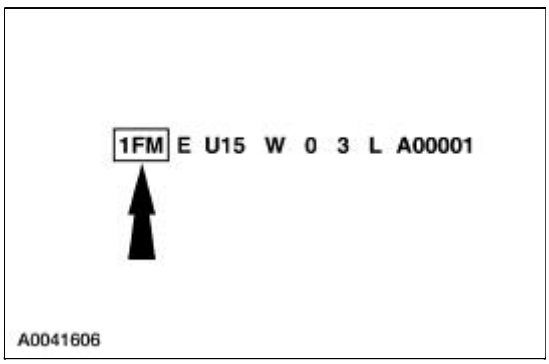
Identification Codes

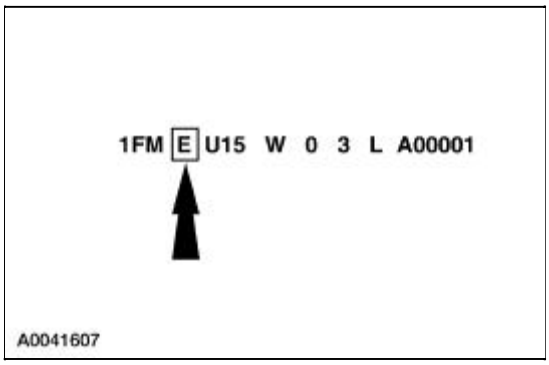


The vehicle identification number (VIN) is a seventeen-digit combination of letters and numbers. The VIN is stamped on a metal tab riveted to the instrument panel, top upper left of the dash. The VIN number is also found on the vehicle certification (VC) label.

Item	Description
1	World manufacturer identifier (WMI)
2	Brake type and gross vehicle weight rating (GVWR)
3	Vehicle line and series
4	Engine type
5	Computer-generated check digit
6	Model year
7	Assembly plant
8	Production sequence number

Vehicle Identification Number (VIN)

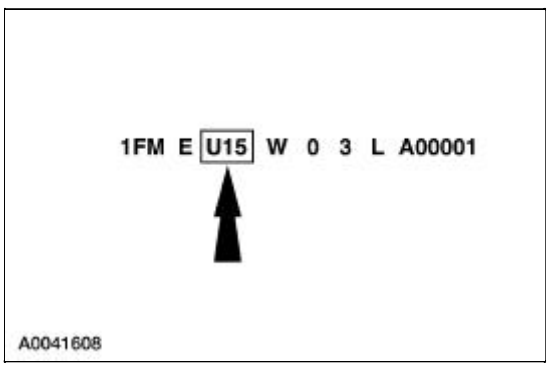
World Manufacturer Identifier (WMI)



The first three vehicle identification number (VIN) positions are the world manufacturer identifier.

- 1FM — Ford Motor Company, USA, multi-purpose vehicle

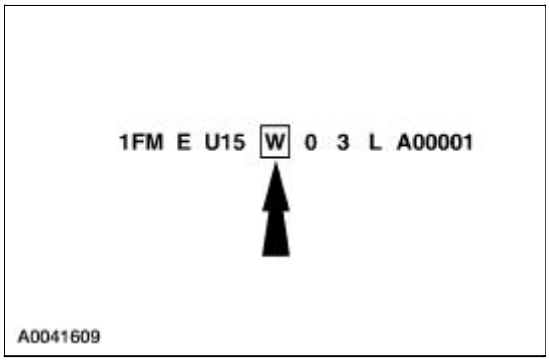
- 5LM — Lincoln, USA, multi-purpose vehicle



Brake Type and Gross Vehicle Weight Rating (GVWR)

The fourth VIN position is the vehicle brake type and gross vehicle weight rating (GVWR) code. All vehicle use hydraulic brakes.

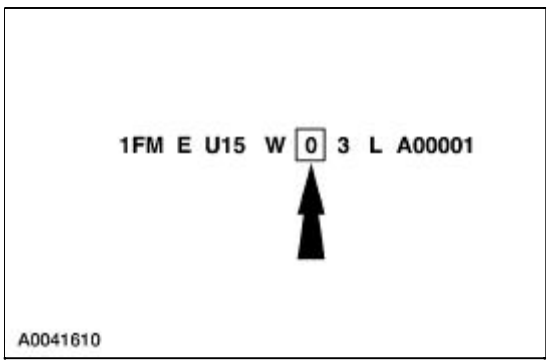
- E — 6,001-7,000 pounds GVWR with driver and front passenger air bags and driver and front passenger side impact air curtains
- F — 7,001-8,000 pounds GVWR with driver and front passenger air bags and driver and front passenger side impact air curtains
- R — 6,001-7,000 pounds GVWR with driver and front passenger air bags
- P — 7,001-8,000 pounds GVWR with driver and front passenger air bags



Vehicle Line and Series

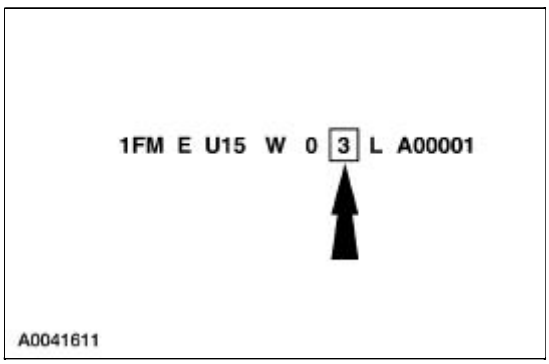
Positions 5 through 7 indicate vehicle line and series.

- U15 — Expedition, 4x2, XLT
- U16 — Expedition, 4x4, XLT
- U17 — Expedition, 4x2, Eddie Bauer
- U18 — Expedition, 4x4, Eddie Bauer
- U27 — Navigator, 4x2
- U28 — Navigator, 4x4



Engine Type

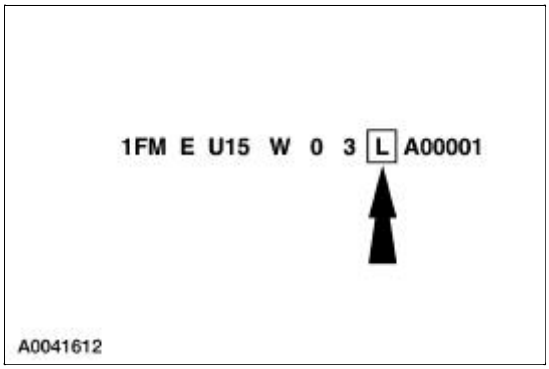
The eighth VIN position is the engine displacement and number of cylinders.



- L — 5.4L, SOHC, EFI, 2V, V-8, gas
- R — 5.4L, DOHC, EFI, 4V, gas
- W — 4.6L, SOHC, EFI, V-8, gas

Computer-Generated Check Digit

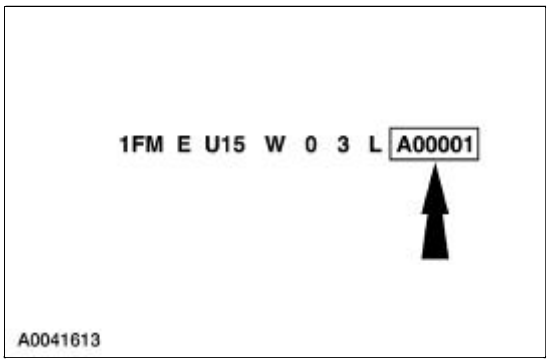
The ninth VIN position is a government assigned, computer-generated check digit.



Model Year

The tenth VIN position is the model year code.

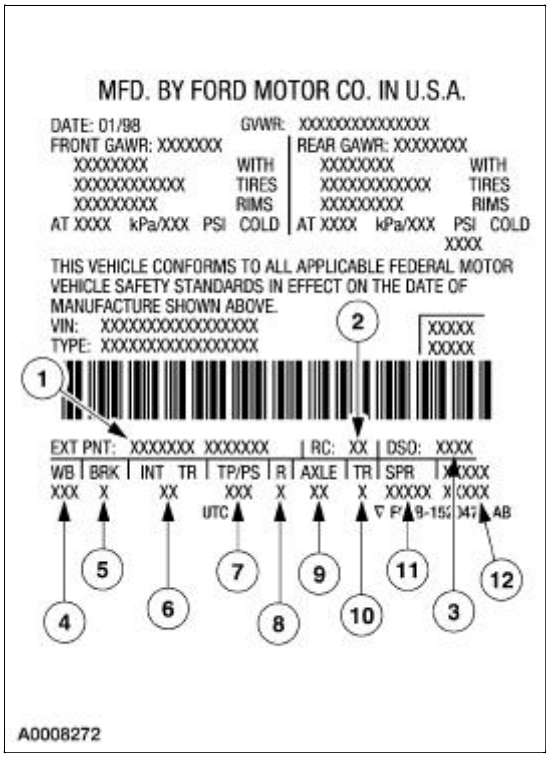
- 3 — 2003



Assembly Plant

The eleventh VIN position is the assembly plant code.

- L — Michigan Truck (Wayne, Michigan)



Vehicle Build Sequence

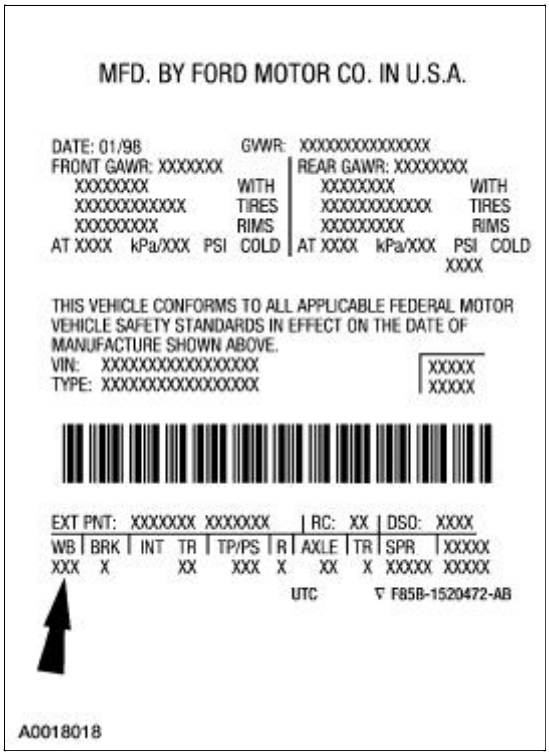
The last six VIN positions are an alphanumeric code for the vehicle build sequence. This is also the vehicle serial and warranty number.

- A00001-C99999 — Ford Division
- J00001-L99999 — Lincoln Division

Vehicle Certification (VC) Label

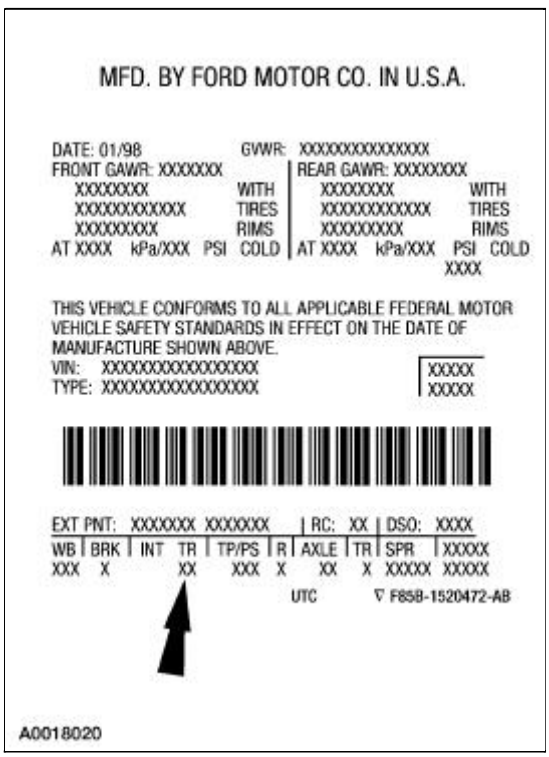
Item	Description
1	Exterior paint code
2	Region code
3	Domestic special order code
4	Wheelbase code
5	Brake code
6	Interior trim code
7	Tape/paint pinstripe code
8	Radio code
9	Axle code
10	Transmission code
11	Spring code
12	Powertrain calibration information

The vehicle certification (VC) label contains the manufacturer name, the month and year of manufacture, the certification statement, and the VIN. It also includes gross vehicle weight ratings (GVWR).



Exterior Paint Code

Paint codes may be listed as a two-part code. The first set of characters listed indicate the vehicle primary body color. The second set of characters listed (if applicable) indicate a two-tone or accent body color. All colors are base coat/clear coat.



- AQ — Arizona Beige — Expedition
- CX — Dark Shadow Gray — Expedition
- E9 — Laser Red Tint — Expedition
- GT — Autumn Red — Navigator
- JP — Silver Birch Metallic — Expedition/Navigator
- L2 — True Blue — Expedition
- LD — Medium Wedgewood Blue — Expedition/Navigator
- P5 — Aspen Green Metallic — Expedition/Navigator
- ST — Estate Green — Expedition
- TK — Mineral Gray — Navigator
- UA — Ebony — Expedition/Navigator
- YZ — Oxford White — Expedition/Navigator

Wheelbase

- 119 — 119-inch (3,023 mm) wheelbase

Interior Trim

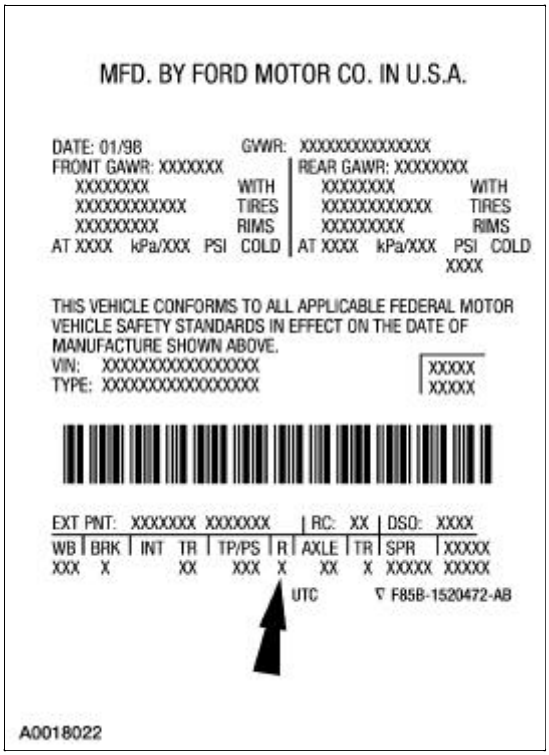
Interior trim codes are listed as a two-part code. The first character identifies the trim type. The second character identifies the interior trim color.

Trim Type

- F — Cloth captain's chairs front, Expedition (XLT)

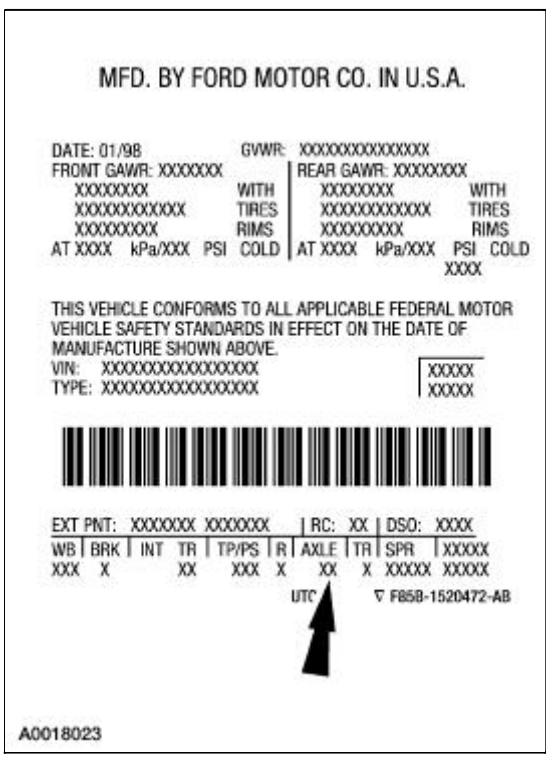
- K — Leather captain's chairs front, Navigator
- 1 — Leather captain's chairs front, Expedition (XLT, Eddie Bauer)
- M — Cloth — 60/40 front, Expedition

Interior Trim Color



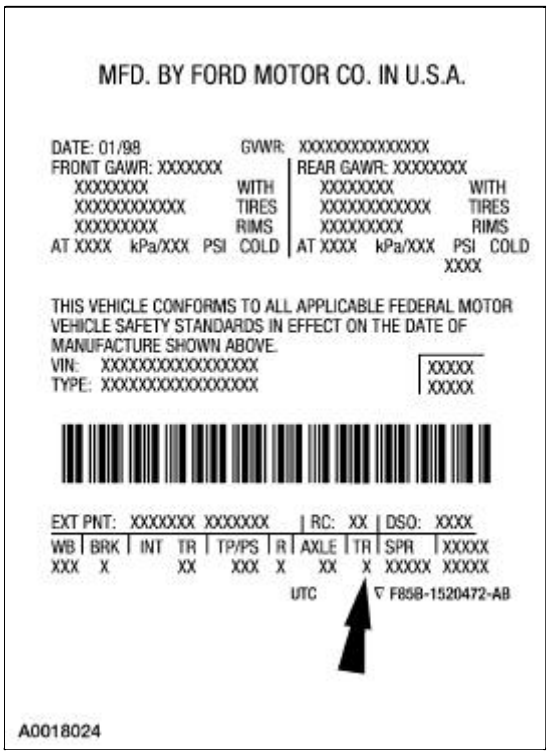
- A — Light Parchment
- B — Black Ink
- G — Dark Flint
- H — Medium Parchment

Tape/Paint Stripe



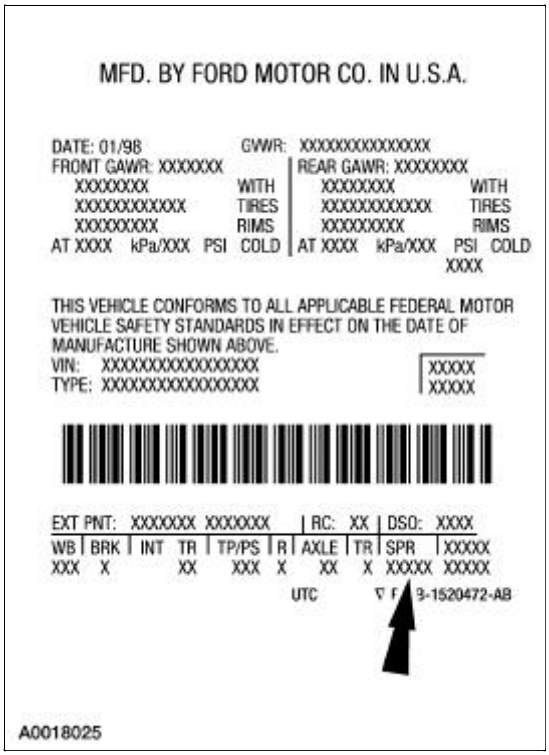
Tape and paint stripe codes do not apply.

Radio Type



- 1 — AM/FM stereo with six-disc, in-dash compact disc (CD) changer
- F — AM/FM stereo with six-disc, in-dash compact disc (CD) changer and navigation system
- K — Premium electronic AM/FM stereo with compact disc (CD) and cassette player
- T — Premium AM/FM stereo Audiophile with six-disc, in-dash compact disc (CD) changer

Axle Code



- H6 — 3.73 ratio, limited slip
- 16 — 3.73 ratio, non-limited slip

Transmission Code

- E — Automatic 4R100 (Navigator)
- U — Automatic 4R70W (Expedition)

Spring Codes

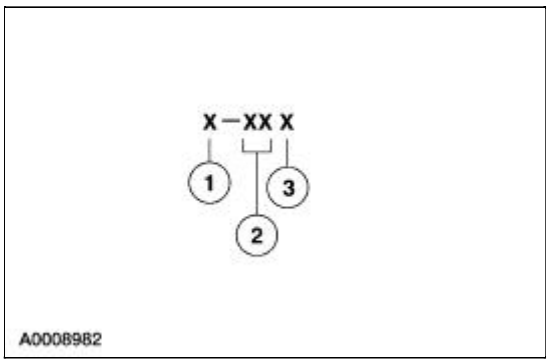
Spring codes are listed as a two-part code. The first character listed identifies the front spring. The second code listed identifies the rear spring or load leveling system.

Front Springs

- 6F — 2L14-18B036-F, standard suspension
- 6G — 2L14-18B036-G, standard suspension
- 6H — 2L14-18B036-H, standard suspension
- 6A — 2L1J-18B036-A
- 4A — 2L74-3C098-B, air suspension, right-hand
- 4A — 2L74-3C144-A, air suspension, left-hand
- 4B — 2L74-3C098-C
- 4B — 2L74-3C144-B, air suspension, left-hand

Rear Springs

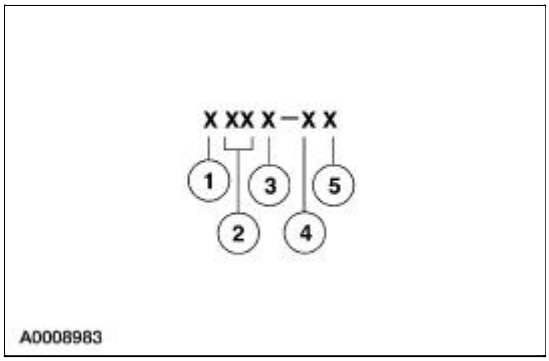
- JA — 2L1J-18W002-A, standard suspension
- 2B — 2L14-18W002-B, standard suspension
- 1A — 2L74-5A980-A, air suspension, right-hand
- 1A — 2L74-5A981-A, air suspension, left-hand
- 1B — 2L74-5A980-B, air suspension, right-hand
- 1B — 2L74-5A981-B, air suspension, left-hand



Powertrain Calibration Information

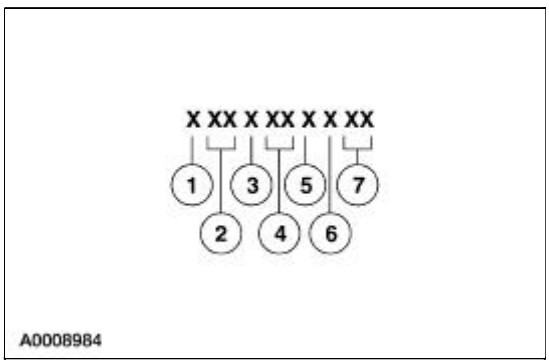
NOTE: Powertrain calibration information is limited to a maximum of five characters per line on the Vehicle Certification (VC) Label. Because of this, calibration identification consisting of more than five characters will wrap to the second line on the VC label.

Powertrain calibration information is printed in the lower right corner of the Vehicle Certification (VC) Label. Only the base calibration information is printed. Revision levels will not appear, however, they can be found in On Line Automotive Service Information System (OASIS). For the current model year, Ford Motor Company is using three different protocols which describe powertrain base calibration. These protocols are designed to provide worldwide standardization for vehicle calibration. If the electronic calibration strategy has been used since 1998 and carried into the current model year, Protocol 1 will be used. Refer to Protocol 1 below. If the electronic calibration strategy has been used since 1999 and is carried into the current model year, Protocol 2 will be used. Refer to Protocol 2 below. For electronic calibration strategies introduced in the 2000 or later model years, use Protocol 3. Refer to Protocol 3 below.



Protocol 1

Item	Description
1	Model year (model year in which calibration strategy was first introduced)
2	Engine code



3	Engine revision level

Protocol 2

Item	Description
1	Model year (model year in which calibration strategy was first introduced)
2	Engine code
3	Transmission code
4	Emission standard (designates the specific country emission standard)
5	Design level (design level assigned to the engine)

Protocol 3

Item	Description
1	Model year (model year in which calibration strategy was first introduced)
2	Vehicle code
3	Transmission code
4	Unique calibration (designates different hardware to similar vehicles). Example: tires, drive ratios, etc.
5	Fleet code (describes fleet to which the vehicle belongs). Example: 6 - evaporative emissions
6	Certification region (lead region where multiple regions are included in one calibration). Example: A - U.S. federal
7	Revision level (will advance as revisions occur). Not printed on label

Protocol 3

The following offers a more detailed explanation of the strategy used in Protocol 3.

Model Year

- 0 — 2000
- 1 — 2001
- 2 — 2002
- 3 — 2003

Vehicle Line

- B3 — Expedition/Navigator

Transmission

- 1 — Automatic transmission

Unique Calibration

The Emissions/|CAFE/CO2 Compliance Department is responsible for assigning these calibration numbers. Unique calibration identifications are assigned to cover similar vehicles to differentiate between tires, drive configurations, final drive ratios and other calibration-significant factors.

These two characters are chosen by the analyst to provide identifiable information unique to each calibration. For example, using the number 2 to denote a two-valve engine versus using the number 4 to denote a four-valve engine provides an easily identifiable difference.

Fleet Code

- 1 — HDGE/Dyno
- 2 — Fast AMA, U.S.
- 3 — ADP, U.S.
- 4 — Not assigned
- 5 — Not assigned
- 6 — Evaporative emissions
- 7 — MACAA
- 8 — On-board diagnostics (OBD)
- 9 — Not assigned

Certification Region

- Where multiple regions are included in one calibration, only the lead region will appear.
- 5 — U.S. fifty states
- A — U.S. Federal, including altitude, may include Canada and/or Mexico
- B — U.S. California Standard, includes U.S. green states
- C — Canada
- D — China
- E — European Community (Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Netherlands, Portugal, Spain, Sweden and United Kingdom)
- F — Extended European Community (E plus Croatia, Czech Republic, Estonia, Hungary, Norway, Poland, Romania, Russian Federation, Slovakia, Slovenia, Switzerland and Yugoslavia)

- G — Gulf Cooperative Council (Bahrain, Kuwait, Oman, Qatar, Saudi Arabia and UAE)
- H — Hong Kong
- J — Japan
- K — Korea
- L — Malaysia
- M — Mexico
- N — New Zealand
- P — Australia
- Q — South America (Brazil)
- S — Singapore
- T — Taiwan
- U — South America (unleaded fuel regions)
- V — Vietnam
- X — ROW (rest of world)
- Y — Military
- Z — Israel

Revision Level (not printed on label)

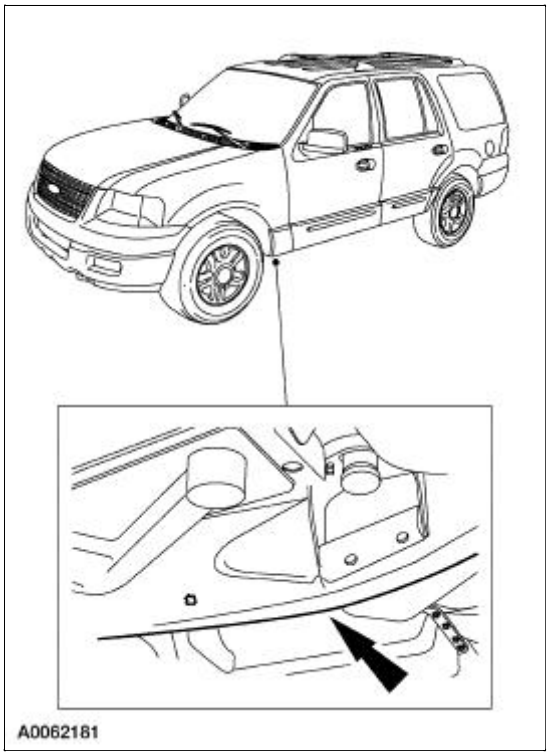
- 91-99 — Hardware certification levels
- 01-04 — Preliminary levels
- 00 — Job 1 production (initial calibration)
- 05-09 — Pre-job 1 revisions to calibrations
- 10-89 — Post-job 1 revisions to calibrations
- 0B — Durability test level
- BD — On-board diagnostics (OBD) intermediate level (pre-05)

Jacking

WARNING: The electrical power to the air suspension system must be shut down prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

WARNING: Do not run the engine when jacking the vehicle. The wheels contacting the ground could cause the vehicle to move.

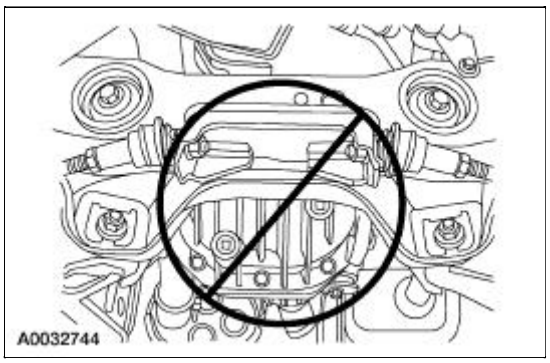
WARNING: Support the vehicle prior to carrying out any procedure requiring the vehicle to be jacked off the ground.



WARNING: Make sure the jack and jack stands are correctly located to prevent the vehicle from falling.

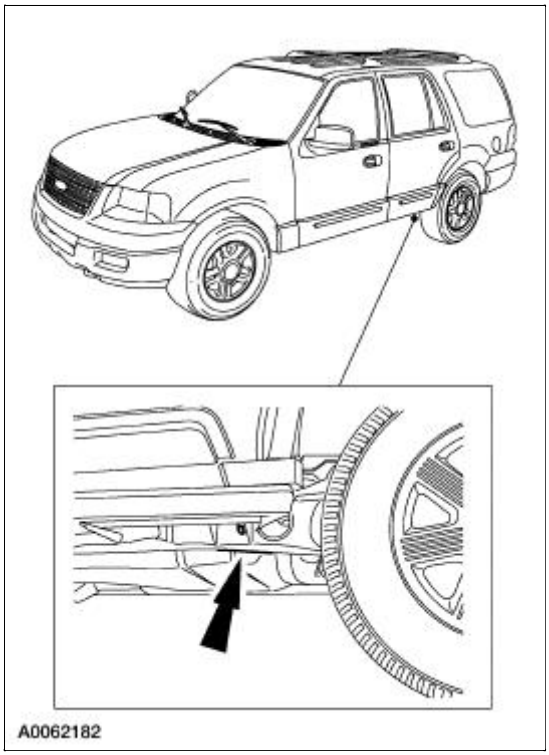
WARNING: Wheel chocks should be used to prevent the vehicle from rolling and falling off the jack.

CAUTION: Never use a halfshaft as a lifting point.



CAUTION: If equipped with retractable running board, disable the system through the instrument cluster controls.

Jacking Points — Front

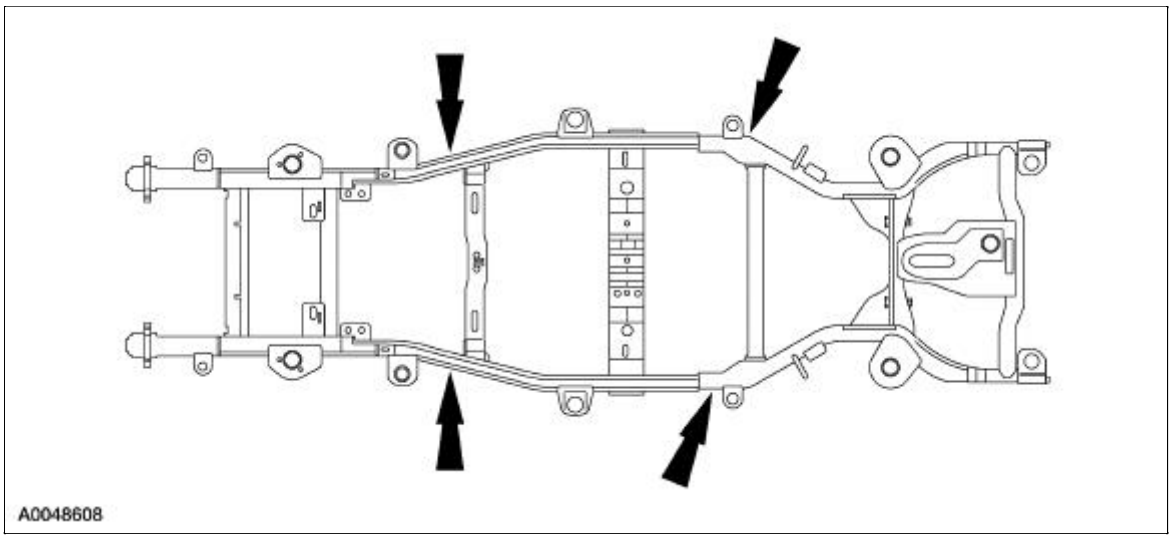


The front jacking point is indicated by an arrow cutout in the frame, located behind the front tire and wheel assembly.

Jacking Points — Rear

CAUTION: Do not use the differential housing as a lift point. Leaks or damage to the rear axle cover and adjoining differential housing surface can occur if a floor jack or any lifting device is allowed to contact the cover at any point where the cover joins the housing.

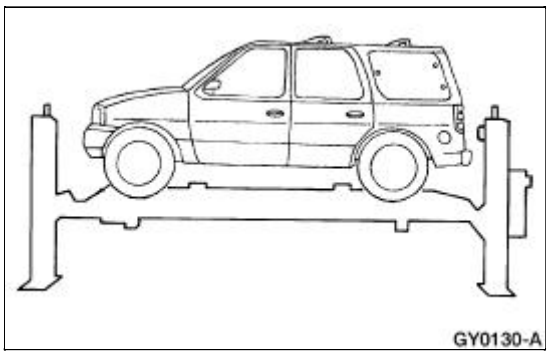
CAUTION: Do not use the rear control arms as a lifting point.



The rear jacking point is indicated by an arrow cutout in the frame, located in front of the rear tire and wheel assembly.

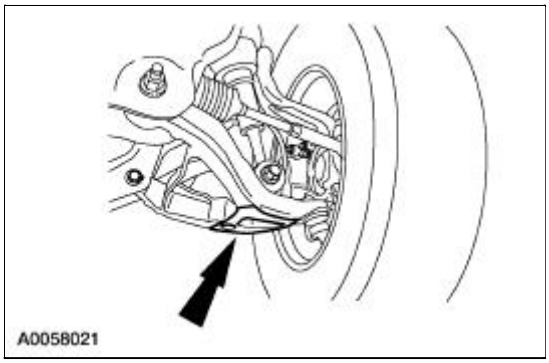
Lifting

WARNING: The electrical power to the air suspension system must be shut down prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.



CAUTION: Damage to suspension, exhaust and steering linkage components can occur if care is not exercised when positioning the hoist adapters prior to lifting the vehicle.

Lifting Points — Twin Post Hoist



Locate the front hoist adapters and rear hoist adapters (top of frame arc) as indicated.

Lifting Points — Drive On Hoist

The vehicle is supported by tires and suspension components.

Lifting Points — Floor Jack, Front

The front can be lifted using a floor jack under the front control arm directly below the shock.

Maintenance Schedule —Vehicles with Gasoline Engines

The maintenance schedule is designed to protect against major repairs resulting from neglect or inadequate maintenance and to prolong the life of the vehicle.

General Maintenance Information

NOTE: This is a generic maintenance schedule for all Ford, Lincoln and Mercury vehicles. There may be items listed that do not apply to all vehicles.

The Normal Schedule applies to operation of the vehicle under typical, everyday driving conditions. The maintenance frequency in this schedule typifies what the vast majority of vehicles will require. The listed services should be carried out at specified mileage intervals. There are, however, additional services required that only the noted vehicles require.

If the vehicle is operated in one or more of the following special operating conditions, those additional services will be required. The special operating conditions are:

- towing or carrying heavy loads.
- extensive idling and/or driving at low speeds for long distances.
- driving in dusty conditions.
- off-road operation.

There are also exceptions to the Normal Operating Schedule which will require more frequent maintenance for some components. Those exceptions are:

- natural gas and propane vehicles — fuel tank intervals.
- normal vehicle axle — maintenance and lubrication.
- police and taxi vehicles — maintenance and lubrication.
- engine oil and yellow coolant — time and mileage-based interval.

Special Operating Condition Requirements

When towing a trailer or using a camper or car-top carrier:

- Change engine oil and install a new oil filter every 4,800 km (3,000 miles) or 3 months.
- Change transfer case fluid every 96,000 km (60,000 miles).
- Change manual transmission fluid as required.
- Inspect and lubricate U-joints as required.

During extensive idling and/or low speed driving for long distances, as in heavy commercial use such as delivery, taxi, patrol car or livery:

- Change engine oil and install a new oil filter, lube front lower control arm and steering linkage ball joints with zerk fittings (if equipped) every 4,800 km (3,000 miles) or 3 months.
- Inspect brake system and check battery electrolyte level (Patrol cars) every 8,000 km (5,000 miles).
- Install a new fuel filter every 24,000 km (15,000 miles).
- Change automatic transmission fluid, lubricate 4x2 wheel bearings, install new grease seals and adjust bearings every 48,000 km (30,000 miles).
- Install new spark plugs and change transfer case fluid every 96,000 km (60,000 miles).
- Install a new cabin air filter as required.

When operating in dusty conditions such as unpaved or dusty roads:

- Change engine oil and install a new oil filter every 4,800 km (3,000 miles) or 3 months.
- Install a new fuel filter every 24,000 km (15,000 miles).
- Change automatic transmission fluid every 48,000 km (30,000 miles).
- Change transfer case fluid every 96,000 km (60,000 miles).
- Install a new engine air filter as required.
- Install a new cabin air filter as required.

When operating in off-road conditions:

- Change automatic transmission fluid every 48,000 km (30,000 miles).
- Change transfer case fluid every 96,000 km (60,000 miles).
- Install a new cabin air filter as required.
- Inspect and lubricate U-joints.
- Inspect and lubricate steering linkage ball joints with zerk fittings.

Checks and Services

Certain basic maintenance checks and inspections should be carried out at specified intervals. Any recognized adverse condition should be corrected as soon as possible.

Maximum Oil Change Interval (Normal Schedule)

- 8,000 km (5,000 miles) or 6 months, whichever occurs first.

Maximum Oil Change Interval (Special Operating Conditions)

- 4,800 km (3,000 miles) or 3 months.

Monthly Checks

Check each of the following items every month:

- All interior and exterior lights.
- Tires for wear and correct air pressure.

- Engine oil fluid level.
- Windshield washer solvent fluid level.
- Check and drain fuel/water separator.

Six Month Checks

Check each of the following items at least every six months:

- Lap/shoulder belts and seat latches for wear and function.
- Spare tire air pressure.
- Power steering fluid level.
- Parking brake for correct operation.
- Safety warning lamps (brake, ABS, air bag, safety belt) for correct operation.
- Coolant system fluid level and correct strength.
- Battery connections. Clean if necessary.
- Clutch fluid level, if equipped.
- Windshield washer spray, wiper operation, clean all wiper blades.
- Lubricate all hinges, latches and outside locks. Inspect for correct operation.
- Lubricate door rubber weatherstrips. Inspect for excessive wear.
- Clean body and door drain holes. Inspect for clogs and obstructions.

Special Checks (Mustang Only)

Carry out the following check every 8,000 km (5,000 miles):

- Adjust clutch by lifting pedal (manual transmission Mustang only, as described in owner guide).

Normal Schedule

The following checks or procedures should be carried out for all cars, minivans, light trucks, sport utilities, vans, 4x4s, natural gas and propane vehicles.

8,000 Km (5,000 Miles)

- Change engine oil and install a new oil filter.
- Rotate tires and inspect for wear.

16,000 Km (10,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

24,000 Km (15,000 Miles)

- Change engine oil and install a new oil filter.

- If equipped, inspect automatic transmission fluid level with dipstick.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect steering linkage, suspension and (if equipped) driveshaft and ball joints.
- Rotate tires and inspect for wear.
- If equipped, install a new cabin air filter.

32,000 Km (20,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

40,000 Km (25,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Drain coalescent fuel filter and replace filter (NGV).

48,000 Km (30,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.
- Inspect steering linkage, suspension and (if equipped) driveshaft and ball joints.
- Rotate tires and inspect for wear.
- Install a new engine air filter.
- Install a new fuel filter. (See ADDITIONAL INFORMATION below.)
- If equipped, install a new cabin air filter.
- Change automatic transmission/transaxle fluid on all vehicles equipped with AX4S, 4F50N, 4R100, 4F27E. Inspect automatic transmission fluid level using dipstick on all other vehicles, if equipped.
- If equipped, install new climate controlled seat filters (Navigator, Lincoln LS and Aviator).

ADDITIONAL INFORMATION: If vehicle is registered in California, the California Air Resources Board (CARB) has determined that failure to install a new fuel filter at this interval will not nullify the emission warranty or limit recall liability prior to completion of the vehicle's useful life. It is, however, recommended that maintenance checks be carried out and recorded at the indicated intervals.

Natural gas and propane vehicles also require checking the fuel tanks and installing a new filter (propane vehicles).

56,000 Km (35,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

64,000 Km (40,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

72,000 Km (45,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect automatic transmission fluid level using dipstick, if equipped.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect steering linkage, suspension and (if equipped) driveshaft and ball joints.
- Rotate tires and inspect for wear.
- If equipped, install a new cabin air filter.
- If filled with green engine coolant, change coolant.

80,000 Km (50,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Drain coalescent fuel filter and replace filter (NGV).

88,000 Km (55,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

96,000 Km (60,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect steering linkage, suspension and (if equipped) driveshaft and ball joints.
- Rotate tires and inspect for wear.
- Install a new engine air filter.
- Install a new fuel filter. (See ADDITIONAL INFORMATION below.)
- If equipped, install a new cabin air filter.
- Change automatic transmission/transaxle fluid on all vehicles equipped with AX4S, 4F50N, 4R100, 4F27E. Inspect automatic transmission fluid level using dipstick on all other vehicles, if

equipped.

- If equipped, install new climate controlled seat filters (Navigator, Lincoln LS and Aviator).

ADDITIONAL INFORMATION: If vehicle is registered in California, the California Air Resources Board (CARB) has determined that failure to install a new fuel filter at this interval will not nullify the emission warranty or limit recall liability prior to completion of the vehicle's useful life. It is, however, recommended that maintenance checks be carried out and recorded at the indicated intervals.

Additional checks for natural gas and propane vehicles at this interval include inspecting fuel tanks, as well as draining coalescent fuel filter and installing a new filter.

104,000 Km (65,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

112,000 Km (70,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

120,000 Km (75,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect automatic transmission fluid level using dipstick.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect steering linkage, suspension and (if equipped) driveshaft and ball joints.
- Rotate tires and inspect for wear.
- Install a new cabin air filter.
- Drain coalescent fuel filter and replace filter (NGV).
- Change green engine coolant, if equipped.

128,000 Km (80,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

136,000 Km (85,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

144,000 Km (90,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.

- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.
- Inspect steering linkage, suspension and (if equipped) driveshaft and ball joints.
- Rotate tires and inspect for wear.
- Install a new engine air filter.
- Install a new fuel filter.
- If equipped, install a new cabin air filter.
- Change automatic transmission/transaxle fluid on all vehicles equipped with AX4S, 4F50N, 4R100, 4F27E. Inspect automatic transmission fluid level using dipstick on all other vehicles, if equipped.
- If equipped, install new climate controlled seat filters (Navigator, Lincoln LS and Aviator).

Additional services for natural gas and propane vehicles include inspecting fuel tanks, as well as draining coalescent fuel filter bowl and installing a new filter.

152,000 Km (95,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

160,000 Km (100,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect accessory drive belt(s).
- Rotate tires and inspect for wear.
- Install new spark plugs.
- If filled with yellow coolant, change coolant or at 5 years, whichever comes first.
- Install a new PCV on all cars and light trucks under 6,000 pounds Gross Vehicle Weight (GVW).
- Drain coalescent fuel filter and replace filter (NGV).

168,000 Km (105,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect automatic transmission fluid level if equipped with dipstick.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect wheel ends for end play and noise.
- Inspect engine coolant system and hoses.
- Inspect steering linkage, suspension and (if equipped) driveshaft and ball joints.
- Rotate tires and inspect for wear.
- If equipped, install a new cabin air filter.
- If filled with green engine coolant, change coolant.

176,000 Km (110,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

184,000 Km (115,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

192,000 Km (120,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.
- Inspect steering linkage, suspension and (if equipped) driveshaft and ball joints.
- Rotate tires and inspect for wear.
- Install a new engine air filter.
- Install a new fuel filter. (See ADDITIONAL INFORMATION below.)
- If equipped, install a new cabin air filter.
- Install new accessory drive belt(s) (Escort).
- Install a new PCV valve on all cars and light trucks over 6,000 Gross Vehicle Weight.
- Change automatic transmission/transaxle fluid on all vehicles equipped with AX4S, 4F50N, 4R100, 4F27E. Inspect automatic transmission fluid level using dipstick on all other vehicles, if equipped.
- Install a new camshaft belt on all 2.0L, 4-cylinder engines (Escort, Focus, ZX2 and Escape).
- If equipped, install new climate controlled seat filters (Navigator, Lincoln LS and Aviator).

ADDITIONAL INFORMATION: Additional services for natural gas and propane vehicles include inspecting fuel tanks, as well as draining coalescent fuel filter bowl and installing a new filter.

200,000 Km (125,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.
- Drain coalescent fuel filter and replace filter (NGV).

208,000 Km (130,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

216,000 Km (135,000 Miles)

- Change engine oil and install a new oil filter.

- If equipped, inspect automatic transmission fluid level with dipstick.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect steering linkage, suspension and (if equipped) driveshaft and ball joints.
- Rotate tires and inspect for wear.
- Install a new cabin air filter.
- If filled with green engine coolant, change coolant.

224,000 Km (140,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

232,000 Km (145,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect tires for wear. Rotation recommended for optimal tire life.

240,000 Km (150,000 Miles)

- Change engine oil and install a new oil filter.
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect wheel ends for end play and noise.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.
- Inspect steering linkage, suspension and (if equipped) driveshaft and ball joints.
- Rotate tires and inspect for wear.
- Install a new engine air filter.
- Install a new fuel filter. (See ADDITIONAL INFORMATION below.)
- If equipped, install a new cabin air filter.
- If filled with yellow engine coolant, change coolant or at 8 years, whichever comes first.
- Change automatic transmission/transaxle fluid and filter.
- Change rear axle lubricant on all rear wheel (RWD) vehicles.
- Install a new accessory drive belt(s) (if a new belt has not been installed within the last 100,000 miles).
- If equipped, install new climate controlled seat filters (Navigator, Lincoln LS and Aviator).

ADDITIONAL INFORMATION: If vehicle is registered in California, the California Air Resources Board (CARB) has determined that failure to install a new fuel filter at this interval will not nullify the emission warranty or limit recall liability prior to completion of the vehicle's useful life. It is, however recommended that maintenance checks be carried out and recorded at the indicated intervals.

Additional checks for natural gas and propane vehicles include inspecting fuel tanks, as well as draining and installing a new filter.

Exceptions To Normal Schedule

Yellow Coolant

- Change coolant at 5 years or 160,000 km (100,000 miles) of the vehicle's life, whichever comes first.
- After the initial change, change coolant every 3 years or 80,000 km (50,000 miles) thereafter.

Natural Gas and Propane Vehicles

- Inspect NGV fuel tanks from the date of tank manufacture every 3 years.
- Inspect propane fuel tanks from vehicle build date every 5 years.
- Install new NGV fuel tanks from the date of tank manufacture every 15 years.

Normal Vehicle Axle Maintenance

Rear axles and power take off (PTO) units containing synthetic lubricant and light duty trucks equipped with Ford-design axles are lubricated for life. These lubricants are not to be checked or changed unless service is required, or if a leak is suspected, or the axle assembly has been submerged in water.

The axle and PTO should be changed anytime they have been submerged in water. Non-synthetic rear axle lubricants should be replaced every 4,800 km (3,000 miles) or three months, whichever occurs first, during extended trailer tow operation above 21°C (70°F) ambient and wide open throttle for extended periods above 45 mph.

The 3,000 mile lube change interval may be waived if the axle was filled with 75W140 synthetic gear lubricant meeting Ford specification WSL-M2C192-A, part number F1TZ-19B546-B or equivalent. Add four ounces of additive friction modifier C8AZ-19B546-A (EST-M2C118-A) or equivalent for complete refill of Traction-Lok rear axles.

The axle lubricant should be changed anytime an axle has been submerged in water.

Police and Taxi Vehicle Axle Maintenance

Replace rear axle lubricant every 160,000 km (100,000 miles). Rear axle lubricant change may be waived if the axle was filled with 75W140 synthetic gear lubricant meeting Ford specification WSL-M2C192-A, part number FITZ-19580-B or equivalent. Add four ounces of additive friction modifier C8AZ-19B546-A (EST-M2C118-A) or equivalent for complete refill of Traction-Lok rear axles.

The axle lubricant should be changed anytime an axle has been submerged in water.

Noise, Vibration And Harshness (NVH)

Noise is any undesirable sound, usually unpleasant in nature. Vibration is any motion, shaking or trembling, that can be felt or seen when an object moves back and forth or up and down. Harshness is a ride quality issue where the vehicle's response to the road transmits sharply to the customer. Harshness normally describes a firmer than usual response from the suspension system. Noise, vibration and harshness (NVH) is a term used to describe these conditions, which result in varying degrees of dissatisfaction. Although, a certain level of NVH caused by road and environmental conditions is normal. This section is designed to aid in the diagnosis, testing and repair of NVH concerns.

Acceptable Noise, Vibration and Harshness

All internal combustion engines and drivelines produce some noise and vibration; operating in a real world environment adds noise that is not subject to control. Vibration isolators, mufflers and dampers reduce these to acceptable levels. A driver who is unfamiliar with a vehicle can think that some sounds are abnormal when actually the sounds are normal for the vehicle type. For example, Traction-Lok® differentials produce a slight noise on slow turns after extended highway driving. This is acceptable and has no detrimental effect on the locking axle function. As a technician, it is very important to be familiar with vehicle features and know how they relate to NVH concerns and their diagnosis. For example, if the vehicle has automatic overdrive, it is important to test drive the vehicle both in and out of overdrive mode.

Diagnostic Theory

The shortest route to an accurate diagnosis results from:

- system knowledge, including comparison with a known good system.
- system history, including repair history and usage patterns.
- condition history, especially any relationship to repairs or sudden change.
- knowledge of possible sources.
- using a systematic diagnostic method that divides the system into related areas.

The diagnosis and correction of noise, vibration and harshness concerns requires:

- a road or system test to determine the exact nature of the concern.
- an analysis of the possible causes.
- testing to verify the cause.
- repairing any concerns found.
- a road test or system test to make sure the concern has been corrected or brought back to within an acceptable range.

Glossary of Terms

Acceleration-Light

An increase in speed at less than half throttle.

Acceleration-Medium

An increase in speed at half to nearly full throttle, such as 0-97 km/h (0-60 mph) in approximately 30 seconds.

Acceleration-Heavy

An increase in speed at one-half to full throttle, such as 0-97 km/h (0-60 mph) in approximately 20 seconds.

Ambient Temperature

The surrounding or prevailing temperature.

Amplitude

The quantity or amount of energy produced by a vibrating component (G force). An extreme vibration has a high amplitude. A mild vibration has a low amplitude.

Backlash

Gear teeth clearance.

Boom

Low frequency or low pitched noise often accompanied by a vibration. Also refer to Drumming.

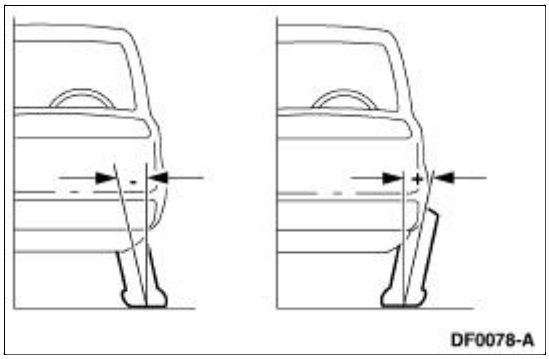
Bound Up

An overstressed isolation (rubber) mount that transmits vibration/noise instead of absorbing it.

Brakes Applied

When the service brakes are applied with enough force to hold the vehicle against movement with the transmission in gear.

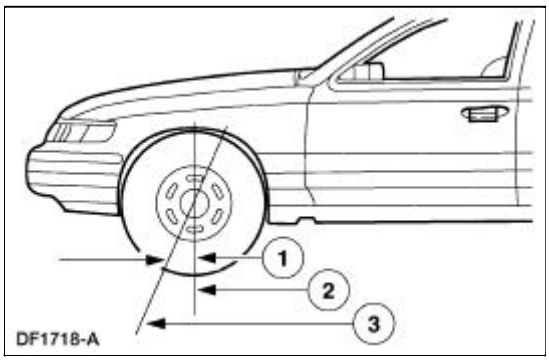
Buffet/Buffeting



Strong noise fluctuations (less than 1000 Hz) caused by gusting winds. An example would be wind gusts against the side glass.

Buzz

A low-pitched sound like (200-5000 Hz) that from a bee. Often a metallic or hard plastic humming sound. Also describes a high frequency (200-800 Hz) vibration. Vibration feels similar to an electric razor.



Camber

The angle of the wheel in relation to the true vertical as measured looking from the front of the vehicle. Camber is positive when the wheel angle is offset so that the top of the wheel is positioned away from the vehicle.

Caster

The angle of the steering knuckle in relation to the true vertical as measured looking from the side of the vehicle.

Item	Description
1	Positive caster
2	True vertical
3	Steering axis

Chatter

A pronounced series of rapidly repeating rattling or clicking sounds.

Chirp

A short-duration high-pitched noise associated with a slipping drive belt.

Chuckle

A repetitious low-pitched sound. A loud chuckle is usually described as a knock.

Click

A sharp, brief, non-resonant sound, similar to actuating a ball point pen.

Clonk

A hydraulic knocking sound. Sound occurs with air pockets in a hydraulic system. Also described as hammering.

Clunk/Driveline Clunk

A heavy or dull, short-duration, low-frequency sound. Occurs mostly on a vehicle that is accelerating or decelerating abruptly. Also described as a thunk.

Coast/Deceleration

Releasing the accelerator pedal at cruise, allowing the engine to reduce vehicle speed without applying the brakes.

Coast/Neutral Coast

Placing the transmission range selector in NEUTRAL (N) or depressing the clutch pedal while at cruise.

Constant Velocity (CV) Joint

A joint used to absorb vibrations caused by driving power being transmitted at an angle.

Controlled Rear Suspension Height

The height at which a designated vehicle element must be when driveline angle measurements are made.

Coupling Shaft

The shaft between the transfer case and the front drive axle or, in a two-piece rear driveshaft, the front section.

CPS

Cycles per second. Same as hertz (Hz).

Cracks

A mid-frequency sound, related to squeak. Sound varies with temperature conditions.

Creak

A metallic squeak.

Cruise

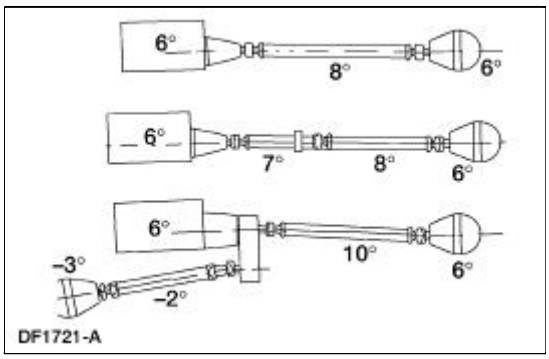
Constant speed on level ground; neither accelerating nor decelerating.

Cycle

The process of a vibrating component going through a complete range of motion and returning to the

starting point.

Decibel



A unit of measurement, referring to sound pressure level, abbreviated dB.

Drive Engine Run-Up (DERU) Test

The operation of the engine through the normal rpm range with the vehicle standing still, the brakes applied and the transmission engaged. This test is used for noise and vibration checks.

Driveline Angles

The differences of alignment between the transmission output shaft, the driveshaft, and the rear axle pinion centerline.

Driveshaft

The shaft that transmits power to the rear axle input shaft (pinion shaft). In a two-piece driveshaft, it is the rearmost shaft.

Drivetrain

All power transmitting components from the engine to the wheels; includes the clutch or torque converter, the transmission, the transfer case, the driveshaft, and the front or rear drive axle.

Drivetrain Damper

A weight attached to the engine, the transmission, the transfer case, or the axle. It is tuned by weight and placement to absorb vibration.

Drone

A low frequency (100-200 Hz) steady sound, like a freezer compressor. Also described as a moan.

Drumming

A cycling, low-frequency (20-100 Hz), rhythmic noise often accompanied by a sensation of pressure on the ear drums. Also described as a low rumble, boom, or rolling thunder.

Dynamic Balance

The equal distribution of weight on each side of the centerline, so that when the wheel and tire assembly spins, there is no tendency for the assembly to move from side-to-side (wobble). Dynamically unbalanced wheel and tire assemblies can cause wheel shimmy.

Engine Imbalance

A condition in which an engine's center mass is not concentric to the rotation center, causing excessive motion.

Engine Misfire

When combustion in one or more cylinders does not occur or occurs at the wrong time.

Engine Shake

An exaggerated engine movement or vibration that directly increases in frequency as the engine speed increases. It is caused by non-equal distribution of mass in the rotating or reciprocating components.

Flexible Coupling

A flexible joint.

Float

A drive mode on the dividing line between cruise and coast where the throttle setting matches the engine speed with the road speed.

Flutter

Mid to high (100-2000 Hz) intermittent sound due to air flow. Similar to a flag flapping in the wind.

Frequency

The rate at which a cycle occurs within a given time.

Gravelly Feel

A grinding or growl in a component, similar to the feel experienced when driving on gravel.

Grind

An abrasive sound, similar to using a grinding wheel, or rubbing sand paper against wood.

Hiss

Steady high frequency (200-800 Hz) noise. Vacuum leak sound.

Hoot

A steady low frequency tone (50-500 Hz), sounds like blowing over a long neck bottle.

Howl

A mid-range frequency (200-800 Hz) noise between drumming and whine. Also described as a hum.

Hum

Mid-frequency (200-800 Hz) steady sound, like a small fan motor. Also described as a howl.

Hz

Hertz; a frequency measured in cycles per second.

Imbalance

Out of balance; heavier on one side than the other. In a rotating component, imbalance often causes vibration.

Inboard

Toward the centerline of the vehicle.

Intensity

The physical quality of sound that relates to the strength of the vibration (measured in decibels). The higher the sound's amplitude, the higher the intensity and vice versa.

Isolate

To separate the influence of one component to another.

Knock

A heavy, loud, repetitious sound, like a knock on the door.

Moan

A constant, low-frequency (100-200 Hz) tone. Also described as a hum.

Neutral Engine Run-Up (NERU) Test

The operation of the engine through the normal rpm range with the vehicle standing still and the transmission disengaged. This test is used to identify engine related vibrations.

Neutralize/Normalize

To return to an unstressed position. Used to describe mounts. Refer to Bound Up.

Outboard

Away from the centerline of the vehicle.

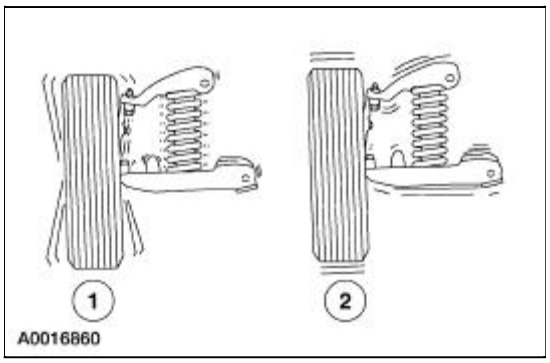
Ping

A short duration, high-frequency sound, which has a slight echo.

Pinion Shaft

The input shaft in a driving axle that is usually a part of the smaller driving or input hypoid gear of a ring and pinion gearset.

Pitch



The physical quality of sound that relates to its frequency. Pitch increases as frequency increases and vice versa.

Pumping Feel

A slow, pulsing movement.

Radial/Lateral

Radial is in the plane of rotation; lateral is at 90 degrees to the plane of rotation.

Item	Description
1	Lateral runout
2	Radial runout

Rattle

A random and momentary or short duration noise.

Ring Gear

The large, circular, driven gear in a ring and pinion gearset.

Road Test

The operation of the vehicle under conditions intended to produce the concern under investigation.

Roughness

A medium-frequency vibration. A slightly higher frequency (20 to 50 Hz) than a shake. This type of vibration is usually related to drivetrain components.

Runout

Lateral runout means measuring the movement or "wobble" of a wheel or tire at the sidewall. Radial runout means measuring the out-of-round at the tread surface.

Rustling

Intermittent sound of varying frequency (100-2000 Hz), sounds similar to shuffling through leaves.

Shake

A low-frequency vibration (5-20 Hz), usually with visible component movement. Usually relates to tires, wheels, brake drums or brake discs if it is vehicle speed sensitive, or engine if it is engine speed sensitive. Also referred to as a shimmy or wobble.

Shimmy

An abnormal vibration or wobbling, felt as a side-to-side motion of the steering wheel in the driveshaft rotation. Also described as waddle.

Shudder

A low-frequency vibration that is felt through the steering wheel or seat during light brake application.

Slap

A resonance from flat surfaces, such as safety belt webbing or door trim panels.

Slip Yoke/Slip Spline

The driveshaft coupling that allows length changes to occur while the suspension articulates and while the driveshaft rotates.

Squeak

A high-pitched transient sound, similar to rubbing fingers against a clean window.

Squeal

A long-duration, high-pitched noise.

Static Balance

The equal distribution of weight around the wheel. Statically unbalanced wheel and tire assemblies can cause a bouncing action called wheel tramp. This condition will eventually cause uneven tire wear.

Tap

A light, rhythmic, or intermittent hammering sound, similar to tapping a pencil on a table edge.

Thump

A dull beat caused by two items striking together.

Tick

A rhythmic tap, similar to a clock noise.

Tip-In Moan

A light moaning noise heard during light vehicle acceleration, usually between 40-100 km/h (25-65 mph).

TIR

The acronym for total indicated runout is TIR.

Tire Deflection

The change in tire diameter in the area where the tire contacts the ground.

Tire Flat Spots

A condition commonly caused by letting the vehicle stand while the tires cool off. This condition can be corrected by driving the vehicle until the tires are warm. Also, irregular tire wear patterns in the tire tread resulting from wheel-locked skids.

Tire Force Vibration

A tire vibration caused by variations in the construction of the tire that is noticeable when the tire rotates against the pavement. This condition can be present on perfectly round tires because of variations in the inner tire construction. This condition can occur at wheel rotation frequency or twice rotation frequency.

Transient

A noise or vibration that is momentary, a short duration.

Two-Plane Balance

Radial and lateral balance.

Vibration

Any motion, shaking or trembling, that can be felt or seen when an object moves back and forth or up and down.

Whine

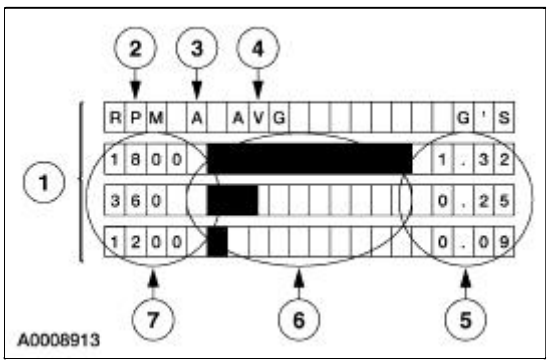
A constant, high-pitched noise. Also described as a screech.

Whistle

High-pitched noise (above 500 Hz) with a very narrow frequency band. Examples of whistle noises are a turbocharger or airflow around an antenna.

Wind Noise

Any noise caused by air movement in, out or around the vehicle.



WOT

The acronym for wide open throttle is WOT.

Tools and Techniques

Electronic Vibration Analyzer (EVA)

The EVA is a hand-held electronic diagnostic tool which will assist in locating the source of unacceptable vibrations. The vibration sensor can be remotely mounted anywhere in the vehicle for testing purposes. The unit displays the three most common vibration frequencies and their corresponding amplitudes simultaneously. A bar graph provides a visual reference of the relative signal strength (amplitude) of each vibration being displayed and its relative G force. The keypad is arranged to make the EVA simple to program and use. Some of the functions include the ability to average readings as well as record, play back and freeze readings. The EVA has a strobe balancing function that can be used to detect imbalance on rotating components such as a driveshaft or engine accessories.

Item	Description
1	EVA screen
2	Frequency mode displayed in rpm or Hz
3	Active sensor input (A or B)
4	Current active mode
5	G force indicators or the strongest frequencies in descending strength of each vibration
6	Strength of each vibration
7	Frequency in rpm/Hz of each vibration

The EVA allows for a systematic collection of information that is necessary to accurately diagnose and repair NVH problems. For the best results, carry out the test as follows:

a. Test drive the vehicle with the vibration sensor inside the vehicle.
b. Place the sensor in the vehicle according to feel.
    - If the condition is felt through the steering wheel, the source is most likely in the front of the vehicle.
    - A vibration that is felt in the seat or floor only will most likely be found in the driveline, drive axle or rear wheels and tires.
c. Record the readings. Also note when the condition begins, when it reaches maximum intensity, and if it tends to diminish above/below a certain speed.
    - Frequencies should be read in the "average" mode.

    - Frequencies have a range of plus or minus 2. A reading of 10 Hz can be displayed as an 8 Hz through 12 Hz.
d. Place the vibration sensor on or near the suspect area outside the vehicle.
e. Continue the road test, driving the vehicle at the speed the symptom occurs, and take another reading.
f. Compare the readings.
    - A match in frequency indicates the problem component or area.
    - An unmatched test could indicate the concern is caused by the engine, torque converter, or engine accessory. Use the EVA in the rpm mode and check if concern is rpm related.
    - Example: A vibration is felt in the seat. Place the sensor on the console. Record the readings. Place the vibration sensor on the rear axle. Compare the readings. If the frequencies are the same, the axle is the problem component.

Vibrate Software®

Vibrate Software® (Rotunda tool number 215-00003) is a diagnostic aid which will assist in pinpointing the source of unacceptable vibrations. The engine's crankshaft is the point of reference for vibration diagnosis. Every rotating component will have an angular velocity that is faster, slower, or the same as the engine's crankshaft. Vibrate Software® calculates the angular velocity of each component and graphically represents these velocities on a computer screen and on a printed vibration worksheet. The following steps outline how Vibrate Software® helps diagnose a vibration concern:

- Enter the vehicle information. Vibrate will do all the calculations and display a graph showing tire, driveshaft and engine vibrations.
- Print a Vibration Worksheet graph. The printed graph is to be used during the road test.
- Road test the vehicle at the speed where the vibration is most noticeable. Record the vibration frequency (rpm) and the engine rpm on the worksheet graph. The point on the graph where the vibration frequency (rpm) reading and the engine rpm reading intersect indicates the specific component group causing the concern.
    - An EVA or equivalent tool capable of measuring vibration frequency and engine rpm will be needed.
- Provide pictures of diagnostic procedures to aid in testing components.

Combination EngineEAR/ChassisEAR

An electronic listening device used to quickly identify noise and the location under the chassis while the vehicle is being road tested. The ChassisEARs can identify the noise and location of damaged/worn wheel bearings, CV joints, brakes, springs, axle bearings or driveshaft carrier bearings.

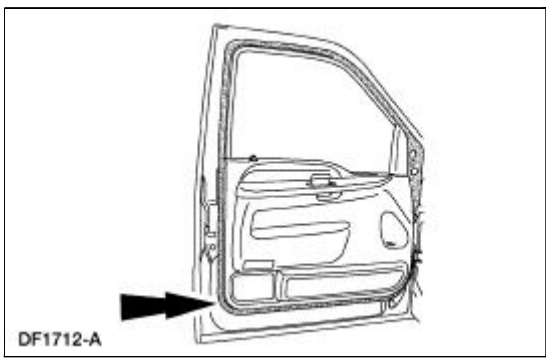
EngineEAR Basic Unit

An electronic listening device used to detect even the faintest noises. The EngineEARs can detect the noise of damaged/worn bearings in generators, water pumps, A/C compressors and power steering pumps. They are also used to identify noisy lifters, exhaust manifold leaks, chipped gear teeth and for detecting wind noise. The EngineEAR has a sensing tip, amplifier, and headphones. The directional sensing tip is used to listen to the various components. Point the sensing tip at the suspect component and adjust the volume with the amplifier. Placing the tip in direct contact with a component will reveal structure-borne noise and vibrations, generated by or passing through, the component. Various volume levels can reveal different sounds.

Ultrasonic Leak Detector

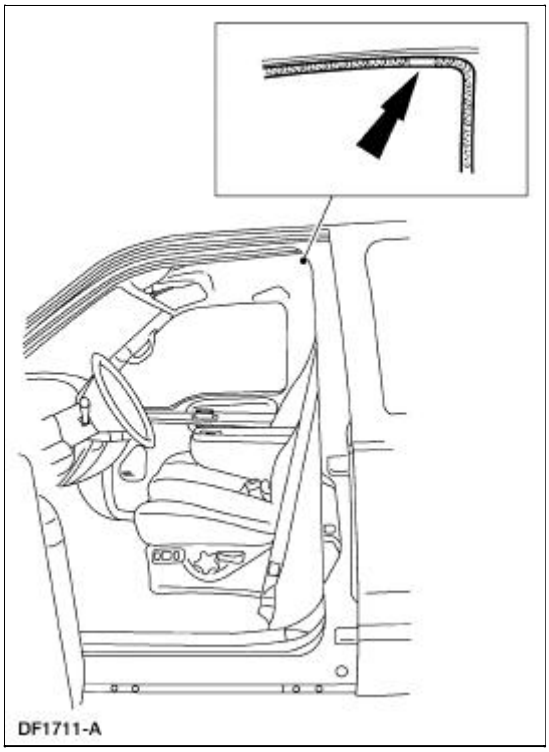
The Ultrasonic Leak Detector is used to detect wind noises caused by leaks and gaps in areas where there is weather-stripping or other sealing material. It is also used to identify A/C leaks, vacuum leaks

and evaporative emission noises. The Ultrasonic Leak Detector includes a multi-directional transmitter (operating in the ultrasonic range) and a hand-held detector. The transmitter is placed inside the vehicle. On the outside of the vehicle, the hand-held detector is used to sweep the area of the suspected leak. As the source of the leak is approached, a beeping sound is produced which increases in both speed and frequency.



Squeak and Rattle Repair Kit

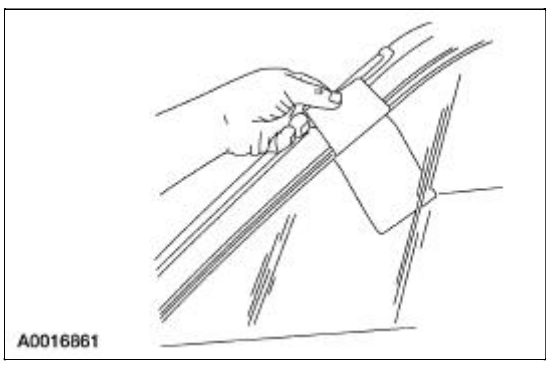
The squeak and rattle repair kit (Rotunda tool number 164-R4900) contains lubricants and self-adhesive materials that can be used to eliminate interior and exterior squeaks and rattles. The kit consists of the following materials:



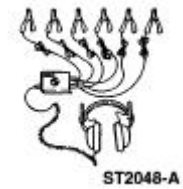
- PVC (soft foam) tape
- Urethane (hard foam) tape
- Flocked (black fuzzy) tape
- UHMW (frosted) tape
- Squeak and rattle oil tube
- Squeak and rattle grease tube

Tracing Powder

Tracing powder is used to check both the uniformity of contact and the tension of a seal against its sealing surface. These tests are usually done when a suspected air leak/noise appears to originate from the seal area or during the alignment and adjustment of a component to a weatherstrip. Tracing powder can be ordered from Crest Industries as ATR Leak Trace. Carry out the tracing powder test as follows:



a. Clean the weatherstrip.
b. Spray the tracing powder on the mating surface only.
c. Close the door completely. Do not slam the door.
d. Open the door. An imprint is made where the weatherstrip contacted the mating surface seal. Gaps or a faint imprint will show where there is poor contact with the weatherstrip.



Index Card

Place an index card or a piece of paper between the weatherstrip and the sealing surface, then close the door. Slowly withdraw the index card or paper after the door is closed and check the amount of pressure on the weatherstrip. There should be a medium amount of resistance as it is withdrawn. Continue around the entire seal area. If there is little or no resistance, this indicates insufficient contact to form a good seal. At these points, the door, the glass, or the weatherstrip is out of alignment.

Noise, Vibration And Harshness (NVH)

Special Tool(s)

 ST2048-A	ChassisEAR 107-R2102 or Equivalent
 ST2311-A	Vibration Analyzer 100-F027 (014-00344) or Equivalent
 ST2312-A	EngineEAR 107-R2100 or Equivalent
 ST2314-A	Ultrasonic Leak Detector 134-R0135 or Equivalent

To assist the service advisor and the technician, a Write-up Job Aid and an NVH Diagnostic Guide are included with this material. The Write-up Job Aid serves as a place to record all important symptom information. The NVH Diagnostic Guide serves as a place to record information reported on the Write-up Job Aid as well as data from the testing to be carried out.

To begin a successful diagnosis, fill out the NVH Diagnostic Guide, record the reported findings, then proceed to each of the numbered process steps to complete the diagnosis.

"WRITE-UP" JOB AID

Comments: _____

A0008914

1: Customer Interview

The diagnostic process starts with the customer interview. The service advisor must obtain as much information as possible about the problem and take a test drive with the customer. There are many ways a customer will describe NVH concerns and this will help minimize confusion arising from descriptive language differences. It is important that the concern is correctly interpreted and the customer descriptions are recorded. During the interview, ask the following questions:

- When was it first noticed?
- Did it appear suddenly or gradually?

- Did any abnormal occurrence coincide with or proceed its appearance?

Use the information gained from the customer to accurately begin the diagnostic process.

2: Pre-Drive Check

It is important to do a pre-drive check before road testing the vehicle. A pre-drive check verifies that the vehicle is relatively safe to drive and eliminates any obvious faults on the vehicle.

The pre-drive check consists of a brief visual inspection. During this brief inspection, take note of anything that will compromise safety during the road test and make those repairs/adjustments before taking the vehicle on the road.

3: Preparing for the Road Test

Observe the following when preparing for the road test:

- Review the information recorded on the NVH Diagnostic Guide. It is important to know the specific concern the customer has with the vehicle.
- Do not be misled by the reported location of the noise/vibration. The cause can actually be some distance away.
- Remember that the vibrating source component (originator) may only generate a small vibration. This small vibration can in turn cause a larger vibration/noise to emanate from another receiving component (reactor), due to contact with other components (transfer path).
- Conduct the road test on a quiet street where it is safe to duplicate the vibration/noise. The ideal testing route is an open, low-traffic area where it is possible to operate the vehicle at the speed in which the condition occurs.
- If possible, lower the radio antenna in order to minimize turbulence. Identify anything that could potentially make noise or be a source of wind noise. Inspect the vehicle for add-on items that create vibration/noise. Turn off the radio and the heating and cooling system blower.
- The engine speed is an important factor in arriving at a final conclusion. Therefore, connect an accurate tachometer to the engine, even if the vehicle has a tachometer. Use a tachometer that has clearly defined increments of less than 50 rpm. This ensures an exact engine speed reading.

4: Verify the Customer Concern

Verify the customer concern by carrying out a road test, an engine run-up test, or both.

The decision to carry out a road test, an engine run-up test, or both depends on the type of NVH concern. A road test may be necessary if the symptom relates to the suspension system or is sensitive to torque. A drive engine run-up (DERU) or a neutral engine run-up (NERU) test identifies noises and vibrations relating to engine and drivetrain rpm. Remember, a condition will not always be identifiable by carrying out these tests, however, they will eliminate many possibilities if carried out correctly.

5: Road Test

NOTE: It may be necessary to have the customer ride along or drive the vehicle to point out the concern. During the road test, take into consideration the customer's driving habits and the driving conditions. The customer's concern just may be an acceptable operating condition for that vehicle.

The following is a brief overview of each test in the order in which it appears. A review of this information helps to quickly identify the most appropriate process necessary to make a successful diagnosis. After reviewing this information, select and carry out the appropriate test(s), proceeding to the next step of this process.

- The Slow Acceleration Test is normally the first test to carry out when identifying an NVH concern, especially when a road test with the customer is not possible.
- The Heavy Acceleration Test helps to determine if the concern is torque-related.
- The Neutral Coast Down Speed Test helps to determine if the concern is vehicle speed-related.
- The Downshift Speed Test helps to determine if the concern is engine speed-related.
- The Steering Input Test helps to determine how the wheel bearings and other suspension components contribute to a vehicle speed-related concern.
- The Brake Test helps to identify vibrations or noise that are brake related.
- The Road Test Over Bumps helps isolate a noise that occurs when driving over a rough or bumpy surface.
- The Engine Run-Up Tests consist of the Neutral Run-up Test and the Engine Load Test. These tests help to determine if the concern is engine speed-related.
- The Neutral Run-up Test is used as a follow-up test to the Downshift Speed Test when the concern occurs at idle.
- The Engine Load Test helps to identify vibration/noise sensitive to engine load or torque. It also helps to reproduce engine speed-related concerns that cannot be duplicated when carrying out the Neutral Run-up Test or the Neutral Coast Down Test.
- The Engine Accessory Test helps to locate faulty belts and accessories that cause engine speed-related concerns.
- The Vehicle Cold Soak Procedure helps to identify concerns occurring during initial start-up and when an extended time lapse occurs between vehicle usage.

Slow Acceleration Test

To carry out this test, proceed as follows:

- Slowly accelerate to the speed where the reported concern occurs. Note the vehicle speed, the engine rpm and, if possible, determine the vibration frequency.
- Attempt to identify from what part of the vehicle the concern is coming.
- Attempt to identify the source of the concern.
- Proceed as necessary.

Heavy Acceleration Test

To carry out this test, proceed as follows:

- Accelerate hard from 0-64 km/h (0-40 mph).

- Decelerate in a lower gear.
- The concern is torque related if duplicated while carrying out this test.
- Proceed as necessary.

Neutral Coast Down Speed Test

To carry out this test, proceed as follows:

- Drive at a higher rate of speed than where the concern occurred when carrying out the Slow Acceleration Test.
- Place the transmission in NEUTRAL and coast down past the speed where the concern occurs.
- The concern is vehicle speed-related if duplicated while carrying out this test. This eliminates the engine and the torque converter as sources.
- If the concern was not duplicated while carrying out this test, carry out the Downshift Speed Test to verify if the concern is engine speed related.
- Proceed as necessary.

Downshift Speed Test

To carry out this test, proceed as follows:

- Shift into a lower gear than the gear used when carrying out the Slow Acceleration Test.
- Drive at the engine rpm where the concern occurs.
- The concern is engine speed related if duplicated while carrying out this test. This eliminates the tires, wheels, brakes and the suspension components as sources.
- If necessary, repeat this test using other gears and NEUTRAL to verify the results.
- Proceed as necessary.

Steering Input Test

To carry out this test, proceed as follows:

- Drive at the speed where the concern occurs, while making sweeping turns in both directions.
- If the concern goes away or gets worse, the wheel bearings, hubs, U-joints (contained in the axles of 4WD applications), and tire tread wear are all possible sources.
- Proceed as necessary.

Brake Test

To carry out this test, proceed as follows:

- Warm the brakes by slowing the vehicle a few times from 80–32 km/h (50–20 mph) using light braking applications. At highway speeds of 89–97 km/h (50–60 mph), apply the brake using a light pedal force.
- Accelerate to 89–97 km/h (55–60 mph).
- Lightly apply the brakes and slow the vehicle to 30 km/h (20 mph).
- A brake vibration noise can be felt in the steering wheel, seat or brake pedal. A brake noise can be heard upon brake application and diminish when the brake is released.

Road Test Over Bumps

To carry out this test, proceed as follows:

- Drive the vehicle over a bump or rough surface one wheel at a time to determine if the noise is coming from the front or the back and the left or the right side of the vehicle.
- Proceed as necessary.

Neutral Engine Run-Up (NERU) Test

To carry out this test, proceed as follows:

- Install a tachometer.
- Increase the engine rpm up from an idle to approximately 4000 rpm while in PARK on front wheel drive vehicles with automatic transmissions, or NEUTRAL for all other vehicles. Note the engine rpm and, if possible, determine the vibration frequency.
- Attempt to identify what part of the vehicle the concern is coming from.
- Attempt to identify the source of the concern.
- Proceed as necessary.

Drive Engine Run-Up (DERU) Load Test

To carry out this test, proceed as follows:

- **WARNING: Block the front and rear wheels, and apply the parking brake and the service brake, or injury to personnel can result.**

  CAUTION: Do not carry out the Engine Load Test for more than five seconds or damage to the transmission or transaxle can result.

  Block the front and rear wheels.
- Apply the parking brake and the service brake.
- Install a tachometer.
- Shift the transmission into DRIVE, and increase and decrease the engine rpm between an idle to approximately 2000 rpm. Note the engine rpm and, if possible, determine the vibration frequency.

- Repeat the test in REVERSE.
- If the vibration/noise is duplicated when carrying out this test, inspect the engine and transmission or transaxle mounts.
- If the concern is definitely engine speed-related, carry out the Engine Accessory Test to narrow down the source.
- Proceed as necessary.

Engine Accessory Test

To carry out this test, proceed as follows:

- **WARNING: Block the front and rear wheels, and apply the parking brake and the service brake, or injury to personnel can result.**

  CAUTION: Limit engine running time to one minute or less with belts removed or serious engine damage will result.

  NOTE: A serpentine drive belt decreases the usefulness of this test. In these cases, use a vibration analyzer (VA), to pinpoint accessory vibrations. An electronic listening device, such as an EngineEAR, will also help to identify noises from specific accessories.

  Remove the accessory drive belts.
- Increase the engine rpm to where the concern occurs.
- If the vibration/noise is duplicated when carrying out this test, the belts and accessories are not sources.
- If the vibration/noise was not duplicated when carrying out this test, install each accessory belt, one at a time, to locate the source.

Vehicle Cold Soak Procedure

To carry out this procedure, proceed as follows:

- Test preparations include matching customer conditions (if known). If not known, document the test conditions: gear selection and engine rpm. Monitor the vibration/noise duration with a watch for up to three minutes.
- Park the vehicle where testing will occur. The vehicle must remain at or below the concern temperature (if known) for 6-8 hours.
- Before starting the engine, conduct a visual inspection under the hood.
- Turn the key on, but do not start the engine. Listen for the fuel pump, anti-lock brake system (ABS) and air suspension system noises.
- Start the engine.
- **CAUTION: Never probe moving parts.**

  Isolate the vibration/noise by carefully listening. Move around the vehicle while listening to find the general location of the vibration/noise. Then, search for a more precise location by using a stethoscope or EngineEAR.

- Refer to Idle Noise/Vibration in the Symptom Chart to assist with the diagnosis.

6: Check OASIS/TSBs/Repair History

After verifying the customer concern, check for OASIS reports, TSBs and the vehicle repair history for related concerns. If information relating to a diagnosis/repair is found, carry out the procedure(s) specified in that information.

If no information is available from these sources, carry out the vehicle preliminary inspection to eliminate any obvious faults.

7: Diagnostic Procedure

Qualifying the concern by the particular sensation present can help narrow down the concern. Always use the "symptom" to "system" to "component" to "cause" diagnosis technique. This diagnostic method divides the problem into related areas to correct the customer concern.

- Verify the "symptom".
- Determine which "system(s)" can cause the "symptom".
  - If a vibration concern is vehicle speed related, the tire and wheel rpm/frequency or driveshaft frequency should be calculated.
  - If a vibration concern is engine speed related, the engine, engine accessory or engine firing frequencies should be calculated.
- After determining the "system", use the diagnostic tools to identify the worn or damaged "components".
- After identifying the "components", try to find the "cause" of the failure.

Once the concern is narrowed down to a symptom/condition, proceed to NVH Condition and Symptom Categories.

NVH Condition and Symptom Categories

A good diagnostic process is a logical sequence of steps that lead to the identification of a causal system. Use the condition and symptom categories as follows:

- Identify the operating condition that the vehicle is exhibiting.
- Match the operating condition to the symptom.
- Verify the symptom.
- Identify which category or system could cause the symptom.
- Refer to the diagnostic symptom chart that is referred to.

Operating Condition—Vehicle is Not Moving

1. Static operation
   - Noise occurs during component/system functioning. GO to Symptom Chart — Squeak and Rattle .

2. While cranking
    1. Grinding or whine, differential ring gear or starter motor pinion noise. GO to Symptom Chart — Engine Noise/Vibration .
    2. Rattle. Exhaust hanger, exhaust heat shield or A/C line noise. GO to Symptom Chart — Squeak and Rattle .
    3. Vibration. Acceptable condition.

3. At idle
    - Idle noise. GO to Symptom Chart — Idle Noise/Vibration .
    - Idle vibration or shake. GO to Symptom Chart — Idle Noise/Vibration .

4. During Gear Selection
    1. Vehicle parked on a steep incline. Acceptable noise.
    2. Vehicle parked on a flat surface. GO to Symptom Chart — Driveline Noise/Vibration .
    3. Vehicle with a manual transmission. GO to Symptom Chart — Transmission (Manual) and Transfer Case Noise/Vibration .

Operating Condition—Vehicle is Moving

1. Depends more on how the vehicle is operated
    1. Speed related
        - Related to vehicle speed
            - Pitch increases with vehicle speed. GO to Symptom Chart — Tire Noise/Vibration .
            - Noise occurs at specific vehicle speed. A high-pitched noise (whine). GO to Symptom Chart — Driveline Noise/Vibration .
            - Loudness proportional to vehicle speed. Low-frequency noise at high speeds, noise and loudness increase with speed. GO to Symptom Chart — Driveline Noise/Vibration .
            - A low-pitched noise (drumming). GO to Symptom Chart — Engine Noise/Vibration .
            - Vibration occurs at a particular speed (mph) regardless of acceleration or deceleration. GO to Symptom Chart — Tire Noise/Vibration .
            - Noise varies with wind/vehicle speed and direction. GO to Symptom Chart — Air Leak and Wind Noise .
        - Related to engine speed.
            - Noise varies with engine rpm. GO to Symptom Chart — Engine Noise/Vibration .
            - Vibration occurs at a particular speed (mph) regardless of engine speed (rpm).
    2. Acceleration
        - Wide open throttle (WOT)
            - Engine induced contact between components. Inspect and repair as necessary.
            - Noise is continuous throughout WOT. Exhaust system or engine ground out. GO to Symptom Chart — Engine Noise/Vibration .
        - Light/moderate acceleration
            - Tip-in moan. Engine/exhaust noise. GO to Symptom Chart — Engine Noise/Vibration .
            - Knock-type noise. GO to Symptom Chart — Engine Noise/Vibration .
            - Driveline shudder. GO to Symptom Chart — Driveline Noise/Vibration .

- Engine vibration. GO to Symptom Chart — Engine Noise/Vibration .

3. Turning noise. GO to Symptom Chart —Steering Noise/Vibration .
4. Braking
   - Clicking sound is signaling ABS is active. Acceptable ABS sound.
   - A continuous grinding/squeal. GO to Symptom Chart — Brake Noise/Vibration .
   - Brake vibration/shudder. GO to Symptom Chart — Brake Noise/Vibration .
5. Clutching
   - A noise occurring during clutch operation. GO to Symptom Chart — Transmission (Manual) and Transfer Case Noise/Vibration .
   - Vibration. GO to Symptom Chart — Transmission (Manual) and Transfer Case Noise/Vibration .
6. Shifting
   - Noise or vibration condition related to the transmission (automatic). GO to Symptom Chart — Transmission (Automatic) Noise/Vibration .
   - Noise or vibration related to the transmission (manual). GO to Symptom Chart — Transmission (Manual) and Transfer Case Noise/Vibration .
7. Engaged in four-wheel drive. GO to Symptom Chart — Transmission (Manual) and Transfer Case Noise/Vibration .
8. Cruising speeds
   - Accelerator pedal vibration. GO to Symptom Chart — Engine Noise/Vibration .
   - Driveline vibration. GO to Symptom Chart — Driveline Noise/Vibration .
   - A shimmy or shake. GO to Symptom Chart — Tire Noise/Vibration .
9. Driving at low/medium speeds
   - A wobble or shudder. GO to Symptom Chart — Tire Noise/Vibration .

2. Depends more on where the vehicle is operated
   1. Bump/pothole, rough road or smooth road. GO to Symptom Chart — Suspension Noise/Vibration y.
      - Noise is random or intermittent occurring from road irregularities. GO to Symptom Chart — Squeak and Rattle .
      - Noise or vibration changes from one road surface to another. Normal sound changes.
      - Noise or vibration associated with a hard/firm ride. GO to Symptom Chart — Suspension Noise/Vibration .

Symptom Charts

Symptom Chart — Air Leak and Wind Noise

Condition	Possible Sources	Action
• Air leak around door perimeter	• Loose fit seal.	• PINCH the seal carrier to improve retention on the seal flange.
	• Seal installed incorrectly.	• REINSTALL the seal.
	• Door misaligned.	• REALIGN the door. CHECK door gaps and fit in the door opening and ADJUST as necessary.

	• Scuff plate installed incorrectly. • Seal or seal push pins damaged.	• REINSTALL the scuff plate. • INSTALL a new seal.
• Air leak around glass run	• Door glass misaligned. • Glass run installed incorrectly. • Leak path behind glass run. • Glass run channel spread wide. • Blow-out clip bent or contacting door glass. • Glass run damaged.	• ADJUST the door glass. • ADJUST the glass run. INSERT foam in the glass run carrier. • INSTALL foam rope behind the glass run. • PINCH the glass run channel to reduce the size of the opening. • ADJUST the blow-out clip or INSTALL a new glass run/blow-out clip molding assembly. • INSTALL a new glass run.
• Air leak at inner belt line	• Belt line seal installed incorrectly on flange. • Belt line seal integrated with door trim installed incorrectly (no glass contact). • No contact with side glass. • No contact with glass runs at both ends of belt line seal. • Belt line seal damaged.	• ADJUST the seal. (Do not bend the flange.) • REINSTALL the door trim. • ADJUST the door glass. • ADJUST the belt line seal or ADD foam at the seal ends. • INSTALL a new seal.
• Air leak at outer belt line	• Belt line seal installed incorrectly on flange (no glass contact). • Belt line seal does not contact the glass. • No contact with glass runs at both ends of belt line seal. • Belt line seal damaged.	• ADJUST the seal. • ADJUST the door glass. • ADJUST the belt line seal/ADD foam at the seal ends. • INSTALL a new seal.
• Draft at inner door handle/speaker opening	• Hole in watershield. • Watershield misaligned. • Exterior door handle seal misaligned/damaged.	• SEAL the hole with a suitable tape. • REALIGN the watershield. INSTALL a new watershield if the pressure sensitive adhesive fails. • REALIGN or INSTALL a new seal as necessary.
• Wind noise from side view mirror	• Outside mirror housing misaligned.	• REALIGN with the edges shingled correctly and no gaps.

	• Mirror sail gasket folded/misaligned.	• REINSTALL with the gasket unfolded and aligned correctly.
	• Mirror housing trim cap installed incorrectly.	• REINSTALL with the edges shingled to the air flow.
	• Air leak through mirror housing hinge.	• Fully ENGAGE the mirror into its operating position/USE foam to block the air path through the hinge.
	• Inner sail trim installed incorrectly.	• REINSTALL the sail trim/ADJUST the door trim.
	• Inner sail gasket/barrier installed incorrectly.	• REINSTALL the trim cover with the gasket/barrier aligned correctly.
	• Air path through wiring bundle/fastener access holes.	• BLOCK the air path(s) with foam/tape.
	• Exposed fastener access hole on mirror housing/sail.	• INSTALL a new cap if it is missing.
• Air leak around perimeter of fixed glass	• Gaps in the sealant bead.	• APPLY approved sealant.
	• Air traveling up windshield molding along A-pillar.	• INSTALL foam rope the full length of the A-pillar.
	• Windshield/backlite misaligned or not installed correctly.	• REINSTALL the windshield/backlite.
	• Rear hood seal at base of windshield misaligned/damaged.	• REALIGN or INSTALL a new seal as necessary.
• Air leak at cowl	• Cowl gasket misaligned/damaged.	• REALIGN or INSTALL a new seal as necessary.
• Air leak around liftgate perimeter	• Loose fit seal.	• PINCH the seal carrier to improve retention on the seal flange or INSERT foam in the carrier.
	• Seal misaligned.	• REINSTALL the seal.
	• Liftgate misaligned.	• REALIGN the liftgate. CHECK the liftgate fit in the body opening and ADJUST as necessary.
	• Scuff plate misaligned.	• REINSTALL the scuff plate.
	• Seal or seal push pins damaged.	• INSTALL a new seal.
• Air leak around the liftgate flip window perimeter	• Loose fit seal.	• PINCH the seal carrier to improve the retention to the seal flange.

	• Seal misaligned. • Glass misaligned. • Seal damaged.	• REINSTALL the seal. • REALIGN the glass. • INSTALL a new seal.
• Wind noise from antenna	• Shape of antenna. • Air leak around antenna cable access hole.	• INSTALL an antenna boot or a spiral antenna. • INSPECT the antenna access hole grommet. REPAIR as necessary.
• Air leak from closed roof opening panel	• Seal installed incorrectly. • Roof opening panel glass/door misaligned. • Roof opening panel damaged.	• REINSTALL the seal. • REALIGN the roof opening panel glass/door. • INSTALL a new roof opening panel.
• Buffeting from an open roof opening panel	• Wind deflector inoperative/damaged. • Wind deflector height incorrect.	• REPAIR or INSTALL a new wind deflector as necessary. • ADJUST the wind deflector higher.
• Wind noise created by airflow over or behind body panels	• Fender splash shield misaligned. • Body panel misaligned (exposed edge). • Hood misaligned (front margin). • Front grille edge noise.	• REALIGN the fender splash shield. • REALIGN the appropriate body panel. • CHECK hood gaps and fit. ADJUST the hood as necessary. • APPLY foam in the hollow areas behind the louvers.
• Wind noise created by grille opening panel	• Grille relationship to leading edge on hood. • Sharp edges due to material imperfections.	• ADJUST the grille opening panel forward to eliminate wind noise. • REMOVE the sharp edges (no damage to visible surface).
• Wind noise from air extractor	• Air extractor housing seated incorrectly. • Air extractor housing or flaps damaged.	• REINSTALL the air extractor housing. • INSTALL a new air extractor.
• Air leak at top of A-pillar — vehicles with a convertible top	• Seal at windshield header installed incorrectly. • Seal pinched. • Gap between side rail and header seal at A-pillar.	• REINSTALL the seal. • FILL the seal with foam to reshape it. • ADJUST the J-hook/vinyl top.
• Air leak at rear quarter glass (division bar) —	• No contact between front side glass and quarter glass division	• ADJUST the front side glass regulator and the rear quarter glass

vehicles with a convertible top	bar.	regulator.
• Air leak or wind noise from top of side glass — vehicles with a convertible top	• Gap between side rail and vinyl top.	• ADD additional foam tape to seal between the side rail and the vinyl top.
	• Seal at windshield header installed incorrectly.	• REINSTALL the seal.
	• Seal damaged between side rail and vinyl top.	• INSTALL a new seal.
	• Vinyl top damaged.	• INSPECT the vinyl top. INSTALL a new vinyl top as necessary.
• Air leak or wind noise at windshield header — vehicles with a convertible top	• Vinyl top not flush with header.	• ADJUST the J-hook to lower the top to achieve a flush condition.
	• Seal at windshield header installed incorrectly.	• REINSTALL the seal.
	• Header seal not flush with header.	• REINSTALL the seal.
• Convertible top flapping with the top up	• Vinyl top contacting interior headliner.	• Working from front to back, INSTALL a 6.35 mm (0.25 in) foam sheet between the headliner and the vinyl top at the suspected area. Allow a clearance of 50 mm (2 in) - 75 mm (3 in) away from the roof bows and the side rails.
• Noise from roof rack	• Roof rack rails or crossbars loose.	• TIGHTEN the fasteners.
	• Roof rack fasteners missing.	• INSTALL the approved fasteners.
	• Roof rack crossbars installed backward.	• REINSTALL the crossbars.
	• Roof rack rub strips partially lifting from roof.	• REAPPLY adhesive or fasteners or INSTALL new rub strips as necessary.
	• Roof rack gaskets loose or misaligned.	• REINSTALL the gasket.
• Wind noise from bug shield/exterior windshield sun visor	• Turbulence created by location and shape.	• REMOVE per customer direction if it is a dealer installed option.

Symptom Chart—Brake Noise/Vibration

Condition	Possible Sources	Action

• Rattling noise	• Caliper mounting bolts loose.	• CHECK the caliper bolts. TIGHTEN to specifications. REFER to Section 206-03 for the front disc brakes or Section 206-04 for the rear disc brakes.
	• Damaged or worn caliper pins or retainers.	• CHECK the caliper pins and retainers for lubrication and correct fit. LUBRICATE or INSTALL new components as necessary. REFER to Section 206-03 for the front disc brakes or Section 206-04 for the rear disc brakes.
	• Missing or damaged anti-rattle clips or springs.	• CHECK the brake pads for missing clips or broken springs. INSTALL new components as necessary. REFER to Section 206-03 for the front disc brakes or Section 206-04 for the rear disc brakes.
	• Loose brake disc shield.	• TIGHTEN the brake disc shield bolts to specification. REFER to Section 206-03 .
• Clicking noise—with brakes applied with ABS brakes	• ABS hydraulic control unit.	• Acceptable condition.
• Squealing noise—occurs on first (morning) brake application	• Disc brake pads.	• Acceptable condition. Caused by humidity and low disc brake pad temperature.
• Squealing noise—a continuous squeal	• Disc brake pads or linings worn below minimum thickness.	• INSTALL new disc brake pads. REFER to Section 206-03 for the front disc brakes or Section 206-04 for the rear disc brakes.
• Squealing noise—an intermittent squeal brought on by cold, heat, water, mud or snow	• Disc brake pad.	• Acceptable condition.
• Groaning noise—occurs at low speeds with brake lightly applied (creeping)	• Disc brake pads.	• Acceptable condition.
• Grinding noise—continuous	• Disc brake pads or linings worn below minimum thickness.	• INSPECT the disc brake pads, brake discs/drums and attaching hardware for damage. REPAIR or INSTALL new components as necessary. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
• Moaning noise	• Brake linings contaminated	• INSPECT the brake pads and shoes for

	with grease or oil.	contamination. REPAIR or INSTALL new components as necessary.
• Brake vibration/shudder—occurs when brakes are applied	• Uneven disc or drum wear. • Uneven disc brake pad or lining transfer. • Suspension components.	• Go To Pinpoint Test A .
• Brake vibration/shudder—occurs when the brake pedal is released	• Brake drag.	• INSPECT the disc brake pads or linings for premature wear. REPAIR or INSTALL a new caliper or wheel cylinder as necessary. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

Symptom Chart—Driveline Noise/Vibration

Condition	Possible Sources	Action
• Axle howling or whine—front or rear axle	• Axle lubricant low.	• CHECK the lubricant level. FILL the axle to specification.
	• Axle housing damage.	• INSPECT the axle housing for damage. REPAIR or INSTALL a new axle as necessary. REFER to Section 205-02A for Ford 8.8 rear axles, Section 205-02B for Ford 9.75 rear axles or Section 205-03 for the front axle.
	• Damaged or worn wheel bearings or axle bearings.	• CHECK for abnormal wheel bearing play or roughness. Refer to Wheel Bearing Check in this section. ADJUST or INSTALL new wheel bearings as necessary.
	• Damaged or worn differential ring and pinion.	• INSPECT the ring and pinion ring for abnormal wear patterns or broken teeth. INSTALL a new ring and pinion as necessary. REFER to Section 205-02A for Ford 8.8 rear axles, Section 205-02B for Ford 9.75 rear axles or Section 205-03 for the front axle.
	• Damaged or worn differential side or pinion bearings.	• CHECK for abnormal bearing play or roughness. INSTALL new bearings as necessary. REFER to Section 205-02A for Ford 8.8 rear axles, Section 205-02B for Ford 9.75 rear axles or Section 205-03 for the front

		axle.
	• Damaged or worn differential side gears and pinion gears.	• DISASSEMBLE the differential carrier. INSPECT the side and pinion gears for abnormal wear patterns or broken teeth. INSTALL new gears as necessary. REFER to Section 205-02A for Ford 8.8 rear axles, Section 205-02B for Ford 9.75 rear axles or Section 205-03 for the front axle.
• Driveline clunk—loud clunk when shifting from reverse to drive	• Incorrect axle lubricant level.	• CHECK the lubricant level. FILL the axle to specification.
	• Excessive backlash in the axle or transmission.	• CARRY OUT a total backlash check. REFER to Section 205-00 .
	• Damaged or worn pinion bearings.	• CHECK for abnormal bearing play or roughness. INSTALL new bearings as necessary
	• Damaged or worn universal joints (U-joints).	• INSPECT the U-joints for wear or damage. INSTALL new U-joints as necessary. REFER to Section 205-01 .
	• Loose suspension components.	• INSPECT the suspension for damage or wear. REPAIR or INSTALL new components as necessary.
	• Broken powertrain mounts.	• INSPECT the powertrain mounts. REFER to Section 303-01A for 4.6L and 5.4L (2V) engines or Section 303-01B for 5.4L (4V) engines. INSTALL new mounts as necessary.
	• Idle speed too high.	• CHECK for the correct idle speed.
• Driveline clunk—occurs as the vehicle starts to move forward following a stop	• Worn or galled driveshaft slip-yoke splines.	• CLEAN and INSPECT the splines of the yoke for a worn or galled condition. INSTALL a new yoke as necessary. REFER to Section 205-01 .
	• Worn or galled driveshaft and coupling shaft splines.	• CLEAN and INSPECT the splines of the driveshaft and coupling shaft for a worn or galled condition. INSTALL a new driveshaft assembly as necessary. REFER to Section 205-01 .
	• Loose rear leaf spring U-bolts.	• CHECK the U-bolts for loose nuts. TIGHTEN to specification. REFER to Section 204-02 .
• Driveline clunk (FWD	• Damaged or	• INSPECT the inboard CV

vehicles)—occurs during acceleration or from cruise to coast/deceleration	worn inboard constant velocity (CV) joint.	joint and boot. REPAIR or INSTALL a new CV joint as necessary.
• Driveline clunk (4WD vehicles)—occurs during shift-on-the-fly engagement	• Clutch relay. • Shift motor. • Transfer case. • GEM.	• CHECK the 4WD engagement system. REPAIR or INSTALL new components as necessary. REFER to Section 308-07A and Section 308-07B .
• Clicking, popping or grinding—occurs while vehicle is turning	• Inadequate or contaminated lubrication in the (CV) joints.	• CHECK the CV boots and joints for wear or damage. REPAIR or INSTALL new components as necessary. REFER to Section 205-04 .
	• Another component contacting the halfshaft.	• CHECK the halfshafts and the area around the halfshafts. REPAIR as necessary.
	• Brake components.	• INSPECT the front brakes for wear or damage. REPAIR as necessary. REFER to Section 206-03 .
	• Steering components.	• INSPECT the drag link, inner and outer tie-rods or idler arm for wear or damage. REPAIR as necessary.
	• Suspension components.	• INSPECT the upper and lower ball joints for wear or damage. REPAIR as necessary. REFER to Section 204-01A for 2-wheel drive vehicles or Section 204-01B for 4-wheel drive vehicles.
	• Damaged or worn wheel bearings.	• CHECK for abnormal wheel bearing play or roughness. Refer to Wheel Bearing Check in this section. ADJUST or INSTALL new wheel bearings as necessary.
• Clicking or snapping—occurs when accelerating around a corner	• Damaged or worn outboard CV joint.	• INSPECT the outboard CV joint and boot. REPAIR or INSTALL a new CV joint as necessary. REFER to Section 205-04 .
• High pitched chattering—noise from the rear axle when the vehicle is turning	• Incorrect or contaminated lubricant.	• CHECK the vehicle by driving in tight circles (5 clockwise, 5 counterclockwise). FLUSH and REFILL with the specified rear axle lubricant and friction modifier as necessary.
	• Damaged or worn differential (differential side gears and	• DISASSEMBLE the differential assembly. INSPECT the differential case, pin and gears for wear

	pinion gears).	or damage. REPAIR or INSTALL a new differential as necessary. REFER to Section 205-02A for Ford 8.8 rear axles or Section 205-02B for Ford 9.75 rear axles.
• Buzz—buzzing noise is the same at cruise or coast/deceleration	• Damaged or worn tires. • Incorrect driveline angles.	• CHECK for abnormal tire wear or damage. INSTALL new tire(s) as necessary. REFER to Section 204-04 . • CHECK for correct driveline angles. REPAIR as necessary. REFER to Section 205-00 .
• Rumble or boom—noise occurs at coast/deceleration, usually driveshaft speed related and noticeable over a wide range of speeds	• Driveshaft is out-of-balance. • U-joints binding or seized. • Excessive pinion flange runout.	• CHECK the driveshaft for damage, missing balance weights or undercoating. CHECK the driveshaft balance. CARRY OUT a driveline vibration test. REFER to Section 205-00 . • ROTATE the driveshaft and CHECK for rough operation or seized U-joints. INSTALL new U-joints as necessary. REFER to Section 205-01 . • CARRY OUT a runout check. REPAIR as necessary. REFER to Section 205-00 .
• Grunting—normally associated with a shudder experienced during acceleration from a dead stop	• Driveshaft slip yoke binding. • Loose rear spring U-bolts.	• CLEAN and LUBRICATE the male and female splines. • INSPECT the rear suspension. TIGHTEN the U-bolt nuts to specification. REFER to Section 204-02 .
• Howl—can occur at various speeds and driving conditions. Affected by acceleration and deceleration	• Incorrect ring and pinion contact, incorrect bearing preload or gear damage.	• CHECK the ring and pinion and bearings for damage. INSPECT the ring and pinion wear pattern. REFER to Checking Tooth Contact Pattern and Condition of the Ring and Pinion component test in this section. ADJUST or INSTALL new components as necessary. REFER to Section 205-02A for Ford 8.8 rear axles, Section 205-02B for Ford 9.75 rear axles or Section 205-03 for the front axle.
• Chuckle—heard at coast/deceleration. Also described as a knock	• Incorrect ring and pinion contact or by damaged teeth on the coast	• CHECK the ring and pinion for damage. INSPECT the ring and pinion wear pattern. REFER to Checking Tooth Contact Pattern and

	side of the ring and pinion.	Condition of the Ring and Pinion component test in this section. ADJUST or INSTALL new components as necessary. REFER to Section 205-02A for Ford 8.8 rear axles, Section 205-02B for Ford 9.75 rear axles or Section 205-03 for the front axle.
• Knock—noise occurs at various speeds. Not affected by acceleration or deceleration	• Gear tooth damage to the drive side of the ring and pinion.	• CHECK the differential case and ring and pinion for damage. INSTALL new components as necessary. REFER to Section 205-02A for Ford 8.8 rear axles, Section 205-02B for Ford 9.75 rear axles or Section 205-03 for the front axle.
	• Excessive axle shaft end play. (Vehicles with integral axles).	• CHECK the axle end play using a dial indicator. INSTALL a new axle shaft or side gears as necessary. REFER to Section 205-02A for Ford 8.8 rear axles, Section 205-02B for Ford 9.75 rear axles or Section 205-03 for the front axle.
• Scraping noise—a continuous low pitched noise starting at low speeds	• Worn or damaged pinion bearings.	• CHECK the pinion bearings. INSTALL new pinion bearings as necessary. REFER to Section 205-02A for Ford 8.8 rear axles, Section 205-02B for Ford 9.75 rear axles or Section 205-03 for the front axle.
• Driveline shudder—occurs during acceleration from a slow speed or stop	• Rear drive axle assembly mispositioned.	• CHECK the axle mounts and the rear suspension for damage or wear. REPAIR as necessary.
	• Loose rear spring U-bolts.	• INSPECT the U-bolts. TIGHTEN the U-bolt nuts to specification. REFER to Section 204-02 .
	• Incorrect or high CV joint operating angle.	• CHECK vehicle ride height is within limits. REPAIR as necessary.
	• Damaged or worn front suspension components.	• CHECK for a loose stabilizer bar, damaged or loose strut/strut bushings or loose or worn ball joints. INSPECT the steering linkage for wear or damage. REPAIR or INSTALL new components as necessary. REFER to the appropriate section for the service procedure.
	• Driveline angles out of specification.	• CHECK for correct driveline angles. REPAIR as necessary. REFER to

		Section 205-00 .
	• U-joints binding or seized.	• ROTATE the driveshaft and CHECK for rough operation or seized U-joints. INSTALL new U-joints as necessary. REFER to Section 205-01 .
	• Binding, damaged or galled splines on the driveshaft slip-yoke.	• CLEAN and INSPECT the splines of the slip-yoke, driveshaft and coupling shaft for a worn, damaged or galled condition. INSTALL a new slip-yoke or driveshaft assembly as necessary. REPAIR as necessary. REFER to Section 205-01 .
• Driveline vibration—occurs at cruising speeds	• U-joints are worn.	• CHECK for wear or incorrect seating. INSTALL new U-joints as necessary. REFER to Section 205-01 .
	• Worn or damaged driveshaft center bearing support.	• CHECK the insulator for damage or wear. ROTATE the driveshaft and CHECK for rough operation. INSTALL a new center bearing support as necessary. REFER to Section 205-01 .
	• Loose axle pinion flange bolts.	• INSPECT the axle pinion flange. TIGHTEN the pinion flange bolts to specification. REFER to Section 205-01 .
	• Excessive axle pinion flange runout.	• CARRY OUT a Runout Check. REPAIR as necessary. REFER to Section 205-01 .
	• Driveshaft is out-of-balance.	• CHECK the driveshaft for damage, missing balance weights or undercoating. CHECK driveshaft balance. CARRY OUT a driveline vibration test. REFER to Section 205-00 . REPAIR as necessary.
	• Binding or damaged splines on the driveshaft slip-yoke.	• CLEAN and INSPECT the splines of the slip-yoke, driveshaft and coupling shaft for wear or damage. INSTALL a new slip-yoke or driveshaft assembly as necessary. REFER to Section 205-01 . REPAIR as necessary.
	• Driveshaft runout.	• CARRY OUT a Runout Check. REFER to Section 205-00 . REPAIR as necessary.
	• Incorrect lateral and radial tire/wheel	• INSPECT the tire and wheels. MEASURE tire runouts. REPAIR or

	runout.	INSTALL new components as necessary. REFER to Section 204-04 .
	• Driveline angles out of specification.	• CHECK for correct driveline angles. REPAIR as necessary. REFER to Section 205-00 .
	• Incorrectly seated CV joint in the front wheel hub.	• CHECK the outer CV joint for correct seating into the hub. REPAIR as necessary. REFER to Section 205-04 .

Symptom Chart — Engine Noise/Vibration

Condition	Possible Sources	Action
• Grinding noise—occurs during engine cranking	• Incorrect starter motor mounting.	• INSPECT the starter motor for correct mounting. REPAIR as necessary. REFER to Section 303-06 .
	• Starter motor.	• CHECK the starter motor. REPAIR or INSTALL a new starter motor as necessary. REFER to Section 303-06 .
	• Incorrect starter motor drive engagement.	• INSPECT the starter motor drive and flexplate/flywheel for wear or damage. INSTALL a new starter motor drive or flexplate/flywheel as necessary. REFER to Section 303-06 .
• Engine ticking noise	• Fuel injector. • Fuel line. • Oil pump. • Valve lifter. • Belt tensioner. • Water pump. • Obstruction of cooling fan.	• Go To Pinpoint Test B .
• Engine drumming noise—normally accompanied by vibration	• Powertrain mount.	• CARRY OUT Powertrain/Drivetrain Mount Neutralizing in this section.
	• Damaged or misaligned exhaust system.	• INSPECT the exhaust system for loose or broken clamps and brackets. CARRY OUT Exhaust System Neutralizing in this section.
• Whistling noise—normally accompanied with poor idle condition	• Air intake system.	• CHECK the air intake ducts, air cleaner, throttle body and vacuum hoses for leaks and correct fit. REPAIR or ADJUST as necessary. REFER to Section 303-12 .
• Clunking noise	• Water pump has excessive end play or	• CHECK the water pump for excessive end play.

	imbalance.	INSPECT the water pump with the drive belt off for imbalance. INSTALL a new water pump as necessary. REFER to Section 303-03 .
	• Generator has excessive end play.	• CHECK the generator for excessive end play. REPAIR or INSTALL a new generator. REFER to Section 414-02 .
• Pinging noise	• Exhaust system leak.	• INSPECT the exhaust system for leaks. REPAIR as necessary.
	• Gasoline octane too low.	• VERIFY with customer the type of gasoline used. CORRECT as necessary.
	• Knock sensor operation.	• CHECK the knock sensor. INSTALL a new knock sensor as necessary. REFER to Section 303-14 .
	• Incorrect spark timing.	• CHECK the spark timing. REPAIR as necessary.
	• High operating temperature.	• INSPECT cooling system for leaks. CHECK the coolant level. REFILL as necessary. CHECK the coolant for the correct mix ratio. DRAIN and REFILL as needed. CHECK engine operating temperature is within specifications. REPAIR as necessary.
	• Foul-out spark plug.	• CHECK the spark plugs. REPAIR or INSTALL new spark plugs as necessary.
	• Catalytic converter.	• Acceptable noise.
• Knocking noise—light knocking noise, also described as piston slap. Noise is most noticeable when engine is cold with light to medium acceleration. Noise disappears as engine warms	• Excessive clearance between the piston and the cylinder wall.	• Engine cold and at high idle. Using an EngineEAR, pull a spark plug or fuel injector connector until the noise goes away. CARRY OUT a cylinder bore clearance to piston check. INSTALL a new piston. REFER to Section 303-01A for 4.6L and 5.4L (2V) engines or Section 303-01B for 5.4L (4V) engines.
• Knocking noise—light double knock or sharp rap sound. Occurs mostly with warm engine at idle or low speeds in DRIVE. Increases in	• Excessive clearance between the piston and the piston pin.	• INSTALL a new piston or piston pin. REFER to Section 303-01A for 4.6L and 5.4L (2V) engines or Section 303-01B for 5.4L (4V) engines.

relation to engine load. Associated with poor lubrication history		
• Knocking noise—light knocking noise is most noticeable when engine is warm. Noise tends to decrease when vehicle is coasting or in neutral	• Excessive clearance between the connecting rod bearings and the crankshaft.	• Engine warm and at idle. Using an EngineEAR, PULL a spark plug or fuel injector connector until the noise goes away. INSTALL new bearings. REFER to Section 303-01A for 4.6L and 5.4L (2V) engines or Section 303-01B for 5.4L (4V) engines.
• Knocking—deep knocking noise. Noise is most noticeable when engine is warm, at lower rpm and under a light load and then at float	• Worn or damaged crankshaft main bearings.	• CARRY OUT Drive Engine Run-Up (DERU) Test. CHECK for noise with vehicle at operating temperature, during medium to heavy acceleration. CHECK at idle with injector disconnected, noise does not change. INSTALL new main bearings. REFER to Section 303-01A for 4.6L and 5.4L (2V) engines or Section 303-01B for 5.4L (4V) engines.
• Knocking noise—occurs mostly with warm engine at light/medium acceleration	• Spark plugs. • Carbon accumulation in combustion chamber.	• CHECK the spark plug for damage or wear. INSTALL new spark plugs as necessary. • REMOVE carbon from combustion chamber.
• Whine or moaning noise	• Air intake system. • Generator electrical field or bearings.	• CHECK the air cleaner and ducts for correct fit. INSPECT the air intake system for leaks or damage. REPAIR as necessary. • CARRY OUT generator load test. REPAIR or INSTALL a new generator as necessary. REFER to Section 414-02 .
• Drone type noise	• Exhaust system. • A/C compressor.	• CARRY OUT Exhaust System Neutralizing in this section. REPAIR as necessary. • CHECK for noise with vehicle at constant speeds. CYCLE the compressor on and off and listen for a change in pitch. REPAIR as necessary. REFER to Section 412-03A .

	• Powertrain mounts.	• CARRY OUT Powertrain/Drivetrain Mount Neutralizing in this section.
• Sputter type noise—noise worse when cold, lessens or disappears when vehicle is at operating temperature	• Damaged or worn exhaust system components.	• INSPECT the exhaust system for leaks or damage. REPAIR as necessary. REFER to Section 309-00 .
• Rattling noise—noise from the upper engine (valve train). Worse when engine is cold	• Low oil level.	• CHECK oil level. FILL as necessary.
	• Thin or diluted oil.	• INSPECT the oil for contamination. If oil is contaminated, CHECK for the source. REPAIR as necessary. CHANGE the oil and filter.
	• Low oil pressure.	• CARRY OUT an oil pressure test. If not within specifications, REPAIR as necessary. REFER to Section 303-00 .
	• Worn rocker arms/fulcrums or followers.	• CARRY OUT a valve train analysis. INSTALL new valve train components as necessary. REFER to Section 303-01A for 4.6L and 5.4L (2V) engines or Section 303-01B for 5.4L (4V) engines.
	• Worn valve guides.	• CARRY OUT a valve train analysis. INSTALL new valve guides as necessary. REFER to Section 303-01A for 4.6L and 5.4L (2V) engines or Section 303-01B for 5.4L (4V) engines.
	• Excessive runout of valve seats on the valve face.	• CARRY OUT a valve seat runout test. INSPECT the valve face and seat. INSTALL new valves as necessary. REFER to Section 303-01A for 4.6L and 5.4L (2V) engines or Section 303-01B for 5.4L (4V) engines.
• Rattling noise—from the bottom of the vehicle	• Loose muffler shields or catalytic converter shields.	• CHECK the exhaust system for loose exhaust shields. REPAIR as necessary.
• Thumping noise—from the bottom of the vehicle, worse at	• Exhaust pipe/muffler grounded to chassis.	• CHECK the exhaust system to chassis clearance. CHECK the exhaust system hangers for damage.

acceleration		REPAIR as necessary. REFER to Section 309-00 .
• Whoosh—occurs during light vehicle acceleration. Heard inside the vehicle	• Throttling late, creating turbulence transmitted through the plastic manifold.	• CHECK for leaks or missing seal in the dash panel.
• Engine vibration—increases intensity as engine rpm is increased	• Engine out-of-balance.	• CARRY OUT Neutral Engine Run-Up (NERU) Test. ROTATE the torque converter, 120° for 3 bolt and 180° for 4 bolt. INSPECT the torque converter pilot outer diameter to crankshaft pilot inner diameter. REPAIR as necessary. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions.
• Engine vibration—is felt with increases and decreases in engine rpm	• Strain on exhaust mounts. • Damaged or worn powertrain/drivetrain mounts. • Engine or transmission grounded to chassis.	• CARRY OUT Exhaust System Neutralizing in this section. REPAIR as necessary. • CHECK the powertrain/drivetrain mounts for damage. CARRY OUT the Powertrain/Drivetrain Mount Neutralizing in this section. REPAIR as necessary. • INSPECT the powertrain/drivetrain for correct clearances. REPAIR as necessary.
• Engine vibration—vibration felt at all times	• Excessive engine pulley runout. • Damaged or worn accessory component.	• CARRY OUT Engine Accessory Test. INSTALL a new engine pulley as necessary. REFER to Section 303-01A for 4.2L and 5.4L (2V) engines or Section 303-01B for 5.4L (4V) engines. • CARRY OUT Engine Accessory Test. REPAIR or INSTALL a new component as necessary.
• Accelerator pedal vibration—felt through the pedal as a buzz	• Throttle cable loose or misrouted.	• INSPECT the throttle cable. REPAIR as necessary. REFER to Section 310-02 .
• Engine vibration—mostly at coast/neutral coast. Condition improves with	• Combustion instability.	• CHECK the ignition system. INSTALL new components as necessary.

vehicle accelerating		
● Engine vibration or shudder—occurs with light to medium acceleration above 56 km/h (35 mph)	● Worn or damaged spark plugs.	● INSPECT the spark plugs for cracks, high resistance or broken insulator. INSTALL a new spark plug (s) as necessary.
	● Plugged fuel injector.	● REPAIR or INSTALL a new injector as necessary.
	● Damaged spark plug wire.	● INSPECT the spark plug wires for damage. INSTALL a new spark plug wire(s) as necessary.
	● Contaminated fuel.	● INSPECT the fuel for contamination. DRAIN the fuel system and refill.
	● Worn or damaged torque converter.	● CHECK the torque converter. INSTALL a new torque converter as necessary. REFER to Section 307-01B for 4R70W transmissions. REFER to Section 307-01A for 4R100 transmissions.

Symptom Chart—Idle Noise/Vibration

Condition	Possible Sources	Action
● Idle air control (IAC) valve moan — occurs on throttle tip-out	● IAC valve is contaminated with oil.	● GO to Component Tests in this section.
● Accessory drive belt chirp — occurs at idle or high idle, cold or hot. Most common occurrence is during humid weather	● Accessory drive belt worn, or pulley is misaligned or loose.	● INSPECT for loose or misaligned pulleys. CHECK the drive belt for wear or damage. INSTALL new pulley(s)/accessory drive component or drive belt, as necessary. REFER to Section 303-05 .
● Accessory drive bearing hoot — occurs at idle or high idle in cold temperatures of approximately +4°C (+40°F) or colder at first start of the day	● Accessory drive idler or tensioner pulley bearing is experiencing stick/slip between ball bearings and bearing race.	● Go To Pinpoint Test C .
● Power steering moan — occurs at high idle and possibly at idle during the first cold start of the day in temperatures of approximately -18°C (0°F) or colder. Noise can even be a severe	● High fluid viscosity, or plugged reservoir screen in power steering reservoir starves pump causing	● Go To Pinpoint Test D .

screech for less than one minute in very cold temperatures of approximately -29°C (-20°F) or colder	cavitation.	
• Generator whine — during high electrical loads at idle or high idle, a high pitch whine or moan is emitted from the generator	• Generator electrical field noise.	• Using an EngineEAR, PROBE near the generator housing. LISTEN for changes in the noise level while changing electrical loads (such as rear defrost, headlamps, etc.). CARRY OUT a generator load test. If the system passes the load test, the noise is from the generator bearings, INSTALL new bearings. If the system fails the load test, INSTALL a new generator. REFER to Section 414-02 .
• Engine-driven cooling fan moan — occurs during the first start of the day. It is most objectionable near idle speeds up to 2000 rpm. The noise increases with rpm	• The viscous cooling fan clutch engages until the fluid in the clutch reaches normal operating temperature, causing the fan to fully engage.	• Go To Pinpoint Test E .
• Drumming noise — occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very rpm dependent	• Exhaust system vibration excites the body resonances inducing interior noise. • Engine vibration excites the body resonances inducing interior noise.	• Go To Pinpoint Test F .
• Hissing noise — occurs during idle or high idle that is apparent with the hood open	• Vacuum leak or idle air control (IAC) valve flow noise. • Vehicles with a plastic intake manifold.	• Use the Ultrasonic Leak Detector/EngineEAR to locate the source. Scan the air intake system from the inlet to each cylinder intake port. DISCARD the leaking parts, and INSTALL a new component. • Acceptable condition. Some plastic manifolds exhibit this noise, which is the effect of the plastic manifold.
• Automatic transmission buzz or hiss	• Incorrect driveline angles. • Worn or	• CHECK for correct driveline angles. REPAIR as necessary. REFER to Section 205-00 . • Using a transmission tester,

	damaged main control solenoids or valves.	activate the solenoids to duplicate sound. INSTALL new components as necessary. REFER to Section 307-01B for 4R70W transmissions. REFER to Section 307-01A for 4R100 transmissions.
• Manual Transmission Clutch throw-out bearing whine. A change in noise pitch or loudness while depressing the clutch pedal	• Worn throw-out bearing.	• INSTALL a new throw-out bearing.
• Heating, vacuum and air conditioning (HVAC) system chirp — most audible inside the vehicle. Listen for a change in noise pitch or loudness while changing the HVAC system blower speed	• Damaged or worn HVAC blower bearing.	• INSTALL a new blower motor. REFER to Section 412-02 .
• Air conditioning (A/C) clutch ticking — occurs when the compressor clutch engages	• Acceptable noise. • Incorrect air gap.	• LISTEN to the clutch to determine if the noise occurs with clutch engagement. A small amount of noise is acceptable. If the noise is excessive, CHECK the A/C clutch air gap. INSPECT the A/C clutch for wear or damage. INSTALL a new clutch as necessary. REFER to Section 412-03A .
• Intermittent rattle, or scraping/rubbing noise	• Loose exhaust heat shield(s). • Wiring, hose or other part interfering with accessory drive belt or pulley.	• INSPECT the exhaust system for loose parts using a glove or clamps to verify cause. REPAIR as necessary. REFER to Section 309-00 . • INSPECT accessory drive system closely verifying there is adequate clearance to all rotating components. REPAIR as necessary.
• Engine ticking or knocking noise — occurs during idle or high idle during the first cold start of the day	• Piston noise or valvetrain noise (bled down lifter/lash adjuster).	• Go To Pinpoint Test G .
• A continuous, speed-dependent rattle from the engine — occurs during idle or high idle during the first cold start of the day and disappears as the	• Piston noise or valvetrain noise (bled down lifter/lash adjuster).	• Go To Pinpoint Test G .

engine warms up		
• Idle vibration—a low-frequency vibration (5-20 Hz) or mild shake that is felt through the seat/floorpan	• Cylinder misfire.	• Using a scan tool, CHECK the ignition system. CARRY OUT a cylinder power test. REFER to Section 303-00 .
	• Engine or torque converter out of balance.	• VERIFY the torque converter to crankshaft pilot clearance is correct, REPAIR as necessary. RE-INDEX the torque converter on the flex plate by 120° on a 3 bolt converter or 180° for a 4 bolt converter. REFER to Section 307-01B for 4R70W transmissions. REFER to Section 307-01A for 4R100 transmissions. RETEST the vehicle.
• Idle vibration—a high-frequency vibration (20–80 Hz) or buzz, that is felt through the steering wheel or seat	• Exhaust system mounts bound up.	• VERIFY concern occurs at engine firing frequency. CHECK that the exhaust system vibrates at the same frequency as the engine. ADD 9–14 km (20–30 lb.) to the tail pipe to test, CARRY OUT Exhaust System Neutralizing in this section.
	• Body mounts loose.	• INSPECT the body mounts. CARRY OUT a Neutral Engine Run-Up (NERU) Test. REPAIR as necessary
	• Power steering lines grounded out.	• INSPECT that the power steering lines are not contacting the chassis or each other. REPAIR as necessary.

Symptom Chart—Squeak and Rattle

Condition	Possible Sources	Action
• Squeak—heard inside the vehicle when closing/opening the door	• Insufficient lubrication on the door hinge or check strap.	• LUBRICATE the hinge or check strap.
	• Internal door components loose, rubbing or misaligned.	• CHECK the inside of the door. TIGHTEN or ALIGN as necessary. USE the Rotunda Squeak and Rattle Kit to isolate any rubbing components.
• Squeak—heard inside the vehicle when closing/opening the window	• Worn or damaged glass run/channel.	• REPAIR or INSTALL a new glass run/channel. REFER to Section 501-11 .
• Squeak—heard outside of vehicle when	• Exhaust shield rubbing against the chassis or	• CHECK the exhaust system. REPAIR as necessary. Section 309-00 .

closing/opening the door	exhaust pipe.	
• Squeak—occurs with initial brake pedal application	• Disc brake pads.	• Under certain conditions, asbestos free pads can generate a squeak noise. This noise is normal and does not indicate a concern.
• Squeak—a constant noise that occurs with brake pedal applications	• Damaged or worn disc brake pads.	• INSPECT the pads for oil, grease or brake fluid contamination. CHECK for glazed linings. A brake disc with hard spots will also cause a squeak type noise. REPAIR or INSTALL new pads as necessary. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
• Squeak—noise occurs over bumps or when turning	• Worn control arm bushings. • Worn or damaged shock absorber/strut.	• INSPECT the control arm bushings. Spray with lubricant and CARRY OUT a "bounce test" to determine which bushing. REPAIR as necessary. REFER to Section 204-01A for 2-wheel drive vehicles or Section 204-01B for 4-wheel drive vehicles. • INSPECT the shock absorber for damage. CARRY OUT a "bounce test" to isolate the noise. INSTALL a new shock absorber/strut as necessary. REFER to Section 204-01A for 2-wheel drive vehicles and Section 204-01B for 4-wheel drive vehicles for the front shock absorber/strut or Section 204-02 for the rear shock absorber/strut.
• Rattle—heard when closing/opening the door or window	• Loose internal door mechanism, bracket or attachment.	• REPEAT the motion or CARRY OUT a "tap test" to duplicate the noise. INSPECT the door for loose components. TIGHTEN loose components or USE the Rotunda Squeak and Rattle Kit to isolate any rattling components.
• Squeak or rattle—heard inside the vehicle over rough roads/bumps	• Misaligned glove compartment door/hinge. • Instrument panel trim loose or misaligned. • Loose interior component or trim.	• ALIGN the glove compartment door. • INSPECT the instrument panel trim for missing or loose clips or screws. REPAIR as necessary. • CARRY OUT a "touch test". ELIMINATE the noise by pressing or pulling on interior trim and components. USE the Rotunda Squeak and Rattle Kit

		to isolate any rattling/squeaking components.
• Squeak or rattle—noise with a vibration concern	• Damaged or worn body mounts.	• INSPECT the upper and lower absorbers and washers for damage or wear. CHECK the body mount brackets for damage. CHECK the nuts and bolts are tightened to specifications. TIGHTEN as necessary.
	• Damaged or worn sub-frame mounts.	• INSPECT the upper and lower absorbers for damage or wear. CHECK the sub-frame for damage. CHECK the nuts and bolts are tightened to specifications. TIGHTEN as necessary.

Symptom Chart—Steering Noise/Vibration

Condition	Possible Sources	Action
• Steering grunt or shudder — occurs when turning into or out of a turn at low speeds (temperature sensitive)	• Steering gear or power steering hoses.	• GO to Steering Gear Grunt/Shudder Test component test in this section.
• Steering System clonk—hydraulic knocking sound	• Air in the steering hydraulic system.	• CHECK for leaks in the system. PURGE the air from the system. REFER to Section 211-00 .
• Power steering pump moan — loud humming noise occurs when the steering wheel is rotated to the stop position. Produces a 120-600 Hz frequency that changes with rpm	• Power steering hose grounded out to chassis.	• INSPECT the power steering hoses. REPAIR as necessary.
	• Aerated fluid.	• PURGE the air from the system. REFER to Section 211-00 . CHECK for leaks in the system.
	• Steering gear isolators.	• INSPECT the isolators for wear or damage. REPAIR as necessary.
	• Low fluid.	• CHECK the fluid level. REFILL as necessary.
	• Power steering pump brackets loose or misaligned.	• CHECK bolts, brackets and bracket alignment. TIGHTEN bolts to specification. REPAIR or INSTALL new brackets as necessary. REFER to Section 211-02 .

• Steering gear clunk — occurs only while cornering over a bump (can be temperature sensitive)	• Steering gear.	• INSPECT the steering gear for loose mounting bolts. TIGHTEN as necessary. REFER to Section 211-02 .
• Feedback (rattle, chuckle or knocking noise in the steering gear) — a condition where roughness is felt in the steering wheel when the vehicle is driven over rough surfaces	• Column intermediate/flexible shaft joints damaged or worn.	• INSTALL a new intermediate/flexible shaft. REFER to Section 211-04 .
	• Loose, damaged or worn tie-rod ends.	• TIGHTEN the nuts to specification or INSTALL new tie-rod ends as necessary.
	• Steering gear insulators or mounting bolts loose or damaged.	• TIGHTEN the bolts or INSTALL new bolts as necessary. REFER to Section 211-02 .
	• Steering column intermediate shaft bolts are loose.	• TIGHTEN the bolts to specification. REFER to Section 211-04 .
	• Steering column damaged or worn.	• REPAIR or INSTALL a new steering column as necessary. REFER to Section 211-04 .
	• Loose suspension bushings, bolts or ball joints.	• INSPECT the suspension system. TIGHTEN or INSTALL new components as necessary. REFER to Section 204-01A for 2-wheel drive vehicles or Section 204-01B for 4-wheel drive vehicles.
• Feedback (nibble at the steering wheel) — a condition where slight rotational movement is felt in the steering wheel when the vehicle is driven over rough or grooved surfaces	• Lateral runout in the tire or wheel.	• Go To Pinpoint Test H .
	• Yoke spring in the steering gear.	• CHECK TSBs for revised yoke spring for applicable vehicles.
• Accessory drive belt squeal/chirp—when rotating the	• Loose or worn accessory drive belt.	• ADJUST or INSTALL a new accessory drive belt as necessary. REFER to

steering wheel from stop to stop		Section 303-05 .
• Power steering gear hiss	• Steering column intermediate/flexible shaft-to-steering gear is binding or misaligned. • Grounded or loose steering column boot at the dash panel. • Damaged or worn steering gear input shaft and valve.	• REPAIR or INSTALL a new intermediate/flexible shaft as necessary. REFER to Section 211-04 . • REPAIR as necessary. • REPAIR or INSTALL a new steering gear as necessary. REFER to Section 211-02 .
• Steering column rattle	• Loose bolts or attaching brackets. • Loose, worn or insufficiently lubricated column bearings. • Steering shaft insulators damaged or worn. • Intermediate/flexible shaft compressed or extended.	• TIGHTEN the bolts to specifications. • LUBRICATE or INSTALL new steering column bearings as necessary. REFER to Section 211-04 . • INSTALL new insulators. REFER to Section 211-04 . • INSPECT the rubber spider coupling for damage. INSTALL a new intermediate/flexible shaft. REFER to Section 211-04 .
• Steering column squeak or cracks	• Insufficient lubricated steering shaft bushings. • Loose or misaligned steering column shrouds. • Steering wheel rubbing against steering column shrouds. • Insufficient lubricated speed control slip ring. • Upper or lower bearing sleeve out of position.	• LUBRICATE the steering shaft and shaft tube seals. • TIGHTEN or ALIGN the steering column shrouds. • REPOSITION the steering column shrouds. • LUBRICATE the speed control slip ring. • REPOSITION the bearing sleeves.
• Power steering pump noisy	• Incorrect assembly of components. • Imperfections on the outside diameter or end surface of the power steering pump rotor. • Damaged or worn power steering pump rotor splines. • A crack on the inner surface of the power steering pump cam. • Interference between	• REPAIR or INSTALL a new power steering pump as necessary. REFER to Section 211-02 .

	the power steering pump rotor and cam. ● Damaged or worn power steering pump rotor and pressure plates.	
● Power steering pump swish noise	● Power steering fluid flow into the bypass valve of the pump valve housing with fluid temperature below 54° C (130°F).	● Acceptable condition.
● Power steering pump whine noise	● Aerated fluid. ● Damaged power steering pump cam. ● Damaged valve cover O-ring seal.	● CHECK for a leak in the system. PURGE the air from the system. REFER to Section 211-00 . ● REPAIR or INSTALL a new power steering pump as necessary. REFER to Section 211-02 . ● REPAIR or INSTALL a new power steering pump as necessary. REFER to Section 211-02 .
● Power steering pump clicking (mechanical) noise	● Power steering pump rotor slippers too long, excessive rotor slipper-to-slot clearance or damaged or worn rotor assembly.	● REPAIR or INSTALL a new power steering pump as necessary. REFER to Section 211-02 .
● Power steering pump clatter noise	● Damaged corners on the outside diameter or the power steering rotor or distorted rotor slipper ring.	● REPAIR or INSTALL a new power steering pump as necessary. REFER to Section 211-02 .

Symptom Chart—Suspension Noise/Vibration

Condition	Possible Sources	Action
● Squeak or grunt—noise from the front suspension, occurs more in cold ambient temperatures. More noticeable over rough roads or when turning	● Front stabilizer bar insulators.	● Under these conditions, the noise is acceptable. CHECK TSBs for applicable vehicle.
● Clunk—noise from the front suspension, occurs in and out of turns	● Loose front struts or shocks.	● INSPECT for loose nuts or bolts. TIGHTEN to specifications. REFER to Section 204-01A for 2-wheel drive vehicles or Section 204-01B for 4-wheel drive vehicles.
● Clunk—noise from the rear suspension, occurs when shifting from	● Loose rear suspension components.	● INSPECT for loose or damaged rear suspension components.

reverse to drive		REPAIR or INSTALL new components as necessary. REFER to Section 204-02 .
• Click or pop—noise from the front suspension. More noticeable over rough roads or over bumps	• Worn or damaged ball joints.	• CARRY OUT a ball joint inspection. INSTALL new ball joints or control arms as necessary. REFER to Section 204-01A for 2-wheel drive vehicles or Section 204-01B for 4-wheel drive vehicles.
• Click or pop (FWD vehicles)—noise occurs when vehicle is turning	• Worn or damaged ball joints.	• CARRY OUT a ball joint inspection. INSTALL new ball joints or control arms as necessary.
• Click or snap—occurs when accelerating around a corner	• Damaged or worn outboard CV joint.	• INSPECT the outboard CV joint and boot. REPAIR or INSTALL a new CV joint as necessary. REFER to Section 205-04 .
• Front suspension noise—a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads	• Steering components. • Loose or bent front struts or shock absorbers. • Damaged spring or spring mounts. • Damaged or worn control/radius arm bushings. • Worn or damaged stabilizer bar bushings or links.	• Go To Pinpoint Test H .
• Rear suspension noise—a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads	• Loose or bent rear shock absorbers. • Damaged spring or spring mounts. • Damaged or worn control arm bushings. • Worn or damaged stabilizer bar bushings or links.	• Go To Pinpoint Test I .
• Shudder—occurs during acceleration from a slow speed or stop	• Rear drive axle assembly mispositioned. • Incorrect or high	• CHECK the axle mounts and the rear suspension for damage or wear. REPAIR as necessary. • CHECK vehicle ride

	CV joint operating angle. ● Damaged or worn front suspension components.	height is within limits. REPAIR as necessary. ● CHECK for a loose stabilizer bar, damaged or loose strut/strut bushings or loose or worn ball joints. INSPECT the steering linkage for wear or damage. REPAIR or INSTALL new components as necessary.
● Shimmy—most noticeable on coast/deceleration. Also hard steering condition	● Excessive positive caster.	● CHECK the caster alignment angle. CORRECT as necessary. REFER to Section 204-00 .

Symptom Chart—Tire Noise/Vibration

Condition	Possible Sources	Action
● Tire noise—hum/moan at constant speeds	● Abnormal wear patterns.	● SPIN the tire and CHECK for tire wear. INSTALL a new tire as necessary. INSPECT for damaged/worn suspension components. CARRY OUT wheel alignment.
● Tire noise—noise tone lowers as the vehicle speed is lowered	● Out-of-balance tire.	● BALANCE the tire and road test. INSTALL a new tire as necessary. REFER to Section 204-04 .
● Tire noise — ticking noise, changes with speed	● Nail puncture or stone in tire tread.	● INSPECT the tire. REPAIR as necessary.
● Wheel and tire—vibration and noise concern is directly related to vehicle speed and is not affected by acceleration, coasting or decelerating	● Damaged or worn tire.	● Go To Pinpoint Test J .
● Tire wobble or shudder — occurs at lower speeds	● Damaged wheel bearings.	● SPIN the tire and CHECK for abnormal wheel bearing play or roughness. ADJUST or INSTALL new wheel bearings as necessary. REFER to Section 204-01A for 2-wheel drive vehicles or Section 204-01B for 4-wheel drive vehicles.
	● Damaged wheel.	● INSPECT the wheel for damage. INSTALL a new wheel as necessary. REFER to Section 204-04 .
	● Damaged or worn suspension	● INSPECT the suspension components for wear or

	components. • Loose wheel nuts. • Damaged or uneven tire wear.	damage. REPAIR as necessary. • CHECK the wheel nuts. TIGHTEN to specification. REFER to Section 204-04 . • SPIN the tire and CHECK for abnormal tire wear or damage. INSTALL a new tire as necessary. REFER to Section 204-04 .
• Tire shimmy or shake— occurs at lower speeds	• Wheel/tire out of balance. • Uneven tire wear. • Excessive radial runout of wheel or tire. • Worn or damaged wheel studs or elongated stud holes. • Excessive lateral runout of the wheel or tire. • Foreign material between the brake disc and hub or in the brake disc fins.	• BALANCE the wheel/tire assembly. • CHECK for abnormal tire wear. INSTALL a new tire as necessary. REFER to Section 204-04 . • CARRY OUT a radial runout test of the wheel and tire. INSTALL a new tire as necessary. REFER to Section 204-04 . • INSPECT the wheel studs and wheels. INSTALL new components as necessary. REFER to Section 204-01A , 2-wheel drive vehicles or Section 204-01B , 4-wheel drive vehicles for the front wheels or Section 204-02 for the rear wheels. • CARRY OUT a lateral runout test of the wheel and tire. REFER to Section 204-04 . CHECK the wheel, tire and hub. REPAIR or INSTALL new components as necessary. • CLEAN the mounting surfaces of the brake disc and hub. CHECK the brake disc fins for material.
• High speed shake or shimmy—occurs at high speeds	• Excessive wheel hub runout. • Damaged or worn tires. • Damaged or worn wheel bearings. • Worn or damaged suspension or steering linkage components. • Brake disc or drum imbalance.	• Go To Pinpoint Test K .

Symptom Chart—Transmission (Manual) and Transfer Case Noise/Vibration

Condition	Possible Sources	Action
• Clutch rattling noise—occurs with clutch engaged, noise changes/disappears with clutch pedal depressed	• Flywheel bolts, clutch housing bolts or clutch pressure plate bolts loose.	• TIGHTEN the bolts to specifications. CHECK the bolts for damage.
• Clutch squeaking noise—noise is heard when the clutch is operated. Vehicle moves slowly or creeps when the clutch is disengaged. Can also be difficult to shift into first and reverse gear	• Pilot bearing seized or damaged.	• INSTALL a new pilot bearing.
• Clutch squeaking noise—occurs with clutch pedal depressed/released	• Worn clutch pedal shaft or bushings.	• INSPECT the clutch pedal for wear or damage. REPAIR as necessary.
• Clutch whirring/rattle noise—occurs when clutch pedal is depressed	• Worn, damaged or misaligned clutch release bearing.	• INSTALL a new clutch release bearing.
• Clutch grating/grinding noise—occurs when clutch pedal is depressed	• Clutch pressure plate fingers bent or worn. • Contact surface of clutch release bearing worn or damaged.	• INSPECT the clutch pressure plate release fingers. INSTALL a new pressure plate as necessary. • INSTALL a new clutch release bearing.
• Clutch chatter—a small amount of noise when clutch pedal is released at initial take-off	• Clutch engagement.	• Acceptable operating condition.
• Clutch chatter/grabs—in some cases a shudder is felt. Occurs with clutch pedal depressed/released	• Damaged or worn powertrain/driveline mounts. • Binding or dragging plunger of the clutch master cylinder or slave cylinder. • Grease or oil on the clutch disc facing.	• INSPECT the powertrain/drivetrain mounts. CARRY OUT Powertrain/Drivetrain Mount Neutralizing in this section. INSTALL new mounts as necessary. • CHECK the master and slave cylinder operation. INSPECT the components for damage or wear. INSTALL a new master or slave cylinder as necessary. • CHECK the input shaft seal and rear main oil seal. REPAIR as

		necessary. INSTALL a new clutch disc.
	• Clutch disc surface glazed or damaged.	• INSPECT the clutch disc surface for a glazed, hardened or damaged condition. CARRY OUT a disc check. INSTALL a new clutch disc as necessary.
	• Damaged or worn clutch pressure plate.	• INSPECT the clutch pressure plate for wear or damage. INSTALL a new clutch pressure plate as necessary.
	• Flywheel surface damaged or glazed.	• INSPECT the flywheel for damage or wear. CARRY OUT a flywheel runout check. INSTALL a new flywheel as necessary.
• Clutch chatter noise—noise when clutch pedal is released at initial take-off. Clutch is hard to engage and disengage	• Pilot bearing worn, damaged or not correctly aligned in bore.	• INSPECT the clutch pressure plate release fingers for uneven wear, clutch components burnt or a seized pilot bearing. INSTALL a new pilot bearing as necessary.
• Clutch vibration	• Loose flywheel bolts. • Damaged or loose clutch pressure plate. • Excessive flywheel runout.	• Go To Pinpoint Test L .
• Transmission rattling/clattering noise—noise at idle or on light acceleration from a stop. Gear selection difficult	• Gearshift lever joint worn or damaged.	• INSTALL a new gearshift lever.
	• Gearshift lever loose.	• TIGHTEN the bolts to specification.
	• Gearshift linkage rods worn or damaged.	• CHECK the linkage bushings for wear. INSTALL new linkage rods as necessary.
• Transmission rattling/clattering noise—occurs in neutral or in gear, at idle	• Incorrect fluid level or fluid quality.	• CHECK that the transmission is filled to the correct level and with the specified fluid.
• Transmission rattling/clattering noise—noise at idle in neutral	• Worn or rough reverse idler gear.	• CHECK the reverse idler gear. REPAIR as necessary.
	• Rough running	• CHECK the ignition

	engine, cylinder misfire. ● Excessive backlash in gears. ● Worn countershaft gears.	system. CARRY OUT a cylinder power test. ● CHECK the gear backlash. ADJUST as necessary. ● REPAIR as necessary.
● Transmission whine—a mild whine at extreme speeds or high rpm	● Rotating gears/geartrain.	● Acceptable noise.
● Transmission whine—a high pitched whine, also described as a squeal	● Transmission gears are worn (high mileage vehicle). ● Mismatched gear sets. ● Damaged or worn transmission bearing.	● Result of normal gear wear. REPAIR as necessary. ● INSPECT the gear sets for an uneven wear pattern on the face of the gear teeth. REPAIR as necessary. ● INSPECT the transmission bearings. INSTALL new bearings as necessary.
● Transmission growling/humming—noise occurs in the forward gears. The noise is more prominent when the gear is loaded. The problem gear can be located as the noise occurs in a specific gear position	● Gear is cracked, chipped or rough.	● INSPECT the transmission gears for damage or wear. INSTALL new gears as necessary.
● Transmission hissing—noise in neutral or in forward gears. As bearings wear or break up, the noise changes to a thumping noise	● Damaged or worn bearings.	● INSPECT the transmission bearings. INSTALL new bearings as necessary.
● Transmission knocking/thudding—noise at low speeds in forward gears	● Bearings with damaged balls or rollers or with pitted and spalled races.	● INSPECT the transmission bearings. INSTALL new bearings as necessary.
● Transmission rumble/growl—noise at higher speeds in forward gears, more pronounced in a coast/deceleration condition	● Incorrect driveline angle. ● Driveshaft out of balance or damaged.	● CHECK the driveline angle. REPAIR as necessary. ● CHECK the driveshaft for damage, missing balance weights or undercoating. Using a vibration analyzer (VA),

		CHECK the driveshaft balance. CARRY OUT a driveline vibration test. REPAIR as necessary.
• Transmission rumble/growl—noise at all speeds in forward gears, more pronounced in a heavy acceleration condition	• Damaged or worn transmission bearing or gears (high mileage vehicles).	• CHECK transmission fluid for excessive metal particles. REPAIR as necessary.
• Transfer case whine—noise at all ranges	• Incorrect fluid level or fluid quality. • Worn oil pump. • Under-inflated or oversized tires.	• CHECK that the transfer case is filled to the correct level and with the specified fluid. REFER to Section 308-07B . • DISASSEMBLE the transfer case. CHECK the oil pump for wear or damage. REPAIR as necessary. REFER to Section 308-07B . • CONFIRM that the tires and wheels are correct for the vehicle. CHECK that the tire inflation pressures are correct.
• Transfer case growl/rumble—noise at all ranges (A small amount of planetary noise can be heard when the transfer case is operated in low range.)	• Damaged or worn bearings or planetary gear.	• DISASSEMBLE the transfer case. CHECK the bearings or planetary gear for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case scraping/grating—noise at all ranges	• Excessively stretched drive chain hitting the case.	• DISASSEMBLE the transfer case. CHECK the drive chain for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case howl/hum—noise at all ranges or high range only	• Worn or damaged sun (input) gear, clutch pack (intermediate) gear or output shaft gear.	• DISASSEMBLE the transfer case. CHECK the gears for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case howl/hum—noise at low range only	• Worn or damaged intermediate gear and sliding gears (clutch pack).	• DISASSEMBLE the transfer case. CHECK the gears for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case vibration—vibration felt with vehicle in 4WD	• Transfer case mounting. • Driveshaft out of balance. • Excessive pinion	• Go To Pinpoint Test M .

	flange runout.	

Symptom Chart—Transmission (Automatic) Noise/Vibration

Condition	Possible Sources	Action
• Rattle—occurs at idle or at light acceleration from a stop	• Damaged engine or transmission mounts.	• CHECK the powertrain/drivetrain mounts for damage. REFER to Section 303-01A for 4.2L and 5.4L (2V) engines or Section 303-01B for 5.4L (4V) engines.
	• A loose front exhaust pipe heat shield.	• REPAIR or INSTALL a new heat shield as necessary.
	• Loose inspection plate or dust cover plate.	• CHECK for loose bolts. TIGHTEN to specifications. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions.
	• Loose flexplate to converter nuts.	• CHECK for loose nuts. TIGHTEN to specifications. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions.
• Whine—pitch increases with vehicle speed. Starts in first and second gear, decreases or goes away at higher gears	• Damaged or worn low one-way clutch. • Damaged or worn intermediate one-way clutch. • Friction elements. • Damaged or worn planetary or sun gear.	• INSPECT the transmission for wear or damage. REPAIR or INSTALL new components as necessary. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions.
• Whine—the pitch changes with engine speed	• A worn or damaged accessory drive component.	• CARRY OUT the Engine Accessory Test. REPAIR or INSTALL new components as necessary.
	• Incorrect fluid level.	• CHECK that the transmission is filled to the correct level. ADD fluid as necessary. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions.
	• Partially blocked filter.	• INSPECT the filter. CLEAN or INSTALL a new filter as necessary. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions.
	• Worn or damaged torque converter.	• CARRY OUT the torque converter service and replacement check. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions.

	• Worn or damaged front pump.	• INSPECT the front pump. INSTALL a new front pump as necessary. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions.
• Whine—pitch changes with vehicle speed	• Speedometer cable or gears.	• REPAIR or INSTALL new cables or gears as necessary.
• Whine/moan type noise—pitch increases or changes with vehicle speed	• Damaged engine or transmission mount.	• CHECK the powertrain/drivetrain mounts for damage. REFER to Section 303-01A for 4.2L and 5.4L (2V) engines or Section 303-01B for 5.4L (4V) engines.
	• U-joints worn or damaged.	• INSPECT the U-joints for wear or damage. INSTALL new U-joints as necessary. REFER to Section 205-01 .
	• Damaged or worn differential ring and pinion.	• INSPECT the differential ring and pinion for damage. CARRY OUT the Checking Tooth Contact Pattern and Condition of the Ring and Pinion component test in this section. REPAIR or INSTALL a new differential ring and pinion as necessary. REFER to Section 205-02A for Ford 8.8 rear axles, Section 205-02B for Ford 9.75 rear axles or Section 205-03 for the front axle.
	• Planetary gears nicked or chipped.	• CHECK the planetary gears for damage. INSTALL new components as necessary. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions.
• Whistle—noise is high pitched, constant. Changes in pitch with throttle position	• Hydraulic pressure in the main control.	• INSPECT the main control. REPAIR or INSTALL new components as necessary. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions.
	• Incorrect band/clutch apply pressure.	• CARRY OUT the line pressure tests. REPAIR or INSTALL components as necessary. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions.
	• Worn or damaged torque converter.	• CARRY OUT the torque converter service and replacement check. REFER to Section 307-01B for 4R70W transmissions or

		Section 307-01A for 4R100 transmissions.
• Clunk—occurs when shifting from PARK to a drive or reverse position	• Damaged powertrain mounts.	• INSPECT the powertrain mounts for damage. INSTALL new mounts as necessary. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions.
	• Damaged or worn pinion bearings.	• CHECK for abnormal bearing play or roughness. INSTALL new bearings as necessary. REFER to Section 205-02A for Ford 8.8 rear axles, Section 205-02B for Ford 9.75 rear axles or Section 205-03 for the front axle.
	• Worn or galled driveshaft slip yoke splines.	• CLEAN and INSPECT the splines of the yoke. INSTALL a new slip yoke as necessary. REFER to Section 205-01 .
	• Worn friction elements or excessive clutch pack end plate play.	• INSPECT the transmission for wear. CHECK that all end play and clearances are within specification. REPAIR or INSTALL new components as necessary. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions.
• Bump—occurs when shifting from PARK to a drive or reverse position. Similar to Clunk but with no sound	• Initial gear engagement.	• Acceptable condition.
• Buzz or hiss	• Incorrect driveline angles.	• CHECK for correct driveline angles. REPAIR as necessary. REFER to Section 205-00 .
	• Worn or damaged main control solenoids or valves.	• Using a transmission tester, ACTIVATE the solenoids to duplicate sound. INSTALL new components as necessary. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions.
• Vibration—a high frequency (20–80 Hz) that is felt through the seat or gear shifter. Changes with	• Transmission cooler lines grounded out.	• CHECK the transmission cooler lines. REPAIR as necessary.

engine speed	● Flexplate to torque converter nuts loose. ● Fluid filler tube grounded out. ● Shift cable incorrectly routed, grounded out or loose.	● CHECK the flexplate nuts. TIGHTEN to specification. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions. ● CHECK the fluid filler tube. REPAIR as necessary. ● CHECK the shift cable. REPAIR as necessary. REFER to Section 307-05 .
● Shutter or chatter—occurs with light to medium acceleration from low speeds or a stop	● Electrical inputs/outputs. ● Vehicle wiring harness. ● Incorrect inputs/outputs from the powertrain control module (PCM), digital transmission range (TR) sensor, brake pedal position (BPP) sensor, throttle position (TP) sensor, transmission speed sensor (TSS), output speed shaft (OSS) sensor or the torque converter clutch (TCC).	● CARRY OUT a Torque Converter Clutch Operation Test. RUN on-board diagnostics or self-test. REFER to Section 307-01B for 4R70W transmissions or Section 307-01A for 4R100 transmissions. CLEAR the DTC's, road test and rerun on-board diagnostics or self–test.

Pinpoint Tests

The pinpoint tests are a step-by-step diagnostic process designed to determine the cause of a condition. It may not always be necessary to follow a pinpoint test to its conclusion. Carry out only the steps necessary to correct the condition. Then, test the system for normal operation. Sometimes, it is necessary to remove various vehicle components to gain access to the component requiring testing. For additional information, REFER to the appropriate Workshop Manual section for removal and installation procedures. Reinstall all components after verifying system operation is normal.

PINPOINT TEST A: BRAKE VIBRATION/SHUDDER

Test Step	Result / Action to Take
A1 ROAD TEST THE VEHICLE—LIGHT BRAKING	
● Check that the wheel and tires are correct for the vehicle. Inspect the tires for abnormal wear patterns. ● Road test the vehicle. Warm the brakes by slowing the vehicle a few times from 80–32 km/h (50 to 20 mph) using light braking applications. At highway speeds of 89–97 km/h (55-60 mph), apply the brake using a light pedal force. ● **Is there a vibration/shudder felt in the steering wheel, seat or brake pedal?**	**Yes** GO to A4 . **No** GO to A2 .

A2 ROAD TEST THE VEHICLE—MODERATE TO HEAVY BRAKING	
• Road test the vehicle. At highway speeds of 89–97 km/h (55-60 mph), apply the brake using a moderate to heavy pedal force. • **Is there a vibration/shudder?**	**Yes** For vehicles with ABS, GO to A3 . For vehicles with standard brakes, GO to A4 . **No** Vehicle is OK. VERIFY condition with customer. TEST the vehicle for normal operation.
A3 NORMAL ACTUATION OF THE ABS SYSTEM DIAGNOSIS	
• During moderate to heavy braking, noise from the hydraulic control unit (HCU) and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct functioning of the ABS system. Pedal pulsation or steering wheel nibble (frequency is proportioned to the vehicle speed) indicates a concern with a brake or suspension component. • **Is the vibration/shudder vehicle speed sensitive?**	**Yes** GO to A5 . **No** The brake system is operating correctly.
A4 APPLICATION OF THE PARKING BRAKE	
• **NOTE:** Begin at the front of the vehicle unless the vibration or shudder has been isolated to the rear. • This test is not applicable to vehicles with drum-in-hat type parking brakes. For vehicles with drum-in-hat parking brakes, proceed to the next test. For all other vehicles, apply the parking brake to identify if the problem is in the front or rear brake. At highway speeds of 89–97 km/h (55-60 mph), lightly apply the parking brake until the vehicle slows down. Release the parking brake immediately after the test. • **Is there a vibration/shudder?**	**Yes** GO to A7 . **No** GO to A5 .
A5 CHECK THE FRONT WHEEL BEARINGS	
• Check the front wheel bearings. Refer to Wheel Bearing Check in this section. • **Are the wheel bearings OK?**	**Yes** GO to A6 . **No** INSPECT the wheel bearings. ADJUST or REPAIR as necessary. TEST the system for normal operation.
A6 CHECK THE FRONT SUSPENSION	
• Check the front suspension for: • Broken or loose bolts. • Damaged springs. • Worn or damaged upper and lower control arm bushings. • Loose or rough front bearings. • Uneven tire wear. • **Are all the suspension components in satisfactory condition?**	**Yes** GO to A7 . **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.
A7 RESURFACE THE FRONT BRAKE DISCS	
• **CAUTION: Do not use a bench lathe to machine brake discs.**	**Yes** GO to A8 .

• **NOTE:** Follow the manufacturer's instructions to machine the brake discs. After machining, make sure the brake disc meets the thickness specification. • Resurface the front brake discs. Refer to Brake Disc Machining in this section. Road test the vehicle. • **Is the vibration/shudder present?**	**No** Vehicle is OK.
A8 CHECK THE REAR SUSPENSION	
• Check the rear suspension for: • Broken or loose bolts. • Damaged or worn springs or spring bushings. • Worn or damaged upper and lower control arm bushings. • Worn or damaged trailing arms. • Loose or rough rear bearings. • Uneven tire wear. • **Are all the suspension components in satisfactory condition?**	**Yes** GO to A9 . **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.
A9 RESURFACE THE REAR BRAKE DISC OR DRUM	
• **CAUTION: Do not use a bench lathe to machine brake discs.** • **NOTE:** Follow the manufacturers instructions to machine the brake discs. After machining, make sure the brake disc meets the thickness specification. • Resurface the rear brake discs or drums. Refer to Brake Disc Machining in this section. Road test the vehicle. • **Is the vibration/shudder present?**	**Yes** Check the front suspension for wear or damage, resurface the front brake discs. Test the system for normal operation. **No** Vehicle is OK.

PINPOINT TEST B: ENGINE TICKING NOISE

Test Step	Result / Action to Take
B1 CHECK FOR TICKING NOISE AT THE FUEL RAIL	
• Disconnect the first fuel line clip. • **Is the ticking noise gone?**	**Yes** CHECK for TSB for applicable vehicle. REPAIR as necessary. TEST the system for normal operation. **No** GO to B2 .
B2 CHECK FOR TICKING NOISE AT THE FUEL INJECTOR	
• Using an EngineEAR, listen at the fuel injectors by placing a probe on each injector. To isolate the faulty injector, disconnect the injector electrical connector and listen for the noise. • **Is the fuel injector the source of the ticking noise?**	**Yes** INSTALL a new fuel injector. REFER to Section 303-04A for 4.6L and 5.4L (2V) engines or Section 303-04B for 5.4L (4V) engines. TEST the system for normal operation. **No** GO to B3 .
B3 CHECK THE BELT TENSIONER FOR TICKING NOISE	
• Inspect the accessory drive. Check for the belt tensioner bottoming at end of travel or	**Yes** INSTALL a new belt tensioner. TEST the

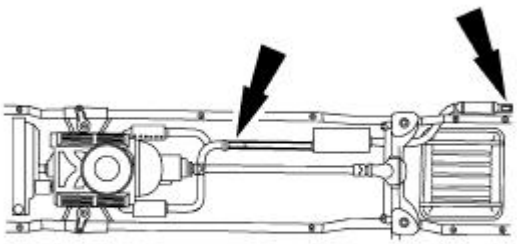
not at end of stroke. ● Using an EngineEAR, listen at the belt tensioner. ● **Is the belt tensioner the source of the noise?**	system for normal operation. **No** GO to B4 .
B4 CHECK THE WATER PUMP FOR TICKING NOISE	
● Using an EngineEAR, listen at the water pump for ticking noise. ● **Is the water pump the source of the noise?**	**Yes** INSTALL a new water pump. REFER to Section 303-03 . TEST the system for normal operation. **No** GO to B5 .
B5 CHECK FOR AN OBSTRUCTION OF THE COOLING FAN	
● Inspect the cooling fan for obstructions. ● Check the cooling fan and shroud for wear or damage. ● **Was there an obstruction or does the cooling fan show signs of damage?**	**Yes** REPAIR or INSTALL a new cooling fan. TEST the system for normal operation. REFER to Section 303-03 . **No** GO to B6 .
B6 CHECK THE OIL PUMP FOR TICKING NOISE	
● Check the oil pump using EngineEARs and probe at the oil filter adapter to verify the oil pump as a source. ● **Is the oil pump the source of the noise?**	**Yes** INSTALL a new oil pump. REFER to Section 303-01A for 4.6L and 5.4L (2V) engines or Section 303-01B for 5.4L (4V) engines. TEST the system for normal operation. **No** GO to B7 .
B7 CHECK VALVE LIFTERS OR LASH ADJUSTERS FOR CORRECT OPERATION	
● Check valve lifter/lash adjuster for correct operation, using EngineEARs. ● **Are the valve lifters/lash adjusters operating correctly?**	**Yes** VERIFY customer concern. CONDUCT a diagnosis of other suspect components. **No** INSTALL a new valve lifter/lash adjuster(s). REFER to Section 303-01A for 4.6L and 5.4L (2V) engines or Section 303-01B for 5.4L (4V) engines. TEST the system for normal operation.

PINPOINT TEST C: ACCESSORY DRIVE BEARING HOOT

Test Step	Result / Action to Take
C1 CHECK THE ACCESSORY DRIVE IDLER AND TENSIONER PULLEY BEARINGS	
● Carry out the Vehicle Cold Soak Procedure in this section. ● Key in START position. ● Place an EngineEAR probe directly on the	**Yes** INSTALL a new pulley/idler. CARRY OUT the Vehicle Cold Soak Procedure and TEST the system for normal operation.

pulley center post or bolt to verify which bearing is making the noise. ● Key in OFF position. ● **Is either bearing making the noise?**	**No** CONDUCT a diagnosis on other suspect accessory drive components.

PINPOINT TEST D: POWER STEERING MOAN



Test Step	Result / Action to Take
D1 CHECK THE POWER STEERING SYSTEM	
● Carry out the Vehicle Cold Soak Procedure in this section. ● Key in START position. ● Turn the steering wheel while the noise is occurring and listen for changes in sound pitch or loudness. ● Key in OFF position. ● **Does the sound pitch or loudness change while turning the steering wheel?**	**Yes** GO to D2 . **No** CONDUCT a diagnosis on other suspect accessory drive components.
D2 VERIFY THE SOURCE	
● Key in START position. ● Place an EngineEAR probe near the power steering pump/reservoir while the noise is occurring. While an assistant turns the steering wheel, listen for changes in sound pitch or loudness. ● Key in OFF position. ● **Does the sound pitch or loudness change while turning the steering wheel?**	**Yes** VERIFY that the supply tube to the pump is unobstructed. CHECK the fluid condition and level. DRAIN the fluid and REFILL. REFER to Section 211-02 . CARRY OUT the Vehicle Cold Soak Procedure and TEST the system for normal operation. **No** Normal system operation.

PINPOINT TEST E: ENGINE DRIVEN COOLING FAN MOAN

Test Step	Result / Action to Take
E1 CHECK THE ENGINE DRIVEN COOLING FAN AFTER A COLD SOAK	
● Carry out the Vehicle Cold Soak Procedure in this section. ● Key in START position. ● Assess the airflow. ● Raise the engine speed to 1500 rpm while listening for the moan to increase in proportion to the airflow. ● Key in OFF position. ● **Does the moan increase in proportion to the airflow?**	**Yes** TEST the fan for normal operation. If the fan tests normal, GO to E2 . Otherwise, REPAIR as necessary. **No** Normal system operation.
E2 CHECK THE ENGINE DRIVEN COOLING FAN AT NORMAL OPERATING TEMPERATURE	
● Key in START position. ● Run the engine to normal operating temperature while listening for the moan to stop. ● Key in OFF position.	**Yes** Normal clutch operation. **No** INSTALL a new fan clutch. TEST the

• **Does the moan stop?**	system for normal operation.

PINPOINT TEST F: DRUMMING NOISE

Test Step	Result / Action to Take
F1 CHECK THE EXHAUST SYSTEM	
• Key in START position. • Increase the engine rpm until the noise is the loudest. Note the engine rpm. • Key in OFF position. • Add approximately 9 kg (20 lb) of weight to the exhaust system. First place the weight at the tail pipe and test, then at the front pipe.  DF1768-A • Key in START position. • Increase the engine rpm and listen for the drumming noise. Note the engine rpm if the noise occurs. • Key in OFF position. • Using a vibration analyzer (VA), determine the amount of vibration that occurs with the drumming noise. • **Is the noise/vibration reduced or eliminated, or does the noise/vibration occur at a different rpm?**	**Yes** CARRY OUT Exhaust System Neutralizing in this section. TEST the system for normal operation. **No** GO to F2.
F2 POWERTRAIN/DRIVETRAIN MOUNT NEUTRALIZING	
• Carry out Powertrain/Drivetrain Mount Neutralizing in this section. Test the system for normal operation. • **Is the noise reduced or eliminated?**	**Yes** Vehicle OK. TEST the system for normal operation. **No** CONDUCT diagnosis of other suspect components.

PINPOINT TEST G: ENGINE TICKING, KNOCKING OR CONTINUOUS RATTLE

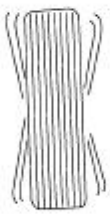
Test Step	Result / Action to Take
G1 CHECK FOR NOISE AT THE VALVE COVERS AND THE FRONT COVERS (OHC ENGINES)	
• Carry out the Vehicle Cold Soak Procedure in this section. • Key in START position. • **NOTE:** For a short-duration ticking noise, multiple engine starts may be necessary.	**Yes** REMOVE the appropriate cover and INSPECT for loose, worn/broken components. REPAIR as necessary. TEST the system for normal operation.

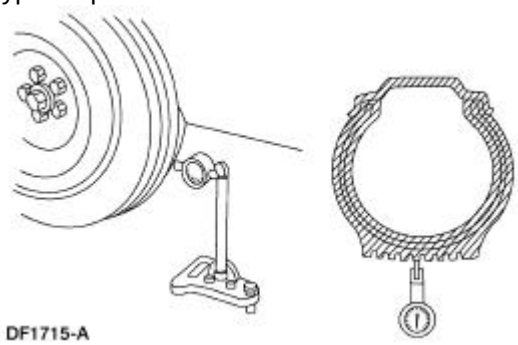
• Using an EngineEAR, listen closely at the valve covers and the front covers (OHC engines) by placing the probe near the surface of the valve cover and then on the surface front cover. • Key in OFF position. • **Is the noise source apparent?**	**No** GO to G2 .
G2 CHECK FOR NOISE AT THE CYLINDER BLOCK	
• Key in START position. • Using an EngineEAR, listen closely at the cylinder block by placing a probe on or near each freeze plug. • Key in OFF position. • **Is the noise source apparent?**	**Yes** REPAIR or INSTALL new components as necessary. **No** GO to G3 .
G3 CHECK FOR NOISE WHILE DISCONNECTING EACH FUEL INJECTOR ELECTRICAL CONNECTOR, ONE AT A TIME	
• Key in START position. • Disconnect each fuel injector electrical connector, one at a time, to decrease piston force and listen for the noise. • Key in OFF position. • **Is the noise reduced or eliminated?**	**Yes** INSTALL a new fuel injector. TEST the system for normal operation. **No** INSPECT accessory drive or the transmission as a possible source.

PINPOINT TEST H: FRONT SUSPENSION NOISE

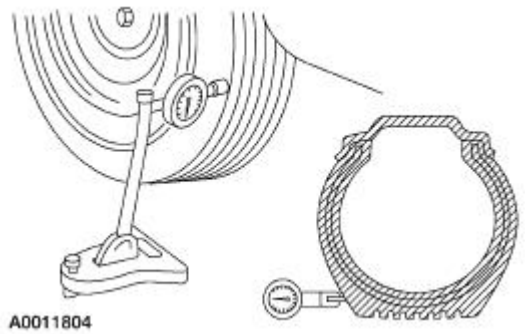
Test Step	Result / Action to Take
H1 ROAD TEST THE VEHICLE	
• Test drive the vehicle. • **NOTE:** An assistant will be needed for this road test. • During the road test, drive the vehicle over a rough road. Using ChassisEARs, determine from which area/component the noise is originating. • **Is there a squeak, creak or rattle noise?**	**Yes** GO to H2 . **No** The suspension system is OK. CONDUCT a diagnosis on other suspect systems.
H2 INSPECT THE STEERING SYSTEM	
• **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.** • Raise and support the vehicle. • Check the steering system for wear or damage. Carry out a steering linkage test. Refer Section 211-00 . • Inspect the tire wear pattern. Refer to Tire Wear Patterns chart in this section. • **Are the steering components worn or damaged?**	**Yes** REPAIR the steering system. INSTALL new components as necessary. TEST the system for normal operation. **No** GO to H3 .
H3 FRONT SHOCK ABSORBER/STRUT CHECK	
• Check the front shock absorber/strut mounts for loose bolts or nuts. • Check the front shock absorbers/struts for wear or damage.	**Yes** TIGHTEN to specifications if loose. INSTALL new front

Carry out a "bounce test". ● **Are the front shock absorbers/struts loose or damaged?**	shock absorbers/struts if damaged. TEST the system for normal operation. **No** GO to H4.
H4 CHECK THE FRONT SPRINGS	
● Check the front spring and front spring mounts/brackets for wear or damage. ● **Are the front springs or spring mounts/brackets worn or damaged?**	**Yes** REPAIR or INSTALL new components as necessary. TEST the system for normal operation. **No** GO to H5.
H5 CHECK THE CONTROL ARMS/RADIUS ARMS	
● Inspect the control arm bushings for wear or damage. ● Inspect for twisted or bent control arm/radius arm. ● **Are the control arms/radius arms damaged or worn?**	**Yes** REPAIR or INSTALL new components as necessary. TEST the system for normal operation. **No** GO to H6.
H6 CHECK THE STABILIZER BAR/TRACK BAR	
● Check the stabilizer bar/track bar bushings and links for damage or wear. ● Check the stabilizer bar/track bar for damage. ● Check for loose or damaged stabilizer bar isolators or brackets. ● **Are the stabilizer bar/track bar components loose, worn or damaged?**	**Yes** REPAIR or INSTALL new components as necessary. TEST the system for normal operation. **No** Suspension system OK. CONDUCT diagnosis on other suspect systems.





PINPOINT TEST I: REAR SUSPENSION NOISE



Test Step	Result / Action to Take
I1 ROAD TEST THE VEHICLE	
● Test drive the vehicle. ● **NOTE:** An assistant will be needed for this road test. ● During the road test, drive the vehicle over a rough road. Using ChassisEARs, determine from which area/component the noise is originating. ● **Is there a squeak, creak or rattle noise?**	**Yes** GO to I2. **No** The suspension system is OK. CONDUCT a diagnosis on other suspect systems.
I2 REAR SHOCK ABSORBER/STRUT CHECK	
● **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**	**Yes** TIGHTEN to specifications if loose. INSTALL new rear shock absorbers/struts if damaged. TEST the system for normal operation. **No**

• Raise and support the vehicle. • Check the rear shock absorber/strut mounts for loose bolts or nuts. • Check the rear shock absorbers/struts for damage. Carry out a shock absorber check. • **Are the rear shock absorbers/struts loose or damaged?**	GO to I3.
I3 CHECK THE REAR SPRINGS	
• Check the rear springs and rear spring mounts/brackets for wear or damage. • **Are the rear springs or spring mounts/brackets worn or damaged?**	**Yes** REPAIR or INSTALL new components as necessary. TEST the system for normal operation. **No** GO to I4.
I4 CHECK THE CONTROL ARMS/TRAILING ARMS	
• Inspect the control arm/trailing arm bushings for wear or damage. Check for loose control arm /trailing arm bolts. • Inspect for twisted or bent control arms/trailing arms. • **Are the control arms/trailing arms loose, damaged or worn?**	**Yes** REPAIR or INSTALL new components as necessary. TEST the system for normal operation. **No** GO to I5.
I5 CHECK THE STABILIZER BAR/TRACK BAR	
• Check the stabilizer bar/track bar bushings and links for damage or wear. • Check the stabilizer bar/track bar for damage. • Check for loose or damaged stabilizer bar isolators or brackets. • **Are the stabilizer bar/track bar components loose, worn or damaged?**	**Yes** REPAIR or INSTALL new components as necessary. Test the system for normal operation. **No** Suspension system OK. CONDUCT diagnosis on other suspect systems.

PINPOINT TEST J: WHEEL AND TIRE

Test Step	Result / Action to Take
J1 ROAD TEST THE VEHICLE	
• **NOTE:** Wheel or tire vibrations felt in the steering wheel are most likely related to the front wheel or tire. Vibration felt through the seat are most likely related to the rear wheel or tire. This may not always be true, but it can help to isolate the problem to the front or rear of the vehicle. • Test drive the vehicle at different speed ranges. • During the road test, if the vibration can be eliminated by placing the vehicle in neutral or is affected by the speed of the engine, the cause is not the wheels or tires. • **Is there a vibration and noise?**	**Yes** GO to J2. **No** The wheel and tires are OK. CONDUCT a diagnosis on other suspect systems.
J2 CHECK THE FRONT WHEEL BEARINGS	
• Check the front wheel bearings. Refer to Wheel Bearing Check in this section. • **Are the wheel bearings OK?**	**Yes** GO to J3. **No**

	INSPECT the wheel bearings. ADJUST or REPAIR as necessary. TEST the system for normal operation.
J3 INSPECT THE TIRES • Check the tires for missing weights. • Check the wheels for damage. • Inspect the tire wear pattern. Refer to the Tire Wear Patterns chart in this section. • **Do the tires have an abnormal wear pattern?**	**Yes** CORRECT the condition that caused the abnormal wear. INSTALL new tire (s). TEST the system for normal operation. **No** GO to J4 .
J4 TIRE ROTATION DIAGNOSIS • Spin the tires slowly and watch for signs of lateral runout.  DF1713-A • Spin the tires slowly and watch for signs of radial runout.  DF1714-A • **Are there signs of visual runout?**	**Yes** GO to J5 . **No** CHECK the wheel and tire balance. CORRECT as necessary. TEST the system for normal operation.
J5 RADIAL RUNOUT CHECK ON THE TIRE • Measure the radial runout of the wheel and tire assembly. A typical specification for total radial runout is 0.045 inch.  DF1715-A • **Is the radial runout within specifications?**	**Yes** GO to J8 . **No** GO to J6 .
J6 RADIAL RUNOUT CHECK ON THE WHEEL	

• Measure the radial runout of the wheel. A typical specification for total radial runout is 0.045 inch. • **Is the radial runout within specifications?**	**Yes** INSTALL a new tire. TEST the system for normal operation. **No** GO to J7 .
J7 CHECK THE HUB/BRAKE DISC OR DRUM PILOT RUNOUT OR BOLT CIRCLE RUNOUT	
• Measure the pilot or bolt circle runout. A typical specification for radial runout is: • Pilot runout— less than 0.15 mm (0.006 inch). • Bolt circle runout— less than 0.38 mm (0.015 inch). • **Is the radial runout within specifications?**	**Yes** INSTALL a new wheel. TEST the system for normal operation. **No** REPAIR or INSTALL new components as necessary. REFER to Section 204-01A , 2-wheel drive vehicles and Section 204-01B , 4-wheel drive vehicles for the front wheels or Section 204-02 for the rear wheels.
J8 LATERAL RUNOUT CHECK ON THE TIRE	
• Measure the lateral runout of the wheel and tire assembly. A typical specification for total lateral runout is 1.14 mm (0.045 inch).  A0011804 • **Is the lateral runout within specifications?**	**Yes** Wheel and tires OK. CONDUCT diagnosis on other suspect systems. **No** GO to J9 .
J9 LATERAL RUNOUT CHECK ON THE WHEEL	
• Measure the lateral runout of the wheel. A typical specification for total radial runout is 1.14mm (0.045 inch. • **Is the lateral runout within specifications?**	**Yes** INSTALL a new tire. TEST the system for normal operation. **No** GO to J10 .
J10 CHECK THE FLANGE FACE LATERAL RUNOUT	
• Measure the flange face lateral runout. A typical specification for lateral runout is: • Hub/brake disc— less than 0.13 mm (0.005 inch). • Axle shaft— less than 0.25 mm (0.010 inch). • **Is the lateral runout within specifications?**	**Yes** INSTALL a new wheel. TEST the system for normal operation. **No** REPAIR or INSTALL new components as

	necessary. REFER to Section 204-01A , 2-wheel drive vehicles and Section 204-01B , 4-wheel drive vehicles for the front wheels or Section 204-02 for the rear wheels.

PINPOINT TEST K: HIGH SPEED SHAKE OR SHIMMY

Test Step	Result / Action to Take
K1 CHECK FOR FRONT WHEEL BEARING ROUGHNESS	
• Chock the rear wheels. • Raise and support the front end of the vehicle so that the front wheel and tire assemblies can spin. • Spin the front tires by hand. Refer to Wheel Bearing Check in this section. • **Do the wheel bearings feel rough?**	**Yes** INSPECT the wheel bearings. REPAIR as necessary. TEST the system for normal operation. **No** GO to K2 .
K2 CHECK THE END PLAY OF THE FRONT WHEEL BEARINGS	
• Check the end play of the front wheel bearings. Refer to Section 204-00 . • **Is the end play OK?**	**Yes** GO to K3 . **No** ADJUST or REPAIR as necessary. TEST the system for normal operation.
K3 MEASURE THE LATERAL RUNOUT AND THE RADIAL RUNOUT OF THE FRONT WHEELS ON THE VEHICLE	
• Measure the lateral runout and the radial runout of the front wheels on the vehicle. Refer to Pinpoint Test J. • **Are the measurements within specifications?**	**Yes** GO to K4 . **No** INSTALL new wheels as necessary and BALANCE the assembly. TEST the system for normal operation.
K4 MEASURE THE LATERAL RUNOUT OF THE FRONT TIRES ON THE VEHICLE	
• Measure the lateral runout of the front tires on the vehicle. Refer to Pinpoint Test J. • **Is the runout within specifications?**	**Yes** GO to K5 . **No** INSTALL new tires as necessary and BALANCE the assembly. TEST the system for normal operation.
K5 MEASURE THE RADIAL RUNOUT OF THE FRONT TIRES ON THE VEHICLE	
	Yes

• Measure the radial runout of the front tires on the vehicle. Refer to Pinpoint Test J. • **Is the runout within specifications?**	BALANCE the front wheel and tire assemblies. If any tire cannot be balanced, INSTALL a new tire. TEST the system for normal operation. **No** GO to K6 .
K6 MATCH MOUNT THE TIRE AND WHEEL ASSEMBLY	
• Mark the high runout location on the tire and also on the wheel. Break the assembly down and rotate the tire 180 degrees (halfway around) on the wheel. Inflate the tire and measure the radial runout. • **Is the runout within specifications?**	**Yes** BALANCE the assembly. TEST the system for normal operation. **No** If the high spot is not within 101.6 mm (4 inches) of the first high spot on the tire, GO to K7 .
K7 MEASURE THE WHEEL FLANGE RUNOUT	
• Dismount the tire and mount the wheel on a wheel balancer. Measure the runout on both wheel flanges. Refer to Section 204-04 .  DG0199-A • **Is the runout within specifications?**	**Yes** LOCATE and MARK the low spot on the wheel. INSTALL the tire, matching the high spot on the tire with the low spot on the wheel. BALANCE the assembly. TEST the system for normal operation. If the condition persists,GO to K8 . **No** INSTALL a new wheel. CHECK the runout on the new wheel. If the new wheel is within limits, LOCATE and MARK the low spot. INSTALL the tire, matching the high spot on the tire with the low spot on the wheel. BALANCE the assembly. TEST the system for normal operation. If the condition persists, GO to K8 .
K8 CHECK FOR VIBRATION FROM THE FRONT OF THE VEHICLE	
WARNING: If only one drive wheel is allowed to rotate, speed must be limited to 55 km/h (34 mph) using the speedometer reading, since actual wheel speed will be twice that indicated on the speedometer. Exceeding a speed of 55 km/h (34 mph) or allowing the drive wheel to hang unsupported can result in tire disintegration or differential failure, which can cause serious personal injury and extensive vehicle damage.	**Yes** SUBSTITUTE known good wheel and tire assemblies as necessary. TEST the system for normal operation. **No** GO to K9 .

• Spin the front wheel and tire assemblies with a wheel balancer while the vehicle is raised on a hoist. Feel for vibration in the front fender or while seated in the vehicle. • **Is the vibration present?**	
K9 CHECK FOR VIBRATION FROM THE REAR OF THE VEHICLE	
WARNING: If only one drive wheel is allowed to rotate, speed must be limited to 55 km/h (34 mph) using the speedometer reading, since actual wheel speed will be twice that indicated on the speedometer. Exceeding a speed of 55 km/h (34 mph) or allowing the drive wheel to hang unsupported can result in tire disintegration or differential failure, which can cause serious personal injury and extensive vehicle damage. • Chock the front wheels. • Raise and support the rear end of the vehicle so that the rear wheel and tire assemblies can spin. • Engage the drivetrain and carefully accelerate the drive wheels while checking for vibration. • **Is the vibration present?**	**Yes** GO to K10 . **No** TEST the system for normal operation.
K10 CHECK THE DRIVETRAIN	
WARNING: If only one drive wheel is allowed to rotate, speed must be limited to 55 km/h (34 mph) using the speedometer reading, since actual wheel speed will be twice that indicated on the speedometer. Exceeding a speed of 55 km/h (34 mph) or allowing the drive wheel to hang unsupported can result in tire disintegration or differential failure, which can cause serious personal injury and extensive vehicle damage. • Remove the rear wheel and tire assemblies. Refer to Section 204-04 . • Secure the brake drums (if so equipped), by installing wheel hub bolt nuts, reversed. • Carefully accelerate the drivetrain while checking for vibration. • **Is the vibration present?**	**Yes** CHECK/TEST the drivetrain and driveline components. TEST the system for normal operation. **No** SUBSTITUTE known good wheel and tire assemblies as necessary. TEST the system for normal operation.

PINPOINT TEST L: CLUTCH VIBRATION

Test Step	Result / Action to Take
L1 CHECK ENGINE COMPONENTS FOR GROUNDING	
• **NOTE:** Make sure the clutch is the cause of the vibration concern. The vibration should occur during clutch operation. The clutch can also be difficult to engage or disengage. Eliminate all related systems before checking the clutch components. • **NOTE:** Check the driveline angles and driveshaft runout before disassembling the clutch system. Refer to Section 205-00 . • Check the powertrain/drivetrain mounts, exhaust manifolds or other engine components for grounding on the chassis. • **Are any mounts or engine components grounded?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** GO to L2
L2 CHECK THE ACCESSORY DRIVE BELT	
• Remove the accessory drive belt. • **Does the vibration stop with the accessory drive belt**	**Yes** DIAGNOSE the accessory drive components.

removed?	**No** GO to L3 .
L3 CHECK FOR LOOSE CLUTCH PRESSURE PLATE BOLTS	
• Check for loose clutch pressure plate bolts. Inspect the clutch pressure plate for damage or for material between the pressure plate and flywheel. • **Are there any loose bolts or damage?**	**Yes** TIGHTEN the bolts to specifications or if damaged, INSTALL a new clutch pressure plate. **No** GO to L4 .
L4 CHECK THE CLUTCH DISC SPRINGS	
• Check for worn, broken or loose clutch disc springs. • **Are the clutch springs worn, broken or loose?**	**Yes** INSTALL a new clutch disc. TEST the system for normal operation. **No** GO to L5 .
L5 CHECK THE CLUTCH DISC SPLINES	
• Inspect the clutch disc splines for damage or wear. • **Is there damage or wear?**	**Yes** INSTALL a new clutch disc. TEST the system for normal operation. **No** GO to L6 .
L6 CHECK THE FLYWHEEL BOLTS	
• Check for loose flywheel bolts. • **Are the bolts loose?**	**Yes** TIGHTEN the bolts to specifications. TEST the system for normal operation. **No** GO to L7 .
L7 CHECK THE FLYWHEEL SURFACE	
• Inspect the flywheel surface for wear or damage. Check the flywheel runout. • **Is there any damage or excessive wear?**	**Yes** INSTALL a new flywheel. TEST the system for normal operation. **No** Clutch system normal. CONDUCT a diagnosis on other suspect systems.

PINPOINT TEST M: TRANSFER CASE VIBRATION

Test Step	Result / Action to Take
M1 INSPECT THE TRANSFER CASE	
• **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing**	**Yes** TIGHTEN to specifications or

an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations. ● Inspect the transfer case for loose or missing mounting bolts. Check for fluid seepage between the transfer case and the transmission. ● **Are the mounting bolts missing or loose?**	INSTALL new bolts as necessary. TEST the system for normal operation. **No** GO to M2 .
M2 INSPECT THE REAR DRIVESHAFT	
● **NOTE:** Verify that the driveshaft and pinion flange index marks are aligned. ● Inspect the driveshaft for missing weights, damage or undercoating. ● Inspect the U-joints for freedom of movement. ● Check driveshaft runout and, if necessary, check the pinion flange runout. ● **Is the driveshaft or U-joints worn or damaged or misaligned?**	**Yes** REPAIR or INSTALL a new driveshaft as necessary. TEST the system for normal operation. **No** GO to M3 .
M3 CHECK THE DRIVELINE ANGLES	
● Measure the rear driveshaft and pinion angles. Refer to Section 205-00 . ● Measure the front driveshaft and pinion angles. Refer to the appropriate workshop manual for the service procedures. ● **Are the driveline angles incorrect?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** GO to M4 .
M4 INSPECT THE FRONT DRIVESHAFT	
● **NOTE:** Verify that the driveshaft and pinion flange index marks are aligned. ● Inspect the front driveshaft for missing weights, damage or undercoating. ● Inspect the U-joints and slip yoke for freedom of movement. ● Check driveshaft runout and, if necessary, check the pinion flange runout. Refer to Section 206-00 . ● **Is the driveshaft or U-joints worn or damaged?**	**Yes** REPAIR or INSTALL a new driveshaft as necessary. TEST the system for normal operation. **No** GO to M5 .
M5 ROAD TEST WITH THE FRONT DRIVESHAFT ONLY	
● **NOTE:** Index mark the driveshaft to the pinion flange and to the output shaft before removal. ● Remove the rear driveshaft. ● Plug the transfer case with an output shaft seal plug. ● **NOTE:** Shift the transfer case into 4WD high so the vehicle is driven by the front driveshaft only. ● Test drive the vehicle. ● **Is the vibration gone?**	**Yes** INSTALL and BALANCE the rear driveshaft. TEST the system for normal operation. **No** GO to M6 .
M6 ROAD TEST WITH THE REAR DRIVESHAFT ONLY	
● **NOTE:** Index mark the front driveshaft to the pinion flange. ● Remove the front driveshaft. ● Test drive the vehicle. ● **Is the vibration gone?**	**Yes** INSTALL and BALANCE the front driveshaft. TEST the system for normal operation. **No** GO to M7 .
M7 TRANSFER CASE TAIL SHAFT INSPECTION	
● Inspect the splines of the output shaft for wear or damage.	**Yes**

• Inspect the splines of the driveshaft slip yoke for wear or damage. • **Are the splines worn or damaged?**	REPAIR or INSTALL new components as necessary. TEST the system for normal operation. **No** The transfer case is OK. CONDUCT a diagnosis on other suspect systems.

Component Tests

Idle Air Control (IAC) Valve

1. Open the hood.
2. **NOTE:** Key symptom is elevated idle speed while noise is occurring.

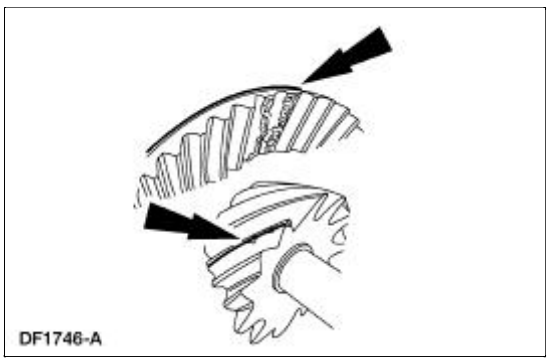
   NOTE: "Snapping" the throttle can induce the noise.

   Verify the condition by operating the vehicle for a short time.
3. Inspect the IAC valve. If physical evidence of contamination exists, install a new IAC valve.
4. While the noise is occurring, either place an EngineEAR probe near the IAC valve and the inlet tube, or create a 6.35 mm (0.25 in)-12.7 mm (0.50 in) air gap between the inlet tube and the clean air tube. If the IAC valve is making the noise, install a new IAC valve.
5. Test the vehicle for normal operation.

Steering Gear Grunt/Shudder Test

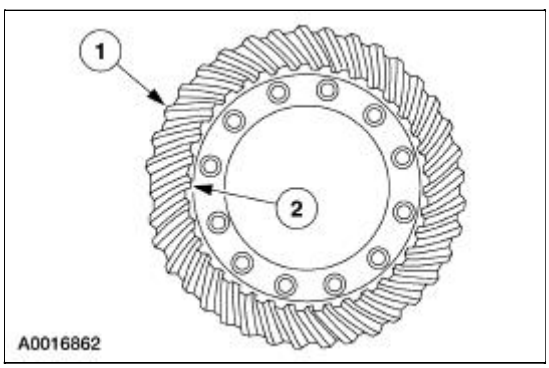
1. Start and run the vehicle to operating temperature.
2. Set engine idle speed to 1200 rpm.
3.  **CAUTION: Do not hold the steering wheel against the stops for more than three to five seconds at a time. Damage to the power steering pump will occur.**

   Rotate the steering wheel to the RH stop, then turn the steering wheel 90° back from that position. Turn the steering wheel slowly in a 15° to 30° arc.
4. Turn the steering wheel another 90°. Turn the steering wheel slowly in a 15° to 30° arc.
5. Repeat the test with power steering fluid at different temperatures.
6. If a light grunt is heard or a low (50-200 Hz) shudder is present, this is a normal steering system condition.
7. If a loud grunt is heard or a strong shudder is felt, fill and purge the power steering system.



Checking Tooth Contact Pattern and Condition of the Ring and Pinion

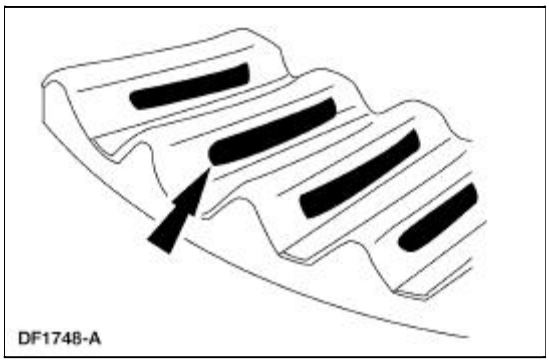
There are two basic types of conditions that will produce ring and pinion noise. The first type is a howl



or chuckle produced by broken, cracked, chipped, scored or forcibly damaged gear teeth and is usually quite audible over the entire speed range. The second type of ring and pinion noise pertains to the mesh pattern of the gear pattern. This gear noise can be recognized as it produces a cycling pitch or whine. Ring and pinion noise tends to peak in a narrow speed range or ranges, and will tend to remain constant in pitch.

1. Raise and support the vehicle. For additional information, refer to Section 100-02 .
2. Drain the axle lubricant. REFER to Section 205-02A for Ford 8.8 rear axles, Section 205-02B for Ford 9.75 rear axles or Section 205-03 for the front axle.
3. Remove the carrier assembly or the axle housing cover depending on the axle type. Refer to Section 205-02A for Ford 8.8 rear axles, Section 205-02B for Ford 9.75 rear axles or Section 205-03 for the front axle.
4. Inspect the gear set for scoring or damage.

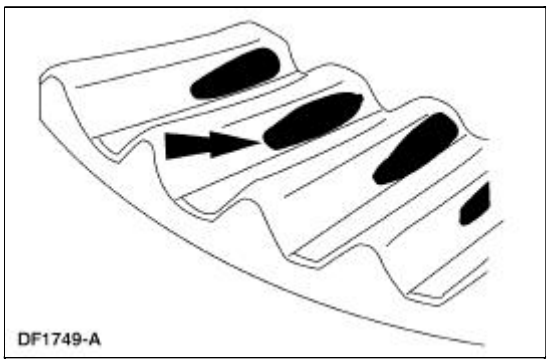
5. In the following steps, the movement of the contact pattern along the length is indicated as toward the" heel" or "toe" of the differential ring gear.



Item	Description

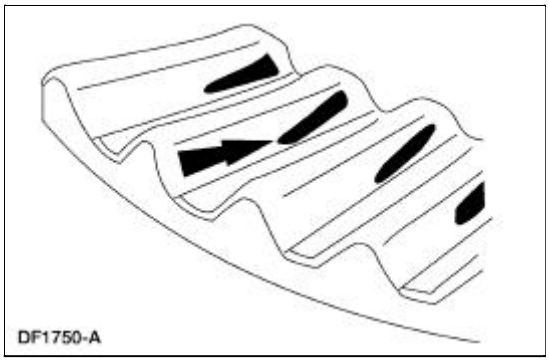
1	Heel
2	Toe

6. Apply a marking compound to a third of the gear teeth on the differential ring gear. Rotate the differential ring gear several complete turns in both directions until a good, clear tooth pattern is obtained. Inspect the contact patterns on the ring gear teeth.



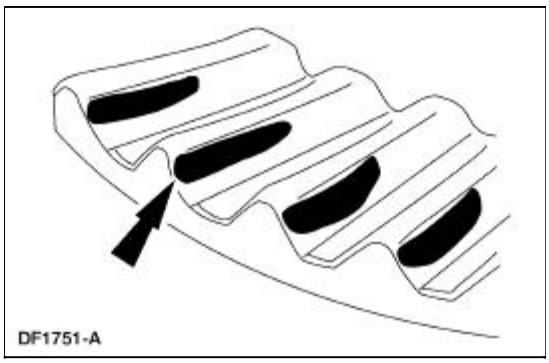
7. A good contact pattern should be centered on the tooth. It can also be slightly toward the toe. There should always be some clearance between the contact pattern and the top of the tooth.

- Tooth contact pattern shown on the drive side of the gear teeth.



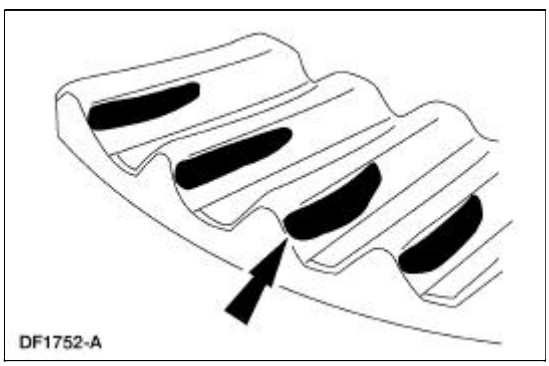
8. A high, thick contact pattern that is worn more toward the toe.

- Tooth contact pattern shown on the drive side of the gear teeth.
- The high contact pattern indicates that the drive pinion is not installed deep enough into the carrier.
- The differential ring gear backlash is correct, a thinner drive pinion shim is needed. A decrease will move the drive pinion toward the differential ring gear.



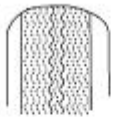
9. A high, thin contact pattern that is worn toward the toe.

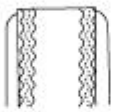
- Tooth contact pattern shown on the drive side of the gear teeth.
- The drive pinion depth is correct. Increase the differential ring gear backlash.

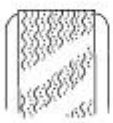


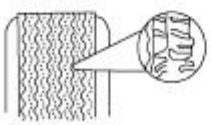
10. A contact pattern that is worn in the center of the differential ring gear tooth toward the heel.

- Tooth contact pattern shown on the drive side of the gear teeth.
- The low contact pattern indicates that the drive pinion is installed too deep into the carrier.
- The differential ring gear backlash is correct. A thicker drive pinion shim is needed.









11. A contact pattern that is worn at the top of the differential ring gear tooth toward the heel.

- Tooth contact pattern shown on the drive side of the gear teeth.
- The pinion gear depth is correct. Decrease the differential ring gear backlash.

Tire Wear Patterns and frequency calculations

Tire Wear Chart

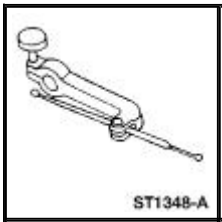
TIRE WEAR	CONDITION	POSSIBLE CAUSES
	• Rapid wear at both shoulders.	• Tires underinflated. • Worn suspension components. • Excessive cornering speeds. • Lack of rotation.
	• Rapid wear at the center.	• Tires overinflated. • Lack of rotation. • Excessive toe on drive wheels. • Heavy acceleration on drive wheels.
	• Wear at one shoulder.	• Toe adjustment out of specification. • Camber out of specification. • Damaged strut. • Damaged lower control arm.
	• Feather edges.	• Toe adjustment out of specification. • Damaged or worn tie rods. • Damaged spindle or knuckle.
	• Bald spots or cupping.	• Unbalanced wheel. • Excessive radial runout. • Worn strut or shock absorber.
	• Tire scalloped.	• Toe adjustment out of specification. • Camber out of specification. • Worn or damaged suspension components.
	• Wear pattern - FWD vehicles.	• Excessive toe on non-drive wheels. • Lack of rotation.
	• Wear pattern - FWD vehicles. Edge of thread blocks worn.	• Excessive toe on non-drive wheels. • Lack of rotation.

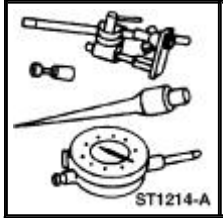
DF1717-A

Wheel and tire NVH concerns are directly related to vehicle speed and are not generally affected by acceleration, coasting or decelerating. Also, out-of-balance wheel and tires can vibrate at more than one speed. A vibration that is affected by the engine rpm, or is eliminated by placing the transmission in NEUTRAL is not related to the tire and wheel. As a general rule, tire and wheel vibrations felt in the steering wheel are related to the front tire and wheel assemblies. Vibrations felt in the seat or floor are related to the rear tire and wheel assemblies. This can initially isolate a concern to the front or rear.

Careful attention must be paid to the tire and wheels. There are several symptoms that can be caused by damaged or worn tire and wheels. Carry out a careful visual inspection of the tires and wheel assemblies. Spin the tires slowly and watch for signs of lateral or radial runout. Refer to the tire wear chart to determine the tire wear conditions and actions.

For a vibration concern, use the vehicle speed to determine tire/wheel frequency and rpm. Calculate tire and wheel rpm and frequency by carrying out and following:





- Measure the diameter of the tire.
- Record the speed at which the vibration occurs.
- Obtain the corresponding tire and wheel rpm and frequency from the Tire Speed and Frequency Chart.
    - If the vehicle speed is not listed, divide the vehicle speed at which the vibration occurs by 16 km/h (10 mph). Multiply that number by 16 km/h (10 mph) tire rpm listed for that tire diameter in the chart. Then divide that number by 60. For example: a 40 mph vibration with 835 mm (33 in) tires. 40 ÷10 = 4. Multiply 4 by 105 = 420 rpm. Divide 420 rpm by 60 seconds = 7 Hz at 40 mph.

Tire Speed and Frequency Chart

Tire Diameter	Tire RPM/Hz	Tire RPM/Hz	Tire RPM/Hz	Tire RPM/Hz
mm (inch)	@ 16 km/h (10 mph)	@ 80 km/h (50 mph)	@ 97 km/h (60 mph)	@ 113 km/h (70 mph)
483 (19)	182	910/15	1092/18	1274/21
508 (20)	173	865/14	1038/17	1211/20
533 (21)	165	825/14	990/16	1155/19
560 (22)	158	790/13	948/16	1106/18
585 (23)	151	755/13	906/15	1057/18
610 (24)	145	725/12	870/14	1015/17
635 (25)	139	695/12	834/14	973/16
660 (26)	134	670/11	804/13	938/16
685 (27)	129	645/11	774/13	903/15
710 (28)	124	620/10	744/12	868/14

Brake Disc Machining

Special Tool(s)

 ST1348-A	Gauge, Clutch Housing 308-021 (T75L-4201-A)
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

Material

Item	Specification
Metal Surface Cleaner F4AZ-19A536-RA or equivalent	WSE-M5B392-A
High Temperature Nickel Anti-Seize Lubricant F6AZ-9L494-AA or equivalent	ESE-M12A4-A

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

CAUTION: Do not install brake discs that are less than the minimum thickness specified. Do not machine a brake disc below the minimum thickness specification.

1. Check wheel bearing end-play and correct as necessary.
2. **NOTE:** Begin at the front of the vehicle unless the vibration has been isolated to the rear.

   Remove the tire and wheel assembly.
3. Remove the brake caliper and the brake caliper anchor plate. Refer to the appropriate section in Group 206 for the procedure.
4. Inspect the brake linings. Install new brake linings if below specification. For additional information, refer to the appropriate brake section.
5. Measure and record the brake disc thickness. Install a new brake disc if the thickness after machining will be at or below specification. The specification is molded into the brake disc.
   - Do not machine a new brake disc.

6. For vehicles with a two-piece hub and brake disc assembly:
   - Match-mark before disassembly.
   - Remove the brake disc.
   - Clean the hub and brake disc mounting surfaces with metal surface cleaner.
   - Using a die grinder with a mild abrasive (Scotch Brite® type), remove any rust or corrosion from the hub and brake disc mounting surfaces.
   - Align the match-marks and reinstall the brake disc on the hub.

7. **CAUTION: Do not use a bench lathe to machine brake discs.**

   NOTE: The depth of cut must be between 0.10 and 0.20 mm (0.004 and 0.008 inch). Lighter cuts will cause heat and wear. Heavier cuts will cause poor brake disc surface finish.

   Using an on-car brake lathe, machine the brake discs. Follow the manufacturer's instructions. After machining, make sure the brake disc still meets the thickness specification.

8. Using the special tools, verify that the brake disc lateral runout is now within specification. For additional information, refer to Section 206-00 .

9. Remove the special tool hub adapter.

10. Remove any remaining metal chips from the machining operation.

11. For vehicles with a two-piece hub and brake disc assembly:
    - Remove the brake disc from the hub.
    - Remove any remaining metal chips from hub and brake disc mounting surfaces and from the ABS sensor.
    - Apply a liberal amount of lubricant to the hub flange, pilot area and to the brake disc-to-hub mounting surface.
    - Using the match marks, mount the brake disc on the hub.

12. Install the brake caliper anchor plate and the brake caliper.

13. Install the tire and wheel assembly.

14. Test the system for normal operation.

Powertrain/Drivetrain Mount Neutralizing

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

1. Raise and support the vehicle.
2. Loosen, but do not remove, the powertrain/drivetrain mount fasteners.
3. Lower the vehicle.
4. **CAUTION: Do not twist or strain the powertrain/drivetrain mounts.**

   Move the vehicle in forward and reverse 0.6-1.2 meters (2-4 ft).
5. Raise and support the vehicle.
6. Tighten the powertrain/drivetrain mount fasteners.
7. Lower the vehicle.
8. Test the system for normal operation.

Exhaust System Neutralizing

WARNING: Exhaust gases contain carbon monoxide, which is harmful to health and potentially lethal. Repair exhaust system leaks immediately. Never operate the engine in an enclosed area.

WARNING: Exhaust system components are hot.

NOTE: Neutralize the exhaust system to relieve strain on mounts which can be sufficiently bound up to transmit vibration as if grounded.

1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   CAUTION: Make sure the system is warmed up to normal operating temperature, as thermal expansion can be the cause of a strain problem.

   Raise and support the vehicle.

2. Loosen all exhaust hanger attachments and reposition the hangers until they hang free and straight.

3. Loosen all exhaust flange joints.

4. Place a stand to support the muffler parallel to the vehicle frame with the muffler pipe bracket free of stress.

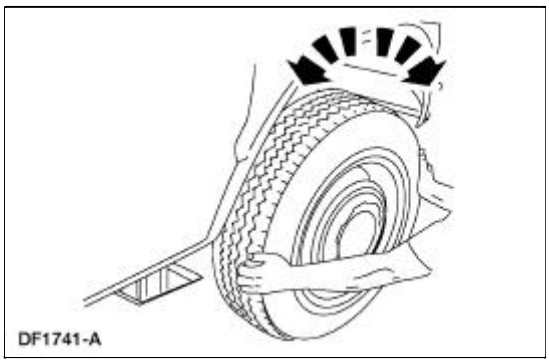
5. Tighten the muffler connection.

6. Tighten all the exhaust hanger clamps and flanges (tighten the exhaust manifold flange joint last).
   - Verify there is adequate clearance to prevent grounding at any point in the system. Make sure that the catalytic converter and heat shield do not contact the frame rails.
   - After neutralization, the rubber in the exhaust hangers should show some flexibility when movement is applied to the exhaust system.
   - With the exhaust system installed securely and cooled, the rear hanger should be angled forward.

7. Lower the vehicle.

8. Test the exhaust system for normal operation.

Wheel Bearing Check



1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   Raise the vehicle until the front tires are off the floor.

   - Make sure the wheels are in a straight forward position.

2. **NOTE:** Make sure the wheel rotates freely and that the brake pads are retraced sufficiently to allow free movement of the tire and wheel assembly.

   Spin the tire by hand to check the wheel bearings for roughness.

3. Grip each front tire at the top and bottom and move the wheel inward and outward while lifting the weight of the tire off the front wheel bearing.

4. If the tire and wheel (hub) is loose on the spindle, does not rotate freely, or has a rough feeling when spun, carry out one of the following:
   1. On vehicles with inner and outer bearings, inspect the bearings and cups for wear or damage. Adjust or install new bearings and cups as necessary.
   2. On vehicles with one sealed bearing, install a new wheel hub.

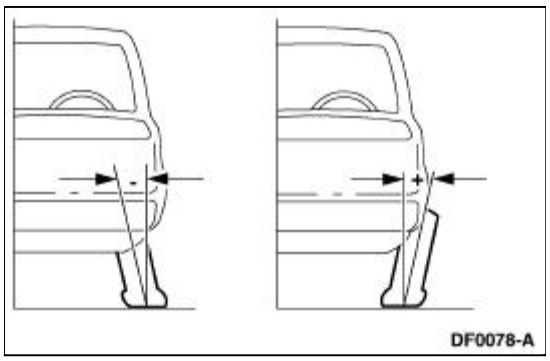
General Specifications

Item	Specification
Front Ride Height	
Expedition	105 mm (4.2 in) ± 7.0 mm (0.28 in)
Navigator	85 mm (3.4 in) ± 7.0 mm (0.28 in)
Rear Ride Height	
Expedition	119 mm (4.76 in) ± 7.0 mm (0.28 in)
Navigator	112 mm (4.48 in) ± 7.0 mm (0.28 in)
Vehicle Lean (Side-to-Side Differences)	
Front ride height—maximum	7 mm (0.28 in)

Rear ride height—maximum	8 mm (0.32 in)
Wheel Track	
Wheel track	0.6 mm (0.02 in)
Dogtracking	
Dogtracking—maximum (centerline of front tires compared to centerline of rear tires)	30 mm (1.18 in)
Ball Joint End Play	
Lower ball joint (front)—maximum vertical	0.8 mm (0.03 in)
Upper ball joint—maximum vertical	0.8 mm (0.03 in)

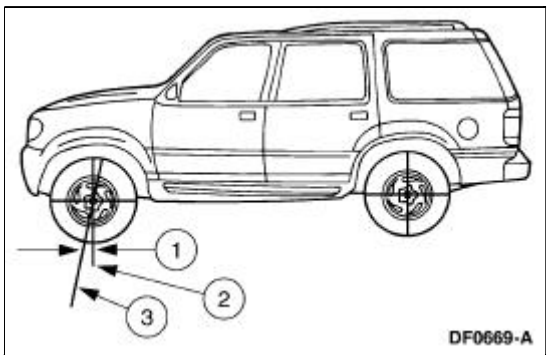
Torque Specifications



Description	Nm	lb-ft
Front lower arm-to-frame nuts	270	200
Toe set jam nuts (front)	103	76
Rear upper arm-to-wheel knuckle bolt and nut	150	111
Toe set jam nuts (rear)	115	85
Forward cam bolt plate-to-crossmember bolts (M6)	15	11
Rearward cam bolt plate-to-crossmember bolts (M8)	40	30

Wheel Alignment Angles

The front caster and camber are adjusted by removing the lower arm-to-frame mounting bolts and installing adjuster kits to allow the arm to be adjusted in the frame slots. Front toe is adjusted by the use of the front wheel spindle tie-rod. The rear camber is adjusted by removing the upper arm-to-wheel knuckle mounting bolt and installing an adjuster kit to allow the wheel knuckle to be adjusted in the arm slot. The rear toe is adjusted by the use of the rear toe link.

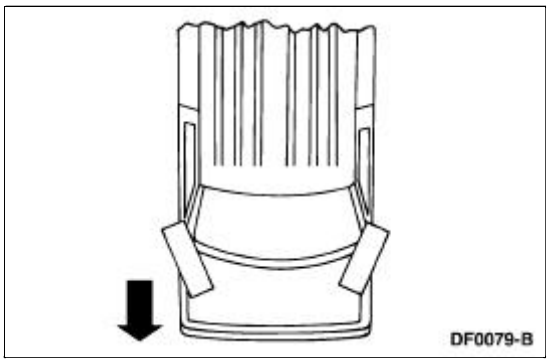


Camber

Negative and Positive Camber

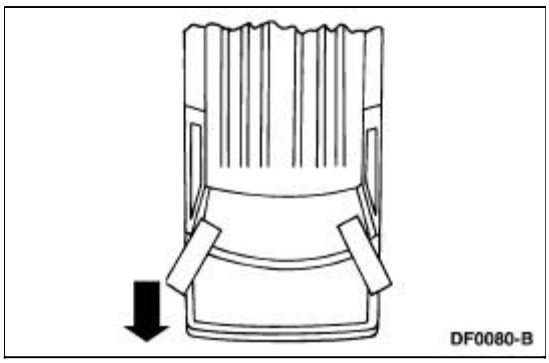
Camber is the vertical tilt of the wheel when viewed from the front. Camber can be positive or negative and has a direct effect on tire wear.

Caster



Item	Part Number	Description
1	—	Positive caster
2	—	True vertical
3	—	Steering axis

Caster is the deviation from vertical of an imaginary line drawn through the ball joints when viewed from the side. The caster specifications in this section will give the vehicle the best directional stability

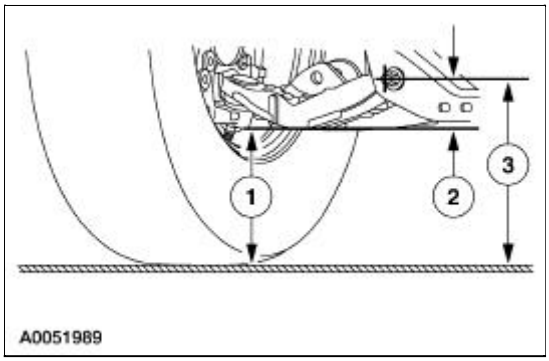


characteristics when loaded and driven. The caster setting is not related to tire wear.

Toe

Positive Toe (Toe In)

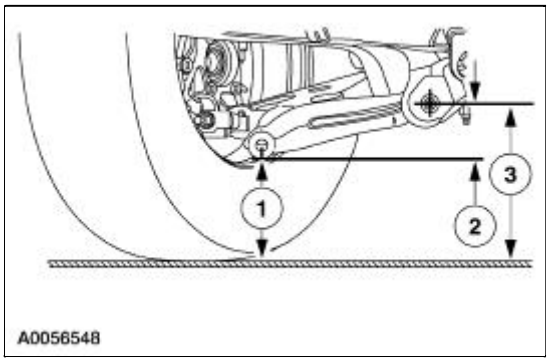
Negative Toe (Toe Out)



The vehicle toe setting:

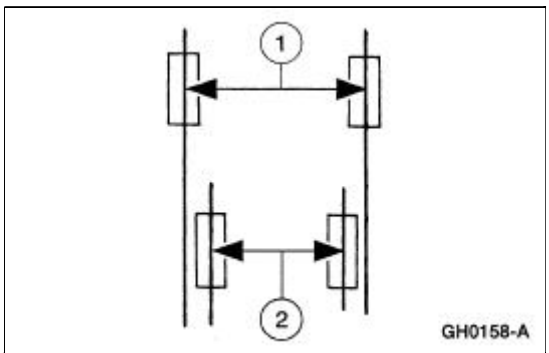
- affects tire wear and directional stability.
- must be checked after adding aftermarket equipment, such as a snowplow or body.

Ride Height



NOTE: Air suspension vehicles must be at trim prior to measuring the vehicle ride height. For additional information, refer to Section 204-05 .

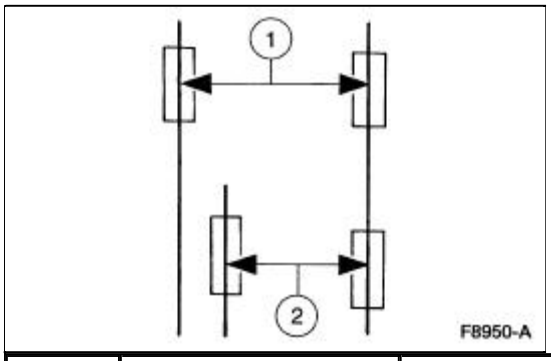
Front Ride Height Measurement



Item	Description
1	Distance between the ground and the lower knuckle surface near the ball joint.
2	Ride height = 3-1
3	Distance between the ground and the center of the lower arm rearward mounting bolt

Rear Ride Height Measurement

Item	Description
1	Distance between the ground and lower edge of arm below the shock absorber mounting bolt
2	Ride height = 3-1
3	Distance between the ground and the center of the lower arm mounting bolt



Wheel Track

Item	Part Number	Description

1	—	Front track
2	—	Rear track

Dogtracking

Item	Part Number	Description
1	—	Front track
2	—	Rear track dogtracking

Dogtracking is the condition in which the rear axle is not square to the chassis. Heavily crowned roads can give the illusion of dogtracking.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel (3600) corrections to maintain a straight path down a level road.

Shimmy

Shimmy, as observed by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire contacts pot holes or irregularities in the road surface.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces or tire imbalance. This condition is observed by the driver as small rotational oscillations of the steering wheel.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe the poor return of the steering wheel to center after a turn or the steering correction is completed.

Drift/Pull

Pull is a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with hands off the steering wheel.

- A vehicle-related drift/pull, on a flat road, will cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull may be induced by conditions external to the vehicle (i.e., wind, road camber).

Poor Groove Feel

Poor groove feel is characterized by little or no buildup of turning effort felt in the steering wheel as the wheel is rocked slowly left and right within very small turns around center or straight-ahead (under 20 degrees of steering wheel turn). Efforts may be said to be "flat on center."

- Under 20 degrees of turn, most of the turning effort that builds up comes from the mesh of gear teeth in the steering gear (3504). In this range, the steering wheel is not yet turned enough to feel the effort from the self-aligning forces at the road wheel or tire patch.
- In the diagnosis of a roadability problem, it is important to understand the difference between wander and poor groove feel.

Suspension System

Inspection and Verification

1. Road test.
   - Verify the customer's concern by performing a road test on a smooth road. If any vibrations are apparent, refer to Section 100-04 .
2. Inspect tires.
   - Check the tire pressure with all normal loads in the vehicle and the tires cold. Refer to the vehicle certification (VC) label.
   - Verify that all tires are sized to specification. Refer to Section 204-04 .
   - Inspect the tires for incorrect wear and damage. Refer to Section 204-04 .
3. Inspect chassis and underbody.
   - Remove any excessive accumulation of mud, dirt or road deposits from the chassis and underbody.
4. Inspect for aftermarket equipment.
   - Check for aftermarket changes to the steering, suspension, wheel and tire components (such as competition, heavy duty, etc.) The specifications shown in this manual do not apply to vehicles equipped with aftermarket equipment.

Visual Inspection Chart

Mechanical
● Front wheel bearing(s) ● Loose or damaged front or rear suspension components ● Loose, damaged or missing suspension fastener(s) ● Incorrect spring usage ● Damaged or sagging spring(s) ● Damaged or leaking shock absorber(s) ● Worn or damaged suspension bushing(s) ● Loose, worn or damaged steering system components ● Damaged axle components

5. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the next step.
6. If the fault is not visually evident, determine the symptom and proceed to the following symptom chart.

Symptom Chart

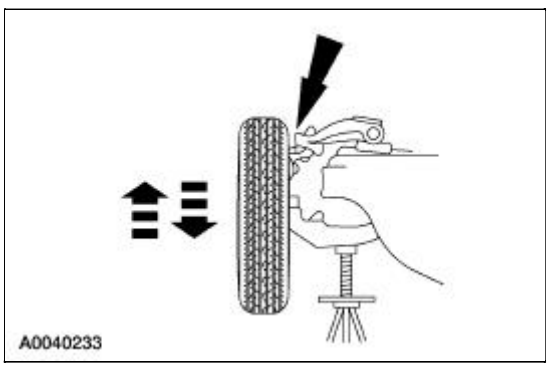
Symptom Chart

Condition	Possible Sources	Action
• Dogtracking	• Excessive rear thrust angle.	• ADJUST as necessary.
	• Front or rear suspension components.	• INSPECT the front and rear suspension system. REPAIR or INSTALL new suspension components as necessary. REFER to Section 204-01A , Section 204-01B or Section 204-02 .
• Drift/pull	• Unequal tire pressure.	• ADJUST tire pressure.
	• Caster total split is not within specification.	• CHECK the wheel alignment. ADJUST as necessary.
	• Camber total split is not within specification.	• CHECK the wheel alignment. ADJUST as necessary.
	• Tire forces.	• CROSS ROTATE tires front to rear.
	• Unevenly loaded or overloaded vehicle.	• NOTIFY the customer of incorrect vehicle loading.
	• Steering components.	• REFER to Section 211-00 .
	• Brake drag.	• REFER to Section 206-00 .
• Front bottoming or riding low	• Spring(s).	• INSTALL new spring(s) as necessary. REFER to Section 204-01A (4x2 and 4x4).
	• Incorrect Spring(s)	• INSTALL new spring(s) as necessary. REFER to Section 204-01A (4x2 and 4x4).
	• Front shock absorber(s).	• INSTALL new shock absorber (s) as necessary. REFER to Section 204-01A (4x2 and 4x4).
• Incorrect tire wear	• Incorrect tire pressure (rapid center rib or inner and outer edge wear).	• ADJUST tire pressure.
	• Excessive front or rear toe (rapid inner or outer edge wear).	• CHECK the wheel alignment. ADJUST as necessary.
	• Excessive negative or positive camber (rapid inner or outer edge wear).	• CHECK the wheel alignment. ADJUST as necessary.
	• Front or rear suspension components.	• INSPECT the front and rear suspension system. REPAIR or INSTALL new suspension components as necessary. REFER to Section 204-01A , Section 204-01B or Section

		204-02 . ● Tires out of balance (tires cupped or dished).	● BALANCE tires.
● Rough ride	● High tire pressure. ● Shock absorber(s). ● Spring(s).	● ADJUST tire pressure. ● INSTALL new shock absorbers as necessary. REFER to Section 204-01A and Section 204-02 . ● INSTALL new spring(s) as necessary. REFER to Section 204-01A and Section 204-02 .
● Shimmy or wheel tramp	● Loose wheel nut (s). ● Loose front suspension fasteners. ● Front wheel bearing. ● Wheel or tire concerns. ● Shock absorber(s). ● Loose, worn or damaged ball joint (s). ● Loose, worn or damaged steering components. ● Front wheel alignment.	● TIGHTEN to specification. REFER to Section 204-04 . ● TIGHTEN to specification. REFER to Section 204-01A (4x2) or Section 204-01B (4x4). ● REFER to Wheel Bearing Inspection in this section. ● REFER to Section 204-04 . ● INSTALL new shock absorber (s) as necessary. REFER to Section 204-01A (front) or Section 204-02 (rear). ● GO to the Ball Joint Inspection component test in this section. ● REFER to Section 211-00 . ● CHECK the wheel alignment. ADJUST as necessary.
● Sticky steering, poor returnability	● Ball joints. ● Steering components. ● Caster out of specification.	● GO to the Ball Joint Inspection component test in this section. ● REFER to Section 211-00 . ● CHECK the wheel alignment. ADJUST as necessary.
● Steering wheel off-center	● Unequal front or rear toe settings (side-to-side). ● Steering components.	● CHECK the wheel alignment. ADJUST as necessary. ● REFER to Section 211-00 .
● Sway or roll	● Overloaded, unevenly or incorrectly loaded vehicle. ● Loose wheel nut (s). ● Shock absorber(s).	● NOTIFY the customer of incorrect vehicle loading. ● TIGHTEN to specification. REFER to Section 204-04 . ● INSTALL new shock absorbers as necessary. REFER to Section 204-01A or Section

		204-02 .
	• Loose stabilizer assembly.	• TIGHTEN to specification. REFER to Section 204-01A (4x2), Section 204-01B (4x4) or Section 204-02 .
	• Worn stabilizer assembly bushing (s) or link(s).	• INSTALL new stabilizer assembly bushings as necessary. REFER to Section 204-01A (4x2), Section 204-01B (4x4) or Section 204-02 .
	• Worn spring(s).	• INSTALL new as necessary. REFER to Section 204-01A (front) or Section 204-02 (rear).
• Vehicle leans to one side	• Unevenly loaded or overloaded vehicle.	• NOTIFY the customer of incorrect vehicle loading.
	• Front or rear suspension components.	• INSPECT the front and rear suspension systems. REPAIR or INSTALL new suspension components as necessary. REFER to Section 204-01A (4x2), Section 204-01B (4x4) or Section 204-02 .
	• Spring(s).	• INSTALL new spring(s) as necessary. REFER to Section 204-01A (front) or Section 204-02 (rear).
	• Incorrect drive axle (s) ride height. Lateral tilt out of specification.	• INSPECT the front and rear suspension systems. ADJUST, REPAIR or INSTALL new suspension components as necessary. REFER to Section 204-01B (4x4) or Section 204-02 .
• Vibration/noise	• Tire and wheel concerns. • Wheel bearings. • Wheel hubs. • Brake components. • Suspension components. • Steering components.	• REFER to Section 100-04 .
• Wander	• Unevenly loaded or overloaded vehicle.	• NOTIFY the customer of incorrect vehicle loading.
	• Ball joint(s).	• GO to the Ball Joint Inspection component test in this section.
	• Loose, worn or damaged front wheel bearing(s).	• REFER to Wheel Bearing Inspection in this section.
	• Loose, worn or damaged suspension component(s).	• INSTALL new suspension components as necessary. REFER to Section 204-01A (4x2) or Section 204-01B (4x4).
	• Loose suspension fasteners.	• TIGHTEN to specification. REFER to Section 204-01A

	• Steering components. • Wheel alignment (excessive total front toe out).	(4x2) or Section 204-01B (4x4). • REFER to Section 211-00 . • ADJUST as necessary.



Component Tests

Ball Joint Inspection

1. Raise and support the vehicle. For additional information, refer to Section 100-02 .
2. Prior to performing any inspection of the ball joints, inspect the front wheel bearings (1216).
3. Position a safety stand beneath the front suspension lower arm (3079) to be tested.

4. While an assistant pries upward on the bottom of the tire, measure the relative movement between the lower spindle arm and the front suspension lower arm ball joint. Any movement at or exceeding the specification indicates a worn or damaged lower ball joint. Install a new ball joint as necessary. For additional information, refer to Section 204-01A or Section 204-01B .

5. While an assistant pries upward on the bottom of the tire, measure the relative movement between the upper spindle arm and the front suspension upper ball joint. Movement at or exceeding the specification indicates a worn or damaged upper ball joint. Install a new upper ball joint as necessary. For additional information, refer to Section 204-01A or Section 204-01B .

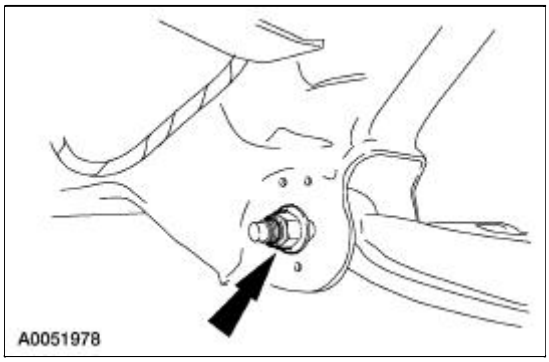
Wheel Bearing Inspection

1. Raise the vehicle until the tire is off the floor. For additional information, refer to Section 100-02 .

2. **NOTE:** Make sure the wheel rotates freely and the brake pads are retracted sufficiently to allow movement of the tire and wheel assembly.

   Grasp each front tire at the top and bottom and move the wheel inward and outward while lifting the weight of the tire off the front wheel bearing.

3. If the wheel (hub) is loose or does not rotate freely, install a new wheel hub. For additional information, refer to Section 204-01A (4x2) or Section 204-01B (4x4).



Camber and Caster Adjustment —Front

NOTE: Air suspension vehicles must be at trim ride height prior to measuring or adjusting the caster, camber or toe. For additional information, refer to Section 204-05 .

1. **NOTE:** New lower arm-to-frame mounting bolts must be installed with cam bolt kits (2L1Z-3B236-AC for forward bushing; and 2L1Z-3B236-AD for rearward bushing), to allow for adjustment of the arm in the frame slot. The vehicle should be supported by the frame to ease movement of the lower arm in the slot.

   Remove the nuts and bolts.

   - Discard the nuts and bolts.
   - Install the cam bolt kit(s) and snug the nut(s).

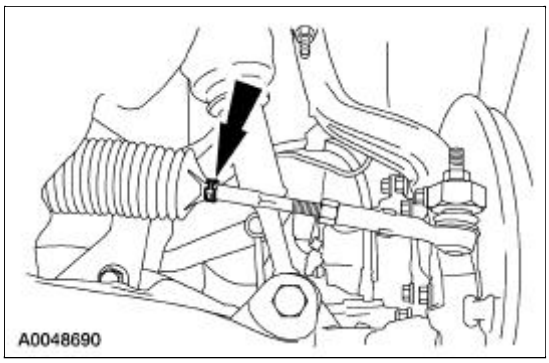
2. To adjust the caster and camber, refer to the following chart.
   - Adjustments that require moving the front and the rear of the lower arm should be made equally.

Adjustment	Front of Lower Arm	Rear of Lower Arm
Increase caster	In	Out
Decrease caster	Out	In
Increase camber	In	In
Decrease camber	Out	Out
Increase caster and camber simultaneously	In	—
Decrease caster and camber simultaneously	Out	—

3. While holding the cam bolt, tighten the nut(s).

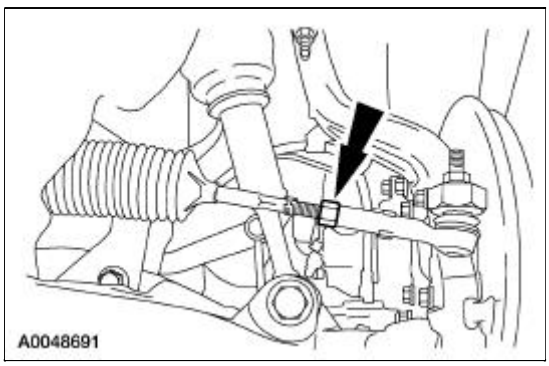
4. Check and, if necessary, adjust the front toe. For additional information, refer to Front Toe Adjustment in this section.

Front Toe Adjustment



NOTE: Air suspension vehicles must be at trim ride height prior to measuring or adjusting the caster, camber or toe. For additional information, refer to Section 204-05 .

1. Start the engine and center the steering wheel.



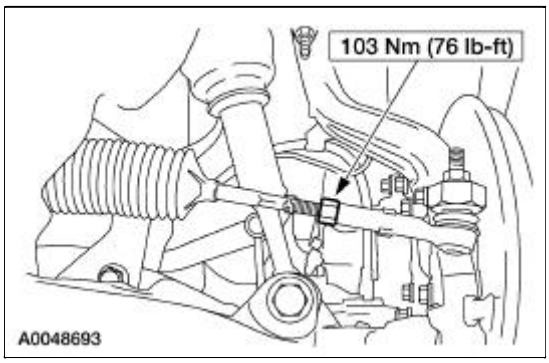
2. Turn the engine off, and hold the steering wheel in the "straight forward" position using a suitable holding device.

3. **NOTE:** Do not allow the steering gear bellows to twist while rotating the spindle tie-rod.

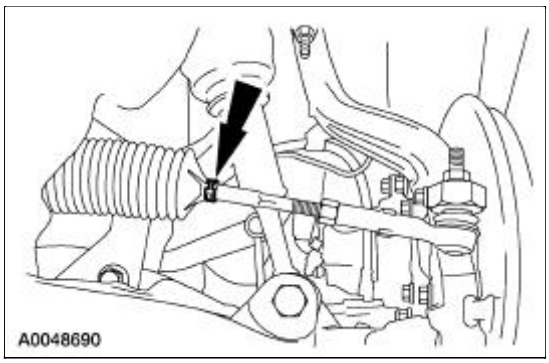
   Remove the clamp(s).

4. Loosen the nut(s).
   - Clean and lubricate the nut(s) and spindle tie-rod threads.

5. Rotate the spindle tie-rod(s).



6. Start the engine and center the steering wheel.
   - Recheck the toe settings and adjust if necessary.

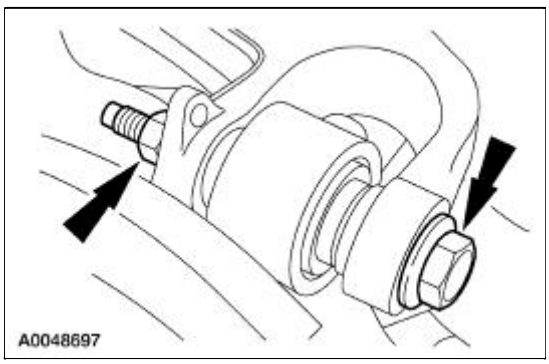


7. **CAUTION: Make sure to hold the tie-rod end stationary while tightening the nut or damage to the boot can occur.**

   NOTE: Make sure that the toe settings are not disturbed while tightening the nuts.

   Tighten the nut(s).

8. Install the clamp(s).



Camber Adjustment —Rear

NOTE: Air suspension vehicles must be at trim ride height prior to measuring or adjusting the rear camber or toe. For additional information, refer to Section 204-05 .

1. **NOTE:** The upper arm-to-wheel knuckle bolt and nut must be removed and replaced with a cam bolt kit (2L14-5K750-AA/2L1Z-5K751-AA) to allow for the adjustment of the arm in the frame slot. The vehicle should be supported by the lower arm to ease movement of the wheel knuckle in the slot.

   Remove the nut and bolt.

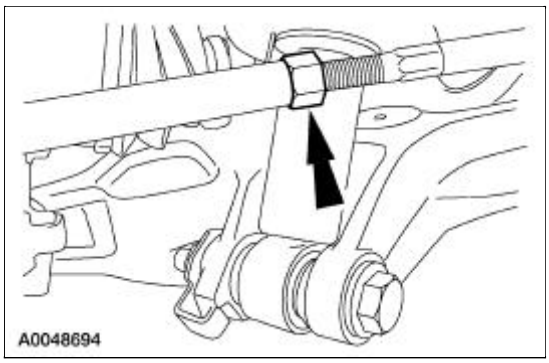
   - Discard the nut and bolt.
     - Install the cam bolt kit and snug the nut.

2. **NOTE:** To decrease the camber, rotate the cam bolt to move the wheel knuckle inward.To increase the camber, rotate the cam bolt to move the the wheel knuckle outward.

   Rotate the cam bolt.

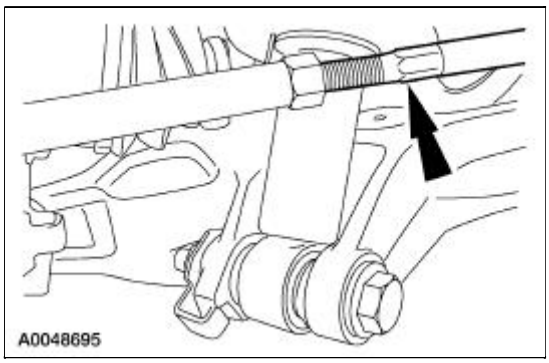
3. While holding the cam-bolt, tighten the nut.

4. Check and if necessary adjust the rear toe. For additional information, refer Rear Toe Adjustment in this section.



Rear Toe Adjustment

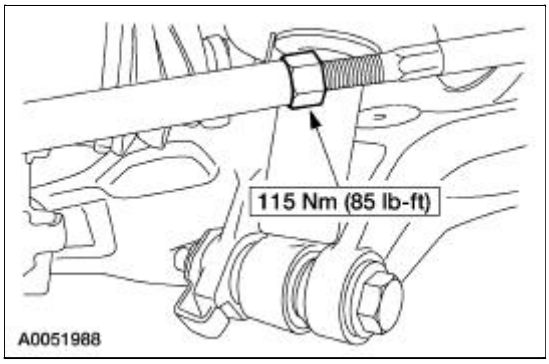
NOTE: Air suspension vehicles must be at trim ride height prior to measuring or adjusting the rear toe. For additional information, refer to Section 204-05 .



1. Start the engine and center the steering wheel.

2. Turn the engine off, and hold the steering wheel in the "straight forward" position using a suitable holding device.

3. Loosen the nuts(s).
   - Clean and lubricate the nut(s) and rear toe link threads.



4. Rotate the spindle tie rod.

5. **NOTE:** Make sure the toe settings are not disturbed while tightening the nuts.

   Tighten the nut(s).

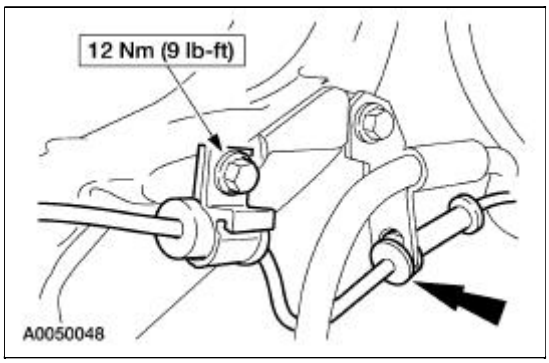
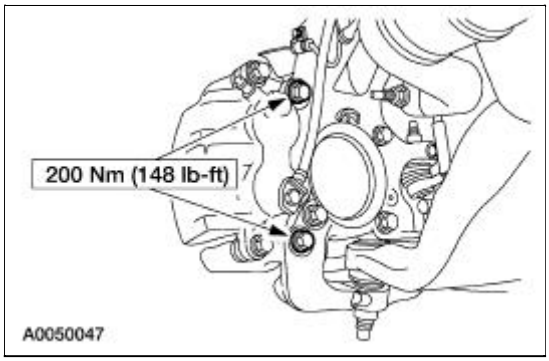
Wheel Hub



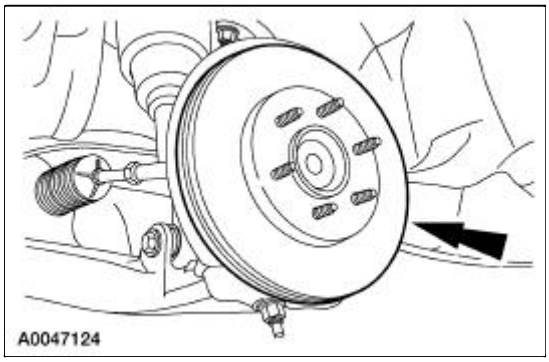
Removal and Installation

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

1. If equipped, turn the air suspension switch to the OFF position.
2. Disconnect the wheel speed sensor connector.



3. Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .
4. Remove the bolt and detach the retainers.



5. **CAUTION: Do not allow the caliper to hang from the brake hose or damage to the hose can result.**

   Remove the bolts, and position the caliper, pads and anchor place aside.

6. Remove the brake disc.

7. Remove the bolts and the wheel bearing and hub assembly.

8. **CAUTION: If the original wheel bearing and hub is being reinstalled, make sure to install a new O-ring.**

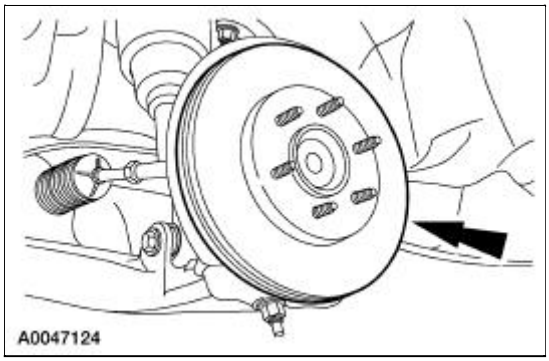
   To install, reverse the removal procedure.

Wheel Studs

Special Tool(s)

 ST1494-A	C-Frame and Screw Assembly 211-023 (T74P-3044-A1)

Removal

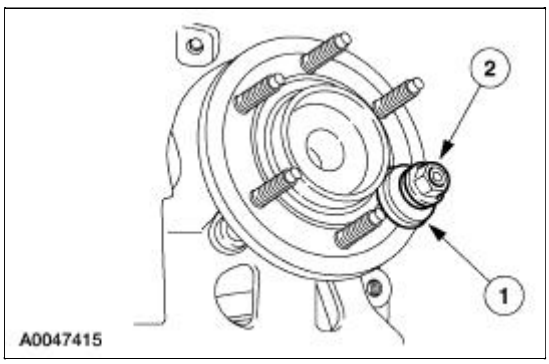


WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

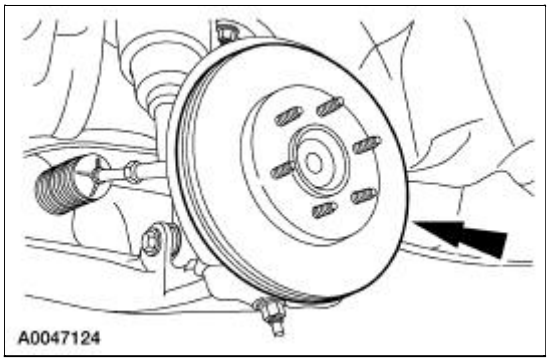
1. If equipped, turn the air suspension switch to the OFF position.
2. Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .
3. **CAUTION: Do not allow the caliper to hang from the brake hose or damage to the brake hose can result.**

   Remove the bolts and position the caliper, pads and anchor plate aside.

