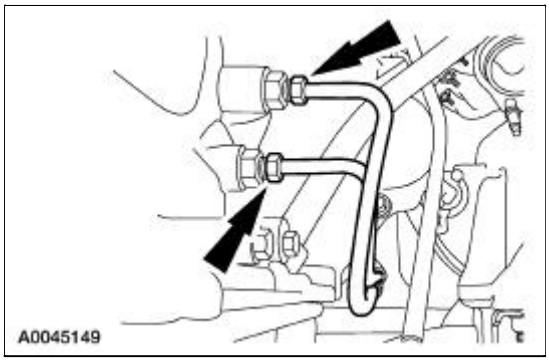
8. Remove the rubber access plug.



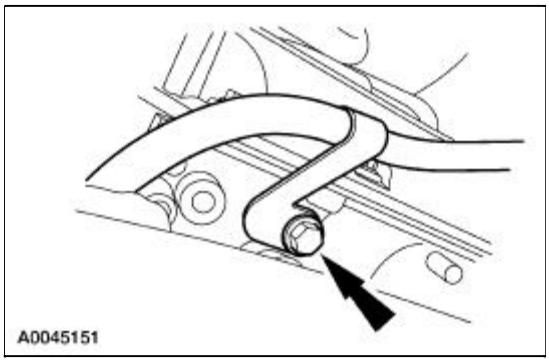
9. Remove and discard the four flexplate-to-torque converter nuts.



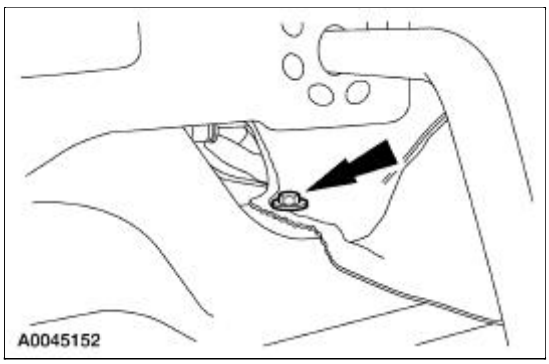
10. Remove the plastic starter motor electrical connector cap.



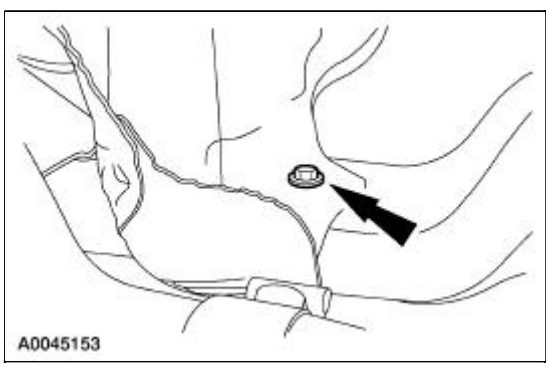
11. Remove the starter motor electrical connectors and the ground wire.



12. Remove the three bolts and the starter motor.

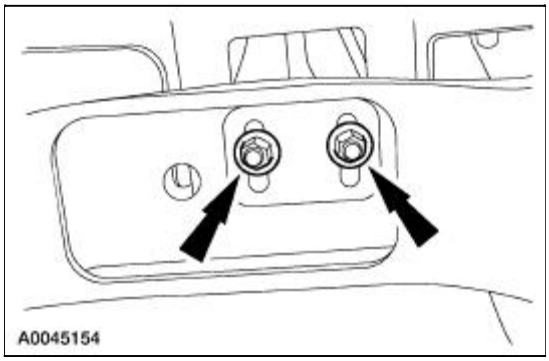


13. Disconnect the transmission cooler lines and position them aside.

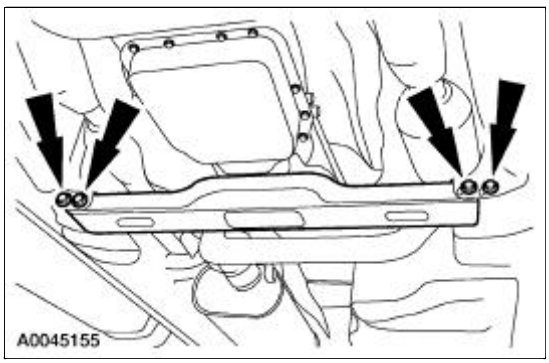


14. Remove the bolt from the RH cylinder head for the transmission filler tube and position the filler tube aside.

15. Remove the RH exhaust shield bolt.

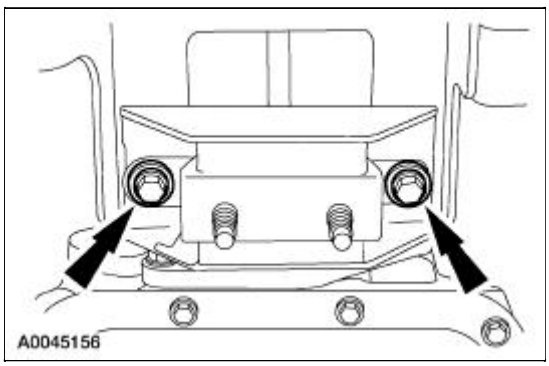


16. Remove the LH exhaust shield bolt.

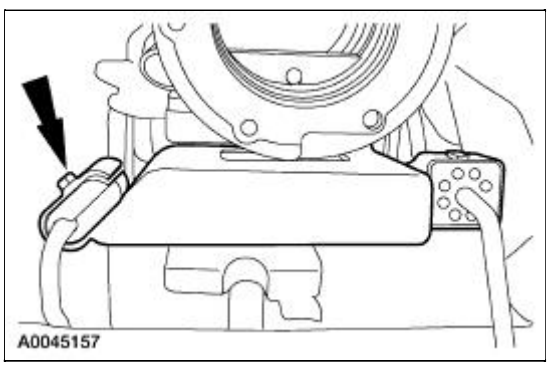


17. **NOTE:** Ensure that the transmission is securely fastened to the transmission jack.

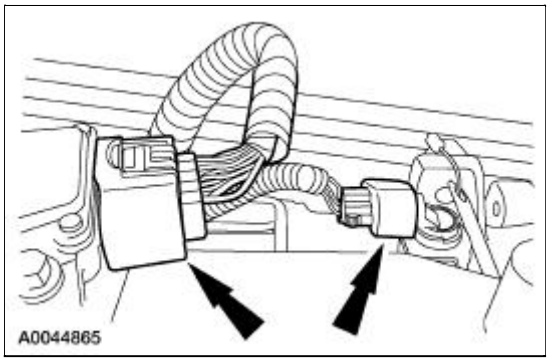
    Position a suitable high-lift transmission jack under the transmission.



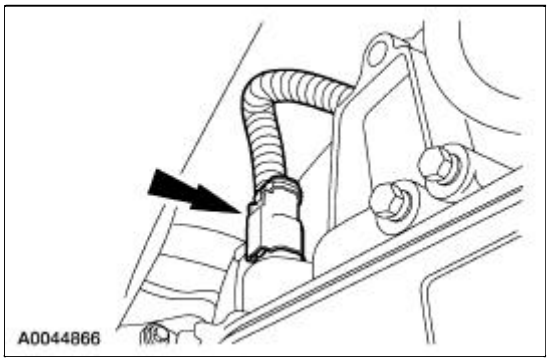
18. Remove the rear crossmember bolts.



19. Remove the rear transmission retainer nuts and remove the crossmember.

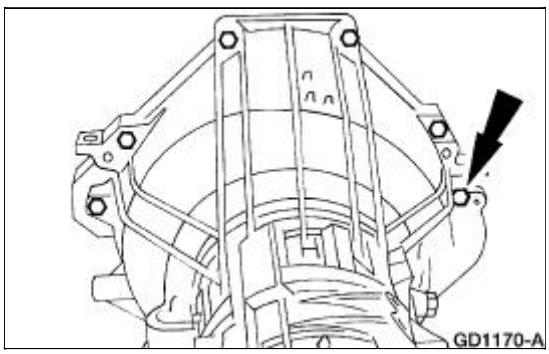


20. Remove the rear transmission support.

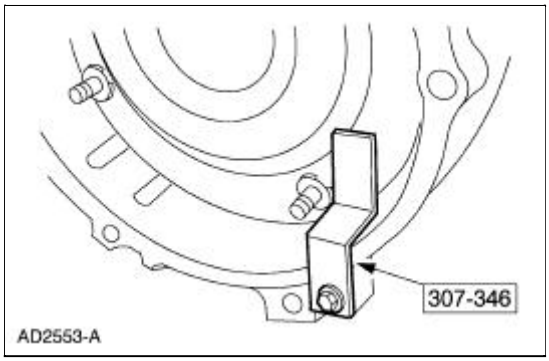


21. Remove the exhaust hanger.

22. Disconnect the digital transmission range (TR) sensor and the output shaft speed (OSS) sensor.



23. Disconnect the solenoid body assembly electrical connector.



24. **NOTE:** Note the length and the location of the bolts during removal.

    Remove the seven transmission-to-engine bolts.

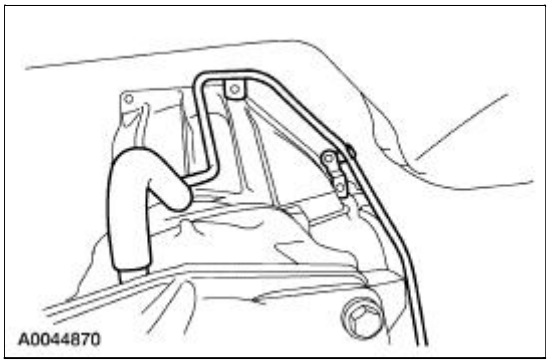
25. **WARNING: The torque converter is heavy and can result in injury if it falls out of the transmission. Secure the torque converter in the transmission.**

    Leaving the transmission in a horizontal position, slide it back far enough to install the special tool. Install the special tool.

26. **CAUTION: To remove the transmission from the vehicle, it will be necessary to put the transmission into a nose-down position to clear the flexplate and the exhaust system.**

    NOTE: Make sure that the special tool is in place and the transmission is securely fastened to the transmission jack before tilting the transmission.

    Lower the transmission from the vehicle.

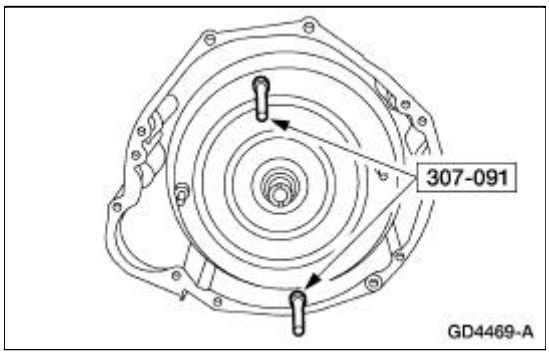


27. Once the transmission is clear of the vehicle the transmission fluid cooler and cooler tubes should be cleaned. Carry out transmission fluid cooler backflushing and cleaning. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.

28. Remove the special tool.

29. Remove the vent tube.

A0044870



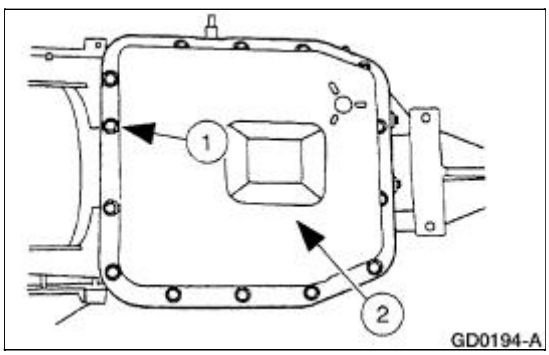
Transmission

Special Tool(s)

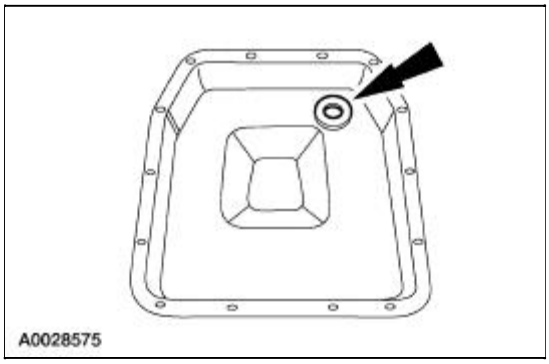
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)
 ST1186-A	Holding Fixture, Transmission 307-003 (T57L-500-B)
 ST1187-A	Slide Hammer 307-005 (T59L-100-B)
 ST1192-A	Remover, Transmission Fluid Seal 307-048 (T74P-77248-A)
 ST1631-A	Handle, Torque Converter 307-091 (T81P-7902-C)
 ST1208-A	Remover, Transmission Fluid Pump 307-221 (T89T-70010-A)
 ST1210-A	Remover/Installer, Servo Piston 307-251 (T92P-70023-A)
	Remover, Torque Converter Fluid Seal

 ST1192-A	307-309 (T94P-77001-BH)
 ST1200-A	Remover, Bearing Cup 308-047 (T77F-1102-A)

1. Using the special tools, remove torque converter.

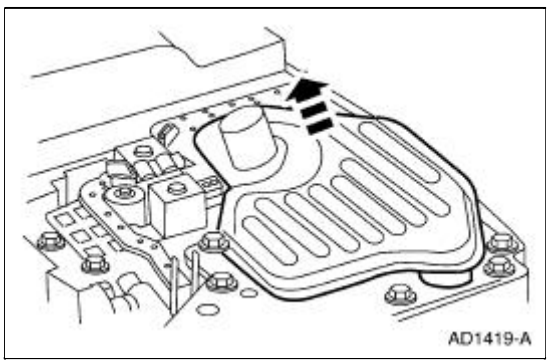


2. Using the special tool, mount the transmission to the bench.



3. **NOTE:** If the transmission fluid pan gasket is not damaged, it may be reused.

   Remove the transmission fluid pan and transmission fluid pan gasket.
   1. Remove the bolts.
   2. Remove the transmission fluid pan and transmission fluid pan to case gasket.

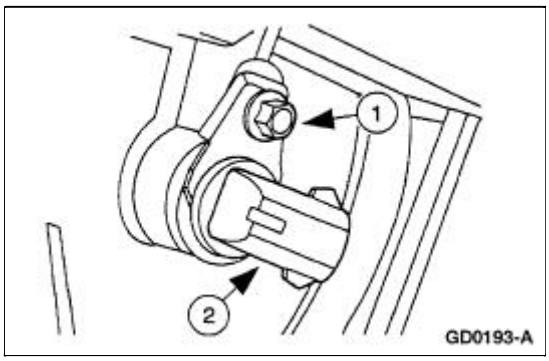


4. Clean the transmission fluid pan and pan magnet.

5. **CAUTION: If installing a new filter, and grommet remains in the main control bore, carefully use a small screwdriver to remove the grommet. Use care not to damage the main control bore.**

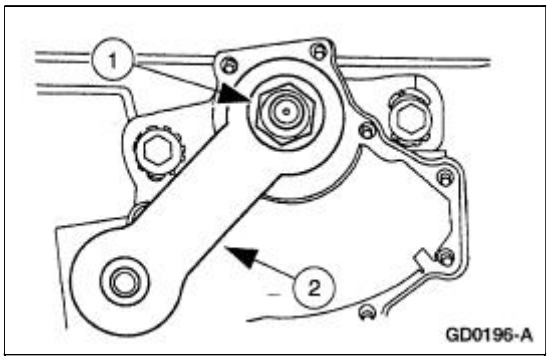
   NOTE: If transmission is being repaired for a contamination-related failure, use a new filter and seal. The filter may be reused if no excessive contamination is present.

   Remove the fluid filter and grommet.

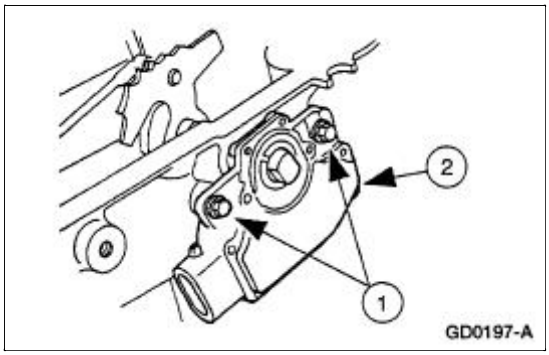


6. **CAUTION: Do not pull on the plastic lead frame. This may cause damage to the connector ends. Carefully pry up on the locking tabs to disconnect the solenoids. Disconnect the molded lead frame from the solenoids.**

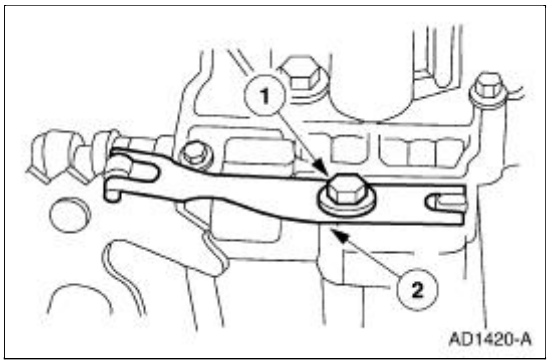
   Disconnect the molded lead frame from the solenoids.
   1. Disconnect the shift solenoid SSA and SSB.
   2. Disconnect the torque converter clutch (TCC).
   3. Disconnect the electronic pressure control (EPC) solenoid.
   4. Disconnect the bulkhead inter-connector.



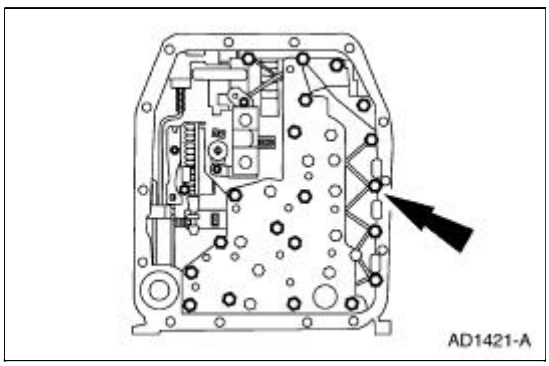
7. Remove the output shaft speed (OSS) sensor.
    1. Remove the bolt.
    2. Remove the OSS sensor.



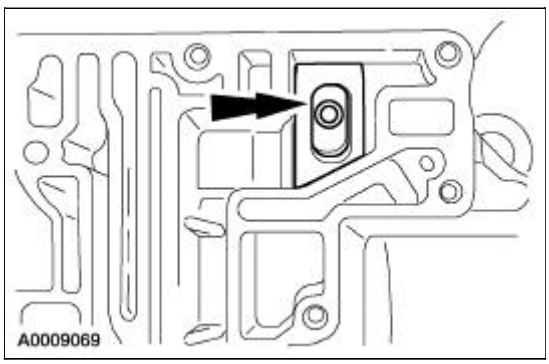
8. **CAUTION: Discard the manual lever shaft outer nut. Do not reuse.**



Remove the outer manual control lever.
1. Remove the manual lever shaft outer nut.
2. Remove the outer manual control lever.

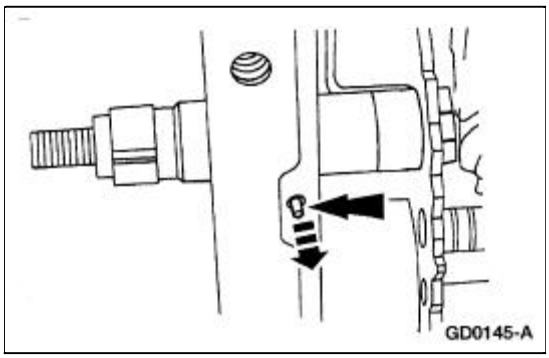


9. Remove the digital transmission range (TR) sensor.
    1. Remove the bolts.
    2. Remove the digital TR sensor.

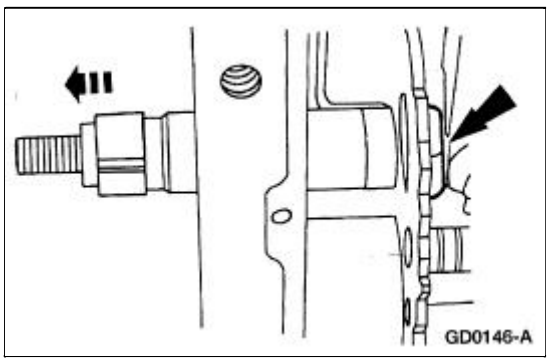


10. Remove the manual control valve detent lever spring.
    1. Remove the bolt.
    2. Remove the manual control valve detent lever spring.

11. Remove the 24 main control valve body bolts and the main control valve body.



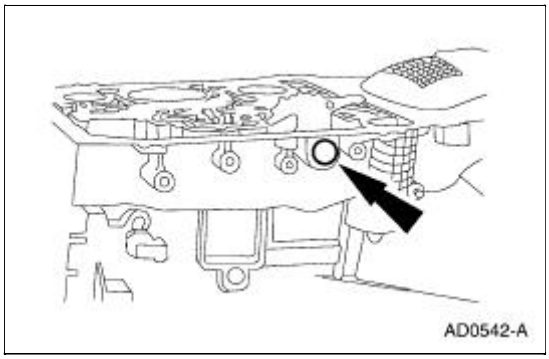
12. Remove and discard the pump outlet screen.



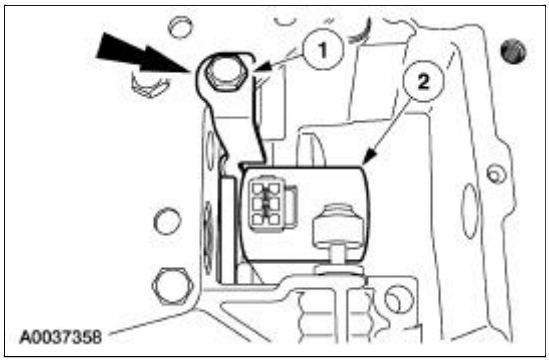
13. **NOTE:** Use a shop cloth to protect the transmission case surface.

    Remove the manual lever shaft retaining pin.

14. Remove the manual lever shaft inner nut.
    - Slide the manual control lever shaft out of the case while removing the inner nut.

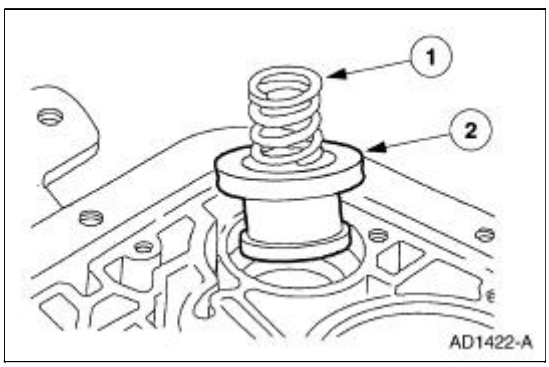


15. Remove the parking lever actuating rod.
    1. Remove the manual valve detent.
    2. Remove the parking lever actuating rod.

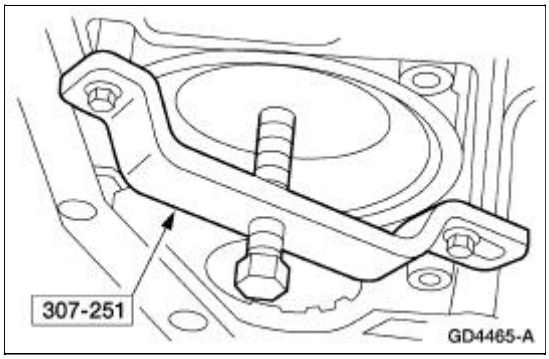


16. **CAUTION: Use care not to damage the manual control lever shaft bore. If the bore is damaged the new seal may leak.**

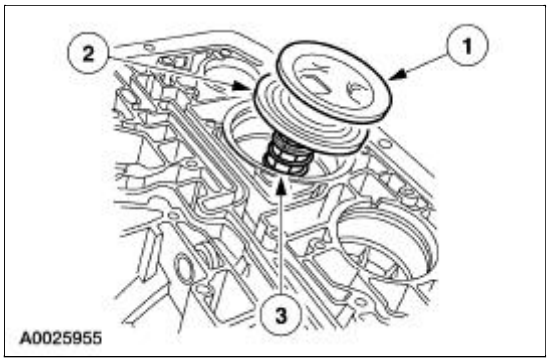
    Remove the manual control lever shaft seal.



17. Remove the EPC solenoid.
    1. Remove the bolt and EPC solenoid bracket.
    2. Remove the EPC solenoid.

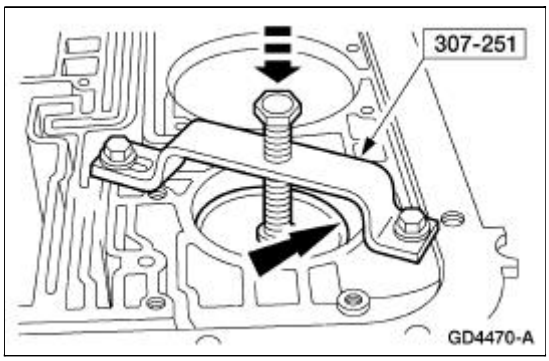


18. Remove the 2-3 accumulator spring retainer.

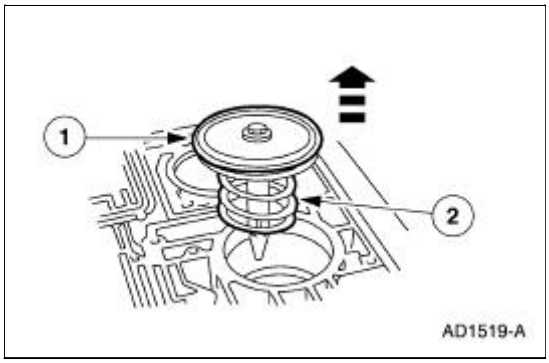


19. Remove the 2-3 accumulator piston.
    1. Remove the 2-3 accumulator spring.
    2. Remove the 2-3 accumulator piston.

20. Using the special tool, remove the reverse band servo retaining ring.

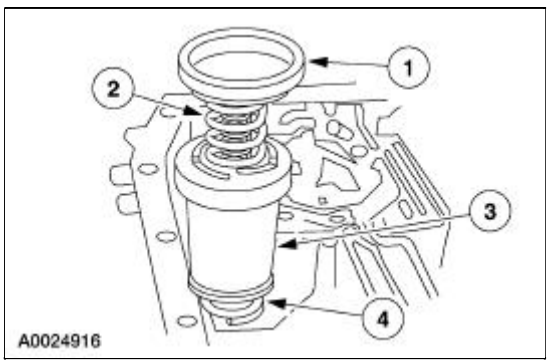


21. Remove the reverse band servo.
    1. Remove the reverse band servo cover.
    2. Remove the reverse band servo piston and rod assembly.
    3. Remove the reverse band servo spring.

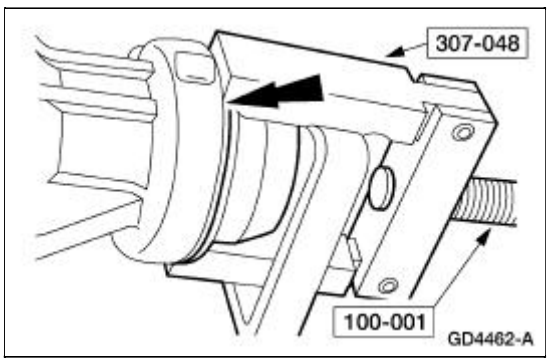


22. **NOTE:** If tool is not available, extreme care must be taken. Spring pressure will force overdrive servo piston assembly out of case. Case bore damage may result from trying to pry on internal retaining ring.

    Using the special tool, compress the piston spring, then remove the overdrive servo piston retainer.



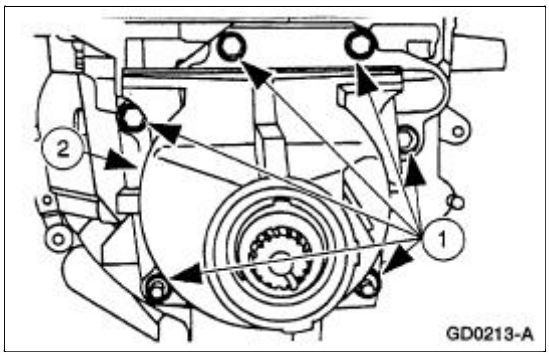
23. Remove the overdrive servo piston.
    1. Remove the overdrive servo piston.
    2. Remove the overdrive servo piston return spring.



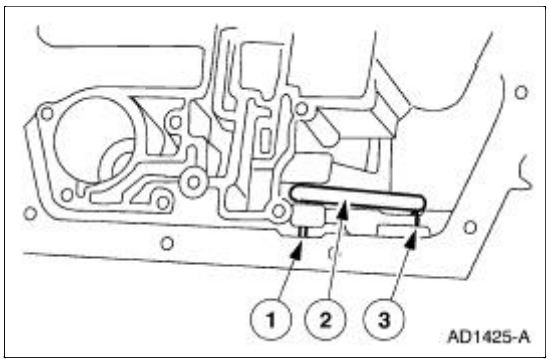
24. Compress the 1-2 accumulator cover and remove the 1-2 accumulator piston retaining ring.

25. Remove the 1-2 accumulator upper spring.
    1. Remove the 1-2 accumulator spring cover.
    2. Remove the inner and outer 1-2 accumulator springs.
    3. Remove the 1-2 accumulator.
    4. Remove the 1-2 accumulator upper spring.

26. Using the special tools, remove the extension housing seal.



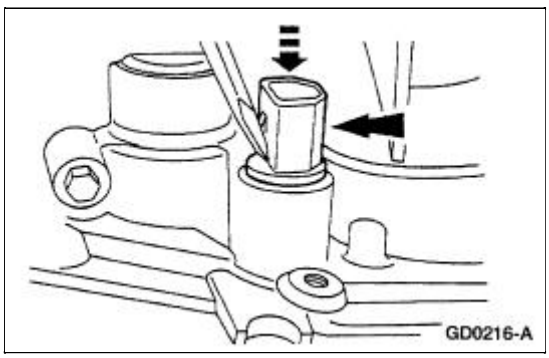
27. **NOTE:** These bolts have been coated with a sealant. High break torque may be required to



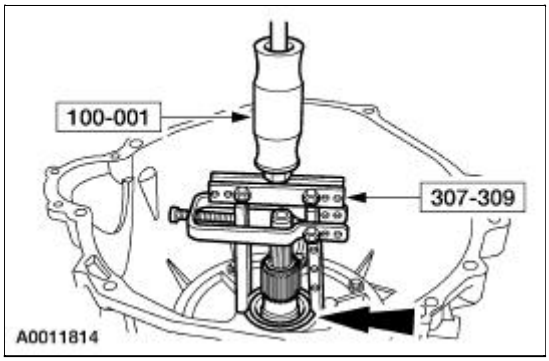
remove these bolts.

Remove the extension housing.

1. Remove the four bolts and two nuts.
2. Remove the extension housing and the extension housing gasket.



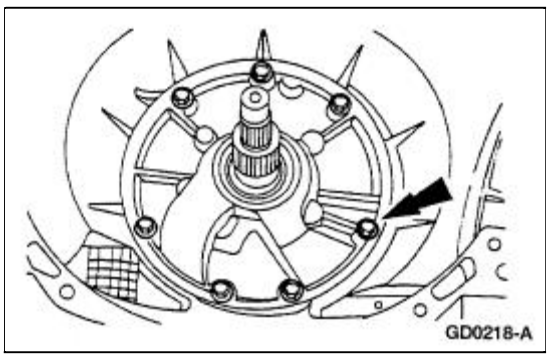
28. Remove the parking pawl.
    1. Remove the parking pawl shaft.
    2. Remove the parking pawl return spring.
    3. Remove the parking pawl.



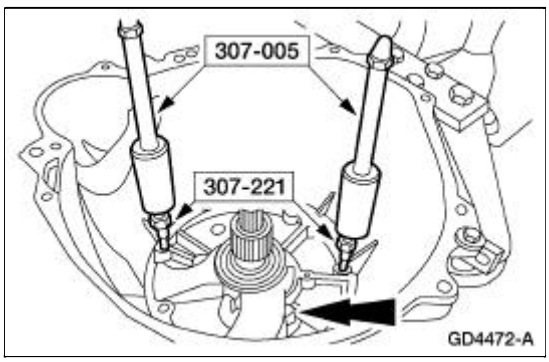
29. Rotate the transmission to the vertical position with the output shaft towards the floor.

30. **CAUTION: Extreme care must be taken during transmission connector removal. Do not pull on wires, or use a hammer on the connector body.**

    Place a screwdriver on the flat portion of the connector and push the connector out through the bottom of the case.

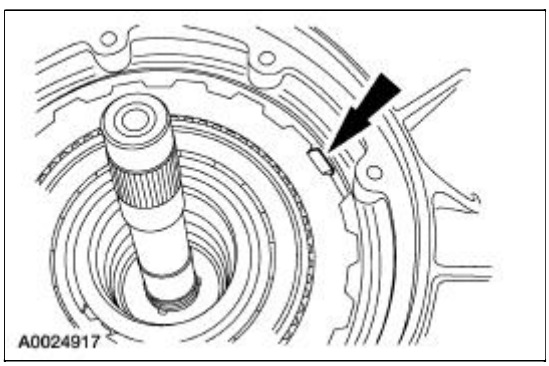


31. Using the special tools remove the front pump seal.



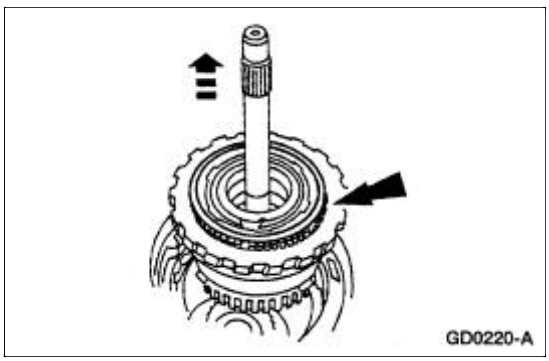
32. **NOTE:** These bolts have been coated with sealant. High break torque may be required to remove the bolts.

    Remove the front bolts.

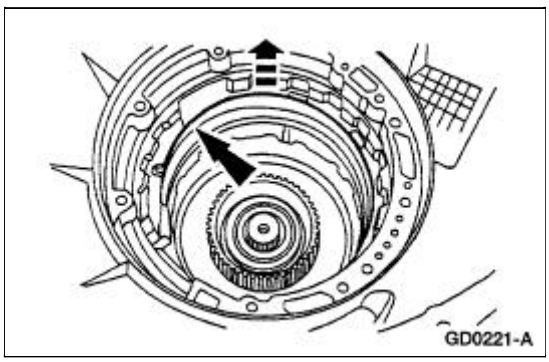


33. Using the special tools, remove the front pump support.

34. Remove and discard the pump gasket.

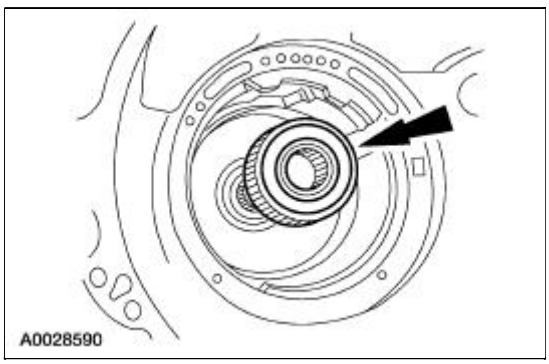


35. If equipped, remove the intermediate clutch anti-ratle clip.

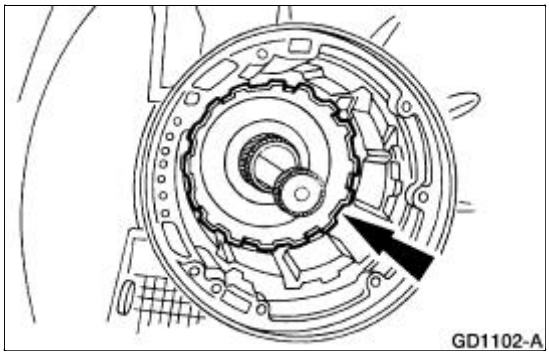


36. **CAUTION: Remove the assembly carefully to prevent damage to the overdrive band friction material by the reverse clutch drive lugs.**

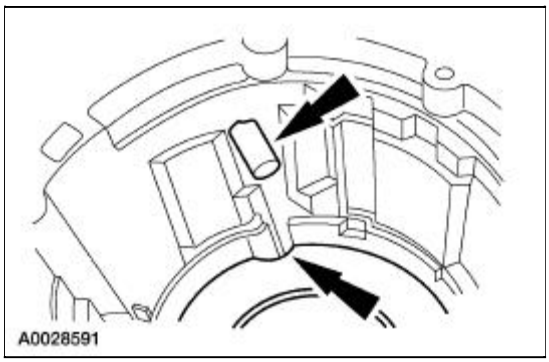
Remove the following components as an assembly:



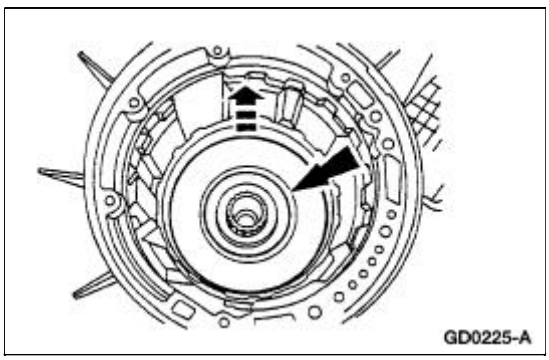
- intermediate clutch pack.
- intermediate one-way clutch.
- reverse clutch.
- forward clutch assembly.



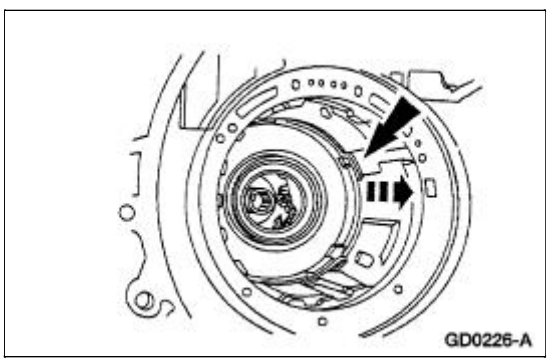
37. Disengage and remove the overdrive band.



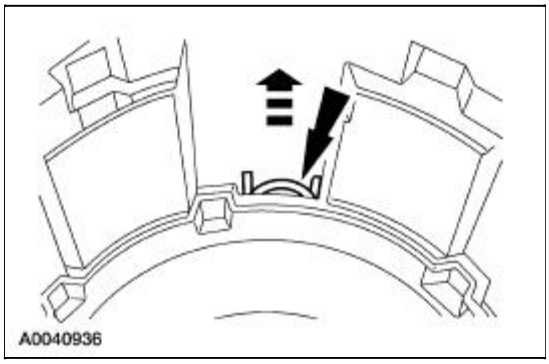
38. Remove the forward clutch hub and the No. 3 forward clutch hub front bearing.



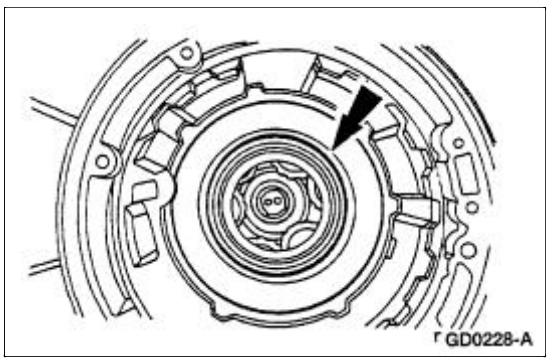
39. Remove the intermediate stub shaft.



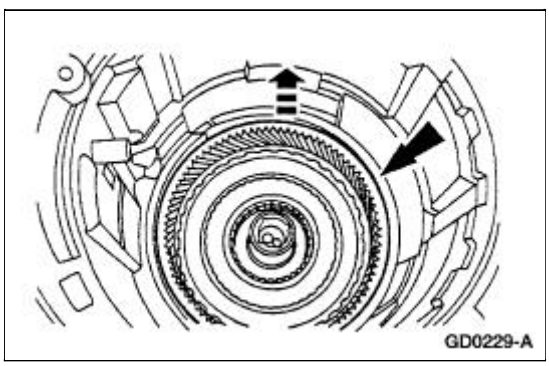
40. Align the reverse sun shell with the overdrive band anchor pin for removal.



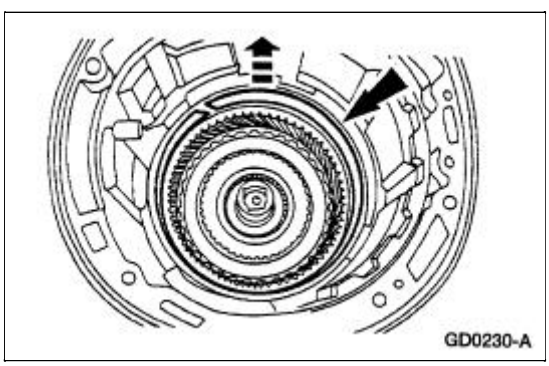
41. Remove the following components as an assembly:
    - Forward clutch sun gear.
    - No. 5 forward clutch sun gear bearing.
    - Reverse clutch sun gear.
    - No. 4 forward clutch hub bearing.



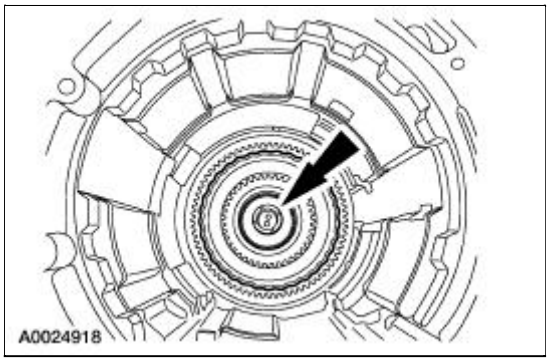
42. Remove the center support retaining ring and note location for assembly.



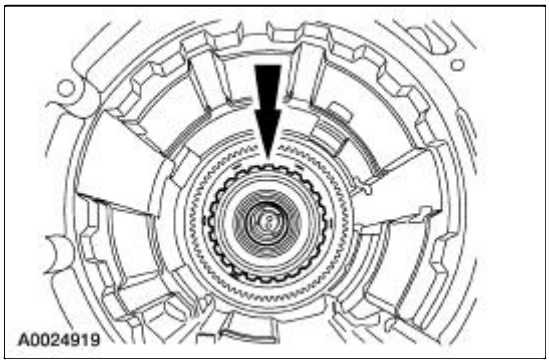
43. Remove the case to planet support spring.



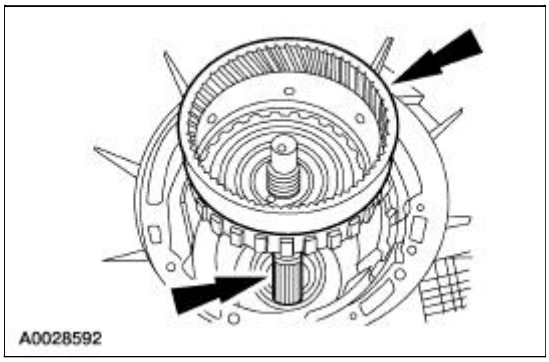
44. Remove the planetary gear support and planetary as an assembly.



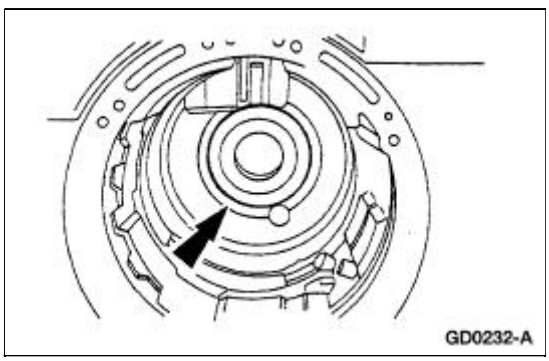
45. Remove the reverse clutch band.



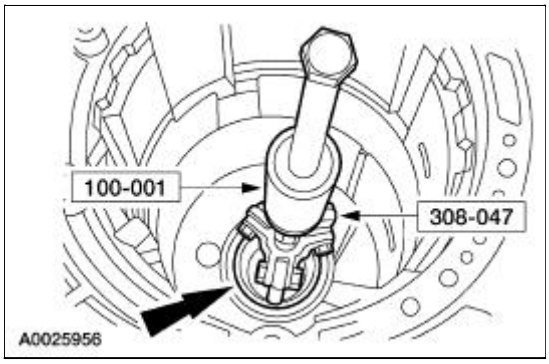
46. Remove the retaining ring.



47. Remove the direct clutch pack.

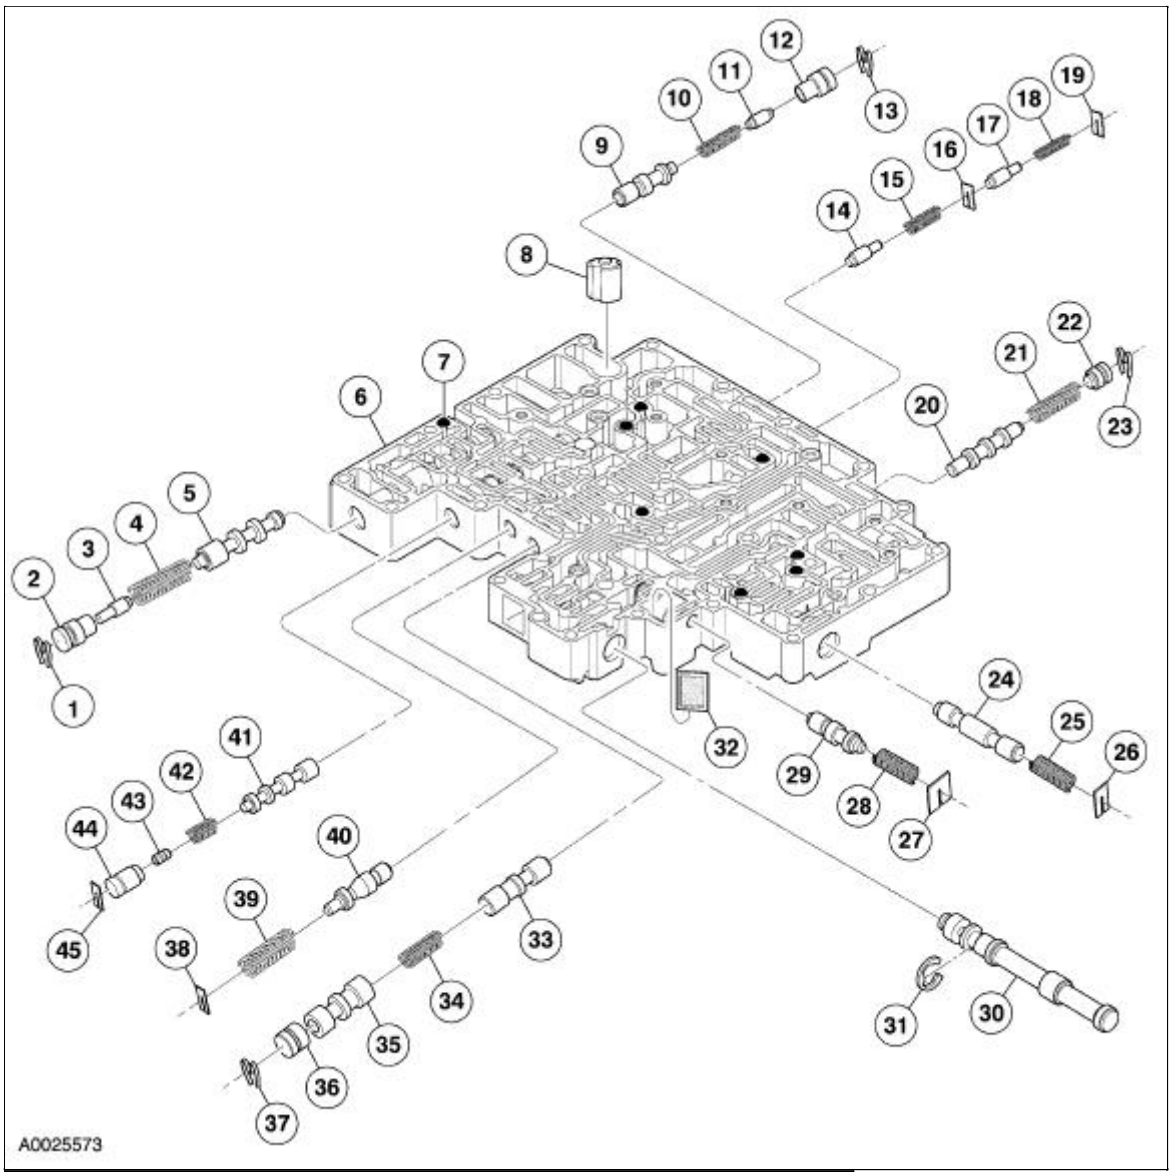


48. Remove the No. 8 bearing.



49. Remove the output shaft, output shaft ring gear assembly and direct clutch.

50. Remove the No. 9 case rear bearing.



51. Inspect and if necessary, using the special tools, remove the rear case bushing.

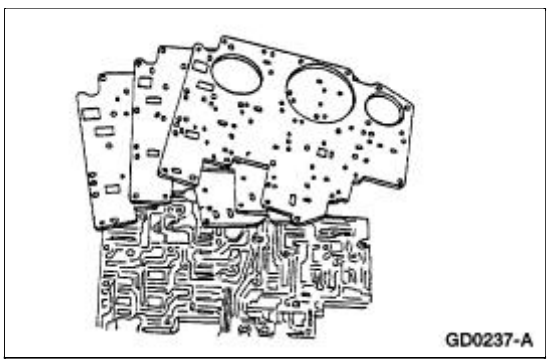
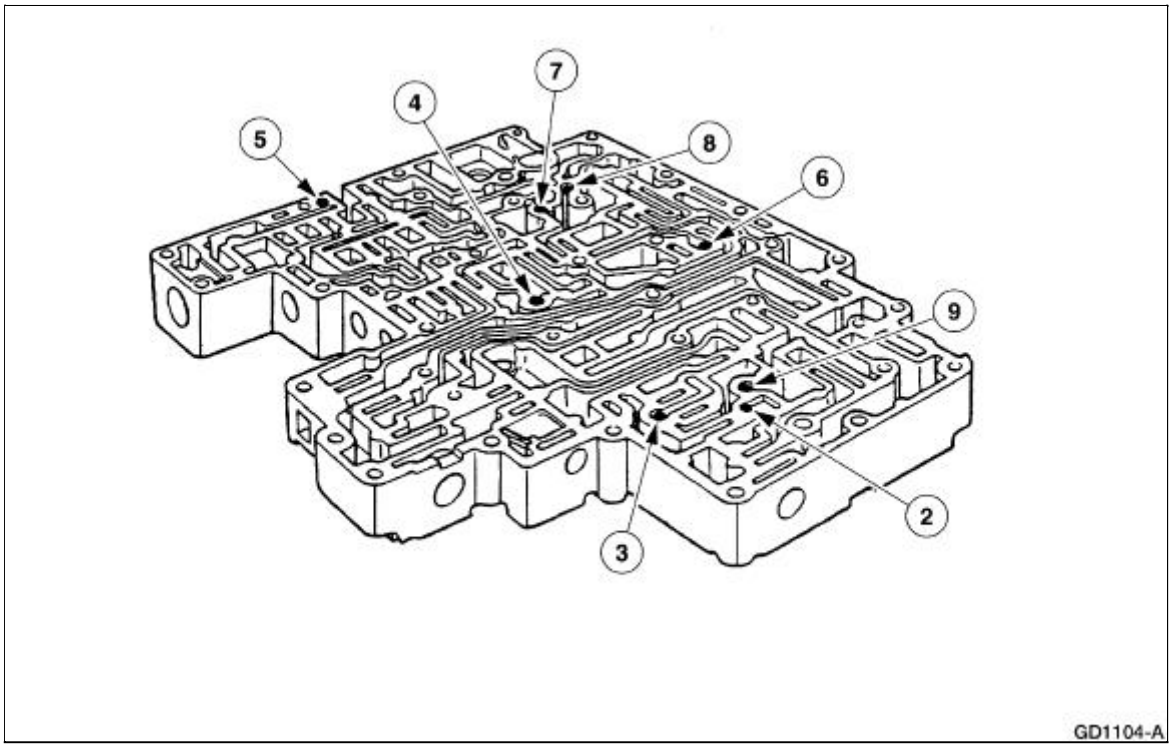
42	—	Bypass clutch control valve spring (part of 7A100)
43	—	Bypass clutch control valve plunger (part of 7A100)
44	—	Bypass clutch control plunger sleeve (part of 7A100)

45	—	Control valve plate (part of 7A100)

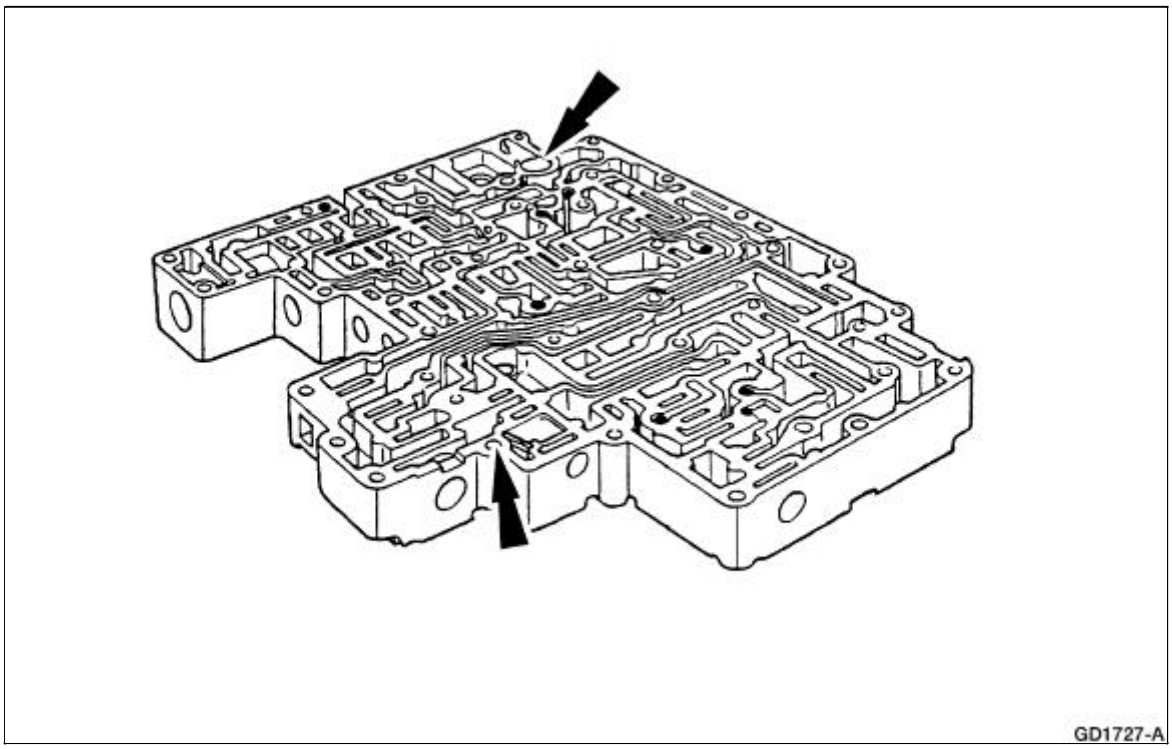


1. Remove the torque converter clutch (TCC) solenoid and the shift solenoid.
    1. Remove the bolt.
    2. Remove the shift solenoid.
    3. Remove the TCC solenoid.

2. Remove the two reinforcement plates.
    1. Remove the bolts.
    2. Remove the plates.



3. Remove the separator plate and discard the gaskets.



4. **NOTE:** Note the location of the eight coasting booster valve shuttle balls for assembly.

   Remove the eight coasting booster valve shuttle balls.

5. Remove the converter drain back valve and solenoid pressure supply screen.

6. Remove the main control valve body cover plate.
    1. Remove the 13 bolts.
    2. Remove the valve body cover plate and gasket.

Assembly

1. **CAUTION: Before beginning assembly, carry out and inspect the following:**

   When building up subassemblies and assembling the transmission, ALWAYS use new gaskets and seals.

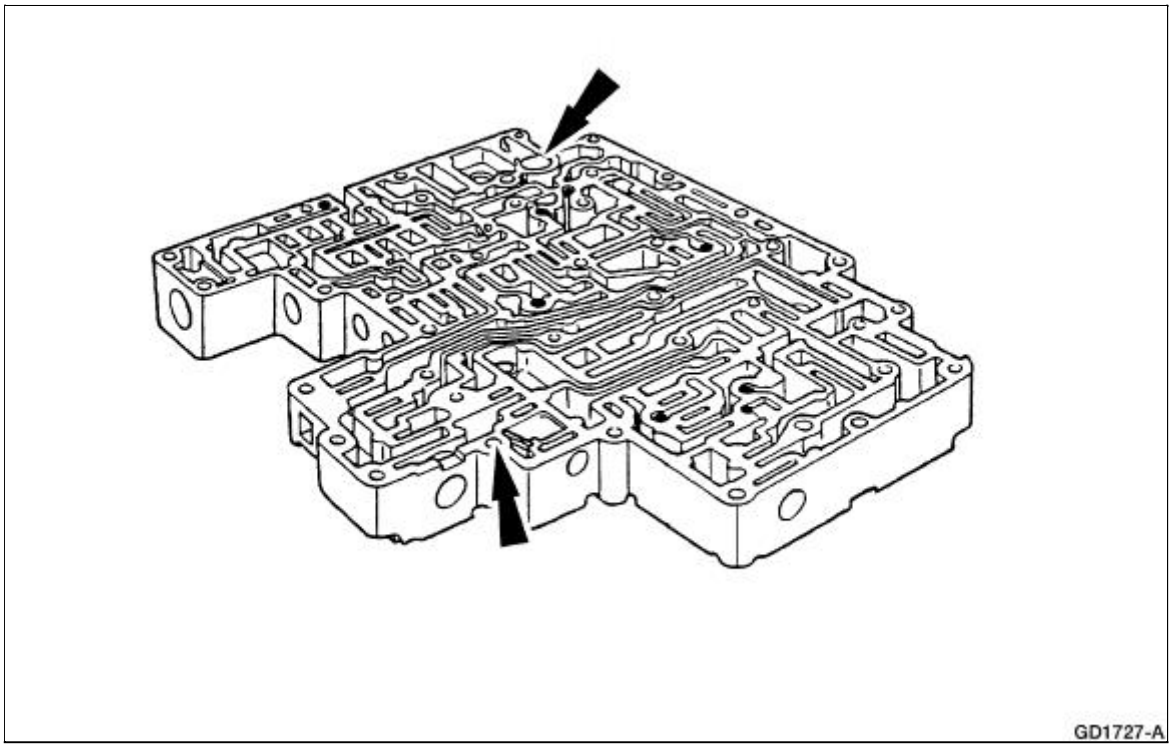
   All fasteners must be tightened to the torque specification indicated. In addition to appearing in the section, the necessary torques can be found in the General Specifications Chart.

   When building up subassemblies, each component part should be lubricated with clean transmission fluid. It is also good practice to lubricate the subassemblies as they are installed in the case.

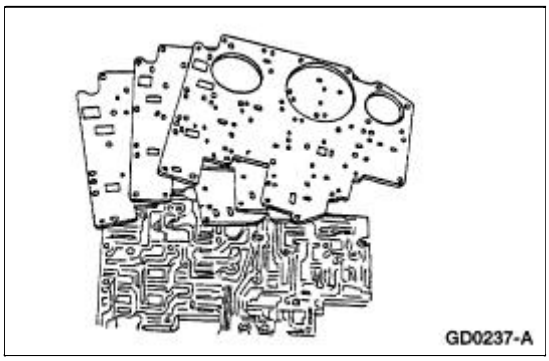
   Needle bearings, thrust washers and seals should be lightly coated with petroleum jelly during subassembly buildup or transmission assembly.

   Many components and surfaces in the transmission are precision machined. Careful handling during disassembly, cleaning, inspection and assembly can prevent unnecessary damage to machined surfaces.

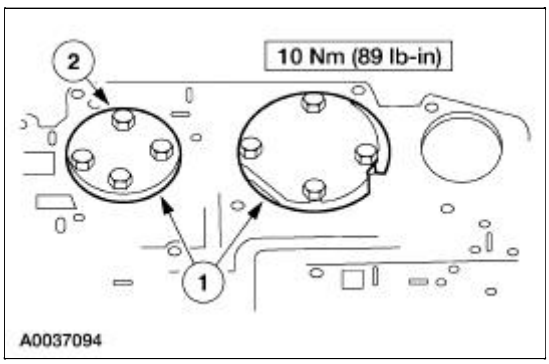
   Install the valve body cover plate.
   1. Position the valve body cover plate gasket and cover plate.
   2. Install the two guide pin bolts.
   3. Install the bolts.



2. Tighten the bolts in the sequence shown.

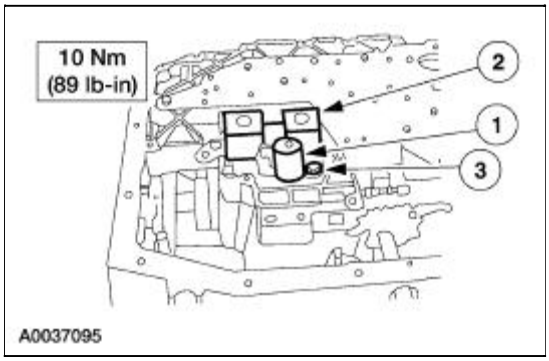


3. Install the eight coasting booster valve shuttle balls.



4. Install the converter drain back valve and solenoid pressure supply screen.

5. Install the separator plate and gaskets.

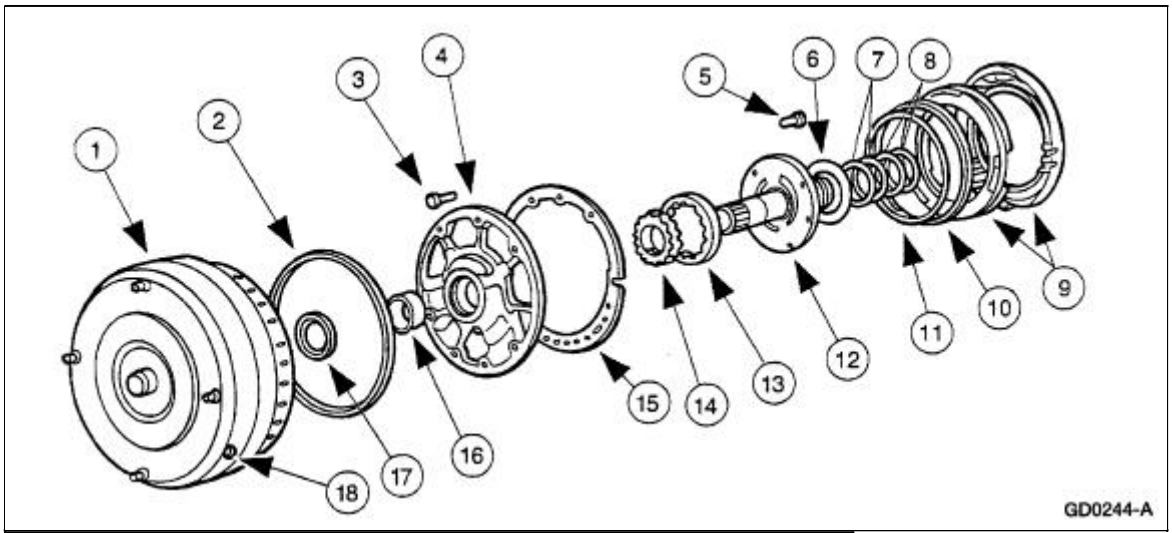


6. Install the two reinforcement plates.
    1. Position the plates.
    2. Install the bolts.

7. **NOTE:** Inspect the shift solenoid O-rings and TCC solenoid O-rings for damage.

    Install the shift solenoid.
    1. Position the TCC solenoid.
    2. Position the shift solenoid.

3. Install the bolt.

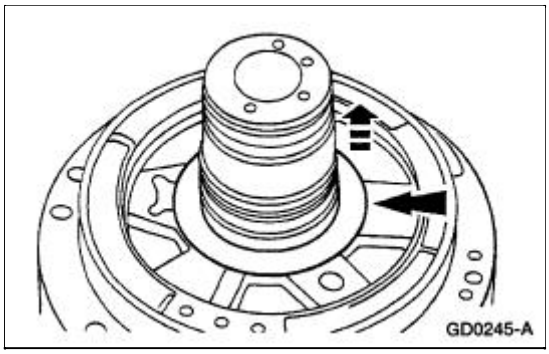


Pump and Intermediate Clutch Piston

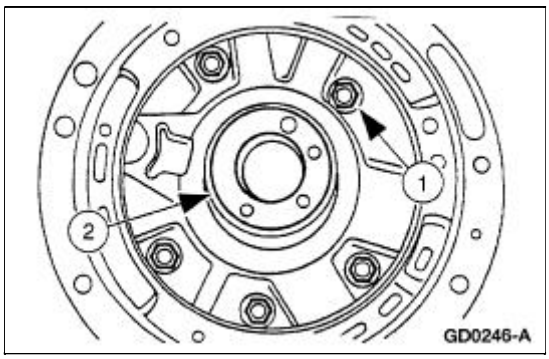
Special Tool(s)

 ST1189-A	Installer, Front Pump Fluid Seal 307-014 (T63L-77837-A)
 ST1914-A	Protector, Piston Seal 307-339 (T95L-77005-A)

Pump and Intermediate Clutch Piston — Disassembled View

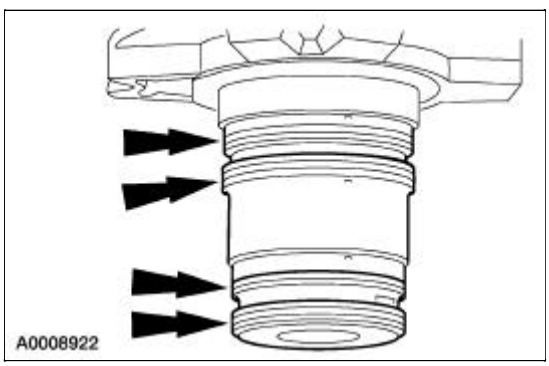


Item	Part Number	Description
1	7902	Torque converter
2	7A248	Front pump O-ring
3	N605789-S101	Bolt
4	—	Pump body assembly
5	N605787-S1000	Front pump support bolt
6	7D014	No. 1 pump support thrust washer
7	7D020	Reverse clutch cylinder seal
8	7D019	Forward clutch cylinder seal
9	7E005	Intermediate clutch piston
10	7F224	Intermediate clutch piston outer seal

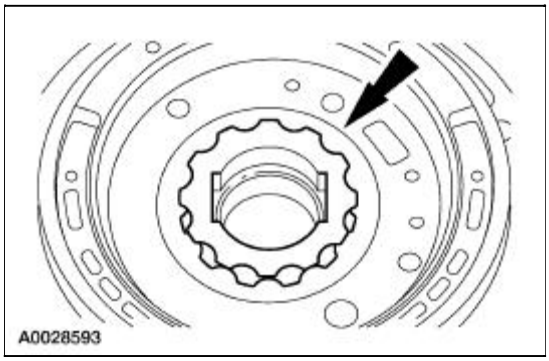


11	7F225	Intermediate clutch piston inner seal
12	7A108	Pump support
13	—	Pump outer gerotor gear
14	—	Pump inner gerotor gear
15	7A136	Pump gasket
16	—	Pump bushing
17	7A248	Pump inner seal
18	391855-S100	Converter drain plug

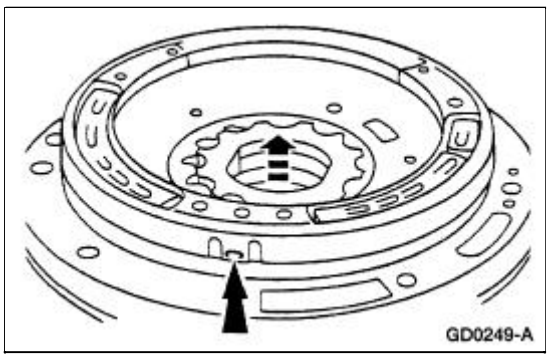
Disassembly



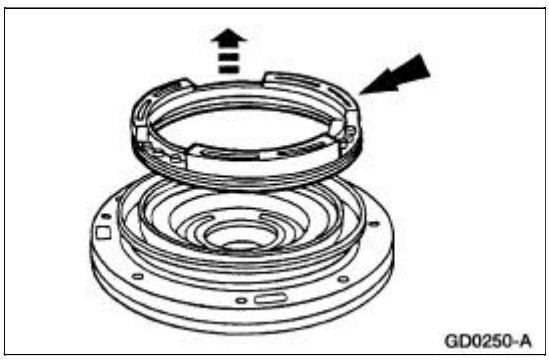
1. Remove the No. 1 selective pump support thrust washer.



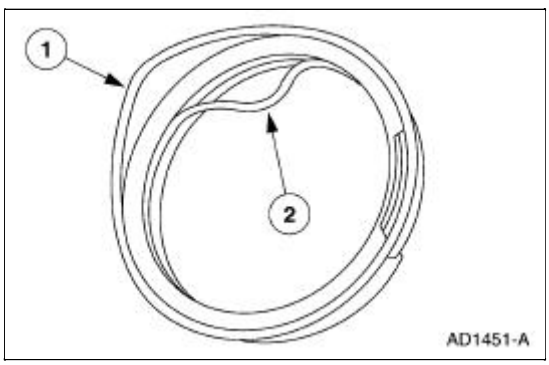
2. Remove the front pump support.
    1. Remove the bolts.
    2. Remove the front pump support.



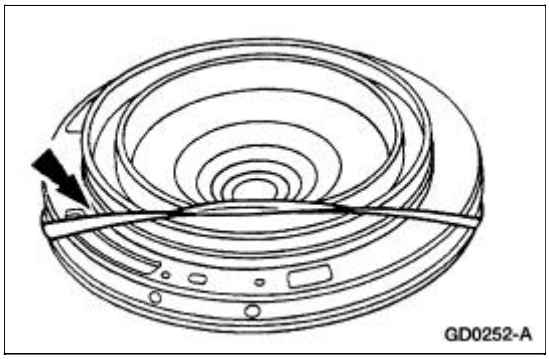
3. Remove the seal rings.



4. Remove the inner and outer pump gerotor gears.

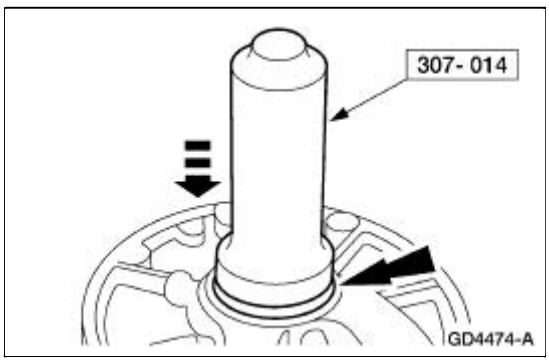


5. Carefully pry spring retainer tabs and remove the spring retainer assembly.

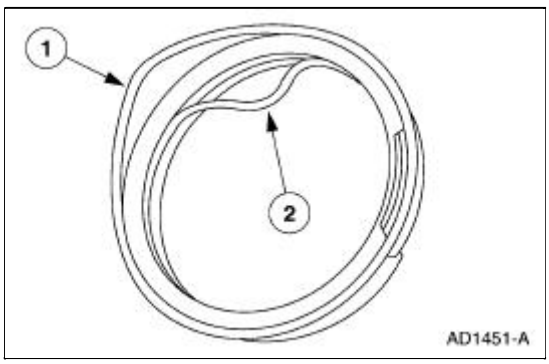


6. Remove the intermediate clutch piston.

7. Remove the clutch piston seals.
    1. Remove the intermediate clutch piston outer seal.
    2. Remove the intermediate clutch piston inner seal.

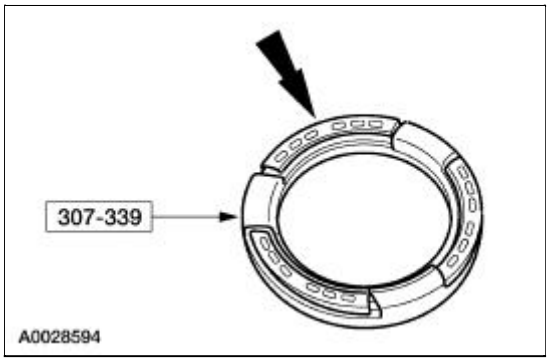


8. Remove and discard the front pump seal.

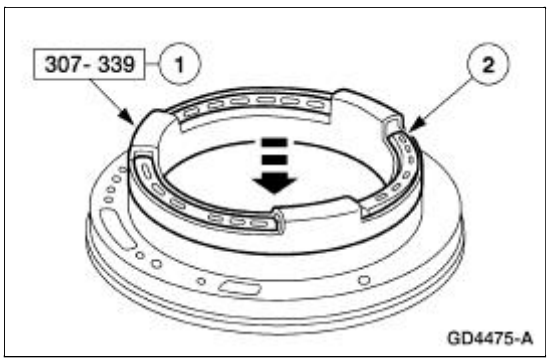


Assembly

1. Using the special tool, install the front pump seal assembly.

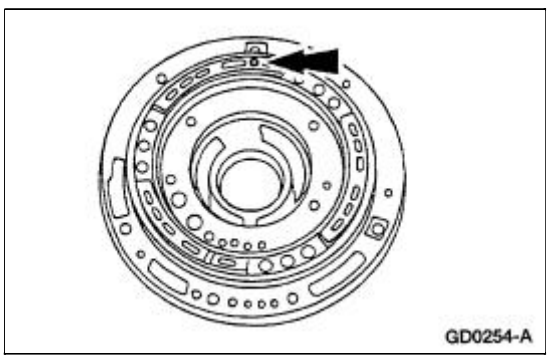


2. Install the clutch piston seals.
    1. Install the intermediate clutch piston outer seal.
    2. Install the intermediate clutch piston inner seal.

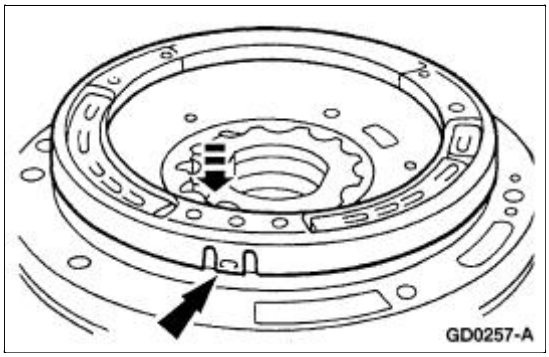


3. **NOTE:** Coat the intermediate clutch piston outer seal, inner seal and pump body with petroleum jelly.

   Install the intermediate clutch piston into the special tool.



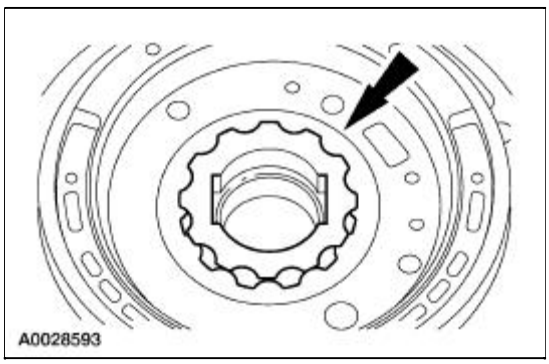
4. Using the special tool, install the intermediate clutch piston.
    1. Position the intermediate clutch piston and the special tool onto the pump body.
    2. Push the intermediate clutch piston to the bottom of the pump body bore, exerting even pressure and remove the special tool.



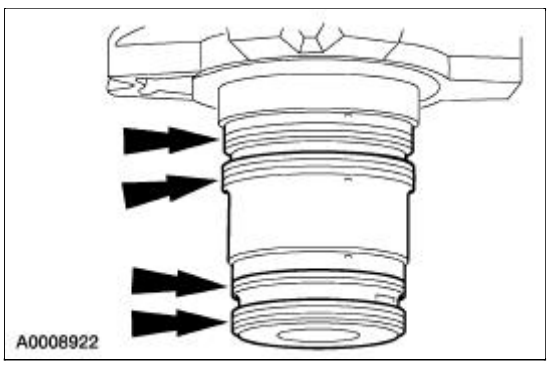
5. **CAUTION: The piston bleed hole must be located at 12 o'clock position (towards the top of the transmission). Shift problems may occur if installed incorrectly.**

    NOTE: The piston bleed hole is the only round hole in the pump body.

    Locate the piston bleed hole.

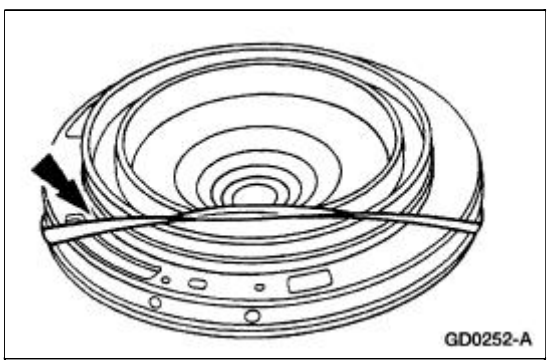


6. Install by snapping the spring retainer assembly on pump body.



7. **NOTE:** The flats on the inner fluid pump gear have steps that must face the pump body or damage will result.

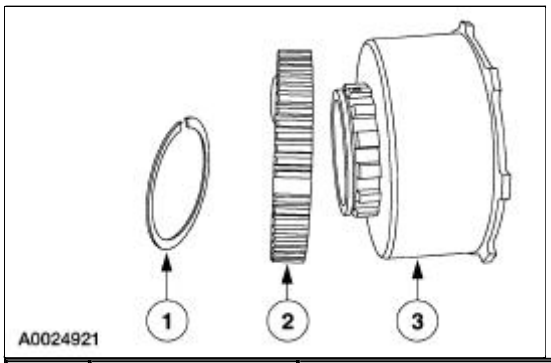
   Install the inner and outer fluid pump gerotor gears.



8. **NOTE:** The reverse clutch cylinder seal rings are larger than the forward clutch cylinder seals.

   Install the seal rings.

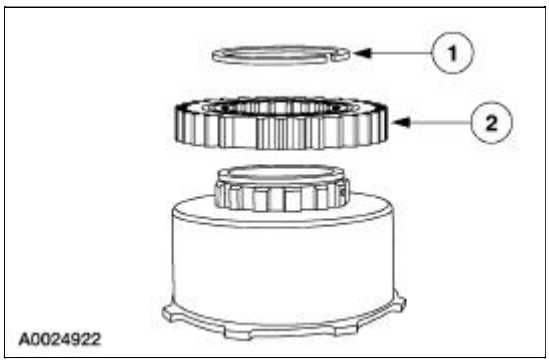
9. Install a new front pump seal.



10. Assemble the front pump.
    1. Position the pump support to the pump body assembly.
    2. Install the bolts.

Intermediate One-Way Clutch

Intermediate Clutch Cylinder Disassembled View



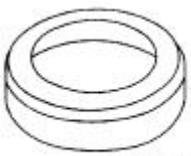
Item	Part Number	Description
1	391267-S	Retaining ring
2	7A089	Intermediate one-way clutch assembly
3	7D044	Reverse clutch drum

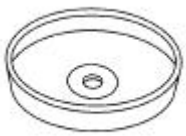
Disassembly

1. **NOTE:** One tab that locks the reverse clutch drum into the reverse sun shell may be removed. This is done for balancing purposes.

   Remove the intermediate one-way clutch.
   1. Remove the snap ring.
   2. Remove the intermediate one-way clutch.

Assembly





1. **NOTE:** The intermediate one-way clutch must rotate counterclockwise when installed on the reverse clutch drum and will make a ratchet sound.

   Install the intermediate one-way clutch.
   1. Install the intermediate one-way clutch.
   2. Install the snap ring.

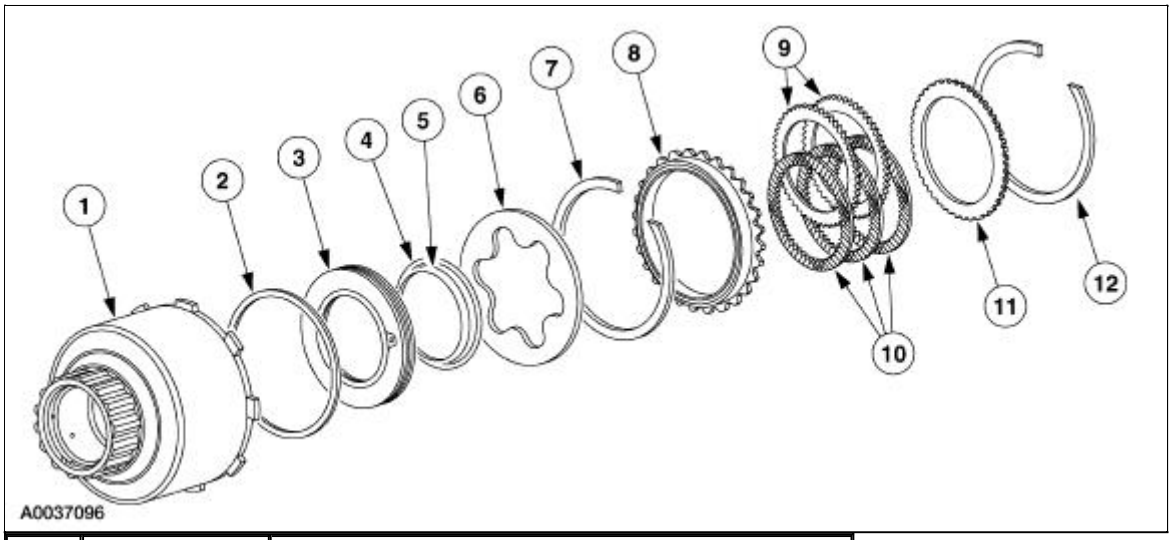
Reverse Clutch



Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C)
 ST1190-A	Compressor, Clutch Spring 307-015 (T65L-77515-A)
 ST1206-A	Protector, Transmission Reverse Clutch Outer Fluid Seal 307-424
 ST1207-A	Protector, Transmission Reverse Clutch Inner Fluid Seal 307-425
 ST1198-B	Compressor, Clutch Spring 307-086 (T80L-77405-A)

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM, XT-5-DM	MERCON® V

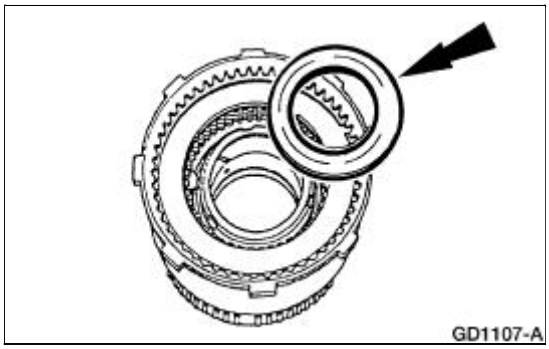
Reverse Clutch Disassembled View

Item	Part Number	Description
1	7D044	Reverse clutch drum
2	7D403	Reverse clutch piston outer seal
3	7D402	Reverse clutch piston
4	7D404	Reverse clutch piston inner seal
5	7D256	Reverse clutch piston spring pressure ring
6	7B070	Reverse clutch piston spring
7	7A577	Reverse clutch piston spring ring
8	7B066	Reverse clutch front pressure plate
9	7B442	Reverse clutch external spline plates (steel)
10	7B164	Reverse clutch internal spline plates (friction)
11	7B066	Reverse clutch rear pressure plate
12	7D483	Reverse clutch retaining ring (select fit)

Disassembly

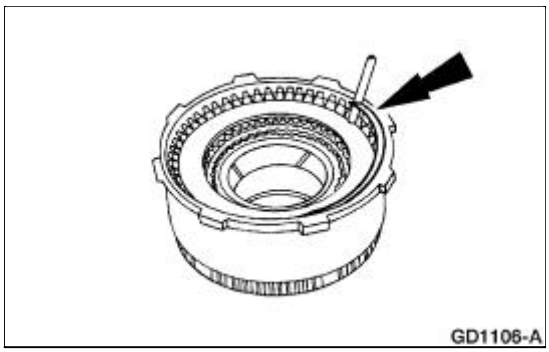
1. Inspect the clutch cylinder thrust surfaces, piston bore and clutch plate serrations for scores or burrs. Minor scores or burrs may be removed with a crocus cloth. Install a new clutch cylinder if badly scored or damaged.

2. Check fluid passage in the clutch cylinder for obstructions. Clean out all fluid passages. Inspect the clutch piston for scores and install new if necessary. Inspect check balls for freedom of movement and correct seating.



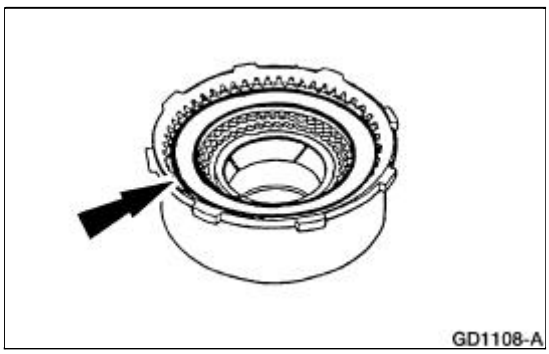
3. Check clutch release spring for distortion and cracks. Install a new spring (including the wave spring) if distorted or cracked.

4. Inspect the composition clutch plates, steel clutch plates and clutch pressure plate for worn or scored bearing surfaces. Install new parts if they are deeply scored or burred.

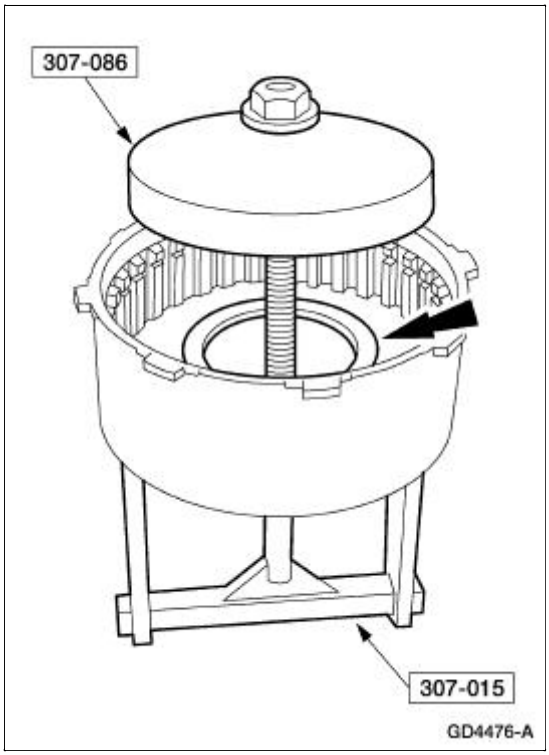


5. Check the clutch plates for flatness and fit on clutch hub serrations. Discard any plate that does not slide freely on serrations or that is not flat.

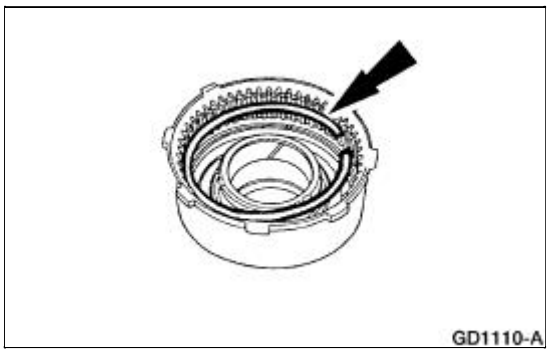
6. Check clutch hub thrust surfaces for scores and clutch hub splines for wear.



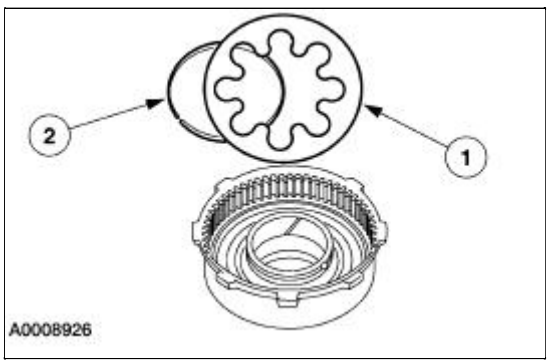
7. Remove the No. 2 forward clutch bearing.



8. Remove the reverse clutch selective retaining ring.

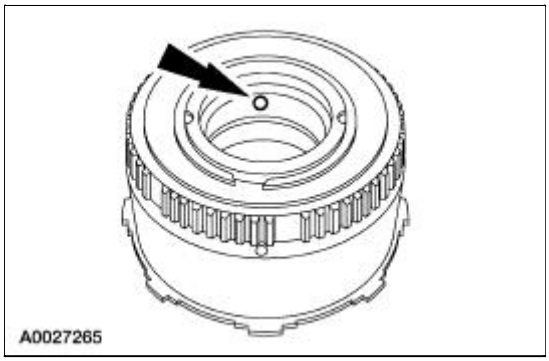


9. Remove the reverse clutch pack.

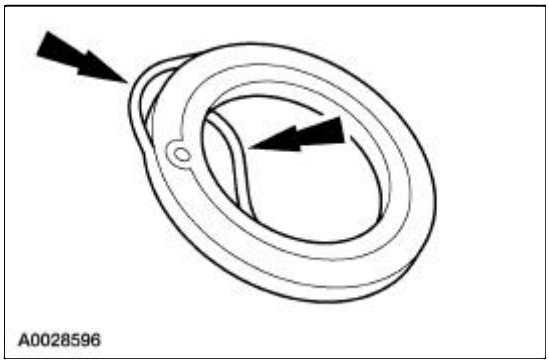


10. Using the special tools, compress the reverse clutch piston spring.

11. Remove the reverse clutch piston spring retaining ring.



12. Remove the reverse clutch piston spring pressure ring.
    1. Remove the reverse clutch piston spring.
    2. Remove the reverse clutch piston spring pressure ring.



13. **NOTE:** To ease reverse clutch piston removal, it may be necessary to apply air pressure to the reverse clutch drum. Block the opposite hole.

    Remove the reverse clutch piston.

14. Remove the reverse clutch piston inner and outer seals.

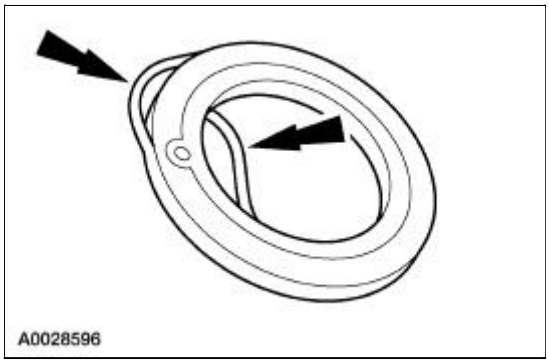
Assembly

1. **NOTE:** One tab that locks the reverse clutch drum into the reverse sun shell may be removed. This is done for balancing purposes.

   Inspect the clutch cylinder thrust surfaces, piston bore and clutch plate serrations for scores or burrs. Minor scores or burrs may be removed with crocus cloth. Install a new clutch cylinder if badly scored or damaged.

2. Check the fluid passage in the clutch cylinder for obstructions. Clean out all fluid passages. Inspect clutch piston for scores and install new if necessary. Inspect the check balls for freedom of movement and correct seating.

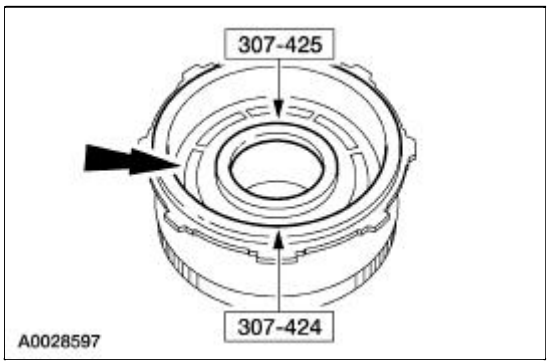
3. Check the clutch release spring for distortion and cracks. Install a new spring (including wave spring) if distorted or cracked.



4. Inspect the composition clutch plates, steel clutch plates and clutch pressure plate for worn or scored bearing surfaces. Install new parts if they are deeply scored or burred.

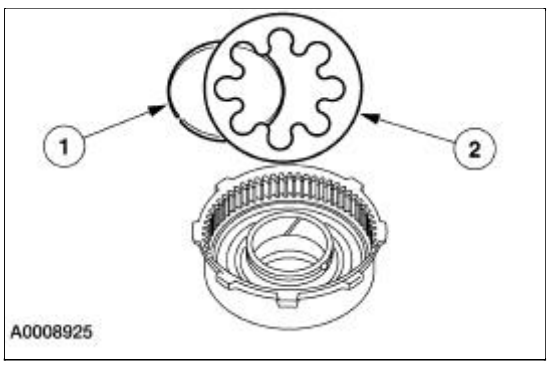
5. Check the clutch plates for flatness and fit on the clutch hub serrations. Discard any plate that does not slide freely on serrations or that is not flat.

6. Check the clutch hub thrust surfaces for scores and clutch hub splines for wear.



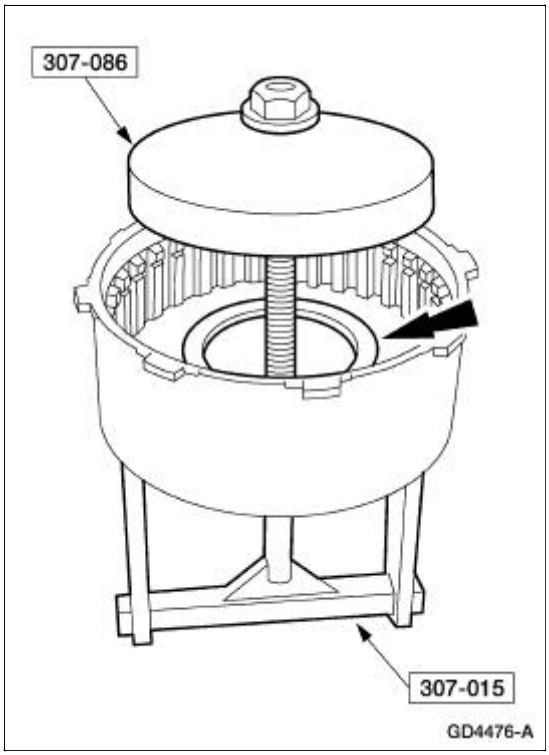
7. **NOTE:** The piston check ball must be present and moving freely.

   Install a new reverse clutch piston inner and outer seals.



8. **NOTE:** Coat the reverse clutch piston inner seal, outer seal, drum sealing area and special tools with petroleum jelly.

   Using the special tools, install the reverse clutch piston using even pressure to push it to the bottom of the reverse clutch drum.

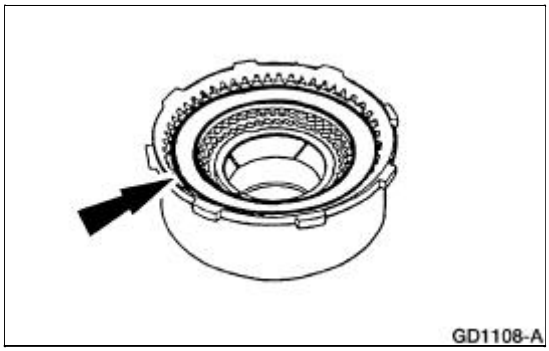


9. **NOTE:** The dished side of the reverse clutch piston spring must face the reverse clutch piston.

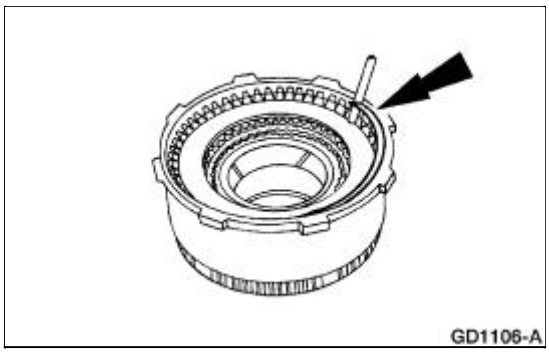
   Install the reverse clutch piston spring.
   1. Install the reverse clutch piston spring pressure ring.
   2. Install the reverse clutch piston spring.

10. Using the special tools, compress the reverse clutch piston spring.

11. Install the reverse clutch piston spring retaining ring.



12. Remove the special tool.

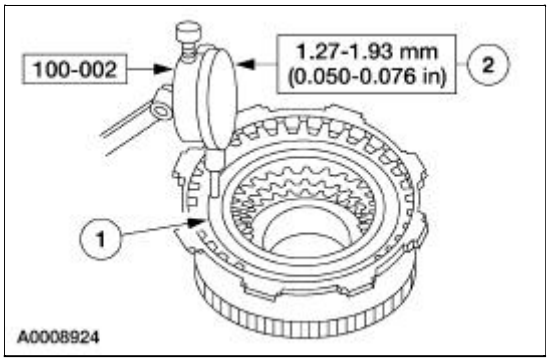


13. **CAUTION: Install the pressure plates with the flat sides facing the clutch pack.**

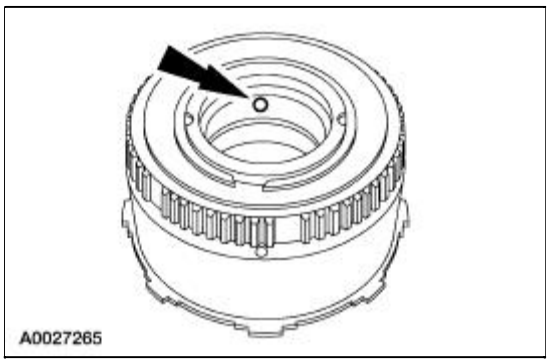
    NOTE: Before assembly, soak the new clutch discs in clean automatic transmission fluid for 15 minutes.

    Install the reverse clutch front pressure plate, clutch pack and reverse clutch rear pressure plate.

14. Install the reverse clutch pressure plate retainer snap ring.



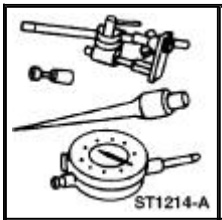
15. Install the special tool on the reverse clutch pack.
    - Push downward on the clutch pack.
    - Release pressure and zero the dial indicator.



16. Using the special tool check the reverse clutch pack clearance.
    1. Lift up on the clutch pack until it fully seats against the reverse clutch pressure plate retainer.
    2. Read the dial indicator.
        - If clearance is not within specifications, install the correct size retaining ring.

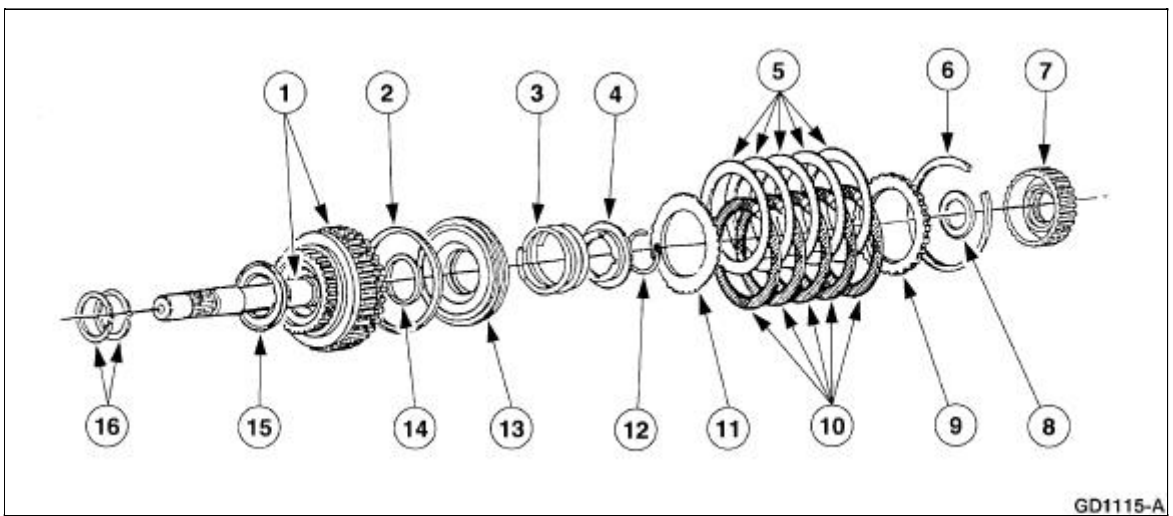
Selective Retaining Rings

Specification
1.52-1.62 mm (0.060-0.064 inch)
1.87-1.98 mm (0.074-0.078 inch)
2.23-2.33 mm (0.088-0.092 inch)
2.59-2.69 mm (0.102-0.106 inch)



17. Check the clutch for correct operation.
    - Apply air pressure to the reverse clutch drum. The clutch should be heard and felt to work without leakage.

Forward Clutch Cylinder



Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

Forward Clutch — Disassembled View

Item	Part Number	Description

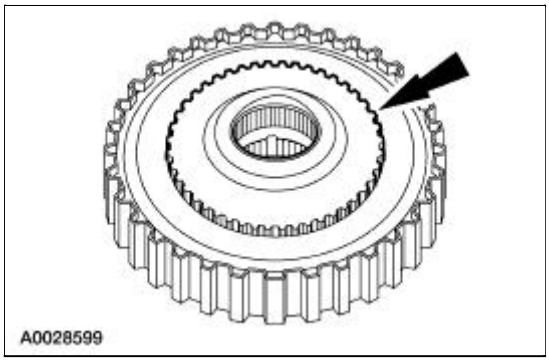
1	7F207	Forward clutch cylinder and shaft
2	7A548	Forward clutch piston outer seal
3	7A480	Forward clutch piston return spring
4	7A527	Forward clutch retainer return spring
5	7B442	Forward clutch external spline plate (steel)
6	7D483	Retaining snap ring
7	7B067	Forward clutch hub
8	7F231	No. 3 forward clutch hub front bearing
9	7B066	Forward clutch pressure plate
10	7B164	Forward clutch internal spline plates (friction)
11	7E085	Forward clutch pressure spring
12	388099-S	Retaining snap ring
13	7A262	Forward clutch piston
14	7C099	Forward clutch piston inner seal
15	7A166	No. 2 forward clutch bearing
16	7B497	Input shaft seal

Disassembly

1. Inspect the clutch cylinder thrust surfaces, piston bore and clutch plate serrations for scores or burrs. Minor scores or burrs may be removed with crocus cloth. Install a new clutch cylinder if it is badly scored or damaged.

2. Check the fluid passage in the clutch cylinder for obstructions. Clean out all the fluid passages. Inspect the clutch piston for scores and install a new piston if necessary. Inspect check balls for freedom of movement and correct seating.

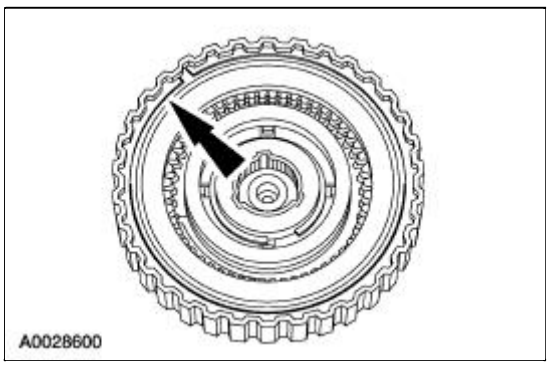
3. Check the clutch release spring for distortion and cracks. Install a new spring (including wave spring) if distorted or cracked.



4. Inspect the composition clutch plates, steel clutch plates and clutch pressure plate for worn or scored bearing surfaces. Install new parts if they are deeply scored or burred.

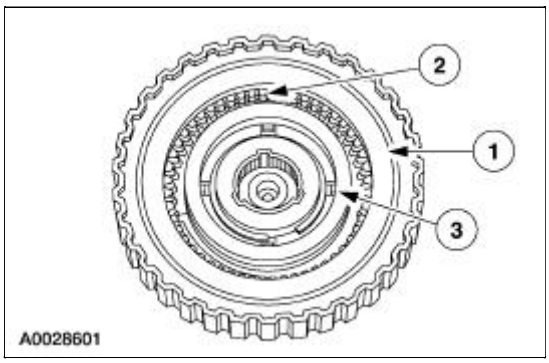
5. Check the clutch plates for flatness and fit on clutch hub serrations. Discard any plate that does not slide freely on serrations or that is not flat.

6. Check the clutch hub thrust surfaces for scores and clutch hub splines for wear.



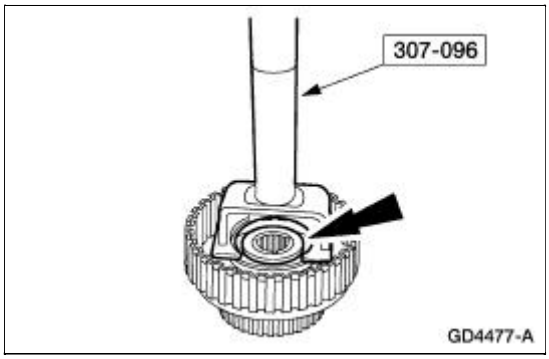
7. **NOTE:** The forward clutch hub may remain in the shell during disassembly.

   Remove the forward clutch hub and the No. 3 forward clutch hub front bearing.

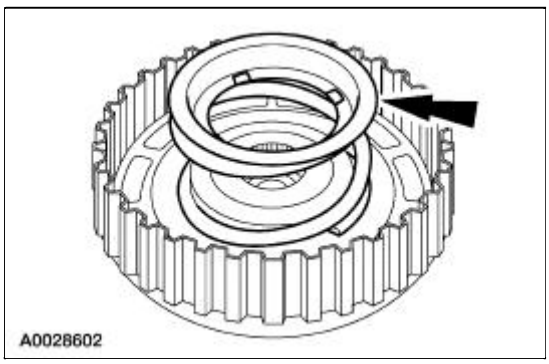


8. **NOTE:** To aid handling, the forward clutch assembly may be set in the extension housing or a hole in the work bench.

   Remove the forward clutch pack selective retaining ring.

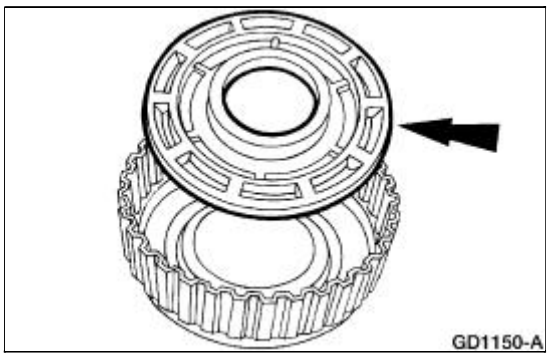


9. Remove the following components.
   1. Remove the pressure plate.
   2. Remove the clutch pack.
   3. Remove the pressure spring.



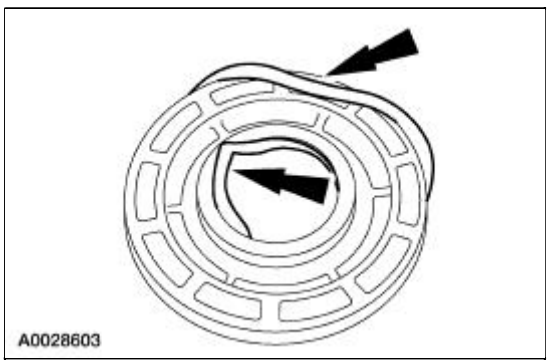
10. **CAUTION: Apply only enough pressure to release pressure on the retaining ring. If too much pressure is applied, the spring may break.**

    Using the special tool, remove the forward clutch retaining ring.



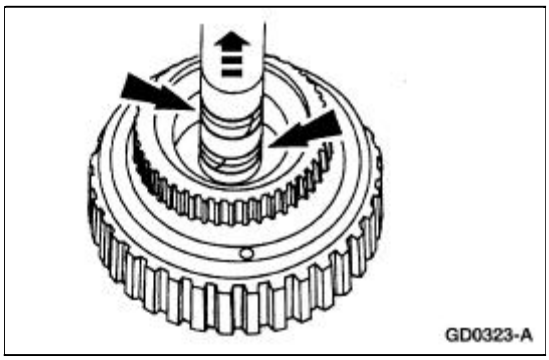
11. Slowly release the press and remove the forward clutch from the press.

12. Remove the forward clutch retainer and the return spring.

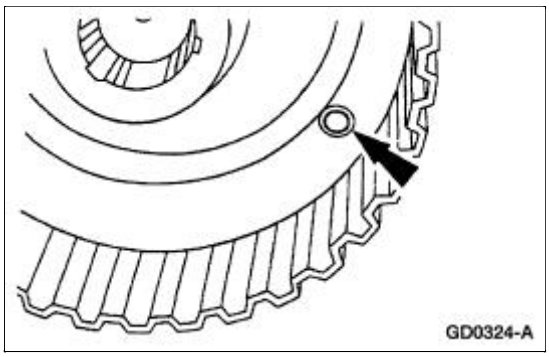


13. **NOTE:** Air pressure may be required to remove the forward clutch piston.

    Remove the forward clutch piston.



14. Remove the inner and outer forward clutch piston seals.



15. **NOTE:** The seals are solid seals, however, when installing new seals use scarf-cut seals.

    Remove the forward clutch input shaft seals.

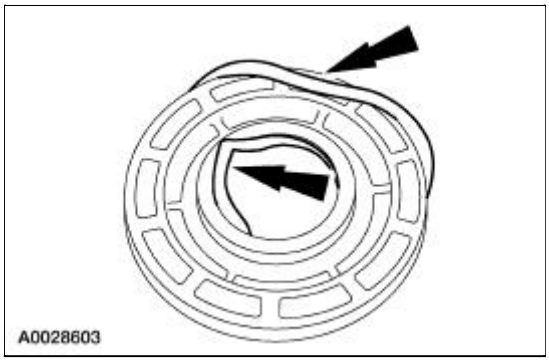
16. Make sure the check ball in the clutch cylinder is free and clean. Check for correct seating.

Assembly

1. Inspect the clutch cylinder thrust surfaces, piston bore and clutch plate serrations for scores or burrs. Minor scores or burrs may be removed with crocus cloth. Install a new clutch cylinder if badly scored or damaged.

2. Check the fluid passage in the clutch cylinder for obstructions. Clean out all fluid passages. Inspect the clutch piston for scores and install a new piston if necessary. Inspect check balls for freedom of movement and correct seating.

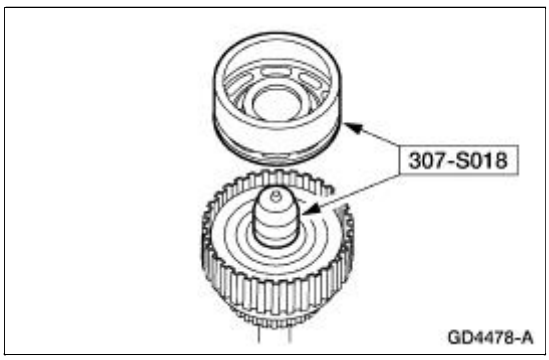
3. Check the clutch release spring for distortion and cracks. Install a new spring (including the wave spring) if distorted or cracked.



4. Inspect composition clutch plates, steel clutch plates and clutch pressure plate for worn or scored bearing surfaces. Install new parts if they are deeply scored or burred.

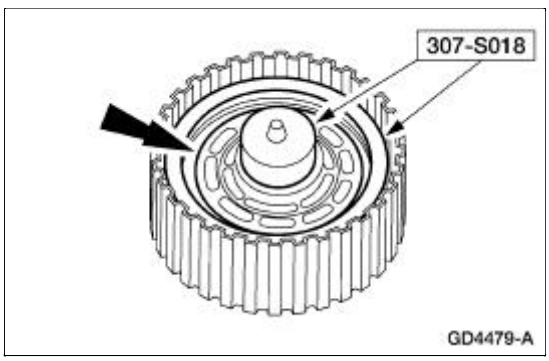
5. Check the clutch plates for flatness and fit on the clutch hub serrations. Discard any plate that does not slide freely on serrations or that is not flat.

6. Check the clutch hub thrust surfaces for scores and the clutch hub splines for wear.



7. **NOTE:** To aid handling, the forward clutch assembly may be set in the extension housing or a hole in the work bench.

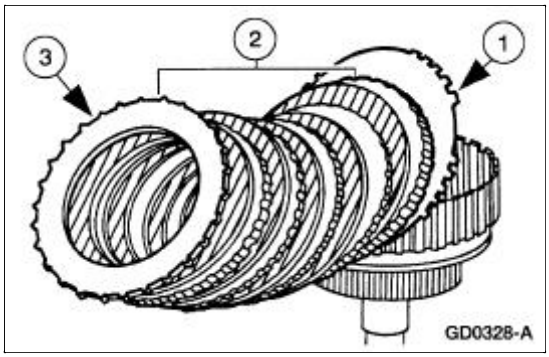
   Install the inner and outer forward clutch piston seals. Note the direction of the sealing rings before installation.



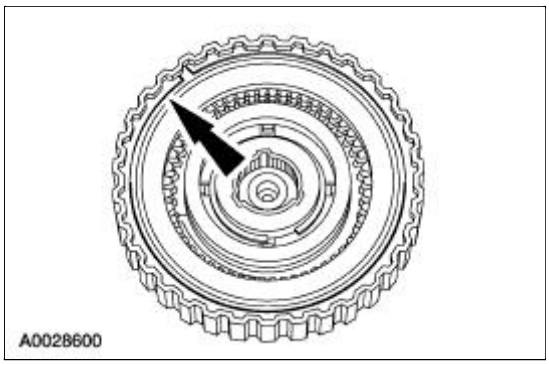
8. **NOTE:** Coat the piston seals and clutch drum sealing area with petroleum jelly.

   Position the special tools on the clutch piston.

9. Using the special tools, install the forward clutch piston into the clutch drum.
   - Push the piston to the bottom of the drum using even pressure.



10. Using the special tool, compress the piston return spring and install the retaining ring.



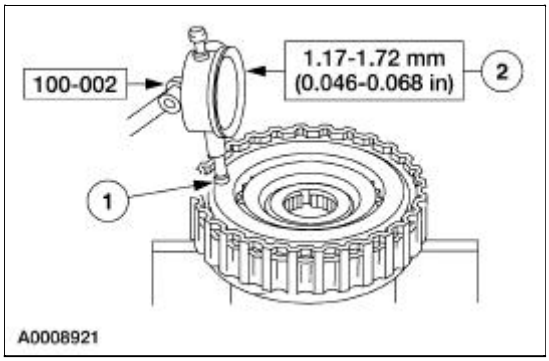
11. Slowly release the press pressure and remove the forward clutch.

12. **NOTE:** Before assembly, soak the new clutch discs in clean automatic transmission fluid for 15 minutes.

    Install the clutch pack assembly.
    1. Install the pressure ring.
    2. Install the clutch pack.
    3. Install the pressure plate.

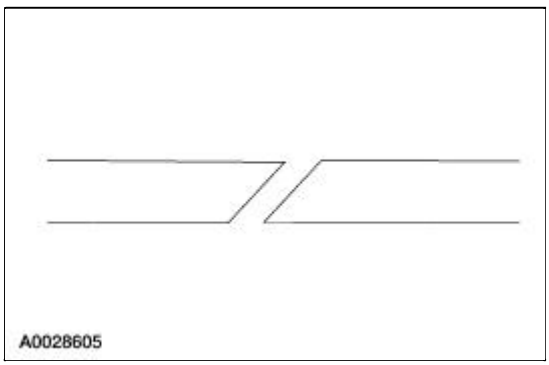
13. Install the clutch pack retaining ring.

14. Install the special tool on the forward clutch pack.
    - Push downward on the clutch pack.
    - Release pressure and zero the dial indicator.



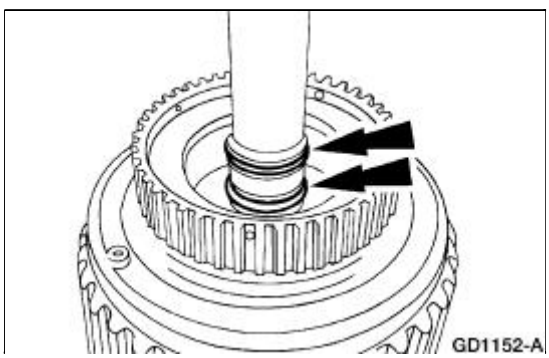
15. Using the special tool, check the clutch pack clearance.
    1. Lift up on the clutch pack until it fully seats against the clutch pressure plate retainer.
    2. Read the dial indicator.
        - If the clearance is not within specifications, install the correct size retaining ring.

Selective Retaining Ring



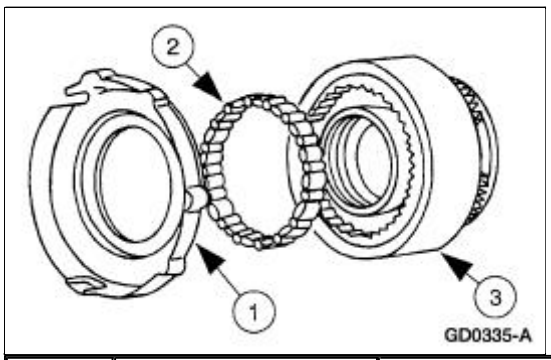
Specification

1.52-1.62 mm (0.060-0.064 inch)
1.87-1.98 mm (0.074-0.078 inch)
2.24-2.34 mm (0.088-0.092 inch)
2.59-2.69 mm (0.102-0.106 inch)



16. **NOTE:** Make sure the scarf-cut seals are mated correctly.

    Slide the two scarf-cut seals on the input shaft.

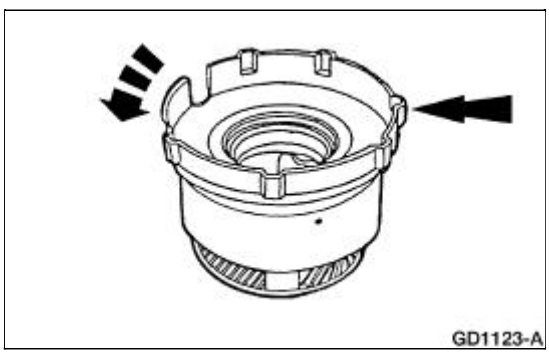


17. Install the two scarf-cut seals on the input shaft.

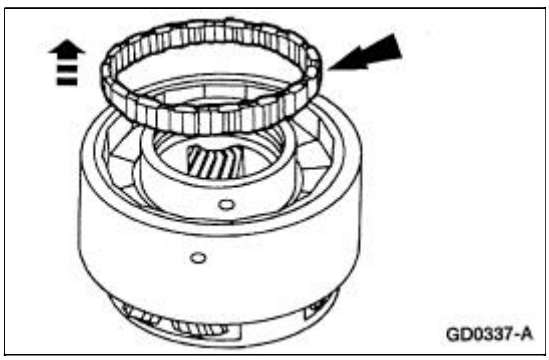
18. Install the No. 3 forward clutch hub front bearing and the forward clutch hub.

A0028606

Planetary Gear Support Assembly and Planetary One-Way Clutch



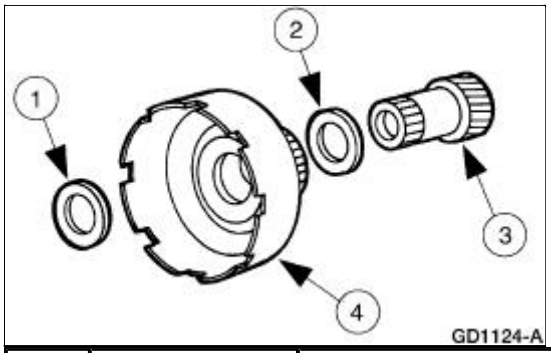
Item	Part Number	Description
1	7A130	Planetary gear support
2	7A089	Planetary one-way clutch
3	7A398	Planetary assembly



Disassembly and Assembly

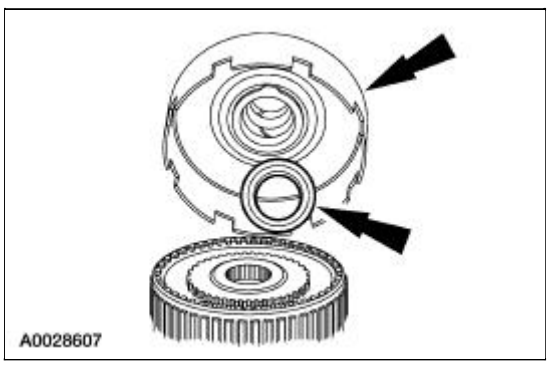
1. **NOTE:** Inspect the outer and inner races for scores or damaged surface areas where rollers contact the races. Inspect the rollers and springs for excessive wear or damage. Inspect the spring and cage for bent or damaged spring retainers.

   Rotate the center support counterclockwise and lift to remove the planetary gear support.



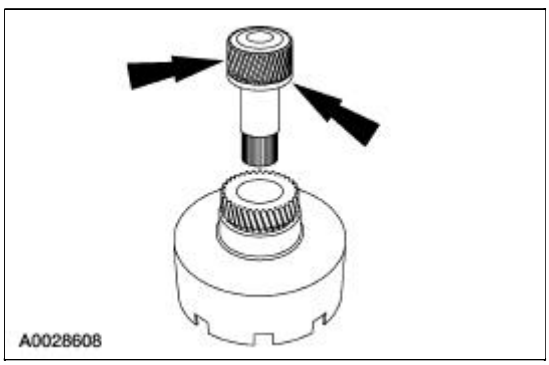
2. Remove the planetary one-way clutch.

3. To assemble, reverse the disassembly procedure.



Reverse Sun Gear

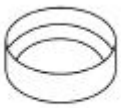
Disassembly



Item	Part Number	Description
1	7C096	Forward clutch hub bearing No. 4
2	7F244	Forward clutch sun gear bearing No. 5
3	7A399	Forward clutch sun gear
4	7A019	Reverse sun gear assembly

1. Remove the reverse clutch sun gear assembly and the No. 4 forward clutch hub bearing and race.

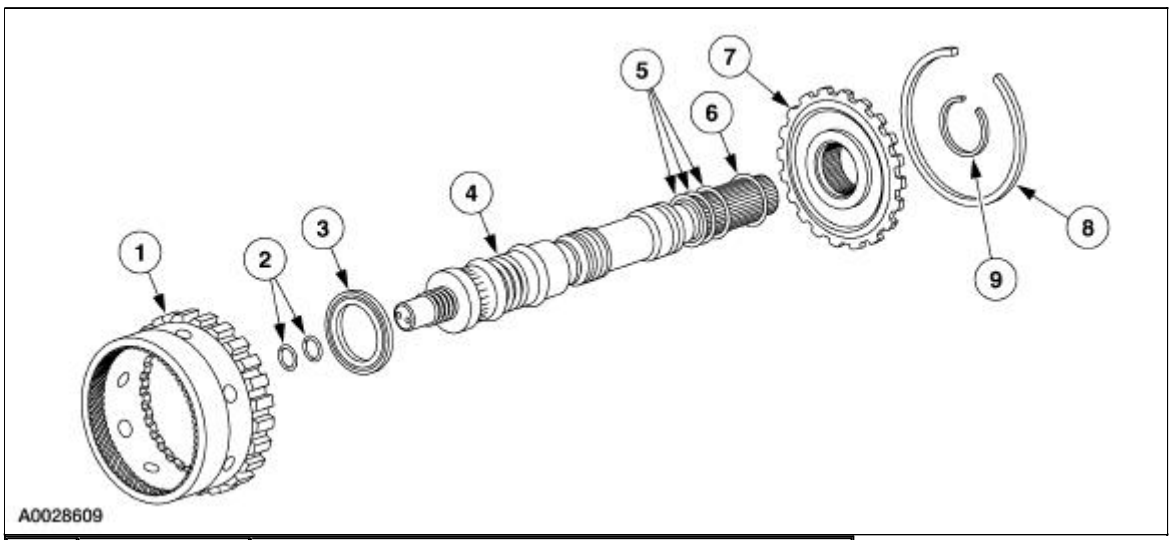
2. Remove the forward clutch sun gear assembly and the No. 5 forward clutch sun gear bearing and race.



Assembly

1. The forward clutch sun gear and reverse sun gear assembly are assembled as part of the transmission assembly procedure.

Output Shaft and Direct Clutch Cylinder



Special Tool(s)

 ST1190-A	Compressor, Clutch Spring 307-015 (T65L-77515-A)
 ST1204-A	Protector, Piston Seal 307-080 (T80L-77234-A)

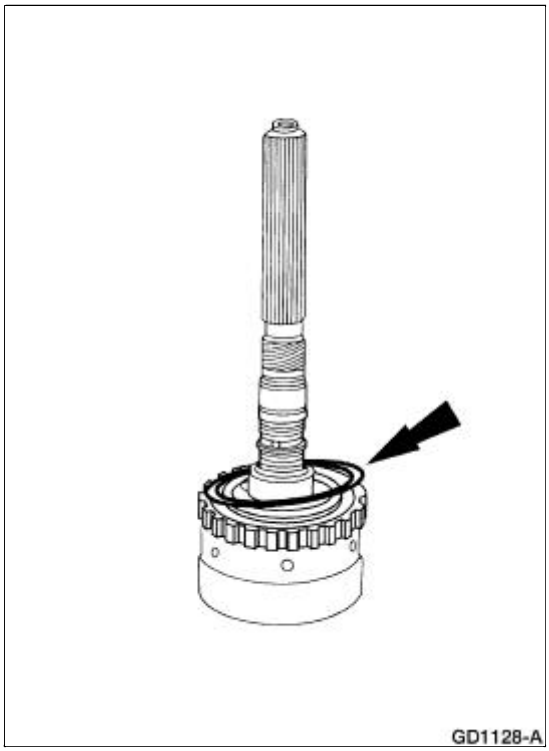
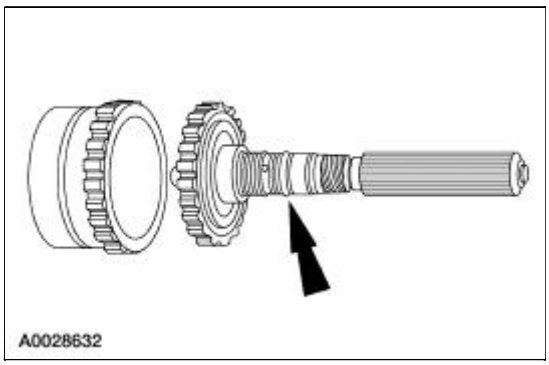
9	7C122	Snap ring

Direct Clutch Disassembled View



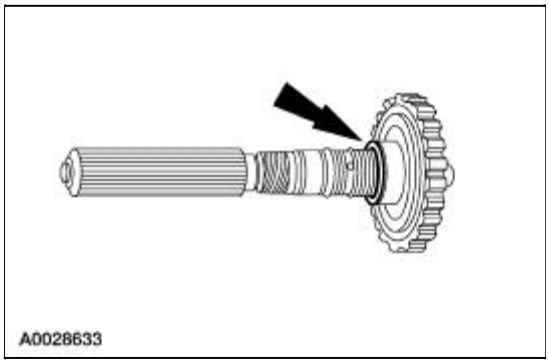
Item	Part Number	Description
1	7F236	Direct clutch hub
2	7F243	No. 7 direct clutch bearing
3	7D483	Direct clutch pressure plate retaining ring
4	7F237	Direct clutch inner bearing support
5	7B066	Direct clutch pressure plate
6	7B442	Direct clutch external spline plates (steel)
7	7B164	Direct clutch internal spline plates (friction)
8	388104-S2	Retaining ring
9	7F235	Direct clutch retainer and spring assembly
10	7A262	Direct clutch piston
11	7C099	Direct clutch piston inner seal
12	7A548	Direct clutch piston outer seal
13	7A233	Output shaft ring gear
14	7F283	Direct clutch cylinder



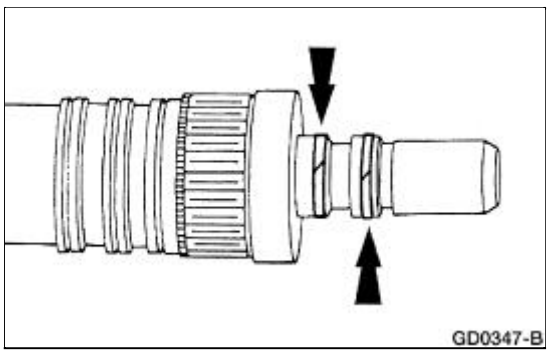
Disassembly

1. **NOTE:** The index mark on the output shaft must be aligned with the index mark on the output shaft ring gear during the assembly procedure.

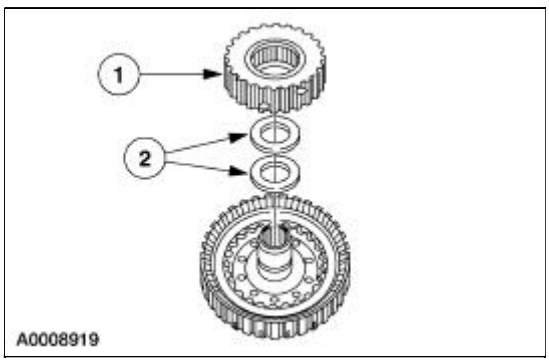
   Remove the ring gear snap ring.



2. Separate the ring gear and output shaft.



3. Remove the three output shaft seal rings.



4. Remove the output shaft hub snap ring and the output shaft hub.

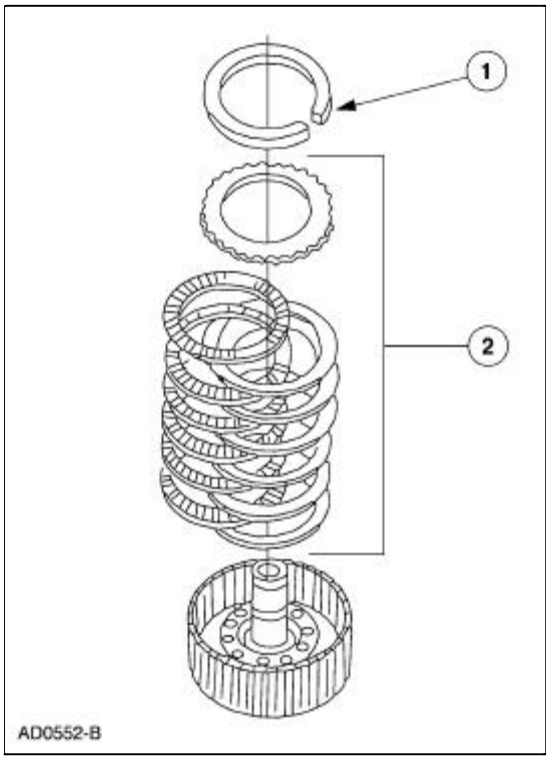
5. Remove the two direct clutch seal rings.

6. Remove the No. 7 direct clutch inner bearing support.
    1. Remove the direct clutch hub.
    2. Remove the No. 7 direct clutch inner bearing support.

7. Inspect the clutch cylinder thrust surfaces, piston bore and clutch plate serrations for scores or burrs. Minor scores or burrs may be removed with a crocus cloth. Install a new clutch cylinder if badly scored or damaged.

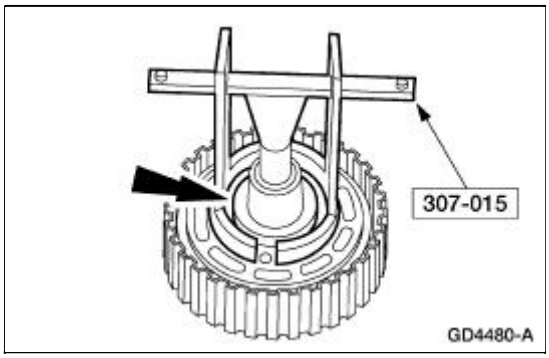
8. Check the fluid passage in the clutch cylinder for obstructions. Clean out all fluid passages. Inspect the clutch piston for scores and install new if necessary. Inspect the check balls for freedom of movement and correct seating.

9. Check clutch release spring for distortion and cracks. Install a new spring (including wave spring) if distorted or cracked.



10. Inspect composition clutch plates, steel clutch plates and clutch pressure plate for worn or scored bearing surfaces. Install new parts if they are deeply scored or burred.

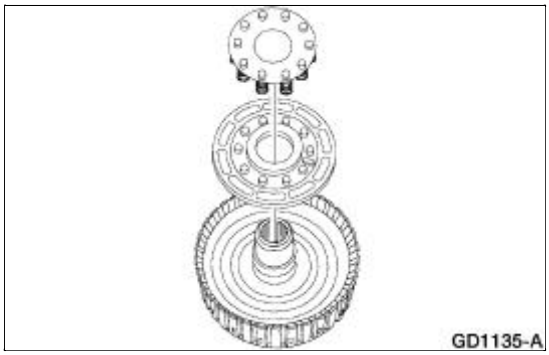
11. Check the clutch plates for flatness and fit on the clutch hub serrations. Discard any plate that



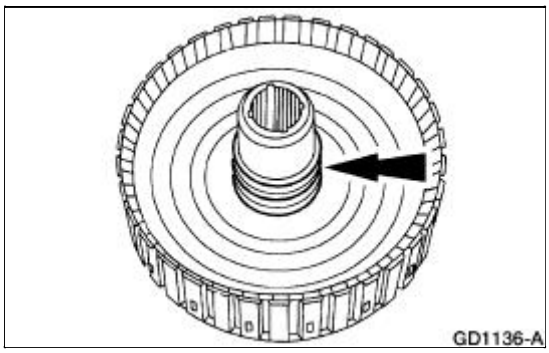
does not slide freely on the serrations or that is not flat.

12. Check the clutch hub thrust surfaces for scores and clutch hub splines for wear.

13. Remove the direct clutch pack.
    1. Remove the selective retaining ring.
    2. Remove the direct clutch pack.



14. Using the special tool, compress the piston return spring and remove the snap ring.

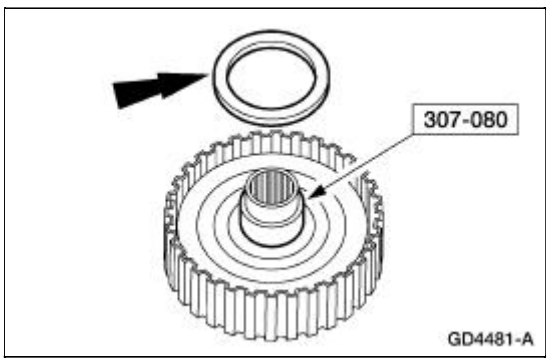


15. **WARNING: Wear safety glasses when using compressed air.**

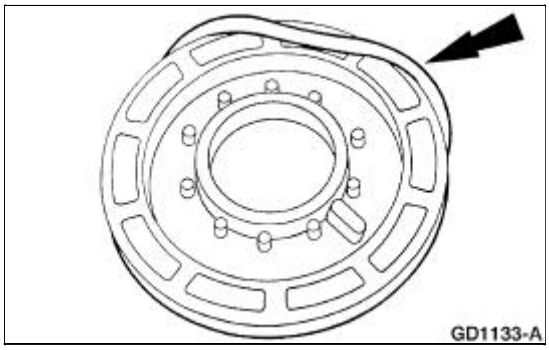
    NOTE: If necessary, use regulated compressed air 207 kPa (30 psi) max pressure to remove the clutch piston.

    Remove the support and spring assembly and piston.

16. Remove the inner piston seal.



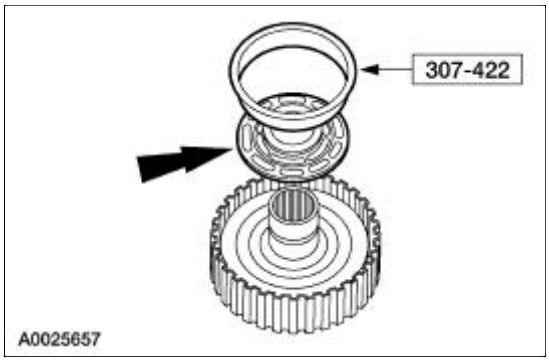
17. Remove the outer piston seal.



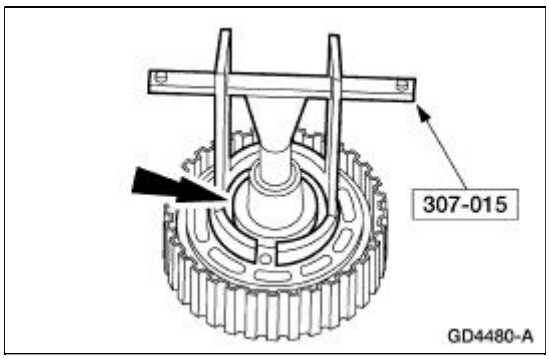
Assembly

1. **NOTE:** Lubricate direct clutch piston inner seal and seal protector with petroleum jelly.

   Using the special tool, install the inner piston seal.
   - Install the seal with sealing lip facing down.

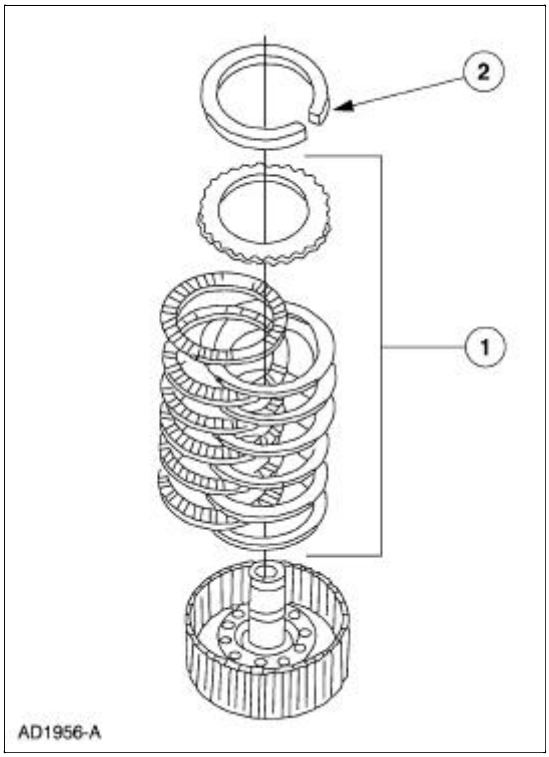


2. Install the clutch piston outer seal so that when the piston is installed the sealing lip points toward the bottom of the cylinder.



3. **NOTE:** Coat the inner and outer direct clutch piston seals, clutch cylinder sealing area and piston inner sealing area with petroleum jelly.

   Using the special tool, install the direct clutch piston.

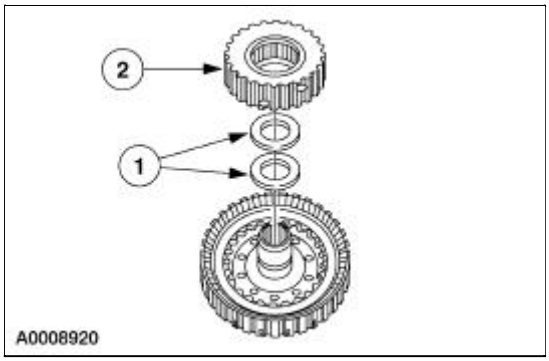


4. Install the piston return spring and retainer assembly.

5. Using the special tool, compress the piston return spring and install the retaining ring.

6. **NOTE:** Before assembly, soak new clutch discs in clean automatic transmission fluid for 15 minutes.

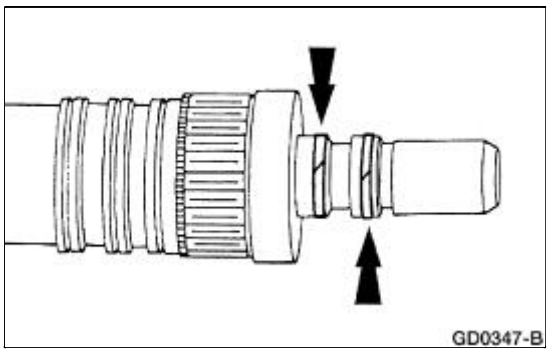
   Install the clutch pack retaining ring.
   1. Alternate external spline (steel) plates and internal spline (friction) plates, starting with a steel plate and ending with the friction plate.
   2. Install the clutch pack retaining ring.



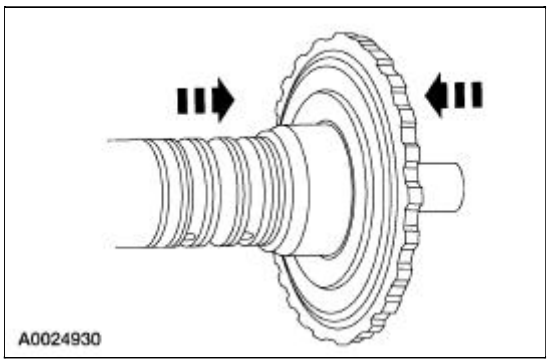
7. Use a feeler gauge to check the clearance between the clutch pack selective retaining ring and the pressure plate.
    - If the clearance is not within specifications, install the correct size retaining ring and recheck the clearance.

Selective Retaining Ring

Specification
1.52-1.62 mm (0.060-0.064 inch)
1.87-1.98 mm (0.074-0.078 inch)
2.24-2.34 mm (0.088-0.092 in)
2.59-2.69 mm (0.102-0.106 inch)



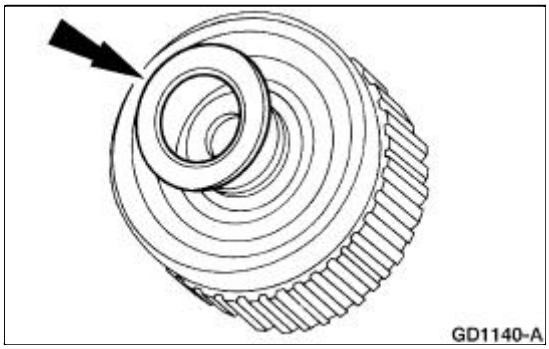
8. Install the direct clutch hub.
    1. Install the No.7 direct clutch inner bearing support.
    2. Install the direct clutch hub.



NOTE: Inspect the output shaft bearing surfaces for scores. Inspect the output shaft splines for wear. Inspect all bushings.

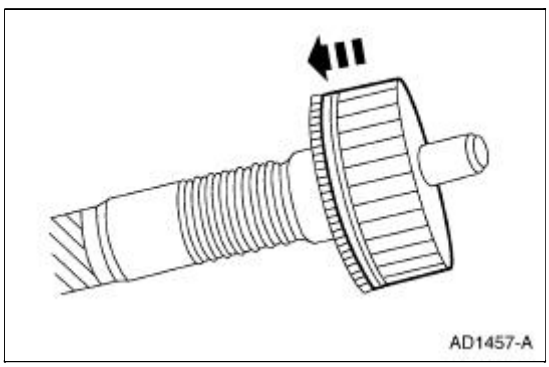
9. **CAUTION: Make sure the seals are lapped correctly. Internal damage may occur.**

   Install the two direct clutch seal rings.

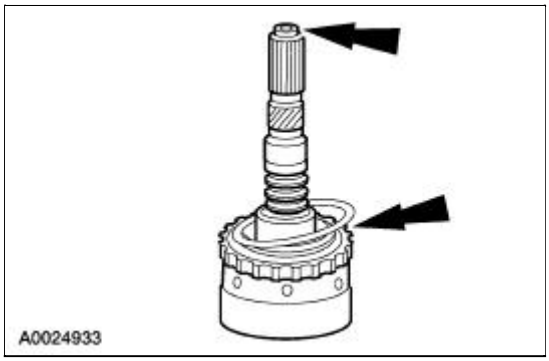


10. Install the output shaft hub.
    - Position the output shaft hub.
    - Install the retaining ring.

11. Install the three output shaft seal rings.



12. Install the No. 8 needle bearing on the direct clutch cylinder.



13. **NOTE:** Direct clutch cylinder may be installed after the output shaft ring gear is installed to the output shaft hub.

    Assemble the direct clutch on the output shaft.

14. **CAUTION: The index mark on the output shaft must be aligned with the index mark on the output shaft ring gear.**

    Align the index marks on output shaft and the output shaft ring gear and install the ring gear on the output shaft.

A0024933

Torque Converter

1. A new or remanufactured torque converter must be installed if one or more of the following statements is true:
    - A torque converter malfunction has been determined based on complete diagnostic procedures.
    - Converter stud or studs, impeller hub or bushing are damaged.
    - Discoloration (due to overheating).
    - The torque converter is found to be out of specification when carrying out one of the following torque converter checks:
        - One-Way Clutch Check
        - End Play Check
        - Stator to Turbine Interference Check
        - Stator to Impeller Interference Check
        - Torque Converter Leak Check
    - Evidence of transmission assembly or fluid contamination due to the following transmission or converter failure modes:
        - Major metallic failure.
        - Multiple clutches or clutch plate failures.
        - Sufficient component wear which results in metallic contamination.

Torque Converter Cleaning And Inspection

Material

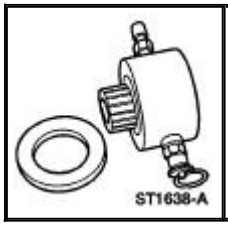
Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM, XT-5-DM	MERCON® V

1. If a new torque converter is being installed, continue with Substep 2 of Step 2.

2. If a new torque converter is not being installed, the following procedures must be performed:
    1. The torque converter must be thoroughly cleaned.
        - Torque converters with drain plugs can be cleaned by using a suitable torque converter/fluid cooler cleaner.
        - Torque converters without drain plugs can be cleaned by hand. Partially fill the torque converter using only recommended transmission fluid for the applicable transmission. Hand agitate the torque converter and then thoroughly drain the fluid. Refill the torque converter with clean automatic transmission fluid specified for transmission, and reinstall.
    2. All in-tank and auxiliary coolers must be thoroughly cleaned by forward and backward flushing. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.
    3. All cooler lines must be thoroughly cleaned by backward and forward flushing. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.
    4. All Cooler Bypass Valves (CBV), if equipped, must be thoroughly cleaned.
    5. Carry out the Transmission Fluid Cooler Flow Test. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.
    6. If the transmission cooling system fails the Transmission Fluid Cooler Flow Test, a new fluid cooler, cooler bypass valve, and/or cooler lines must be installed. For additional information, refer to Section 307-02 .
    7. If new coolers are to be installed, use only factory approved service parts.

Torque Converter Flushing

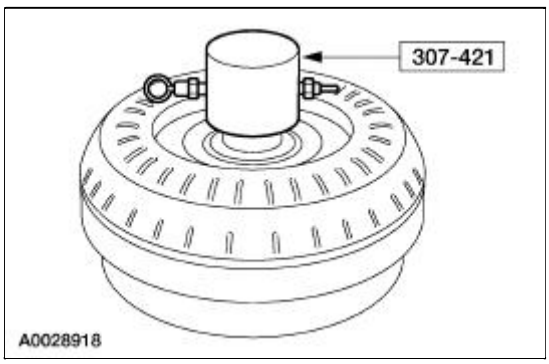
Material



Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM, XT-5-DM	MERCON® V

NOTE: When the transmission has been repaired for internal damage the torque converter must be cleaned using a mechanically agitated cleaner.

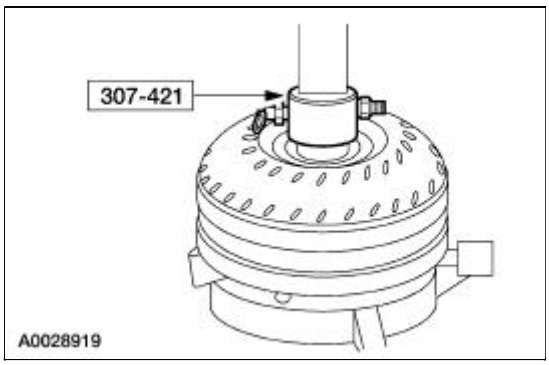
1. Using a suitable torque converter/fluid cooler cleaner, clean and flush the torque converter.
2. After flushing, drain the remainder of the solvent.
3. Add 1.9 liter (2 qt.) of clean transmission fluid to the converter and agitate by hand.
4. Thoroughly drain the solution.



Torque Converter Leak Check

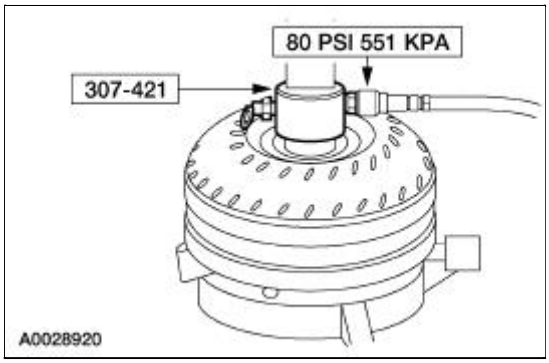
Special Tool(s)

	Leak Tester, Torque Converter 307-421



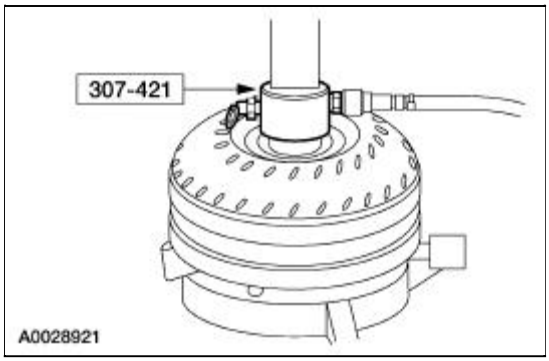
1. Clean the outside surface of the torque converter.

2. Install the special tool into the converter hub.



3. **WARNING: Always follow correct safety procedures while using press. Failure to follow these instructions may result in personal injury.**

   Install the torque converter with the installed special tool into the arbor press.
   Secure the press, apply enough force to seal the tool into the torque converter.

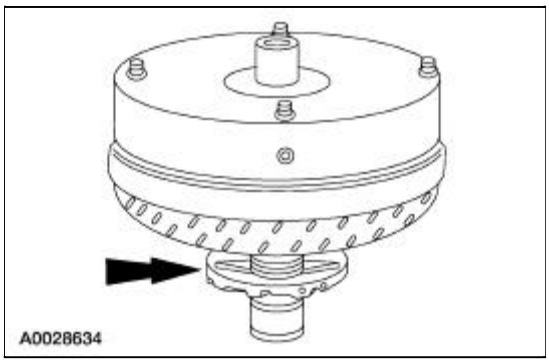


4. **NOTE:** Use clean dry shop air.

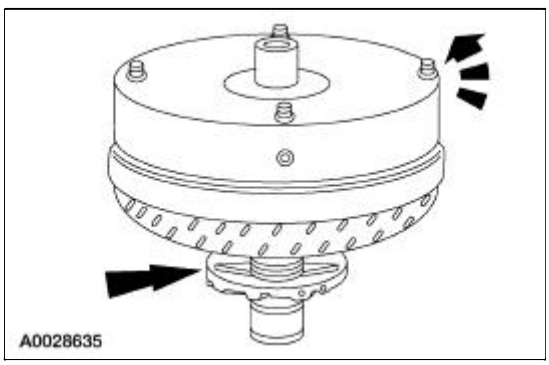
   Apply air pressure to the valve on the special tool.

5. With air pressure applied to the valve, inspect for leaks at the converter hub, seams, drain plug and studs. A soap bubble solution may be applied around these areas to aid in diagnosis. If a leak is found around the drain plug, install a new drain plug and recheck the torque converter. If any other leaks are present, install a new or remanufactured torque converter.

6. Remove the air hose. Release pressure and then slowly release the press. Remove the torque converter. Remove the special tool.



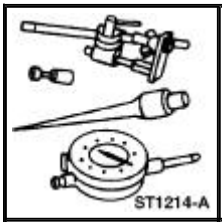
Torque Converter Impeller to Pump Stator Interference Check



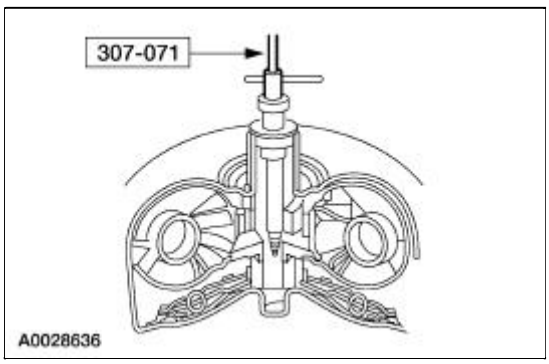
1. **NOTE:** Front pump support may remain in front pump support and gear during this test.

   Position the front pump support with the splines up.

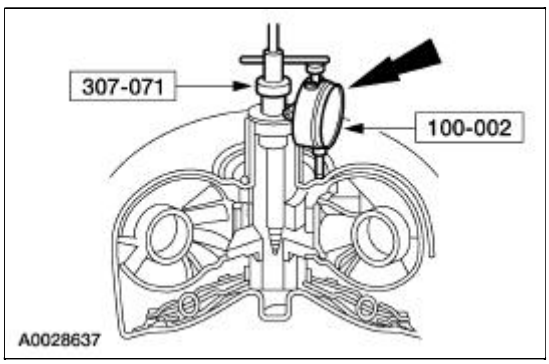
2. Mount the torque converter on the front pump support with the splines on the one-way clutch inner race, engaging the mating splines of the front pump support.



3. Hold the front pump support stationary and rotate the torque converter counterclockwise.
   - The torque converter should rotate freely with no signs of scraping.
   - If there are signs of scraping, install a new or remanufactured torque converter.



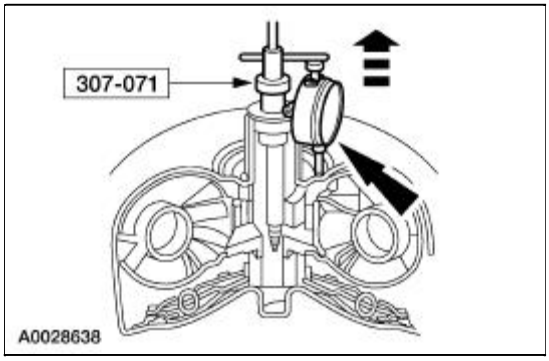
Torque Converter End Play Check



Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
 ST1196-A	End Play Gauge, Torque Converter 307-071 (T80L-7902-A) or equivalent

1. Install the special tool into the torque converter pump drive.
   - Tighten the inner post until the tool is securely locked.

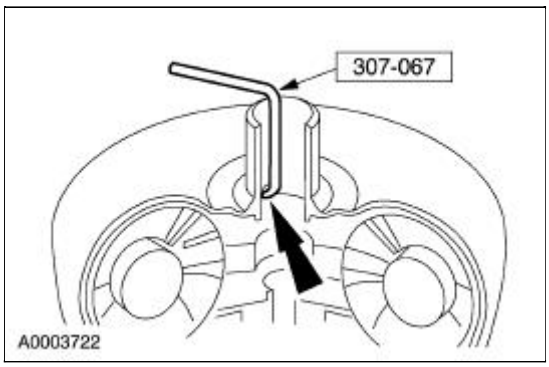


2. Install the special tool on the converter pump drive hub and zero the dial indicator.

3. Lift up on the special tool and note the dial indicator reading.
   - If the reading exceeds end play limits, install a new or remanufactured torque converter.

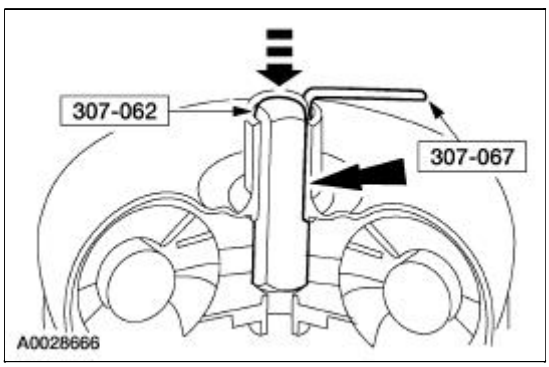
Torque Converter End Play

New or Rebuilt Torque Converter	Used Torque Converter
0.355-1.04 mm (0.014-0.041 inch) Max.	0.355-1.87 mm (0.014-0.074 inch) Max.



4. Remove the special tools.

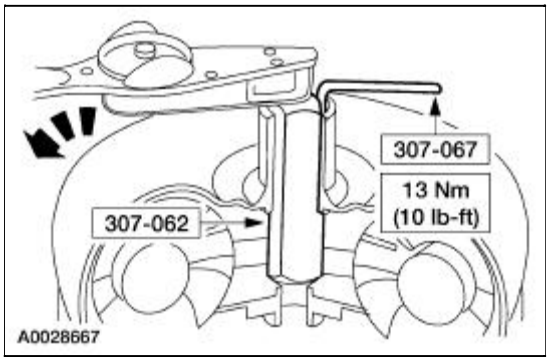
Torque Converter One-Way Clutch Check



Special Tool(s)

 ST1193-A	Holding Tool, One-Way Clutch 307-062 (T76L-7902-C) or equivalent
 ST1195-A	Holding Tool, Torque Converter Clutch 307-067 (T77L-7902-R) or equivalent

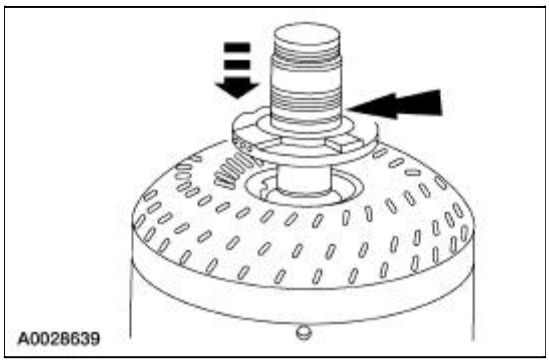
1. Install the special tool in one of the grooves in the stator thrust washer.



2. Install the special tool in the converter pump drive.

3. Use a torque wrench to turn the special tool counterclockwise while holding the special tool stationary.
   - The converter should lock up and hold torque.
   - The torque converter one-way clutch should rotate freely in the clockwise direction.
   - Try the clutch for lockup and hold in at least five positions.

- If the torque converter fails the lockup test torque, install a new or remanufactured torque converter.



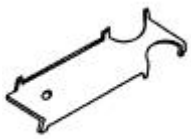
Torque Converter Turbine to Pump Stator Interference Check

1. **NOTE:** Front pump support may remain in front pump support and gear during this test.

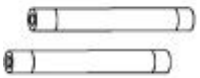
   Position the torque converter with the pump drive up.

2. Install the front pump support to engage the mating splines of the front pump support shaft on the torque converter.

3. Install the forward clutch cylinder and shaft, engaging the splines with the rear clutch hub.



4. Check for stator to turbine interference.
   1. Hold the front pump support stationary.
   2. Attempt to rotate the forward clutch cylinder and shaft.
      - The turbine and torque converter clutch assemblies should rotate in both directions, not exceeding maximum torque of 9.5 Nm (7 lb-ft), without any signs of metallic interference or scraping noise.



5. If interference exists, the stator front thrust washer may be worn, allowing the stator to hit the turbine. In such cases, a new or remanufactured torque converter must be installed.
   - The converter crankshaft pilot should be checked for nicks or damaged surfaces that could cause interference when installing the torque converter into the crankshaft. Check the converter front impeller hub for nicks or sharp edges that would damage the pump seal.

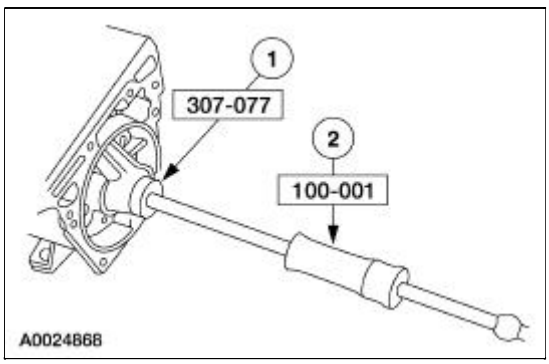
Material

Item	Specification
MERCON® V Automatic	

Transmission Fluid XT-5-QM	MERCON® V
Multi-Purpose Grease D0AZ-19584-AA	ESB-M1C93-B

CAUTION: Before beginning assembly, carry out and inspect the following:

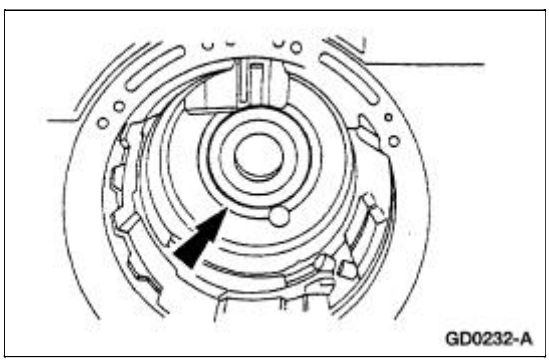
When building up subassemblies and assembling the transmission, ALWAYS use new gaskets and seals.



All fasteners must be tightened to the torque specification indicated. In addition to appearing in the section, the necessary torques can be found in the General Specifications Chart.

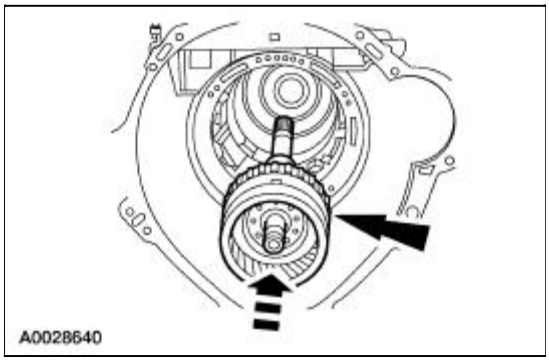
When building up subassemblies, each component part should be lubricated with clean transmission fluid. It is also good practice to lubricate the subassemblies as they are installed in the case.

Needle bearings, thrust washers and seals should be lightly coated with petroleum jelly during subassembly buildup or transmission assembly.



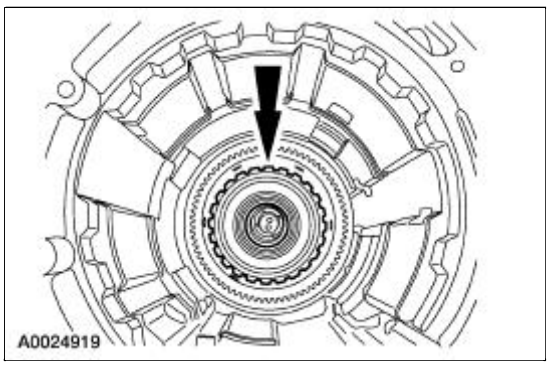
Many components and surfaces in the transmission are precision machined. Careful handling during disassembly, cleaning, inspection and assembly can prevent unnecessary damage to machined surfaces.

1. Use the special tools to install the rear case bushing if removed.
    1. Position the rear case bushing and the special tool inside the case.
    2. Assemble the special tools through the back of the case.