4. Remove the brake disc.

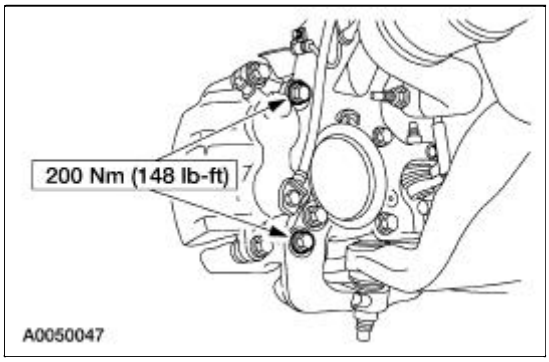


5. Using the special tool, remove the wheel stud.



Installation

1. Install the wheel stud.
    1. Install four washers onto the wheel stud.
    2. Install the wheel nut. Tighten the wheel nut until the wheel stud seats fully onto the wheel hub flange.



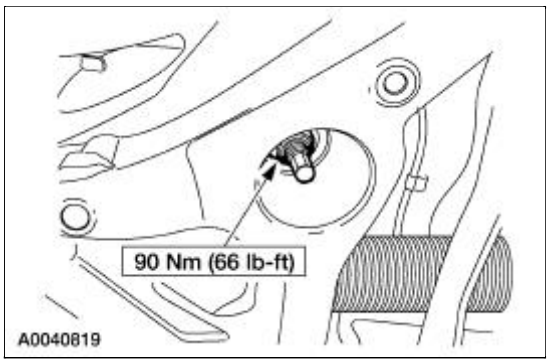
2. Remove the wheel nut and washers.

3. Install the brake disc.

4. Position the caliper, pads and anchor plate and install the bolts.

5. Install the wheel and tire assembly. For additional information, refer to Section 204-04 .

6. If equipped, turn the air suspension switch to the ON position.



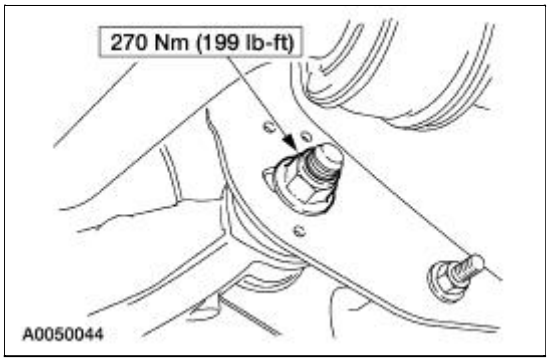
Lower Arm

Removal and Installation

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

1. If equipped, turn the air suspension switch to the OFF position.
2. Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .
3. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

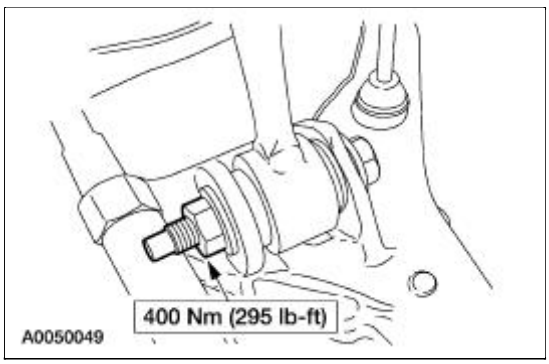
   Remove and discard the nut.



4. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   NOTE: If necessary, tap on the end of the stud to separate the stud from the knuckle.

   Remove and discard the nut.



5. Remove the nut and bolt.
   - Discard the nut.

6. Remove the nut and bolt.
    - Discard the nut.

7. Remove the nut, bolt and the lower arm.
    - Discard the nut.

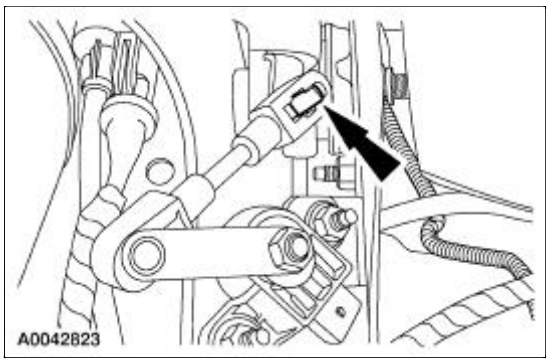
8. **NOTE:** Assemble the lower arm pivot nuts and bolts. Do not tighten until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

    To install, reverse the removal procedure.

9. Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

Upper Arm

Removal and Installation

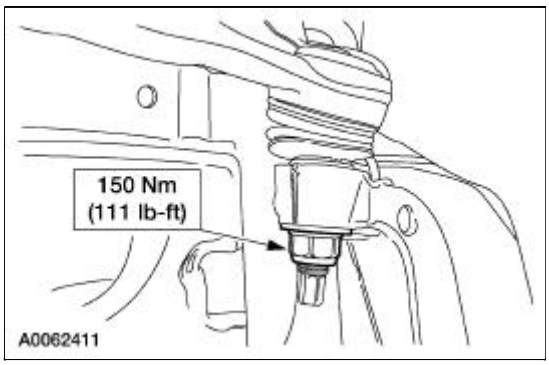


Vehicles with coil spring suspension

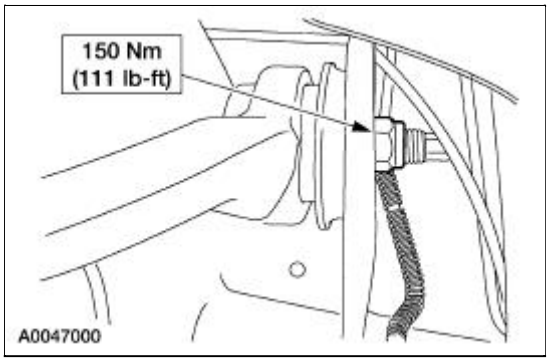
1. Remove the shock absorber and spring assembly. For additional information, refer to Shock Absorber and Spring Assembly in this section.

Vehicles with air suspension

2. Remove the air shock absorber assembly. For additional information, refer to Section 204-05 .



3. Detach the height sensor from the upper arm.



All vehicles

4. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove and discard the nut.

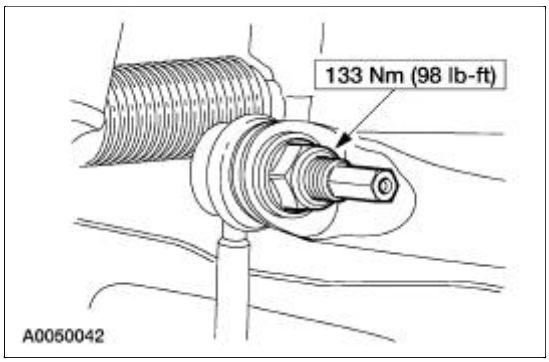
5. Remove the nut and bolt.
   - Discard the nut.

6. Remove the nut, bolt and the upper arm.
    - Discard the nut.

7. **NOTE:** Assemble the upper arm pivot nuts and bolts. Do not tighten until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

   To install, reverse the removal procedure.

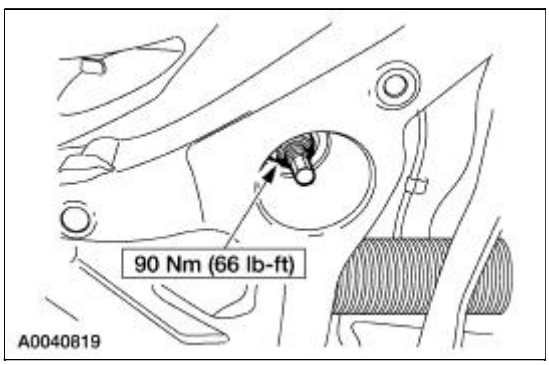
8. Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .



Stabilizer Bar and Link

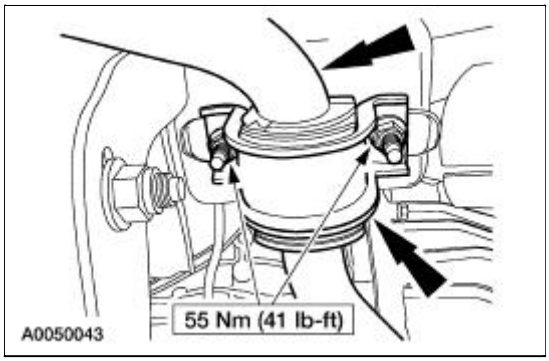
Removal and Installation

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.



1. If equipped, turn the air suspension switch to the OFF position.
2. Raise and support the vehicle. For additional information, refer to Section 204-04 .
3. **NOTE:** The hex holding feature can be used to prevent turning of the stud while removing the nut.

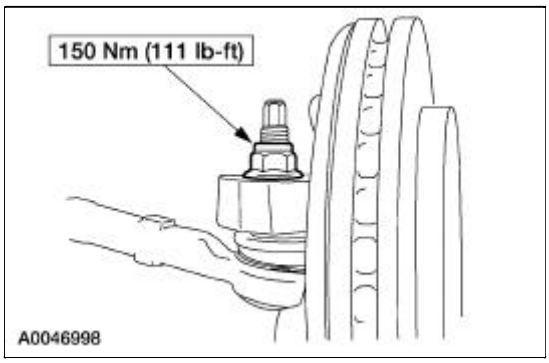
   Remove and discard the two nuts.



4. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

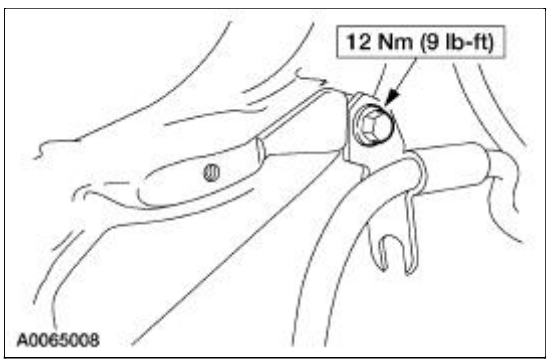
   Remove the two nuts and the stabilizer bar links.
   - Discard the nuts.

5. Remove the four nuts, brackets, bushings and the stabilizer bar.
   - Discard the nuts.



6. Inspect and, if necessary, install new stabilizer bar bushings.
7. To install, reverse the removal procedure.

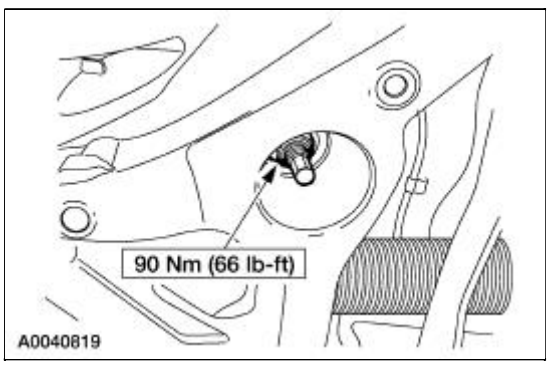
Wheel Knuckle



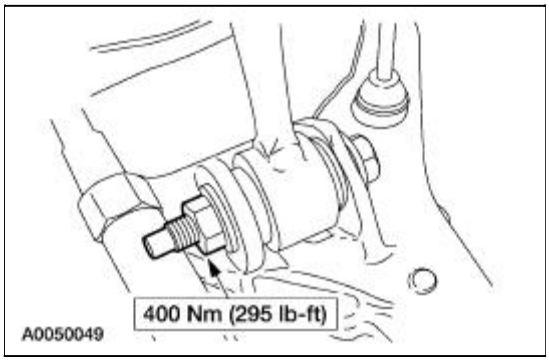
Removal and Installation

1. Remove the wheel hub. For additional information, refer to Wheel Hub in this section.
2. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove the nut and detach the tie-rod from the wheel knuckle.
   - Discard the nut.

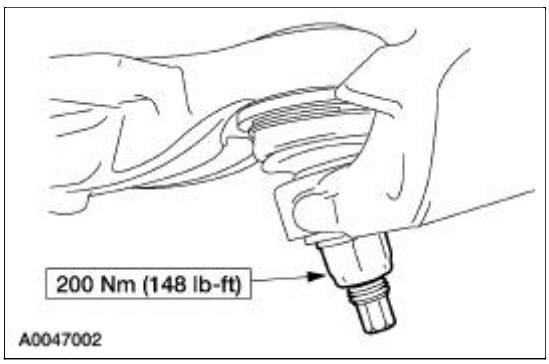


3. Remove the bolt and position the brake hose aside.



4. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove and discard the nut.



5. Remove the nut and bolt.
    - Discard the nut.

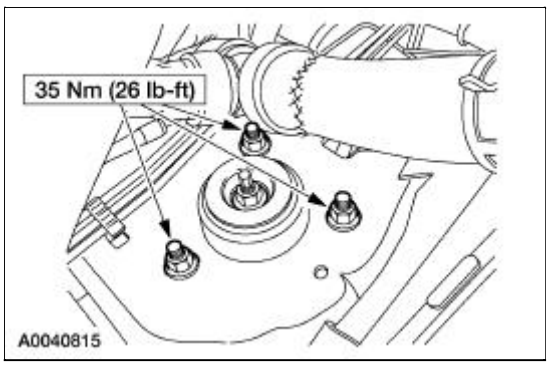
6. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   NOTE: To separate the ball joint from the wheel knuckle, loosely install the nut and then tap on the end of the stud.

   Remove the nut and separate the ball joint from the knuckle.
    - Discard the nut.

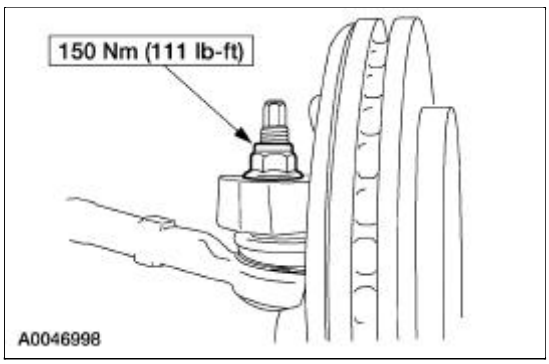
7. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove the nut and the wheel knuckle.
    - Discard the nut.



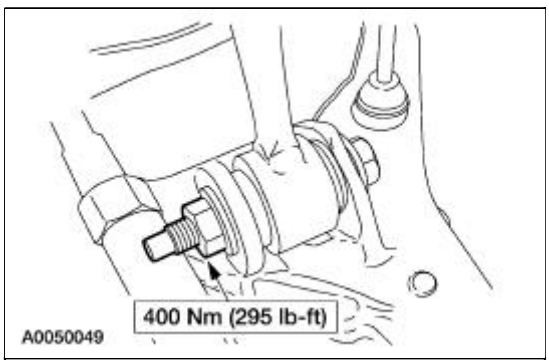
8. To install, reverse the removal procedure.

9. Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .



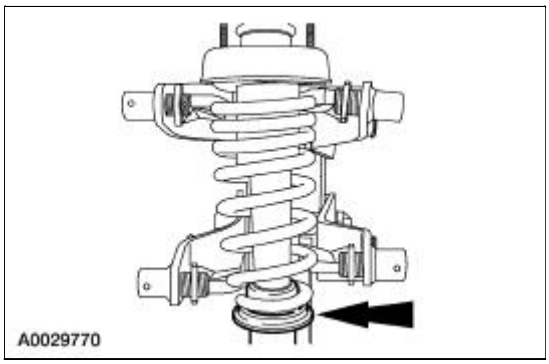
Shock Absorber and Spring Assembly

1. Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .
2. Remove and discard the nuts.

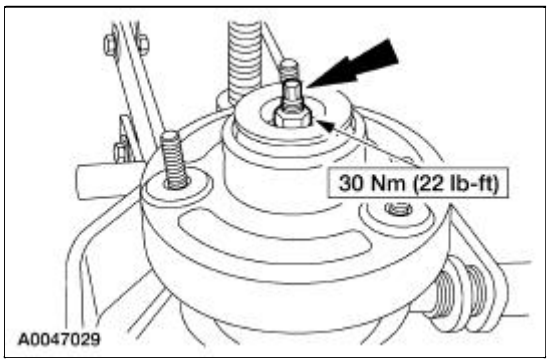


3. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

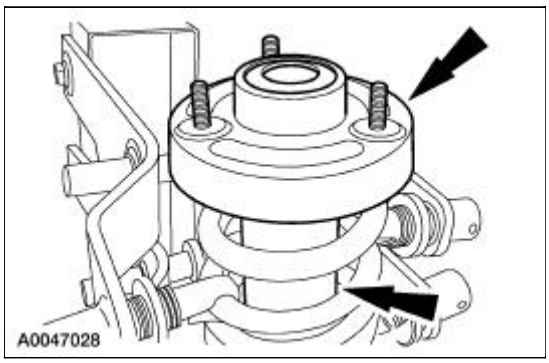
   Remove the nut and detach the tie-rod from the wheel knuckle.
   - Discard the nut.



4. Remove the nut, bolt and the shock absorber and spring assembly.
   - Discard the nut.



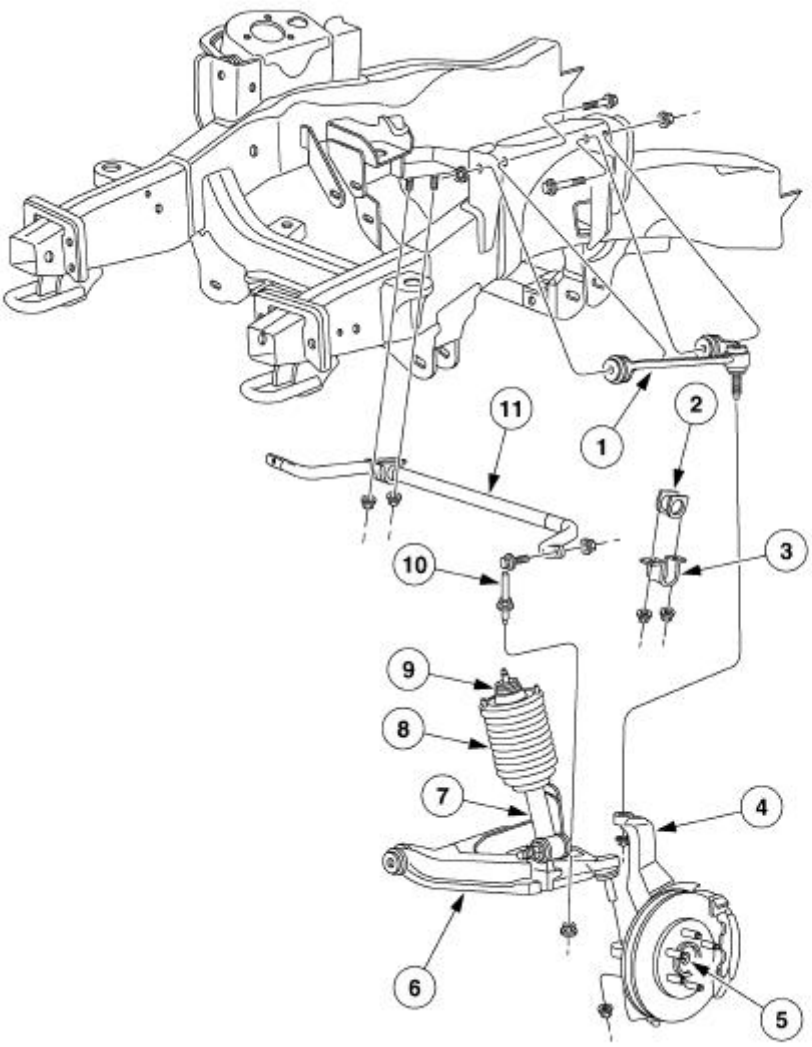
5. **NOTE:** For reference during assembly, index the upper mount, spring and shock absorber.



Using a suitable spring compressor, compress the spring until the tension is released from the shock absorber.

6. While holding the shock rod, remove the nut and washer.
   - Remove the shock absorber.
   - Discard the nut.

7. Remove the upper mount, dust shield and insulator.



8. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft
Wheel hub-to-knuckle bolts	150	111
Axle-to-wheel hub nut	27	20
Wheel end actuator-to-wheel knuckle bolts	15	11
Tie-rod end nut	150	111
Upper ball joint nut	150	111
Upper arm-to-frame nuts and bolts	150	111
Lower ball joint nut	200	148
Lower arm-to-frame nuts and bolts	270	199

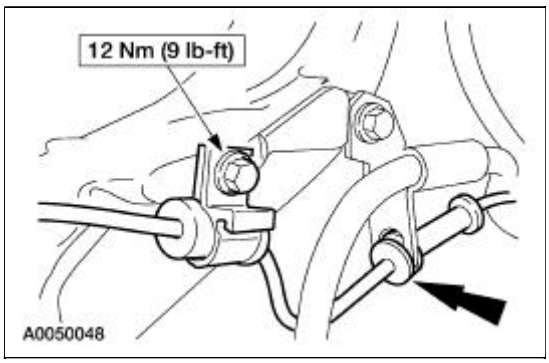
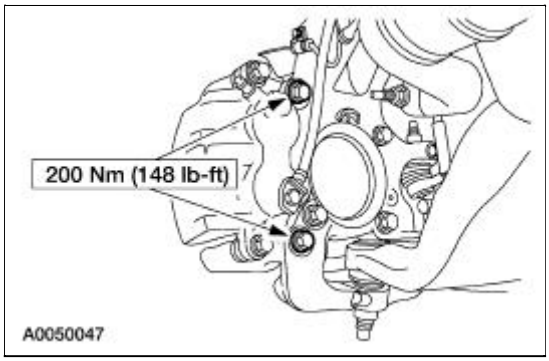
Wheel Hub



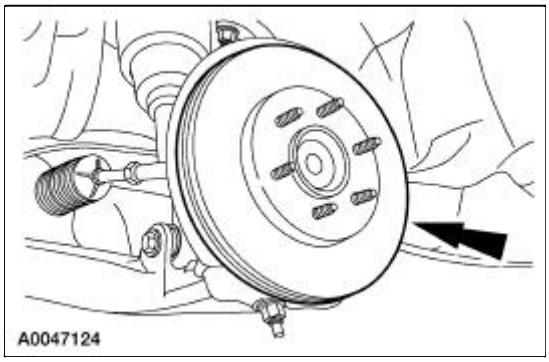
Removal and Installation

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

1. If equipped, turn the air suspension switch to the OFF position.
2. Disconnect the wheel speed sensor electrical connector.

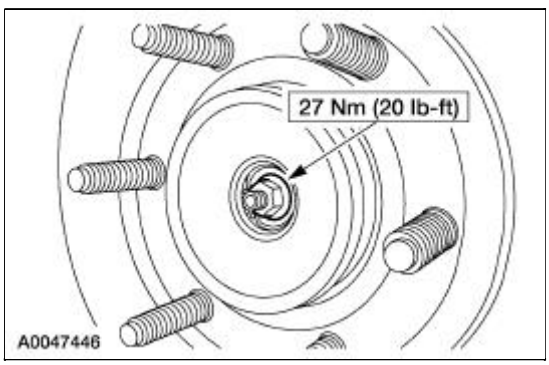


3. Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .
4. Remove the bolt and detach the retainers.

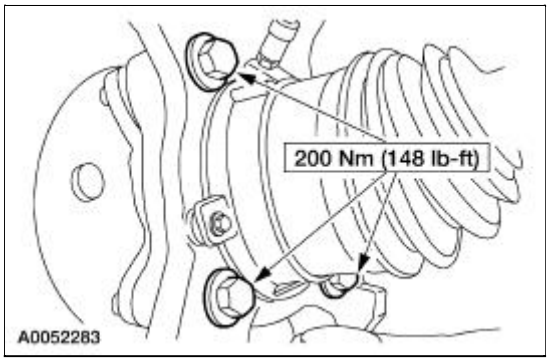


5. **CAUTION: Do not allow the caliper to hang from the brake hose or damage to the hose can result.**

   Remove the bolts, and position the caliper, pads and anchor plate aside.



6. Remove the brake disc.



7. Remove the dust cap.

8. Remove and discard the nut.

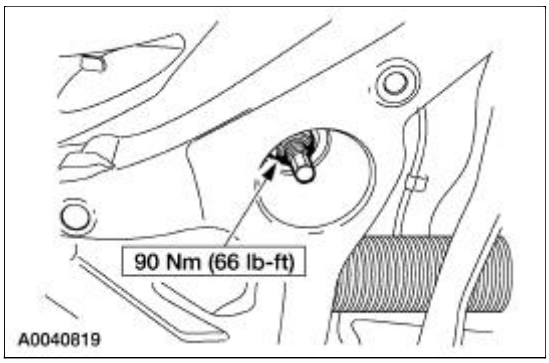
9. Remove the bolts and the wheel bearing and hub assembly.

10. **CAUTION: If the original wheel bearing and hub is being reinstalled, make sure to install a new O-ring.**

    To install, reverse the removal procedure.

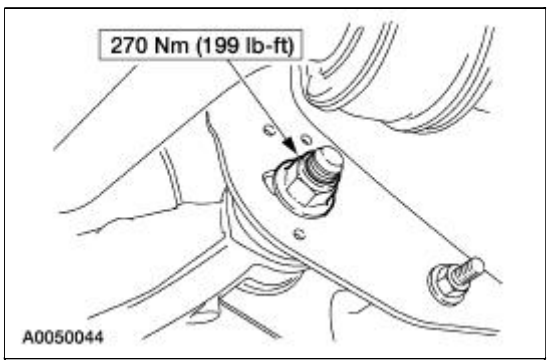
Wheel Studs

For additional information, refer to Section 204-01A .



Lower Arm

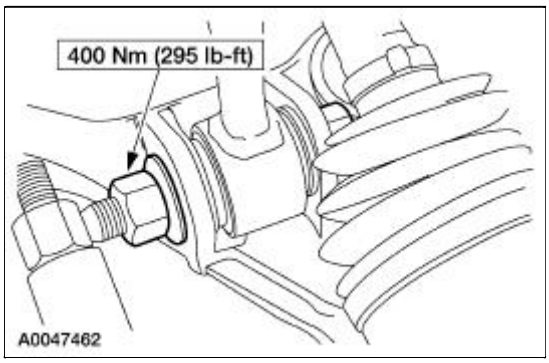
Removal and Installation



WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

1. If equipped, turn the air suspension switch to the OFF position.
2. Remove the wheel knuckle. For additional information, refer to Wheel Knuckle in this section.
3. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove and discard the nut.



4. Remove the nut and bolt.
   - Discard the nut.

5. Remove the nut and bolt.
   - Discard the nut.

6. Remove the nut, bolt and the lower arm.
   - Discard the nut.

7. **NOTE:** Assemble the lower arm pivot nuts and bolts. Do not tighten until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies.

   To install, reverse the removal procedure.

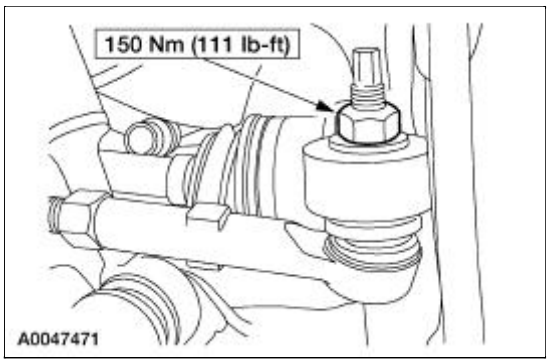
8. Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

Upper Arm

For additional information, refer to Section 204-01A .

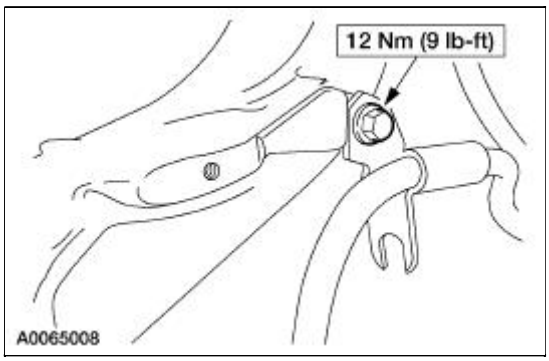
Stabilizer Bar and Link

For additional information, refer to Section 204-01A .



Wheel Knuckle

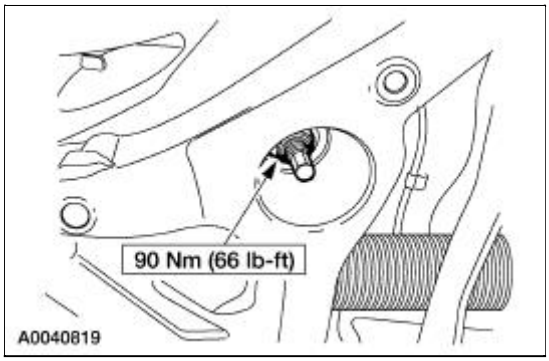
Removal and Installation



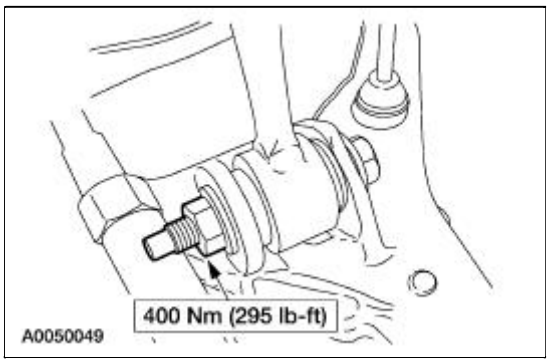
WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

1. If equipped, turn the air suspension to the OFF position.
2. Remove the wheel hub. For additional information, refer to Wheel Hub in this section.
3. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove and discard the nut.



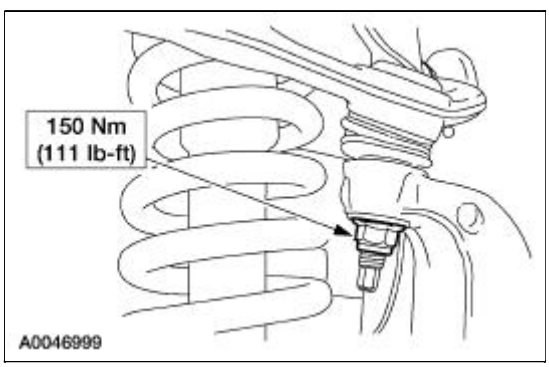
4. Remove the bolt and position the brake hose aside.



5. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove and discard the nut.

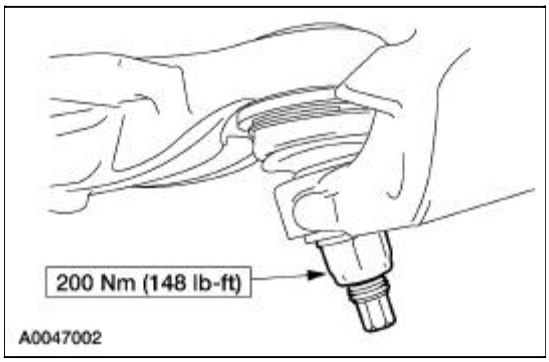
6. Remove the nut and bolt.
    - Discard the nut.



7. Remove the three bolts.

8. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

    Remove and discard the nut.



9. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

NOTE: To separate the ball joint from the wheel knuckle, loosely install the nut and then tap on the end of the stud.

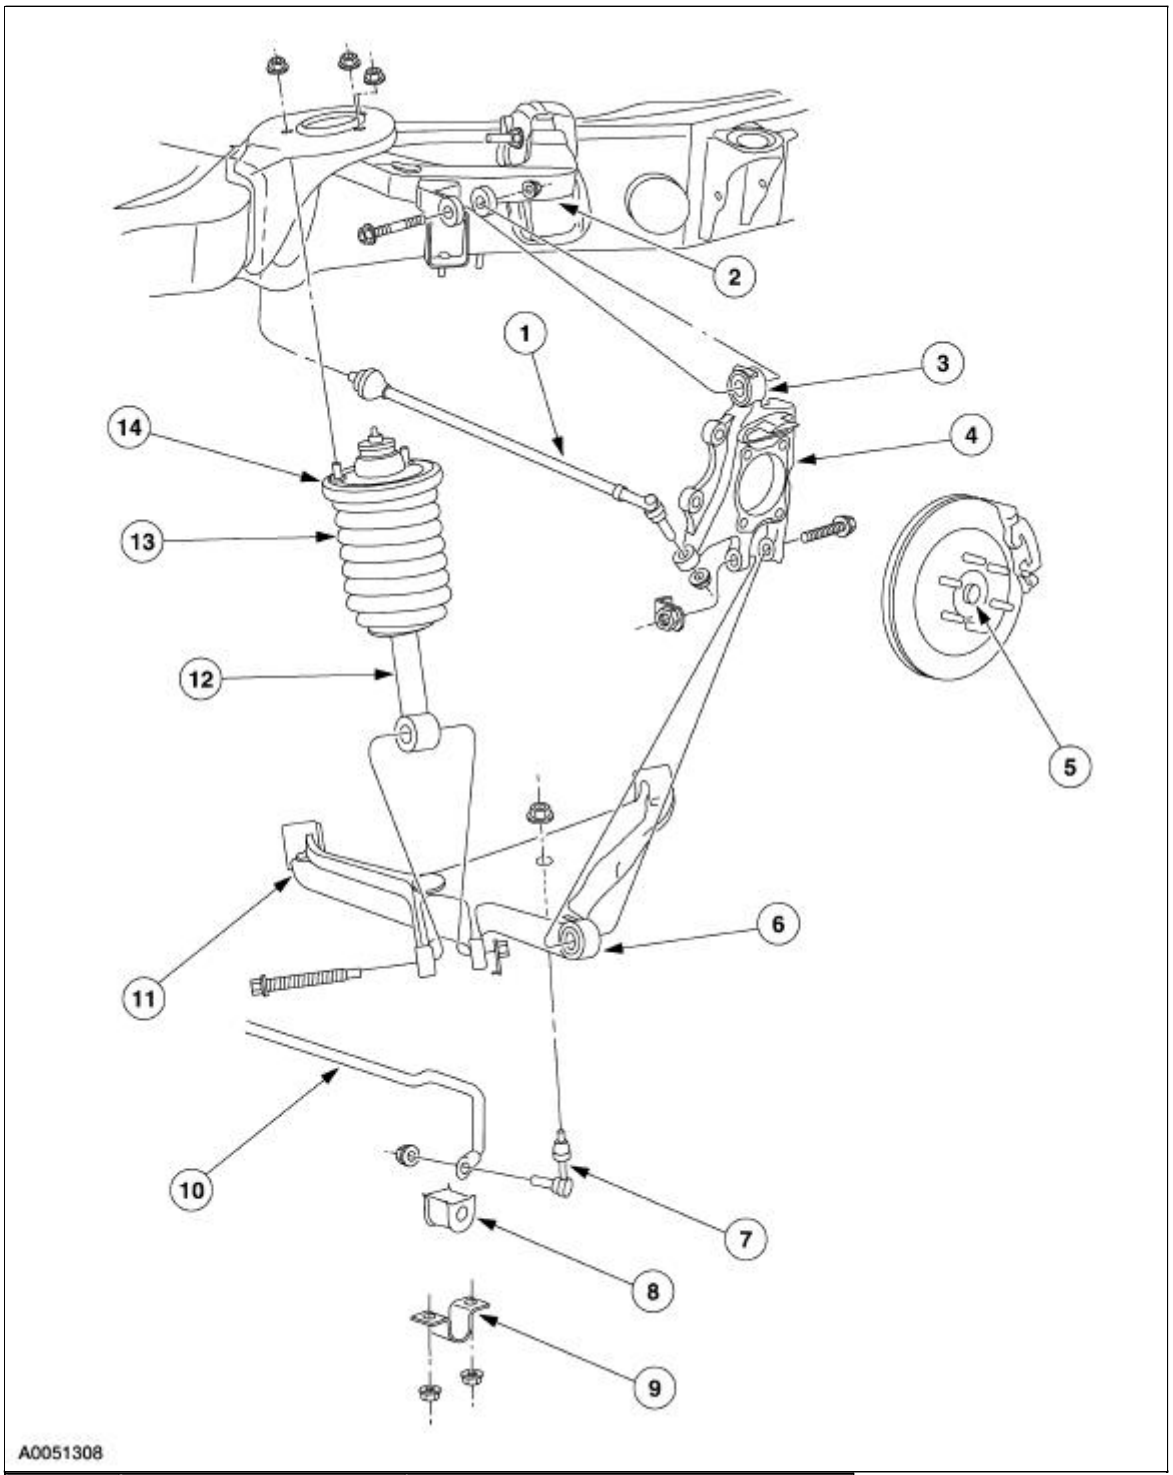
Remove the nut and the wheel knuckle.

- Discard the nut.

10. To install, reverse the removal procedure.

11. Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

Shock Absorber and Spring Assembly



For additional information, refer to Section 204-01A .

Rear Suspension

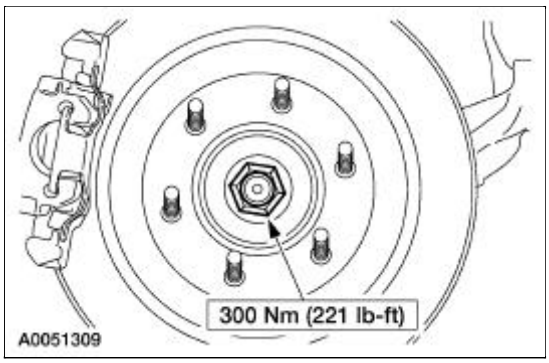
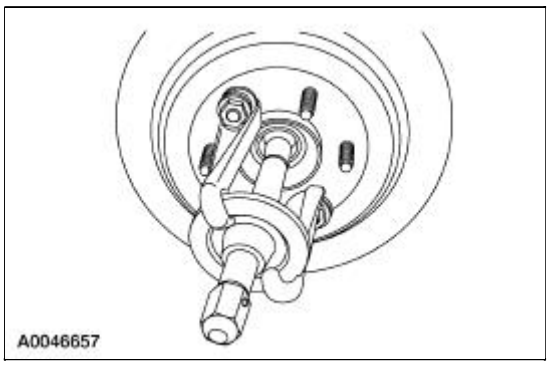
Refer to Section 204-00 .



Wheel Bearing and Wheel Hub

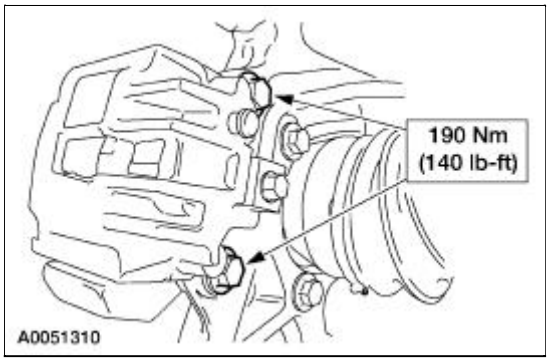
Removal and Installation



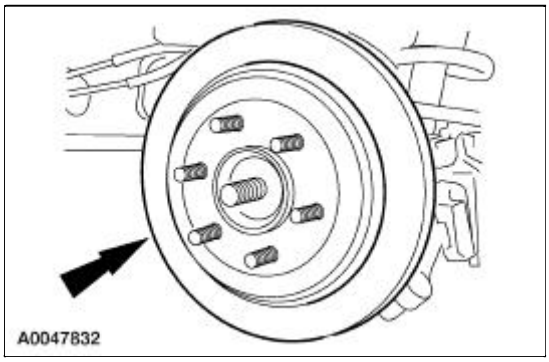
WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

1. If equipped, turn the air suspension switch to the OFF position.
2. Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .
3. **NOTE:** Have an assistant press the brake pedal to keep the axle from rotating.

   Remove and discard the rear axle wheel hub retainer and the washer.

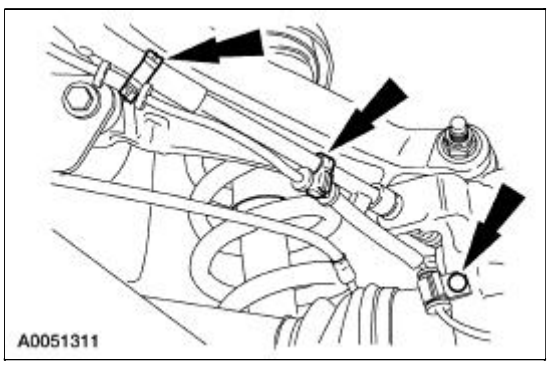


4. Using a suitable hub puller, separate the outboard CV joint from the wheel hub.

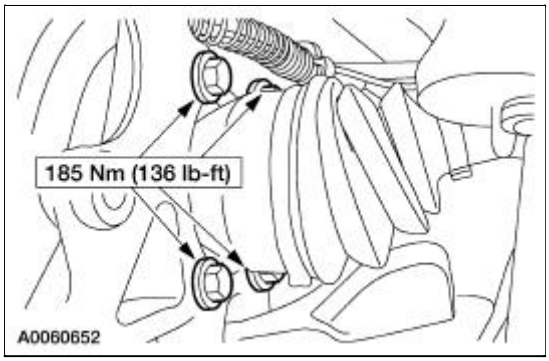


5. **CAUTION: Do not allow the caliper to hang from the brake hose or damage to the hose can result.**

   Remove the bolts, and position the caliper, pads and anchor plate aside.



6. Remove the brake disc.



7. Disconnect the wheel speed sensor electrical connector and detach the retainer.

8. Remove the bolt and detach the retainers.

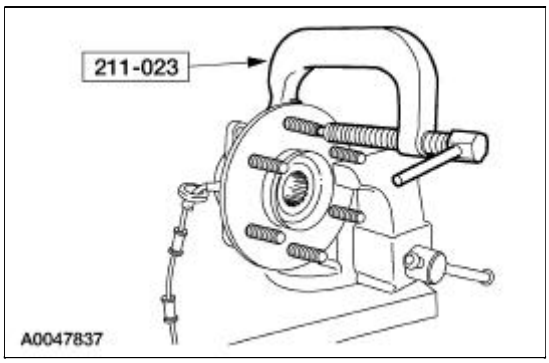
9. Remove the bolts, the wheel bearing and the wheel speed sensor as an assembly.
    - Route the sensor wiring through the access hole in the brake shield.
    - Discard the bolts.

10. To install, reverse the removal procedure.

Wheel Studs

Special Tool(s)

 ST1494-A	C-Frame and Screw 211-023 (T74P-3044-A1)



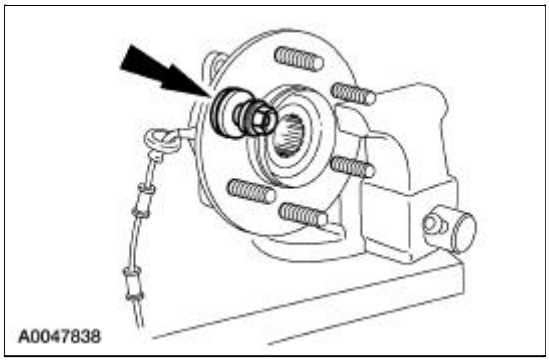
Removal

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

1. Remove the wheel bearing. For additional information, refer to Wheel Bearing and Wheel Hub in this section.

2. **CAUTION: Never use a hammer to remove a wheel stud. Damage to the wheel hub can result.**

   Place the wheel hub in a soft jawed vice and using the special tool, remove the wheel stud.



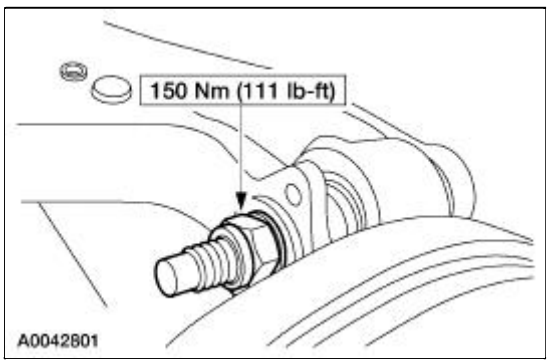
Installation

1. **CAUTION: Do not use power tools to install the wheel stud. The serrations on the flange can be stripped.**

   NOTE: Do not use the wheel nut that came with the vehicle.

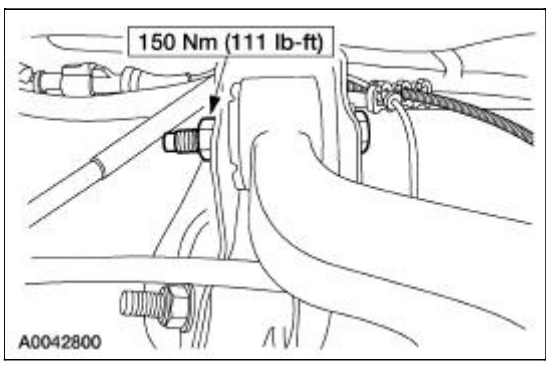
   Install the washers and wheel nut on the wheel stud and tighten the wheel nut until the stud seats against the flange.

   - Discard the wheel nut.



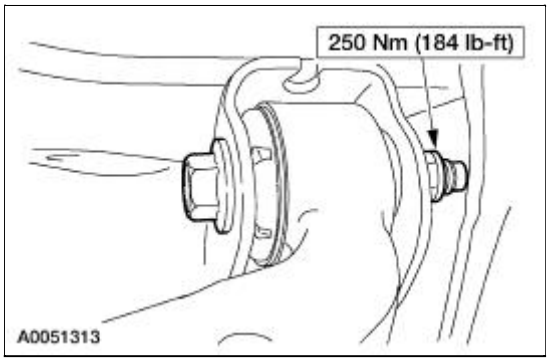
2. Install the wheel bearing. For additional information, refer to Wheel Bearing and Wheel Hub in this section.

Upper Arm



Removal and Installation

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

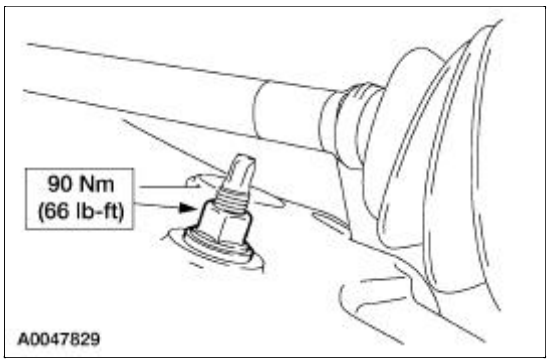


1. If equipped, turn the air suspension switch to the OFF position.
2. Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .
3. Remove the nut and bolt.
   - Discard the nut.

4. Remove the nut and bolt.
   - Discard the nut.

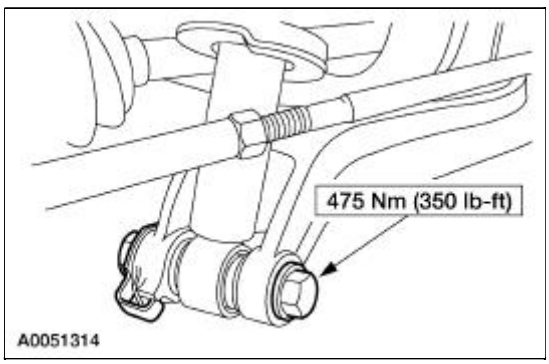
5. Remove the nut, bolt and the upper arm.
   - Discard the nut.

6. To install, reverse the removal procedure.



7. Check and, if necessary, adjust the rear alignment. For additional information, refer to Section 204-00 .

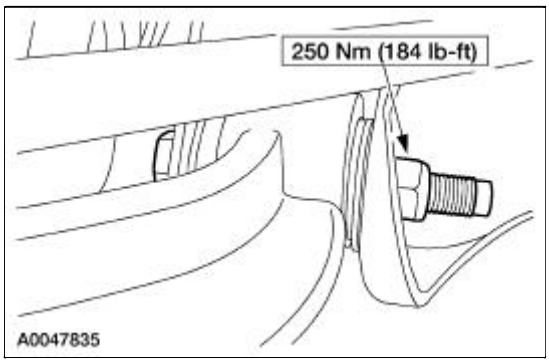
Lower Arm



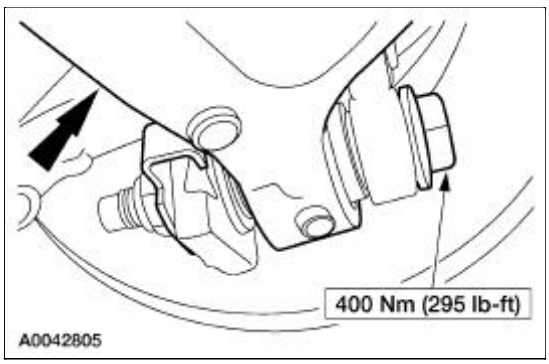
WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

1. If equipped, turn the air suspension switch to the OFF position.
2. Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .
3. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove and discard the nut.



4. Remove the bolt and flag nut.
   - Discard the flag nut.



5. Remove the nut and bolt.
   - Discard the nut.

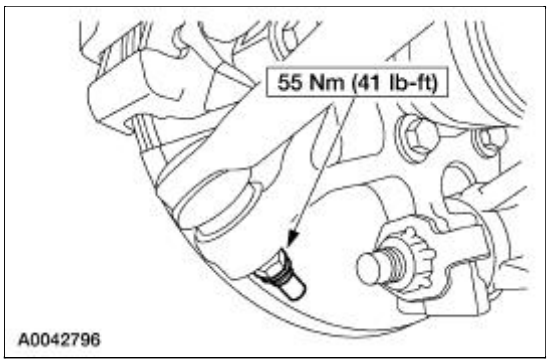
6. Remove the nut and bolt.
    - Discard the nut.

7. Remove the bolt, flag nut and the lower arm.
    - Discard the flag nut.

8. If necessary, using a suitable press and adapters, remove the lower ball joint.

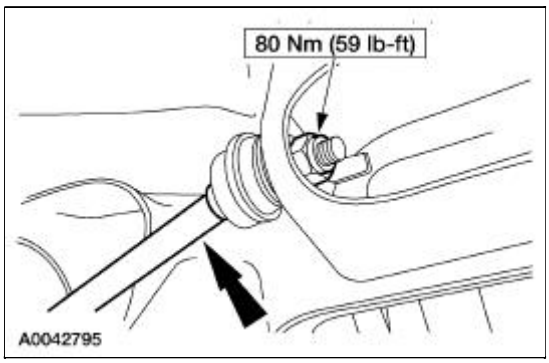
9. **NOTE:** Snug the lower arm-to-frame pivot nuts and bolts. Do not tighten to specification until installation procedure is complete and the vehicle is at curb ride height.

    To install, reverse the removal procedure.
    - Check and, if necessary, adjust the rear alignment. For additional information, refer to Section 204-00 .



Toe Link

Removal and Installation



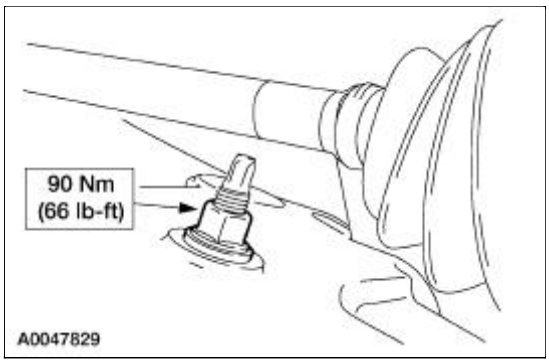
WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

1. If equipped, turn the air suspension switch to the OFF position.
2. Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .
3. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove the nut and separate the toe link from the wheel knuckle.

4. Remove the nut and the toe link.

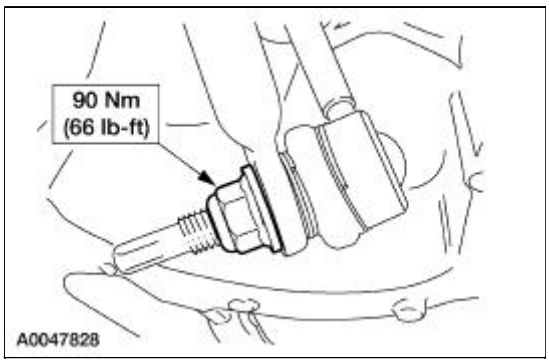
5. To install, reverse the removal procedure.
6. Check and, if necessary, adjust the rear toe. For additional information, refer to Section 204-00 .



Stabilizer Bar and Link

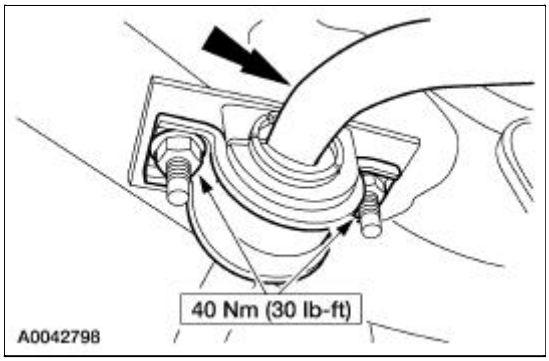
Removal and Installation

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.



1. If equipped, turn the air suspension switch to the OFF position.
2. Remove the wheel and tire assemblies. For additional information, refer to Section 204-04 .
3. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

   Remove the two nuts.
   - Discard the nuts.



4. **NOTE:** Use the hex holding feature to prevent the stud from turning while removing the nut.

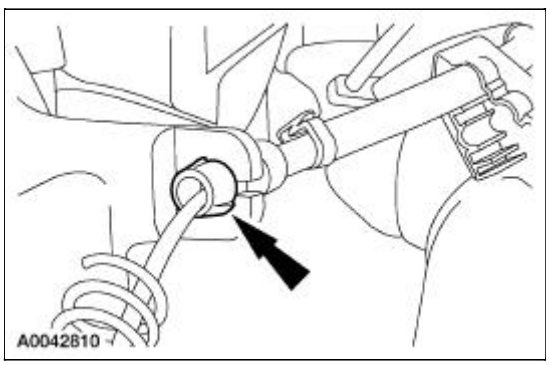
   Remove the two nuts and the stabilizer bar links.
   - Discard the nuts.

5. Remove the four nuts, brackets and the stabilizer bar.

6. **NOTE:** Inspect and, if necessary, install new bushings.

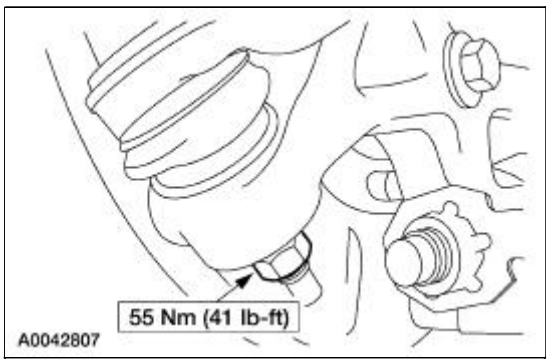
   To install, reverse the removal procedure.

Wheel Knuckle

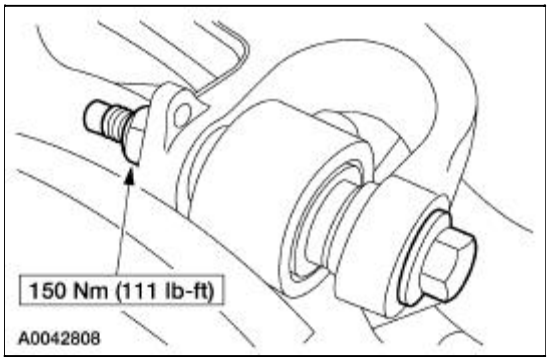


WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

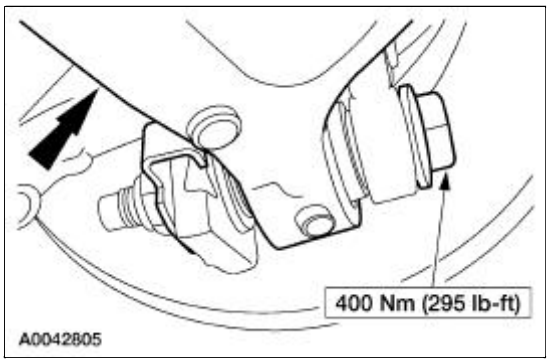
1. Remove the wheel bearing. For additional information, refer to Wheel Bearing and Wheel Hub in this section.



2. Remove the springs, adjuster and the parking brake shoes.



3. Depress the tabs and detach the parking brake cable from the wheel knuckle.

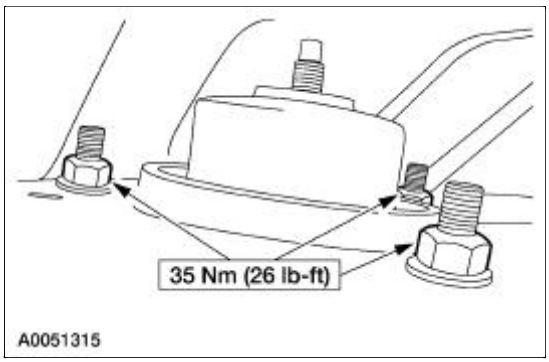


4. Remove the nut and detach the toe link from the wheel knuckle.
   - Discard the nut.

5. Remove the nut and bolt.
    - Discard the nut.

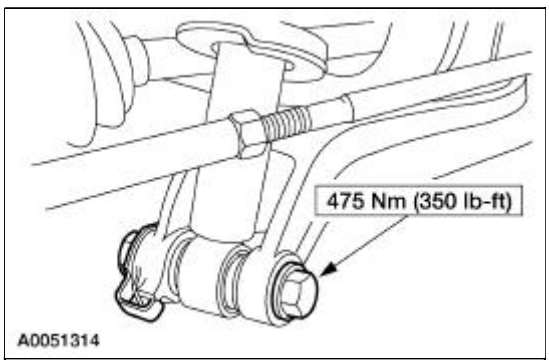
6. Remove the bolt, flag nut and the wheel knuckle.
    - Discard the flag nut.

7. If necessary, using a suitable press and adapters, remove the upper ball joint.



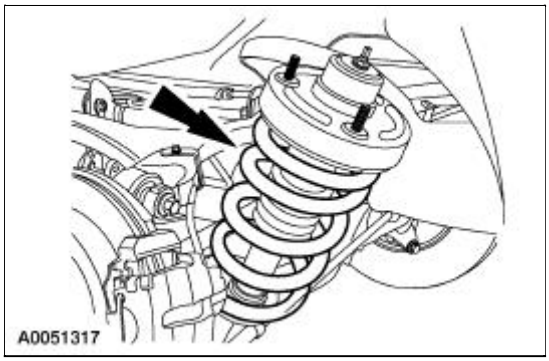
8. To install, reverse the removal procedure.
    - Check and, if necessary, adjust the rear alignment. For additional information, refer to Section 204-00 .

Shock Absorber and Spring Assembly



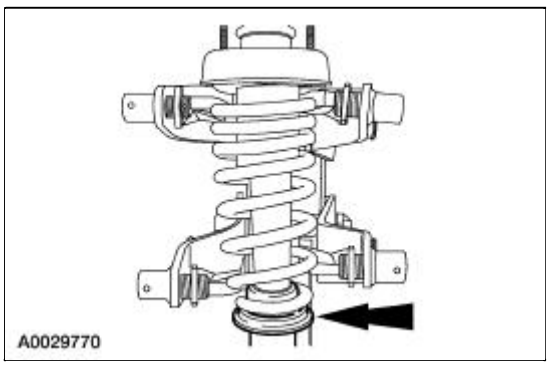
Removal and Installation

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

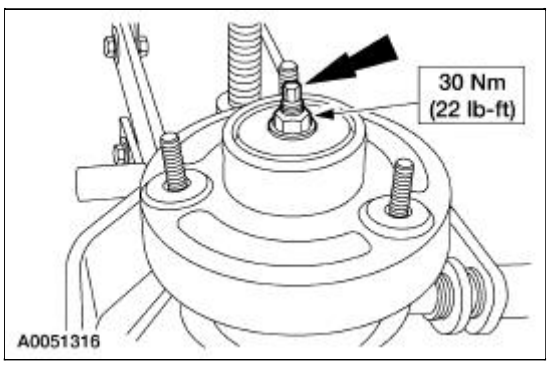


1. If equipped, turn the air suspension switch to the OFF position.
2. Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .
3. Remove and discard the nuts.

4. Remove the bolt and flag nut.
   - Discard the flag nut.



5. Remove the shock absorber and spring assembly.



6. **NOTE:** For reference during assembly, index the upper mount, spring and shock absorber.

   Using a suitable spring compressor, compress the spring until the tension is released from the shock absorber.

7. While holding the shock rod, remove the nut and washer.
   - Remove the shock absorber.
   - Discard the nut.

8. Remove the upper mount, dust shield and insulator.

9. To install, reverse the removal procedure.

General Specifications

Item	Specification
Wheel Balance Weight	
Maximum balance weight (total of inner and outer wheel flanges)	170 g (6 oz)
Wheel rim runout (maximum radial or lateral)	1.12 mm (0.044 in.)
Tire Inflation	
Tires	See safety certification sticker located on driver door jamb.

Torque Specifications

Description	Nm	lb-ft	lb-in
Wheel nuts	204	150	—
Tire pressure monitoring sensor valve stem nut	7	—	62
Tire pressure monitoring system module screws	8	—	71

Wheels And Tires

 **WARNING: Do not mix different types of tires, such as radial, bias, or bias-belted, on the same vehicle except in emergencies (temporary spare usage). Vehicle handling can be seriously affected and can result in loss of control.**

Factory-installed tires and wheels are designed to operate satisfactorily with loads up to and including full-rated load capacity when inflated to recommended inflation pressures.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

Replacement tires should follow the recommended:

- tire sizes.
- speed rating.
- load range.
- radial construction type.

Use of any other tire size or type may seriously affect:

- ride.
- handling.
- speedometer/odometer calibration.
- vehicle ground clearance.
- tire clearance between the body and chassis.
- wheel bearing life.
- brake cooling.

New wheels need to be installed when:

- bent.
- dented.
- heavily rusted.
- leaking.
- they have elongated wheel hub bolt holes.
- they have excessive lateral or radial runout.

The vehicle uses a one-piece cone wheel nut.

Wheel and tire assemblies are attached by six noncentering wheel nuts.

The spare tire is mounted under the frame. The valve stem should be on the top side of the tire to reduce the possibility of accidental valve stem air leakage.

To equalize tire wear, rotate the tires periodically.

Safety Precautions

 **WARNING: Never run the engine with one wheel off the ground, for example, when changing a tire. The wheel resting on the ground could cause the vehicle to move.**

 **WARNING: The tire and wheel must always be correctly matched. It is very important to determine the size of each component before any assembly operations commence. Failure to adhere to these instructions can result in an explosive separation and cause serious bodily injury or death.**

 **WARNING: Aftermarket aerosol tire sealants are extremely flammable. Always question the customer to make sure these products have not been used.**

 **WARNING: Use only wheels and wheel nuts that have been designed for current model year Ford trucks. Aftermarket wheels or wheel nuts may not fit or function correctly, and can cause personal injury or damage the vehicle.**

 **WARNING: Always wear safety goggles or a face shield when carrying out any work with tire and wheel assemblies.**

 **WARNING: Retighten the wheel nuts at 800 km (500 miles) after any wheel change or any time the wheel nuts are loosened.**

 **WARNING: Failure to retighten wheel nuts at the mileage specified can allow wheels to come off while the vehicle is in motion, possibly causing loss of vehicle control and collision.**

 **CAUTION: Do not clean aluminum wheels with steel wool, abrasive-type cleaners or strong detergents. Use Custom Bright Metal Cleaner 8A-19522-A or equivalent meeting Ford specification ESR-M5B194-B.**

 **CAUTION: Reduce the air pressure as much as possible by pushing the valve core plunger in prior to removing the valve core.**

When carrying out any inspection or repair procedures on wheels and tires, follow the preceding safety precautions.

Wheels And Tires

Inspection and Verification

WARNING: A vehicle equipped with a Traction-Lok® differential will always have both wheels driving. If, while the vehicle is being serviced, only one wheel is raised off the ground and the rear axle is driven by the engine, the wheel on the ground could drive the vehicle off the stand or jack. Be sure both rear wheels are off the ground.

WARNING: Never run the engine with one wheel off the ground, for example, when changing a tire. The wheel(s) resting on the ground could cause the vehicle to move.

WARNING: Do not balance the wheels and tires while they are mounted on the vehicle. Possible tire disintegration or differential failure could result, causing personal injury and extensive component damage. Use off-vehicle wheel and tire balancer only.

Be sure to follow the warnings when carrying out inspection and verification.

Road Test

Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are apparent, refer to Section 100-04 .

To maximize tire performance, inspect for signs of incorrect inflation and uneven wear, which may indicate a need for balancing, rotation, or front suspension alignment.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increases tire wear.

Replacement tires must follow the recommended:

- tire sizes.
- speed rating.
- load range.
- tire construction type.

Use of any other tire size or type can seriously affect:

- ride.
- handling.
- speedometer/odometer calibration.
- vehicle ground clearance.
- tire clearance between the body and chassis.

- wheel bearing life.
- brake cooling.

New wheels need to be installed when vehicle's wheels:

- are bent.
- are cracked.
- are dented.
- are heavily corroded.
- are leaking.
- have elongated wheel hub bolt holes.
- have excessive lateral or radial runout.

Wheel and tire assemblies are attached by six wheel nuts.

It is mandatory to use only the tire sizes recommended on the tire chart attached to the vehicle. Larger or smaller tires can damage the vehicle, affect durability, and require changing the speedometer calibration. Make sure wheel size and offsets match those recommended for the tire in use.

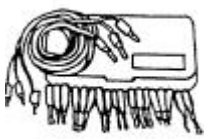
1. Inspect for signs of uneven wear that may indicate a need for balancing, rotation, front suspension alignment, damaged tie-rod, or steering components.

2. Check tires for:
   - cuts.
   - stone bruises.
   - abrasions
   - blisters.
   - embedded objects.

3. Tread wear indicators are molded into the bottom of the tread grooves. Install a new tire when the indicator bands become visible.

Symptom Chart

Symptom Chart



Condition	Possible Sources	Action
• Tires show excess wear on edge of tread	• Underinflated tires.	• ADJUST air pressure in tires.
	• Vehicle overloaded.	• RETURN vehicle. NOTIFY customer of overload condition.
	• High-speed cornering.	• RETURN vehicle. NOTIFY customer of cause of condition.
	• Incorrect ride height.	• SET ride height.
	• Incorrect wheel alignment.	• SET alignment to specification. REFER

		to Section 204-00 . ● ADVISE customer of condition. ROTATE tires.
● Tires show excess wear in center of tread	● Tires overinflated.	● ADJUST air pressure.
● Other excessive tire wear problems	● Incorrect tire rotation intervals. ● Incorrect tire pressure. ● Loose or leaking shock absorbers. ● Incorrect wheel alignment. ● Loose, worn or damaged suspension components. ● Wheel and tire assembly out of balance. ● Excessive lateral or radial runout of wheel.	● ADVISE customer of condition. ROTATE tires. ● ADJUST pressure. ● TIGHTEN or INSTALL new shock absorbers as necessary. ● SET alignment to specification. REFER to Section 204-00 . ● REFER to Section 204-00 . ● BALANCE wheel and tire assembly. ● REFER to Section 100-04 .
● Wobble or shimmy	● Damaged wheel bearings. ● Loose or damaged suspension components. ● Bent wheel. ● Damaged tire. ● Loose wheel nuts.	● REFER to Section 204-00 . ● REFER to Section 204-00 . ● INSTALL a new wheel as necessary. ● INSTALL a new tire as necessary. ● TIGHTEN to specification.
● High-speed shake	● Wheel hub face/pilot/bolt circle runout. ● Tires/wheels. ● Wheel bearings. ● Suspension/steering linkage. ● Engine. ● Transmission. ● Brake discs/imbalance.	● REFER to Section 100-04 .

Tire Pressure Monitoring System

Refer to Wiring Diagrams Cell 118 for schematic and connector information.

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WAS) 418-F224 New Generation STAR (NOS) Tester 418-F052 or equivalent scan tool
 ST1177-A	Rotunda 88 Digital Multimeter or equivalent 105-R0053
 ST1138-A	Flex Probe Kit 418-F090 (105-R025B)
 ST2735-A	Activation Tool, Tire Pressure Monitor 204-324

Principles of Operation

The tire pressure monitoring system (TPMS) has the ability to monitor the air pressure of all five tires. The tire-mounted pressure sensors transmit signals to the TPMS module by using the valve stem as an antenna. These transmissions are sent approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The TPMS module compares each tire pressure sensor transmission against low and high pressure limits. If the TPMS module determines that the tire pressure has exceeded the limit, the TPMS module communicates on the SCP network to the vehicle message center, which then displays a warning message. The system is not affected by wheel and tire rotation.

Vehicle Message Center TPMS Messages

The vehicle message center sometimes displays messages that cannot be resolved by the customer. Treat these messages as TPMS system faults that must be serviced. Refer to the symptom chart for the following messages:

Warning—Tire Very Low

Displayed when one or more tires have very low pressure. When this warning message is displayed, a warning chime will sound reminding you to stop the vehicle as soon as safely possible and check the tires for correct pressure, leaks and damage.

Check Tire Pressure

Displayed when any of the tire pressures are high or low.

Check Spare Tire Pressure

Displayed when the spare tire pressure is high or low.

Tire Pressure Sensor Fault

Displayed when a tire pressure sensor is malfunctioning.

If the customer requests that the TPMS be turned off, it can be done by configuring the message center through the instrument cluster (IC), using the scan tool. Refer to Section 413-01 .

Inspection and Verification

1. Verify the customer concern by inspecting the vehicle and observing the message center.
2. Inspect to determine if one of the following mechanical or electrical concerns apply:

Visual Inspection Chart

Mechanical	Electrical
● Tire pressure ● Tire size or mismatched tires ● TPMS sensor missing	● Blown fuse(s) ● Battery junction box (BJB): ■ fuse(s) 1 (10A), 21 (15A) ● Connectors or connections ● Ground integrity ● Harness routing ● Wire chafing ● Circuitry open/shorted ● TPMS module missing or damaged

3. If the inspection reveals an obvious concern(s) that can be readily identified, repair as required.
4. If the concern remains after the inspection, connect the scan tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the scan tool menu. If the scan tool does not communicate with the vehicle:
   - check the connections to the vehicle.
   - check the ignition switch position.
   - verify that the battery voltage is between 10 and 16 volts. Refer to Section 414-00 .
5. If the scan tool still does not communicate with the vehicle, refer to the scan tool manual.
6. Carry out the DATA LINK DIAGNOSTIC TEST. If the scan tool responds with:
   - CKT914, CKT915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-

00 .

- SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs, and carry out self-test diagnostics for the TPMS module.

7. If the DTCs retrieved are related to the concern, refer to Tire Pressure Monitor Module Diagnostic Trouble Code (DTC) Index to continue diagnostics.

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

Tire Pressure Monitor System (TPMS) Module Diagnostic Trouble Code (DTC) Index

Tire Pressure Monitor System (TPMS) Module Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU is Defective	TPMS Module	INSTALL a new tire pressure monitor module. REFER to Tire Pressure Monitoring System Module .
B2477	Module Configuration Failure / Mismatch	TPMS Module	REFER to Section 418-01 .
B2849	Horn Output Relay Circuit Open	TPMS Module	Go To Pinpoint Test D .
B2872	Tire Pressure Sensor Fault	TPMS Module	Go To Pinpoint Test E .
B2885	Spare Tire Pressure Sensor Fault	TPMS Sensor	Go To Pinpoint Test E .
C2780	ECU in Manufacturing Mode	TPMS Module	INSTALL a new tire pressure monitor module. REFER to Tire Pressure Monitoring System Module .
U1014	SCP Invalid or Missing Data for Vehicle Speed	SCP	REFER to Section 418-00 .
U1262	SCP Communication Bus Fault	SCP	REFER to Section 418-00 .

Symptom Chart

NOTE: The tire pressure monitoring system is not affected by wheel and tire rotation.

Failure of a tire pressure monitor system component may not cause the message center to display a system fault message or a DTC to be stored. The Symptom Chart is a starting point to begin diagnosis of these concerns.

Symptom Chart

Condition	Possible Sources	Action
• No communication with the TPMS module	• Fuse(s). • Circuitry. • Module.	• Go To Pinpoint Test A .
• Unable to enter self-test	• Module. • Scan tool.	• Go To Pinpoint Test A .

• TPMS will not enter sensor training mode	• TPMS sensor. • Message center. • TPMS module. • BOO switch. • ABS/TC/IVD module.	• Go To Pinpoint Test B . • REFER to Section 206-09A or Section 206-09B .
• Message center displays "WARNING TPMS SYSTEM FAULT"	• TPMS module. • Four TPMS sensors (excluding spare tire) failed, missing, or incorrectly trained. • Message center misconfigured.	• Go To Pinpoint Test C . • REFER to Section 413-01 .
• Message center displays "WARNING — TIRE VERY LOW"	• TPMS module. • TPMS sensor.	• Go To Pinpoint Test C .
• Message center displays "CHECK TIRE PRESSURE"	• TPMS module. • TPMS sensor.	• Go To Pinpoint Test C .
• Message center displays "CHECK SPARE TIRE PRESSURE"	• TPMS module. • TPMS sensor.	• Go To Pinpoint Test C .

Pinpoint Tests

PINPOINT TEST A: NO COMMUNICATION WITH THE TPMS MODULE / UNABLE TO ENTER SELF-TEST

Test Step	Result / Action to Take
CAUTION: The Flex Probe Kit must be used for all test connections. Use of standard multimeter probes may damage wiring terminals.	
A1 CHECK CIRCUITS 1002 (BK/PK) and 3049 (BK/LG) FOR AN OPEN	
• Disconnect: TPMS Module C3183. • Key in ON position. • Measure the voltage between TPMS module connector C3183 pin 5, circuit 1002 (BK/PK) harness side and ground and between pin 3 circuit 3049 (BK/LG) harness side and ground. • **Are the voltages greater than 10 volts?**	**Yes** GO to A2 . **No** REPAIR circuit 1002 (BK/PK) or circuit 3049 (BK/LG). TEST the system for normal operation.
A2 CHECK CIRCUIT 57 (BK) FOR OPEN	
• Measure the resistance between TPMS module harness connector C3183 pin 6, circuit 57 (BK) and ground. • **Is the resistance greater than 5 ohms?**	**Yes** REPAIR circuit 57 (BK). TEST the system for normal operation.

	No REFER to Section 418-00 .

PINPOINT TEST B: TPMS WILL NOT ENTER SENSOR TRAINING MODE

Test Step	Result / Action to Take
CAUTION: The Flex Probe Kit must be used for all test connections. Use of standard multimeter probes may damage wiring terminals.	
B1 CHECK THE BRAKE PEDAL POSITION BRAKE ON/OFF SWITCH ● Using the scan tool menu, monitor the brake pedal position switch PID. ● Press and release the brake pedal while monitoring the PID. ● **Do the brake pedal PID values match the brake pedal positions?**	**Yes** GO to B2 . **No** REFER to Section 206-09A and Section 206-09B .
B2 CHECK THE INSTRUMENT CLUSTER ● Using the scan tool menu, monitor the instrument cluster ignition switch status PID. ● Cycle the ignition switch to the ON and OFF position while monitoring the PID. ● **Does the ignition switch status PID values match the ignition switch positions?**	**Yes** INSTALL a new TPMS module. REFER to Tire Pressure Monitoring System Module . TEST the system for normal operation. **No** REFER to Section 413-01 .

PINPOINT TEST C: MESSAGE CENTER DISPLAYS TPMS SYSTEM FAULT

Test Step	Result / Action to Take
C1 CHECK FOR DTCS ● Connect the scan tool. ● Retrieve and document the continuous DTCs. ● **Are DTCs obtained?**	**Yes** REFER to TPMS module Diagnostic Trouble Code (DTC) Index. If DTC B2872 is retrieved, TRAIN the TPMS sensors. REFER to Sensor Training component test in this section. CLEAR the message center. **No** GO to C2 .
C2 CHECK THE SYSTEM COMPONENTS ● Carry out the sensor training procedure. Refer to Sensor Training component test. ● Using the scan tool menu, enter the TPMS module function test for tire pressure status. ● Compare the recorded tire	**Yes** INSTALL a new TPMS module. REFER to Tire Pressure Monitoring System Module in this section. TEST the system for normal operation. **No** INSTALL new tire pressure sensors for those with discrepancies. REFER to Tire Pressure Sensor in this

pressure values to the tire status values obtained by the function test. ● **Do the compared tire pressure values match within ±3 psi?**	section. TEST the system for normal operation.

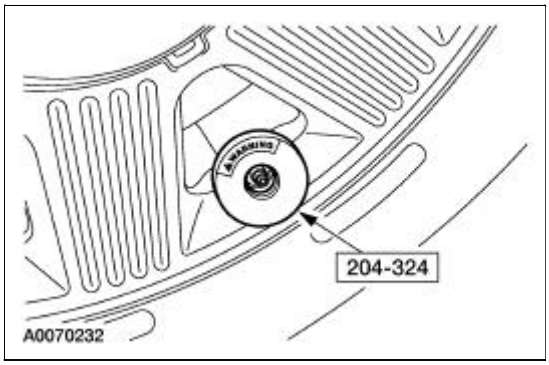
PINPOINT TEST D: DTC B2849 HORN OUTPUT RELAY CIRCUIT OPEN

Test Step	Result / Action to Take
CAUTION: The Flex Probe Kit must be used for all test connections. Use of standard multimeter probes may damage wiring terminals.	
D1 CHECK MANUAL HORN OPERATION	
● Confirm horn operation. ● **Does the horn sound?**	**Yes** GO to D2 . **No** REPAIR the horn. REFER to Section 413-06 . TEST the system for normal operation.
D2 CHECK HORN OPERATION USING ACTIVE COMMAND	
● Using the scan tool active command menu, actuate the horn. ● **Does the horn sound?**	**Yes** CHECK the TPMS module connector C3183 for corroded, damaged or backed out pins. If no faults are found, INSTALL a new TPMS module. REFER to Tire Pressure Monitoring System Module in this section. CLEAR the DTC. TEST the system for normal operation. **No** GO to D3 .
D3 CHECK CIRCUIT 490 (DB) FOR AN OPEN	
● Disconnect the battery ground cable. Refer to Section 414-01 . ● Disconnect: TPMS Module C3183. ● Disconnect: Battery Junction Box (BJB) Horn Relay. ● Measure the resistance between TPMS module C3183 pin 4 circuit 490 (DB) harness side and ground. ● **Is the resistance greater than 5 ohms?**	**Yes** INSTALL a new TPMS module. REFER to Tire Pressure Monitoring System Module in this section. CLEAR the DTC. TEST the system for normal operation. **No** REPAIR circuit 490 (DB). TEST the system for normal operation.

PINPOINT TEST E: DTC B2872, B2885— TIRE PRESSURE SENSOR FAULT

Test Step	Result / Action to Take

E1 CHECK FOR FAULT REPEATABILITY	
• Connect the scan tool. • Carry out the tire pressure sensor training procedure using the scan tool. • **Does the tire training procedure initiate?**	**Yes** GO to E2 . **No** CHECK the message center. REFER to Section 413-08 .
E2 CHECK TIRE PRESSURE SENSOR TRANSMITTING ABILITY	
• Train the tire pressure sensors. Refer to the Sensor Training component test. • **Do all of the tire pressure sensors transmit correctly or does the horn sound when each tire pressure sensor transmits to the TPMS module?**	**Yes** GO to E3 . **No** INSTALL a new tire pressure sensor. REFER to Tire Pressure Sensor . CLEAR the DTC(s). REPEAT the self-test.
E3 CHECK THE TPMS MODULE	
• Review the continuous and on-demand self-test DTCs. • **Was DTC B1342 retrieved?**	**Yes** INSTALL a new TPMS module. REFER to Tire Pressure Monitoring System Module . CLEAR the DTCs. REPEAT the self-test. **No** The system is functioning normally. CLEAR the DTCs. If other DTCs are retrieved, REFER to the DTC index.



Sensor Training

NOTE: The tire pressure monitoring system is not affected by wheel and tire rotation.

NOTE: The tire pressure sensor training procedure must be done on a single vehicle, in an area without radio frequency (RF) noise.

RF noise is generated by electrical motor and appliance operation, cellular telephones, and remote transmitters.

1. Turn the ignition switch to the OFF position.
2. Turn the ignition switch from the OFF position to the RUN position three times, ending in the RUN position. Do not wait more than two minutes between each key cycle.
3. Press and release the brake pedal.
4. Turn the ignition switch to the OFF position.
5. Turn the ignition switch from the OFF position to the RUN position three times, ending in the RUN position. Do not wait more than two minutes between each key cycle.

6. When the message center displays "TRAIN LEFT FRONT TIRE", place the magnet on the valve stem of the LF tire pressure sensor. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the TPMS module.

7. Within two minutes after the horn sounds, place the magnet on the valve stem of the RF tire pressure sensor.

NOTE: If the TPMS module does not recognize any one of the five tire pressure sensors during the tire training procedure, the horn will sound twice and the message center will display "TIRE TRAINING MODE INCOMPLETE" and the procedure must be repeated.

8. Repeat Step 7 for the RR, LR, and spare tires.
   When the tire training procedure is complete, the horn will sound once and the message center will display "TIRE TRAINING MODE COMPLETE".

Wheel and Tire

Material

Item	Specification
Anti-Seize Lubricant XG-3	ESE-M12A4-A

Removal

1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   If equipped, turn the air suspension switch to the OFF position.

2. **NOTE:** To avoid damage or scratching to the center cap, place facing up when removed.

   Remove the center cap.

3. **CAUTION: Do not use heat to loosen a seized wheel nut. Heat can damage the wheel and wheel bearings.**

   With the weight of the vehicle on the wheels, loosen the wheel nuts.

4. With the vehicle in NEUTRAL, position on a hoist. For additional information, refer to Section 100-02 .

5. Remove the wheel nuts and the wheel and tire assembly.

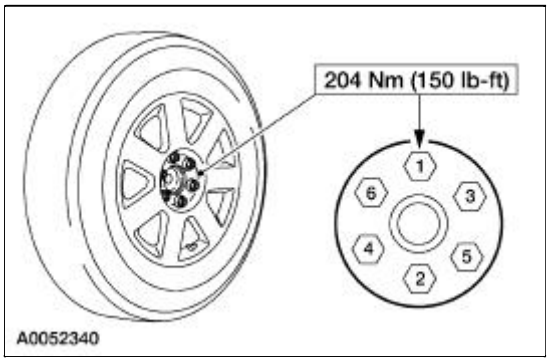
Installation

1. **WARNING: When a wheel is installed, always remove any corrosion, dirt or foreign material present on the mounting surfaces of the wheel or the surface of the wheel hub, brake drum or brake disc that contacts the wheel. Installing wheels without correct metal-to-metal contact at the wheel mounting surfaces can cause the wheel nuts to loosen and the wheel to come off while the vehicle is in motion, causing loss of control.**

   WARNING: Retighten at 800 km (500 miles) after any wheel change or any time the wheel nuts are loosened.

   WARNING: Failure to retighten wheel nuts at the mileage specified could allow wheels to come off while the vehicle is in motion, possibly causing loss of vehicle control and collision.

   Clean the wheel hub mounting surface.



2. **CAUTION: Make sure to apply a thin coat of anti-seize lubricant to the hub pilot surface only. Do not allow the lubricant to make contact with the wheel studs, brake pads or brake disc.**

   Apply a thin coat of anti-seize lubricant to the wheel hub pilot surface.

3. Install the tire and wheel assembly.
   - Position the tire and wheel assembly.
   - Install the wheel nuts, hand-tight, then lower the vehicle.

4. **CAUTION: Failure to tighten the wheel nuts in a star pattern can result in high brake disc runout, which will speed up the development of brake roughness, shudder and vibration.**

   Tighten the wheel nuts in sequence.

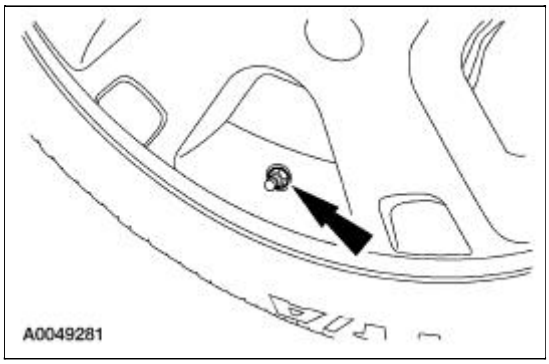
5. Install the center cap.

6. If equipped, turn the air suspension switch to the OFF position.

Tire Pressure Sensor

Removal

CAUTION: Make sure to install a new sensor grommet or an air leak can occur.



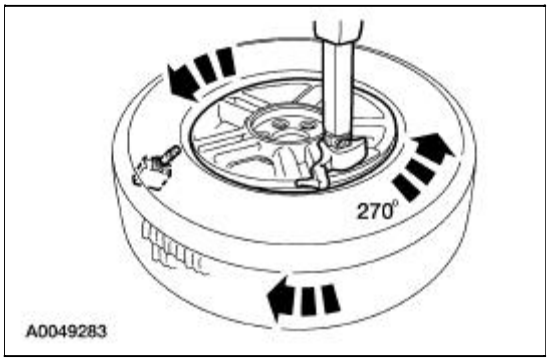
NOTE: Do not remove the valve stem core to relieve the tire pressure.

1. Remove the wheel and tire assembly. For additional information, refer to Wheel and Tire in this section.

2. **CAUTION: If the valve stem core has been removed from the valve stem, a new nickel-plated core must be installed. Failure to use a nickel-plated core will result in corrosion and the possible loss of tire pressure.**

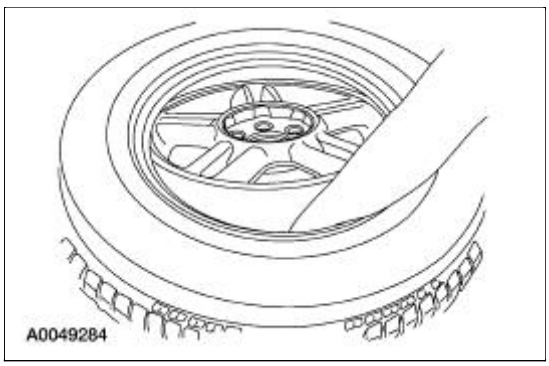
   NOTE: Release the tire pressure by removing the sensor retaining nut.

   With the valve stem at the 6 o'clock position, remove the sensor retaining nut and allow the sensor to fall into the tire.



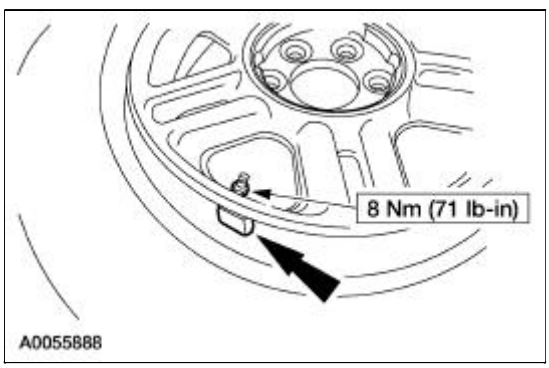
3. **CAUTION: Make sure that the valve stem mounting hole remains in the 6 o'clock position while separating the beads of the tire.**

   Using a suitable tire machine, separate both beads of the tire from the wheel.

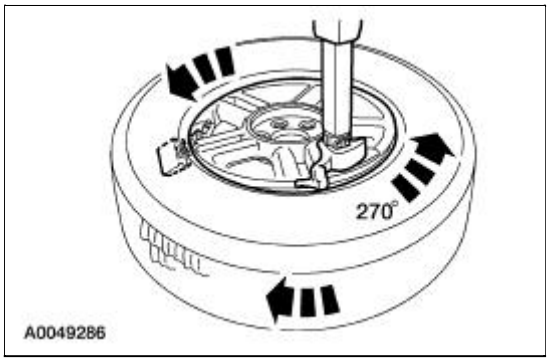


4. Place the wheel and tire on the turntable of the tire machine so that the valve stem hole is positioned 270 degrees from the mounting/dismounting fixture.

- Index-mark the valve stem and wheel weight positions.
- Lubricate the bead of the tire.
- Dismount the outside bead of the tire from the rim.



5. Remove the tire pressure sensor.
    - Discard the grommet.



Installation

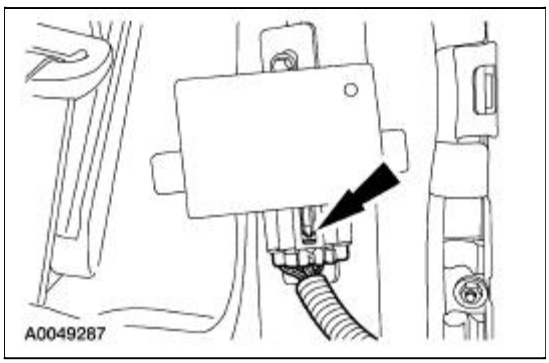
1. Install the sensor and tighten the retainer nut.

2. **NOTE:** Do not allow the tire to rotate relative to the rim while mounting the tire.

   Lubricate and mount the outside bead of the tire to the rim.

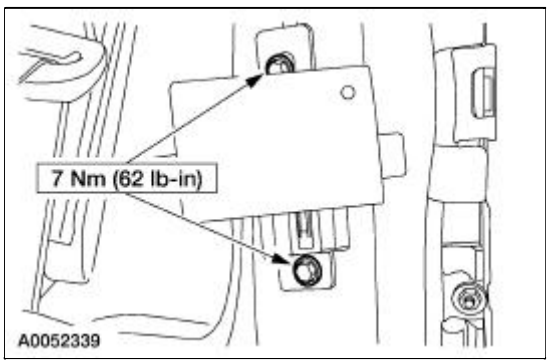
3. Inflate the tire to the pressure specified on the safety certification sticker located on the driver door jamb.

4. Install the wheel and tire assembly. For additional information, refer to Wheel and Tire in this section.



5. Train the tire pressure sensors. For additional information, refer to Sensor Training component test in this section.

Tire Pressure Monitoring System Module



Removal and Installation

CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage can result.

1. Disconnect the battery ground cable.
2. Remove the LH C-pillar trim panel. For additional information, refer to Section 501-05 .
3. Disconnect the electrical connector.

4. Remove the bolts and the module.

5. To install, reverse the removal procedure.
6. Train the tire pressure sensors. For additional information, refer to Sensor Training component test in this section.
7. Reconfigure the TPMS module. For additional information, refer to Section 418-01 .

General Specifications

Item	Specification

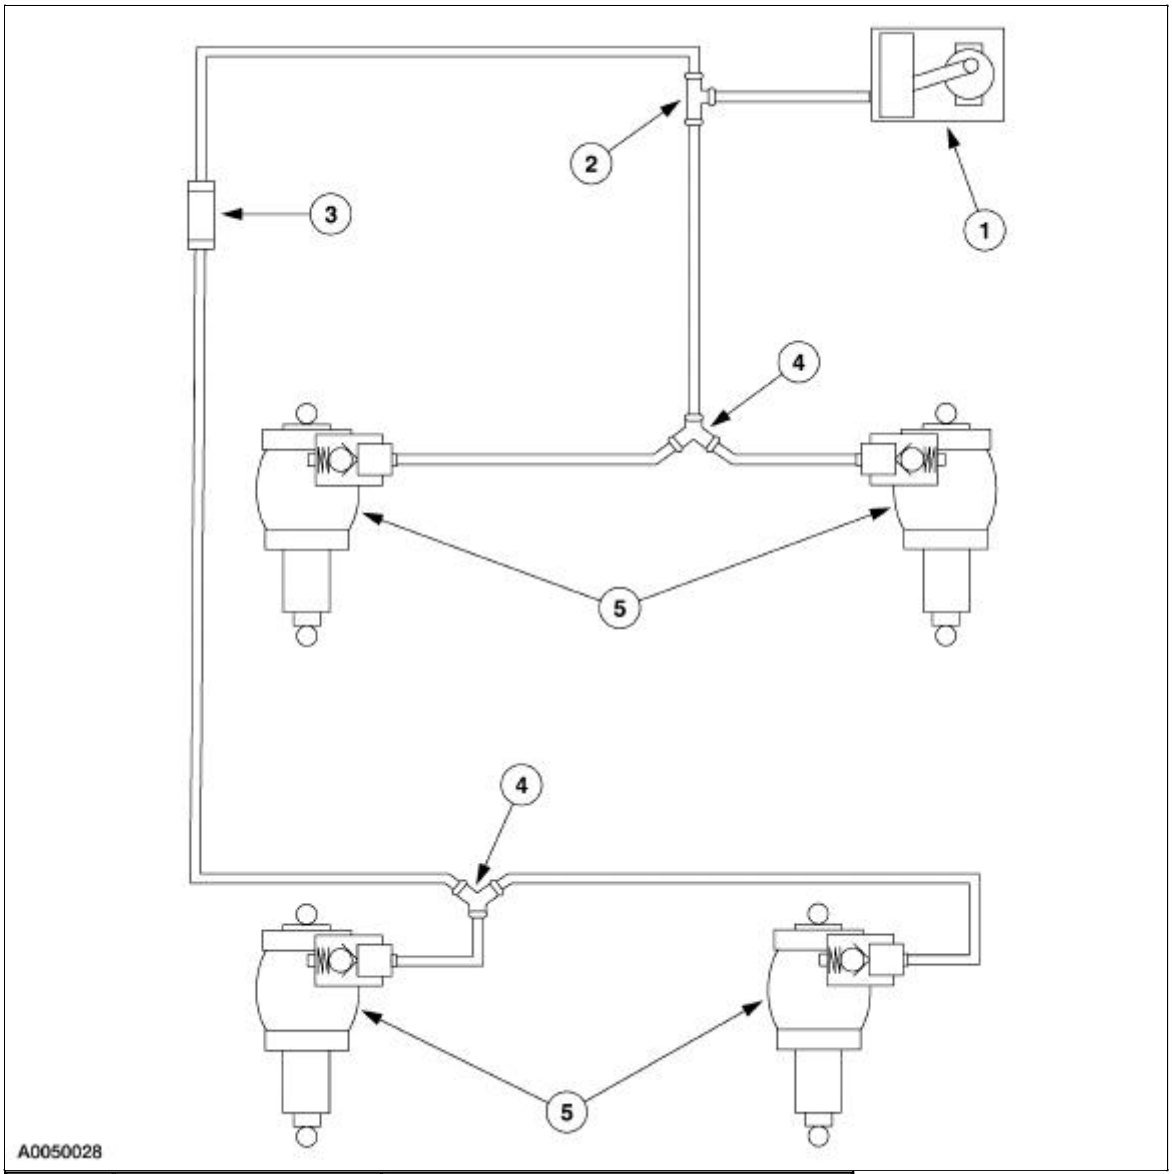
Vehicle Dynamic Suspension



The four wheel air suspension system is comprised of the following components:

- service switch
- control module
- two front height sensors
- one rear height sensor
- compressor and drier assembly (includes vent solenoid)
- air lines
- front and rear air spring and shock absorber assemblies
- four air spring solenoids
- compressor relay

WARNING: The service switch for the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the jack storage area in the rear of the passenger compartment. Failure to do so may result in unexpected inflation or deflation of the air springs which may result in shifting of the vehicle during these operations.

WARNING: Do not remove an air spring under any circumstances when there is pressure in the air spring. Do not remove any components supporting an air spring without either exhausting the air or providing support for the air spring to prevent vehicle damage or personal injury.

Air Suspension Pneumatic Diagram

Item	Part Number	Description
1	5319	Air compressor and drier
2	5B322	Air line T-fitting
3	5B321	Air line union
4	—	Air line Y-fitting
5	18945/5311	Air spring and solenoid

Vehicle Dynamic Suspension —4-Wheel Air Suspension

Refer to Wiring Diagrams Cell 41 , Programmable Ride Control for schematic and connector information.

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052 or equivalent scan tool
 ST1176-A	Vacuum Tester or equivalent 014-R1054
 ST1137-A	73 Digital Multimeter or equivalent 105-R0051

Principles of Operation

The 4-wheel air suspension (4WAS) module commands changes in vehicle height that are necessary for both the load leveling and the vertical height adjustment features.

The 4WAS load leveling feature automatically makes adjustments in vehicle height so that the vehicle is always at target height, and that constant front-to-rear vehicle attitudes are maintained over the load range of the vehicle. Adjustments in height that are necessary to correct height differences between the vehicle left and right sides for the 4WAS system are restricted to what can be reliably achieved with three height sensors.

The height adjustment feature has three vehicle target heights within a two-inch span:

Kneel height — improves the ease of entering and exiting by lowering the vehicle one inch below the trim height in the front and rear when the vehicle ignition is in the OFF or LOCK positions and the vehicle is stationary.

Trim height — normal vehicle ride position; vehicle moves to trim position when the ignition is ON, when the transmission is initially shifted to DRIVE or REVERSE mode, when all doors are closed or when speed of more than 24 km/h (15 mph) is detected.

Off-road height — improves ground clearance by raising the vehicle one inch above trim height in the front and rear when the vehicle is at 4x4 low modes and the vehicle speed is less than 40 km/h (25 mph).

The 4WAS module uses the universal bus protocol, (UBP), module communications network for sending and receiving various signals, information from the three height sensors, and the air suspension service switch. For additional information about UBP, refer to Section 418-00 .

The 4WAS system holds vehicle height when any door or rear hatch is opened. The system stores front and rear vehicle height the moment any door is detected open. The system then maintains this height regardless of the addition or removal of a load. The system returns to its commanded height when all doors are closed or vehicle speed exceeds 24 km/h (15 mph).

The system will remain active for 40 minutes after the ignition is turned off to make limited height adjustments as necessary.

Vehicle Height Modes

Ignition State	Transfer Case Mode	Speed or Speed Range	Resulting Vehicle Height
OFF	4x2, A4WD, 4x4 HI	N/A	Kneel (TRIM - 25 mm)
ON and RUN	4x2, A4WD, 4x4 HI	All speeds	TRIM
ON and RUN	4x4 Low	Below 13 km/h (8 mph)	Off-Road (TRIM + 25 mm)
ON and RUN	4x4 Low	Above 40 km/h (25 mph)	TRIM
OFF	4x4 Low	N/A	Stays at current position (prior to ignition transition)

Air Suspension Service Switch

The air suspension service switch signal is needed to wake up the 4WAS module. Without the module receiving this signal, the 4WAS system is inoperative at speeds below 24 km/h (15 mph) and will not react when the vehicle is raised or lowered. At speeds above 24 km/h (15 mph), the system will be active as if the air suspension service switch is in the ON position.

Vehicles without message center

When the air suspension service switch is in the OFF position and the ignition switch is in the RUN position, a "CHECK SUSP" will appear in the RH corner of the instrument cluster.

Vehicles with message center

When the air suspension service switch is in the OFF position and the ignition switch is in the RUN position, the message center will display "SUSPENSION SWITCHED OFF"

Air Compressor

The air compressor:

- consists of the compressor and vent solenoid; neither are replaceable as individual items.
- is a single cylinder electric motor driven unit that provides pressurized air as required.
- is powered by an electromechanical or solid state relay, which is controlled by the 4WAS module.

- passes pressurized air through the compressor air drier that contains silica gel (a drying agent). Moisture is then removed from the compressor air drier when vented air passes out of the system during vent operation.
- has a single port drier that can be installed separately.

The vent solenoid:

- allows air to escape from the system during venting actions.
- is part of the air compressor cylinder head.
- shares a common electrical connector with the air compressor motor.
- is enclosed in the cylinder head casting, which forms an integral valve housing that allows the valve tip to enter the pressurized side of the system.
- has an O-ring seal that prevents air leakage past the valve tip.
- opens when the 4WAS module determines that lowering is required.
- provides an escape route for pressurized air when system pressures exceed safe operating levels.
- has a 1034 kPa (150 psi) internal relief valve.
- is installed with the air compressor as a unit.

Air Spring

The 4WAS system has front and rear air springs. The air springs provide a varying spring rate proportional to the system's air pressure and volume. The air suspension system regulates the air pressure in each air spring by compressing and venting the system's air. Increasing air pressure (compressing) raises the vehicle; decreasing air pressure (venting) lowers the vehicle. Vehicle height is maintained by the addition and removal of air in each air spring through an air spring solenoid installed in the upper spring cap and energized through the 4WAS module command.

Air Lines and Fittings

NOTE: Apply a soapy water solution to the air lines to verify the location of air leaks. If the air lines are cut, ruptured or leaking, a service repair kit is available.

Nylon air lines with quick connect fittings connect to the air compressor and air spring solenoids. The compressor assembly output line is divided by the use of a fitting to supply the front and rear air springs. Fittings are also used to divide the air supply to the RH and LH air spring solenoids.

Air Suspension Height Sensors

There are two sensors used for the front suspension and one sensor used for the rear suspension. The sensors send a voltage signal to the 4WAS module. The output ranges from approximately 4.50 volts at minimum height (when the vehicle is low or in full jounce) to 0.50 volt at maximum height (when the vehicle is high or in full rebound). The sensors have a usable range of ± 45° compared to total suspension travel of 196 mm (7.84 in) at the front wheels and 240 mm (9.6 in) at the rear wheels. Therefore, the sensors are mounted to the suspension at a point where full suspension travel at the wheel is relative to the travel at the height sensor. The front height sensors are mounted to the frame and the links are attached to the upper arm ball studs. The left and right sensors are not interchangeable. The rear height sensor is mounted to the frame and the link is attached to the rear lower arm ball stud.

When the height sensor indicates that the vehicle is lower than trim under normal driving conditions, the air compressor will turn on and pump compressed air to the system. When the sensor indicates that the vehicle is raised above trim under normal driving conditions, this will cause the air to be vented from the system to lower the vehicle to its trim height level.

Compressor Relay

A (electromechanical or solid state) relay is used in the air suspension system for compressor control. The relay switches high current loads in response to low power signals and is controlled by the logic of the 4WAS module.

The compressor (electromechanical or solid state) relay is energized by the 4WAS module to have high current flow from the battery to the compressor motor.

4-Wheel Air Suspension (4WAS) Module

NOTE: The 4WAS module must receive a ride height adjustment calibration and must pass a pneumatic test when it is installed new or swapped.

The 4-wheel air suspension (4WAS) module controls the air compressor motor (through an electromechanical or solid state relay), all air spring solenoids, and provides power to front and rear height sensors. The 4WAS module also controls vehicle height adjustments by monitoring the three height sensors and other universal bus protocol (UBP) signals. The 4WAS module conducts all fail-safe and diagnostic strategies, and contains self-test and communication software for testing the vehicle and related components.

The 4WAS module monitors and controls the air suspension system through a 26-pin, two-way connector. The 4WAS module is keyed so that it cannot be plugged into an incorrect harness. There are two harness hardshell connectors and each is uniquely colored and keyed to prevent reversed connections.

Air Spring Solenoid

WARNING: Never rotate an air spring solenoid valve to the release slot in the end cap fitting until all pressurized air has escaped from the spring to prevent damage or injury.

The air spring solenoid:

- allows air to enter and exit the air spring during leveling operations.
- is electrically operated and controlled by the 4WAS module.
- is only replaced as a unit (the air spring solenoid is serviced separately from the air spring).

Inspection and Verification

1. Verify the customer concern.

2. **NOTE:** If the door ajar indicator is illuminated when all doors, liftgate, and liftgate glass are closed, the air suspension will not work correctly. Repair door ajar indicator; refer to Section 413-01.

   Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Restricted suspension movement • Excessive vehicle load • Cut, severed, crimped air line(s) • Unmounted height sensor(s) • Damaged front air spring(s) • Damaged rear air spring(s)	• Battery junction box (BJB) fuses 11 (10) (later built vehicles), 20 (30A), fuse 27 (5A), and fuse 111 (50A) • Loose, corroded, or disconnected connectors • Air suspension service switch is in the OFF position • Damaged solenoid valve(s)/height sensor(s)

3. If the inspection reveals an obvious concern that can be readily repaired, correct the concern before continuing with Inspection and Verification.

4. **NOTE:** The 4WAS module is also referred to as the Vehicle Dynamic Module (VDM).

   If the concern remains after the inspection, use the scan tool connected to the data link connector (DLC) to retrieve continuous diagnostic trouble codes (DTCs) and to execute On-Demand Self Test diagnostics for the 4WAS module.
   - If the On-Demand Self Test is passed and no DTCs are retrieved, GO to Symptom Chart to continue diagnostics.
   - If DTCs are retrieved, go to the 4WAS Module Diagnostic Trouble Code (DTC) Index in this section.
   - If the 4WAS module cannot be accessed by the scan tool, Go To Pinpoint Test A .

Pneumatic Test

This test verifies that the air lines are connected and that they are not restricted. It also verifies that the air compressor, air compressor vent solenoid and air spring solenoid valves are functioning properly. Verify that the following conditions are met before running the Pneumatic Test.

- All doors, liftgate, and liftgate glass must be closed.
- Vehicle in PARK.
- The vehicle speed is less the 3 km/h (1.87 mph).
- The air suspension service switch must be in the ON position.
- Test is used to clear DTCs C1990 and C1991.

Trim Height Test (or Accurate Trim Test)

The trim height test is used to make the vehicle level to within 2 mm (0.08 in) of the calibrated trim height. Accurate trim test should be run before setting vehicle alignment.

- All doors, liftgate, and liftgate glass must be closed.
- The transmission is in PARK.
- The vehicle speed is less than 3 km/h (1.87 mph).
- The ignition switch is in the ON position.
- The air suspension service switch is in the ON position.
- Battery voltage greater than 11 volts for duration of test.

1. Fulfill the pre-conditions.

2. Install a battery charger for the Trim Height Test to prevent battery drain.
3. Run the Trim Height Test.

Self-Test

Verify that the following conditions are met before running the On-Demand Self Test.

- All doors, liftgate, and liftgate glass must be closed.
- The transmission is in PARK.
- The vehicle speed is less than 3 km/h (1.87 mph).
- The ignition switch is in the ON position.
- The vehicle is not in 4L mode.

1. Fulfill the pre-conditions.
2. Install a battery charger for the On-Demand Self Test to prevent battery drain.
3. Run the air suspension On-Demand Self Test.
4. Record all listed DTCs.
5. Retrieve stored DTCs.
6. Troubleshoot any On-Demand Self Test DTCs first.
7. Repeat the On-Demand Self Test and clear DTCs after repairs are completed.

4-Wheel Air Suspension (4WAS) Module Diagnostic Trouble Code (DTC) Index

4-Wheel Air Suspension (4WAS) Module Diagnostic Trouble Code (DTC) Index

NOTE: Repair all other DTCs before C1725 and C1726. Repair DTCs C1990 and C1991 last.

DTCs	Description	Source	Action
B1317	Battery voltage high	4WAS module	Go To Pinpoint Test C .
B1318	Battery voltage low	4WAS module	Go To Pinpoint Test C .
B1342	ECU is defective	4WAS module	INSTALL a new 4WAS module. REFER to Air Suspension Control Module . SET the ride height. REFER to Ride Height Adjustments . CARRY OUT the pneumatic test. TEST the system for normal operation.
B1566	Door circuit failure	4WAS module	REFER to the Symptom Chart.
B2477	VAPS II steering assist curve not complete	4WAS module	REFER to Section 211-00 .
C1445	Vehicle speed signal circuit failure	4WAS module	GO to Symptom Chart .
C1724	Air suspension height	4WAS	Go To Pinpoint Test D .

	sensor power circuit failure	module	
C1725	Air suspension front pneumatic failure	4WAS module	Go To Pinpoint Test E .
C1726	Air suspension rear pneumatic failure	4WAS module	Go To Pinpoint Test E .
C1760	Air suspension rear height sensor signal circuit failure	4WAS module	Go To Pinpoint Test F .
C1770	Air suspension vent solenoid output circuit failure	4WAS module	Go To Pinpoint Test G .
C1790	Air suspension LR air spring/shock solenoid output circuit failure	4WAS module	Go To Pinpoint Test H .
C1795	Air suspension RR air spring/shock solenoid output circuit failure	4WAS module	Go To Pinpoint Test H .
C1830	Air suspension compressor relay circuit failure	4WAS module	Go To Pinpoint Test I .
C1840	Air suspension disable switch circuit failure	4WAS module	Go To Pinpoint Test J .
C1873	Air suspension RF air spring solenoid output circuit failure	4WAS module	Go To Pinpoint Test H .
C1877	Air suspension LF air spring solenoid output circuit failure	4WAS module	Go To Pinpoint Test H .
C1881	Air suspension RF height sensor circuit failure	4WAS module	Go To Pinpoint Test F .
C1889	Air suspension LF height sensor circuit failure	4WAS module	Go To Pinpoint Test F .
C1897	Steering VAPS circuit loop failure	4WAS module	REFER to Section 211-00 .
U1950	UBP communication bus fault	4WAS module	REFER to Section 418-00 .
C1964	Air suspension compressor actual run time exceeded allowed run time	4WAS module	Allow the air compressor to cool down. CLEAR the DTC. REPEAT the self-test.
C1990	New control module initialization (requires ride height calibration and pneumatic test pass)	4WAS module	CARRY OUT the ride height resetting procedure. REFER to Ride Height Adjustments in this section. Then, CARRY OUT the pneumatic test. REFER to the Pneumatic Test in this section. RETRIEVE any DTCs. If any DTCs are found, REPAIR as necessary. **Navigator:** If no DTCs are found, REFER to Section 211-00 to download the VAPS information. **Expedition:** If no DTCs are found, procedure is complete.
C1991	Plant ride height setting and/or tests incomplete	4WAS module	CARRY OUT the pneumatic test. REFER to the Pneumatic Test in this section.

			RETRIEVE the DTCs. If DTC C1991 is found, CARRY OUT the ride height resetting procedure. Refer to Ride Height Adjustments in this section. RETRIEVE the DTCs. IF DTC C1991 is found, RUN the On-Demand Self Test. If the self-test yields no faults, procedure is complete. If the self-test yields a fault(s), GO to Symptom Chart. If no DTCs are found, procedure is complete.
U2235	4x4 mode status invalid	4x4 control module	REFER to Section 418-00.
U2306	Transmission PRNDL indicator or vehicle speed signal invalid	Instrument Cluster (IC)	REFER to Section 418-00.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the 4WAS module (VDM)	• BJB fuses 20 (30A), 27 (5A), 102 (30A). • Circuitry. • 4WAS module (VDM).	• Go To Pinpoint Test A.
• **NOTE:** Be sure that the ignition switch is in the ON position and the air suspension service switch is in the ON position before determining that the 4WAS module will not enter the self-test. Unable to enter self-test	• Air suspension service switch. • 4WAS module.	• Go To Pinpoint Test B.
• Vehicle raises and/or lowers too slowly	• Front/rear pneumatic failure. • Height sensor. • Air compressor assembly. • Circuitry. • Solenoid. • Air line.	• Go To Pinpoint Test E.
• Uneven vehicle height	• Front/rear pneumatic failure. • Height sensor. • Solenoid. • Air compressor assembly. • Air line. • Circuitry.	• Go To Pinpoint Test E.
• The air compressor continuously cycles with the ignition switch	• Circuitry. • Air suspension relay. • 4WAS module.	• Go To Pinpoint Test K.

in the OFF position and no DTC is set		
• The air suspension system is inoperative without DTCs and vehicle at rest	• UBP network communication fault.	• Go To Pinpoint Test L .
• Air suspension system operates with air suspension service switch in the OFF position	• Circuitry. • Air suspension switch. • 4WAS module.	• Go To Pinpoint Test M .
• Excessive air compressor noise	• Silencer. • Mounting bracket. • Air compressor assembly. • Air compressor assembly in contact with other components.	• Go To Pinpoint Test N .
• The compressor is inoperative	• BJB fuse 111 (50A). • Air compressor assembly. • Circuitry. • Air suspension (electromechanical or solid state) relay.	• Go To Pinpoint Test O .
• DTC B1566: Door circuit failure	• Door(s) or liftgate open during on demand self-test.	• Validate that all doors, liftgate, and liftgate glass are closed. Check the door ajar indicator in the cluster. ▪ If the door ajar indicator is illuminated, REFER to Section 419-10 .
• **NOTE:** Vehicle speed signal is sent through the UBP communication (secondary) network and it is transmitted by hardwire (primary). DTC C1445: Vehicle Speed Signal Circuit Failure	• Circuitry. • PCM. • UBP communication network.	• REFER to Section 418-00 .

Pinpoint Tests

PINPOINT TEST A: NO COMMUNICATION WITH THE 4WAS (VDM) MODULE

Test Step	Result / Action to Take
A1 CHECK CIRCUIT 1524 (DB) FOR POWER	
• Disconnect: 4WAS Module C2131a. • Measure the voltage between 4WAS module C2131a pin 1, circuit 1524 (DB), harness side and ground, and between 4WAS module C2131a pin 15, circuit 1524 (DB), harness side and ground. • **Are the voltages greater than 10 volts?**	**Yes** GO to A2 . **No** REPAIR circuit 1524 (DB). TEST the system for normal operation.
A2 CHECK CIRCUIT 1003 (GY/YE)	
• Key in ON position. • Measure the voltage between 4WAS module C2131b pin 4, circuit 1003 (GY/YE), harness side and ground. • **Is the voltage greater than 10 volts?**	**Yes** GO to A3 . **No** REPAIR circuit 1003 (GY/YE). TEST the system for normal operation.
A3 CHECK CIRCUIT 875 (BK/LG) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between 4WAS module C2131b pin 19, circuit 875 (BK/LG), harness side and ground. • **Is the resistance less than 5 ohms?**	**Yes** CHECK the UBP communication network. REFER to Section 418-00 . **No** REPAIR circuit 875 (BK/LG). TEST the system for normal operation.

PINPOINT TEST B: UNABLE TO ENTER SELF-TEST

Test Step	Result / Action to Take
NOTE: Be sure that the ignition switch is in the ON position and the air suspension service switch is in the ON position before determining that the 4WAS module will not enter the self-test.	
B1 CHECK THE COMMUNICATION TO THE 4WAS MODULE	
• Verify that the following conditions have been met: ▪ ignition switch is in the ON position ▪ air suspension service switch is in the ON position ▪ vehicle speed is less than 3 km/h (2 mph) ▪ transmission selector is in PARK ▪ battery voltage is greater than 10 volts • **Does scan tool communicate with the 4WAS module?**	**Yes** INSTALL a new 4WAS module. REFER to Air Suspension Control Module in this section. REPEAT the self-test. **No** Go To Pinpoint Test A .

PINPOINT TEST C: DTC B1317/B1318 — BATTERY VOLTAGE HIGH/LOW

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>C1 CHECK THE BATTERY VOLTAGE

● Measure the battery voltage between the positive and negative battery posts with the key ON engine OFF (KOEO), and with the engine running.
● Is the battery voltage between 10 and 13 volts with KOEO, and between 11 and 18 volts with the engine running?</td><td>Yes
GO to C2 .

No
REFER to Section 414-00 . TEST the system for normal operation.</td></tr>
<tr><td>C2 CHECK VOLTAGE TO THE 4WAS MODULE

● Key in OFF position.
● Disconnect: 4WAS Module C2131a.
● Key in ON position.
● Measure the voltage between the following 4WAS module C2131a pins, harness side and ground:
<table><tr><th>4WAS Module Connector C2131a Pin No.</th><th>Circuit</th></tr><tr><td>1</td><td>1524 (DB)</td></tr><tr><td>4</td><td>1003 (GY/YE)</td></tr><tr><td>15</td><td>1524 (DB)</td></tr></table>● Is the voltage between 10 and 13 volts with KOEO, and between 11 and 18 volts with the engine running?</td><td>Yes
GO to C3 .

No
REPAIR circuit 1524 (DB) or circuit 1003 (GY/YE). CLEAR the DTCs. REPEAT the self-test.</td></tr>
<tr><td>C3 CHECK CIRCUIT 875 (BK/LG) FOR AN OPEN

● Key in OFF position.
● Measure the resistance between 4WAS module C2131a pin 19 circuit 875 (BK/LG), harness side, and ground.
● Are the resistances less than 5 ohms?</td><td>Yes
INSTALL a new 4WAS module. REFER to Air Suspension Control Module in this section. REPEAT the self-test.

No
REPAIR circuit 875 (BK/LG). CLEAR the DTCs. REPEAT the self-test.</td></tr>
</table>

PINPOINT TEST D: DTC C1724 — AIR SUSPENSION HEIGHT SENSOR POWER CIRCUIT FAILURE

Test Step	Result / Action to Take
D1 CHECK AIR SUSPENSION HEIGHT SENSOR POWER CIRCUITS FOR OPEN ● Disconnect: 4WAS Module C2131a. ● Disconnect: LF Height Sensor C1153. ● Disconnect: RF Height Sensor C1151. ● Disconnect: Rear Height Sensor C4084. ● Measure the resistance between 4WAS module C2131b pin 17, circuit 426 (RD/BK), harness side and between LF height sensor C1153 pin 3, and RF height sensor C1151 pin 3, circuit 426 (RD/BK) and between 4WAS module C2131b pin 8, circuit 429 (PK/LG), harness side and rear height sensor C4084 pin 3, circuit 429 (PK/LG). ● **Is the resistance less than 5 ohms?**	**Yes** GO to D2 . **No** REPAIR circuit 426 (RD/BK) or circuit 429 (PK/LG). CLEAR the DTC. REPEAT the self-test.

D2 CHECK AIR SUSPENSION HEIGHT SENSOR POWER CIRCUITS FOR SHORT TO GROUND	
• Measure the resistance between 4WAS module C2131b pin 17, circuit 426 (RD/BK), harness side and ground, between LF height sensor C1153 pin 3 and ground, between RF height sensor C1151 pin 3, circuit 426 (RD/BK) and ground, and between 4WAS module C2131b pin 8, circuit 429 (PK/LG), harness side and ground and between rear height sensor C4084 pin 3, circuit 429 (PK/LG) and ground. • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D3 . **No** REPAIR circuit 426 (RD/BK) or circuit 429 (PK/LG). CLEAR the DTC. REPEAT the self-test.
D3 CHECK AIR SUSPENSION HEIGHT SENSOR SIGNAL RETURN CIRCUITS	
• Measure the resistance between 4WAS module C2131b pin 10, circuit 432 (BK/PK), harness side and rear height sensor C4084 pin 1, circuit 432 (BK/PK) and between 4WAS module C2131b pin 20, circuit 432 (BK/PK), harness side and LF and RF height sensor C1151 and C1153 pin 1, circuit 432 (BK/PK). • **Is the resistance less than 5 ohms?**	**Yes** GO to D4 . **No** REPAIR circuit 432 (BK/PK). CLEAR the DTCs. REPEAT the self-test.
D4 CHECK VOLTAGE AT THE LF, RF, AND REAR HEIGHT SENSORS	
• Connect: 4WAS Module C2131b. • Key in ON position. • Measure the voltages at C1153 (LF), C1151 (RF), and C4084 (rear) height sensors between pin 1, circuit 432 (BK/PK) and pin 3, circuit 429 (PK/LG). • **Are the voltages 5 volts?**	**Yes** INSTALL a new height sensor. REFER to Suspension Height Sensor in this section. CLEAR the DTC. REPEAT the self-test. **No** INSTALL a new 4WAS module. REFER to Air Suspension Control Module in this section. CLEAR the DTC. REPEAT the self-test.

PINPOINT TEST E: DTCS C1725/C1726— AIR SUSPENSION FRONT/REAR PNEUMATIC FAILURE

Test Step	Result / Action to Take
NOTE: It may be necessary to vent air from the front air suspension air springs during this pinpoint test.	
E1 CHECK THE AIR SUSPENSION HEIGHT SENSORS	
• Inspect the LF, RF, and rear air suspension height sensor for correct installation at the upper and lower ball stud bracket for damage. • Inspect the air suspension height sensor mounting brackets for damage. • Verify that all air lines are fully seated. • **Are the air suspension height sensors, mounting brackets, and air lines OK?**	**Yes** GO to E2 . **No** REPAIR as necessary. If the height sensor mounting brackets are installed or repaired, RESET front ride height. REFER to Ride Height Adjustments in this section. CLEAR the DTCs. REPEAT the

	self-test.
E2 CHECK THE AIR SUSPENSION HEIGHT SENSOR OPERATION • Turn the air suspension switch to the OFF position. • Disconnect the lower end of the LF and RF, and rear air suspension height sensors. • Connect the diagnostic tool. • Monitor LF, RF, and rear height sensor PIDs. • **NOTE:** The voltage increases as the suspension is compressed. • While monitoring the 4WAS module LF, RF, rear height sensor PID display, slowly move the LF, RF, rear air suspension height sensors up and down its full travel. • **Do the voltages vary between 0.50 volts and 4.50 volts?**	**Yes** RECONNECT air suspension height sensors. GO to E3 . **No** INSTALL a new height sensor. REFER to Suspension Height Sensor in this section. CLEAR the DTC. REPEAT the self-test.
E3 VERIFY THAT THE VEHICLE CAN BE RAISED • **NOTE:** To trigger the OFF active command using the NGS, press "cancel", then press off. • TRIGGER the 4WAS module front and rear suspension fill active commands. • Allow the vehicle to raise for 30 seconds. • Record the voltage levels for the LF, RF, and rear air suspension height sensors at the up and down full travel positions. • **Does the vehicle raise evenly and hold the new height?**	**Yes** TRIGGER the 4WAS module off active command. GO to E4 . **No** TRIGGER the 4WAS module off active command. GO to E5 .
E4 VERIFY THAT THE VEHICLE CAN BE LOWERED • TRIGGER the 4WAS module vent front and rear air suspension active commands. • Allow the front and rear to lower for 30 seconds. • **Does the vehicle lower evenly?**	**Yes** INSTALL a new 4WAS module. REFER to Air Suspension Control Module in this section. REPEAT the self-test. **No** GO to E8 .
E5 CHECK OPERATION OF AIR COMPRESSOR **CAUTION: The 4WAS module limits the air compressor run time. If the air compressor overheats, it will not restart until it cools down. The ignition switch must be in the OFF position to allow the compressor thermal switch to cool.** • TRIGGER the 4WAS module compressor on active command. • **Does the air compressor run (slight buzzing noise from RF fender)?**	**Yes** TRIGGER the 4WAS module compressor off active command. GO to E6 . **No** TRIGGER the 4WAS module compressor off active command. INSTALL a new air compressor. REFER to Air Suspension Compressor . CLEAR the DTCs. REPEAT the self-test.
E6 CHECK AIR COMPRESSOR PRESSURE OUTPUT **CAUTION: The 4WAS module limits the air compressor run time. If the air compressor overheats, it will not restart until it cools down. The ignition switch must be in the OFF position to allow the compressor thermal switch to cool. NOTE:** If fluid is present when disconnecting an air line, clear the air lines; refer to Air Line Fluid Purge procedure in this	**Yes** GO to E8 . **No** GO to E7 .

section. Check the compressor air drier for water or the front air spring for oil. ● Disconnect air line T-fitting at the right front shock tower. ● Connect an air pressure gauge (1,723 kPa [250 psi] maximum reading) with common fittings to the air line going to the compressor air drier. ● TRIGGER the 4WAS module compressor on active command. ● Run the air compressor for 30 seconds. ● Wait five minutes. ● TRIGGER the 4WAS module compressor vent on active command. ● **Did the compressor produce 1,034 kPa (150 psi) within 30 seconds and hold developed pressure during the five minutes?**	
E7 CHECK THE AIR DRIER FOR LEAKS	
CAUTION: The 4WAS module limits the air compressor run time. If the air compressor overheats, it will not restart until it cools down. The ignition switch must be in the OFF position to allow the compressor thermal switch to cool. NOTE: Apply a soap and water solution to the air lines and air line connections when checking for air suspension system leakage. ● TRIGGER the 4WAS module compressor on active command. ● Thoroughly inspect the air drier-to-air compressor connection. ● **Is the air drier leaking at the air compressor?**	**Yes** INSTALL a new air drier. REFER to Air Suspension Compressor Drier in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to E9.
E8 CHECK AIR LINE FROM AIR DRIER	
CAUTION: The 4WAS module limits the air compressor run time. If the air compressor overheats, it will not restart until it cools down. The ignition switch must be in the OFF position to allow the compressor thermal switch to cool. NOTE: Apply a soap and water solution to the air lines and air line connections when checking for air suspension system leakage. ● TRIGGER the 4WAS module compressor on active command. ● Check for excessive air leaks, kinked or pinched air lines between the air compressor and LF, RF, LR, and RR air spring solenoids and between the air compressor and the air pressure gauge. ● **Are there any excessive leaks, kinks or pinched air lines?**	**Yes** INSTALL new or REPAIR the air line where necessary. CLEAR the DTCs. REPEAT the self-test. **No** GO to E9.
E9 CHECK FOR A PLUGGED AIR DRIER	
● Disconnect the air drier from the air compressor while leaving the air line connected. ● TRIGGER the front and rear suspension vent active commands. ● **Does the vehicle lower at an acceptable rate?**	**Yes** INSTALL new air drier. REFER to Air Suspension Compressor Drier in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to E10.
E10 CHECK FOR BLOCKAGE IN AIR LINE TO LF OR RF AIR SPRING	

NOTE: If fluid is present when disconnecting an air line, clear the air lines; refer to Air Line Fluid Purge in this section. Check the air compressor air drier for water and check the air springs for oil. ● Disconnect the air line at LF, RF, LR, or RR air spring. ● Disconnect the air line at the air drier. ● Connect the vacuum tester at the suspect air spring air line and try to draw a vacuum. ● **Can a vacuum be drawn and held?**	**Yes** REPAIR the blockage in the affected air line(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to E11 .
E11 CHECK THE SPRINGS FOR CORRECT OPERATION	
NOTE: If fluid is present when disconnecting an air line, clear the air lines; refer to Air Line Fluid Purge in this section. Check the air compressor air drier for water and check the air springs for oil. ● Disconnect the air line at the LF, RF, LR, or RR air spring solenoids. ● TRIGGER the 4WAS module LF, RF, LR, and RR air spring solenoid valve vent active commands. ● **Does each corner of the vehicle lower?**	**Yes** INSTALL a new 4WAS module. REFER to Air Suspension Control Module in this section. REPEAT the self-test. **No** INSTALL a new air spring solenoid valve. REFER to Air Spring Solenoid Valve in this section. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST F: DTC C1760 (REAR), C1881 (RF), C1889 (LF)— AIR SUSPENSION HEIGHT SENSOR SIGNAL CIRCUIT FAILURE

Test Step	Result / Action to Take
F1 VALIDATE DTC ERROR	
● CARRY OUT the 4WAS module On-Demand Self Test. ● **Is the same air suspension height sensor DTC set?**	**Yes** GO to F2 . **No** If no DTC is retrieved, GO to F5 . If a different DTC is retrieved, REFER to the 4WAS Module Diagnostic Trouble Code (DTC) Index.
F2 CHECK SUSPECT AIR SUSPENSION HEIGHT SENSOR SIGNAL RETURN CIRCUIT	
● Key in OFF position. ● Turn the air suspension service switch to the OFF position. ● Disconnect: Air Suspension Service Switch C4169. ● Disconnect: 4WAS Module C2131a. ● Measure the resistance between the suspect height sensor connector pin 1 harness side, circuit 432 (BK/PK) and 4WAS module C2131a pin 20 (front sensors), C2131a pin 10 (rear sensor); harness side.	**Yes** GO to F3 . **No** REPAIR circuit 432 (BK/PK). CLEAR the DTCs. REPEAT the self-test.

Air Suspension Height Sensor	Air Suspension Height Sensor Connector No.
Left Front (LF)	C1153
Right Front (RF)	C1151
Rear	C4084

• **Is the resistance less than 5 ohms?**	
F3 CHECK 4WAS MODULE POWER AND RETURN CIRCUITS	
• Key in OFF position. • Turn the air suspension service switch to the OFF position. • Disconnect: Air Suspension Service Switch C4169. • Key in ON position. • For DTC C1760, measure the voltage between rear height sensor C4084 pin 1, circuit 432 (BK/PK) harness side and pin 3, circuit 426 (RD/BK) harness side. • For DTC's C1881 (RF) or C1889 (LF), measure the voltage between C1151 or C1153 height sensor pin 1, circuit 432 (BK/PK) harness side and pin 3, circuit 429 (PK/LG) harness side. • **Is the voltage approximately 5 volts?**	**Yes** GO to F5 . **No** GO to F4 .
F4 CHECK AIR SUSPENSION HEIGHT SENSOR POWER CIRCUIT	
• Key in OFF position. • Turn the air suspension service switch to the OFF position. • Measure the voltage between suspect height sensor connector pin 3, circuit 429 (PK/LG) harness side and ground. • **Is voltage present?**	**Yes** REPAIR circuit 429 (PK/LG). **No** Go To Pinpoint Test D .
F5 CHECK THE HEIGHT SENSOR OUTPUT	
• Connect: Height Sensor(s). • Turn the air suspension service switch to the OFF position. • Key in ON position. • Disconnect the suspect height sensor ball stud from the height sensor bracket. • Using the scan tool, monitor the suspect height sensor PID(s). • Move the suspect height sensor arm through its full range of motion. • **Does the voltage vary from 0.50 to 4.5 volts?**	**Yes** INSTALL a new 4WAS module. REFER to Air Suspension Control Module in this section. REPEAT the self-test. **No** Go To Pinpoint Test D .

PINPOINT TEST G: DTC C1770 — AIR SUSPENSION VENT SOLENOID OUTPUT CIRCUIT FAILURE

Test Step	Result / Action to Take
G1 VALIDATE DTC C1770	
• Carry out 4WAS module On-Demand Self Test. • **Is the same air suspension DTC set?**	**Yes** GO to G2 . **No** CHECK the 4WAS module and air compressor harness connectors for bent or pushed out pins, corrosion or damage. CARRY OUT the pneumatic test. REPEAT the self-test. If other DTCs are present, REFER to the 4WAS Module Diagnostic Trouble Code (DTC) Index.
G2 CHECK VENT SOLENOID CONNECTOR	

• Key in OFF position. • Turn the air suspension service switch to the OFF position. • Disconnect: Air Compressor Assembly C1179. • Inspect the pins and terminals of the air compressor assembly connector for corrosion, bent or broken pins, moisture, or other damage. • **Is the air compressor assembly C1179 OK?**	**Yes** RECONNECT the air compressor assembly C1179. GO to G3. **No** REPAIR the connector as necessary. CLEAR the DTC. REPEAT the self-test.
G3 CHECK VENT SOLENOID PID	
• Turn the air suspension service switch to the ON position. • Key in ON position. • TRIGGER the 4WAS module vent on and vent off active command. • **Do the letters O, G, or B appear next to the ON/OFF text for the air suspension vent solenoid?**	**Yes** If O appeared, GO to G4. If G appeared, GO to G5. If B appeared, GO to G7. **No** CLEAR the DTCs. REPEAT the self-test.
G4 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
• Measure the resistance between air compressor assembly C1179 pin 2, circuit 57 (BK), harness side and ground. • **Is the resistance less than 5 ohms?**	**Yes** GO to G5. **No** REPAIR circuit 57 (BK). CLEAR the DTCs. REPEAT the self-test.
G5 CHECK THE VENT SOLENOID FOR AN OPEN	
• Disconnect: Air Compressor C1179. • Measure the resistance between air compressor C1179 pin 2 and pin 3, component side. • **Is the resistance between 17 and 22 ohms?**	**Yes** GO to G6. **No** INSTALL a new air compressor. REFER to Air Suspension Compressor in this section. CLEAR the DTCs. REPEAT the self-test.
G6 CHECK CIRCUIT 421 (PK)	
• Disconnect: 4WAS Module C2131b. • Measure the resistance between 4WAS module C2131b pin 5, circuit 421 (PK), harness side and air compressor assembly C1179 pin 3, circuit 421 (PK), harness side. • **Is the resistance less than 5 ohms?**	**Yes** GO to G7. **No** REPAIR circuit 421 (PK). CLEAR the DTCs. REPEAT the self-test.
G7 CHECK CIRCUIT 421 (PK) FOR SHORT TO GROUND	
• Disconnect: 4WAS Module C2131b. • Measure the resistance between 4WAS module C2131b pin 5, circuit 421 (PK), harness side and ground. • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G8. **No** REPAIR circuit 421 (PK). CLEAR the DTCs. REPEAT the self-test.
G8 CHECK CIRCUIT 421 (PK) FOR	

SHORT TO POWER	
• Key in OFF position. • Turn the air suspension service switch to the OFF position. • Disconnect: 4WAS Module C2131b. • Key in ON position. • Measure the voltage between 4WAS module C2131b pin 5, circuit 421 (PK), harness side and ground. • **Is the voltage at zero?**	**Yes** INSTALL a new 4WAS module. REFER to Air Suspension Control Module in this section. REPEAT the self-test. **No** REPAIR circuit 421 (PK). CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST H: DTC C1790 (LR), C1795 (RR), C1873 (RF), C1877 (LF)— AIR SUSPENSION AIR SPRING SOLENOID OUTPUT CIRCUIT FAILURE

Test Step	Result / Action to Take
H1 VALIDATE DTC	
• Carry out the 4WAS module On-Demand Self Test. • **Is DTC C1790, C1795, C1873, or C1877 set?**	**Yes** GO to H2. **No** If no DTCs are retrieved, GO to H10. If different DTCs are retrieved, REFER to 4WAS Module Diagnostic Trouble Code (DTC) Index.
H2 CHECK AIR SUSPENSION AIR SPRING SOLENOID CONNECTOR(S)	
• Key in OFF position. • Turn the air suspension service switch to the OFF position. • Disconnect: Air Suspension Air Spring Solenoid Connector. • Inspect the pins and terminals of the air suspension air spring solenoid connector (s) for corrosion, bent or broken pins, moisture, or other damage. • **Is the air suspension air spring solenoid connector(s) OK?**	**Yes** RECONNECT the air suspension air spring solenoid connector(s). GO to H3. **No** REPAIR the connector(s) as necessary. CLEAR the DTCs. REPEAT the self-test.
H3 CHECK AIR SPRING SOLENOID PID(S)	
• Turn the air suspension service switch to the ON position. • Key in ON position. • Monitor the air spring solenoid PID. • **Do the letters O, G, or B appear next to the ON/OFF text for the air suspension air spring solenoid?**	**Yes** If O appeared, GO to H4. If G appeared, GO to H7. If B appeared, GO to H9. **No** GO to H10.
H4 CHECK AIR SUSPENSION AIR SPRING SOLENOID COIL(S) FOR OPEN	
• Key in OFF position. • Turn the air suspension service switch to the OFF position. • Disconnect: Air Spring Solenoid connector. • Measure the resistance between the	**Yes** GO to H5. **No** INSTALL a new air spring solenoid. For front

<table>
<tr><td>suspect air spring solenoid(s) pin 1 and pin 2 (component side).
● Is the resistance between 15 and 18 ohms?</td><td>air spring solenoid, REFER to Air Shock Absorber—Front in this section, for rear air spring solenoid, REFER to Air Shock Absorber—Rear in this section. CLEAR the DTC. REPEAT the self-test.</td></tr>
<tr><td>H5 CHECK GROUND CIRCUIT 57 (BK) FOR OPEN</td><td></td></tr>
<tr><td>● Measure the resistance between the suspect air spring solenoid pin 1, circuit 57 (BK), harness side and ground.

</table>

(LF) 16	415 (LG/RD)

- **Is the resistance greater than 10,000 ohms?**

Test Step	Result / Action to Take
H9 CHECK OUTPUT CIRCUIT FOR SHORT TO POWER	
• Key in OFF position. • Disconnect: 4WAS Module C2131b. • Measure the voltage between 4WAS module C2131b pin (harness side) and ground. **4WAS Module C2131B Pin** / **Air Suspension Air Spring Solenoid Output Circuit** (LR) 13 — 1114 (BR/PK) (RR) 14 — 1115 (TN/WH) (RF) 2 — 414 (OG/RD) (LF) 16 — 415 (LG/RD) • **Is voltage present?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTC. REPEAT the self-test. **No** INSTALL a new 4WAS module. REFER to Air Suspension Control Module in this section. REPEAT the self-test.
H10 CHECK AIR SUSPENSION AIR SPRING SOLENOID CONNECTOR FOR DAMAGE	
• Key in OFF position. • Turn the air suspension service switch to the OFF position. • Disconnect: Suspect Air Suspension Air Spring Solenoid. • Inspect the pins and terminals of the air suspension air spring solenoid for corrosion, bent or broken pins, moisture, or other damage; inspect the wiring near the connector for damage. • **Is the air suspension air spring solenoid connector OK?**	**Yes** RECONNECT the air suspension air spring solenoid connector. Turn the air suspension service switch to the ON position. REPEAT the self-test. If no DTCs are retrieved, the system is OK. If a DTC is retrieved, REFER to 4WAS Module Diagnostic Trouble Code (DTC) Index. **No** REPAIR the connector(s) as necessary. CLEAR the DTC. REPEAT the self-test.

PINPOINT TEST I: DTC C1830 — AIR SUSPENSION COMPRESSOR RELAY CIRCUIT FAILURE

Test Step	Result / Action to Take
I1 VALIDATE DTC C1830	
• Carry out the 4WAS module On-Demand Self Test. • **Is the same air suspension DTC set?**	**Yes** GO to I2 . **No** If no DTC is retrieved, GO to I8 . If a different DTC is retrieved, REFER to 4WAS Module Diagnostic Trouble Code (DTC) Index.
I2 CHECK AIR COMPRESSOR RELAY AND CONNECTOR	
• Key in OFF position. • Turn the air suspension service switch to	**Yes** RECONNECT air compressor relay C1300. GO

the OFF position. • Disconnect: Air Compressor Relay C1300. • Inspect the pins and terminals of the air compressor relay for corrosion, bent or broken pins, moisture, or other damage. For vehicles built after 2/03, carry out the Air Compressor Relay Component test. Refer to Cell 149. • **Is the connector OK?**	to I3 . **No** REPAIR as necessary. CLEAR the DTC. REPEAT the self-test.
I3 CHECK THE AIR COMPRESSOR PID	
• Turn the air suspension service switch to the ON position. • Key in ON position. • TRIGGER the 4WAS module compressor on and off active command. • **Do the letters O or B appear next to the ON/OFF text for the air compressor?**	**Yes** If O appeared, GO to I4 . If B appeared, GO to I8 . **No** GO to I9 .
I4 CHECK POWER TO AIR SUSPENSION RELAY COIL	
• Key in OFF position. • Turn the air suspension service switch to the OFF position. • Disconnect: Air Suspension Relay C1300. • Measure the voltage between air compressor relay C1300 pin 1, circuit 833 (PK/LB). • **Is the voltage greater than 10 volts?**	**Yes** GO to I5 . **No** REPAIR the circuit. CLEAR the DTC. REPEAT the self-test.
I5 CHECK POWER TO AIR SUSPENSION RELAY	
• Measure the voltage between air compressor relay C1300 pin 3, circuit 1053 (LB/PK), component side and ground. • **Is the voltage greater than 10 volts?**	**Yes** GO to I6 . **No** REPAIR the circuit. CLEAR the DTC. REPEAT the self-test.
I6 CHECK CIRCUIT 420 (DB/YE) FOR AN OPEN	
• Disconnect: 4WAS Module C2131b. • Measure the resistance between 4WAS module C2131b pin 18, circuit 420 (DB/YE), harness side and air compressor relay C1300 pin 2, circuit 420 (DB/YE), harness side. • **Is the resistance less than 5 ohms?**	**Yes** GO to I7 . **No** REPAIR circuit 420 (DB/YE). CLEAR the DTC. REPEAT the self-test.
I7 CHECK CIRCUIT 420 (DB/YE) FOR SHORT TO GROUND	
• Disconnect: 4WAS Module C2131b. • Measure the resistance between 4WAS module C2131b pin 18, circuit 420 (DB/YE), harness side and ground. • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I8 . **No** REPAIR circuit 420 (DB/YE). CLEAR the DTC. REPEAT the self-test.
I8 CHECK CIRCUIT 420 (DB/YE) FOR SHORT TO POWER	

• Key in OFF position. • Turn the air suspension service switch to the OFF position. • Disconnect: Air Compressor Relay C1300. • Disconnect: 4WAS Module C2131b. • Turn the air suspension service switch to the ON position. • Key in ON position. • Measure the voltage between 4WAS module C2131b pin 18, circuit 420 (DB/YE), harness side and ground. • **Is the voltage greater than zero volts?**	**Yes** REPAIR the circuit. CLEAR the DTC. REPEAT the self-test. **No** INSTALL a new 4WAS module. REFER to Air Suspension Control Module in this section. REPEAT the self-test.
I9 CHECK AIR COMPRESSOR RELAY CONNECTOR	
• Key in OFF position. • Turn the air suspension service switch to the OFF position. • Disconnect: Air Compressor Relay C1300. • Inspect the pins and terminals of the air compressor relay for corrosion, bent or broken pins, moisture, or other damage; inspect the wiring near the connector for damage. • **Is the connector OK?**	**Yes** RECONNECT air compressor relay. PLACE the air suspension service switch in the ON position. TEST the system for normal operation. If no DTCs are retrieved, the system is OK. If a DTC is retrieved, REFER to 4WAS Module Diagnostic Trouble Code (DTC) Index. **No** REPAIR as necessary. CLEAR the DTC. REPEAT the self-test.

PINPOINT TEST J: DTC C1840 — AIR SUSPENSION SERVICE SWITCH CIRCUIT FAILURE

Test Step	Result / Action to Take
J1 CHECK POSITION OF AIR SUSPENSION SERVICE SWITCH	
• Verify that the air suspension service switch is in the ON position. • **Is the air suspension service switch ON?**	**Yes** GO to J2 . **No** Turn ON the air suspension service switch. CLEAR the DTC. REPEAT the self-test. If DTC C1840 is retrieved, GO to J2 .
J2 CHECK THE AIR SUSPENSION SERVICE SWITCH	
• Turn the air suspension service switch to the OFF position. • Disconnect: Air Suspension Service Switch C4169. • Press the air suspension service switch ON and measure the resistance between pin 1 and 2. • **Is the resistance less than 5 ohms?**	**Yes** GO to J3 . **No** INSTALL a new air suspension service switch. CLEAR the DTC. REPEAT the self-test.
J3 CHECK CIRCUIT 418 (PK/LG) FOR OPEN	
• Key in OFF position. • Disconnect: 4WAS Module C2131b. • Measure the resistance between the air suspension service switch C4169 pin 2, circuit 418 (PK/LG)	**Yes** GO to J4 . **No**

(harness side), and 4WAS module C2131b pin 25 (harness side), circuit 418 (PK/LG). ● **Is the resistance less than 5 ohms?**	REPAIR circuit 418 (PK/LG). CLEAR the DTC. REPEAT the self-test.
J4 CHECK CIRCUIT 418 (PK/LG) FOR SHORT TO GROUND	
● Measure the resistance between the air suspension service switch C4169 pin 2 (harness side), circuit 418 (PK/LG) and ground. ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to J5 . **No** REPAIR circuit 418 (PK/LG). CLEAR the DTC. REPEAT the self-test.
J5 CHECK CIRCUIT 429 (PK/LG) FOR VOLTAGE	
● Connect: 4WAS Module C2131b. ● Key in ON position. ● Measure the voltage between the air suspension service switch C4169 pin 1 (harness side), circuit 429 (PK/LG) and ground. ● **Is the voltage 5 volts?**	**Yes** INSTALL a new 4WAS module. REFER to Air Suspension Control Module in this section. REPEAT the self-test. **No** REPAIR circuit 429 (PK/LG). CLEAR the DTC. REPEAT the self-test.

PINPOINT TEST K: THE AIR COMPRESSOR CONTINUOUSLY CYCLES WITH THE IGNITION SWITCH IN THE OFF POSITION AND NO DTC IS SET

Test Step	Result / Action to Take
K1 CHECK FOR MODULE ACTIVITY	
NOTE: The 4WAS module is powered for 40 minutes after the ignition is turned OFF. During this time, the air suspension system is still active and may activate system components. ● Key in OFF position. ● Check to see if the air compressor still cycles 50 minutes after the ignition is turned OFF. ● **Does the air compressor still cycle after the module goes to sleep?**	**Yes** GO to K2 . **No** The system is OK. INFORM the owner of system operations.
K2 CHECK THE 4WAS MODULE	
● Turn the air suspension service switch to the OFF position. ● Disconnect: 4WAS Module C2131b. ● **Does the air compressor still cycle?**	**Yes** GO to K3 . **No** INSTALL a new 4WAS module. REFER to Air Suspension Control Module in this section. REPEAT the self-test.
K3 CHECK THE AIR COMPRESSOR RELAY	
● Disconnect: Air Compressor Relay C1000. ● **Does the air compressor still cycle?**	**Yes** REPAIR circuit 538 (GY/RD). TEST the system for normal operation. **No** GO to K4 .

K4 CHECK CIRCUIT 420 (DB/YE) FOR SHORT TO GROUND	
• Measure the resistance between the air compressor relay C1000 pin D and ground. • **Is the resistance less than 10,000 ohms?**	**Yes** INSTALL a new air suspension relay. TEST the system for normal operation. **No** REPAIR circuit 420 (DB/YE). TEST the system for normal operation.

PINPOINT TEST L: AIR SUSPENSION SYSTEM INOPERATIVE WITHOUT DTCS AND VEHICLE AT REST

Test Step	Result / Action to Take
L1 CHECK 4WAS MODULE FOR IGNITION SWITCH ON INPUT	
• Enter the following diagnostic mode on the diagnostic tool: Scan Tool. • Monitor 4WAS module ignition switch position PID. • **Does the PID indicate that the ignition switch is in the ON position?**	**Yes** GO to L2 . **No** REPAIR circuit 1003 (GY/YE). TEST the system for normal operation.
L2 CHECK 4WAS MODULE FOR IGNITION SWITCH OFF INPUT	
NOTE: The ignition switch must initially be in the ON position for this test step to be valid. • Key in OFF position. • **Does the PID indicate that the ignition switch is in the ON position?**	**Yes** GO to L3 . **No** REPAIR circuit 1003 (GY/YE). TEST the system for normal operation.
L3 CHECK 4WAS MODULE FOR DOOR AJAR INPUT	
• Monitor 4WAS module door position status PID. • Close all doors, liftgate, and liftgate glass. • While observing the scan tool, open and close one door. • **Does the door status PID change between CLOSED and AJAR states?**	**Yes** GO to L4 . **No** CHECK for a UBP network fault. REFER to Section 418-00 .
L4 CHECK 4WAS MODULE FOR 4X4 STATE INPUT	
• Monitor 4WAS module PID 4WDLOW. • **NOTE:** The 4x4 light on the instrument panel will turn off when the system is in 2H mode. • Place the mode switch into 2H mode. • Place the mode switch into 4L mode. • Select NEUTRAL. • Press the brake pedal. • **Did PID 4WDLOW show OFF in 2H and ON in 4L, and did the cluster indicators agree with PID 4WDLOW?**	**Yes** GO to L5 . **No** CHECK for a UBP network fault. REFER to Section 418-00 .
L5 CHECK 4WAS MODULE FOR VSS INPUT	

• Monitor 4WAS module VSS PID. • Test drive the vehicle at different speeds. • **Does VSS PID track the speedometer within 8 km/h (5 mph)?**	**Yes** GO to L6 . **No** REPAIR circuit 679 (GY/BK). TEST the system for normal operation.
L6 CHECK PARK/NEUTRAL INPUT TO 4WAS MODULE	
• Monitor 4WAS module Park/Neutral switch PID. • Select DRIVE. • Select PARK. • **Does Park/Neutral switch PID show OFF with the vehicle in Drive and ON with the vehicle in Park?**	**Yes** RETRIEVE all DTCs and REFER to the 4WAS Module Diagnostic Trouble Code (DTC) Index and Symptom Chart for further diagnostics. **No** CHECK for a UBP network fault. REFER to Section 418-00 .

PINPOINT TEST M: AIR SUSPENSION SYSTEM OPERATES WITH AIR SUSPENSION SERVICE SWITCH IN THE OFF POSITION

Test Step	Result / Action to Take
NOTE: The air suspension system will operate at speeds greater that 24 km/h (15 mph) with the air suspension service switch in the OFF position.	
M1 CHECK AIR SUSPENSION SWITCH	
• Key in OFF position. • Turn the air suspension service switch to the OFF position. • Disconnect: Air Suspension Service Switch C4169. • Measure the resistance between air suspension service switch terminals. • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to M2 . **No** INSTALL a new air suspension service switch. TEST the system for normal operation.
M2 CHECK CIRCUIT 418 (DG/YE) FOR VOLTAGE	
• Disconnect: Air Suspension Service Switch C4169. • Key in ON position. • Measure the voltage between air suspension service switch C4169 pin 2, circuit 418 (DG/YE), harness side and ground. • **Is the voltage approximately 0 volts?**	**Yes** INSTALL a new 4WAS module. REFER to Air Suspension Control Module in this section. REPEAT the self-test. **No** REPAIR circuit 418 (DG/YE). TEST the system for normal operation.

PINPOINT TEST N: EXCESSIVE AIR COMPRESSOR NOISE

Test Step	Result / Action to Take
N1 CHECK FOR AIR COMPRESSOR AND/OR AIR COMPRESSOR WIRING CONTACTING OTHER COMPONENTS	
• Check the air compressor wiring to see if it is contacting other components inside the engine compartment at any place other than the mounting points.	**Yes** ADJUST air compressor wiring harness so that it does not contact non-mounting components or FASTEN/REMOVE objects so

• Check for anything contacting the air compressor (other wire harnesses, air lines, hoses, loose fasteners, stones or other foreign objects). • **Is the air compressor wiring contacting non-mounting components or is anything contacting the compressor assembly besides the mounts?**	they no longer contact the air compressor assembly. TEST the system for normal operation. **No** GO to N2 .
N2 CHECK FOR BENT AIR COMPRESSOR BRACKET	
• Check the air compressor bracket for any damage/bends that may contact other components within the engine compartment. • **Is the air compressor bracket making contact with other components?**	**Yes** REPAIR the air compressor and bracket assembly or other components as necessary. REFER to Air Suspension Compressor in this section. TEST the system for normal operation. **No** GO to N3 .
N3 CHECK AIR COMPRESSOR MOUNTS FOR DAMAGE	
• Check the air compressor mounts for signs of cracks or breaking away of insulation material. • **Are any faults in the mounts present?**	**Yes** INSTALL a new air compressor and bracket assembly. REFER to Air Suspension Compressor in this section. TEST the system for normal operation. **No** GO to N4 .
N4 CHECK AIR COMPRESSOR FOR NOISE	
CAUTION: Do not run the air compressor for more than three minutes. The air compressor can overheat and stop operating due to an internal temperature sensitive thermal breaker. • Remove the air compressor assembly, but leave it connected electrically. • Connect the diagnostic tool. • TRIGGER the 4WAS module compressor on active command. • **Is the air compressor noisy?**	**Yes** INSTALL a new air compressor assembly. REFER to Air Suspension Compressor in this section. TEST the system for normal operation. **No** RECHECK the mountings and bracket for damage. If damaged, INSTALL a new air compressor assembly. REFER to Air Suspension Compressor in this section. TEST the system for normal operation.

PINPOINT TEST O: THE COMPRESSOR IS INOPERATIVE

Test Step	Result / Action to Take
NOTE: This test is for the harness side of the relay circuitry. Refer to Wiring Diagrams Cell 149 , relay component for schematic and connector information.	
O1 CHECK AIR COMPRESSOR RELAY CONNECTOR	
• Disconnect: Air Compressor Relay C1000. • Inspect the pins of the air compressor relay connector for corrosion, bent or broken pins,	**Yes** GO to O2 .

moisture, or other damage. • **Is the air compressor relay C1000 OK?**	**No** REPAIR as necessary. TEST the system for normal operation.
O2 CHECK CIRCUIT 1053 (LB/BK) • Measure the voltage between air compressor relay C1000 pin 1, circuit 1053 (LB/BK), harness side and ground. • **Is the voltage greater than 10 volts?**	**Yes** GO to O3 . **No** REPAIR the circuit. TEST the system for normal operation.
O3 CHECK CIRCUIT 538 (GY/RD) • Disconnect: Air Compressor Assembly C194. • Measure the resistance between air compressor relay C1000 pin 5, circuit 538 (GY/RD), harness side and air compressor assembly C194 pin 4, circuit 538 (GY/RD), harness side. • **Is the resistance less than 5 ohms?**	**Yes** GO to O4 . **No** REPAIR the circuit. TEST the system for normal operation.
O4 CHECK CIRCUIT 577 (LG/RD) • Measure the resistance between air compressor assembly C194 pin 1, circuit 577 (LG/RD), harness side and ground. • **Is the resistance less than 5 ohms?**	**Yes** RECONNECT air compressor relay C1000 and air compressor assembly C194. GO to O5 . **No** REPAIR the circuit. TEST the system for normal operation.
O5 CHECK AIR COMPRESSOR AFTER COOL DOWN PERIOD • Turn the air suspension service switch to the OFF position. Allow the vehicle to sit for 60 minutes to give the air compressor assembly time to cool off. • Turn the air suspension service switch to the ON position. • Key in ON position. • TRIGGER the 4WAS module vent on active command. • TRIGGER the 4WAS module compressor on active command. • **Does the air compressor assembly run?**	**Yes** GO to O8 . **No** GO to O6 .
O6 CHECK AIR COMPRESSOR RELAY POWER • Disconnect: Air Compressor Relay C1000. • Measure the voltage between air compressor relay C1000 pin 2 circuit 577 (PK/LB), harness side and ground. • **Is the voltage less than 10 volts?**	**Yes** GO to O7 . **No** REPAIR circuit 577 (PK/LB). TEST the system for normal operation.
O7 CHECK AIR COMPRESSOR RELAY • Key in OFF position. • Connect a fused (50A) jumper wire (10 gauge) between air compressor relay C1000 pin 3, circuit 1053 (LB/BK), harness side and air compressor relay C1000 pin 5, circuit 538 (GY/RD), harness side. • **Does the air compressor run?**	**Yes** DISCONNECT the jumper wire. INSTALL a new air compressor relay. TEST the system for normal operation. **No** DISCONNECT the jumper wire. INSTALL a new air compressor. REFER to Air

	Suspension Compressor in this section. TEST the system for normal operation.
O8 CHECK AIR COMPRESSOR THERMAL BREAKER	
• TRIGGER the 4WAS module LR and RR air spring solenoid valve open active commands. • Run the air compressor assembly for 60 seconds. • **Did the air compressor assembly run for 60 seconds?**	**Yes** The thermal breaker was overheated. RETEST to validate the system is OK. **No** INSTALL a new air compressor assembly. REFER to Air Suspension Compressor in this section. TEST the system for normal operation.

Component Test

Relay

Refer to Wiring Diagrams Cell 149 for schematic and connector information.

Ride Height Adjustments

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052 or equivalent scan tool

Inflation and Deflation of the Air Suspension System

1. **NOTE:** Make sure that the air suspension switch is in the ON position

   NOTE: Make sure that a battery voltage of at least 11 volts is maintained while carrying out this procedure.

   Turn the ignition switch to the ON position.

2. Connect scan tool to the data link connector (DLC).

3. Select Air Suspension Control Module under Active Command Mode:
   - VENT FRNT to deflate the front down.
   - LIFT FRNT to inflate the front up.
   - VENT REAR to deflate the rear down.
   - LIFT REAR to inflate the rear up.

Calibration

Ride Height Resetting

1. **NOTE:** Make sure that the air suspension switch is in the ON position.

   NOTE: Make sure that a battery voltage of at least 11 volts is maintained while carrying out this procedure.

   Turn the ignition to the ON position.
   - Exit the vehicle, close all doors and allow the system to vent the vehicle down to kneel height (approximately 45 seconds).

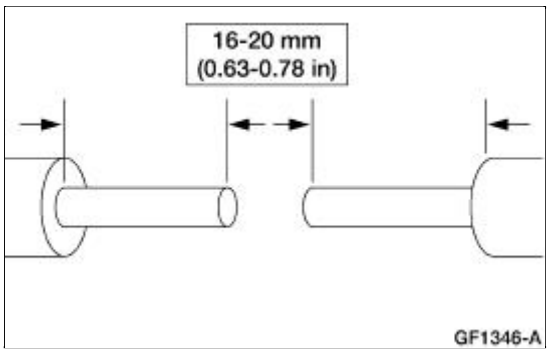
2. With the ignition remaining in the ON position, shift the vehicle into DRIVE and then back to PARK.

- Exit the vehicle, close all doors and allow the vehicle to pump to trim (approximately 45 seconds).

3. Measure the ride height. For additional information, refer to Section 204-00 .
4. Open the LF door.
5. Connect scan tool to the data link connector (DLC).
6. While outside of the vehicle, select the proper vehicle year, model and engine type.
7. Select 4WAS module.
8. Using the active command mode, vent or lift the vehicle to achieve the correct ride height.
9. Select the "Save Calibration Values (Store Ride Height)" scan tool command to calibrate the 4WAS module.

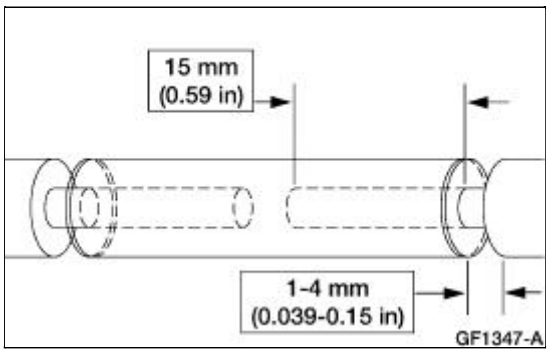
Air Leaks

1. Apply a soapy water solution to the air lines, air line fittings, air springs and the air compressor.



2. **NOTE:** If a leak is detected within the air compressor, install a new compressor. If a leak is detected in a line, carry out the air line repair procedure.

   Verify the location of air leak(s) and repair or install new components as necessary.



Air Line Repair

3. Cut the line at the damaged area.

4. Trim the sleeve material from both ends of the damaged line.

5. Install the repair filling.

6. **NOTE:** Check system for leaks.

   Inflate the air suspension system. For additional information, refer to Ride Height Adjustments in this section.

Air Line Fluid Purge

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052 or equivalent scan tool

1. **NOTE:** If oil is present in the air lines, remove the air spring solenoids and inspect the solenoid filters. If oil is present in a filter, replace the solenoid and the shock absorber.

   Disconnect the air line at the air compressor drier that is connected to the front fill solenoid inlet.

2. Disconnect the air line at the RF and LF air spring solenoids.

3. Connect shop air line to the disconnected air line (drier end) and blow out any fluid.

4. **NOTE:** When installing air lines, make sure the white air line is fully inserted into the fitting for correct installation.

   Reconnect the air line at the RF air spring solenoid.

5. Disconnect the air line at the RR and LR air spring solenoids.

6. Connect the shop air line (drier end) to the disconnected air line and blow out any fluid.

7. **NOTE:** When installing the air lines, make sure the white air line is fully inserted into the fitting for correct installation.

   Reconnect the air line at the RR and LR air spring solenoids.

8. Replace the air compressor drier. For additional information, refer to Air Suspension Compressor Drier in this section.

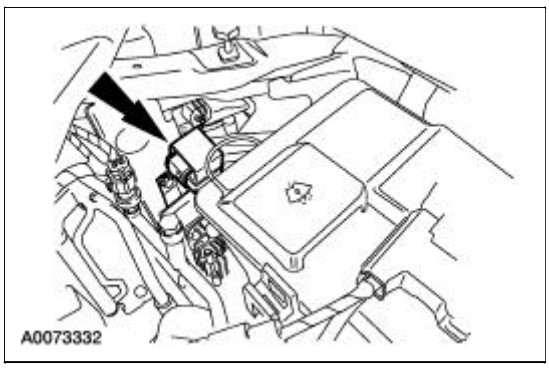
9. **NOTE:** When installing the air lines, make sure the white air line is fully inserted into the fitting for correct installation.

   Reconnect the air line to the air compressor drier.

10. **NOTE:** When installing the air lines, make sure the white air line is fully inserted into the fitting for correct installation.

    Reconnect the air line at the rear LH and RH air spring solenoids.

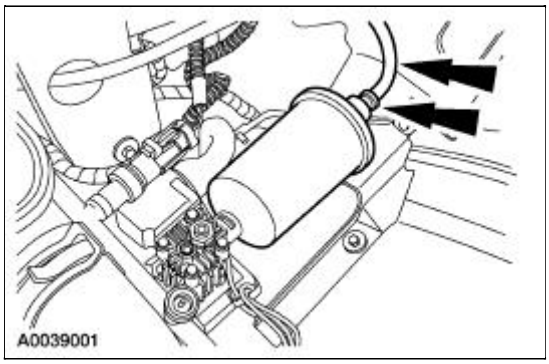
11. Replace the air compressor drier. For additional information, refer to Air Suspension Compressor Drier in this section.



12. **NOTE:** When installing the air lines, make sure the white air line is fully inserted into the fitting for correct installation.

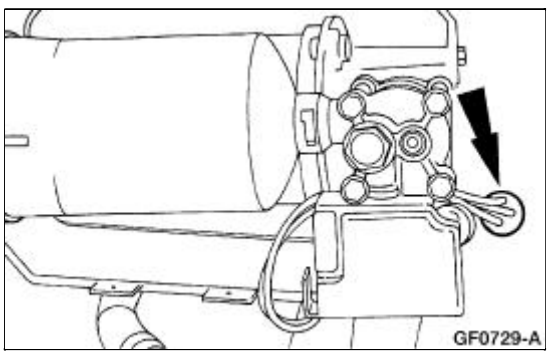
    Reconnect the air line to the air compressor drier.

Air Suspension Compressor

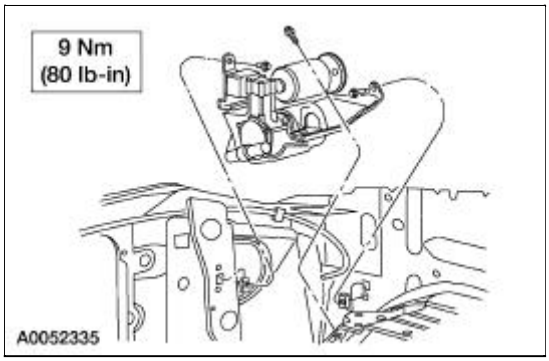


Removal and Installation

1. Remove the air suspension relay from the bracket (if equipped).



2. Remove the windshield washer pump and reservoir. For additional information, refer to Section 501-16 .



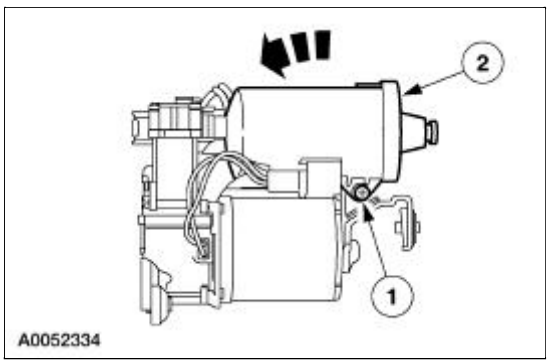
3. Compress the orange quick-connect lock ring inward while pulling outward on the air supply line.

4. Disconnect the air compressor electrical connector.

5. Remove the air compressor bracket bolts and remove the air compressor/drier assembly.

6. **NOTE:** When installing the air lines, make sure the white air line is fully inserted into the fitting for correct installation.

   To install, reverse the removal procedure.



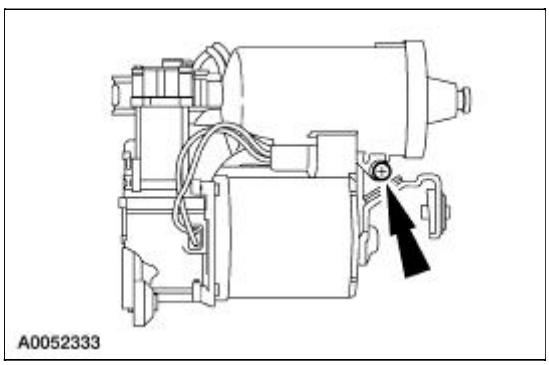
Air Suspension Compressor Drier

Removal

1. Remove the air compressor. For additional information, refer to Air Suspension Compressor in this section.

2. **NOTE:** Make sure that the drier O-ring does not remain inside of the compressor assembly.

   Remove the air compressor drier.
   1. Remove the screw.
   2. Rotate 90 degrees counterclockwise to unlock, then remove the air compressor drier.



Installation

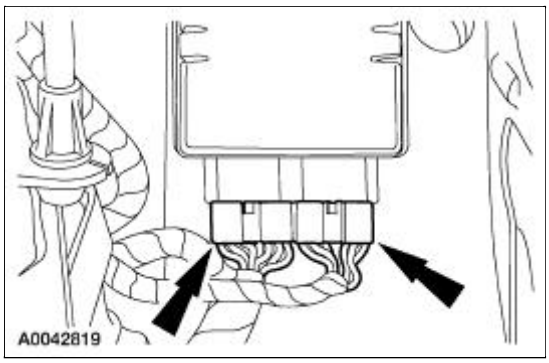
1. **NOTE:** Inspect the drier O-ring for damage and replace as necessary.

   NOTE: When installing the air lines, make sure the white air line is fully inserted into the fitting for correct installation.

   NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

   To install, reverse the removal procedure.

Air Suspension Control Module



Removal and Installation

1. **CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.**

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. **NOTE:** The air suspension control module is mounted to the lower left side of the dash above the parking brake control.

   Disconnect the electrical connectors.

3. Pull back the dash padding to expose the module mounting nuts.

4. Remove the air suspension control module nuts.

5. **NOTE:** When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.

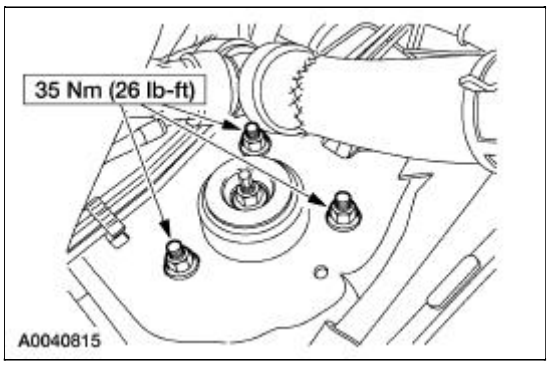
   NOTE: The air suspension control module is calibrated with information from the ride height sensor. A new or exchanged air suspension control module requires that the ride height adjustment calibration and pneumatic test be carried out. For additional information, refer to Calibration Initialize System — Clear C1990 and C1991 DTCs.

   To install, reverse the removal procedure.

Air Shock Absorber —Front

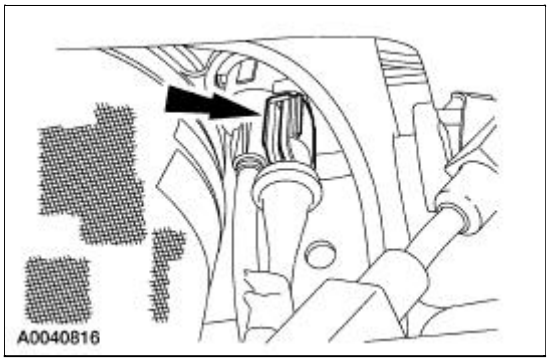
Material

Item	Specification
Multi-Purpose Grease XG-4	ESR-M1C159-A



Removal and Installation

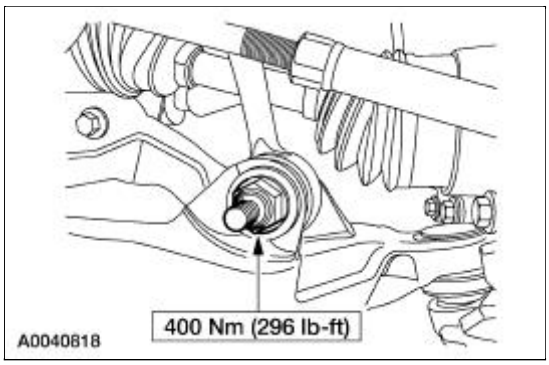
WARNING: Do not remove an air spring under any circumstances when there is pressure in the air spring. Do not remove any components supporting an air spring without either exhausting the air or providing support for the air spring to prevent vehicle damage or personal injury.



CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be used if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

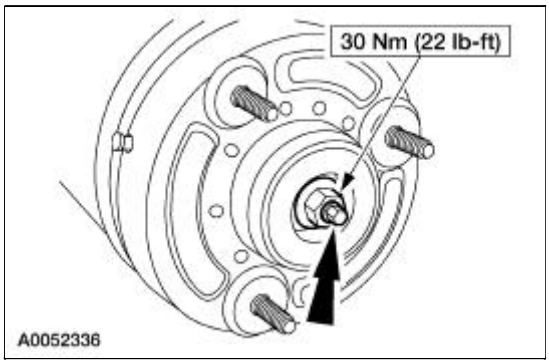
1. Using the scan tool, vent the appropriate air spring(s).
2. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH rear quarter trim panel. Failure to do so may result in unexpected inflation or deflation of the air springs which may result in shifting of the vehicle during these operations.**

   Turn the air suspension switch to the OFF position.
3. Remove the nuts.
   - Discard the nuts.



4. Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .
5. Disconnect the electrical connector.

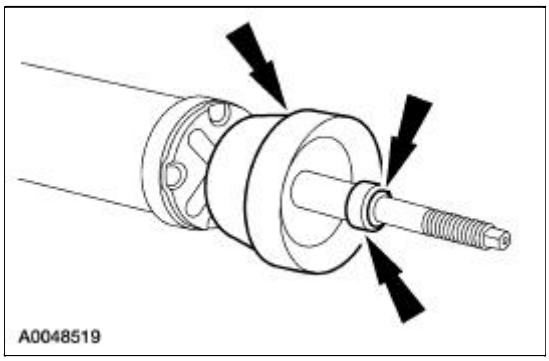
6. Compress the orange quick-connect lock ring while pulling outward on the air supply line.



7. Remove the nut, bolt and the air shock absorber.
    - Discard the nut.

8. **NOTE:** Use the hex holding feature to prevent the shock rod from turning while removing the nut.

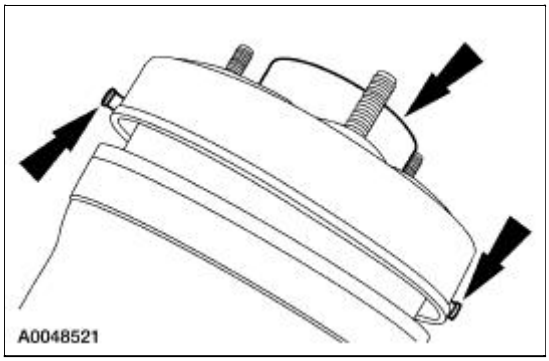
    Remove and discard the nut.



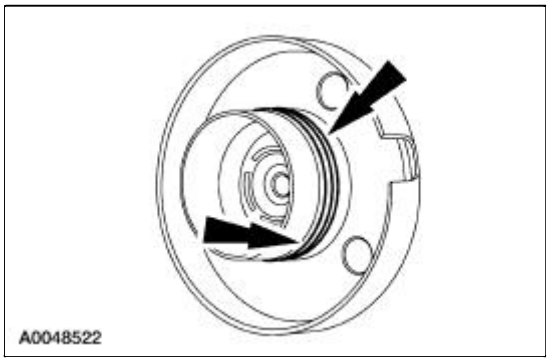
9. **CAUTION: If the retainer tabs are broken, a new air spring must be installed.**

   NOTE: Make an index mark on the air spring and the shock absorber for reference during the installation procedure.

   Depress the retainer tabs and remove the air spring.



10. Remove the O-ring seal, washer and jounce bumper.
    - Discard the seal and washer.



11. Remove and discard the O-ring seals.

12. Remove the retainer pins and the upper mount.
    - Discard the pins.

13. Remove and discard the O-ring seals.

14. **CAUTION: Use a suitable press to install the upper mount retainer pins. Do not use a hammer or damage may occur.**

    NOTE: During installation, use assembly kit 2L74-5B303-AA.

    NOTE: Make sure to apply a thin coat of grease to the new O-ring seals.

    To install, reverse the removal procedure.

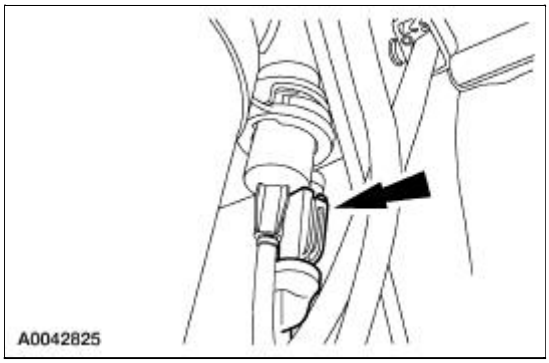
Removal and Installation

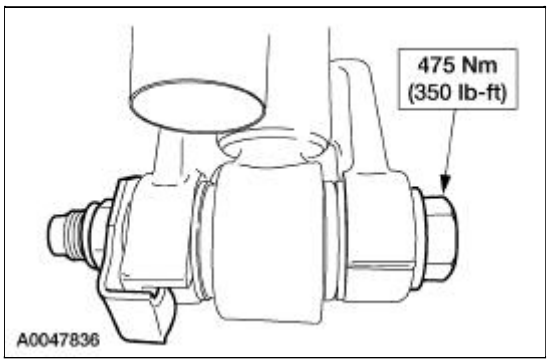
WARNING: Do not remove an air spring under any circumstances when there is pressure in the air spring. Do not remove any components supporting an air spring without either exhausting the air or providing support for the air spring to prevent vehicle damage or personal injury.



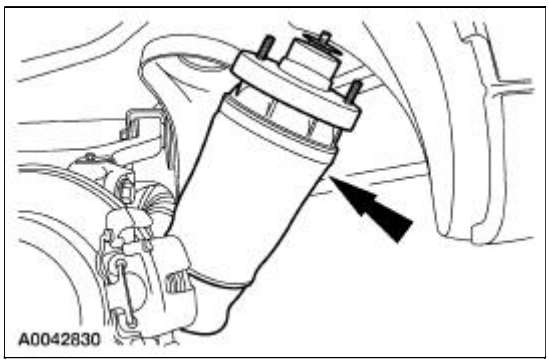
CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be used if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Using the scan tool, vent the appropriate air spring.
2. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH quarter trim panel. Failure to do so may result in unexpected inflation or deflation of the air springs which may result in shifting of the vehicle during these operations.**

   Turn the air suspension switch to the OFF position.
3. Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .
4. Remove the nuts.
   - Discard the nuts.

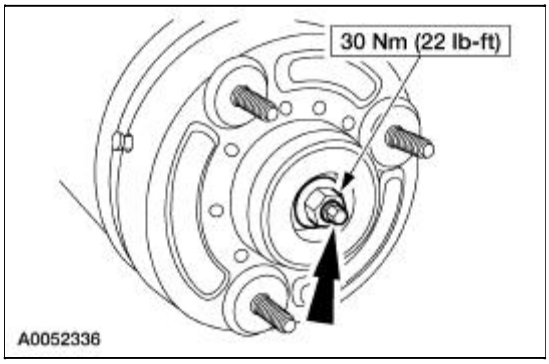


5. Disconnect the electrical connector.



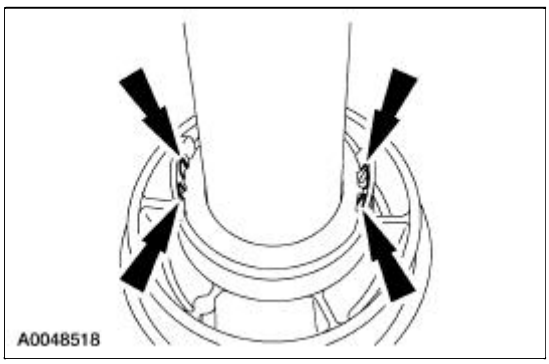
6. Compress the quick connect lock ring while pulling outward on the air supply line.

7. Remove the bolt and flag nut.
    - Discard the flag nut.

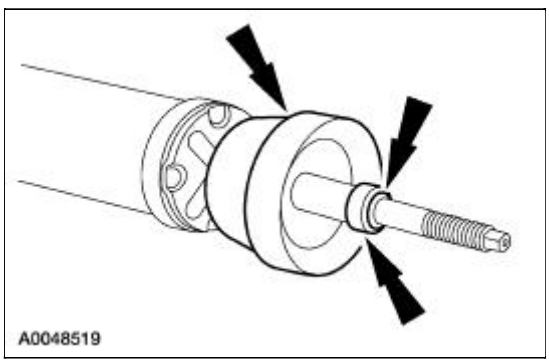


8. Remove the air shock absorber.

9. **NOTE:** Use the hex holding feature to prevent the shock rod from turning while removing the nut.



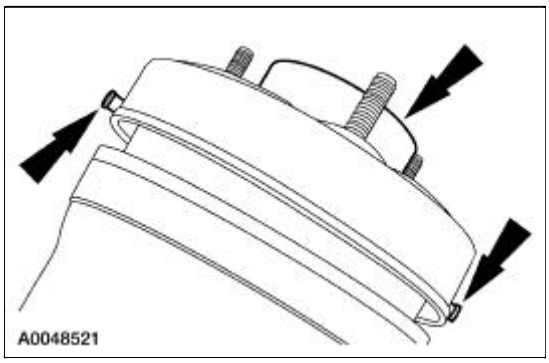
Remove and discard the nut.



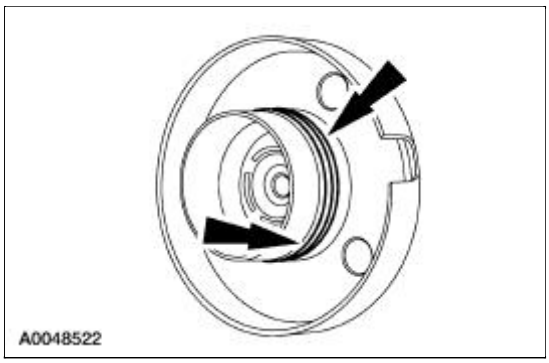
10. **CAUTION: If the retainer tabs are broken, a new air spring must be installed.**

    NOTE: Make an index mark on the air spring and shock absorber for reference during the installation procedure.

    Depress the retainer tabs and remove the air spring.



11. Remove the O-ring seal, washer and jounce bumper.
    - Discard the seal and washer.



12. Remove and discard the O-ring seals.

13. Remove the retainer pins and the upper mount.
    - Discard the pins.

14. Remove and discard the O-ring seals.

15. **CAUTION: Use a suitable press to install the upper mount retainer pins. Do not use a hammer or damage may occur.**

    NOTE: During installation, use assembly kit 2L74-5B303-AA.

    NOTE: Make sure to apply a thin coat of grease to the new O-ring seals.

    To install, reverse the removal procedure.

Air Spring Solenoid Valve

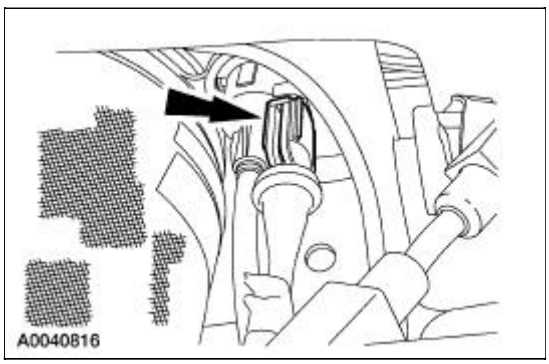
Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3	ESE-M1C171-A

Removal and Installation

WARNING: Do not remove an air spring under any circumstances when there is pressure in the air spring. Do not remove any components supporting an air spring without either exhausting the air or providing support for the air spring to prevent vehicle damage or personal injury.

NOTE: Front shown, rear similar



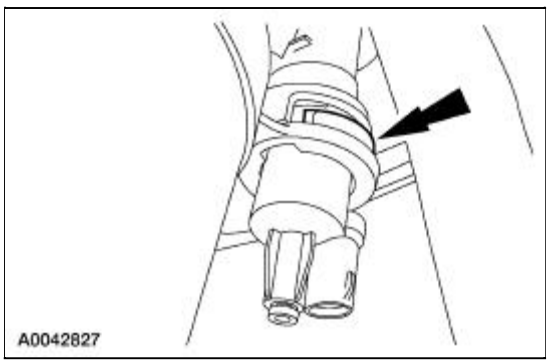
1. If the air spring solenoid valve is functional, use the scan tool to vent the appropriate air spring (s).

2. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH quarter trim panel. Failure to do so may result in unexpected inflation or deflation of the air springs which may result in shifting of the vehicle during these operations.**

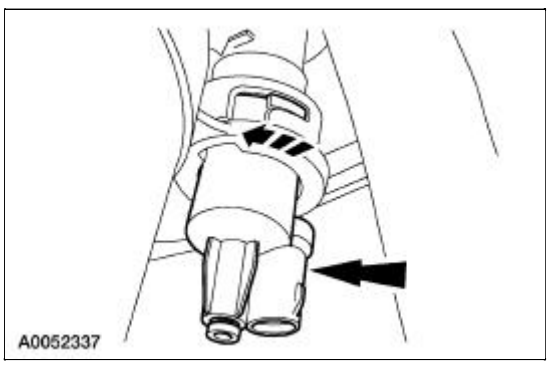
   Turn the air suspension switch to the OFF position.

3. Remove the wheel and tire assembly. For additional information, refer to Section 204-04

4. Disconnect the electrical connector.



5. Compress the lock ring while pulling down on the air line and disconnect the air line.



6. **CAUTION: Remove any dirt or other debris from the air spring assembly prior to removing the air spring solenoid valve from the air spring assembly.**

   Remove the air spring solenoid clip.

7. **WARNING: The air spring solenoid valve has a two stage release. When removing a non-functional solenoid and the air spring is inflated, carefully rotate the solenoid counterclockwise until it reaches the first stage to release the air from the air spring. Turn the solenoid to the second stage to remove the solenoid. Failure to follow these instructions when removing a non-functional air spring solenoid can cause personal injury or damage to components as high pressure air is vented uncontrolled.**

   Rotate the air spring solenoid and remove the solenoid.

8. **NOTE:** Inspect the O-ring for damage and install a new O-ring as necessary. Lubricate the solenoid seal area with silicone grease.

   NOTE: After installing the solenoid, it is necessary to inflate the air suspension system. For additional information, refer to Ride Height Adjustments in this section.

   NOTE: When installing the air lines, make sure the white air line is fully inserted into the fitting

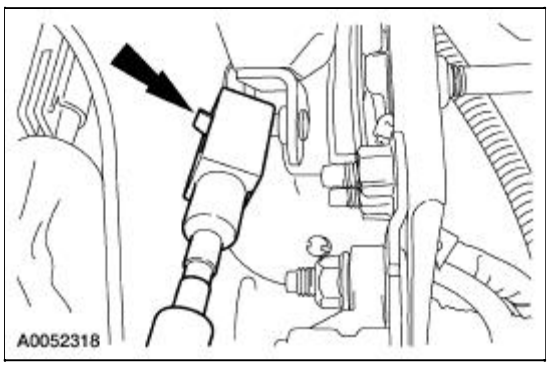
for correct installation.

To install, reverse the removal procedure.

Suspension Height Sensor

Removal and Installation

NOTE: Front shown, rear similar

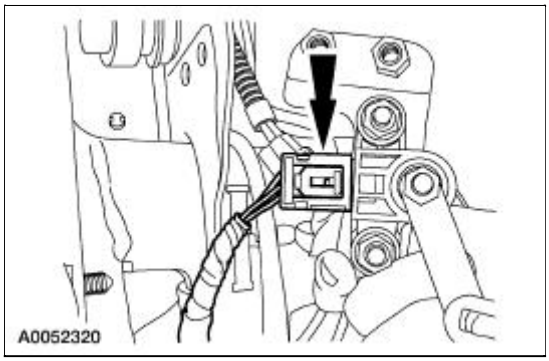


All vehicles

1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the LH quarter trim panel. Failure to do so may result in unexpected inflation or deflation of the air springs which may result in shifting of the vehicle during these operations.**

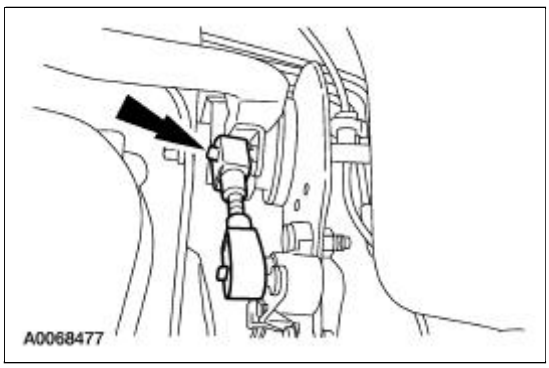
   Raise and support the vehicle. For additional information, refer to Section 100-02 .

Vehicles with bracket mounted sensor

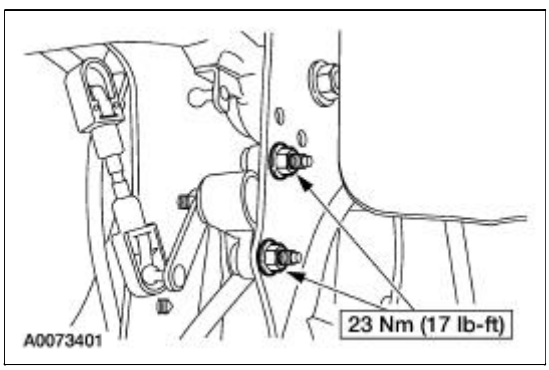


2. Disconnect the sensor arm.

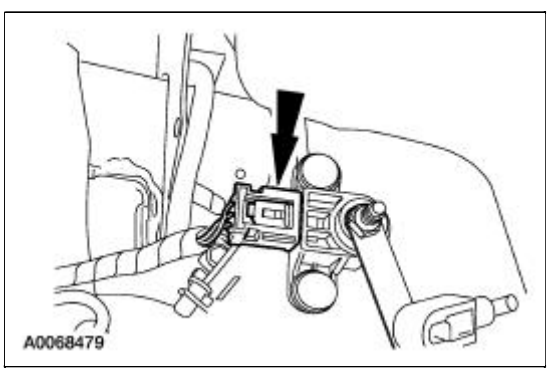
3. Remove the bolts and the sensor.



4. Disconnect the electrical connector.



Vehicles with stud mounted sensor



5. Disconnect the sensor arm.

6. Remove and discard the nuts.

7. Disconnect the electrical connector.

All vehicles

8. **NOTE:** The RH (3C112) and LH (3C113) height sensors cannot be used on opposite sides of the vehicle.

   To install, reverse the removal procedure.

General Specifications

Item	Specification
Driveline Angles	
Universal Joint Operating Angle	0.5°-3.0°
Axle Capacities and Lubricant Specifications	
SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL	WSL-M2C192-A
Additive Friction Modifier XL-3	EST-M2C118-A
Premium Long-Life Grease XG-1-C	ESA-M1C75-B
SAE-75W90 XY-75W90-QL	FEHP
Front axle liters (pints)	1.70 (3.6)
Conventional rear axle liters (pints) 8.8 in./9.75 in.	1.9 (4.0)
Traction-Lok® rear axle liters (pints) 8.8 in./9.75 in.	1.77 (3.75)
Traction-Lok® [a] ml (ounces)	118 (4)

[a] Friction Modifier

Driveline System

The source of the drivetrain's power is generated by the engine and delivered to the transmission. The driveline transfers the engine torque through the driveshaft to the axle.

- On 2-wheel drive vehicles, power is transmitted through the transmission to the driveshaft and then to the rear axle.
- On 4-wheel drive vehicles, power is transmitted through the transmission and the transfer case. The transfer case directs the power to the rear driveshaft and then to the rear axle. When engaged, it also transmits power through the front driveshaft to the front axle.

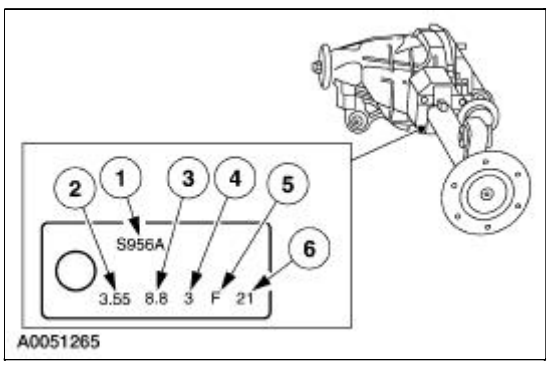
The rear driveshaft is connected to the output shaft of the transmission and to the rear axle. The front driveshaft is connected to the transfer case and to the front axle. Universal joints are used at both ends of the driveshaft to allow for angular motions. Slip yokes are used to allow for any changes to the length of the driveshaft. The engine torque enters the axle through the drive pinion, which rotates the ring gear. The ring gear is mounted to the differential case, which contains the gears that transmit power to the rear axle shafts or front halfshafts. These shafts rotate the drive wheels.

For additional information on the front axle assembly, refer to Section 205-03 .

For additional information on the halfshaft, refer to Section 205-04 .

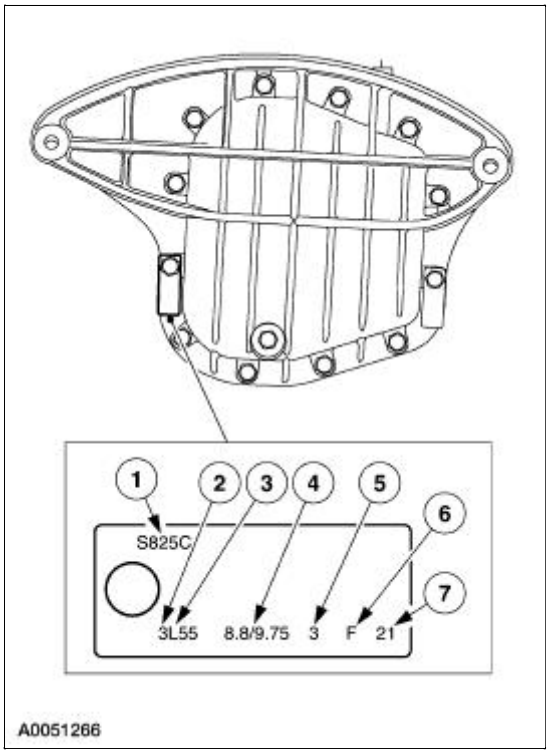
For additional information on the driveshaft, refer to Section 205-01 .

For additional information on the rear axle, refer to Section 205-02A or to Section 205-02B .



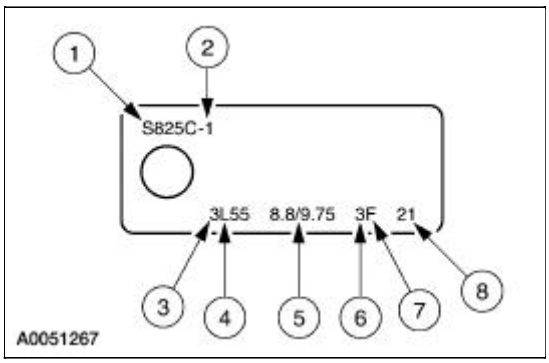
The engine angle is built into the engine mounts. If the engine angle is out of specification, the engine mounts must be inspected for damage. For additional information, refer to Section 303-01A for 4.6L or 5.4L engines.

Vehicle Certification (VC) Label Example



The vehicle certification (VC) label is located in the driver door jamb. The first two digits of the axle code indicate the rear axle and the third digit refers to the front axle, if so equipped. For additional information on the VC label, refer to Section 100-01 .

Front Axle Identification Tag



Item	Description
1	Plant code
2	Axle ratio
3	Ring gear diameter (inch)
4	Build year
5	Build month
6	Build day

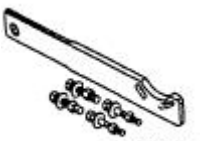
Rear Axle Identification Tag

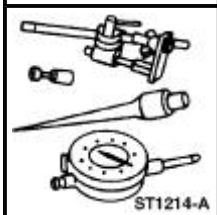
Item	Description
1	Plant code
2	Axle ratio
3	Denotes Traction-Lok®
4	Ring gear diameter (inch)
5	Build year
6	Build month
7	Build day

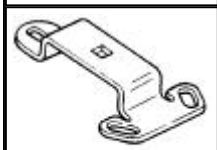
Axle Identification Tag Denoting Interchangeability Affected Internally

Item	Description
1	Plant code
2	Denotes interchangeability affected internally

3	Axle ratio
4	Denotes Traction-Lok®
5	Ring gear diameter (inch)
6	Build year
7	Build month
8	Build day







CAUTION: The axle identification tag is the official service identifier. Do not damage the tag. Always reinstall the tag after removing it for axle inspection/repair.

The plant code denotes a particular axle design, a specific ratio, and if it is a conventional or limited slip (Traction-Lok®) type. In addition, the plant code will not change as long as that particular axle assembly never undergoes an external design change. If, however, an internal design change takes place during the production life of the axle and that internal change affects parts interchangeability, a dash and numerical suffix is added to the plant code.

Note that the plant code in the front and rear axle identification tag illustrations is similar, but the illustration denoting interchangeability affected internally shows the addition of the suffix. This means that as an assembly both axles are interchangeable; however, internally they are different. Each axle requires different internal parts at the time of repair.

Driveline System

Special Tool(s)

 ST1268-A	Clamp Plate, Driveshaft 205-320 (T92L-4851-C)
 ST1348-A	Gauge, Clutch Housing 308-021 (T75L-4201-A)
 ST1257-A	Holding Fixture, Drive Pinion Flange 205-126 (T78P-4851-A)
 ST1267-A	Runout Gauge, Drive Pinion Flange 205-319 (T92L-4851-B)
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
 ST1266-A	Dial Indicator Gauge with Holding Fixture 100-D002 (D78P-4201-B) or equivalent
 ST1863-A	Gauge, Differential (Traction-Lok) 205-385 (T97T-4205-B)

Inspection and Verification

Certain axle noise or vibration symptoms are also common to the engine, transmission, wheel bearings, tires, and other parts of the vehicle. For this reason, be sure that the cause of the trouble is in the axle before disassembling, adjusting or repairing the axle. For additional information, refer to Section 100-04 .

Certain driveshaft vibration symptoms are common to the front engine accessory drive (FEAD), the engine, transmission or tires. Be sure the cause of the concern is the driveshaft before repairing or installing a new driveshaft. For additional information, refer to Section 100-04 .

Certain symptoms may be caused by Traction-Lok® differentials. Check the vehicle certification label and axle identification tag to determine the type of differential. For additional information, refer to Section 100-01 .

Noise Acceptability

NOTE: A gear-driven unit will produce a certain amount of noise. Some noise is acceptable and audible at certain speeds or under various driving conditions such as a newly paved blacktop road. Slight noise is not detrimental to the operation of the axle and is considered normal.

With the Traction-Lok® differential axle, slight chatter noise on slow turns after extended highway driving is considered acceptable and has no detrimental effect on the locking axle function.

Universal Joint (U-Joint) Inspection

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

Place the vehicle on a frame hoist and rotate the driveshaft by hand. Check for rough operation or seized U-joint. Install a new U-joint if it shows signs of seizure, excessive wear, or incorrect seating. For additional information, refer to Section 205-01 .

Analysis of Leakage

Clean up the leaking area enough to identify the exact source. An axle leak can be caused by the following:

- Axle lubricant level is too high.
- Worn or damaged axle shaft seals or differential seals.
- Differential housing is cracked.
- Flange yoke seal is worn or damaged.
- Pinion flange is scored or damaged.
- Axle cover is not sealed.
- Vent is plugged.

Repair the axle as necessary. Make sure the axle lubricant is at the correct level. For additional information, refer to Specifications if this section.

Axle Vent

NOTE: If a plugged vent cannot be cleared, install a new one.

A plugged vent will cause excessive seal lip wear due to internal pressure buildup. If a leak occurs, check the vent. Make sure the vent hose is not kinked. Remove the hose from the vent nipple and clear the hose of any foreign material. While the hose is removed, pass a length of mechanics wire or a small diameter Allen wrench in and out of the vent to clean it. Connect the hose when done.

Flange Yoke Seal

Leaks at the axle drive pinion seal originate for the following reasons:

- Seal was not correctly installed.
- Poor quality seal journal surface.

Any damage to the seal bore (dings, dents, gouges, or other imperfections) will distort the seal casing and allow leakage past the outer edge of the axle drive pinion seal.

The axle drive pinion seal can be torn, cut, or gouged if it is not installed carefully. The spring that holds the axle drive pinion seal against the pinion flange may be knocked out and allow leakage past the lip.

The rubber lips can occasionally become hard (like plastic) with cracks at the oil lip contact point. The contact point on the pinion flange may blacken, indicating excessive heat. Marks, nicks, gouges, or rough surface texture on the seal journal of the pinion flange will also cause leaks.

Axle drive pinion seal wear 1.27 mm (0.050 inch) or greater is considered excessive.

A new pinion flange must be installed if any of these conditions exist.

Metal chips or sand trapped at the sealing lip may also cause oil leaks. This can cause a wear groove on the pinion flange and heavy pinion seal wear.

When a seal leak occurs, install a new seal and check the vent and the vent hose to make sure they are clean and free of foreign material.

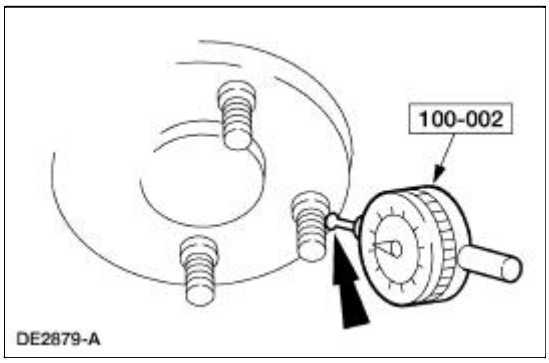
Axle Shaft Seals

Axle shaft oil seals are susceptible to the same kinds of damage as axle drive pinion seals if incorrectly installed. The seal bore must be clean and the lip handled carefully to avoid cutting or tearing it. Axle shaft journal surface must be free of nicks, gouges, and rough surface texture.

Differential Seals

For additional information on differential seals, refer to Section 205-02A or Section 205-02B for the rear axle or Section 205-03 for the front axle.

Analysis of Vibration

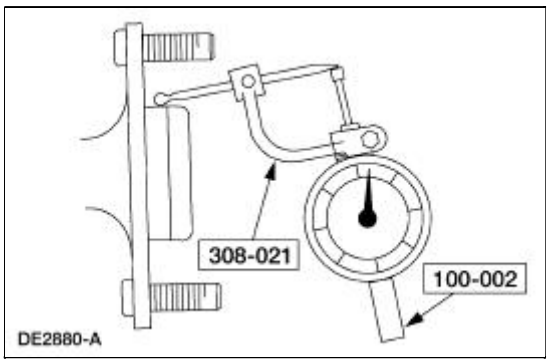


WARNING: A vehicle equipped with a Traction-Lok® differential will always have both wheels driving. If only one wheel is raised off the floor and the rear axle is driven by the engine, the wheel on the floor could drive the vehicle off the stand or jack. Be sure both rear wheels are off the floor.

Few vibration conditions are caused by the front or rear axle. On a vibration concern, follow the diagnosis procedure in Section 100-04 unless there is a good reason to suspect the axle.

Wheel Hub or Axle Flange Bolt Circle Runout

NOTE: The brake discs must be removed to carry out all runout measurements.

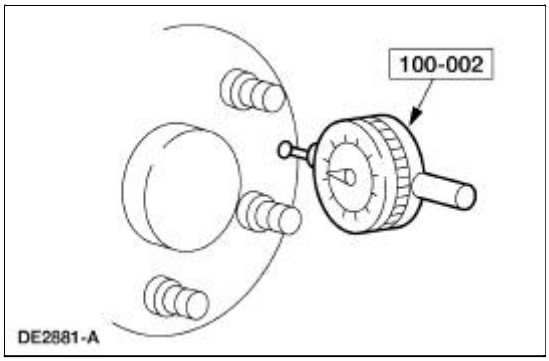


1. Position the special tool perpendicular to the wheel hub or axle flange bolt, as close to the hub or flange face as possible. Zero the indicator to allow the pointer to deflect either way.

2. Rotate the hub or flange until the next bolt is contacted. Record the measurement and continue until each bolt is checked. The difference between the maximum and minimum contact readings will be the total wheel hub or axle flange bolt pattern runout. The runout must not exceed 0.38 mm (0.015 inch).

Pilot Runout

1. Position the special tool as close to the hub or axle flange face as possible. Zero the indicator to allow the pointer to deflect either way.



2. Rotate the hub or flange one full turn and note the maximum and minimum readings. The difference between the maximum and minimum readings will be the total pilot runout. Pilot runout must not exceed 0.15 mm (0.006 inch).

Wheel Hub or Axle Flange Face Runout

NOTE: If the axle shaft assembly is removed, check runout of the shaft itself. The forged (unmachined) part of the shaft is allowed to have as much as 3.0 mm (0.120 inch) runout. This alone will not cause a vibration condition.

1. Position the special tools on the wheel hub or axle flange face, as close to the outer edge as possible. Zero the indicator to allow the pointer to deflect either way.

2. Rotate the hub or flange one full turn and note the maximum and minimum readings. The difference between the maximum and minimum readings will be the total face runout. The runout must not exceed 0.254 mm (0.010 inch).

Drive Pinion Stem and Pinion Flange

Check the pinion flange runout when all other checks have failed to show the cause of vibration.

One cause of excessive pinion flange runout is incorrect installation of the axle drive pinion seal. Check to see if the spring on the seal lip has been dislodged before installing a new ring gear and pinion.

Halfshafts

NOTE: New constant velocity (CV) joints must not be installed unless disassembly and inspection reveals unusual wear. For additional information, refer to Section 205-04 or Section 205-05 .

NOTE: Inspect the boots for indentations ("dimples") in the boot convolutions. Indentations must be removed.

- Inspect the boots for evidence of cracks, tears, or splits.
- Inspect the underbody for any indication of grease splatter near the boots outboard and inboard locations. This is an indication of boot/clamp damage.

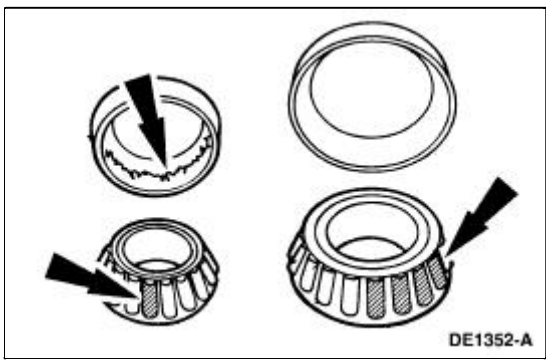
Axle Noise

NOTE: Before disassembling the axle to diagnose and correct gear noise, eliminate the tires, exhaust, trim items, roof racks, axle shafts and wheel bearings as possible causes. Follow the diagnostic procedures. For additional information, refer to Section 100-04 .

The noises described as follows usually have specific causes that can be diagnosed by observation as the unit is disassembled. The initial clues are the type of noise heard during the road test.

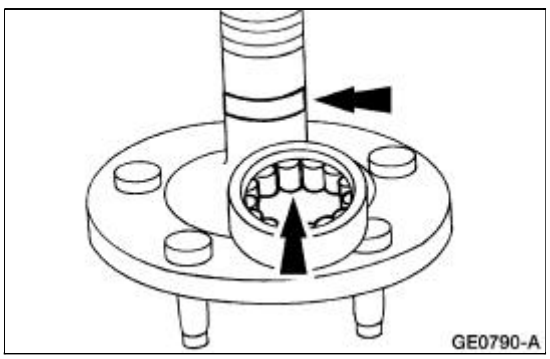
Gear Howl and Whine

Howling or whining of the ring gear and pinion is due to an incorrect gear pattern, gear damage or incorrect bearing preload.



Bearing Whine

Bearing whine is a high-pitched sound similar to a whistle. It is usually caused by worn/damaged pinion bearings, which are operating at driveshaft speed. Bearing noise occurs at all driving speeds. This distinguishes it from gear whine which usually comes and goes as speed changes.



As noted, pinion bearings make a high-pitched, whistling noise, usually at all speeds. If however there is only one pinion bearing that is worn/damaged, the noise may vary in different driving phases. New pinion bearings must not be installed unless scoring or damage is found or there is a specific pinion bearing noise. A worn/damaged bearing will normally be obvious at disassembly. Examine the large end of the rollers for wear. If the pinion bearings original blend radius has worn to a sharp edge, a new pinion bearing must be installed.

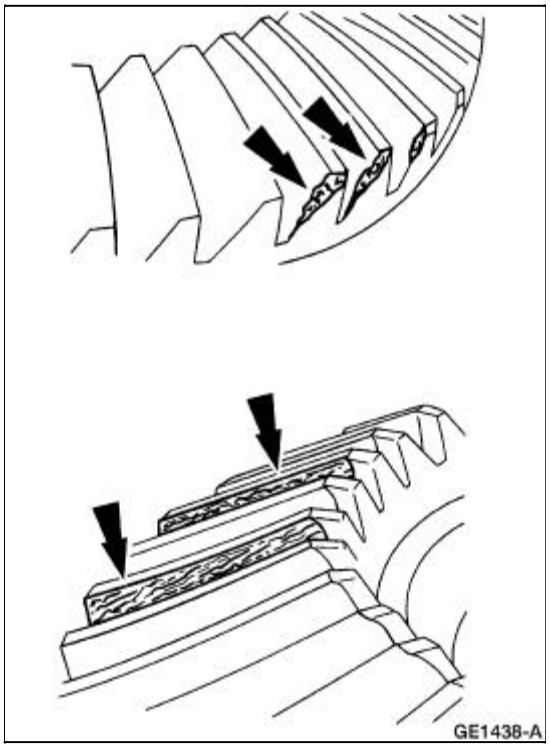
NOTE: A low-pitched rumble normally associated with a worn/damaged wheel bearing can be caused by the exterior luggage rack or tires.

A wheel bearing noise can be mistaken for a pinion bearing noise. On 4x2 vehicles, check the wheel bearing for a spalled cup, and spalled/damaged rollers. Install a new wheel bearing if any of these concerns are detected.

If the wheel bearing is damaged, the roller surface on the axle shaft may also be damaged. Install a new axle shaft if any damage is detected.

On 4x4 vehicles, check the wheel bearing for rotating smoothness and end play. Install new wheel bearings as required.

Chuckle

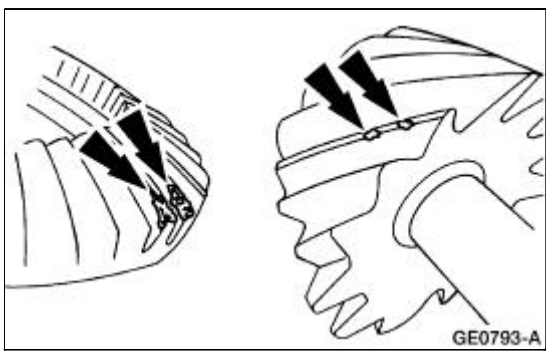


Chuckle that occurs on the coast driving phase is usually caused by excessive clearance between the differential gear hub and the differential case bore.

Damage to a gear tooth on the coast side can cause a noise identical to a chuckle. A very small tooth nick or ridge on the edge of a tooth can cause the noise.

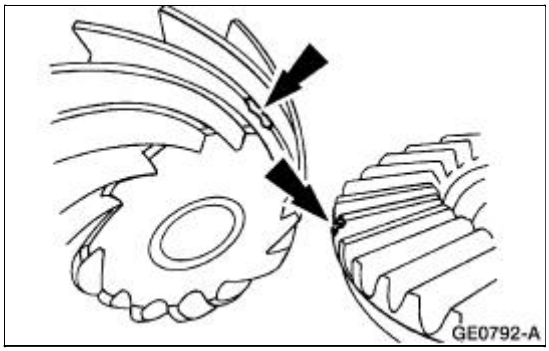
Clean the gear tooth nick or ridge with a small grinding wheel. If the damaged area is larger than 3.2 mm (1/8 inch), install a new gearset.

To check the ring gear and pinion, remove as much lubricant as possible from the gears with clean solvent. Wipe the gears dry or blow them dry with compressed air. Look for scored or damaged teeth. Also look for cracks or other damage.



If either gear is scored or damaged badly, a new ring gear and pinion must be installed.

If metal has broken loose, the axle housing must be cleaned to remove particles that will cause damage. At this time if any other damaged parts are found in the axle housing, new parts must also be installed.



Knock

Knock, which can occur on all driving phases, has several causes including damaged teeth or gearset.

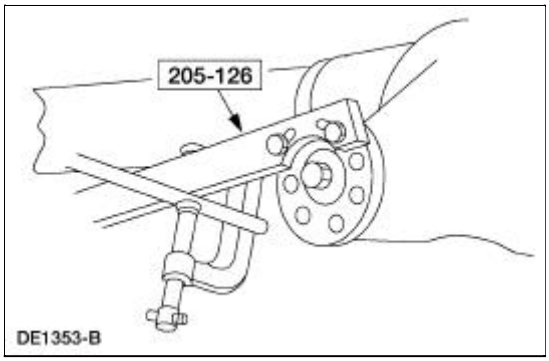
In most cases, one of the following conditions will occur:

1. A gear tooth damaged on the drive side is a common cause of the knock. This can usually be corrected by grinding the damaged area.

2. **NOTE:** Measure the end play with a Dial Indicator Gauge with Holding Fixture and not by feel.

   The knock is also caused by excessive end play in the axle shafts. Up to 0.762 mm (0.030 inch) is allowed in semi-float axles. The frequency of the knock will be less because the axle shaft speed is slower than the driveshaft.

Clunk



Clunk is a metallic noise heard when the automatic transmission is engaged in REVERSE or DRIVE. The noise may also occur when throttle is applied or released. It is caused by backlash somewhere in the driveline or loose suspension components; it is felt or heard in the axle. Refer to Total Backlash Check in this section.

Additionally, clunk may be heard upon initial drive-away. This occurs as engine torque shifts vehicle weight, forcing changes in driveline angles, preventing the driveshaft slip-yoke from sliding on the output shaft. To correct this condition, lubricate the slip-yoke splines. For additional information, refer to Section 205-01 .

Total Backlash Check

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

1. Raise and support the vehicle. For additional information, refer to Section 100-02 .
2. Remove the driveshaft. For additional information, refer to Section 205-01 .
3. Install the special tool.
   - Clamp a rigid bar or pipe to the tool. Clamp the other end of the bar or pipe to the frame or a body member in order to prevent movement of the pinion flange.

4. Lower the vehicle so that one rear wheel is resting on a wheel chock to prevent it from turning. The other rear wheel will be used to measure total rear axle backlash.

5. Rotate the free wheel slowly, by hand, until the feeling of driving the rear axle is encountered. Place a mark on the side of the tire, 305 mm (12 inches) from the center of the wheel, with a crayon or chalk.

6. While holding the crayon or chalk against the tire, rotate the wheel slowly in the opposite direction until the feeling of driving the rear axle is encountered again.

7. Measure the length of the crayon or chalk mark on the tire.
    - If the length of the mark is 25.4 mm (1 inch) or less, the rear axle backlash is within allowable limits.
    - If the chalk mark is greater than 25.4 mm (1 inch), check for these conditions:
        - Elongation of the differential pinion shaft and holes in the differential case (4204).
        - Missing differential pinion thrust washer (4230) or differential side gear thrust washer (4228)
        - Galling of the differential pinion shaft (4211) and bore.
        - Excessive ring gear and pinion backlash. Follow the procedure for the type of rear axle to check backlash.

Axle Shaft Bearing Noise

Axle shaft bearing noise is similar to gear noise and differential pinion bearing whine. Axle shaft bearing noise will usually distinguish itself from gear noise by occurring in all driving modes (drive, coast, and float), and will persist with the transmission in NEUTRAL while the vehicle is moving at the speed in which the concern is occurring. If the vehicle makes this noise, remove the suspect axle shaft and install a new bearing and axle seal. Re-evaluate the vehicle for noise before removing any internal components.

Bearing Rumble

Bearing rumble sounds like marbles being tumbled. This condition is usually caused by a worn/damaged wheel bearing. The lower pitch is because the wheel bearing turns at only about one-third of the driveshaft speed. Wheel bearing noise also may be high-pitched, similar to gear noise, but will be evident in all four driving modes.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action

• Traction-Lok® does not work in snow, mud or on ice	• Differential.	• CARRY OUT the Traction-Lok® Differential Operation Check in this section. REPAIR as necessary. REFER to Section 205-02A or Section 205-02B .
• Lubricant leaking from the pinion seal, axle shaft oil seals or support arm to the housing	• Vent. • Damage in the seal contact area or dust slinger on the pinion flange dust shield.	• CLEAN the axle housing vent. • INSTALL a new pinion flange and the pinion seal if damage is found.
• The vehicle does not shift between the different modes correctly	• Mode switch. • Wiring/relays. • Shift motor. • Transfer case. • GEM.	• REFER to Section 308-07A .
• Front axle will not engage	• Switches • Wiring. • GEM. • Shift motor.	• REFER to Section 308-07A .
• Front axle will not disengage	• Switches. • Wiring. • GEM. • Shift motor.	• REFER to Section 308-07A .
• Differential side gears/pinion gears are scored	• Insufficient lubrication. • Incorrect or contaminated lubricant type	• INSTALL new gears. REFER to Section 205-02A , Section 205-02B or Section 205-03 . FILL the axle to specification. • INSTALL new gears. REFER to Section 205-02A , Section 205-02B or Section 205-03 . CLEAN and REFILL the axle to specification.
• Axle overheating	• Lubricant level too low. • Incorrect or contaminated lubrication type. • Bearing preload adjusted too tight. • Excessive gear wear. • Incorrect ring gear backlash	• CHECK the lubricant level. FILL the axle to specification. • INSPECT the axle for damage. REPAIR as necessary. CLEAN and REFILL the axle to specification. • CHECK the ring and pinion for damage. INSPECT the ring and pinion wear pattern. ADJUST the preload as necessary. • INSPECT all the axle gears for wear or damaged. INSTALL new components as necessary. • INSPECT the ring gear for scoring. INSPECT the ring and pinion wear pattern. ADJUST the ring gear backlash as necessary.

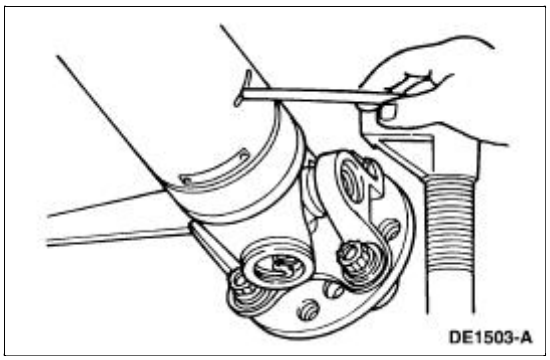
• Broken gear teeth on the ring gear or pinion	• Overloading the vehicle.	• INSTALL a new ring and pinion. REFER to Section 205-02A , Section 205-02B or Section 205-03 .
• Axle shaft broken	• Overloading the vehicle. • Misaligned axle shaft tube.	• INSTALL a new axle shaft. REFER to Section 205-02A , Section 205-02B or Section 205-03 . • INSPECT the axle for damage. CHECK axle shaft tube alignment. INSTALL a new axle shaft. REFER to Section 205-02A , Section 205-02B or Section 205-03 .

Component Tests

Driveline Vibration

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

Driveline vibration exhibits a higher frequency and lower amplitude than does high-speed shake. Driveline vibration is directly related to the speed of the vehicle and is usually noticed at various speed ranges. Driveline vibration can be perceived as a tremor in the floor pan or is heard as a rumble, hum, or boom. Driveline vibration can exist in all drive modes, but may exhibit different symptoms depending upon whether the vehicle is accelerating, decelerating, floating, or coasting. Check the driveline angles if the vibration is particularly noticeable during acceleration or deceleration, especially at lower speeds. Driveline vibration can be duplicated by supporting the axle upon a hoist or upon jack stands, though the brakes may need to be applied lightly in order to simulate road resistance.

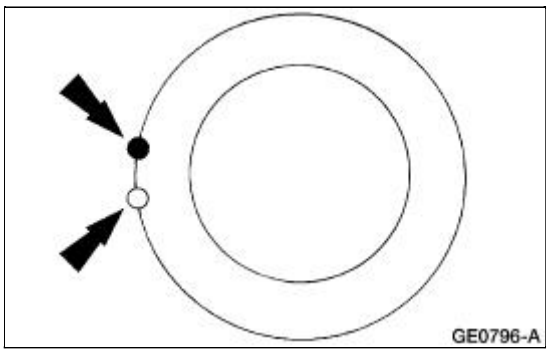


1. Raise the vehicle promptly after road testing. Use twin-post hoist or jack stands to prevent tire flat-spotting. Engage the drivetrain and accelerate to the observed road test speed to verify the presence of the vibration. If the vibration is not evident, check the non-driving wheels with a wheel balancer to rule out imbalance as a possible cause. If required, balance the non-driving wheels and repeat the road test. If the vibration is still evident, proceed to Step 2.

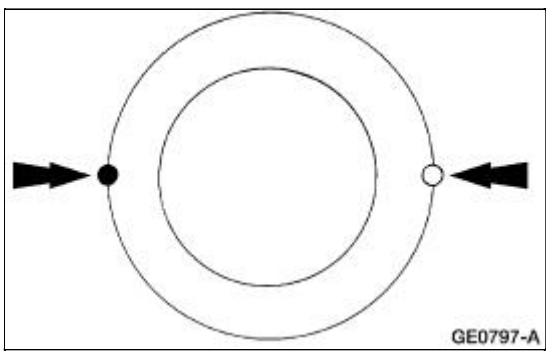
2. Mark the relative position of the drive wheels to the wheel bolts. Remove the wheels. Install all the wheel nuts in the reversed position and repeat the road speed acceleration. If the vibration is gone, refer to the tire and wheel runout procedure in Section 204-04 . If the vibration persists, proceed to Step 3.

3. Inspect the driveshaft(s) for signs of physical damage, missing balance weight, undercoating, incorrect seating, wear and binding universal joints (4635). Clean the driveshaft and install new universal joints or install a new driveshaft if damaged. Check the index marks (paint spots) on the rear of the driveshaft and pinion flange. If these marks are more than one quarter turn apart, disconnect the driveshaft and re-index to align the marks as closely as possible. After any corrections are made, recheck for vibration at the road test speed. If the vibration is gone, reinstall the wheels and road test. If the vibration persists, proceed to Step 4.

4. Raise the vehicle on a hoist and remove the wheels. Rotate the driveshaft by turning the axle and measure the runout at the front, the center, and the rear of the driveshaft with the indicator. If the runout exceeds 0.89 mm (0.035 inch) at the front or center, a new driveshaft must be



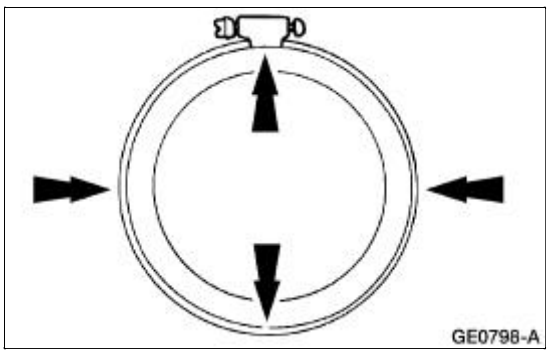
installed. If the front and center are within this limit, but the rear runout is not, mark the rear runout high point and proceed to Step 5. If the runout is within the limits at all points, proceed to Step 7.



5. **NOTE:** Check the U-joints during re-indexing. If a U-joint feels stiff or gritty, install new U-joints.

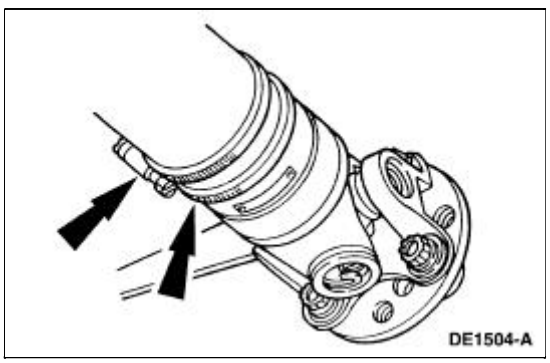
   Scribe alignment marks on the driveshaft and the pinion flange. Disconnect the driveshaft, rotate it one half turn, and reconnect it. Circular pinion flanges can be turned in one quarter increments to fine tune the runout condition; half-round pinion flanges are limited to two positions. Check the runout at the rear of the driveshaft. If it is still over 0.89 mm (0.035 inch), mark the high point and proceed to Step 6. If the runout is no longer excessive, check for vibration at the road test speed. If vibration is still present, re-index the driveshaft slip-yoke on the transmission output shaft one half turn and road test the vehicle. If the vibration persists, proceed to Step 7.

6. Excessive driveshaft runout may originate in the driveshaft itself or in the pinion flange. To determine which, compare the two high points marked in Steps 4 and 5. If the marks are close together, within about 25 mm (1 inch), a new driveshaft must be installed and the vehicle road tested.



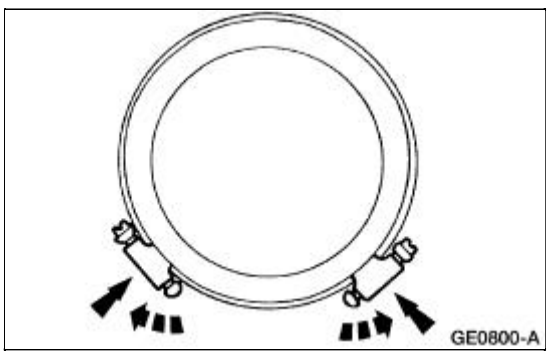
If the marks are on opposite sides of the driveshaft, the yoke or pinion flange is responsible for the vibration.

When installing a new pinion flange, the driveshaft runout must not exceed 0.89 mm (0.035 inch). When runout is within limits, recheck for vibration at road speed. If vibration persists, balance the driveshaft.



7. To balance the driveshaft, install one or two hose clamps on the driveshaft, near the rear. Position of the hose clamp head(s) can be determined by trial-and-error.

8. Mark the rear of the driveshaft into four approximately equal sectors and number the marks 1 through 4. Install a hose clamp on the driveshaft with its head at position No. 1.



Check for vibration at road speed. Recheck with the clamp at each of the other positions to find the position that shows minimum vibration. If two adjacent positions show equal improvement, position the clamp head between them.

9. If the vibration persists, add a second clamp at the same position and recheck for vibration.

If no improvement is noted, rotate the clamps in opposite directions, equal distances from the best position determined in Step 8. Separate the clamp heads about 13 mm (1/2 inch) and recheck for vibration at the road speed.

Repeat the process with increasing separation until the best combination is found or the vibration is reduced to an acceptable level.

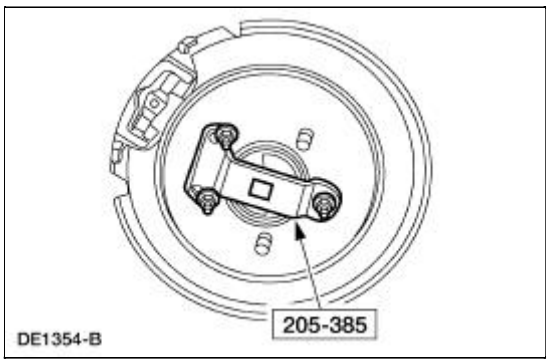
10. Install the wheels and road test (vibration noticeable on the hoist may not be evident during the road test). If the vibration is still not acceptable, install a new axle drive line vibration damper first, if so equipped. If the vibration is still not acceptable, refer to Section 205-02A or Section 205-02B for differential case and ring gear runout checks.

Driveshaft Vibrates

1. Road test the vehicle to determine the critical vibration points. Note the road speed, the engine rpm, and the shift lever positions at which the vibration occurs.

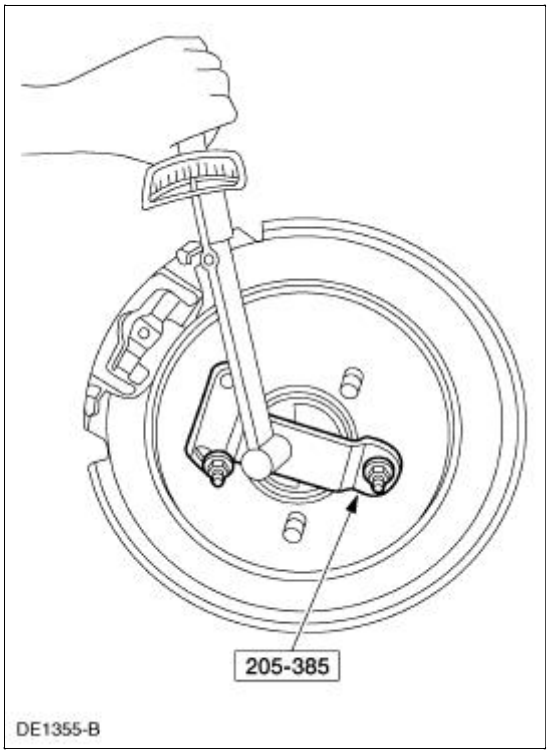
2. Stop the vehicle, place the transmission lever in neutral and run the engine through the critical speed ranges determined in Step 1.

3. If no vibration is felt, balance the driveshaft. Refer to Driveline Vibration in this section.



Traction-Lok® Differential Operation Check

A Traction-Lok® differential can be checked for correct operation without removing it from the rear axle housing (4010).



WARNING: A vehicle equipped with a Traction-Lok® differential will always have both wheels driving. If only one wheel is raised off the floor and the rear axle is driven by the engine, the wheel on the floor could drive the vehicle off the stand or jack. Be sure both rear wheels are off the floor.

WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

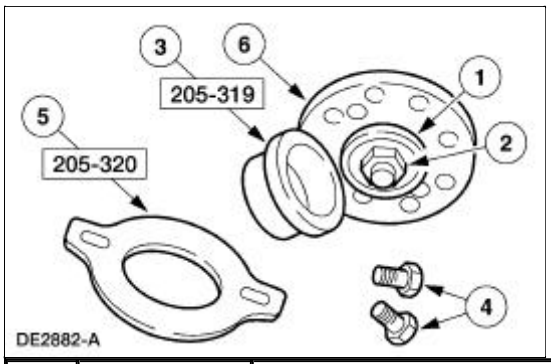
Raise and remove only one rear wheel. Install the special tool on the wheel bolts.

Use a torque wrench with the capacity of at least 271 Nm (200 lb-ft) to rotate the axle shaft. Be sure that the transmission is in NEUTRAL, and that one rear wheel is on the floor while the other rear wheel is raised off the floor. The breakaway torque required to start rotation must be at least 27 Nm (20 lb-ft). The initial breakaway torque may be higher than the continuous turning torque.

The axle shaft must turn with even pressure throughout the check without slipping or binding. If the torque reading is less than specified, check the differential case for incorrect assembly.

Traction-Lok® Differential Check Road Test

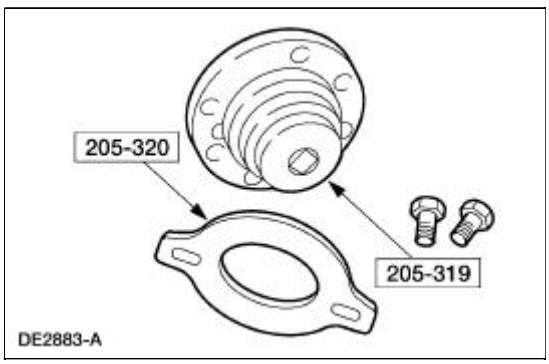
1. Place one wheel on a dry surface and the other wheel on ice, mud or snow.
2. Gradually open the throttle to obtain maximum traction prior to break away. The ability to move the vehicle demonstrates correct performance of a Traction-Lok® rear axle assembly (4006).
3. When starting with one wheel on an excessively slippery surface, a slight application of the parking brake may be necessary to help energize the Traction-Lok® feature of the differential. Release the brake when traction is established. Use light throttle on starting to provide maximum traction.
4. If, with unequal traction, both wheels slip, the limited slip rear axle has done all it can possibly do.
5. In extreme cases of differences in traction, the wheel with the least traction may spin after the Traction-Lok® has transferred as much torque as possible to the non-slipping wheel.



Pinion Flange Runout Check — Circular

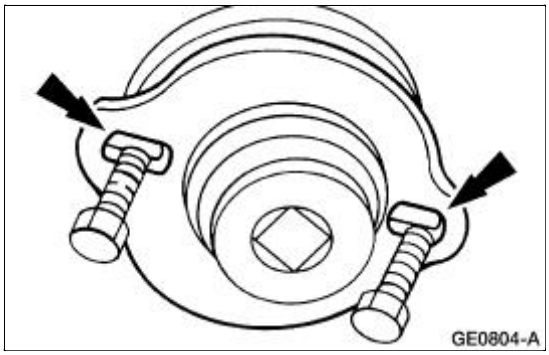
WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

CAUTION: Pinion bearing preload must be reset if the pinion nut has been loosened or

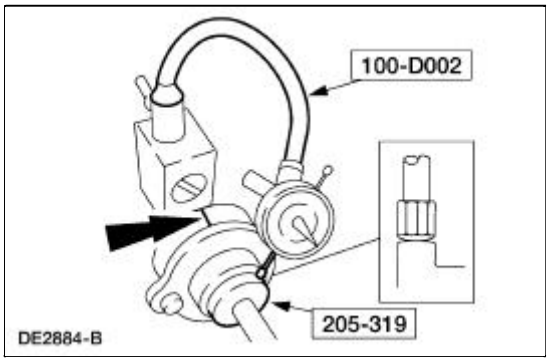


removed for pinion flange reindexing or replacement.

1. Raise the vehicle on a twin-post hoist that supports the rear axle.
2. Remove the driveshaft. For additional information, refer to Section 205-01 .
3. Check the pinion flange for damage.
4. Position special tool on the pinion flange.

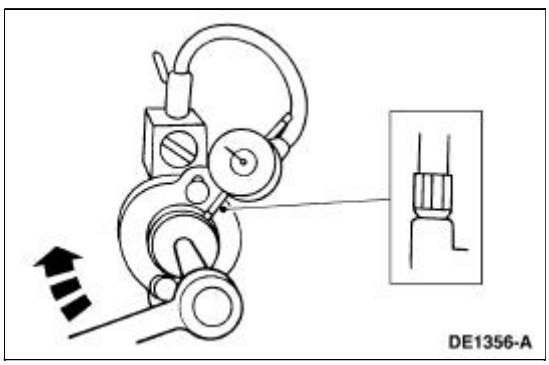


Item	Part Number	Description
1	—	Pilot (part of 205-319) (T92L-4851-B)
2	354845	Pinion nut
3	205-319	Gauge, Companion Flange Runout (T92L-4851-B)
4	—	Bolts (2 req'd) (part of 205-320) (T92L-4851-C)
5	205-320	Plate, Companion Flange (T92L-4851-C)
6	4851	Pinion flange



5. Position the special tools onto the pinion flange.

6. Align the holes on the clamp plate with the holes in the pinion flange and install the bolts. Snug the bolts evenly.



7. Position the special tool as shown. Turn the special tool, and locate and mark the high spot on the pinion flange with yellow paint.

If the flange runout exceeds 0.25 mm (0.010 inch), remove the pinion flange, reindex the flange one-half turn on the pinion, and reinstall it. Refer to Section 205-02A , Section 205-02B or Section 205-03 for the flange removal and installation procedures.

8. Check the runout again. If necessary, rotate the flange until an acceptable runout is obtained. If the flange runout is still more than 0.25 mm (0.010 inch), install a new pinion flange.

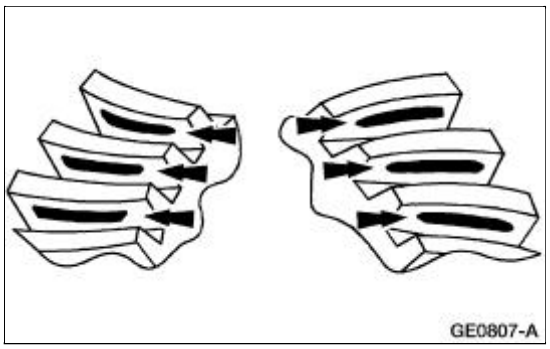
9. If excessive runout is still evident after replacement of the pinion flange, install a new ring and pinion. Repeat the above checks until the runout is within specifications.

10. Install the driveshaft. For additional information, refer to Section 205-01 .

Tooth Contact Pattern Check — Gearset

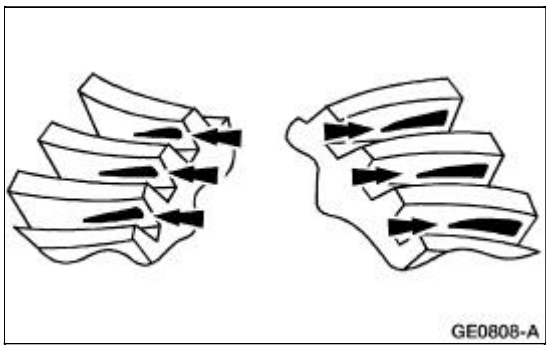
1. To check the gear tooth contact, paint the gear teeth with the special marking compound. A mixture that is too wet will run and smear; a mixture that is too dry cannot be pressed out from between the teeth.

2. Use a box wrench on the ring gear bolts as a lever to rotate the ring gear several complete revolutions in both directions or until a clear tooth contact pattern is obtained.



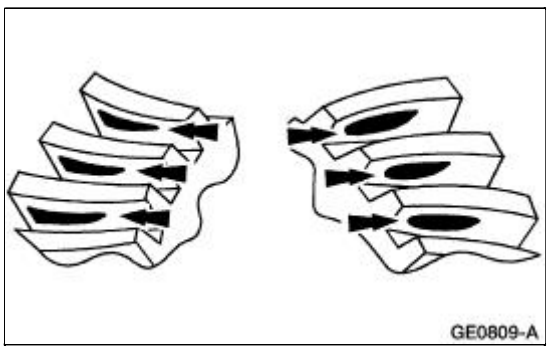
3. Certain types of gear tooth contact patterns on the ring gear indicate incorrect adjustment. Incorrect adjustment can be corrected by readjusting the ring gear or the pinion.

Contact Pattern Location

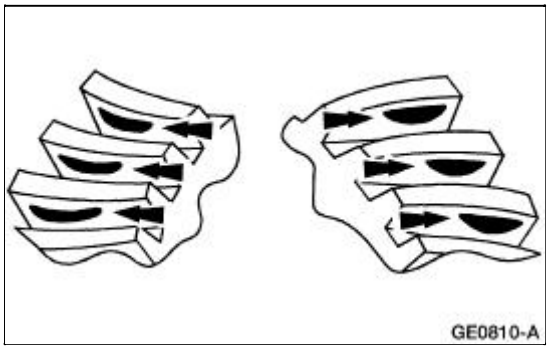


In general, desirable ring gear tooth patterns must have the following characteristics:

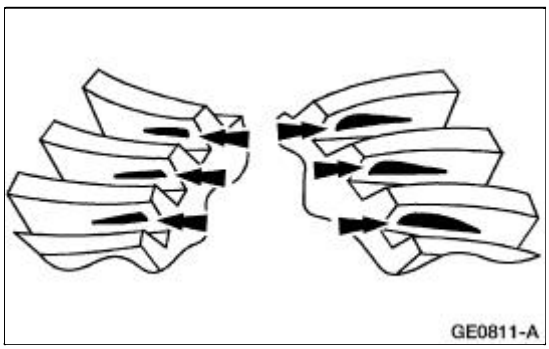
- Drive pattern on the drive side ring gear well centered on the tooth.
- Coast pattern on the coast side ring gear well centered on the tooth.
- Clearance between the pattern and the top of the tooth.
- No hard lines where the pressure is high.



Acceptable ring gear tooth patterns for all axles.



Correct backlash with a thinner pinion position shim required.

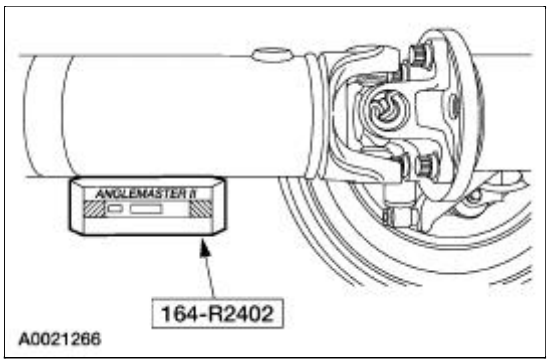


Correct backlash with a thicker pinion position shim required.

Correct pinion position shim that requires a decrease in backlash.

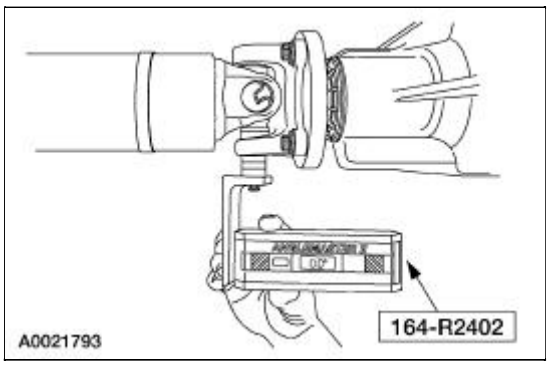
Correct pinion position shim that requires an increase in backlash.

Driveline Angle Inspection



Special Tool(s)

 ST1622-A	Anglemaster II Driveline Inclinometer/Protractor 164-R2402 or equivalent

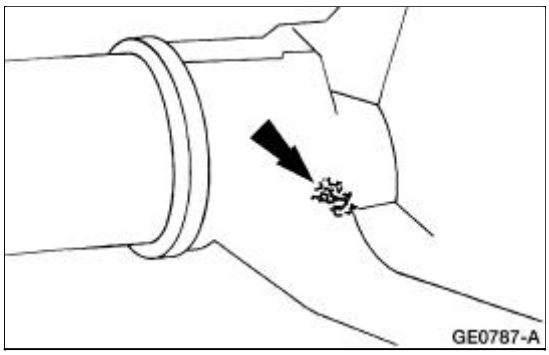


CAUTION: Prior to checking driveline angularity, inspect the U-joints for correct operation.

NOTE: An incorrect driveline angle can cause a vibration or shudder. For additional information, refer to Section 100-04 .

1. For the driveshaft angle reading, place the special tool flush against the bottom of the driveshaft. Press the ALT ZERO button to calibrate the inclinometer.

2. To check the pinion operating angle, rotate the driveshaft so that the rear axle pinion flange yoke ear is parallel to the floor. Remove the U-joint snap ring, then install the special tool. Check and record the pinion operating angle reading.
   - If the angle is not within specifications, repair or adjust to obtain the correct angle . Inspect the rear suspension, rear axle, rear axle mounting or the frame for wear or damage.



3. Repeat the step, using the front universal joint to record the transmission operating angle.
4. Compare the operating angles. Ideally, the operating angles on each end of the driveshaft must:
    - be equal or within one degree of each other.
    - have a three degree maximum operating angle.
    - have at least one-half degree of operating angle.

Axle Housing Casting Porosity (Holes in Casting) Repair

CAUTION: To keep the axle's sound characteristics, do not disassemble the carrier.

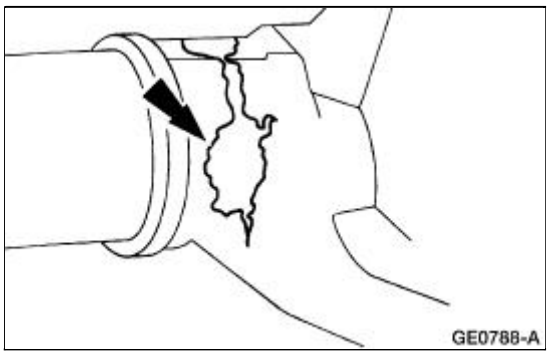
NOTE: Casting porosity is a condition where occasionally gas bubbles will form during the casting process leaving small pockets in the metal that will cause the axle housing to leak.

1. To fill small pockets, peen in a small amount of body lead.

2. Seal the pocket.
   - Use Devcon Aluminum Liquid F2 or equivalent meeting Ford specification M-3D35A(E).

3. To fill large pockets, drill and tap a shallow hole for a small setscrew. Install the setscrew and seal it.
   - Use Devcon Aluminum Liquid F2 or equivalent meeting Ford specification M-3D35A(E).

Axle Housing Weld Leaks Repair



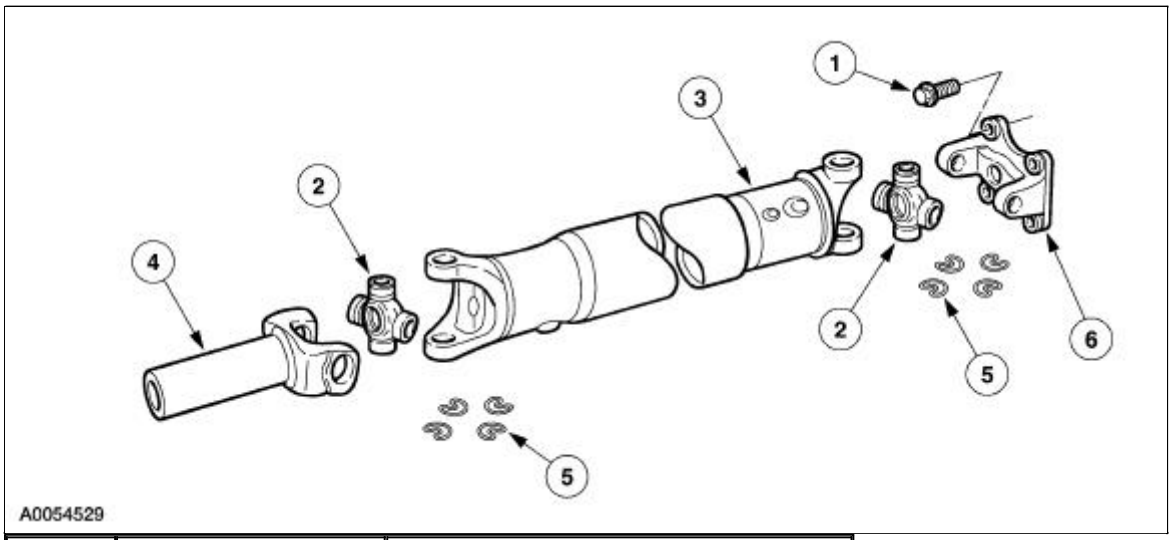
1. **CAUTION: To keep the axle's sound characteristics, do not disassemble the carrier.**

   CAUTION: Rear axle housing straightness is too critical for field repair. Install a new axle housing if a weld is broken.

   NOTE: Most minor weld leaks are repairable. This includes the puddle and fill welds that join the axle shaft tube to the axle housing on integral axles.

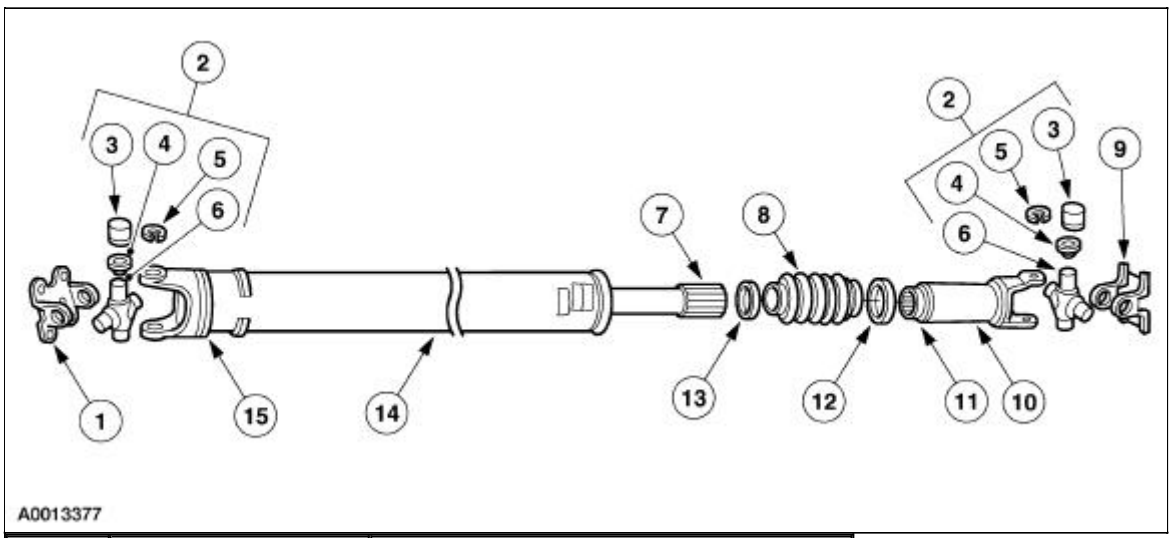
   Seal the weld.

   - Use Devcon Aluminum Liquid F2 or equivalent meeting Ford specification M-3D35A(E).



Torque Specifications

Description	Nm	lb-ft
Bolts retaining rear flange to transfer case flange	104	77
Bolts retaining front flange to front drive axle pinion flange	112	83
Nuts retaining front driveshaft shield to transfer case	25	18
Bolts retaining driveshaft flange yoke to rear axle pinion flange	112	83



Driveshaft

Rear

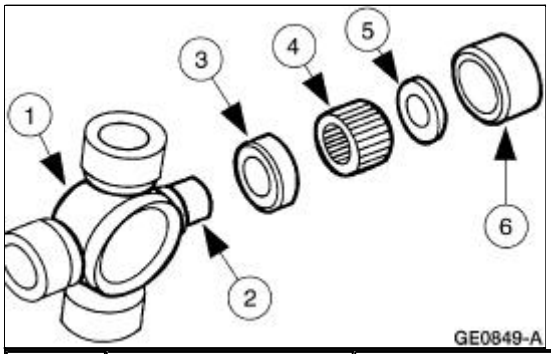
Item	Part Number	Description
1	—	Bolt (part of 4A378)
2	4635	Universal joint assembly
3	4602	Driveshaft assembly
4	4A335	Driveshaft slip yoke
5	—	Snap ring (part of 4635)
6	4A378	Driveshaft flange yoke

Front

Item	Part Number	Description
1	4A378	Front flange

2	4635	Universal joint kit
3	—	Bearing (part of 4635)
4	—	Seal (part of 4635)
5	—	Snap ring (part of 4635)
6	—	Spider (part of 4635)
7	—	Splined stud shaft
8	4421	Rubber boot
9	4A378	Rear flange
10	4841	Driveshaft slip yoke
11	—	Boot groove (part of 4841)
12	4K227	Large clamp
13	4K227	Small clamp
14	4A376	Driveshaft assembly
15	—	Front yoke (part of 4602)

CAUTION: All driveshafts are balanced. If undercoating the vehicle, protect the driveshaft and universal joints to prevent overspray of any undercoating material.



NOTE: Refer to Section 205-00 for driveshaft runout and balance, and indexing procedures.

Driveshafts differ in length, diameter, and type of yoke to accommodate various wheelbase and powertrain combinations.

The front driveshaft uses one universal joint to connect the flange yoke at each end of the driveshaft. Inspect the front driveshaft slip yoke rubber boot for rips and holes. Install new components as necessary.

The rear driveshaft is connected to the pinion flange by the driveshaft flange yoke with four bolts. It is connected to the transmission or transfer case with a driveshaft slip yoke.

Universal Joints

Item	Part Number	Description
1	—	Spider (part of 4635)
2	—	Trunnion (part of 4635)
3	—	Grease seal (part of 4635)
4	—	Needle rollers (part of 4635)
5	—	Thrust washer (part of 4635)
6	—	Bearing cup (part of 4635)

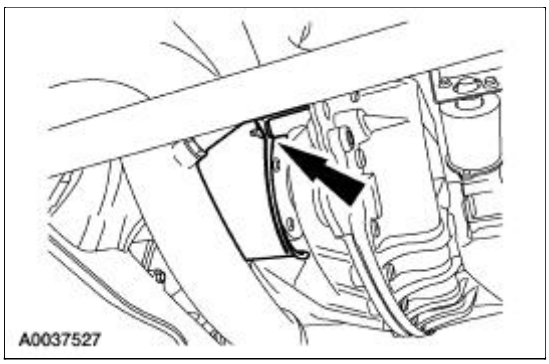
The universal joint (U-joint) connects to the drive axle of the driveshaft and allows for up and down movement of the axle. The U-joint is lubricated for the life of the vehicle.

Driveshaft

Refer to Section 205-00 .

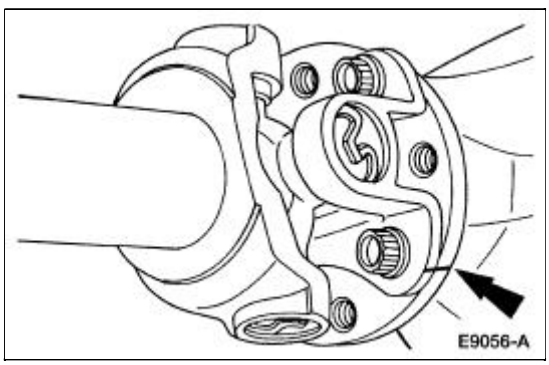
Driveshaft —Front

Material



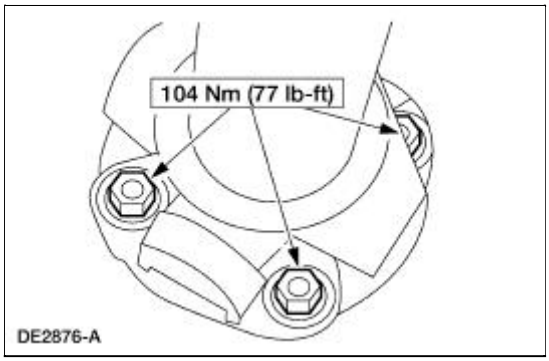
Item	Specification
Threadlock and Sealer E0AZ-19554-AA	WSK-M2G351-A5

Removal and Installation

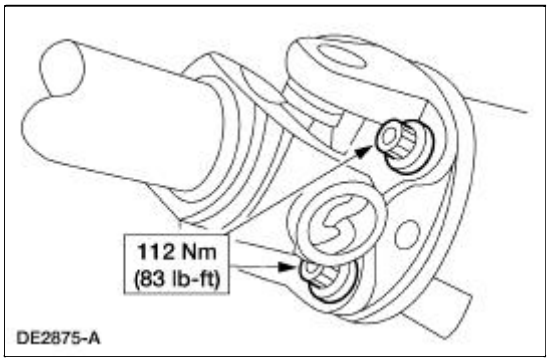


1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the rear jack storage area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations. Failure to follow these instructions may result in personal injury.**

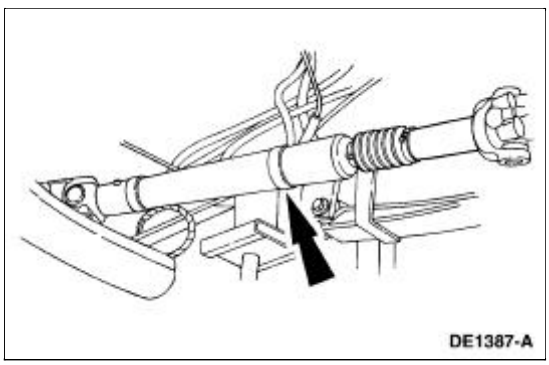
   With the vehicle in neutral, position the vehicle on a hoist. For additional information, refer to Section 100-02 .



2. Remove the front driveshaft shield.



3. Index-mark the front flange and pinion flange.
   - Repeat for the rear flange and transfer case flange.



4. Remove the four bolts retaining the rear flange to the transfer case.

5. Remove the four bolts retaining the front flange to the pinion flange.

6. Remove the front driveshaft.

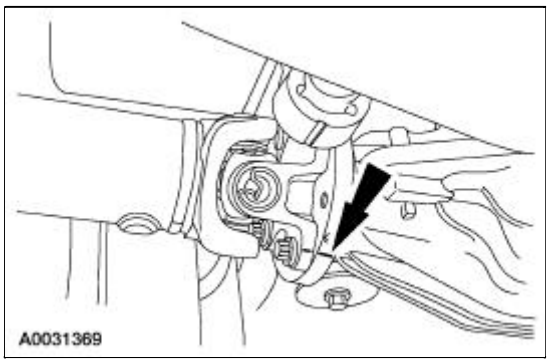
7. **CAUTION: If new bolts to retain the driveshaft to the axle and the driveshaft to the transfer case are not available, coat the threads of the original bolts with threadlock and sealer.**

CAUTION: The front driveshaft must be installed with the boot toward the transfer case to prevent damage to the boot from the exhaust system.

To install, reverse the removal procedure.

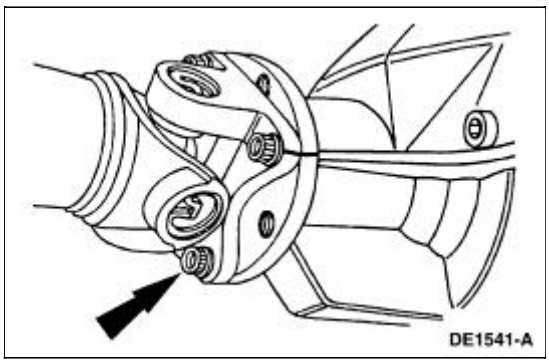
Driveshaft —Rear

Material



Item	Specification
Threadlock and Sealer E0AZ-19554-AA	WSK-M2G351-A5
Premium Long Life Grease XG-1-C	ESA-M1C75-B

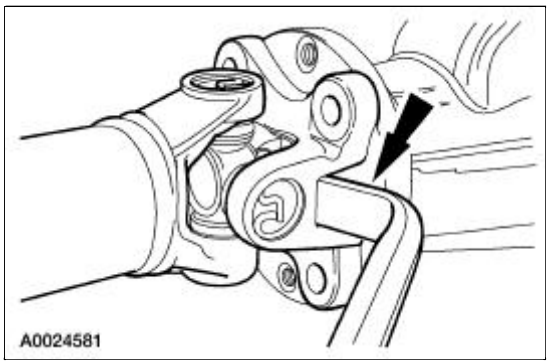
Removal and Installation



1. **CAUTION: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the rear jack storage area. Failure to do so can result in the unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations. Failure to follow these instructions may result in personal injury.**

   With the vehicle in NEUTRAL, position the vehicle on a hoist. For additional information, refer to Section 100-02 .

2. Index-mark the driveshaft flange and the rear axle pinion flange.



3. Remove the four bolts.

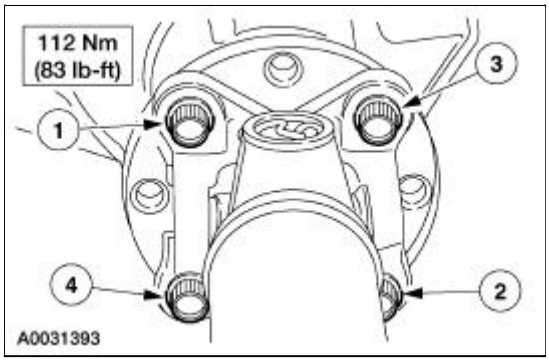
4. **CAUTION: The driveshaft flange fits tightly on the rear axle pinion flange pilot. Never hammer on the driveshaft or any of its components to disconnect the driveshaft from the pinion flange. Pry only in the area shown, with a suitable tool, to disconnect the driveshaft flange from the pinion flange.**

   Using a suitable tool as shown, disconnect the driveshaft flange from the rear axle pinion flange.

5. **NOTE:** Do not rotate the driveshaft when removing the slip yoke from the transmission output shaft.

   Index-mark the driveshaft slip yoke and the transmission extension housing.

   - Mark the transmission output shaft to the transmission extension housing after removing the driveshaft.



6. **CAUTION: Coat the threads of the original bolts with sealer.**

   CAUTION: The driveshaft flange fits tightly on the rear axle pinion flange pilot. To make sure that the driveshaft flange seats squarely on the pinion flange, tighten the bolts evenly in a cross pattern as shown.

   CAUTION: Make sure all index marks are aligned.

   To install, reverse the removal procedure.

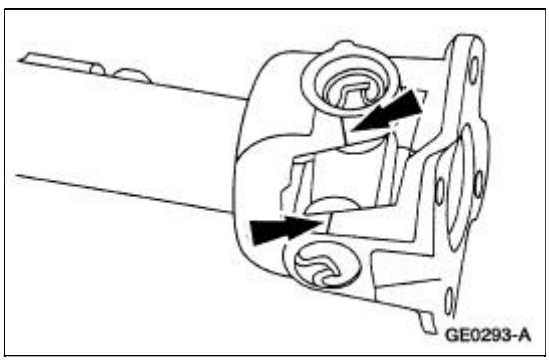
Universal Joint —Single Cardan

Special Tool(s)

 ST1172-A	Installer/Remover, C-Frame and Screw 205-086 (T74P-4635-C)

Disassembly



1. Remove the driveshaft. For additional information, refer to Driveshaft—Rear or Driveshaft—Front in this section.

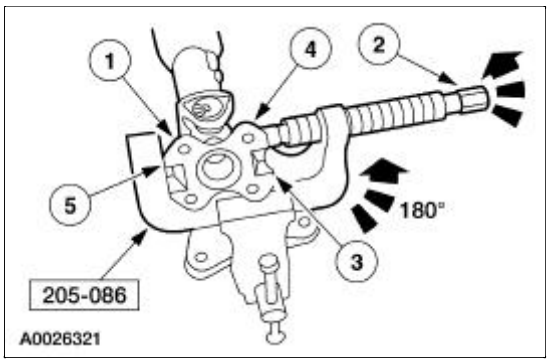
2. **CAUTION: Do not clamp the driveshaft in the jaws of a vise or a similar holding fixture.**

   Carefully place the driveshaft on a suitable workbench.

3. **NOTE:** Index-mark the driveshaft components relative to the driveshaft tube. Make sure all components are reassembled in the same relationship to maintain correct balance.

   Index-mark the driveshaft and driveshaft components.

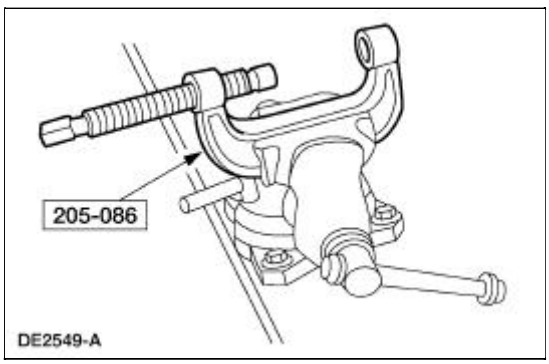
4. Position the special tool in a vise.



5. Remove the snap rings from the universal joint.

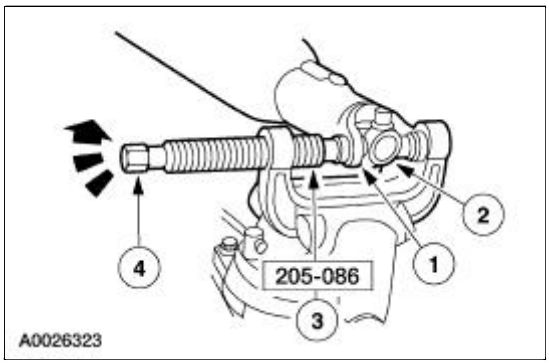
6. **NOTE:** If necessary, use a pair of pliers to remove a bearing cup if it cannot be pressed out all the way.

   Remove the driveshaft flange yoke.
   1. Position the driveshaft flange in the special tool.
   2. Press out the bearing cup.
   3. Rotate the driveshaft flange yoke.
   4. Press on the spider to remove the remaining bearing cup.
   5. Remove the driveshaft flange yoke.



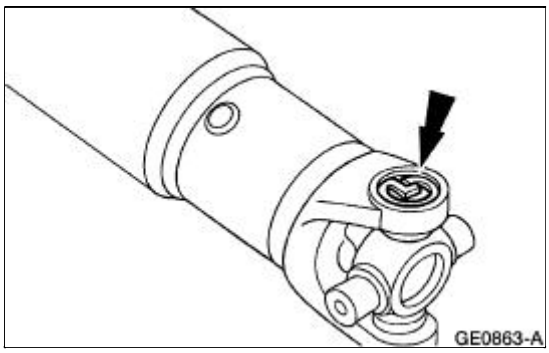
7. Repeat the previous step to remove the remaining bearing cups and spider from the driveshaft.

8. Clean the yoke area at the end of the driveshaft and flange yoke.



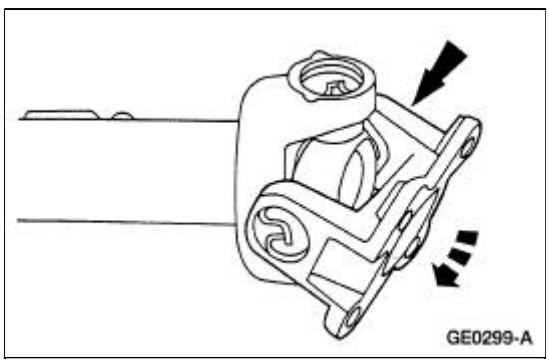
Assembly

NOTE: Universal joint service kits are to be installed as complete assemblies only. Do not use components from other universal joints.



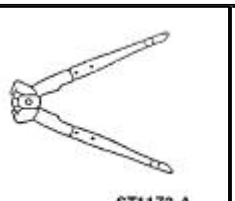
1. Clamp the special tool in a vise.

2. Install a new bearing cup.
    1. Start a new bearing cup into the driveshaft yoke.
    2. Position a new spider in the driveshaft yoke.
    3. Install the driveshaft into the special tool.
    4. Press the bearing cup below the yoke surface.



3. Remove the driveshaft from the special tool and install the snap ring.

4. Repeat the previous steps to install the remaining bearing cups.



5. **NOTE:** Do not strike the bearings. If binding, strike the yoke with a brass or plastic hammer.

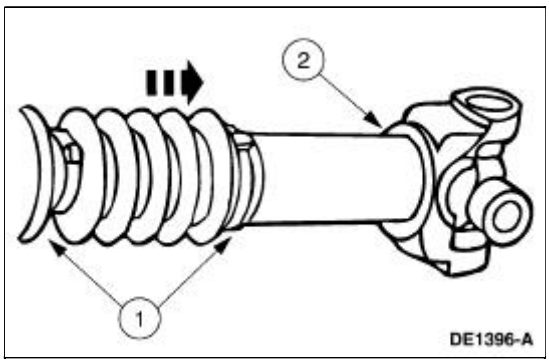
   Check the universal joint for freedom of movement.

Driveshaft Slip Yoke

Special Tool(s)

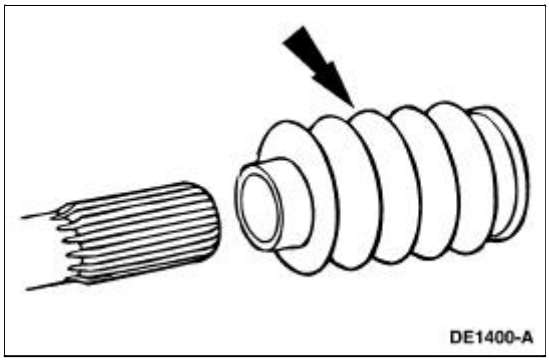
 ST1173-A	Installer, Keystone Clamp 211-002 (T63P-9171-A)

Material



Item	Specification
Premium Long Life Grease XG-1-C	ESA-M1C75-B

Disassembly

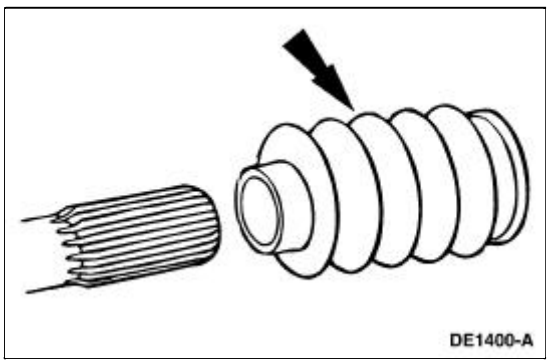


1. **CAUTION: Do not, under any circumstance, clamp the driveshaft in the jaws of a vise or similar holding fixture. Denting or localizing fracture can result, causing driveshaft failure during vehicle operation.**

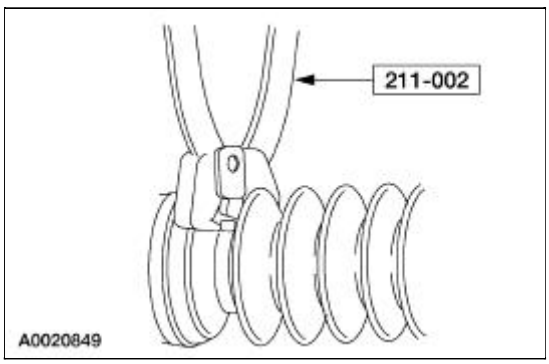
   Place the driveshaft on a suitable workbench. Do not damage the tubes.

2. Remove the driveshaft slip-yoke from the driveshaft.
   1. Cut and discard the driveshaft slip-yoke boot clamps.
   2. Remove the driveshaft slip-yoke from the driveshaft.

3. Remove the slip-yoke boot from the driveshaft.
   - Inspect the boot for damage. Discard the boot as necessary.

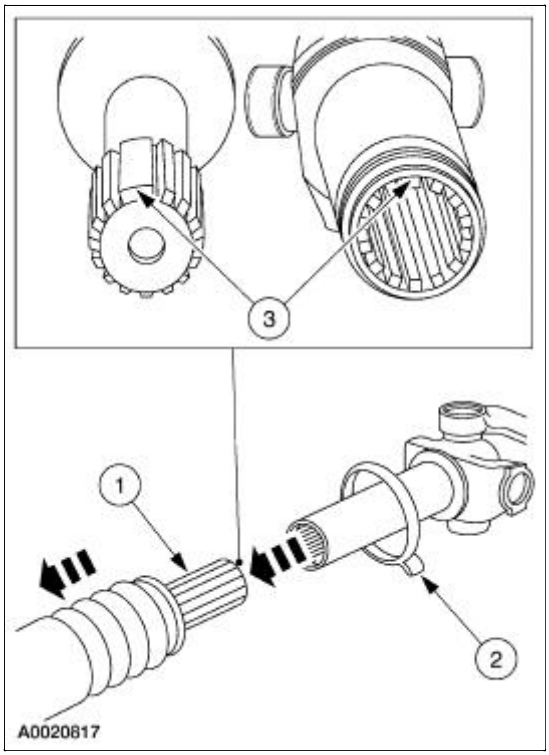


4. Inspect the lubricant on the driveshaft splines and in the driveshaft slip-yoke for contamination. If contaminated, inspect the driveshaft splines and the driveshaft slip-yoke for wear. Install new components as necessary.

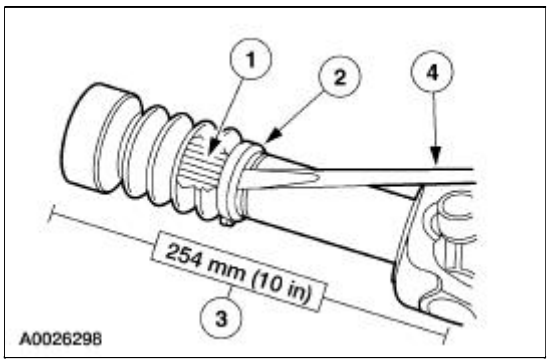


Assembly

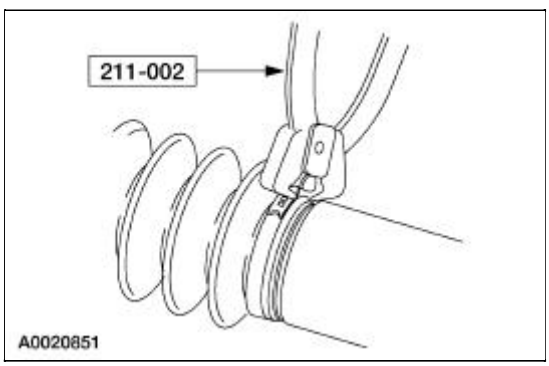
1. Position the new small driveshaft slip-yoke boot clamp on the driveshaft stub shaft.



2. Slide the small opening end of the slip-yoke boot on the driveshaft stub shaft, as far as it will travel.



3. Using the special tool, crimp the driveshaft slip-yoke boot clamp.



4. Install the driveshaft slip-yoke on the driveshaft.
    1. Pull the slip-yoke boot toward the driveshaft. Lubricate the driveshaft splines with approximately 10 grams (0.24 oz) of grease.
    2. Position the new large slip-yoke boot clamp.
    3. Align the blind splines, and install the driveshaft slip-yoke on the driveshaft.

5. Set the driveshaft assembled length to specification.
    1. Remove any excess grease from the slip-yoke boot and driveshaft slip-yoke surfaces.
    2. Position the slip-yoke boot in the slip-yoke boot groove.
    3. Set the driveshaft assembled length to specification.
        - Measure from the stub shaft weld to the U-joint centerline.
    4. Bleed the air from the slip-yoke boot.

6. Using the special tool, crimp the large driveshaft slip-yoke boot clamp.

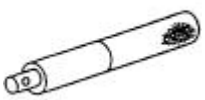
- The differential housing consists of a cast aluminum housing and a cast aluminum differential housing cover. The differential housing cover uses silicone sealant as a gasket.
- The hypoid-design gearset consists of an 8.8-inch differential ring gear and a drive pinion gear. Two opposed pinion bearings support the drive pinion gear in the differential housing.
- A differential drive pinion collapsible spacer, located on the drive pinion gear shaft, maintains pinion bearing preload. The pinion nut adjusts the preload.
- Differential bearing shims, located between the differential bearing cups and the differential housing, adjust the differential ring gear backlash and the differential bearing preload.
- The differential case is a one-piece design with two openings to allow for assembly of the internal components and lubricant flow. Two opposed differential bearings support the differential case in the differential housing. Removable differential bearing caps retain the differential assembly in the differential housing.
- Inside the differential case, the differential pinion shaft supports two differential pinion gears. The pinion gears engage the differential side gears to which the halfshafts are splined. The differential pinion shaft lock bolt retains the differential pinion shaft in the differential case.



- A circlip, located on the inboard CV joint stub shaft, holds the halfshaft in the differential case. When installed, the circlip engages a groove in the differential side gear.
- The limited slip rear axle requires SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL or equivalent meeting Ford specification WSL-M2C192-A with 4 ounces of Friction Modifier XL-3 or equivalent meeting Ford specification EST-M2C118-A.
- An embossed metal tag, bolted to the differential housing cover, contains rear axle identification. For additional information, refer to Section 205-00 .
- The conventional rear axle requires SAE 75W-90 FEHP XY-75W90-QFEHP or equivalent.

Rear Drive Axle and Differential

Refer to Section 205-00 .

Stub Shaft Pilot Bearing and Seal

Special Tool(s)

 ST1200-A	Remover, Bearing Cup 308-047 (T77F-1102-A)
 ST2258-A	Protector, Halfshaft Seal (Pair) 205-506
 ST1721-A	Installer, Halfshaft Pilot Bearing 205-504
 ST1326-A	Adapter for 303-224 (Handle) 205-153 (T80T-4000-W)

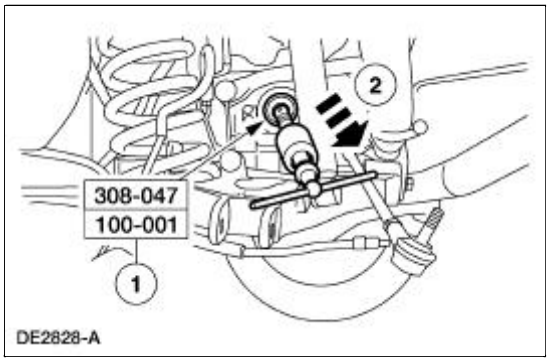
 ST1721-A	Installer, Halfshaft Seal 205-505



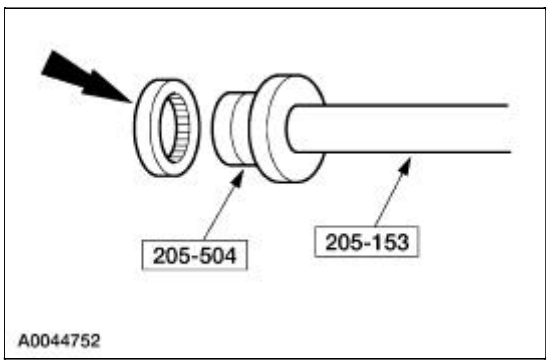
Material

Item	Specification
SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL	WSL-M2C192-A
Premium Long Life Grease	

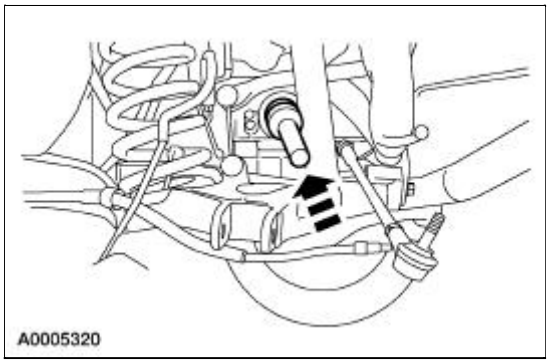
1. Remove the halfshaft assembly. For additional information, refer to Section 205-05 .

2. **NOTE:** If removing the stub shaft pilot seal only, engage the tangs of the special tool on the seal.

   Using the special tools, remove the stub shaft pilot bearing and seal.
   1. Firmly engage the tangs of the special tool on the stub shaft pilot bearing.
   2. Remove the bearing and seal.



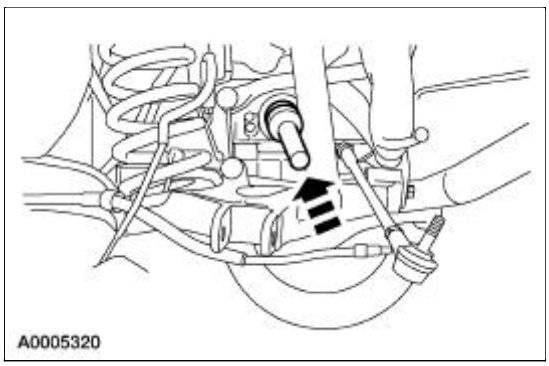
3. Inspect the seal journal for rust, nicks and scratches. Polish the seal journal surface with fine crocus cloth, if necessary.



4. Lubricate the new stub shaft pilot bearing with axle lubricant.

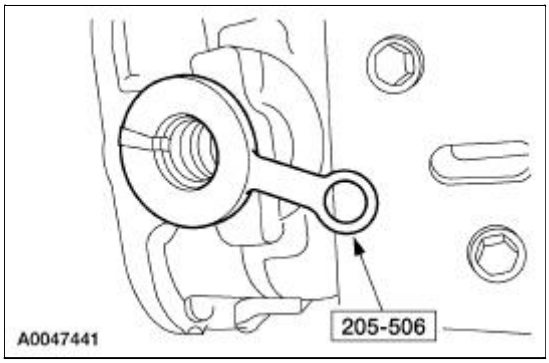
5. **CAUTION: Installation of the stub shaft pilot bearing or stub shaft oil seal without the correct tools can result in early bearing or seal failure. If the stub shaft pilot bearing becomes cocked in the bore during installation, remove it and install a new one.**

   Place the stub shaft pilot bearing onto the special tools.



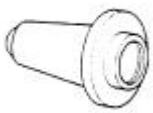
6. Install the stub shaft pilot bearing into the rear axle housing bore.

7. Lubricate the lip of the stub shaft pilot bearing oil seal with grease and install the seal onto the special tools.



8. Carefully align the stub shaft pilot bearing oil seal with the housing bore and install the stub shaft pilot bearing oil seal.

9. **CAUTION: Use the special tool, 205-506, to avoid damaging the seal with the halfshaft.**



CAUTION: Inspect the stub shaft seal journal for rust, nicks, or scratches prior to installing the halfshaft. Polish the seal journal with fine crocus cloth, if required.

Install the halfshaft. For additional information, refer to Section 205-05 .

Drive Pinion Flange and Drive Pinion Seal

Special Tool(s)

 ST2026-A	2-Jaw Puller 205-D072 (D97L-4221-A) or equivalent
 ST1257-A	Holding Fixture, Drive Pinion Flange 205-126 (T78P-4851-A)
 ST1862-A	Installer, Drive Pinion Flange 205-002 (TOOL-4858-E) or equivalent
 ST1325-A	Installer, Drive Pinion Oil Seal 205-208 (T83T-4676-A)

Material

Item	Specification
Premium Long Life Grease XG-1-C or equivalent	ESA-M1C75-B

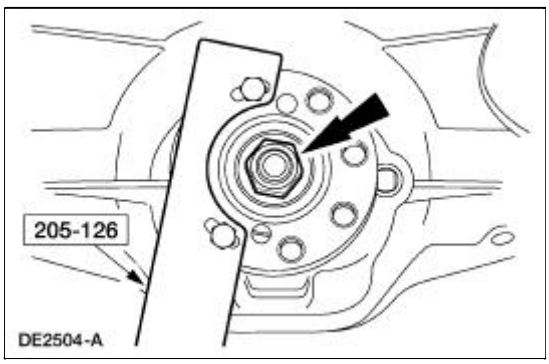
Removal

1. Position the vehicle on a hoist. For additional information, refer to Section 100-02 .
2. Remove the rear wheel and tire assemblies. For additional information, refer to Section 204-04 .
3. **CAUTION: Remove the rear brake calipers to prevent drag during the drive pinion bearing preload adjustment.**

   CAUTION: Do not allow the calipers to hang from the brake hoses.

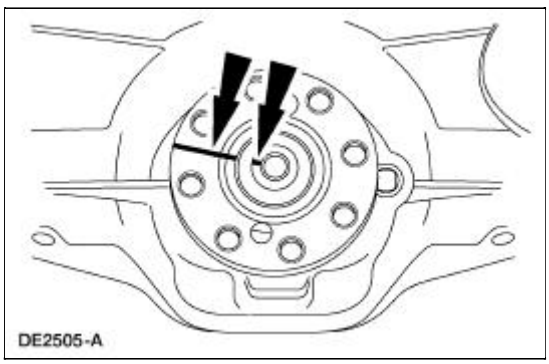
   Remove the rear brake caliper and support bracket from the knuckle as an assembly. Wire the

caliper and support bracket assembly out of the way. For additional information, refer to Section 206-04 .



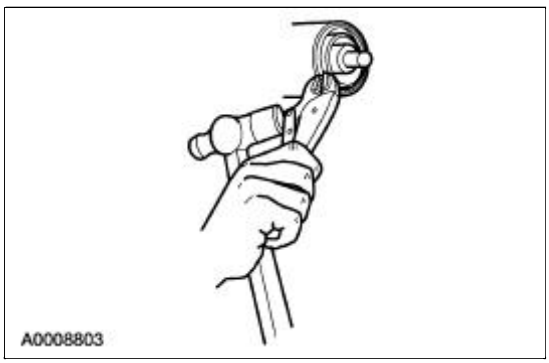
4. Remove the driveshaft assembly. For additional information, refer to Section 205-01 .

5. Install an Nm (inch/pound) torque wrench on the nut and record the torque necessary to maintain rotation of the drive pinion gear through several revolutions.



6. **CAUTION: After removing the nut, discard it. Use a new nut for installation.**

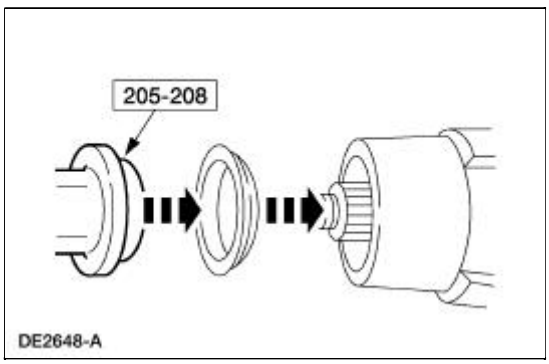
   Use the special tool to hold the rear axle pinion flange while removing the nut.



7. Index-mark the rear axle pinion flange and drive pinion gear stem to maintain initial balance during installation.

8. Using the special tool, remove the rear axle pinion flange.

9. Force up on the metal flange of the rear axle drive pinion seal. Install gripping pliers and strike with a hammer until the rear axle drive pinion seal is removed.

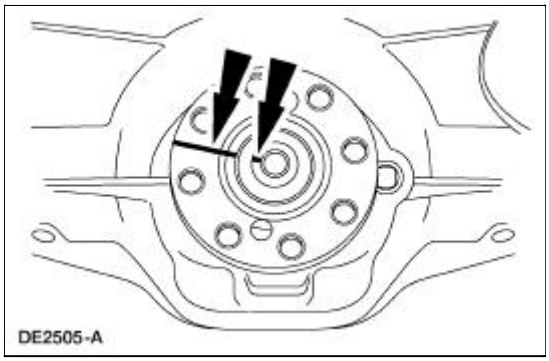


Installation

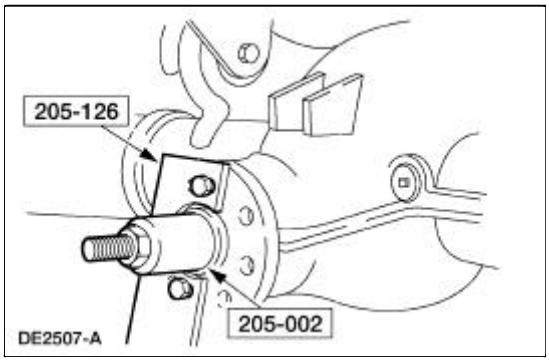
1. Lubricate the new rear drive pinion seal with grease.

2. **CAUTION: If the rear axle drive pinion seal becomes misaligned during installation, remove the rear axle drive pinion seal and install a new seal.**

   Using the special tool, install the rear axle drive pinion seal.



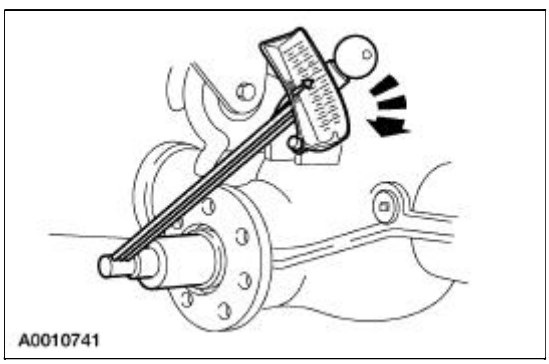
3. Inspect the rear axle pinion flange seal journal for rust, nicks and scratches prior to installing the flange. Polish the seal journal with fine crocus cloth, if necessary.



4. Lubricate the rear axle pinion flange splines.

5. **NOTE:** Disregard the index marks if installing a new rear axle pinion flange.

   Position the rear axle pinion flange.

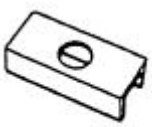


6. Using the special tools, install the rear axle pinion flange.

7. **CAUTION: Do not under any circumstance loosen the nut to reduce preload. If it is necessary to reduce preload, install a new differential drive pinion collapsible spacer and nut.**

   Tighten the nut to set the preload.

   - Rotate the pinion occasionally to make sure the pinion bearings seat correctly. Take frequent pinion bearing torque preload readings by rotating the drive pinion gear with a Nm (inch-pound) torque wrench.
   - If the preload recorded prior to disassembly is lower than the specification for used bearings, tighten the nut to specification. If the preload recorded prior to disassembly is higher than the specification for used bearings, tighten the nut to the original reading as recorded.
   - Refer to the torque specification for used pinion bearings in the Specifications portion of this section.

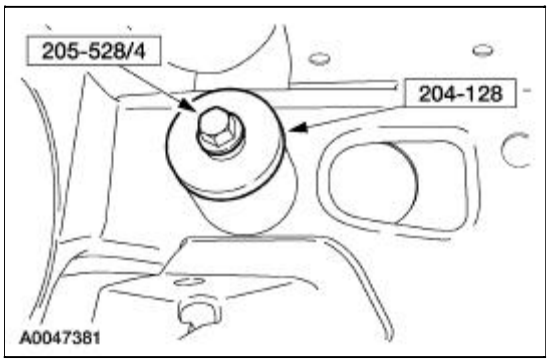


8. Install the driveshaft. For additional information, refer to Section 205-01 .

9. Install the rear brake calipers. For additional information, refer to Section 206-04 .

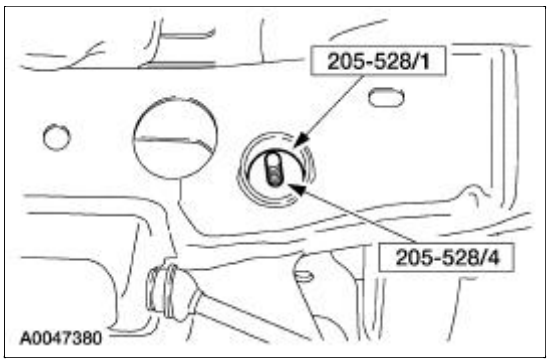
10. Install the rear wheel and tire assemblies. For additional information, refer to Section 204-04 .

Rear Axle Housing Support Insulator



Special Tool(s)

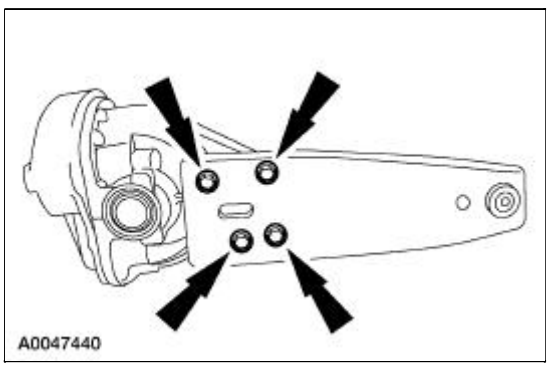
 ST2668-A	Forcing Screw 205-528/4
 ST1970-A	Bushing Installer 205-528/2
 ST2669-A	Bushing Receiving Cup 205-528/3
 ST1965-A	Bushing Remover 205-528/1
 ST1569-A	Adapter for 204-S127 204-128 (T86P-5638-AH1)
 ST1367-A	Installer, Drive Pinion Bearing 205-488
 ST1254-A	Plate, Bearing/Oil Seal 205-09



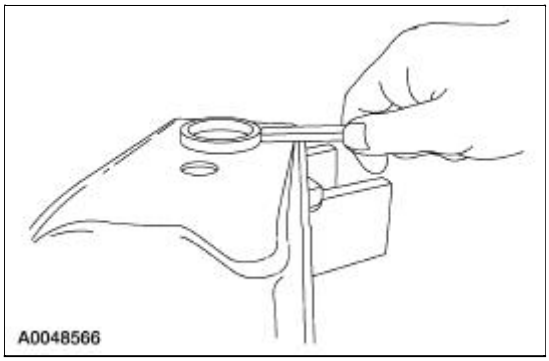
Removal

1. Remove the rear axle assembly. For additional information, refer to Axle Assembly—Air Suspension , or Axle Assembly—Coil Suspension in this section.

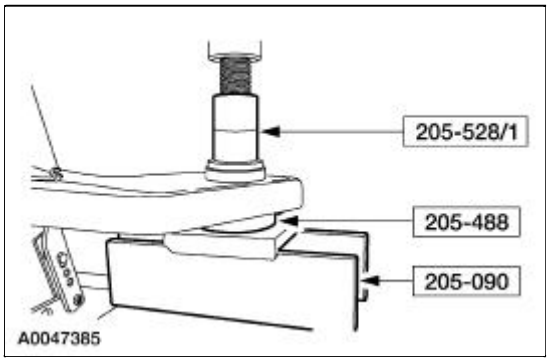
2. Insert special tools (205-528/4) through 204-128 and frame support insulator.



3. Thread bushing remover 205-528/1 on 205-528/4.

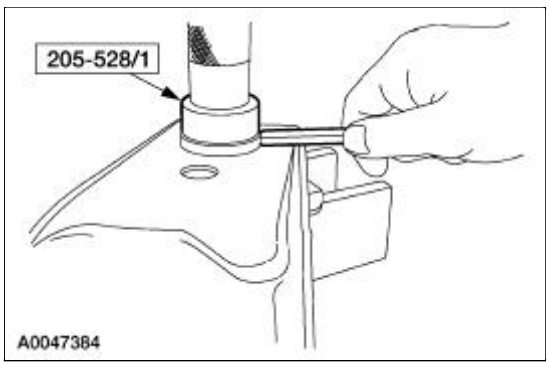


4. Tighten the special tool to remove the frame support insulator.

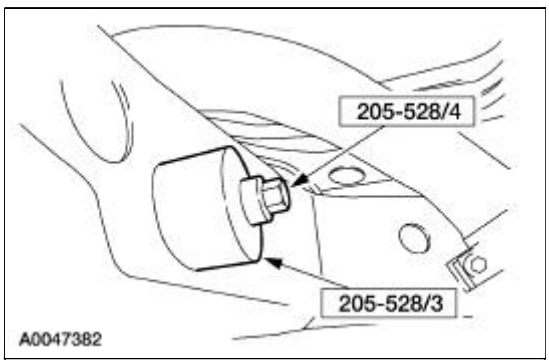


5. Remove the four bolts attaching the torque arm to the axle housing.

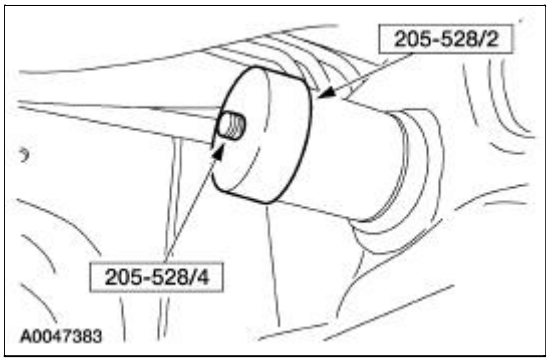
6. Measure and record the distance the insulator extends from the face of the torque arm.



7. Using a shop press and the special tools, remove the torque arm insulator from the torque arm.

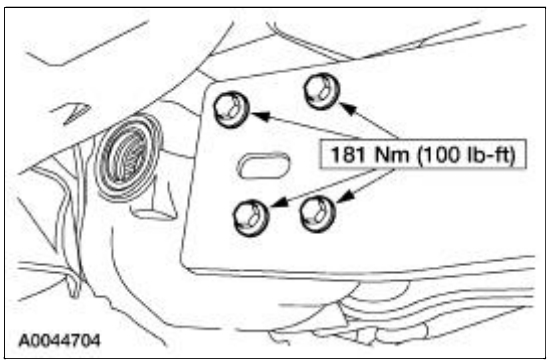


Installation



1. Using a shop press and the special tools, install the new torque arm insulator to the previously recorded depth.

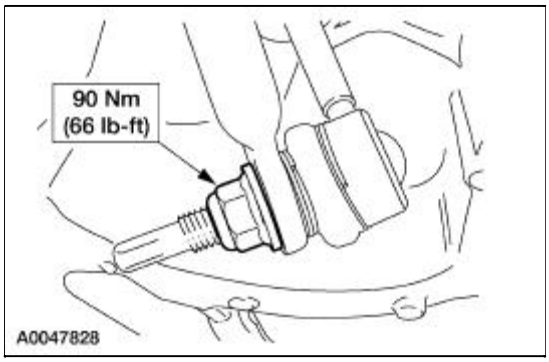
2. Position the special tools on the rear of the crossmember.



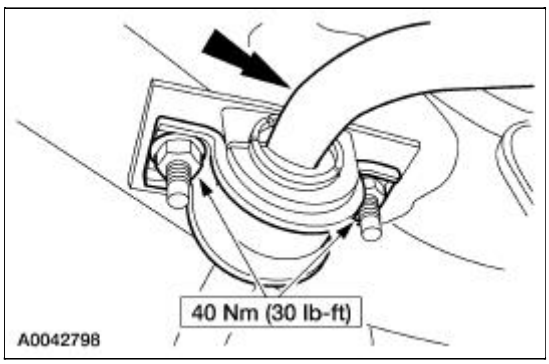
3. Position the new insulator and thread the special tools together.

4. Tighten the drawbolt to seat and position the new insulator.

5. Install the torque arm on the rear axle housing.

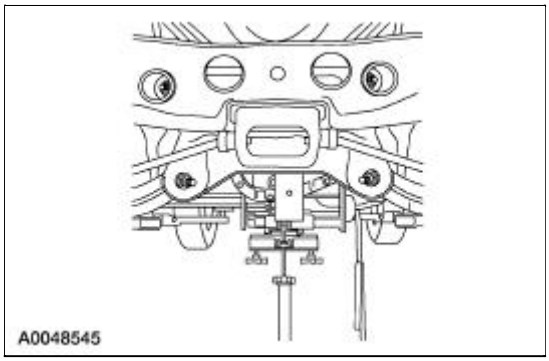


6. Install the rear axle assembly. For additional information, refer to Axle Assembly—Air Suspension , or Axle Assembly—Coil Suspension in this section.

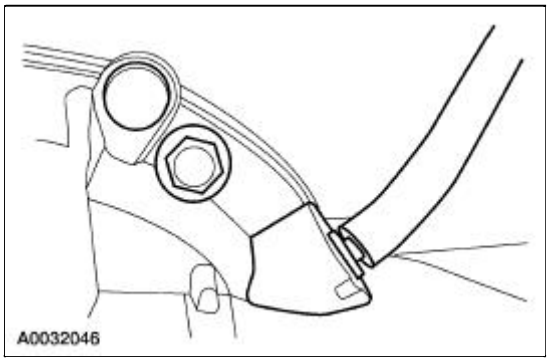


Axle Assembly —Air Suspension

Removal and Installation

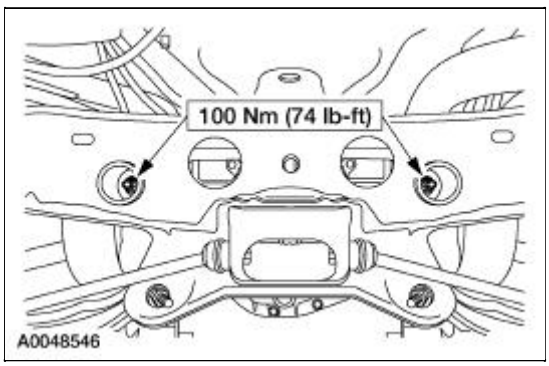


1. Position the vehicle on a hoist. For additional information, refer to Section 100-02 .
2. Deflate the rear air springs. For additional information, refer to Section 204-05 .
3. Remove the rear driveshaft assembly. For additional information, refer to Section 205-01 .
4. Remove the lower rear sway bar links.

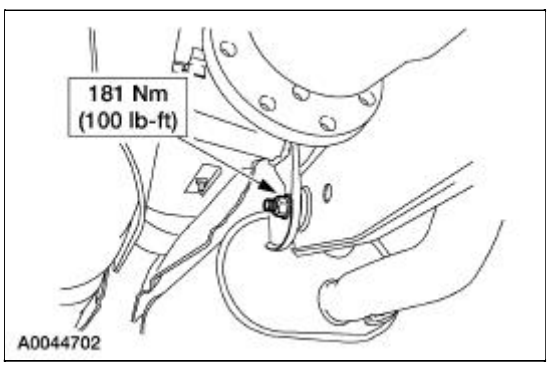


5. Remove the four bracket bolts and remove the rear sway bar.

6. Remove the axle halfshafts. For additional information, refer to Section 205-05 .
7. Support the axle housing.

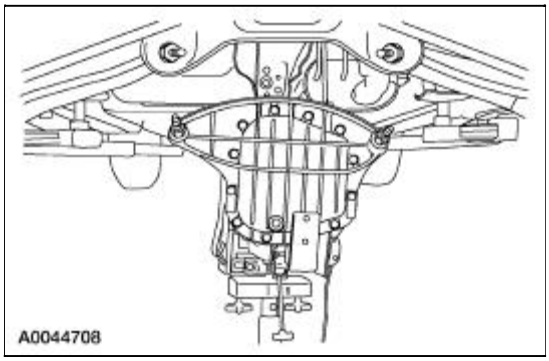


8. Disconnect the axle housing vent tube.



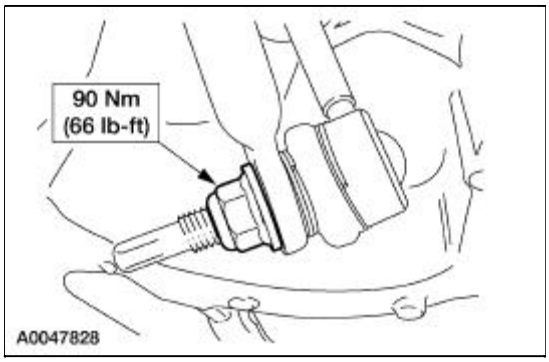
9. **NOTE:** Spare wheel removed for clarity.

   Remove the upper axle housing stud nuts.

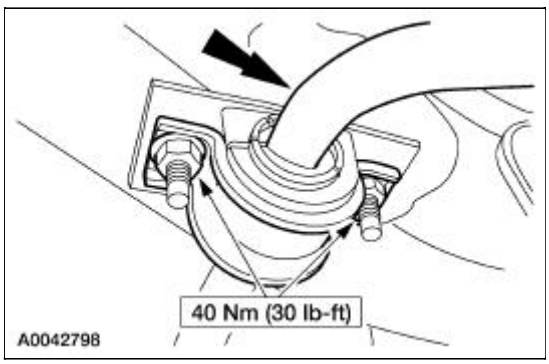


10. Remove the front torque arm bolt.

11. **NOTE:** Move the axle housing forward to clear the rear mounting studs from the bushings.

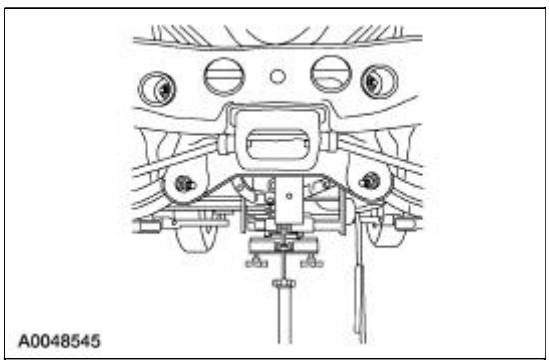


Lower the axle housing from the vehicle.

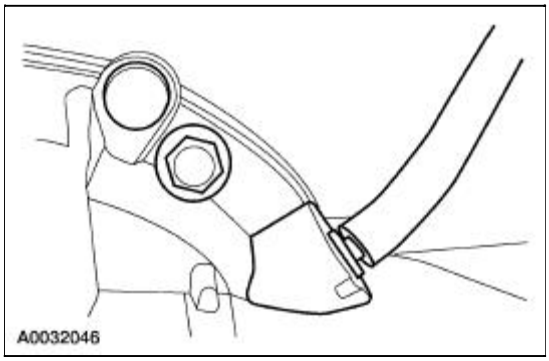


12. To install, reverse the removal procedure.

Axle Assembly —Coil Suspension

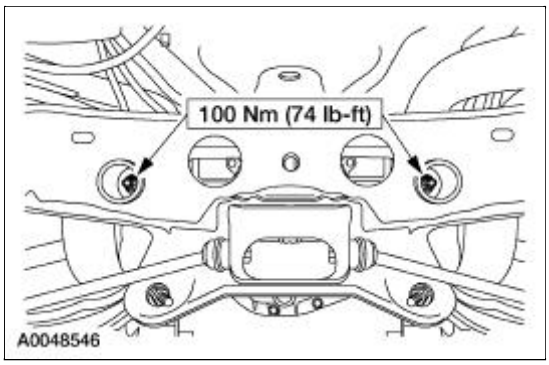


1. Position the vehicle on a hoist. For additional information, refer to Section 100-02 .
2. Remove the rear wheel and tire assemblies. For additional information, refer to Section 204-04 .
3. Remove the rear driveshaft assembly. For additional information, refer to Section 205-01 .
4. Remove the rear halfshafts. For additional information, refer to Section 205-05 .
5. Remove the lower rear sway bar links.

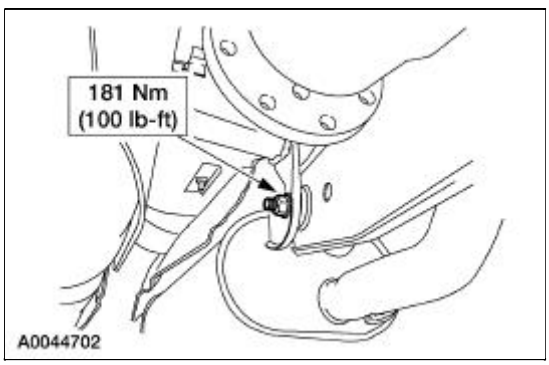


6. Remove the four bracket bolts and remove the rear sway bar.

7. Support the axle housing.

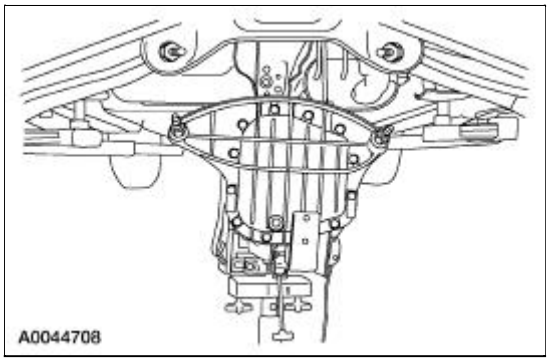


8. Disconnect the axle housing vent tube.



9. **NOTE:** Spare wheel removed for clarity.

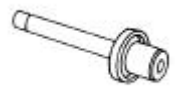
   Remove the upper axle housing stud nuts.

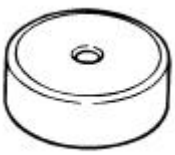


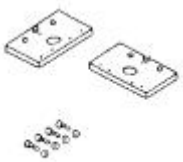
10. Remove the front torque arm bolt.

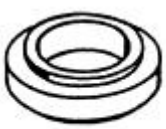
11. **NOTE:** Move the axle housing forward to clear the rear mounting studs from the bushings.

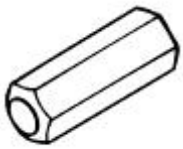
    Lower the axle housing from the vehicle.

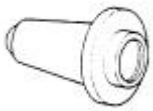


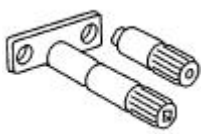




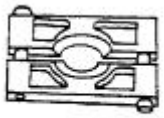








12. To install, reverse the removal procedure.



Axle

Special Tool(s)

 ST2026-A	2-Jaw Puller 205-D072 (D97L-4221-A) or equivalent

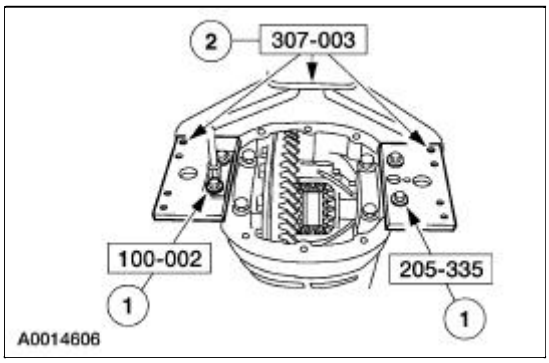
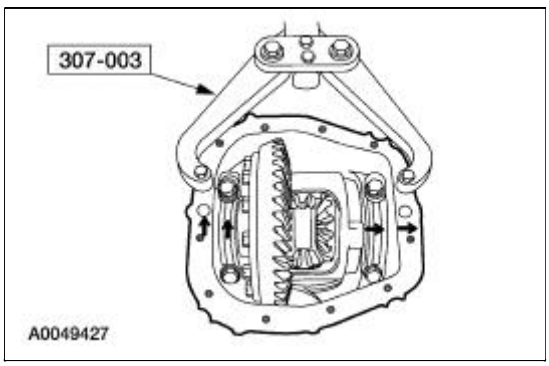
Disassembly

Initial disassembly



1. Remove the differential housing cover and drain the lubricant into a suitable container.
2. Wipe the lubricant from the internal working parts and inspect the parts for wear and damage.
3. Using the special tool, measure and record the differential ring gear backlash between teeth at four places around the ring gear.
   - Remove the special tool.

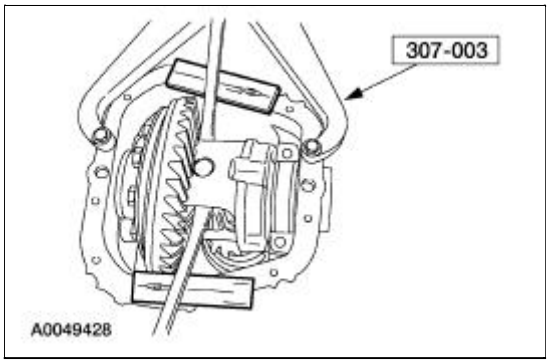
4. **CAUTION: Do not damage the aluminum differential housing while carrying out these procedures.**



Using the special tools, mount the differential housing to a work bench.

1. Attach the special tools to the differential housing with four bolts that retain the differential housing cover to the differential housing.
2. Attach the special tools together with two 3/8 inch x 1-1/2 inch bolts.

5. **CAUTION: Mark the position and location of the differential bearing caps as the arrows may not be visible. Always install the differential bearing caps in their identical location and position.**

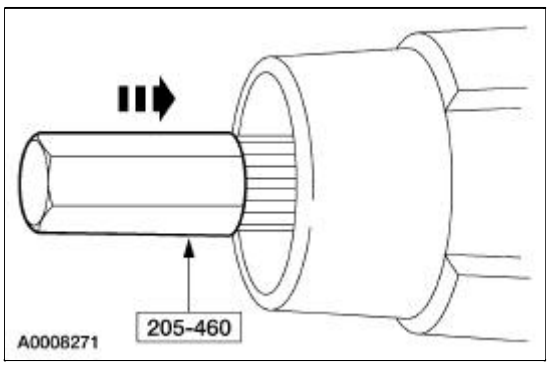


Remove the differential bearing caps.

6. **CAUTION: Use wood blocks to avoid damaging the differential housing.**

Remove the differential assembly.

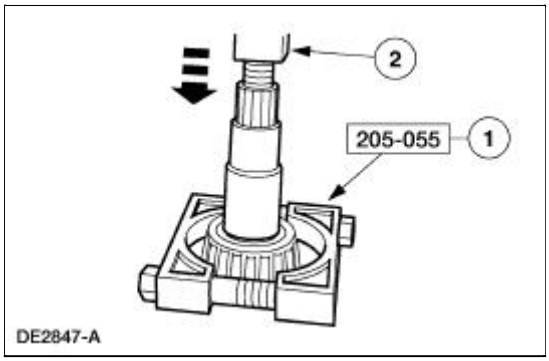
- Position wood blocks at the top and bottom of the differential case.
- Pry the differential assembly and the differential bearing shims out of the differential housing.



7. **CAUTION: Record the torque necessary to maintain rotation of the drive pinion gear through several revolutions prior to removing the rear axle pinion flange.**

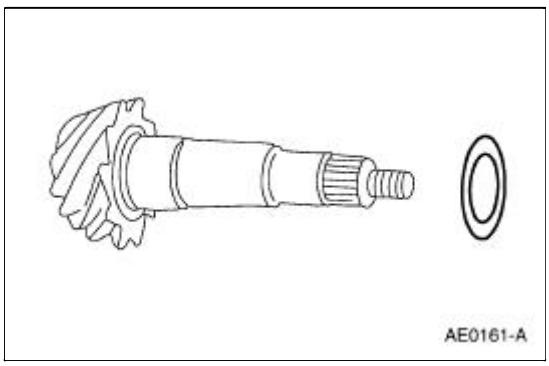
   Remove the rear axle pinion flange and the rear axle drive pinion seal. For additional information, refer to Drive Pinion Flange and Drive Pinion Seal in this section.

8. Remove the rear axle drive pinion shaft oil slinger.

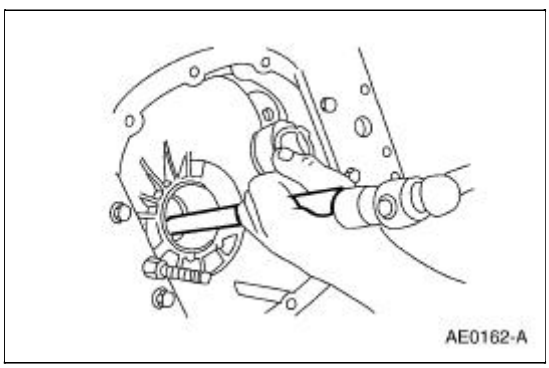


9. Using the special tool and a soft-faced hammer, drive the drive pinion gear out of the front pinion bearing and remove it through the rear of the differential housing.

10. Remove and discard the differential drive pinion collapsible spacer.

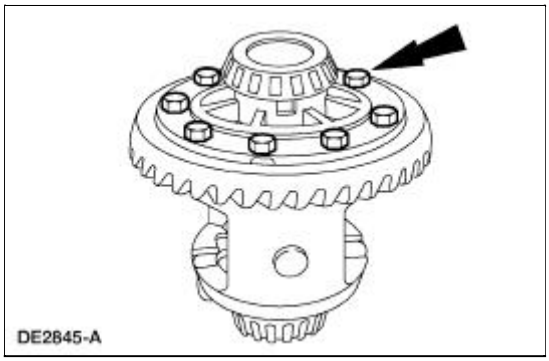


11. Using the special tool and a press, remove the pinion bearing.
    1. Position the special tool under the pinion bearing.
    2. Using a press, remove the pinion bearing.



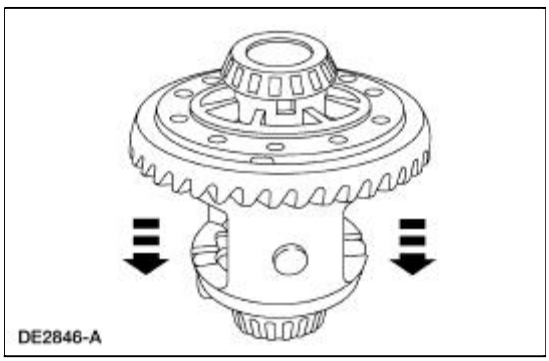
12. **NOTE:** Using a micrometer, measure the drive pinion bearing adjustment shim thickness. Use this measurement as a reference to compare to the shim gauge reading taken prior to installing the pinion bearing.

    Remove the drive pinion bearing adjustment shim.



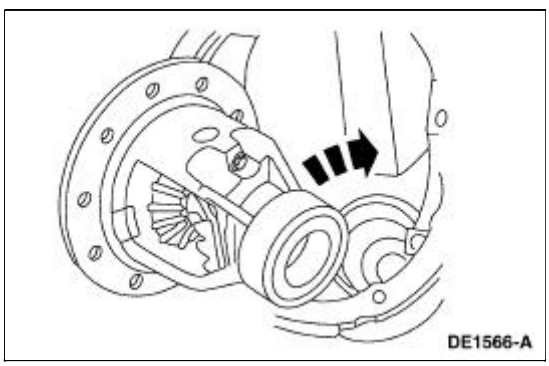
13. Using a brass drift and a hammer, remove any damaged differential drive pinion bearing cup from the differential housing. Tap alternately on each side of the cup to prevent it from cocking in the bore.

14. If the differential ring gear backlash measurement between teeth, taken at the beginning of this procedure, did not exceed the specification, proceed to Final disassembly in this procedure. If the differential ring gear backlash measurement between teeth, taken at the beginning of this procedure, exceeded the specification, the cause may be a warped differential ring gear, a damaged differential case, or loss of differential bearing preload. Proceed to Excessive differential ring gear backlash in this procedure to verify the cause of the excessive runout.



Excessive differential ring gear backlash between teeth

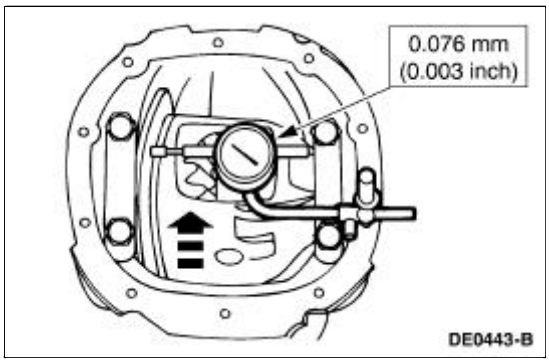
15. Remove the bolts.



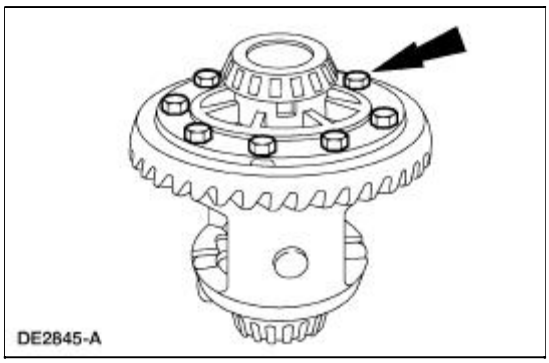
16. **CAUTION: Do not damage the bolt hole threads.**

    Insert a punch in the bolt holes and drive off the differential ring gear.

17. Install the differential case, differential bearings, cups and shims in their original location. Rotate the differential case to seat the differential bearings.

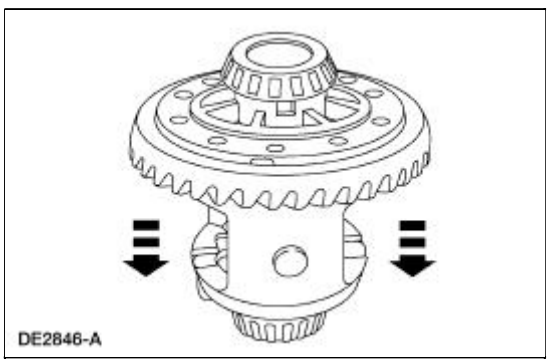


18. Install the special tool.



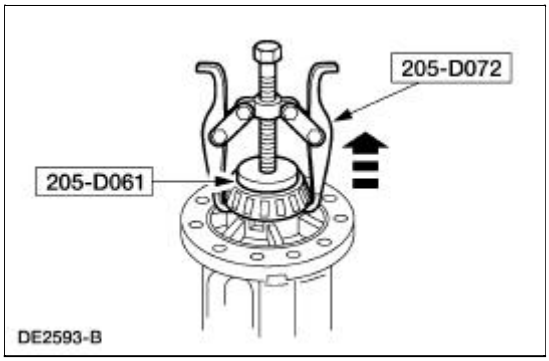
19. Using the special tool, measure the differential case flange runout.

- If the runout does not exceed the specification, the cause of the original excessive runout is the differential ring gear. Remove the differential case. Discard the differential ring gear and the drive pinion gear. Proceed to Final disassembly in this procedure.
- If the runout exceeds the specification, the differential ring gear is true and the concern is due to either differential case or differential bearing damage. Remove the differential case. Discard the differential bearings/differential case. Proceed to Final disassembly in this procedure.
    - Remove the special tool.



Final disassembly

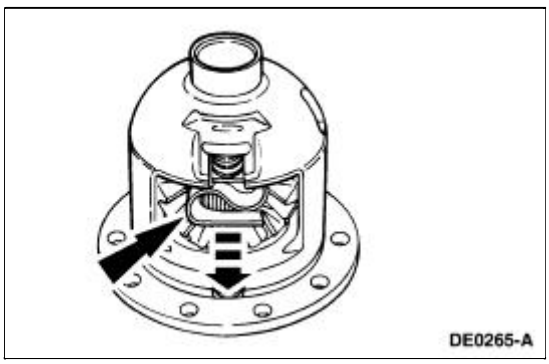
20. If not done previously, remove the bolts.



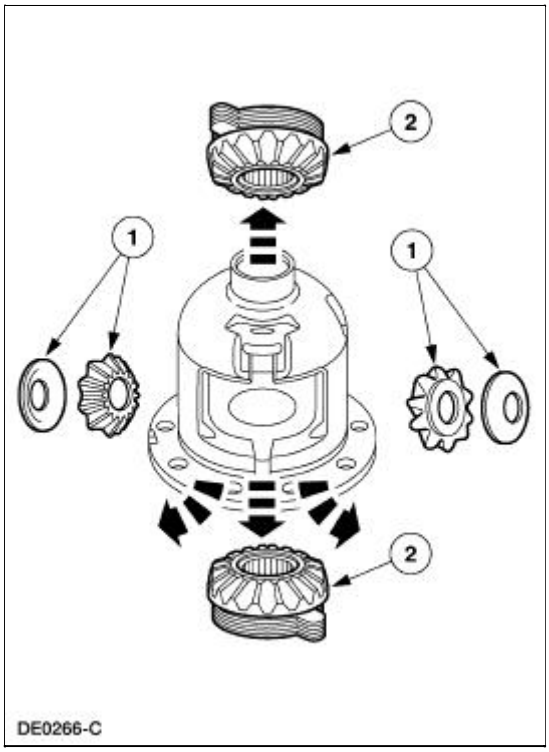
21. **CAUTION: Do not damage the bolt hole threads.**

    If not done previously, insert a punch in the bolt holes and drive off the differential ring gear.

22. Using the special tools, remove the differential bearing.
    - Repeat for the other side.

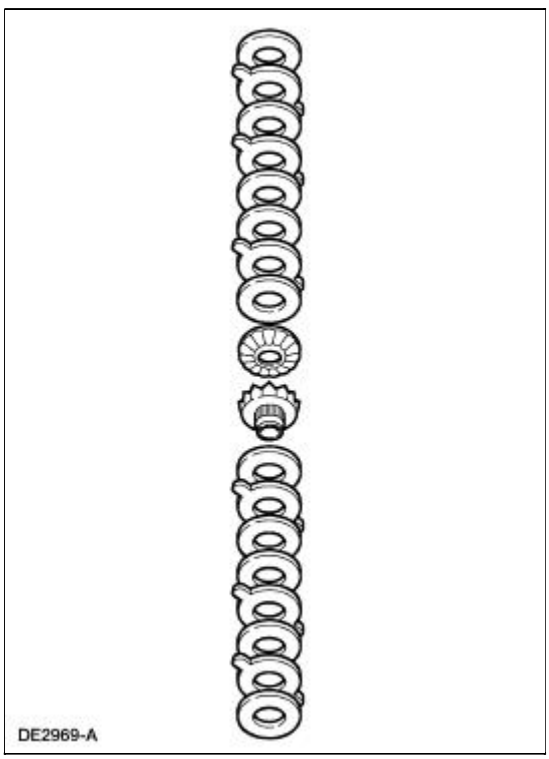


23. Remove the bolt and remove the differential pinion shaft.



24. **WARNING: The differential clutch spring is under tension. Remove the spring carefully. Failure to follow these instructions may result in personal injury.**

    Remove the differential clutch spring.



25. Remove the differential gears.
    1. Remove the two differential pinion gears and pinion thrust washers.
    2. Remove the two differential side gears with the clutch packs and the shims and tag them "left" and "right."

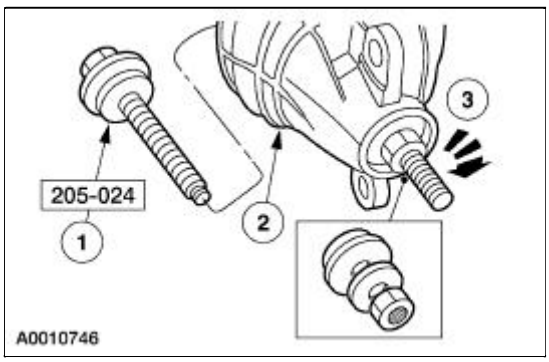
26. **CAUTION: Keep the differential clutch packs in order. Do not mix them. Always reassemble them in the same sequence.**

Remove the differential clutch packs and shims from the differential side gears.

- Clean and inspect the remaining differential components for wear and damage. Install new parts as necessary.

27. **CAUTION: Do not use acids or solvents when cleaning the differential clutch packs.**

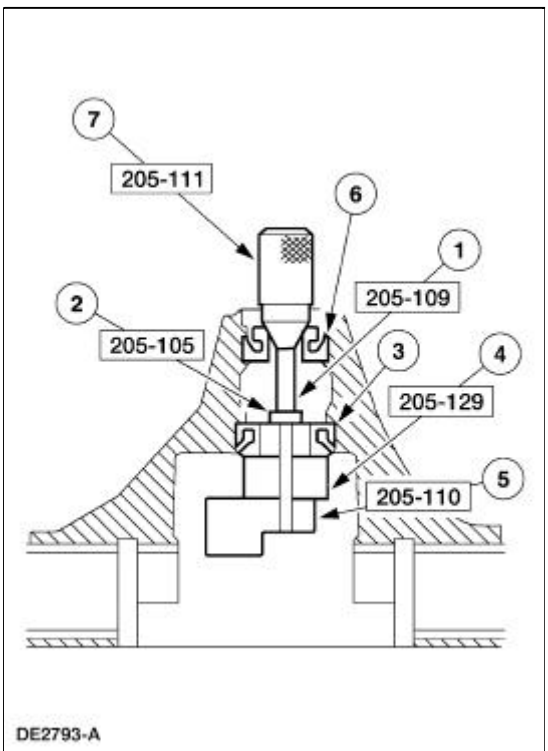
Wipe the components only with a clean, lint-free cloth.



Clean and inspect the differential clutch packs for wear and damage. Install new parts as necessary.

Assembly

Initial assembly

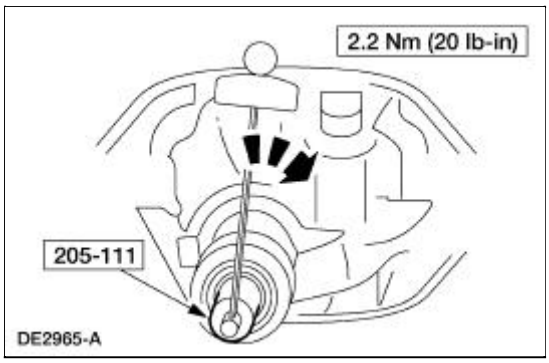


1. Coat the new differential drive pinion bearing cup(s) with lubricant.

2. Using the special tool, install the differential drive pinion bearing cup(s).
    1. Position the bearing cup(s) on the special tool.
    2. Position the special tool and the bearing cup(s) in the differential housing.
    3. Tighten the special tool to fully seat the bearing cup(s) in the bore(s).

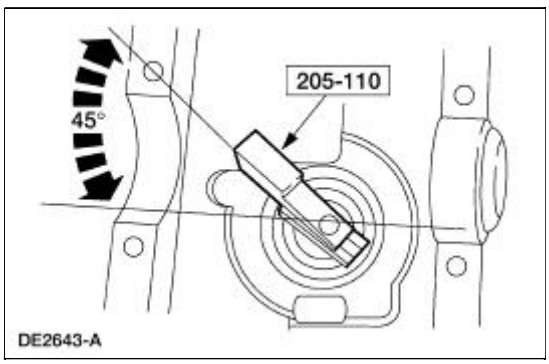
3. **NOTE:** Apply a light film of lubricant on the front and rear pinion bearings.

   Install the pinion bearings and special tools as shown.



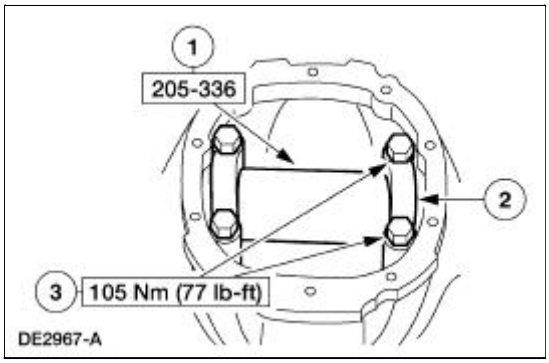
Item	Part Number	Description
1	205-109	Adapter for 205-S127

2	205-105	Adapter for 205-S127
3	4630	Rear (inner) pinion bearing
4	205-129	Adapter for 205-S127
5	205-110	Adapter for 205-S127
6	4621	Front (outer) pinion bearing
7	205-111	Adapter for 205-S127



4. **NOTE:** This step duplicates pinion bearing preload.

   Thread the special tool onto the Screw and tighten to the specification shown.

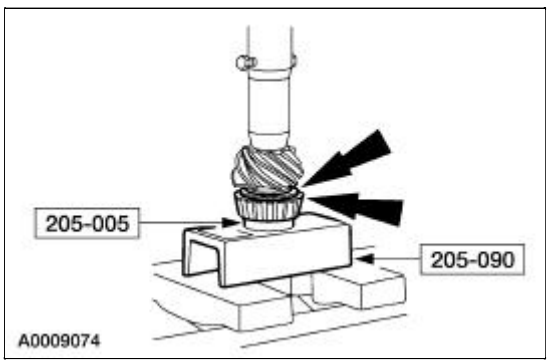


5. **CAUTION: Offset the special tool to obtain an accurate reading.**

   Rotate the special tool several half turns to seat the pinion bearings. Position the special tool as shown.

6. Install the special tool.
   1. Position the special tool on the differential housing differential bearing seat.
   2. Install the differential bearing caps.
   3. Install the bolts.

7. Use a drive pinion bearing adjustment shim as a gauge for shim selection. Check the drive pinion bearing adjustment shim thickness between the Gauge Block and the Gauge Tube. A slight drag indicates correct shim selection.

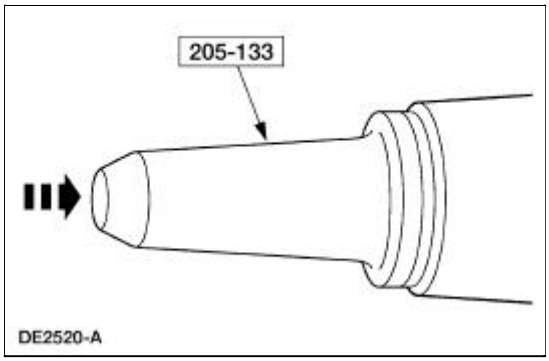


8. Remove all of the special tools.

9. **CAUTION: Use the same pinion bearings and drive pinion bearing adjustment shim from the drive pinion bearing adjustment shim selection procedure for final assembly.**

   Position the drive pinion bearing adjustment shim and the pinion bearing on the drive pinion gear stem.

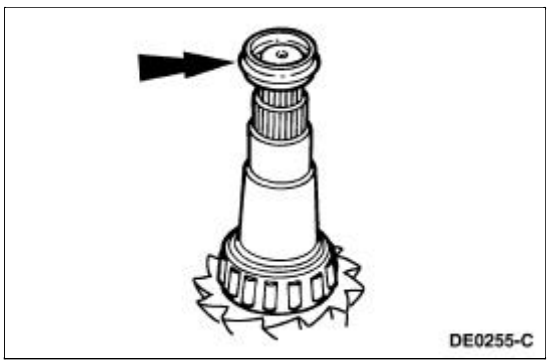
10. Using the special tools and a suitable press, firmly seat the drive pinion bearing adjustment shim and pinion bearing on the drive pinion gear stem.



11. Install the front pinion bearing and the rear axle drive pinion shaft oil slinger in the differential housing.

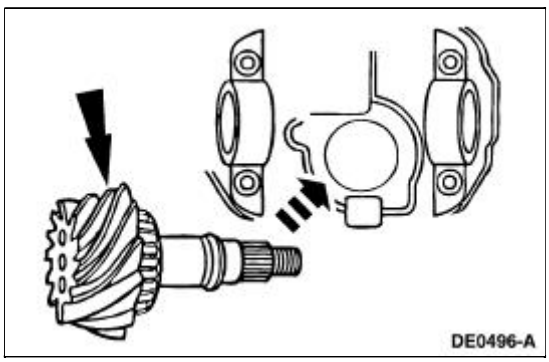
12. **CAUTION: Installation without the correct tool can result in early seal failure.**

CAUTION: If the seal becomes misaligned during installation, remove it and install a new one.



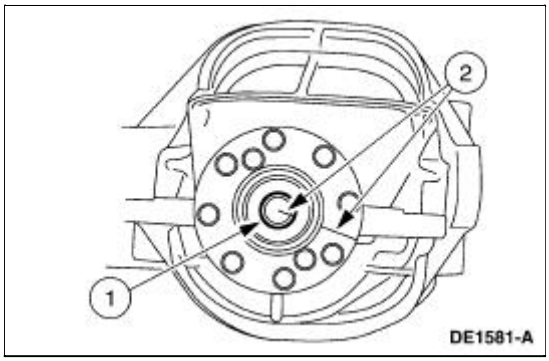
NOTE: Coat the rear axle drive pinion seal lips with grease.

Using the special tool, install the new rear axle drive pinion seal.

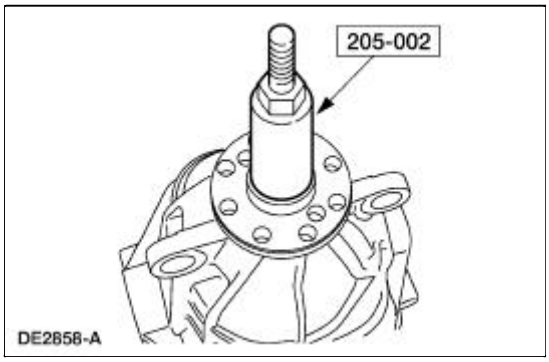


13. **CAUTION: Make sure the splines on the drive pinion gear stem are free of burrs. If burrs are evident, remove them using a fine crocus cloth.**

    Place a new differential drive pinion collapsible spacer on the drive pinion gear stem against the pinion stem shoulder.

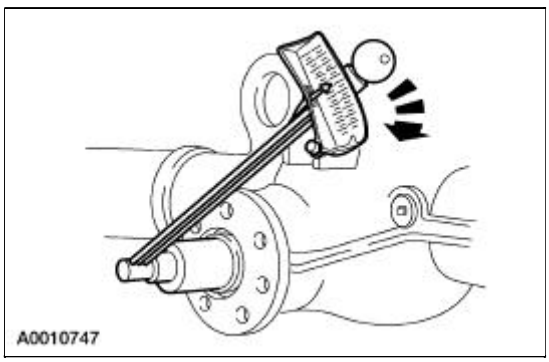


14. Install the drive pinion gear with the differential drive pinion collapsible spacer in the differential housing.



15. **NOTE:** Disregard the index marks if installing a new rear axle pinion flange.

    Position the rear axle pinion flange.
    1. Lubricate the rear axle pinion flange splines.
    2. Position the rear axle pinion flange.

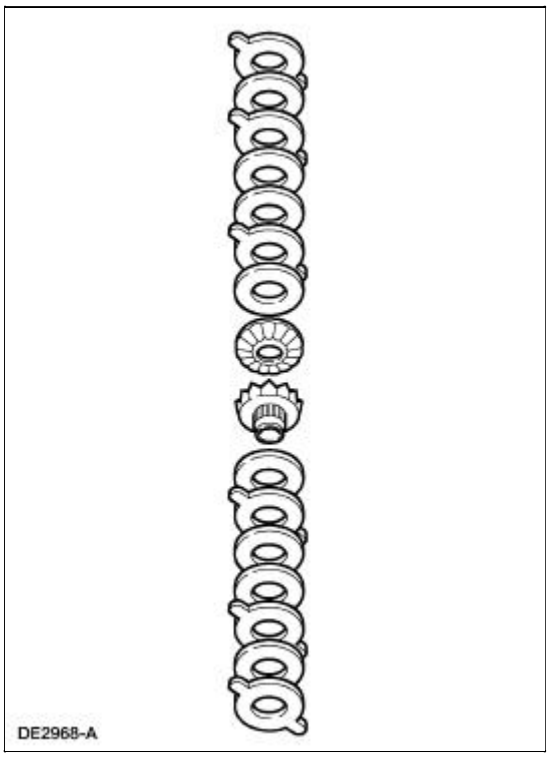


16. Using the special tool, install the rear axle pinion flange.

17. **CAUTION: Do not under any circumstance loosen the nut to reduce preload. If it is necessary to reduce preload, install a new differential drive pinion collapsible spacer and nut.**

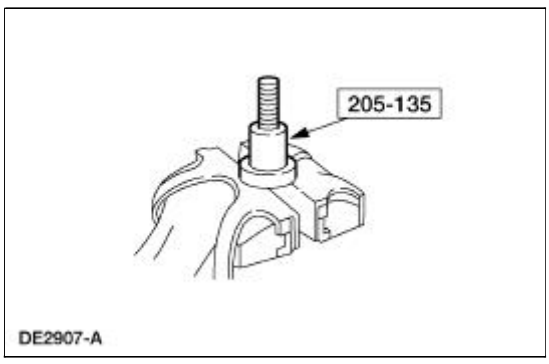
    Tighten the nut to set the preload.

    - Rotate the pinion occasionally to make sure the pinion bearings seat correctly. Take frequent pinion bearing torque preload readings by rotating the drive pinion gear with a Nm (inch/pound) torque wrench.
    - For new pinion bearings, tighten the nut to specification. Refer to torque specifications for new pinion bearings in the Specifications portion of this section.
    - For used pinion bearings, if the preload recorded prior to disassembly is lower than the specification for used bearings, then tighten the nut to specification. Refer to torque specifications for used pinion bearings in the Specifications portion of this section.
    - For used pinion bearings, if the preload recorded prior to disassembly is higher than the specification for used bearings, then tighten the nut to the original reading as recorded.



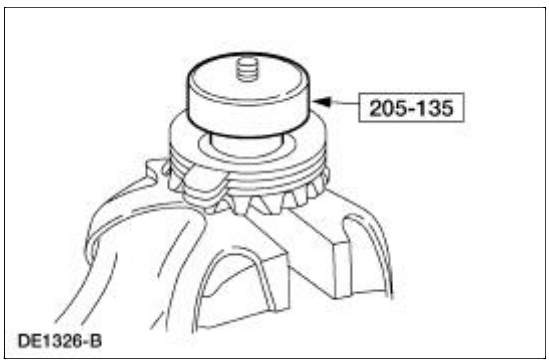
18. **CAUTION: 118 ml (4 oz) of additive friction modifier must be used in the axle.**

Lubricate each steel clutch plate with additive friction modifier and soak all friction plates for no less than 15 minutes.

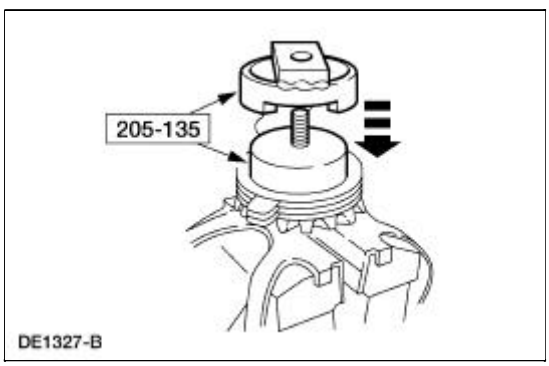


19. **CAUTION: Do not mix the clutch plates, clutch discs or shim from one side with the other.**

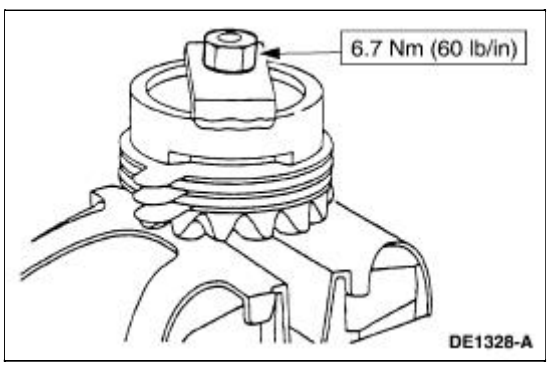
    Assemble the differential clutch packs (without the shims) on their respective differential side gear.



20. Place the base portion of the special tool in a vise.

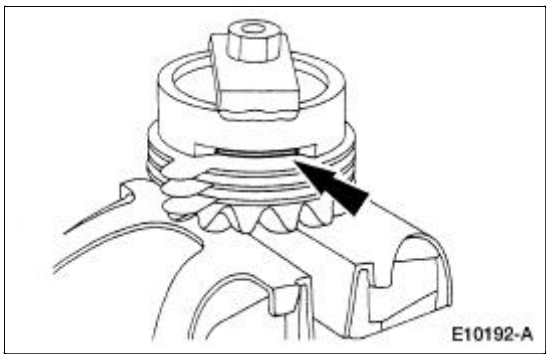


21. Install the differential clutch pack and differential side gear (without the shim) on the special tool.

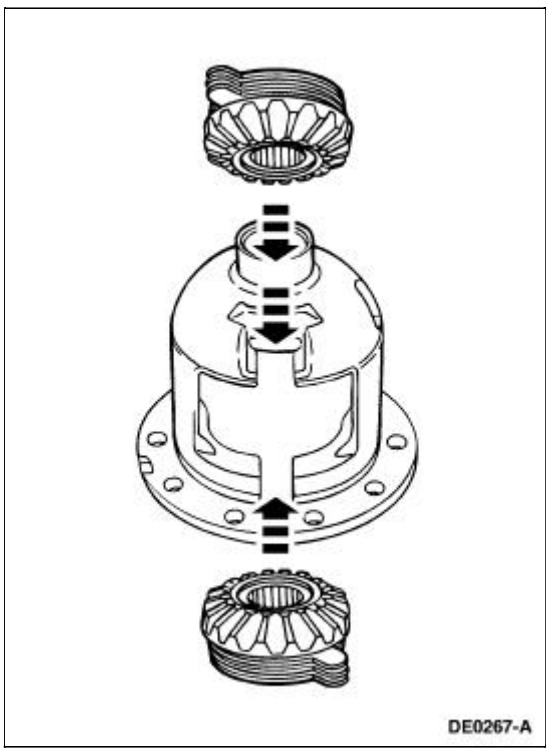


22. Position the special tool hand-tight on top of the differential clutch pack.

23. Install the special tool over the disc and differential clutch pack.

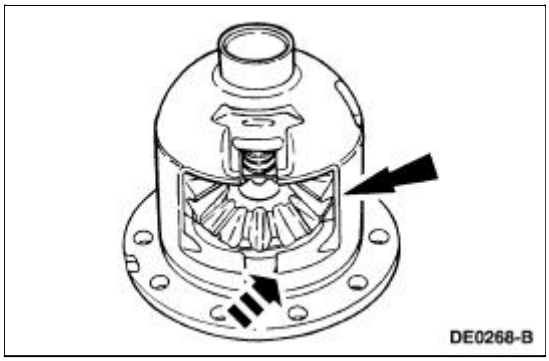


24. Install the nut.

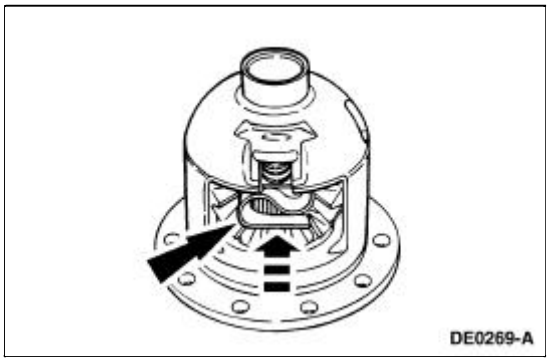


25. Select and insert the thickest feeler gauge blade that will enter between the tool and the differential clutch pack. The reading will be the thickness of the new clutch shim.

Selective Shims

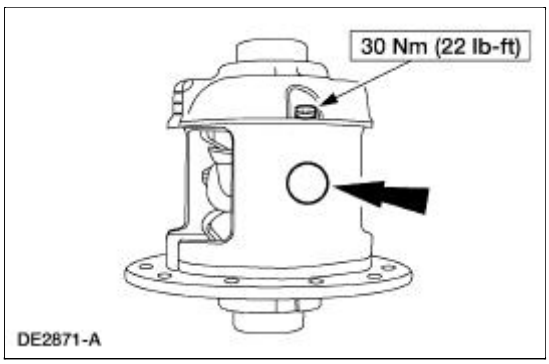


Part Number	Description
E0AZ-4A324-G	0.025 inch
E0AZ-4A324-H	0.030 inch
E0AZ-4A324-C	0.035 inch
E0AZ-4A324-D	0.040 inch
E0AZ-4A324-F	0.045 inch

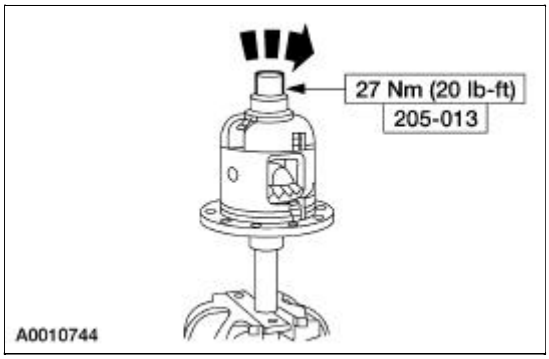


26. Remove the special tool from the differential clutch pack and differential side gear assembly.
27. Install the shim(s) on the differential clutch pack and differential side gear assembly.
28. Install the differential side gear assemblies in the differential case.

29. Install the differential pinion gear and differential pinion thrust washer assemblies in the differential case.

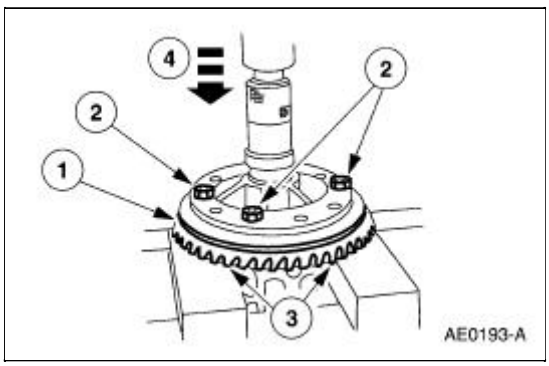


30. Using a soft-faced hammer, install the differential clutch spring.

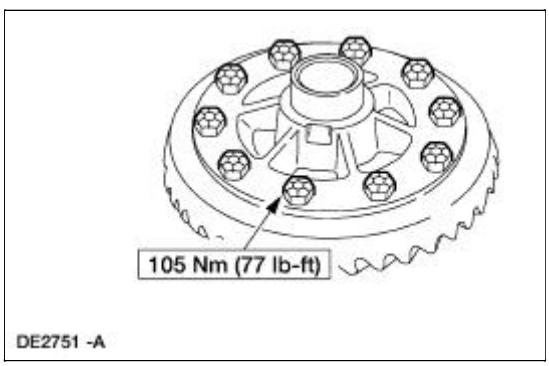


31. **NOTE:** If a new bolt is unavailable, coat the original bolt threads with threadlock and sealer prior to final installation.

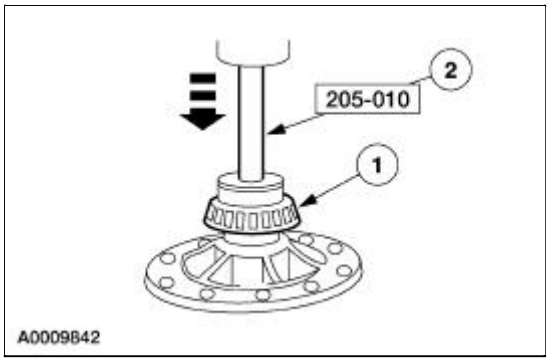
    Install the differential pinion shaft and install a new bolt finger-tight.



32. Mount the differential case and the special tool in a vise. Using the special tool, check the torque necessary to rotate one differential side gear.
    - If reusing the original clutch plates, the initial minimum break-away torque must be no less than the specification. The minimum rotating torque necessary to keep the differential side gear turning with new clutch plates may vary.

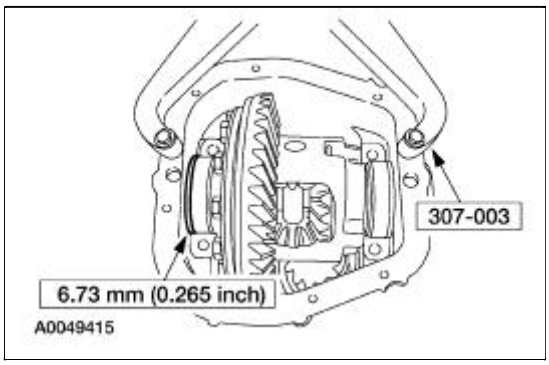


33. Draw-file the differential ring gear mounting surface to remove any nicks or burrs.

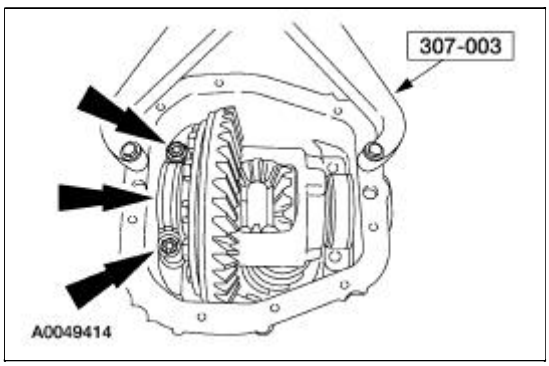


34. Install the differential ring gear.
    1. Place the differential ring gear on the differential case.
    2. Hand start three bolts to align the holes in the differential ring gear and the differential case.
    3. Place the differential case and differential ring gear onto the press bed blocks with the differential ring gear teeth facing downward.
    4. Press the differential ring gear into place.

35. Install the remaining bolts.

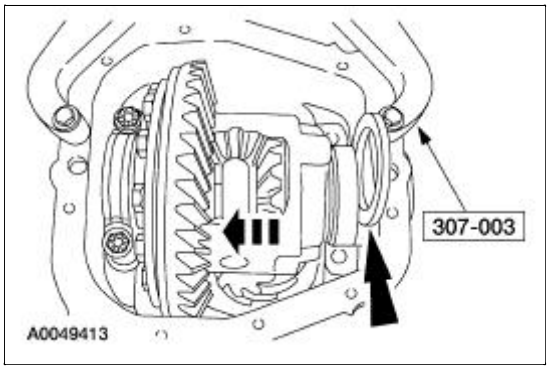


36. Press the left and right differential bearing on the differential case.
    1. Place the bearing on the differential case.
    2. Use the special tool to install the bearing.



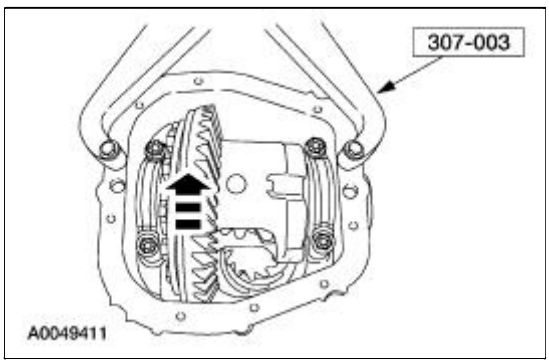
37. With the pinion depth set and the pinion installed, place the differential case in the rear axle housing.

38. Install a shim as shown on the left side.



39. **NOTE:** Apply pressure toward the left side to make sure the left bearing cup is seated.

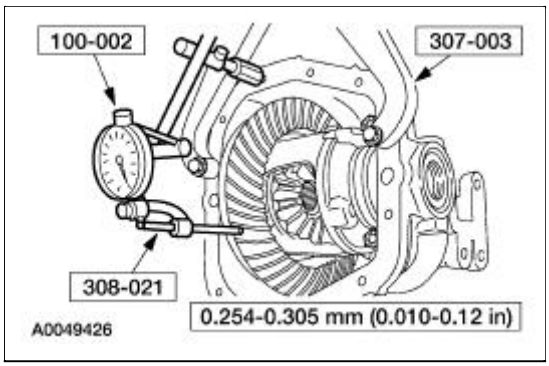
    Install the left bearing cap and loosely install the bearing cap bolts.



40. Install progressively larger shims on the right side until the largest shim selected can be installed by hand.

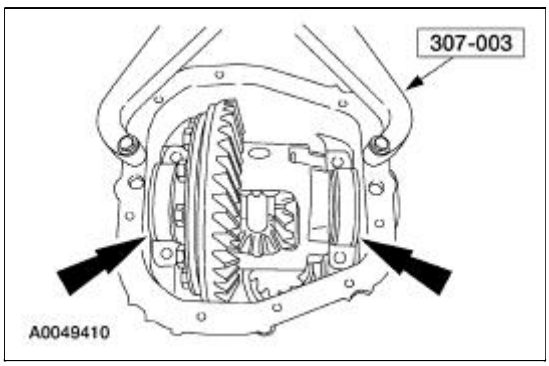
41. Install the right side bearing cap and tighten the bolts.

42. Rotate the differential case to make sure it rotates freely.



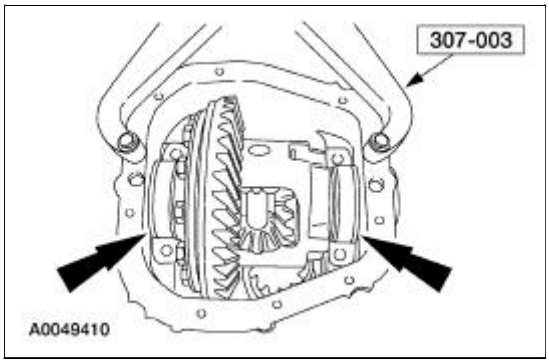
Measuring backlash

43. Using the special tools, measure and note the differential ring gear backlash.
    - If backlash is within the specification, refer to Backlash within specification in this procedure.
    - If a zero backlash condition occurs, refer to Zero backlash in this procedure.
    - If backlash is not within the specification, refer to Backlash not within specification in this procedure.



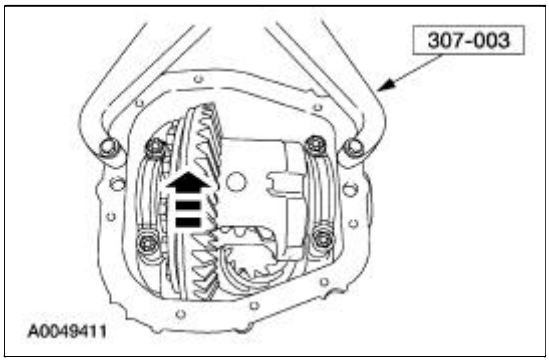
Backlash Change Required		Thickness Change Required	
mm	**Inch**	**mm**	**Inch**
0.025	0.001	0.050	0.002
0.050	0.002	0.050	0.002
0.076	0.003	0.101	0.004

0.101	0.004	0.152	0.006
0.127	0.005	0.152	0.006
0.152	0.006	0.203	0.008
0.177	0.007	0.254	0.010
0.203	0.008	0.254	0.010
0.228	0.009	0.304	0.012
0.254	0.010	0.355	0.014
0.279	0.011	0.355	0.014
0.304	0.012	0.406	0.016
0.330	0.013	0.457	0.018
0.335	0.014	0.457	0.018
0.381	0.015	0.508	0.020

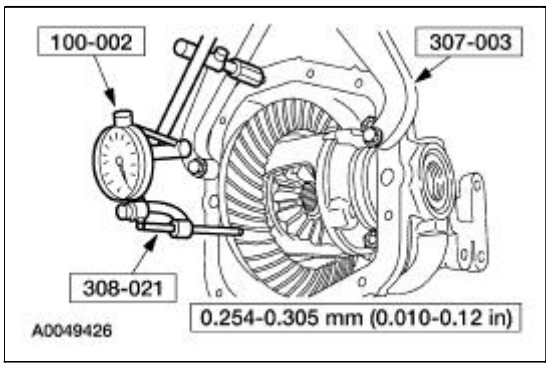


Zero backlash

44. If a zero backlash condition occurs, add 0.51 mm (0.020 inch) to the RH side and subtract 0.51 mm (0.020 inch) from the LH side to allow backlash indication. Measure the backlash. Refer to Measuring backlash in this procedure.

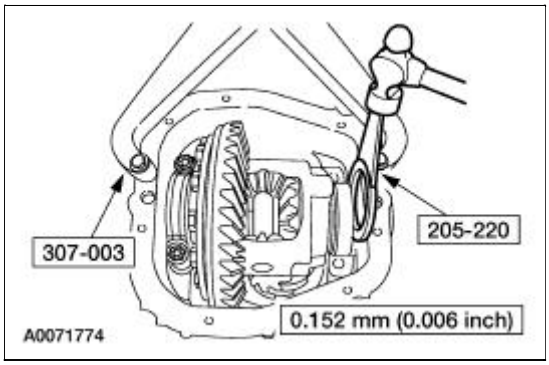


Backlash not within specification

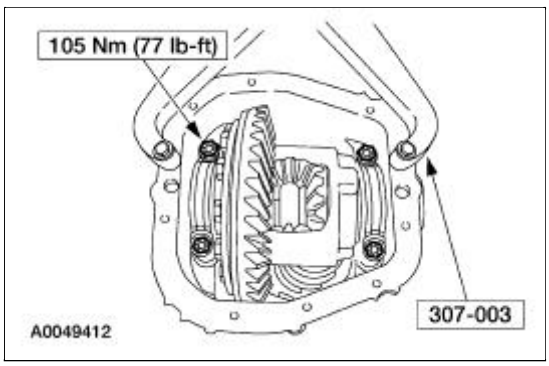


45. To increase or decrease backlash, remove the differential bearing caps and install a thicker shim and a thinner shim accordingly.
    - If backlash is not within the specification, increase the thickness of one differential bearing shim and decrease the thickness of the other differential bearing shim by the same amount.

46. Rotate the differential assembly several times to verify that the differential bearings seated correctly.

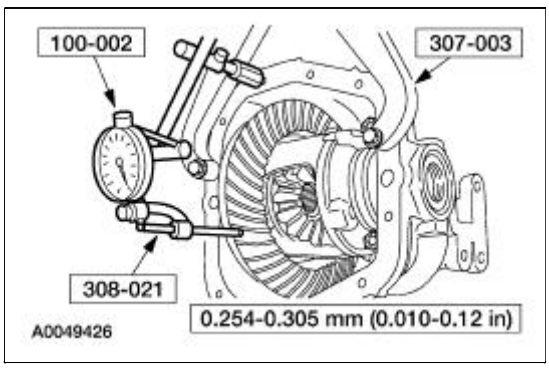


47. Using the special tools, recheck the backlash.
    - If backlash is within the specification, refer to Backlash within specification in this procedure. If backlash is not within the specification, repeat Backlash not within specification in this procedure.



Backlash within specification

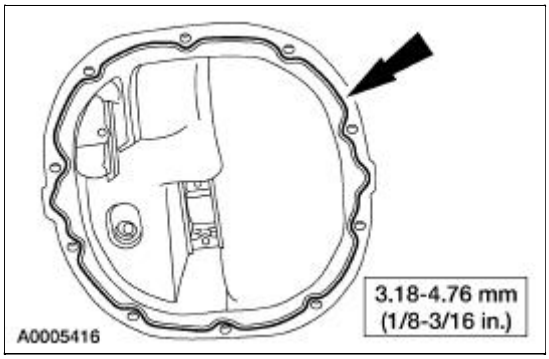
48. Remove the bolts and the differential bearing caps.



49. To establish differential bearing preload, increase both left and right differential bearing shim sizes by the specification shown.

50. Install the differential bearing caps and bolts.

51. Using the special tools, recheck the backlash.



Final assembly

52. **CAUTION: The machined surfaces on the differential housing and the differential housing cover must be clean and free of oil before applying the new silicone sealant. Cover the inside of the axle before cleaning the machined surface to prevent contamination.**

CAUTION: Install the differential housing cover within 15 minutes of applying the silicone material.

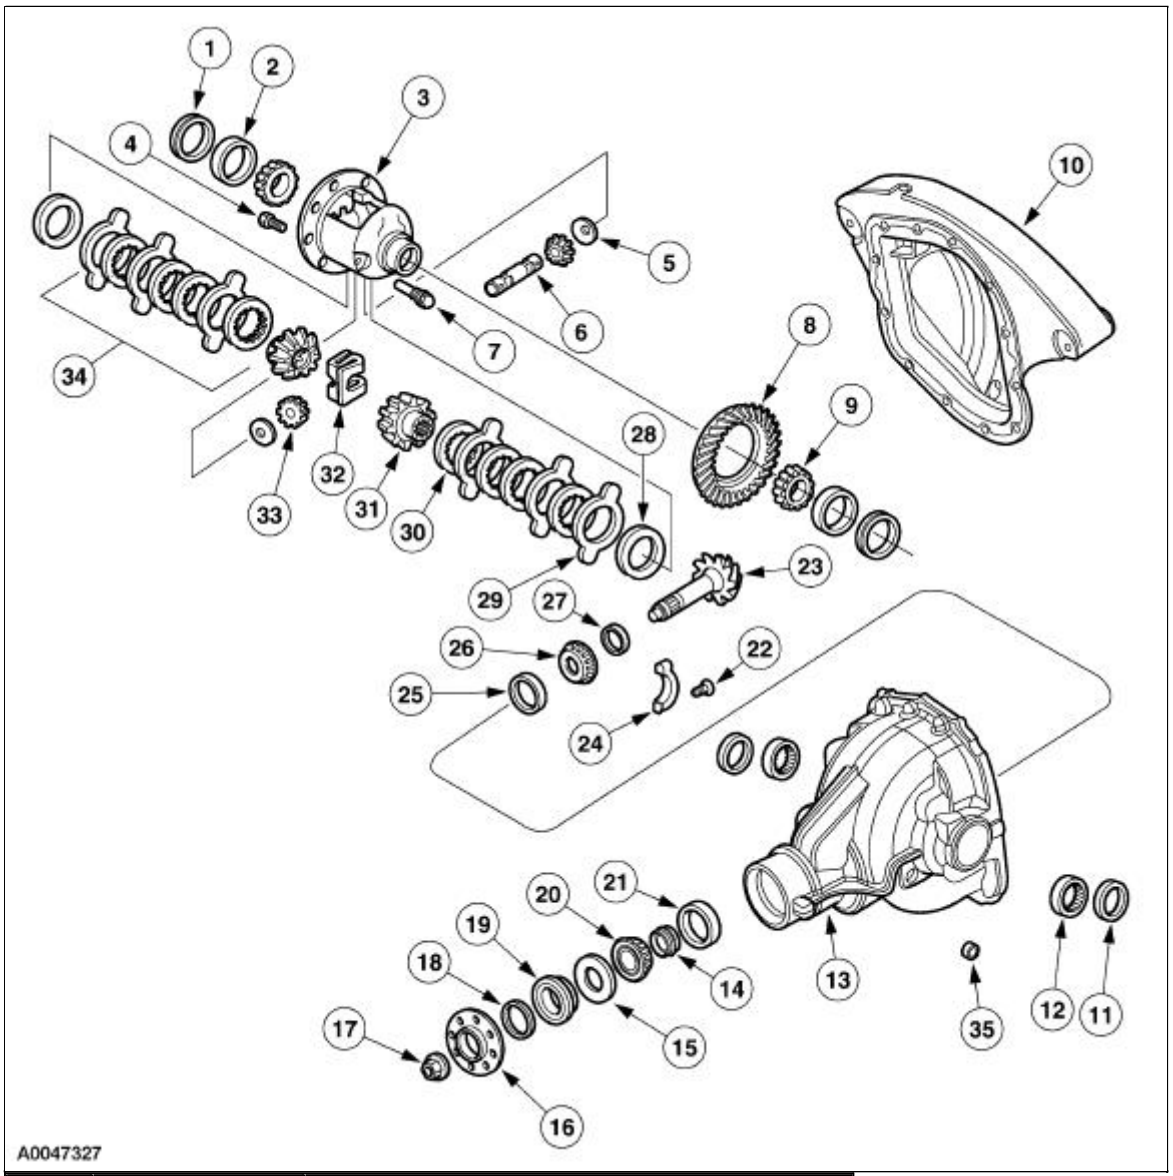
CAUTION: Allow the sealant to cure for one hour before filling the axle with lubricant.

Apply a continuous bead of sealant, of the specified thickness, to the differential housing cover mounting surface.

53. Install the differential housing cover.

54. **CAUTION: Place 118 ml (4 oz) of additive friction modifier in the rear axle assembly.**

    Install the rear axle assembly in the vehicle. Fill the axle with the specified lubricant. For additional information, refer to Axle Assembly—Air Suspension or Axle Assembly—Coil Suspension in this section.



General Specifications

Item	Specification
Lubricants and Sealants	
SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL	WSL-M2C192-A

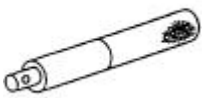
Torque arm insulator bolt	181	100	—
Rear axle cover insulator stud nut	100	74	—

Rear Drive Axle and Differential

Item	Part Number	Description
1	4067	Differential bearing shim
2	4222	Differential bearing cup
3	4204	Differential case
4	4216	Differential ring gear case bolt
5	4230	Differential pinion thrust washer
6	4211	Differential pinion shaft
7	4241	Differential pinion shaft lock bolt
8	—	Differential ring gear (part of 4209)
9	4221	Differential bearing

10	4033	Differential housing cover
11	4B416	Stub shaft pilot bearing seal
12	4B413	Stub shaft pilot bearing
13	4010	Differential housing
14	4662	Drive pinion collapsible spacer
15	4670	Drive pinion shaft oil slinger
16	4851	Drive pinion flange
17	389546-S100	Drive pinion nut
18	4859	Drive pinion oil seal deflector
19	4676	Drive pinion seal
20	4621	Drive pinion bearing
21	4616	Drive pinion bearing cup
22	56187-S	Bolt
23	—	Drive pinion gear (part of 4209)
24	—	Differential bearing cap (part of 4010)
25	4628	Drive pinion bearing cup
26	4630	Drive pinion bearing
27	4663	Drive pinion bearing adjustment shim
28	4A321	Differential clutch shim
29	—	Clutch plate (part of 4947)
30	—	Clutch disc (part of 4947)
31	4236	Differential side gear
32	4214	Differential clutch spring
33	4215	Differential pinion gear
34	4947	Differential clutch pack
35	390943 S100	Fill plug

- The differential housing consists of a cast iron housing and a cast aluminum differential housing cover. The differential housing cover uses silicone sealant as a gasket.
- The hypoid-design gearset consists of a 9.75-inch differential ring gear and a drive pinion gear. Two opposed pinion bearings support the drive pinion gear in the differential housing.
- A drive pinion collapsible spacer, located on the drive pinion gear shaft, maintains pinion bearing preload. The pinion nut adjusts the preload.
- Differential bearing shims, located between the differential bearing cups and the differential housing, adjust the differential ring gear backlash and the differential bearing preload.
- The differential case is a one-piece design with two openings to allow for assembly of the internal components and lubricant flow. Two opposed differential bearings support the differential case in the differential housing. Removable differential bearing caps retain the differential assembly in the differential housing.
- Inside the differential case, the differential pinion shaft supports two differential pinion gears. The pinion gears engage the differential side gears, to which the halfshafts are splined. The differential pinion shaft lock bolt retains the differential pinion shaft in the differential case.
- A circlip, located on the stub shaft, holds the halfshaft in the differential case. When installed, the circlip engages a groove in the differential side gear.



- The rear axle uses SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL or equivalent meeting Ford specification WSL-M2C192-A.
- An embossed metal tag, bolted to the differential housing cover, contains rear axle identification. For additional information, refer to Section 205-00 .

Rear Drive Axle and Differential

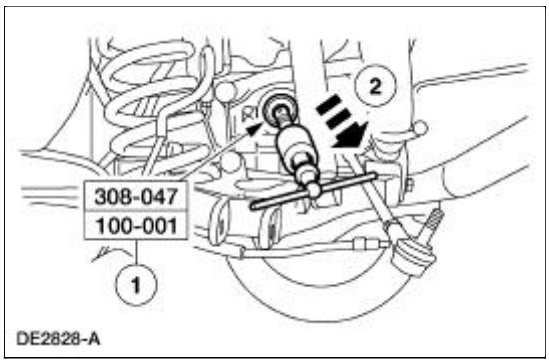
Refer to Section 205-00 .

Stub Shaft Pilot Bearing and Seal

Special Tool(s)

 ST1200-A	Remover, Bearing Cup 308-047 (T77F-1102-A)
 ST2258-A	Protector, Halfshaft Seal (Pair) 205-506
 ST1676-A	Installer, Halfshaft Seal 205-505
 ST1326-A	Adapter for 303-224 (Handle) 205-153 (T80T-4000-W)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)
 ST1721-A	Installer, Halfshaft Pilot Bearing 205-504
 ST1192-A	Remover, Transmission Fluid Seal 307-048 (T74P-77248-A)

Material

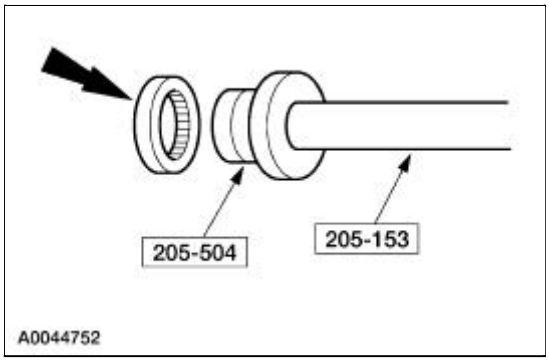


Item	Specification
SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL	WSL-M2C192-A
Premium Long Life Grease XG-1-C	ESA-M1C75-B

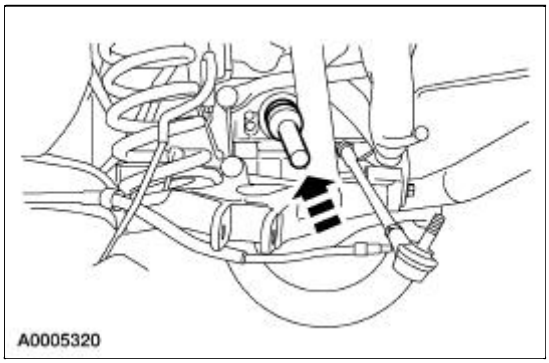
1. Remove the halfshaft assembly. For additional information, refer to Section 205-05 .

2. Using the special tools, remove the stub shaft pilot bearing seal.

3. Using the special tools, remove the stub shaft pilot bearing.
    1. Firmly engage the tangs of the special tool on the stub shaft pilot bearing.
    2. Remove the bearing.



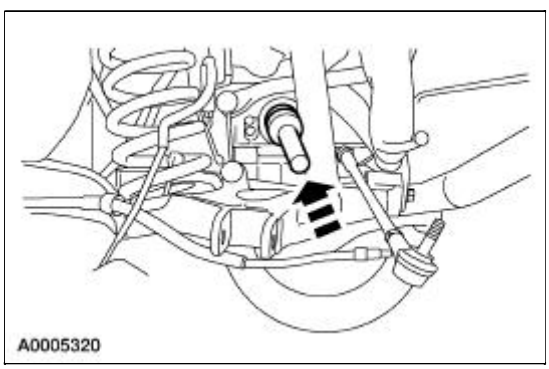
4. Inspect the seal journal for rust, nicks and scratches. Polish the seal journal surface with fine crocus cloth, if necessary.



5. Lubricate the new stub shaft pilot bearing with axle lubricant.

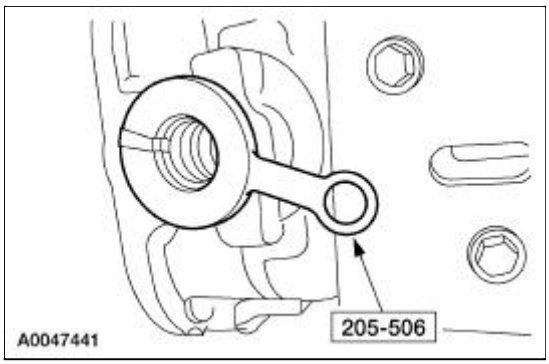
6. **CAUTION: Installation of the stub shaft pilot bearing or stub shaft oil seal without the correct tools can result in early bearing or seal failure. If the stub shaft pilot bearing becomes cocked in the bore during installation, remove it and install a new one.**

    Place the stub shaft pilot bearing onto the special tools.



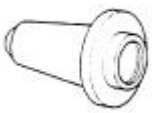
7. Install the stub shaft pilot bearing into the rear axle housing bore.

8. Lubricate the lip of the stub shaft pilot bearing seal with grease and install the seal onto the special tools.



9. Carefully align the stub shaft pilot bearing seal with the housing bore and install the stub shaft pilot bearing seal.

10. **CAUTION: Use the special tool to avoid damaging the seal with the halfshaft.**



CAUTION: Inspect the stub shaft seal journal for rust, nicks, or scratches prior to installing the halfshaft. Polish the seal journal with fine crocus cloth, if required.

Install the halfshaft. For additional information, refer to Section 205-05 .

Drive Pinion Flange and Drive Pinion Seal

Special Tool(s)

 ST2026-A	2-Jaw Puller 205-D072 (D97L-4221-A) or equivalent
 ST1257-A	Holding Fixture, Drive Pinion Flange 205-126 (T78P-4851-A)
 ST1734-A	Installer, Drive Pinion Flange 205-233 (T85T-4851-AH)
 ST1325-A	Installer, Drive Pinion Oil Seal 205-208 (T83T-4676-A)

Material

Item	Specification
Premium Long Life Grease XG-1-C	ESA-M1C75-B
Threadlock and Sealer E0AZ-19554-AA	WSK-M2G351-A5 (type II)
SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL	WSL-M2C192-A

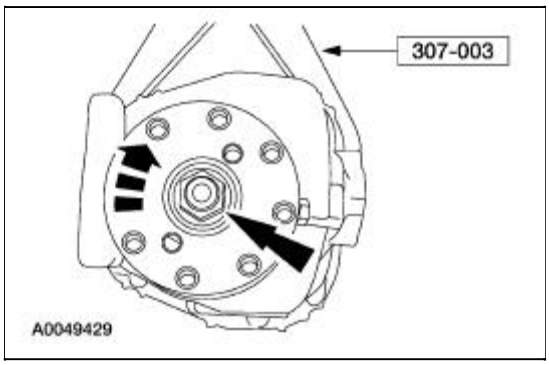
Removal

CAUTION: Remove the rear wheel and tire assemblies, brake calipers, and brake discs to prevent brake drag during the drive pinion bearing preload adjustment.

1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by**

turning off the air suspension switch located in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations. Failure to follow these instructions may result in personal injury and vehicle damage.

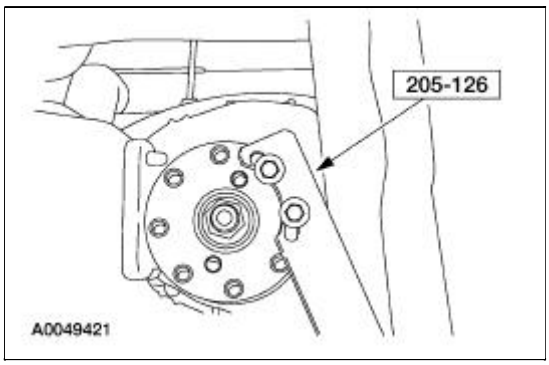
Position the vehicle on a hoist. For additional information, refer to Section 100-02 .



2. Remove the rear wheel and tire assemblies. For additional information, refer to Section 204-04 .

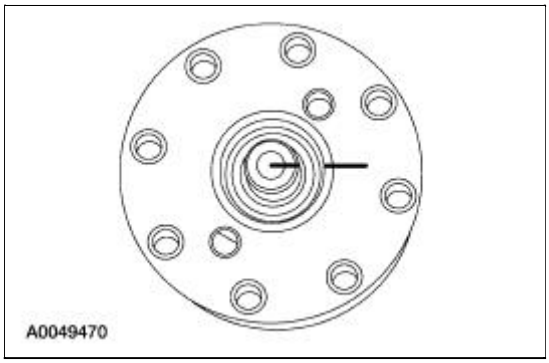
3. **CAUTION: Do not allow the brake caliper to hang from the brake hose. Provide a suitable support.**

   Remove the rear brake calipers, and the brake discs. Position the brake calipers aside. For additional information, refer to Section 206-04 .



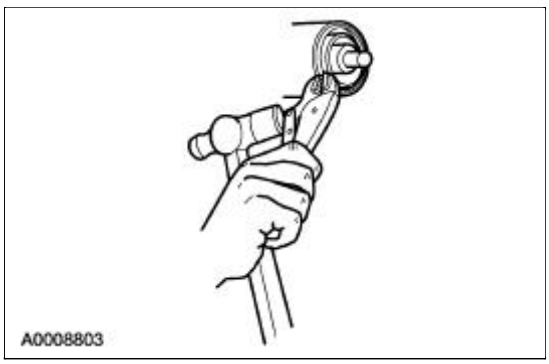
4. Remove the rear driveshaft assembly. For additional information, refer to Section 205-01 .

5. Install a Nm (inch-pound) torque wrench on the nut and record the torque necessary to maintain rotation of the drive pinion gear through several revolutions.



6. **CAUTION: After removing the pinion nut, discard it. Use a new nut for installation.**

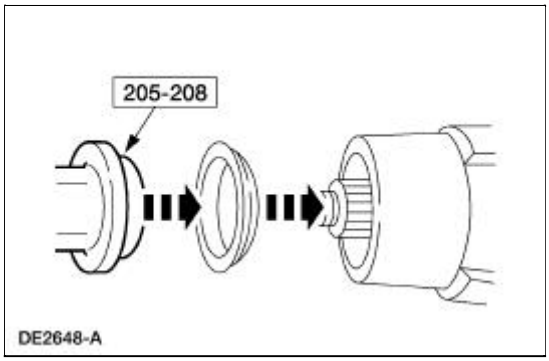
   Use the special tool to hold the pinion flange while removing the pinion nut.



7. Index-mark the drive pinion flange and the drive pinion gear stem to maintain initial balance during installation.

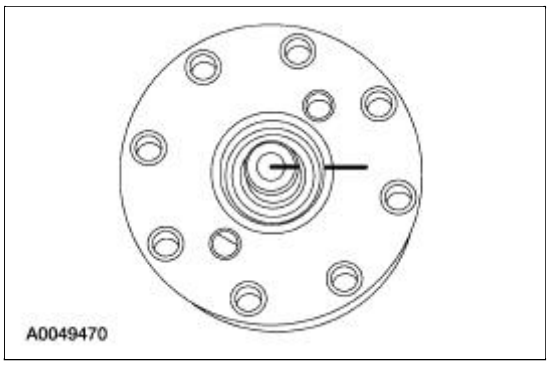
8. Using the special tool, remove the drive pinion flange.

9. Force up on the metal flange of the drive pinion seal. Install gripping pliers and strike with a hammer until the pinion seal is removed.



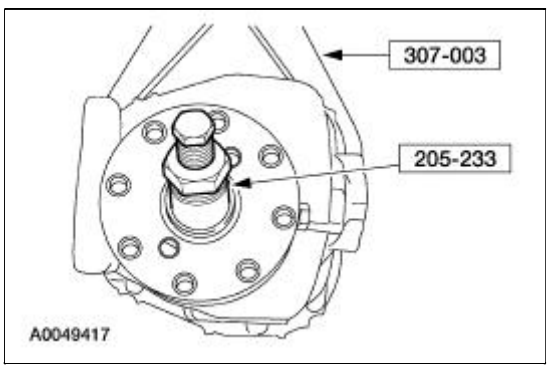
Installation

1. Lubricate the lips of the new drive pinion seal with grease.



2. **CAUTION: If the drive pinion seal becomes misaligned during installation, remove it and install a new seal.**

   Using the special tool, install the drive pinion seal.

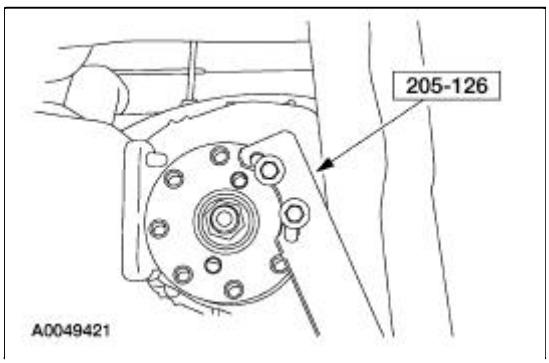


3. Lubricate the drive pinion flange splines with rear axle lubricant.
4. **NOTE:** Disregard the index marks if installing a new drive pinion flange.

   Position the drive pinion flange.

5. Using the special tool, install the drive pinion flange.

6. Position the new drive pinion nut.



7. **CAUTION: Do not under any circumstance loosen the nut to reduce preload. If it is necessary to reduce preload, install a new drive pinion collapsible spacer and nut.**

   CAUTION: Remove the special tool while taking preload readings with the Nm (inch-pound) torque wrench.

   Use the special tool to hold the pinion flange while tightening the nut.

   - Rotate the pinion occasionally to make sure the pinion bearings seat correctly. Take frequent pinion bearing torque preload readings by rotating the drive pinion gear with a Nm (inch/pound) torque wrench.
   - If the preload recorded prior to disassembly is lower than the specification for used bearings, tighten the nut to specification. If the preload recorded prior to disassembly is higher than the specification for used bearings, tighten the nut to the original reading as recorded.
   - Refer to the torque specification for used pinion bearings in the Specifications portion of this section.

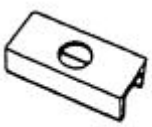
8. **CAUTION: Install the driveshaft with new bolts. If new bolts are not available, apply sealer to the threads of the original bolts.**

   CAUTION: Align the index marks.

   CAUTION: The driveshaft flange yoke fits tightly on the pinion flange pilot. To make sure that the yoke seats squarely on the flange, tighten the bolts evenly in a cross pattern as shown.

   Install the rear driveshaft. For additional information, refer to Section 205-01 .

9. Install the rear brake discs, and the brake calipers. For additional information, refer to Section 206-04 .

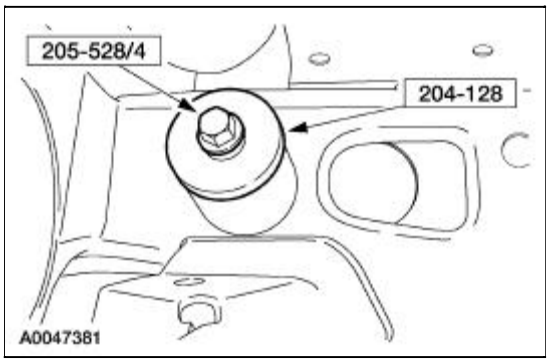


10. Install the rear wheel and tire assemblies. For additional information, refer to Section 204-04 .

11. Lower the vehicle.

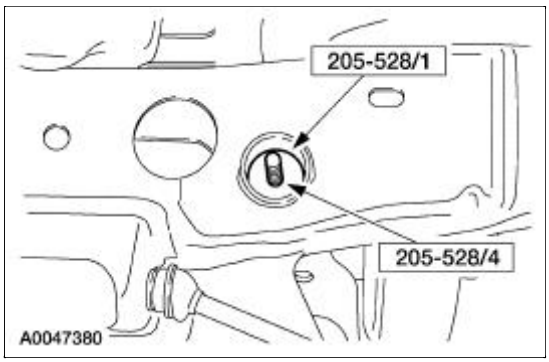
12. If equipped with air suspension, reactivate the system.

Rear Axle Housing Support Insulator



Special Tool(s)

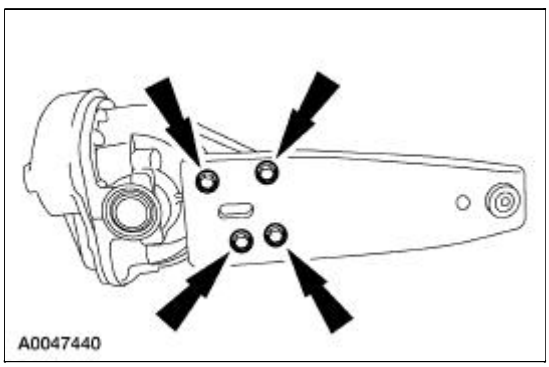
 ST2668-A	Forcing Screw, Rear Differential Housing Bushing 205-528/4
 ST1970-A	Installer, Rear Differential Housing Bushing 205-528/2
 ST2669-A	Receiver Cup, Rear Differential Housing Bushing 205-528/3
 ST1965-A	Remover, Rear Differential Housing Bushing 205-528/1
 ST1569-A	Adapter for 204-S127 204-128 (T86P-5638-AH1)
 ST1367-A	Installer, Drive Pinion Bearing 205-488
 ST1254-A	Plate, Bearing/Oil Seal 205-090 (T75L-1165-B)



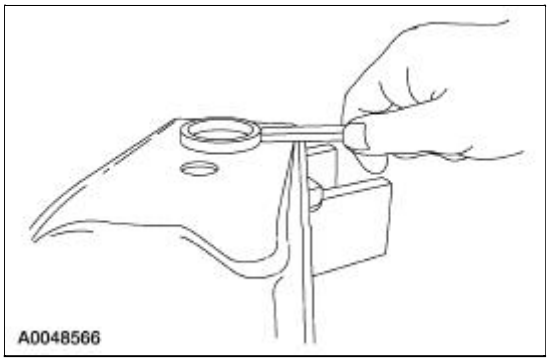
Removal

1. Remove the rear axle assembly. For additional information, refer to Axle Assembly—Air Suspension , or Axle Assembly—Coil Suspension in this section.

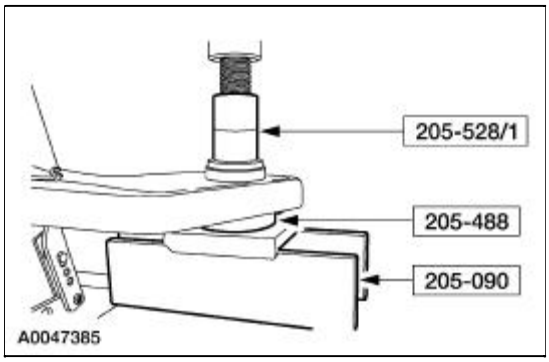
2. Insert the forcing screw through the adapter and the frame support insulator.



3. Thread the bushing remover on the forcing screw.

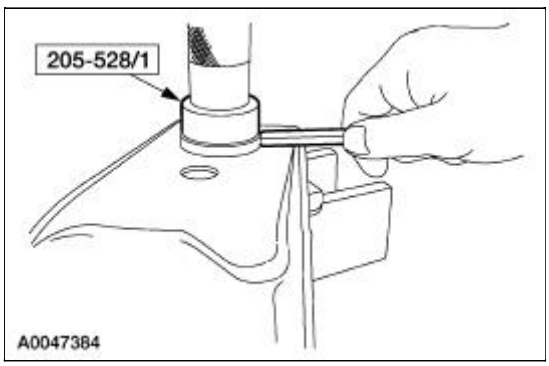


4. Tighten the special tool to remove the frame support insulator.

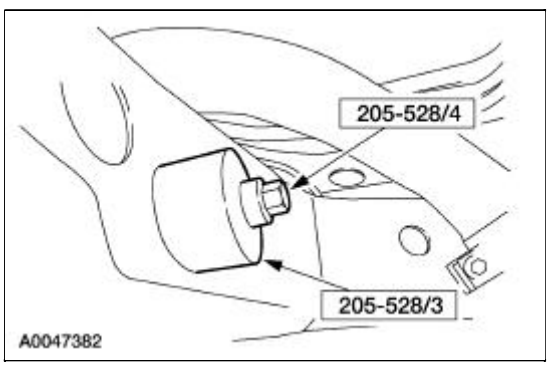


5. Remove the four bolts attaching the torque arm to the axle housing.

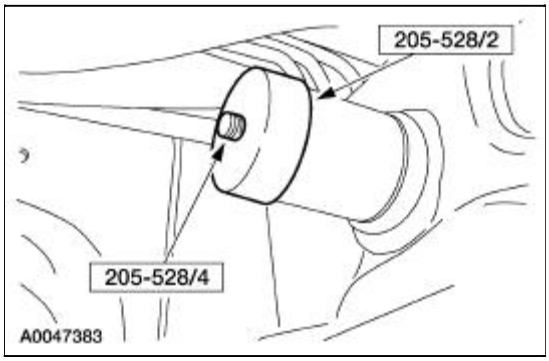
6. Measure and record the distance the insulator extends from the face of the torque arm.



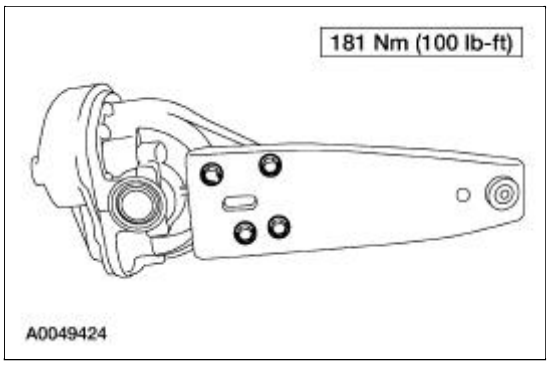
7. Using a suitable press and the special tools, remove the torque arm insulator from the torque arm.



Installation



1. Using a suitable press and the special tools, install the new torque arm insulator to the previously recorded depth.

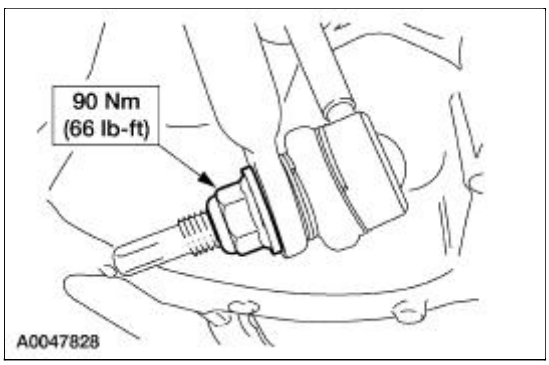


2. Position the special tools on the rear of the crossmember.

3. Position the new insulator and thread the special tools together.

4. Tighten the forcing screw to seat and position the new insulator.
5. Install the torque arm on the rear axle housing.

6. Install the rear axle assembly. For additional information, refer to Axle Assembly—Air Suspension , or Axle Assembly—Coil Suspension in this section.

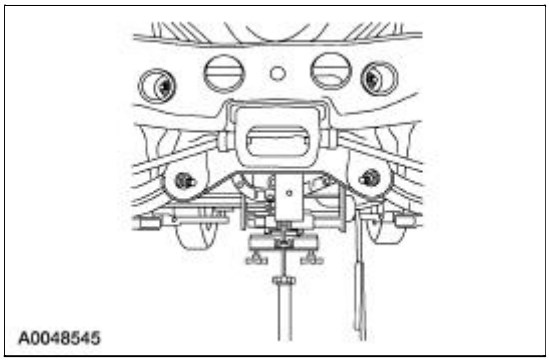


Axle Assembly —Air Suspension

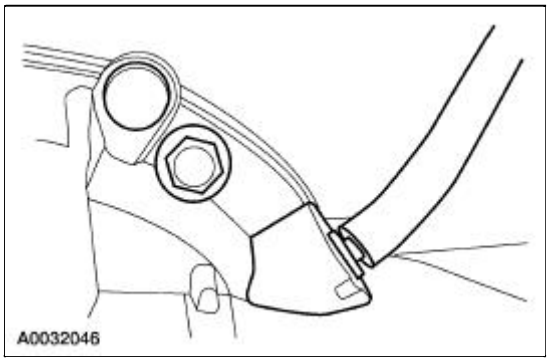
Special Tool(s)

 ST1927-A	Hi-Lift Transmission Jack 164-R3508 or equivalent

Removal and Installation

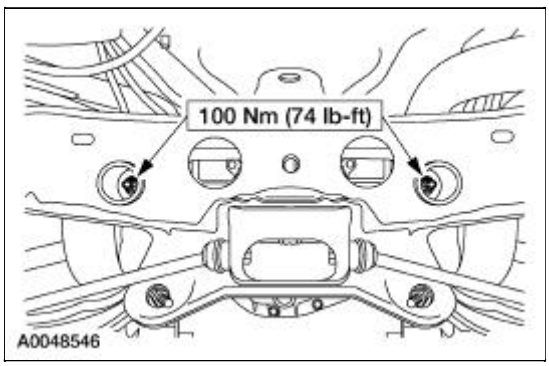


1. Position the vehicle on a hoist. For additional information, refer to Section 100-02 .
2. Deflate the rear air springs. For additional information, refer to Section 204-05 .
3. Remove the rear driveshaft assembly. For additional information, refer to Section 205-01 .
4. Remove the axle halfshafts. For additional information, refer to Section 205-05 .
5. Remove the lower rear sway bar links.

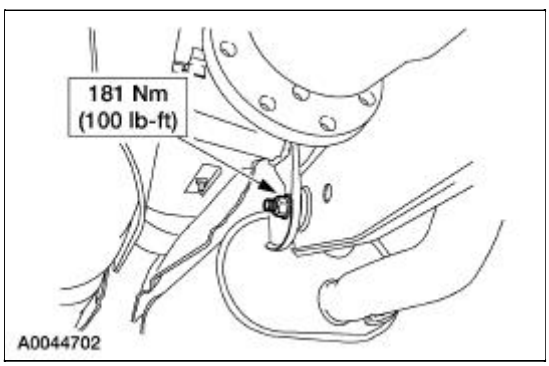


6. Remove the four bracket bolts and remove the rear sway bar.

7. Using a suitable jack, support the axle housing.

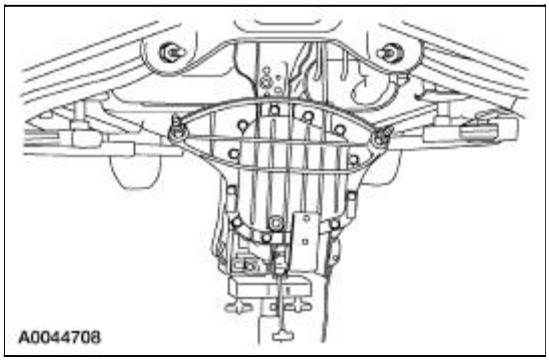


8. Disconnect the axle housing vent tube.



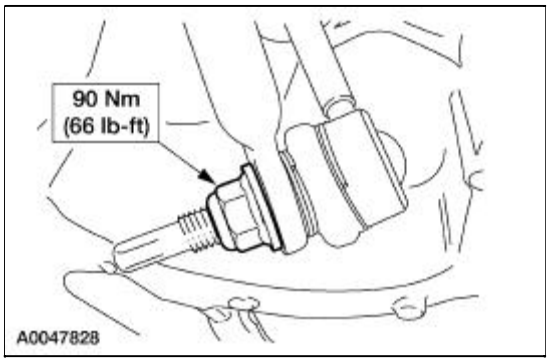
9. **NOTE:** Spare wheel removed for clarity.

   Remove the upper axle housing stud nuts.

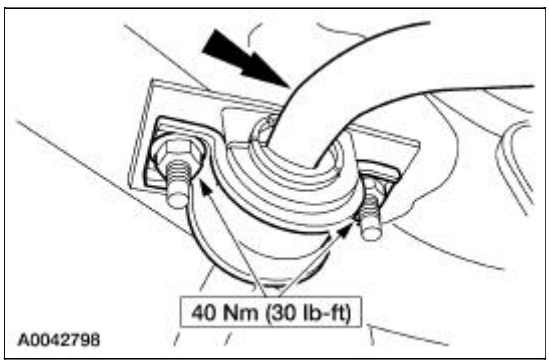


10. Remove the front torque arm bolt.

11. **NOTE:** Move the axle housing forward to clear the rear mounting studs from the bushings.

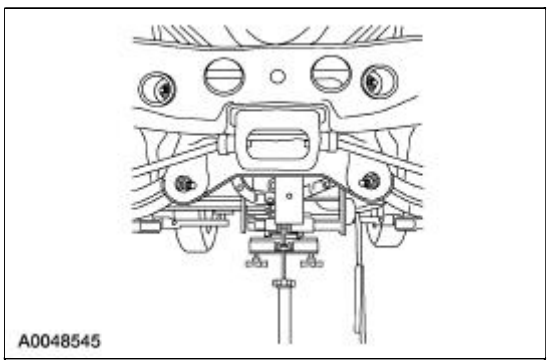


Lower the axle housing from the vehicle.

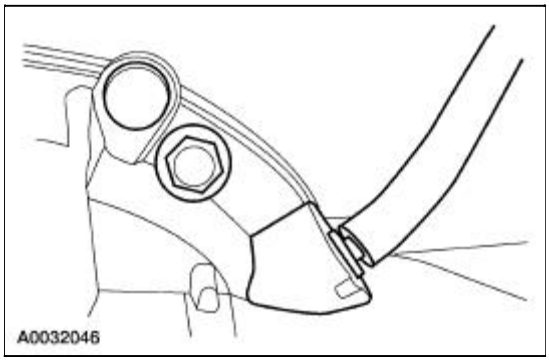


12. To install, reverse the removal procedure.

Axle Assembly —Coil Suspension

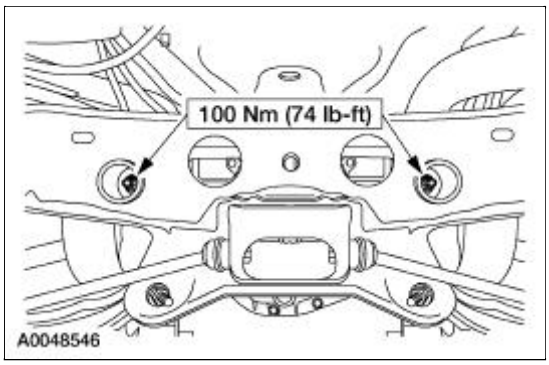


1. Position the vehicle on a hoist. For additional information, refer to Section 100-02 .
2. Remove the rear wheel and tire assemblies. For additional information, refer to Section 204-04 .
3. Remove the rear driveshaft assembly. For additional information, refer to Section 205-01 .
4. Remove the rear halfshafts. For additional information, refer to Section 205-05 .
5. Remove the lower rear sway bar links.

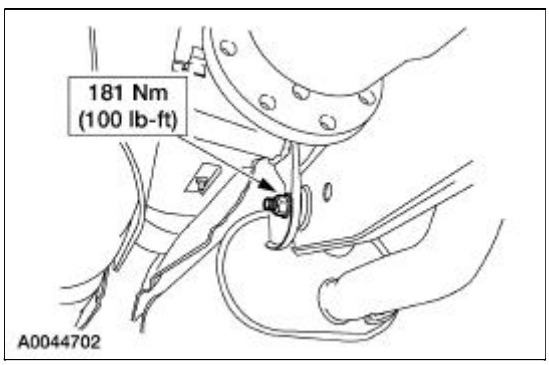


6. Remove the four bracket bolts and remove the rear sway bar.

7. Using a suitable jack, support the axle housing.

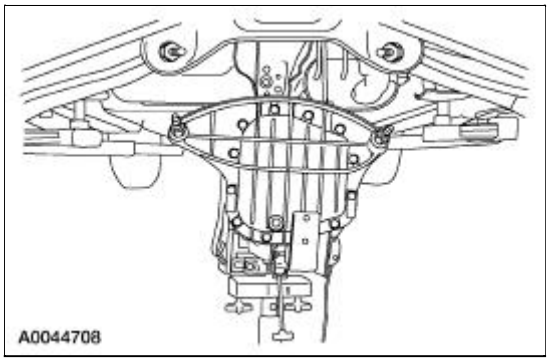


8. Disconnect the axle housing vent tube.



9. **NOTE:** Spare wheel removed for clarity.

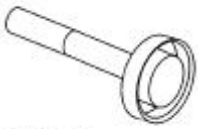
   Remove the upper axle housing stud nuts.

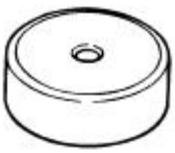


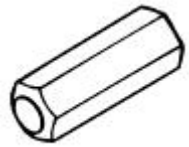
10. Remove the front torque arm bolt.

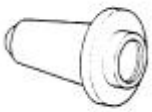
11. **NOTE:** Move the axle housing forward to clear the rear mounting studs from the bushings.

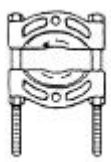
    Lower the axle housing from the vehicle.



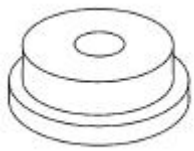


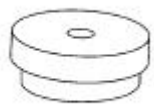






12. To install, reverse the removal procedure.





Axle

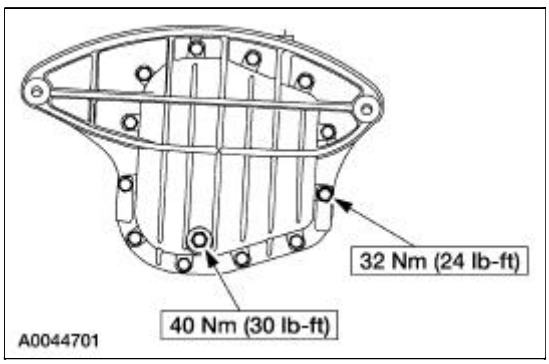
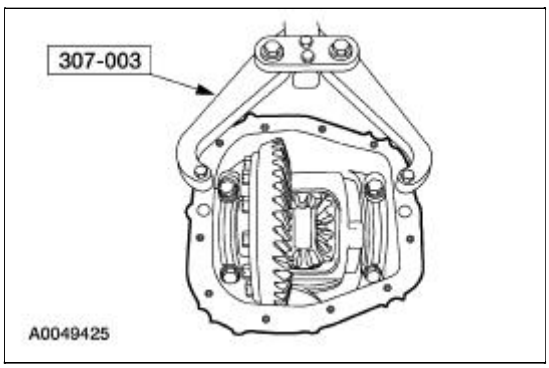
Ultra Silicone Rubber F7TZ-19554-AA	WSS-M4G320-A3
Stud and Bearing Mount E0AZ-19554-BA	WSK-M2G349-A1

Disassembly

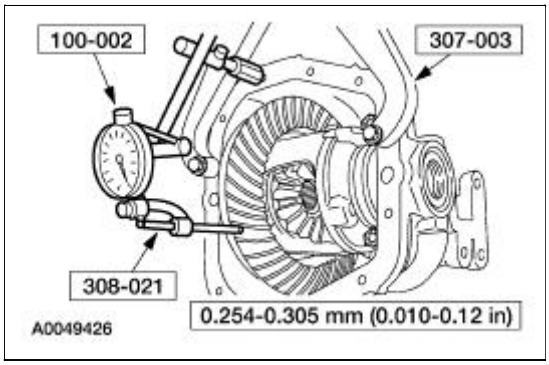


All Axles

1. Remove the axle assembly from the vehicle. For additional information, refer to Axle Assembly—Air Suspension or Axle Assembly—Coil Suspension in this section.

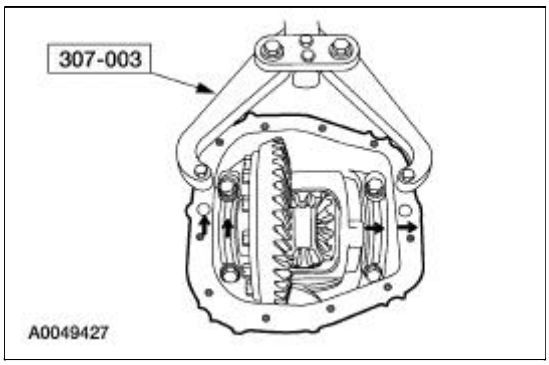


2. Remove the four bolts retaining the torque arm to the rear axle housing.



3. Drain the rear axle lubricant and remove the rear axle cover.

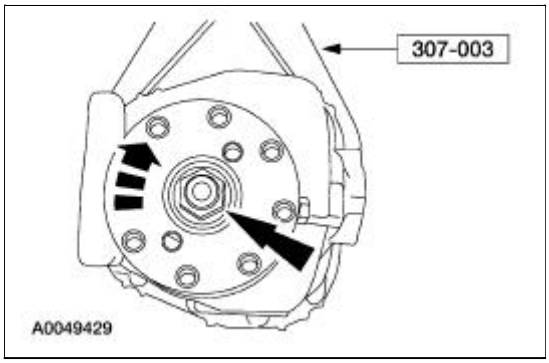
4. Using the special tools, mount the differential housing to a work bench.



5. Using the special tool, measure and record the differential ring gear backlash between teeth in four equally spaced places around the ring gear.
    - Remove the dial indicator.

6. **CAUTION: Mark the position and location of the differential bearing caps as the arrows may not be visible. Always install the differential bearing caps in their identical location and position.**

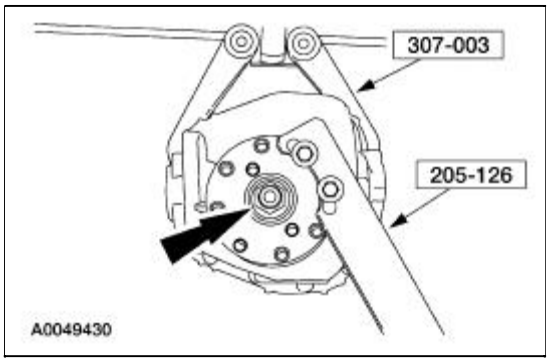
   Remove the differential bearing caps.



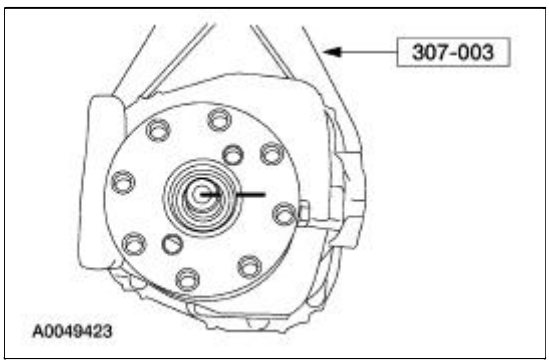
7. **CAUTION: Use wood blocks to avoid damaging the differential housing.**

   NOTE: Tag the bearing caps and shims for location as removed.

   Remove the differential assembly.
   1. Position wood blocks at the top and bottom of the differential case.
   2. Pry the differential assembly and the differential bearing shims out of the differential housing.

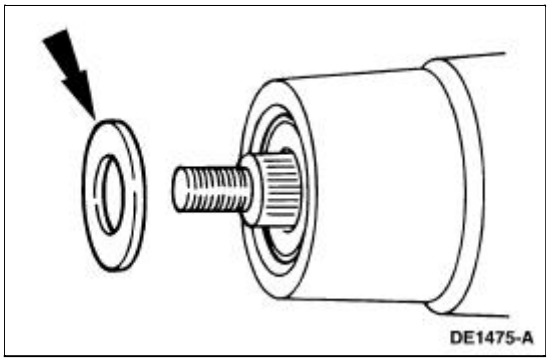


8. Record the torque necessary to maintain rotation of the drive pinion gear through several revolutions prior to removing the drive pinion flange.

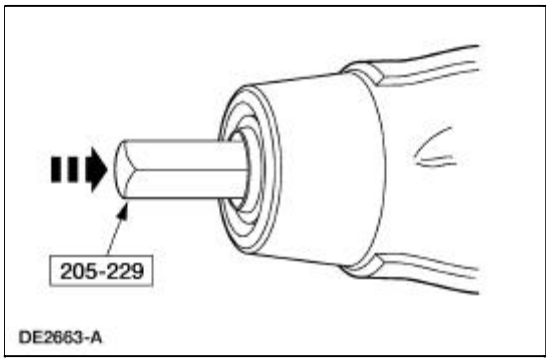


9. **CAUTION: After removing the drive pinion nut, discard it. Use a new nut for installation.**

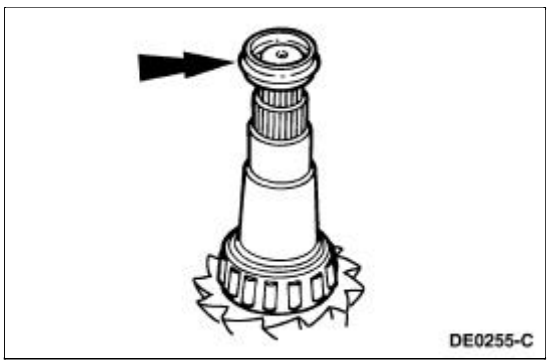
   Using the special tool, remove the drive pinion nut.



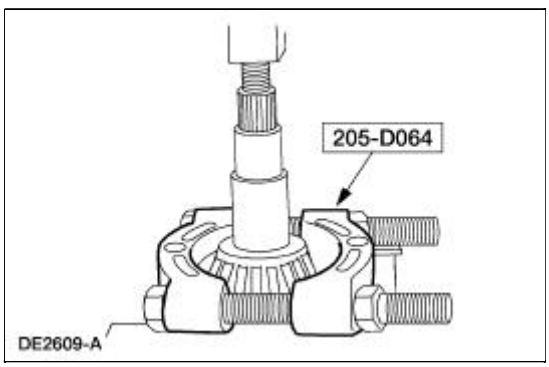
10. Index-mark the drive pinion flange and drive pinion gear stem to maintain initial balance during installation.



11. Remove the drive pinion flange and the pinion seal. For additional information, refer to Drive Pinion Flange and Drive Pinion Seal in this section.

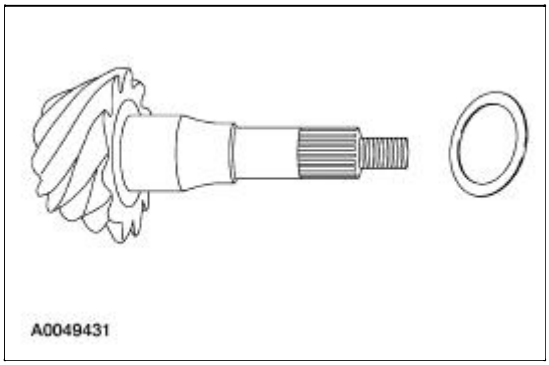


12. Remove the drive pinion shaft oil slinger.

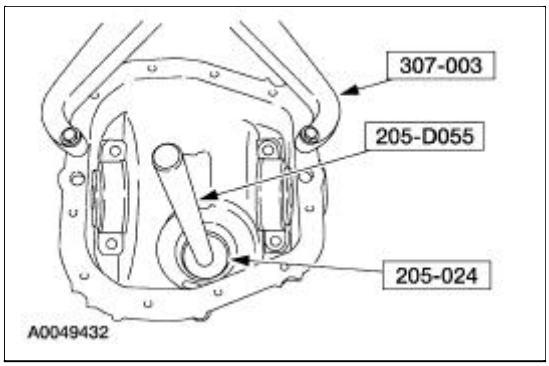


13. Using the special tool and a soft-faced hammer, drive the drive pinion gear out of the front pinion bearing and remove it through the rear of the differential housing.

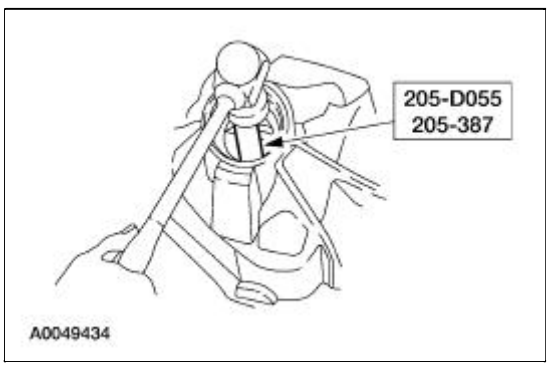
14. Remove and discard the drive pinion collapsible spacer.



15. Using the special tool and a suitable press, remove the drive pinion bearing.

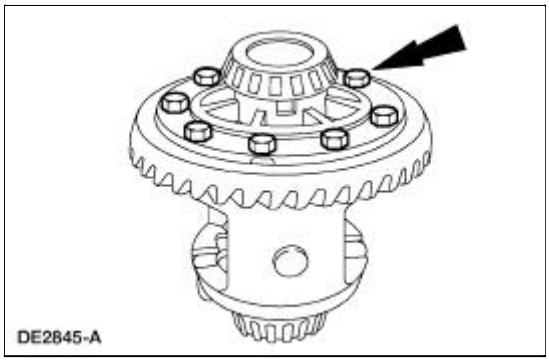


16. **NOTE:** Using a micrometer, measure the drive pinion bearing adjustment shim thickness. Use this measurement as a reference to compare to the shim gauge reading taken prior to installing the pinion bearing.



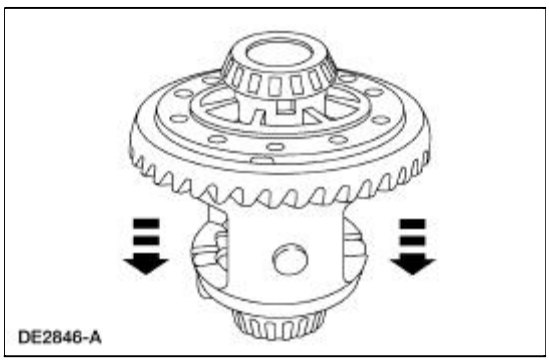
Remove the drive pinion bearing adjustment shim.

17. Using the special tools, remove the outer drive pinion bearing cup, if necessary.



18. Using the special tools, remove the inner drive pinion bearing cup.

19. If the differential ring gear backlash between teeth measurement, taken at the beginning of this procedure, did not exceed the specification, proceed to Final disassembly in this procedure. If the differential ring gear backlash between teeth measurement exceeds the specification, the cause may be a warped differential ring gear, a damaged differential case, or loss of differential bearing preload. Proceed to Excessive differential ring gear backlash between teeth in this procedure to verify the cause of the excessive runout.



Excessive differential ring gear backlash between teeth

20. Remove the ring gear bolts.

21. **CAUTION: Do not damage the bolt hole threads.**

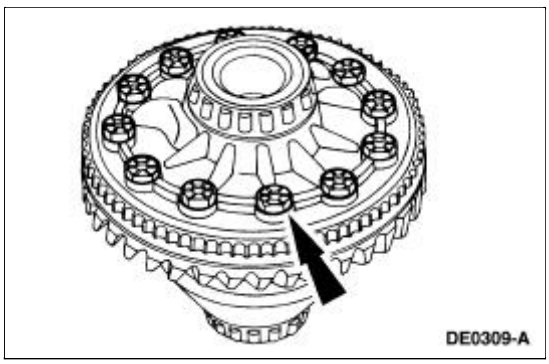
    Insert a punch in the bolt holes and drive off the differential ring gear.

22. **NOTE:** Visually inspect the differential carrier bearings and cups for discoloration or other signs of bearing failure.

    NOTE: Install the differential bearing cups and shims in the same locations they were in before disassembly.

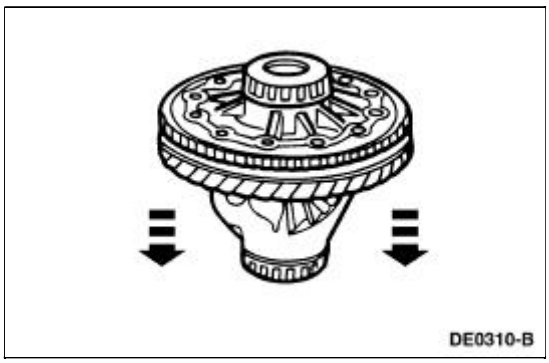
    Install the differential case. Rotate the differential case to seat the differential bearings.

23. Using the special tool, measure the differential case flange runout.
    1. Rotate the differential case to make sure the differential bearings are seated.
    2. Position the special tool.
    - If the runout does not exceed the specification, the cause of the original excessive runout is the differential ring gear. Remove the differential case. Discard the differential ring gear and the drive pinion gear. Proceed to Final disassembly in this procedure.
    - If the runout exceeds the specification, the differential ring gear is true and the concern is due to either differential case/differential bearing damage. Remove the differential case. Discard the differential bearings/differential case. Proceed to Final disassembly in this



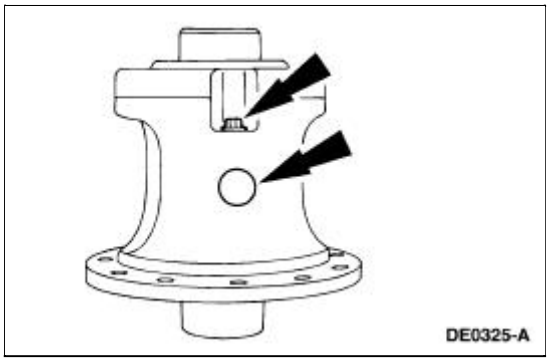
procedure.

- Remove the special tool.



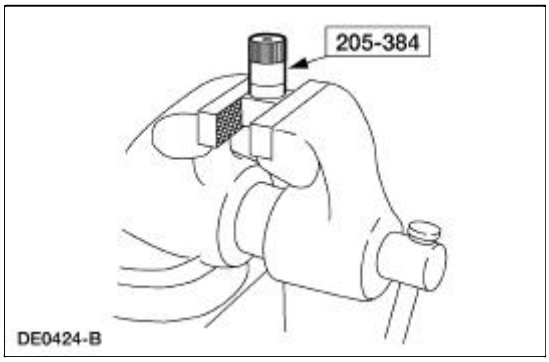
Final Disassembly, Differential Case and Ring Gear—Traction-Lok®

24. Remove the differential ring gear bolts



25. **CAUTION: Do not damage the ring gear bolt hole threads.**

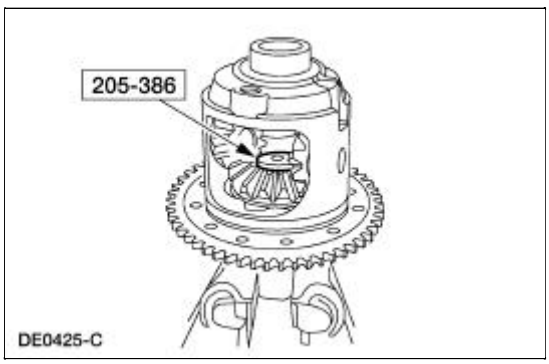
    Insert a punch in the bolt holes and drive the differential ring gear off the differential case.



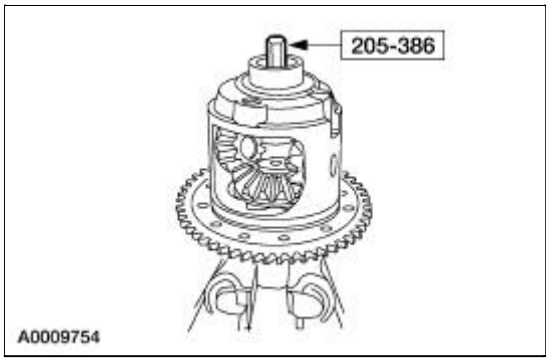
26. **NOTE:** The differential bearings do not need to be removed to overhaul the Traction-Lok® differential. If bearing removal is required, use special tool 205-D072 and special tool 205-D019 for the differential case bearings.

    Remove the differential pinion shaft lock bolt and remove the differential pinion shaft.

27. Install the special tool in a suitable vise.

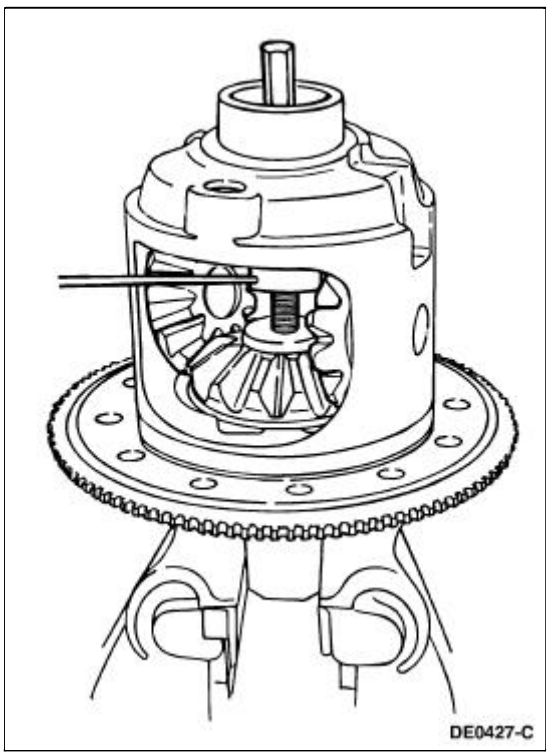


28. Install the differential case on the tool.

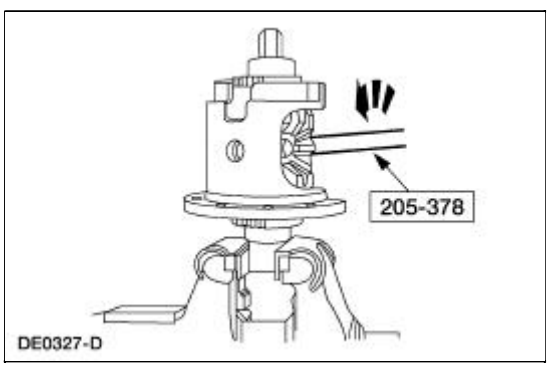


29. **NOTE:** Apply a small amount of grease to the centering hole of the special tool.

    Install the special tool in the bottom side gear bore.

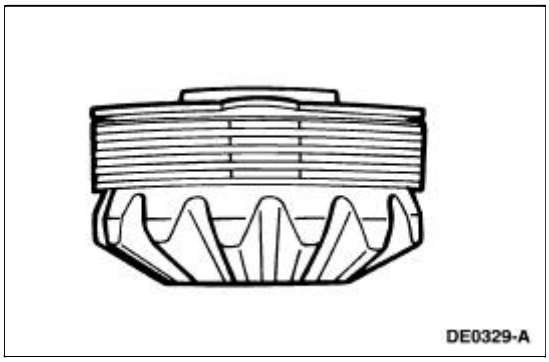


30. Install the nut in the upper differential side gear. Hold the nut in position while installing the hex screw. Tighten the hex nut until contact is made with the step plate.



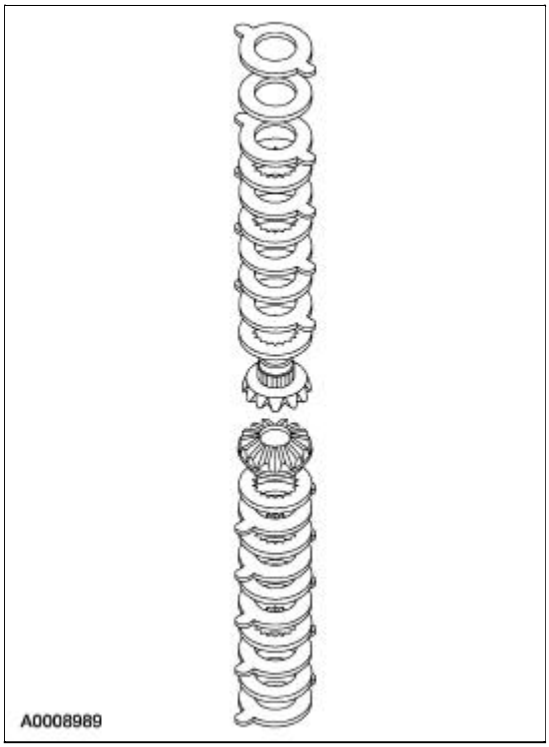
31. **NOTE:** The dowel bar is used to keep the nut from turning when the forcing screw is tightened.

    Insert a suitable dowel bar in the hole of the nut. Tighten the forcing screw to force the differential side gear away from the differential pinion gears.



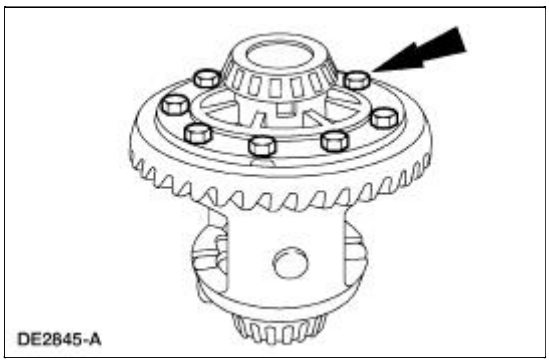
32. Insert the special tool in the pinion shaft bore and turn the differential case to move the differential pin gears and thrust washers to the differential case opening.

33. Remove the differential pinion gears and differential pinion gear thrust washers.



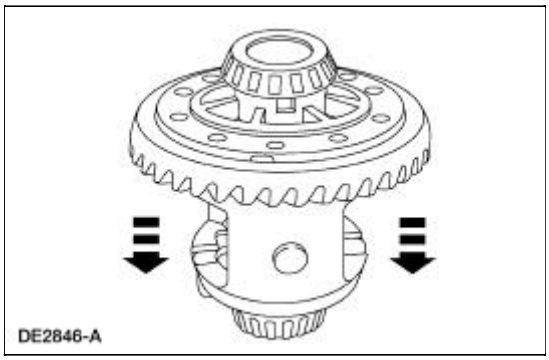
34. Remove the differential side gears and differential clutch packs. Tag the gears, clutch packs and shims for location.

35. **CAUTION: When separating the clutch plates and clutch discs, note the sequence in which they are disassembled. They must be reassembled in the same sequence.**



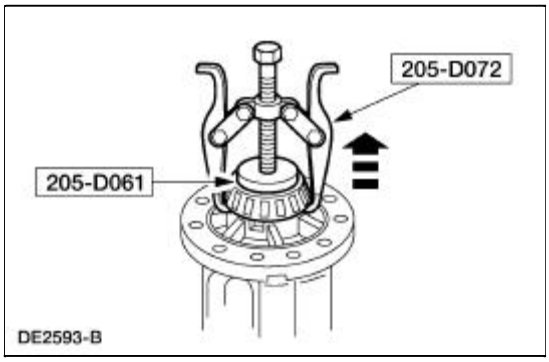
CAUTION: Do not use acids or solvents to clean the differential clutch components. Use a clean, lint-free cloth only.

Separate the differential clutch packs for cleaning and inspection.



Final Disassembly, Differential Case and Ring Gear—Conventional

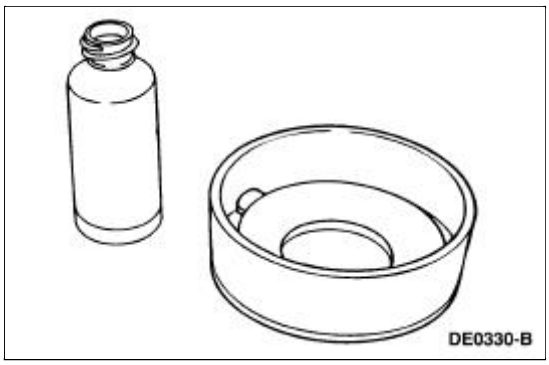
36. Remove the differential ring gear bolts.



37. **CAUTION: Do not damage the ring gear bolt hole threads.**

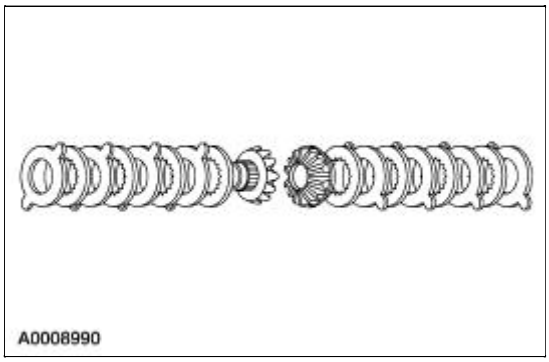
    Insert a punch in the bolt holes and drive off the differential ring gear.

38. Using the special tools, remove the differential bearing.



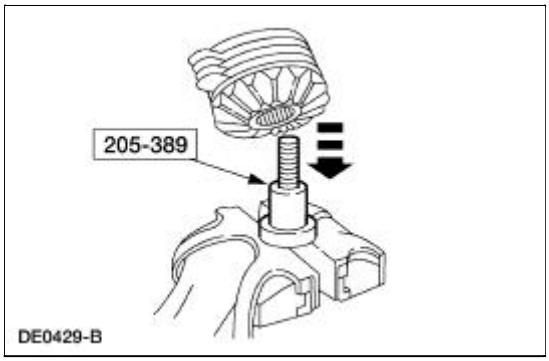
- Repeat for the other side.

Assembly



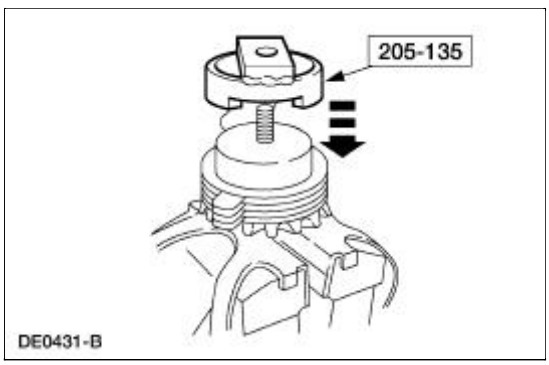
Assembly, Differential Case and Ring Gear—Traction-Lok®

1. Prelubricate each steel clutch plate and soak all friction plates with 118 ml (4 ounces) of friction modifier for at least 15 minutes.

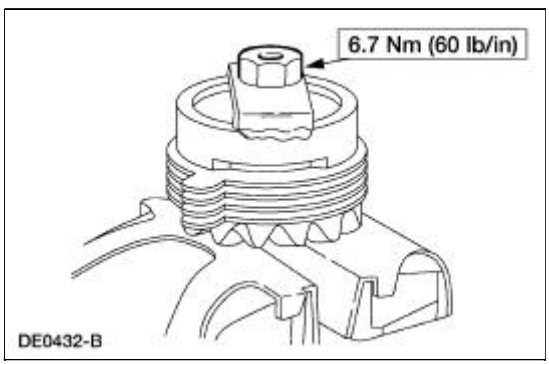


2. **NOTE:** Do not mix the differential clutch packs or shims from one side with the opposing side.

   Assemble the differential clutch packs (without the shims or Belleville springs) on the respective side gears.



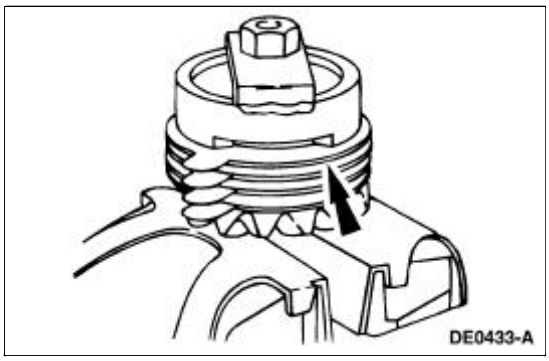
3. Clamp the bolt head of the special tool in a vise. Install the differential clutch pack and the differential side gear (without the shims or Belleville spring) on the gauge.



4. Position the special tool on top of the differential clutch pack.

5. Install the special tool over the disc and differential clutch pack.

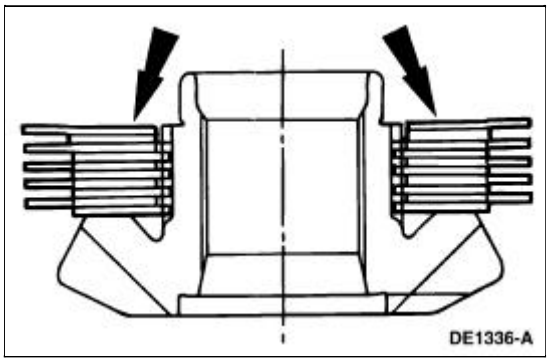
6. Install the nut over the top and base stud.



7. **NOTE:** A maximum of two shims can be used on each clutch pack.

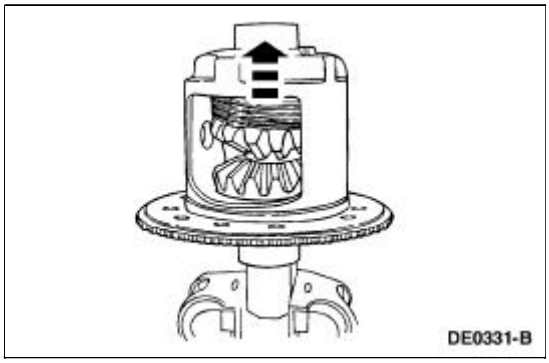
   Select and insert the thickest feeler gauge blade that will enter between the tool and the differential clutch pack. Subtract 0.010 inch from the reading to obtain the thickness of the new

clutch shim. Select the correct shim and remove the special tool.



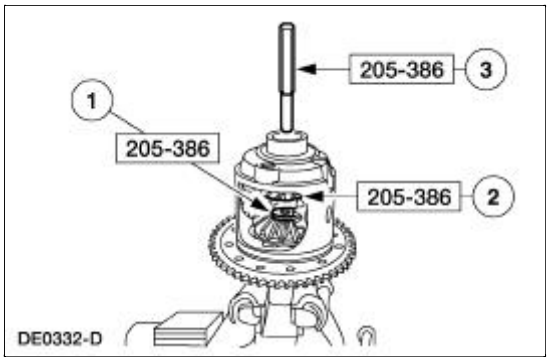
Selective Shims

Part Number	Description
F75Z-4A324-DA	0.030 Inch
F75Z-4A324-EA	0.035 Inch
F75Z-4A324-FA	0.040 Inch
F75Z-4A324-GA	0.045 Inch
F75Z-4A324-HA	0.050 Inch
F75Z-4A324-JA	0.055 Inch
F75Z-4A324-KA	0.060 Inch

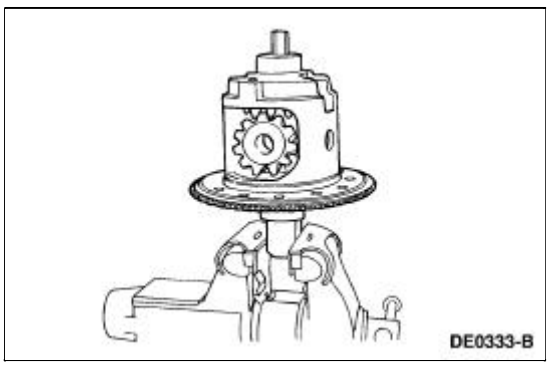


8. **NOTE:** The concave side of the Belleville spring must face up and against the thrust face of the differential case.

   Place the shim and the Belleville spring on the differential clutch pack.

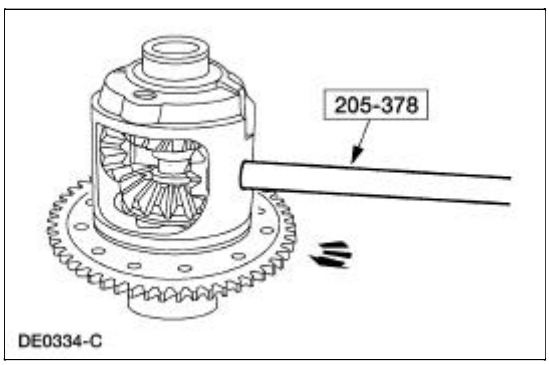


9. Insert the differential clutch packs with the shims and Belleville springs and differential side gears into the differential case.



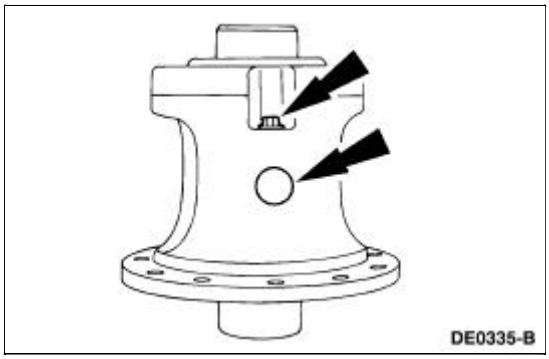
10. **NOTE:** If necessary, insert the dowel bar in the nut bore to keep the nut from turning as the hex screw is tightened.

    Assemble the special tool in the differential case.
    1. Position the special tool in the bottom side gear bore.
    2. Position the special tool in the top side gear bore and hold it in place.
    3. Install the special tool and tighten it two turns after it contacts the bottom step plate.



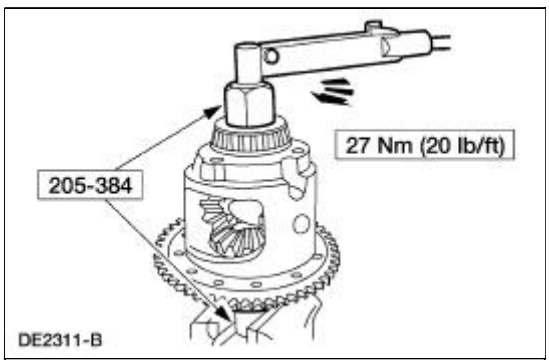
11. **NOTE:** Coat both sides of the differential pinion thrust washers with rear axle lubricant.

    Position the differential pinion gears and thrust washers in the differential case window so they mesh with the differential side gear teeth.

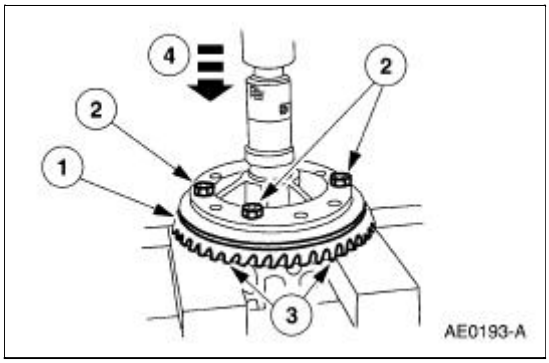


12. **NOTE:** It may be necessary to loosen or tighten the special tool forcing screw to allow the differential side gears to rotate.

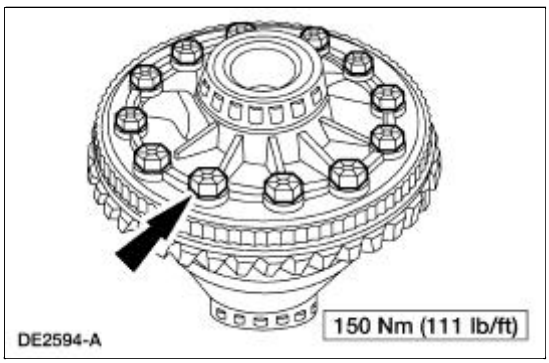
    Insert the special tool into the pinion shaft bore and turn the differential case. This will move the differential side gears and position them in the differential case. Rotate the differential case until the pinion mating shaft holes are aligned with the differential pinion gears.



13. Loosen the special tool forcing screw and remove the special tool from the differential case. Install a new differential pinion shaft and bolt in the differential case.

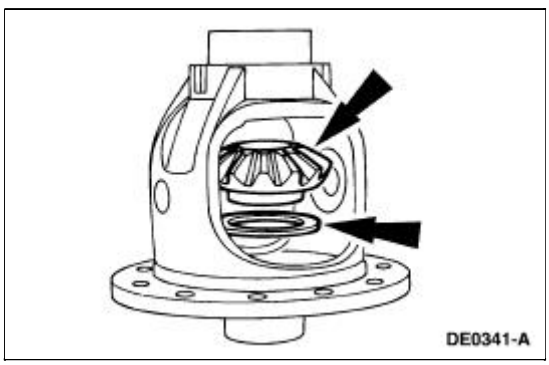


14. If removed, install new differential carrier bearings.

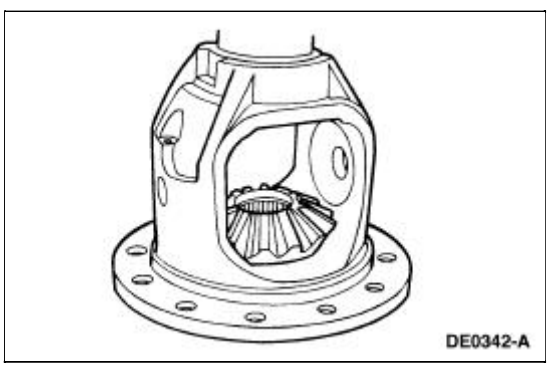


15. Using the special tools, check the torque required to rotate on differential side gear.
    1. Install the special tools as shown.
    2. If the original clutch plates are used, the initial breakaway torque must be within specification. The rotating torque required to turn the differential side gear with new clutch plates, may vary.

16. Install the differential ring gear.
    1. Place the differential ring gear on the differential case.
    2. Hand start three bolts to align the ring gear to the differential case.
    3. Place the differential case and ring gear on the press bed with the ring gear teeth facing down.
    4. Press the ring gear into place on the differential case.



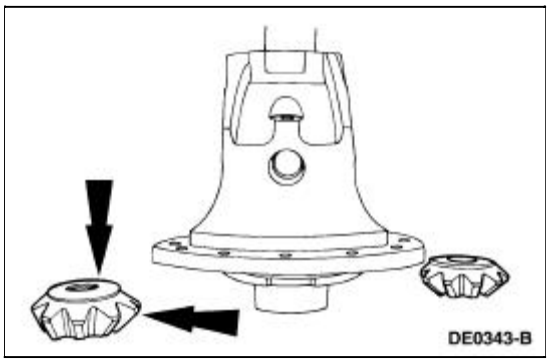
17. Install the ring gear bolts and tighten to specification.



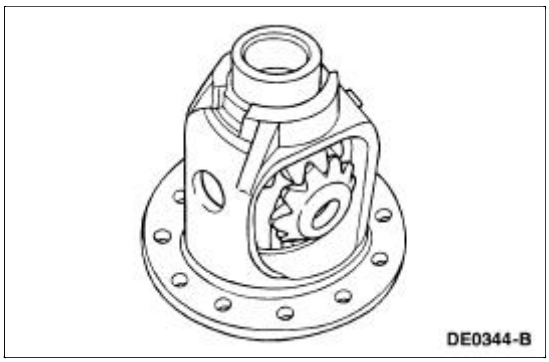
Assembly, Differential Case and Ring Gear—Conventional

18. **NOTE:** Coat the differential side gears and differential side gear thrust washers with rear axle lubricant.

    Position the differential thrust washers on the differential side gears.

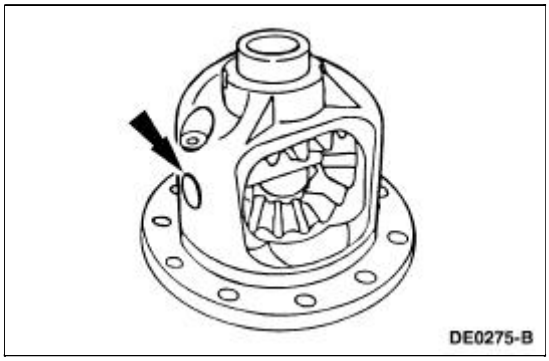


19. Position the differential side gears and thrust washers in the differential case.



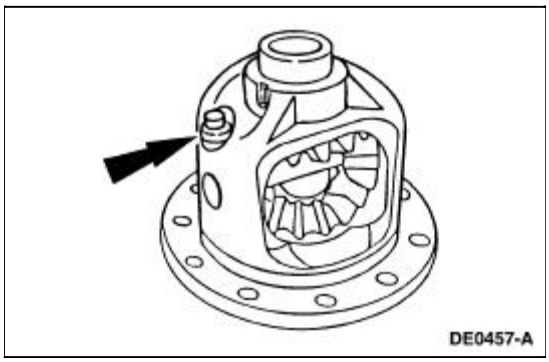
20. **NOTE:** Coat the differential pinion thrust washers and differential pinion gears with rear axle lubricant.

    Assemble the differential pinion thrust washers and the differential pinion gears.

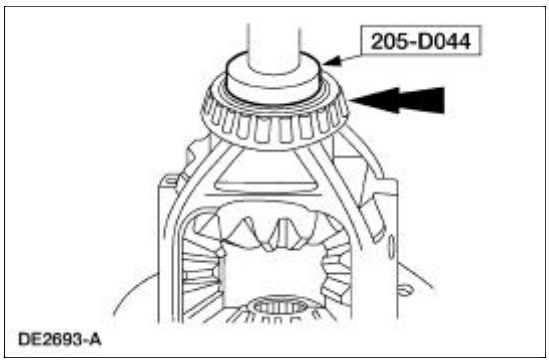


21. Engage the differential pinion gears opposite the differential side gears.

22. Rotate the differential pinion gears to align with the differential pinion shaft bore.



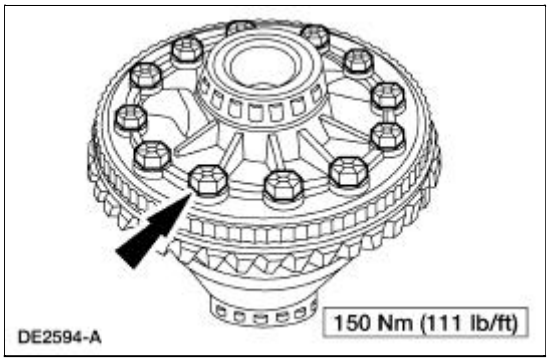
23. Insert the differential pinion shaft.



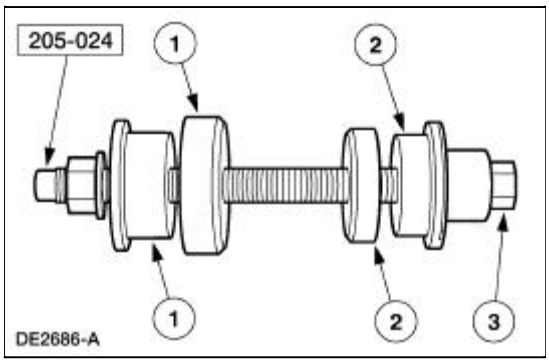
24. **NOTE:** If a new pinion shaft lock bolt is unavailable, coat the threads with sealer prior to installation.

    Install a new differential shaft lock bolt and torque to specification.

25. Using the special tool, install the differential bearings.

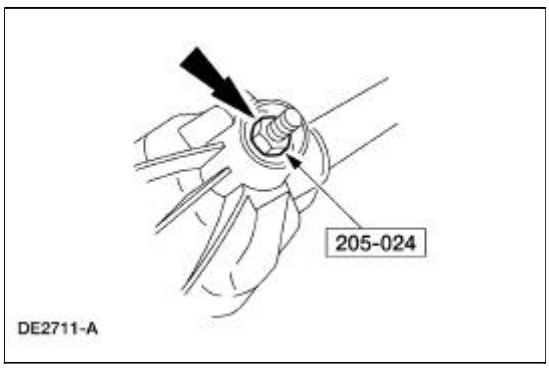


26. Install the differential ring gear.
    1. Place the differential ring gear on the differential case.
    2. Hand start three bolts to align the holes in the differential ring gear and the differential case.
    3. Place the differential case and the differential ring gear on the press bed with the ring gear facing down.
    4. Press the ring gear into place.



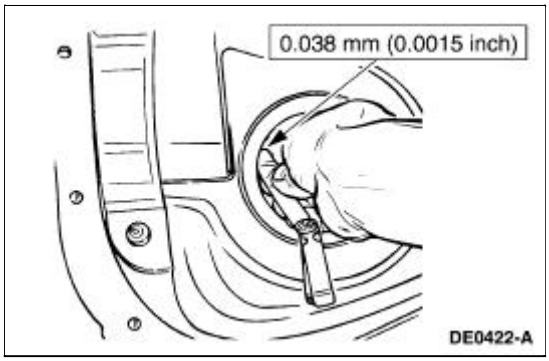
27. **NOTE:** Apply sealer to the threads of the ring gear bolts.

    Install the differential ring gear bolts and tighten.

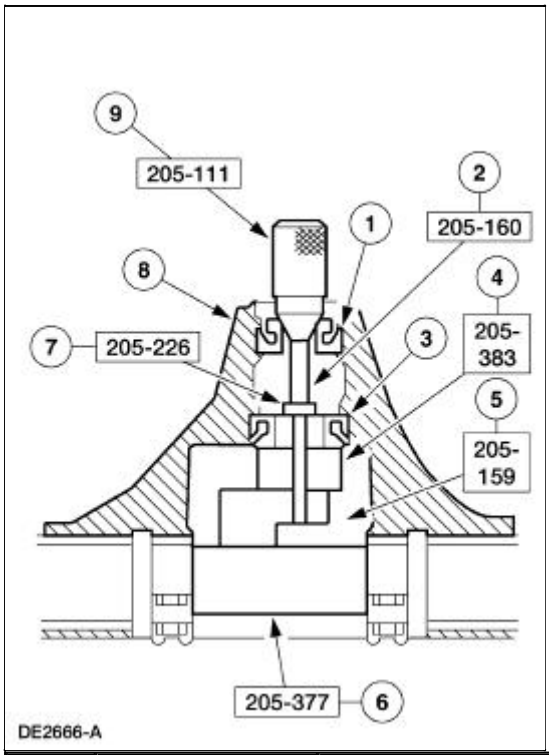


Final assembly—All Differentials

28. Position the inner and outer bearing cups in their respective bores.
    1. After positioning the bearing cups in the bores, place the special tool on the inner bearing cup.
    2. Place the special tool on the outer bearing cup.
    3. Install the special tools.



29. Tighten the special tool to seat the bearing cups in the bores.



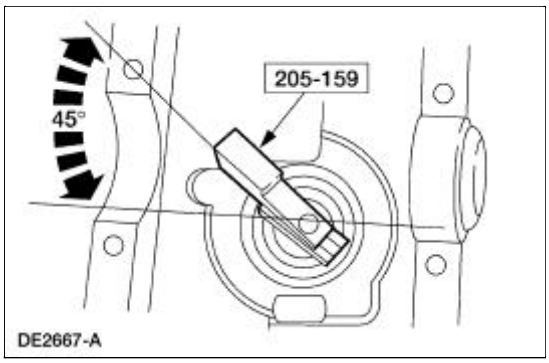
30. **NOTE:** If a feeler gauge of the specification shown can be inserted between a cup and the bottom of its bore at any point around the cup, the cup is not correctly seated.

    Make sure the differential pinion bearing cups are correctly seated.

31. **NOTE:** Apply a light film of lubricant on the front and rear pinion bearings.

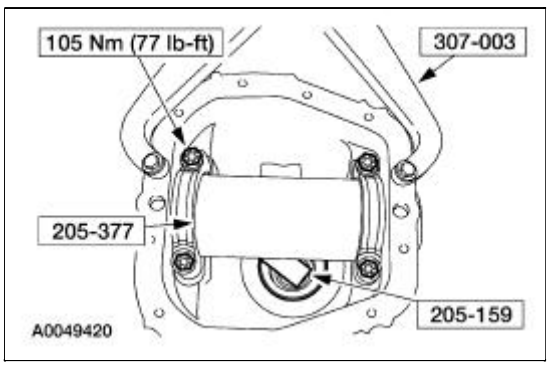
    Install the pinion bearings and special tools as shown.

Item	Part Number	Description
1	4621	Outer pinion bearing
2	205-160	Adapter for 205-S127
3	4630	Inner pinion bearing
4	205-383	Depth Gauge/Aligner, Drive Pinion
5	205-159	Adapter for 205-S126
6	205-377	Drive Pinion Gauge Tube
7	205-226	Depth Gauge/Aligner, Drive Pinion
8	4010	Rear axle housing
9	205-111	Adapter for 205-S127



32. **NOTE:** This step duplicates pinion bearing preload.

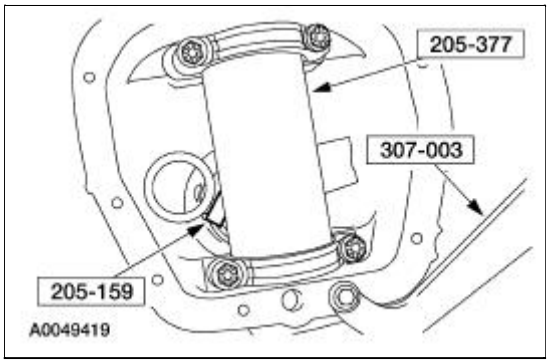
    Thread the special tool onto the screw and tighten to the specification shown.



33. **NOTE:** The special tool must be offset to obtain an accurate reading.

    Position the special tool.

34. Install the special tool.

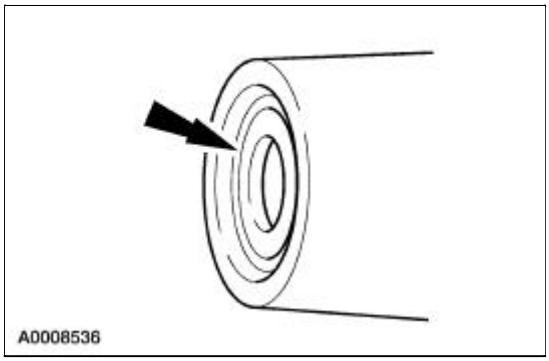


35. **NOTE:** Drive pinion bearing adjustment shims must be flat and clean.

    NOTE: A slight drag should be felt for correct shim selection. Do not attempt to force the pinion shim between the Gauge Block and the Gauge Tube. This will minimize selection of a pinion shim thicker than required, which results in a deep tooth contact in the final assembly of integral rear axle assemblies.

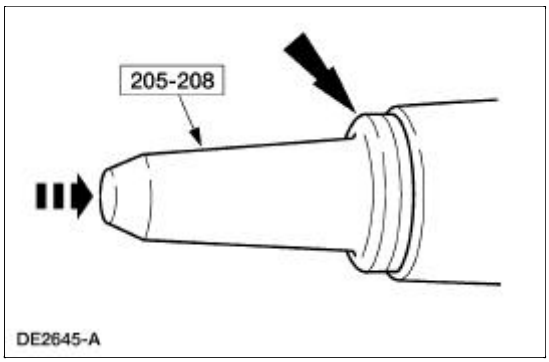
    Use a drive pinion bearing adjustment shim as a gauge for shim selection.

    - After the correct shim thickness has been determined, remove the special tools.



36. Using the special tools, press the inner pinion bearing and pinion shim until they are firmly seated on the pinion.

37. Place a new drive pinion collapsible spacer on the pinion shaft against the pinion stem shoulder.

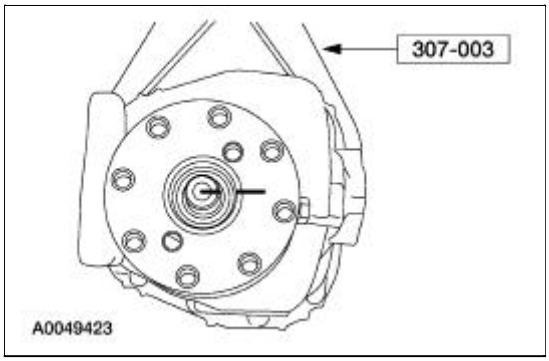


38. Install a new outer pinion bearing, and rear axle drive pinion shaft oil slinger.

39. **CAUTION: Installation without the correct tool can result in early seal failure. If the rear axle drive pinion seal becomes cocked during installation, remove it and install a new one.**

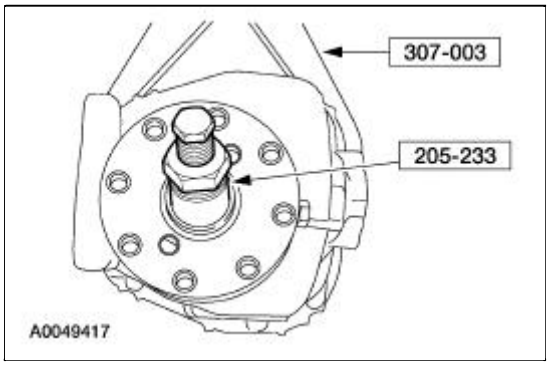
    CAUTION: Coat the lips of the rear axle drive pinion seal with grease.

    Place the drive pinion oil seal on the special tool and drive the seal into place.



40. **NOTE:** Lubricate the pinion flange splines with rear axle lubricant.

    Install the drive pinion in the drive pinion carrier bore from inside the rear axle housing. Seat the drive pinion with a plastic hammer.

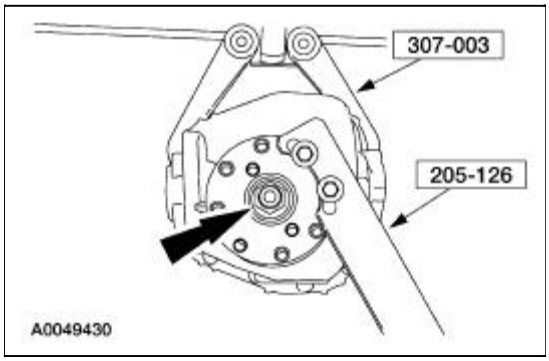


41. **NOTE:** Disregard the scribe marks if a new pinion flange is being installed.

    Align the pinion flange with the drive pinion shaft.

42. With the drive pinion in the axle housing, install the pinion flange using the special tool.

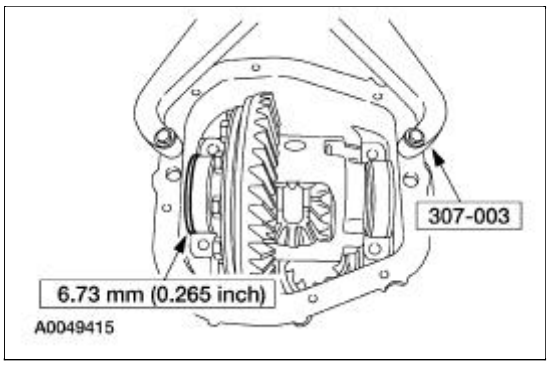
43. Position the new pinion nut.



44. **CAUTION: Under no circumstances is the pinion nut to be backed off to reduce preload. If reduced preload is required, a new drive pinion collapsible spacer and pinion nut must be installed.**

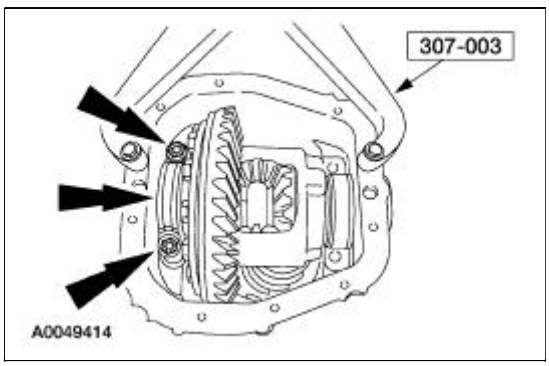
CAUTION: The pinion flange holding tool must be removed before preload readings can be taken.

Using the special tool, tighten the pinion nut.



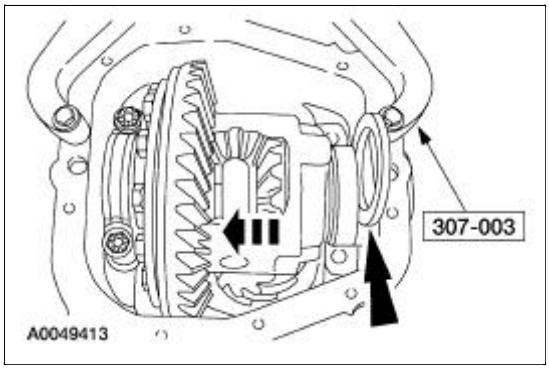
- Rotate the pinion occasionally to make sure the drive pinion bearings are seating correctly.
- Install a Nm (inch-pound) torque wrench on the pinion nut.
- Rotating the pinion through several revolutions, take frequent drive pinion bearing torque preload readings until the original recorded preload reading is obtained.
- If the original recorded preload is below specification, tighten to the appropriate specification for used bearings. If the preload is above specification, tighten the nut to the

original readings as recorded.



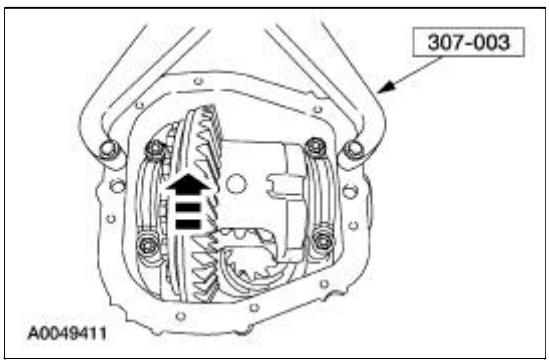
45. With the pinion depth set and the pinion installed, place the differential case in the rear axle housing.

46. Install a shim as shown on the left side.



47. **NOTE:** Apply pressure toward the left side to make sure the left bearing cup is seated.

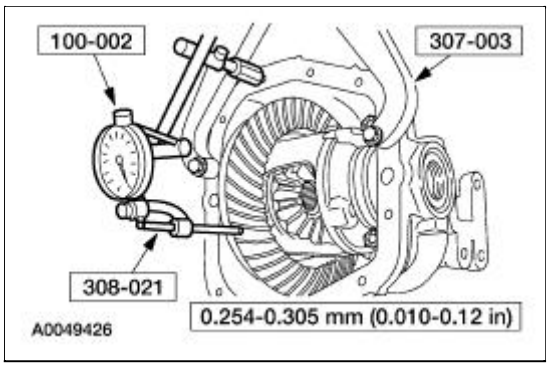
    Install the left bearing cap and loosely install the bearing cap bolts.



48. Install progressively larger shims on the right side until the largest shim selected can be installed by hand.

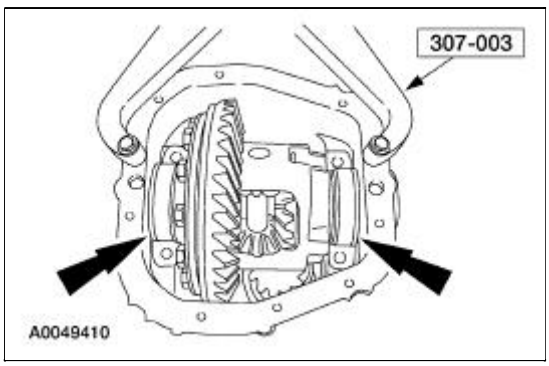
49. Install the right side bearing cap and tighten the bolts.

50. Rotate the differential case to make sure it rotates freely.



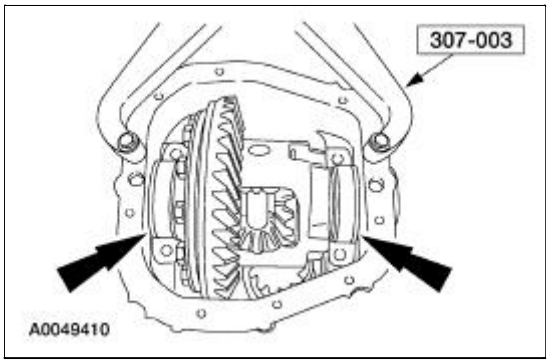
Measuring backlash

51. Using the special tools, measure and note the differential ring gear backlash.
    - If backlash is within the specification, refer to Backlash within specification in this procedure.
    - If a zero backlash condition occurs, refer to Zero backlash in this procedure.
    - If backlash is not within the specification, refer to Backlash not within specification in this procedure.



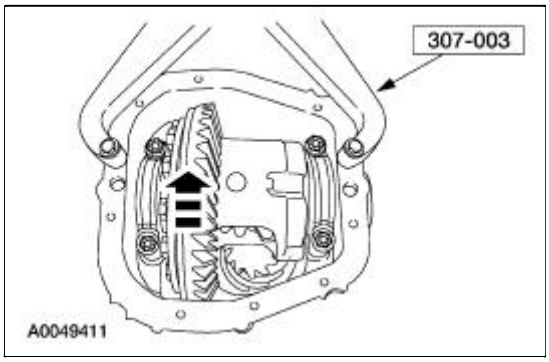
Backlash Change Required		Thickness Change Required	
mm	**Inch**	**mm**	**Inch**
0.025	0.001	0.050	0.002
0.050	0.002	0.050	0.002
0.076	0.003	0.101	0.004

0.101	0.004	0.152	0.006
0.127	0.005	0.152	0.006
0.152	0.006	0.203	0.008
0.177	0.007	0.254	0.010
0.203	0.008	0.254	0.010
0.228	0.009	0.304	0.012
0.254	0.010	0.355	0.014
0.279	0.011	0.355	0.014
0.304	0.012	0.406	0.016
0.330	0.013	0.457	0.018
0.335	0.014	0.457	0.018
0.381	0.015	0.508	0.020

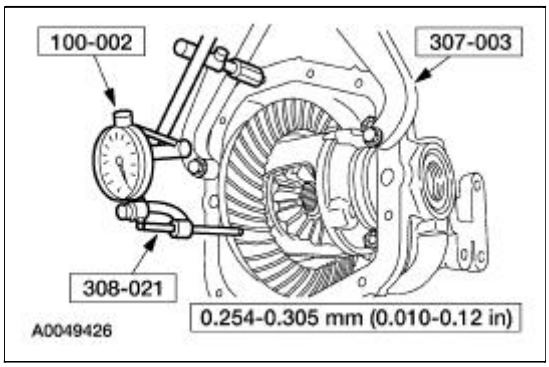


Zero backlash

52. If a zero backlash condition occurs, add 0.51 mm (0.020 inch) to the RH side and subtract 0.51 mm (0.020 inch) from the LH side to allow backlash indication. Measure the backlash. Refer to Measuring backlash in this procedure.

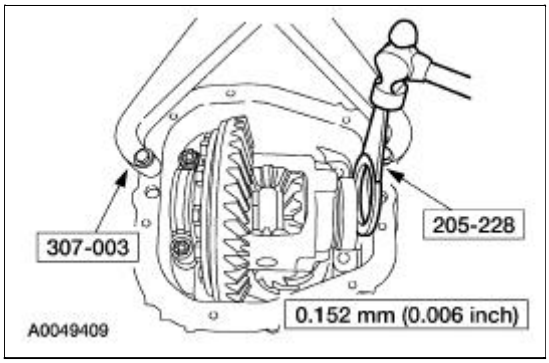


Backlash not within specification

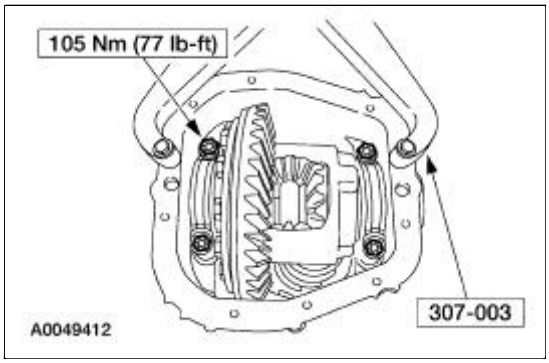


53. To increase or decrease backlash, remove the differential bearing caps and install a thicker shim and a thinner shim accordingly.
    - If backlash is not within the specification, increase the thickness of one differential bearing shim and decrease the thickness of the other differential bearing shim by the same amount.

54. Rotate the differential assembly several times to verify that the differential bearings seated correctly.

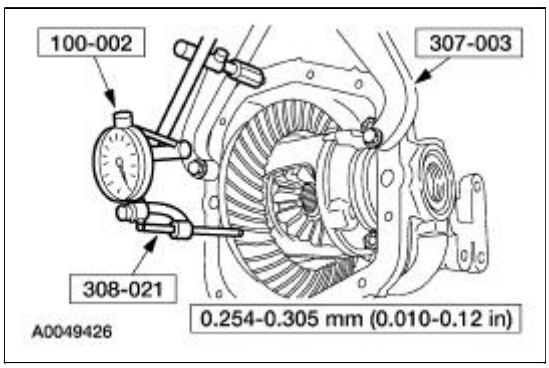


55. Using the special tools, recheck the backlash.
    - If backlash is within the specification, refer to Backlash within specification in this procedure. If backlash is not within the specification, repeat Backlash not within specification in this procedure.

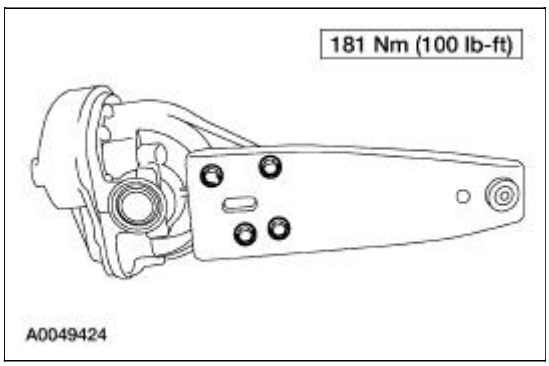


Backlash within specification

56. Remove the bolts and the differential bearing caps.

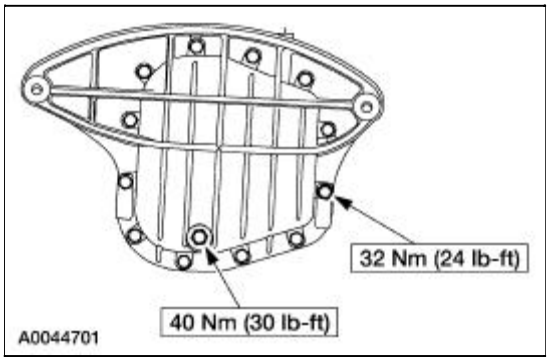


57. To establish differential bearing preload, increase both left and right differential bearing shim sizes by the specification shown.



58. Install the differential bearing caps and bolts.

59. Using the special tools, recheck the backlash.



60. Remove the axle assembly from the holding fixture and install the torque arm.

61. **NOTE:** The differential housing cover must be installed within 15 minutes of application of the silicone, or new sealant must be applied. If possible, allow 1 hour before filling with lubricant to make sure the silicone sealant has cured correctly.

Install the differential housing cover and tighten the differential housing cover bolts.

General Specifications

- The axle housing assembly consists of a cast-aluminum center section, a removable cast-aluminum axle housing tube, and a differential housing cover. Both the axle housing tube and the differential housing cover use silicone sealant as a gasket.
- The hypoid-design gearset consists of an 8.8-inch ring gear and a pinion gear. Two opposed tapered roller bearings support the drive pinion in the axle housing.
- A drive pinion collapsible spacer, located on the pinion shaft, maintains pinion bearing preload. The pinion nut adjusts the preload.
- Differential bearing shims, located between the differential bearing cups and the axle housing, adjust the differential bearing preload and the ring gear backlash.
- The differential case is a one-piece design with two openings to allow for assembly of the internal components and lubricant flow. Two opposed tapered roller bearings (differential bearings) support the differential case in the axle housing. Removable differential bearing caps retain the differential assembly in the axle housing.
- Inside the differential case, the differential pinion shaft supports two differential pinion gears. The pinion gears engage the differential side gears, to which the left axle shaft and the right axle shaft are splined. The differential pinion shaft bolt retains the differential pinion shaft in the differential case.
- An embossed metal tag, bolted to the rear face of the RH axle tube, contains front axle identification information.

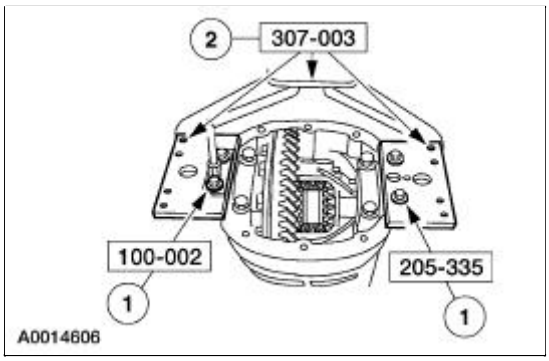
Front Drive Axle

Refer to Section 205-00 .

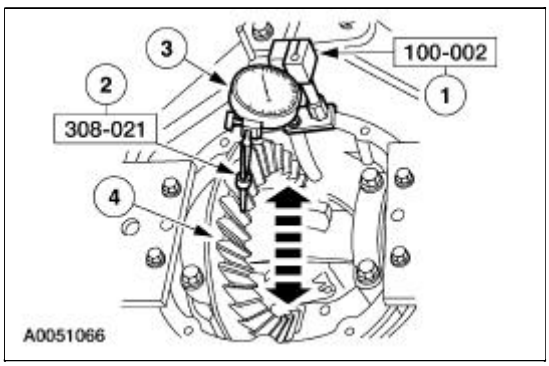
Differential Case Runout Check

Special Tool(s)

 ST1321-A	2-Jaw Puller 205-D072 (D97L-4221-A) or equivalent
 ST1214-A	Dial Indicator With Holding Fixture 100-002 (TOOL-4201-C)
 ST1259-A	Spreader, Differential Carrier 205-001 (TOOL-4000-E)
 ST1344-A	Spreader, Differential Housing (Plate) 205-335 (T93P-4000-A)
 ST1437-A	Installer, Differential Side Bearing 205-010 (T57L-4221-A2)
 ST1188-A	Holding Fixture, Transmission 307-003 (T57L-500-B)
 ST2043-A	Step Plate 205-D061 (D83T-4205-C2)
	Gauge, Clutch Housing 308-021 (T75L-4201-A)



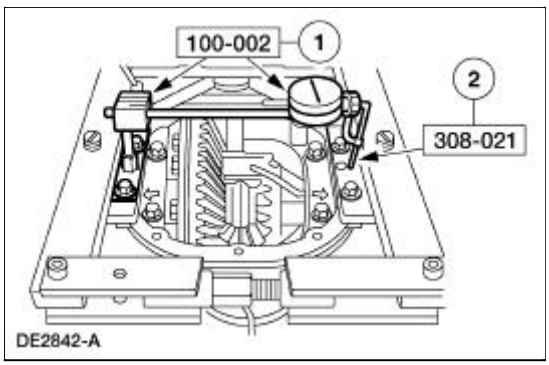
1. Remove the front drive axle assembly. For additional information, refer to Axle Assembly—Front Drive in this section.



2. Remove the axle shafts from the differential assembly. For additional information, refer to Axle—Front Drive in this section.

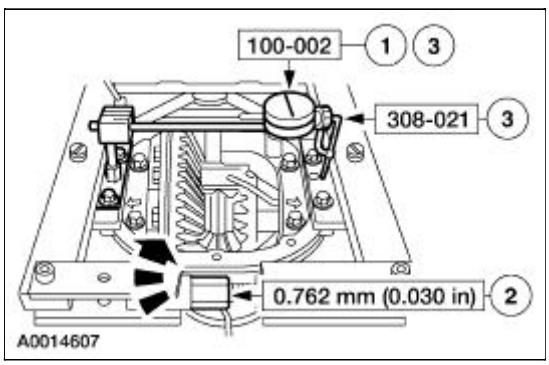
3. **CAUTION: Do not damage the aluminium differential housing while carrying out these procedures.**

   Using the special tools, mount the differential housing to a work bench.
   1. Attach the special tools to the differential housing with four bolts that retain the differential housing cover to the differential housing.
   2. Attach the special tools together with two 3/8 inch x 1-1/2 inch bolts.



4. Install the special tools, measure and record the differential ring gear backlash between teeth in four opposing places.
   - If the backlash between teeth exceeds the specification of 0.254-0.305 mm (0.010-0.012 in.), the cause may be a warped ring gear, differential bearings, or a damaged differential case. To determine the cause of the excessive backlash, remove the dial indicator and proceed as follows:

5. Install the special tool by placing the spreader pins in the hole in the Differential Housing (Plate) Spreader.

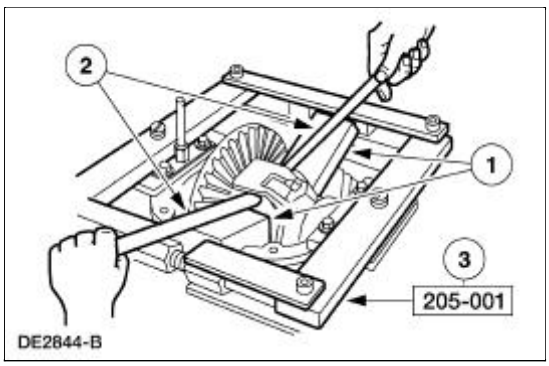


6. Assemble the special tool.
    1. Install the special tool.
    2. Attach the special tool and position the tip in the Differential Housing (Plate) Spreader hole.

7. **CAUTION: Overspreading can damage the differential housing.**

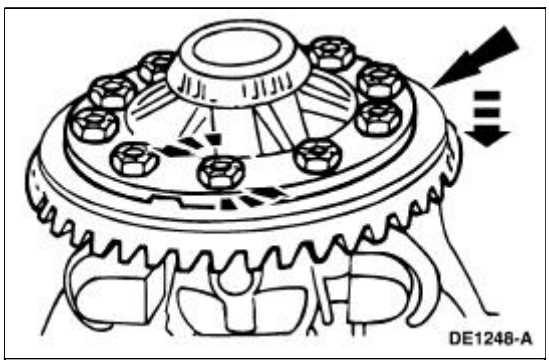
    NOTE: Tighten and loosen the Differential Carrier Spreader screw several times to normalize the Differential Housing (Plate) Spreader Adapters prior to taking the final Dial Indicator reading.

    Spread the differential housing to specifications.
    1. Adjust the Dial Indicator with Holding Fixture to zero.
    2. Tighten the screw until the differential housing is spread to specification.
    3. Remove the Dial Indicator with Holding Fixture and the Clutch Housing Gauge.



8. **CAUTION: Mark the position and location of the differential bearing caps as the arrows may not be visible.**

    Remove the bearing caps.
    1. Remove the bolts.
    2. Remove the bearing caps.

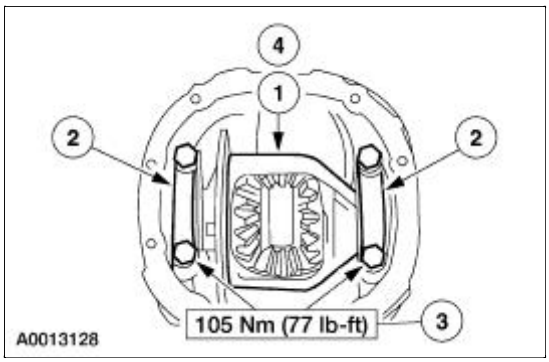


9. **CAUTION: Use wood blocks to avoid damaging the differential housing.**

   Remove the differential assembly.
   1. Position the wood blocks at the top and bottom of the differential case.
   2. Pry the differential assembly with the bearing cups and shims out of the differential housing.
   3. Remove the special tool.

10. Separate the bearing shims and cones from the differential assembly and tag them left and right for assembly.

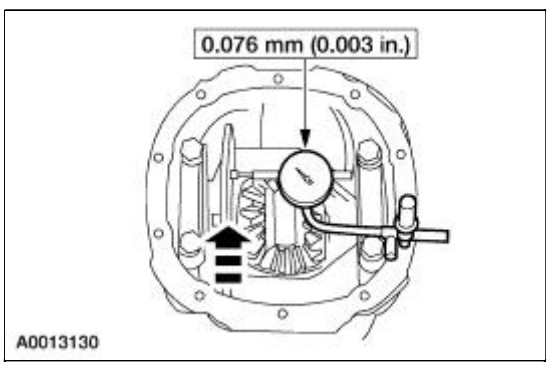
11. Remove the ring gear.
    - Remove the ten bolts.
    - Use a drift punch to separate the ring gear from the differential case.



12. **NOTE:** Visually inspect the differential bearing cups and cones for discoloration indicating bearing overheating or failure.

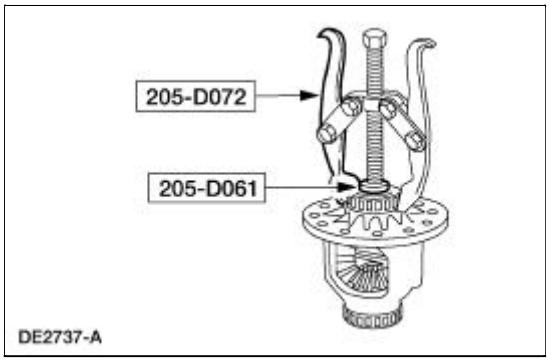
    NOTE: It may be necessary to use the Differential Carrier Spreader to carry out this step.

    Install the differential case with the bearing cups and all the shims in the housing.



1. Position the differential case with the bearing cups and shims in their original location.
2. Install the bearing caps.
3. Install the bolts.
4. Rotate the differential case to make sure the bearings have seated correctly.

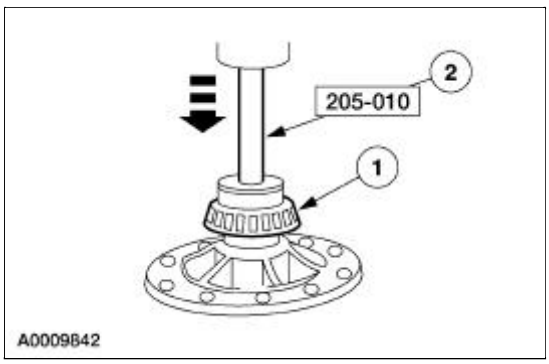
13. Install the special tool.



14. Rotate the differential case and check the differential case runout.
    - If the runout does not exceed the specification, install a new ring gear and pinion.
    - If runout exceeds the specification, the ring gear is true and the condition is due to differential case/differential bearing damage.
        - Inspect the differential bearings and the differential case. Always install new differential bearings when installing a new differential case, or if a bearing condition is questionable.