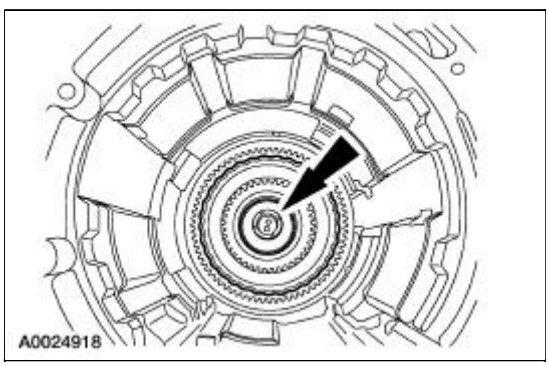


2. Place the transmission in the vertical position.

3. Coat the No. 9 case rear bearing with petroleum jelly and install on the case boss.

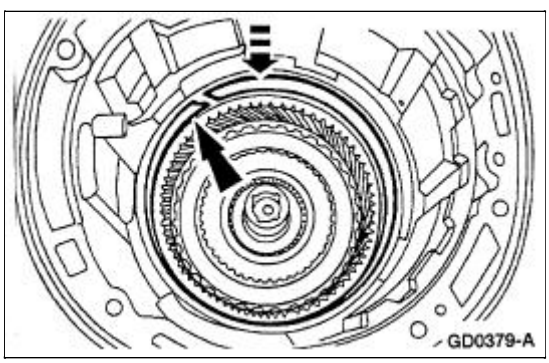


4. **CAUTION: Be sure the No. 7 needle bearing and direct clutch hub are installed as shown in the Subassembly section. Internal damage and shift problems may occur.**

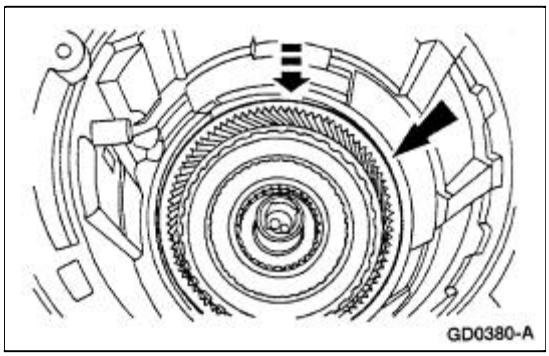


Install the output shaft and output shaft ring gear.

5. Install the No. 8 bearing.



6. Install the direct clutch.

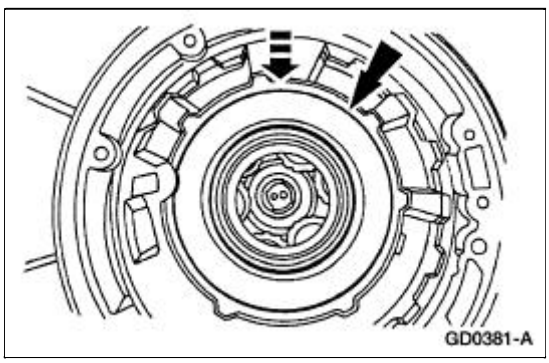


7. **NOTE:** The reverse band support retaining ring is used for assembly purposes during production. The reverse band support retaining ring is not required during assembly, it will not affect the operation of the transmission.

   Install the reverse band support retaining ring.

8. **NOTE:** Make sure the band is seated on the anchor pins.

   Install the reverse band.

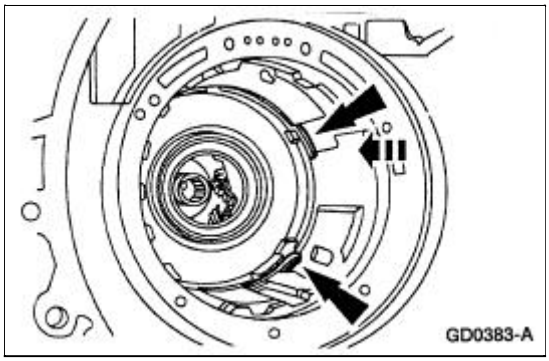


9. **NOTE:** The planetary assembly and planetary gear support cannot be installed unless the notch cut in the planetary gear support is aligned with the overdrive band anchor pin.

   NOTE: The top of the planetary gear support must be below the snap ring groove.

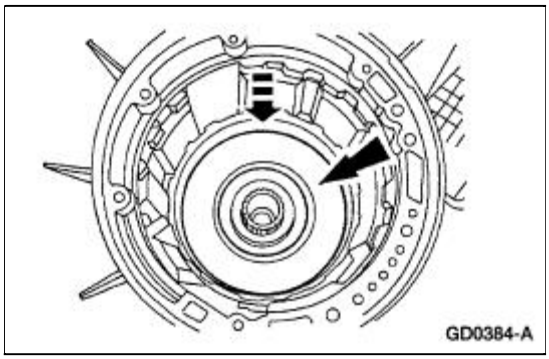
   Install the planetary assembly and planetary gear support as a unit.

   - Rotate the output shaft to fully seat the planetary assembly.



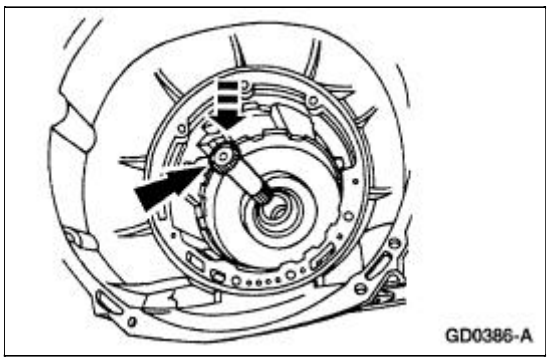
10. **NOTE:** The planet support spring must be compressed and installed below the snap ring groove. When the planet support spring is installed correctly both ends of the spring will be visible.

    Install the case to planet support spring located at the 1 o'clock position.

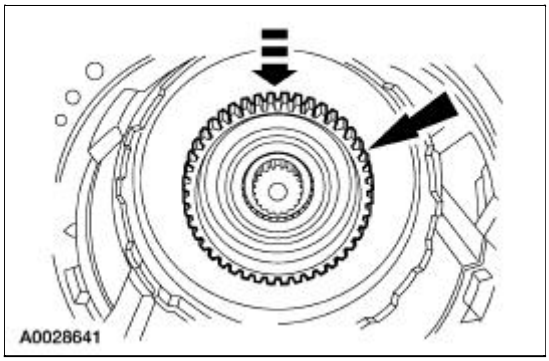


11. Install the center support retaining ring.

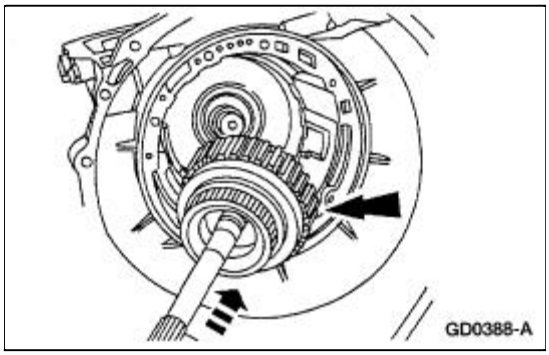
    - Reference the retaining ring tabs to the band anchor pin location.



12. Install the forward clutch sun gear, No. 5 forward clutch sun gear bearing and the reverse sun gear.

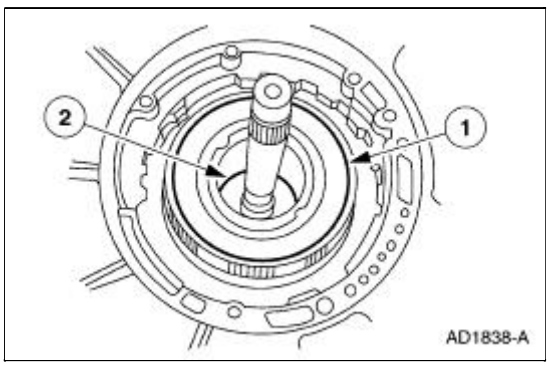


13. Install the No. 4 forward clutch hub bearing.

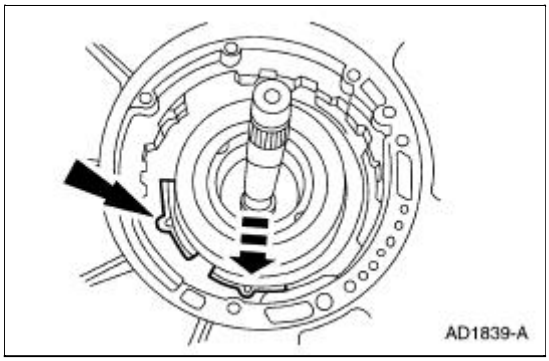


14. Install the intermediate stub shaft.

15. Install the forward clutch hub and the No. 3 forward clutch hub front bearing.

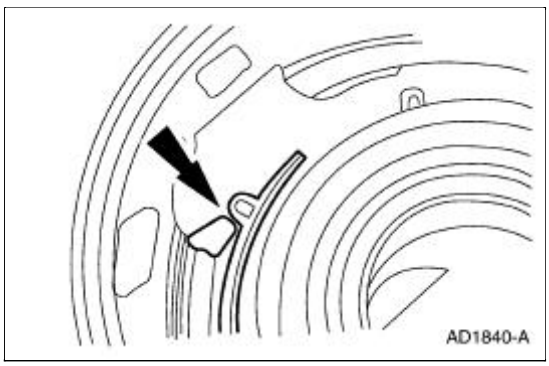


16. Install the forward clutch assembly.

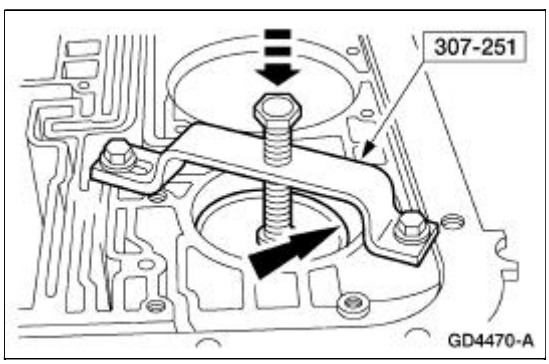


17. **NOTE:** Make sure the reverse clutch cylinder lugs are completely seated in the notches of the reverse sun gear.

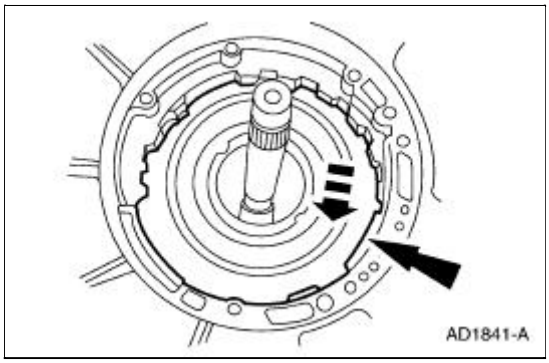
    Install the reverse clutch cylinder assembly.
    1. Install the reverse clutch cylinder assembly.
    2. Install the No. 2 forward clutch bearing.



18. Install the overdrive band.
    - Position the overdrive band pocket onto the anchor pin.

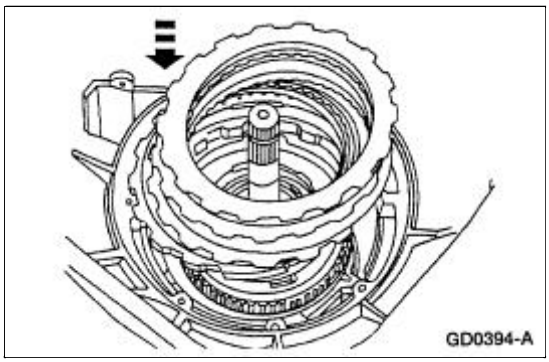


19. Install the overdrive servo spring.
    1. Install the overdrive servo piston return spring.
    2. Install the overdrive servo piston.



20. Verify the tip of the piston assembly engages the pocket of the overdrive band.

21. Using the special tool, compress the overdrive servo assembly and install the overdrive servo retaining ring.



22. Install the intermediate clutch pressure plate.

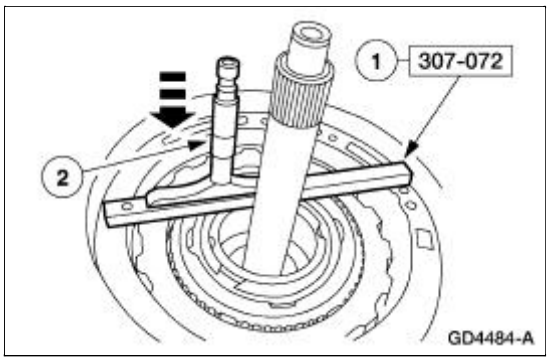
23. **NOTE:** Before assembly, soak the new clutch discs in clean automatic transmission fluid for 15 minutes.

    Install the intermediate clutch pack and selective steel plate.

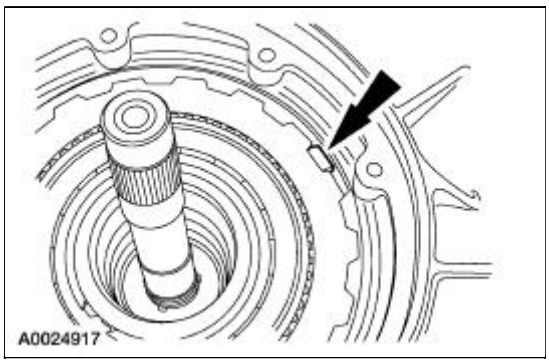
24. Using the special tool, check the intermediate clutch clearance.
    1. Position the special tool on the pump case mounting surface.
    2. Maintaining downward pressure, use a depth micrometer to measure and verify intermediate clutch clearance is within specification.
       If the intermediate clutch is not within specification, install a correct selective plate.

Selective Steel Plates

Specification
1.80-1.7 mm (0.071-0.067 inch)
2.05-1.95 mm (0.081-0.077 inch)
2.31-2.20 mm (0.091-0.087 inch)
2.56-2.46 mm (0.101-0.097 inch)

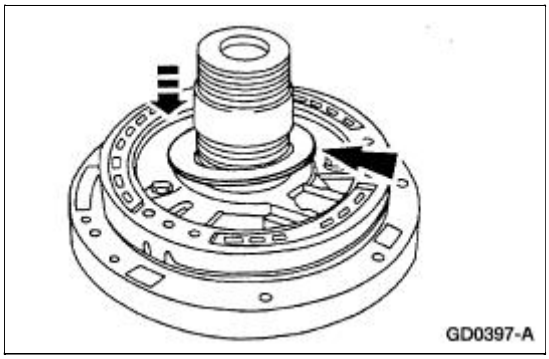


25. Using the special tool, measure end clearance for the No. 1 front pump thrust washer.
    1. Position the special tool on the pump case mounting surface.
    2. Maintaining downward pressure, use a depth micrometer to measure end play clearance.



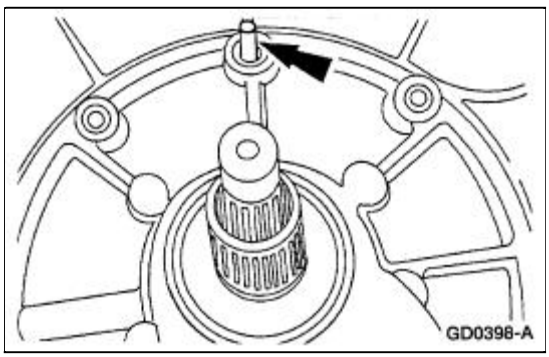
Use the No. 1 thrust washer chart to select the correct washer.

No.1 Thrust Washer Chart



Depth	Thickness	Color Code
37.706-38.184 mm (1.485-1.503 inch)	1.270-1.372 mm (0.050-0.054 inch)	Green
38.185-38.641 mm (1.504-1.521 inch)	1.727-1.829 mm (0.068-0.072 inch)	Yellow
38.642-39.073 mm (1.522-1.538 inch)	2.159-2.261 mm (0.085-0.089 inch)	Natural
39.074-39.505 mm (1.539-1.555 inch)	2.591-2.692 mm (0.102-0.106 inch)	Red
39.506-40.165 mm (1.556-1.581 inch)	3.023-3.124 mm (0.119-0.123 inch)	Blue

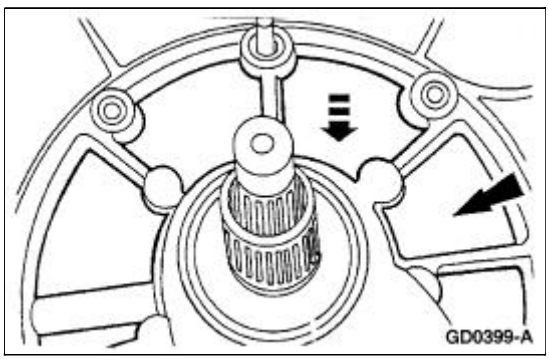
26. If equipped, install the intermediate clutch anti-rattle clip.



27. Install the No. 1 front pump support thrust washer.
    - Use petroleum jelly to hold the washer in place.

28. **NOTE:** The alignment pin is a fabricated M8 x 1.25 mm (0.05 in) bolt with the head removed.

    Install an alignment pin at the top of the case.

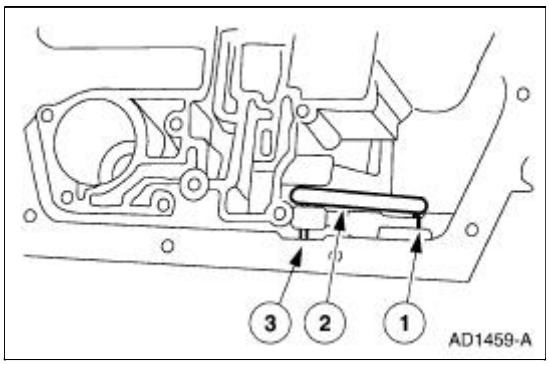


29. **NOTE:** Make sure the gasket is positioned correctly and the case passages are not covered.

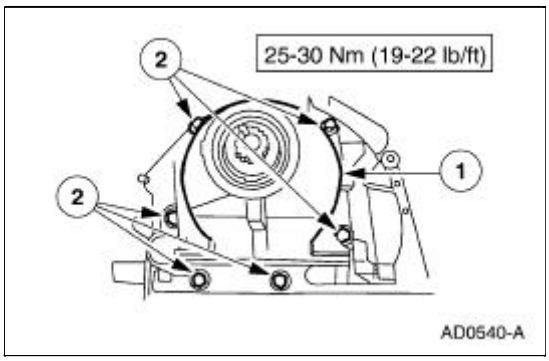
    Install the pump gasket.

30. **NOTE:** To aid assembly, shake the input shaft while pushing down on the pump.

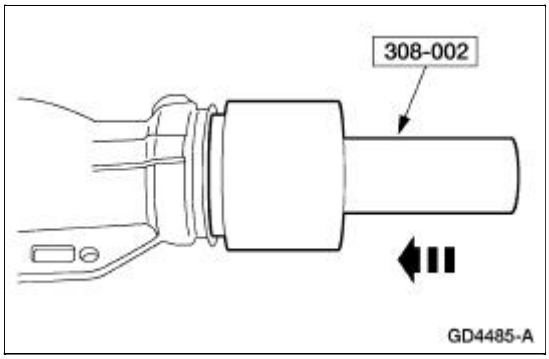
    Install the pump assembly.



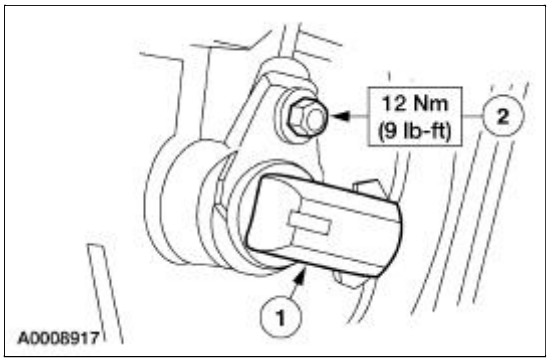
31. Remove the alignment pin and install the front pump bolts.
    - Alternate bolt tightening to set the pump.



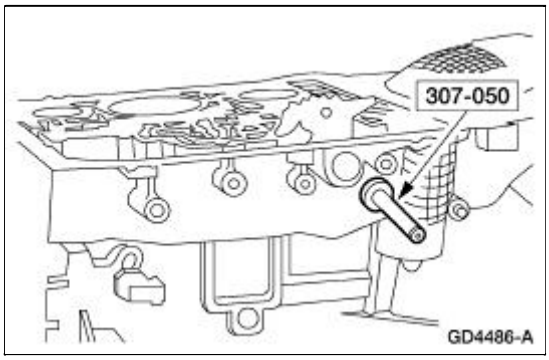
32. Rotate the transmission to the horizontal position.



33. Install the parking pawl.
    1. Position the parking pawl return spring.
    2. Position the parking pawl.
    3. Install the parking pawl shaft.

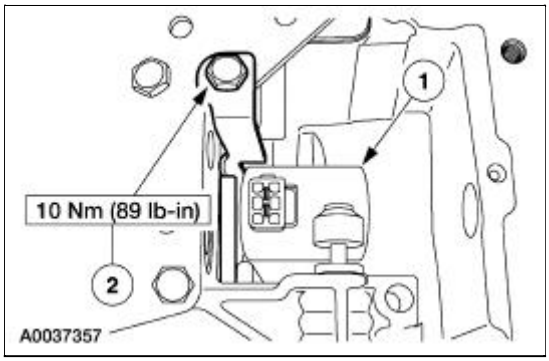


34. Install a new extension housing gasket and the extension housing.
    1. Position the extension housing.
    2. Install the four bolts and two nuts.

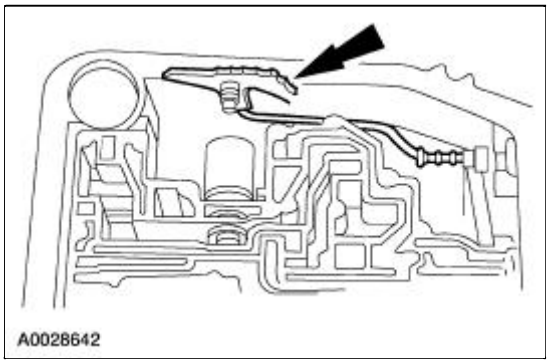


35. Using the special tool, install a new extension housing seal.

36. Install the output shaft speed (OSS) sensor.
    1. Position the OSS sensor.
    2. Install the bolt.

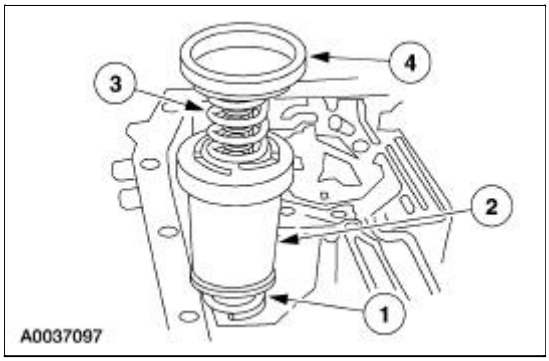


37. Using the special tool, install the manual control lever seal.

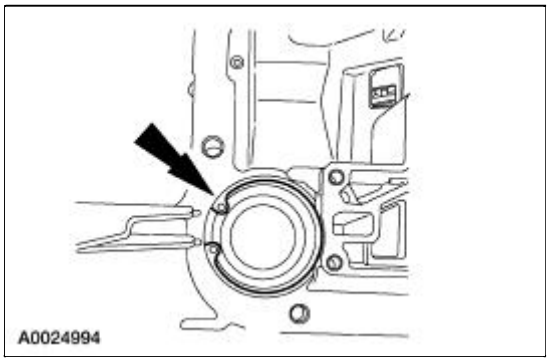


38. **NOTE:** Lubricate the electronic pressure control (EPC) solenoid O-rings with clean automatic transmission fluid.

    Install the EPC solenoid.
    1. Install the EPC solenoid.
    2. Install the EPC solenoid bracket and bolt.

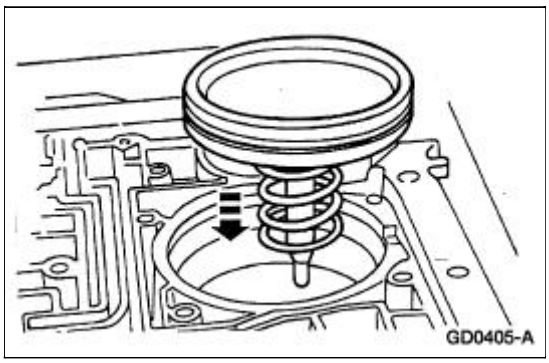


39. Install the manual valve detent lever and parking lever actuating rod.

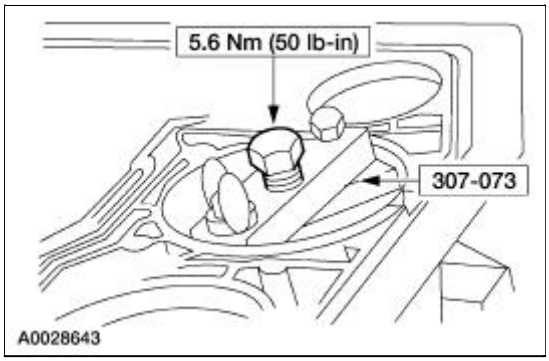


40. Install the manual control lever shaft.
    1. Slide the manual control shaft into the case.
    2. Install the manual lever shaft inner nut.
    3. Install the manual lever shaft retaining pin.

41. Install the 1-2 accumulator piston assembly.
    1. Install the 1-2 accumulator spring.
    2. Install the 1-2 accumulator.
    3. Install the inner and outer 1-2 accumulator springs.
    4. Install the 1-2 accumulator cover and seal.



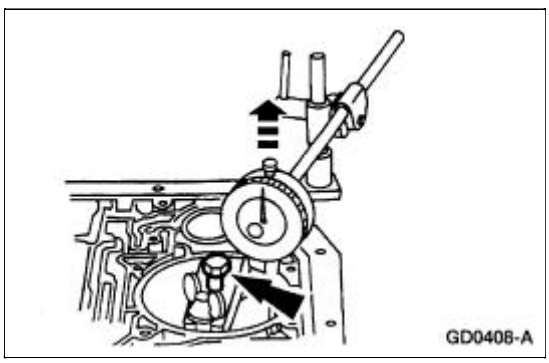
42. Install the 1-2 accumulator springs and install the accumulator piston retaining ring.



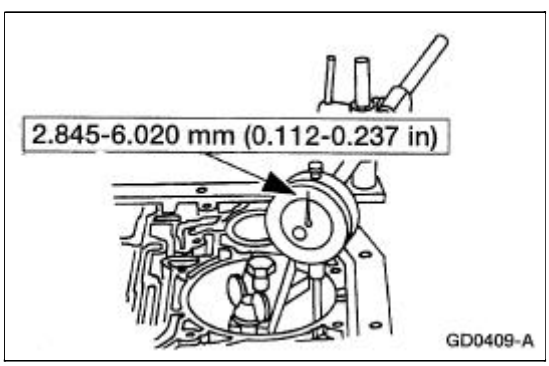
43. **NOTE:** This is not an ordinary installation procedure and does not compensate for band wear. When a new piston and rod assembly becomes necessary, or when a new reverse band has been installed, the reverse piston and rod length must be adjusted.

    NOTE: Lubricate the reverse piston seal to facilitate assembly and prevent damage to the seal.

    Install the reverse servo piston and return spring.

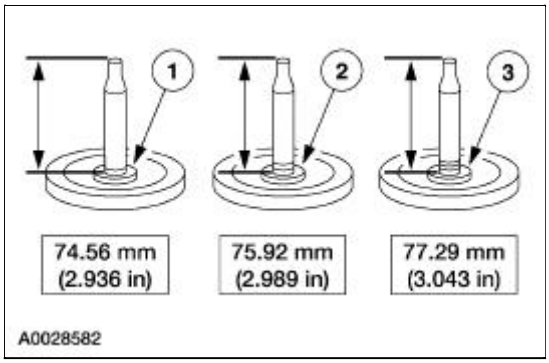


44. Install the special tool.
    - Tighten the bolt.

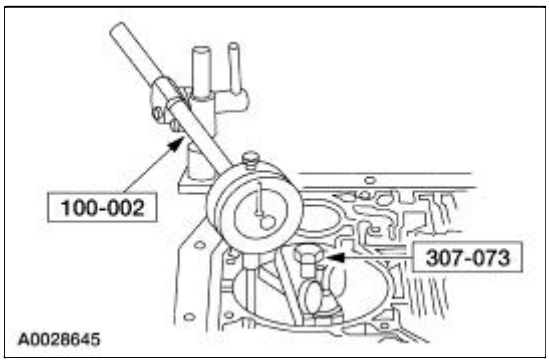


45. Install the special tool.
    - Position the indicator stem on the flat portion of the reverse servo piston and zero the dial indicator.

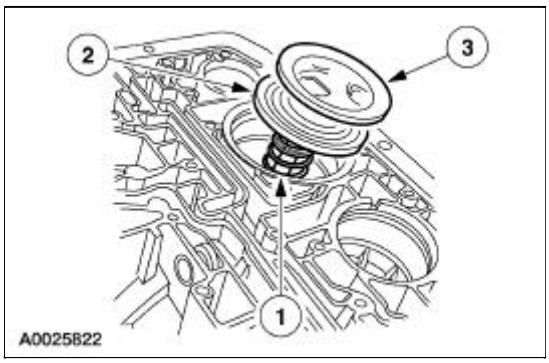
46. Loosen the bolt until the piston stops against the tool.



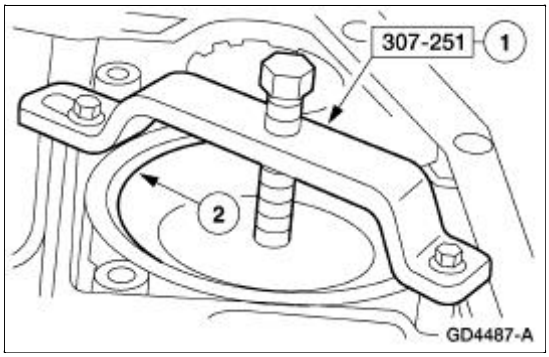
47. Verify the amount of piston travel on the dial indicator is within specification.



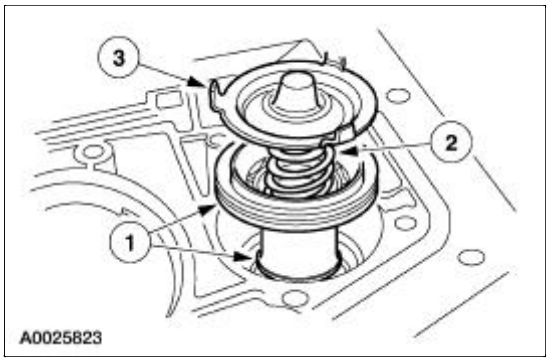
48. If piston travel is not within specification, select and install the correct servo assembly to bring the servo piston travel within specification.



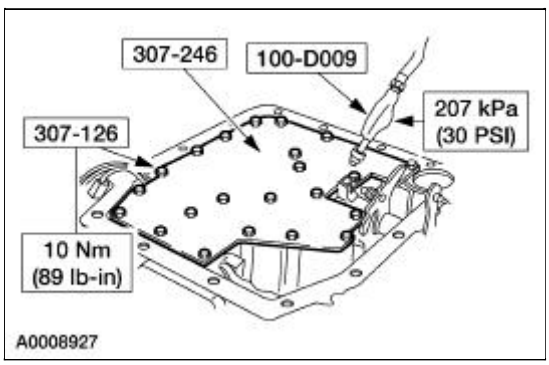
1. One groove
2. Two grooves
3. Three grooves



49. Remove the special tools.

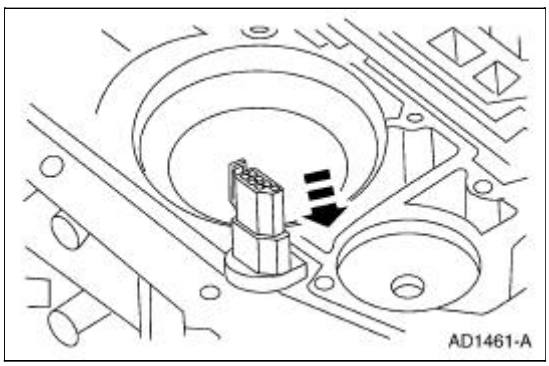


50. Install the reverse servo assembly.
    1. Install the rod.
    2. Install the piston assembly.
    3. Install the reverse servo piston cover and seal.

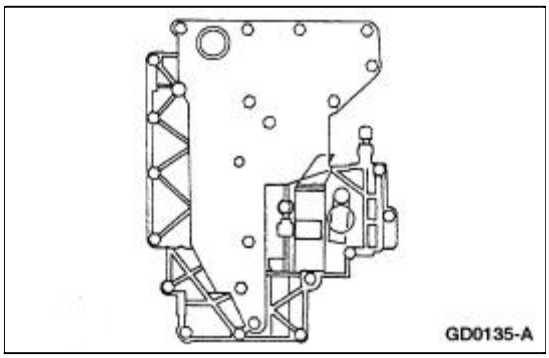


51. Using the special tool, install the reverse servo retaining ring.
    1. Compress the reverse band servo.
    2. Install the reverse band servo retaining ring.

52. Install the 2-3 accumulator assembly.
    1. Install the accumulator piston.
    2. Install the accumulator piston spring.
    3. Install the accumulator spring retainer.

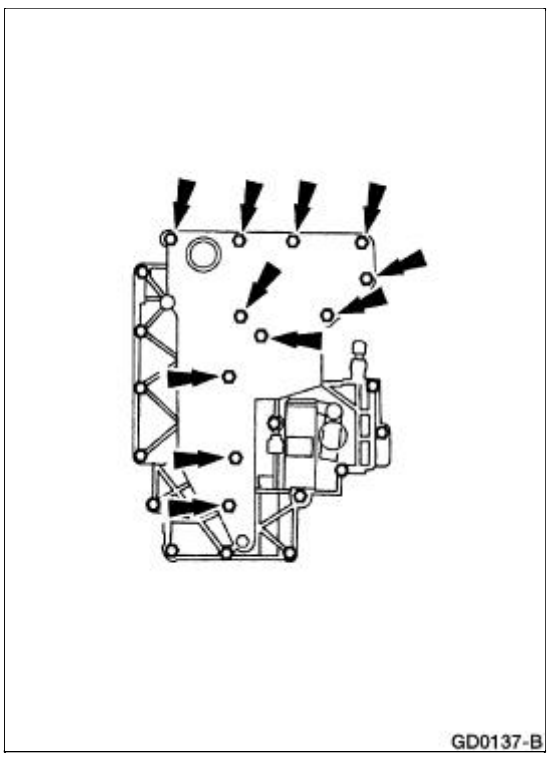


53. Using the special tools apply regulated air pressure to the test ports. Verify that the components are applied and released.



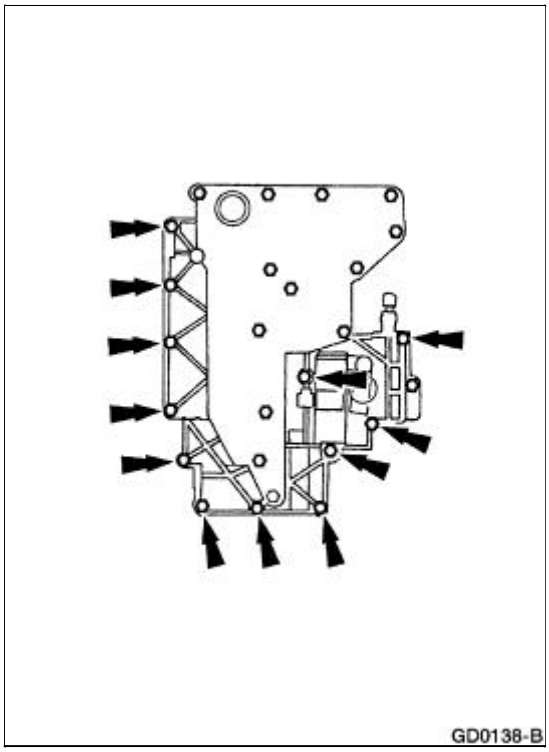
54. **NOTE:** The tab on the electrical connector is secured by main control valve body.

    Install the electrical connector into case.



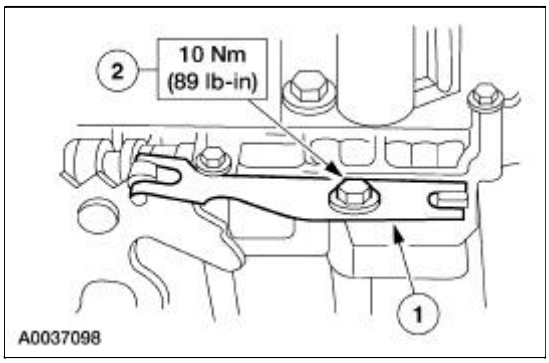
55. **NOTE:** The alignment bolts are valve body assembly bolts and are in the valve body.

    Align the main control valve body alignment bolts and position the main control valve body.



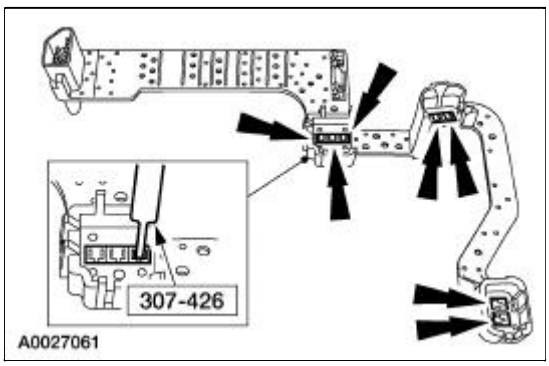
56. **NOTE:** The main control valve body bolts will be tightened in later steps.

    Loosely install the 11 long main control valve body bolts.

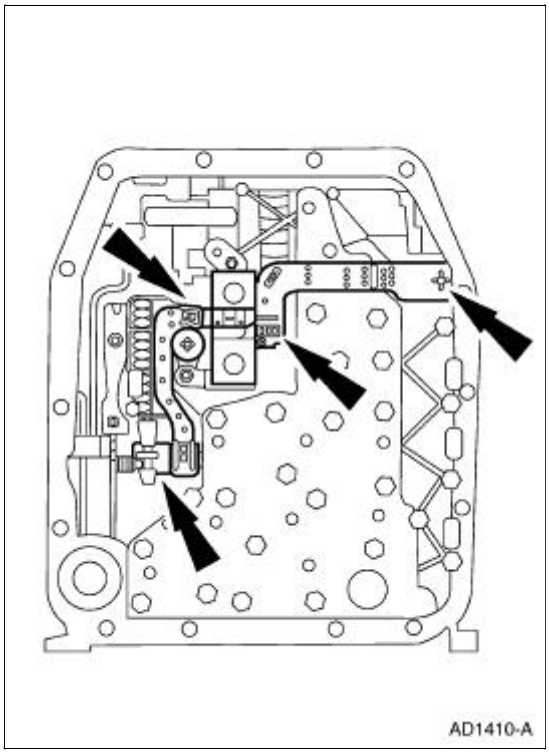


57. **NOTE:** The main control valve body bolts will be tightened in later steps.

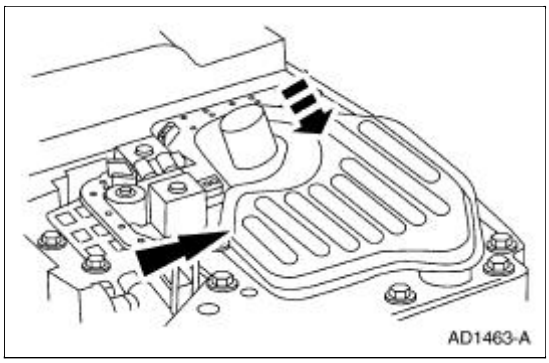
    Loosely install the 12 short main control valve body bolts.



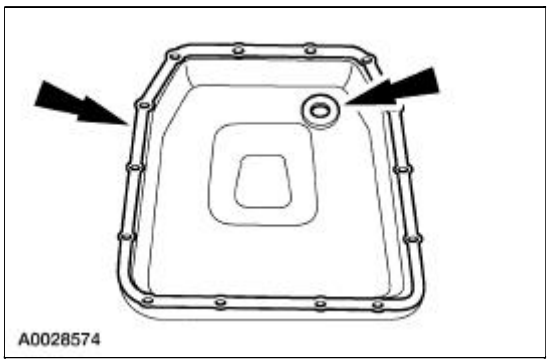
58. Install the manual control valve detent lever spring.
    1. Position the manual control valve detent lever spring.
    2. Install the bolt.



59. Tighten the bolts in the sequence shown.

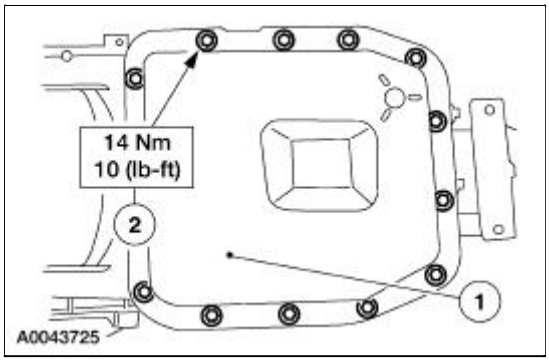


60. Inspect the lead frame for damage.
    - Using the special tool, check all lead frame solenoid connections. The gauge should fit tightly and not fall out after being inserted.
    - If the special tool passes through any lead frame connector pins or does not feel like it makes a good contact, install a new lead frame.

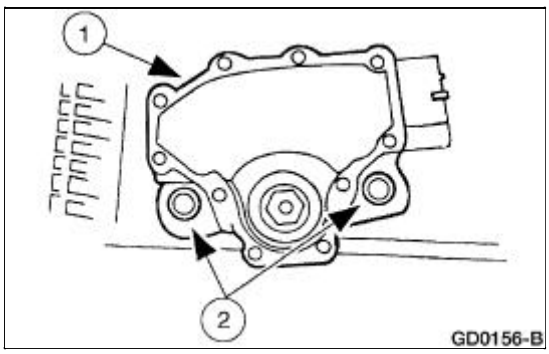


61. Connect the molded lead frame to the solenoids.
    - Connect the bulkhead inter-connector by pressing it in place by hand and fully seating the connector in place.
    - Connect the EPC solenoid by pressing it in place by hand and fully seating the connector in place. Make sure that the terminals pass fully through the connector slots.
    - Connect the TCC by pressing it in place by hand and fully seating the connector in place. Make sure that the terminals pass fully through the connector slots.
    - Connect the shift solenoid SSA and SSB by pressing it in place by hand and fully seating the connector in place. Make sure that the terminals pass fully through the connector slots.

62. Install the fluid filter and seal assembly.

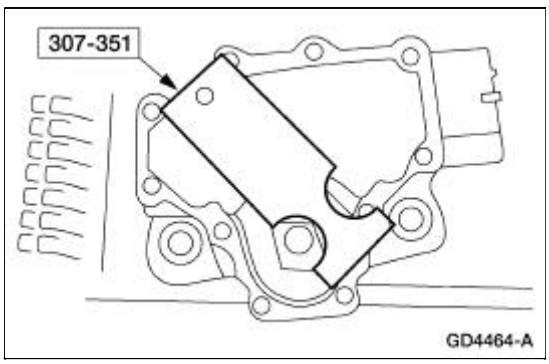


63. Position the pan magnet onto the fluid pan.

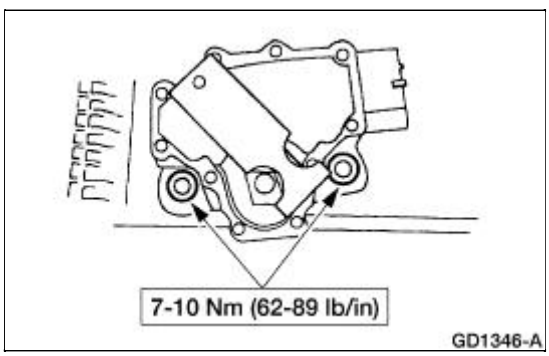


64. **NOTE:** The pan gasket is reusable; clean and inspect for damage. If not damaged, the gasket should be reused.

    Install the fluid pan and gasket.
    1. Position the transmission fluid pan with the gasket in place.
    2. Install the bolts.



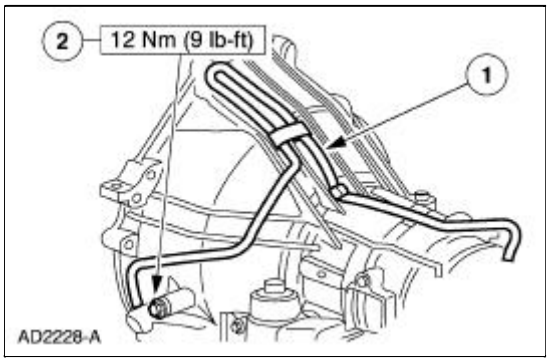
65. Install the digital transmission range (TR) sensor.
    1. Install the digital TR sensor.
    2. Loosely install the digital TR bolts.



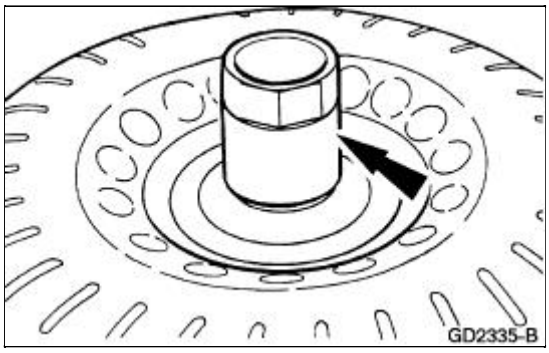
66. **NOTE:** The tool is designed to fit snug.

    NOTE: Manual shift lever must be in the neutral position.

    Using the special tool, align the digital TR sensor slots.



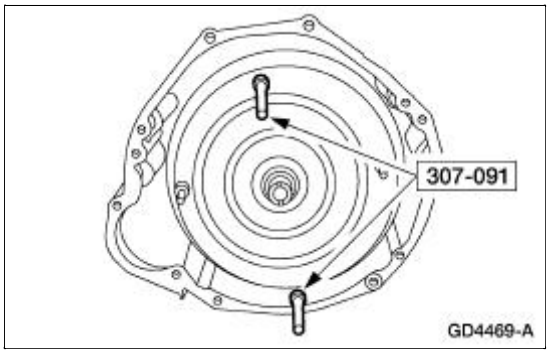
67. Tighten the bolts.



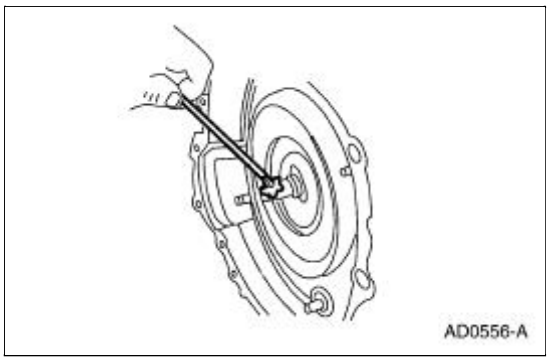
68. Install the manual control lever.
    1. Install the manual control lever.
    2. Install the nut.

69. Install the transmission vent tube, if equipped.
    1. Install the transmission vent tube.
    2. Install the bolt.

70. Lightly lubricate the converter hub with clean automatic transmission fluid.



71. **WARNING: The torque converter can fall out if the transmission is tipped.**



CAUTION: Make sure the converter hub is fully engaged in the front pump support and gear and rotates freely. Do not damage the hub seal.

CAUTION: If the torque converter slides out, the hub seal may be damaged.

Using special tools, install the torque converter.

72. Lubricate the torque converter pilot hub with multi-purpose grease.

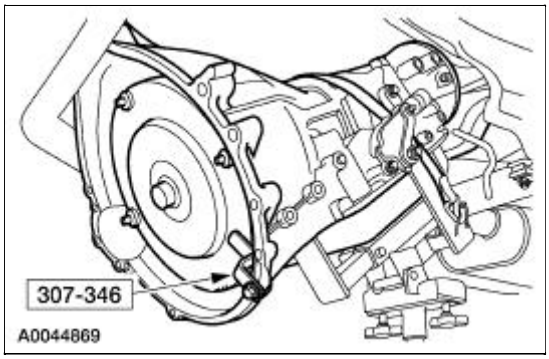
Transmission —4x2

Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

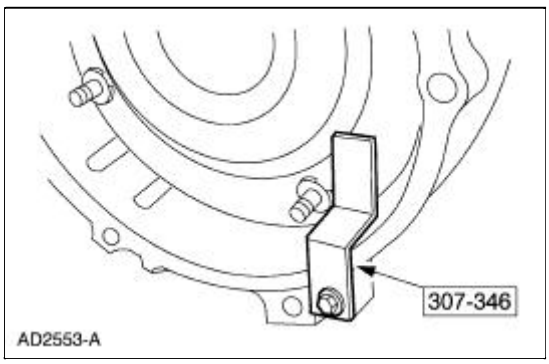
Material

Item	Specification
MERCON®V Automatic Transmission Fluid XT-5-QM	MERCON®V



Installation

1. Install the special tool if not done in the assembly procedure.

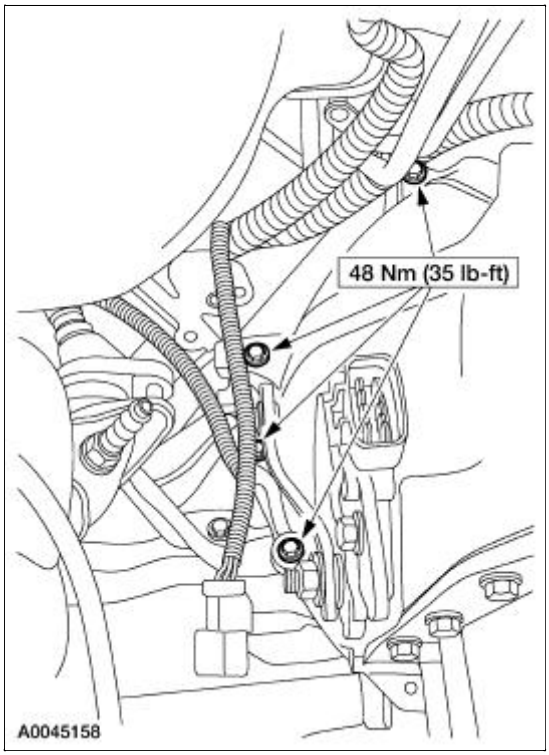


2. **CAUTION: To position the transmission in the vehicle, put the transmission into a nose-down position on the transmission jack. This allows the tail shaft to go over the exhaust system. The converter housing is piloted into position by dowels in the rear of the engine block. The torque converter must rest squarely against the flexplate. This indicates that the converter pilot is not binding in the engine crankshaft.**

   Position and secure the transmission on the high-lift transmission jack. Raise and position the transmission into the vehicle. Once the transmission is in position, place the transmission in a horizontal position.

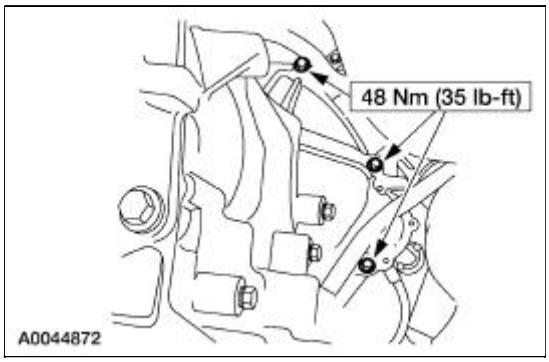
3. **NOTE:** Do not remove the special tool until the transmission is in a horizontal position.

   Remove the special tool.



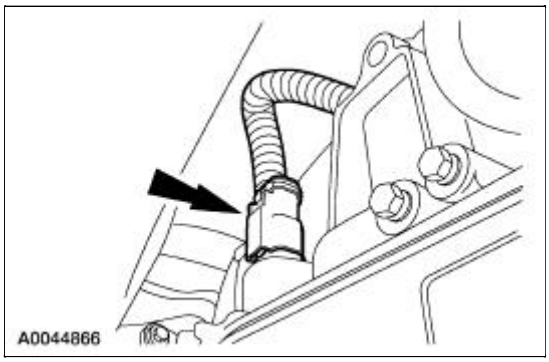
4. **NOTE:** Make sure the torque converter is fully seated in the transmission before aligning the transmission to the engine.

   With the transmission in a horizontal position move it toward the engine. Align the orange balancing marks between the torque converter studs and the flexplate bolt holes.



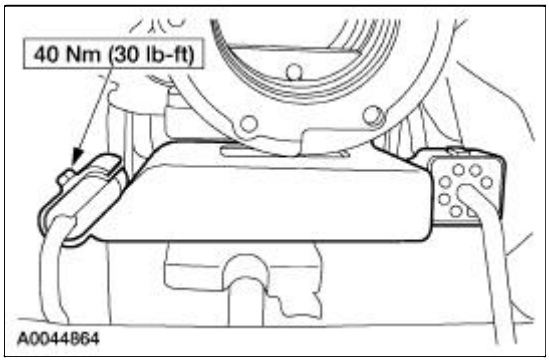
5. **NOTE:** Install the transmission retaining bolts in their correct locations made during removal.

   Install the LH transmission retaining bolts.

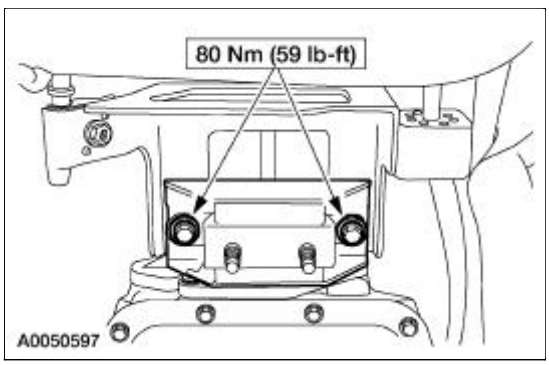


6. **NOTE:** Install the transmission retaining bolts in their correct locations made during removal.

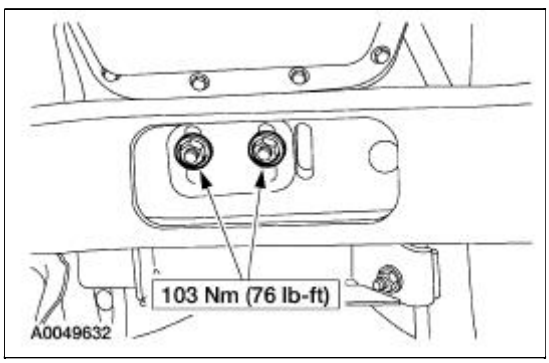
   Install the RH transmission retaining bolts.



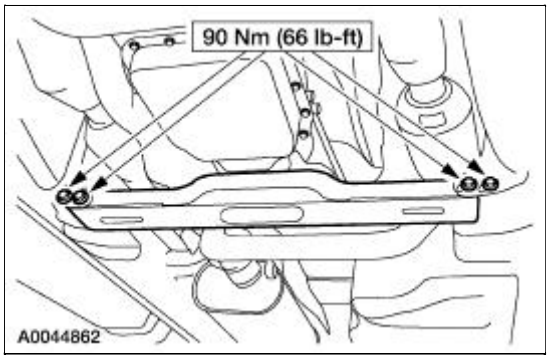
7. Connect the solenoid body connector and connect the harness retainer to the transmission.



8. Connect the output shaft speed (OSS) sensor, the digital TR sensor connectors and connect the harness retainer to the transmission.

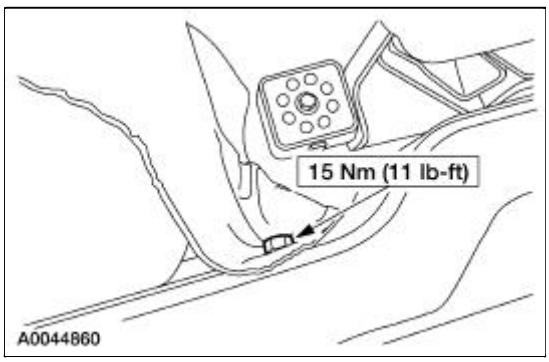


9. Install the exhaust hanger.

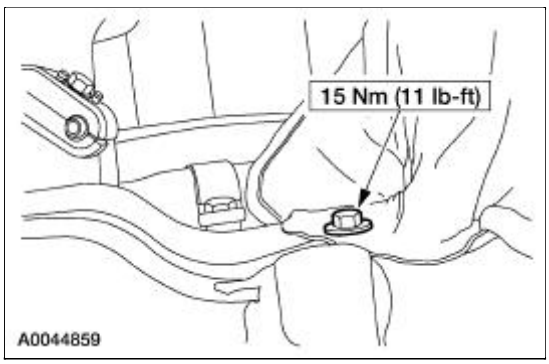


10. Install the rear transmission support.

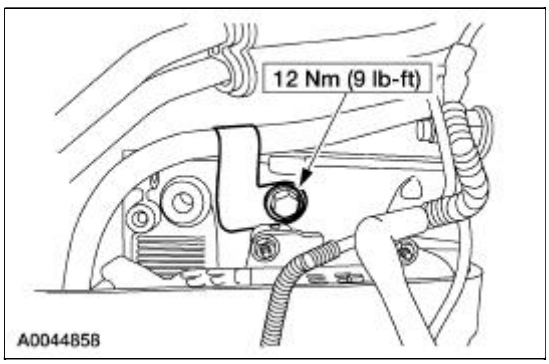
11. Position the rear crossmember in place and install the rear transmission support nuts.



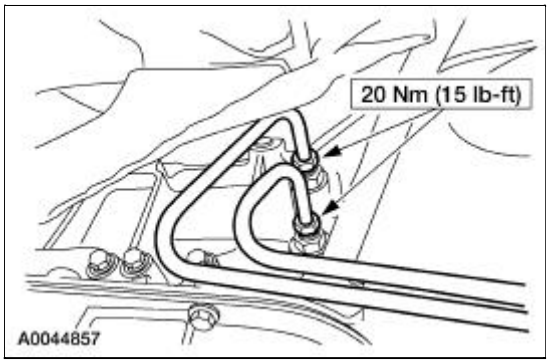
12. Position the rear crossmember in place and install the bolts.



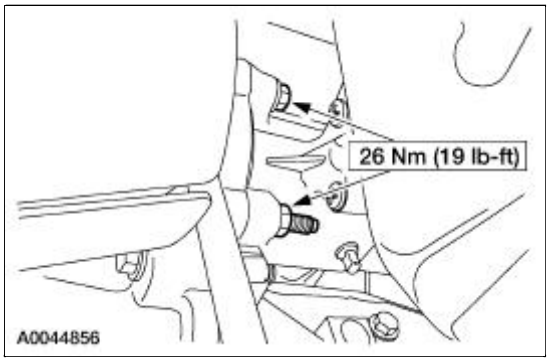
13. Remove the transmission jack.



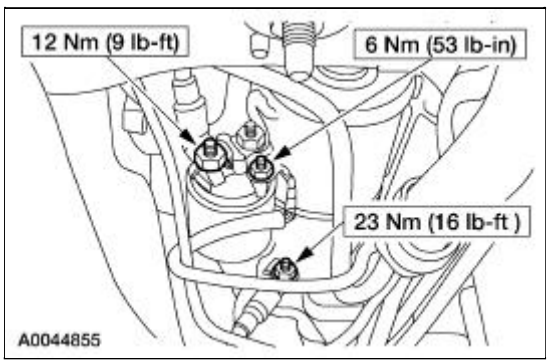
14. Install the RH exhaust shield bolt.



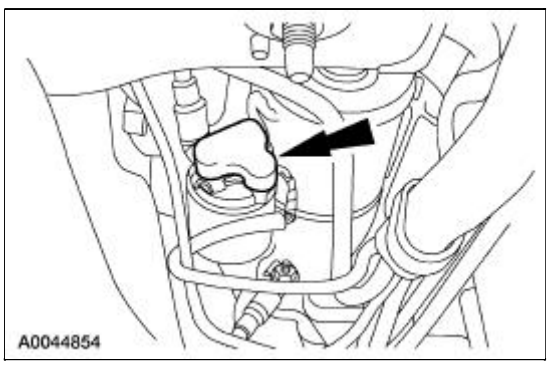
15. Install the LH exhaust shield bolt.



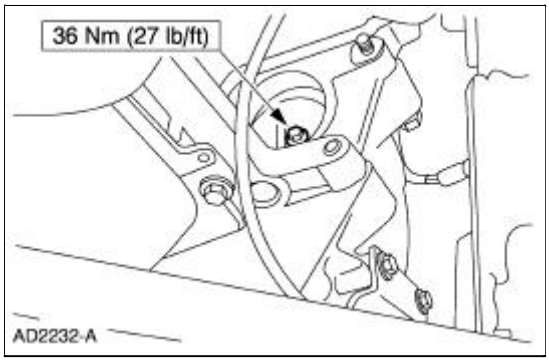
16. Position the transmission fluid fill tube into the transmission and install the retaining bolt on the RH cylinder head.



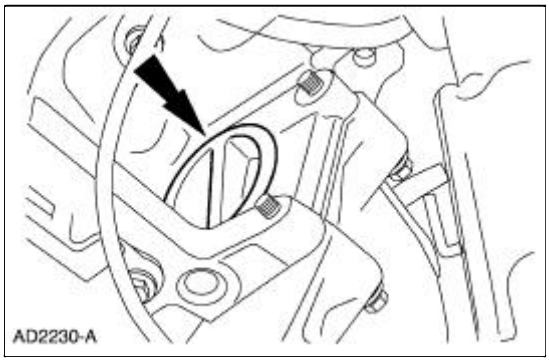
17. Connect the transmission fluid cooler tubes.



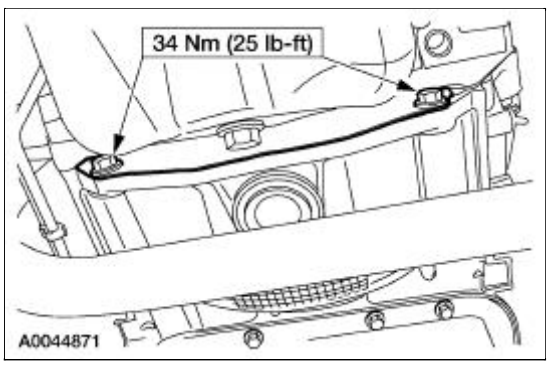
18. Install the starter motor and install three bolts.



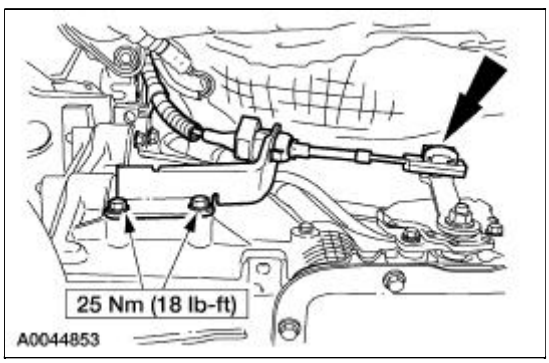
19. Install the starter motor electrical connectors and the ground wire.



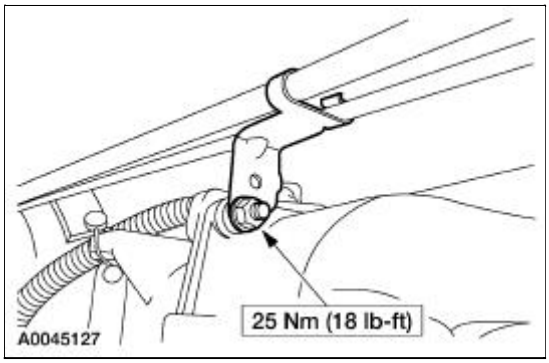
20. Install the plastic starter motor electrical connector cap.



21. Install the four torque converter nuts.
    - Rotate the crankshaft to access all the torque converter nuts.

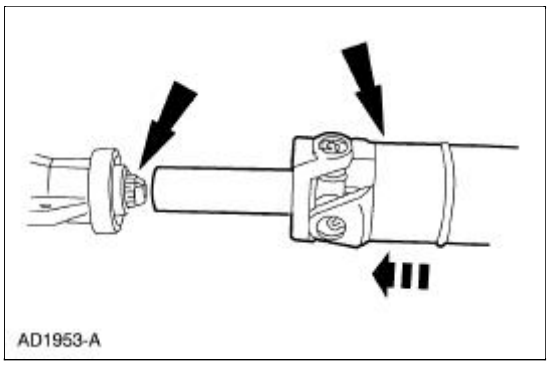


22. Install the rubber access plug.

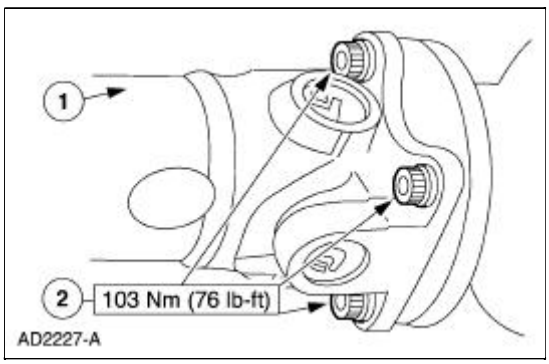


23. Install the flexplate inspection cover

24. Install the shift cable end and the bracket.

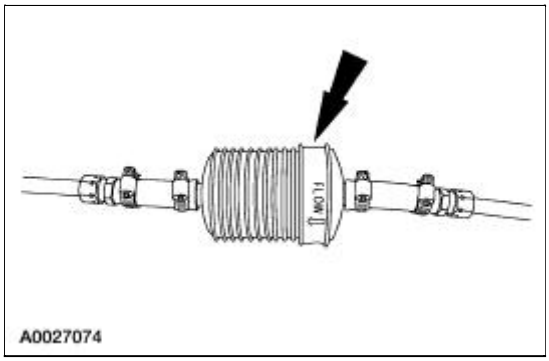


25. Install the fuel line bracket.



26. **NOTE:** The output shaft and the driveshaft are a balanced assembly.

    Install the driveshaft.
    - Align the yellow dots and position the driveshaft on the transmission.
    - Position the driveshaft to the rear differential.



27. **NOTE:** To maintain initial driveshaft balance, align the index marks made during removal.

    Install the rear driveshaft.
    1. Position the driveshaft.
    2. Install the four bolts.

28. Use the following guidelines for the in-line transmission fluid filter:
    - If the transmission was overhauled and the vehicle was equipped with an in-line fluid filter, install a new in-line fluid filter.
    - If the transmission was overhauled and the vehicle was not equipped with an in-line fluid filter, install a new in-line fluid filter kit.
    - If the transmission is being installed for a non-internal repair, do not install an in-line filter or filter kit.
    - If installing a Ford authorized remanufactured transmission, install the in-line

transmission fluid filter that is supplied
Prior to lowering the vehicle, install a new in-line transmission filter or a filter kit.

29. Connect the battery ground cable.

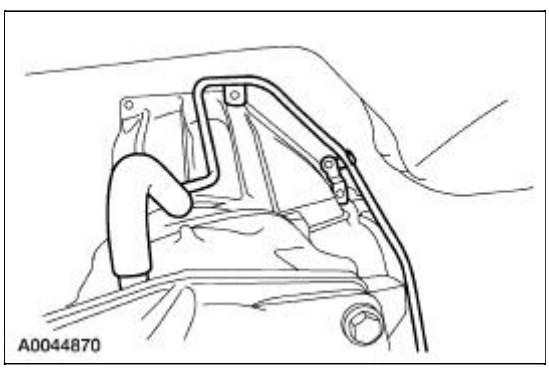
30. Fill the transmission with clean automatic transmission fluid and inspect for correct operation.

Transmission —4x4

Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

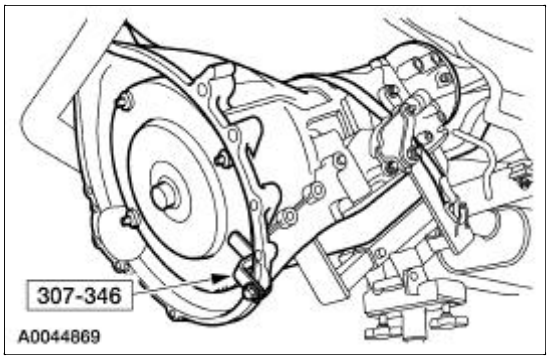
Material



Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

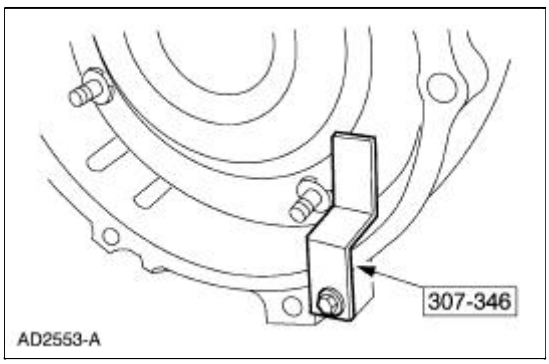
Installation

1. Install the special tool if not done during the assembly process.



2. Position the vent tube on the top of the transmission.

3. **CAUTION: To position the transmission in the vehicle, put the transmission into a nose-down position to get the tail shaft over the exhaust system. The converter housing**

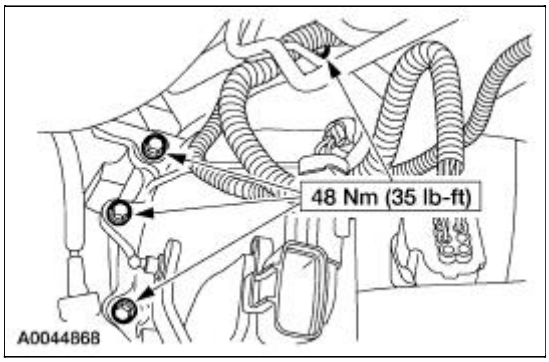


is piloted into position by dowels in the rear of the engine block. The torque converter must rest squarely against the flexplate. This indicates that the converter pilot is not binding in the engine crankshaft.

Position and secure the transmission on the high-lift transmission jack. Raise and position the transmission into the vehicle. Once the transmission is in position, place the transmission in a horizontal position.

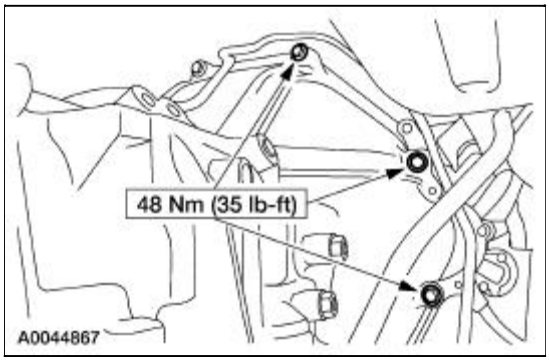
4. **NOTE:** Do not remove the special tool until the transmission is in a horizontal position.

   Remove the special tool.



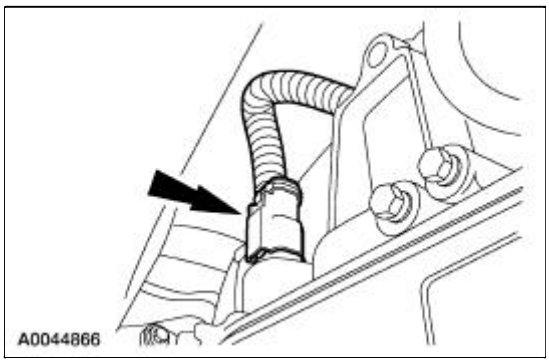
5. **NOTE:** Make sure that the torque converter is fully seated in the transmission before aligning the transmission to the engine.

   With the transmission in a horizontal position move it toward the engine. Align the orange balancing marks between the torque converter and the flexplate bolt holes.



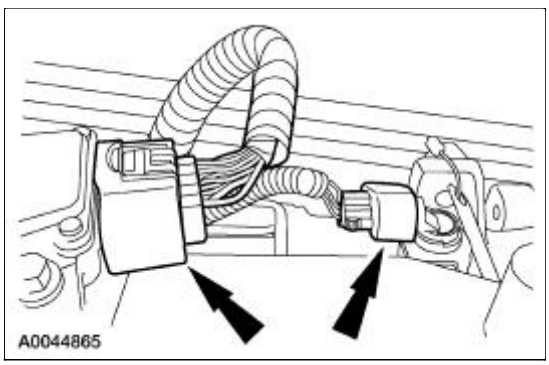
6. **NOTE:** Install the transmission retaining bolts in their correct locations made during removal.

   Install the shift cable bracket and the LH transmission retaining bolts.



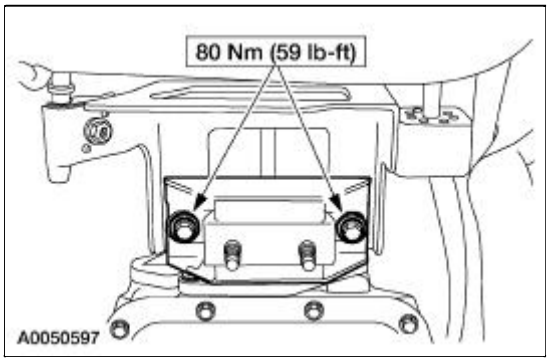
7. **NOTE:** Install the transmission retaining bolts in their correct locations made during removal.

Position the vent tube in its correct location and install the RH transmission retaining bolts.

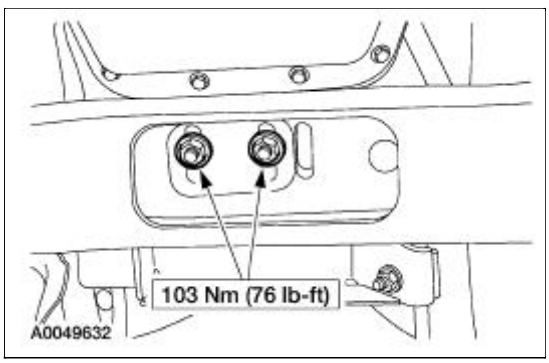


8. **NOTE:** It may be necessary to disconnect the rubber vent hose in order to route the wire harness under the vent hose.

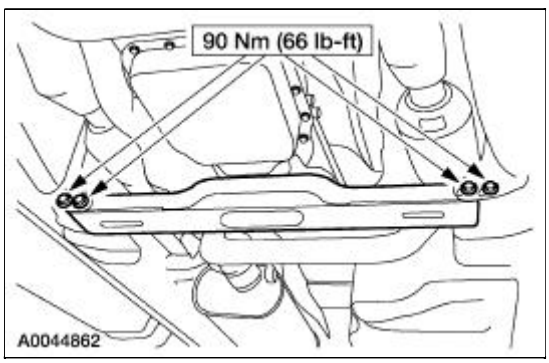
   Route the harness under the vent hose, connect the solenoid body connector and connect the harness retainer to the transmission.



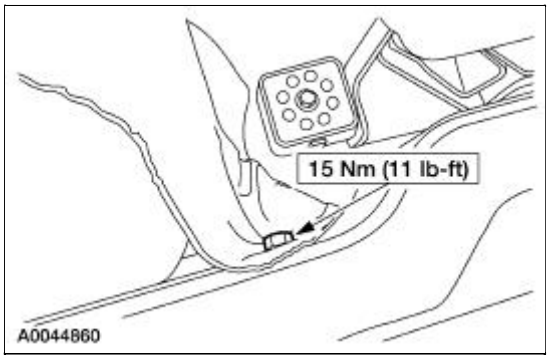
9. Connect the output shaft speed (OSS) sensor, the digital TR sensor connectors and connect the harness retainer.



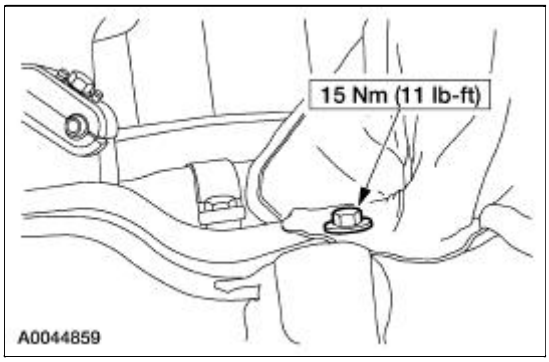
10. Install the exhaust hanger.



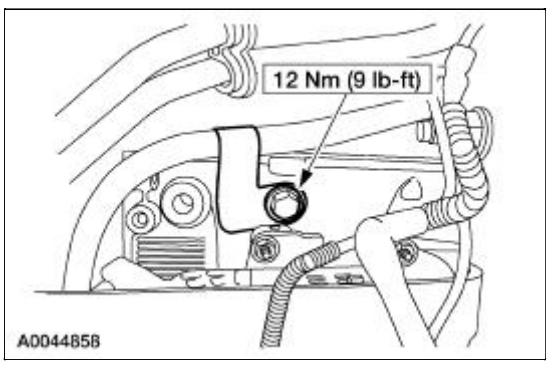
11. Install the rear transmission support.



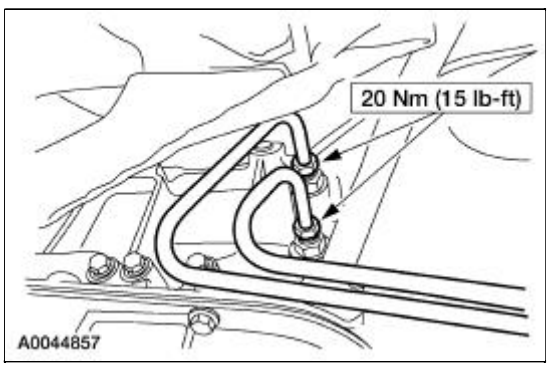
12. Position the rear crossmember in place and install the nuts.



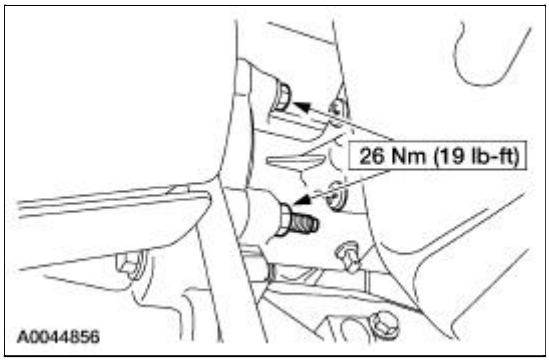
13. Position the rear crossmember in place and install the bolts and nuts.



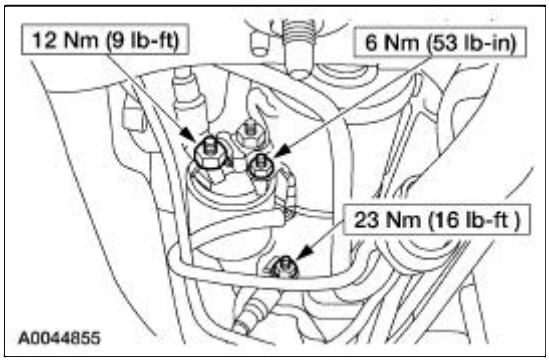
14. Install the RH exhaust bolts.



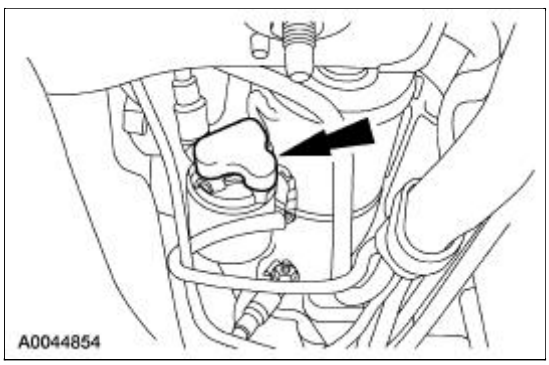
15. Install the LH exhaust bolts.



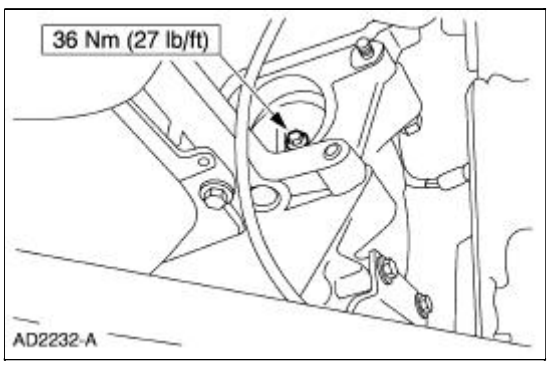
16. Position the transmission fluid fill tube into the transmission and install the retaining bolt on the RH cylinder head.



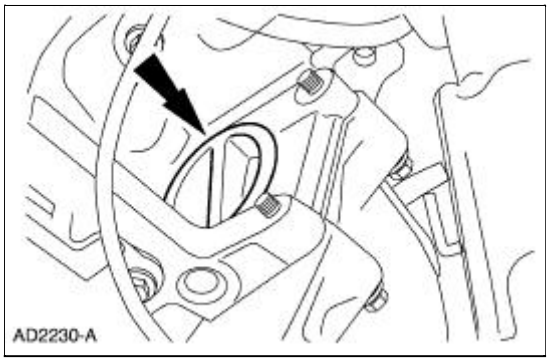
17. Connect the transmission fluid cooler tubes.



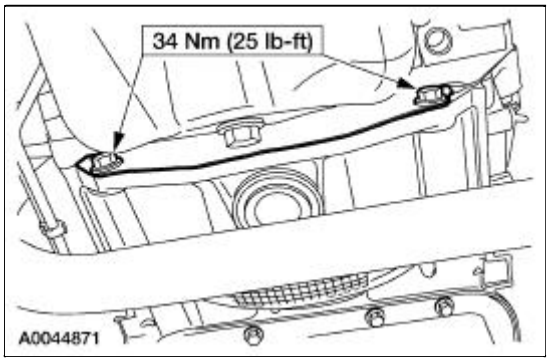
18. Install the starter motor and three bolts.



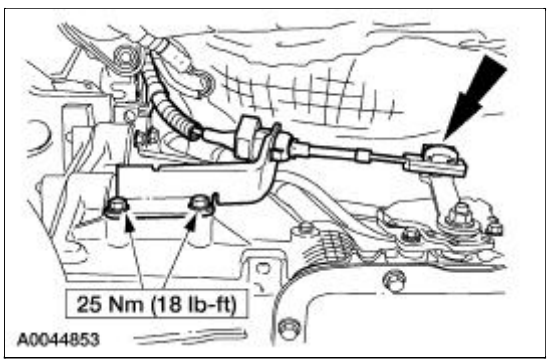
19. Install the starter motor electrical connectors and the ground wire.



20. Install the plastic starter motor electrical connector cap.

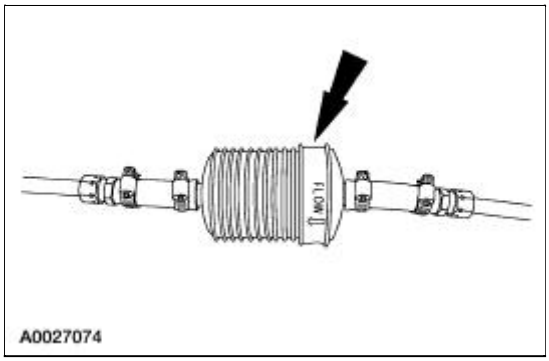


21. Install the four torque converter nuts.



22. Install the rubber access plug.

23. Install the flexplate inspection cover.



24. Install the shift cable end and the bracket.

25. Install the transfer case. For additional information, refer to Section 308-07B .

26. Use the following guidelines for the in-line transmission fluid filter:
    - If the transmission was overhauled and the vehicle was equipped with an in-line fluid filter, install a new in-line fluid filter.
    - If the transmission was overhauled and the vehicle was not equipped with an in-line fluid filter, install a new in-line fluid filter kit.
    - If the transmission is being installed for a non-internal repair, do not install an in-line filter or filter kit.
    - If installing a Ford-authorized remanufactured transmission, install the in-line transmission fluid filter that is supplied.
      Prior to lowering the vehicle, install a new in-line transmission filter or a filter kit.

27. Fill to correct level with clean automatic transmission fluid.

General Specifications

Item	Specification
Fluid	
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX (4R100 Transmission)	MERCON®
MERCON® V Automatic Transmission Fluid XT-5-QM (4R70W Transmission)	MERCON® V

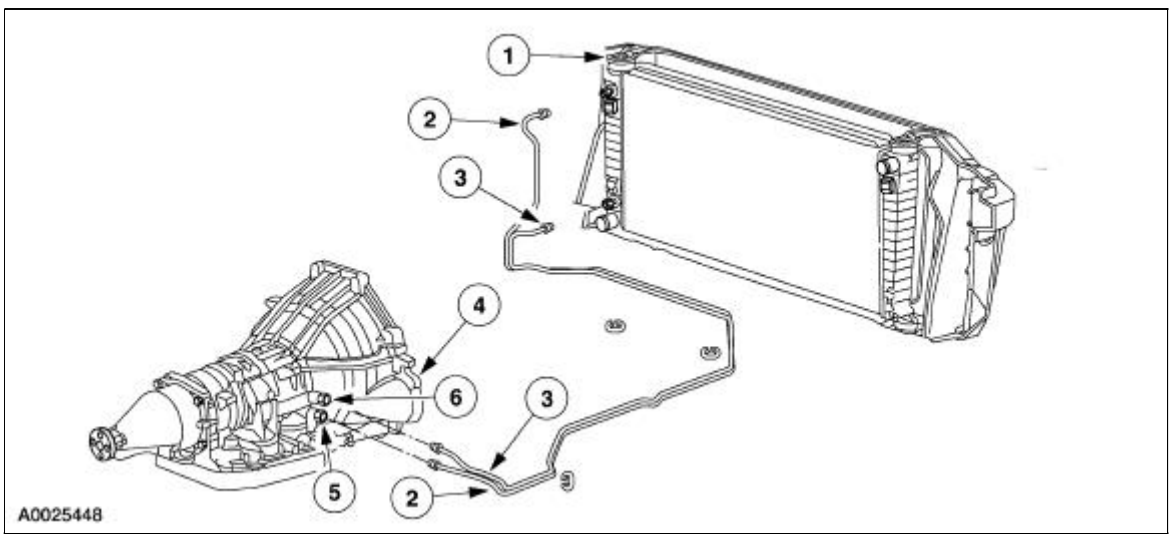
Torque Specifications

Description	Nm	lb-ft
Bolts retaining the skid plate to the frame (4x4 only)	15	11
Fluid cooler tube-to-transmission fluid tube connector assembly (4R70W)	32	24
Fluid cooler tube-to-cooler line case fitting (4R100)	27	20
Front cooler line case fitting-to-transmission case (4R100)	30	22
Rear cooler line case fitting-to-transmission case (4R100)	37	27

Transmission Cooling

The transmission fluid cooling system, without an auxiliary transmission fluid cooler, consists of:

- an intank fluid cooler inlet tube
- a non-repairable intank transmission fluid cooler
- an intank fluid cooler return tube

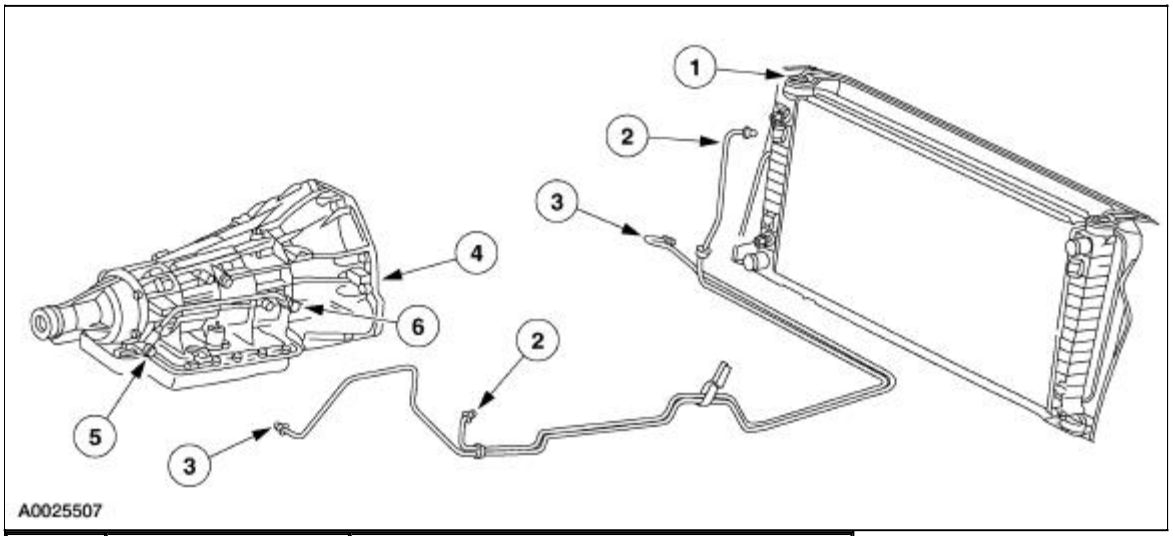


The transmission fluid cooling system, with an auxiliary transmission fluid cooler, consists of:

- an intank fluid cooler inlet tube
- a non-repairable intank transmission fluid cooler
- an auxiliary fluid cooler inlet tube
- an auxiliary transmission fluid cooler
- an auxiliary fluid cooler return tube

The transmission fluid flows from the transmission (front fitting for 4R100) (bottom fitting for 4R70W), to the intank transmission fluid cooler, to the auxiliary transmission fluid cooler, if so equipped, and returns to the transmission (rear fitting for 4R100) (top fitting for 4R70W).

For fluid cooler flow testing, and backflushing and cleaning procedures, refer to Section 307-01A (4R100) or Section 307-01B (4R70W).



4R70W Transmission Without Auxiliary Transmission Fluid Cooler

Item	Part Number	Description
1	8005	Radiator
2	7A030	Intank fluid cooler inlet tube
3	7A031	Intank fluid cooler return tube
4	—	4R70W transmission

8	7A095	Auxiliary transmission fluid cooler

Transmission Cooling

Inspection and Verification

CAUTION: When internal wear or damage occurs in the transmission, metal particles, clutch plate material and band material can travel into the torque converter, the fluid cooler tubes, the intank transmission fluid cooler and the auxiliary transmission fluid cooler, if so equipped. These contaminants are a major cause of recurring transmission concerns. To prevent future concerns, remove these contaminants from the cooling system before placing the transmission back into use. Refer to Section 307-01A (4R100) or Section 307-01B (4R70W) for fluid cooler flow testing, backflushing and cleaning, torque converter cleaning and inspection, and flushing. Refer to Section 307-01A (4R100 only) for cooler bypass valve (CBV) assembly cleaning and flushing.

1. Visually inspect for obvious signs of mechanical damage, incorrect component installation and system leaks. Repair as necessary.
   - Install a new or remanufactured radiator when fluid is found leaking from the intank transmission fluid cooler. For additional information, refer to Section 303-03 .
   - Install a new auxiliary transmission fluid cooler if there is leakage from the fluid cooler. For additional information, refer to Auxiliary Transmission Fluid Cooler in this section.
2. If the fault is not visually evident, GO to the Symptom Chart

Symptom Chart

SYMPTOM CHART

Condition	Possible Sources	Action
• Transmission overheating	• Excessive vehicle or towing loads, severe vehicle use.	• REFER to the vehicle specification manual for load and GVW/GCW information. REFER to the Owner's Guide.
	• Incorrect fluid level.	• CHECK and, if necessary, ADJUST the fluid to the correct level. REFER to Section 307-01A (4R100) or Section 307-01B (4R70W).
	• Fluid condition.	• CHECK fluid condition. REFER to Section 307-01A (4R100) or Section 307-01B (4R70W).
	• Incorrect fluid type.	• REFER to Specifications in this section.
	• Transmission cooling system damaged, blocked, restricted or installed incorrectly.	• CARRY OUT the transmission fluid cooler flow test. REFER to Section 307-01A (4R100) or Section 307-01B (4R70W).

	• Cooler bypass valve (CBV) assembly (4R100 only) damaged, blocked, restricted or installed incorrectly.	• INSPECT for damage and restrictions. If necessary, REFER to Cooler Bypass Valve—4R100 Transmission in this section for removal and installation. REFER to Section 307-01A for flushing and cleaning procedure.
	• System leaks.	• REFER to Section 307-01A (4R100) or Section 307-01B (4R70W) for leakage inspection procedures.
	• Engine overheating.	• REFER to Section 303-03 .
	• Powertrain control system electrical inputs/outputs, vehicle wiring harnesses, powertrain control module (PCM), torque converter clutch (TCC) solenoid.	• CARRY OUT on-board diagnostics. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, and Section 307-01A (4R100) or Section 307-01B (4R70W).
	• Internal transmission concerns.	• REFER to Section 307-01A (4R100) or Section 307-01B (4R70W).

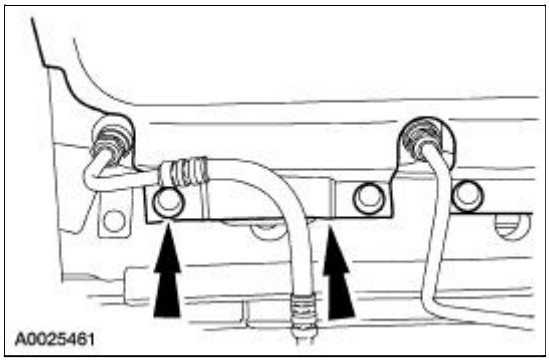
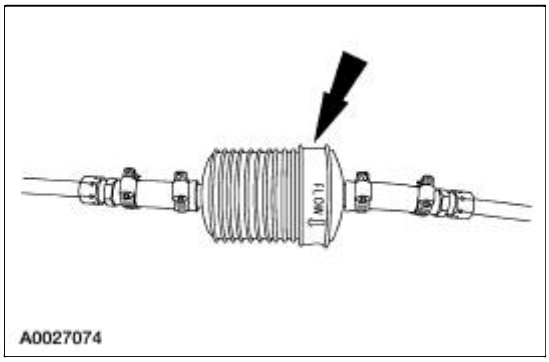
Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM, XT-5-DM	MERCON® V
MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

Removal

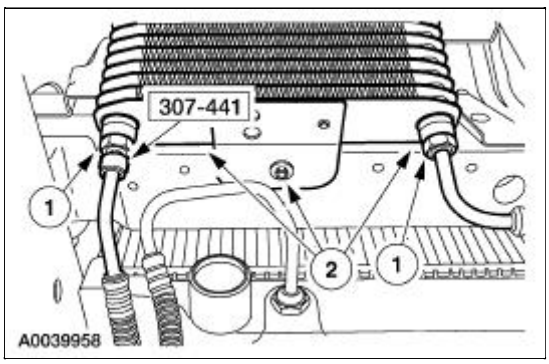


1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   Put the vehicle in NEUTRAL and position on a hoist. For additional information, refer to Section 100-02 .

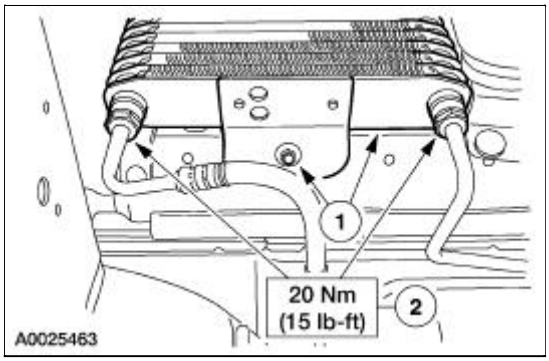


2. Remove the bolts and the skid plate (4x4 vehicles).

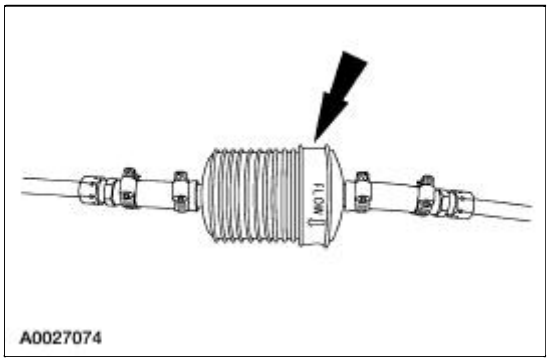


3. Remove three fasteners and position the air deflector aside.

4. If equipped, remove and discard the in-line transmission fluid filter.

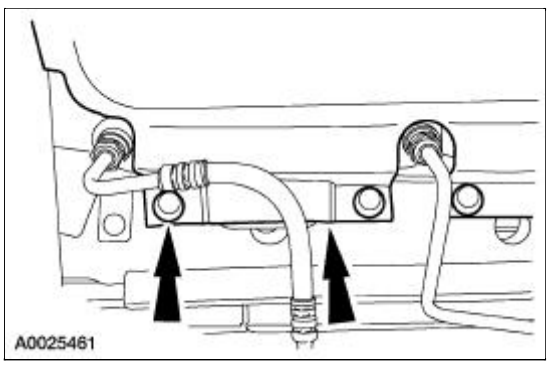


5. Remove the auxiliary transmission fluid cooler.
    1. Using the special tool, disconnect the fluid cooler tube fittings from the fluid cooler.
    2. Remove the three bolts and the fluid cooler.

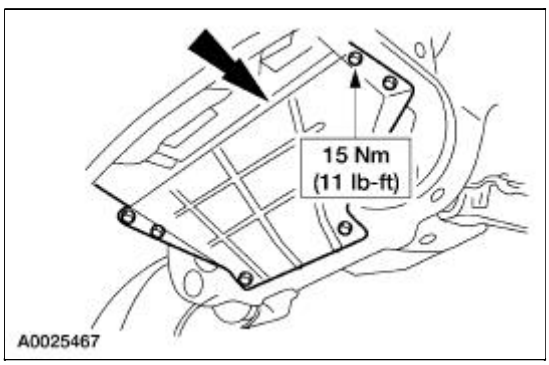


Installation

All vehicles



1. Install the auxiliary transmission fluid cooler.
    1. Position the fluid cooler and install the three bolts.
    2. Connect the fluid cooler tube fittings to the fluid cooler.



2. If equipped, install a new in-line transmission fluid filter.

3. Position the air deflector and install the fasteners.

4. Position the skid plate and install the bolts (4x4 vehicles).

5. Lower the vehicle.

Vehicles with 4R100 transmission

6.  **CAUTION: Do not use any fluid approved for MERCON® V application. Using a fluid rated for MERCON® V can cause internal damage in MERCON® only applications.**

   Fill the transmission with the specified type and quantity of transmission fluid. For additional information, refer to Section 307-01A .

Vehicles with 4R70W transmission

7. Fill the transmission with the specified type and quantity of transmission fluid. For additional information, refer to Section 307-01B .

All vehicles

8. Check for leaks.

9. If equipped with air suspension, reactivate the system by turning on the air suspension switch.

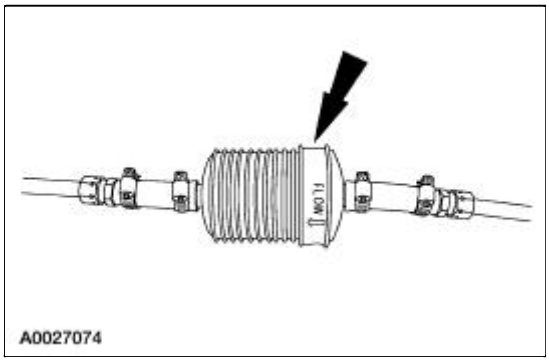
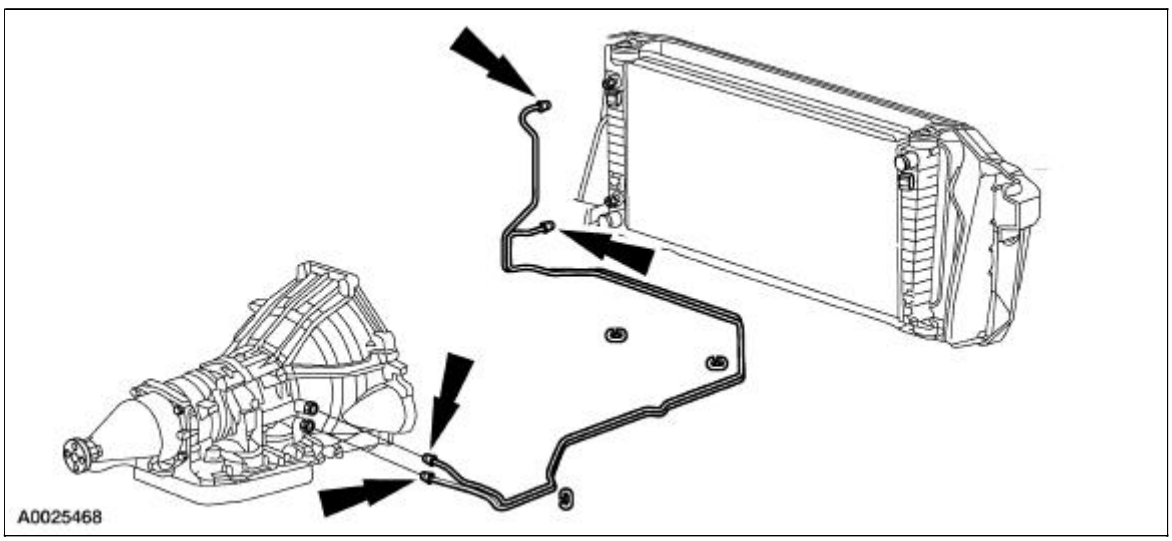
   Put the vehicle in NEUTRAL and position on a hoist. For additional information, refer to Section 100-02 .



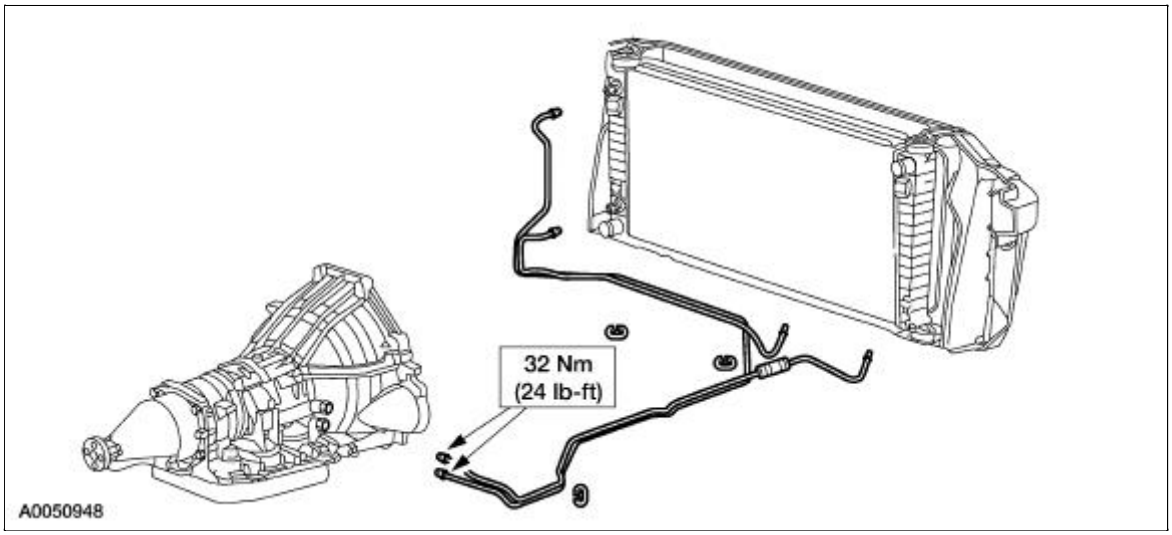
2. Remove the bolts and the skid plate (4x4 vehicles).

3. Remove three fasteners and position the air deflector aside.



4. If equipped, remove and discard the in-line transmission fluid filter.

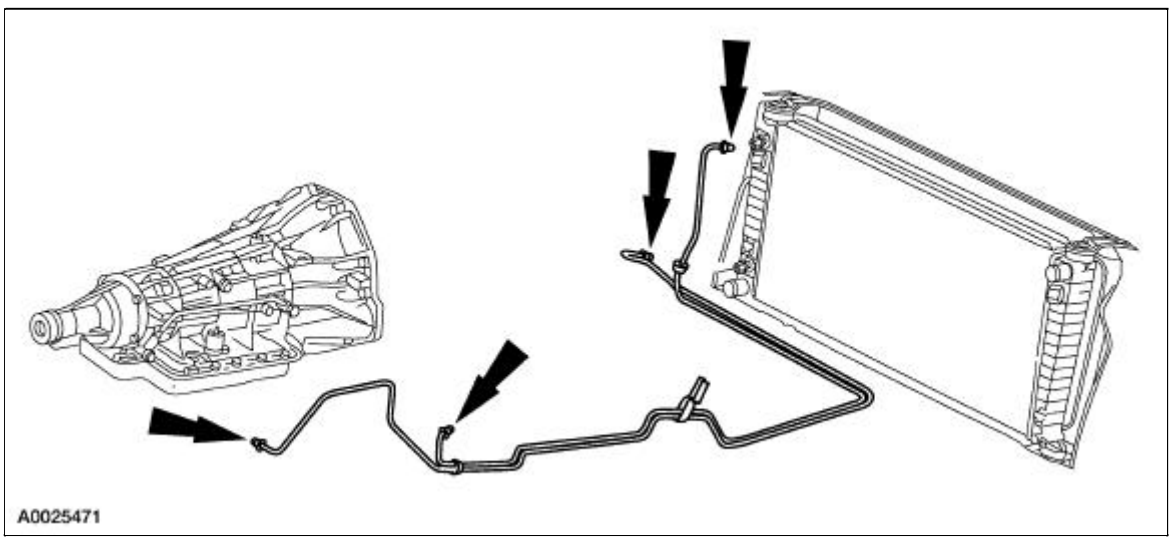
5. If not done previously, carry out the transmission fluid cooler flow test procedure. For additional information, refer to Section 307-01A .



4R70W without auxiliary fluid cooler

6. Remove the fluid cooler tubes, as necessary.

4R70W with auxiliary fluid cooler



7. Remove the fluid cooler tubes, as necessary.

4R100 without auxiliary fluid cooler

8. **NOTE:** If cooler bypass valve (CBV) assembly removal is necessary, refer to Cooler Bypass Valve—4R100 Transmission in this section.

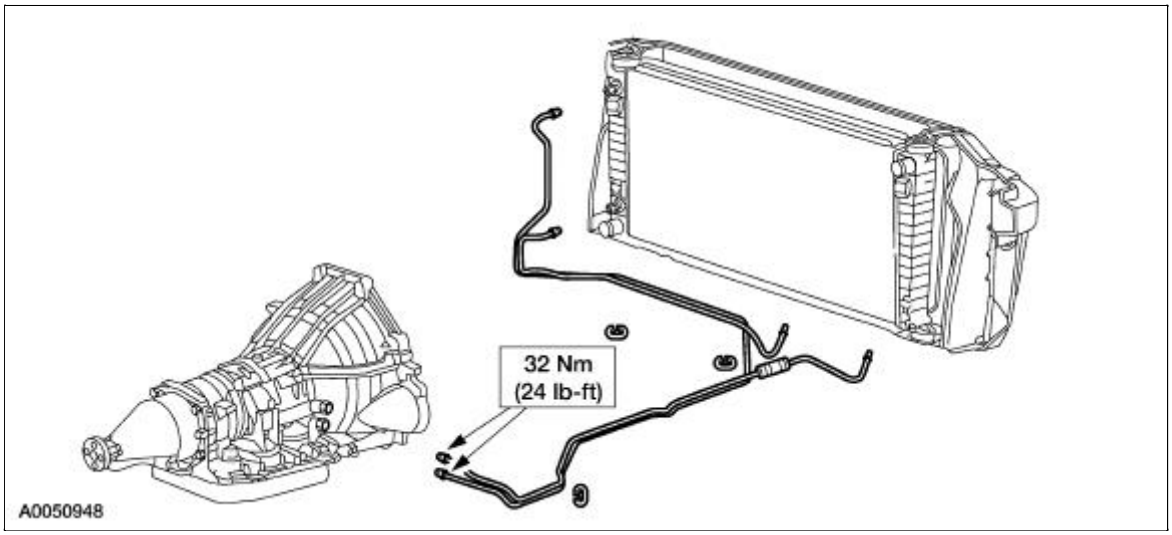
   Remove the fluid cooler tubes, as necessary.

4R100 with auxiliary fluid cooler

9. **NOTE:** If CBV assembly removal is necessary, refer to Cooler Bypass Valve—4R100 Transmission in this section.

   Remove the fluid cooler tubes, as necessary.

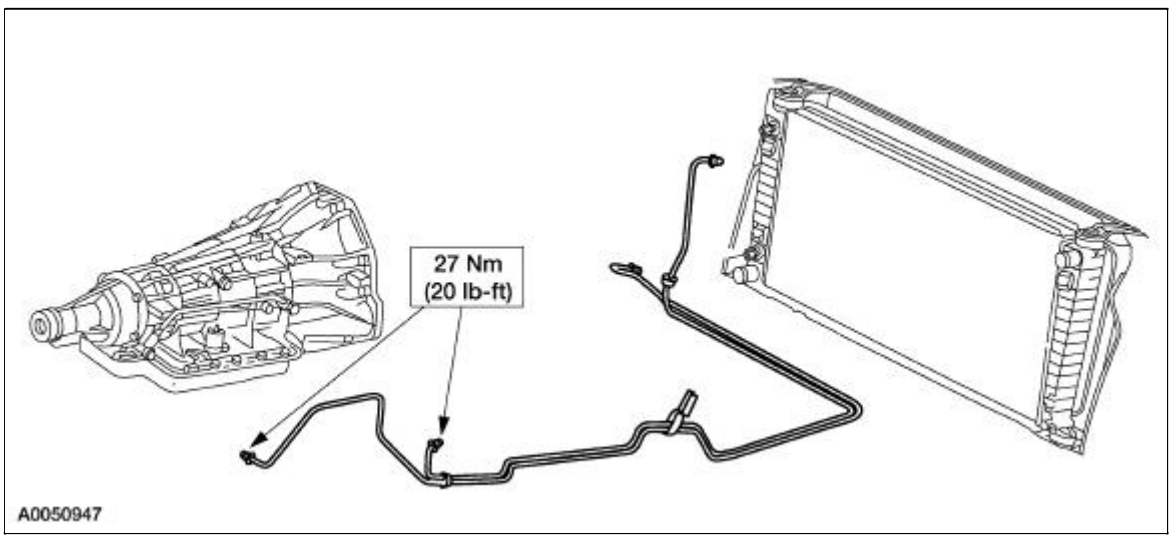
Installation



4R70W without auxiliary fluid cooler

1. Install the fluid cooler tube(s).

4R70W with auxiliary fluid cooler

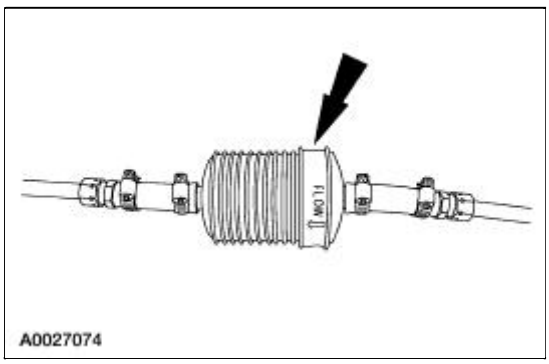


2. Install the fluid cooler tube(s).

4R100 without auxiliary fluid cooler

3. **NOTE:** If the CBV assembly was removed, refer to Cooler Bypass Valve—4R100 Transmission in this section for the installation procedure.

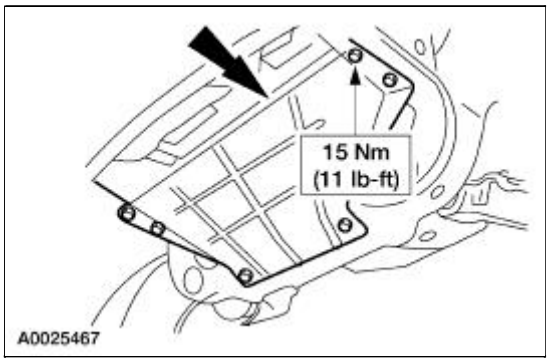
   Install the fluid cooler tube(s).



4R100 with auxiliary fluid cooler

4. **NOTE:** If the CBV assembly was removed, refer to Cooler Bypass Valve—4R100 Transmission in this section for the installation procedure.

   Install the fluid cooler tube(s).



5. If equipped, install a new in-line transmission fluid filter.

6. Position the air deflector and install the fasteners.

7. Position the skid plate and install the bolts (4x4 vehicles).

8. Lower the vehicle.

Vehicles with 4R100 transmission

9.  **CAUTION: Do not use any fluid approved for MERCON® V application. Using a fluid rated for MERCON® V can cause internal damage in MERCON® only applications.**

   Fill the transmission with the specified type and quantity of transmission fluid. For additional information, refer to Section 307-01A .

Vehicles with 4R70W transmission

10. Fill the transmission with the specified type and quantity of transmission fluid. For additional information, refer to Section 307-01B .

All vehicles

11. Check for leaks.

12. If equipped with air suspension, reactivate the system by turning on the air suspension switch.

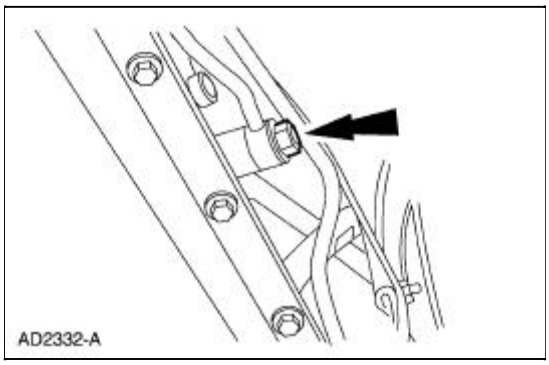
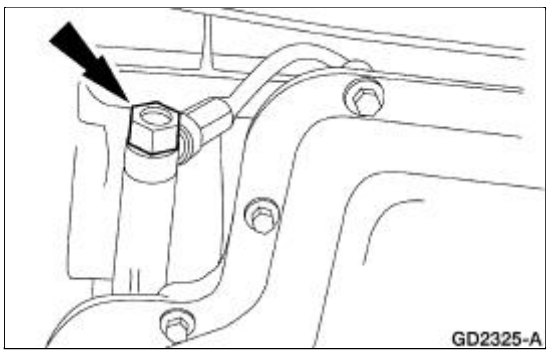
2. If not done previously, carry out the transmission fluid cooler flow test procedure. For additional information, refer to Section 307-01A .

3. Remove the fluid cooler tube from the front cooler line case fitting.



4. Remove the fluid cooler tube from the rear cooler line case fitting.

5. **NOTE:** The two rubber-coated sealing washers can fall out when removing the cooler line case

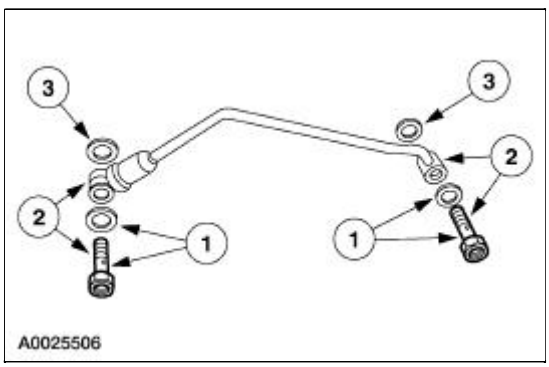


fitting.

Remove and discard the front cooler line case fitting, and the two rubber-coated sealing washers.

6. **NOTE:** The two rubber-coated sealing washers can fall out when removing the cooler line case fitting.

   Remove and discard the rear cooler line case fitting, and the two rubber-coated sealing washers.

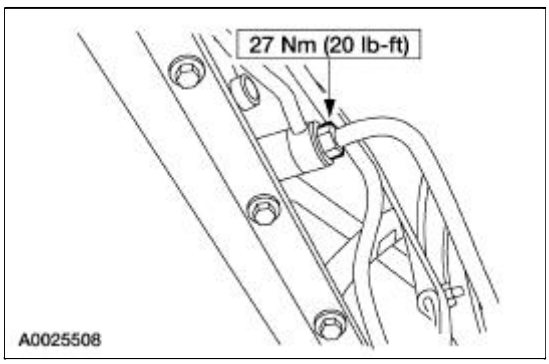


7. Remove the cooler bypass valve (CBV) assembly from the transmission.

Installation

1. **CAUTION: Failure to correctly install the new rubber-coated sealing washers will result in transmission fluid leaks.**

   Install the new rubber-coated sealing washers and the new cooler line case fittings.
   1. Install one rubber-coated sealing washer on each cooler line case fitting.
   2. Install both cooler line case fittings into the CBV assembly fittings.
   3. Install one rubber-coated sealing washer on each cooler line case fitting.



2. **CAUTION: Damage will occur to the rubber-coated sealing washers and transmission fluid will leak if the cooler line case fittings are over-tightened.**

   NOTE: Align the rubber-coated sealing washers while installing CBV assembly on the transmission case.

   Install the CBV assembly.

3. Install the fluid cooler tubes in the front and rear cooler line case fittings.

4. Lower the vehicle.

5. **CAUTION: Do not use any fluid approved for MERCON® V application. Using a fluid rated for MERCON® V can cause internal damage in MERCON® only applications.**

   Fill the transmission with the specified type and quantity of transmission fluid. For additional information, refer to Section 307-01A .

6. Check for leaks.

7. If equipped with air suspension, reactivate the system by turning on the air suspension switch.

Torque Specifications

Description	Nm	lb-ft	lb-in
Shift cable bracket bolts (4R70W)	28	21	—
Shift lock actuator bolts (column shift)	5	—	44
Shift lock actuator screws (floor shift)	5	—	44
Floor shift mechanism to floor	15	11	—
Column shift insert plate bolts	15	11	—
Shift cable bracket bolts (4R100)	34	25	—

External Controls

The transmission shift cable transfers the transmission operating mode from the gearshift lever to the automatic transmission. The indicated position of the transmission control selector lever is transferred to the transmission through the steering column shift selector on the 4R70W transmission, or the floor shifter mechanism on the 4R100 transmission, then to the cable and down to the manual control lever on the transmission.

Shift Interlock System

The shift interlock system prevents the shifting from PARK unless the brake pedal is depressed. The shift interlock system consists of a shift lock actuator mounted at the base of the steering column or on the floor shifter mechanism. If the ignition switch is in the RUN position, the shift lock actuator is on unless the brake pedal is depressed.

Transmission Control Switch (TCS)

The transmission control switch (TCS) is a momentary contact switch that is located on the end of the column transmission control selector lever or on the floor shifter knob. Pushing the TCS will either disengage or engage the overdrive function of the automatic transmission. If the OVERDRIVE is disengaged, the word OFF will illuminate on the instrument panel.

External Controls —Column Shift

Refer to Wiring Diagrams Cell 37 , Shift Lock for schematic and connector information.

Special Tool(s)

 ST1137-A	73 Digital Multimeter 105-R0051 or equivalent

Inspection and Verification

1. Verify the customer concern by operating the transmission external control.
2. Visually inspect for obvious signs of mechanical and electrical damage; refer to the following chart:

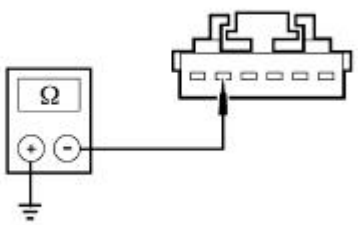
Visual Inspection Chart

Mechanical	Electrical
● Damaged shift lock actuator ● Damaged transmission control switch	● Failed fuse(s) ● Damaged wiring harness ● Loose or corroded connections

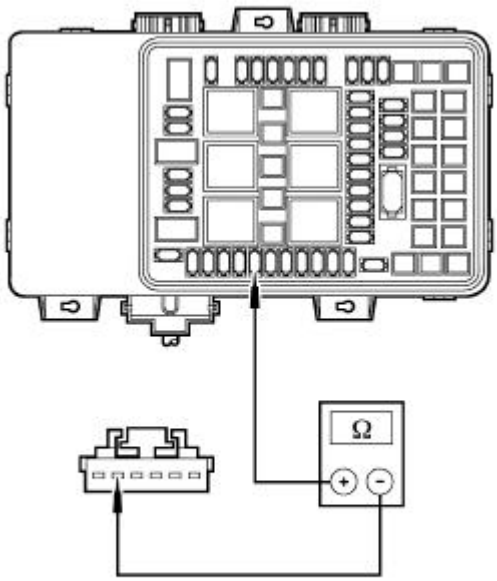
3. If the fault is not visually evident, determine the symptom. GO to Symptom Chart .

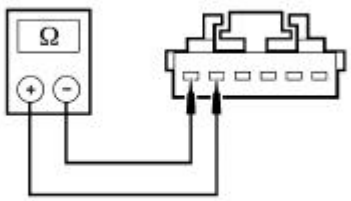
Symptom Chart

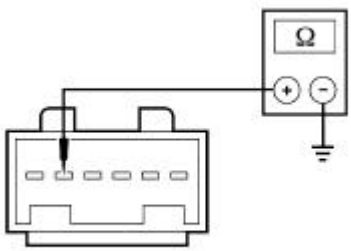
Symptom Chart



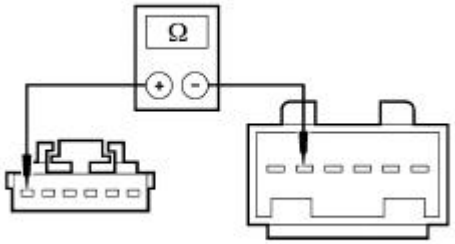
Condition	Possible Sources	Action
● The shift interlock system does not release/lock correctly	● Circuitry. ● Fuse(s). ● Shift lock actuator. ● Brake pedal position switch.	● Go To Pinpoint Test A .
● The shift control is out of correct gear relationship	● Transmission shift cable and bracket. ● Selector lever indicator. ● Shift control linkage.	● Go To Pinpoint Test B .

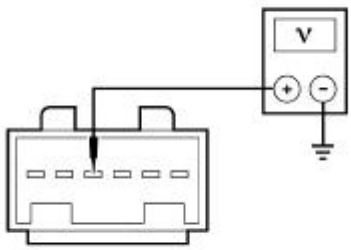


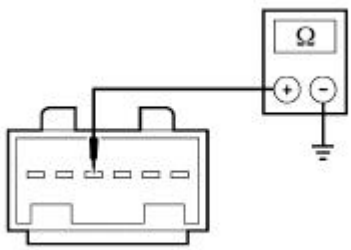




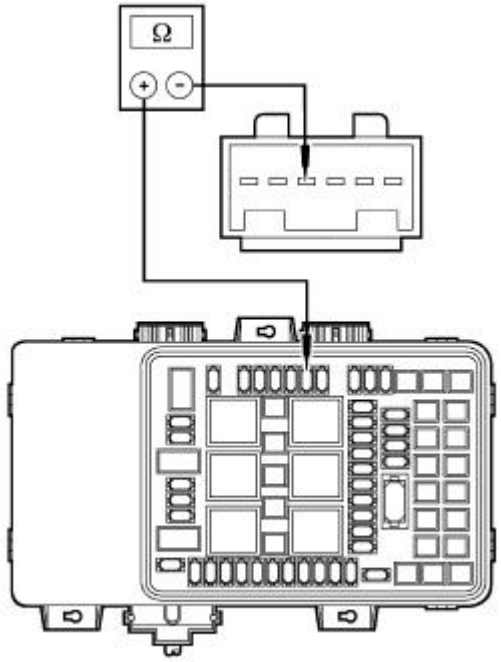
• Transmission range indicator does not correspond to the gear	• Transmission shift cable bracket.	• TIGHTEN bolts holding the transmission shift cable bracket.
	• Transmission control indicator linkage.	• ADJUST PRNDL at steering housing. REFER to Adjustments in this section.
	• Transmission shift cable loose from the transmission retainer bracket.	• VERIFY cable is fully seated in the transmission bracket.
	• Shift linkage.	• VERIFY transmission shift cable adjustment. REFER to Adjustments in this section. ADJUST transmission shift cable if necessary. VERIFY digital transmission range (TR) sensor or transmission range (TR) sensor for correct adjustment. REFER to Section 307-01A or Section 307-01B .
	• Clip securing the transmission shift cable to the steering column bracket.	• INSTALL clip correctly.
• Transmission range indicator lamp does not illuminate	• Bulb. • Circuitry.	• REFER to Section 413-00 .
• The transmission control switch (TCS) is inoperative	• Fuse. • TCS. • TCS not cycled during self-test. • Powertrain Control Module. • Circuitry.	• Go To Pinpoint Test C .
• The transmission control indicator lamp (TCIL) is not operating correctly	• Bulb. • Circuitry. • Powertrain Control Module.	• Go To Pinpoint Test D .
• Rattle, noise, buzz, or other noise	• Selector lever knob.	• INSTALL a new selector lever knob.
	• Shift control selector lever.	• TIGHTEN housing bolts.
	• Shift interlock spring.	• ATTACH shift interlock spring correctly.
• Water enters inside the vehicle	• Cable assembly grommet.	• SECURE grommet to floor panel.
	• Torn cable assembly grommet.	• INSTALL a new transmission shift cable.
• Excessive shift	• Transmission	• INSTALL a new transmission

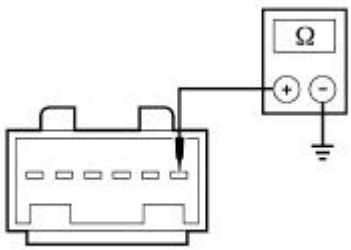






effort	shift cable. • Cable bracket.	shift cable. • ADJUST cable. TIGHTEN cable bracket screws.
• Transmission range selector lever will not shift	• Transmission shift cable. • Column bracket clip. • Broken transmission shift cable.	• REINSTALL transmission shift cable. • INSTALL a new bracket clip. • INSTALL a new transmission shift cable.





Pinpoint Tests

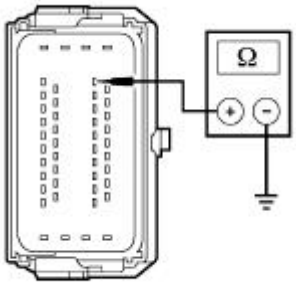
PINPOINT TEST A: THE SHIFT INTERLOCK SYSTEM DOES NOT RELEASE/LOCK CORRECTLY

Test Step	Result / Action to Take
A1 TEST BRAKE LIGHTS	
• Apply brake pedal and view brake lights. • **Do brake lights illuminate?**	**Yes** GO to A7 . **No** GO to A2 .
A2 TEST FUSE 5 (7.5A)	
• Check fuse: Fuse 5 (7.5A). • Measure the resistance of fuse 5. • **Is the resistance 5 ohms or less?**	**Yes** GO to A4 . **No** GO to A3 .
A3 TEST CIRCUIT 729 (RD/WH) FOR SHORT TO GROUND	
• Disconnect: Brake Pedal Position Switch C278. • Measure resistance of circuit 729 (RD/WH) at C278-5.  A0050540 • **Is the resistance 10 K ohms or less?**	**Yes** SERVICE circuit 729 (RD/WH) for short to ground. TEST the system for normal operation. **No** GO to A4 .
A4 TEST CIRCUIT 729 (RD/WH) FOR OPEN	
• Measure resistance between output side of fuse 5 (7.5A) and Brake Pedal Position Switch Connector C278-5, circuit 729 (RD/WH).	**Yes** GO to A5 . **No** SERVICE circuit 729

 A0050532 ● **Is the resistance 5 ohms or less?**	(RD/WH) for open. RETEST the system.
A5 TEST BRAKE PEDAL POSITION SWITCH	
● Measure resistance of brake pedal position switch while open (OFF) and closed (ON).  A0050529 ● **Is the resistance of switch greater than 10 K ohms while OFF and 5 ohms or less while ON?**	**Yes** GO to A6 . **No** INSTALL a new brake pedal position switch. TEST the system for normal operation.
A6 CHECK CIRCUIT 810 (RD/LG) FOR SHORT TO GROUND	
● Disconnect: Shift Lock Actuator C2008. ● Measure resistance of circuit 810 (RD/LG), pin C2008-2.  A0051045 ● **Is the resistance 10 K ohms or less?**	**Yes** SERVICE circuit 810 (RD/LG) for short to ground. TEST the system for normal operation. **No** GO to A7 .
A7 CHECK CIRCUIT 810 (RD/LG) FOR OPEN	

• Measure the resistance of circuit 810 (RD/LG) between shift lock actuator pin C2008-2 and brake pedal position switch connector C278-6.  A0051043 • **Is the resistance 5 ohms or less?**	**Yes** GO to A8 . **No** SERVICE circuit 810 (RD/LG) for open. TEST the system for normal operation.
A8 TEST FOR B+ ON CIRCUIT 1003 (GY/YE)	
• Measure voltage at shift lock actuator pin C2008-3, circuit 1003 (GY/YE).  A0051044 • **Is B+ present?**	**Yes** GO to A12 . **No** GO to A9 .
A9 TEST FUSE 27 (5A)	
• Check fuse: Fuse 27 (5A). • **Is the resistance 5 ohms or less?**	**Yes** GO to A11 . **No** GO to A10 .
A10 TEST CIRCUIT 1003 (GY/YE) FOR SHORT TO GROUND	
• Measure resistance at pin C2008-2, circuit 1003 (GY/YE).  A0051042 • **Is the resistance 10 K ohms or less?**	**Yes** SERVICE circuit 1003 (GY/YE) for short to ground. TEST the system for normal operation. **No** GO to A11 .
A11 TEST CIRCUIT 1003 (GY/YE) FOR OPEN	
• Measure resistance of circuit 1003 (GY/YE) between output side of fuse 27 (5A) and shift lock actuator pin C2008-2.	**Yes** GO to A12 . **No** SERVICE circuit 1003

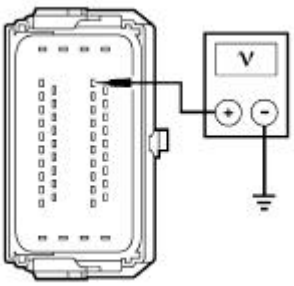
 A0051041 ● **Is the resistance 5 ohms or less?**	(GY/YE) for open. TEST the system for normal operation.
A12 TEST CIRCUIT 57 (BK) FOR OPEN	
● Measure the resistance of shift lock actuator C2008-6, circuit 57 (BK).  A0051040 ● **Is the resistance 5 ohms or less?**	**Yes** INSTALL a new shift lock actuator. TEST the system for normal operation. **No** SERVICE circuit 57 (BK) for open. TEST the system for normal operation.



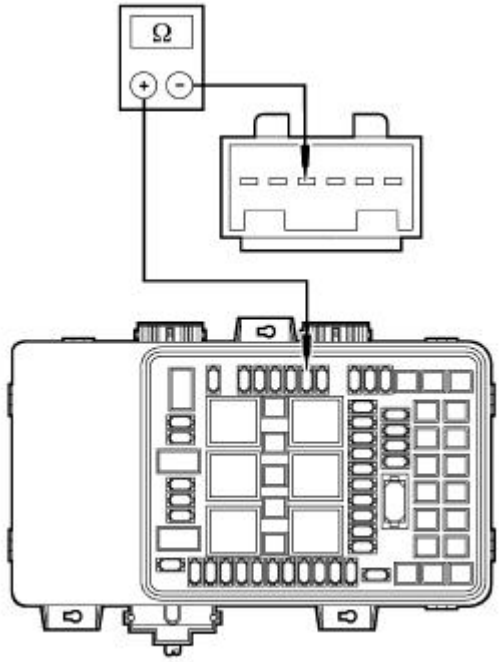
PINPOINT TEST B: THE SHIFT CONTROL IS OUT OF CORRECT GEAR RELATIONSHIP

Test Step	Result / Action to Take
B1 CHECK SHIFT CONTROL LINKAGE	
● Apply the brake pedal. ● Gain access to the column shift control linkage. ● Actuate the transmission range selector lever in all ranges. ● Observe all linkages	**Yes** INSTALL new column shift control linkage. TEST the system for normal operation. **No** GO to B2 .

during operation. ● **Is the linkage damaged?**	
B2 CHECK TRANSMISSION SHIFT CABLE	
● Check transmission shift cable and bracket installation and tightness. ● **Is the transmission shift cable correctly installed and adjusted?**	**Yes** VERIFY the transmission shift cable adjustment. REFER to Cable and Bracket Adjustment—Column Shift in this section. ADJUST the transmission shift cable if necessary. VERIFY the digital transmission range (TR) sensor for proper adjustment. REFER to Section 307-01A (4R70W). Adjust digital TR or TR sensor if necessary. GO to B3 . **No** REPAIR as necessary. TEST the system for normal operation.
B3 CHECK LINKAGE/CABLE FOR CORRECT GEAR RELATIONSHIP	
● Apply the brake pedal. ● Actuate the transmission range selector lever in all ranges. ● **Does the indicator match the gear selection?**	**Yes** System OK. TEST the system for normal operation. **No** REFER to Selector Lever Indicator Adjustment in this section. TEST the system for normal operation.

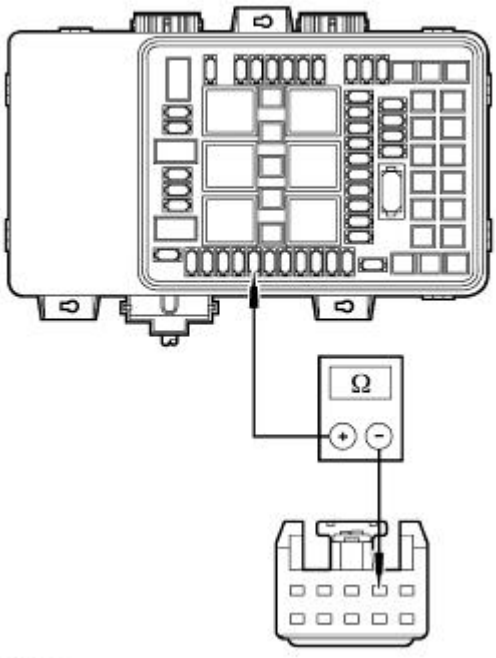


PINPOINT TEST C: THE TRANSMISSION CONTROL SWITCH (TCS) IS INOPERATIVE



Test Step	Result / Action to Take
C1 CHECK FUSE 29	
● Check fuse: Fuse Junction Panel Fuse 27 (5A). ● **Is the resistance less than 5 ohms?**	**Yes** GO to C3 . **No** INSTALL a new fuse. TEST the system for normal operation. If the fuse fails again, GO to C2 .
C2 CHECK CIRCUIT 224 (TN/WH) FOR SHORT TO GROUND	
● Disconnect: Powertrain Control Module C175b. ● Inspect for damaged or pushed-out pins, corrosion, loose wires, etc. Repair as necessary. ● Measure the resistance between circuit 224 (TN/WH), pin C175b-22 and ground.	**Yes** GO to C3 . **No** REPAIR circuit 224 (TN/WH). TEST the system for normal operation.

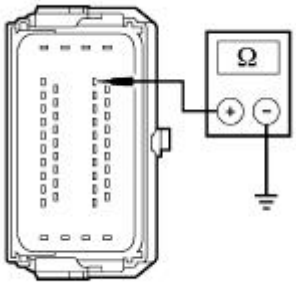
A0050536



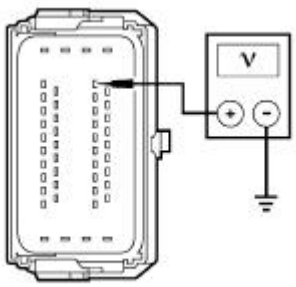
- **Is the resistance greater than 10 K ohms?**

C3 CHECK TRANSMISSION CONTROL SWITCH (TCS) CIRCUIT FOR VOLTAGE	
• Disconnect: Powertrain Control Module C175b. • Inspect for damaged or pushed-out pins, corrosion, loose wires, etc. Repair as necessary. • Leave PCM disconnected. • Measure the voltage at C175b-22, circuit 224 (TN/WH) and ground while cycling the TCS several times.  A0050537 • **Does the voltage cycle?**	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** GO to C4 .
C4 CHECK CIRCUIT 1003 (GY/YE) FOR OPEN	
• Disconnect: Power Distribution Junction Box. • Disconnect: Transmission Control Switch (TCS) C2135. • Inspect both ends for damaged or pushed-out pins, moisture, corrosion, loose wires, etc. Repair as necessary. • Measure the resistance between the PDJB fuse 27 (5A) and the power side of the TCS vehicle harness C2135-2, circuit 1003 (GY/YE).	**Yes** GO to C5 . **No** REPAIR open circuit. RECONNECT all components. TEST the system for normal operation.

A0051041



- Measure the resistance between C2135-1, circuit 224 (TN/WH) and signal side of the transmission control switch vehicle harness C175b-22, circuit 224 (TN/WH).



A0051038

- **Is the resistance less than 5 ohms for both circuits?**

C5 CHECK CIRCUIT 224 (TN/WH) FOR SHORT TO POWER	
• Measure the resistance between C175b-22, circuit 224 (TN/WH) and C175b-34.	**Yes** INSTALL a new transmission control switch. RECONNECT all components. TEST the system for normal operation.

 A0050536 ● **Is the resistance greater than 10 K ohms?**	**No** REPAIR circuit 224 (TN/WH). RECONNECT all components. TEST the system for normal operation.

PINPOINT TEST D: TRANSMISSION CONTROL INDICATOR LAMP (TCIL) IS NOT OPERATING CORRECTLY

Test Step	Result / Action to Take
D1 CHECK TRANSMISSION CONTROL INDICATOR LAMP (TCIL) CIRCUIT FOR VOLTAGE	**Yes** GO to D2 . **No** CHECK the indicator bulb and the fuse. If OK, REPAIR the wiring between ignition switch and the PCM harness connector. REPAIR as necessary. TEST the system for normal operation.
● Disconnect: Powertrain Control Module (PCM) C175b. ● Inspect for damaged or pushed-out pins, corrosion, loose wires, etc. Repair as necessary. ● Measure the voltage at C175b-22, circuit 224 (TN/WH).  A0050537 ● **Is the voltage reading greater than 2 volts?**	
D2 CYCLE TRANSMISSION CONTROL SWITCH (TCS)	**Yes** OK at this time. Concern may be intermittent. **No** GO to D3 .
● Cycle the transmission control switch (TCS). ● **Does the transmission control indicator lamp (TCIL) illuminate and then go off?**	
D3 CHECK CIRCUIT 911 (W/LG) FOR SHORT TO GROUND	**Yes** REPAIR circuit 911 (W/LG). RECONNECT all components. TEST the system for normal operation. **No** INSTALL a new PCM. TEST the system for normal operation.
● Disconnect: Powertrain Control Module (PCM) C175b. ● Inspect both ends for damage or pushed-out pins, moisture, corrosion, loose wires, etc. Repair as necessary. ● **Does the TCIL remain on?**	

External Controls —Floor Shift

Refer to Wiring Diagrams Cell 37 , Shift Lock for schematic and connector information.

Special Tool(s)

 ST1137-A	73 Digital Multimeter 105-R0051 or equivalent

Inspection and Verification

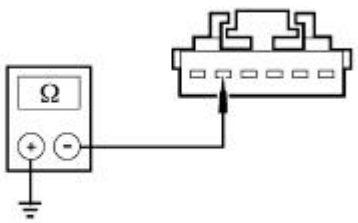
1. Verify the customer concern by operating the transmission external control.
2. Visually inspect for obvious signs of mechanical and electrical damage; refer to the following chart:

Visual Inspection Chart

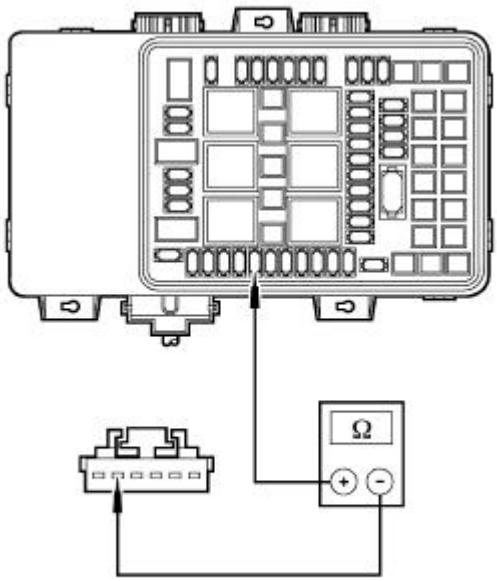
Mechanical	Electrical
● Damaged shift lock actuator ● Damaged transmission control switch	● Failed fuse(s) ● Damaged wiring harness ● Loose or corroded connections

3. If the fault is not visually evident, determine the symptom. GO to the Symptom Chart.

Symptom Chart



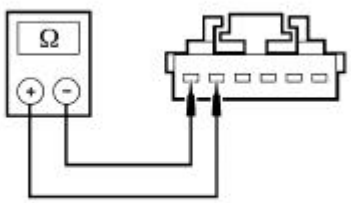
Symptom Chart

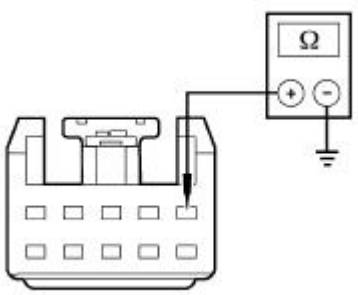


Condition	Possible Sources	Action
● The shift interlock system does not release/lock correctly	● Circuitry. ● Fuse(s). ● Shift lock actuator. ● Brake pedal position switch.	● Go To Pinpoint Test E .
● The shift control is out of correct gear relationship	● Transmission shift cable and bracket. ● Retainer bracket. ● Shift control linkage.	● Go To Pinpoint Test F .
● Transmission	● Transmission	● TIGHTEN bolts holding

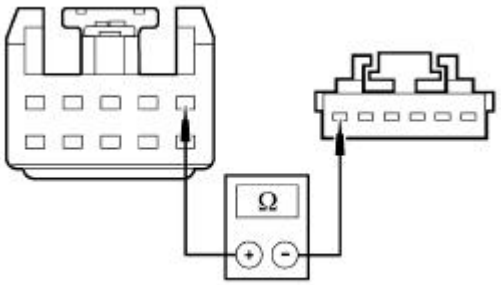
range indicator does not correspond to the gear	shift cable bracket. ● Transmission shift cable loose from the transmission retainer bracket. ● Shift linkage.	transmission shift cable bracket. ● TIGHTEN transmission shift cable bolts. ● VERIFY transmission shift cable adjustment. REFER to Adjustments in this section. ADJUST transmission shift cable if necessary. VERIFY digital transmission range (TR) sensor or transmission range (TR) sensor for correct adjustment. REFER to Section 307-01A or Section 307-01B .
● Transmission range indicator LED's do not illuminate	● Bulb. ● Circuitry.	● REFER to Section 413-00 .
● The transmission control switch (TCS) is inoperative	● Fuse. ● TCS. ● TCS not cycled during self-test. ● Powertrain Control Module. ● Circuitry.	● Go To Pinpoint Test G .
● The transmission control indicator lamp (TCIL) is not operating correctly	● Bulb. ● Circuitry. ● Powertrain Control Module.	● Go To Pinpoint Test H .
● Rattle, noise, buzz, or other noise	● Selector lever knob. ● Shift control selector lever.	● INSTALL a new selector lever knob. ● TIGHTEN housing bolts.
● Water enters inside the vehicle	● Cable assembly grommet. ● Torn cable assembly grommet.	● SECURE grommet to floor panel. ● INSTALL a new transmission shift cable.
● Excessive shift effort	● Transmission shift cable. ● Cable bracket.	● INSTALL a new transmission shift cable. ● ADJUST cable. TIGHTEN cable bracket screws.
● Transmission range selector lever will not shift	● Transmission shift cable. ● Shifter knob. ● Broken transmission floor shifter.	● REINSTALL transmission shift cable. ● INSTALL a new shifter knob. ● INSTALL a new transmission floor shifter.

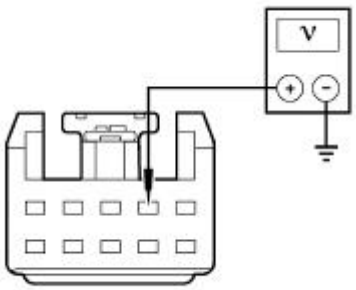
Pinpoint Tests

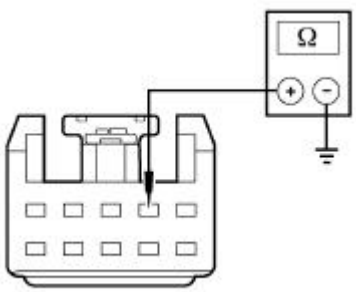




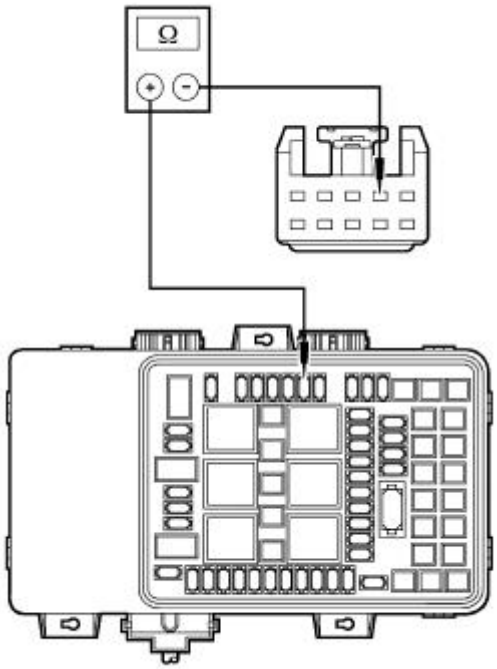
PINPOINT TEST E: THE SHIFT INTERLOCK SYSTEM DOES NOT RELEASE/LOCK CORRECTLY

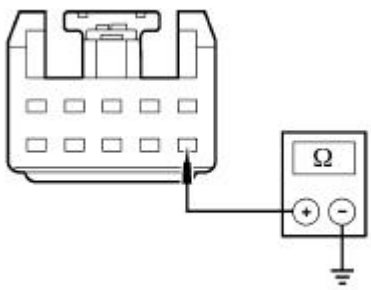






Test Step	Result / Action to Take
E1 TEST BRAKE LIGHTS	
• Apply brake pedal and view brake lights. • **Do the brake lights illuminate?**	**Yes** GO to E7 . **No** GO to E2 .
E2 TEST FUSE 5 (7.5A)	
• Check fuse: Fuse 5 (7.5A). • Measure the resistance of fuse 5. • **Is the resistance 5 ohms or less?**	**Yes** GO to E4 . **No** GO to E3 .
E3 TEST CIRCUIT 729 (RD/WH) FOR SHORT TO GROUND	
• Disconnect: Brake Pedal Position Switch C278. • Measure resistance of circuit 729 (RD/WH) at C278-5.  A0050540 • **Is the resistance 10 K ohms or less?**	**Yes** SERVICE circuit 729 (RD/WH) for short to ground. TEST the system for normal operation. **No** GO to E4 .
E4 TEST CIRCUIT 729 (RD/WH) FOR OPEN	
• Measure resistance between output side of fuse 5 (7.5A) and Brake Pedal Position Switch Connector C278-5, circuit 729 (RD/WH).	**Yes** GO to E5 . **No** SERVICE circuit 729 (RD/WH) for open. RETEST the system.





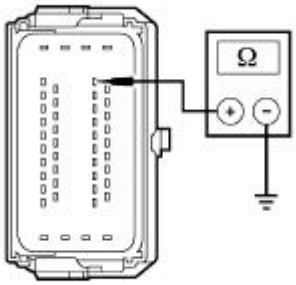
A0050532

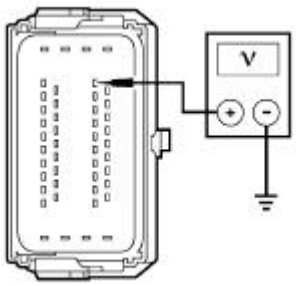
- **Is resistance 5 ohms or less?**

E5 TEST BRAKE PEDAL POSITION SWITCH	
• Measure resistance of brake pedal position switch while open (OFF) and closed (ON).  A0050529 • **Is the resistance of switch greater than 10 K ohms while OFF and 5 ohms or less while ON?**	**Yes** GO to E6 . **No** INSTALL a new brake pedal position switch. TEST the system for normal operation.
E6 CHECK CIRCUIT 810 (RD/LG) FOR SHORT TO GROUND	
• Disconnect: Shift Lock Actuator C2008. • Measure resistance of circuit 810 (RD/LG), pin C2008-2.  A0050530 • **Is the resistance 10 K ohms or less?**	**Yes** SERVICE circuit 810 (RD/LG) for short to ground. TEST the system for normal operation. **No** GO to E7 .
E7 CHECK CIRCUIT 810 (RD/LG) FOR OPEN	

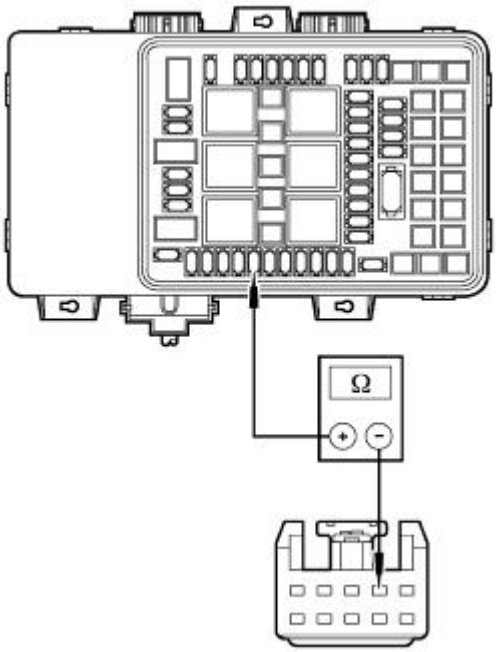
• Measure the resistance of circuit 810 (RD/LG) between shift lock actuator pin C2008-2 and brake pedal position switch connector C278-6.  A0050531 • **Is the resistance 5 ohms or less?**	**Yes** GO to E8 . **No** SERVICE circuit 810 (RD/LG) for open. TEST the system for normal operation.
E8 TEST FOR B+ ON CIRCUIT 1003 (GY/YE)	
• Measure voltage at shift lock actuator pin C2008-3, circuit 1003 (GY/YE).  A0051039 • **Is B+ present?**	**Yes** GO to E12 . **No** GO to E9 .
E9 TEST FUSE 27 (5A)	
• Check fuse: Fuse 27 (5A). • **Is the resistance 5 ohms or less?**	**Yes** GO to E11 . **No** GO to E10 .
E10 TEST CIRCUIT 1003 (GY/YE) FOR SHORT TO GROUND	
• Measure resistance at pin C2008-2, circuit 1003 (GY/YE).  A0051215 • **Is the resistance 10 K ohms or less?**	**Yes** SERVICE circuit 1003 (GY/YE) for short to ground. TEST the system for normal operation. **No** GO to E11 .
E11 TEST CIRCUIT 1003 (GY/YE) FOR OPEN	
• Measure resistance of circuit 1003 (GY/YE) between output side of fuse 27 (5A) and shift lock actuator pin C2008-2.	**Yes** GO to E12 . **No** SERVICE circuit 1003

 A0050538 ● **Is the resistance 5 ohms or less?**	(GY/YE) for open. TEST the system for normal operation.
E12 TEST CIRCUIT 57 (BK) FOR OPEN	
● Measure the resistance of shift lock actuator C2008-6, circuit 57 (BK).  A0050535 ● **Is the resistance 5 ohms or less?**	**Yes** INSTALL a new shift lock actuator. TEST the system for normal operation. **No** SERVICE circuit 57 (BK) for open. TEST the system for normal operation.





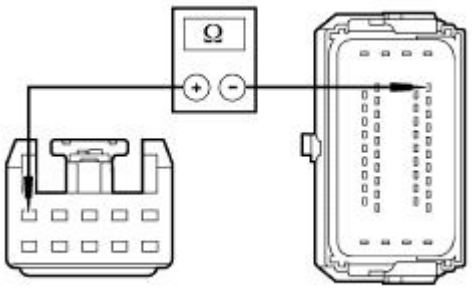
PINPOINT TEST F: THE SHIFT CONTROL IS OUT OF CORRECT GEAR RELATIONSHIP



Test Step	Result / Action to Take
F1 CHECK SHIFT CONTROL LINKAGE	
● Apply the brake pedal. ● Gain access to the shift control linkage. ● Actuate the transmission range selector lever in all ranges. ● Observe all linkages during operation.	**Yes** INSTALL a new floor shifter. TEST the system for normal operation. **No** GO to F2 .

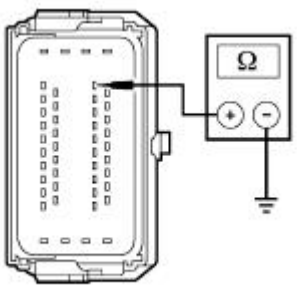
• **Is the linkage damaged?**	
F2 CHECK TRANSMISSION SHIFT CABLE	
• Check transmission shift cable and bracket installation and tightness. • **Is the transmission shift cable correctly installed and adjusted?**	**Yes** VERIFY the transmission shift cable adjustment. REFER to Cable and Bracket Adjustment—Floor Shift in this section. ADJUST the transmission shift cable if necessary. VERIFY the digital transmission range (TR) sensor for correct adjustment. REFER to Section 307-01B (4R100). Adjust digital TR or TR sensor if necessary. GO to F3 . **No** REPAIR as necessary. TEST the system for normal operation.
F3 CHECK LINKAGE/CABLE FOR CORRECT GEAR RELATIONSHIP	
• Apply the brake pedal. • Actuate the transmission range selector lever in all ranges. • **Does the indicator match the gear selection?**	**Yes** System OK. TEST the system for normal operation. **No** REFER to Cable and Bracket Adjustment—Floor Shift in this section. TEST the system for normal operation.

PINPOINT TEST G: THE TRANSMISSION CONTROL SWITCH (TCS) IS INOPERATIVE



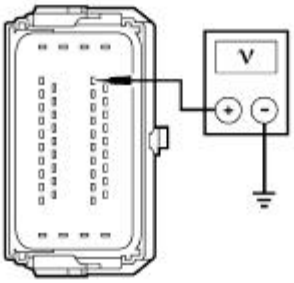
Test Step	Result / Action to Take
G1 CHECK FUSE 27	
• Check fuse: Fuse Junction Panel Fuse 27 (5A). • **Is the resistance less than 5 ohms?**	**Yes** GO to G3 . **No** INSTALL a new fuse. TEST the system for normal operation. If the fuse fails again, GO to G2 .
G2 CHECK CIRCUIT 224 (TN/WH) FOR SHORT TO GROUND	
• Disconnect: Powertrain Control Module C175b. • Inspect for damaged or pushed-out pins, corrosion, loose wires, etc. Repair as necessary. • Measure the resistance between circuit 224 (TN/WH), pin C175b-22 and ground.	**Yes** GO to G3 . **No** REPAIR circuit 224 (TN/WH). TEST the system for normal operation.

 A0050536 ● **Is the resistance greater than 10 K ohms?**	
G3 CHECK TRANSMISSION CONTROL SWITCH (TCS) CIRCUIT 224 (TN/WH) FOR VOLTAGE	
● Disconnect: Powertrain Control Module C175b. ● Inspect for damaged or pushed-out pins, corrosion, loose wires, etc. Repair as necessary. ● Leave PCM disconnected. ● Measure the voltage at C175b-22, circuit 224 (TN/WH) and ground while cycling the TCS several times.  A0050537 ● **Does the voltage cycle?**	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** GO to G4 .
G4 CHECK CIRCUIT 1003 (GY/YE) FOR OPEN	
● Disconnect: Power Distribution Junction Box. ● Disconnect: Transmission Control Switch (TCS) C2135. ● Inspect both ends for damaged or pushed-out pins, moisture, corrosion, loose wires, etc. Repair as necessary. ● Measure the resistance between the PDJB fuse 27 (5A) and the power side of the TCS vehicle harness C2135-2, circuit 1003 (GY/YE).	**Yes** GO to G5 . **No** REPAIR open circuit. RECONNECT all components. TEST the system for normal operation.



A0051038

- Measure the resistance between C2135-1, circuit 224 (TN/WH) and signal side of the transmission control switch vehicle harness C175b-22, circuit 224 (TN/WH).



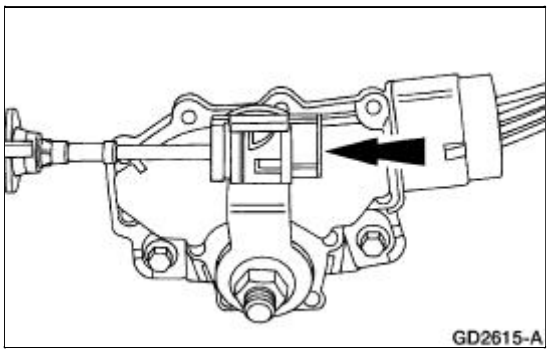
A0051037

- **Is the resistance less than 5 ohms for both circuits?**

G5 CHECK CIRCUIT 224 (TN/WH) FOR SHORT TO POWER - Measure the resistance between C175b-22, circuit 224 (TN/WH) and C175b-34.  A0050536 - **Is the resistance greater than 10 K ohms?**	**Yes** INSTALL a new transmission control switch. RECONNECT all components. TEST the system for normal operation. **No** REPAIR circuit 224 (TN/WH). RECONNECT all components. TEST the system for normal operation.

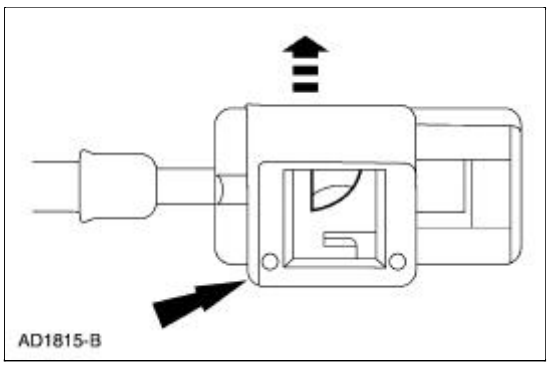
PINPOINT TEST H: TRANSMISSION CONTROL INDICATOR LAMP (TCIL) IS NOT OPERATING CORRECTLY

Test Step	Result / Action to Take
H1 CHECK TRANSMISSION CONTROL INDICATOR LAMP (TCIL) CIRCUIT FOR VOLTAGE	
• Disconnect: Powertrain Control Module (PCM) C175b. • Inspect for damaged or pushed-out pins, corrosion, loose wires, etc. Repair as necessary. • Measure the voltage at C175b-22, circuit 224 (TN/WH).  A0050537 • **Is the voltage reading greater than 2 volts?**	**Yes** GO to H2 . **No** CHECK the indicator bulb and the fuse. If OK, REPAIR the wiring between ignition switch and the PCM harness connector. REPAIR as necessary. TEST the system for normal operation.
H2 CYCLE TRANSMISSION CONTROL SWITCH (TCS)	
• Cycle the transmission control switch (TCS). • **Does the transmission control indicator lamp (TCIL) illuminate and then go off?**	**Yes** OK at this time. Concern may be intermittent. **No** GO to H3 .
H3 CHECK CIRCUIT 911 (WH/LG) FOR SHORT TO GROUND	
• Disconnect: Powertrain Control Module (PCM) C175b. • Inspect both ends for damage or pushed-out pins, moisture, corrosion, loose wires, etc. Repair as necessary. • **Does the TCIL remain on?**	**Yes** REPAIR circuit 911 (WH/LG). RECONNECT all components. TEST the system for normal operation. **No** INSTALL a new PCM. TEST the system for normal operation.



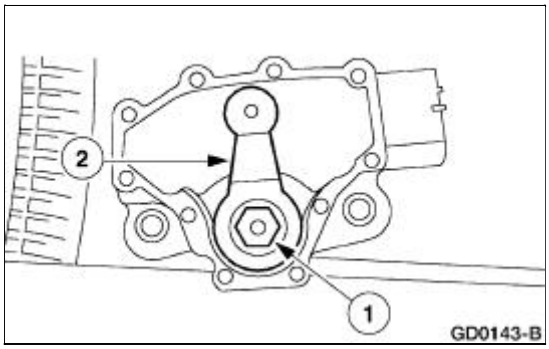
Cable and Bracket Adjustment —Column Shift

1. Place the gearshift lever in the (D) position.
   - Place a three pound weight on the gearshift lever.



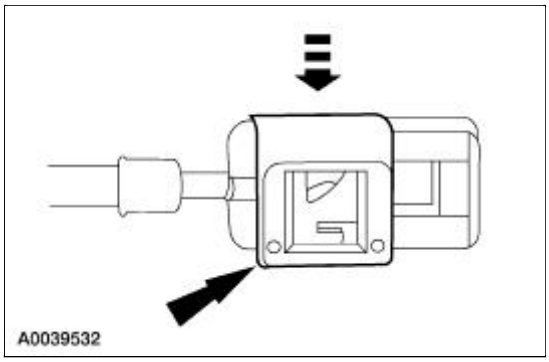
2. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   Position the vehicle on a hoist. For additional information, refer to Section 100-02 .



3. Disconnect the transmission shift cable from the manual control lever.

4. Unlock the lock tab on the transmission shift cable.



5. Place the manual control lever in the (D) position.
   1. Place the manual control lever in the first gear position.
   2. Move the manual control lever two detents to the (D) position.

6. Connect the transmission shift cable to the manual control lever.

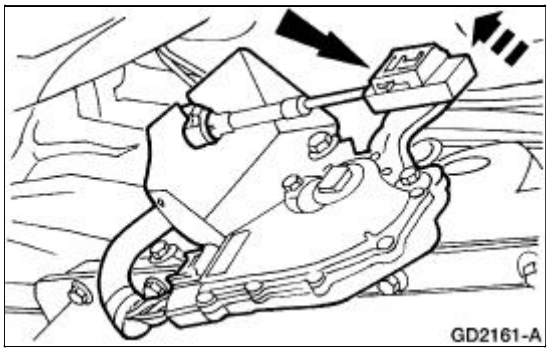
7. Lock the transmission shift cable lock tab.

8. **NOTE:** If equipped with air suspension, reactivate the system by turning on the air suspension switch.

   Lower the vehicle.

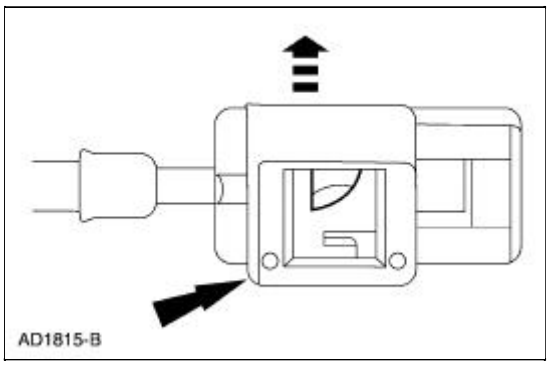
9. Remove the three pound weight.