15. Remove the bearing caps, and the differential case with the bearing cups and shims from the housing.

16. If necessary, using the special tools, remove the differential bearings.

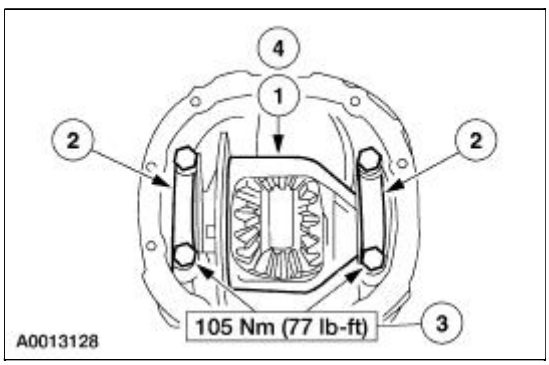


17. **CAUTION: Press against the differential bearing inner cone only.**

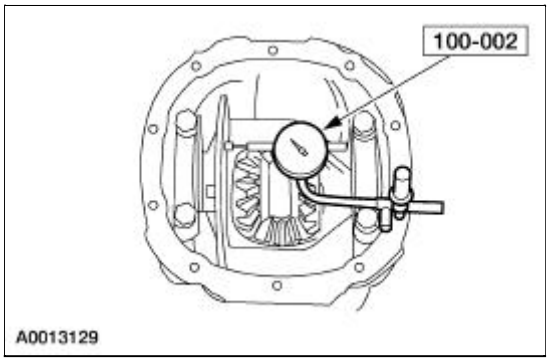
Install the new differential bearings.

1. Position the appropriate differential bearing (RH or LH).
2. Using a suitable press and the special tool, install the differential bearing.

- Repeat the steps for the other differential bearing.



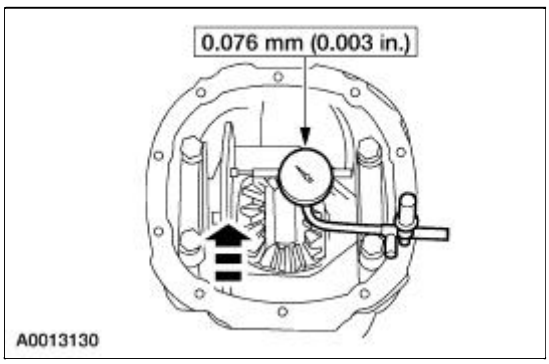
18. **NOTE:** It may be necessary to use the Differential Carrier Spreader to carry out this step.



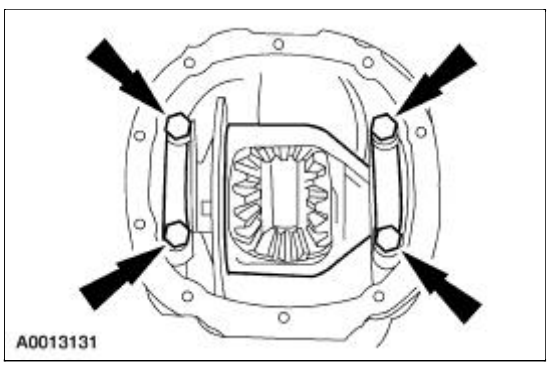
NOTE: Recheck the flange runout.

Install the differential case with the bearing cups and the shims in the housing.

1. Position the differential case with the bearing cups and shims in their original location.
2. Install the bearing caps.
3. Install the bolts.
4. Rotate the differential case to make sure the bearings have seated correctly.



19. Install the special tool.



20. **NOTE:** If the runout is still excessive, install a new differential case.

    Check the runout with the new differential bearings. If the runout does not exceed the specification, use the new differential bearings for assembly.

21. Remove the bolts.

22. Remove the differential case with the bearing cups and the shims from the housing.
    1. Remove the bearing caps.
    2. Remove the differential case with the bearing cups and the shims from the housing.

23. Install the ring gear and the differential assembly. For additional information, refer to Axle—Front Drive in this section.

24. Install the axle shafts in the differential assembly. For additional information, refer to Axle Assembly—Front Drive in this section.

25. Install the front drive axle assembly. For additional information, refer to Axle Assembly—Front Drive in this section.

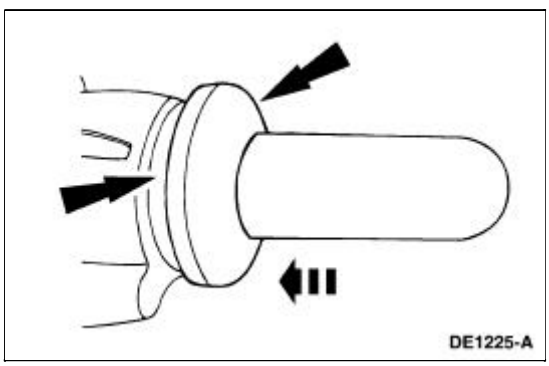
Drive Pinion Seal

Special Tool(s)

 ST1358-A	Installer, Drive Pinion Oil Seal 205-133 (T79P-4676-A)

Removal

1. Remove the front axle universal joint flange. For additional information, refer to Universal Joint Flange—Front in this section.

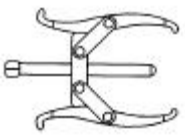


2. **CAUTION: Do not damage the front axle housing.**

   Force up on the metal flange of the rear axle drive pinion seal. Install gripping pliers and strike with a hammer to remove the pinion seal.

Installation

1. Clean the pinion seal bore, and use the Drive Pinion Oil Seal Installer to install the pinion seal.



2. Install the front axle universal joint flange. For additional information, refer to Universal Joint

Flange—Front in this section.

Universal Joint Flange —Front

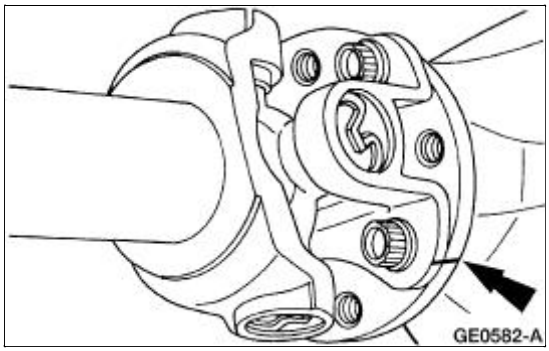
Material

Item	Specification
SAE 75W-90 Premium 4x4 Front Axle Lubricant XY-75W90-TQL	WSP-M2C201-A

Removal

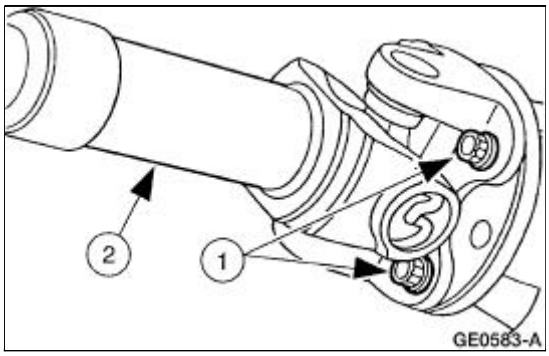
WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.



CAUTION: This operation disturbs the pinion bearing preload. Carefully reset the preload during assembly.

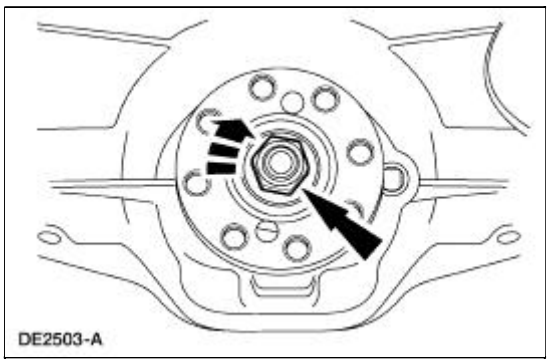
1. Position the vehicle on a hoist. For additional information, refer to Section 100-02 .
2. Remove the front wheel and tire assemblies. For additional information, refer to Section 204-04 .
3. **CAUTION: Remove the front brake caliper to prevent drag during the drive pinion bearing preload adjustment.**

CAUTION: Do not allow the calipers to hang from the brake hoses.



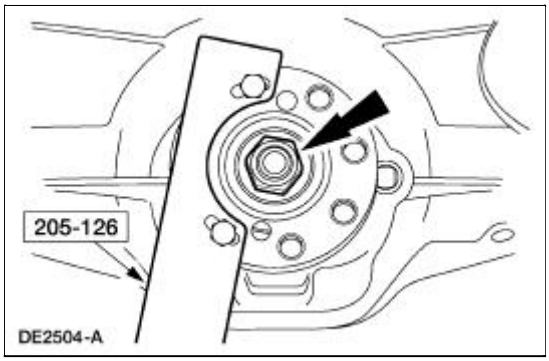
Remove the front brake calipers. Wire the caliper out of the way. For additional information, refer to Section 206-03 .

4. Index-mark the front driveshaft to the axle universal joint flange.

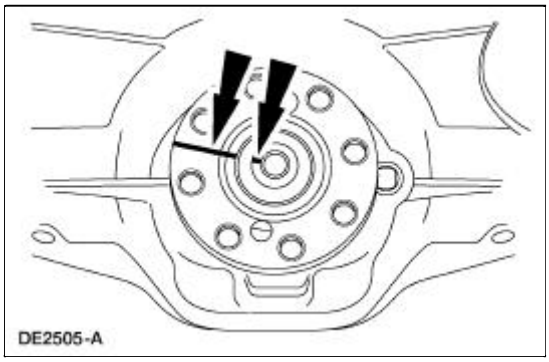


5. **CAUTION: Do not allow the driveshaft to hang unsupported.**

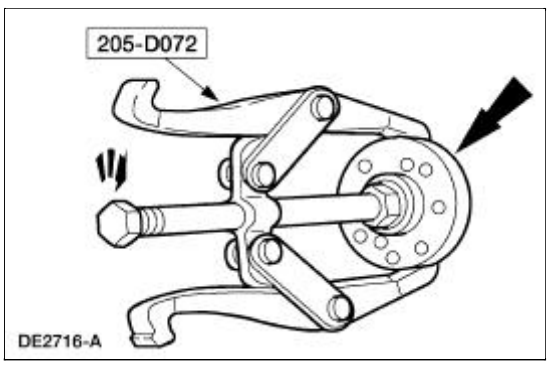
Disconnect and support the front driveshaft.
1. Remove the four bolts.
2. Carefully disconnect and support the front driveshaft.



6. Using a Nm (inch/pound) torque wrench, measure the torque necessary to maintain pinion rotation. Record the measurement for reference during installation.



7. **CAUTION: After removing the pinion nut, discard it. Use a new pinion nut for installation.**



Install the special tool, and remove the pinion nut.

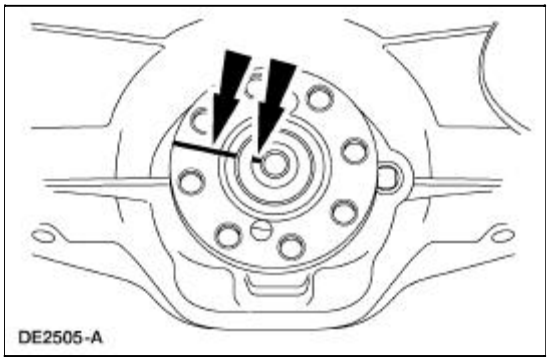
8. Index-mark the axle universal joint flange to the pinion stem.

9. Using the special tool, separate the axle universal joint flange from the pinion gear.

10. Remove the flange.

11. Inspect the axle universal joint flange for burrs, the nut counterbore and the seal contact surface for nicks, and the bearing cone contact area for damage. Install a new flange if necessary.

12. Check the pinion stem splines for burrs. If burrs are evident, remove them with a fine crocus cloth.



Installation

1. Lubricate the axle universal joint flange splines and the pinion seal.
    - Use front axle lubricant.

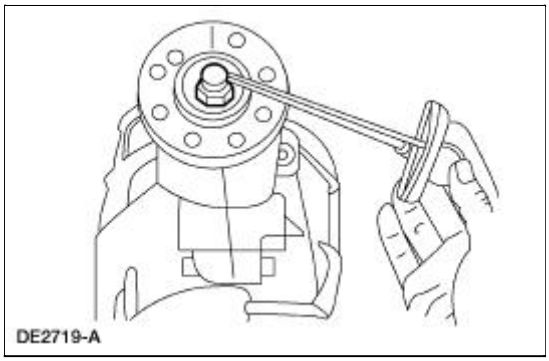
2. **CAUTION: Never install the axle universal joint flange with a hammer or power tools.**

    NOTE: Disregard the scribe marks if installing a new flange.

Align the index-marks and position the axle universal joint flange on the pinion shaft.

3. **NOTE:** Rotate the pinion gear occasionally to make sure the pinion bearings seat correctly.

   Using the special tool, install the axle universal joint flange.

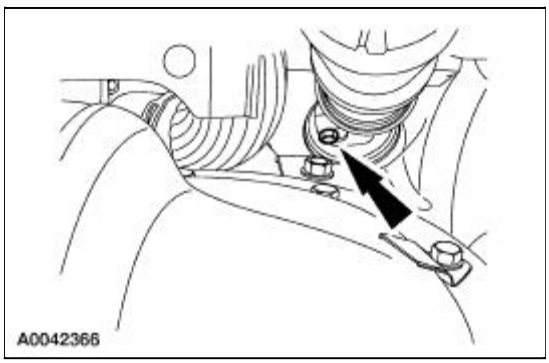


4. **CAUTION: Do not loosen the pinion nut to reduce preload under any circumstance. If it is necessary to reduce preload, install a new drive pinion collapsible spacer and pinion nut.**

   Install the special tool, and tighten the pinion nut. Refer to the torque specifications for used bearings in the Specifications portion of this section.

   - Rotate the pinion gear occasionally to make sure the pinion bearings are seating correctly. Take frequent pinion bearing torque preload readings by rotating the pinion gear with a Nm (inch/pound) torque wrench.
   - If the preload recorded prior to disassembly is lower than the specification for used bearings, then tighten the pinion nut to the specification. If the preload recorded prior to disassembly is higher than the specification for used bearings, then tighten the pinion nut to the original reading as recorded.

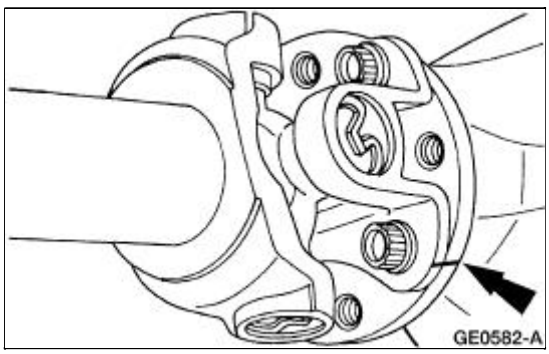
5. Align the index-marks then attach the front driveshaft. Refer to Section 205-01 for driveshaft fastener tightening specifications.



6. Inspect and, if necessary, fill the differential.
   - Use front axle lubricant.
7. Lower the vehicle.
8. If equipped with air suspension, reactivate the system by turning on the air suspension switch.

Axle Assembly —Front Drive

Removal

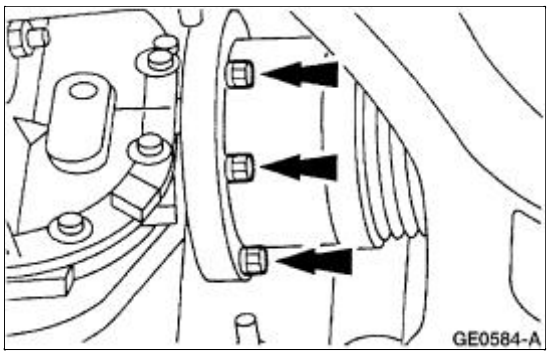


1. Position the vehicle on a hoist. For additional information, refer to Section 100-02 .
2. Open the air cleaner clamp and set the outlet air cleaner aside.
3. Remove the steering column shaft pinch bolt.

4. Disconnect the steering column coupling from the steering gear.
5. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

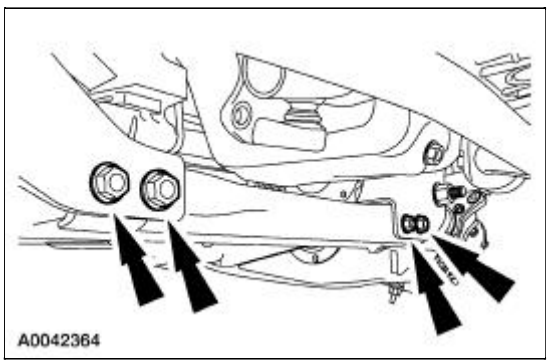
   With the transmission in NEUTRAL, raise and support the vehicle.

6. Index-mark the front driveshaft to the universal joint drive pinion flange.



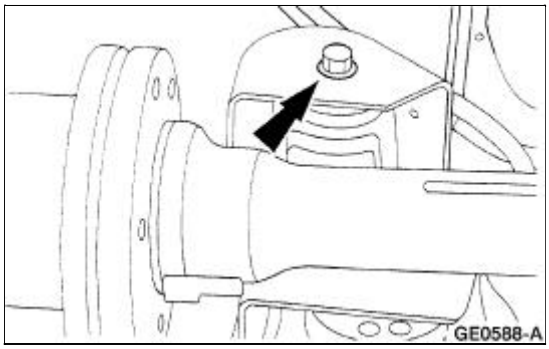
7. **CAUTION: Do not allow the driveshaft to hang unsupported.**

   Disconnect and support the front driveshaft.
   1. Remove the four bolts.
   2. Carefully disconnect and support the front driveshaft.

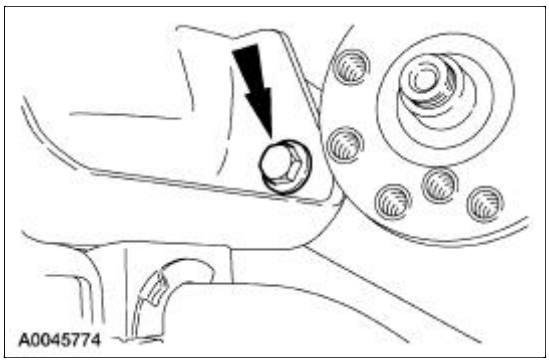


8. **CAUTION: Do not allow the halfshaft to hang unsupported.**

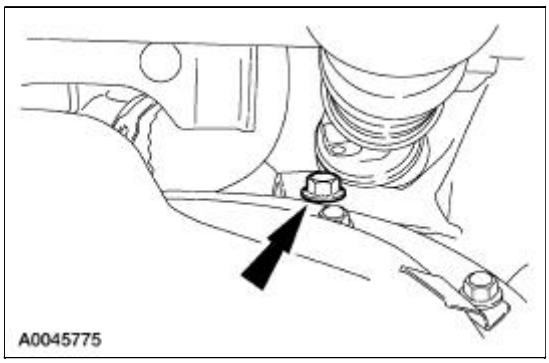
   Remove the six bolts, and disconnect the front drive halfshaft from the front axle shaft.
   - Repeat this step for the opposite side.



9. Remove the four crossmember bolts and the crossmember.



10. Use a high-lift jack to support the axle assembly.

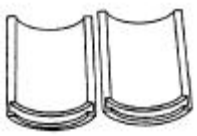


11. Remove the nut and bolt.

12. Remove the bolt.

13. Remove the bolt.

14. Carefully lower the front drive axle assembly.



15. Disconnect the vent hose from the axle vent barbed fitting.

Installation

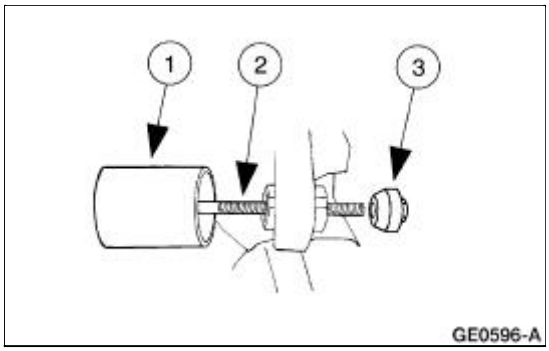
1. To install, reverse the removal procedure.
    - Refer to Section 205-04 for halfshaft fastener tightening specifications.
    - Refer to Section 205-01 for driveshaft fastener tightening specifications.
    - Refer to Section 211-04 for steering column tightening specifications.

Axle Carrier Bushing

Special Tool(s)

 ST1160-A	Installer, Front Axle Mounting Bushing Collet 205-372 (T96T-5638-F)
 ST1159-A	Remover, Front Axle Mounting Bushing Cup 205-371 (T96T-5638-E)
 ST1155-A	Remover, Bushing 205-527
 ST1156-A	Installer, Front Axle Mounting Bushing 205-370 (T96T-5638-B)
 ST1162-A	Drawbolt 205-527
 ST1167-B	Ring Gauge (0.225 in.) 204-206 (T96T-5638-D)

Removal



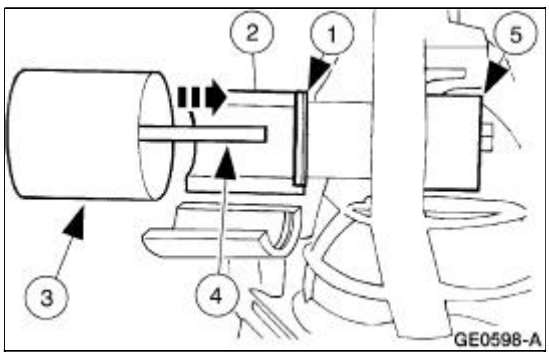
NOTE: The following procedure is applicable for all of the front axle mounting bushings.

1. **NOTE:** It is not necessary to remove the axle assembly from the jack.

   Remove the front drive axle assembly. For additional information, refer to Axle Assembly—Front

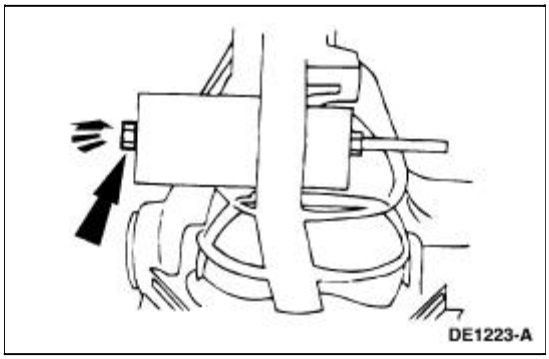
Drive in this section.

2. Position the carrier bushing removal tools.
    1. Position the Front Axle Mounting Bushing Cup Remover.
    2. Position the Drawbolt through Front Axle Mounting Bushing Cup Remover and the bushing.
    3. Thread the Bushing Remover onto the Drawbolt.



3. Tighten the Drawbolt to remove the carrier bushing.

Installation



1. Position the carrier bushing and the carrier bushing installation tools.
    1. Position the Gauge Ring on the outer face of the bushing flange.
    2. Position the Front Axle Mounting Bushing Collet Installer over the Gauge Ring and the bushing flange.
    3. Slide the Front Axle Mounting Bushing Cup Remover over the Front Axle Mounting Bushing Collet Installer.
    4. Insert the Drawbolt.
    5. Thread the Front Axle Mounting Bushing Installer onto the Drawbolt.

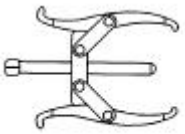
2. **NOTE:** The Gauge Ring will correctly locate the carrier bushing when the Bushing Collet Installer bottoms out on the carrier.

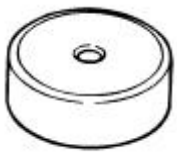
Tighten the Drawbolt until the Bushing Collet Installer contacts the carrier.

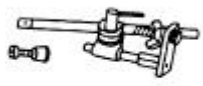
- Remove the tools.

3. Install the front drive axle assembly. For additional information, refer to Axle Assembly—Front Drive in this section.

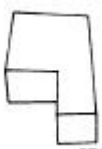
Axle Cover Bushing

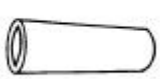




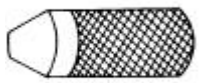


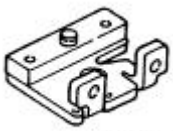
1. Refer to Axle Carrier Bushing in this section.

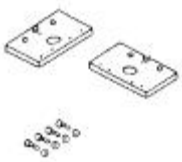




Axle Tube Bushing







1. Refer to Axle Carrier Bushing in this section.

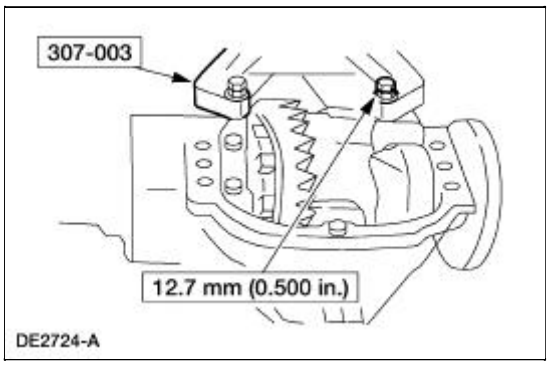
Material

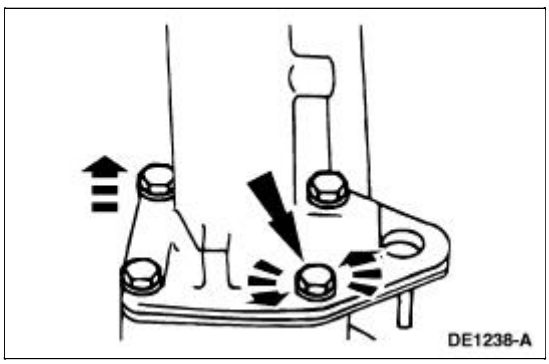
Item	Specification
Silicone Gasket and Sealant F7AZ-19554-EA	WSE-M4G323-A4
Premium Long Life Grease XG-1-C	ESA-M1C75-B
SAE 75W-90 Premium 4x4 Front Axle Lubricant XY-75W90-TQL	WSP-M2C201-A

Disassembly



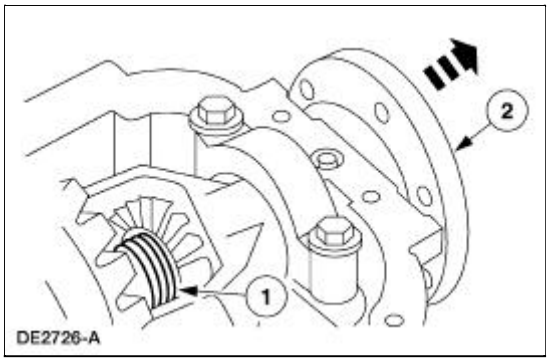
1. Remove the front drive axle assembly. For additional information, refer to Axle Assembly—Front Drive in this section.

2. Remove the differential housing cover.
    1. Remove the drain plug.
    2. Drain the fluid.
    3. Remove the bolts.
    4. Remove the differential housing cover.



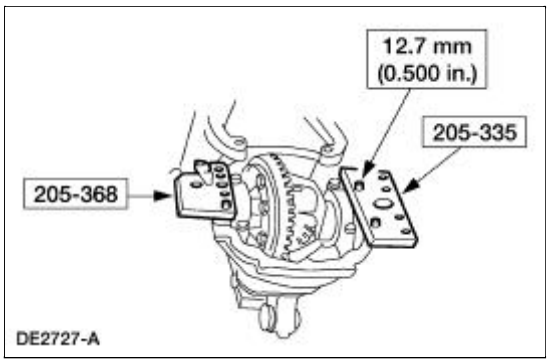
3. **CAUTION: The fixture mounting bolts must have the minimum specified thread engagement in the carrier.**

    Install the special tool.

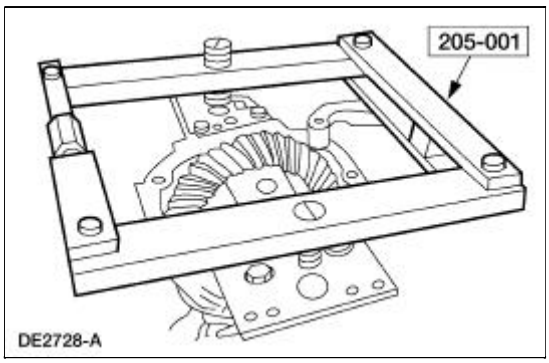


4. Remove the right hand axle shaft.
    1. Remove the snap ring.
    2. Remove the axle shaft.

5. Remove the axle housing tube.



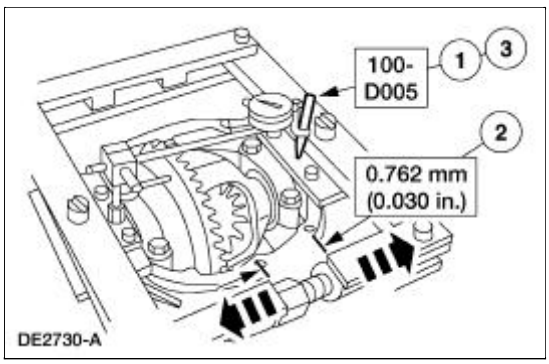
6. Remove the axle shaft.
    1. Remove the snap ring.
    2. Remove the axle shaft.



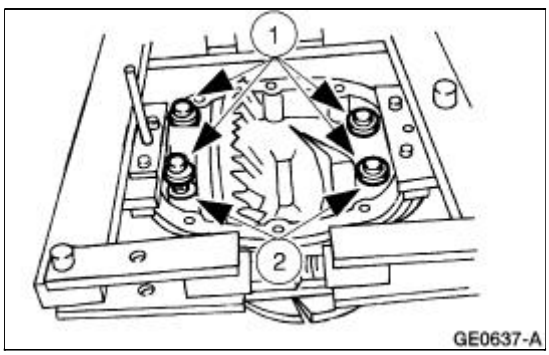
7. **CAUTION: The housing spreader adapter bolts must have the minimum specified thread engagement in the carrier.**

    Install the special tools.

8. Position the special tool on the spreader adapters.



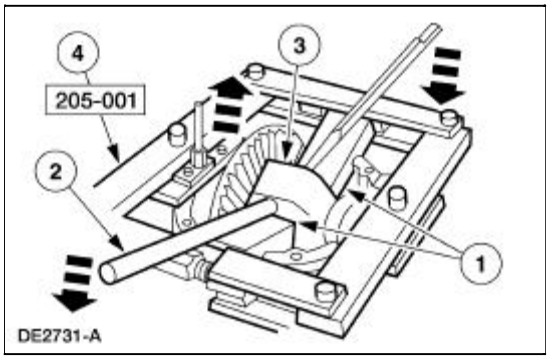
9. Install the special tools.
    - Position the adapter tip in the spreader adapter hole.



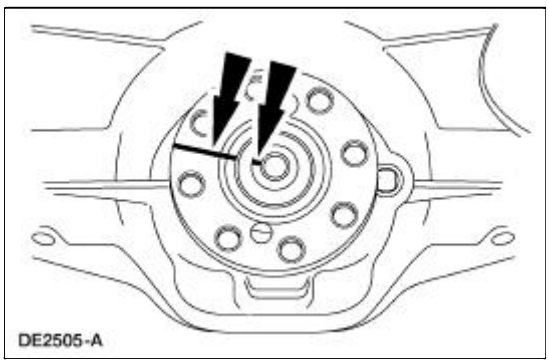
10. **CAUTION: Overspreading can damage the axle housing.**

Spread the axle housing to the specification.
1. Adjust the special tool to zero.
2. Tighten the housing spreader screw to spread the axle housing to the specification.
3. Remove the special tool.

11. **CAUTION: Mark the differential bearing caps Top or Bottom and LH or RH appropriately before removing them. Always install the bearing caps in their original place and position.**

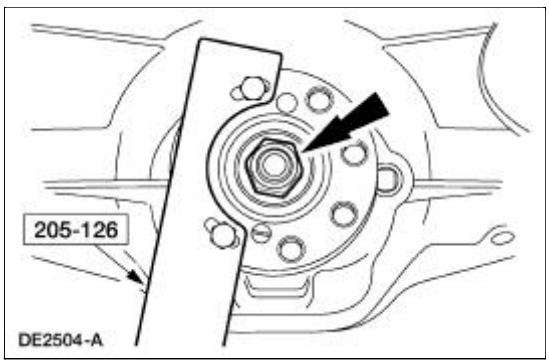


Mark and remove the differential bearing caps.
1. Remove the bolts.
2. Remove the differential bearing caps.

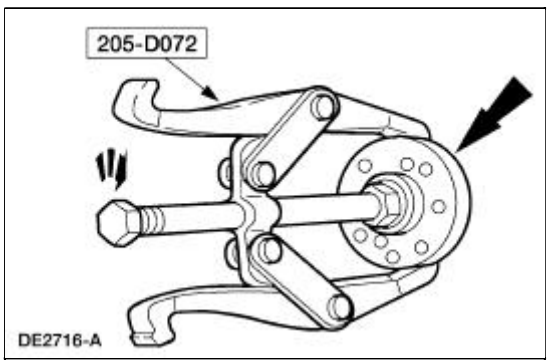


12. **CAUTION: Use wood blocks to avoid axle housing damage.**

Remove the differential assembly from the axle housing.
1. Position the wood blocks.
2. Position and push down on the two pry bars.
3. Remove the differential assembly.

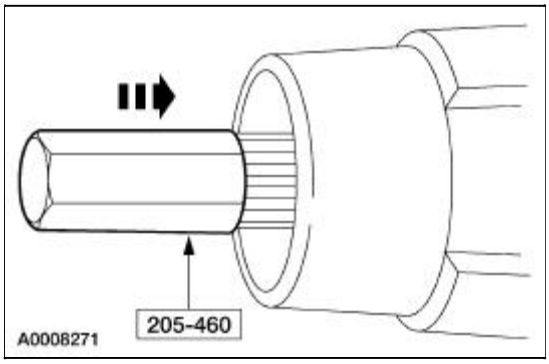


4. Remove the special tool.

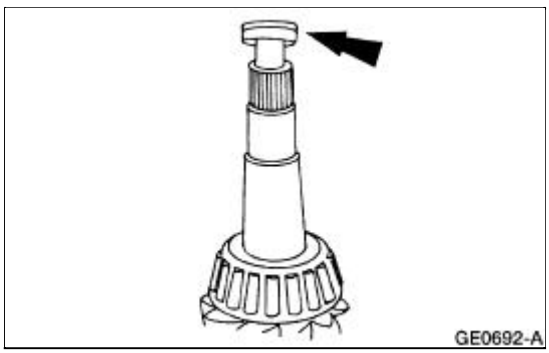


13. Index-mark the axle universal joint flange to the pinion stem.

14. Install the special tool and loosen, but do not remove, the pinion nut.

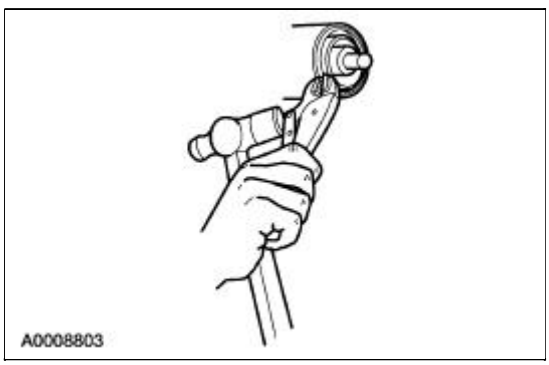


15. With the pinion nut still engaged by a few threads, use the special tool to separate the axle universal joint flange from the pinion gear.



16. Remove the nut and the flange.

17. Using the special tool and a soft hammer, remove the pinion gear.

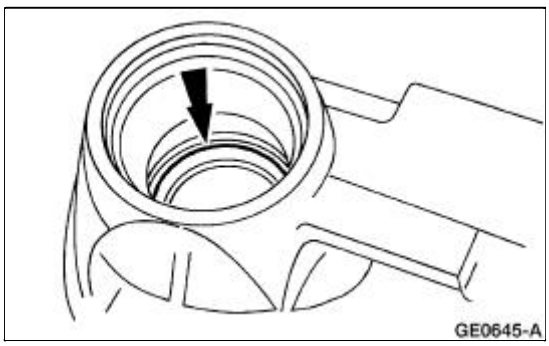


18. Discard the drive pinion collapsible spacer.

19. **CAUTION: Do not damage the carrier housing while removing the pinion seal.**

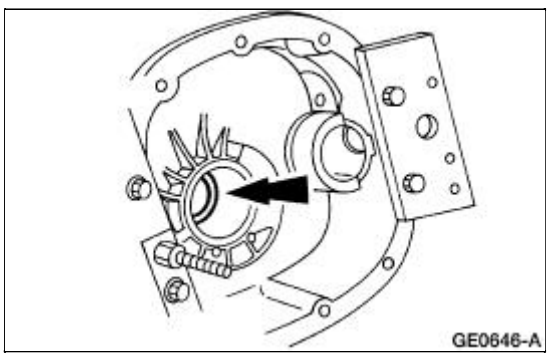
    Remove the pinion seal and slinger.

    - Pry up on the seal flange. Install gripping pliers, and strike with a hammer to remove the seal.



20. Remove the outer pinion bearing.

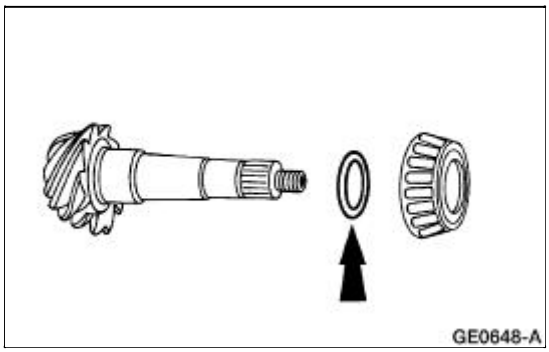
21. Using the special tools, remove the inner pinion bearing cup.



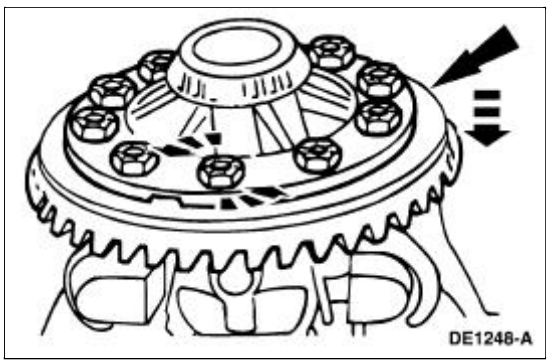
22. **NOTE:** The pinion bearing oil baffle aids in bearing lubrication. Normally, it is not necessary to remove the baffle.

    If necessary, remove the pinion bearing oil baffle.

23. Remove the outer pinion bearing cup by tapping alternately on each side to prevent the cup from cocking.

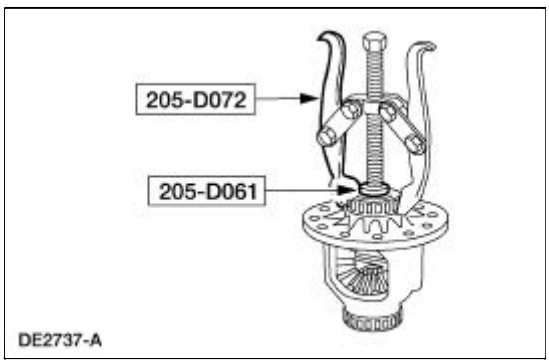


24. Using the special tool and a suitable press, remove the pinion bearing.



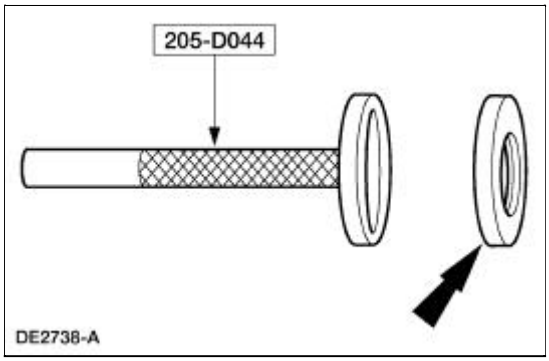
25. **NOTE:** A drive pinion bearing adjustment shim sits under the pinion bearing. Use a micrometer

to measure the shim thickness. Record the measurement for comparison to the shim gauge reading taken prior to installing the pinion bearing.

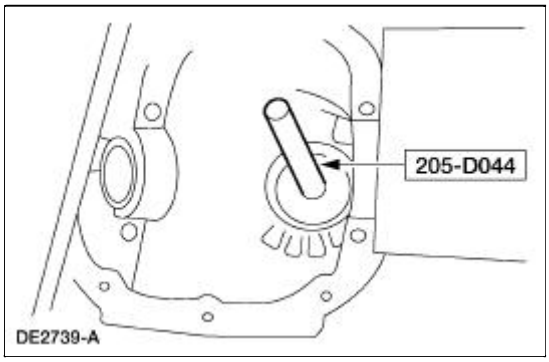


Remove and measure the drive pinion bearing adjustment shim.

26. Remove the ten bolts and the ring gear.
    - Use a drift punch to separate the ring gear from the differential case.



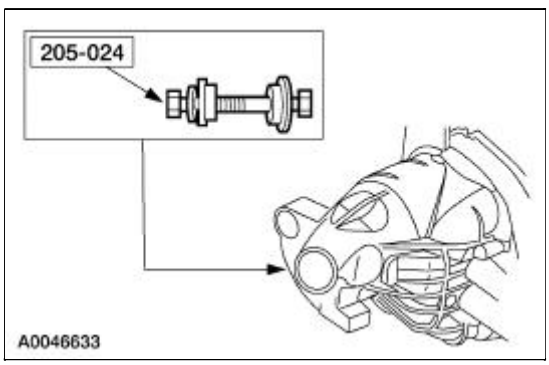
27. Using the special tools, remove the differential bearings.



Assembly

1. **CAUTION: Do not omit the pinion bearing oil baffle; bearing failure can result.**

   If removed, position the baffle on the special tool.

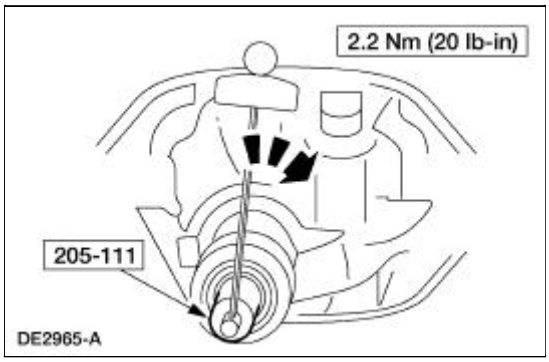


2. Using the special tool, install the baffle.

3. **NOTE:** Always install new pinion bearings when installing new pinion bearing cups.

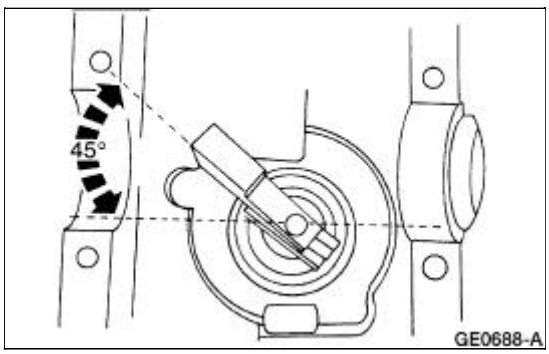
   Lightly oil the new pinion bearing cups and pinion bearings with front axle lubricant.

4. Using the special tool, install the bearing cups.



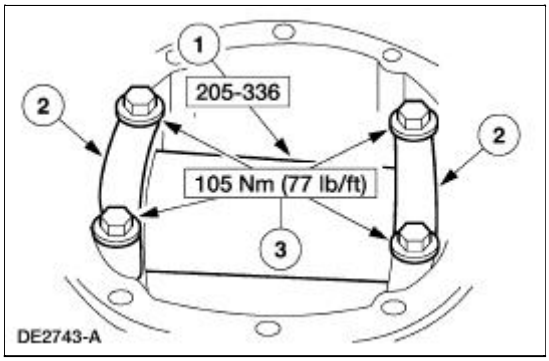
5. **NOTE:** You must use the pinion bearings assembled in this procedure step at final assembly.

   Assemble and position the special tools and the pinion bearings in the carrier housing.
   1. Position the screw Adapter.
   2. Position the aligning Adapter.
   3. Position the pinion bearing.
   4. Position the gauge disc Adapter.
   5. Position the gauge block Adapter.
   6. Position the pinion bearing.
   7. Thread on the handle Adapter.



6. **NOTE:** This step duplicates final pinion bearing preload.

   Tighten the special tool to the specification to simulate bearing preload.

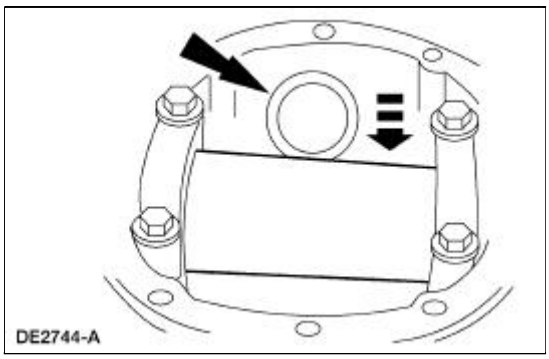


7. **NOTE:** Offset the gauge block Adapter to obtain an accurate reading.

   Rotate the gauge block Adapter several half-turns to make sure the pinion bearings seat correctly, and position the gauge block Adapter.

8. Install the special tool.
   1. Position the special tool.

2. Install the differential bearing caps.
3. Install the bolts.

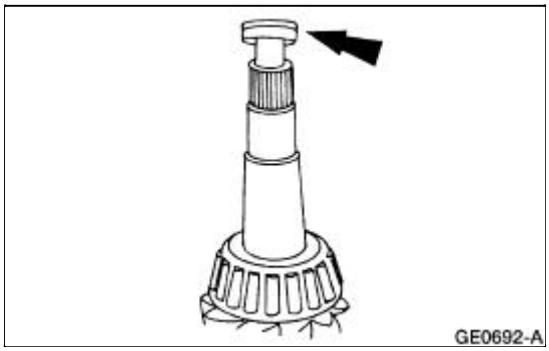


9. **NOTE:** Use only flat, clean drive pinion bearing adjustment shims.

   NOTE: Selection of too thick a shim results in a deep tooth contact at final assembly of integral axle assemblies. Do not attempt to force the shim between the gauge block Adapter and the gauge tube Adapter. A slight drag indicates correct shim selection.

   Use a drive pinion bearing adjustment shim as a gauge for shim selection.

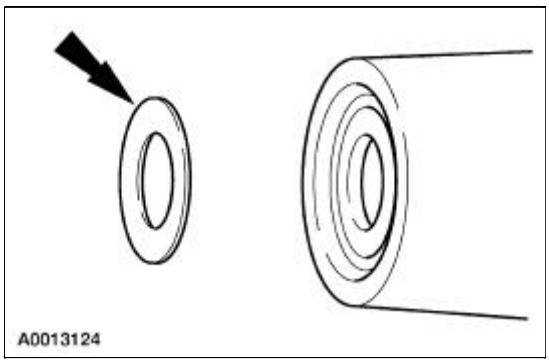
   - Check the adjustment shim thickness between the gauge block Adapter and the gauge tube Adapter.
   - After determining the correct shim thickness, remove the special tools.



10. **NOTE:** You must use the same pinion bearings from the previous steps.

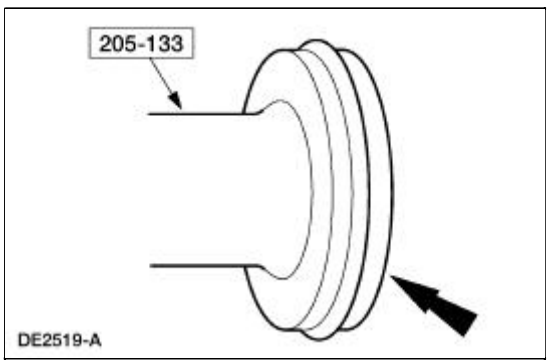
    Install the pinion bearing.

    - Place the drive pinion bearing adjustment shim on the pinion gear.
    - Using a suitable press and the special tool, press the pinion bearing until it is firmly seated on the pinion gear.

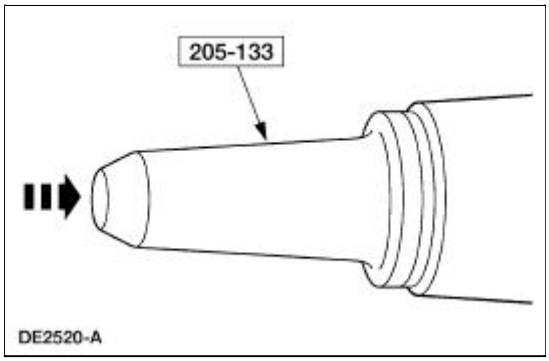


11. Place a new drive pinion collapsible spacer on the pinion stem.

12. Install the outer pinion bearing.

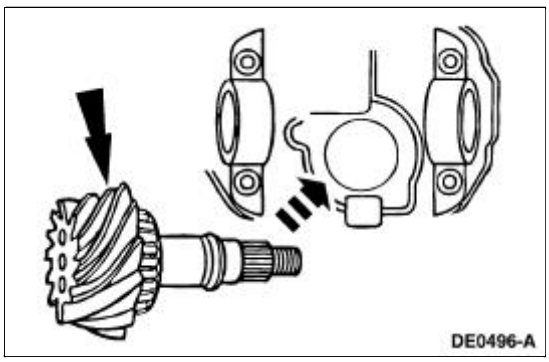


13. Install the slinger.



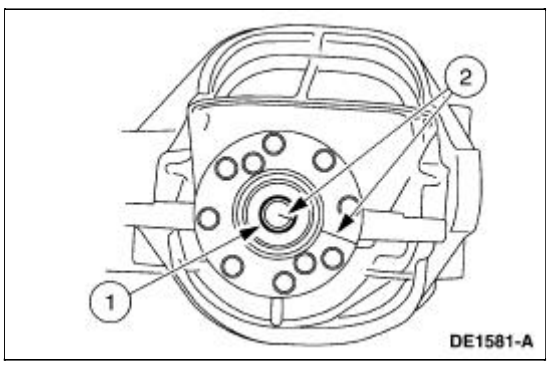
14. **NOTE:** Coat the lips of the pinion seal with front axle lubricant.

    Place the pinion seal on the special tool.

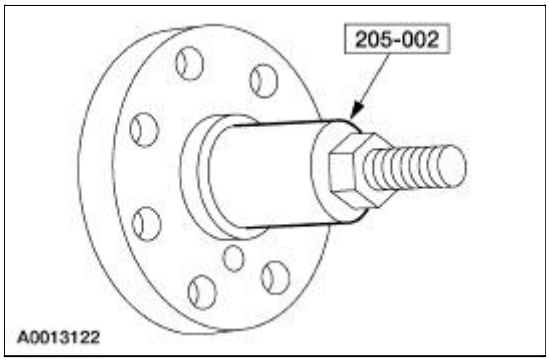


15. Place the special tool and seal in the pinion seal bore and drive the seal into place.

16. Lightly lubricate the pinion gear splines with front axle lubricant.



17. Position the drive pinion in the housing.

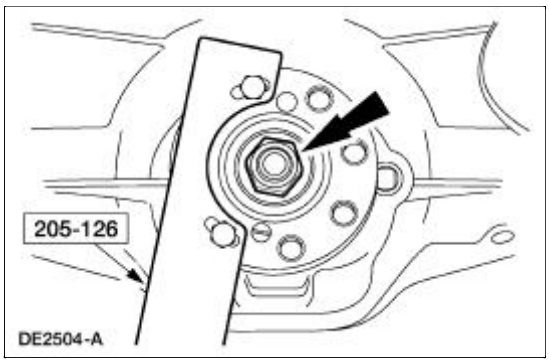


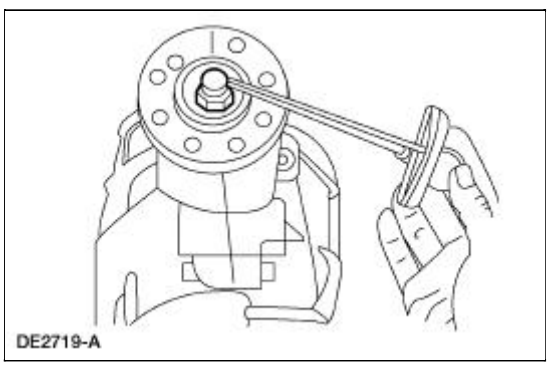
18. **CAUTION: Never install the drive pinion universal joint flange with a hammer or power tools.**

    NOTE: Disregard the scribe marks if installing a new flange.

    Align the index-marks and position the universal joint flange on the drive pinion.

19. Using the special tool, install the drive pinion universal joint flange.



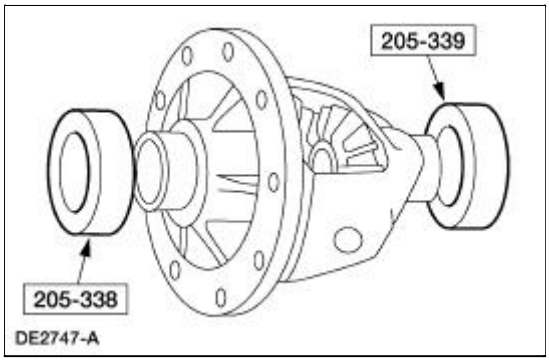


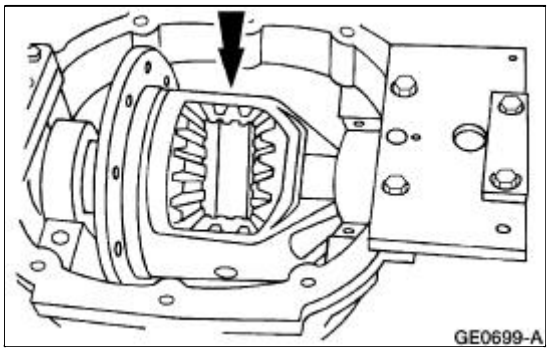
20. Apply a small amount of lubricant to the washer side of the new pinion nut, and install the nut.

21. **CAUTION: Do not loosen the pinion nut to reduce preload under any circumstance. If it is necessary to reduce preload, install a new drive pinion collapsible spacer and pinion nut.**

    Install the special tool, and tighten the pinion nut. Refer to the torque specifications in the Specifications portion of this section.

    - Rotate the pinion gear occasionally to make sure the pinion bearings are seating correctly. Take frequent pinion bearing torque preload readings by rotating the pinion gear with a Nm (inch-pound) torque wrench.

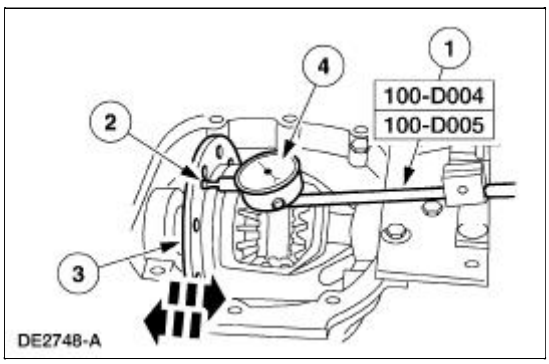




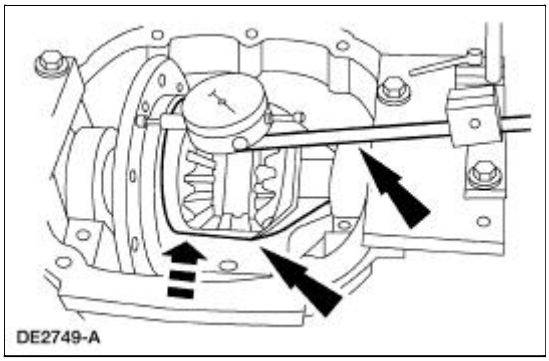
22. **CAUTION: Use extreme care not to damage the aluminum differential carrier housing while carrying out the following procedure steps.**

    CAUTION: The special tools are marked LH and RH. Install them accordingly.

    Install the special tools.

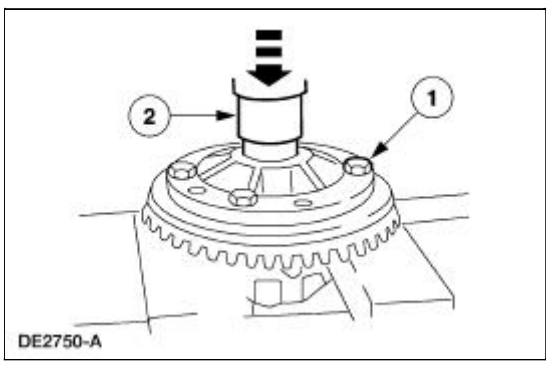


23. Install the differential case with the Differential Bearings Gauge in the differential carrier housing.

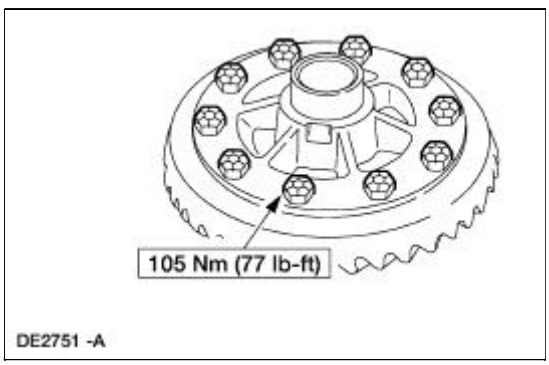


24. **NOTE:** Repeat this step until you obtain a consistent reading.

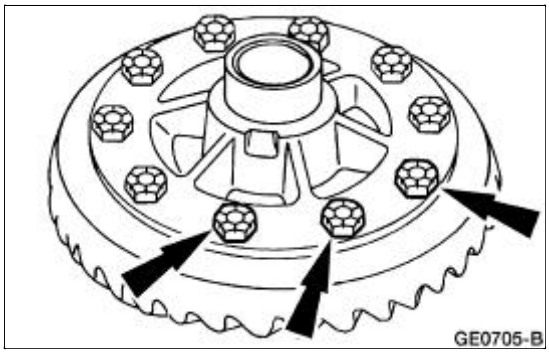
    Measure the total end play.
    1. Position the special tools.
    2. Position the indicator tip on the machined surface and adjust it to measure full travel.
    3. Push the differential case left and right (as far as possible).
    4. Measure the total end play and record the reading on the Differential Bearing Shim Selection Procedure Worksheet, Line A, in this procedure.



25. Remove the special tools and the differential case.

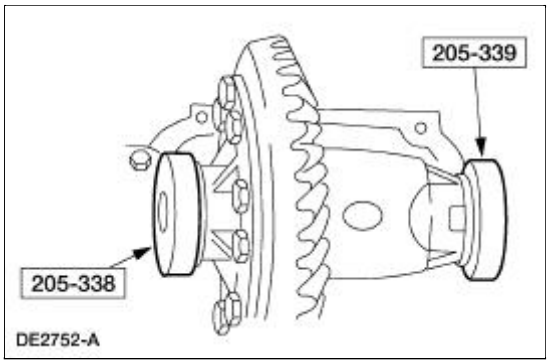


26. Use a fine flat file to remove any burrs or nicks from the ring gear mounting surface.

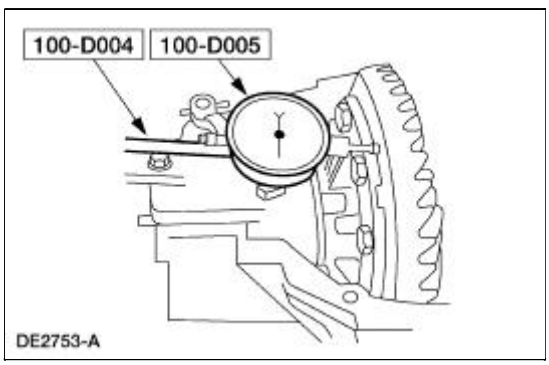


27. Install the ring gear.
    1. Position three bolts to align the holes in the ring gear and the differential case.
    2. Using a suitable press, install the ring gear.

28. Install the remaining bolts.



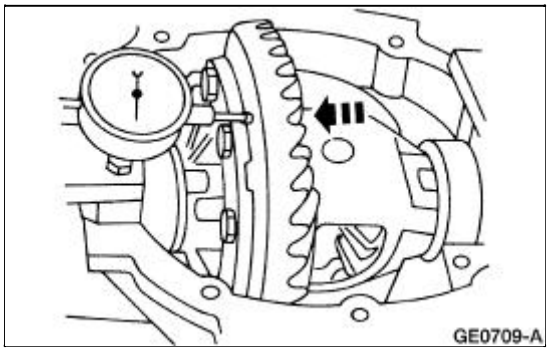
29. Remove three adjacent bolts.



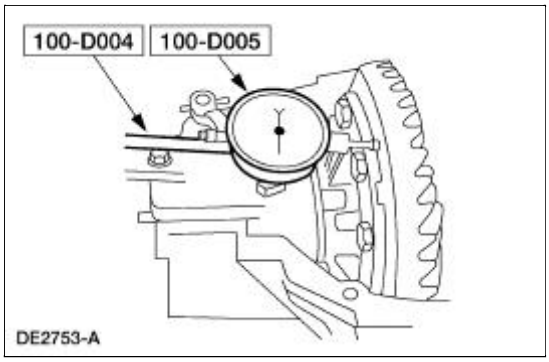
30. **CAUTION: Position the three empty bolt holes downward.**

    Position the differential case with the special tools into the differential carrier housing.

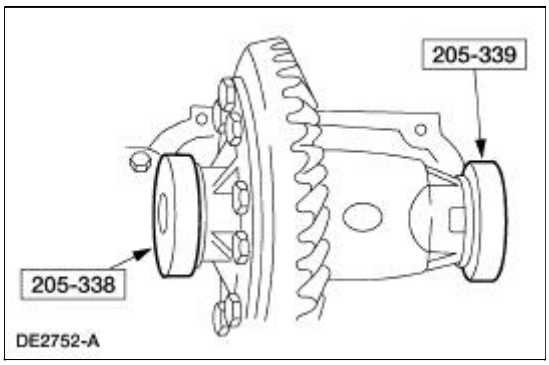
31. Position the special tools.



32. Push and rock the ring gear into mesh with the pinion gear (zero backlash) and adjust the special tool to zero.

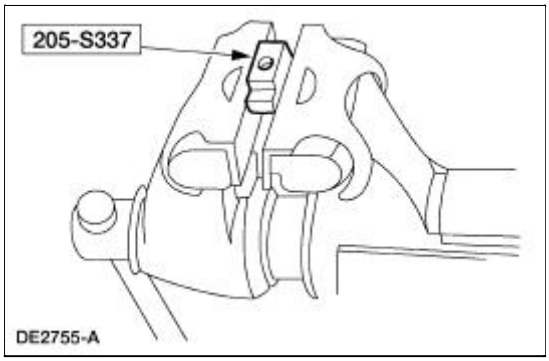


33. Move the ring gear away from the pinion gear as far as possible. Record the reading on the

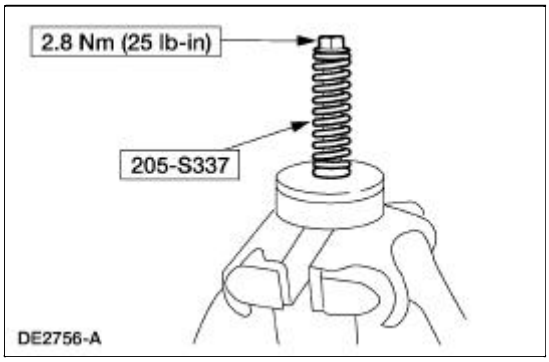


Differential Bearing Shim Selection Procedure Worksheet, Line B, in this procedure.

34. Remove the special tools.



35. Remove the differential case and the special tools.



36. **NOTE:** Measure both of the differential bearing stand heights prior to installing them on the differential case.

    NOTE: Mark the left and right differential bearings before measuring them.

    Clamp the special tool base in a soft jawed vise with the bearing mounting surface above the surface of the vise.

37. Position the differential bearing assembly in the special tool, and tighten the tool.

38. Measure the differential bearing stand height.
    1. Invert the special tool and bearing assembly in the vise.
    2. Use a depth micrometer to measure and record the differential bearing stand height.
    - Repeat the procedure for the other bearing.

39. Select appropriate differential bearing shims.

Differential Bearing Shim Selection Chart

8.8-inch Aluminum Axle	Example	Actual
Line-A End play without ring gear	0.498	
Line-B End play with ring gear (ring gear side)	-0.245	minus (-)
Line-C Subtract Line-B from Line-A, also record on Line C, below	0.253	

8.8-inch Aluminum Axle	Left Differential Bearing Height		Right Differential Bearing Height	
	Example	Actual	Example	Actual

Master bearing height	0.8695	0.8695	0.8695	0.8695
Line-D Actual bearing height	-0.8478	minus (-)	-0.8491	minus (-)
Line-E Difference	0.0217		0.0204

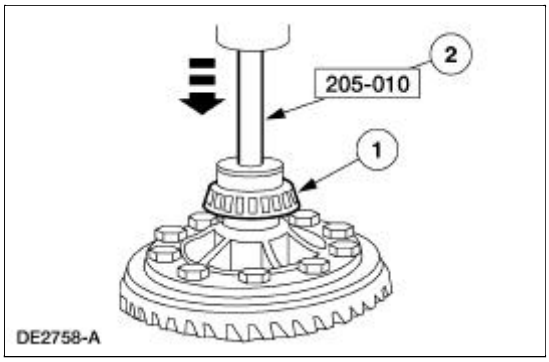
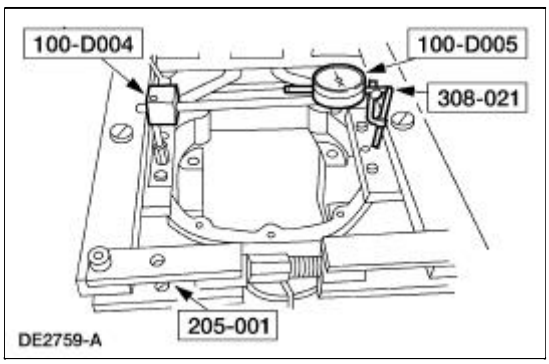
41. Install the three bolts.



42. **CAUTION: Press against the bearing inner core only.**

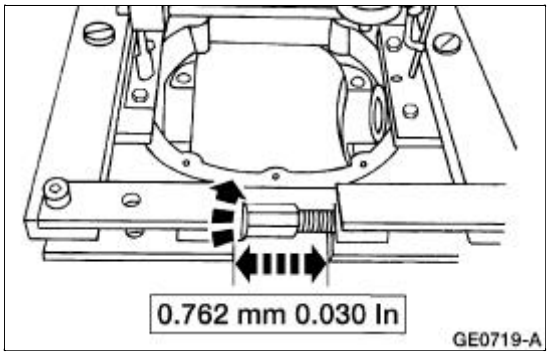
Using a suitable press and the special tool, install the differential bearings.



1. Position the appropriate differential bearing (RH or LH).
2. Using a suitable press and the special tool, install the differential bearing.

- Repeat the procedure for the other differential bearing.

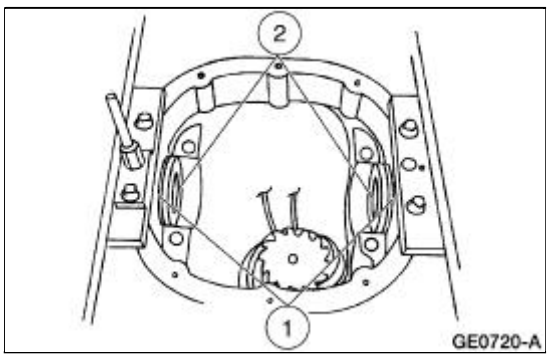
43. **NOTE:** Make sure the indicator needle is in the spreader adapter hole.



Install the special tools.

44. **CAUTION: Overspreading can damage the axle housing.**

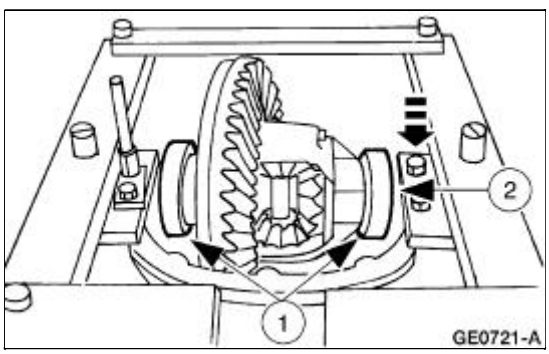
Spread the axle housing to the specification.



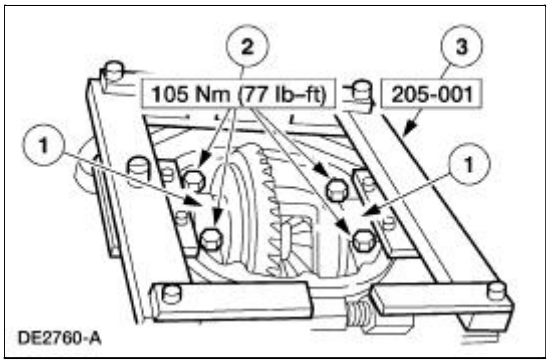
- Remove the Dial Indicator.

45. **CAUTION: Never attempt to drive the differential bearing shim in place. Permanent damage to the machined axle housing surfaces can occur.**

If removed, position the differential bearing shims.

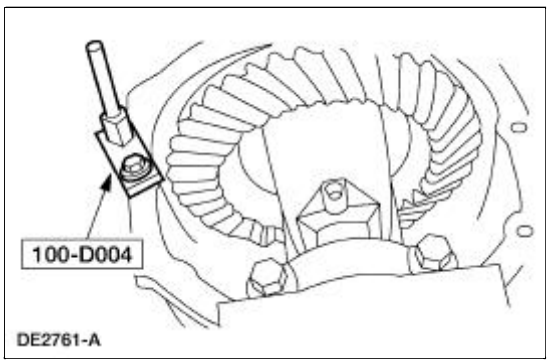


1. Apply a light coating of long life grease to one side of the differential bearing shims to help hold them in place.
2. Position the differential bearing shims.

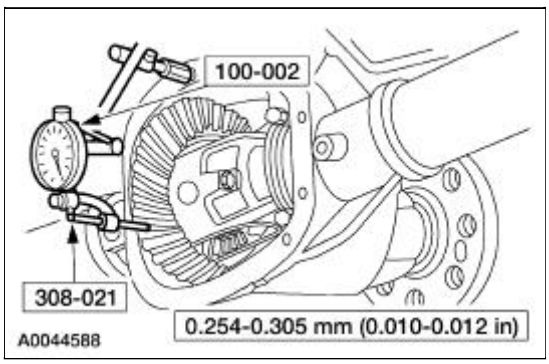


46. **NOTE:** Push the differential case downward to fully seat the differential bearing cups in the axle housing.

Position the differential case assembly.

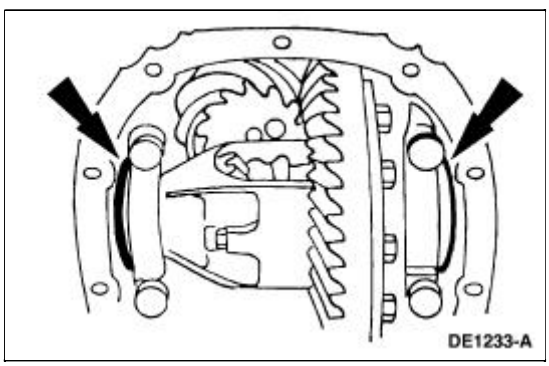


1. Position the differential bearing cups on the differential bearings.
2. Lower the differential case assembly in place between the differential bearing shims.

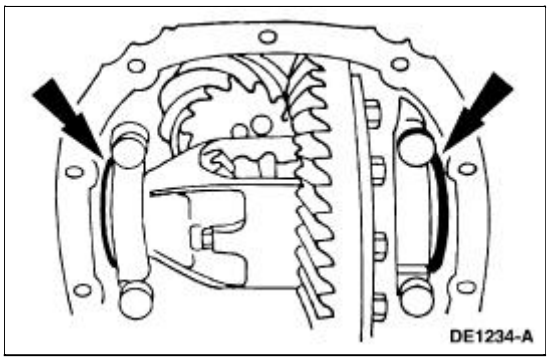


47. Install the bearing caps in their original positions and tighten with the housing still spread.
    1. Position the bearing caps.
    2. Install the bolts.
    3. Remove the special tool.

48. Install the special tool.



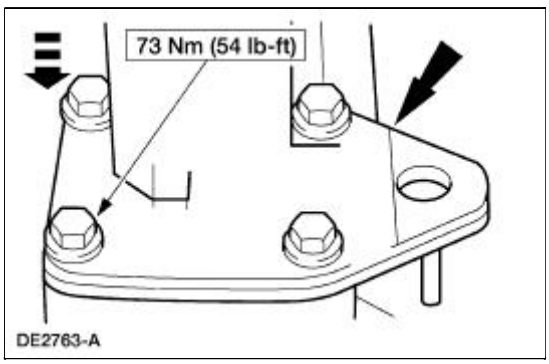
49. Measure the ring gear backlash at four places to obtain a consistent reading.



50. **NOTE:** If the backlash is not within the specifications, correct it by increasing the thickness of one differential bearing shim and decreasing the thickness on the other differential bearing shim by the same amount.

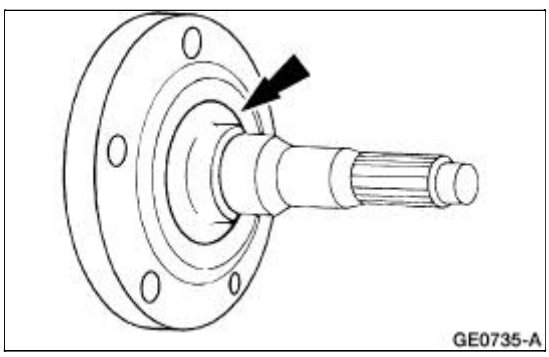
    To increase the backlash, install a thicker differential bearing shim and a thinner differential bearing shim as shown.

51. To decrease the backlash, install a thicker differential bearing shim and a thinner differential bearing shim as shown.



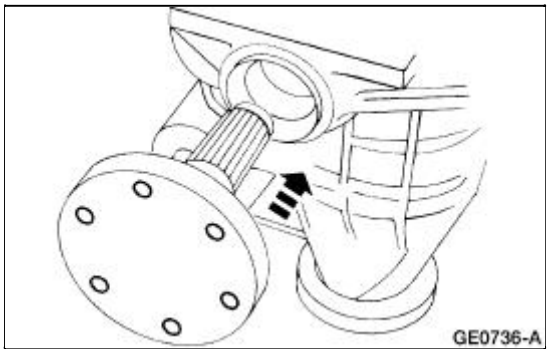
52. **CAUTION: Remove all of the old liquid gasket, and make sure the machined surfaces are free of oil before applying the new silicone rubber.**

CAUTION: Install the axle housing tube within 15 minutes of applying the silicone or it will be necessary to remove and reapply new sealant. If possible, allow one hour before filling with lubricant to make sure the silicone sealant has cured.



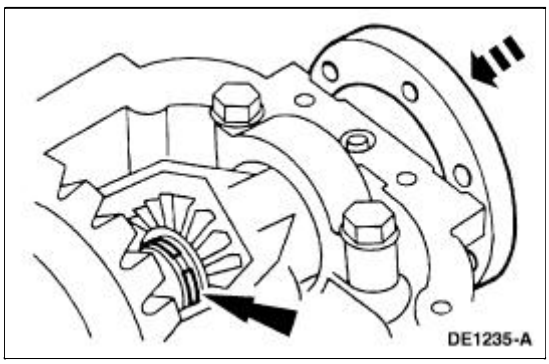
CAUTION: Do not allow any silicone rubber to squeeze inside during assembly.

Assemble the axle housing tube.



- Align the bolt holes and position the axle tube.
- Position the axle identification tag.
- Install the bolts.

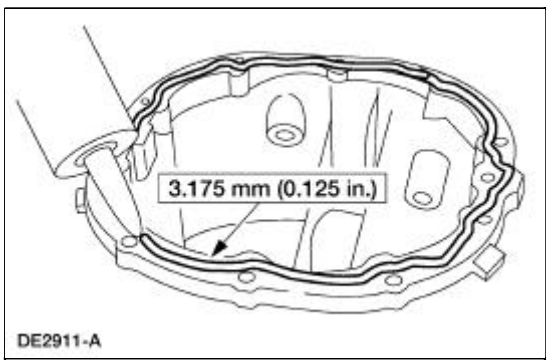
53. Examine the axle shaft seal and bearing surface for damage. If necessary, polish the bearing surface with fine crocus cloth.



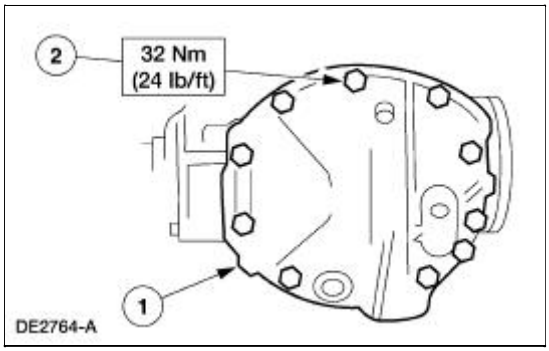
54. Insert the axle shafts and engage them with the side gears.

55. **NOTE:** Do not reuse the old snap rings.

    Push in on the axle shafts and install new snap rings.



56. Remove the axle assembly from the Holding Fixture and place it on the bench.



57. **CAUTION: Remove all of the old liquid gasket, and make sure the machined surfaces are free of oil before applying the new silicone rubber.**

    CAUTION: Install the differential housing cover within 15 minutes of applying the silicone, or it will be necessary to remove and reapply new sealant. If possible, allow one hour before filling with lubricant to make sure the silicone sealant has cured.

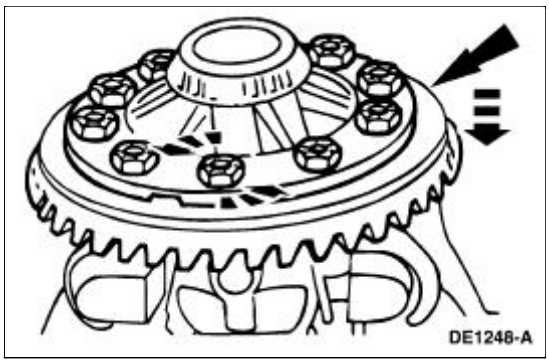
    Fill the sealing groove on the differential housing cover with silicone gasket and sealant.

58. Install the differential housing cover.
    1. Position the differential housing cover.
    2. Install the bolts.

59. Fill the differential carrier housing, and install the fill plug.
    - Use front axle lubricant.
    - Be sure to tighten both the drain and fill plugs.

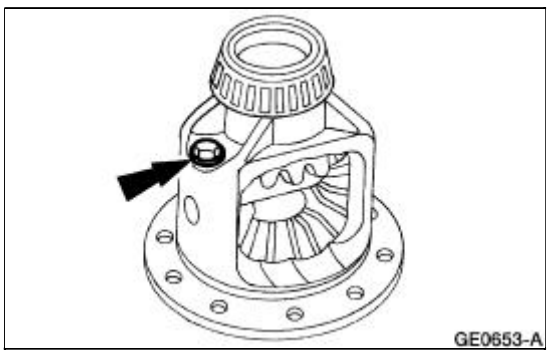
60. Install the front drive axle assembly. For additional information, refer to Axle Assembly—Front Drive in this section.

Differential Case



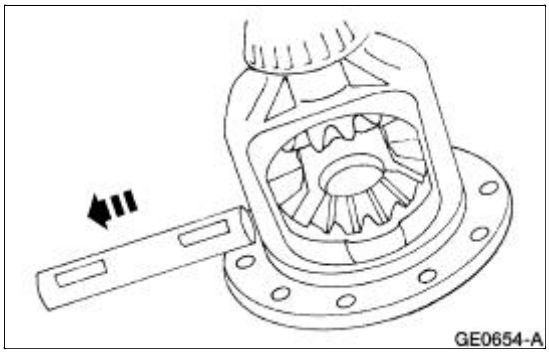
Material

Item	Specification
SAE 75W-90 Premium 4x4 Front Axle Lubricant XY-75W90-TQL	WSP-M2C201-A
Threadlock and Sealer E0AZ-19554-AA	WSK-M2G351-A5 (type II)

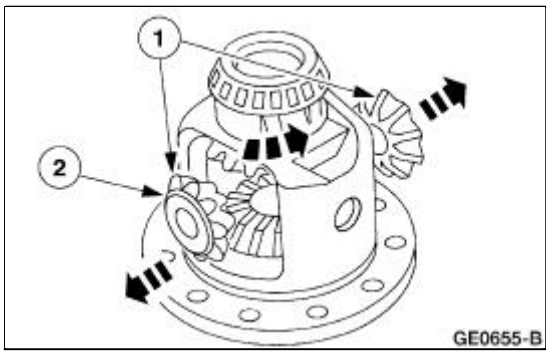


Disassembly

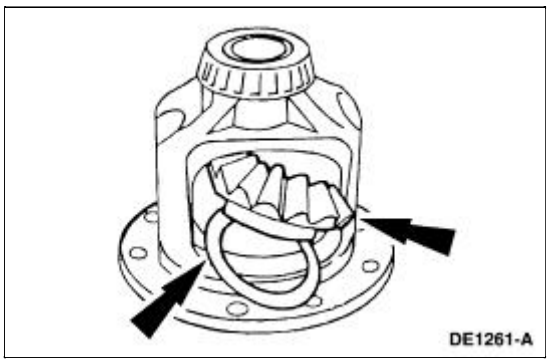
1. Remove the differential assembly from the differential carrier housing. For additional information, refer to Axle—Front Drive in this section.



2. Remove the ring gear.
   - Remove the ten bolts.
   - Use a drift punch to separate the ring gear from the differential case.

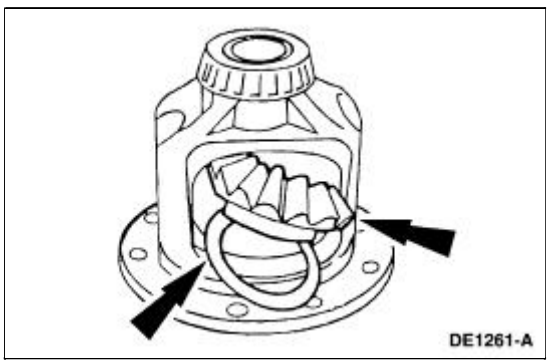


3. Remove the differential pinion shaft bolt.

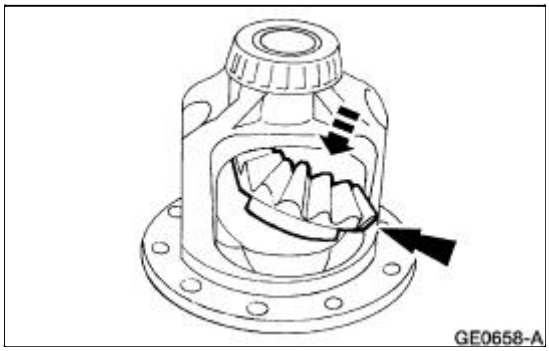


4. Remove the differential pinion shaft.

5. Remove the differential pinion thrust washers and the differential pinion gears.
    1. Rotate the differential pinion gears to the differential case window, and remove them.
    2. Separate the thrust washers from the gears.

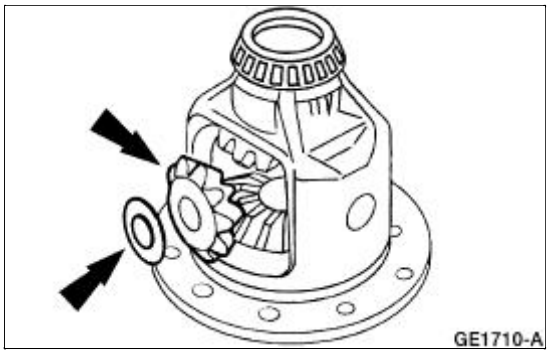


6. Remove the differential side gears and the differential side gear thrust washers.

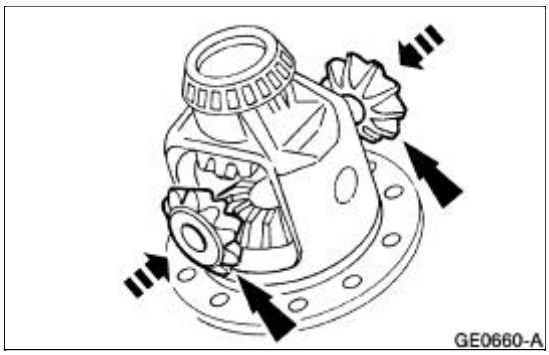


Assembly

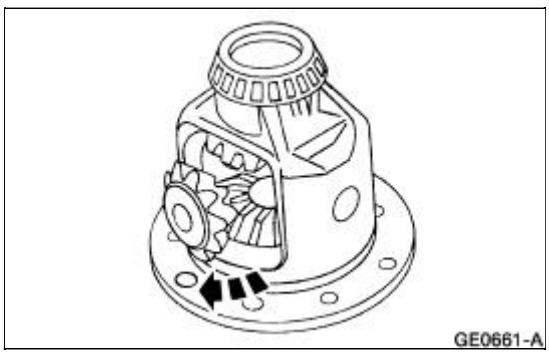
1. Lubricate the differential side gear thrust washers and the differential side gear journals.



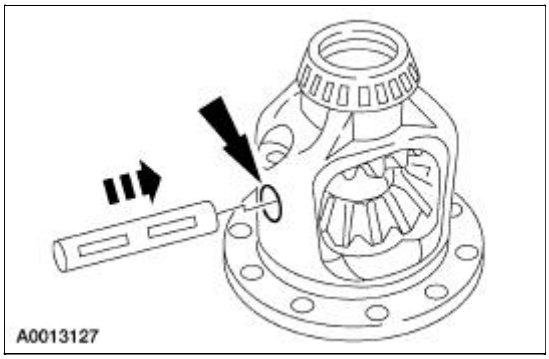
2. Position the differential side gear thrust washers on the differential side gears.



3. Position the differential side gears.

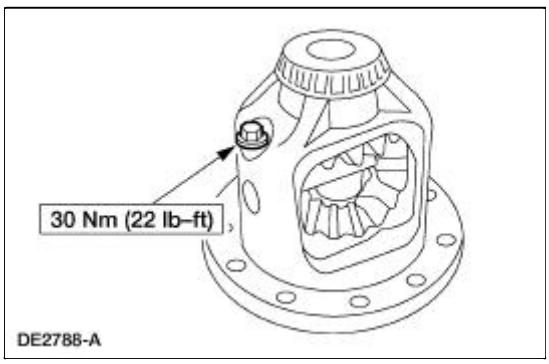


4. Lubricate the differential pinion thrust washers and the differential pinion gears and assemble them.

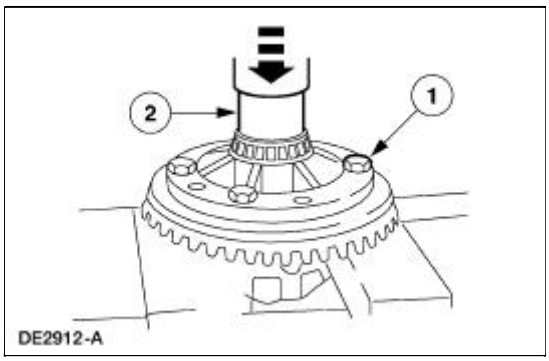


5. Engage the differential pinion gears opposite the differential side gears.

6. Rotate the differential pinion gears to align with the differential pinion shaft bore.

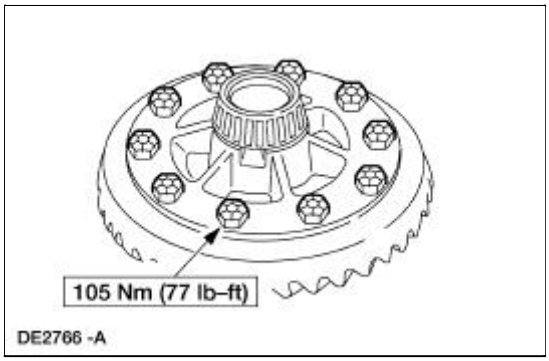


7. Insert the differential pinion shaft.



8. **NOTE:** If a new pinion shaft bolt is unavailable, coat the threads with sealer.

   Install a new differential pinion shaft bolt.



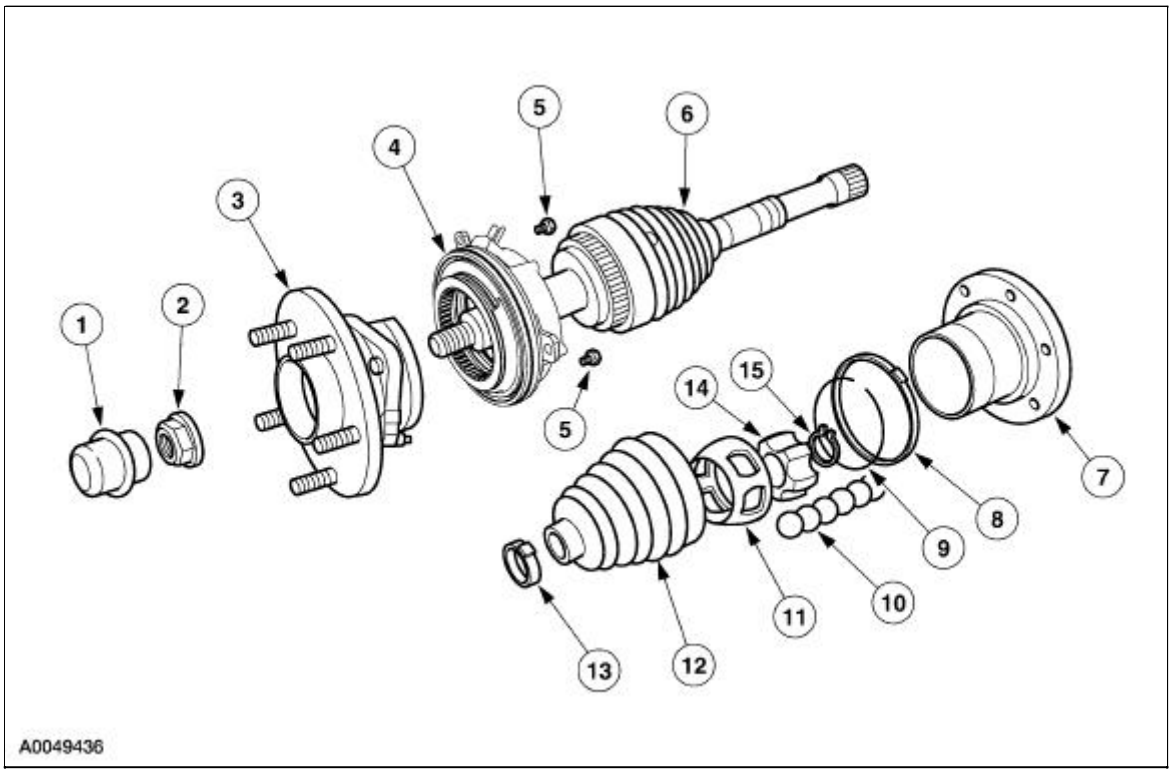
9. **CAUTION: Do not press on the bearing.**

   Install the ring gear.
   1. Position three bolts to align the holes in the ring gear and the differential case.
   2. Using a suitable press, install the ring gear.

10. Install the remaining bolts.

11. Install the differential carrier into the differential carrier housing. For additional information, refer to Axle—Front Drive in this section.

General Specifications



Item	Specification
Halfshaft assembled length mm (inch)	429.96 (16.93)

Torque Specifications

Description	Nm	lb-ft
Bolt retaining halfshaft to axle	82	60
Nut retaining knuckle-to-upper control arm	150	111
Nut retaining tie rod end to knuckle	150	111
Bolt retaining front disc brake caliper to anchor plate	32	24
Nut retaining halfshaft to hub	27	20
Nut retaining IWE disconnect to steering knuckle	15	11

Front Drive Halfshafts

Front Wheel Halfshaft and Joint, Disassembled View

Item	Description
1	Dust cap
2	Nut
3	Hub and bearing assembly
4	Integrated wheel end disconnect
5	Integrated wheel end disconnect retaining bolt (3)
6	Outboard constant velocity joint and interconnecting shaft assembly
7	Inboard constant velocity joint housing
8	Boot clamp
9	Retaining ring
10	Ball (6)
11	Ball cage
12	Inboard boot
13	Boot clamp
14	Inner race
15	Snap ring

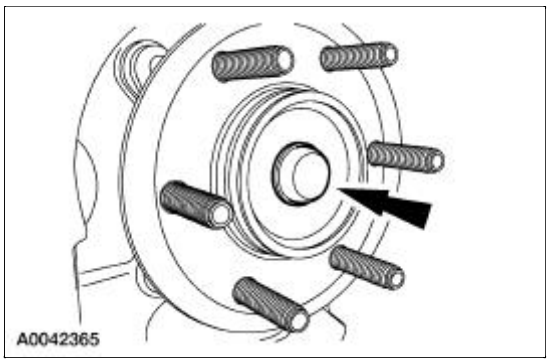
New halfshaft components are available as follows:

- A repair kit includes the boots, clamps, snap ring, retaining ring, and grease.
- A new inboard CV joint (plunge type).
- A new outboard CV joint and interconnecting shaft assembly includes the outboard front wheel halfshaft joint (fixed type), boot, and clamps.
- A new integrated wheel end disconnect assembly.

Front Drive Halfshafts

Refer to Section 205-00 .

Halfshaft

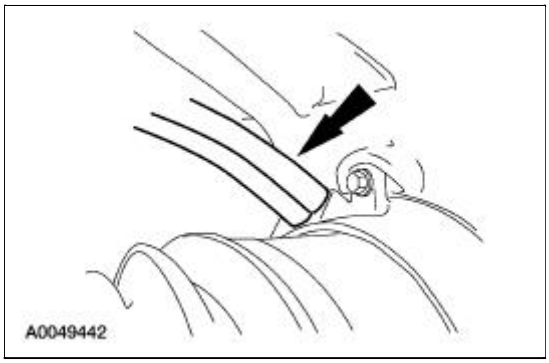


Removal and Installation

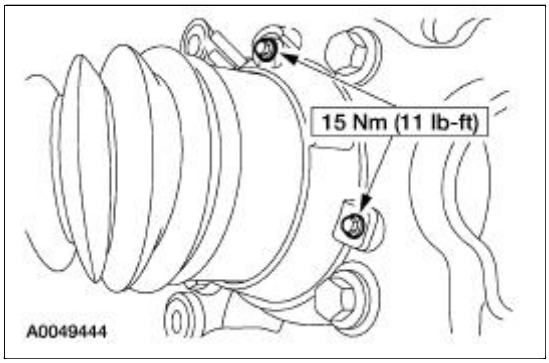
1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the left rear quarter trim panel. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   Position the vehicle on a hoist. For additional information, refer to Section 100-02 .

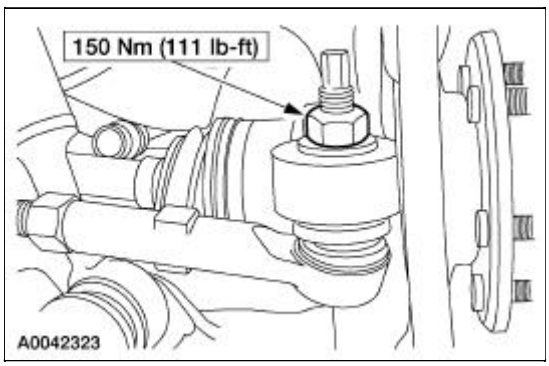
2. Remove the front wheel and tire assembly. For additional information, refer to Section 204-04 .



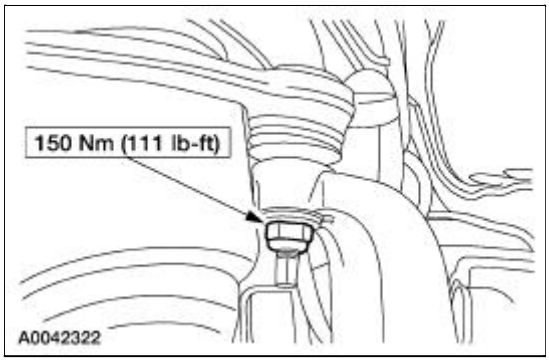
3. Remove the dust cap.



4. Remove the axle nut.
   - Discard the axle nut.

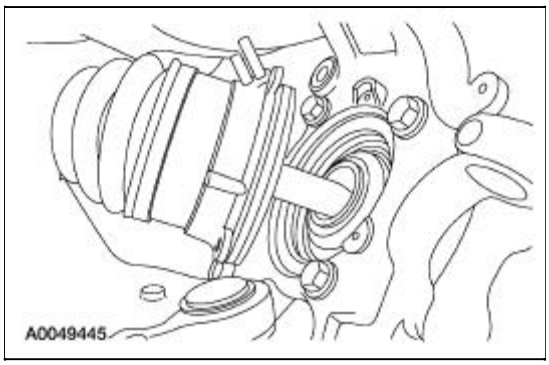


5. Remove the vacuum/vent line at the vacuum/vent port of the integrated wheel end disconnect.

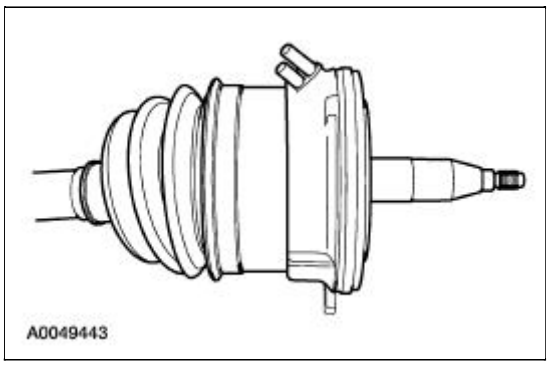


6. Remove the three bolts retaining the integrated wheel end disconnect to the steering knuckle.

7. Remove the tie rod end nut.
    - Disconnect the tie rod end from the steering knuckle.
    - Discard the tie rod end nut.



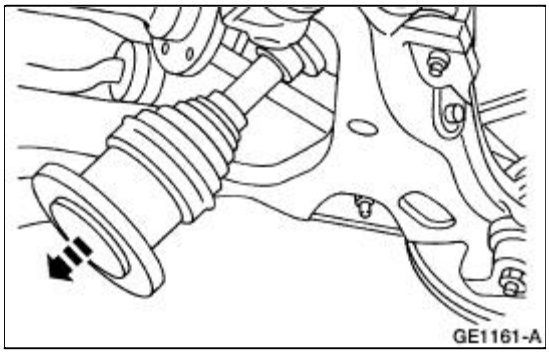
8. Remove the upper ball joint nut.
    - Disconnect the upper ball joint from the steering knuckle.
    - Discard the upper ball joint nut.



9. **CAUTION: Do not damage the hub seal.**

   NOTE: Allow the steering knuckle to swing outboard while keeping the constant velocity shaft pushed inboard.

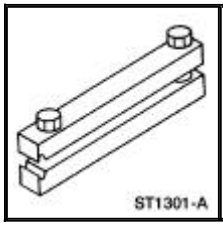
   Once clearance is available, remove the constant velocity shaft joint outboard end and integrated wheel end disconnect from the steering knuckle hub bearing.



10. Remove the integrated wheel end disconnect from the outboard constant velocity joint housing.

11. Remove the six bolts retaining the halfshaft to the axle.

12. Separate the halfshaft from the axle and the hub, and remove the assembly from the vehicle.



13. **CAUTION: Verify the spline engagement by checking for spline lash before installing the halfshaft nut.**

To install, reverse the removal procedure.

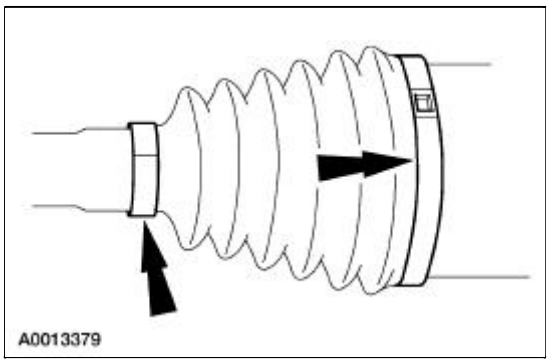
- Install a new axle nut, tie rod end nut and an upper ball joint nut.

Halfshaft

Special Tool(s)

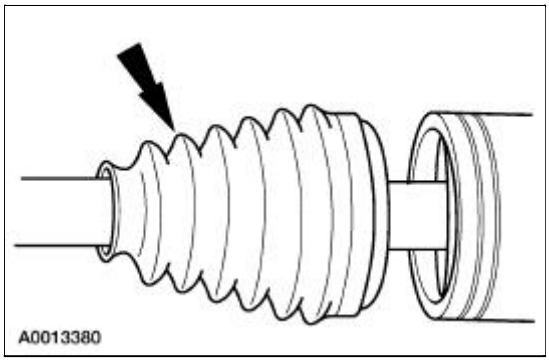
 ST1301-A	Installer, Constant Velocity Joint Boot Clamp 205-343 (T95P-3514-A)

Material



Item	Specification
Motorcraft Constant Velocity Joint Grease XG-5	WSS-M1C258-A1

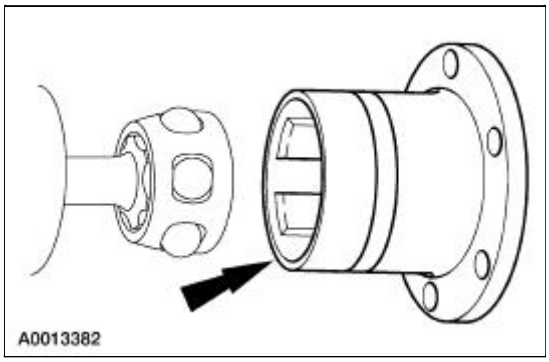
Disassembly



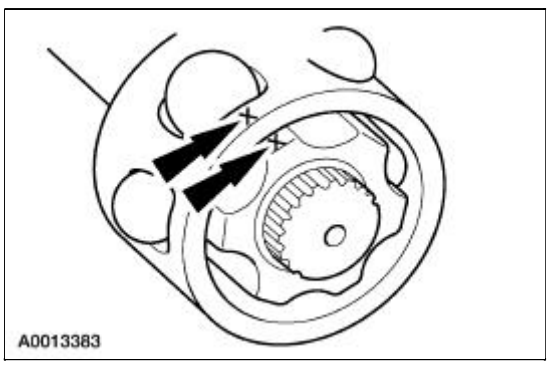
1. Remove the halfshaft from the vehicle. For additional information, refer to Halfshaft in the Removal and Installation portion of this section.

2. **CAUTION: Do not damage the boot.**

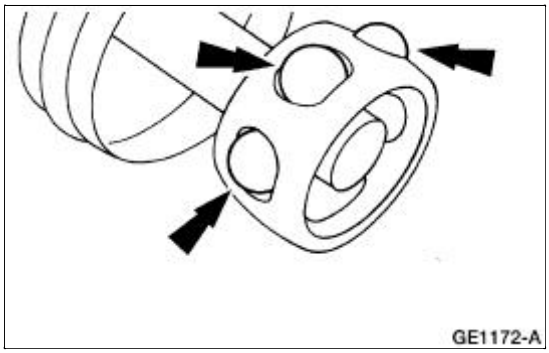
   Remove the boot clamps.



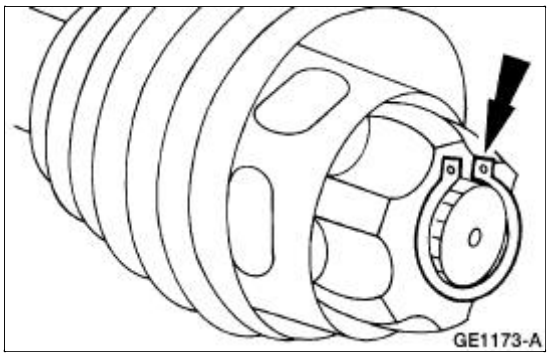
3. Separate the boot from the inboard CV joint housing.



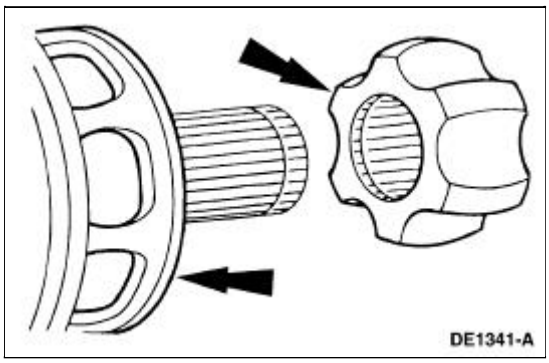
4. Remove the retaining ring.



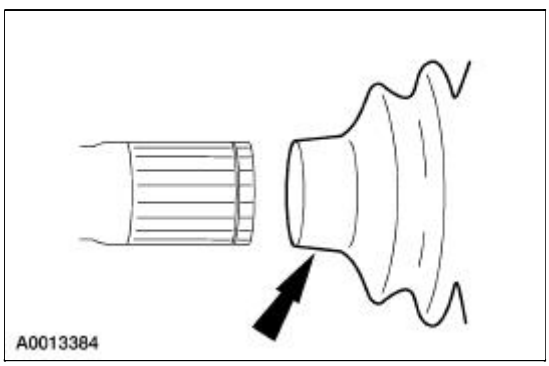
5. Remove the inboard CV joint housing.



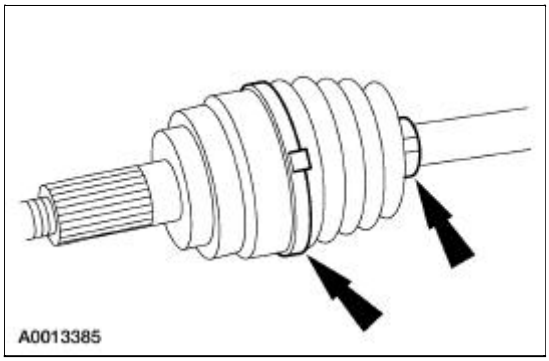
6. Index-mark the inner race and ball cage.



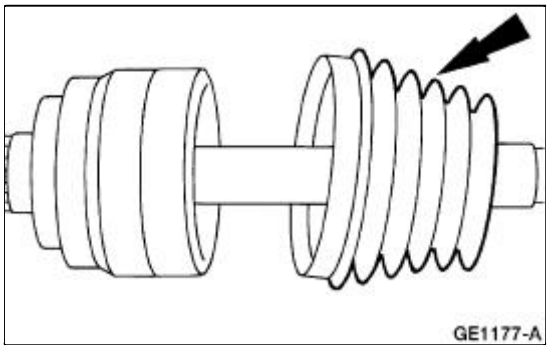
7. Remove the six balls.



8. Remove the snap ring.



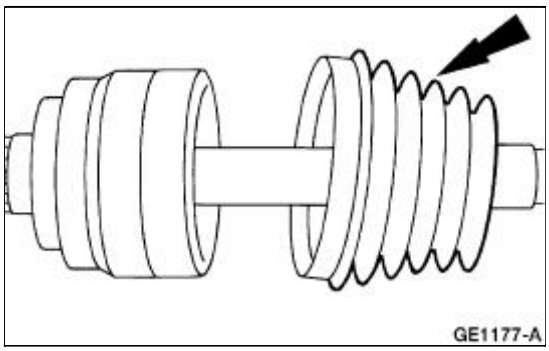
9. Remove the inner race and the ball cage.



10. Remove the inboard boot.

11. Remove the boot clamps.

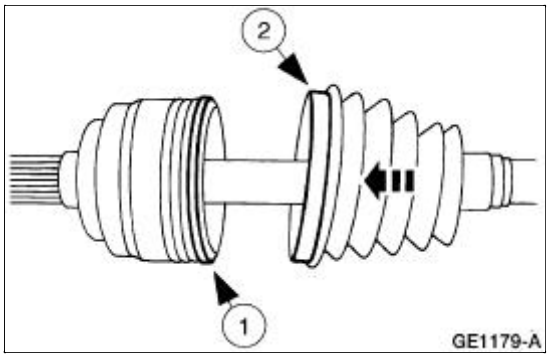
12. Remove the outboard boot.



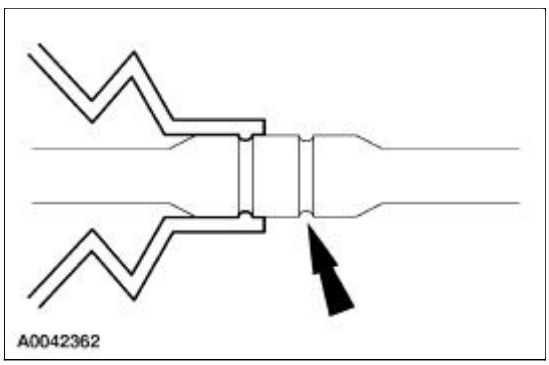
13. **NOTE:** If the grease is contaminated, clean and inspect the joint for wear. Install a new outboard CV joint and interconnecting shaft assembly if worn/damaged.

    Check the grease for contamination.

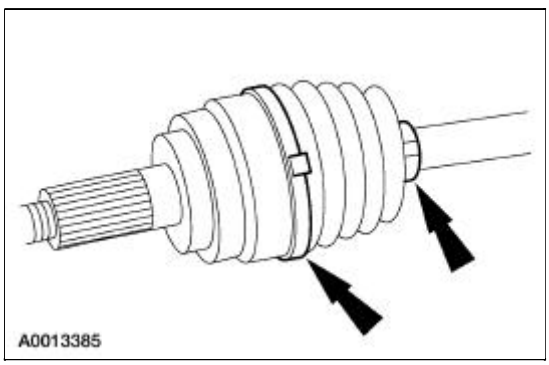
Assembly



1. Position the outboard boot on the shaft.

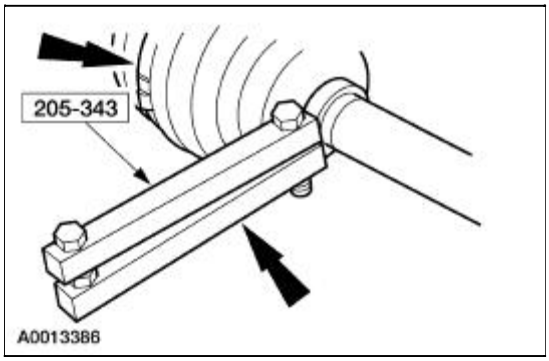


2. Pack the outboard CV joint with 165 grams (5.82 ounces) of grease.
    1. Use constant velocity joint grease or equivalent provided in the boot kit.
    2. Spread any remaining grease from the kit evenly inside the boot.

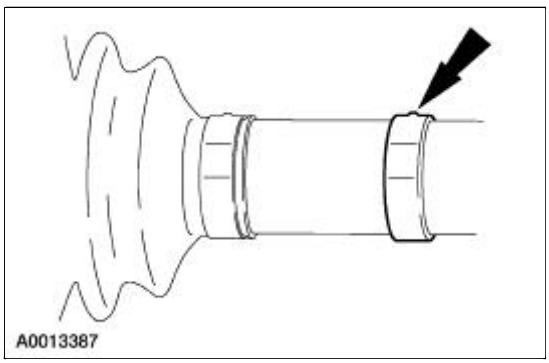


3. Install the outboard boot.
    1. Clean the boot mounting surface.
    2. Seat the boot in the joint boot groove.

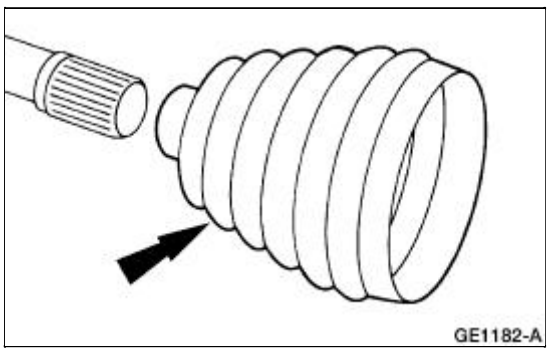
4. Make sure a shaft groove is exposed by positioning the small end of the boot in the groove closest to the constant velocity joint housing.



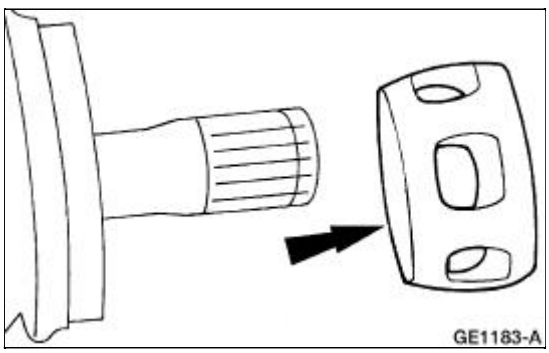
5. Position the boot clamps.



6. **NOTE:** Tighten the through-bolt until the tool is in the closed position.

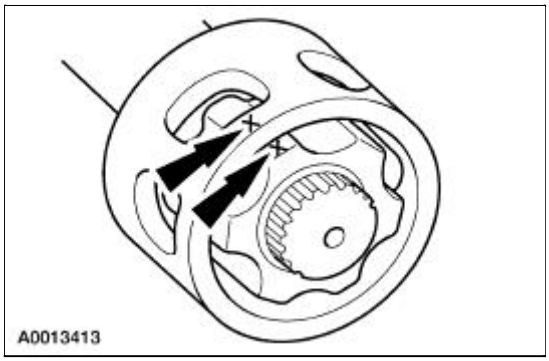


Using the special tool, install the two boot clamps.

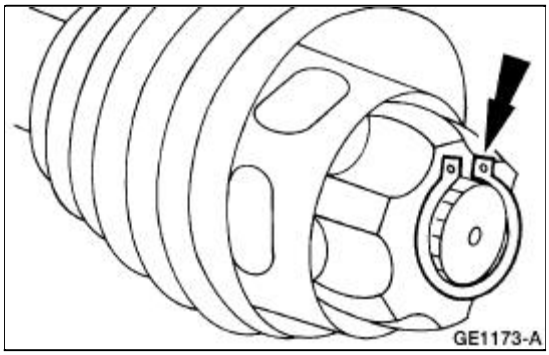


7. Position the boot clamp on the shaft.

8. Position the inboard boot on the shaft.

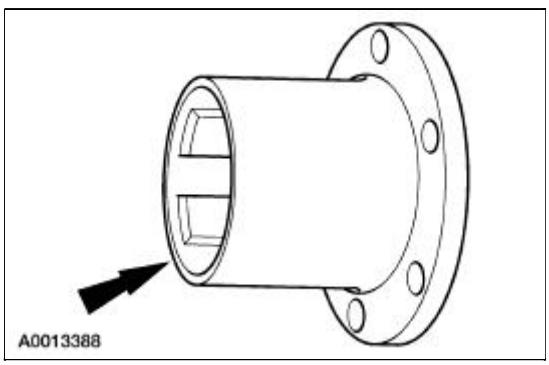


9. Position the ball cage on the shaft with the tapered end facing the boot.

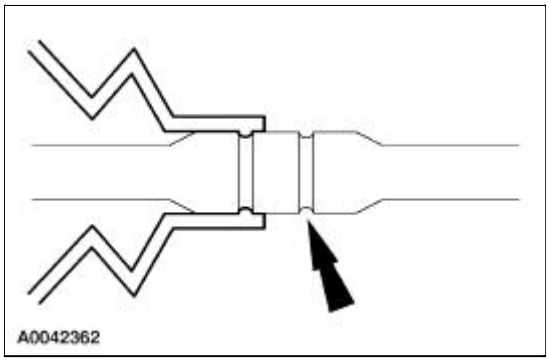


10. **NOTE:** Align the index marks.

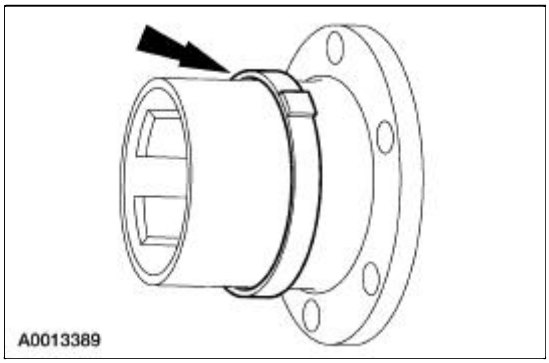
    Position the inner race on the shaft with the counterbored end facing the boot.



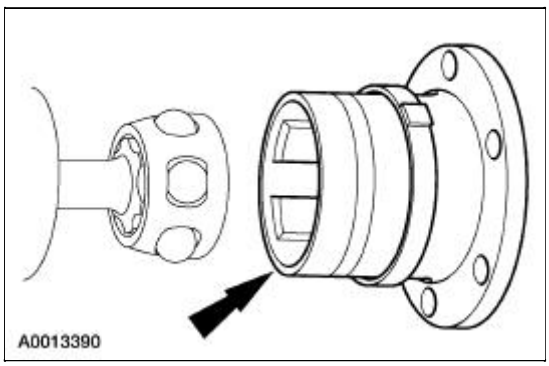
11. Install the snap ring.



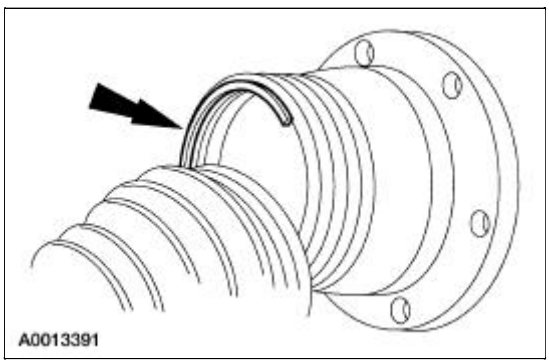
12. Lubricate and position the six balls.
    - Use constant velocity joint grease or equivalent provided in the boot kit.



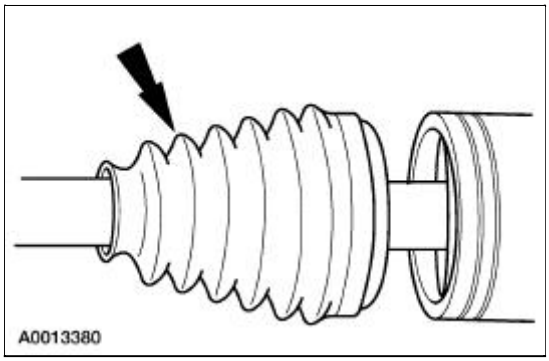
13. Fill the inboard CV joint housing with 235 grams (8.29 ounces) of grease.
    - Use constant velocity joint grease or equivalent provided in the boot kit.



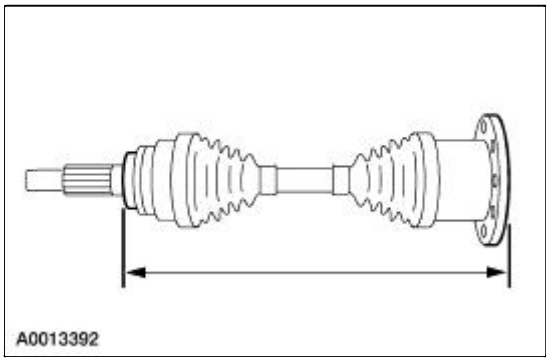
14. Make sure a shaft groove is exposed by positioning the small end of the boot in the groove closest to the constant velocity joint housing.



15. Position the boot clamp on the inboard CV joint housing.

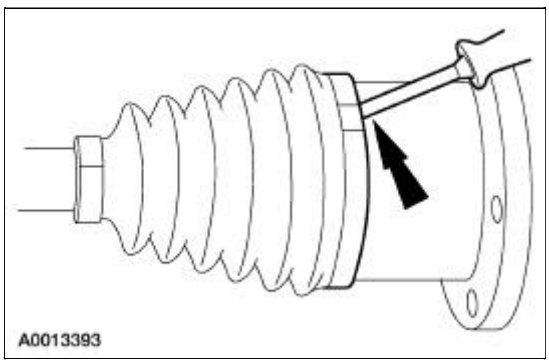


16. Position the inboard CV joint housing on the ball and race assembly.

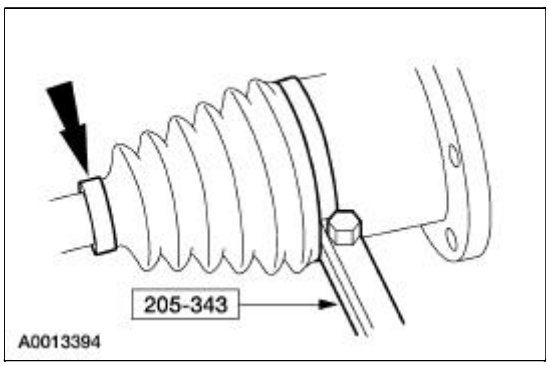


17. Install the retaining ring.

18. Remove any excess grease from the mating surface. Seat the boot in the joint boot groove.

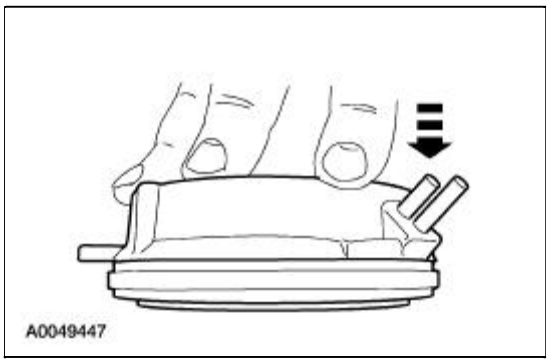


19. Set the halfshaft assembled length to specification. Refer to Specifications in this section.



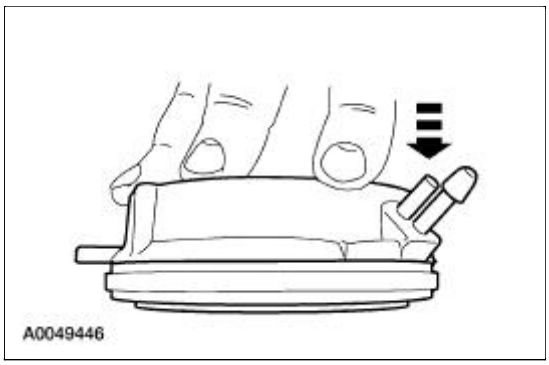
20. **CAUTION: Do not damage the boot.**

    Insert a dull screwdriver blade under the boot to release the pressure.



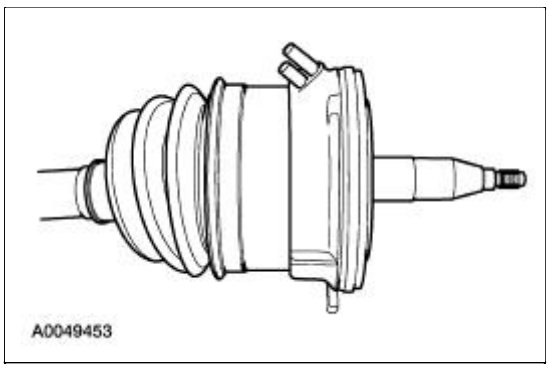
21. **NOTE:** Tighten the through-bolt until the tool is in the closed position.

    Using the special tool, install the two boot clamps.



22. **NOTE:** Maintain a clean work surface.

    Compress the integrated wheel end disconnect on the bench to collapse the vacuum chamber.



23. While the integrated wheel end disconnect is collapsed, install a vacuum cap on the vacuum port.

24. **CAUTION: Do not install the integrated wheel end disconnect in the knuckle. It must be installed on the outer constant velocity joint housing.**

    Install the integrated wheel end disconnect on the outer constant velocity joint housing.

25. **CAUTION: Verify the spline engagement by checking for spline lash before installing the halfshaft nut.**

    Install the halfshaft in the vehicle. For additional information, refer to Halfshaft in the Removal and Installation portion of this section.

General Specifications

Item	Specification
Halfshaft assembled length, 9.75 inch ring gear, LH	997.8 mm (39.29 in)
Halfshaft assembled length, 9.75 inch ring gear, RH	956.3 mm (37.65 in)
Halfshaft assembled length, 8.8 inch ring gear, LH	999.2 mm (39.34 in)
Halfshaft assembled length, 8.8 inch ring gear, RH	957.7 mm (37.70 in)

Torque Specifications

Description	Nm	lb-ft
Rear axle wheel hub retainer	338	250
Tow link nut	55	41
Knuckle to lower control arm bolt	400	295

Rear Drive Halfshafts

- The RH and LH halfshafts are different lengths, with the LH halfshaft being the longer of the two.
- Inboard and outboard CV joints connect to a splined shaft. A circlip stopper holds the cross groove inboard race assembly (inboard CV joint) together.
- An axle circlip retains the splined inboard CV joint to the differential side gear. Install a new axle circlip every time the halfshaft is removed from the vehicle.
- A rear axle wheel hub retainer secures the side shaft assembly (interconnecting shaft and outboard CV joint) to the rear hub. Install a new rear axle wheel hub retainer every time you remove the halfshaft from the vehicle.

Halfshaft Handling

CAUTION: Never pick up or hold the halfshaft by the inboard or outboard CV joint only.

NOTE: Only the inner CV joints are removable for installation of new CV boots and clamps. The boots and clamps are the only serviced parts of the halfshaft assembly.

Handle all halfshaft components carefully during removal and installation procedures.

- The halfshaft assemblies are not repairable. Install new assemblies if worn/damaged.
- To separate the halfshaft from the rear hub, press the outboard CV joint from the rear hub.
- To separate the halfshaft from the differential, apply a load to the back face of the inboard CV joint assembly to overcome the axle circlip.
- Do not over-angle the CV joints.
- Damage will occur to an assembled inboard CV joint if it is over-plunged outward from the joint housing.
- Never use a hammer to remove or install the halfshafts.
- Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft.
- Do not allow the boots to contact sharp edges or hot exhaust components.
- Handle the halfshaft by the interconnecting shaft only to avoid pull-apart and potential damage to the CV joints.
- Do not drop assembled halfshafts. The impact can cut the boots from the inside without evidence of external damage.

Wheel and Tire Balancing, Rear

WARNING: Do not balance the rear wheels and tires while mounted on the vehicle. For additional information, refer to Section 204-04 .

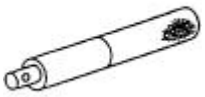
Hoisting

CAUTION: Use a frame-contact hoist only. Vehicle or component damage can result if

other types of hoists are used. For additional information, refer to Section 100-02 .

Never raise the vehicle using the halfshafts as lift points.

Undercoating and Rustproofing



During undercoating and rustproofing procedures, protect the boots from the coating materials. Foreign materials on the rubber boots will cause extreme advanced wear.

Rear Drive Halfshafts

Refer to Section 205-00 .

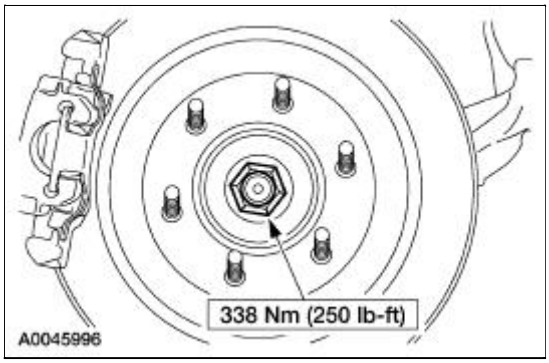
Halfshaft

Special Tool(s)

 ST2258-A	Protector, Halfshaft Seal 205-506
 ST2666-A	Remover, Halfshaft 205-529
 ST1326-A	Adapter for 303-224 (Handle) 205-153 (T80T-4000-W)

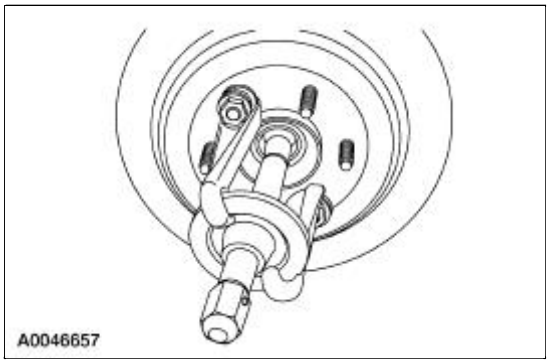
Removal and Installation

NOTE: This procedure applies to both rear halfshaft assemblies.



1. **CAUTION: Do not loosen the rear axle wheel hub retainer until after the wheel and tire assembly is removed from the vehicle. Wheel bearing damage will occur if the wheel bearing is unloaded with the weight of the vehicle applied.**

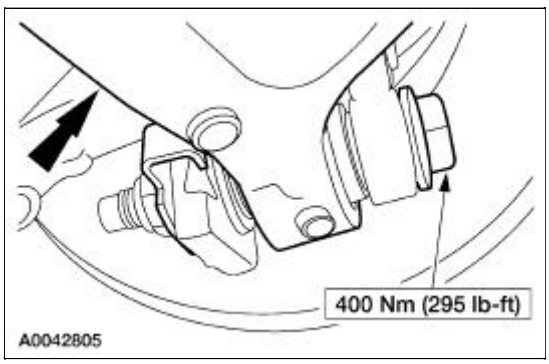
   With the vehicle in NEUTRAL, raise and support the vehicle. For additional information, refer to Section 100-02 .



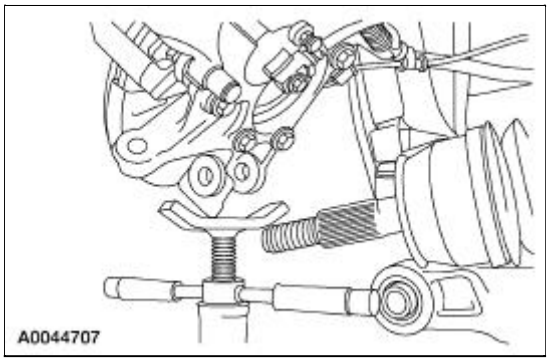
2. Remove the rear wheel and tire assembly. For additional information, refer to Section 204-04 .

3. **NOTE:** Have an assistant press the brake pedal to keep the axle from rotating.

   Remove and discard the rear axle wheel hub retainer and the washer.



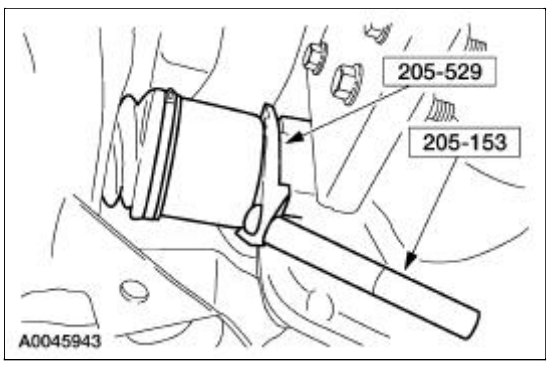
4. Using a suitable hub puller, separate the halfshaft from the knuckle.



5. Disconnect the tow link from the rear knuckle.

6. Remove the bolt retaining the knuckle to the lower control arm.

7. Pivot the rear knuckle on the upper control arm bolts and support the knuckle in a raised position.

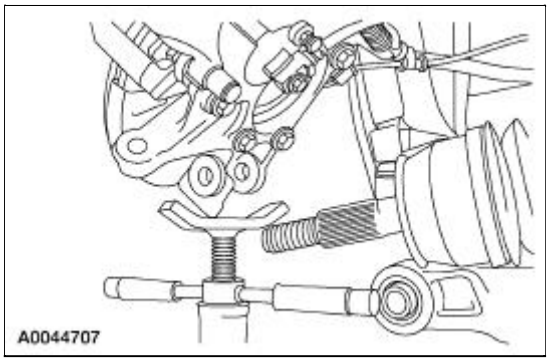


8. **CAUTION: Do not damage the axle shaft oil seal or the machined sealing surface on the inboard CV joint housing.**

   CAUTION: Do not allow the splines on inboard CV joint housing to touch the axle shaft oil seal.

   NOTE: A circlip retains the inboard CV joint housing to the differential side gear in the axle.

   Using the special tool, disengage the inboard CV joint housing from the differential side gear.



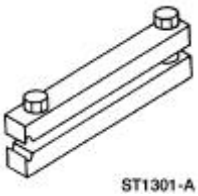
9. **CAUTION: To prevent damage to the axle shaft oil seal, install the special tool before removing the inboard CV joint housing from the axle.**

   Install the special tool.

10. Remove the halfshaft assembly from the vehicle.

11. Remove and discard the halfshaft retainer circlip.

12. **CAUTION: To prevent damage to the axle shaft oil seal, install the Halfshaft Seal Protector before positioning the inboard CV joint housing in the axle.**



CAUTION: Always install the halfshaft with a new retainer circlip and a new rear axle wheel hub retainer.

CAUTION: Never use power tools to tighten the rear axle wheel hub retainer.

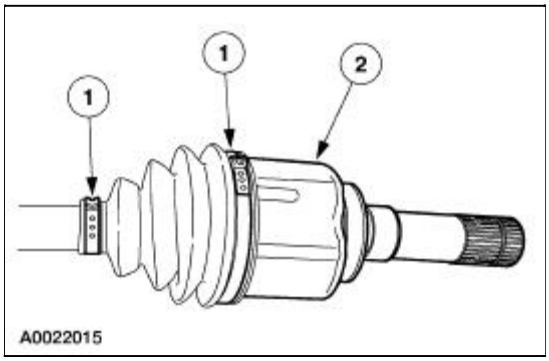
To install, reverse the removal procedure.

Halfshaft Joint

Special Tool(s)

 ST2266-A	Installer, Spindle/Axle Shaft 205-199 (T83T-3132-A1)
 ST1301-A	Installer, Constant Velocity Joint Boot Clamp 205-343 (T95P-3514-A)
 ST1358-A	Installer, Drive Pinion Oil Seal 205-133 (T79P-4676-A)
 ST2527-A	Installer, Inner CV Joint Dust Seal 205-531
 ST2528-A	Installer, Outer CV Joint Dust Seal 205-530

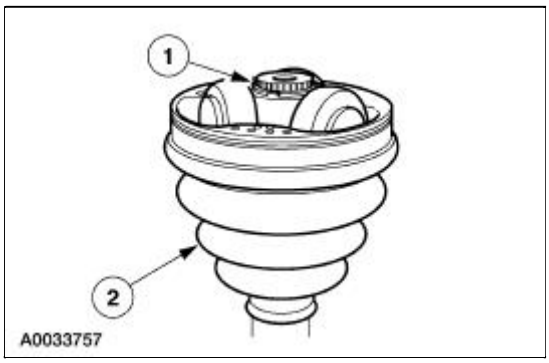
Material



Item	Specification
Constant Velocity Joint Grease XG-5	WSS-M1C258-A1

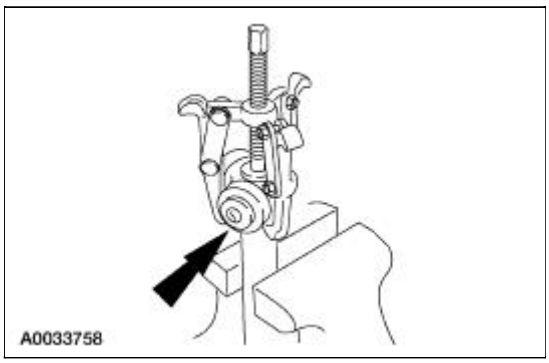
Disassembly

1. Remove the halfshaft assembly from the vehicle. For additional information, refer to Halfshaft in this section.



2. For the inboard CV joint, carry out the following:
    1. Remove and discard the boot clamps.

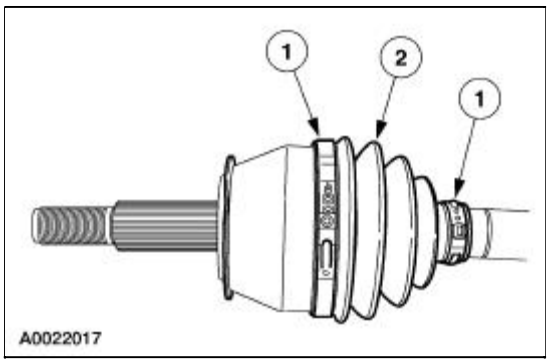
2. Remove the inboard CV joint housing.



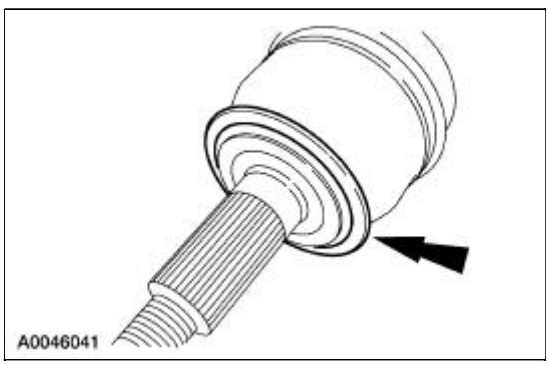
3. **NOTE:** Install the halfshaft in a soft jaw vise.

   For the inboard CV joint, carry out the following:
   1. Remove and discard the retainer circlip.
   2. Slide the boot away from the CV joint.

4. Using a suitable 3-jaw puller, remove the CV joint.

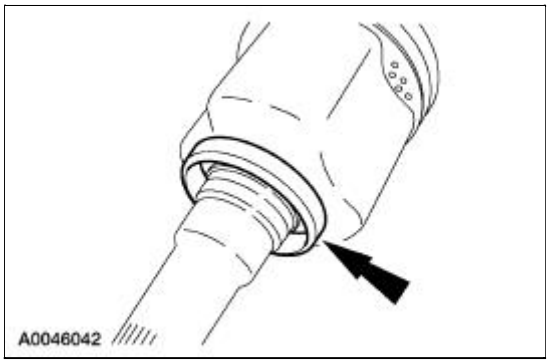


5. Remove and discard the tri-lobe insert and the boot.

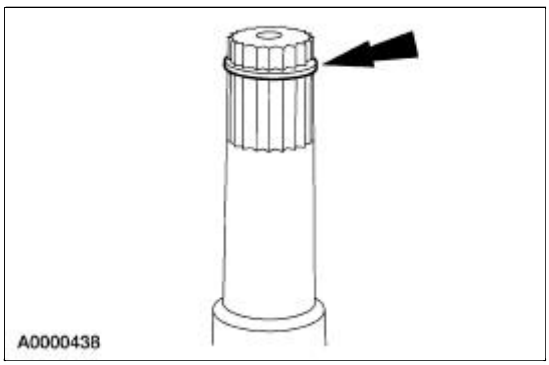


6. **NOTE:** The outboard CV joint is not removable from the halfshaft. The boot must be removed or installed from the inboard CV joint side of the shaft.

   For the outboard CV joint, carry out the following:
   1. Remove and discard the boot clamps.
   2. Remove and discard the boot.

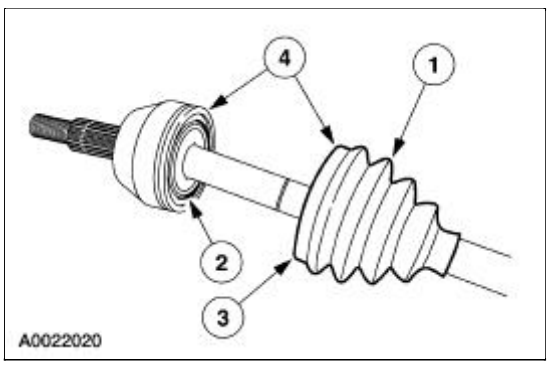


7. Inspect the grease, packed in the inboard CV joint and the outboard CV joint, for contamination. Rub some of the grease from each joint between two fingers. Any gritty feeling indicates contamination. Wash all of the grease from the inboard CV joint, the inboard CV joint housing, the outboard CV joint, and the interconnecting shaft. Thoroughly dry all of the components and inspect them for wear or damage. Discard the assembly, if necessary. Only proceed as follows if not discarding the assembly.



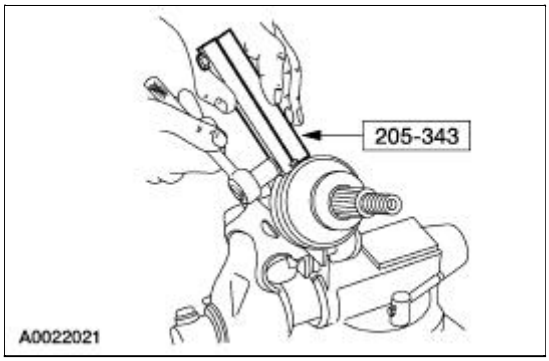
8. If necessary, remove and discard the outboard dust seal.
   - Tap uniformly around the seal to separate it from the joint.

9. If necessary, remove and discard the inboard dust seal.
   - Tap uniformly around the seal to separate it from the housing.



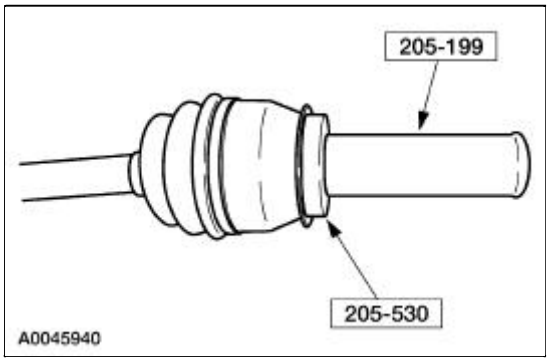
10. On the inboard end, remove and discard the retainer circlip.

Assembly



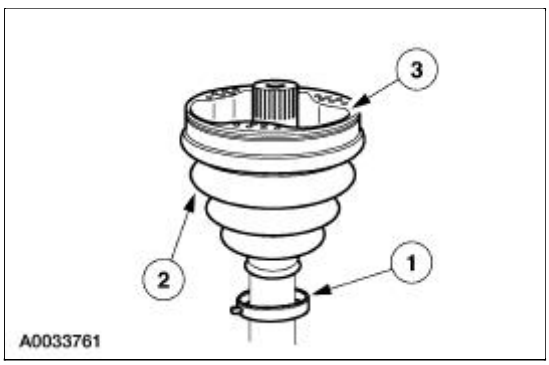
1. **NOTE:** Clean any excess grease from the boot mounting surfaces before installing the boot.

   For the outboard CV joint, carry out the following:
   1. Slide the boot on the interconnecting shaft.
   2. Pack the outboard CV joint with 275 grams (9.7 ounces) of grease.
   3. Spread any remaining grease evenly inside the boot.
   4. Install the boot by seating it in the groove in the CV joint housing.



2. **NOTE:** Tighten the through-bolt until the special tool is in the closed position.

   Using the special tool, install both boot clamps.

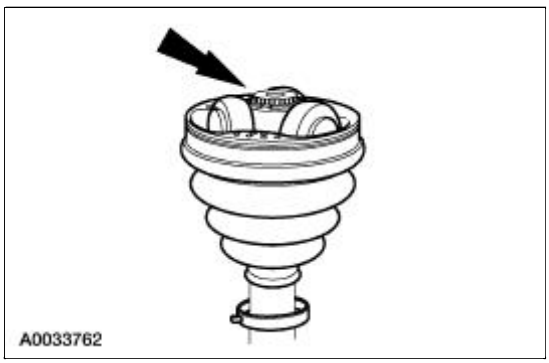


3. If removed, use the special tools to install the dust seal.

4. **NOTE:** Install the halfshaft in a soft jaw vise.

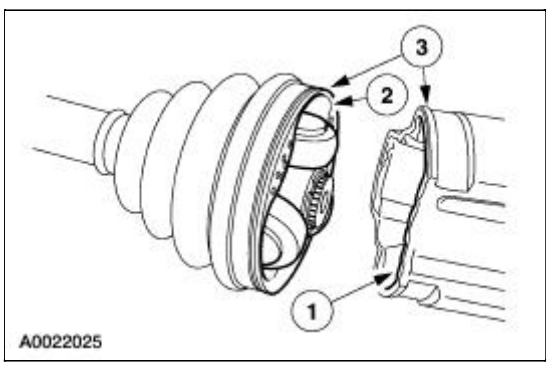
   NOTE: The lip on the end of the tri-lobe insert must seat against the end of the boot.

   For the inboard CV joint, carry out the following:
   1. Position the clamp on the interconnecting shaft.
   2. Position the boot on the interconnecting shaft.
   3. Install the tri-lobe insert.

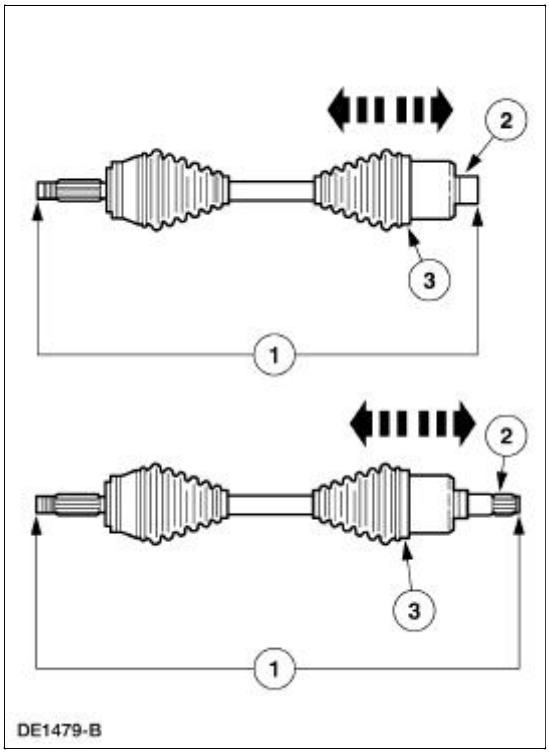


5. **NOTE:** One side of the inboard CV joint has a chamfer cut in the edge of joint at the inner diameter near the splines. Install the inboard CV joint so that the chamfer faces the outboard end of the halfshaft.

   Install the CV joint.

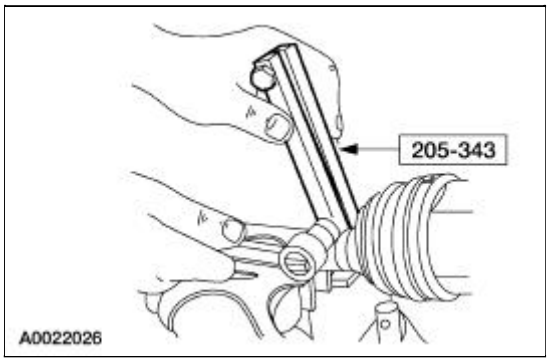


6. Install the retainer circlip.

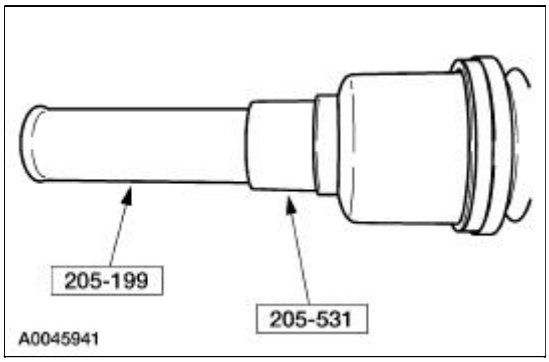


7. **NOTE:** Clean any excess grease from the boot mounting surfaces before installing the boot.

   For the inboard CV joint, carry out the following:
   1. Pack the inboard CV joint housing with 325 grams (11.5 ounces) of grease.
   2. Spread any remaining grease evenly inside the boot and on the CV joint.
   3. Install the inboard CV joint housing, seating the boot in the groove in the housing.

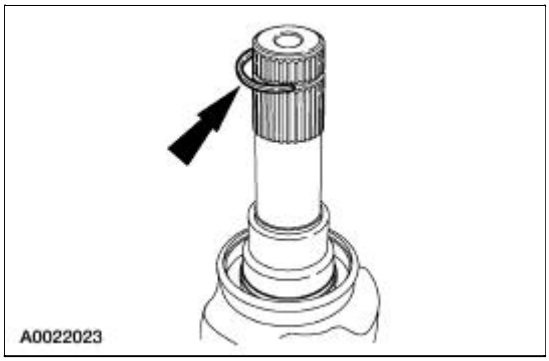


8. Set the halfshaft assembled length to specification. For additional information, refer to Specifications in this section.
   1. Measure the entire assembly length.
   2. Push in or pull out on the inner joint as necessary to adjust the halfshaft assembled length to specification.
   3. Hold the inner joint to prevent the assembled length from changing, and insert a small flat blade screwdriver between the boot and the joint to equalize the pressure.



9. **NOTE:** Tighten the through-bolt until the special tool is in the closed position.

   Using the special tool, install both boot clamps.



10. If removed, use the special tools to install the dust seal.

11. **CAUTION: Do not overexpand or twist the circlip during installation.**

    Install a new retainer circlip.

12. Install the halfshaft assembly in the vehicle. For additional information, refer to Halfshaft in this section.

Torque Specifications

Description	Nm	lb-ft
Disc brake caliper bleeder screw	15	11
Master cylinder brake tube	25	18

Brake System

The vehicle is equipped with a vacuum-assisted power braking system. For additional information, refer to Section 206-07 .

The braking system is a front-to-rear split hydraulic system. For additional information, refer to Section 206-06 .

The front wheel brakes utilize a dual piston brake caliper and disc brake system. For additional information, refer to Section 206-03 .

The rear brakes utilize a single piston brake caliper and disc brake system. For additional information, refer to Section 206-04 .

The parking brake system is a mechanical system that activates a shoe-and-drum system within the brake disc. For additional information, refer to Section 206-05 .

A 4-wheel anti-lock brake system (4WABS) is standard equipment. For additional information, refer to Section 206-09A or Section 206-09B .

Adjustable Pedals

Expedition and Navigator are equipped with an adjustable brake pedal. Using the adjustable pedal switch, located on the LH side of the instrument panel below the headlamp switch, the driver can adjust the brake and accelerator pedals for a more comfortable driving position. For removal and installation of adjustable pedals, refer to Section 206-06 .

Driver Seat Module

The adjustable pedals are controlled by the driver seat module (DSM) only when the vehicle is equipped with the programmable/recall memory option (Navigator only).

The DSM system consists of the following components:

- DSM
- Adjustable pedals
- Adjustable pedals switch
- Memory set switch
- Driver memory seat switch
- Memory mirror switch
- Front vertical seat motor
- Rear vertical seat motor
- Driver horizontal seat motor
- Left heated memory mirror
- Right heated memory mirror
- Remote anti-theft personality (RAP) module

The DSM incorporates multiple functions into one module and offers diagnostics to easily locate and

repair concerns affecting the subsystems that it controls.

The DSM constantly monitors the systems under its control and reports a concern in the form of diagnostic trouble codes (DTCs). A DTC can be retrieved with the Worldwide Diagnostic System (WDS) or equivalent scan tool through the communications link.

Adjustable Pedal Operation

The adjustable pedals, with memory feature, (Navigator only) are controlled by the DSM and are operational all the time, ignition switch ON, or OFF. Using the adjustable pedal switch, the driver can adjust the adjustable pedals forward, and rearward. The DSM will power the adjustable pedals until the switch is released, or until the travel limit is reached.

Memory Adjustable Pedal Operation

The memory adjustable pedal feature allows the driver to program a personalized pedal position that can be recalled using the memory switches or remote keyless entry transmitters. There are three memory settings possible. The outside rearview mirror and power driver seat positions are also stored and recalled with the power adjustable pedal positions.

Programming Adjustable Pedal Positions

Programming adjustable pedal positions can be accomplished by doing the following:

- An adjustable pedal position can be stored at any time. To store the adjustable pedal position to memory, the driver must move the pedals to the preferred position using the adjustable pedal switch. The driver must then depress the memory SET switch, activating the memory SET switch light emitting diode (LED). Within 5 seconds (before the LED goes out) the driver must select a memory position. Memory no. 1 is selected by depressing the 1 switch. Memory no. 2 is selected by depressing the 2 switch.
- If no memory switch input is received within the 5 second time limit, the operation is aborted and the memory SET switch LED is turned OFF. If one of the following inputs is received during the 5 second programming limit, the operation is aborted and the memory SET switch LED is turned OFF:
    - Adjustable pedal switch
    - Power driver seat switch
    - Power outside rearview mirrors switch
    - Memory SET switch.

Recalling a Stored Adjustable Pedal Position

Once the driver has stored a preferred adjustable pedal position, the driver can recall the setting by depressing the corresponding memory switch, or by using a programmed remote keyless entry transmitter. Recalling a stored adjustable pedal position can be accomplished by doing the following:

- The driver can recall a preferred adjustable pedal position by depressing one or both of the memory recall switches. Pressing memory switch 1 will initiate a recall of the adjustable pedal position stored in memory no. 1. Pressing memory switch 2 will initiate a recall of the adjustable pedal position stored in memory no. 2. Pressing both memory no. 1, and memory switch 2, will initiate a recall of the adjustable pedal position stored in memory no. 3.
- A remote keyless entry transmitter (RAP module interface) can be used to recall previously set memory positions. The remote keyless entry transmitters are manufactured with an assigned personality number (1, 2, or 3) and are so designated on the back of the remote keyless entry transmitter case. The remote keyless entry transmitter assigned with personality 1 is capable of only recalling memory position 1. Similarly, the remote keyless entry transmitters assigned with

personalities 1 and 2, can only recall memory positions 1 and 2, respectively.

- Memory recall occurs when the UNLOCK switch is pressed on the remote keyless entry transmitters. A second press of the UNLOCK switch, which unlocks the passenger doors, does not initiate a memory recall.
- A memory recall in progress does not prohibit the initiation of another memory recall; the most recently requested memory recall will be executed.

Brake System

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Refer to Wiring Diagrams Cell 97 , Daytime Running Lamps for schematic and connector information.

Refer to Wiring Diagrams Cell 123 , Memory Seats for schematic and connector information.

Refer to Wiring Diagrams Cell 127 , Adjustable Pedal for schematic and connector information.

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 or equivalent scan tool New Generation Star (NGS) Tester 418-F052 or equivalent
 ST1137-A	73111 Digital Multimeter 105-R0057 or equivalent

Inspection and Verification

WARNING: Use of any other than the approved DOT 3 brake fluid will cause permanent damage to brake components and will render the brakes inoperative.

WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

CAUTION: Do not spill brake fluid onto painted surfaces. If spilled, wipe up immediately.

NOTE: Always check the fluid level in the brake master cylinder reservoir before performing the test procedures. If the fluid level is not at the correct level, add High Performance DOT 3 Brake Fluid PM-1 or equivalent DOT 3 fluid meeting Ford specification ESA-M6C25-A.

NOTE: Prior to performing any diagnosis, make sure the brake warning indicator is functional. Refer to Section 413-01 .

The first indication that something may be wrong in the brake system is a change in the feeling through the brake pedal. The brake warning indicator in the instrument cluster and the brake fluid level in the brake master cylinder reservoir are also indicators of system concerns.

If a wheel is locked and the vehicle must be moved, open a bleeder screw at the locked wheel to let out enough fluid to relieve the pressure. Close the bleeder screw. This bleeding operation may release the brakes but will not correct the cause of trouble. If this does not relieve the locked wheel condition, repair the locked components before proceeding.

Inspect all hoses and connections. All unused vacuum connectors should be capped. Make sure hoses and their connections are correctly secured and in good condition with no holes, soft or collapsed areas.

Non-Pressure Leaks

The only part of the brake system that could have a brake fluid loss that does not appear when the system is under pressure is the brake master cylinder reservoir area. Brake fluid loss can be caused by a missing or poorly-fitted brake master cylinder filler cap, a punctured or otherwise damaged brake master cylinder reservoir, a missing or damaged brake master cylinder filler cap gasket, or by missing, damaged or poorly-fitted sealing grommets between the brake master cylinder and the brake master cylinder reservoir

The brake master cylinder reservoir grommets are not separately serviceable and must be installed new as part of a new brake master cylinder reservoir

NOTE: The wet appearance on the outer cover of rubber brake hoses is called "sweating." This is a normal condition for neoprene rayon braid hose. The sweating condition is not evidence of a brake fluid leak and will not result in a loss of pressure in the system.

Install a new flexible brake hose if it shows signs of softening, cracking or other damage.

When installing a new brake hose, position the hose to avoid contact with other vehicle components.

Road Test

For an overview of a road test, refer to Section 100-04 .

Avoid locking the brakes. Locked brakes are not an indication of braking efficiency.

Visual Inspection Chart

Mechanical	Electrical
● Brake master cylinder ● Brake caliper piston ● Brake discs ● Wheel bearings ● Brake pads ● Power brake booster ● Brake pedal linkage ● Booster vacuum hose ● Tires ● Foreign material	● Parking brake switch ● Damaged or corroded wiring harness ● Brake master cylinder fluid level switch

For low or spongy brake pedal concerns:

- check and, if necessary, refill the brake master cylinder reservoir.
- bleed the brake system and retest the brake pedal feel.
- if the brake pedal is still low or spongy, check the wheel bearings. Refer to Section 206-03 (4x2) or Section 204-01B (4x4) for front wheel bearings, and to Section 205-02A or Section 205-02B for rear wheel bearings.

For a slow or incomplete brake pedal return concern:

- inspect for binding, damage, correct installation or interference at the brake pedal.
- check the power brake booster for binding, damage and correct installation.

For vibration concerns when brakes are applied:

- refer to Section 100-04 .

Adjustable Pedals With Memory Feature (Navigator only)

1. Verify the customer concern by operating the adjustable pedals.

NOTE: If the adjustable pedals are not installed on the vehicle, when a self-test is carried out, the module will set pedal codes.

2. Visually inspect for obvious signs of mechanical or electrical damage. Refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical
● Adjustable pedals ● Adjustable pedal switch	● Damaged or corroded connector ● Damaged or corroded wiring harness ● Battery junction box (BJB) fuse: ■ 109 (30A)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the scan tool does not power up, refer to the scan tool manual.

5. Carry out the DATA LINK DIAGNOSTIC TEST. If the scan tool responds with:
   - CKT914, CKT915 or CKT70—ALL ECUS NO RESP/NOT EQUIP. Refer to Section 418-00 .
   - NO RESP/NOT EQUIP for Driver Seat Module (DSM), Go To Pinpoint Test A .
   - System passed, retrieve and record the continuous DTCs and carry out self-test diagnostics for the DSM.

6. If the DTCs retrieved are related to the concern, go to the DSM Diagnostic Trouble Code (DTC) Index.

7. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

• Brakes drag	• Parking brake components.	• REPAIR or INSTALL new components as necessary. REFER to Section 206-05.
	• Disc brake caliper.	• REPAIR or INSTALL new components as necessary. REFER to Section 206-03 or Section 206-04.
	• Brake booster to brake master cylinder push rod adjustment.	• Go To Pinpoint Test G.
	• Brake master cylinder.	• CARRY OUT a Brake Master Cylinder Component Test in this section.
• Brake noise	• Brake discs.	• REPAIR or INSTALL new brake discs as necessary. REFER to Section 206-03 or Section 206-04.
	• Brake pads.	• CLEAN or INSTALL new brake pads as necessary.
	• Anti-rattle clips.	• INSTALL new components as necessary.
	• Disc brake caliper mounting bolts.	• REPAIR or INSTALL new components as necessary.
• Adjustable brake pedal does not operate correctly — system without memory	• Motor. • Obstruction(s). • Cable. • Switch.	• Go To Pinpoint Test H.
• Adjustable brake pedal does not operate correctly — does not operate using the adjustable pedal switch (Navigator only)	• Battery junction box (BJB) fuses: ▪ 109 (30A). • Circuitry.	• Go To Pinpoint Test I.

	• Switch. • Adjustable pedal motor. • Driver Seat Module (DSM).	
• Adjustable brake pedal does not operate correctly — does not operate using the memory set switch (Navigator only)	• Battery junction box (BJB) fuses: ■ 109 (30A). • Circuitry. • Switch. • Adjustable pedal motor. • Driver Seat Module (DSM).	• Go To Pinpoint Test J .
• Adjustable brake pedal does not operate correctly — does not operate using the remote transmitter (Navigator only)	• Battery junction box (BJB) fuses: ■ 109 (30A). • Circuitry. • Switch. • Adjustable pedal motor. • Driver Seat Module (DSM). • Remote transmitter.	• Go To Pinpoint Test K .

Pinpoint Tests

PINPOINT TEST A: NO COMMUNICATION WITH THE MODULE — UNABLE TO CARRY OUT ON-DEMAND SELF TEST WITH THE DSM (NAVIGATOR ONLY)

Test Step	Result / Action to Take
A1 CHECK FUSE 3 (7.5A)	
• Key in OFF position. • Check fuse: Fuse 3 (7.5A). • **Is fuse 3 (7.5A) OK?**	**Yes** GO to A2 . **No** INSTALL a new fuse. REPEAT the self-test.
A2 CHECK FOR VOLTAGE AT BATTERY JUNCTION BOX FUSE 3 (7.5A)	
• Key in ON position. • Measure the voltage between central junction box fuse 3 (7.5A) pin 1, harness side and ground. • **Is the voltage greater than 10 volts?**	**Yes** GO to A3 . **No** REPAIR the central junction box. REPEAT the self-test, CLEAR the DTCs.
A3 CHECK CIRCUIT 956 (OG/LG) FOR OPEN	
• Key in OFF position.	**Yes**

• Disconnect: DSM C356. • Key in ON position. • Measure the resistance between DSM C356-1, circuit 956 (OG/LG), harness side and BJB fuse 3 (7.5A) cavity. • **Is the resistance greater than 5 ohms?**	GO to A4 . **No** REPAIR circuit 956 (OG/LG). REPEAT the self-test, CLEAR the DTCs.
A4 CHECK CIRCUIT 57 (BK) FOR OPEN	
• Key in OFF position. • Measure the resistance between DSM C356-2, circuit 57 (BK), harness side and ground. • **Is the resistance less than 5 ohms?**	**Yes** REFER to Section 418-00 . **No** REPAIR circuit 57 (BK). REPEAT the self-test, CLEAR the DTCs.

PINPOINT TEST B: BRAKES PULL OR DRIFT

Test Step	Result / Action to Take
B1 CHECK THE TIRE PRESSURE	
• Check for excessive wear and measure the air pressure in all four tires. • **Are the tires good and the tire pressure within specification?**	**Yes** GO to B2 . **No** ADJUST the tire pressure. ROTATE the tires front to rear. INSTALL new tires. TEST the system for normal operation.
B2 CHECK THE CALIPER PISTON AND PINS	
• Check the disc brake caliper pistons and pins for binding or sticking. • **Do the disc brake caliper pistons or pins bind or stick?**	**Yes** REPAIR or INSTALL new components as necessary. TEST the system for normal operation. **No** GO to B3 .
B3 INSPECT THE BRAKE PADS	
• Inspect the brake pads for contamination and wear concerns. • **Are the brake pads OK?**	**Yes** GO to B4 . **No** INSTALL new brake pads. REFER to Section 206-03 (front) or Section 206-04 (rear).
B4 CHECK THE ALIGNMENT	
• Check for correct camber, caster and toe-in settings. Refer to Section 204-00 . • **Is the alignment set to specification?**	**Yes** INSTALL a new disc brake caliper at the affected wheel. TEST the system for normal operation. **No** RESET the alignment and road test the vehicle.

PINPOINT TEST C: RED BRAKE WARNING INDICATOR ALWAYS ON

Test Step	Result / Action to Take
C1 CHECK BRAKE MASTER CYLINDER FLUID LEVEL SWITCH ● Key in OFF position. ● Disconnect: Brake Master Cylinder Fluid Level Switch. ● Key in ON position. ● **Does the brake warning indicator turn on?**	**Yes** GO to C2 . **No** INSTALL a new brake master cylinder fluid level switch. TEST the system for normal operation.
C2 CHECK PARKING BRAKE SWITCH ● Key in OFF position. ● Disconnect: Parking Brake Switch. ● Key in ON position. ● **Does the red brake warning indicator turn on?**	**Yes** For vehicles without daytime running lamps (DRL), GO to C3 . For vehicles equipped with DRL, GO to C4 . **No** INSTALL a new parking brake switch. TEST the system for normal operation.
C3 CHECK CIRCUITS 977 (PK/WH), 162 (LG/RD), 531 (DG/YE) ● Key in OFF position. ● Disconnect: Instrument Cluster C238. ● Measure the resistance between instrument cluster C238-10, circuit 977 (PK/WH), and ground. ● **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the instrument cluster. TEST the system for normal operation. **No** REPAIR circuit 977 (PK/WH), 531 (DG/YE), or 162 (LG/RD). TEST the system for normal operation.
C4 CHECK CIRCUITS 977 (PK/WH) AND 531 (DG/YE) ● Key in OFF position. ● Disconnect: Instrument Cluster. ● Disconnect: DRL Module. ● Measure the resistance between instrument cluster C238-10, circuit 977 (PK/WH), and ground. ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C5 . **No** REPAIR circuit 977 (PK/WH)/531 (DG/YE). TEST the system for normal operation.
C5 CHECK PARKING BRAKE CIRCUIT 162 (LG/RD) ● Measure the resistance between DRL module C142-4, circuit 162 (LG/RD), and ground. ● **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new DRL module. REFER to Section 417-04 . TEST the system for normal operation. **No** REPAIR circuit 162 (LG/RD). TEST the system for normal operation.

PINPOINT TEST D: BRAKE PEDAL GOES DOWN FAST

Test Step	Result / Action to Take
D1 CHECK THE BRAKE FLUID LEVEL IN	

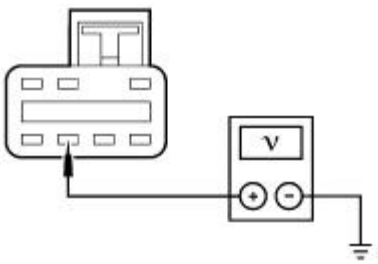
THE BRAKE MASTER CYLINDER RESERVOIR	
• Check the brake fluid level at the brake master cylinder reservoir. • **Is the brake fluid level within specification?**	**Yes** GO to D2 . **No** ADD fluid. CHECK for leaks. INSTALL a new reservoir as necessary. TEST the system for normal operation.
D2 PRESSURIZE THE SYSTEM	
• Pump the brake pedal rapidly (five times). • **Does the brake pedal height build up and then hold?**	**Yes** BLEED the system of air. REFER to Brake System Bleeding in this section. **No** CARRY OUT the Brake Master Cylinder Component Test in this section. TEST the system for normal operation.

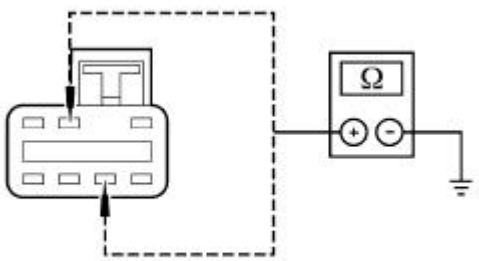
PINPOINT TEST E: BRAKES LOCK UP DURING LIGHT BRAKE PEDAL FORCE

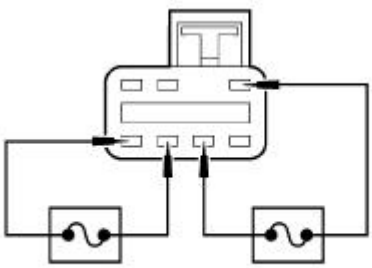
Test Step	Result / Action to Take
E1 CHECK FOR BINDING OR STICKING BRAKE COMPONENTS	
• Key in OFF position. • Check brake components for binding, damage and correct installation at each wheel. • **Do any of the components bind or stick?**	**Yes** REPAIR or INSTALL new components as necessary. TEST the system for normal operation. **No** GO to E2 .
E2 CHECK PARKING BRAKE COMPONENTS	
• Check parking brake components for damage, seized condition, and correct adjustment. Refer to Section 206-05 . • **Are the parking brake components OK?**	**Yes** GO to E3 . **No** REPAIR or INSTALL new components as necessary. REFER to Section 206-05 . TEST the system for normal operation.
E3 INSPECT BRAKE PADS	
• Inspect brake pads for contamination, excessive wear or damage. Refer to Section 206-03 for front disc brakes. Refer to Section 206-04 for rear disc brakes. • **Are the brake pads OK?**	**Yes** GO to E4 . **No** INSTALL new brake pads as necessary. TEST the system for normal operation.
E4 CHECK FOR LOOSE BRAKE COMPONENT MOUNTINGS	
• Check for loose or damaged caliper mounting bolts. • **Are the component mountings OK?**	**Yes** CHECK the 4-wheel anti-lock brake system (4WABS). REFER to Section 206-09A or Section 206-09B .

	No REPAIR as necessary. TEST the system for normal operation.

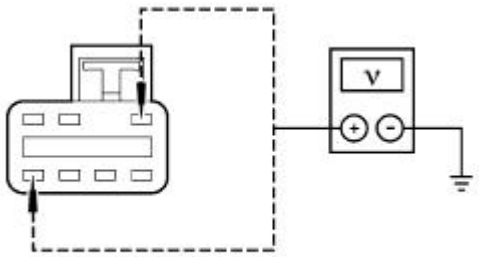
PINPOINT TEST F: EXCESSIVE/ERRATIC BRAKE PEDAL TRAVEL

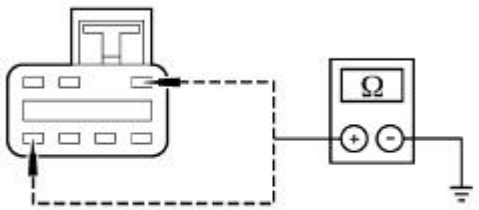


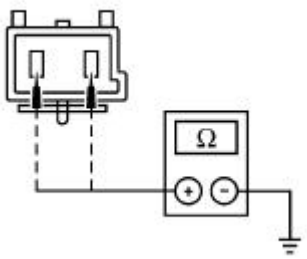




Test Step	Result / Action to Take
F1 CHECK FOR SPONGY PEDAL	
• Key in ON position. • Operate the brake pedal and note pedal feel. • **Does the pedal feed spongy?**	**Yes** BLEED the brake system. REFER to Brake System Bleeding in this section. TEST the system for normal operation. **No** GO to F2 .
F2 CHECK BRAKE PEDAL	
• Inspect the brake pedal and bracket for binding, obstruction or damage. • **Is the brake pedal OK?**	**Yes** GO to F3 . **No** REPAIR or INSTALL a new brake pedal as necessary. TEST the system for normal operation.
F3 CHECK BRAKE COMPONENTS	
• Inspect the disc brake calipers and brake pads for binding, damage, correct installation and contamination. • **Are the disc brake calipers and brake pads OK?**	**Yes** GO to F4 . **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.
F4 CHECK BEARINGS	
• **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.** • Raise and support the vehicle so that the tires clear the floor. • Check the wheel bearings for wear, damage and correct installation. Refer to Section 206-03 (4x2) or Section 204-01B (4x4) for front wheel bearings and Section 205-02A or Section 205-02B for rear wheel bearings. • **Are the bearings OK?**	**Yes** INSTALL a new power brake booster. TEST the system for normal operation. **No** REPAIR or INSTALL new bearings as necessary. TEST the system for normal operation.







PINPOINT TEST G: BRAKES DRAG

Test Step	Result / Action to Take
G1 INSPECT PUSH ROD ADJUSTMENT ● Inspect brake master cylinder push rod adjustment. Refer to Section 206-07 . ● **Is brake master cylinder push rod adjustment within specification?**	**Yes** GO to G2 . **No** ADJUST the brake master cylinder push rod. REFER to Section 206-07 .
G2 CHECK PARKING BRAKE COMPONENTS ● Check all parking brake components for correct adjustment, correct installation, or binding. Refer to Section 206-05 . ● **Are all parking brake components OK?**	**Yes** CARRY OUT the Brake Master Cylinder Component Test in this section. TEST the system for normal operation. **No** ADJUST the parking brake or INSTALL new components as necessary. REFER to Section 206-05 .

PINPOINT TEST H: ADJUSTABLE BRAKE PEDAL DOES NOT OPERATE CORRECTLY — SYSTEM WITHOUT MEMORY

Test Step	Result / Action to Take
H1 CHECK MOTOR SOUND ● Allow two minutes for the thermal overload to reset. ● Operate the adjustable pedal control switch. ● **Can the adjustable pedal motor be heard to operate?**	**Yes** GO to H2 . **No** GO to H5 .
H2 CHECK MOTOR INSTALLATION ● Check adjustable pedal motor for correct installation. ● **Is the motor installation OK?**	**Yes** GO to H3 . **No** CORRECT the motor installation. TEST the system for normal operation.
H3 CHECK ADJUSTABLE ACCELERATOR PEDAL SYSTEM ● Disconnect the brake pedal-to-accelerator pedal cable. ● Operate the adjustable pedal control switch. ● **Does the adjustable brake pedal operate now?**	**Yes** REPAIR the adjustable accelerator pedal system. REFER to Section 310-02 . TEST the system for normal operation. **No** GO to H4 .
H4 INSPECT FOR FOREIGN MATERIAL ● Inspect the adjustable brake pedal assembly for foreign material causing a binding condition. ● **Was any foreign material found?**	**Yes** REMOVE the foreign material. RETEST for normal

	operation. **No** GO to H5 .
H5 CHECK CABLE ● Dismount the adjustable pedal motor. ● Inspect the ends of the brake pedal motor cable for wear or damage. ● **Are the cable ends OK?**	**Yes** GO to H6 . **No** INSTALL a new brake pedal motor cable. TEST the system for normal operation.
H6 CHECK POWER TO SWITCH ● Disconnect: Adjustable Pedal Switch C2089. ● Measure the voltage at C2089-6, circuit 566 (DG).  A0013396 ● **Is the voltage greater than 10 V?**	**Yes** GO to H7 . **No** REPAIR circuit 566 (DG). TEST the system for normal operation.
H7 CHECK GROUND TO SWITCH ● Measure resistance to ground at C2089-2, circuit 57 (BK) and C2089-5, circuit 57 (BK).  A0013397 ● **Is the resistance less than 5 ohms at both pins?**	**Yes** GO to H8 . **No** REPAIR the open circuit. TEST the system for normal operation.
H8 TEST SWITCH ● Connect fused jumpers between C2089-1 and 5 and between C2089-7 and 5.  A0013398	**Yes** INSTALL a new adjustable pedal switch. TEST the system for normal operation. **No** GO to H9 .

• **Does the adjustable pedal motor run?**	
H9 CHECK CIRCUITS FOR SHORT TO BATTERY	
• Measure voltage at C2089-1 and C2089-7.  A0013399 • **Is the voltage greater than 0 V at either pin?**	**Yes** REPAIR the short to battery. TEST the system for normal operation. **No** GO to H10 .
H10 CHECK CIRCUITS FOR SHORT TO GROUND	
• Measure resistance to ground at C2089-1 and C2089-7.  A0013400 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to H11 . **No** REPAIR the grounded circuit. TEST the system for normal operation.
H11 CHECK SWITCH-TO-MOTOR CIRCUITS CONTINUITY	
• Connect: Adjustable Pedal Switch C2089. • Disconnect: Adjustable Pedal Motor C2001. • Measure resistance to ground at both pins of the adjustable pedal motor connector, circuits 1494 (RD) and 1495 (WH).  DH1252-A • **Is the resistance less than 5 ohms at both pins?**	**Yes** INSTALL a new adjustable pedal motor. TEST the system for normal operation. **No** REPAIR the open circuit. TEST the system for normal operation.

PINPOINT TEST I: ADJUSTABLE BRAKE PEDAL DOES NOT OPERATE CORRECTLY — DOES NOT OPERATE USING THE ADJUSTABLE PEDAL SWITCH

Test Step	Result / Action to Take

I1 USE THE RECORDED DTCS FROM THE DSM CONTINUOUS AND ON-DEMAND SELF TEST

- Use the recorded results from DSM Continuous and On-Demand Self Test.
- **Are any DTCs recorded?**

Yes
If DTC B1987, GO to I9.

If DTC B1988, GO to I3.

If DTC B1989, GO to I3.

If DTC B1342, INSTALL a new DSM. For additional information, REFER to Section 419-10. REPEAT the self-test, CLEAR the DTCs.

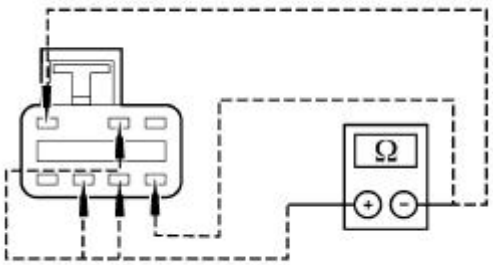
No
GO to I2.

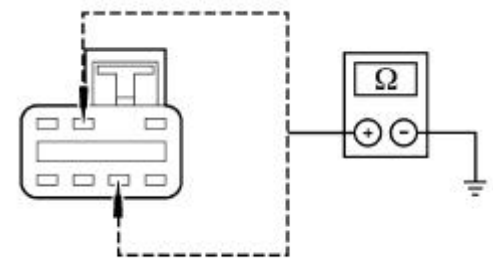
I2 CHECK DSM FOR CORRECT ADJUSTABLE PEDAL SWITCH INPUTS — MONITOR DSM PID PDL_POS

- Key in OFF position.
- Connect the diagnostic tool.
- Key in ON position.
- Monitor the DSM PID PDL_POS while activating the adjustable pedal switch.
- **Does the DSM PID PDL_POS value agree with the adjustable pedal switch position within 1 second of releasing the switch?**

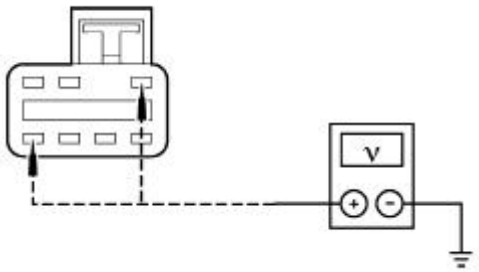
Yes
GO to I9.

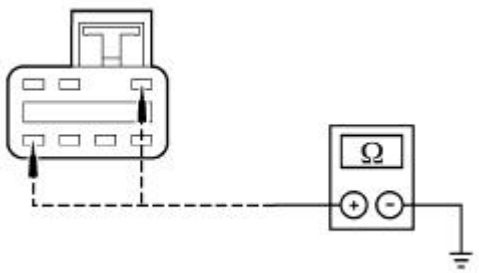
No
GO to I3.

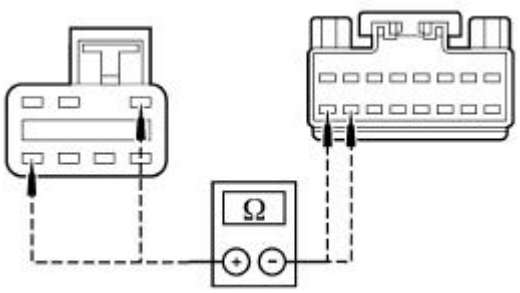




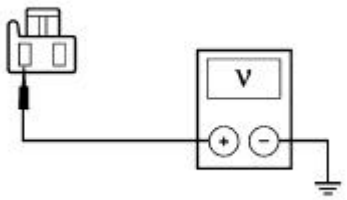
I3 CHECK ADJUSTABLE PEDAL SWITCH

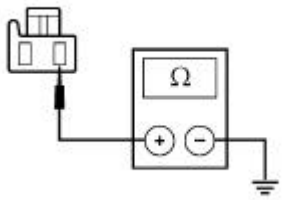


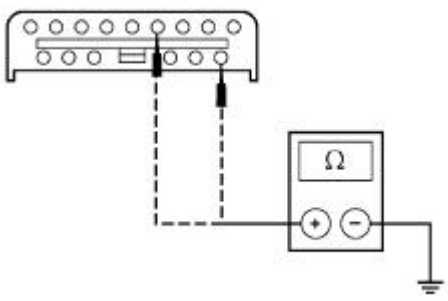




- Key in OFF position.
- Disconnect: Adjustable Pedal Switch C2089.
- Measure the resistance between the following pins on adjustable pedal switch C2089, component side:







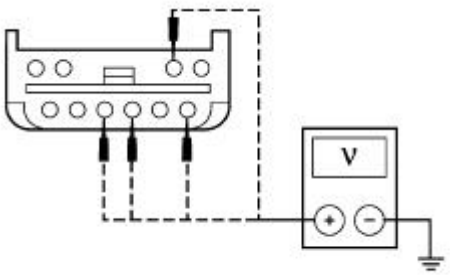
C2089 Pins	Forward	Neutral	Rearward
1, 6	Less than 5 ohms	Less than 5 ohms	Greater than 10,000 ohms
1, 2	Greater than 10,000 ohms	Greater than 10,000 ohms	Less than 5 ohms
7, 3	Greater than 10,000 ohms	Less than 5 ohms	Less than 5 ohms
7, 2	Less than 5 ohms	Greater than 10,000 ohms	Greater than 10,000 ohms

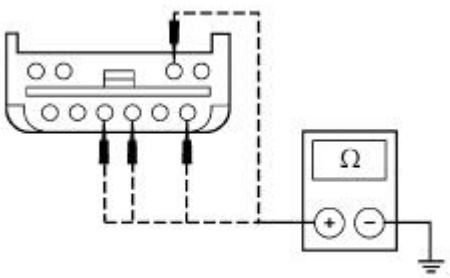
Yes
GO to I4.

No
INSTALL a new adjustable pedal switch. REPEAT the self-test, CLEAR the DTCs.

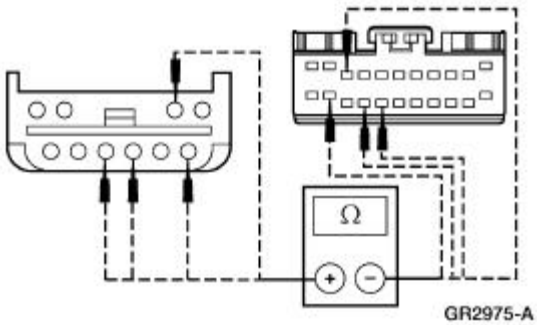
 A0013403 ● **Do the measured resistance values agree with the expected resistance values?**	
I4 CHECK CIRCUIT 1492 (LB/RD) AND 1493 (PK/BK) SHORT TOGETHER	
● Disconnect: DSM C341C. ● Measure the resistance between adjustable pedal switch C2089-7, and 1 harness side. ● **Is the resistance less than 10,000 ohms?**	**Yes** GO to I5 . **No** REPAIR circuit 566 (DG). REPEAT the self-test, CLEAR the DTCs.
I5 CHECK CIRCUIT 875 (BK/LB) FOR OPEN	
● Measure the resistance between adjustable pedal switch C2089-5, circuit 875 (BK/LB), harness side and ground; and between adjustable pedal switch C2089-2, circuit 875 (BK/LB), harness side and ground.  A0013402 ● **Are the resistances less than 5 ohms?**	**Yes** GO to I6 . **No** REPAIR circuit 875 (BK/LB). REPEAT the self-test. CLEAR the DTCs.
I6 CHECK CIRCUIT 1492 (LB/RD) AND CIRCUIT 1493 (PK/BK) FOR SHORT TO VOLTAGE	
● Disconnect: DSM C357. ● Measure the voltage between adjustable pedal switch C2089-7, circuit 1492 (LB/RD), harness side and ground; and between adjustable pedal switch C2089-1, circuit 1493 (PK/BK), harness side and ground.	**Yes** REPAIR circuit 1492 (LB/RD), or circuit 1493 (PK/BK), as necessary. REPEAT the self-test, CLEAR the DTCs. **No** GO to I7 .

 A0013404 ● **Is any voltage indicated?**	
I7 CHECK CIRCUIT 1492 (LB/RD) AND CIRCUIT 1493 (PK/BK) FOR SHORT TO GROUND	
● Measure the resistance between adjustable pedal switch C2089-7, circuit 1492 (LB/RD), harness side and ground; and between adjustable pedal switch C2089-1, circuit 1493 (PK/BK), harness side and ground.  A0013405 ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I8 . **No** REPAIR circuit 1492 (LB/RD), or circuit 1493 (PK/BK), as necessary. REPEAT the self-test, CLEAR the DTCs.
I8 CHECK CIRCUIT 1492 (LB/RD) AND CIRCUIT 1493 (PK/BK) FOR OPEN	
● Measure the resistance between adjustable pedal switch C2089-1, circuit 1492 (LB/RD), harness side and DSM C341c-9, circuit 1492 (LB/RD), harness side; and between adjustable pedal switch C2089-1, circuit 1493 (PK/BK), harness side and DSM C341c-10, circuit 1493 (PK/BK), harness side.  A0013406 ● **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DSM. For additional information, REFER to Section 419-10 . REPEAT the self-test, CLEAR the DTCs. **No** REPAIR circuit 1492 (LB/RD), or circuit 1493 (PK/BK), as necessary. REPEAT the self-test, CLEAR the DTCs.
I9 CHECK DRIVER SEAT MODULE FOR CORRECT OUTPUTS — USE THE DSM ACTIVE COMMANDS PEDAL_FWD AND PEDAL_RWD.	
● Select PARK. ● Trigger the DSM active command PEDAL_FWD ON, and then OFF. ● Trigger the DSM active command PEDAL_RWD ON, and then OFF.	**Yes** INSTALL a new DSM. For additional information, REFER to Section 419-10 .

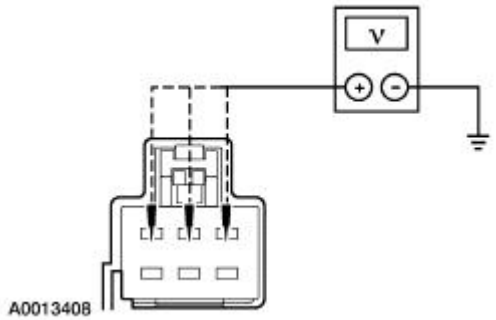


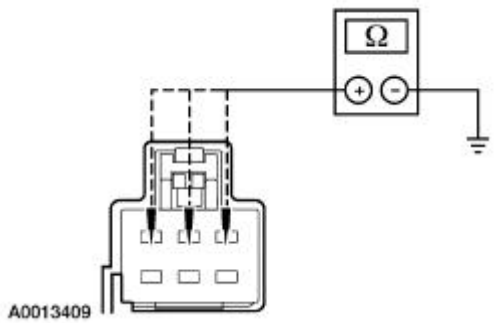


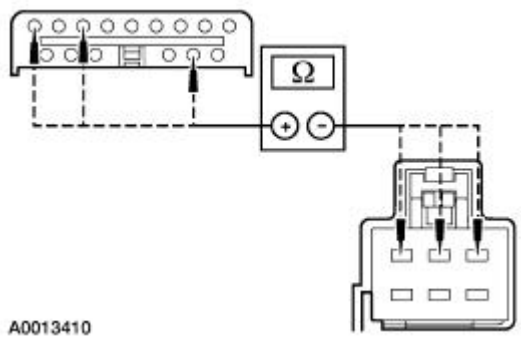
• **Do the adjustable pedals respond correctly to the corresponding active commands?**	REPEAT the self-test, CLEAR the DTCs. **No** GO to I10 .
I10 CHECK CIRCUIT 566 (DG) FOR VOLTAGE	
• Key in OFF position. • Disconnect: DSM C341a. • Measure the voltage between DSM C341a-1, circuit 566 (DG), harness side and ground.  GR2633-A • **Is the voltage greater than 10 volts?**	**Yes** GO to I11 . **No** REPAIR circuit 566 (DG). REPEAT the self-test, CLEAR the DTCs.
I11 CHECK CIRCUIT 57 (BK) FOR OPEN	
• Measure the resistance between DSM C341a-2, circuit 57 (BK), harness side and ground.  GR2636-A • **Is the resistance less than 5 ohms?**	**Yes** GO to I12 . **No** REPAIR circuit 57 (BK). REPEAT the self-test, CLEAR the DTCs.
I12 CHECK CIRCUIT 1490 (LB/OG) AND CIRCUIT 1489 (LB/BK) FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: DSM C341c. • Disconnect: Adjustable Pedal Motor C2003. • Measure the resistance between DSM C341c-7, circuit 1490 (LB/OG), harness side and ground; and between DSM C341c-16, circuit 1489 (LB/BK), harness side and ground  GH2535-A • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I13 . **No** REPAIR circuit 1490 (LB/OG), or circuit 1489 (LB/BK), as necessary. REPEAT the self-test, CLEAR the DTCs.
I13 CHECK CIRCUIT 1490 (LB/OG) AND CIRCUIT 1489 (LB/BK) FOR	



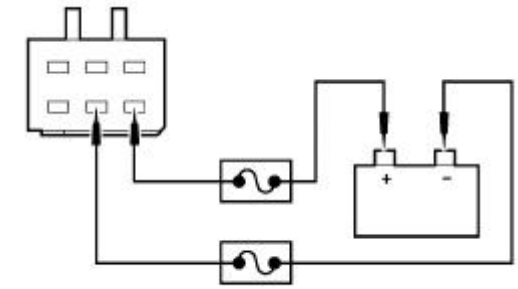
OPEN	
• Measure the resistance between DSM C341b-7, circuit 1490 (LB/OG), harness side and adjustable pedal motor C2003-5, circuit 1490 (LB/OG), harness side; and between DSM C341b-16, circuit 1489 (LB/BK), harness side and adjustable pedal motor C2003-6, circuit 1489 (LB/BK), harness side. • **Are the resistances less than 5 ohms?**	**Yes** GO to I14 . **No** REPAIR circuit 1489 (LB/BK), or circuit 1490 (LB/OG), as necessary. REPEAT the self-test, CLEAR the DTCs.
I14 CHECK CIRCUIT 1490 (LB/OG) AND CIRCUIT 1489 (LB/BK) FOR SHORT TO VOLTAGE	
• Measure the voltage between DSM C341b-7, circuit 1490 (LB/OG), harness side and ground; and between DSM C341b-16, circuit 1489 (LB/BK), harness side and ground. • **Is any voltage indicated?**	**Yes** REPAIR circuit 1489 (LB/BK), or circuit 1490 (LB/OG), as necessary. REPEAT the self-test, CLEAR the DTCs. **No** INSTALL a new DSM. For additional information, REFER to Section 419-10 . REPEAT the self-test, CLEAR the DTCs.

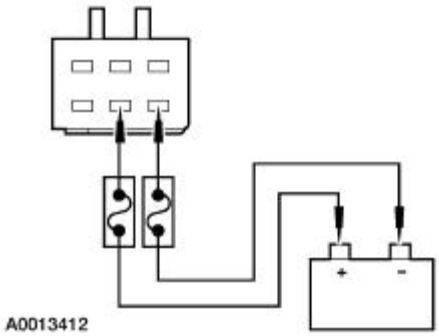






PINPOINT TEST J: ADJUSTABLE BRAKE PEDAL DOES NOT OPERATE CORRECTLY — DOES NOT OPERATE USING THE MEMORY SET SWITCH

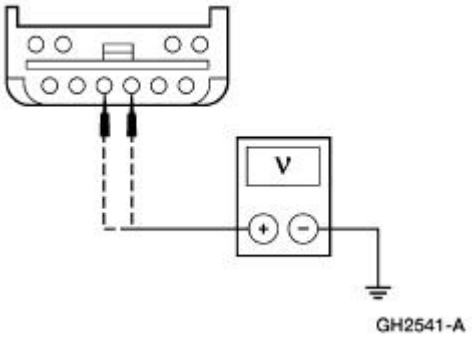


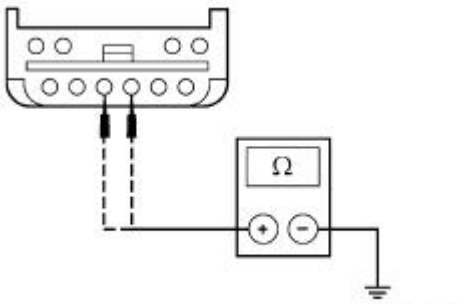


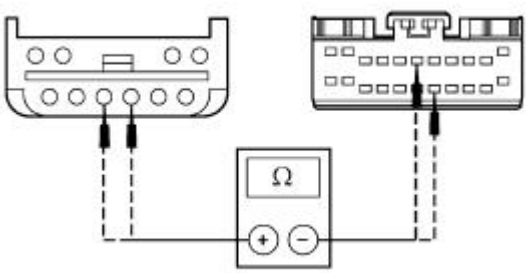
Test Step	Result / Action to Take
J1 USE THE RECORDED DTCS FROM THE DSM CONTINUOUS AND ON-DEMAND SELF TEST	
• Use the recorded results from DSM Continuous and On-Demand Self Test. • **Are any DTCs recorded?**	**Yes** If DTC B1529, GO to J6 . If DTC B1533, GO to J6 . If DTC B1537, GO to J6 . If DTC B1987, GO to J10 . If DTC B1990, GO to J10 . If DTC B1991, GO to J10 . If DTC B1342,

	INSTALL a new DSM. For additional information, REFER to Section 419-10 . REPEAT the self-test, CLEAR the DTCs. **No** GO to J2 .
J2 CHECK DSM FOR CORRECT MEMORY SET SWITCH INPUTS — MONITOR DSM PIDS MEM1_SW, MEM2_SW, AND MEMS_SW ● Monitor the DSM PIDS MEM1_SW, MEM2_SW, AND MEMS_SW, while activating the memory switch, . ● **Do the PID values agree with the switch position?**	**Yes** GO to J9 . **No** GO to J3 .
J3 CHECK THE MEMORY SET SWITCH ● Disconnect: Memory Set Switch C503. ● Carry out the memory set switch component test. For additional information, refer to wiring diagram cell 149. ● **Is the memory set switch OK?**	**Yes** GO to J4 . **No** INSTALL a new memory seat switch. REPEAT the self-test, CLEAR the DTCs.
J4 CHECK CIRCUIT 956 (OG/LG) FOR VOLTAGE — MEMORY SET SWITCH ● Measure the voltage between memory set switch C503-6, circuit 956 (OG/LG), harness side and ground.  GR2677-A ● **Is the voltage greater than 10 volts?**	**Yes** GO to J5 . **No** REPAIR circuit 956 (OG/LG). REPEAT the self-test, CLEAR the DTCs.
J5 CHECK CIRCUIT 875 (BK/LB) FOR OPEN ● Measure the resistance between memory set switch C503-9, circuit 875 (BK/LB), harness side and ground.  GR2658-A	**Yes** GO to J6 . **No** REPAIR circuit 875 (BK/LB). REPEAT the self-test, CLEAR the DTCs.

• **Is the resistance less than 5 ohms?**	
J6 CHECK CIRCUIT 267 (BN/LG), CIRCUIT 268 (BK/OG), CIRCUIT 270 (BN/OG), AND CIRCUIT 272 (WH/OG) FOR SHORT TO VOLTAGE	
• Disconnect: DSM C341c. • Measure the voltage between the following memory set switch C503 pins and ground: **Connector** / **Circuit** C503-1 — 270 (BN/OG) C503-3 — 268 (BK/OG) C503-4 — 267 (BN/LG) C503-8 — 272 (WH/OG)  GR2973-A • **Is any voltage indicated?**	**Yes** REPAIR circuit 267 (BN/LG), circuit 268 (BK/OG), circuit 270 (BN/OG), or circuit 272 (WH/OG), as necessary. REPEAT the self-test, CLEAR the DTCs. **No** GO to J7 .
J7 CHECK CIRCUIT 267 (BN/LG), CIRCUIT 268 (BK/OG), CIRCUIT 270 (BN/OG), AND CIRCUIT 272 (WH/OG) FOR SHORT TO GROUND	
• Measure the resistance between the following memory set switch C503 pins and ground: **Connector** / **Circuit** C503-1 — 270 (BN/OG) C503-3 — 268 (BK/OG) C503-4 — 267 (BN/LG) C503-8 — 272 (WH/OG)  GR2974-A • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to J8 . **No** REPAIR circuit 267 (BN/LG), circuit 268 (BK/OG), circuit 270 (BN/OG), or circuit 272 (WH/OG), as necessary. REPEAT the self-test, CLEAR the DTCs.
J8 CHECK CIRCUIT 267 (BN/LG), CIRCUIT 268 (BK/OG), CIRCUIT 270 (BN/OG), AND CIRCUIT 272 (WH/OG) FOR OPEN	
• Disconnect: DSM C341c.	**Yes**







• Measure the resistance between the following memory set switch C503 pins and DSM C341c pins: **Memory Set Switch / Circuit / DSM** C503-4 / 267 (BN/LG) / C341c-16 C503-3 / 268 (BK/OG) / C341c-15 C503-1 / 270 (BR/OG) / C341c-3 C503-8 / 272 (WH/OG) / C341c-13  • **Is the resistance less than 5 ohms?**	INSTALL a new DSM. For additional information, REFER to Section 419-10 . REPEAT the self-test, CLEAR the DTCs. **No** REPAIR circuit 267 (BN/LG), circuit 268 (BK/OG), circuit 270 (BN/OG), or circuit 272 (WH/OG), as necessary. REPEAT the self-test, CLEAR the DTCs.
J9 CHECK CIRCUITS 268 (BK/OG), 267 (BN/LG), 270 (BN/OG), AND 272 (WH/OG) FOR SHORT TOGETHER	
• Measure the resistance between each of the following memory set switch circuit pins: **Connector / Circuit** C503-1 / 270 (BN/OG) C503-3 / 268 (BK/OG) C503-4 / 267 (BN/LG) C503-8 / 272 (WH/OG) • **Are the resistances less than 10,000 ohms?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTC (s). REPEAT the self-test. **No** GO to J10 .
J10 CHECK DSM FOR CORRECT OUTPUTS — MONITOR THE DSM PID PDL_POS	
• Use the adjustable pedal switch to move the pedals to a central position. • Monitor the DSM PID PDL_POS while moving the adjustable pedal switch into the FWD position, then into the RWD position. • **Does the PID value increase with forward movement, and decrease with rearward movement, throughout the pedals entire travel?**	**Yes** INSTALL a new DSM. For additional information, REFER to Section 419-10 . REPEAT the self-test, CLEAR the DTCs. **No** GO to J10 .
J11 CHECK CIRCUIT 1491 (LB/YE), CIRCUIT 447 (OG/RD), AND CIRCUIT 446 (OG/WH) FOR SHORT TO VOLTAGE	
• Disconnect: DSM C341c. • Disconnect: Adjustable Pedal Motor Sensor C2090. • Measure the voltage between adjustable pedal motor sensor C2090-2, circuit 1491 (LB/YE), harness side and ground; and between	**Yes** REPAIR circuit 1491 (LB/YE), circuit 447

adjustable pedal motor sensor C2090-3, circuit 447 (OG/RD), harness side and ground; and between adjustable pedal motor sensor C2090-1, circuit 446 (OG/WH), harness side and ground.  ● **Is any voltage indicated?**	(OG/RD), or circuit 446 (OG/WH), as necessary. REPEAT the self-test, CLEAR the DTCs. **No** GO to J11 .
J12 CHECK CIRCUIT 1491 (LB/YE), CIRCUIT 447 (OG/RD), AND CIRCUIT 446 (OG/WH) FOR SHORT TO GROUND	
● Measure the resistance between adjustable pedal motor sensor C2090-2, circuit 1491 (LB/YE), harness side and ground; and between adjustable pedal motor sensor C2090-3, circuit 447 (OG/RD), harness side and ground; and between adjustable pedal motor sensor C2090-1, circuit 446 (OG/WH), harness side and ground.  ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to J12 . **No** REPAIR circuit 1491 (LB/YE), circuit 447 (OG/RD), or circuit 446 (OG/WH), as necessary. REPEAT the self-test, CLEAR the DTCs.
J13 CHECK CIRCUIT 1491 (LB/YE), CIRCUIT 447 (OG/RD), AND CIRCUIT 446 (OG/WH) FOR OPEN	
● Measure the resistance between adjustable pedal motor sensor C2090-2, circuit 1491 (LB/YE), harness side and DSM C341c-15, circuit 1491 (LB/YE), harness side; and between adjustable pedal motor sensor C2090-3, circuit 447 (OG/RD), harness side and DSM C341b-1, circuit 447 (OG/RD), harness side; and between adjustable pedal motor sensor C2090-1, circuit 446 (OG/WH), harness side and DSM C341b-3, circuit 446 (OG/WH), harness side.  ● **Are the resistances less than 5 ohms?**	**Yes** GO to J13 . **No** REPAIR circuit 1491 (LB/YE), circuit 447 (OG/RD), or circuit 446 (OG/WH), as necessary. REPEAT the self-test, CLEAR the DTCs.
J14 CHECK ADJUSTABLE PEDAL MOTOR	

• Disconnect: Adjustable Pedal Motor C2003. • Use a fused (10A) jumper between adjustable pedal motor C2003-6, circuit 1489 (LB/BK), component side and the battery positive terminal; and between adjustable pedal motor C2003-5, circuit 1490 (LB/OG), component side and battery negative terminal.  A0013411 • Use a fused (10A) jumper between adjustable pedal motor C2003-6, circuit 1489 (LB/BK), component side and the battery negative terminal; and between adjustable pedal motor C2003-5, circuit 1490 (LB/OG), component side and battery positive terminal.  A0013412 • **Does the adjustable pedal motor operate first in one direction, and then in the opposite direction?**	**Yes** INSTALL a new DSM. For additional information, REFER to Section 419-10 . REPEAT the self-test, CLEAR the DTCs. **No** INSTALL a new adjustable pedal motor. REPEAT the self-test, CLEAR the DTCs. REFER to Section 501-10 . REPEAT the self-test, CLEAR the DTCs.

PINPOINT TEST K: ADJUSTABLE BRAKE PEDAL DOES NOT OPERATE CORRECTLY — DOES NOT OPERATE USING THE REMOTE TRANSMITTER

Test Step	Result / Action to Take
K1 CHECK OPERATION OF REMOTE TRANSMITTER ONE	
• Adjust the driver seat to a new position and store for Memory 1. • Adjust the driver seat to a different position. • Press the UNLOCK button on remote transmitter one. • **Does the driver seat move to memory seat position one?**	**Yes** GO to K2 . **No** GO to Section 501-14 to diagnose the inoperative driver seat memory recall from the remote transmitter.
K2 CHECK CIRCUIT 267 (BN/LG) AND 268 (BK/OG) FOR SHORT TO VOLTAGE	
• Select PARK. • Disconnect: Memory Set Switch C503. • Measure the voltage between memory set switch C503-4, circuit	**Yes** REPAIR circuit 267 (BN/LG), or circuit

267 (BN/LG), harness side and ground; and between memory set switch C503-3, circuit 268 (BK/OG), harness side and ground.  GH2541-A • **Is any voltage indicated?**	268 (BK/OG). REPEAT the self-test, CLEAR the DTCs. **No** GO to K3 .
K3 CHECK CIRCUIT 267 (BN/LG) AND 268 (BK/OG) FOR SHORT TO GROUND	
• Measure the resistance between memory set switch C503-4, circuit 267 (BN/LG), harness side and ground; and between memory set switch C503-3, circuit 268 (BK/OG), harness side and ground.  GH2542-A • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to K4 . **No** REPAIR circuit 267 (BN/LG), or circuit 268 (BK/OG),as necessary. REPEAT the self-test, CLEAR the DTCs.
K4 CHECK CIRCUIT 267 (BN/LG) AND 268 (BK/OG) FOR OPEN	
• Disconnect: DSM C341c. • Measure the resistance between memory set switch C503-4, circuit 267 (BN/LG), harness side and DSM C341c-4, circuit 267 (BN/LG), harness side; and between memory set switch C503-3, circuit 268 (BK/OG), harness side and DSM C341c-3, circuit 268 (BK/OG), harness side.  GH2543-A • **Is the resistance less than 5 ohms?**	**Yes** REFER to Section 501-14 . REPEAT the self-test, CLEAR the DTCs. **No** REPAIR circuit 267 (BN/LG), or circuit 268 (BK/OG). REPEAT the self-test, CLEAR the DTCs.

Component Tests

Brake Booster

1. Check the hydraulic brake system for leaks or insufficient fluid.

2. With the transmission in NEUTRAL, stop the engine and apply the parking brake control. Apply the brake pedal several times to exhaust all vacuum in the system.

3. Apply the brake pedal and hold it in the applied position. Start the engine. If the vacuum system is operating, the brake pedal will tend to move downward under constant foot pressure. If no motion is felt, the power brake booster system is not functioning.

Brake Booster Operation Check

1. Remove the vacuum booster hose from the check valve connection. Manifold vacuum must be available at the check valve end of the vacuum booster hose with the engine at idle speed and the transmission in NEUTRAL. If the manifold vacuum is available to the power brake booster, connect the vacuum booster hose to the power brake booster check valve and repeat Steps 2 and 3 of the Brake Booster check. If no downward movement of the brake pedal is felt, install a new power brake booster.

2. Operate the engine a minimum of 10 seconds at fast idle. Stop the engine, and let the vehicle stand for 10 minutes. Then apply the brake pedal with approximately 89 N (20 lb) of force. The brake pedal feel should be the same as that noted with the engine operating. If the brake pedal feels hard (no power assist), install a new power brake booster check valve and retest. If the brake pedal feels spongy, bleed the hydraulic system to remove air. Refer to Brake System Bleeding in this section.

Check Valve

The function of the power brake booster check valve is to allow manifold vacuum to enter the power brake booster and prevent the escape of vacuum in case manifold vacuum is lost during sustained full throttle operation.

To test the function of the power brake booster check valve :

- Start and run the engine for at least 10 seconds.
- Operate the brake pedal to check for power assist.
- Disconnect the vacuum booster hose from the power brake booster. Do not remove the power brake booster check valve from the power brake booster.
- There should be enough vacuum retained in the power brake booster for at least one more power-assisted brake operation.

Brake Master Cylinder — Normal Conditions

The following conditions are considered normal and are not indications that the brake master cylinder is in need of service.

Condition 1: During normal operation of the brake master cylinder, the fluid level in the brake master cylinder reservoir will rise during brake application and fall during release. The net fluid level (i.e., after brake application and release) will remain unchanged.

Condition 2: A trace of brake fluid will exist on the booster shell below the master cylinder mounting flange. This results from the normal lubricating action of the master cylinder bore and seal.

Condition 3: Fluid level will decrease with pad wear.

Brake Master Cylinder — Abnormal Conditions

Changes in brake pedal feel or travel are indicators that something could be wrong in the brake system. GO to Symptom Chart for abnormal condition diagnosis.

Bypass Condition Test

1. Disconnect the brake lines at the brake master cylinder.
2. Plug the outlet ports of the brake master cylinder.
3. Apply the brakes. If brake pedal height cannot be maintained, the brake master cylinder has an internal leak and must be rebuilt or installed new.

Compensator Port Check

The purpose of the compensator ports in the brake master cylinder is to supply any additional brake fluid required by the system due to brake pad wear and to allow brake fluid returning from the brake lines to the brake master cylinder to enter the brake master cylinder reservoir

The returning brake fluid will cause a slight turbulence in the brake master cylinder reservoir. Turbulence seen in the brake master cylinder reservoir upon release of the brake pedal is normal and shows that the compensating ports are not plugged.

Brake System Bleeding

Special Tool(s)

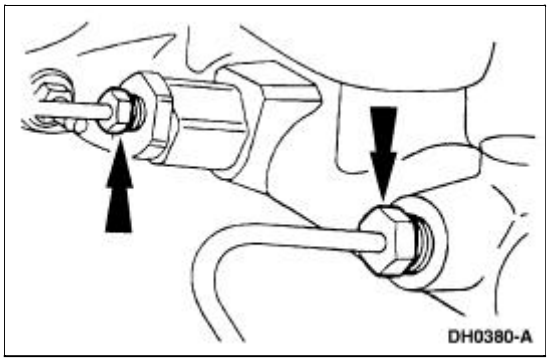
 ST2332-A	Worldwide Diagnostic Tool (WDS) 418-F224, or equivalent scan tool New Generation Star (NGS) Tester 418-F052 or equivalent

Material

Item	Specification
High Performance DOT 3 Brake Fluid PM-1	ESA-M6C25-A

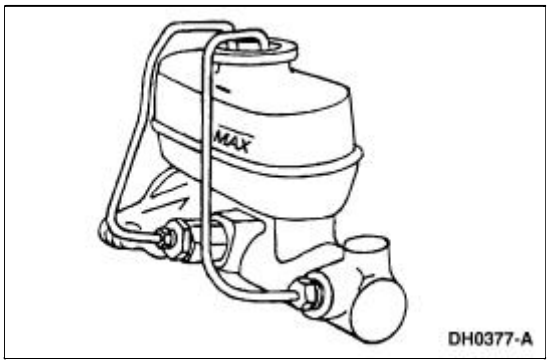
Master Cylinder, In Vehicle

WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.



CAUTION: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with the specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

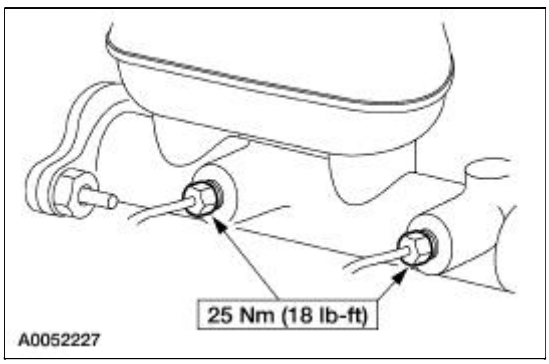


NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

1. **NOTE:** When a new brake master cylinder has been installed or the system has been emptied, or partially emptied, it should be primed to prevent air from getting into the system.

   Disconnect the brake master cylinder outlet tubes.

2. Install short brake tubes with ends submerged in the brake master cylinder reservoir and fill the brake master cylinder reservoir with brake fluid.



3. Have an assistant pump the brake pedal until clear fluid flows from both brake tubes without air bubbles.

4. Remove the short brake tubes and install the brake outlet tubes.

5. Bleed each brake tube at the brake master cylinder as follows:
    1. Have an assistant pump the brake pedal and then hold firm pressure on the brake pedal.
    2. Loosen the rearmost brake tube fittings until a stream of brake fluid comes out. Have an assistant maintain pressure on the brake pedal while tightening the brake tube fitting.
    3. Repeat this operation until clear, bubble-free fluid comes out.
    4. Refill the brake master cylinder reservoir as necessary. Repeat the bleeding operation at the front brake tube.

6. While the assistant maintains pressure on the brake pedal, tighten the brake tubes.

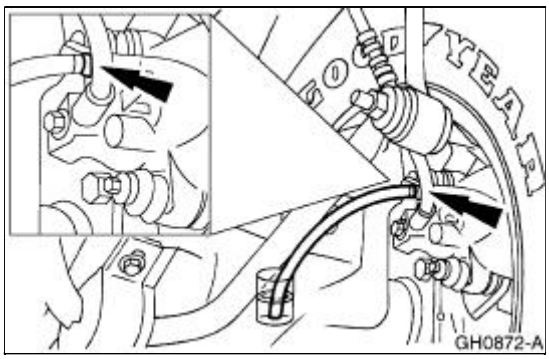
Four Wheel Anti-Lock Brake System (4WABS)

WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

CAUTION: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with the specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

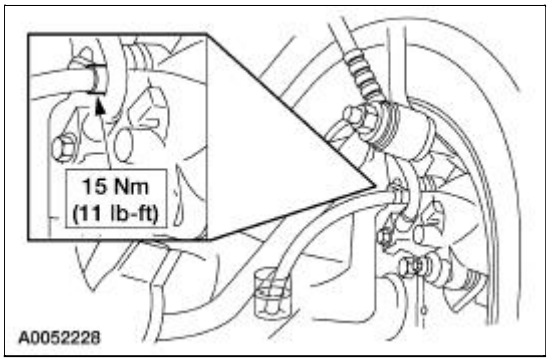


NOTE: This procedure must be performed if the 4 wheel anti-lock brake (4WABS) hydraulic control unit (HCU) has been installed new.

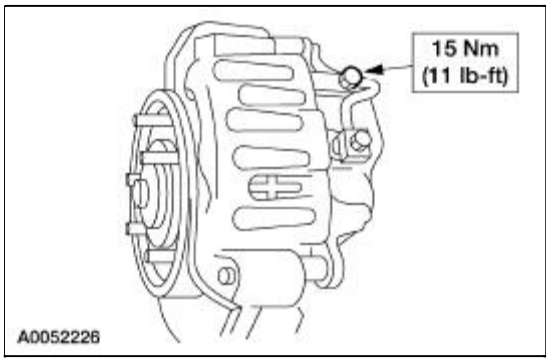
NOTE: One conventional pressure bleed cycle consists of advancing the brake pedal to its depressed position, opening the disc brake caliper bleeder screw, allowing fluid to be released into the waste container, closing the disc brake caliper bleeder screw and releasing the brake pedal.

NOTE: Performing the NGS program routine drives entrapped air from the otherwise inaccessible lower section of the 4WABS valve into the upper sections (accessible by bleeding the brakes). Subsequent bleedings remove the air from the system.

NOTE: Add recommended brake fluid as necessary throughout the procedure.



1. Connect a clear waste line to the RH rear disc brake caliper bleeder screw and the other end in a container partially filled with recommended brake fluid.



2. Have an assistant pump the brake pedal and then hold firm pressure on the brake pedal.

3. Loosen the RH rear disc brake caliper bleeder screw until a stream of brake fluid comes out. Have an assistant maintain pressure on the brake pedal while tightening the RH rear disc brake caliper bleeder screw.
    - Repeat until clear, bubble-free fluid comes out.
    - Refill the brake master cylinder reservoir as necessary.

4. Tighten the RH rear disc brake caliper bleeder screw.

5. Repeat Steps 1, 2, 3, and 4 for the LH rear disc brake caliper bleeder screw, RH front disc brake caliper bleeder screw, and the LH front disc brake caliper bleeder screw.

6. **NOTE:** Go to the help menu in the scan tool.

   Connect the scan tool DCL cable adapter into the vehicle data link connector (DLC) under the dash and follow the scan tool instructions.

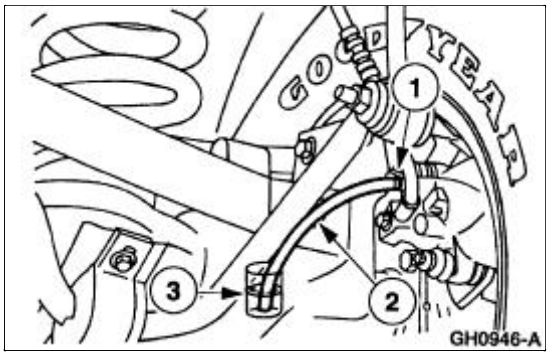
7. Repeat the conventional bleed procedure as outlined in Steps 1 through 5.

8. If the brake pedal feels spongy, repeat the scan tool service bleed procedure.

Gravity

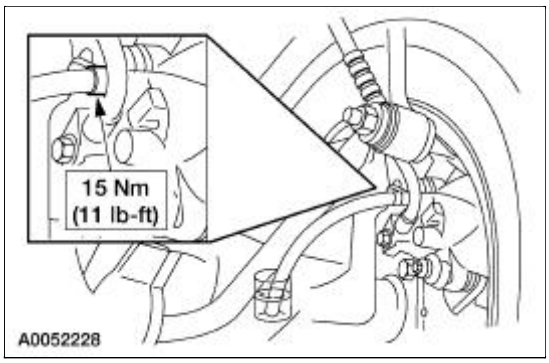
WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

CAUTION: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with the specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.



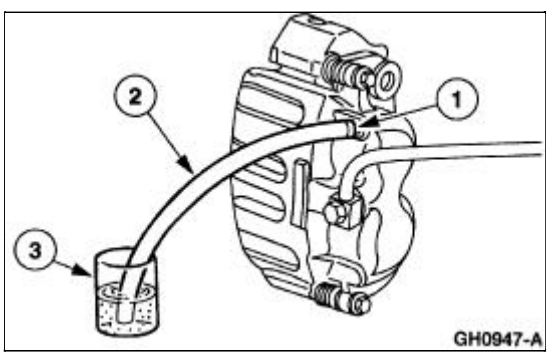
CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

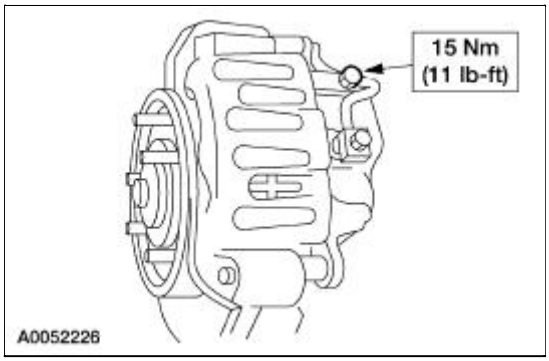


NOTE: When a new brake master cylinder has been installed or the system has been emptied, or partially emptied, it should be primed to prevent air from getting into the system.

1. Fill the brake master cylinder reservoir with brake fluid.



2. Bleed the rear disc brake calipers.
    1. Place a box end wrench on the RH rear disc brake caliper bleeder screw.
    2. Attach a rubber drain tube to the RH rear disc brake caliper bleeder screw and submerge the free end of the tube in a container partially filled with clean brake fluid.
    3. Open the bleeder screw and leave open until clear bubble-free brake fluid flows.
        - Repeat for LH rear disc brake caliper.

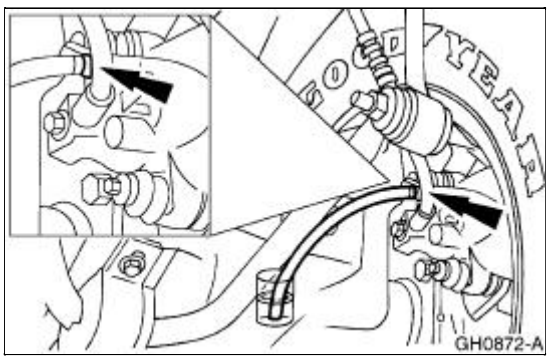


3. Tighten the rear disc brake caliper bleeder screws.

4. Bleed the front disc brake calipers.
    1. Place a box end wrench on the RH front disc brake caliper bleeder screw.
    2. Attach a rubber drain tube to the RH front disc brake caliper bleeder screw and submerge the free end of the tube in a container partially filled with clean brake fluid.
    3. Open the bleeder screw and leave open until clear bubble-free brake fluid flows.
        - Repeat for LH front disc brake caliper.

5. Tighten the front disc brake caliper bleeder screws.

Manual

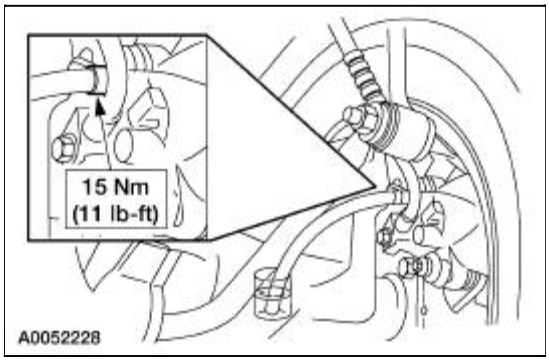


WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

CAUTION: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with the specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

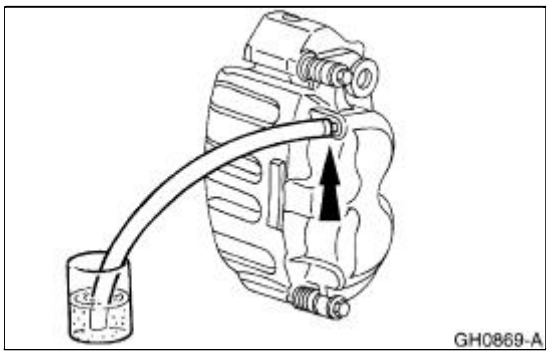
CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.



1. Place a box end wrench on the RH rear disc brake caliper bleeder screw. Attach a rubber drain tube to the RH rear disc brake caliper bleeder screw and submerge the free end of the tube in a container partially filled with clean brake fluid.

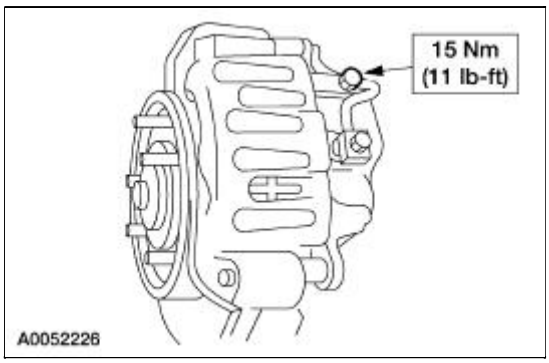
2. Have an assistant pump the brake pedal and then hold firm pressure on the brake pedal.



3. Loosen the RH rear disc brake caliper bleeder screw until a stream of brake fluid comes out. Have an assistant maintain pressure on the brake pedal while tightening the RH rear disc brake caliper bleeder screw.
    - Repeat until clear, bubble-free fluid comes out.
    - Refill the brake master cylinder reservoir as necessary.

4. Tighten the RH rear disc brake caliper bleeder screw.

5. Repeat Steps 1, 2, 3, and 4 for the LH rear disc brake caliper.



6. Place a box end wrench on the RH front disc brake caliper bleeder screw. Attach a rubber drain tube to the RH front disc brake caliper bleeder screw and submerge the free end of the tube in a container partially filled with clean brake fluid.

7. Have an assistant pump the brake pedal and then hold firm pressure on the brake pedal.

8. Loosen the RH front disc brake caliper bleeder screw until a stream of brake fluid comes out. Have an assistant maintain pressure on the brake pedal while tightening the RH front disc brake caliper bleeder screw.
    - Repeat until clear, bubble-free fluid comes out.
    - Refill the brake master cylinder reservoir as necessary.

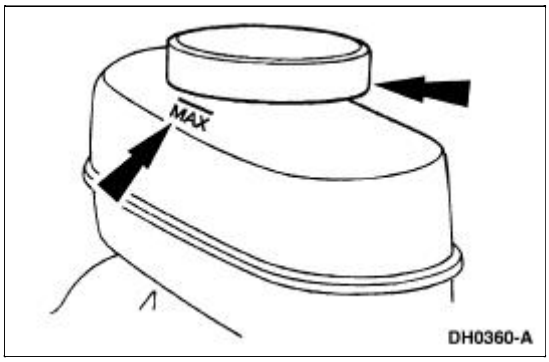
9. Tighten the RH front disc brake caliper bleeder screw.

10. Repeat Steps 6, 7, 8, and 9 for the LH front disc brake caliper bleeder screw.

11. If necessary, bleed the brake master cylinder. For additional information, refer to Brake System Bleeding in this section.

Pressure

WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

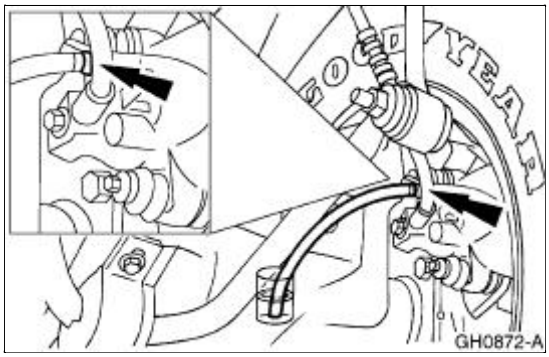


CAUTION: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with the specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

NOTE: Bleed the longest line first. Be sure the bleeder tank contains enough specified brake fluid to complete the bleeding operation.



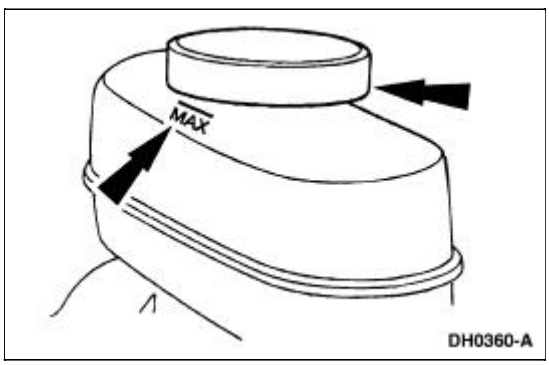
1. Clean all dirt from and remove the brake master cylinder filler cap and fill the brake master cylinder reservoir with the specified brake fluid.

2. **NOTE:** Master cylinder pressure bleeder adapter tools are available from various manufacturers of pressure bleeding equipment. Follow the instructions of the manufacturer when installing the adapter.

   Install the bleeder adapter to the brake master cylinder reservoir and attach the bleeder tank hose to the fitting on the adapter.

3. Place a box end wrench on the RH rear disc brake caliper bleeder screw. Attach a rubber drain tube to the RH rear disc brake caliper bleeder screw and submerge the free end of the tube in a container partially filled with clean brake fluid.

4. Open the valve on the bleeder tank.



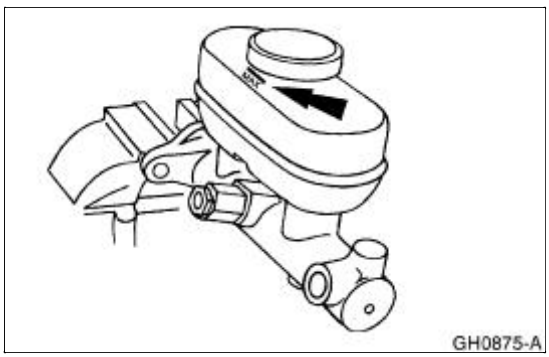
5. Loosen the rear disc brake caliper bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten rear disc brake caliper bleeder screw and remove the rubber hose.

6. Continue bleeding the rest of the system, going in order from the LH rear disc brake caliper to the RH front disc brake caliper ending with the LH front disc brake caliper.

7. Close the bleeder tank valve and remove the tank hose from the adapter and remove the adapter.

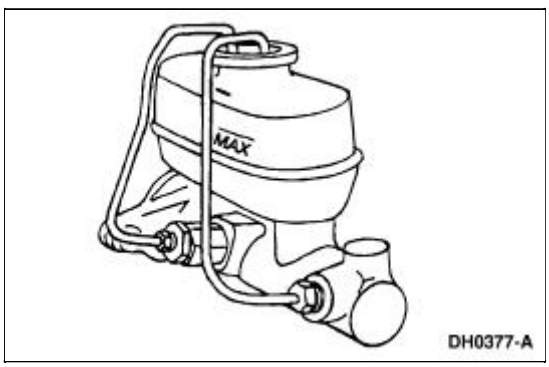
8. Fill the brake master cylinder reservoir and install the brake master cylinder filler cap.

Master Cylinder, Bench



WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

CAUTION: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with the specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.



CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

1. Support the brake master cylinder body in a vise and fill the brake master cylinder reservoir with specified brake fluid.
    - Use clean brake fluid.

2. Install short brake tubes with the ends submerged in the brake master cylinder reservoir.

3. Slowly depress the primary piston until clear fluid flows from both brake tubes, without air bubbles.

4. Remove the short brake tubes.

Brake System Leak Check

1. **NOTE:** Brake fluid is water soluble and therefore evidence of leakage can be washed away if the vehicle is operated in rain or snow.

   Fill the brake master cylinder reservoir.

2. Apply and hold the brakes several times.

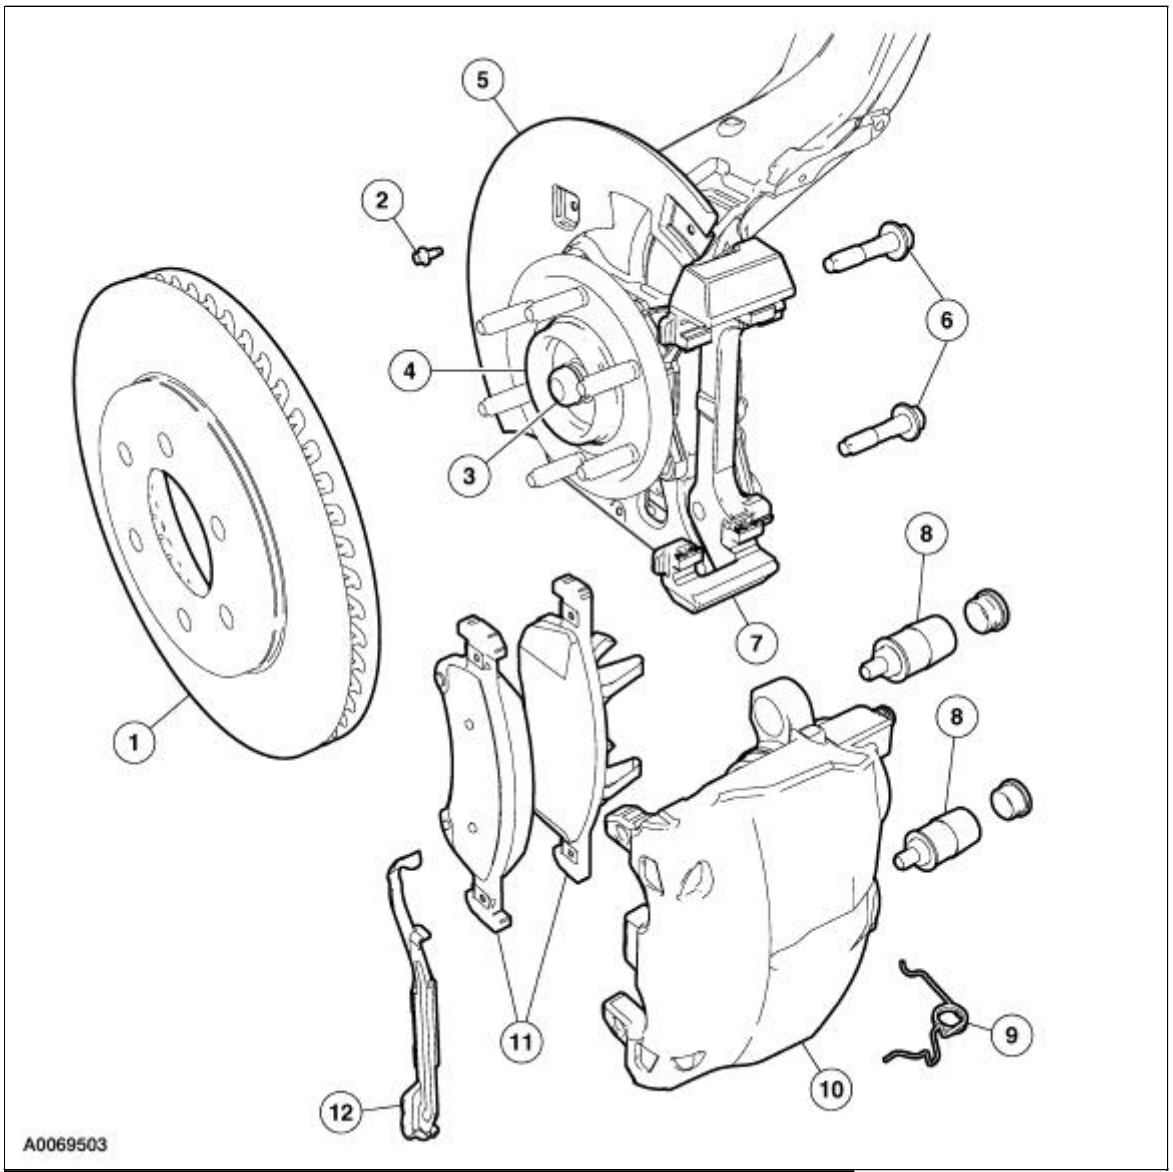
3. Check the brake master cylinder reservoir to verify fluid loss.

4. Inspect the brake system for signs of fresh brake fluid leakage.

5. Locate and correct the source of the external leak.

General Specifications

Item	Specification
Disc brake lining wear limit	1.5 mm (0.059 in)
Disc minimum thickness	27 mm (1.06 in)
Disc thickness variation	0.009 mm (0.0003 in)



Torque Specifications

Description	Nm	lb-ft	lb-in
Caliper slide pins	55	41	—
Front brake hose bolt	35	26	—
Front disc brake caliper anchor plate bolts	200	148	—
Brake disc shield screws	12	—	106
Spindle nut 4x4 [a]	7	—	62

[a] Refer to the Brake Disc procedure in this section.

Front Disc Brake

Front Disc Brake System

Item	Part Number	Description
1	1125	Brake disc
2	W505211-S301	Brake disc shield screws (3 req'd)
3	1131	Grease cap (4x4)
4	1A148	Wheel hub and bearing assembly
5	2K004	Brake disc shield
6	—	Brake caliper anchor plate bolts (part of 2L527)
7	2C566	Brake caliper anchor plate
8	—	Brake caliper slide pin boot (part of 2L527)

8	—	Brake caliper slide pin (part of 2L527)
9	2035	Zero-drag spring
10	2B120	Brake caliper
11	2001	Brake pads
12	2B164	Anchor housing spring

On front disc brake systems:

- the disc brake caliper bolts to the front disc brake caliper anchor plate.
- the front disc brake caliper anchor plate bolts to the front wheel knuckle.
- a separate brake disc attaches to the wheel hub.

The disc brake caliper:

- is a pin slider, dual piston type.
- housing has a fluid inlet at the center of the bore. A square section seal fitted into an annular groove in the caliper cylinder bore seals against hydraulic pressure, while rubber boots seal the caliper pistons and caliper bore from contamination.

The brake disc shield:

- bolts to the front wheel knuckle.
- protects the inboard surface of the brake disc.

The pads are:

- contained within the front disc brake caliper anchor plate.
- held to the front disc brake caliper anchor plate abutments by disc brake anti-rattle clips.

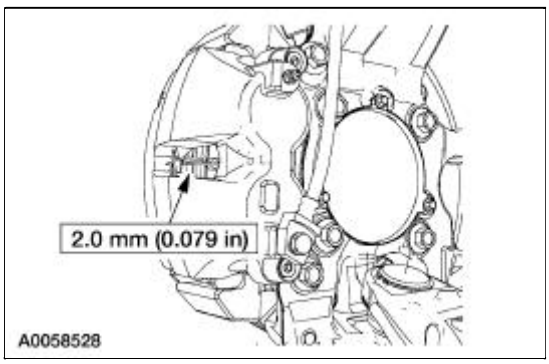
Front Disc Brake

Refer to Section 206-00 .

Brake Pads

Material

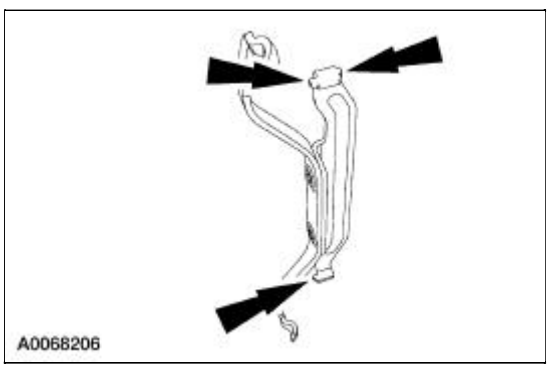
Item	Specification
Brake Parts Cleaner PM-4	—



Removal

1. **CAUTION: Install a new lining if worn to or past the specified thickness above the metal backing plate or rivets. Install new pads in complete axle sets.**

   If necessary, using a suitable suction device, remove the brake fluid in the master cylinder reservoir until it is half filled.

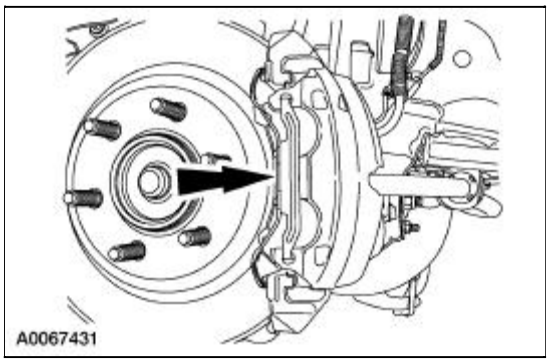


2. Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .

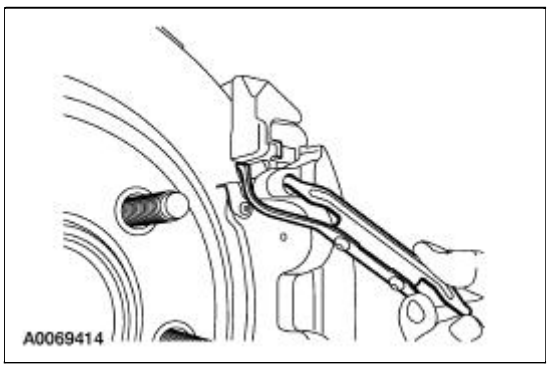
3. Inspect the brake pads for wear or contamination.

4. **CAUTION: If the anchor housing spring is to be reused, do not force the anchor housing spring off the brake caliper. Do not install a damaged anchor housing spring.**

   Remove the anchor housing spring.



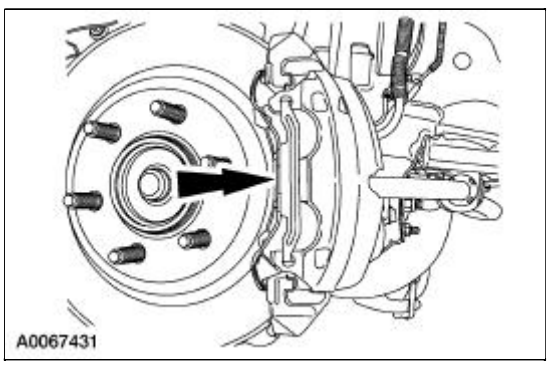
5. **NOTE:** Verify if the anchor housing spring has 1 end with 2 tabs. If yes, the LH side anchor



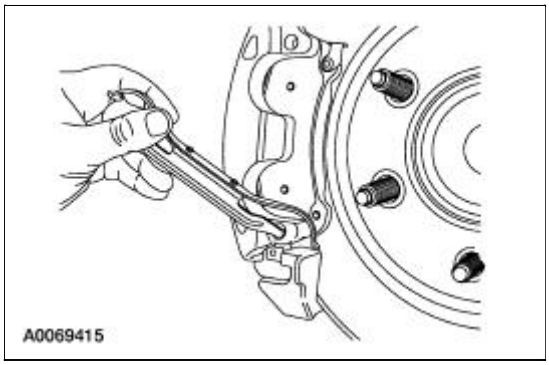
housing spring must be installed with the 2-tabbed end in the upper brake caliper cavity.

For the LH brake caliper, release the lower portion of the anchor housing spring.

- Apply force at the center of the anchor housing spring and pull outward at the bottom of the anchor housing spring to remove it from the lower brake caliper cavity.