10. Carefully move the manual control lever from detent to detent and compare with transmission settings. Verify that the vehicle will start in PARK or NEUTRAL and backup lamps illuminate in REVERSE. If not, Steps 1-5 must be repeated and include digital transmission range (TR) or transmission range (TR) sensor adjustment in NEUTRAL. For additional information, refer to Section 307-01A .
    - Readjust if necessary.



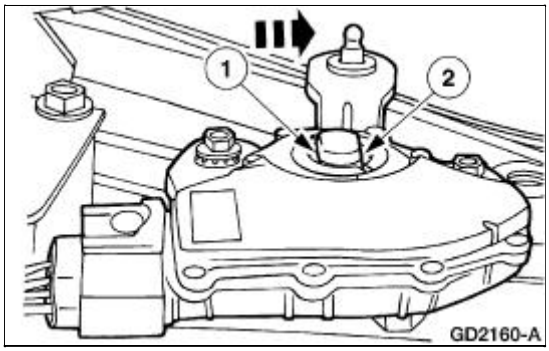
Cable and Bracket Adjustment —Floor Shift

1. Place the gearshift lever in the (D) position.

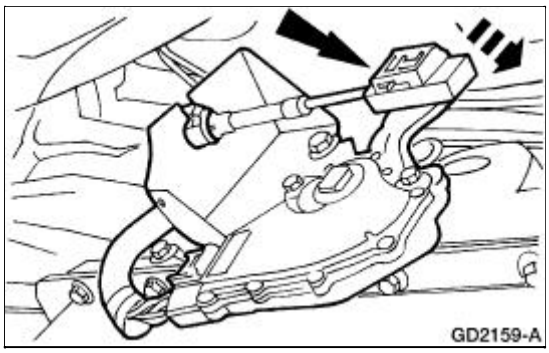


2. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

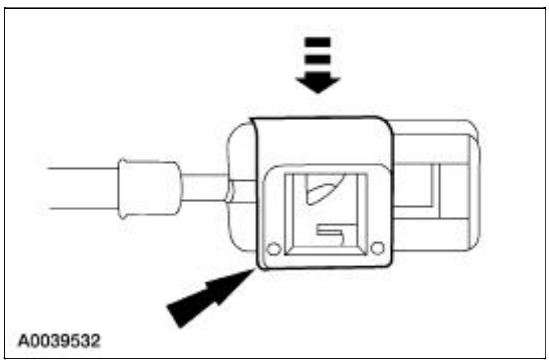
   Position the vehicle on a hoist. For additional information, refer to Section 100-02 .



3. Disconnect the transmission shift cable from the manual control lever.



4. Unlock the lock tab on the transmission shift cable.



5. Place the manual control lever in the (D) position.
   1. Place the manual control lever in the first gear position.
   2. Move the manual control lever two detents to the (D) position.

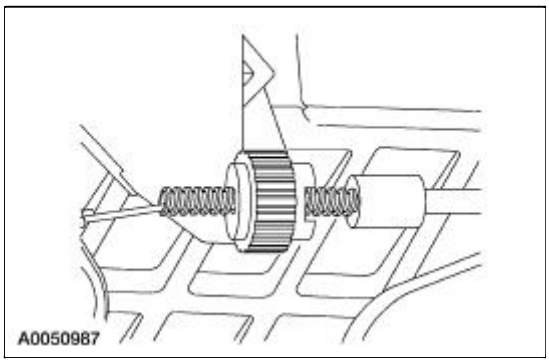
6. Connect the transmission shift cable to the manual control lever.

7. Lock the transmission shift cable lock tab.

8. **NOTE:** If equipped with air suspension, reactivate the system by turning on the air suspension switch.

   Position the vehicle.

9. Carefully move the manual control lever from detent to detent and compare with transmission settings. Verify that the vehicle will start in PARK or NEUTRAL and backup lamps illuminate in REVERSE. If not, Steps 1-5 must be repeated and include digital transmission range (TR) or transmission range (TR) sensor adjustment in NEUTRAL. For additional information, refer to Section 307-01B .
   - Readjust if necessary.



Selector Lever Indicator Adjustment

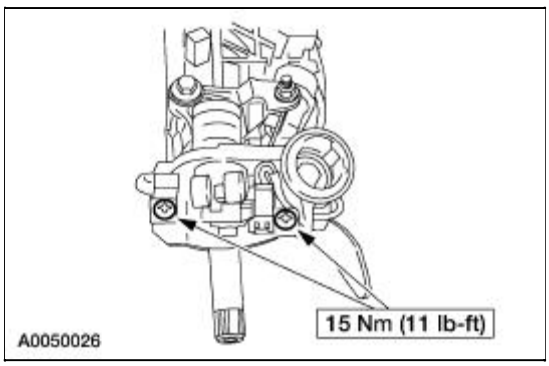
1. Remove the upper instrument panel steering column cover. For additional information, refer to Section 501-12 .

2. Place the transmission control selector lever in the (D) position.
   - Rotate the transmission control selector lever clockwise until it bottoms out (first gear), then rotate two detents counterclockwise ((D) position).

3. Hang a three pound weight on the transmission control selector lever.

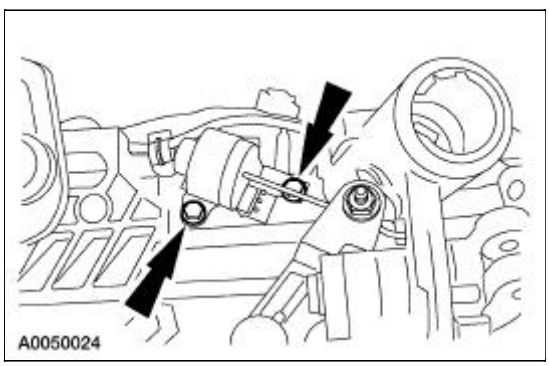
4. Center the pointer in the middle of the (D) position.
   - Rotate the thumbwheel located on the bottom of the steering column to adjust the pointer.

5. Remove the three pound weight.



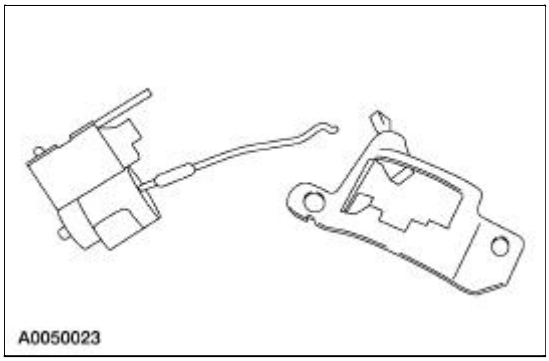
6. Carefully move the shift control selector lever from detent to detent and compare with transmission settings.
   - Readjust if necessary.

7. Install the upper instrument panel steering column cover. For additional information, refer to Section 501-12 .



Brake Shift Interlock Actuator —Column Shift

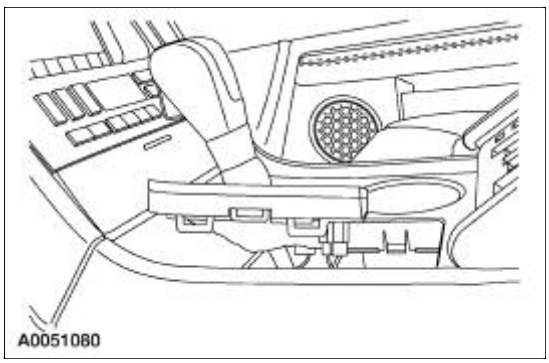
Removal and Installation



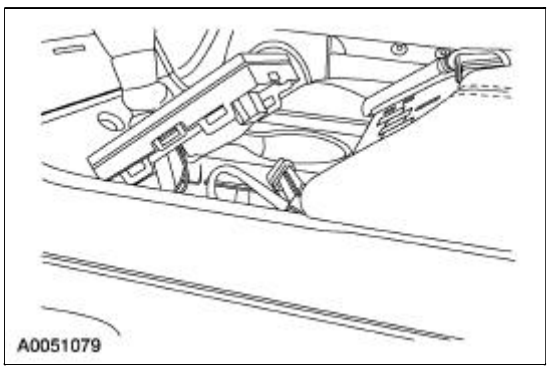
1. Remove the steering column. For additional information, refer to Section 211-04 .
2. Remove the shift lever while in the DRIVE position.
3. Remove the two insert plate screws.
   - Remove the brake switch interlock actuator interupt switch bracket.
   - Position the PARK detection switch aside.

4. Carefully remove the brake switch interlock interrupt switch from the steering column housing.
5. Confirm the two retaining holes for the brake switch interlock interrupt switch are free of plastic material.
6. Remove the wire harness from the retaining clips.
7. Remove the two screws retaining the brake shift interlock actuator from the steering column housing.

8. Rotate the brake shift interlock actuator rod to remove the blocker on the insert plate from the actuator.

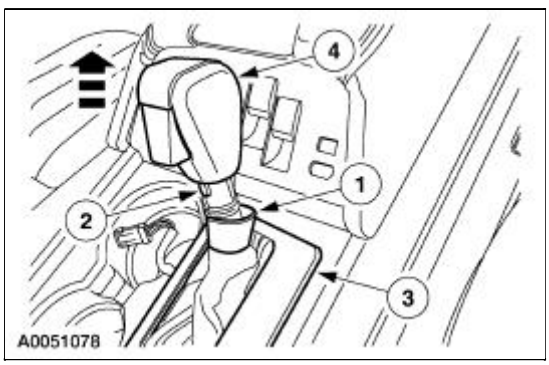


9. To install, reverse the removal procedure.



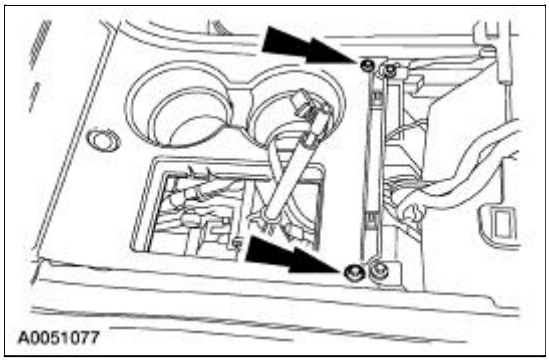
Brake Shift Interlock Actuator —Floor Shift

Removal and Installation

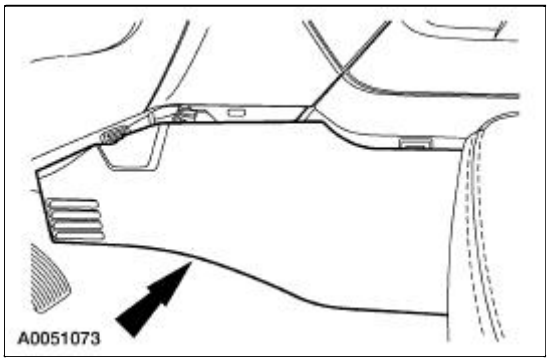


1. Lift the floor shift PRNDL bezel.

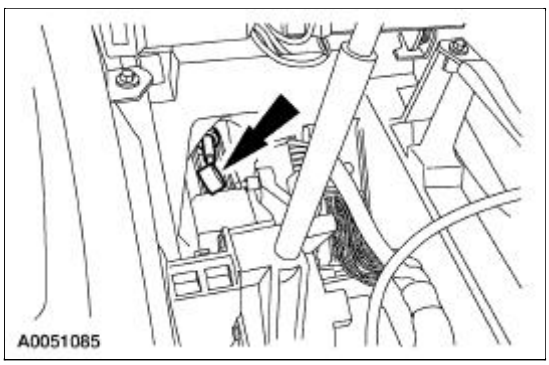
2. Disconnect the PRNDL bezel wire harness connector.



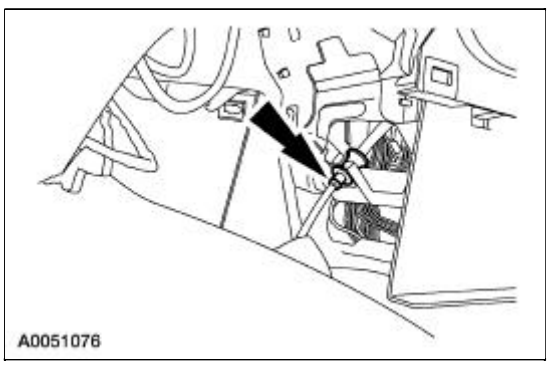
3. Remove the shift lever handle and cover.
    1. Slide the handle bezel down.
    2. Remove the screw.
    3. Disconnect the TCS wire harness.
    4. Lift assembly from the shifter lever.



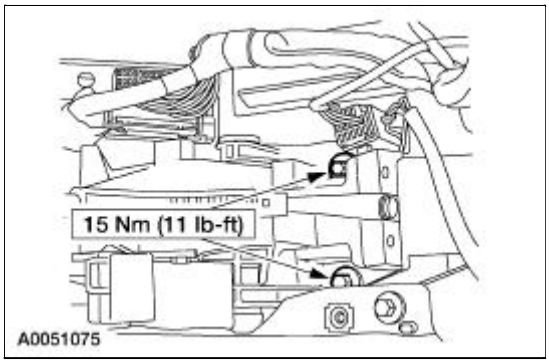
4. Position the window regulator control panel aside.



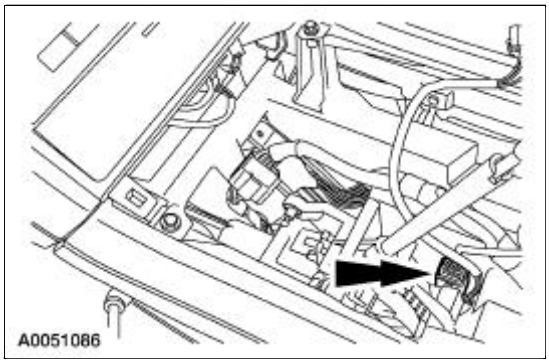
5. Remove the screws and the console finish panel.



6. Remove the left side console access panel.

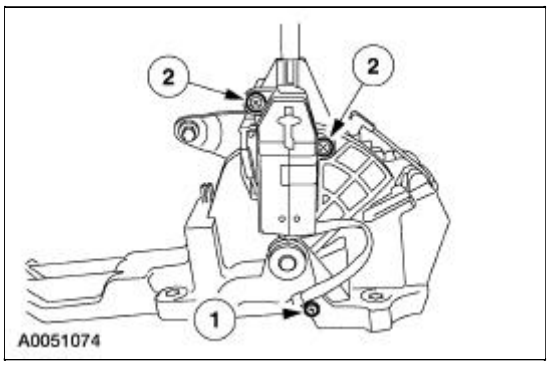


7. Disconnect the transmission shift cable from the transmission selector arm.



8. Remove the transmission shift cable retaining clip from the floor shift mechanism through the console access.

9. Remove the four bolts retaining the floor shift mechanism to the floor.



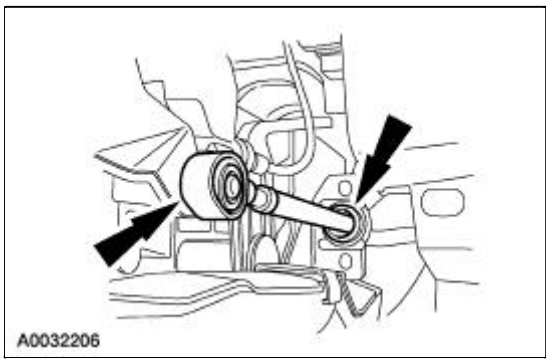
10. Disconnect the floor shift mechanism wire harness connector.

11. Remove the floor shift mechanism from the console.

12. Remove the brake shift interlock actuator and harness.
    1. Remove the wire harness retainers.
    2. Remove the two screws retaining the brake shift interlock assembly.

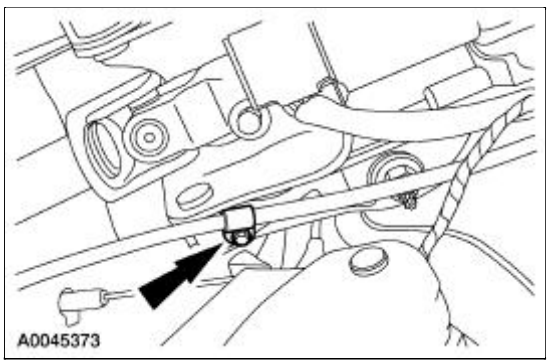
13. To install, reverse the removal procedure.

Selector Lever Cable and Bracket —Column Shift



Removal and Installation

1. Remove the instrument panel lower finish panel. For additional information, refer to Section 413-01 .



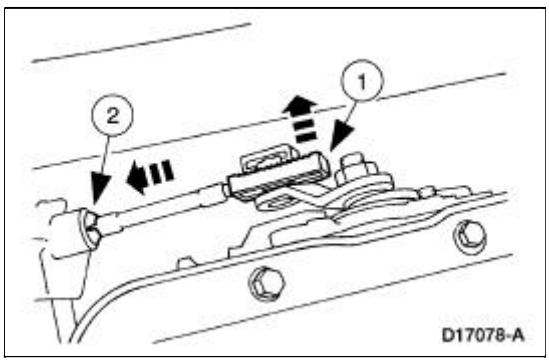
2. **NOTE:** To prevent cable damage, do not apply force to the transmission shift cable assembly between the steering column transmission selector lever arm and the steering column bracket.

   Disconnect the transmission shift cable from the steering column.

   - Disconnect the transmission shift cable from the transmission selector lever arm and support.
   - Carefully lift the two locking tabs and disconnect the transmission shift cable from the steering column bracket.

3. Remove the cable retaining screw.

4. Push the rubber grommet and transmission shift cable through the floor panel.



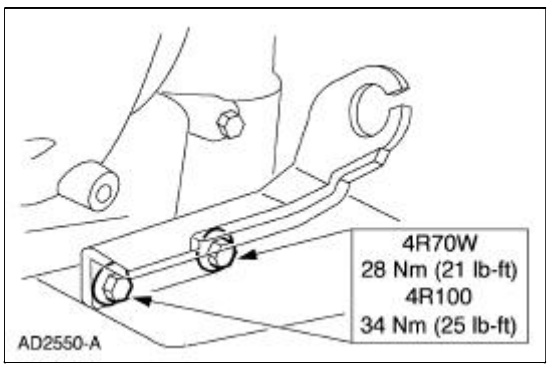
5. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   Put the vehicle in NEUTRAL and position on a hoist. For additional information, refer to Section 100-02 .

6. **NOTE:** To prevent shift cable damage, do not apply force to the transmission shift cable between the manual control lever and the transmission shift cable bracket.

   Remove the transmission shift cable from the automatic transmission.
   1. Disconnect the transmission shift cable from the manual control lever.
   2. Depress the lock tabs to release the transmission shift cable and disconnect the transmission shift cable from the transmission shift cable bracket.

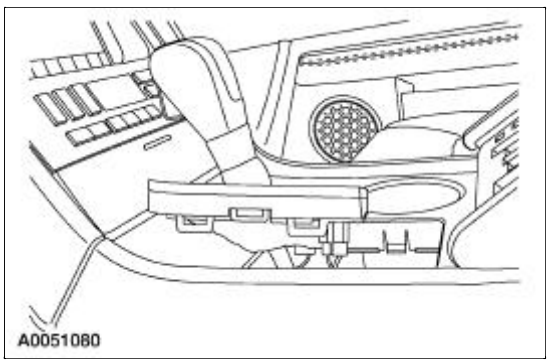
7. Remove the shift cable bracket from the transmission (4R70W).
   1. Remove the bolts.
   2. Remove the bracket.



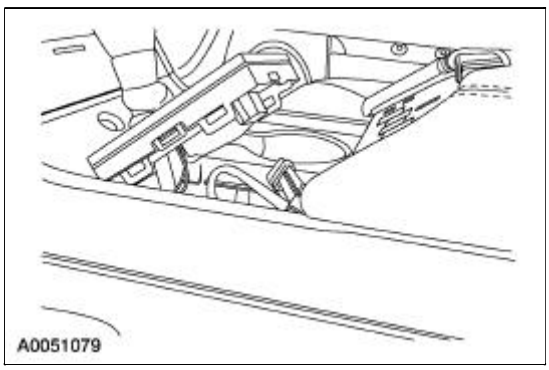
8. Remove the cable from the cable route assist clip located at the transmission bell housing.

9. To install, reverse the removal procedure.

CAUTION: Make sure the cable is inserted into the cable route assist clip. Failure to do so can result in exhaust contact.

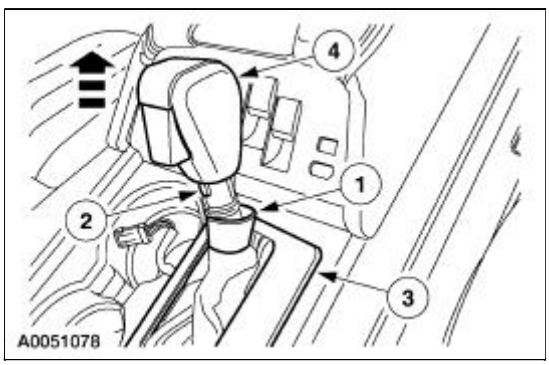


- Adjust the shift cable. For additional information, refer to Cable and Bracket Adjustment—Column Shift in this section.



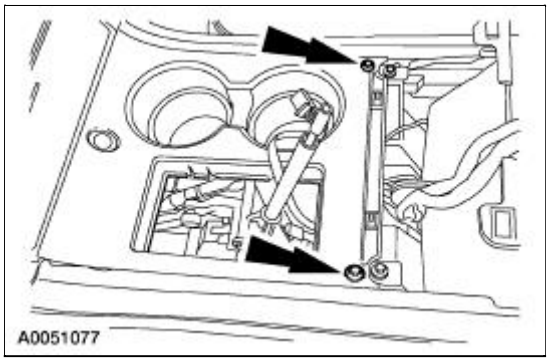
Selector Lever Cable and Bracket —Floor Shift

Removal

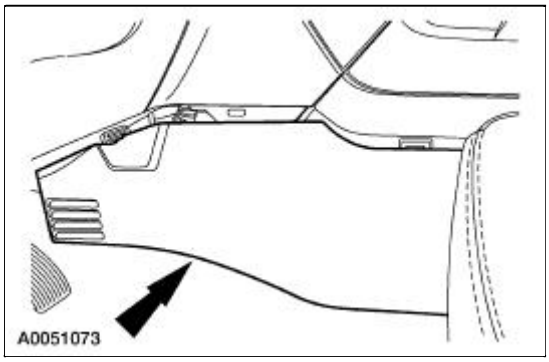


1. Lift the floor shift PRNDL bezel.

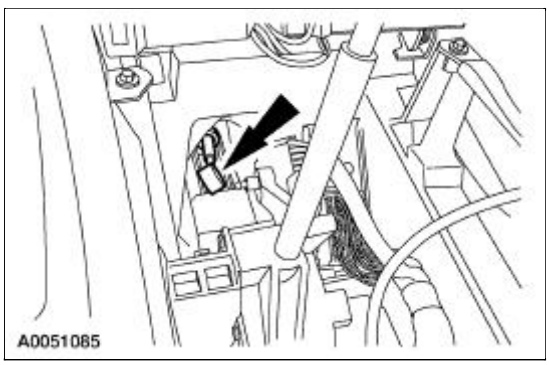
2. Disconnect the PRNDL bezel wire harness connector.



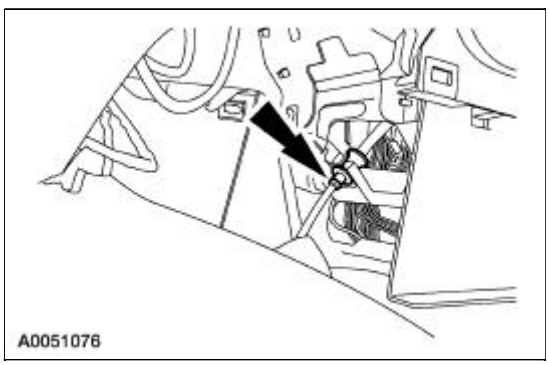
3. Remove the handle and PRNDL bezel.
    1. Slide the handle bezel down.
    2. Remove the screw.
    3. Disconnect the TCS wire harness.
    4. Remove the handle and bezel.



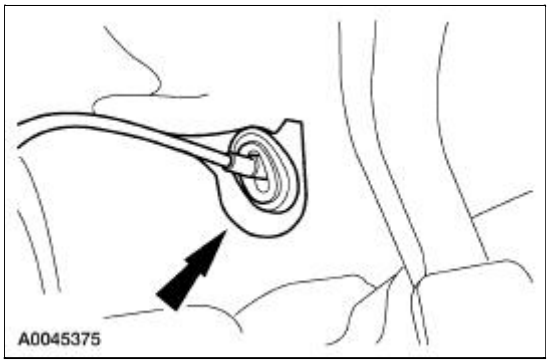
4. Remove the window regulator control panel.



5. Remove the screws and the console finish panel.

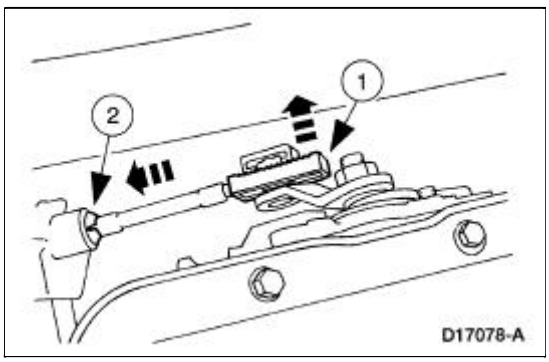


6. Remove the left side console access panel.

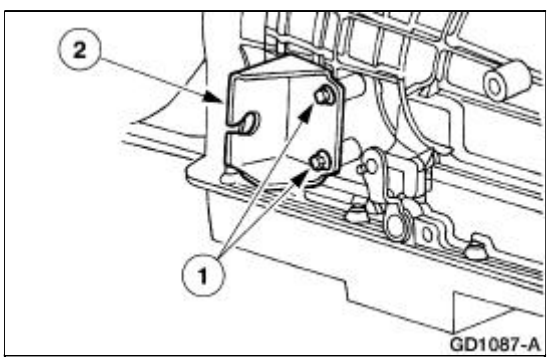


7. Disconnect the transmission shift cable from the transmission selector lever arm.

8. Remove the transmission shift cable retaining clip from the floor shift mechanism through the console access panel.



9. Push the rubber grommet and transmission shift cable through the floor panel.

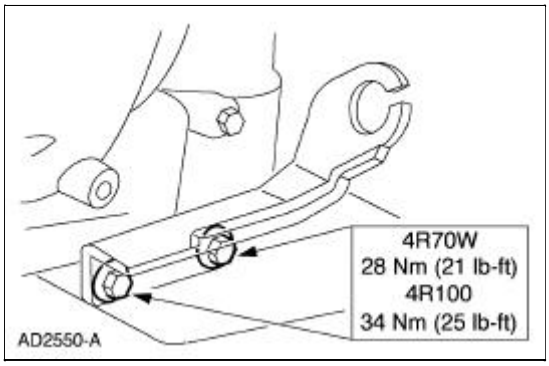


10. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the rh kick panel area. Failure to do so may result in unexpected inflation or deflation of the air springs which may result in shifting of the vehicle during these operations.**

    Place the shifter lever in NEUTRAL and position the vehicle on a hoist. For additional information, refer to Section 100-02 .

11. Remove the transmission shift cable from the automatic transmission.
    1. Disconnect the transmission shift cable from the manual control lever.
    2. Depress the lock tabs to release the transmission shift cable and disconnect the transmission shift cable from the transmission shift cable bracket.

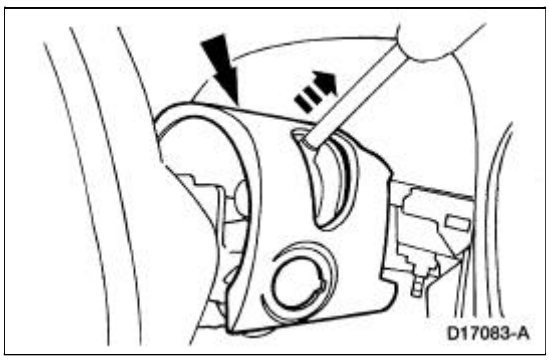
12. Remove the shift cable bracket from the transmission.
    1. Remove the bolts.
    2. Remove the shift cable bracket.



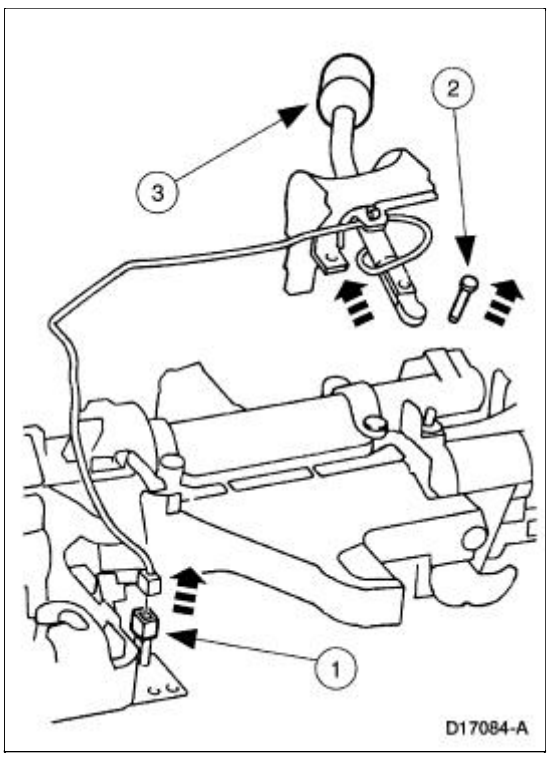
Installation

1. **NOTE:** If equipped with air suspension, reactivate the system by turning on the air suspension switch.

Follow the removal procedure in reverse order.



- Adjust the shift cable. For additional information, refer to Cable and Bracket Adjustment—Floor Shift in this section.



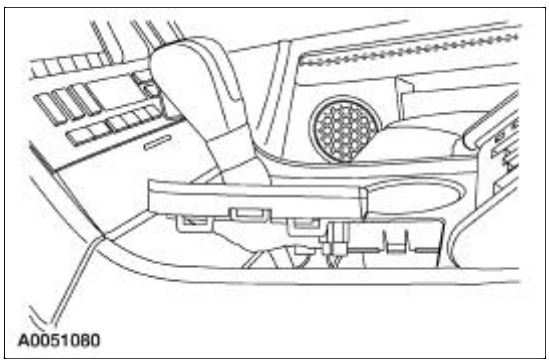
Selector Lever —Column Shift

Removal

1. Remove the ignition switch lock cylinder. For additional information, refer to Section 211-05 .
2. Remove the steering wheel. For additional information, refer to Section 211-04 .
3. Remove the upper steering column shroud.

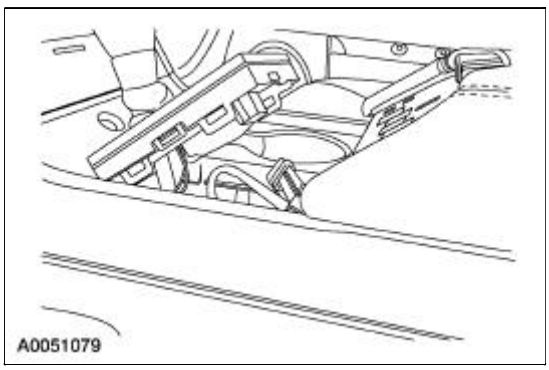
4. Remove the gearshift lever.
    1. Disconnect the electrical connector.
    2. Remove and discard the gearshift lever pin.
    3. Remove the gearshift lever.

Installation



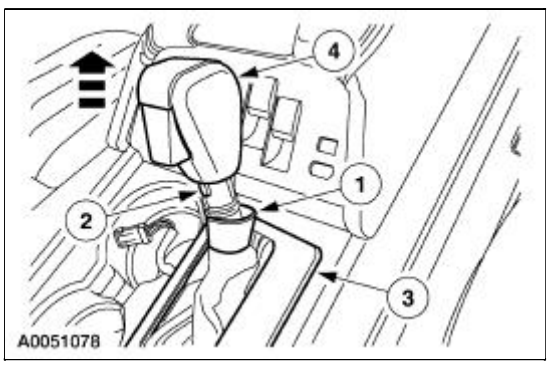
1. **NOTE:** A new gearshift lever pin must be installed whenever removed.

   Follow the removal procedure in reverse order.



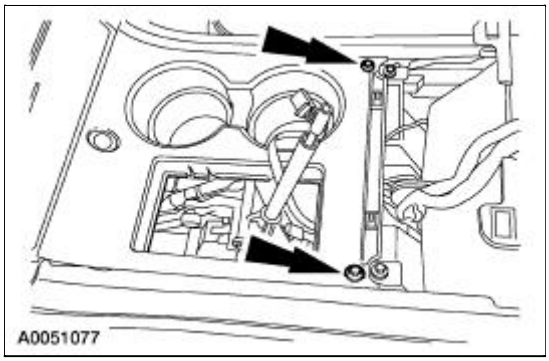
Selector Lever —Floor Shift

Removal and Installation

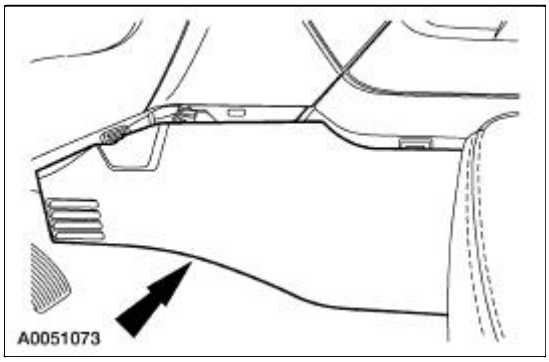


1. Lift the floor shift PRNDL bezel.

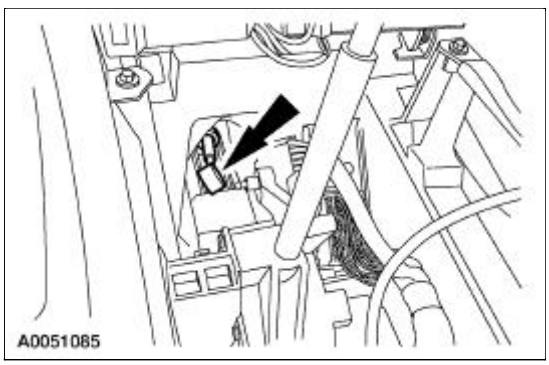
2. Disconnect the PRNDL bezel wire harness connector.



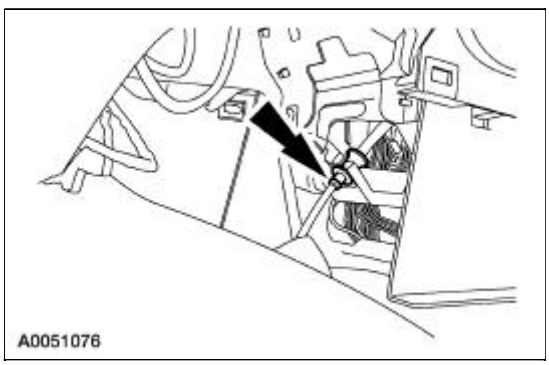
3. Remove the shift lever handle and cover.
    1. Slide the handle bezel down.
    2. Remove the screw.
    3. Disconnect the TCS wire harness.
    4. Lift assembly from the shifter lever.



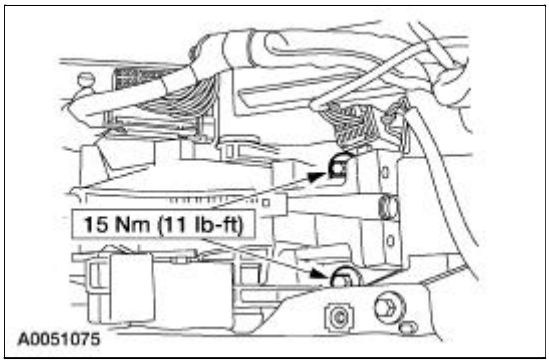
4. Position the window regulator control panel aside.



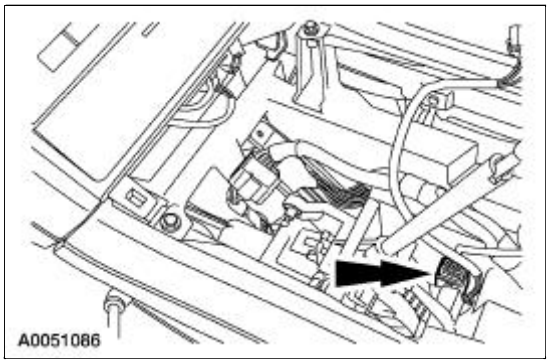
5. Remove the screws and the console finish panel.



6. Remove the left side console access panel.

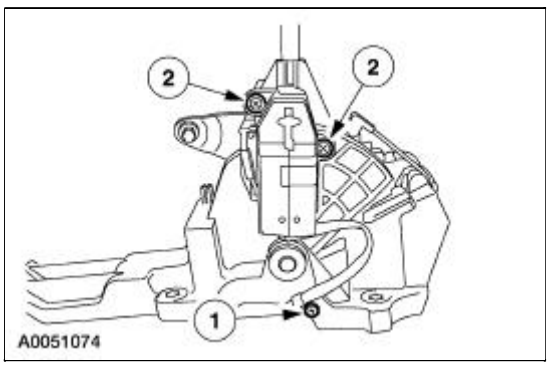


7. Disconnect the transmission shift cable from the transmission selector arm.



8. Remove the transmission shift cable retaining clip from the floor shift mechanism through the console access.

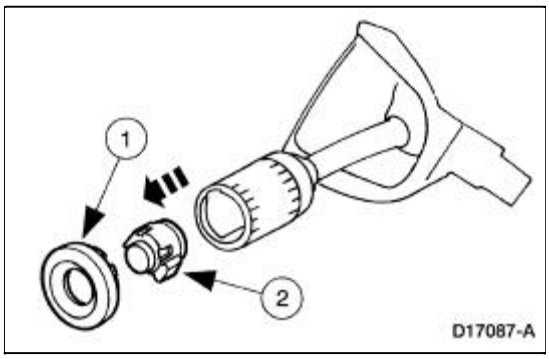
9. Remove the four bolts retaining the floor shift mechanism to the floor.



10. Disconnect the floor shift mechanism wire harness connector.

11. Remove the floor shift mechanism from the console.

12. Remove the brake shift interlock actuator, parking brake release mechanism and harness.
    - Remove the wire harness retainers.
    - Remove the wire harness retainers.
    - Remove the two screws retaining the brake shift interlock assembly.
    - Remove the two screws retaining the parking brake controller.

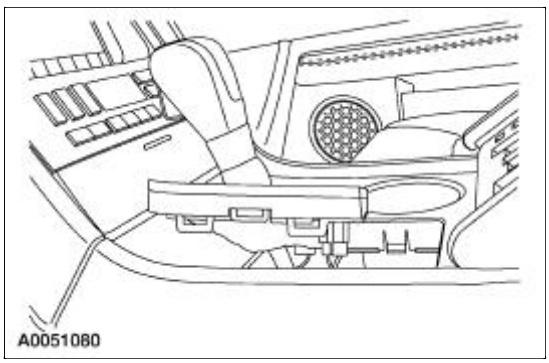


13. To install, reverse the removal procedure.

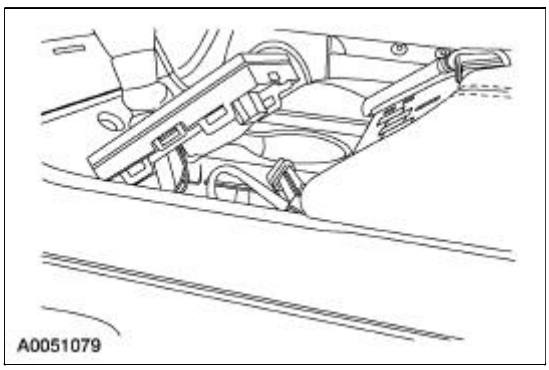
Transmission Control (TC) Switch —Column Shift

Removal and Installation

1. Remove the transmission control (TC) switch.
    1. Remove the TC switch cover.
    2. Remove the TC switch.

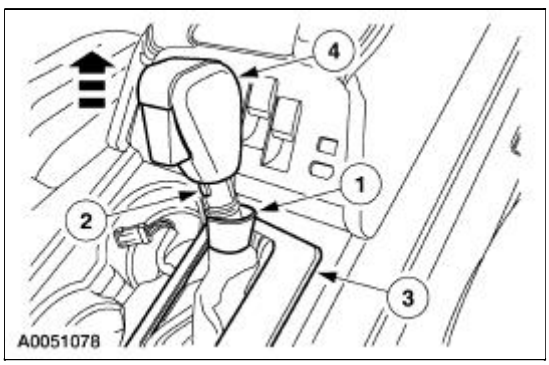


2. To install, reverse the removal procedure.



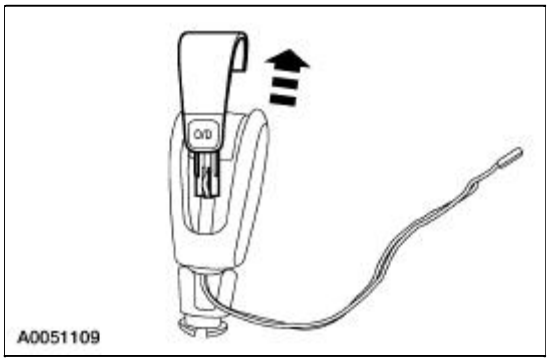
Transmission Control (TC) Switch —Floor Shift

Removal and Installation



1. Lift the floor shift PRNDL bezel.

2. Disconnect the PRNDL bezel wire harness connector.



3. Remove the shift lever handle and cover.
    1. Slide the handle bezel down.
    2. Remove the screw.
    3. Disconnect the TCS wire harness.
    4. Lift assembly from the shifter lever.

4. Remove TCS switch from shift handle.
    - Lift switch from handle body.

- Route harness through handle passage.

5. To install, reverse the removal procedure.

Four-Wheel Drive Systems

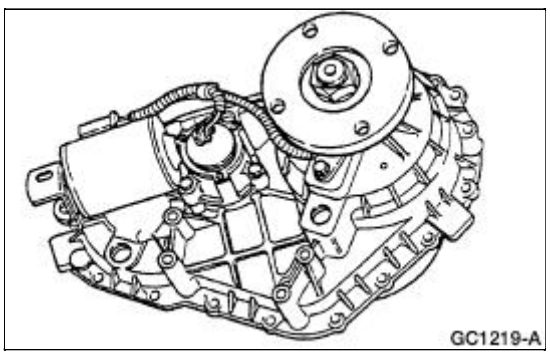
The automatic 4-wheel drive transfer case system consists of the following:

- automatic 4WD indicator light
- brake pedal position (BPP) switch
- integrated wheel ends (IWE) solenoid
- torque on demand (TOD) relay
- 4WD control module
- 4WD high indicator light
- 4WD low indicator light
- 4WD mode select switch (MSS)
- shift position sensor
- throttle position output (TPO) from the powertrain control module (PCM)
- transmission range sensor
- average front and rear wheel speed signals from the anti-lock brake system

Four-Wheel Drive Systems

Refer to Wiring Diagrams Cell 24 , Engine Controls for schematic and connector information.

Refer to Wiring Diagrams Cell 23 , Engine Controls for schematic and connector information.



Refer to Wiring Diagrams Cell 34 , All-Wheel Drive for schematic and connector information.

Refer to Wiring Diagrams Cell 59 , Generic Electronic Module for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052 or equivalent scan tool
 ST1176-A	Vacuum Pump 014-R1054 or equivalent

Principles of Operation

GC1219-A

The automatic four-wheel drive (A4WD) system is an electronic-shift 4WD system that allows the operator to choose between 2WD and three different 4WD modes. The operator can switch between A4WD and 4WD HIGH modes at any speed. To engage or disengage 4WD LOW range, the vehicle

speed must be less than 5 km/h (3.1 mph), the brake pedal must be pressed and the transmission must be in NEUTRAL.

Wheel slip is sensed using one axle shaft speed sensor on each axle. Based on throttle position and wheel slip, a pulse width modulated (PWM) signal is transmitted to the transfer case clutch when a predetermined slip-threshold is exceeded.

The 4WD control module will provide the IVD brake system with current clutch duty cycle and whether or not IVD may command the clutch duty cycle.

The brake subsystem sends the following information signals to the 4WD system:

- occurrences of brake events and failures (for additional information, refer to Section 206-09.)
- steering wheel angle status (for additional information, refer to Section 206-09.)
- average rear wheel speed (for additional information, refer to Section 206-09.)
- average front wheel speed (for additional information, refer to Section 206-09.)
- delta front wheel speeds (for additional information, refer to Section 206-09.)

A concern with any of the above listed brake system signals will affect operation of the 4WD system.

The throttle position output signal is provided to the 4WD control module from the powertrain control module (PCM). This signal is used by the 4WD control module in controlling the 4WD clutch.

The shift motor sense plate, an integral part of the gearmotor encoder assembly, informs the 4WD control module of the transfer case position.

The digital transmission range (TR) sensor is located on the LH side of the transmission. This sensor informs the 4WD control module when the transmission is in NEUTRAL.

The electric shift motor is mounted externally to the gearmotor encoder assembly at the rear of the transfer case. It drives a rotary cam which moves the mode fork and range fork within the transfer case between the HIGH range (A4WD, 4WD HIGH) and 4WD LOW range positions.

The 4WD shift motor is controlled by the 4WD control module which shifts the transfer case shift motor between HIGH range (A4WD, 4WD HIGH), and 4WD LOW modes.

The solid-state clutch is duty-cycled by the 4WD control module to activate the 4WD clutch within the transfer case.

In the A4WD system, the 4WD control module varies the torque sent to the front driveline by controlling the transfer case clutch. At rest and under cruising conditions, the 4WD control module activates the transfer case clutch a minimum duty cycle (percentage of time the clutch is turned on), which allows for the slight difference between the front and rear driveshafts which normally occurs when negotiating a corner on dry pavement. Under any of the following conditions, the 4WD control module will increase the duty cycle in order to prevent or control slip:

- slip is detected
- heavy acceleration (throttle position)

Feature inputs:

- brake ON/OFF switch
- mode select switch (MSS)
- digital TR sensor (automatic transmission only)

- vehicle speed signal (transmitted from the ABS module)
- front and rear driveshaft speed sensors
- throttle position information (transmitted from the PCM)
- gearmotor encoder contact plate position inputs A, B, C, D

Feature outputs:

- solid state clutch (pulse width modulated signal)
- 4WD LOW indicator
- 4WD shift motor outputs

Shifts between A4WD and 4WD HIGH can be made at any speed. Listed below are the inputs and outputs needed by the 4WD control module to execute a change between any of these modes.

Feature inputs:

- front and rear driveshaft speed sensors
- vehicle speed signal
- throttle position information
- 4WD Mode Select Switch (MSS)

Feature outputs:

- solid state clutch (pulse width modulated signal)
- 4WD HIGH switch indicator

When shifting into or out of LOW range, the 4WD control module requires that the vehicle speed is less than 5 km/h (3 mph), the brake is applied, and the transmission is in NEUTRAL.

Feature inputs:

- throttle position information (transmitted from PCM)
- MSS
- gearmotor encoder contact plate position inputs A, B, C, D
- vehicle speed signal (transmitted from ABS module)
- brake ON/OFF (BOO) switch input (battery voltage when brake pedal is depressed, open circuit when not activated)
- digital TR sensor (ground when transmission is in NEUTRAL, open circuit otherwise)

Feature outputs:

- 4WD shift motor outputs
- 4WD LOW switch indicator
- solid state clutch (pulse width modulated signal)

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Axle shafts and universal joints ● Driveshaft and universal joints ● Fluid leaks ● Matching tire size	● Central junction box (CJB) fuses: ■ 11(10A) ■ 115 (30A) ■ 20 (30A) ● 4WD control module ● Wiring harness ● MSS ● Gearmotor encoder assembly ● Connector(s) ● Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:

- check that the program card is correctly installed.
- check the connections to the vehicle.
- check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:

- CKT930, CKT914, CKT 915 and CKT70= ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
- NO RESP/NOT EQUIP for 4WD control module, go to Pinpoint Test B.
- SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the 4WD control module self-test.

7. If the DTCs retrieved are related to the concern, go to the 4WD Control Module Diagnostic Trouble Code (DTC) Index to continue diagnostics.

4WD Control Module Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1317	Battery Voltage High	4WD	Go To Pinpoint Test B .

		control module	
B1318	Battery Voltage Low	4WD control module	Go To Pinpoint Test B .
B1342	ECU is Defective	4WD control module	CLEAR the DTCs. REPEAT the 4WD control module self-test. If DTC B1342 is retrieved, INSTALL a new 4WD control module. REFER to Four-Wheel Drive (4WD) Control Module in this section. CLEAR the DTCs. REPEAT the self-test.
B2105	Throttle Position Input Out of Range Low	4WD control module	Go To Pinpoint Test A .
B2106	Throttle Position Input Out of Range High	4WD control module	Go To Pinpoint Test A .
C1728	Transfer Case Unable to Transition Between 2H and 4H.	4WD control module	Go To Pinpoint Test C .
C1729	Transfer Case Unable to Transition Between 4WD HIGH and 4WD LOW	4WD control module	Go To Pinpoint Test C .
C1979	IWE Solenoid Circuit Failure	4WD control module	Go To Pinpoint Test A .
C1980	IWE Solenoid Short to Battery	4WD control module	Go To Pinpoint Test A .
P1812	Transmission 4-Wheel Drive Mode Select Circuit Failure	4WD control module	Go To Pinpoint Test A .
P1815	Transmission 4-Wheel Drive Mode Select Short Circuit to Ground	4WD control module	Go To Pinpoint Test A .
P1824	Transmission 4-Wheel Drive Clutch Relay Circuit Failure	4WD control module	Go To Pinpoint Test A .
P1826	Transmission 4-Wheel Drive Low Clutch Relay Short Circuit to Battery	4WD control module	Go To Pinpoint Test A .
P1827	Transmission 4-Wheel Drive Low Clutch Relay Short Circuit to Ground	4WD control module	Go To Pinpoint Test A .
P1849	Transmission Transfer Case Contact Plate A Short Circuit to Ground	4WD control module	Go To Pinpoint Test C .
P1853	Transmission Transfer Case Contact Plate B Short Circuit to Ground	4WD control module	Go To Pinpoint Test C .
P1857	Transmission Transfer Case Contact Plate C Short Circuit to Ground	4WD control module	Go To Pinpoint Test C .
P1861	Transmission Transfer Case Contact Plate D	4WD control	Go To Pinpoint Test C .

	Short Circuit to Ground	module	
P1867	Transmission Transfer Case Contact Plate General Circuit Failure	4WD control module	Go To Pinpoint Test C .
P1874	Transmission Automatic Hall Effect Sensor Power Circuit Failure	4WD control module	Go To Pinpoint Test A .
P1875	Transmission Automatic Hall Effect Sensor Power Circuit Short to Battery	4WD control module	Go To Pinpoint Test A .
P1891	Transmission Transfer Case Contact Plate Ground Return Open Circuit	4WD control module	Go To Pinpoint Test C .
U1900	CAN Communication BUS Fault	4WD control module	Section 418-00 .

U2023	External Node Fault	4WD control module	Section 418-00 .
U2306	Invalid UBP Data From Instrument Cluster (Node 60)	4WD control module	Section 418-00 .
U2226	Invalid UBP Data From PCM (Node 10)	4WD control module	Section 418-00 .
—	For All Other DTCs	4WD control module	REFER to Section 419-10 .

Functional Test — Electronic Shift

PINPOINT TEST A: ELECTRONIC SHIFT FUNCTIONAL TEST

Test Step	Result / Action to Take
CAUTION: The function test must be carried out on a hard surface in a vacant area without traffic.	
A1 CHECK FOR 2WD INDICATED ● Make sure the hublocks are in the AUTO position. ● Start the vehicle and allow to idle. ● Apply the brake pedal and hold. ● For automatic transmission, shift to NEUTRAL. ● Turn the mode select switch (MSS) to 2WD while holding the	**Yes** GO to A3 . **No** GO to A2 .

shift conditions. ● Observe the 4X4 and 4X4 LOW indicators. ● **Are both indicators off?**	
A2 CHECK FOR THE PRESENCE OF 4X4	**Yes** RETRIEVE 4WD Control Module self-test DTCs. If a self-test DTC related to the concern is retrieved, REFER to the 4WD Control Module Diagnostic Trouble Code (DTC) Index in this section. If no DTC is retrieved, REFER to Section 308-07B and REPAIR the transfer case as necessary. **No** If the 4X4 indicator is ON, Go To Pinpoint Test E. If the 4X4 indicator is OFF, GO to A3.
● **CAUTION: Make sure there is a clear area behind the vehicle before backing up.** ● Shift the transmission to REVERSE and back the vehicle up 3 meters (10 feet) to relieve driveline wind-up. ● Drive the vehicle forward for 3 meters (10 feet) and stop. ● Press the brake pedal and hold. ● For automatic transmission, shift to NEUTRAL. ● Execute tight turns on a hard surface. ● Check for the presence of driveline wind-up and tire scuff. ● **Is driveline wind-up and tire scuff present?**	
A3 CHECK INDICATOR PROVE-OUT	**Yes** GO to A4. **No** REPAIR the instrument cluster as necessary. REFER to Section 413-01.
● Key in OFF position. ● turn the ignition switch to start and observe the 4X4 and 4X4 LOW indicators for prove-out. ● **Did the indicators prove out?**	
A4 VERIFY SHIFT TO 4X4	**Yes** GO to A6. **No** GO to A5.
● Turn the MSS to 4X4. ● Listen for relay clicks and gearmotor operation. ● Wait for 20 seconds after the MSS is turned to 4X4. ● **Is the 4X4 indicator ON?**	
A5 ATTEMPT MECHANICAL ASSIST ENGAGEMENT	**Yes** GO to A6. **No** RETRIEVE the 4WD control module self-test DTCs. If a self-test DTC related to the concern is retrieved, REFER to the 4WD Control Module Diagnostic Trouble Code (DTC) Index in this section. If no DTC related to the concern is retrieved, Go To Pinpoint Test D.
● Drive the vehicle above 8 kmh (5 mph) for at least 20 seconds. ● Stop the vehicle. ● Observe the 4X4 indicator. ● **Is the 4X4 indicator on?**	
A6 CHECK FOR MECHANICAL ENGAGEMENT OF 4X4	**Yes** GO to A9. **No** 4X4 did not mechanically engage. RETRIEVE 4WD
● Drive the vehicle for two minutes above 16 kmh (10 mph). ● Execute tight turns on a hard surface. ● Check for the presence of	

driveline wind-up and tire scuff. ● **Is driveline wind-up and tire scuff present?**	control module self-test DTCs. If a self-test DTC related to the concern is retrieved, REFER to the 4WD Control Module Diagnostic Trouble Code (DTC) Index in this section. If no DTC related to the concern is retrieved, GO to A7 .
A7 CHECK FOR FRONT AXLE ENGAGEMENT ● Raise and support the front tires off the ground until they can be spun freely. Refer to Section 100-02 . ● Rotate the left front tire one revolution forward and one revolution backward while observing the left front axle shaft and universal joint. ● Rotate the right front tire one revolution forward and one revolution backward while observing the right front axle shaft and universal joint. ● **Did both front axle shafts rotate?**	**Yes** GO to A8 . **No** Go To Pinpoint Test E .
A8 CHECK FOR FRONT AXLE/DIFFERENTIAL ENGAGEMENT ● Rotate the front driveshaft. ● **Does either front axle shaft turn?**	**Yes** Go To Pinpoint Test B . **No** REPAIR the front differential or axle as necessary. REFER to Section 205-03 .
A9 CHECK FOR CORRECT INDICATOR OPERATION ON 4X4 LOW ENGAGEMENT ● While driving the vehicle forward above 8 kmh (5 mph), turn the MSS to 4X4 LOW while observing the indicators for five seconds. ● Shift the MSS to 4X4. ● Stop the vehicle and apply the parking brake. ● For automatic transmission, shift the transmission to PARK and release the brake pedal. ● **Did the 4X4 LOW indicator stay off?**	**Yes** GO to A10 . **No** RETRIEVE 4WD control module self-test DTCs. If a self-test DTC related to the concern is retrieved, REFER to the 4WD Control Module Diagnostic Trouble Code (DTC) Index in this section. If no DTC related to the concern is retrieved, refer to Section 413-01 .
A10 CHECK THE 4X4 LOW INDICATOR ON IN ERROR ● Turn the MSS to 4X4 LOW. ● Apply and hold the brake pedal. ● **Is the 4X4 LOW indicator OFF?**	**Yes** GO to A11 . **No** RETRIEVE 4WD control module self-test DTCs. If a self-test DTC related to the concern is retrieved, REFER to the 4WD Control Module Diagnostic Trouble Code (DTC) Index in this section. If no DTC related to the concern is retrieved, refer to Section 413-01 .

A11 CHECK THE 4X4 LOW INDICATOR FOR ON IN 4X4 LOW • For automatic transmission, shift the transmission to NEUTRAL. • Listen for relay clicks and gearmotor operation. • Hold the shift conditions for 20 seconds. • **Is the 4X4 LOW indicator ON?**	**Yes** GO to A13 . **No** GO to A12 .
A12 ATTEMPT MECHANICAL ASSIST OF 4X4 LOW ENGAGEMENT •  **CAUTION: Make sure there is a clear area behind the vehicle before backing up.** • Shift the transmission to REVERSE and back the vehicle up 3 meters (10 feet) to relieve driveline wind-up and stop. • Drive the vehicle forward for 3 meters (10 feet) and stop. • Apply the brake pedal and hold. • For automatic transmission, shift to NEUTRAL. • Observe the 4X4 LOW indicator. • **Is the 4X4 LOW indicator ON?**	**Yes** GO to A13 . **No** RETRIEVE 4WD control module self-test DTCs. If a self-test DTC related to the concern is retrieved, REFER to the 4WD Control Module Diagnostic Trouble Code (DTC) Index in this section. If no DTC related to the concern is retrieved, Go To Pinpoint Test D .
A13 CHECK FOR MECHANICAL ENGAGEMENT OF 4X4 LOW • **NOTE:** Driveline wind-up and tire scuff is present in both 4X4 and 4X4 LOW. However, vehicle speed is severely limited in 4X4 LOW. • Execute tight turns on a hard surface. • Check for the presence of driveline wind-up, tire scuff and reduced vehicle speed. • **Is driveline eind-up, tire scuff and reduced speed present?**	**Yes** GO to A14 . **No** 4X4 LOW did not mechanically engage. RETRIEVE 4WD control module self-test DTCs. If self-test DTC related to the concern is retrieved, REFER to the 4WD Control Module Diagnostic Trouble Code (DTC) Index in this section. If no DTC related to the concern is retrieved, Go To Pinpoint Test D .
A14 CHECK FOR CORRECT INDICATOR OPERATION ON 4X4 LOW DISENGAGEMENT • While driving the vehicle forward above 8 km/h (5 mph), turn the MSS to 4X4 while observing the indicators. • Turn the MSS to 4X4 LOW. • Stop the vehicle and apply the parking brake. • For automatic transmission, shift to PARK and release the brake pedal. • **Is the 4X4 LOW indicator ON?**	**Yes** GO to A15 . **No** RETRIEVE 4WD control module self-test DTCs. If a self-test DTC related to the concern is retrieved, REFER to the 4WD Control Module Diagnostic Trouble Code (DTC) Index in this section. If no DTC related to the concern is retrieved, Go To Pinpoint Test D .
A15 CHECK THE 4X4 LOW INDICATOR • Turn the MSS to 4X4. • Apply and hold the brake pedal.	**Yes** GO to A16 .

• **Is the 4X4 Low indicator ON?**	**No** RETRIEVE 4WD control module self-test DTCs. If a self-test DTC related to the concern is retrieved, REFER to the 4WD Control Module Diagnostic Trouble Code (DTC) Index in this section. If no DTC related to the concern is retrieved, REFER to Section 413-01 .
A16 CHECK FOR 4X4 LOW INDICATOR OFF IN 4X4 • Press and hold the brake pedal. • For automatic transmission, shift the transmission to NEUTRAL. • Listen for relay clicks and gearmotor operation. • Hold the shift conditions for 20 seconds. (The system will use up to five cycles of shift attempts trying to engage 4X4.) • **Is the 4X4 LOW indicator OFF?**	**Yes** GO to A18 . **No** GO to A17 .
A17 ATTEMPT MECHANICAL ASSIST OF 4X4 LOW DISENGAGEMENT • Drive the vehicle forward above 8 kmh (5 mph) for at least five seconds. • Stop the vehicle. • Apply the brake pedal and hold. • For automatic transmission, shift to NUETRAL. • Observe the 4X4 LOW indicator. • **Is the 4X4 LOW indicator OFF?**	**Yes** GO to A18 . **No** RETRIEVE 4WD control module self-test DTCs. If a self-test DTC related to the concern is retrieved, REFER to the 4WD Control Module Diagnostic Trouble Code (DTC) Index in this section. If no DTC related to the concern is retrieved, REFER to Section 413-01 .
A18 CHECK FOR MECHANICAL 4X4 LOW DISENGAGEMENT AND 4X4 ENGAGEMENT • Apply the brake. • **CAUTION: Make sure there is a clear area behind the vehicle before backing up.** • Shift the transmission to REVERSE and back the vehicle up 3 meters (10 feet) to relieve driveline wind-up. • Stop the vehicle. • Drive the vehicle forward and execute tight turns on a hard surface. • **NOTE:** Driveline wind-up and tire scuff are present in both 4X4 and 4X4 LOW. However, vehicle speed is severely limited in 4X4 LOW. • Verify the presence of driveline wind-up and tire scuff. Also verify the increased vehicle speed from when 4X4 LOW was engaged. • **Did 4X4 engage and the vehicle speed increase?**	**Yes** GO to A19 . **No** 4X4 LOW is mechanically bound or locked. REPAIR the transfer case as necessary. REFER to Section 308-07B .

A19 CHECK THE 4X4 TO 2WD SHIFT • Stop the vehicle. • Turn the MSS to 2WD and wait 20 seconds. • Listen for relay clicks and gearmotor operation. • **Are the 4X4 and 4X4 LOW indicators OFF?**	**Yes** GO to A21 . **No** GO to A20 .
A20 ATTEMPT MECHANICAL ASSIST OF 4X4 DISENGAGEMENT • Drive the vehicle forward above 8 kmh (5 mph) for at least 20 seconds. • Stop the vehicle. • Observe the 4X4 and 4X4 LOW indicators. • **Are the 4X4 and 4X4 LOW indicators OFF?**	**Yes** GO to A21 . **No** RETRIEVE 4WD control module self-test DTCs. If a self-test DTC related to the concern is retrieved, REFER to the 4WD Control Module Diagnostic Trouble Code (DTC) Index in this section. If no DTC related to the concern is retrieved, GO to A22 .
A21 VERIFY THE HUBLOCKS DISENGAGE • Raise and support the front tires off the ground until they can be spun freely. Refer to Section 100-02 . • Rotate the left front tire one revolution forward and one revolution backward, while observing the left front axle shaft and universal joint. • Rotate the right front tire one revolution forward and one revolution backward, while observing the right front axle shaft and universal joint. • **Did either axle shaft rotate?**	**Yes** Go To Pinpoint Test E . **No** GO to A22 .
A22 VERIFY THE TRANSFER CASE MECHANICALLY DISENGAGED • Apply the parking brake. • Rotate the front driveshaft. • **Does the front driveshaft turn?**	**Yes** GO to A23 . **No** The transfer case did not disengage from 4X4. REPAIR the transfer case as necessary. REFER to Section 308-07B .
A23 VERIFY THE HUBLOCKS WILL LOCK MANUALLY • Turn the MSS to 4X4. • Rotate the left front tire one revolution forward and one revolution backward while observing the left front axle shaft and universal joint. • Rotate the right front tire one revolution forward and one revolution backward while observing the right front axle shaft and universal joint.	**Yes** GO to A24 . **No** Go To Pinpoint Test E .

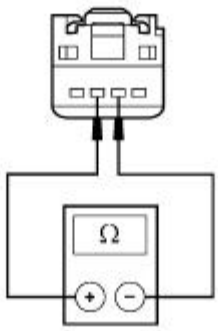
• **Do both axles rotate?**	
A24 VERIFY THE HUBLOCKS WILL UNLOCK MANUALLY • Turn the MSS to 2WD. • Rotate the left front tire one revolution forward and one revolution backward while observing the left front axle shaft and universal joint. • Rotate the right front tire one revolution forward and one revolution backward while observing the right front axle shaft and universal joint. • **Does either axle rotate?**	**Yes** INSTALL a new hublock. REFER to Hublock in this section. **No** The transfer case is operating correctly. INSTRUCT the customer on correct system operation.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The vehicle does not operate correctly in A4WD and 4WD HIGH modes	• Central junction box (CJB) fuses: ■ 11 (10A). ■ 115 (30A). ■ 20 (30A). • Mode select switch (MSS). • Transfer case shaft speed sensors. • Transfer case electric clutch. • 4WD control module. • Powertrain control module (PCM). • IVD. • IWE solenoid. • Circuitry.	• Go To Pinpoint Test B .
• No communication with the 4WD control module	• Central junction box (CJB) fuses: ■ 115 (30A). ■ 20 (30A). • 4WD control module. • 4WD control module connectors. • Circuitry.	• Go To Pinpoint Test C .
• The vehicle does not shift between 4X4AUTO/4WD HIGH and 4WD LOW modes correctly	• Central junction box (CJB) fuses: ■ 11 (10A). ■ 115 (30A). ■ 20 (30A). • Mode select switch (MSS). • Gearmotor encoder contact plate A, B, C, or D. • Gearmotor encoder assembly. • Circuitry.	• Go To Pinpoint Test D .

	• 4WD control module. • Transfer case internal mechanism. • Transfer case shift motor. • Digital TR sensor. • BPP switch. • IVD. • IWE solenoid. • 4WABS control module. • Instrument cluster. • PCM.	

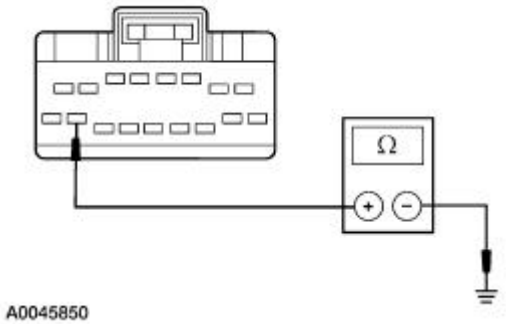


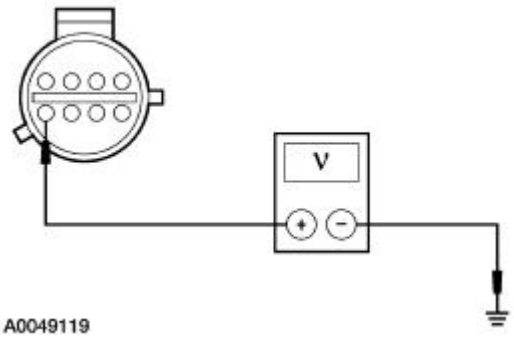
Pinpoint Tests

PINPOINT TEST B: THE VEHICLE DOES NOT OPERATE CORRECTLY IN A4WD AND 4WD HIGH MODES

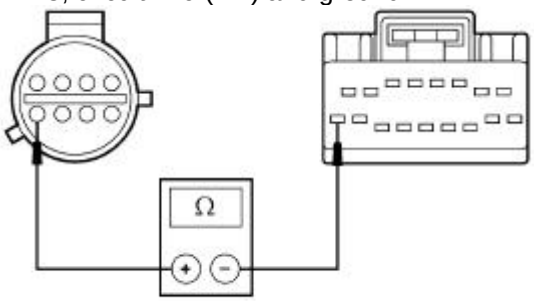
Test Step	Result / Action to Take
B1 CHECK INDICATOR PROVE-OUT	
• Key in OFF position. • Start the vehicle while observing the 4WD indicators for prove out. • **Did indicators prove out?**	**Yes** GO to B3 . **No** GO to B2 .
B2 CHECK FOUR-WHEEL DRIVE (4WD) CONTROL MODULE COMMUNICATION	
• Key in ON position. • Connect the diagnostic tool. • Retrieve the 4WD control module self-test DTCs. • **Did the 4WD control module respond?**	**Yes** REPAIR the instrument cluster as necessary. REFER to Section 413-01 . **No** Go To Pinpoint Test C .
B3 CHECK FOR A4WD SYSTEM ERROR	
• Turn the vehicle off and restart the vehicle. • **Is the 4WD HIGH indicator flashing several times?**	**Yes** GO to B13 . **No** GO to B4 .
B4 CHECK FOR THE PRESENCE OF 4WD	
• Select 4 HIGH on the mode select switch (MSS). • Execute tight turns on a hard surface. • Check for the presence of driveline windup and tire scuff. • **Are driveline windup and tire scuff present with 4X4 HIGH indicator on?**	**Yes** GO to B5 . **No** GO to B21 .
B5 REVIEW THE FOUR-WHEEL DRIVE (4WD) CONTROL DIAGNOSTIC TROUBLE CODES	
• CARRY OUT the 4WD control module self-test. • **Are any DTCs retrieved?**	**Yes** If DTC B1317 or B1318 is retrieved,

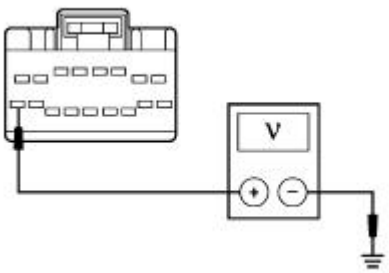
	Go To Pinpoint Test C . If DTC C1728, C1729, P1849, P1853, P1857, P1861, P1867 or P1891 is retrieved, Go To Pinpoint Test D . If DTC B2105 or B2106 or both are retrieved,GO to B19 . If DTC C1979 or C1980 or both is retreived, GO to B22 . If DTC P1824, P1826 or P1827 is retrieved, GO to B14 . **No** GO to B6 .
B6 CHECK THE 4WD MODE SELECT SWITCH IN THE 2WD POSITION (MONITOR THE PID 4WD_SW) ● Monitor the PID 4WD_SW. ● Select 2WD on the 4WD MSS. ● **Does the PID 4WD_SW indicate 2WD?**	**Yes** GO to B7 . **No** GO to B10 .
B7 CHECK THE 4WD MODE SELECT SWITCH IN THE A4WD POSITION (MONITOR THE PID 4WD_SW) ● Monitor the PID 4WD_SW. ● Select A4WD on the 4WD MSS. ● **Does the PID 4WD_SW indicate A4WD?**	**Yes** GO to B8 . **No** GO to B10 .
B8 CHECK THE 4WD MODE SELECT SWITCH IN THE 4WD HIGH POSITION (MONITOR THE PID 4WD_SW) ● Monitor the PID 4WD_SW. ● Select 4WD HIGH on the 4WD MSS. ● **Does the PID 4WD_SW indicate 4WD HIGH?**	**Yes** GO to B9 . **No** GO to B10 .
B9 CHECK THE 4WD MODE SELECT SWITCH IN THE 4WD LOW POSITION (MONITOR THE PID 4WD_SW) ● Monitor the PID 4WD_SW. ● Select 4WD LOW on the 4WD MSS. ● **Does the PID 4WD_SW indicate 4WD LOW?**	**Yes** GO to B12 . **No** GO to B10 .
B10 CHECK THE MODE SELECT (MSS) SWITCH ● Key in OFF position. ● Disconnect: Mode Select Switch (MSS) C284. ● Rotate the MSS to the A4WD, 4H, and 4L positions. ● Measure the resistance between MSS terminals 2 and 3 while rotating the switch through all positions; refer to the following chart. **Mode Select Switch (MSS) Position** / **Resistance Range** A4WD / 264.33 - 269.67 4WD HIGH / 128.7 - 131.3 4WD LOW / 61.38 - 62.62	**Yes** GO to B11 . **No** INSTALL a new MSS. CLEAR the DTCs. TEST the system for normal operation.

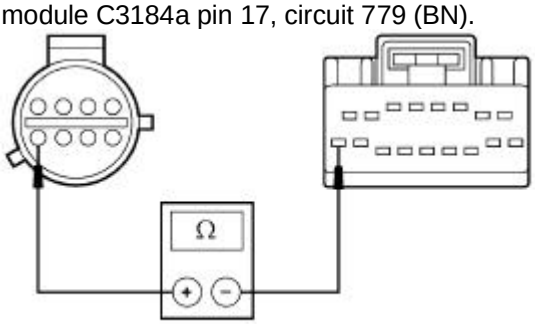


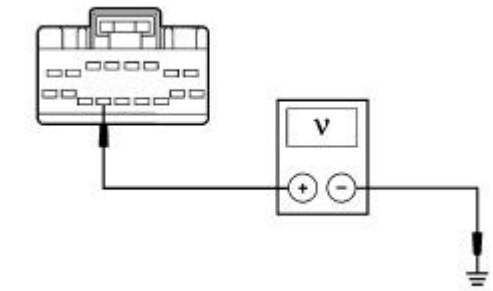


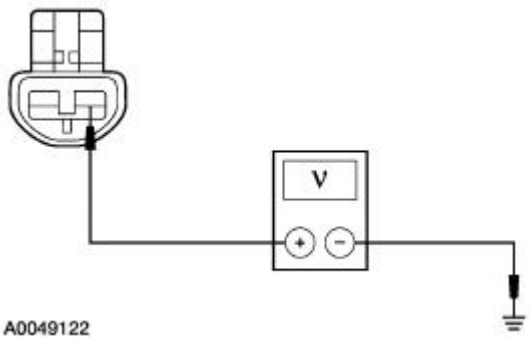
2WD HIGH	616.9 - 623.1

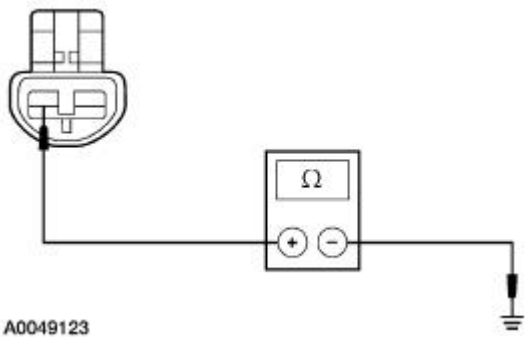




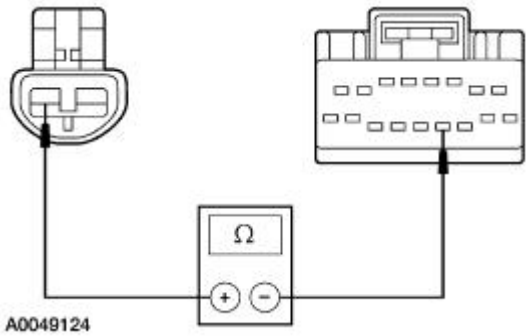








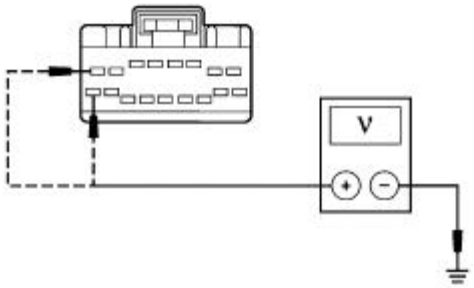
A0049121



- **Are the resistances within specification?**

B11 CHECK CIRCUIT 682 (DB) FOR AN OPEN	
• Key in OFF position. • Disconnect: Mode Select Switch C284. • Disconnect: 4WD Module C3184b. • Measure the resistance between MSS C284 pin 2, circuit 682 (DB) and 4WD control module C4184b pin 10, circuit 682 (DB).  A0049118 • **Is the resistance less than 5 ohms?**	**Yes** GO to B12 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B12 CHECK CIRCUIT 780 (DB) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between 4WD control module C3184b, pin 16, circuit 780 (DB) and ground.  A0045849 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to B13 .
B13 CHECK CIRCUIT 780 (DB) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between 4WD control module C3184b, pin 16, circuit 780 (DB) and ground.	**Yes** GO to B14 . **No**

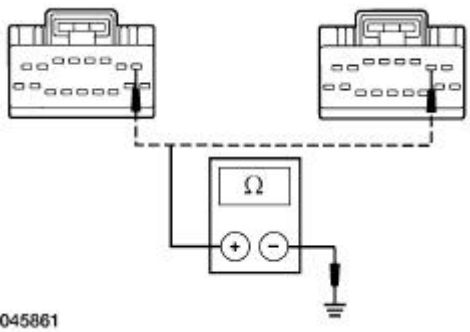
 A0045850 ● **Is the resistance greater than 10,000 ohms?**	REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B14 CHECK THE ELECTRIC CLUTCH—ENERGIZED ● Connect: 4WD Control Module C3184a. ● Connect: 4WD Control Module C3184b. ● Key in ON position. ● Select NEUTRAL. ● Select 4WD HIGH on the MSS. ● Raise and support the vehicle; refer to Section 100-02 . ● Connect the diagnostic tool. ● Trigger the electric clutch control output command (CLUTCHSOL). Set the command to 100 percent. ● Rotate the front driveshaft. ● **Does the front driveshaft lock to the rear?**	**Yes** GO to B15 . **No** GO to B16 .
B15 CHECK THE ELECTRIC CLUTCH—NOT ENERGIZED ● Connect the diagnostic tool. ● Trigger the electric clutch control output command (CLUTCHSOL). Set the command to zero percent. ● Rotate the front driveshaft. ● **Does the front driveshaft lock to the rear?**	**Yes** GO to B17 . **No** GO to Section 206-09.
B16 CHECK THE VOLTAGE TO THE ELECTRIC CLUTCH— ENERGIZED ● Key in OFF position. ● Disconnect: Transfer Case C350. ● Key in ON position. ● Trigger the electric clutch control output command (CLUTCHSOL). Set the command to 100 percent. ● Measure the voltage between transfer case C350 pin 8, circuit 779 (BN) and ground.  A0049119 ● **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new electric clutch. REFER to Section 308-07B . CLEAR the DTCs. TEST the system for normal operation. **No** GO to B19 .
B17 CHECK THE VOLTAGE TO THE ELECTRIC CLUTCH—NOT ENERGIZED ● Key in OFF position. ● Disconnect: Transfer Case C350.	**Yes** INSTALL a new electric clutch.



• Key in ON position. • Measure the voltage between transfer case C350 Pin 8, circuit 779 (BN) and ground.  A0049120 • **Is the voltage zero volts?**	REFER to Section 308-07B . CLEAR the DTCs. TEST the system for normal operation. **No** GO to B18 .
B18 CHECK CIRCUIT 779 (BN) FOR SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: 4WD Control Module C3184a. • Key in ON position. • Measure the voltage between 4WD control module C3184a pin 17, circuit 779 (BN), harness side and ground.  A0045851 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to B19 .
B19 CHECK CIRCUIT 779 (BN) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between transfer case C350 pin 8, circuit 779 (BN) and 4WD control module C3184a pin 17, circuit 779 (BN).  A0049120 • **Is the resistance less than 5 ohms?**	**Yes** GO to B20 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
B20 CHECK THE THROTTLE POSITION INPUT—MONITOR THE 4WD PID TPI	
• Key in ON position. • Monitor the PID: TPI while pressing and releasing the accelerator pedal. • **Does the PID: TPI increase when the**	**Yes** DISCONNECT 4WD control module connector C3184b and the PCM connector C1752. INSPECT circuit

accelerator pedal is pressed and decrease when the accelerator pedal is released?	1498 (PK/OG) for signs of corrosion or damage. If OK, RECONNECT the connectors making sure they seat correctly. CLEAR the DTCs. TEST the system for normal operation. **No** GO to B21 .
B21 CHECK CIRCUIT 1498 (PK/OG) FOR A SHORT TO VOLTAGE ● Key in ON position. ● Measure the voltage between 4WD control module C3184b pin 14, circuit 1498 (PK/OG), harness side and ground.  A0045859 ● **Is any voltage indicated?**	**Yes** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation. **No** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
B22 CHECK CIRCUIT 474 (OG/LG) FOR OPEN ● Disconnect: IWE Solenoid C1157. ● Measure the voltage between IWE solenoid C1157 pin 1, circuit 474 (OG/LG) and ground.  A0049122 ● **Is the voltage greater than 10 volts?**	**Yes** GO to B23 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
B23 CHECK CIRCUIT 605 (RD) FOR SHORT TO GROUND ● Measure the resistance between IWE solenoid C1157 pin 2, circuit 605 (RD) and ground.  A0049123 ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B24 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.

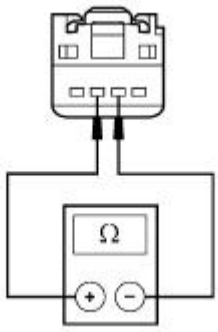
B24 CHECK CIRCUIT 605 (RD) FOR OPEN	
• Disconnect: 4WD Control Module C3184b. • Measure the resistance between IWE solenoid C1157 pin 2, circuit 605 (RD) and 4WD control module C3184b pin 12, circuit 605 (RD).  • **Is the resistance less than 5 ohms?**	**Yes** GO to B25 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
B25 CHECK IWE SOLENOID	
• Carry out the IWE solenoid component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the IWE solenoid pass the component tests?**	**Yes** GO to B26 . **No** INSTALL a new IWE solenoid. CLEAR the DTCs. TEST the system for normal operation.
B26 CHECK FOR CORRECT 4WD CONTROL MODULE OPERATION	
• Disconnect all 4WD control module connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all 4WD control module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4WD control module. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.



PINPOINT TEST C: NO COMMUNICATION WITH THE FOUR-WHEEL DRIVE (4WD) CONTROL MODULE

Test Step	Result / Action to Take
C1 CHECK POWER TO 4WD CONTROL MODULE	
• Key in OFF position. • Disconnect: 4WD Control Module C3184b. • Key in ON position. • Measure the voltage between 4WD control module and ground. Refer to the following chart: **4WD Control Module Pin** / **Circuit** C3184b pin 8 / 1524 (DB) C3184b pin 17 / 704 (DG/LG)	**Yes** GO to C2 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.

A0045860



- **Are all of the voltage measurements greater than 10 volts?**

C2 CHECK 4WD CONTROL MODULE GROUND CIRCUITS	
• Key in OFF position. • Disconnect: 4WD Control Module C3184a. • Disconnect: 4WD Control Module C3184b. • Measure the resistance between 4WD control module C3184a, pin 1, circuit 57 (BK), harness side and ground; and between 4WD control module C3184b, pin 2, circuit 875 (BK/LB), harness side and ground.  A0045861 • **Are both resistance less than 5 ohms?**	**Yes** GO to C3 . **No** REPAIR the circuit. TEST the system for normal operation.
C3 CHECK FOR CORRECT 4WD CONTROL MODULE OPERATION	
• Disconnect all 4WD control module connectors (C3184a and C3184b), and the transfer case connector (C350). • Check for: • corrosion • pushed-out pins • Connect all 4WD control module connectors and the transfer case connector and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4WD control module. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST D: THE VEHICLE DOES NOT SHIFT BETWEEN AUTO/4WD HIGH AND 4WD LOW MODES CORRECTLY

Test Step	Result / Action to Take

D1 REVIEW THE FOUR-WHEEL DRIVE (4WD) CONTROL DIAGNOSTIC TROUBLE CODES	
• Connect the diagnostic tool. • CARRY OUT the 4WD control module self-test. • **Are any DTCs retrieved?**	**Yes** If DTC B2105, B2106, C1979 or C1980 are retrieved, Go To Pinpoint Test B. IF DTC U1900, U1950, U2023, U2306 or U2226 is retrieved, REFER to Section 418-00. For all other DTCs, GO to D2. **No** GO to D2.
D2 CHECK THE DIGITAL TRANSMISSION RANGE (TR) SENSOR	
• CARRY OUT the instrument cluster module self-test. • **Are any DTCs retrieved?**	**Yes** Section 413-01. **No** GO to D3.
D3 CHECK BRAKE PEDAL SWITCH PID	
• Monitor the ABS module brake input switch status PID. • Step on the brake pedal. • **Does the brake input switch status PID indicate active?**	**Yes** GO to D4. **No** REFER to Section 206-09.
D4 CHECK WHEEL SPEED SENSOR INPUTS	
• Monitor the ABS module wheel speed sensor inputs. • **Do the wheel speed sensor inputs indicate 0 kph (0 mph)?**	**Yes** GO to D5. **No** REFER to Section 206-09.
D5 CHECK THE MODE SELECT SWITCH (MSS)—MONITOR THE 4WD CONTROL MODULE PID 4WD_SW	
• Key in ON position. • Monitor the 4WD control module PID: 4WD_SW while selecting each of the positions on the mode select switch (MSS). • **Do the 4WD control module PID values agree with the MSS positions?**	**Yes** GO to D7. **No** GO to D6.
D6 CHECK THE MSS — ALL POSITIONS	
• Disconnect: MSS C284. • Measure the resistance between MSS terminals 2 and 3 while rotating the switch through all positions. Refer to the following chart: **MSS Position** / **Resistance** A4WD: 264.33 - 269.67 4WD HIGH: 128.7 - 131.3 4WD LOW: 61.38 - 62.62 2WD HIGH: 616.9 - 623.1	**Yes** GO to D7. **No** INSTALL a new MSS. REFER to Mode Select Switch (MSS) in this section. CLEAR the DTCs. REPEAT the self-test.

- **Are all the resistances within the specified values?**

D7 CHECK FOR CORRECT 4WD CONTROL MODULE OPERATION

- Key in OFF position.
- Disconnect both 4WD control module connectors (C3184a and C3184b) and the transfer case connector (C350).
- Check for:
  - corrosion
  - pushed-out pins
- Connect both 4WD control module connectors (C3184a and C3184b) and the transfer case connector (C350), making sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
GO to D8 .

No
The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

D8 CHECK THE CONTACT PLATE ENCODER SWITCH

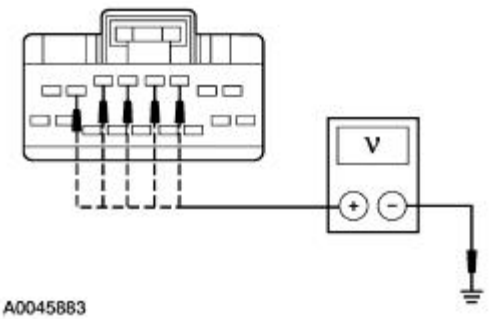
- Place the transmission range selector lever in NEUTRAL (for manual transmission, press and hold the clutch pedal).
- Press and hold the brake pedal.
- Monitor mode select switch (MSS) PID.
- Monitor the contact plate PIDs: PLATE_A, PLATE_B, PLATE _C and PLATE_D.
- **NOTE:** The contact plate PIDs can only be read for approximately two seconds. To continue reading, cycle the MSS again.
- Cycle the MSS to A4WD and 4WD LOW two times.
- Compare the contact plate PID values for each shift position selected by the MSS. Refer to the following chart:

Plate PID	MSS PID A4WD	MSS PID 4WD LOW
PLATE_A	CLOSED	OPEN
PLATE_B	OPEN	CLOSED
PLATE_C	CLOSED	OPEN
PLATE_D	CLOSED	CLOSED

- **Do the contact plate PID values agree with the MSS PIDs?**

Yes
GO to D15 .

No
GO to D9 .



D9 CHECK CIRCUIT 762 (YE/WH), CIRCUIT 763 (OG/WH), CIRCUIT 764 (BN/WH), CIRCUIT 770 (WH), AND CIRCUIT 771 (VT/YE) FOR A SHORT TO VOLTAGE

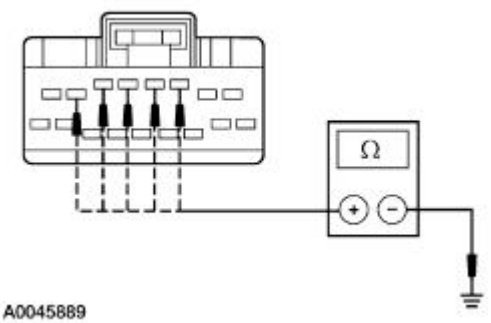
- Key in OFF position.
- Disconnect: 4WD Control Module C3184a.
- Key in ON position.
- Measure the voltage between the following circuits at the 4WD control module connector pins and ground:

Yes
REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self-test.

No

Circuit	4WD Control Module Connector and Pins
762 (YE/WH)	C3184a pin 3
763 (OG/WH)	C3184a pin 4
764 (BN/WH)	C3184a pin 5
770 (WH)	C3184a pin 6
771 (VT/YE)	C3184a pin 7

A0045883



- **Is any voltage present?**

GO to D10 .

D10 CHECK CIRCUIT 762 (YE/WH), CIRCUIT 763 (OG/WH), CIRCUIT 764 (BN/WH), CIRCUIT 770 (WH), AND CIRCUIT 771 (VT/YE) FOR A SHORT TO GROUND

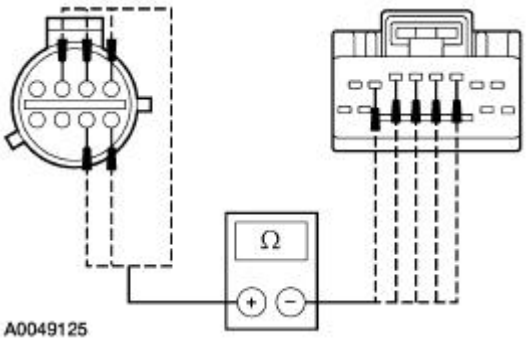
- Key in OFF position.
- Disconnect: Transfer Case C350.
- Measure the resistance between the following circuits at the 4WD control module connector pins and ground:

Circuit	4WD Control Module Connector and Pins
762 (YE/WH)	C3184a pin 3
763 (OG/WH)	C3184a pin 4
764 (BN/WH)	C3184a pin 5
770 (WH)	C3184a pin 6
771 (VT/YE)	C3184a pin 7

A0045889

- **Are the resistances all over 10,000 ohms?**

Yes
GO to D11 .



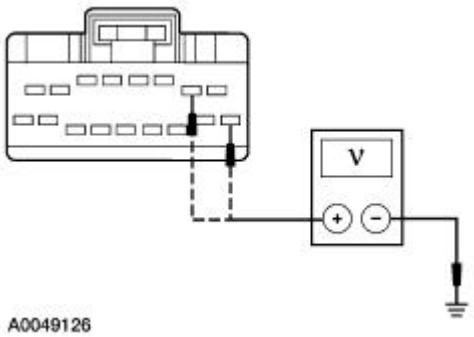
No
REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self-test.

D11 CHECK CIRCUIT 762 (YE/WH), CIRCUIT 763 (OG/WH),

CIRCUIT 764 (BN/WH), CIRCUIT 770 (WH), AND CIRCUIT 771 (VT/YE) FOR AN OPEN

- Measure the resistance of the following circuits at the 4WD control module connector pins and transfer case connector pins shown.

Circuit	4WD Control Module Connector and Pins	Transfer Case Connector and Pins
762 (YE/WH)	C3184a pin 3	C350 pin 6
763 (OG/WH)	C3184a pin 4	C350 pin 3
764 (BN/WH)	C3184a pin 5	C350 pin 2
770 (WH)	C3184a pin 6	C350 pin 1
771 (VT/YE)	C3184a pin 7	C350 pin 5



- **Are all the resistances less than 5 ohms?**

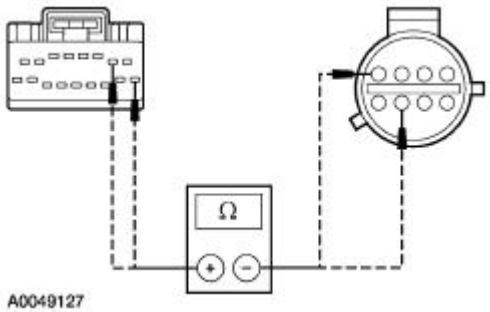
Yes
GO to D12 .

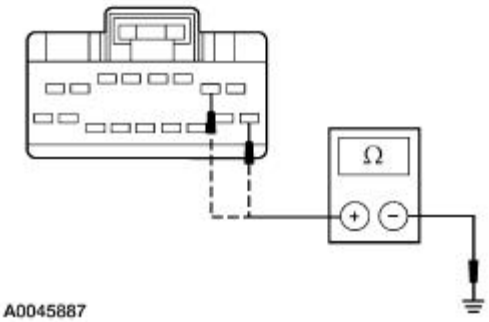
No
REPAIR the circuit or circuit (s) in question. CLEAR the DTCs. REPEAT the self-test.

D12 CHECK CIRCUIT 777 (YE) AND CIRCUIT 778 (OG) FOR A SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between 4WD control module C3184a, pin 9, circuit 777 (YE), harness side and ground; and between 4WD control module C3184a, pin 2, circuit 778 (OG), harness side and ground.

- **Is any voltage present?**



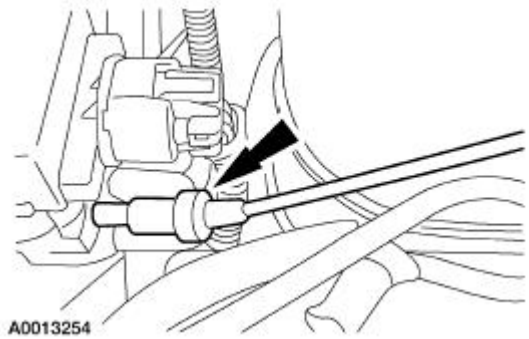


Yes
REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.

No
GO to D13 .

D13 CHECK CIRCUIT 777 (YE) AND CIRCUIT 778 (OG) FOR AN OPEN

- Measure the resistance between 4WD control module C3184a, pin 9, circuit 777 (YE), harness side and transfer case C350, pin 4, circuit 777 (YE), harness side; and



Yes
GO to D14 .

between 4WD control module C3184a, pin 2, circuit 778 (OG), harness side and transfer case C350, pin 7, circuit 778 (OG), harness side.  • **Are the resistances less than 5 ohms?**	**No** REPAIR the suspect circuit. CLEAR the DTCs. REPEAT the self-test.
D14 CHECK CIRCUIT 777 (YE) AND CIRCUIT 778 (OG) FOR A SHORT TO GROUND	
• Measure the resistance between 4WD control module C3184a, pin 9, circuit 777 (YE), harness side and ground; and between 4WD control module C3184a, pin 2, circuit 778 (OG), harness side and ground.  • **Are the resistances more than 10,000 ohms?**	**Yes** GO to D15 . **No** REPAIR the suspect circuit. CLEAR the DTCs. REPEAT the self-test.
D15 CHECK THE TRANSFER CASE	
• Key in OFF position. • Release the parking brake. • Using a wrench, manually shift the transfer case sector shaft to the full clockwise (AUTO) direction while turning the rear driveshaft. • Apply the parking brake. • Rotate the front driveshaft. • **Does the front driveshaft turn?**	**Yes** GO to D16 . **No** REPAIR the transfer case as necessary. REFER to Section 308-07B . TEST the system for normal operation.
D16 CHECK THE SECTOR SHAFT TURNING EFFORT	
NOTE: The transfer case has three detented shift positions. The full clockwise position is AUTO and the full counterclockwise position is 4WD LOW. Normal operation should not take more than 45 Nm (33 lb-ft) to manually shift the transfer case. • Release the parking brake. • Using a torque wrench, manually shift the transfer case sector shaft in a counterclockwise direction to the 4WD HIGH detent position while rotating the rear driveshaft. • **Did the torque required to shift exceed 45 Nm (33 lb-ft)?**	**Yes** REPAIR the transfer case as necessary. REFER to Section 308-07B . TEST the system for normal operation. **No** GO to D17 .
D17 CHECK THE TRANSFER CASE SHIFT TO 4WD HIGH AND 4WD LOW	
• Apply the parking brake. • Rotate the front driveshaft.	**Yes** REPAIR the transfer case

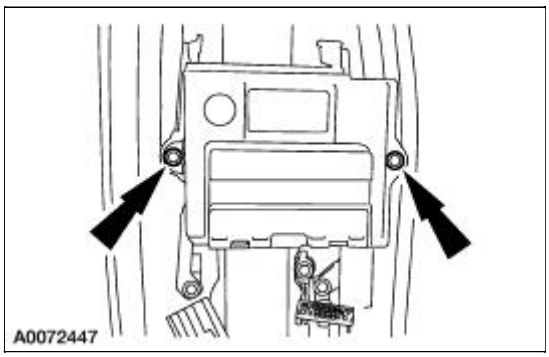
• **Does the front driveshaft rotate?**	as necessary. REFER to Section 308-07B . **No** INSTALL a new gearmotor encoder assembly. REFER to Gearmotor Encoder Assembly in this section. CLEAR the DTCs. REPEAT the self-test. If still inoperative, INSTALL a new 4WD control module. REFER to Four-Wheel Drive (4WD) Control Module in this section. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST E: THE FRONT AXLE DOES NOT ENGAGE CORRECTLY

Test Step	Result / Action to Take
E1 CHECK THE HUBLOCKS DISENGAGEMENT	**Yes** GO to E2 . **No** Go To Pinpoint Test D .
• Lift and support the vehicle off the ground until the front tires can be spun freely. Refer to Section 100-02 . • **NOTE:** The engine is required to be at idle during the following steps to supply the vaccum required for the hublocks to engage and disengage. • • Start engine and allow to idle. • Place the shift selector into 2H mode. • Spin the tires. • **Are the hub locks engaged?**	
E2 CHECK FOR GROSS VACCUM LEAK	**Yes** REPAIR or INSTALL a new vacuum supply hose or vacuum reservior as necessary. REFER to Section 412-00 . **No** GO to E3 .
• Set the heater control to FLOOR. • Check heat output at defroster vents. • **Is the heater mode selector stuck at DEFROST?**	
E3 CHECK FOR VACUUM LEAK IN FRONT AXLE HUB LOCK SYSTEM	**Yes** GO to E4 . **No** GO to E7 .
• Disconnect the vacuum line at the IWE solenoid (located on the firewall behind the battery).	

 A0013254 ● Connect the vacuum pump to the vacuum supply line. ● Apply a vaccum of 20 inches of mercury to the hublock vacuum for 30 seconds. ● **Is a vacuum leak greater than 25 mm (1 in) Hg/minutes indicated?**	
E4 CHECK FOR VACUUM LEAK IN RIGHT FRONT AXLE HUBLOCK	
● Disconnect and plug the vacuum line at the RF hublock. ● Apply a vacuum of 20 inches of mercury directly to RF hublock assembly. ● Monitor the hublock vacuum for 30 seconds. ● **Does the RF hublock leak down at a rate less than 1 inHg/minute?**	**Yes** GO to E5 . **No** INSTALL a new hublock. REFER to Section 205-03 .
E5 CHECK FOR VACUUM LEAK IN LEFT FRONT AXLE HUBLOCK	
● Disconnect and plug the vacuum line at the LF hublock. ● Apply a vacuum of 20 inches of mercury directly to the LF hublock. ● Monitor the system vacuum for 30 seconds. ● **Does the LF hublock leak down at a rate less than 1 inHg/minute?**	**Yes** GO to E6 . **No** INSTALL a new hublock. REFER to Section 205-03 .
E6 CHECK FOR VACUUM LEAK IN VACUUM LINES	
● Connect the vacuum pump to the vacuum supply line. Cap off the vacuum delivery line at both actuators. ● Apply a vacuum of 20 inches of mercury to the hublock vacuum system. ● Monitor the system vacuum for 30 seconds. ● **Is a vacuum leak greater than 1 inHg/minute indicated?**	**Yes** REPAIR or INSTALL a new vacuum supply hose or tube as necessary. **No** GO to E7 .
E7 CHECK FOR CORRECT FOUR-WHEEL DRIVE CONTROL MODULE OPERATION	
● Key off. ● Disconnect all four-wheel drive control module connectors (C3184a and C3184b) and the transfer case connector (C350). ● Check for: ● corrosion ● pushed-out pins ● Connect all four-wheel drive control module connectors (C3184a and C3184b) and the transfer case connector (C350), and make sure that they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new four-wheel drive control module. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Four-Wheel Drive (4WD) Control Module



Removal

CAUTION: Prior to removal of the four-wheel drive (4WD) control module, it is necessary to upload module configuration information to a diagnostic tool. This information needs to be downloaded into the new module once installed. For additional information, refer to Section 418-01 .

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the LH B-pillar interior trim panel. For additional information, refer to Section 501-05 .

3. Disconnect the connectors from the 4WD module.

4. Remove the bolts and the 4WD module.
5. **CAUTION: Once the new 4WD control module is installed, it is necessary to download the module configuration information from the diagnostic tool into the new module. For additional information, refer to Section 418-01 .**

   To install, reverse the removal procedure.

General Specifications

Item	Specification

Output speed sensor bolt	5	—	44
Shift motor bolts	10	—	89
Transmission-to-transfer case bolts	47	35	—

Transfer Case —Automatic Four-Wheel Drive (A4WD)

Features and Operation

The automatic four-wheel drive (A4WD) transfer case uses an electronic shift 4x4 system that allows the operator to choose between four different operational modes. The operator can switch between 2WD, A4WD and 4WD HIGH modes at any speed. However, to engage or disengage LOW Range, the 4WD Control Module requires that the vehicle speed is less than 5 km/h (3 mph), the brake is applied, and the transmission is in NEUTRAL.

In A4WD, the 4WD Control Module varies the torque split between front and rear drivelines by controlling the transfer case clutch. Under most conditions, the 4WD Control Module activates the transfer case clutch at a minimum duty cycle (percentage of time the clutch is turned on) which allows for a slight speed difference between the front and rear drivelines which normally occurs when negotiating a corner on dry pavement. When the rear wheels are overpowered, the 4WD Control Module detects this slip condition, and the duty cycle to the transfer case clutch is increased until the speed difference between front and rear drivelines is reduced. In this manner, the 4WD Control Module can redirect engine torque to the front wheels when the rear wheels lose traction yet still allow operation in the A4WD mode on dry pavement.

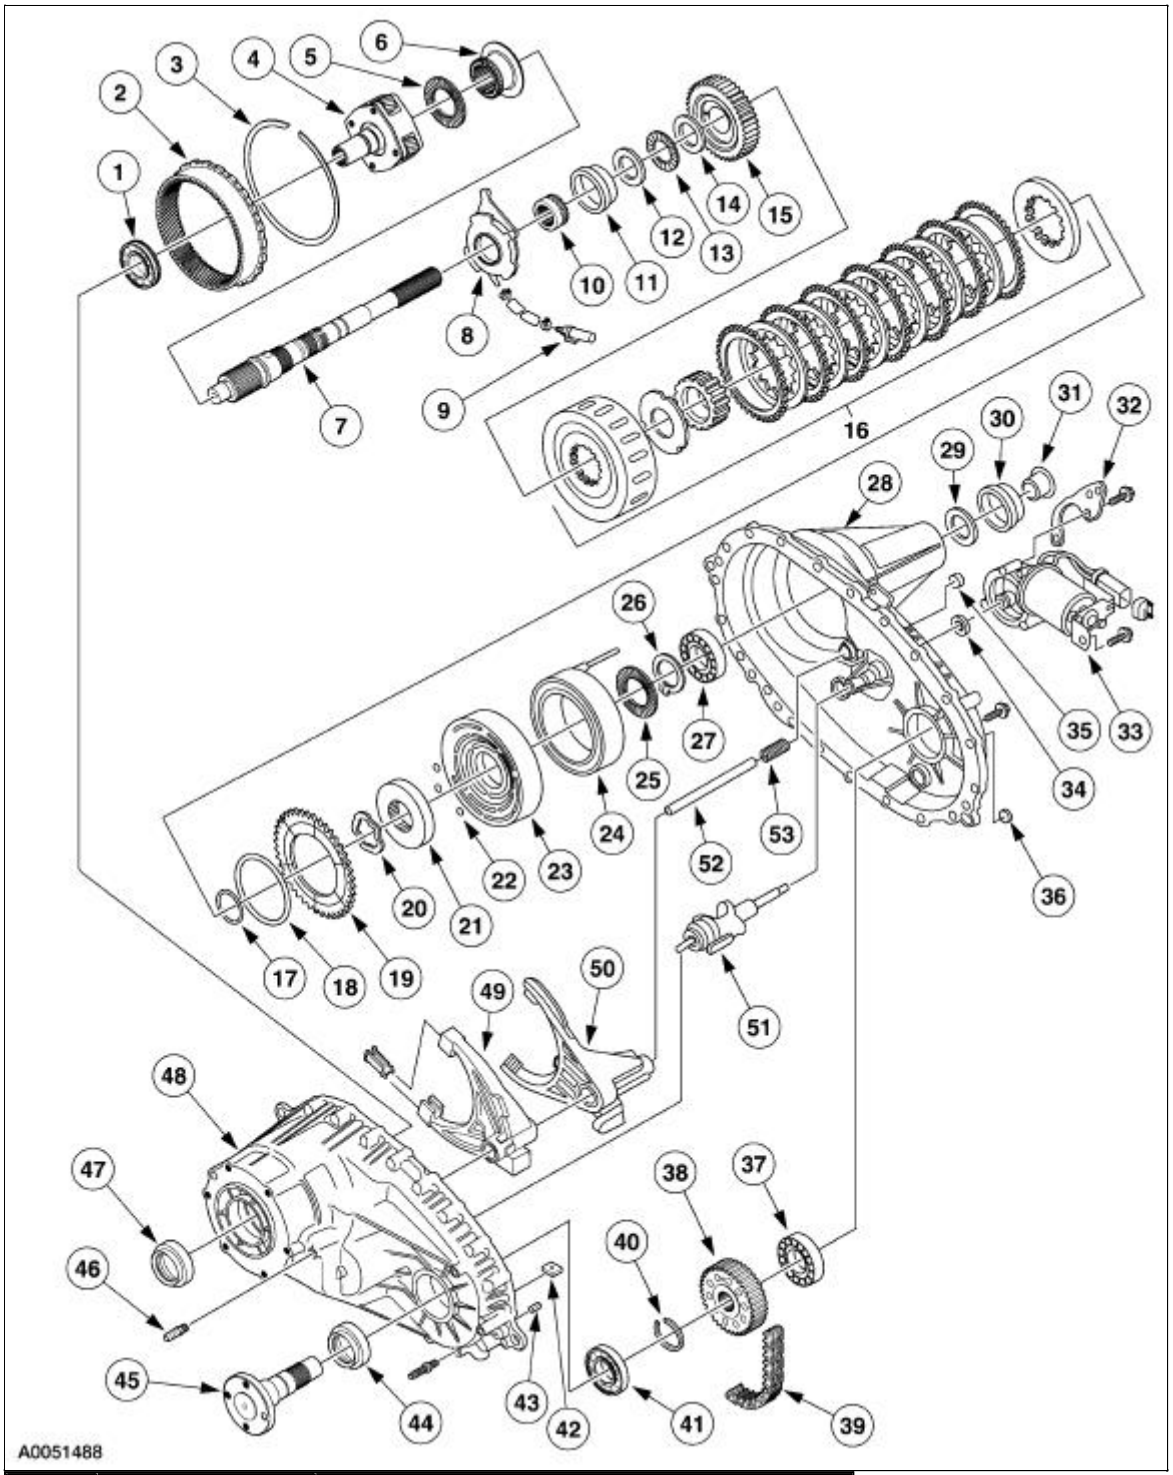
When the ABS system is active, the 4WD Control Module will default to a minimum duty cycle for the transfer case clutch.

Feature Inputs:

- Shift range selector switch.
- ABS active input (battery voltage when ABS is active, grounded when inactive).
- Contact plate position inputs A, B, C, D grounded when closed, open circuit when open.

Feature Outputs:

- Solid state clutch relay (pulse width modulated signal: grounded when relay is on, battery potential when relay is off).



Shifting Between 2WD, A4WD and 4WD HIGH

The operator can switch between 2WD, A4WD and 4WD HIGH mode at any speed.

Shifting Into/Out of LOW RANGE

When shifting into or out of LOW RANGE, the 4WD control module requires that the vehicle speed is less than 5 km/h (3 mph), the brake is applied, and the transmission is in NEUTRAL.

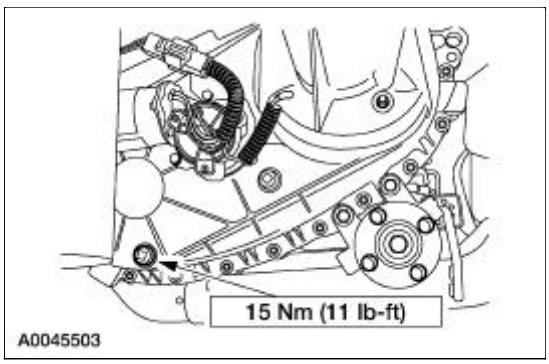
Transfer Case

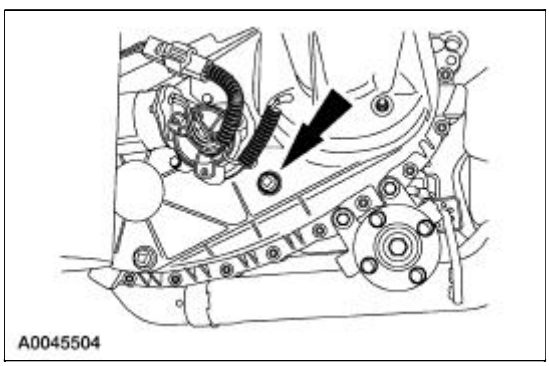
Refer to Section 308-07A .

Transfer Case Draining and Filling



Special Tool(s)

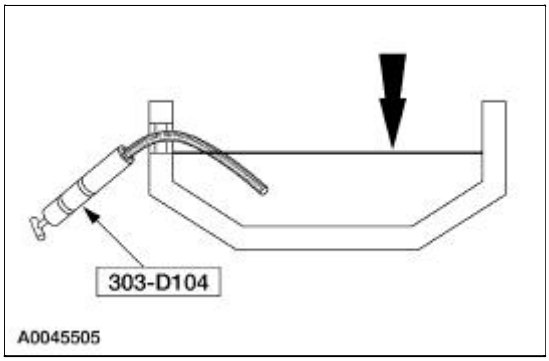
 ST2323-A	Oil Suction Gun 303-D104 (D94T-9000-A)



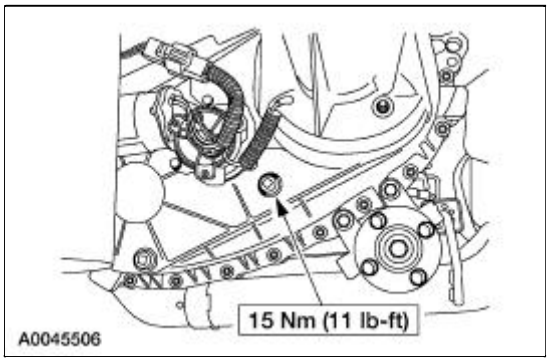
Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®
Pipe Sealant with Teflon® D8AZ-19554-A	WSK-M2G350-A2

1. Remove the drain plug and drain the fluid. Clean the drain plug and the drain plug area. Apply pipe sealant to the drain plug threads, then install the drain plug.



2. Clean the area around the fill plug. Remove the fill plug.



3. **CAUTION: Incorrect fluid fill can result in transfer case failure.**

Using the special tool, fill the transfer case to specification.

- The fluid must be just below the fill plug hole. Fill the case until the fluid slowly flows over the fill plug threads. Clean the fluid from the fill plug area.

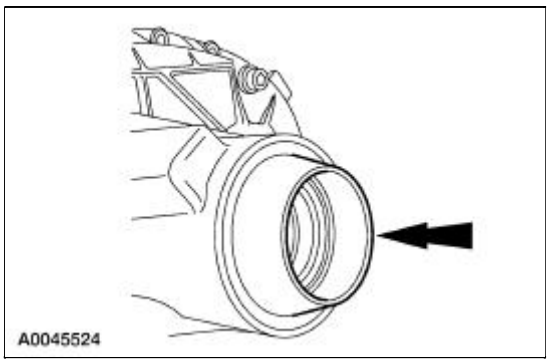
4. Apply pipe sealant to the fill plug threads, then install the fill plug.

Transfer Case Rear Output Shaft Oil Seal

Special Tool(s)

 ST2261-A	Installer, Input Shaft Oil Seal 308-249 (T96T-7127-A)

Removal



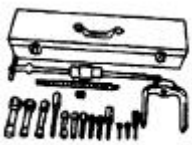
1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking, or towing an air suspension vehicle. Failure to do this will result is unexpected inflation or deflation of the vehicle during these operations.**

   Position the vehicle on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** Index-mark the rear driveshaft yoke and pinion flange to maintain initial driveshaft balance during installation.

   Remove the rear driveshaft. For additional information, refer to Section 205-01 .

3. Using a suitable tool, remove the oil seal.



Installation

1. To install, reverse the removal procedure.
   - Using the special tool, install the oil seal.

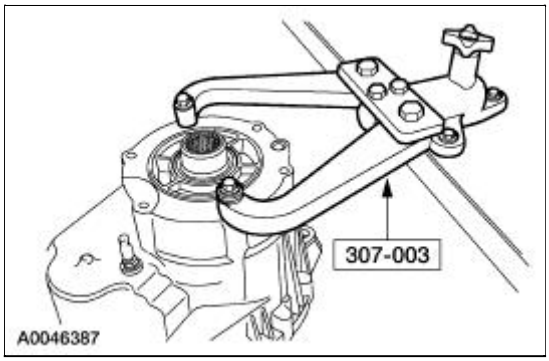
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

Disassembly



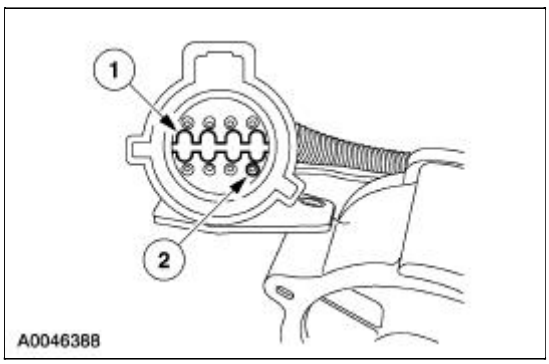
1. **WARNING: Make sure protective eyewear is in place.**

   WARNING: Use a petroleum-based solvent to clean the transfer case. Refer to the solvent manufacturer's safety precautions to prevent personal injury or transfer case damage.

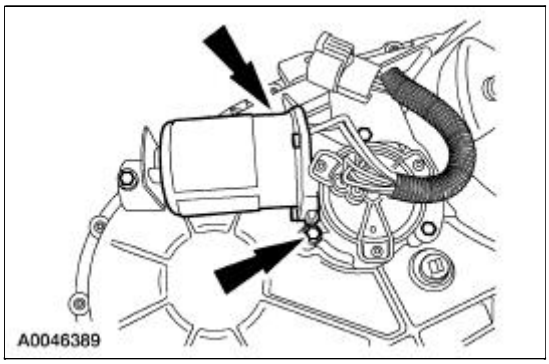
   CAUTION: Seal all openings before cleaning the transfer case exterior. This will prevent entry of dirt and water, which can cause damage to internal components.

   Clean the transfer case exterior with solvent and dry with compressed air.

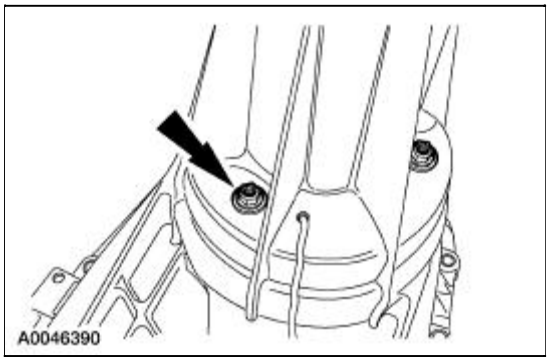
2. Using the special tool, secure the transfer case to a work bench. Rotate the transfer case so that the output shaft is pointing upward.



3. Drain the fluid from the transfer case, if not done previously.

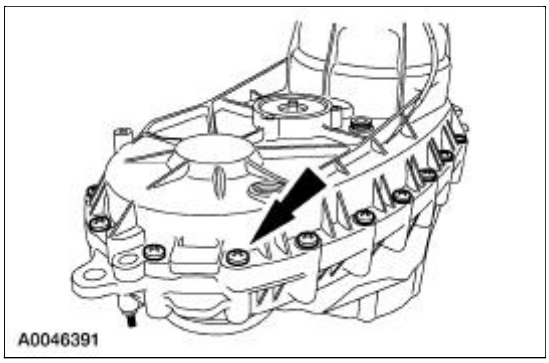


4. Using a suitable tool, remove and discard the oil seal.

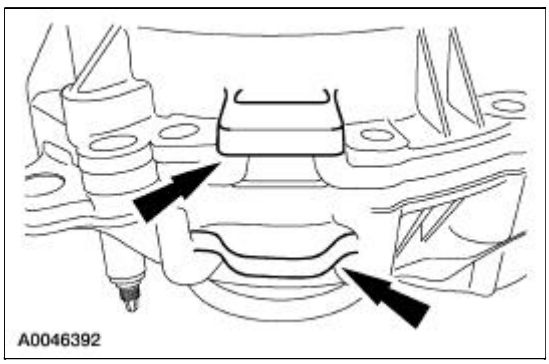


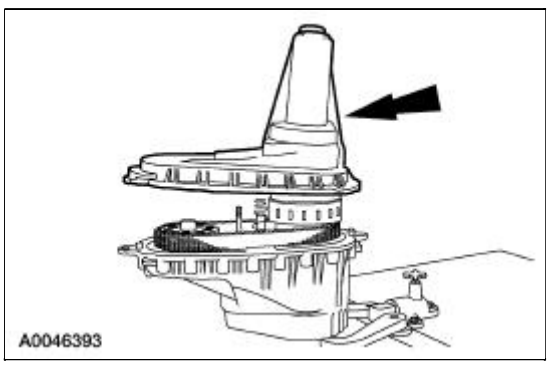
5. Remove the coil wire pin from the electrical connector.
    1. Remove the wire connector spacer.
    2. Remove the coil wire pin (tan wire).
        - Use an electrical connector pin extractor tool.

6. Remove the bolts and transfer case shift motor.



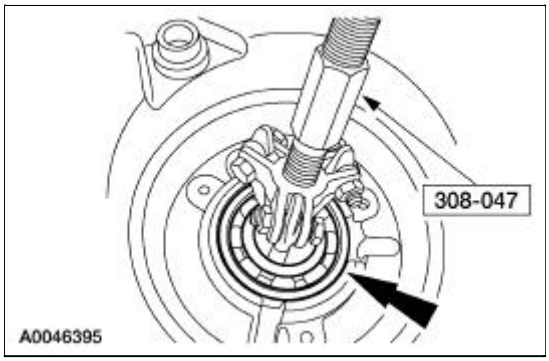
7. Remove the three coil nuts and washers.



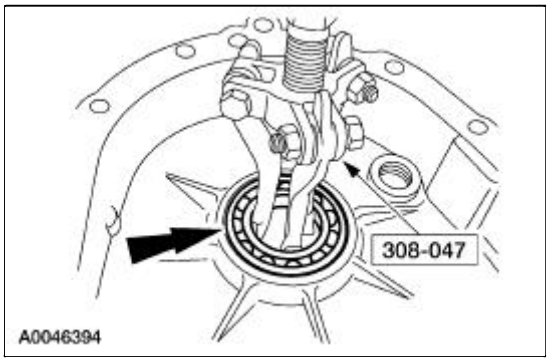


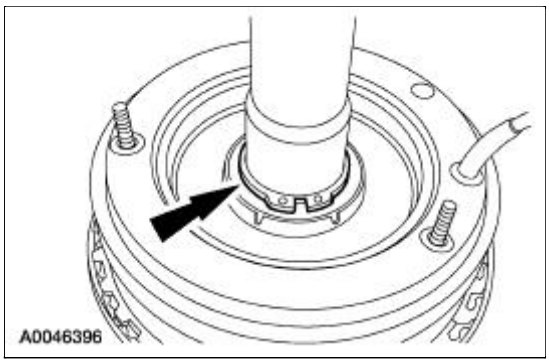
8. **NOTE:** It is normal to find metal shavings after removing the self-tapping transfer case bolts.

   Remove the 20 bolts.

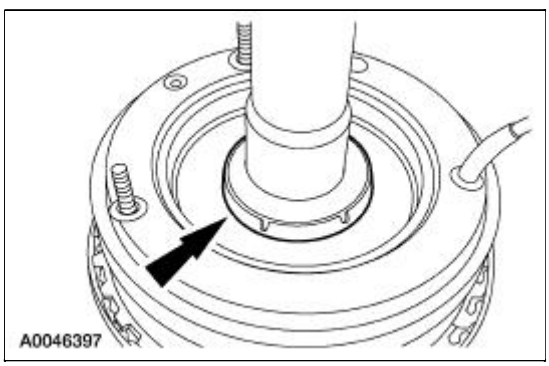


9. Separate the transfer case halves.
   - Use the pry bosses to separate the case halves.

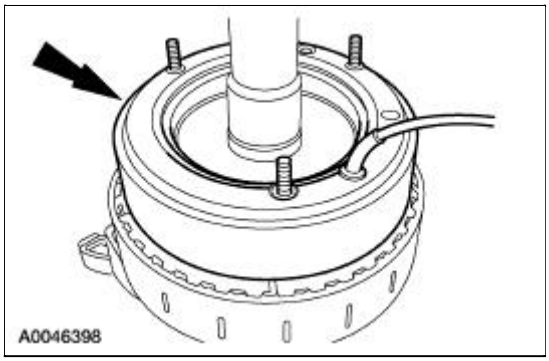




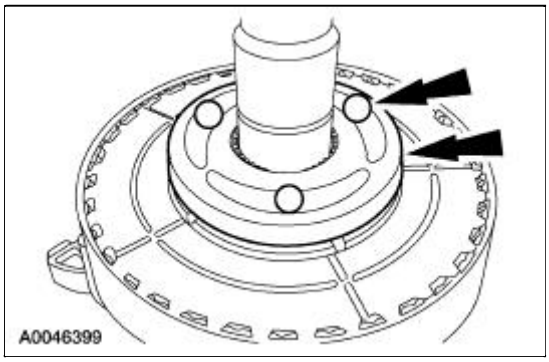
10. Using the special tools, remove the rear output shaft support bearing.



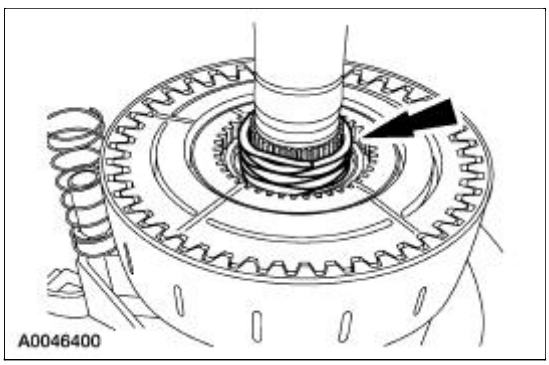
11. Using the special tools, remove the front output shaft rear bearing.



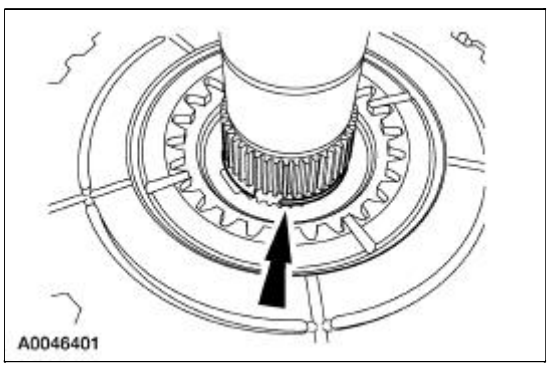
12. Remove the snap ring.
    - Inspect the snap ring for wear or damage. Install a new snap ring as necessary.



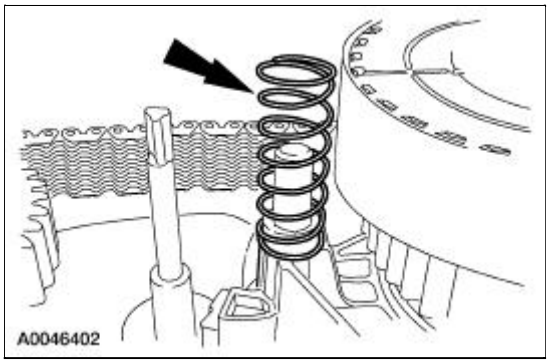
13. Remove the caged thrust bearing assembly.
    - Inspect the bearing for wear or damage. Install a new bearing as necessary.



14. Remove the cam/coil housing.

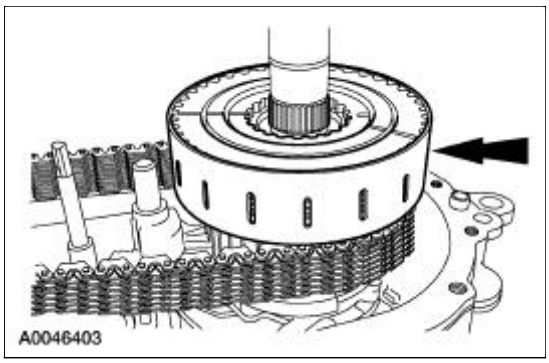


15. Remove the steel balls and the cam.

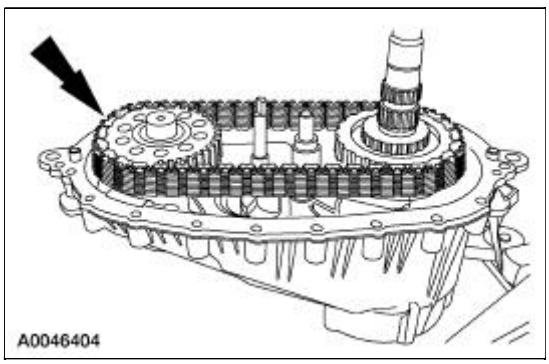


16. Remove the wave spring.

17. Remove and discard the snap ring.

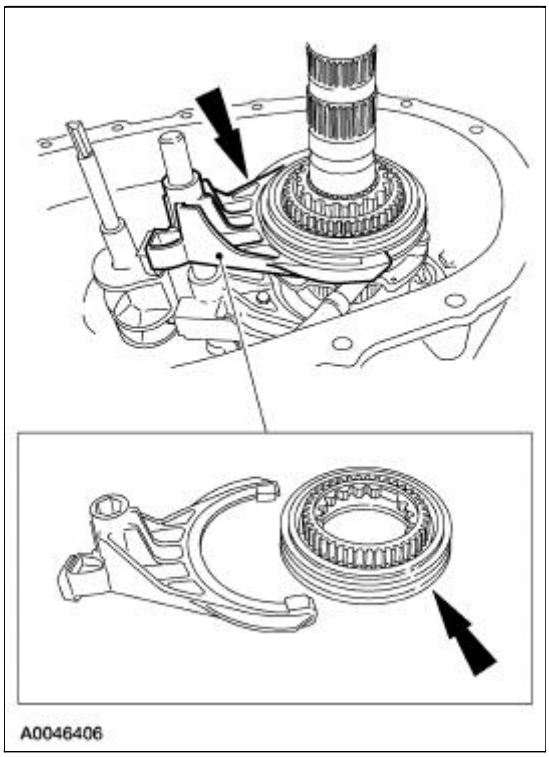


18. Remove the lockup shift fork spring.

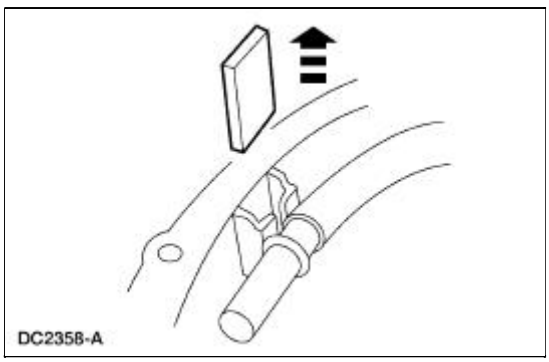


19. **CAUTION: When removing the clutch pack assembly, do not separate the clutch pack assembly. Keep tension on the clutch pack upon removal. Set the clutch pack assembly on the bench in the same position as located in the transfer case. The thrust washer in the lower clutch pack uses tabs to hold it in place. If the thrust washer is not in place, a transfer case clearance problem can occur.**

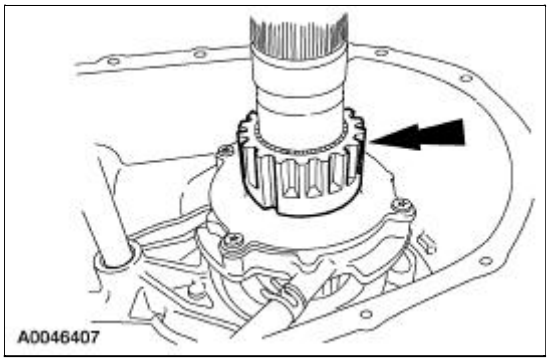
    Remove the clutch pack assembly.



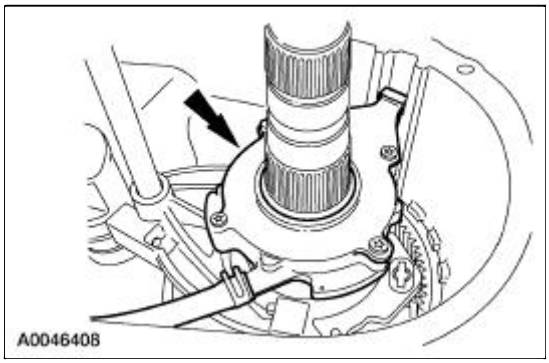
20. Remove the drive chain and the sprockets as an assembly.
    - Inspect the drive chain for wear or damage. Inspect the sprockets for broken or cracked teeth. Install new components as necessary.



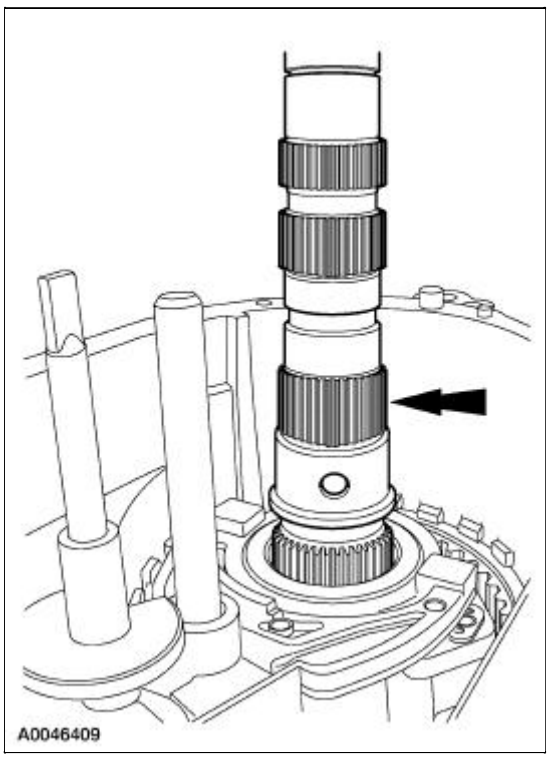
21. Remove the thrust bearing assembly.
    1. Remove the thrust washer.
        - The upper thrust washer may be attached to the sprocket.
    2. Remove the thrust bearing.
    3. Remove the thrust washer.
    - Inspect the washers and bearing for wear or damage. Install new components as necessary.



22. Remove the lockup collar and the lockup fork as an assembly.
    - Separate and inspect the lockup collar and the lockup fork for wear or damage.

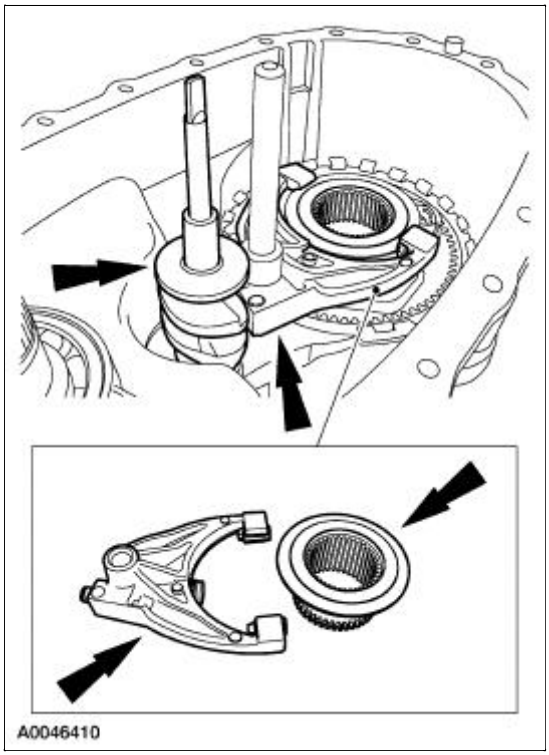


23. Remove and clean the oil pan magnet.

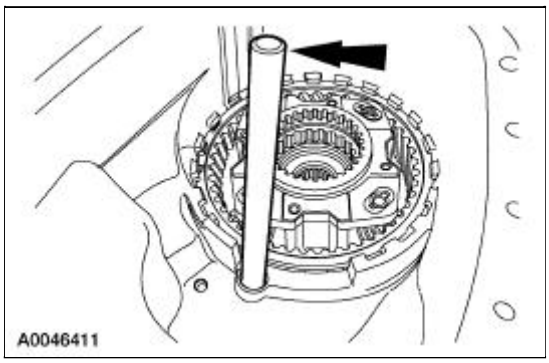


24. Remove the output shaft hub.

25. Remove the oil pump assembly.

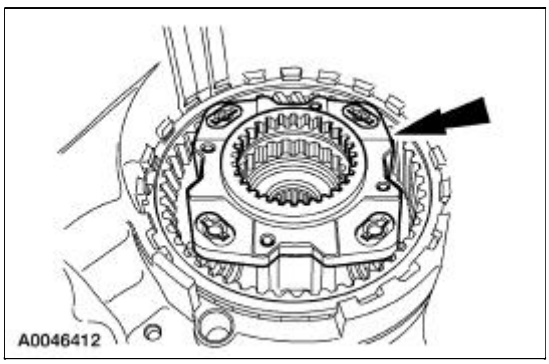


26. Remove the output shaft.

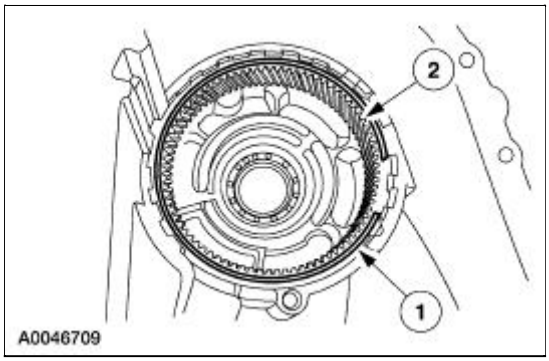


27. **WARNING: Do not disassemble the shift cam assembly.**

Remove the reduction shift fork, the reduction hub, and the shift cam as an assembly.

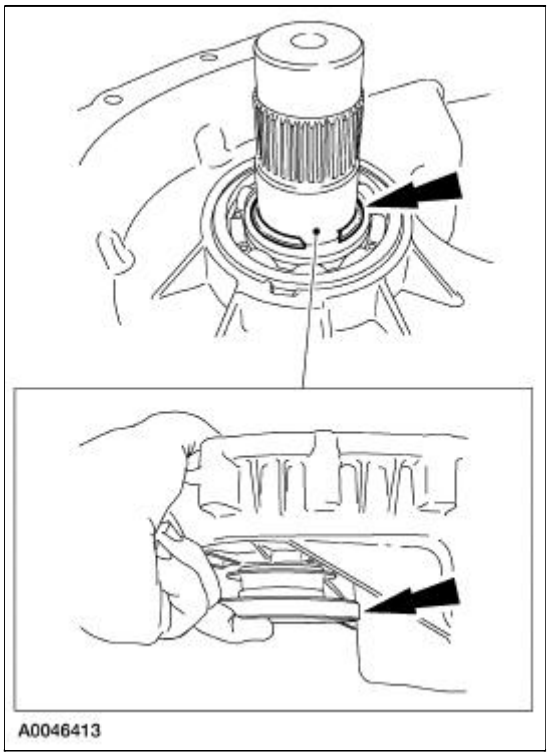


- Separate and inspect the reduction hub and the reduction shift fork for wear or damage.



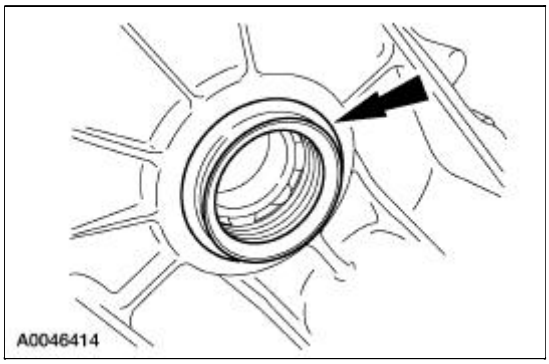
28. Remove the shift fork shaft.

29. Remove the front planet.
    - Using a drift and a hammer, remove the front planet needle bearing, if necessary.



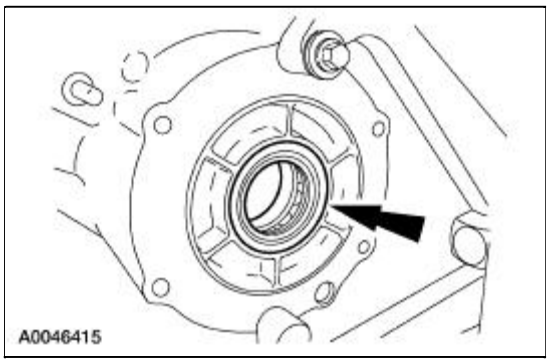
30. Remove the ring gear.
    1. Remove the snap ring.
        - Inspect the snap ring for wear or damage. Install a new snap ring as necessary.
    2. Remove the ring gear.

31. **CAUTION: Do not let the front output shaft fall when removing the snap ring.**



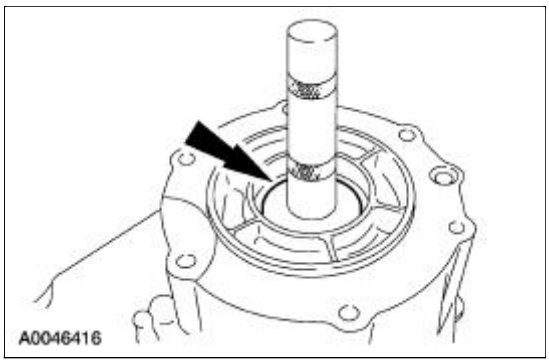
Remove the snap ring and the front output shaft.

- Inspect the snap ring for wear or damage. Install a new snap ring as necessary.



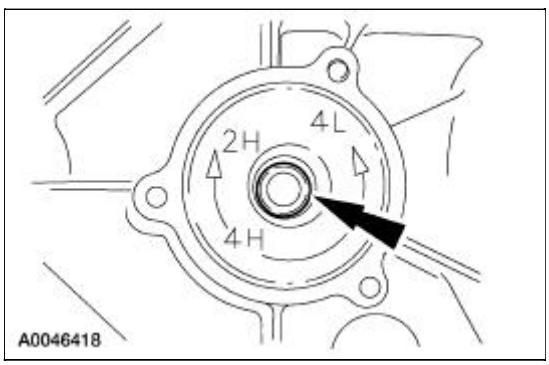
32. **NOTE:** Carefully remove the seal, do not damage the seal bore.

Remove and discard the front output shaft oil seal.



33. **NOTE:** Carefully remove the seal, do not damage the seal bore.

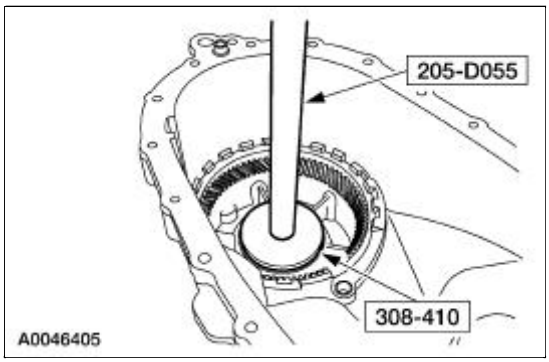
    Remove and discard the front input shaft oil seal.



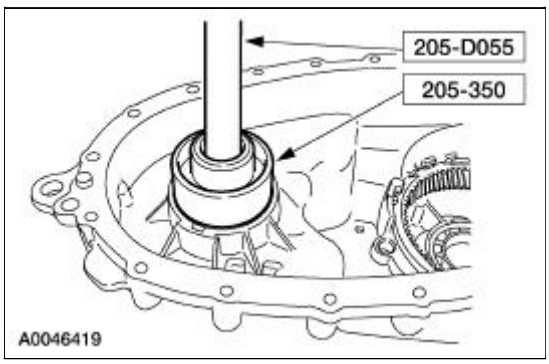
34. Using a suitable driver, remove the front planet support bearing.

35. Using a suitable driver, remove the front output shaft support bearing.

36. Using a suitable tool, remove and discard the shifter shaft seal.

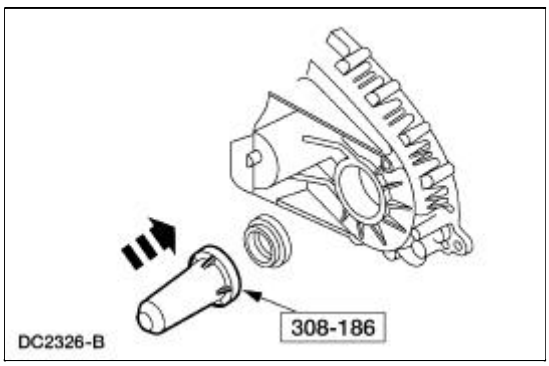


Assembly



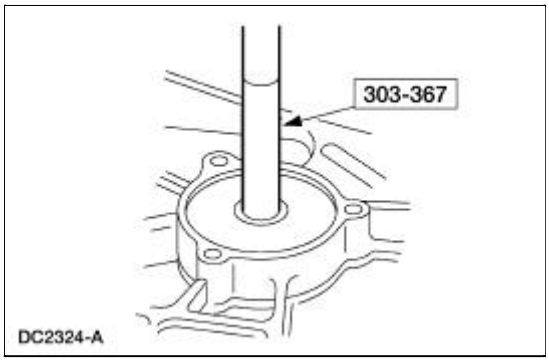
1. Lubricate all internal components with the recommended transfer case lubricant during reassembly.

2. Clean the mating surfaces of the cases.

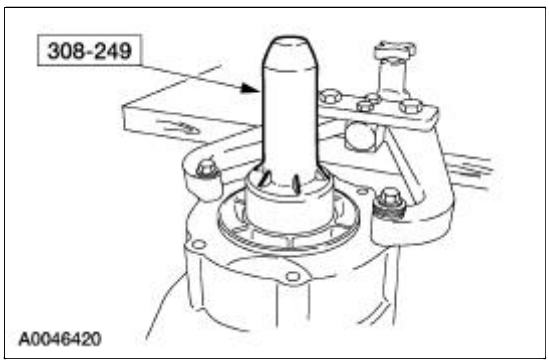


3. Using a suitable press and the special tools, install the front planet support bearing.

4. Using a suitable press and the special tools, install the front output shaft support bearing.

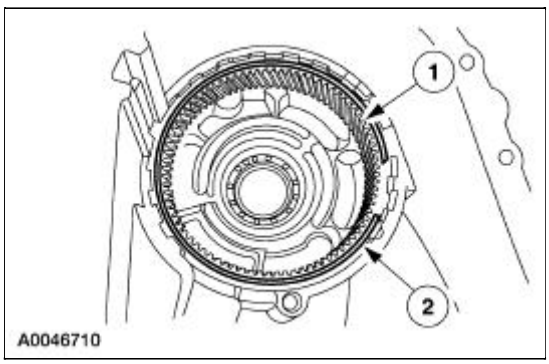


5. Using the special tool, install a new oil seal.

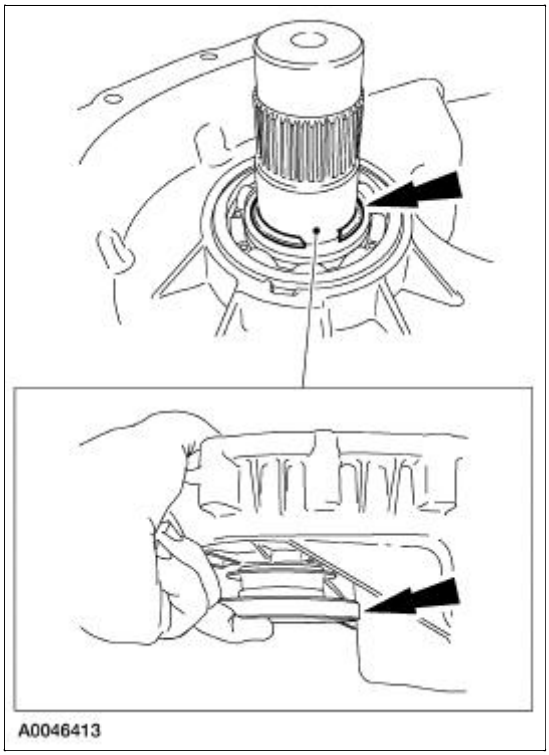


6. **CAUTION: Be careful not to crush the seal.**

   Using the special tool, install a new shifter shaft seal.

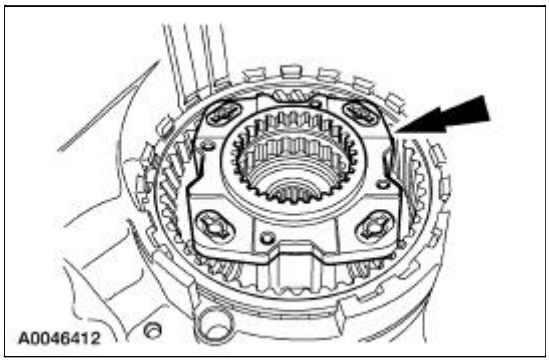


7. Install the case to the transmission holding fixture. Secure the case to the work bench.

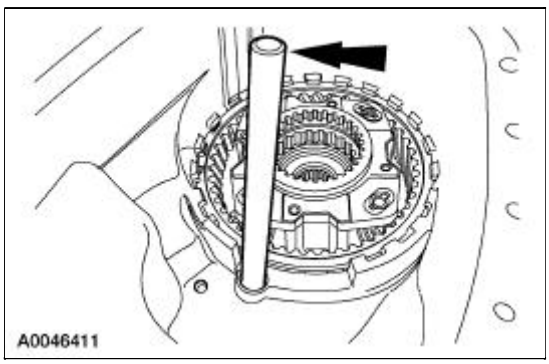


8. Using the special tools, install a new oil seal.

9. Install the ring gear.
    1. Position the ring gear in the case.
    2. Install the snap ring.

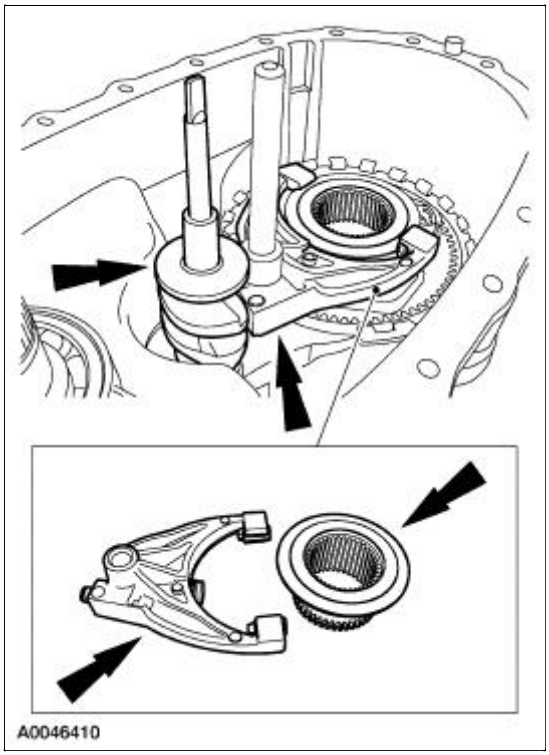


10. Install the front output shaft and the snap ring.

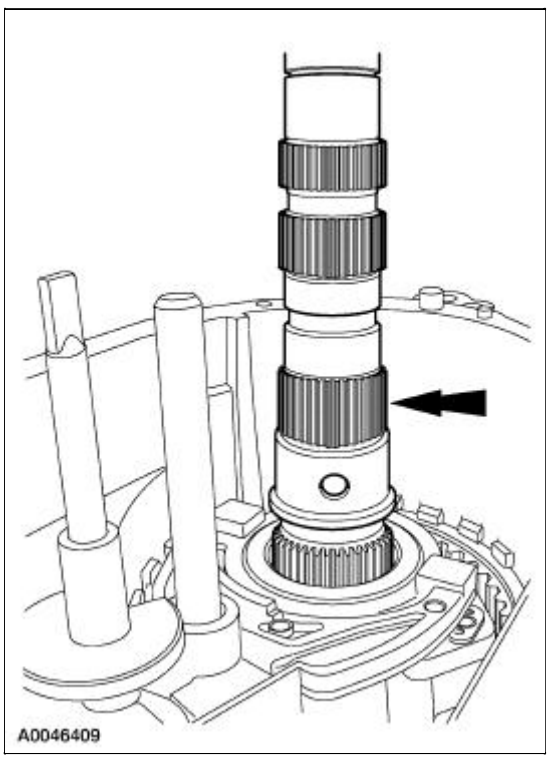


11. **NOTE:** If removed, using a suitable press and the special tool 308-085, install the needle bearing into the front planet. Be careful not to crush the bearing cage.

    Install the front planet.

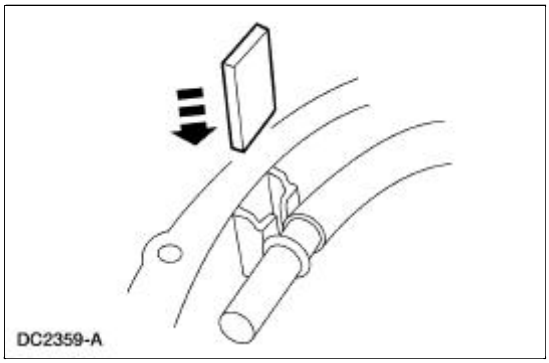


12. Install the shift fork shaft.

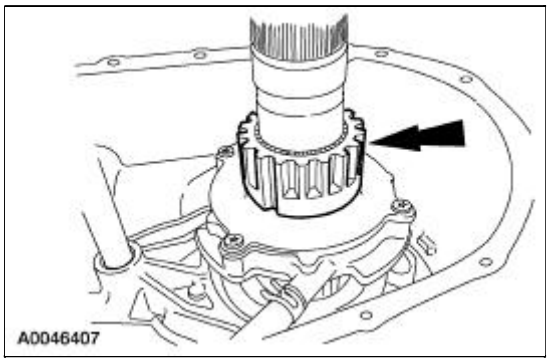


13. **NOTE:** Assemble the reduction hub and the reduction shift fork.

    Install the reduction shift fork, the reduction hub, and the shift cam as an assembly.

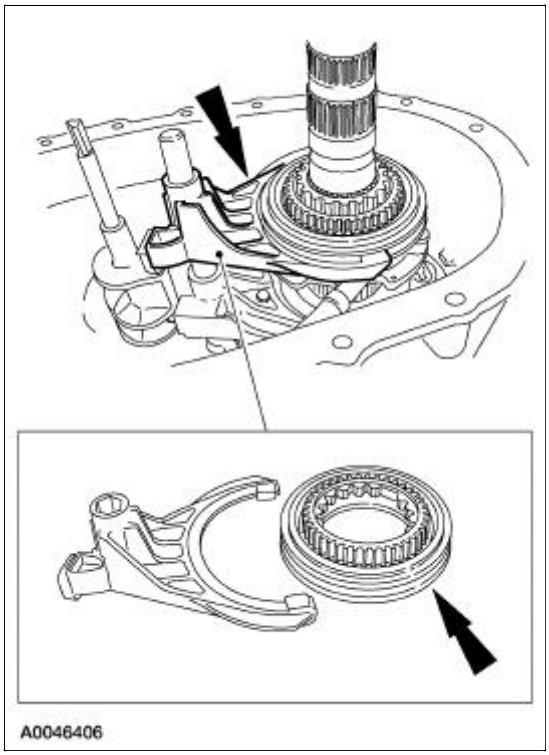


14. Install the output shaft.

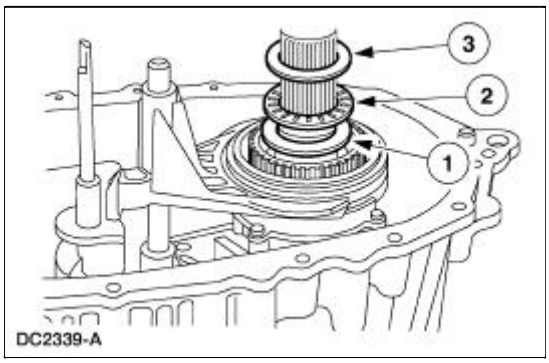


15. Install the oil pump assembly.
    - Make sure the oil pump finger is in the slot in the case.

16. Install the oil pan magnet into its slot in the case.



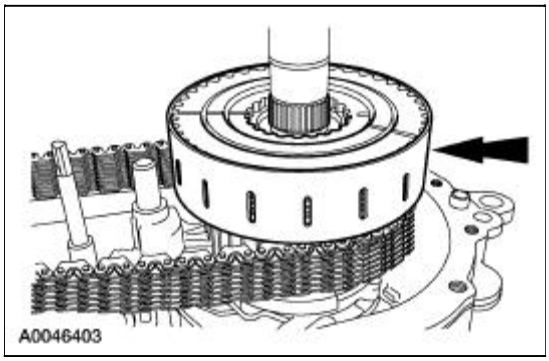
17. Install the output shaft hub.



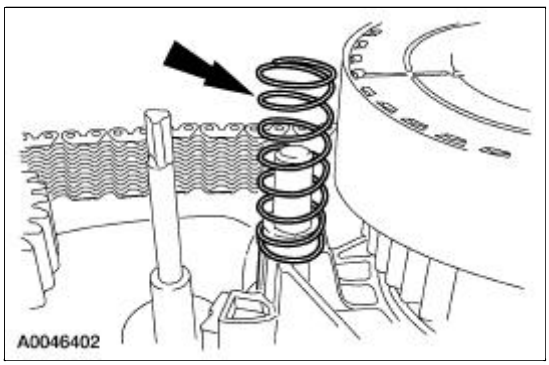
18. **NOTE:** Assemble the lockup collar and the lockup fork.

    Install the lockup collar and the lockup fork as an assembly.

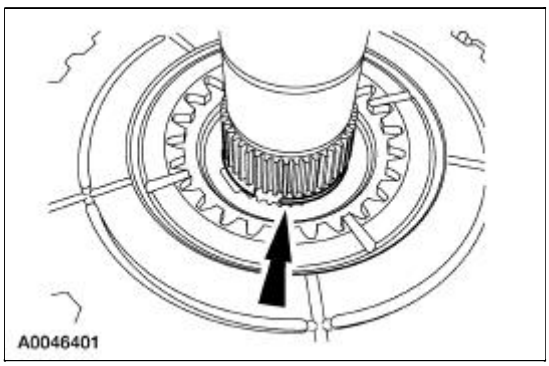
19. Install the three-piece thrust bearing assembly.
    1. Install the thrust washer.
    2. Install the thrust bearing.
    3. Install the thrust washer.



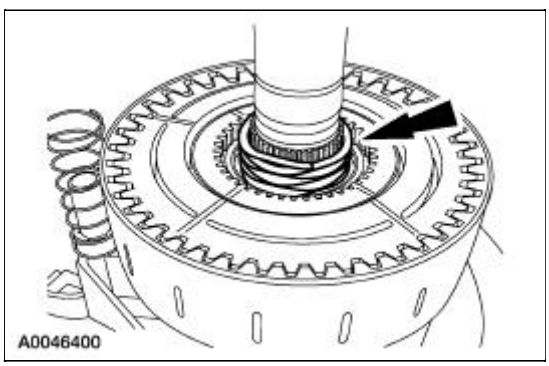
20. Install the drive chain and the sprockets as an assembly.



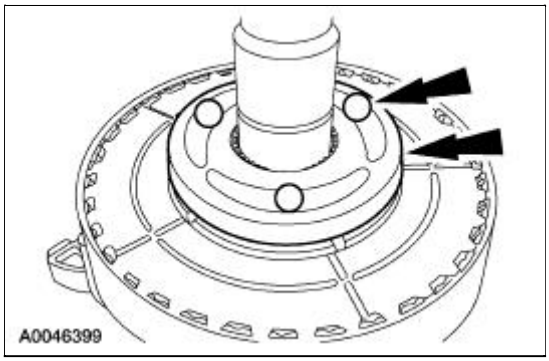
21. **CAUTION: When installing the clutch assembly, do not separate the clutch pack assembly. The thrust washer in the lower clutch pack uses tabs to hold it in place. If the thrust washer is not in place, a transfer case clearance problem can occur.**



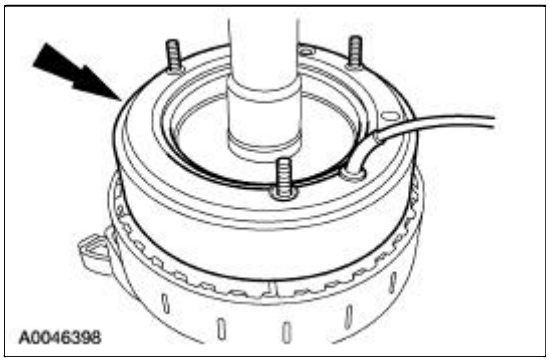
Install the clutch pack assembly.



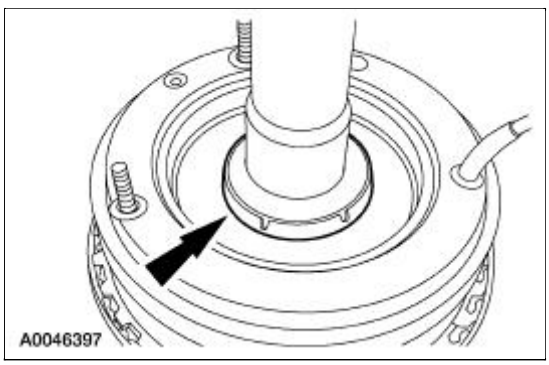
22. Install the lockup shift fork spring.



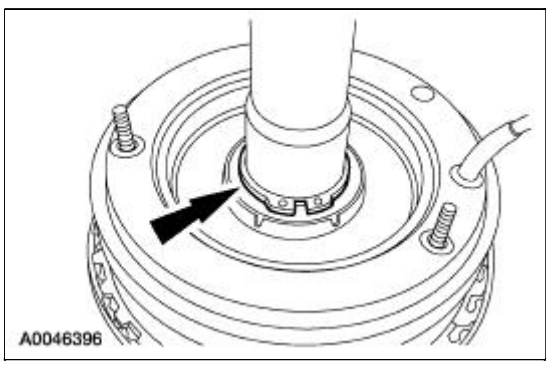
23. Install a new snap ring.



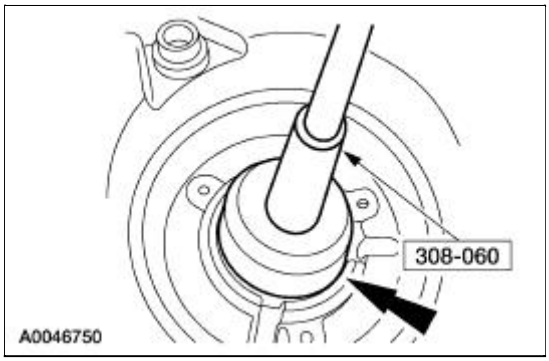
24. Install the wave spring.



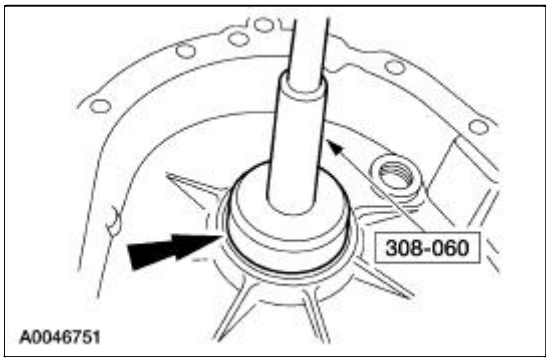
25. Install the cam and the steel balls.



26. Install the cam/coil housing.

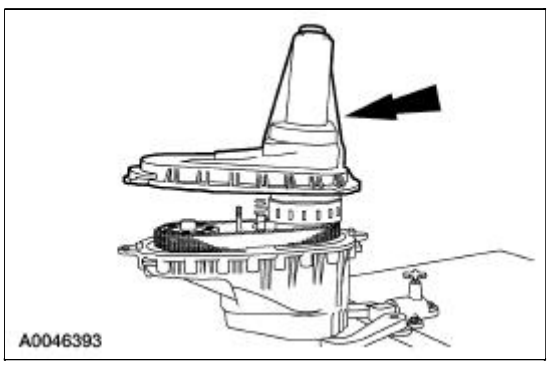


27. Install the thrust bearing assembly.

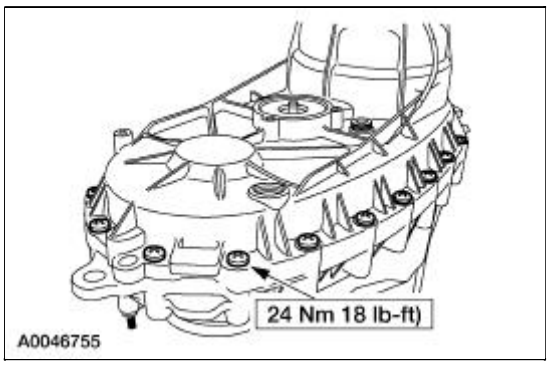


28. Install the snap ring.

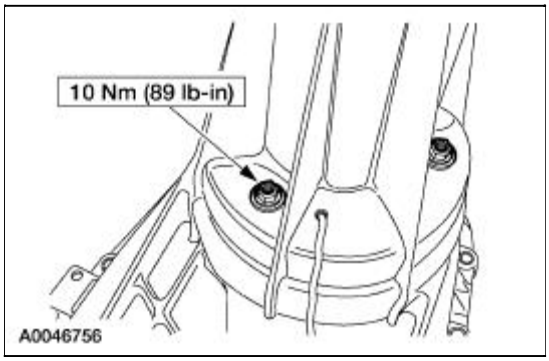
29. Using a suitable press and the special tool, install the rear output shaft support bearing.