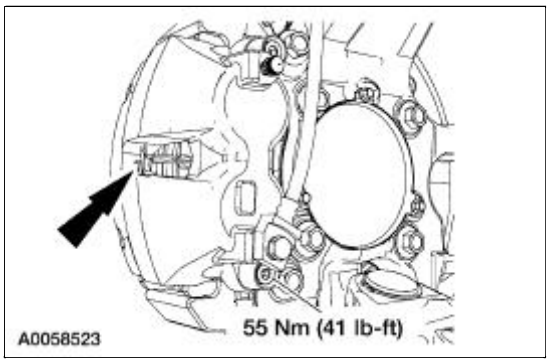
6. Rotate the spring upward then remove it from the brake caliper.



7. **NOTE:** On the RH side, the anchor housing spring must be installed with the 2-tabbed end in the lower brake caliper cavity. The illustration below shows the anchor housing spring end with 2 tabs.

   For RH brake caliper, release the upper portion of the anchor housing spring.

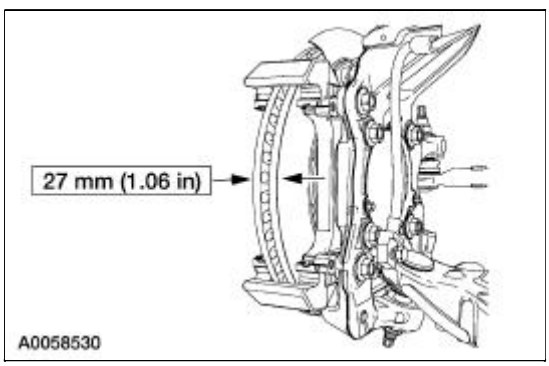
   - Apply force at the center of the anchor housing spring and pull outward at the top of the anchor housing spring to remove it from the upper brake caliper cavity.



8. Rotate the spring downward then remove it from the brake caliper.

9. **NOTE:** Do not allow the brake caliper to hang from the brake hose.

   Remove the brake caliper.
   1. Remove the zero-drag spring.
   2. Remove and discard the brake caliper-to-anchor plate bolts, guide pins and boots.



10. Remove the brake pads from the brake caliper.

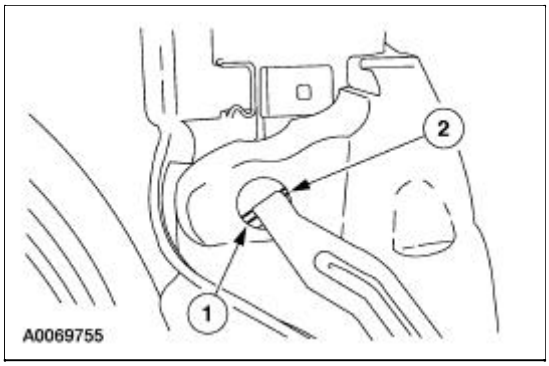
11. **NOTE:** Use a wood block or used brake pad to protect the brake caliper piston boots.

    Compress the brake caliper pistons.

12. Measure the brake disc thickness.
    - Install a new brake disc if it is not within specification. For additional information, refer to Brake Disc in this section.

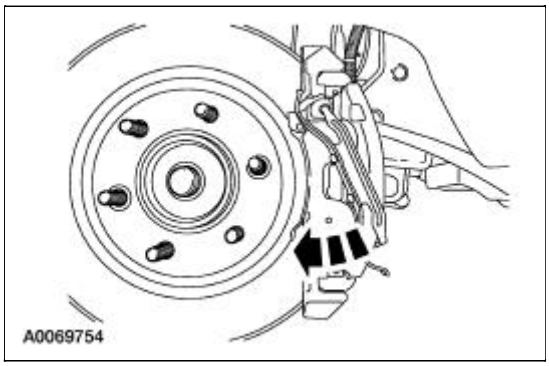
Installation

1. Using brake parts cleaner, clean the inner surfaces of the brake caliper where the brake pads attach.



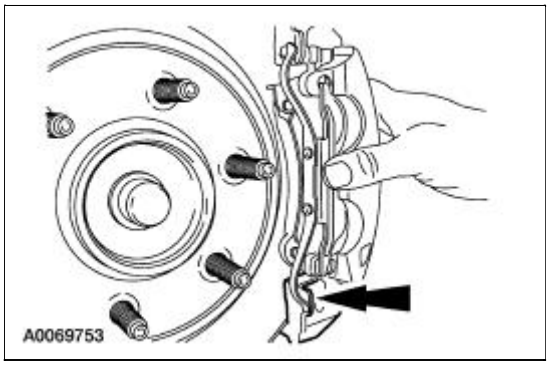
2. Install new brake hardware as follows:

- Install the guide pin bushings into the caliper bores.
- Apply grease to the inside of the guide pin bushing. Do not apply grease to the guide pin threads.
- Push the guide pins into the bushing.



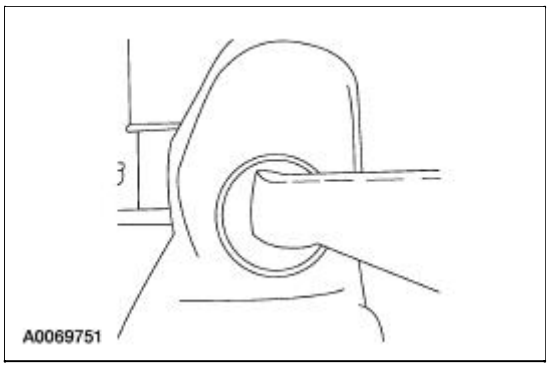
3. Install the inboard brake pad into the brake caliper.
4. Remove the protective paper from the outboard brake pad and install it into the brake caliper.
5. Install the brake caliper on the brake disc.
6. Tighten the guide pins and install the dust caps.
7. Install the zero-drag spring.

NOTE: If present, the 2-tabbed end of the anchor housing spring must be installed first.



8. Install the anchor housing spring.
    1. Insert tab of the anchor housing spring into the brake caliper cavity.
    2. Twist tab into the brake caliper cavity (LH side-upper brake caliper cavity/RH side-lower brake caliper cavity).

9. Rotate the anchor housing spring and position the upper portion onto the anchor plate.



10. Position the other anchor housing spring portion onto the brake caliper anchor plate.

11. Push down and inward until the upper and lower ends of the anchor housing spring are latched and seated in the brake caliper cavities.

12. **NOTE:** The latch **MUST** be positioned as shown.

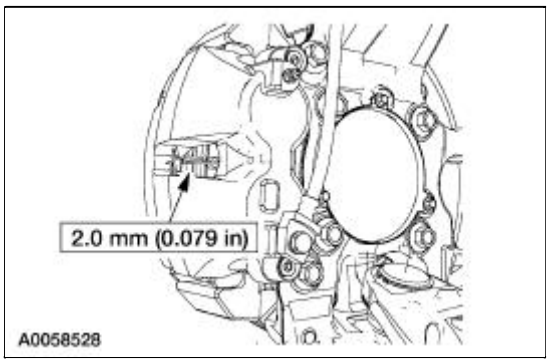
    Verify that the anchor housing spring is correctly latched.

13. Install the wheel and tire assembly. For additional information, refer to Section 204-04 .

14. Apply the brake several times to verify correct brake operation.

Brake Caliper

Removal and Installation



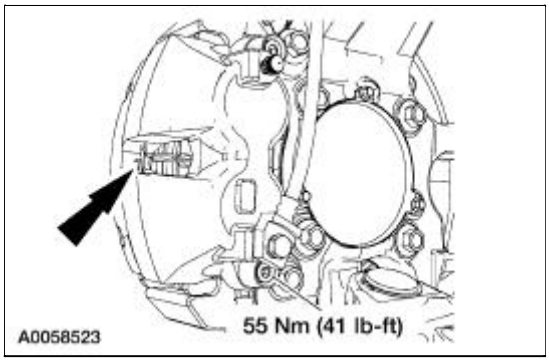
1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .

2. Remove the brake pads. For additional information, refer to Brake Pads in this section.

3. **CAUTION: Install a new lining if worn to or past the specified thickness above the metal backing plate or rivets. Install new pads in complete axle sets.**

   Inspect the pads for wear or contamination.



4. **WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.**

   Disconnect the front brake hose.

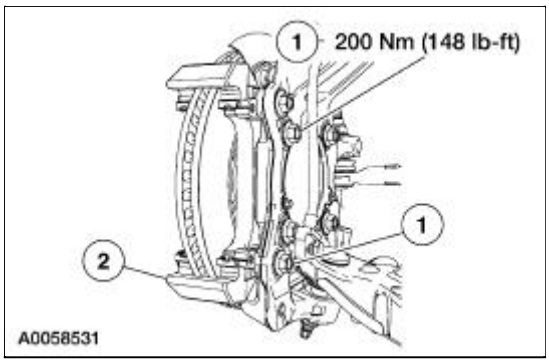
   - Use new copper washers to connect the front brake hose.

5. Remove the disc brake caliper bolts.

6. Measure the brake disc thickness.
    - Install a new brake disc (1125) if not within specification.

7. Inspect the disc brake caliper for leaks.
    - If leaks are found, the brake caliper must be disassembled. For additional information, refer to Brake Caliper .

8. Bleed the brake system. For additional information, refer to Section 206-00 .



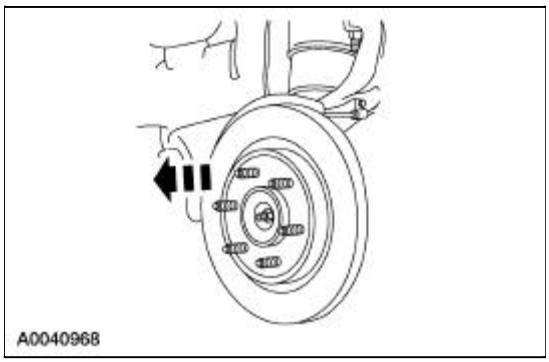
9. To install, reverse the removal procedure.

Brake Caliper Anchor Plate

Removal and Installation

1. Remove the brake pads. For additional information, refer to Brake Pads in this section.

2. Remove the brake caliper anchor plate.
    1. Remove the brake caliper anchor plate bolts.
    2. Remove the brake caliper anchor plate.



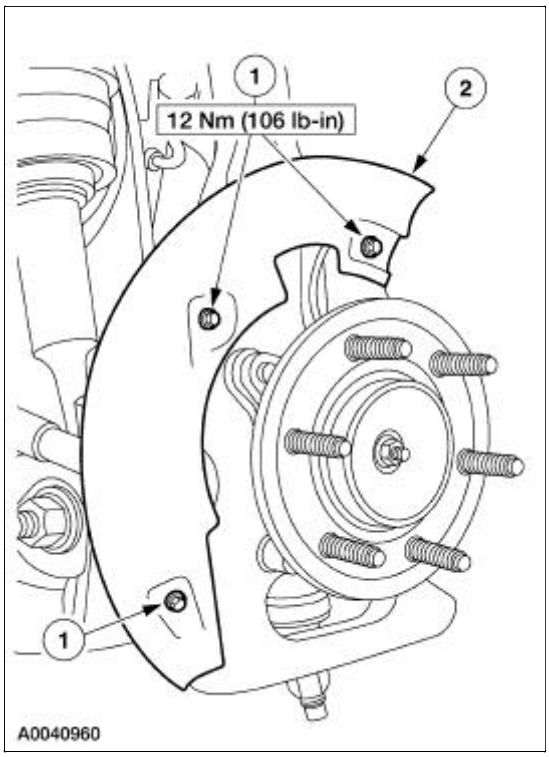
3. To install, reverse the removal procedure.

Brake Disc

Removal and Installation

1. Remove the brake caliper anchor plate. For additional information, refer to Brake Caliper Anchor Plate in this section.

2. Remove the brake disc.



3. To install, reverse the removal procedure.

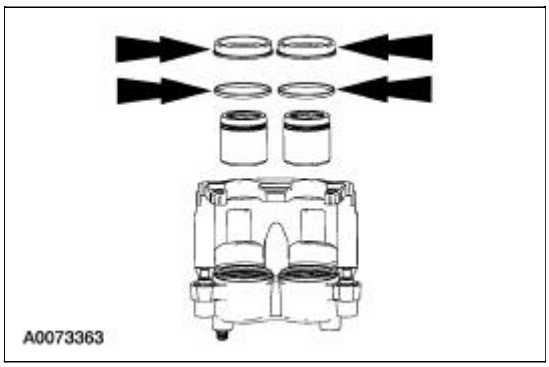
Brake Disc Shield

Removal and Installation

1. Remove the brake disc. For additional information, refer to Brake Disc in this section.

2. Remove the brake disc shield.
    1. Remove the brake disc shield screws.
    2. Remove the brake disc shield.

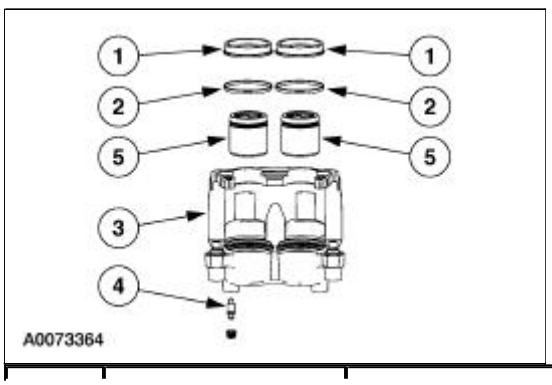
3. To install, reverse the removal procedure.



Brake Caliper

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM1	ESA-M6C25-A



Disassembly

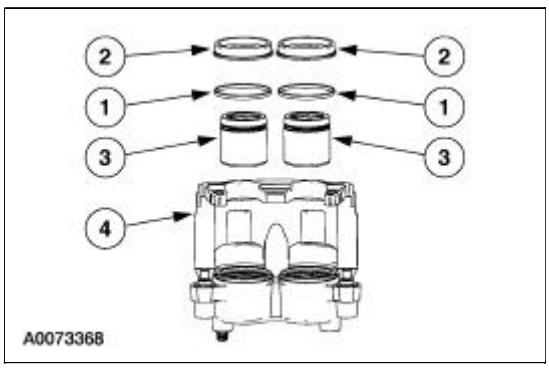
1. Remove the disc brake caliper. For additional information, refer to Brake Caliper in this section.
2. Drain the remaining brake fluid from the disc brake caliper.
3. Secure the disc brake caliper in a vise.
4. Remove the caliper pistons (2196).
    1. Place a block of wood between the caliper bridge and the caliper pistons.
    2. Apply low air pressure to the fluid port in the disc brake caliper.
    3. Force out the caliper pistons to the block of wood.
    4. Remove the block of wood and the caliper pistons.
5. Remove and discard the piston seals and boots.

6. **NOTE:** Do not hone the cylinder bores. Pistons are not available for honed cylinder bores.

   If the cylinder bores are excessively scored or corroded, replace the disc brake caliper.

Item	Part Number	Description
1	2L484	Piston boot (part of 2B120 kit)
2	—	Piston seal (part of 2B120)
3	2B120/2B121	Disc brake caliper (LH/RH)
4	2208	Bleeder screw (part of 2B120)
5	2C197	Caliper piston (part of 2B120)

Assembly



CAUTION: Never reuse piston seals and dust boots.

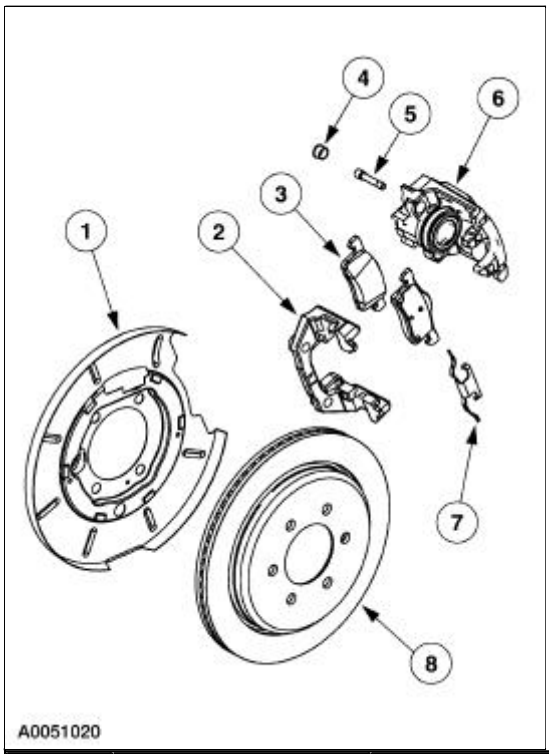
NOTE: Never reuse brake fluid that has been drained from the hydraulic system or has been allowed to stand in an open container for an extended period of time.

1. Lubricate the piston boot, caliper piston, piston seal, and cylinder bores with brake fluid.
2. Place the brake caliper in a vise.
3. Install the caliper pistons.
    1. Install the piston seal.
    2. Install the piston boot on the brake caliper.
    3. **CAUTION: Be careful not to damage or dislodge the piston seal.**

       Insert the caliper piston.
    4. **CAUTION: Be careful not to cock the caliper piston.**

       Insert the piston into the disc brake caliper bore.
        - Place the piston squarely against the dust boot.
        - While applying shop air to the fluid port in the disc brake caliper, push the piston squarely into the bore.
4. Install the disc brake caliper. For additional information, refer to Brake Caliper in this section.

General Specifications



Item	Specification
Rear disc brake lining minimum thickness mm (in)	1.0 (0.039)
Brake disc minimum thickness mm (in)	19.0 (0.75)
Maximum brake disc runout mm (in)	0.0025 (0.000098)
Maximum brake disc thickness variation mm (in)	0.009 (0.0004)
Lubricants	
High-Performance Dot 3 Brake Fluid PM-1	ESA-M6C25-A

Torque Specifications

Description	Nm	lb-ft
Brake caliper guide pins	35	26
Brake caliper flow bolt	35	26
Brake caliper anchor plate bolts	190	140

Rear Disc Brake

Rear Disc Brake Components

Item	Part Number	Description
1	2C028	Brake disc shield
2	2209	Brake caliper anchor plate
3	2200	Brake pads
4	—	Cap
5	—	Brake caliper bolt
6	2555	Brake caliper
7	—	Anchor housing spring
8	2C026	Brake disc

NOTE: The inboard and outboard brake pads are not interchangeable.

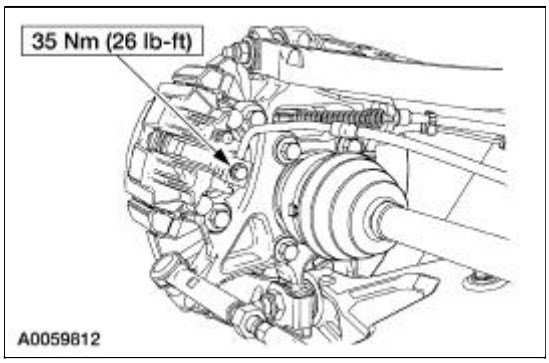
The brake disc is a vented, full-cast, drum-in-hat type. The rear disc brake caliper is a single-piston type. Each brake pad is equipped with a riveted spring clip that secures it to either the rear disc brake caliper piston or the rear disc brake caliper housing.

Rear Disc Brake

Refer to Section 206-00 .

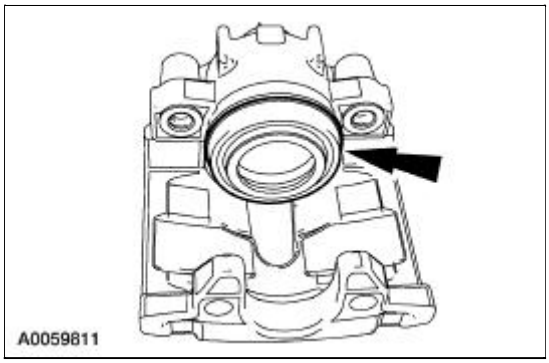
Brake Caliper

Removal and Installation



1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .



2. **WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.**

   CAUTION: Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

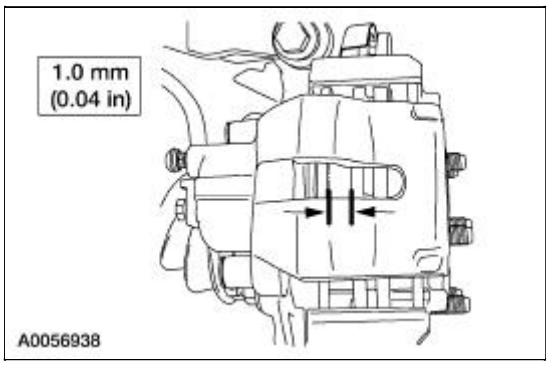
   Remove the bolt and disconnect the hose.
   - Remove and discard the copper washers.

3. Remove the brake pads. For additional information, refer to Brake Pads in this section.
4. Inspect the rear disc brake caliper for leaks.
   - If leaks are found, disassembly is required. For additional information refer to Caliper , Disassembly in this section.

5. To install, reverse the removal procedure.

Brake Pads

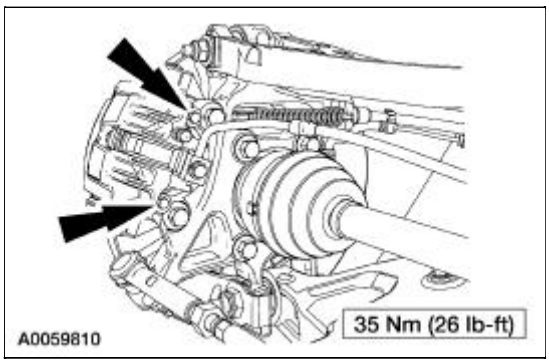
Removal and Installation



1. Using a clear suction device, remove brake fluid in the master cylinder reservoir until the reservoir is half full.

2. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

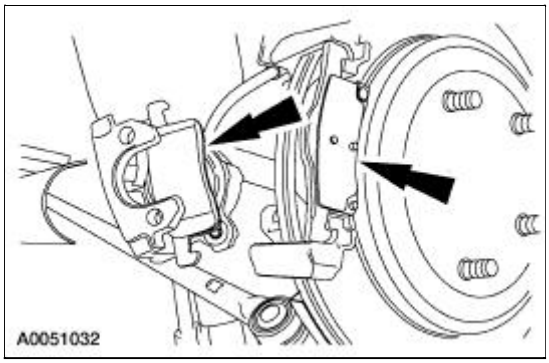
   Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .



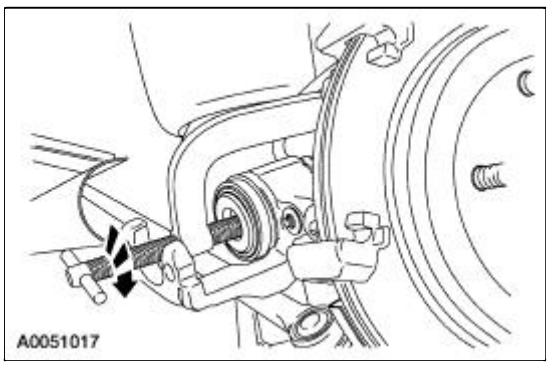
3. **CAUTION: Install new pads if worn to or past the specified thickness above the metal backing plate. Install new pads in complete axle sets.**

   Inspect the brake pads for wear or contamination. Install new pads if worn to or past specification.

4. Remove the anchor housing spring.
   - Squeeze at the center of the spring until it unlatches from the brake caliper at both ends.
   - Rotate the spring, then remove it from the caliper housing.



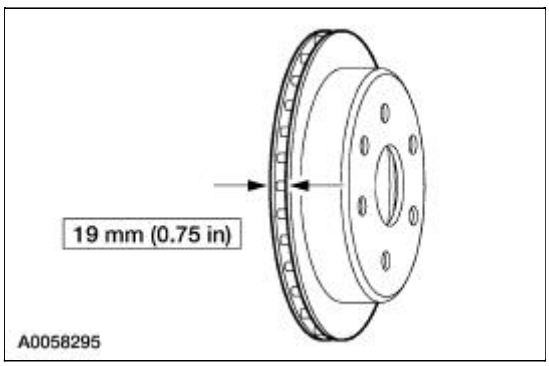
5. Remove the caps and brake caliper bolts.



6. **CAUTION: Do not allow the brake caliper to hang by the flexible brake hose.**

   NOTE: It is not necessary to remove the rear wheel brake hose when carrying out this procedure.

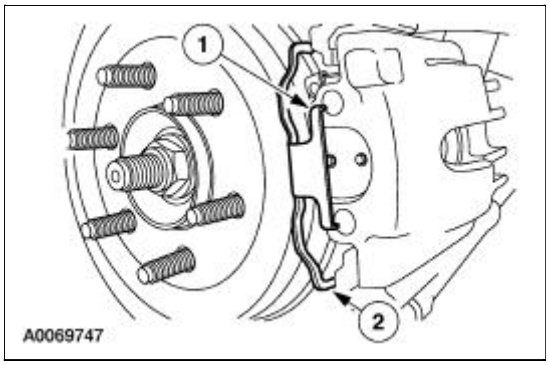
   Remove the caliper and the brake pads.



7. Using a suitable clamp, press the piston into the caliper.

8. **CAUTION: If machining is necessary, use a hub-mount brake lathe to machine the rear brake disc.**

   Inspect the brake disc. If it is scored it must be resurfaced.

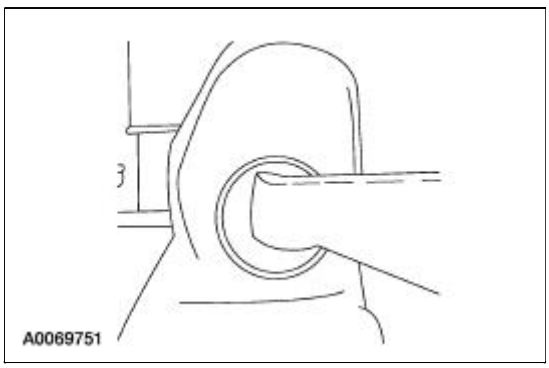


9. **NOTE:** Also, resurface the rear brake disc if a test drive has identified vibration transmitted through the steering wheel, seat, or brake pedal while braking.

   Measure the rear brake disc, and resurface as necessary. Install a new rear brake disc if beyond specification.

10. To install, reverse the removal procedure.

11. Install the anchor housing spring.
    1. Insert the upper anchor housing spring end into the brake caliper cavity.
    2. Rotate the anchor housing spring and position the lower arm onto the anchor plate.

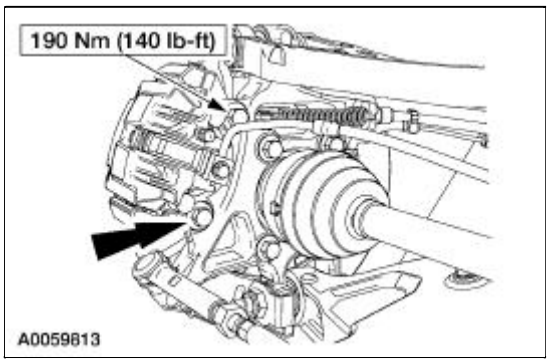


12. Position the upper arm onto the anchor plate, then press down and inward until it is correctly seated and latched into the brake caliper cavities.

13. **NOTE:** The latch **MUST** be positioned as shown.

    Verify that the anchor housing spring is correctly latched.

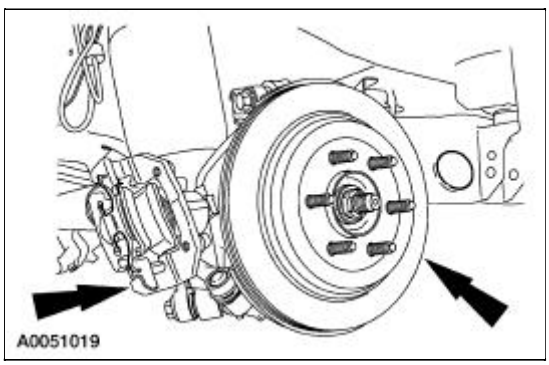
Brake Disc



Removal and Installation

1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .



2. **NOTE:** When removing the rear disc brake caliper in this procedure, it is not necessary to disconnect the rear wheel brake hose.

   Remove the brake caliper anchor plate bolts.

3. **CAUTION: Do not allow the brake caliper to hang by the flexible brake hose.**

   Remove the anchor plate and caliper as an assembly.

4. **NOTE:** If the brake disc binds on the parking brake shoe, remove the adjustment hole access plug and contract the parking brake shoe.

   Remove the brake disc.

5. **CAUTION: If machining is necessary use a hub-mount brake lathe to machine the**

rear brake disc.

NOTE: Inspect the brake disc. If it is scored, it must be resurfaced. Also, resurface the rear brake disc if a test drive has identified vibration transmitted through the steering wheel, seat or brake pedal while braking.

Measure the rear brake disc, and resurface as necessary. Install a new rear brake disc if beyond specification.

6. To install, reverse the removal procedure.

Caliper

Special Tool(s)

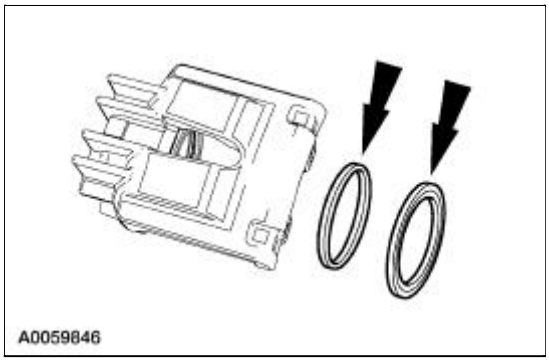
 ST1255-A	Adapter for 303-224 (Handle) 205-153 (T80T-4000-W)
 ST1588-A	Installer, Rear Wheel Hub Dust Seal 206-053 (T92P-2588-AH)

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1	ESA-M6C25-A

Disassembly

1. Remove the rear disc brake caliper. For additional information, refer to Brake Caliper in this section.



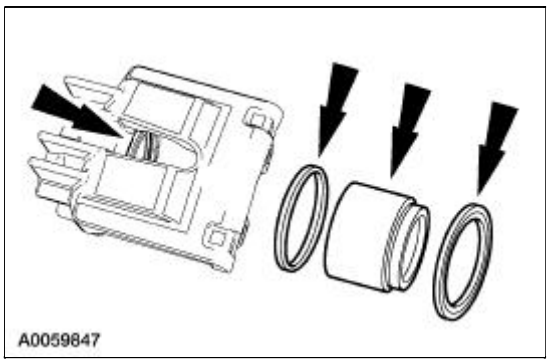
2. Drain the remaining brake fluid from the rear disc brake caliper.

3. Secure the rear disc brake caliper in a vise.

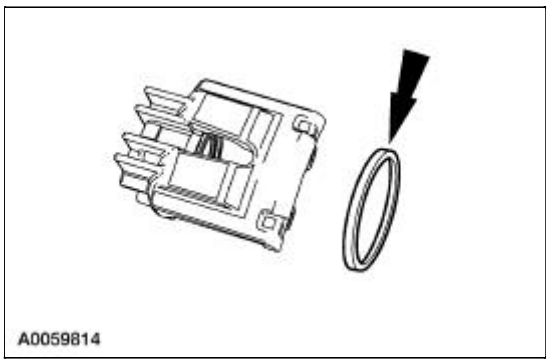
4. Remove the caliper piston.
    1. Place a block of wood between the caliper bridge and the caliper piston.
    2. Apply low air pressure to the fluid port in the rear disc brake caliper.
    3. Force out the caliper piston to the block of wood.
    4. Remove the block of wood and the caliper piston.

5. **NOTE:** Do not hone the cylinder bore. Caliper pistons are not available for honed cylinder bores. If the rear disc brake caliper cylinder bore or piston is excessively scored or corroded, install a new rear disc brake caliper.

   Remove and discard the piston seal and dust boot.

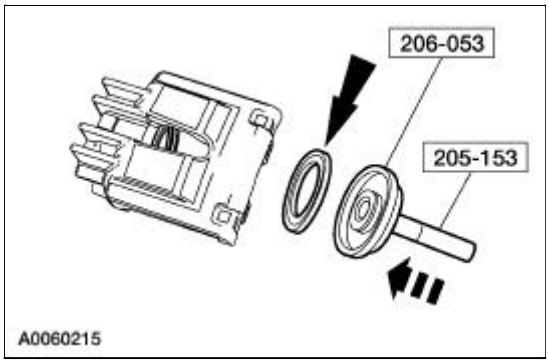


Assembly



CAUTION: Never reuse the piston seal or dust boot.

NOTE: Never reuse brake fluid that has been drained from the hydraulic system or has been allowed to stand in an open container for an extended period of time.



1. Lubricate the following with brake fluid.
    - Cylinder bore.
    - Piston seal.
    - Caliper piston.
    - Dust boot.

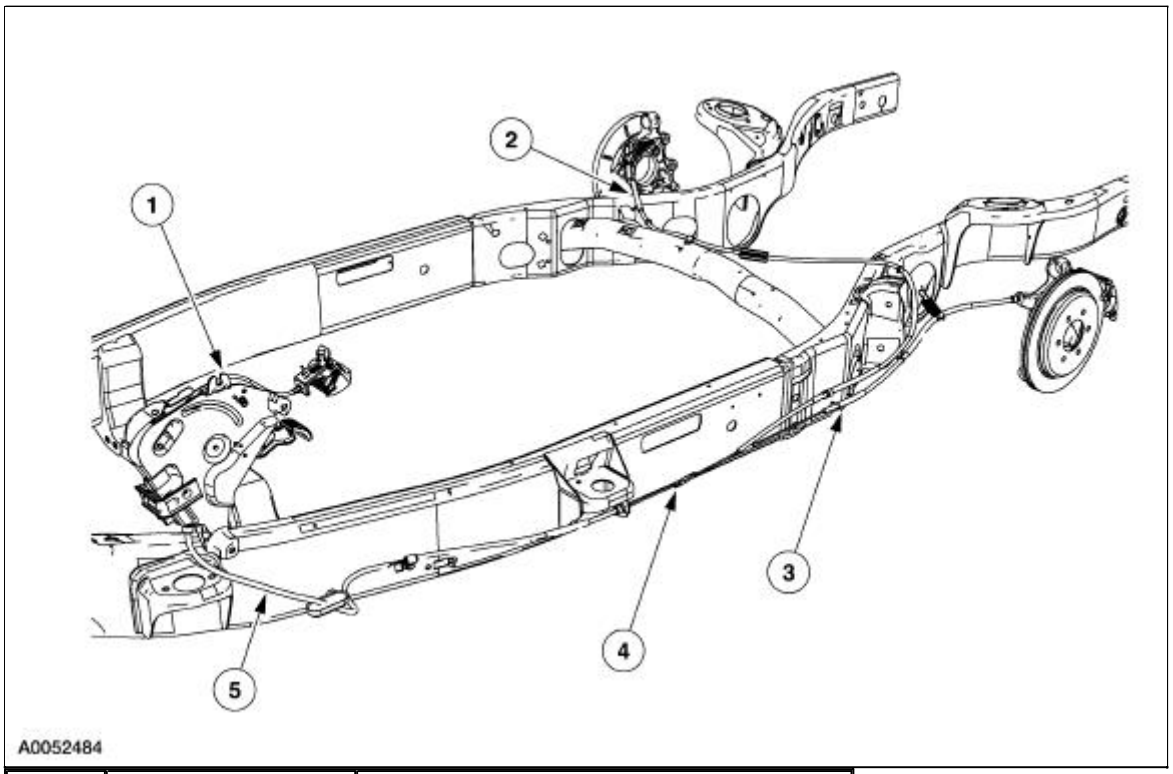
2. Install the piston seal.

3. Using the special tools, install the dust boot.

4. **CAUTION: Be careful not to damage or dislodge the piston seal.**

   CAUTION: Insert the caliper piston squarely into the caliper bore.

   Install the caliper piston.
   1. Place the brake caliper in a vise.
   2. Place the piston squarely against the dust boot.
   3. While applying shop air into the brake caliper, push the piston squarely into the brake caliper bore.



5. Install the rear disc brake caliper. For additional information, refer to Brake Caliper in this section.

Electronic Parking Brake Release

The parking brake release uses an electrically operated solenoid to release the park brake. The solenoid is mounted on the parking brake control. With the brake pedal depressed and the gear shift lever shifted from the park position, the solenoid retracts to release the parking brake.

Operation of the actuator is controlled through release and return relays. Output from the electronic cluster controls the opening and closing of the relay contacts. The cluster actually provides a path to ground for the coils in the relays. Actuation of the cluster depends on input signals from the brake pedal switch, park brake switch and a gear shift-operated micro switch.

Automatic Parking Brake Release Components

2	—	Parking brake release solenoid
3	—	Floor shift mounted actuator switch
4	—	Column mounted actuator switch (Expedition only)

Parking Brake

Principles of Operation—Automatic Parking Brake Release (Lincoln Navigator)

The automatic parking brake release consists of the following components:

- Release actuator
- Electromechanical solenoid
- Gearshift lever position switch
- Parking brake warning indicator switch
- Wiring harnesses connecting the various components

When the parking brake is set and the gearshift lever is moved to "R" or "D", the gearshift lever position switch closes. The instrument cluster module energizes the parking brake return solenoid. Once the parking brake is released, the parking brake warning indicator switch opens, and the instrument cluster module's second signal releases the actuator. The solenoid is energized only when both the parking brake warning indicator switch and the gearshift lever position switch are closed with the brake pedal applied.

Inspection and Verification

1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   Check the operation of the parking brake with the vehicle on a hoist and the parking brake control fully released. Check for any cable damage and install a new cable as necessary.

2. Check the parking brake by depressing the parking brake control pedal. The parking brake must fully set upon full apply.

3. Inspect to determine if one of the following mechanical or electrical concerns apply:

Visual Inspection Chart

Mechanical	Electrical
● Release actuator ● Electromechanical solenoid ● Gearshift lever position switch ● Parking brake warning indicator switch	● Battery junction box (BJB) fuses: ■ 18 (10A) ■ 21 (15A) ● Wiring harness ● Connectors or connections ● Circuitry

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
● Parking brake will not apply	● Clearance.	● CHECK the brake cable for slack, or breaks. ADJUST or REPAIR as necessary.
	● Grease-soaked parking brake shoe linings.	● REPAIR the source of the leak and INSTALL a new parking brake shoe and lining.
	● Binding linkage.	● CHECK for linkage binding and misalignment. LUBRICATE all friction points.
	● Parking brake shoe and lining.	● INSTALL a new parking brake shoe and lining. CHECK the drum-in-hat surface for scoring and INSTALL new as necessary. REFER to Section 206-04 .
	● Worn or damaged parking brake components.	● INSTALL new components as necessary.
● Parking brake will not release	● Parking brake control. ● Parking brake cables binding. ● Binding parking brake components.	● INSPECT and REPAIR as necessary.
● Automatic parking brake release does not operate	● Battery junction box (BJB) fuses: ■ 18 (10A) ■ 21 (15A) ● Gearshift lever position switch. ● Wiring. ● Release actuator. ● Retract relay.	● Go To Pinpoint Test A .
● Excessive lining wear	● Brake drag.	● CHECK the parking brake cables for a binding condition. INSPECT for broken or missing springs.
	● Rough brake disc drum surface.	● INSTALL a new brake disc if drum section is badly scored. REFER to Section 206-04 .

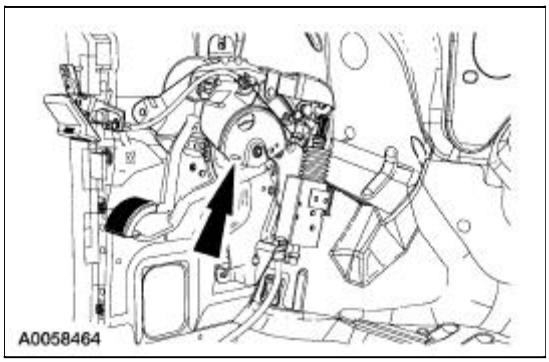
Pinpoint Tests

PINPOINT TEST A: AUTOMATIC PARKING BRAKE RELEASE DOES NOT OPERATE

Test Step	Result / Action to Take
A1 VERIFY THE CONDITION	
	Yes

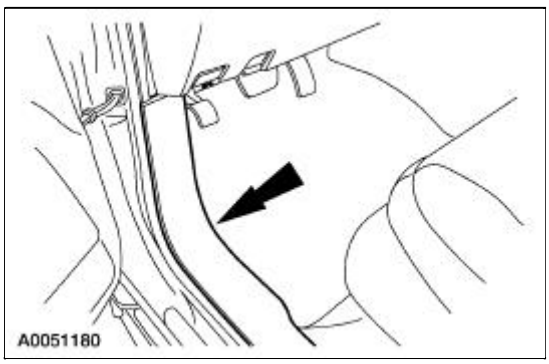
WARNING: Chock the wheels and make sure the service brake is pressed firmly down to prevent vehicle movement. Failure to follow these instructions can result in personal injury. ● Apply the parking brake. ● Key in ON position. ● Move the transmission shift lever from P to R, and to D. ● **Does the parking brake release actuate?**	System is OK. RETURN the vehicle to the customer. **No** GO to A2.
A2 CHECK BATTERY JUNCTION BOX (BJB) FUSE 18 (10A) AND FUSE 21 (15A)	
● Check BJB fuses 18 (10A) and 21 (15A). ● **Are the fuses okay?**	**Yes** GO to A3. **No** INSTALL new fuses. CHECK the system for normal operation.
A3 CHECK THE PARKING BRAKE RELEASE SOLENOID	
● Disconnect: Parking Brake Release Solenoid C2132. ● Connect a fused (15A) wire between parking brake release motor pin 1 and ground. ● Momentarily connect a fused (15A) wire between parking brake release motor pin 2 and battery. ● **Does the parking brake release actuate?**	**Yes** GO to A4. **No** INSTALL a new parking brake release solenoid. REFER to Parking Brake Release Solenoid in this section. TEST the system for normal operation.
A4 CHECK THE PARKING BRAKE RETRACT RELAY	
● Carry out the relay component test for the parking brake retract and release relays. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Do the relays pass the component test?**	**Yes** GO to A5. **No** INSTALL a new parking brake retract or release relay. TEST the system for normal operation.
A5 CHECK CIRCUIT 1892 (OG/BK) FOR AN OPEN	
● Disconnect: Parking Brake Release Relay C2244. ● Measure the resistance between parking brake release motor C2132 pin 2, circuit 1892 (OG/BK), harness side and parking brake release relay C2244 pin 3, circuit 1892 (OG/BK), harness side. ● **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to A6.
A6 CHECK CIRCUIT 57 (BK) FOR AN OPEN	
● Measure the resistance between parking brake retract relay C2245 pin 4, circuit 57 (BK), harness side and ground; and between parking brake release relay C2244 pin 4, circuit 57 (BK), harness side and ground. ● **Are the resistances less than 5 ohms?**	**Yes** GO to A7. **No** REPAIR the circuit. TEST the system for normal operation.
A7 CHECK CIRCUIT 3049 (BK/LG) FOR AN OPEN	
● Measure the resistance between parking brake retract relay C2245 pin 5, circuit 3049 (BK/LG), harness side and BJB fuse cavity 21 (15A), output side; and between parking brake release relay C2244 pin 5, circuit 3049	**Yes** GO to A8. **No**

(BK/LG), harness side and BJB fuse cavity 21 (15A) output side. ● **Are the resistances less than 5 ohms?**	REPAIR the circuit. TEST the system for normal operation.
A8 CHECK CIRCUIT 294 (WH/LB) FOR AN OPEN	
● Measure the resistance between parking brake retract relay C2245 pin 2, circuit 294 (WH/LB), harness side and BJB fuse cavity 18 (10A) output side; and between parking brake release relay C2245 pin 2, circuit 294 (WH/LB), harness side and BJB fuse cavity 18 (10A) output side. ● **Are the resistances less than 5 ohms?**	**Yes** GO to A9 . **No** REPAIR the circuit. TEST the system for normal operation.
A9 CHECK CIRCUIT 1794 (WH) AND CIRCUIT 1795 (GY) FOR AN OPEN	
● Disconnect: Instrument Cluster C220a. ● Disconnect: Instrument Cluster C220b. ● Measure the resistance between parking brake retract relay C2245 pin 1, circuit 1794 (WH), harness side and instrument cluster C220a pin 19, circuit 1794 (WH), harness side; and between parking brake release relay C2244 pin 1, circuit 1795 (GY), harness side and instrument cluster C220b pin 9, circuit 1795 (GY), harness side. ● **Are the resistances less than 5 ohms?**	**Yes** GO to A10 . **No** REPAIR the circuit(s). TEST the system for normal operation.
A10 CHECK THE PARK DETECTION SWITCH	
NOTE: The park detection switch is part of the brake shift interlock solenoid assembly and is not serviced separately. ● Disconnect: Park Detection Switch. ● Close the park detection switch contacts. ● Measure the resistance between park detection switch pin 1 and 2. ● **Is the resistance less than 5 ohms?**	**Yes** GO to A11 . **No** INSTALL a new park detection switch. REFER to Section 307-05 . TEST the system for normal operation.
A11 CHECK PARK DETECTION SWITCH CIRCUIT 1794 (WH) AND CIRCUIT 1795 (GY) FOR AN OPEN	
● Measure the resistance between park detection switch pin 1, circuit 1794 (WH), harness side and instrument cluster C220a pin 19, circuit 1794 (WH), harness side; and between park detection switch pin 2, circuit 1795 (GY) and instrument cluster C220b pin 9, circuit 1795 (GY). ● **Are the resistances less than 5 ohms?**	**Yes** CARRY OUT the instrument cluster diagnostics. For additional information, REFER to Section 413-01 . **No** REPAIR circuit 1794 (WH) or circuit 1795 (GY). TEST the system for normal operation.



Parking Brake Control

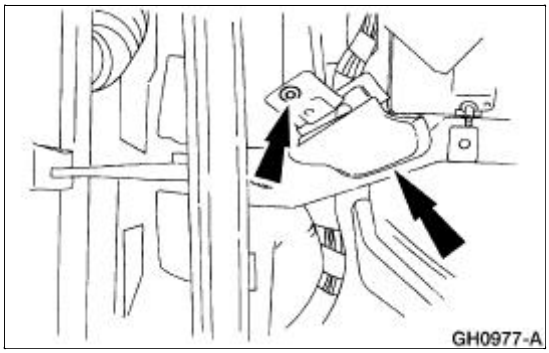
Removal and Installation



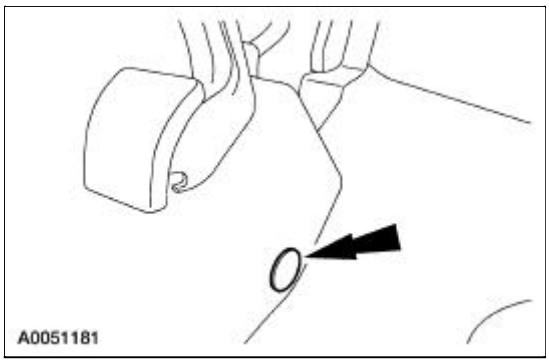
1. **NOTE:** The parking brake control is shown removed for clarity.

   Make sure tension on the parking brake cables is fully released.

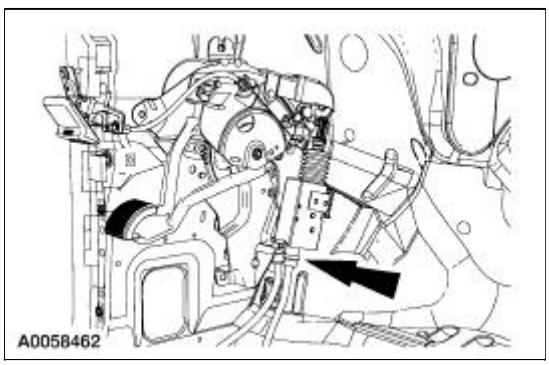
   - While a helper pulls down on the front cable, insert a pin through the park brake control frame and cam.



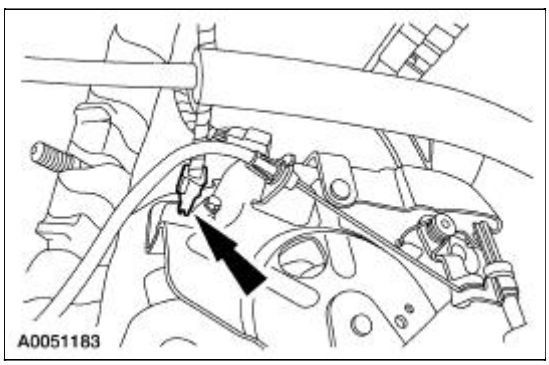
2. Remove the door scuff plate.



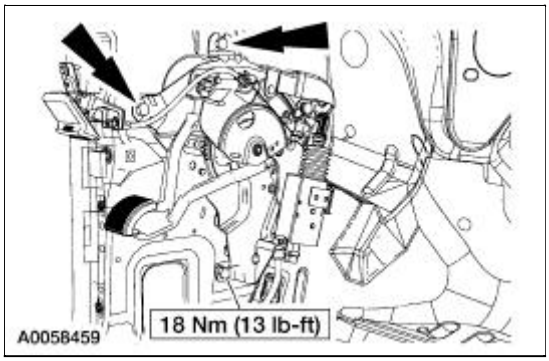
3. Remove the screws and the finish panel.
   - Pull the weatherstrip back to release the edge of the panel.



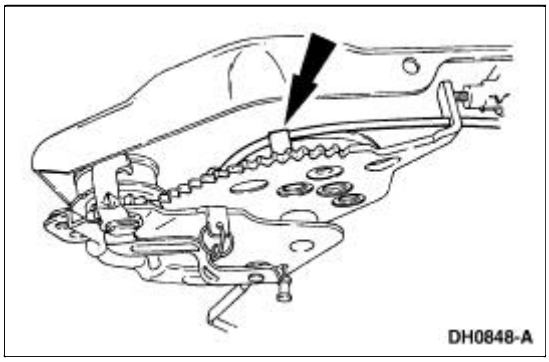
4. Remove the release handle bolt.



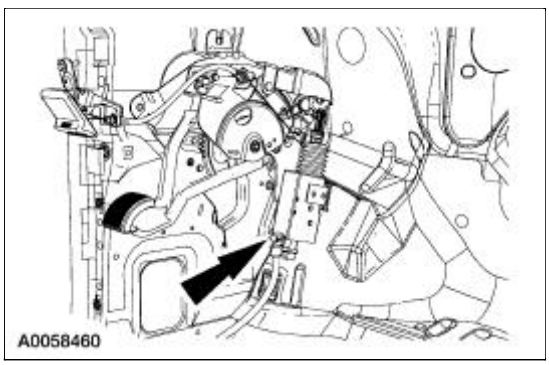
5. Remove the retainer and the cowl trim panel.



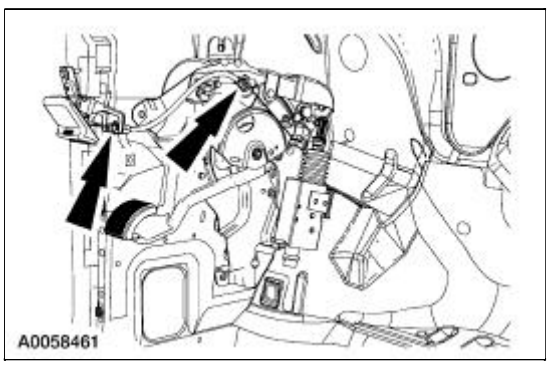
6. Disconnect the electrical connector at the solenoid.



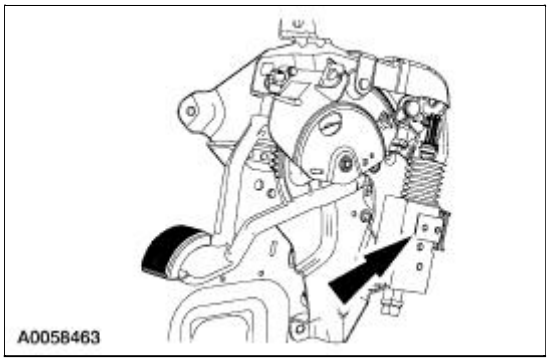
7. Disconnect the electrical connector at the park detection switch.



8. Remove the park brake control bolts.



9. Straighten the tab on the take-up spool.

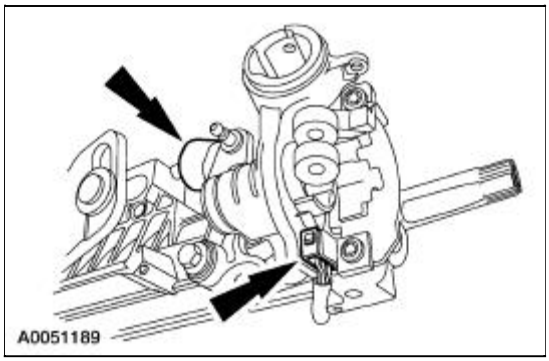


10. Disconnect the conduit and remove the park brake control.
    - Compress the conduit retainer to disconnect it from the control.

11. Remove the release handle and cable assembly.

12. Remove the release solenoid.
    - Pry the mounting bracket apart slightly to release the solenoid.

13. To install, reverse the removal procedure.



Parking Brake Release Switch

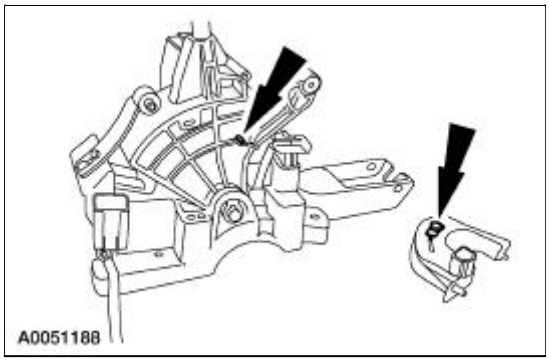
Removal and Installation

Column shift (Expedition only)

1. **NOTE:** The parking brake release switch is located on the steering column. It is serviced as an assembly with the brake shift interlock.

   Remove the brake shift interlock/park brake release switch assembly. For additional information, refer to Section 307-05 .

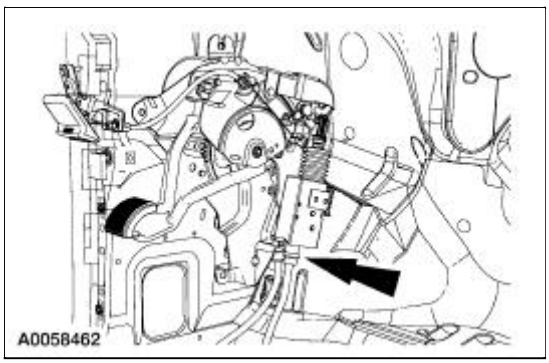
Floor shift



2. Remove the floor shift selector lever. For additional information, refer to Section 307-05 .

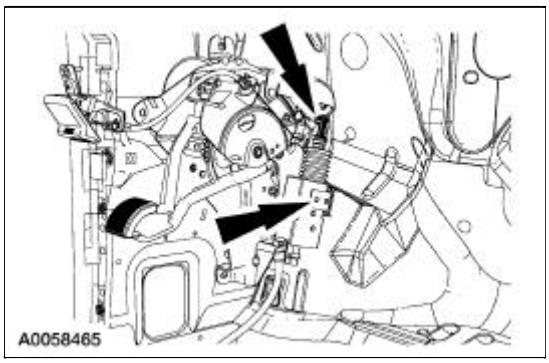
3. Remove the screws, disconnect the electrical connector and remove the switch.

All vehicles



4. To install, reverse the removal procedure.
   - Make sure the switch is correctly aligned with the extension on the shifter before installing the screws.

A0051188

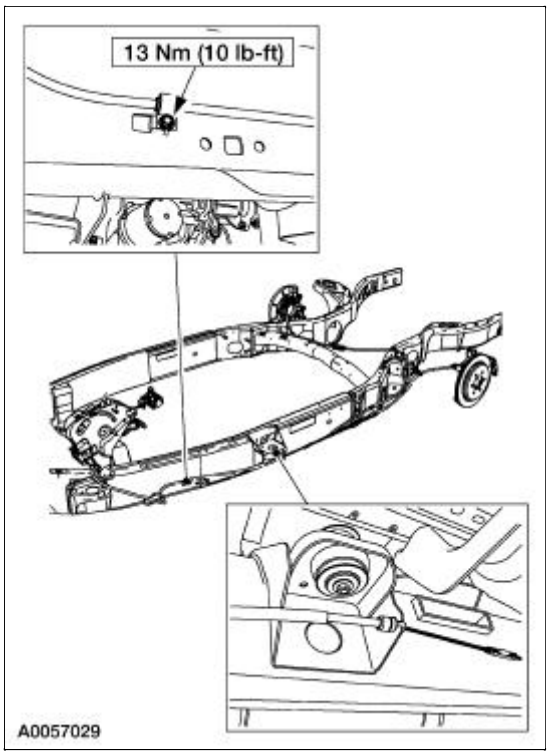


Parking Brake Release Solenoid

Removal and Installation

1. Disconnect the electrical connector.

2. Remove the solenoid.
   - Pry the mounting bracket apart slightly to release the solenoid.
   - Disengage the solenoid from the release lever.

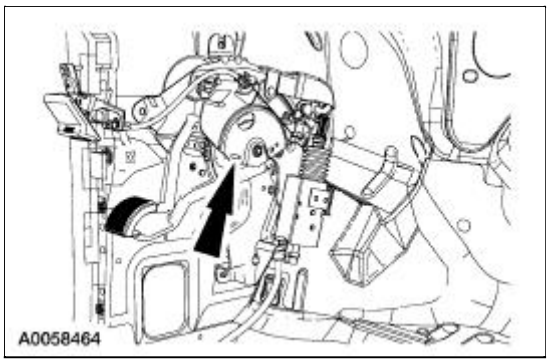


Parking Brake Cable —Front

Removal and Installation

1. Remove the parking brake control. For additional information, refer to Parking Brake Control in this section.

2. Remove the front parking brake cable and conduit.
   - Pry the rubber seal from the front floor pan.
   - Compress the retainer and release the conduit from the bracket.
   - Remove the front cable and conduit from the cable union.



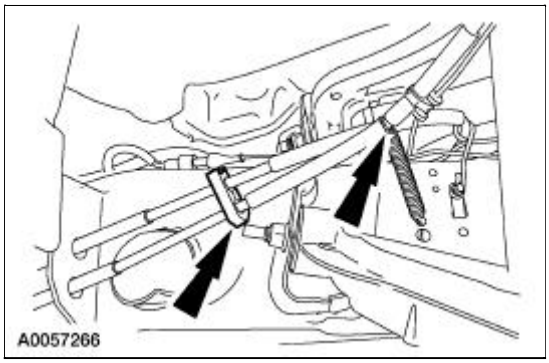
3. To install, reverse the removal procedure.

Parking Brake Cable —RH Rear

Removal and Installation

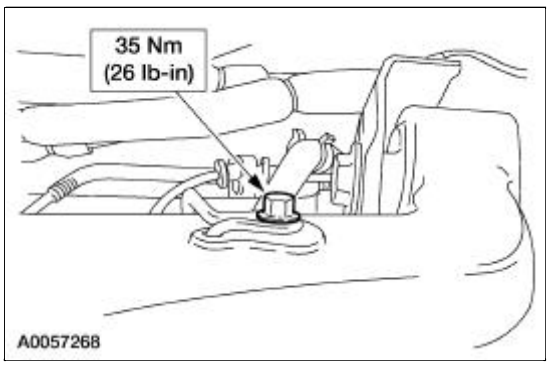
1. **NOTE:** The parking brake control is shown removed for clarity.

   Make sure tension on the parking brake cables is fully released
   1. While a helper pulls down on the front cable, insert a pin through the park brake control frame and cam.

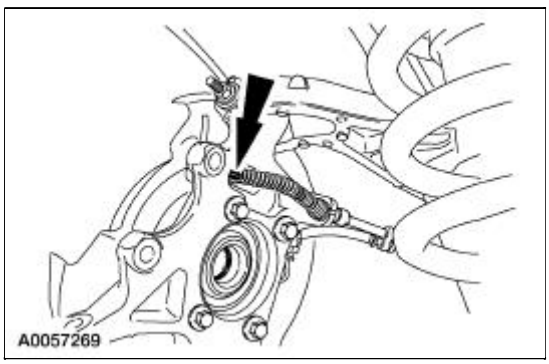


2. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   Raise and support the vehicle. For additional information, refer to Section 100-02 .



3. Disconnect the RH rear cable.
   - Remove the RH rear cable from the cable union.
   - Compress the cable clip and release the conduit from the equalizer.



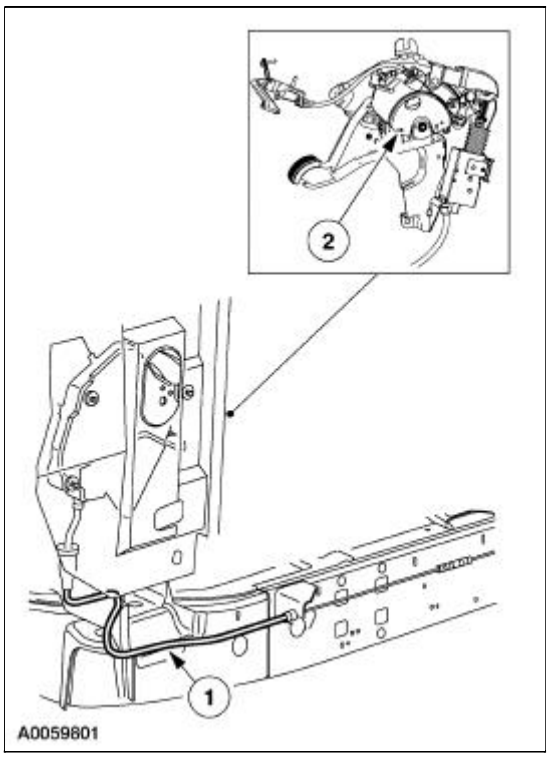
4. Remove the RH rear cable from the retaining clip.

5. Remove the wireform bracket from the upper control arm.

6. Compress the retainer and release the conduit, then unclip the cable end from the lever.

7. To install, reverse the removal procedure.

Parking Brake Shoes



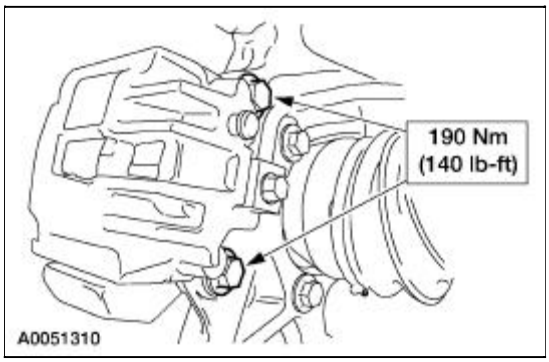
Special Tool(s)

 ST1468-A	Gauge, Brake Adjusting 206-D002 (D81L-1103-A) or equivalent

Removal and Installation

1. **NOTE:** Verify that the parking brake control (2780) is fully released.

   Relieve the tension on the parking brake system.
   1. Pull the front parking brake cable and conduit (2853).
   2. Insert a 4 mm (5/32-inch) drill bit or equivalent retainer.



2. Remove the rear tire and wheel assembly. For additional information, refer to Section 204-04 .

3. **CAUTION: To prevent damage to the brake hose, do not allow the disc brake caliper to hang suspended from the hose.**

   Remove the disc brake caliper and anchor plate.

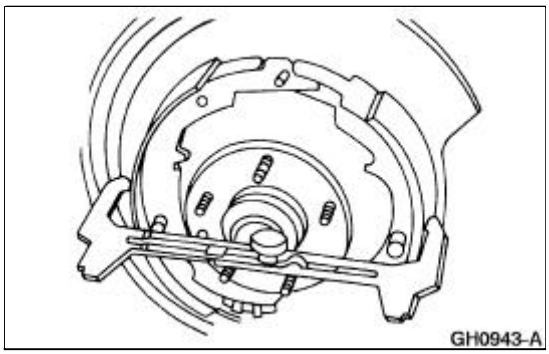
   - Remove the two bolts and lift the disc brake caliper and brake pads and anchor plate off the brake disc.

- Using mechanics wire, position the disc brake caliper brake pads and anchor plate aside.
- Remove the brake disc.

4. **NOTE:** Wheel hub has been removed for clarity.

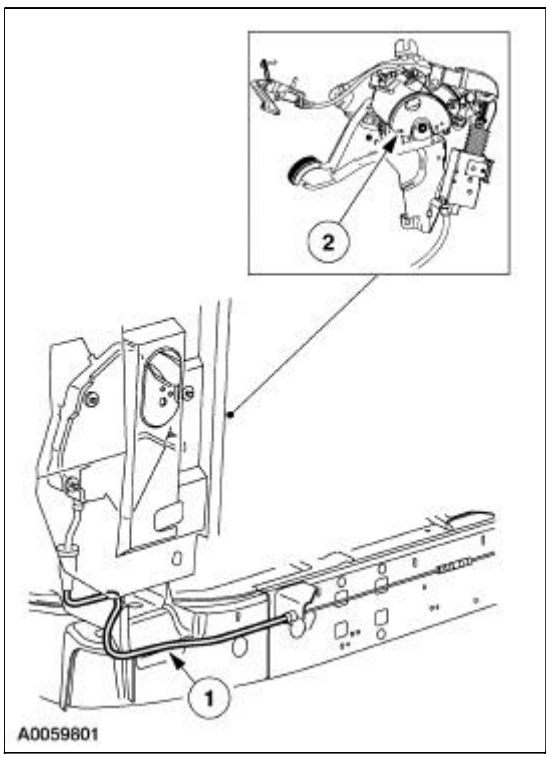
   Remove the brake shoe components in the following order:
   1. Retracting spring
   2. Adjusting screw spring
   3. Adjuster screw
   4. Hold down springs
   5. Brake shoe and linings

5. Inspect the components for excessive wear or damage and install new as required.



6. **WARNING: Always remove any corrosion, dirt or foreign material present on the mounting surfaces of the wheel, the surface of the wheel or the surface of the wheel hub, brake drum or brake disc that contacts the wheel. Installing wheels without correct metal-to-metal contact at the wheel mounting surfaces can cause the wheel nuts to loosen and come off while the vehicle is in motion, causing loss of control.**

NOTE: Before installation, lubricate the applied parking brake shoe at points where it contacts the wheel knuckle using Silicone Brake Caliper Grease and Dielectric Compound D7AZ-19A331-A (Motorcraft WA-10) or an equivalent silicone compound meeting Ford specification ESE-M1C171-A.

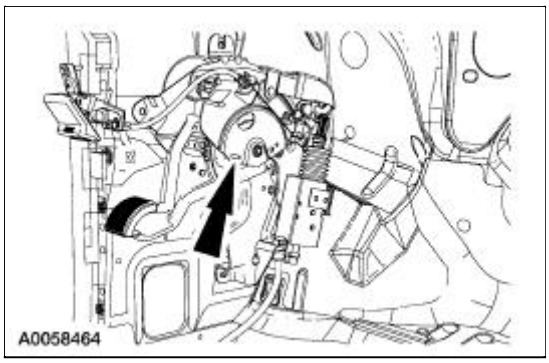


To install, reverse the removal procedure.

- Use the Brake Adjusting Gauge to measure the inside diameter of the drum position of the rear brake disc.
- **NOTE:** Make sure the shoes are correctly centered. Take measurement across the center of the shoes.

  Use the Brake Adjusting Gauge to set the rear brake shoe and lining diameter to 0.45 mm (0.018 in) less than the inside diameter of the drum portion of the rear brake disc.

7. Apply tension to the parking brake cable system.
   1. Hold the front parking brake cable and conduit taut.
   2. Remove the retainer from the parking brake control.



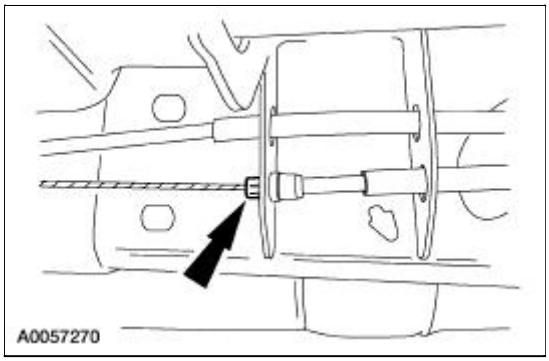
8. Check the operation of the parking brake.

Parking Brake Cable —LH Rear

Removal and Installation

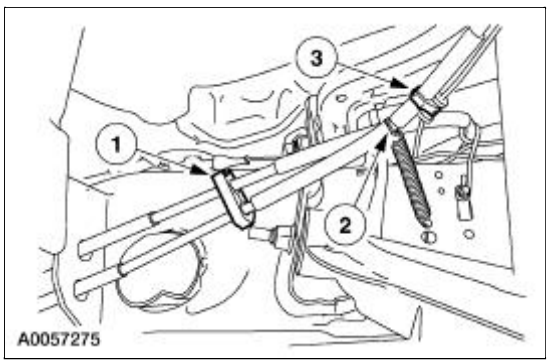
1. **NOTE:** The parking brake control is shown removed for clarity.

   Make sure tension on the parking brake cables is fully released
   1. While a helper pulls down on the front cable, insert a pin through the park brake control frame and cam.

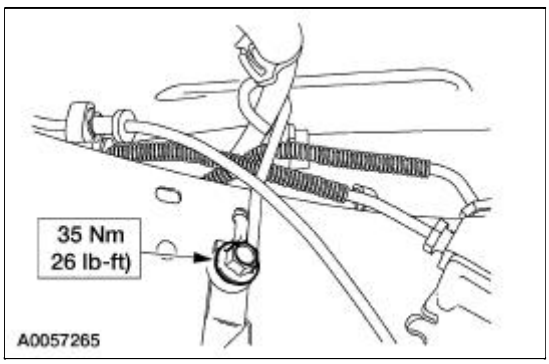


2. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

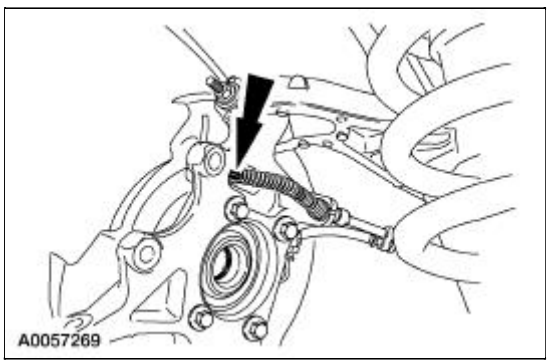
   Raise and support the vehicle. For additional information, refer to Section 100-02 .



3. Separate the LH rear cable from the equalizer.



4. Remove the conduit from the bracket.
   1. Compress the retainer.
   2. Remove the conduit from the bracket.



5. Remove the LH rear cable.
    1. Remove the LH rear cable from the retaining clip.
    2. Disconnect the spring.
    3. Disconnect the ABS sensor wire.

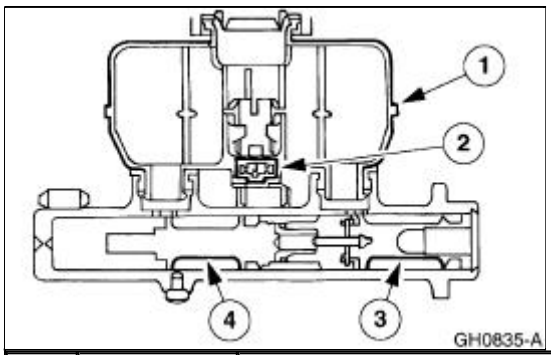
6. Remove the wireform bracket retaining screw.

7. Compress the retainer and release the conduit, then unclip the cable end from the lever.

8. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft
Brake master cylinder nuts	22-28	17-20
Brake pedal bracket nuts and bolt	21-29	16-21
Brake pressure switch	14-20	11-14



Hydraulic Brake Actuation

The brake pedal is connected to the power brake booster, which is connected to the brake master cylinder. The brake pedal is adjustable, either non-memory or memory is available. When the brake pedal is depressed, brake fluid is pushed from the master cylinder through the metal tubing and flexible hoses to the front disc brake calipers and the rear disc brake calipers. The front disc brake caliper pistons are forced outward against the brake pads, and contact the braking surface of the brake discs. The brake fluid enters the rear disc brake calipers, forcing the rear disc brake caliper pistons outward against the brake pads. The brake pads press against the braking surface on the brake discs. When the brake pedal is released, the pressure is relieved, returning the brake caliper pistons and the brake shoes and linings to the unapplied position.

The dual brake system is split front and rear with the front wheel brakes comprising one circuit and the rear wheel brakes, the other circuit.

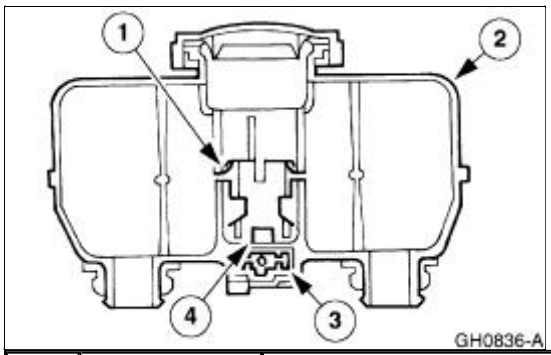
The ability of a brake system to stop the vehicle is dependent on the available traction.

Brake Master Cylinder

Item	Part Number	Description
1	2K478	Brake master cylinder reservoir
2	—	Brake master cylinder fluid level warning switch (part of 2K478)
3	2149	Primary piston (part of 2140)
4	2149	Secondary piston (part of 2140)

The brake master cylinder is a dual-piston type.

The brake master cylinder is assisted by a power brake booster. For additional information, refer to Section 206-07 .



The following conditions are considered normal, and are not indications that the brake master cylinder is in need of repair or replacement:

- Low brake fluid level detected without signs of leakage. This condition is caused by displacement of brake fluid from the brake master cylinder reservoir into the disc brake calipers to compensate for normal brake wear. Add brake fluid as needed.
- A momentary or slight ripple of brake fluid inside the brake master cylinder reservoir upon

application or release of the brake pedal.

- A trace of brake fluid found on the outside of the power brake booster below the brake master cylinder mounting flange. This condition results from the lubricating action of the brake master cylinder wiping seal.

Brake Fluid Level Warning Switch

Item	Part Number	Description
1	—	Float (part of 2K478)
2	2K478	Brake master cylinder reservoir
3	—	Brake fluid level warning switch (part of 2K478)
4	—	Magnet (part of 2K478)

The brake fluid level warning switch is an integral part of the brake master cylinder reservoir. It consists of a float containing a magnet and a reed switch mounted in the bottom of the brake master cylinder reservoir.

When the brake fluid in the brake master cylinder reservoir gets to a predetermined level, the floating magnet actuates the reed switch, causing the red brake warning indicator to illuminate. Loss of brake fluid from either the primary (front) or secondary (rear) system will cause this system to activate. If the brake fluid level warning switch is inoperative, a new brake master cylinder reservoir must be installed.

Lines and Hoses

CAUTION: Only Ford authorized inlet hydraulic brake tubes should be used. These tubes are of a specific design and new Ford authorized parts only should be installed.

Steel tubing with flex hoses are used in the hydraulic lines between the brake master cylinder and the hydraulic control unit. Steel tubing is used between the hydraulic control unit and the front and rear hoses.

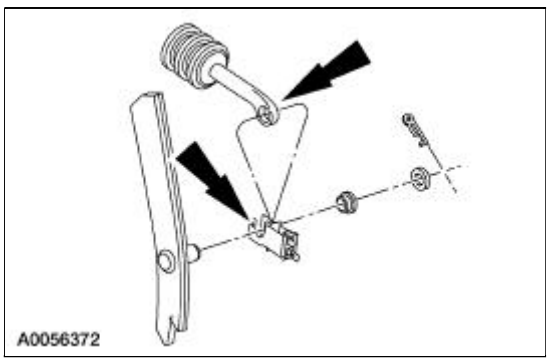
Double flared brake tubing should provide good leakproof connections.

When replacing hydraulic brake tubing, hoses, or connectors, tighten all connections securely. After replacement, bleed the brake system. For additional information, refer to Section 206-00.

Hydraulic Brake Actuation

Refer to Section 206-00 .

Brake Pedal and Bracket



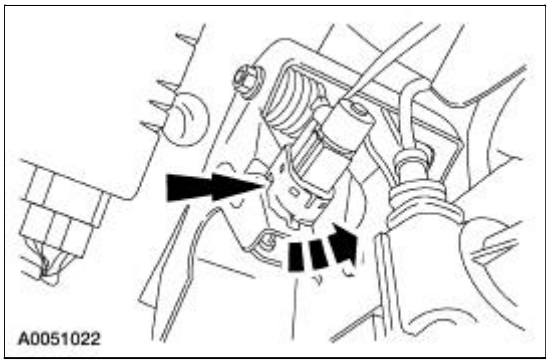
Removal and Installation

1. **CAUTION: The brake pedal and the accelerator pedal must be in the same position when installing a new cable or a new pedal. The pedals must be in the all the way forward or all the way rearward position.**

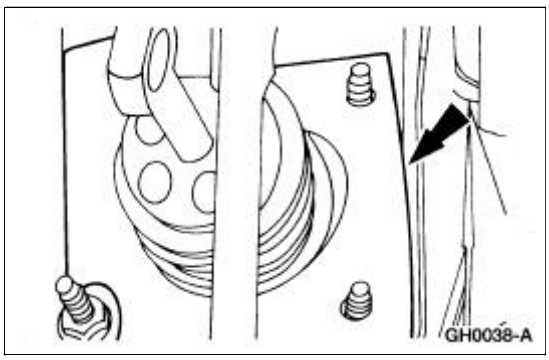
   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. **CAUTION: Do not install the cruise control deactivation switch after detaching it from the brake pedal bracket. Always install a new unit in its place.**

   Remove the stoplight switch self-lock pin and slide the stoplight switch, booster push rod and the bushing off the brake pedal pin.

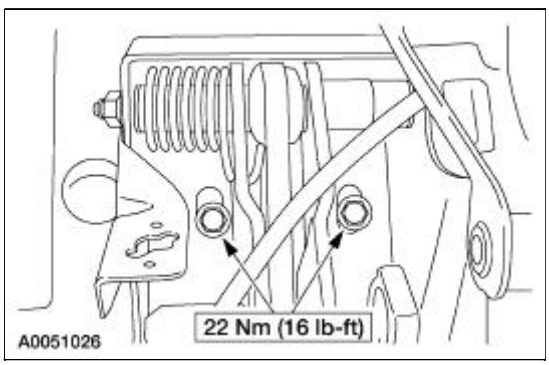


3. Remove the accelerator pedal-to-brake pedal cable.



4. **CAUTION: The booster pushrod must be installed with pushrod offset, if present, pointing downward.**

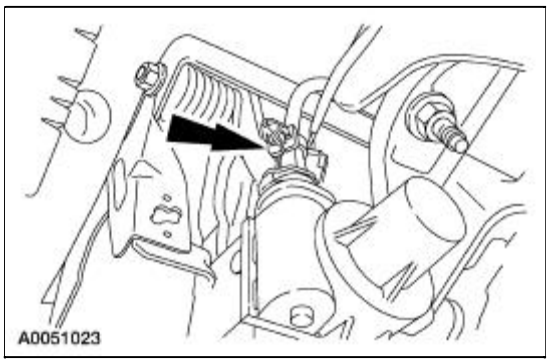
   Turn the cruise control deactivation switch counterclockwise and detach it from the brake pedal bracket.



5. Remove the bulkhead sound insulator.

6. Remove the four brake pedal bracket nuts.

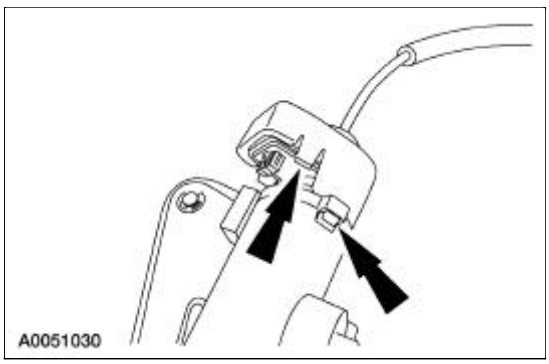
7. Remove the brake pedal bracket bolts, and remove the brake pedal and bracket.



8. To install, reverse the removal procedure.

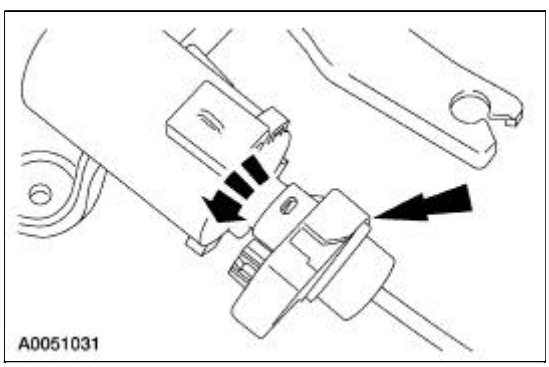
Brake Pedal Motor Cable

Removal and Installation



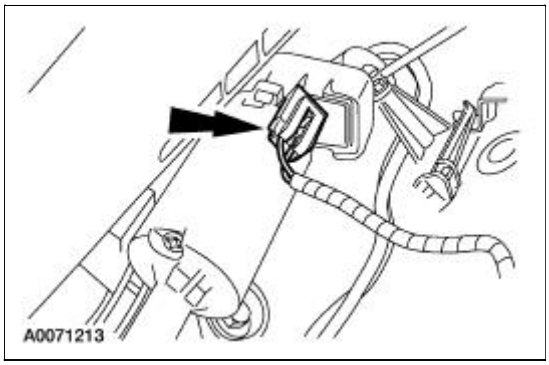
All vehicles

1. Disconnect the brake pedal motor cable at the brake pedal and bracket assembly.

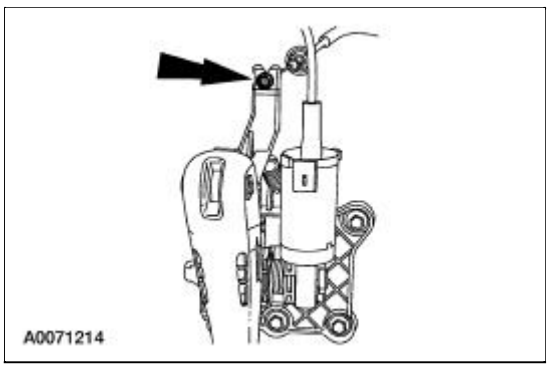


Vehicles with memory

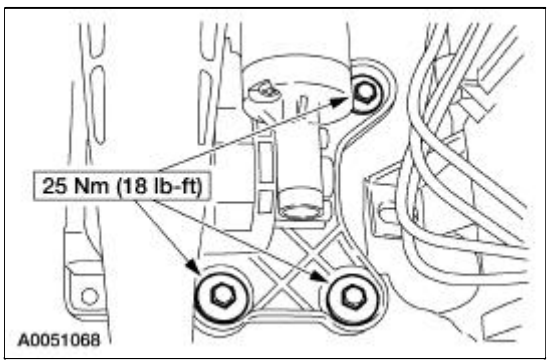
2. Unclip the protective cover from the memory potentiometer.



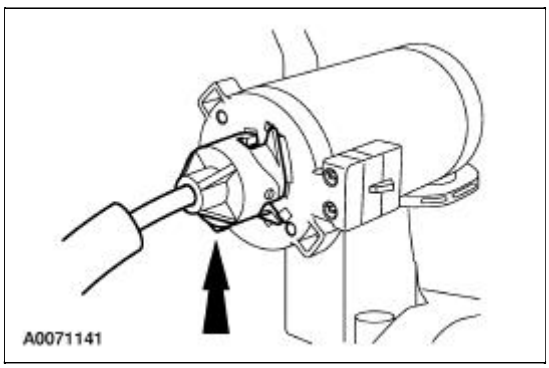
3. Remove the memory potentiometer and cable from the adjustable pedal motor.



Vehicles without memory



4. Disconnect the drive motor electrical cnnector.



5. Disconnect the accelerator cable from the accelerator pedal.

6. Remove the bolts and the accelerator pedal.

7. Disconnect the cable from the adjustable pedal motor.

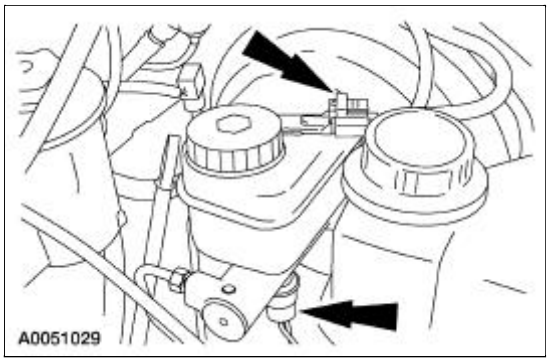
All vehicles

8. To install, reverse the removal procedure.

Brake Master Cylinder

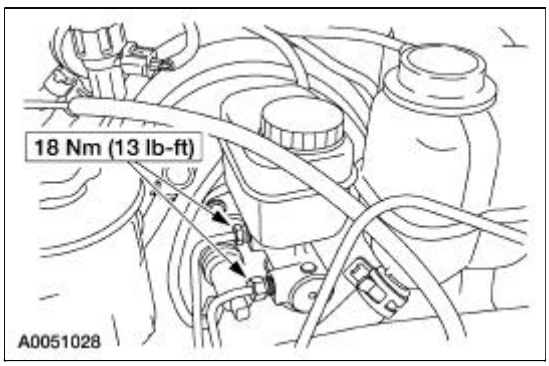
Removal and Installation

All vehicles



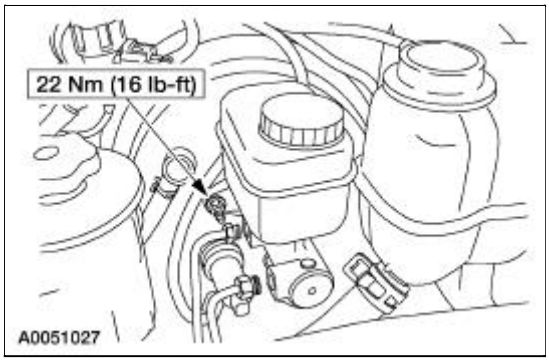
1. Disconnect the battery negative cable. For additional information, refer to Section 414-01 .

Vehicles with cruise control



2. Disconnect the brake pressure switch.

All vehicles



3. Disconnect the brake fluid level switch.

4. Disconnect the brake lines and plug the master cylinder ports.

5. Remove the two nuts and the brake master cylinder.

6. To install, reverse the removal procedure.
    - Bleed the brake system. For additional information, refer to Section 206-00 .

Torque Specifications

Description	Nm	lb-ft
Power brake booster nuts	25	18

Brake Booster

The power brake booster:

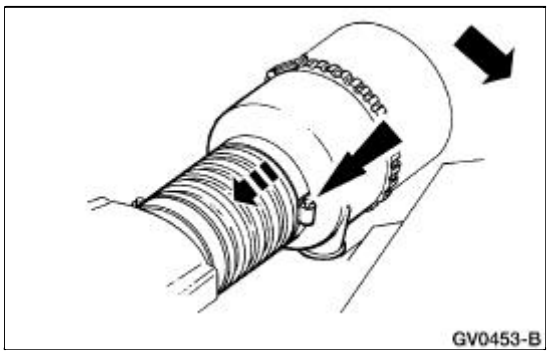
- is a dual diaphragm, vacuum-assisted power brake booster.
- reduces brake pedal pressure and travel distance.
- is divided into separate vacuum and atmospheric pressure chambers by a diaphragm.

If the power assist fails, the brake system will continue to operate with increased brake pedal effort.

Hose and Check Valve

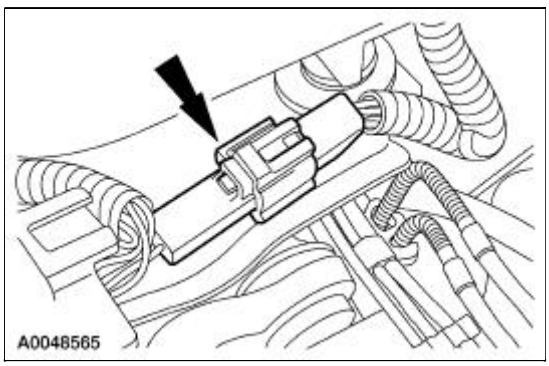
The power brake booster check valve:

- closes when the engine is turned off.
- in the closed position, traps engine vacuum in the power brake booster.
- retains vacuum to provide several power-assisted brake applications with the engine off.



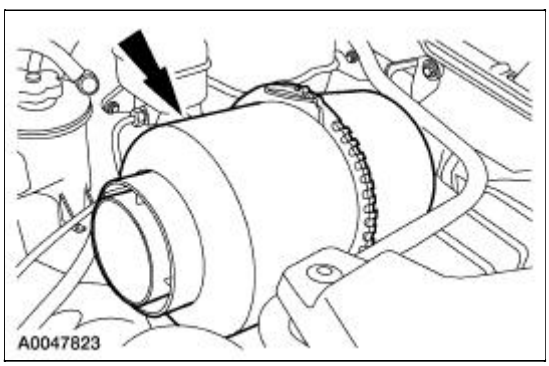
Power Brake System

Refer to Section 206-00 .

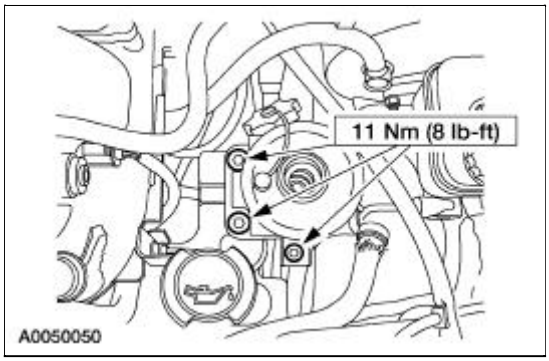


Brake Booster

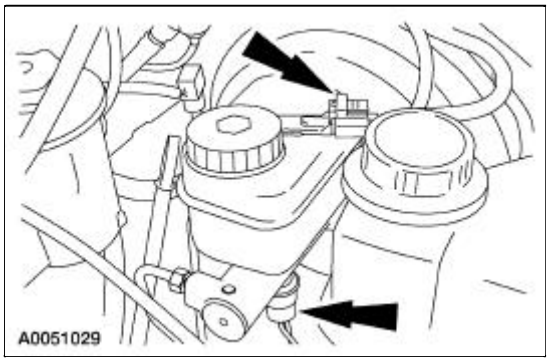
Removal and Installation



1. Disconnect the battery negative cable. For additional information, refer to Section 414-01 .
2. Loosen the clamp and separate the air cleaner outlet tube and resonator from the air cleaner.

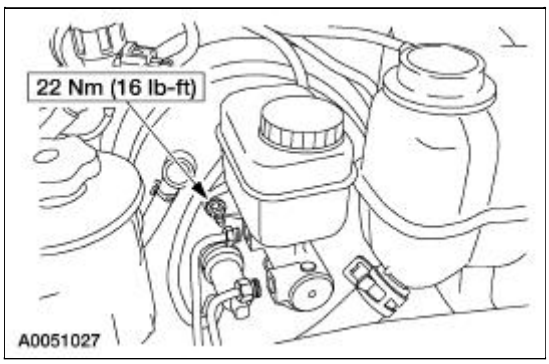


3. Disconnect the mass air flow (MAF) sensor electrical connector.

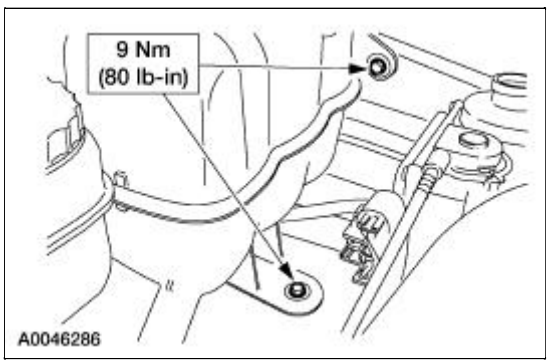


4. Lift the air cleaner assembly from the air cleaner tray.

5. Remove the screws and position aside the power steering reservoir.

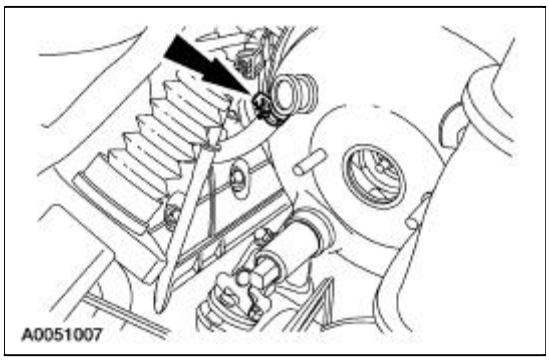


6. Disconnect the brake fluid level switch and if equipped, the brake pressure switch.

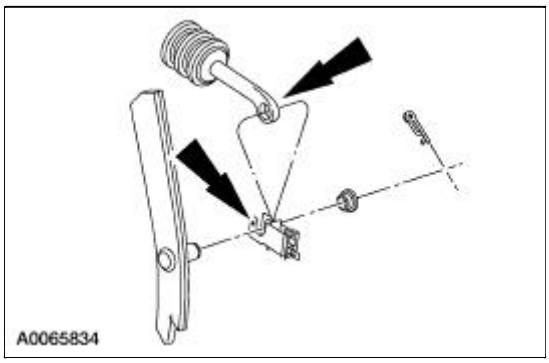


7. **NOTE:** Support the master cylinder with a wire tie or mechanics wire.

   Remove and discard the two nuts and position the master cylinder aside.

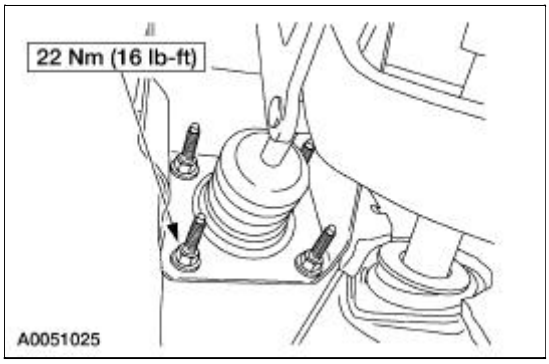


8. Remove the mounting bolts for the degas bottle and position aside.



9. If equipped, disconnect the wiring at the pedal travel sensor and solenoid.

10. Release the clamp and disconnect the hose.



11. Remove the pin, washer, bushing and switch, and disconnect the booster pushrod.

12. Remove the nuts and the brake booster.
    - To access the retaining nuts, fold back the sound insulation.

13. **NOTE:** The booster pushrod must be installed with the pushrod offset pointing downward.

    To install, reverse the removal procedure.
    - Use new nuts when installing the master cylinder.

Anti-Lock Control

The 4-wheel, 4-channel anti-lock brake system (4WABS) consists of the following components:

- Anti-lock brake control module
- Front wheel speed sensor
- Front wheel speed sensor ring
- Hydraulic control unit
- Rear wheel speed sensor
- Rear wheel speed sensor ring
- Yellow ABS warning indicator

Anti-Lock Control

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025B

Refer to Wiring Diagrams Cell 42 , ABS for schematic and connector information.

Principles of Operation

The anti-lock-brake control module receives wheel speed readings from each anti-lock brake sensor and processes this information to determine if an ABS event is necessary. The anti-lock brake sensor electrically senses each tooth of the anti-lock brake sensor indicators as it passes through the anti-lock brake sensor magnetic field.

The anti-lock brake control module continuously monitors and compares the rotational speed of each wheel and, when it detects an impending wheel lock, modulates brake pressure to the appropriate brake caliper. This is accomplished by triggering the hydraulic control unit (HCU) to open and close the appropriate solenoid valves. Once the affected wheel returns to normal speed, the anti-lock brake control module returns the solenoid valves to their normal position, and normal (base) braking resumes.

The anti-lock brake control module is self-monitoring. When the ignition switch is turned to the RUN position, the anti-lock brake control module will do a preliminary electrical check, and at approximately 20 km/h (12 mph) the pump motor is turned on for approximately one-half second. Any malfunction of the ABS will cause the ABS or anti-lock brake system (ABS) to shut off and the yellow anti-lock brake warning indicator to illuminate. However, the power assist braking system functions normally.

Electronic Brake Distribution

The electronic brake distribution (EBD) controls rear brake pressure and acts as an electronic proportioning valve. It is controlled by the anti-lock brake control module. When EBD is disabled, the amber ABS warning indicator and the red brake warning indicator will illuminate.

Inspection and Verification

NOTE: The anti-lock brake control module must be reconfigured when installed new. For additional information, refer to Section 418-01 .

1. Verify the customer concern by applying the brakes under different conditions.

2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Base brake concerns ● Tire pressure ● Tire size or mismatched tires ● Hydraulic control unit (HCU) ● Wheel speed sensor ring	● Battery junction box (BJB) fuses: ■ 16 (10A) ■ 102 (30A) ● Anti-lock brake control module ● Wheel speed sensors ● Brake on/off (BOO) switch ● Circuitry ● Connectors or connections ● EVAC and fill connector ● Wire harness routing

3. If the fault is not visually evident, connect the scan tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the scan tool menu. If the scan tool does not communicate with the vehicle:
   - check the connections to the vehicle.
   - check the ignition switch position.
   - check that the program card is correctly installed.

4. If the scan tool still does not communicate with the vehicle, refer to the scan tool manual.

5. Carry out the DATA LINK DIAGNOSTIC TEST. If the scan tool responds with:
   - CKT914, CKT915, or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
   - NO RESP/NOT EQUIP for anti-lock brake control module, Go To Pinpoint Test A .
   - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the self-test diagnostics for the anti-lock brake control module.

6. If the DTCs retrieved are related to the concern, go to Anti-Lock Brake Control Module Diagnostic Trouble Code (DTC) Index to continue diagnostics.

7. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Anti-Lock Brake Control Module Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU is Defective	Anti-Lock Brake Control Module	CLEAR the DTCs. RETRIEVE the DTCs. If other DTCs are retrieved, REPAIR them. CLEAR the DTCs, and REPEAT the self-test. If DTC B1342 is retrieved, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module .
B1483	Brake Pedal Input Circuit Failure	Anti-Lock Brake Control Module	Go To Pinpoint Test B .
B1676	Battery Pack Voltage Out of Range	Anti-Lock Brake Control Module	Go To Pinpoint Test C .
B2477	Module Configuration Failure	Anti-Lock Brake Control Module	CONFIGURE the anti-lock brake control module. REFER to Section 418-01 . CLEAR the DTCs. REPEAT the self-test. If DTC B2477 is retrieved again, INSTALL a new anti-lock brake control module. REFER to Anti-Lock Brake System (ABS) Module . REPEAT the self-test.
C1095	Hydraulic Pump Motor Circuit Failure	Anti-Lock Brake Control Module	Go To Pinpoint Test D .
C1145	Speed Wheel Sensor RF Input Circuit Failure	Anti-Lock Brake Control Module	Go To Pinpoint Test E .
C1155	Speed Wheel Sensor LF Input Circuit Failure	Anti-Lock Brake Control Module	Go To Pinpoint Test E .
C1165	Speed Wheel Sensor RR Input Circuit Failure	Anti-Lock Brake Control Module	Go To Pinpoint Test E .
C1175	Speed Wheel Sensor LR Input Circuit Failure	Anti-Lock Brake Control Module	Go To Pinpoint Test E .
C1233	Speed Wheel LF Input Signal Missing	Anti-Lock Brake Control Module	Go To Pinpoint Test F .
C1234	Speed Wheel RF Input Signal Missing	Anti-Lock Brake Control Module	Go To Pinpoint Test F .
C1235	Speed Wheel RR Input Signal Missing	Anti-Lock Brake Control Module	Go To Pinpoint Test F .
C1236	Speed Wheel LR	Anti-Lock	Go To Pinpoint Test F .

	Input Signal Missing	Brake Control Module	
U1009	SCP (J1850) Invalid or Missing Data for Engine Torque	ABS	CARRY OUT the PCM self-test.
U1027	SCP (J1850) Invalid or Missing Data for Engine RPM	ABS	CARRY OUT the PCM self-test.
U1262	SCP (J1850) Communication Bus Fault	ABS	REFER to Section 418-00 .

Symptom Chart

NOTE: Refer to the wiring diagrams for connector numbers stated in the pinpoint tests.

Symptom Chart

Condition	Possible Sources	Action
● No communication with the anti-lock brake control module	● BJB Fuses 16 (10A) and 102 (30A). ● Circuitry. ● Anti-lock brake control module.	● Go To Pinpoint Test A .
● The yellow anti-lock brake warning indicator does not self-check	● Anti-lock brake control module. ● Circuitry.	● REFER to Section 413-01 .
● Spongy brake pedal with no warning indicator	● Air in brake hydraulic system.	● REFER to Section 206-00 .

Pinpoint Tests

PINPOINT TEST A: NO COMMUNICATION WITH THE ANTI-LOCK BRAKE CONTROL MODULE/UNABLE TO ENTER SELF-TEST

Test Step	Result / Action to Take
CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.	
A1 CHECK VOLTAGE TO THE ANTI-LOCK BRAKE CONTROL MODULE	
● Key in OFF position. ● Disconnect: Anti-Lock Brake Control Module C135. ● Key in ON position. ● Measure the voltage between anti-lock brake control module C135 pins, harness side and ground as follows:	**Yes** GO to A2 . **No** REPAIR the circuit in

	question. TEST the system for normal operation.

Pin	Circuit
1	534 (YE/LG)
4	533 (TN/RD)
32	532 (OG/YE)

- **Are the voltages greater than 10 volts?**

A2 CHECK ANTI-LOCK BRAKE MODULE GROUNDS	
• Key in OFF position. • Measure the resistance between anti-lock brake control module C135 pin 16, circuit 530 (LG/YE), harness side and ground; and between anti-lock brake control module C135 pin 47, circuit 530 (LG/YE), harness side and ground. • **Are the resistances less than 5 ohms?**	**Yes** CHECK the module communication network. REFER to Section 418-00 . **No** REPAIR the circuit 530 (LG/YE). TEST the system for normal operation.

PINPOINT TEST B: DTC B1483, BRAKE PEDAL INPUT CIRCUIT FAILURE

Test Step	Result / Action to Take
CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.	
B1 CHECK THE STOPLAMP OPERATION	
• Press the brake pedal. • **Do the stoplamps operate correctly?**	**Yes** GO to B2 . **No** REFER to Section 417-01 .
B2 CHECK CIRCUIT 810 (RD/LG) FOR OPEN	
• Key in OFF position. • Disconnect: Anti-Lock Brake Control Module C135. • Key in ON position. • Measure the voltage between anti-lock brake control module pin 41 circuit 810 (RD/LG), harness side and ground, while depressing the brake pedal. • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new anti-lock brake control module. REFER to Anti-Lock Brake System (ABS) Module . CLEAR the DTC. REPEAT the self-test. **No** REPAIR circuit 810 (RD/LG). CLEAR the DTC. REPEAT the self-test.

PINPOINT TEST C: DTC B1676, BATTERY PACK VOLTAGE OUT OF RANGE

Test Step	Result / Action to Take
CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.	

NOTE: DTC B1676 is generated when the anti-lock brake control module detects system voltage is less than 9 volts or greater than 19 volts for more than 8 seconds.

C1 CHECK THE BATTERY VOLTAGE	
• Key in OFF position. • Measure the voltage between positive and negative battery posts. • **Is the voltage between 10 and 17 volts?**	**Yes** GO to C2 . **No** REFER to Section 414-00 .
C2 CHECK VOLTAGE TO THE ANTI-LOCK BRAKE CONTROL MODULE	
• Disconnect: Anti-Lock Brake Control Module C135. • Key in ON position. • Measure the voltage between anti-lock brake control module C135 pins, harness and ground as follows: Pin / Circuit 1 – 534 (YE/LG) 4 – 533 (TN/RD) 32 – 532 (OG/YE) • **Are the voltages greater than 10 volts?**	**Yes** GO to C3 . **No** REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.
C3 CHECK CIRCUIT 530 (YE/LG) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between anti-lock control module pin 16, circuit 530 (YE/LG), harness side and ground; and between anti-lock control module pin 47, circuit 530 (YE/LG), harness side and ground. • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new anti-lock brake control module. REFER to Anti-Lock Brake System (ABS) Module . CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.

PINPOINT TEST D: DTC C1095, HYDRAULIC PUMP MOTOR CIRCUIT FAILURE

Test Step	Result / Action to Take
CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.	
D1 CHECK THE ABS PUMP MOTOR	
• Key in ON position. • **Is the ABS pump motor running all the time?**	**Yes** INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. REPEAT the self-test. **No** GO to D2 .
D2 CHECK PUMP MOTOR OPERATION	
• Key in ON position.	**Yes**

• Connect the scan tool. • Trigger the stability assist module pump motor active command. • **Does the ABS pump motor run for approximately three seconds?**	CLEAR the DTC. CHECK the yellow ABS warning indicator while driving the vehicle (brakes must not be applied) above 32 km/h (20 mph). If the yellow ABS warning indicator illuminates, RETRIEVE the DTCs. If DTC C1095 is retrieved, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. REPEAT the self-test. If the yellow ABS warning indicator does not illuminate, the system is OK. **No** TRIGGER the stability assist module pump motor off active command. GO to D3.
D3 CHECK CIRCUIT 534 (YE/LG) FOR AN OPEN	
• Disconnect: Stability Assist Module C135. • Measure the voltage between stability assist module C135-1, circuit 534 (YE/LG) harness side, and ground. • **Is the voltage greater than 10 volts?**	**Yes** GO to D4. **No** REPAIR circuit 534 (YE/LG). CLEAR the DTC. REPEAT the self-test.
D4 CHECK CIRCUIT 530 (LG/YE) FOR AN OPEN	
• Disconnect: Stability Assist Module C135. • Measure the resistance between stability assist module C135-16, circuit 530 (LG/YE) harness side, and ground; and between stability assist module C135-47, circuit 530 (LG/YE) harness side and ground. Then, measure the resistance between stability assist module C135-16 and C135-47 circuit 530 (LG/YE), component side. • **Is the resistance greater than 5 ohms?**	**Yes** INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. REPEAT the self-test. **No** REPAIR circuit 530 (LG/YE). CLEAR the DTC. REPEAT the self-test.

PINPOINT TEST E: DTC C1145 (RF), DTC C1155 (LF), DTC C1165 (RR), DTC C1175 (LR), ANTI-LOCK BRAKE SENSOR CIRCUIT FAILURE

Test Step	Result / Action to Take
CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.	
E1 CHECK FOR SHORT TO POWER	
NOTE: Both circuits must be checked for each DTC. • Key in OFF position. • Disconnect: Anti-Lock Brake Control Module C135. • Disconnect: Suspect Wheel Speed Sensor. • Key in ON position. • Measure the voltage between anti-lock brake control module C135 pins, harness side and ground as follows:	**Yes** REPAIR the affected circuit(s). CLEAR the DTC(s). REPEAT the self-test. **No** GO to E2.

DTC	Anti-Lock Brake Control Module C135	Circuit
C1145 (RF)	Pin 33	516 (YE/BK)
C1145 (RF)	Pin 34	514 (YE/RD)
C1155 (LF)	Pin 45	521 (TN/OG)
C1155 (LF)	Pin 46	522 (TN/BK)
C1165 (RR)	Pin 42	524 (PK/BK)
C1165 (RR)	Pin 43	523 (RD/PK)
C1175 (LR)	Pin 36	518 (LG/RD)
C1175 (LR)	Pin 37	519 (LG/BK)

- **Is any voltage present?**

E2 CHECK FOR SHORT TO GROUND

NOTE: Both circuits must be checked for each DTC.
- Key in OFF position.
- Measure the resistance between anti-lock brake control module C135 pin, harness side and ground as follows:

DTC	Anti-Lock Brake Control Module C135	Circuit
C1145 (RF)	Pin 33	516 (YE/BK)
C1145 (RF)	Pin 34	514 (YE/RD)
C1155 (LF)	Pin 45	521 (TN/OG)
C1155 (LF)	Pin 46	522 (TN/BK)
C1165 (RR)	Pin 42	524 (PK/BK)
C1165 (RR)	Pin 43	523 (RD/PK)
C1175 (LR)	Pin 36	518 (LG/RD)
C1175 (LR)	Pin 37	519 (LG/BK)

- **Are the resistances greater than 10,000 ohms?**

Yes
GO to E3 .

No
REPAIR the affected circuit(s). CLEAR the DTC(s). REPEAT the self-test.

E3 CHECK FOR AN OPEN

NOTE: Both circuits must be checked for each DTC.
- Measure the resistance between anti-lock brake control module C135 pins, harness side and suspect wheel speed sensor connector pins, harness side as follows:

Yes
GO to E4 .

No

DTC	Anti-Lock Brake Control Module C135 Pin No.	Wheel Speed Sensor Pin No.	Circuit
C1145	33	2	516 (YE/BK)
C1145	34	1	514 (YE/RD)
C1155	45	1	521 (TN/OG)
C1155	46	2	522 (TN/BK)
C1165	42	1	524 (PK/BK)
C1165	43	2	523 (RD/PK)
C1175	36	1	518 (LG/RD)
C1175	37	2	519 (LG/BK)

- **Are the resistances less than 5 ohms?**

REPAIR the affected circuit(s). CLEAR the DTC(s). REPEAT the self-test.

E4 CHECK FOR WHEEL SPEED SENSOR CIRCUITS SHORTED TOGETHER

- Measure the resistance across the suspect wheel speed sensor pins
- **Are the resistances less than 10,000 ohms?**

Yes
REPAIR the affected circuit(s). CLEAR the DTC(s). REPEAT the self-test.

No
GO to E5 .

E5 CHECK THE ANTI-LOCK BRAKE CONTROL MODULE OUTPUT

- Connect: Anti-Lock Brake Control Module C135.
- Key in ON position.
- Measure the voltage between suspect anti-lock brake sensor connector pins, harness side.

DTC	Suspect Anti-Lock Brake Sensor Circuit	Suspect Anti-Lock Brake Sensor Circuit
C1234 (RF)	514 (YE/RD)	516 (YE/BK)
C1233 (LF)	521 (TN/OG)	522 (TN/BK)
C1235 (RR)	523 (RD/PK)	524 (PK/BK)
C1236 (LR)	518 (LG/RD)	519 (LG/BK)

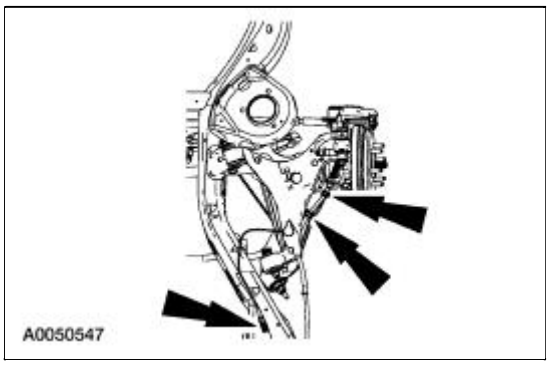
- **Are the voltages greater than 9 volts?**

Yes
INSTALL a new anti-lock brake sensor. REFER to Front Wheel Speed Sensor , or Rear Wheel Speed Sensor . CLEAR the DTC(s). REPEAT the self-test.

No
INSTALL a new anti-lock brake control module. REFER to Anti-Lock Brake System (ABS) Module . CLEAR the DTC(s). REPEAT the self-test.

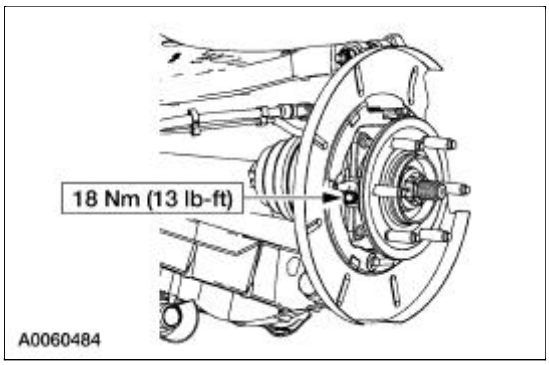
PINPOINT TEST F: DTC C1233 (LF), DTC C1234 (RF), DTC C1235 (RR), DTC C1236 (LR) — ANTI-LOCK BRAKE SENSOR INPUT SIGNAL MISSING

Test Step	Result / Action to Take
CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.	
NOTE: Any time an anti-lock brake sensor is removed, thoroughly clean the mounting surfaces, apply High Temperature 4x4 Front Axle and Wheel Bearing Grease E8TZ-19590-A or equivalent meeting Ford specification ESA-M1C198-A.	
F1 VERIFY DTC(S) ● Connect the diagnostic tool. ● Key in ON position. ● RETRIEVE the DTC(s). ● **Is DTC C1145, C1155, C1165, or C1175 retrieved?**	**Yes** Go To Pinpoint Test E . **No** GO to F2 .
F2 MONITOR THE WHEEL SPEED SENSOR PIDS ● Monitor the wheel speed PIDs while driving the vehicle at a constant speed. ● **Are the wheel speed PIDs consistent?**	**Yes** CLEAR the DTC(s). DRIVE the vehicle. RETRIEVE the DTC(s). IF DTC C1233, C1234, C1235, or C1236 is retrieved, INSTALL a new anti-lock brake control module. REFER to Anti-Lock Brake System (ABS) Module in this section. REPEAT the self-test. **No** GO to F3 .
F3 CHECK THE WHEEL SPEED SENSOR AND MOUNTING **NOTE:** Any time a wheel speed sensor is removed, thoroughly clean the mounting surfaces. Apply High-Temperature 4x4 Front Axle and Wheel Bearing Grease before installation. ● Raise the vehicle on a hoist. For additional information, REFER to Section 100-02 . ● **CAUTION: Examine the wheel speed sensor wire carefully, using a good light source. Failure to verify damage in the wheel speed sensor wire can lead to unnecessary installation of a new component.** ● Inspect the anti-lock brake sensor mounting for looseness or corrosion. CLEAN as necessary. ● **Are the wheel speed sensor and mounting OK?**	**Yes** GO to F4 . **No** If the wheel speed sensor is loose or corroded, REMOVE it and thoroughly clean the mounting surfaces. APPLY High Temperature 4x4 Front Axle and Wheel Bearing Grease. CLEAR the DTCs. REPEAT the self-test.
F4 CHECK THE WHEEL SPEED SENSOR RING FOR DAMAGE **NOTE:** Any time a wheel speed sensor is removed, thoroughly clean the mounting surfaces. Apply High-Temperature 4x4 Front Axle and Wheel Bearing Grease before installation. ● Remove the wheel speed sensor. ● **CAUTION: Examine the wheel speed sensor indicator carefully, using a good light**	**Yes** GO to F5 . **No** INSTALL a new wheel speed sensor ring. REFER to Front Wheel Speed Sensor Ring or Rear Wheel Speed Sensor Ring in this section. CLEAR



<table>
<tr>
<td>source. Failure to verify damage in the wheel speed sensor indicator can lead to unnecessary installation of a new component.
● Inspect the anti-lock brake sensor ring for damaged or missing teeth. Rotate the wheel to verify that no teeth are missing.
● Is the wheel speed sensor ring OK?</td>
<td>the DTC(s). REPEAT the self-test.</td>
</tr>
<tr>
<td>F5 CHECK THE ANTI-LOCK BRAKE CONTROL MODULE OUTPUT
● Connect: Anti-Lock Brake Control Module C135.
● Key in ON position.
● Measure the voltage between suspect anti-lock brake sensor connector pins, harness side.
<table><tr><th>DTC</th><th>Suspect Anti-Lock Brake Sensor Circuit</th><th>Suspect Anti-Lock Brake Sensor Circuit</th></tr><tr><td>C1234 (RF)</td><td>514 (YE/RD)</td><td>516 (YE/BK)</td></tr><tr><td>C1233 (LF)</td><td>521 (TN/OG)</td><td>522 (TN/BK)</td></tr><tr><td>C1235 (RR)</td><td>523 (RD/PK)</td><td>524 (PK/BK)</td></tr><tr><td>C1236 (LR)</td><td>518 (LG/RD)</td><td>519 (LG/BK)</td></tr></table>● Are the voltages greater than 9 volts?</td>
<td>Yes
INSTALL a new anti-lock brake sensor. REFER to Front Wheel Speed Sensor , or Rear Wheel Speed Sensor . CLEAR the DTC(s). REPEAT the self-test.

No
INSTALL a new anti-lock brake control module. REFER to Anti-Lock Brake System (ABS) Module . CLEAR the DTC(s). REPEAT the self-test.</td>
</tr>
</table>



Rear Wheel Speed Sensor

Removal and Installation

1. Remove the parking brake shoes. For additional information, refer to Section 206-05 .
2. Disconnect the wheel speed sensor wire from the retaining clips.

3. Remove the bolt and remove the rear wheel speed sensor.

4. To install, reverse the removal procedure.

Front Wheel Speed Sensor Ring

Removal and Installation

NOTE: The front wheel speed sensor ring is integral to the front hub and bearing assembly.

For additional information, refer to Section 204-01A .For additional information, refer to Section 204-01B .

Rear Wheel Speed Sensor Ring

Removal and Installation

1. **NOTE:** The rear wheel speed sensor ring is integral to the rear wheel hub and bearing assembly.

   For rear wheel speed sensor ring removal and installation, refer to Section 204-02 .

Torque Specifications

Description	Nm	lb-ft	lb-in
Hydraulic control unit (HCU) bracket bolts to frame	40	30	—
Hydraulic control unit (HCU) bolts to bracket	16	12	—
Front wheel speed sensor bolt	8	—	71
Hydraulic brake tubes	18	13	—
Rear wheel speed sensor bolt	8	—	71

Anti-Lock Control

CAUTION: The following stability assist system components installed on vehicles built before February 2003 cannot be interchanged with components manufactured for vehicles built after February 2003:

- **stability assist module**
- **lateral accelerometer**
- **longitudinal accelerometer**
- **yaw rate sensor**

The four wheel anti-lock brake system (4WABS) with traction control and stability assist system consists of the following components:

- active brake booster with integral solenoid
- brake booster release switch
- front anti-lock brake sensors
- front anti-lock brake sensor indicators
- hydraulic control unit (HCU)
- stability assist event indicator
- stability assist module
- lateral accelerometer
- rear anti-lock brake sensors
- rear anti-lock brake sensor indicators
- steering wheel position sensor
- two brake pressure transducers
- Advance Trac®/stability assist switch
- yaw rate sensor
- yellow anti-lock brake warning indicator

For removal and installation of the brake booster release switch, refer to Section 206-07 .

For removal and installation of the front anti-lock brake sensor indicators, refer to Section 204-01A for 4x2 vehicles or Section 204-01B for 4x4 vehicles.

For removal and installation of the rear anti-lock brake sensor indicator, refer to Section 205-05 .

For removal and installation of the steering wheel position sensor, refer to Section 211-04 .

Anti-Lock Control

Refer to Wiring Diagrams Cell 42 for schematic and connector information.

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool
 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Principles of Operation

NOTE: The diagnostic tool refers to the stability assist module as an "ABS module". The stability assist module is an ABS module at its core.

The stability assist module simultaneously manages the anti-lock braking, traction control, and engine control systems to maintain vehicle control during deceleration and acceleration.

When the ignition switch is put in the RUN position, the stability assist module will do a preliminary electrical check, and at approximately 20 km/h (12 mph) the hydraulic pump motor is turned on for approximately one half-second. Any malfunction of the anti-lock brake control system will disable the ABS/TC/Stability Assist and the anti-lock brake warning indicator will illuminate, however the power-assist braking system will function normally.

With the ignition in the START or RUN positions, the stability assist module functions similar to a conventional anti-lock brake module by monitoring and comparing the rotational speed of each wheel. Wheel speeds are measured by the anti-lock brake sensor which electrically senses each tooth of the anti-lock sensor indicator as they pass through the sensor's magnetic field. When the stability assist module detects an impending wheel lock, wheel spin or vehicle motion that is inconsistent with the driver's commands, brake pressure is modulated to the appropriate brake caliper(s). The stability assist module triggers the hydraulic control unit (HCU) to open and close the appropriate solenoid valves. Once the affected wheel(s) return to the desired speed, the stability assist module returns the solenoid valves to their normal position, and normal base brake operation is restored.

The stability assist module communicates with the powertrain control module (PCM) to assist with traction control. At speeds under 40 km/h (25 mph), when drive wheels loose traction and begin to spin, the stability assist module requests the PCM to reduce engine torque, while simultaneously applying and releasing the appropriate brake caliper(s) to maintain traction. The PCM accomplishes this by minor incremental timing changes and fewer fuel injector pulses until the stability assist module ends the request, the request is ended when the driven wheel speed returns to normal. After the vehicle speed exceeds 40 km/h (25 mph), the traction control is accomplished only through the PCM

torque control.

The stability assist system constantly monitors vehicle motion relative to the driver's intended course. This is done by using sensors to compare the driver's steering input and brake application with that of the actual vehicle motion. The system does not activate when the vehicle is traveling in reverse, however, ABS and traction control will continue to function as usual.

The stability assist/Advance Trac® switch allows the driver to control use of the stability assist system. This is independent of the ABS function, which cannot be switched off by the driver. The stability assist system's status is indicated by a stability assist warning light in the stability assist/Advance Trac® switch. An illuminated stability assist/Advance Trac® switch indicates that the stability assist system is switched off. In vehicles with a message center, the message "ADVANCETRAC OFF" is displayed. If a failure is detected somewhere in the stability assist system which affects either the yaw control or traction control functions, the stability assist indicator will be illuminated. The anti-lock brake function will continue to work as designed unless the yellow anti-lock brake warning indicator is also illuminated. The normal brake function will always occur, unless the red brake warning indicator is illuminated.

When stability assist activates, the following can occur:

- a rumble or grinding sound much like ABS or traction control.
- a small deceleration or a reduction in the acceleration of the vehicle.
- the stability assist indicator will flash.
- a vibration in the brake pedal much like ABS when the pedal is applied.
- if the event is severe and the brake pedal is not applied, the pedal will move to generate higher brake forces. A whoosh sound can also be heard from under the instrument panel in an event this severe.

Some drivers may notice a slight movement of the brake pedal when the system checks itself. The brake pedal moves when an active test of the brake booster is run. During this test a small amount of pressure will be generated at the master cylinder, but no pressure will be generated in the brake calipers. This test will occur above 48 km/h (30 mph) after the vehicle has been running approximately 8 minutes. The test will only be run if the vehicle is stable, the driver is not braking and the accelerator pedal is slightly depressed. If the brake system has not been bled correctly, the brake pedal movement can become more significant.

Yaw Rate Sensor

The yaw rate sensor measures the relative vehicle motion about the vertical axis through its center of gravity.

Lateral Accelerometer

The lateral accelerometer measures the acceleration which corresponds to the force involved while the vehicle slides sideways. This acceleration has two forms. The first is the centrifugal acceleration which is generated when the vehicle travels around in a circle. The second is the acceleration due to gravity. The accelerometer only measures the acceleration along the lateral (or sideways) direction of the vehicle, on level ground there is no contribution from this acceleration. However, if the vehicle is parked sideways on a bank or incline, the sensor will measure some lateral acceleration due to gravity even though the vehicle is not moving.

Longitudinal Accelerometer (4x4 vehicles)

The longitudinal accelerometer measures the acceleration corresponding to the force involved when the vehicle moves forward and rearward in the horizontal plane, along the centerline of the vehicle's front and rear wheels.

Steering Wheel Rotation Sensor

The steering wheel rotation sensor measures the rate of rotation of the steering wheel by monitoring the steering wheel rotation ring as it passes through the sensor gap. The steering wheel rotation sensor uses two signal lines to transmit information to the stability assist module, whether the steering wheel is being turned left or right and how far it is being turned. The steering wheel rotation sensor does not indicate the position of the steering wheel relative to straight ahead. The stability assist system learns this position by comparing the steering wheel position with other signals and storing the position it has learned. The stability assist system confirms this position and modifies it as necessary during every new driving cycle.

Active Brake Booster

The active brake booster functions like a conventional brake booster with the added feature that it can be actuated electrically by the stability assist module. The electrical brake booster actuation is necessary in severe stability assist events and makes sure that the hydraulic control unit can generate enough brake pressure to maintain vehicle stability. The brake assist from the brake booster is especially useful in cold weather when the hydraulic control unit cannot draw the brake fluid from the reservoir quickly at cold temperatures.

A solenoid within the active brake booster has a release switch to indicate when the driver is stepping on the brake pedal. The solenoid provides electrical actuation of the brake booster. Without the force of the input rod, the air valve is directly opened due to the movement of the energized solenoid. With increasing current applied to the solenoid, the air valve opens and output force is created. With decreasing current applied to the solenoid, the air valve is closed and the vacuum valve opens reducing output force.

The release switch indicates when the brake pedal has been depressed. It is integrated into the booster key that normally sits against the rear shell of the boot in its rest position and it adjoins the valve body when in its balance position. The switch itself provides indication from two positions. In its rest position, it supplies two signals, normally open (NO) and normally closed (NC). Upon application of sufficient force to initiate movement of the key away from the valve body, the brake booster switch changes state, signifying a driver application.

When the stability assist module is activating the brake booster, the brake pedal is pulled forward as the valve body moves. The release switch is held in position by the input rod spring and remains against the valve body. Although the pedal travel sensor (PTS) switch changes state when the brake pedal drops, the release switch remains inactive until such time as it encounters an external force from the driver, whether in a stability assist event controlled by the stability assist module, or in a standard mechanical braking event.

Electronic Brake Distribution

The electronic brake distribution (EBD) controls rear brake pressure and acts as an electronic proportioning valve. It is controlled by the stability assist module. When EBD is disabled, the amber ABS warning indicator and the red brake warning indicator will illuminate.

Brake Assist Braking

Brake assist braking functions by fully applying the brake booster during a panic stop. Depending on vehicle speed, if pedal stroke is more rapid than normal, it manipulates a valve in the brake booster that automatically applies full brake boost. Brake assist will be disabled when the driver releases the brake pedal.

DTC C1963

This Diagnostic Trouble Code (DTC) is stored if the stability assist warning indicator has been turned ON because the system could not confirm the straight-ahead steering wheel position for more than 30 seconds above 18 km/h (11 mph) or if driving aggressively immediately after turning the ignition on. This condition will most likely occur if there is some other DTC or if the vehicle reaches 75 km/h (47 mph) before confirming the straight-ahead position. If there is another DTC logged, the repair procedure is to follow the procedure for the first DTC. This DTC can be stored if:

- the PRNDL or Reverse switch has failed (check operation of PRNDL display and back-up lights).
- chassis modifications have been made that were not authorized by Ford.
- the vehicle is driven aggressively immediately after start-up.

In very rare circumstances this DTC can be stored by itself without the occurrence of any actual component failure. These conditions can cause DTC C1963 to set with no other DTC:

- The steering wheel has been turned while the ignition is off and then the vehicle is started, and either the vehicle is driven continuously in a circle or the vehicle is driven with continuous swerving, sliding or tire spinning.
- A new stability assist module can have been installed in the vehicle and was not calibrated.

Stability Assist Module Calibration

NOTE: When carrying out a calibration on a 4x2 vehicle, if the diagnostic tool instructs to calibrate the longitudinal accelerometer, ignore this request — 4x2 vehicles are not equipped with a longitudinal accelerometer.

The stability assist module needs to be recalibrated whenever a component specific to the stability assist system is disconnected or a new component is installed. For additional information regarding the DTCs that require the recalibration procedure, refer to the Stability Assist Calibration List. If a DTC is logged for any component of the stability assist system, the DTC must be cleared before carrying out the recalibration procedure. The need to recalibrate the stability assist module is also indicated by the active/fail lamp flashing and the presence of DTC C1998. The lamp will flash after clearing the DTCs that are indicated on the stability assist calibration list. If a DTC is retrieved after recalibration; refer to the Stability Assist Module Diagnostic Trouble Code (DTC) Index. If installing a new stability assist module, the calibration procedures as well as the configuration procedure must be carried out. For additional information regarding the module configuration procedure, refer to Section 418-01 .

When carrying out the lateral or longitudinal accelerometer or yaw rate calibration on the scan tester, the vehicle must be on a level surface, must not be moving and the ignition switch must be in the RUN position. When carrying out the steering wheel rotation sensor calibration on the scan tester, the ignition switch must be in the RUN position with the engine running and the steering wheel must be rotated back and forth from lock position to lock position.

Inspection and Verification

NOTE: If a new stability assist module is installed it must be reconfigured. For additional information, refer to Section 418-01 .

1. Verify the customer's concern by operating the vehicle to duplicate the condition.

2. Verify the stoplamps operate correctly by depressing and releasing the brake pedal with the ignition switch in the OFF position. If the stoplamps do not operate correctly, refer to Section 417-01 . If the stoplamps operate correctly, proceed to the next step.

3. Verify that the PRNDL operates correctly on the instrument cluster. If the PRNDL does not operate correctly, refer to Section 413-01 . If the PRNDL operates correctly, proceed to the next step.

4. Inspect to determine if one of the following mechanical or electrical concerns apply:

Visual Inspection Chart

Mechanical	Electrical
● Wheel speed sensor ring ● Hydraulic control unit (HCU) ● Incorrectly inflated tires ● Mismatched wheels or tires on vehicle ● Base brake concern ● Brake booster vacuum hose ● Ford specified steering components, suspension components and tire size ● Steering wheel rotation ring	● Battery junction box (BJB) Fuse: ■ 2 (20A) ■ 16 (10A) ■ 28 (5A) ■ 102 (30A) ■ 103 (30A) ■ 112 (30A) ● Stability assist module ● EVAC and fill connector ● Anti-lock brake sensor ● Stability assist/Advance Trac® switch ● BPP switch ● Steering wheel rotation sensor ● Brake booster solenoid ● Brake booster release switch ● Primary/main pressure transducer ● Yaw rate sensor ● Lateral accelerometer. ● Longitudinal rotation sensor (4x4 vehicles) ● Brake light switch ● IVD stoplamp relay ● Brake fluid level switch ● Wiring harness ● Connectors or connections ● Circuitry

5. If the concern remains after the inspection, connect the scan tester to the data link connector (DLC) located beneath the instrument panel, and select the vehicle to be tested from the scan tester menu. If the scan tester does not communicate with the vehicle:
   - Check that the program card is correctly installed.
   - Check the connection of the data link connector to the vehicle.
   - Check that the ignition switch is in the RUN position.

6. If the scan tester still does not communicate with the vehicle, refer to the scan tester manual.

7. Carry out the DATA LINK DIAGNOSTIC TEST. If scan tester responds with:
   - CKT914, CKT915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
   - NO RESP/NOT EQUIP for stability assist module, Go To Pinpoint Test A .
   - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the self-test diagnostics for the stability assist module.

8. If the DTCs retrieved are related to the concern, go to Stability Assist Module Diagnostic Trouble Code (DTC) Index to continue diagnostics.

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

Stability Assist Module Diagnostic Trouble Code (DTC) Index

NOTE: The need to recalibrate the stability assist module is indicated by the active/fail lamp flashing and the presence of DTC C1998. There are other service actions that can require recalibration when there is no flashing lamp. For additional information, refer to the Stability Assist Module Calibration section. The lamp will flash after clearing the DTCs that are indicated on the stability assist calibration list.

Stability Assist Module Diagnostic Trouble Code (DTC) Index

NOTE: DTC C1730 (Reference Voltage Out Of Range) must be repaired before DTC C1279, C1280, C1281, C1282, C1288, C1289.

DTC	Description	Source	Action
B1342	ECU Is Defective	Stability Assist	**CAUTION:Do not replace stability assist modules installed on vehicles built before February 2003 with those manufactured after February 2003.** CLEAR the DTCs. RETRIEVE the DTCs. If other DTCs are retrieved, repair them, CLEAR the DTCs, and REPEAT the self-test. If DTC B1342 is retrieved, INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist . REPEAT the self-test.
B1483	Brake Pedal Input Circuit Failure	Stability Assist	Go To Pinpoint Test B .
B1676	Battery Pack Voltage Out of Range	Stability Assist	Go To Pinpoint Test C .
B2477	Module Configuration Failure	Stability Assist	REFER to Section 418-01 .
B2734	Pedal Travel Sensor (PTS) Supply Error	Stability Assist	REFER to Section 418-01 .
B2736	Pedal Travel Sensor (PTS) Circuit Fault	Stability Assist	REFER to Section 418-01 .
B2737	Pedal Travel Sensor (PTS) Jammed Error	Stability Assist	REFER to Section 418-01 .
B2738	Pedal Travel Sensor (PTS) Spike Error	Stability Assist	REFER to Section 418-01 .
B2740	Pedal Travel Sensor (PTS) Spike Error	Stability Assist	REFER to Section 418-01 .
B2741	Sensor Cluster Loop End	Stability Assist	REFER to Section 418-01 .

Stability Assist Calibration List

NOTE: The need to recalibrate the stability assist module is indicated by the active/fail lamp flashing and the presence of DTC C1998. For additional information, refer to the Stability Assist Module Calibration section for other service actions requiring recalibration. The lamp will flash after the DTCs on the stability assist calibration list are cleared.

Stability Assist Calibration List

DTC	Description	Stability Assist Calibration
C1277	Steering Wheel Angle 1 and 2 Circuit Failure	YES
C1278	Steering Wheel Angle 1 and 2 Signal Fault	YES
C1279	Yaw Rate Sensor Circuit Failure	YES
C1280	Yaw Rate Sensor Signal Fault	YES
C1281	Lateral Accelerometer Circuit Failure	YES
C1282	Lateral Accelerometer Signal Fault	YES
C1283	Switch Test Signal Failure	YES
C1285	Booster Solenoid Circuit Failure	YES
C1286	Booster Mechanical Failure	YES
C1287	Booster Pedal Force Switch Circuit Failure	YES
C1288	Pressure Transducer Main/Primary Input Circuit Failure	YES
C1440	Pressure Transducer Main/Primary Signal Fault	YES
C1730	Reference Voltage Out of Range (+5 V)	YES
C1960	Driver Brake Apply Circuit Fault	NO
C1963	Stability Control Inhibit Warning	NO
C1991	Module Configuration Failure	YES
C2769	Longitudinal Acceleration Sensor Circuit Failure	YES
C2770	Longitudinal Acceleration Sensor Signal Fault	YES

Symptom Chart

NOTE:

Refer to Wiring Diagrams Cell 42 for schematic and connector information.

Symptom Chart

Condition	Possible Sources	Action
• No communication with the stability assist module	• BJB Fuse 16 (10A), 103 (30A) or 112 (30A). • Circuitry. • Stability assist module.	• Go To Pinpoint Test A .
• The yellow ABS warning indicator does not self-check	• Circuitry. • Stability assist module. • Instrument cluster.	• REFER to Section 413-01 .
• Spongy brake pedal with no warning indicator	• Air in brake hydraulic system.	• REFER to Section 206-00 .

• The Advance Trac® switch indicator is always on/cannot be disabled	• Circuitry. • Stability assist/Advance Trac® switch. • Stability assist module.	• Go To Pinpoint Test O .
	• Base brake system.	• REFER to Section 206-00 .
	• Thermal model.	• Wait for brakes to cool down, the thermal model will reset automatically.

Pinpoint Tests

PINPOINT TEST A: NO COMMUNICATION WITH THE STABILITY ASSIST MODULE

Test Step	Result / Action to Take
A1 CHECK THE VOLTAGE TO THE STABILITY ASSIST MODULE	
• Key in OFF position. • Disconnect: Stability Assist Module C135. • Key in ON position. • Measure the voltage between stability assist module C135-4, circuit 533 (TN/RD), harness side and ground. • **Is the voltage greater than 10 volts?**	**Yes** GO to A2 . **No** REPAIR circuit 533 (TN/RD). REPEAT the self-test.
A2 CHECK THE STABILITY ASSIST MODULE GROUNDS	
• Key in OFF position. • Disconnect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between stability assist module C135-16, circuit 530 (LG/YE), harness side, and ground; and between stability assist module C135-47 circuit 530 (LG/YE) harness side, and ground. • **Are the resistances less than 5 ohms?**	**Yes** CHECK the SCP communication network. REFER to Section 418-00 . **No** REPAIR circuit 530 (LG/YE). REPEAT the self-test.

PINPOINT TEST B: DTC B1483 — BRAKE PEDAL INPUT CIRCUIT FAILURE

Test Step	Result / Action to Take
B1 CHECK THE STOPLAMP OPERATION	
• Press the brake pedal. • **Do the stoplamps operate correctly?**	**Yes** GO to B2 . **No** REFER to Section 417-01 .
B2 CHECK THE BRAKE ON/OFF (BOO) SWITCH PID	

• Connect the diagnostic tool. • Key in ON position. • Monitor the BOO switch PID while pressing and releasing the brake pedal. • **Does the BOO switch PID match the brake pedal positions (ON/OFF)?**	**Yes** The vehicle is OK. CLEAR the DTC. The ABS module will set DTC B1483 if the vehicle is driven with one foot on the brake pedal while the other foot is on the accelerator. **No** GO to B3 .
B3 CHECK CIRCUIT 810 (RD/LG) FOR AN OPEN	
• Key in OFF position. • Disconnect: Anti-Lock Brake Control Module C135. • Key in ON position. • Measure the voltage between anti-lock brake control module pin 41 circuit 810 (RD/LG), harness side and ground, while depressing the brake pedal. • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new anti-lock brake control module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist . CLEAR the DTC. REPEAT the self-test. **No** REPAIR circuit 810 (RD/LG). CLEAR the DTC. REPEAT the self-test.

PINPOINT TEST C: DTC B1676 — BATTERY PACK VOLTAGE OUT OF RANGE

Test Step	Result / Action to Take
C1 CHECK THE BATTERY VOLTAGE	
• Measure the battery voltage between the positive and negative battery posts with the key ON engine OFF (KOEO), and with the engine running. • **Is the battery voltage between 10 and 13 volts with KOEO, and between 11 and 17 volts with the engine running?**	**Yes** GO to C2 . **No** REFER to Section 414-00 . TEST the system for normal operation.
C2 CHECK THE VOLTAGE TO THE ANTI-LOCK BRAKE CONTROL MODULE	
• Disconnect: Anti-Lock Brake Control Module C135. • Key in ON position. • Measure the voltage between anti-lock brake control module C135 pins, harness and ground as follows: Pin / Circuit 1 — 534 (YE/LG) 4 — 533 (TN/RD) 32 — 532 (OG/YE) • **Are the voltages greater than 10 volts?**	**Yes** GO to C3 . **No** REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.
C3 CHECK CIRCUIT 530 (LG/YE) FOR AN OPEN	
• Key in OFF position. • Disconnect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between anti-lock control module pin 16, circuit 530 (LG/YE), harness side and ground; and between anti-lock control module pin 47, circuit 530 (LG/YE), harness side and	**Yes** INSTALL a new anti-lock brake control module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist . CLEAR the DTCs. REPEAT the self-test.

ground. ● **Are the resistances less than 5 ohms?**	**No** REPAIR circuit 530 (LG/YE). CLEAR the DTC. REPEAT the self-test.

PINPOINT TEST D: DTC C1095 — ABS HYDRAULIC PUMP MOTOR CIRCUIT FAILURE

Test Step	Result / Action to Take
D1 CHECK THE ABS PUMP MOTOR	
● Key in ON position. ● **Is the ABS pump motor running all the time?**	**Yes** INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist in this section. CLEAR the DTC. REPEAT the self-test. **No** GO to D2.
D2 CHECK THE PUMP MOTOR OPERATION	
● Key in ON position. ● Connect the scan tool. ● Trigger the stability assist module pump motor active command. ● **Does the ABS pump motor run for approximately three seconds?**	**Yes** CLEAR the DTC. CHECK the yellow ABS warning indicator while driving the vehicle (brakes must not be applied) above 32 km/h (20 mph). If the yellow ABS warning indicator illuminates, RETRIEVE the DTCs. If DTC C1095 is retrieved, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist in this section. CLEAR the DTC. REPEAT the self-test. If the yellow ABS warning indicator does not illuminate, the system is OK. **No** TRIGGER the stability assist module pump motor off active command.GO to D3.
D3 CHECK CIRCUIT 534 (YE/LG) FOR AN OPEN	
● Disconnect: Stability Assist Module C135. ● Measure the voltage between stability assist module C135-1, circuit 534 (YE/LG) harness side, and ground. ● **Is the voltage greater than 10 volts?**	**Yes** GO to D4. **No** REPAIR circuit 534 (YE/LG). CLEAR the DTC. REPEAT the self-test.
D4 CHECK CIRCUIT 530 (LG/YE) FOR AN OPEN	
● Disconnect: Stability Assist Module C135. ● Disconnect the battery ground cable. Refer to Section 414-01. ● Measure the resistance between stability assist module C135-16, circuit 530 (LG/YE) harness side, and ground; and between stability assist module C135-47, circuit 530 (LG/YE) harness side and ground. Then, measure the resistance between stability assist	**Yes** INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist in this section. CLEAR the DTC. REPEAT the self-test. **No** REPAIR circuit 530 (LG/YE). CLEAR the DTC. REPEAT the self-test.

module C135-16 and C135-47 circuit 530 (LG/YE), component side. • **Is the resistance greater than 5 ohms?**	

PINPOINT TEST E: DTC C1145 (RF), DTC C1155 (LF), DTC C1165 (RR), DTC C1175 (LR) — ANTI-LOCK BRAKE SENSOR INPUT CIRCUIT FAILURE

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>E1 CHECK FOR A SHORT TO POWER

NOTE: Both circuits must be checked for each DTC.
• Key in OFF position.
• Disconnect: Stability Assist Module C135 .
• Disconnect: Suspect Anti-lock Brake Sensor.
• Key in ON position.
• Measure the voltage between stability assist module C135 pin, harness side, and ground, as follows:

<table>
<tr><th>DTC</th><th>Stability Assist Module C135 Pin</th><th>Circuit</th></tr>
<tr><td>C1145 (RF)</td><td>33</td><td>516 (YE/BK)</td></tr>
<tr><td>C1145 (RF)</td><td>34</td><td>514 (YE/RD)</td></tr>

Yes
GO to E4 .

No
REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.

E4 CHECK FOR SHORTED WHEEL SPEED SENSOR CIRCUITS

- Measure the resistance between the suspect anti-lock brake sensor pins.
- **Is the resistance greater 10,000 ohms?**

Yes
GO to E5 .

	No REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.
E5 CHECK THE STABILITY ASSIST MODULE OUTPUT ● Connect: Stability Assist Module C135. ● Key in ON position. ● Measure the voltage between the suspect anti-lock brake sensor pins, harness side. **DTC** / **Suspect Anti-Lock Brake Sensor Circuit** / **Suspect Anti-Lock Brake Sensor Circuit** C1234 (RF) — 514 (YE/RD) — 516 (YE/BK) C1233 (LF) — 521 (TN/OG) — 522 (TN/BK) C1235 (RR) — 523 (RD/PK) — 524 (PK/BK) C1236 (LR) — 518 (LG/RD) — 519 (LG/BK) ● **Are the voltages greater than 9 volts?**	**Yes** INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist in this section. CLEAR the DTC. REPEAT the self-test. **No** INSTALL a new anti-lock brake sensor. For the front anti-lock brake sensor, REFER to Front Wheel Speed Sensor in this section. CLEAR the DTC. REPEAT the self-test. For the rear anti-lock brake sensor, REFER to Rear Wheel Speed Sensor in this section. CLEAR the DTC. REPEAT the self-test.

PINPOINT TEST F: DTC C1233 (LF), DTC C1234 (RF), DTC C1235 (RR), DTC C1236 (LR) — ANTI-LOCK BRAKE SENSOR INPUT SIGNAL MISSING

Test Step	Result / Action to Take
F1 CHECK FOR DTCS ● Key in ON position. ● Connect the diagnostic tool. ● Retrieve DTCs. ● **Is DTC C1145, C1155, C1165 or C1175 present?**	**Yes** Go To Pinpoint Test E . **No** GO to F2 .
F2 CHECK THE WHEEL SPEED PIDS ● Use the scan tool to monitor the wheel speed PIDS while driving the vehicle at a constant speed. ● **Are the four wheel speed PID values similar?**	**Yes** CLEAR the DTC. DRIVE the vehicle. RETRIEVE DTCs. If DTC C1233, C1234, C1235 or C1236 is present, INSTALL a new anti-lock brake control module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist in this section. REPEAT the self-test. **No** GO to F3 .
F3 CHECK THE ANTI-LOCK BRAKE SENSOR FOR DAMAGE AND/OR LOOSENESS ● Key in OFF position.	**Yes**

- Raise and support the vehicle. Refer to Section 100-02 .
- **CAUTION: Examine the anti-lock brake sensor wire carefully with a good light. Failure to verify damage in the anti-lock brake sensor wire can lead to unnecessary installation of a new component.**
- Inspect the anti-lock brake sensor mounting for looseness. If the anti-lock brake sensor is suspected, inspect the sensor for corrosion or on the front anti-lock brake mounting flange. Clean as necessary.
- **Is the anti-lock brake sensor OK?**

GO to F4 .

No
INSTALL a new anti-lock brake sensor. For the front anti-lock brake sensor, REFER to Front Wheel Speed Sensor in this section. CLEAR the DTC. REPEAT the self-test. For the rear anti-lock brake sensor, REFER to Rear Wheel Speed Sensor in this section. CLEAR the DTC. REPEAT the self-test.

F4 CHECK FOR WHEEL SPEED SENSOR RING DAMAGE

- Raise and support the vehicle. Refer to Section 100-02 .
- Remove the anti-lock brake sensor.
- Inspect the wheel speed sensor ring for damaged or missing teeth. Rotate the wheel to verify that no teeth are missing.
- **Is the wheel speed sensor ring OK?**

Yes
GO to F5 .

No
INSTALL a new wheel speed sensor ring. For the front wheel speed sensor ring, REFER to Front Wheel Speed Sensor Ring in this section. CLEAR the DTC. REPEAT the self-test. For the rear wheel speed sensor ring, REFER to Rear Wheel Speed Sensor Ring in this section. CLEAR the DTC. REPEAT the self-test.

F5 CHECK THE ANTI-LOCK BRAKE CONTROL MODULE OUTPUT

- Key in ON position.
- Measure the voltage between the stability assist module C135 and the suspect wheel speed sensor connectors as follows:

DTC	Circuit	Stability Assist Module C135 Pin	Wheel Speed Sensor Connector Pin
C1234 (RF)	516 (YE/BK)	33	2
C1234 (RF)	514 (YE/RD)	34	1
C1233 (LF)	521 (TN/OG)	45	1
C1233 (LF)	522 (TN/BK)	46	2
C1235 (RR)	523 (RD/PK)	42	1
C1235 (RR)	524 (PK/BK)	43	2
C1236 (LR)	518 (LG/RD)	36	1
C1236 (LR)	519 (LG/BK)	37	2

Yes
INSTALL a new anti-lock brake sensor. For the front anti-lock brake sensor, REFER to Front Wheel Speed Sensor in this section. CLEAR the DTC. REPEAT the self-test. For the rear anti-lock brake sensor, REFER to Rear Wheel Speed Sensor in this section. CLEAR the DTC. REPEAT the self-test.

No
INSTALL a new anti-lock brake control module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist in this section. TEST the system for normal operation.

• **Are the voltages greater than 9 volts?**	

PINPOINT TEST G: DTC C1277/C1278 — STEERING WHEEL ANGLE 1 AND 2 CIRCUIT FAILURE/FAULT

Test Step	Result / Action to Take
G1 CARRY OUT THE RECALIBRATION PROCEDURE	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Clear the DTC. • Carry out the steering wheel angle recalibration procedure using the scan tester. • Test drive the vehicle. • Enter the following diagnostic mode on the diagnostic tool: Retrieve DTCs. • **Are any DTCs retrieved or does the recalibration procedure indicate a fault?**	**Yes** If DTC C1277 or C1278 is retrieved or the recalibration procedure indicates a fault, GO to G2 . If any other DTC, GO to the Stability Assist Module Diagnostic Trouble Code (DTC) Index. **No** The stability assist system is operating correctly. The DTC C1278 was meant for detection of steering wheel rotation sensor harness wiring problems at vehicle assembly time. The steering wheel rotation sensor circuit is checked for swapped wires (channel A and B). This DTC should not occur during repair unless the harness wiring to the steering wheel rotation sensor was changed or the PRNDL position indicator is not operating correctly. The DTC will occur only after driving a few feet and making a turn if the wiring problem or PRNDL problem exists.
G2 MONITOR THE STEERING WHEEL ROTATION SENSOR PIDS	
• Key in ON position. • Monitor the steering wheel rotation sensor PIDs while rotating the steering wheel clockwise and counterclockwise. • **Are the two steering wheel rotation sensor PID values switching as the wheel rotates?**	**Yes** CLEAR the DTC. Drive the vehicle. RETRIEVE the DTCs. IF DTC C1278 is present, CHECK for swapped circuit in connector C226. Otherwise, GO to G7 . **No** GO to G3 .
G3 CHECK THE STEERING WHEEL ROTATION SENSOR RING	
• Check the steering wheel rotation sensor ring for damage. • **Is the steering wheel rotation sensor OK?**	**Yes** GO to G4 . **No** INSTALL a new steering wheel rotation sensor ring. REFER to Section 211-04 .
G4 CHECK CIRCUIT 1574 (DB) FOR POWER	
• Disconnect: Sensor Cluster. • Key in ON position. • Measure the voltage between sensor cluster C3073-3, circuit 1574 (DB), harness side and	**Yes** GO to G5 . **No** INSTALL a new sensor cluster. REFER to Yaw Rate

<table>

PINPOINT TEST H: DTC C1279, C1280, C1281, C1282, C2769, C2770— SENSOR CLUSTER FAULT

Test Step	Result / Action to Take
NOTE: The yaw rate sensor, lateral accelerometer, and longitudinal accelerometer (4x4 vehicles) are integral to the sensor cluster.	

The sensor cluster is not serviceable and must be installed as an assembly.

H1 CARRY OUT THE RECALIBRATION PROCEDURE

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Clear DTC.
- Carry out the yaw rate sensor recalibration procedure using the scan tester.
- Enter the following diagnostic mode on the diagnostic tool: Diagnostic Tool.
- Test drive the vehicle.
- **Are any DTCs retrieved or does the recalibration procedure indicate a fault?**

Yes
GO to H2 .

No
The stability assist system is operating correctly.

H2 CHECK THE STABILITY ASSIST MODULE YAW RATE PID

- Monitor the stability assist module yaw rate PID.
- **Is the stability assist module yaw rate PID value between -4 and +4?**

Yes
GO to H3 .

No
INSTALL a new yaw rate sensor. REFER to Yaw Rate Sensor in this section. CLEAR DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

H3 CHECK THE VOLTAGE FROM THE STABILITY ASSIST MODULE

- Connect: Stability Assist Module C135.
- Key in ON position.
- Measure the voltage between yaw rate sensor C3073-3, circuit 1574 (DB), (harness side), and yaw rate sensor C3073-5, circuit 1571 (BK), (harness side).
- **Is the voltage 10 volts or greater?**

Yes
INSTALL a new sensor cluster. REFER to Yaw Rate Sensor in this section. CLEAR the DTC. REPEAT the self-test.

No
GO to H4 .

H4 CHECK THE YAW RATE SENSOR CIRCUITRY FOR AN OPEN

- Measure the resistance between stability assist module C135 pins, (harness side), and yaw rate sensor C3073 pins, harness side as follows:

Stability Assist Module C135 Pin	Yaw Rate Sensor C3073 Pin	Circuit
7	3	1574 (DB)
5	5	1571 (BK)
25	1	1879 (PK/BK)

CLEAR the DTC. RECALIBRATE the stability assist module. REPEAT the self-test.
L3 CHECK CIRCUIT 1902 (RD) FOR A SHORT TO BATTERY	
• Key in ON position. • Measure the voltage between stability assist module C135-26, circuit 1902 (RD), harness side, and ground. • **Is voltage present?**	**Yes** REPAIR circuit 1902 (RD). CLEAR the DTC. RECALIBRATE the stability assist module. REPEAT the self-test. **No** GO to L4 .
L4 CHECK CIRCUIT 1902 (RD) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between stability assist module C135-26, circuit 1902 (RD), harness side, and ground. • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to L5 . **No** REPAIR circuit 1902 (RD). CLEAR the DTC. RECALIBRATE the stability assist module. REPEAT the self-test.
L5 CHECK THE PRESSURE TRANSDUCER AND	

PEDAL TRAVEL SENSOR (PTS) CIRCUITS FOR AN OPEN

- Key in OFF position.
- Measure the resistance between the following pins:

Stability Assist Module Connector C135 Pin	Pressure Transducer C147 Pin	Circuit
18	3	3601 (WH/RD)
19	1	3603 (RD)
26	1	1902 (RD)
24	2	1904 (GY/BK)

- **Are the resistances less than 5 ohms?**

Yes
GO to L6 .

No
REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.

L6 CHECK THE STABILITY ASSIST MODULE OUTPUT

- Connect: Stability Assist Module C135.
- Key in ON position.
- Measure the voltage between pressure transducer C147-3 and C147-1 and between pedal travel sensor C146-1 and C146-2.
- **Is the voltage approximately 5 volts?**

Yes
GO to L7 .

No
INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist in this section. REPEAT the self-test.

L7 CHECK THE STABILITY ASSIST COMPONENTS

- Reconnect the pedal travel sensor C146 and the pressure transducer C147, one at a time, while clearing the DTCs and retrieving the DTCs in between each component being reconnected.
- **Is DTC C1730 retrieved?**

Yes
If DTC C1730 appeared after plugging in the PTS, INSTALL a new PTS. If DTC C1730 appeared after plugging in the pressure transducer, INSTALL a new brake booster. REFER to Section 206-07 .

No
System is OK. REPEAT the self-test.

PINPOINT TEST M: DTC C1960 — DRIVER BRAKE APPLY CIRCUIT FAULT

Test Step	Result / Action to Take
M1 CHECK FOR OTHER DTCs	
NOTE: DTC C1960 does not set a warning lamp. The driver brake apply circuit only provides a power signal to an aftermarkert trailer brake module. If the electric trailer brakes are not required, there is no need to repair this circuit. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Clear DTCs.	**Yes** GO to M2 . **No** If a different DTC is retrieved, GO to the Stability Assist Module Diagnostic Trouble Code (DTC) Index. If no DTCs are retrieved, system is OK.

• Press and release the brake pedal several times. • Enter the following diagnostic mode on the diagnostic tool: Retrieve DTCs. • **Is DTC C1960 retrieved?**	
M2 CHECK CIRCUIT 1791 (RD) FOR SHORT TO POWER	
• Key in OFF position. • Disconnect: Stability Assist Module C135. • Key in ON position. • Measure the voltage between ABS module C135-44, circuit 1791 (RD) and ground. • **Is the voltage greater than 0 volts?**	**Yes** REPAIR circuit 1791 (RD). CLEAR the DTC. REPEAT the self-test. **No** GO to M3 .
M3 CHECK THE STABILITY ASSIST MODULE OUTPUT	
• Key in OFF position. • Connect: Stability Assist Module C135. • Key in ON position. • Measure the voltage between the trailer tow harness connector and ground while pressing the brake pedal. • **Is the voltage greater than 8 volts?**	**Yes** RELEASE the brake pedal and MEASURE the voltage between the trailer tow harness connector and ground. If the voltage drops below 2 volts, system is OK. If not, INSPECT the aftermarket trailer tow components. CLEAR the DTC. REPEAT the self-test. **No** GO to M4 .
M4 CHECK CIRCUIT 1791 (RD) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Stability Assist Module C135. • Measure the resistance between C135-44 circuit 1791 (RD) and ground. • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist in this section. **No** REPAIR circuit 1791 (RD). CLEAR the DTC. REPEAT the self-test.

PINPOINT TEST N: THE ADVANCE TRAC® CANNOT BE DISABLED/IS INOPERATIVE

Test Step	Result / Action to Take
N1 CHECK FOR DTCS	
• Connect the diagnostic tool. • Retrieve and document continuous DTCs. • **Are any DTCs retrieved?**	**Yes** GO to the Stability Assist Module Diagnostic Trouble Code (DTC) Index. **No** GO to N2 .
N2 CHECK THE ADVANCE TRAC® SWITCH	
• Disconnect: Advance Trac® Switch C206. • Key in OFF position. • Press and hold the Advance Trac® switch in the ON position.	**Yes** INSTALL a new Advance Trac® switch. TEST the system for normal operation. **No**

• Measure the resistance between Advance Trac® switch C206-4, circuit 959 (GY/BK), and C206-1, circuit 640 (RD/YE). • **Is the resistance greater than 5 ohms?**	GO to N3 .
N3 CHECK THE POWER TO THE ADVANCE TRAC® SWITCH	
• Key in ON position. • Measure the voltage between Advance Trac® switch C206-1 circuit 640 (RD/YE), harness side and ground. • **Is the voltage greater than 10 volts?**	**Yes** GO to N4 . **No** REPAIR circuit 640 (RD/YE). TEST the system for normal operation.
N4 CHECK THE ADVANCE TRAC® SWITCH INPUT	
• Key in OFF position. • Connect: Advance Trac® Switch C206. • Disconnect: Stability Assist Module C135. • Key in ON position. • Measure the voltage between stability assist module C135-38 circuit 959 (GY/BK) and ground while pressing the Advance Trac® switch on. • **Is the voltage greater than 10 volts?**	**Yes** RELEASE the Advance Trac® switch. If the voltage drops to less than 2 volts, INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist in this section. **No** REPAIR circuit 959 (GY/BK). TEST the system for normal operation.

PINPOINT TEST O: ADVANCE TRAC® SWITCH INDICATOR IS ALWAYS ON/CANNOT BE DISABLED

Test Step	Result / Action to Take
O1 CHECK THE ADVANCE TRAC® SWITCH	
• Disconnect: Advance Trac® Switch C206. • Key in OFF position. • Measure the resistance between Advance Trac® switch C206-1 (component side), and Advance Trac® switch C206-4 (component side). • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to O2 . **No** INSTALL a new Advance Trac® switch. TEST the system for normal operation.
O2 CHECK CIRCUIT 959 (GY/BK) FOR A SHORT TO POWER	
• Key in OFF position. • Disconnect: Stability Assist Module 135. • Key in ON position. • Measure the voltage between stability assist module C135-38, circuit 959 (GY/BK), harness side, and ground. • **Is voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTC. REPEAT the self-test. **No** GO to O3 .
O3 CHECK CIRCUIT 960 (BK/LB) FOR SHORT TO POWER	
• Measure the voltage between stability assist module C135-13, circuit 960 (BK/LB), harness side and ground; and between Advance Trac® switch C206-5, circuit 960 (BK/LB) and ground.	**Yes** REPAIR the circuit(s). TEST the system for normal operation.

• **Is voltage present?**	**No** GO to O4 .
O4 CHECK CIRCUIT 960 (BK/LB) FOR A SHORT TO GROUND	
• Measure the resistance between stability assist module C135-13 circuit 960 (BK/LB) and ground. • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist in this section. TEST the system for normal operation. **No** REPAIR circuit 960 (BK/LB). TEST the system for normal operation.

PINPOINT TEST P: DTC C1440 PRESSURE TRANSDUCER INPUT CIRCUIT FAILURE

Test Step	Result / Action to Take
NOTE: Excessive clearance between brake pad and rotor, leaks, or air in the hydraulic brake system can also set DTC C1440.	
P1 CHECK FOR DTCS	
• Key in ON position. • Connect the diagnostic tool. • Retrieve DTCs. • **Is DTC C1483, C1287, B2734, B2736, B2737, B2738, or B2740 present?**	**Yes** SERVICE these DTCs first. GO to the appropriate pinpoint test for each DTC received. **No** GO to P2 .
P2 CHECK FOR 5 VOLT REFERENCE VOLTAGE TO THE PRESSURE TRANSDUCER	
• Key in OFF position. • Disconnect: Pressure Transducer C147. • Key in ON position. • Measure the voltage at the pressure transducer C147 between pin 1 and 3 harness side. • **Does the meter show 5 volts?**	**Yes** GO to P6 . **No** GO to P3 .
P3 CHECK CIRCUITS FOR A SHORT TO POWER	
• Key in OFF position. • Disconnect: Stability Assist Module C135. • Key in ON position. • Check the voltage between pressure transducer pin 3 and ground, between pin 1 and ground, and between pin 2 and ground. • **Is voltage present?**	**Yes** REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test. **No** GO to P4 .
P4 CHECK CIRCUITS FOR A SHORT TO GROUND	
• Key in OFF position. • Check the resistance between pressure transducer pin 3 and ground, between pin 1 and ground, and between pin 2 and ground. • **Is the resistance greater than 10,000 ohms in each test?**	**Yes** GO to P5 . **No** REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.
P5 CHECK CIRCUIT RESISTANCE	

- Check the resistance between stability assist module C135 and pressure transducer C147 pins.

Stability Assist Module C135 Pin	Pressure Transducer C147 Pin	Circuit
18	3	3601 (WH/RD)
20	2	3600 (RD/WH)
19	1	3603 (RD)

- **Is the resistance less than 5 ohms in each test?**

Yes
GO to P6 .

No
REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.

P6 CHECK THE SIGNAL FROM THE PRESSURE TRANSDUCER

- Disconnect: Pressure Transducer C147.
- Disconnect: Stability Assist Module C135 pin 20, circuit 3600 (RD/WH).
- Connect: Stability Assist Module C135.
- Key in ON position.
- Measure the voltage between terminal pin 20, circuit 3600 (RD/WH) and ground while pressing and releasing the brake pedal.
- **Is the voltage between 0.125 and 5 volts?**

Yes
INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist in this section.

No
NOTE: The pressure transducer is not serviceable and a new transducer must be installed as part of the brake booster assembly.

INSTALL a new pressure transducer. REFER to Section 206-07 . CLEAR the DTC. REPEAT the self-test.

PINPOINT TEST Q: DTC C1998 IVD SENSOR AND STABILITY ASSIST MODULE CALIBRATION

Test Step	Result / Action to Take
NOTE: Stability assist lamp will flash when calibration is required. IVD calibration is required after certain DTCs are cleared.	
Q1 CHECK FOR DTCS - Connect the diagnostic tool. - Key in ON position. - Retrieve DTCs. - **Is any other DTC retrieved with C1998?**	**Yes** GO to the appropriate pinpoint test for the DTC. **Note:** Some of the pinpoint tests recommend IVD calibration prior to any further diagnostics, in this case GO to Q2 . **No** GO to Q2 .
Q2 IVD CALIBRATION - Connect the diagnostic tool. - Key on, engine running. - **NOTE:** Be sure to rotate the steering wheel lock-to-lock during the	**Yes** GO to Q3 . **No**

calibration of the stability assist system. ● Carry out IVD calibration per the diagnostic tool instructions. ● **Did calibration complete for all IVD sensors? And did stability assist lamp stop flashing and go off?**	GO to **Q1** . **NOTE:** Some concerns will cause a calibration not complete. If sent here from another pinpoint test return to that pinpoint test for further diagnostics.
Q3 CLEAR DTC C1998	
NOTE: You must clear DTC C1998 after the completion of the IVD calibration. ● Connect the diagnostic tool. ● Key in ON position. ● Clear the DTC. ● **Did the DTC clear?**	**Yes** TEST DRIVE the vehicle. REPEAT the self-test. **NOTE:** If sent here from another pinpoint test, return to that pinpoint test for further diagnostics. **No** GO to **Q1** .

PINPOINT TEST R: DTCS C2777 AND C2778 SENSOR CLUSTER BUS FAILURE

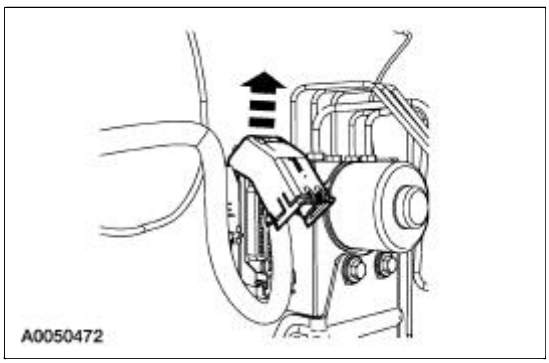
Test Step	Result / Action to Take
NOTE: Check all pins of the sensor cluster and stability assist module when removing connectors. Care should be taken when reinstalling these connectors.	
R1 CHECK THE VOLTAGE TO THE SENSOR CLUSTER	
● Disconnect: Sensor Cluster C3073. ● Key in ON position. ● Measure the voltage between sensor cluster C3073-3, circuit 1574 (DB), harness side and ground. ● **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new sensor cluster. REFER to Yaw Rate Sensor in this section. CLEAR the DTCs. RECALIBRATE the system. REPEAT the self-test. **No** GO to R2 .
R2 CHECK THE STEERING WHEEL ROTATION SENSOR	
● Disconnect: Steering Wheel Rotation Sensor C226. ● Measure the voltage between sensor cluster C3073-3, circuit 1574 (DB), harness side and ground. ● **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new steering wheel rotation sensor. REFER to Steering Wheel Rotation Sensor in this section. CLEAR the DTCs. RECALIBRATE the system. REPEAT the self-test. **No** GO to R3 .
R3 CHECK CIRCUIT 1574 (DB) FOR A SHORT TO GROUND	
● Disconnect: ABS Module C135. ● Measure the resistance between sensor cluster C3073-3 circuit 1574 (DB), harness side and ground. ● **Is the resistance greater than 10,000 ohms?**	**Yes** GO to R4 . **No** REPAIR the circuit. CLEAR the DTCs. RECALIBRATE the system. REPEAT the self-test.

R4 CHECK CIRCUIT 1574 (DB) FOR AN OPEN FROM THE SENSOR CLUSTER	
• Measure the resistance between steering wheel rotation sensor C226-1, harness side and ABS module C135-7, harness side, circuit 1574 (DB). • **Is the resistance less than 5 ohms?**	**Yes** GO to R5 . **No** REPAIR the circuit. CLEAR the DTCs. RECALIBRATE the system. REPEAT the self-test.
R5 CHECK THE CAN BUS CIRCUITS FOR A SHORT TO POWER	
• Key in ON position. • Measure the voltage between sensor cluster C3073-1, circuit 1879 (PK/BK), harness side and ground. • Measure the voltage between sensor cluster C3073-2, circuit 1878 (WH/BK), harness side and ground. • **Is voltage present?**	**Yes** REPAIR circuit 1878 (WH/BK) or circuit 1879 (PK/BK). CLEAR the DTC. RECALIBRATE the system. REPEAT the self-test. **No** GO to R6 .
R6 CHECK THE CAN BUS CIRCUITS FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between sensor cluster C3073-1, circuit 1879 (PK/BK), harness side and ground. • Measure the resistance between sensor cluster C3073-2, circuit 1878 (WH/BK), harness side and ground. • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to R7 . **No** REPAIR circuit 1878 (WH/BK) or circuit 1879 (PK/BK). CLEAR the DTC. RECALIBRATE the system. REPEAT the self-test.
R7 CHECK THE CAN BUS CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between sensor cluster C3073-1, circuit 1879 (PK/BK), harness side and sensor cluster C3073-2, circuit 1878 (WH/BK), harness side. • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to R8 . **No** REPAIR circuit 1878 (WH/BK) and circuit 1879 (PK/BK). CLEAR the DTC. RECALIBRATE the system. REPEAT the self-test.
R8 CHECK THE CAN BUS CIRCUITS FOR AN OPEN	
• Measure the resistance between sensor cluster	**Yes** INSTALL a new sensor cluster. REFER to Yaw Rate

C3073-1, harness side and ABS module C135-25, harness side, circuit 1879 (PK/BK). • Measure the resistance between sensor cluster C3073-2, harness side and ABS module C135-25, harness side, circuit 1878 (WH/BK). • **Is the resistance less than 5 ohms?**	Sensor in this section. CLEAR the DTCs. RECALIBRATE the system. TEST DRIVE the vehicle. REPEAT the self-test. IF DTC C2777 or C2778 is retrieved, INSTALL a new ABS module. REFER to Anti-Lock Control in this section. CLEAR the DTC. RECONFIGURE the ABS module. RECALIBRATE the system. REPEAT the self-test. **No** REPAIR circuit 1878 (WH/BK) or circuit 1879 (PK/BK). CLEAR the DTC. RECALIBRATE the system. REPEAT the self-test.

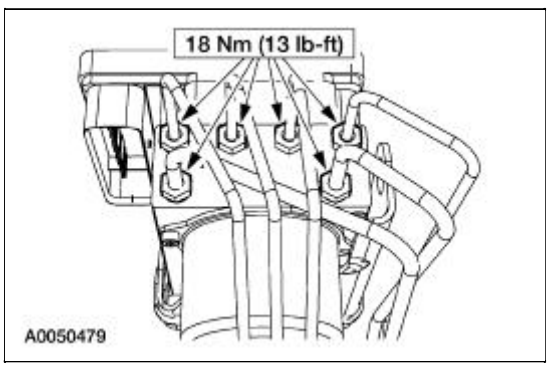
PINPOINT TEST S: DTC B2900: VIN MISMATCHED

Test Step	Result / Action to Take
NOTE: When the stability assist module is configured, the VIN number is stored. At the beginning of each ignition cycle, that VIN is compared to the VIN stored in the PCM. If the VIN stored in the stability assist module does not match the VIN stored in the PCM, DTC B2900 is set and the yellow ABS lamp and the Advance Trac® lamp will illuminate.	
S1 CHECK THE PCM • Check the PCM repair history. • **Has the PCM been reflashed or replaced recently?**	**Yes** VERIFY that the correct VIN is stored in the PCM. REPROGRAM the PCM if the VIN is not correct. CLEAR the DTC. REPEAT the self-test. **No** GO to S2.
S2 CHECK THE STABILITY ASSIST MODULE • Check the stability assist module repair history. • **Has the stability assist module been replaced recently?**	**Yes** VERIFY that the correct VIN is stored in the stability assist module. If the VIN does not match the stored VIN in the PCM, RECONFIGURE the module using the vehicle as-built data. REPEAT the self-test. **No** GO to S3.
S3 CHECK THE MODULE COMMUNICATION NETWORK FOR FAULTS • Check for module communication network DTCs in the stability assist module and the PCM. • **Are there any DTCs present?**	**Yes** REPAIR the DTC(s). REFER to the Stability Assist Module Diagnostic Trouble Code (DTC) Index. CLEAR the DTC. REPEAT the self-test. **No** RECONFIGURE the stability assist module using the vehicle as-built data. REPEAT the self-test.



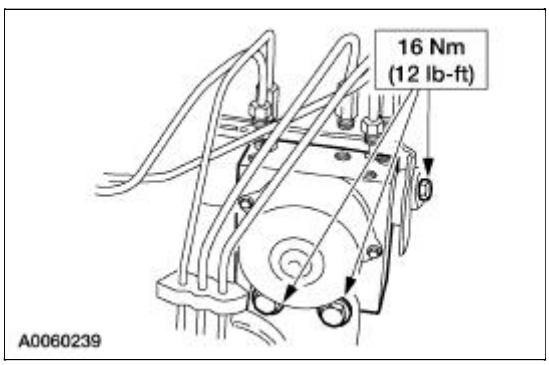
Hydraulic Control Unit (HCU)

Removal and Installation



1. **CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage can result.**

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .



2. Disconnect the stability assist module (ECU) electrical connector.

3. Disconnect the brake tubes from the hydraulic control unit (HCU).

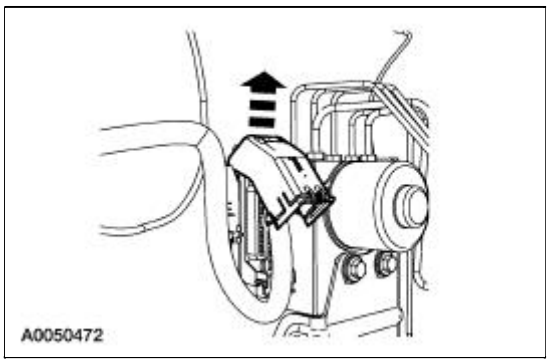
4. Remove the bolts and remove the HCU/ECU assembly.

5. Disconnect the ECU from the HCU.

6. To install, reverse the removal procedure.

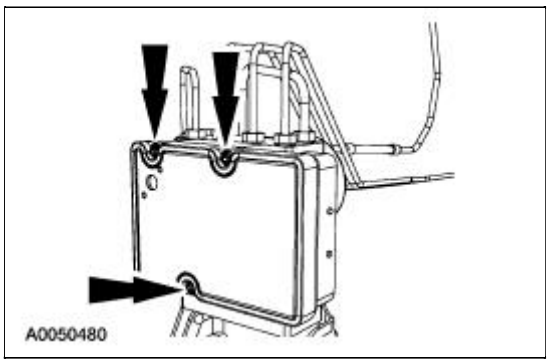
Anti-Lock Brake System (ABS) Module —Stability Assist

Removal and Installation



CAUTION: Do not replace stability assist modules installed on vehicles built before February 2003 with those manufactured after February 2003.

NOTE: When installing a new module, it must be calibrated and reconfigured (either by download/upload or uploading the as-built database method).

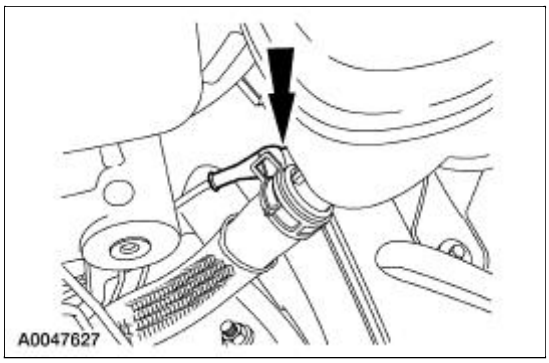


1. **CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage can result.**

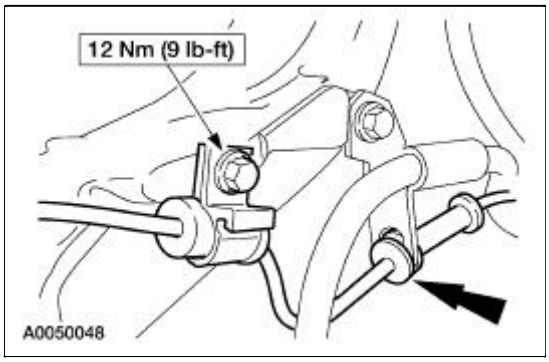
   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Disconnect the anti-lock brake control module electrical connector.

3. Remove the screws and the anti-lock brake control module.



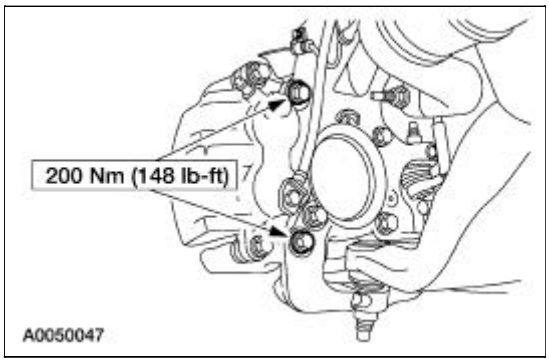
4. To install, reverse the removal procedure.



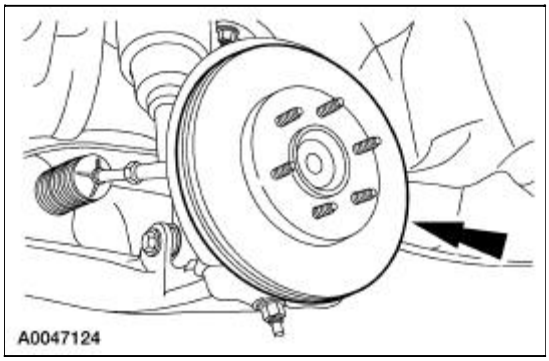
Front Wheel Speed Sensor

Removal and Installation

1. If equipped, turn the air suspension switch to the OFF position.
2. Disconnect the wheel speed sensor connector.



3. Remove the wheel and tire assembly. For additional information, refer to Section 204-04 .
4. Remove the bolt and detach the retainers.

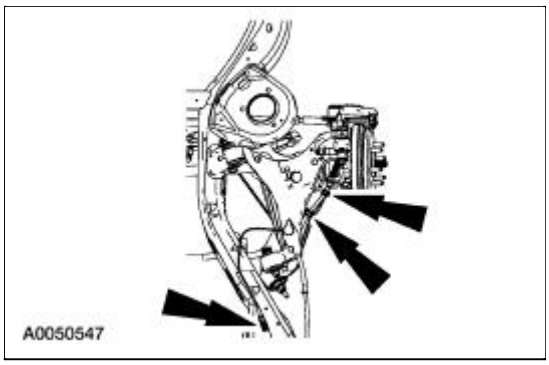


5. **CAUTION: Do not allow the caliper to hang from the brake hose or damage to the hose can result.**

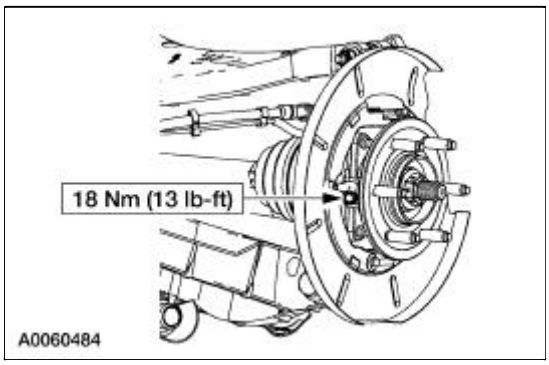
   Remove the bolts, and position the caliper, pads and anchor plate aside.

6. Remove the brake disc.

7. Remove the bolt and the front wheel speed sensor.



8. To install, reverse the removal procedure.



Rear Wheel Speed Sensor

Removal and Installation

1. Remove the parking brake shoes. For additional information, refer to Section 206-05 .
2. Disconnect the wheel speed sensor wire from the retaining clips.

3. Remove the bolt and remove the rear wheel speed sensor.

4. To install, reverse the removal procedure.

Front Wheel Speed Sensor Ring

Removal and Installation

1. **NOTE:** The front wheel speed sensor ring is integral to the front wheel hub and bearing assembly.

   For front wheel speed sensor ring removal and installation, refer to Section 204-01A for 4x2 vehicles or Section 204-01B for 4x4 vehicles.

Rear Wheel Speed Sensor Ring

Removal and Installation

1. **NOTE:** The rear wheel speed sensor ring is integral to the rear wheel hub and bearing assembly.

   For rear wheel speed sensor ring removal and installation, refer to Section 204-02 .

Yaw Rate Sensor

Removal and Installation

CAUTION: Do not replace yaw rate sensors installed on vehicles built before February 2003 with those manufactured for vehicles built after February 2003.

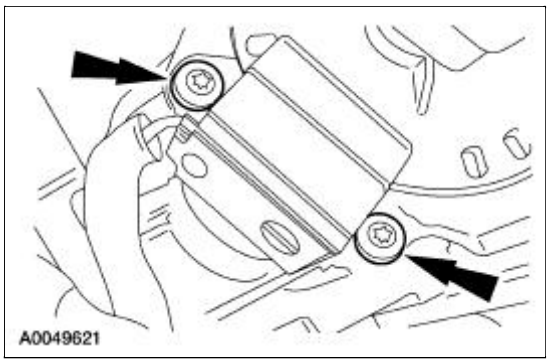
1. Remove the front floor console. For additional information, refer Section 501-12 .
2. Remove the yaw rate sensor.

3. To install, reverse the removal procedure.

Accelerometer

Removal and Installation

CAUTION: Do not replace accelerometers installed on vehicles built before February 2003 with those manufactured after February 2003.



1. **NOTE:** The lateral and longitudinal accelerometer are located within the same component as the yaw rate sensor.

   For additional information, refer to Yaw Rate Sensor .

Steering Wheel Rotation Sensor

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the screws and remove the steering wheel rotation sensor.

3. To install, reverse the removal procedure.

General Specifications

Item	Specification
Lubricants	
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®
Fluid capacity (included in pump reservoir fill)	1.3 L (2.7 pt) (approximate)
Power Steering Gear	
Type	Rack and Pinion
Ratio — Navigator (all) and Expedition vehicles built before 6/2002	17:1
Ratio — Expedition vehicles built 6/2002 onward	20:1
Static steering wheel turning effort Navigator Expedition	 4.0 Nm (35 lb-in) 5.0 Nm (44 lb-in)
Turning effort Navigator Expedition	 2.14 kg (4.7 lbs) 2.68 kg (5.9 lbs)
Turns of steering wheel (lock to lock — linkage disconnected)	3.3
Power Steering Purge Vacuum	
Minimum vacuum	67-84 kPa (20-25 in-Hg)
Power Steering Pump	
Flow (Navigator)	3.0 gpm ± 0.2 @ 50 psi and 2,500 rpm
Flow (Expedition)	3.0 gpm ± 0.2 @ 50 psi and 1,000 rpm 2.5 gpm ± 0.2 @ 50 psi and 2,800 rpm
Minimum capacity	1.6 gpm @ 750 psi and 500 rpm
Relief pressure	1,300-1,480 psi

Steering System

The steering system consists of the following components:

- power steering pump
- fluid reservoir
- steering column
- steering gear
- fluid cooler

For information on the power steering pump, steering gear, steering lines and fluid reservoir, refer to Section 211-02 .

For information on the steering wheel, column assembly and intermediate shaft, refer to Section 211-04 .

Steering System

Refer to Wiring Diagrams Cell 41 for schematic and connector information.

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool
 ST1477-A	Power Steering Analyzer 014-00207 or equivalent
 ST1396-A	Dial Thermometer 0-220°F 023-R0007 or equivalent
 ST1137-A	73 III Automotive Meter 105-R0057 or equivalent

Principles of Operation

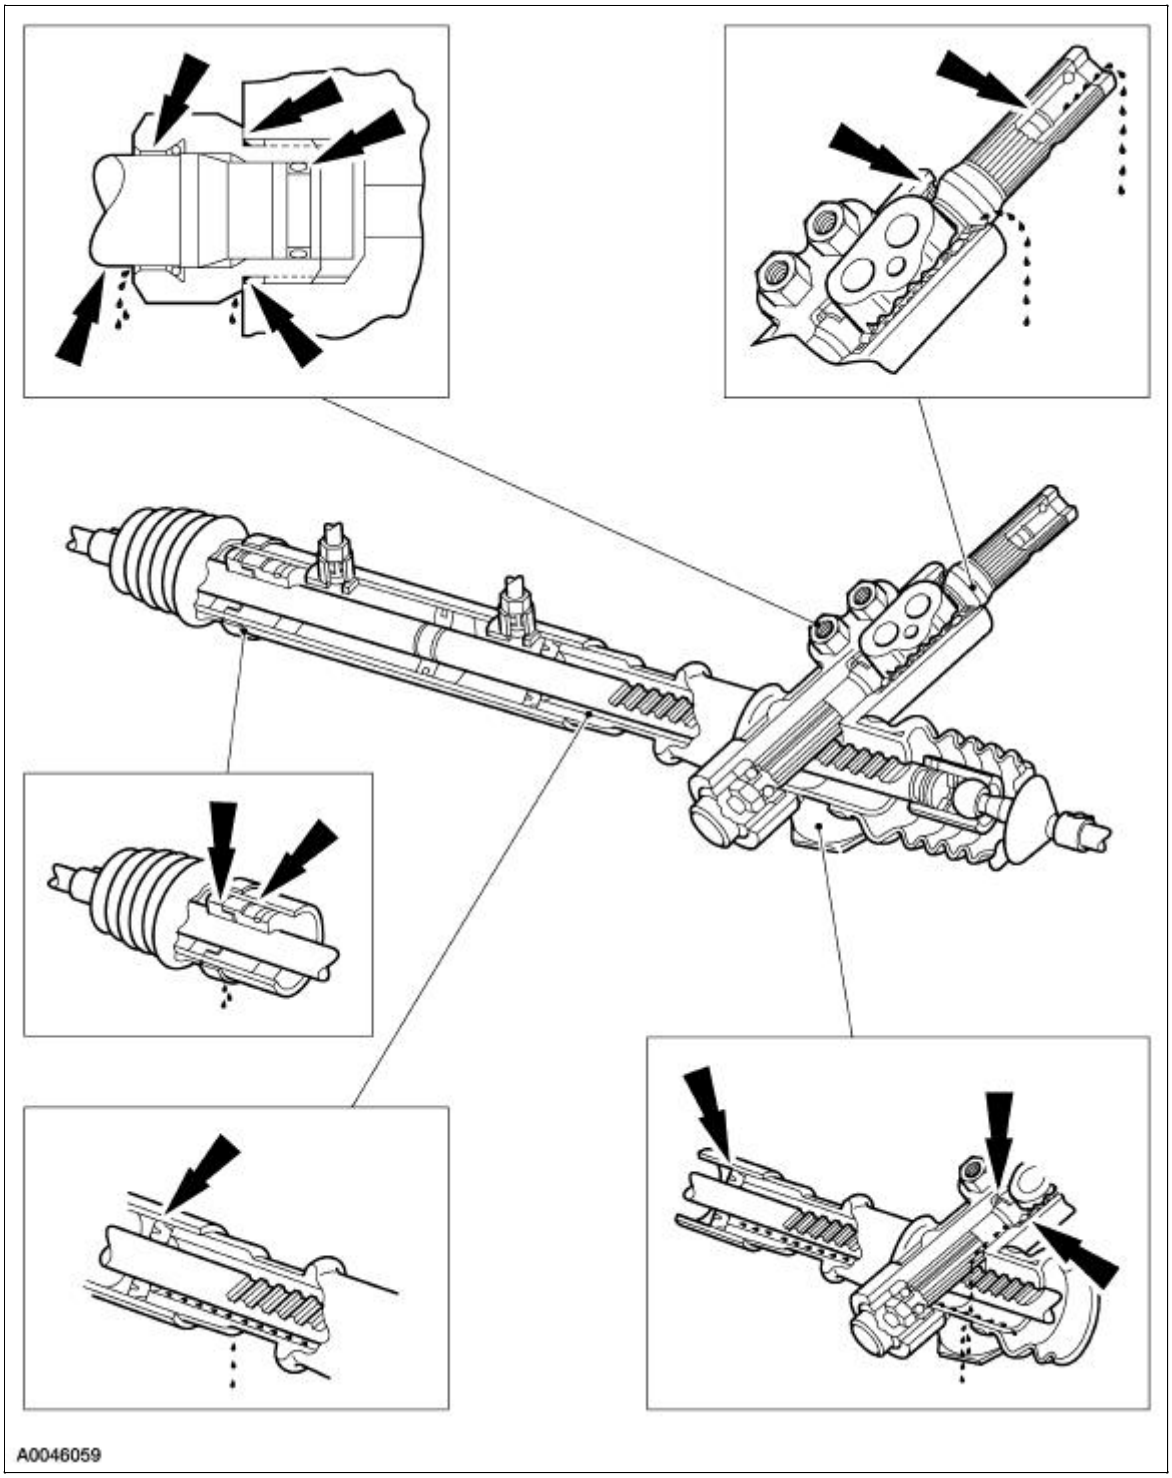
Variable Assist Power Steering (VAPS)

Navigator vehicles include a VAPS system that controls the level of power assistance available to the driver based on vehicle speed. Below 3.2 km/h (2 mph), full power steering assist is provided to lessen steering efforts and increase maneuverability. Between 3.2 km/h (2 mph) and 191 km/h (119 mph), steering assist will decrease gradually at a calibrated rate to raise steering efforts for increased directional stability and greater road feel. Above 191 km/h (119 mph), steering assist is constant.

The 4-wheel air suspension module (4WAS) outputs a pulse-width-modulated (PWM) current to the control valve actuator. The control valve actuator controls the hydraulic valve that determines the amount of hydraulic assist provided to the steering gear. The amount of assistance provided varies with the control valve actuator current, which is based on vehicle speed according to a look-up table internal to the module. The module pulse-width modulates the VAPS actuator current to provide the desired amount of assistance. The amount of hydraulic steering assistance provided by the VAPS subsystem is proportional to the average control valve current.

The vehicle speed is provided to the air suspension module through a transmission mounted vehicle

speed sensor (VSS).



Inspection and Verification

CAUTION: Do not hold the steering wheel (3600) at the stops for an extended amount of time. Damage to the power steering pump (3A674) can result.

NOTE: Make the following preliminary checks before repairing the steering system:

1. Verify the customer concern by operating the steering system.
2. Inspect Tires
   - Check the tire pressure. For additional information, refer to the Vehicle Certification (VC) label.
   - Verify that all tires are sized to specification. For additional information, refer to Section 204-04 .
   - Check the tires for damage or uneven wear. For additional information, refer to Section 204-04 .
3. Belt and Tensioner Check
   - Refer to Section 303-05 for diagnosis and testing of the accessory drive system.
4. Fluid Level Check
   - Verify that the power steering fluid level is within the appropriate hot or cold range on the dipstick. Add MERCON® Multi-Purpose (ATF) Transmission Fluid XT-02-QDX or MERCON® equivalent.
5. Air Bleeding
   - Verify that there is no air in the power steering system. Run the engine (6007) until it reaches normal operating temperature. Turn the steering wheel to the left and right several times without hitting the stops. If any air bubbles are present, refer to Power Steering System Purging in this section.

External Leak Check — Typical Power Rack-and-Pinion Steering Gear

6. External Leak Check
    - With the ignition switch at OFF, wipe off the power steering pump, power steering pressure hose (3A719), power steering return hose (3A713), power steering fluid cooler and hose assembly and steering gear (3504).
    - With the engine running, turn the steering wheel from stop-to-stop several times. Do not hold the steering wheel at stops. Check for leaks. Repair as necessary if leaks are observed.

7. Turning Effort Check
    - Refer to Turning Effort Test under Component Tests in this section.

8. Visually inspect for obvious signs of mechanical damage. For additional information, refer to the following chart.

Visual Inspection Chart

Mechanical	Electrical
● Loose tie-rod ends ● Loose suspension components ● Loose steering column shaft universal joints ● Loose column intermediate shaft bolts ● Steering gear ● Binding or misaligned steering column ● Power steering pump ● Bent or pinched power steering hoses	● Wiring ● Connectors

9. If an obvious cause for an observed or reported malfunction is found, correct the cause (if possible) before proceeding to the next step.

10. If the concern remains after the inspection, connect the Scan Tool to the data link connector (DLC) located beneath the instrument panel, and select the vehicle to be tested from the Scan Tool menu. If the Scan Tool does not communicate with the vehicle:
    - check that the program card is correctly installed.
    - check the connections to the vehicle.
    - check the ignition switch position.

11. If the Scan Tool still does not communicate with the vehicle, refer to the tester manual.

12. Carry out the DATA LINK DIAGNOSTIC TEST. If the Scan Tool responds with:
    - CKT914, CKT915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
    - NO RESP/NOT EQUIP for 4WAS module, refer to Section 418-00 .
    - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the self-test diagnostics for the 4WAS module.

13. If the DTCs retrieved are related to the concern, go to Diagnostic Trouble Code (DTC) Index to continue diagnostics.

14. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

15. If the fault is not visually evident, determine the symptom and GO to Symptom Chart .

Diagnostic Trouble Code (DTC) Index

4WAS/VAPS Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
C1897	Steering VAPS Circuit Loop Failure	Circuit, Valve Solenoid, 4WAS Module	Go To Pinpoint Test B .
C1445	Vehicle Speed Signal Circuit Failure	4WAS	REFER to Section 204-05 .
U1950	VAP Communication BUS Fault	4WAS	REFER to Section 204-05
B1317	Battery Voltage High	4WAS Module	REFER to Section 204-

			05 .
B1318	Battery Voltage Low	4WAS Module	REFER to Section 204-05 .
B1342	ECU is Defective	4WAS Module	REFER to Section 204-05 .
B2477	Module Configuration Failure	4WAS Module	REFER to Section 418-01 .

Steering System Symptom Definitions

Drift/Pull

Pull is a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with hands off the steering wheel.

- A vehicle-related drift/pull, on a flat road, can cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull can be induced by conditions external to the vehicle (i.e., wind, road camber).

Excessive Steering Wheel Play

Excessive steering wheel play is a condition in which there is too much steering wheel movement before the wheels move. A small amount of steering wheel play is considered normal.

Feedback

Feedback is a roughness felt in the steering wheel when the vehicle is driven over rough pavement.

Hard Steering or Lack of Assist

Hard steering or lack of assist is experienced when the steering wheel effort exceeds specifications. Hard steering can remain constant through the full turn or occur near the end of a turn. It is important to know the difference between hard steering/lack of assist and binding.

Hard steering or lack of assist can result from either hydraulic or mechanical conditions. It is extremely important to know if this concern occurs during driving, or during very heavy or static parking maneuvers.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces and observed by the driver as small rotational oscillations of the steering wheel.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe the poor return of the steering wheel to center after a turn or the steering correction is completed.

Shimmy

Shimmy, as observed by the driver, is large, consistent, rotational oscillations of the steering wheel

resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire contacts pot holes or irregularities in the road surface.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the 4WAS module/unable to enter self-test	• Circuit(s). • Module.	• Go To Pinpoint Test A .
• Hard steering or lack of assist (without DTCs or air suspension light illuminated)	• Seized lower steering column shaft U-joints.	• INSTALL a new lower steering column shaft. REFER to Section 211-04 .
	• Damaged, fractured steering column bearing(s).	• REPAIR the steering column. REFER to Section 211-04 .
	• Power steering pump.	• GO to Pump Flow and Pressure Test Component Test in this section.
	• Suspension components.	• REFER to Section 204-00 for suspension system diagnosis and testing.
	• Steering gear internal leakage.	• GO to Pump Flow and Pressure Test Component Test in this section.
• Excessive steering pump noise	• Power steering pump.	• GO to Pump Flow and Pressure Test Component Test in this section.
• Excessive steering wheel play	• Damaged, loose, or worn tie-rod end (3290).	• GO to the Steering Linkage Component Test.
	• Loose, worn or damaged tie-rod (3280).	• GO to the Tie-Rod Articulation Torque Component Test.
	• Damaged/worn steering gear.	• INSTALL a new steering gear. REFER to Section 211-02 .
	• Loose, worn or damaged steering	• INSTALL new steering column

	column bearing(s). ● Loose, worn or damaged lower steering column shaft U-joint(s).	bearing(s). REFER to Section 211-04 . ● INSTALL a new lower steering column shaft. REFER to Section 211-04 .
● Wander	● Unevenly loaded or overloaded vehicle. ● Loose, worn or damaged tie-rod. ● Loose, worn or damaged tie-rod ends. ● Loose or damaged steering gear mounting bolts. ● Loose lower steering column shaft U-joint bolts. ● Loose, worn or damaged lower steering column shaft U-joints. ● Loose, worn or damaged steering column bearing(s). ● Suspension components.	● INFORM the customer of incorrect vehicle loading. ● GO to the Tie-Rod Articulation Torque Component Test. ● GO to the Steering Linkage Component Test. ● INSTALL new bolts or TIGHTEN the bolts. REFER to Section 211-02 . ● TIGHTEN the bolts. REFER to Section 211-04 . ● INSTALL a new lower steering column shaft. REFER to Section 211-04 . ● INSTALL new steering column bearings. REFER to Section 211-04 . ● REFER to Section 204-00 for suspension system diagnosis and testing.
● Drift/pull	● Unevenly loaded or overloaded vehicle. ● Wheel alignment. ● Loose, worn or damaged tie-rod. ● Loose, worn or damaged tie-rod ends. ● Suspension components. ● The steering gear	● INFORM the customer of incorrect vehicle loading. ● ADJUST as required. REFER to Section 204-00 . ● GO to the Tie-Rod Articulation Torque Component Test. ● GO to the Steering Linkage Component Test. ● REFER to Section 204-00 for suspension system diagnosis and testing. ● GO to Steering Gear

	valve effort out of balance. ● Check the brake system for correct operation. ● Incorrect frame/underbody alignment.	Valve Component Test in this section. ● REFER to Section 206-00 . ● CORRECT as required. REFER to Frame Dimension Manual.
● Feedback	● Loose, worn or damaged tie-rod. ● Loose, worn or damaged tie-rod ends. ● Loose or damaged steering gear insulators or bolts. ● Loose lower steering column shaft U-joint bolts. ● Loose suspension bushings, fasteners or ball joints. ● Worn or damaged steering column bearing(s).	● GO to the Tie-Rod Articulation Torque Component Test. ● GO to the Steering Linkage Component Test. ● INSTALL new bolts or TIGHTEN the retaining bolts. REFER to Section 211-02 . ● TIGHTEN the bolts. REFER to Section 211-04 . ● INSTALL new components as necessary. REFER to Section 204-01A or Section 204-01B . ● INSTALL new steering column bearing(s). REFER to Section 211-04 .
● Poor returnability/sticky steering	● Binding lower steering column shaft U-joints. ● Loose, worn or damaged front wheel spindle tie-rod. ● Loose, worn or damaged tie-rod ends. ● Suspension components. ● Binding steering column bearing(s).	● INSTALL a new lower steering column shaft. REFER to Section 211-04 . ● GO to the Tie-Rod Articulation Torque Component Test. ● GO to the Steering Linkage Component Test. ● REFER to Section 204-00 for suspension system diagnosis and testing. ● INSTALL new steering column bearing(s). REFER to Section 211-04 .
● Shimmy	● Loose, worn or damaged tie-rod end. ● Loose, worn or damaged tie-rod.	● GO to the Steering Linkage Component Test. ● GO to the Tie-Rod Articulation Torque

		Component Test.
	• Suspension components.	• REFER to Section 204-00 for suspension system diagnosis and testing.
• Power steering pump noisy	• Low fluid level and possible leakage.	• FILL reservoir to specified level. CHECK for leaks. REPAIR as necessary.
	• Plugged reservoir filter.	• INSTALL a new reservoir. REFER to Section 211-02 .
	• Power steering pump.	• INSTALL a new power steering pump. REFER to Section 211-02 .
	• Entrained air.	• REFER to Power Steering System Purging in this section.

Pinpoint Tests

PINPOINT TEST A: NO COMMUNICATION WITH THE 4WAS MODULE/UNABLE TO ENTER SELF-TEST

Test Step	Result / Action to Take
A1 CHECK CIRCUITS 1003 (GY/YE) AND 1524 (DB) FOR AN OPEN	
• Key in OFF position. • Disconnect: 4WAS C2131b. • Key in ON position. • Measure the voltage between the following 4WAS module C2131b pins, harness side and ground: **Pin** / **Circuit** 1 / 1524 (DB) 4 / 1003 (GY/YE) 15 / 1524 (DB) • **Are the voltages greater than 10 volts?**	**Yes** GO to A2 . **No** REPAIR the affected circuit(s). TEST the system for normal operation.
A2 CHECK CIRCUIT 875 (BK/LG) FOR AN OPEN	
• Disconnect: Air Suspension Control Module C2131b. • Measure the resistance between 4WAS module C2131b pin 19, circuit 875 (BK/LG), harness side and ground. • **Is the resistance less than 5 ohms?**	**Yes** CHECK the module communication network. REFER to Section 418-00 . **No** REPAIR circuit 875 (BK/LG). TEST the system for normal operation.

PINPOINT TEST B: DTC 1897 — STEERING VAPS CIRCUIT LOOP FAILURE

Test Step	Result / Action to Take
B1 CHECK CIRCUITS 412 (OG/LB) AND 413 (LG) FOR SHORT TO GROUND	
• **WARNING: The electrical power to the air suspension system must be turned off prior to hoisting, jacking or towing an air suspension vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.** • Turn the air suspension switch off. • Raise and support the vehicle. For additional information, REFER to Section 100-02 . • Disconnect: 4WAS Module C2131b. • Measure the resistance between 4WAS module C2131b pin 21, circuit 413 (LG), harness side and ground and between 4WAS module C2131b pin 22, circuit 412 (OG/LB), harness side and ground. • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B2 . **No** GO to B5 .
B2 CHECK CIRCUITS 412 (OG/LB) AND 413 (LG) FOR SHORT TO BATTERY	
• Disconnect: Air Suspension Control Module C2131b. • Measure the voltage between 4WAS module C2131b pin 21, circuit 413 (LG), harness side and ground and between 4WAS module C2131b pin 22, circuit 412 (OG/LB), harness side and ground. • **Are the voltages greater than 10.0 volts?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTC. REPEAT the self-test. **No** GO to B3 .
B3 CHECK CIRCUITS 412 (OG/LB) AND 413 (LG) FOR AN OPEN	
• Key in OFF position. • Disconnect: VAPS Actuator C120. • Raise the vehicle on a hoist. For additional information, refer to Section 100-02 . • Measure the resistance between 4WAS module C2131b pin 22 and VAPS actuator C120 pin 1, circuit 412 (OG/LB) and between 4WAS module C2131b pin 21 and VAPS actuator C120 pin 2, circuit 413 (LG). • **Are the resistances less than 5 ohms?**	**Yes** GO to B4 . **No** REPAIR the affected circuit(s). CLEAR the DTC. REPEAT the self-test.
B4 CHECK VAPS ACTUATOR FOR AN OPEN	
• Measure the resistance between the VAPS actuator C120 pin 1 and pin 2, component side. • **Is the resistance between 4 and 8 ohms?**	**Yes** INSTALL a new 4WAS module. REFER to Section 204-05 . REPEAT the self-test. **No** INSTALL a new steering gear. REFER to Section 211-02 . CLEAR the DTC. REPEAT the self-test.
B5 CHECK VAPS ACTUATOR FOR SHORT TO GROUND	
• Raise the vehicle on a hoist. For additional information, refer to	**Yes**

Section 100-02 . ● Disconnect: VAPS Actuator C120. ● Measure the resistance between VAPS actuator C120 pin 1, component side and ground and between VAPS actuator C120 pin 2, component side and ground. ● **Are the resistances greater than 10,000 ohms?**	GO to B6 . **No** INSTALL a new steering gear. REFER to Section 211-02 . CLEAR the DTC. REPEAT the self-test.
B6 CHECK CIRCUITS 412 (OG/LB) AND 413 (LG) FOR A SHORT TOGETHER ● Measure the resistance between VAPS actuator C120 pin 1 and 2, component side. ● Disconnect: VAPS Actuator C120. ● Measure the resistance between VAPS actuator C120 pin 1 and pin 2, harness side. ● **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new 4WAS module. REFER to Section 204-05 . REPEAT the self-test. **No** INSTALL a new steering gear. REFER to Section 211-02 . CLEAR the DTC. REPEAT the self-test.

Component Tests

Steering Linkage

1. With the parking brake applied, carry out the following:
    1. **NOTE:** Excessive vertical or horizontal motion of the stud relative to the steering linkage ball sockets may indicate excessive wear.

       Have an assistant rotate the steering wheel back and forth 360 degrees and watch for relative motion of the studs in the steering linkage ball sockets.
    2. Watch for a loose steering gear attachment to the frame.

2. Another method is to raise the front tires off the ground, grasp the tire at the front and rear and watch for excessive play in the joints while trying to pivot the wheels by hand.

3. **NOTE:** Incorrect separation of the tapered stud from its seat will cause premature failure of the ball socket.

   Joints can be checked for excessive wear by measuring the torque it takes to turn the stud.
    1. Separate the tapered stud from its seat and thread the attaching nut back onto the stud.
    2. **NOTE:** Some joint turning torques will be as little as 0.2 Nm (2 lb-in) within the first 1,000 miles and will remain there for the life of the joint.

       Turn the stud with an inch-pound torque wrench and note the torque required to turn the stud.

Torque Required to Turn Stud in Socket	Nm	Lb-In
New joints	2.0-5.0	18-47
Used joints	0.2-3	2-26
Joints with excessive play	Less than 0.2	Less than 2

    3. **NOTE:** Only install a new ball joint if the stud torque is less than 0.2 Nm (2 lb-in) and the

joint has any play when moved by hand.

Install new tie-rod ends as necessary.

Pump Flow and Pressure Test

WARNING: Do not touch the flowmeter during the test procedure or severe burns and serious injury may occur.

1. **CAUTION: Make sure that the connection point will not interfere with any of the engine accessory drive components or drive belts.**

   Install the Power Steering Analyzer at the high pressure port of the power steering pump. Make sure the power steering analyzer gate valve is fully open.

   - On some vehicles, the power steering pump high pressure port is inaccessible, and therefore, the power steering analyzer should be installed either at the steering gear or at a point in the high pressure line between the power steering pump and the steering gear.

2. Place a Dial Thermometer in the power steering pump reservoir.

3. Check the power steering fluid level. If necessary, add power steering fluid.
   - Use Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX or equivalent meeting Ford specification MERCON®.

4. Install the digital tachometer.

5. **CAUTION: Do not hold the steering wheel against the stops for more than three to five seconds at a time. Damage to the power steering pump will occur.**

   Start the engine. Place the transmission in N (NEUTRAL). Set the parking brake. Raise the power steering fluid temperature to 74-80°C (165-175°F) by rotating the steering wheel fully to the left and right several times.

6. Set the engine speed to idle. Record the flow rate and pressure readings.
   - If the flow rate is below the idle flow rate specification, the power steering pump may require repair. Continue with the test procedure.
   - If the pressure reading is above the idle pressure specification, then check power steering hoses for kinks and restrictions.

7. Partially close the gate valve to obtain 5,175 kPa (750 psi). Record the flow rate.
   - If the flow rate is less than the specified flow rate, install a new power steering pump.

8. **CAUTION: Do not allow the gate valve to remain closed for more than five seconds.**

   Completely close and partially open the gate valve three times. Record the pressure relief valve actuation pressure reading.

   - If the pressure does not meet the relief pressure specification, install a new power steering pump.

9. Set the engine speed to 1,500 rpm. Record the flow rate.

- If the flow rate varies more than 3.785 liters/minute (1 gallon/minute) from the initial flow rate reading, install a new power steering pump.

10.  **CAUTION: Do not hold the steering wheel against the stops for more than three to five seconds at a time. Damage to the power steering pump will occur.**

    Set the engine speed at idle. Turn (or have an assistant turn) the steering wheel to the left and right stops. Record flow rate and pressure readings at the stops.
    - The pressure reading at both stops should be nearly the same as the maximum pump relief pressure.
    - The flow rate should drop below 1.9 liters/minute (0.5 gallon/minute).
    - If the pressure does not reach the maximum pump relief pressure or the flow rate does not drop below the specified value, excessive internal leakage is occurring. Install a new steering gear as necessary. For additional information, refer to Section 211-02 .

11. Turn (or have an assistant turn) the steering wheel slightly in both directions and release it quickly while watching the pressure gauge.
    - The pressure reading should move from the normal backpressure reading and snap back as the steering wheel is released.
    - If the pressure returns slowly or sticks, the rotary valve in the steering gear is binding. Check the steering column and linkage before installing a new steering gear.

Turning Effort Test

NOTE: Make sure front wheels are correctly aligned and tire pressure is correct before checking turning effort.

1. Park the vehicle on dry concrete and set the parking brake.

2. Idle the engine for two to three minutes. Turn the steering wheel to the left and right several times to warm the fluid to 43-49°C (110-120°F).

3. With the engine running, attach a pull scale to the rim of the steering wheel. Measure pull required to turn one complete revolution in each direction. Refer to Specifications for Static Steering Wheel Turning Efforts for acceptable measurements.

Steering Gear Insulator

1. With the wheel normally loaded (on the ground), check the steering gear housing for excessive lateral movement.
    - If the steering gear housing moves more than 1.5 mm (0.05 in), the steering gear insulators may have deteriorated or the steering gear mounting nuts may have loosened. Tighten the steering gear mounting nuts.
    - If the steering gear housing movement is still excessive after tightening the gear mounting nuts, install new steering gear insulators.

Steering Gear Valve

NOTE: For vehicles with a steering pull.

1. With the vehicle in motion, place the transmission in N (NEUTRAL) and turn the engine OFF.
    - If the vehicle does not pull with the engine OFF, repair or install a new steering gear. For additional information, refer to Section 211-02 .
    - If the vehicle pull direction does not change, check the front suspension components and wheel alignment. For additional information, refer to Section 204-00 .

Tie-Rod Articulation Torque

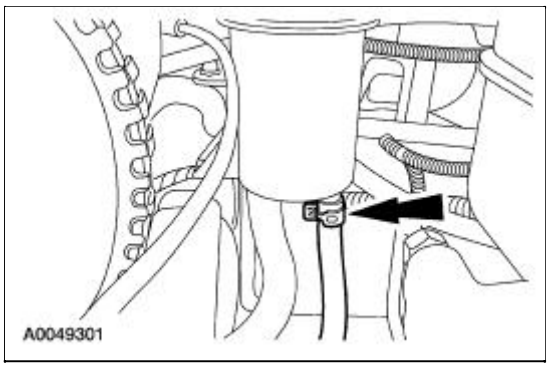
1. **NOTE:** This check can be done with the steering gear on or off the vehicle.

   Disconnect the tie-rod end from the front wheel spindle. Refer to Section 211-02 .

2. Move the tie-rod back and forth three times.

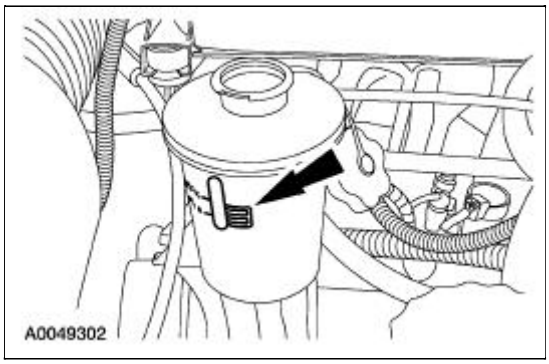
3. Hook the Spring Scale over the tie-rod end or the threaded portion of the tie-rod and measure the force required to move the front wheel spindle tie-rod. Refer to Tie-Rod Articulation Torque in General Specifications in this section.

4. If the force required to move the front wheel spindle tie-rod does not meet the specifications, install a new tie-rod.



Power Steering System Flushing

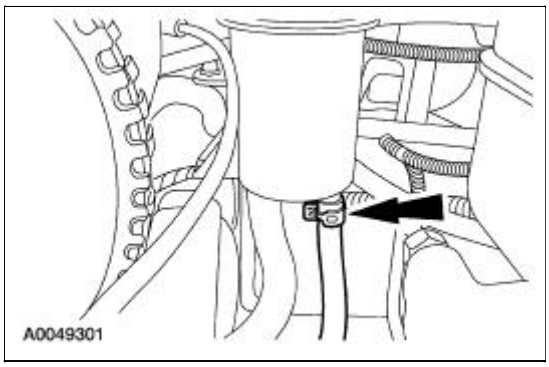
Material



Item	Specification
Motorcraft MERCON®Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

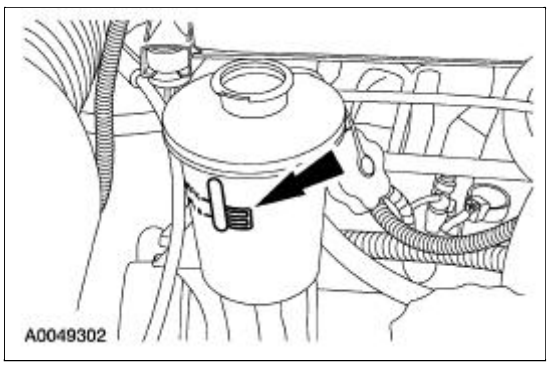
WARNING: Do not mix fluid types. Any mixture or any unapproved fluid can lead to seal deterioration and leaks. A leak can ultimately cause loss of fluid, which can result in a loss of power steering assist.

1. Remove the ignition coil fuse to disable the engine from starting.
2. Loosen the clamp, disconnect the power steering return hose and plug the reservoir inlet.



3. Attach an extension hose between the power steering return hose and an empty container.
4. Fill the power steering fluid reservoir.

5. Raise the front wheels off the ground. For additional information, refer to Section 100-02 .
6. **CAUTION: Do not operate the starter motor for more than 10 seconds at a time. Damage to the starter motor can result.**



Turn the steering wheel from stop to stop while cranking the engine until the fluid exiting the extension hose is clean.

7. Disconnect the extension hose from the power steering return hose and attach the power steering return hose to the fluid reservoir.

8. **NOTE:** Do not overfill the power steering fluid reservoir.

   Fill the power steering fluid reservoir.

9. Install the ignition coil fuse.

10. **CAUTION: Do not hold the steering wheel against the stops for more than three to five seconds at a time. Damage to the power steering pump will occur.**

    Start the engine and turn the steering wheel from stop to stop.

11. **NOTE:** If power steering is noisy and accompanied by aerated fluid, it will be necessary to purge the power steering system. For additional information, refer to Power Steering System Purging in this section.

    Check the power steering fluid level.

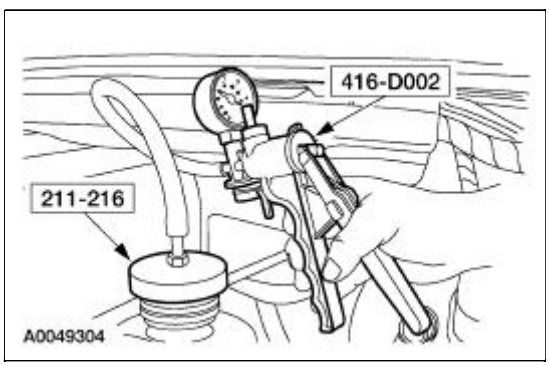
12. Clear diagnostic trouble codes (DTCs). For additional information, refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Power Steering System Purging

Special Tool(s)

 ST1176-B	Vacuum Pump Kit 416-D002 (D95L-7559-A)
 ST2670-A	Evacuation Cap, Power Steering 211-265

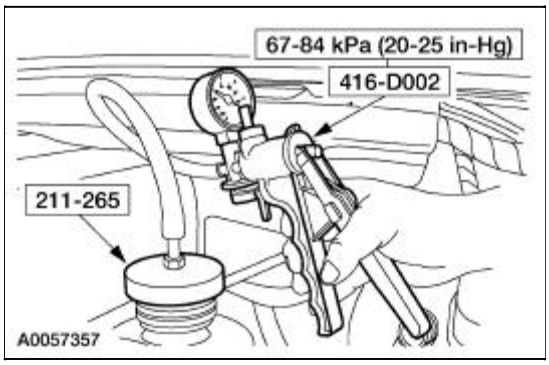
Material



Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

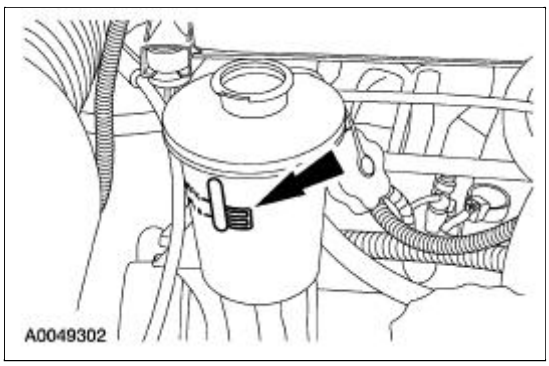
NOTE: If the air is not purged from the power steering system correctly, pump failure can result. This condition can occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.

A whine heard from the power steering pump may be caused by air in the system. The power steering purging procedure must be carried out under the following conditions:



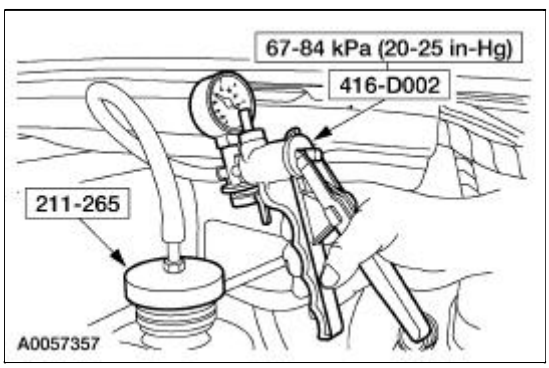
- Prior to any component repair for which power steering noise complaints are accompanied by evidence of aerated fluid.
- After replacement of any power steering system component (gear, hose, etc.).

1. Remove the cap and install the special tools.



2. Start the engine and allow it to idle.

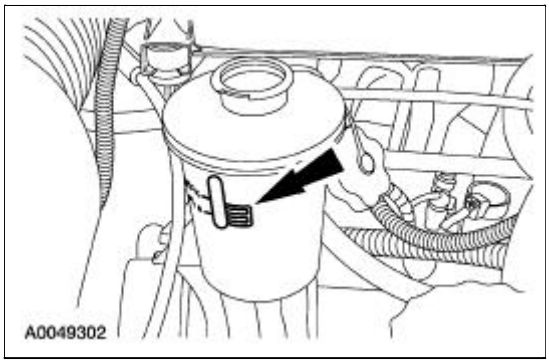
3. Using the special tool, apply maximum vacuum for a minimum of three minutes with the engine at idle. Maintain the maximum vacuum with vacuum pump.



4. Release the vacuum source and remove the vacuum pump.

5. Add fluid to the power steering fluid reservoir.

6. Using the special tool, reinstall the vacuum pump stopper and apply maximum vacuum.



7. **CAUTION: Do not hold the steering wheel against the stops for more than three to five seconds at a time. Damage to the power steering pump will occur.**

   Cycle the steering wheel from stop to stop every 30 seconds for approximately five minutes.

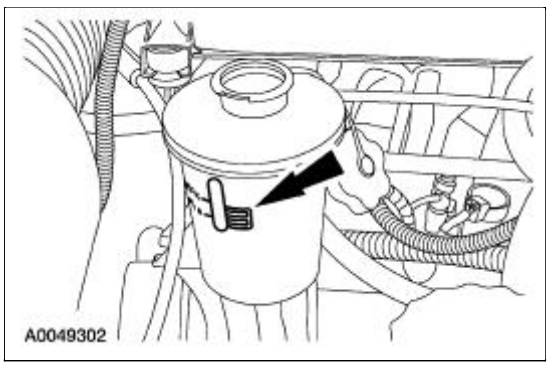
8. Stop the engine, release the vacuum source, and remove the vacuum pump.

9. Add power steering fluid if necessary. Install the power steering fluid reservoir cap.

10. **CAUTION: Do not hold the steering wheel against the stops for more than three to five seconds at a time. Damage to the power steering pump will occur.**

    Start the engine and cycle the steering wheel from stop to stop every 30 seconds for approximately five minutes.

11. Check for power steering fluid leaks at all connections. If the power steering fluid still shows signs of aeration, repeat this procedure.

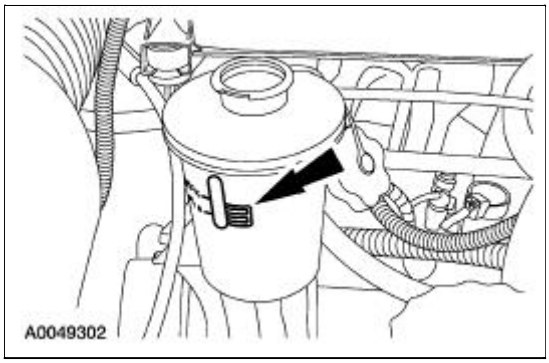


Power Steering System Filling

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

WARNING: Do not mix fluid types. Any mixture or any unapproved fluid can lead to seal deterioration and leaks. A leak can ultimately cause loss of fluid, which can result in a loss of power steering assist.



1. Fill the power steering reservoir to the appropriate level.

2. Remove the ignition coil fuse to disable the engine from starting.
3. Raise the front wheels off the floor. For additional information, refer to Section 100-02 .
4. **CAUTION: Do not operate the starter motor for more than 10 seconds at a time. Damage to the starter motor can result.**

   Turn the steering wheel from stop to stop while cranking the engine.
5. Lower the vehicle.
6. **CAUTION: Do not overfill the power steering fluid reservoir.**

   Fill the power steering fluid reservoir to the appropriate level.

7. Install the ignition coil fuse.

8. **NOTE:** If the power steering is noisy and accompanied by evidence of aerated fluid it will be necessary to purge the power steering system. For additional information, refer to Power Steering System Purging in this section.

   Clear the diagnostic trouble codes (DTCs). For additional information, refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

   - Start the engine and check the system for leaks.

Power Steering — Hydraulic System

NOTE: Navigator shown, Expedition similar.

Item	Part Number	Description
1	3A697	Fluid reservoir
2	3691	Supply hose (reservoir-to-pump)
3	3A713	Return hose (cooler-to-reservoir)
4	3A733	Pulley
5	3A764	Power steering pump
6	3504	Steering gear

7	3A131	Tie-rod end
8	3280	Spindle tie-rod
9	3332	Bellows boot
10	3A713	Return line (gear-to-cooler)
11	3D746	Fluid cooler
12	3A719	Pressure line (pump-to-gear)

Power Steering Pump

The CIII power steering pump has the following features:

- It is a belt-driven, vane-type, power steering pump.
- It is mounted directly to the engine by three bolts.
- The power steering pump uses a quick-connect fitting for the power steering pressure hose.
- The power steering pump is replaced as an assembly.
- The identification tag attached to the power steering pump indicates the model number and bar code. Refer to the identification tags when installing a new pump.

Power Steering Gear

The Expedition and Navigator steering gears have the following features:

- It is a torsion-bar type hydraulic assisted system.
- It reduces road shock and vibration.
- It includes a rotary-style hydraulic valve.

Navigator vehicles are equipped with Variable Assist Power Steering (VAPS). The VAPS system is equipped with an actuator that is located on the steering gear. As the vehicle speed increases, the solenoid changes the level of assist to the steering system, increasing the amount of torque required to turn the steering wheel.

The VAPS control strategy is integrated into the air suspension module.

Steering Gear Identification

The steering gear is stamped with a manufacturer's code. The following is an example:

- SFRA A 102501 1142

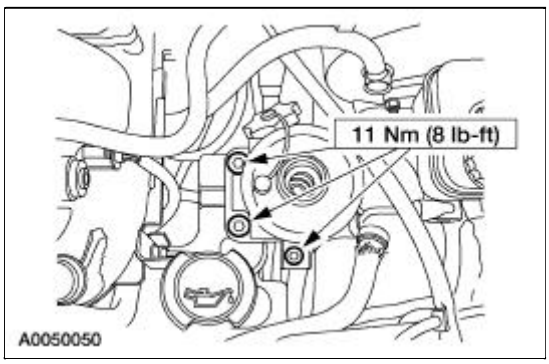
The code is interpreted as follows:

- SFRA-Model code
- A 102501 1142-Build code
    - A — Test stand
    - 10 — Month

- 25 — Day
- 01 — Year
- 1142 — Time

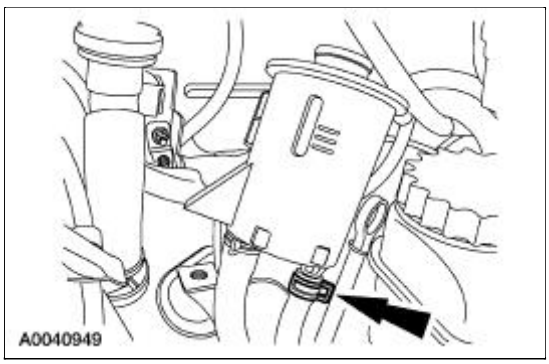
Power Steering

Refer to Section 211-00 .



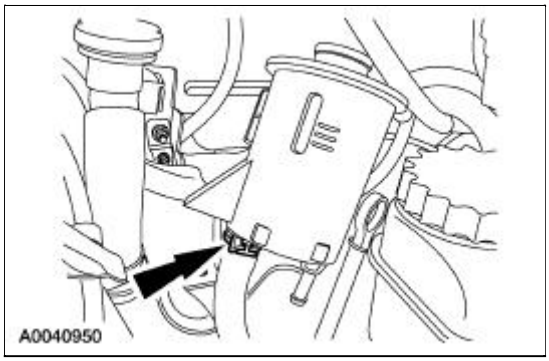
Power Steering Fluid Reservoir

Material



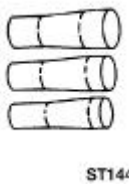
Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

Removal and Installation



1. Remove the screws.

2. Disconnect the hose.



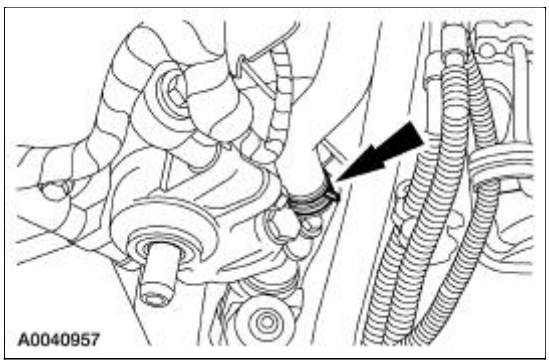
3. Disconnect the hose and remove the power steering pump reservoir.

4. To install, reverse the removal procedure.
5. Fill, purge and leak check the system. For additional information, refer to Section 211-00 .

Power Steering Pump

Special Tool(s)

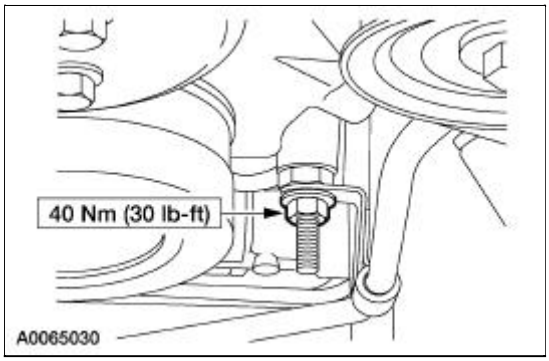
 ST1444-A	Installer Set, Teflon Seal D90P-3517-A or Equivalent



Material

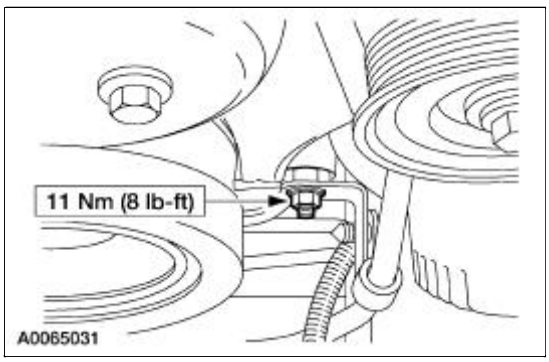
Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

Removal and Installation



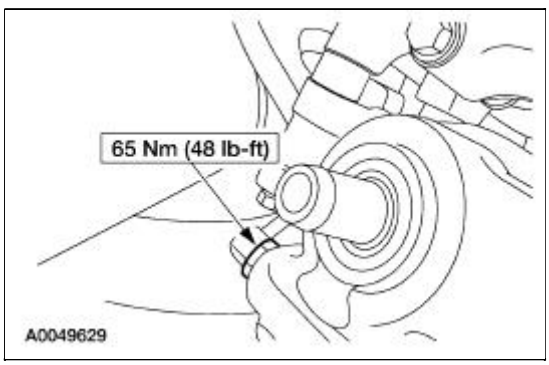
All vehicles

1. Remove the cooling fan. For additional information, refer to Section 303-03 .
2. Remove the power steering pump pulley. For additional information, refer to Power Steering Pump Pulley in this section.
3. Disconnect the hose.



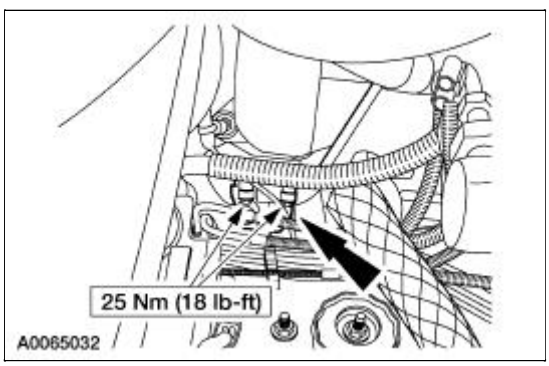
Vehicles with 5.4L engine

4. Remove the nut.

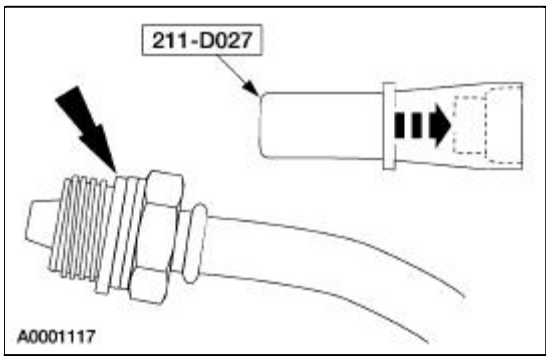


Vehicles with 4.6L engine

5. Remove the nut.



All vehicles

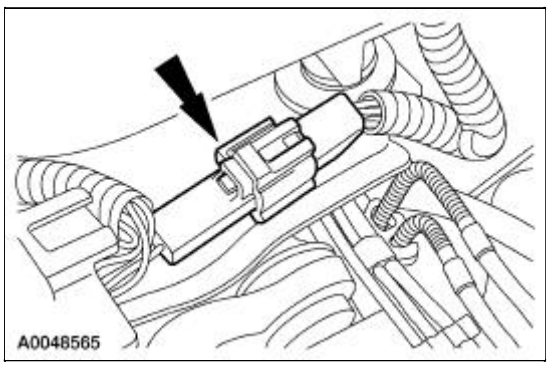


6. Disconnect the line.

7. Remove the three bolts.
    - Detach the harness retainer and remove the pump.

8. To install, reverse the removal procedure.
9. Using the special tool, install a new seal on the pressure hose fitting.

10. Fill, purge and leak check the system. For additional information, refer to Section 211-00 .

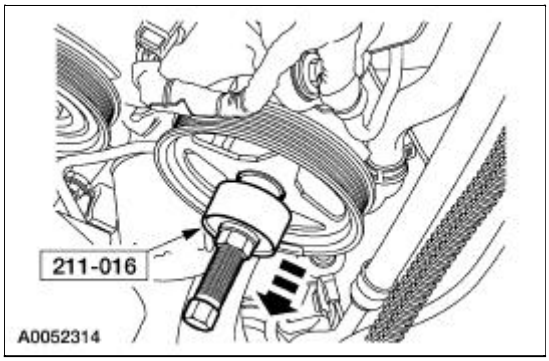


Power Steering Pump Pulley

Special Tool(s)

	Remover, Power Steering Pump Pulley 211-016 (T69L-10300-B)
 ST1586-A	Installer, Power Steering Pump Pulley 211-185 (T91P-3A733-A)

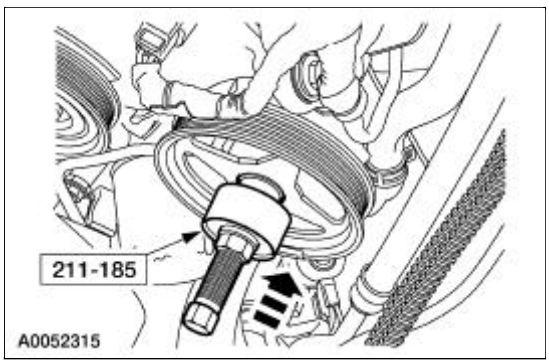
Removal and Installation



1. Remove the drive belt. For additional information, refer to Section 303-05 .
2. Disconnect the mass air flow sensor electrical connector.

3. Loosen the clamps, then disconnect the electrical connector.
   - Remove the air cleaner outlet canister and pipe.

4. Using the special tool, remove the power steering pump pulley.



5. To install, reverse the removal procedure.

6. **CAUTION: If the pulley has been removed and installed twice, install a new power steering pump pulley.**

   Using the special tool, install the power steering pump pulley.

   - Inspect the pulley for paint marks in the web area near the hub. If there are two paint marks, install a new pulley. If there is one paint mark or none at all, use a paint pencil to mark the web area of the pulley near the hub.

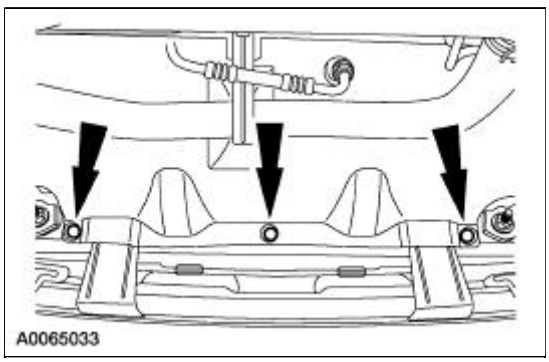
Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

Removal and Installation

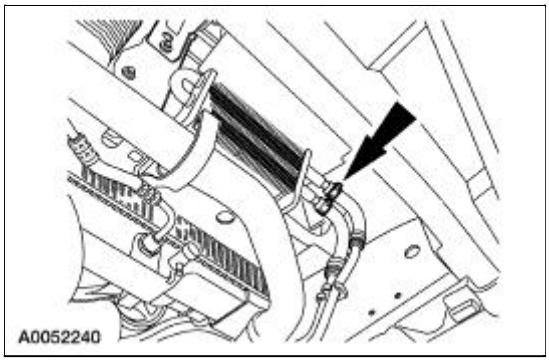
All vehicles



1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located near the jack storage area in the rear of the passenger compartment. Failure to do so may result in unexpected inflation or deflation of the air springs which may result in shifting of the vehicle during these operations.**

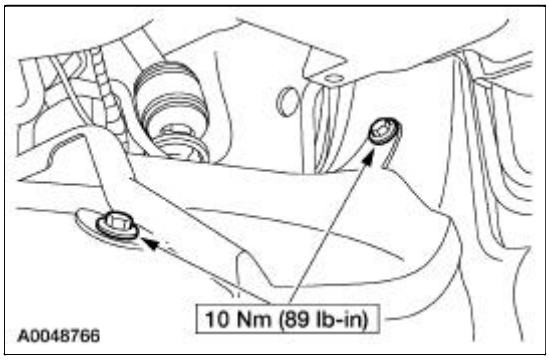
   If equipped, turn the air suspension switch to the OFF position.

2. With the vehicle in NEUTRAL, position on a hoist. For additional information, refer to Section 100-02 .

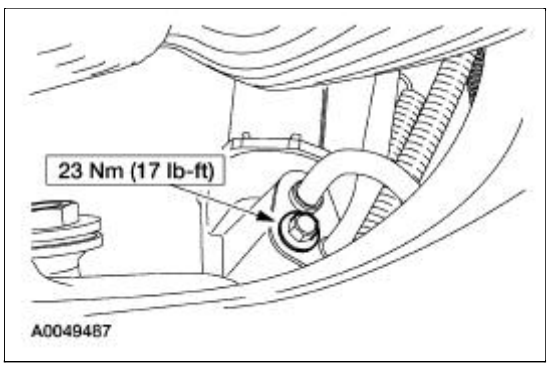


Navigator vehicles

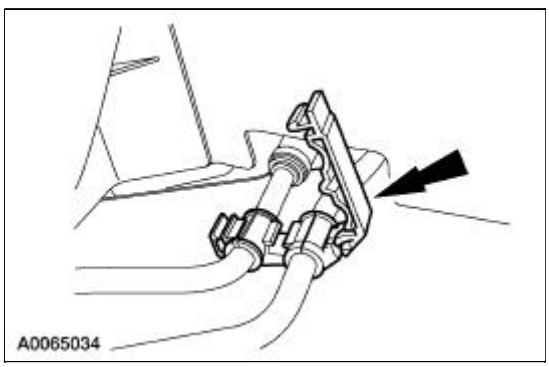
3. Remove the pushpins and the deflector shield.



All vehicles



4. Disconnect the hose.



5. Remove the bolts and the oil drip shield.

6. Remove the bolt.

7. Detach the hose from the frame rail retainers and remove the hose.

8. To install, reverse the removal procedure.

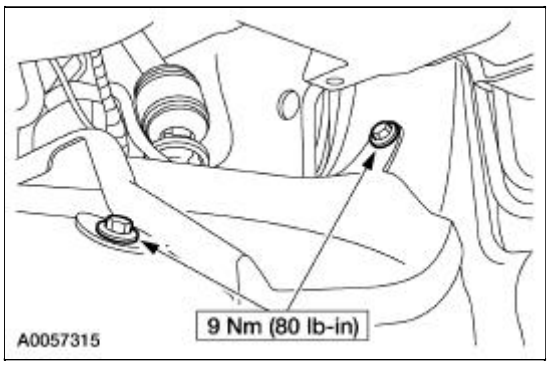
9. Fill, purge and leak check the system. For additional information, refer to Section 211-00 .

Power Steering Pump to Steering Gear Pressure Line —4x2

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

Removal and Installation



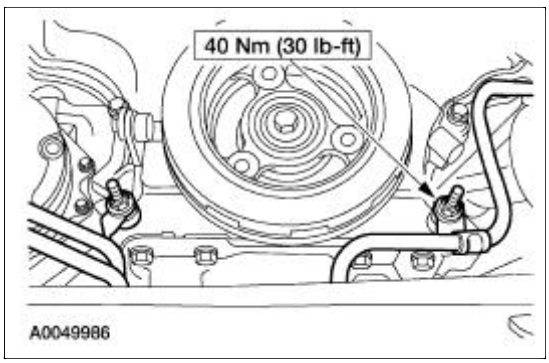
All vehicles

1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located near the jack storage area in the rear of the passenger compartment. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

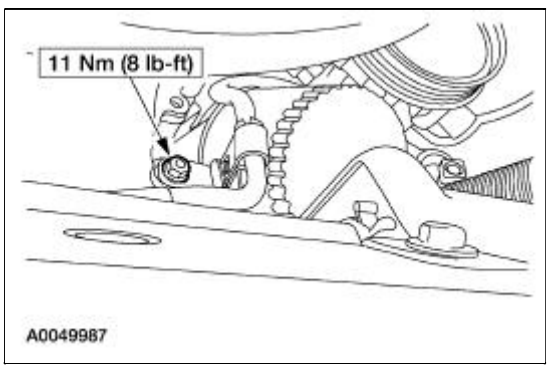
   If equipped, turn the air suspension switch to the OFF position.