30. Using a suitable press and the special tool, install the front output shaft rear bearing.

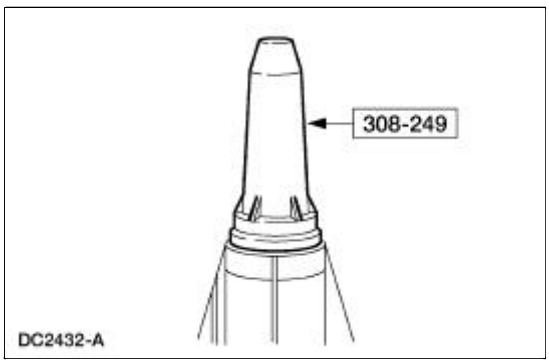


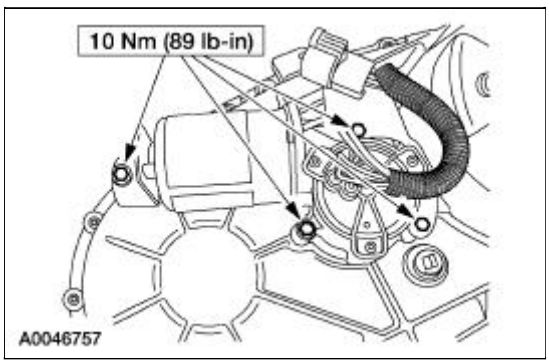
31. **CAUTION: Applying too much silicone sealant can plug the fluid filter and cause transfer case failure.**



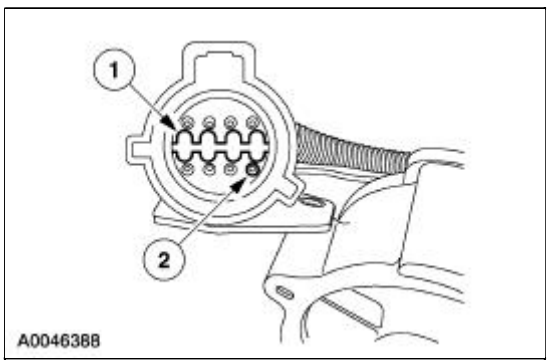
Apply a bead of silicone sealant to the transfer case mating surfaces, then position the two transfer case halves together. Tighten the bolts evenly in a star pattern.

- Position the coil studs through the case holes, make sure the shift cam shaft is aligned with its case bore, and the lockup shift fork spring is in position.

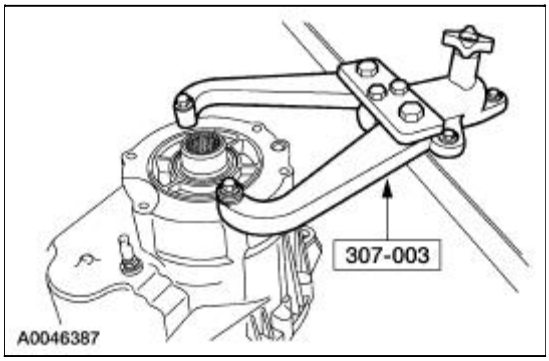




32. Install the coil washers and nuts.

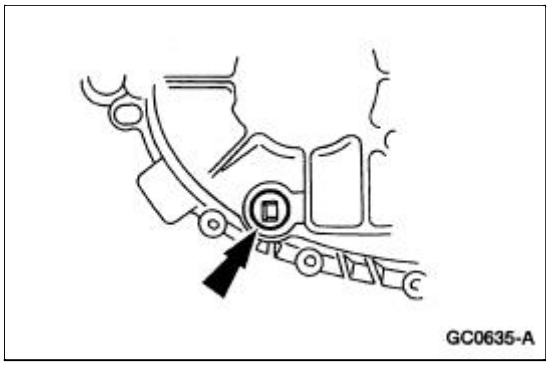


33. Using the special tool, install the oil seal.



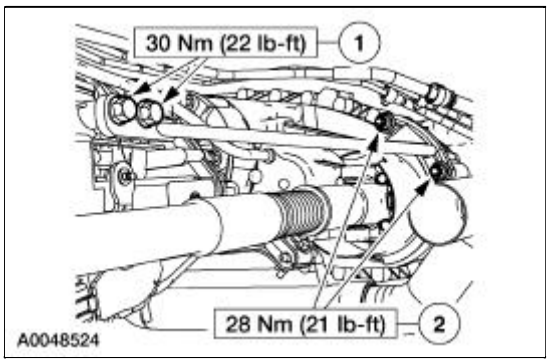
34. Install the transfer case shift motor.

35. Install the coil wire pin in the electrical connector.
    1. Remove the wire connector spacer.
    2. Install the coil wire pin. Reinstall the wire connector spacer.



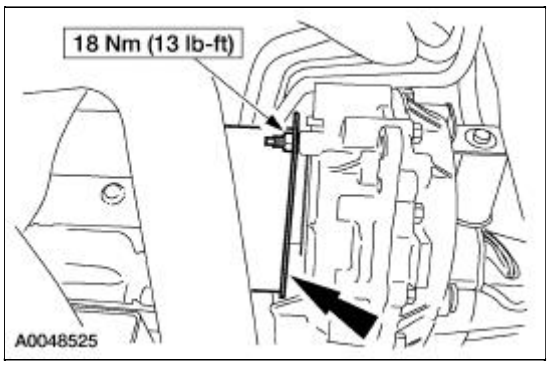
36. Remove the transfer case from the special tool.

Transfer Case —4R100 Transmission



1. With the vehicle in NEUTRAL position the vehicle on a hoist. For additional information, refer to Section 100-02 .

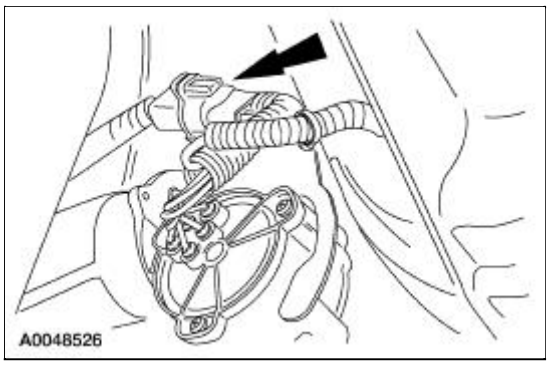
2. Drain the fluid if the transfer case is to be disassembled.
   - Install the drain plug when finished draining.



3. **NOTE:** The catalytic converter is removed for clarity.

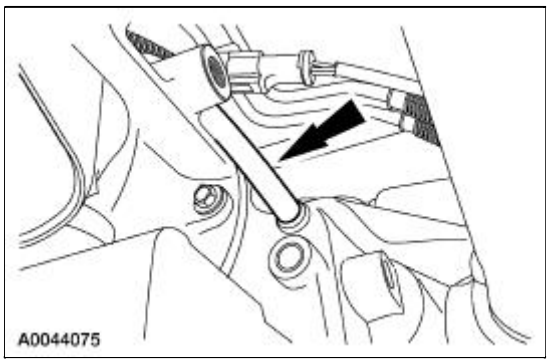
   Remove the transfer case-to-transmission brace.
   1. Remove the bolts from the transmission.
   2. Remove the nuts from the transfer case.

4. Remove the two nuts and the front driveshaft shield.



5. **NOTE:** Index-mark the driveshaft to maintain initial driveshaft balance during installation.

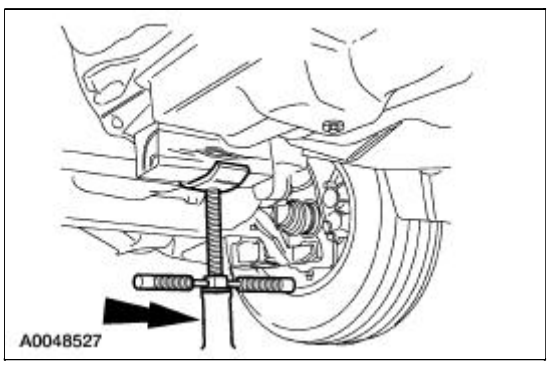
Remove the front driveshaft. For additional information, refer to Section 205-01 .



6. **NOTE:** Index-mark the driveshaft to maintain initial driveshaft balance during installation.

   Remove the rear driveshaft. For additional information, refer to Section 205-01 .

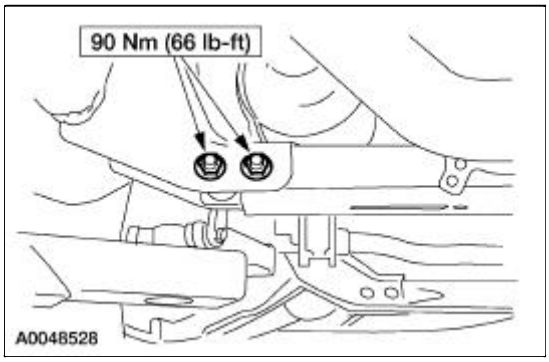
7. Disconnect the electrical connector.



8. Disconnect the vent hose.

9. **CAUTION: Never support the transmission from the bottom of the transmission pan.**

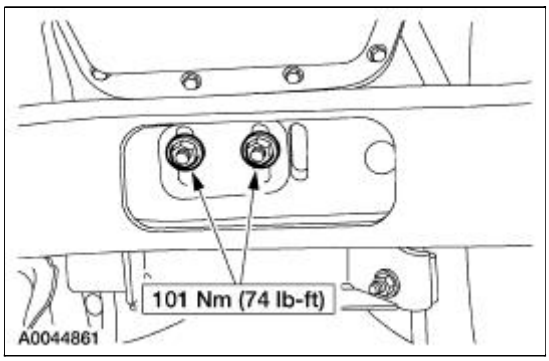
   Using a suitable jack stand, support the transmission.



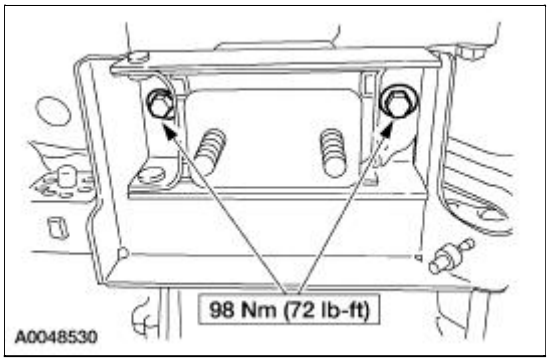
10. **CAUTION: Secure the transfer case to the jack with a safety strap.**

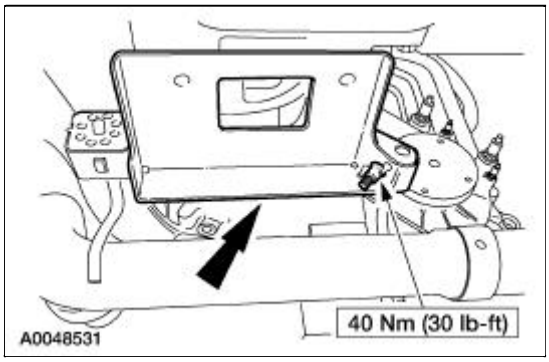
    Using a suitable transmission jack, support the transfer case.

11. Remove the two exhaust heat shield-to-crossmember bolts.



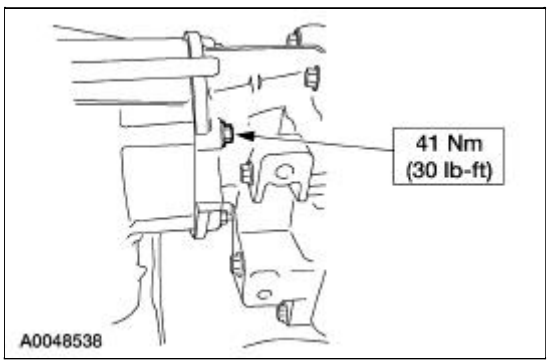
12. Remove the crossmember-to-frame nuts and bolts.





13. Remove the transmission mount-to-crossmember nuts, then remove the crossmember.

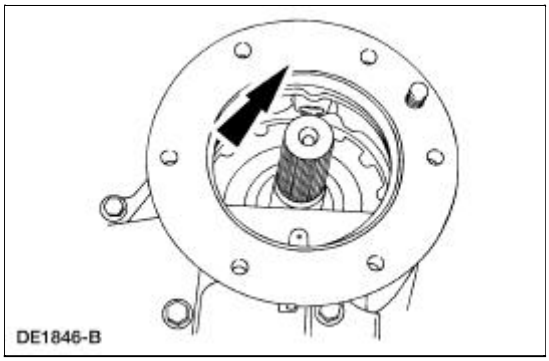
14. Remove the bolts and the transmission mount.



15. Remove the bolt and the exhaust hanger bracket.

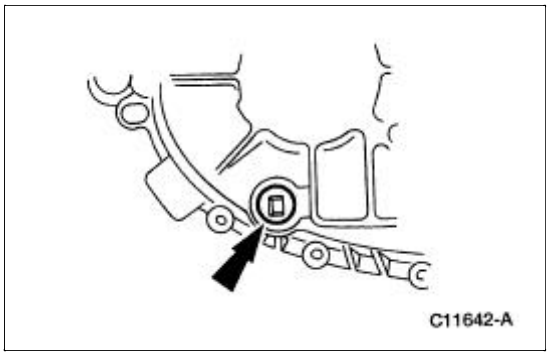
16. **NOTE:** Position a suitable drain pan below the transmission extension housing.

    Remove the six transfer case-to-transmission extension housing bolts.



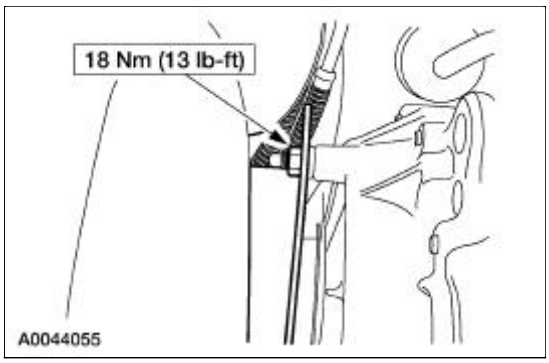
17. **NOTE:** Watch for obstructions.

    Separate the transfer case from the transmission extension housing, move the transfer case rearward off the output shaft, then lower the transfer case from the vehicle.



18. **CAUTION: Carefully clean the gasket surfaces. Nicks and gouges cause fluid leaks.**

    Remove the transfer case-to-transmission gasket and clean the mating surfaces.

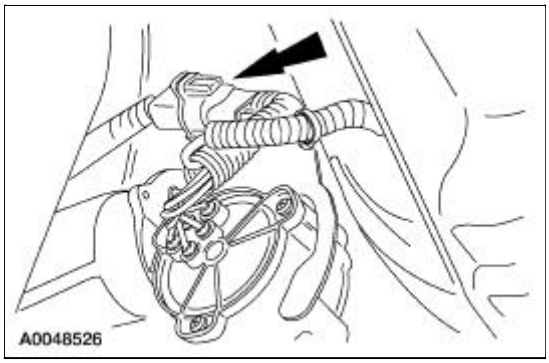


DE1846-B

Transfer Case —4R70W Transmission

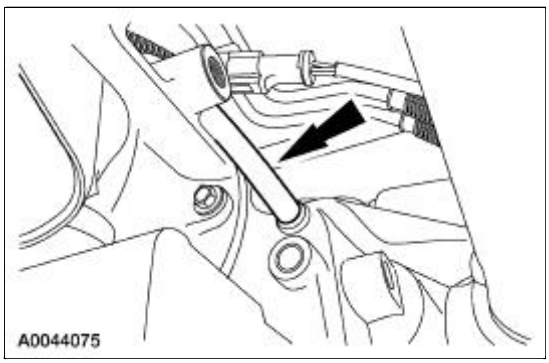
1. With the vehicle in NEUTRAL, position the vehicle on a hoist. For additional information, refer to Section 100-02 .
2. Drain the fluid if the transfer case is to be disassembled.
   - Install the drain plug when finished draining.

3. Remove the two nuts and the front driveshaft shield.



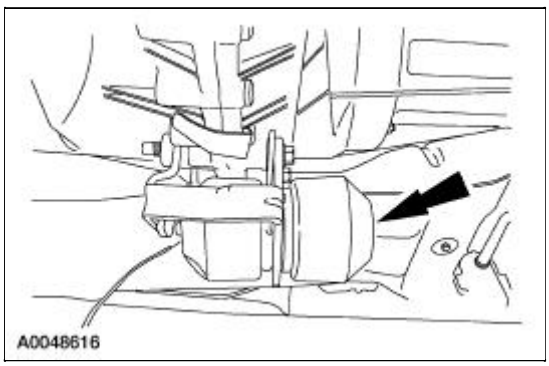
4. **NOTE:** Index-mark the driveshaft to maintain initial driveshaft balance during installation.

   Remove the front driveshaft. For additional information, refer to Section 205-01 .



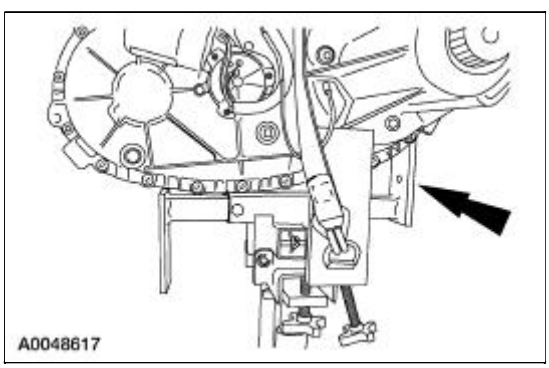
5. **NOTE:** Index-mark the driveshaft to maintain initial driveshaft balance during installation.

   Remove the rear driveshaft. For additional information, refer to Section 205-01 .

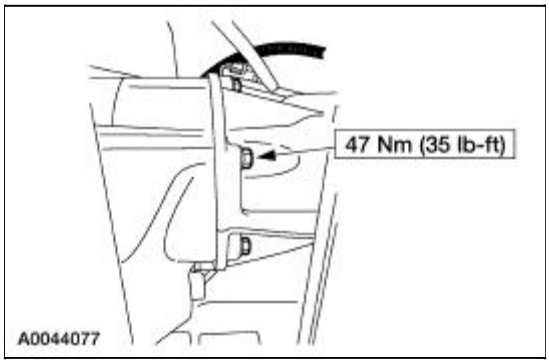


6. Disconnect the electrical connector.

7. Disconnect the vent hose.



8. Remove the bolts and the damper.

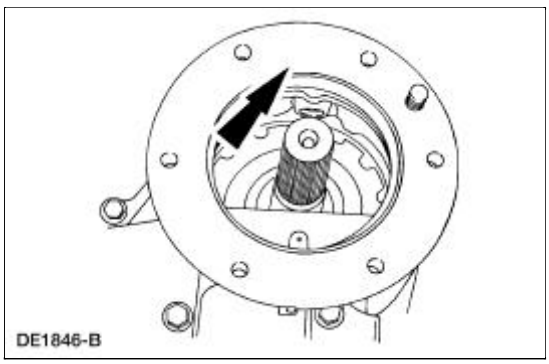


9. **CAUTION: Secure the transfer case to the jack with a safety strap.**

   Using a suitable transmission jack, support the transfer case.

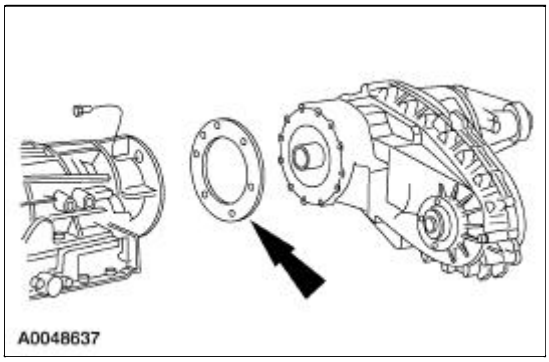
10. **NOTE:** Position a suitable drain pan below the transmission extension housing.

Remove the six transfer case-to-transmission extension housing bolts.



11. **NOTE:** Watch for obstructions.

    Separate the transfer case from the transmission extension housing, move the transfer case rearward off the output shaft, then lower the transfer case from the vehicle.

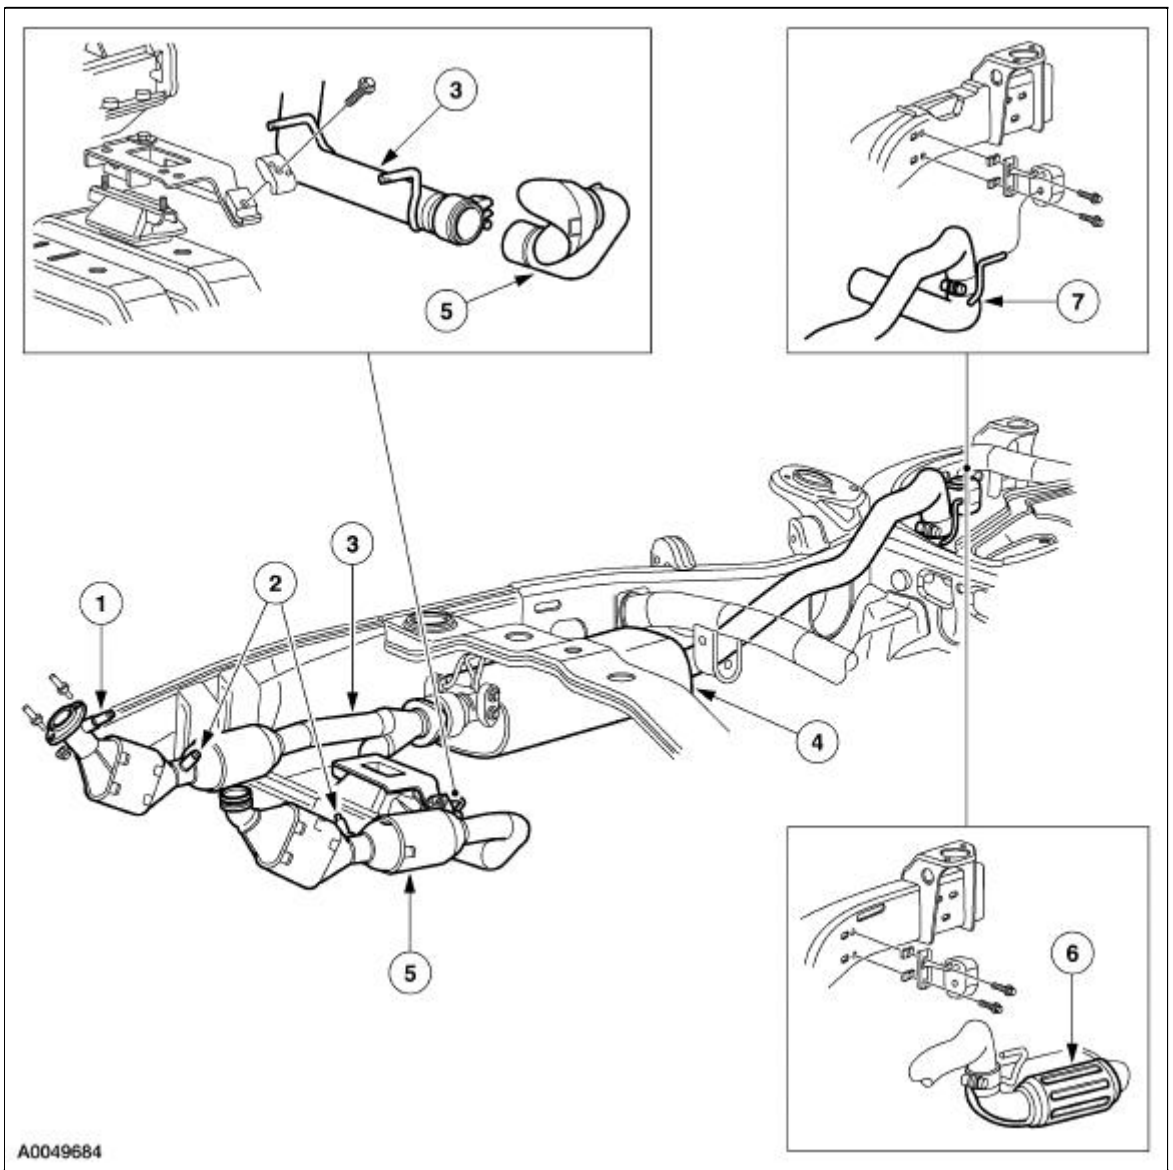


12. **CAUTION: Carefully clean the gasket surfaces. Nicks and gouges cause fluid leaks.**

    Remove the transfer case-to-transmission gasket and clean the mating surfaces.

Transfer Case

1. To install, reverse the removal procedure.
    - Install a new transfer case-to-transmission gasket.
    - Fill the transfer case. For additional information, refer to Transfer Case Draining and Filling in the General Procedures portion of this section when refilling the transfer case. Refer to Specifications in this section for the correct type and quantity of fluid.
    - Tighten the transfer case-to-transmission bolts evenly in a star pattern.



Torque Specifications

Description	Nm	lb-ft
Catalytic converter-to-exhaust manifold nuts	40	30
Exhaust clamp nut	48	35
Converter bracket and insulator bolt	40	30
Converter-to-muffler bolts	40	30
Exhaust hanger-to-frame bolts	20	15
Heated oxygen and catalyst monitor sensors	40	30

Exhaust System

The exhaust system consists of the components shown in the following illustrations.

Exhaust System Components — 4.6L and 5.4L 2V shown, 5.4L 4Vsimilar

Item	Part Number	Description
1	9F472	Heated oxygen sensor
2	9F472	Catalyst monitor sensor
3	5E212	RH catalytic converter
4	5230	Muffler
5	5E212	LH catalytic converter
6	—	Resonator (5.4L 4V only)

7	5202	Extension pipe (4.6L and 5.4V 2V)

Exhaust System

Inspection and Verification

1. Verify the customer's concern by running the engine or road testing the vehicle to duplicate the condition.
2. Visually inspect for obvious signs of mechanical and electrical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical
● Exhaust pipe pinched, crushed. ● Broken or damaged muffler. ● Broken or damaged exhaust pipe. ● Broken or damaged catalytic converter. ● Cracked exhaust manifold.

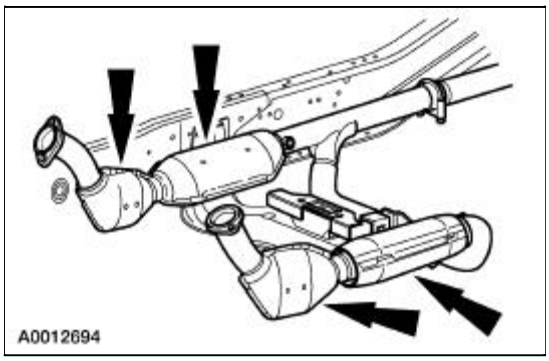
3. If the fault is not visually evident, determine the symptom and GO to Symptom Chart.

Symptom Chart

SYMPTOM CHART

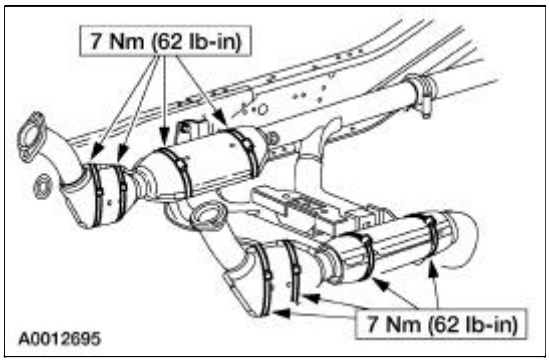
Condition	Possible Sources	Action
● Noisy or leaking exhaust	● Exhaust leak. ● Misaligned exhaust. ● Loose clamps. ● Restricted exhaust.	● REPAIR as necessary.
● Loss of power	● Kinked or damaged exhaust pipe. ● Clogged catalytic converter. ● Foreign object in exhaust pipe.	● REPAIR as necessary.

Exhaust System Alignment



1. Raise and support the vehicle. For additional information, refer to Section 100-02 .
2. Check for loose, damaged, or missing heat shields. Install new heat shields as necessary. Check for any trapped debris between the heat shields and the exhaust system components.
3. Loosen all exhaust component fasteners and clamps from the exhaust manifolds to the muffler extension pipe.
4. **NOTE:** Make sure the exhaust insulators are hanging straight up and down and are free to move.

   Beginning at the front of the vehicle, align the exhaust system to establish the maximum clearance. Make sure that all slip fit pipes are pushed all the way into the preceding pipe and the notches are correctly lined up with the tabs.
5. Beginning at the front of the vehicle, tighten all fasteners and clamps to specification. For additional information, refer to Specifications in this section.
6. Start the engine and check the exhaust system for leaks.

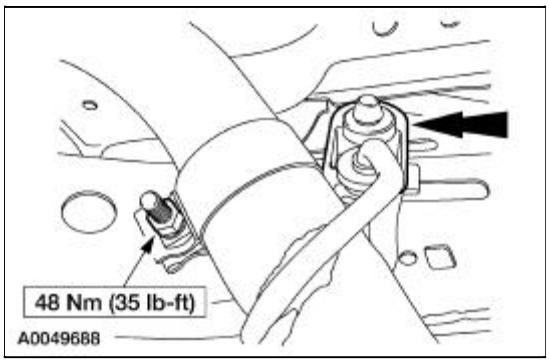


Exhaust Heat Shields

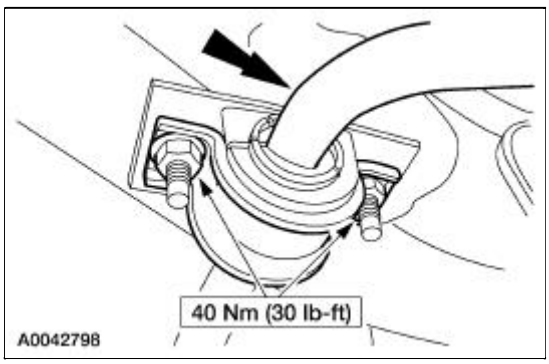
Removal and Installation

1. Raise and support the vehicle. For additional information, refer to Section 100-02 .
2. Inspect the exhaust system for loose or missing heat shields or debris trapped between the heat shields and the exhaust system components.

3. If any heat shields are loose, install worm gear clamps.
   - Use one of the following clamps: FOTZ-5A231–A or W705949–S300.
   - Trim off the excess ear of the worm clamp.

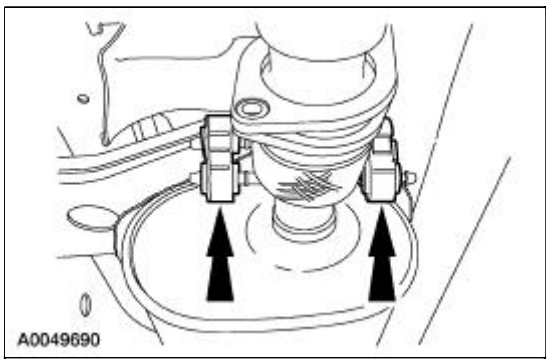


4. If the heat shields are missing, install new heat shields or exhaust system components as necessary.
5. Lower the vehicle.

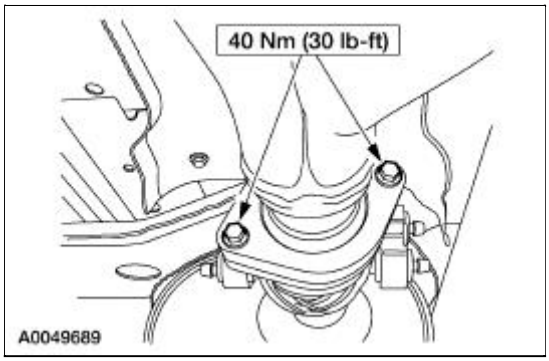


Muffler And Tailpipe

Removal and Installation

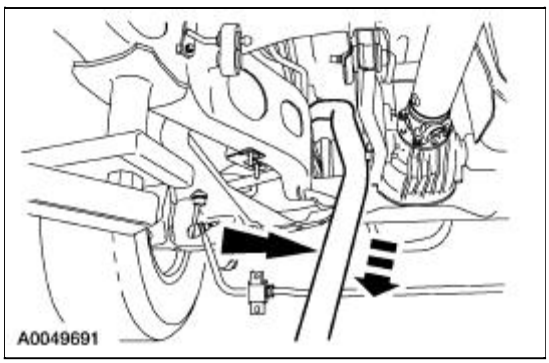


1. Raise and support the vehicle. For additional information, refer to Section 100-02 .
2. Loosen the clamp, detach the isolator and remove the extension pipe or, if equipped, remove the resonator.



3. Remove the four nuts and two stabilizer bar brackets.
   - Allow the bar to hang from the links.

4. Using a suitable jack stand, support the muffler.
5. Detach the isolators from the muffler.



6. Remove and discard the bolts and flag nuts.

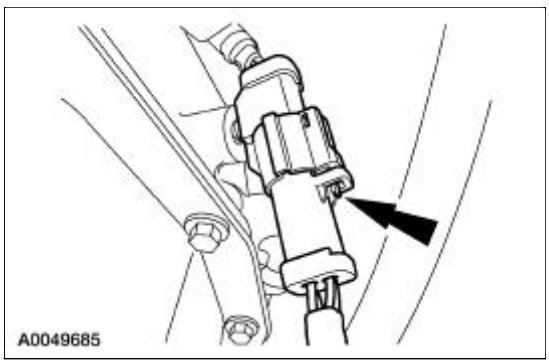
7. **CAUTION: Make sure not to make contact with the axle boots while routing the muffler outlet over the rear axle or damage to the boots may result.**

   Remove the muffler and tailpipe assembly.

8. To install, reverse the removal procedure.

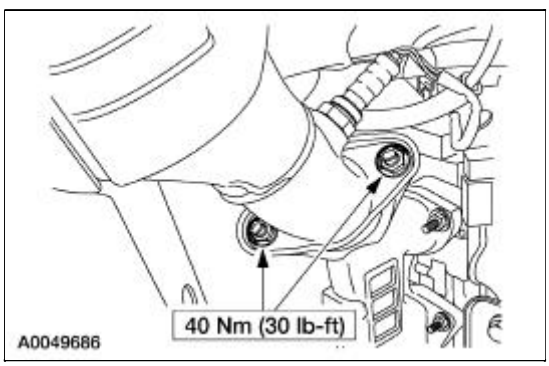
Dual Converter Y-Pipe

Material



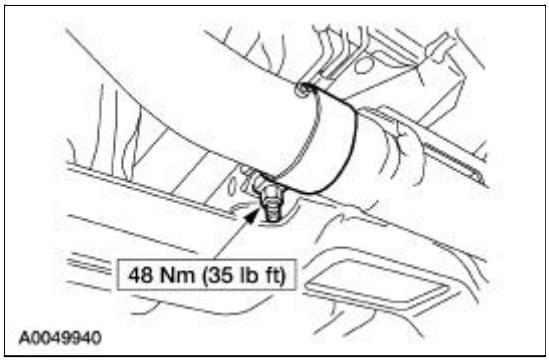
Item	Specification
High Temperature Nickel Anti-Seize Lubricant F6AZ-9L494-AA	ESE-M12A4-A

Removal and Installation



NOTE: The dual converter Y-pipe is a two-piece assembly. The RH and LH converters can be serviced separately as needed.

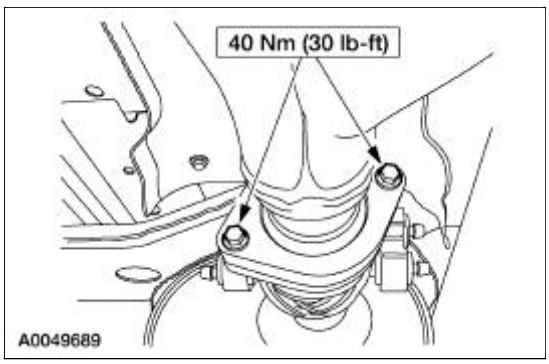
Both RH and LH converters



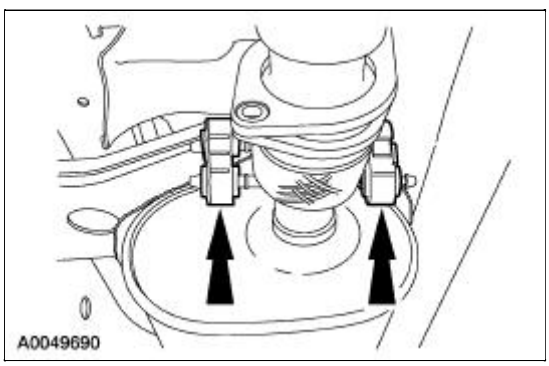
1. Raise and support the vehicle. For additional information, refer to Section 100-02 .
2. Disconnect the heated oxygen and catalyst monitor sensors.

3. Remove and discard the catalytic converter-to-exhaust manifold nuts.

4. Loosen the clamp.

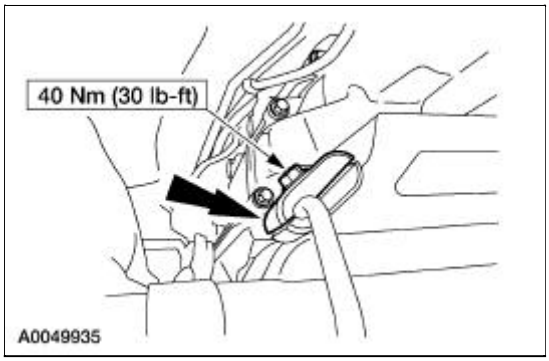


LH converter only



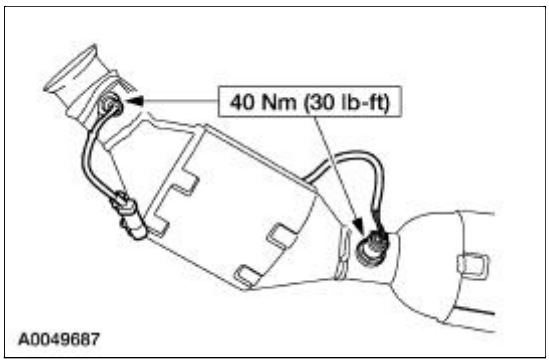
5. Separate and remove the LH converter.

RH converter only



6. Remove and discard the bolts and flag nuts.

7. Using a suitable jack stand, support the muffler.
8. Detach the isolators and lower the muffler assembly.



9. Remove the bolt, isolator cap and the RH converter.

Both RH and LH converters

10. **NOTE:** Make sure to apply anti-seize lubricant to the threads of the sensors before installation.

    If necessary, remove the heated oxygen and the catalyst monitor sensors.

11. **CAUTION: Do not tighten the fasteners until all components are assembled, making sure to tighten all fasteners beginning at the front of the vehicle.**

    To install, reverse the removal procedure.

1	9H307	Fuel pump and sender assembly
2	9K007	Fuel tank assembly
3	9J337	Tank fuel line assembly (Navigator)
4	9155	Fuel filter (Navigator)
5	9J279	Fuel supply, return and vapor tube (Navigator)
6	2S284	Fuel supply and vapor tube (Expedition)
7	9J337	Tank fuel line assembly (Expedition)
8	9155	Fuel filter (Expedition)

The vehicle:

- is equipped with a multiport fuel injection system.
- has separately controlled fuel injectors mounted to the intake manifold for each cylinder.
- has fuel injectors that are supplied with pressurized fuel from the fuel pump through the fuel injection supply manifold.

The 5.4L 4V engine:

- has a fuel injection supply manifold which is equipped with a fuel pressure regulator.
- has a fuel pressure regulator controlling the pressure going to the fuel injectors.
- has excess fuel to the fuel injectors returned to the fuel tank.

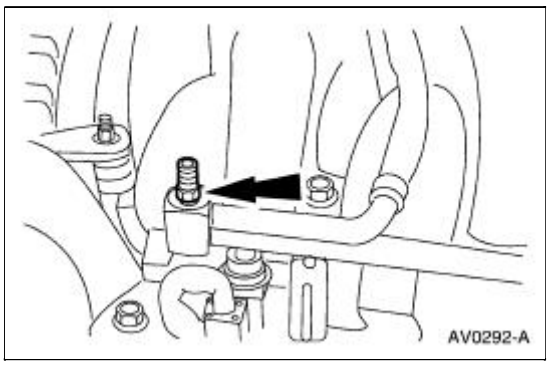
The 4.6L and 5.4L (2V) engines:

- have a returnless fuel supply manifold.
- have a fuel pressure regulator mounted to the fuel pump assembly inside the fuel tank.
- have a fuel injection supply manifold which is equipped with a fuel pressure damper.

Fuel System

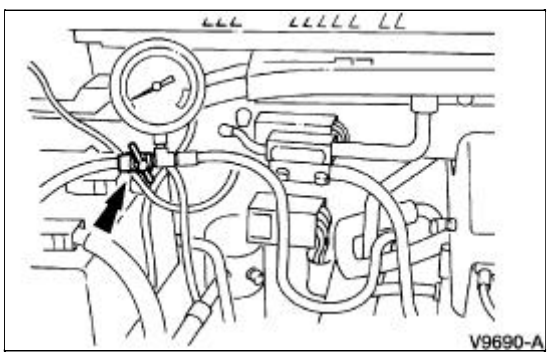
Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Fuel System Pressure Release



Special Tool(s)

 ST1371-A	Fuel Pressure Gauge 310-012 (T80L-9974-B)



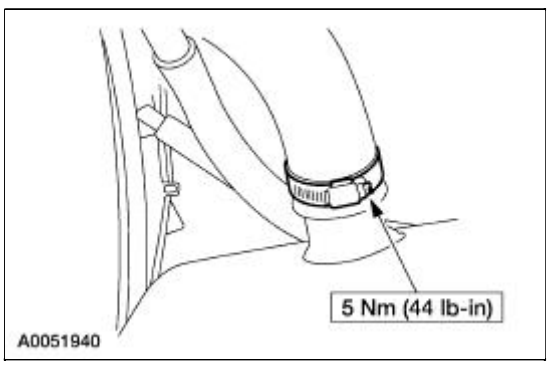
WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related component. Highly flammable mixtures are always present and may be ignited, resulting in possible personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before servicing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, causing personal injury or a fire hazard.

1. Remove the schrader valve cap and install the special tool.

2. Open the manual valve slowly on the special tool and relieve the fuel pressure.
   - This will drain some fuel out of the system. Place the fuel in a suitable container.

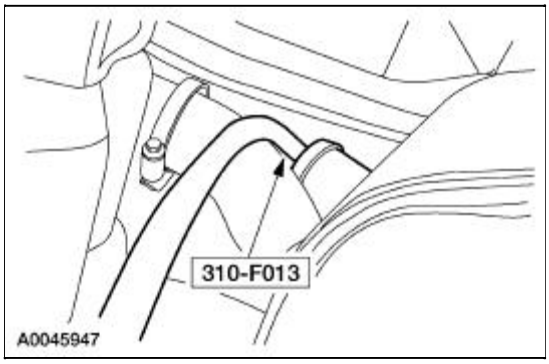
Fuel Tank Draining



Special Tool(s)

 ST2134-A	Fuel Tank Drain Hose 310-F013
 ST1114-A	Hand Operated Fuel Storage Tank 164-R3201 or equivalent

WARNING: Do not smoke, carry lighted tobacco or open flame of any type when working on or near any fuel- related component. Highly flammable mixtures are always present and can be ignited, resulting in possible personal injury.



1. If equipped, turn the air suspension switch off.
2. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.
3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
4. **CAUTION: The fuel filter is located near the left side frame rail on the fuel tank. Correct placement of the vehicle hoisting equipment is necessary to prevent damaging any fuel system components.**

   Raise and support the vehicle. For additional information, refer to Section 100-02 .
5. Disconnect the fuel tank filler pipe from the fuel tank.

6. **NOTE:** Follow the operating instructions of the equipment manufacturer.

Using the special tool, siphon the fuel from the fuel tank opening into a suitable container.

Spring Lock Couplings

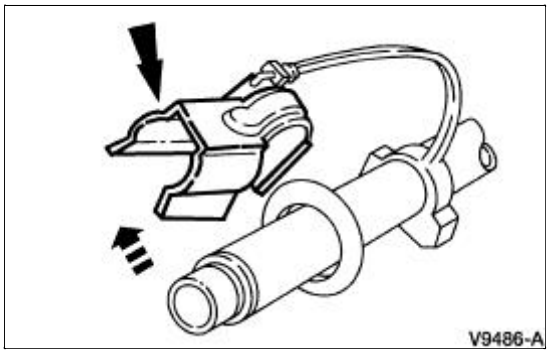
Special Tool(s)

 ST1146-A	Disconnect Tool, Spring Lock Coupling (3/8 inch) 310-D004 (D87L-9280-A) or equivalent
 ST1147-A	Disconnect Tool, Spring Lock Coupling (1/2 inch) 310-D005 (D87L-9280-B) or equivalent

Material

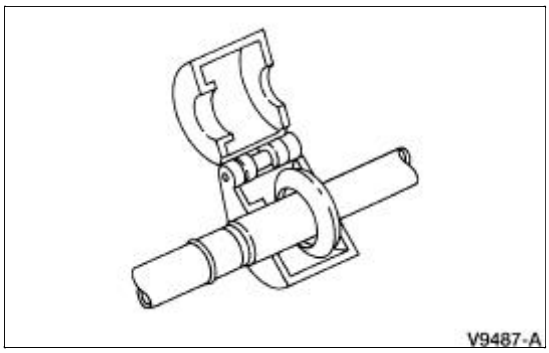
Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Disconnect



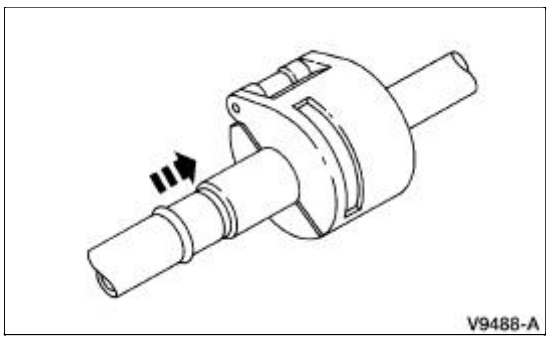
WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel- related component. Highly flammable mixtures are always present and may be ignited, resulting in possible personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before servicing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, causing personal injury or a fire hazard.

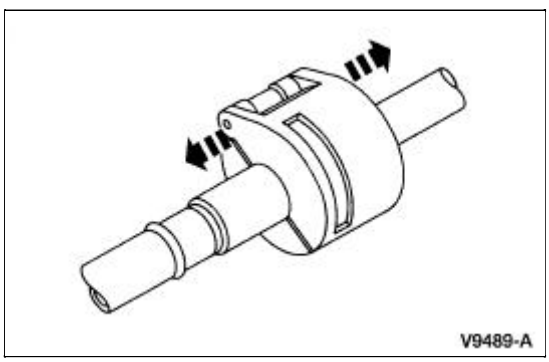


NOTE: These couplings are used to connect the fuel hoses to the fuel supply manifold.

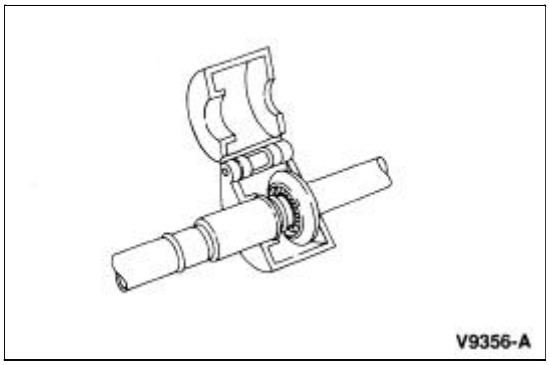
1. Relieve the fuel pressure. For additional information, refer to Fuel System Pressure Release in this section.



2. Remove the fuel tube clip.

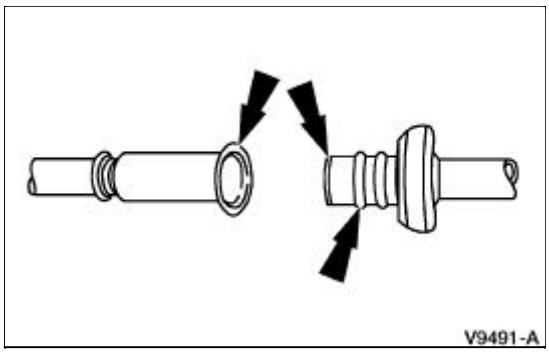


3. Install the Disconnect Tool.



4. Close and push the Disconnect Tool into the open side of the cage.

5. Separate the fitting.



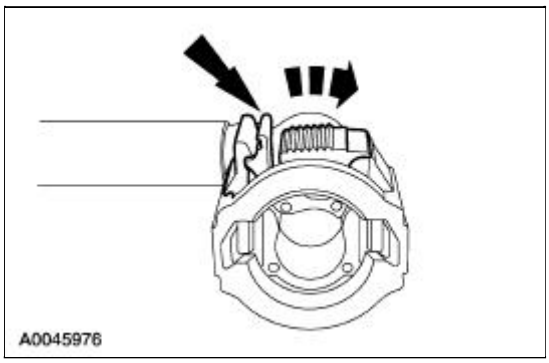
6. Remove the Disconnect Tool.

Connect

1. To connect the fittings, reverse the disconnect procedure.
    - Inspect and clean both the coupling ends.
    - Lubricate the O-rings with clean engine oil.

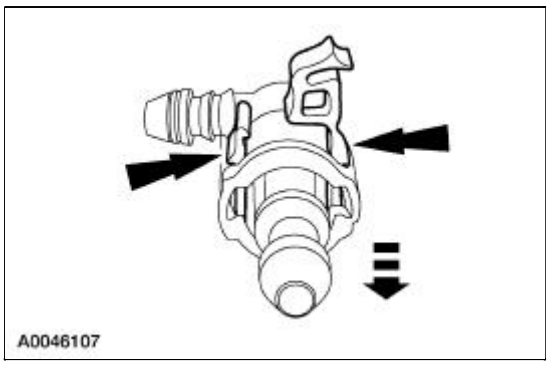
Quick Release Coupling

Disconnect



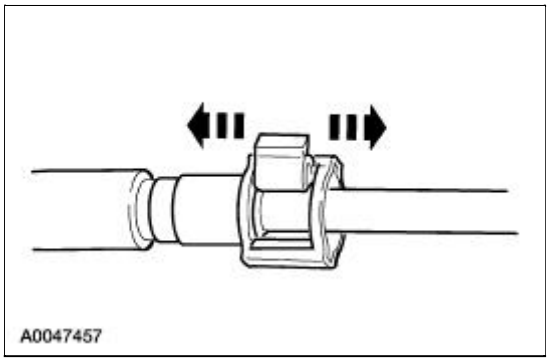
WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel- related component. Highly flammable mixtures are always present and can be ignited, resulting in possible personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before servicing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, causing personal injury or a fire hazard.



NOTE: These couplings are used to connect the fuel tank fuel lines to the front fuel lines, and the pump/sender assembly ports.

1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

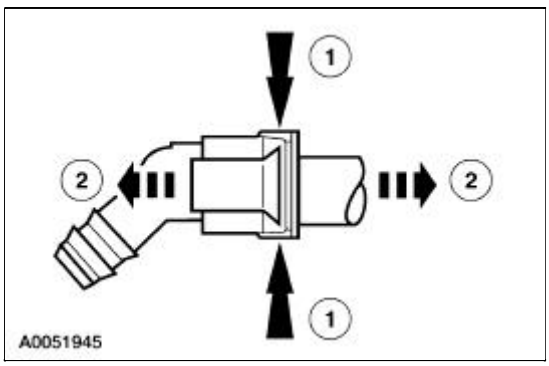


2. Unclip the tab.

3. Depress the tabs and press the clip downward.

4. Separate the fittings.

5. To connect the fittings, reverse the disconnect procedure.



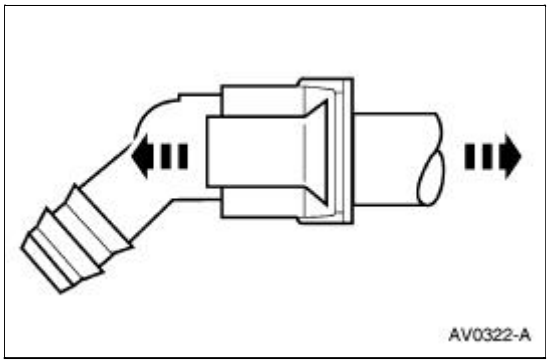
Vapor Tube Fittings

Removal

1. **WARNING: The evaporative emission system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or fuel liquid is present in the area.**

   Disconnect the battery ground cable.

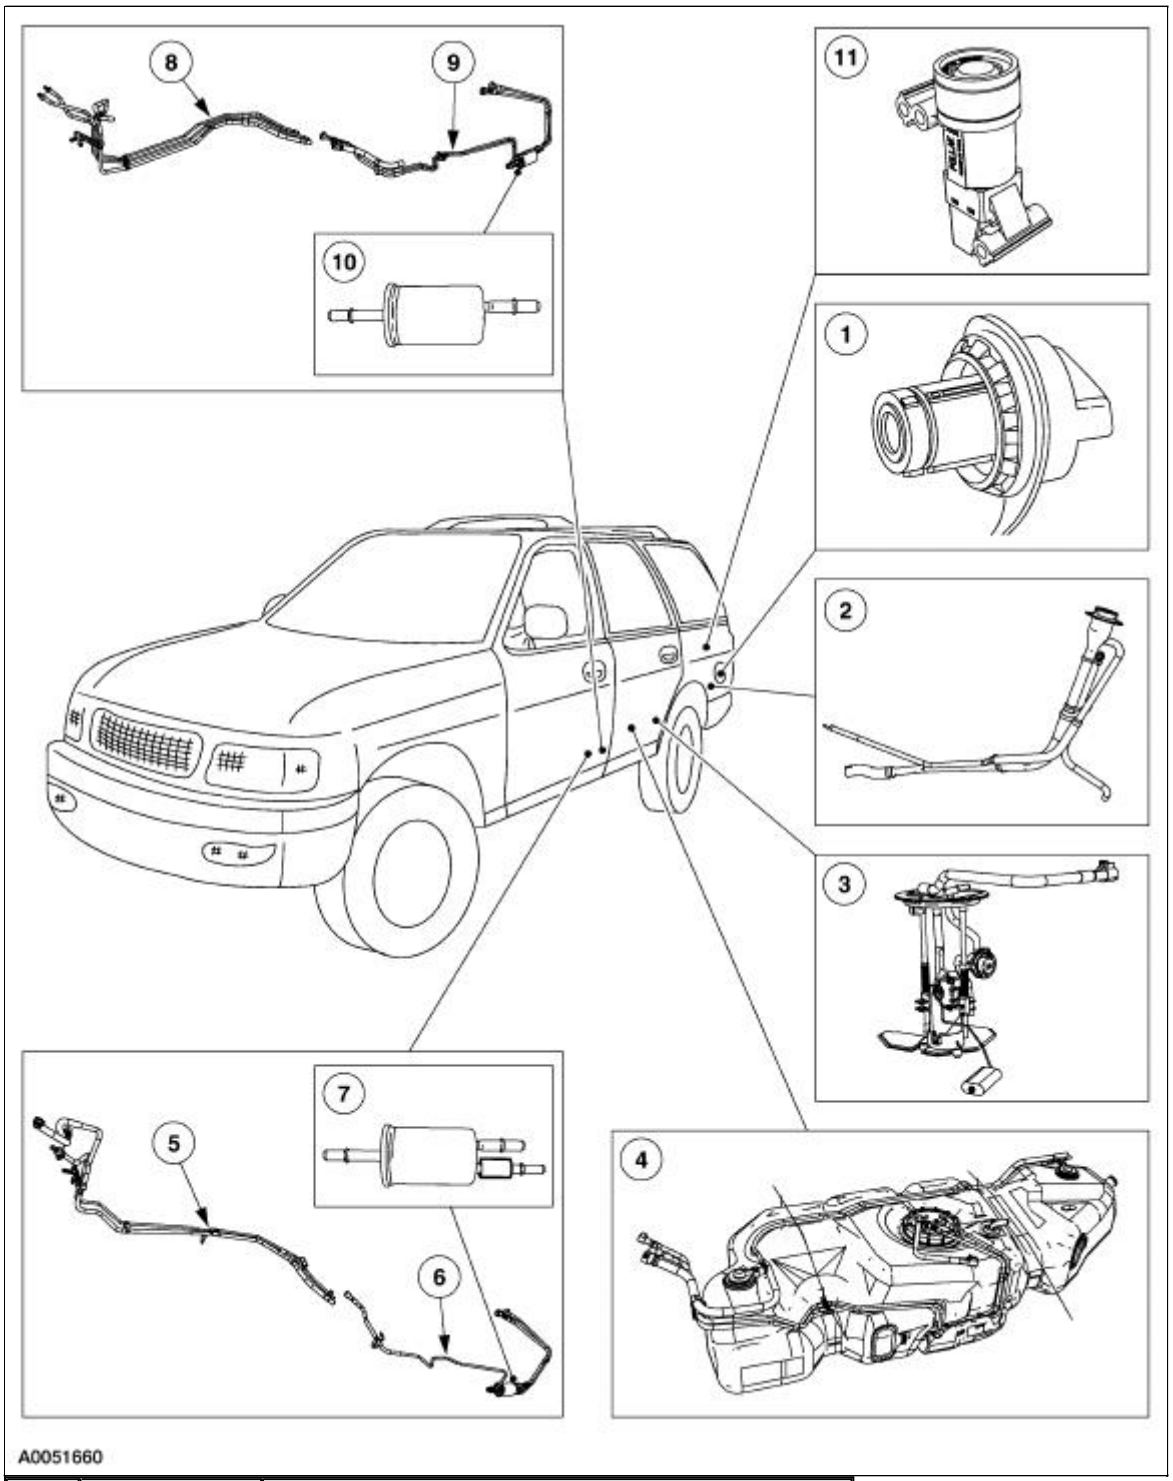
2. Disconnect the vapor tube from the fitting.
   1. Squeeze the fitting.
   2. Disconnect the vapor tube from the fitting.



Installation

1. Inspect the fitting and the tube for damage.
2. Remove any dirt or obstructions.
3. Push the tube into the fitting until it snaps in place.

4. Pull on the connection to make sure the fitting is secure.



AV0322-A

Fuel Tank And Lines

Component Location

Item	Part Number	Description
1	9030	Fuel tank filler cap
2	9034	Fuel tank filler pipe assembly

3	9H307	Fuel pump and sender assembly
4	9K007	Fuel tank assembly
5	2S284	Fuel supply and vapor tube (Expedition)
6	9J337	Tank fuel line assembly (Expedition)
7	9155	Fuel filter (Expedition)
8	9J279	Fuel supply, return and vapor hose (Navigator)
9	9J337	Tank fuel line assembly (Navigator)
10	9155	Fuel filter (Navigator)
11	9341	Inertia fuel shutoff switch

The fuel system consists of:

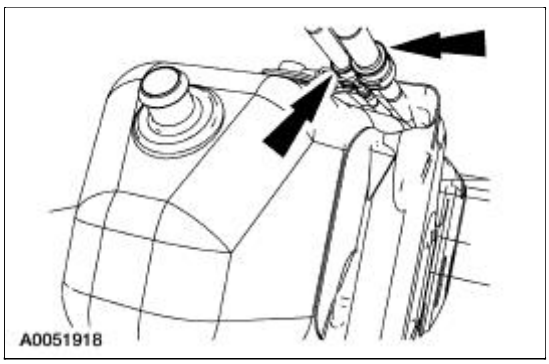
- the fuel tank assembly.
- the fuel tank filler pipe which contains a restrictor plate to permit only unleaded fuel to be pumped into the fuel tank.
- a 1/8 turn type fuel tank filler cap.
- a fuel filter to protect the fuel injectors located on the fuel tank assembly.
- fuel lines.
- fuel pressure regulator, located on the fuel supply manifold for Navigator and inside the fuel tank assembly on the fuel pump for Expedition.
- a fuel pump containing:
    - the electric fuel pump which provides pressurized fuel to the engine.
    - the fuel level sensor.
    - an inlet filter.
    - a check valve which maintains system pressure after the pump is shut off.
    - a pressure relief valve for overpressure protection in the event of restricted flow.

The fuel pump is controlled by the powertrain control module (PCM) which energizes the fuel pump relay. Electrical power to the pump is provided through the inertia fuel shutoff switch.

Fuel Tank And Lines

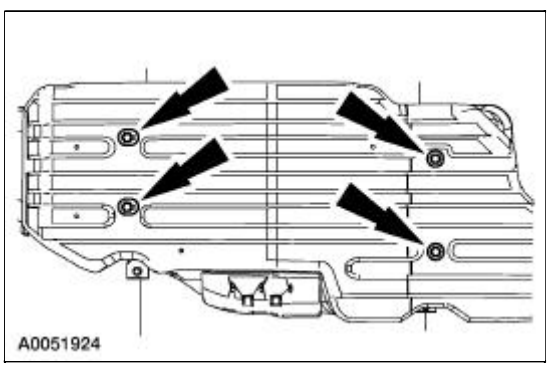
Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Fuel Tank



Removal

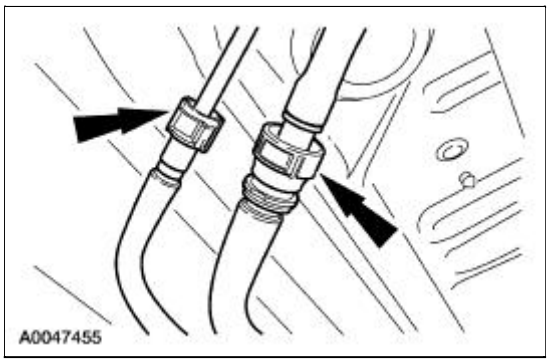
WARNING: Do not smoke, carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and can be ignited, resulting in possible personal injury.



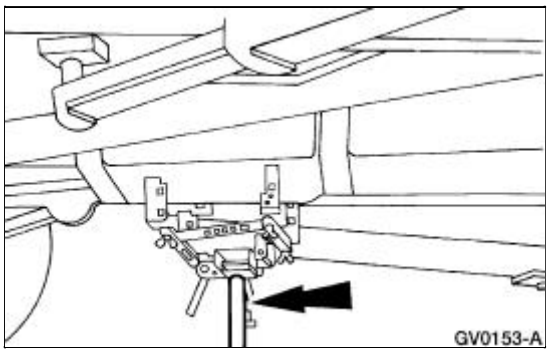
WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before servicing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, causing personal injury or a fire hazard.

CAUTION: The fuel filter is located near the left side frame rail on the fuel tank. Correct placement of the vehicle hoisting equipment is necessary to prevent damaging any fuel system components.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Drain the fuel tank. For additional information, refer to Section 310-00 .
3. Disconnect the vapor hoses at the rear of the fuel tank.

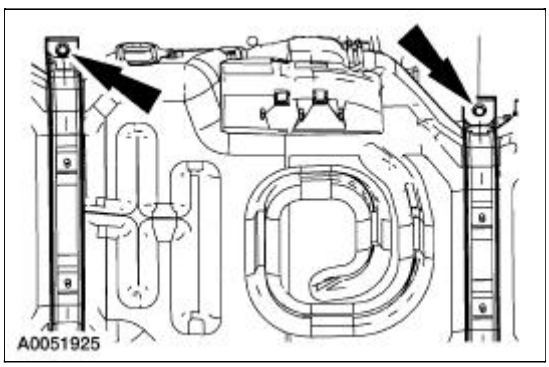


4. If equipped, remove the fuel tank skid plate.



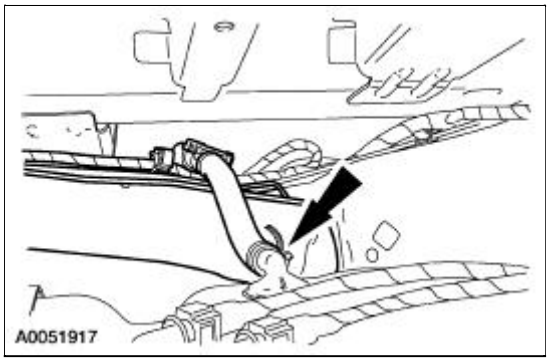
5. **NOTE:** The 4.6L and 5.4L (2V) engines are equipped with returnless fuel systems. The 5.4L 4V engine is equipped with a return-type fuel system.

Disconnect the vapor hose and the fuel hose(s) forward of the fuel tank. For additional information, refer to Section 310-00 .



6. **CAUTION: Do not support the fuel tank directly beneath the fuel pump mounting area. Damage to the fuel pump assembly can occur.**

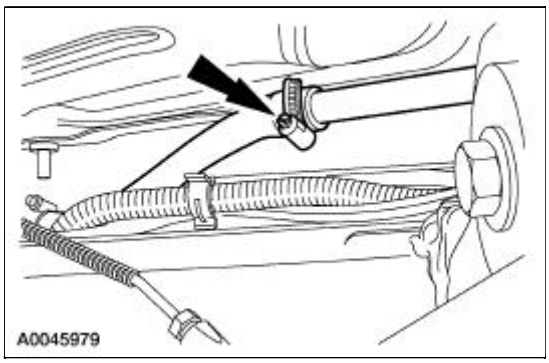
   Position a suitable jack under the fuel tank.



7. **NOTE:** The location of the fuel vent hose is critical to fuel system operation. Note the routing of the fuel vent hose at this time.

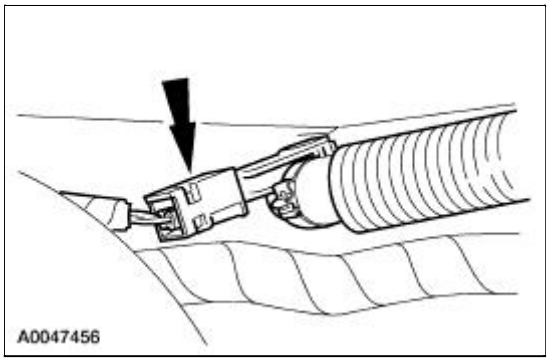
   Remove the fuel tank front and rear support straps and lower the front of the fuel tank approximately 25 mm (1 in).

8. Loosen the clamp and disconnect the vent hose from the fuel tank vent spout.



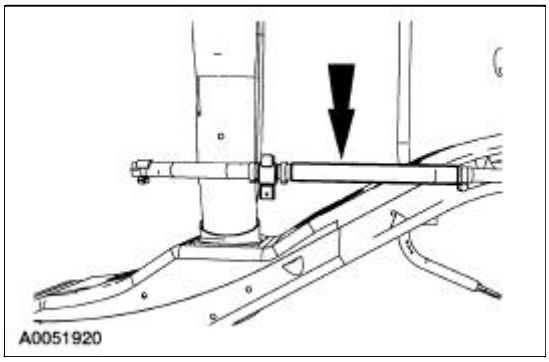
9. Disconnect the fuel pump electrical connector.

10. Remove the fuel tank from the vehicle.



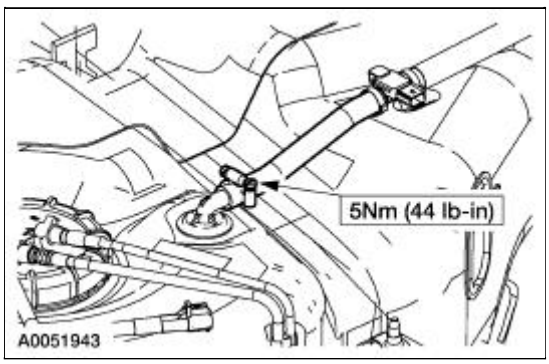
11. **NOTE:** The clamp is located on the top of the left side frame rail.

    Loosen the clamp and disconnect the hose from the fuel fill pipe vent tube.



12. **NOTE:** The fuel tank pressure sensor is located forward of the left rear wheel well above the frame rail.

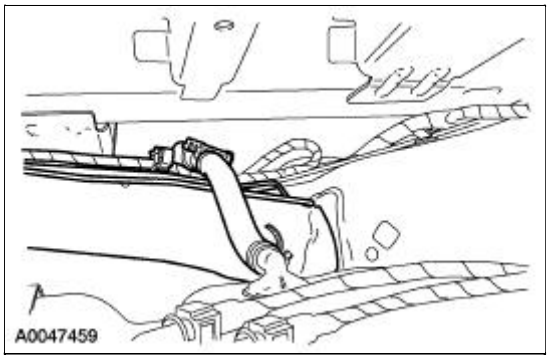
    Disconnect the fuel tank pressure sensor electrical connector.



13. Remove the vent hose assembly.

Installation

1. Install the vent hose to the fuel tank vent spout.

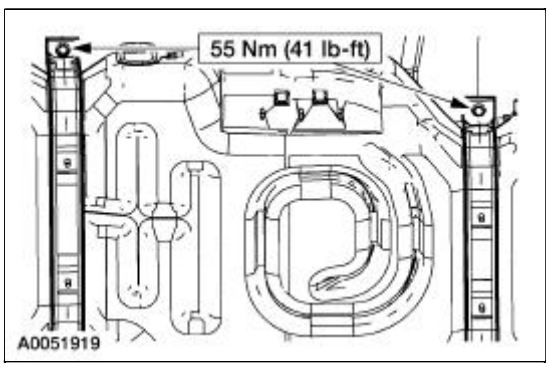


2. **CAUTION: Do not support the fuel tank directly beneath the fuel pump mounting area. Damage to the fuel pump assembly can occur.**

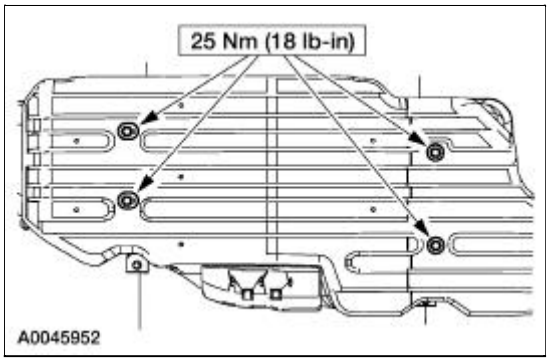
   CAUTION: Correct routing of the fuel vent hose and fuel tank pressure sensor is critical to fuel system operation. Make sure that the fuel vent hose and fuel tank pressure sensor are routed above the crossmember and brake cables.

   NOTE: If a new fuel tank is being installed, transfer the fuel vent hose and fuel tank pressure sensor to the new tank.

   Position the fuel tank in the vehicle.

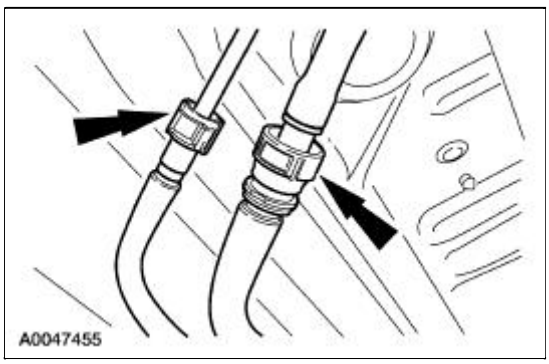


3. Connect the fuel tank pressure sensor electrical connector.

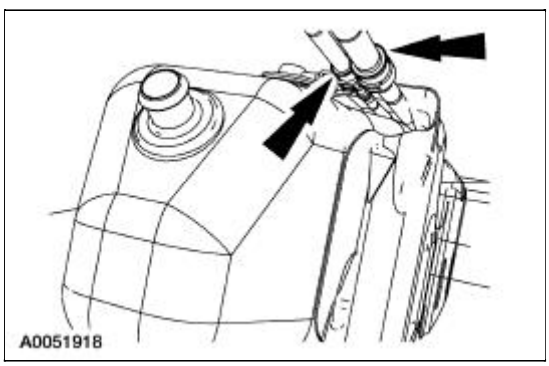


4. Connect the fuel pump electrical connector.

5. Install the front and rear support straps.

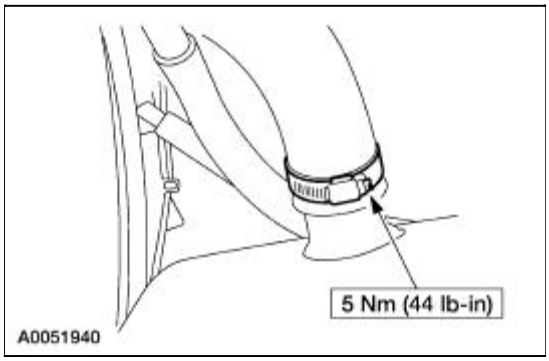


6. If equipped, install the fuel tank skid plate.



7. **NOTE:** The 4.6L and 5.4L (2V) engines are equipped with returnless fuel systems. The 5.4L 4V engine is equipped with a return-type fuel system.

   Connect the vapor hose and the fuel hose(s) forward of the fuel tank. For additional information, refer to Section 310-00 .



8. Connect the vapor hoses at the rear of the fuel tank.

9. Connect the vent hose to the filler pipe.

10. Connect the fuel filler hose.

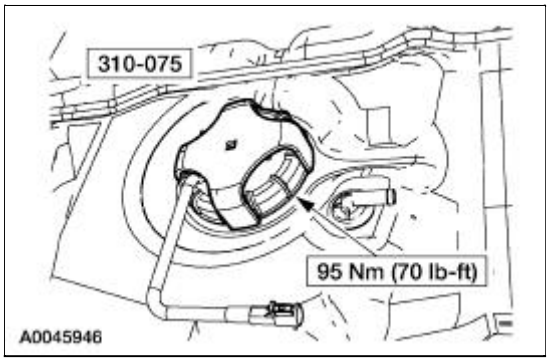
11. Fill the fuel tank.

Fuel Pump Module

Special Tool(s)

 ST2672-A	310-075 Wrench, Fuel Tank Lock Ring

Removal and Installation

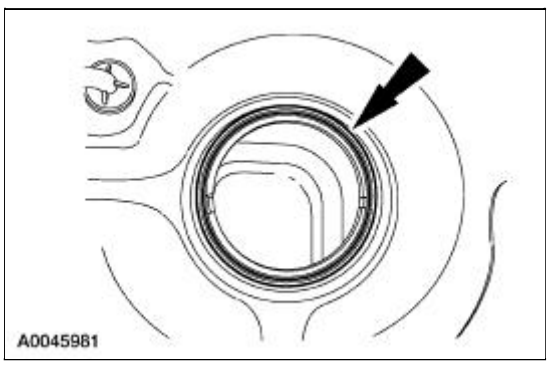


WARNING: Do not smoke, carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and can be ignited, resulting in possible personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before servicing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, causing personal injury or a fire hazard.

1. Remove the fuel tank. For additional information, refer to Fuel Tank in this section.
2. Disconnect the quick release fittings from the fuel pump. For additional information, refer to Section 310-00 .

3. Using the special tool, remove the fuel pump lock ring.



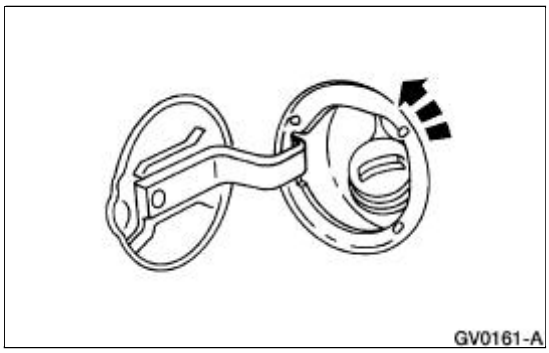
4. **CAUTION: Carefully remove the fuel pump assembly to avoid damaging the fuel level sensor.**

   Remove the fuel pump assembly.

5. **CAUTION: Note the location of the fuel pump alignment tabs.**

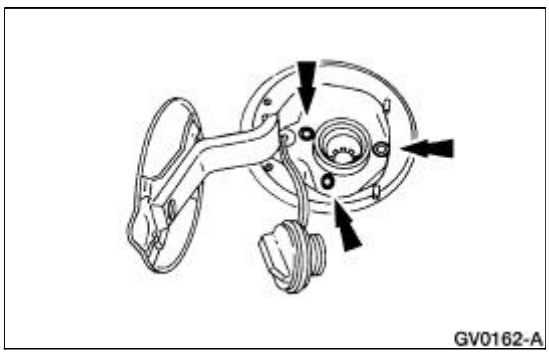
   Remove the O-ring.

6. Remove the fuel level sensor. For additional information, refer to Fuel Level Sensor in this section.



7. To install, reverse the removal procedure.

Fuel Tank Filler Pipe

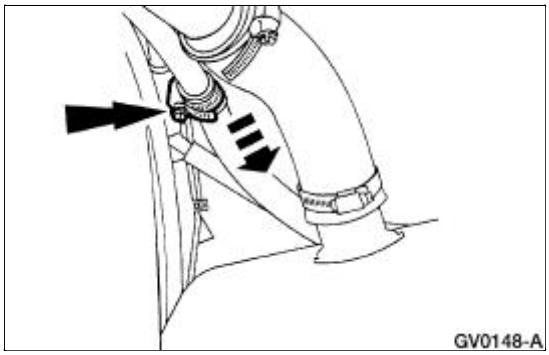


Removal and Installation

WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and can be ignited, resulting in possible personal injury.

1. Remove the fuel tank filler cap.

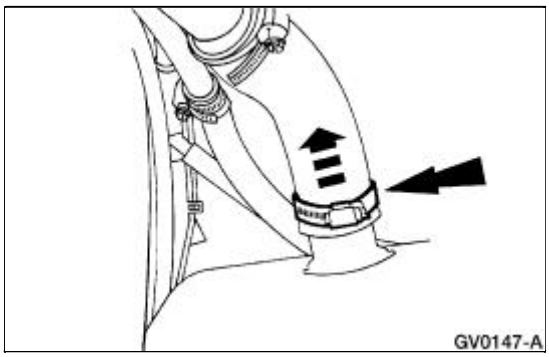
2. Remove the screws.



3. **CAUTION: The fuel filter is located near the left side frame rail on the fuel tank. Correct placement of the vehicle hoisting equipment is necessary to prevent damaging any fuel system components.**

   Raise the vehicle on a hoist. For additional information, refer to Section 100-02 .

4. Remove the evaporative emissions canister assembly. For additional information, refer to Section 303-13 .



5. Loosen the hose clamp and disconnect the fuel filler vent hose from the fuel tank filler pipe.

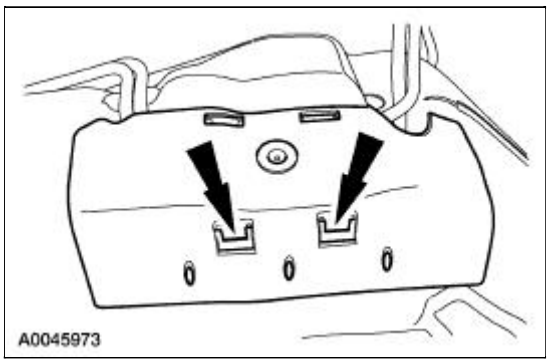
6. Remove the two bolts from the filler pipe bracket.

7. Disconnect the fuel tank from the filler pipe hose and remove the fuel tank filler pipe.

8. To install, reverse the removal procedure.

Fuel Filter

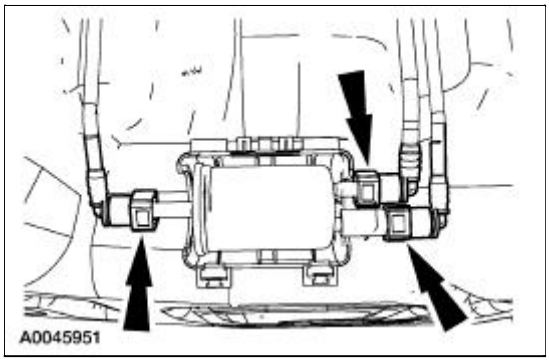
Removal and Installation



All vehicles

WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel- related component. Highly flammable mixtures are always present and can be ignited, resulting in possible personal injury.

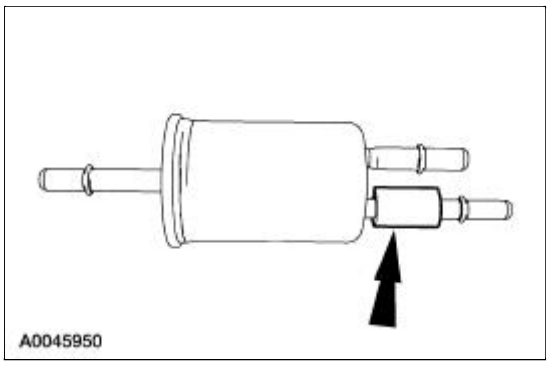
WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before servicing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, causing personal injury or a fire hazard.



1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. **CAUTION: The fuel filter is located near the left side frame rail on the fuel tank. Correct placement of the vehicle hoisting equipment is necessary to prevent damaging any fuel system components.**

   Raise and support the vehicle on a hoist. For additional information, refer to Section 100-02 .
4. Insert a medium flat-blade screwdriver in the the fuel filter protective cover tabs, turn 45 degrees, and gently remove the cover from the tank.

Vehicles equipped with 4.6L and 5.4L (2V) engines

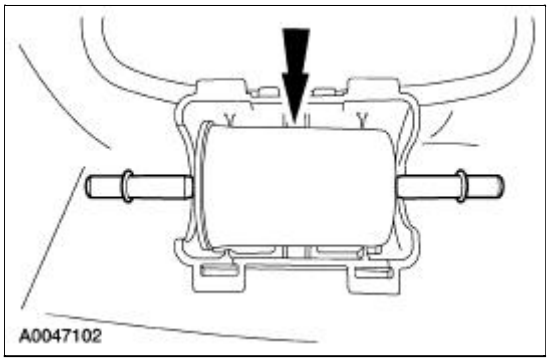


5. Disconnect the fittings.

6. **NOTE:** Note the location of the fuel tube orientation sleeve.

   Remove the fuel filter.

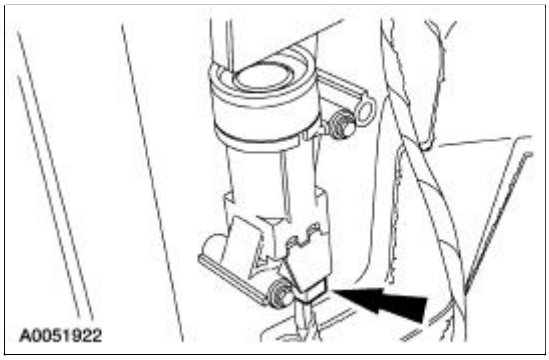
7. Remove the fuel tube orientation sleeve from the fuel filter.



Vehicles equipped with 5.4L (4V) engines

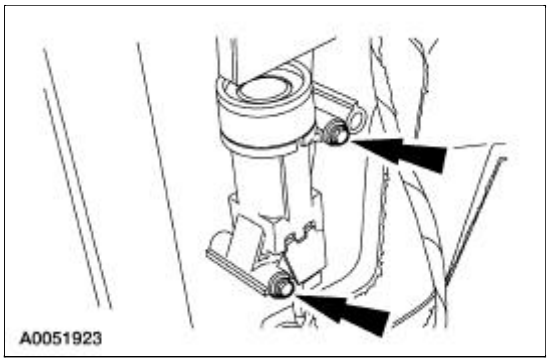
8. Disconnect the fittings.

9. Remove the fuel filter.



All vehicles

10. To install, reverse the removal procedure.

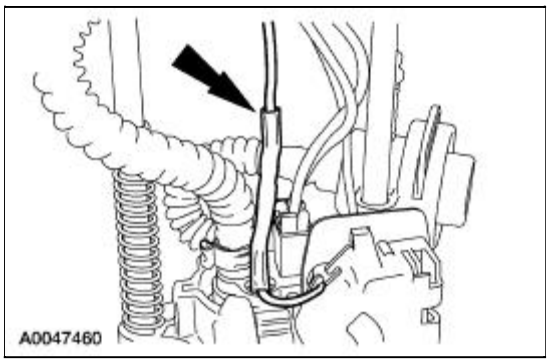


Inertia Fuel Shutoff (IFS) Switch

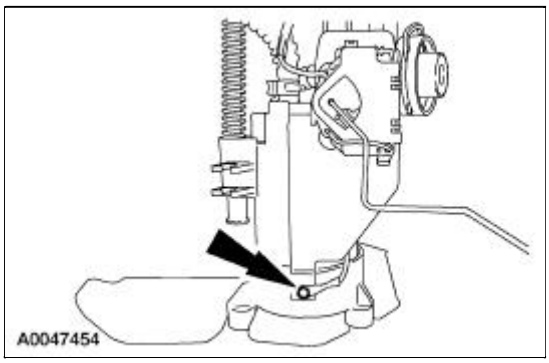
Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the LH rear interior trim panel.
3. Disconnect the inertia fuel shutoff (IFS) switch electrical connector.

4. Remove the bolts and the inertia fuel shutoff (IFS) switch.



5. To install, reverse the removal procedure.



Fuel Level Sensor

Removal and Installation

1. Remove the fuel pump module. For additional information, refer to Fuel Pump Module in this section.
2. Remove the shrink wrap and disconnect the electrical connector.

3. Remove the fastener and lift the fuel level sensor from the fuel pump module.

4. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in
Accelerator pedal bolts	25	18	—
Appearance cover nuts	10	—	89
Appearance cover mounting bracket bolts	10	—	89
Accelerator cable bracket bolts	10	—	89

Acceleration Control

The throttle is controlled by an accelerator cable attached to the accelerator pedal. The accelerator pedal should travel smoothly from the idle position to the wide open throttle position. Hesitation or binding should not be experienced at any portion of the accelerator pedal travel. Surrounding components such as wiring, hoses, sound insulator and floor carpet must not contact the sliding inner member of the accelerator cable, or interfere with the accelerator pedal.

All vehicles are equipped with adjustable pedals. This allows both the accelerator and brake pedals to be adjusted simultaneously forward or rearward. A rocker switch on the instrument panel provides adjustment on the pedal's assembly when it is activated. On vehicles with the memory seat option, the pedal's position can be controlled by the memory selection, as well as the rocker switch. The accelerator pedal can be serviced separately from the brake pedal. The components in the acceleration control system are not adjustable and new components must be installed if damaged or worn.

Acceleration Control

Inspection and Verification

1. Verify the customer's concern by operating the acceleration control system to duplicate the condition.
2. Inspect to determine if any of the following mechanical concerns apply:

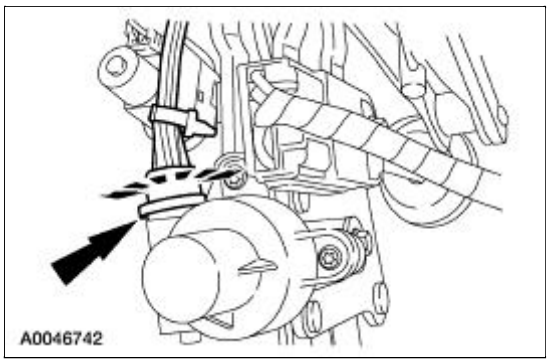
Visual Inspection Chart

Mechanical
● Damaged accelerator pedal and shaft ● Damaged linkage ● Damaged accelerator cable ● High engine idle speed ● Damaged throttle body ● Damaged or binding adjustable pedal assembly

3. If the inspection reveals an obvious concern that can be readily identified, repair it as required.
4. If the concern remains after the inspection, determine the symptom(s). GO to Symptom Chart .

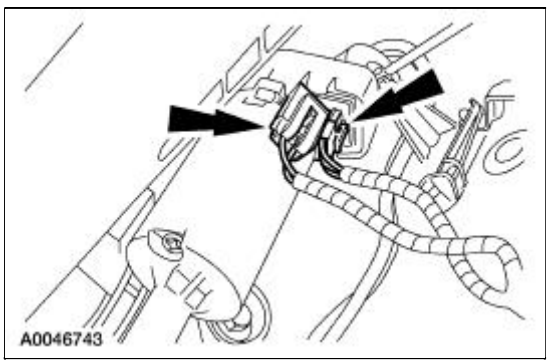
Symptom Chart

Symptom Chart



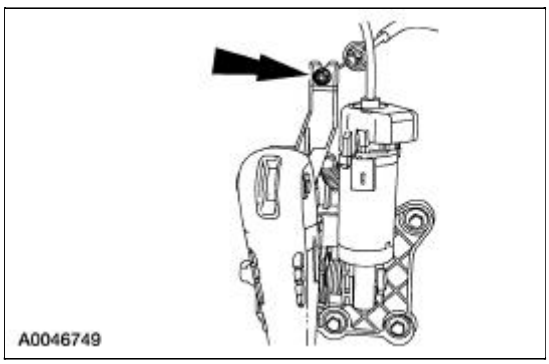
Condition	Possible Sources	Action
● Excessive effort is needed to depress accelerator cable	● Interference between accelerator cable and foreign object or another component under dash.	● CORRECT interference condition.
	● Interference between accelerator pedal and foreign object or another component.	● CORRECT interference condition.
	● Accelerator cable binding.	● INSTALL a new accelerator cable.
	● Worn or damaged throttle body.	● INSTALL a new throttle body. REFER to Section 303-04A (4.6L, 5.4L 2V) or Section 303-04B (5.4L 4V).
	● Worn accelerator lever pivot bushing.	● INSTALL a new accelerator pedal.

• Accelerator pedal binds or sticks	• Foreign object caught under pedal or in linkage under dash. • Floormat interference with pedal. • Kinked accelerator cable. • Worn or damaged throttle body.	• CHECK accelerator pedal and linkage. • CHECK floormat and floormat hook. • INSTALL a new accelerator cable. • INSTALL a new throttle body. REFER to Section 303-04A (4.6L, 5.4L 2V) or Section 303-04B (5.4L 4V).
• Engine idle speed is high and throttle is held off the throttle body idle stop	• Foreign object caught in accelerator pedal linkage. • Kinked or bound accelerator cable.	• CHECK the accelerator pedal linkage. • INSTALL a new accelerator cable.
• Engine idle speed is high and throttle is NOT held off the throttle body idle stop.	• Vacuum leak. • Electronic engine control system.	• CHECK for disconnected or damaged vacuum lines. • Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• The accelerator pedal feels rough or raspy	• Frayed or binding accelerator cable. • Worn or damaged throttle body.	• INSTALL a new accelerator cable. • Install a new throttle body. REFER to Section 303-04A (4.6L, 5.4L 2V) or Section 303-04B (5.4L 4V).
• Adjustable accelerator pedal does not adjust	• Foreign object caught in accelerator pedal linkage. • Accelerator pedal assembly drive cable disconnected or broken. • Adjustable pedal assembly drive motor.	• CHECK the accelerator pedal linkage. • CHECK that the adjustable pedal assembly drive cable is connected to the brake pedal assembly. • REFER to Section 206-00 for adjustable pedal assembly diagnostics.

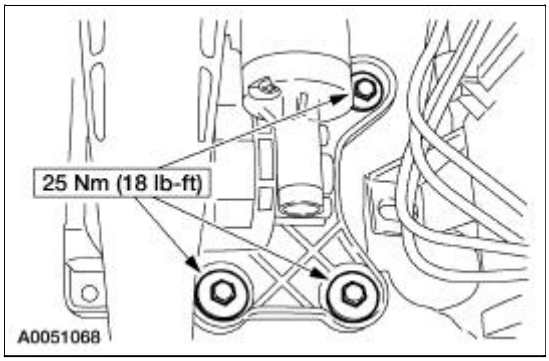


Accelerator Pedal

Removal and Installation



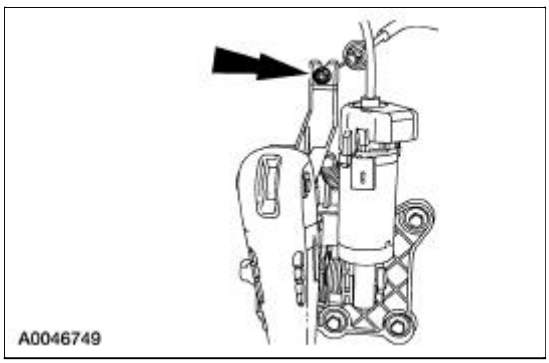
1. Turn the locking cap 90 degrees in either direction and remove the drive cable from the brake pedal assembly.



2. Disconnect the drive motor electrical connectors.

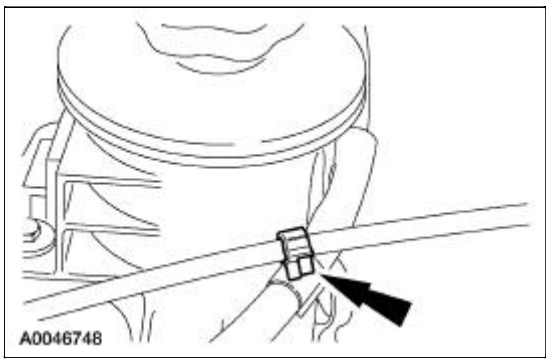
3. Disconnect the accelerator cable from the accelerator pedal.

4. Remove the bolts and the accelerator pedal.



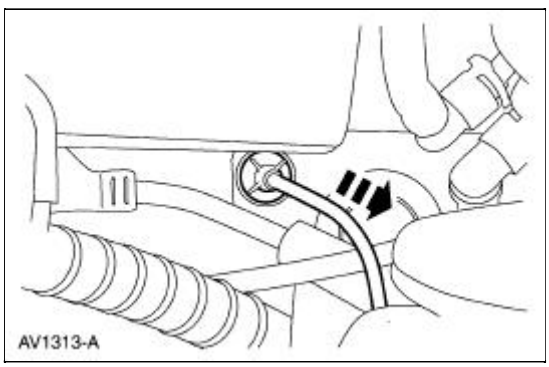
5. To install, reverse the removal procedure.

Accelerator Cable —4.6L

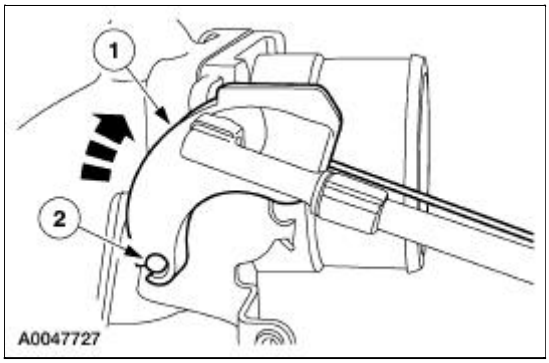


Removal and Installation

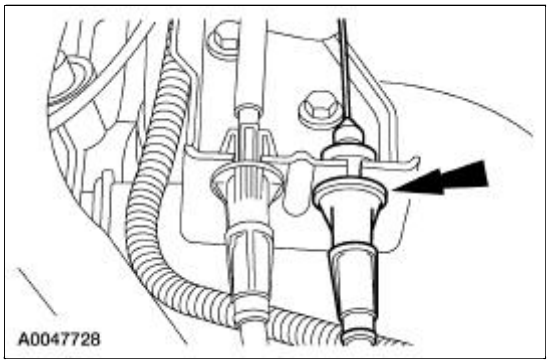
1. Disconnect the accelerator cable from the accelerator pedal.



2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .



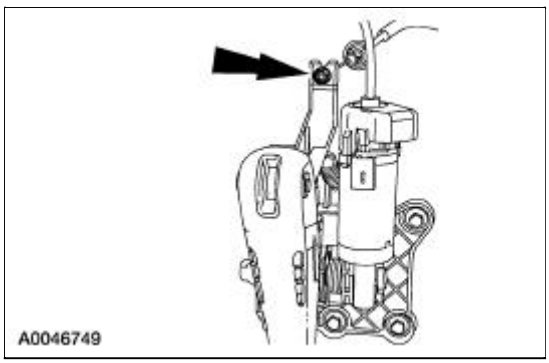
3. Detach the accelerator cable from the routing clip.



4. Squeeze the accelerator cable lock tabs on the inside of the passenger compartment and push the accelerator cable into the engine compartment.

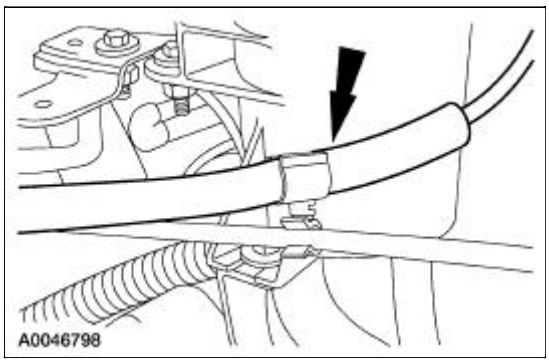
5. Disconnect the accelerator cable from the throttle lever to remove the accelerator cable.
    1. Rotate the throttle body cam forward.
    2. Slide the accelerator cable end from the throttle body cam.

6. Depress the locking tabs and remove the accelerator cable from the accelerator cable bracket.



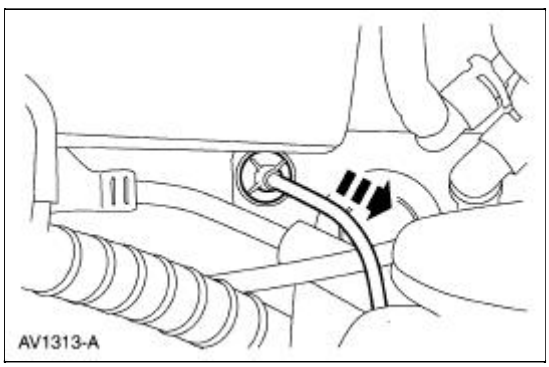
7. To install, reverse removal procedure.

Accelerator Cable —5.4L (2V)

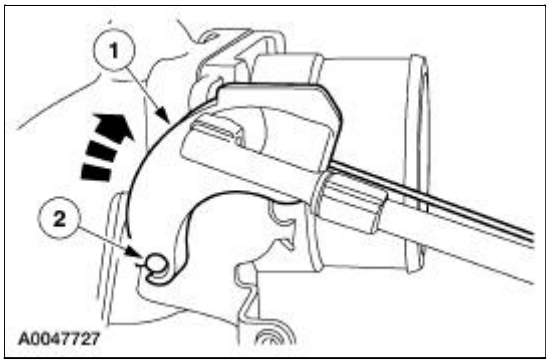


Removal and Installation

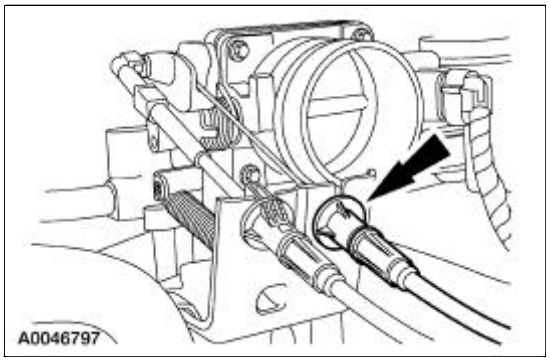
1. Disconnect the accelerator cable from the accelerator pedal.



2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .



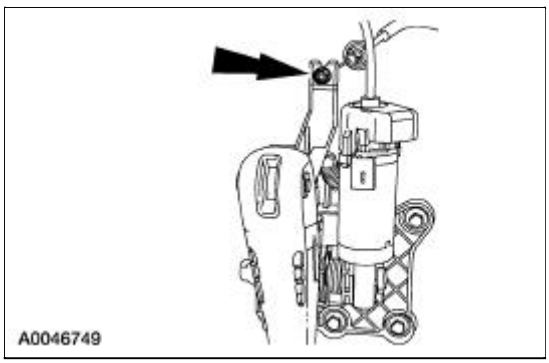
3. Detach the accelerator cable from the routing clip.



4. Squeeze the accelerator cable lock tabs on the inside of the passenger compartment and push the accelerator cable into the engine compartment.

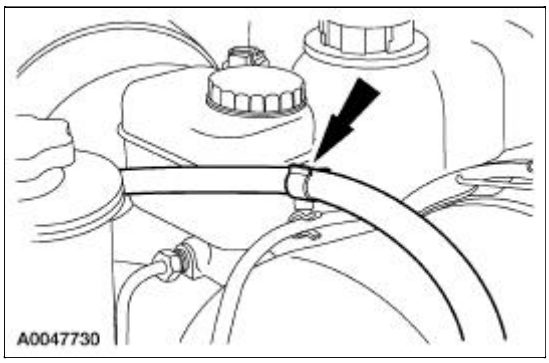
5. Disconnect the accelerator cable from the throttle body cam.
    1. Rotate the throttle body cam forward.
    2. Slide the accelerator cable end from the throttle body cam.

6. Depress the locking tabs and remove the accelerator cable from the accelerator cable bracket.



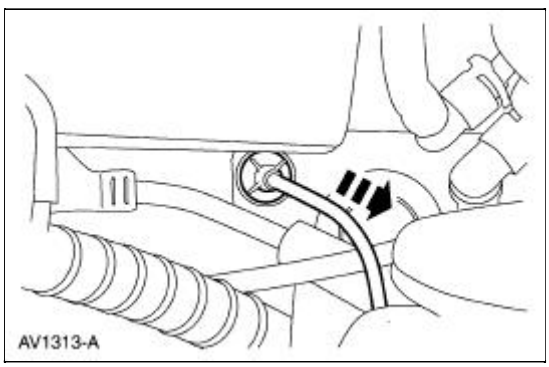
7. To install, reverse the removal procedure.

Accelerator Cable —5.4L (4V)

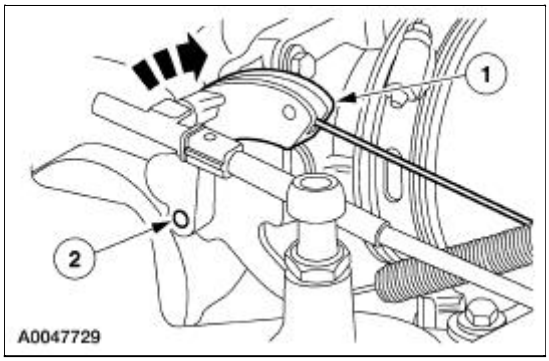


Removal and Installation

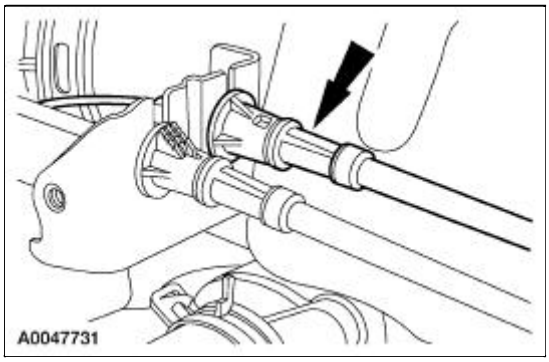
1. Disconnect the accelerator cable from the accelerator pedal.



2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .



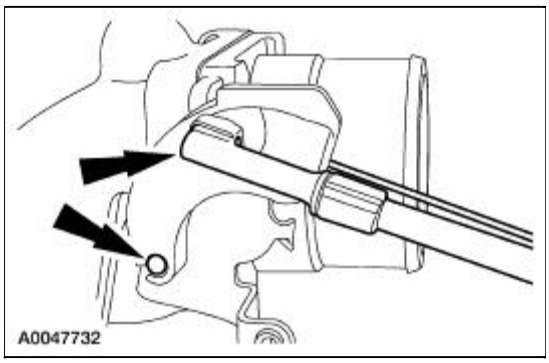
3. Detach the accelerator cable from the routing clip.



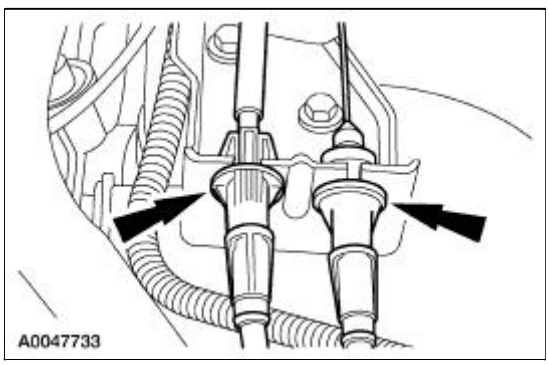
4. Squeeze the accelerator cable lock tabs on the inside of the passenger compartment and push the accelerator cable into the engine compartment.

5. Disconnect the accelerator cable from the throttle body cam.
    1. Rotate the throttle body cam forward.
    2. Slide the accelerator cable end from the throttle body cam.

6. Depress the tabs and remove the accelerator cable from the accelerator cable bracket.

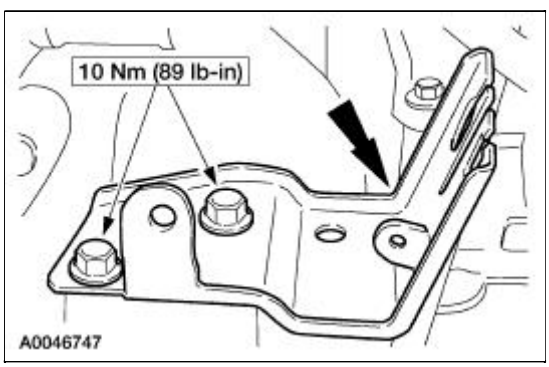


7. To install, reverse the removal procedure.



Accelerator Cable Bracket —4.6L

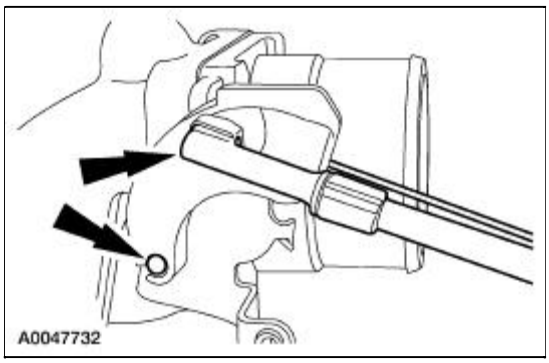
Removal and Installation



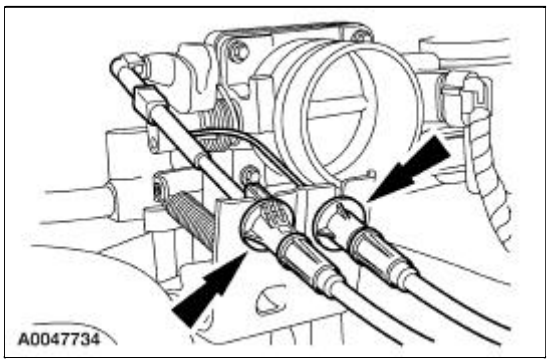
1. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
2. Disconnect the accelerator cable and the speed control cable from the throttle body cam.

3. Disconnect the accelerator cable and the speed control cable from the accelerator cable bracket.

4. Remove the throttle return spring from the accelerator cable bracket.
5. Remove the accelerator cable bracket.

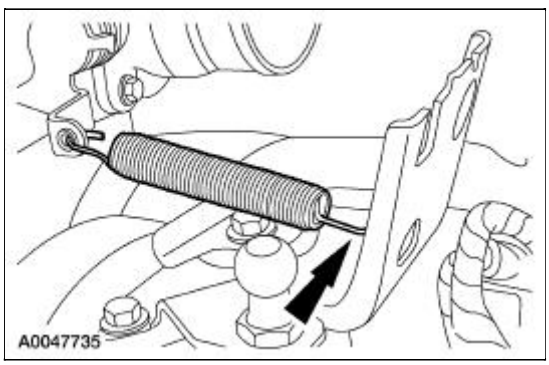


6. To install, reverse the removal procedure.

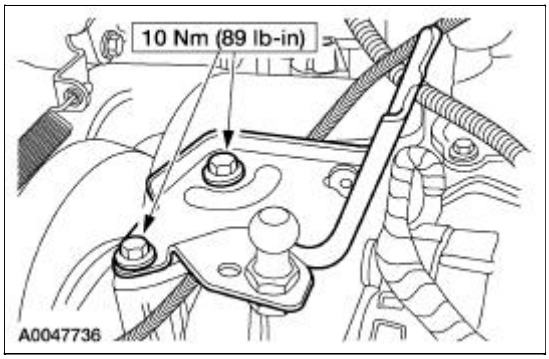


Accelerator Cable Bracket —5.4L (2V)

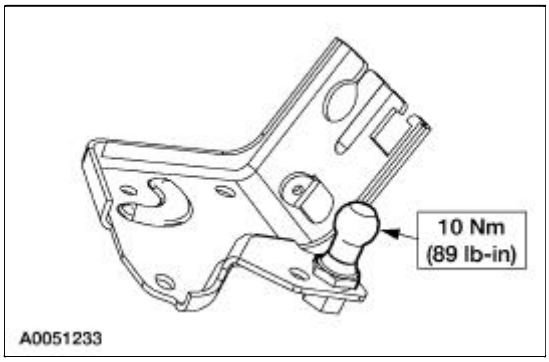
Removal and Installation



1. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
2. Disconnect the accelerator cable and the speed control cable from the throttle body cam.



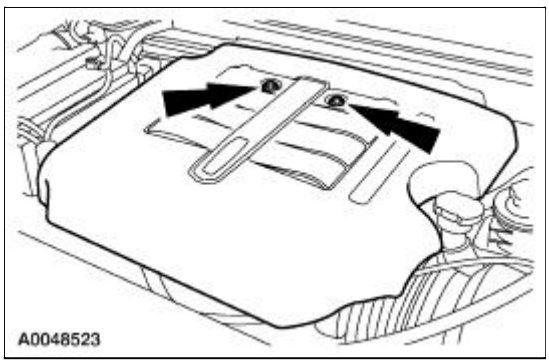
3. Disconnect the accelerator cable and the speed control cable from the accelerator cable bracket.



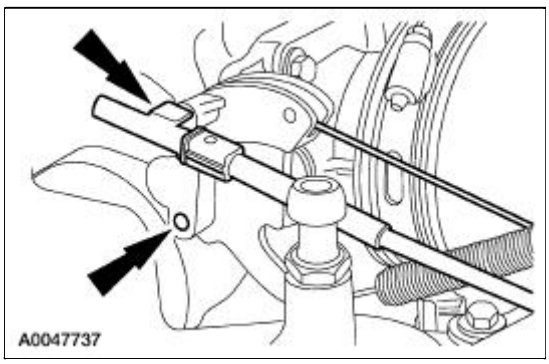
4. Remove the throttle return spring from the accelerator cable bracket.

5. Remove the accelerator cable bracket.

6. Remove the ball stud from the accelerator bracket.

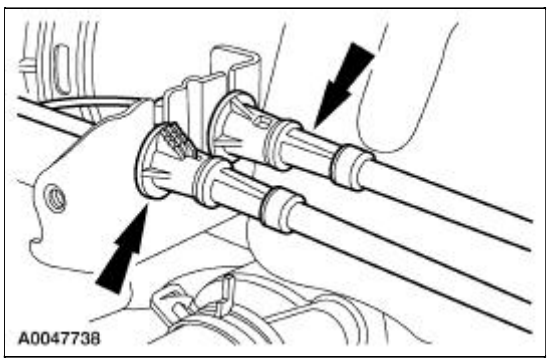


7. To install, reverse the removal procedure.

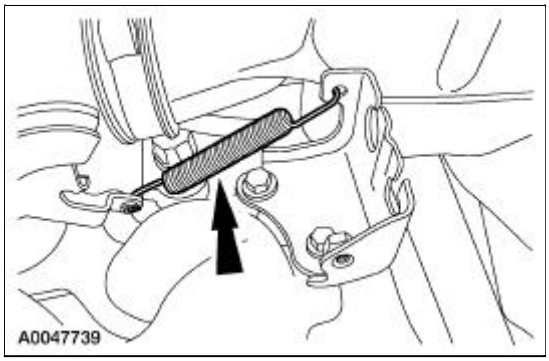


Accelerator Cable Bracket —5.4L (4V)

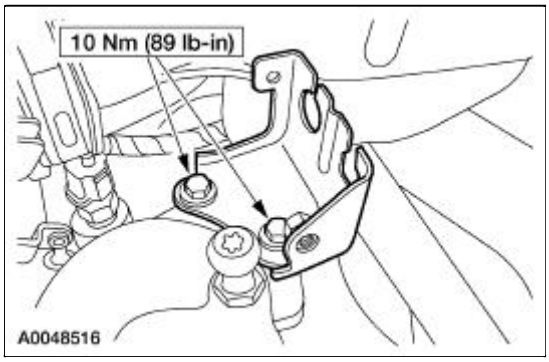
Removal and Installation



1. Remove the appearance cover.



2. Disconnect the accelerator cable and the speed control cable from the throttle body cam.



3. Disconnect the accelerator cable and the speed control cable from the accelerator cable bracket.

4. Remove the throttle return spring from the accelerator cable bracket.

5. Remove the accelerator cable bracket.

6. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in
Deactivator switch	18	13	—
Speed control actuator bracket bolts	9	—	80
Speed control actuator bracket screws	12	9	—
Speed control switch	7	—	62

Speed Control

The speed control system consists of the following components:

- brake pedal position (BPP) switch
- deactivator switch
- speed control actuator
- speed control actuator cable
- speed control actuator switches
- powertrain control module (PCM)

Speed Control

Refer to Wiring Diagrams Cell 31 , Speed Control for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter or equivalent 105-R0057
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool

Refer to Wiring Diagrams Cell 31 for schematic and connector information.

Principles of Operation

The speed control system is designed to maintain a selected vehicle speed between approximately 40 and 200 km/h (25 and 125 mph).

The electronic stepper motor (internal to the speed control actuator) is controlled by turning the three phases of the motor on and off in sequence. The sequence determines the motor direction (open throttle or closed throttle based on vehicle speed).

The speed control module is fully integrated into the powertrain control module (PCM). The PCM strategy uses engine control to accelerate smoothly. In instances where the vehicle tends to want to exceed the set speed, the PCM will invoke an engine braking strategy to help maintain the desired vehicle speed.

Whenever the system is engaged and active, a speed control set indicator will be illuminated in the instrument cluster.

The brake pedal position (BPP) switch is a normally open switch. When the brake pedal is applied with the speed control system engaged, the BPP switch closes to battery voltage, putting the vehicle speed control in stand-by mode.

NOTE: The deactivator switch is provided as an additional safety feature.

Normally, when the brake pedal is pressed, the PCM will deactivate the speed control system. Under increased brake pedal effort, the deactivator switch, a normally closed switch, will open and remove power to the speed control actuator clutch, releasing the throttle independently of the PCM.

The clockspring provides the electrical interface between the steering column wiring and the speed

control switches in the steering wheel.

The PCM sends a standard corporate protocol (SCP) output message to the instrument cluster to indicate when the vehicle speed control system is active.

Inspection and Verification

1. Verify the customer concern.
2. Verify the speedometer operates correctly without speed control by test driving the vehicle. If the speedometer does not operate correctly, refer to Section 413-01 .
3. Verify the stoplamps operate correctly with the ignition switch in the OFF position. If the stoplamps do not operate correctly, refer to Section 417-01 .
4. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Speed control cable ● Throttle lever ● Speed control actuator ● Brake pedal position (BPP) switch ● Power control module (PCM)	● Central junction box (CJB) fuses: ■ 5 (7.5A) ■ 12 (10A) ■ 28 (5A) ● Circuitry

5. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
6. If the cause of the fault is not visually evident, proceed to diagnoses of the speed control system by:

- connecting the diagnostic tool or
- entering the speed control self-test.

Diagnostic tool

7. Connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel, and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
    - check that the program card is correctly installed.
    - check the connections to the vehicle.
    - check the ignition switch position.
8. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.
9. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:

- CKT914, CKT915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
- NO RESP/NOT EQUIP for PCM, Go To Pinpoint Test A .
- SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the KOEO Test.

10. If the DTCs retrieved are related to the concern, go to the PCM Diagnostic Trouble Code (DTC) Index to continue diagnostics.

11. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart to continue diagnostics.

NOTE: DTC P0703 and DTC P1572 must be repaired before any other DTC.

Speed Control Actuator Diagnostic Trouble Code (DTC) Index

DTCs	Description	Source	Action
P0500	Vehicle Speed Error	PCM	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1572	Brake On/Off Failure	PCM	Go To Pinpoint Test G .
P0703	Brake Switch Input Malfunction	PCM	Go To Pinpoint Test F .

Speed Control Self-Test Diagnostics

WARNING: This test is a key on engine off (KOEO) test only that is conducted in PARK only with the emergency brake fully engaged.

1. Enter the Self-Test Diagnostics by depressing the speed control OFF switch while turning the ignition key ON, making sure the engine does not start and is not running. Five additional flashes at this point indicate a defective speed control actuator. Release the OFF switch.

2. Press the remaining switches in this sequence: ON, RESUME, COAST and SET/ACCEL or CANCEL (for Navigator).
   If the "ON" switch is not pressed within five seconds after entering the diagnostic mode, the module times out and the procedure must be started over.
   The speed control indicator lamp will flash as each switch is pressed. Press each switch in the sequence immediately after the indicator light goes out for the previous switch.

3. **NOTE:** There will be a slight delay when the last button is pressed and the lamp flashes.

   A lamp flash with the last button (SET/ACCEL) or CANCEL (for Navigator) indicates that the STATIC test passed. If the lamp does not flash with the last button and there are no additional flashes of the lamp, the switches are defective.
   If the lamp does not flash with the last button, and additional flashes occur, follow the chart below for trouble codes:

NOTE: If unable to enter self-test, Go To Pinpoint Test D .

Flashes	Source
2 Flashes	BPP defective, circuit is defective, brake applied
3 Flashes	Deactivator switch is open or circuit defective

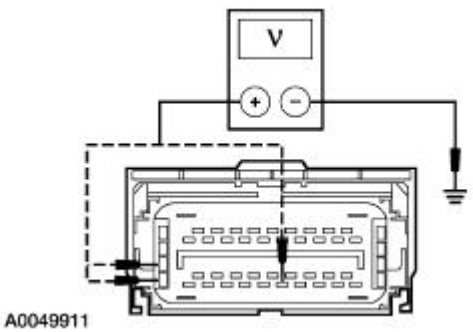
4. Immediately after the STATIC test, the speed control servo does a DYNAMIC test by automatically actuating the throttle lever from 8 mm (0.315 in) to 12 mm (0.472 in) of travel from the idle position. During the DYNAMIC throttle pull, observe throttle movement to witness any binding or sticking of the speed control cable and correct connection of speed control cable to throttle lever. Make sure the throttle returns back to the idle position.

5. Return the ignition switch to the OFF position and proceed to the Symptom Chart.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the powertrain control module (PCM)	• Central junction box (CJB) fuses: ■ 5 (7.5A) ■ 34 (20A) • Circuitry. • PCM.	• Go To Pinpoint Test A .
• The speed control is inoperative—no DTCs	• Circuitry. • Deactivator switch. • Digital transmission range (TR) sensor. • Low battery voltage.	• Go To Pinpoint Test B .
• The speed control does not disengage when the brake are applied	• Speed control actuator. • BPP switch. • Speed control switch. • Deactivator switch.	• Go To Pinpoint Test C .
• The speed control switches are inoperative—no DTCs	• Speed control switch.	• Go To Pinpoint Test D .
• The speed control indicator lamp is always on	• Instrument cluster.	• REFER to Section 413-01 .
• Flash code 2 — brake pedal position switch circuit failure.	• Circuitry. • BPP switch. • Speed control servo.	• Go To Pinpoint Test E .
• Flash code 3 — deactivator switch circuit failure.	• CJB fuse 34 (10A). • Circuitry. • Deactivator switch. • Speed control servo.	• Go To Pinpoint Test F .



Pinpoint Test

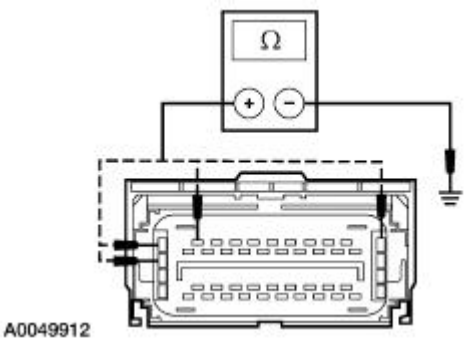
PINPOINT TEST A: NO COMMUNICATION WITH THE POWERTRAIN CONTROL MODULE (PCM)

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>A1 CHECK THE PCM POWER CIRCUITS</td><td rowspan="2">Yes
GO to A2 .

No
REPAIR the circuit.
REPEAT the self-test.</td></tr>
<tr><td>

Key in OFF position.
Disconnect: PCM C175b.
Key in ON position.
Measure the voltage between the PCM C175b and ground as follows:

<table>
<tr><th>Pin</th><th>Circuit</th></tr>
<tr><td>34</td><td>361 (RD)</td></tr>
<tr><td>40</td><td>729 (RD/WH)</td></tr>
<tr><td>46</td><td>361 (RD)</td></tr>
</table>



A0049911

Are the voltages greater than 10 volts?

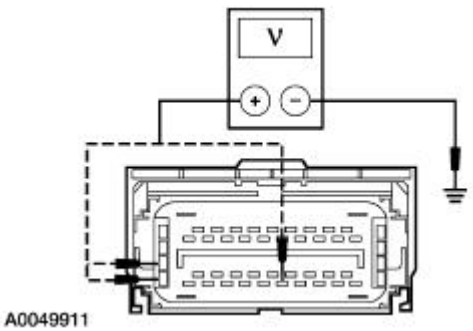
</td></tr>
<tr><td>A2 CHECK THE PCM GROUND CIRCUITS</td><td rowspan="2">Yes
REFER to Section 418-00 .

No
REPAIR the circuit.
REPEAT the self-test.</td></tr>
<tr><td>

Key in OFF position.
Measure the resistance between the PCM C175b and ground as follows:

<table>
<tr><th>Pin</th><th>Circuit</th></tr>
<tr><td>1</td><td>570 (BK/WH)</td></tr>
<tr><td>10</td><td>567 (BK)</td></tr>
<tr><td>11</td><td>570 (BK/WH)</td></tr>
<tr><td>23</td><td>570 (BK/WH)</td></tr>
</table>

A0049912



Are the resistances less than 5 ohms?

</td></tr>
</table>

PINPOINT TEST B: THE SPEED CONTROL IS INOPERATIVE—NO DTCs

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>B1 CHECK THE PCM POWER CIRCUITS</td><td></td></tr>
<tr><td>

Key in OFF position.
Disconnect: PCM C175b.
Key in ON position.
Measure the voltage between the PCM C175b and ground as follows:

<table>
<tr><th>Pin</th><th>Circuit</th></tr>
<tr><td>34</td><td>361 (RD)</td></tr>
<tr><td>40</td><td>729 (RD/WH)</td></tr>
<tr><td>46</td><td>361 (RD)</td></tr>

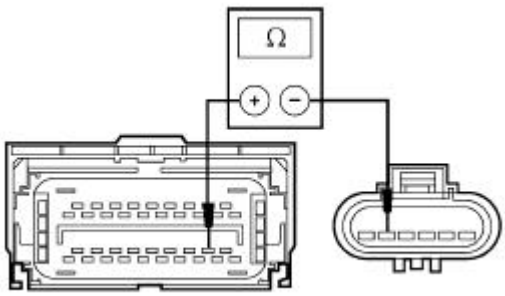
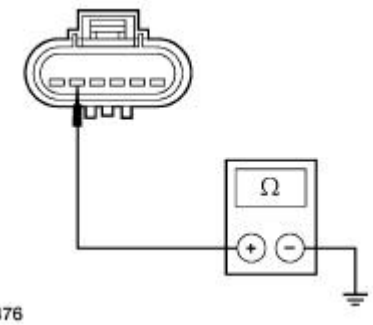
GO to B3 .





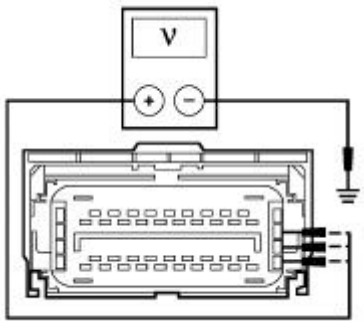
No
REPAIR the circuit.
REPEAT the self-test.</td></tr>
</table>

 A0049912 ● **Are the resistances less than 5 ohms?**	
B3 CHECK CIRCUIT 1928 (RD/WH) FOR AN OPEN	
● Key in OFF position. ● Disconnect: Speed Control Actuator C122. ● Key in ON position. ● Measure the voltage between the speed control actuator C122 pin 1, circuit 1928 (RD/WH), harness side and ground.  A0005468 ● **Is the voltage greater than 10 volts?**	**Yes** GO to B4 . **No** REPAIR the circuit. REPEAT the self-test.
B4 CHECK THE DEACTIVATOR SWITCH CIRCUITRY FOR AN OPEN	
● Measure the voltage between the speed control actuator C122 pin 6, circuit 307 (BK/YE), harness side and ground.  A0005472 ● **Is the voltage greater than 10 volts?**	**Yes** GO to B5 . **No** REPAIR the circuit. REPEAT the self-test.
B5 CHECK CIRCUIT 1927 (TN) FOR SHORT TO POWER	
● Key in ON position. ● Measure the voltage between the speed control actuator C122 pin 5, circuit 1927 (TN), harness side and ground.	**Yes** REPAIR the circuit. REPEAT the self-test. **No** GO to B6 .

A0005474

- **Is any voltage present?**

B6 CHECK CIRCUIT 1927 (TN) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the speed control actuator C122 pin 5, circuit 1927 (TN), harness side and the PCM C175b pin 26, circuit 1927 (TN), harness side.  A0049919 • **Is the resistance less than 5 ohms?**	**Yes** GO to B7 . **No** REPAIR the circuit. REPEAT the self-test.
B7 CHECK CIRCUIT 1927 (TN) FOR SHORT TO GROUND	
• Measure the resistance between the speed control actuator C122 pin 5, circuit 1927 (TN), harness side and ground.  A0005476 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B8 . **No** REPAIR the circuit. REPEAT the self-test.
B8 CHECK THE SPEED CONTROL ACTUATOR	
• Key in OFF position. • Measure the resistance between the speed control actuator pins (component side) as follows: **Speed Control Actuator** Pin 1 — Pin 2 Pin 1 — Pin 3 Pin 1 — Pin 4	**Yes** GO to B9 . **No** INSTALL a new speed control actuator. REFER to Speed Control Actuator in this section. REPEAT the self-test.



A0006460

- **Are the resistances between 2 and 3 ohms?**

B9 CHECK THE SPEED CONTROL ACTUATOR CIRCUITRY FOR SHORT TO POWER

- Disconnect: PCM C175b.
- Key in ON position.
- Measure the voltage between the PCM C175b, harness side and ground as follows:

PCM C175b	Circuit
Pin 35	1924 (DG/WH)
Pin 24	1925 (PK/BK)
Pin 12	1926 (VT/YE)

A0049917

- **Is any voltage present?**

Yes
REPAIR the circuit(s).
REPEAT the self-test.

No
GO to B10 .

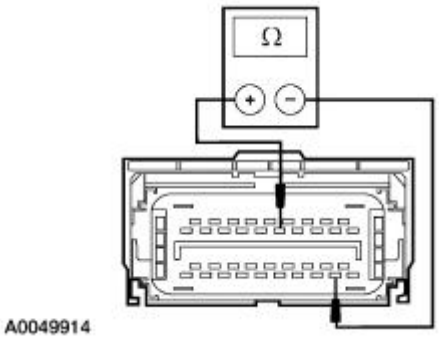
B10 CHECK THE SPEED CONTROL ACTUATOR CIRCUITRY FOR AN OPEN

- Key in OFF position.
- Measure the resistance between the PCM C175b, harness side and the speed control actuator C122, harness side as follows:

PCM C175b	Speed Control Actuator C122	Circuit
Pin 35	Pin 4	1924 (DG/WH)
Pin 24	Pin 3	1925 (PK/BK)
Pin 12	Pin 2	1926 (VT/YE)

- **Are the resistances less than 5 ohms?**

Yes
GO to B11 .



No
REPAIR the circuit(s).
REPEAT the self-test.

B11 CHECK FOR CONTINUITY

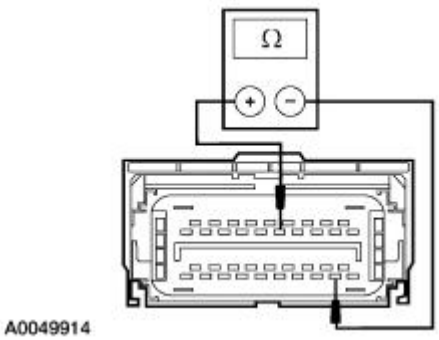
- Key in OFF position.

Yes

- Disconnect: PCM C175b.
- Measure the resistance between the PCM C175b pin 37, circuit 151 (LB/BK), harness side and the PCM C175b pin 17, circuit 848, (DG/OG), harness side.

- **Is the resistance between 4,085 and 4,515 ohms?**

GO to B12 .



No
GO to B13 .

B12 CHECK THE SPEED CONTROL SWITCHES

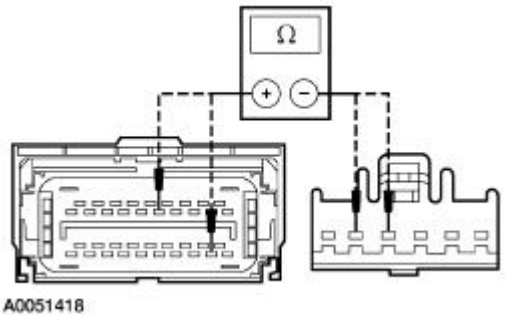
- Measure the resistance between the PCM C175b pin 37, circuit 151 (LB/BK), harness side and the PCM C175b pin 17, circuit 848, (DG/OG), harness side while pressing the switches.

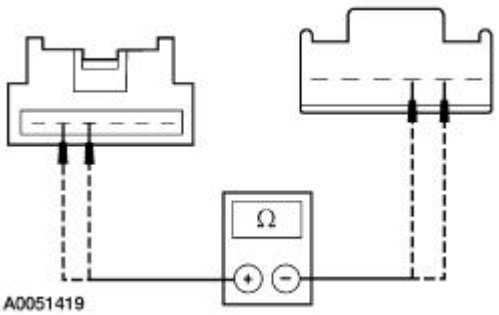
Speed Control Switch with remote audio/climate control

Speed Control Actuator Switch	Resistance Value
Cancel	Between 114 and 126 ohms
Coast	Between 285 and 315 ohms
SET/ACCEL	Between 570 and 630 ohms
Resume	Between 1,055 and 1,165 ohms
On	Between 1,995 and 2,205 ohms
Off	Less than 5 ohms

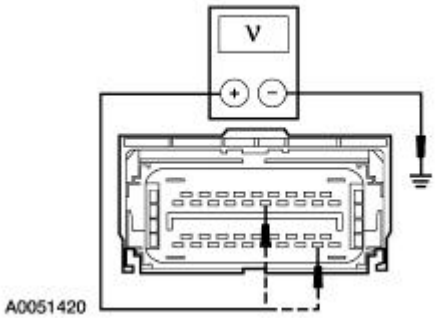
- **Are the speed control actuator switch resistances values OK?**

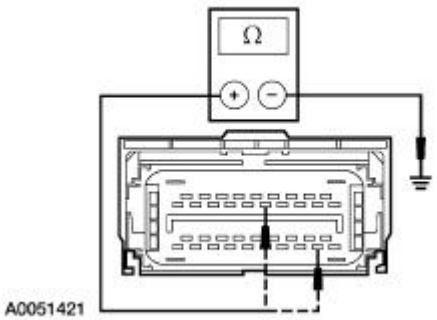
Yes
GO to B16 .





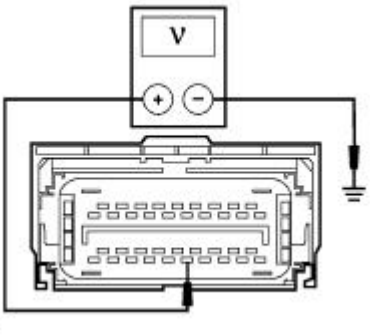
No
INSTALL a new speed control switch. REFER to Speed Control Switch—With Remote Audio/Climate Control or Speed Control Switch—Without Remote Audio/Climate Control in this section. TEST the system for normal operation.





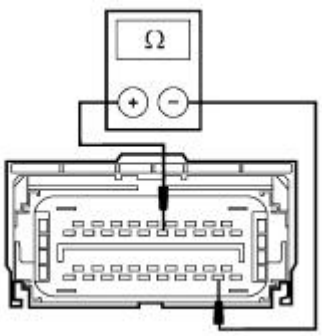
B13 CHECK CIRCUIT 151 (LB/BK) AND 848 (DG/OG) FOR OPEN

- Disconnect: Clockspring C218b.
- Measure the resistance between the PCM C175b pin 37, circuit 151 (LB/BK), harness side and the clockspring C218b pin 4, circuit 151 (LB/BK), harness side; and measure the resistance between the PCM C175b pin 17, circuit 848



Yes
GO to B14 .

No
REPAIR the circuit. REPEAT the self-test.



(DG/OG), harness side and the clockspring C218b pin 5, circuit 848 (DG/OG), harness side.  ● **Are the resistances less than 5 ohms?**	
B14 CHECK THE CLOCKSPRING	
● Remove the driver side air bag. Refer to Section 501-20B . ● Disconnect: Horn Switch Wiring Harness Connector. ● Measure the resistance between the clockspring C218b pin 4, circuit 151, (component side) and the upper clockspring pin 3, circuit 151, (component side); and measure the resistance between the clockspring C218b pin 5, circuit 848, (component side) and the upper clockspring pin 2, circuit 848, (component side).  ● **Are the resistances less than 5 ohms?**	**Yes** GO to B15 . **No** INSTALL a new clockspring. REFER to Section 501-20B . TEST the system for normal operation.
B15 CHECK THE HORN SWITCH WIRING HARNESS	
● Disconnect: Speed Control Switches. ● Inspect the horn switch wiring harness for shorts, opens or any damage. ● **Is the horn switch wiring harness OK?**	**Yes** INSTALL a new speed control switch. REFER to Speed Control Switch—With Remote Audio/Climate Control or Speed Control Switch—Without Remote Audio/Climate Control in this section. TEST the system for normal operation. **No** REPAIR or INSTALL a new horn switch wiring harness. TEST the system for normal operation.
B16 CHECK CIRCUIT 151 (LB/BK) AND 848 (DG/OG) FOR SHORT TO POWER	
● Key in OFF position. ● Disconnect: Clockspring C218b.	**Yes** REPAIR the circuit in

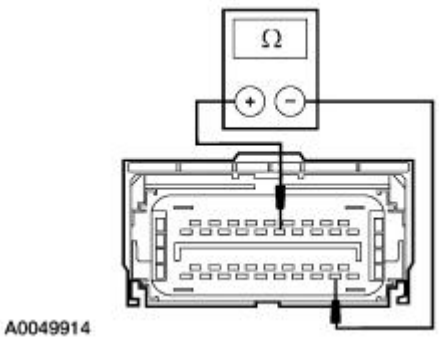
• Key in ON position. • Measure the voltage between the PCM C175b pin 37, circuit 151 (LB/BK), harness side and ground; and between the PCM C175b pin 17, circuit 848 (DG/OG), harness side and ground.  A0051420 • **Is any voltage present?**	questions. TEST the system for normal operation. **No** GO to B17 .
B17 CHECK CIRCUIT 151 (LB/BK) AND 848 (DG/OG) FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Clockspring C218b. • Key in ON position. • Measure the resistance between the PCM C175b pin 37, circuit 151 (LB/BK), harness side and ground; and between the PCM C175b pin 17, circuit 848 (DG/OG), harness side and ground.  A0051421 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit. REPEAT the self-test. **No** GO to B18 .
B18 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: • corrosion • pushed-out pins • Connect all PCM connectors and make sure they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

PINPOINT TEST C: SPEED CONTROL DOES NOT DISENGAGE WHEN THE BRAKES ARE APPLIED

Test Step	Result / Action to Take
C1 CHECK THE BRAKE PEDAL POSITION (BPP) INPUT TO PCM	
• Key in OFF position. • Disconnect: PCM C175b. • Key in ON position. • Measure the voltage between the PCM C175b pin 40, circuit 810 (RD/LG), harness side and ground while depressing the brake pedal.  A0049923 • **Is the voltage greater than 10 volts?**	**Yes** GO to C2 . **No** REPAIR the circuit. TEST the system for normal operation.
C2 CHECK FOR CORRECT PCM OPERATION	
• Key in OFF position. • Disconnect all the PCM connectors. • Check for: • corrosion • pushed-out pins • Connect all PCM connectors and make sure they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

PINPOINT TEST D: THE SPEED CONTROL SWITCHES ARE INOPERATIVE

Test Step	Result / Action to Take
D1 CHECK FOR CONTINUITY	
• Key in OFF position. • Disconnect: PCM C175b. • Measure the resistance between the PCM C175b pin 37, circuit 151 (LB/BK), harness side and the PCM C175b pin 17, circuit 848, (DG/OG), harness side.  A0049914	**Yes** GO to D2 . **No** GO to D3 .



- **Is the resistance between 4,085 and 4,515 ohms?**

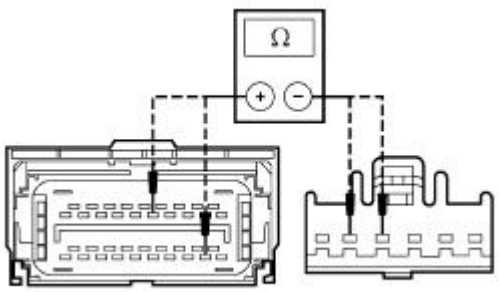
D2 CHECK THE SPEED CONTROL SWITCHES

- Measure the resistance between the PCM C175b pin 37, circuit 151 (LB/BK), harness side and the PCM C175b pin 17, circuit 848, (DG/OG), harness side while pressing the switches.

Speed Control Switch with remote audio/climate control

Speed Control Actuator Switch	Resistance Value
Cancel	Between 114 and 126 ohms
Coast	Between 285 and 315 ohms
SET/ACCEL	Between 570 and 630 ohms
Resume	Between 1,055 and 1,165 ohms
On	Between 1,995 and 2,205 ohms
Off	Less than 5 ohms

A0049914



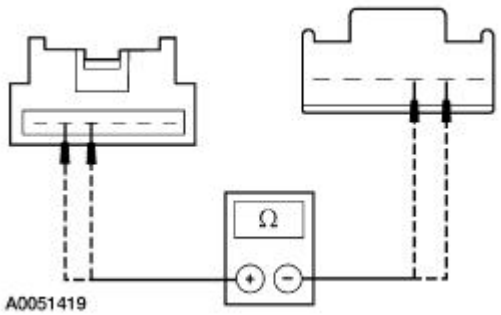
- **Are the speed control actuator switch resistances values OK?**

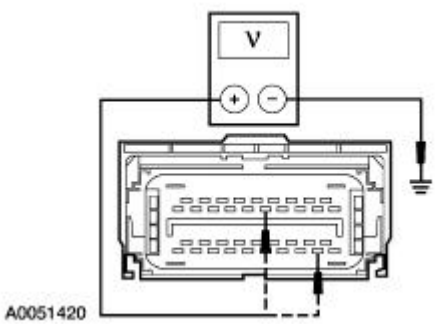
Yes
GO to D6.

No
INSTALL a new speed control switch. REFER to Speed Control Switch—With Remote Audio/Climate Control or Speed Control Switch—Without Remote Audio/Climate Control in this section. TEST the system for normal operation.

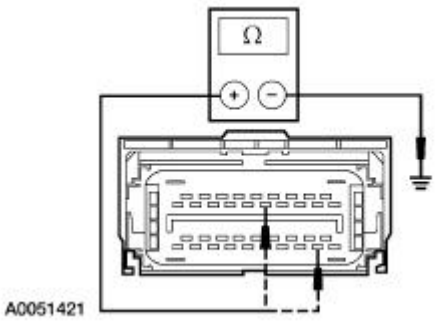
D3 CHECK CIRCUIT 151 (LB/BK) AND 848 (DG/OG) FOR OPEN

- Disconnect: Clockspring C218b.
- Measure the resistance between the PCM C175b pin 37, circuit 151 (LB/BK), harness side and the clockspring C218b pin 4, circuit 151 (LB/BK), harness side; and measure the resistance between the PCM C175b pin 17, circuit 848 (DG/OG), harness side and the clockspring C218b pin 5, circuit 848 (DG/OG), harness side.





A0051418



- **Are the resistances less than 5 ohms?**

Yes
GO to D4.

No
REPAIR the circuit. REPEAT the self-test.

D4 CHECK THE CLOCKSPRING

• Remove the driver side air bag. Refer to Section 501-20B . • Disconnect: Horn Switch Wiring Harness Connector. • Measure the resistance between the clockspring C218b pin 4, circuit 151, (component side) and the upper clockspring pin 3, circuit 151, (component side); and measure the resistance between the clockspring C218b pin 5, circuit 848, (component side) and the upper clockspring pin 2, circuit 848, (component side).  • **Are the resistances less than 5 ohms?**	**Yes** GO to D5 . **No** INSTALL a new clockspring. REFER to Section 501-20B . TEST the system for normal operation.
D5 CHECK THE HORN SWITCH WIRING HARNESS	
• Disconnect: Speed Control Switches. • Inspect the horn switch wiring harness for shorts, opens or any damage. • **Is the horn switch wiring harness OK?**	**Yes** INSTALL a new speed control switch. REFER to Speed Control Switch—With Remote Audio/Climate Control or Speed Control Switch—Without Remote Audio/Climate Control in this section. TEST the system for normal operation. **No** REPAIR or INSTALL a new horn switch wiring harness. TEST the system for normal operation.
D6 CHECK CIRCUIT 151 (LB/BK) AND 848 (DG/OG) FOR SHORT TO POWER	
• Key in OFF position. • Disconnect: Clockspring C218b. • Key in ON position. • Measure the voltage between the PCM C175b pin 37, circuit 151 (LB/BK), harness side and ground; and between the PCM C175b pin 17, circuit 848 (DG/OG), harness side and ground.  	**Yes** REPAIR the circuit in questions. TEST the system for normal operation. **No** GO to D7 .

• **Is any voltage present?**	
D7 CHECK CIRCUIT 151 (LB/BK) AND 848 (DG/OG) FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Clockspring C218b. • Key in ON position. • Measure the resistance between the PCM C175b pin 37, circuit 151 (LB/BK), harness side and ground; and between the PCM C175b pin 17, circuit 848 (DG/OG), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit. REPEAT the self-test. **No** GO to D8 .
D8 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: • corrosion • pushed-out pins • Connect all PCM connectors and make sure they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

PINPOINT TEST E: FLASH WITH LAST SWITCH PRESSED AND NO DYNAMIC PULL OCCURS AT THROTTLE AND SPEED CONTROL INOPERATIVE

Test Step	Result / Action to Take
E1 CHECK THE SPEED CONTROL CABLE	
• Disconnect the speed control cable at the throttle body. • Check the speed control cable slack by pulling the speed control cable end taut from within the speed control cable housing. • **Is the speed control cable slack greater than 0 mm (0 in) and less than 0.24 in (6 mm) ?**	**Yes** GO to E2 . **No** INSTALL a new speed control cable. REFER to Speed Control Cable in this section. REPEAT the self-test.
E2 CHECK FOR DAMAGE, STICKING OR BINDING SPEED CONTROL CABLE	
• Disconnect the speed control cable from the speed control actuator.	**Yes** GO to E3 .

- Check the speed control cable for damage, sticking or binding.
- **Is the speed control cable OK?**

No
INSTALL a new speed control cable. REFER to Speed Control Cable in this section. REPEAT the self-test.

E3 CHECK THE SPEED CONTROL ACTUATOR OUTPUT

- Key in ON position.
- Check the speed control actuator pulley for movement while triggering the on-demand self-test.
- **Does the speed control actuator pulley move?**

Yes
REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

No
GO to E4.

E4 CHECK THE SPEED CONTROL ACTUATOR

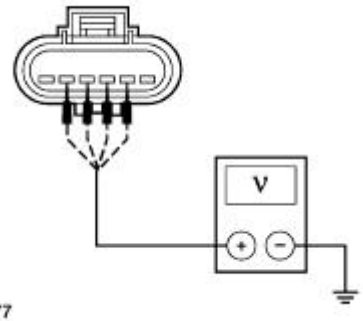
- Key in OFF position.
- Disconnect: Speed Control Actuator C122.
- Measure the resistance between the speed control actuator pins (component side) as follows:

Speed Control Actuator	Speed Control Actuator	Expected Value
Pin 1	Pin 2	Between 2 and 3 ohms
Pin 1	Pin 3	Between 2 and 3 ohms
Pin 1	Pin 4	Between 2 and 3 ohms
Pin 5	Pin 6	Between 20 and 30 ohms

- **Are the resistances OK?**

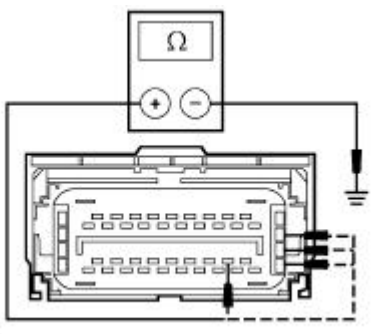
Yes
GO to E5.

No
INSTALL a new speed control actuator. REFER to Speed Control Actuator in this section. REPEAT the self-test.

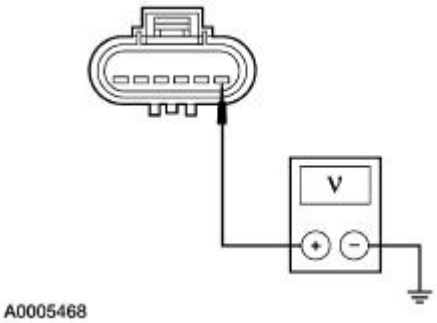


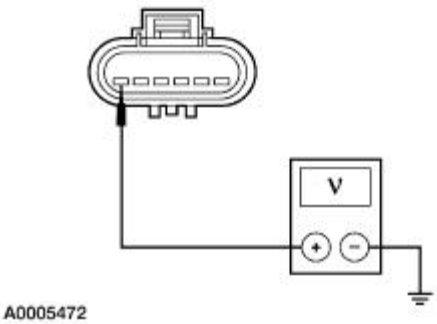
E5 CHECK THE SPEED CONTROL ACTUATOR CIRCUITRY FOR SHORT TO POWER

- Disconnect: PCM C175b.
- Key in ON position.
- Measure the voltage between the speed control actuator C122, harness side and ground as follows:



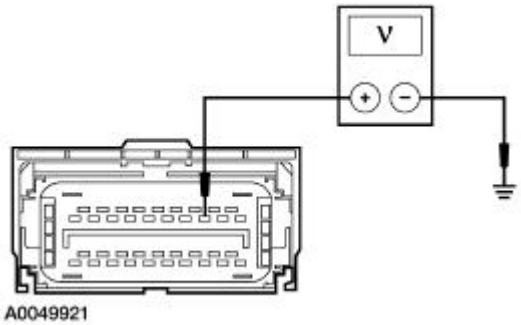
Speed Control Actuator C122	Circuit
Pin 2	1926 (VT/YE)
Pin 3	1925 (PK/BK)
Pin 4	1924 (DG/WH)
Pin 5	1927 (TN)

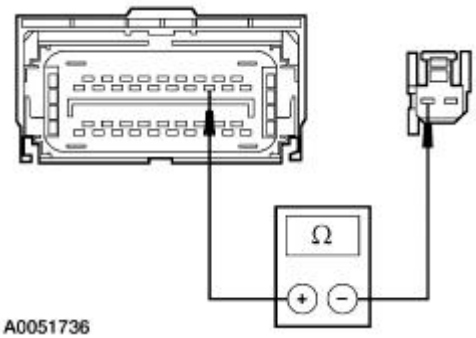


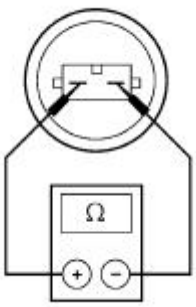


Yes
REPAIR the circuit(s). REPEAT the self-test.

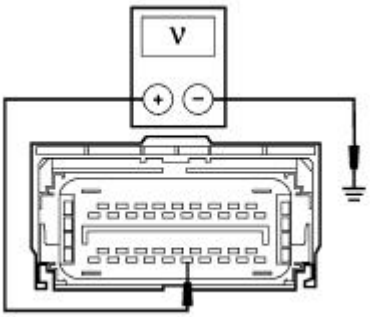
No
GO to E6.





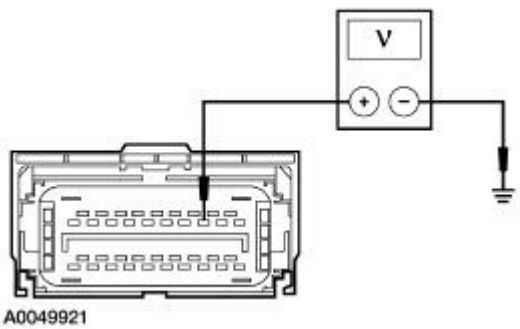


- **Is any voltage present?**

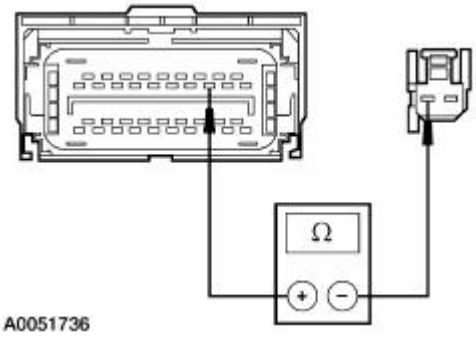


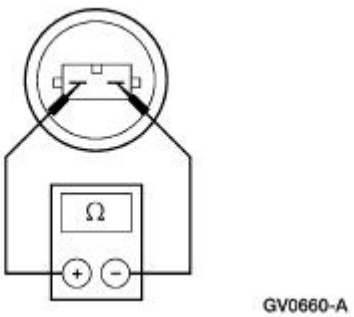
E6 CHECK THE SPEED CONTROL ACTUATOR CIRCUITRY FOR AN OPEN CIRCUIT	
• Key in OFF position. • Measure the resistance between the PCM C175b, harness side and the speed control actuator C122, harness side as follows: **PCM C175b** / **Speed control actuator C122** / **Circuit** Pin 12 / Pin 2 / 1926 (VT/YE) Pin 24 / Pin 3 / 1925 (PK/BK) Pin 35 / Pin 4 / 1924 (DG/WH) Pin 26 / Pin 5 / 1927 (TN) • **Are the resistances less than 5 ohms?**	**Yes** GO to E7 . **No** REPAIR the circuit(s). REPEAT the self-test.
E7 CHECK THE SPEED CONTROL ACTUATOR CIRCUITRY FOR SHORT TO GROUND	
• Measure the resistances between the PCM C175b, harness side and ground as follows: **PCM C175b** / **Circuit** Pin 26 / 1927 (TN) Pin 35 / 1924 (DG/WH) Pin 24 / 1925 (PK/BK) Pin 12 / 1926 (VT/YE)  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to E8 . **No** REPAIR the circuit(s). REPEAT the self-test.
E8 CHECK CIRCUIT 1928 (RD/WH) FOR AN OPEN	

• Key in ON position. • Measure the voltage between the speed control actuator C122 pin 1, circuit 1928 (RD/WH), harness side and ground.  A0005468 • **Is the voltage greater than 10 volts?**	**Yes** GO to E9 . **No** REPAIR the circuit. REPEAT the self-test.
E9 CHECK THE DEACTIVATOR SWITCH CIRCUITRY FOR AN OPEN	
• Key in OFF position. • Measure the voltage between the speed control actuator C122 pin 6, circuit 307 (BK/YE), harness side and ground.  A0005472 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new speed control actuator. REFER to Speed Control Actuator in this section. REPEAT the self-test. **No** REPAIR the circuit. REPEAT the self-test.



PINPOINT TEST F: FLASH CODE 2 —BRAKE PEDAL POSITION SWITCH CIRCUIT FAILURE





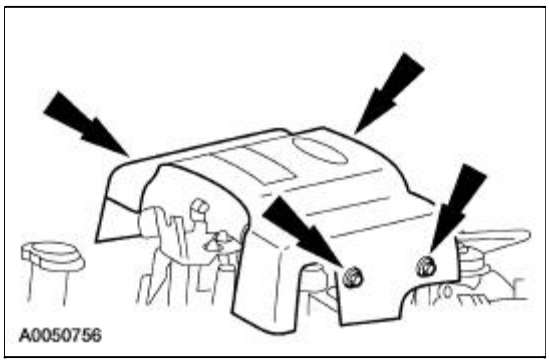
Test Step	Result / Action to Take
F1 MONITOR THE PCM PID BPP_SW	
• Key in ON position. • Monitor the PCM PID BPP_SW without pressing the brake pedal. • **Does the PCM BPP_SW PID indicate ON?**	**Yes** GO to F2 . **No** GO to F5 .
F2 CHECK FOR AN OPEN CIRCUIT	
• Key in OFF position. • Disconnect: PCM C175b. • Key in ON position. • Measure the voltage between the PCM C175b pin 15, circuit 307 (BK/YE), harness side and ground.	**Yes** GO to F6 . **No** GO to F3 .

 A0049921 ● **Is the voltage greater than 10 volts?**	
F3 CHECK CIRCUIT 307 (BK/YE)	
● Key in OFF position. ● Disconnect: Deactivator Switch C277. ● Measure the resistance between the PCM C175b pin 15, circuit 307 (BK/YE), harness side and the deactivator switch C277 pin 2, circuit 307 (BK/YE), harness side.  A0051736 ● **Is the resistance less than 5 ohms?**	**Yes** GO to F4 . **No** REPAIR the circuit. REPEAT the self-test.
F4 CHECK THE DEACTIVATOR SWITCH	
● Measure the resistance between the deactivator switch pins, (component side) while pressing and releasing the brake pedal.  GV0660-A ● **Is the resistance less than 5 ohms with the brake pedal released and greater than 10,000 ohms with the brake pedal depressed?**	**Yes** REPAIR the CIRCUIT. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new deactivator switch. REFER to Speed Control Deactivator Switch in this section. CLEAR the DTCs. REPEAT the self-test.
F5 CHECK THE BRAKE PEDAL POSITION (BPP) INPUT TO PCM	
● Key in OFF position. ● Disconnect: PCM C175t. ● Key in ON position. ● Measure the voltage between the PCM C175t pin 40, circuit 810 (RD/LG), harness side and ground while depressing the brake pedal.	**Yes** GO to F6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0049923 ● **Is the voltage greater than 10 volts?**	
F6 CHECK FOR CORRECT PCM OPERATION	
● Key in OFF position. ● Disconnect all the PCM connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all PCM connectors and make sure they are seated correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

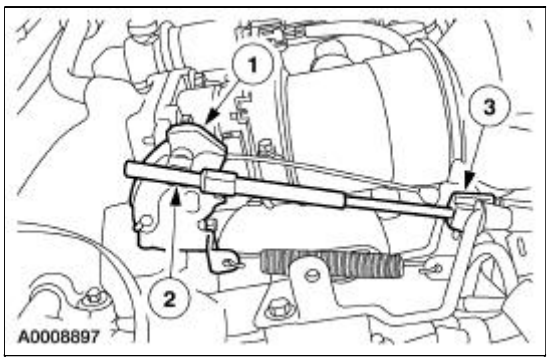
PINPOINT TEST G: FLASH CODE 3—DEACTIVATOR SWITCH CIRCUIT FAILURE

Test Step	Result / Action to Take
G1 MONITOR THE PCM PID BPA_SW	
● Key in ON position. ● Monitor the PCM PID BPA_SW without pressing the brake pedal. ● **Does the PID BPA_SW indicate ON?**	**Yes** GO to G2 . **No** GO to G5 .
G2 CHECK FOR AN OPEN CIRCUIT	
● Key in OFF position. ● Disconnect: PCM C175b. ● Key in ON position. ● Measure the voltage between the PCM C175b pin 15, circuit 307 (BK/YE), harness side and ground.  A0049921 ● **Is the voltage greater than 10 volts?**	**Yes** GO to G5 . **No** GO to G3 .



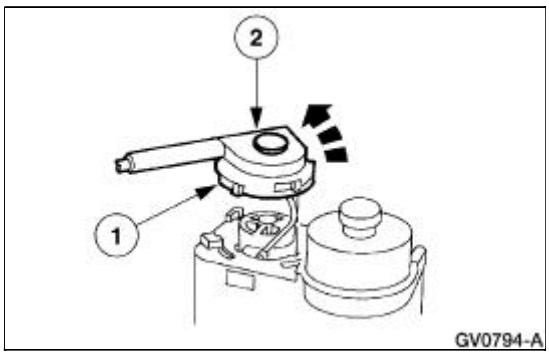
G3 CHECK CIRCUIT 307 (BK/YE)	
• Key in OFF position. • Disconnect: Deactivator Switch C277. • Measure the resistance between the PCM C175b pin 15, circuit 307 (BK/YE), harness side and the deactivator switch C277 pin 2, circuit 307 (BK/YE), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to G4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
G4 CHECK THE DEACTIVATOR SWITCH	
• Measure the resistance between the deactivator switch pins, (component side) while pressing and releasing the brake pedal.  • **Is the resistance less than 5 ohms with the brake pedal released and greater than 10,000 ohms with the brake pedal depressed?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new deactivator switch. REFER to Speed Control Deactivator Switch in this section. REPEAT the self-test.
G5 CHECK FOR CORRECT PCM OPERATION	
• Key in OFF position. • Disconnect all the PCM connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all PCM connectors and make sure they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Speed Control Cable



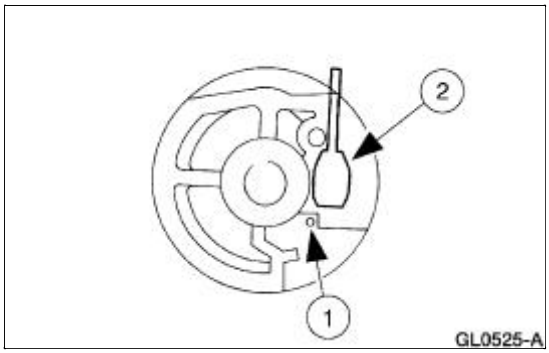
Removal

NOTE: 5.4L 2-valve Triton V8 shown; others are similar.



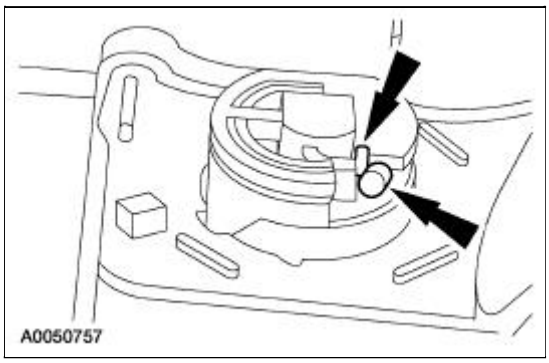
1. Remove the screws and the accelerator control splash shield.

2. Remove the speed control actuator cable.
    1. Open the throttle valve.
    2. Slide the throttle cable back to remove it from the throttle cam nail head.
    3. Squeeze the speed control actuator cable tabs and remove from the accelerator bracket.



3. Remove the speed control actuator cable cap from the speed control actuator.
    1. Push in the locking arm on the speed control actuator cable cap.
    2. Rotate the speed control actuator cable cap counterclockwise.

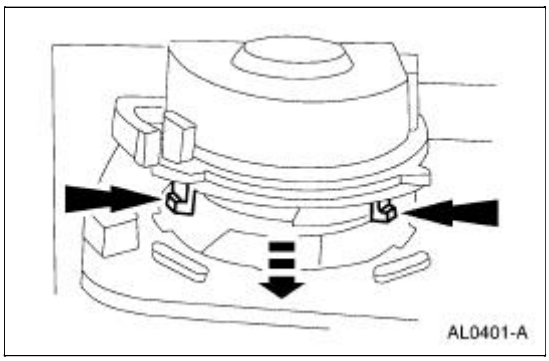
4. Remove the speed control actuator cable.



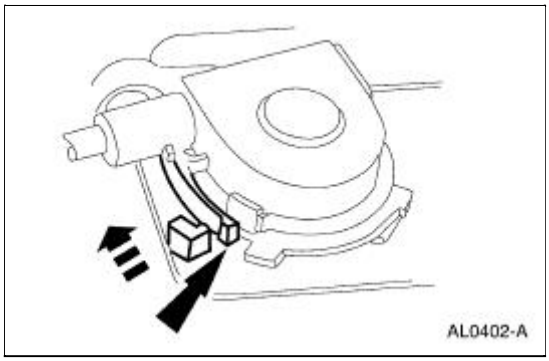
1. Press the spring retainer.
2. Slide the core wire end out of the speed control actuator pulley and remove the speed control actuator cable.

5. Remove the cable from the retainer clips.

Installation



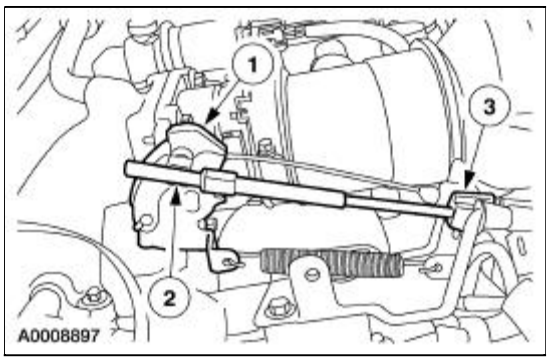
1. Insert the speed control cable slug into the speed control actuator pulley slot.
    1. Gently compress the speed control actuator spring.



2. **NOTE:** Make sure the rubber seal is fully seated onto the speed control actuator cable cap.

   NOTE: Incorrect wrapping of the speed control actuator cable around the speed control actuator pulley may result in a high idle condition.

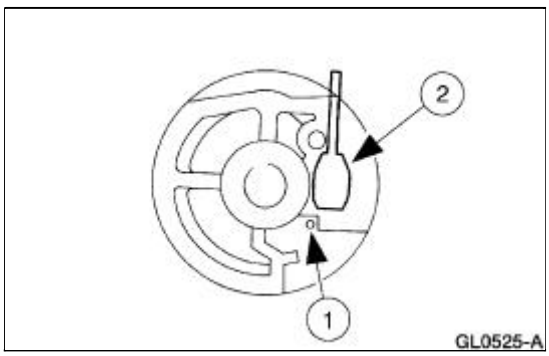
   Release the compressed spring while aligning the speed control actuator cable cap tabs with the slots in the speed control actuator housing



3. Rotate the speed control actuator cable cap until the locking arm engages.

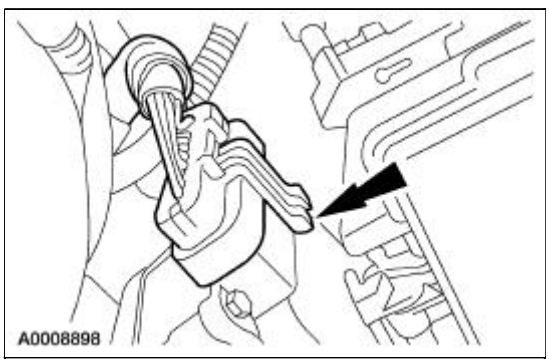
4. **NOTE:** Make sure the speed control cable is installed to all cable retainer clips.

   Install the speed control actuator cable.
   1. Open the throttle valve.
   2. Install the speed control cable to the throttle valve.
   3. Install the speed control cable to the bracket.