2. With the vehicle in NEUTRAL, position on a hoist. For additional information, refer to Section 100-02 .

3. Remove the bolts and the oil drip shield.

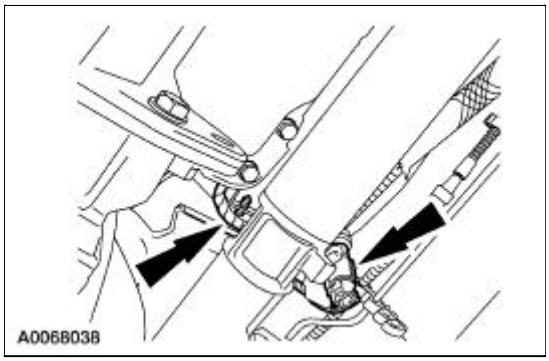


4. Remove the bolt and detach the crossmember retainers.



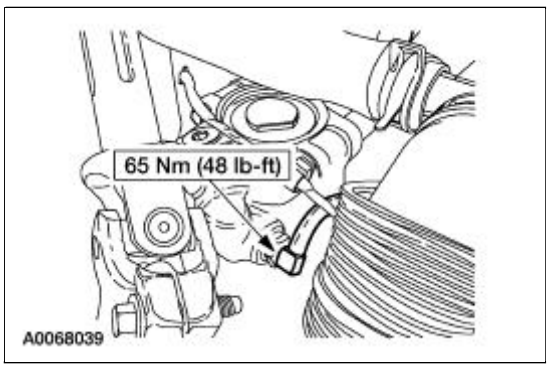
5.4L engine

5. Remove the nut.



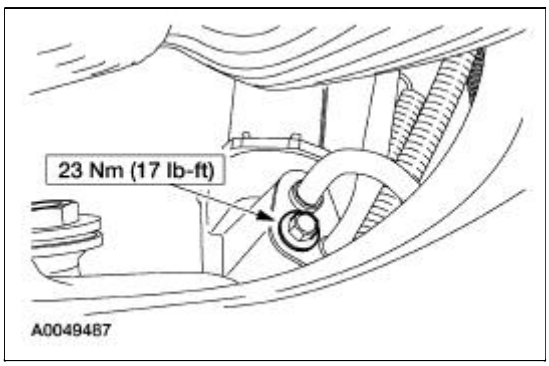
4.6L engine

6. Remove the nut.



Expedition vehicles

7. If equipped, disconnect the pressure sensor electrical connector and detach the harness retainer.



All vehicles

8. From the back side of the pump, disconnect the line.

9. Remove the bolt and the pressure line.

10. To install, reverse the removal procedure.

11. Fill, purge and leak check the system. For additional information, refer to Section 211-00 .

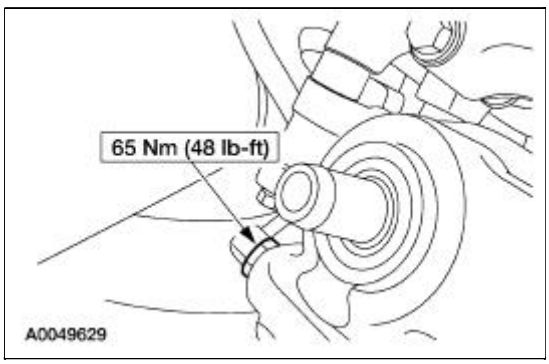
Power Steering Pump to Steering Gear Pressure Line —4x4

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®

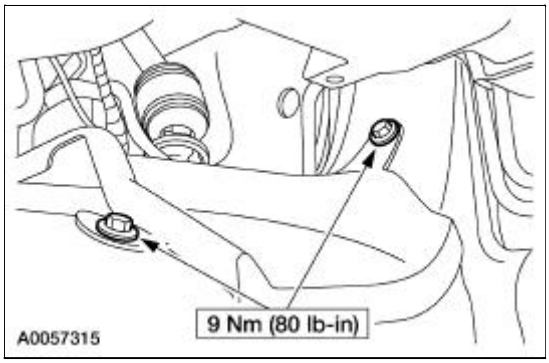
Removal and Installation

All vehicles



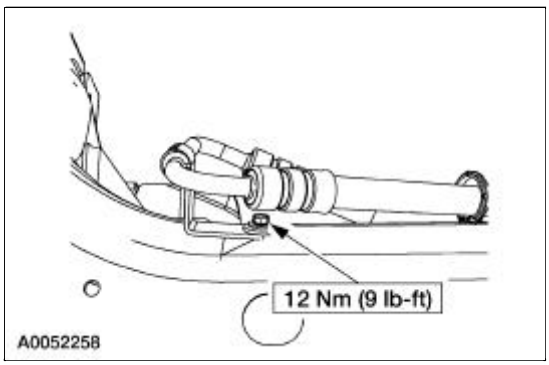
1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located near the jack storage area in the rear of the passenger compartment. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   If equipped, turn the air suspension switch to the OFF position.



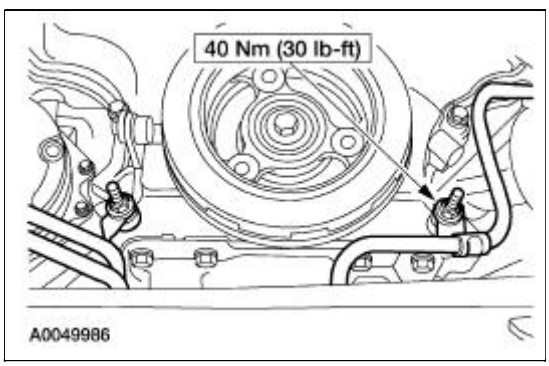
2. Remove the cooling fan and shrouds. For additional information, refer to Section 303-03 .

3. Remove the power steering pump pulley. For additional information, refer to Power Steering Pump Pulley in this section.

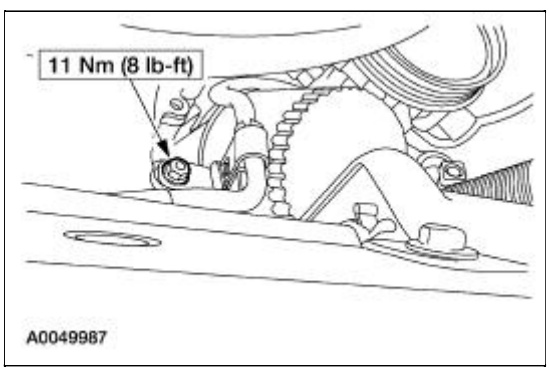


4. Disconnect the line.

5. Remove the bolts and the oil drip shield.

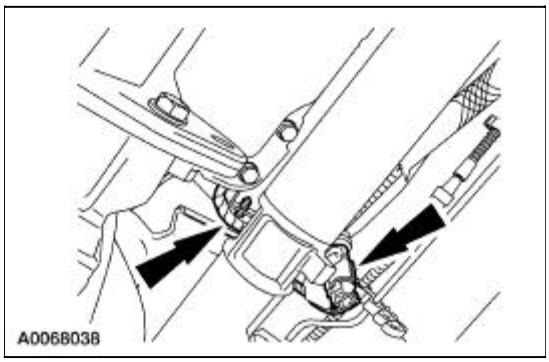


6. Remove the bolt and detach the crossmember retainers.



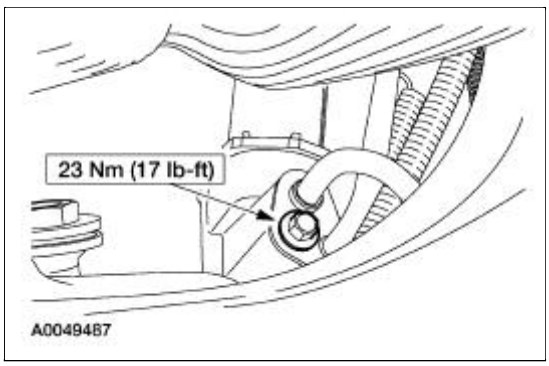
5.4L engine

7. Remove the nut.



4.6L engine

8. Remove the nut.



Expedition vehicles

9. If equipped, disconnect the pressure sensor electrical connector and detach the harness retainer.

All vehicles

10. Remove the bolt and the pressure line.

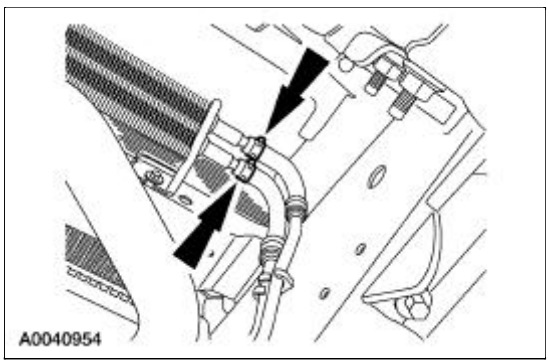
11. To install, reverse the removal procedure.

12. Fill, purge and leak check the system. For additional information, refer to Section 211-00 .

Power Steering Fluid Cooler

Material

Item	Specification
Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX	MERCON®



Removal and Installation

1. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located near the jack storage area in the rear of the passenger compartment. Failure to do so may result in unexpected inflation or deflation of the air springs which may result in shifting of the vehicle during these operations.**

   If equipped, turn the air suspension switch to the OFF position.

2. With the vehicle in NEUTRAL, position on a hoist. For additional information, refer to Section 100-02 .

3. Disconnect the hoses.

4. Remove the screws and the power steering fluid cooler.

5. To install, reverse the removal procedure.

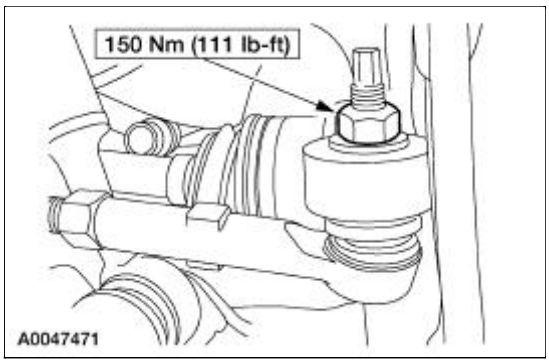
6. Fill, purge and leak check the system. For additional information, refer to Section 211-00 .

Steering Gear —4x2

Removal and Installation

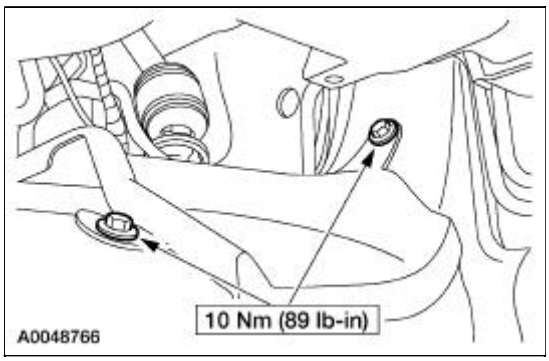
All vehicles

1. Place the front wheels in the straight-ahead position and the ignition switch in the OFF position.



2. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located near the jack storage area in the rear of the passenger compartment. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   If equipped, turn the air suspension switch to the OFF position.

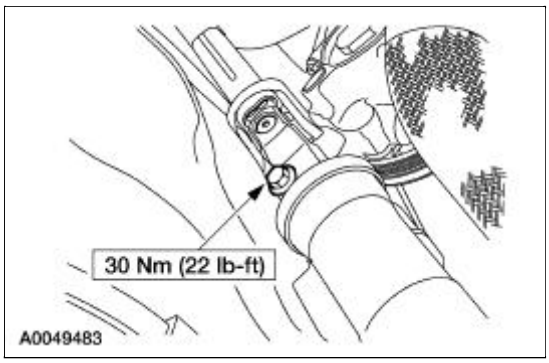


3. With the vehicle in NEUTRAL, position on a hoist. For additional information, refer to Section 100-02 .

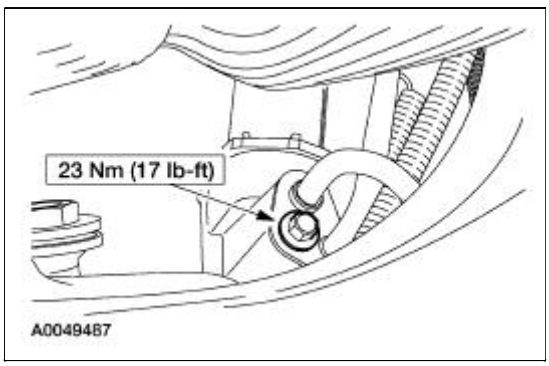
4. **NOTE:** The hex holding feature can be used to prevent turning of the stud while removing the nut.

   Remove the nuts and detach the tie-rods from the wheel knuckles.

5. Remove the bolts and the oil drip shield.

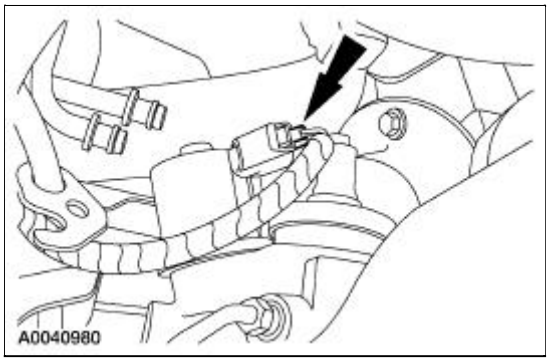


6. Detach the lines from the clip.

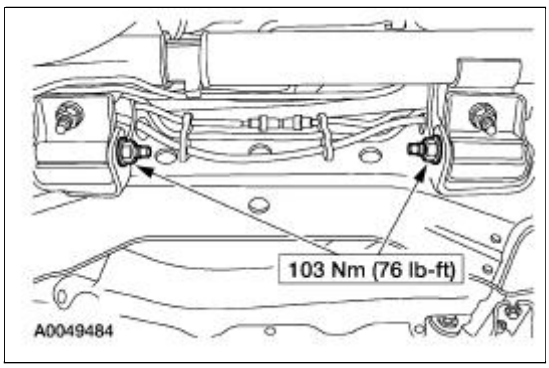


7. **CAUTION: Do not allow the intermediate shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the intermediate shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   Remove the bolt and detach the intermediate shaft from the gear.

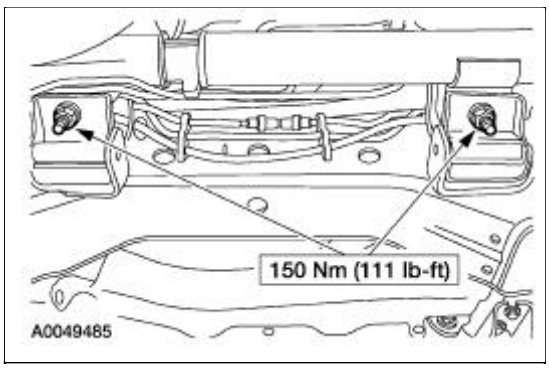


8. Remove the bolt and disconnect the power steering lines.
   - Position the lines aside.



Navigator vehicles

9. Disconnect the electrical connector.
   - Rotate the actuator until the connector housing is facing the steering gear input shaft.



All vehicles

10. Remove the nuts and bolts.
    - Discard the nuts.

11. **CAUTION: Make sure that the steering lines are clear from the removal path of the gear or damage to the lines can result.**

    Remove the nuts, bolts, brackets and the steering gear.
    - Discard the nuts.

12. **CAUTION: On 4x4 vehicles make sure that the wheel end vacuum line is clear of the steering gear mounting fasteners before tightening the bolts or damage to the line can result.**

    CAUTION: Make sure to tighten the bracket-to-steering gear bolts (M14) before tightening the bracket-to-crossmember bolts (M12) or damage to the steering gear can result.

To install, reverse the removal procedure.

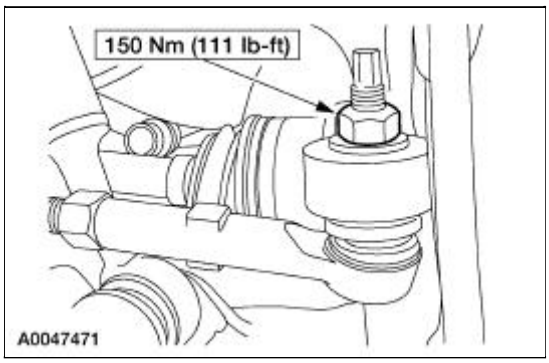
13. Fill, purge and leak check the system. For additional information, refer to Section 211-00 .

Steering Gear —4x4

Removal and Installation

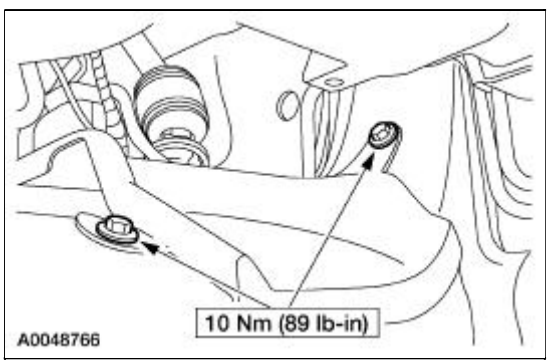
All vehicles

1. Place the front wheels in the straight-ahead position and the ignition switch in the OFF position.



2. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located near the jack storage area in the rear of the passenger compartment. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.**

   If equipped, turn the air suspension switch to the OFF position.

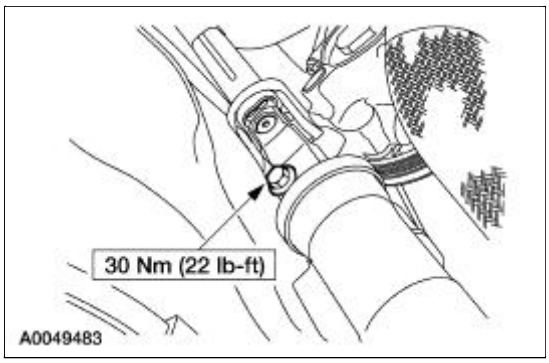


3. Remove the cooling fan and shrouds. For additional information, refer to Section 303-03 .

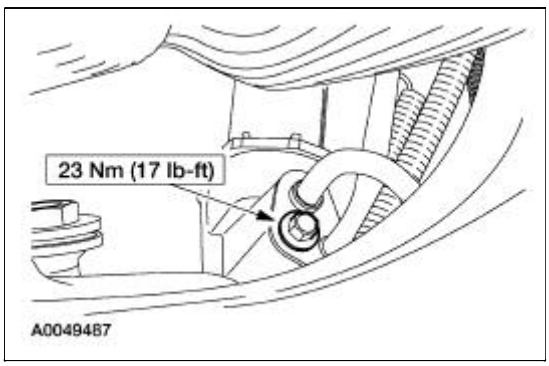
4. **NOTE:** The hex holding feature can be used to prevent turning of the stud while removing the nut.

   Remove the nuts and detach the tie-rods from the wheel knuckles.

5. Remove the bolts and the oil drip shield.

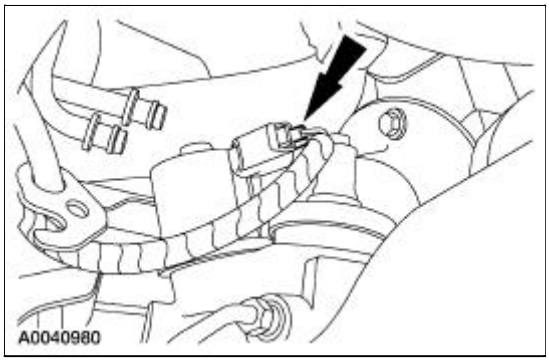


6. Detach the lines from the clip.

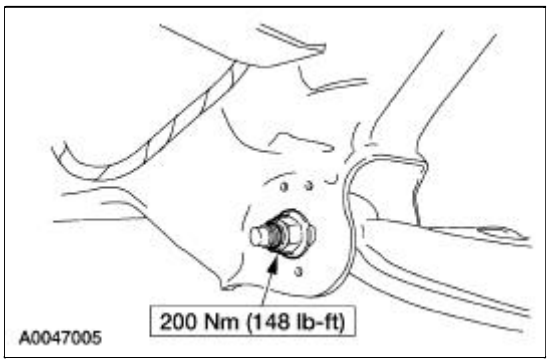


7. **CAUTION: Do not allow the intermediate shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the intermediate shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

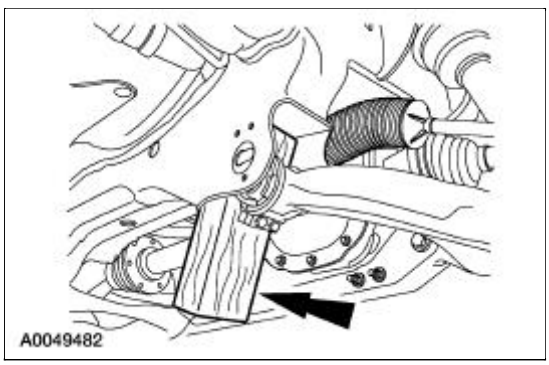
   Remove the bolt and detach the intermediate shaft from the gear.



8. Remove the bolt and disconnect the power steering lines.
   - Position the lines aside.

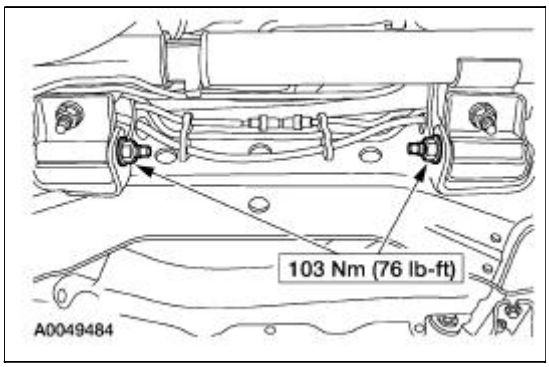


Navigator vehicles



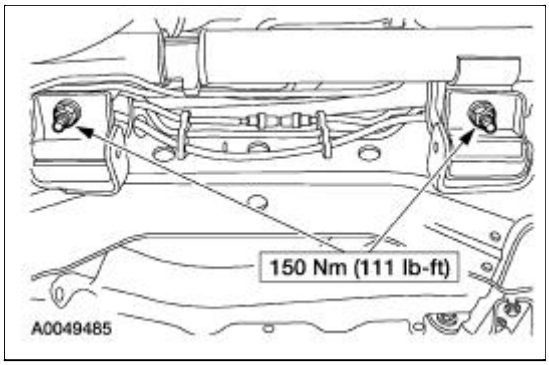
9. Disconnect the electrical connector.
   - Rotate the actuator until the connector housing is facing the steering gear input shaft.

10. Remove the nut and bolt.
    - Discard the nut.



11. Insert a block of wood between the lower arm and the frame.

All vehicles



12. Remove the nuts and bolts.
    - Discard the nuts.

13. **CAUTION: Make sure that the steering lines are clear from the removal path of the gear or damage to the lines can result.**

    Remove the nuts, bolts, brackets and the steering gear.

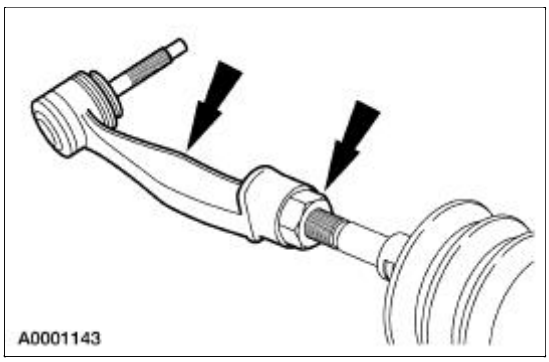
    - Discard the nuts.

14. **CAUTION: Make sure that the wheel end vacuum line is clear of the steering gear mounting fasteners before tightening the bolts or damage to the line can result.**

    CAUTION: Make sure to tighten the bracket-to-steering gear bolts (M14) before tightening the bracket-to-crossmember bolts (M12) or damage to the steering gear can result.

    To install, reverse the removal procedure.

15. Fill, purge and leak check the system. For additional information, refer to Section 211-00 .

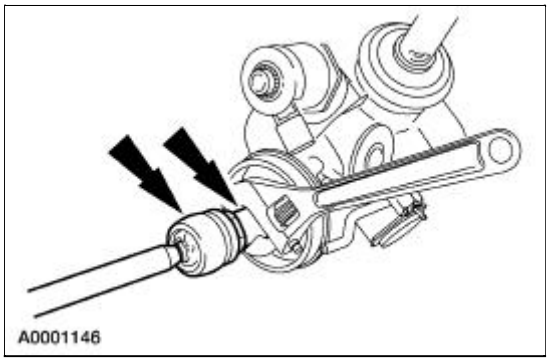


Steering Gear —Power

Special Tool(s)

 ST1301-A	Installer, Constant Velocity Boot Camp 205-343 (T95P-3514-A)

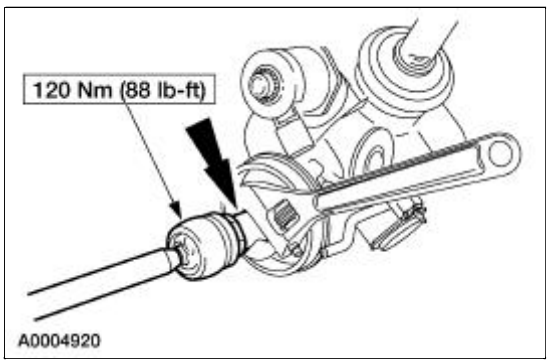
Disassembly



1. Remove the steering gear. For additional information, refer to Steering Gear—4x2 or Steering Gear—4x4 in this section.
2. Position the steering gear in a soft-jawed vice.
3. Make marks to index the tie-rods end and jam nuts for reference during installation.
4. Loosen the jam nuts and remove the tie-rod ends.
   - Remove and discard the jam nuts.

A0001143

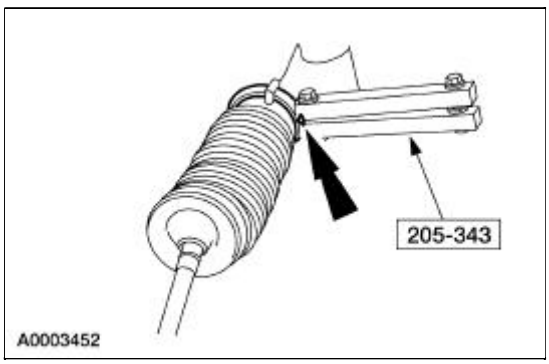
5. Remove the clamps and the bellows boots.
   - Discard the clamps.



A0001145

6. While holding the steering gear rack, remove and discard the tie-rods.

Assembly

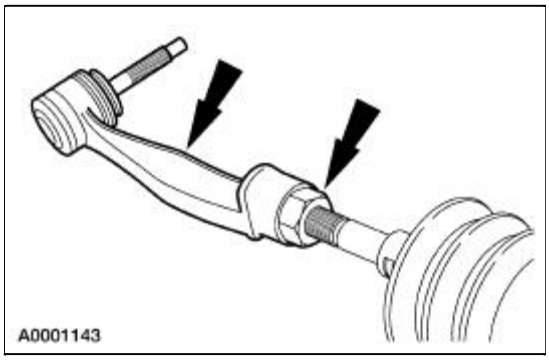


1. While holding the steering gear rack, install the tie-rods.

2. **NOTE:** Apply a thin coat of grease to the inner diameter of the inboard end of the bellows.

   Install the bellows boots and inboard clamps making sure that the air tube is inserted into the boot.

   - Using the special tool, tighten the clamps.

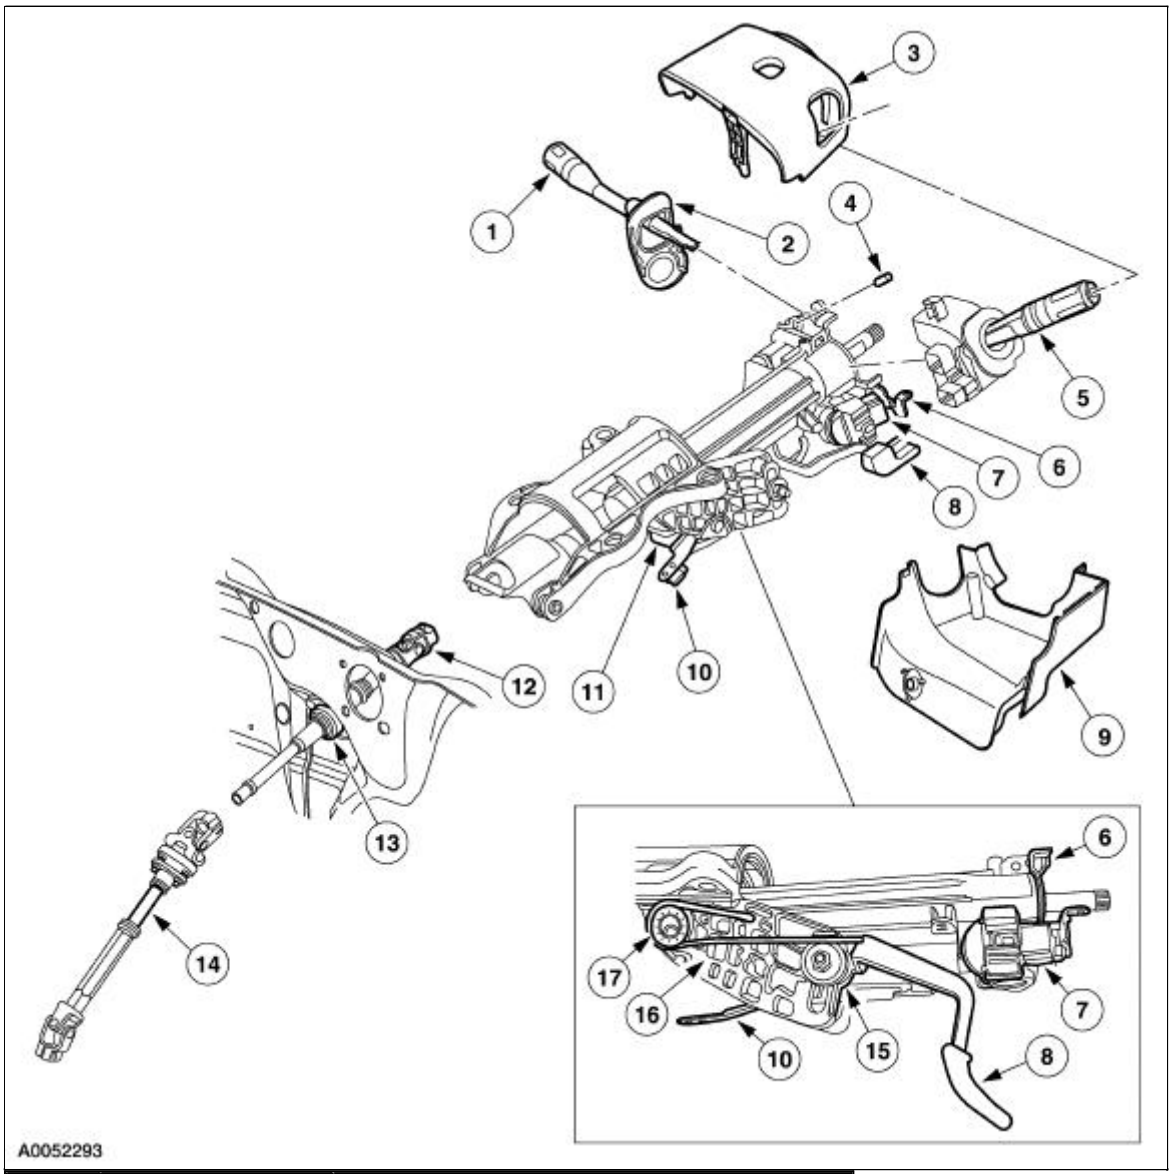


3. **CAUTION: Make sure that the end of the boot is positioned between the two grooves on the inner tie-rod or an internal leak can result.**

   Install the clamps.

4. Install the jam nuts and the tie-rods using the index marks made during disassembly.

5. Install the steering gear. For additional information, refer to Steering Gear—4x2 or Steering Gear—4x4 in this section.



General Specifications

Item	Specification
Lubricants	
Premium Long Life Grease XG-1C	ESA-M1C75-B

Torque Specifications

Description	Nm	lb-ft	lb-in
Steering wheel bolt	40	30	—
Steering column support bracket-to-instrument panel nuts	15	11	—
Clockspring bracket-to-steering column screws	6	—	53
Shift cable bracket bolts	21	15	—
Steering column shaft-to-steering column shaft bolt	30	22	—
Upper steering column shaft-to-lower steering column shaft bolt	48	35	—
Steering column shaft-to-steering gear bolt	30	22	—
Steering column shaft dash seal bolts	12	9	—
Driver air bag module bolts	9	—	80

Steering Column

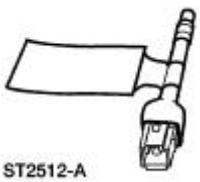
Item	Part Number	Description
1	7F256	Gearshift lever
2	7N097	Gearshift lever boot
3	3530	Steering column upper shroud
4	3G357	Gearshift lever pin
5	13K359	Multi-function switch
6	3678	Clockspring upper bracket
7	11572	Ignition switch
8	3B661	Tilt lever assembly
9	3530	Steering column lower shroud
10	14A206	Harness retainer bracket

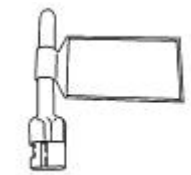
11	7E364	Shift cable bracket
12	3B676	Upper steering column shaft
13	3513	Steering column shaft dash seal
14	3A525	Lower steering column shaft
15	3D672	Steering column clamp retainer
16	3D655	Spring
17	3D686	Spring retainer

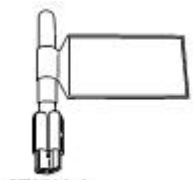
For shift interlock service information, refer to Section 307-05 .

For ignition lock cylinder service information, refer to Section 501-14 .

For ignition switch service information, refer to Section 211-05 .







For steering wheel rotation sensor service information, refer to Section 206-09B .

Steering Column

Refer to Section 211-00 .

Supplemental Restraint System (SRS) Deactivation and Reactivation

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 req'd) 418-F395 (014-R1079)
 ST2512-A	Diagnostic Tool, Restraint System (1 req'd) 418-F403
 ST2507-A	Diagnostic Tool, Restraint System (2 req'd) 418-133 (014-R1076)
 ST2506-A	Diagnostic Tool, Restraint System (2 req'd) 418-F088 (105-R0012)

Deactivation

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an airbag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Never probe the connectors on the safety canopy module. Doing so can result in safety canopy module deployment.

WARNING: Vehicle sensor orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and properly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.

NOTE: If a seat equipped with a seat mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.**

NOTE: Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors.

NOTE: Diagnostics or repairs are not to be carried out on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

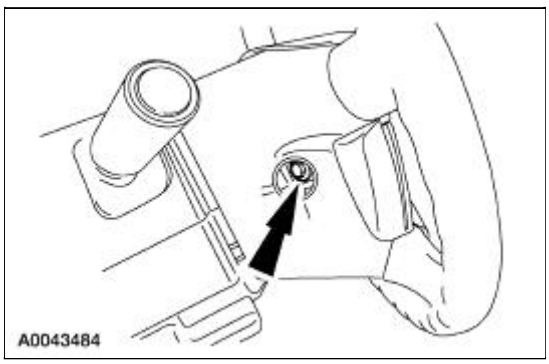
All vehicles

1. **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   The front impact severity sensor is located at the bottom of the hood latch support bracket.

   The first row side impact sensors (if equipped) are located in the first row doors, behind the door trim panel.

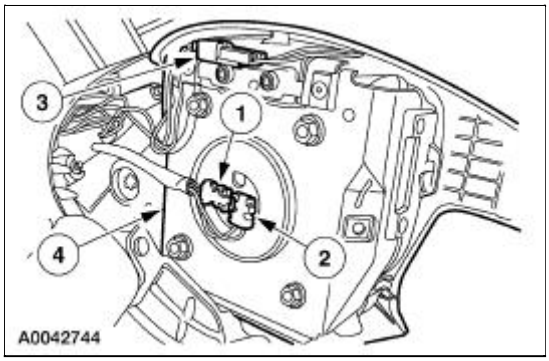
The second row side impact sensors (if equipped) are located at or near the base of the C-pillars.



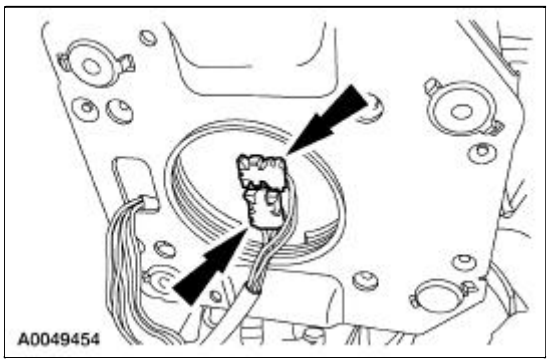
To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. Remove the two steering wheel back cover plugs (one shown).

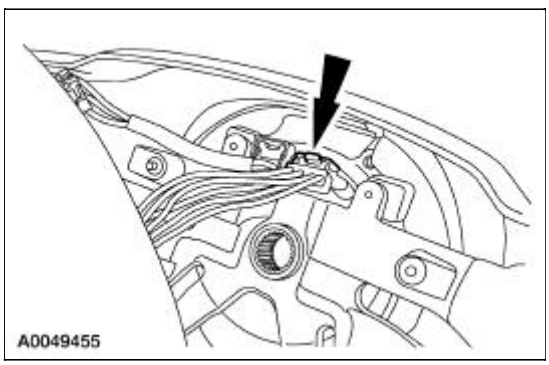


3. Remove the two driver air bag module bolts (one shown).



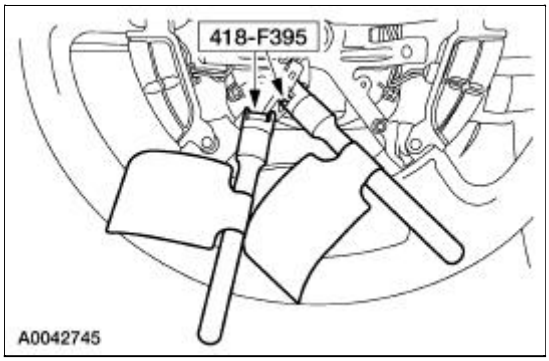
Expedition vehicles

4. Remove the driver air bag module.
    1. Release the two retaining tabs. Disconnect the driver air bag module electrical connector.
        - Label the driver air bag module squib number on the driver air bag module electrical connector before disconnecting.
    2. Release the two retaining tabs. Disconnect the driver air bag module electrical connector.
        - Label the driver air bag module squib number on the driver air bag module electrical connector before disconnecting.
    3. Disconnect the horn switch electrical connector.
    4. Remove the driver air bag module.

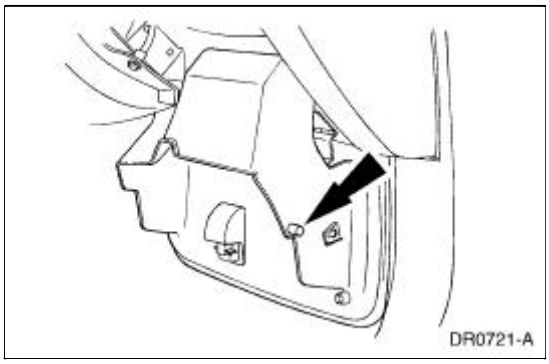


Navigator vehicles

5. Disconnect the driver air bag module
    - Release the two tabs on each driver air bag module electrical connector and disconnect them.
        - Label each driver air bag module electrical connector before disconnecting.

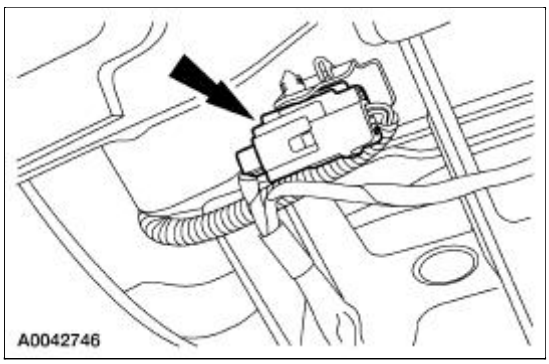


6. Release the tab and disconnect the driver air bag module accessories electrical connector at the top of the clockspring and remove the driver air bag module.

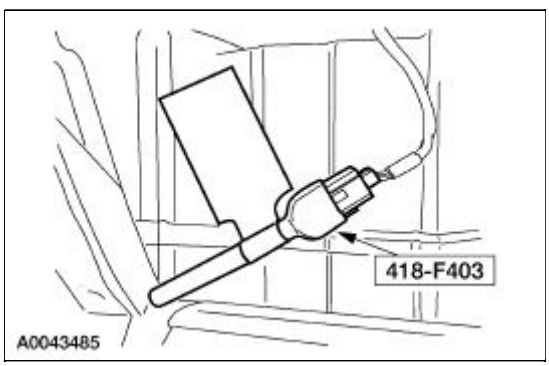


All vehicles

7. Attach the restraint system diagnostic tools to the clockspring electrical connectors at the top of the steering column.



8. While pushing in on the two glove compartment door tabs, position the glove compartment downward.

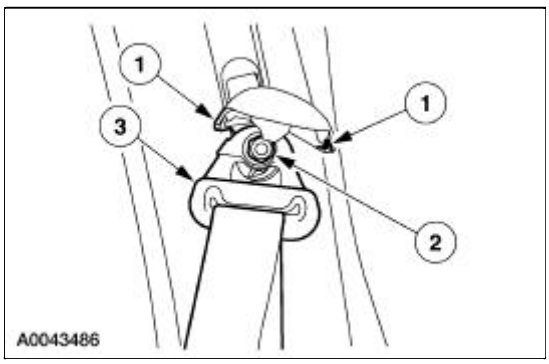


9. **NOTE:** The Expedition is shown, the Navigator is similar.

   Through the glove compartment opening, release the tab and disconnect the passenger air bag module electrical connector.

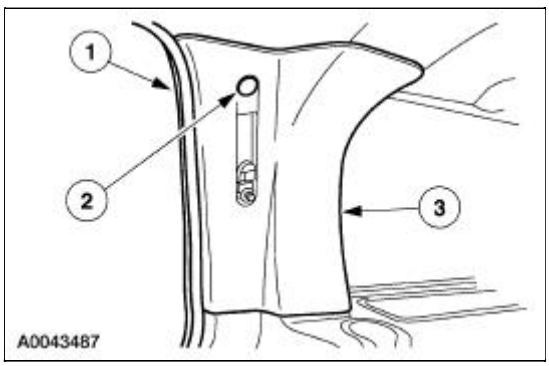
10. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag module electrical connector.

Vehicles without safety canopies



11. **CAUTION: Do not deactivate the safety canopy module circuit by removing the safety canopy bridge resistor from the safety canopy electrical connector.**

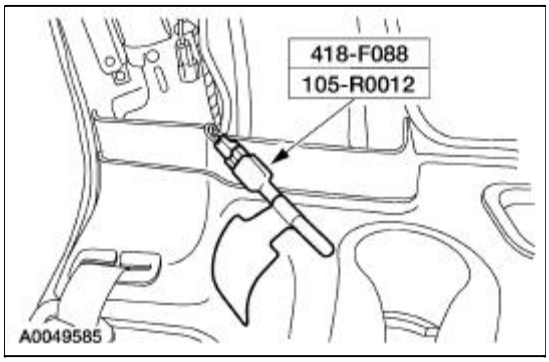
    If the safety canopy bridge resistor is removed, an open circuit fault will be generated by the restraints control module (RCM).
    If a restraint system diagnostic tool is installed at the safety canopy electrical connector, a low resistance fault will be generated by the RCM.



Vehicles with safety canopies

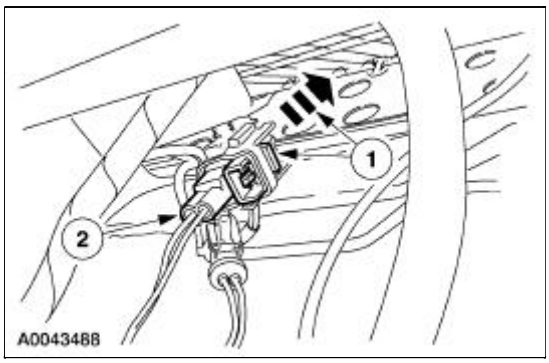
12. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

    Remove the second row passenger side safety belt guide.
    1. Release the retaining tab at each side and open the safety belt guide cover.
    2. Remove the nut.
    3. Remove the second row passenger side safety belt guide.

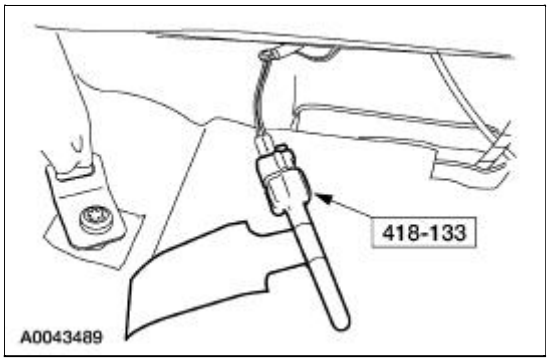


13. Remove the passenger side C-pillar trim panel.
    1. Separate the weather-stripping along the passenger side C-pillar trim panel.
    2. Remove the bolt cover and bolt.
    3. Pull out to release the retainers and remove the passenger side C-pillar trim panel.

14. Disconnect the passenger side safety canopy electrical connector.

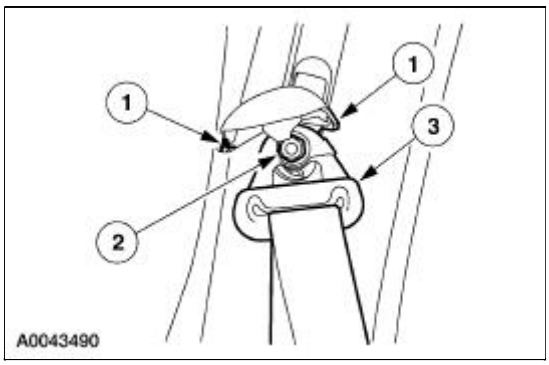


15. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger side safety canopy electrical connector.

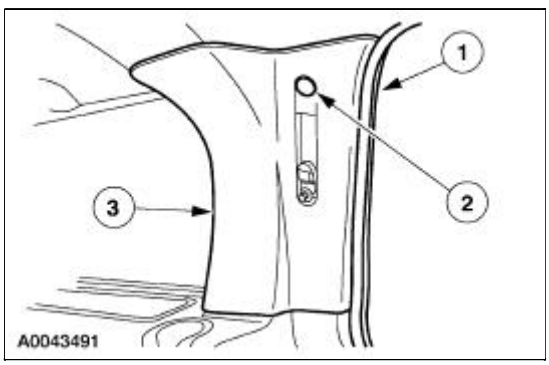


All vehicles

16. Disconnect the passenger seat safety belt buckle pretensioner electrical connector.
    1. Slide and disengage the passenger seat safety belt buckle pretensioner electrical connector locking clip.
    2. Push in to release the tab and disconnect the passenger seat safety belt buckle pretensioner electrical connector.



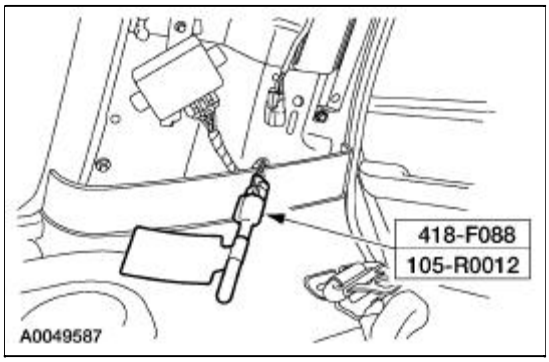
17. Attach the restraint system diagnostic tool to the passenger seat safety belt buckle pretensioner floor electrical connector.



Vehicles with safety canopies

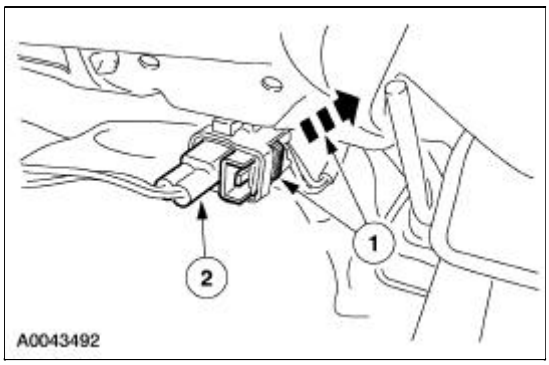
18. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

    Remove the second row driver side safety belt guide.
    1. Release the retaining tab at each side and open the safety belt guide cover.
    2. Remove the nut.
    3. Remove the second row driver side safety belt guide.

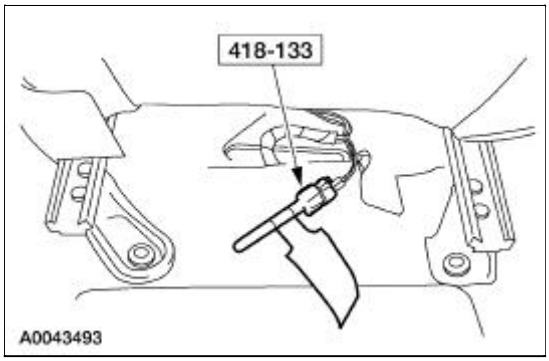


19. Remove the driver side C-pillar trim panel.
    1. Separate the weather-stripping along the driver side C-pillar trim panel.
    2. Remove the bolt cover and bolt.
    3. Pull out to release the retainers and remove the driver side C-pillar trim panel.

20. Disconnect the driver side safety canopy electrical connector.



21. Attach the restraint system diagnostic tool to the vehicle harness side of the driver side safety canopy electrical connector.



All vehicles

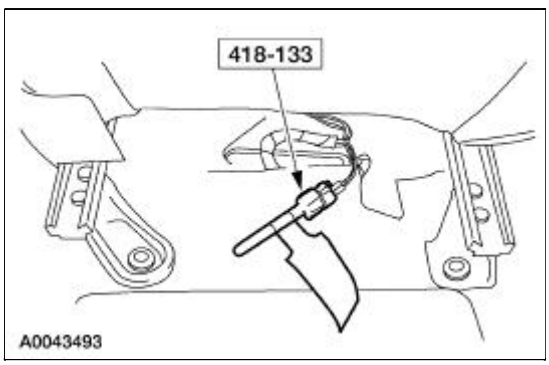
22. Disconnect the driver seat safety belt buckle pretensioner electrical connector.
    1. Slide and disengage the driver seat safety belt buckle pretensioner electrical connector locking clip.
    2. Push in to release the tab and disconnect the driver seat safety belt buckle pretensioner electrical connector.

23. Attach the restraint system diagnostic tool to the driver seat safety belt buckle pretensioner floor electrical connector.

24. Connect the battery ground cable. For additional information, refer to Section 414-01 .

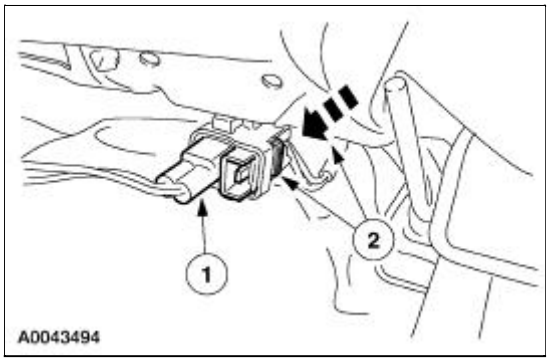
25. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of Section 501-20B .

26. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .



Reactivation

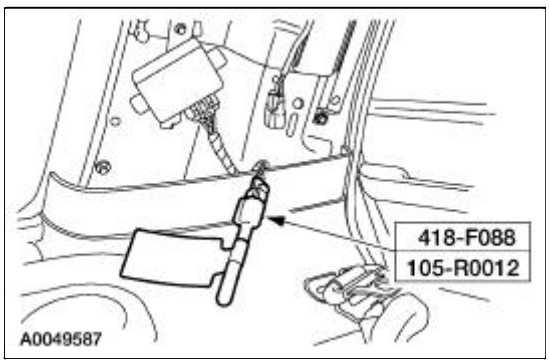
WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the deactivation procedure.



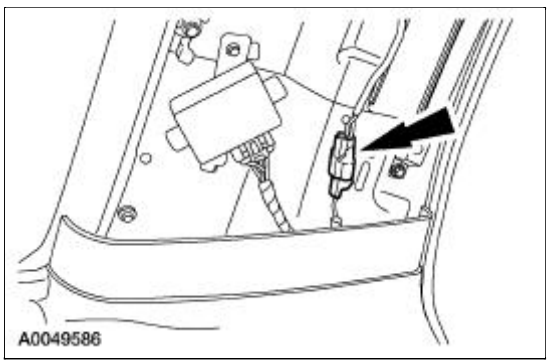
All vehicles

1. **NOTE:** Make sure the battery negative cable is still disconnected before proceeding with the reactivation portion of this procedure.

   Remove the restraint system diagnostic tool from the driver seat safety belt buckle pretensioner floor electrical connector.

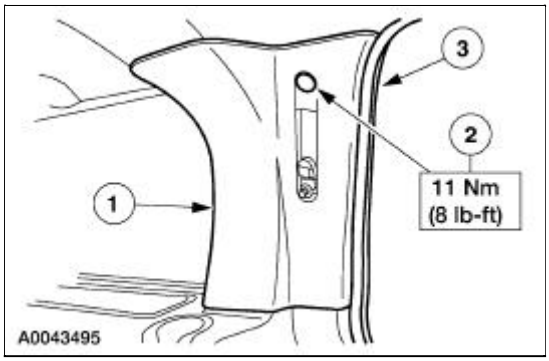


2. Connect the driver seat safety belt buckle pretensioner electrical connector.
   1. Connect the driver seat safety belt buckle pretensioner electrical connector.
   2. Slide and engage the driver seat safety belt buckle pretensioner electrical connector locking clip.



Vehicles with safety canopies

3. Remove the restraint system diagnostic tool from the vehicle harness side of the driver side safety canopy electrical connector.



4. Connect the driver side safety canopy electrical connector.

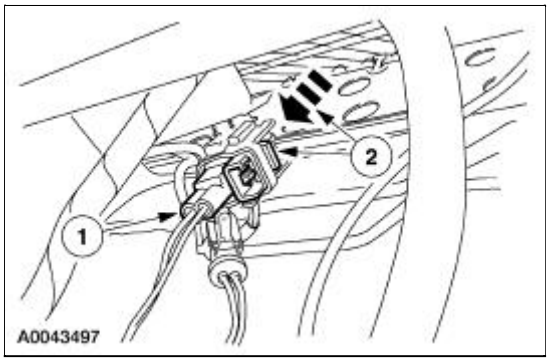
5. **WARNING: Anytime the safety canopy module has deployed, the headliner, and all A, B, and C pillar upper trim panels and attaching hardware must be replaced along with any other damaged components and hardware. Failure to do so may result in personal injury in the event of a safety canopy module deployment.**

   Install the driver side C-pillar trim panel.
   1. Position the driver side C-pillar trim panel and push in, engaging the retainers.
   2. Install the bolt and bolt cover.
   3. Install the weather-stripping along the driver side C-pillar trim panel.

6. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

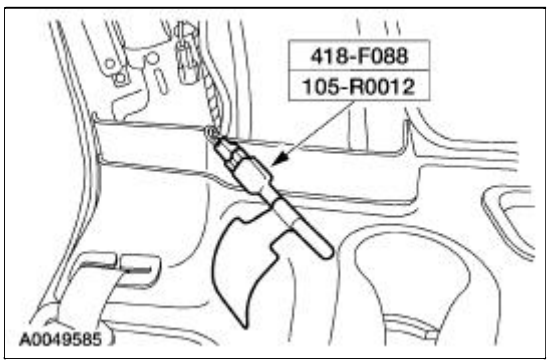
   NOTE: Make sure the safety belt is not twisted prior to installation.

   Install the second row driver side safety belt guide.
   1. Position the second row driver side safety belt guide.
   2. Install the nut.
   3. Close the safety belt guide cover.

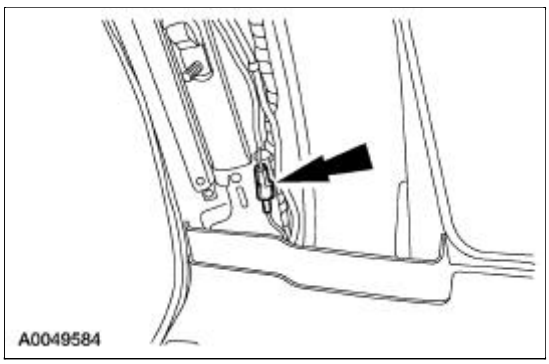


All vehicles

7. Remove the restraint system diagnostic tool from the passenger seat safety belt buckle pretensioner floor electrical connector.

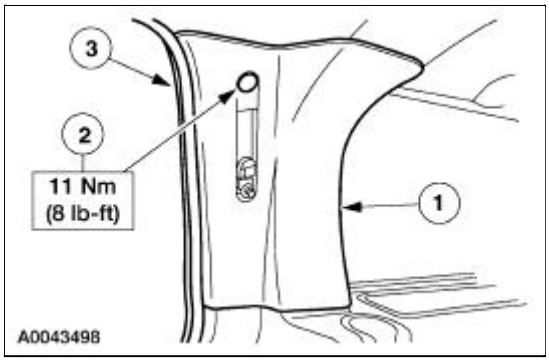


8. Connect the passenger seat safety belt buckle pretensioner electrical connector.
   1. Connect the passenger seat safety belt buckle pretensioner electrical connector.
   2. Slide and engage the passenger seat safety belt buckle pretensioner electrical connector locking clip.



Vehicles with safety canopies

9. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger side safety canopy electrical connector.



10. Connect the passenger side safety canopy electrical connector.

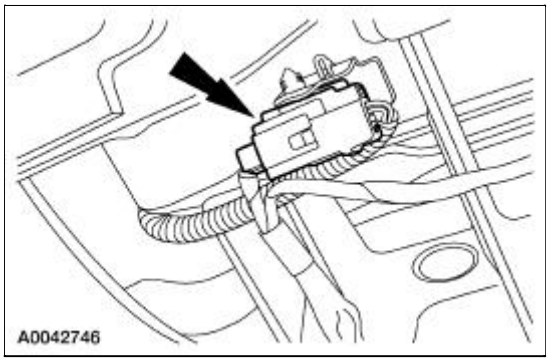
11. **WARNING: Anytime the safety canopy module has deployed, the headliner, and all A, B, and C pillar upper trim panels and attaching hardware must be replaced along with any other damaged components and hardware. Failure to do so may result in personal injury in the event of a safety canopy module deployment.**

    Install the passenger C-pillar trim panel.
    1. Position the passenger side C-pillar trim panel and push in, engaging the retainers.
    2. Install the bolt and bolt cover.
    3. Install the weather-stripping along the passenger side C-pillar trim panel.

12. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or if it does not remain closed, install a new shoulder safety belt guide cover.

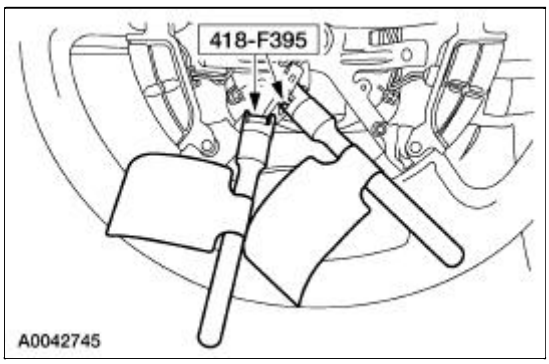
    NOTE: Make sure the safety belt is not twisted prior to installation.

    Install the second row passenger side safety belt guide.
    1. Position the second row passenger side safety belt guide.
    2. Install the nut.
    3. Close the safety belt guide cover.



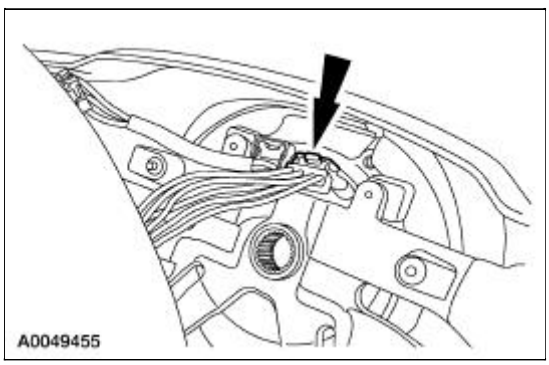
All vehicles

13. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag module electrical connector.



14. **NOTE:** The Expedition is shown, the Navigator is similar.

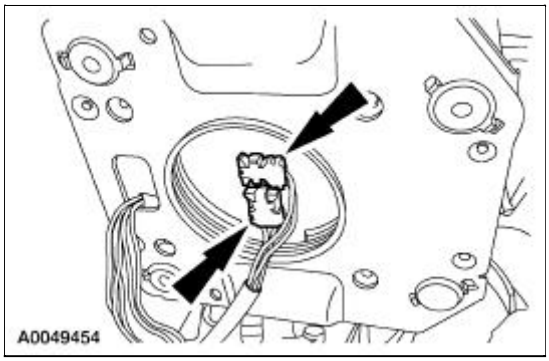
    Connect the passenger air bag module electrical connector.



15. Close the glove compartment.

16. Remove the restraint system diagnostic tools from the clockspring electrical connector at the top of the steering column.

Navigator vehicles



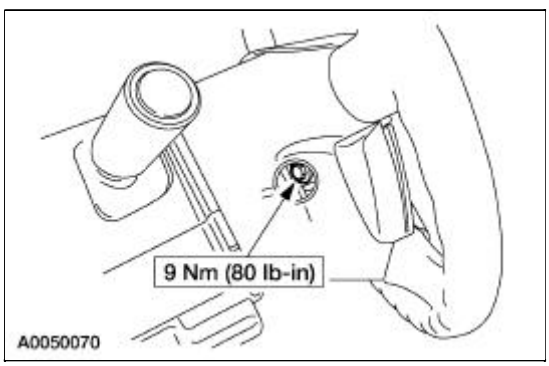
17. Connect the driver air bag module accessories electrical connector to the connector end at the top of the clockspring.

18. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

    Connect the driver air bag module electrical connectors as noted during removal.

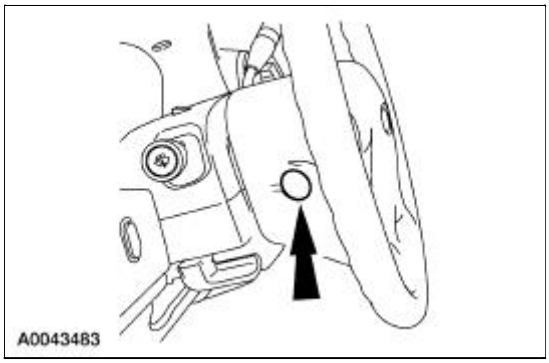
    - Position the driver air bag module to the steering wheel.

Expedition vehicles



19. Position the driver air bag module to the steering wheel.
    1. Connect the horn switch electrical connector.
    2. **CAUTION: The clockspring electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.**

       Connect the driver air bag module electrical connectors as noted during removal.
    3. Position the driver air bag module to the steering wheel.



All vehicles

20. Install the two driver air bag module bolts (one shown).

21. Install the two steering wheel back cover plugs (one shown).

22. Connect the battery ground cable. For additional information, refer to Section 414-01 .

23. **WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove restraint system diagnostic tools could result in injury and possible violation of vehicle safety standards.**

    With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of Section 501-20B .

Vehicles with safety canopies

24. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A .

Steering Wheel

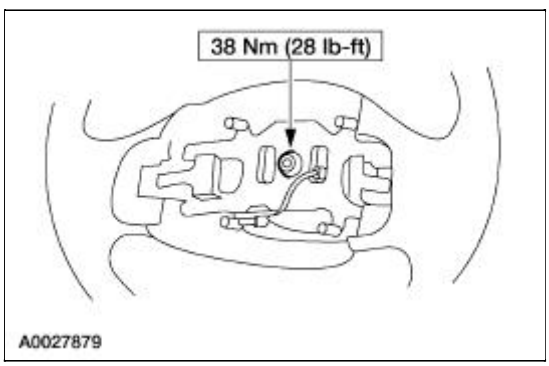
Special Tool(s)

 ST1321-A	Remover, Differential Bearing 205-116 (T77F-4220-B1)

Removal and Installation

1. Turn the steering wheel to the straight ahead position and turn the ignition switch to the OFF position.

2. Disconnect the battery ground cable (14301) and wait at least one minute to allow depletion of the restraint system backup power supply. For additional information, refer to Section 414-01 .



3. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes in the deactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

4. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes and instructions in the driver air bag removal and installation procedure.**

   Remove the driver side air bag module (043B13). For additional information, refer to Section 501-20B .

5. Remove the steering wheel bolt.

6. **CAUTION: Removing the steering wheel without using a puller can damage the column bearings.**

   Use the Differential Side Bearing Puller to remove the steering wheel (3600).

7. To install, reverse the removal procedure.

8. **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes in the reactivation procedure.**

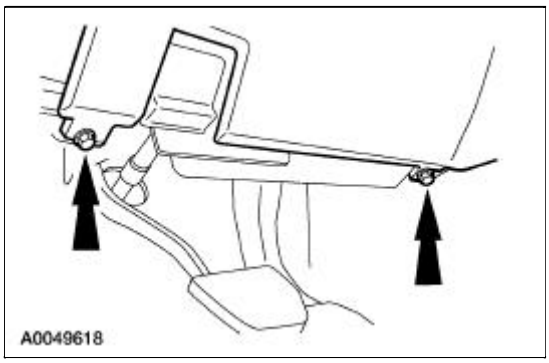
   Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

Steering Column

Removal and Installation

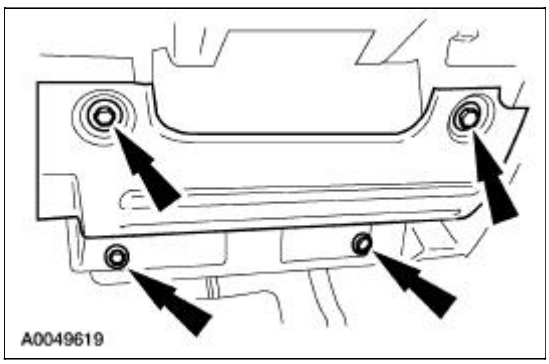
All vehicles

1. Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the supplemental restraint system (SRS) backup power supply. For additional information, refer to Section 414-01 .



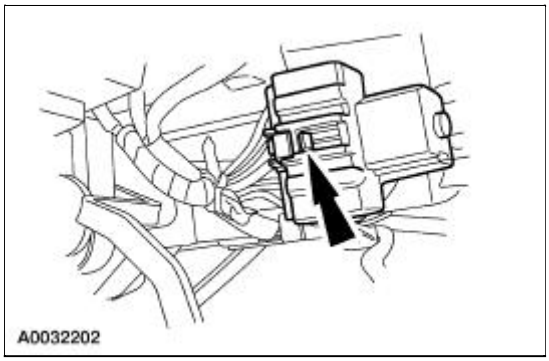
2. **WARNING: To avoid the risk of serious personal injury, follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation procedure.**

   Deactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

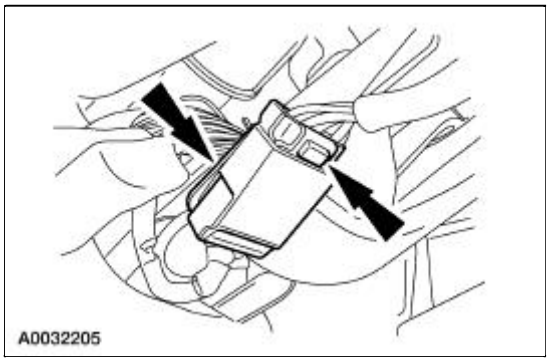


3. **WARNING: To avoid the risk of serious personal injury, follow all warnings, cautions, notes and instructions in the clockspring removal and installation procedure.**

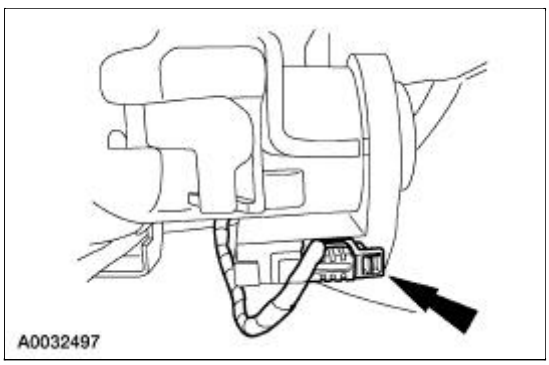
   Remove the clockspring. For additional information, refer to Section 501-20B .



4. Remove the screws and the instrument panel steering column cover.

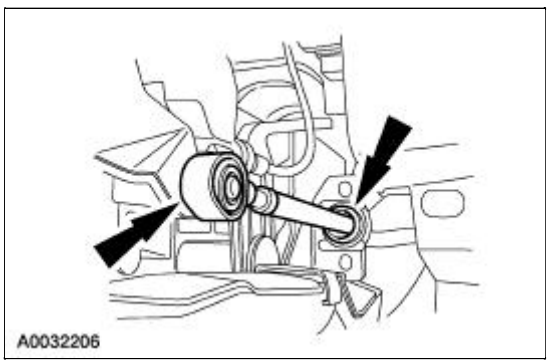


5. Remove the screws and the steering column cover reinforcement.

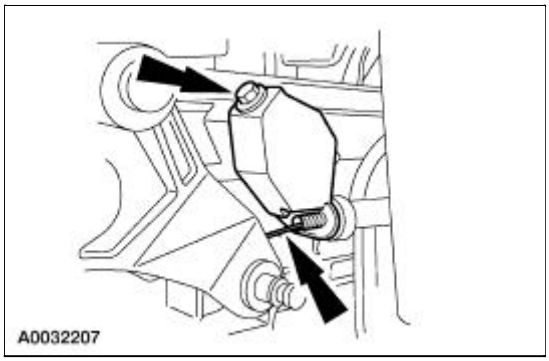


6. Disconnect the ignition switch electrical connector.

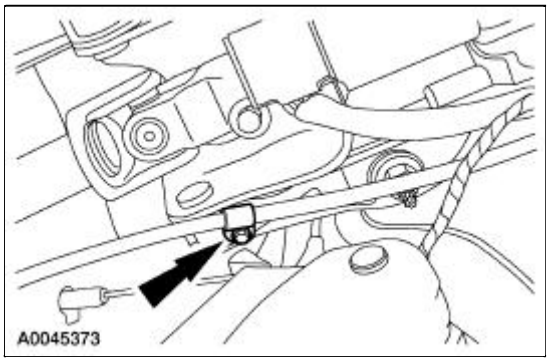
7. Disconnect the electrical connector and detach the push pin from the column.



8. Disconnect the PATS transceiver electrical connector.

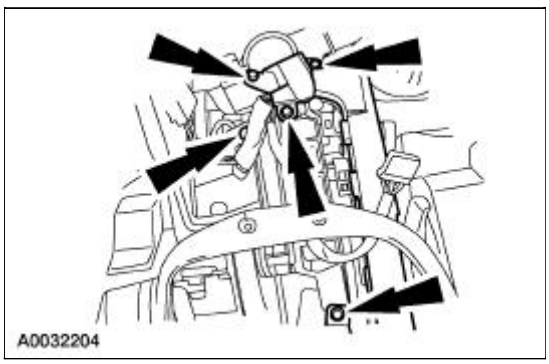


Vehicles with column shift

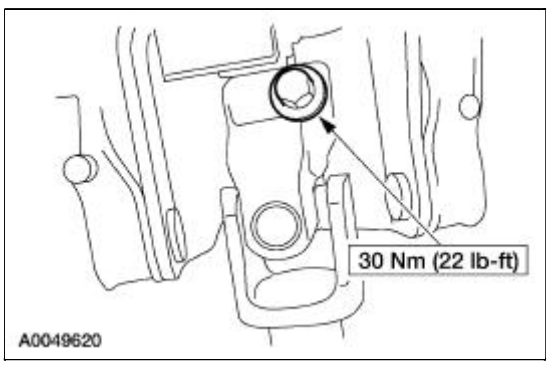


9. Detach the shift cable from the column and the bracket.

10. Remove the bolt and disconnect the transmission range indicator cable.

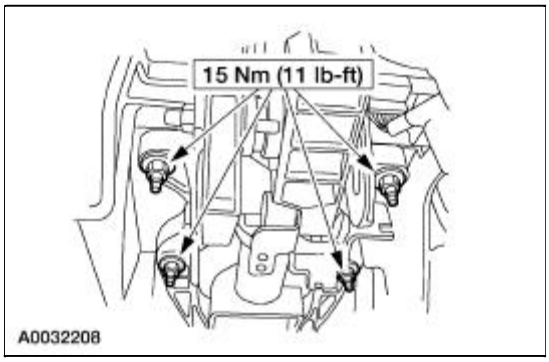


11. Remove the screw.



All vehicles

12. Remove the screws and detach the conduit from the column.



13. Remove the bolt and detach the intermediate shaft from the column.
    - Discard the bolt.

14. Remove the nuts and the steering column.

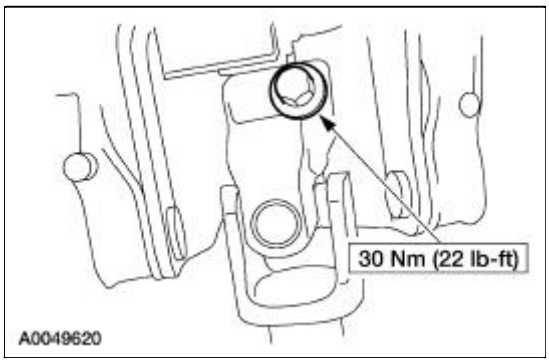
- Discard the nuts.

15. **CAUTION: Make sure that the column support is flush with the instrument panel before tightening the nuts.**

    To install, reverse the removal procedure.

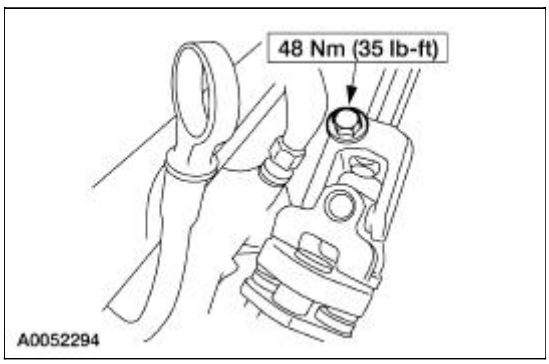
16. **WARNING: To avoid the risk of serious personal injury, follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) reactivation procedure.**

    Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.



Steering Column Shaft

Removal and Installation



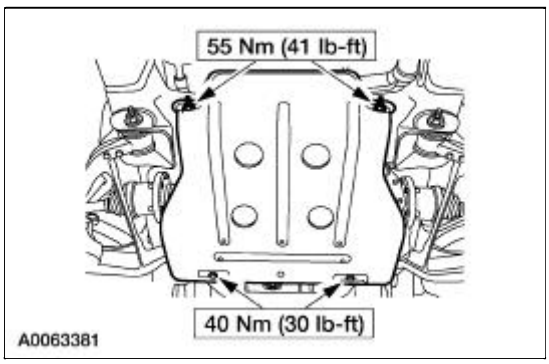
All vehicles

1. **CAUTION: Do not allow the steering column shaft to rotate while the intermediate shaft is disconnected or damage to the clockspring can result. If there is evidence that the shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B**

   Remove the bolt and disconnect the intermediate shaft from the steering column.
   - Discard the bolt.

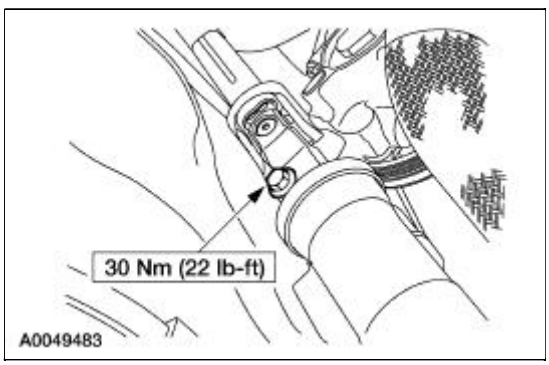
2. Remove the bolt and disconnect the upper intermediate shaft from the lower intermediate shaft.
   - Discard the bolt.

3. Remove the bolts, dash seal and the upper intermediate shaft.



Navigator 4x4 vehicles

4. Remove the cooling fan and shroud. For additional information, refer to Section 303-03 .



All vehicles except Navigator 4x4

5. Raise and support the vehicle. For additional information, refer to Section 100-02 .
6. If equipped, remove the skid plate.

All vehicles

7. Remove the bolt and the lower intermediate shaft.
   - Discard the bolt.

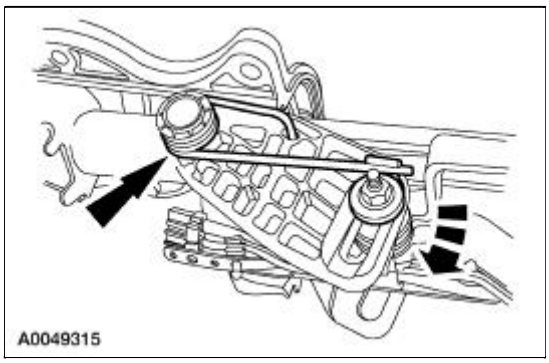
8. To install, reverse the removal procedure.

Steering Column

Material

Item	Specification
Premium Long Life Grease XG-1-C	ESA-M1C75-B

Disassembly



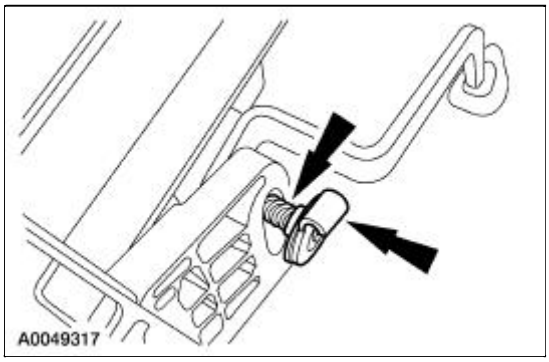
NOTE: For shift interlock service information, refer to Section 307-05 .

1. **WARNING: To avoid the risk of serious personal injury, follow all warnings, cautions, notes and instructions in the steering column removal procedure.**

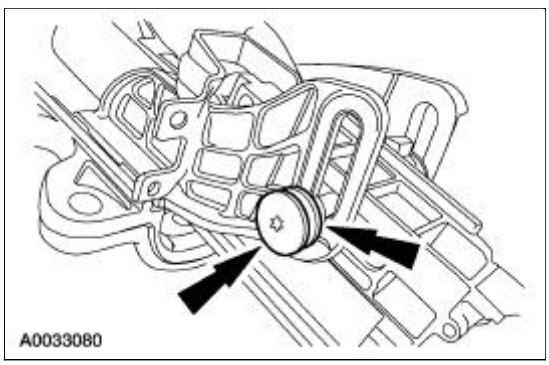
   Remove the steering column. For additional information. refer to Steering Column in this section.

2. **NOTE:** To ease the removal of the spring, make sure that the column tilt assembly is in the upward position.

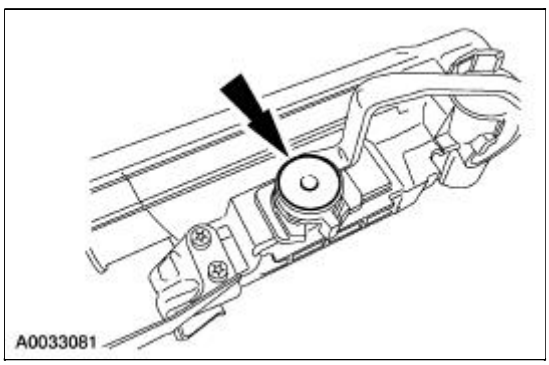
   Pull downward on the spring and release the spring tension, and route the spring above the spring hanger.



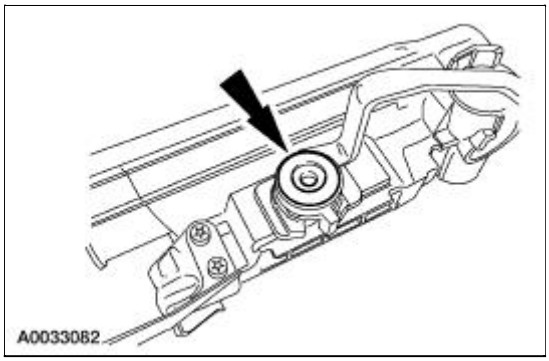
3. Cut the spring retainer and remove the spring.



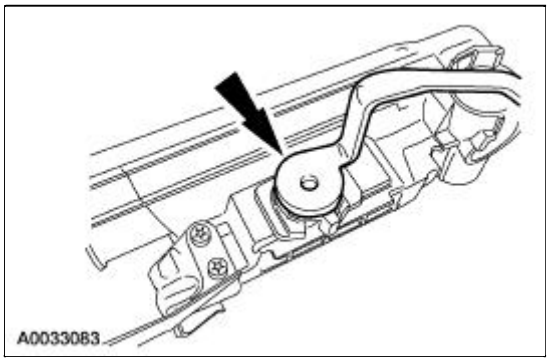
4. Remove the nut.



5. Remove the spring hanger, sleeve washer and spring.

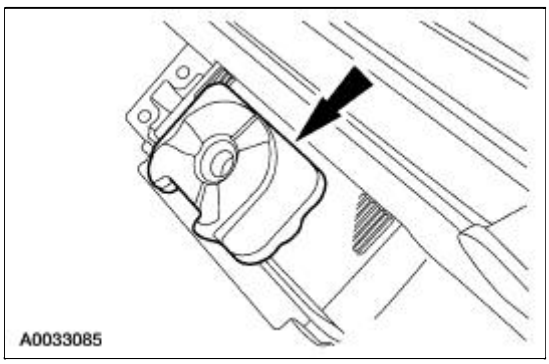


6. Remove the bolt and sleeve washer, and pivot the steering column mounting bracket upward.

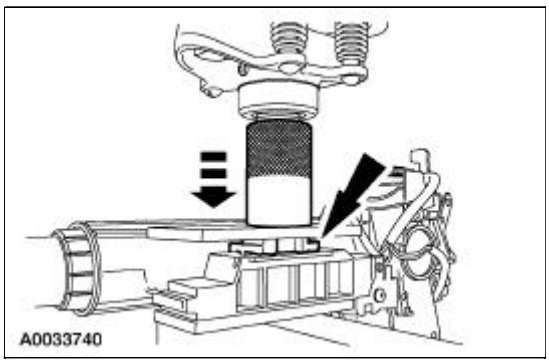


7. Remove the washer.

8. Remove the bearing.

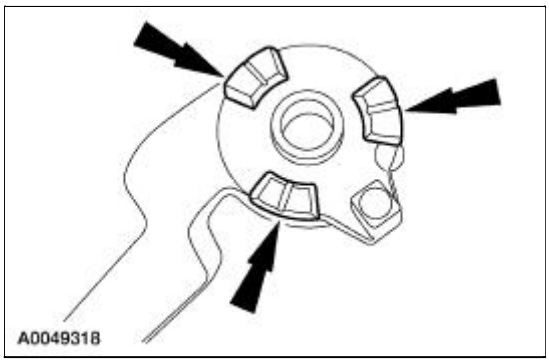


9. Remove the tilt lever.

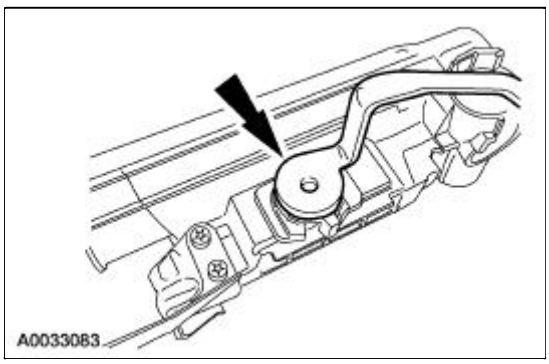


10. **CAUTION: Do not use a screwdriver to separate the clamp retainer or damage can result.**

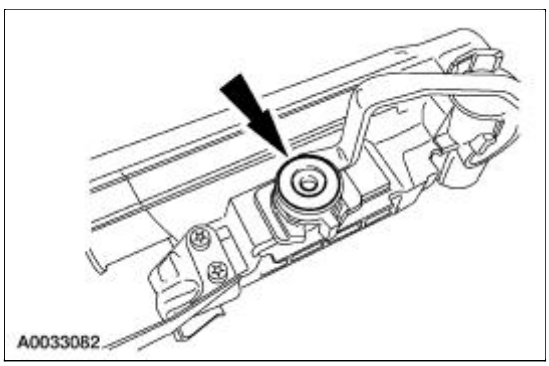
    Turn the column over and use a suitable punch to remove the steering column clamp retainer.



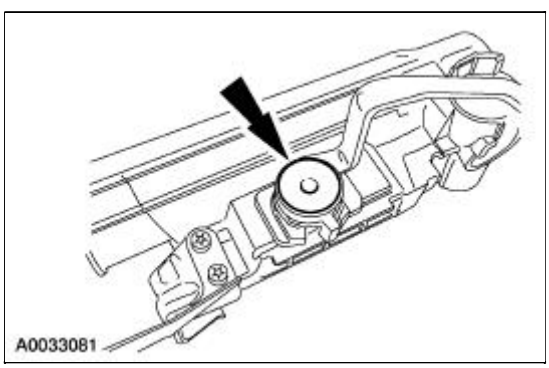
Assembly



1. Using a suitable press and protective adapters, install the clamp retainer.

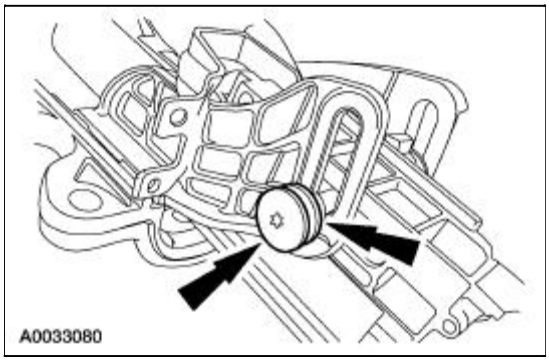


2. Apply a small amount of grease to the tilt lever cam mating surface, making sure to fill the grooves.

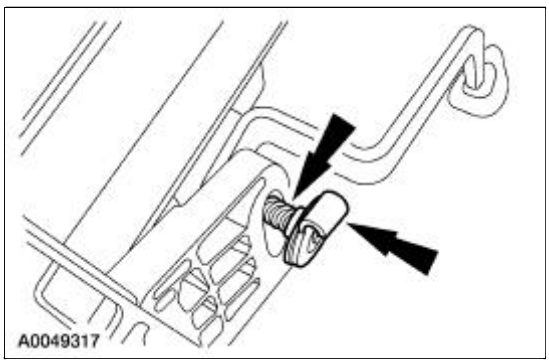


3. Install the tilt lever.

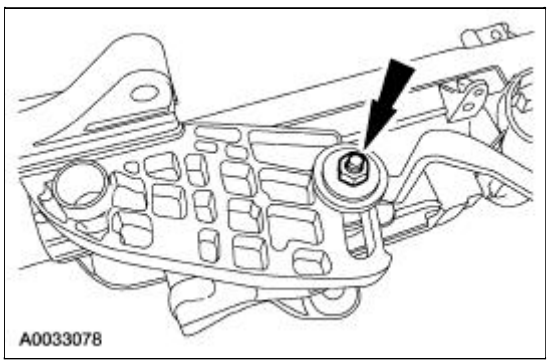
4. Install the bearing.



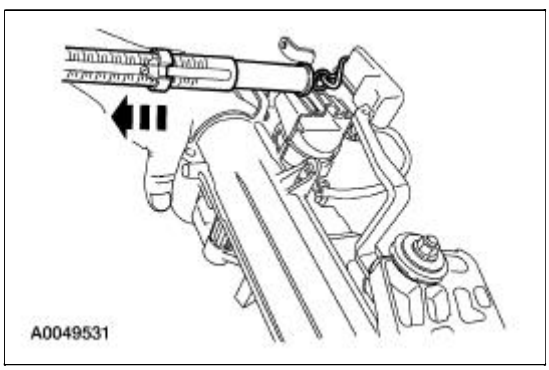
5. Install the washer.



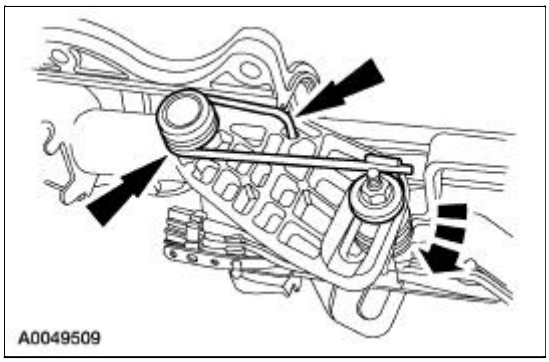
6. While holding the tilt lever, pivot the steering column mounting bracket downward and install the



bolt and sleeve washer.

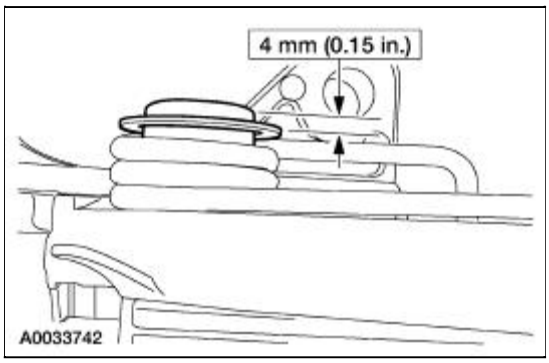


7. Install the spring, sleeve washer and the spring hanger.



8. Install and snug the nut.

9. Attach a suitable spring scale with a capacity of 30 pounds to the end of the tilt lever and pull the lever into the locked position. Tighten or loosen the nut until 12-16 pounds is required to lock the lever.



10. Insert the short end of the spring into the bracket and while holding it in place, position the long end of the spring under the spring hanger.

11. **CAUTION: Make sure that the retainer is 4 mm (0.16 in) from top of the post or damage can result.**

    Install the spring retainer.

12. **WARNING: To avoid the risk of serious personal injury, follow all warnings, cautions, notes and instructions in the steering column installation procedure.**

    Install the steering column. For additional information, refer to Steering Column in this section.

Steering Column Switches

The steering column switches consist of the following:

- multifunction switch which controls the:
  - turn signal
  - hazard flasher
  - windshield wiper/washer
  - rear wiper/washer
  - headlamp dimmer/flash-to-pass
- ignition switch

Steering Column Switches

Refer to Wiring Diagrams Cell 13 for schematic and connector information.

Refer to Wiring Diagrams Cell 81 for schematic and connector information.

Refer to Wiring Diagrams Cell 92 for schematic and connector information.

Refer to Wiring Diagrams Cell 90 for schematic and connector information.

Refer to Wiring Diagrams Cell 149 for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418–F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool

Inspection and Verification

1. Verify the customer concern by operating the multifunction switch or ignition switch.
2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Multifunction switch ● Ignition switch ● Key efforts	● Central junction box (CJB) fuse(s): ■ 1 (10A) ■ 7 (10A) ■ 13 (10A) ■ 14 (10A) ■ 15 (10A) ■ 16 (10A) ■ 18 (10A) ■ 19 (10A) ■ 27 (1A) ■ 28 (10A)

	■ 29 (10A) ■ 101 (30A) ■ 102 (30A) ● Circuitry ● Instrument cluster ● Passive anti-theft system (PATS) module ● Wiring harness

3. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.
4. If diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool manual.
5. Carry out the DATA LINK DIAGNOSTICS TEST. If the diagnostic tool responds with:
   - CKT914, CKT91 or CKT693 = ALL ECUS NO RESP/NOT EQUIP, refer to Section 418-00 .
   - NO RESP/NOT EQUIP for INSTRUMENT CLUSTER, go to Section 413-01 .
   - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs, and carry out the self-test diagnostics for the instrument cluster.
6. If the DTCs retrieved are related to the concern, go to the Instrument Cluster Diagnostic Trouble Code (DTC) Index to continue diagnostics.
7. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart to continue diagnostics.

Ignition Switch Mechanical Check

Test the mechanical operation of the ignition switch by rotating the lock cylinder through all switch positions. The movement should not stick or bind and should return from the START position back to the ON position without assistance (spring return). If sticking or binding is encountered, check for the following:

- burrs on the lock cylinder key
- insufficient lube on the lock cylinder
- bent or damaged the ignition rod
- object rubbing against the ignition rod
- excessive rubbing of the actuator against the transmission shift socket
- binding lock cylinder
- shroud rubbing the against lock cylinder
- burrs or foreign material around the rack and pinion actuator in the lock cylinder housing
- insufficient lube on the actuator (Do not apply lubricant to the inside of the ignition switch.)
- binding ignition switch

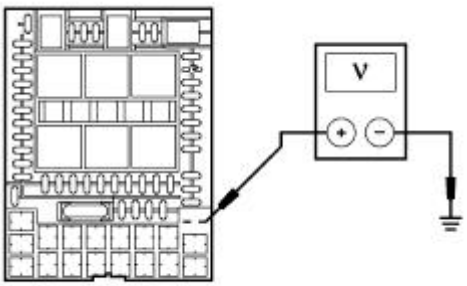
If the steering wheel lock is engaged with the wheels loaded against a curb, high effort will be necessary to turn the key from LOCK. Turn the steering wheel to either side of the lock to unload the

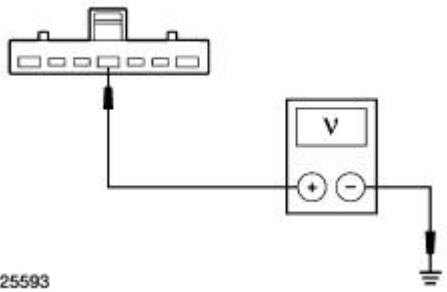
system.

Instrument Cluster Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1352	Ignition Key-In Circuit Failure	Instrument cluster	REFER to Section 419-01 .
B1360	Ignition Run/Acc Circuit Open	Instrument cluster	Go To Pinpoint Test B .
—	All Other DTCs	Instrument cluster	REFER to Section 419-10 .

Symptom Chart

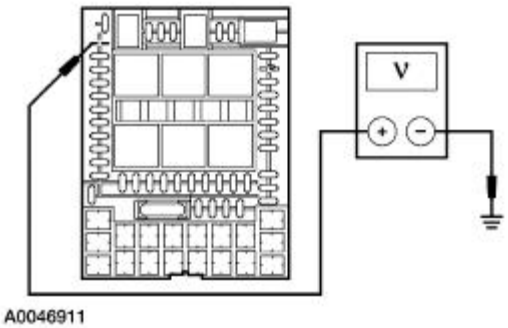


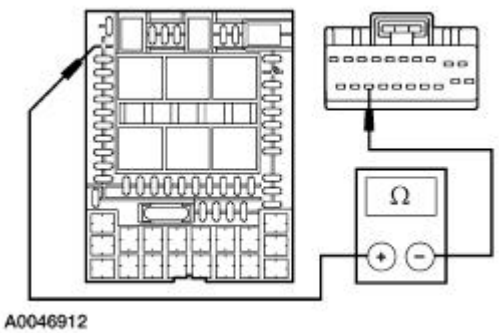


Symptom Chart

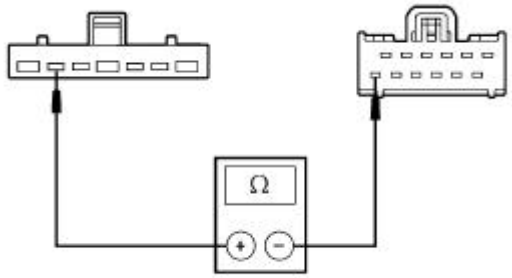
Condition	Possible Sources	Action
● The ignition switch is inoperative	● Central junction box (CJB) fuse: ■ 101 (30A). ■ 102 (30A). ● Ignition switch. ● Circuitry.	● Go To Pinpoint Test A .
● No power in ACC	● Central junction box (CJB) fuse 1 (10A). ● Ignition switch. ● Circuitry.	● Go To Pinpoint Test B .
● No power in RUN	● Central junction box (CJB) fuse: ■ 1 (10A). ■ 7 (7.5A). ■ 13 (10A). ■ 14 (10A). ■ 15 (5A). ■ 16 (10A). ■ 18 (10A). ■ 19 (10A). ■ 27 (5A). ■ 28 (5A). ■ 101 (30A). ■ 102 (30A). ● Ignition switch. ● Circuitry.	● Go To Pinpoint Test C .
● No power in START	● Central junction box (CJB) fuse(s): ■ 101 (30A). ■ 102 (30A). ● Ignition switch. ● Circuitry.	● Go To Pinpoint Test D .
● The multifunction switch/hazard switch does not operate correctly	● Multifunction switch.	● CARRY OUT the Multifunction Switch Continuity Test for electrical diagnosis. Refer to Wiring

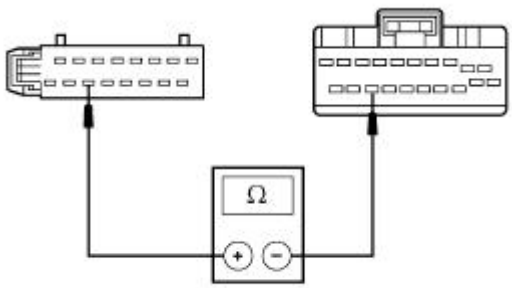
		Diagrams Cell 149 for schematic and connector information.





Pinpoint Tests

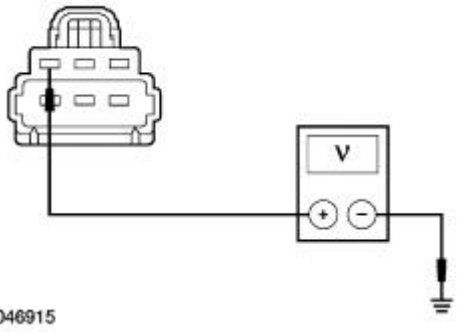




PINPOINT TEST A: THE IGNITION SWITCH IS INOPERATIVE

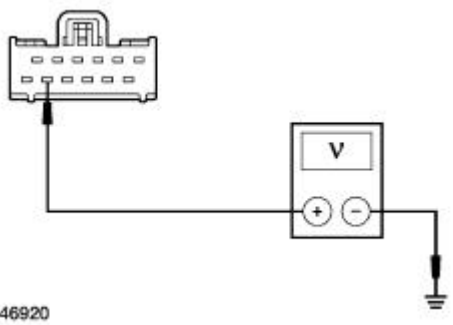
Test Step	Result / Action to Take
A1 CHECK FOR VOLTAGE AT CENTRAL JUNCTION BOX (CJB) FUSE 102 (30A)	
• Disconnect: CJB Fuse 102 (30A). • Measure the voltage between the CJB fuse 102, input side and ground.  A0046910 • **Is the voltage greater than 10 volts?**	**Yes** GO to A2 . **No** INSTALL a new CJB. TEST the system for normal operation.
A2 CHECK CIRCUIT 1050 (LG/VT) FOR AN OPEN	
• Disconnect: Ignition Switch C250. • Measure the voltage between the ignition switch C250 pin 4, circuit 1050 (LG/VT), harness side and ground.  A0025593 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST B: NO POWER IN ACC



Test Step	Result / Action to Take
B1 RETRIEVE THE DIAGNOSTIC TROUBLE CODES (DTCS)	
• Carry out the on-demand self-test for the instrument cluster. • **Is DTC B1360 recorded from the instrument cluster module?**	**Yes** GO to B3 . **No**

	GO to B2 .
B2 CHECK THE IGNITION SWITCH PIDS ● Key in ACCESSORY position. ● Monitor the instrument cluster IGN_A and the instrument cluster IGN A/R PIDs. ● **Do any of the instrument cluster PIDs indicate NO?**	**Yes** GO to B3 . **No** GO to B8 .
B3 CHECK FOR VOLTAGE AT CENTRAL JUNCTION BOX (CJB) FUSE 1 (10A) ● Key in OFF position. ● Disconnect: CJB Fuse 1 (10A). ● Key in ACCESSORY position. ● Measure the voltage between the CJB fuse 1 (10A) input side, circuit 297 (BK/LG) and ground.  A0046911 ● **Is the voltage greater than 10 volts?**	**Yes** GO to B5 . **No** GO to B4 .
B4 CHECK THE IGNITION SWITCH ● Carry out the ignition switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. ● **Is the ignition switch OK?**	**Yes** GO to B6 . **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation.
B5 CHECK CIRCUIT 295 (LB/PK) FOR AN OPEN ● Key in OFF position. ● Disconnect: Instrument Cluster C220a. ● Measure the resistance between the instrument cluster C220a pin 18, circuit 1002 (BK/PK), harness side and the CJB fuse 1, circuit 1002 (BK/PK), output side.  A0046912 ● **Is the resistance less than 5 ohms?**	**Yes** GO to B8 . **No** GO to B7 .
B6 CHECK THE CIRCUIT 297 (BK/LG) FOR AN OPEN ● Key in OFF position.	**Yes**



• Disconnect: CJB C270h. • Disconnect: Ignition Switch C250. • Measure the resistance between the ignition switch C250 pin 6, circuit 297 (BK/LG), harness side and the CJB C270h pin 12, circuit 297 (BK/LG), harness side.  A0046913 • **Is the resistance less than 5 ohms?**	INSTALL a new CJB. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
B7 CHECK THE CJB • Key in OFF position. • Disconnect: CJB C270j. • Measure the resistance between the instrument cluster C220a pin 18, circuit 1002 (BK/PK), harness side and the CJB C270j pin 5, circuit 1002 (BK/PK), harness side.  A0046914 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new CJB. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
B8 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION • Key in OFF position. • Disconnect all instrument cluster connectors. • Check for: • corrosion • pushed-out pins • Connect all instrument cluster connectors and make sure they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new instrument cluster. REFER to Section 419-10 . REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST C: NO POWER IN RUN

Test Step	Result / Action to Take
C1 CHECK CIRCUIT 964 (DB/LG) FOR VOLTAGE	

• Key in OFF position. • Disconnect: CJB C270g. • Key in ON position. • Measure the voltage between the CJB C270g pin 3, circuit 964 (DB/LG), harness side and ground.  A0046915 • **Is the voltage greater than 10 volts?**	**Yes** GO to C2 . **No** REPAIR or INSTALL a new CJB as necessary. TEST the system for normal operation.
C2 CHECK THE IGNITION SWITCH	
• CARRY OUT the ignition switch continuity check. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Does the ignition switch test OK?**	**Yes** REPAIR circuit 964 (DB/LG) between ignition switch and CJB. TEST the system for normal operation. **No** INSTALL a new ignition switch; REFER to Ignition Switch in this section. TEST the system for normal operation.

PINPOINT TEST D: NO POWER IN START

Test Step	Result / Action to Take
D1 CHECK CIRCUIT 32 (RD/LB) FOR VOLTAGE	
• Key in OFF position. • Disconnect: CJB C270h. • Key in ON position. • Measure the voltage between the CJB C270h pin 11, circuit 32 (RD/LB), harness side and ground.  A0046920 • **Is the voltage greater than 10 volts?**	**Yes** GO to D2 . **No** REPAIR or INSTALL a new CJB as necessary. TEST the system for normal operation.
D2 CHECK THE IGNITION SWITCH	
• CARRY OUT the ignition switch continuity check. Refer to Wiring Diagrams Cell 149 for schematic and	**Yes** REPAIR circuit 32 (RD/LB) between ignition switch and CJB. TEST the system for

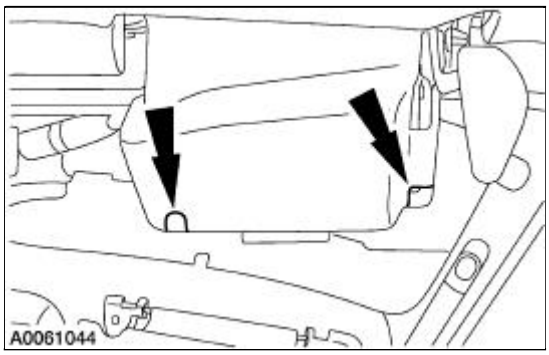
connector information. • **Does the ignition switch test OK?**	normal operation. **No** INSTALL a new ignition switch; REFER to Ignition Switch in this section. TEST the system for normal operation.

Component Test

Ignition Switch Continuity Check

Refer to Wiring Diagrams Cell 149 for schematic and connector information.

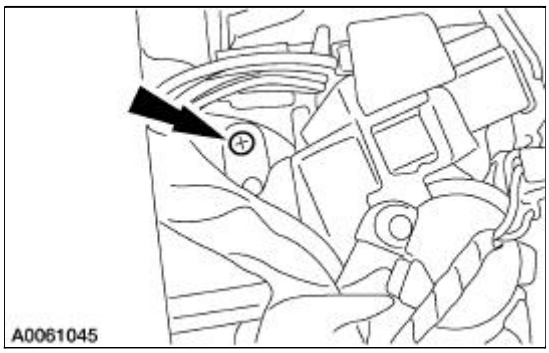
Multifunction Switch



Refer to Wiring Diagrams Cell 149 for schematic and connector information.

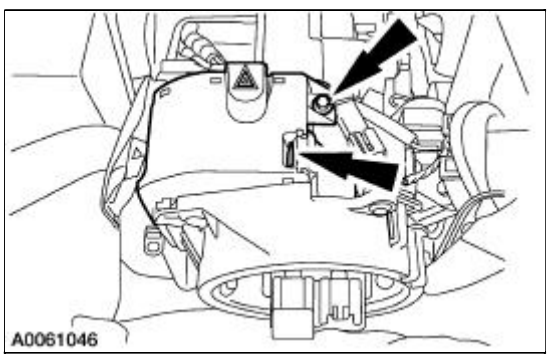
Steering Column Multifunction Switch

Removal and Installation



1. Remove the steering wheel. For additional information, refer to Section 211-04 .
2. **NOTE:** Lower tilt release handle to access the second screw.

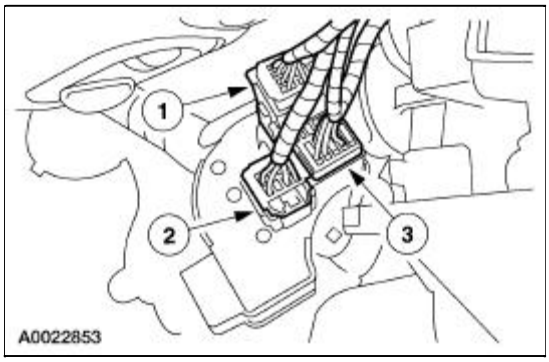
   Remove the lower steering column shroud.
   - Remove the screws.



3. **NOTE:** The screw is located behind the multifunction switch.

   Remove the screw and the upper steering column shroud.

4. Remove the bolt, push the release and raise the switch.

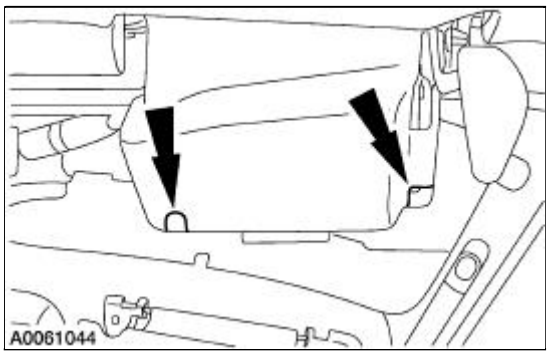


5. **NOTE:** A small screwdriver will be required to depress the connector release tab on connector

number 2.

Remove the multifunction switch.

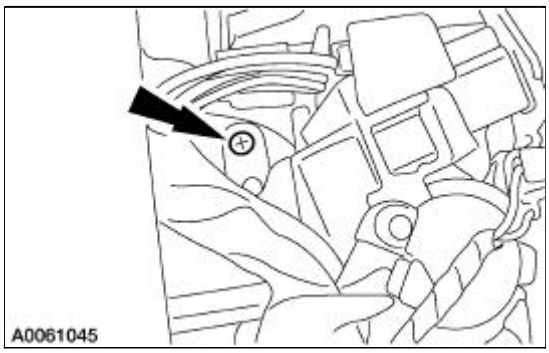
- Disconnect the connectors in the sequence shown.
- Remove the switch.



6. To install, reverse the removal procedure.

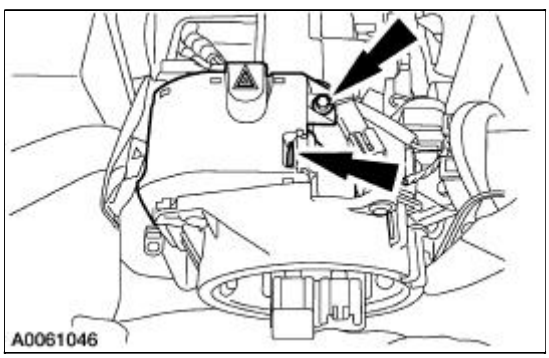
Ignition Switch

Removal and Installation



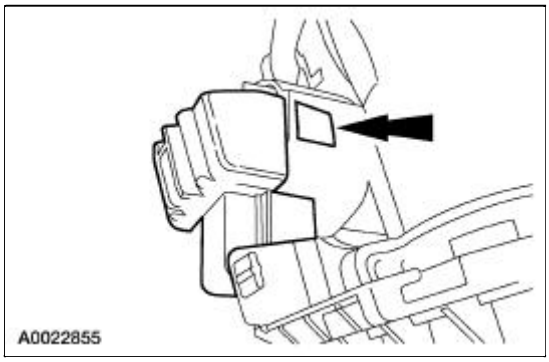
1. Remove the steering wheel. For additional information, refer to Section 211-04 .
2. **NOTE:** Lower tilt release handle to access second screw.

   Remove the lower steering column shroud.
   - Remove the screws.



3. **NOTE:** The screw is located behind the multifunction switch.

   Remove the screw and the upper steering column shroud.



4. Remove the bolt, push the release and position the multifunction switch aside.

5. Disconnect the ignition switch electrical connector.

6. Remove the ignition switch.

7. To install, reverse the removal procedure.
    - Make sure that the spring located under the ignition switch is positioned on the steering column lock rod.

General Specifications

Item	Specification
Lubricants and Sealants	
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP	WSS-M2C153-H
Diesel engine oil	Refer to owner literature
Gasoline Engine Oil Dye 164-R3705	ESE-M99C103-B1
Threadlock® 262 E2FZ-19554-B	WSK-M2G351-A6

Engine

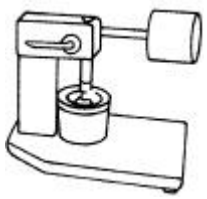
NOTE: This section contains information, steps and procedures that may not be specific to your engine.

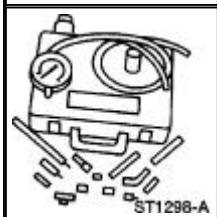
This section covers general procedures and diagnosis and testing of the engine system, except for exhaust emission control devices, which are covered in the Powertrain Control/Emissions Diagnosis Manual.

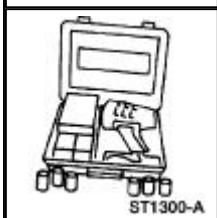
The engine incorporates the following features:

- a closed positive crankcase ventilation (PCV) system. For additional information, refer to Section 303-08 .
- an exhaust emission control system. For additional information, refer to Section 303-08 .
- an evaporative emission control system. For additional information, refer to Section 303-13 .

Some engines incorporate a fail-safe cooling system. Refer to the appropriate section in Group 303 for the procedure.







The engine, fuel system, ignition system, emissions system and exhaust system all affect exhaust emission levels and must be maintained according to the maintenance schedule. Refer to the scheduled Maintenance Guide.

Correct engine identification is required to order parts. Refer to the appropriate section in Group 303 for the procedure.

For complete vehicle and engine identification codes, refer to Section 100-01 .

Engine

Special Tool(s)

	Commercially Available Leakdown Tester —
	Quick Disconnect Compression Tester 134-R0212 or equivalent

Engine Oil	Refer to owner literature

Inspection and Verification

1. Verify the customer concern by operating the engine to duplicate the condition.
2. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical
● Engine coolant leaks ● Engine oil leaks ● Fuel leaks ● Damaged or severely worn parts ● Loose mounting bolts, studs and nuts

3. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.
4. If the concerns remain after the inspection, determine the symptoms. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
● Difficult starting	● Damaged ignition system.	● Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	● Damaged fuel system.	● Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	● Damaged starting system.	● Refer to the appropriate section in Group 303 for the procedure.

		REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Damaged charging system/battery.	• REFER to Section 414-00 .
	• Burnt valve.	• INSTALL a new valve.
	• Worn piston.	• INSTALL a new piston.
	• Worn piston rings.	• INSTALL new piston rings.
	• Worn cylinder.	• REPAIR or INSTALL a new cylinder block.
	• Damaged head gasket.	• INSTALL a new head gasket.
	• Damaged cooling system.	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• Poor idling	• Vacuum leaks.	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Malfunctioning or damaged ignition system.	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Malfunctioning or damaged fuel system.	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Damaged valve tappet or lash adjuster.	• INSTALL a new valve tappet or lash adjuster.
	• Damaged valve tappet guide or lash adjuster.	• INSTALL a new valve tappet guide or valve tappet.
	• Incorrect valve-to-valve seat contact.	• REPAIR or INSTALL a new valve or valve seat.
	• Damaged head gasket.	• INSTALL a new head gasket.
• Abnormal combustion	• Malfunctioning or damaged fuel system.	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Malfunctioning or damaged ignition system.	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Malfunctioning or damaged air intake system.	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis

		(PC/ED) manual.
	• Damaged valve tappet or lash adjuster.	• INSTALL a new valve tappet or lash adjuster.
	• Damaged valve tappet guide or valve tappet.	• INSTALL a new valve tappet guide or valve tappet.
	• Burnt or sticking valve.	• REPAIR or INSTALL a new valve.
	• Weak or broken valve spring.	• INSTALL a new valve spring.
	• Carbon accumulation in combustion chamber.	• ELIMINATE carbon buildup.
• Excessive oil consumption	• Leaking oil.	• REPAIR oil leakage.
	• Malfunctioning PCV system.	• REPAIR or INSTALL new necessary components.
	• Worn valve stem seal.	• INSTALL a new valve stem seal.
	• Worn valve stem or valve guide.	• INSTALL a new valve and valve guide.
	• Sticking piston rings.	• REPAIR or INSTALL new piston rings.
	• Worn piston ring groove.	• INSTALL a new piston and piston pin.
	• Worn piston or cylinder.	• REPAIR or INSTALL a new piston or cylinder block.
• Engine noise	• Leaking exhaust system.	• REPAIR exhaust leakage.
	• Incorrect drive belt tension.	• REFER to Section 303-05 .
	• Malfunctioning generator bearing.	• Refer to the appropriate section in Group 414 for the procedure.
	• Malfunctioning water pump bearing.	• REFER to Section 303-03 .
	• Malfunctioning or damaged cooling system.	• REFER to Section 303-03 .
	• Malfunctioning or damaged fuel system.	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Loose timing chain/belt (6268).	• ADJUST or INSTALL a new timing chain/belt.
	• Damaged timing chain tensioner (6L266).	• INSTALL a new timing chain tensioner.
	• Excessive main bearing clearance.	• ADJUST clearance or INSTALL a new crankshaft main bearing (6333).

	• Seized or heat damaged crankshaft main bearing.	• INSTALL a new crankshaft main bearing.
	• Excessive crankshaft end play.	• INSTALL a new thrust bearing or crankshaft (6303).
	• Excessive connecting rod bearing clearance.	• INSTALL a new connecting rod bearing or connecting rod (6200).
	• Heat damaged connecting rod bearing (6211).	• INSTALL a new connecting rod bearing.
	• Damaged connecting rod bushing (6207).	• INSTALL a new connecting rod bushing.
	• Worn cylinder.	• REPAIR or INSTALL a new cylinder block (6010).
	• Worn piston (6108) or piston pin (6135).	• INSTALL a new piston or piston pin.
	• Damaged piston rings.	• INSTALL new piston rings.
	• Bent connecting rod.	• INSTALL a new connecting rod.
	• Malfunctioning valve tappet (6500) or lash adjuster.	• INSTALL a new valve tappet or lash adjuster.
	• Excessive valve tappet or lash adjuster clearance.	• ADJUST clearance or INSTALL a new valve tappet guide or valve tappet.
	• Broken valve spring (6513).	• INSTALL a new valve spring.
	• Excessive valve guide clearance.	• ADJUST clearance or INSTALL a new valve guide (6510) or valve.
• Insufficient power	• Malfunctioning or damaged ignition system.	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Malfunctioning or damaged fuel system.	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Malfunctioning or damaged air intake system.	• Refer to the appropriate section in Group 303 for the procedure. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
	• Damaged or plugged exhaust system.	• INSPECT exhaust system.
	• Incorrect tire size.	• REFER to Section 204-04 .
	• Dragging brakes.	• REFER to Section 206-00 .

	• Slipping transmission. • Malfunctioning valve tappet or lash adjuster. • Damaged valve tappet guide or valve tappet. • Compression leakage at valve seat. • Seized valve stem. • Weak or broken valve spring. • Worn or damaged camshaft. • Damaged head gasket (6051). • Cracked or distorted cylinder head. • Damaged, worn or sticking piston ring (s). • Worn or damaged piston.	• Refer to the appropriate section in Group 307 for the procedure. • INSTALL a new valve tappet or lash adjuster. • INSTALL a new valve tappet guide or valve tappet. • REPAIR or INSTALL a new valve, valve seat or cylinder head (6049). • INSTALL a new valve. • INSTALL a new valve spring. • INSTALL a new camshaft. • INSTALL a new head gasket. • INSTALL a new cylinder head. • REPAIR or INSTALL a new piston ring(s). • INSTALL a new piston and piston pin.

Component Tests

Engine Oil Leaks

NOTE: When diagnosing engine oil leaks, the source and location of the leak must be positively identified prior to repair.

Prior to carrying out this procedure, clean all sealing surface areas with a suitable solvent to remove all traces of oil.

Engine Oil Leaks—Fluorescent Oil Additive Method

Use the UV Leak Detector Kit to carry out the following procedure for oil leak diagnosis.

1. Add gasoline engine oil dye. Use a minimum 14.8 ml (0.5 ounce) to a maximum 29.6 ml (1 ounce) of fluorescent additive to all engines. If the oil is not premixed, fluorescent additive must first be added to crankcase.

2. Run the engine for 15 minutes. Stop the engine and inspect all seal and gasket areas for leaks using the UV Leak Detector Kit. A clear bright yellow or orange area will identify the leak. For extremely small leaks, several hours may be required for the leak to appear.

Leakage Points—Underhood

Examine the following areas for oil leakage:

- valve cover gaskets

- intake manifold gaskets
- cylinder head gaskets
- oil bypass filter
- oil filter adapter
- engine front cover
- oil filter adapter and filter body
- oil level indicator tube connection
- oil pressure sensor

Leakage Points—Under Engine—With Vehicle on Hoist

- oil pan gaskets (6710)
- oil pan sealer
- oil pan rear seal (6723)
- engine front cover gasket
- crankshaft front seal (6700)
- crankshaft rear oil seal (6701)
- crankshaft main bearing cap side bolts
- oil filter adapter and filter body
- oil cooler, if equipped

Leakage Points—With Transmission and Flywheel Removed

- crankshaft rear oil seal
- rear main bearing cap parting line
- rear main bearing cap and seals
- flywheel mounting bolt holes (with flywheel [6375] installed)
- camshaft rear bearing covers (6266) or pipe plugs at the end of oil passages

Oil leaks at crimped seams in sheet metal parts and cracks in cast or stamped parts can be detected when using the dye method.

Compression Test—Compression Gauge Check

1. Make sure the oil in the crankcase is of the correct viscosity and at the correct level and that the battery (10655) is correctly charged. Operate the vehicle until the engine is at normal operating temperature. Turn the ignition switch to the OFF position, then remove all the spark plugs (12405).

2. Set the throttle plates in the wide-open position.

3. Install a compression gauge such as the Compression Tester in the No. 1 cylinder.

4. Install an auxiliary starter switch in the starting circuit. With the ignition switch in the OFF position, and using the auxiliary starter switch, crank the engine a minimum of five compression strokes and record the highest reading. Note the approximate number of compression strokes

required to obtain the highest reading.

5. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.

Compression Test—Test Results

The indicated compression pressures are considered within specification if the lowest reading cylinder is at least 75 percent of the highest reading. Refer to the Compression Pressure Limit Chart.

Compression Pressure Limit Chart

Maximum Pressure	Minimum Pressure	Maximum Pressure	Minimum Pressure	Maximum Pressure	Minimum Pressure	Maximum Pressure	Minimum Pressure
924 kPa (134 psi)	696 kPa (101 psi)	1131 kPa (164 psi)	848 kPa (123 psi)	1338 kPa (194 psi)	1000 kPa (146 psi)	1544 kPa (224 psi)	1158 kPa (168 psi)

1110 kPa (161 psi)	834 kPa (121 psi)	1324 kPa (192 psi)	993 kPa (144 psi)	1631 kPa (222 psi)	1145 kPa (166 psi)	—	—

If one or more cylinders reads low, squirt approximately one tablespoon of engine oil on top of the pistons in the low-reading cylinders. Repeat the compression pressure check on these cylinders.

Compression Test—Interpreting Compression Readings

1. If compression improves considerably, piston rings are faulty.

2. If compression does not improve, valves are sticking or seating incorrectly.

3. If two adjacent cylinders indicate low compression pressures and squirting oil on each piston does not increase compression, the head gasket may be leaking between cylinders. Engine oil or coolant in cylinders could result from this condition.
   Use the Compression Pressure Limit Chart when checking cylinder compression so that the lowest reading is within 75 percent of the highest reading.

Cylinder Leakage Detection

When a cylinder produces a low reading, use of the Engine Cylinder Leak Detection/Air Pressurization Kit will be helpful in pinpointing the exact cause.

The leakage detector is inserted in the spark plug hole, the piston is brought up to dead center on the compression stroke, and compressed air is admitted.

Once the combustion chamber is pressurized, a special gauge included in the kit will read the percentage of leakage. Leakage exceeding 20 percent is excessive.

While the air pressure is retained in the cylinder, listen for the hiss of escaping air. A leak at the intake valve (6507) will be heard in the throttle body (9E926). A leak at the exhaust valve (6505) can be heard at the tail pipe. Leakage past the piston rings will be audible at the positive crankcase ventilation (PCV) connection. If air is passing through a blown head gasket to an adjacent cylinder, the noise will be evident at the spark plug hole of the cylinder into which the air is leaking. Cracks in the cylinder block or gasket leakage into the cooling system may be detected by a stream of bubbles in the radiator (8005).

Oil Consumption Test

The following diagnostic procedure is used to determine the source of excessive internal oil consumption.

1. **NOTE:** Oil use is normally greater during the first 16,100 km (10,000 miles) of service. As mileage increases, oil use generally decreases. Vehicles in normal service should get at least 1,450 km per liter (900 miles per quart) after 16,000 km (10,000 miles) of service. High speed driving, towing, high ambient temperature and other factors may result in greater oil use.

   Define excessive oil consumption, such as the number of miles driven per liter (quart) of oil used. Also determine customer's driving habits, such as sustained high speed operation, towing, extended idle and other considerations.

2. Verify that the engine has no external oil leak as described under Engine Oil Leaks in the Diagnosis and Testing portion of this section.

3. Verify that the engine has the correct oil level dipstick (6750).

4. Verify that the engine is not being run in an overfilled condition. Check the oil level at least five minutes after a hot shutdown with the vehicle parked on a level surface. In no case should the level be above MAX or the letter F in FULL. If significantly overfilled, carry out Steps 6a through 6d.

5. Verify the spark plugs are not oil saturated. If the spark plugs are oil saturated and compression is good it can be assumed the valve seals or valve guides are at fault.

6. Carry out an oil consumption test:

a. Drain the engine oil, remove the oil bypass filter (6714) and refill with one liter (quart) less than the recommended amount.
b. Run the engine for three minutes (10 minutes if cold), and allow the oil to drain back for at least five minutes with the vehicle on a level surface.
c. Remove oil level dipstick and wipe clean. (Do not wipe with anything contaminated with silicone compounds.) Reinstall the oil level dipstick, being sure to seat it firmly in the oil level indicator tube (6754). Remove the oil level dipstick and draw a mark on the back (unmarked) surface at the indicated oil level. This level should be about the same as the MIN or ADD mark on the face of the oil level dipstick.
d. Add one liter (quart) of oil. Restart the engine and allow to idle for at least two minutes. Shut off the engine and allow the oil to drain back for at least five minutes. Mark the oil level dipstick, using the procedure above.
e. Record the vehicle mileage.
f. Instruct the customer to drive the vehicle as usual and perform the following:
    - Check the oil level regularly at intervals of 160 to 240 km (100-150 miles).
    - Return to the service point when the oil level drops below the lower (MIN or ADD) mark on the oil level dipstick.
    - Add only full liters (quarts) of the same oil in an emergency. Note the mileage at which the oil is added.
g. Check the oil level under the same conditions and at the same location as in Steps 6c and 6d.
    - Measure the distance from the oil level to the UPPER mark on the oil level dipstick and record.
    - Measure the distance between the two scribe marks and record.
    - Divide the first measurement by the second.
    - Divide the distance driven during the oil test by the result. This quantity is the approximate oil consumption rate in kilometers per liter or in miles per quart.
h. If the oil consumption rate is unacceptable, go to Step 7.

7. Check the positive crankcase ventilation (PCV) system. Make sure the system is not plugged.

8. Check for plugged oil drain-back holes in the cylinder heads and cylinder block.

9. If the condition still exists after performing the above steps, go to Step 10.

10. Perform a cylinder compression test or perform a cylinder leak detection test with Engine Cylinder Leak Detection/Air Pressurization Kit. This can help determine the source of oil consumption such as valves, piston rings or other areas.

11. **NOTE:** After determining if new parts should be installed, make sure correct parts are used.

    Check valve guides for excessive guide clearance. Install new all valve stem seals (6571) after verifying valve guide clearance.

12. Worn or damaged internal engine components can cause excessive oil consumption. Small deposits of oil on the tips of spark plugs can be a clue to internal oil consumption. If internal oil consumption still persists, proceed as follows:

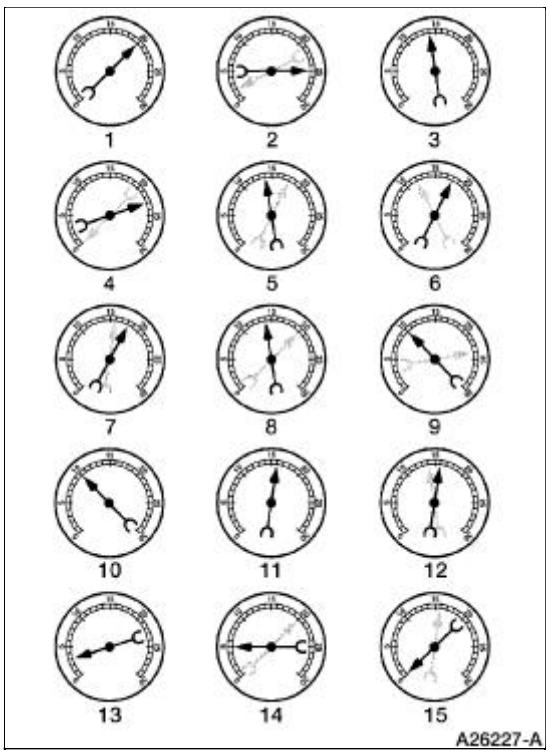
a. Remove the engine from the vehicle and place it on an engine work stand. Remove the intake manifolds (9424), cylinder heads, oil pan (6675) and oil pump (6600).
b. Check piston ring clearance, ring gap and ring orientation. Repair as necessary.
c. Check for excessive bearing clearance. Repair as necessary.

13. Repeat the oil consumption test (Step 6) to confirm the oil consumption concern has been resolved.

Intake Manifold Vacuum Test

Bring the engine to normal operating temperature. Connect the Vacuum/Pressure Tester to the intake manifold. Run the engine at the specified idle speed.

The vacuum gauge should read between 51-74 kPa (15-22 in-Hg) depending upon the engine condition and the altitude at which the test is performed. Subtract 4.0193 kPa (1 in-Hg) from the specified reading for every 304.8 m (1,000 feet) of elevation above sea level.



The reading should be steady. If necessary, adjust the gauge damper control (where used) if the needle is fluttering rapidly. Adjust the damper until the needle moves easily without excessive flutter.

Intake Manifold Vacuum Test—Interpreting Vacuum Gauge Readings

A careful study of the vacuum gauge reading while the engine is idling will help pinpoint trouble areas. Always conduct other appropriate tests before arriving at a final diagnostic decision. Vacuum gauge readings, although helpful, must be interpreted carefully.

Most vacuum gauges have a normal band indicated on the gauge face.

The following are potential gauge readings. Some are normal; others should be investigated further.

1. NORMAL READING: Needle between 51-74 kPa (15-22 in-Hg) and holding steady.

2. NORMAL READING DURING RAPID ACCELERATION AND DECELERATION: When the engine is rapidly accelerated (dotted needle), the needle will drop to a low reading (not to zero). When the throttle is suddenly released, the needle will snap back up to a higher than normal figure.

3. NORMAL FOR HIGH-LIFT CAMSHAFT WITH LARGE OVERLAP: The needle will register as low as 51 kPa (15 in-Hg) but will be relatively steady. Some oscillation is normal.

4. WORN RINGS OR DILUTED OIL: When the engine is accelerated (dotted needle), the needle drops to 0 kPa (0 in-Hg). Upon deceleration, the needle runs slightly above 74 kPa (22 in-Hg).

5. STICKING VALVES: When the needle (dotted) remains steady at a normal vacuum but occasionally flicks (sharp, fast movement) down and back about 13 kPa (4 in-Hg), one or more valves may be sticking.

6. BURNED OR WARPED VALVES: A regular, evenly-spaced, downscale flicking of the needle indicates one or more burned or warped valves. Insufficient hydraulic lash adjuster or hydraulic lash adjuster (HLA) clearance will also cause this reaction.

7. POOR VALVE SEATING: A small but regular downscale flicking can mean one or more valves are not seating.

8. WORN VALVE GUIDES: When the needle oscillates over about a 13 kPa (4 in-Hg) range at idle speed, the valve guides could be worn. As engine speed increases, the needle will become steady if guides are responsible.

9. WEAK VALVE SPRINGS: When the needle oscillation becomes more violent as engine rpm is increased, weak valve springs are indicated. The reading at idle could be relatively steady.

10. LATE VALVE TIMING: A steady but low reading could be caused by late valve timing.

11. IGNITION TIMING RETARDING: Retarded ignition timing will produce a steady but somewhat low reading.

12. INSUFFICIENT SPARK PLUG GAP: When spark plugs are gapped too close, a regular, small pulsation of the needle can occur.

13. INTAKE LEAK: A low, steady reading can be caused by an intake manifold or throttle body gasket leak.

14. BLOWN HEAD GASKET: A regular drop of fair magnitude can be caused by a blown head gasket or warped cylinder head-to-cylinder block surface.

15. RESTRICTED EXHAUST SYSTEM: When the engine is first started and is idled, the reading may be normal, but as the engine rpm is increased, the back pressure caused by a clogged muffler (5230), kinked tail pipe or other concerns will cause the needle to slowly drop to 0 kPa (0 in-Hg). The needle then may slowly rise. Excessive exhaust clogging will cause the needle to drop to a low point even if the engine is only idling.

16. When vacuum leaks are indicated, search out and correct the cause. Excess air leaking into the system will upset the fuel mixture and cause concerns such as rough idle, missing on acceleration or burned valves. If the leak exists in an accessory unit such as the power brake booster (2005), the unit will not function correctly. Always fix vacuum leaks.

Excessive Engine Oil Consumption

The amount of oil an engine uses will vary with the way the vehicle is driven in addition to normal engine-to-engine variation. This is especially true during the first 16,100 km (10,000 miles) when a new engine is being broken in or until certain internal engine components become conditioned. Vehicles used in heavy-duty operation may use more oil. The following are examples of heavy-duty operation:

- trailer towing applications
- severe loading applications
- sustained high speed operation

Engines need oil to lubricate the following internal components:

- cylinder block cylinder walls
- pistons and piston, pin and rings (6102)
- intake and exhaust valve stems
- intake and exhaust valve guides
- all internal engine components

When the pistons move downward, a thin film of oil is left on the cylinder walls. As the vehicle is operated, some oil is also drawn into the combustion chambers past the intake and exhaust valve stem seals and burned.

The following is a partial list of conditions that can affect oil consumption rates:

- engine duty cycle
- operator driving habits
- ambient temperature
- quality and viscosity of the oil

Operation under varying conditions can frequently be misleading. A vehicle that has been run for several thousand miles on short trips or in below-freezing ambient temperatures may have consumed a "normal" amount of oil. However, when checking the engine oil level, it may measure up to the FULL or MAX on the oil level dipstick due to dilution (condensation and fuel) in the engine crankcase. The vehicle might then be driven at high speeds on the highway where the condensation and fuel boil off. The next time the engine oil is checked, it may appear that a liter (quart) of oil was used in about 160 km (100 miles). This perceived 160 km (100 miles) per liter (quart) oil consumption rate causes customer concern even though the actual overall oil consumption rate is about 2,400 km (1,500 miles) per liter (quart).

Make sure the selected engine oil meets the current recommended API performance category with SAE viscosity grade as shown in the vehicle Owner's Guide. It is also important that the engine oil is changed at the intervals specified. Refer to the vehicle Owner's Guide.

Oil Pressure Test

1. Disconnect and remove the oil pressure sensor (9278) from the engine.
2. Connect the Oil Pressure Gauge to the oil pressure sender oil galley port.
3. Run the engine until normal operating temperature is reached.
4. Run the engine at the specified rpm and record the gauge reading.
5. The oil pressure should be within specifications; refer to the specification chart in the appropriate engine section.
6. If the pressure is not within specification, check the following possible sources:
    - insufficient oil
    - oil leakage
    - worn or damaged oil pump
    - oil pump screen cover and tube (6622)
    - excessive main bearing clearance

- excessive connecting rod bearing clearance

Valve Train Analysis—Engine Off—Valve Cover Removed

Check for damaged or severely worn parts and correct assembly. Make sure correct parts are used with the static engine analysis as follows.

Valve Train Analysis—Engine Off, Rocker Arm

- Check for loose mounting bolts, studs and nuts.
- Check for plugged oil feed in the rocker arms (6564) or cylinder head.

Valve Train Analysis—Engine Off, Camshaft Roller Followers and Hydraulic Lash Adjusters, Overhead Camshaft

- Check for loose mounting bolts on camshaft carriers.
- Check for plugged oil feed in the camshaft roller followers, lash adjusters or cylinder heads.

Valve Train Analysis—Engine Off, Camshaft—Engines

- Check for broken or damaged parts.

Valve Train Analysis—Engine Off, Push Rods

- Check for bent push rods (6565) and restricted oil passage.

Valve Train Analysis—Valve Springs

- Check for broken or damaged parts.

Valve Train Analysis—Engine Off, Valve Spring Retainer and Valve Spring Retainer Keys

- Check for correct seating of the valve spring retainer key (6518) on the valve stem and in valve spring retainer (6514).
- Check for correct seating on the valve stem.

Valve Train Analysis—Engine Off, Valves and Cylinder Head

- Check for plugged oil drain back holes.
- Check for worn or damaged valve tips.
- Check for missing or damaged guide-mounted valve stem seal.
- Check collapsed valve tappet gap.
- Check installed valve spring height.
- Check for missing or worn valve spring seats.
- Check for plugged oil metering orifice in cylinder head oil reservoir (if equipped).

Static checks (engine off) are to be made on the engine prior to the dynamic procedure.

Valve Train Analysis—Engine Running

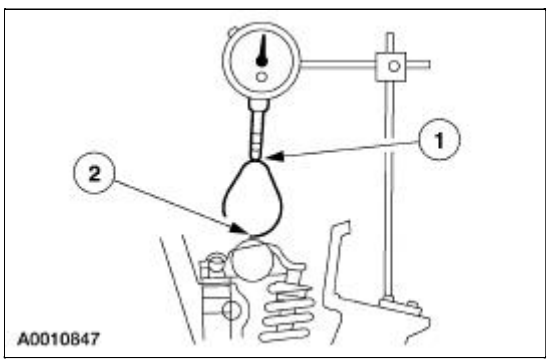
- Start the engine and, while idling, check for correct operation of all parts. Check the following:

Valve Train Analysis—Engine Running, Valves and Cylinder Head

- Check for plugged oil drain back holes.
- Check for missing or damaged valve stem seals or guide mounted valve stem seals.
- Check for a plugged oil metering orifice in the cylinder head oil reservoir (4.6L engine only).

If insufficient oiling is suspected, check oil passages for blockage, then accelerate the engine to 1,200 rpm with the transmission in NEUTRAL and the engine at normal operating temperature. Oil should spurt from the rocker arm oil holes such that valve tips and camshaft roller followers are well oiled. With the valve covers (6582) off, some oil splash may overshoot camshaft roller followers.

Valve Train Analysis—Engine Running, Camshaft Lobe Lift—OHC Engines



Check the lift of each camshaft lobe in consecutive order and make a note of the readings.

1. Remove the valve covers.

2. Remove the spark plugs.

3. Install the Dial Indicator Gauge with Holding Fixture so the rounded tip of indicator is on top of the camshaft lobe and on the same plane as the valve tappet.

4. Rotate the crankshaft using a breaker bar and socket attached to the crankshaft pulley retainer bolt. Rotate the crankshaft until the base circle of the camshaft lobe is reached.

5. Zero the dial indicator. Continue to rotate the crankshaft until the (1) high-lift point of the camshaft lobe is in the fully-raised position (highest indicator reading).

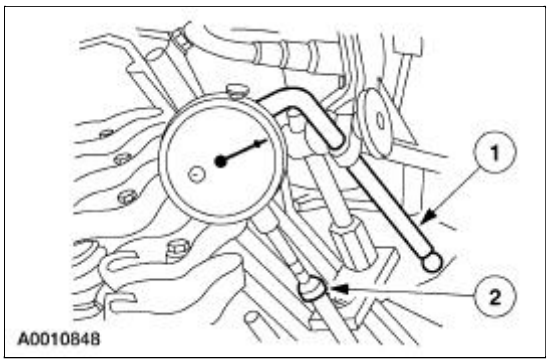
6. To check the accuracy of the original indicator reading, continue to rotate crankshaft until the (2) base circle is reached. The indicator reading should be zero. If zero reading is not obtained, repeat Steps 1 through 6.

7. **NOTE:** If the lift on any lobe is below specified service limits, install a new camshaft, and new camshaft roller followers.

   Remove the Dial Indicator Gauge with Holding Fixture.

8. Install the spark plugs.

9. Install the valve covers.



Valve Train Analysis—Engine Running, Camshaft Lobe Lift—Push Rod Engine

Check the lift of each lobe in consecutive order and make a note of the readings.

1. Remove the valve covers.

2. Remove the rocker arm seat bolts, rocker arm seat (6A528) and rocker arms.

Typical Engine With Push Rods

3. Make sure the valve tappet is seated against camshaft (6250). Install (1) Dial Indicator Gauge with Holding Fixture so the ball socket adapter of the indicator is on top of the valve tappet or (2) Dial Indicator Gauge Adapter is on top of push rod and in same plane as valve tappet push rod movement.

4. Remove the spark plugs.

5. Connect an auxiliary starter switch in the starting circuit. Crank the engine with ignition switch in OFF position. Bump crankshaft over until valve tappet is on base circle of camshaft lobe. At this point, valve tappet will be in its lowest position. If checking during engine assembly, turn crankshaft using a socket or ratchet.

6. Zero the dial indicator. Continue to rotate crankshaft slowly until valve tappet is in fully-raised position (highest indicator reading).

7. **NOTE:** If lift on any lobe is below specified service limits, install a new camshaft, and new valve tappets.

   Remove the Dial Indicator with Holding Fixture, Dial Indicator Gauge Adapter, and auxiliary starter switch.

8. Install rocker arm seats, rocker arms and rocker arm seat bolts.

9. Install valve covers.

10. Install spark plugs.

Valve Train Analysis—Engine Running, Valve Tappet

Valve tappet noise can be caused by any of the following:

- excessive valve tappet gap (collapsed)

- incorrectly functioning valve tappet
- air in lubrication system
- excessive valve guide wear
- low oil pressure

Excessive collapsed valve tappet gap can be caused by loose rocker arm seat bolts/nuts, incorrect initial adjustment or wear of valve tappet face, or worn roller valve tappets, push rod (6565), rocker arm (6564), rocker arm seat or valve tip. With valve tappet collapsed, check gap between the valve tip and the rocker arm to determine if any other valve train parts are damaged, worn or out of adjustment.

An incorrectly functioning valve tappet can be sticking, caused by contaminants or varnish inside the tappet. The tappet can have a check valve that is not functioning correctly, which can be caused by an obstruction, such as dirt or chips that prevent the check valve from closing, or a broken check valve spring. A tappet with a leakdown time out of specification can cause tappet noise. If no other cause for noisy valve tappets can be found, the leakdown rate should be checked and new valve tappets installed if found to be out of specification.

Assembled valve tappets can be tested with Hydraulic Tappet Leakdown Tester to check the leakdown rate. The leakdown rate specification is the time in seconds for the plunger to move a specified distance while under a 22.7 kg (50 lb) load.

Air bubbles in the lubrication system will prevent the valve tappet from supporting the valve spring load. This can be caused by too high or too low an oil level in the oil pan or by air being drawn into the system through a hole, crack or leaking gasket on the oil pump screen cover and tube.

General Specifications

Item	Specification
Lubricants and Sealants

General Specifications

Item	Specification
Engine — 4.6L	
Displacement	4.6L (281 CID)
Number of cylinders	8
Bore	90.2 mm (3.55 in)
Stroke	90.0 mm (3.54 in)
Firing order	1-3-7-2-6-5-4-8
Oil pressure (@ 2000 rpm — hot)	275.8-413.7 kPa (40-60 psi)
Oil capacity (includes filter change)	5.7 L (6.0 qts)
Compression ratio	9.3:1
Cylinder Head and Valve Train	
Combustion chamber volume	51.5-52.5 cc (3.14-3.20 cu in)
Valve arrangement (front to rear) — LH	E-I-E-I-E-I-E-I
Valve arrangement (front to rear) — RH	I-E-I-E-I-E-I-E
Valve guide bore diameter	7.044-7.015 mm (0.2773-0.2762 in)
Valve stem diameter — intake	6.995-6.975 mm (0.2754-0.2746 in)
Valve stem diameter — exhaust	6.970-6.949 mm (0.2744-0.2736 in)
Valve stem-to-guide clearance — intake	0.020-0.069 mm (0.0008-0.0027 in)
Valve stem-to-guide clearance — exhaust	0.045-0.095 mm (0.0018-0.0037 in)
Valve head diameter — intake	44.5 mm (1.751 in)
Valve head diameter — exhaust	34.0 mm (1.338 in)

Valve face runout	0.05 mm (0.0019 in)
Valve face angle	45.25-45.75 degrees
Valve seat width	1.9-2.1 mm (0.0748-0.0827 in)
Valve seat runout (T.I.R.) max.	0.025 mm (0.0010 in)
Valve seat angle	45.50 degrees
Valve spring free length	49.55 mm (1.9508 in)
Valve spring squareness	2 degrees
Valve spring compression pressure	587.14 N @ 28.02 mm (131.994 lb @ 1.1032 in)
Valve spring installed height	39.7-40.3 mm (1.5630-1.5866 in)
Valve spring installed pressure — valve open	587.165 N @ 27.99 mm (132 lb @ 1.102 in)
Valve spring installed pressure — valve closed	244.652 N @ 39.98 mm (55 lb @ 1.574 in)
Roller follower ratio	1.75:1
Hydraulic Lash Adjuster	
Diameter	16.000-15.9888 mm (0.6299-0.6295 in)
Clearance-to-bore	0.018-0.069 mm (0.0007-0.0027 in)
Service limit	0.016 mm (0.0006 in)
Hydraulic leakdown rate	5-25 seconds [a]
Collapsed lash adjuster gap	0.085-0.450 mm (0.0033-0.0177 in)
Camshaft	
Theoretical valve lift @ 0 lash	12.0 mm (0.472 in)
Lobe lift	6.5 mm (0.2560 in)
Allowable lobe lift loss	0
Journal diameter (all)	26.962-26.936 mm (1.0615-1.0605 in)
Camshaft journal bore inside diameter (all)	27.012-26.987 mm (1.0635-1.0625 in)
Camshaft journal-to-bearing clearance	0.025-0.076 mm (0.0010-0.0030 in)
Runout	0.05 mm (0.002 in)
End play	0.09-0.19 mm (0.0035-0.0075 in)
Cylinder Block	
Cylinder bore diameter — grade 1	90.200-90.213 mm (3.5512-3.5517 in)
Cylinder bore diameter — grade 2	90.213-90.226 mm (3.5517-3.5522 in)
Cylinder bore diameter — grade 3	90.226-90.239 mm (3.5522-3.5527 in)
Cylinder bore maximum taper	0.006 mm (0.0002 in)
Cylinder bore maximum out-of-round	0.020 mm (0.0008 in)
Main bearing bore inside diameter	72.401-72.422 mm (2.850-2.851 in)
Crankshaft	
Main bearing journal diameter	63.0 mm (2.4803 in)
Main bearing journal maximum taper	0.020 mm (0.0007 in)
Main bearing journal maximum out-of-round	0.05 mm (0.002 in)
Main bearing journal-to-cylinder block clearance	0.027-0.065 mm (0.0011-0.0026 in)
Connecting rod journal diameter	52.988-53.003 mm (2.0861-2.0867 in)
Connecting rod journal maximum taper	0.015 mm (0.0006 in)

Connecting rod journal maximum out-of-round	0.05 mm (0.0020 in)
Crankshaft maximum end play	0.130-0.301 mm (0.0051-0.012 in)
Piston and Connecting Rod	
Piston diameter — coded red 1	90.177-90.197 mm (3.550-3.551 in)
Piston diameter — coded blue 2	90.190-90.210 mm (3.5507-3.5515 in)
Piston diameter — coded yellow 3	90.203-90.223 mm (3.513-3.5521 in)
Piston-to-cylinder bore clearance	0.012-0.0026 mm (0.0005-0.001 in)
Piston ring end gap — compression (top and bottom)	0.23-0.49 mm (0.010-0.020 in)
Piston ring end gap — oil ring (steel rail)	0.05-0.66 mm (0.006-0.026 in)
Piston ring groove width — compression (top)	1.520-1.550 mm (0.060-0.610 in)
Piston ring groove width — compression (bottom)	1.520-1.530 mm (0.060-0.0602 in)
Piston ring groove width — oil ring	6.996-7.224 mm (0.275-0.2844 in)
Piston ring width — compression	1.49-1.47 mm (0.0587-0.0579 in)
Piston ring width — oil ring rail (2)	0.473-0.447 mm (0.0186-0.0176 in), 0.483 mm (0.0190 in) max. at ID
Piston ring width — oil ring expander	2.038-1.960 mm (0.080-0.077 in)
Piston ring-to-groove clearance — compression	0.030-0.070 mm (0.0012-0.0028 in)
Piston ring-to-groove clearance — oil ring assembly	0.046-0.196 mm (0.0018-0.0077 in)
Piston pin bore diameter	22.0015-22.004 mm (0.866-0.8663 in)
Piston pin diameter	22.0 mm (0.866 in)
Piston pin length	61.8 mm (2.433 in)
Piston pin-to-piston fit	0.005-0.010 mm (0.0002-0.0004 in)
Connecting rod-to-pin clearance	0.015-0.040 mm (0.0006-0.0016 in)
Connecting rod pin bore diameter	21.959-21.979 mm (0.864-0.865 in)
Connecting rod length (center-to-center)	150.7 mm (5.93 in)
Connecting rod maximum allowed bend	0.038 mm per 25 mm (0.0015-0.984 in)
Connecting rod maximum allowed twist [b]	0.050 mm per 25 mm (0.0015-0.984 in)
Connecting rod bearing bore diameter	56.756-56.876 mm (2.234-2.24 in)
Connecting rod bearing-to-crankshaft clearance	0.027-0.069 mm (0.001-0.0027 in)
Connecting rod side clearance (assembled to crank) — standard	0.015-0.45 mm (0.0006-0.0177 in)
Connecting rod side clearance (assembled to crank) — service limit	0.05 mm (0.02 in) max.

[a] Time required for the plunger to leak down 1.6 mm of travel with 222 N force and leak-down fluid in the lash adjuster.

[b] The pin bore and crank bearing bore must be parallel and in the same vertical plane within the specified total difference when measured at the ends of a 203 mm bar, 105.5 mm on each side of rod centerline.

General Specifications

Item	Specification
Engine — 5.4L	

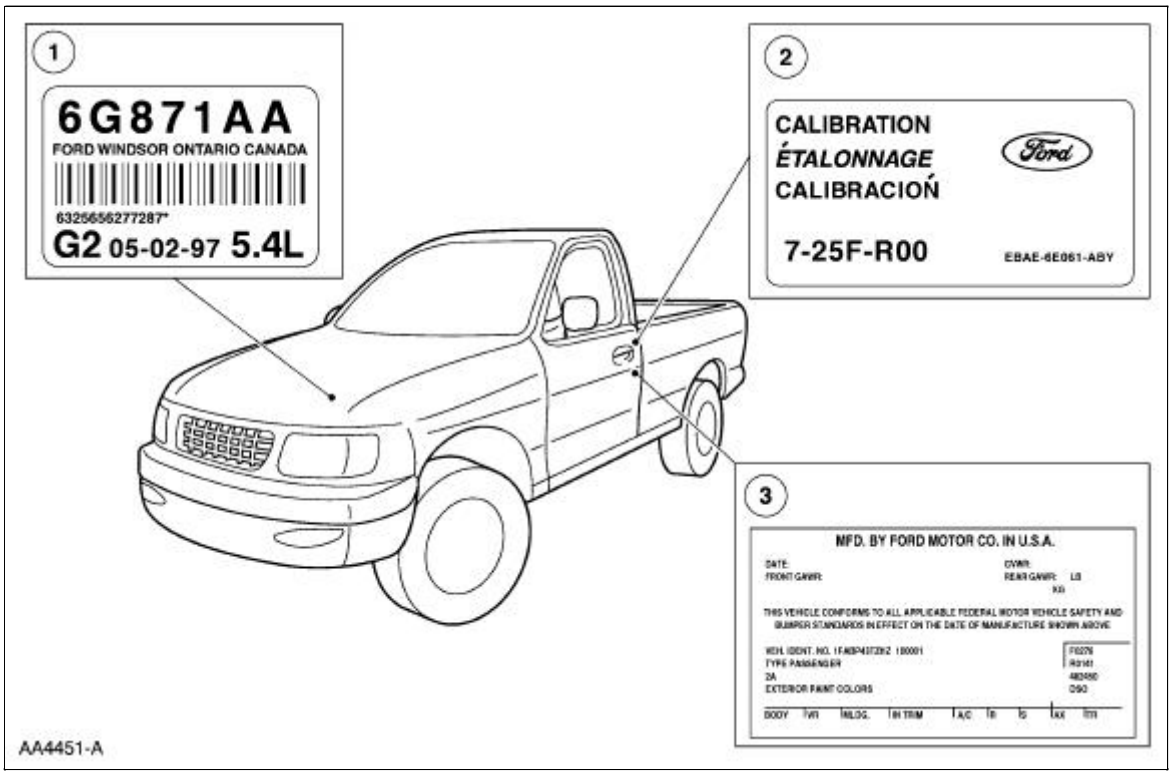
Displacement	5.4L (330 cu in)
Number of cylinders	8
Bore	90.2 mm (3.55 in)
Stroke	105.8 mm (4.17 in)
Firing order	1-3-7-2-6-5-4-8
Oil pressure (@ 2000 rpm — hot)	275.8-413.7 kPa (40-60 psi)
Oil capacity (includes filter change)	5.7 L (6.0 qts)
Compression ratio	9.0:1
Cylinder Head and Valve Train	
Combustion chamber volume	42.45-45.45 cc (2.59-2.77 cu in)
Valve arrangement (front to rear) — LH	E-I-E-I-E-I-E-I
Valve arrangement (front to rear) — RH	I-E-I-E-I-E-I-E
Valve guide bore diameter	7.044-7.015 mm (0.2773-0.2762 in)
Valve stem diameter — intake	6.995-6.975 mm (0.2754-0.2746 in)
Valve stem diameter — exhaust	6.970-6.949 mm (0.2744-0.2736 in)
Valve stem-to-guide clearance — intake	0.069-0.020 mm (0.0027-0.0008 in)
Valve stem-to-guide clearance — exhaust	0.095-0.045 mm (0.0037-0.0018 in)
Valve head diameter — intake	44.63-44.37 mm (1.7571-1.7469 in)
Valve head diameter — exhaust	36.01 mm (1.4177 in)
Valve face runout	0.05 mm (0.0020 in)
Valve face angle	45.75-45.25 degrees
Valve seat width — intake	1.3-1.5 mm (0.0512-0.0591 in)
Valve seat width — exhaust	2.1-1.9 mm (0.0827-0.0748 in)
Valve seat runout (T.I.R.)	0.025 mm (0.0010 in)
Valve seat angle	45.50 degrees
Valve spring free length	53.37 mm (2.10 in)
Valve spring squareness	2.0 degrees
Valve spring compression pressure	720-800 N (161.862-179.847 lb) @ 28.02 mm (1.10 in)
Valve spring installed height	42.9-42.3 mm (1.6890-1.6654 in)
Valve spring installed pressure — valve open	760 N @ 28.80 mm (170.855 lb @ 1.1339 in)
Valve spring installed pressure — valve closed	302 N @ 42.56 mm (67.8923 lb @ 1.6756 in)
Roller follower ratio	1.75:1
Hydraulic Lash Adjuster	
Diameter	16.000-15.988 mm (0.6299-0.6295 in)
Clearance-to-bore	0.018-0.069 mm (0.0007-0.0027 in)
Service limit	0.016 mm (0.0006 in)
Hydraulic leakdown rate	5-25 seconds [a]
Collapsed lash adjuster gap	0.085-0.450 mm (0.0335-0.0177 in)
Camshaft	
Theoretical valve lift @ 0 lash — intake	12.02 mm (0.4732 in)
Theoretical valve lift @ 0 lash — exhaust	12.67 mm (0.4988 in)

Lobe lift — intake	7.1104 mm (0.2799 in)
Lobe lift — exhaust	7.4979 mm (0.2952 in)
Allowable lobe lift loss	0
Journal diameter	26.962-26.936 mm (1.0615-1.0605 in)
Camshaft journal bore inside diameter (cap assembled)	27.012-26.987 mm (1.0635-1.0625 in)
Camshaft journal-to-bearing clearance	0.076-0.025 mm (0.0030-0.0010 in)
Runout [b]	0.03 mm (0.0012 in)
End play	0.0270-0.0190 mm (0.0011-0.0075 in)
Cylinder Block	
Cylinder bore diameter — grade 1	90.200-90.210 mm (3.5512-3.5516 in)
Cylinder bore diameter — grade 2	90.210-90.220 mm (3.5516-3.5520 in)
Cylinder bore diameter — grade 3	90.220-90.230 mm (3.5520-3.5524 in)
Cylinder bore maximum taper	0.006 mm (0.0002 in)
Cylinder bore maximum out-of-round	0.020 mm (0.0008 in)
Main bearing bore inside diameter	72.401-72.422 mm (2.850-2.851 in)
Crankshaft	
Main bearing journal diameter	67.483-67.503 mm (2.6568-2.6576 in)
Main bearing journal maximum taper (straightness)	0.004 mm (0.0002 in)
Main bearing journal maximum out-of-round	0.0075 mm (0.0003 in) between cross sections
Main bearing journal-to-cylinder block clearance	0.048-0.024 mm (0.0019-0.0009 in)
Connecting rod journal diameter	53.003-52.983 mm (2.0867-2.0859 in)
Connecting rod journal maximum taper	0.004 mm (0.0002 in)
Connecting rod journal maximum out-of-round	0.0075 mm (0.0003 in) between cross sections
Crankshaft maximum end play	0.075-0.377 mm (0.0030-0.0148 in)
Piston and Connecting Rod	
Piston diameter — grade 1 (at right angle to pin bore)	90.175-90.165 mm (3.5502-3.5498 in)
Piston diameter — grade 2 (at right angle to pin bore)	90.185-90.175 mm (3.5506-3.5502 in)
Piston diameter — grade 3 (at right angle to pin bore)	90.195-90.185 mm (3.5510-3.5506 in)
Piston-to-cylinder bore clearance (at grade size)	0.025-0.045 mm (0.0010-0.0018 in)
Piston ring end gap — top	0.13-0.28 mm (0.0051-0.0110 in)
Piston ring end gap — intermediate	0.25-0.40 mm (0.0098-0.0158 in)
Piston ring end gap — oil control	0.15-0.65 mm (0.0059-0.0256 in)
Piston ring groove width — top	1.53-1.55 mm (0.0602-0.0610 in)
Piston ring groove width — intermediate	1.52-1.54 mm (0.0598-0.0606 in)
Piston ring groove width — oil control	3.030-3.050 mm (0.1193-0.1201 in)
Piston ring width	1.49-1.46 mm (0.0587-0.0575 in)
Piston ring-to-groove clearance — top	0.030-0.050 mm (0.0012-0.0020 in)
Piston ring-to-groove clearance — intermediate	0.030-0.080 mm (0.0012-0.0031 in)
Piston pin bore diameter	22.008-22.014 mm (0.8665-0.8667 in)

Piston pin diameter	22.0005-22.0030 mm (0.8662-0.8663 in)
Piston pin length	61.8 mm (2.433 in)
Piston pin-to-piston fit (clearance)	0.005-0.0135 mm (0.0002-0.0005 in)
Connecting rod-to-pin clearance	0.009-0.0235 mm (0.0004-0.0093 in)
Connecting rod pin bore diameter	22.012-22.024 mm (0.8666-0.8671 in)
Connecting rod length (centerline bore-to-bore)	169.1 mm (6.6575 in)
Connecting rod maximum allowed bend	± 0.038 mm (0.0015 in)
Connecting rod maximum allowed twist	± 0.05 mm (0.0020 in)
Connecting rod bearing bore diameter (with assembled liners)	53.049-53.027 mm (2.0885-2.0877 in)
Connecting rod bearing-to-crankshaft clearance	0.064-0.026 mm (0.0025-0.0010 in)
Connecting rod side clearance	0.475-0.125 mm (0.0187-0.0049 in)

[a] Time required for the plunger to leak down 1.6 mm of travel with 222 N force and leak-down fluid in the lash adjuster.
[b] Full indicator measurement on all journals when supported on front and rear journals (4 places).

Torque Specifications



Description	Nm	lb-ft	lb-in
Accelerator cable bracket bolts	10	—	89
Brake booster vacuum hose bracket nut (4.6L)	10	—	89
Brake booster vacuum hose bracket bolt (5.4L)	10	—	89
Camshaft bearing cap bolts	10	—	89
Camshaft sprocket bolts [a]	—	—	—
Cylinder head temperature sensor (CHT)	26	19	—
Camshaft position sensor bolt	10	—	89
Crankshaft position sensor bolt	10	—	89
Connecting rod bolts [a]	—	—	—
Crankshaft damper pulley bolt [a]	—	—	—
Crankshaft main bearing bolts (cross-mounted) [a]	—	—	—
Crankshaft main bearing bolts (vertical) [a]	—	—	—

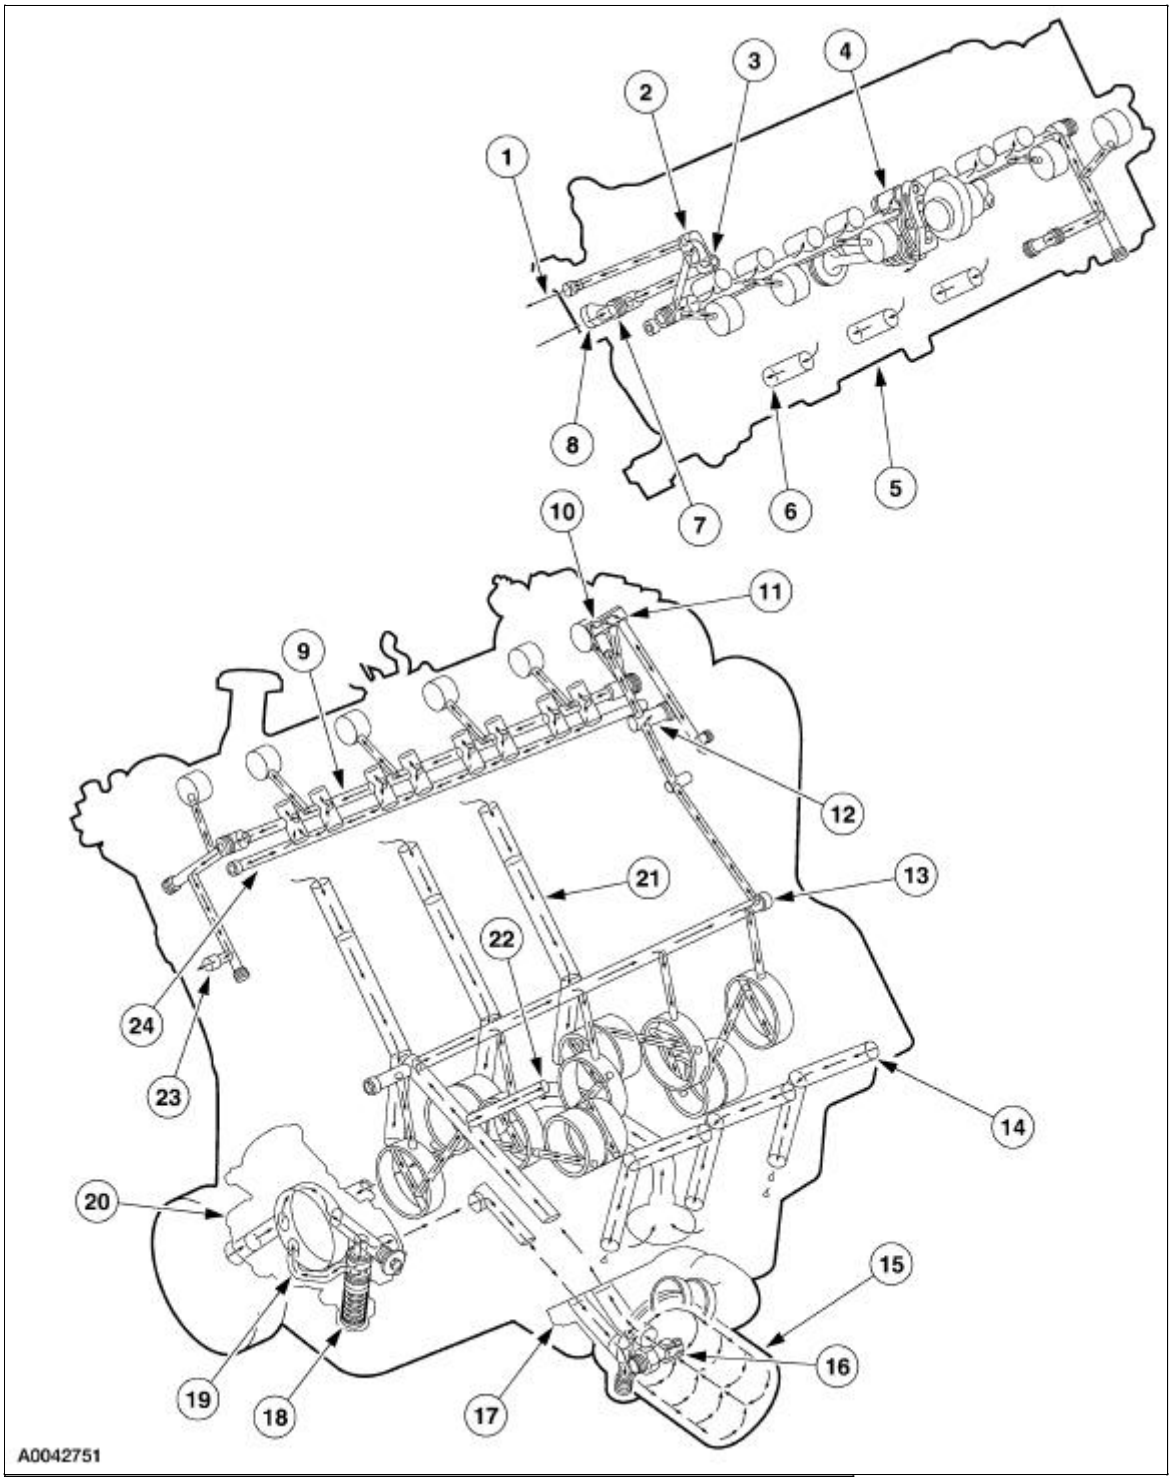
Engine

Item	Description
1	Engine identification label
2	Emission calibration label
3	Vehicle identification label

Engine Component View

The concept of modularity allows engine designs to share commonization between concepts and engine hardware. The four modules are the:

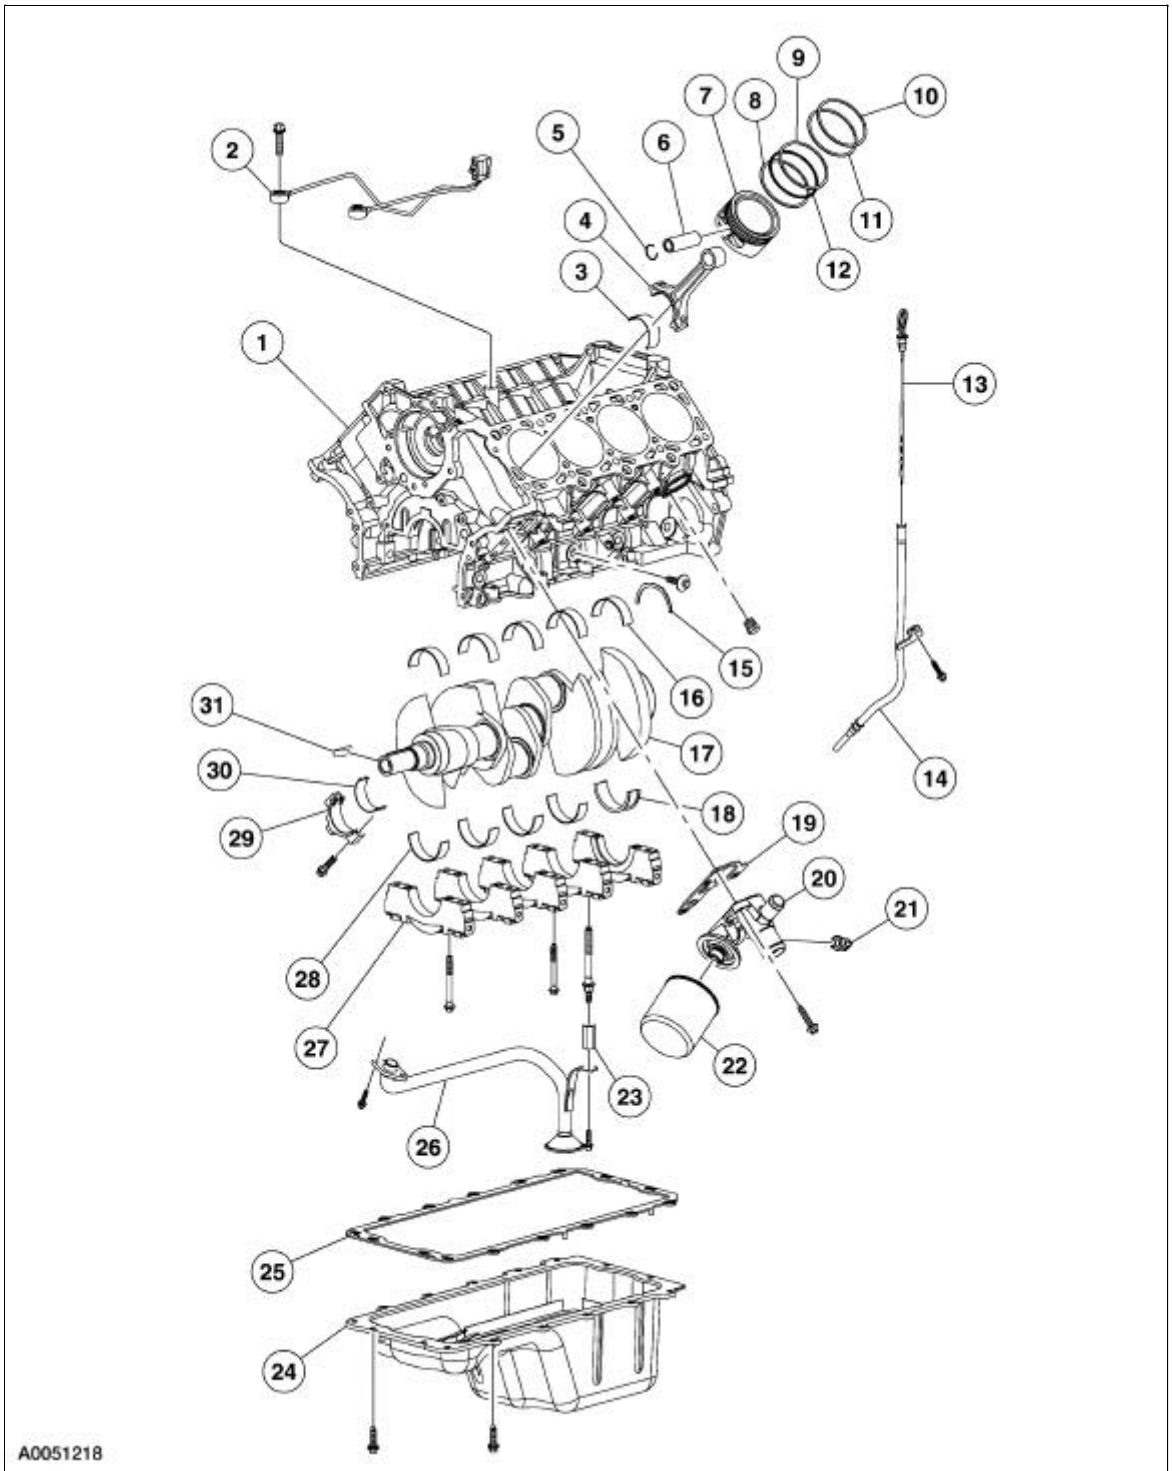


- intake module
- cylinder head module (RH)
- cylinder head module (LH)
- lower engine module

The modular engine concept supports efficiencies during repairs by allowing the removal and installation of these modules. While not all in-vehicle repairs can take advantage of the modular concept, most out-of-vehicle repairs benefit in reduction of time and labor needed to repair the engine.

The basic engine components consist of:

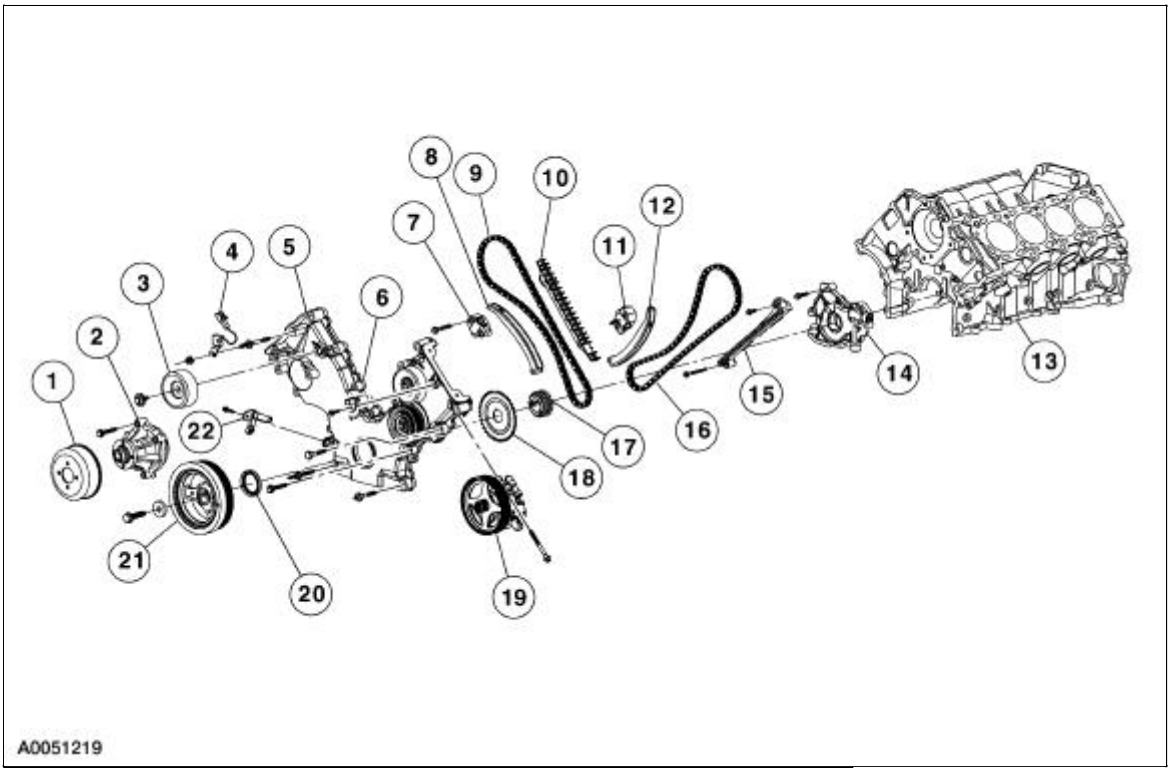
- single overhead camshafts
- two valves per cylinder
- sequential multiport fuel injection (SFI)
- aluminum cylinder heads
- a cast aluminum, 90-degree V-cylinder block (4.6L engines)
- a cast iron, 90-degree V-cylinder block (5.4L engines)
- individual ignition coils for each spark plug
- a two-piece intake manifold system with an aluminum upper and composite-material lower intake manifold with noise insulator (4.6L engines)
- a composite-material intake manifold with noise insulator and aluminum cross-over tube (5.4L engines)
- a large-bore throttle body



Engine Lubrication

Item	Part Number	Description
1	—	To hydraulic chain tensioner
2	—	Head gallery oil reservoir
3	—	Orifice and strainer
4	—	Metered oil travels through tappet and rocker arm and is splashed onto the cam lobe, roller bearings in rocker arm, and valve tip. Valve stem is lubricated by metered leakage past the lip of the stem seal.
5	6049	LH cylinder head
6	—	Oil drain to sump

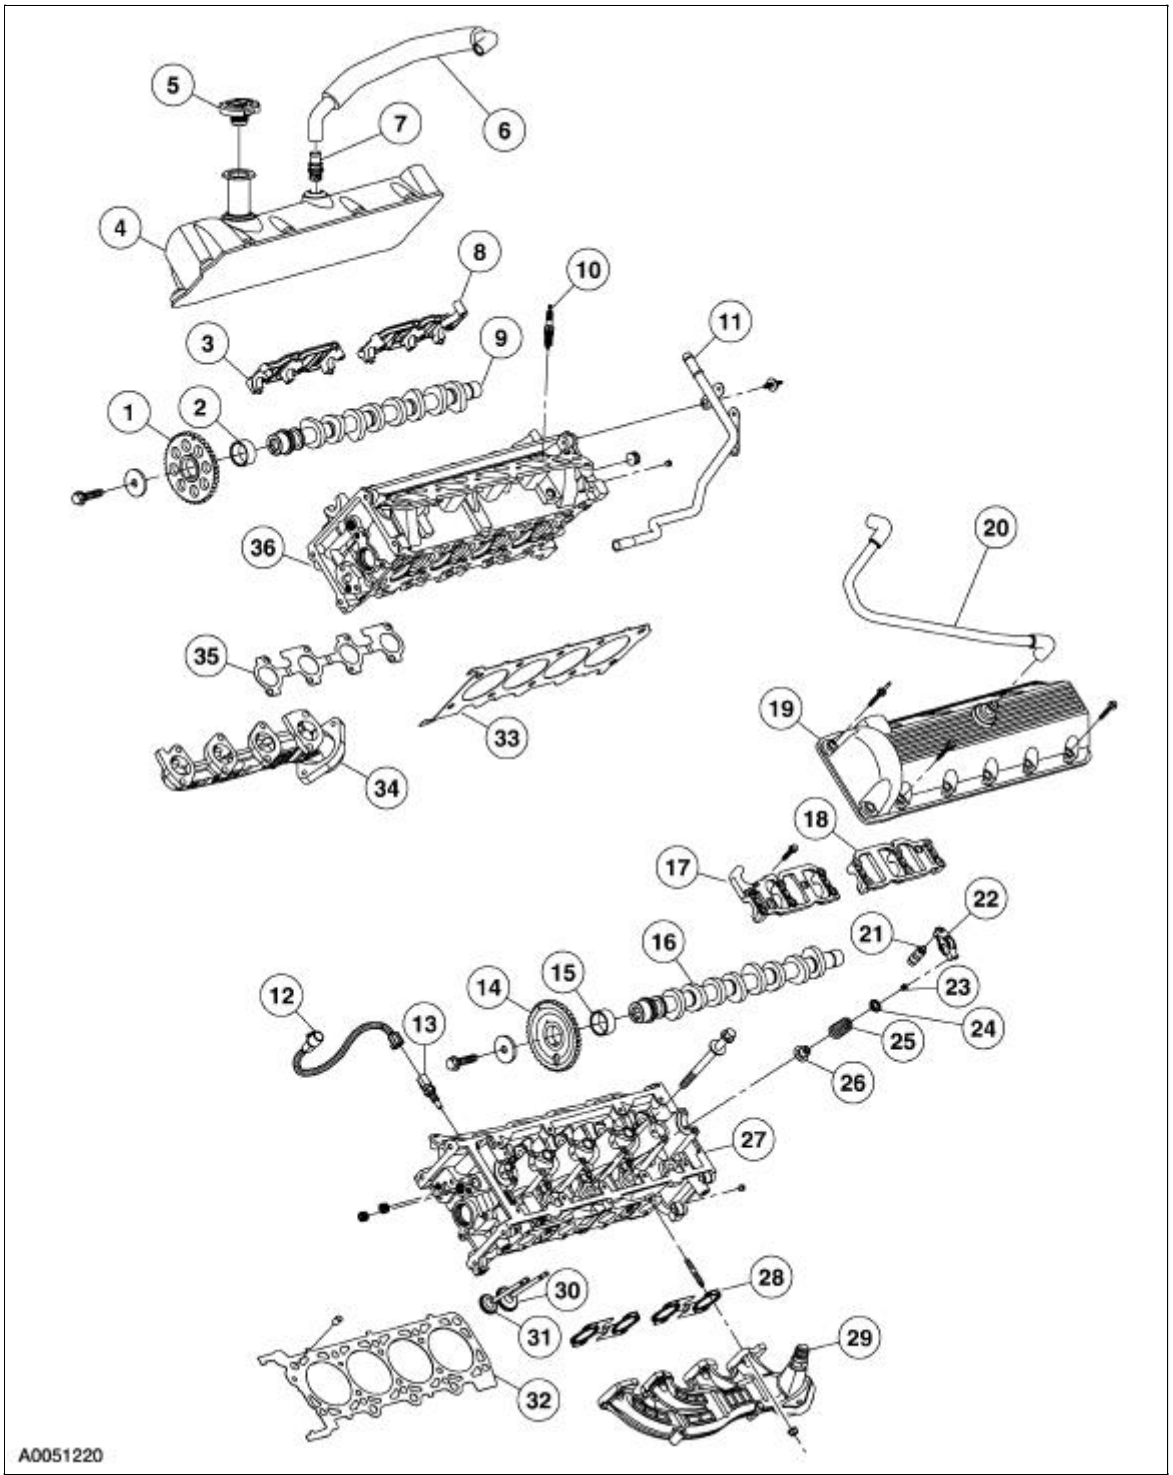
7	—	Plant prelube access
8	—	From the left bank of the cylinder block
9	—	Tappet and cam bearing feed gallery (reduced pressure)
10	—	Orifice and strainer
11	—	Head gallery oil reservoir
12	—	Plant prelube access
13	—	Primary main gallery pressure (not restricted)
14	—	Oil drain to sump
15	6714	Oil bypass filter
16	9278	Oil pressure switch
17	6881	Oil filter adapter
18	Part of 6621	Oil pump integral relief valve
19	—	Bypass
20	6621	Oil pump
21	—	Oil drain to sump
22	—	To LH cylinder head
23	—	To hydraulic chain tensioner. Chain lubrication is metered through the tensioners
24	—	Tappet vent gallery (open to crankcase)



4.6L Romeo Engine — Lower End

Item	Part Number	Description
1	6010	Cylinder block
2	12A699	Knock sensor assembly
3	6211	Connecting rod bearing — upper (8 req'd)
4	—	Connecting rod assembly (8 req'd) (part of 6200)
5	6140	Piston pin retainer (16 req'd)
6	6135	Piston pin (8 req'd)
7	6110	Piston (8 req'd)
8	6159	Oil control ring — outer (8 req'd)

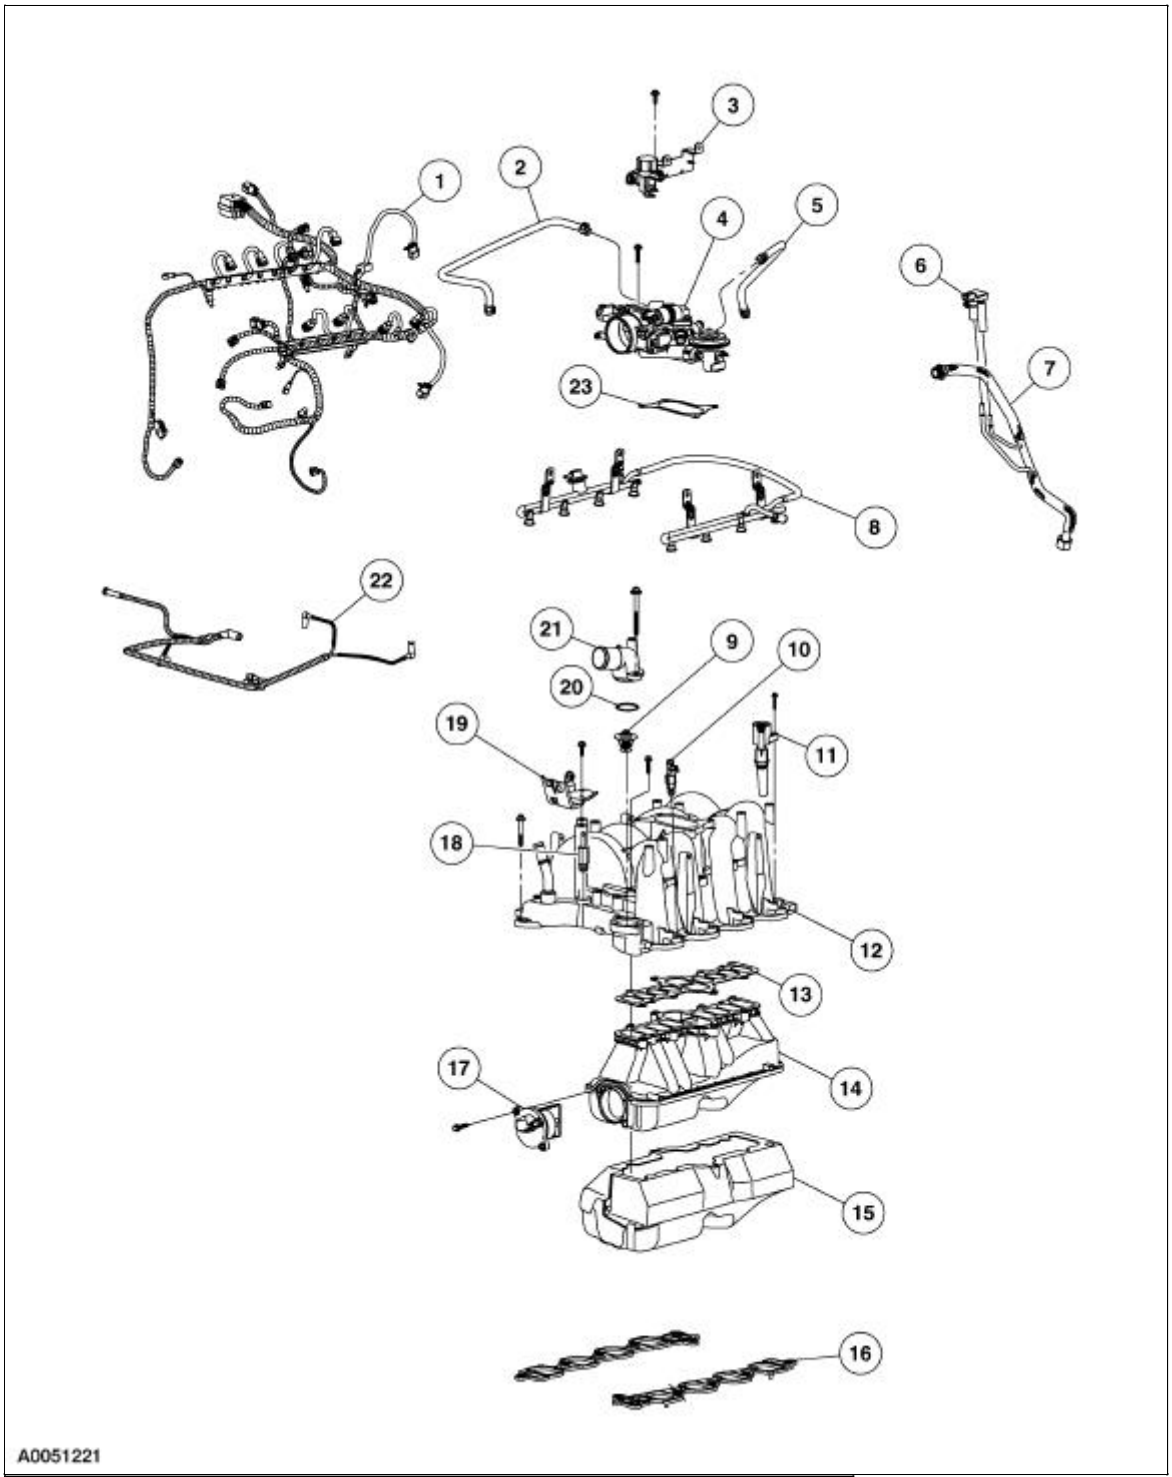
9	6159	Oil control ring — outer (8 req'd)
10	6150	Compression ring — upper (8 req'd)
11	6152	Compression ring — lower (8 req'd)
12	6161	Oil control ring — inner (8 req'd)
13	6750	Oil level indicator
14	6754	Oil level indicator tube
15	6A341	Crankshaft thrust washer
16	6333	Crankshaft main bearing — upper (5 req'd)
17	6303	Crankshaft
18	6A339	Crankshaft thrust bearing — lower
19	6A636	Oil filter adapter gasket
20	6881	Oil filter adapter
21	9278	Oil pressure switch
22	6714	Oil bypass filter
23	N806180	Spacer
24	6675	Oil pan
25	6710	Oil pan gasket
26	6622	Oil pump screen and pickup tube
27	6325	Crankshaft bearing cap (5 req'd)
28	6A338	Crankshaft main bearing — lower (4 req'd)
29	—	Connecting rod cap (8 req'd) (part of 6200)
30	6211	Connecting rod bearing — lower (8 req'd)
31	N806201	Key



4.6L Romeo Engine — Front End

A0051219

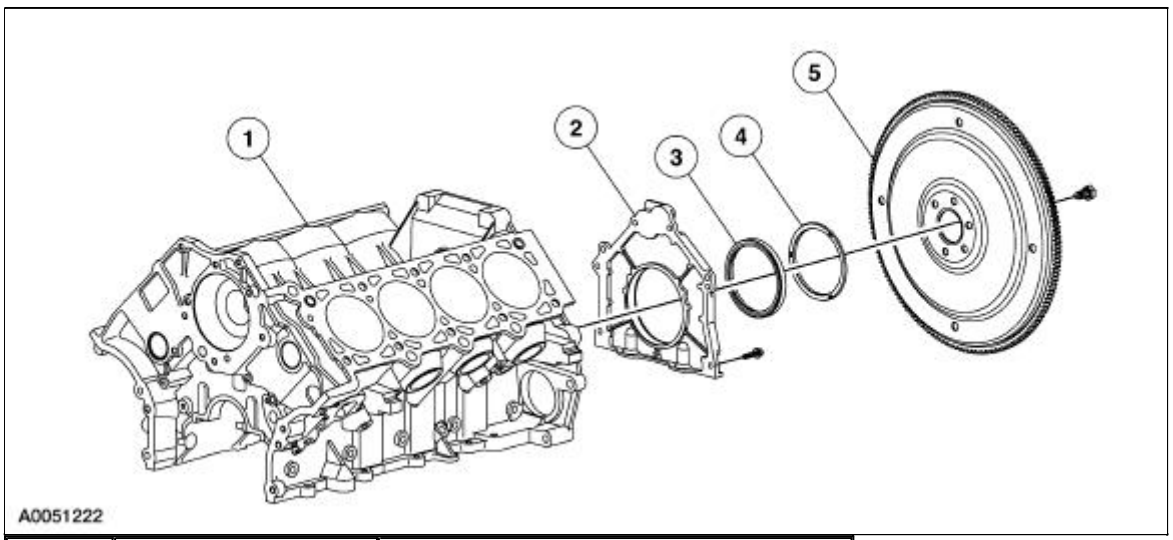
Item	Part Number	Description
1	8A528	Water pump pulley
2	8501	Water pump
3	19A216	Idler pulley
4	18801	Radio ignition interference capacitor (2 req'd)
5	6C086	Engine front cover
6	6B288	Camshaft position sensor
7	6L266	Timing chain tensioner — RH
8	6L253	Timing chain tensioner arm — RH
9	6268	Timing chain — RH
10	6K297	Timing chain guide — RH
11	6L266	Timing chain tensioner — LH
12	6L253	Timing chain tensioner arm — LH
13	6010	Cylinder block
14	6621	Oil pump
15	6K297	Timing chain guide — LH
16	6268	Timing chain — LH
17	6306	Crankshaft sprocket
18	12A227	Ignition pulse wheel
19	3A696	Power steering pump assembly
20	6700	Crankshaft front oil seal
21	6316	Crankshaft pulley
22	6C315	Crankshaft position sensor



4.6L Upper End Components

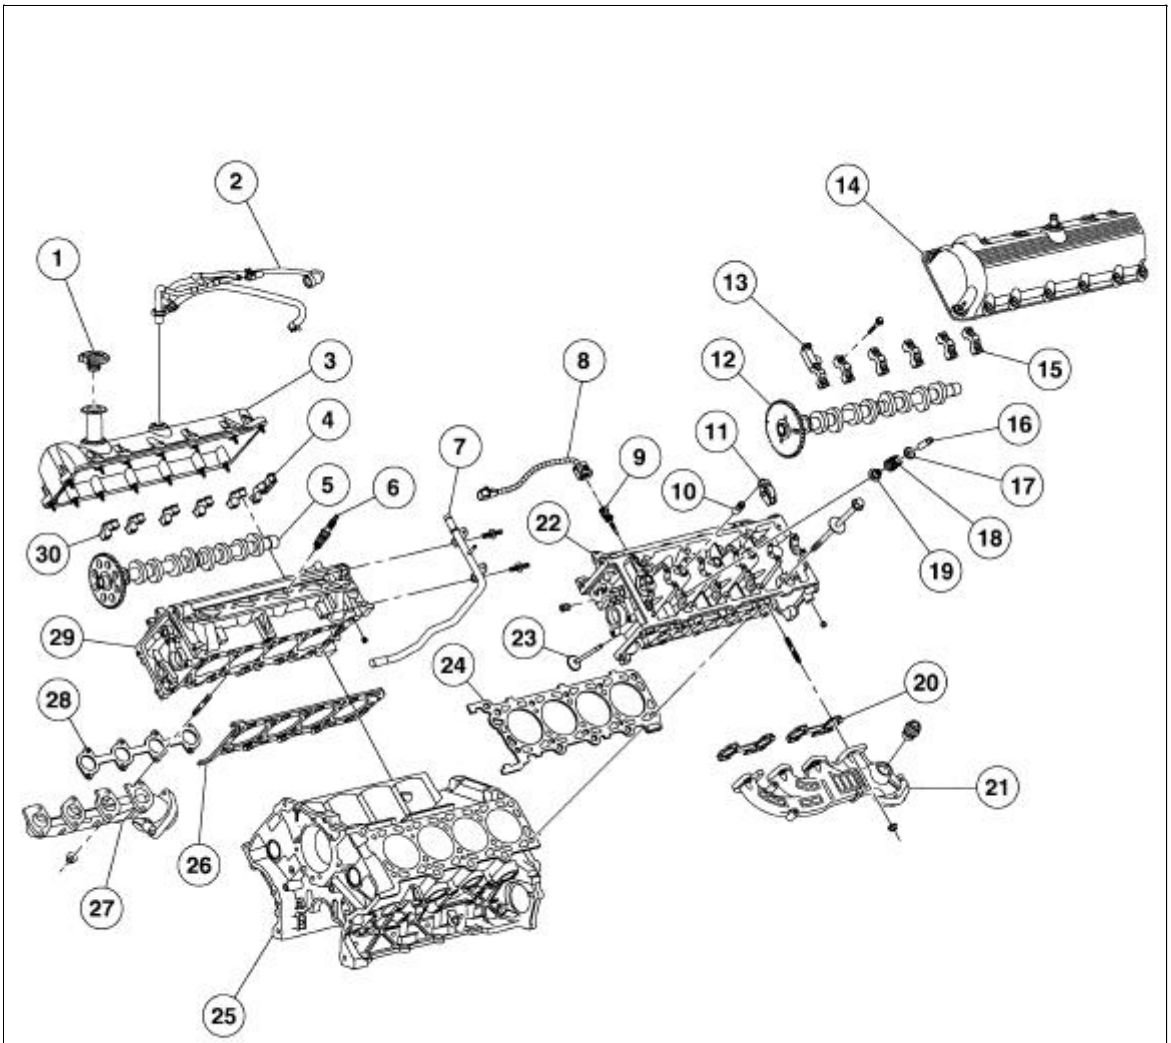
Item	Part Number	Description
1	6256	Camshaft sprocket — RH
2	6265	Spacer
3	6B280	Camshaft bearing cap — RH, front
4	6582	Valve cover — RH
5	6766	Oil filler cap
6	6C324	Crankcase ventilation tube
7	6A666	Positive crankcase ventilation valve
8	6B280	Camshaft bearing cap — RH, rear

9	6250	Camshaft — RH
10	12405	Spark plug (8 req'd)
11	18663	Heater outlet tube
12	14B102	Jumper wire — CHT sensor
13	6G004	Cylinder head temperature sensor
14	6256	Camshaft sprocket — LH
15	6265	Spacer
16	6250	Camshaft — LH
17	6B280	Camshaft bearing cap — LH, front
18	6B280	Camshaft bearing cap — LH, rear
19	6A505	Valve cover — LH
20	6758	Crankcase ventilation tube
21	6C501	Hydraulic lash adjuster (16 req'd)
22	6529	Roller follower (16 req'd)
23	6518	Valve spring retainer key (32 req'd)
24	6514	Valve spring retainer (16 req'd)
25	6513	Valve spring (16 req'd)
26	6A517	Valve stem seal (16 req'd)
27	6050	Cylinder head — LH
28	9Y431	Exhaust manifold gasket — LH (2 req'd)
29	9429	Exhaust manifold — LH
30	6507	Intake valve (8 req'd)
31	6505	Exhaust valve (8 req'd)
32	6083	Cylinder head gasket — LH
33	6051	Cylinder head gasket — RH
34	9430	Exhaust manifold — RH
35	9448	Exhaust manifold gasket — RH
36	6049	Cylinder head — RH



4.6L Engine Induction System Components

Item	Part Number	Description
1	12B637	Engine sensor control wiring harness
2	18465	Heated throttle body hose — inlet
3	9S429	Control and bracket — EGR vacuum
4	6E822	Throttle body and spacer assembly
5	18465	Heated throttle body hose — outlet
6	9J433	Differential pressure feedback EGR system
7	9D477	Exhaust manifold to EGR valve tube
8	9F792	Fuel injection supply manifold

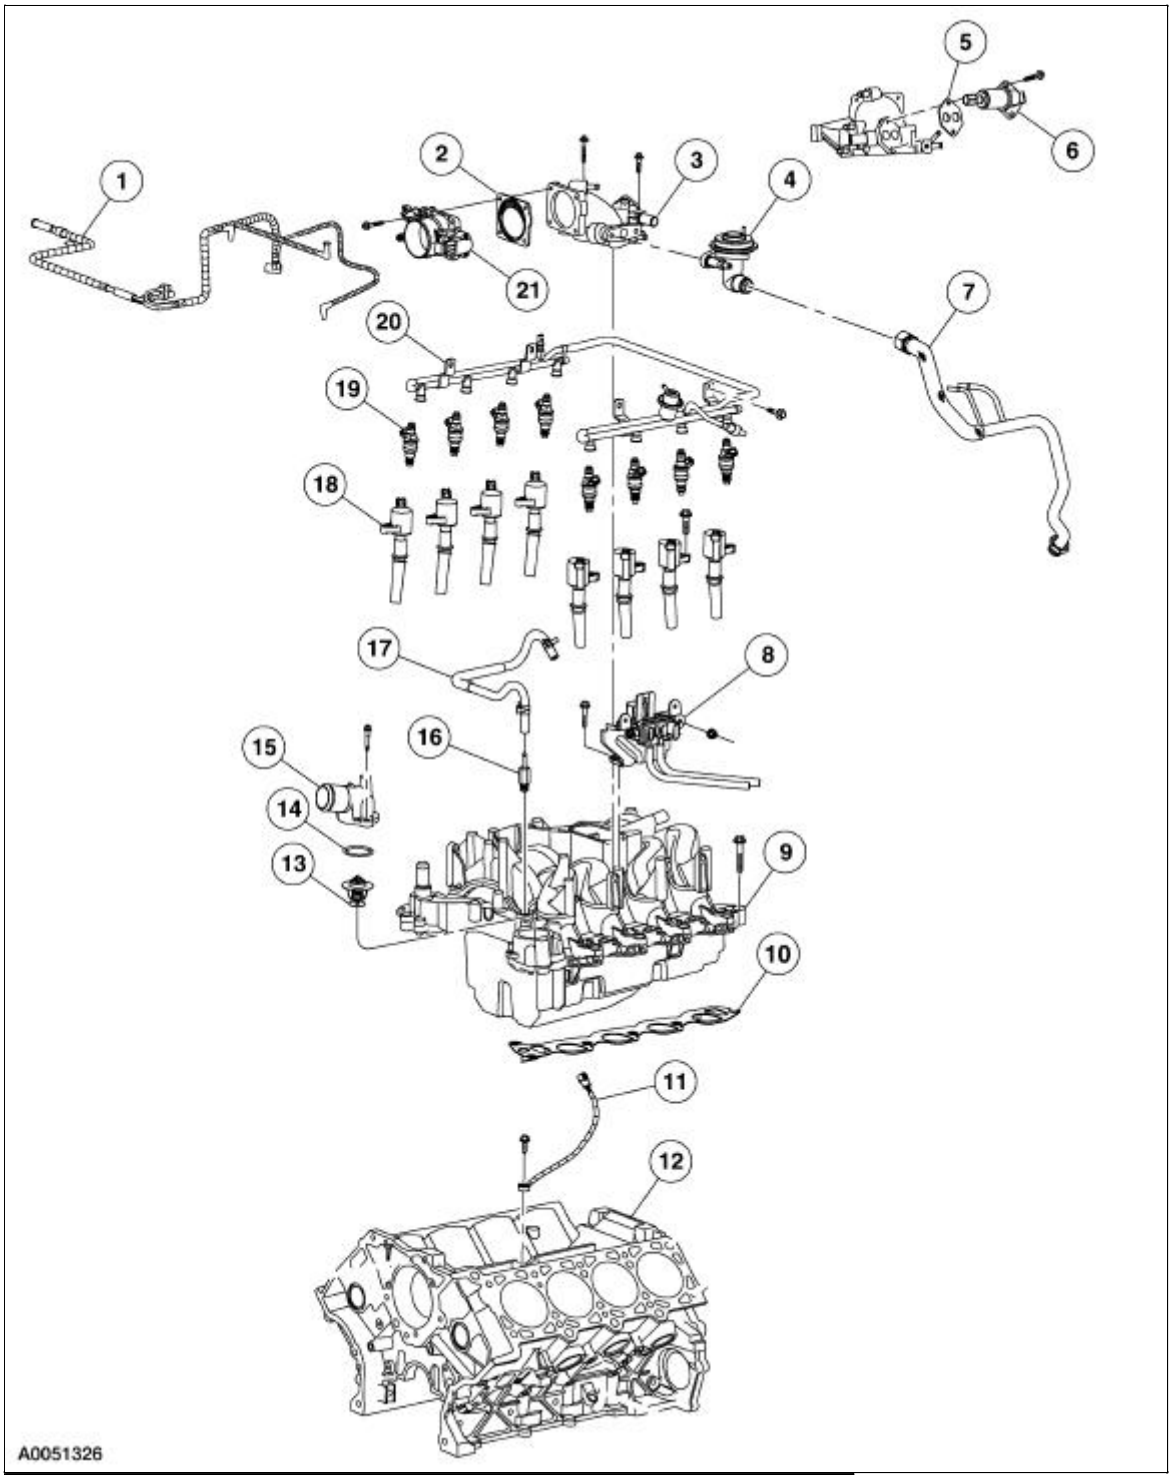


9	8575	Water thermostat
10	9F593	Fuel injector (8 req'd)
11	12A366	Ignition coil (8 req'd)
12	9424	Intake manifold — upper
13	9461	Intake manifold gasket— lower
14	9K461	Intake manifold — lower
15	6N041	Noise shield
16	9439	Intake manifold gasket — upper (2 req'd)
17	9L490	Intake manifold tuning valve
18	8597	Fitting — heated throttle body inlet
19	9728	Accelerator cable bracket
20	N806807	O-ring seal
21	8594	Water outlet housing
22	9E498	Vacuum harness
23	9L437	Throttle body adapter gasket

4.6L Engine Rear End Components

Item	Part Number	Description
1	6010	Cylinder block
2	6K318	Rear main seal retainer
3	6701	Rear main oil seal
4	6310	Rear main seal oil slinger
5	6375	Flexplate

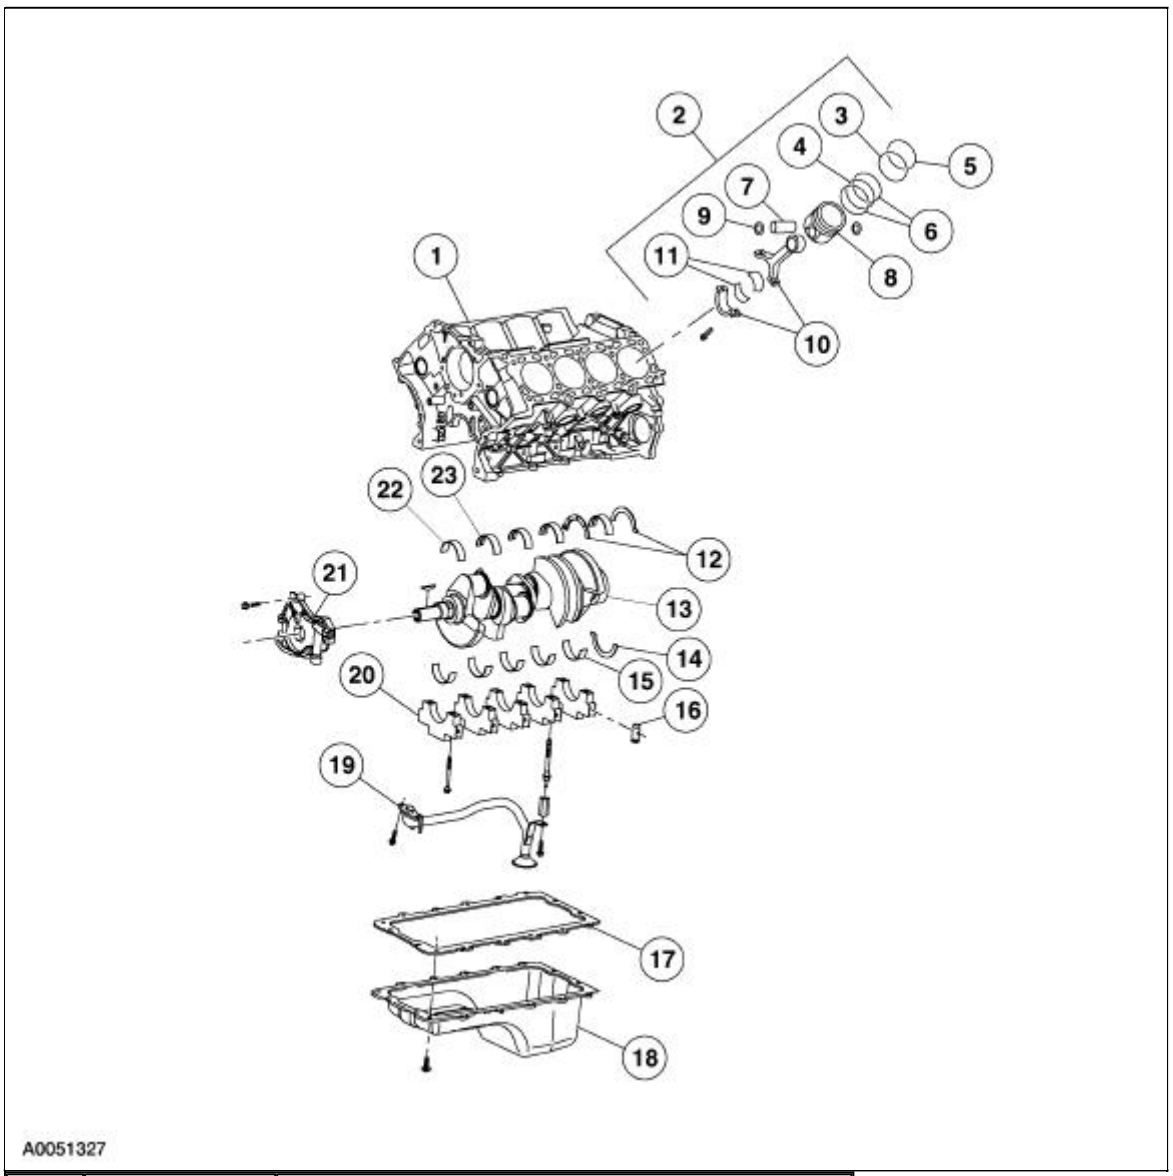
5.4L Engine — Upper End



A0051325

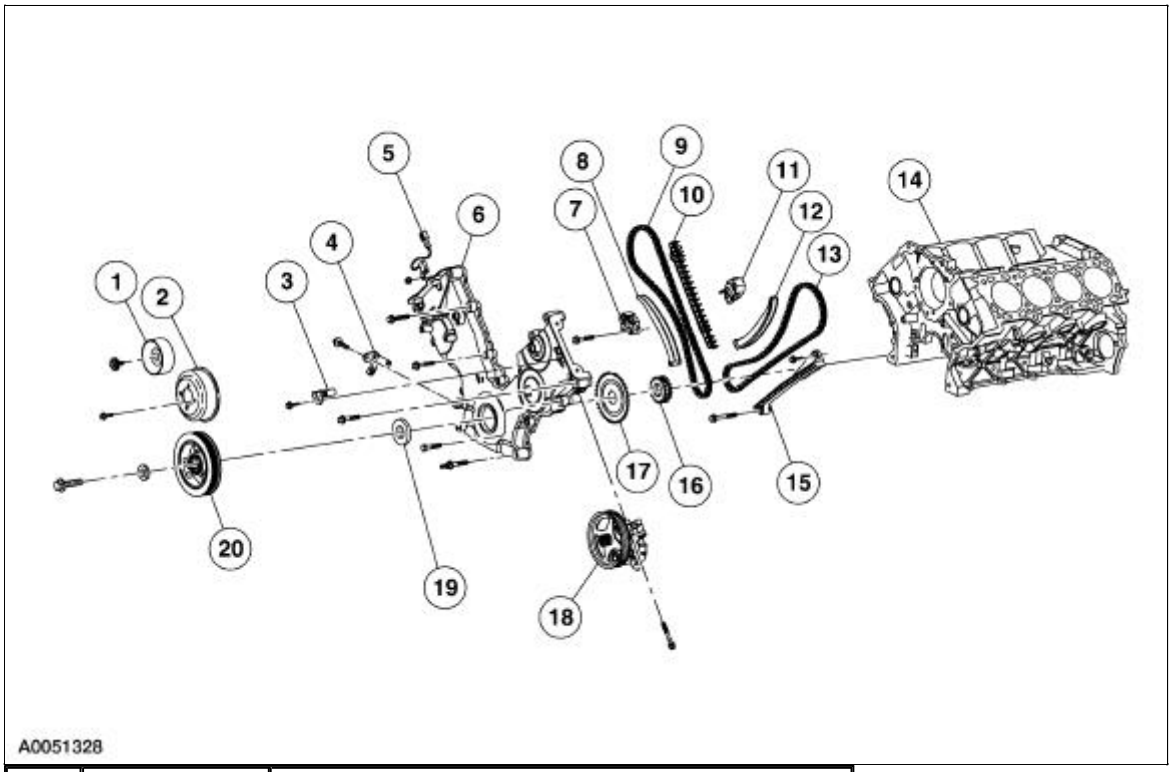
Item	Part Number	Description
1	6766	Oil filler cap
2	6C324	Crankcase ventilation hose — with valve
3	6582	Valve cover — RH
4	6B284	Camshaft bearing cap
5	6251	Camshaft — RH
6	12405	Spark plug (8 req'd)
7	18663	Heater outlet tube
8	14B102	Cylinder head temperature sensor jumper harness
9	6G004	Cylinder head temperature sensor
10	6C501	Hydraulic lash adjuster (16 req'd)
11	6529	Roller follower (16 req'd)
12	6C255	Camshaft — LH
13	6B284	Camshaft bearing cap
14	6A505	Valve cover — LH

15	6B280	Camshaft bearing cap (5 req'd)
16	5618	Valve spring retainer key (32 req'd)
17	6514	Valve spring retainer (16 req'd)
18	6513	Valve spring (16 req'd)
19	6A517	Valve stem seal (16 req'd)
20	9Y431	Exhaust manifold gasket (2 req'd)
21	9431	Exhaust manifold — LH
22	6050	Cylinder head — LH
23	6505	Exhaust valve (8 req'd)
23	6507	Intake valve (8 req'd)
24	6083	Cylinder head gasket — LH
25	6010	Cylinder block
26	6051	Cylinder head gasket — RH
27	9430	Exhaust manifold — RH
28	9448	Exhaust manifold gasket — RH
29	6049	Cylinder head — RH
30	6B280	Camshaft bearing cap (5 req'd)



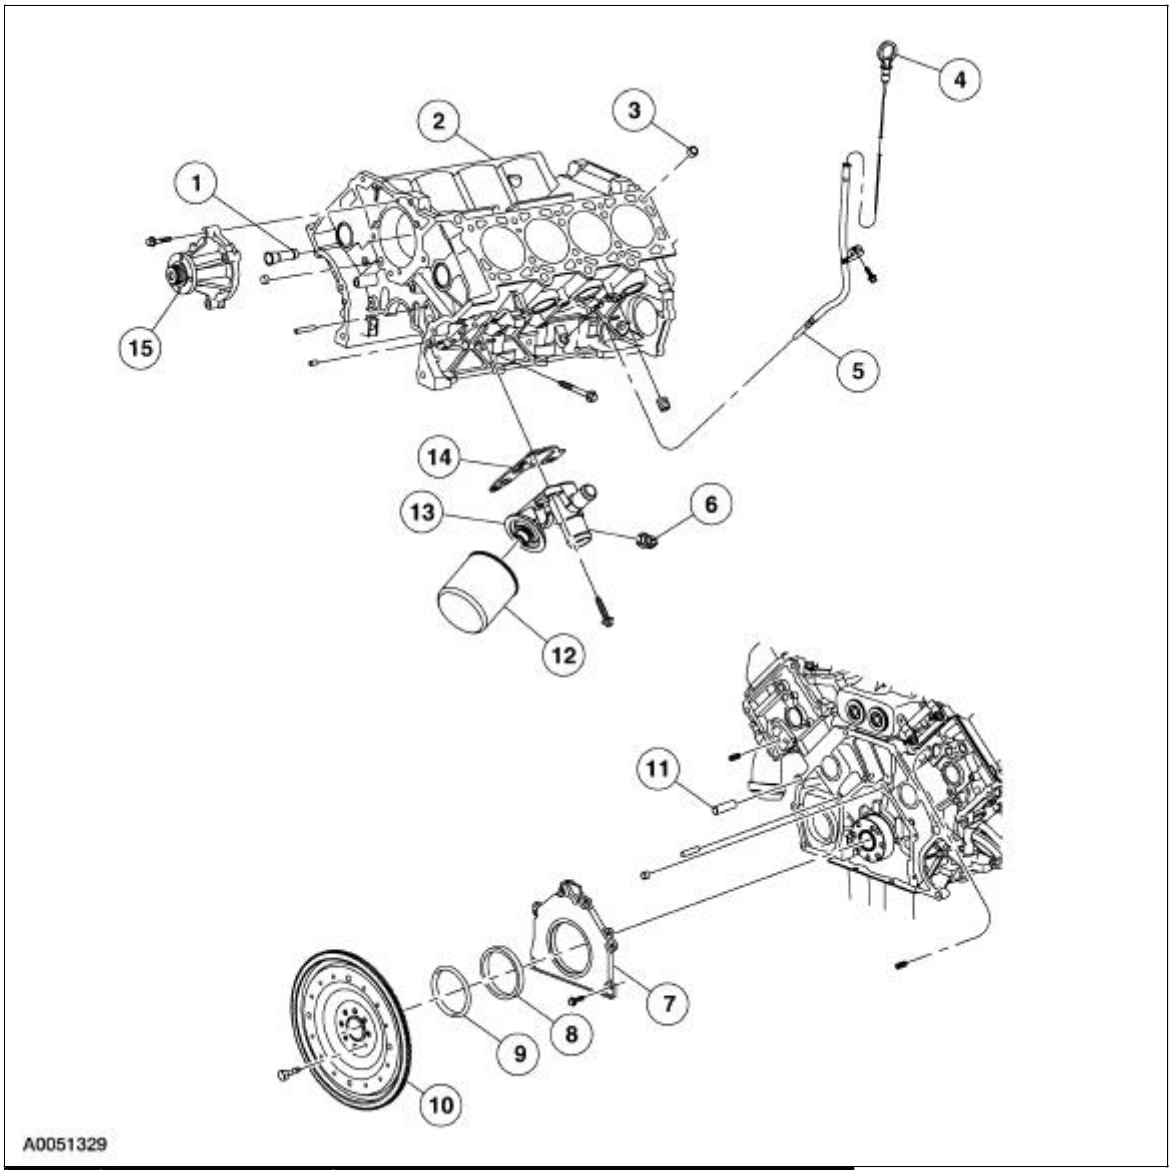
5.4L Engine Induction System

Item	Part Number	Description
1	9E498	Vacuum harness
2	9E936	Throttle body gasket
3	9A589	Throttle body adapter
4	9D460	EGR valve
5	9F670	Idle air control valve gasket
6	9F715	Idle air control valve
7	9D477	Exhaust manifold to EGR valve tube
8	9J472	Differential pressure feedback EGR system



9	9424	Intake manifold
10	9439	Intake manifold gasket (2 req'd)
11	12A699	Knock sensor
12	6010	Cylinder block
13	8575	Water thermostat
14	N806807	O-ring seal
15	8594	Water outlet
16	8597	Fitting — heated throttle body inlet
17	18465	Heated throttle body hose — inlet
18	12A366	Ignition coil (8 req'd)
19	9F593	Fuel injector (8 req'd)
20	9F792	Fuel injection supply manifold
21	9E926	Throttle body

5.4L Engine — Lower End



Item	Part Number	Description
1	6010	Cylinder block
2	6100	Piston and rod assembly (8 req'd)
3	6152	Lower compression ring (8 req'd)
4	6161	Inner oil control ring (8 req'd)
5	6150	Upper compression ring (8 req'd)
6	6159	Outer oil control ring (16 req'd)
7	6135	Piston pin (8 req'd)
8	6110	Piston (8 req'd)
9	6140	Piston pin retainer (16 req'd)
10	6200	Connecting rod assembly (8 req'd)
11	6211	Connecting rod bearing (16 req'd)
12	6A341	Crankshaft thrust washer — upper (2 req'd)
13	6303	Crankshaft
14	6K302	Crankshaft thrust washer — lower
15	6A338	Crankshaft bearing — lower (5 req'd)
16	6A346	Dowel (10 req'd)
17	6710	Oil pan gasket
18	6675	Oil pan
19	6622	Oil pump screen and pickup tube
20	6325	Crankshaft main bearing cap (5 req'd)
21	6621	Oil pump
22	6W337	Front crankshaft bearing — upper
23	6333	Crankshaft bearing — upper (4 req'd)

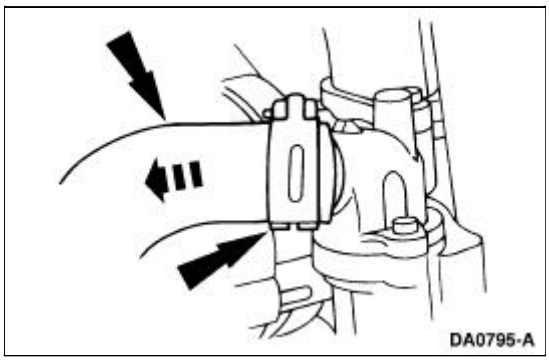
5.4L Engine — Front End

Item	Part Number	Description
1	19A216	Idler pulley (2 req'd)
2	8A528	Water pump pulley
3	6B288	Camshaft position sensor
4	6C315	Crankshaft position sensor
5	18801	Radio ignition interference capacitor (2 req'd)
6	6C086	Engine front cover
7	6L266	Timing chain tensioner — RH
8	6K255	Timing chain tensioner arm — RH
9	6268	Timing chain — RH
10	6M256	Timing chain guide — RH
11	6M269	Timing chain tensioner — LH
12	6M274	Timing chain tensioner arm — LH
13	6268	Timing chain — LH
14	6010	Cylinder block
15	6B274	Timing chain guide — LH
16	6306	Crankshaft sprocket
17	12A227	Ignition pulse wheel
18	3A696	Power steering pump
19	6700	Front crankshaft oil seal
20	6316	Crankshaft pulley

5.4L Engine — Exterior Components

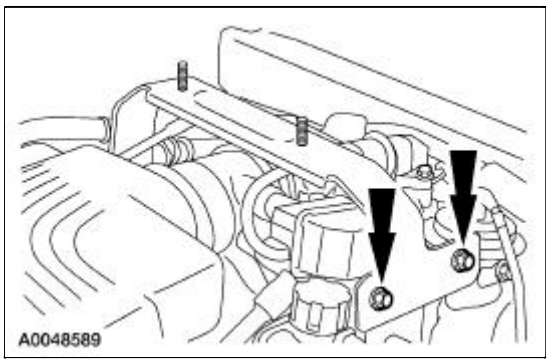
Item	Part Number	Description
1	18B402	Heater water inlet connector
2	6010	Cylinder block
3	W704688	Hollow dowel (4 req'd)
4	6750	Oil level indicator
5	6K873	Oil level indicator tube
6	9278	Oil pressure switch
7	6K318	Rear main oil seal retainer plate
8	6701	Rear main oil seal
9	6310	Oil slinger
10	6375	Flexplate
11	N807198	Hollow dowel (2 req'd)
12	6714	Oil bypass filter
13	6K623	Oil filter adapter
14	6A636	Oil filter adapter gasket
15	8501	Water pump

Engine



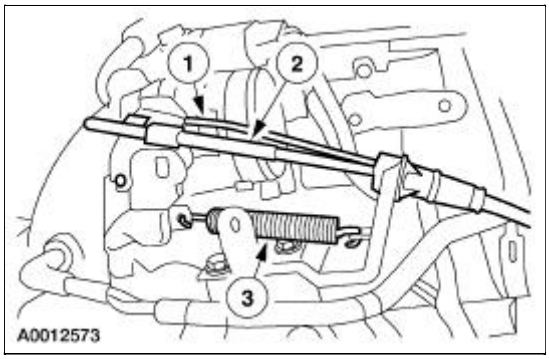
For basic engine mechanical concerns, refer to Section 303-00 . For driveability concerns, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Intake Manifold —4.6L

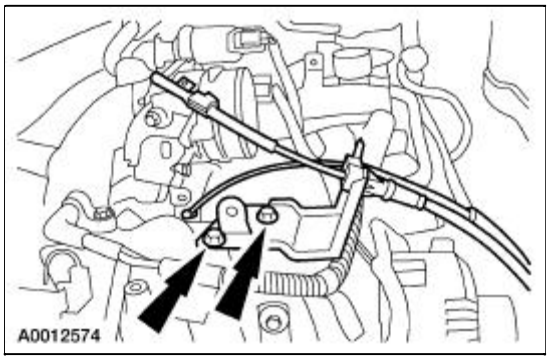


Removal

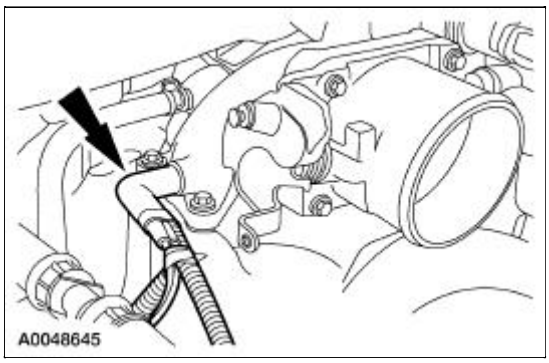
WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.



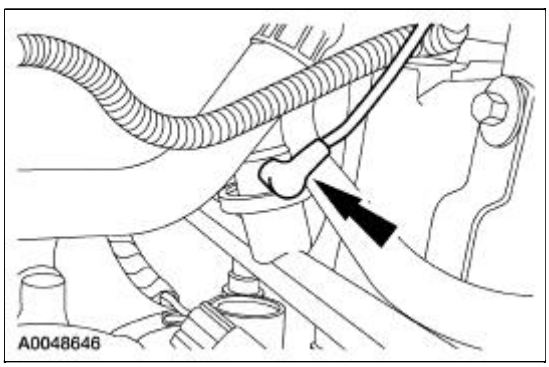
1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
3. Drain the engine cooling system. For additional information, refer to Section 303-03 .
4. Compress the hose clamp and disconnect the upper radiator hose.



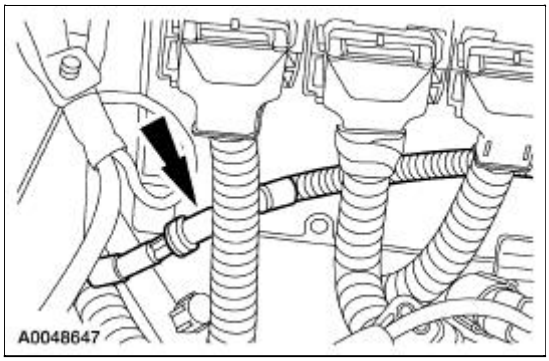
5. Remove the three bolts and the appearance cover mounting bracket.



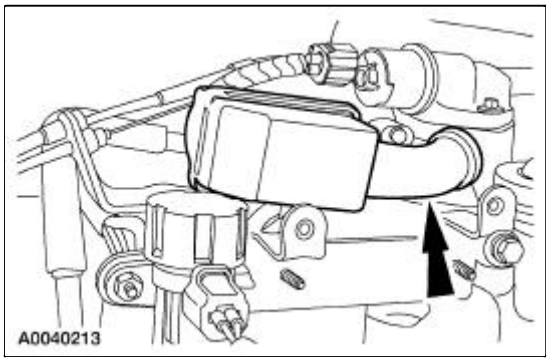
6. Disconnect the throttle body cam.
    1. Disconnect the accelerator cable.
    2. Disconnect the speed control actuator cable.
    3. Remove the accelerator return spring.



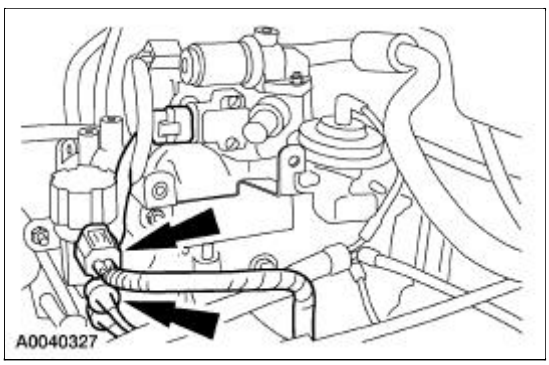
7. Remove the accelerator cable bracket bolts and position the bracket and cables aside.



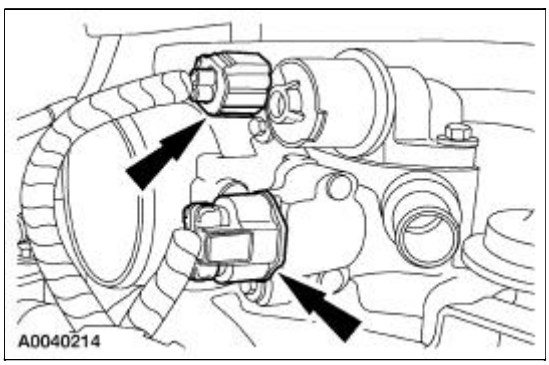
8. Disconnect the main vacuum harness.



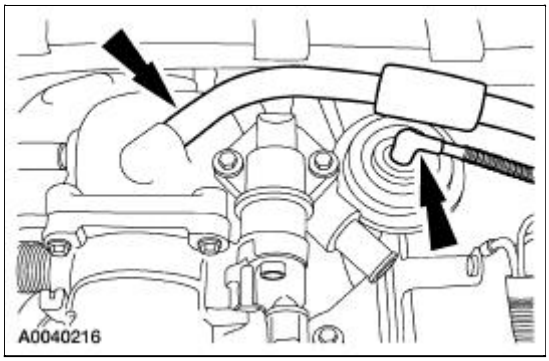
9. Disconnect the fuel pressure regulator vacuum hose.



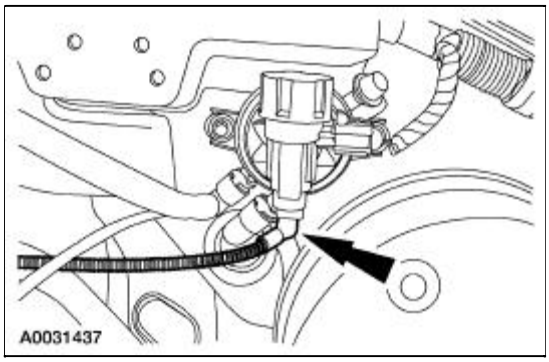
10. Disconnect the climate control vacuum hose.



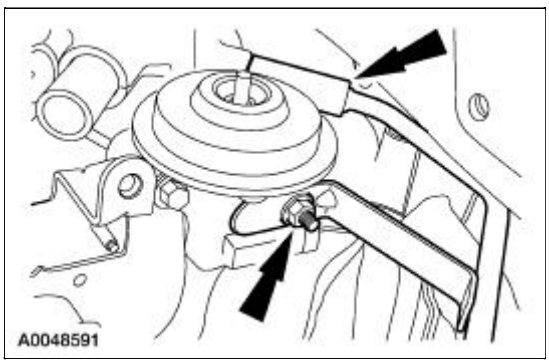
11. Remove the idle air control (IAC) fresh air hose.



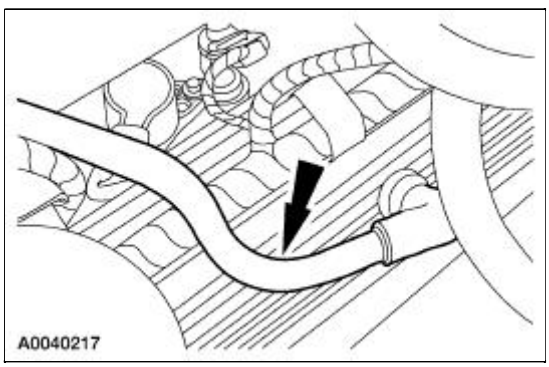
12. Disconnect the exhaust gas recirculation (EGR) vacuum regulator solenoid connections.



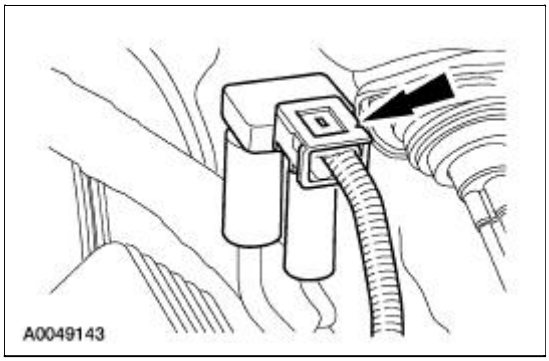
13. Disconnect the IAC and throttle position (TP) sensor electrical connectors.



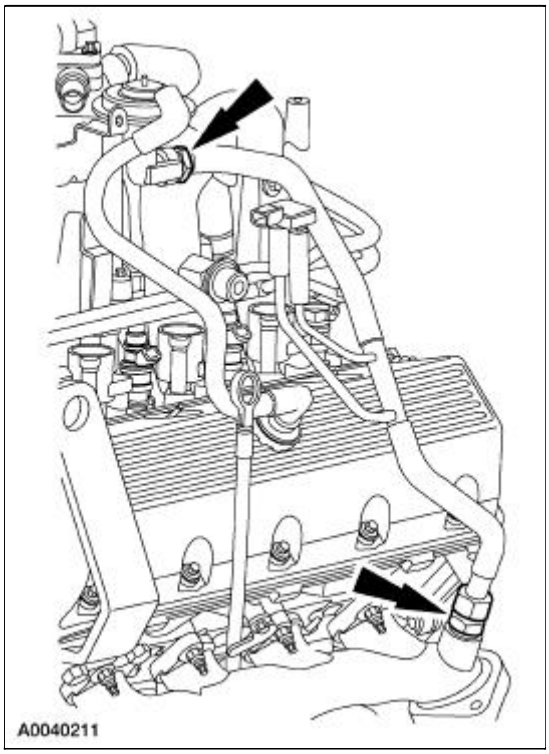
14. Disconnect the EGR valve vacuum hose and the evaporative emission canister purge valve hose and position them aside.



15. Disconnect the evaporative emission canister purge valve vacuum hose and remove the vacuum harness.

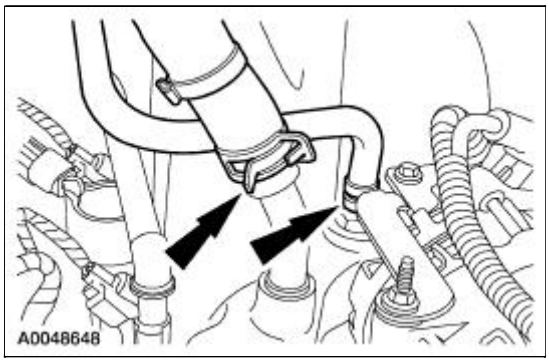


16. Remove the nut and disconnect the brake booster vacuum tube. Position the bracket and tube aside.

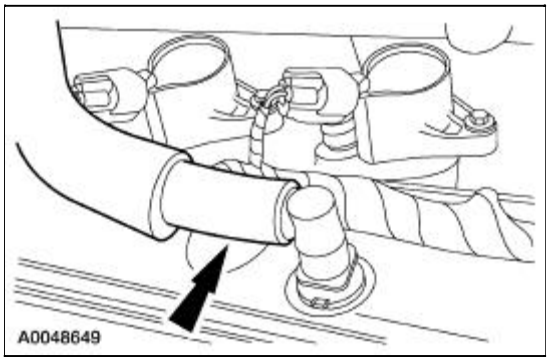


17. Position the crankcase ventilation hose aside.

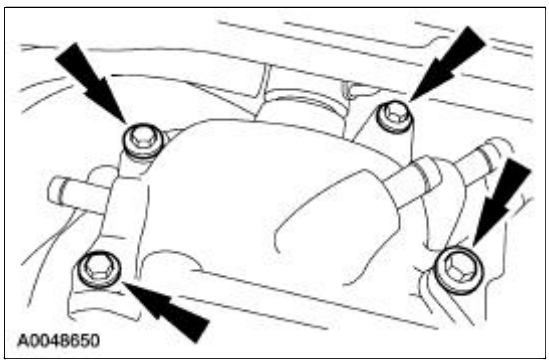
18. Disconnect the differential pressure feedback EGR system electrical connector.



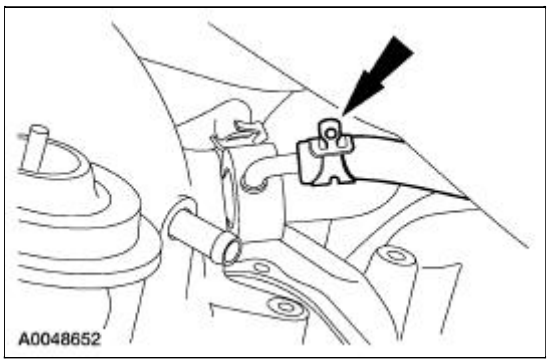
19. Position the exhaust manifold to EGR valve tube aside.
    - Disconnect the upper fitting.
    - Loosen the lower fitting.
    - Position the tube aside.



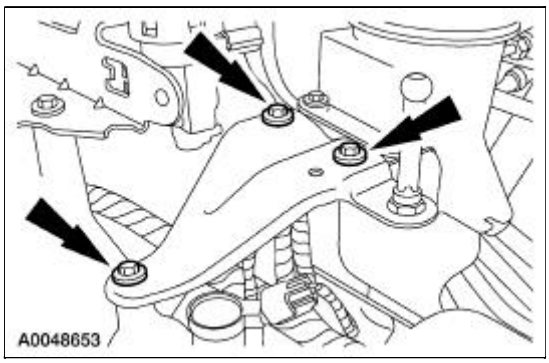
20. Disconnect the fuel hose spring lock coupling. For additional information, refer to Section 310-00 .



21. Disconnect the heater hose and the heated throttle body hose.

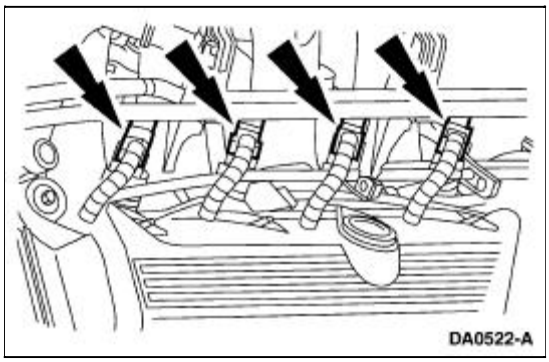


22. Disconnect the positive crankcase ventilation (PCV) hose.

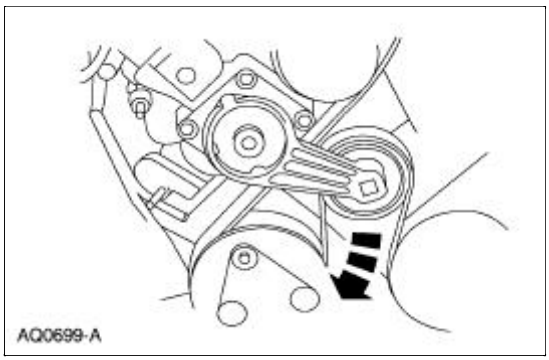


23. Remove the four bolts and move the throttle body adapter forward slightly.

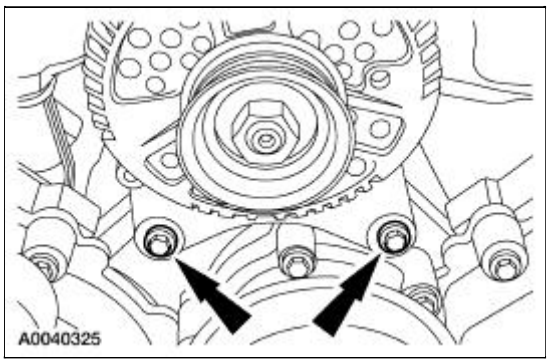
24. Disconnect the heated throttle body hose and remove the throttle body adapter.
    - Discard the throttle body adapter-to-intake manifold gasket.
    - Inspect the throttle body and adapter for damage.



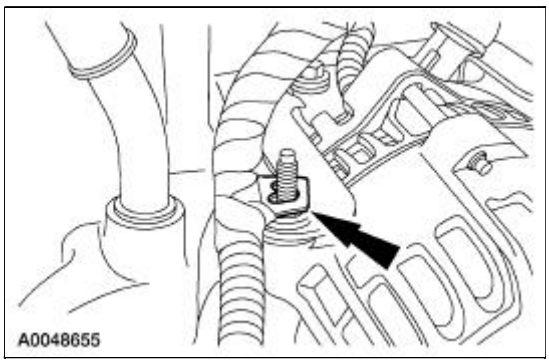
25. Remove the power steering reservoir upper mounting bracket.



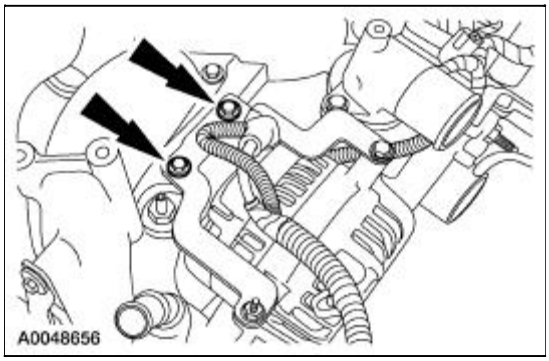
26. Disconnect and remove the eight ignition coils. For additional information, refer to Section 303-07A .



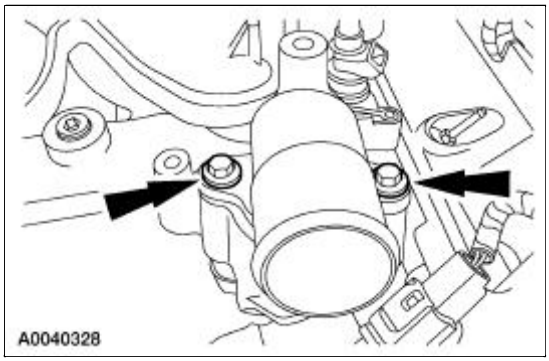
27. Disconnect the eight fuel injectors.