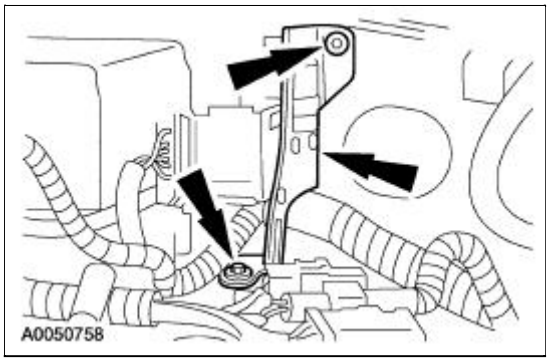
Speed Control Actuator

Removal

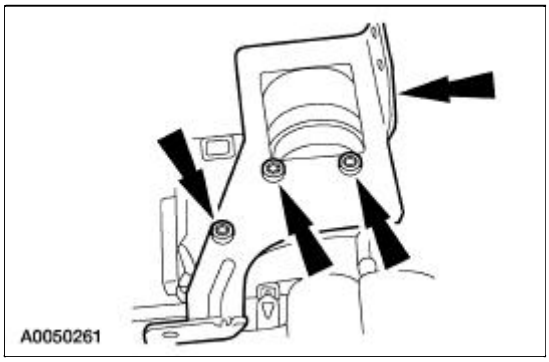


1. Remove the speed control actuator cable cap from the speed control actuator.
    1. Push in the locking arm on the speed control actuator cable cap.
    2. Rotate the speed control actuator cable cap counterclockwise.

2. Disconnect the speed control actuator cable from the speed control actuator.
    1. Depress the spring retainer.
    2. Slide the core wire end out of the speed control actuator pulley.

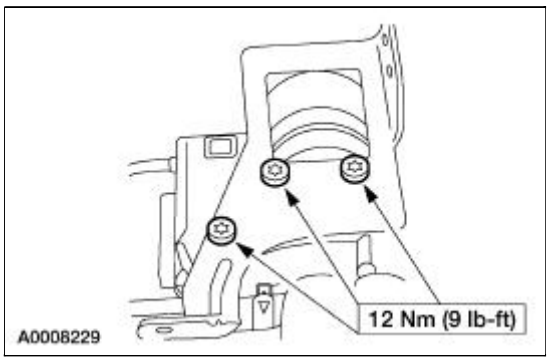


3. Disconnect the speed control actuator electrical connector.
    - Depress the connector tab.

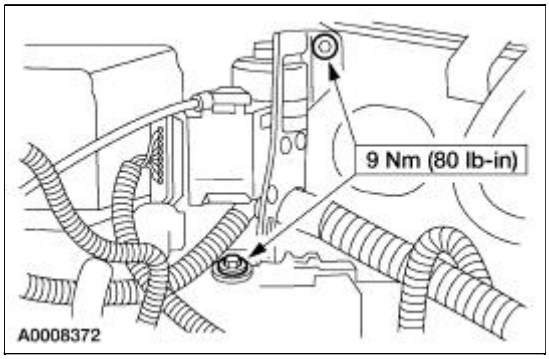


4. **NOTE:** Do not remove the rubber grommets from the speed control actuator bracket.

   Remove the bolts and the speed control actuator and bracket.



5. Remove the screws and the speed control actuator bracket.

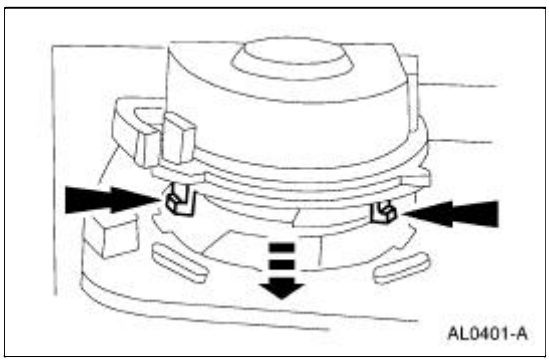


Installation

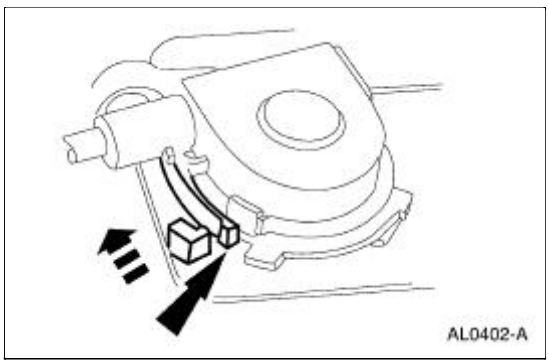
1. **NOTE:** The rubber grommets must be correctly seated in the speed control actuator bracket for correct noise and vibration isolation.

   Install the speed control actuator bracket.

2. Install the speed control actuator.



3. Insert the speed control cable slug into the speed control actuator pulley slot.
    1. Gently compress the speed control actuator spring.



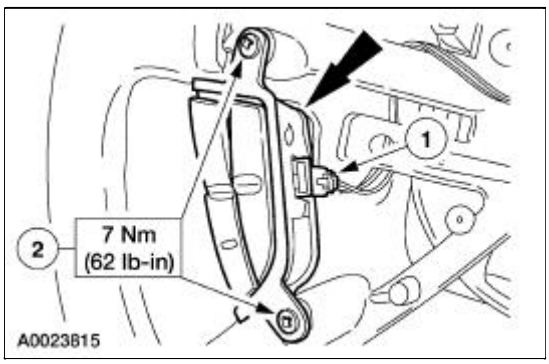
4. **NOTE:** Make sure the rubber seal is fully seated onto the speed control actuator cable cap.

   NOTE: Incorrect wrapping of the speed control actuator cable around the speed control actuator pulley may result in a high idle condition.

   Release the compressed spring while aligning the speed control actuator cable cap tabs with the slots in the speed control actuator housing.

5. Rotate the speed control actuator cable cap until the locking arm engages.

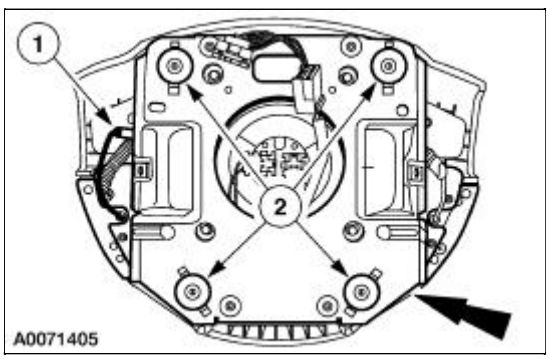
Speed Control Switch —With Remote Audio/Climate Control



Removal and Installation

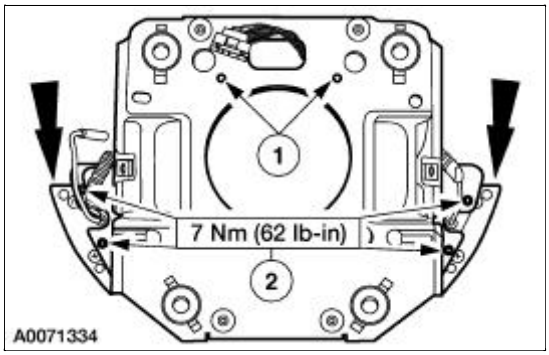
All vehicles

1. Remove the driver side air bag module. For additional information, refer to Section 501-20B .



Expedition

2. Remove the speed control switch.
    1. Disconnect the electrical connector.
    2. Remove the screws.

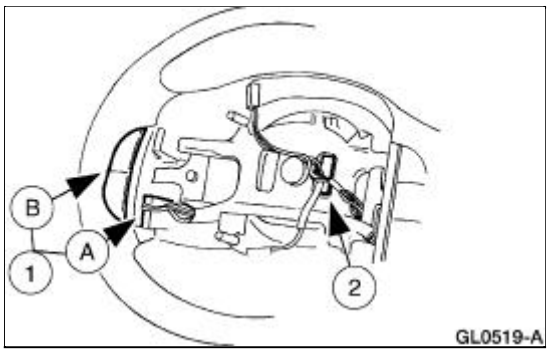


Navigator

3. Remove the horn switch.
    1. Disconnect the electrical connector.
    2. Remove the bolts.

4. Remove the speed control switch.
    1. Disconnect the wiring harness locators.
    2. Remove the screws.

All vehicles



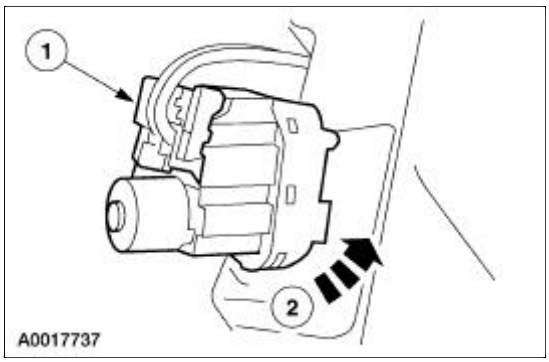
5. To install, reverse the removal procedure.

Speed Control Switch —Without Remote Audio/Climate Control

Removal and Installation

1. Remove the driver side air bag module. Refer to Section 501-20B .

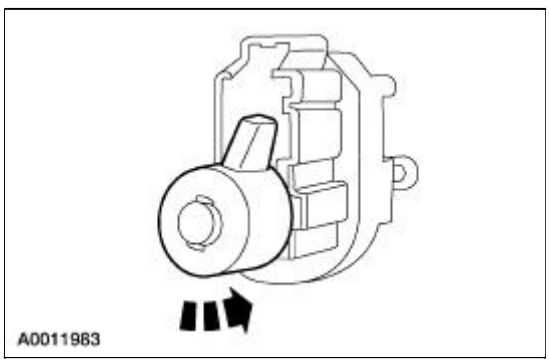
2. Remove the speed control actuator switch.
    1. Release the four (A) speed control actuator switch clips and remove the (B) speed control actuator switch.
    2. Disconnect the speed control actuator switch electrical connector.



3. To install, reverse the removal procedure.

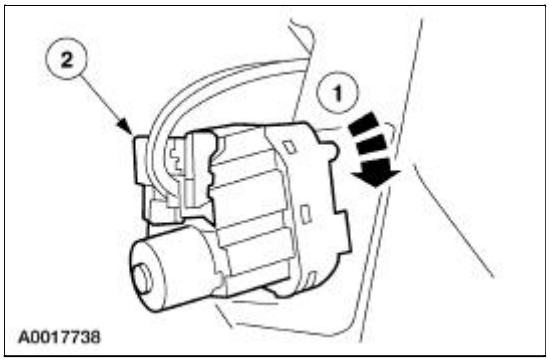
Speed Control Deactivator Switch

Removal



1. Remove the deactivator switch.
    1. Disconnect the electrical connector.
    2. Rotate counterclockwise 45 degrees and remove the deactivator switch.

Installation



All vehicles

1. Release the plunger lock (if equipped).
    - Turn the lock knob counterclockwise until first click is felt.

2. Fully depress the brake pedal.

3. Install the deactivator switch.
    1. Position the deactivator switch in the bracket and rotate clockwise 45 degrees.
    2. Connect the electrical connector.

Vehicles equipped with locking tab

4. **NOTE:** There should be an extra click heard when tugging on the brake pedal.

   Slowly release the brake pedal and tug moderately once the pedal reaches the rest position.

General Specifications

Item	Specification
A/C Compressor	
Type	SC115 fixed scroll
Displacement	115 cc (7 cu in)
A/C Pressure Relief Valve [a]	
Open pressures	3,792-4,137 kPa (550-600 psi)
Coolant Hose Lubricant	
MERPOL®	ESE-M99B144-B
Magnetic Clutch	
Air gap clearance	0.35-0.75 mm (0.014-0.030 in)
Pressure Cutoff Switch [a]	
Open status	3,137-3,413 kPa (455-495 psi)
Closed status	2,034-2,448 kPa (295-355 psi)
Low Charge Protection Switch [a]	
Open pressure	62-76 kPa (9-11 psi)
Closed pressure	110-165 kPa (16-24 psi)
Thermostatic A/C Cycling Switch	
On temperatures	2.2-3.3°C (36-38°F)
Off temperatures	2.2-3.3°C (36-38°F)
Refrigerant Lubricant and Capacity	
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B
Capacity without auxiliary climate control	266 ml (9 oz)
Capacity with auxiliary climate control	414 ml (14 oz)
Refrigerant and Capacity	
R-134a Refrigerant YN-19	WSH-M17B19-A
Capacity without auxiliary climate control	1.0 kg (32 oz)
Capacity with auxiliary climate control	1.53 kg (54 oz)
Refrigerant System Cleaner	
A/C Systems Flushing Solvent F4AZ-19579-A	—

[a] Manifold gauge set pressures may vary slightly depending on the distance between the service gauge port valve and the A/C pressure relief valve, A/C cycling switch, and pressure cutoff switch locations.

Torque Specifications

Description	Nm	lb-in
Peanut fitting	8	71

Climate Control System

WARNING: To avoid accidental deployment and possible injury, the air bag system backup power supply must be depleted before repairing any climate control components. To deplete the backup power supply, disconnect the battery ground cable and wait one minute. Failure to follow these instructions may result in personal injury.

WARNING: Carbon monoxide is colorless, odorless and dangerous. If it is necessary to operate the engine with vehicle in a closed area such as a garage, always use an exhaust collector to vent the exhaust gases outside the closed area. Failure to follow these instructions may result in personal injury.

WARNING: R-134a is classified as a safe refrigerant, but misuse can make it dangerous. The following precautions must be observed. Failure to follow these instructions may result in personal injury.

- **Always wear safety goggles when repairing an air conditioning system.**
- **Avoid contact with liquid refrigerant R-134a. R-134a vaporizes at approximately -25°C (-13°F) under atmospheric pressure and it will freeze skin tissue.**
- **Never allow refrigerant R-134a gas to escape in quantity in an occupied space. R-134a is non-toxic, but it will displace the oxygen needed to support life.**
- **Never use a torch in an atmosphere containing R-134a gas. R-134a is non-toxic at all normal conditions, but when it is exposed to high temperatures, such as a torch flame, it decomposes. During decomposition, it releases irritating and toxic gases (as described in the MSDS sheet from the manufacturer). Decomposition products are hydrofluoric acid, carbon dioxide and water.**
- **Do not allow any portion of the charged air conditioning system to become too hot. The pressure in an air conditioning system rises as the temperature rises, and temperatures of approximately 85°C (185°F) can be dangerous.**
- **Allow the engine to cool sufficiently prior to performing maintenance or serious burns and injury can occur.**

CAUTION: To avoid damaging the vehicle or A/C components, the following precautions must be observed:

- **The A/C refrigerant of all vehicles must be identified and analyzed prior to refrigerant charging. Failure to due so can contaminate the shop bulk refrigerant and other vehicles.**
- **Do not add R-12 refrigerant to an A/C system that requires the use of R-134a refrigerant. These two types of refrigerant must never be mixed. Doing so can damage the A/C system.**
- **Charge the A/C system with the engine running only at the low-pressure side to prevent refrigerant slugging from damaging the A/C compressor.**
- **Use only R-134a refrigerant. Due to environmental concerns, when the air conditioning system is drained, the refrigerant must be collected using refrigerant recovery/recycling equipment. Federal law requires that R-134a be recovered into appropriate equipment and the process be conducted by qualified technicians who have been certified by an approved organization, such as MACS, ASI, etc. Use of a recovery machine dedicated to**

R-134a is necessary to reduce the possibility of oil and refrigerant incompatibility concerns. Refer to the instructions provided by the equipment manufacturer when removing refrigerant from or charging the air conditioning system.

- **Refrigerant R-134a must not be mixed with air for leak testing or used with air for any other purpose above atmospheric pressure. R-134a is combustible when mixed with high concentrations of air and higher pressures.**
- **Some manufacturers are producing refrigerant products that are described as direct substitutes for refrigerant R-134a. The use of any unauthorized substitute refrigerant can severely damage the A/C components. If repair is required, use only new or recycled refrigerant R-134a.**

 **CAUTION: To avoid contamination of the A/C system:**

- **Never open or loosen a connection before discharging the system.**
- **When loosening a connection, if any residual pressure is evident, allow it to leak out before opening the fitting.**
- **Evacuate a system that has been opened to install a component or one that has discharged through leakage before charging.**
- **Seal open fitting with a cap or plug immediately after disconnecting a component from the system.**
- **Clean the outside of the fittings thoroughly before disconnecting a component from the system.**
- **Do not remove the sealing caps from a new component until ready to install.**
- **Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open an oil container until ready to use, and install the cap immediately after using. Store the oil in a clean, moisture-free container.**
- **Install a new O-ring seal before connecting an open fitting. Coat the fitting and O-ring seal with PAG oil before connecting.**
- **When installing a refrigerant line, avoid sharp bends. Position the line away from the exhaust or any sharp edges that can chafe the line.**
- **Tighten threaded fittings only to specifications. The steel and aluminum fittings used in the refrigerant system will not tolerate overtightening.**
- **When disconnecting a fitting, use a wrench on both halves of the fitting to prevent twisting of the refrigerant lines or tubes.**
- **Do not open a refrigerant system or uncap a replacement component unless it is as close as possible to room temperature. This will prevent condensation from forming inside a component that is cooler than the surrounding air.**

The manual climate control system heats or cools the vehicle depending on the function selector switch position and the temperature selected.

- The function selector switch position determines air distribution.
- The temperature control setting determines the air temperature.
- The heater blower motor switch (18578) varies the blower motor speed.

The electronic automatic temperature control system maintains the selected vehicle interior temperature by heating or cooling the air.

- During A/C operation, the system also reduces the relative humidity of the air.
- The driver may override the automatic mode of operation.

Principles of Operation

There are four main principles involved with the basic theory of operation:

- Heat transfer
- Latent heat of vaporization
- Relative humidity
- Effects of pressure

Heat Transfer

If two substances of different temperature are placed near each other, the heat in the warmer substance will transfer to the colder substance.

Latent Heat of Vaporization

When a liquid boils (converts to gas) it absorbs heat without raising the temperature of the resulting gas. When the gas condenses (converts back to a liquid), it gives off heat without lowering the temperature of the resulting liquid.

Relative Humidity

The amount of moisture (water vapor content) that the air can hold is directly related to the air temperature. The more heat there is in the air, the more moisture the air can hold. The lower the moisture content in the air, the more comfortable you feel. Removing moisture from the air lowers its relative humidity and improves personal comfort.

Effects of Pressure on Boiling or Condensation

As the pressure is increased on a liquid, the temperature at which the liquid boils (converts to gas) also increases. Conversely, when the pressure on a liquid is reduced, its boiling point is also reduced. When in the gas state, an increase in pressure causes an increase in temperature, while a decrease in pressure will decrease the temperature of the gas.

Compressor Anti-Slugging Strategy

Liquid refrigerant may accumulate in the A/C compressor under certain conditions. To alleviate damage to the A/C compressor, compressor anti-slugging strategy (CASS) is utilized.

CASS is initiated only under specific conditions:

- The ignition is off for more than 8 hours.
- The ambient temperature is above -4°C (25°F).
- Battery voltage is above 8.5 volts during engine cranking.

When these conditions are present, the powertrain control module (PCM) will activate the A/C control relay prior to cranking of the engine. The A/C control relay engages the A/C compressor for approximately 4-15 A/C compressor revolutions or a maximum of two seconds (depending upon vehicle application), allowing the liquid refrigerant to be pushed from the A/C compressor. CASS is initiated by the PCM regardless of the function selector switch position or the EATC system settings.

The Refrigerant Cycle

During stabilized conditions (air conditioning system shutdown), the refrigerant is in a vaporized state and pressures are equal throughout the system. When the A/C compressor is in operation, it increases pressure on the refrigerant vapor raising its temperature. The high-pressure, high-temperature vapor is then released into the top of the A/C condenser core.

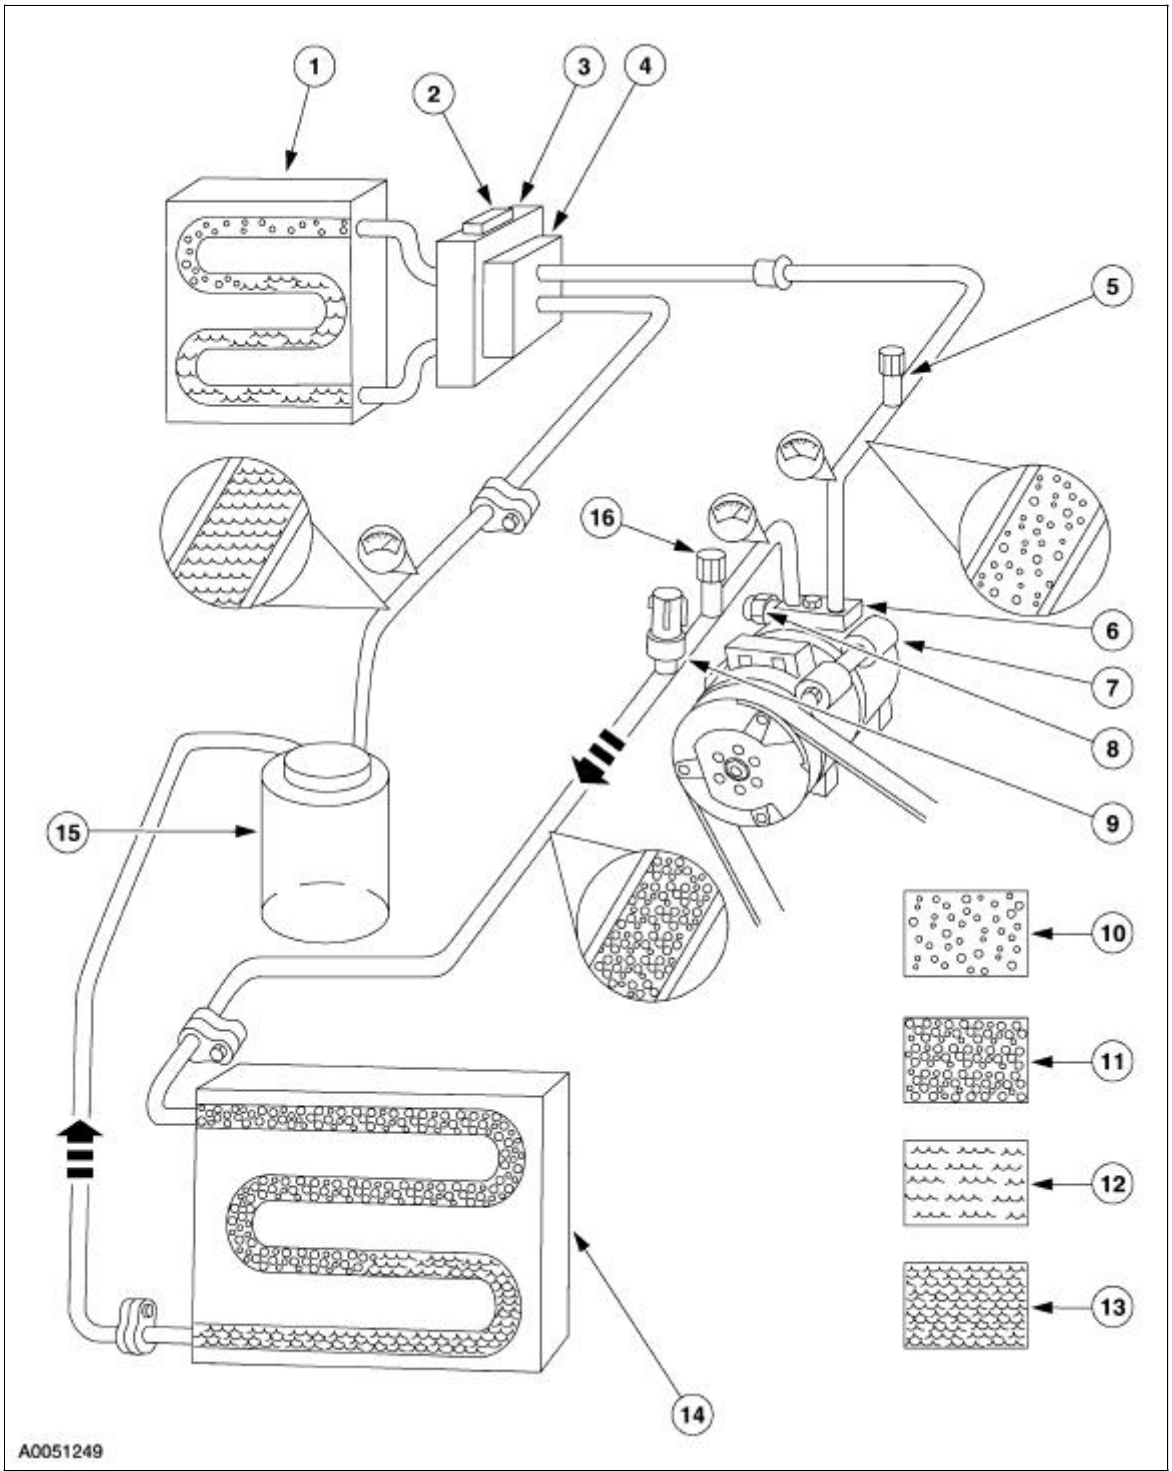
The A/C condenser core, being close to ambient temperature, causes the refrigerant vapor to condense into a liquid when heat is removed from the refrigerant by ambient air passing over the fins and tubing. The now liquid refrigerant, still at high pressure, exits from the bottom of the A/C condenser core and enters the inlet side of the receiver/drier.

The receiver/drier is designed to remove moisture from the refrigerant. The refrigerant, still at high pressure, exits the receiver/drier and enters the thermostatic expansion valve.

The thermostatic expansion valve is the restriction in the refrigerant system that creates the high-pressure buildup in the A/C condenser core and separates the high and low-pressure sides of the A/C system. As the liquid refrigerant leaves this restriction, its pressure and boiling point are reduced.

The liquid refrigerant is now at its lowest pressure and temperature. As it passes through the A/C evaporator core, it absorbs heat from the passenger compartment airflow passing over the plate/fin sections of the A/C evaporator core. This addition of heat causes the refrigerant to boil (convert to gas). The now cooler passenger compartment air can no longer support the same humidity level of the warmer air and this excess moisture condenses on the exterior of the evaporator coils and fins and drains outside the vehicle.

The refrigerant cycle is now repeated with the A/C compressor again increasing the pressure and temperature of the refrigerant.



The A/C thermostatic cycling switch interrupts compressor operation before the external temperature of the A/C evaporator core gets low enough to cause the condensed water vapor (excess humidity) to turn to ice. It does this by supplying an ON/OFF command to the PCM.

The low charge protection switch protects the A/C compressor in the event of a low refrigerant charge. The low charge protection switch interrupts the voltage to the A/C thermostatic cycling switch when the low side refrigerant pressure drops below acceptable levels.

The high side line pressure is also monitored so that A/C compressor operation can be interrupted if system pressure becomes too high.

The A/C compressor relief valve will open and vent refrigerant to relieve unusually high system pressure.

Clutch Cycling Thermostatic Expansion Valve Type Refrigerant System

Item	Part Number	Description
1	19860	A/C evaporator core
2	19C734	A/C thermostatic cycling switch
3	19849	Thermostatic expansion valve
4	19835	Thermostatic expansion valve manifold and tube assembly
5	19D701	Low side charge valve port
6	19D734	Compressor manifold and tube assembly
7	19703	A/C compressor

System Airflow Description — Manual Climate Control

Max A/C

When MAX A/C is selected:

- The air inlet door vacuum control motor is at full vacuum, closing off outside air and admitting only recirculated air.
- The panel door and floor/defrost door vacuum control motors are at full vacuum, directing airflow to the instrument panel A/C registers. A small amount of airflow from the side window demisters will be present.
- Blended air temperature is not available.
- The A/C request button is illuminated and will be disabled.
- The A/C compressor will operate if the outside temperature is above approximately 2°C (35°F).
- The blower motor is on.
- The auxiliary blower motor is enabled, if equipped.

PANEL

When PANEL is selected:

- The air inlet door vacuum control motor is at no vacuum, admitting only outside air into the passenger compartment.
- The panel door and floor/defrost door vacuum control motors are at full vacuum, directing airflow to the instrument panel A/C registers. A small amount of airflow from the side window demisters will be present.
- Blended air temperature is available.
- The A/C request button is enabled. The A/C compressor will operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 2°C (35°F).
- The blower motor is on.
- The auxiliary blower motor is enabled, if equipped.

PANEL/FLOOR

When PANEL/FLOOR is selected:

- The air inlet door vacuum control motor is at no vacuum, admitting only outside air into the passenger compartment.
- The floor/defrost door vacuum control motor is at full vacuum and the panel door vacuum control motor is at partial vacuum, directing airflow to the floor duct and the instrument panel A/C registers. A small amount of airflow from the side window demisters will be present.
- Blended air temperature is available.
- The A/C request button is enabled. The A/C compressor will operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 2°C (35°F).
- The blower motor is on.
- The auxiliary blower motor is enabled, if equipped.

OFF

When OFF is selected:

- The air inlet door vacuum control motor is at full vacuum, closing off outside air from entering the passenger compartment.
- The panel door and floor/defrost door vacuum control motors are at no vacuum.
- The A/C request button is disabled.
- The blower motor is off.
- The auxiliary blower motor is disabled, if equipped.

FLOOR

When FLOOR is selected:

- The air inlet door vacuum control motor is at no vacuum, admitting only outside air into the passenger compartment.
- The floor/defrost door vacuum control motor is at partial vacuum and the panel door vacuum control motor is at no vacuum, directing airflow to the floor duct. A small amount of airflow from the instrument panel A/C registers, defroster duct and side window demisters will be present.
- Blended air temperature is available.
- The A/C request button is enabled. The A/C compressor will operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 2°C (35°F).
- The blower motor is on.
- The auxiliary blower motor is enabled, if equipped.

FLOOR/DEFROST

When the FLOOR/DEFROST is selected:

- The air inlet door vacuum control motor is at no vacuum, admitting only outside air into the passenger compartment.
- The floor/defrost door vacuum control motor is at partial vacuum and the panel door vacuum control motor is at no vacuum, directing airflow to the floor duct, the defroster duct and the side window demisters. A small amount of airflow from the instrument panel A/C registers will be present.

- Blended air temperature is available.
- The A/C request button will not illuminate and is disabled. To reduce fogging, the A/C compressor will operate automatically if the outside temperature is above approximately 2°C (35°F).
- The blower motor is on.
- The auxiliary blower motor is enabled, if equipped.

DEFROST

When DEFROST is selected:

- The air inlet door vacuum control motor is at no vacuum, admitting only outside air into the passenger compartment.
- The panel door and floor/defrost door vacuum control motors are at no vacuum, directing airflow to the defroster duct and side window demisters. A small amount of airflow from the instrument panel A/C registers and floor duct will be present.
- Blended air temperature is available.
- The A/C request button will not illuminate and is disabled. To reduce fogging, the A/C compressor will operate automatically if the outside temperature is above approximately 2°C (35°F).
- The blower motor is on.
- The auxiliary blower motor is enabled, if equipped.

System Airflow Description — EATC/DATC

AUTO

When AUTO is selected:

- The temperature control setting(s) is/are manually set to the desired setting(s).
- The air inlet door vacuum control motor is automatically controlled by the EATC/DATC module, based on the temperature setting(s).
- The mode door vacuum control motors are automatically controlled by the EATC/DATC module based on the temperature setting(s).
- The A/C compressor is automatically controlled by the EATC/DATC module based on the temperature settings. The A/C compressor will not operate if the outside temperature is below approximately 2°C (35°F).
- The A/C request button or the RECIRC request button, if pressed, will transfer the system to manual operation.
- The blower motor is on. The blower motor speed is automatically controlled by the EATC/DATC module based on the temperature settings, but can be manually overridden.

OFF

When OFF is selected:

- The air inlet door vacuum control motor is at full vacuum, closing off outside air from entering the passenger compartment.
- The panel door and floor/defrost door vacuum control motors are at no vacuum.
- The A/C request button is disabled.

- The blower motor is off.
- The auxiliary blower motor is disabled, if equipped.

PANEL

When PANEL is selected:

- The recirc request button is enabled. If the recirc request button is selected (indicator on), the air inlet door vacuum control motor will be at full vacuum, closing off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator off), the air inlet door vacuum control motor will be at no vacuum, admitting only outside air into the passenger compartment.
- The panel door and floor/defrost door vacuum control motors are at full vacuum, directing airflow to the instrument panel A/C registers. A small amount of airflow from the side window demisters will be present.
- Blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator on), can the airflow temperature be cooled below the outside air temperature.
- The A/C request button is enabled. The A/C compressor will operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 2°C (35°F).
- The blower motor is on.
- The auxiliary blower motor is enabled, if equipped.

PANEL/FLOOR

When PANEL/FLOOR is selected:

- The Recirc request button is enabled. If the recirc request button is selected (indicator on), the air inlet door vacuum control motor will be at full vacuum, closing off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator off), the air inlet door vacuum control motor will be at no vacuum, admitting only outside air into the passenger compartment.
- The floor/defrost door vacuum control motor is at full vacuum and the panel door vacuum control motor is at partial vacuum, directing airflow to the floor duct and the instrument panel A/C registers. A small amount of airflow from the side window demisters will be present.
- Blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator on), can the airflow temperature be cooled below the outside air temperature.
- The A/C request button is enabled. The A/C compressor will operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 2°C (35°F).
- The blower motor is on.
- The auxiliary blower motor is enabled, if equipped.

FLOOR

When FLOOR is selected:

- The recirc request button is enabled. If the recirc request button is selected (indicator on), the air inlet door vacuum control motor will be at full vacuum, closing off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator off), the air

inlet door vacuum control motor will be at no vacuum, admitting only outside air into the passenger compartment.

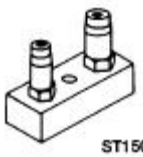
- The floor/defrost door vacuum control motor is at partial vacuum and the panel door vacuum control motor is at no vacuum, directing airflow to the floor duct. A small amount of airflow from the instrument panel A/C registers, defroster duct and side window demisters will be present.
- Blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator on), can the airflow temperature be cooled below the outside air temperature.
- The A/C request button is enabled. The A/C compressor will operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 2°C (35°F).
- The blower motor is on.
- The auxiliary blower motor is enabled, if equipped.

FLOOR/DEFROST

When the FLOOR/DEFROST is selected:

- The recirc request button is disabled. The air inlet door vacuum control motor will be at no vacuum, admitting only outside air into the passenger compartment.
- The floor/defrost door vacuum control motor is at partial vacuum and the panel door vacuum control motor is at no vacuum, directing airflow to the floor duct, the defroster duct and the side window demisters. A small amount of airflow from the instrument panel A/C registers will be present.
- Blended air temperature is available.
- The A/C request button will not illuminate and is disabled. To reduce fogging, the A/C compressor will operate automatically if the outside temperature is above approximately 2°C (35°F).
- The blower motor is on.
- The auxiliary blower motor is enabled, if equipped.

DEFROST



When DEFROST is selected:

- The recirc request button is enabled. If the recirc request button is selected (indicator on), the air inlet door vacuum control motor will be at full vacuum, closing off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator off), the air inlet door vacuum control motor will be at no vacuum, admitting only outside air into the passenger compartment.
- The panel door and floor/defrost door vacuum control motors are at no vacuum, directing airflow to the defroster duct and side window demisters. A small amount of airflow from the instrument panel A/C registers and floor duct will be present.
- Blended air temperature is available.
- The A/C request button will not illuminate and is disabled. To reduce fogging, the A/C compressor will operate automatically if the outside temperature is above approximately 2°C (35°F).
- The blower motor is on.
- The auxiliary blower motor is enabled, if equipped.

0	Black	Vacuum Source	V	V	V	V	V	V
1	Blue	Floor/ Defrost	NV	V	V	V	V	NV
2	Yellow	Floor/ Defrost	NV	V	V	V	NV	NV
3	Red	Panel	NV	V	V	NV	NV	NV
4	Orange	Panel	NV	V	NV	NV	NV	NV
5	White	Air Inlet [a]	V	NV/V	NV/V	NV/V	NV/V	NV/V
6	Gray	Heater Control Valve [b]	V	—	—	—	—	—

[a] The DATC/EATC system may be manually set to enable or disable the recirculation of cabin air by pressing the RECIRCULATION manual override button in all manual override modes except DEFROST.

[b] The automatic temperature control solenoid and manifold will supply vacuum and close the heater control valve depending on the DATC module settings and ambient conditions in any setting except OFF.

V = Vacuum

NV= No Vacuum

Inspection and Verification

1. Verify the customer concern by operating the climate control system to duplicate the condition.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Loose, missing or damaged A/C compressor drive belt ● Loose or disconnected A/C clutch ● Loose, misrouted or damaged vacuum lines [a] ● Broken or leaking vacuum control motor [a] ● Discharged A/C system ● Broken or leaking refrigerant	● Open fuses ● Blower motor inoperative ● A/C compressor inoperative ● Circuitry open/shorted ● Disconnected, loose fitting, or incorrectly installed electrical connectors and pins

lines	

[a] A leak in the vacuum control circuit may occur during acceleration (slow leak), may exist at all times (large leak), and may exist only when specific functions are selected (indicating a leak in that portion of the circuit). The vacuum hoses used in the passenger compartment control circuit are constructed from PVC plastic material. The vacuum hoses used in the engine compartment are constructed of Hytrel®. Because of the materials used, never pinch the vacuum hoses off during diagnosis to locate a leak. A golf tee can be used as a plug when it is necessary to plug one end of the vacuum hose for leak test purposes.

3. As pinpoint tests and measurements are being carried out, be sure to inspect for any disconnected, loose-fitting, or incorrectly installed component, module and in-line electrical connectors and pins.

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. If the cause is not visually evident, connect a diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

6. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

7. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:
   - CKT 914, CKT 915, or CKT 70 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 to diagnose the network concern.
   - If the powertrain control module (PCM) is not listed for a communication concern, turn the A/C controls to OFF and execute the self-test diagnostics for the PCM.
   - If the DATC/EATC module is not listed for a communication concern, execute self-test diagnostics for the DATC/EATC module.

8. If any PCM or DATC/EATC DTCs are retrieved, and are related to the concern, go to the Powertrain Control Module Diagnostic Trouble Code (DTC) Index or the Electronic Automatic Temperature Control (DATC/EATC) Module Diagnostic Trouble Code (DTC) Index to continue diagnostics.

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

10. If the DATC/EATC module cannot be accessed by the diagnostic tool, Go To Pinpoint Test G .

Dual/Electronic Automatic Temperature Control Module — Diagnostic Methods

The dual/electronic automatic temperature control system must be diagnosed by first retrieving any DTCs, if present.

- An on-demand (hard fault) DTC indicates that the fault is currently present. An on-demand DTC suggests a wiring fault, disconnected connector, or component failure.
- A continuous (intermittent) DTC alone (corresponding on-demand DTC is not present) indicates that the fault is an intermittent condition and may not be currently present. A continuous only DTC suggests a poor wiring connection, loose pin or terminal, or intermittent component failure.

On-demand (hard fault) or continuous (intermittent fault) DTCs can be retrieved using a diagnostic tool.

If using a diagnostic tool, refer to the diagnostic tool operating manual.

On-demand DTCs can also be retrieved by carrying out the Dual/Electronic Automatic Temperature Control Module Self-Test. To retrieve and/or clear continuous DTCs, carry out the Dual/Electronic Automatic Temperature Control Module — Retrieve Continuous DTCs procedure. Always carry out the Electronic Automatic Temperature Control Module Self-Test before retrieving continuous DTCs.

If no DTCs are present, GO to Symptom Chart for the appropriate diagnostic action.

Dual/Electronic Automatic Temperature Control Module Self-Test

- The DATC/EATC module self-test will not detect concerns associated with data link messages like engine coolant temperature or vehicle speed signals. A diagnostic tool must be used to retrieve these concerns.
- The DATC/EATC module self-test will detect concerns in the system control functions and will display hard diagnostic trouble codes (DTCs) in addition to intermittent diagnostic trouble codes for concerns that occur during system operation. The vehicle interior temperature should be between 4-32°C (40-90°F) when performing the self-test. If the temperatures are not within the specified ranges, false in-car temperature sensor DTCs will be displayed.
- The self-test can be initiated after cycling the ignition switch from OFF to ON. Normal operation of the climate control system stops when the self-test is activated.
- To enter the self-test, press the OFF and FLOOR buttons simultaneously and then press the AUTOMATIC button within two seconds. The display will show a pulse tracer going around the center of the display window. The test may run as long as 30 seconds. Record all DTCs displayed.
- If any DTCs appear during the self-test, follow the diagnostics procedure given under ACTION for each DTC given.
- If a condition exists but no DTCs appear during the self-test, GO to Symptom Chart Condition: The DATC/EATC System Is Inoperative, Intermittent or Improper Operation.
- To exit self-test and retain all intermittent DTCs, push the blue (cooler temperature) button. The control will exit self-test, retain all intermittent DTCs and then turn OFF (display blank).
- To exit self-test and clear all DTCs, press the DEFROST button. The vacuum fluorescent display window will show 888 and all function symbols for one second. Then, the DATC/EATC control assembly will turn OFF (display blank) and all DTCs will be cleared.
- Always exit the self-test before powering the system down (system turned OFF).
- Intermittent DTCs will be deleted after 80 ignition switch ON cycles after the intermittent condition occurs.

Dual/Electronic Automatic Temperature Control Module — Retrieve Continuous DTCs

The DATC/EATC module will retrieve only continuous (intermittent) DTCs when carrying out this procedure.

- Retrieval of continuous DTCs can be initiated after cycling the ignition switch from OFF to ON. Normal operation of the climate control system stops when retrieving continuous DTCs.
- To retrieve continuous DTCs, press the OFF and PANEL buttons simultaneously and release, then press the AUTO button within two seconds. All vacuum fluorescent segments will be displayed if there are no continuous DTCs present. Continuous DTCs are indicated by the presence of the degrees Celsius symbol (°C) on the DATC/EATC module display. Record all DTCs displayed.

- If any DTCs appear, carry out the diagnostic procedure. Refer to the Dual/Electronic Automatic Temperature Control Module Diagnostic Trouble Code Index and follow the ACTION for each DTC given.
- If a condition exists but no DTCs appear, GO to Symptom Chart Condition: The DATC/EATC System Is Inoperative, Intermittent or Incorrect Operation.
- To exit and retain all continuous DTCs, press any button except DEFROST. The DATC/EATC module will exit the retrieve continuous DTCs mode and retain all continuous DTCs.
- To exit and clear all continuous DTCs, press the DEFROST button. The DATC/EATC module will exit the retrieve continuous DTCs mode and all continuous DTCs will be cleared.
- Always exit the procedure before powering the system down (system turned OFF). Once the procedure is exited the ignition switch must remain ON for at least 30 seconds to allow the temperature blend door actuators to automatically recalibrate.
- Continuous DTCs will be deleted after 80 ignition switch ON cycles after the intermittent fault occurs.

Diagnostic Trouble Code Index

DUAL/ELECTRONIC AUTOMATIC TEMPERATURE CONTROL (DATC/EATC) MODULE DIAGNOSTIC TROUBLE CODE (DTC) INDEX

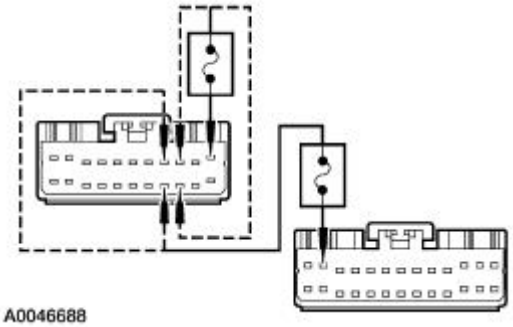
DTC	DATC/EATC DTC displayed	Notes	Description	Action to Take
B2266	2266	N/A	(LH) lower blend door failure or short	Go To Pinpoint Test A.
B2267	2267	DATC Only	(RH) upper blend door failure or short	Go To Pinpoint Test A.
B1251	1251	N/A	A/C in-vehicle temperature sensor open circuit	Go To Pinpoint Test B.
B1253	1253	N/A	A/C in-vehicle temperature sensor circuit short to ground	Go To Pinpoint Test B.
B1255	1255	N/A	A/C ambient temperature sensor open circuit	Go To Pinpoint Test C.
B1257	1257	N/A	A/C ambient temperature sensor circuit short to ground	Go To Pinpoint Test C.
B1259	1259	N/A	A/C solar radiation sensor open circuit	Go To Pinpoint Test D.
B1261	1261	N/A	A/C solar radiation sensor circuit short to ground	Go To Pinpoint Test D.
B2268	2268	N/A	Steering wheel control switch open circuit	Go To Pinpoint Test E.
B2269	2269	N/A	Steering wheel control switch circuit short to ground	Go To Pinpoint Test E.
B2411	2411	DATC Only	A/C humidity sensor open circuit	Go To Pinpoint Test F.
B2412	2412	DATC Only	A/C humidity sensor circuit short to ground	Go To Pinpoint Test F.
B2413	2413	DATC Only	A/C humidity sensor failure	Go To Pinpoint Test F.
B2477	N/A	N/A	Module not configured	Configure DATC/EATC module.

Symptom Chart

SYMPTOM CHART

Condition	Possible Sources	Action
• No communication with the dual/electronic automatic temperature control module	• Circuitry short/open • DATC/EATC module communication network	• Go To Pinpoint Test G .
• The DATC/EATC system is inoperative, intermittent or incorrect operation	• Circuitry short/open • Input sensor (s)/erratic input signals • Automatic temperature control sensor hose and elbow	• Go To Pinpoint Test H .
• Incorrect/erratic direction of airflow from outlet — manual climate control	• Function selector switch. • Vacuum hose. • A/C vacuum reservoir tank and check valve. • Vacuum control motor. • Vacuum actuator arm. • Mode door.	• Go To Pinpoint Test I .
• Incorrect/erratic direction of airflow from outlet — DATC/EATC	• DATC/EATC module. • ATC solenoid and manifold assembly. • Vacuum hose. • A/C vacuum reservoir tank and check valve. • Vacuum control motor. • Vacuum actuator arm. • Mode door.	• Go To Pinpoint Test J .
• Insufficient, erratic, or no heat	• Low engine coolant level. • Engine overheating. • Plugged or partially plugged heater core. • Temperature blend door is binding or stuck. • A/C electric blend door actuator.	• Go To Pinpoint Test K .

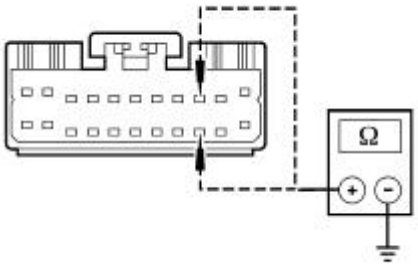
	• Incorrect heater control valve operation. • Heater hose is kinked or binding.	
• The A/C is inoperative/does not operate correctly	• Open fuse. • Circuitry short/open. • A/C thermostatic switch. • A/C system discharged/low charge. • A/C pressure cutoff switch. • A/C control. • Function selector switch. • A/C low charge protection switch.	• Go To Pinpoint Test L .
• The A/C is always on	• Circuitry short. • A/C control. • A/C compressor clutch air gap.	• Go To Pinpoint Test M .
• The temperature control is inoperative/does not operate correctly — manual climate control	• Temperature blend door actuator control. • Temperature blend door. • A/C electronic blend door actuator motor. • Circuitry open/shorted.	• Go To Pinpoint Test N .
• The blower motor is inoperative — manual climate control	• Fuse. • Circuitry open/shorted. • A/C blower motor switch. • A/C blower motor resistor. • Blower motor relay. • A/C blower motor.	• Go To Pinpoint Test O .
• The blower motor does not operate correctly — manual climate control	• Circuitry short. • A/C blower motor resistor. • A/C blower motor switch.	• Go To Pinpoint Test P .
• The blower motor is inoperative — DATC/EATC	• Circuitry short/open. • Blower motor relay. • A/C blower motor. • A/C blower motor speed control.	• Go To Pinpoint Test Q .
• The blower motor	• A/C blower motor	• Go To Pinpoint Test R .

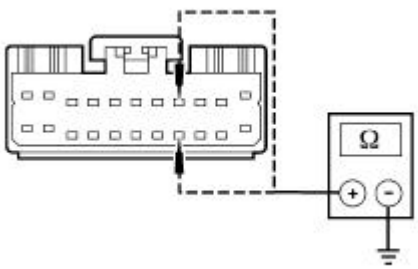


does not operate correctly — DATC/EATC	speed control. ● A/C blower motor. ● DATC/EATC module.	
● The auxiliary blower motor is inoperative	● Fuse. ● Circuitry short/open. ● Auxiliary blower motor relay. ● Auxiliary blower motor.	● Go To Pinpoint Test S .
● The auxiliary blower motor does not operate correctly using the front auxiliary climate controls	● Fuse. ● Circuitry short/open. ● Auxiliary blower motor switch. ● Auxiliary blower motor resistor.	● Go To Pinpoint Test T .
● The auxiliary blower motor does not operate correctly using the rear auxiliary climate controls	● Fuse. ● Circuitry short/open. ● Auxiliary blower motor switch. ● Auxiliary blower motor resistor.	● Go To Pinpoint Test U .
● The panel/floor control is inoperative using the front auxiliary climate controls	● Fuse. ● Circuitry short/open. ● Auxiliary mode control panel. ● Auxiliary mode door actuator. ● Mode door.	● Go To Pinpoint Test V .
● The panel/floor control is inoperative using the rear auxiliary climate controls	● Fuse. ● Circuitry short/open. ● Auxiliary mode control panel. ● Auxiliary mode door actuator.	● Go To Pinpoint Test W .
● The temperature control is inoperative using the front auxiliary climate controls	● Fuse. ● Circuitry short/open. ● Auxiliary temperature control panel. ● Auxiliary blend door actuator. ● Temperature blend door.	● Go To Pinpoint Test X .
● The temperature control is inoperative using the rear auxiliary climate controls	● Fuse. ● Circuitry short/open. ● Auxiliary temperature control panel. ● Auxiliary blend door actuator.	● Go To Pinpoint Test Y .

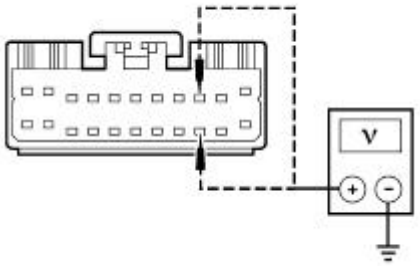
• The panel/floor and cool/warm controls are inoperative using the front auxiliary climate controls	• Fuse. • Circuitry short/open. • Auxiliary blower motor switch. • Auxiliary climate control panel.	• Go To Pinpoint Test Z .
• The panel/floor and cool/warm controls are inoperative using the rear auxiliary climate controls	• Fuse. • Circuitry short/open. • Auxiliary blower motor switch. • Auxiliary climate control panel.	• Go To Pinpoint Test AA .
• Insufficient air conditioning (A/C) cooling	• Restricted A/C evaporator core orifice. • Low refrigerant level. • A/C low charge protection switch. • Evaporator discharge air temperature sensor. • Temperature blend door actuator control. • A/C pressure cutoff switch. • Heater control valve. • Vacuum line blocked or leaking.	• Go To Pinpoint Test AB .
• The dual temperature control is inoperative/does not operate correctly — DATC	• Temperature blend door/actuator broken/binding • DATC module	• CHECK the temperature blend doors/actuators for a binding or broken condition. If no condition is found, INSTALL a new DATC/EATC module.
• The temperature set point does not repeat after turning the ignition switch OFF	• Open fuse • Circuitry short/open • DATC/EATC module	• CHECK circuit 729 (LB/BK) for a short or open and repair as necessary. If okay, INSTALL a new DATC/EATC module.
• The temperature display will not switch between Celsius and Fahrenheit	• DATC/EATC module	• PRESS the MAX A/C and DEFROST buttons simultaneously for at least 0.75 second. If the temperature display does not switch between Celsius and Fahrenheit, INSTALL a new DATC/EATC module.

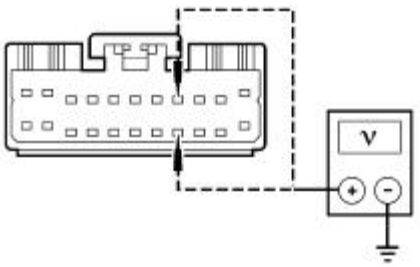
Pinpoint Tests



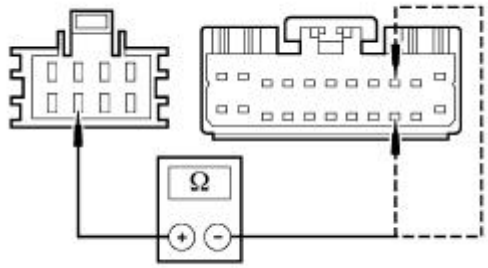


PINPOINT TEST A: DTC B2266 OR DTC B2267 — BLEND DOOR FAILURE OR SHORT



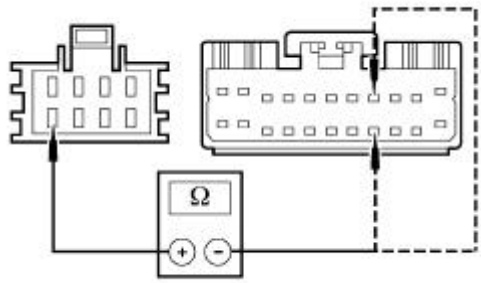


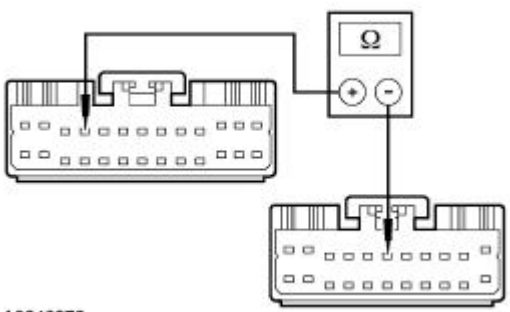
Test Step	Result / Action to Take
A1 CHECK THE BLEND DOOR ACTUATOR CLOCKWISE OPERATION	
• Disconnect: DATC/EATC Module C228a. • Disconnect: DATC/EATC Module C228b. • Remove the door actuator and disengage the actuator driveshaft from the actuator door. Refer to Section 412-04 . • Mark the door actuator driveshaft position. • Key in ON position. • Connect a fused jumper wire between: ▪ For DTC B2266, DATC/EATC module C228b-19, circuit 250 (OG) and DATC/EATC module C228b-11, circuit 729 (RD/WH). Connect a second fused jumper wire between DATC/EATC module C228b-20, circuit 249 (DB/LG) and DATC/EATC module C228a-2, circuit 875 (BK/LB). ▪ For DTC B2267, DATC module C228b-8, circuit 1136 (RD/WH) and DATC module C228b-11, circuit 729 (RD/WH). Connect a second fused jumper wire between DATC module C228b-9, circuit 1137 (YE/LG) and DATC module C228a-2, circuit 875 (BK/LB).  A0046687 • **Does the actuator motor move in the clockwise direction?**	**Yes** GO to A2 . **No** GO to A3 .
A2 CHECK THE BLEND DOOR ACTUATOR COUNTERCLOCKWISE OPERATION	
• Connect a fused jumper wire between: ▪ For DTC B2266, DATC/EATC module C228b-20, circuit 249 (DB/LG) and DATC/EATC module C228b-11, circuit 729 (RD/WH). Connect a second fused jumper wire between DATC/EATC module C228b-19, circuit 250 (OG) and DATC/EATC module C228a-2, circuit 875 (BK/LB). ▪ For DTC B2267, DATC module C228b-9, circuit 1137 (YE/LG) and DATC module C228b-11, circuit 729 (RD/WH). Connect a second fused jumper wire between DATC module C228b-8, circuit 1136 (RD/WH) and DATC module C228a-2, circuit 875 (BK/LB).	**Yes** GO to A9 . **No** GO to A3 .



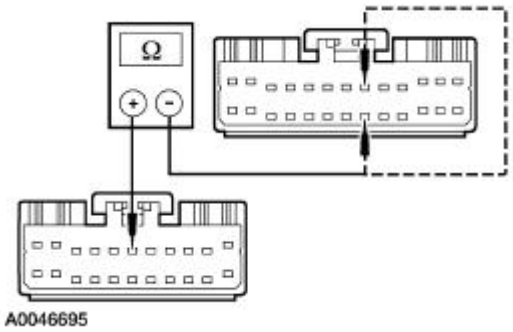
A0046688

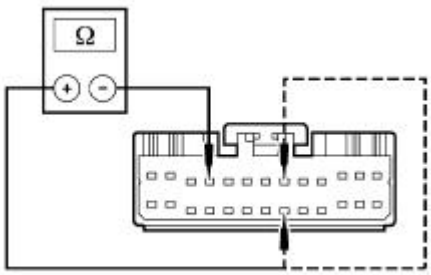
- **Does the actuator motor move in the counterclockwise direction?**



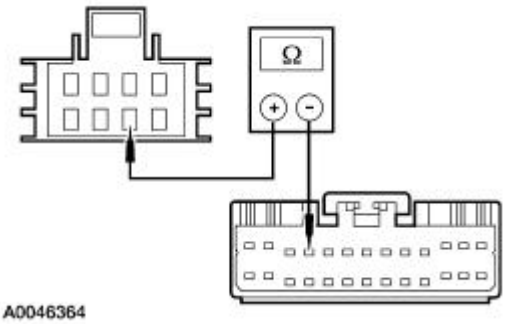


A3 CHECK CIRCUIT 249 (DB/LG) OR CIRCUIT 1137 (YE/LG) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Temperature Blend Door Actuator C2091 or C2092. • Measure the resistance between ground and: ■ For DTC B2266, DATC/EATC module C228b-20, circuit 249 (DB/LG). ■ For DTC B2267, DATC module C228b-9, circuit 1137 (YE/LG).  A0046689 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A4 . **No** REPAIR circuit 249 (DB/LG) or circuit 1137 (YE/LG) for a short to ground. TEST the system for normal operation.
A4 CHECK CIRCUIT 250 (OG) OR CIRCUIT 1136 (RD/WH) FOR A SHORT TO GROUND	
• Measure the resistance between ground and: ■ For DTC B2266, DATC/EATC module C228b-19, circuit 250 (OG). ■ For DTC B2267, DATC module C228b-8, circuit 1136 (RD/WH).  A0046690 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A5 . **No** REPAIR circuit 250 (OG) or circuit 1136 (RD/WH) for a short to ground. TEST the system for normal operation.
A5 CHECK CIRCUIT 249 (DB/LG) OR CIRCUIT 1137 (YE/LG) FOR A SHORT TO POWER	

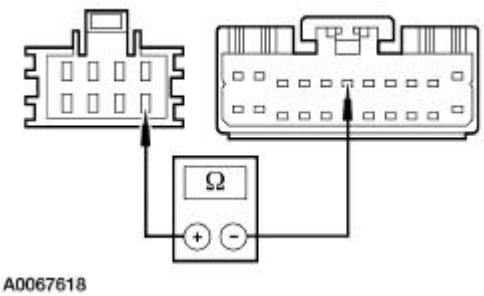


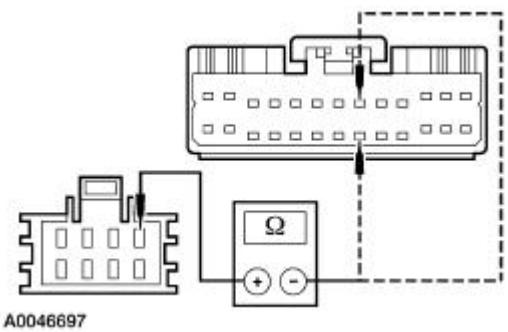


• Key in ON position. • Measure the voltage between ground and: ■ For DTC B2266, DATC/EATC module C228b-20, circuit 249 (DB/LG). ■ For DTC B2267, DATC module C228b-9, circuit 1137 (YE/LG).  A0046691 • **Is voltage present?**	**Yes** REPAIR circuit 249 (DB/LG) or circuit 1137 (YE/LG) for a short to power. TEST the system for normal operation. **No** GO to A6 .
A6 CHECK CIRCUIT 250 (OG) OR CIRCUIT 1136 (RD/WH) FOR A SHORT TO POWER	
• Measure the voltage between ground and: ■ For DTC B2266, DATC/EATC module C228b-19, circuit 250 (OG). ■ For DTC B2267, DATC module C228b-8, circuit 1136 (RD/WH).  A0046692 • **Is voltage present?**	**Yes** REPAIR circuit 250 (OG) or circuit 1136 (RD/WH) for a short to power. TEST the system for normal operation. **No** GO to A7 .
A7 CHECK CIRCUIT 249 (DB/LG) OR CIRCUIT 1137 (YE/LG) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between: ■ For DTC B2266, DATC/EATC module C228b-20, circuit 249 (DB/LG) and the temperature blend door actuator C2091-7, circuit 249 (DB/LG). ■ For DTC B2267, DATC module C228b-9, circuit 1137 (YE/LG) and the temperature blend door actuator C2092-7, circuit 1137 (YE/LG).	**Yes** GO to A8 . **No** REPAIR circuit 249 (DB/LG) or circuit1137 (YE/LG) for an open. TEST the system for normal operation.

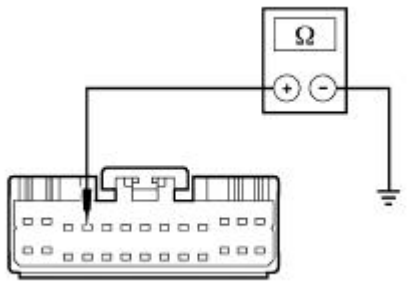


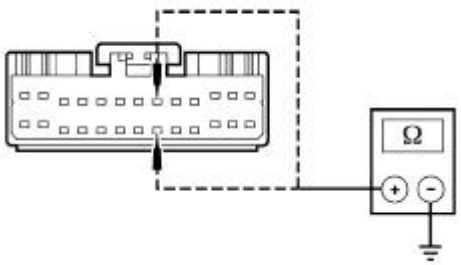
A0046693

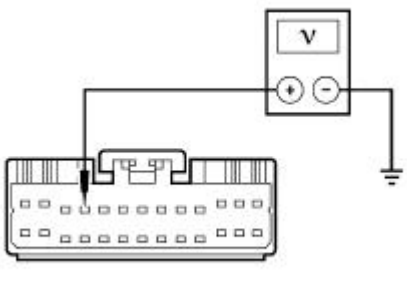




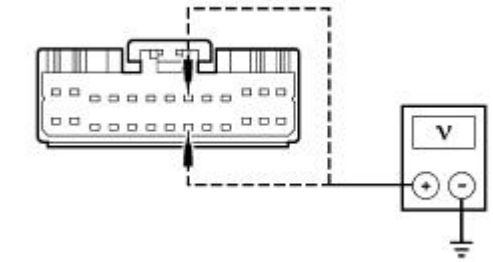
- **Is the resistance less than 5 ohms?**

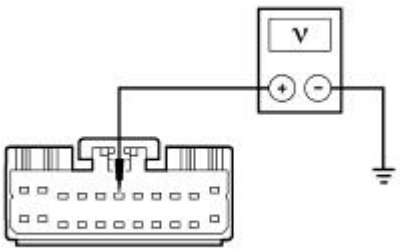


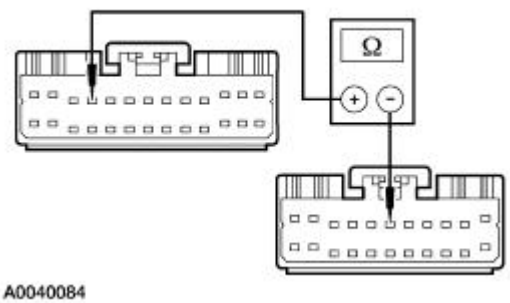




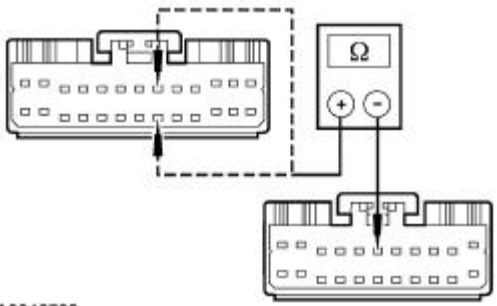
A8 CHECK CIRCUIT 250 (OG) OR CIRCUIT 1136 (RD/WH) FOR AN OPEN	
• Measure the resistance between: ■ For DTC B2266, DATC/EATC module C228b-19, circuit 250 (OG) and the temperature blend door actuator C2091-8, circuit 250 (OG). ■ For DTC B2267, DATC module C228b-8, circuit 1136 (RD/WH) and the temperature blend door actuator C2092-8, circuit 1136 (RD/WH).  A0046694 • **Is the resistance less than 5 ohms?**	**Yes** INSPECT for binding or broken linkage. If no condition is found, INSTALL a new door actuator. REFER to Section 412-04 . TEST the system for normal operation. **No** REPAIR circuit 250 (OG) or circuit 1136 (RD/WH) for an open. TEST the system for normal operation.
A9 CHECK THE FEEDBACK POTENTIOMETER TOTAL RESISTANCE	
• Connect: For DTC B2266, Temperature Blend Door Actuator C2091. • Connect: For DTC B2267, Temperature Blend Door Actuator C2092. • Measure the resistance between DATC/EATC module C228a-4, circuit 436 (RD/LG) and DATC/EATC module C228b-6, circuit 438 (RD/WH).  A0040073 • **Is the resistance between 5,000 and 6,000 ohms?**	**Yes** GO to A10 . **No** If the resistance is greater than 6,000 ohms, GO to A12 . If the resistance is less than 5,000 ohms, GO to A20 .
A10 CHECK POTENTIOMETER LOW SIDE RESISTANCE	
• Measure the resistance between DATC/EATC module C228b-6,	**Yes**

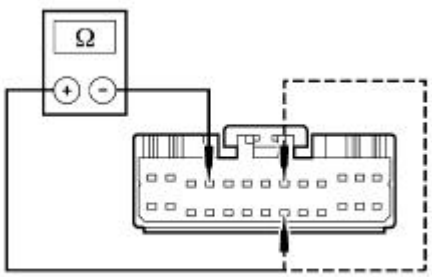






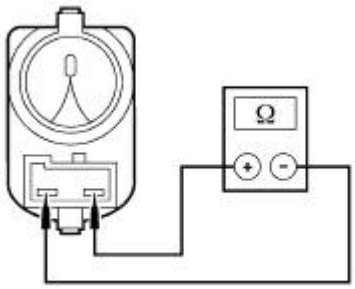
circuit 438 (RD/WH). ■ For DTC B2266, DATC/EATC module C228a-21, circuit 437 (YE/LG). ■ For DTC B2267, DATC module C228a-8, circuit 1122 (RD).  A0046695 ● **Is the resistance between 250 and 5,500 ohms?**	GO to A11 . **No** If the resistance is greater than 5,500 ohms, GO to A13 . If the resistance is less than 250 ohms, GO to A21 .
A11 CHECK POTENTIOMETER HIGH SIDE RESISTANCE	
● Measure the resistance between DATC/EATC module C228a-4, circuit 436 (RD/LG) and ■ For DTC B2266, DATC/EATC module C228a-21, circuit 437 (YE/LG). ■ For DTC B2267, DATC module C228a-8, circuit 1122 (RD).  A0046696 ● **Is the resistance between 250 and 5,500 ohms?**	**Yes** GO to A15 . **No** If the resistance is greater than 5,500 ohms, GO to A12 . If the resistance is less than 250 ohms, GO to A22 .
A12 CHECK 436 (RD/LG) CIRCUIT FOR AN OPEN	
● Disconnect: For DTC B2266, Temperature Blend Door Actuator C2091. ● Disconnect: For DTC B2267, Temperature Blend Door Actuator C2092. ● Measure the resistance between DATC/EATC module C228a-4, circuit 436 (RD/LG) and: ■ For DTC B2266, temperature blend door actuator C2091-6, circuit 436 (RD/LG). ■ For DTC B2267, temperature blend door actuator C2092-6, circuit 436 (RD/LG).	**Yes** GO to A13 . **No** REPAIR circuit 436 (RD/LG) for an open. TEST the system for normal operation.

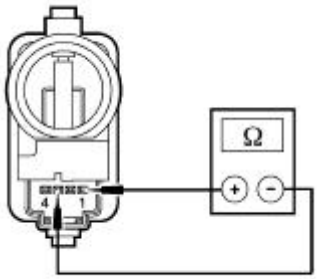


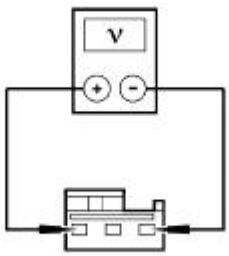


- **Is the resistance less than 5 ohms?**

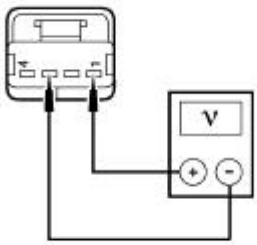
A13 CHECK THE ACTUATOR RETURN CIRCUIT 438 (RD/WH) FOR AN OPEN	
• Disconnect: For DTC B2266, Temperature Blend Door Actuator C2091 (If not previously disconnected). • Disconnect: For DTC B2267, Temperature Blend Door Actuator C2092 (If not previously disconnected). • Measure the resistance between DATC/EATC module C228b-6, circuit 438 (RD/WH) and: ■ For DTC B2266, temperature blend door actuator C2091-5, circuit 438 (RD/WH). ■ For DTC B2267, temperature blend door actuator C2092-5, circuit 438 (RD/WH).  • **Is the resistance less than 5 ohms?**	**Yes** GO to A14 . **No** REPAIR circuit 438 (RD/WH) for an open. TEST the system for normal operation.
A14 CHECK CIRCUIT 437 (YE/LG) OR CIRCUIT 1122 (RD) FOR AN OPEN	
• Measure the resistance between: ■ For DTC B2266, DATC/EATC module C228a-21, circuit 437 (YE/LG) and temperature blend door actuator C2091-1, circuit 437 (YE/LG). ■ For DTC B2267, DATC module C228a-8, circuit 1122 (RD) and temperature blend door actuator C2092-1, circuit 1122 (RD).  	**Yes** INSTALL a new door actuator. REFER to Section 412-04 . TEST the system for normal operation. **No** REPAIR circuit 437 (YE/LG) or circuit 1122 (RD) for an open. TEST the system for normal operation.







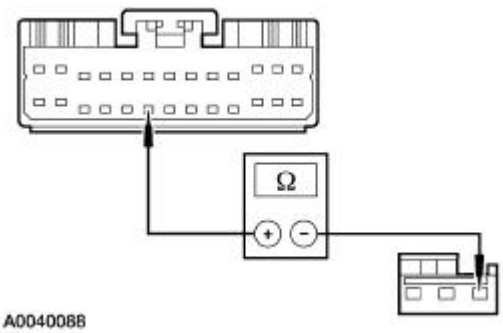
• **Is the resistance less than 5 ohms?**	
A15 CHECK CIRCUIT 436 (RD/LG) FOR A SHORT TO GROUND	
• Measure the resistance between DATC/EATC module C228a-4, circuit 436 (RD/LG) and ground.  A0040079 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A16 . **No** REPAIR circuit 436 (RD/LG) for a short to ground. TEST the system for normal operation.
A16 CHECK CIRCUIT 437 (YE/LG) OR CIRCUIT 1122 (RD) FOR A SHORT TO GROUND	
• Measure the resistance between ground and: ■ For DTC B2266, DATC/EATC module C228a-21, circuit 437 (YE/LG). ■ For DTC B2267, DATC module C228a-8, circuit 1122 (RD).  A0046698 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A17 . **No** REPAIR circuit 437 (YE/LG) or circuit 1122 (RD) for a short to ground. TEST the system for normal operation.
A17 CHECK CIRCUIT 436 (RD/LG) FOR A SHORT TO POWER	
• Key in ON position. • Measure the voltage between DATC/EATC module C228a-4, circuit 436 (RD/LG) and ground.  A0040081 • **Is voltage present?**	**Yes** REPAIR circuit 436 (RD/LG) for a short to power. TEST the system for normal operation. **No** GO to A18 .
A18 CHECK CIRCUIT 437 (YE/LG) OR CIRCUIT 1122 (RD) FOR A SHORT TO POWER	
• Measure the voltage between ground and: ■ For DTC B2266, DATC/EATC module C228a-21, circuit	**Yes** REPAIR circuit 437

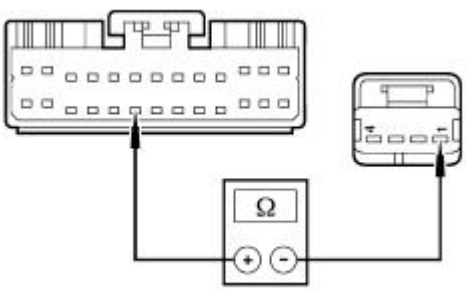


437 (YE/LG). ■ For DTC B2267, DATC module C228a-8, circuit 1122 (RD).  A0046699 ● **Is voltage present?**	(YE/LG) or circuit 1122 (RD) for a short to power. TEST the system for normal operation. **No** GO to A19 .
A19 CHECK CIRCUIT 438 (RD/WH) FOR A SHORT TO POWER	
● Measure the voltage between DATC/EATC module C228b-6, circuit 438 (RD/WH) and ground.  A0040083 ● **Is voltage present?**	**Yes** REPAIR circuit 438 (RD/WH) for a short to power. TEST the system for normal operation. **No** INSTALL a new door actuator. REFER to Section 412-04 . TEST the system for normal operation.
A20 CHECK CIRCUIT 438 (RD/WH) AND CIRCUIT 436 (RD/LG) FOR A SHORT TOGETHER	
● Disconnect: For DTC B2266, Temperature Blend Door Actuator C2091. ● Disconnect: For DTC B2267, Temperature Blend Door Actuator C2092. ● Measure the resistance between DATC/EATC module C228b-6, circuit 438 (RD/WH) and DATC/EATC module C228a-4, circuit 436 (RD/LG).  A0040084 ● **Is the resistance less than 5 ohms?**	**Yes** REPAIR circuits 438 (RD/WH) and circuit 436 (RD/LG) for a short together. TEST the system for normal operation. **No** INSTALL a new door actuator. REFER to Section 412-04 . TEST the system for normal operation.
A21 CHECK CIRCUIT 438 (RD/WH) AND CIRCUIT 437 (YE/LG) OR CIRCUIT 1122 (RD) FOR A SHORT TOGETHER	
● Disconnect: For DTC B2266, Temperature Blend Door Actuator C2091. ● Disconnect: For DTC B2267, Temperature Blend Door Actuator	**Yes** REPAIR circuits 438 (RD/WH) and circuit

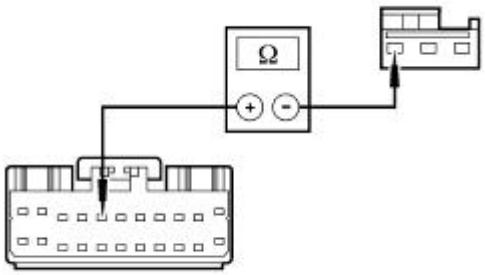
C2092. ● Measure the resistance between DATC/EATC module C228b-6, circuit 438 (RD/WH) and: ■ For DTC B2266, DATC/EATC module C228a-21, circuit 437 (YE/LG). ■ For DTC B2267, DATC module C228a-8, circuit 1122 (RD).  A0046700 ● **Is the resistance less than 5 ohms?**	437 (YE/LG) or circuit 1122 (RD) for a short together. TEST the system for normal operation. **No** INSTALL a new door actuator. REFER to Section 412-04 . TEST the system for normal operation.
A22 CHECK CIRCUIT 436 (RD/LG) AND CIRCUIT 437 (YE/LG) OR CIRCUIT 1122 (RD) FOR A SHORT TOGETHER	
● Disconnect: For DTC B2266, Temperature Blend Door Actuator C2091. ● Disconnect: For DTC B2267, Temperature Blend Door Actuator C2092. ● Measure the resistance between DATC/EATC module C228a-4, circuit 436 (RD/LG) and: ■ For DTC B2266, DATC/EATC module C228a-21, circuit 437 (YE/LG). ■ For DTC B2267, DATC module C228a-8, circuit 1122 (RD).  A0046696 ● **Is the resistance less than 5 ohms?**	**Yes** REPAIR circuits 436 (RD/LG) and circuit 437 (YE/LG) or circuit 1122 (RD) for a short together. TEST the system for normal operation. **No** INSTALL a new door actuator. REFER to Section 412-04 . TEST the system for normal operation.

PINPOINT TEST B: DTC B1251 OR DTC1253 — A/C IN-VEHICLE TEMPERATURE SENSOR OPEN CIRCUIT OR SHORT TO GROUND



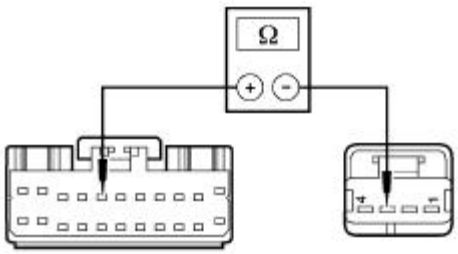


Test Step	Result / Action to Take
B1 CHECK THE SENSOR RESISTANCE	
● Key in OFF position. ● Disconnect: In-Vehicle Temperature Sensor C233. ● **NOTE:** EATC system only. ● Measure the resistance between the in-vehicle temperature	**Yes** GO to B2 . **No**



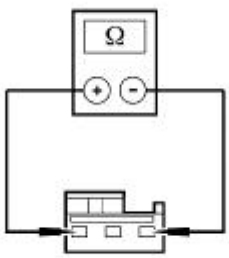
sensor terminals.  A0013635 ● **NOTE:** DATC system only. ● Measure the resistance between the in-vehicle temperature sensor terminals 1 and 3.  A0047071 ● **Is the resistance within the specified values for these temperature ranges: 10-20°C (50-68°F), 37,000-58,000 ohms; 20-30°C (68-86°F), 24,000-37,000 ohms; 30-40°C (86-104°F), 16,000-24,000 ohms?**	INSTALL a new in-car temperature sensor. TEST the system for normal operation.
B2 CHECK THE DATC/EATC SENSOR OUTPUT VOLTAGE ● Key in ON position. ● Press the AUTOMATIC button. ● **NOTE:** EATC system only. ● Measure the voltage between the in-vehicle temperature sensor C233, circuit 790 (WH/OG) and circuit 470 (PK/BK).  A0040087 ● **NOTE:** DATC system only. ● Measure the voltage between the in-vehicle temperature sensor C233, circuit 790 (WH/OG) and circuit 470 (PK/BK).	**Yes** INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** If diagnosing DTC B1251, GO to B3 . If diagnosing DTC B1253, GO to B5 .

A0047072

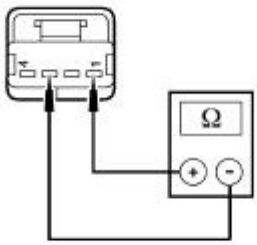


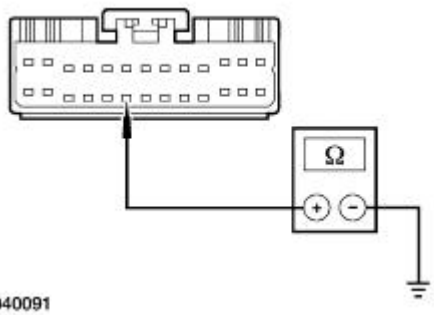
- **Is the voltage between 4.7 and 5.1 volts?**

B3 CHECK CIRCUIT 790 (WH/OG) FOR AN OPEN	
• Key in OFF position. • Disconnect: DATC/EATC Module C228a. • **NOTE:** EATC system only. • Measure the resistance between the DATC/EATC module C228a-19, circuit 790 (WH/OG) and the in-vehicle temperature sensor C233, circuit 790 (WH/OG).  A0040088 • **NOTE:** DATC system only. • Measure the resistance between the DATC/EATC module C228a-19, circuit 790 (WH/OG) and the in-vehicle temperature sensor C233, circuit 790 (WH/OG).  A0047073 • **Is the resistance less than 5 ohms?**	**Yes** GO to B4 . **No** REPAIR circuit 790 (WH/OG) for an open. TEST the system for normal operation.
B4 CHECK CIRCUIT 470 (PK/BK) FOR AN OPEN	
• Disconnect: DATC/EATC Module C228b. • **NOTE:** EATC system only. • Measure the resistance between the DATC/EATC module C228b-5, circuit 470 (PK/BK) and the in-vehicle temperature sensor C233, circuit 470 (PK/BK).	**Yes** INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** REPAIR circuit 470 (PK/BK) for an open. TEST the system for normal operation.

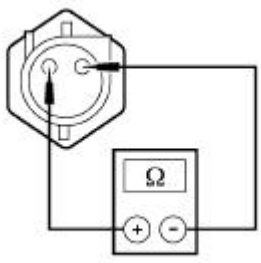


A0040089

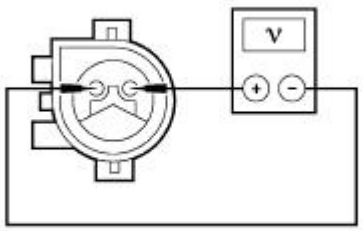


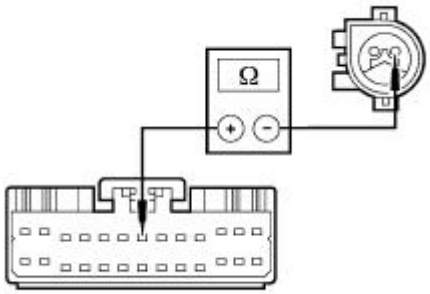


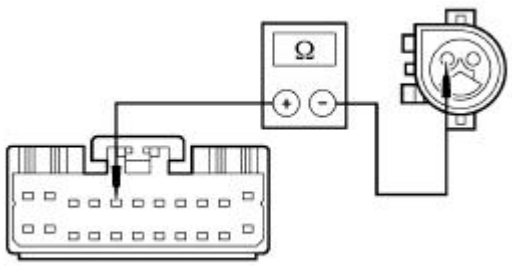
- **NOTE:** DATC system only.
- Measure the resistance between the DATC/EATC module C228b-5, circuit 470 (PK/BK) and the in-vehicle temperature sensor C233, circuit 470 (PK/BK).



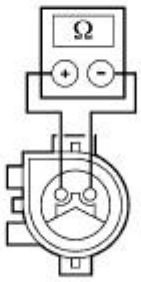
A0047074

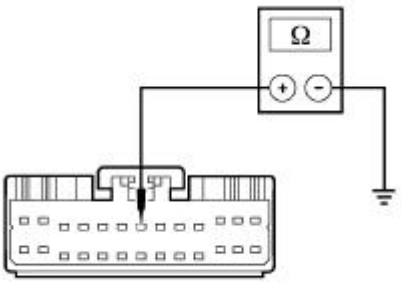






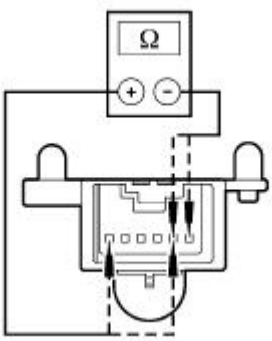
- **Is the resistance less than 5 ohms?**



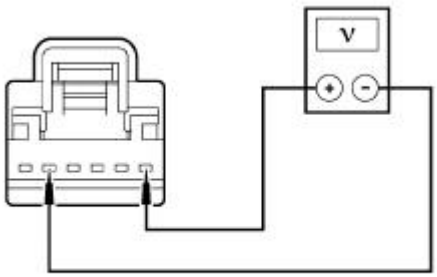


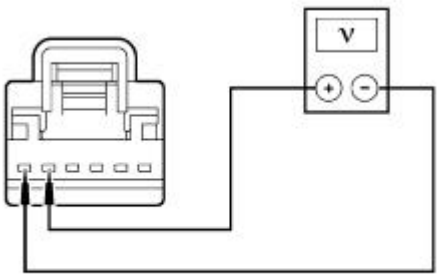
B5 CHECK CIRCUIT 790 (WH/OG) FOR A SHORT TO CIRCUIT 470 (PK/BK)	
• Key in OFF position. • Disconnect: DATC/EATC Module C228a. • Disconnect: DATC/EATC Module C228b. • **NOTE:** EATC system only. • Measure the resistance between the in-vehicle temperature sensor C233, circuit 790 (WH/OG) and circuit 470 (PK/BK).  A0040090 • **NOTE:** DATC system only. • Measure the resistance between the in-vehicle temperature sensor C233, circuit 790 (WH/OG) and circuit 470 (PK/BK).	**Yes** GO to B6 . **No** REPAIR circuit 790 (WH/OG) for a short to circuit 470 (PK/BK). TEST the system for normal operation.

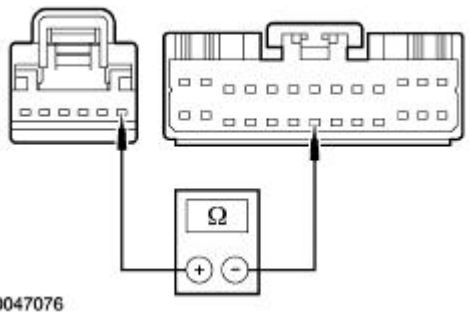
 A0047075 ● **Is the resistance greater than 10,000 ohms?**	
B6 CHECK CIRCUIT 790 (WH/OG) FOR A SHORT TO GROUND	
● Measure the resistance between the DATC/EATC module C228a-19, circuit 790 (WH/OG) and ground.  A0040091 ● **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** REPAIR circuit 790 (WH/OG) for a short to ground. TEST the system for normal operation.



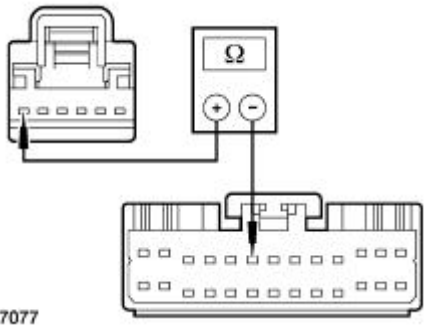
PINPOINT TEST C: DTC B1255 OR DTC B1257 — A/C AMBIENT TEMPERATURE SENSOR OPEN CIRCUIT OR SHORT TO GROUND

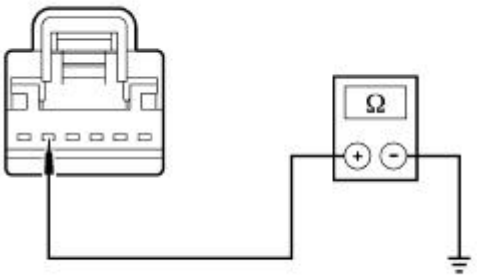


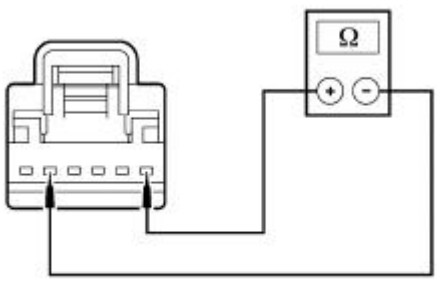




Test Step	Result / Action to Take
C1 CHECK THE AMBIENT TEMPERATURE SENSOR RESISTANCE	
● Key in OFF position. ● Disconnect: Ambient Temperature Sensor C132. ● Measure the resistance between the ambient temperature sensor terminals.  A0013640 ● **Is the resistance within the specified values for these temperature ranges: 10-20°C (50-68°F), 37,000-58,000 ohms; 20-30°C (68-86°F), 24,000-37,000 ohms; 30-40°C (86-104°F), 16,000-24,000 ohms?**	**Yes** GO to C2 . **No** INSTALL a new ambient air temperature sensor and bracket. TEST the system for normal operation.
C2 CHECK THE DATC/EATC MODULE OUTPUT VOLTAGE	





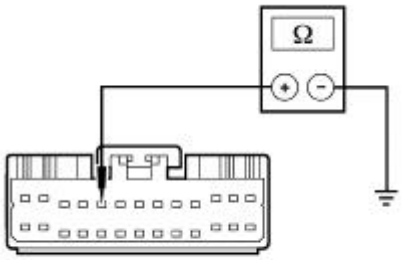


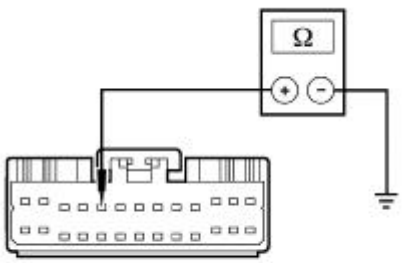
• Key in ON position. • Press the AUTOMATIC button. • Measure the voltage between the ambient temperature sensor C132, circuit 767 (LB/OG) and circuit 470 (PK/BK).  A0013641 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** If diagnosing DTC 1255, GO to C3 . If diagnosing DTC 1257, GO to C5 .
C3 CHECK CIRCUIT 767 (LB/OG) FOR AN OPEN	
• Key in OFF position. • Disconnect: DATC/EATC Module C228a. • Measure the resistance between the DATC/EATC module C228a-7, circuit 767 (LB/OG) and the ambient temperature sensor C132, circuit 767 (LB/OG).  A0040092 • **Is the resistance less than 5 ohms?**	**Yes** GO to C4 . **No** REPAIR circuit 767 (LB/OG) for an open. TEST the system for normal operation.
C4 CHECK CIRCUIT 470 (PK/BK) FOR AN OPEN	
• Measure the resistance between the DATC/EATC module C228b-5, circuit 470 (PK/BK) and the ambient temperature sensor C132, circuit 470 (PK/BK).  A0067617 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** REPAIR circuit 470 (PK/BK) for an open. TEST the system for normal operation.
C5 CHECK CIRCUIT 767 (LB/OG) FOR A SHORT TO CIRCUIT 470 (PK/BK)	
• Key in OFF position. • Disconnect: DATC/EATC Module C228a. • Disconnect: DATC/EATC Module C228b. • Measure the resistance between the in-car temperature sensor C132, circuit 767 (LB/OG) and circuit 470 (PK/BK).	**Yes** GO to C6 . **No** REPAIR circuit 767

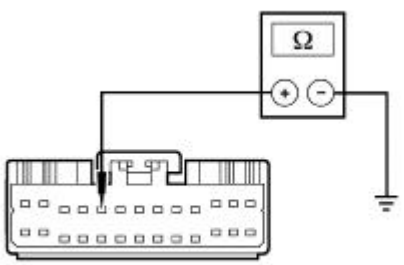
 A0038068 ● **Is the resistance greater than 10,000 ohms?**	(LB/OG) for a short to circuit 470 (PK/BK). TEST the system for normal operation.
C6 CHECK CIRCUIT 767 (LB/OG) FOR A SHORT TO GROUND	
● Key in OFF position. ● Measure the resistance between the DATC/EATC module C228a-7, circuit 767 (LB/OG) and ground.  A0040094 ● **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** REPAIR circuit 767 (LB/OG) for a short to ground. TEST the system for normal operation.

PINPOINT TEST D: DTC B1259 OR DTC B1261 — SOLAR RADIATION SENSOR OPEN CIRCUIT OR SHORT TO GROUND

Test Step	Result / Action to Take
D1 CHECK THE SOLAR RADIATION SENSOR RESISTANCE	
● Key in OFF position. ● Disconnect: Solar Radiation Sensor C286. ● Measure the resistance between the solar radiation sensor terminals C286-1 and C286-5 and if vehicle is equipped with DATC, between C286-5 and C286-6.  A0032464 ● **Is continuity present and the resistance greater than 0 ohms?**	**Yes** GO to D2 . **No** INSTALL a new solar radiation sensor and bracket. TEST the system for normal operation.
D2 CHECK THE DATC/EATC MODULE OUTPUT VOLTAGE	
● Key in ON position.	**Yes**



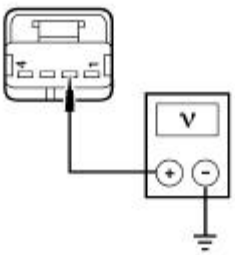


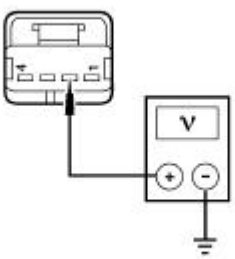


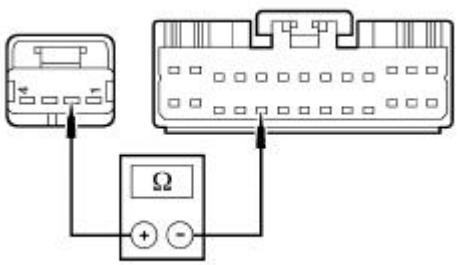
• Press the AUTOMATIC button. • Measure the voltage between the solar radiation sensor C286-1, circuit 468 (BN) and C286-5, circuit 875 (BK/LB).  A0015935 • **NOTE:** Vehicles equipped with DATC only. • Measure the voltage between the solar radiation sensor C286-5, circuit 875 (BK/LB) and C286-6, circuit 1958 (GY/YE).  A0038234 • **Are the voltages between 4.7 and 5.1 volts?**	INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** If diagnosing DTC 1259, GO to D3 . If diagnosing DTC 1261, GO to D5 .
D3 CHECK CIRCUIT 468 (BR) AND CIRCUIT 1958 (GY/YE) FOR AN OPEN	
• Key in OFF position. • Disconnect: DATC/EATC Module C228a. • Measure the resistance between the DATC/EATC module C228a-20, circuit 468 (BR) and the solar radiation sensor C286-1, circuit 468 (BR).  A0047076 • **NOTE:** Vehicles equipped with DATC only. • Measure the resistance between the DATC/EATC module C228a-6, circuit 1958 (GY/YE) and the solar radiation sensor C286-6, circuit 1958 (GY/YE).	**Yes** GO to D4 . **No** REPAIR the circuit for an open. TEST the system for normal operation.

 A0047077 ● **Is the resistance less than 5 ohms?**	
D4 CHECK CIRCUIT 875 (BK/LB) FOR AN OPEN ● Measure the resistance between the solar radiation sensor C286-5, circuit 875 (BK/LB) and ground.  A0015937 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** REPAIR circuit 875 (BK/LB) for an open. TEST the system for normal operation.
D5 CHECK CIRCUIT 468 (BR) AND 1958 (GY/YE) FOR A SHORT TO CIRCUIT 875 (BK/LB) ● Key in OFF position. ● Disconnect: DATC/EATC Module C228a. ● Measure the resistance between the solar radiation sensor C286-1, circuit 468 (BR) and circuit C286-5, 875 (BK/LB).  A0047078 ● **NOTE:** Vehicles equipped with DATC only. ● Measure the resistance between the solar radiation sensor C286-6, circuit 1958 (GY/YE) and circuit C286-5, 875 (BK/LB).	**Yes** GO to D6 . **No** REPAIR circuit 468 (BR) and 1958 (GY/YE) for a short to circuit 875 (BK/LB). TEST the system for normal operation.

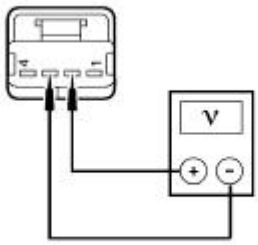
 A0047079 ● **Are the resistances greater than 10,000 ohms?**	
D6 CHECK CIRCUIT 468 (BR) AND CIRCUIT 1958 (GY/YE) FOR A SHORT TO GROUND	
● Measure the resistance between the solar radiation sensor C286-1, circuit 468 (BR) and ground.  A0015938 ● **NOTE:** Vehicles equipped with DATC only. ● Measure the resistance between the solar radiation sensor C286-6, circuit 1958 (GY/YE) and ground.  A0032467 ● **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** REPAIR circuit 468 (BR) or 1958 (GY/YE) for a short to ground. TEST the system for normal operation.

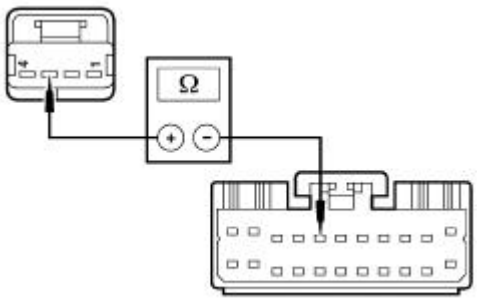


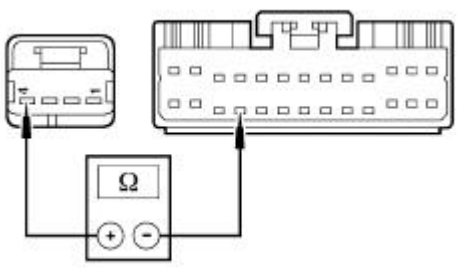




PINPOINT TEST E: DTC B2268 OR DTC B2269 — STEERING WHEEL CONTROL SWITCH OPEN CIRCUIT OR SHORT TO GROUND





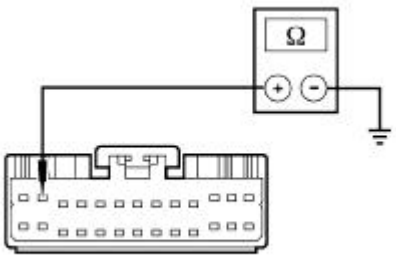


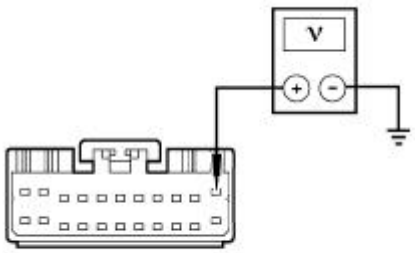
Test Step	Result / Action to Take
NOTE: Before carrying out the following test, verify that the vehicle is equipped with, and the module is configured for, redundant steering wheel controls.	
E1 CHECK THE INPUT TO THE DATC/EATC MODULE	
● Key in OFF position. ● Disconnect: DATC/EATC Module C228a. ● Measure the resistance between the DATC/EATC module C228a-5, circuit 1070 (BN/LB) and ground.	**Yes** GO to E2 . **No** If the resistance is less

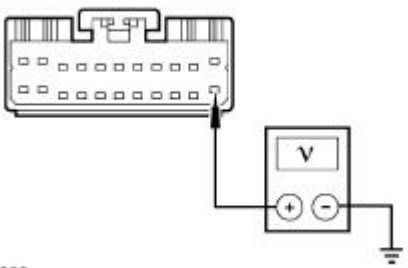
 A0040195 ● **Is the resistance reading between 4,500 and 5,000 ohms?**	than 4,500 ohms, GO to E3 . If the resistance is greater than 5,000 ohms, GO to E5 .
E2 CHECK THE STEERING WHEEL CONTROL SWITCH OUTPUT	
● Measure the resistance between the DATC/EATC module C228a-5, circuit 1070 (BN/LB) and ground.  A0040195 ● Press each steering wheel control switch and compare the resistance reading to the chart below. **Switch** / **Resistance (ohms)** TEMP UP: 336-375 TEMP DOWN: 1620-1810 FAN UP: 736-821 FAN DOWN: 123-138 ● **Are the resistance readings within the range?**	**Yes** INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** INSTALL a new steering wheel control switch. TEST the system for normal operation.
E3 CHECK CIRCUIT 1070 (BN/LB) FOR A SHORT TO GROUND	
● Disconnect: Steering Wheel Control Switch. ● Measure the resistance between the DATC/EATC module C228a-5, circuit 1070 (BN/LB) and ground.  A0040195 ● **Is the resistance reading less than 10,000 ohms?**	**Yes** REPAIR circuit 1070 (BN/LB) for a short to ground. TEST the system for normal operation. **No** GO to E4 .
E4 CHECK CIRCUIT 1070 (BN/LB) FOR A SHORT TO CIRCUIT	

848 (DG/OG)	
• Disconnect: Radio C290b. • Measure the resistance between the DATC/EATC module C228a-5, circuit 1070 (BN/LB) and the radio C290b-15, circuit 848 (DG/OG).  A0047080 • **Is the resistance reading greater than 10,000 ohms?**	**Yes** INSTALL a new steering wheel control switch. TEST the system for normal operation. **No** REPAIR circuit 1070 (BN/LB) for a short to circuit 848 (DG/OG). TEST the system for normal operation.
E5 CHECK CIRCUIT 1070 (BN/LB) FOR AN OPEN	
• Disconnect: Steering Wheel Control Switch. • Measure the resistance between the DATC/EATC module C228a-5, circuit 1070 (BN/LB) and the steering wheel control switch connector (LB/RD).  A0047081 • **Is the resistance less than 5 ohms?**	**Yes** GO to E6 . **No** REPAIR circuit 1070 (BN/LB) for an open. TEST the system for normal operation.
E6 CHECK CIRCUIT 848 (DG/OG) FOR AN OPEN	
• Disconnect: Clockspring C218b. • Measure the resistance between the radio C290b-15, circuit 848 (DG/OG) and the steering wheel control switch connector.  A0047082 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new steering wheel control switch. TEST the system for normal operation. **No** REPAIR circuit 848 (DG/OG) for an open. TEST the system for normal operation.

PINPOINT TEST F: DTC B2411, DTC B2412 OR DTC B2413 — A/C HUMIDITY SENSOR OPEN CIRCUIT, SHORT TO GROUND OR FAILURE





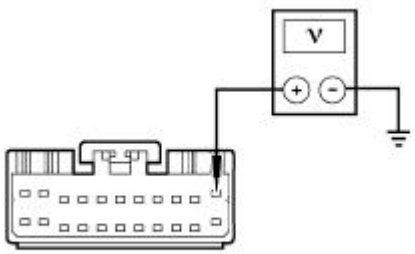


Test Step	Result / Action to Take
F1 CHECK THE A/C HUMIDITY SENSOR VOLTAGE INPUT	
• Key in OFF position. • Disconnect: A/C Humidity Sensor C2247. • Key in ON position. • Press the AUTO button on the DATC module. • Measure the voltage between the A/C humidity sensor C2247-2, circuit 3062 (BK/WH) and ground.  A0047094 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** GO to F4 . **No** GO to F2 .
F2 CHECK THE CIRCUIT 3062 (BK/WH) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: DATC Module C228a and C228b. • Key in ON position. • Measure the voltage between the A/C humidity sensor C2247-2, circuit 3062 (BK/WH) and ground.  A0047094 • **Is voltage present?**	**Yes** REPAIR circuit 3062 (BK/WH) for a short to voltage. TEST the system for normal operation. **No** GO to F3 .
F3 CHECK THE CIRCUIT 3062 (BK/WH) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the DATC module C2248a-18, circuit 3062 (BK/WH) and the A/C humidity sensor C2247-2, circuit 3062 (BK/WH).  A0047095 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR circuit 3062 (BK/WH) for an open. TEST the system for normal operation.
F4 CHECK THE A/C HUMIDITY SENSOR GROUND	

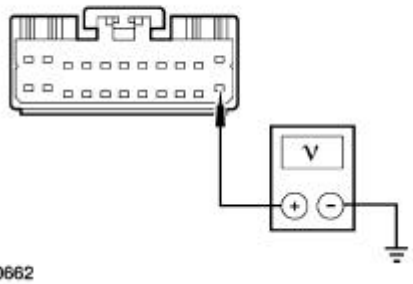
• Measure the voltage between the A/C humidity sensor C2247-2, circuit 3062 (BK/WH) and A/C humidity sensor C2247, circuit 470 (PK/BK).  A0047096 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** GO to F6 . **No** GO to F5 .
F5 CHECK CIRCUIT 470 (PK/BK) FOR AN OPEN	
• Key in OFF position. • Disconnect: DATC Module C228a and C228b. • Measure the resistance between the DATC module C228b-5, circuit 470 (PK/BK) and the A/C humidity sensor C2247-3, circuit 470 (PK/BK).  A0047097 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR circuit 470 (PK/BK) for an open. TEST the system for normal operation.
F6 CHECK CIRCUIT 3063 (TN/OG) FOR AN OPEN	
• Key in OFF position. • Disconnect: DATC Module C228a and C228b. • Measure the resistance between the DATC module C228a-17, circuit 3063 (TN/OG) and the A/C humidity sensor C2247-4, circuit 3063 (TN/OG).  A0047098 • **Is the resistance less than 5 ohms?**	**Yes** GO to F7 . **No** REPAIR circuit 3063 (TN/OG) for an open. TEST the system for normal operation.
F7 CHECK CIRCUIT 3063 (TN/OG) FOR A SHORT TO CIRCUIT 470 (PK/BK)	
• Measure the resistance between the DATC module C228a-17, circuit 3063 (TN/OG) and the DATC module C228b-5, circuit 470 (PK/BK).	**Yes** GO to F8 . **No**

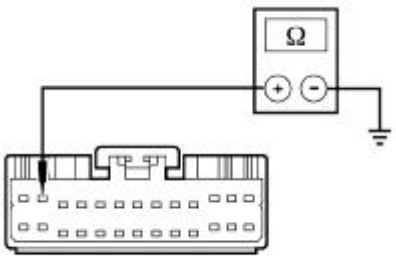
 A0047099 ● **Is the resistance greater than 10,000 ohms?**	REPAIR circuit 3063 (TN/OG) for a short to circuit 470 (PK/BK). TEST the system for normal operation.
F8 CHECK CIRCUIT 3063 (TN/OG) FOR A SHORT TO GROUND	
● Measure the resistance between the DATC module C228a-17, circuit 3063 (TN/OG) ground.  A0047100 ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to F9 . **No** REPAIR circuit 3063 (TN/OG) for a short ground. TEST the system for normal operation.
F9 CHECK THE A/C HUMIDITY SENSOR VOLTAGE OUTPUT	
● Key in ON position. ● Measure the voltage between the A/C humidity sensor C2247-4, circuit 3063 (TN/OG) and ground by back-probing the A/C humidity sensor C2247.  A0048686 ● **Is the voltage between 0.3 and 4.3 volts?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** INSTALL a new A/C humidity sensor. TEST the system for normal operation.

PINPOINT TEST G: NO COMMUNICATION WITH THE DUAL/ELECTRONIC AUTOMATIC TEMPERATURE CONTROL MODULE



Test Step	Result / Action to Take
G1 CHECK CIRCUIT 875 (BK/LB) FOR AN OPEN	
● Key in OFF position. ● Disconnect: DATC/EATC Module C228a. ● Measure the resistance between the DATC/EATC module	**Yes** GO to G2 .

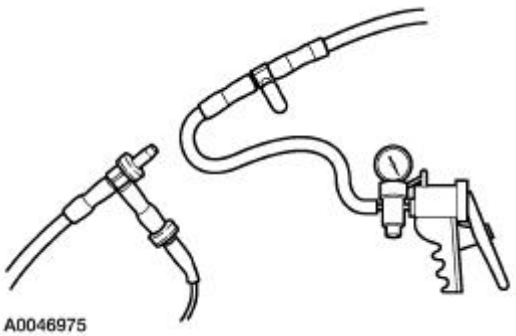


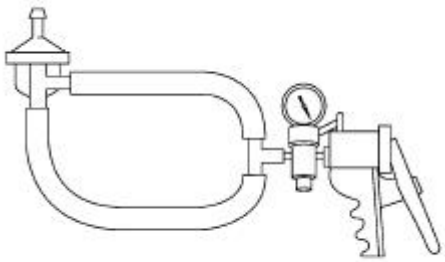


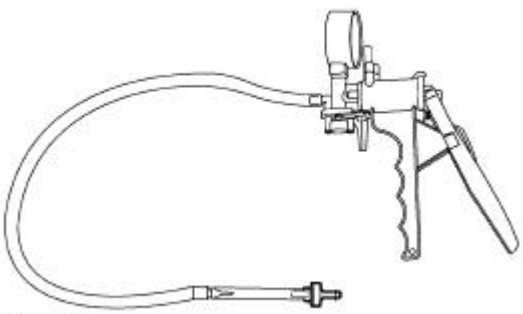
C228a-2, circuit 875 (BK/LB) and ground.  A0040170 ● **Is the resistance less than 25 ohms?**	**No** REPAIR circuit 875 (BK/LB) for an open. TEST the system for normal operation.
G2 CHECK CIRCUIT 729 (RD/WH) FOR B+	
● Disconnect: DATC/EATC module C228b. ● Measure the voltage between the DATC/EATC module C228b-11, circuit 729 (RD/WH) and ground.  A0050661 ● **Is the voltage B+?**	**Yes** GO to G3 . **No** REPAIR circuit 729 (RD/WH) for an open. TEST the system for normal operation.
G3 CHECK CIRCUIT 296 (WH/VT) FOR B+	
● Key in ON position. ● Measure the voltage between the DATC/EATC module C228b-22, circuit 296 (WH/VT) and ground.  A0050662 ● **Is the voltage B+?**	**Yes** REFER to Section 418-00 to diagnose a network concern. **No** REPAIR circuit 296 (WH/VT) for an open. TEST the system for normal operation.

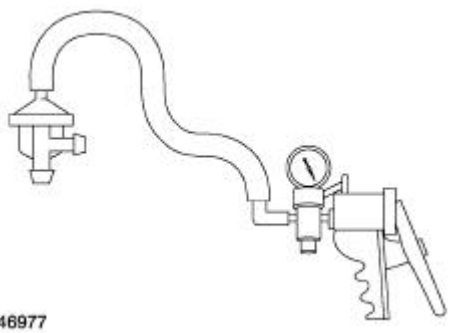
PINPOINT TEST H: THE DATC/EATC SYSTEM IS INOPERATIVE, INTERMITTENT OR INCORRECT OPERATION

Test Step	Result / Action to Take
H1 VERIFY AUTOMATIC OPERATION	
● Key in START position. ● Press the AUTOMATIC button. ● **Does the indicator above the AUTO button illuminate**	**Yes** GO to H2 .

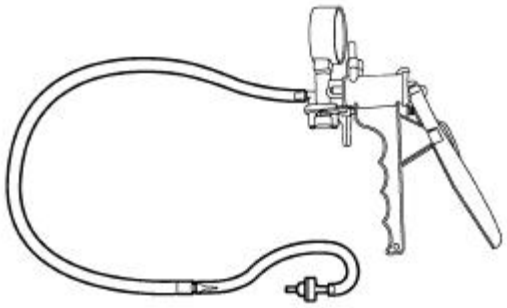


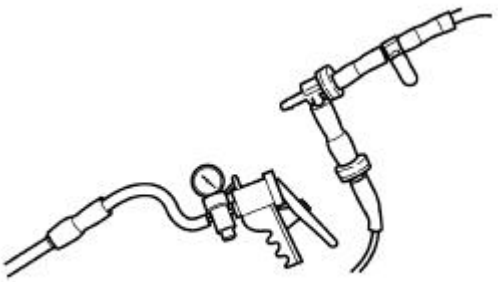


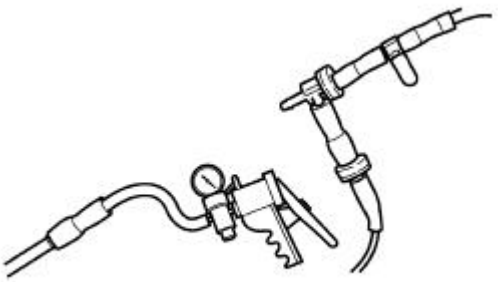




and the selected temperature for both the driver and passenger appear in the display window?	**No** GO to H11 .
H2 PERFORM THE DATC/EATC MODULE SELF-TEST	
• Key in ON position. • Carry out the DATC/EATC module self-test. Refer to the Electronic Automatic Temperature Control Module Self-Test in this section. Record the DTCs displayed, if any. • **Were any DTCs displayed as a result of the DATC/EATC self-test?**	**Yes** REFER to the DATC/EATC Module Diagnostic Trouble Code (DTC) Index. CARRY OUT the necessary diagnosis and REPAIR as required. **No** GO to H3 .
H3 CHECK THE VACUUM FLUORESCENT DISPLAY	
• Exit self-test by pressing the DEFROST button. Observe the button indicators and function symbols displayed on the vacuum fluorescent display while changing the temperature, blower speed and functions. • **Are the display and indicators correct and complete without any missing elements?**	**Yes** GO to H4 . **No** INSTALL a new DATC/EATC module. TEST the system for normal operation.
H4 CHECK THE BLOWER MANUAL OVERRIDE OPERATION	
• Press the blower motor speed override control fully up and fully down. • **Does the blower motor speed increase from low speed to high and high speed to low?**	**Yes** GO to H5 . **No** If the blower motor is inoperative, Go To Pinpoint Test L . If the blower motor does not operate correctly, Go To Pinpoint Test M .
H5 VERIFY THE DEFROST OVERRIDE OPERATION	
• Press the override button for DEFROST operation. • **Is outside air being discharged from the windshield defroster nozzle and the side window demisters?**	**Yes** GO to H6 . **No** Go To Pinpoint Test G .
H6 VERIFY THE FLOOR OVERRIDE OPERATION	
• Press the override button for FLOOR operation. • **Is outside air being discharged from the floor duct?**	**Yes** GO to H7 . **No** Go To Pinpoint Test G .
H7 VERIFY THE PANEL OVERRIDE OPERATION	
• Press the override button for PANEL operation. • **Is outside air being discharged from the instrument panel registers?**	**Yes** GO to H8 . **No** Go To Pinpoint Test G .
H8 VERIFY THE A/C CLUTCH DOES NOT ENGAGE IN THE PANEL MODE	
• In PANEL operation, listen for the compressor clutch to engage.	**Yes** REFER to the Powertrain







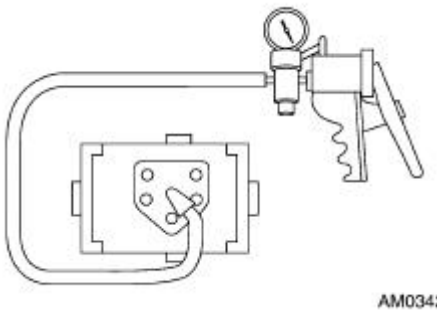
• **Does the A/C clutch engage with the PANEL override button pressed?**	Control/Emissions Diagnosis (PC/ED) manual. **No** GO to H9 .
H9 VERIFY A/C CLUTCH ENGAGEMENT IN THE A/C MODE	
• Make sure the ambient air temperature is above 2°C (35° F). • Press the override button for A/C operation. • **Does the A/C clutch engage when the A/C override button is pressed?**	**Yes** GO to H10 . **No** Go To Pinpoint Test I .
H10 VERIFY THE RECIRC OVERRIDE OPERATION	
• Press the PANEL and RECIRC override buttons. • **Is recirculated air being discharged from the instrument panel registers?**	**Yes** The test is complete. The system is functioning normally. **No** Go To Pinpoint Test G .
H11 CHECK THE DATC/EATC MODULE FUNCTIONS	
• Press each function button and observe the display. • **Does the DATC/EATC perform and display any functions?**	**Yes** INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** GO to H12 .
H12 CHECK THE VOLTAGE TO THE DATC/EATC	
• Key in OFF position. • Disconnect: DATC/EATC C228b. • Key in ON position. • Measure the voltage between ground and DATC/EATC module C228b-11, circuit 729 (RD/WH).  A0050661 • Measure the voltage between ground and DATC/EATC module C228b-22, circuit 296 (WH/VT).	**Yes** GO to H13 . **No** REPAIR the affected circuit. TEST the system for normal operation.

 A0050662 ● **Are the voltages greater than 10 volts?**	
H13 CHECK THE GROUND CIRCUIT TO THE DATC/EATC	**Yes** INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** REPAIR circuit 875 (BK/LB) for an open. TEST the system for normal operation.
● Key in OFF position. ● Disconnect: DATC/EATC C228a. ● Measure the resistance between the DATC/EATC module C228a-2, circuit 875 (BK/LB) and ground.  A0040170 ● **Is the resistance less than 5 ohms?**	

PINPOINT TEST I: INCORRECT/ERRATIC DIRECTION OF AIRFLOW FROM OUTLET(S) — MANUAL CLIMATE CONTROL

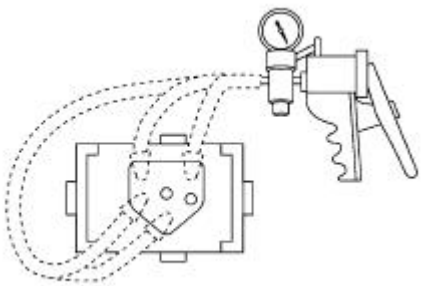
Test Step	Result / Action to Take
I1 CHECK THE SYSTEM AIRFLOW	**Yes** The system is operating normally. **No** If the airflow is from the defrost outlet only in all settings, GO to I2. If the airflow is incorrect in one setting only, NOTE the non-functional setting. GO to I10.
● Key in START position. ● Set the blower motor speed to maximum. ● Check for proper airflow in each function selector switch position at engine idle and under acceleration. ● **Is the airflow correct in each function selector switch position?**	
I2 CHECK FOR VACUUM AT THE CHECK VALVE	**Yes** GO to I3. **No** REPAIR or INSTALL
● Disconnect the vacuum check valve and connect the vacuum pump to the vacuum source line and check for manifold vacuum.	

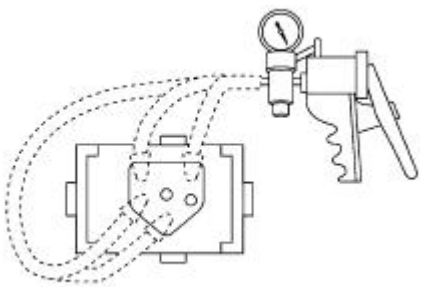
 A0046975 ● **Is manifold vacuum present at the check valve vacuum source line?**	a new check valve vacuum source line. TEST the system for normal operation.
I3 CHECK THE VACUUM CHECK VALVES FOR LEAKAGE	
● Key in OFF position. ● Disconnect: A/C Check Valves. ● Connect the vacuum pump to the open ports on the vacuum check valve and attempt to pull a vacuum.  AL0547-A ● Connect the vacuum pump to the open port on the vacuum check valve and attempt to pull a vacuum.  A0033876 ● **Can a vacuum be pulled on the vacuum check valves?**	**Yes** GO to I4 . **No** INSTALL a new vacuum check valve. TEST the system for normal operation.
I4 CHECK THE VACUUM CHECK VALVES FOR BLOCKAGE	
● Connect the vacuum pump to the open port on the vacuum check valve and attempt to pull a vacuum.  A0046977	**Yes** GO to I5 . **No** INSTALL a new vacuum check valve. TEST the system for normal operation.



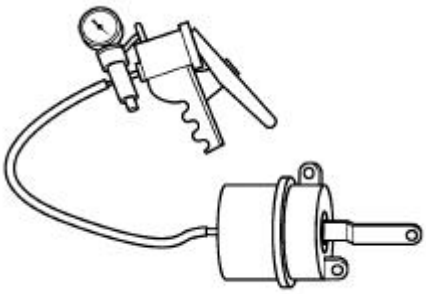
• Connect the vacuum pump to the open port on the vacuum check valve and attempt to pull a vacuum.  A0047027 • **Can a vacuum be pulled on the vacuum check valves?**	
I5 CHECK THE VACUUM RESERVOIR LINE FOR LEAKS	**Yes** REPAIR or INSTALL a new vacuum reservoir line. TEST the system for normal operation. **No** GO to I6 .
• Disconnect the vacuum reservoir line at the vacuum reservoir. • Plug the vacuum reservoir line at the vacuum reservoir connection. • Leak test the vacuum reservoir line, using the vacuum pump.  A0046978 • **Does the vacuum reservoir line leak?**	
I6 CHECK THE VACUUM RESERVOIR LINE FOR BLOCKAGE	**Yes** REPAIR or INSTALL a new vacuum reservoir line. TEST the system for normal operation. **No** GO to I7 .
• Unplug the vacuum reservoir line at the vacuum reservoir connection. • Connect the vacuum pump to the vacuum reservoir line at the vacuum check valve connection and attempt to pull a vacuum.  A0046978 • **Can a vacuum be pulled on the vacuum reservoir line?**	
I7 CHECK THE VACUUM RESERVOIR FOR A LEAK	**Yes** INSTALL a new vacuum reservoir. TEST the system for normal operation. **No** GO to I8 .
• Connect the vacuum pump reservoir line to the vacuum reservoir. • With the vacuum pump connected to the vacuum reservoir line, leak test the vacuum reservoir.	

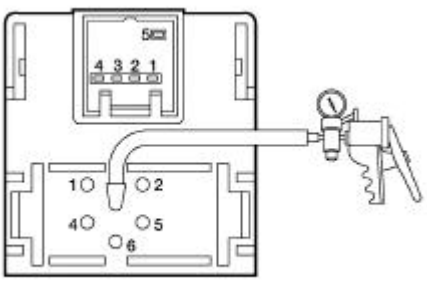
A0046979

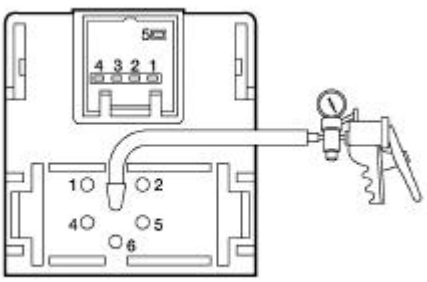




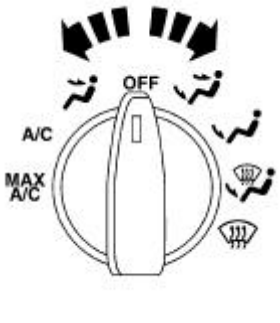
- **Does the vacuum reservoir leak?**



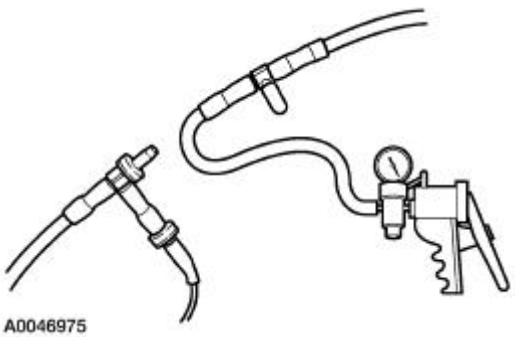




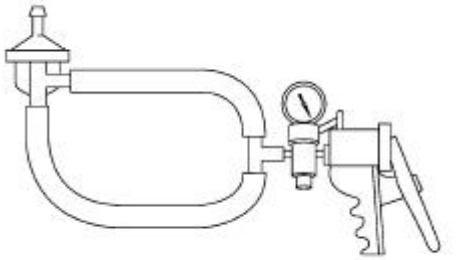
I8 CHECK THE FUNCTION SELECTOR SWITCH VACUUM SOURCE LINE FOR BLOCKAGE	
• Disconnect the function selector switch vacuum connector. • Connect the vacuum pump to the function selector switch vacuum source line and attempt to pull a vacuum.  AM0342-A • **Can a vacuum be pulled on the function selector switch vacuum source line?**	**Yes** REPAIR or INSTALL a new function selector switch vacuum source line. TEST the system for normal operation. **No** GO to I9 .
I9 CHECK THE FUNCTION SELECTOR SWITCH VACUUM SOURCE LINE FOR LEAKS	
• Plug the function selector switch vacuum source line at the vacuum check valve connection.  A0046980 • Leak test the function selector switch vacuum source line using the vacuum pump.	**Yes** REPAIR or INSTALL a new function selector switch vacuum source line. TEST the system for normal operation. **No** GO to I14 .



AM0342-A



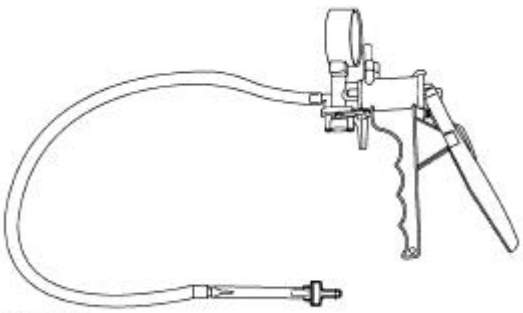
- **Does the function selector switch vacuum source line leak?**



I10 CHECK THE VACUUM CONTROL MOTOR LINE FOR BLOCKAGE	
• Key in OFF position. • Disconnect the function selector switch vacuum connector. • Disconnect the vacuum line from the appropriate vacuum control motor and/or heater control valve, noted in step I1. • Connect the vacuum pump to the appropriate vacuum control motor line noted in step I1, and attempt to pull a vacuum.  AM0350-A • **Can a vacuum be pulled on the vacuum control motor line?**	**Yes** REPAIR or INSTALL a new vacuum harness. TEST the system for normal operation. **No** GO to I11 .
I11 CHECK THE VACUUM CONTROL MOTOR LINE FOR LEAKS	
• Plug the vacuum control motor line at the vacuum control motor connection. • Leak test the vacuum control motor line using the vacuum pump.  AM0350-A • **Does the vacuum control motor line leak?**	**Yes** REPAIR or INSTALL a new vacuum harness. TEST the system for normal operation. **No** GO to I12 .
I12 CHECK THE VACUUM CONTROL MOTOR FOR LEAKS AND CORRECT OPERATION	
• Connect the vacuum pump to the appropriate vacuum control motor and pull a vacuum.	**Yes** GO to I13 . **No** INSTALL a new vacuum control motor (18A318). TEST the

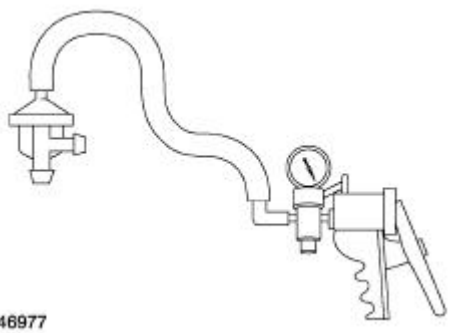
 AL0136-A ● **Does the vacuum control motor operate and hold vacuum?**	system for normal operation.
I13 CHECK THE MODE DOOR LINKAGE AND MOVEMENT ● Inspect the mode door linkage and verify correct movement of the mode door. ● **Is the mode door or mode door linkage broken, binding or otherwise obstructed?**	**Yes** REPAIR the mode door or mode door linkage as necessary. TEST the system for normal operation. **No** GO to I14 .
I14 CHECK THE FUNCTION SELECTOR SWITCH FOR BLOCKAGE ● Connect a vacuum pump to the function selector switch vacuum supply port and try to pull a vacuum in each function selector switch position except DEFROST. If the vacuum pump can pull and hold a vacuum, the switch is plugged. If the vacuum pump pulls a vacuum that slowly decays, the switch is restricted.  A0047083 ● **Is the switch plugged or restricted?**	**Yes** INSTALL a new function selector switch. REFER to Section 412-04 . TEST the system for normal operation. **No** GO to I15 .
I15 LEAK TEST THE FUNCTION SELECTOR SWITCH ● Disconnect: Function Selector Switch Vacuum Harness. ● Connect a vacuum pump to the function selector switch vacuum supply port and plug each control port.  A0047083 ● At each function selector switch position, apply 51 kPa (15 in-Hg) of vacuum.	**Yes** INSTALL a new function selector switch. REFER to Section 412-04 . TEST the system for normal operation. **No** The system is operating normally.

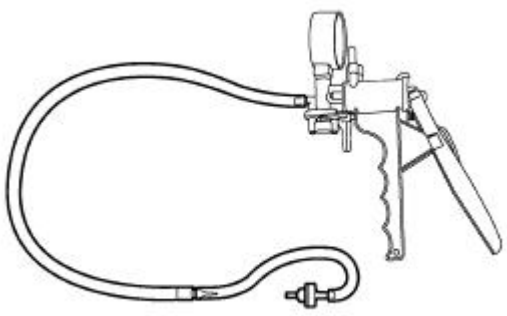
 AM0418-A ● **Does the vacuum drop exceed 3.37 kPa (1 in-Hg) per minute?**	



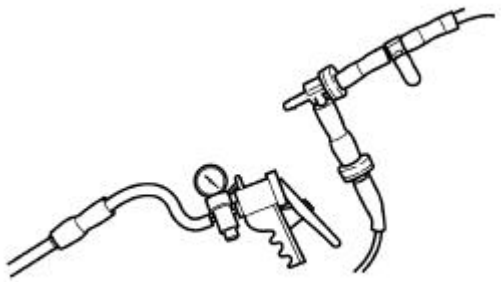
PINPOINT TEST J: INCORRECT/ERRATIC DIRECTION OF AIRFLOW FROM OUTLET(S) — DATC/EATC

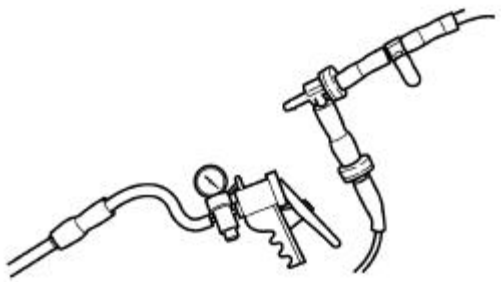
Test Step	Result / Action to Take
J1 CHECK THE AIRFLOW IN EACH SETTING	
● Key in START position. ● Check the airflow in each manual override setting on the DATC/EATC module during engine idle and under acceleration. ● **Is the airflow correct in each manual override setting?**	**Yes** The system is operating normally. **No** If the airflow is from the defrost outlet only in all settings, GO to J2. If the airflow is incorrect in one setting only, NOTE the non-functional setting. GO to J10.
J2 CHECK FOR VACUUM AT THE CHECK VALVE	
● Disconnect the vacuum check valve and connect the vacuum pump to the vacuum source line and check for manifold vacuum.  A0046975 ● **Is manifold vacuum present at the check valve vacuum source line?**	**Yes** GO to J3. **No** REPAIR or INSTALL a new check valve vacuum source line. TEST the system for normal operation.
J3 CHECK THE VACUUM CHECK VALVES FOR LEAKAGE	
● Key in OFF position. ● Disconnect: A/C Check Valves. ● Connect the vacuum pump to the open ports on the vacuum check valve and attempt to pull a vacuum.	**Yes** GO to J4. **No** INSTALL a new vacuum check valve. TEST the system for normal operation.

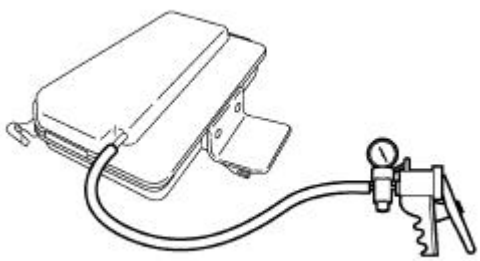




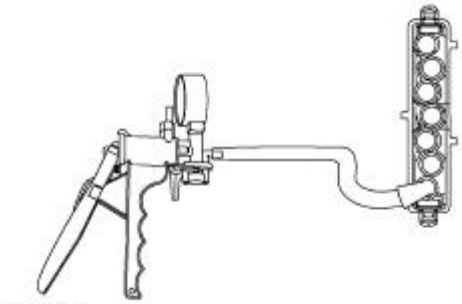
AL0547-A

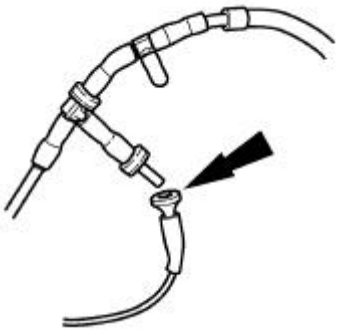


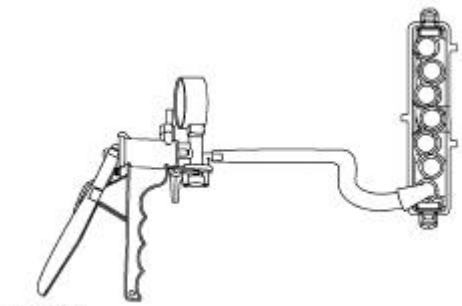


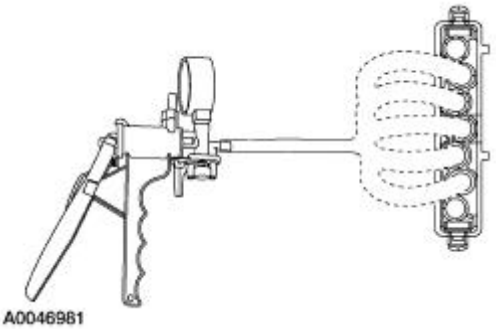


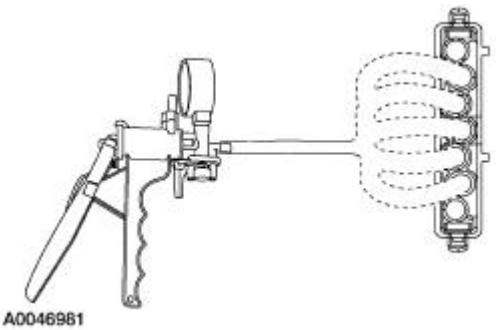
- Connect the vacuum pump to the open port on the vacuum check valve and attempt to pull a vacuum.

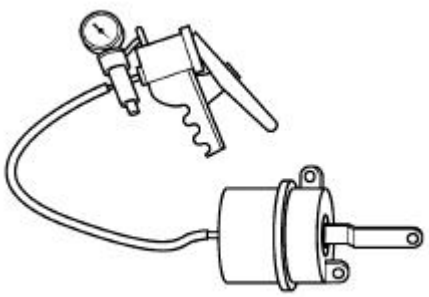




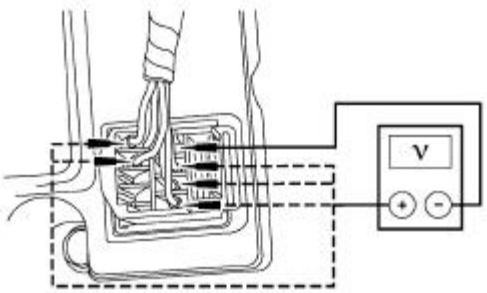


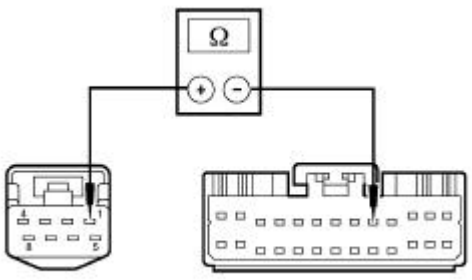




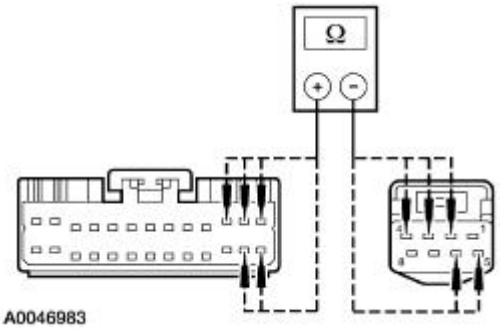


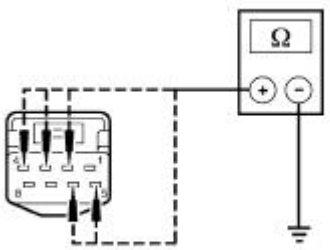
A0033876





- **Can a vacuum be pulled on the vacuum check valves?**



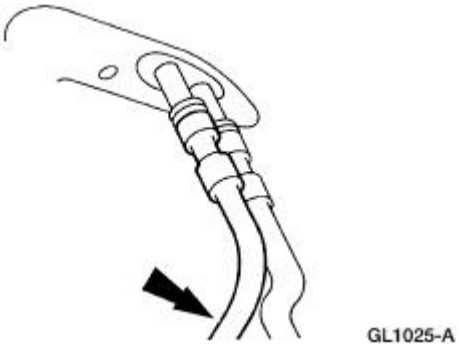


J4 CHECK THE VACUUM CHECK VALVES FOR BLOCKAGE	
- Connect the vacuum pump to the open port on the vacuum check valve and attempt to pull a vacuum.  A0046977 - Connect the vacuum pump to the open port on the vacuum check valve and attempt to pull a vacuum.  A0047027 - **Can a vacuum be pulled on the vacuum check valves?**	**Yes** GO to J5 . **No** INSTALL a new vacuum check valve. TEST the system for normal operation.
J5 CHECK THE VACUUM RESERVOIR LINE FOR LEAKS	
- Disconnect the vacuum reservoir line at the vacuum reservoir. - Plug the vacuum reservoir line at the vacuum reservoir	**Yes** REPAIR or INSTALL a new vacuum reservoir line. TEST

connection. ● Leak test the vacuum reservoir line, using the vacuum pump.  A0046978 ● **Does the vacuum reservoir line leak?**	the system for normal operation. **No** GO to J6 .
J6 CHECK THE VACUUM RESERVOIR LINE FOR BLOCKAGE	
● Unplug the vacuum reservoir line at the vacuum reservoir connection. ● Connect the vacuum pump to the vacuum reservoir line at the vacuum check valve connection and attempt to pull a vacuum.  A0046978 ● **Can a vacuum be pulled on the vacuum reservoir line?**	**Yes** REPAIR or INSTALL a new vacuum reservoir line. TEST the system for normal operation. **No** GO to J7 .
J7 CHECK THE VACUUM RESERVOIR FOR A LEAK	
● Connect the vacuum pump reservoir line to the vacuum reservoir. ● With the vacuum pump connected to the vacuum reservoir line, leak test the vacuum reservoir.  A0046979 ● **Does the vacuum reservoir leak?**	**Yes** INSTALL a new vacuum reservoir. TEST the system for normal operation. **No** GO to J8 .
J8 CHECK THE RSA MODULE VACUUM SOURCE LINE FOR BLOCKAGE	
● Disconnect the RSA module vacuum connector. ● Connect the vacuum pump to the RSA module vacuum source line and attempt to pull a vacuum.	**Yes** REPAIR or INSTALL a new RSA module vacuum source line. TEST the system for

 A0046976 ● **Can a vacuum be pulled on the RSA module vacuum source line?**	normal operation. **No** GO to J9 .
J9 CHECK THE RSA MODULE VACUUM SOURCE LINE FOR LEAKS	
● Plug the RSA module vacuum source line at the vacuum check valve connection.  A0046980 ● Leak test the RSA module vacuum source line, using the vacuum pump.  A0046976 ● **Does the RSA module vacuum source line leak?**	**Yes** REPAIR or INSTALL a new RSA module vacuum source line. TEST the system for normal operation. **No** INSTALL a new RSA module. TEST the system for normal operation.
J10 CHECK THE VACUUM CONTROL MOTOR LINE FOR BLOCKAGE	
● Key in OFF position. ● Disconnect the RSA module vacuum connector. ● Disconnect the vacuum line from the appropriate vacuum control motor noted in step J1. ● Connect the vacuum pump to the appropriate vacuum control motor line noted in step J1, and attempt to pull a vacuum.	**Yes** REPAIR or INSTALL a new vacuum or RSA module harness. TEST the system for normal operation. **No** GO to J11 .

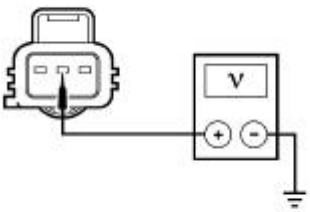
 A0046981 ● **Can a vacuum be pulled on the vacuum control motor line?**	
J11 CHECK THE VACUUM CONTROL MOTOR LINE FOR LEAKS	
● Plug the vacuum control motor line at the vacuum control motor connection. ● Leak test the vacuum control motor line, using the vacuum pump.  A0046981 ● **Does the vacuum control motor line leak?**	**Yes** REPAIR or INSTALL a new vacuum harness. TEST the system for normal operation. **No** GO to J12 .
J12 CHECK THE VACUUM CONTROL MOTOR FOR LEAKS AND CORRECT OPERATION	
● Connect the vacuum pump to the appropriate vacuum control motor and pull a vacuum.  AL0136-A ● **Does the vacuum control motor operate and hold vacuum?**	**Yes** GO to J13 . **No** INSTALL a new vacuum control motor (18A318). TEST the system for normal operation.
J13 CHECK THE MODE DOOR LINKAGE AND MOVEMENT	
● Inspect the mode door linkage and verify correct movement of the mode door. ● **Is the mode door or mode door linkage broken, binding or otherwise obstructed?**	**Yes** REPAIR the mode door or mode door linkage as necessary. TEST the system for normal operation. **No** GO to J14 .

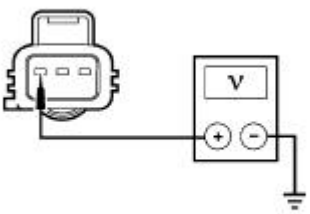


J14 CHECK THE ATC SOLENOID AND MANIFOLD	
• Connect the vacuum harness connector to the ATC solenoid and manifold. • Key in START position. • Press the PANEL/FLOOR button then the RECIRCULATION button on the DATC/EATC module. • **NOTE:** The following measurements must be taken by back-probing the ATC solenoid and manifold C2093. • Measure the voltage between ATC solenoid and manifold C2093-1, circuit 1957 (LB/RD) and: ■ pin 2, circuit 1952 (OG/LG). ■ pin 3, circuit 1953 (WH/VT). ■ pin 4, circuit 1954 (DG/VT). ■ pin 5, circuit 1955 (DB/OG). ■ pin 6, circuit 1956 (TN/WH).  A0046982 • **Are all the voltages greater than 10 volts?**	**Yes** INSTALL a new ATC solenoid and manifold. TEST the system for normal operation. **No** If none of the circuits measure greater than 10 volts, GO to J15 . If some of the circuits measure greater than 10 volts, GO to J16 .
J15 CHECK CIRCUIT 1957 (LB/RD)	
• Key in OFF position. • Disconnect: DATC/EATC Module C228a and ATC Solenoid and Manifold C2093. • Measure the resistance between the DATC/EATC module C228a-9, circuit 1957 (LB/RD) and the ATC solenoid and manifold C2093-1, circuit 1957 (LB/RD).  A0040175 • **Is the resistance less than 5 ohms?**	**Yes** GO to J16 . **No** REPAIR circuit 1957 (LB/RD) for an open. TEST the system for normal operation.
J16 CHECK THE ATC SOLENOID AND MANIFOLD CIRCUITS FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the harness side of the connectors/pins indicated below that corresponds to the affected circuits. ■ Circuit 1952 (OG/LG), DATC/EATC C228a-13 and ATC solenoid and manifold C2093-2. ■ Circuit 1953 (WH/VT), DATC/EATC C228a-26 and ATC solenoid and manifold C2093-3. ■ Circuit 1954 (DG/VT), DATC/EATC C228a-25 and ATC solenoid and manifold C2093-4.	**Yes** GO to J17 . **No** REPAIR the affected circuit for an open. TEST the system for normal operation.

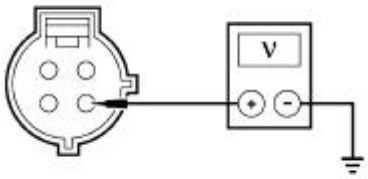
■ Circuit 1955 (DB/OG), DATC/EATC C228a-12 and ATC solenoid and manifold C2093-5. ■ Circuit 1956 (TN/WH), DATC/EATC C228a-11 and ATC solenoid and manifold C2093-6.  ● **Is the resistance less than 5 ohms?**	
J17 CHECK THE ATC SOLENOID AND MANIFOLD CIRCUITS FOR A SHORT TO GROUND	
● Measure the resistance between the harness side of the connectors/pins indicated below that corresponds to the affected circuits and ground. ■ Circuit 1952 (OG/LG), ATC solenoid and manifold C2093-2. ■ Circuit 1953 (WH/VT), ATC solenoid and manifold C2093-3. ■ Circuit 1954 (DG/VT), ATC solenoid and manifold C2093-4. ■ Circuit 1955 (DB/OG), ATC solenoid and manifold C2093-5. ■ Circuit 1956 (TN/WH), ATC solenoid and manifold C2093-6.  ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to J18 . **No** REPAIR the affected circuit for a short to ground. TEST the system for normal operation.
J18 CHECK THE ATC SOLENOID AND MANIFOLD	
● Carry out the ATC solenoid and manifold component test in this section. ● **Does the ATC solenoid and manifold test good?**	**Yes** INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** INSTALL a new ATC solenoid and manifold. TEST the system for normal operation.

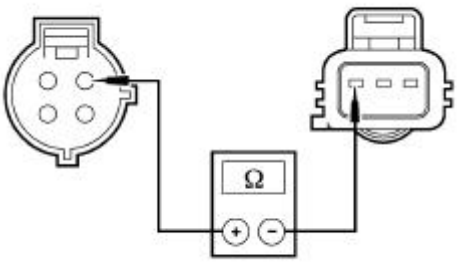
PINPOINT TEST K: INSUFFICIENT, ERRATIC OR NO HEAT

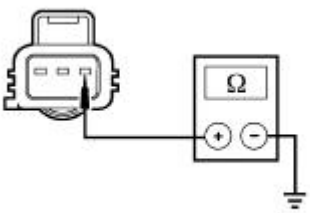




Test Step	Result / Action to Take
K1 CHECK FOR PROPER ENGINE COOLANT LEVEL	
• Key in OFF position. • Check the engine coolant level when hot and cold. • **Is the engine coolant at the correct level (hot/cold) as indicated on the engine coolant recovery reservoir?**	**Yes** GO to K3 . **No** GO to K2 .
K2 CHECK THE ENGINE COOLING SYSTEM FOR LEAKS	
• Pressure test the cooling system for leaks. Refer to Section 303-03 . • **Does the engine cooling system leak?**	**Yes** REPAIR the engine coolant leak. TEST the system for normal operation. **No** GO to K3 .
K3 CHECK FOR COOLANT FLOW TO THE HEATER CORE	
WARNING: The heater core inlet hose will become too hot to handle and may cause serious burns if the system is working correctly. • Key in START position. • Run the engine until it reaches normal operation temperature. Select the FLOOR position on the control assembly. Set the temperature control to full WARM. • Feel the heater core inlet hose to see if it is hot.  GL1024-A • **Is the heater core inlet hose hot?**	**Yes** GO to K8 . **No** GO to K4 .
K4 CHECK FOR COOLANT FLOW TO THE HEATER CONTROL VALVE	
WARNING: The heater control valve inlet hose will become too hot to handle and may cause serious burns if the system is working correctly. • Feel the heater control valve inlet hose to see if it is hot.  A0035188 • **Is the heater control valve inlet hose hot?**	**Yes** GO to K5 . **No** REFER to Section 303-03 .
K5 CHECK FOR VACUUM AT THE HEATER CONTROL	

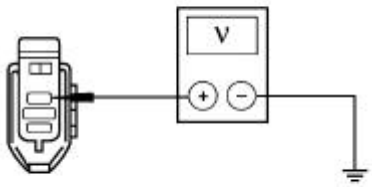


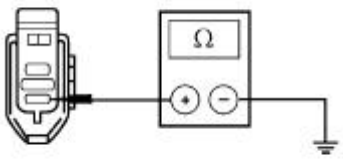


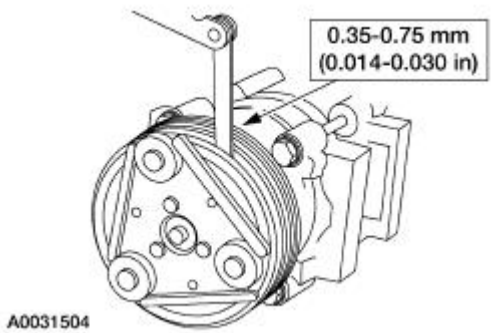


VALVE ● Disconnect the heater control valve vacuum connector and check for vacuum.  A0035187 ● **Is vacuum present at the heater control valve?**	**Yes** Manual climate control system, GO to K6 . DATC/EATC, GO to K7 . **No** INSTALL a new heater control valve. TEST the system for normal operation.
K6 CHECK FOR INCORRECT VACUUM LINE PLACEMENT ● Key in OFF position. ● Inspect the heater control valve and A/C vacuum lines for correct placement. ● **Is the vacuum line placement correct?**	**Yes** INSTALL a new climate control assembly or RSA module. REFER to Section 412-04 . TEST the system for normal operation. **No** CORRECT the vacuum line placement. TEST the system for normal operation.
K7 CHECK THE CIRCUIT FOR AN OPEN ● Key in OFF position. ● Disconnect: DATC/EATC Module C228a. ● Disconnect: RSA Module C2093. ● Measure the resistance between the DATC/EATC Module C228a-24, circuit 773 (DG/OG) and the RSA module C2093-7, circuit 773 (DG/OG).  A0067616 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new RSA module. REFER to Section 412-04 . TEST the system for normal operation. **No** REPAIR the circuit for an open. TEST the system for normal operation.
K8 CHECK FOR A PLUGGED OR RESTRICTED HEATER CORE **WARNING: The heater core outlet hose will become too hot to handle and may cause serious burns if the system is operating correctly.** ● Feel the heater core outlet hose to see if it is hot.	**Yes** Vehicles with manual climate control, Go To Pinpoint Test M . Vehicles with EATC, Go To Pinpoint Test A . **No** INSTALL a new heater

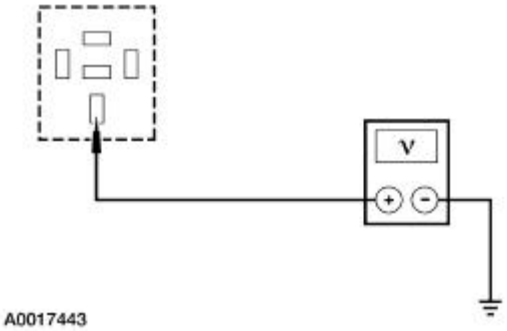
 GL1025-A ● **Is the heater core outlet hose hot?**	core. REFER to Section 412-02 . TEST the system for normal operation.

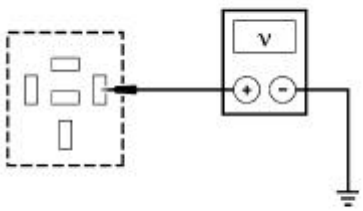


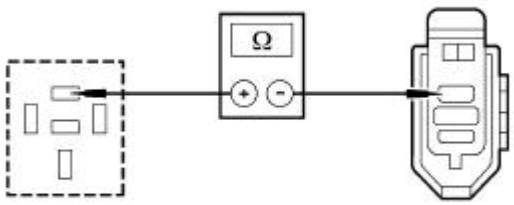




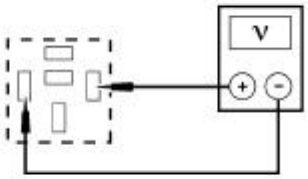
PINPOINT TEST L: THE A/C DOES NOT OPERATE/DOES NOT OPERATE CORRECTLY

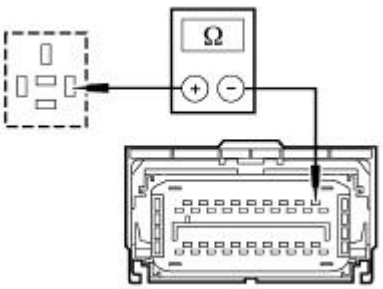






Test Step	Result / Action to Take
NOTE: Before carrying out the following test, diagnose any PCM DTCs.	
NOTE: Before carrying out the following test, check that the A/C system pressure is above 290 kPa (42 psi). If the pressure is below 290 kPa (42 psi), Refer to Fluorescent Dye Leak Detection in this section.	
L1 CHECK A/C REQUEST PID WITH THE A/C OFF ● Key in START position. ● Place the function selector switch to the OFF position, or press the OFF manual override button on the DATC/EATC module. ● Enter the following diagnostic mode on the diagnostic tool: PCM A/C REQUEST PID. ● **Does the PCM A/C REQUEST PID read ON?**	**Yes** DATC/EATC systems, INSTALL a new DATC/EATC module. TEST the system for normal operation. Manual climate control systems, GO to L6 . **No** GO to L2 .
L2 CHECK A/C CLUTCH RELAY PID WITH THE A/C OFF ● Enter the following diagnostic mode on the diagnostic tool: PCM A/C CLUTCH RELAY PID. ● **Does the PCM A/C CLUTCH RELAY PID read ON?**	**Yes** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** DATC/EATC systems, GO to L3 . Manual climate control systems, GO to L4 .
L3 CHECK THE A/C SWITCH PID WITH THE A/C ON ● Enter the following diagnostic mode on the diagnostic tool: PCM A/C SWITCH PID. ● Press the PANEL and A/C manual override buttons on the DATC module. ● **Does the PCM A/C SWITCH PID read ON?**	**Yes** GO to L4 . **No** INSTALL a new DATC/EATC module. TEST the system for normal operation.
L4 CHECK THE A/C REQUEST PID WITH THE A/C ON ● Enter the following diagnostic mode on the diagnostic tool: PCM A/C REQUEST PID. ● Place the function selector switch in the MAX A/C position, or press the DEFROST button on the	**Yes** GO to L5 . **No**

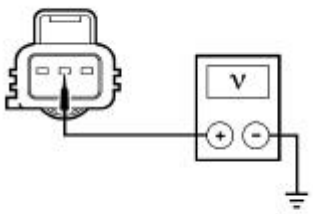


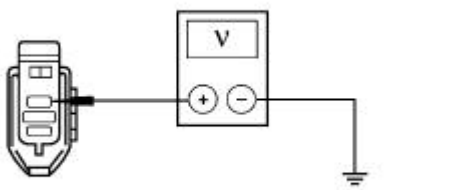


DATC/EATC module. ● **Does the PCM A/C REQUEST PID read ON?**	INSTALL a new PCM. TEST the system for normal operation.
L5 CHECK THE A/C CLUTCH RELAY PID WITH THE A/C ON	
● Enter the following diagnostic mode on the diagnostic tool: PCM A/C CLUTCH RELAY PID. ● **Does the PCM A/C CLUTCH RELAY PID read ON?**	**Yes** GO to L15 . **No** GO to L7 .
L6 CHECK CIRCUIT 1932 (OG/LB) FOR A SHORT TO VOLTAGE	
● Key in OFF position. ● Disconnect: A/C Thermostatic Switch C1373 and PCM C175. ● Key in ON position. ● Measure the voltage between the A/C thermostatic switch C1373-2, circuit 1932 (OG/LB) and ground.  A0047090 ● **Is any voltage present?**	**Yes** REPAIR circuit 1932 (OG/LB) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new function selector switch. TEST the system for normal operation.
L7 CHECK THE A/C THERMOSTATIC SWITCH VOLTAGE	
● Key in OFF position. ● Disconnect: A/C Thermostatic Switch C1373. ● Key in ON position. ● Measure the voltage between the A/C thermostatic switch C1373, circuit 441 (RD/YE) and ground.  A0047084 ● **Is the voltage greater than 10 volts?**	**Yes** GO to L11 . **No** GO to L8 .
L8 CHECK THE A/C PRESSURE CUTOFF SWITCH VOLTAGE	
● Key in OFF position. ● Disconnect: A/C Pressure Cutoff Switch C1078. ● Key in ON position. ● Measure the voltage between the A/C pressure cutoff switch C1078, circuit 348 (VT) and ground.	**Yes** GO to L9 . **No** Vehicles with manual climate control, GO to L14 . Vehicles with DATC/EATC, REPAIR circuit 348

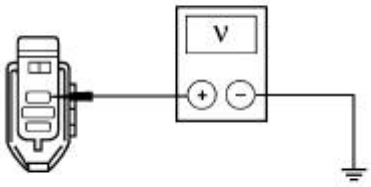
 A0008130 ● **Is the voltage greater than 10 volts?**	(VT). TEST the system for normal operation.
L9 CHECK THE CIRCUIT 441 (RD/YE) FOR AN OPEN	
● Key in OFF position. ● Measure the resistance between the A/C pressure cutoff switch C1078, circuit 441 (RD/YE) and A/C thermostatic switch C1373, circuit 441 (RD/YE).  A0047085 ● **Is the resistance less than 5 ohms?**	**Yes** GO to L10 . **No** REPAIR circuit 441 (RD/YE) for an open. TEST the system for normal operation.
L10 CHECK THE A/C SYSTEM PRESSURE	
● Key in OFF position. ● Connect the manifold gauge set. Refer to Manifold Gauge Set Connection in this section. ● **Is the pressure reading between 345 kPa (50 psi) and 1,724 kPa (250 psi)?**	**Yes** INSTALL a new A/C pressure cutoff switch. TEST the system for normal operation. **No** CHECK the system for refrigerant leaks. REFER to Electronic Leak Detection and Fluorescent Dye Leak Detection in this section.
L11 CHECK CIRCUIT 875 (BK/LB) FOR AN OPEN	
● Key in OFF position. ● Measure the resistance between the A/C thermostatic switch C1373-3, circuit 875 (BK/LB) and ground.  A0047086 ● **Is the resistance less than 5 ohms?**	**Yes** GO to L12 . **No** REPAIR circuit 875 (BK/LB) for an open. TEST the system for normal operation.
L12 CHECK CIRCUIT 1932 (OG/LB) FOR AN OPEN	

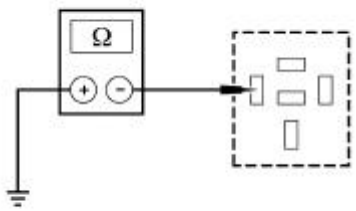
• Disconnect: PCM C175. • Measure the resistance between the PCM C175-41, circuit 1932 (OG/LB) and the A/C thermostatic switch C1373-2, circuit 1932 (OG/LB).  A0051129 • **Is the resistance less than 5 ohms?**	**Yes** GO to L13. **No** REPAIR circuit 1932 (OG/LB) for an open. TEST the system for normal operation.
L13 CHECK A/C LOW CHARGE PROTECTION SWITCH	
• Key in OFF position. • Connect: PCM C175. • Connect: A/C Thermostatic Switch C1373. • Key in ON position. • Connect a fused jumper between the A/C low charge protection switch terminals.  A0008127 • **Does the A/C operate correctly?**	**Yes** INSTALL a new A/C low charge protection switch. REFER to Section 412-04. TEST the system for normal operation. **No** INSTALL a new A/C thermostatic switch. REFER to Section 412-04. TEST the system for normal operation. If the A/C is still inoperative, INSTALL a new PCM. REFER to Section 303-14. TEST the system for normal operation.
L14 CHECK CIRCUIT 348 (VT) FOR AN OPEN	
• Key in OFF position. • Disconnect: Function Selector Switch C294b and C294c. • Measure the resistance between the A/C pressure cutoff switch C1078, circuit 348 (VT) and the function selector switch: ▪ C294b-5, circuit 348 (VT). ▪ C294c-9, circuit 348 (VT).  A0047088 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new function selector switch. REFER to Section 412-04. TEST the system for normal operation. **No** REPAIR circuit 348 (VT). TEST the system for normal operation.
L15 CHECK THE VOLTAGE AT THE A/C COMPRESSOR	

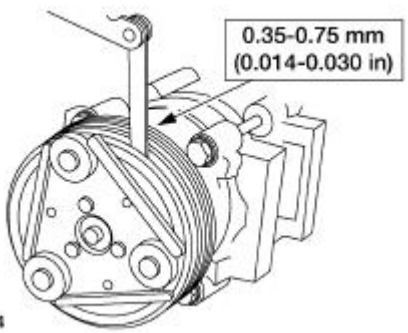




CLUTCH FIELD COIL	
• Key in OFF position. • Disconnect: A/C Compressor Clutch Field Coil C100. • Key in ON position. • Measure the voltage between the A/C compressor clutch field coil C100, circuit 321 (GY/WH) and ground.  GL1034-A • **Is the voltage greater than 10 volts?**	**Yes** GO to L16 . **No** GO to L18 .
L16 CHECK THE GROUND AT THE A/C COMPRESSOR CLUTCH FIELD COIL	
• Key in OFF position. • Measure the resistance between the A/C compressor clutch field coil C100, circuit 57 (BK) and ground.  GL1035-A • **Is the resistance less than 5 ohms?**	**Yes** GO to L17 . **No** REPAIR circuit 57 (BK). TEST the system for normal operation.
L17 CHECK THE A/C COMPRESSOR CLUTCH AIR GAP	
• Measure the A/C compressor clutch air gap at three equally spaced locations between the clutch hub and the A/C compressor clutch pulley.  A0031504 • **Is the A/C compressor clutch air gap greater than 0.75 mm (0.030 in)?**	**Yes** ADJUST the A/C compressor clutch field coil. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new A/C compressor clutch field coil. REFER to Section 412-03A . TEST the system for normal operation.
L18 CHECK CIRCUIT 883 (PK/LB)	
• Key in OFF position. • Disconnect: A/C Control Relay. • Key in ON position.	**Yes** GO to L19 .



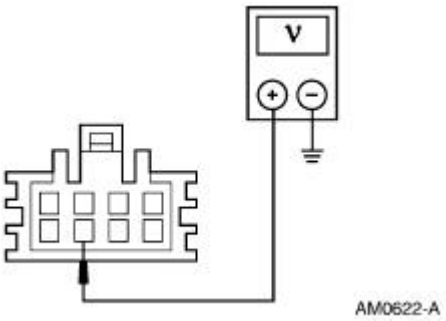


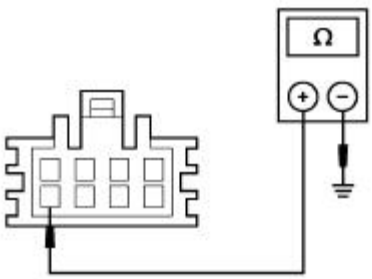


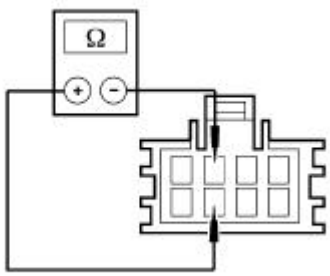
• Measure the voltage between the A/C control relay socket pin 30, circuit 883 (PK/LB) and ground.  A0017443 • **Is the voltage greater than 10 volts?**	**No** REPAIR circuit 883 (PK/LB). TEST the system for normal operation.
L19 CHECK CIRCUIT 391 (RD/YE)	
• Measure the voltage between the A/C control relay socket pin 86, circuit 391 (RD/YE) and ground.  A0020210 • **Is the voltage greater than 10 volts?**	**Yes** GO to L20 . **No** REPAIR circuit 391 (RD/YE). TEST the system for normal operation.
L20 CHECK CIRCUIT 321 (GY/WH)	
• Key in OFF position. • Measure the resistance between the A/C control relay socket pin 87, circuit 321 (GY/WH) and the A/C compressor clutch field coil C100, circuit 321 (GY/WH).  A0017427 • **Is the resistance less than 5 ohms?**	**Yes** GO to L21 . **No** REPAIR circuit 321 (GY/WH). TEST the system for normal operation.
L21 CHECK THE WAC OUTPUT FROM THE PCM	
• Key in START position. • Measure the voltage between the A/C control relay socket pin 85, circuit 331 (PK/YE) and socket pin 86, circuit 391 (RD/YE).	**Yes** INSTALL a new A/C control relay. CLEAR the DTCs. TEST the system for normal operation. **No** GO to L22 .

 A0034149 ● **Is the voltage greater than 10 volts?**	
L22 CHECK CIRCUIT 331 (PK/YE)	
● Key in OFF position. ● Disconnect: PCM C175. ● Measure the resistance between the A/C control relay socket pin 85, circuit 331 (PK/YE) and the PCM C175-41 circuit 331 (PK/YE).  A0051128 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** REPAIR circuit 331 (PK/YE). CLEAR the DTCs. TEST the system for normal operation.

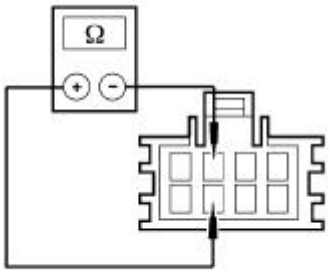
PINPOINT TEST M: THE A/C IS ALWAYS ON

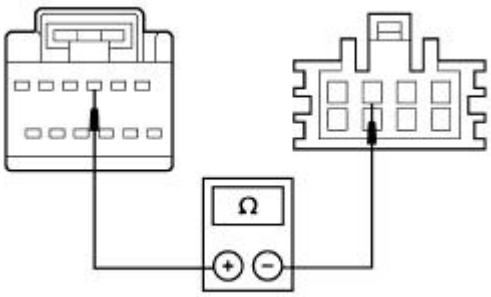


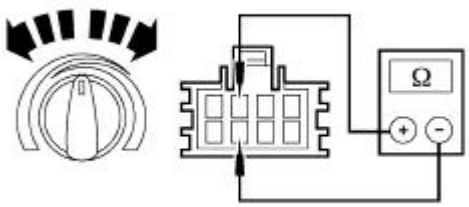




Test Step	Result / Action to Take
M1 CHECK A/C CLUTCH RELAY FAULT PID WITH THE A/C OFF	
● Key in ON position. ● Place the function selector switch to the OFF position or press the OFF manual override button on the DATC/EATC module. ● Enter the following diagnostic mode on the diagnostic tool: PCM A/C CLUTCH RELAY FAULT PID. ● **Does the PCM A/C CLUTCH RELAY FAULT PID read YES?**	**Yes** REPAIR circuit 331 (PK/YE). TEST the system for normal operation. **No** DATC/EATC systems, GO to M2 . Manual climate control systems, GO to M3 .
M2 CHECK A/C SWITCH PID WITH THE A/C OFF	
● Enter the following diagnostic mode on the diagnostic tool: PCM A/C SWITCH PID. ● **Does the PCM A/C SWITCH PID read ON?**	**Yes** INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** GO to M3 .
M3 CHECK A/C REQUEST PID WITH THE A/C OFF	
● Enter the following diagnostic mode on the diagnostic	**Yes**



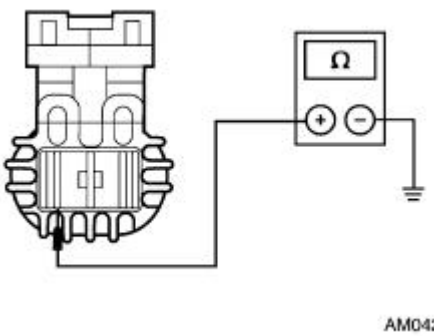




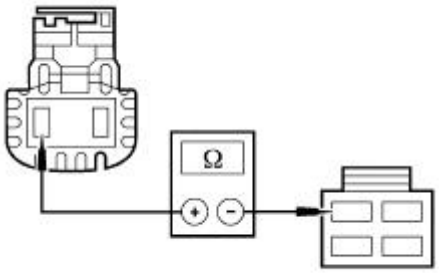
tool: PCM A/C REQUEST PID. ● **Does the PCM A/C REQUEST PID read ON?**	DATC/EATC systems, INSTALL a new PCM. TEST the system for normal operation. Manual climate control systems, Go To Pinpoint Test L . **No** GO to M4 .
M4 CHECK CIRCUIT 1932 (OG/LB) FOR A SHORT TO VOLTAGE	
● Key in OFF position. ● Disconnect: A/C Thermostatic Switch C1373 and PCM C175. ● Key in ON position. ● Measure the voltage between the A/C thermostatic switch C1373-2, circuit 1932 (OG/LB) and ground.  A0047090 ● **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit 1932 (OG/LB) for a short to voltage. TEST the system for normal operation. **No** GO to M5 .
M5 CHECK FOR VOLTAGE TO THE A/C COMPRESSOR CLUTCH FIELD COIL	
● Key in OFF position. ● Disconnect: A/C Compressor Clutch Field Coil C100. ● Key in ON position. ● Measure the voltage between the A/C compressor clutch field coil C100, circuit 321 (GY/WH) and ground.  GL1034-A ● **Is the voltage greater than 10 volts?**	**Yes** GO to M6 . **No** GO to M8 .
M6 CHECK CIRCUIT 321 (GY/WH) FOR A SHORT TO VOLTAGE	
● Key in OFF position. ● Disconnect: A/C Control Relay. ● Key in ON position. ● Measure the voltage between the A/C compressor clutch field coil C100, circuit 321 (GY/WH) and ground.	**Yes** REPAIR circuit 321 (GY/WH). TEST the system for normal operation. **No** GO to M7 .

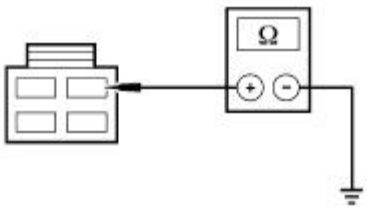
 GL1034-A ● **Is the voltage greater than 10 volts?**	
M7 CHECK CIRCUIT 331 (PK/YE) FOR A SHORT TO GROUND	
● Measure the resistance between the A/C control relay socket pin 85, circuit 331 (PK/YE) and ground.  A0013869 ● **Is the resistance less than 5 ohms?**	**Yes** REPAIR circuit 321 (GY/WH). TEST the system for normal operation. **No** INSTALL a new A/C control relay. TEST the system for normal operation.
M8 CHECK THE A/C COMPRESSOR CLUTCH AIR GAP	
● Key in OFF position. ● Measure the A/C compressor clutch air gap at three equally spaced locations between the clutch hub and the A/C compressor clutch pulley.  A0031504 ● **Is the A/C compressor clutch air gap greater than 0.75 mm (0.030 in)?**	**Yes** ADJUST the A/C compressor clutch field coil. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new A/C compressor clutch field coil. REFER to Section 412-03A . TEST the system for normal operation.

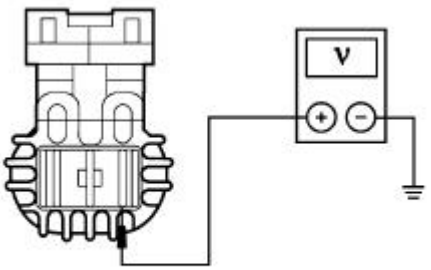
PINPOINT TEST N: THE TEMPERATURE CONTROL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY — MANUAL CLIMATE CONTROL



Test Step	Result / Action to Take
N1 CHECK THE VOLTAGE TO THE BLEND DOOR ACTUATOR	
● Key in OFF position.	**Yes**







• Disconnect: A/C Electronic Blend Door Actuator Motor C289. • Key in ON position. • Measure the voltage between blend door actuator motor C289, circuit 295 (LB/BK), harness side and ground.  AM0622-A • **Is the voltage greater than 10 volts?**	GO to N2 . **No** REPAIR the circuit. TEST the system for normal operation.
N2 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the blend door actuator motor C289, circuit 57 (BK), harness side and ground.  AM2240-A • **Is the resistance less than 5 ohms?**	**Yes** GO to N3 . **No** REPAIR the circuit. TEST the system for normal operation.
N3 CHECK THE TEMPERATURE CONTROL POTENTIOMETER TOTAL RESISTANCE	
• Key in OFF position. • Measure the resistance between temperature blend door actuator C289, circuit 295 (LB/BK) and circuit 437 (YE/LG).  A0044539 • **Is the resistance between 4,000 and 5,000 ohms?**	**Yes** GO to N6 . **No** If the resistance is less than 5,000 ohms, GO to N4 . If the resistance is greater than 6,000 ohms, GO to N5 .
N4 CHECK CIRCUITS 295 (LB/BK) AND 437 (YE/LG) FOR A SHORT TOGETHER	
• Disconnect: Climate Control Switch C294c. • Measure the resistance between temperature blend door actuator C289, circuit 295 (LB/BK) and circuit 437 (YE/LG).	**Yes** REPAIR circuits 295 (LB/BK) and 437 (YE/LG) for a short together. TEST the system for normal

 A0044539 ● **Is the resistance less than 5 ohms?**	operation. **No** INSTALL a new climate control switch. REFER to Section 412-04 . TEST the system for normal operation.
N5 CHECK 437 (YE/LG) FOR OPEN	
● Disconnect: Climate Control Switch C294c. ● Measure the resistance between blend door actuator control connector C289, circuit 437 (YE/LG), harness side and the front A/C control head C294c, circuit 437 (YE/LG), harness side.  AM2154-A ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new climate control switch. REFER to Section 412-04 . TEST the system for normal operation. **No** REPAIR circuit 437 (YE/LG) for an open. TEST the system for normal operation.
N6 CHECK THE TEMPERATURE CONTROL POTENTIOMETER OPERATION	
● Measure the resistance between temperature blend door actuator C289, circuit 295 (LB/BK) and circuit 437 (YE/LG) while rotating the temperature control potentiometer from full WARM to full COOL.  A0044541 ● **Does the resistance vary between 250 and 5,500 ohms?**	**Yes** GO to N7 . **No** INSTALL a new climate control switch. TEST the system for normal operation.
N7 CHECK CIRCUIT 437 (YE/LG) FOR A SHORT TO GROUND	
● Disconnect: Climate Control Switch C294c. ● Measure the resistance between blend door actuator C289, circuit 437 (YE/LG) and ground.	**Yes** GO to N8 . **No** REPAIR circuit 437 (YE/LG) for a short to ground. TEST the system for normal

 A0044542 ● **Is the resistance greater than 10,000 ohms?**	operation.
N8 CHECK FOR A BINDING, STUCK OR BROKEN BLEND DOOR	
● Key in OFF position. ● Remove the actuator. Refer to Section 412-04 . ● Inspect for a binding, stuck or broken blend door or linkage. ● **Is there a binding, stuck or broken blend door or linkage condition?**	**Yes** REPAIR the blend door/linkage. REFER to Section 412-04 . TEST the system for normal operation. **No** INSTALL a new temperature blend door actuator. REFER to Section 412-04 . TEST the system for normal operation.

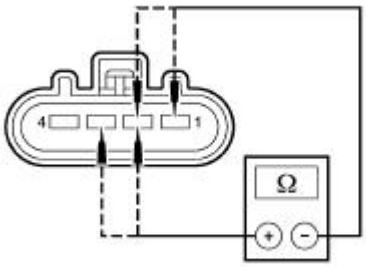
PINPOINT TEST O: THE BLOWER MOTOR IS INOPERATIVE — MANUAL CLIMATE CONTROL

Test Step	Result / Action to Take
O1 CHECK CIRCUIT 261 (OG/BK)	
● Disconnect: Blower Motor C288. ● Turn the blower motor switch to the HIGH position. ● Measure the resistance between the A/C blower motor connector C288, circuit 261 (OG/BK) and ground.  AM0420-A ● **Is the resistance less than 5 ohms?**	**Yes** GO to O4 . **No** GO to O2 .
O2 CHECK CIRCUIT 261 (OG/BK)	
● Disconnect: Blower Motor Switch C294a. ● Measure the resistance between the blower motor switch C294a, circuit 261 (OG/BK) and blower motor C288, circuit 261 (OG/BK).	**Yes** GO to O3 . **No** REPAIR circuit 261

 A0040183 ● **Is the resistance less than 5 ohms?**	(OG/BK). TEST the system for normal operation.
O3 CHECK CIRCUIT 57 (BK) ● Measure the resistance between the blower motor switch C294a, circuit 57 (BK) and ground.  A0040182 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new blower motor switch. REFER to Section 412-04 . TEST the system for normal operation. **No** REPAIR circuit 57 (BK). TEST the system for normal operation.
O4 CHECK A/C BLOWER MOTOR CIRCUIT 399 (BN/YE) FOR VOLTAGE ● Key in ON position. ● Measure the voltage between the A/C blower motor connector C288, circuit 399 (BN/YE) and ground.  AM0416-A ● **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new blower motor. REFER to Section 412-04 . TEST the system for normal operation. **No** GO to O5 .
O5 CHECK CIRCUIT 399 (BN/YE) ● Key in OFF position. ● Disconnect: Blower Motor Relay. ● Measure the resistance between the blower motor relay connector pin 87, circuit 399 (BN/YE) and the blower motor C288, circuit 399 (BN/YE).	**Yes** GO to O6 . **No** REPAIR circuit 399 (BN/YE). TEST the system for normal operation.

 A0032572 ● **Is the resistance less than 5 ohms?**	
O6 CHECK THE BLOWER MOTOR RELAY ● Connect: Blower Motor C288. ● Key in ON position. ● Connect a fused jumper lead between the blower motor relay socket pin 30 and pin 87, circuit 399 (BN/YE).  A0032587 ● **Does the blower motor operate?**	**Yes** GO to O7 . **No** REPAIR the relay power circuit. TEST the system for normal operation.
O7 CHECK CIRCUIT 57 (BK) ● Key in OFF position. ● Measure the resistance between the blower motor relay socket pin 86, circuit 57 (BK) and ground.  A0042416 ● **Is the resistance less than 5 ohms?**	**Yes** GO to O8 . **No** REPAIR circuit 57 (BK). TEST the system for normal operation.
O8 CHECK THE BLOWER MOTOR RELAY ● Key in ON position. ● Measure the voltage between the blower motor relay socket pin 85, circuit 753 (YE/RD) and socket pin 86, circuit 57 (BK).	**Yes** INSTALL a new blower motor relay. TEST the system for normal operation. **No** GO to O9 .

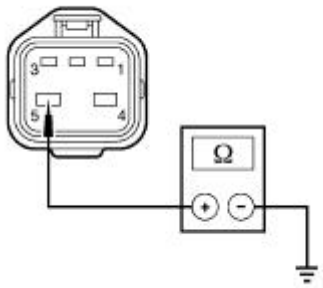
 A0038291 ● **Is the voltage greater than 10 volts?**	
O9 CHECK CIRCUIT 753 (YE/RD)	**Yes** GO to O10 . **No** REPAIR circuit 753 (YE/RD). TEST the system for normal operation.
● Key in OFF position. ● Measure the resistance between the blower motor relay connector pin 85, circuit 753 (YE/RD) and the function selector switch C294b-1, circuit 753 (YE/RD).  A0047091 ● **Is the resistance less than 5 ohms?**	
O10 CHECK CIRCUIT 296 (WH/VT) FOR VOLTAGE	**Yes** INSTALL a new function selector switch. REFER to Section 412-04 . TEST the system for normal operation. **No** REPAIR circuit 296 (WH/VT). TEST the system for normal operation.
● Key in ON position. ● Measure the voltage between the blower motor switch C294b, circuit 296 (WH/VT) and ground.  A0032574 ● **Is the voltage greater than 10 volts?**	



PINPOINT TEST P: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY — MANUAL CLIMATE CONTROL

Test Step	Result / Action to Take
P1 CHECK THE BLOWER MOTOR OPERATION	**Yes** If the blower motor does not operate in HI, GO to
● Key in ON position. ● Turn the function selector switch to the FLOOR position.	

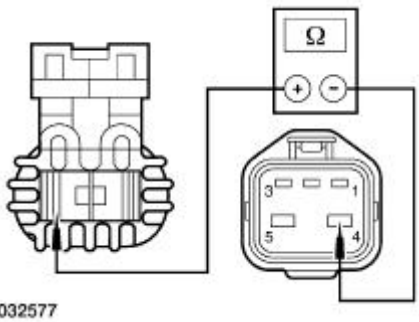
 L10572-A ● Select all blower speed positions. ● **Does the blower motor operate in any position?**	P2 . If the blower motor does not operate in MED-HI, GO to P3 . If the blower motor does not operate in MED-LO, GO to P4 . If the blower motor does not operate in LO, GO to P5 . For all other symptoms, , GO to P9 . **No** Go To Pinpoint Test N .
P2 CHECK CIRCUIT 261 (OG/BK)	
● Key in OFF position. ● Disconnect: Blower Motor Switch C294a. ● Disconnect: Blower Motor C288. ● Measure the resistance between the blower motor switch C294a, circuit 261 (OG/BK) and the blower motor C288, circuit 261 (OG/BK).  A0040183 ● **Is the resistance less than 5 ohms?**	**Yes** GO to P7 . **No** REPAIR circuit 261 (OG/BK). TEST the system for normal operation.
P3 CHECK CIRCUIT 752 (YE/RD)	
● Key in OFF position. ● Disconnect: Blower Motor Switch C294a. ● Disconnect: Blower Motor Resistor C2185. ● Measure the resistance between the blower motor switch C294a, circuit 752 (YE/RD) and the blower motor Resistor C2185, circuit 752 (YE/RD).  A0035322 ● **Is the resistance less than 5 ohms?**	**Yes** GO to P4 . **No** REPAIR circuit 752 (YE/RD). TEST the system for normal operation.
P4 CHECK CIRCUIT 754 (LG/WH)	

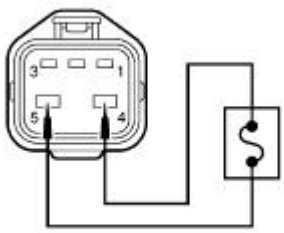


• Key in OFF position. • Disconnect: Blower Motor Switch C294a. • Disconnect: Blower Motor Resistor C2185. • Measure the resistance between the blower motor switch C294a, circuit 754 (LG/WH) and the blower motor Resistor C2185, circuit 754 (LG/WH).  A0035325 • **Is the resistance less than 5 ohms?**	**Yes** GO to P5 . **No** REPAIR circuit 754 (LG/WH). TEST the system for normal operation.
P5 CHECK BLOWER MOTOR RESISTOR GROUND CIRCUIT 57 (BK)	
 A0035320 • Measure the resistance between the blower motor resistor C2185, circuit 57 (BK) and ground. • **Is the resistance less than 5 ohms?**	**Yes** GO to P6 . **No** REPAIR circuit 57 (BK). TEST the system for normal operation.
P6 CHECK THE BLOWER MOTOR RESISTOR CIRCUIT 261 (OG/BK)	
• Connect: Blower Motor C288. • Measure the resistance between the blower motor resistor C2185, circuit 261 (OG/BK) and blower motor C288, circuit 261 (OG/BK).  A0040183 • **Is the resistance less than 5 ohms?**	**Yes** GO to P7 . **No** REPAIR circuit 261 (OG/BK). TEST the system for normal operation.
P7 CHECK THE BLOWER MOTOR SWITCH CIRCUIT 57 (BK)	
• Measure the resistance between the blower motor switch C294a, circuit 57 (BK) and ground.	**Yes** GO to P8 .

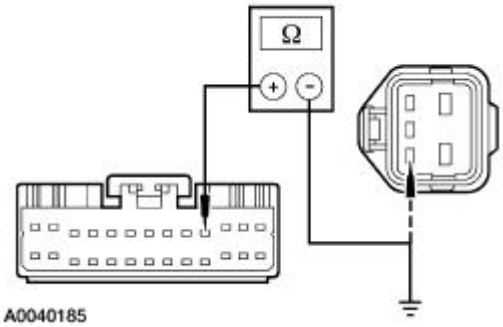
 A0020414 ● **Is the resistance less than 5 ohms?**	**No** REPAIR circuit 57 (BK). TEST the system for normal operation.
P8 CHECK THE BLOWER MOTOR RESISTOR	
● Carry out the blower motor resistor component test in this section. ● **Does the blower motor resistor test good?**	**Yes** INSTALL a new blower motor switch. REFER to Section 412-04 . TEST the system for normal operation. **No** INSTALL a new blower motor resistor. REFER to Section 412-04 . TEST the system for normal operation.
P9 CHECK CIRCUITS 261 (OG/BK), 752 (YE/RD) AND 754 (LG/WH) FOR A SHORT TO GROUND	
● Key in OFF position. ● Disconnect: Blower Motor C288. ● Disconnect: Blower Motor Resistor C2185. ● Place the blower switch in the lowest setting. ● Measure the resistance between ground and the blower motor resistor C1308, circuit: ● 261 (OG/BK) pin 2 ● 752 (YE/RD) pin 3 ● 754 (LG/WH) pin 1  A0051664 ● **Are the resistances less than 5 ohms?**	**Yes** GO to P10 . **No** REPAIR the affected circuit. TEST the system for normal operation.
P10 CHECK THE BLOWER MOTOR CIRCUITS FOR SHORTS TOGETHER	
● Measure the resistance between the blower motor resistor C2185: ■ pin 1, circuit 754 (LG/WH) and pin 2, circuit 261 (OG/BK). ■ pin 1, circuit 754 (LG/WH) and pin 3, circuit 752 (YE/RD).	**Yes** INSTALL a new blower motor switch. REFER to Section 412-04 . TEST the system for normal operation.

■ pin 2, circuit 261 (OG/BK) and pin 3, circuit 752 (YE/RD).  A0051665 ● **Are the resistances greater than 10,000 ohms?**	**No** REPAIR the affected circuits. TEST the system for normal operation.

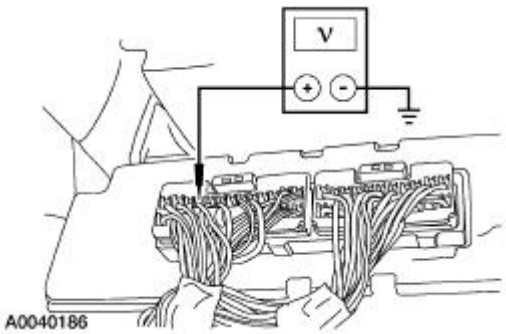


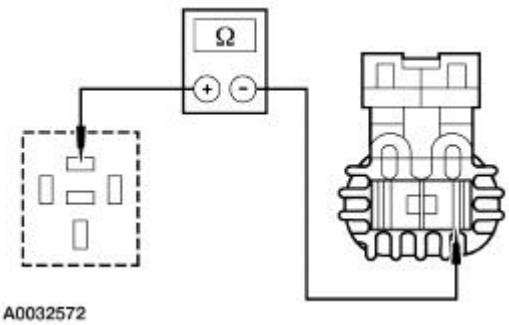


PINPOINT TEST Q: THE BLOWER MOTOR IS INOPERATIVE — DATC/EATC

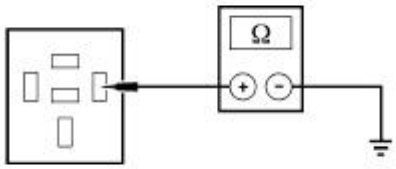


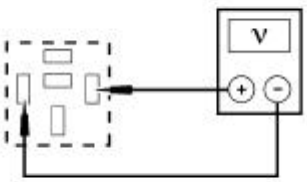
Test Step	Result / Action to Take
Q1 VERIFY THE BLOWER MOTOR OPERATION	
● Key in ON position. ● Press the PANEL button on the DATC/EATC module. Adjust the blower motor setting to LO and then to HI. ● **Is the blower motor inoperative in all settings?**	**Yes** GO to Q2 . **No** Go To Pinpoint Test S .
Q2 CHECK FOR VOLTAGE TO THE BLOWER MOTOR	
● Key in OFF position. ● Disconnect: Blower Motor C288. ● Key in ON position. ● Measure the voltage between the blower motor C288, circuit 399 (BN/YE) and ground.  AM0416-A ● **Is the voltage greater than 10 volts?**	**Yes** GO to Q3 . **No** GO to Q8 .
Q3 CHECK CIRCUIT 57 (BK)	
● Key in OFF position. ● Disconnect: Blower Motor Speed Control C297. ● Measure the resistance between the blower motor speed control C297-5, circuit 57 (BK) and ground.	**Yes** GO to Q4 . **No** REPAIR circuit 57 (BK). TEST the system for normal operation.

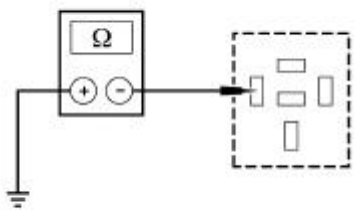




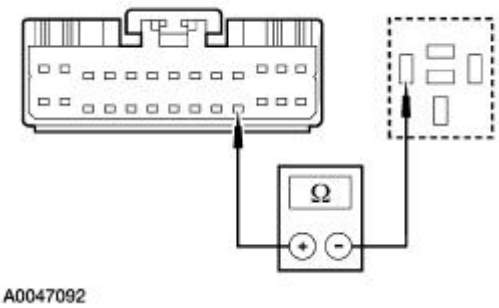
A0032576



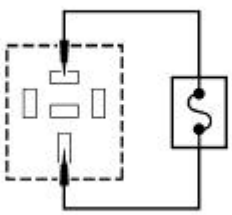




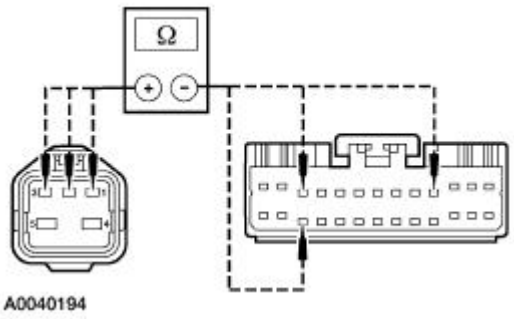
- **Is the resistance less than 5 ohms?**

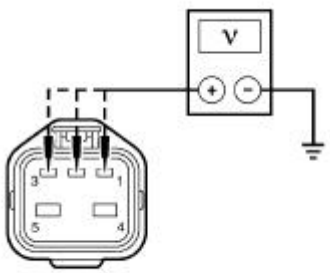


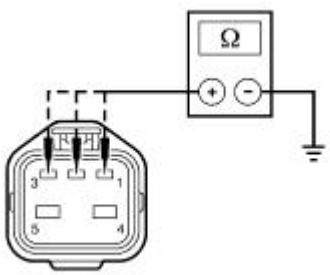
Q4 CHECK CIRCUIT 755 (BN/WH)	
• Measure the resistance between the blower motor C288, circuit 755 (BN/WH) and the blower motor speed control C297-4, circuit 755 (BN/WH).  A0032577 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q5 . **No** REPAIR circuit 755 (BN/WH). TEST the system for normal operation.
Q5 CHECK THE BLOWER MOTOR	
• Connect: Blower Motor C288. • Connect a fused jumper lead between the blower motor speed control C297-4, circuit 755 (BN/WH) and C297-5, circuit 57 (BK).  A0032579 • Key in ON position. • **Does the blower motor operate?**	**Yes** GO to Q6 . **No** INSTALL a new blower motor. TEST the system for normal operation.
Q6 CHECK CIRCUIT 757 (RD/WH) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Removed the fused jumper lead from the blower motor speed control C297. • Disconnect: DATC/EATC Module C228a. • Measure the resistance between the DATC/EATC module C228a-10, circuit 757 (RD/WH) and the blower motor speed control C297-3, circuit 757 (RD/WH), and measure the resistance between the DATC/EATC module C228a-10, circuit 757 (RD/WH) and ground.	**Yes** GO to Q7 . **No** REPAIR circuit 757 (RD/WH). TEST the system for normal operation.



- **Is the resistance less than 5 ohms between the DATC/EATC module and the blower motor speed control and greater than 10,000 ohms between the DATC/EATC module and ground?**







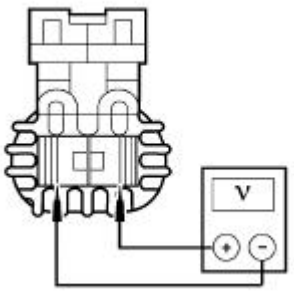
Q7 CHECK THE DATC/EATC MODULE OUTPUT	
• Connect: DATC/EATC Module C228a. • Connect: Blower Motor Speed Control C297. • Key in ON position. • Adjust the blower motor speed to HI. • Measure the voltage between the DATC/EATC module C228a-10, circuit 757 (RD/WH) and ground by back-probing the DATC/EATC module C228a.  • **Is the voltage within 2 volts of battery voltage?**	**Yes** INSTALL a new blower motor speed control. TEST the system for normal operation. **No** INSTALL a new DATC/EATC module. TEST the system for normal operation.
Q8 CHECK CIRCUIT 399 (BN/YE)	
• Key in OFF position. • Disconnect: Blower Motor Relay. • Measure the resistance between the blower motor relay socket pin 87, circuit 399 (BN/YE) and the blower motor C288, circuit 399 (BN/YE).  • **Is the resistance less than 5 ohms?**	**Yes** GO to Q9 . **No** REPAIR circuit 399 (BN/YE). TEST the system for normal operation.
Q9 CHECK CIRCUIT 57 (BK)	
• Measure the resistance between the blower motor relay socket pin 86, circuit 57 (BK) and ground.	**Yes** GO to Q10 . **No**

 A0042416 ● **Is the resistance less than 5 ohms?**	REPAIR circuit 57 (BK). TEST the system for normal operation.
Q10 CHECK THE DATC/EATC MODULE OUTPUT	
● Key in ON position. ● Measure the voltage between the blower motor relay socket pin 86, circuit 57 (BK) and socket pin 85, circuit 461 (OG).  A0034149 ● **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new blower motor relay. TEST the system for normal operation. **No** GO to Q11 .
Q11 CHECK CIRCUIT 461 (OG) FOR SHORT TO GROUND	
● Key in OFF position. ● Disconnect: DATC/EATC Module C228a. ● Key in ON position. ● Measure the resistance between the blower motor relay socket pin 85, circuit 461 (OG) and ground.  A0013869 ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to Q12 . **No** REPAIR circuit 461 (OG). TEST the system for normal operation.
Q12 CHECK CIRCUIT 461 (OG)	
● Measure the resistance between the DATC/EATC module C228a-23, circuit 461 (OG) and the blower motor relay socket pin 85, circuit 461 (OG).	**Yes** INSTALL a new DATC/EATC module. TEST the system for normal operation. **No** REPAIR circuit 461 (OG). TEST the

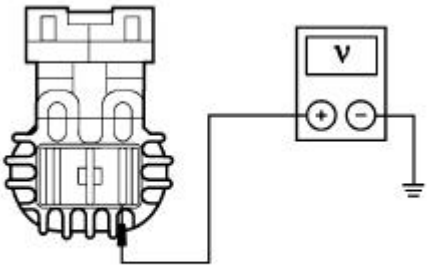
 A0047092 ● **Is the resistance less than 5 ohms?**	system for normal operation.

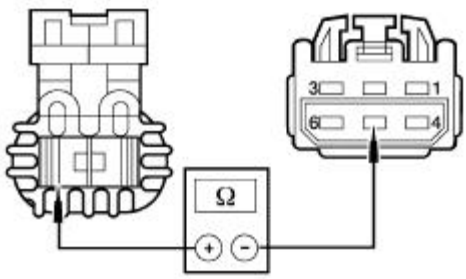
PINPOINT TEST R: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY —DATC/ EATC

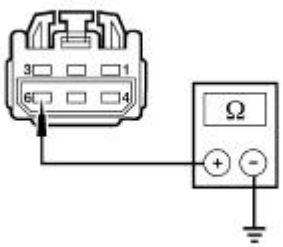
Test Step	Result / Action to Take
R1 CHECK CIRCUIT 755 (BN/WH) FOR A SHORT TO GROUND ● Key in OFF position. ● Disconnect: Blower Motor Speed Control C297. ● Key in ON position. ● Press the PANEL button on the DATC/EATC module. Adjust the blower motor setting to LO and then to HI. ● **Does the blower motor operate?**	**Yes** REPAIR circuit 755 (BN/WH) for a short to ground. TEST the system for normal operation. **No** GO to R2 .
R2 CHECK THE BLOWER MOTOR SPEED CONTROL ● Key in OFF position. ● Connect: Blower Motor Speed Control C297. ● Disconnect: DATC/EATC Module C228a. ● Disconnect: Blower Motor Relay. ● Connect a fused jumper lead between the blower motor relay socket pin 30 and pin 87, circuit 399 (BN/YE).  A0032587 ● **Does the blower motor operate?**	**Yes** INSTALL a new blower motor speed control module. TEST the system for normal operation. **No** GO to R3 .
R3 CHECK THE BLOWER MOTOR SPEED CONTROL CIRCUITS FOR AN OPEN ● Key in OFF position. ● Connect: Blower Motor Relay. ● Disconnect: Blower Motor Speed Control C297. ● Measure the resistance between the blower motor speed control C297: ■ pin 1, circuit 184 (TN/OG) and the DATC/EATC module C228a-3, circuit 184 (TN/OG). ■ pin 2, circuit 758 (VT/WH) and the DATC/EATC module	**Yes** GO to R4 . **No** REPAIR the affected circuit. TEST the system for normal operation.



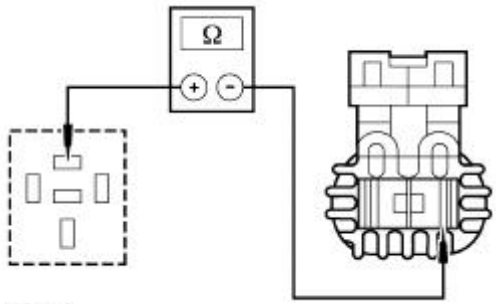
C228a-16, circuit 758 (VT/WH). ■ pin 3, circuit 757 (RD/WH) and the DATC/EATC module C228a-10, circuit 757 (RD/WH).  A0040194 ● **Are the resistances less than 5 ohms?**	
R4 CHECK THE BLOWER MOTOR SPEED CONTROL CIRCUITS FOR A SHORT TO VOLTAGE ● Key in ON position. ● Measure the voltage between the blower motor speed control C297 ■ pin 1, circuit 184 (TN/OG) and ground. ■ pin 2, circuit 758 (VT/WH) and ground. ■ pin 3, circuit 757 (RD/WH) and ground.  A0033862 ● **Is voltage present?**	**Yes** REPAIR the affected circuit. TEST the system for normal operation. **No** GO to R5 .
R5 CHECK THE BLOWER MOTOR SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND ● Key in OFF position. ● Measure the resistance between the blower motor speed control C297: ■ pin 1, circuit 184 (TN/OG) and ground. ■ pin 2, circuit 758 (VT/WH) and ground. ■ pin 3, circuit 757 (RD/WH) and ground.  A0033863 ● **Are the resistances greater than 10,000 ohms?**	**Yes** GO to R6 . **No** REPAIR the affected circuit. TEST the system for normal operation.

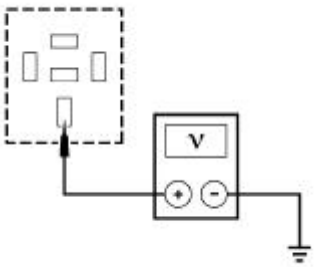


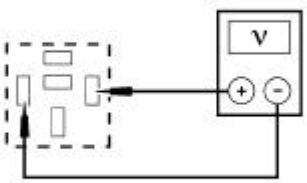


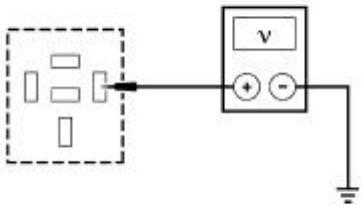


R6 CHECK THE BLOWER MOTOR SPEED CONTROL CIRCUITS FOR SHORTS	
• Measure the resistance between the blower motor speed control C297: ▪ pin 1, circuit 184 (TN/OG) and pin 2, circuit 758 (VT/WH). ▪ pin 1, circuit 184 (TN/OG) and pin 3, circuit 757 (RD/WH). ▪ pin 2, circuit 758 (VT/WH) and pin 3, circuit 757 (RD/WH).  A0033864 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to R7 . **No** REPAIR the affected circuits. TEST the system for normal operation.
R7 CHECK THE DATC/EATC MODULE HIGH BLOWER OUTPUT	
• Connect: DATC/EATC C228a. • Connect: Blower Motor Speed Control C297. • Key in ON position. • Adjust the blower motor speed to HI. • Measure the voltage between the DATC/EATC module C228a-10, circuit 757 (RD/WH) and ground by back-probing the DATC/EATC module C228a.  A0040186 • **Is the voltage within 2 volts of battery voltage?**	**Yes** GO to R8 . **No** INSTALL a new DATC/EATC module. TEST the system for normal operation.
R8 CHECK THE DATC/EATC MODULE BLOWER CONTROL OUTPUT	
• Adjust the blower motor speed to LO. • Measure the voltage between the DATC/EATC module C228a-16, circuit 758 (VT/WH) and ground by back-probing the DATC/EATC module C228a.	**Yes** INSTALL a new blower motor speed control. TEST the system for normal operation. **No** INSTALL a new DATC/EATC module. TEST the system for normal operation.









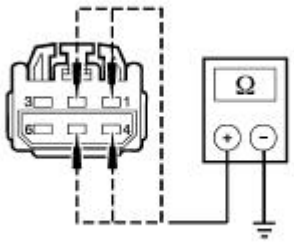
- **Is the voltage greater than 1 volt?**

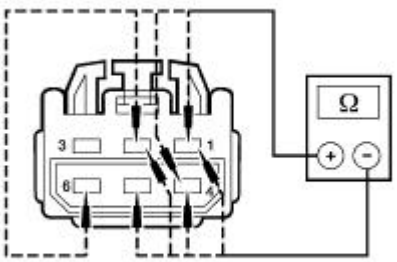
PINPOINT TEST S: THE AUXILIARY BLOWER MOTOR IS INOPERATIVE

Test Step	Result / Action to Take
NOTE: On vehicles with manual climate control, the auxiliary blower motor is enabled only when the ignition switch is ON and the function selector switch is in any setting except OFF. On vehicles with DATC/EATC the auxiliary blower motor is enabled when the ignition switch is ON, regardless of the DATC/EATC module setting.	
S1 CHECK FOR VOLTAGE AND GROUND TO THE AUXILIARY BLOWER MOTOR • Key in OFF position. • Disconnect: Auxiliary Blower Motor C4106. • **NOTE:** Manual climate control only. • Turn the function selector switch to the FLOOR position.  • Place the front auxiliary blower motor switch to HI. • Key in ON position. • Measure the voltage between the auxiliary blower motor C4106, circuit 536 (BK/LG) and circuit 515 (OG/RD).  • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new auxiliary blower motor. TEST the system for normal operation. **No** GO to S2 .

S2 CHECK FOR VOLTAGE TO THE AUXILIARY BLOWER MOTOR ● Measure the voltage between the auxiliary blower motor C4106, circuit 536 (BK/LG) and ground.  AM0416-A ● **Is the voltage greater than 10 volts?**	**Yes** GO to S3 . **No** GO to S5 .
S3 CHECK CIRCUIT 515 (OG/RD) ● Key in OFF position. ● Disconnect: Front Auxiliary Climate Control Assembly C989a-5. ● Measure the resistance between the front auxiliary climate control assembly C989a-5, circuit 515 (OG/RD) and the auxiliary blower motor C4106, circuit 515 (OG/RD).  A0046460 ● **Is the resistance less than 5 ohms?**	**Yes** GO to S4 . **No** REPAIR circuit 515 (OG/RD). TEST the system for normal operation.
S4 CHECK CIRCUIT 57 (BK) ● Measure the resistance between the front auxiliary climate control assembly C989a-6, circuit 57 (BK) and ground.  A0046461 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new front auxiliary climate control assembly. TEST the system for normal operation. **No** REPAIR circuit 57 (BK). TEST the system for normal operation.
S5 CHECK CIRCUIT 536 (BK/LG) ● Key in OFF position. ● Disconnect: Auxiliary Blower Motor Relay. ● Measure the resistance between the auxiliary blower motor relay socket pin 87, circuit 536 (BK/LG) and the auxiliary blower motor C4106, circuit 536 (BK/LG).	**Yes** GO to S6 . **No** REPAIR circuit 536 (BK/LG). TEST the system for normal operation.

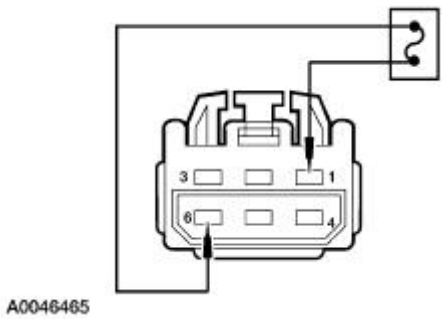
 A0032572 ● **Is the resistance less than 5 ohms?**	
S6 CHECK CIRCUIT 371 (PK/WH)	
● Measure the voltage between the auxiliary blower motor relay socket pin 30, circuit 371 (PK/WH) and ground.  A0032573 ● **Is the voltage greater than 10 volts?**	**Yes** GO to S7 . **No** REPAIR circuit 371 (PK/WH). TEST the system for normal operation.
S7 CHECK THE AUXILIARY BLOWER MOTOR RELAY	
● Key in ON position. ● Measure the voltage between the auxiliary blower motor relay socket pin 85, DATC/EATC circuit 462 (VT), manual climate control circuit 753 (YE/RD) and socket pin 86, circuit 57 (BK).  A0034149 ● **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new auxiliary blower motor relay. TEST the system for normal operation. **No** GO to S8 .
S8 CHECK CIRCUIT 462 (VT) OR 753 (YE/RD)	
● Measure the voltage between the auxiliary blower motor relay C3023 socket pin 85, DATC/EATC circuit 462 (VT), manual climate control circuit 753 (YE/RD) and ground.	**Yes** REPAIR circuit 57 (BK). TEST the system for normal operation. **No** REPAIR circuit 462 (VT) or 753 (YE/RD). TEST the system for normal operation.

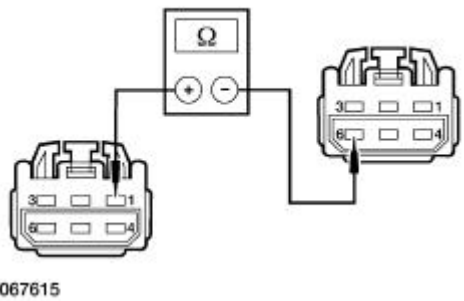




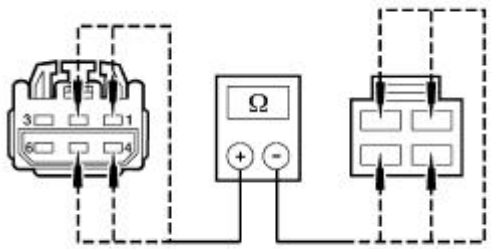
A0020210

- **Is the voltage greater than 10 volts?**





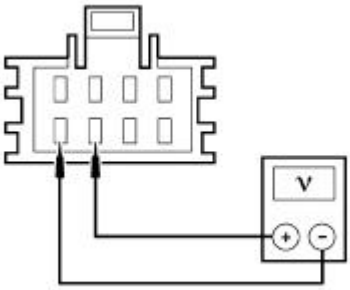
PINPOINT TEST T: THE AUXILIARY BLOWER MOTOR DOES NOT OPERATE CORRECTLY USING THE FRONT AUXILIARY CLIMATE CONTROLS

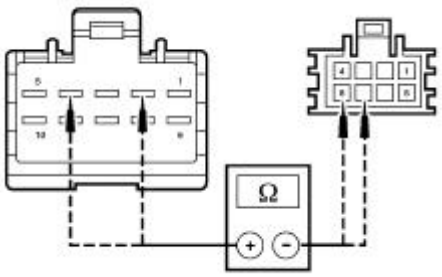


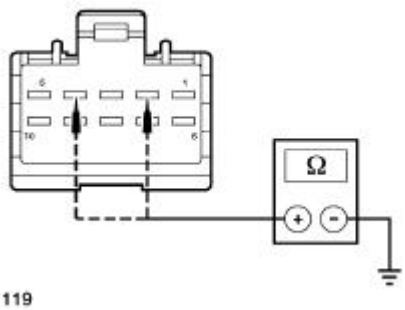
Test Step	Result / Action to Take
T1 CHECK THE AUXILIARY BLOWER MOTOR CIRCUITS FOR AN OPEN	
• Disconnect: Auxiliary Blower Motor Resistor C4107. • Disconnect: Front Auxiliary Climate Control Assembly C989a. • Measure the resistance between the rear auxiliary climate control assembly C3198a and the auxiliary blower motor resistor C4107 as follows: C989a / C4107 / Circuit: Pin 2 / Pin 3 / 269 (LB/OG) Pin 4 / Pin 1 / 751 (YE/RD) Pin 5 / Pin 2 / 515 (OG/RD) Pin 1 / Pin 4 / 756 (RD/PK) [a] [a] Only on vehicles equipped with a rear auxiliary climate control assembly.  A0046466 • **Are the resistances less than 5 ohms?**	**Yes** GO to T2 . **No** REPAIR the affected circuit(s). TEST the system for normal operation.
T2 CHECK THE AUXILIARY BLOWER MOTOR CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the auxiliary climate control assembly C989a: ■ pin 1, circuit 1120 (BK/WH) or circuit 756 (RD/PK) and ground. ■ pin 2, circuit 269 (LB/OG) and ground.	**Yes** GO to T3 . **No** REPAIR the affected

■ pin 4, circuit 751 (YE/RD) and ground. ■ pin 5, circuit 515 (OG/RD) and ground.  A0046464 ● **Are the resistances greater than 10,000 ohms?**	circuit(s). TEST the system for normal operation.
T3 CHECK THE AUXILIARY BLOWER MOTOR CIRCUITS FOR A SHORT	
● Measure the resistance between the auxiliary climate control assembly C989a: ■ pin 6, circuit 57 (BK) and pin 1, circuit 1120 (BK/WH) or circuit 756 (RD/PK). ■ pin 6, circuit 57 (BK) and pin 2, circuit 269 (LB/OG). ■ pin 6, circuit 57 (BK) and pin 4, circuit 751 (YE/RD). ■ pin 6, circuit 57 (BK) and pin 5, circuit 515 (OG/RD). ■ pin 1, circuit 1120 (BK/WH) or circuit 756 (RD/PK) and pin 2, circuit 269 (LB/OG). ■ pin 1, circuit 1120 (BK/WH) or circuit 756 (RD/PK) and pin 4, circuit 751 (YE/RD). ■ pin 1, circuit 1120 (BK/WH) or circuit 756 (RD/PK) and pin 5, circuit 515 (OG/RD). ■ pin 2, circuit 269 (LB/OG) and pin 4, circuit 751 (YE/RD). ■ pin 2, circuit 269 (LB/OG) and pin 5, circuit 515 (OG/RD). ■ pin 4, circuit 751 (YE/RD) and pin 5, circuit 515 (OG/RD).  A0046467 ● **Are the resistances greater than 10,000 ohms?**	**Yes** GO to T4 . **No** REPAIR the affected circuit(s). TEST the system for normal operation.
T4 CHECK THE AUXILIARY BLOWER MOTOR RESISTOR	
● Carry out the auxiliary blower motor resistor component test in this section. ● **Does the auxiliary blower motor resistor test good?**	**Yes** INSTALL a new front auxiliary climate control assembly. TEST the system for normal operation. **No** INSTALL a new blower

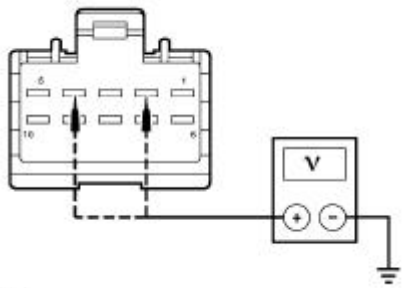
	motor resistor. REFER to Section 412-04 . TEST the system for normal operation.

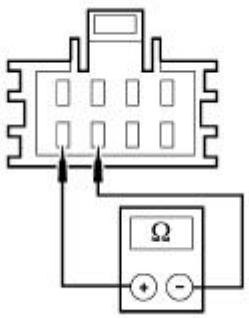






PINPOINT TEST U: THE AUXILIARY BLOWER MOTOR DOES NOT OPERATE CORRECTLY USING THE REAR AUXILIARY CLIMATE CONTROLS

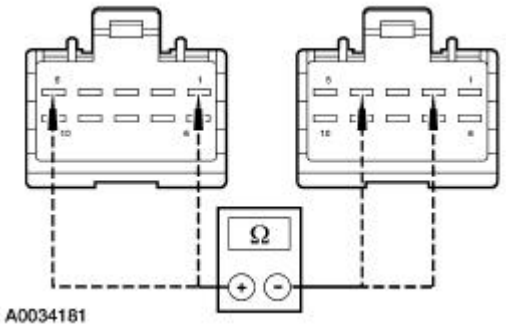


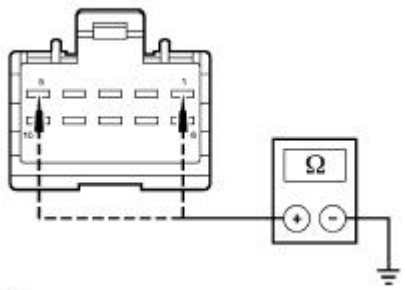


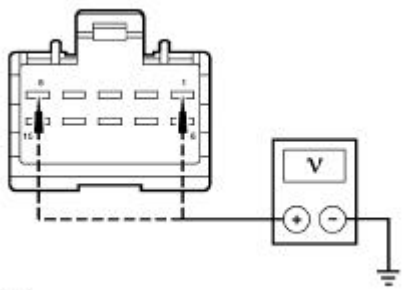
Test Step	Result / Action to Take
NOTE: Carry out this test only if the front auxiliary blower motor switch operates correctly in all settings except REAR.	
U1 BYPASS THE FRONT AUXILIARY CLIMATE CONTROL ASSEMBLY ● Key in OFF position. ● Disconnect: Front Auxiliary Climate Control Assembly C989a. ● Connect a fused jumper lead between the front auxiliary climate control assembly C989a-6, circuit 57 (BK) and C989a-1, circuit 1120 (BK/WH).  A0046465 ● Key in ON position. ● Check the auxiliary blower motor operation in each rear auxiliary blower motor switch position. ● **Does the rear auxiliary climate control assembly correctly operate the auxiliary blower motor?**	**Yes** INSTALL a new front auxiliary climate control assembly. TEST the system for normal operation. **No** GO to U2 .
U2 CHECK CIRCUIT 1120 (BK/WH) ● Key in OFF position. ● Disconnect: Rear Auxiliary Climate Control Assembly C3198a. ● Measure the resistance between the front auxiliary climate control assembly C989a-1, circuit 1120 (BK/WH) and the rear auxiliary climate control assembly C3198a-6, circuit 1120 (BK/WH).  A0067615 ● **Is the resistance less than 5 ohms?**	**Yes** GO to U3 . **No** REPAIR circuit 1120 (BK/WH). TEST the system for normal operation.
U3 CHECK THE AUXILIARY BLOWER MOTOR CIRCUITS FOR AN	

OPEN • Disconnect: Auxiliary Blower Motor Resistor C4107. • Measure the resistance between the rear auxiliary climate control assembly C3198a and the auxiliary blower motor resistor C4107 as follows: **C3198a** / **C4107** / **Circuit** Pin 1 / Pin 1 / 756 (RD/PK) Pin 2 / Pin 2 / 269 (LB/OG) Pin 4 / Pin 3 / 751 (YE/RD) Pin 5 / Pin 4 / 515 (OG/RD)  A0046466 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new rear auxiliary climate control assembly. TEST the system for normal operation. **No** REPAIR the affected circuit(s). TEST the system for normal operation.

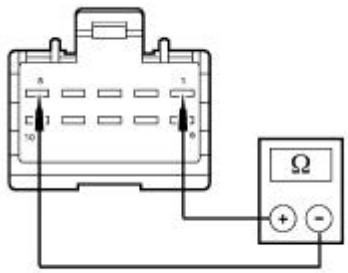
PINPOINT TEST V: THE PANEL/FLOOR CONTROL IS INOPERATIVE USING THE FRONT AUXILIARY CLIMATE CONTROLS





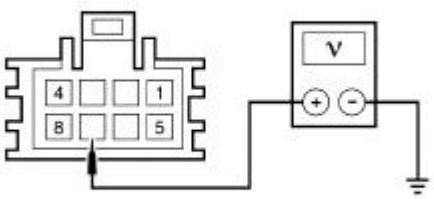


Test Step	Result / Action to Take
V1 CHECK THE FLOOR MODE OUTPUT • Disconnect: Air Distribution Door Actuator C3044. • Key in ON position. • Vehicles with manual climate control, place the function selector switch in FLOOR. • Place the front auxiliary blower motor switch in HI and set the front auxiliary climate control assembly to FLOOR. • Measure the voltage between the air distribution door actuator C3044-8, circuit 1131 (LG) and C3044-7, circuit 1137 (YE/LG).  A0051118 • **Is the voltage greater than 10 volts?**	**Yes** GO to V2 . **No** GO to V3 .
V2 CHECK THE PANEL MODE OUTPUT	

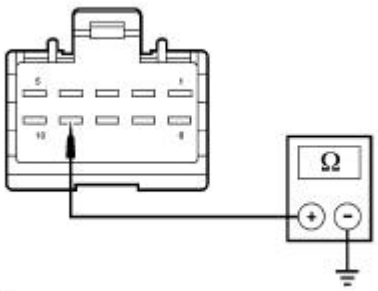


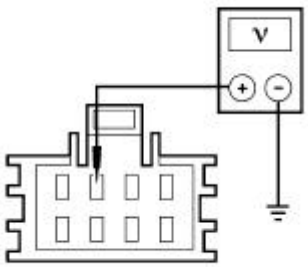
• Set the front auxiliary climate control assembly to PANEL. • Measure the voltage between the air distribution door actuator C3044-7, circuit 1137 (YE/LG) and C3044-8, circuit 1131 (LG).  A0051117 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new air distribution door actuator. TEST the system for normal operation. **No** GO to V3 .
V3 CHECK THE AIR DISTRIBUTION DOOR CIRCUITS	
• Key in OFF position. • Disconnect: Front Auxiliary Climate Control Assembly C989b. • Measure the resistance between the front auxiliary climate control assembly C989b-2, circuit 1131 (LG) and the air distribution door actuator C3044-7, circuit 1131 (LG), and between the front auxiliary climate control assembly C989b-4, circuit 1137 (YE/LG) and the air distribution door actuator C3044-8, circuit 1137 (YE/LG).  A0034159 • **Are the resistances less than 5 ohms?**	**Yes** GO to V4 . **No** REPAIR the affected circuit. TEST the system for normal operation.
V4 CHECK CIRCUIT 1131 (LG) AND CIRCUIT 1137 (YE/LG) FOR A SHORT TO GROUND	
• Measure the resistance between ground and the front auxiliary climate control assembly: • C989b-2, circuit 1131 (LG). • C989b-4, circuit 1137 (YE/LG).  A0051119 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to V5 . **No** REPAIR the affected circuit. TEST the system for normal operation.
V5 CHECK CIRCUIT 1131 (LG) AND CIRCUIT 1137 (YE/LG) FOR A SHORT TO VOLTAGE	
• Key in ON position.	**Yes**

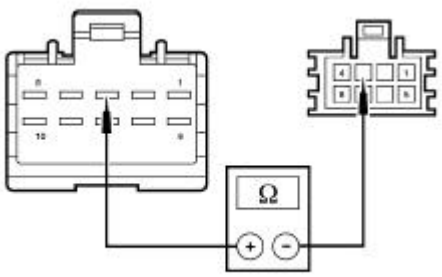
• Measure the voltage between ground and the front auxiliary climate control assembly: • C989b-2, circuit 1131 (LG). • C989b-4, circuit 1137 (YE/LG).  A0051120 • **Is voltage present?**	GO to V6 . **No** REPAIR the affected circuit. TEST the system for normal operation.
V6 CHECK CIRCUIT 1137 (YE/LG) FOR A SHORT TO CIRCUIT 1131 (LG)	
• Key in OFF position. • Measure the resistance between the front auxiliary climate control assembly C989a-8, circuit 1137 (YE/LG) and C989a-7, circuit 1131 (LG).  A0051121 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new front auxiliary climate control assembly. TEST the system for normal operation. **No** REPAIR the affected circuit. TEST the system for normal operation.



PINPOINT TEST W: THE PANEL/FLOOR CONTROL IS INOPERATIVE USING THE REAR AUXILIARY CLIMATE CONTROLS







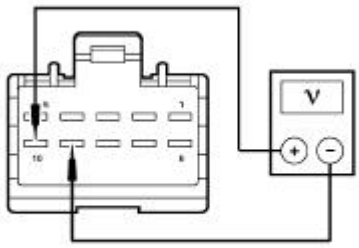
Test Step	Result / Action to Take
NOTE: Carry out this test only if the front auxiliary climate control assembly correctly operates the PANEL/FLOOR control.	
W1 CHECK THE AIR DISTRIBUTION DOOR CIRCUITS	
• Disconnect: Front Auxiliary Climate Control Assembly C989b. • Disconnect: Rear Auxiliary Climate Control Assembly C3198b. • Measure the resistance between the front auxiliary climate control assembly C989b-1, circuit 1129 (BN/WH) and the rear auxiliary climate control assembly C3198b-2, circuit 1129 (BN/WH), and between the front auxiliary climate control assembly C989b-5, circuit 1128 (GY/LB) and the rear auxiliary climate control assembly C3198b-4, circuit 1128 (GY/LB).	**Yes** GO to W2 . **No** REPAIR the affected circuit (s). TEST the system for normal operation.

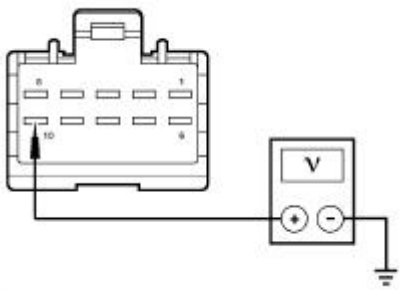
 A0034181 ● **Are the resistances less than 5 ohms?**	
W2 CHECK CIRCUIT 1128 (GY/LB) AND CIRCUIT 1129 (BN/WH) FOR A SHORT TO GROUND	
● Measure the resistance between ground and the front auxiliary climate control assembly: ● C989b-5, circuit 1128 (GY/LB) ● C989b-1, circuit 1129 (BN/WH)  A0051122 ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to W3 . **No** REPAIR the affected circuit (s). TEST the system for normal operation.
W3 CHECK CIRCUIT 1128 (GY/LB) AND CIRCUIT 1129 (BN/WH) FOR A SHORT TO VOLTAGE	
● Key in ON position. ● Measure the voltage between ground and the front auxiliary climate control assembly: ● C989b-5, circuit 1128 (GY/LB) ● C989b-1, circuit 1129 (BN/WH)  A0051123 ● **Is voltage present?**	**Yes** GO to W4 . **No** REPAIR the affected circuit (s). TEST the system for normal operation.
W4 CHECK CIRCUIT 1128 (GY/LB) FOR A SHORT TO CIRCUIT 1129 (BN/WH)	
● Key in OFF position. ● Measure the voltage between the front auxiliary climate control assembly C989b-5, circuit 1128 (GY/LB) and C989b-1, circuit 1129 (BN/WH).	**Yes** GO to W5 . **No**

 A0051124 ● **Is the resistance greater than 10,000 ohms?**	REPAIR the affected circuit (s). TEST the system for normal operation.
W5 CHECK THE REAR AUXILIARY CLIMATE CONTROL ASSEMBLY	
● Carry out the rear auxiliary climate control assembly component test in this section. ● **Does the rear auxiliary climate control assembly test good?**	**Yes** INSTALL a new front auxiliary climate control assembly. TEST the system for normal operation. **No** INSTALL a new rear auxiliary climate control assembly. TEST the system for normal operation.

PINPOINT TEST X: THE TEMPERATURE CONTROL IS INOPERATIVE USING THE FRONT AUXILIARY CLIMATE CONTROLS

Test Step	Result / Action to Take
X1 CHECK VOLTAGE TO BLEND DOOR ACTUATOR	
● Disconnect: Auxiliary Temperature Blend Door Actuator C3004. ● Key in ON position. ● Measure the voltage between the auxiliary temperature blend door actuator C3004-7, circuit 294 (WH/LB) and ground.  A0032565 ● **Is the voltage greater than 10 volts?**	**Yes** GO to X2 . **No** REPAIR circuit 294 (WH/LB). TEST the system for normal operation.
X2 CHECK THE BLEND DOOR ACTUATOR GROUND CIRCUIT	

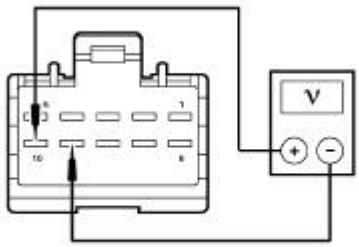


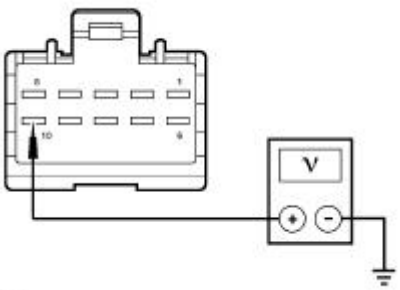


• Key in OFF position. • Measure the resistance between the front auxiliary climate control assembly C989b-9, circuit 57 (BK) and ground.  A0067614 • **Is the resistance less than 5 ohms?**	**Yes** GO to X3. **No** REPAIR circuit 57 (BK). TEST the system for normal operation.
X3 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR SIGNAL	
• Key in ON position. • Place the front auxiliary blower motor switch in HI. • Measure the voltage between the auxiliary temperature blend door actuator C3004-3, circuit 1126 (LB) and ground. Rotate the temperature control switch to full COOL then to full WARM.  A0051126 • **Does the voltage vary from greater than 10 volts (full COOL) to less than 1 volt (full WARM)?**	**Yes** INSTALL a new auxiliary temperature blend door actuator. TEST the system for normal operation. **No** GO to X4.
X4 CHECK CIRCUIT 1126 (LB)	
• Key in OFF position. • Disconnect: Front Auxiliary Climate Control Assembly C989b. • Measure the resistance between the front auxiliary climate control assembly C989b-3, circuit 1126 (LB) and the auxiliary temperature blend door actuator C3004-3, circuit 1126 (LB).  A0034185 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new front auxiliary climate control assembly. TEST the system for normal operation. **No** REPAIR circuit 1126 (LB). TEST the system for normal operation.

PINPOINT TEST Y: THE TEMPERATURE CONTROL IS INOPERATIVE USING THE REAR AUXILIARY CLIMATE CONTROLS

Test Step	Result / Action to Take
NOTE: Carry out this test only if the front auxiliary climate control assembly temperature control operates correctly.	
Y1 CHECK CIRCUIT 1130 (PK/LG)	
• Disconnect: Front Auxiliary Climate Control Assembly C989b. • Disconnect: Rear Auxiliary Climate Control Assembly C3198b. • Measure the resistance between the front auxiliary climate control assembly C989b-8, circuit 1130 (PK/LG) and the rear auxiliary climate control assembly C3198b-3, circuit 1130 (PK/LG).  • **Is the resistance less than 5 ohms?**	**Yes** GO to Y2 . **No** REPAIR circuit 1130 (PK/LG). TEST the system for normal operation.
Y2 CHECK THE REAR AUXILIARY CLIMATE CONTROL ASSEMBLY	
• Carry out the rear auxiliary climate control assembly component test in this section. • **Does the rear auxiliary climate control assembly test good?**	**Yes** INSTALL a new front auxiliary climate control assembly. TEST the system for normal operation. **No** INSTALL a new rear auxiliary climate control assembly. TEST the system for normal operation.

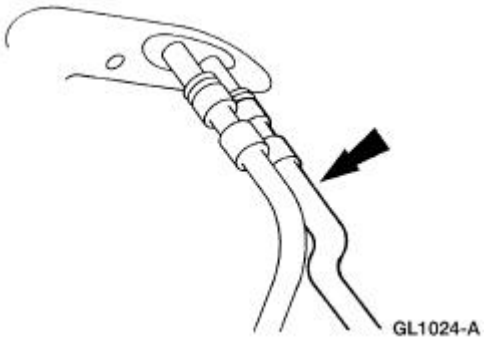




PINPOINT TEST Z: THE PANEL/FLOOR AND COOL/WARM CONTROLS ARE INOPERATIVE USING THE FRONT AUXILIARY CLIMATE CONTROLS

Test Step	Result / Action to Take
Z1 CHECK FOR VOLTAGE TO THE FRONT AUXILIARY CLIMATE CONTROL ASSEMBLY	
• Key in OFF position. • Vehicles with manual climate control, place the function selector switch in FLOOR. • Disconnect: Front Auxiliary Climate Control Assembly C989b. • Key in ON position. • Measure the voltage between the front auxiliary climate control assembly C989b-10, circuit 294 (WH/LB) and C989b-9, circuit 57 (BK).	**Yes** INSTALL a new front auxiliary climate control assembly. TEST the system for normal operation. **No** GO to Z2 .

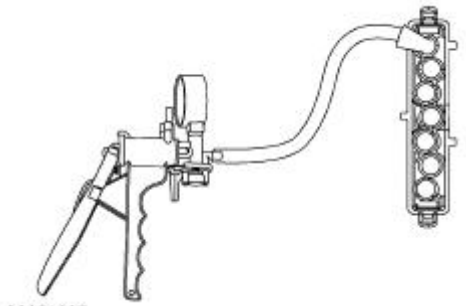
 A0034192 ● **Is the voltage greater than 10 volts?**	
Z2 CHECK CIRCUIT 294 (WH/LB) ● Measure the voltage between the front auxiliary climate control assembly C989b-10, circuit 294 (WH/LB) and ground.  A0034193 ● **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit 57 (BK). TEST the system for normal operation. **No** REPAIR circuit 294 (WH/LB). TEST the system for normal operation.

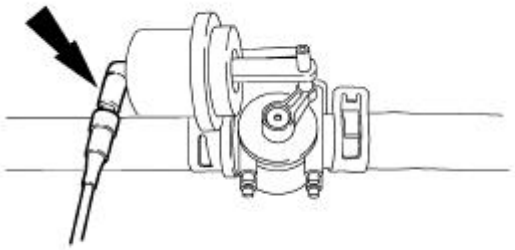


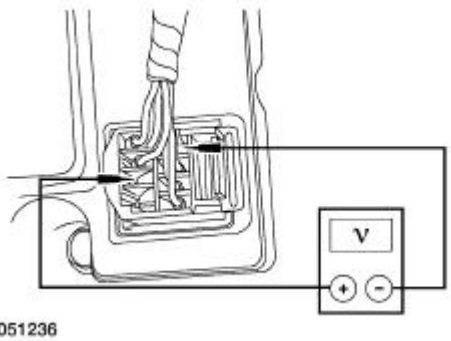
PINPOINT TEST AA: THE PANEL/FLOOR AND COOL/WARM CONTROLS ARE INOPERATIVE USING THE REAR AUXILIARY CONTROLS

Test Step	Result / Action to Take
NOTE: Carry out this test only if the front auxiliary climate control assembly correctly operates the PANEL/FLOOR and COOL/WARM controls.	
AA1 CHECK FOR VOLTAGE TO THE REAR AUXILIARY CLIMATE CONTROL ASSEMBLY ● Key in OFF position. ● Disconnect: Rear Auxiliary Climate Control Assembly C3198b. ● Key in ON position. ● **NOTE:** Manual climate control only. ● Turn the function selector switch to the FLOOR position. ● Place the front auxiliary climate control assembly in REAR. ● Measure the voltage between the rear auxiliary climate control assembly C3198b-10, circuit 243 (LG/OG) and C3198b-9, circuit 57 (BK).	**Yes** INSTALL a new rear auxiliary climate control assembly. TEST the system for normal operation. **No** GO to AA2 .

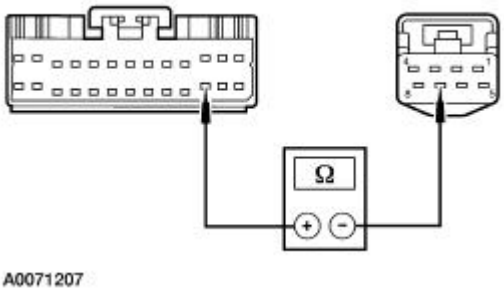
 A0034192 ● **Is the voltage greater than 10 volts?**	
AA2 CHECK CIRCUIT 243 (LG/OG)	
● Measure the voltage between the rear auxiliary climate control assembly C3198b-10, circuit 243 (LG/OG) and ground.  A0034193 ● **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit 57 (BK). TEST the system for normal operation. **No** REPAIR circuit 243 (LG/OG). TEST the system for normal operation.





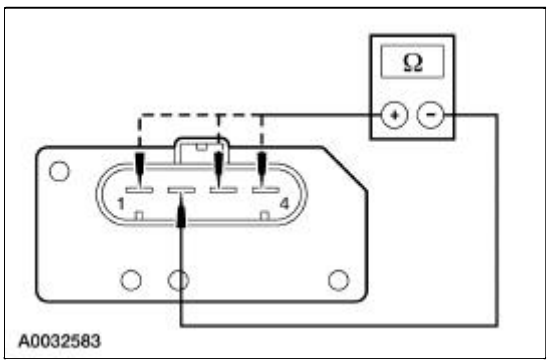


PINPOINT TEST AB: INSUFFICIENT AIR CONDITIONING (A/C) COOLING



Test Step	Result / Action to Take
AB1 CHECK FOR COOLANT FLOW TO THE HEATER CORE	
WARNING: The heater core inlet hose will become too hot to handle and may cause serious burns if the system is working correctly. ● Key in START position. ● Run the engine until it reaches normal operation temperature. ● **NOTE:** Manual climate control only. ● Select the FLOOR position on the control assembly. Set the temperature control to full COOL. ● **NOTE:** DATC/EATC only. ● Press the PANEL, RECIRC and A/C buttons on the DATC/EATC module. Set the temperature control to full COOL. ● Feel the heater core inlet hose to see if it is hot.	**Yes** GO to AB2 . **No** Go to Refrigerant System Tests in this section.

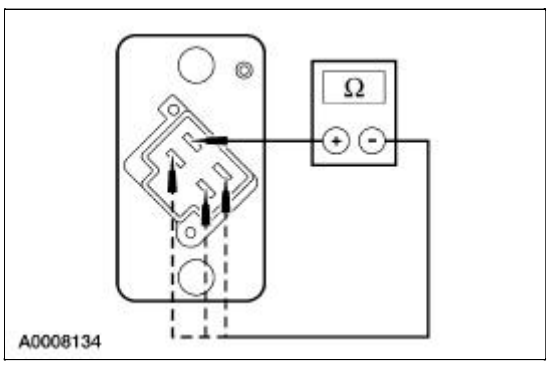
- **Is the heater core inlet hose hot?**



AB2 CHECK FOR VACUUM AT THE HEATER CONTROL VALVE	
• Disconnect the heater control valve vacuum connector and check for vacuum.  A0035187 • **Is vacuum present at the heater control valve?**	**Yes** INSTALL a new heater control valve. TEST the system for normal operation. **No** Manual climate control system, Go To Pinpoint Test I and diagnose the RECIRC circuit. DATC/EATC, GO to AB3 .
AB3 CHECK THE HEATER CONTROL VALVE VACUUM LINE FOR BLOCKAGE	
• Key in OFF position. • Disconnect the ATC solenoid and manifold vacuum connector. • Connect the vacuum pump to the heater control valve vacuum line and attempt to pull a vacuum.  A0051237 • **Can a vacuum be pulled on the heater control valve vacuum line?**	**Yes** INSTALL a new vacuum harness. TEST the system for normal operation. **No** GO to AB4 .
AB4 CHECK THE HEATER CONTROL VALVE VACUUM LINE FOR LEAKS	
• Plug the heater control valve vacuum line at the heater control valve connection. • Leak test the heater control valve vacuum line, using the vacuum pump.	**Yes** INSTALL a new vacuum harness. TEST the system for normal operation. **No** GO to AB5 .

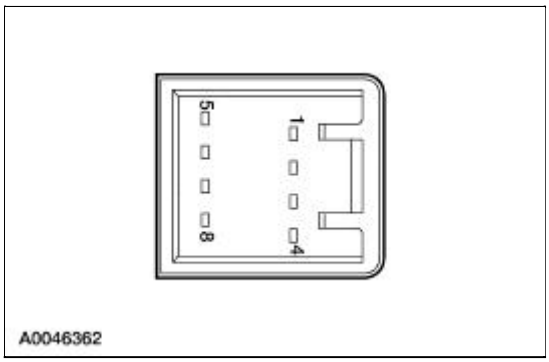
 A0051237 ● **Does the heater control valve vacuum line leak?**	
AB5 CHECK THE VACUUM CONTROL MOTOR FOR LEAKS AND CORRECT OPERATION	
● Connect the vacuum pump to the heater control valve and pull a vacuum.  A0035187 ● **Does the heater control valve operate and hold vacuum?**	**Yes** GO to AB6 . **No** INSTALL a new heater control valve. TEST the system for normal operation.
AB6 CHECK THE ATC SOLENOID AND MANIFOLD CIRCUIT VOLTAGE	
● Connect the vacuum harness connector to the ATC solenoid and manifold. ● Key in START position. ● Press the PANEL, RECIRC and A/C buttons on the DATC/EATC module. ● **NOTE:** The following measurement must be taken by back-probing the ATC solenoid and manifold C2093. ● Measure the voltage between ATC solenoid and manifold C2093-1, circuit 1957 (LB/RD) and C2093-7, circuit 773 (DG/OG).  A0051236 ● **Is all the voltage greater than 10 volts?**	**Yes** INSTALL a new ATC solenoid and manifold. TEST the system for normal operation. **No** GO to AB7 .
AB7 CHECK THE ATC SOLENOID AND MANIFOLD CIRCUIT	
● Key in OFF position. ● Disconnect: DATC/EATC Module C228a and ATC Solenoid and Manifold C2093. ● Measure the resistance between the DATC/EATC module	**Yes** INSTALL a new DATC/EATC module. TEST the system for

C228a-24, circuit 773 (DG/OG) and the ATC solenoid and manifold C2093-7, circuit 773 (DG/OG).  • **Is the resistance less than 5 ohms?**	normal operation. **No** REPAIR the for an open. TEST the system for normal operation.



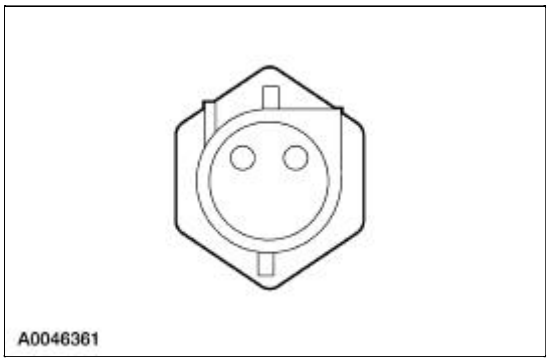
Component Tests

Blower Motor Resistor



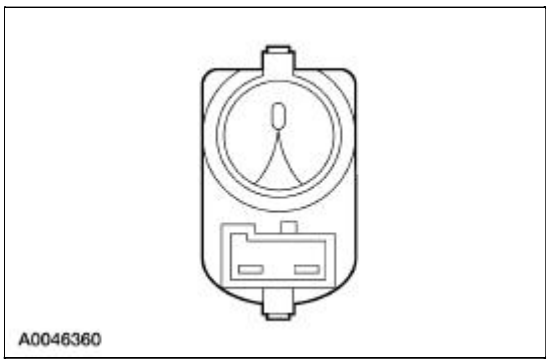
Blower Motor Resistor Pins	Resistance
4 and 2	2.3-2.9 ohms
2 and 3	0.8-1.1 ohms
2 and 1	0.2-0.4 ohms

Auxiliary Blower Motor Resistor



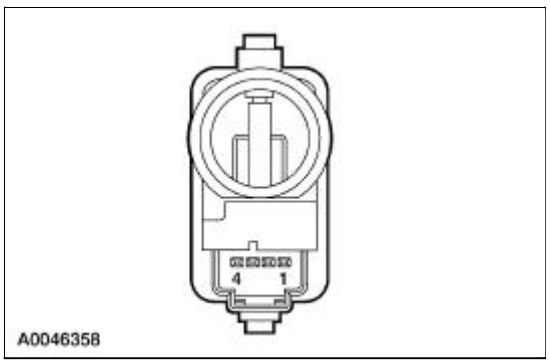
Blower Motor Resistor Pins	Resistance
3 and 4	0.2-0.4 ohms
3 and 1	0.8-1.1 ohms
3 and 2	2.1-2.6 ohms

ATC Solenoid and Manifold



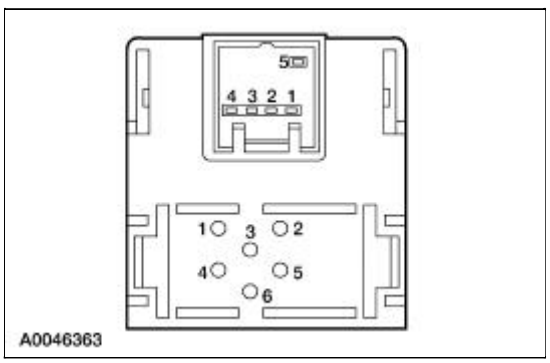
ATC Solenoid and Manifold Pins	Resistance
1 and 2	44-54 ohms
1 and 3	44-54 ohms
1 and 4	44-54 ohms
1 and 5	44-54 ohms
1 and 6	44-54 ohms

Ambient Temperature Sensor



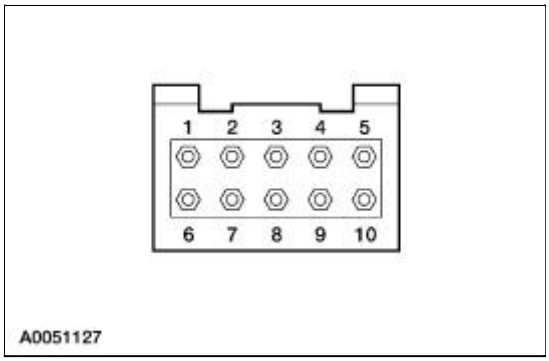
Ambient Temperature	Resistance
10-20°C (50-68°F)	37,000-58,000 ohms
20-30°C (68-86°F)	24,000-37,000 ohms
30-40°C (86-104°F)	16,000-24,000 ohms

In-Vehicle Temperature Sensor — EATC



Temperature	Resistance
10-20°C (50-68°F)	37,000-58,000 ohms
20-30°C (68-86°F)	24,000-37,000 ohms
30-40°C (86-104°F)	16,000-24,000 ohms

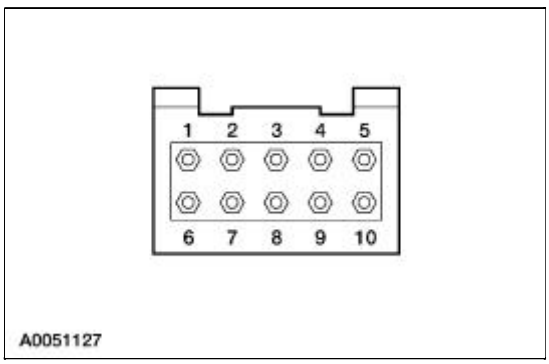
In-Vehicle Temperature Sensor — DATC



Temperature	Resistance between pins 1 and 3
10-20°C (50-68°F)	37,000-58,000 ohms
20-30°C (68-86°F)	24,000-37,000 ohms
30-40°C (86-104°F)	16,000-24,000 ohms

Function Selector Switch

Function selection	Continuity between electrical pins
MAX A/C	1,2,3 and 4
PANEL	1,2 and 4
PANEL/FLOOR	1,2 and 4
OFF	None
FLOOR	1,2 and 4
FLOOR/DEFROST	1,2 and 5
DEFROST	1,2 and 5



Front Auxiliary Climate Control Assembly

Blower Mode	Airflow Mode	Continuity between pins
HIGH	FLOOR	4 and 9, 2 and 10
HIGH	PANEL	4 and 10, 2 and 9
REAR	FLOOR/PANEL	10 and 7, 4 and 5
REAR	FLOOR/PANEL	2 and 1, 3 and 8

Resistance between pins	Resistance Range (approx.)
3 and 9	50 ohms (WARM)-3,000 ohms (COOL)
3 and 10	50 ohms (COOL)-3,000 ohms (WARM)

Rear Auxiliary Climate Control Assembly

Airflow Mode	Continuity between pins
FLOOR	4 and 9, 2 and 10
PANEL	4 and 10, 2 and 9

Resistance between pins	Resistance Range (approx.)
3 and 9	50 ohms (WARM)-3,000 ohms (COOL)
3 and 10	50 ohms (COOL)-3,000 ohms (WARM)

Heater Core

WARNING: Carbon monoxide is colorless, odorless and dangerous. If it is necessary to operate the engine with the vehicle in a closed area such as a garage, always use an exhaust

collector to vent the exhaust gases outside the closed area.

1. **NOTE:** Testing of returned heater cores reveals that a large percentage of heater cores were good and did not require replacement. If a heater core leak is suspected, the heater core must be tested by carrying out the plugged heater core component test before the heater core pressure test. Carry out a system inspection by checking the heater system thoroughly as follows:

   Inspect for evidence of coolant leakage at the heater water hose to heater core attachments. A coolant leak in the heater water hose could follow the heater core tube to the heater core (18476) and appear as a leak in the heater core.

2. **NOTE:** Spring-type clamps are installed as original equipment. Installation and overtightening of non-specification clamps can cause leakage at the heater water hose connection and damage the heater core.

   Check the integrity of the heater water hose clamps.

Heater Core — Plugged

WARNING: The heater core inlet hose will become too hot to handle if the system is working correctly.

1. Check to see that the engine coolant is at the correct level.

2. Start the engine and turn on the heater.

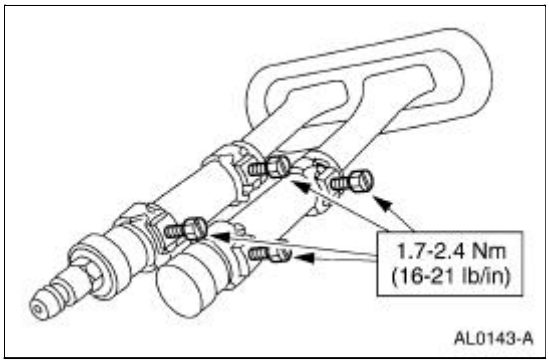
3. When the engine coolant reaches operating temperature, feel the heater core outlet hose to see if it is hot.

If it is not hot:

- the heater core may have an air pocket.
- the heater core may be plugged.
- the thermostat is not working correctly.

Heater Core — Pressure Test

Use the Radiator/Heater Core Pressure Tester to perform the pressure test.



1. **NOTE:** Due to space limitations, a bench test may be necessary for pressure testing.

   Drain the coolant from the cooling system.

2. Disconnect the heater water hoses from the heater core. For additional information, refer to Section 412-02.

3. Install a short piece of heater water hose, approximately 101 mm (4 inches) long on each heater core tube.

4. Fill the heater core and heater water hoses with water and install Plug BT-7422-B and adapter BT-7422-A from the Radiator/Heater Core Pressure Tester in the heater water hose ends. Secure the heater water hoses, plug and adapter with hose clamps.

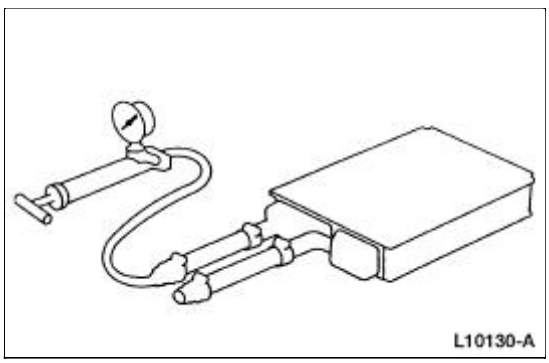
5. Attach the pump and gauge assembly from the Radiator/Heater Core Pressure Tester to the adapter.

6. Close the bleed valve at the base of the gauge. Pump 241 kPa (35 psi) of air pressure into the heater core.

7. Observe the pressure gauge for a minimum of three minutes.

8. If the pressure drops, check the heater water hose connections to the core tubes for leaks. If the heater water hoses do not leak, remove the heater core from the vehicle and perform the bench test.

Heater Core — Bench Test



1. Remove the heater core from the vehicle. For additional information, refer to Section 412-02 .

2. Drain all of the coolant from the heater core.

3. Connect the 101 mm (4 inch) test heater water hoses with plug and adapter to the core tubes. Then connect the Radiator/Heater Core Pressure Tester to the adapter.

4. Apply 241 kPa (35 psi) of air pressure to the heater core. Submerge the heater core in water.

5. If a leak is observed, replace the heater core.

A/C Evaporator/Condenser Core — On Vehicle Leak Test

1. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. **NOTE:** DO NOT leak test an A/C evaporator core with the suction accumulator/drier (19C836) attached to the core tubes.

   Disconnect the suspect A/C evaporator core or A/C condenser core from the A/C system. For

additional information, refer to Section 412-03A or Section 412-03B .

3. Clean the spring lock couplings. For additional information, refer to Spring Lock Coupling in this section.

4. Connect the appropriate test fittings from the R-12/R-134a Air Conditioning Test Fitting Set to the evaporator or condenser tube connections.

5. **NOTE:** The automatic shut-off valves on some gauge set hoses do not open when connected to the test fittings. If available, use hoses without shut-off valves. If hoses with shut-off valves are used, make sure the valve opens when attached to the test fittings or install an adapter which will activate the valve. The test is not valid if the shut-off valve does not open.

   Connect the red and blue hoses from the R-134a Manifold Gauge Set to the test fittings on the A/C evaporator core or A/C condenser core. Connect the yellow hose to a known good vacuum pump.

6. Open both gauge set valves and start the vacuum pump. Allow the vacuum pump to operate for a minimum of 45 minutes after the gauge set low pressure gauge indicates 101 kPa (30 in-Hg). The 45 minute evacuation is necessary to remove any refrigerant from oil left in the A/C evaporator core or A/C condenser core. If the refrigerant is not completely removed from the oil, outgassing will degrade the vacuum and appear as a refrigerant leak.

7. If the low pressure gauge reading will not drop to 101 kPa (30 in-Hg) when the valves on the gauge and manifold set are open and the vacuum pump is operating, close the gauge set valves and observe the low pressure gauge. If the pressure rises rapidly to zero, a large leak is indicated. Recheck the test fitting connections and gauge set connections before replacing the A/C evaporator core or A/C condenser core.

8. After evacuating for 45 minutes, close the gauge set valves and stop the vacuum pump. Observe the low pressure gauge; it should remain at the 101 kPa (30 in-Hg) mark.
   - If the low pressure gauge reading rises 34 or more kPa (10 or more in-Hg) of vacuum from the 101 kPa (30 in-Hg) position in 10 minutes, a leak is indicated.
   - If a very small leak is suspected, wait 30 minutes and observe the vacuum gauge.
   - If a small amount of vacuum is lost, operate the vacuum pump with gauge valves open for an additional 30 minutes to remove any remaining refrigerant from the oil in the A/C evaporator core or A/C condenser core. Then recheck for loss of vacuum.
   - If a very small leak is suspected, allow the system to set overnight with vacuum applied and check for vacuum loss.

9. If the A/C evaporator core or A/C condenser core does leak, as verified by the above procedure, install a new A/C evaporator core or A/C condenser core. For additional information, refer to Section 412-03A or Section 412-03B .

A/C Compressor — External Leak Test

1. Install the A/C Pressure Test Adapter on the rear head of the A/C compressor, using the existing manifold retaining bolt.

2. Connect the high and low pressure lines of a manifold gauge set or a refrigerant recovery/recycling station such as the R-134a A/C Service Center to the corresponding fittings on the A/C Pressure Test Adapter.

3. Attach the center hose of the manifold gauge set to a refrigerant container standing in an upright position.

4. Hand-rotate the compressor shaft 10 complete revolutions to distribute the oil inside the A/C compressor.

5. Open the low pressure gauge valve, the high pressure gauge valve and the valve on the refrigerant container to allow the refrigerant vapor to flow into the A/C compressor.

6. Using the Automatic Calibration Halogen Leak Detector, check the entire A/C compressor for leaks.

7. If an external leak is found, install a new A/C compressor. For additional information, refer to Section 412-03A .

8. When the leak test is complete, recover the refrigerant from the compressor.

Air Conditioning (A/C) System Check — Retail Procedure

NOTE: This Retail Procedure is not eligible for claiming on Ford paid repairs (warranty and ESP).

NOTE: The engine should be run at idle for 10 minutes with the air conditioning on and set to MAX A/C before carrying out this retail procedure.

NOTE: Read and follow all of the Warnings, Cautions and Notes at the beginning of this section before continuing.

Visual inspection

1. Open the hood and visually inspect the heating and air conditioning systems for the following:
    - Coolant reservoir for correct coolant level
    - Heater hoses for deterioration or loose connections
    - Radiator and condenser for debris or damaged fins restricting airflow, loose mounting or connections
    - Accessory drive belt(s) and cooling fan(s) for wear or physical damage
    - Refrigerant lines and connections for physical damage or loose connections
    - Compressor for physical damage or loose connections
    - Receiver/drier for physical damage or loose connections
    - Wiring and connectors for excessive wear, loose or damaged connections, or incorrect routing

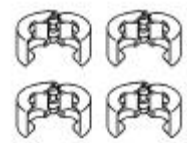
A/C refrigerant analysis

2. Carry out air conditioning refrigerant analysis. For additional information, refer to Refrigerant Identification Testing in this section.
    - If the refrigerant fails the analysis, discontinue diagnosis and make recommendations for repairs.
    - If the refrigerant passes the analysis, carry out the air conditioning system check.

Air conditioning system check

3. Connect manifold gauge set or charging station with gauges to refrigerant system.
    - With the vehicle in park, parking brake set, thermometer installed in center panel vent, and air conditioning system on and set to FULL COOL, start the engine.
    - Record air refrigerant system pressures while running the engine at 1,500 rpm and allow engine to return to idle.
    - Operate the blower motor in all control positions and check for correct blower speed changes.
    - With the blower motor on HI, operate air discharge mode selector in all positions and check for correct airflow in each position.
    - Operate the temperature blend selector in all positions and check for correct change in discharge temperature. Check the air discharge temperature with the selector in the coolest position and the air conditioning on and set to FULL COOL to determine if the air

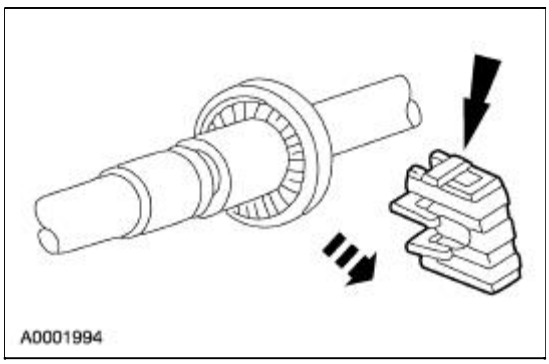
discharge temperature is acceptable for the current ambient air temperature.



- Carry out the DATC self-test (if applicable).
  If the refrigerant system pressures were low, carry out the refrigerant system leak test.

Refrigerant system leak test

4. Use either an ultraviolet (UV) or an electronic leak detector to check for leaks at all refrigerant lines, connections, and components.
   After all tests have been completed, report all findings and recommended repairs to your service advisor before carrying out further diagnostic procedures.

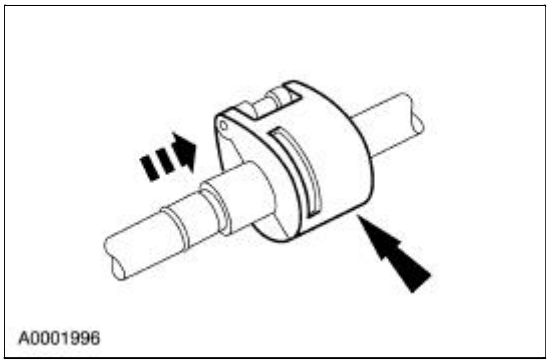


Spring Lock Coupling

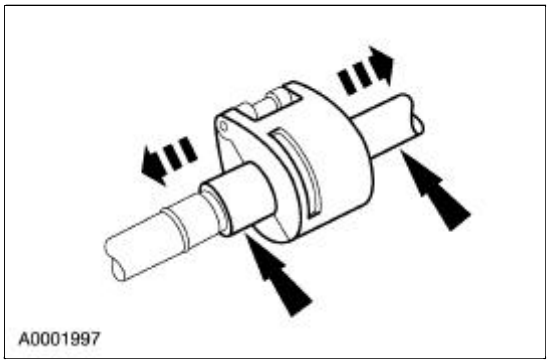
Special Tool(s)

 ST2352-A	Remover, Refrigerant Coupling Spring 412-039 (T84L-19623-B)

Disconnect

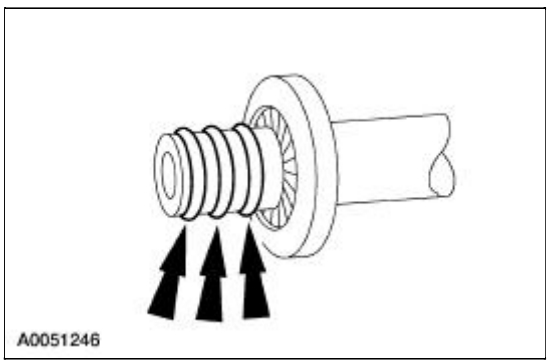


1. Remove the A/C tube lock coupling clip (19E746), if equipped.

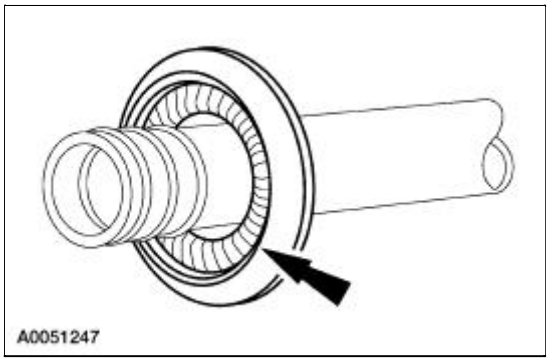


2. Fit the special tool to the spring lock coupling.

3. Push the tool into the cage opening to release the female fitting from the A/C tube lock coupling spring (19E576).

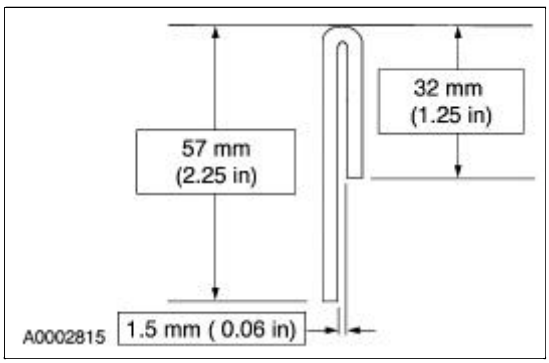


4. Pull the spring lock coupling fittings apart.



5. **CAUTION: Do not use metal tools to remove the O-ring seals. They can cause axial scratches across the O-ring seal grooves, resulting in refrigerant leaks.**

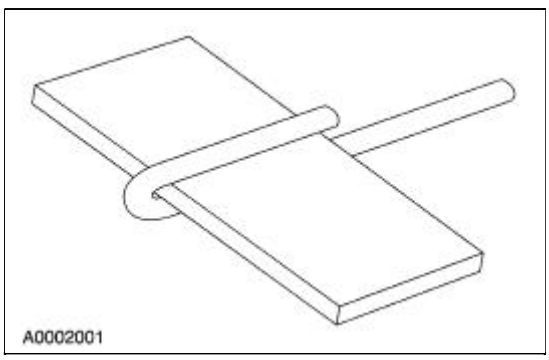
   Remove the O-ring seals with a non-metallic tool.



6. **CAUTION: Do not use a screwdriver or similar tool to remove the A/C tube lock coupling spring; this can cause axial scratches across the O-ring seal grooves resulting in refrigerant leaks.**

   Remove the A/C tube lock coupling spring with a small hooked wire.

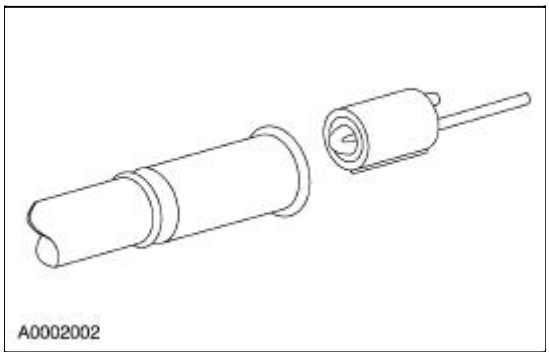
Cleaning



1. Fabricate a cleaning tool from a 1/8 inch diameter brazing rod.

2. Cut an abrasive pad from maroon colored 3M Scotch Brite® with the dimensions corresponding to the coupling size.

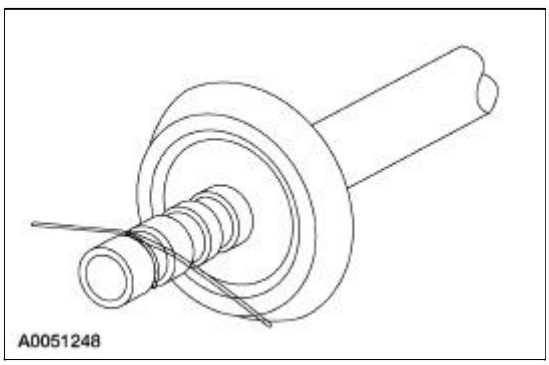
Coupling Size	Pad Size
3/8 inch	25 x 50 mm (1 x 2 inch)
1/2 inch	25 x 50 mm (1 x 2 inch)
5/8 inch	25 x 76 mm (1 x 3 inch)
3/4 inch	25 x 102 mm (1 x 4 inch)



3. Assemble the pad to the tool.

4. Coat the abrasive pad with PAG Refrigerant Compressor Oil (R-134a Systems) or equivalent.
5. Roll the pad on the tool and install it in a variable speed drill motor.
6. **CAUTION: Maintain low speed drill rotation when inserting or removing the cleaning**

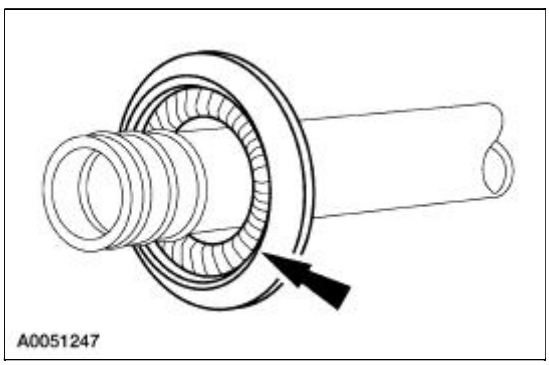
tool to prevent axial scratches which may cause future leaks.



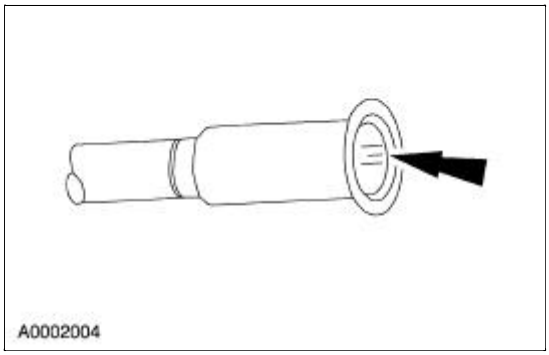
Polish for one minute at moderate speed (less than 1,500 rpm) or until the surface is clean and free of scratches or foreign material.

7. Clean the fitting with a lint-free cloth.

8. Inspect the surface for grooves or scratches. If grooves and scratches are still present, install a new component.



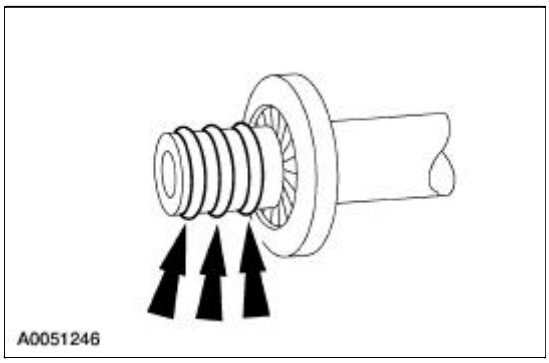
9. Clean the O-ring seal grooves with a 300 mm (12 inch) length of natural fiber string.
    - Loop the string around the grooves and pull the string back and forth.



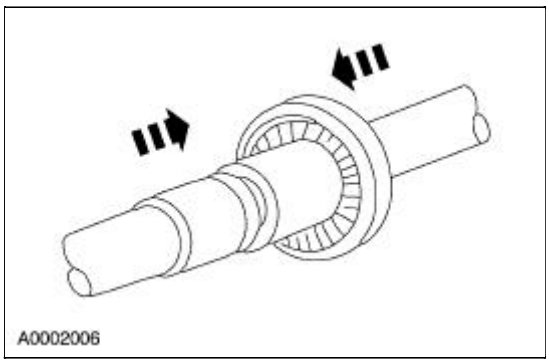
10. Remove any foreign material from the grooves with a lint-free cloth.

Connect

1. Install the A/C tube lock coupling spring.



2. Lubricate the inside of the coupling with PAG Refrigerant Compressor Oil (R-134a Systems) or equivalent.



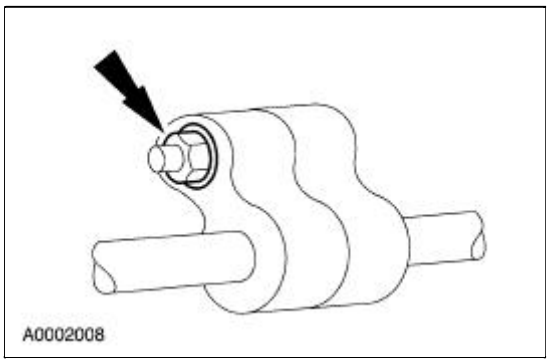
3. **CAUTION: Use only the new O-ring seals. The use of any O-ring seals other than those specified in the Ford Master Parts Catalog may result in intermittent leakage during vehicle operation.**

   Install the O-ring seals.

   - Lubricate the O-ring seals with PAG Refrigerant Compressor Oil (R-134a Systems) or equivalent.

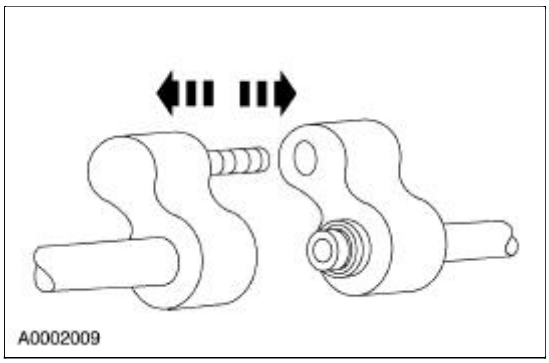
4. Connect the spring lock coupling fittings with a twisting motion until the A/C tube lock coupling spring snaps over the flared end of the female fitting.

5. Install the A/C tube lock coupling clip.



A0002007

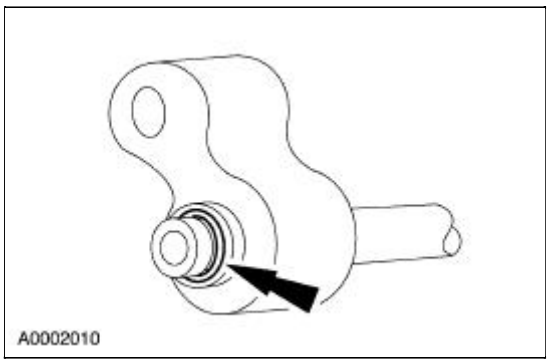
Air Conditioning Line (Peanut) Fitting



Disconnect

1. **CAUTION: Support the female fitting with a wrench to prevent the tubes from twisting.**

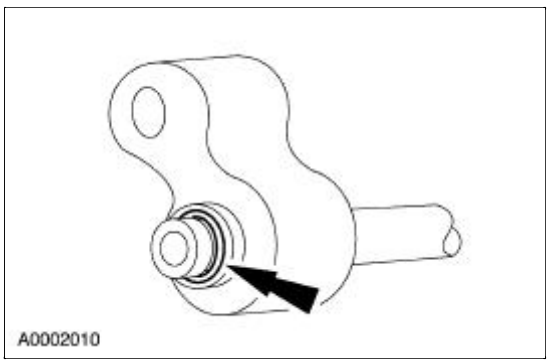
   Remove the nut from the peanut fitting.



2. Pull the peanut fitting apart.

3. **CAUTION: Do not use metal tools to remove the O-ring seal. They can cause axial scratches across the O-ring seal groove, resulting in refrigerant leaks.**

   Remove the O-ring seal with a non-metallic tool.



Connect

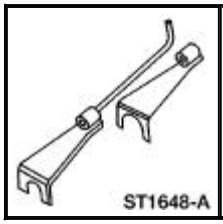
1. Clean all dirt or foreign material from the fittings.

2. **CAUTION: Use only the new O-ring seals. The use of any O-ring seals other than those specified in the Ford Master Parts Catalog may result in intermittent leakage during vehicle operation.**

   Install the O-ring seal.

   - Lubricate the O-ring seal with PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C) or equivalent meeting Ford specification WSH-M1C231-B.

3. Lubricate the inside of the fittings with PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C) or equivalent meeting Ford specification WSH-M1C231-B.



4. **NOTE:** When correctly assembled, the male and female fittings should be flush.

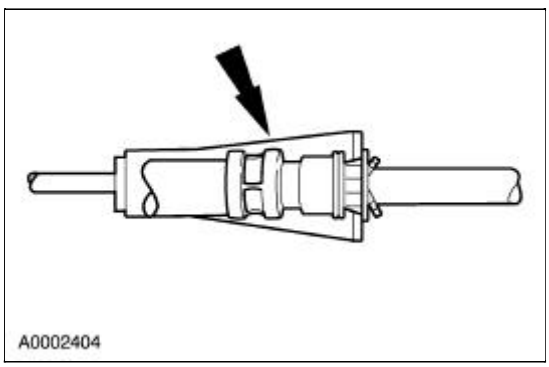
   Assemble the male and female fittings together.

Heater Hose Coupling

Special Tool(s)

 ST1648-A	Remover, Heater Hose Inlet Tube 412-042 (T85T-18539-AH)

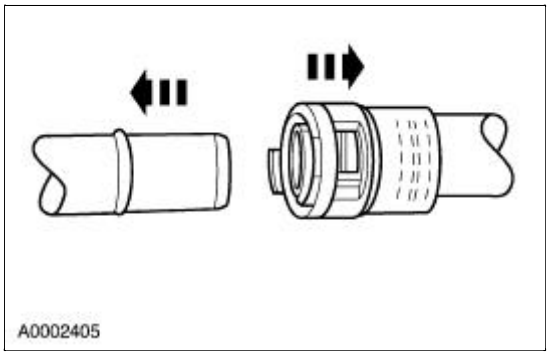
Disconnect



1. **WARNING: The engine must be off, fully cool and the cooling system fully depressurized before attempting to disconnect any heater water hoses. Failure to comply with this warning can result in serious injury or burns from hot liquid escaping out of the engine cooling system.**

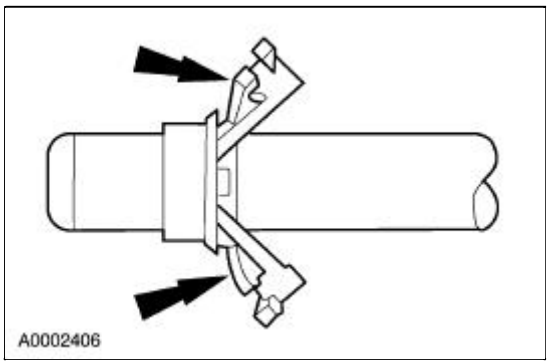
   Depressurize the engine cooling system.

2. Push the heater water hose toward the tube to fully expose the locking tabs.



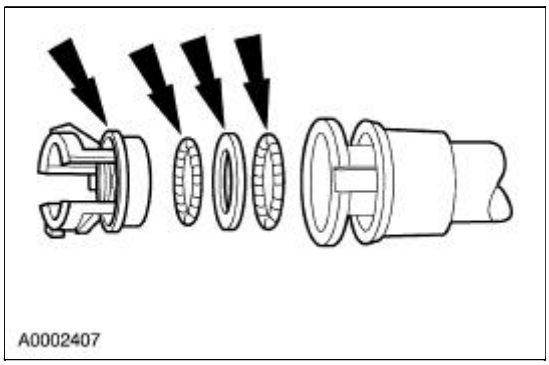
3. **NOTE:** When compressing the white coupling retainer, the Heater Hose Disconnect Tool must be perpendicular to and on the highest point of the coupling.

   Push the special tool over the coupling retainer windows to compress the retainer locking tabs.

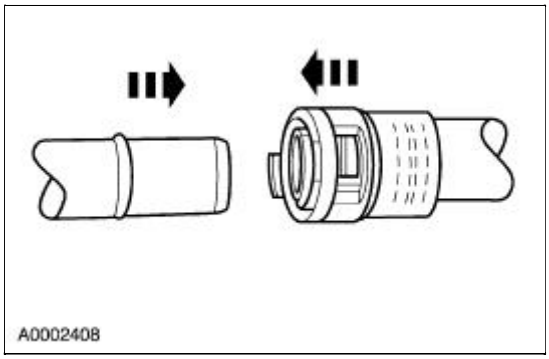


4. **NOTE:** A slight twisting motion while pulling on the heater water hose may be necessary to assist in the removal.

   Pull the heater water hose away from the heater core tube.



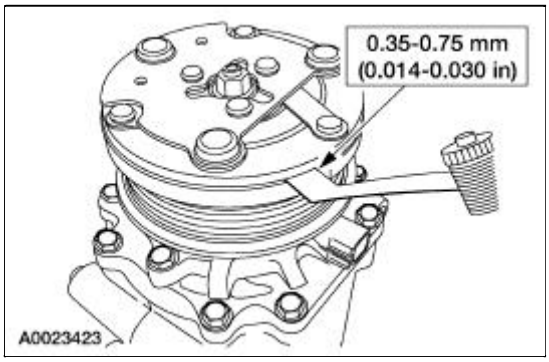
5. Plug the heater water hose.
6. Remove the white coupling retainer from the tube.
7. Spread the retainer tabs apart and slide the retainer off the tube.



8. Discard the retainer.

Connect

1. Clean the tubes and lubricate with MERPOL® meeting Ford specification ESE-M99B144-B or plain water.
2. Install a new coupling retainer, spacer, and lubricated O-ring seals into the quick disconnect coupling housing.

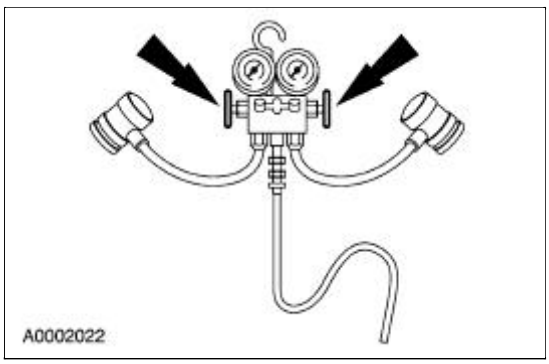


3. Push the heater water hose with a quick disconnect coupling onto the tube.

4. Make sure the coupling is fully engaged by lightly pulling on the heater water hose.

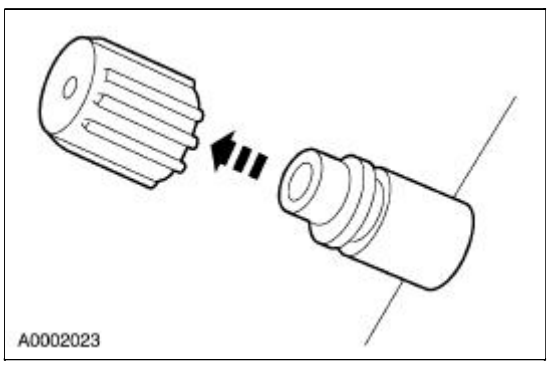
Air Conditioning (A/C) Clutch Air Gap Adjustment

1. Check the A/C clutch air gap at three equally spaced places between the clutch plate and the A/C clutch pulley.



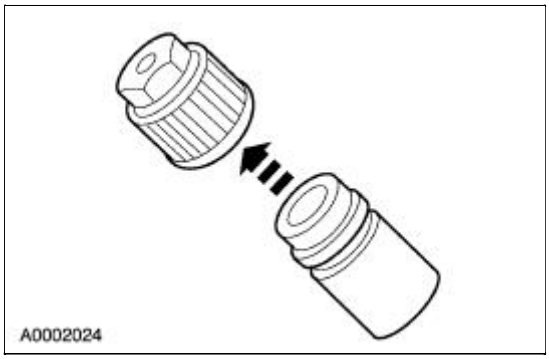
2. If the A/C clutch air gap is out of range, remove the clutch plate. Add or remove spacers between the clutch plate hub and the compressor shaft until the clearance is within specification.

Manifold Gauge Set Connection

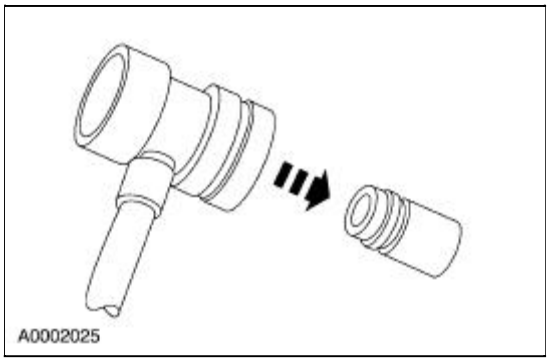


Special Tool(s)

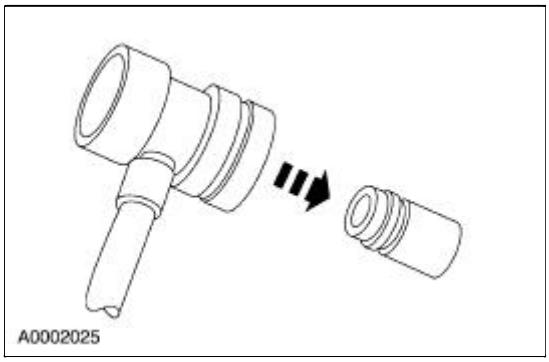
 ST1928-A	R-134a Manifold Gauge Set 176-R032A or equivalent



1. Turn both valves on the R-134a Manifold Gauge Set clockwise to close the low- and high-pressure hoses to the center manifold and center hose.



2. Remove the A/C charging valve cap (19D702) from the low-pressure service gauge port valve.

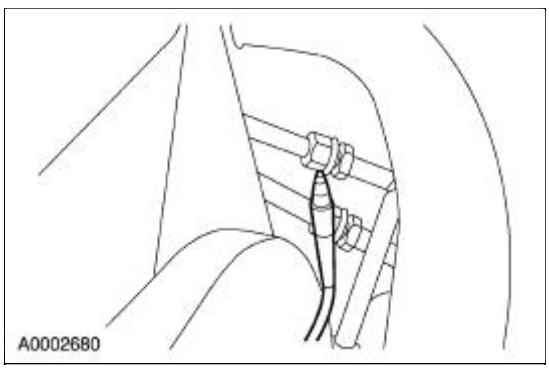


3. Remove the A/C charging valve cap from the high-pressure service gauge port valve.

4. Connect the R-134a Manifold Gauge Set low-pressure hose and the R-134a low side quick disconnect to the low-pressure service gauge port valve.

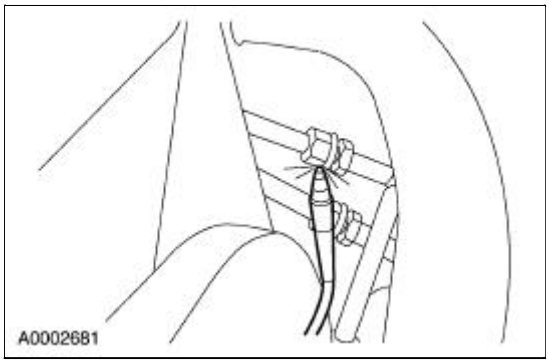
5. Connect the R-134a Manifold Gauge Set high-pressure hose and the R-134a high side quick disconnect to the high-pressure service gauge port valve.

Electronic Leak Detection



Special Tool(s)

 ST2351-A	H10PM Refrigerant Leak Detector With Battery 216-00001 or equivalent



CAUTION: Good ventilation is necessary in the area where electronic A/C leak testing is to be carried out. If the surrounding air is contaminated with refrigerant gas, the leak detector will indicate this gas all the time. Odors from other chemicals such as antifreeze, diesel fuel, disc brake cleaner, or other cleaning solvents can cause the same problem. A fan, even in a well-ventilated area, is very helpful in removing small traces of contamination from the air that might affect the leak detector.

1. **NOTE:** The system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off.

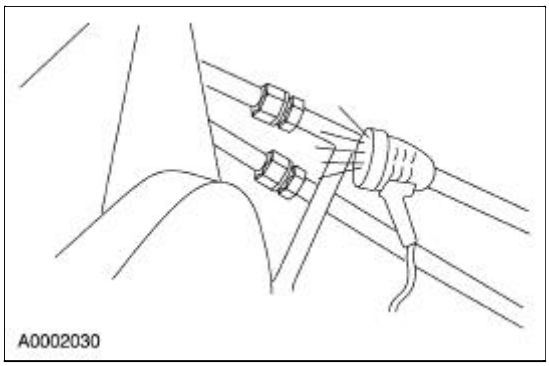
   Leak test the refrigerant system using the Refrigerant Leak Detector. Follow the instructions included with the leak detector for handling and operation techniques.

   
   A0002680

2. If a leak is found, discharge and recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.
   - Repair the system.
   - Test the system for normal operation.

A0002681

Fluorescent Dye Leak Detection



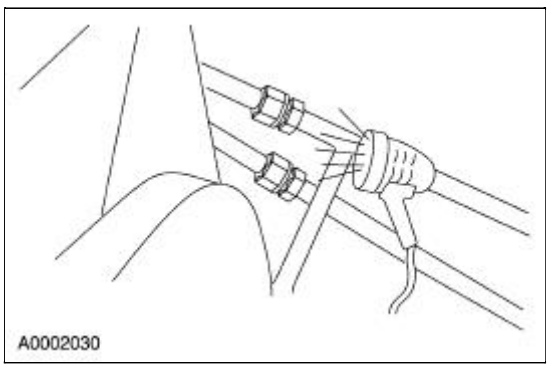
Special Tool(s)

 ST1834-A	R-134a Refrigerant Service Center 023-00153 or equivalent
 ST1261-A	120 Watt UV Spot Lamp 164-R0721 or equivalent
 ST1705-B	R-134a Fluorescent Dye Injector 164-R0775 or equivalent
 ST2651-A	High Intensity UV Lamp — 12 Volt 164-R6000
 ST2650-A	R-134a Leak Detection Dye 164-R6060
 ST1928-A	R-134a Manifold Gauge Set 176-R032A
 ST2649-A	Deluxe Injector Loop Kit 219-00069

Fluorescent Dye Detection

NOTE: Ford Motor Company vehicles are produced with R-134a fluorescent dye installed in the refrigerant system from the factory. The location of leaks can be pinpointed by the bright yellow-green glow of the fluorescent dye under a UV lamp. Since more than one leak can exist, make sure to inspect each component, line, and fitting in the refrigerant system for a leak.

1. Check for leaks using the special tool.
    - Inspect all components, lines, and fittings of the refrigerant system.



2. If a leak is found, recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

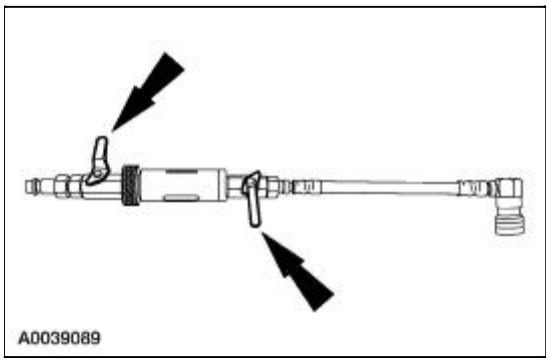
3. Repair the refrigerant system leak(s).

4. Evacuate and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

5. After the leak(s) is/are repaired, remove any traces of fluorescent dye with a general purpose oil solvent.

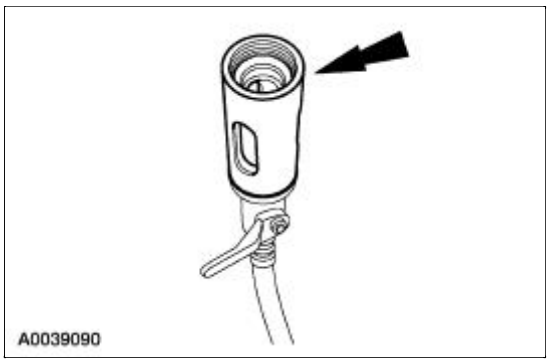
6. Verify the repair by running the vehicle for a short period of time and rechecking the area of the leak with the special tool.

Fluorescent Dye Injection — Using an A/C Refrigerant Center and Dye Injector



NOTE: Before using the R-134a fluorescent dye injector for the first time, refer to the manufacturers instructions on evacuation of any non-condensable gasses from the hoses.

NOTE: Only connect the R-134a fluorescent dye injector to a manifold and gauge set or R-134a service center when fluorescent dye is to be injected. The R-134a fluorescent dye injector has a one way check valve that will prevent refrigerant system recovery and evacuation.



NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off.

1. Install an R-134a A/C refrigerant service center or a manifold and gauge set. For additional information, refer to Manifold and Gauge Set Connection in this section.

2. Verify that the valves on the special tool are closed.

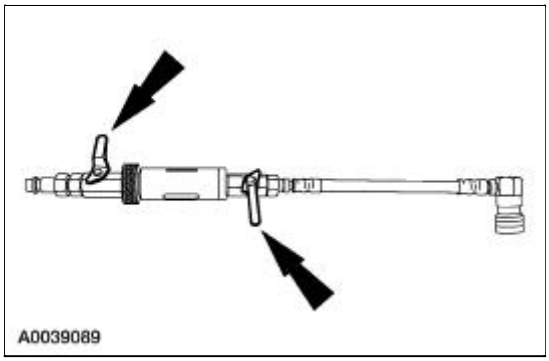
3. Fill the special tool reservoir with 7 ml (0.25 oz) of fluorescent dye.

4. Install the special tool between the low-pressure service gauge port valve and the R-134a refrigerant service center or manifold gauge set.

5. Open all valves and inject the fluorescent dye into the refrigerant system.

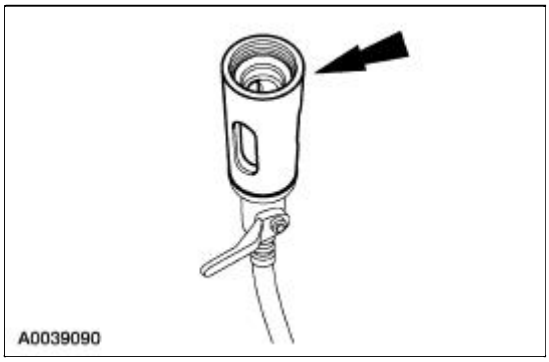
6. When fluorescent dye injection is complete, close all valves.

7. Recover the refrigerant from the R-134a fluorescent dye injector.



8. Remove the fluorescent dye injector from the low-pressure service gauge port valve and the R-134a A/C refrigerant service center or manifold gauge set.

Fluorescent Dye Injection — Using a Dye Injector Loop Kit

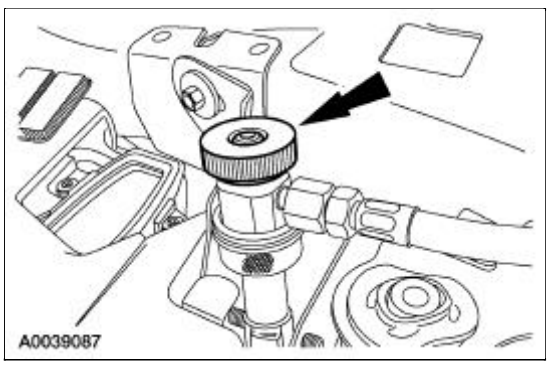


NOTE: Before using the R-134a fluorescent dye injector for the first time, refer to the equipment manufacturers instructions on evacuation of non-condensable gasses from the hoses.

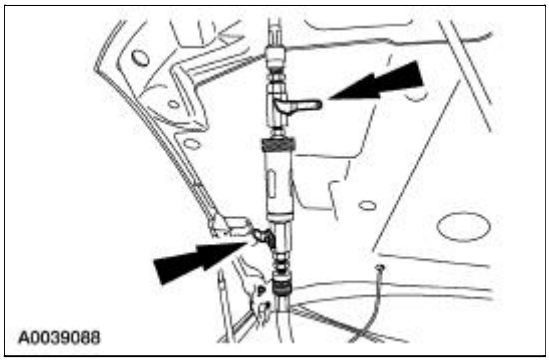
NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24°C.

1. Verify that the valves on the special tool are closed.

2. Fill the special tool reservoir with 7 ml (0.25 oz) of fluorescent dye.

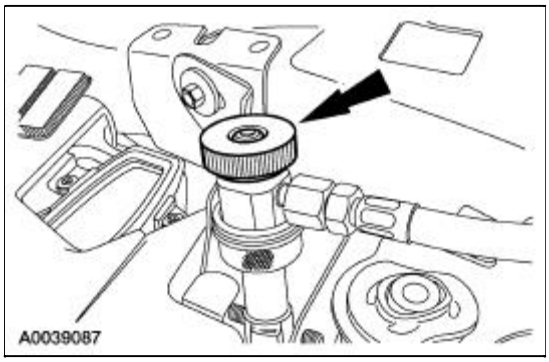


3. Install the special tool between the high-pressure and low-pressure service gauge port valves.



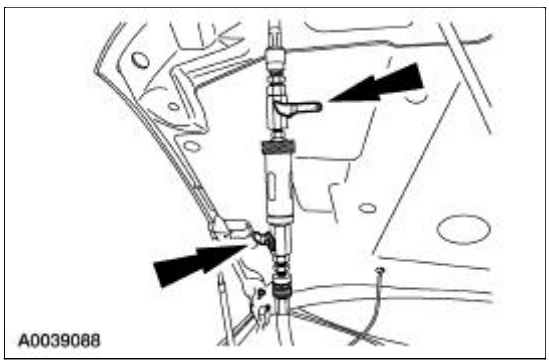
4. **CAUTION: Make sure all tools and hoses are clear of the engine cooling fan and drive belt before starting the engine.**

   Start the engine.



5. Open the high-pressure service valve.

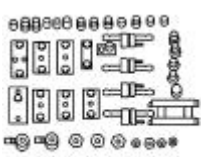
6. Open the special tool valves and inject the fluorescent dye into the refrigerant system.



7. Close the high-pressure service valve to allow the pressure inside the special tool to equalize with the suction side of the refrigerant system.

8. **NOTE:** Close the valves on the special tool while the A/C compressor is operating.

   Close the valves on the special tool.



9. **NOTE:** Leave all valves on the special tool closed when not in use.

   Disconnect the high-pressure and low-pressure service valves and remove the special tool from the vehicle.

Air Conditioning (A/C) System Flushing

Special Tool(s)

 ST2466-A	Flushworks Mobile A/C Flush and Purge Machine 219-00022 (part of 219-00023) or equivalent
 ST2469-A	A/C Flush and Purge Fitting Kit 219-00024 (part of 219-00023) or equivalent

WARNING: Use extreme care and observe all safety and service precautions related to the use of refrigerants.

WARNING: Due to refrigerant hazards, always wear safety goggles and non-penetrable gloves when working on or flushing A/C systems.

CAUTION: An A/C refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer's procedures and instructions.

CAUTION: Suction accumulator/drier, muffler, hoses, thermal expansion valve, and evaporator core orifice should be removed when flushing the A/C system. Internal plumbing of these devices makes it impossible to correctly remove any residual-flushing agent. Except for the hoses, these components are typically discarded after A/C system contamination. Hoses can normally be reused unless they are clogged with foreign material. The 3.785 liters (1 gallon) of A/C Systems Flushing Solvent F4AZ-19579-A and FL1-A filter used in A/C Flush and Purge Machine 219-00022 are intended for use on one vehicle only. They may be used to flush both the A/C condenser core and the A/C evaporator core on an individual vehicle, but under no circumstances should they be used on more than one vehicle.

NOTE: Prior to using the A/C Flush and Purge Machine 219-00022 for the first time, review the operating instructions.

NOTE: Only the A/C Flush and Purge Machine kit 219-00023, which includes A/C Flush and Purge Machine 219-00022, A/C Flush and Purge Fitting Kit 219-00024, and the Ford Part number F4AZ-19579-A A/C Systems Flushing Solvent, is approved for use on Ford vehicles. No other flushing device or solvent is approved for flushing heat exchangers (A/C condenser, A/C evaporator). Use of any other flusher or solvent may cause damage to the A/C system and the flushing unit.

NOTE: Ford Motor Company has approved a procedure to provide technicians with a non-CFC method of flushing contaminated A/C system heat exchangers. The procedure allows the specific components to be cleaned and flushed while installed in their normal in-vehicle location. The types of contamination flushed include particle matter that results from A/C compressor or desiccant failure within the suction accumulator/drier and gummy residue that can form when refrigerant oil is overheated during A/C compressor seizure. The flushing process is a two-step procedure that involves the use of an A/C Flush and Purge Machine 219-00022 to:

- Circulate the flushing solvent through the heat exchanger in the reverse direction of normal refrigerant flow (back-flushing). Particulate matter picked up during flushing is filtered from the returning solvent before the solvent is returned to the reservoir for continued circulation.
- Remove the flushing solvent from the heat exchanger. In this step of the procedure, pressurized air 621-862 kPa (90-125 psi) is used to push and evaporate any remaining flush solvent from the heat exchanger.

1. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Disconnect the refrigerant lines from the heat exchanger(s) to be flushed.

3. Connect the A/C flush and purge machine fitting kit and the A/C flush and purge machine to the heat exchanger to be flushed. Do not flush through the evaporator core orifice, mufflers or hoses. Internal plumbing and material make-up of these components make it impossible to correctly remove foreign material or residual flushing solvent.

4. **NOTE:** Use 3.785 liters (one gallon) of A/C Systems Flushing Solvent part number F4AZ-19579-A to flush the heat exchanger for a minimum of 15 minutes. The flush solvent may be used for one or both heat exchangers in the A/C system. However, the flush solvent is intended for one vehicle only. The filter used on the flushing unit is also intended for use on one vehicle only.

   Flush the heat exchanger for a minimum of 15 minutes.

5. Apply 621-862 kPa (90-125 psi) pressurized air to the component for a minimum of 30 minutes. The 30-minute purge time is required to force and evaporate all residual solvent from the A/C system component. Failure to successfully remove all residual solvent within the component can result in system damage when reconnected and operated. Dispose of the used flush solvent and filter in accordance with local, state and federal regulations.

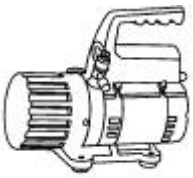
6. **NOTE:** A/C system filtering as described in this section is optional if system flushing is carried out. However, the filter kit use is recommended after flushing if the A/C system contamination is extensive.

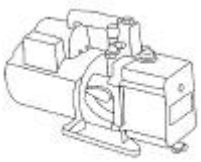
   Install a new A/C evaporator core orifice in any vehicle being serviced for an internal A/C compressor or desiccant failure.

7. Install new refrigerant hoses if clogged with foreign material.

8. Install a new suction accumulator in any vehicle being serviced for an internal A/C compressor or desiccant failure.

9. Reconnect the heat exchanger being serviced.





10. If a new A/C compressor is not to be installed, lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

11. If a new A/C compressor is not to be installed, evacuate, leak test and charge the A/C system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and

Charging in this section.

Air Conditioning (A/C) System Recovery, Evacuation and Charging

Special Tool(s)

 ST1226-A	R-134a A/C Refrigerant Center 176-00002 or equivalent
 ST1834-A	R-134a A/C Refrigerant Center 023-00153 or equivalent
 ST1928-A	R-134a Manifold Gauge Set 176-R032A or equivalent
 ST1685-A	1.2 CFM Vacuum Pump 023-00162 or equivalent
 ST1686-A	4.0 CFM Vacuum Pump 023-00163 or equivalent

Refrigerant System Recovery

NOTE: Ford Motor Company recommends use of an A/C service center to carry out recovery, evacuation, and charging of the refrigerant system. If an A/C service center is not available, refrigerant system recovery, evacuation, and charging may be accomplished using a separate recovery station, vacuum pump, charging cylinder, and manifold gauge set.

1. Prior to recovering the refrigerant system, you must verify the purity of the refrigerant. For additional information, refer to Refrigerant Identification Testing in this section.

2. **NOTE:** Some R-134a service centers require the use of an A/C manifold gauge set. For additional information, refer to Manifold Gauge Set Connection in this section.

Connect an R-134a A/C service center to the low- and high-pressure service gauge port valves.

3. Recover the refrigerant from the system following the operating instructions provided by the equipment manufacturer.

4. Once the service center has recovered the vehicle A/C system refrigerant, close the service center inlet valve (if equipped). Then switch off the power supply.

5. Allow the vehicle A/C system to remain closed for about two minutes. Observe the system vacuum level as shown on the gauge. If the vacuum does not decrease, disconnect the refrigerant center hose(s).

6. If the system vacuum does decrease, repeat Steps 2 through 5 until the vacuum level remains stable for two minutes.

7. Carry out the required repairs.

Refrigerant System Evacuation

NOTE: Ford Motor Company recommends use of an A/C service center to carry out recovery, evacuation, and charging of the refrigerant system. If an A/C service center is not available, refrigerant system recovery, evacuation, and charging may be accomplished using a separate recovery station, vacuum pump, charging cylinder, and manifold gauge set.

1. Connect an R-134a service center to the low- and high-pressure service gauge port valves.

2. Evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the vacuum pump for a minimum of 45 minutes.

3. Turn off the vacuum pump. Observe the low-pressure gauge for five minutes to make sure that the system vacuum is held. If vacuum is not held for five minutes, leak test the system, service the leak, and evacuate the system again.

Refrigerant System Charging

NOTE: Ford Motor Company recommends use of an A/C service center to carry out recovery, evacuation, and charging of the refrigerant system. If an A/C service center is not available, refrigerant system recovery, evacuation, and charging may be accomplished using a separate recovery station, vacuum pump, charging cylinder, and manifold gauge set.

1. Correctly oil match the system to verify that the correct amount of refrigerant oil is present in the system. For additional information, refer to Refrigerant Oil Adding in this section.

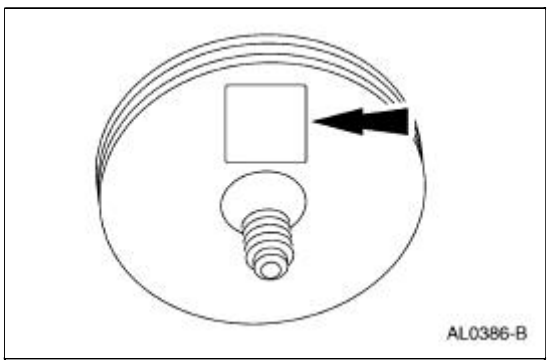
2. Charge the system with the specified amounts of refrigerant oil and refrigerant.

3. When no more refrigerant is being drawn into the system, start the engine and select MAX A/C operation. Adjust the blower motor speed to the maximum and allow the remaining refrigerant to be drawn into the system. Continue to add refrigerant into the system until the specified weight of R-134a has been added. Close the charging cylinder valve and allow the system to pull any remaining refrigerant from the hose. When the low-pressure drops to approximately 207 kPa (30 psi), close the charging hose valve.

Refrigerant System Filtering Following Air Conditioning (A/C) Component Installation

Special Tool(s)

 ST1252-A	A/C Fittings Set 412-DS028 (014-00333, D93L-19703-B) or equivalent

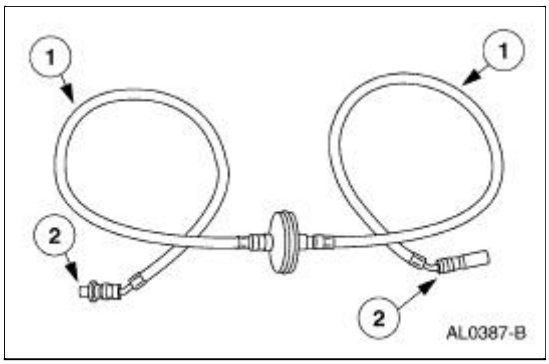


WARNING: Use extreme care and observe all safety and service precautions related to the use of refrigerants.

WARNING: Due to refrigerant hazards, always wear safety goggles and non-penetrable gloves when working on A/C systems.

CAUTION: An A/C refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer's procedures and instructions.

CAUTION: On vehicles being serviced for an internal compressor or desiccant failure, a new suction accumulator/drier, muffler, thermal expansion valve, and evaporator core orifice must be installed prior to filtering the A/C system. Internal plumbing of these devices makes it impossible to correctly remove any residual agent. These components are typically discarded after A/C system contamination. Hoses can normally be reused unless they are clogged with foreign material. The filter is intended for use on one vehicle only.



1. Orient the filter inlet toward the A/C condenser core.

2. **NOTE:** The pancake filter is not permanently installed and will be removed at the end of this procedure.

Temporarily install the pancake filter between the A/C condenser core and the condenser to evaporator tube.

1. Use flexible refrigerant hose of 17,238 kPa (2,500 psi) burst rating.
2. Make the connections using the A/C Test Fitting Set.

3. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

4. Evacuate and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

5. Check all refrigerant system hoses, lines and the position of the newly installed filters to be sure they do not interfere with other engine compartment components. If necessary, use tie-straps to make adjustments.

6. Provide adequate airflow to the front of the vehicle (with a fan, if necessary). Select A/C operation and set the blower motor speed to maximum. Start the engine and let it idle briefly. Make sure the A/C system is operating correctly.

7. Gradually bring the engine up to 1,200 rpm by running it at lower rpms for short periods (first at 800 rpm, then at 1,000 rpm). Set the engine at 1,200 rpm and run it for one hour with the A/C system operating.

8. Stop the engine.

9. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

10. Remove the fittings, flexible hoses and pancake filter from between the condenser and the condenser to evaporator tube.

11. Discard the pancake filter. It can be used one time only.

12. Reconnect the condenser to evaporator tube to the A/C condenser core.

13. Evacuate, charge and leak-test the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Refrigerant Oil Adding

CAUTION: During normal A/C operation, oil is circulated through the system with the refrigerant, and a small amount is retained in each component. If certain components of the system are removed for new installation, some of the refrigerant oil will go with the component. To maintain the original total oil charge, it is necessary to compensate for the oil lost by adding oil to the system with the new part.

1. **NOTE:** Service A/C compressors are shipped without compressor oil.

   Rotate the A/C compressor shaft six to eight revolutions while collecting oil in a clean measuring device.

   - If the amount of oil drained from the old A/C compressor is between 85-142 ml (3-5 ounces), pour the same amount plus 30 ml (1 ounce) of clean PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C) WSH M1C231-B or equivalent into the new A/C compressor.
   - If the amount of oil that was removed from the old A/C compressor is greater than 142 ml (5 ounces), pour the same amount drained of clean PAG Refrigerant Compressor Oil (R-134a Systems) or equivalent into the new A/C compressor.
   - If the amount of oil that was removed from the old A/C compressor is less than 85 ml (3 ounces), pour 85 ml (3 ounces) of clean PAG Refrigerant Compressor Oil (R-134a Systems) or equivalent into the new A/C compressor.

2. For the suction accumulator/drier, drill one 13 mm (0.52 in) hole in the suction accumulator/drier cylinder and drain the oil into a calibrated container.
   - Add a quantity of new oil to match that drained from the old suction accumulator/drier plus 60 ml (2 ounces) of clean PAG Refrigerant Compressor Oil (R-134a Systems) or equivalent.

3. For the A/C evaporator core, add 89 ml (3 ounces) of clean PAG Refrigerant Compressor Oil (R-134a Systems) or equivalent to the suction accumulator/drier inlet tube.

4. For the A/C condenser core, add 30 ml (1 ounce) of clean PAG Refrigerant Compressor Oil (R-134a Systems) or equivalent to the A/C condenser core or the suction accumulator/drier inlet tube.

5. Add 60 ml (2 ounces) of clean PAG Refrigerant Compressor Oil (R-134a Systems) or equivalent to the suction accumulator/drier inlet tube when carrying out each of the following repairs:
   - installation of a new A/C evaporator core orifice
   - installation of a new A/C compressor pressure relief valve (19D644)
   - installation of a new refrigerant line
   - repair of an O-ring seal leak
   - repair of a charge port leak

6. Installation of new components that do not require discharge of refrigerant and resulting oil loss, such as the A/C cycling switch and the A/C pressure switch, do not require additional oil.

Refrigerant Identification Testing

Special Tool(s)

 ST1457-A	Refrigerant Identifier with Air-Radicator 198-00003 or equivalent

1. **NOTE:** An A/C refrigerant analyzer must be used to identify gas samples taken directly from the refrigeration system or storage containers prior to recovering or charging the refrigerant system.

   Follow the instructions included with the Deluxe Refrigerant Diagnostic Tool to obtain the sample for testing.

2. The diagnostic tool will display one of the following:
   - If the purity level of R-134a or R-12 is 98% or greater by weight, the green "PASS" light emitting diode (LED) will light. The weight concentrations of R-134a, R-12, R-22, hydrocarbons, and air will be displayed on the digital display.
   - If refrigerants R-134a or R-12 do not meet the 98% purity levels, the red "FAIL" LED will light and a horn will sound alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22, and hydrocarbons will be displayed on the digital display.
   - If hydrocarbon concentrations are 2% or greater by weight, the red "FAIL" LED will light, "Hydrocarbon High" will be displayed on the digital display, and a horn will sound alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22, and hydrocarbons will also be displayed on the digital display.

3. The percentage of air contained in the sample will be displayed if the R-134a or R-12 content is 98% or greater. The diagnostic tool eliminates the effect of air when determining the refrigerant sample content because air is not considered a contaminant, although air can affect A/C system performance. When the diagnostic tool has determined that a refrigerant source is pure (R-134a or R-12 is 98% or greater by weight) and air concentration levels are 2% or greater by weight, the diagnostic tool will prompt the user if an air purge is desired.

4. If contaminated refrigerant is detected, repeat the refrigerant identification test to verify that the refrigerant is indeed contaminated.

5. **CAUTION: If contaminated refrigerant is detected, DO NOT recover the refrigerant into R-134a or R-12 recovery/recycling equipment.**

   Recover any contaminated refrigerant using suitable recovery-only equipment designed for capturing and storing contaminated refrigerant. For additional information, refer to Contaminated Refrigerant Handling in this section.

Contaminated Refrigerant Handling

1. **CAUTION: If contaminated refrigerant is detected, DO NOT recover the refrigerant into your recovery/recycling equipment.**

   Recover the contaminated refrigerant using suitable recovery-only equipment designed for capturing and storing contaminated refrigerant.

   - This equipment must only be used to recover contaminated refrigerant to prevent the spread to other vehicles.
   - If this equipment is not available, contact an A/C service facility in your area with the correct equipment to carry out this service.

2. Determine and correct the cause of the customer's initial concern.

3. **NOTE:** Residual refrigerant oil in the suction accumulator/drier must be drained and measured for correct oil system matching. For additional information, refer to Refrigerant Oil Adding in this section.

   The suction accumulator/drier cannot be cleaned. A new suction accumulator/drier must be installed.
   Remove the suction accumulator/drier.

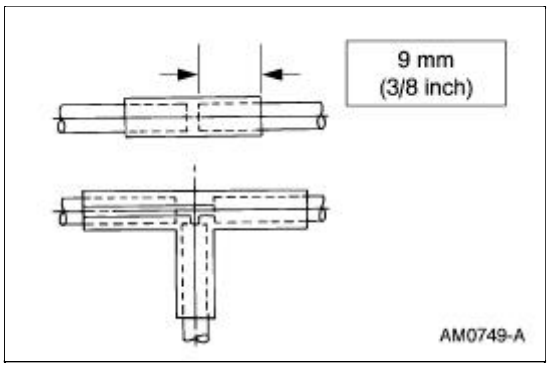
4. Clean the A/C evaporator core and the A/C condenser core by flushing. For additional information, refer to Air Conditioning (A/C) System Flushing in this section.

5. Install the new suction accumulator/drier.

6. Correctly oil match the system. For additional information, refer to Refrigerant Oil Adding in this section.

7. Evacuate and charge the system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

8. Dispose of contaminated refrigerant according to all federal, state and local regulations.



Vacuum Hose Repair —Mini-Tube

Special Tool(s)

 ST1176-A	Vacuum Pump Kit 416-D002 (D95L-7559-A) or equivalent

1. Measure the length of the damaged area of the mini-tube vacuum hose.
2. Cut a piece of standard 1/8 inch inner diameter vacuum hose approximately 25 mm (1 inch longer than the damaged area of the mini-tube vacuum hose).
3. Cut off the mini-tube vacuum hose on each side of the damaged area.
4. **WARNING: Read the warning information on the product label to prevent possible personal injury.**

   Dip the mini-tube hose ends in commercially available paint thinner containing methyl ethyl ketone (MEK). This solvent will seal the mini-tube in the vacuum hose.
5. Insert the ends of the mini-tube vacuum hose approximately 9 mm (3/8 inch) into the ends of the standard 1/8 inch repair vacuum hose section.

6. Shake the repair joint after assembly to make sure the solvent is dispersed and the vacuum line is not plugged.
7. Test the system for a vacuum leak in the repair area.
   - Use the Vacuum Pump or equivalent.

Air Distribution

NOTE: The air distribution system of this vehicle cannot be equipped with a cabin air filter.

There are two sources of air available to the air distribution system:

- outside air
- recirculated air

Recirculated air is only used when the climate control assembly is set to the MAX A/C and OFF modes on vehicles equipped with manual climate control. Vehicles equipped with EATC or DATC use recirculated air only when in the AUTOMATIC mode (if functioning to obtain selected temperatures), or when the RECIRC function is selected.

Air distribution within the vehicle is determined by the function selector switch position (manual A/C), or the EATC/DATC system in the AUTOMATIC mode. The air distribution mode on vehicles equipped with EATC or DATC can be overridden by the driver if desired. Airflow mode control doors are used to direct airflow within the heater air plenum chamber. Vacuum control motors are used to position these airflow mode control doors.

Vehicles equipped with DATC use a partitioned plenum chamber with two separate temperature blend doors. This allows for individual temperature settings to be selected for the RH and LH air outlets. The airflow mode doors are not partitioned for separate RH and LH airflow positions, therefore the airflow mode will always remain similar for the RH and LH sides of the vehicle regardless of the temperatures selected.

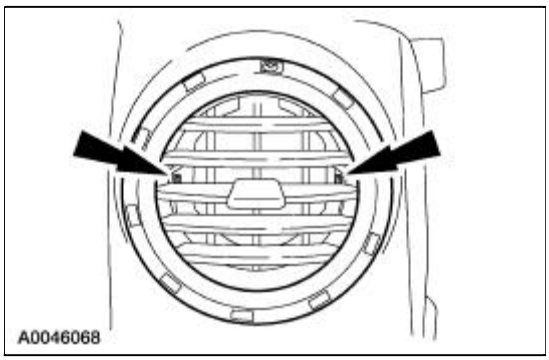
The air distribution system is designed to provide airflow from the defrost nozzle when no vacuum is applied to any of the vacuum control motors. This is done to prevent a situation where defrost cannot be obtained due to a system vacuum leak.

Air enters the passenger compartment from the:

- instrument panel A/C registers.
- heater outlet floor duct.
- windshield defroster hose nozzle.
- side window demisters.
- rear seat airflow duct (if equipped).

Passenger compartment air is exhausted from the vehicle through open windows or body air vents.

Air Distribution



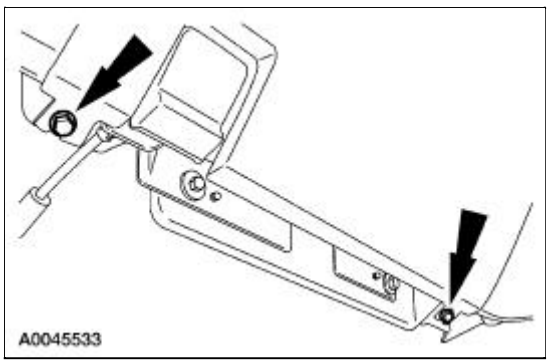
Refer to Section 412-00 .

Instrument Panel Registers —Expedition

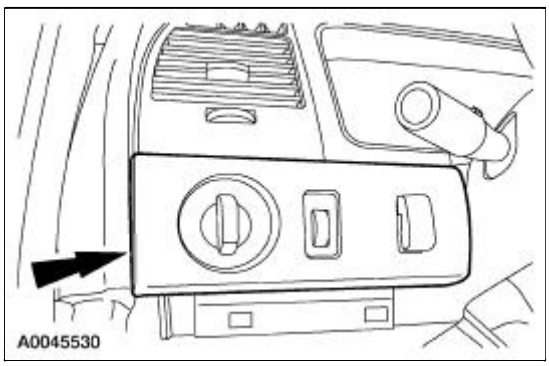
Removal and Installation

1. **NOTE:** Do not separate the outer ring from the register assembly.

   Depress the tabs and remove the instrument panel register.

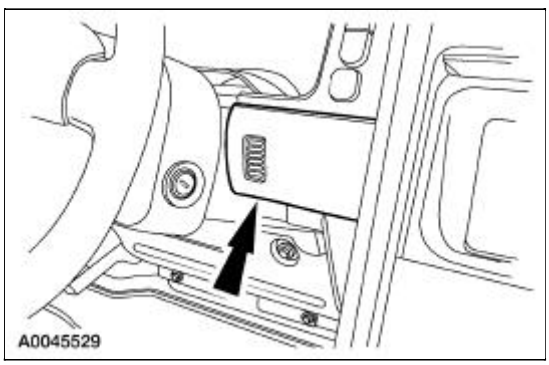


2. To install, reverse the removal procedure.



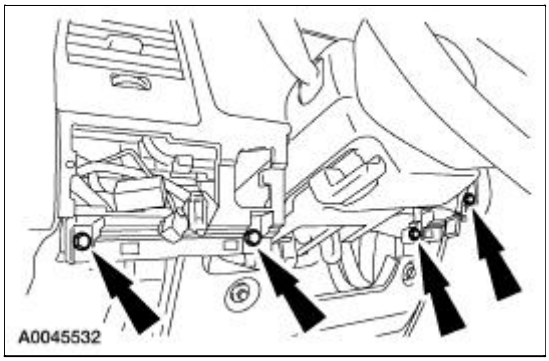
Driver Side Register —Navigator

Removal and Installation

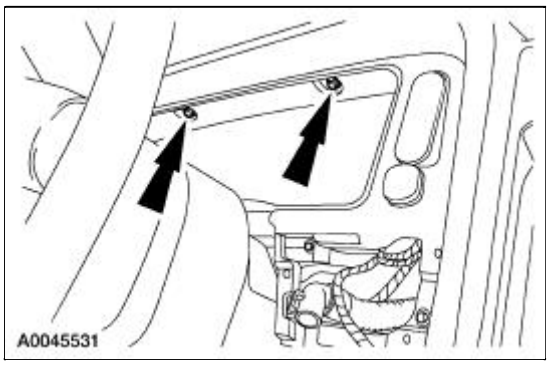


1. Remove the screws and remove the lower steering column cover.

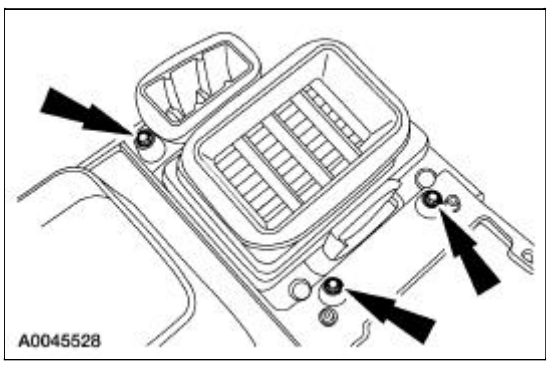
2. Remove the headlamp switch trim panel.
   - Disconnect the electrical connectors.



3. Remove the in-vehicle temperature sensor trim panel.
   - Disconnect the aspirator hose and in-vehicle temperature sensor electrical connector.



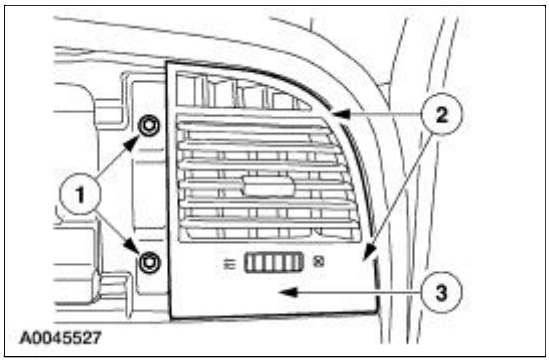
4. Lower the steering wheel to the lowest position.



5. Remove the instrument cluster finish panel lower screws.

6. Remove the screws and remove the instrument panel finish panel.
    - Disconnect the electrical connectors.

7. Remove the screws and remove the driver side register.



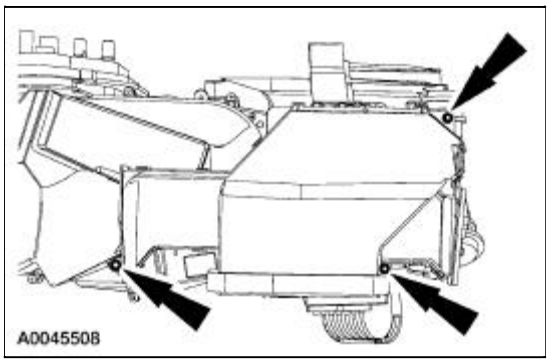
8. To install, reverse the removal procedure.

Passenger Side Register —Navigator

Removal and Installation

1. Remove the passenger airbag module. For additional information, refer to Section 501-20B .

2. Remove the passenger side register.
    1. Remove the screws.
    2. Disengage the clips.
    3. Remove the passenger side register.



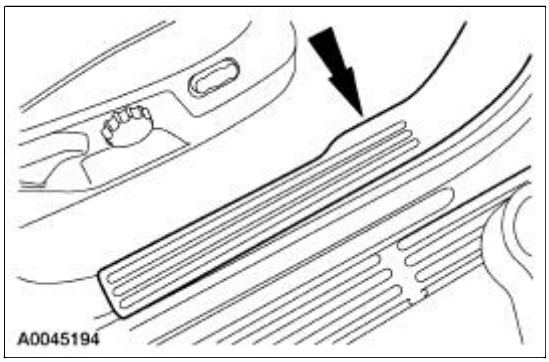
3. To install, reverse the removal procedure.

Floor Duct

Removal and Installation

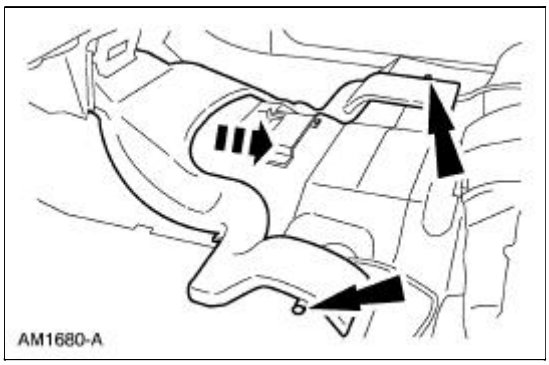
1. Remove the plenum chamber. For additional information, refer to Plenum Chamber in this section.

2. Remove the screws and remove the floor duct.



3. To install, reverse the removal procedure.

Rear Footwell Duct



Removal and Installation

1. Remove the front seats. For additional information, refer to Section 501-10 .
2. Remove the center floor console. For additional information, refer to Section 501-12 .
3. **NOTE:** RH cowl trim and sill plate shown, LH similar.

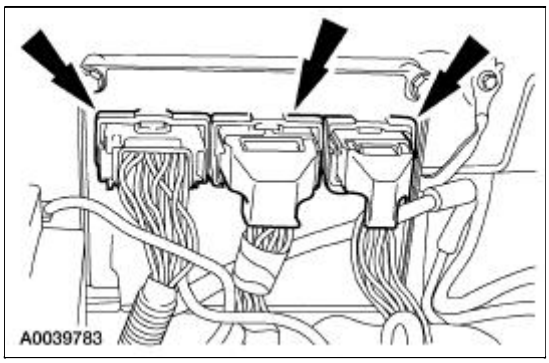
   Remove the RH and LH cowl trim panel and sill plates.

4. Fold back the carpet to completely uncover the rear footwell duct.
5. Remove the pin-type retainers and remove the duct.

6. To install, reverse the removal procedure.

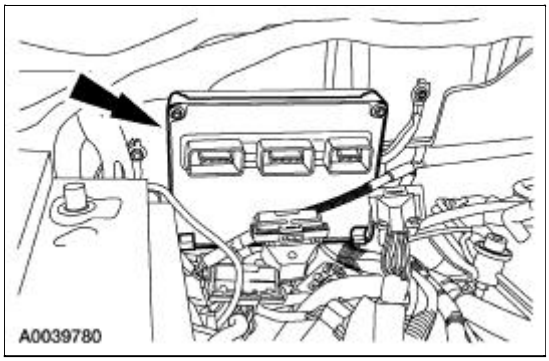
Plenum Chamber

Material



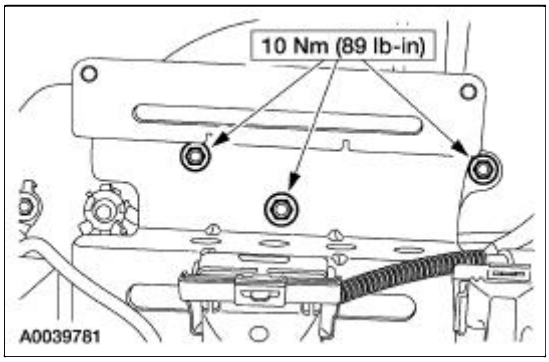
Item	Specification
MERPOL®	ESE-M99B144-B
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B

Removal and Installation

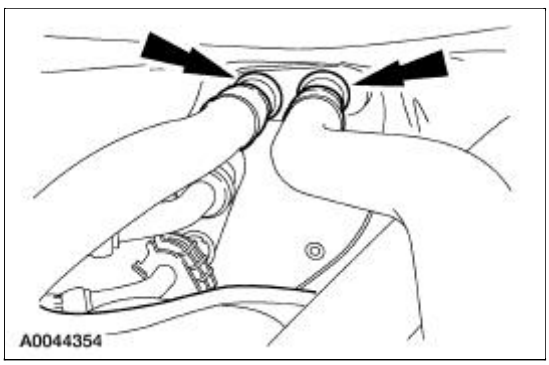


NOTE: If an evaporator core leak is suspected, the evaporator must be vacuum leak tested before it is removed from the vehicle. For additional information, refer to Section 412-00 .

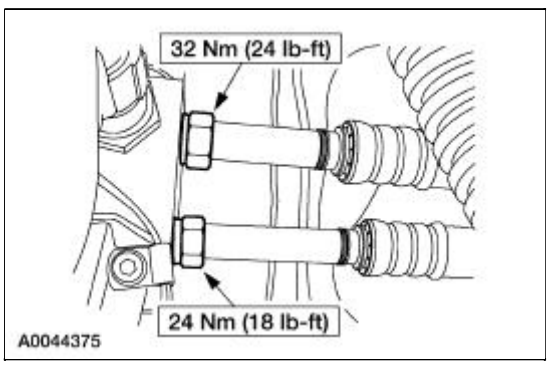
NOTE: Installation of a new receiver/drier is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier.



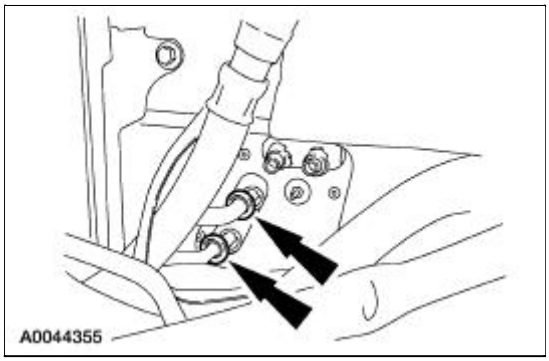
1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. Remove the instrument panel. For additional information, refer to Section 501-12 .
3. Remove the rear footwell duct. For additional information, refer to Rear Footwell Duct in this section.
4. Disconnect the powertrain control module (PCM) electrical connectors.



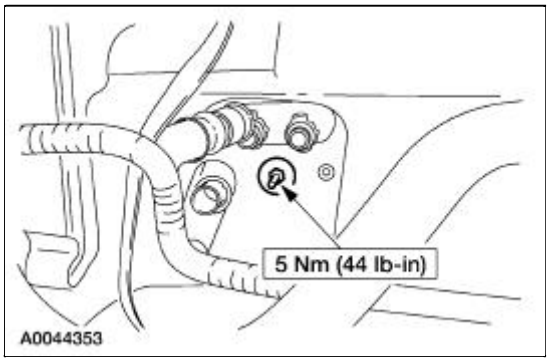
5. Remove the bolts and remove the PCM.



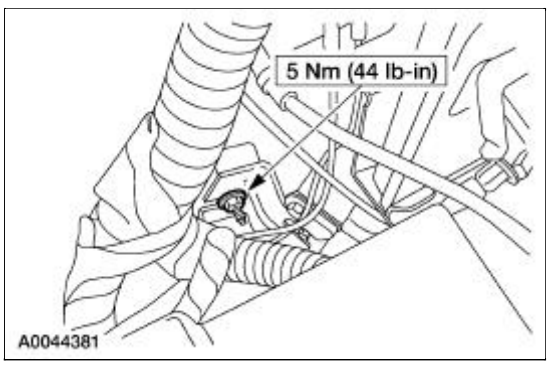
6. Remove the bolts and remove the PCM bracket.



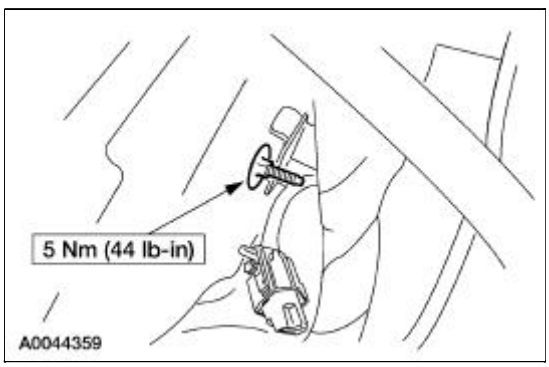
7. Clamp off the heater hoses and disconnect the quick-disconnect fittings at the heater core.