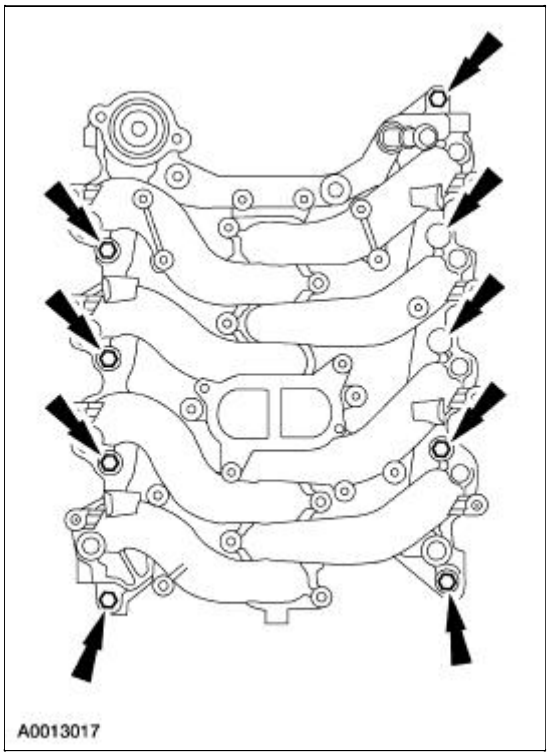
28. Rotate the belt tensioner clockwise and detach the drive belt from the generator pulley.



29. Loosen the generator lower mounting bolts.

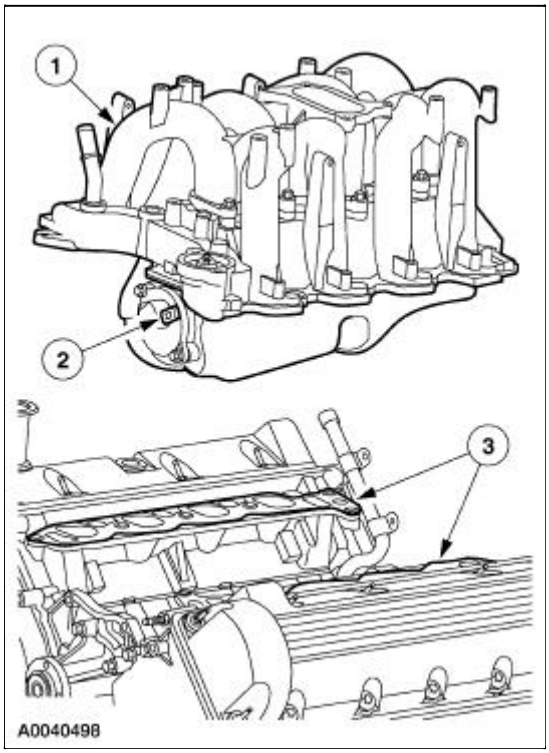


30. Disconnect the harness routing clip.



31. Remove the bolts and position the generator aside.

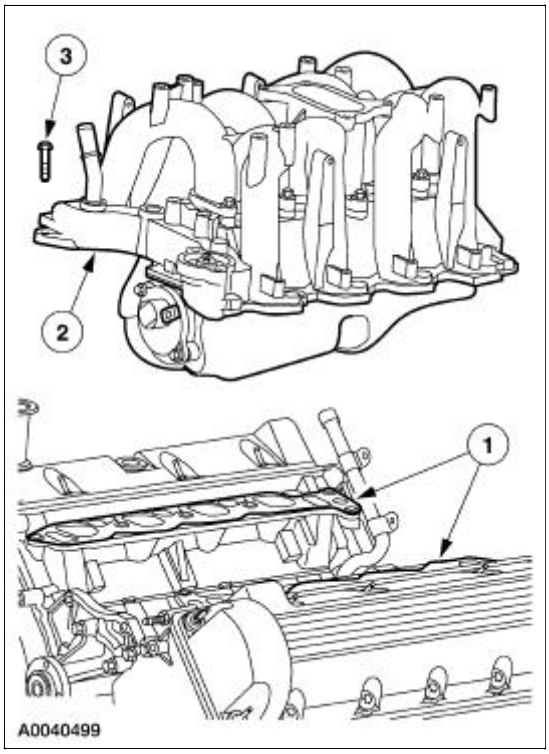
32. Remove the bolts, water thermostat housing and thermostat.
    - Discard the O-ring seal.



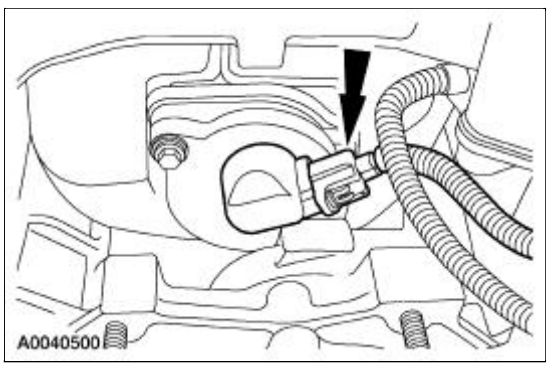
33. Remove the nine bolts.

34. Remove the intake manifold assembly.
    1. Lift the intake manifold.
    2. Disconnect the intake manifold tuning valve connector.

3. Remove the intake manifold and discard the gaskets.
   - Inspect the intake manifold assembly for damage.

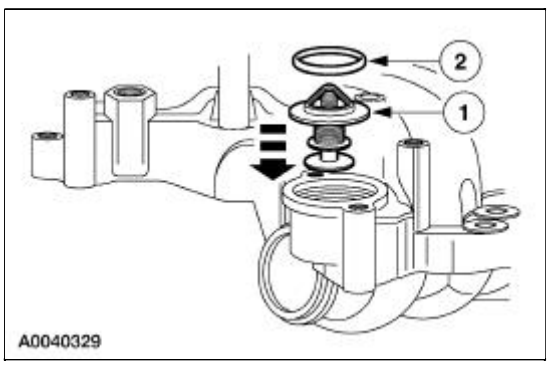


Installation



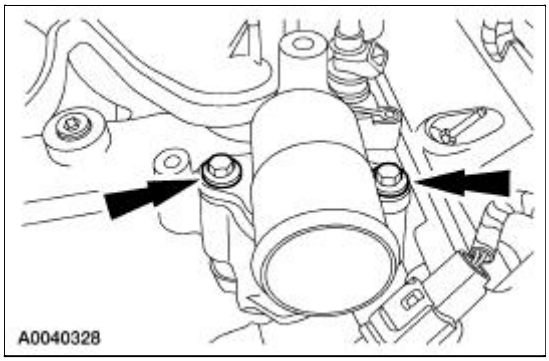
1. **CAUTION: Do not use metal scrapers, power abrasive discs or any abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraper only.**

   Clean all the sealing surfaces.

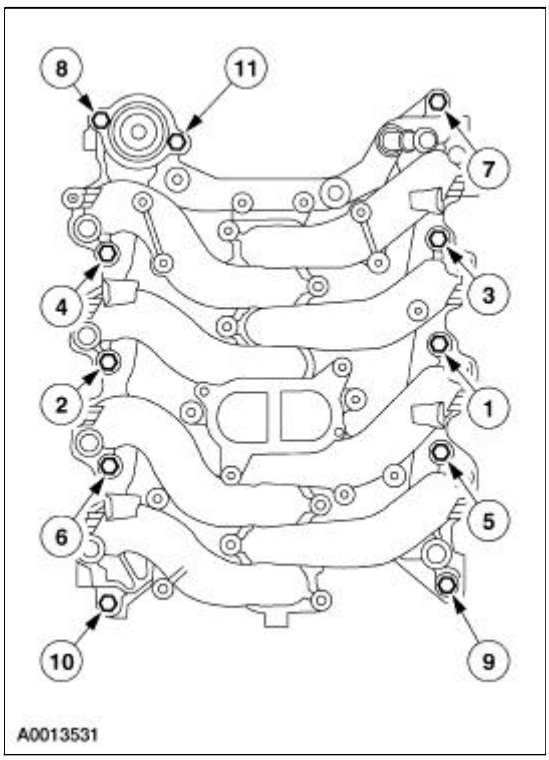


2. Install the upper intake manifold.
   1. Position the new intake manifold gaskets.
   2. Position the upper intake manifold.
   3. Loosely install nine bolts.

3. Connect the intake manifold tuning valve electrical connector.

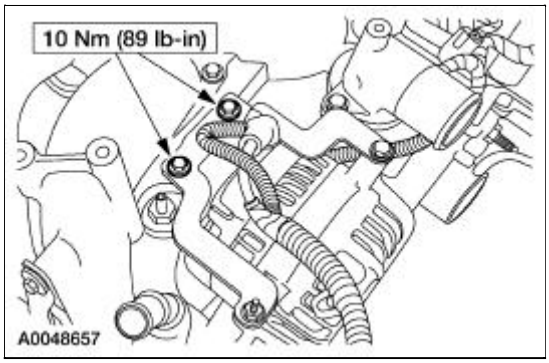


4. Install the water thermostat.
    1. Install the thermostat.
    2. Install a new O-ring seal.

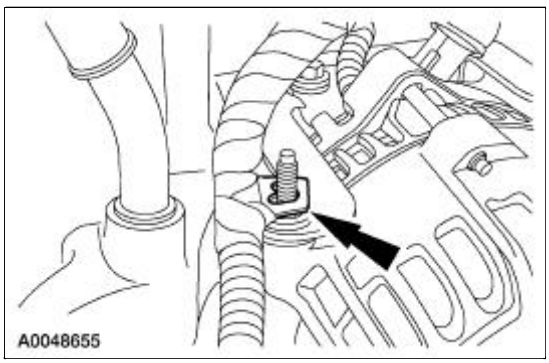


5. **NOTE:** The thermostat housing bolts are tightened in sequence with the intake manifold bolts.

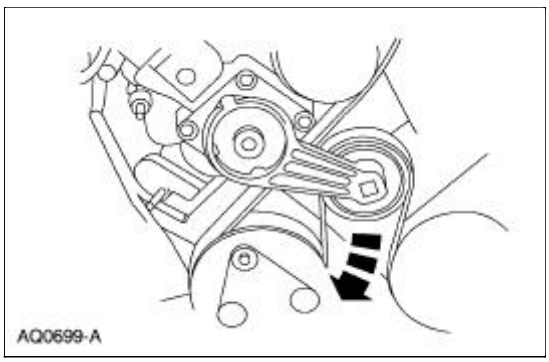
    Install the thermostat housing and loosely install the bolts.



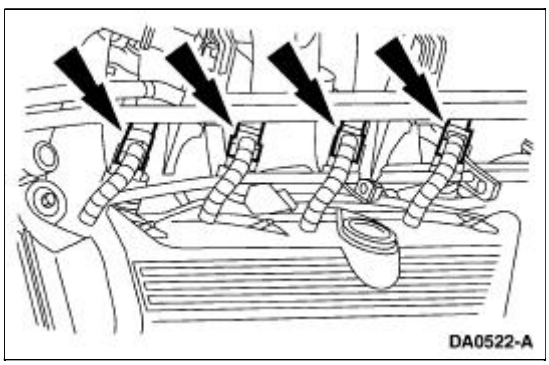
6. Tighten the 11 bolts in two stages in the sequence shown.
    - Stage 1: tighten to 2 Nm (18 lb-in).
    - Stage 2: tighten to 25Nm (18 lb-ft).



7. Position the generator and tighten the lower mounting bolts.

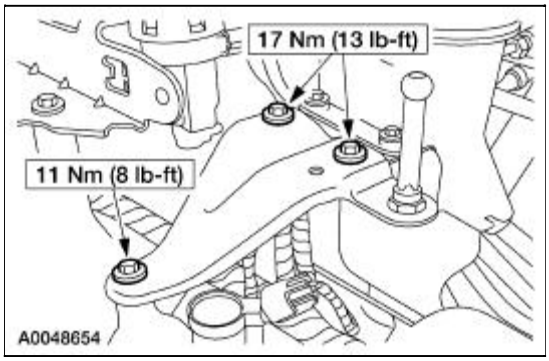


8. Install the generator upper mounting bracket bolts.

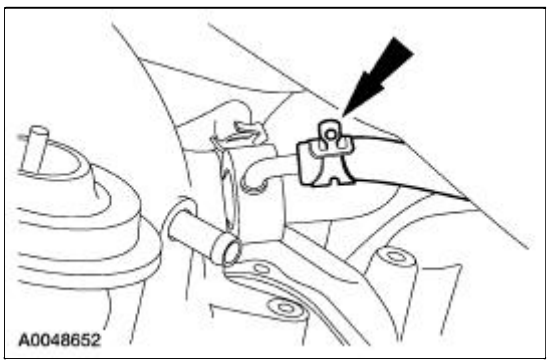


9. Install the harness routing clip.

10. Rotate the belt tensioner clockwise and install the drive belt. Refer to the decal on the radiator upper air deflector for belt routing.

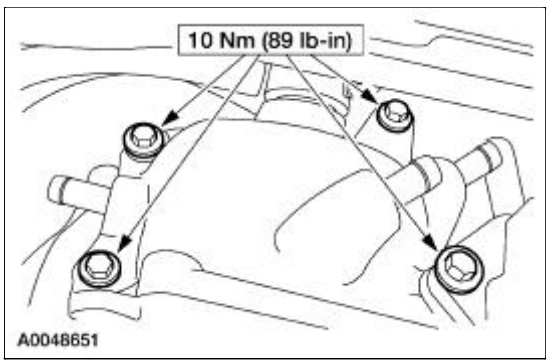


11. Connect the eight fuel injector electrical connectors.

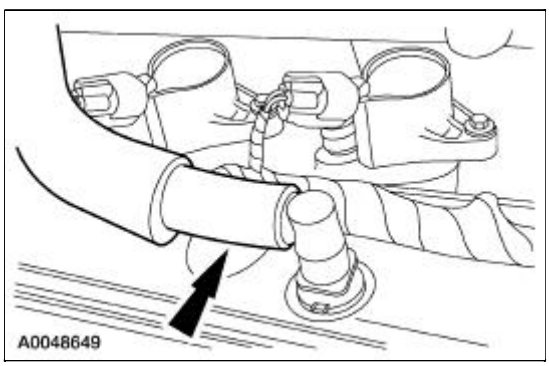


12. Install and connect eight ignition coils. For additional information, refer to Section 303-07A .

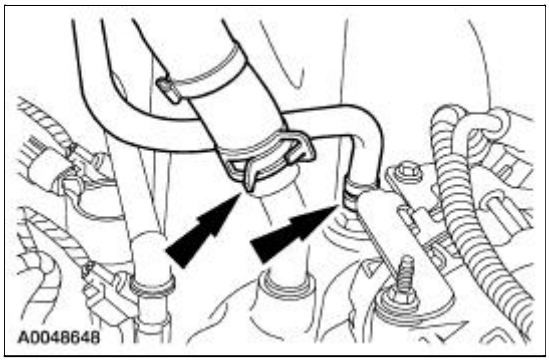
13. Connect the fuel hose spring lock coupling. For additional information, refer to Section 310-00 .



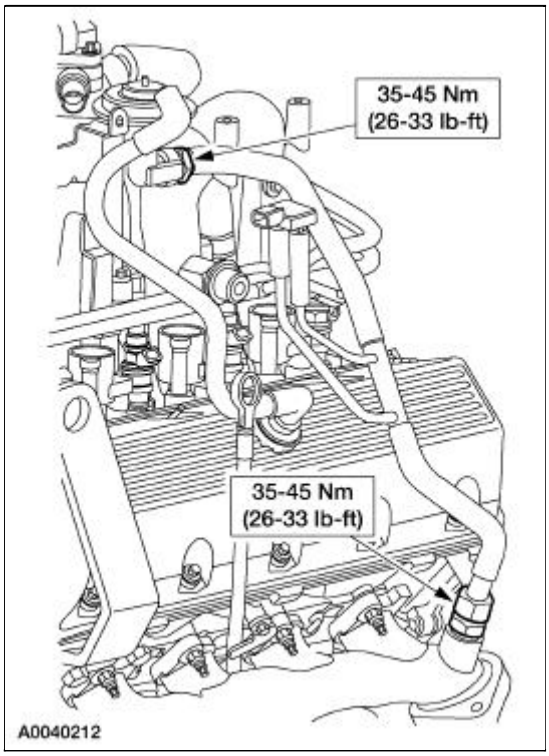
14. Install the power steering reservoir upper mounting bracket.



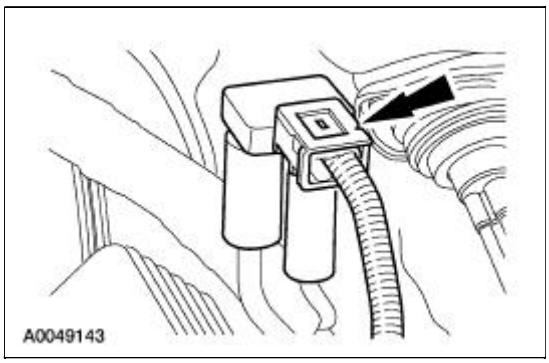
15. Roughly position the throttle body adapter in the vehicle and connect the heated throttle body hose.



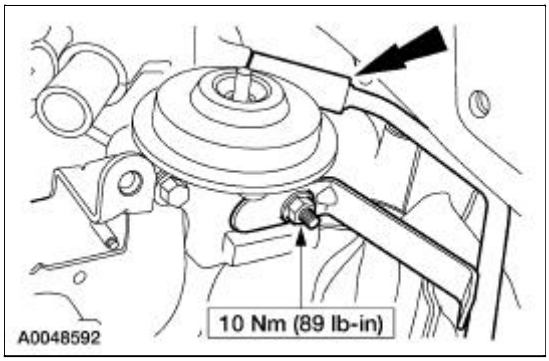
16. Install a new gasket and the throttle body adapter.



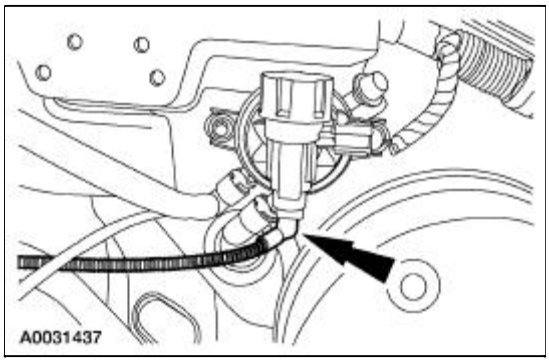
17. Connect the PCV hose.



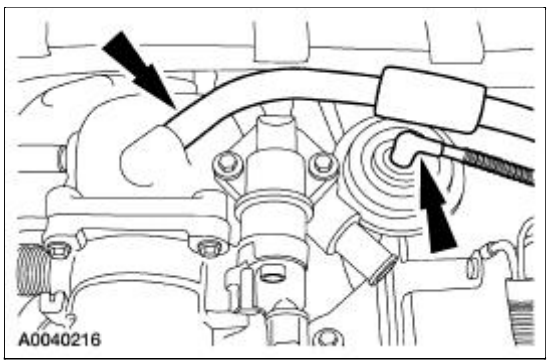
18. Connect the heater hose and heated throttle body hose.



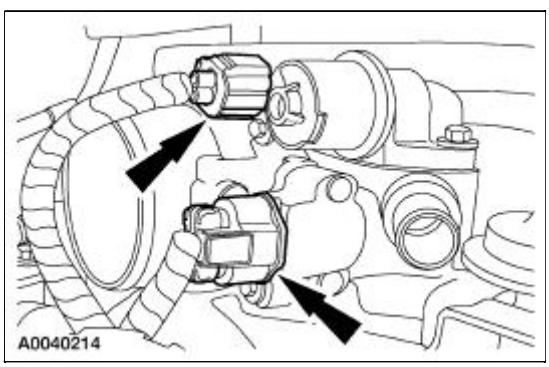
19. Install the exhaust manifold to EGR valve tube.
    - Hand-tighten the fittings.
    - Tighten the upper fitting.
    - Tighten the lower fitting.



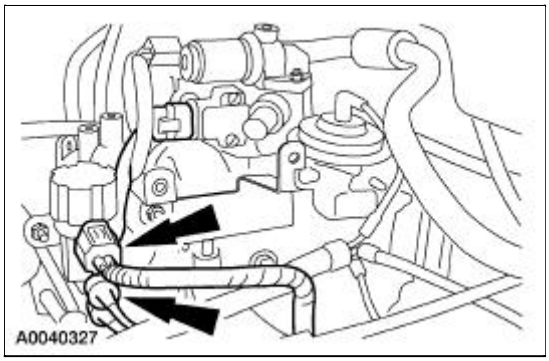
20. Connect the differential pressure feedback EGR system electrical connector.



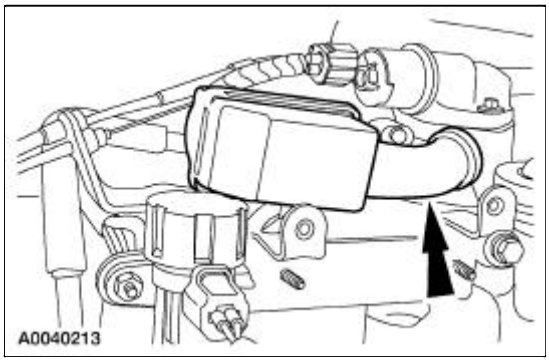
21. Connect the brake booster vacuum tube and bracket, and install the nut.



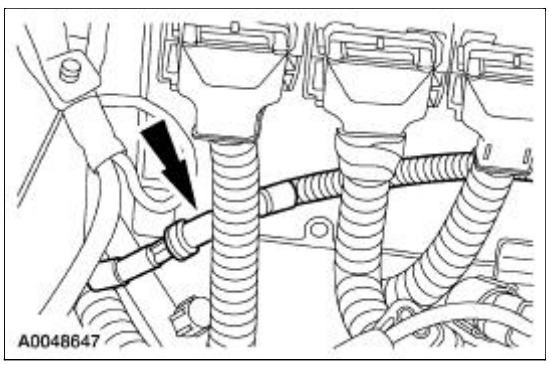
22. Roughly position the vacuum harness and connect the evaporative emission canister purge valve vacuum hose.



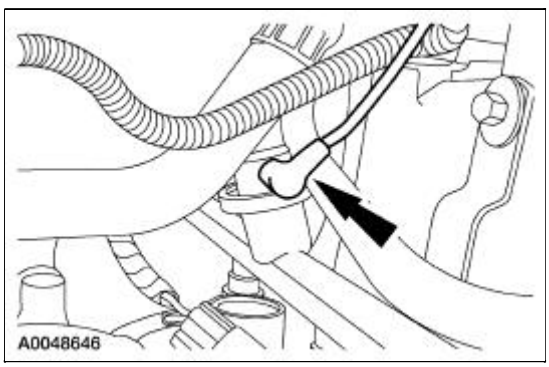
23. Connect the evaporative emission canister purge valve hose and the EGR valve vacuum hose.



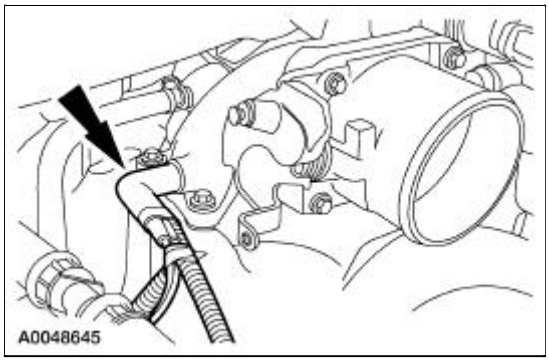
24. Connect the TP sensor and IAC electrical connectors.



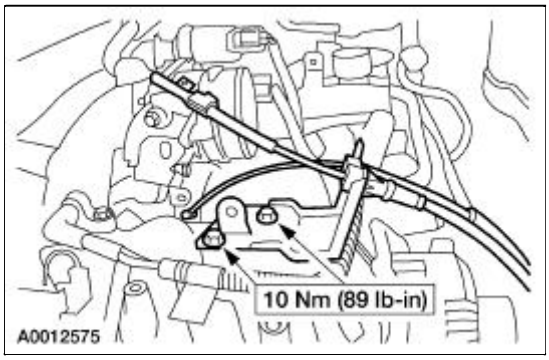
25. Connect the EGR vacuum regulator solenoid connections.



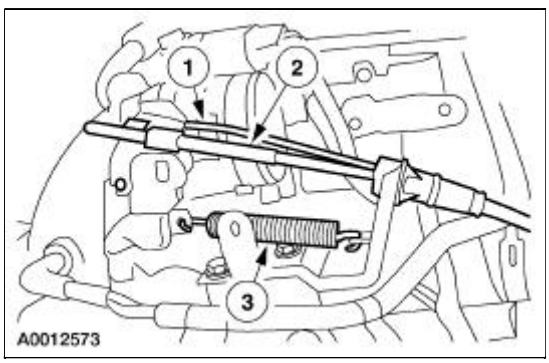
26. Install the IAC fresh air hose.



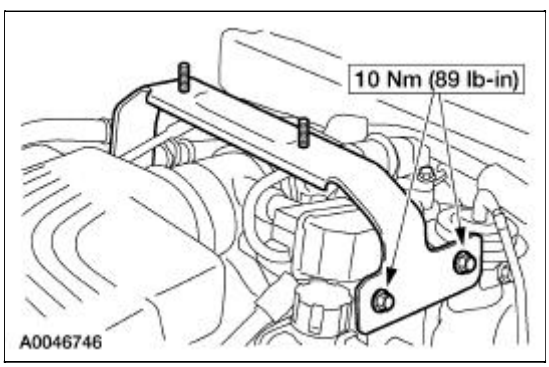
27. Connect the climate control vacuum hose.



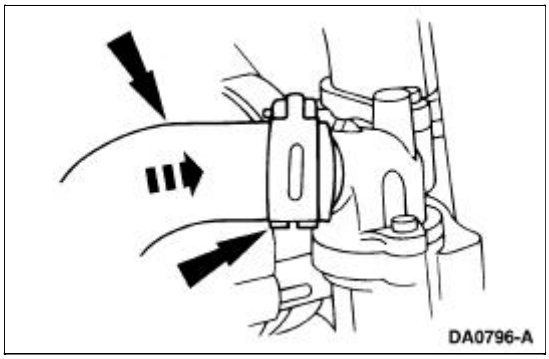
28. Connect the fuel pressure regulator vacuum hose.



29. Connect the main vacuum harness.



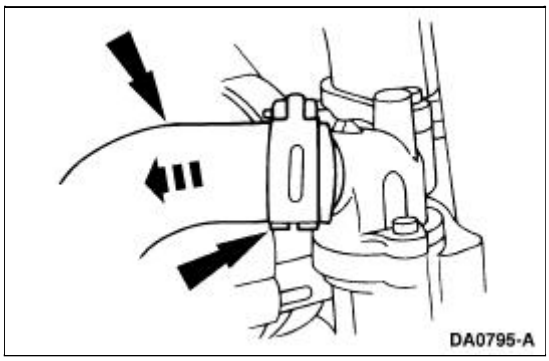
30. Install the accelerator cable bracket and the bolts.



31. Connect the throttle body cam.
    1. Connect the accelerator cable.
    2. Connect the speed control actuator cable.
    3. Install the throttle return spring.

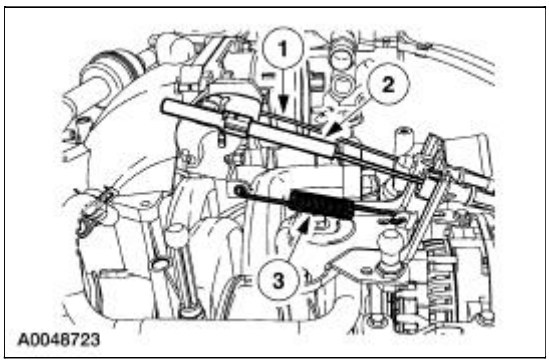
32. Install the appearance cover mounting bracket and the three bolts.

33. Connect the upper radiator hose and position the clamp.



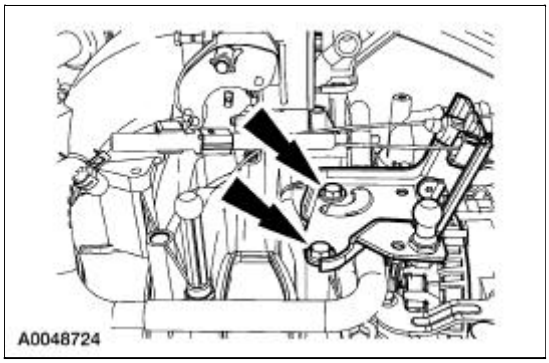
34. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
35. Connect the battery ground cable. For additional information, refer to Section 414-01 .
36. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .

Intake Manifold —5.4L

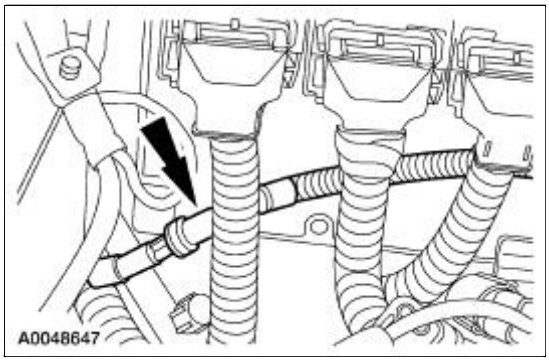


Removal

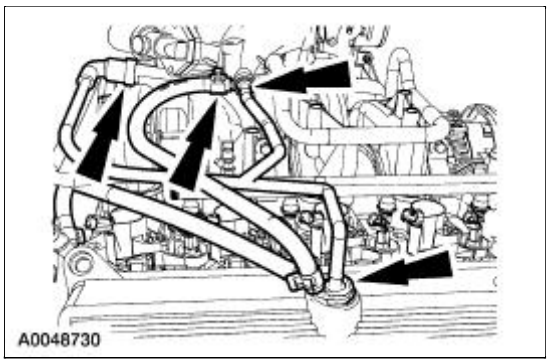
WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.



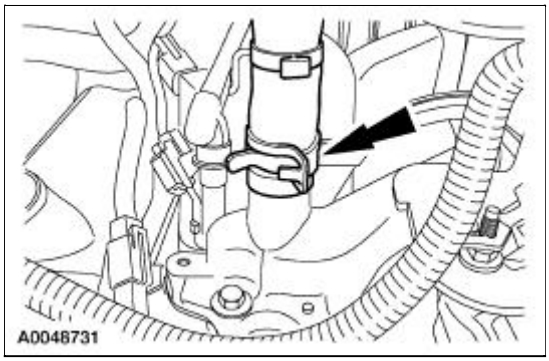
1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
3. Drain the engine cooling system. For additional information, refer to Section 303-03 .
4. Compress the hose clamp and disconnect the upper radiator hose.



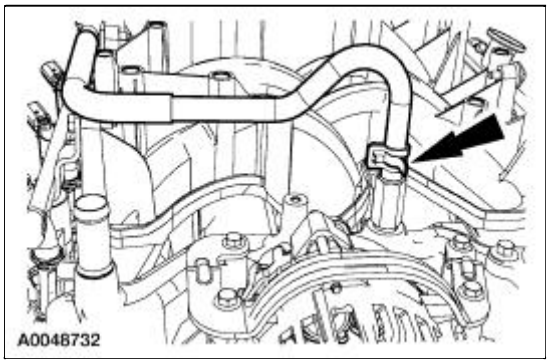
5. Disconnect the throttle body cam.
    1. Disconnect the accelerator cable.
    2. Disconnect the speed control actuator cable.
    3. Remove the accelerator return spring.



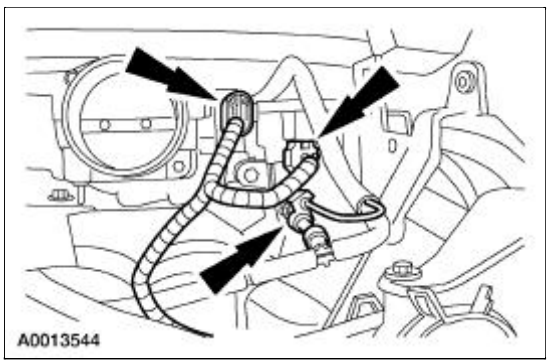
6. Remove the accelerator cable bracket bolts and position the bracket and cables aside.



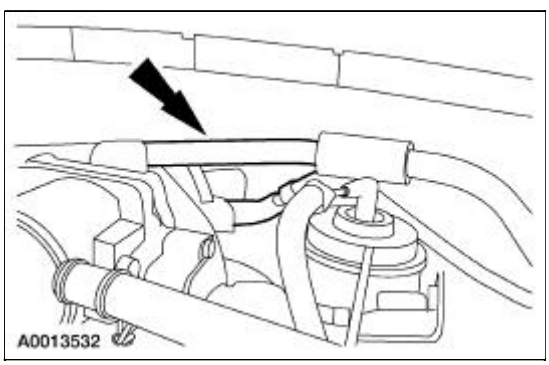
7. Disconnect the climate control vacuum hose.



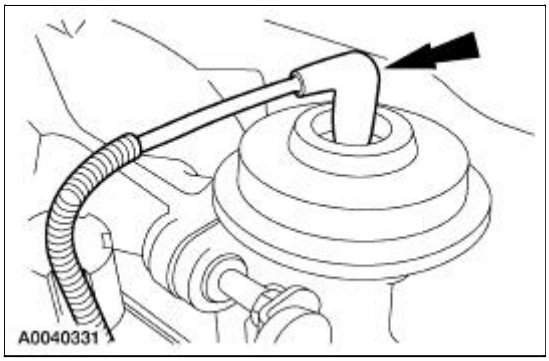
8. Position the heated positive crankcase ventilation (PCV) hose harness aside.
    - Disconnect the PCV hose from the throttle body adapter.
    - Disconnect the heated throttle body outlet hose from the throttle body adapter.
    - Disconnect the PCV hose from the intake manifold.
    - Remove the PCV valve.



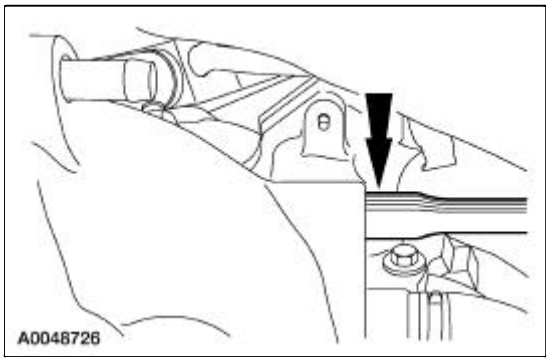
9. Disconnect the heater hose.



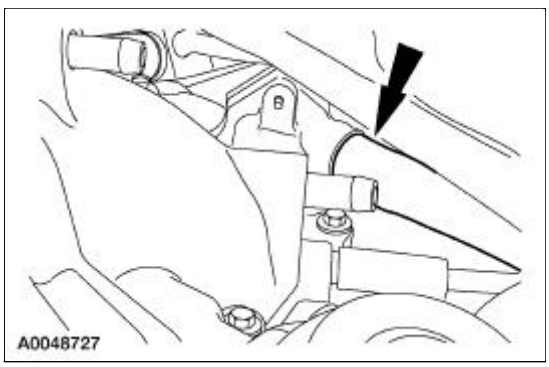
10. Disconnect the heated throttle body inlet hose.



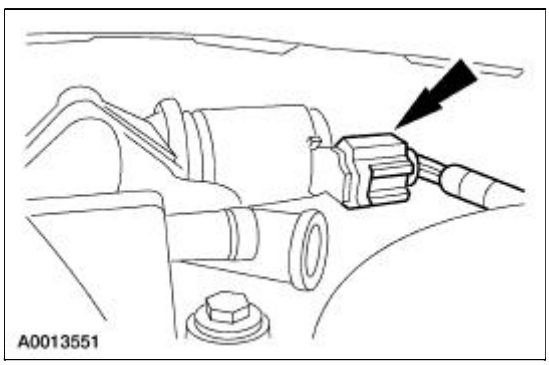
11. Disconnect the throttle position (TP) sensor electrical connector, and the exhaust gas recirculation (EGR) vacuum regulator solenoid electrical and vacuum connectors.



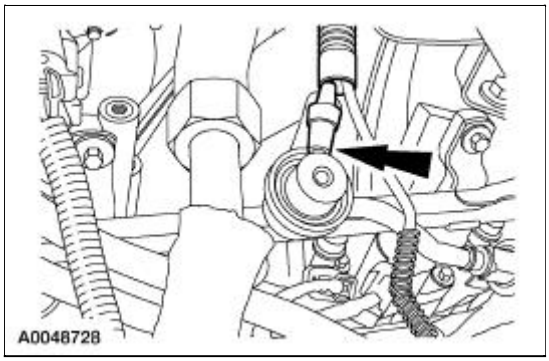
12. Disconnect the evaporative emission canister purge valve hose.



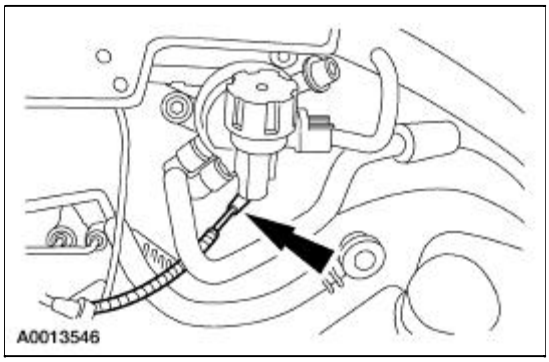
13. Disconnect the EGR valve vacuum hose.



14. Disconnect the main vacuum harness from the throttle body adapter.

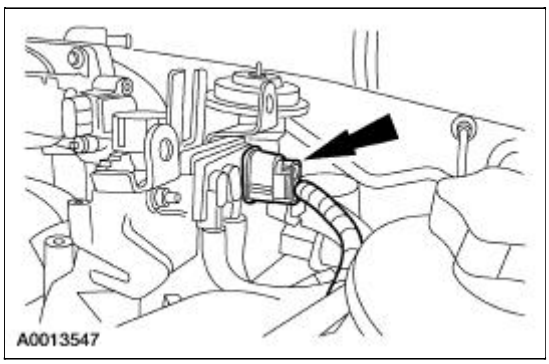


15. Remove the idle air control (IAC) valve fresh air tube.

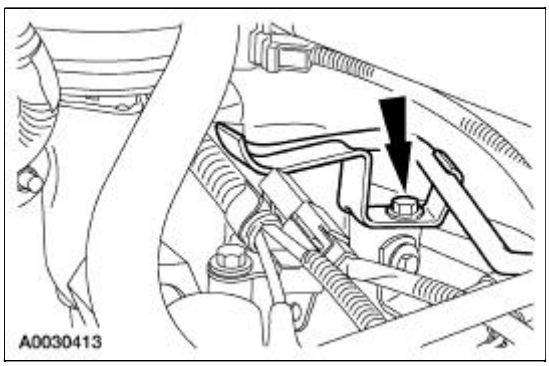


16. Disconnect the IAC electrical connector.

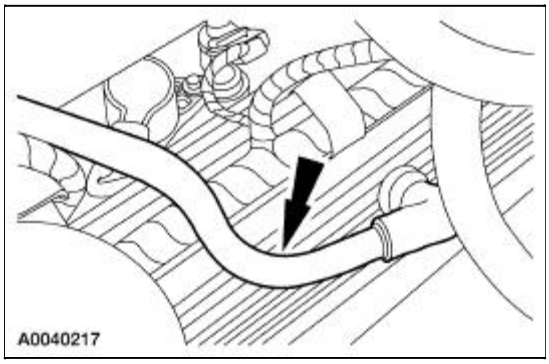
17. Disconnect the fuel pressure regulator vacuum hose.



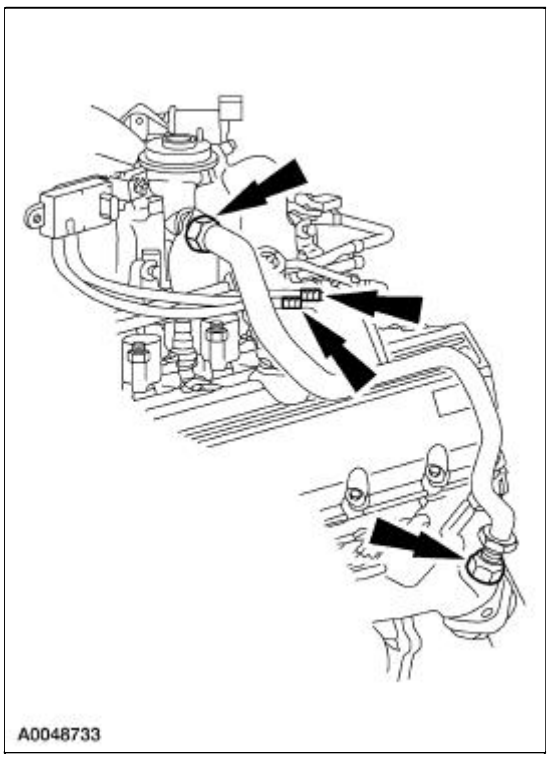
18. Disconnect the evaporative emission canister purge valve vacuum hose and remove the vacuum harness.



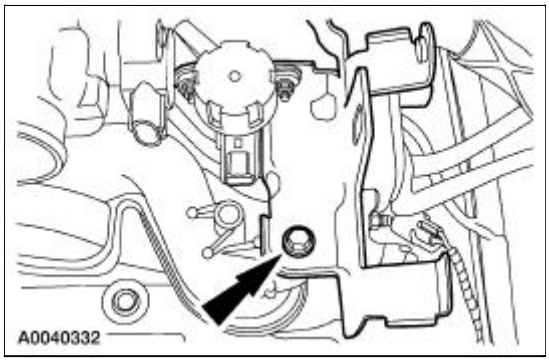
19. Disconnect the fuel hose spring lock coupling. For additional information, refer to Section 310-00 .



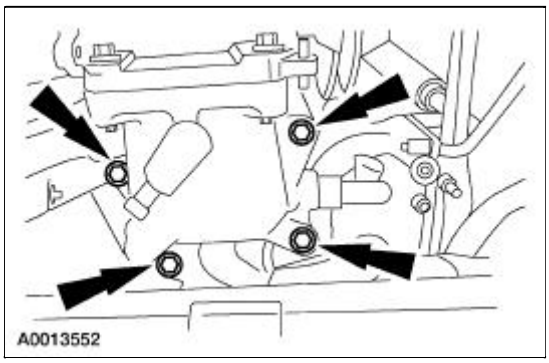
20. Disconnect the differential pressure feedback EGR system electrical connector.



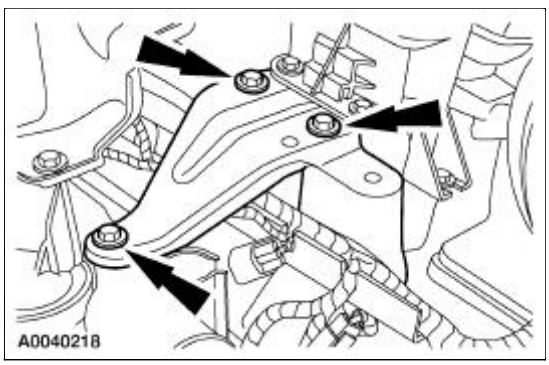
21. Remove the bolt and disconnect the brake booster vacuum tube. Position the bracket and tube aside.



22. Position the crankcase ventilation tube aside.

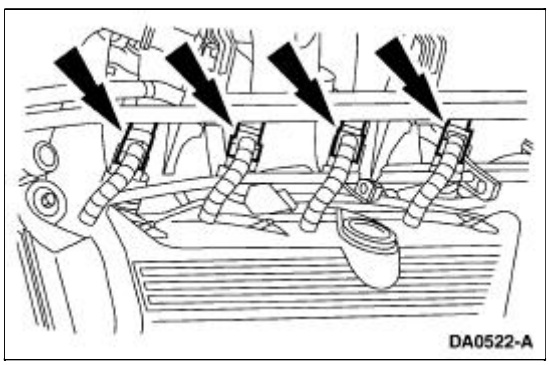


23. Position the exhaust manifold to EGR valve tube aside.
    - Disconnect the upper fitting.
    - Loosen the lower fitting.
    - Disconnect the two differential pressure feedback EGR system hoses.
    - Position the tube aside.

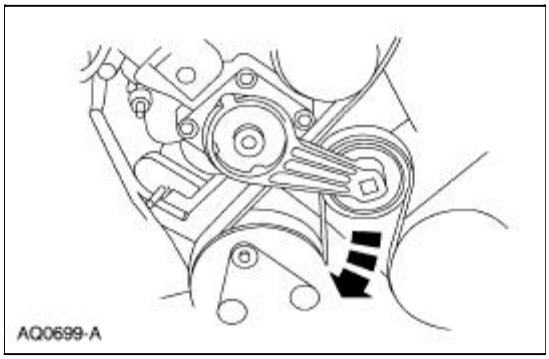


24. Remove the differential pressure feedback EGR system bracket bolt.

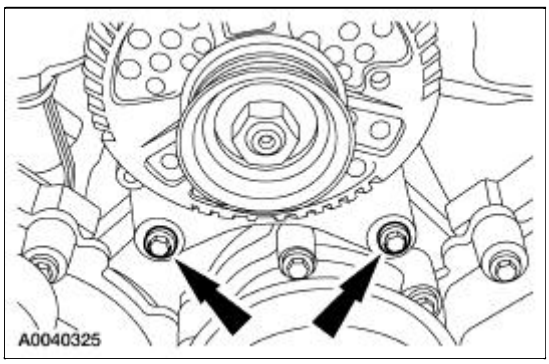
25. Remove the four bolts and the throttle body adapter.
    - Discard the throttle body adapter gasket.



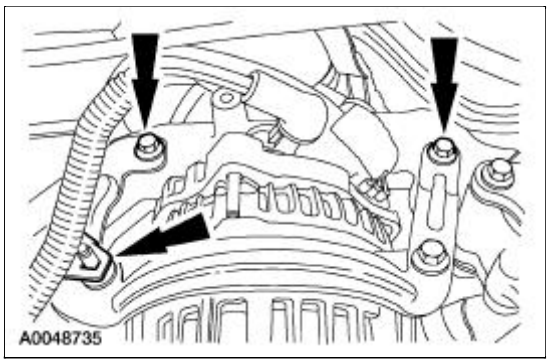
26. Remove the power steering reservoir upper mounting bracket.



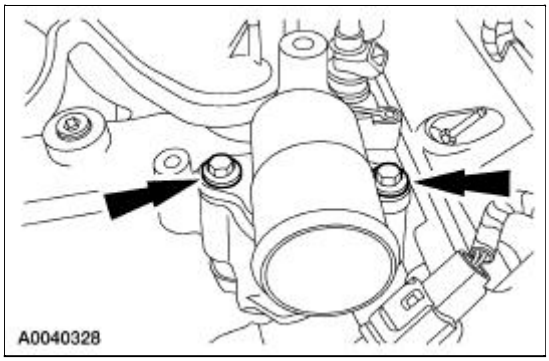
27. Disconnect and remove the eight ignition coils. For additional information, refer to Section 303-07A .



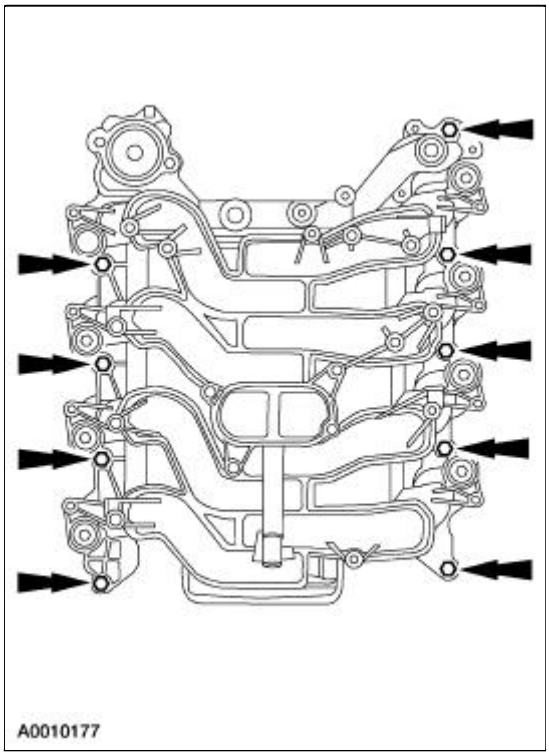
28. Disconnect the eight fuel injectors.



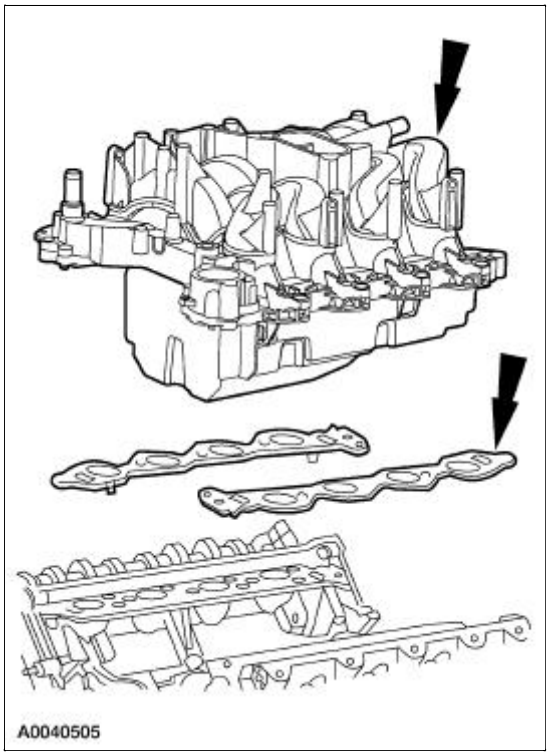
29. Rotate the belt tensioner clockwise and detach the drive belt from the generator pulley.



30. Loosen the generator lower mounting bolts.



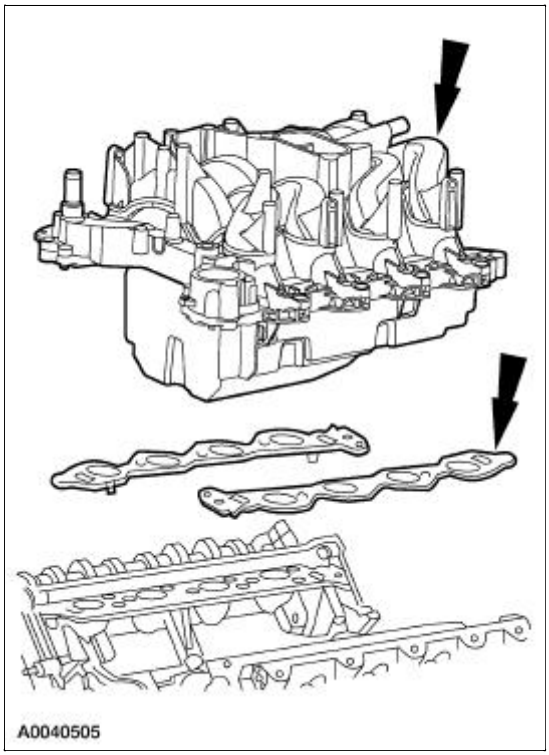
31. Position the generator aside.
    - Disconnect the harness routing clip.
    - Remove the generator upper mounting bracket bolts.



32. Remove the bolts, water thermostat housing and the thermostat.
    - Discard the O-ring seal.

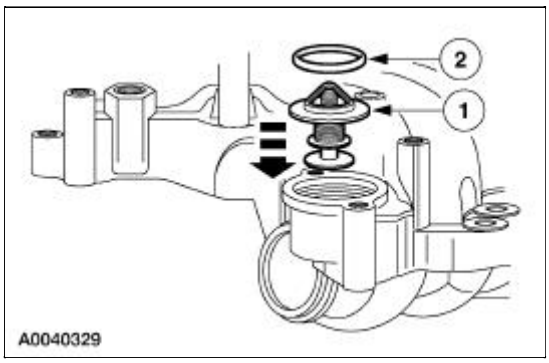
33. Remove the nine bolts.

34. Remove the intake manifold.
    - Discard the intake manifold gaskets.



35. Inspect the intake manifold and throttle body for damage.

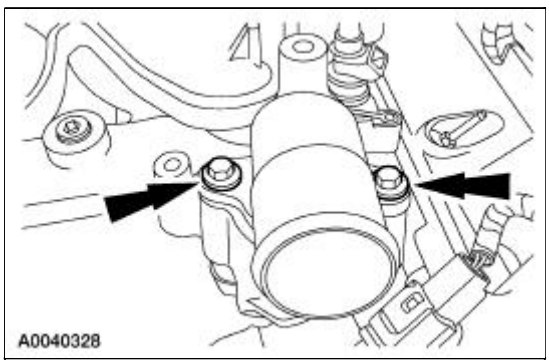
Installation



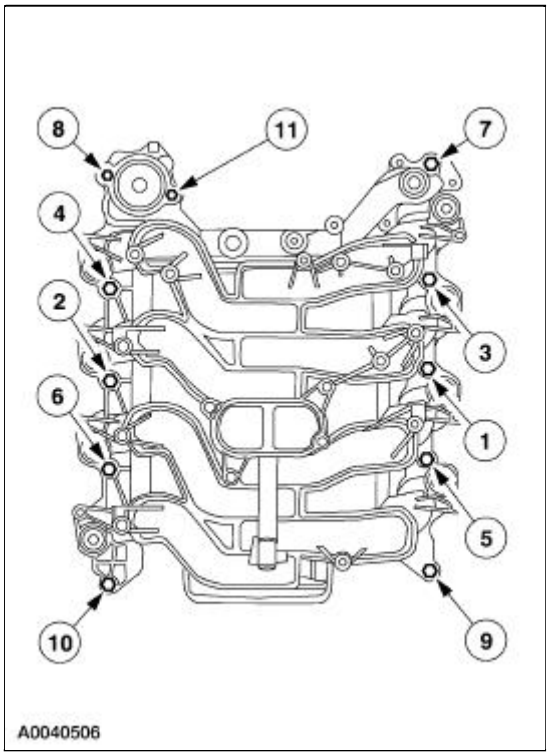
1. **CAUTION: Do not use metal scrapers, power abrasive discs or any abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraper only.**

   Clean all the sealing surfaces.

2. Install the intake manifold.
   - Position the new intake manifold gaskets.
   - Position the intake manifold.
   - Loosely install nine bolts.

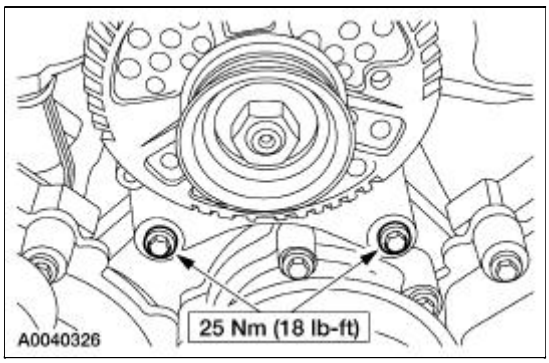


3. Install the water thermostat.
    1. Install the thermostat.
    2. Install a new O-ring seal.

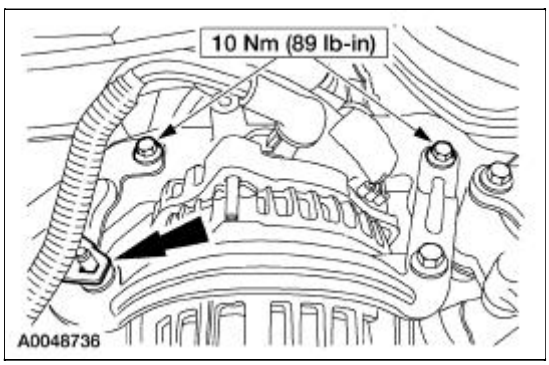


4. **NOTE:** The thermostat housing bolts are tightened in sequence with the intake manifold bolts.

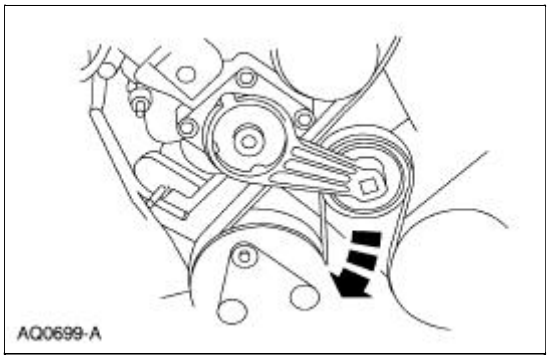
    Install the thermostat housing and loosely install the bolts.



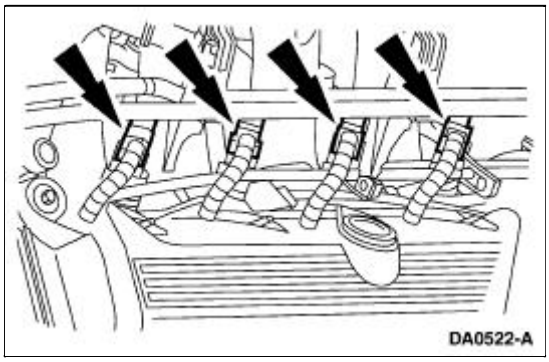
5. Tighten the 11 bolts in two stages in the sequence shown.
    - Stage 1: tighten to 2 Nm (18 lb-in).



- Stage 2: tighten to 25Nm (18 lb-ft).

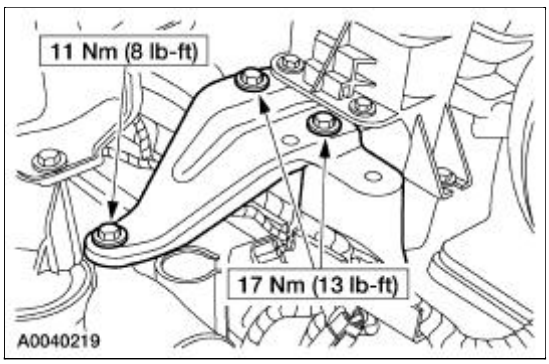


6. Position the generator on the lower mounting bolts and tighten the bolts.

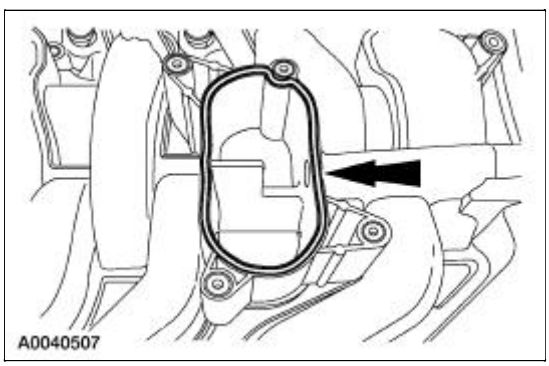


7. Install the generator upper mounting bracket bolts and harness routing clip.

8. Rotate the belt tensioner clockwise and install the drive belt. Refer to the decal on the radiator upper air deflector for belt routing.

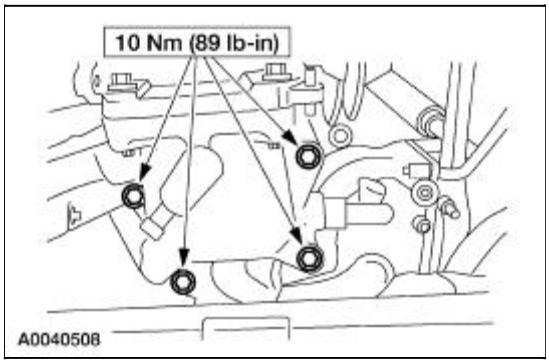


9. Connect the eight fuel injector electrical connectors.

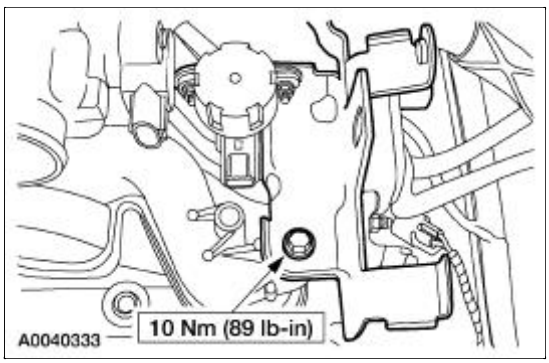


10. Install and connect eight ignition coils. For additional information, refer to Section 303-07A .

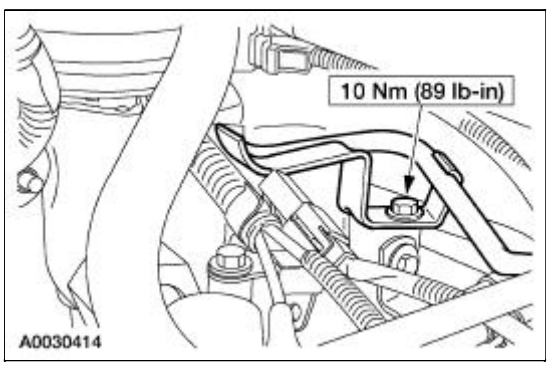
11. Install the power steering reservoir upper mounting bracket.



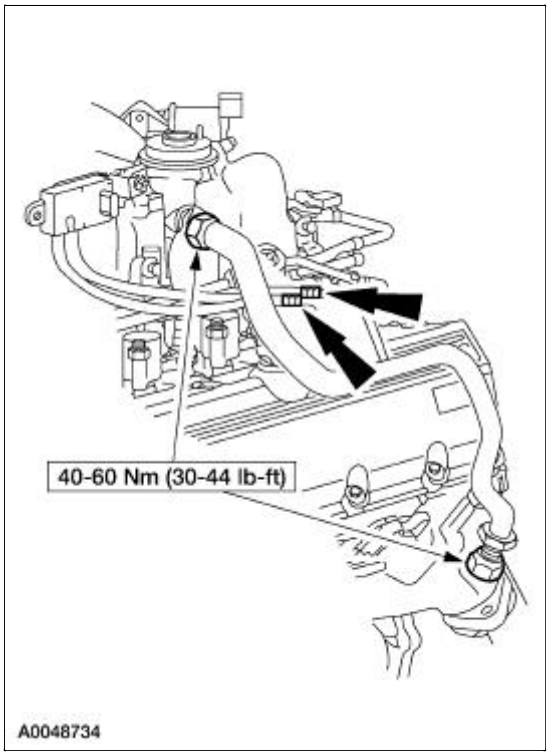
12. Connect the fuel hose spring lock coupling. For additional information, refer to Section 310-00 .



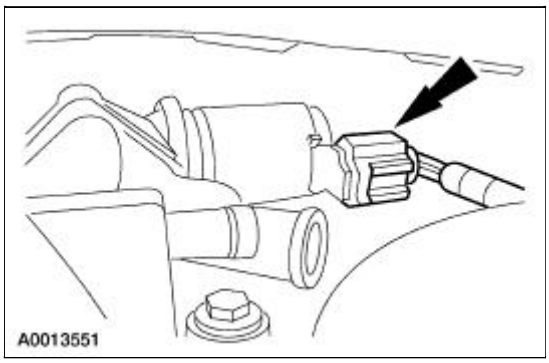
13. Install a new intake manifold-to-throttle body adapter gasket.



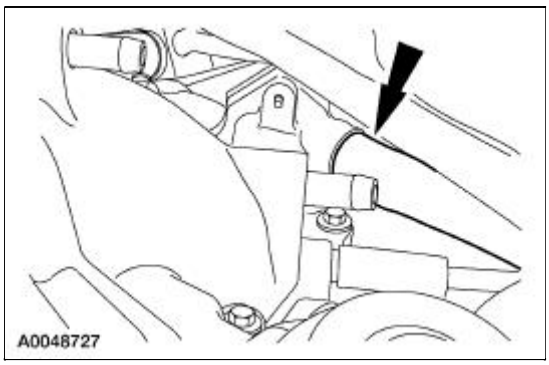
14. Install the throttle body adapter and the bolts.



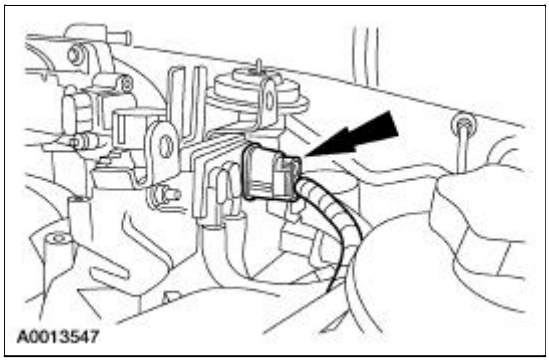
15. Install the differential pressure feedback EGR system bracket bolt.



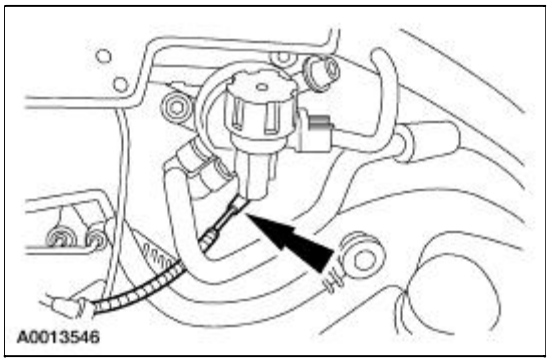
16. Connect the brake booster vacuum tube. Position the bracket and install the bolt.



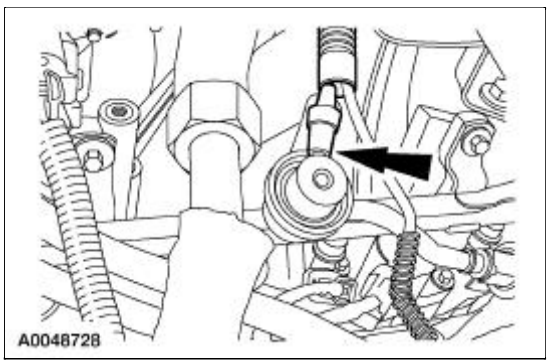
17. Install the exhaust manifold to EGR valve tube.
    - Hand-tighten the fittings.
    - Tighten the upper fitting.
    - Tighten the lower fitting.
    - Connect the two differential pressure feedback EGR system hoses.



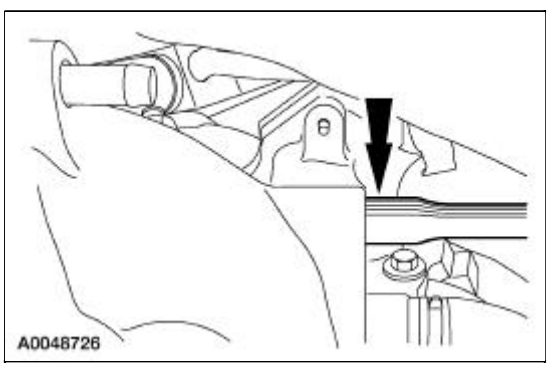
18. Connect the IAC electrical connector.



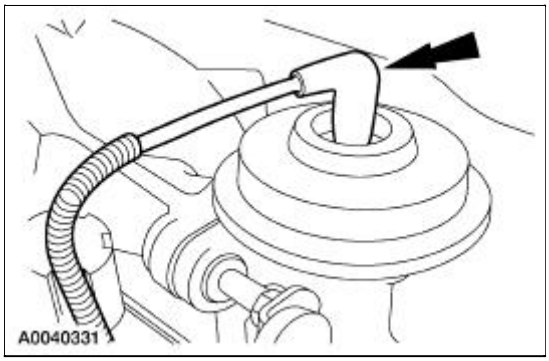
19. Install the IAC fresh air tube.



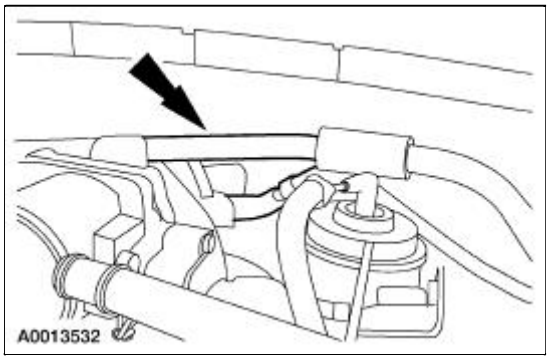
20. Connect the differential pressure feedback EGR system electrical connector.



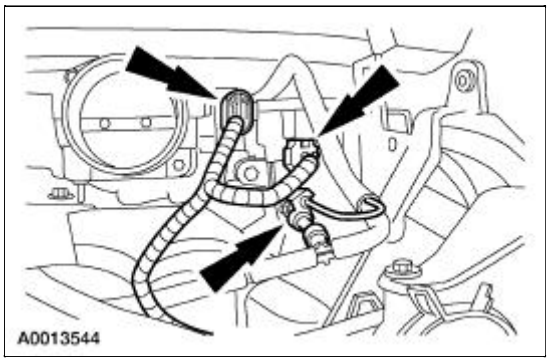
21. Roughly position the vacuum harness and connect the evaporative emission canister purge valve vacuum hose.



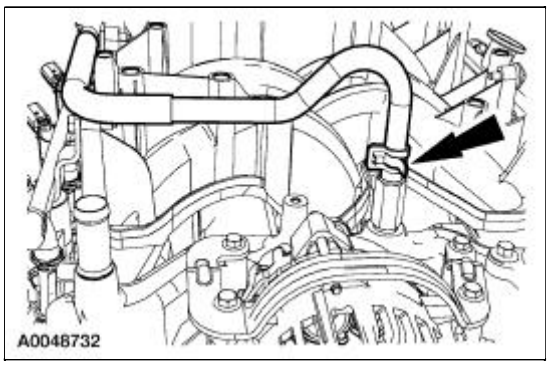
22. Connect the fuel pressure regulator vacuum hose.



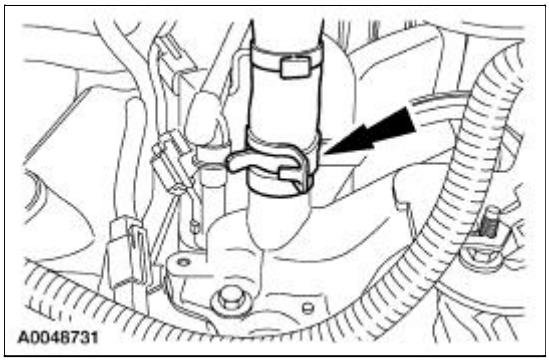
23. Connect the main vacuum harness.



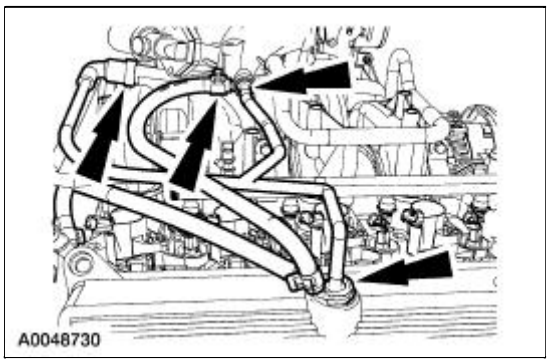
24. Connect the EGR valve vacuum hose.



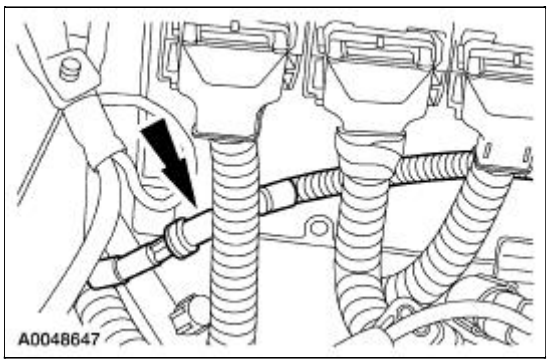
25. Connect the evaporative emission canister purge valve hose.



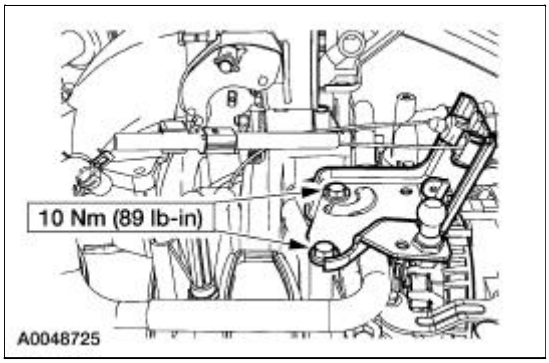
26. Connect the TP sensor electrical connector, and the EGR vacuum regulator solenoid electrical and vacuum connectors.



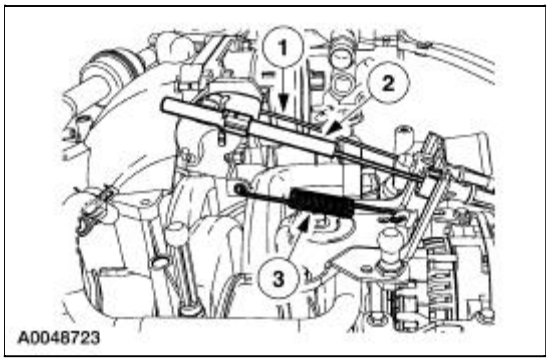
27. Connect the heated throttle body inlet hose.



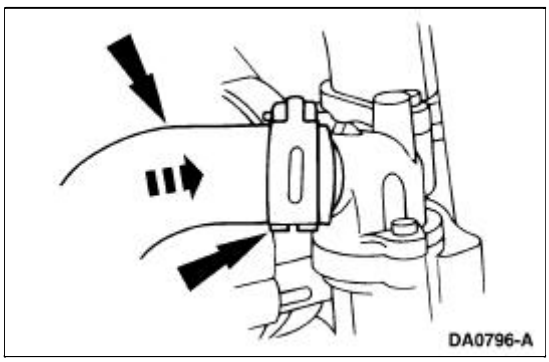
28. Connect the heater hose.



29. Install the heated PCV hose harness.
    - Install the PCV valve.
    - Connect the PCV hose to the intake manifold.
    - Connect the heated throttle body outlet hose.
    - Connect the PCV hose to the throttle body adapter.



30. Connect the climate control vacuum hose.



31. Install the accelerator cable bracket and the bolts.

32. Connect the throttle body cam.
    1. Connect the accelerator cable.
    2. Connect the speed control actuator cable.
    3. Install the throttle return spring.

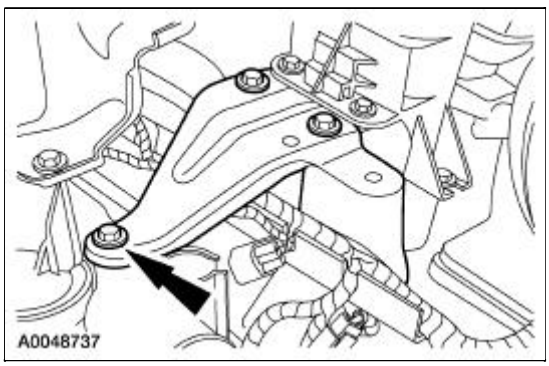
33. Connect the upper radiator hose and position the clamp.

34. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

35. Connect the battery ground cable. For additional information, refer to Section 414-01 .

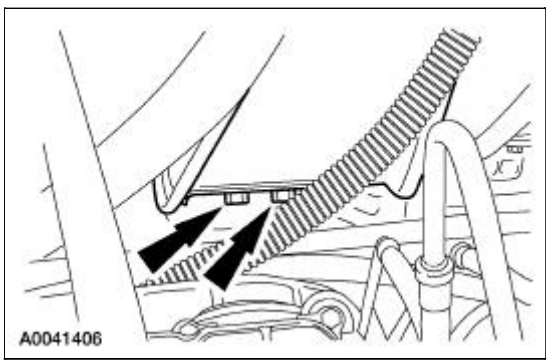
36. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .

Valve Cover LH



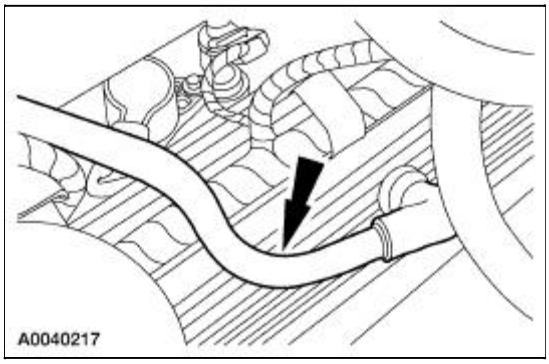
Material

Item	Specification
Motorcraft Silicone Gasket Remover ZC-30	—
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4
Instant Adhesive E8AZ-19554-A or equivalent	WSK-M2G402-A4



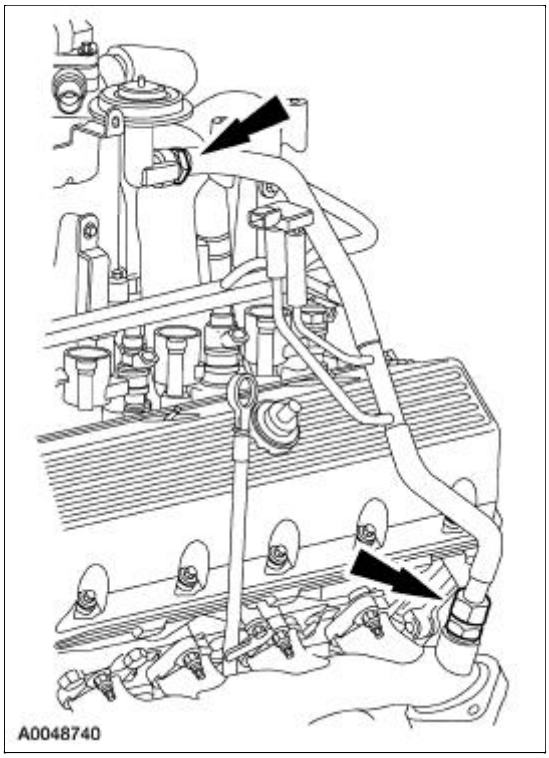
Removal

All vehicles

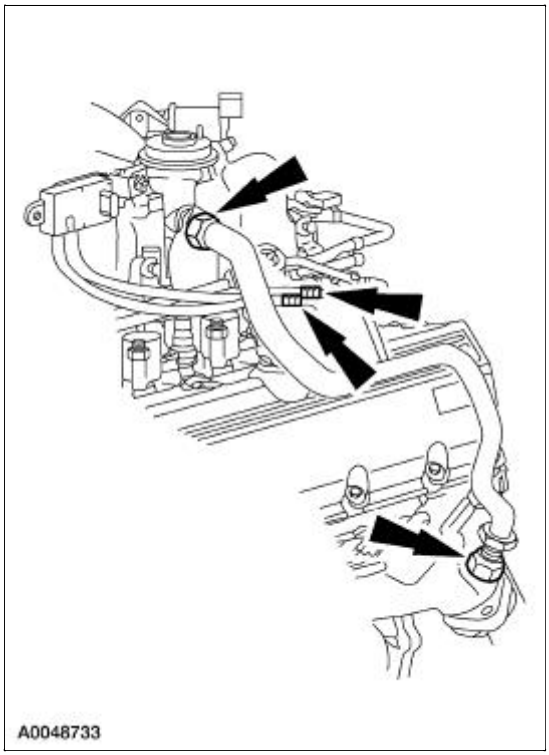


1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the engine air cleaner (ACL) and the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
3. Remove the power steering fluid reservoir bracket bolt.

4. Remove the bolts and position the power steering fluid reservoir and bracket aside.

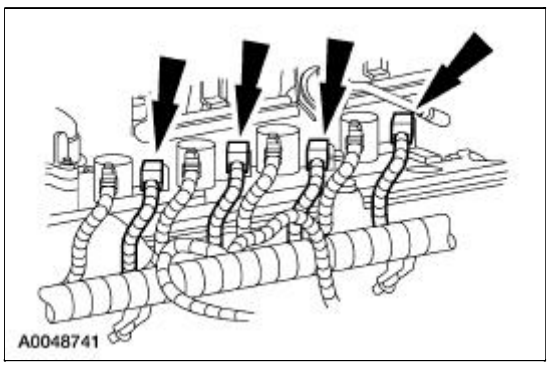


5. Remove the crankcase ventilation tube from the valve cover.



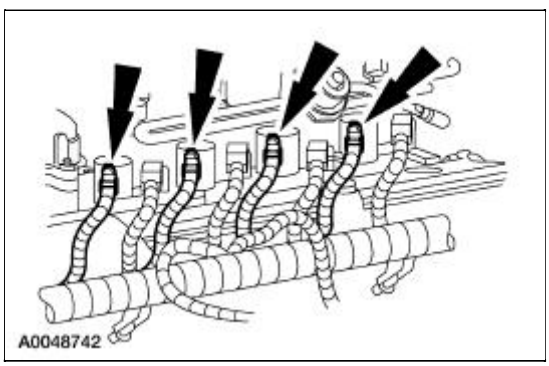
Romeo engine (4.6L)

6. Remove the exhaust manifold to exhaust gas recirculation (EGR) valve tube.
    - Disconnect the differential pressure feedback EGR system electrical connector.
    - Disconnect the upper and lower exhaust manifold to EGR valve tube fittings.

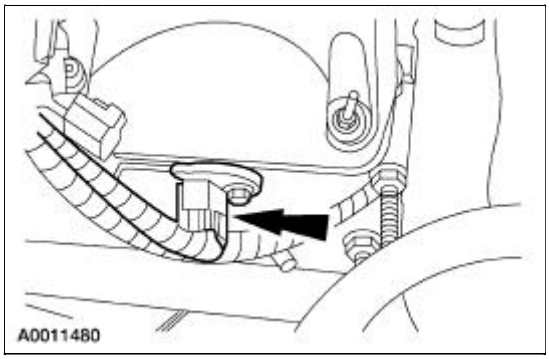


Windsor engine (5.4L)

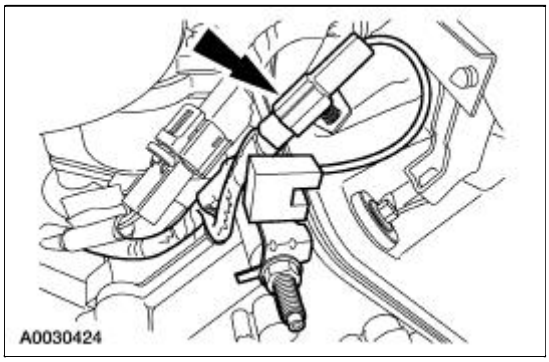
7. Remove the exhaust manifold to EGR valve tube.
    - Disconnect the two differential pressure feedback EGR system hoses.
    - Disconnect the upper and lower exhaust manifold to EGR valve tube fittings.



All vehicles



8. Disconnect the LH fuel injector electrical connections.

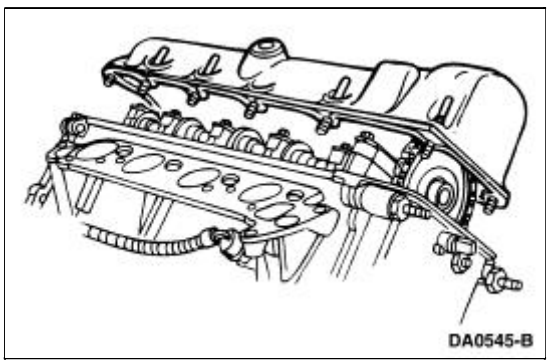


9. Disconnect the LH ignition coil electrical connections.

10. Disconnect the camshaft position (CMP) sensor.

11. Disconnect the LH radio interference capacitor.

12. Lift the engine control wiring harness off of the valve cover studs.



13. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

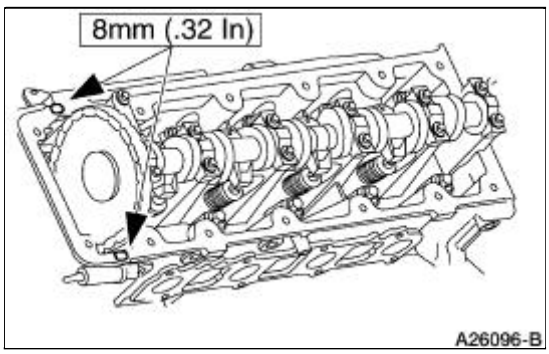
    NOTE: The intake manifold is removed for clarity.

    NOTE: The bolts are part of the valve cover and should not be removed.

    Remove the LH valve cover.

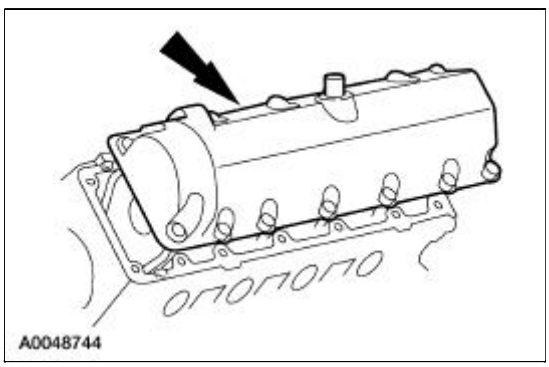
    - Fully loosen the bolts and remove the valve cover.
    - Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
    - Inspect the valve cover gasket. If the gasket is damaged, remove and discard the gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

Installation



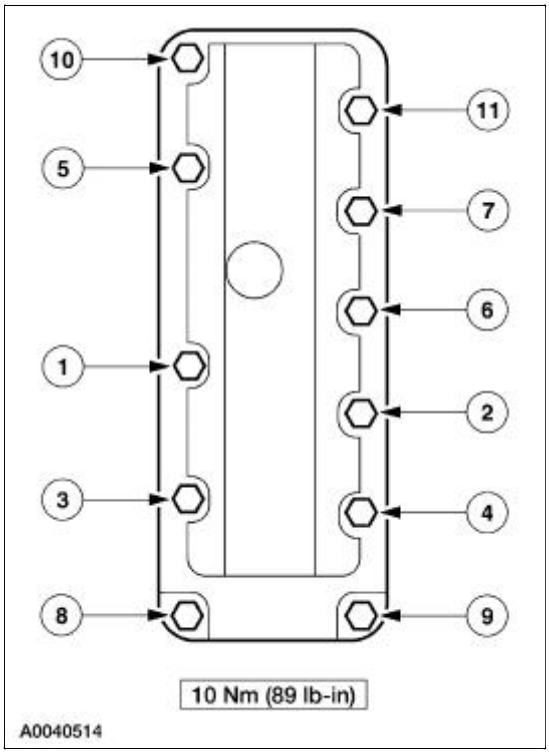
All vehicles

1. If a new gasket is being installed, apply instant adhesive completely around the gasket groove in the valve cover. Install the new valve cover gasket.

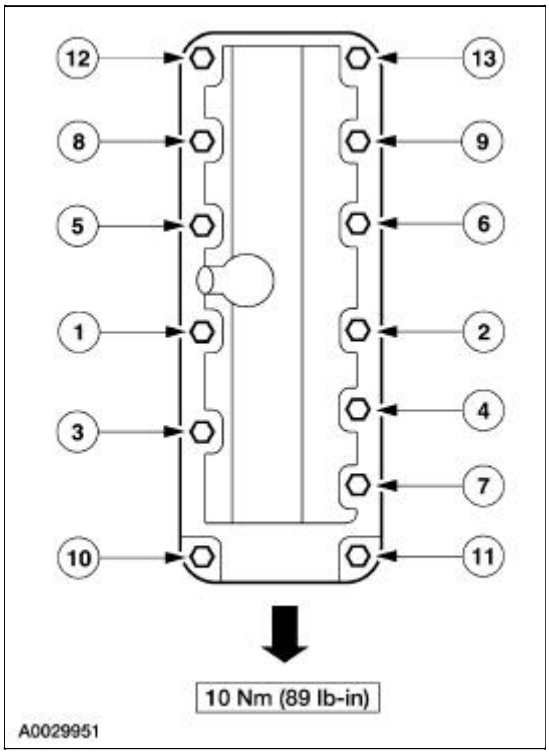


2. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

   Apply a bead of silicone gasket and sealant in two places where the engine front cover meets the cylinder head.

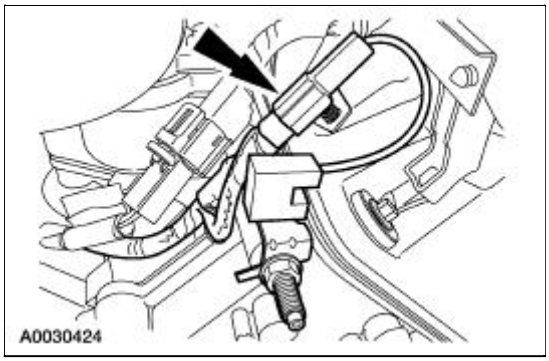


3. Position the valve cover and gasket on the cylinder head. Loosely install the bolts.



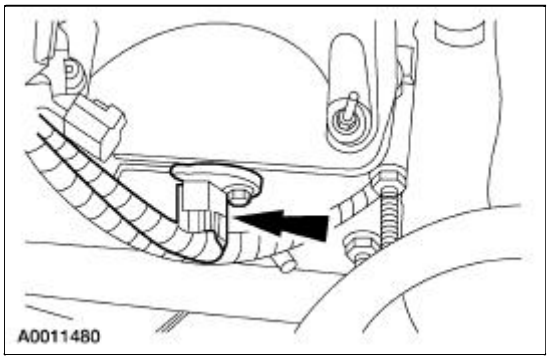
Romeo engine (4.6L)

4. Tighten the bolts in the sequence shown.

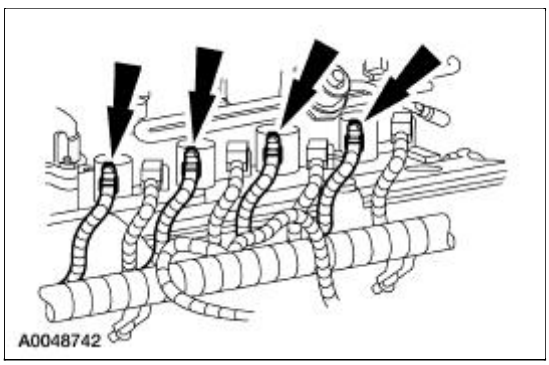


Windsor engine (5.4L)

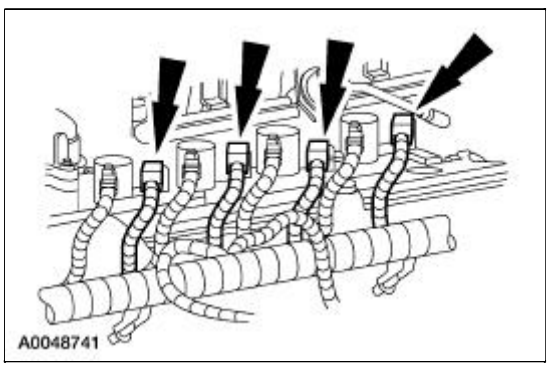
5. Tighten the bolts in the sequence shown.



All vehicles

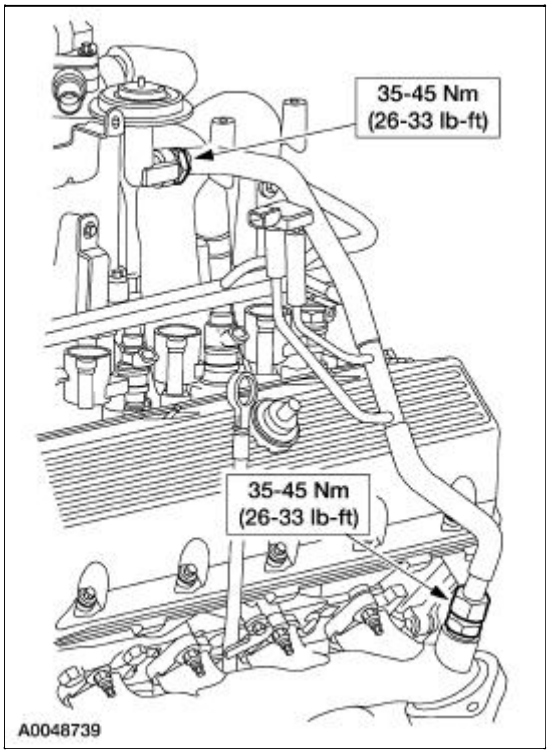


6. Position the engine control wiring harness onto the valve cover studs.
7. Connect the LH radio interference capacitor electrical connector.



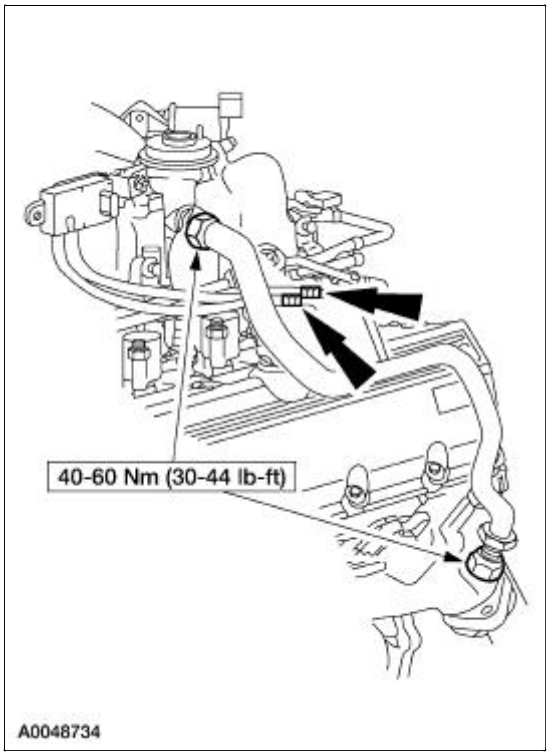
8. Connect the CMP electrical connector.

9. Connect the LH ignition coil electrical connectors.



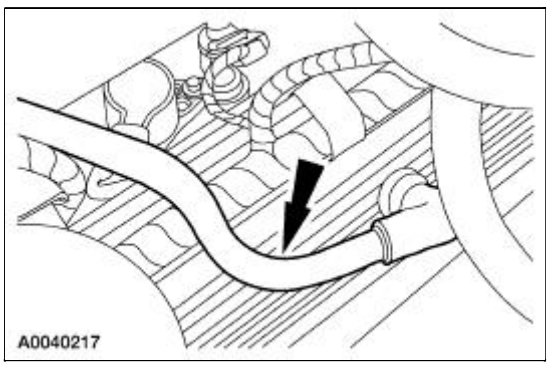
10. Connect the LH fuel injector electrical connectors.

Romeo engine (4.6L)



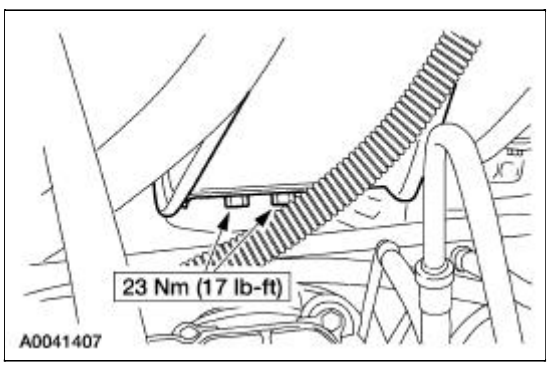
11. Install the exhaust manifold to EGR valve tube.
    - Connect the differential pressure feedback EGR system electrical connector.

- Tighten both fittings starting at the top in two stages.
  - Stage 1: hand-tighten.
  - Stage 2: tighten to 35-45 Nm (26-33 lb-ft).



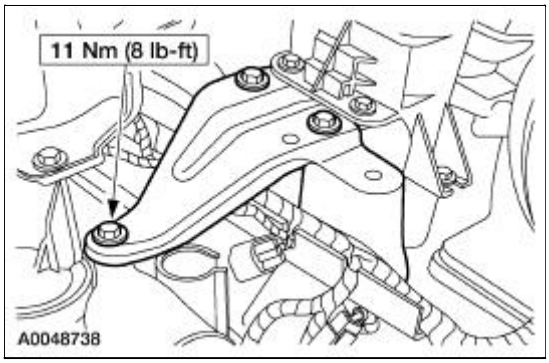
Windsor engine (5.4L)

12. Install the exhaust manifold to EGR valve tube.
    - Tighten both fittings starting at the top in two stages.
      - Stage 1: hand-tighten.
      - Stage 2: tighten to 40-60 Nm (30-44 lb-ft).
    - Connect the two differential pressure feedback EGR system hoses.



All vehicles

13. Connect the crankcase ventilation tube to the valve cover.



14. Install the ACL and air cleaner outlet pipe. For additional information, refer to Section 303-12 .

15. Position the power steering fluid reservoir and bracket. Install the bolts.

16. Install the power steering fluid reservoir bracket bolt.

17. Connect the battery ground cable. For additional information, refer to Section 414-01 .

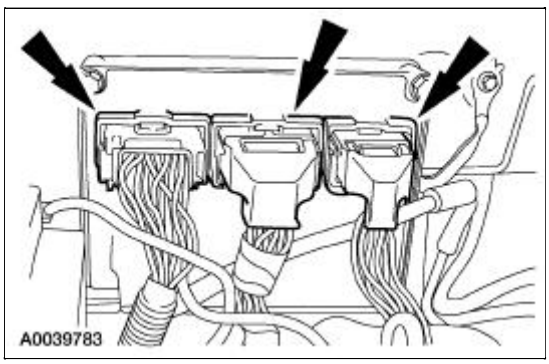
Valve Cover RH

Material

Item	Specification
Motorcraft Silicone Gasket Remover ZC-30	—
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4
Instant Adhesive E8AZ-19554-A or equivalent	WSK-M2G402-A4

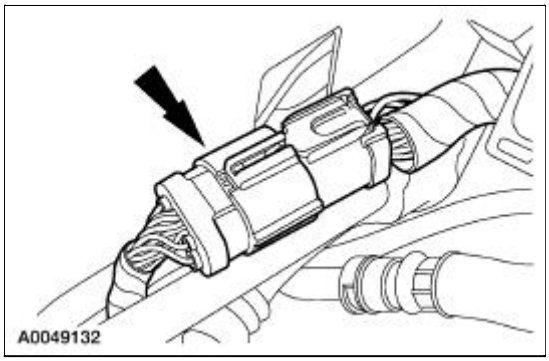
Removal

All vehicles



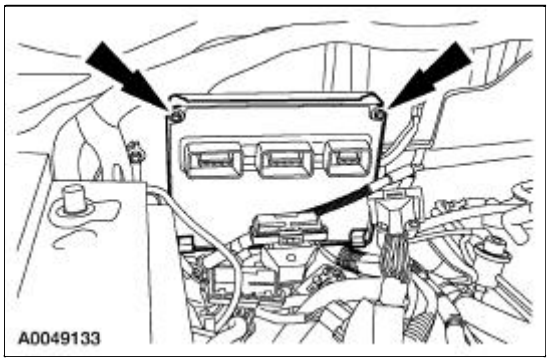
1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Discharge and recover the air conditioning system. For additional information, refer to Section 412-03A .

Vehicles with auxiliary heat

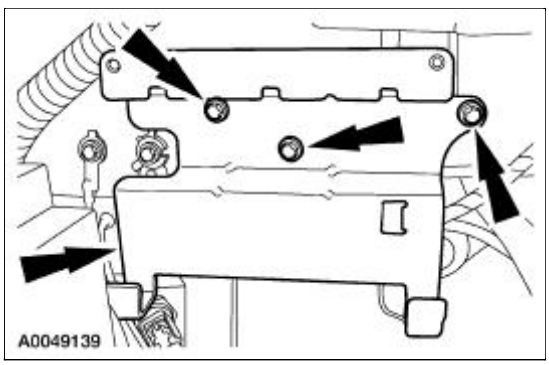


3. Drain the cooling system. For additional information, refer to Section 303-03 .

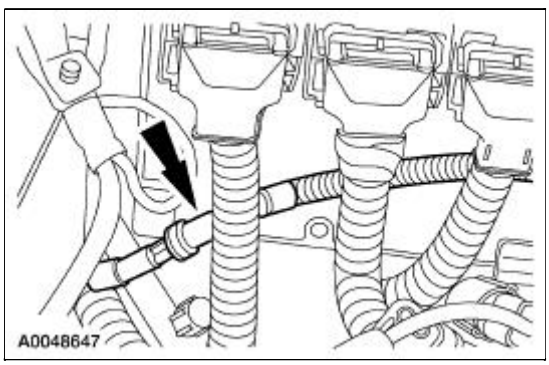
All vehicles



4. Disconnect the powertrain control module (PCM) electrical connectors.

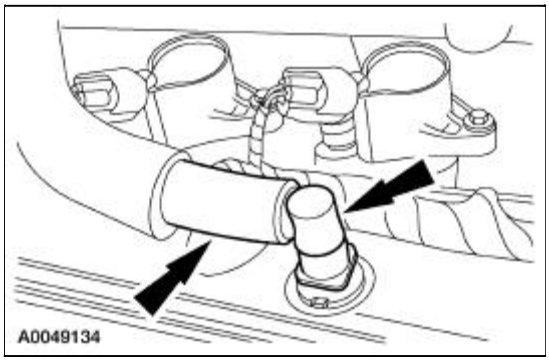


5. Disconnect the engine wiring harness electrical connector.



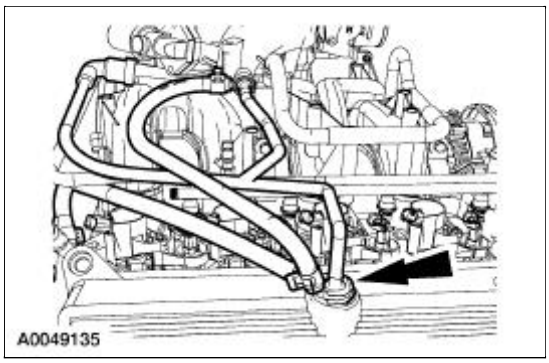
6. Remove the bolts and the PCM.

7. Remove the PCM mounting bracket.



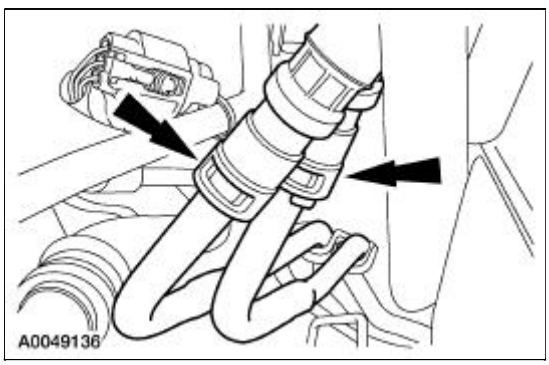
8. Disconnect the climate control vacuum hose and position it aside.

Romeo engine (4.6L)



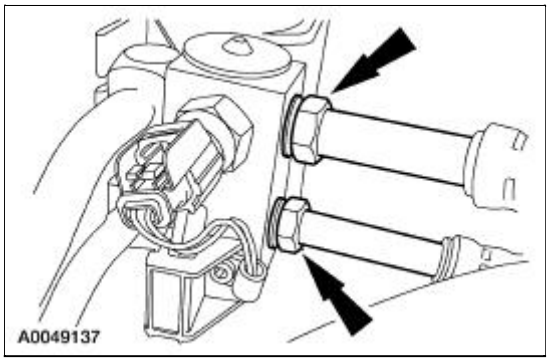
9. **NOTE:** Rotate the positive crankcase ventilation (PCV) valve to remove.

Disconnect the hose and position it aside, then remove the PCV valve from the valve cover.



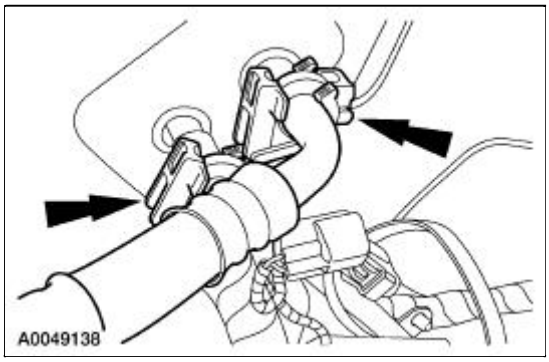
Windsor engine (5.4L)

10. Remove the PCV valve from the valve cover. Position the valve and hoses aside.

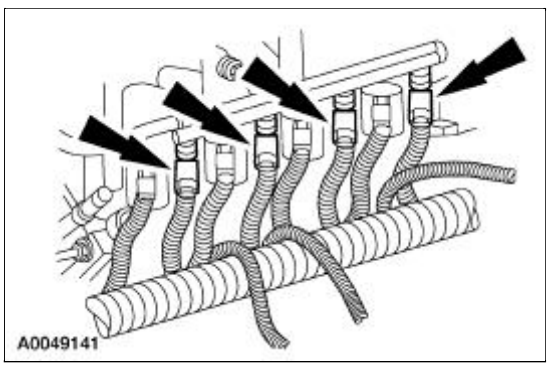


Vehicles with auxiliary heat

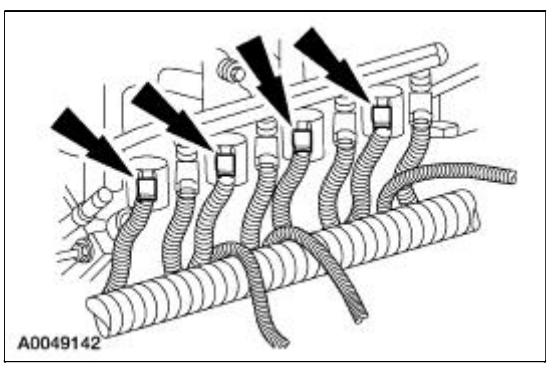
11. Disconnect the rear heater water lines.



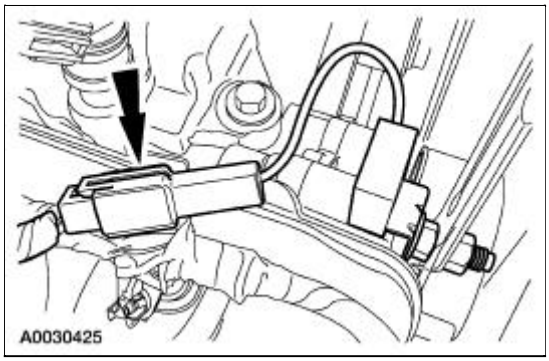
All vehicles



12. Disconnect the evaporator tubes from the manifold.



13. Disconnect the evaporator tubes from the evaporator.

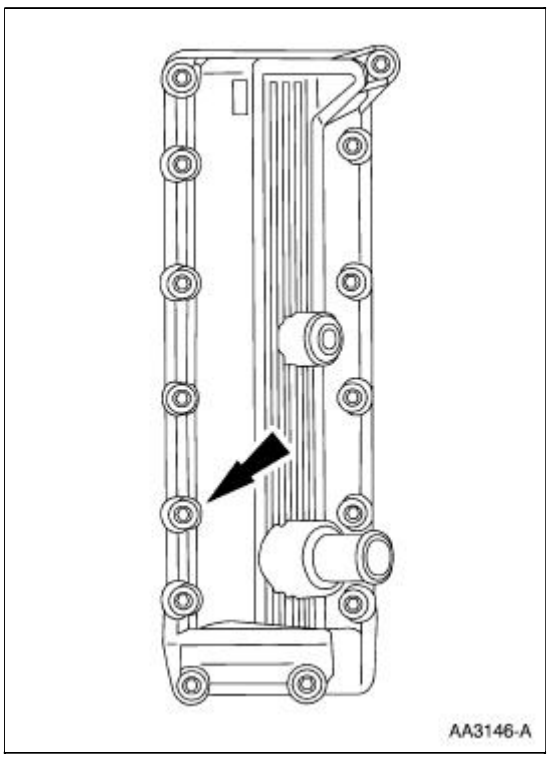


14. Disconnect the RH fuel injector electrical connections.

15. Disconnect the RH ignition coil electrical connections.

16. Disconnect the RH radio interference capacitor.

17. Lift the engine control wiring harness off of the valve cover studs and position it aside.



18. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    NOTE: The bolts are part of the valve cover and cannot be removed.

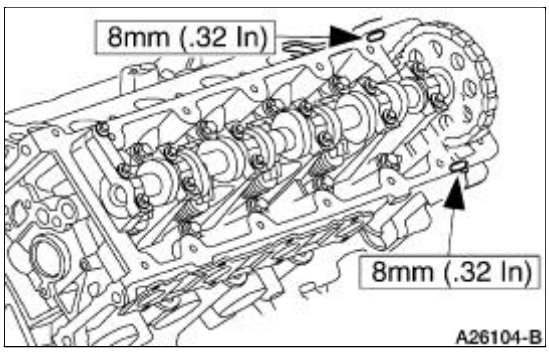
    NOTE: Windsor engine shown; Romeo engine similar.

    Remove the RH valve cover.

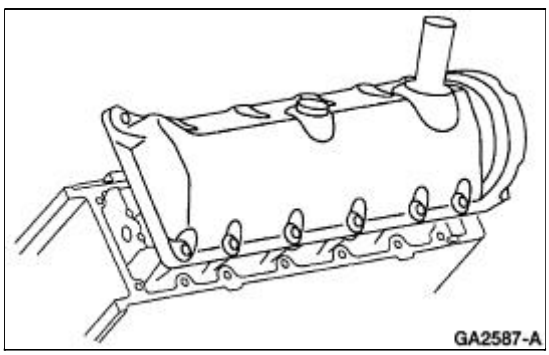
    - Fully loosen the bolts and remove the valve cover.
    - Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
    - Inspect the valve cover gasket. If the gasket is damaged, remove and discard the gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

Installation

All vehicles



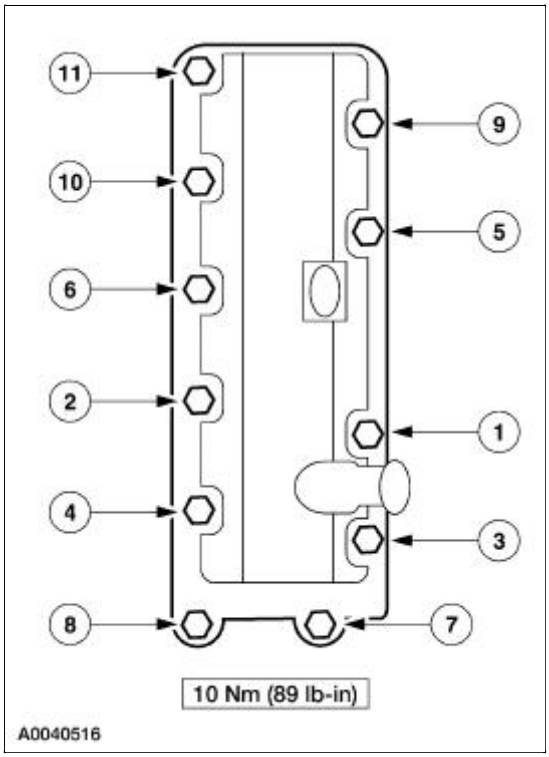
1. If a new gasket is being installed, apply instant adhesive completely around the gasket groove in the valve cover. Install the new valve cover gasket.



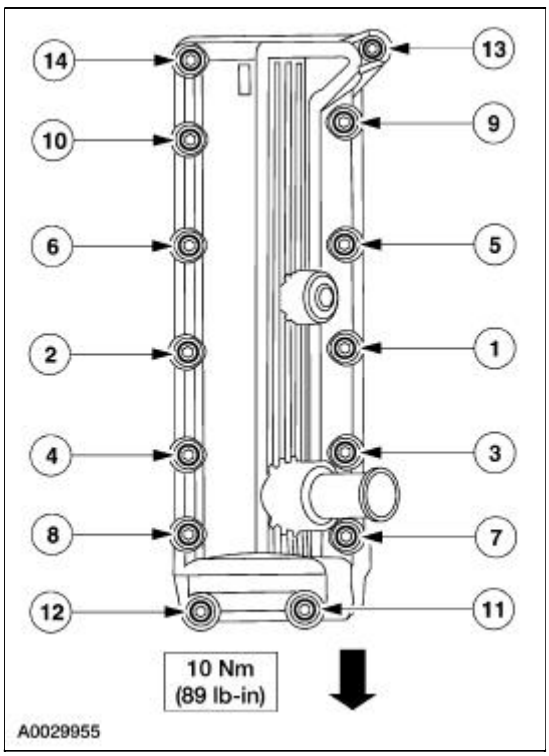
2. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   NOTE: If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

   Apply the silicone gasket and sealant in two places where the engine front cover meets the cylinder head.

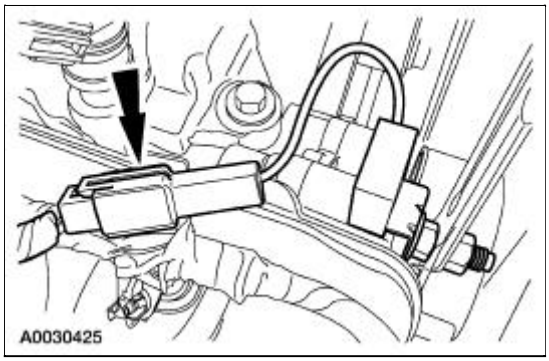


3. Position the valve cover on the cylinder head and loosely install the valve cover bolts.



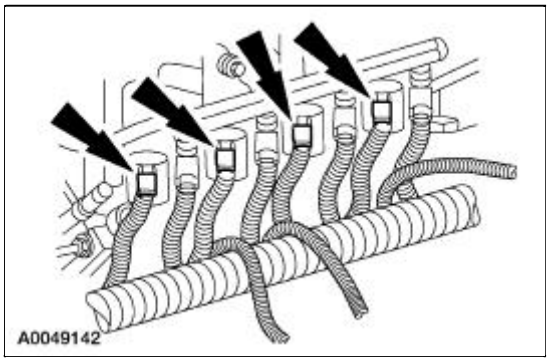
Romeo engine (4.6L)

4. Tighten the bolts in the sequence shown.

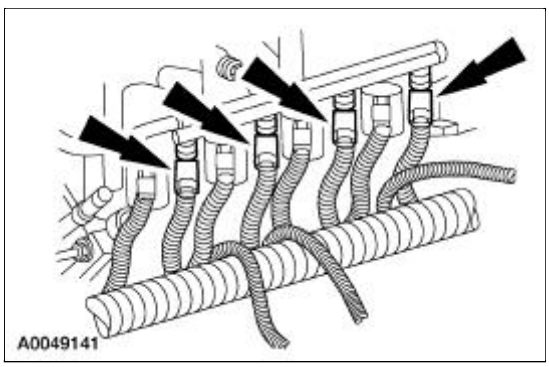


Windsor engine (5.4L)

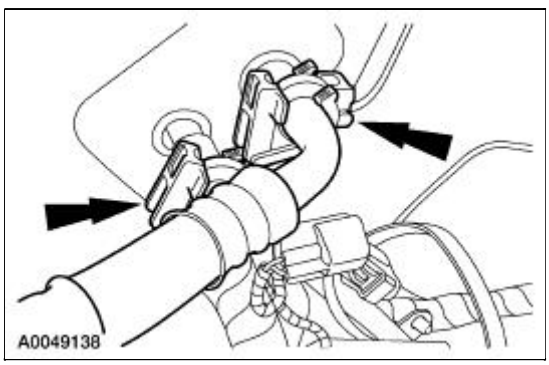
5. Tighten the bolts in the sequence shown.



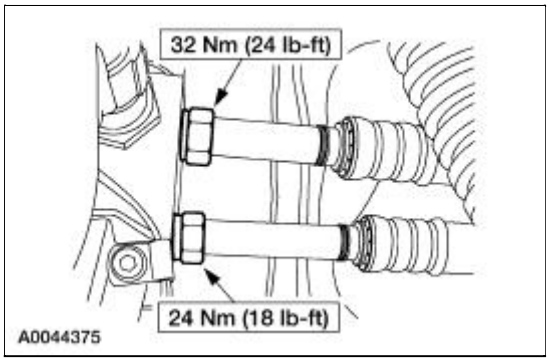
All vehicles



6. Position the engine control wiring harness on the valve cover studs.
7. Connect the RH radio interference capacitor electrical connector.

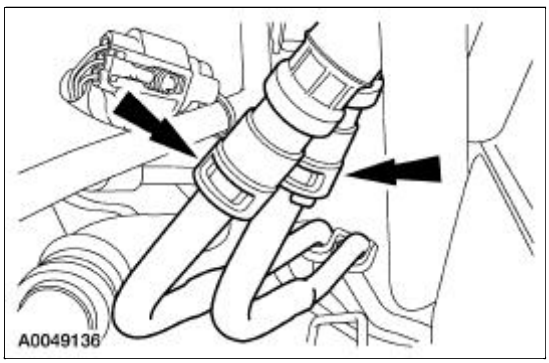


8. Connect the RH ignition coil electrical connectors.



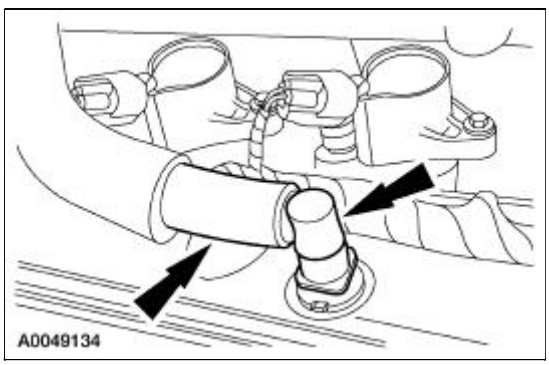
9. Connect the RH fuel injector electrical connectors.

10. Connect the evaporator tubes to the evaporator.



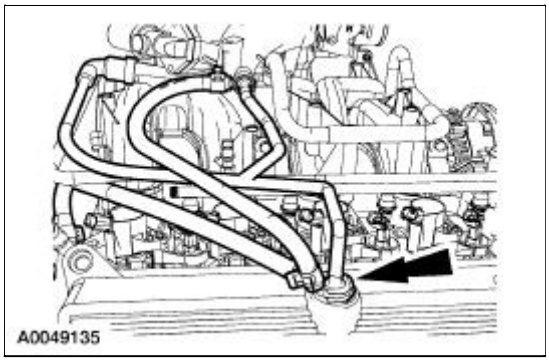
11. Connect the evaporator tubes to the manifold.

Vehicles with auxiliary heat



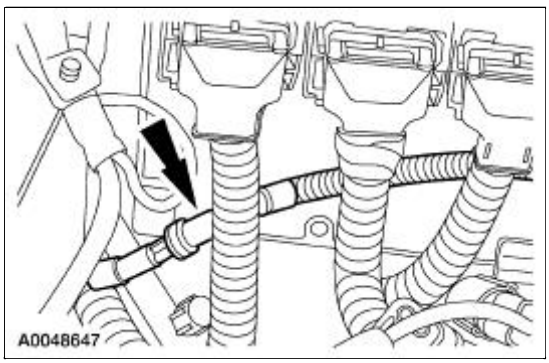
12. Connect the rear heater water lines.

Romeo engine (4.6L)



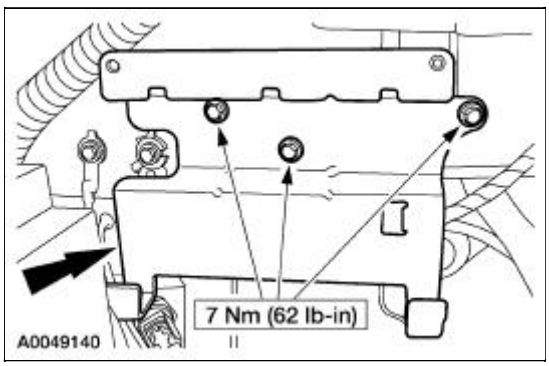
13. **NOTE:** Rotate the PCV valve to lock it in place.

    Install the PCV valve in the valve cover and connect the hose.

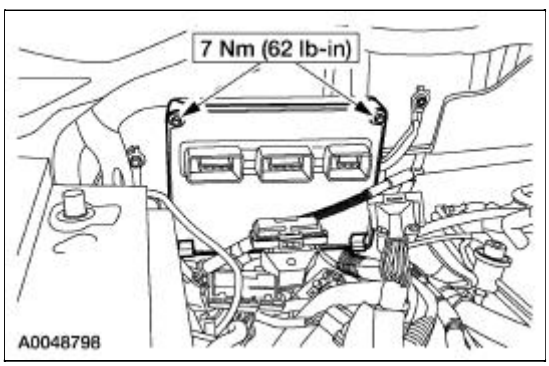


Windsor engine (5.4L)

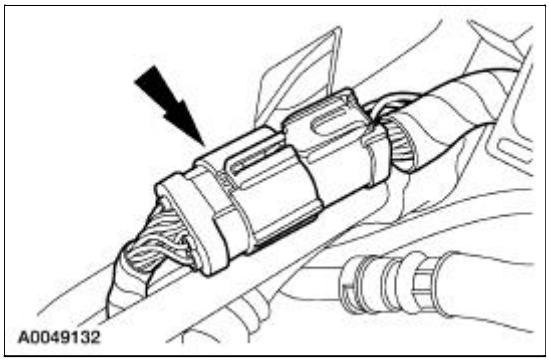
14. Install the PCV valve in the valve cover.



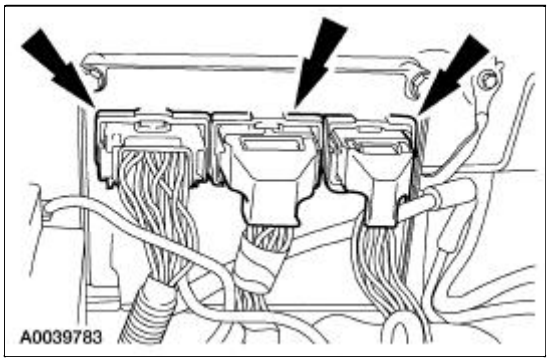
All vehicles



15. Connect the climate control vacuum hose.



16. Install the PCM mounting bracket.



17. Position the PCM and install the bolts.

18. Connect the engine wiring harness electrical connector located near the battery.

19. Connect the PCM electrical connectors.

20. Connect the battery ground cable. For additional information, refer to Section 414-01 .

21. Recharge the air conditioning system. For additional information, refer to Section 412-03A .

Vehicles with auxiliary heat

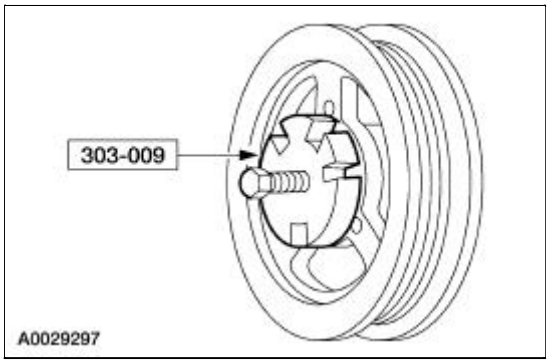
22. Fill the engine cooling system. For additional information, refer to Section 303-03 .

Crankshaft Pulley

Special Tool(s)

 ST1286-A	Remover, Crankshaft Vibration Damper 303-009 (T58P-6316-D)
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)

Material

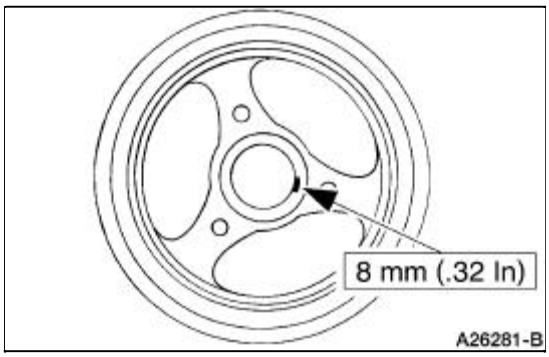


Item	Specification
Motorcraft Silicone Gasket Remover ZC-30	—
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4

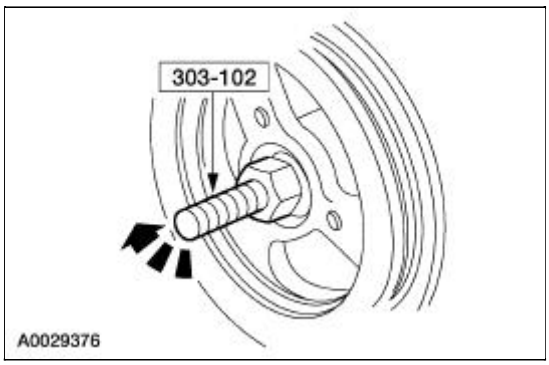
Removal

1. Remove the engine cooling fan (8K620) and fan shroud (8146). For additional information, refer to Section 303-03 .
2. Remove the drive belt (8620). For additional information, refer to Section 303-05 .
3. Remove the crankshaft pulley bolt (6A340).

GA2590-A



4. Use the special tool to remove the crankshaft pulley (6312).



Installation

1. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

   Apply silicone gasket and sealant to the Woodruff key slot on the crankshaft pulley.

2. Use the special tool to install the crankshaft pulley.

3. Install the bolt and washer. Tighten the bolt in four stages.
   - Stage 1: tighten to 90 Nm (66 lb-ft).
   - Stage 2: loosen the bolt.
   - Stage 3: tighten to 50 Nm (37 lb-ft).
   - Stage 4: tighten an additional 85-90 degrees.

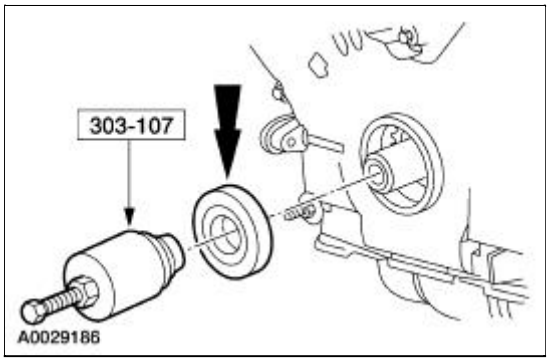
4. Install the drive belt. For additional information, refer to Section 303-05 .

5. Install the engine cooling fan and the fan shroud. For additional information, refer to Section 303-03 .

Crankshaft Front Oil Seal

Special Tool(s)

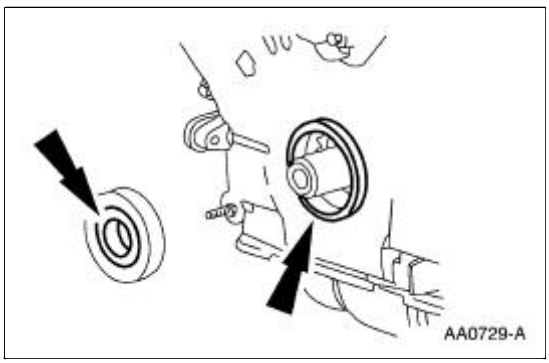
 ST2197-A	Installer, Crankshaft Front Oil Seal 303-635
 ST1328-A	Installer, Front Cover Oil Seal 303-335 (T88T-6701-A)
 ST1288-A	Remover, Crankshaft Front Oil Seal 303-107 (T74P-6700-A)
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)



Material

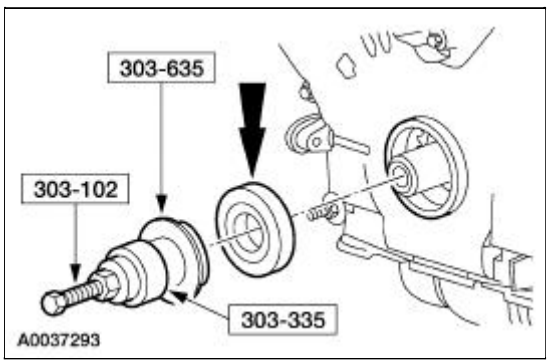
Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal



1. Remove the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.

2. Using the special tool, remove the crankshaft front oil seal.



Installation

1. Lubricate the engine front cover and the crankshaft front oil seal inner lip with clean engine oil.

2. Using the special tools, install the crankshaft front oil seal into the engine front cover.

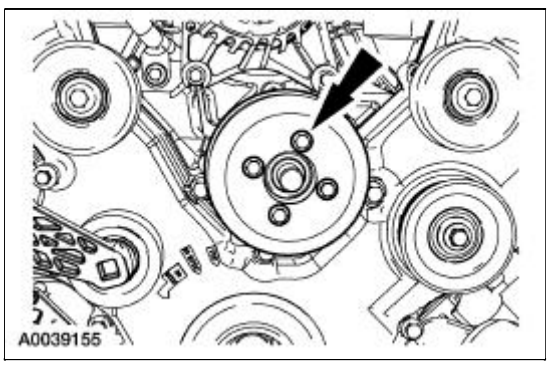
3. Install the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.

Engine Front Cover

Material

Item	Specification
Motorcraft Silicone Gasket Remover ZC-30	—
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal

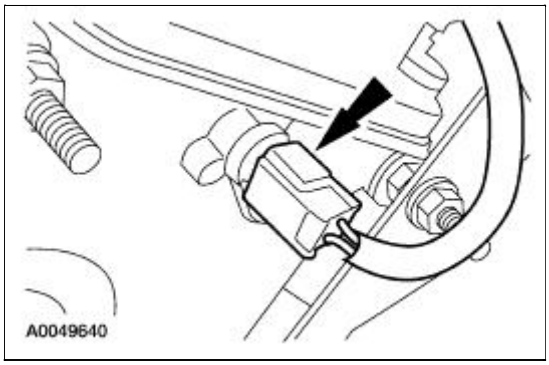


1. **CAUTION: The air suspension switch must be turned off prior to raising the vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which could result in shifting of the vehicle during the repair operation.**

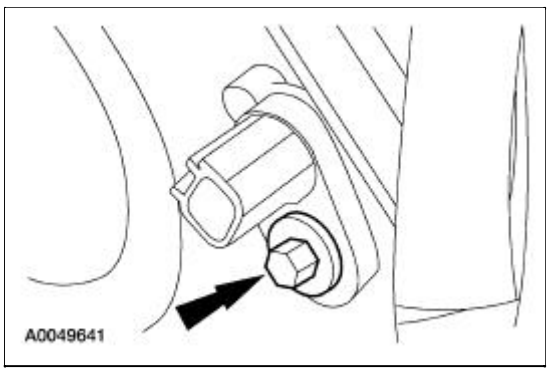
   If equipped, turn the air suspension switch off.

2. Remove both of the valve covers. For additional information, refer to Valve Cover LH and Valve Cover RH in this section.

3. Remove the cooling fan. For additional information, refer to Section 303-03 .

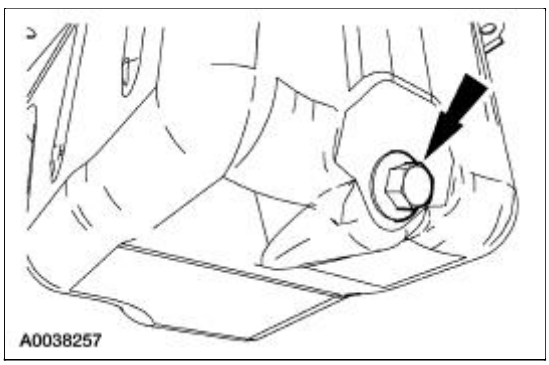


4. Remove the bolts and the coolant pump pulley.

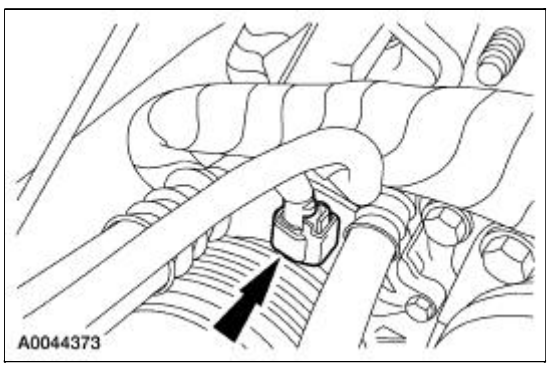


5. Remove the power steering pump. For additional information, refer to Section 211-02 .

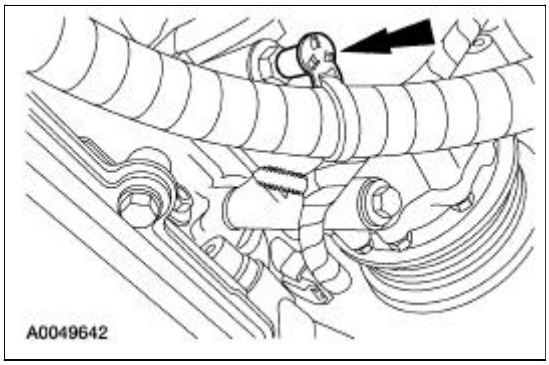
6. Remove the crankshaft front oil seal. For additional information, refer to Crankshaft Front Oil Seal in this section.



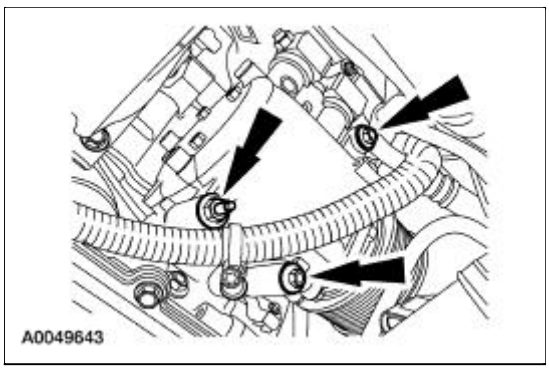
7. Disconnect the camshaft position (CMP) sensor electrical connector.



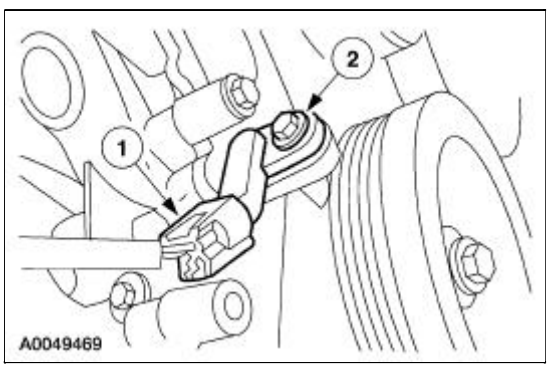
8. Remove the bolt and the CMP sensor.



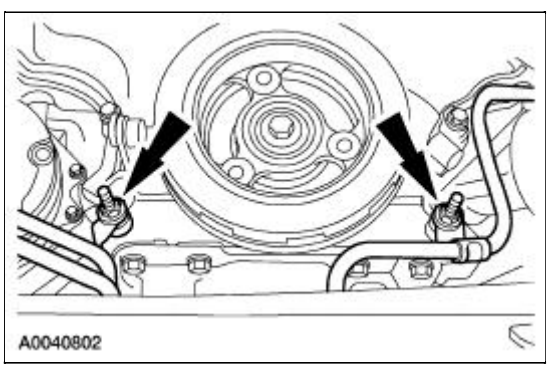
9. Raise and support the vehicle. For additional information, refer to Section 100-02 .
10. Remove the drain plug and drain the engine oil.



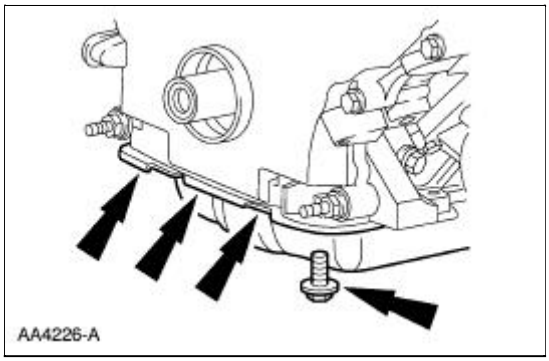
11. Disconnect the A/C compressor electrical connector.



12. Disconnect the harness routing clip and position the harness aside.

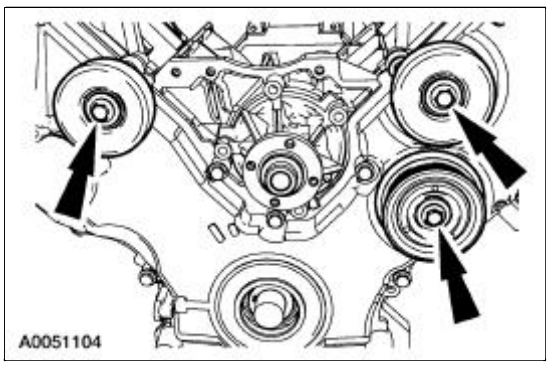


13. Remove the fasteners and position the A/C compressor aside.

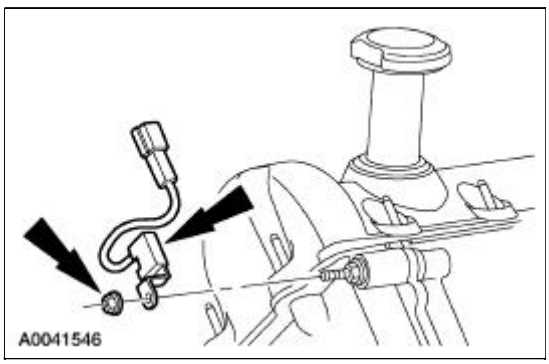


14. Remove the crankshaft position (CKP) sensor.
    1. Disconnect the electrical connector.
    2. Remove the bolt and the sensor.

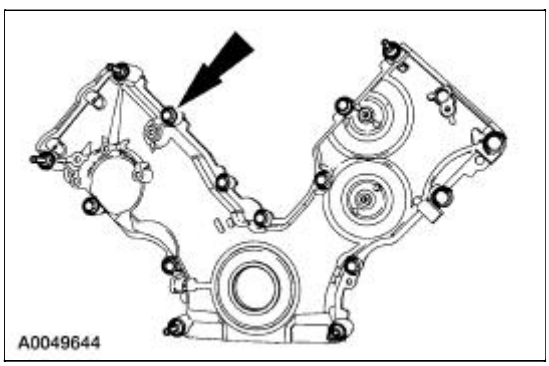
15. Remove the nuts and detach the power steering and transmission cooler tube brackets.



16. Remove the four bolts.



17. Lower the vehicle.



18. Remove the bolts and the drive belt idler pulleys.

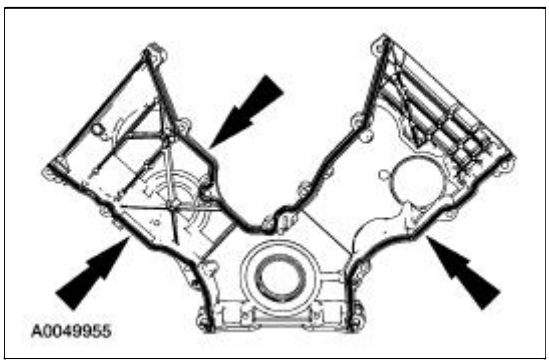
19. Remove the nuts and the two radio interference capacitors.

20. Remove the 15 fasteners, the engine front cover and the gaskets.

21. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges**

which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.

CAUTION: Cover the oil pan opening to prevent foreign material from falling into the oil pan.

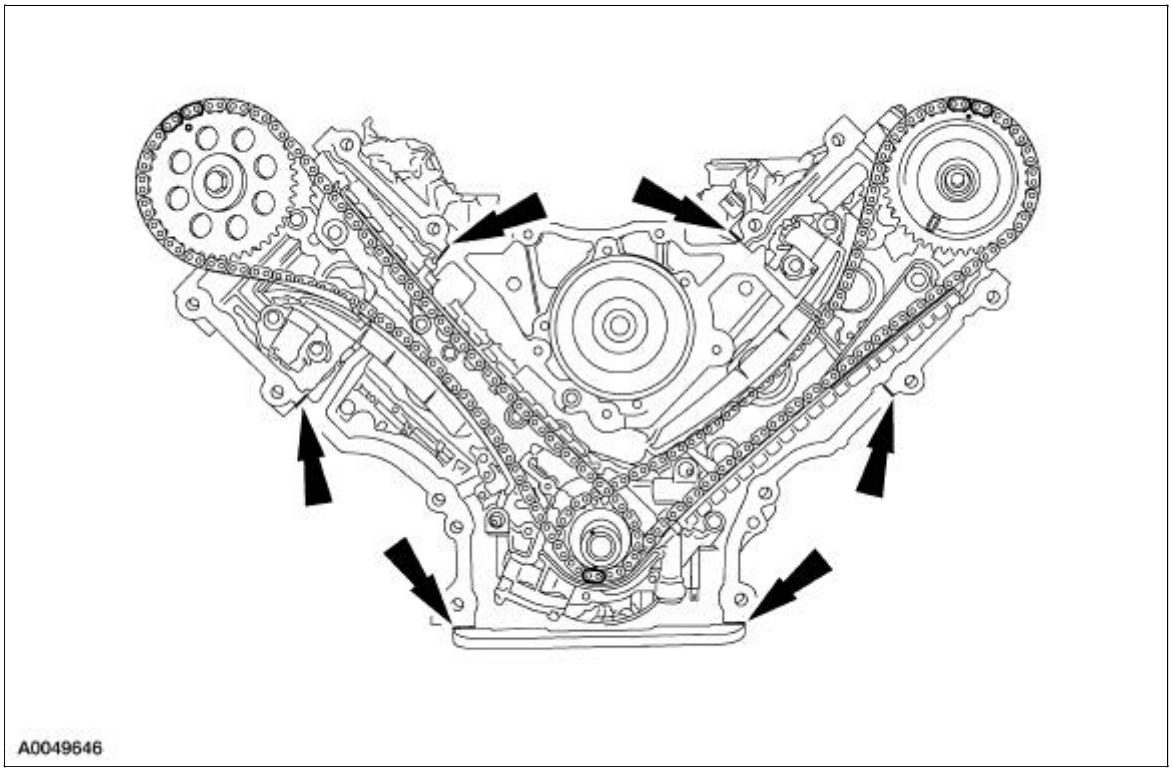


Inspect and clean the gasket mating surfaces.

- Clean the mating surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
- Inspect the mating surfaces.

Installation

All vehicles



1. Install the gaskets on the engine front cover.

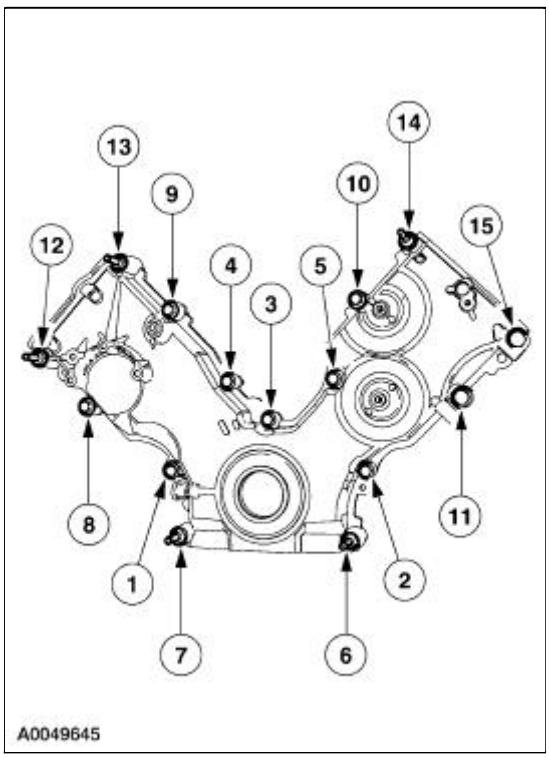
2. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   NOTE: If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

   Apply a bead of silicone gasket and sealant at the cylinder head-to-cylinder block surface and the oil pan-to-cylinder block surface, at the locations shown.

3. **NOTE:** Make sure that the engine front cover gaskets are in place on the engine front cover before installation.

   Position the engine front cover on the front cover-to-cylinder block dowels and loosely install the bolts.



Romeo engine (4.6L)

4. Tighten the engine front cover fasteners in the sequence shown to 25 Nm (18 lb-ft).

Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
4	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
5	N806177	Bolts, Hex Flange Head Pilot, M8 x 53
6	N808586	Stud, Hex Shldr Pilot, M8 x 1.25 — M6 x 1 x 86.35
7	N808586	Stud, Hex Shldr Pilot, M8 x 1.25 — M6 x 1 x 86.35

8	N808586	Stud, Hex Shldr Pilot, M8 x 1.25 — M6 x 1 x 86.35

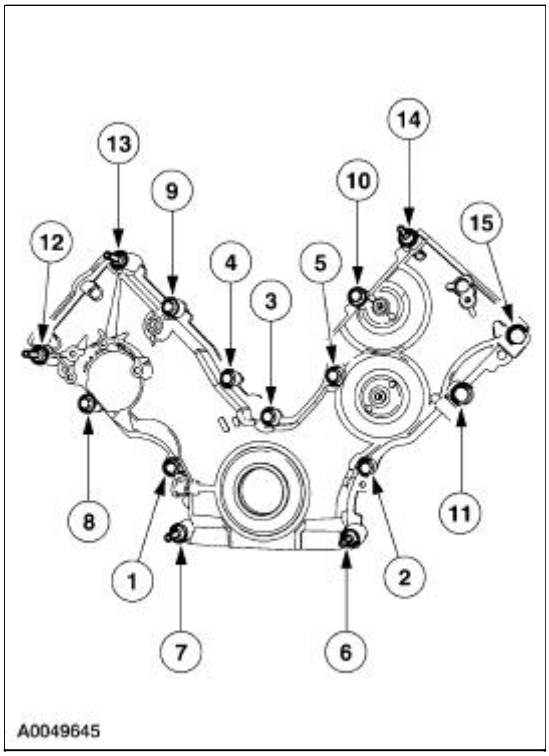
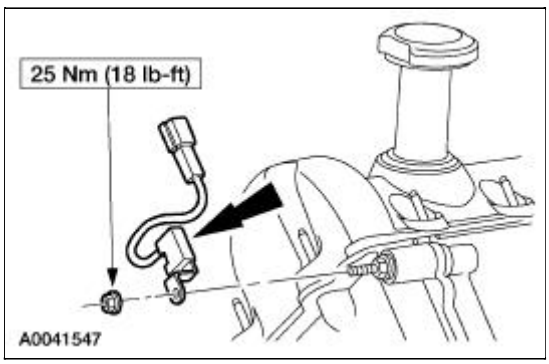
12	N806300	Stud, Hex Shldr Pilot, M8 x 1.25 x 1.25 x 91.1
13	N806300	Stud, Hex Shldr Pilot, M8 x 1.25 x 1.25 x 91.1
14	N806300	Stud, Hex Shldr Pilot, M8 x 1.25 x 1.25 x 91.1
15	N806177	Bolt, Hex Flange Head Pilot, M8 x 53



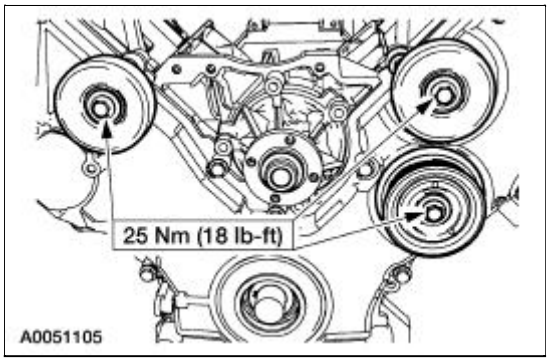
Windsor engine (5.4L)

5. Tighten the engine front cover fasteners in the sequence shown in three stages.
   Stage 1: tighten fasteners 1 through 5 to 25 Nm (18 lb-ft).
   Stage 2: tighten fasteners 6 and 7 to 48 Nm (35 lb-ft).
   Stage 3: tighten fasteners 8 through 15 to 48 Nm (35 lb-ft).



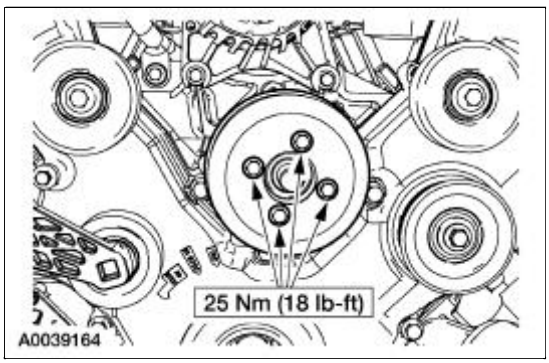
Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
4	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
5	N806177	Bolts, Hex Flange Head Pilot, M8 x 53
6	N808529	Stud, Hex Head Pilot, M10 x 103.1
7	N808529	Stud, Hex Head Pilot, M10 x 103.1
8	N808142	Screw and Washer, Hex Pilot, M10 x 1.5 x 57.5
9	N808142	Screw and Washer, Hex Pilot, M10 x 1.5 x 57.5

10	N808142	Screw and Washer, Hex Pilot, M10 x 1.5 x 57.5
11	W706604	Bolt, Hex Flange Head, M10 x 65
12	N808140	Stud and Washer, Hex Head Pilot, M10/M8 x 107
13	N808140	Stud and Washer, Hex Head Pilot, M10/M8 x 107
14	N808140	Stud and Washer, Hex Head Pilot, M10/M8 x 107
15	W706604	Bolt, Hex Flange Head, M10 x 65

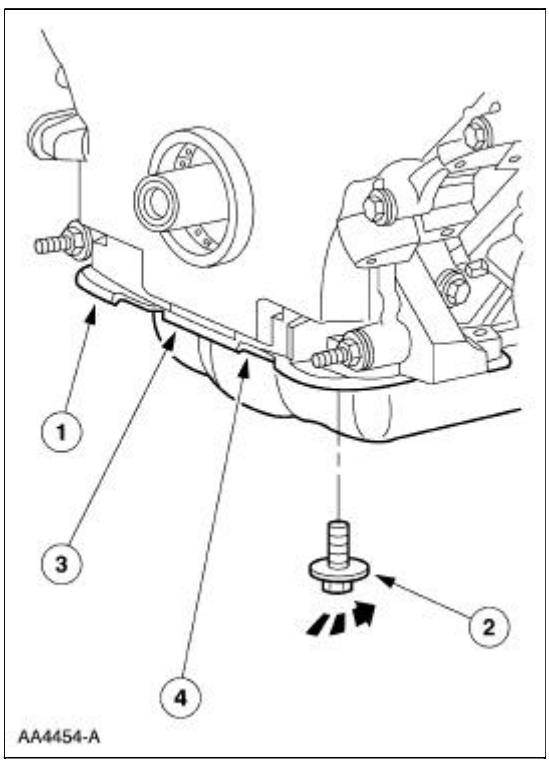


All vehicles

6. Position the two radio frequency interference capacitors and install the nuts.

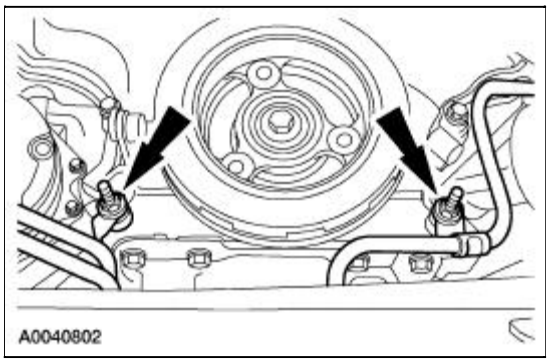


7. Position the drive belt idler pulleys and install the bolts.

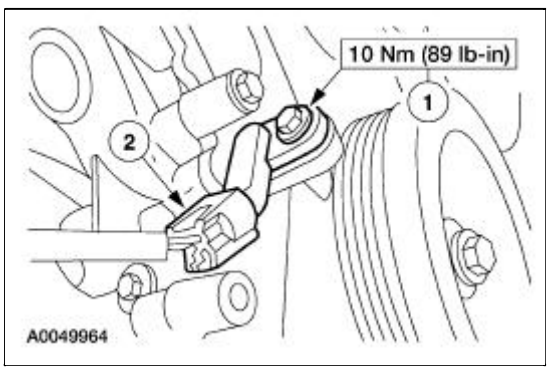


8. **NOTE:** Hold the water pump pulley with a suitable tool to prevent rotation.

   Position the coolant pump pulley and install the bolts.

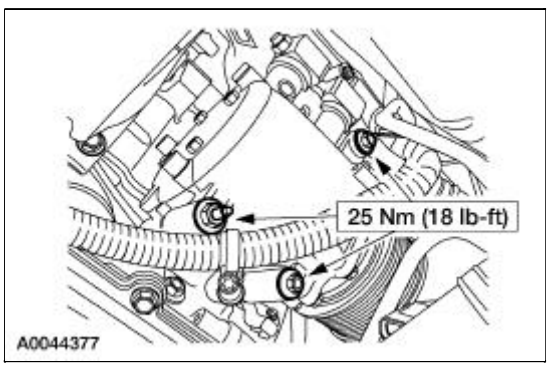


9. Raise and support the vehicle. For additional information, refer to Section 100-02 .

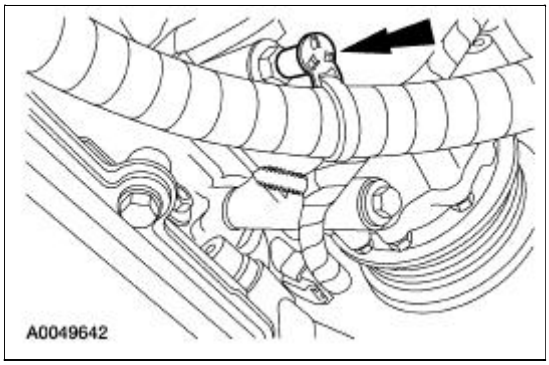


10. Loosely install the bolts, then tighten the bolts in two stages, in the sequence shown.
    - Stage 1: tighten to 20 Nm (15 lb-ft).
    - Stage 2: tighten an additional 90 degrees.

11. Position the transmission cooler tube and the power steering tube brackets. Install the nuts.
    - On 4.6L engine, tighten the nuts to 11 Nm (8 lb-ft).
    - On 5.4L engine, tighten the nuts to 40 Nm (30 lb-ft).

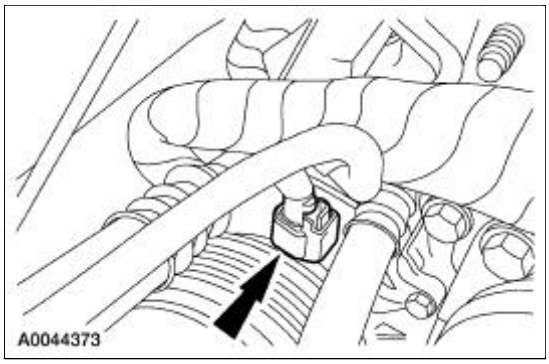


12. Install the CKP sensor.
    1. Install the sensor and bolt.
    2. Connect the electrical connector.

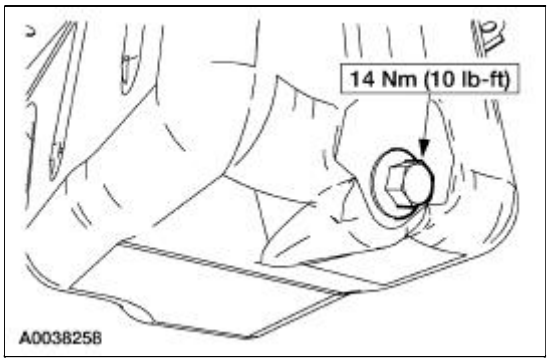


13. Install a new crankshaft front oil seal. For additional information, refer to Crankshaft Front Oil Seal in this section.

14. Install the power steering pump. For additional information, refer to Section 211-02 .

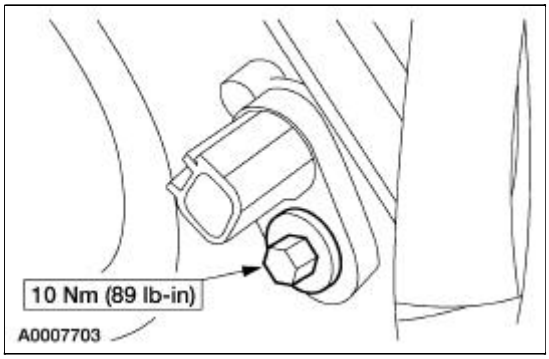


15. Position the A/C compressor and install the fasteners.

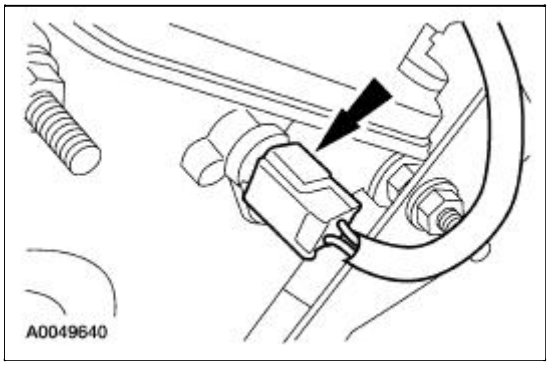


16. Install the harness routing clip.

17. Connect the A/C compressor electrical connector.



18. Install the drain plug.



19. Install a new engine oil filter.

20. Lower the vehicle.

21. Install the CMP sensor and bolt.

22. Connect the CMP sensor electrical connector.

23. Install the cooling fan. For additional information, refer to Section 303-03 .

24. **CAUTION: Fill the engine with clean engine oil before starting the engine to fill the cooling system or charge the A/C system.**

    Install the LH and RH valve covers. For additional information, refer to Valve Cover LH and Valve Cover RH in this section.

25. Fill the engine with clean engine oil.

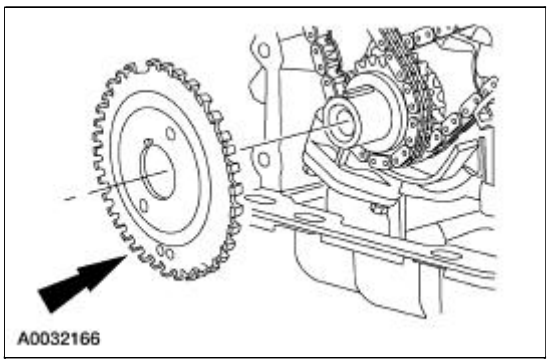
26. If equipped, turn on the air suspension switch.

Timing Drive Components —Windsor Engine (5.4L)

Special Tool(s)

 ST1335-A	Holding Tool, Crankshaft 303-448 (T93P-6303-A)
	Aligner, Camshaft Position 303-557 (T96T-6256-B)
 ST2565-A	Alignment Set, Camshaft 303-S568 (T96T-6256-AR)

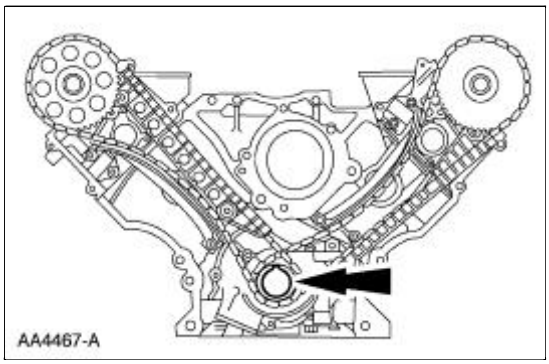
Material



Item	Specification
Hydraulic Chain Tensioner Retaining Clip	1L3Z-6P250-AA

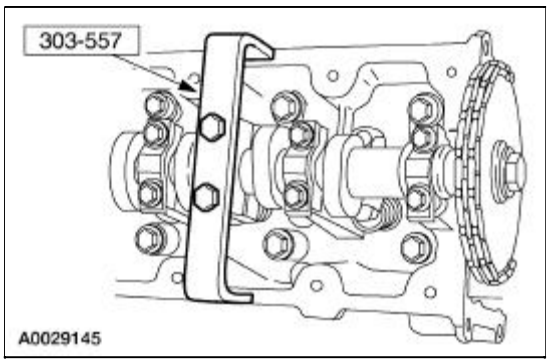
Removal

CAUTION: Since the engine is not free-wheeling, the timing procedures must be followed exactly or piston and valve damage can occur.



1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.

2. Remove the crankshaft sensor ring from the crankshaft.



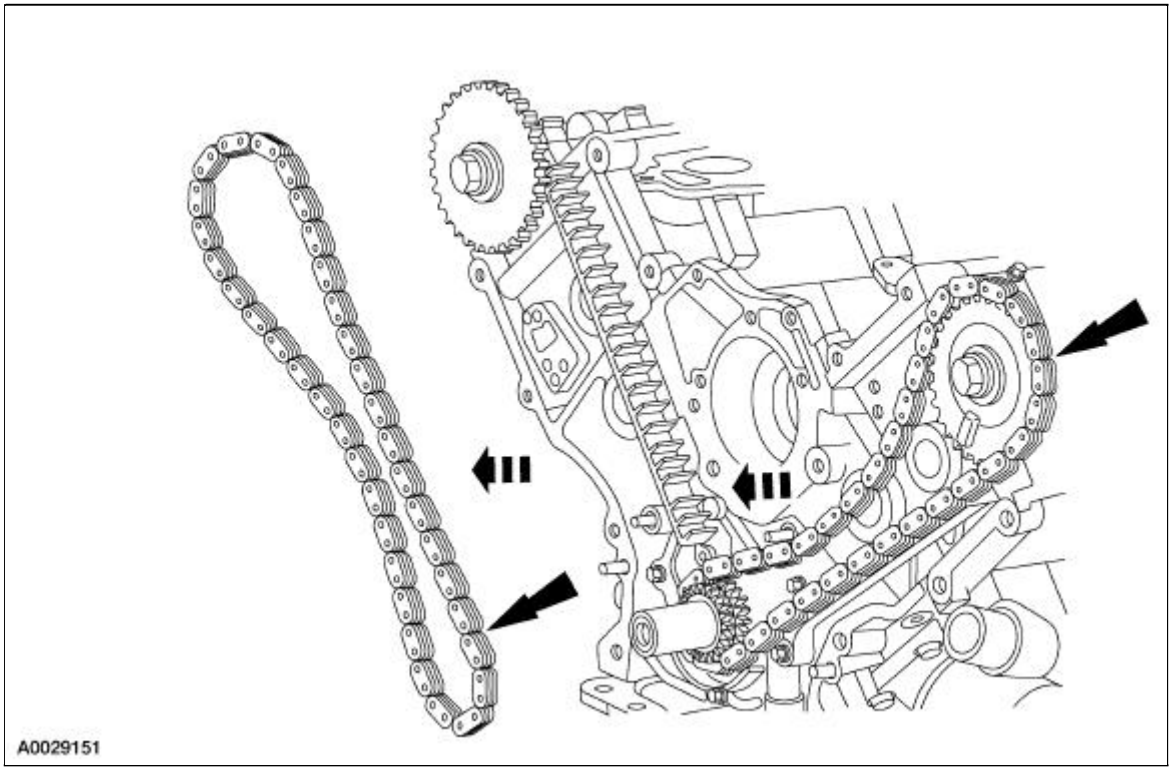
A0032166

3. **CAUTION: Unless otherwise instructed, at no time when the timing chains are removed and the cylinder heads are installed is the crankshaft or camshaft to be rotated. Severe piston and valve damage will occur.**

   Position the crankshaft with the keyway at the 12 o'clock position.

4. Install and fully tighten the special tools on both camshafts.

5. Remove the timing chain tensioning system from both timing chains.
   1. Remove the bolts.
   2. Remove the timing chain tensioners.
   3. Remove the timing chain tensioner arms.

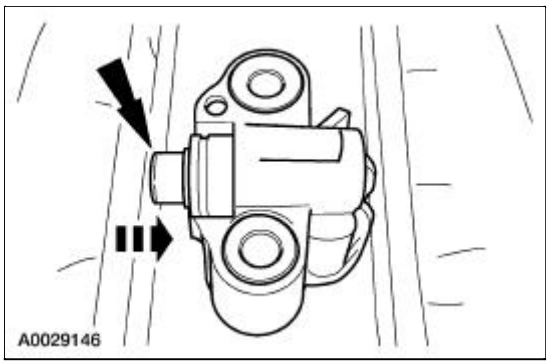


6. **CAUTION: Unless otherwise instructed, at no time when the timing chains are removed and the cylinders heads are installed is the crankshaft or camshaft to be rotated. Severe piston and valve damage will occur.**

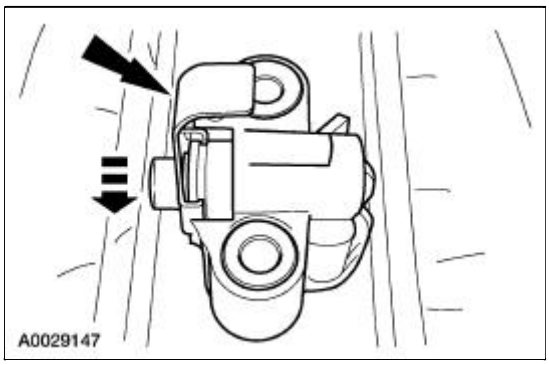
   Remove the RH and LH timing chains and the crankshaft sprocket.

   - Remove the RH timing chain from the camshaft sprocket.
   - Remove the RH timing chain from the crankshaft sprocket.

- Remove the LH timing chain from the camshaft sprocket.
- Remove the LH timing chain and crankshaft sprocket.



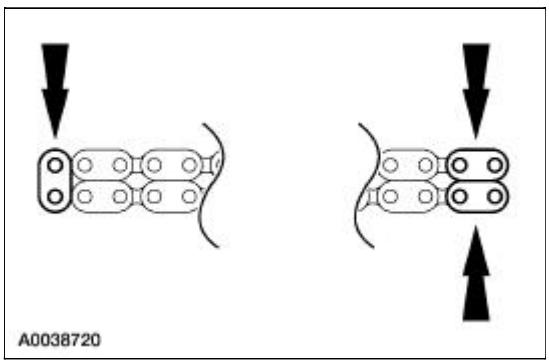
7. Remove both timing chain guides.
    - Remove the bolts.
    - Remove both timing chain guides.



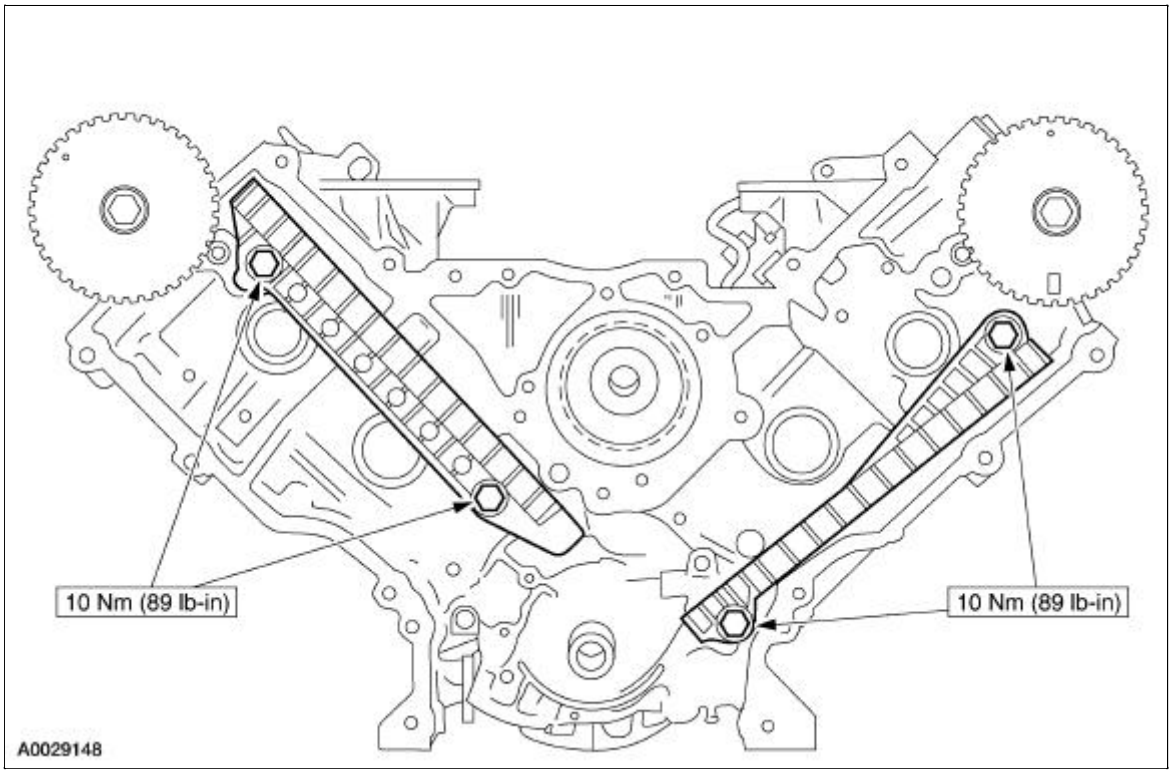
Installation

1. **CAUTION: Timing chain procedures must be followed exactly or damage to valves and pistons will result.**

   Compress the tensioner plunger, using a vise.

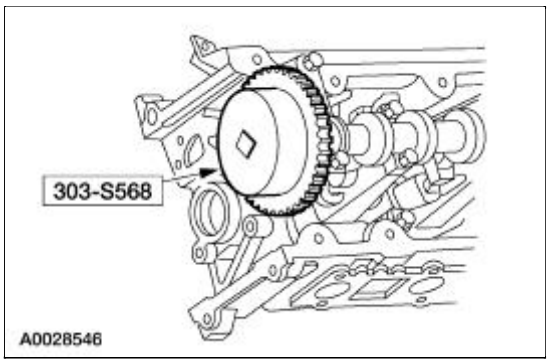


2. Install a retaining clip on the tensioner to hold the plunger in during installation.



3. Remove the tensioner from the vise.

4. If the copper links are not visible, mark two links on one end and one link on the other end, and use as timing marks.



5. Install the timing chain guides.

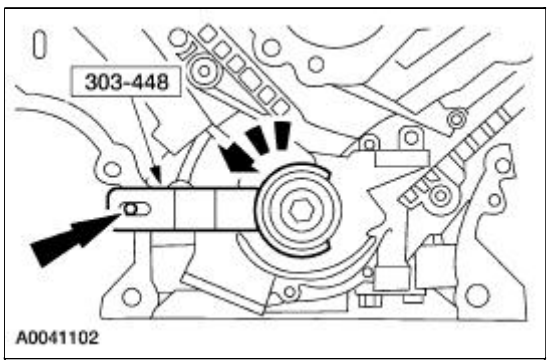
6. **CAUTION: Do not turn the engine over with the Camshaft Alignment Set or damage to the camshaft sprocket or the bolt can occur.**

   Install the special tool.

7. **NOTE:** Slightly loosen the Camshaft Position Aligner tools to allow slight camshaft movement.

   Pre-position the camshafts.
   1. Rotate the LH camshaft with the Camshaft Alignment Set until the timing mark is approximately at 12 o'clock.
   2. Rotate the RH camshaft with the Camshaft Alignment Set until the timing mark is approximately at 11 o'clock.

   - Tighten the Camshaft Position Aligner tools to maintain camshaft pre-positioning.

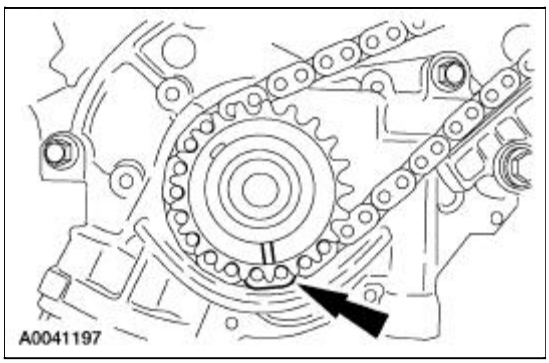


8. **CAUTION: Unless otherwise instructed, at no time when the timing chains are removed and the cylinder heads are installed is the crankshaft or camshaft to be rotated. Severe piston and valve damage will occur.**

   CAUTION: Rotate the crankshaft counterclockwise only. Do not rotate past position shown or severe piston and valve damage can occur.

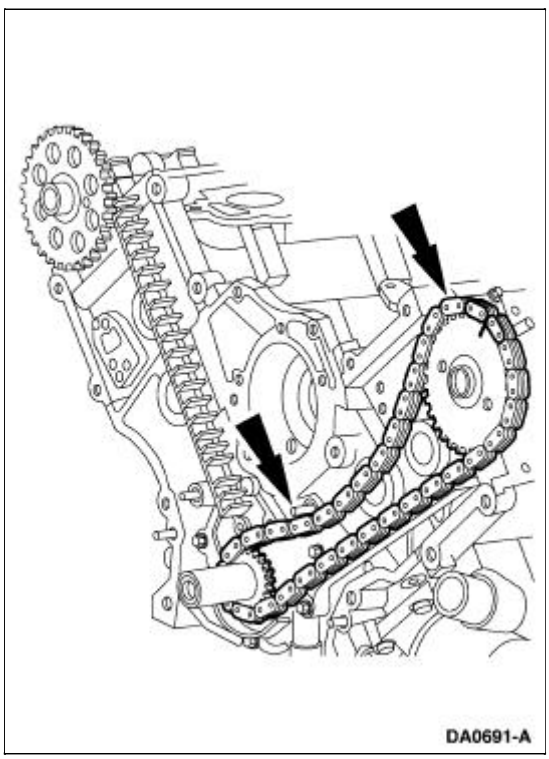
   NOTE: The number one cylinder is at top dead center (TDC) when the stud on the engine block fits into the slot in the handle of the special tool.

   Position the crankshaft so the number one cylinder is at TDC with the special tool.



9. Remove the Crankshaft Holding Tool.

10. Install the crankshaft sprocket, making sure the flange faces forward.

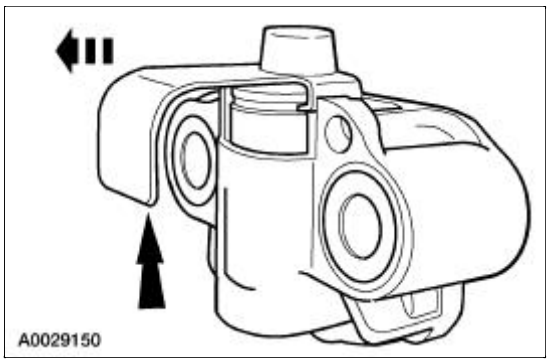


11. Position the lower end of the LH (inner) timing chain on the crankshaft sprocket, aligning the timing mark on the outer flange of the crankshaft sprocket with the single copper (marked) link on the chain.

12. **NOTE:** Make sure the upper half of the timing chain is below the tensioner arm dowel.

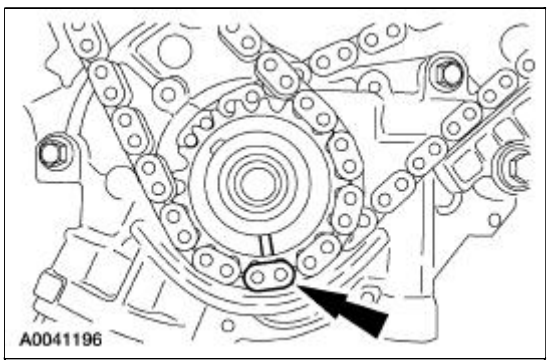
    NOTE: If necessary, use the Camshaft Alignment Set to adjust the camshaft sprocket slightly to obtain timing mark alignment.

    Position the timing chain on the camshaft sprocket with the camshaft sprocket timing mark positioned between the two copper (marked) chain links.

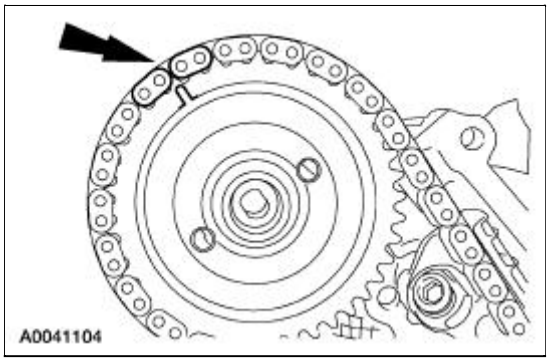


13. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole, for identification.

    Position the LH timing chain tensioner arm on the dowel pin and install the LH timing chain tensioner.

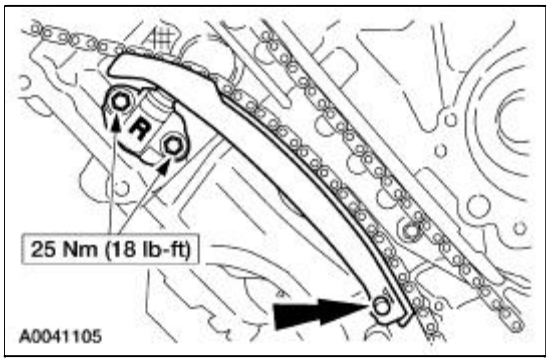


14. Remove the retaining clip from the LH timing chain tensioner.



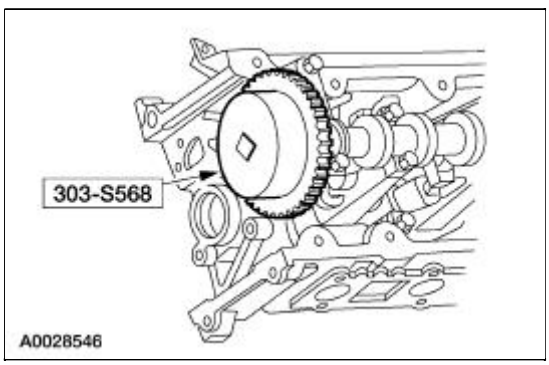
15. **NOTE:** The lower half of the timing chain must be positioned above the tensioner arm dowel.

    Position the lower end of the RH (outer) timing chain on the crankshaft sprocket, aligning the timing mark on the sprocket with the single copper (marked) link on the timing chain.

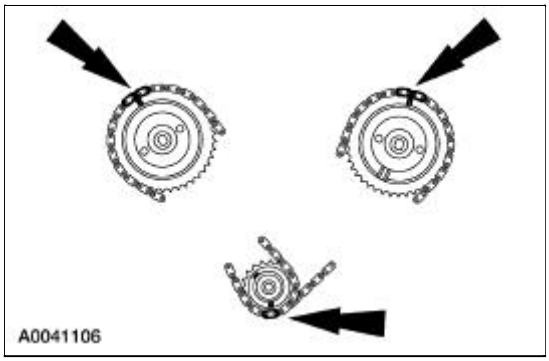


16. **NOTE:** If necessary, use the Camshaft Alignment Set to adjust the camshaft sprocket slightly to obtain timing mark alignment.

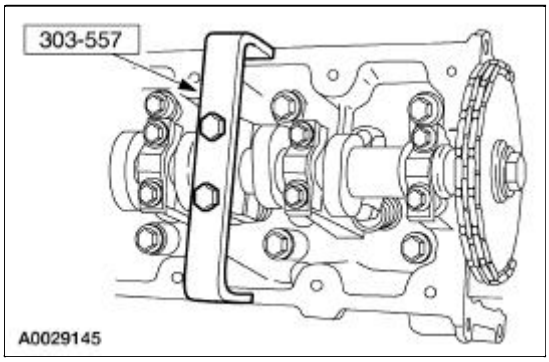
    Position the RH timing chain on the camshaft sprocket. Make sure the camshaft sprocket timing mark is positioned between the two copper (marked) chain links.



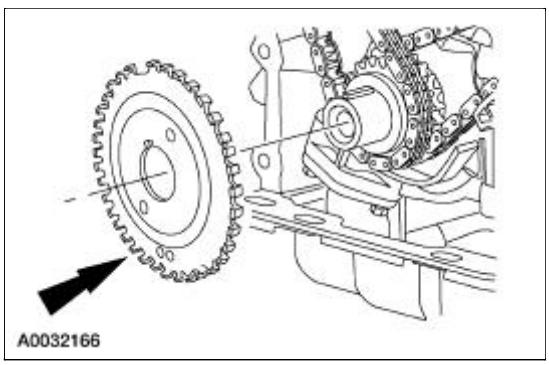
17. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner.



18. Remove the retaining clip from the RH timing chain tensioner.



19. Remove the special tool.



20. As a post-check, verify correct alignment of all timing marks.

21. Remove the special tool.

22. Position the crankshaft sensor ring on the crankshaft.

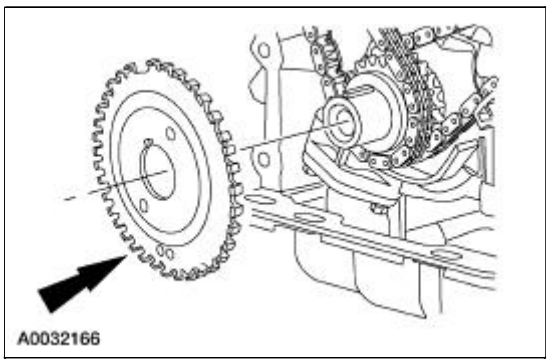
23. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

Timing Drive Components —Romeo Engine (4.6L)

Special Tool(s)

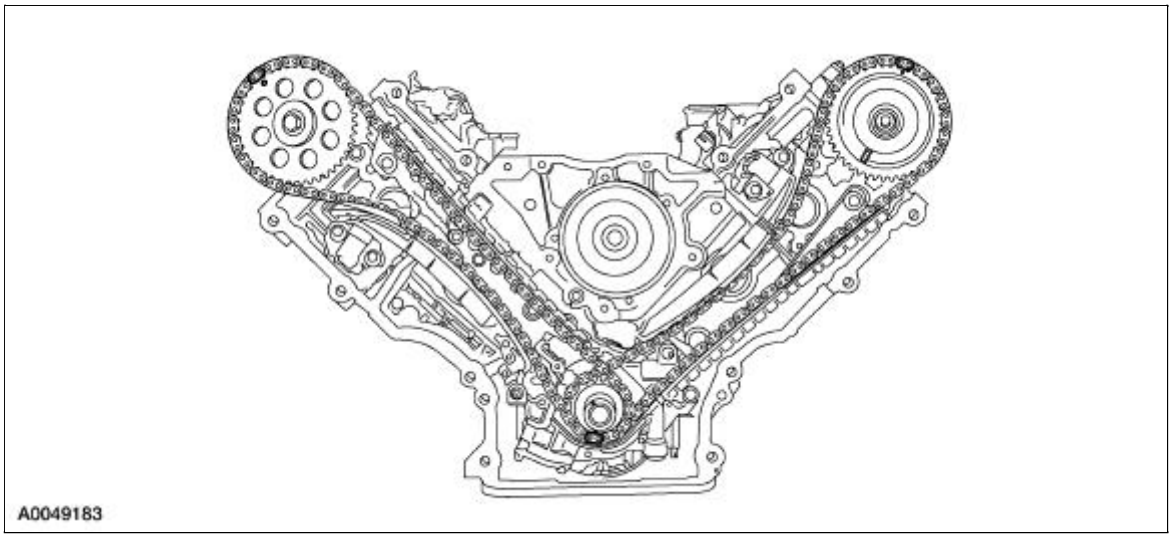
 ST1329-A	Aligner, Camshaft 303-380 (T91P-6256-A)
 ST1334-A	Aligner, Camshaft Pulley 303-413 (T92P-6256-A)
 ST1335-A	Holding Tool, Crankshaft 303-448 (T93P-6303-A)

Material



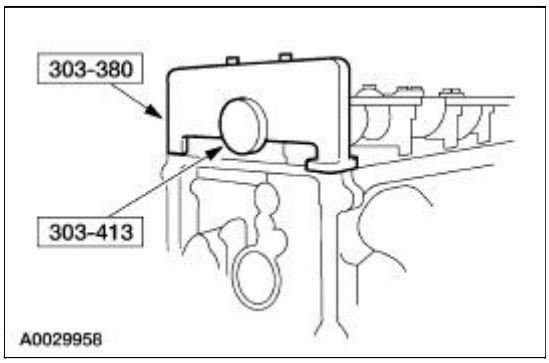
Item	Specification
Hydraulic Chain Tensioner Retaining Clip	1L3Z-6P250-AA

Removal

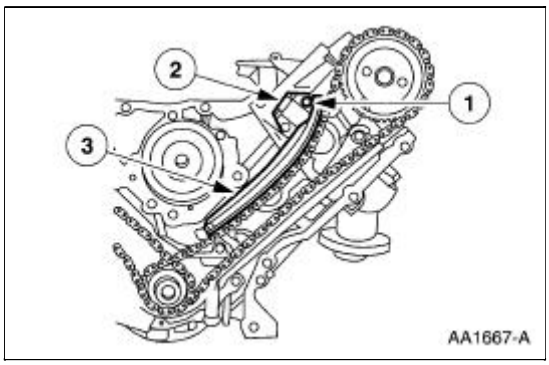


CAUTION: Since the engine is not free-wheeling, timing procedures must be followed exactly or piston and valve damage can occur.

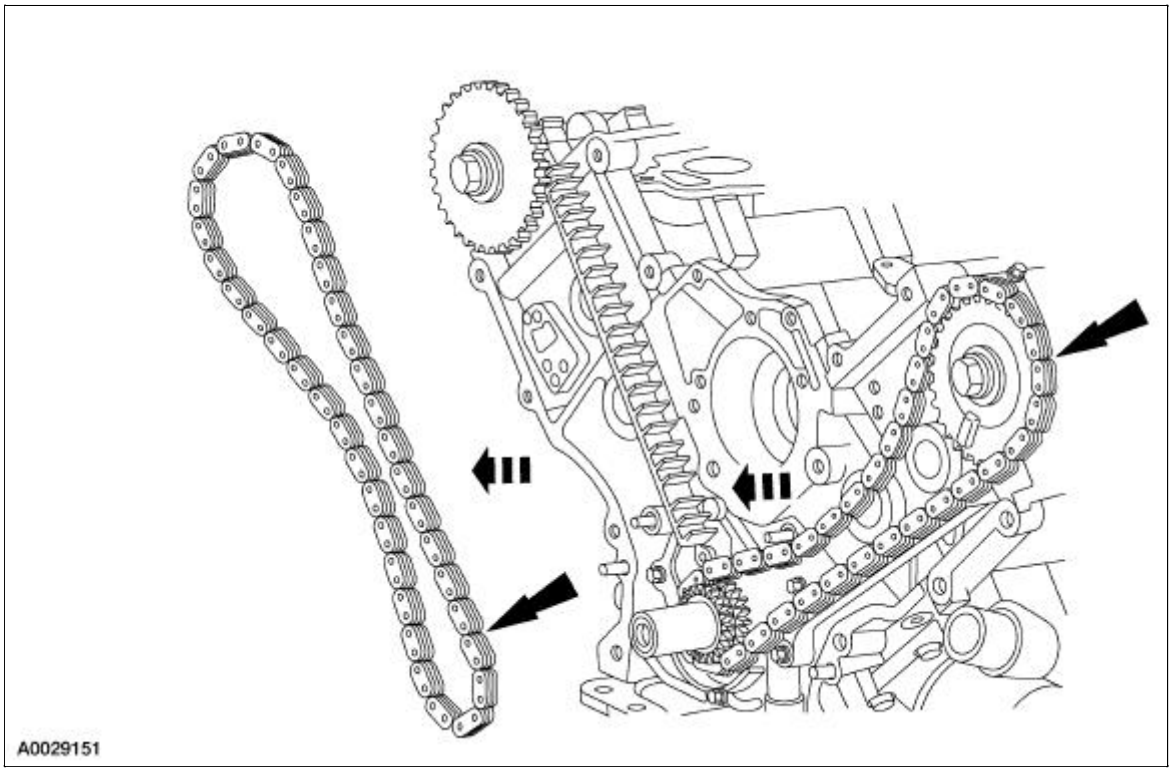
1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.



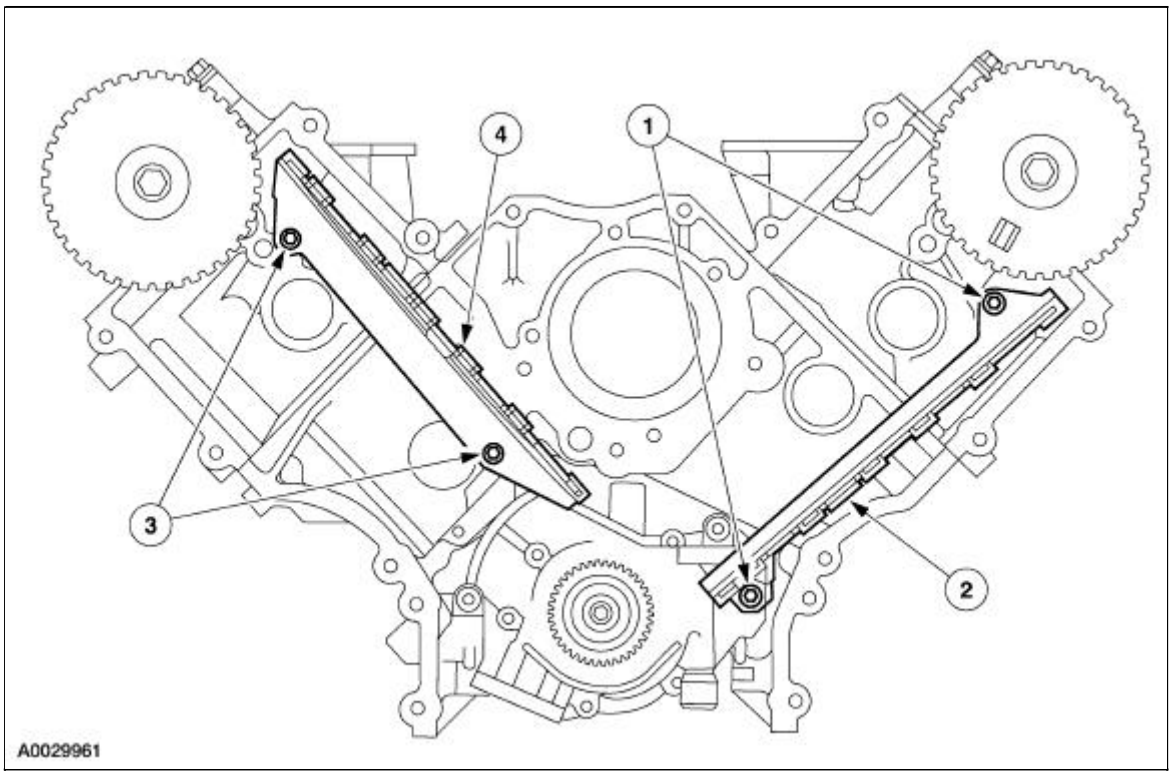
2. Remove the crankshaft sensor ring from the crankshaft.



3. Rotate the crankshaft until the timing mark on the RH camshaft sprocket is approximately at the 11 o'clock position and the timing mark on the LH camshaft sprocket is approximately at the 12 o'clock position.



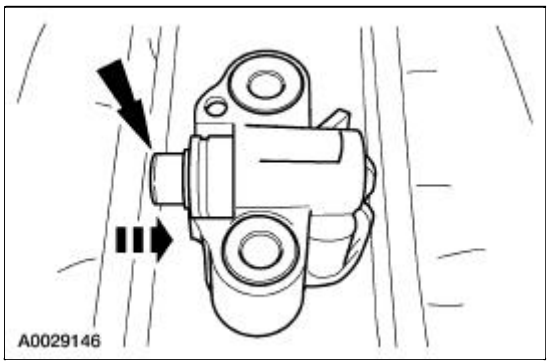
4. Install the special tools on the camshaft.



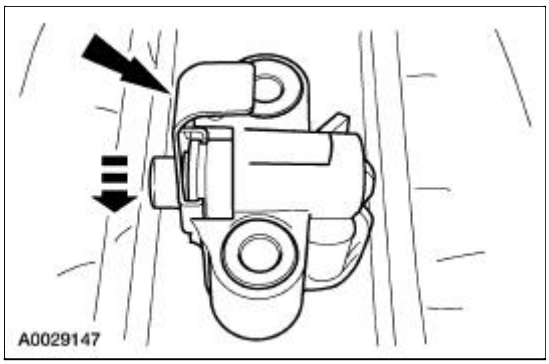
5. Remove the timing chain tensioning system from both timing chains.
    1. Remove the bolts.
    2. Remove the timing chain tensioners.
    3. Remove the timing chain tensioner arms.

6. Remove the timing chains and crankshaft sprocket.

7. Remove the timing chain guides.
    1. Remove the bolts.
    2. Remove the LH timing chain guide.
    3. Remove the bolts.
    4. Remove the RH timing chain guide.

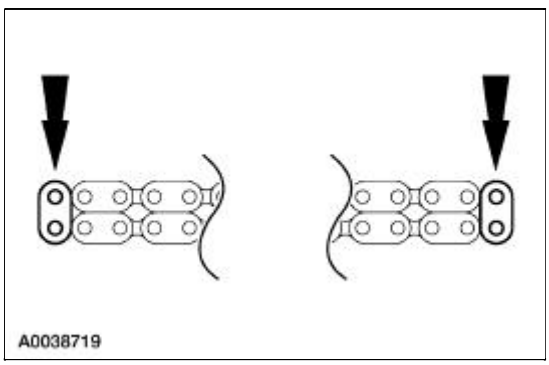


Installation

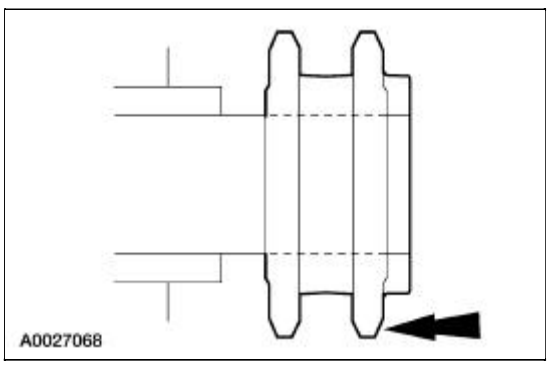


1. **CAUTION: Timing chain procedures must be followed exactly or damage to valves**

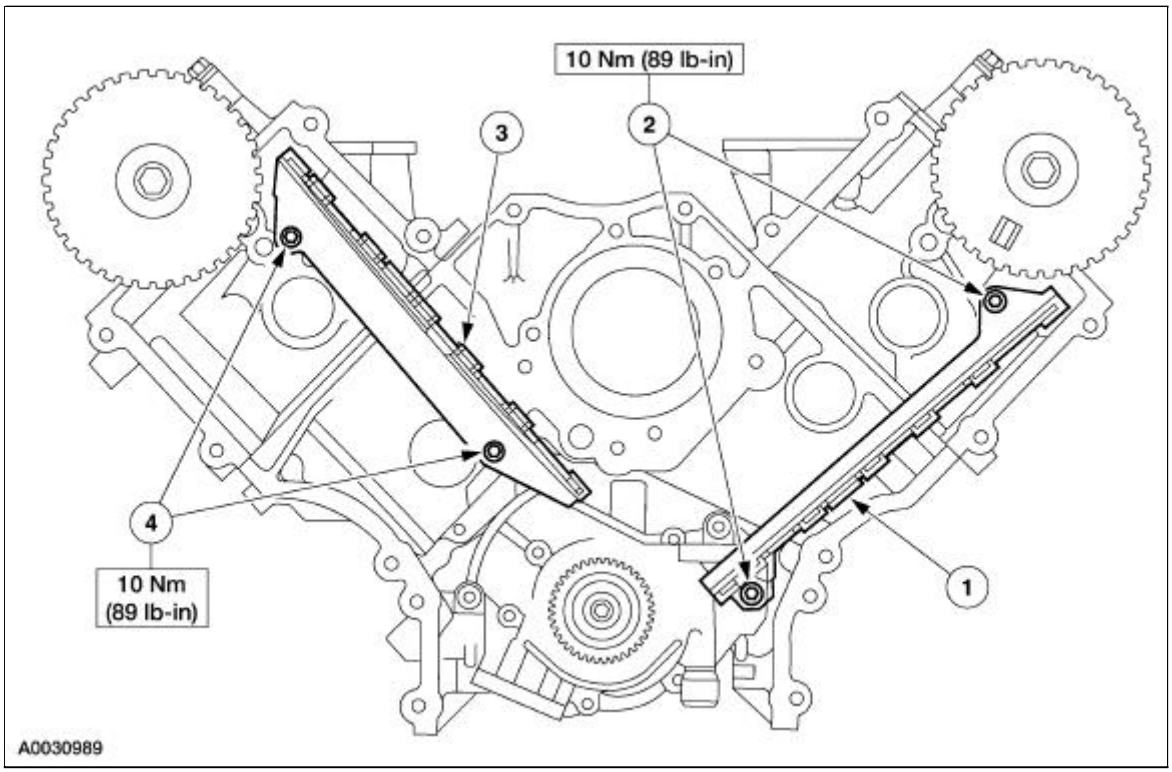
and pistons will result.



Compress the tensioner plunger, using a vise.

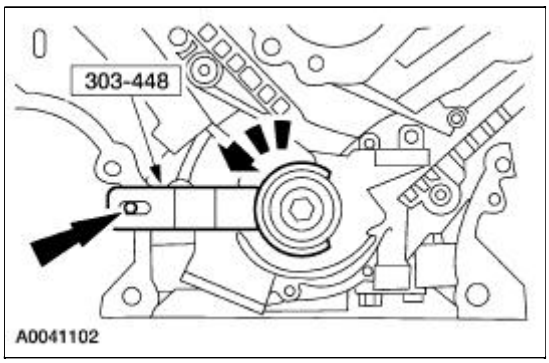


2. Install a retaining clip on the tensioner to hold the plunger in during installation.



3. If the copper links are not visible, mark one link on one end and one link on the other end, and use as timing marks.

4. Install the crankshaft sprocket, making sure the flange faces forward.

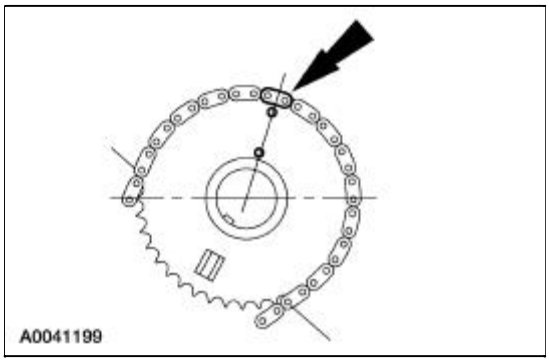


5. Install the timing chain guide.
    1. Position LH timing chain guide.
    2. Install and tighten the bolts.
    3. Position the RH timing chain guide.
    4. Install and tighten the RH bolts.

6. **CAUTION: Unless otherwise instructed, do not rotate either the crankshaft or the camshafts, when the timing chains are removed and the cylinder heads are installed. Severe piston and valve damage will occur.**

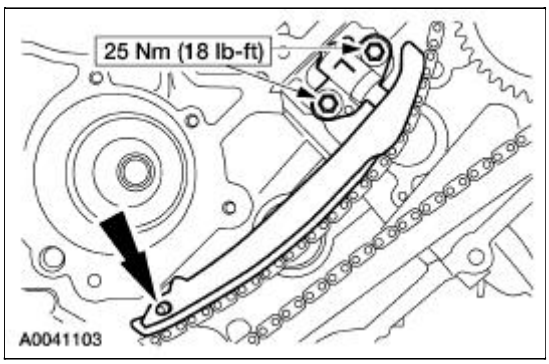
    NOTE: The number one cylinder is at top dead center (TDC) when the stud on the engine block fits into the slot in the handle of the special tool.

    Using the special tool, position the crankshaft so the number one cylinder is at TDC.

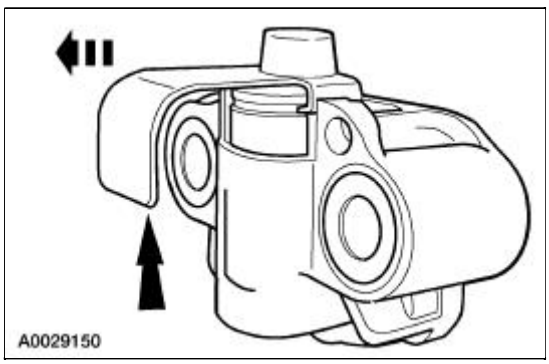


7. Remove the Crankshaft Holding Tool.

8. Position the LH (inner) timing chain on the crankshaft sprocket, aligning the copper (marked) link with the timing mark on the sprocket.

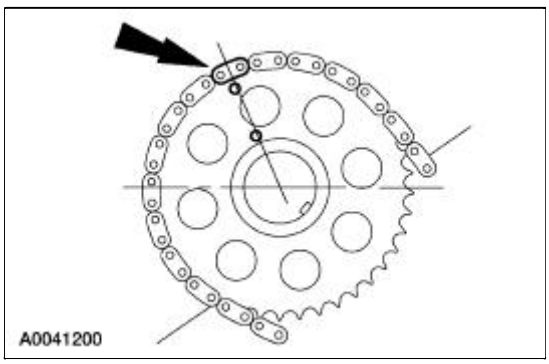


9. Install the LH timing chain on the camshaft sprocket, aligning the copper (marked) link with the timing marks on the sprocket.

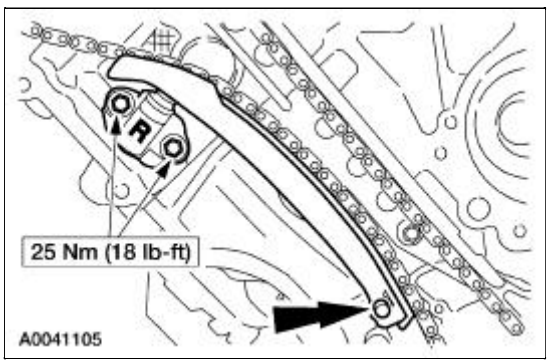


10. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole for identification.

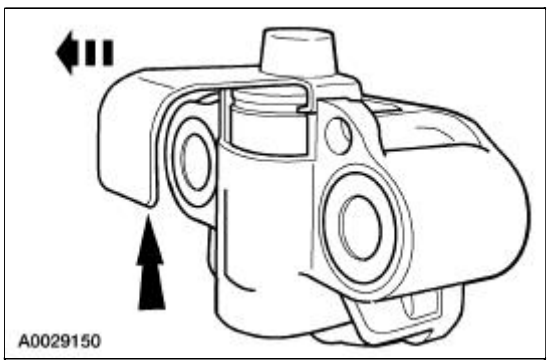
    Position the LH timing chain tensioner arm on the dowel pin and install the LH timing chain tensioner.



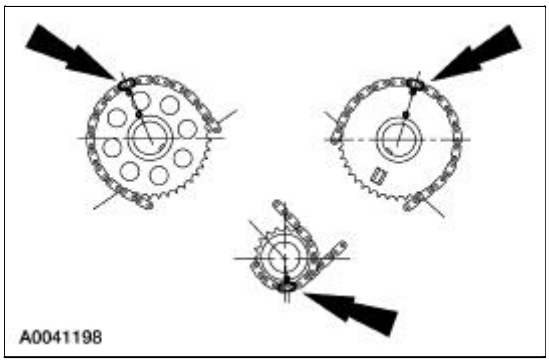
11. Remove the retaining clip from the LH timing chain tensioner.



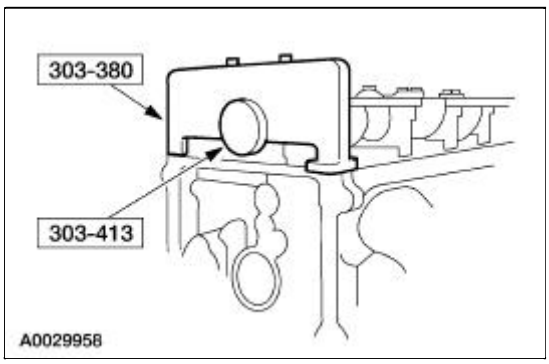
12. Position the RH (outer) timing chain on the crankshaft sprocket, aligning the copper (marked) link with the timing mark on the sprocket.



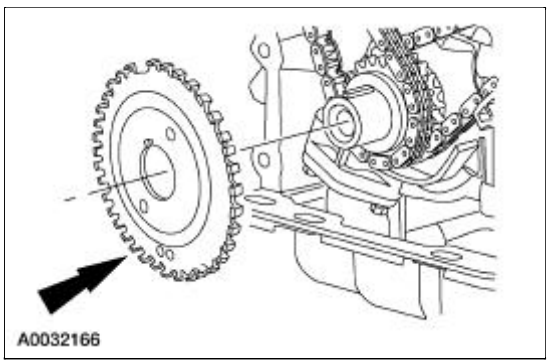
13. Install the RH timing chain on the camshaft sprocket, aligning the copper (marked) link with the timing marks on the sprocket.



14. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner.

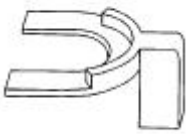


15. Remove the retaining clip from the RH timing chain tensioner.



16. Make sure that the copper (marked) chain links are lined up with the dots on the crankshaft sprockets and the camshaft sprocket.

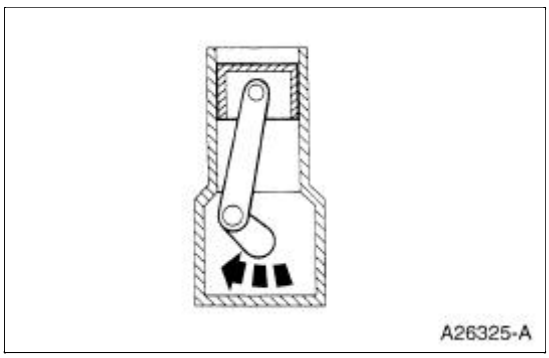
17. Remove special tools from the camshaft.



18. Install the crankshaft sensor ring on the crankshaft.

19. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

Valve Springs

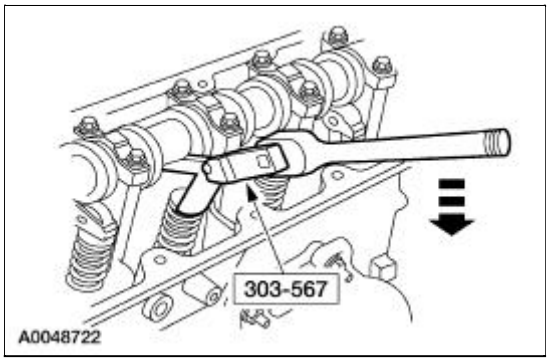


Special Tool(s)

 ST1330-A	Compressor, Valve Spring 303-567 (T97P-6565-AH)
 ST1331-A	Compressor Spacer, Valve Spring 303-382 (T91P-6565-AH)

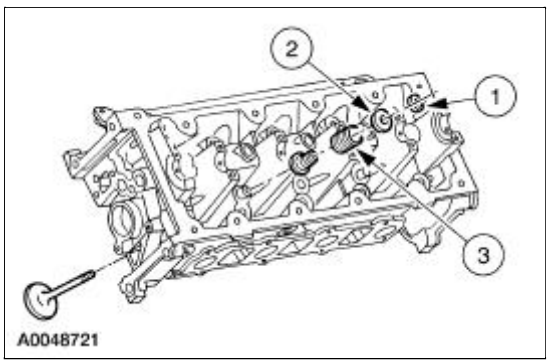
Removal

1. Remove the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.



2. Position the piston at the top of the stroke.

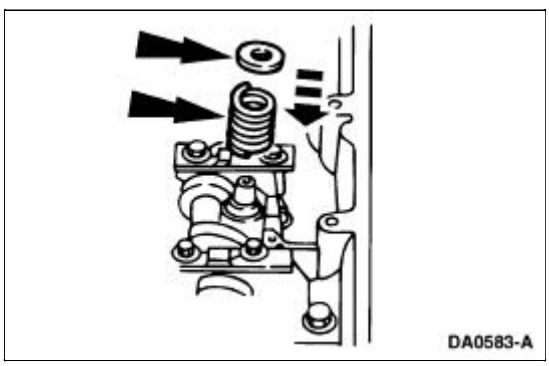
A26325-A



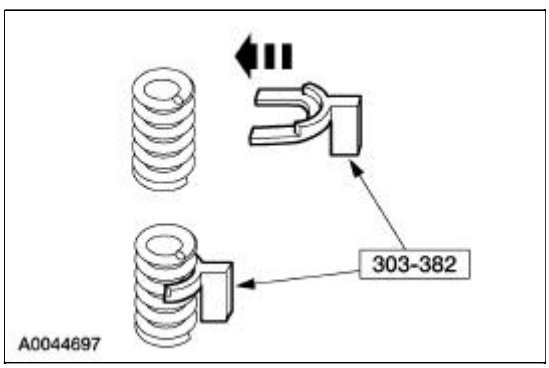
3. Remove the spark plug and install compressed air in the cylinder to hold both valves in position.

CAUTION: If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal.

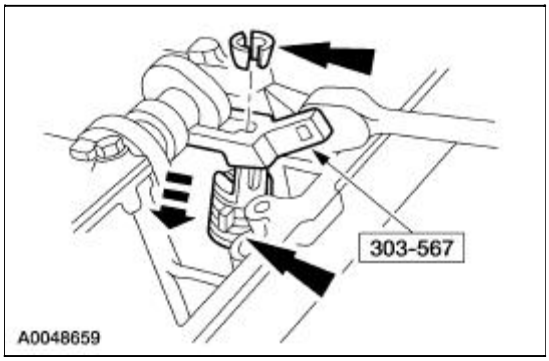
4. Use the special tool to compress the valve springs.



5. Remove the valve springs.
    1. Remove the valve spring retainer keys.
    2. Remove the valve spring retainers.
    3. Remove the valve springs.



Installation



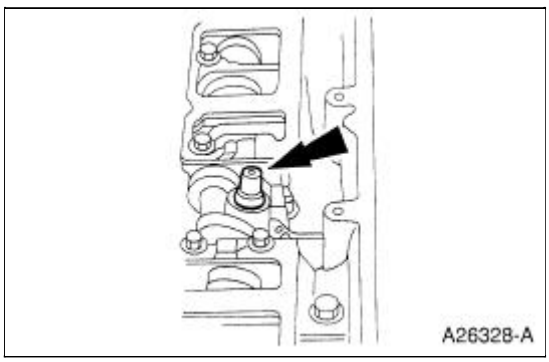
1. Position the valve spring and the valve spring retainers.

2. Install the special tool between the valve spring coils to prevent valve stem seal damage.

3. Use the special tool to compress the valve spring. Install the valve spring retainer keys.

4. Install the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.

5. Install the spark plug.



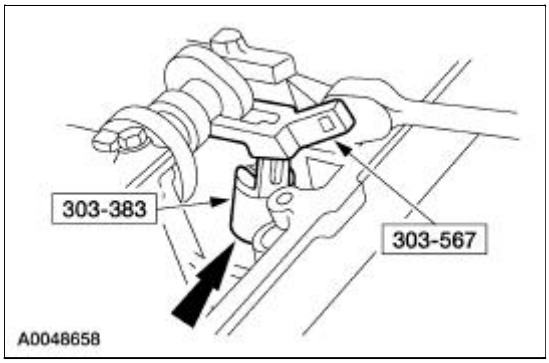
Valve Seals

Special Tool(s)

 ST1332-A	Installer, Valve Stem Oil Seal 303-383 (T91P-6571-A)
 ST1330-A	Compressor, Valve Spring 303-567 (T97P-6565-AH)

Removal

1. Remove the valve springs. For additional information, refer to Valve Springs in this section.
2. Remove the valve stem seals.



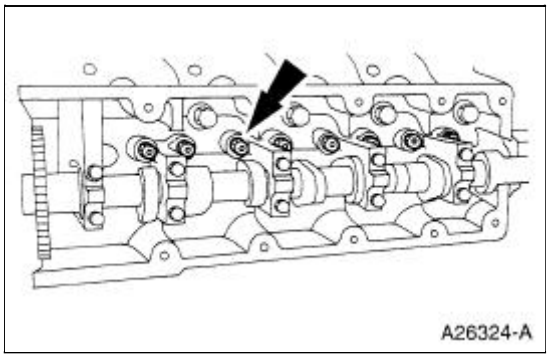
Installation

1. **NOTE:** The valve stem seal must be bottomed on the valve seat.

   NOTE: Make sure that the garter spring is present in the valve stem seal.

   Use the special tools to install the valve stem seals.

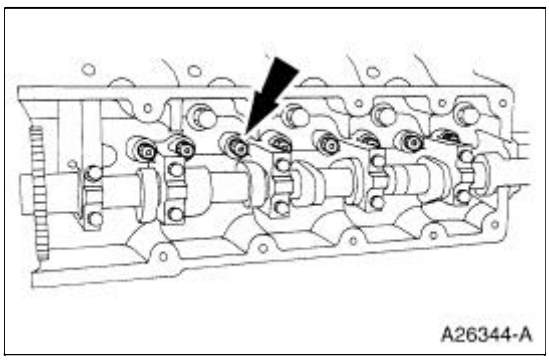
2. Install the valve springs. For additional information, refer to Valve Springs in this section.



Hydraulic Lash Adjuster

Removal

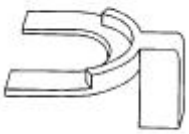
1. Remove the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.



2. **NOTE:** The valve tappets are positional. Mark each valve tappet for installation in its original location.

   Remove the valve tappets (6500).

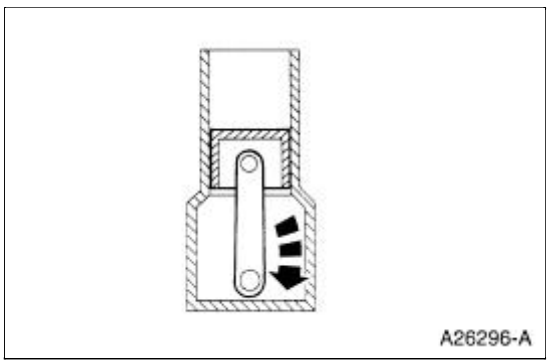
Installation



1. Install the valve tappets in their original locations.

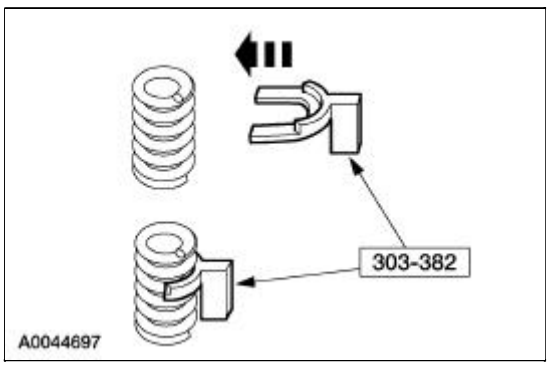
2. Install the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.

Camshaft Roller Follower



Special Tool(s)

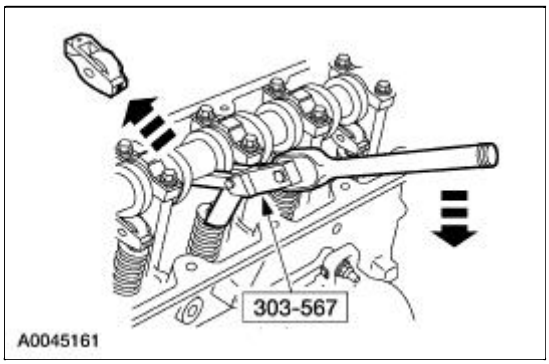
 ST1330-A	Compressor, Valve Spring 303-567 (T97P-6565-AH)
 ST1331-A	Compressor Spacer, Valve Spring 303-382 (T91P-6565-AH)



Removal

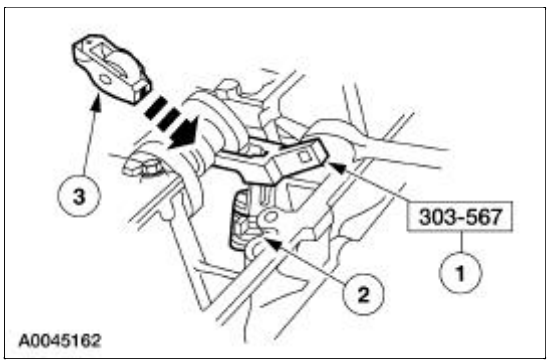
1. Remove the valve cover. For additional information, refer to Valve Cover LH , or Valve Cover RH in this section.

2. Position the piston of the cylinder being repaired at the bottom of the stroke.



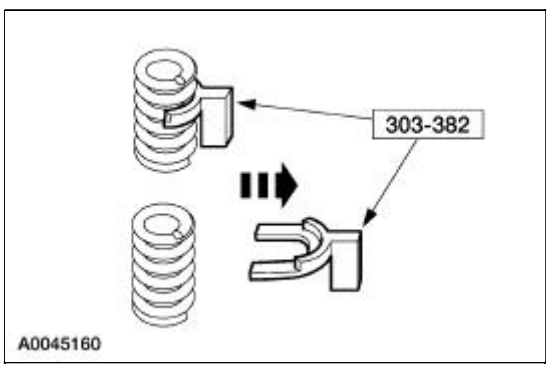
3. Install the special tool between the valve spring coils to prevent valve stem seal damage.

4. **NOTE:** The camshaft roller followers must be installed in their original locations. Record the



camshaft roller follower locations.

Use the special tool to compress the valve springs and remove the camshaft roller followers.



Installation

1. Install the camshaft roller followers.
    1. Install the special tool.
    2. Compress the valve springs.
    3. Install the camshaft roller followers in their original locations.

2. Remove the special tool.

3. Install the valve covers. For additional information, refer to Valve Cover LH , or Valve Cover RH in this section.

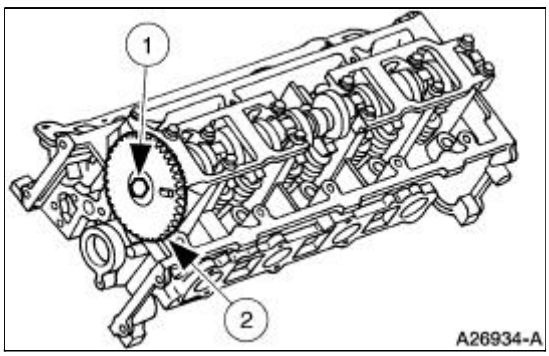
Camshaft

Material

Item	Specification
Motorcraft Silicone Gasket Remover ZC-30	—
Motorcraft Metal Surface Prep ZC-31	—
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal

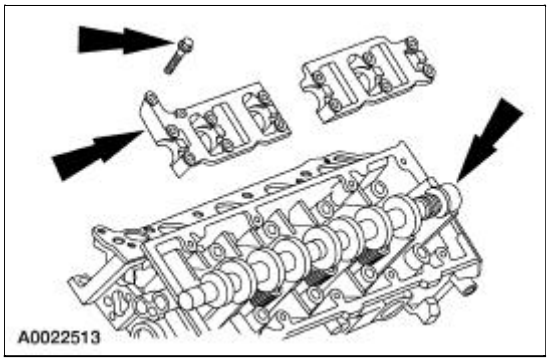
All engines



1. Remove the timing chains. For additional information, refer to Timing Drive Components—Romeo Engine (4.6L) or Timing Drive Components—Windsor Engine (5.4L) in this section.

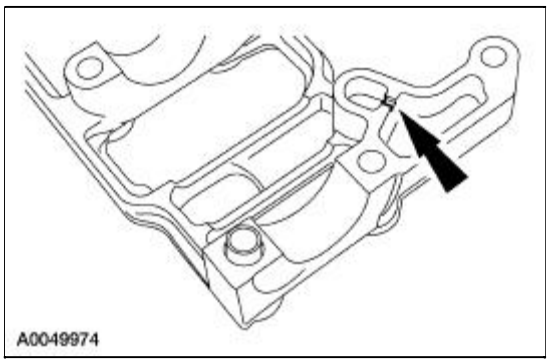
CAUTION: At no time, when the timing chains are removed and the cylinder heads are installed may the crankshaft or camshaft be rotated. Severe piston and valve damage will occur.

2. Remove the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.



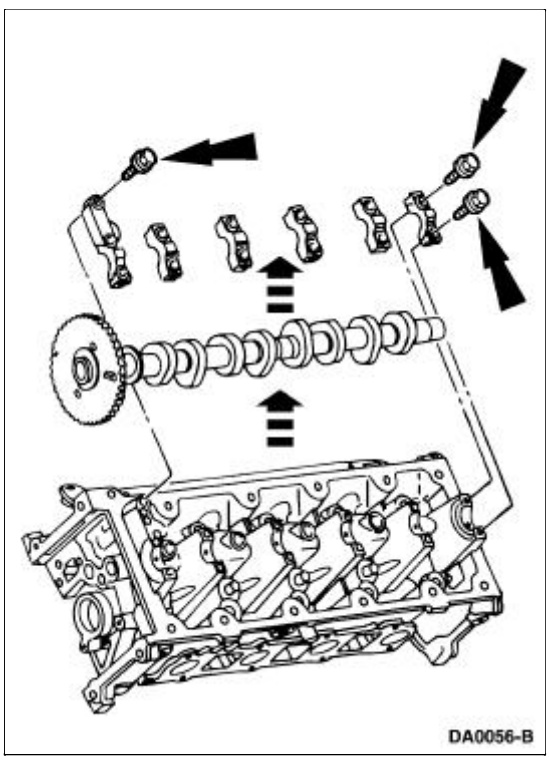
Romeo engine (4.6L)

3. Remove the camshaft sprocket.
    1. Remove the bolt.
    2. Remove the camshaft sprocket.

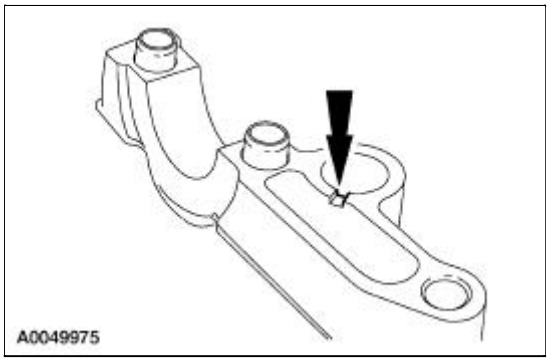


4. **NOTE:** The camshaft bearing caps must be installed in their original location. Record camshaft bearing cap location.

    Remove the bolts, the bearing caps and the camshaft.



5. Clean and inspect the camshaft bearing caps.
    - One of the bearing caps contains an oil flow restriction groove. Make sure the groove is free of foreign material.

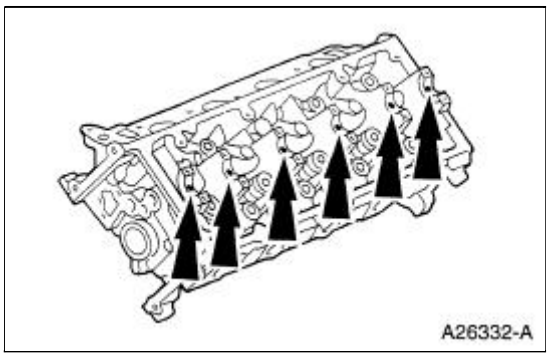


Windsor engine (5.4L)

6. **NOTE:** The camshaft bearing caps must be installed in their original location. Record camshaft bearing cap location.

    Remove the bolts, the bearing caps and the camshaft.

7. Clean and inspect the camshaft bearing caps.
    - One of the bearing caps contains an oil flow restriction groove. Make sure the groove is free of foreign material.



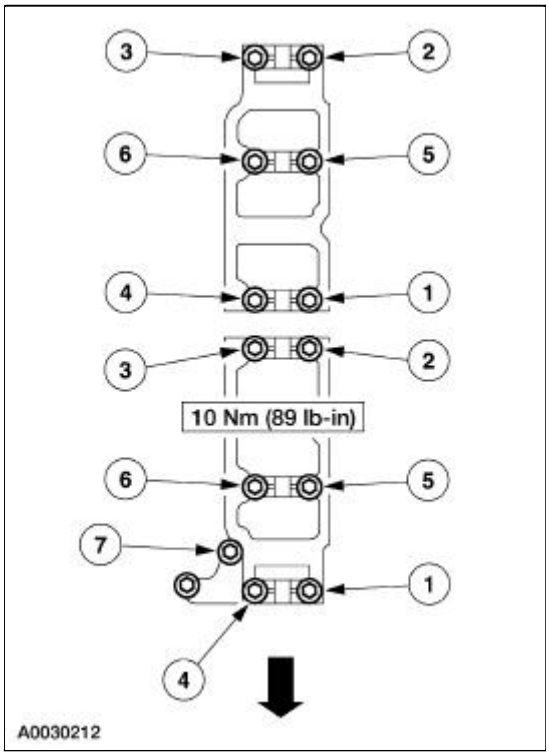
Installation

All engines

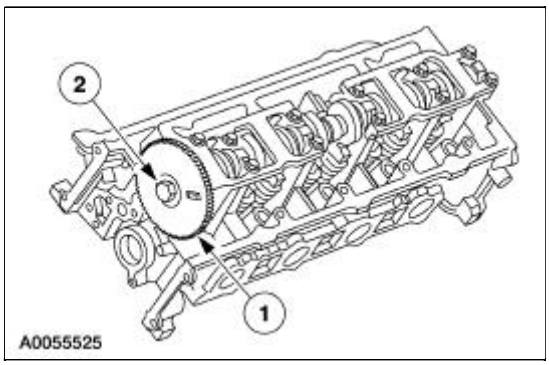
1. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

2. Lubricate the camshaft journals with clean engine oil.

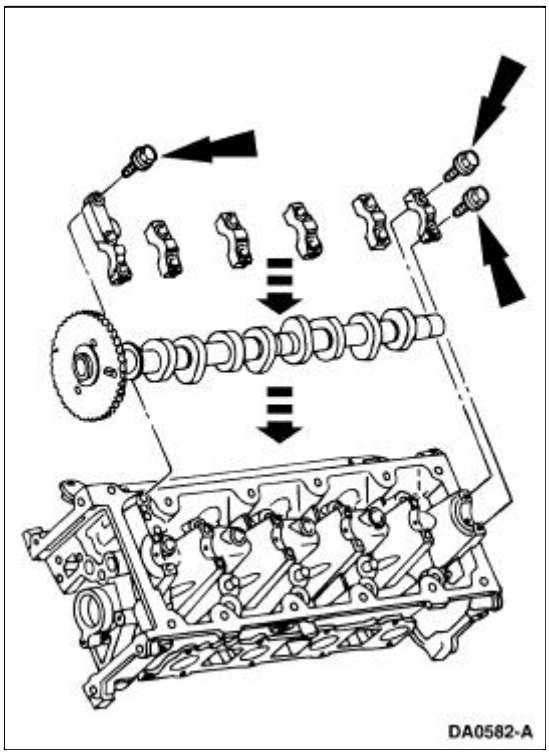


Romeo engine (4.6L)

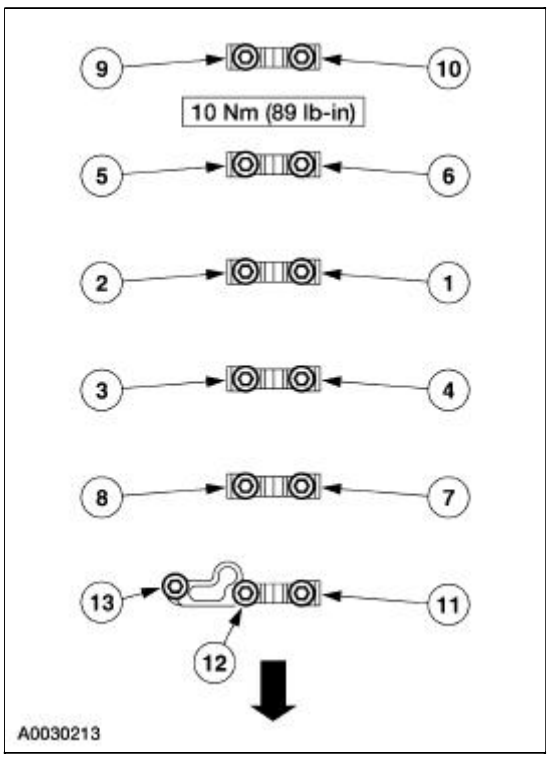


3. Install the camshaft and the camshaft bearing caps in their original locations.
    - Lubricate the camshaft bearing caps with clean engine oil.
    - Position the camshaft bearing caps.
    - Install the bolts loosely.

4. Tighten the bolts in the sequence shown.



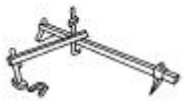
5. Install the camshaft sprocket.
    1. Install the sprocket.
    2. Install and tighten the bolt.
        - Tighten in two stages.
        - Stage 1: Tighten to 40 Nm (30 lb-ft).
        - Stage 2: Tighten an additional 90 degrees.



Windsor engine (5.4L)

6. Install the camshaft and the camshaft bearing caps in their original locations.
    - Lubricate the camshaft bearing caps with clean engine oil.
    - Position the camshaft bearing caps.
    - Install the bolts loosely.

7. Tighten the bolts in the sequence shown.



All engines

8. Install the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.

9. Install the timing chains. For additional information, refer to Timing Drive Components—Romeo Engine (4.6L) or Timing Drive Components—Windsor Engine (5.4L) in this section.

Exhaust Manifold RH —4.6L

Special Tool(s)

 ST2334-A	Support Bracket, Engine 303-639
 ST2176-B	Heavy Duty Engine Support 303-F070

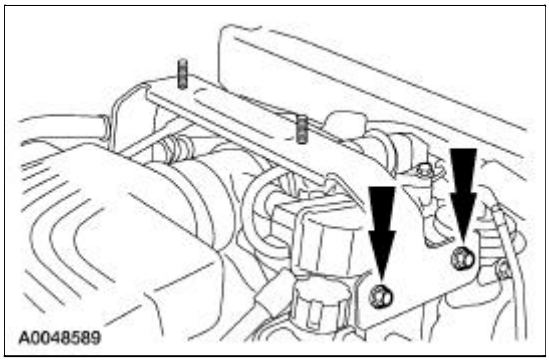
Removal

All vehicles

1. **CAUTION: The air suspension switch must be turned off prior to raising the vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which could result in shifting of the vehicle during the repair operation.**

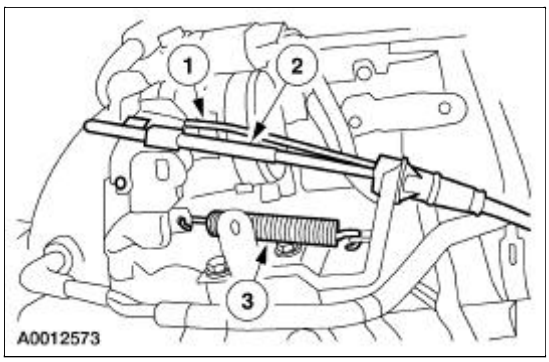
   If equipped, turn the air suspension switch off.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

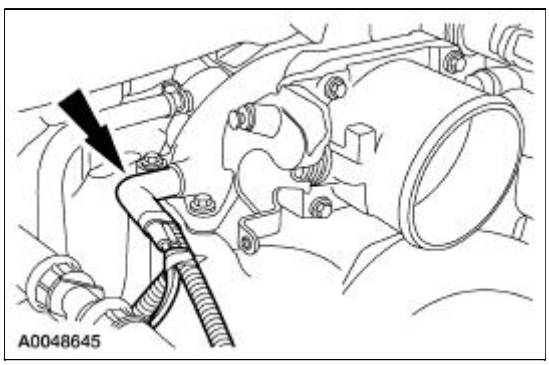


3. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

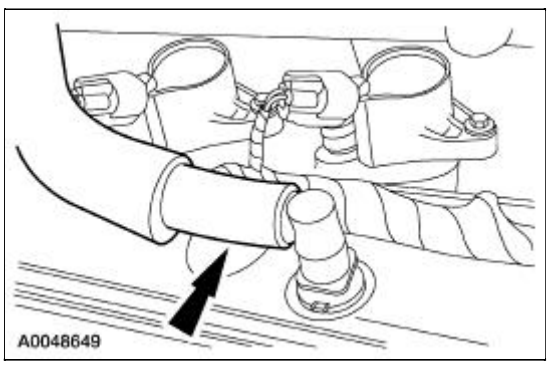
4. Partially drain the engine cooling system. For additional information, refer to Section 303-03 .



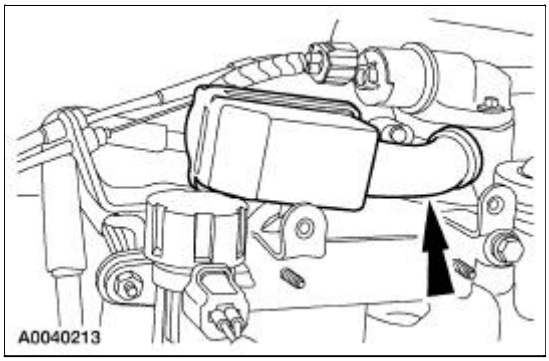
5. Remove the upper air deflector.
   1. Remove the pin-type retainers.
   2. Remove the upper air deflector.



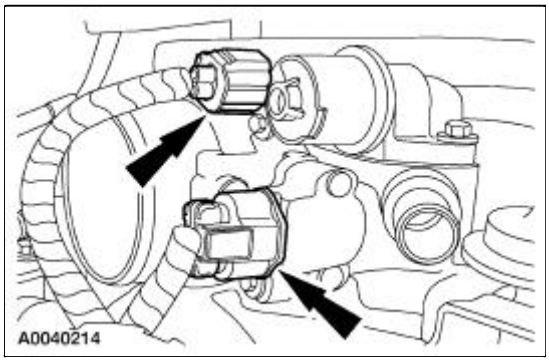
6. Remove the three bolts and the appearance cover mounting bracket.



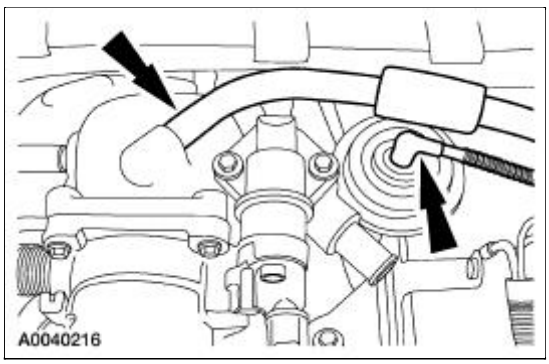
7. Disconnect the throttle body cam.
    1. Disconnect the accelerator cable.
    2. Disconnect the speed control actuator cable.
    3. Remove the accelerator return spring.



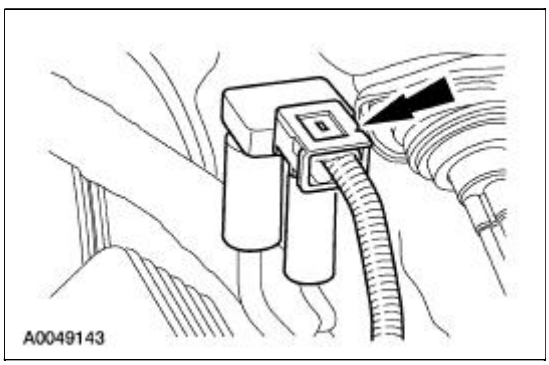
8. Disconnect the main vacuum harness.



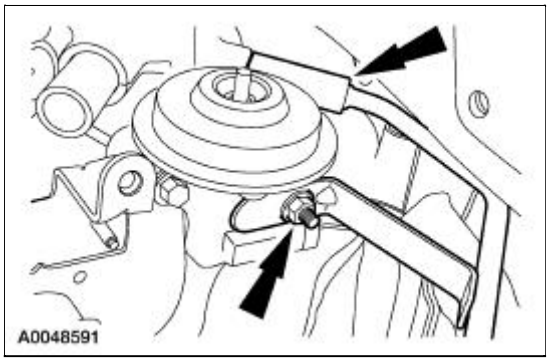
9. Disconnect the positive crankcase ventilation (PCV) hose.



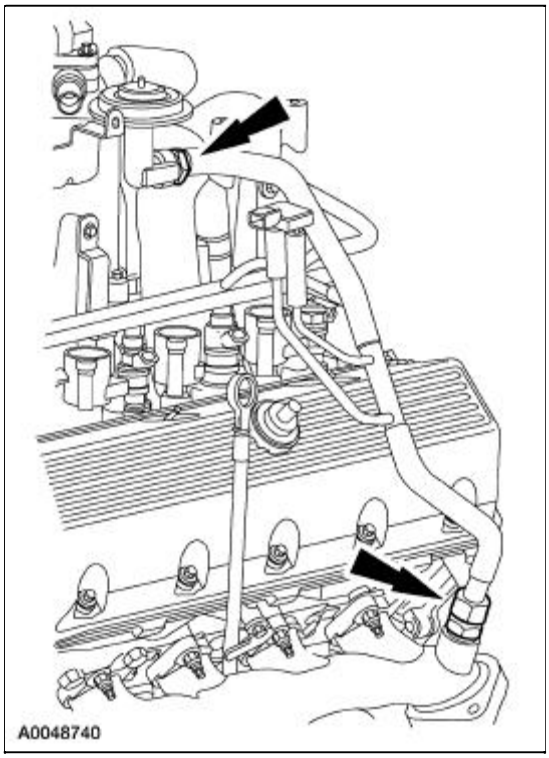
10. Remove the idle air control (IAC) fresh air hose.



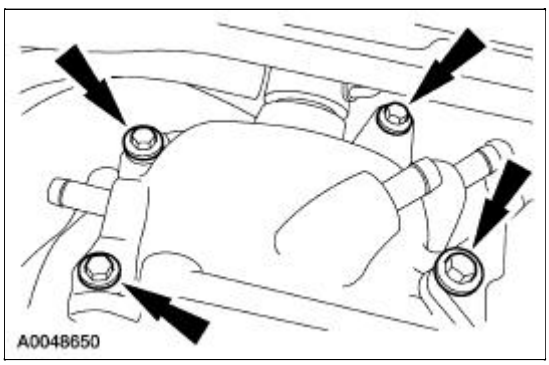
11. Disconnect the IAC and throttle position (TP) sensor electrical connectors.



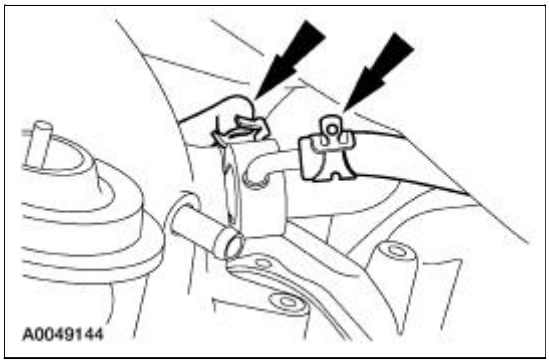
12. Disconnect the exhaust gas recirculation (EGR) valve vacuum hose and the evaporative emission canister purge valve hose and position them aside.



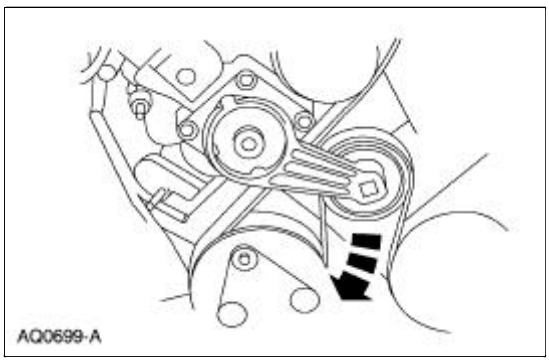
13. Disconnect the differential pressure feedback EGR system electrical connector.