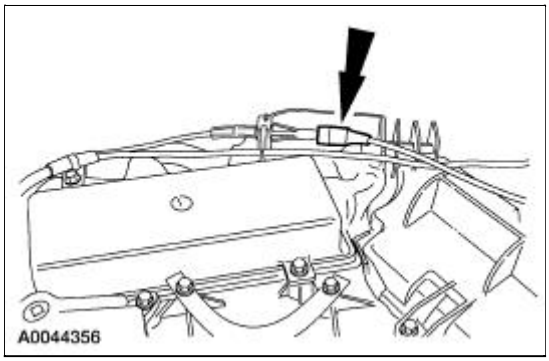
8. Disconnect the fittings at the thermostatic expansion valve.
    - Discard the O-ring seals.



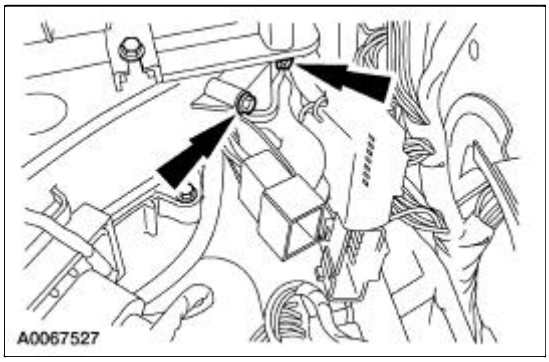
9. Disconnect the A/C fittings at the evaporator core.
    - Discard the O-ring seals.



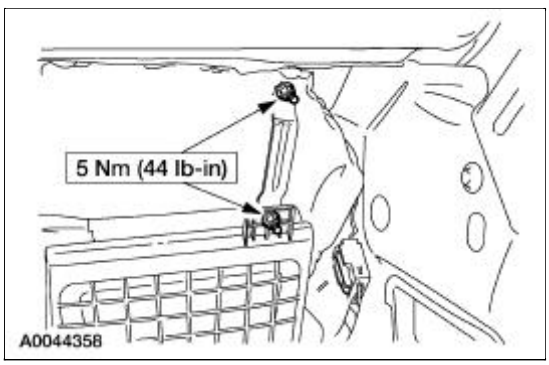
10. Remove the nut.



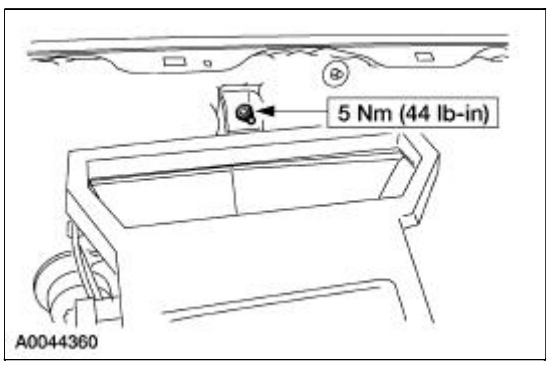
11. Remove the nut.



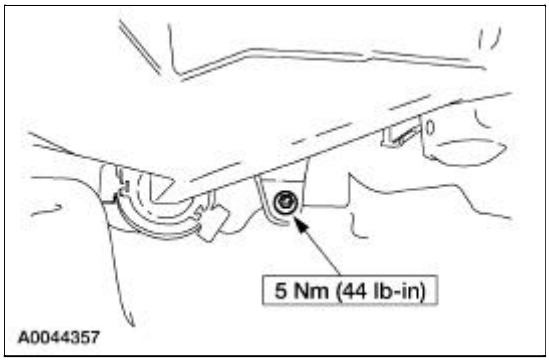
12. Remove the nut.



13. Disconnect the two vacuum lines at the top of the plenum chamber.



14. Remove the screws and position the wire harness aside.

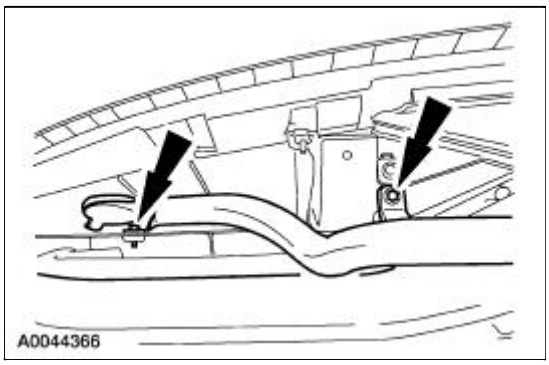


15. Remove the nuts.

16. Remove the nut.

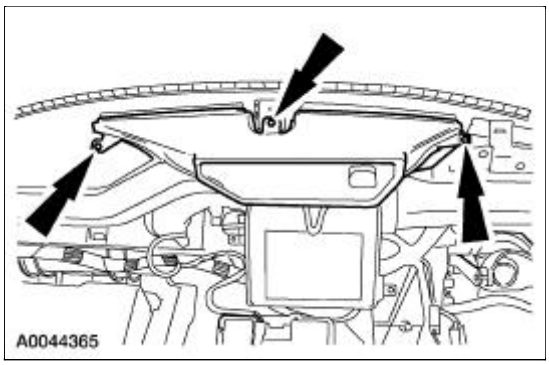
17. Remove the nut and remove the plenum chamber.

18. To install, reverse the removal procedure.
    - Install new O-ring seals lubricated in clean PAG oil.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .
    - Clean and lubricate the coolant hoses with coolant hose lubricant or plain water only if needed.



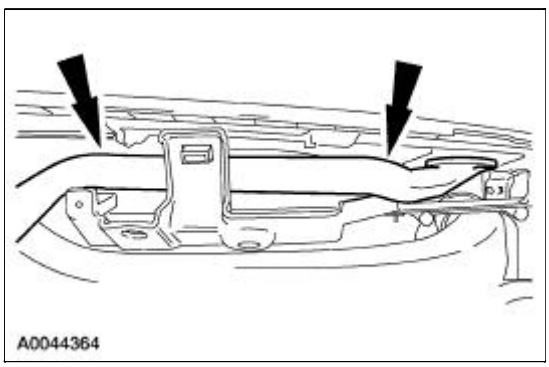
19. Refill the engine coolant level. For additional information, refer to Section 303-03 .

20. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

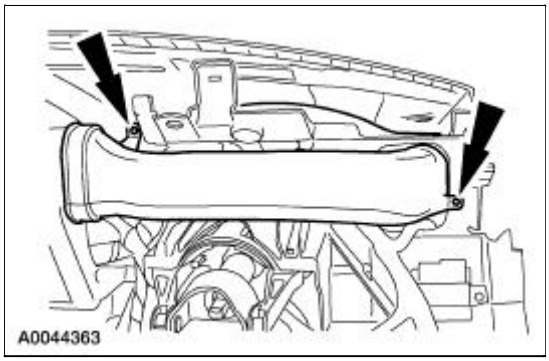


Instrument Panel Air Distribution Ducts —Expedition

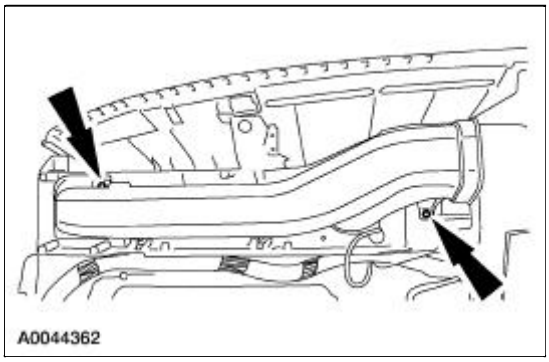
Disassembly and Assembly



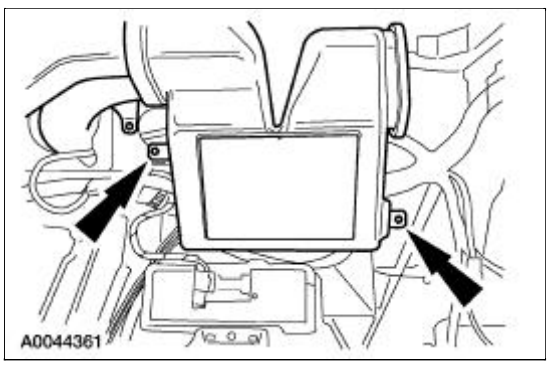
1. Remove the instrument panel. For additional information, refer to Section 501-12 .
2. Remove the screws and remove the RH demister.



3. Remove the screws and remove the defroster duct.



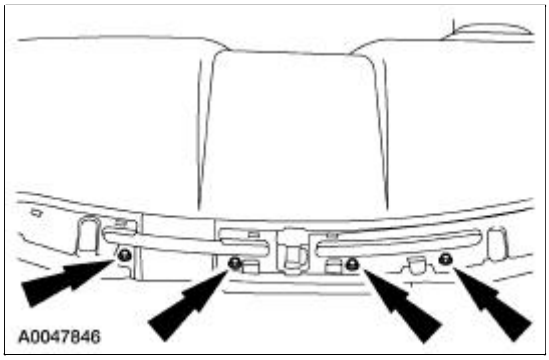
4. Remove the screws and remove the LH demister.



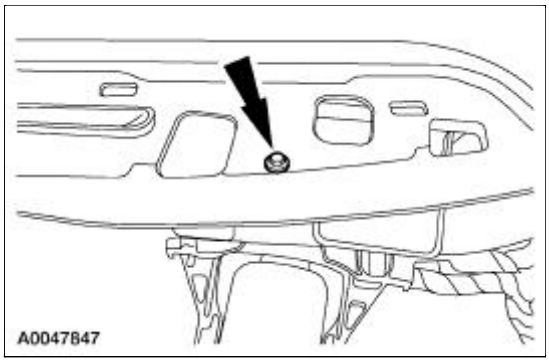
5. Remove the screws and remove the LH panel duct.

6. Remove the RH panel duct screws.

7. Remove the center panel duct screws and remove the center and RH panel ducts.

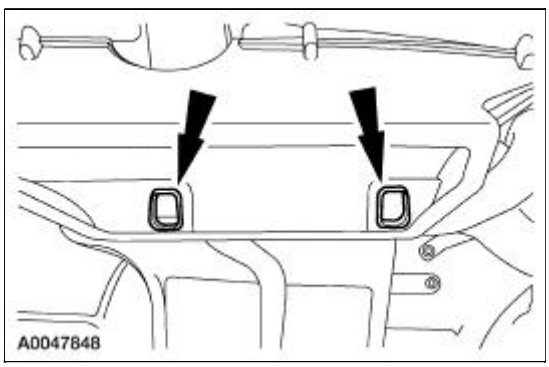


8. To assemble, reverse the disassembly procedure.

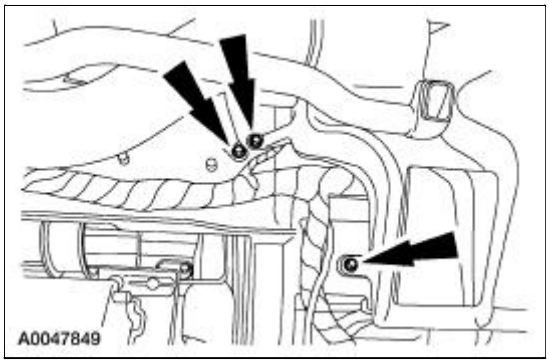


Instrument Panel Air Distribution Ducts —Navigator

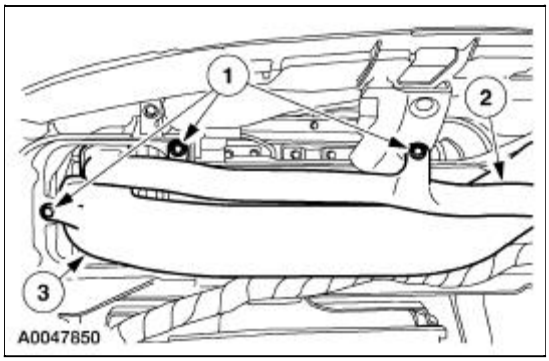
Disassembly and Assembly



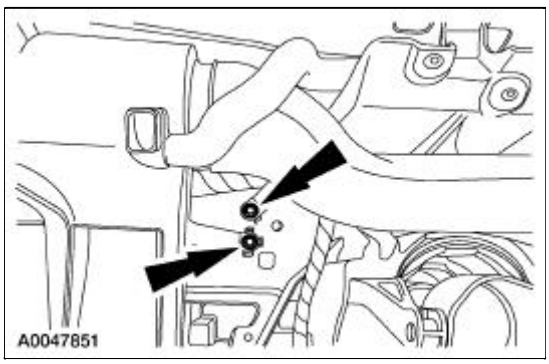
1. Remove the instrument cluster. For additional information, refer to Section 413-01 .
2. Remove the instrument panel. For additional information, refer to Section 501-12 .
3. Remove the defroster duct screws.



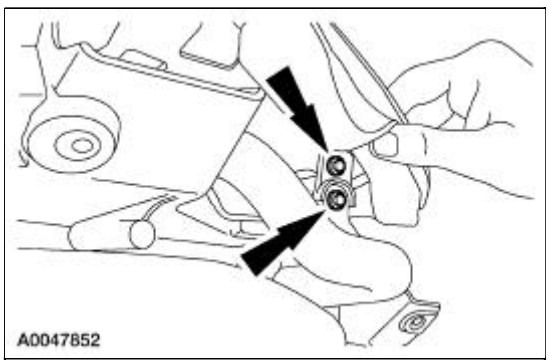
4. Remove the instrument panel upper pad screw.



5. Detach the demisters and remove the defroster duct.

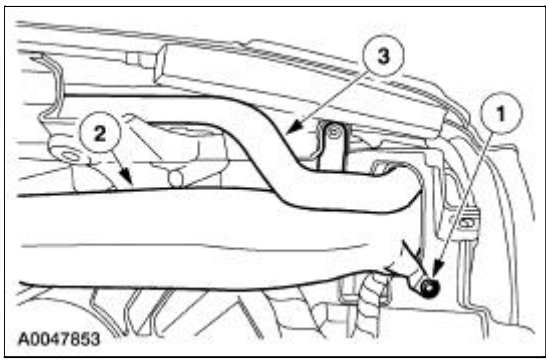


6. Remove the screws.



7. Remove the RH ducts.
    1. Remove the screws.
    2. Remove the RH demister.
    3. Remove the RH instrument panel duct.

8. Remove the screws and the center instrument panel duct.



9. Remove the screws.

10. Remove the LH ducts.
    1. Remove the screw.

2. Rotate upwards, and remove the LH instrument panel duct.
3. Remove the LH demister.

11. To assemble, reverse the disassembly procedure.

Heating and Ventilation

The heating and ventilation system has the following features:

- Controls the temperature and, during A/C operation, reduces the relative humidity of the air inside the vehicle.
- Delivers heated or cooled air to maintain the vehicle interior temperature and comfort level.
- Controls the A/C blower motor speed.
- Cooling or heating can be adjusted to maintain the desired temperature.
- Uses a reheat method to provide conditioned air to the passenger compartment.
- The blower motor draws outside air through the air inlet duct, except for MAX A/C (manual climate control), or when the RECIRC mode (EATC/DATC) has been selected.
- All airflow from the blower motor passes through the A/C evaporator core.
- Temperature blending is controlled by the temperature blend door(s), which regulate(s) the amount of air that flows through and around the heater core, where it is then mixed and distributed.

Heater Core

The heater core consists of fins and tubes arranged to extract heat from the engine coolant and transfer the heat to air passing through the plenum.

Blower Motor

The blower motor pulls air from the air inlet and forces it into the plenum chamber where it is mixed and distributed.

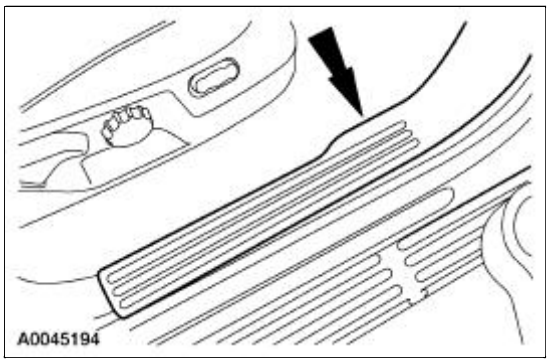
Plenum Chamber

The plenum chamber directs airflow from the blower motor through the evaporator core and heater core. All airflow from the blower motor passes through the evaporator core. Airflow is then directed through or around the heater core by the temperature blend door(s). Vehicles equipped with DATC use a partitioned plenum chamber with two electric actuator-positioned temperature blend doors. This allows for separate temperatures to be selected for the driver and passenger sides of the passenger compartment. Manual systems and EATC systems use a single electric actuator-positioned temperature blend door to direct airflow through or around the heater core.

Heating and Ventilation

Refer to Section 412-00 .

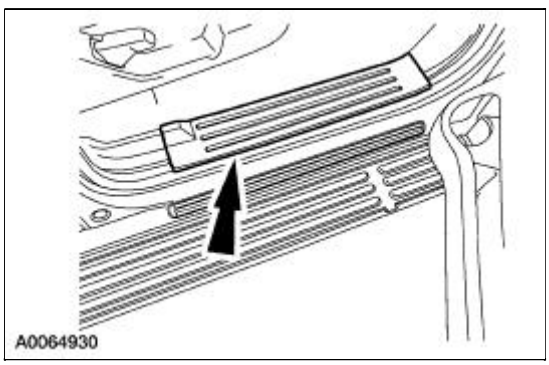
Blower Motor



Removal and Installation

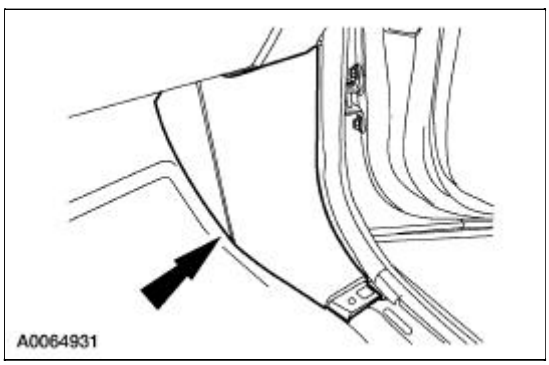
All vehicles

1. Remove the RH lower instrument panel insulator.



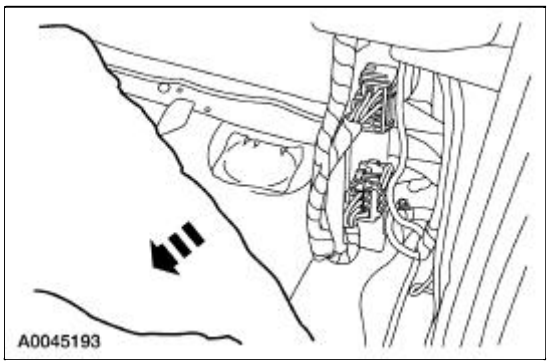
Navigator only

2. Remove the RH scuff plate.

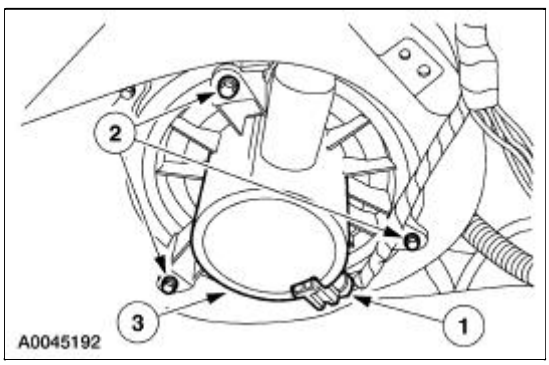


Expedition only

3. Remove the RH scuff plate.



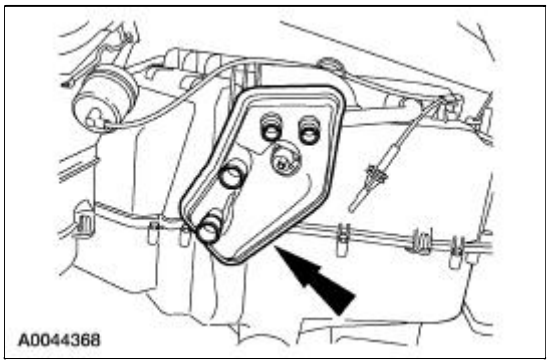
4. Remove the RH lower A-pillar trim panel.



All vehicles

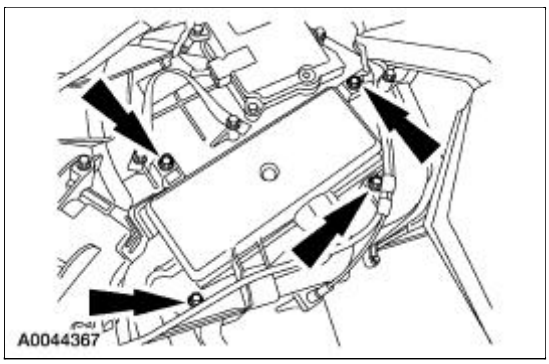
5. Position the carpet aside.

6. Remove the blower motor.
    1. Disconnect the electrical connector and position the wire harness aside.
    2. Remove the screws.
    3. Remove the blower motor.



7. To install, reverse the removal procedure.

Heater Core



Removal and Installation

NOTE: If a heater core leak is suspected, the heater core must be leak tested before it is removed from the vehicle. For additional information, refer to Section 412-00 .

1. Remove the plenum chamber. For additional information, refer to Section 412-01 .
2. Remove the dash panel seal.

3. Remove the screws and the heater core cover.

4. Remove the heater core.
5. To install, reverse the removal procedure.

Air Conditioning

The air conditioning system components are:

- A/C compressor (19703).
- A/C condenser core (19712).
- A/C evaporator core.
- receiver/drier (19959).
- connecting refrigerant lines.
- thermostatic expansion valve (19849).
- A/C thermostatic switch.
- A/C high pressure cutoff switch (19D594).
- A/C compressor pressure relief valve (19D644).
- low charge protection switch

The refrigerant system incorporates an A/C compressor controlled by the powertrain control module (PCM) through an A/C clutch relay.

The A/C compressor clutch will only be engaged by the PCM if all of the following conditions are met:

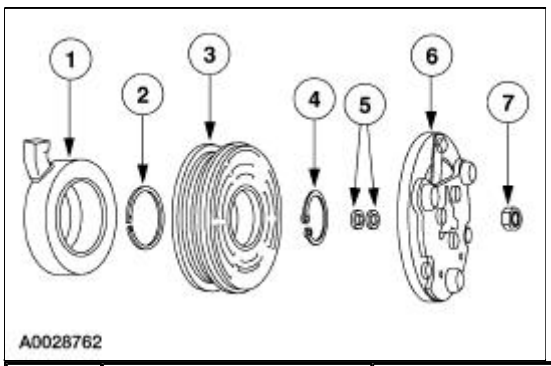
- The climate control assembly is set to a mode which provides an A/C request to the PCM.
- The A/C thermostatic switch is reading a temperature above 37°F.
- The high pressure cutoff switch is not open due to excessive pressure in the high side of the refrigerant system.
- The low charge protection switch is not open due to insufficient low side refrigerant system pressure.
- The A/C compressor relay is switched to the closed position by the PCM.
- The engine coolant temperature is not excessively high.
- The PCM has not detected a wide open throttle (WOT) condition.

For additional information concerning operating specifications, refer to Section 412-00 .

An A/C compressor pressure relief valve is installed in the compressor manifold and tube assembly (19D734) to protect the refrigerant system against excessively high refrigerant pressures.

Refrigerant flow into the evaporator core is metered by a thermostatic expansion valve.

For additional information concerning the refrigerant cycle and principles of A/C operation, refer to Section 412-00 .



A/C Compressor and Clutch Assembly

NOTE: Internal A/C compressor components are not serviced separately. The SC115 A/C compressor is serviced only as an assembly. The clutch plate, clutch pulley and bearing (19D784), and clutch field coil (19D798) are serviceable.

NOTE: Installation of a new receiver/drier is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver/drier.

The SC115 A/C compressor has the following characteristics:

- Tangential mount design - three lugs.
- The single manifold block of the compressor manifold and tube assembly fits to the suction and discharge ports. Two O-ring seals are used for sealing.
- An eccentric bushing is driven by the shaft of the A/C compressor.
- An orbiting scroll driven by the eccentric bushing compresses the refrigerant gas against the walls of the fixed scroll.
- Single reed-type discharge valve mounted on the back of the fixed scroll. There are no suction valves.
- Non-serviceable shaft seal fully supported on both sides by bearings.
- The A/C compressor uses PAG oil or equivalent. This oil contains special additives required for the A/C compressor.
- The A/C compressor oil from vehicles equipped with an SC115 A/C compressor may have some slightly dark-colored streaks while maintaining normal oil viscosity. This is normal for this A/C compressor because of break-in wear of the scroll seals that can discolor the oil.
- Use standard oil matching procedures when installing new compressors.

Item	Part Number	Description
1	19D798	A/C clutch field coil
2	W704579-S301	A/C clutch field coil snap ring
3	19D784	A/C clutch pulley
4	W701742-S301	A/C clutch pulley snap ring
5	19D648	A/C clutch hub spacer
6	19D786	A/C clutch
7	W704577-S301	A/C clutch nut

When battery voltage is applied to the A/C compressor clutch field coil, the clutch plate and hub assembly is drawn toward the A/C clutch pulley. The magnetic force locks the clutch plate and hub assembly and the A/C clutch pulley together as one unit, causing the compressor shaft to rotate. When battery voltage is removed from the A/C compressor clutch field coil, springs in the clutch plate and hub assembly move the clutch plate away from the A/C clutch pulley.

Thermostatic Expansion Valve

The thermostatic expansion valve (TXV) is located between the evaporator core lines and the thermostatic expansion valve manifold and tube assembly at the RH rear of the engine compartment.

The TXV provides a restriction to the flow of refrigerant from the high pressure side of the refrigerant system, and separates the low pressure and high pressure sides of the refrigerant system. Refrigerant entering and exiting the evaporator core passes through the TXV through two separate flow paths. An internal temperature sensing bulb senses the temperature of the refrigerant flowing out of the evaporator core and adjusts an internal pin-type valve to meter the refrigerant flow into the evaporator core. The internal pin-type valve decreases the amount of refrigerant entering the evaporator core at lower temperatures, and increases the amount of refrigerant entering the evaporator core at higher temperatures.

A/C Thermostatic Switch

The A/C thermostatic switch monitors the temperature of the refrigerant exiting the evaporator core into the TXV. It is used (by the PCM) to prevent freezing of the evaporator core by controlling A/C compressor clutch engagement/disengagement. Battery voltage is sent to the A/C thermostatic switch (via the low charge protection switch) when the ignition switch is in the RUN position. The A/C thermostatic switch either completes the circuit to the PCM (when the refrigerant temperature rises), or interrupts the circuit (when the refrigerant temperature drops). The PCM engages the A/C compressor clutch when the circuit is complete and an A/C request has been received from the climate control assembly. For specifications regarding operating temperature(s), refer to Section 412-00.

The A/C thermostatic switch is mounted on the TXV. Thermal grease must be applied to the A/C thermostatic switch probe when installing it into the TXV.

Low Charge Protection Switch

CAUTION: It is necessary to recover the refrigerant from the A/C system before removing the low charge protection switch.

The low charge protection switch (19E561) is used to prevent A/C compressor damage in the event of a low refrigerant charge, by interrupting voltage to the A/C thermostatic switch and the PCM, when the low side refrigerant pressure drops below acceptable levels. The electrical switch contacts open when the suction pressure drops below normal levels. The contacts close when the suction pressure rises. For specifications regarding operating pressure(s), refer to Section 412-00.

The low charge protection switch is mounted on the TXV.

High Pressure Cutoff Switch

The high pressure cutoff switch is used to interrupt A/C compressor operation by interrupting the voltage circuit to the low charge protection switch in the event of high system discharge pressures. When the A/C compressor discharge pressure rises, the switch contacts open to disengage the A/C compressor. When the pressure drops, the contacts close to allow operation of the A/C compressor. For specifications regarding operating pressure(s), refer to Section 412-00.

The high pressure cutoff switch is mounted on a Schrader valve-type fitting on the high pressure side of the compressor manifold and tube assembly. It is not necessary to discharge the refrigerant system to remove the high pressure cutoff switch.

Condenser Core

NOTE: Installation of a new receiver/drier is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver/drier.

The condenser is an aluminum fin and tube design heat exchanger, located in front of the vehicle radiator (8005). It cools compressed refrigerant gas by allowing air to pass over fins and tubes to extract heat, and by condensing gas to liquid refrigerant as it is cooled.

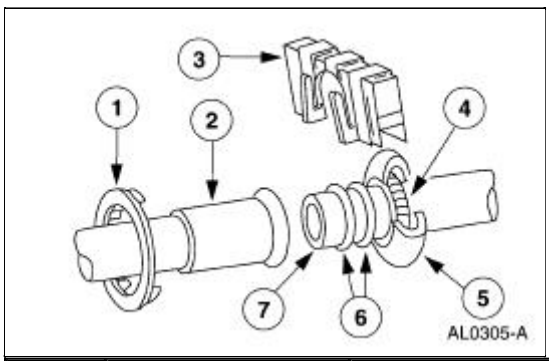
Evaporator Core

NOTE: If an evaporator core leak is suspected, the evaporator core must be vacuum leak tested before it is removed from the vehicle. For additional information, refer to Section 412-00 .

NOTE: Installation of a new receiver/drier is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver/drier.

The evaporator core is an aluminum plate/fin type and is located in the plenum chamber. A mixture of refrigerant and oil enters the bottom of the evaporator core through the evaporator core inlet tube, continues over to the remaining five plate/fin sections, and then moves out of the evaporator core through the evaporator core outlet tube. Air from the blower motor is cooled and dehumidified as it flows through the evaporator core fins.

Receiver/Drier



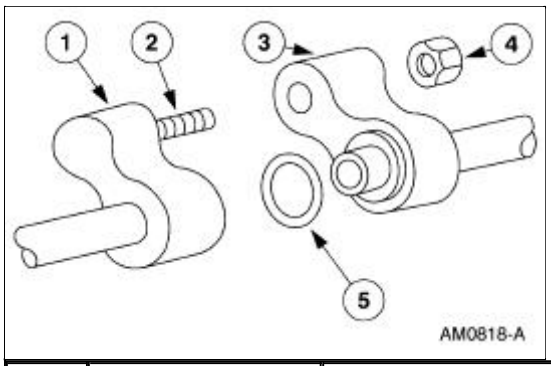
NOTE: Installation of a new receiver/drier is not required when repairing the refrigerant system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier.

The receiver/drier is mounted to the right of the radiator support. It stores high pressure liquid after it leaves the condenser core. A desiccant bag mounted inside the receiver/drier removes any retained moisture from the refrigerant.

A/C Compressor Pressure Relief Valve

An A/C compressor pressure relief valve is incorporated in the compressor manifold and tube assembly to prevent damage to the A/C compressor and other system components, and to avoid total refrigerant loss by relieving unusually high refrigerant system discharge pressure buildups. For additional information, regarding operating pressure(s) specifications, refer to Section 412-00 .

Spring Lock Coupling



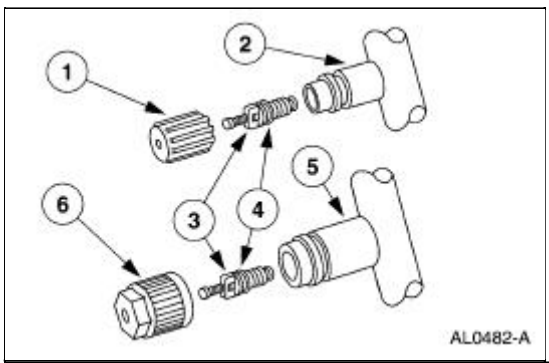
Item	Part Number	Description
1	—	Plastic indicator ring
2	—	Female fitting
3	19E746	A/C tube lock coupling clip
4	19E576	A/C tube lock coupling spring
5	—	Cage
6	—	O-ring seals (2 req'd)
7	—	Male fitting

NOTE: Use only the O-ring seals listed in the Ford Master Parts Catalog for the spring lock coupling.

The spring lock coupling is a refrigerant line coupling held together by a garter spring inside a circular cage. When the coupling is connected together, the flared end of the female fitting slips behind the garter spring inside the cage of the male fitting. The garter spring and cage then prevent the flared end of the female fitting from pulling out of the cage. Three O-ring seals are used to seal between the two halves of the couplings. A plastic indicator ring is used on the spring lock couplings of the evaporator core to indicate, during vehicle assembly, that the coupling is connected. Once the coupling is connected, the indicator ring is no longer necessary but will remain captive by the coupling near the cage opening. The indicator ring can also be used during service operations to indicate connection of the coupling. An A/C tube lock coupling clip (19E746) can be used to secure the coupling but is not required.

Peanut Fitting

Some A/C lines use peanut shaped fittings instead of spring lock couplings for attachment and sealing. The male and female blocks of the peanut fitting are retained with a nut. An O-ring seal is installed around the tube on the male block. When correctly assembled the male and female fittings should be flush.



Item	Part Number	Description
1	—	Female block (part of tube assembly)
2	W701890-S426	Stud (part of female block)
3	—	Male block (part of 19712)
4	W520413-S301	Nut
5	—	O-ring seal

Service Gauge Port Valves

The high pressure service gauge port valve is located on the compressor manifold and tube assembly.

The low pressure service gauge port valve is located on the thermostatic expansion valve manifold and tube assembly suction tube.

Item	Part Number	Description
1	19D702	A/C charging valve cap

2	19D701	Low pressure service gauge port valve
3	—	Schrader-type valve
4	—	O-ring seal
5	19D701	High pressure service gauge port valve
6	19D702	A/C charging valve cap

NOTE: Always install the A/C charging valve cap (19D702) on the service gauge port valves after repairing the refrigerant system.

The fitting is an integral part of the refrigeration line or component, special couplings are required for both the high-side and low-side service gauge ports. A new Schrader-type valve core can be installed if the seal leaks.

Air Conditioning

Refer to Section 412-00 .

Air Conditioning (A/C) Compressor

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B

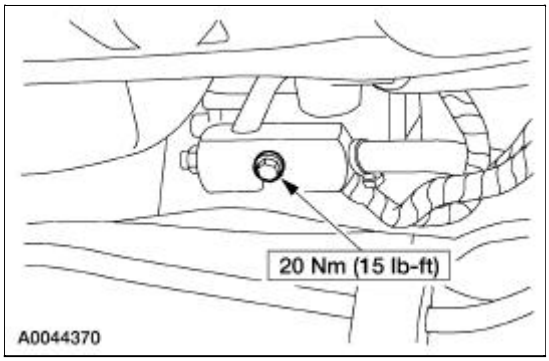
Removal and Installation

CAUTION: If installing a new air conditioning (A/C) compressor (19703) due to an internal failure of the old unit, you must carry out the following procedures to remove contamination from the air conditioning system:

- **If A/C flushing equipment is available, carry out flushing of the air conditioning system. For additional information, refer to Section 412-00 .**
- **If A/C flushing equipment is not available, carry out filtering of the air conditioning system after a new air conditioning compressor has been installed. For additional information, refer to Section 412-00 .**
- **Install a new thermostatic expansion valve (TXV) (19849) as directed by the A/C flushing or filtering procedure.**
- **Install a new receiver/drier (19959) as directed by the A/C flushing or filtering procedure.**

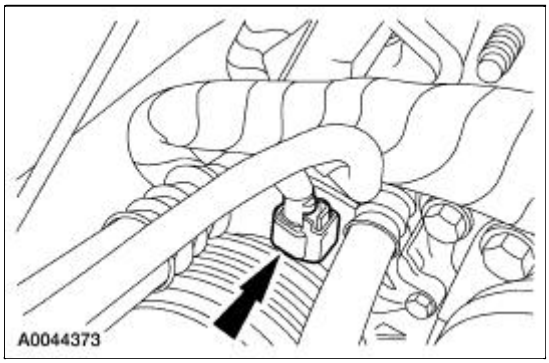
NOTE: Installation of a new receiver/drier is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier.

4x4 vehicles



1. Remove the cooling fan and shroud. For additional information, refer to Section 303-03 .

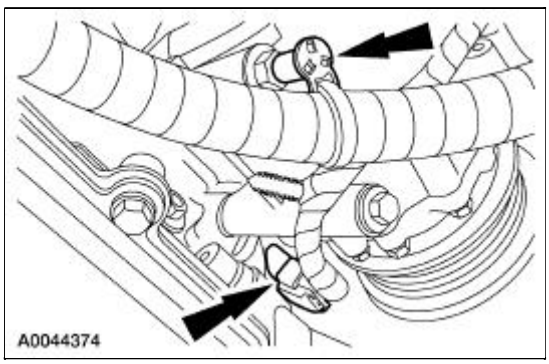
All vehicles



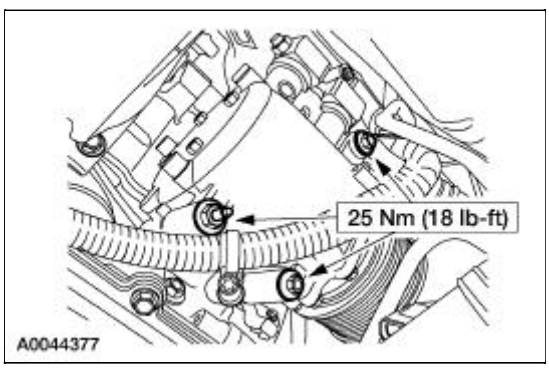
2. If flushing of the air conditioning system has not been carried out, recover the refrigerant. For additional information, refer to Section 412-00 .

3. Remove the drive belt from the A/C compressor pulley.

4. Loosen the bolt and detach the compressor manifold and tube assembly.
   - Discard the O-ring seals.



5. Disconnect the field coil electrical connector.



6. Raise the vehicle. For additional information, refer to Section 100-02 .

7. Disconnect the crankshaft position sensor electrical connector and detach the wiring harness.

8. Remove the bolts and the stud.

4x2 vehicles

9. Remove the A/C compressor.

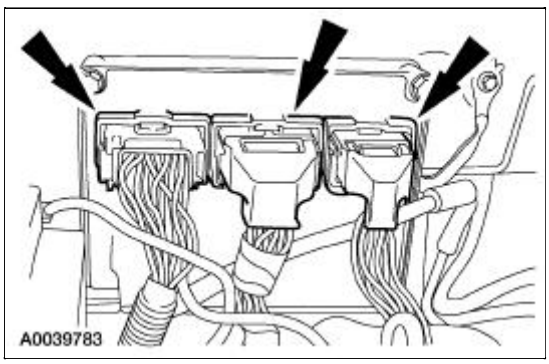
4x4 vehicles

10. Lower the vehicle and remove the A/C compressor.

All vehicles

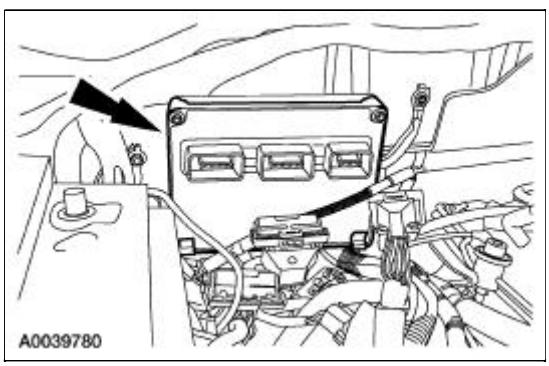
11. To install, reverse the removal procedure.
    - Install new O-ring seals lubricated in clean PAG oil.
    - If filtering of the refrigerant system is not to be carried out, lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .
12. If filtering of the refrigerant system is not to be carried out, evacuate, charge and leak test the refrigerant system. For additional information, refer to Section 412-00 .

Thermostatic Expansion Valve



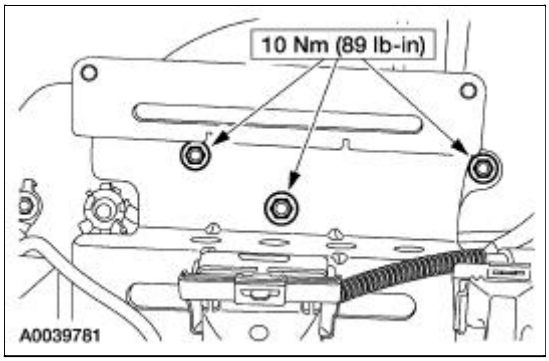
Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B

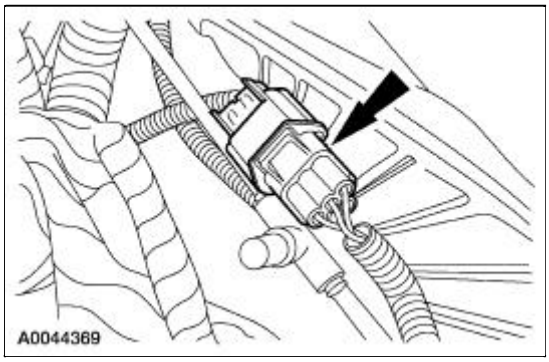


Removal and Installation

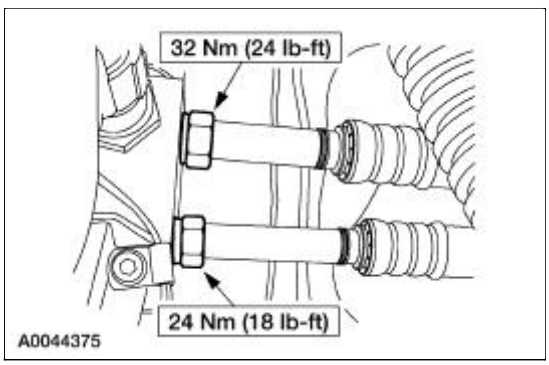
NOTE: Installation of a new receiver/drier is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver/drier.



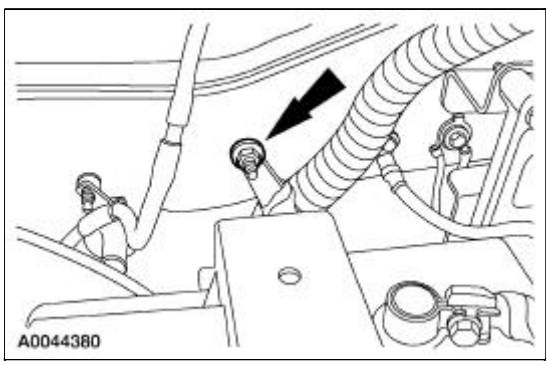
1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. Disconnect the negative battery cable. For additional information, refer to Section 414-01 .
3. Disconnect the powertrain control module (PCM) electrical connectors.



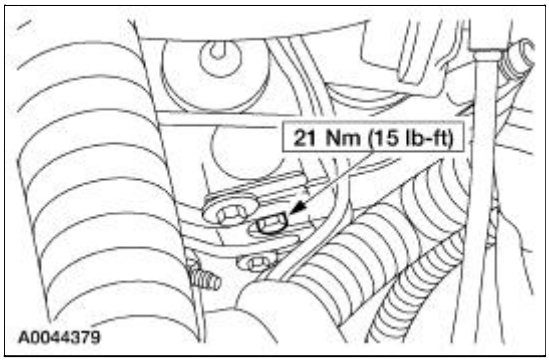
4. Remove the bolts and the PCM.



5. Remove the bolts and the PCM bracket.



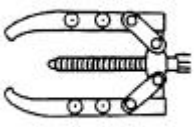
6. Disconnect the electrical connector.



7. Disconnect the evaporator line fittings.
    - Discard the O-ring seals.

8. Remove the nut and position the wiring harness aside.

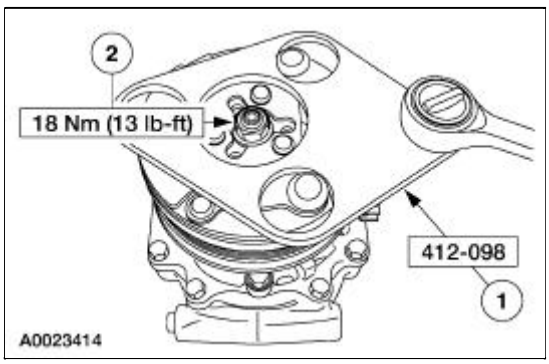
9. Remove the bolt and the thermostatic expansion valve.
    - Discard the O-ring seals.



10. To install, reverse the removal procedure.

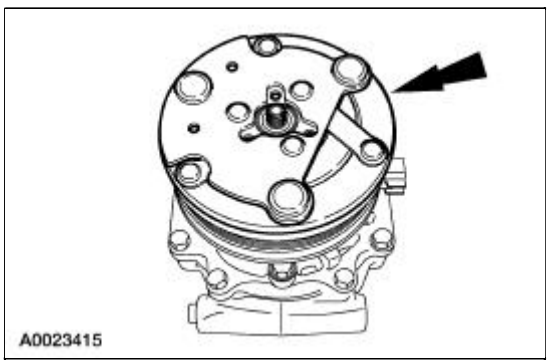
11. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Clutch and Clutch Field Coil



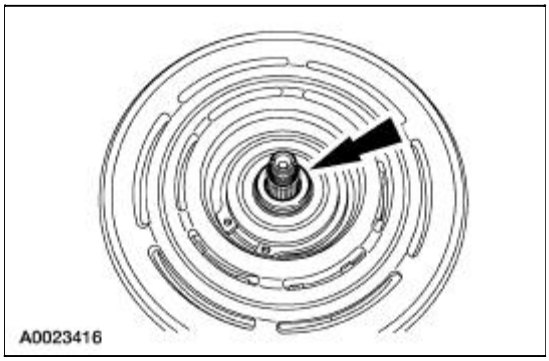
Special Tool(s)

 ST1260-A	2-Jaw Puller 205-D026 (D80L-1002-L) or equivalent
 ST1235-A	Holding Fixture, Compressor Clutch 412-098 (T94P-19703-AH)

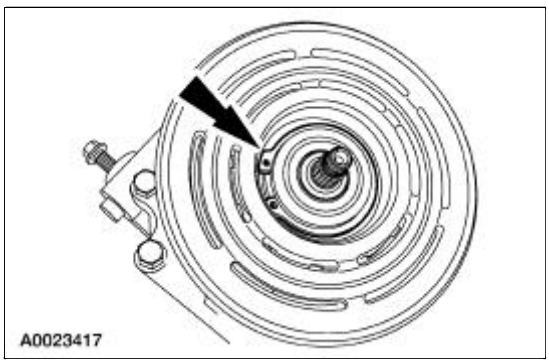


Removal and Installation

1. Remove the A/C compressor. For additional information, refer to Air Conditioning (A/C) Compressor in this section.

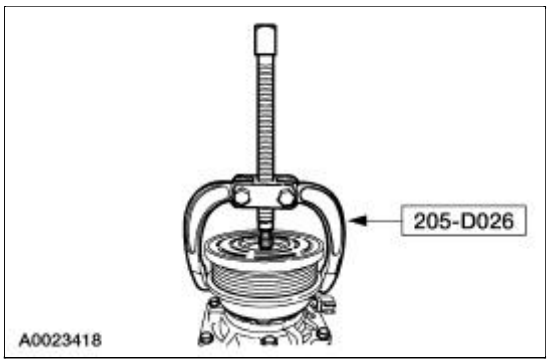


2. Remove the A/C clutch plate retaining nut.
   1. Using the special tool, hold the A/C clutch plate.
   2. Remove the nut.

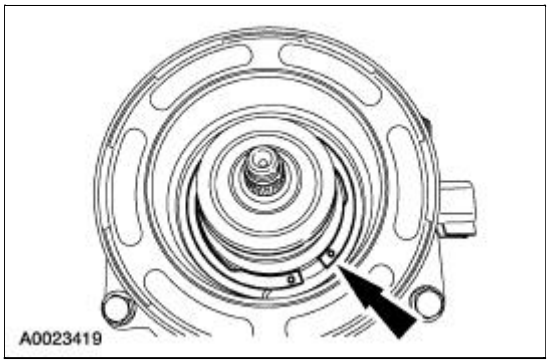


3. Remove the A/C clutch plate.

4. Remove the A/C clutch plate spacer.



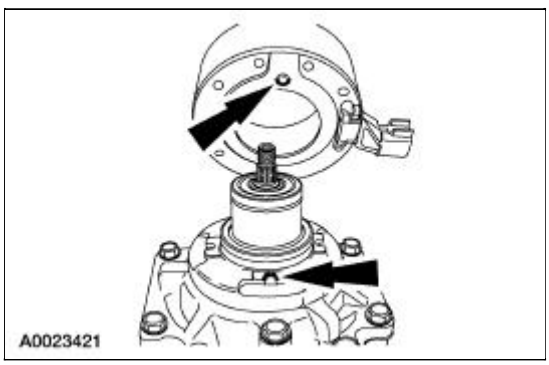
5. Remove the A/C clutch pulley snap-ring.



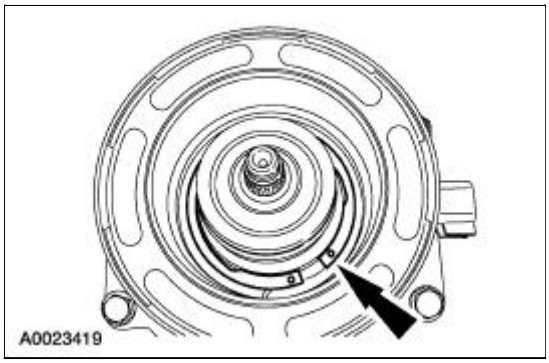
6. **CAUTION: Do not use air tools. Damage to the A/C clutch pulley may result.**

   Using the special tool, remove the A/C clutch pulley.

7. Note the location of the A/C clutch field coil connector.
8. Remove the A/C clutch field coil snap-ring.



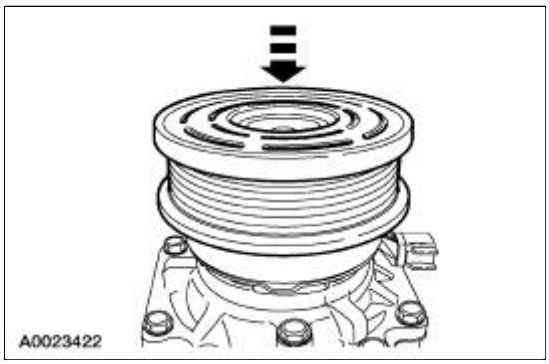
9. Remove the A/C clutch field coil.



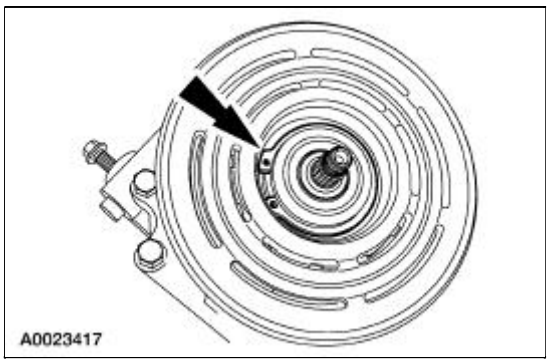
10. Clean the A/C compressor, A/C clutch field coil, and the A/C clutch pulley mounting surfaces.

11. **CAUTION: There is an indexing locator on the A/C clutch field coil mounting surface. Make sure it is correctly aligned during installation to the A/C compressor.**

    Align and install the A/C clutch field coil to the A/C compressor.

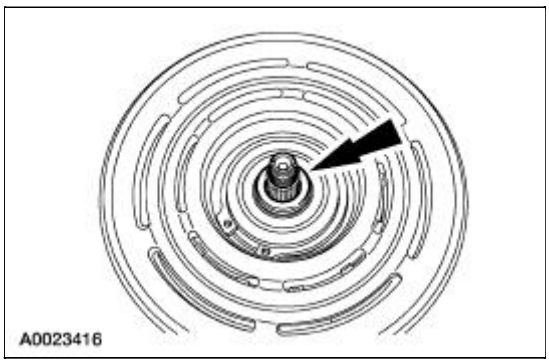


12. Install the A/C clutch field coil snap-ring.



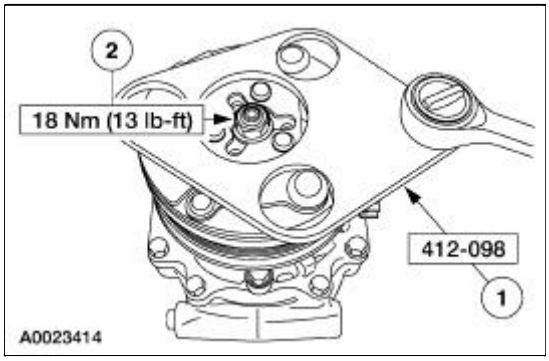
13. **NOTE:** The A/C clutch pulley fits tightly to the A/C compressor. It must be aligned correctly for installation.

    Install the A/C clutch pulley.

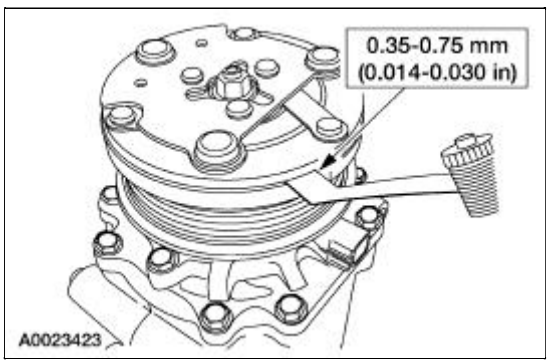


14. **NOTE:** The snap-ring must be installed with the bevel side up.

    Install the A/C clutch pulley snap-ring with the bevel side up.



15. Install one nominal thickness A/C clutch plate spacer onto the A/C compressor shaft.



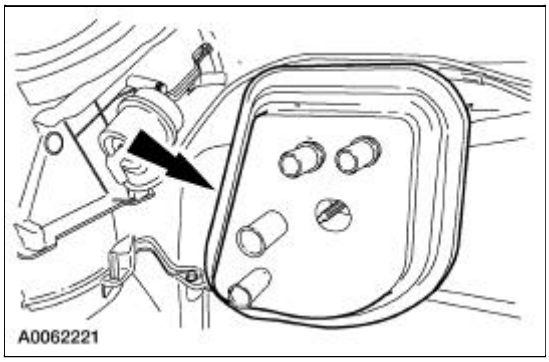
16. Install the A/C clutch plate.

17. Install the clutch plate retaining nut.
    1. Using the special tool, hold the A/C clutch plate.
    2. Tighten the nut.

18. Measure and adjust (if necessary) the A/C clutch air gap by removing or adding A/C clutch plate spacers. For additional information, refer to Section 412-00 .

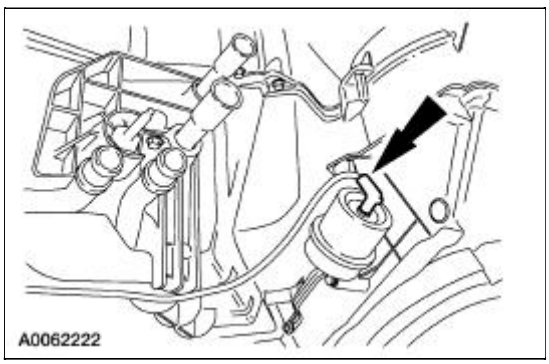
19. Install the A/C compressor. For additional information, refer to Air Conditioning (A/C) Compressor in this section.

Evaporator Core



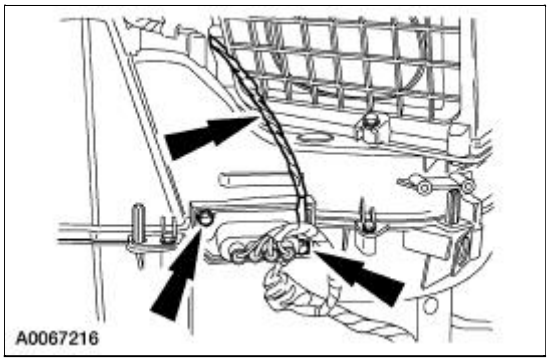
Removal and Installation

NOTE: If an evaporator core leak is suspected, the evaporator core must be vacuum leak tested before it is removed from the vehicle.

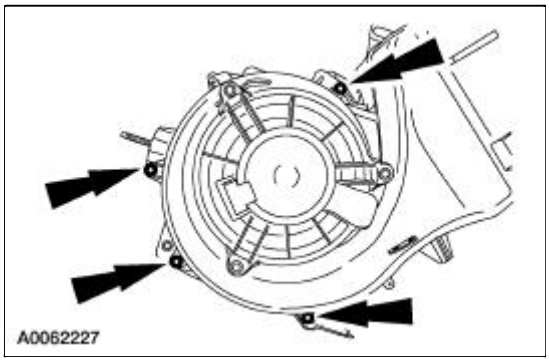


NOTE: Installation of a new receiver drier is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver drier.

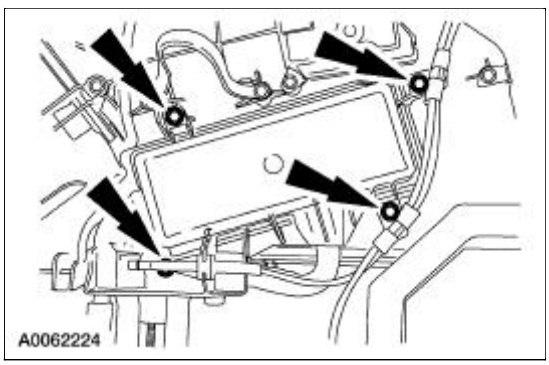
NOTE: A new evaporator core seal is supplied as a kit with the evaporator core service part. Failure to install this seal, or failure to install it correctly, will result in air bypassing the evaporator core and loss of cooling efficiency.



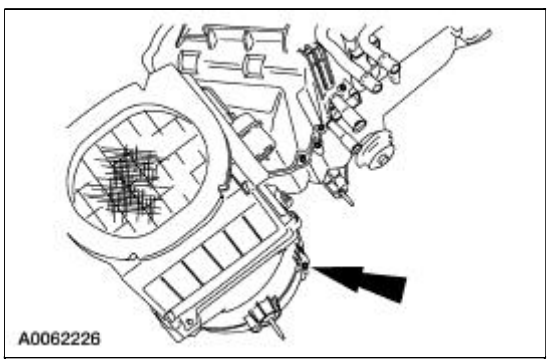
1. Remove the plenum chamber. For additional information, refer to Section 412-01 .
2. Remove the dash panel seal.



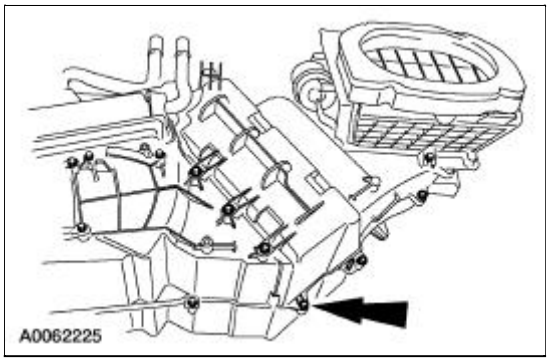
3. Detach the wire harness from the evaporator core cover.
4. Disconnect the air inlet vacuum control motor vacuum connector.



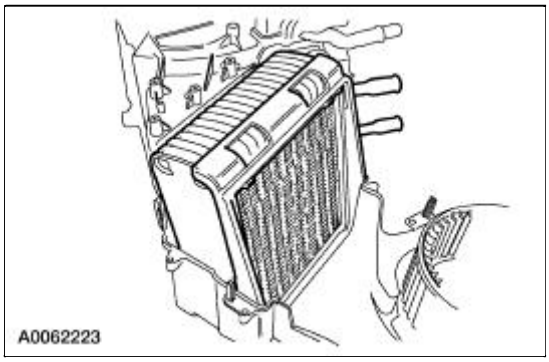
5. Remove the screws and detach the blower resistor or blower motor speed control and wire harness from the plenum chamber.



6. Remove the four bottom evaporator core cover screws.



7. Remove the screws and position the heater core cover aside.



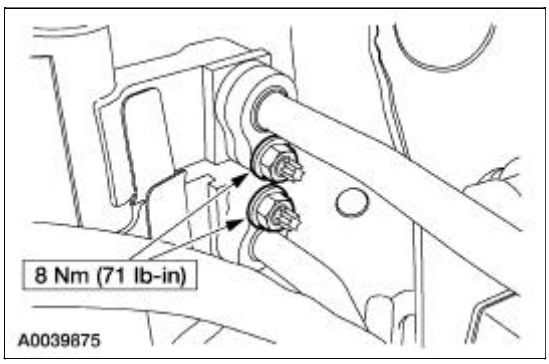
8. Remove the five upper evaporator core cover screws.

9. Remove the remaining upper evaporator core cover screws and the evaporator core cover.

10. Remove the evaporator core.

11. To install, reverse the removal procedure.

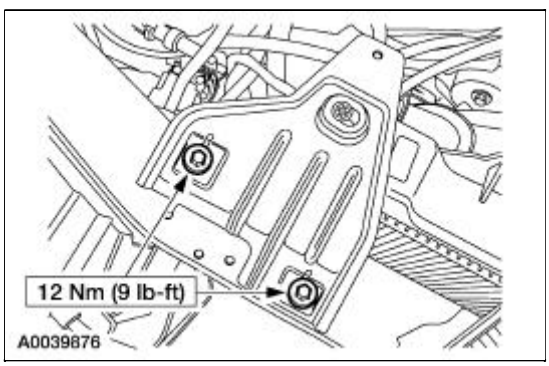
Condenser Core



Material

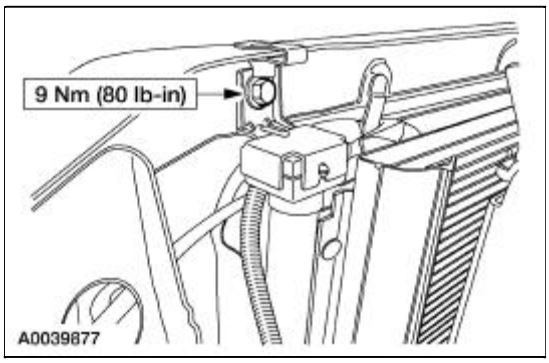
Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B

Removal and Installation



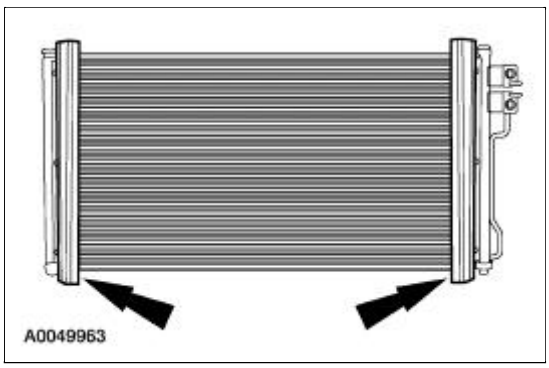
NOTE: Installation of a new receiver/drier is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier.

1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. Remove the upper radiator sight shield.
3. Remove the nuts and disconnect the condenser line fittings.
   - Discard the O-ring seals.



4. **NOTE:** LH radiator bracket shown, RH similar.

   Remove the bolts and the RH and LH radiator brackets.



5. **NOTE:** RH condenser core bracket shown, LH similar.

   Remove the bolt and the RH and LH condenser core brackets.

6. Remove the condenser core.

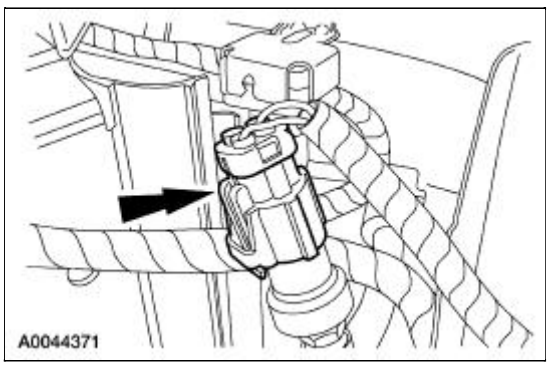
7. If a new condenser core is to be installed, transfer the air deflectors from the old unit to the new unit.

8. To install, reverse the removal procedure.
   - Install new O-ring seals lubricated in clean PAG oil.
   - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

9. Evacuate, charge, and leak test the refrigerant system. For additional information, refer to Section 412-00 .

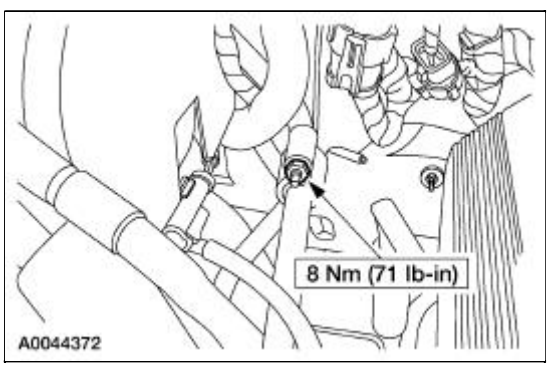
Compressor Manifold and Tube Assembly

Material



Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B

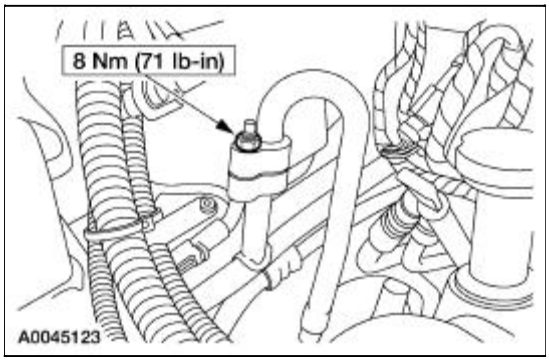
Removal and Installation



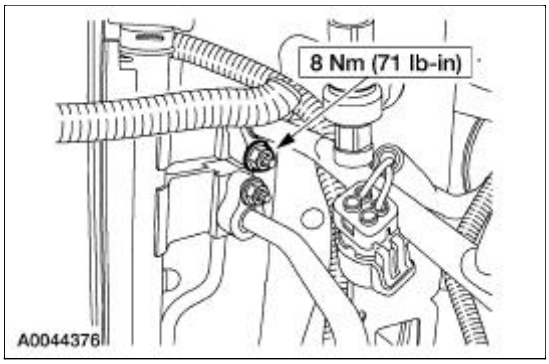
NOTE: Installation of a new receiver/drier is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier.

All vehicles

1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. Disconnect the pressure cutoff switch electrical connector.

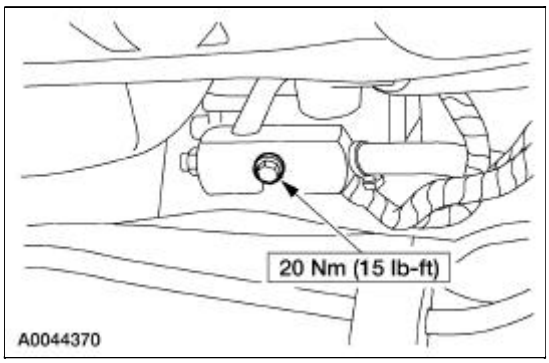


3. Remove the nut and disconnect the A/C fitting.
   - Discard the O-ring seal.



Vehicles with auxiliary A/C

4. Remove the nut and disconnect the auxiliary A/C line fitting.
    - Discard the O-ring seal.



All vehicles

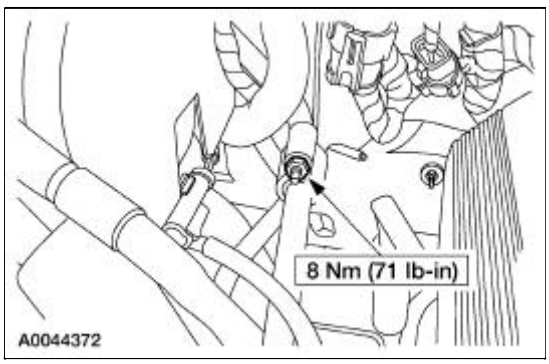
5. Remove the nut and disconnect the A/C fitting.
    - Discard the O-ring seal.

6. Loosen the bolt and remove the compressor manifold and tube assembly.
    - Discard the O-ring seals.

7. To install, reverse the removal procedure.
    - Install new O-ring seals, lubricated in clean PAG oil.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

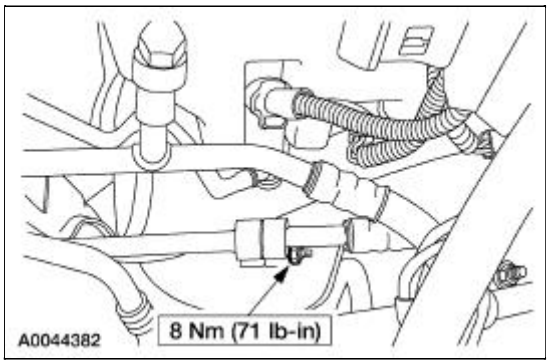
8. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Thermostatic Expansion Valve Manifold and Tube Assembly



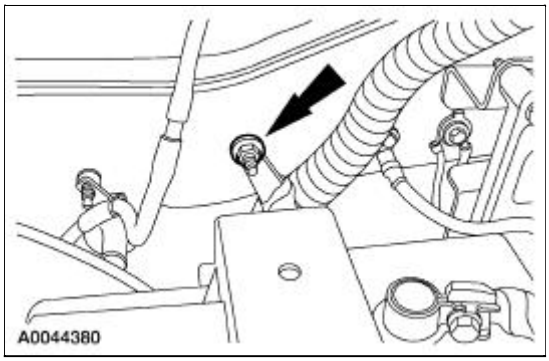
Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B

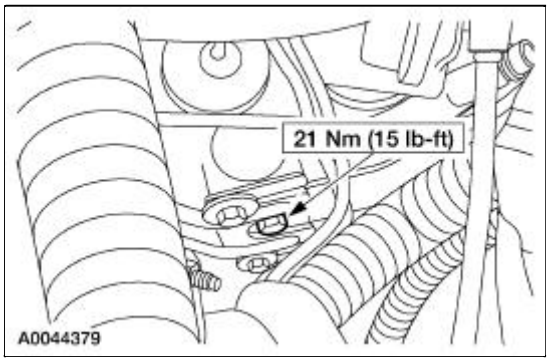


Removal and Installation

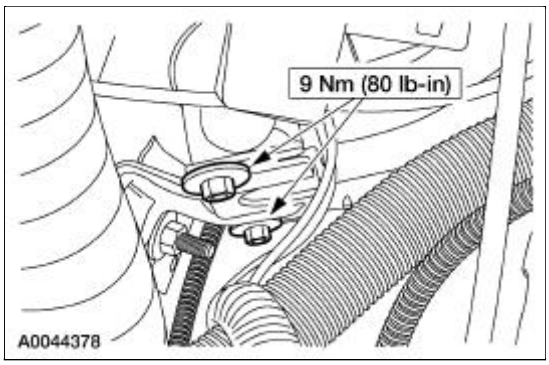
NOTE: Installation of a new receiver/drier is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier.



1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. Remove the nut and disconnect the A/C fitting.
   - Discard the O-ring seal.



3. Remove the nut and disconnect the A/C fitting.
   - Discard the O-ring seal.



4. Remove the nut and position the wiring harness aside.

5. Remove the bolt.

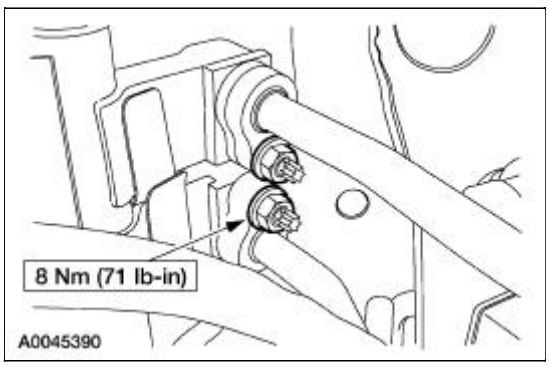
6. Loosen the bolts and remove the thermostatic expansion valve manifold and tube assembly.
   - Discard the O-ring seals.

7. To install, reverse the removal procedure.
   - Install new O-ring seals, lubricated in clean PAG oil.
   - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

8. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Receiver Drier

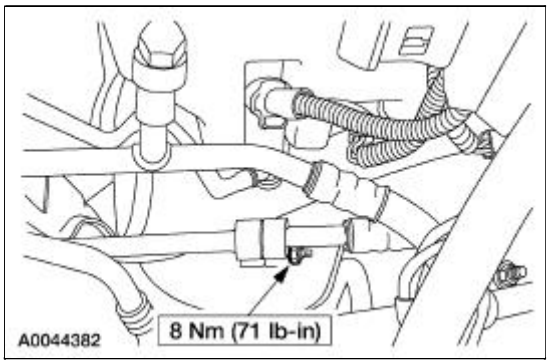
Material



Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B

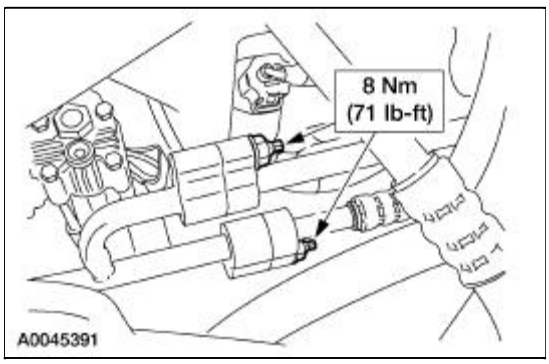
Removal and Installation

NOTE: Installation of a new receiver/drier is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier.



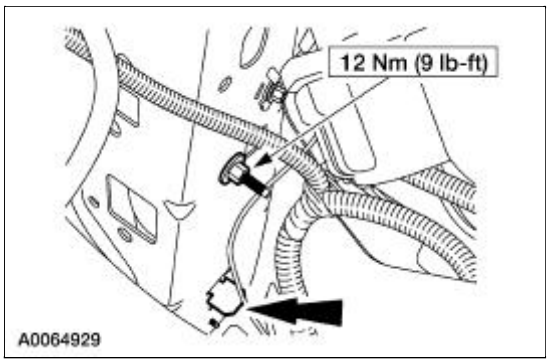
All vehicles

1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. Disconnect the A/C fitting.
   - Discard the O-ring seal.



Vehicles without auxiliary A/C

3. Disconnect the A/C fitting.
   - Discard the O-ring seal.



Vehicles with auxiliary A/C

4. Remove the nuts and disconnect the A/C fittings.
    - Discard the O-ring seal.

All vehicles

5. Remove the nut, detach the bracket and remove the receiver/drier.

6. To install, reverse the removal procedure.
    - Install new O-ring seals lubricated in clean PAG oil.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

7. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

General Specifications

Item	Specification

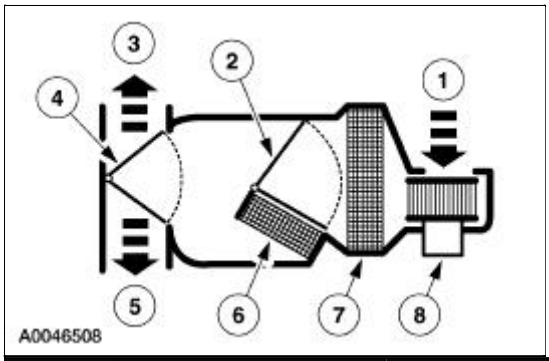
Thermostatic expansion valve fittings	15	11	—
Auxiliary line bracket nuts	5	—	44
Exhaust heat shield bolts	15	11	—

Auxiliary Climate Control

An optional auxiliary air conditioning and heating system is available. The system is a one-piece unit that is located on the RH side of the vehicle between the side windows and the floorpan, behind the rear wheel well. The driver has primary control of the auxiliary air conditioning and heating system or can transfer control to a rear passenger control panel.



All of the auxiliary A/C-heater system components are serviceable from the inside of the vehicle except the lines.

Auxiliary Climate Control Housing

Item	Part Number	Description
1	19A706	Blower motor resistor
2	19805	Blower motor
3	19860	Evaporator core
4	18472	Drain tube
5	18476	Heater core
6	19E616	Temperature blend door actuator
7	19E616	Auxiliary mode door actuator

System Airflow

Item	Part Number	Description
1	—	Air inlet door
2	—	Temperature blend door
3	—	Headliner airflow
4	—	Auxiliary mode door
5	—	Floor airflow
6	18476	Heater core
7	19860	Evaporator core
8	19805	Blower motor

The auxiliary A/C and heating system has the following features:

- The auxiliary A/C and heating system is functional whenever the instrument panel mounted A/C control is in any position except OFF.
- The auxiliary blower motor recirculates the air inside the vehicle. Outside air is not available to the auxiliary system.
- Air is cooled and dehumidified by the auxiliary A/C evaporator core only if the instrument panel mounted A/C control is adjusted to a position that requires A/C compressor operation.
- The temperature blend door and the auxiliary mode door are controlled by electric actuator motors.
- Movement of the auxiliary temperature control between COOL and WARM causes a corresponding movement of the temperature blend door to mix air flowing through and around the auxiliary heater core.
- Movement of the auxiliary mode control between PANEL and FLOOR causes a corresponding movement of the auxiliary mode door to direct air flow between the panel (headliner) registers and the floor duct.

Blower Motor

The auxiliary air conditioning system contains a blower motor which is controlled by the heater blower motor switch on the front or rear auxiliary A/C control.

Control Assembly

The auxiliary A/C system has dual controls for the front and rear passengers consisting of temperature, blower speed, and mode. The front auxiliary A/C control is mounted in the overhead console. The rear auxiliary A/C control is mounted in the rear finish panel of the front floor console.

Heater Core

The heater core consists of fins and tubes arranged to extract heat from the engine coolant and transfer the heat to air passing through the auxiliary climate control housing.

Evaporator Core

NOTE: If an evaporator core leak is suspected, the evaporator core must be vacuum leak tested before it is removed from the vehicle. For additional information, refer to Section 412-00 .

NOTE: Installation of a new receiver/drier is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver/drier.

The evaporator core is an aluminum plate/fin type and is located in the auxiliary climate control housing. A mixture of refrigerant and oil enters the bottom of the evaporator core through the evaporator core inlet tube and then moves out of the evaporator core through the evaporator core outlet tube. When the A/C compressor is operating, air from the blower motor is cooled and dehumidified as it flows through the evaporator core fins.

Thermostatic Expansion Valve

The thermostatic expansion valve (TXV) restricts the flow of refrigerant from the high pressure side of the refrigerant system and separates the low pressure and high pressure sides of the auxiliary refrigerant system. Refrigerant entering and exiting the auxiliary evaporator core passes through the TXV through two separate flow paths. An internal temperature sensing bulb senses the temperature of the refrigerant flowing out of the evaporator core and adjusts an internal pin-type valve to meter the refrigerant flow into the evaporator core. The internal pin-type valve decreases the amount of refrigerant entering the evaporator core at lower temperatures, and increases the amount of refrigerant entering the evaporator core at higher temperatures.

Auxiliary A/C-Heater Lines

The auxiliary lines are secured to the underbody of the vehicle. Each auxiliary line is only available as a multiple-piece kit for ease of installation.

Air Conditioning

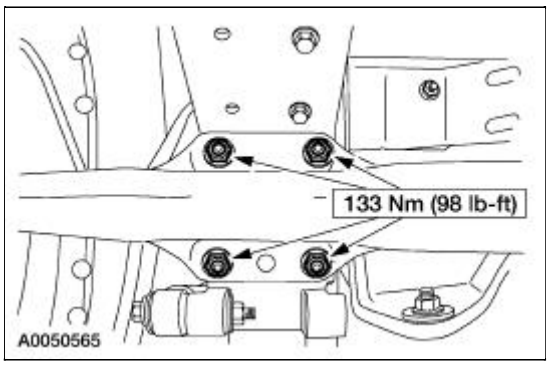
Refer to Section 412-00 .

Auxiliary Climate Control Housing

Material

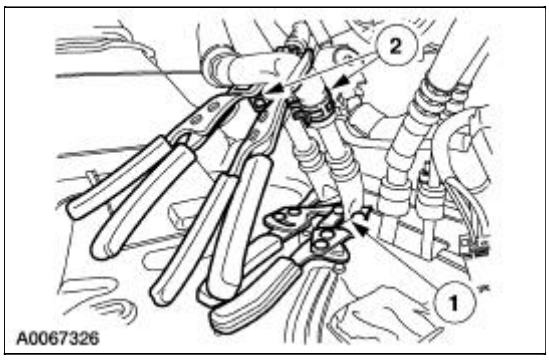
Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B

Removal and Installation



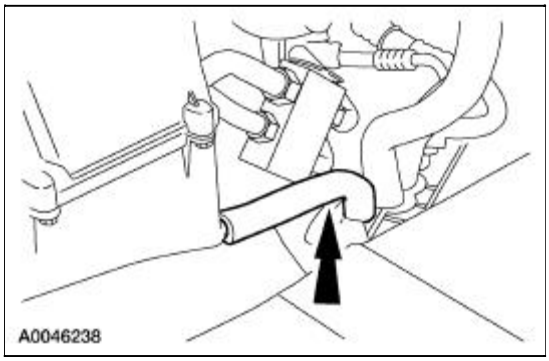
1. **WARNING: Do not open the cooling system while it is hot or while the engine is running. Failure to follow these instructions can result in personal injury.**

   Recover the refrigerant. For additional information, refer to Section 412-00 .

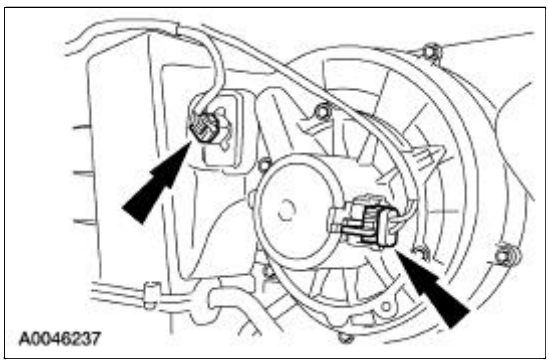


2. Remove the RH quarter trim panel. For additional information, refer to Section 501-05 .

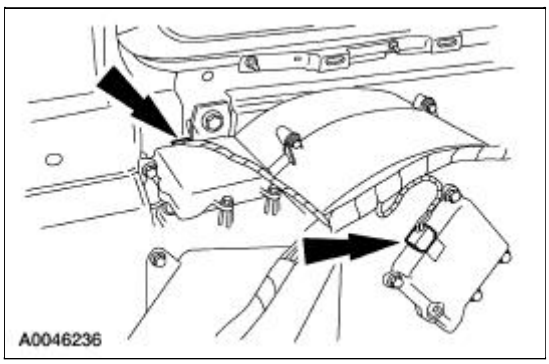
3. Detach the upper air duct from the auxiliary housing.



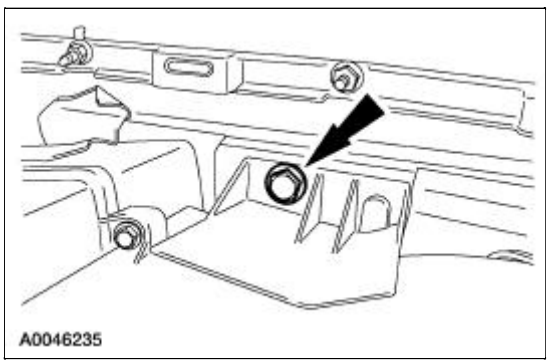
4. Remove the bolts and the auxiliary line bracket.



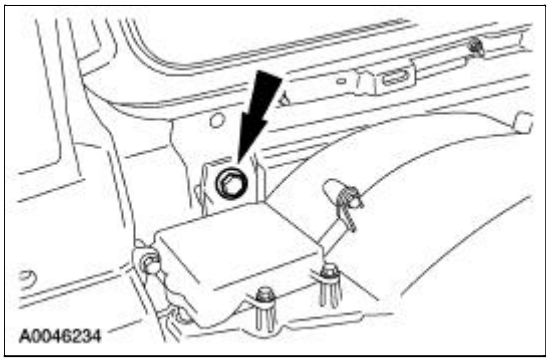
5. Disconnect the heater hoses.
   1. Using suitable tools, clamp off the heater hoses.
   2. Disconnect the heater hoses.



6. Disconnect the drain hose.



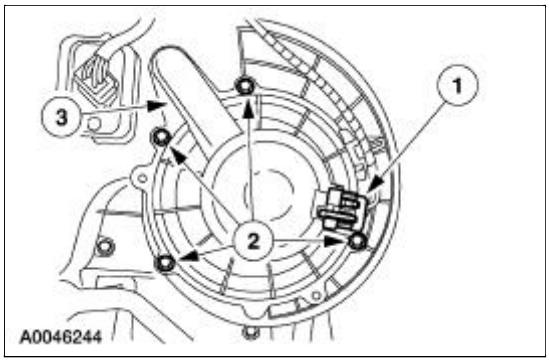
7. Disconnect the blower motor and blower motor resistor electrical connectors.



8. Disconnect the electrical actuator electrical connectors.

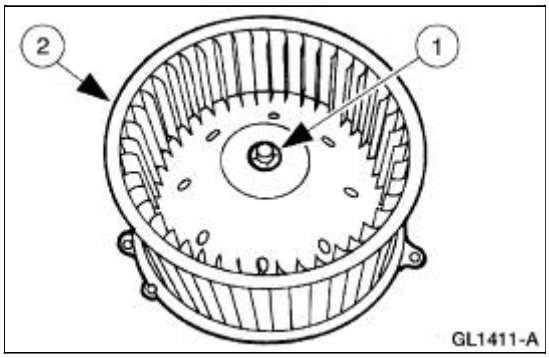
9. Remove the bolt.

10. Remove the bolt and the auxiliary climate control housing.



11. To install, reverse the removal procedure.
    - Install new O-ring seals with the correct amount of clean PAG oil.
    - Clean and lubricate the coolant hoses with plain water only if needed.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .
12. Fill the engine coolant level. For additional information, refer to Section 303-03 .
13. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Blower Motor



Removal and Installation

1. Remove the RH quarter trim panel. For additional information, refer to Section 501-05 .

2. Remove the blower motor.
   1. Disconnect the blower motor electrical connector.
   2. Remove the screws.
   3. Remove the blower motor.

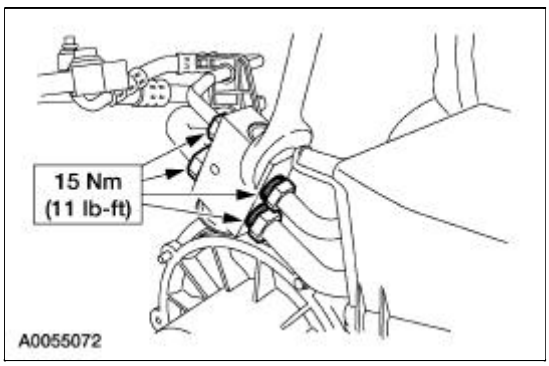
3. Remove the wheel from the blower motor.
   1. Remove the push clip.
   2. Remove the wheel.

4. To install, reverse the removal procedure.

Evaporator Core

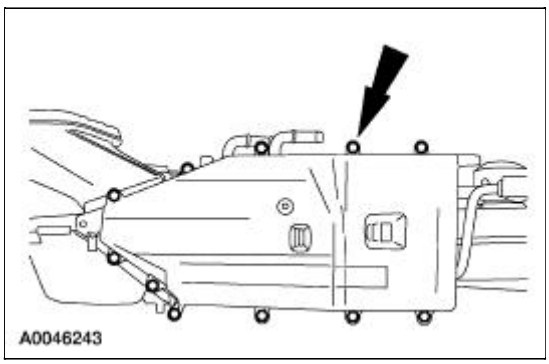
Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B



Removal and Installation

NOTE: If an evaporator core leak is suspected, the evaporator core must be vacuum leak tested before it is removed from the vehicle.



NOTE: Installation of a new receiver/drier is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier.

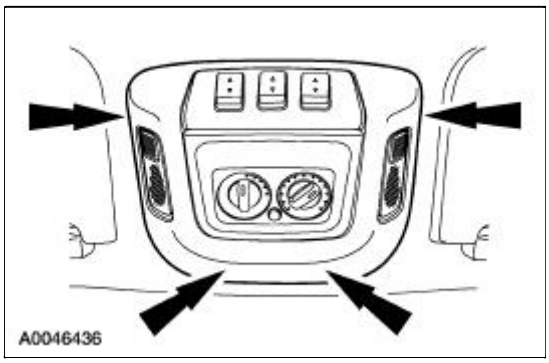
1. Remove the auxiliary climate control housing. For additional information, refer to Auxiliary Climate Control Housing in this section.

2. Disconnect the A/C fittings and remove the thermostatic expansion valve (TXV).
   - Discard the O-ring seals.

3. Remove the screws and the evaporator/heater core access cover.

4. Remove the A/C evaporator core (19860).

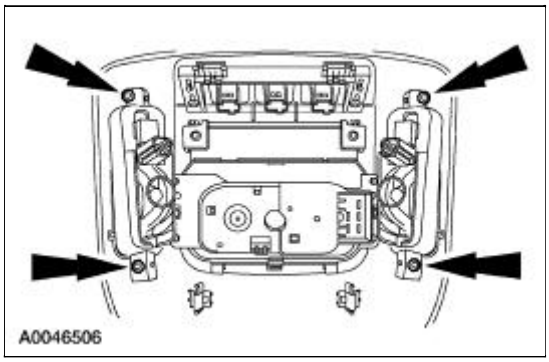
5. To install, reverse the removal procedure.
    - Install new O-ring seals lubricated in clean PAG oil.



Auxiliary Climate Control Assembly —Front

Removal and Installation

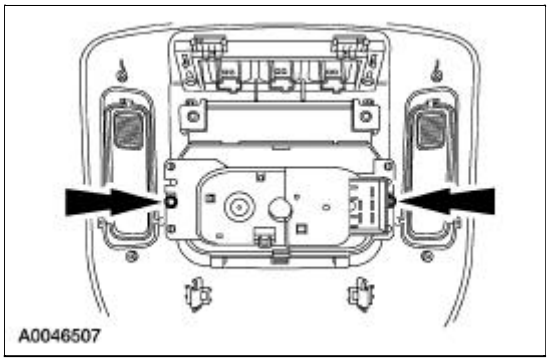
All vehicles



1. **NOTE:** Vehicle with moonroof shown, vehicle without moonroof similar.

   Disengage the clips and remove the overhead console.
   - Disconnect the electrical connectors.

Vehicles with moonroof

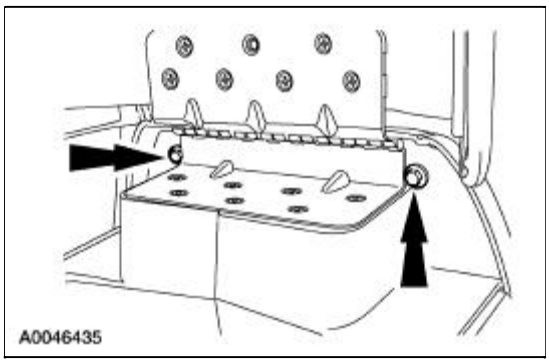


2. Remove the screws and the map lights.

All vehicles

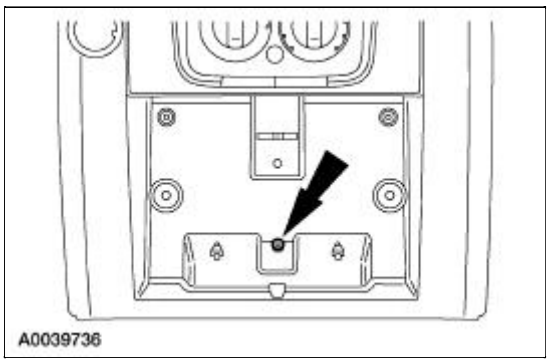
3. **NOTE:** Vehicle with moonroof shown, vehicle without moonroof similar.

   Remove the screws and the front auxiliary climate control assembly.



4. To install, reverse the removal procedure.

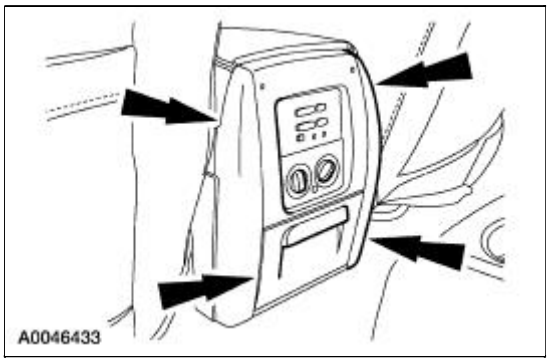
Auxiliary Climate Control Assembly —Rear



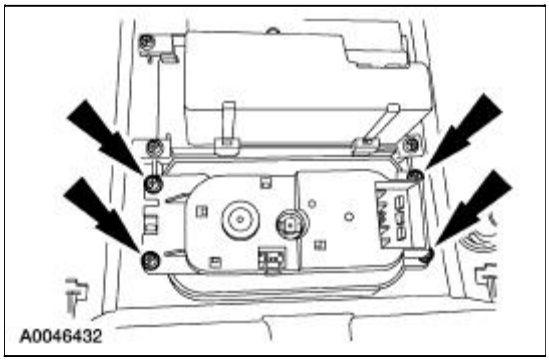
Removal and Installation

Navigator

1. Open the front floor console cover and remove the screws.



2. Open the cup holder and remove the screw.

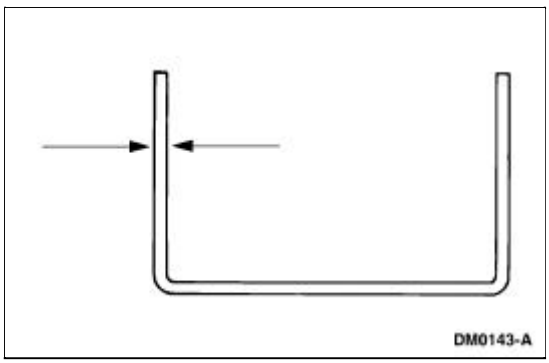


All vehicles

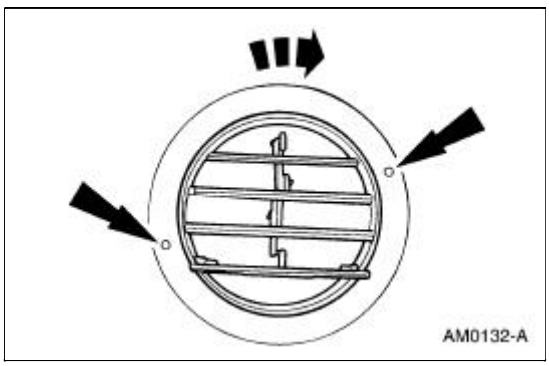
3. **NOTE:** Navigator shown, Expedition similar.

   Disengage the clips and remove the floor console rear finish panel.
   - Disconnect the electrical connectors.

4. Remove the screws and the rear auxiliary climate control assembly.



5. To install, reverse the removal procedure.

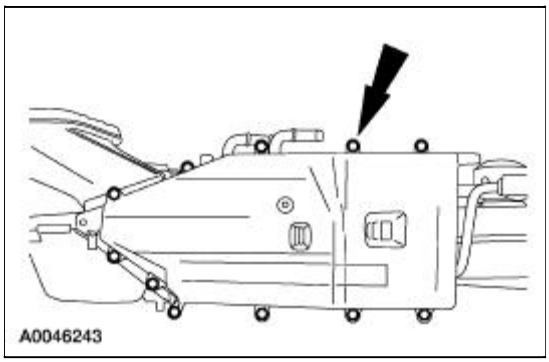


Register

Removal and Installation

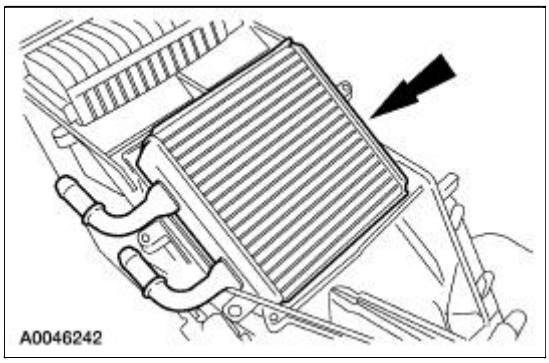
1. Fabricate a removal tool from a 1/8-inch diameter rod.

2. Rotate the A/C register with the removal tool to align the retaining ears with the clearance openings and remove the A/C register.



3. To install, reverse the removal procedure.

Heater Core



Removal and Installation

1. Remove the auxiliary climate control housing. For additional information, refer to Auxiliary Climate Control Housing in this section.

2. Remove the screws and the evaporator/heater core access cover.

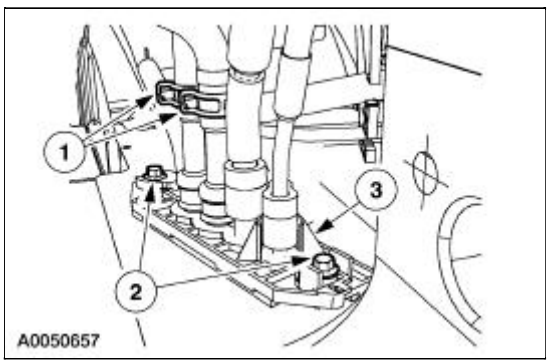
3. Remove the heater core.

4. To install, reverse the removal procedure.

Auxiliary Heater Outlet and Inlet Line

Material

Item	Specification
MERPOL® Coolant Hose Lubricant	ESE-M99B144-B

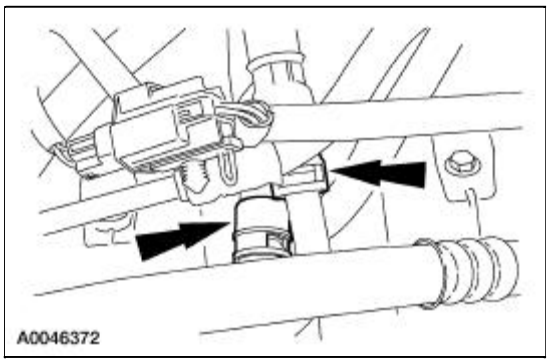


Removal

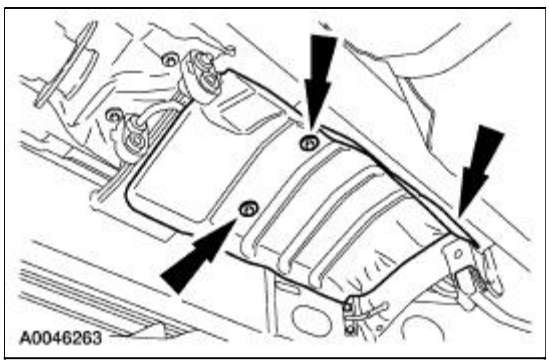
CAUTION: To avoid refrigerant loss, clearly differentiate the auxiliary heater lines from the auxiliary refrigerant lines before beginning this procedure.

NOTE: The auxiliary heater inlet and outlet lines are not supplied together as an assembly. The auxiliary heater inlet line and outlet line are each installed from the factory as one piece assemblies. The replacement parts are supplied as separate kits containing multiple piece lines for ease of installation.

NOTE: The following procedure can be used to remove and install one of, or both the auxiliary heater inlet line and auxiliary heater outlet line. If only one auxiliary heater line is to be removed and installed, cut or disconnect only the desired line at the specified points within the procedure.



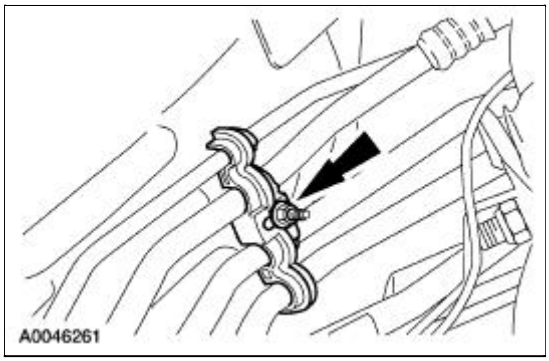
1. Drain the engine coolant. For additional information, refer to Section 303-03 .
2. Remove the RH quarter trim panel. For additional information, refer to Section 501-05 .
3. Detach the auxiliary heater lines.
    1. Disconnect the heater hose(s).
    2. Remove the bolts.
    3. Remove the line bracket.



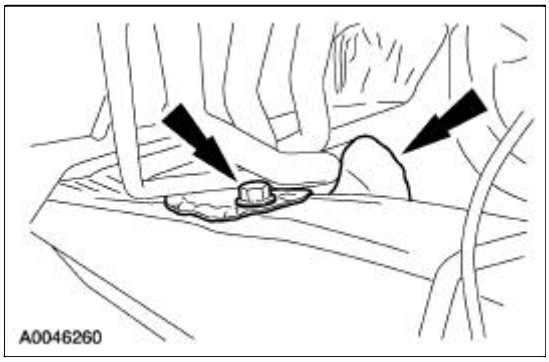
4. Remove the spare tire.
5. Raise the vehicle. For additional information, refer to Section 100-02 .
6. Remove the RH front wheel.
7. Remove the RH fender splash shield.

8. **NOTE:** If installing only one auxiliary heater line, disconnect only the desired line.

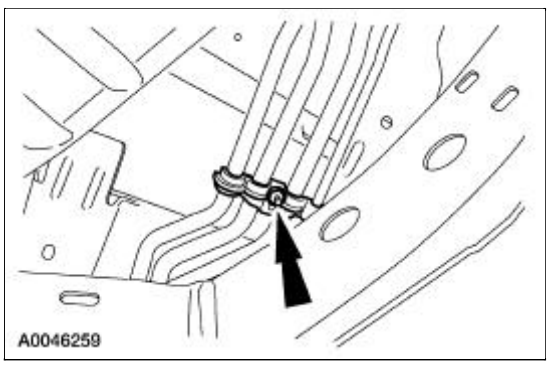
   Disconnect the heater hose(s).



9. Remove the muffler. For additional information, refer to Section 309-00 .
10. Remove the RH catalytic converter. For additional information, refer to Section 309-00 .
11. Remove the three bolts and the heat shield.



12. Remove the bolts.



13. Remove the nut and the line bracket.

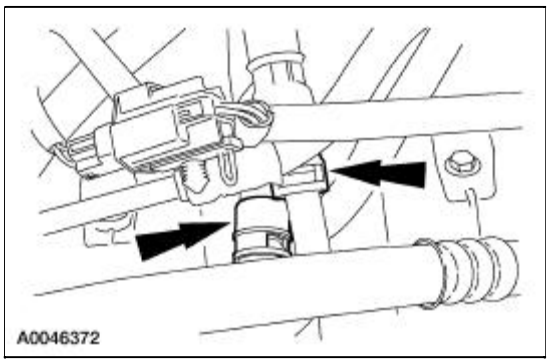
14. Remove the bolt and the heat shield.

15. Remove the nuts and the remaining line brackets.

16. **NOTE:** If installing only one auxiliary heater line, cut only the desired line.

    Assemble and lay out the replacement line(s) in the same position as the existing line(s) and, using a suitable tool, cut the auxiliary heater line(s) in the same position as the fittings on the new line(s).

17. Remove the auxiliary heater line(s) in three separate pieces.

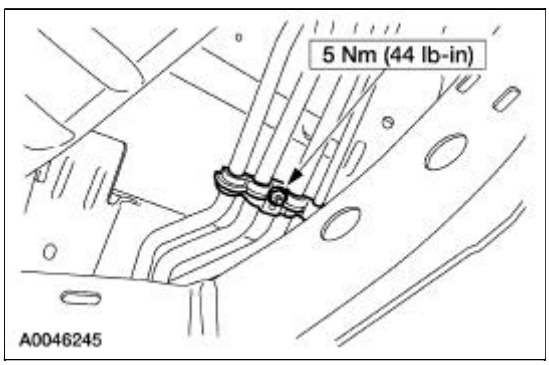


Installation

1. Partially lower the vehicle.

2. Attach the rear portion of the auxiliary heater lines.
    1. Connect the heater hoses.
    2. Install the line bracket.
    3. Install the bolts.

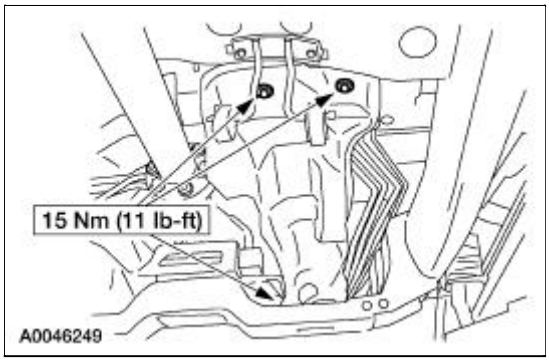
3. Install the front auxiliary heater line(s) and connect the heater hose(s).
    - Clean and lubricate the heater hoses with Coolant Hose Lubricant or plain water only if needed.



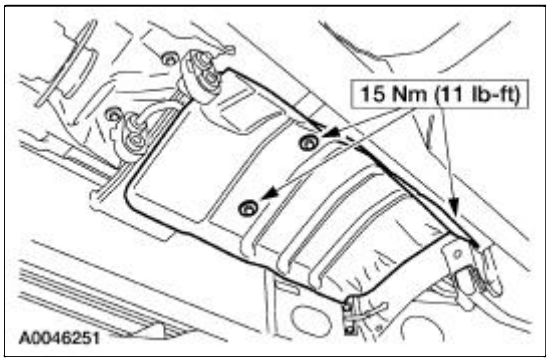
4. Raise the vehicle.

5. **NOTE:** Loosely connect, but do not tighten, the fittings.

   Install the middle auxiliary heater line(s).

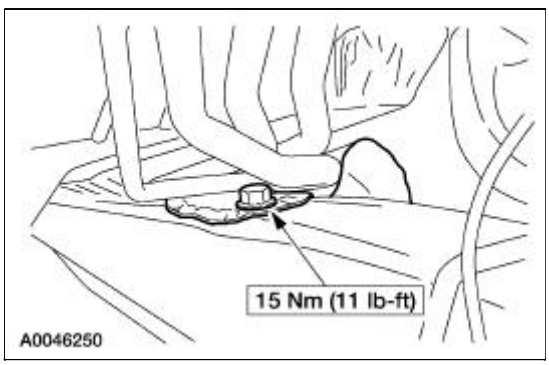


6. Starting from the rear of the vehicle, install the first three line brackets.

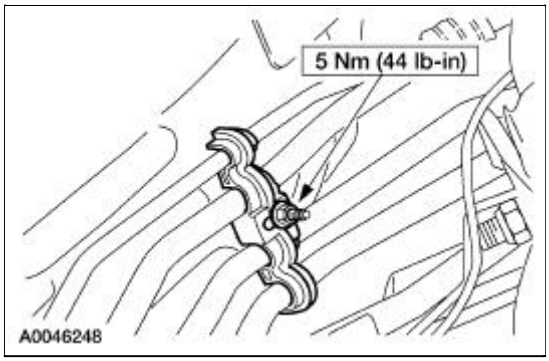


7. Tighten the middle auxiliary heater line fittings.

8. Inspect the auxiliary heater lines for correct installation. Loosen, reposition and tighten as needed.



9. Install the heat shield and the bolts.



10. Install the heat shield and the bolts.

11. Install the RH catalytic converter. For additional information, refer to Section 309-00 .
12. Install the muffler. For additional information, refer to Section 309-00 .
13. Partially lower the vehicle.
14. Install the heat shield bolt.

15. Install the line bracket.

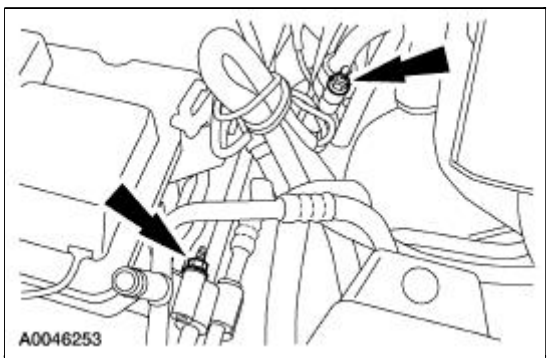
16. Lower the vehicle.
17. Install the spare tire.
18. Install the RH quarter trim panel. For additional information, refer to Section 501-05 .
19. Fill the engine coolant level. For additional information, refer to Section 303-03 .

Auxiliary Evaporator Outlet and Inlet Line

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B

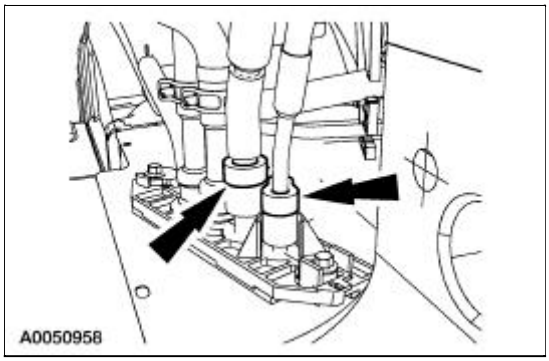
Removal



NOTE: The auxiliary evaporator inlet and outlet lines are not supplied together as an assembly. The auxiliary evaporator inlet line and outlet line are each installed from the factory as one piece assemblies. The replacement parts are supplied as separate kits containing multiple piece lines for ease of installation.

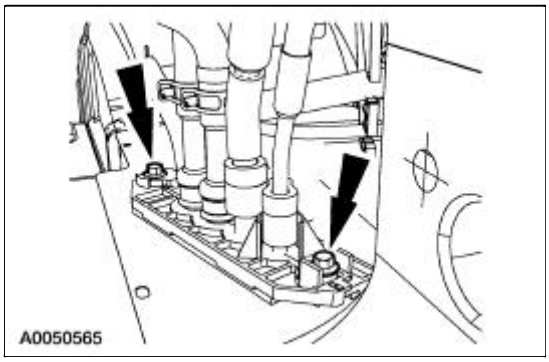
NOTE: The following procedure can be used to remove and install one of, or both the auxiliary evaporator inlet line and auxiliary evaporator outlet line. If only one auxiliary evaporator line is to be removed and installed, cut or disconnect only the desired line at the specified points within the procedure.

NOTE: Installation of a new receiver/drier is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier.



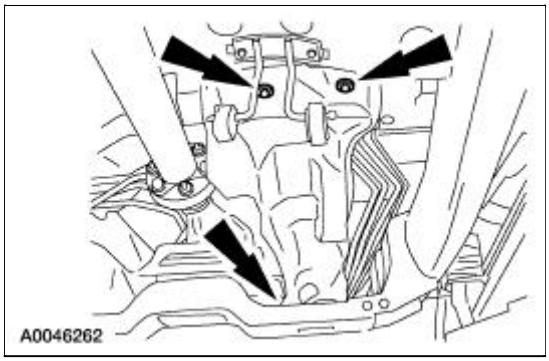
1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. **NOTE:** If only one auxiliary evaporator line is to be removed, disconnect only the desired line.

   Remove the nut(s) and disconnect the A/C fitting(s).

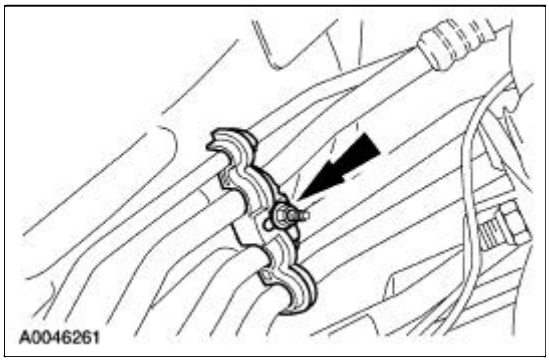


3. Remove the RH quarter trim panel. For additional information, refer to Section 501-05 .
4. Remove the spare tire and spare tire carrier splash shield.
5. **NOTE:** Both A/C fittings must be disconnected even if only one line is to be removed.

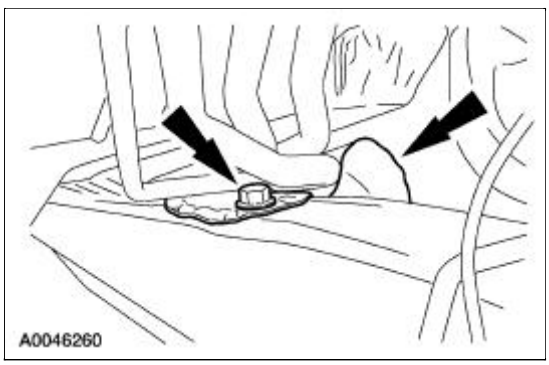
   Disconnect the A/C fittings.
   - Install new O-rings lubricated in clean PAG oil.



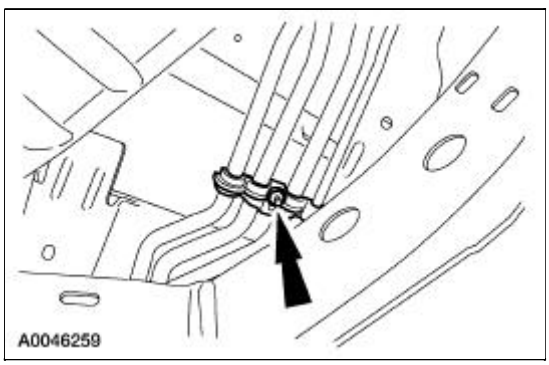
6. Remove the bolts and the line bracket.



7. Raise the vehicle. For additional information, refer to Section 100-02 .
8. Remove the RH front wheel.
9. Remove the RH fender splash shield.
10. Remove the muffler. For additional information, refer to Section 309-00 .
11. Remove the RH catalytic converter. For additional information, refer to Section 309-00 .
12. Remove the three bolts and the heat shield.



13. Remove the bolts.



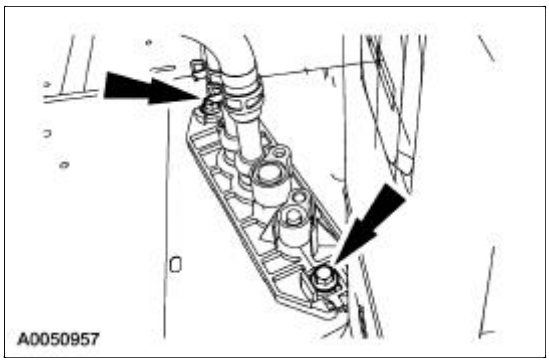
14. Remove the nut and the line bracket.

15. Remove the bolt and the heat shield.

16. Remove the nuts and the remaining line brackets.

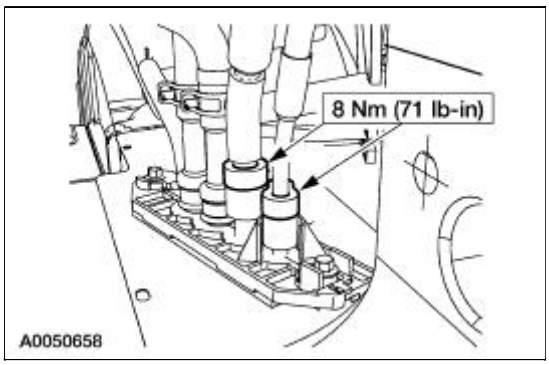
17. **NOTE:** If installing only one auxiliary evaporator line, cut only the desired line.

    Assemble and lay out the replacement line(s) in the same position as the existing line(s) and, using a suitable tool, cut the auxiliary evaporator line(s) in the same position as the fittings on



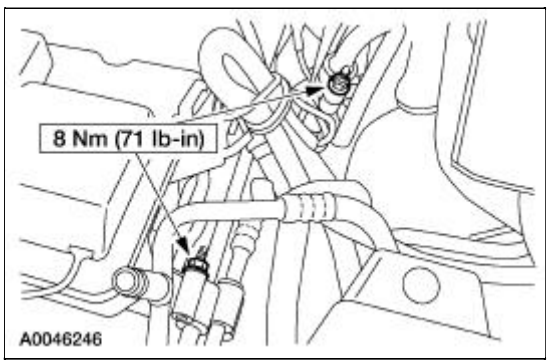
the new line(s).

18. Remove the auxiliary evaporator line(s) in three separate pieces.



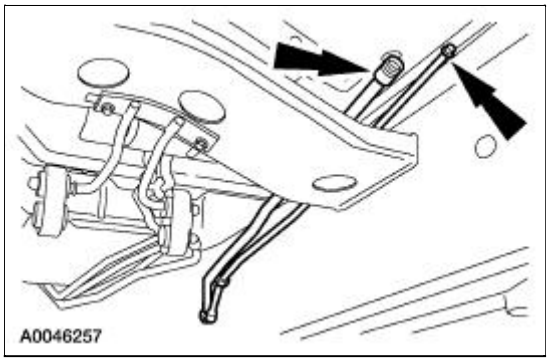
Installation

1. Partially lower the vehicle to allow access to both the rear auxiliary line fittings and the underside of the vehicle.

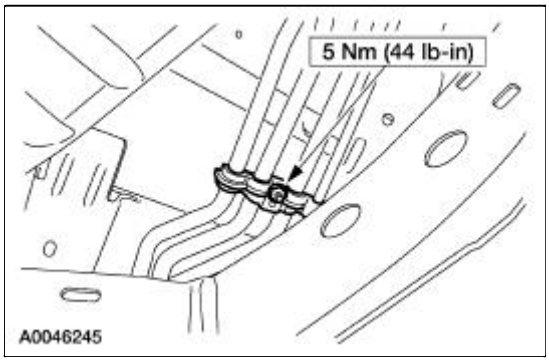


2. Position the rear portion of the auxiliary evaporator line(s) and install the line bracket and bolts.

3. Connect the A/C fittings.



4. Install the front auxiliary evaporator line(s) and connect the A/C fittings.
    - Install new O-ring seals lubricated in clean PAG oil.

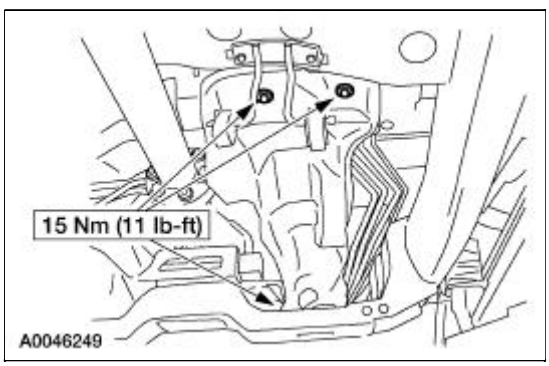


5. Raise the vehicle.

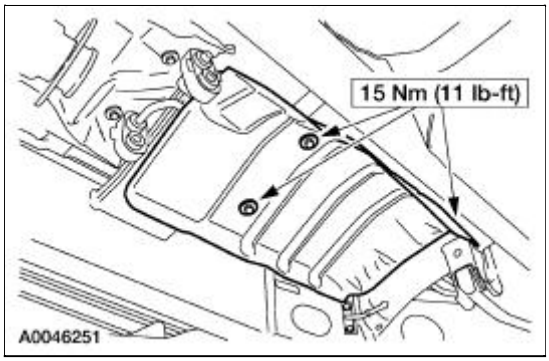
6. **NOTE:** Loosely connect, but do not tighten, the fittings.

   Install the middle auxiliary evaporator line(s).

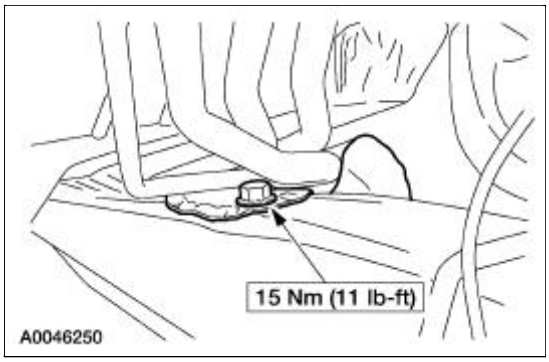
7. Starting from the rear of the vehicle, install the first three line brackets.



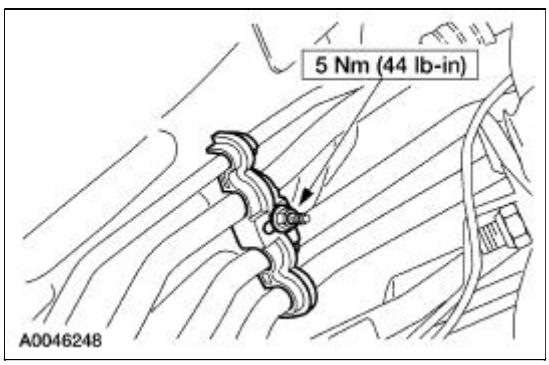
8. Tighten the middle auxiliary evaporator line fittings.



9. Inspect the auxiliary evaporator lines for correct installation. Loosen, reposition and tighten as needed.



10. Install the heat shield and the bolts.



11. Install the heat shield and the bolts.

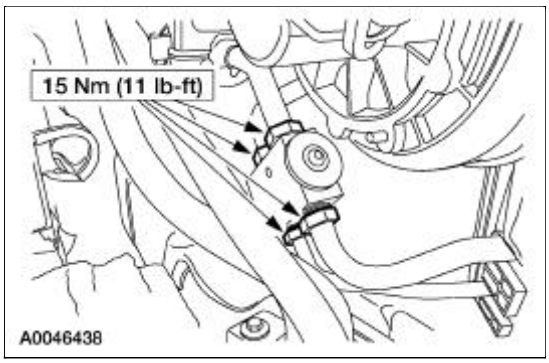
12. Install the RH catalytic converter. For additional information, refer to Section 309-00 .
13. Install the muffler. For additional information, refer to Section 309-00 .
14. Partially lower the vehicle.
15. Install the heat shield bolt.

16. Install the line bracket.

17. Lower the vehicle.
18. Install the spare tire.
19. Install the RH quarter trim panel. For additional information, refer to Section 501-05 .
20. Install the RH front fender splash shield.
21. Install the RH front wheel.
22. Install the spare tire and spare tire carrier splash shield.

23. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

24. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .



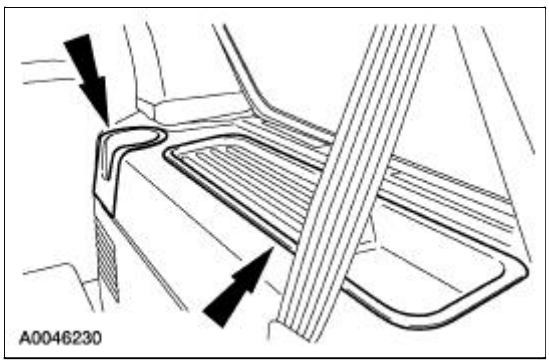
Thermostatic Expansion Valve

Material

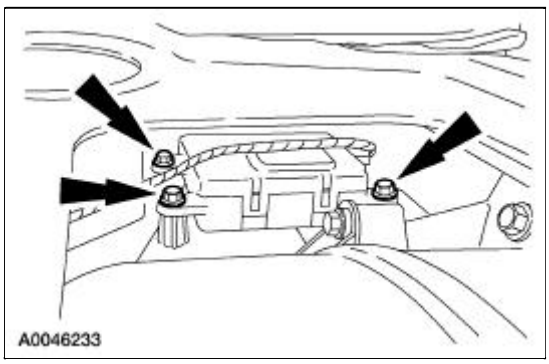
Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B

Removal and Installation

1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. Remove the RH quarter trim panel. For additional information, refer to Section 501-05 .
3. Disconnect the fittings and remove the thermostatic expansion valve.
   - Discard the O-ring seals.

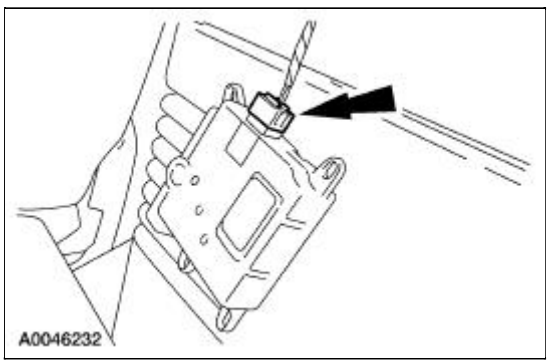


4. To install, reverse the removal procedure.
   - Install new O-ring seals lubricated in clean PAG oil.
   - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .
5. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .



Auxiliary Blend Door Actuator —Air Distribution

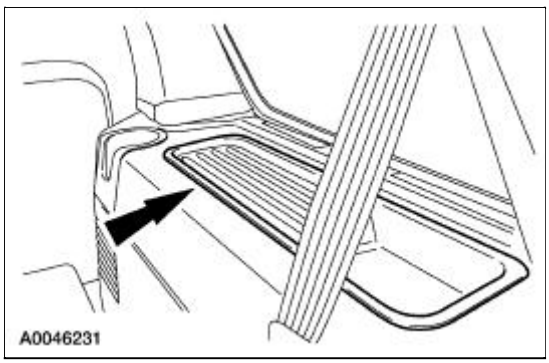
Removal and Installation



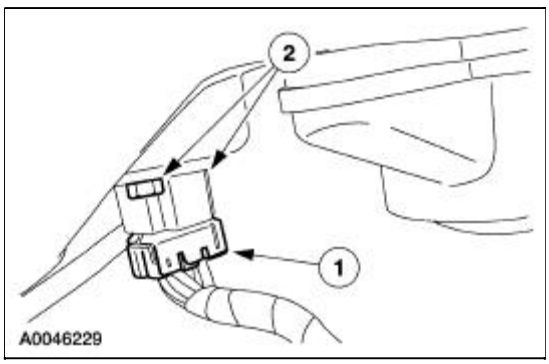
1. Remove the RH quarter trim panel cup holder and access panel.

2. Remove the screws.

3. Disconnect the blend door actuator electrical connector.



4. To install, reverse the removal procedure.

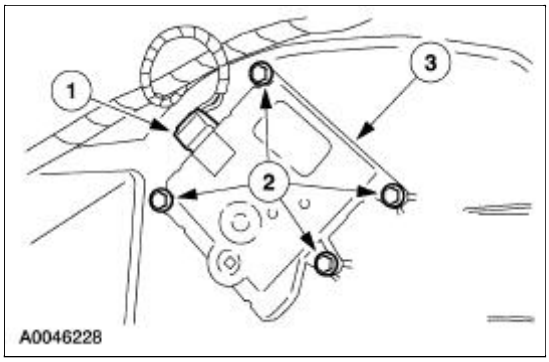


Blower Motor Resistor

Removal and Installation

1. Remove the RH quarter trim panel access panel.

2. Remove the blower motor resistor.
    1. Disconnect the blower motor resistor electrical connector.
    2. Remove the screws and the blower motor resistor.



3. To install, reverse the removal procedure.

Auxiliary Blend Door Actuator —Temperature

Removal and Installation

1. Remove the RH quarter trim panel. For additional information, refer to Section 501-05 .

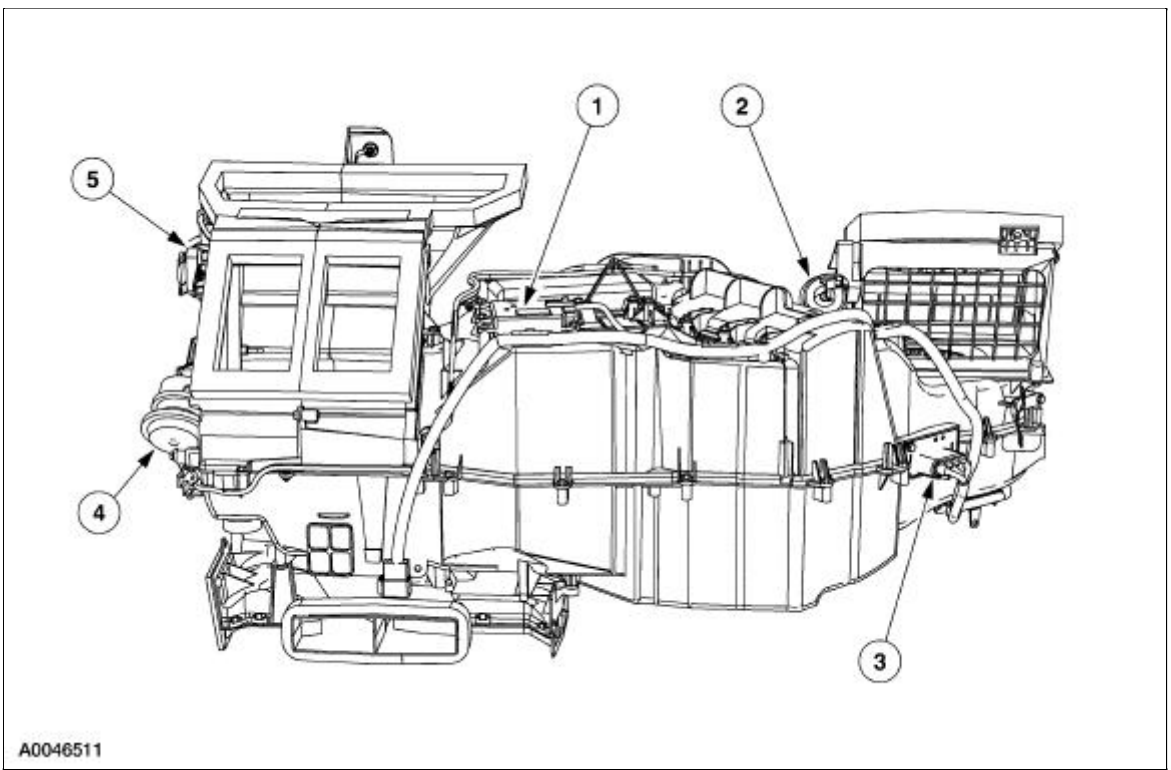
2. Remove the auxiliary temperature blend door actuator.
    1. Disconnect the temperature blend door actuator electrical connector.
    2. Remove the screws.
    3. Remove the auxiliary temperature blend door actuator.

3. To install, reverse the removal procedure.

Control Components

Three climate control systems are available:

- manual climate control (Expedition only)
- electronic automatic temperature control
- dual automatic temperature control



Refer to the appropriate heading below for information concerning each system.

Manual Climate Control

The manual climate control components are used to select:

- air inlet source (outside or recirculated).
- blower motor speed.
- discharge air temperature (temperature blend).
- discharge air location (defrost, panel, floor).
- A/C compressor operation.

Plenum Chamber Control Components — Manual

Item	Part Number	Description
1	19E616	Temperature blend door actuator

2	18A318	Air inlet door vacuum control motor
3	19A706	Blower motor resistor
4	18A318	Panel door vacuum control motor
5	18A318	Floor/defrost door vacuum control motor

Control System Inputs — Manual Climate Control

Function Selector Switch

The function selector switch combines a vacuum selector valve that determines air distribution and an electrical switch to supply battery voltage to the A/C compressor circuit and the blower motor circuit. When the function selector switch is in the MAX A/C, DEFROST or FLOOR/DEFROST positions, the A/C compressor will be operational regardless of the A/C request switch status.

Climate Control Assembly

The climate control assembly integrates the temperature control switch, A/C request button and rear defog switch into a single unit.

The temperature control switch setting determines air temperature. Temperature selection is accomplished with a potentiometer (temperature control switch) connected to the temperature blend door actuator. Movement of the temperature control switch from COOL (blue) to WARM (red) causes a corresponding movement of the temperature blend door and determines the air discharge temperature that the air distribution system will maintain. The temperature control switch is an integral part of the manual climate control assembly and cannot be installed separately.

The A/C request switch determines A/C compressor operation, except when the function selector switch is in the OFF, MAX A/C, DEFROST or FLOOR/DEFROST positions. The A/C request switch is an integral part of the manual climate control assembly and cannot be installed separately.

The rear defog button signals activation of the heated backlight and heated mirrors. The rear defog button is an integral part of the manual climate control assembly and cannot be installed separately.

Blower Motor Switch

The blower motor switch controls blower motor speed by supplying voltage to the blower resistor circuits.

Control System Outputs — Manual Climate Control

Blower Motor Resistor

The blower motor resistor:

- is located on the plenum chamber near the blower motor.
- has three resistor elements mounted on the resistor board to provide four blower motor speeds.
- has an overheating device (thermal limiter) that will open the resistor coil when the temperature reaches approximately 184°C (363°F), interrupting the blower motor operation in all speeds except high.
- is serviced as an assembly. The thermal limiter cannot be reset and is not serviceable.

Depending on the blower motor switch position, series resistance is added or bypassed in the blower motor circuit to decrease or increase blower motor speed.

Temperature Blend Door Actuator

The temperature blend door actuator:

- is located on the plenum chamber.
- moves the temperature blend door on command of the temperature control switch.
- contains a reversible electric motor.

Vacuum Control Motors

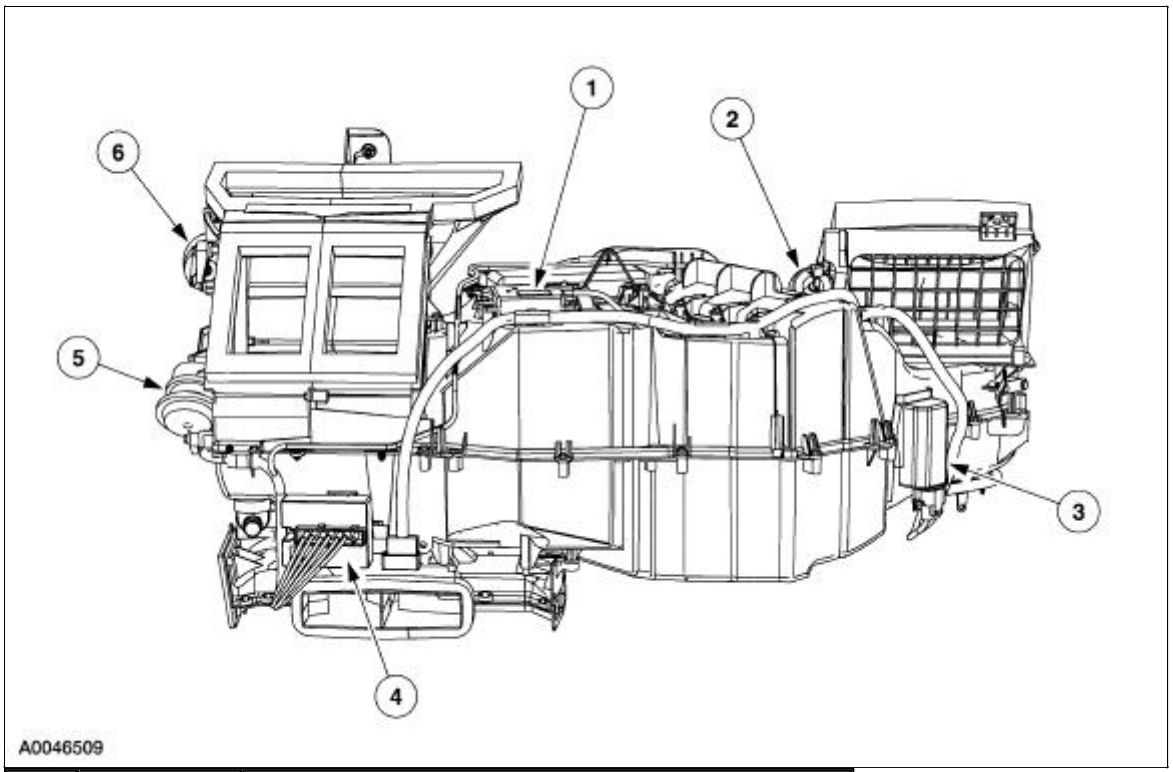
The three vacuum control motors have the following characteristics:

- They are actuated by the function selector switch.
- They position the plenum doors to direct system airflow to the vehicle interior as determined by the function selector switch settings.
- The air inlet door vacuum control motor is a single-diaphragm actuator with a single vacuum source.
- The airflow mode door vacuum control motors are double-diaphragm actuators with two separate vacuum sources to allow the actuator to fully retract or partially retract.
- When vacuum is applied to both vacuum sources, the actuator will fully retract.
- When vacuum is applied only to the partial stage vacuum source, the actuator will partially retract.

Coolant Control Valve

The coolant control valve is actuated by the air inlet vacuum circuit. When the air inlet vacuum circuit is closed (at full vacuum), coolant flow through the heater core is shut off and A/C cooling efficiency is increased.

Electronic Automatic Temperature Control



The electronic automatic temperature control (EATC) module analyzes input from the following major sources:

- temperature, function and blower selection (made by the vehicle occupants)
- in-vehicle temperature
- ambient temperature
- sunload
- vehicle speed
- engine coolant temperature

Using these inputs, the EATC module determines the correct conditions for the following outputs:

- A/C compressor operation
- blower speed
- temperature blend door position
- airflow door position
- coolant control valve

Plenum Chamber Control Components — EATC

Item	Part Number	Description
1	19E616	Temperature blend door actuator
2	18A318	Air inlet door vacuum control motor
3	19E624	Blower motor speed control
4	19D611	Automatic temperature control (ATC) solenoid and manifold
5	18A318	Floor/defrost door vacuum control motor
6	18A318	Panel door vacuum control motor

Control System Inputs—EATC

EATC Module (Climate Control Assembly)

The EATC module:

- is located in the instrument panel.
- has a vacuum fluorescent display for displaying set temperature, function and diagnostic trouble codes (DTCs).
- utilizes an on-board diagnostic (OBD) feature to supply the technician with diagnostic trouble codes (DTCs). These DTCs direct the technician to the inoperative component.

Steering Wheel Audio/Climate Control Switch

The steering wheel audio/climate control switch:

- is located on the right side of the steering wheel.

- allows the driver to adjust the passenger compartment temperature setting and manually override the blower motor speed setting.

For removal and installation of the steering wheel audio/climate control switch, refer to Section 415-01 .

Ambient Air Temperature Sensor

The ambient air temperature sensor:

- is located in front of the condenser core.
- provides a resistance value to a reference voltage from the EATC module that is proportional to the outside ambient temperature. The resulting voltage is then returned to the EATC module where it is interpreted as a temperature reading.

In-Vehicle Temperature Sensor

The in-vehicle temperature sensor operates in the following manner:

- A thermistor in the in-vehicle temperature sensor measures air temperature inside the passenger compartment.
- A hose and elbow is connected between the plenum chamber and the in-vehicle temperature sensor.
- Airflow through the plenum chamber creates a venturi-type suction through the hose which draws passenger compartment air through the in-vehicle temperature sensor and across the thermistor.

Solar Amplifier (Sunload Sensor)

The solar amplifier supplies sunload information to the EATC module. For information on the location and service of the solar amplifier, refer to Section 417-01 .

Control System Outputs—EATC

Automatic Temperature Control (ATC) Solenoid and Manifold

The ATC solenoid and manifold:

- is located on the plenum chamber in front of the front floor console.
- is controlled by the EATC module.
- uses solenoid-type valves to distribute vacuum to the vacuum control motors based on the settings of the EATC module.

Blower Motor Speed Control

The blower speed control:

- is located on the heater core and evaporator core housing near the blower motor.
- converts low power signals from the EATC module to a high current, variable ground feed for the blower motor.
- varies the blower motor speed and is controlled by the EATC module software.

- has a delay function to provide a gradual increase or decrease in blower motor speed under all conditions.
- controls the integral high blower speed relay which is engaged when maximum fan speed is selected.

Temperature Blend Door Actuator

The EATC system utilizes a temperature blend door actuator to control the temperature blend door. The temperature blend door actuator:

- is located on the plenum chamber.
- moves the temperature blend door on command from the EATC module.
- contains a reversible electric motor and a potentiometer. The potentiometer wiper is connected to the actuator output shaft and moves with the output shaft to indicate the position of the temperature blend door.
- receives a reference voltage to one end of the potentiometer. The voltage available at the wiper indicates the position of the potentiometer. The expressed value of the actuator wiper voltage is sent to the EATC module and is matched with an expected wiper voltage value. The EATC module then drives the actuator motor in whichever direction is necessary to make the actuator wiper voltage match the expected EATC module wiper voltage value.

Vacuum Control Motors

The three vacuum control motors have the following characteristics:

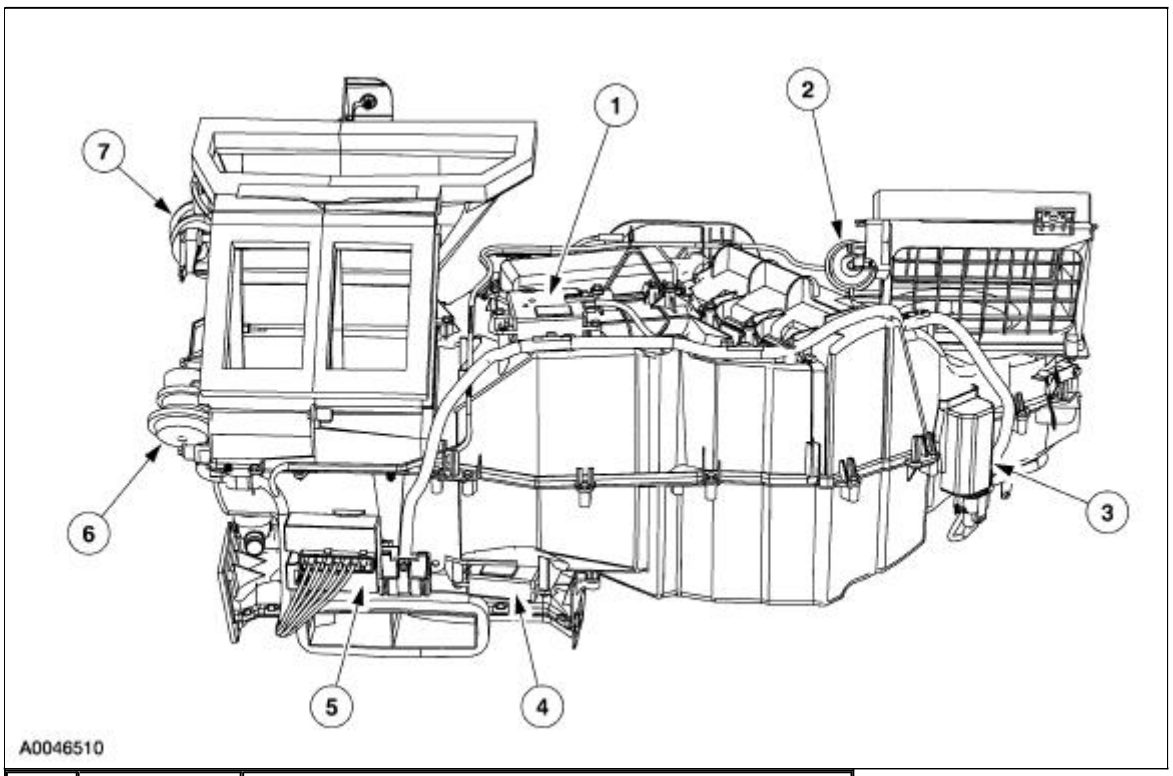
- They are actuated by the ATC solenoid and manifold based on input from the EATC module.
- They position the mode doors to direct system airflow to the vehicle interior as determined by the EATC module settings.
- The air inlet door vacuum control motor is a single-diaphragm actuator with a single vacuum source.
- The airflow mode door vacuum control motors are double-diaphragm actuators with two separate vacuum sources to allow the actuator to fully retract or partially retract.
- When vacuum is applied to both vacuum sources, the actuator will fully retract.
- When vacuum is applied only to the partial stage vacuum source, the actuator will partially retract.

Coolant Control Valve

The coolant control valve is actuated by the coolant control valve vacuum circuit. When the coolant control valve is closed (at full vacuum), coolant flow through the heater core is shut off and A/C cooling efficiency is increased.

Dual Automatic Temperature Control

The dual automatic temperature control (DATC) module analyzes input from the following major sources:



- temperature, function and blower selection (made by the vehicle occupants)
- in-vehicle temperature
- in-vehicle humidity (Navigator only)

- ambient temperature
- sunload
- vehicle speed
- engine coolant temperature

Using these inputs, the DATC module determines the correct conditions for the following outputs:

- A/C compressor operation
- blower speed
- LH side temperature blend door position
- RH side temperature blend door position
- panel airflow door position
- airflow door positions
- coolant control valve

Plenum Chamber Control Components — DATC

Item	Part Number	Description
1	19E616	Temperature blend door actuator — RH
2	18A318	Air inlet door vacuum control motor
3	19E624	Blower motor speed control
4	19E616	Temperature blend door actuator — LH
5	19D611	Automatic temperature control (ATC) solenoid and manifold
6	18A318	Floor/defrost door vacuum control motor

7	18A318	Panel door vacuum control motor

Control System Inputs—DATC

DATC Module (Climate Control Assembly)

The DATC module:

- is located in the instrument panel.
- has a vacuum fluorescent display for displaying set temperature, function and diagnostic trouble codes (DTCs).
- utilizes an on-board diagnostic (OBD) feature to supply the technician with diagnostic trouble codes (DTCs). These DTCs direct the technician to the inoperative component.

Steering Wheel Audio/Climate Control Switch

The steering wheel audio/climate control switch:

- is located on the right side of the steering wheel.
- allows the driver to adjust the passenger compartment temperature setting and manually override the blower motor speed setting.

For removal and installation of the steering wheel audio/climate control switch, refer to Section 415-01 .

Ambient Air Temperature Sensor

The ambient air temperature sensor:

- is located in front of the condenser core.
- provides a resistance value to a reference voltage from the DATC module that is proportional to the outside ambient temperature. The resulting voltage is then returned to the DATC module where it is interpreted as a temperature reading.

In-Vehicle Temperature/Humidity Sensor — Navigator

The in-vehicle temperature/humidity sensor operates in the following manner:

- A thermistor in the in-vehicle temperature/humidity sensor measures air temperature inside the passenger compartment.
- A humidity transducer in the in-vehicle temperature/humidity sensor measures in-vehicle humidity.
- A hose and elbow is connected between the plenum chamber and the in-car temperature/humidity sensor.
- Airflow through the plenum chamber creates a venturi-type suction through the hose which draws passenger compartment air through the in-vehicle temperature/humidity sensor and across the thermistor and humidity transducer.

In-Vehicle Temperature Sensor — Expedition

The in-vehicle temperature sensor operates in the following manner:

- A thermistor in the in-vehicle temperature sensor measures air temperature inside the passenger compartment.
- A hose and elbow is connected between the plenum chamber and the in-vehicle temperature sensor.
- Airflow through the plenum chamber creates a venturi-type suction through the hose which draws passenger compartment air through the in-vehicle temperature sensor and across the thermistor.

Dual Zone Solar Amplifier (Sunload Sensor) — Navigator

The solar amplifier is a dual zone type that supplies separate information to the DATC module indicating LH side and RH side sunload. For information on the location and service of the solar amplifier, refer to Section 417-01 .

Single Zone Solar Amplifier (Sunload Sensor) — Expedition

The solar amplifier supplies information to the DATC module indicating sunload. For information on the location and service of the solar amplifier, refer to Section 417-01 .

Control System Outputs—DATC

Automatic Temperature Control (ATC) Solenoid and Manifold

The ATC solenoid and manifold:

- is located on the plenum chamber in front of the front floor console.
- is controlled by the DATC module.
- uses solenoid-type valves to distribute manifold vacuum to the vacuum control motors based on the settings of the DATC module.

Blower Motor Speed Control

The motor blower speed control:

- is located on the heater core and evaporator core housing near the blower motor.
- converts low power signals from the DATC module to a high current, variable ground feed for the blower motor.
- varies the blower motor speed and is controlled by the DATC module software.
- has a delay function to provide a gradual increase or decrease in blower motor speed under all conditions.
- controls the integral high blower speed relay which is engaged when maximum fan speed is selected.

Temperature Blend Door Actuators

The DATC system utilizes two temperature blend door actuators to control two separate temperature blend doors that independently vary the LH and RH side temperature settings, as desired. The temperature blend door actuators:

- are located on the plenum chamber.
- move the temperature blend doors on command from the DATC module.
- contain a reversible electric motor and a potentiometer. The potentiometer wiper is connected to the actuator output shaft and moves with the output shaft to indicate the position of the temperature blend door.
- receive a reference voltage to one end of the potentiometer. The voltage available at the wiper indicates the position of the potentiometer. The expressed value of the actuator wiper voltage is sent to the DATC module and is matched with an expected wiper voltage value. The DATC module then drives the actuator motor in whichever direction is necessary to make the actuator wiper voltage match the expected DATC module wiper voltage value.

Vacuum Control Motors

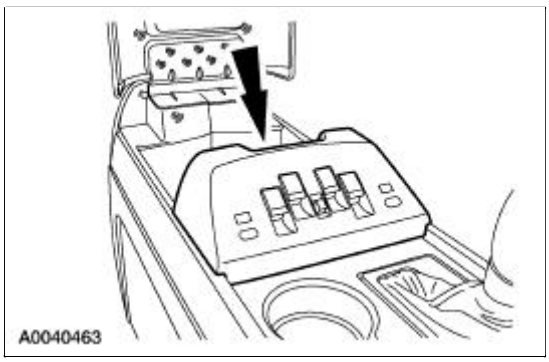
The three vacuum control motors have the following characteristics:

- They are actuated by the ATC solenoid and manifold based on input from the DATC module.
- They position the mode doors to direct system airflow to the vehicle interior as determined by the DATC module settings.
- The air inlet door vacuum control motor is a single-diaphragm actuator with a single vacuum source.
- The airflow mode door vacuum control motors are double-diaphragm actuators with two separate vacuum sources to allow the actuator to fully retract or partially retract.
- When vacuum is applied to both vacuum sources, the actuator will fully retract.
- When vacuum is applied only to the partial stage vacuum source, the actuator will partially retract.

Coolant Control Valve

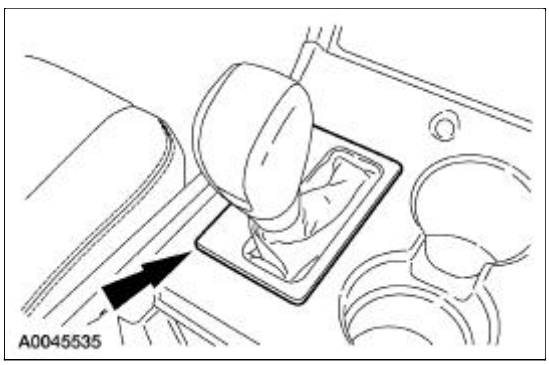
The coolant control valve is actuated by the coolant control valve vacuum circuit. When the coolant control valve is closed (at full vacuum), coolant flow through the heater core is shut off and A/C cooling efficiency is increased.

Control Components



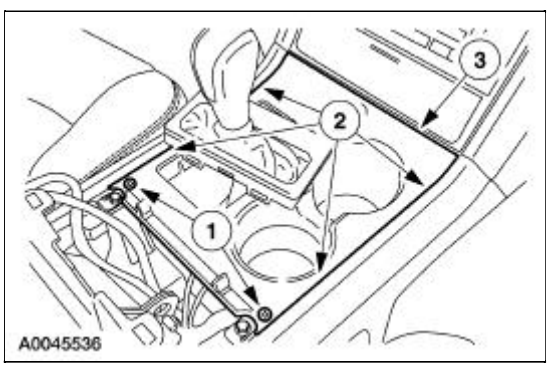
Refer to Section 412-00 .

Climate Control Assembly —EATC, DATC

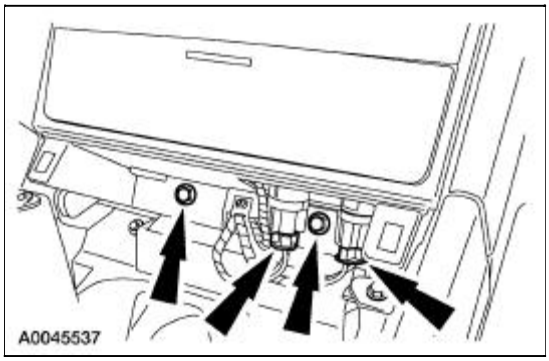


Removal and Installation

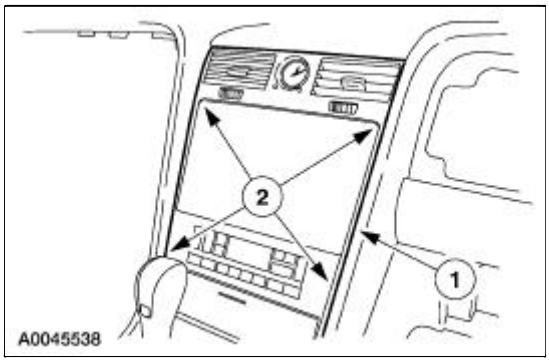
Navigator



1. Disconnect the negative battery cable. For additional information, refer to Section 414-00 .
2. Detach and position aside the switch housing.



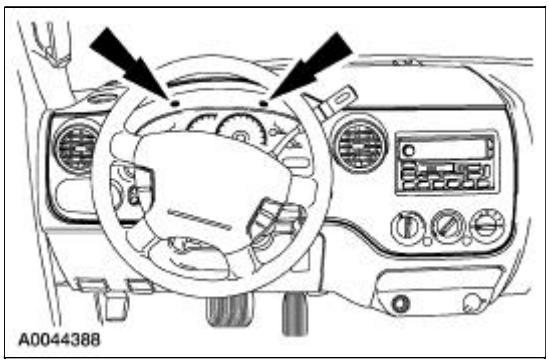
3. Detach the shift lever cover.
   - Disconnect the electrical connector.



4. Remove the center console trim panel.
   1. Remove the screws.
   2. Disengage the four clips.
   3. Remove the center console trim panel.

5. Disconnect the electrical connectors and remove the screws.

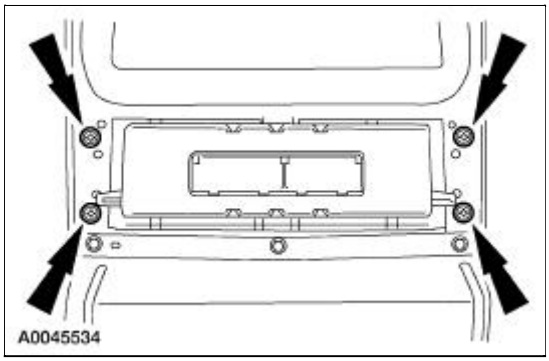
6. Remove the center instrument panel finish panel.
    1. Open the audio unit cover to the full open position.
    2. Disengage the four clips.
    - Disconnect the electrical connectors.



Expedition

7. Apply the parking brake and place the gear selector in (1).

8. Disconnect the negative battery cable. For additional information, refer to Section 414-00 .

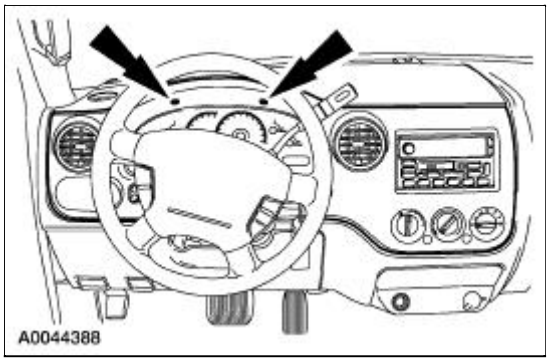


9. Remove the screws and the instrument cluster finish panel.
    - Disconnect the electrical connectors.

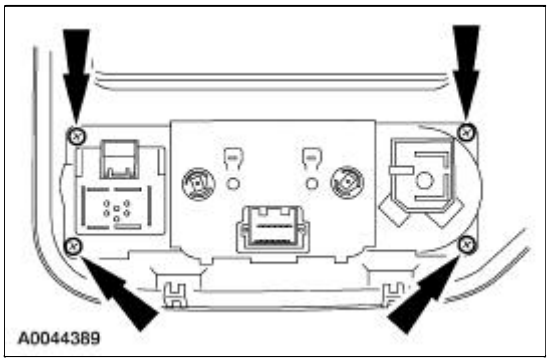
All vehicles

10. **NOTE:** Navigator shown, Expedition similar.

    Remove the screws and the climate control assembly.



11. To install, reverse the removal procedure.

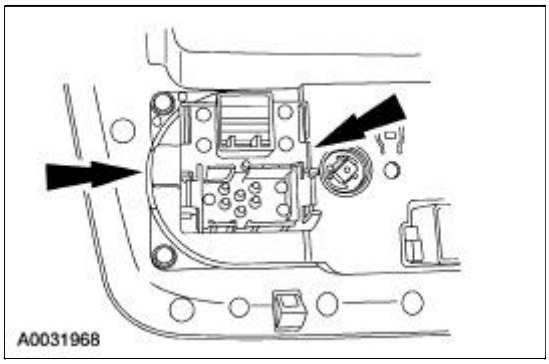


Climate Control Assembly —Manual

Removal and Installation

1. Remove the screws and the instrument cluster finish panel.
   - Disconnect the electrical connectors.

2. Remove the screws and the climate control assembly.

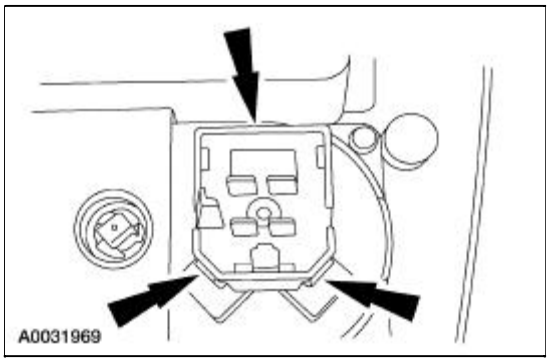


3. To install, reverse the removal procedure.

Function Selector Switch

Removal and Installation

1. Remove the manual climate control assembly. For additional information, refer to Climate Control Assembly—Manual in this section.
2. Pull and remove the function selector knob.
3. Release the clips and remove the function selector switch.

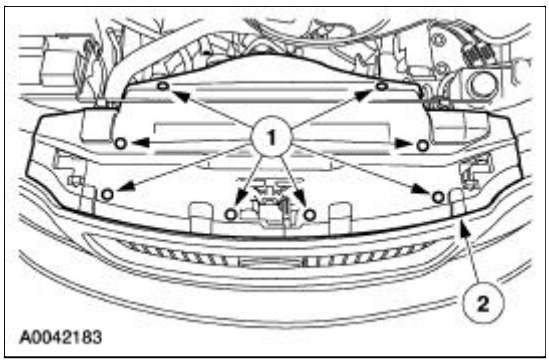


4. To install, reverse the removal procedure.

Blower Motor Switch

Removal and Installation

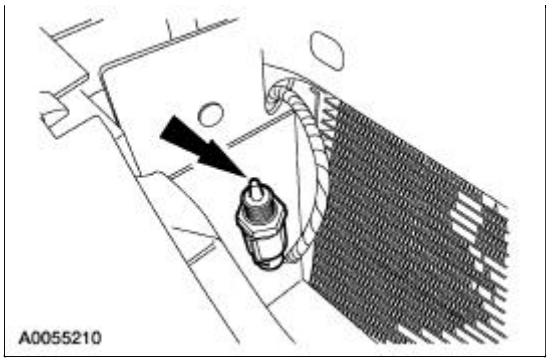
1. Remove the climate control assembly. For additional information, refer to Climate Control Assembly—Manual in this section.
2. Pull and remove the blower motor switch knob.
3. Release the clips and remove the blower motor switch.



4. To install, reverse the removal procedure.

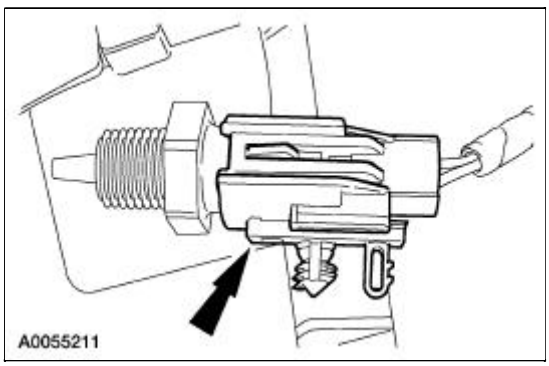
Ambient Air Temperature Sensor

Removal and Installation



Expedition

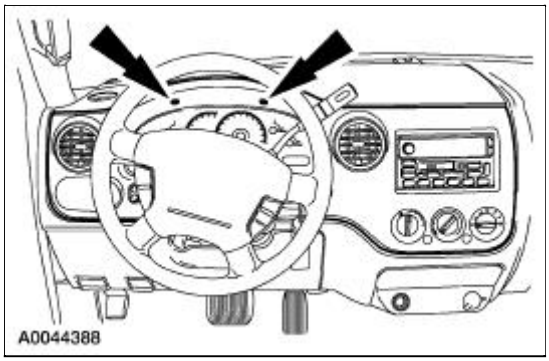
1. Remove the radiator sight shield.
    1. Remove the pin-type retainers.
    2. Remove the radiator sight shield.



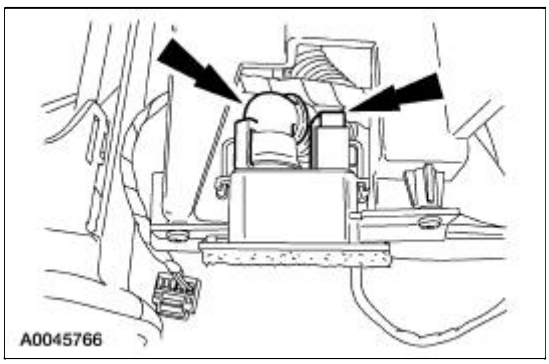
All vehicles

2. Detach the ambient temperature sensor pin-type retainer.

3. Disconnect the electrical connector and remove the ambient temperature sensor.

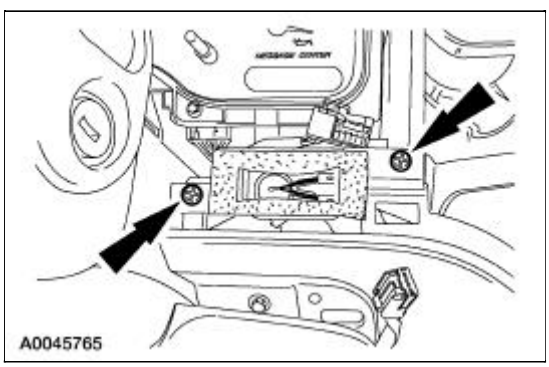


4. To install, reverse the removal procedure.



In-Vehicle Temperature Sensor

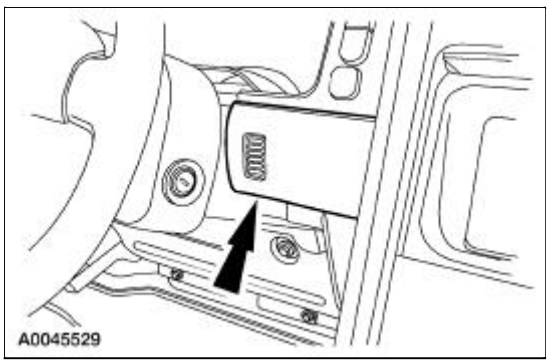
Removal and Installation



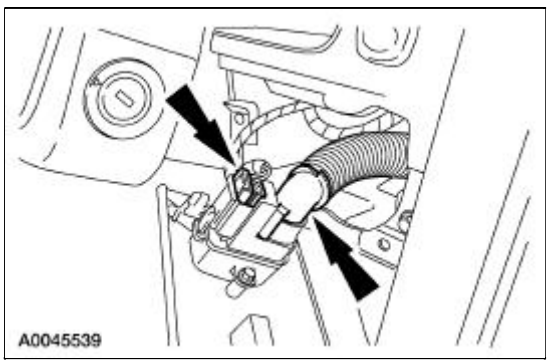
1. Remove the screws and the instrument cluster finish panel.
   - Disconnect the electrical connectors.

2. Disconnect the aspirator hose and the in-vehicle temperature sensor electrical connector.

3. Remove the screws and the in-vehicle temperature sensor.

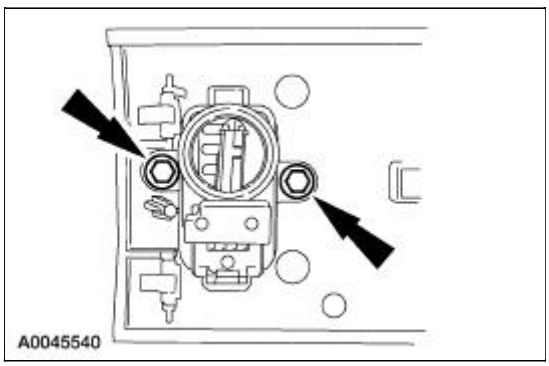


4. To install, reverse the removal procedure.



In-Vehicle Temperature and Humidity Sensor

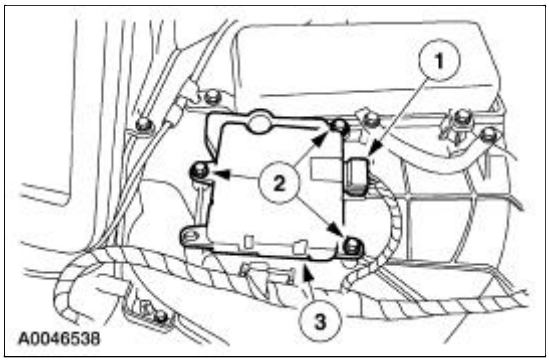
Removal and Installation



1. Remove the in-vehicle temperature and humidity sensor trim cover.

2. Disconnect the aspirator hose and the in-vehicle temperature and humidity sensor electrical connector.

3. Remove the screws and the in-vehicle temperature and humidity sensor.



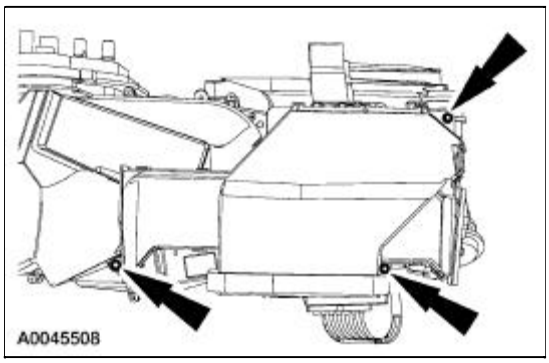
4. To install, reverse the removal procedure.

Temperature Blend Door Actuator —RH

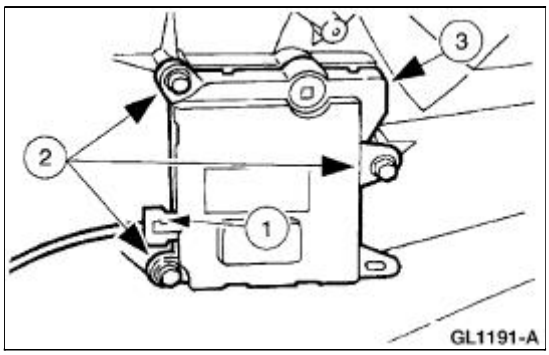
Removal and Installation

1. Remove the instrument panel. For additional information, refer to Section 501-12 .

2. Remove the temperature blend door actuator.
    1. Disconnect the temperature blend door actuator electrical connector.
    2. Remove the screws.
    3. Remove the temperature blend door actuator.



3. To install, reverse the removal procedure.

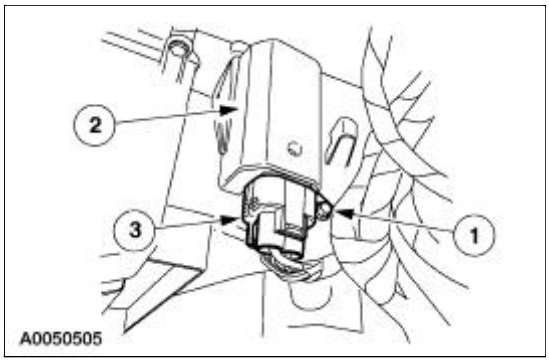


Temperature Blend Door Actuator —LH

Removal and Installation

1. Remove the plenum chamber. For additional information, refer to Section 412-01 .
2. Remove the screws and the floor duct.

3. Remove the temperature blend door actuator.
    1. Disconnect the temperature blend door actuator electrical connector.
    2. Remove the screws.
    3. Remove the temperature blend door actuator.



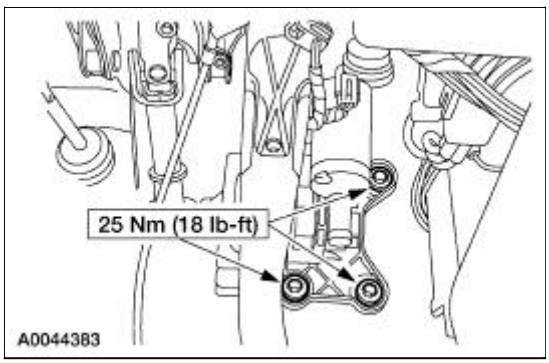
4. To install, reverse the removal procedure.

Blower Motor Speed Control

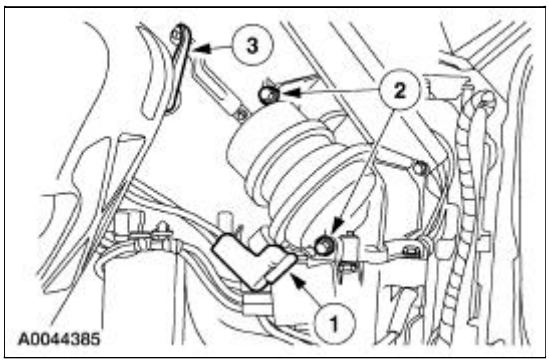
Removal and Installation

1. Remove the RH lower instrument panel insulator.

2. Remove the blower motor speed control.
    1. Remove the screw.
    2. Remove the blower motor speed control.
    3. Disconnect the blower motor speed control electrical connector.



3. To install, reverse the removal procedure.



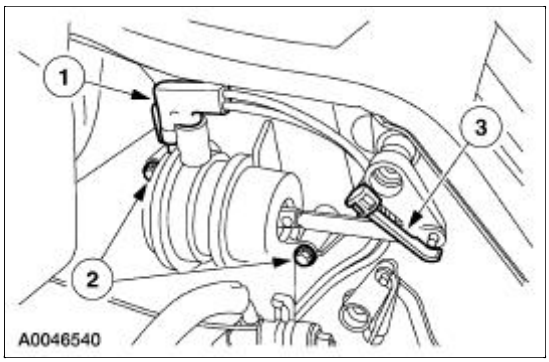
Vacuum Control Motor —Floor/Defrost Door

Removal and Installation

1. Remove the bolts and position aside the accelerator pedal.

2. Remove the floor/defrost door vacuum control motor.
    1. Disconnect the vacuum connector.
    2. Remove the screws.
    3. Rotate the floor/defrost door vacuum control motor to clear the retaining arm.

3. Remove the floor/defrost door vacuum control motor.



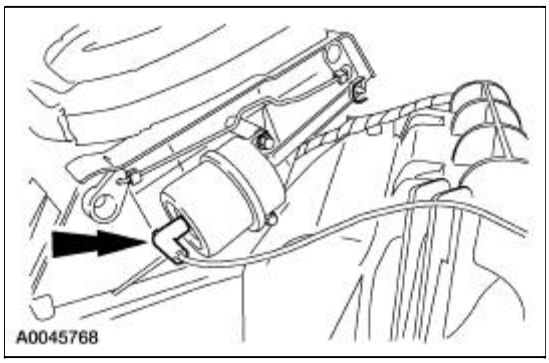
4. To install, reverse the removal procedure.

Vacuum Control Motor —Panel Door

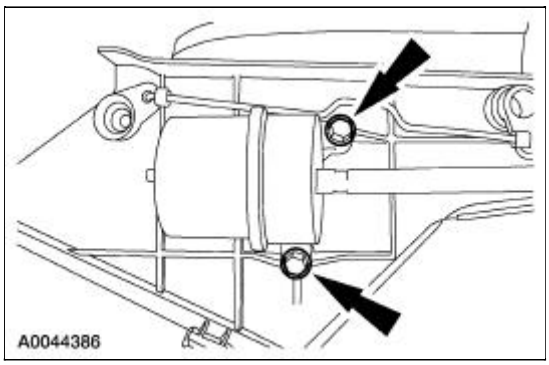
Removal and Installation

1. Remove the instrument panel. For additional information, refer to Section 501-12 .

2. Remove the panel door vacuum control motor.
    1. Disconnect the vacuum connector.
    2. Remove the screws.
    3. Rotate the panel door vacuum control motor to clear the retaining arm.
    - Remove the panel door vacuum control motor.



3. To install, reverse the removal procedure.

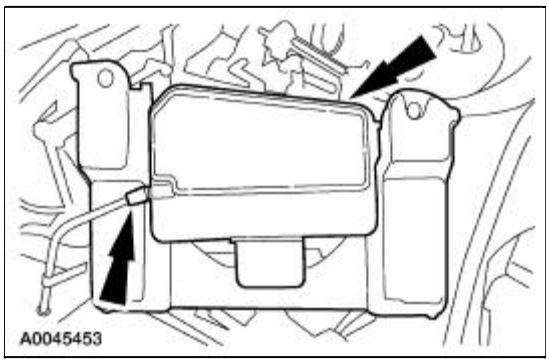


Vacuum Control Motor —Air Inlet Door

Removal and Installation

1. Remove the instrument panel. For additional information, refer to Section 501-12 .
2. Disconnect the vacuum connector.

3. Remove the screws and the air inlet door vacuum control motor.

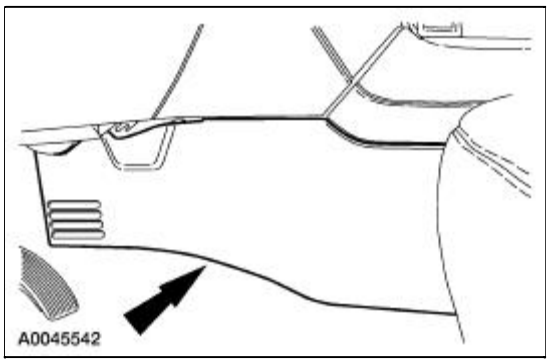


4. To install, reverse the removal procedure.

Vacuum Reservoir

Removal and Installation

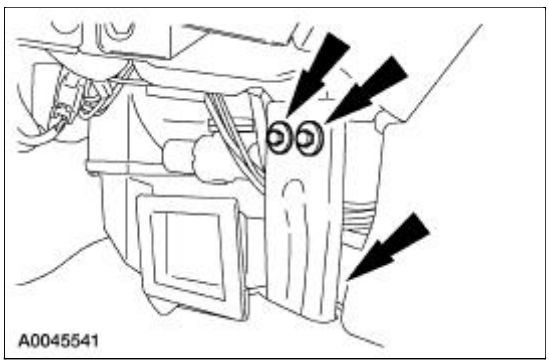
1. Remove the battery and battery tray. For additional information, refer to Section 414-01 .
2. Disconnect the vacuum hose and remove the vacuum reservoir.



3. To install, reverse the removal procedure.

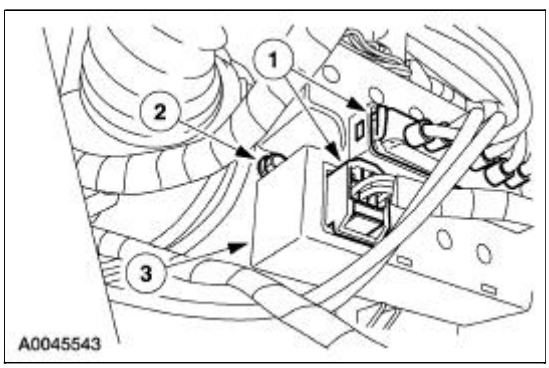
Automatic Temperature Control Solenoid and Manifold

Removal and Installation



Navigator

1. Remove the floor console trim panel.



Expedition

2. Remove the bolts and the instrument panel brace.

All vehicles

3. Remove the automatic temperature control (ATC) solenoid and manifold.
    1. Disconnect the vacuum and electrical connectors.
    2. Remove the screw.
    3. Remove the ATC solenoid and manifold.

4. To install, reverse the removal procedure.

Instrument Cluster and Panel Illumination

The instrument cluster and panel lighting system illuminates the following components:

- A4WD mode switch
- adjustable pedal switch
- ash receptacle
- cigar lighter
- manual A/C control assembly
- electronic automatic temperature control (EATC)
- auxiliary climate control (front, rear)
- electric clock (Navigator only)
- headlamp switch
- heated back window switch and light
- instrument cluster
- message center switch
- exterior rear view mirror control
- power door lock switches (front left, front right)
- power window switches
- power rear quarter window switches
- sliding roof panel switch
- audio unit
- radio and A/C rear integral control panel (RICP)
- steering wheel switches

Instrument Cluster and Panel Illumination

Refer to Wiring Diagrams Cell 71 , Instrument Illumination for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Inspection and Verification

NOTE: Upon installation of a new instrument cluster, the module must be reconfigured. For additional information, refer to Section 418-01 .

1. Verify the customer concern by operating the instrument illumination.
2. Visually inspect for obvious signs of electrical damage; refer to the following chart.

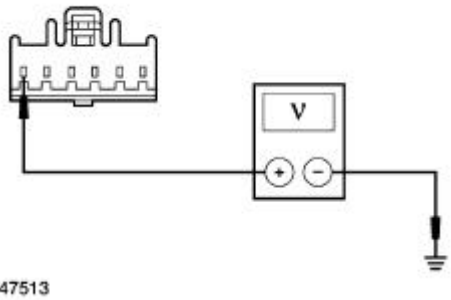
Visual Inspection Chart

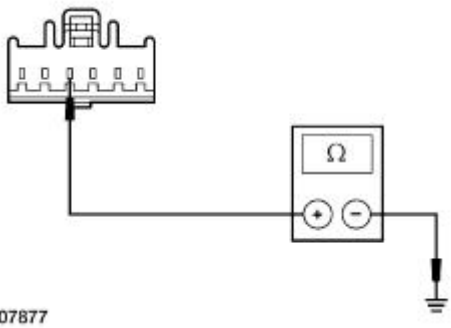
Electrical
● Central junction box (CJB) fuse(s): ■ 6 (15A) ■ 22 (10A) ● Wiring harness ● Headlamp switch ● Dimmer module (Navigator only)

3. If the fault is not visually evident, determine the symptom and proceed to the Symptom Chart.

Symptom Chart

Symptom Chart

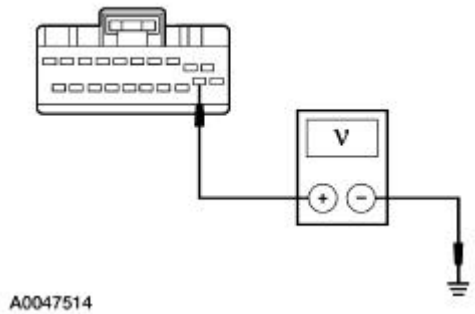


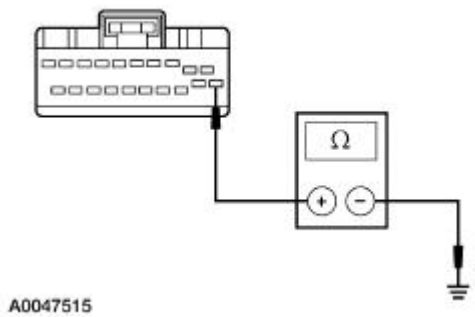


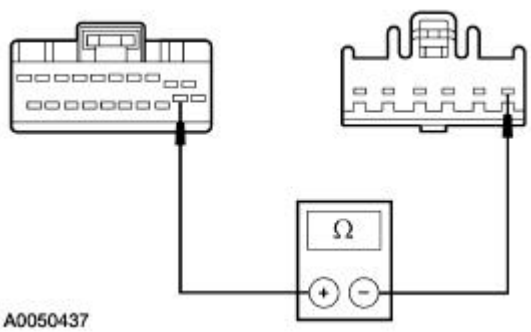
Condition	Possible Sources	Action
● The control illumination is inoperative	● Central Junction Box (CJB) Fuse 6 (15A). ● Circuitry. ● Headlamp switch.	● Go To Pinpoint Test A .
● The instrument cluster illumination is inoperative	● Bulb(s). ● Circuitry. ● Instrument cluster. ● Headlamp switch	● Go To Pinpoint Test B .
● The climate control illumination is inoperative	● Circuitry. ● Bulb(s).	● Go To Pinpoint

	• Electronic automatic temperature control (EATC).	Test C .
• The audio system illumination is inoperative	• Circuitry. • Audio unit.	• Go To Pinpoint Test D .
• A single illumination source is inoperative	• Bulb. • Circuitry. • Switch.	• Go To Pinpoint Test E .
• The power window switch(es) illumination source is inoperative — Expedition only	• Circuitry. • Switch.	• Go To Pinpoint Test F .
• The steering wheel control (SWC) switches illumination source is inoperative	• Circuitry. • SWC. • Clockspring.	• Go To Pinpoint Test G .
• One or more module controlled illumination source is inoperative — Navigator only	• Circuitry. • Dimmer module.	• Go To Pinpoint Test H .

Pinpoint Tests



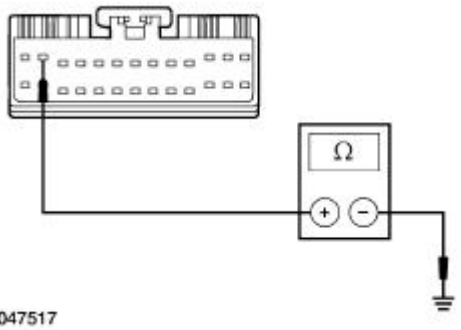


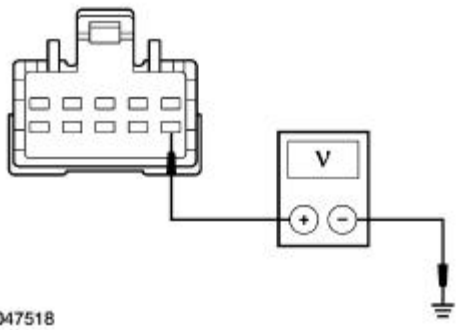


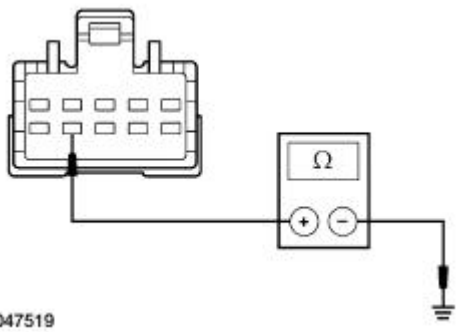
PINPOINT TEST A: THE CONTROL ILLUMINATION IS INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK EXTERIOR LAMPS	
• Place the headlamp switch in the ON position. • **Are the exterior lamps on?**	**Yes** GO to A2 . **No** REFER to Section 417-01 .
A2 CHECK HEADLAMP SWITCH	
• Place the headlamp switch in the OFF position. • Disconnect: Headlamp Switch C205a and C205b. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** RECONNECT the headlamp switch C205a. GO to A3 . **No** INSTALL a new headlamp switch; REFER to Section 417-01 . TEST the system for normal operation.
A3 CHECK CIRCUIT 14 (BN) FOR AN OPEN	
• Turn the headlamp switch to the parking lamps ON position. • Measure the voltage between the headlamp switch C205b pin 6, circuit 14 (BN), harness side and ground, while the headlamp switch is in the parking lamps ON position.	**Yes** GO to A4 . **No** REPAIR the circuit. TEST the system for normal operation.

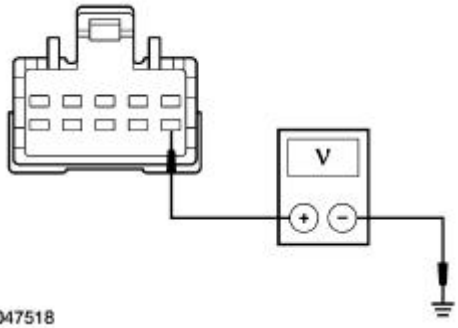
 A0047513 ● **Is the voltage greater than 10 volts?**	
A4 CHECK CIRCUIT 57 (BK) FOR AN OPEN	**Yes** For Expedition, REPAIR circuit 19 (LB/RD). For Navigator, REPAIR circuit 505 (GY/YE). TEST the system for normal operation. **No** REPAIR circuit 57 (BK). TEST the system for normal operation.
● Turn the headlamp switch off. ● Measure the resistance between the headlamp switch C205b pin 4, circuit 57 (BK), harness side and ground.  A0007877 ● **Is the resistance less than 5 ohms?**	

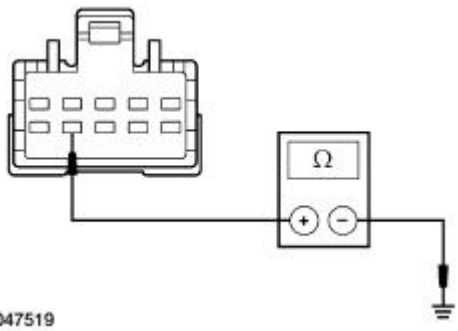


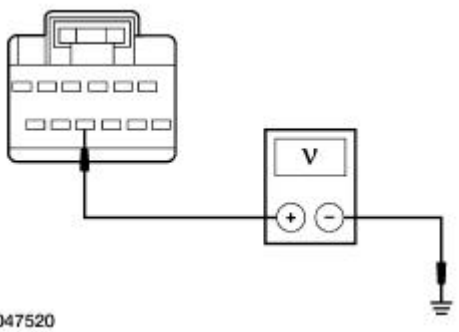




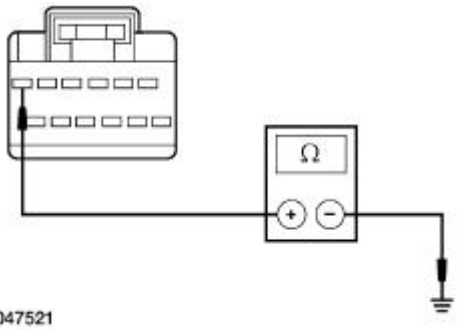
PINPOINT TEST B: THE INSTRUMENT CLUSTER ILLUMINATION IS INOPERATIVE





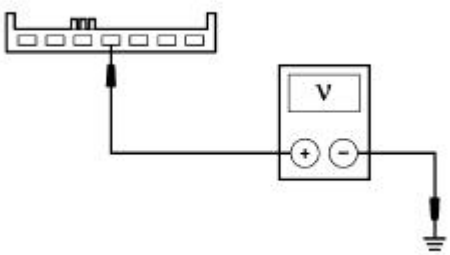


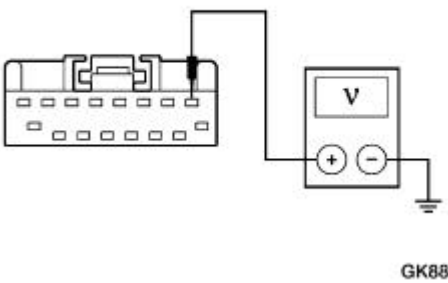
Test Step	Result / Action to Take
B1 MONITOR THE INSTRUMENT PANEL DIMMER SWITCH INPUT TO THE INSTRUMENT CLUSTER	
● Carry out the instrument cluster self-diagnostic mode. Refer to Section 413-01 . ● Advance the self-diagnostic mode until PWM_DIM_INPUT is displayed on the message center (Expedition/Navigator with message center) or rhO is displayed on the odometer (Expedition with base cluster). ● Turn the headlamp switch to the parking lamps ON position. ● Rotate the instrument panel dimmer switch from the full dim to the full illumination positions while observing the odometer display. ● **Does the value displayed vary from 1 in the full dim position to 22 in the full illumination position?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. **No** GO to B2 .
B2 CHECK VOLTAGE TO INSTRUMENT CLUSTER ILLUMINATION	
● Key in OFF position. ● Turn the headlamp switch off. ● Disconnect: Instrument Cluster C220a. ● Turn the headlamp switch to the parking lamps ON position. ● Rotate the instrument panel dimmer switch to the full illumination position. ● Measure the voltage between the instrument cluster C220a pin 12,	**Yes** GO to B3 . **No** GO to B4 .



circuit 505 (GY/YE) (Navigator), harness side and ground; or between the instrument cluster C220a pin 12, circuit 19 (LB/RD) (Expedition), harness side and ground.  A0047514 • **Is the voltage greater than 10 volts?**	
B3 CHECK GROUND CIRCUIT TO INSTRUMENT CLUSTER	
• Turn the headlamp switch off. • Measure the resistance between the instrument cluster C220a pin 11, circuit 57 (BK), harness side and ground.  A0047515 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
B4 CHECK CIRCUIT 505 (GY/YE) (NAVIGATOR) OR CIRCUIT 19 (LB/RD) (EXPEDITION)	
• Disconnect: Headlamp/Instrument Panel Dimmer Switch C205b. • Measure the resistance between the instrument cluster C220a pin 12, circuit 505 (GY/YE) (Navigator) or circuit 19 (LB/RD) (Expedition) harness side and headlamp switch C205b pin 1, circuit 505 (GY/YE) (Navigator) or circuit 505 (GY/YE) (Navigator) or circuit 19 (LB/RD) (Expedition), harness side.  A0050437 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new instrument panel dimmer switch. REFER to Instrument Panel Dimmer Switch in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST C: THE CLIMATE CONTROL ILLUMINATION IS INOPERATIVE





Test Step	Result / Action to Take
C1 VERIFY THE CLIMATE CONTROL ILLUMINATION OPERATION	
• Turn the headlamp switch to the parking lamps ON position. • Rotate the instrument panel dimmer switch to the full illumination position. • **Does the climate control illumination operate correctly?**	**Yes** System is OK. **No** If the EATC illumination does not operate correctly, GO to C2 . If the front auxiliary climate control illumination does not operate correctly, GO to C4 . If the rear auxiliary climate control illumination does not operate correctly, GO to C6 . If the manual climate control illumination does not operate correctly, GO to C8 .
C2 CHECK VOLTAGE TO THE EATC ILLUMINATION	
• Disconnect: EATC C228a. • Measure the voltage between the EATC C228a pin 14, circuit 235 (RD/BK) (Navigator), harness side and ground; or between the EATC C228a pin 14, circuit 19 (LB/RD) (Expedition), harness side and ground.  A0047516 • **Are the voltages greater than 10 volts?**	**Yes** GO to C3 . **No** REPAIR the circuit. TEST the system for normal operation.
C3 CHECK EATC GROUND	
• Measure the resistance between the EATC C228a pin 2, circuit 875 (BK/LB), harness side and ground.	**Yes** INSTALL a new EATC. REFER to Section 412-04 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

 A0047517 ● **Is the resistance less than 5 ohms?**	
C4 CHECK THE VOLTAGE TO THE FRONT AUXILIARY CLIMATE CONTROL	
● Disconnect: Front Auxiliary Climate Control C989b. ● Measure the voltage between the front auxiliary climate control C989b pin 6, circuit 19 (LB/RD), harness side and ground.  A0047518 ● **Is the voltage greater than 10 volts?**	**Yes** GO to C5 . **No** REPAIR the circuit. TEST the system for normal operation.
C5 CHECK THE GROUND CIRCUIT TO THE FRONT AUXILIARY CLIMATE CONTROL	
● Measure the resistance between the front auxiliary climate control C989b pin 9, circuit 57 (BK), harness side and ground.  A0047519 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new front auxiliary climate control assembly. REFER to Section 412-04 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
C6 CHECK THE VOLTAGE TO THE REAR AUXILIARY CLIMATE CONTROL	
● Disconnect: Rear Auxiliary Climate Control C3198b. ● Measure the voltage between the rear auxiliary climate control C3198b pin 6, circuit 1417 (LG/RD) (Navigator), harness side and ground; or between the rear auxiliary climate control C3198b pin 6, circuit 19 (LB/RD) (Expedition), harness side and ground.	**Yes** GO to C7 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0047518 ● **Is the voltage greater than 10 volts?**	
C7 CHECK THE GROUND CIRCUIT TO THE REAR AUXILIARY CLIMATE CONTROL	
● Measure the resistance between the rear auxiliary climate control C3198b pin 9, circuit 57 (BK), harness side and ground.  A0047519 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new rear auxiliary climate control assembly. REFER to Section 412-04 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
C8 CHECK THE VOLTAGE TO THE MANUAL CLIMATE CONTROL	
● Disconnect: Function Selector Switch C294c. ● Measure the voltage between the function selector switch C294c pin 10, circuit 19 (LB/RD), harness side and ground.  A0047520 ● **Is the voltage greater than 10 volts?**	**Yes** GO to C9 . **No** REPAIR the circuit. TEST the system for normal operation.
C9 CHECK THE GROUND CIRCUIT TO THE MANUAL CLIMATE CONTROL	
● Measure the resistance between the function selector switch C294c pin 6, circuit 57 (BK), harness side and ground.	**Yes** INSTALL a new manual climate control assembly. REFER to Section 412-04 . TEST the system for normal operation. **No** REPAIR the circuit.

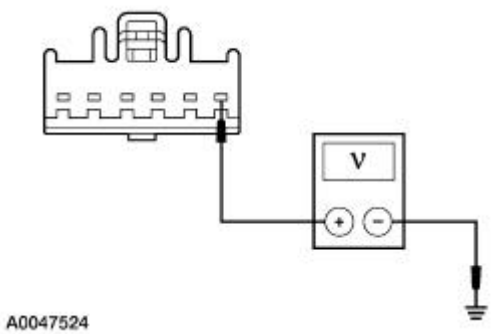
 ● **Is the resistance less than 5 ohms?**	TEST the system for normal operation.

PINPOINT TEST D: THE AUDIO SYSTEM ILLUMINATION IS INOPERATIVE

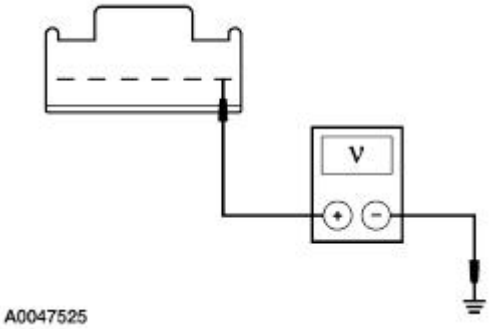
Test Step	Result / Action to Take
D1 CHECK VOLTAGE TO AUDIO UNIT	
● Disconnect: Audio Unit C2188a (with Navigation system) or C290a (without Navigation system). ● Turn the headlamp switch to the parking lamps ON position. ● Rotate the instrument panel dimmer switch to the full illumination position. ● Measure the voltage between the audio unit C2188a pin 4, circuit 235 (RD/BK) (Navigator with navigation system), harness side and ground; or between the audio unit C2188a pin 4, circuit 19 (LB/RD) (Expedition with navigation system), harness side and ground.  ● Measure the voltage between the audio unit C290a pin 1, circuit 235 (RD/BK) (Navigator without navigation system), harness side and ground; or between the audio unit C290a pin 1, circuit 19 (LB/RD) (Expedition without navigation system), harness side and ground.  ● **Is the voltage greater than 10 volts?**	**Yes** GO to D2 . **No** REPAIR circuit 235 (RD/BK) (Navigator) or circuit 19 (LB/RD) (Expedition). TEST the system for normal operation.

D2 CHECK GROUND TO AUDIO UNIT	
• Measure the resistance between the audio unit C2188a (with navigation system) pin 2, circuit 57 (BK) or between the audio unit C290a (without navigation system) pin 2, circuit 57 (BK), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST E: A SINGLE ILLUMINATION SOURCE IS INOPERATIVE



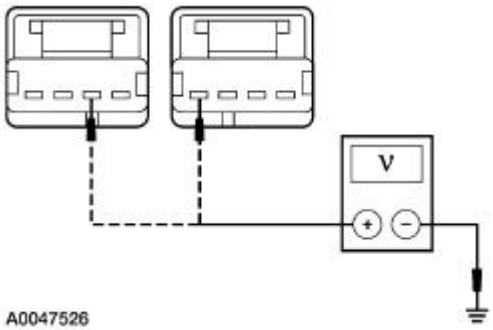
Test Step	Result / Action to Take
E1 CHECK VOLTAGE TO THE INOPERATIVE ILLUMINATION SOURCE	
• Disconnect: Inoperative Illumination Source. • Turn the headlamp switch to the parking lamps ON position. • Rotate the instrument panel dimmer switch to the full illumination position. • Measure the voltage between the inoperative illumination source, circuit 19 (LB/RD), circuit 194 (PK) (Expedition only), circuit 235 (RD/BK) (Navigator only), or circuit 1417 (LG/RD) (Navigator only), harness side and ground. • **Is the voltage greater than 10 volts?**	**Yes** GO to E2 . **No** REPAIR circuit 19 (LB/RD), circuit 194, (PK), circuit 235 (RD/BK), or circuit 1417 (RD/BK). TEST the system for normal operation.
E2 CHECK INOPERATIVE ILLUMINATION SOURCE GROUND	
• Measure the resistance between the inoperative illumination source, circuit 57 (BK), harness side and ground. • **Is the resistance less than 5 ohms?**	**Yes** If the bulb(s) are damaged, INSTALL new bulb(s). Otherwise, INSTALL a new component. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

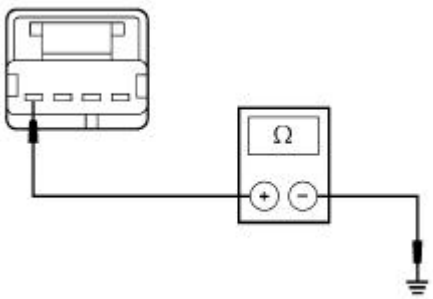


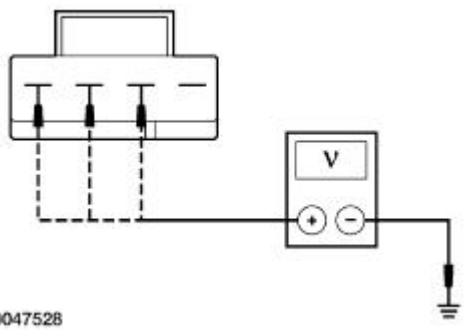
PINPOINT TEST F: THE POWER WINDOW SWITCH(ES) ILLUMINATION SOURCE IS INOPERATIVE — EXPEDITION ONLY

Test Step	Result / Action to Take
F1 CHECK POWER WINDOW OPERATION	
• Key in ON position.	**Yes**

• Turn the headlamp switch to the parking lamps ON position. • Rotate the instrument panel dimmer switch to the full illumination position. • Operate the power window switch in both up and down directions. • **Does the power window operate in both up and down directions?**	INSTALL a new power window switch assembly. REFER to Section 501-11 **No** REFER to Section 501-11 .







PINPOINT TEST G: THE STEERING WHEEL CONTROL (SWC) SWITCHES ILLUMINATION SOURCE IS INOPERATIVE

Test Step	Result / Action to Take
G1 CHECK SPEED CONTROL SYSTEM	
• Operate the speed control system. • **Does the speed control system operate correctly?**	**Yes** GO to G2 . **No** REFER to Section 310-03 .
G2 CHECK VOLTAGE TO THE CLOCKSPRING CONNECTOR	
• Key in OFF position. • Disconnect: Clockspring C218b. • Turn the headlamp switch to the parking lamps ON position. • Rotate the instrument panel dimmer switch to the full illumination position. • Measure the voltage between the clockspring C218b pin 1, circuit 19 (LB/RD), harness side and ground.  A0047524 • **Is the voltage greater than 10 volts?**	**Yes** GO to G3 . **No** REPAIR the circuit. TEST the system for normal operation.
G3 CHECK THE CLOCKSPRING	
• Connect: Clockspring C218b. • Deactivate the air bag system; refer to Section 501-20B . • Disconnect: Steering Wheel Connector(s). • Measure the voltage between the top of the clockspring connector pin 1, circuit 19 (LB/RD), harness side and ground.	**Yes** GO to G4 . **No** INSTALL a new clockspring. REFER to Section 501-20B . TEST the system for normal operation.

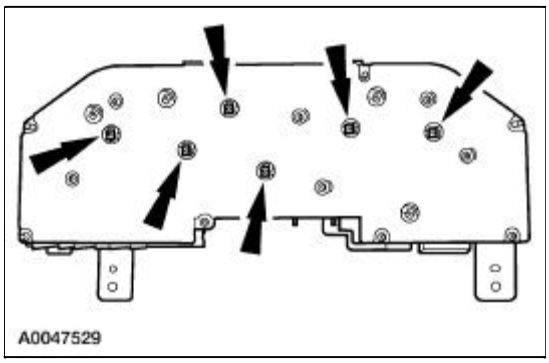
 ● **Is the voltage greater than 10 volts?**	
G4 CHECK STEERING WHEEL CONTROL SWITCH HARNESS	
● Inspect the steering wheel control switch harness for shorts, opens, or any damage. ● **Is the steering wheel control switch harness OK?**	**Yes** INSTALL new steering wheel control switch(es). REFER to Section 415-01 . TEST the system for normal operation. **No** INSTALL a new steering wheel control switch harness. TEST the system for normal operation.

PINPOINT TEST H: ONE OR MORE MODULE CONTROLLED ILLUMINATION SOURCE IS INOPERATIVE — NAVIGATOR ONLY

Test Step	Result / Action to Take
H1 CHECK THE MODULE CONTROLLED ILLUMINATION OPERATION	
● Turn the headlamp switch to the parking lamps ON position. ● Rotate the panel dimmer switch to the full illumination position. ● **Are all of the module controlled illumination sources inoperative?**	**Yes** GO to H2 . **No** GO to H4 .
H2 CHECK FOR VOLTAGE AT THE DIMMER MODULE	
● Turn the headlamp switch off. ● Disconnect: Dimmer Module C2065a and C2065b. ● Turn the headlamp switch to the parking lamps ON position. ● Rotate the instrument panel dimmer switch to the full illumination position. ● Measure the voltage between the dimmer module C2065b pin 2, circuit 14 (BN), harness side and ground; and between the dimmer module C2065a pin 4, circuit 505 (GY/YE), harness side and ground.	**Yes** GO to H3 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 A0047526 ● **Are the voltages greater than 10 volts?**	
H3 CHECK THE DIMMER MODULE GROUND	
● Measure the resistance between the dimmer module C2065b pin 4, circuit 57 (BK), harness side and ground.  A0047527 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new dimmer module. REFER to Dimmer Module in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
H4 CHECK VOLTAGE OUTPUT FROM THE DIMMER MODULE	
● Turn the headlamp switch off. ● Disconnect: Dimmer Module C2065a. ● Turn the headlamp switch to the parking lamps ON position. ● Rotate the instrument panel dimmer switch to the full illumination position. ● Measure the voltage between the dimmer module C2065a pin 1, circuit 19 (LB/RD), component side and ground; or between the dimmer module C2065a pin 2, circuit 1417 (LG/RD), component side and ground; or between the dimmer module C2065a pin 3, circuit 235 (RD/BK), component side and ground.  A0047528 ● **Are the voltages greater than 10 volts?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** INSTALL a new dimmer module. REFER to Dimmer Module in this section. TEST the system for normal operation.

Climate Control Assembly Bulb



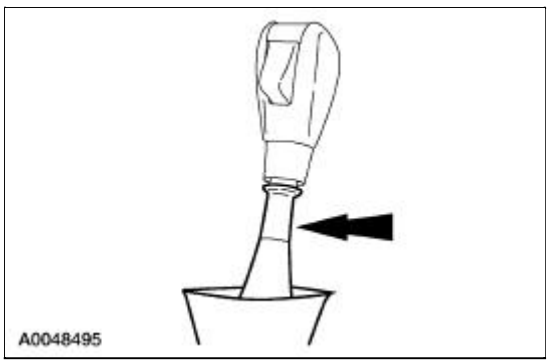
Removal and Installation

For additional information, refer to Section 412-04 .

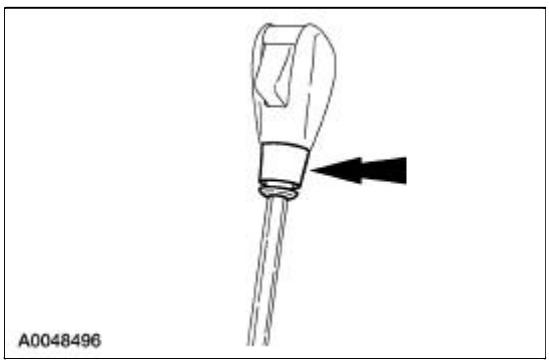
Instrument Cluster Bulb

Removal and Installation

1. Remove the instrument cluster. For additional information, refer to Section 413-01 .
2. Remove the instrument cluster illumination bulbs.

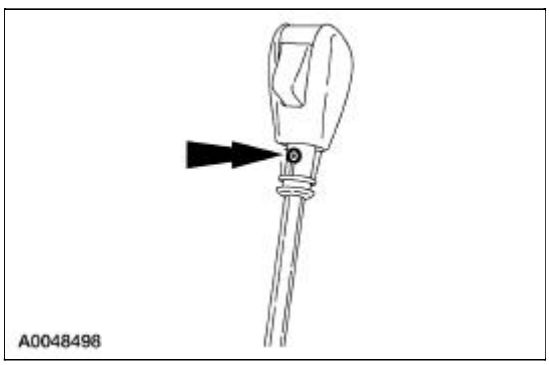


3. To install, reverse the removal procedure.

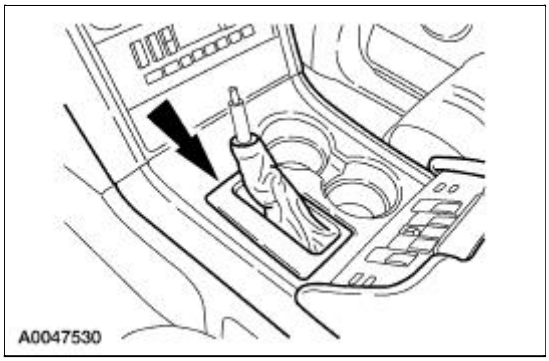


Selector Lever Indicator Bulb

Removal and Installation



1. Push down the selector lever boot.

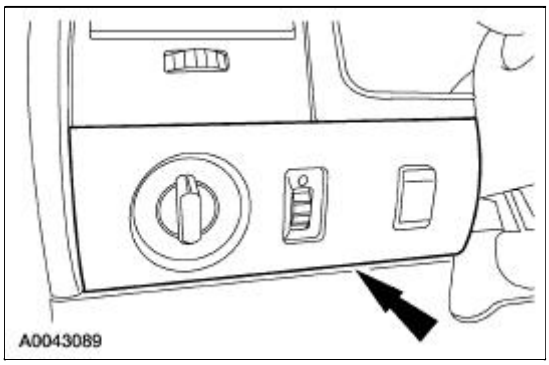


2. Push down the selector lever collar.

3. Remove the selector lever knob screw.
   - Remove the selector lever knob.

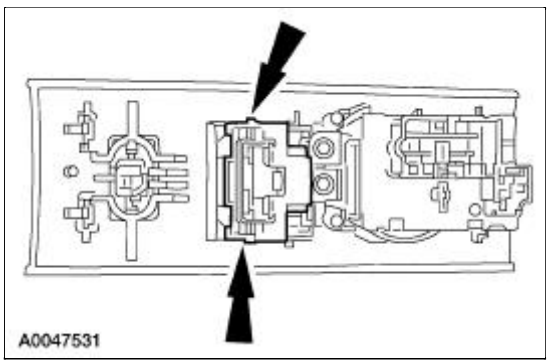
4. Detach the selector lever indicator bezel.
   - Disconnect the electrical connector.

5. To install, reverse the removal procedure.



Instrument Panel Dimmer Switch

Removal and Installation

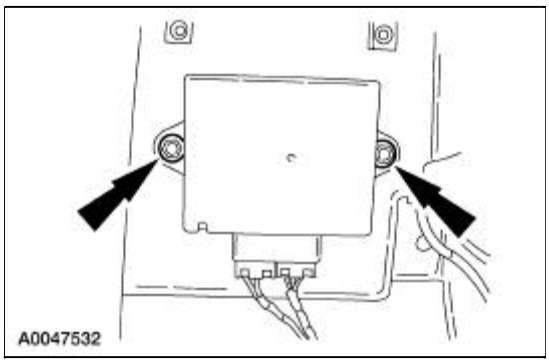


1. **NOTE:** For Expedition headlamp and dimmer switch removal, refer to Section 417-01 .

   Remove the instrument panel finish panel.

   - Disconnect the electrical connectors.

2. Depress the tabs and remove the instrument panel dimmer switch.



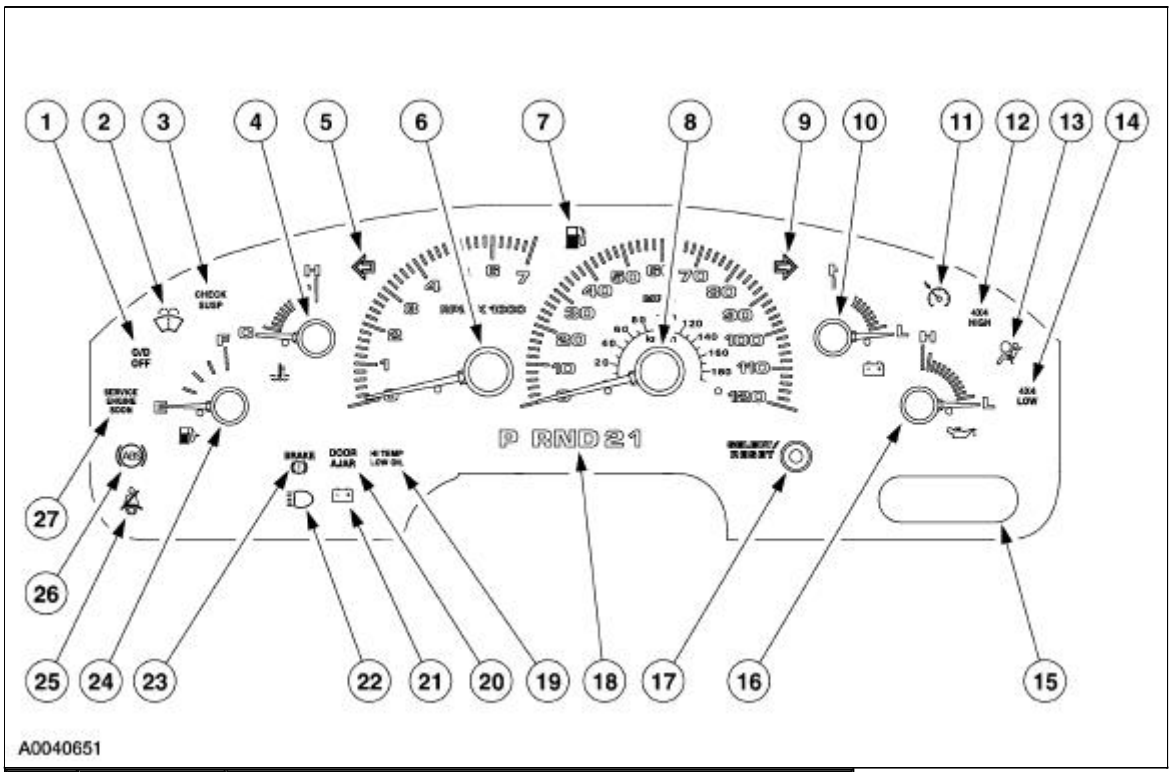
3. To install, reverse the removal procedure.

Dimmer Module

Removal and Installation

1. Remove the instrument panel glove compartment. Refer to Section 501-12 .
2. Remove the screws.
   - Disconnect the electrical connectors.

3. To install, reverse the removal procedure.



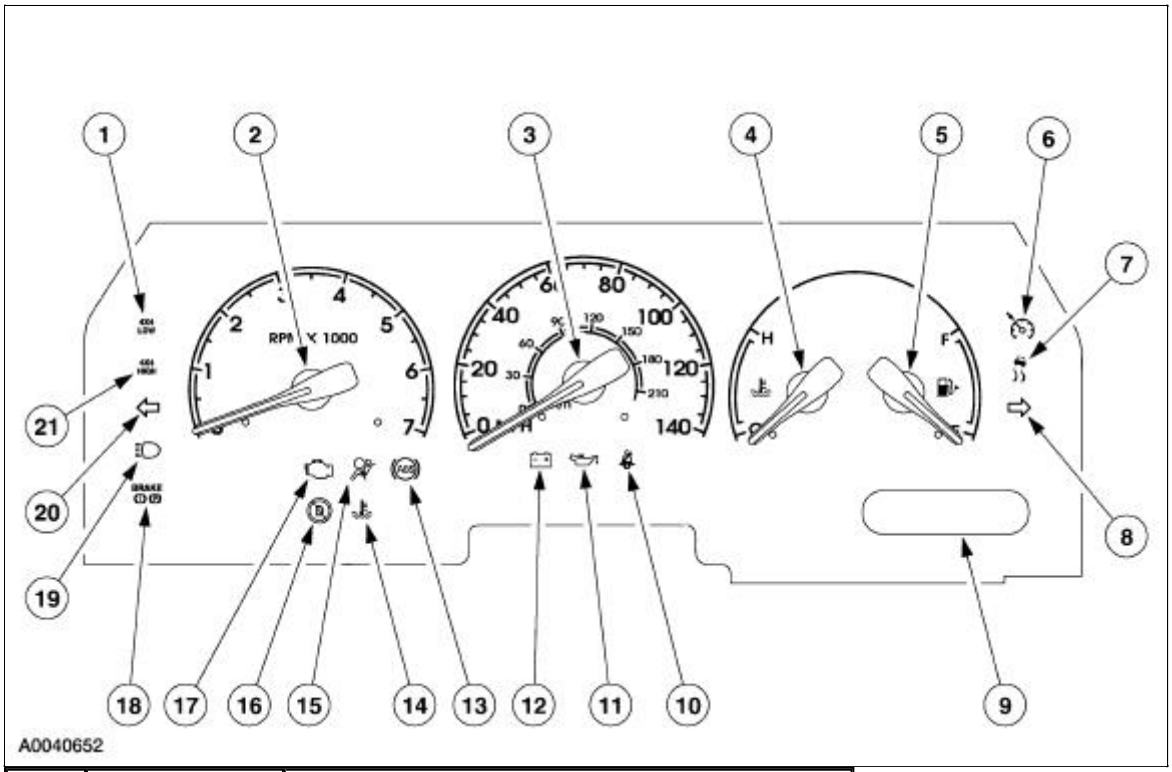
Instrument Cluster

The Navigator utilizes a virtual instrument cluster. The Expedition utilizes two instrument clusters, a base cluster and a message center cluster. The Navigator and Expedition base and message center clusters utilize a vacuum fluorescent tube display, located in the lower RH corner of the instrument cluster. The base cluster display contains the odometer, trip odometer, compass and outside air temperature information. The message center clusters contain an expanded vehicle information system in addition to the odometer, trip odometer, compass and outside air temperature information. For additional information regarding the message center displays and functions, refer to Section 413-08.

The Expedition instrument clusters consist of the following gauges and indicators:

NOTE: The English cluster is shown, the metric cluster is similar.

Instrument Cluster — Expedition



Item	Part Number	Description
1	—	O/D OFF indicator
2	—	Low washer indicator (base cluster only)
3	—	CHECK SUSP indicator (base cluster only)
4	—	Engine coolant temperature gauge
5	—	LH turn indicator
6	—	Tachometer
7	—	Low fuel warning indicator

8	—	Speedometer
9	—	RH turn indicator
10	—	Voltage gauge
11	—	Speed control indicator
12	—	4X4 HIGH indicator
13	—	Air bag warning indicator
14	—	4X4 LOW indicator
15	—	Integrated circuit display (base cluster) or message center (message center cluster)
16	—	Oil pressure gauge
17	—	SELECT/RESET button
18	—	PRNDL
19	—	HI TEMP/LOW OIL warning indicator
20	—	DOOR AJAR indicator
21	—	Charging system warning indicator
22	—	High beam indicator
23	—	BRAKE warning indicator
24	—	Fuel gauge
25	—	Safety belt warning indicator
26	—	ABS warning indicator
27	—	SERVICE ENGINE SOON indicator

The Navigator instrument cluster consists of the following gauges and indicators:

NOTE: The English cluster is shown, the metric cluster is similar.

Instrument Cluster — Navigator

Item	Part Number	Description
1	—	4X4 LOW indicator
2	—	Tachometer
3	—	Speedometer
4	—	Engine temperature gauge
5	—	Fuel gauge
6	—	Speed control indicator
7	—	Traction control indicator
8	—	RH turn indicator
9	—	Message center
10	—	Safety belt warning indicator
11	—	Low oil pressure warning indicator
12	—	Charging system warning indicator
13	—	ABS warning indicator
14	—	Temperature warning indicator
15	—	Air bag warning indicator
16	—	Overdrive off indicator
17	—	Malfunction indicator lamp (MIL) indicator
18	—	BRAKE warning indicator
19	—	High beam indicator
20	—	LH turn indicator
21	—	4X4 HIGH indicator

Instrument Cluster

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST1473-A	Instrument Gauge System Tester 014-R1063 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418–F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool

Principles of Operation

The Expedition and Navigator instrument clusters are configurable, hybrid electronic clusters (HEC) that contain a microprocessor, gauges, indicator lamps, and internal circuitry. The instrument cluster is non-repairable at the dealership level with the exception of the warning indicator bulbs on the Expedition only and the instrument cluster lens on both the Expedition and Navigator clusters. The instrument cluster utilizes hardwired circuitry, the standard corporate protocol (SCP), and UART based protocol (UBP) communication networks. Communication using the SCP network transmits and receives data between the instrument cluster, the PCM, and the anti-lock brake system/traction control/integrated vehicle dynamics (ABS/TC/IVD) module. Communication using the UBP network utilizes data transmitted and received by the instrument cluster and the four-wheel drive control module, power liftgate module (Navigator only), parking aid module, air suspension module, vehicle security module, driver seat module and the electronic air temperature control (EATC). For additional information regarding the SCP and UBP communication networks, refer to Section 418-00 .

It is very important to understand:

- where the input originates from.
- all the information necessary in order for a feature to operate.
- which module(s) receive(s) the input or command message.
- does the module which received the input control the output of the feature, or does it output a message over the SCP or UBP network to another module?

- which module controls the output of the feature.

The instrument cluster carries out a display prove-out to verify that the warning/indicator lamps and monitored systems are operating correctly. When the ignition switch is turned to the ON position with the engine off, the following indicators will illuminate:

- 4x4 HIGH indicator
- 4x4 LOW indicator
- ABS warning indicator
- air bag warning indicator
- BRAKE warning indicator
- oil pressure warning indicator
- coolant temperature warning indicator
- low fuel warning indicator
- HI TEMP/LOW OIL warning indicator
- low washer fluid indicator
- traction control indicator
- CHECK SUSP indicator
- door ajar indicator

Gauge Indication Systems

Instrument Cluster Replacement

CAUTION: When installing a new instrument cluster, the instrument cluster must be re-configured. For additional information, refer to Section 418-01 .

When installing a new instrument cluster, contact the Instrument Cluster Program.

Integrated Circuit Display

The integrated circuit display is a vacuum fluorescent tube display that contains the odometer, trip odometer, outside air temperature and compass display on base clusters and the message center display on message center clusters. For additional information on the message center, refer to Section 413-08 . The compass module and outside air temperature sensor are hardwired to the instrument cluster. The odometer information is transmitted from the PCM through the SCP communication network to the instrument cluster. The instrument cluster microprocessor displays the appropriate message(s) upon receipt of the outside air temperature, compass heading and odometer data received.

Speedometer

The instrument cluster receives the vehicle speed sensor (VSS) signal from the powertrain control module (PCM) through the standard corporate protocol (SCP) communication network. The instrument cluster micro-processor monitors the VSS input from the PCM and commands the speedometer with a corresponding movement of the pointer.

Odometer

The odometer and trip odometer are viewed through the message center in the integrated circuit display on message center clusters or in the integrated circuit display on base clusters. The odometer is tamper resistant and accumulates and registers up to one million miles in English mode or one million kilometers in metric mode, based upon rolling count data sent from the PCM through the SCP network. The trip odometer is resettable and accumulates and registers up to 1,000 miles or 1,000 kilometers.

Fuel Gauge

The instrument cluster is hardwired to the fuel sending unit, which is a variable resistor controlled by the action of a float arm. When the fuel level is low, resistance in the unit is low (15 ohms ± 1 ohm). When the fuel level is high, the resistance is high (160 ohms ± 2 ohms). The instrument cluster micro-processor monitors the input from the fuel sender and commands the fuel gauge indication according to the fuel level data.

Temperature Gauge

The PCM receives the engine coolant temperature status through hardwired circuitry to the engine coolant temperature (ECT) sensor. The instrument cluster receives the engine coolant temperature data from the PCM through the SCP communication network. The instrument cluster microprocessor monitors the engine coolant temperature data received from the PCM and commands the temperature gauge indication with a corresponding movement of the pointer.

Oil Pressure Gauge

The instrument cluster is hardwired to the oil pressure sender unit. The oil pressure sender unit consists of a diaphragm and contact points, which are normally open. When there is low or no oil pressure, the oil pressure switch remains open and removes the ground to the instrument cluster and when sufficient oil pressure exists, the oil pressure switch closes providing a ground signal to the instrument cluster. The instrument cluster microprocessor monitors the oil pressure and commands the oil pressure gauge indication with a corresponding pointer movement.

Voltage Gauge

The voltage gauge displays the system battery voltage as measured at the instrument cluster run input.

Tachometer

The instrument cluster receives the tachometer data from the PCM through the SCP network and commands the tachometer according to the data.

Warning Indicators

Charging System Warning Indicator

The instrument cluster receives the charging system status from the PCM through the SCP communication network. Charging system data is monitored by the instrument cluster microprocessor and when charging system voltage is low, turns on the charging system indicator by providing a ground.

BRAKE Warning Indicator

The parking brake switch is hardwired to the instrument cluster and the brake fluid level switch is hardwired to the ABS module. The instrument cluster BRAKE warning indicator utilizes two inputs. The first input is provided by the parking brake switch and when applied, provides a ground to the instrument cluster turning on the BRAKE warning indicator. The second input is controlled by the ABS module. The ABS module, upon receipt of a low brake fluid level signal, ABS concern, or base brake

system concern, provides a brake signal to the instrument cluster through the SCP communication network. The instrument cluster microprocessor upon receipt of the brake signal, controls the BRAKE warning indicator according to the monitored signal.

ABS Warning Indicator

The ABS warning indicator is used to indicate an ABS concern or deactivation of the ABS. The instrument cluster receives the ABS message from the ABS module through the SCP communication network.

Malfunction Indicator Lamp (MIL)

The malfunction indicator lamp (MIL) is illuminated when a diagnostic trouble code (DTC) is detected by the powertrain control module (PCM). The instrument cluster receives the MIL data from the PCM through the SCP network.

Air Bag Warning Indicator

The instrument cluster is hardwired to the restraint control module. If an air bag system concern is detected, a DTC is logged and the restraint control module provides a ground path to the instrument cluster turning on the air bag indicator.

Safety Belt Warning Indicator

The restraint control module monitors the safety belt position through the safety belt buckle switch. When the safety belt is buckled, the restraint control module receives a ground signal and sends a SCP message to the instrument cluster to turn off the safety belt warning indicator. When the safety belt is unbuckled, the ground to the restraint control module is removed and the restraint control module sends a SCP safety belt warning message to the instrument cluster to turn on the indicator.

Low Fuel Warning Indicator (if equipped)

The low fuel warning indicator is controlled by the instrument cluster microprocessor and utilizes hardwired fuel level data from the fuel pump module. When the fuel level drops below approximately one-sixteenth of a tank, the instrument cluster microprocessor turns on the low fuel warning indicator.

Coolant Temperature Warning Indicator (if equipped)

The PCM receives the engine coolant temperature status through hardwired circuitry from the engine coolant temperature (ECT) sensor. Engine coolant temperature status is subsequently transmitted to the instrument cluster from the PCM through the SCP communication network. The instrument cluster microprocessor monitors the engine coolant temperature data received from the PCM and commands the coolant temperature warning indicator on when coolant temperature reaches 244°-250°F (118°-121°C).

Low Oil Pressure Warning Indicator (if equipped)

The instrument cluster is hardwired to the oil pressure sender unit. The oil pressure sender unit consists of a diaphragm and contact points, which are normally open. When there is low (under 6 psi [41 kPa]) or no oil pressure, the oil pressure switch remains open, removing the ground to the instrument cluster. When sufficient oil pressure exists, the oil pressure switch closes providing a ground signal to the instrument cluster. The instrument cluster microprocessor monitors the oil pressure ground signal and commands the low oil pressure warning indicator on or off according to engine oil pressure.

Door Ajar Indicator

The door ajar switches provide a ground signal to the vehicle security module. The vehicle security module, upon receipt of the door ajar ground data, supplies a door ajar status message to the instrument cluster through the UBP communication network. The instrument cluster microprocessor

monitors the door ajar status and commands the door ajar indicator on or off according to the door ajar status message.

Traction Control Indicator - Navigator

The traction control indicator flashes when the vehicle traction control is in active mode or is being controlled by the ABS/TC/IVD module. The instrument cluster receives the traction control signal from the anti-lock brake system/traction control/integrated vehicle dynamics (ABS/TC/IVD) module through the UBP communication network. The instrument cluster monitors the traction control signal and when the ABS/TC/IVD module detects a traction control concern, the instrument cluster microprocessor will turn on the traction control indicator.

RH and LH Turn Indicators

The instrument cluster provides a ground for the RH and LH turn indicators. When the multifunction switch is in the RH or LH turn position, power is supplied to the instrument cluster through hardwired circuitry and the RH or LH turn indicators flash on and off.

High Beam Indicator

The instrument cluster provides a ground for the high beam indicator. When the high beams are turned on, the multifunction switch provides a power signal to the instrument cluster through hardwired circuitry and illuminates the high beam indicator.

Speed Control Indicator

The instrument cluster receives the speed control signal from the PCM through the SCP communication network. When the speed control is engaged, the PCM provides a ground to the instrument cluster and turns on the speed control indicator.

HI TEMP/LOW OIL Warning Indicator - Expedition

The HIGH TEMP/LOW OIL warning indicator will illuminate when either of the following conditions exist:

- if the engine oil pressure drops below approximately 42 kPa (6 psi)
- if the engine temperature exceeds approximately 118° C (244° F)

Low Washer Fluid Indicator - Expedition

The instrument cluster is hardwired to the low washer fluid switch. The low washer fluid switch closes when the washer fluid level indicated is approximately 1/3 full, providing a ground to the instrument cluster and turning on the low washer fluid indicator. When the washer fluid is above the low level, the low washer fluid switch opens and removes the ground to the instrument cluster and the low washer fluid indicator turns off.

CHECK SUSP Indicator - Expedition

The instrument cluster is hardwired to the suspension control module. The CHECK SUSP indicator is powered through the instrument cluster, and when the air suspension is activated, the suspension control module provides the ground to the instrument cluster and illuminates the CHECK SUSP indicator.

Overdrive Off Indicator

The instrument cluster receives the overdrive off signal from the PCM through the SCP communication network. The overdrive off switch is hardwired to the PCM. When the transmission overdrive is selected off, the overdrive off switch provides a ground signal to the PCM. The PCM upon receipt of

the overdrive off ground signal, provides an SCP overdrive off signal to the instrument cluster and the instrument cluster microprocessor will turn on the overdrive off indicator.

4x4 HIGH and 4x4 LOW Indicators

The instrument cluster receives the 4x4 HIGH and 4x4 LOW information from the four-wheel drive control module through the UPB communication network. When either 4x4 high or 4x4 low are selected, the four-wheel drive control module will provide a 4x4 status signal to the instrument cluster microprocessor and turn on the appropriate indicator.

Inspection and Verification

1. Verify the customer concern by operating the system.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Low washer fluid level ● Engine oil filter ● Engine oil level ● Oil pump ● Door adjustment ● Engine coolant level ● Water thermostat ● Fuel tank ● Fuel evaporative system	● Central junction box (CJB) fuses: ■ 1 (10A) ■ 21 (15A) ■ 15 (5A) ● Miniature bulb(s) ● Circuitry ● Instrument cluster

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card or disk is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the DATA LINK DIAGNOSTICS TEST. If the diagnostic tool responds with:
   - CKT1906, CKT914, CKT915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
   - NO RESP/NOT EQUIP for the instrument cluster, Go To Pinpoint Test A . For vehicle security module, refer to Section 419-10 ; for anti-lock brake system (ABS), refer to Section 206-09A or Section 206-09B ; or for restraint control module, refer to Section 501-20B .
   - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the instrument cluster.

7. If the DTCs retrieved are related to the concern, go to the Instrument Cluster Diagnostic Trouble Code (DTC) Index, or Restraint Control Module Diagnostic Trouble Code (DTC) Index to continue diagnostics.

8. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart to continue diagnostics.

Instrument Cluster Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1201	Fuel Sender Circuit Failure	Instrument Cluster	Go To Pinpoint Test B .
B1204	Fuel Sender Circuit Short to Ground	Instrument Cluster	Go To Pinpoint Test B .
B1205	EIC Switch-1 Assembly Circuit Failure	Instrument Cluster	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
B1209	EIC Switch-2 Assembly Circuit Failure	Instrument Cluster	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
B1255	Air Temperature External Sensor Circuit Open	Instrument Cluster	Go To Pinpoint Test AC .
B1257	Air Temperature External Sensor Circuit Short to Ground	Instrument Cluster	Go To Pinpoint Test AC .
B1317	Battery Voltage High	Instrument Cluster	Go To Pinpoint Test C .
B1318	Battery Voltage Low	Instrument Cluster	Go To Pinpoint Test C .
B1342	ECU is Defective	Instrument Cluster	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
B1360	Ignition Run/Acc Circuit Open	Instrument Cluster	Go To Pinpoint Test A .
B2143	NVM Memory Failure	Instrument Cluster	Go To Pinpoint Test AC .
C1284	Oil Pressure Switch Failure	Instrument Cluster	For Expedition, Go To Pinpoint Test D . For Navigator, Go To Pinpoint Test X .
U1073	Invalid or Missing Data for Engine Coolant	Instrument Cluster	For temperature gauge, Go To Pinpoint Test E . For temperature warning indicator, Go To Pinpoint Test Y .
U1123	Invalid or Missing Data for Odometer	Instrument Cluster	Go To Pinpoint Test G .
U2013	Compass Module is not responding	Instrument Cluster	Go To Pinpoint Test AC .

For a complete list of instrument cluster DTCs, refer to Section 419-10 .

Instrument Cluster Self-Test Mode

To enter the instrument cluster self-test mode with the engine off, depress and hold the odometer reset

button (base cluster) or simultaneously depress and hold the message center reset and setup buttons (message center cluster). Turn the ignition switch to the RUN position and hold until the display indicates tESt (base cluster) or TEST (message center cluster) usually within three to five seconds. Depress the reset button once to advance to each stage of the self-test.

To exit the instrument cluster self-test mode, turn the ignition to the OFF position. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart to continue diagnostics.

Instrument Cluster Self-Test Mode

Base cluster display	Message center cluster display	Description
tESt	TEST	Initial entry display into self-test mode.
GAGE	GAUGES SWEEP	Carries out gauge sweep of all gauges, then displays the present gauge values. Also carries out the checksum test on ROM and EEPROM.
All segments illuminated	All segments illuminated	Illuminates all odometer segments.
bulb	TEST TELLTALES	Illuminates all micro-controlled lamps and LEDs.
—	PART NUMBER, 2L#F-10849-##	Displays alpha-numeric part number.
2L1F	—	Display alpha-numeric part number prefix (first four digits).
####	—	Suffix (last two digits of the part number are displayed as tow byte hexadecimal number).
######	SERIAL NUMBER ######	Display serial number in decimal.
i9nin#	IGNITION KEY, #	Display key-in-ignition status.
r ####	ROM LEVEL ####, CHKSUM ####	Returns to normal operation of all micro-controlled lamps and LEDs and displays hexadecimal value for read-only memory (ROM) level (used when requesting assistance from the hotline).
nr####	NVM LEVEL ##, CHKSUM ####	Displays hexadecimal ROM level and type as stored in non-volatile memory (NVM).
EE ##	—	Displays hexadecimal value for EE level (used when requesting assistance from the hotline).
dt ####	FINAL DATE, ####	Displays hexadecimal coding of final manufacturing test date.
CF1-CF4	MODULE CONFIG, BYTE1-BYTE4=##	Displays hexadecimal of bytes 1-4 of module configuration settings.
dtc ####	DIAG TROUBLE, CODE: ####	Displays a 16 bit DTC in hexadecimal format. DTCs displayed are those detected in continuous operation, not during self-test.
E ###.#	VEHICLE SPEED, ###.# MPH	Displays English speed value being input, speedometer will indicate present speed.
###.#	VEHICLE SPEED, ###.# KPH	Displays metric speed value being input, speedometer will indicate present speed.
t ####	TACH VALUE, ####RPM	Displays the tachometer value being input to the instrument cluster. Tachometer will indicate present rpm.
F ###	FUEL LEVEL A/D,	Displays present fuel level analog/digital ratio input in

	###	decimal. The instrument cluster will indicate present fuel level.
FP ###	FUEL LEVEL %, ###	Displays present fuel level percent status in decimal.
### C	COOLANT TEMP, ###	Displays last temperature gauge input value from SCP, temperature gauge will indicate present temperature.
odo###	ODO SCP INPUT, ###	Displays the odometer input received through SCP in decimal.
OIL###	OIL PRESSURE, ###	Displays the last analog/digital reading of the oil pressure switch contact resistance, oil gauge will indicate present level.
br #	BRAKE FLUID AD, #	Displays the brake fluid level received from the ABS module.
bAt ##.#	BATTERY VOLTS, ##.#	Displays present SBATT reading in 10th of volt.
—	PWM DIM STEP, ##	Displays dimming step in decimal.
rhO ###	PWM DIM INPUT , ###	Displays present hexadecimal pulse width modulation (PWM) dimming input.
Prnd##	PRNDL, ##	Displays hexadecimal value of PRNDL inputs packed into a single byte.
Par-#	PARK BRAKE, #	Displays input status of the park brake switch.
door1-#	DOOR AJAR, #	Displays input status of any/all door ajar input (U222 only).
door2-#	LIFTGATE AJAR, #	Displays input status of liftgate ajar input.
Stbt-#	SEATBELT, #	Displays input status of safety belt switch.
—	RUN/START, #	RUN/START sense circuit check.
—	RUN/ACC, #	RUN/ACC sense circuit check.
CHE ##	CHECK ENGINE, ###	Displays 8 bit hexadecimal value of SCP service engine soon (MIL) telltale command.
PA, Pb, PE, PG ##	PORT A, B, E and J, ##	Displays 8-bit hexadecimal value for the ports A, b, E and G (base clusters) or J (message center clusters) readings (used when requesting information from the hotline).
PP, PS, PT, PCAn, PAD0 and PAD1 ##	PORT H, IB, P, S and T, ##	Displays 8-bit hexadecimal value for the ports P, S, T, CAn, AD0 and AD1 (base clusters) or H, IB, P, S, and T (message center clusters) in analog/digital readings (used when requesting information from the hotline).
AD00-AD17 ##	PORT AD00-AD17	Displays 8-bit hexadecimal value for the ports AD00-AD17 in analog/digital readings (used when requesting information from the hotline).

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
● No communication with the instrument cluster	● Central junction box (CJB) fuse(s): ■ 1 (11A).	● Go To Pinpoint Test A .

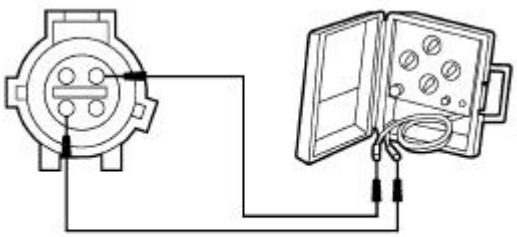
	■ 21 (15A). ■ 15 (5A). ● Circuitry. ● J1850 standard corporate protocol (SCP) communication network. ● UART based protocol (UBP) communication network. ● Instrument cluster.	
● Incorrect fuel gauge indication	● Circuitry. ● Fuel sender. ● Fuel tank. ● Instrument cluster.	● Go To Pinpoint Test B.
● Incorrect voltage gauge indication (Expedition only)	● Circuitry. ● Charging system. ● Powertrain control module (PCM). ● Instrument cluster.	● Go To Pinpoint Test C.
● Incorrect oil pressure gauge indication (Expedition only)	● Circuitry. ● Oil pressure switch. ● Instrument cluster.	● Go To Pinpoint Test D.
● Incorrect temperature gauge indication	● Circuitry. ● Cylinder head temperature sensor. ● Powertrain control module (PCM). ● Instrument cluster.	● Go To Pinpoint Test E.
● The low fuel warning indicator is never/always on	● Instrument cluster.	● Go To Pinpoint Test F.
● The speedometer/odometer is inoperative	● Circuitry. ● Powertrain control module (PCM). ● Instrument cluster.	● Go To Pinpoint Test G.
● The tachometer is inoperative	● Circuitry. ● Powertrain control module (PCM). ● Instrument cluster.	● Go To Pinpoint Test H.
● The door ajar indicator is inoperative (chime is operative)/does not operate correctly	● Circuitry. ● Instrument cluster. ● Vehicle security module.	● Go To Pinpoint Test I.
● The safety belt warning indicator is inoperative (chime is operative)/does	● Circuitry. ● Restraint control module (RCM).	● Go To Pinpoint Test J.

not operate correctly	• Safety belt switch (part of the driver belt buckle). • Instrument cluster.	
• Inaccurate speedometer reading	• Instrument cluster. • Anti-lock brake system (ABS) module. • Tires.	• Go To Pinpoint Test G .
• The ABS warning indicator is never on	• Circuitry. • Instrument cluster. • Anti-lock brake system (ABS) module.	• Go To Pinpoint Test K .
• The ABS warning indicator is always on	• Instrument cluster. • Anti-lock brake system (ABS) module.	• Section 501-20B .
• The brake warning indicator is never/always on	• Circuitry. • Brake fluid level switch. • Parking brake switch. • Anti-lock brake system (ABS) module. • Instrument cluster.	• Go To Pinpoint Test L .
• Malfunction indicator lamp (MIL) is never on	• Powertrain control module (PCM). • Instrument cluster.	• Go To Pinpoint Test M .
• Malfunction indicator lamp (MIL) is always on	• Diagnostic trouble code (DTC) related concern (s).	• REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• The charging system warning indicator is never on	• Charging system. • Circuitry. • Powertrain control module (PCM). • Instrument cluster.	• Go To Pinpoint Test N .
• The charging system warning indicator is always on	• Circuitry. • Generator (charging system). • Powertrain control module (PCM). • Instrument cluster.	• REFER to Section 414-00 .
• The air bag indicator warning is never/always on	• Circuitry. • Restraint control module (RCM).	• Go To Pinpoint Test O .

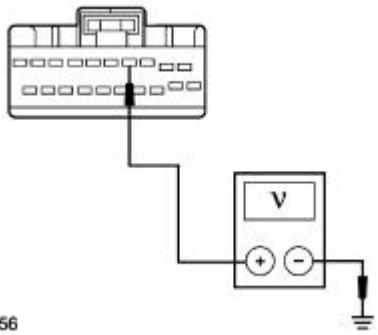
	• Instrument cluster.	
• The high beam indicator is never on	• High beam indicator bulb. • Circuitry. • Instrument cluster.	• Go To Pinpoint Test P.
• The LH turn indicator is never on	• LH turn indicator bulb. • Circuitry. • Instrument cluster.	• Go To Pinpoint Test Q.
• The RH turn indicator is never on	• RH turn indicator bulb. • Circuitry. • Instrument cluster.	• Go To Pinpoint Test R.
• The 4X4 HIGH range indicator is never/always on	• Circuitry. • Four-wheel drive (4WD) control module. • Instrument cluster.	• Go To Pinpoint Test S.
• The 4X4 LOW range indicator is never/always on	• Circuitry. • Four-wheel drive (4WD) control module. • Instrument cluster.	• Go To Pinpoint Test T.
• The speed control indicator is never/always on	• Speed control indicator bulb. • Circuitry. • Speed control servo. • Powertrain control module (PCM). • Instrument cluster.	• Go To Pinpoint Test U.
• The HI TEMP/LOW OIL warning indicator is never/always on - Expedition	• Circuitry. • Powertrain control module (PCM). • Instrument cluster.	• Go To Pinpoint Test V.
• The CHECK SUSP indicator is never/always on - Expedition	• Circuitry. • Air suspension module. • Instrument cluster.	• Go To Pinpoint Test W.
• The oil pressure warning indicator is never/always on - Navigator	• Circuitry. • Oil pressure switch. • Powertrain control module (PCM). • Instrument cluster.	• Go To Pinpoint Test X.
• The temperature warning indicator is never/always on - Navigator	• Circuitry. • Cylinder head temperature	• Go To Pinpoint Test Y.

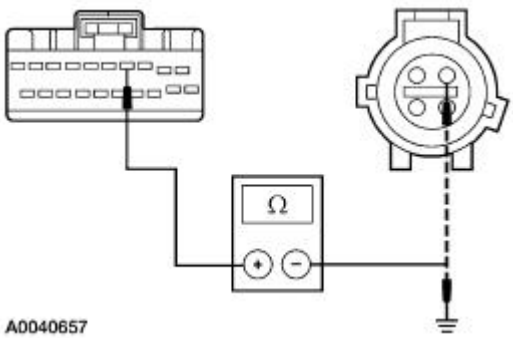
	sensor. ● Powertrain control module (PCM). ● Instrument cluster.	
● The low washer fluid indicator is never/always on - Expedition	● Circuitry. ● Low washer fluid switch. ● Instrument cluster.	● Go To Pinpoint Test Z .
● The traction control indicator is never/always on - Navigator	● Anti-lock brake system (ABS) module. ● Instrument cluster.	● Go To Pinpoint Test AA .
● The O/D OFF indicator is never/always on	● Circuitry. ● Powertrain control module (PCM). ● Instrument cluster.	● Go To Pinpoint Test AB .
● The integrated circuit display is inoperative	● Central junction box (CJB) fuse(s): ■ 1 (11A). ■ 21 (15A). ■ 15 (5A). ● Circuitry. ● Instrument cluster	● If the integrated circuit display is inoperative, Go To Pinpoint Test AD . ● If the temperature display is inoperative, Go To Pinpoint Test AC . ● If the compass is inoperative, REFER to Section 413-08 .
● The instrument cluster is inoperative	● Central junction box (CJB) fuse(s): ■ 1 (11A). ■ 21 (15A). ■ 15 (5A). ● Circuitry. ● Instrument cluster.	● Go To Pinpoint Test AD .

Pinpoint Tests

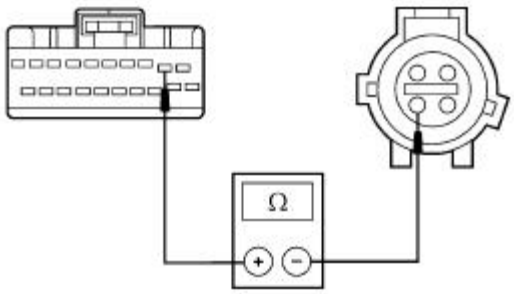


PINPOINT TEST A: NO COMMUNICATION WITH THE INSTRUMENT CLUSTER





Test Step	Result / Action to Take
CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.	
A1 CHECK THE INSTRUMENT CLUSTER POWER SUPPLY	
● Key in OFF position. ● Disconnect: Instrument Cluster C220a.	**Yes** GO to A2 .



• Disconnect: Instrument Cluster C220b. • Key in ON position. • Using the following table, measure the voltage between the instrument cluster, harness side and ground. **Connector / Pin / Circuit** C220a / 18 / 1002 (BK/PK) C220b / 1 / 3049 (BK/LG) C220b / 7 / 640 (RD/YE)  A0040653 • **Are the voltages greater than 10 volts?**	**No** REPAIR the circuit (s) in question. TEST the system for normal operation.
A2 CHECK INSTRUMENT CLUSTER GROUND CIRCUITS 57 (BK) AND 676 (PK/OG)	
• Key in OFF position. • Measure the resistance between the instrument cluster C220a pin 11, circuit 57 (BK), harness side and ground; and between the instrument cluster C220b pin 2, circuit 676 (PK/OG), harness side and ground.  A0040654 • **Are the resistances less than 5 ohms?**	**Yes** REFER to Section 418-00 . **No** REPAIR the circuit (s) in question. TEST the system for normal operation.

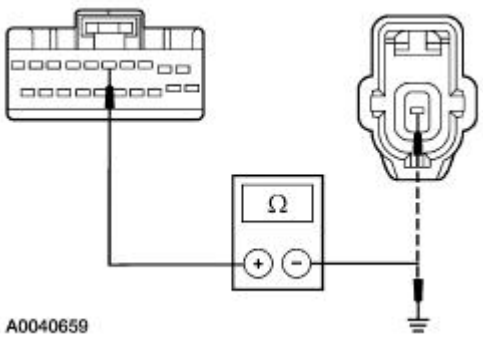
PINPOINT TEST B: INCORRECT FUEL GAUGE INDICATION

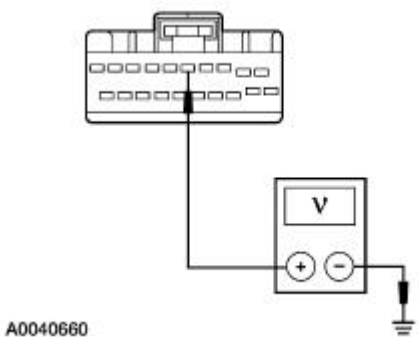
Test Step	Result / Action to Take
CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.	
B1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Use the recorded instrument cluster DTCs from the continuous and on-demand self-tests.	**Yes** If instrument cluster

• **Are any instrument cluster DTCs recorded?**	DTC B1201 or B1204 is retrieved, GO to B6 . For all other instrument cluster DTCs REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index. **No** GO to B2 .
B2 CARRY OUT THE INSTRUMENT CLUSTER FUEL GAUGE ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster. • Select the instrument cluster FUEL LEVEL CONTROL active command. Trigger, monitor, and scroll FUELLEVEL at: 0% , 50%, and 100%. • **Does the fuel gauge display: below E with 0%, half with 50%, and full stop with 100%?**	**Yes** GO to B3 . **No** GO to B9 .
B3 CHECK THE FUEL GAUGE OPERATION	
• Key in OFF position. • Disconnect: Fuel Pump Assembly C433. • Connect one lead of the Instrument Gauge System Tester to the fuel pump assembly C433 pin 1, circuit 29 (YE/WH), harness side and the other lead to the fuel pump assembly C433 pin 4, circuit 396 (BK/OG), harness side.  A0040655 • Set the Instrument Gauge System Tester to 160 ohms. • Key in ON position. • Wait one minute for the gauge to respond. • Key in OFF position. • Set the tester to 15 ohms. • Key in ON position. • **NOTE:** The fuel gauge should read below E (empty mark) when carrying out this test step. • Wait one minute and read the fuel gauge. • Key in OFF position. • Set the tester to 160 ohms. • Key in ON position. • **NOTE:** The fuel gauge should read F (full) or above when carrying out this test step. • Wait one minute and read the fuel gauge. • Key in OFF position. • **Does the fuel gauge operate correctly?**	**Yes** GO to B4 . **No** GO to B6 .
B4 CHECK THE FUEL TANK	

• Check the fuel tank for any damage or deformation. • **Is the fuel tank OK?**	**Yes** GO to B5 . **No** INSTALL a new fuel tank. REFER to Section 310-01 . TEST the system for normal operation.
B5 INSPECT THE FUEL PUMP ASSEMBLY • Check the fuel pump assembly in-tank mounting, float, float rod, wiring and connections for damage or obstruction. • **Are the fuel pump assembly and wiring OK?**	**Yes** INSTALL a new fuel sender. TEST the system for normal operation. **No** REPAIR or INSTALL a new fuel pump assembly as necessary. TEST the system for normal operation.
B6 CHECK CIRCUIT 29 (YE/WH) FOR SHORT TO POWER • Disconnect: Instrument Cluster C220a. • Key in ON position. • Measure the voltage between the instrument cluster C220a pin 4, circuit 29 (YE/WH), harness side and ground.  A0040656 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to B7 .
B7 CHECK CIRCUIT 29 (YE/WH) FOR AN OPEN OR SHORT TO GROUND • Measure the resistance between the instrument cluster C220a pin 4, circuit 29 (YE/WH), harness side and the fuel pump assembly C433 pin 1, circuit 29 (YE/WH), harness side; and between the instrument cluster C220a pin 4, circuit 29 (YE/WH), harness side and ground.  A0040657	**Yes** GO to B8 . **No** REPAIR the circuit. TEST the system for normal operation.

• **Is the resistance less than 5 ohms between the instrument cluster and the fuel pump assembly; and greater than 10,000 ohms between the instrument cluster and ground?**	
B8 CHECK FUEL SENDING UNIT GROUND CIRCUIT 396 (BK/OG) FOR AN OPEN	
• Measure the resistance between the instrument cluster C220a pin 2, circuit 396 (BK/OG), harness side and the fuel pump assembly C433 pin 4, circuit 396 (BK/OG), harness side.  A0040658 • **Is the resistance less than 5 ohms?**	**Yes** GO to B9 . **No** REPAIR the circuit. TEST the system for normal operation.
B9 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.





PINPOINT TEST C: INCORRECT VOLTAGE GAUGE INDICATION (EXPEDITION ONLY)

Test Step	Result / Action to Take
C1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Use the recorded instrument cluster DTCs from the continuous and on-demand self-tests. • **Are any instrument cluster DTCs recorded?**	**Yes** If instrument cluster DTC B1317 or B1318 is retrieved, REFER to Section 414-00 . For all other instrument cluster DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index. **No**

	GO to C2 .
C2 CARRY OUT THE VOLTMETER ACTIVE COMMAND USING THE DIAGNOSTIC TOOL ● Connect the diagnostic tool. ● Key in ON position. ● Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. ● Select the instrument cluster voltmeter active command. ● Trigger the voltmeter active command. Scroll in three increments 0%, 50% and 100%. ● **Did the voltmeter start at L (low) when at 0%, move to half at 50% and H (high) at 100%?**	**Yes** REFER to Section 414-00 . **No** GO to C3 .
C3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION ● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.

PINPOINT TEST D: INCORRECT OIL PRESSURE GAUGE INDICATION (EXPEDITION ONLY)

Test Step	Result / Action to Take
CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.	
D1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS ● Use the recorded instrument cluster DTCs from the continuous and on-demand self-tests. ● **Are any instrument cluster DTCs recorded?**	**Yes** If instrument cluster DTC C1284 is retrieved, INSTALL a new oil pressure switch. TEST the system for normal operation. For all other instrument cluster DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index. **No** GO to D2 .

D2 CARRY OUT THE OIL PRESSURE GAUGE ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster oil pressure gauge active command. • Trigger the oil pressure gauge active command. Scroll in three increments 0%, 50% and 100%. • **Did the engine oil pressure gauge start at L (low) when at 0%, move to half at 50% and H (high) at 100%?**	**Yes** GO to D3 . **No** GO to D6 .
D3 CHECK THE ENGINE OIL PRESSURE	
• Carry out the engine oil pressure test. Refer to Section 303-00 . • Key in ON position. • **Is the oil pressure within specification?**	**Yes** GO to D4 . **No** REFER to Section 303-00 .
D4 CHECK CIRCUIT 31 (WH/RD) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Instrument Cluster C220a. • Disconnect: Oil Pressure Switch C135. • Measure the resistance between the instrument cluster C220a pin 5, circuit 31 (WH/RD), harness side and the oil pressure switch C135, circuit 31 (WH/RD), harness side; and between the instrument cluster C220a pin 5, harness side and ground.  A0040659 • **Is the resistance less than 5 ohms between the instrument cluster and the oil pressure switch; and greater than 10,000 ohms between the instrument cluster and ground?**	**Yes** GO to D5 . **No** REPAIR the circuit. TEST the system for normal operation.
D5 CHECK CIRCUIT 31 (WH/RD) FOR SHORT TO POWER	
• Key in ON position. • Measure the voltage between the instrument cluster C220a pin 5, circuit 31 (WH/RD), harness side and ground.  A0040660 • **Is any voltage indicated?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new oil pressure switch. TEST the system for normal operation.

D6 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.

PINPOINT TEST E: INCORRECT TEMPERATURE GAUGE INDICATION

Test Step	Result / Action to Take
E1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Use the recorded instrument cluster DTCs from the continuous and on-demand self-tests. • **Are any instrument cluster DTCs recorded?**	**Yes** If instrument cluster DTC U1073 is retrieved, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis. For all other instrument cluster DTCs REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index. **No** GO to E2.
E2 CARRY OUT THE COOLANT TEMPERATURE GAUGE ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster engine coolant active command. • Trigger the engine coolant active command. Scroll in three increments 0%, 50% and 100%. • **Did the temperature gauge start at cold when at 0%, move to half at 50% and full hot at 100%?**	**Yes** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis. **No** GO to E3.
E3 CHECK FOR CORRECT INSTRUMENT	

CLUSTER OPERATION • Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST F: THE LOW FUEL WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
F1 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL • Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster warning lamps and chime active command. Trigger the all lamps active command on and off. Observe the low fuel warning indicator. • **Does the low fuel warning indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to F2 . **No** GO to F3 .
F2 CHECK THE FUEL GAUGE • Key in ON position. • Check the fuel gauge. • **Does the fuel gauge operate correctly?**	**Yes** GO to F3 . **No** Go To Pinpoint Test B .
F3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION • Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST G: THE SPEEDOMETER/ODOMETER IS

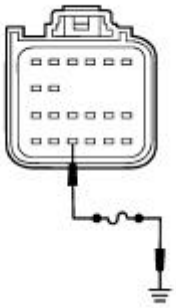
INOPERATIVE

Test Step	Result / Action to Take
G1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Use the recorded instrument cluster DTCs from the continuous and on-demand self-tests. • **Are any instrument cluster DTCs recorded?**	**Yes** If instrument cluster U1123 is retrieved, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis. For all other instrument cluster DTCs REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index. **No** For inoperative speedometer, GO to G2 . For inoperative odometer, GO to G3 .
G2 CARRY OUT THE SPEEDOMETER ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster speedometer active command. • Trigger the speedometer and scroll in increments of 10% while monitoring the speedometer. The speedometer should increase in increments of approximately 20 km/h (12 mph) on the Expedition and approximately 23 km/h (14 mph) on the Navigator for each 10% change. • **Does the speedometer increase within specifications?**	**Yes** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis. **No** GO to G4 .
G3 MONITOR THE INTEGRATED CIRCUIT DISPLAYS	
• Key in ON position. • Monitor the compass, air temperature and message center functions of the integrated circuit display. • **Do the compass, air temperature or message center displays operate correctly?**	**Yes** GO to G4 . **No** Go To Pinpoint Test AC .
G4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been

	caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST H: THE TACHOMETER IS INOPERATIVE

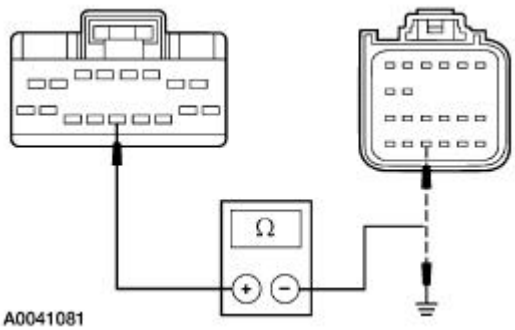
Test Step	Result / Action to Take
H1 CARRY OUT THE TACHOMETER ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	**Yes** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis. **No** GO to H2 .
● Connect the diagnostic tool. ● Key in ON position. ● Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. ● Select the instrument cluster tachometer active command. ● Trigger the tachometer and scroll in increments of 10%. Monitor the tachometer gauge. The tachometer should increase in increments of approximately 700 rpm for each 10% change. ● **Does the tachometer gauge increase within specifications?**	
H2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	

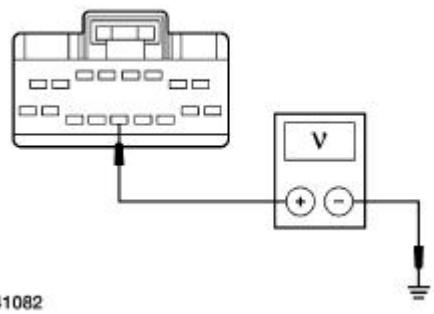


PINPOINT TEST I: THE DOOR AJAR INDICATOR IS INOPERATIVE (CHIME IS OPERATIVE)/DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
I1 CHECK THE INTERIOR LAMPS OPERATION	**Yes** GO to I2 . **No** REFER to Section 417-02 .
● Open and close each door while monitoring the interior lamps. ● **Do the interior lamps operate correctly?**	
I2 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	**Yes** GO to I3 .
● Key in OFF position. ● Connect the diagnostic tool. ● Key in ON position.	

• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster indicator lamp control active command. Trigger the door ajar active command. Observe the door ajar indicator. • **Is the door ajar indicator illuminated?**	**No** GO to I4 .
I3 CHECK FOR CORRECT VEHICLE SECURITY MODULE OPERATION	
• Disconnect all vehicle security module connectors. • Check for: • corrosion • pushed-out pins • Connect all vehicle security module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new vehicle security module. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
I4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.





PINPOINT TEST J: THE SAFETY BELT WARNING INDICATOR IS INOPERATIVE (CHIME IS OPERATIVE)/DOES NOT OPERATE CORRECTLY

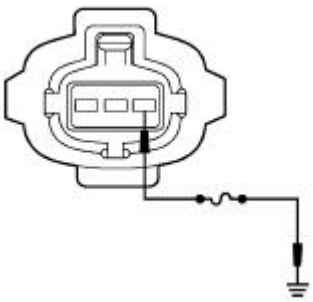
Test Step	Result / Action to Take
J1 CHECK THE SAFETY BELT WARNING INDICATOR OPERATION	
• Deactivate the restraint control supplemental air bag system. Refer to Section 501-20B . • Key in OFF position. • Disconnect: Restraint Control Module C310a. • Connect a fused (10A) jumper wire between the restraint control module C310a pin 22, circuit 1083 (LB/BK), harness side and ground.	**Yes** REFER to Section 501-20B to continue diagnosis. **No** GO to J2 .

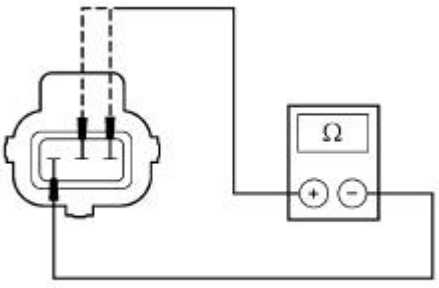
A0041080

- Observe the safety belt warning indicator with the jumper wire connected and disconnected.
- Key in ON position.
- **Does the safety belt warning indicator lamp illuminate with the jumper wire connected and turn off when disconnected?**

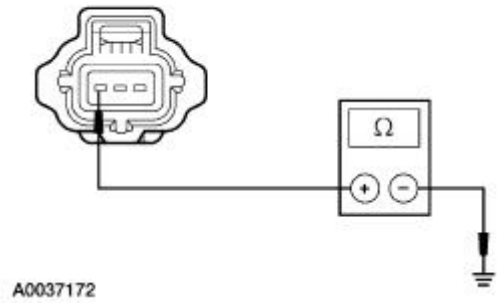
J2 CHECK CIRCUIT 1083 (LB/BK) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Instrument Cluster C220b. • Measure the resistance between the instrument cluster C220b pin 13, circuit 1083 (LB/BK), harness side and the restraint control module C310a pin 22, circuit 1083 (LB/BK), harness side; and between the instrument cluster C220b pin 13, circuit 1083 (LB/BK), harness side and ground.  A0041081 • **Is the resistance less than 5 ohms between the instrument cluster and the restraint control module; and greater than 10,000 ohms between the instrument cluster and ground?**	**Yes** GO to J3 . **No** REPAIR the circuit. TEST the system for normal operation.
J3 CHECK CIRCUIT 1083 (LB/BK) FOR SHORT TO POWER	
• Key in ON position. • Measure the voltage between the instrument cluster C220b pin 13, circuit 1083 (LB/BK), harness side and ground.  A0041082 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to J4 .
J4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors.	**Yes**

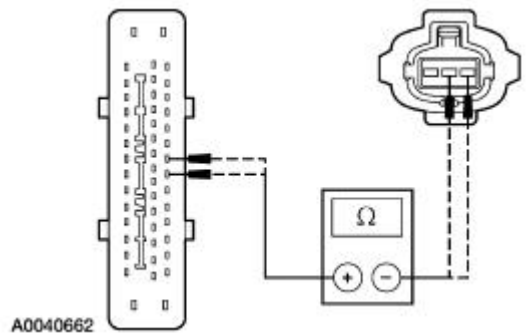
• Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.

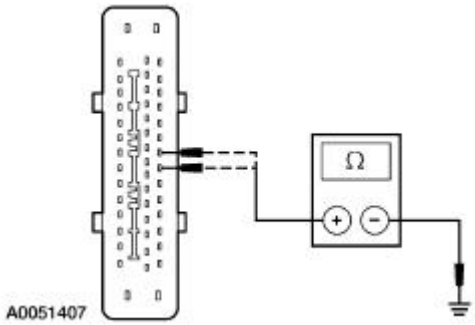




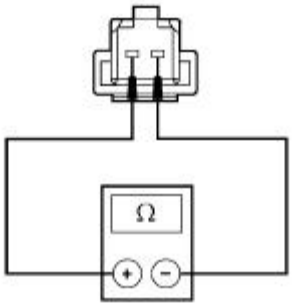
PINPOINT TEST K: THE ABS WARNING INDICATOR IS NEVER ON

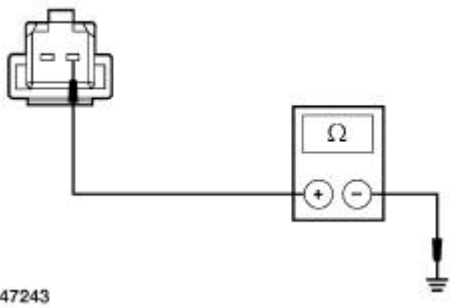


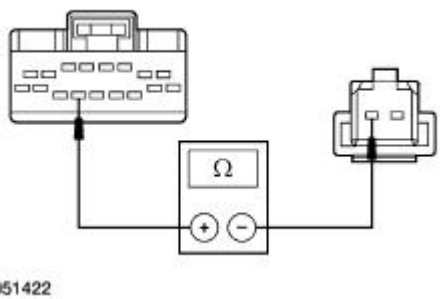




Test Step	Result / Action to Take
K1 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster warning lamps and chime active command. Trigger the all lamps active command. Observe the ABS warning indicator. • **Is the ABS warning indicator illuminated?**	**Yes** REFER to Section 501-20B to continue the diagnosis. **No** GO to K2.
K2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.







PINPOINT TEST L: THE BRAKE WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

L1 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster warning lamps and chime active command. Trigger the all lamps active command on then off. Observe the brake warning indicator. • **Does the brake warning indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to L2 . **No** GO to L11 .
L2 CHECK THE ABS MODULE OPERATION	
• Disconnect: Brake Fluid Level Switch C124. • Key in ON position. • Observe the brake warning indicator. • Key in OFF position. • Connect a fused (10A) jumper wire between the brake fluid level switch C124 pin 3, circuit 531 (DG/YE), harness side and ground.  A0045316 • Key in ON position. • Observe the brake warning indicator. • **Does the brake warning indicator illuminate with the brake fluid level switch disconnected; and turn off with the jumper wire connected?**	**Yes** GO to L3 . **No** GO to L5 .
L3 CHECK BRAKE FLUID LEVEL SWITCH	
NOTE: Verify that the brake fluid level is full. • Measure the resistances between the brake fluid level switch pin 3, circuit 531 (DG/YE), component side and the brake fluid level switch pin 1, circuit 1205 (BK), component side; and between the brake fluid level switch pin 3, circuit 531 (DG/YE), component side and the brake fluid level switch pin 2, circuit 512 (TN/LG), component side.  A0037169 • **Is the resistance greater than 10,000 ohms between the brake**	**Yes** GO to L4 . **No** INSTALL a new brake fluid level switch. TEST the system for normal operation.

fluid level switch pin 3 and the brake fluid level switch pin 1; and less than 5 ohms between the brake fluid level switch pin 3 and the brake fluid level switch pin 2?	
L4 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Measure the resistance between the brake fluid level switch C124 pin 1, circuit 57 (BK), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to L7 . **No** REPAIR the circuit. TEST the system for normal operation.
L5 CHECK CIRCUIT 531 (DG/YE) AND CIRCUIT 512 (TN/LG) FOR AN OPEN	
• Key in OFF position. • Disconnect: ABS Module C135. • Measure the resistance between the ABS module C135 pin 8, circuit 512 (TN/LG), harness side and the brake fluid level switch C124 pin 2, circuit 512 (TN/LG), harness side; and between the ABS module C135 pin 9, circuit 531 (DG/YE), harness side and the brake fluid level switch C124 pin 3, circuit 531 (DG/YE), harness side.  • **Are the resistances less than 5 ohms?**	**Yes** GO to L6 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
L6 CHECK CIRCUIT 531 (DG/YE) AMD CIRCUIT 512 (TN/LG) FOR SHORT TO GROUND	
• Measure the resistance between the ABS module C135 pin 8, circuit 512 (TN/LG), harness side and ground; and between the ABS module C135 pin 9, circuit 531 (DG/YE), harness side and ground.  	**Yes** GO to L10 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.

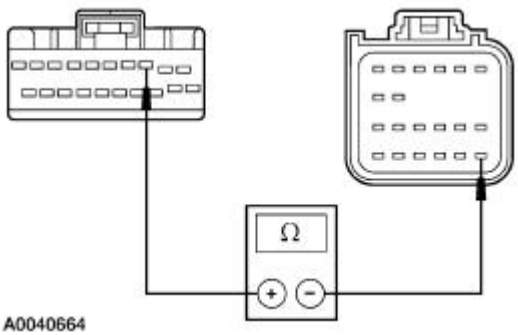
• **Are the resistances greater than 10,000 ohms?**	
L7 CHECK PARKING BRAKE SWITCH	
• Key in OFF position. • Disconnect: Parking Brake Switch C2015. • Measure the resistance between the parking brake switch C2015 pin 1, circuit 57 (BK), component side and the parking brake switch C2015 pin 2, circuit 162 (LG/RD), component side while engaging and fully disengaging the parking brake control.  A0047247 • **Is the resistance less than 5 ohms with the parking brake engaged and greater than 10,000 ohms with the parking brake fully disengaged?**	**Yes** GO to L9 . **No** GO to L8 .
L8 CHECK CIRCUIT 57 (BK) FOR OPEN	
• Measure the resistance between the parking brake switch C2105 pin 1, circuit 57 (BK), harness side and ground.  A0047243 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new parking brake switch. REFER to Section 206-00 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
L9 CHECK CIRCUIT 162 (LG/RD) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Instrument Cluster C220b. • Measure the resistance between the instrument cluster C220b pin 14, circuit 162 (LG/RD), harness side and the parking brake switch C2015 pin 2, circuit 162 (LG/RD), harness side; and between the instrument cluster C220b pin 14, circuit 162 (LG/RD), harness side and ground.  A0051422	**Yes** GO to L11 . **No** REPAIR the circuit. TEST the system for normal operation.

• **Is the resistance less than 5 ohms between the instrument cluster and the parking brake switch; and greater than 10,000 ohms between the instrument cluster and ground?**	
L10 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect all ABS module connectors. • Check for: • corrosion • pushed-out pins • Connect all ABS module connectors and make sure they seat correctly. • Operate the system and verify that concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09A or Section 206-09B. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.
L11 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify that concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused be a loose or corroded connector. TEST the system for normal operation.

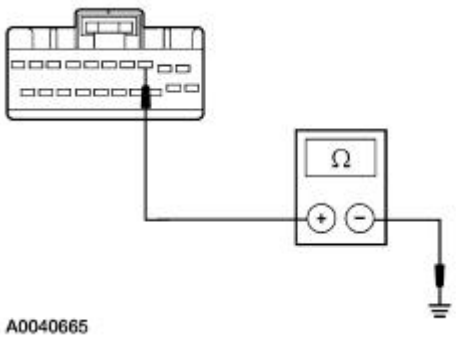
PINPOINT TEST M: MALFUNCTION INDICATOR LAMP (MIL) IS NEVER ON

Test Step	Result / Action to Take
M1 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster warning lamps and chime active command. Trigger the all lamps active command. Observe the	**Yes** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to M2.

SERVICE ENGINE SOON indicator. ● **Is the SERVICE ENGINE SOON indicator illuminating?**	
M2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION ● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.



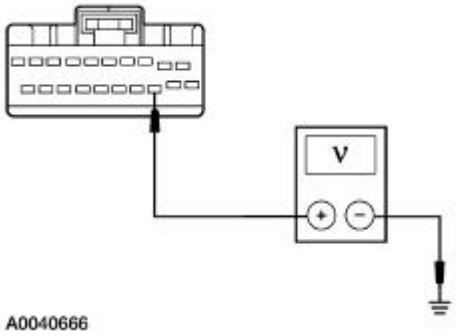
PINPOINT TEST N: THE CHARGING SYSTEM WARNING INDICATOR IS NEVER ON

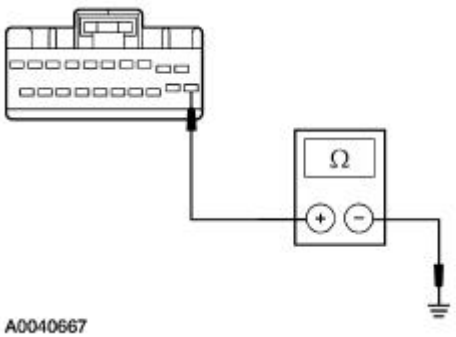


Test Step	Result / Action to Take
N1 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL ● Key in OFF position. ● Connect the diagnostic tool. ● Key in ON position. ● Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. ● Select the instrument cluster warning lamps and chime active command. Trigger the all lamps active command. Observe the charging system warning indicator. ● **Is the charging system warning indicator illuminating?**	**Yes** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to N2 .
N2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION ● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST O: THE AIR BAG WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take

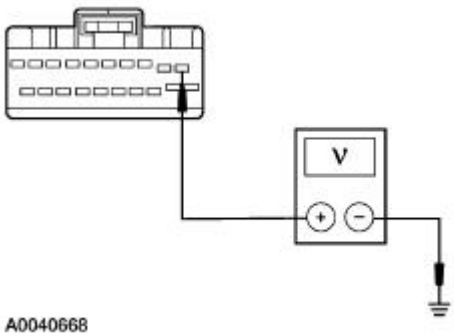


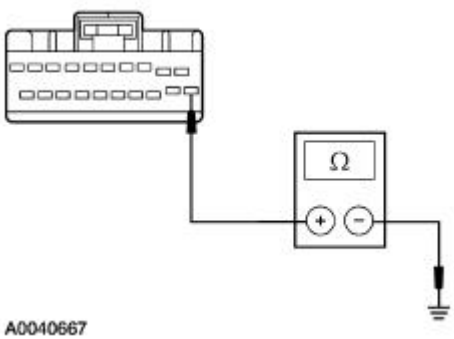


CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

O1 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster warning lamps and chime active command. Trigger the all lamps active command on then off. Observe the charging system warning indicator. • **Does the airbag warning indicator turn on when commanded on and turn off when commanded off?**	**Yes** If the air bag indicator is never on, GO to O2 . If the air bag indicator is always on, GO to O4 . **No** GO to O6 .
O2 CHECK CIRCUIT 608 (BK/YE)	
• Deactivate the restraint control supplemental air bag system. Refer to Section 501-20B . • Key in OFF position. • Disconnect: Restraint Control Module C310a. • Connect a fused (10A) jumper wire between the restraint control module C310a pin 19, circuit 608 (BK/YE), harness side and ground.  A0040663 • Key in ON position. • **Does the air bag indicator lamp illuminate?**	**Yes** REFER to Section 501-20B . **No** GO to O3 .
O3 CHECK CIRCUIT 608 (BK/YE) FOR AN OPEN	
• Key in OFF position. • Disconnect: Instrument Cluster C220a. • Measure the resistance between the instrument cluster C220a pin 3, circuit 608 (BK/YE), harness side and the restraint control module C310a pin 19, circuit 608 (BK/YE), harness side.  A0040664 • **Is the resistance less than 5 ohms?**	**Yes** GO to O6 . **No** REPAIR the circuit. TEST the system for normal operation.
O4 ISOLATE RESTRAINT CONTROL MODULE	

• Key in OFF position. • Deactivate the restraint control supplemental air bag system. Refer to Section 501-20B . • Disconnect: Restraint Control Module C223a. • Observe the air bag warning indicator. • Key in ON position. • **Does the air bag warning indicator illuminate?**	**Yes** GO to O5 . **No** REFER to Section 501-20B .
O5 CHECK CIRCUIT 608 (BK/YE) FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Instrument Cluster C220a. • Measure the resistance between the instrument cluster C220a pin 3, circuit 608 (BK/YE), harness side and ground.  A0040665 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to O6 . **No** REPAIR the circuit. TEST the system for normal operation.
O6 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

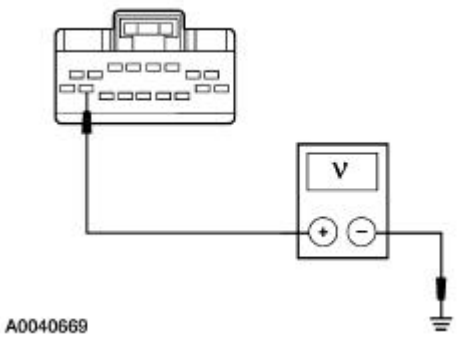


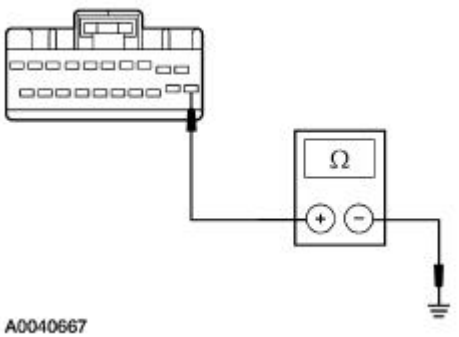


PINPOINT TEST P: THE HIGH BEAM INDICATOR IS NEVER ON

Test Step	Result / Action to Take
CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.	
P1 VERIFY HIGH BEAM OPERATION	
• Verify the high beam headlamps operation. • **Do the high beam headlamps operate correctly?**	**Yes** GO to P2 . **No** REFER to Section 417-01 .
P2 CHECK CIRCUITS 1718 (RD/PK) AND 12 (LG/BK) FOR AN OPEN	

• Disconnect: Instrument Cluster C220a. • **NOTE:** Headlamps must be on for this test. • Place the multifunction switch in the high beam position. • Measure the voltage between the instrument cluster C220a pin 13, circuit 1718 (RD/PK), harness side and ground.  A0040666 • **Is the voltage greater than 10 volts?**	**Yes** GO to P3 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
P3 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Measure the resistance between the instrument cluster C220a pin 11, circuit 57 (BK), harness side and ground.  A0040667 • **Is the resistance less than 5 ohms?**	**Yes** GO to P4 . **No** REPAIR the circuit. TEST the system for normal operation.
P4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.





PINPOINT TEST Q: THE LH TURN INDICATOR IS NEVER ON

Test Step	Result / Action to Take
CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.	

Q1 VERIFY TURN SIGNAL OPERATION • Verify the turn signal operation. • **Do the turn signals operate correctly?**	**Yes** GO to Q2 . **No** REFER to Section 417-01 .
Q2 CHECK CIRCUIT 3 (LG/WH) FOR VOLTAGE • Disconnect: Instrument Cluster C220a. • Key in ON position. • Place the multifunction switch in the LH turn signal position. • Measure the voltage between the instrument cluster C220a pin 1, circuit 3 (LG/WH), harness side and ground.  A0040668 • **Does the voltage fluctuate between 0 and greater than 10 volts?**	**Yes** GO to Q3 . **No** REPAIR the circuit. TEST the system for normal operation.
Q3 CHECK CIRCUIT 57 (BK) FOR AN OPEN • Key in OFF position. • Disconnect: Instrument Cluster C220a. • Measure the resistance between the instrument cluster C220a pin 11, circuit 57 (BK), harness side and ground.  A0040667 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q4 . **No** REPAIR the circuit. TEST the system for normal operation.
Q4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION • Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

	CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST R: THE RH TURN INDICATOR IS NEVER ON

Test Step	Result / Action to Take
CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.	
R1 VERIFY TURN SIGNAL OPERATION ● Verify the turn signal operation. ● **Do the turn signals operate correctly?**	**Yes** GO to R2 . **No** REFER to Section 417-01 .
R2 CHECK CIRCUIT 2 (WH/LB) FOR VOLTAGE ● Disconnect: Instrument Cluster C220b. ● Key in ON position. ● Place the multifunction switch in the RH turn signal position. ● Measure the voltage between the instrument cluster C220b pin 16, circuit 2 (WH/LB), harness side and ground.  A0040669 ● **Does the voltage fluctuate between 0 and greater than 10 volts?**	**Yes** GO to R3 . **No** REPAIR the circuit. TEST the system for normal operation.
R3 CHECK CIRCUIT 57 (BK) FOR AN OPEN ● Key in OFF position. ● Disconnect: Instrument Cluster C220a. ● Measure the resistance between the instrument cluster C220a pin 11, circuit 57 (BK), harness side and ground.  A0040667 ● **Is the resistance less than 5 ohms?**	**Yes** GO to R4 . **No** REPAIR the circuit. TEST the system for normal operation.
R4 CHECK FOR CORRECT INSTRUMENT CLUSTER	

OPERATION	
• Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST S: THE 4X4 HIGH INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
S1 VERIFY THE FOUR WHEEL DRIVE OPERATION	
• Test drive the vehicle and verify that the vehicle is in two wheel drive when the 4x4 HIGH is switched off and that the four wheel drive high operates when switched to the 4x4 HIGH range. • **Does the 4x4 HIGH range operate correctly?**	**Yes** GO to S2. **No** REFER to Section 308-07A.
S2 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster warning lamps and chime active command. Trigger the all lamps active command on and off. Observe the 4x4 HIGH indicator. • **Does the 4x4 HIGH indicator illuminate when triggered on and turn off when triggered off?**	**Yes** GO to S3. **No** GO to S4.
S3 CHECK FOR CORRECT FOUR-WHEEL DRIVE MODULE OPERATION	
• Disconnect all four-wheel drive module connectors. • Check for: • corrosion • pushed-out pins • Connect all four-wheel drive module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new four-wheel drive module. REFER to Section 308-07A. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.

S4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.

PINPOINT TEST T: THE 4X4 LOW INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
T1 VERIFY THE FOUR WHEEL DRIVE OPERATION	
• Test drive the vehicle and verify that the vehicle is in two wheel drive when the 4x4 LOW is switched off and that the four wheel drive low operates when switched to the 4x4 LOW range. • **Does the 4x4 LOW range operate correctly?**	**Yes** GO to T2. **No** REFER to Section 308-07A.
T2 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster warning lamps and chime active command. Trigger the all lamps active command on and off. Observe the 4x4 LOW indicator. • **Does the 4x4 LOW indicator illuminate when triggered on and turn off when triggered off?**	**Yes** GO to T3. **No** GO to T4.
T3 CHECK FOR CORRECT FOUR-WHEEL DRIVE MODULE OPERATION	
• Disconnect all four-wheel drive module connectors. • Check for: • corrosion • pushed-out pins • Connect all four-wheel drive module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new four-wheel drive module. REFER to Section 308-07A. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.
T4 CHECK FOR CORRECT INSTRUMENT	

CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.

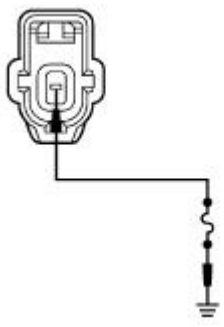
PINPOINT TEST U: THE SPEED CONTROL INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
U1 CHECK SPEED CONTROL OPERATION	
• Test drive the vehicle and operate the speed control. • **Does the speed control operate correctly?**	**Yes** GO to U2. **No** REFER to Section 310-03.
U2 CARRY OUT THE INSTRUMENT CLUSTER SELF-TEST	
• Key in ON position. • Carry out the instrument cluster self-test and observe the speed control indicator. Refer to Instrument Cluster Self-Test Mode in this section. • **Does the speed control indicator illuminate during the self-test mode and turn off when not in the self-test mode?**	**Yes** GO to U3. **No** GO to U4.
U3 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all PCM connectors. • Check for: • corrosion • pushed-out pins • Connect all PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.
U4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs.

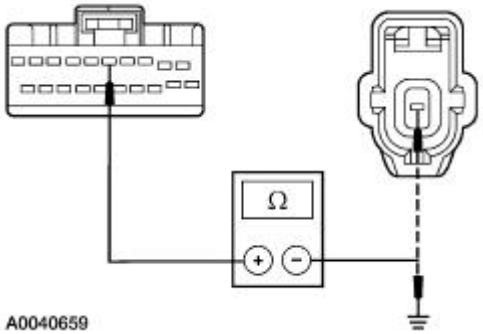
is still present. • **Is the concern still present?**	TEST the system for normal operation.

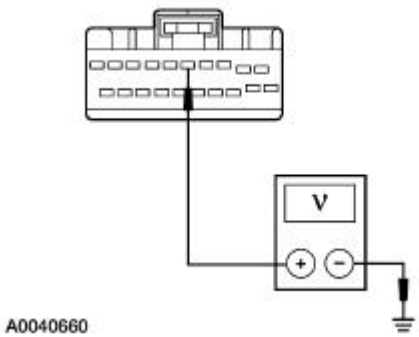
PINPOINT TEST V: THE HI TEMP/LOW OIL WARNING INDICATOR IS NEVER/ALWAYS ON - EXPEDITION

Test Step	Result / Action to Take
V1 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster indicator lamp control active command. Trigger the check gauges indicator active command. Observe the HI TEMP/LOW OIL indicator. • **Is the HI TEMP/LOW OIL indicator illuminating?**	**Yes** GO to V2 . **No** GO to V3 .
V2 CHECK THE GAUGES	
• Key in START position. • Verify the fuel gauge, voltmeter and the oil pressure gauge operation. • **Are the gauges operating correctly?**	**Yes** GO to V3 . **No** RETURN to the Symptom Chart.
V3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.



PINPOINT TEST W: THE CHECK SUSP INDICATOR IS NEVER/ALWAYS ON - EXPEDITION





Test Step	Result / Action to Take
W1 VERIFY AIR SUSPENSION SYSTEM OPERATION	
• Check the air suspension system operation. • **Does the air suspension system operate correctly?**	**Yes** GO to W2 . **No** REFER to Section 204-05 .

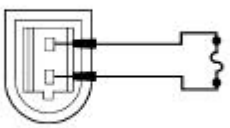
W2 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster warning lamps and chime active command. Trigger the all lamps active command on and off. Observe the CHECK SUSP indicator. • **Does the CHECK SUSP indicator illuminate when triggered on and turn off when triggered off?**	**Yes** GO to W3 . **No** GO to W4 .
W3 CHECK FOR CORRECT SUSPENSION CONTROL MODULE OPERATION	
• Disconnect all suspension control module connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all suspension control module connectors and make sure they seat correctly. • Make sure all other system connectors are fully seated. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new suspension control module. REFER to Section 204-05 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
W4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Make sure all other system connectors are fully seated. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST X: THE OIL PRESSURE WARNING INDICATOR IS NEVER/ALWAYS ON - NAVIGATOR

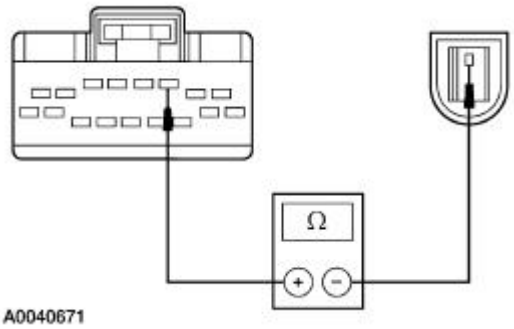
Test Step	Result / Action to Take
CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.	
X1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Use the recorded instrument cluster DTCs from the continuous and on-demand self-tests.	**Yes** If instrument cluster

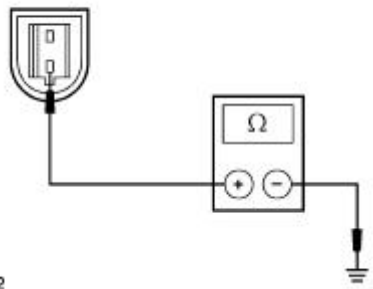
• **Are any instrument cluster DTCs recorded?**	DTC C1284 is retrieved, INSTALL a new oil pressure switch. TEST the system for normal operation. For all other instrument cluster DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index. **No** GO to X2.
X2 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster indicator lamp control active command. Trigger the oil pressure low indicator active command. Observe the oil pressure warning indicator. • **Is the oil pressure warning indicator illuminating?**	**Yes** GO to X3. **No** GO to X7.
X3 CHECK THE OIL PRESSURE WARNING INDICATOR	
• Key in OFF position. • Disconnect: Oil Pressure Switch C135. • Key in ON position. • Connect a fused (10A) jumper wire between the engine oil pressure switch C103, circuit 31 (WH/RD), harness side and ground.  A0014311 • **Does the oil pressure warning indicator illuminate?**	**Yes** GO to X4. **No** GO to X5.
X4 CHECK THE ENGINE OIL PRESSURE	
• Carry out the engine oil pressure test. Refer to Section 303-00. • Key in ON position. • **Is the oil pressure within specification?**	**Yes** INSTALL a new oil pressure switch. TEST the system for normal operation. **No** REFER to Section 303-00.
X5 CHECK CIRCUIT 31 (WH/RD) FOR AN OPEN OR SHORT TO GROUND	

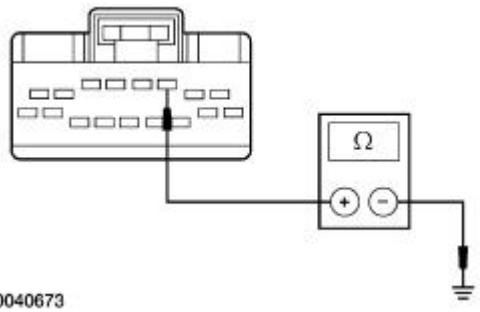
• Key in OFF position. • Disconnect: Instrument Cluster C220a. • Measure the resistance between the instrument cluster C220a pin 5, circuit 31 (WH/RD), harness side and the oil pressure switch C103, circuit 31 (WH/RD), harness side; and between the instrument cluster C220a pin 5, circuit 31 (WH/RD), harness side and ground.  • **Is the resistance less than 5 ohms between the instrument cluster and the oil pressure switch; and greater than 10,000 ohms between the instrument cluster and ground?**	**Yes** GO to X6 . **No** REPAIR the circuit. TEST the system for normal operation.
X6 CHECK CIRCUIT 31 (WH/RD) FOR SHORT TO POWER	
• Key in ON position. • Measure the voltage between the instrument cluster C220a pin 5, circuit 31 (WH/RD), harness side and ground.  • **Is any voltage present?**	**Yes** GO to X7 . **No** REPAIR the circuit. TEST the system for normal operation.
X7 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Make sure all other system connectors are fully seated. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.



PINPOINT TEST Y: THE TEMPERATURE WARNING INDICATOR IS







NEVER/ALWAYS ON - NAVIGATOR

Test Step	Result / Action to Take
Y1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Use the recorded instrument cluster DTCs from the continuous and on-demand self-tests. • **Are any instrument cluster DTCs recorded?**	**Yes** If instrument cluster DTC U1073 is retrieved, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis. For all other instrument cluster DTCs REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index. **No** GO to Y2 .
Y2 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster indicator lamp control active command. Trigger the engine over-temperature indicator active command on and off. Observe the temperature warning indicator. • **Does the temperature warning indicator illuminate when triggered on and turn off when triggered off?**	**Yes** GO to Y3 . **No** GO to Y4 .
Y3 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all PCM connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.
Y4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the

	DTCs. REPEAT the self-test.

PINPOINT TEST Z: THE LOW WASHER FLUID INDICATOR IS NEVER/ALWAYS ON - EXPEDITION

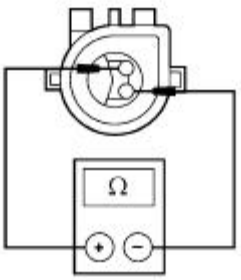
Test Step	Result / Action to Take
NOTE: Verify that the low washer fluid is full and that the key has been cycled at least once prior to carrying out the pinpoint test.	
Z1 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster warning lamps and chime active command. Trigger the all lamps active command on and off. Observe the low washer fluid indicator. • **Does the low washer fluid indicator illuminate when triggered on and turn off when triggered off?**	**Yes** If the low washer fluid indicator is inoperative, GO to Z2 . If the low washer fluid indicator is always on, GO to Z5 . **No** GO to Z6 .
Z2 CHECK THE LOW WASHER FLUID SWITCH	
• Key in OFF position. • Disconnect: Low Washer Fluid Switch C138. • Connect a fused (10A) jumper wire between the low washer fluid switch C138 pin 1, circuit 81 (RD/LG), harness side and the low washer fluid switch C138 pin 2, circuit 57 (BK), harness side.  A0040670 • Key in ON position. • **Does the low washer fluid indicator illuminate?**	**Yes** INSTALL a new low washer fluid switch. TEST the system for normal operation. **No** GO to Z3 .
Z3 CHECK CIRCUIT 81 (RD/LG) FOR AN OPEN	
• Disconnect: Instrument Cluster C220b. • Measure the resistance between the instrument cluster C220b pin 3, circuit 81 (RD/LG), harness side and the low washer fluid switch C138 pin 1, circuit 81 (RD/LG), harness side.	**Yes** GO to Z4 . **No** REPAIR the circuit. TEST the system for normal operation.

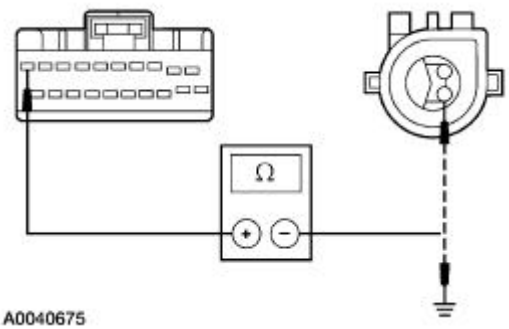
 A0040671 ● **Is the resistance less than 5 ohms?**	
Z4 CHECK CIRCUIT 57 (BK) FOR AN OPEN	**Yes** GO to Z6 . **No** REPAIR the circuit. TEST the system for normal operation.
● Measure the resistance between the low washer fluid switch C138 pin 2, circuit 57 (BK), harness side and ground.  A0040672 ● **Is the resistance less than 5 ohms?**	
Z5 CHECK CIRCUIT 81 (RD/LG) FOR SHORT TO GROUND	**Yes** GO to Z6 . **No** REPAIR the circuit. TEST the system for normal operation.
● Key in OFF position. ● Disconnect: Low Washer Fluid Switch C138. ● Disconnect: Instrument Cluster C220b. ● Measure the resistance between the instrument cluster C220b pin 3, circuit 81 (RD/LG), harness side and ground.  A0040673 ● **Is the resistance greater than 10,000 ohms?**	
Z6 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time.
● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	

	Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

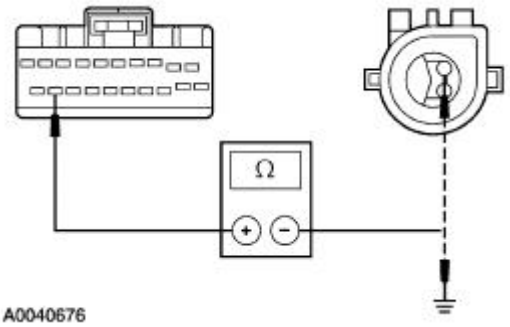
PINPOINT TEST AA: THE TRACTION CONTROL INDICATOR IS NEVER/ALWAYS ON - NAVIGATOR

Test Step	Result / Action to Take
AA1 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster indicator lamp control active command. Trigger the traction assist active indicator active command on and off. Observe the traction control indicator. • **Does the traction control indicator illuminate when triggered on and turn off when triggered off?**	**Yes** REFER to Section 206-09A or Section 206-09B . **No** GO to AA2 .
AA2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all instrument cluster connectors. • Check for: ◦ corrosion ◦ pushed-out pins • Connect all instrument cluster connectors and make sure they seat correctly. • Make sure all other system connectors are fully seated. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.





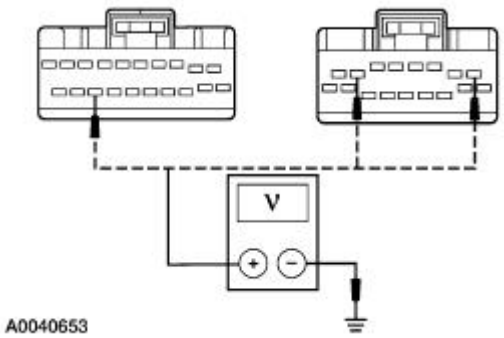
PINPOINT TEST AB: THE O/D OFF INDICATOR IS NEVER/ALWAYS ON

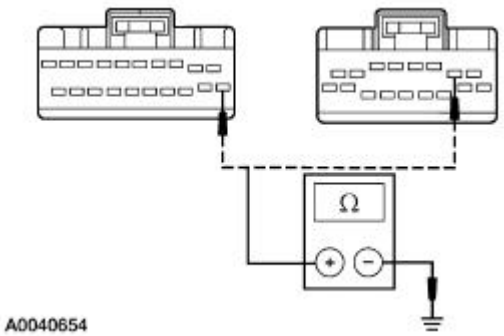


Test Step	Result / Action to Take
AB1 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster	**Yes** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue the diagnosis.

Active Command. ● Select the instrument cluster warning lamps and chime active command. Trigger the all lamps active command off and then on. Observe the O/D OFF indicator. ● **Does the O/D OFF indicator illuminate when commanded on and turn off when commanded off?**	**No** GO to AB2 .
AB2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.

PINPOINT TEST AC: THE INTEGRATED CIRCUIT DISPLAY IS INOPERATIVE





Test Step	Result / Action to Take
AC1 RETRIEVE AND RECORD DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS—INSTRUMENT CLUSTER	
● Connect the diagnostic tool. ● Key in ON position. ● Enter the following diagnostic mode on the diagnostic tool: Continuous DTCs. ● Retrieve and document the continuous DTCs. ● **Are DTCs B1255, B1257, B2143 or U2013 retrieved?**	**Yes** If DTC B2143 is present, GO to AC7 . If DTC B1255 or B1257 are present, GO to AC4 . **No** If DTC U2013 is present, GO to AC2 .
AC2 VERIFY THE INTEGRATED CIRCUIT DISPLAY OPERATION	
● Key in ON position. ● Monitor the compass, air temperature and odometer/trip odometer functions of the integrated circuit display. ● **Does the integrated circuit display operate correctly?**	**Yes** The system is operating correctly at this time. **No** If the compass is inoperative, REFER to Section 413-08 . If the odometer/trip odometer are inoperative, GO to AC3 . If the air temperature display is inoperative,

	GO to AC4 .
AC3 VERIFY THE SPEEDOMETER OPERATION ● Operate the vehicle and verify the speedometer operation. ● **Does the speedometer operate correctly?**	**Yes** GO to AC7 . **No** Go To Pinpoint Test G .
AC4 CHECK THE AMBIENT AIR TEMPERATURE SENSOR FUNCTION ● Disconnect: Ambient Air Temperature Sensor C132. ● Measure the resistance between the ambient air temperature sensor C132 pin 1, circuit 470 (PK/BK), component side and the ambient air temperature sensor C132 pin 2, circuit 767 (LB/OG), component side at ambient temperature of 18°-29°C (65°-85°F).  A0040677 ● **Is the resistance between 8,000 ohms and 14,000 ohms?**	**Yes** GO to AC5 . **No** INSTALL a new ambient air temperature sensor. TEST the system for normal operation.
AC5 CHECK CIRCUIT 767 (LB/OG) FOR AN OPEN OR SHORT TO GROUND ● Disconnect: Instrument Cluster C220a. ● Measure the resistance between the instrument cluster C220a pin 10, circuit 767 (LB/OG), harness side and the ambient air temperature sensor C132 pin 2, circuit 767 (LB/OG), harness side; and between the instrument cluster C220a pin 10, circuit 767 (LB/OG), harness side and ground.  A0040675 ● **Is the resistance less than 5 ohms between the instrument cluster and the ambient air temperature sensor; and greater than 10,000 ohms between the instrument cluster and ground?**	**Yes** GO to AC6 . **No** REPAIR the circuit. TEST the system for normal operation.
AC6 CHECK CIRCUIT 470 (PK/BK) FOR AN OPEN OR SHORT TO GROUND ● Measure the resistance between the instrument cluster C220a pin 19, circuit 470 (PK/BK), harness side and the ambient air temperature sensor C132 pin 1, circuit 470 (PK/BK), harness side; and between the instrument cluster C220a pin 19, circuit 470 (PK/BK), harness side and ground.	**Yes** GO to AC7 . **No** REPAIR the circuit.

 ● **Is the resistance less than 5 ohms between the instrument cluster and the ambient air temperature sensor; and greater than 10,000 ohms between the instrument cluster and ground?**	TEST the system for normal operation.
AC7 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION ● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST AD: THE INSTRUMENT CLUSTER IS INOPERATIVE

Test Step	Result / Action to Take
CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.	
AD1 CHECK THE INSTRUMENT CLUSTER POWER SUPPLY ● Key in OFF position. ● Disconnect: Instrument Cluster C220a. ● Disconnect: Instrument Cluster C220b. ● Key in ON position. ● Using the following table, measure the voltage between the instrument cluster, harness side and ground. **Connector** / **Pin** / **Circuit** C220a / 18 / 1002 (BK/PK) C220b / 1 / 3049 (BK/LG) C220b / 7 / 640 (RD/YE)	**Yes** GO to AD2 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.

 A0040653 ● **Are the voltages greater than 10 volts?**	
AD2 CHECK INSTRUMENT CLUSTER GROUND CIRCUITS 57 (BK) AND 676 (PK/OG)	**Yes** GO to AD3 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
● Key in OFF position. ● Measure the resistance between the instrument cluster C220a pin 11, circuit 57 (BK), harness side and ground; and between the instrument cluster C220b pin 2, circuit 676 (PK/OG), harness side and ground.  A0040654 ● **Are the resistances less than 5 ohms?**	
AD3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
● Disconnect all instrument cluster connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all instrument cluster connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	

Instrument Cluster

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418–F224 New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool

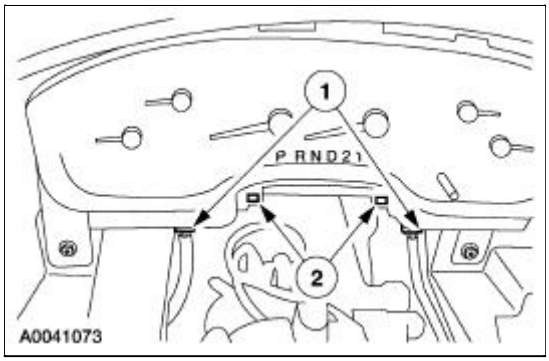
Removal and Installation

All vehicles

1. **CAUTION: Prior to removal of the module, it is necessary to upload module configuration information to the diagnostic tool. This information needs to be downloaded into the new module once installed. For additional information, refer to Section 418-01 .**

   Disconnect the battery. For additional information, refer to Section 414-01 .

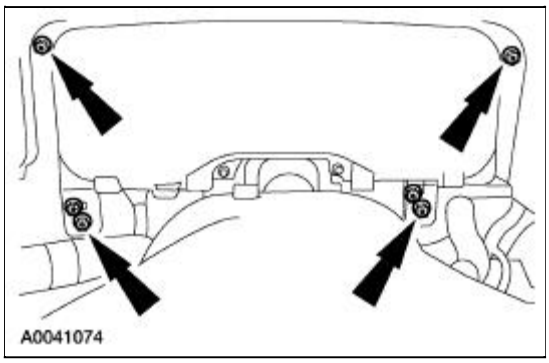
2. Remove the instrument panel finish panel. For additional information, refer to Section 501-12 .



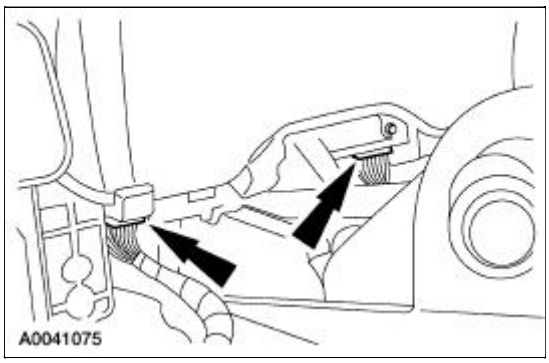
Expedition

3. **CAUTION: Electronic modules are sensitive to electrical charges. If exposed to these charges, damage may result.**

   Remove the instrument cluster screws and pull the instrument cluster out from the instrument panel.



4. Remove the instrument cluster.
   1. Disconnect the electrical connectors.
   2. Depress the retaining tabs to remove the PRNDL and remove the instrument cluster.



Navigator

5. **CAUTION: Electronic modules are sensitive to electrical charges. If exposed to these charges, damage may result.**

   Remove the instrument cluster screws and pull the instrument cluster out from the instrument panel.

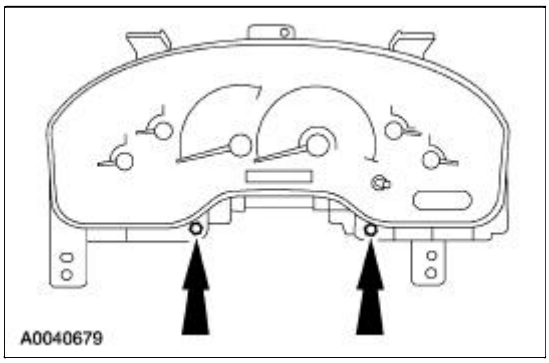
6. Disconnect the electrical connectors and remove the instrument cluster.

All vehicles

7. **CAUTION: Once the new module is installed, it is necessary to download the module configuration information from the diagnostic tool into the new module. For additional information, refer to Section 418-01**

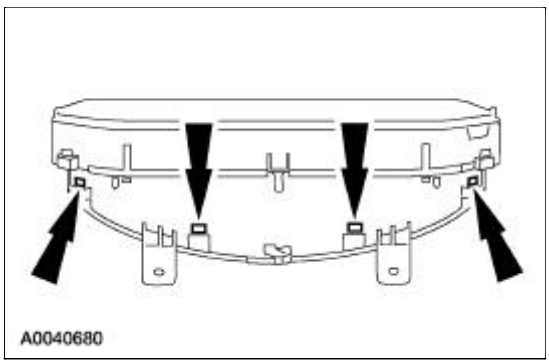
   To install, reverse the removal procedure.

Instrument Cluster Lens



Removal and Installation

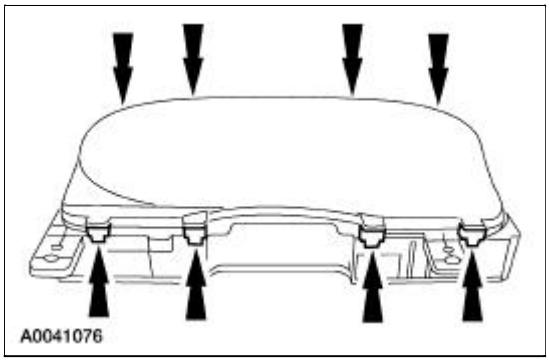
All Vehicles



1. Remove the instrument cluster. For additional information, refer to Instrument Cluster in this section.

Expedition

2. Remove the screws.



3. Release the clips and remove the cluster lens.

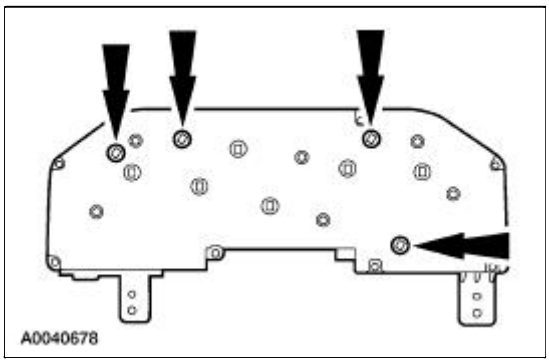
Navigator

4. Release the retaining tabs and remove the cluster lens.

All vehicles

5. To install, reverse the removal procedure.

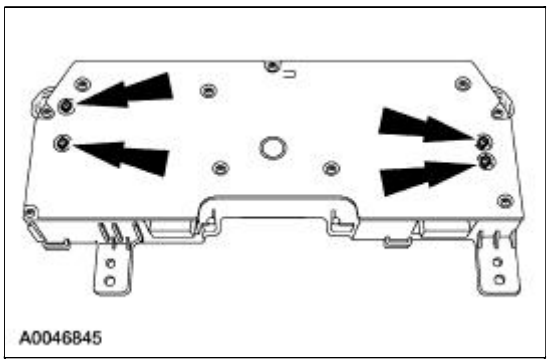
Warning Indicator Bulb



Removal and Installation

All vehicles

1. Remove the instrument cluster. For additional information, refer to Instrument Cluster in this section.



Expedition

2. Turn the warning indicator bulb one quarter turn counterclockwise and remove the bulb.

Navigator

3. Turn the warning indicator bulb one quarter turn counterclockwise and remove the bulb.

All vehicles

4. To install, reverse the removal procedure.

Horn

Horn components include the following items:

- clockspring
- horn relay
- horns
- steering wheel pad horn switch

Horn switches

The horn switch is incorporated into the driver side air bag module in the steering wheel. The switch is powered through the clockspring and grounded through the steering column. For removal and installation of the horn switch, refer to Section 501-20B .

Horn relay

The horn relay is incorperated into the central junction box (CJB). The central junction box is located behind the passenger lower kick panel.

Horn

Refer to Wiring Diagrams Cell 44 for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool

Inspection and Verification

1. Verify the customer concern by operating the horn system.
2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Central junction box (CJB) ● Horn ● Horn switch	● Central junction box (CJB) ● Central junction box (CJB) fuse 26 (20A) ● Circuitry ● Clockspring ● Powertrain control module (PCM) ● Tire pressure monitor (TPM) module ● Vehicle security module

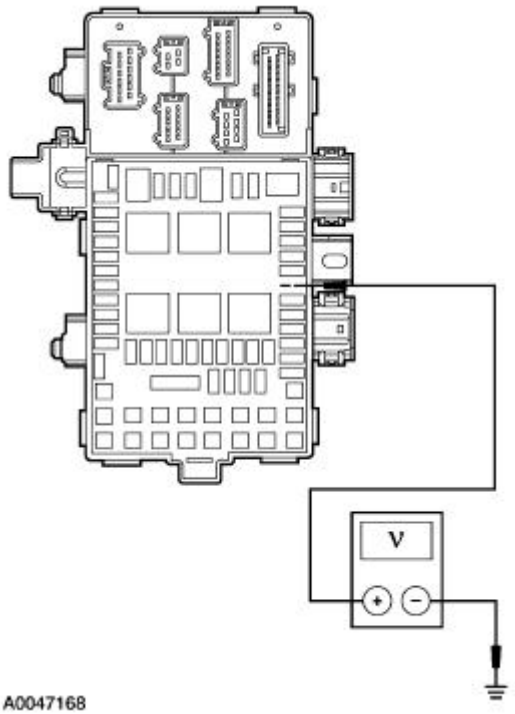
3. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel, and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.
4. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool manual.

5. Carry out the DATA LINK DIAGNOSTICS TEST. If the diagnostic tool responds with:
    - CKT914, CKT915, CKT693 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
    - NO RESP/NOT EQUIP for vehicle security module, refer to Section 419-10 .
    - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the vehicle security module.
6. If the DTCs retrieved are related to the concern, go to the vehicle security module (DTC) Index to continue diagnostics.
7. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart to continue diagnostics.

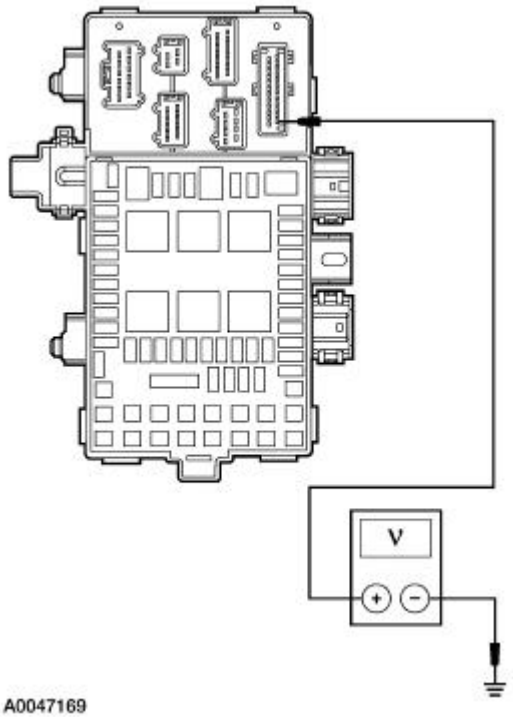
Vehicle Security Module Diagnostic Trouble Code (DTC) Index

DTC	Description	Source By	Action
B1217	Horn Relay Output	Body security module	Go To Pinpoint Test B .

Symptom Chart



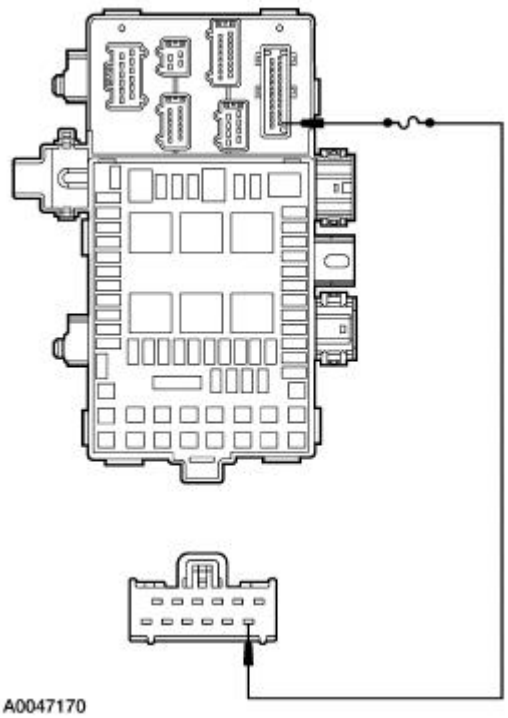
Symptom Chart



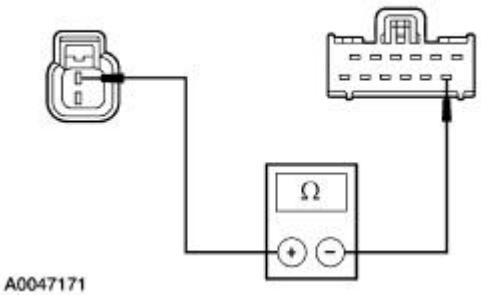
Condition	Possible Sources	Action
● The horn does not sound	● Central junction box (CJB). ● CJB fuse 26 (20A). ● Circuitry. ● Horn switch. ● Horn. ● Clockspring. ● Powertrain control module (PCM).	● Go To Pinpoint Test A .
● The horn sounds continuously	● Central junction box (CJB). ● Circuitry. ● Horn switch. ● Horn. ● Vehicle security module. ● Tire pressure monitor (TPM) module. ● Clockspring	● Go To Pinpoint Test B .

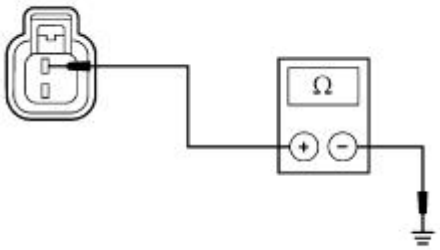
Pinpoint Tests

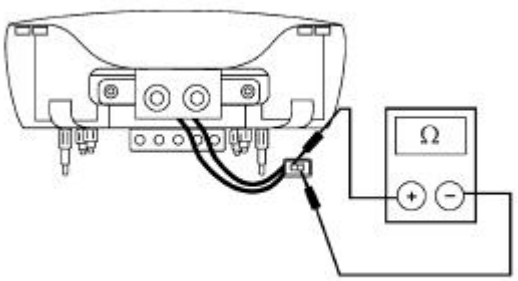
PINPOINT TEST A: THE HORN DOES NOT SOUND



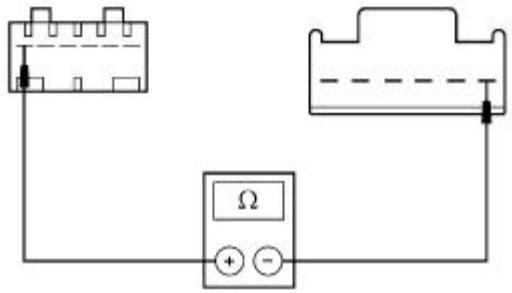
Test Step	Result / Action to Take
A1 TRIGGER THE HORN CONTROL COMMAND	

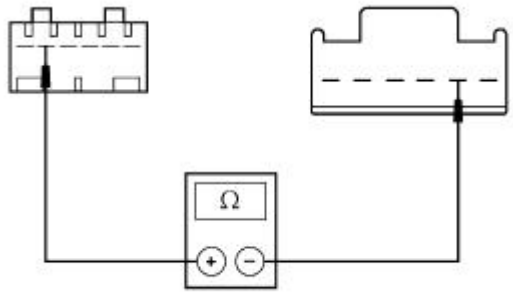


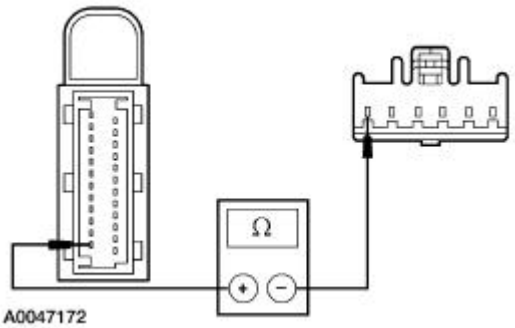


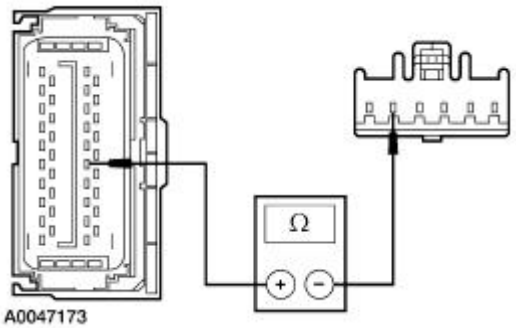


• Connect the diagnostic tool. • Trigger the horn control command. • **Does the horn sound?**	**Yes** GO to A7 . **No** GO to A2 .
A2 CHECK POWER SUPPLY TO THE CENTRAL JUNCTION BOX (CJB) HORN RELAY	
• Key in OFF position. • Disconnect: Fuse 26 (20A). • Measure the voltage between the CJB fuse 26 (20A) input side and ground.  A0047168 • **Is the voltage greater than 10 volts?**	**Yes** GO to A3 . **No** INSTALL or REPAIR a new CJB as necessary. TEST the system for normal operation.
A3 CHECK THE CJB HORN RELAY OUTPUT	
• Disconnect: CJB C270e. • Measure the voltage between CJB C270e pin 12, circuit 1 (DB), component side and ground.	**Yes** GO to A4 . **No** INSTALL or REPAIR a new CJB as necessary. TEST the system for normal operation.









A0047169

- **Is the voltage greater than 10 volts?**

A4 CHECK THE HORNS OUTPUT CIRCUIT	
• Disconnect: CJB C270a. • Connect a 15A fused jumper wire between the CJB C270e pin 12, circuit 1 (DB), component side and the CJB C270a pin 7, circuit 6 (YE/LG), harness side.  A0047170 • **Does the horn sound?**	**Yes** GO to A7 . **No** GO to A5 .
A5 CHECK CIRCUIT 6 (YE/LG) FOR AN OPEN	
• Disconnect: Horn C131. • Measure the resistance between the CJB C270a pin 7, circuit 6 (YE/LG) harness side and horn C131 pin 1, circuit 6	**Yes** GO to A6 .

(YE/LG), harness side.  A0047171 ● **Is the resistance less than 5 ohms?**	**No** REPAIR the circuit. TEST the system for normal operation.
A6 CHECK CIRCUIT 57 (BK) BETWEEN HORN AND GROUND	
● Measure the resistance between right horn connector C131 pin 2, circuit 57 (BK), harness side and ground.  A0032815 ● **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new horn. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
A7 CHECK THE HORN SWITCH CIRCUITRY	
● Deactivate the air bag system. Refer to Section 501-20B . ● Measure the resistance between the horn pad switch connector pins under the following conditions: **Steering Wheel Pad Horn Switch Position** / **Resistance** Pressed / Less than 5 ohms Released / Greater than 10,000 ohms  K26006-A ● **Are the resistances correct?**	**Yes** GO to A8 . **No** INSTALL a new driver side air bag module. REFER to Section 501-20B . TEST the system for normal operation.
A8 CHECK THE CLOCKSPRING	
● Disconnect: Clockspring C218b. ● Measure the resistance between upper clockspring	**Yes** GO to A9 .

connector pin 6, (component side), and lower clockspring C218b pin 6, (component side).  A0024225 • Measure the resistance between upper clockspring connector pin 5, (component side), and lower clockspring C218b pin 5, (component side).  A0024226 • **Are the resistances less than 5 ohms?**	**No** INSTALL a new clockspring. TEST the system for normal operation.
A9 CHECK CIRCUIT 1 (DB) FOR AN OPEN	
• Measure the resistance between the CJB C270e pin 12, circuit 1 (DB), harness side and clockspring C218b pin 6, circuit 1 (DB), harness side.  A0047172 • **Is the resistance less than 5 ohms?**	**Yes** GO to A10 . **No** REPAIR the circuit. TEST the system for normal operation.
A10 CHECK CIRCUIT 848 (DG/OG) BETWEEN CLOCKSPRING AND POWERTRAIN CONTROL MODULE	
• Measure the resistance between the clockspring C218b pin 5, circuit 848 (DG/OG), harness side and the powertrain control module C175a pin 17, circuit 848 (DG/OG), harness side.	**Yes** GO to A11 . **No** REPAIR the circuit. TEST the system for normal operation.

 ● **Is the resistance less than 5 ohms?**	
A11 CHECK FOR CORRECT PCM OPERATION	
● Disconnect all PCM connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all PCM connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the PCM self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST B: THE HORN SOUNDS CONTINUOUSLY

Test Step	Result / Action to Take
B1 CHECK THE CJB TO HORN	
● Key in OFF position. ● Disconnect: C270a. ● **Does the horn continue to sound?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to B2 .
B2 CHECK THE HORN SWITCH CIRCUIT	
● Disconnect: CJB C270e. ● Connect: CJB C270a. ● **Does the horn continue to sound?**	**Yes** REPAIR or INSTALL a new CJB as necessary. TEST the system for normal operation. **No** GO to B3 .
B3 CHECK THE HORN SWITCH	
● Connect: CJB C270e. ● Disconnect: Upper Clockspring. ● **Does the horn continue to sound?**	**Yes** GO to B4 . **No** INSTALL a new driver side air bag module. REFER to Section 501-20B . TEST the system for normal operation.

B4 CHECK THE CLOCKSPRING ● Disconnect: Lower Clockspring C218b. ● **Does the horn continue to sound?**	**Yes** GO to B5 . **No** INSTALL a new clockspring. TEST the system for normal operation.
B5 CHECK VEHICLE SECURITY MODULE ● Disconnect: Vehicle Security Module C2113b. ● **Does the horn continue to sound?**	**Yes** GO to B6 . **No** GO to B7 .
B6 CHECK TIRE PRESSURE MODULE ● Disconnect: Tire Pressure Module C3813. ● **Does the horn continue to sound?**	**Yes** REPAIR circuit 1 (DB). TEST the system for normal operation. **No** GO to B8 .
B7 CHECK THE VEHICLE SECURITY MODULE FOR CORRECT OPERATION ● Disconnect all vehicle security module connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all vehicle security module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new vehicle security module. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
B8 CHECK THE TIRE PRESSURE MONITOR (TPM) MODULE FOR CORRECT OPERATION ● Disconnect all TPM connectors. ● Check for: ● corrosion ● pushed-out pins ● Connect all TPM connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new TPM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Clock

The stand-alone electric analog clock, available in the Navigator only, is centrally located on the instrument panel and displays time in a 12 hour format. The clock is backlit when the headlamps and parking lamps are on. The Expedition clock is integrated into the radio.

Clock

Refer to Wiring Diagrams Cell 44 , Horn/Cigar Lighter/Digital Clock for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

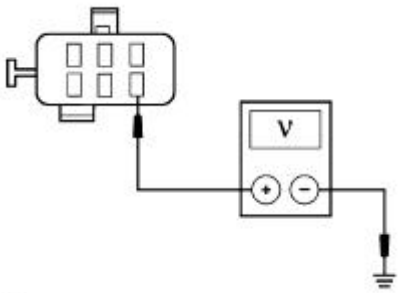
Inspection and Verification

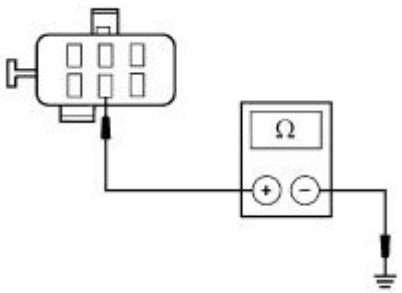
1. Verify the customer concern by operating the electric clock.
2. Visually inspect for obvious signs of mechanical and/or electrical damage using the following chart:

Visual Inspection Chart

Mechanical	Electrical
● Electric clock	● Central junction box (CJB) fuse 5 (7.5A) ● Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is not visually evident, proceed to the Symptom Chart.



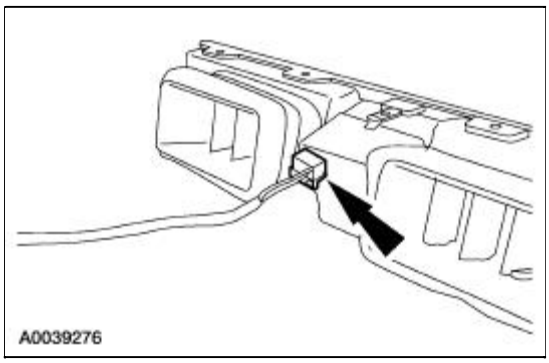


Symptom Chart

Symptom Chart

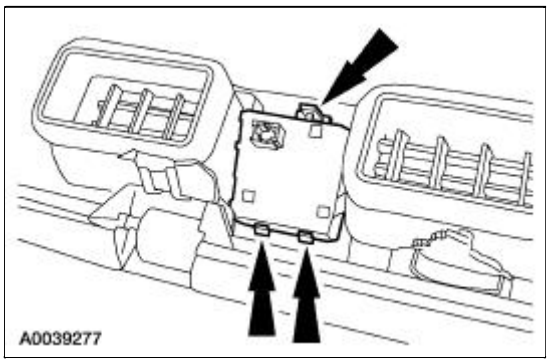
Condition	Possible Sources	Action
● The clock operation is erratic/inoperative	● Central junction box (CJB) fuse 5 (7.5A). ● Circuitry. ● Electric clock.	● GO to Pinpoint Test A .

Pinpoint Tests



PINPOINT TEST A: THE CLOCK OPERATION IS ERRATIC/INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK POWER SUPPLY TO THE ELECTRIC CLOCK	**Yes** GO to A2 . **No** REPAIR the circuit. TEST the system for normal operation.
● Key in OFF position. ● Measure the voltage between the electric clock C2016 pin 6, circuit 729 (RD/WT), harness side and ground.  A0039279 ● **Is the voltage greater than 10 volts?**	
A2 CHECK ELECTRIC CLOCK GROUND CIRCUIT	**Yes** INSTALL a new clock. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
● Measure the resistance between electric clock C2016 pin 5, circuit 57 (BK), harness side and ground.  A0039280 ● **Is the resistance less than 5 ohms?**	



Clock

Removal and Installation

1. Remove the instrument cluster center finish panel. Refer to Section 501-12 .
2. Disconnect the electrical connector.

3. Pry the retaining clips away from the clock and remove the clock from the instrument cluster center finish panel.

4. To install, reverse the removal procedure.

Information And Message Center

The message center display is a green vacuum fluorescent, fixed format display. The message center is a two-line display integrated into the right side of the instrument cluster and is controlled by the message center switches. Refer to the owner literature for operating instructions.

Information And Message Center

Refer to Wiring Diagrams Cell 60 , Overhead Console for schematic and connector information.

Special Tool(s)

 ST1137-A	73 III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool

Principles of Operation

The message center is a vacuum fluorescent display, part of the instrument cluster. The message center electronic functions use both hardwired, standard corporate protocol (SCP), and UART based protocol (UBP) communication networks to transmit and receive information. As a technician it is very important to understand:

- where the input (command) originates from.
- all the information (messages) necessary in order for a feature to operate.
- which module(s) receive(s) the input or command message.
- does the module which received the input (message) control the output of the feature, or does it output a message over the SCP communication network to another module?
- which module controls the output of the feature.

The message center provides the following features:

- information displays
- setup displays
- warning messages
- system check messages

The message center information can be selected through a set of three buttons:

- INFO
- SETUP

- RESET

Information Displays

The information displays are non-timed modes. The selected mode remains on until the driver depresses a message center button to change the mode or it is overridden by another mode. The information display modes are:

- odometer
- trip odometer
- compass
- distance to empty
- average fuel economy

For additional information regarding the odometer and trip odometer, refer to Section 413-01 .

Setup Displays

The setup displays are timed modes and terminate after a finite interval. The setup display modes are:

- language
- English/metric units
- system check
- charge system status
- oil pressure status
- engine temp status
- washer fluid status
- brake fluid status
- fuel level status
- distance to empty
- tire warning