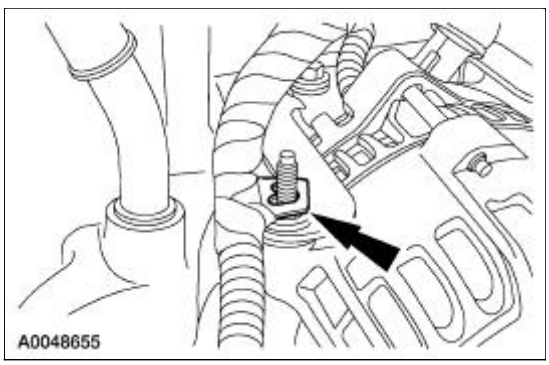
14. Remove the nut and disconnect the brake booster vacuum tube. Position the bracket and tube aside.



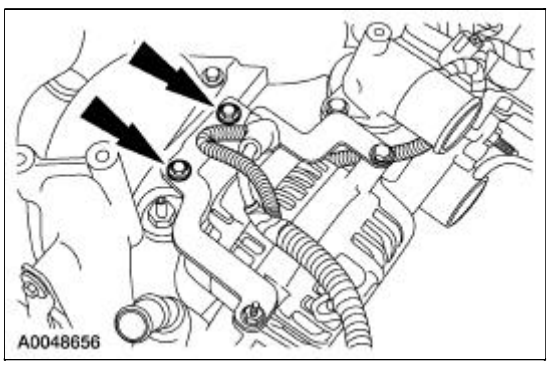
15. Disconnect the exhaust manifold to EGR valve tube fittings and remove the tube.



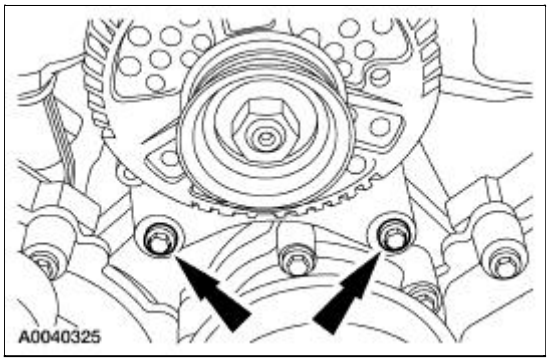
16. Remove the four bolts and move the throttle body adapter forward slightly.



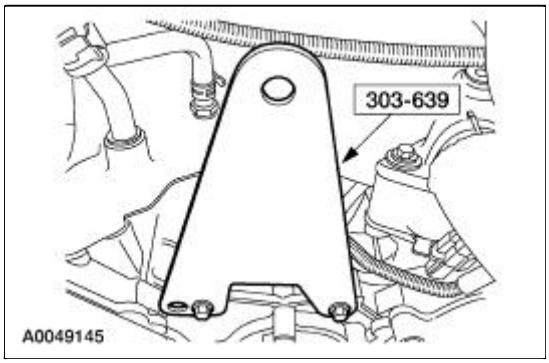
17. Disconnect the heated throttle body hoses. Remove the throttle body adapter and PCV hose from the vehicle.
    - Discard the throttle body adapter-to-intake manifold gasket.
    - Inspect the throttle body and adapter for damage.



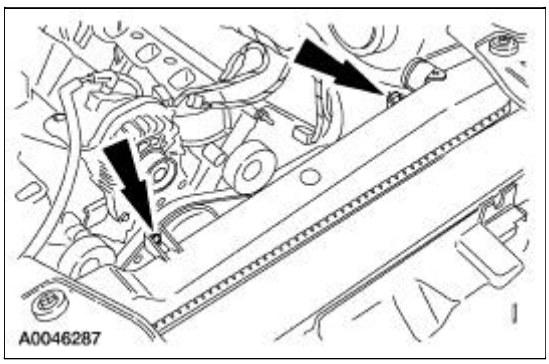
18. Rotate the belt tensioner clockwise and detach the drive belt from the generator pulley.



19. Disconnect the harness routing clip.



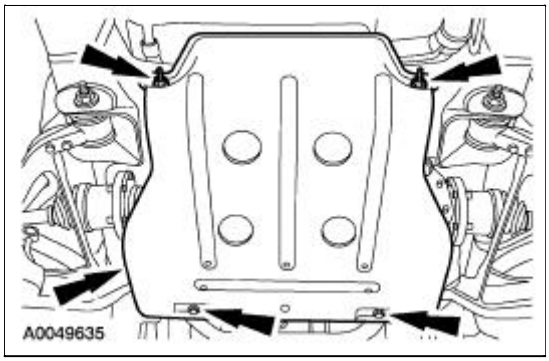
20. Remove the two bolts.



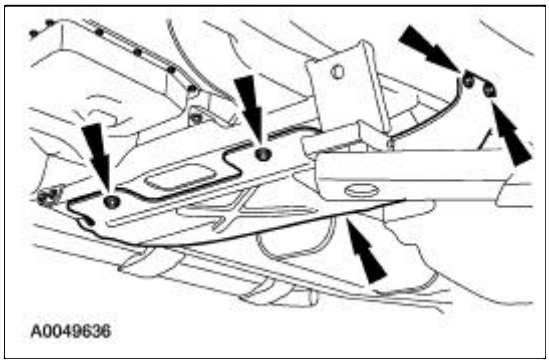
21. Remove the generator lower mounting bolts and position the generator aside.

22. Install the special tool.

23. Remove the fan shroud mounting bolts.



24. Remove the RH front wheel and tire. For additional information, refer to Section 204-04 .

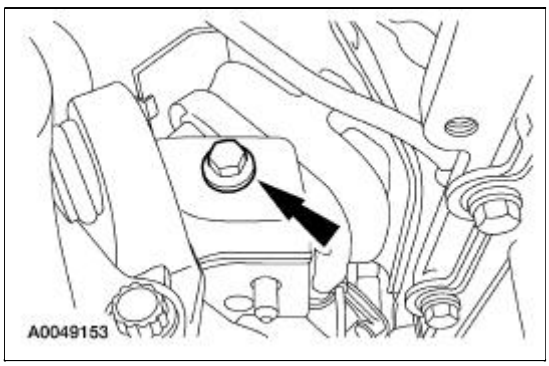


25. Remove the front fender splash shield.

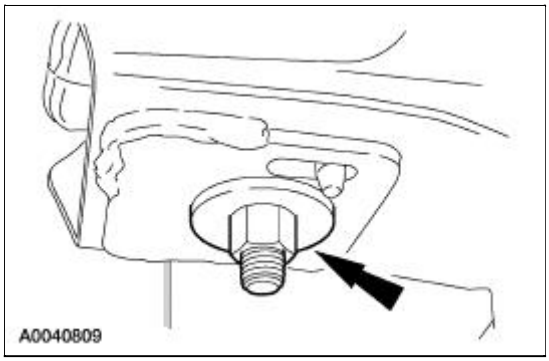
4x4 vehicles

26. Remove the fasteners and the engine skid shield.

27. Remove the six bolts and the transmission skid shield.



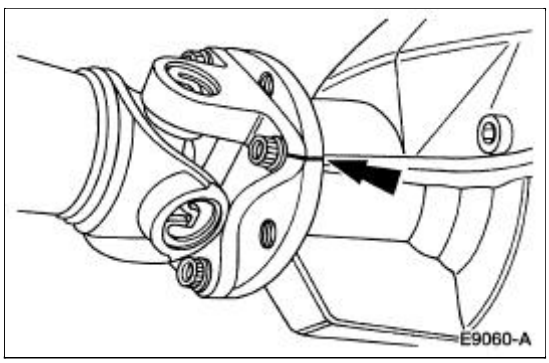
All vehicles



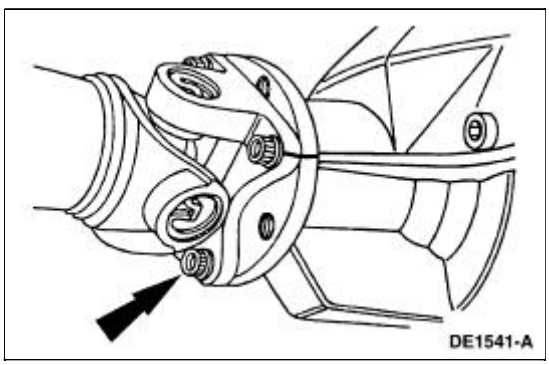
28. Remove the dual converter Y-pipe. For additional information, refer to Section 309-00 .

29. **NOTE:** The caged nut on the frame may break during bolt removal. If necessary, install a new nut.

    Remove the LH engine mount bolt.

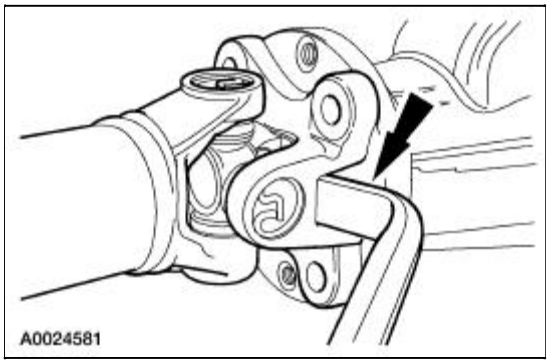


30. Remove the RH engine mount nut.

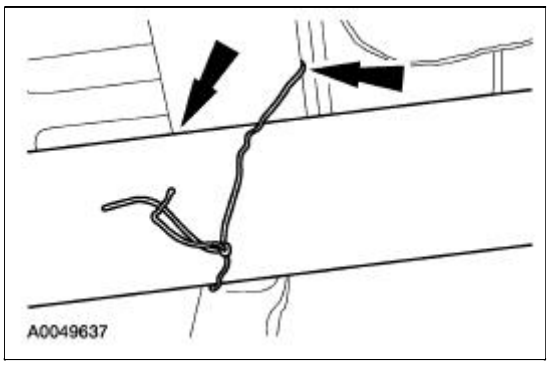


31. Loosen the rear transmission mount nuts.

32. Index-mark the driveshaft flange yoke and the pinion flange.

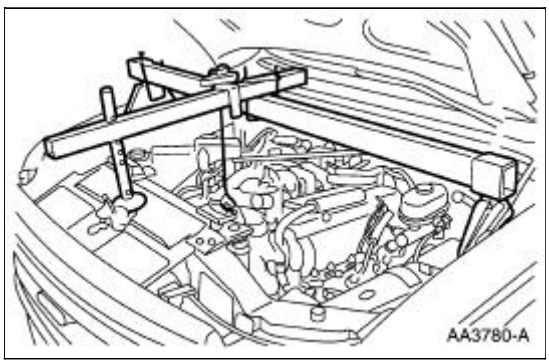


33. Remove the four bolts.



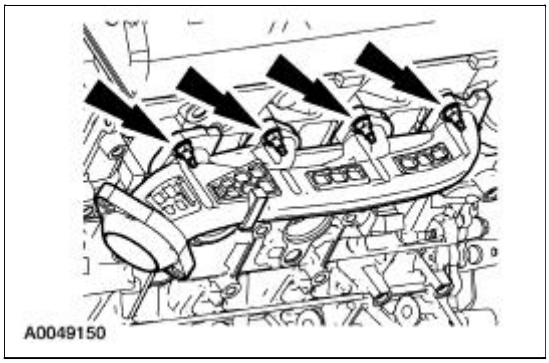
34. **CAUTION: The driveshaft flange yoke fits tightly on the pinion flange pilot. Never hammer on the driveshaft or any of its components to disconnect the yoke from the flange. Pry only in the area shown, with a suitable tool, to disconnect the yoke from the flange.**

Using a suitable tool as shown, disconnect the driveshaft flange yoke from the pinion flange.



35. **CAUTION: The driveshaft alignment bushing can be damaged if the driveshaft is allowed to hang unsupported.**

    Wire the driveshaft to the frame crossmember to support it at the same height as when it was installed.

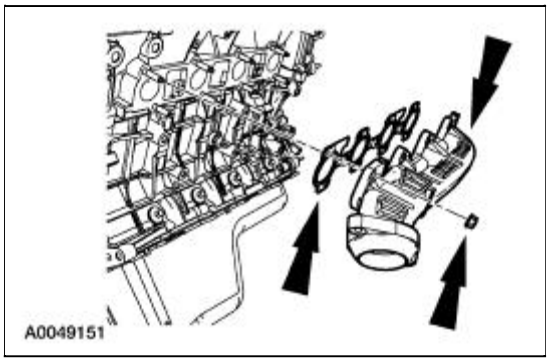


36. Lower the vehicle.

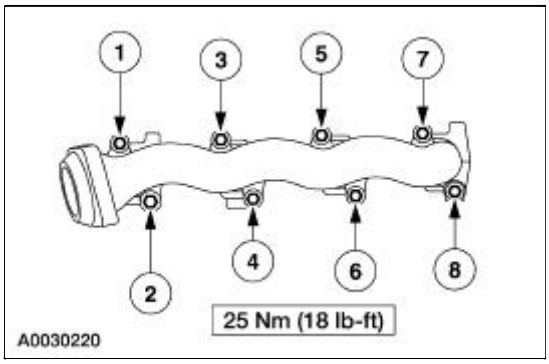
37. Install the special tool and raise the engine.

38. Raise and support the vehicle. For additional information, refer to Section 100-02 .

39. Remove the eight nuts, the exhaust manifold and the gasket.
    - Discard the exhaust manifold gasket.



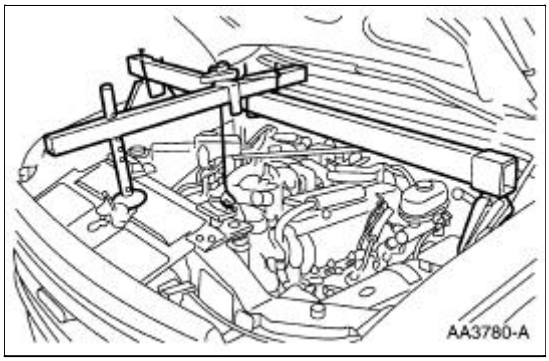
40. Clean and inspect the exhaust manifold. For additional information, refer to Section 303-00 .



Installation

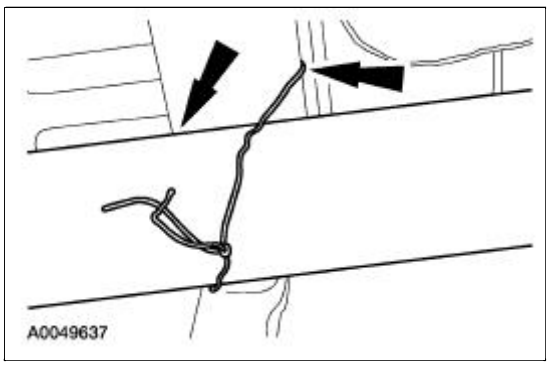
All vehicles

1. Position the exhaust manifold gasket and the exhaust manifold, and loosely install the nuts.



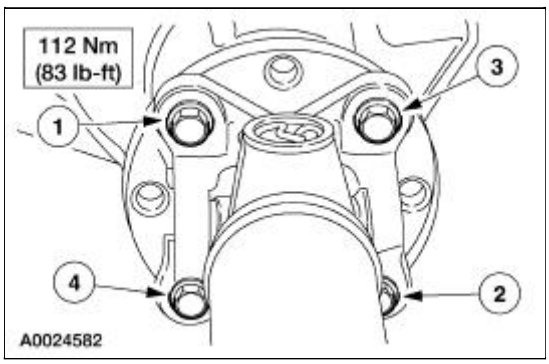
2. Tighten the nuts in the sequence shown.

3. Lower the vehicle.

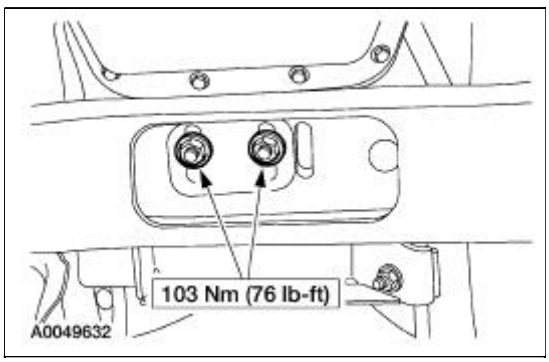


4. **NOTE:** Make sure the engine mounts align with, and settle into, the frame brackets as the engine is lowered.

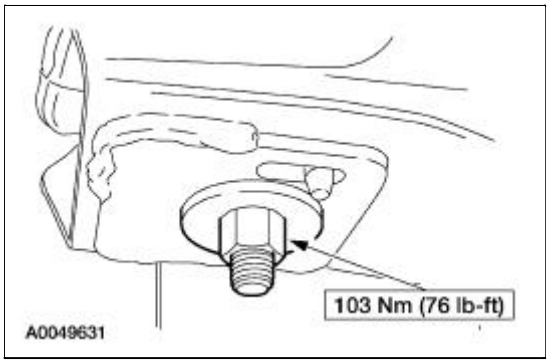
   Lower the engine and remove the special tool.



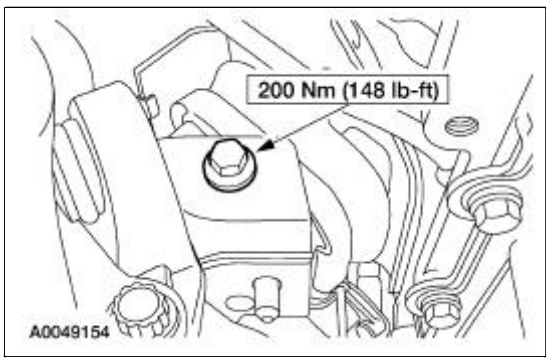
5. Raise and support the vehicle. For additional information, refer to Section 100-02 .



6. Remove the driveshaft support wire.

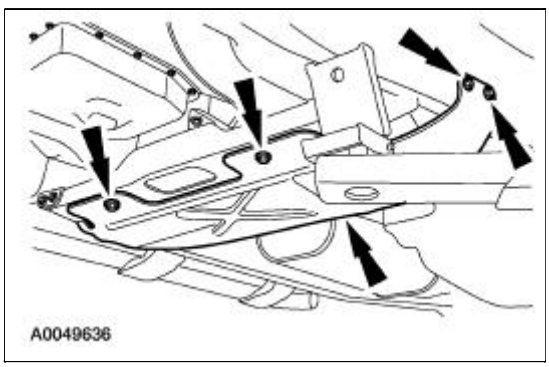


7. Align the index marks and install the driveshaft flange yoke to the pinion flange. Tighten the bolts in the sequence shown.

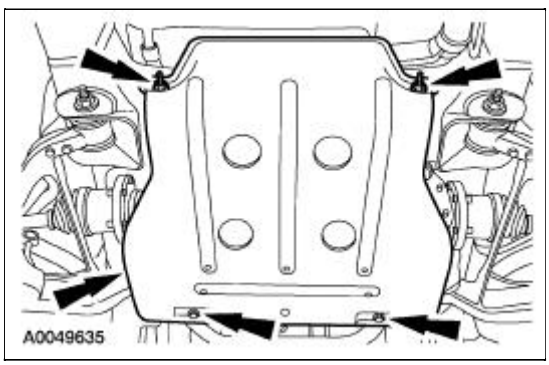


8. Tighten the rear transmission mount nuts.

9. Install the RH engine mount nut.



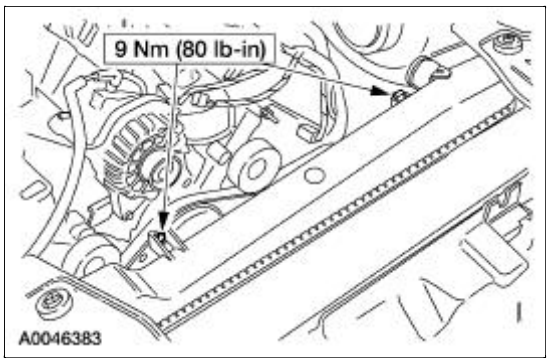
10. Install the LH engine mount bolt.



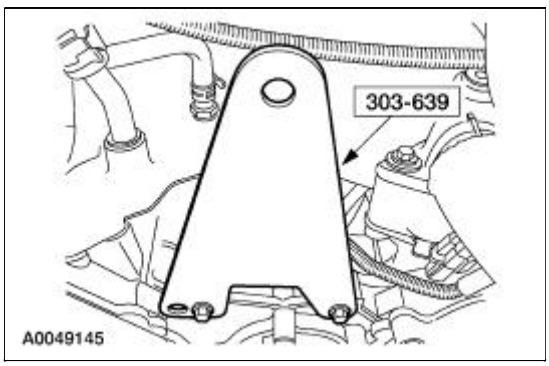
11. Install the dual converter Y-pipe. For additional information, refer to Section 309-00 .

4x4 vehicles

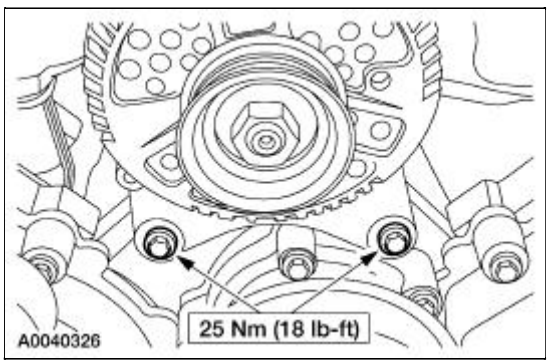
12. Position the transmission skid shield and install the six bolts.



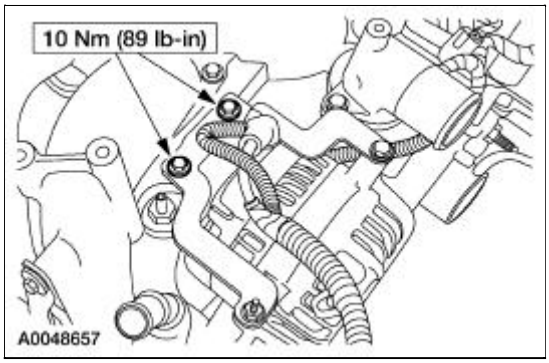
13. Position the engine skid shield and install the fasteners.



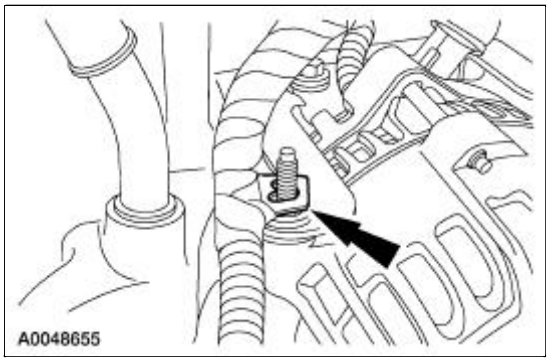
All vehicles



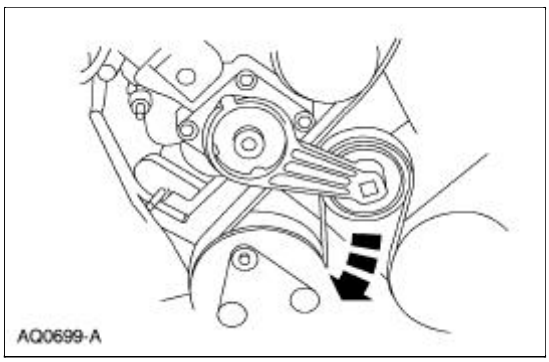
14. Install the front fender splash shield.
15. Install the RH front wheel and tire. For additional information, refer to Section 204-04 .
16. Position the fan shroud and install the mounting bolts.



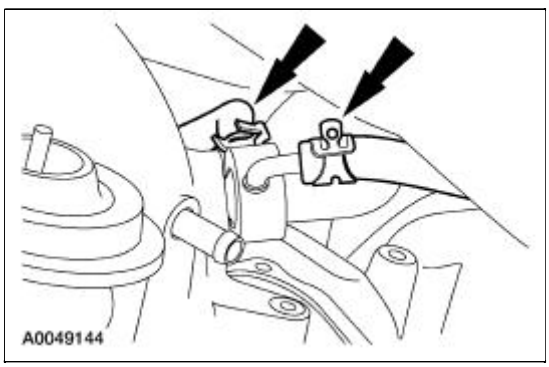
17. Remove the special tool.



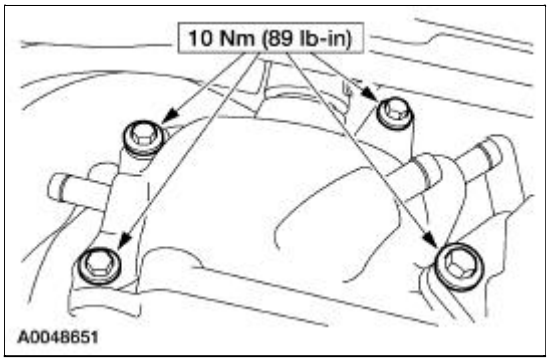
18. Position the generator and install the lower mounting bolts.



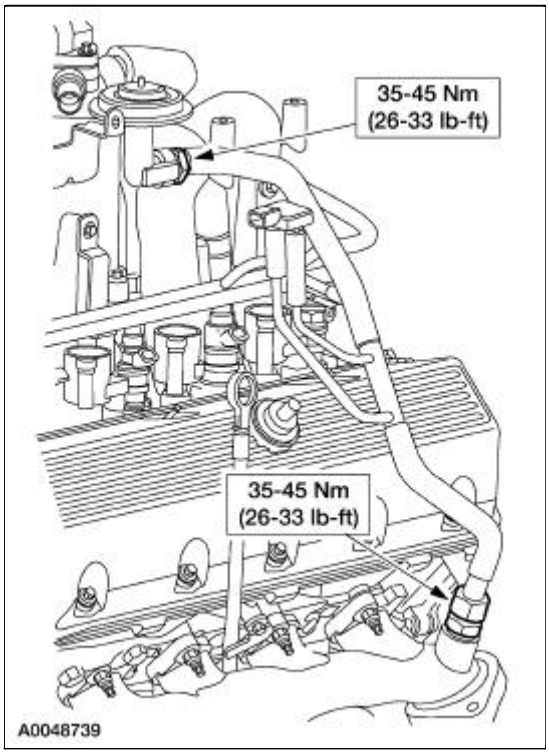
19. Install the generator upper mounting bracket bolts.



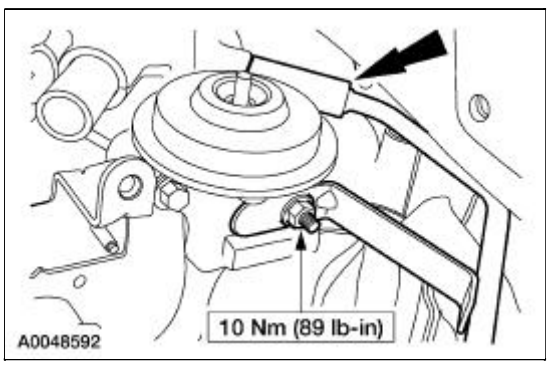
20. Install the harness routing clip.



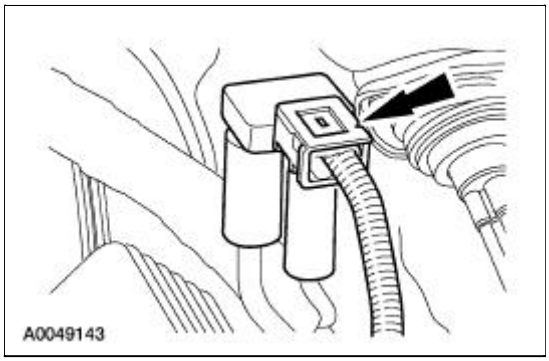
21. Rotate the belt tensioner clockwise and install the drive belt. Refer to the decal on the radiator upper air deflector for belt routing.



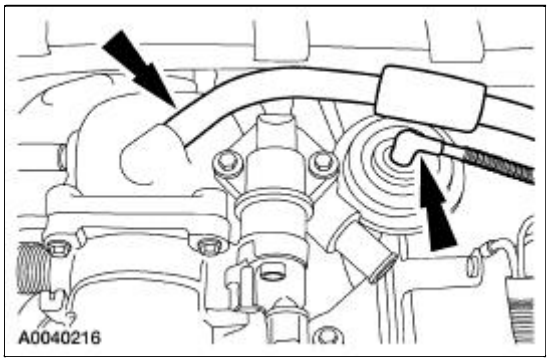
22. Roughly position the throttle body adapter and PCV hose in the vehicle and connect the heated throttle body hoses.



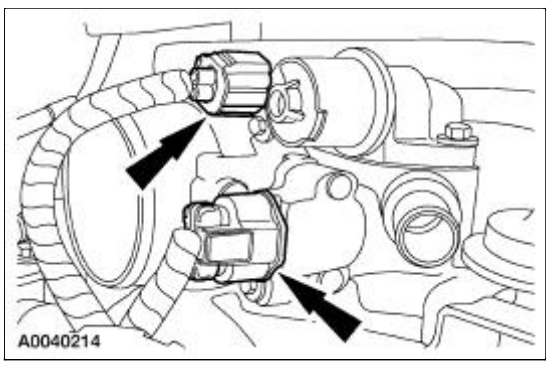
23. Install a new gasket and the throttle body adapter.



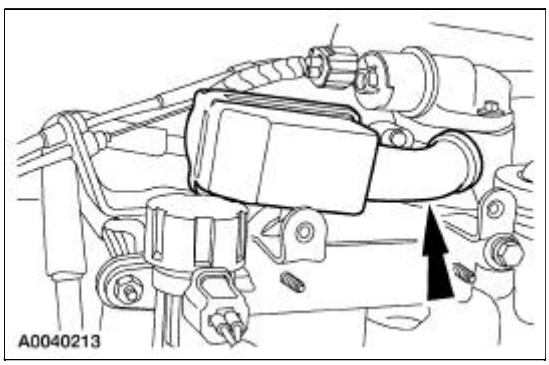
24. Position the exhaust manifold to EGR valve tube and tighten the fittings.



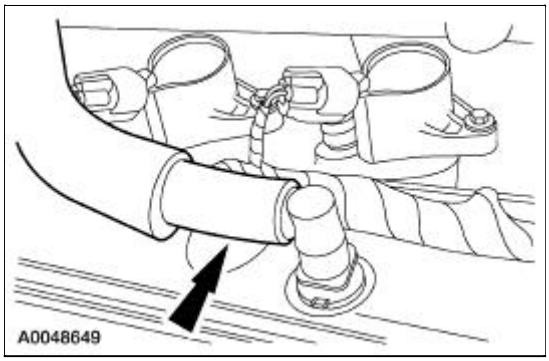
25. Connect the brake booster vacuum tube and bracket. Install the nut.



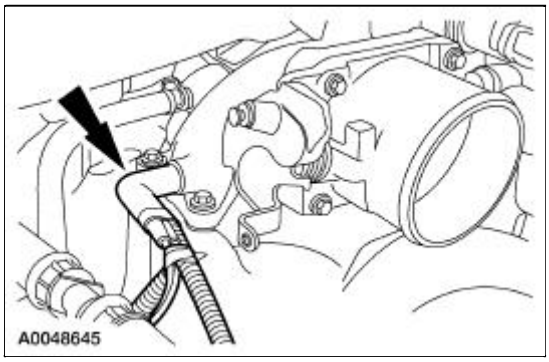
26. Connect the differential pressure feedback EGR system electrical connector.



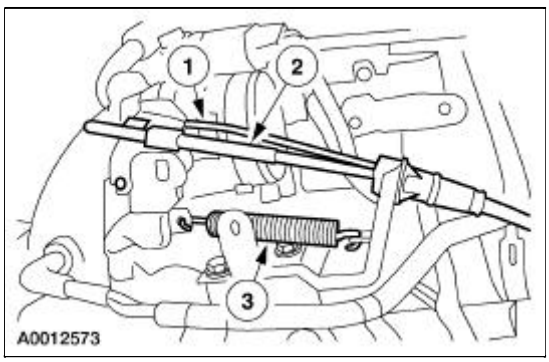
27. Connect the evaporative emission canister purge valve hose and the EGR valve vacuum hose.



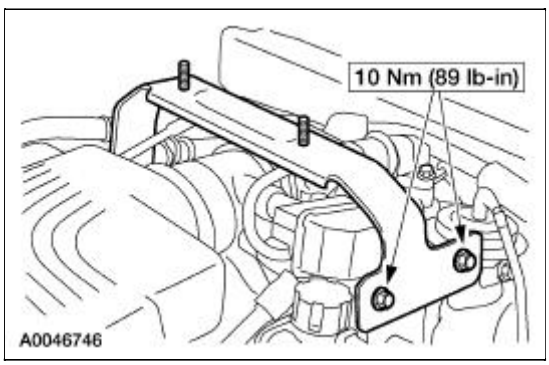
28. Connect the TP sensor and IAC electrical connectors.



29. Install the IAC fresh air hose.

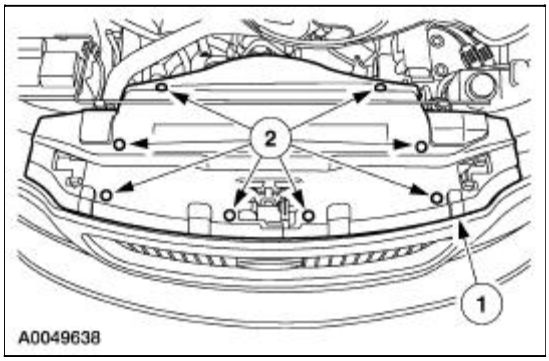


30. Connect the PCV hose.



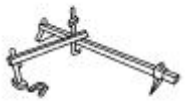
31. Connect the main vacuum harness.

32. Connect the throttle body cam.
    1. Connect the accelerator cable.
    2. Connect the speed control actuator cable.
    3. Install the throttle return spring.



33. Install the appearance cover mounting bracket and the three bolts.

34. Install the upper air deflector.
    1. Position the upper air deflector.



2. Install the pin-type retainers.

35. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
36. Connect the battery ground cable. For additional information, refer to Section 414-01 .
37. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .
38. If equipped, turn on the air suspension switch.

Exhaust Manifold RH —5.4L

Special Tool(s)

 ST2334-A	Support Bracket, Engine 303-639
 ST2176-B	Heavy Duty Engine Support 303-F070

Removal

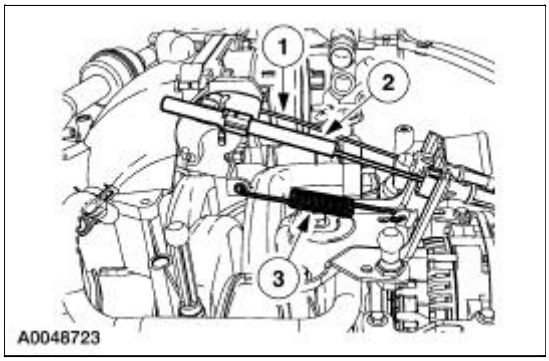
All vehicles

1. **CAUTION: The air suspension switch must be turned off prior to raising the vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which could result in shifting of the vehicle during the repair operation.**

   If equipped, turn the air suspension switch off.

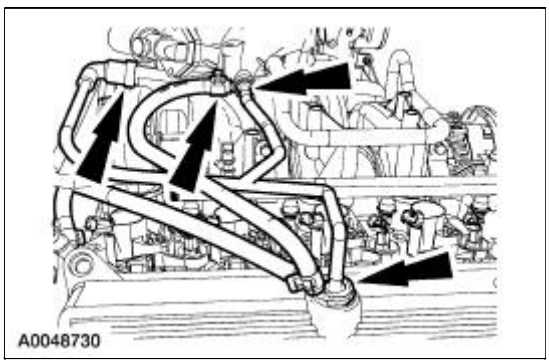
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

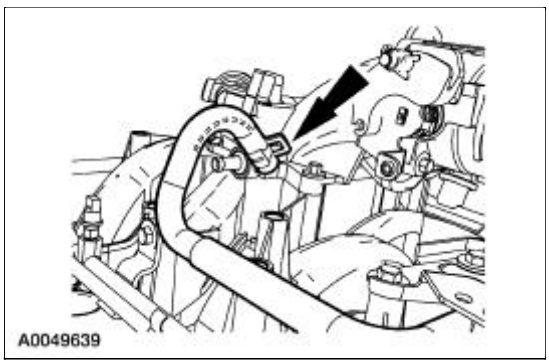


4. Partially drain the engine cooling system. For additional information, refer to Section 303-03 .

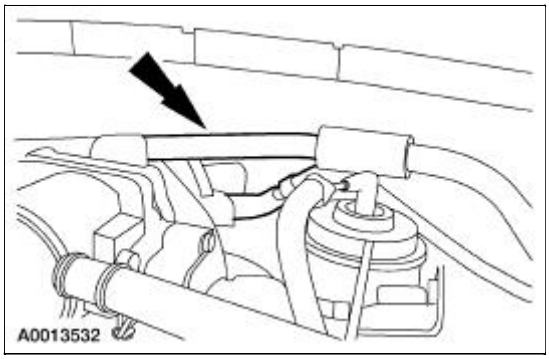
5. Remove the upper air deflector.
   1. Remove the pin-type retainers.
   2. Remove the upper air deflector.



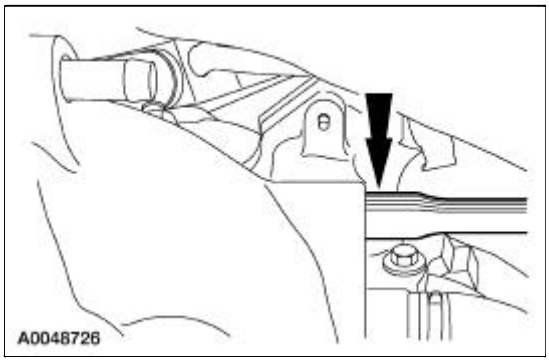
6. Disconnect the throttle body cam.
   1. Disconnect the accelerator cable.



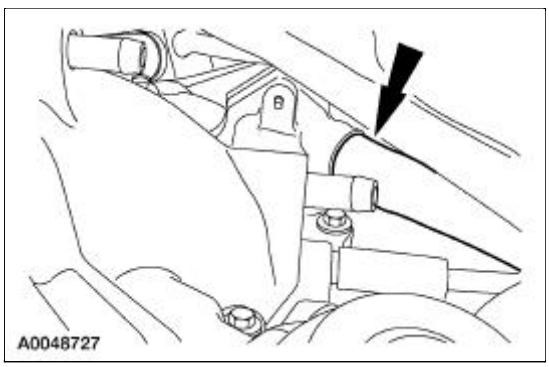
2. Disconnect the speed control actuator cable.
3. Remove the accelerator return spring.



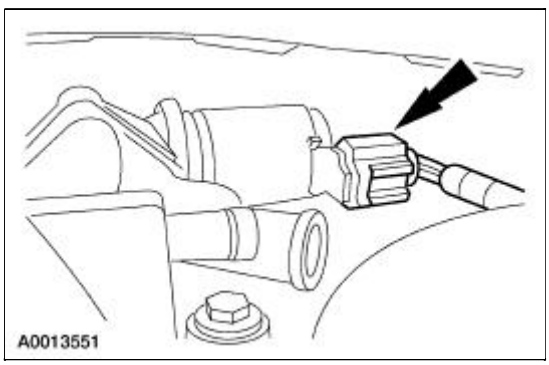
7. Position the heated positive crankcase ventilation (PCV) hose harness aside.
   - Disconnect the PCV hose from the throttle body adapter.
   - Disconnect the heated throttle body outlet hose from the throttle body adapter.
   - Disconnect the PCV hose from the intake manifold.
   - Remove the PCV valve and position the harness aside.



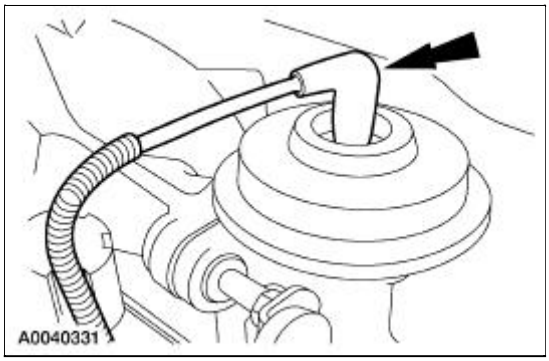
8. Disconnect the heated throttle body inlet hose from the throttle body adapter.



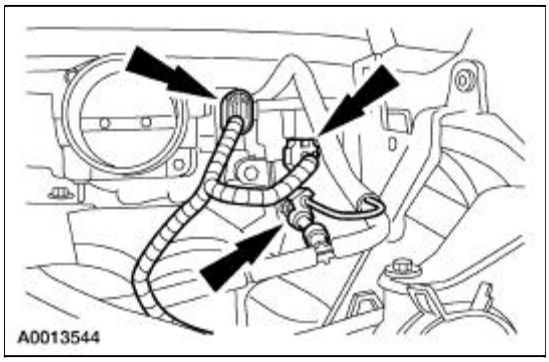
9. Disconnect the evaporative emission canister purge valve hose.



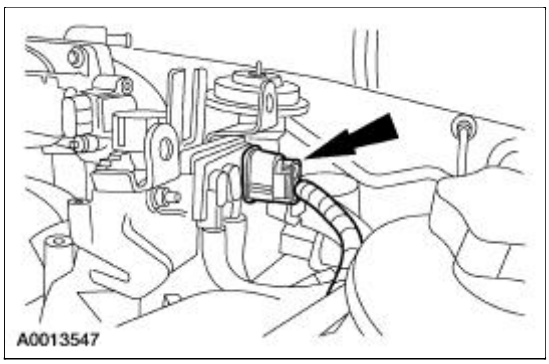
10. Disconnect the main vacuum harness from the throttle body adapter.



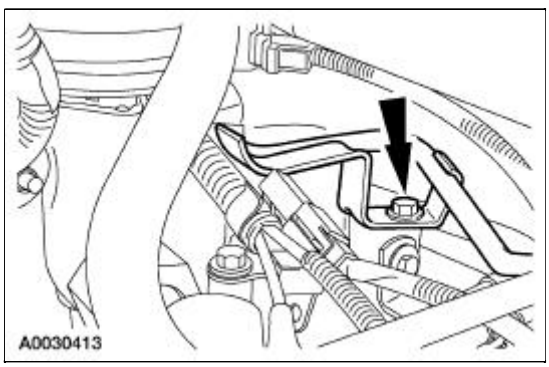
11. Remove the idle air control (IAC) valve fresh air tube.



12. Disconnect the IAC electrical connector.

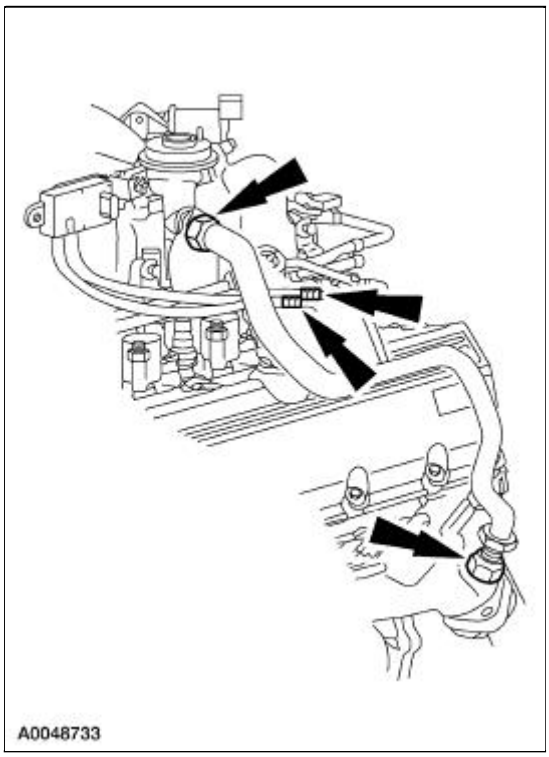


13. Disconnect the EGR valve vacuum hose.

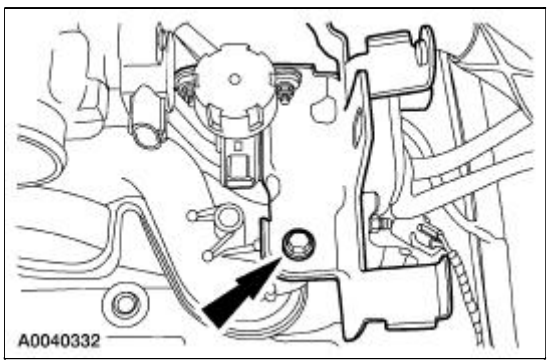


14. Disconnect the throttle position (TP) sensor electrical connector, and the exhaust gas recirculation (EGR) vacuum regulator solenoid electrical and vacuum connectors.

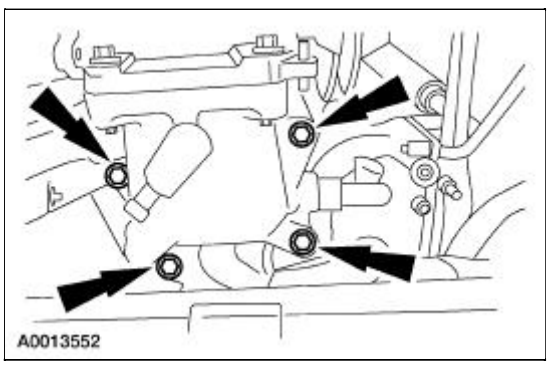
15. Disconnect the differential pressure feedback EGR system electrical connector.



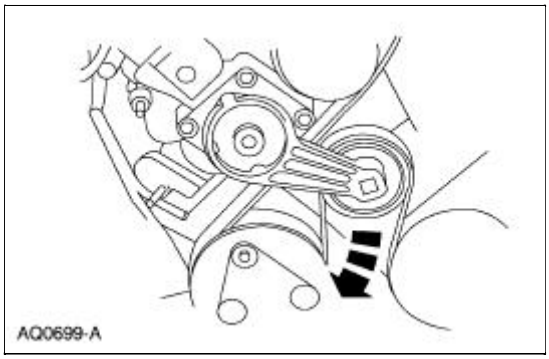
16. Remove the bolt and disconnect the brake booster vacuum tube. Position the bracket and tube aside.



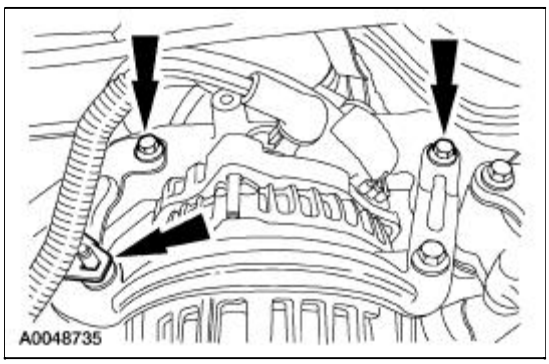
17. Remove the exhaust manifold to EGR valve tube.
    - Disconnect the upper fitting.



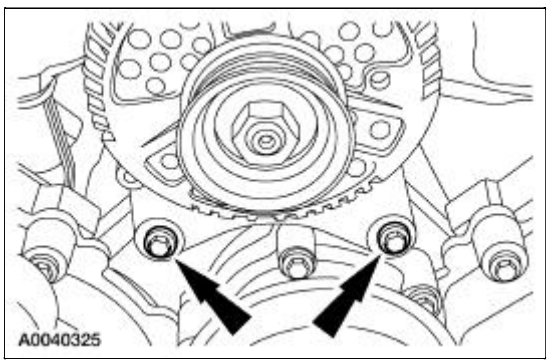
- Disconnect the two differential pressure feedback EGR system hoses.
- Disconnect the lower fitting and remove the tube.



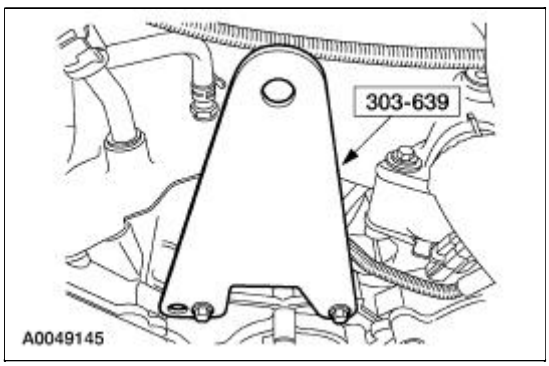
18. Remove the differential pressure feedback EGR system bracket bolt.



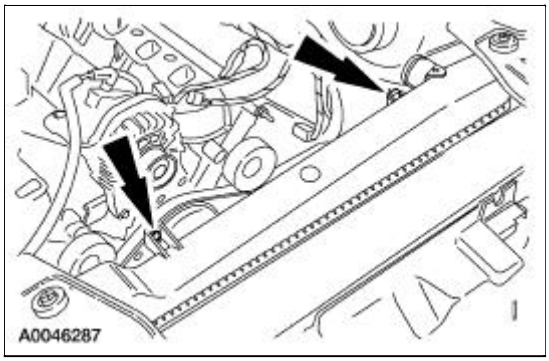
19. Remove the four bolts and remove the throttle body adapter.
    - Discard the throttle body adapter gasket.



20. Rotate the belt tensioner clockwise and detach the drive belt from the generator pulley.



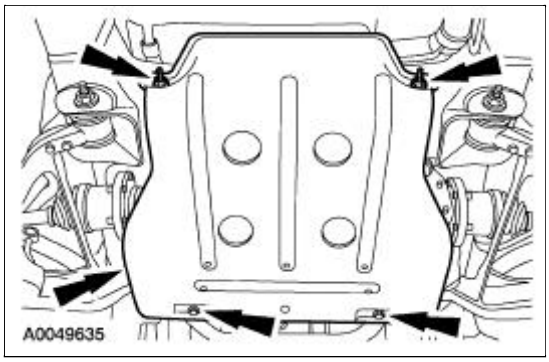
21. Disconnect the generator upper mounting bracket.
    - Disconnect the harness routing clip.
    - Remove the two bolts.



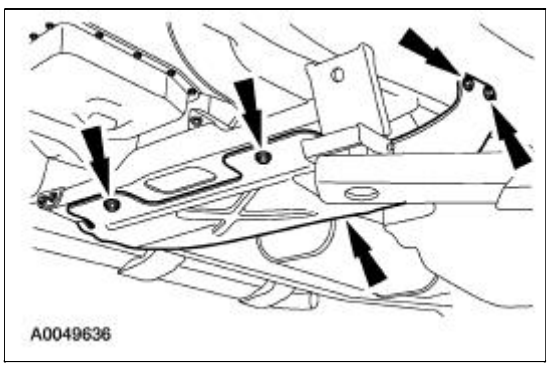
22. Remove the generator lower mounting bolts and position the generator aside.

23. Install the special tool.

24. Remove the fan shroud mounting bolts.



25. Remove the RH front wheel and tire. For additional information, refer to Section 204-04 .

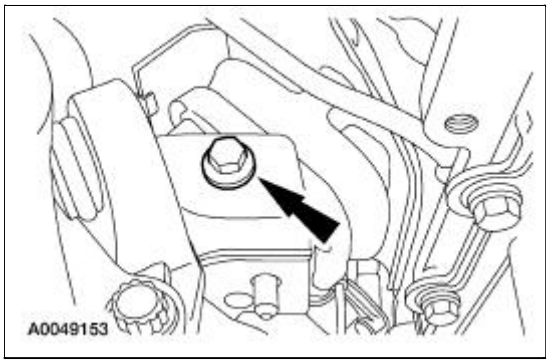


26. Remove the front fender splash shield.

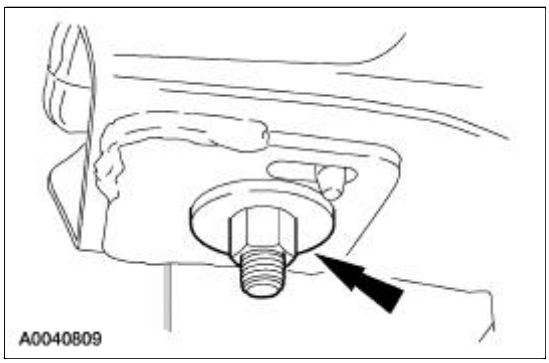
4x4 vehicles

27. Remove the fasteners and the engine skid shield.

28. Remove the six bolts and the transmission skid shield.



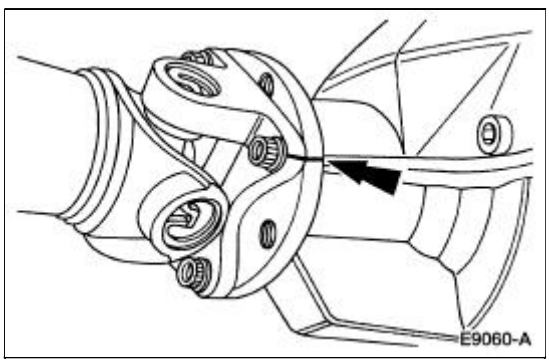
All vehicles



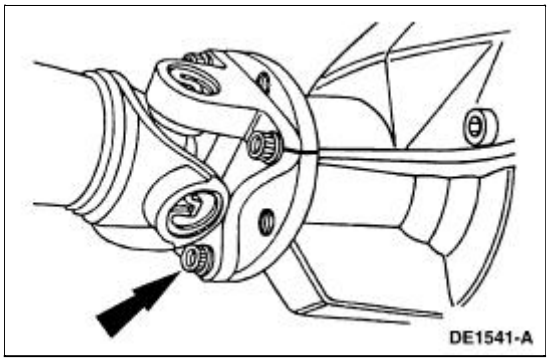
29. Remove the dual converter Y-pipe. For additional information, refer to Section 309-00 .

30. **NOTE:** The caged nut on the frame may break during bolt removal. If necessary, install a new nut.

    Remove the LH engine mount bolt.

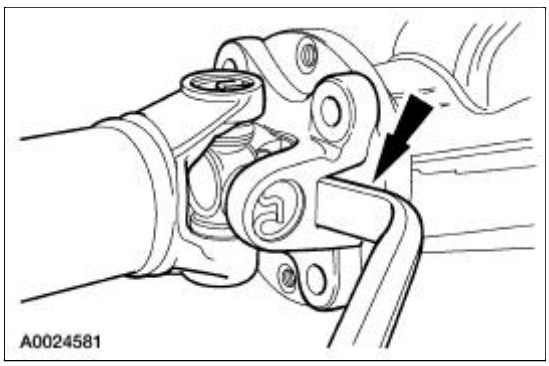


31. Remove the RH engine mount nut.

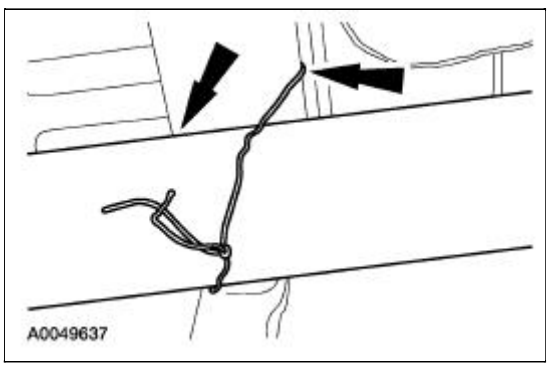


32. Loosen the rear transmission mount nuts.

33. Index-mark the driveshaft flange yoke and the pinion flange.

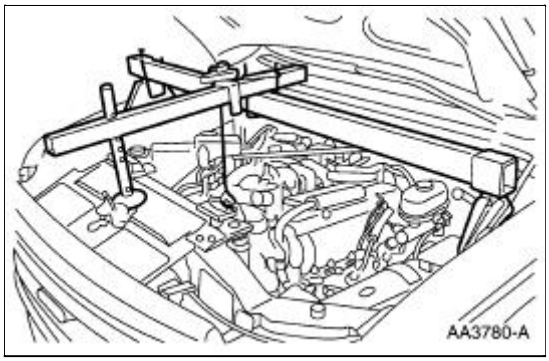


34. Remove the four bolts.



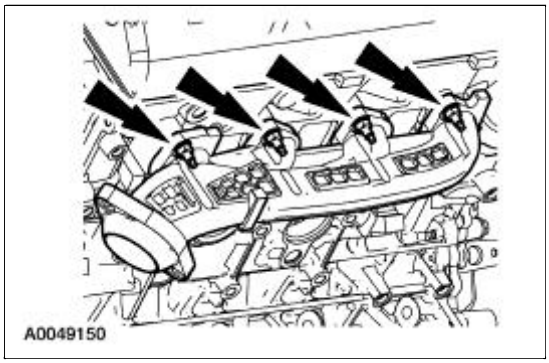
35. **CAUTION: The driveshaft flange yoke fits tightly on the pinion flange pilot. Never hammer on the driveshaft or any of its components to disconnect the yoke from the flange. Pry only in the area shown, with a suitable tool, to disconnect the yoke from the flange.**

    Using a suitable tool as shown, disconnect the driveshaft flange yoke from the pinion flange.



36. **CAUTION: The driveshaft alignment bushing can be damaged if the driveshaft is allowed to hang unsupported.**

    Wire the driveshaft to the frame crossmember to support it at the same height as when it was installed.

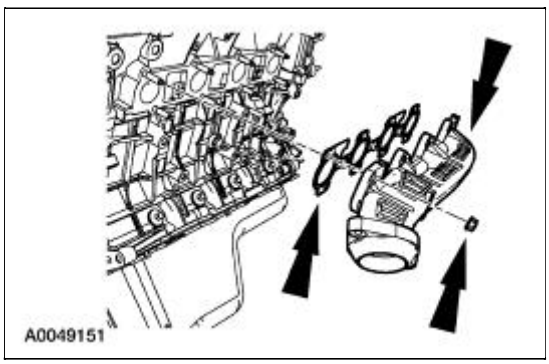


37. Lower the vehicle.

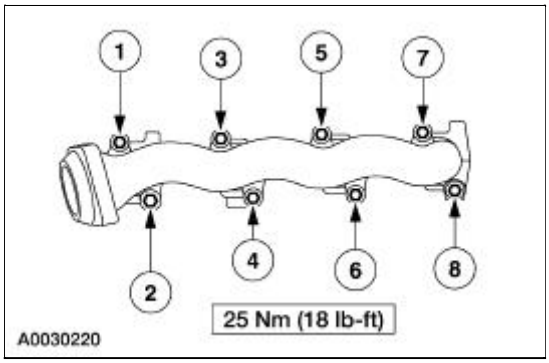
38. Install the special tool and raise the engine.

39. Raise and support the vehicle. For additional information, refer to Section 100-02 .

40. Remove the eight nuts, the exhaust manifold and the gasket.
    - Discard the exhaust manifold gasket.



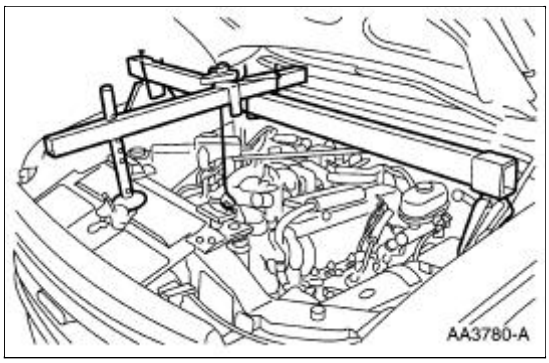
41. Clean and inspect the exhaust manifold. For additional information, refer to Section 303-00 .



Installation

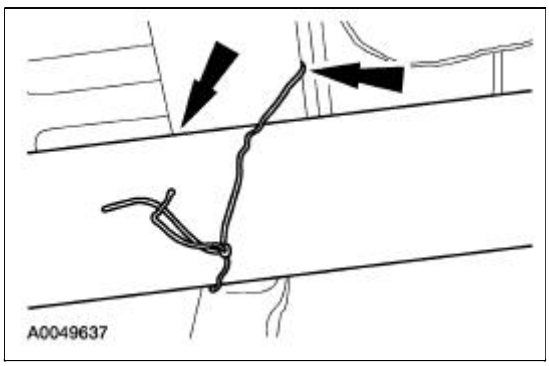
All vehicles

1. Position the exhaust manifold gasket and the exhaust manifold. Loosely install the nuts.



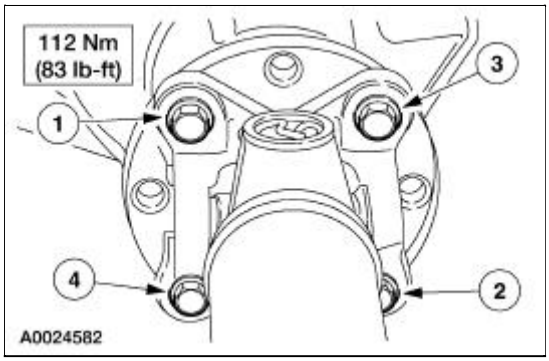
2. Tighten the nuts in the sequence shown.

3. Lower the vehicle.

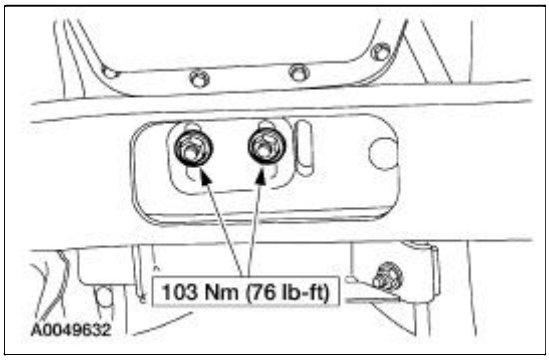


4. **NOTE:** Make sure the engine mounts align with, and settle into, the frame brackets as the engine is lowered.

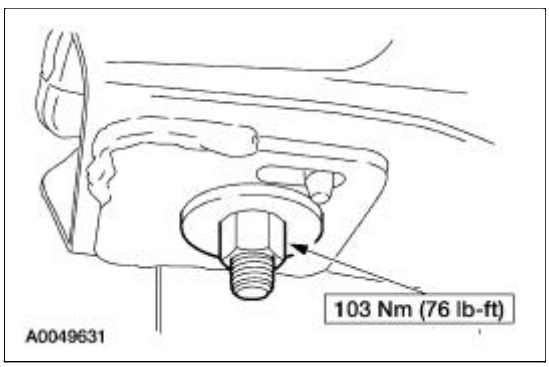
   Lower the engine and remove the special tool.



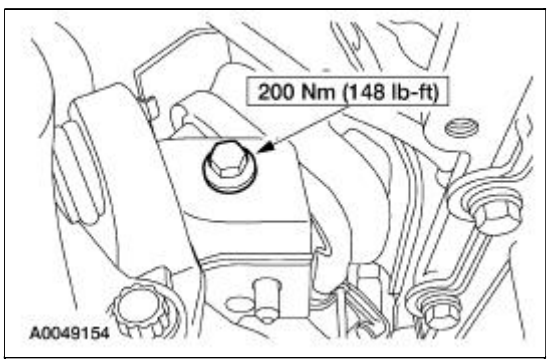
5. Raise and support the vehicle. For additional information, refer to Section 100-02 .



6. Remove the driveshaft support wire.

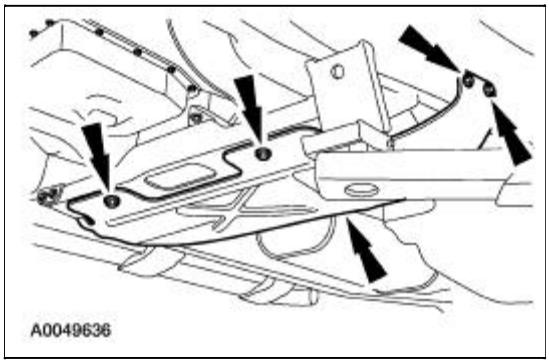


7. Align the index marks and install the driveshaft flange yoke to the pinion flange. Tighten the bolts in the sequence shown.

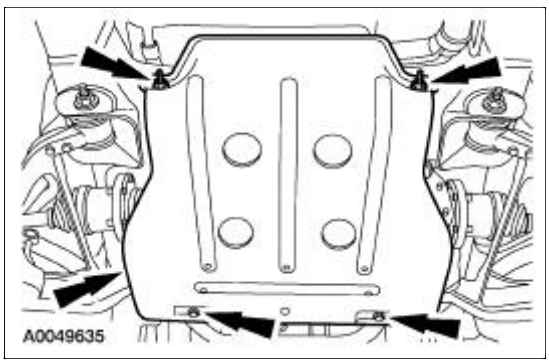


8. Tighten the rear transmission mount nuts.

9. Install the RH engine mount nut.



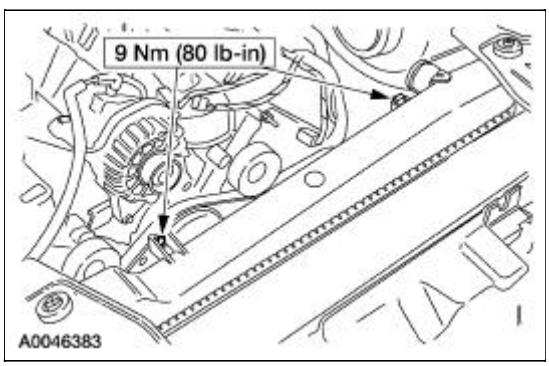
10. Install the LH engine mount bolt.



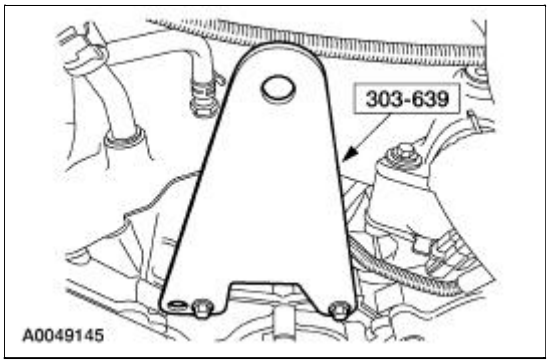
11. Install the dual converter Y-pipe. For additional information, refer to Section 309-00 .

4x4 vehicles

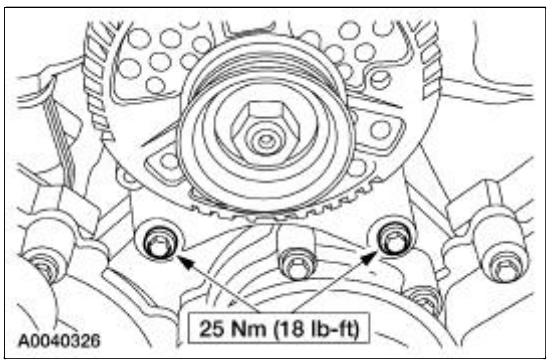
12. Position the transmission skid shield and install the six bolts.



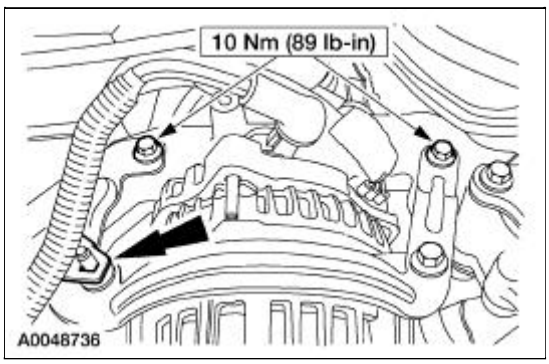
13. Position the engine skid shield and install the fasteners.



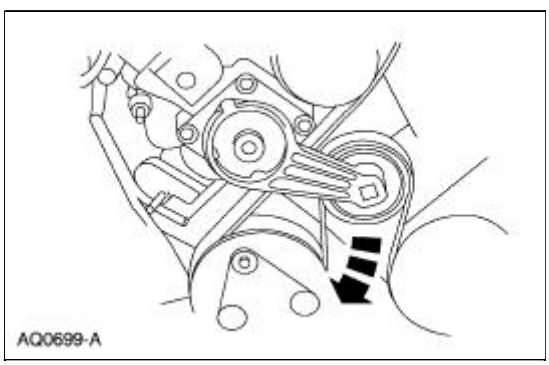
All vehicles



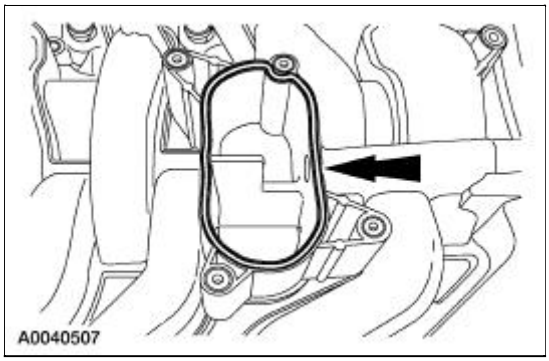
14. Install the front fender splash shield.
15. Install the RH front wheel and tire. For additional information, refer to Section 204-04 .
16. Position the fan shroud and install the mounting bolts.



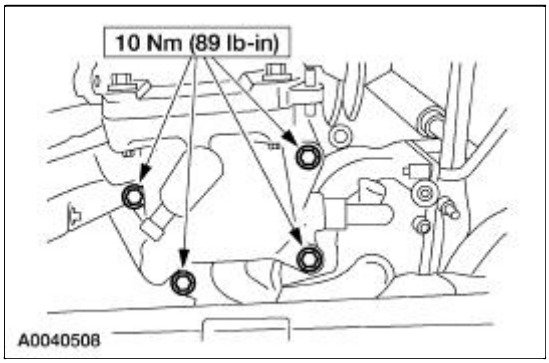
17. Remove the special tool.



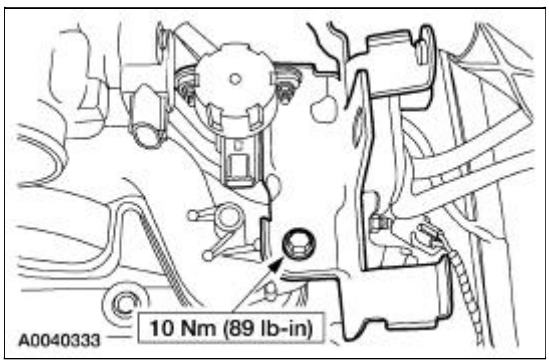
18. Position the generator and install the lower mounting bolts.



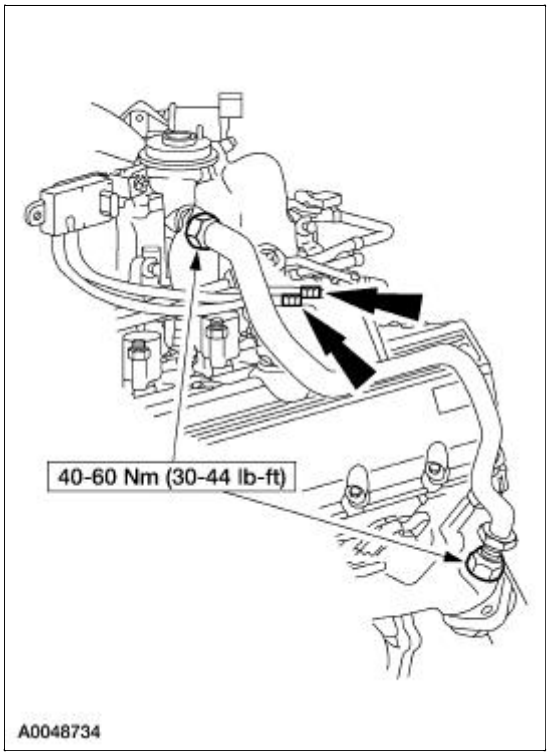
19. Install the generator upper mounting bracket bolts and harness routing clip.



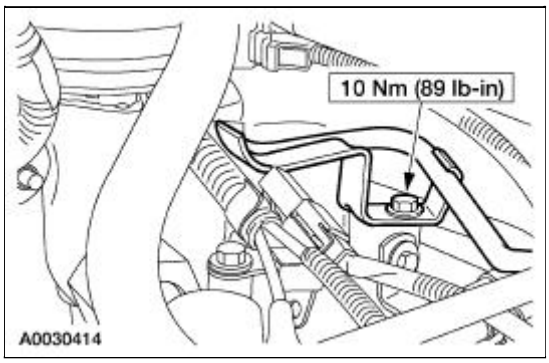
20. Rotate the belt tensioner clockwise and install the drive belt. Refer to the decal on the radiator upper air deflector for belt routing.



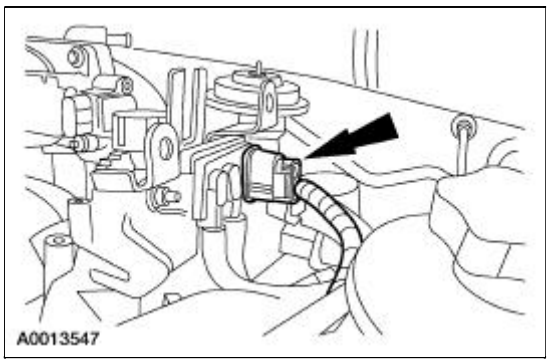
21. Install a new intake manifold-to-throttle body adapter gasket.



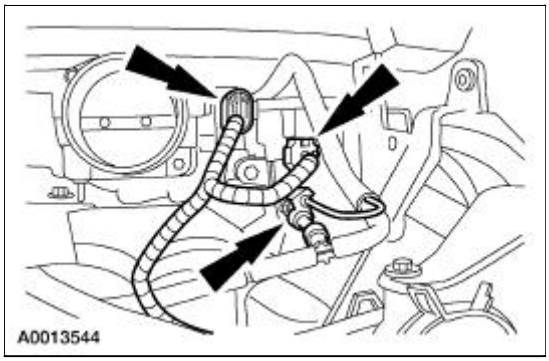
22. Install the throttle body adapter and the four bolts.



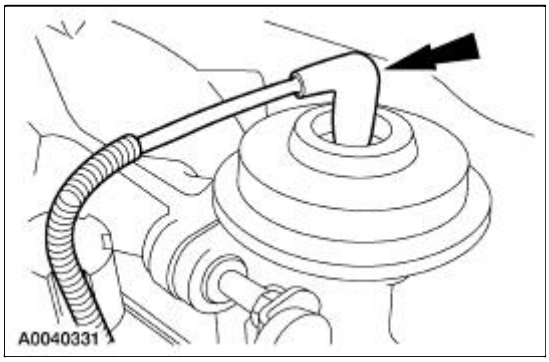
23. Install the differential pressure feedback EGR system bracket bolt.



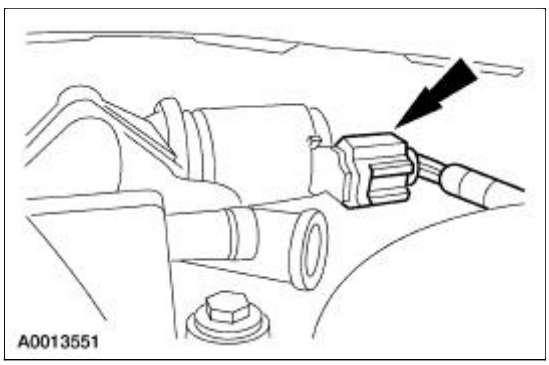
24. Install the exhaust manifold to EGR valve tube.
    - Position the tube and hand-tighten the fittings.
    - Tighten the upper fitting.
    - Tighten the lower fitting.
    - Connect the two differential pressure feedback EGR system hoses.



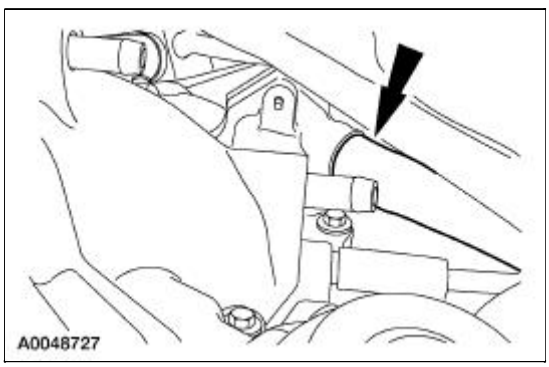
25. Connect the brake booster vacuum tube and position the bracket. Install the bolt.



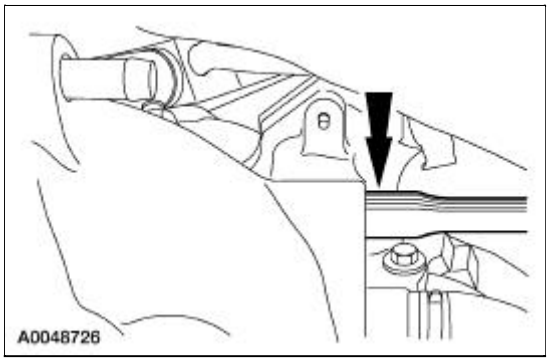
26. Connect the differential pressure feedback EGR system electrical connector.



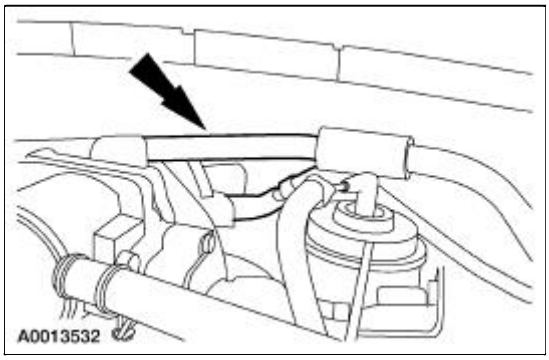
27. Connect the TP sensor electrical connector, and the EGR vacuum regulator solenoid electrical and vacuum connectors.



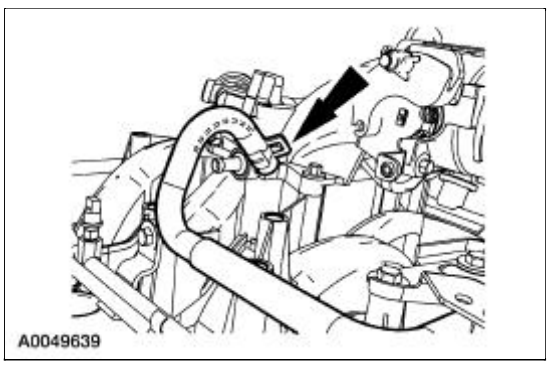
28. Connect the EGR valve vacuum hose.



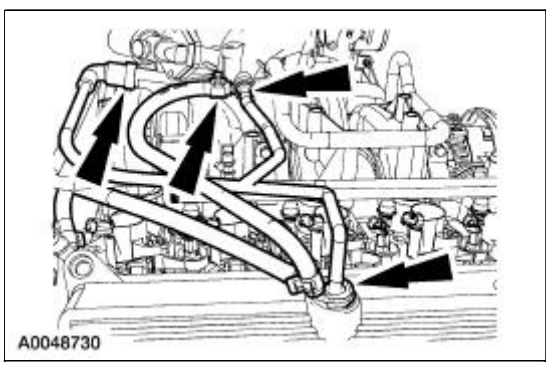
29. Connect the IAC electrical connector.



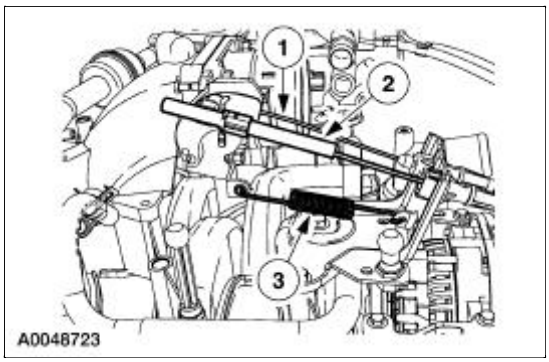
30. Install the IAC fresh air tube.



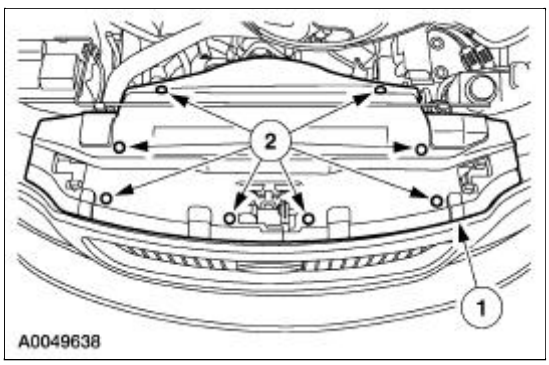
31. Connect the main vacuum harness.



32. Connect the evaporative emission canister purge valve hose.



33. Connect the heated throttle body inlet hose to the throttle body adapter.

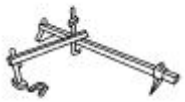


34. Install the heated PCV hose harness.
    - Install the PCV valve.
    - Connect the PCV hose to the intake manifold.
    - Connect the heated throttle body outlet hose.
    - Connect the PCV hose to the throttle body adapter.

35. Connect the throttle body cam.
    1. Connect the accelerator cable.
    2. Connect the speed control actuator cable.
    3. Install the throttle return spring.

36. Install the upper air deflector.
    1. Position the upper air deflector.
    2. Install the pin-type retainers.

37. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12 .



38. Connect the battery ground cable. For additional information, refer to Section 414-01 .

39. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .

40. If equipped, turn on the air suspension switch.

Exhaust Manifold LH —4.6L

Special Tool(s)

 ST2334-A	Support Bracket, Engine 303-639
 ST2176-B	Heavy Duty Engine Support 303-F070

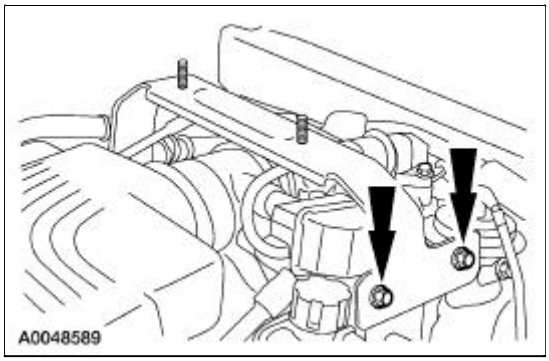
Removal

All vehicles

1. **CAUTION: The air suspension switch must be turned off prior to raising the vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which could result in shifting of the vehicle during the repair operation.**

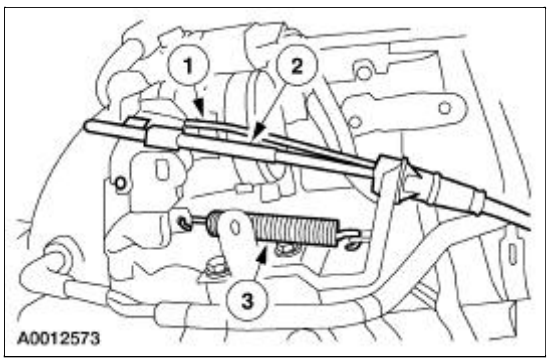
   If equipped, turn the air suspension switch off.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

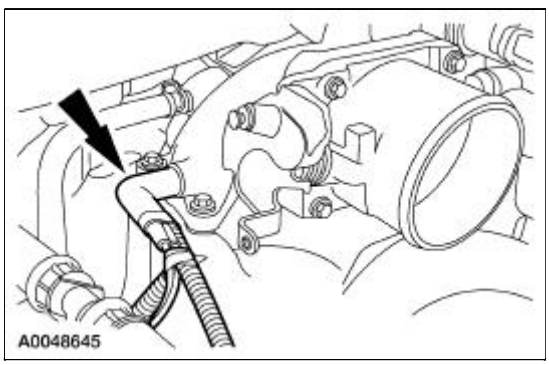


3. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

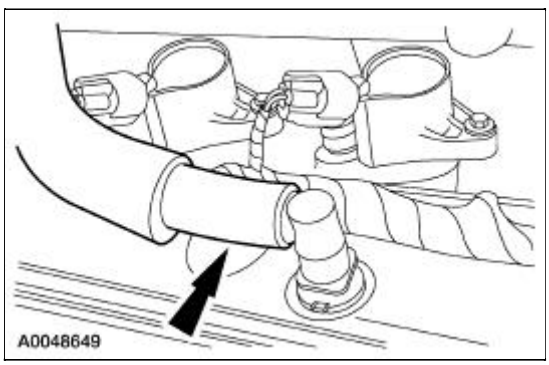
4. Partially drain the engine cooling system. For additional information, refer to Section 303-03 .



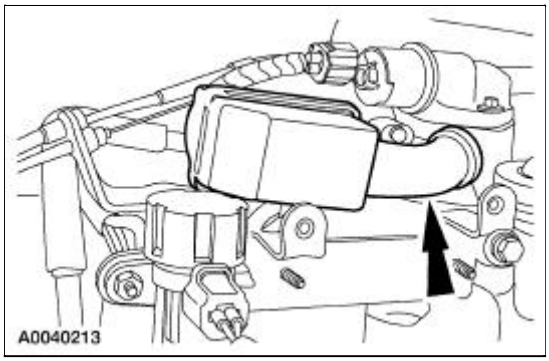
5. Remove the upper air deflector.
   1. Remove the pin-type retainers.
   2. Remove the upper air deflector.



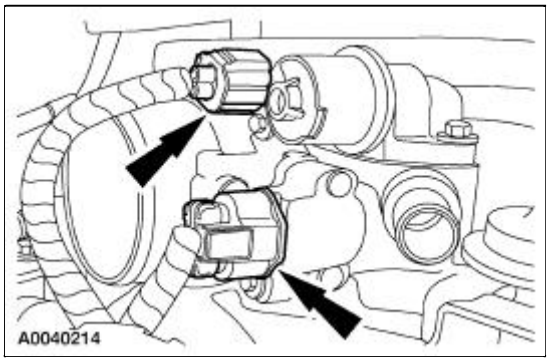
6. Remove the three bolts and the appearance cover mounting bracket.



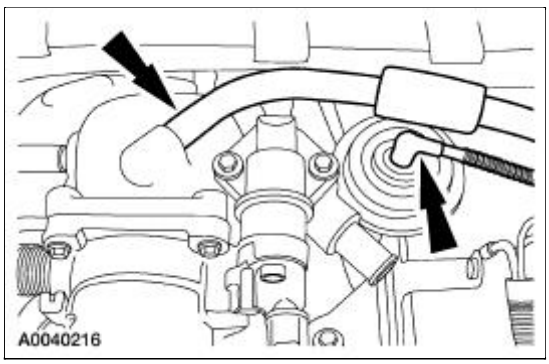
7. Disconnect the throttle body cam.
    1. Disconnect the accelerator cable.
    2. Disconnect the speed control actuator cable.
    3. Remove the accelerator return spring.



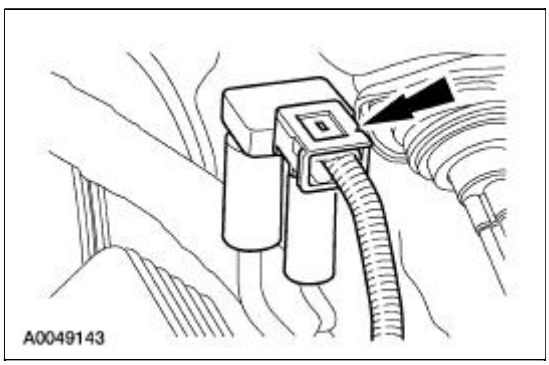
8. Disconnect the main vacuum harness.



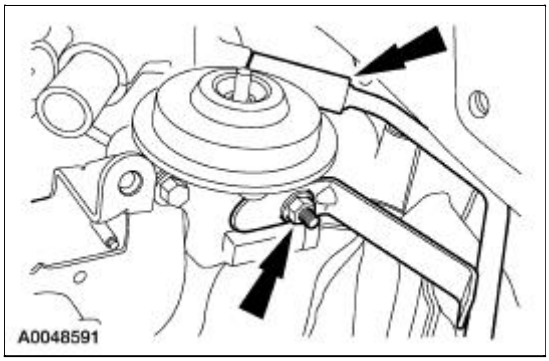
9. Disconnect the positive crankcase ventilation (PCV) hose.



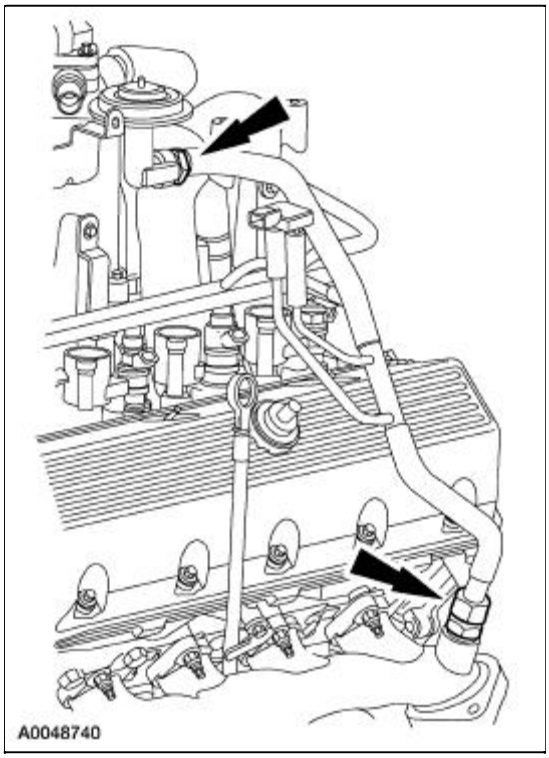
10. Remove the idle air control (IAC) fresh air hose.



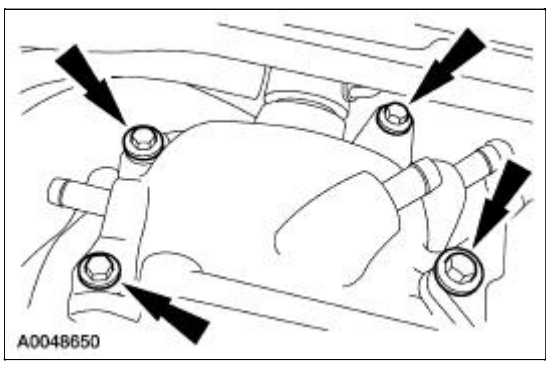
11. Disconnect the IAC and throttle position (TP) sensor electrical connectors.



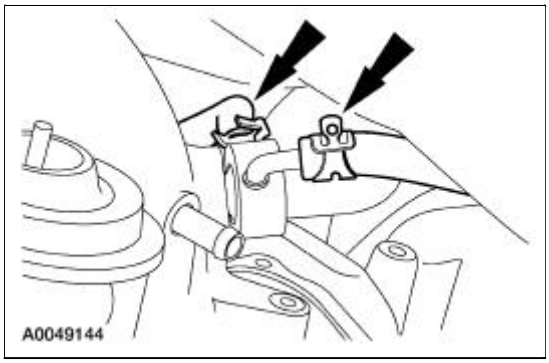
12. Disconnect the exhaust gas recirculation (EGR) valve vacuum hose and the evaporative emission canister purge valve hose and position them aside.



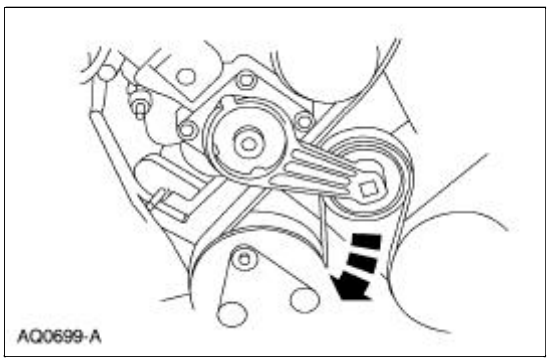
13. Disconnect the differential pressure feedback EGR system electrical connector.



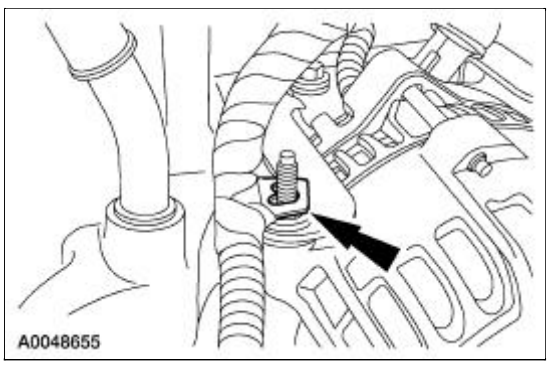
14. Remove the nut and disconnect the brake booster vacuum tube. Position the bracket and tube aside.



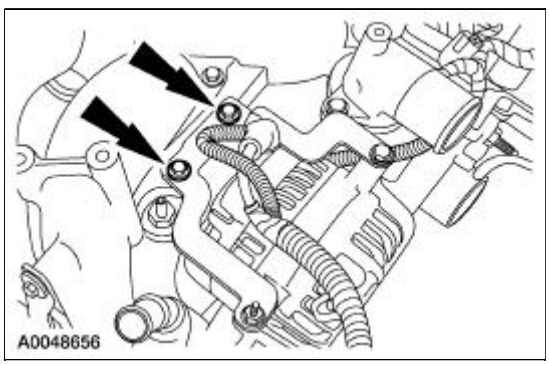
15. Disconnect the exhaust manifold to EGR valve tube fittings and remove the tube.



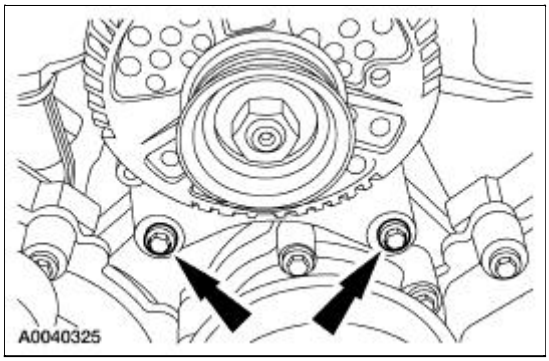
16. Remove the four bolts and move the throttle body adapter forward slightly.



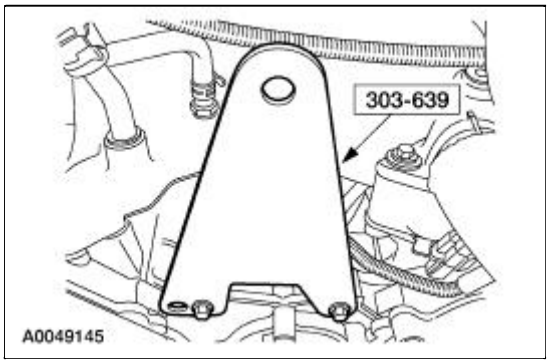
17. Disconnect the heated throttle body hoses and remove the throttle body adapter and PCV hose from the vehicle.
    - Discard the throttle body adapter-to-intake manifold gasket.
    - Inspect the throttle body and adapter for damage.



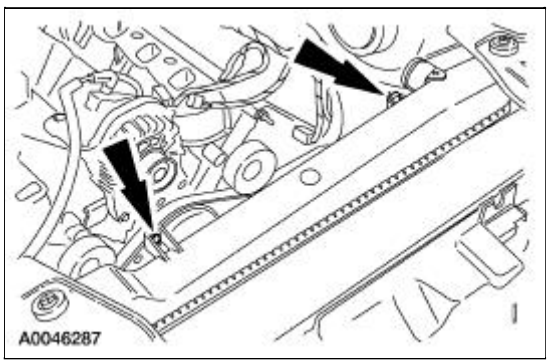
18. Rotate the belt tensioner clockwise and detach the drive belt from the generator pulley.



19. Disconnect the harness routing clip.



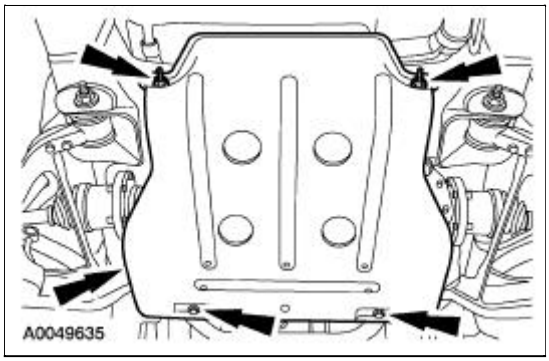
20. Remove the two bolts.



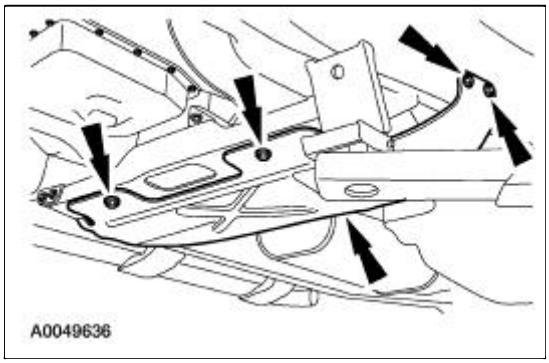
21. Remove the generator lower mounting bolts and position the generator aside.

22. Install the special tool.

23. Remove the fan shroud mounting bolts.



24. Remove the LH front wheel and tire. For additional information, refer to Section 204-04 .

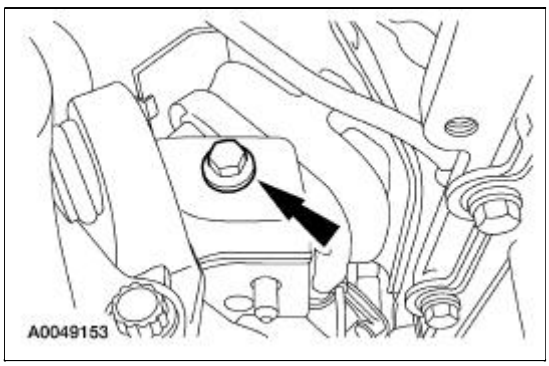


25. Remove the front fender splash shield.

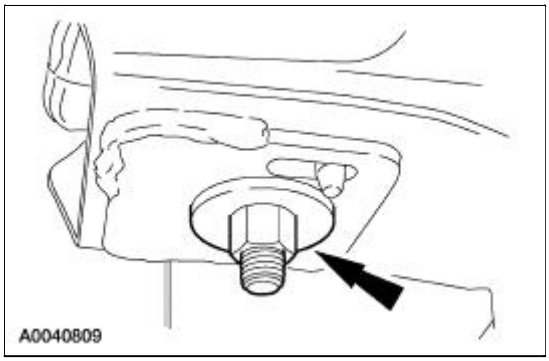
4x4 vehicles

26. Remove the fasteners and the engine skid shield.

27. Remove the six bolts and the transmission skid shield.



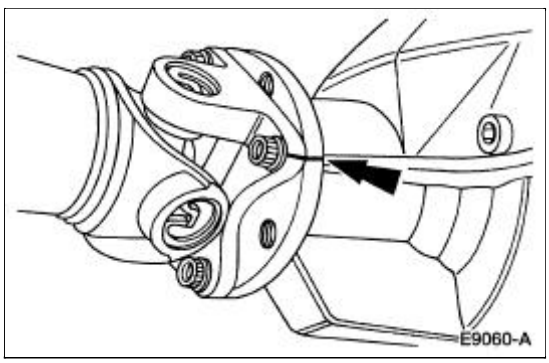
All vehicles



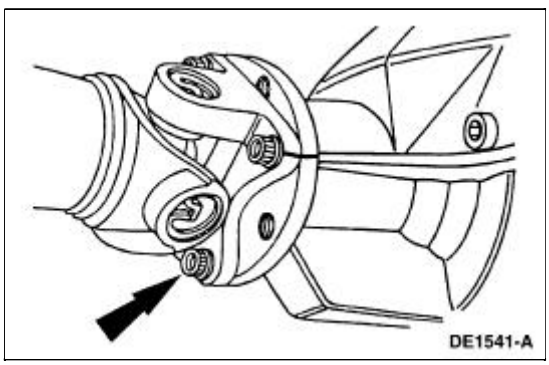
28. Remove the dual converter Y-pipe. For additional information, refer to Section 309-00 .

29. **NOTE:** The caged nut on the frame may break during bolt removal. If necessary, install a new nut.

    Remove the LH engine mount bolt.

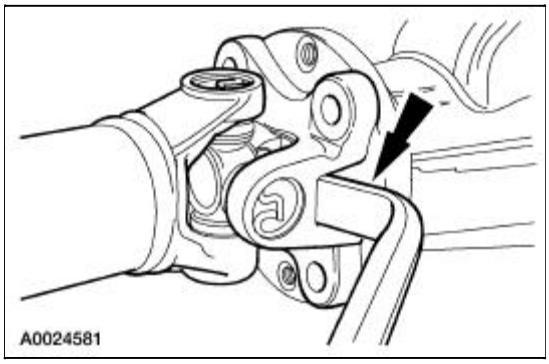


30. Remove the RH engine mount nut.

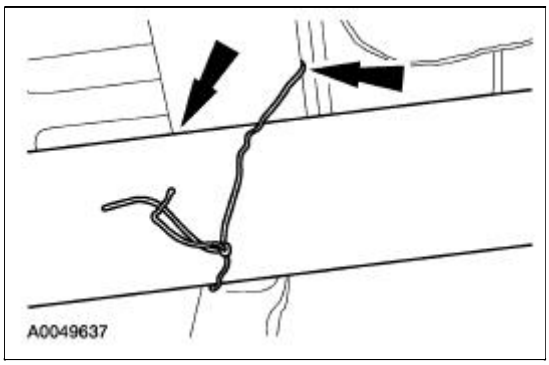


31. Loosen the rear transmission mount nuts.

32. Index-mark the driveshaft flange yoke and the pinion flange.

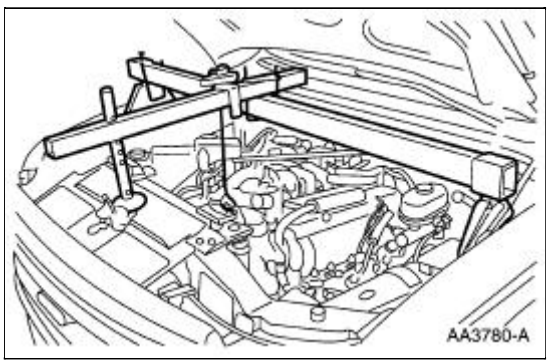


33. Remove the four bolts.



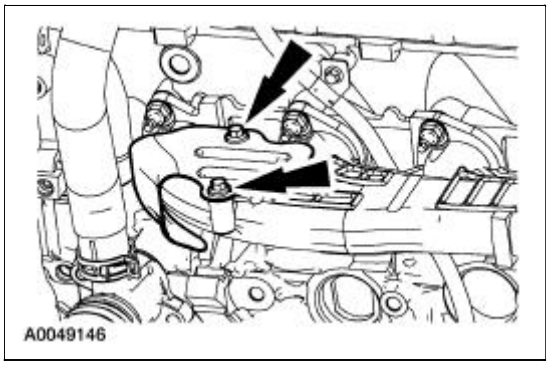
34. **CAUTION: The driveshaft flange yoke fits tightly on the pinion flange pilot. Never hammer on the driveshaft or any of its components to disconnect the yoke from the flange. Pry only in the area shown, with a suitable tool, to disconnect the yoke from the flange.**

Using a suitable tool as shown, disconnect the driveshaft flange yoke from the pinion flange.



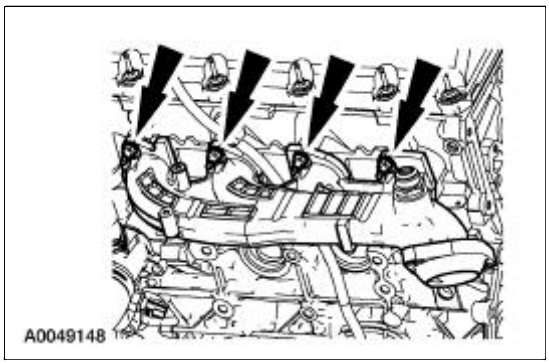
35. **CAUTION: The driveshaft alignment bushing can be damaged if the driveshaft is allowed to hang unsupported.**

    Wire the driveshaft to the frame crossmember to support it at the same height as when it was installed.



36. Lower the vehicle.

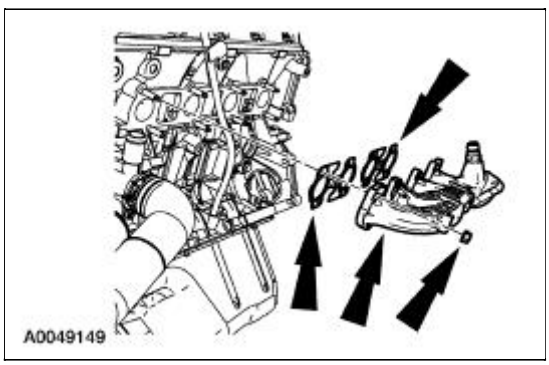
37. Install the special tool and raise the engine.



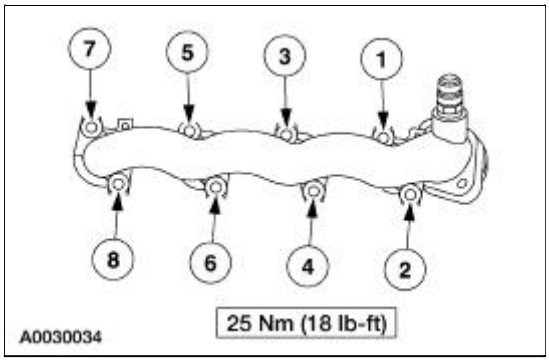
38. Raise and support the vehicle. For additional information, refer to Section 100-02 .

39. Remove the bolts and the heat shield.

40. Remove the eight nuts, the exhaust manifold and the gaskets.
    - Discard the exhaust manifold gaskets.

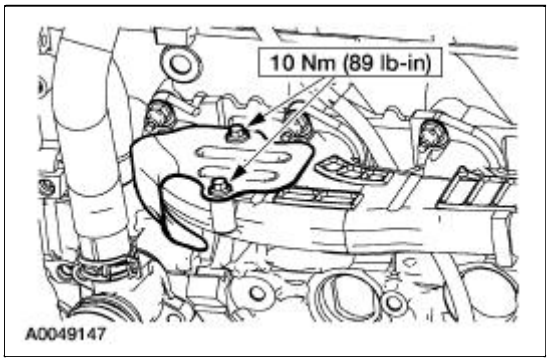


41. Clean and inspect the exhaust manifold. For additional information, refer to Section 303-00 .



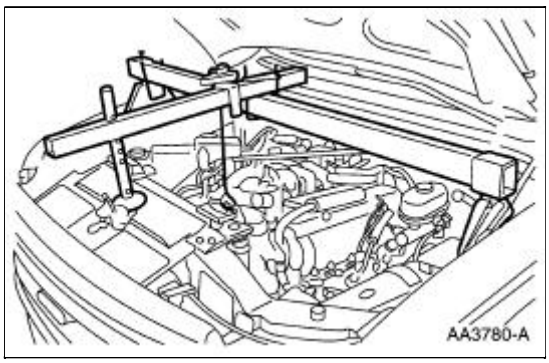
Installation

All vehicles



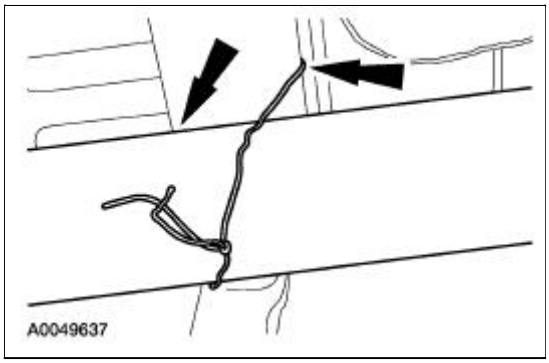
1. Position the exhaust manifold gaskets and the exhaust manifold. Loosely install the nuts.

2. Tighten the nuts in the sequence shown.



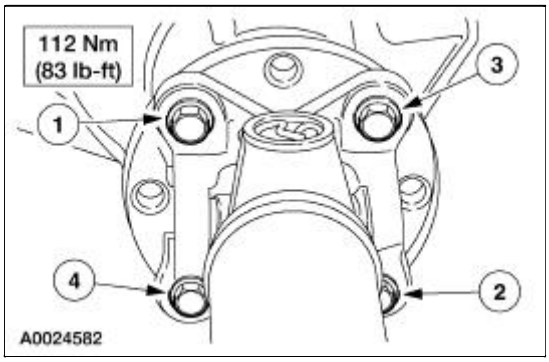
3. Install the heat shield and bolts.

4. Lower the vehicle.

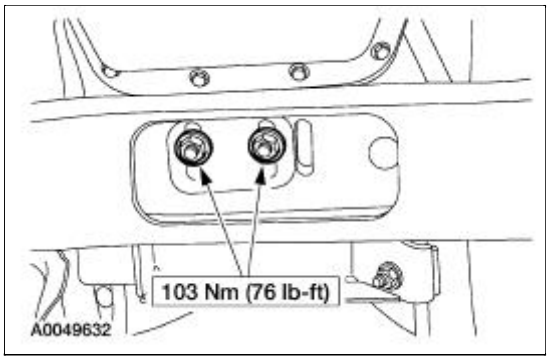


5. **NOTE:** Make sure the engine mounts align with, and settle into, the frame brackets as the engine is lowered.

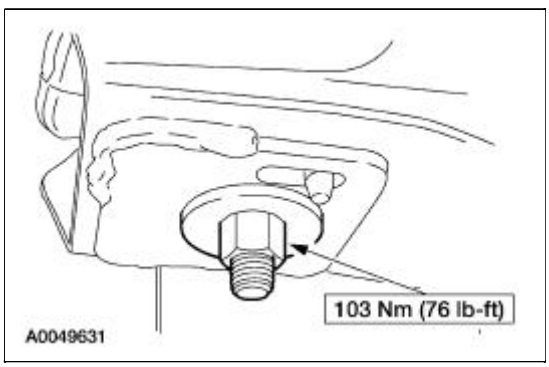
   Lower the engine and remove the special tool.



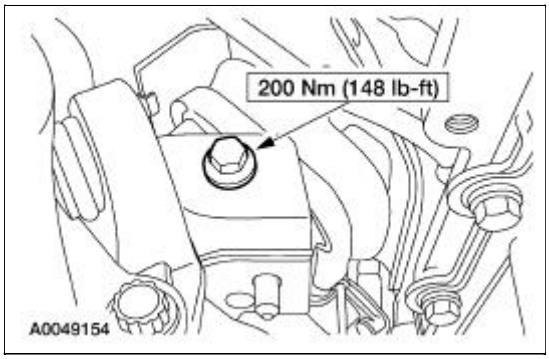
6. Raise and support the vehicle. For additional information, refer to Section 100-02 .



7. Remove the driveshaft support wire.

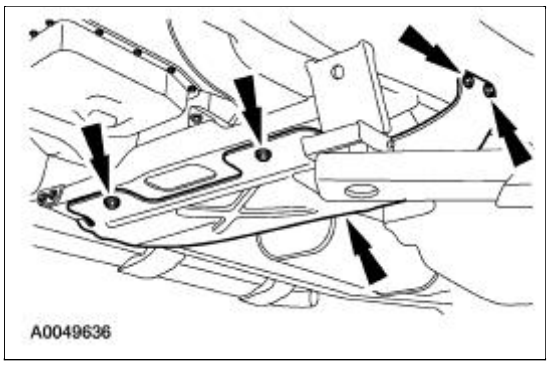


8. Align the index marks and install the driveshaft flange yoke to the pinion flange. Tighten the bolts in the sequence shown.

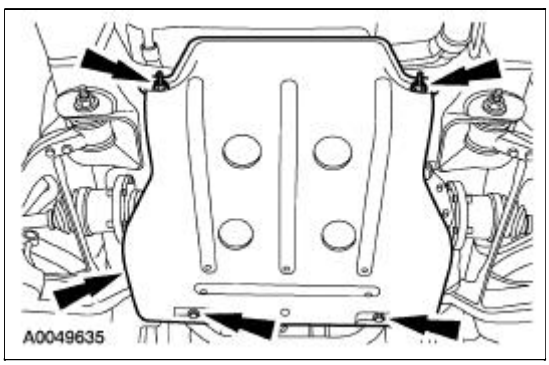


9. Tighten the rear transmission mount nuts.

10. Install the RH engine mount nut.



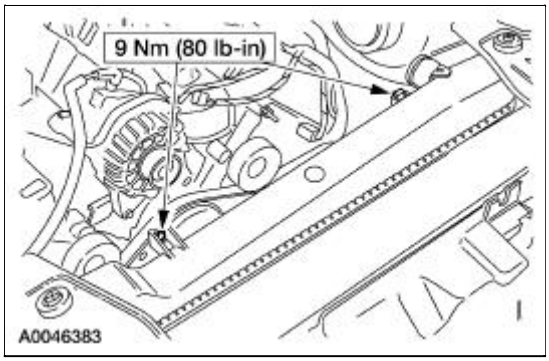
11. Install the LH engine mount bolt.



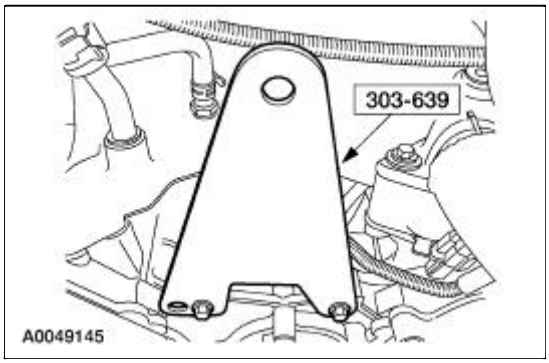
12. Install the dual converter Y-pipe. For additional information, refer to Section 309-00 .

4x4 vehicles

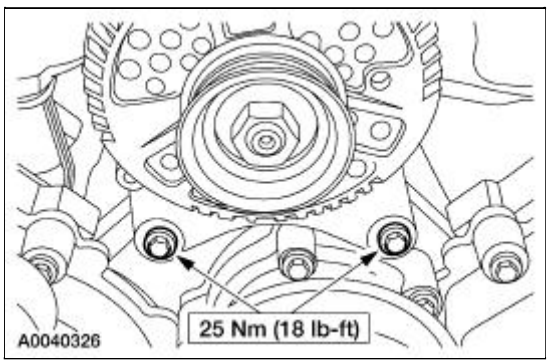
13. Position the transmission skid shield and install the six bolts.



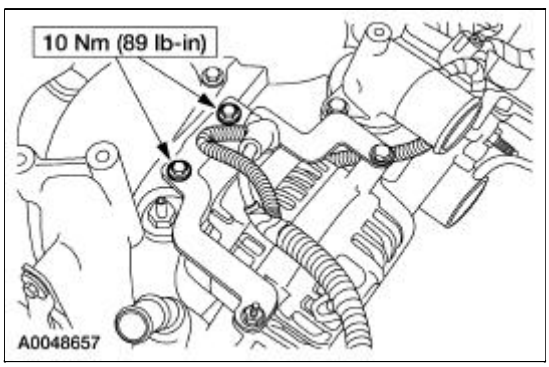
14. Position the engine skid shield and install the fasteners.



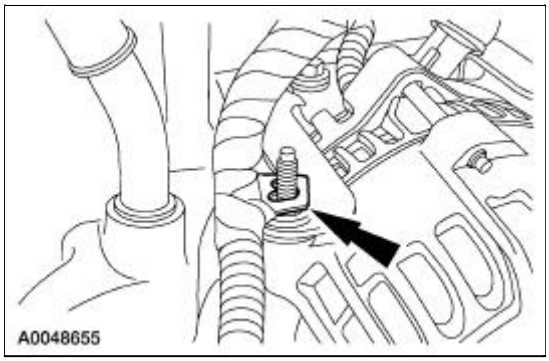
All vehicles



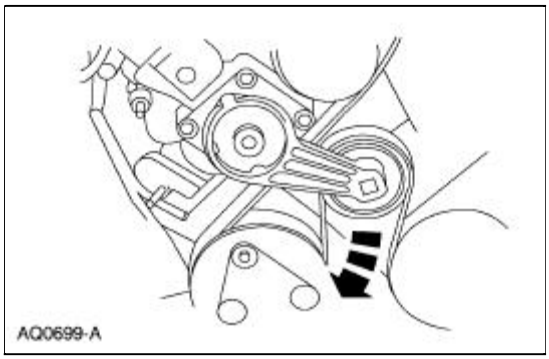
15. Install the front fender splash shield.
16. Install the LH front wheel and tire. For additional information, refer to Section 204-04 .
17. Position the fan shroud and install the mounting bolts.



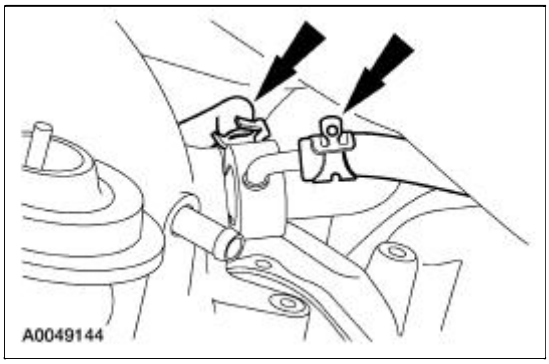
18. Remove the special tool.



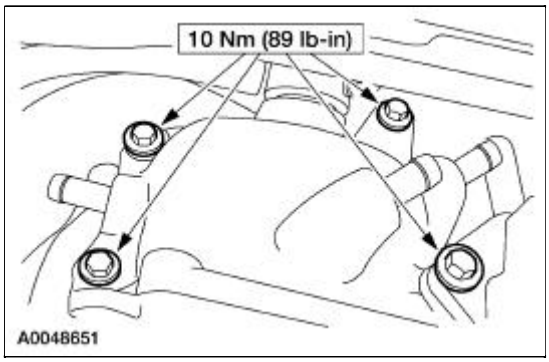
19. Position the generator and install the lower mounting bolts.



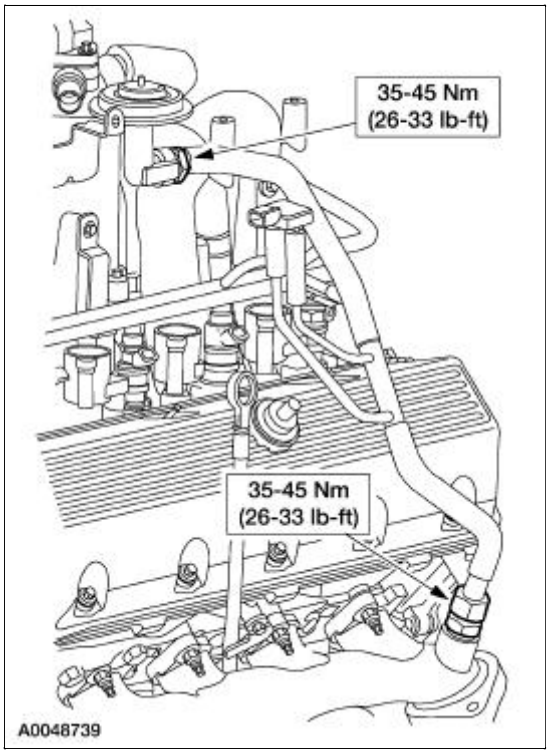
20. Install the generator upper mounting bracket bolts.



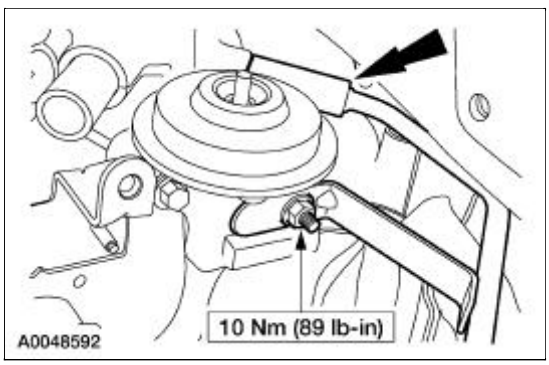
21. Install the harness routing clip.



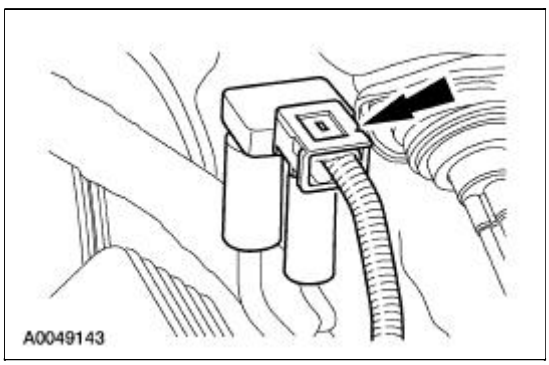
22. Rotate the belt tensioner clockwise and install the drive belt. Refer to the decal on the radiator upper air deflector for belt routing.



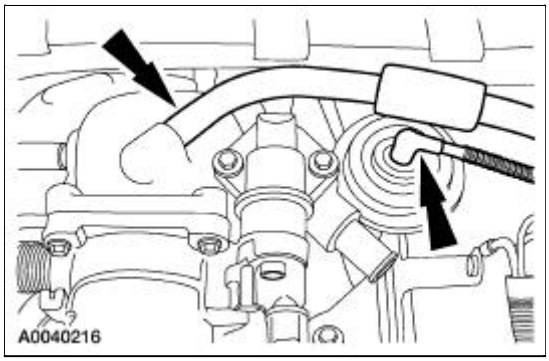
23. Roughly position the throttle body adapter and PCV hose in the vehicle and connect the heated throttle body hoses.



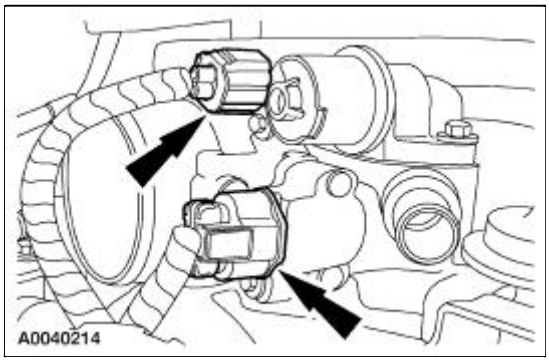
24. Install a new gasket and the throttle body adapter.



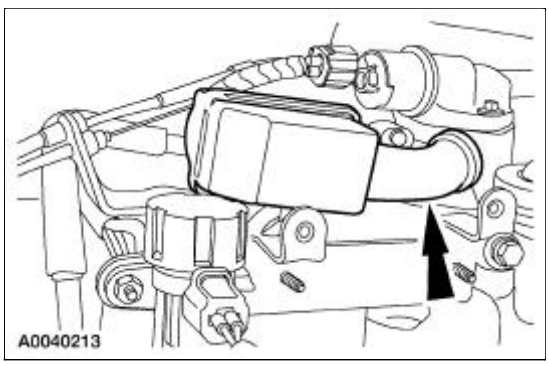
25. Position the exhaust manifold to EGR valve tube and tighten the fittings.



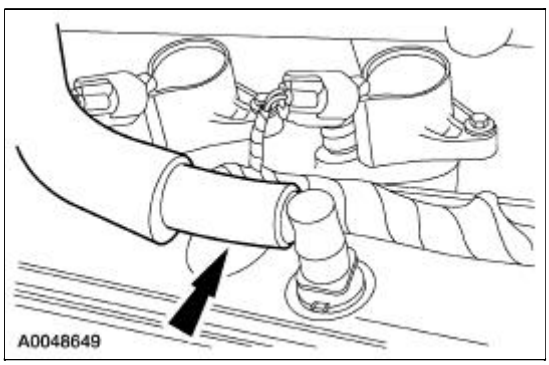
26. Connect the brake booster vacuum tube and bracket. Install the nut.



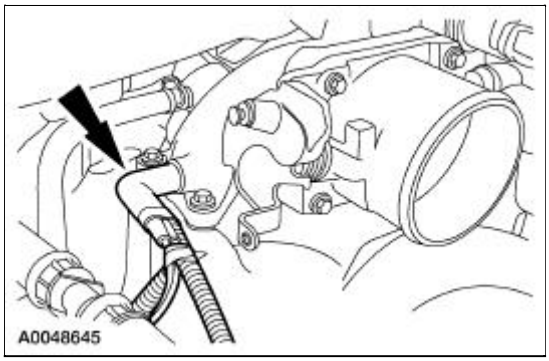
27. Connect the differential pressure feedback EGR system electrical connector.



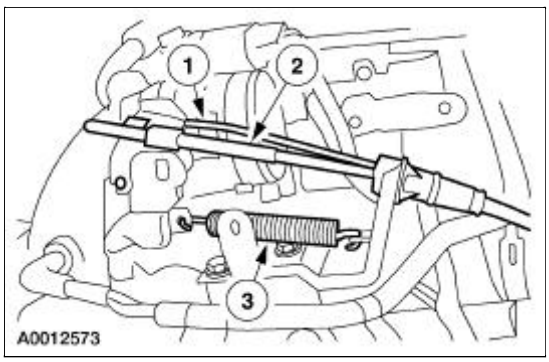
28. Connect the evaporative emission canister purge valve hose and the EGR valve vacuum hose.



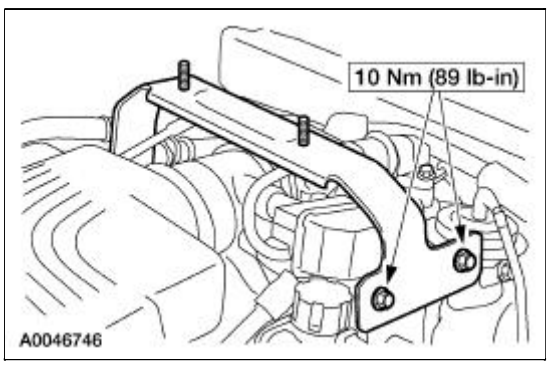
29. Connect the TP sensor and IAC electrical connectors.



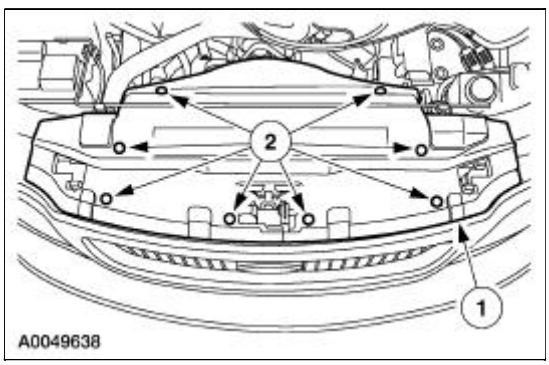
30. Install the IAC fresh air hose.



31. Connect the PCV hose.

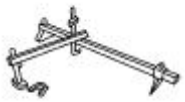


32. Connect the main vacuum harness.



33. Connect the throttle body cam.
    1. Connect the accelerator cable.
    2. Connect the speed control actuator cable.
    3. Install the throttle return spring.

34. Install the appearance cover mounting bracket and the three bolts.



35. Install the upper air deflector.
    1. Position the upper air deflector.
    2. Install the pin-type retainers.

36. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
37. Connect the battery ground cable. For additional information, refer to Section 414-01 .
38. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .
39. If equipped, turn on the air suspension switch.

Exhaust Manifold LH —5.4L

Special Tool(s)

 ST2334-A	Support Bracket, Engine 303-639
 ST2176-B	Heavy Duty Engine Support 303-F070

Removal

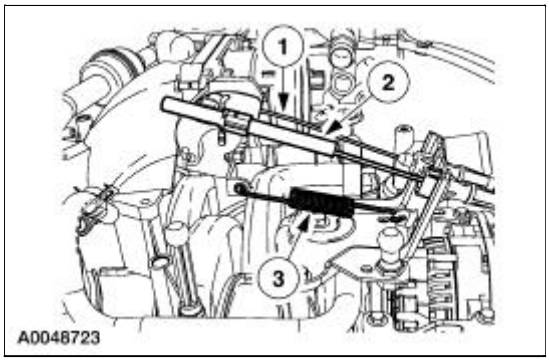
All vehicles

1. **CAUTION: The air suspension switch must be turned off prior to raising the vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which could result in shifting of the vehicle during the repair operation.**

   If equipped, turn the air suspension switch off.

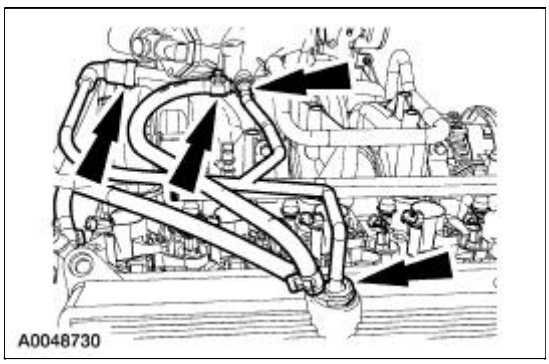
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

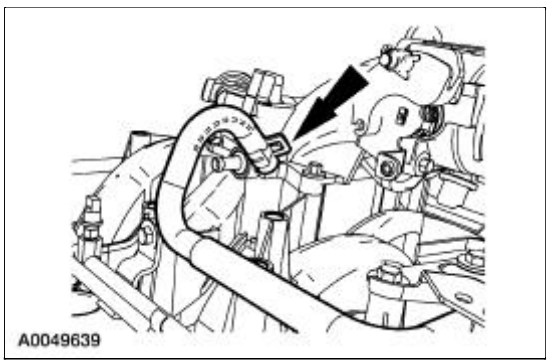


4. Partially drain the engine cooling system. For additional information, refer to Section 303-03 .

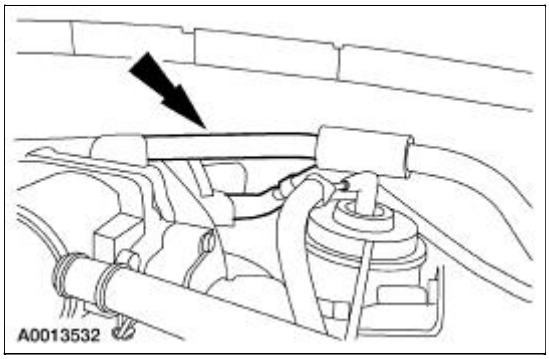
5. Remove the upper air deflector.
   1. Remove the pin-type retainers.
   2. Remove the upper air deflector.



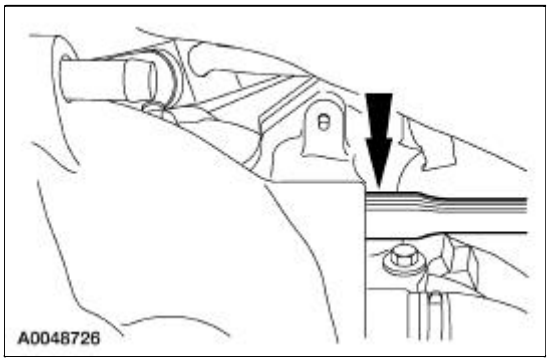
6. Disconnect the throttle body cam.
   1. Disconnect the accelerator cable.



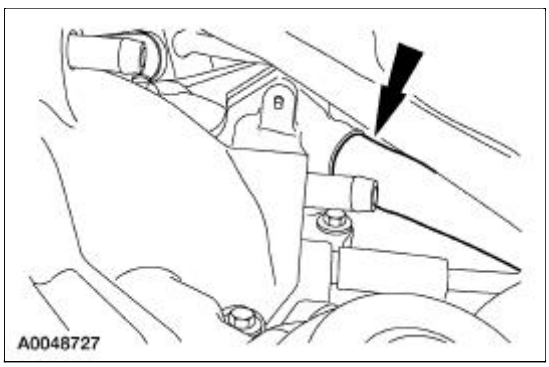
2. Disconnect the speed control actuator cable.
3. Remove the accelerator return spring.



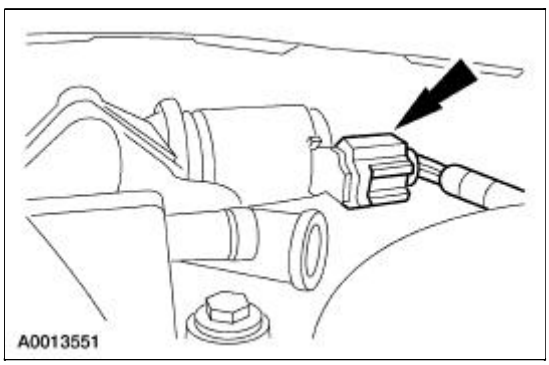
7. Position the heated positive crankcase ventilation (PCV) hose harness aside.
   - Disconnect the PCV hose from the throttle body adapter.
   - Disconnect the heated throttle body outlet hose from the throttle body adapter.
   - Disconnect the PCV hose from the intake manifold.
   - Remove the PCV valve and position the harness aside.



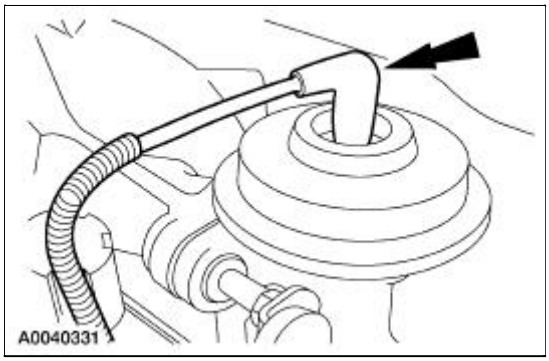
8. Disconnect the heated throttle body inlet hose from the throttle body adapter.



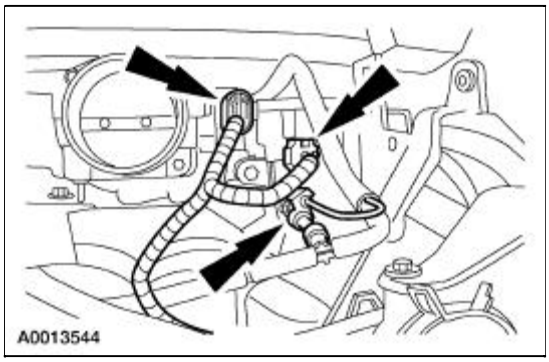
9. Disconnect the evaporative emission canister purge valve hose.



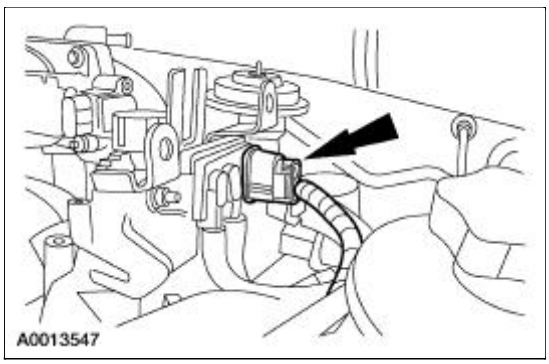
10. Disconnect the main vacuum harness from the throttle body adapter.



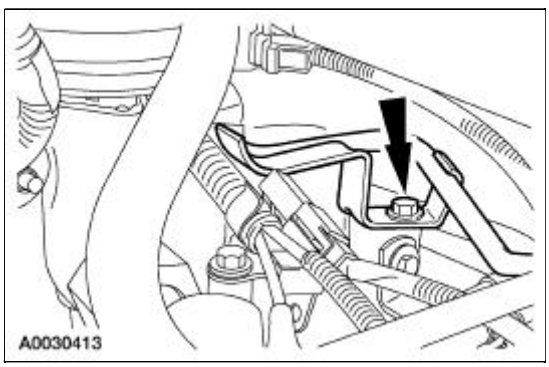
11. Remove the idle air control (IAC) valve fresh air tube.



12. Disconnect the IAC electrical connector.

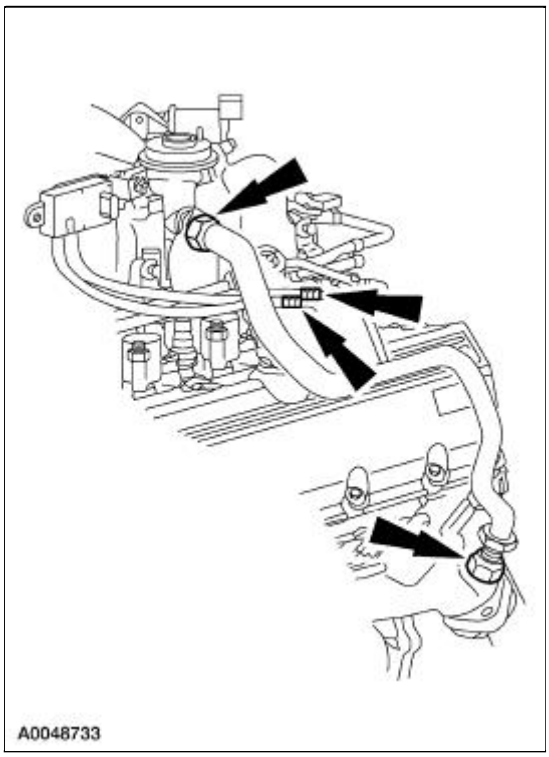


13. Disconnect the EGR valve vacuum hose.

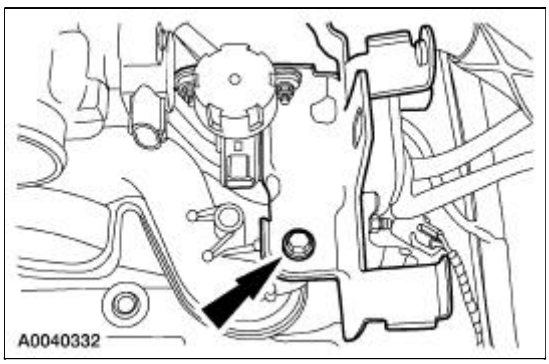


14. Disconnect the throttle position (TP) sensor electrical connector, and the exhaust gas recirculation (EGR) vacuum regulator solenoid electrical and vacuum connectors.

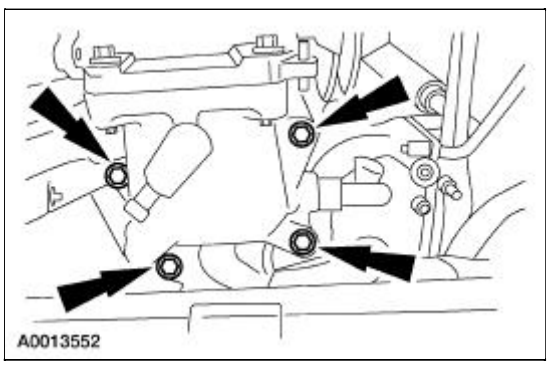
15. Disconnect the differential pressure feedback EGR system electrical connector.



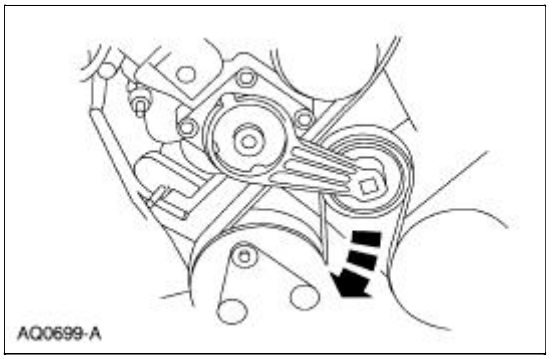
16. Remove the bolt and disconnect the brake booster vacuum tube. Position the bracket and tube aside.



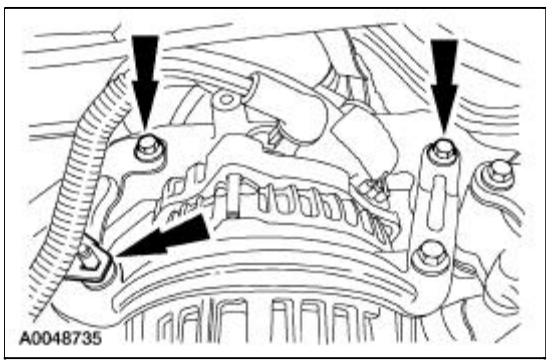
17. Remove the exhaust manifold to EGR valve tube.
    - Disconnect the upper fitting.



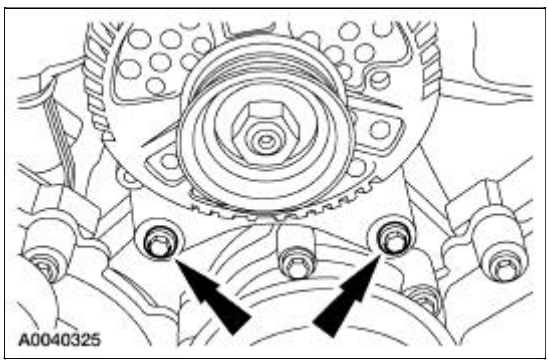
- Disconnect the two differential pressure feedback EGR system hoses.
- Disconnect the lower fitting and remove the tube.



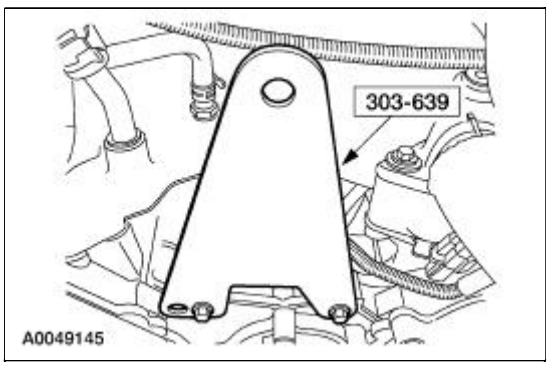
18. Remove the differential pressure feedback EGR system bracket bolt.



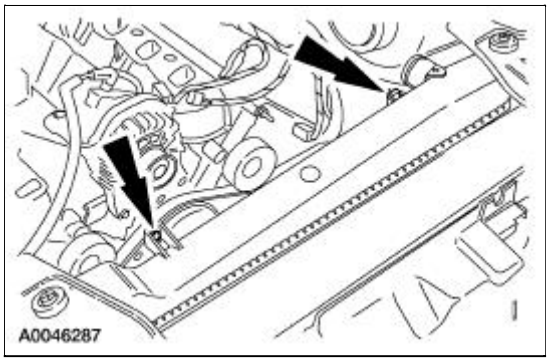
19. Remove the four bolts and remove the throttle body adapter.
    - Discard the throttle body adapter gasket.



20. Rotate the belt tensioner clockwise and detach the drive belt from the generator pulley.



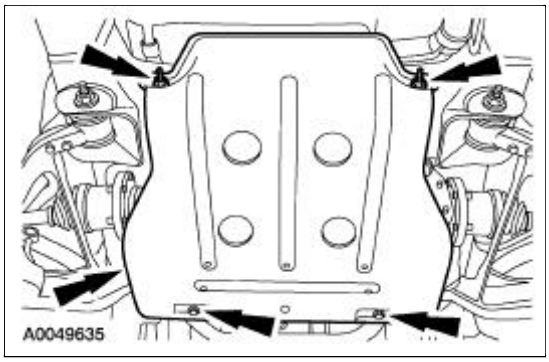
21. Disconnect the generator upper mounting bracket.
    - Disconnect the harness routing clip.
    - Remove the two bolts.



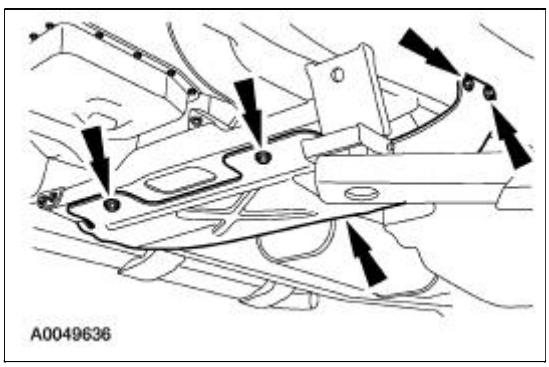
22. Remove the generator lower mounting bolts and position the generator aside.

23. Install the special tool.

24. Remove the fan shroud mounting bolts.



25. Remove the LH front wheel and tire. For additional information, refer to Section 204-04 .

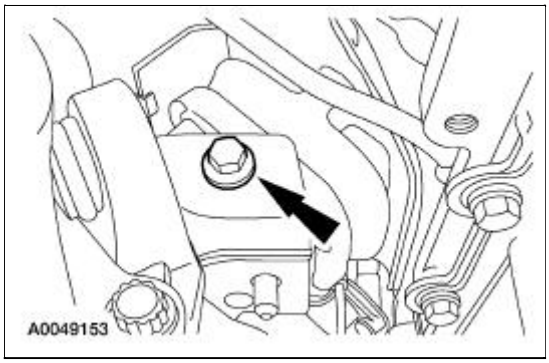


26. Remove the front fender splash shield.

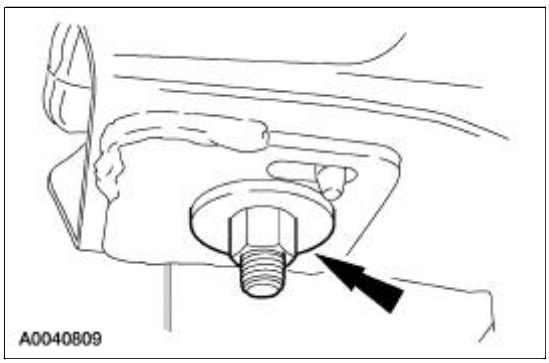
4x4 vehicles

27. Remove the fasteners and the engine skid shield.

28. Remove the six bolts and the transmission skid shield.



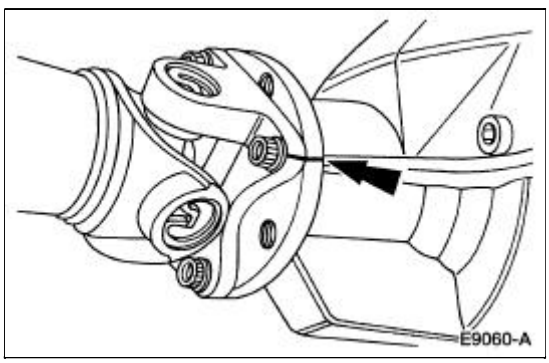
All vehicles



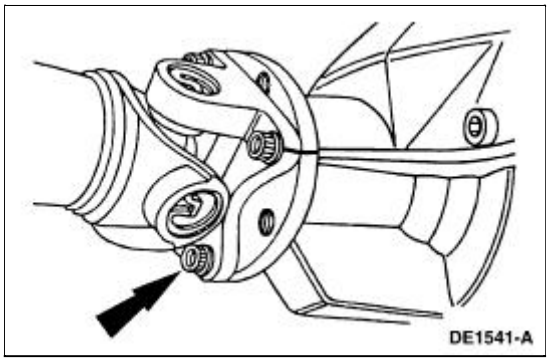
29. Remove the dual converter Y-pipe. For additional information, refer to Section 309-00 .

30. **NOTE:** The caged nut on the frame may break during bolt removal. If necessary, install a new nut.

    Remove the LH engine mount bolt.

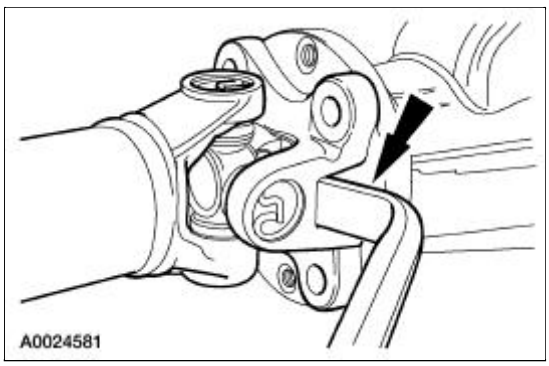


31. Remove the RH engine mount nut.

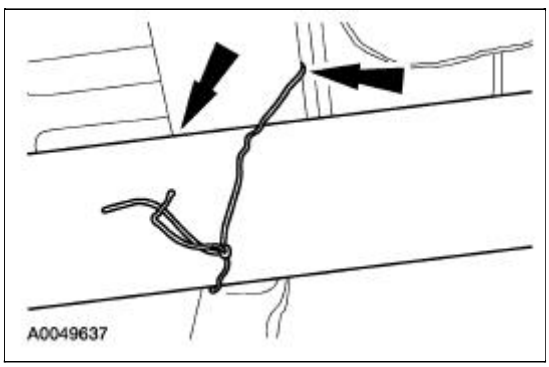


32. Loosen the rear transmission mount nuts.

33. Index-mark the driveshaft flange yoke and the pinion flange.

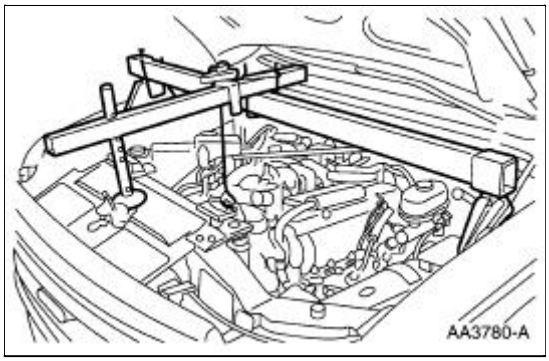


34. Remove the four bolts.



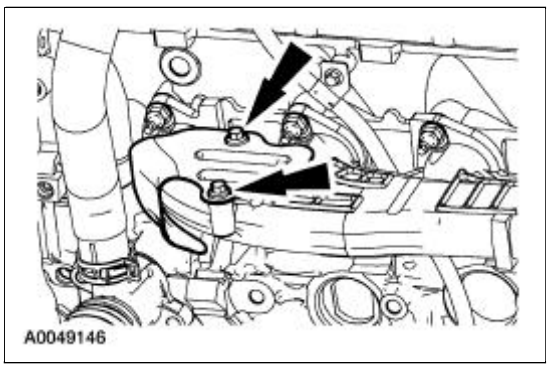
35. **CAUTION: The driveshaft flange yoke fits tightly on the pinion flange pilot. Never hammer on the driveshaft or any of its components to disconnect the yoke from the flange. Pry only in the area shown, with a suitable tool, to disconnect the yoke from the flange.**

    Using a suitable tool as shown, disconnect the driveshaft flange yoke from the pinion flange.



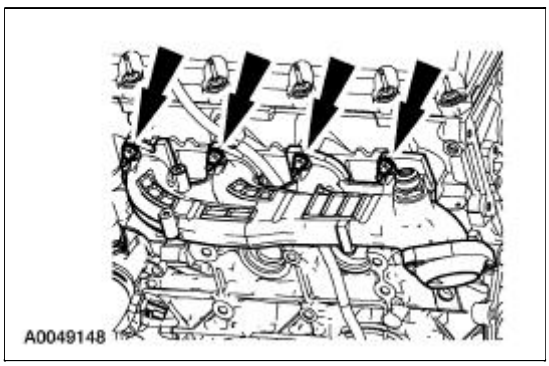
36. **CAUTION: The driveshaft alignment bushing can be damaged if the driveshaft is allowed to hang unsupported.**

    Wire the driveshaft to the frame crossmember to support it at the same height as when it was installed.



37. Lower the vehicle.

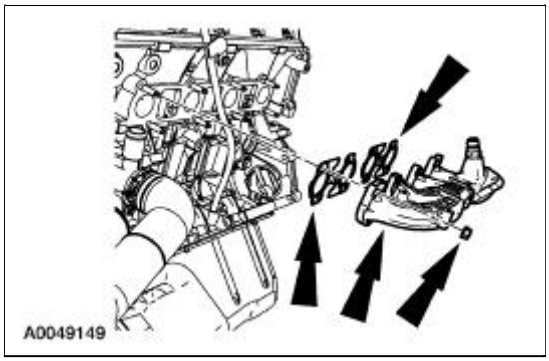
38. Install the special tool and raise the engine.



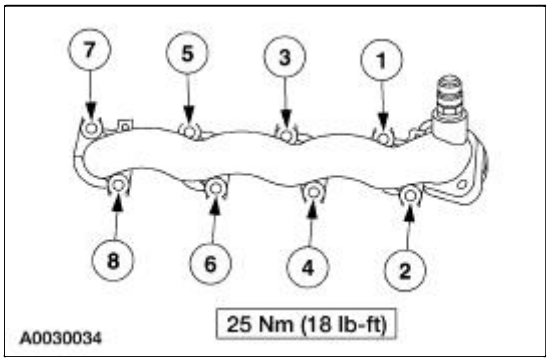
39. Raise and support the vehicle. For additional information, refer to Section 100-02 .

40. Remove the bolts and the heat shield.

41. Remove the eight nuts, the exhaust manifold and the gaskets.
    - Discard the exhaust manifold gaskets.

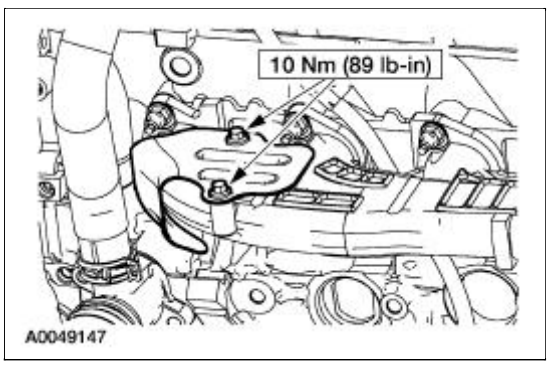


42. Clean and inspect the exhaust manifold. For additional information, refer to Section 303-00 .



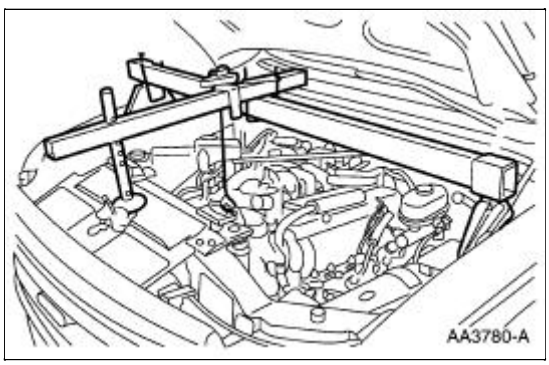
Installation

All vehicles



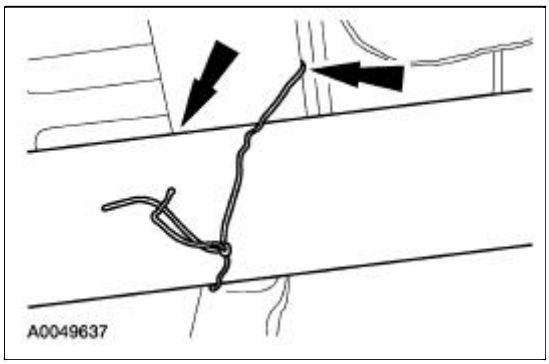
1. Position the exhaust manifold gaskets and the exhaust manifold. Loosely install the nuts.

2. Tighten the nuts in the sequence shown.



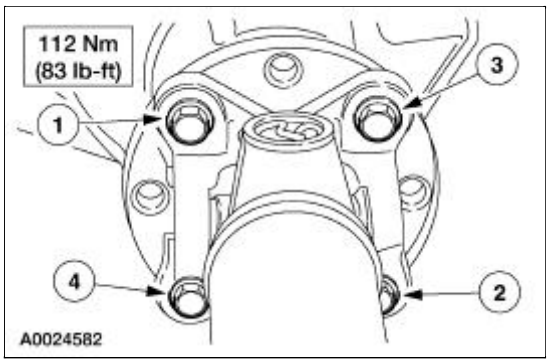
3. Install the heat shield and bolts.

4. Lower the vehicle.

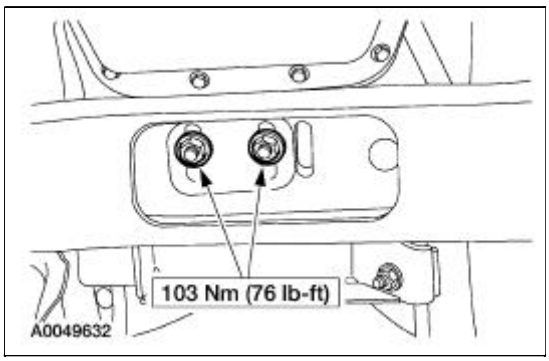


5. **NOTE:** Make sure the engine mounts align with, and settle into, the frame brackets as the engine is lowered.

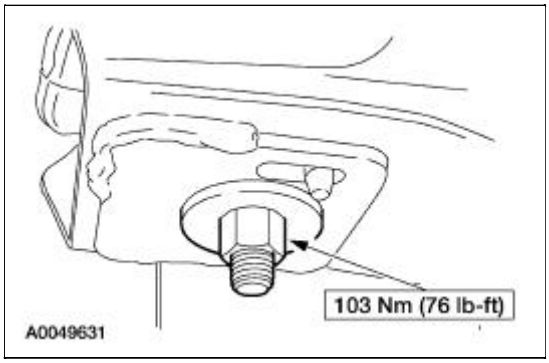
   Lower the engine and remove the special tool.



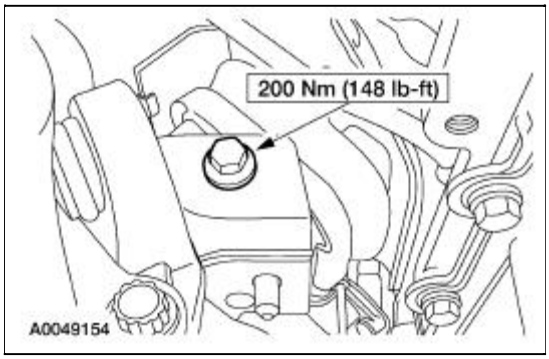
6. Raise and support the vehicle. For additional information, refer to Section 100-02 .



7. Remove the driveshaft support wire.

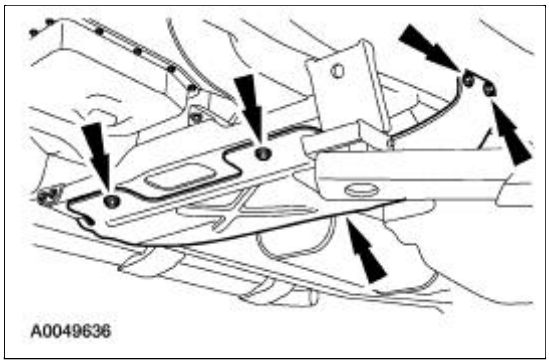


8. Align the index marks and install the driveshaft flange yoke to the pinion flange. Tighten the bolts in the sequence shown.

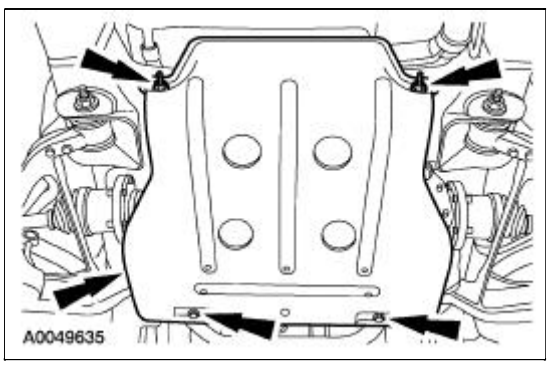


9. Tighten the rear transmission mount nuts.

10. Install the RH engine mount nut.



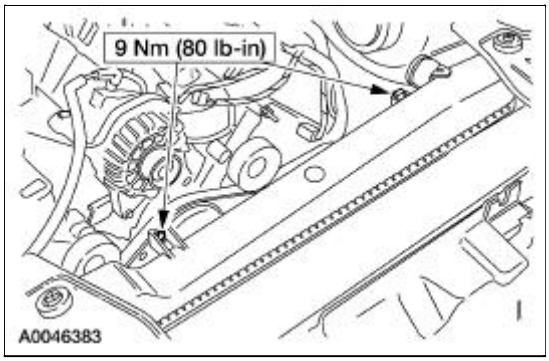
11. Install the LH engine mount bolt.



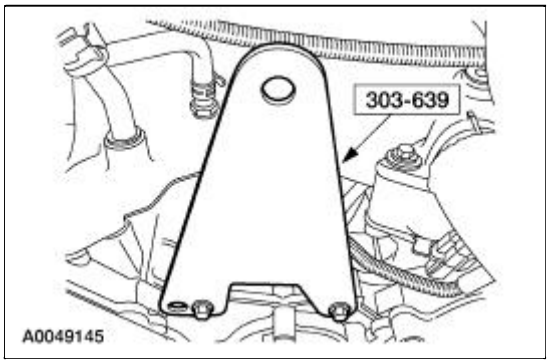
12. Install the dual converter Y-pipe. For additional information, refer to Section 309-00 .

4x4 vehicles

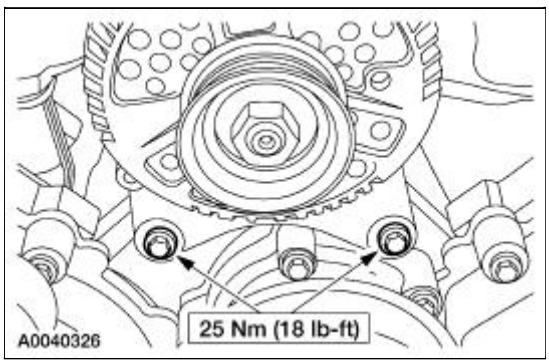
13. Position the transmission skid shield and install the six bolts.



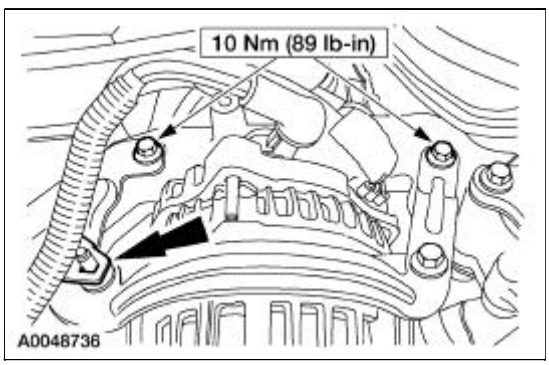
14. Position the engine skid shield and install the fasteners.



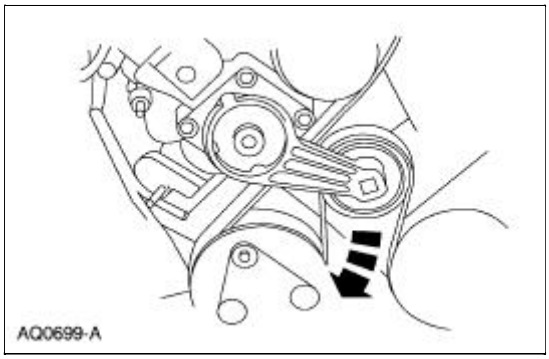
All vehicles



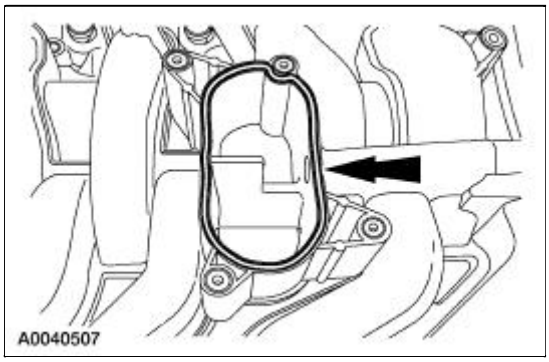
15. Install the front fender splash shield.
16. Install the LH front wheel and tire. For additional information, refer to Section 204-04 .
17. Position the fan shroud and install the mounting bolts.



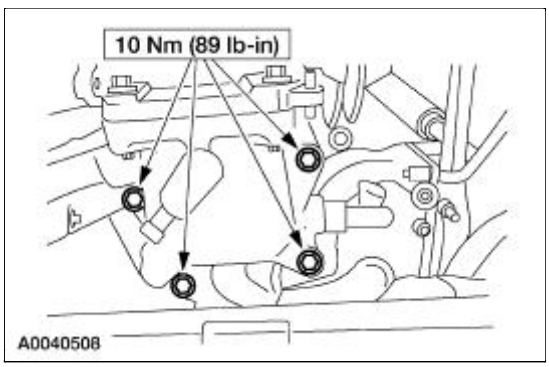
18. Remove the special tool.



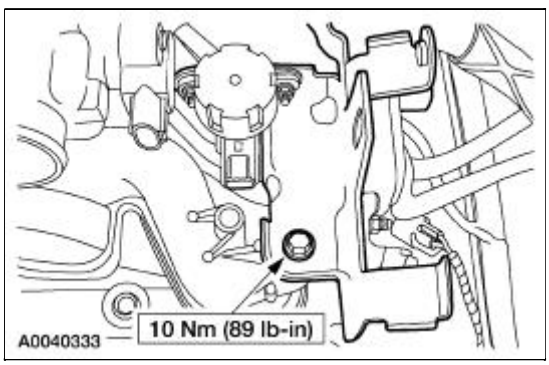
19. Position the generator and install the lower mounting bolts.



20. Install the generator upper mounting bracket bolts and harness routing clip.

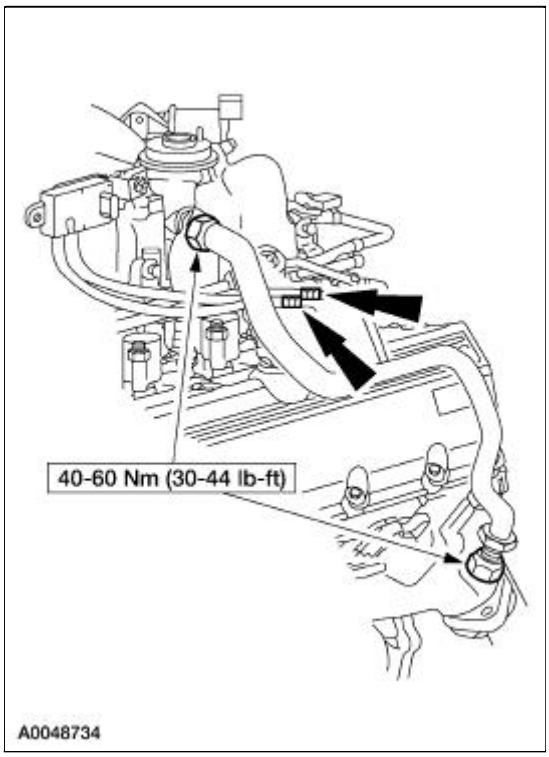


21. Rotate the belt tensioner clockwise and install the drive belt. Refer to the decal on the radiator upper air deflector for belt routing.

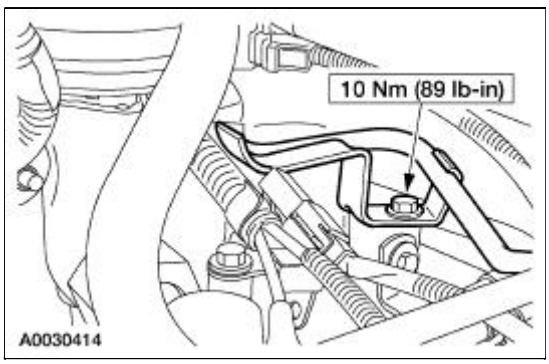


22. Install a new intake manifold-to-throttle body adapter gasket.

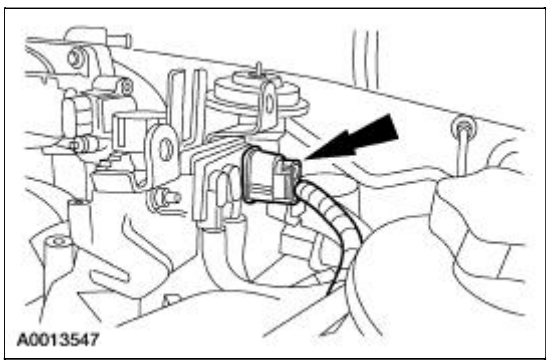
23. Install the throttle body adapter and the four bolts.



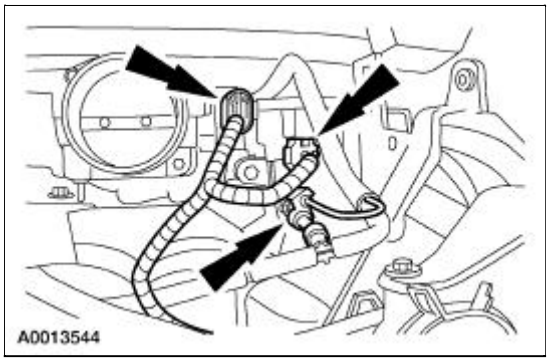
24. Install the differential pressure feedback EGR system bracket bolt.



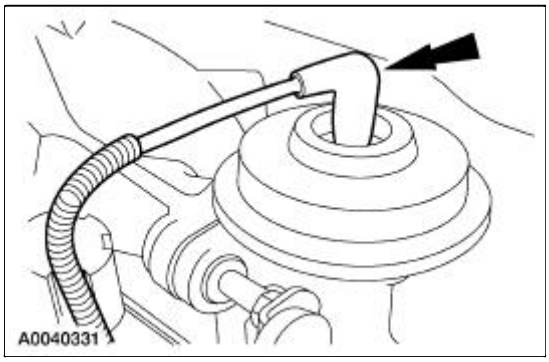
25. Install the exhaust manifold to EGR valve tube.
    - Position the tube and hand-tighten the fittings.
    - Tighten the upper fitting.



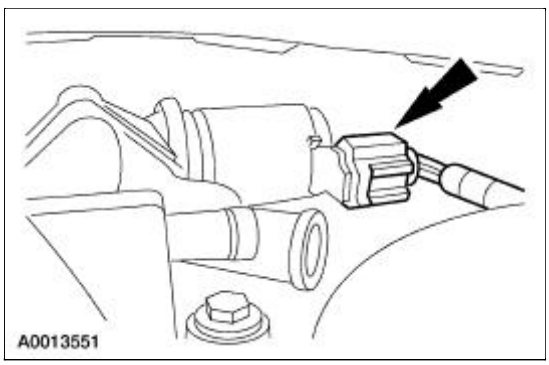
- Tighten the lower fitting.
- Connect the two differential pressure feedback EGR system hoses.



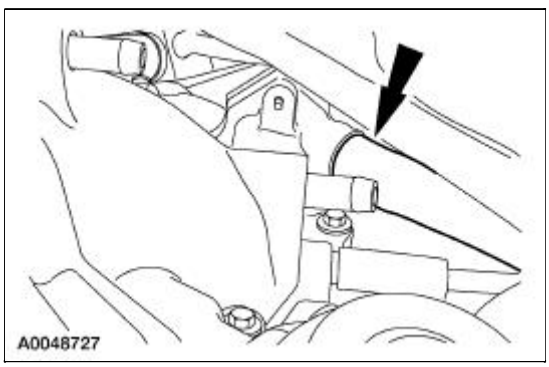
26. Connect the brake booster vacuum tube and position the bracket. Install the bolt.



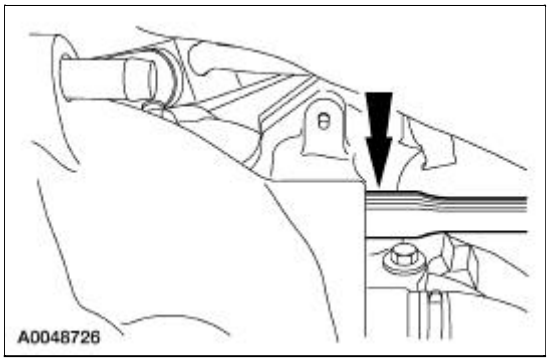
27. Connect the differential pressure feedback EGR system electrical connector.



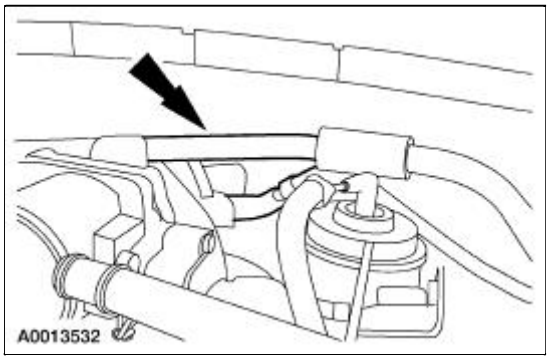
28. Connect the TP sensor electrical connector, and the EGR vacuum regulator solenoid electrical and vacuum connectors.



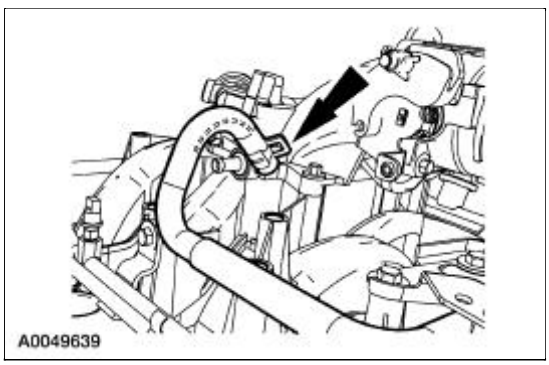
29. Connect the EGR valve vacuum hose.



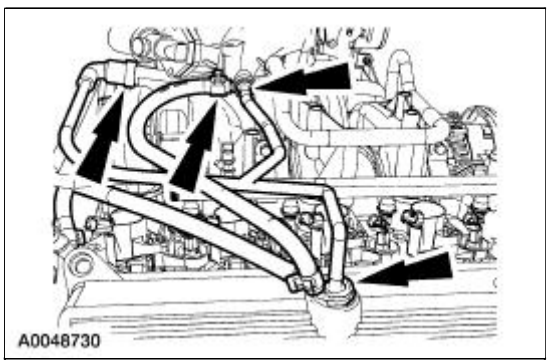
30. Connect the IAC electrical connector.



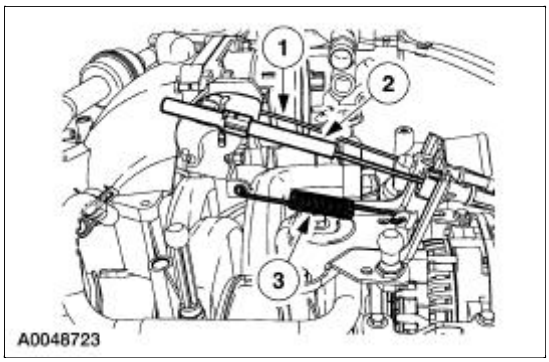
31. Install the IAC fresh air tube.



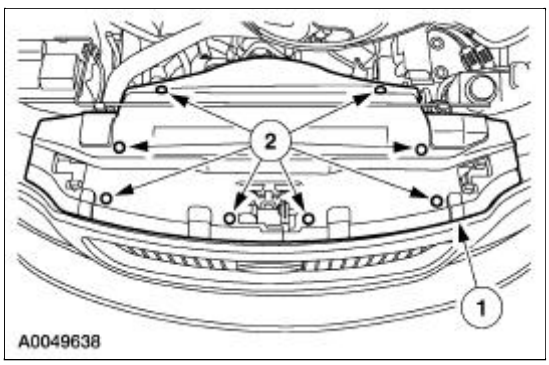
32. Connect the main vacuum harness.



33. Connect the evaporative emission canister purge valve hose.



34. Connect the heated throttle body inlet hose to the throttle body adapter.



35. Install the heated PCV hose harness.
    - Install the PCV valve.
    - Connect the PCV hose to the intake manifold.
    - Connect the heated throttle body outlet hose.
    - Connect the PCV hose to the throttle body adapter.

36. Connect the throttle body cam.
    1. Connect the accelerator cable.
    2. Connect the speed control actuator cable.
    3. Install the throttle return spring.

37. Install the upper air deflector.
    1. Position the upper air deflector.
    2. Install the pin-type retainers.

38. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

39. Connect the battery ground cable. For additional information, refer to Section 414-01 .

40. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .

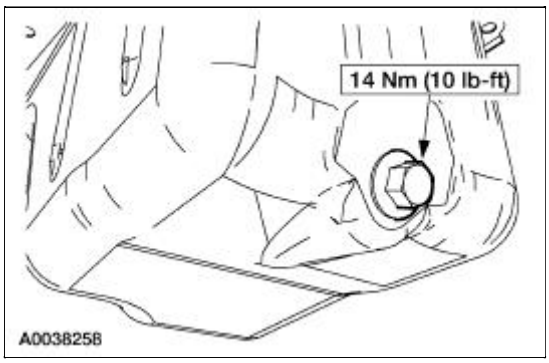
41. If equipped, turn on the air suspension switch.

Oil Filter Adapter —4x2

Material

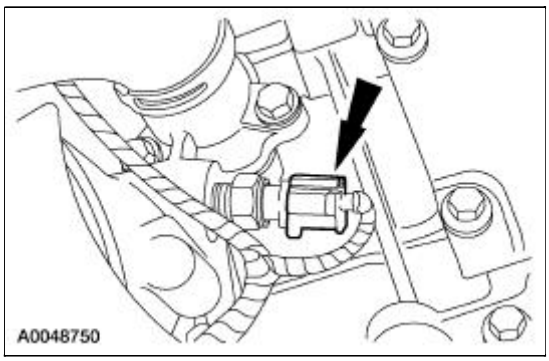
Item	Specification
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal and Installation



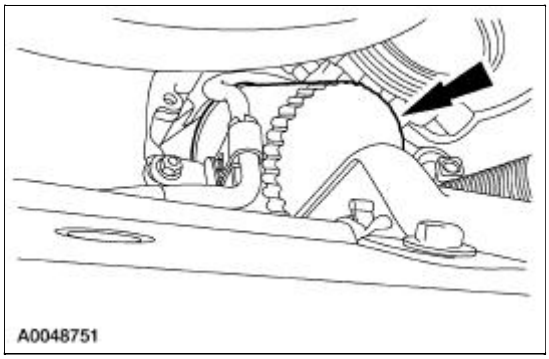
1. **CAUTION: The air suspension switch must be turned off prior to raising the vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which could result in shifting of the vehicle during the repair operation.**

   If equipped, turn the air suspension switch off.

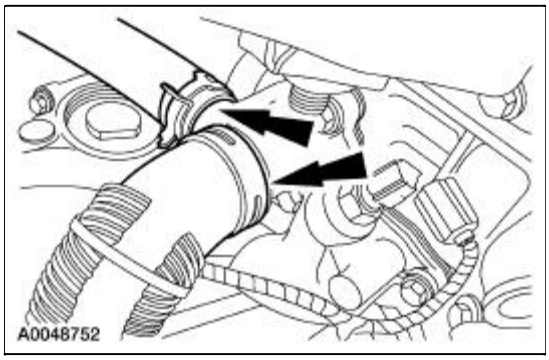


2. Raise and support the vehicle. For additional information, refer to Section 100-02 .

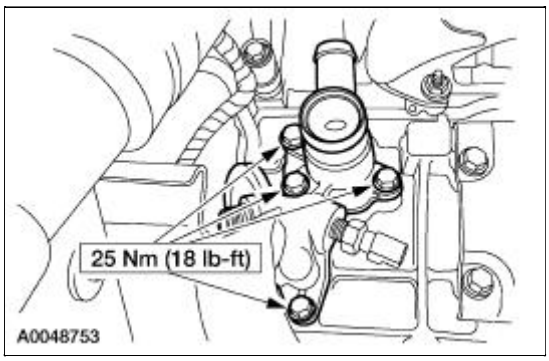
3. Drain the engine cooling system. For additional information, refer to Section 303-03 .



4. Remove the drain plug and drain the engine oil.



5. Disconnect the oil pressure switch electrical connector.



6. Remove the oil filter.

7. Disconnect the lower radiator hose and the degas bottle hose from the oil filter adapter.

8. Remove the bolts and the oil filter adapter, and discard the gasket.

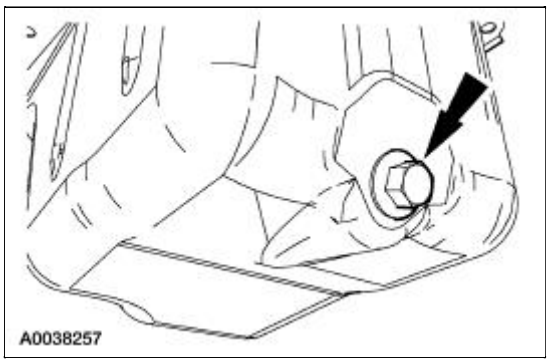
9. To install, reverse the removal procedure.

Oil Filter Adapter —4x4

Material

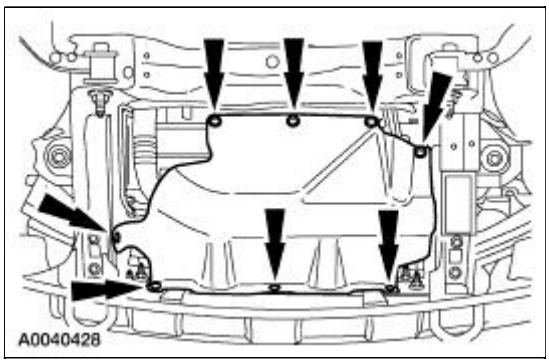
Item	Specification
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal



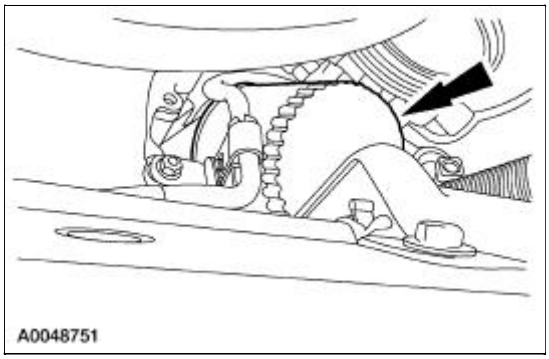
1. **CAUTION: The air suspension switch must be turned off prior to raising the vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which could result in shifting of the vehicle during the repair operation.**

   If equipped, turn the air suspension switch off.

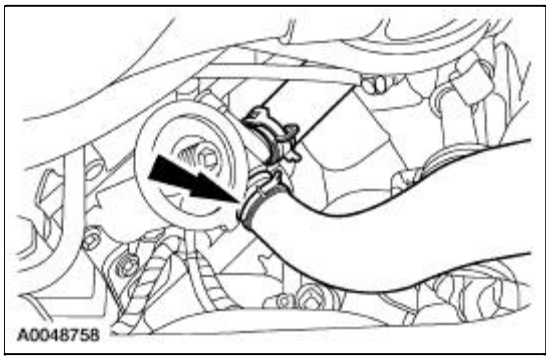


2. Raise and support the vehicle. For additional information, refer to Section 100-02 .

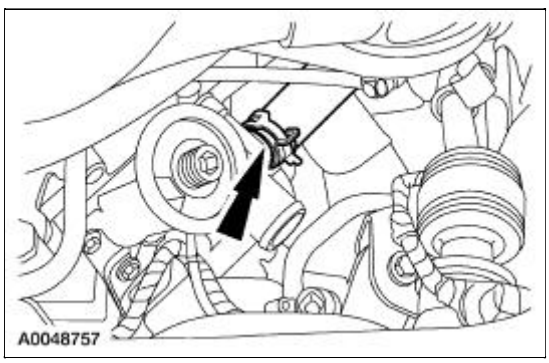
3. Drain the engine cooling system. For additional information, refer to Section 303-03 .



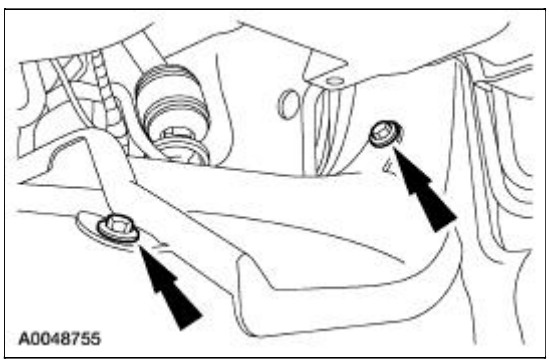
4. Remove the drain plug and drain the engine oil.



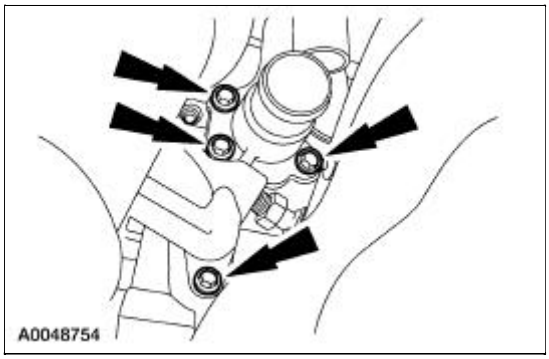
5. Remove the pin-type retainers and the radiator lower air deflector.



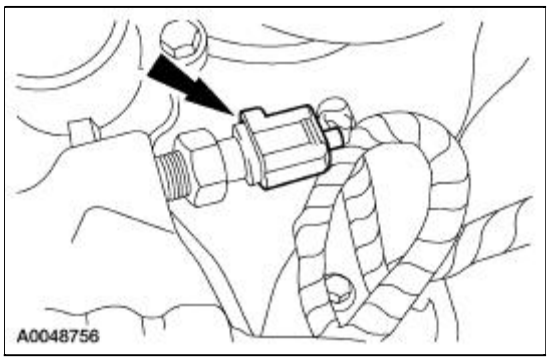
6. Remove the oil filter.



7. Disconnect the lower radiator hose from the oil filter adapter.

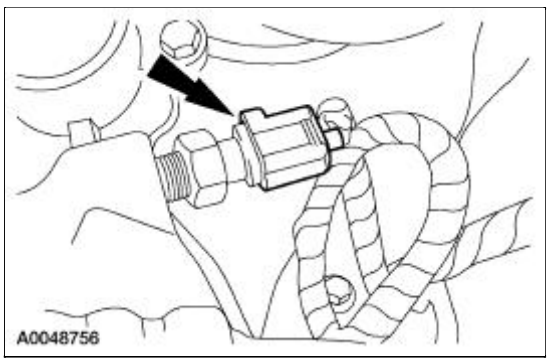


8. Disconnect the degas bottle hose from the oil filter adapter.

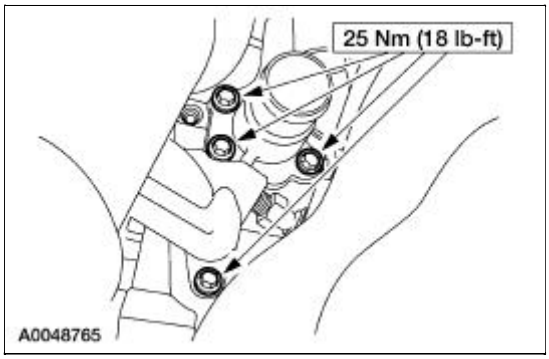


9. Remove the bolts and the oil filter drip shield.

10. Remove the four bolts and lower the oil filter adapter slightly.

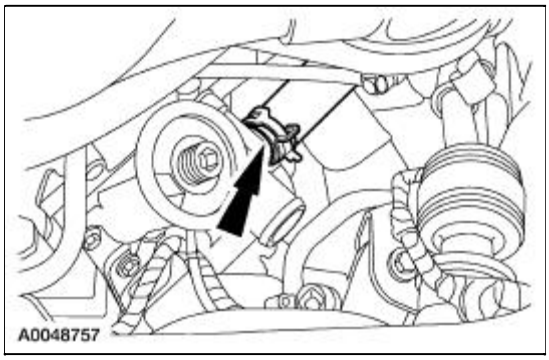


11. Disconnect the oil pressure switch electrical connector and remove the oil filter adapter.
    - Discard the oil filter adapter gasket.

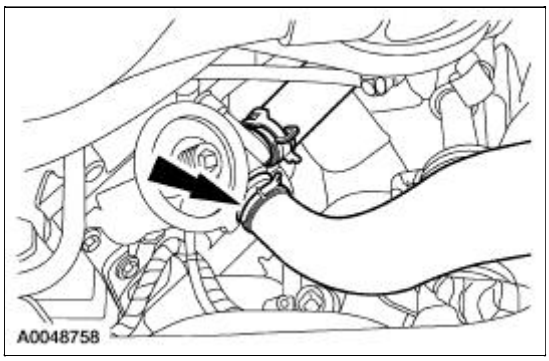


Installation

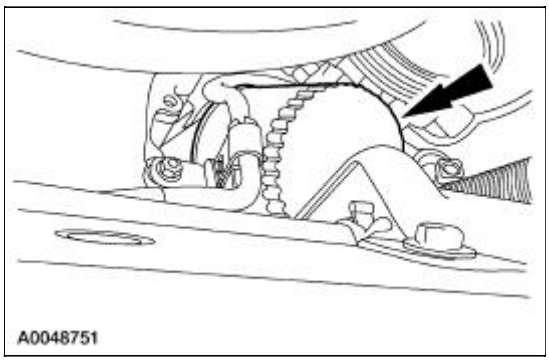
1. Clean and inspect the cylinder block and oil filter adapter mating surfaces.



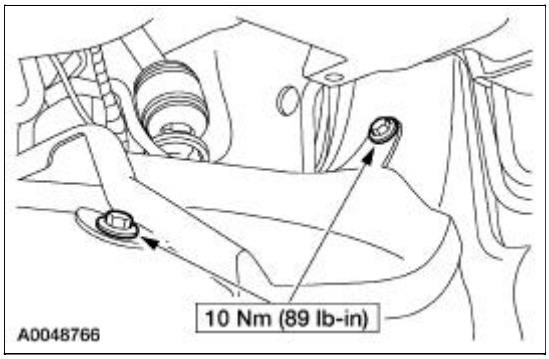
2. Roughly position the oil filter adapter in the vehicle and connect the oil pressure switch electrical connector.



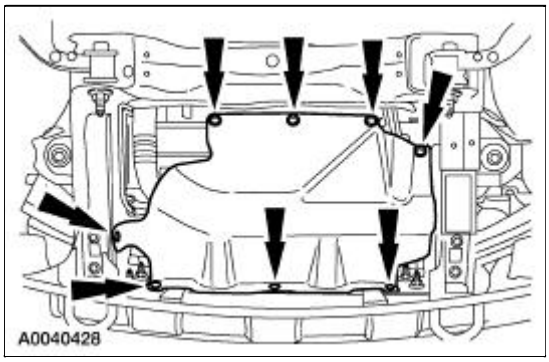
3. Position a new oil filter adapter gasket and the oil filter adapter, and install the four bolts.



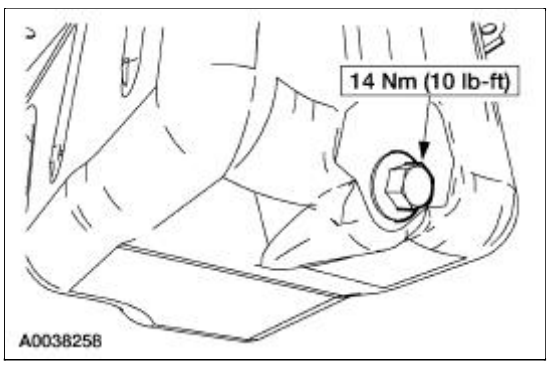
4. Install the degas bottle hose on the oil filter adapter.



5. Install the lower radiator hose on the oil filter adapter.



6. Lubricate the seal with clean engine oil and install a new oil filter.

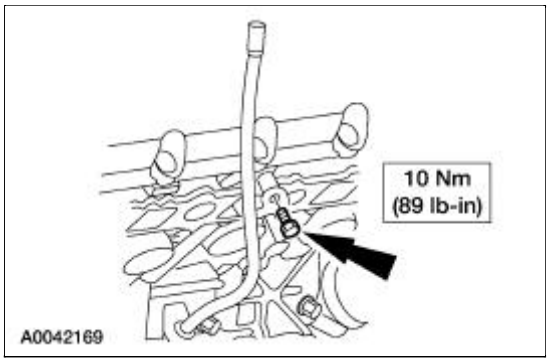


7. Install the oil filter drip shield.

8. Position the radiator lower air deflector and install the pin-type retainers.

9. Install the drain plug.

10. Lower the vehicle.
11. Fill the engine with clean engine oil.
12. Fill the engine cooling system. For additional information, refer to Section 303-03 .
13. Start the engine and inspect for leaks.
14. If equipped, turn on the air suspension switch.



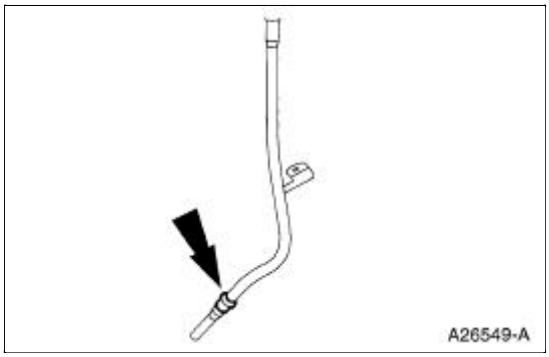
Oil Level Indicator and Tube

Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal and Installation

1. Remove LH exhaust manifold. For additional information, refer to Exhaust Manifold LH—4.6L in this section.
2. Remove the oil level indicator.
3. Remove the bolt.



4. Remove the oil level indicator tube.

5. **NOTE:** Lubricate the new O-ring seal with clean engine oil.

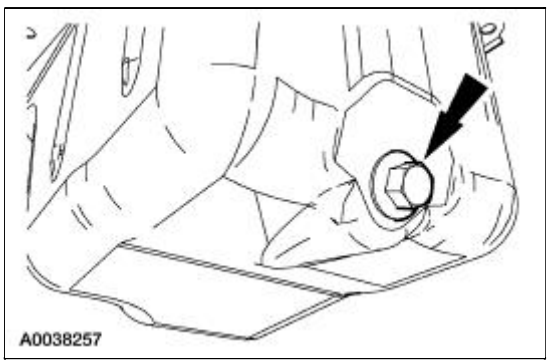
   Install a new O-ring seal.

6. To install, reverse the removal procedure.

Oil Pan —4x2

Material

Item	Specification
Motorcraft Silicone Gasket Remover ZC-30	—
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

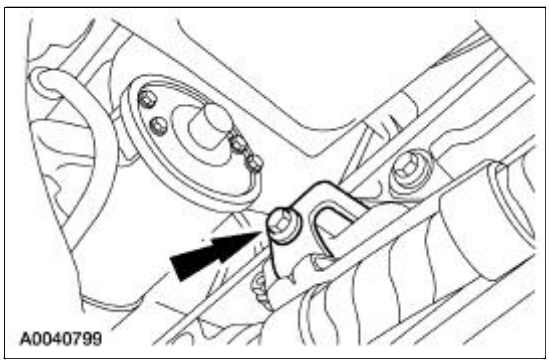


Removal

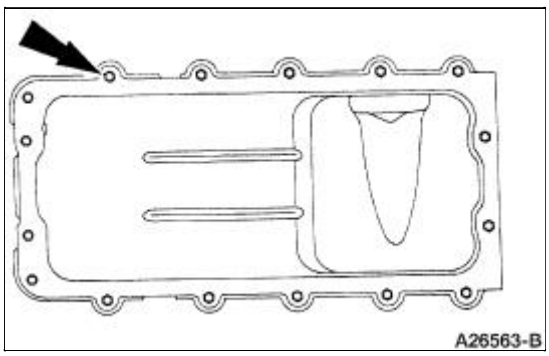
1. **CAUTION: The air suspension switch must be turned off prior to raising the vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which could result in shifting of the vehicle during the repair operation.**

   If equipped, turn the air suspension switch off.

2. Raise the vehicle on the hoist. For additional information, refer to Section 100-02 .



3. Drain the engine oil.



4. Remove the bolts and the frame crossmember.

5. Remove the bolt and detach the wire harness bracket.

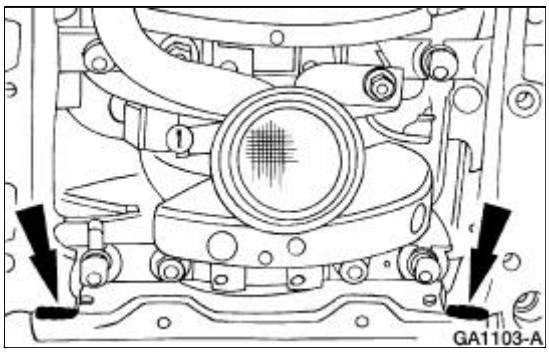
6. Remove the bolts and the oil pan.

7. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs, or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

   Remove and discard the oil pan gasket. Clean the sealing surfaces.

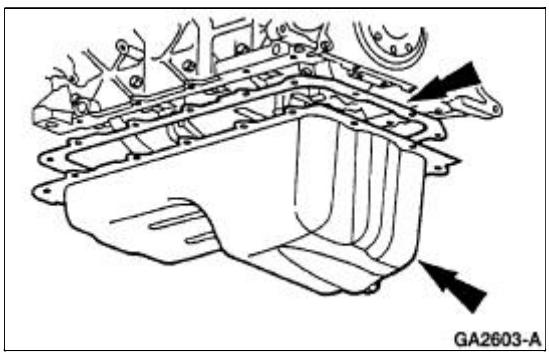
   - Clean the sealing surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

Installation



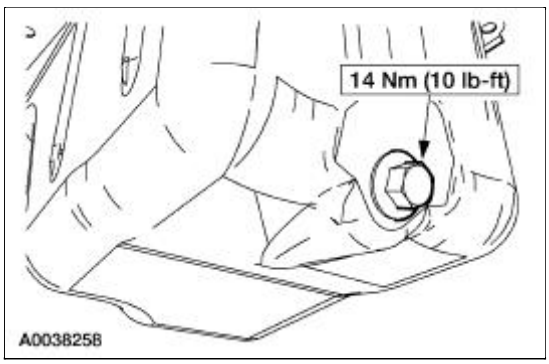
1. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

   Apply silicone gasket and sealant at the engine front cover to cylinder block mating surface.



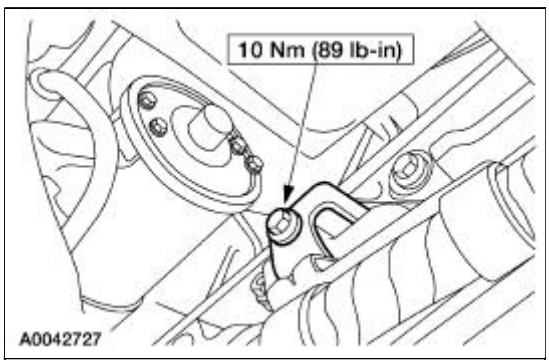
2. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

   Apply silicone gasket and sealant at the rear oil seal retainer to cylinder block sealing surface.

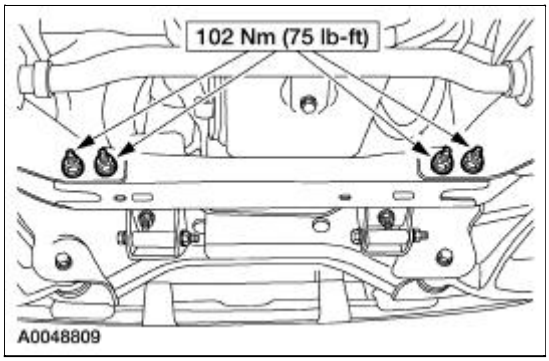


3. Position the new oil pan gasket and the oil pan, and loosely install the bolts.

4. Tighten the bolts in three stages, in the sequence shown.
   - Stage 1: tighten to 2 Nm (18 lb-in).
   - Stage 2: tighten to 20 Nm (15 lb-ft).
   - Stage 3: tighten an additional 60 degrees.



5. Install the drain plug.



6. Install a new oil filter.

7. Position the wire harness bracket and install the bolt.

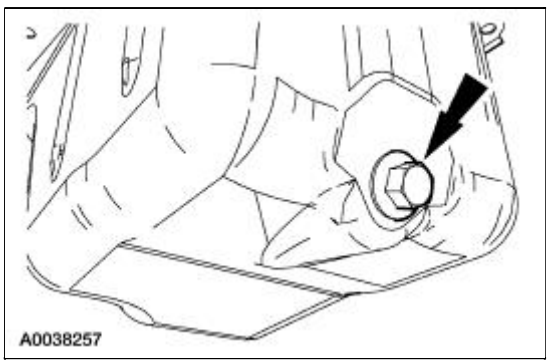
8. Position the frame crossmember and install the bolts.

9. Lower the vehicle.
10. Fill the engine with clean engine oil.
11. Start the engine and inspect for leaks.
12. If equipped, turn on the air suspension switch.

Oil Pan —4x4

Material

Item	Specification
Motorcraft Silicone Gasket Remover ZC-30	—
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

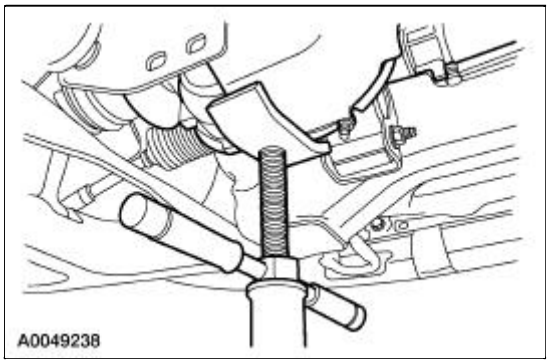


Removal

1. **CAUTION: The air suspension switch must be turned off prior to raising the vehicle. Failure to do so can result in unexpected inflation or deflation of the air springs, which could result in shifting of the vehicle during the repair operation.**

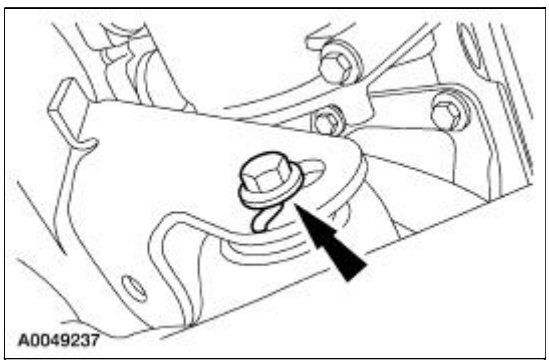
   If equipped, turn the air suspension switch off.

2. Raise the vehicle on the hoist. For additional information, refer to Section 100-02 .

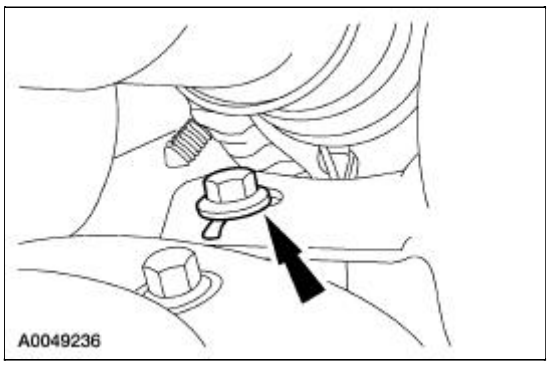


3. Drain the engine oil.

4. Remove the bolts and the frame crossmember.

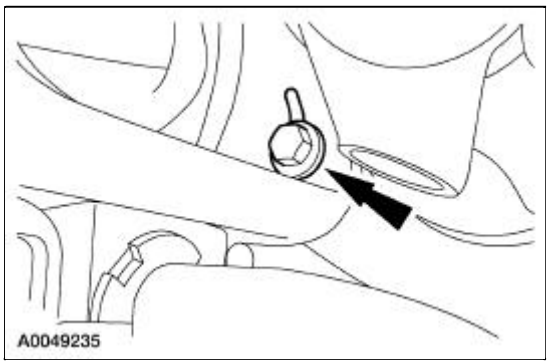


5. Support the front axle housing with a jack stand.



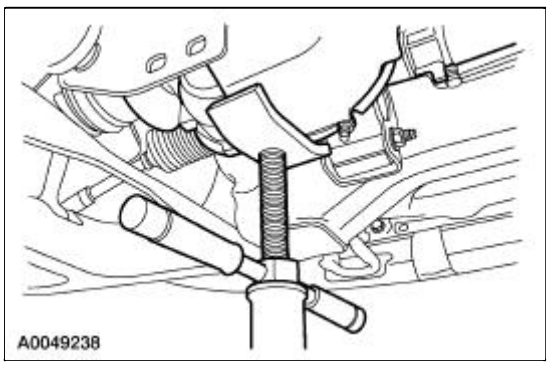
6. **NOTE:** Mark the bolt and bracket so that alignment can be maintained on installation.

   Remove the front axle housing RH mounting bolt.



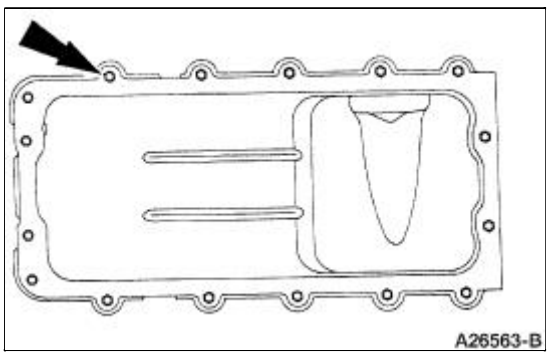
7. **NOTE:** Mark the bolt and bracket so that alignment can be maintained on installation.

   Remove the front axle housing LH front mounting bolt.



8. **NOTE:** Mark the bolt and bracket so that alignment can be maintained on installation.

   Remove the front axle housing LH rear mounting bolt.



9. **CAUTION: Use care when lowering the front axle housing, or the vacuum lines to the axle solenoid may become disconnected or damaged.**

   Lower the axle to allow clearance for the oil pan to be removed.

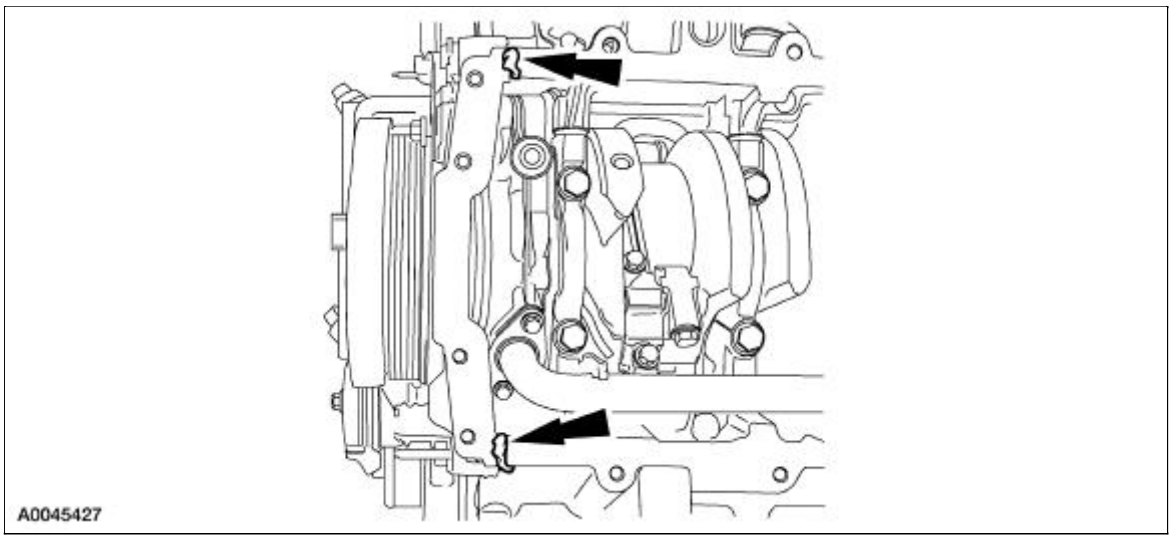
10. Remove the bolts and the oil pan.

11. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs, or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

    Remove and discard the oil pan gasket. Clean the sealing surfaces.

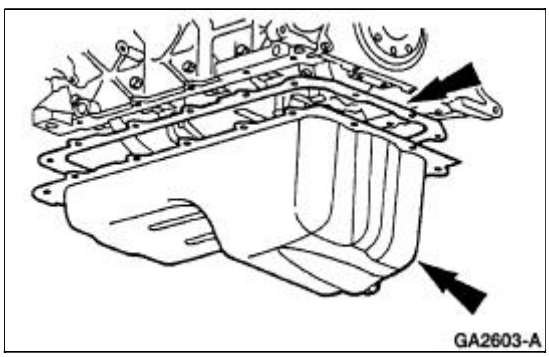
    - Clean the sealing surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

Installation



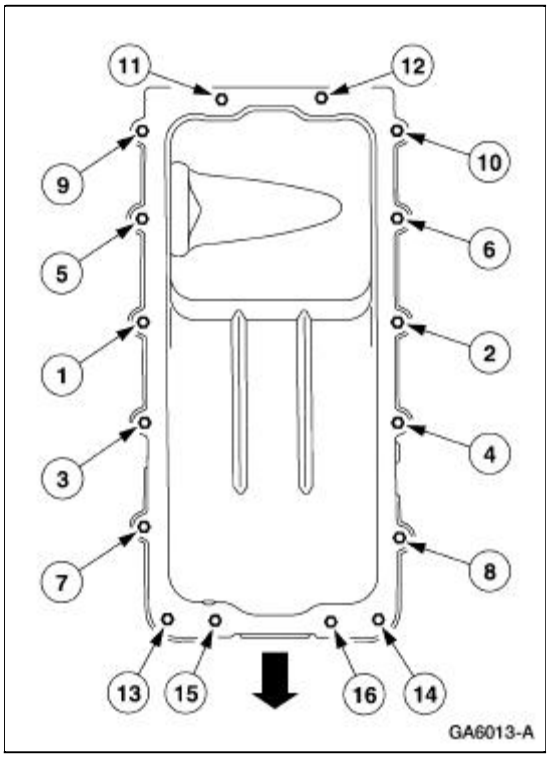
1. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

   Apply silicone gasket and sealant at the rear oil seal retainer to cylinder block sealing surface.

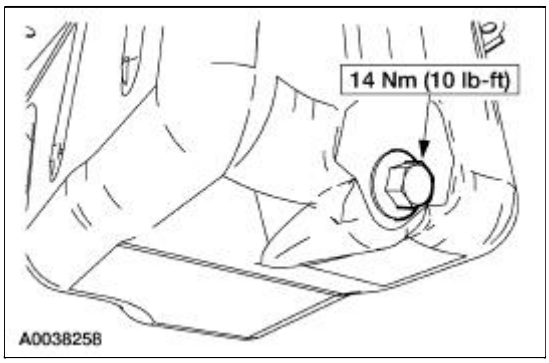


2. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

   Apply silicone gasket and sealant at the engine front cover to cylinder block mating surface.

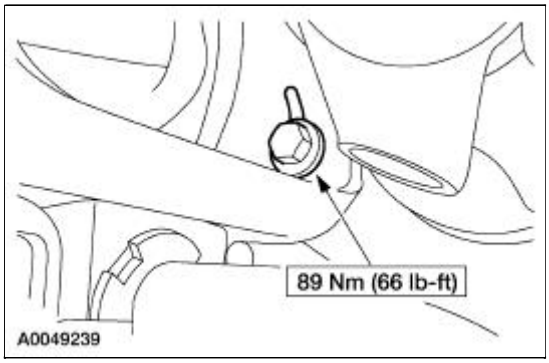


3. Position the new oil pan gasket and the oil pan and loosely install the bolts.

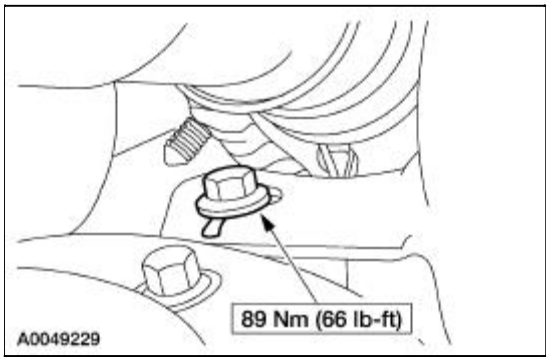


4. Tighten the bolts in three stages in the sequence shown.
   - Stage 1: tighten to 2 Nm (18 lb-in).
   - Stage 2: tighten to 20 Nm (15 lb-ft).

- Stage 3: tighten an additional 60 degrees.

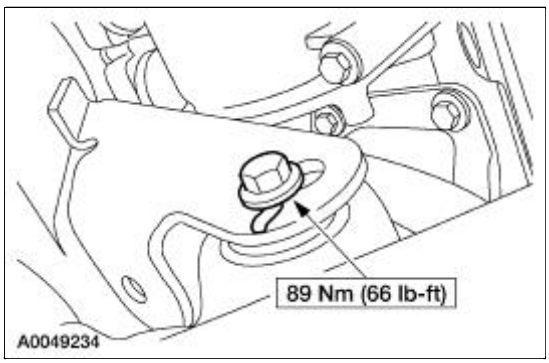


5. Install the drain plug.

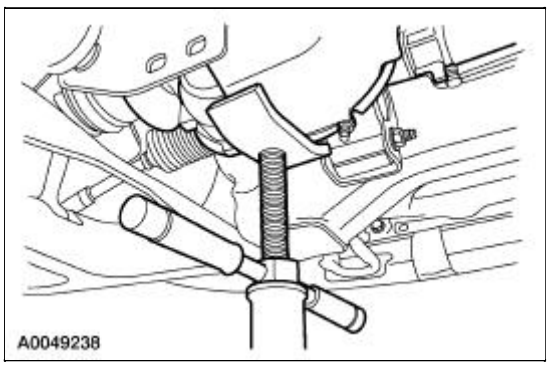


6. Install a new oil filter.

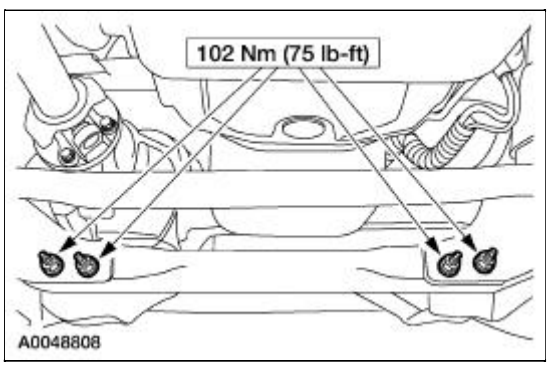
7. Position the front axle housing and loosely install the three bolts, aligning the bolt location marks made during removal.



8. Tighten the front axle housing LH rear mounting bolt.



9. Tighten the front axle housing LH front mounting bolt.



10. Tighten the front axle housing RH mounting bolt.

11. Remove the jack stand.

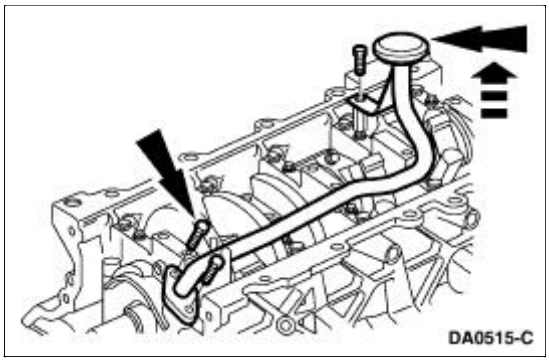
12. Position the frame crossmember and install the bolts.

13. Lower the vehicle.

14. Fill the engine with clean engine oil.
15. Start the engine and inspect for leaks.
16. If equipped, turn on the air suspension switch.

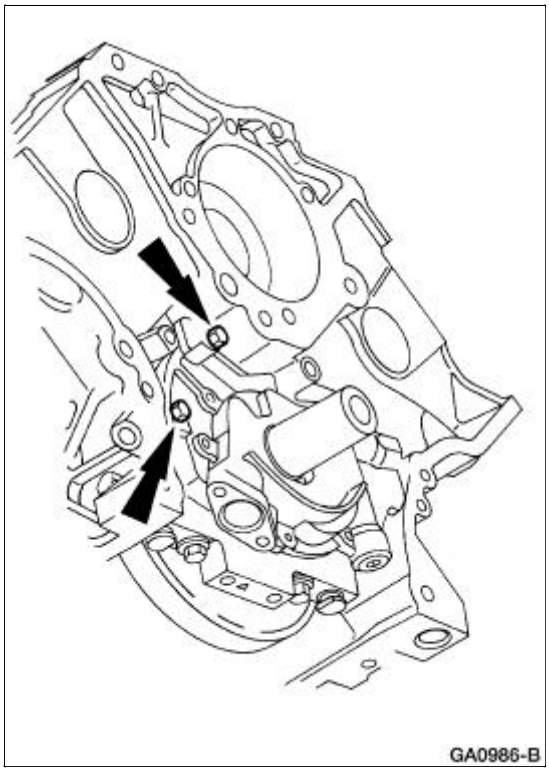
Oil Pump

Material



Item	Specification
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal

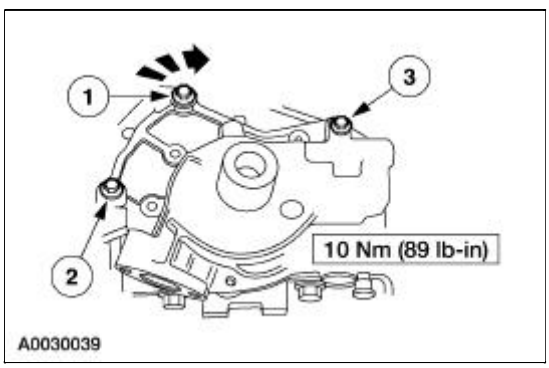


1. Remove the timing chains. For additional information, refer to Timing Drive Components—Windsor Engine (5.4L) or Timing Drive Components—Romeo Engine (4.6L) in this section.

2. Remove the oil pan. For additional information, refer to Oil Pan—4x2 or Oil Pan—4x4 in this section.

3. Remove the three bolts and the oil pump screen and pickup tube.

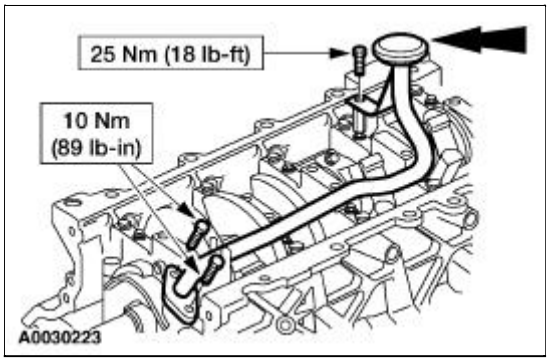
4. Remove the oil pump.
   - Remove the three bolts.
   - Remove the oil pump.



Installation

1. **NOTE:** Lubricate the new O-ring seal with clean engine oil.

   Clean and inspect the mating surfaces and install a new O-ring seal.



2. Install the oil pump and loosely install the bolts.
   - Position the oil pump.
   - Loosely install the bolts.
   - Tighten the bolts in the sequence shown.

3. **CAUTION: Make sure the O-ring is in place and not damaged. A missing or damaged O-ring can cause foam in the lubrication system, low oil pressure and severe engine damage.**

   NOTE: Install a new O-ring and lubricate with clean engine oil.

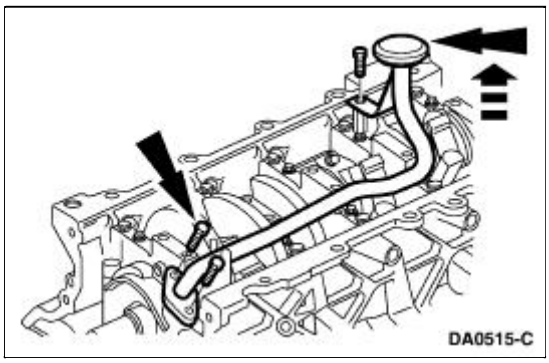
   Position the oil pump screen and pickup tube and install the bolts.

4. Install the timing chains. For additional information, refer to Timing Drive Components—Windsor Engine (5.4L) or Timing Drive Components—Romeo Engine (4.6L) in this section.

5. **CAUTION: The oil pump must be primed prior to starting the engine.**

   Install the oil pan. For additional information, refer to Oil Pan—4x2 or Oil Pan—4x4 in this section.

Oil Pump Screen and Pickup Tube



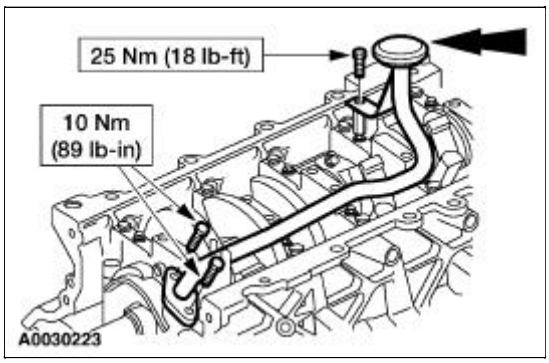
Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal

1. Remove the oil pan. For additional information, refer to Oil Pan—4x2 or Oil Pan—4x4 in this section.

2. Remove the three bolts and the oil pump screen and pickup tube.



Installation

1. **NOTE:** Lubricate the new O-ring seal with clean engine oil.

   Clean and inspect the mating surfaces and install a new O-ring seal.

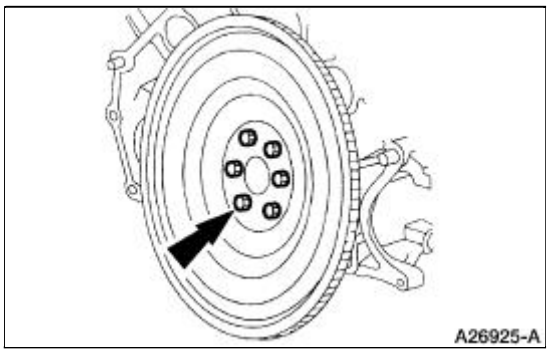
2. Install the oil pump screen and pickup tube and install the bolts.

3. **CAUTION: The oil pump must be primed prior to starting the engine.**

   Install the oil pan. For additional information, refer to Oil Pan—4x2 or Oil Pan—4x4 in this

section.

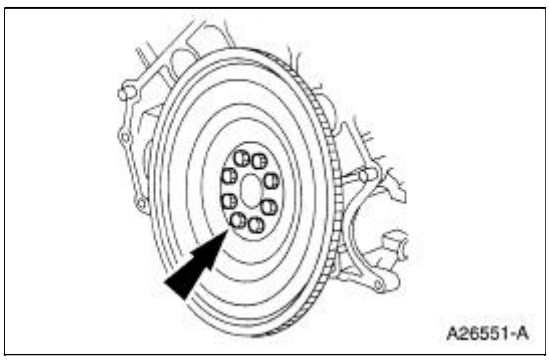
Flexplate



Removal

All vehicles

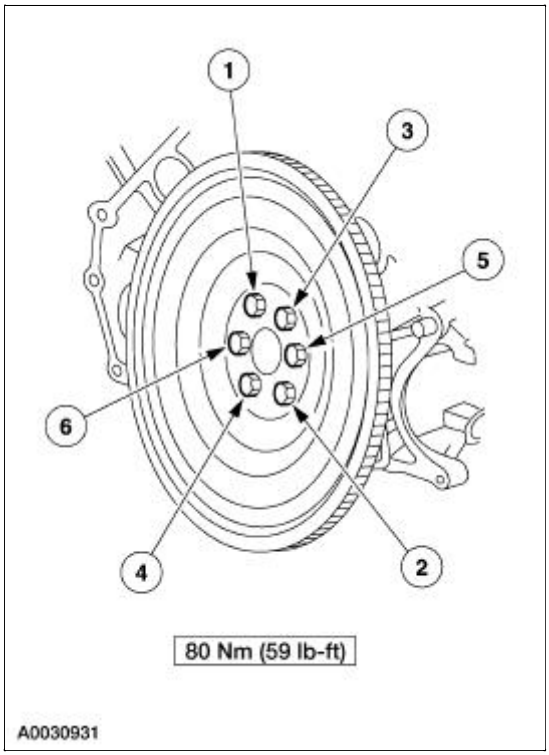
1. Remove the transmission. For additional information, refer to Section 307-01A (4R100) or Section 307-01B (4R70W).



Romeo engine (4.6L)

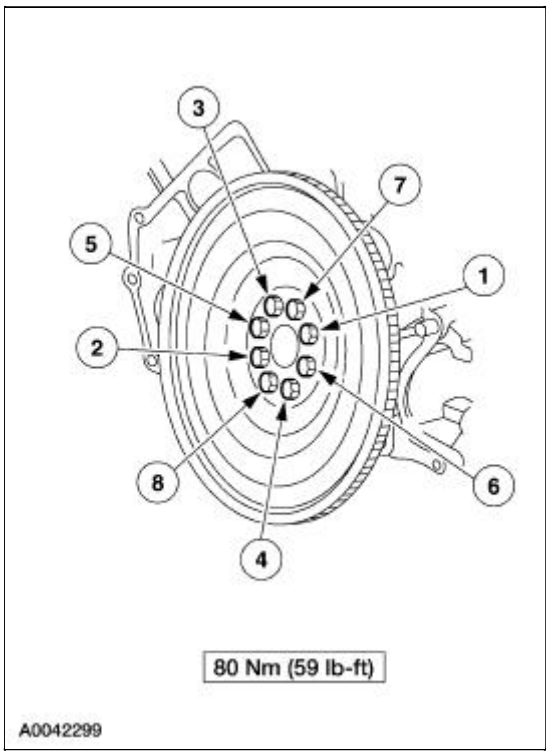
2. Remove the bolts and the flexplate.

Windsor engine (5.4L)



3. Remove the bolts and the flexplate.

Installation

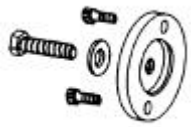


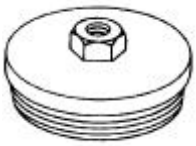
Romeo engine (4.6L)

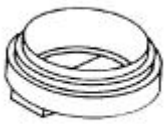
1. Position the flexplate and install the bolts.
   Tighten the bolts in two stages:
   - Stage 1: loosely install the bolts.
   - Stage 2: tighten the bolts in sequence shown.

Windsor engine (5.4L)

2. Position the flexplate and install the bolts.
   Tighten the bolts in two stages:
   - Stage 1: loosely install the bolts.
   - Stage 2: tighten the bolts in sequence shown.







All vehicles

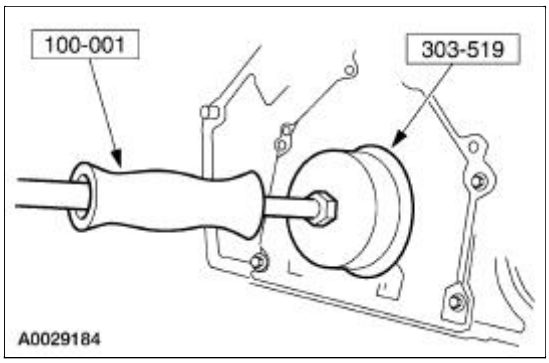
3. Install the transmission. For additional information, refer to Section 307-01A (4R100) or Section 307-01B (4R70W).

Crankshaft Rear Oil Seal

Special Tool(s)

 ST1480-A	Installer, Crankshaft Rear Oil Seal 303-518 (T95P-6701-DH)
 ST1382-A	Remover, Crankshaft Rear Oil Seal 303-519 (T95P-6701-EH)
 ST1479-A	Installer, Crankshaft Rear Oil Seal 303-516 (T95P-6701-BH)
 ST1481-A	Remover, Crankshaft Rear Oil Slinger 303-514 (T95P-6701-AH)
 ST1482-A	Installer, Crankshaft Rear Oil Slinger 303-517 (T95P-6701-CH)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

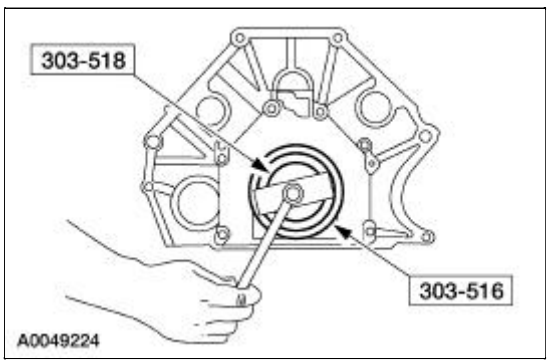
Material



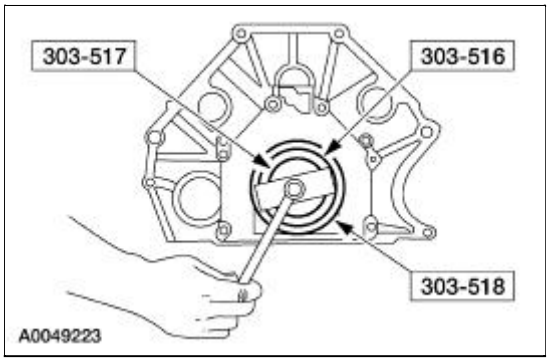
Item	Specification
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal

1. Remove the flexplate (6375). For additional information, refer to Flexplate in this section.
2. Use the special tools to remove the crankshaft rear oil seal slinger.



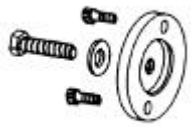
3. Use the special tools to remove the crankshaft rear oil seal.

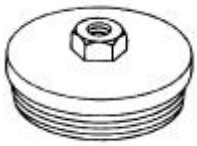


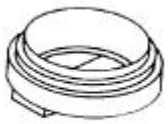
Installation

1. **NOTE:** Lubricate the inner lip of the crankshaft rear seal with clean engine oil.

   Use the special tools to install the rear oil seal.







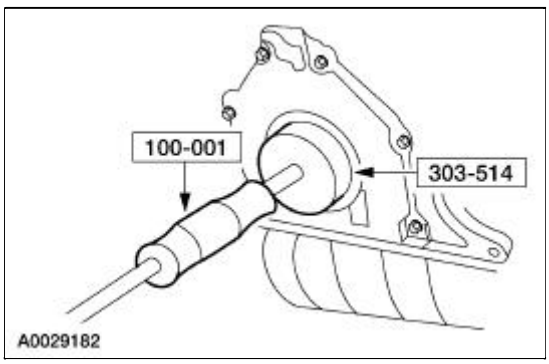
2. Using the special tools, install the crankshaft rear oil slinger.

3. Install the flexplate. For additional information, refer to Flexplate in this section.

Crankshaft Rear Seal with Retainer Plate

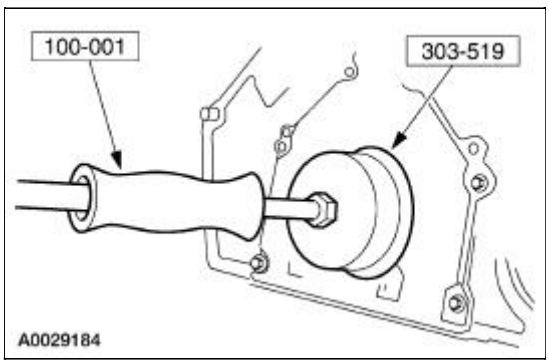
Special Tool(s)

 ST1480-A	Installer, Crankshaft Rear Oil Seal 303-518 (T95P-6701-DH)
 ST1382-A	Remover, Crankshaft Rear Oil Seal 303-519 (T95P-6701-EH)
 ST1479-A	Installer, Crankshaft Rear Oil Seal 303-516 (T95P-6701-BH)
 ST1481-A	Remover, Crankshaft Rear Oil Slinger 303-514 (T95P-6701-AH)
 ST1482-A	Installer, Crankshaft Rear Oil Slinger 303-517 (T95P-6701-CH)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)



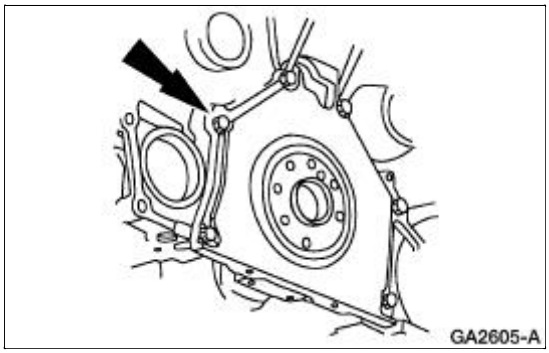
Material

Item	Specification
Motorcraft Silicone Gasket Remover ZC-30	—
Motorcraft Metal Surface Prep	—



ZC-31	
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal



1. Remove the transmission. For additional information, refer to Section 307-01A (4R100) or Section 307-01B (4R70W).
2. Remove the oil pan (6675). For additional information, refer to Oil Pan—4x2 or Oil Pan—4x4 in this section.
3. Remove the flexplate (6375). For additional information, refer to Flexplate in this section.
4. Use the special tools to remove the crankshaft rear oil slinger.

5. Use the special tools to remove the crankshaft rear oil seal.

6. Remove the six bolts and the crankcase rear oil seal retainer.

Installation

1. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   NOTE: Clean the sealing surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

   Clean and inspect the mating surfaces.

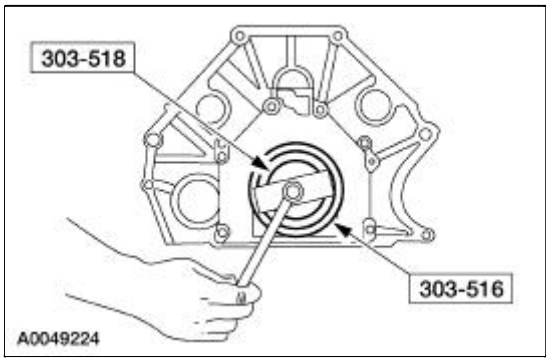
2. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   NOTE: If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

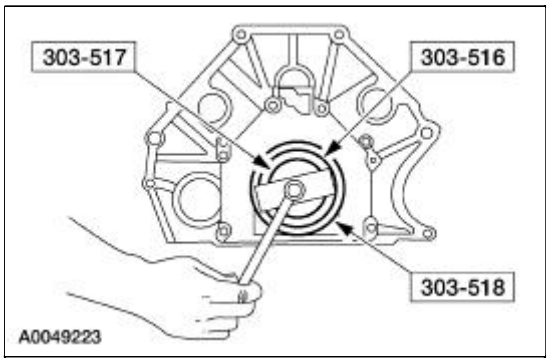
   NOTE: The silicone must be applied on the groove along the retainer plate.

   Apply a 4 mm (0.16 in) bead of silicone gasket and sealant around the rear oil seal retainer sealing surface.

3. Install the rear oil seal retainer and loosely install the six bolts.



4. Tighten the bolts in the sequence shown.



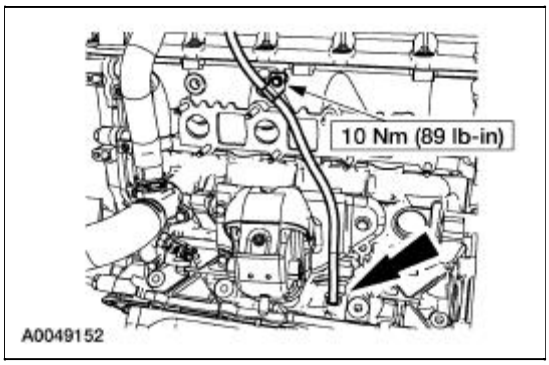
5. **NOTE:** Lubricate the inner lip of the crankshaft rear seal with clean engine oil.

   Use the special tools to install the rear oil seal.

6. Using the special tools, install the crankshaft rear oil slinger.

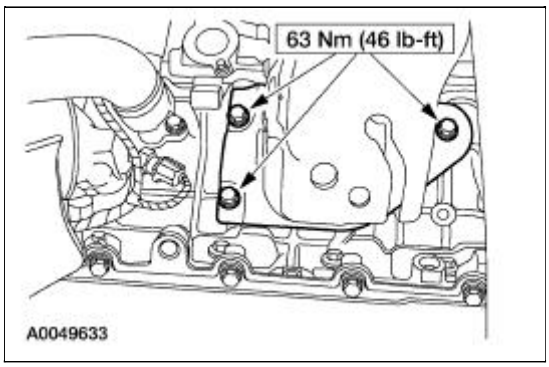
7. Install the flexplate. For additional information, refer to Flexplate in this section.

8. Install the oil pan. For additional information, refer to Oil Pan—4x2 or Oil Pan—4x4 in this section.



9. Install the transmission. For additional information, refer to Section 307-01A (4R100) or Section 307-01B (4R70W).

Engine Mount LH

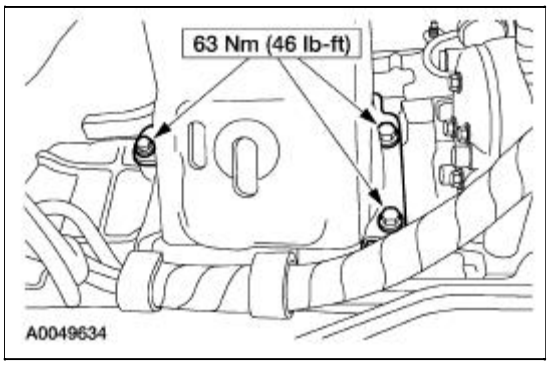


Removal and Installation

1. Remove the exhaust manifold LH. For additional information, refer to Exhaust Manifold LH—4.6L or Exhaust Manifold LH—5.4L in this section.

2. Remove the bolt and the oil level indicator tube.

3. Remove the bolts and remove the engine mount.

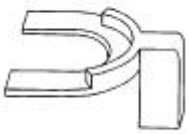


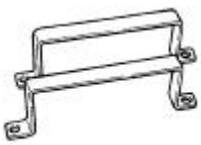
4. To install, reverse the removal procedure.

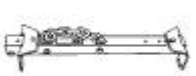
Engine Mount RH

Removal and Installation

1. Remove the exhaust manifold RH. For additional information, refer to Exhaust Manifold RH—4.6L or Exhaust Manifold RH—5.4L in this section.







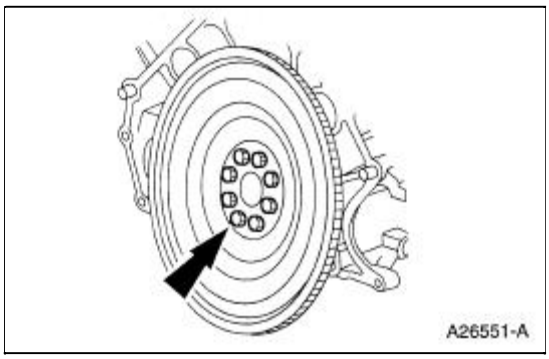
2. Remove the bolts and remove the engine mount.

3. To install, reverse the removal procedure.

Cylinder Heads —5.4L

Special Tool(s)

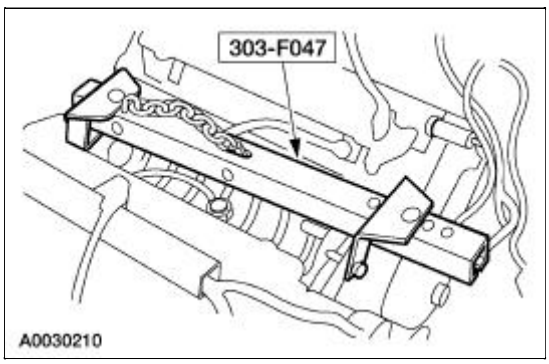
 ST1330-A	Compressor, Valve Spring 303-567 (T97P-6565-AH)
 ST1331-A	Compressor Spacer, Valve Spring 303-382 (T91P-6565-AH)
 ST1286-A	Remover, Crankshaft Vibration Damper 303-009 (T58P-6316-D)
 ST1730-A	Remover, Crankshaft Front Oil Seal 303-107 (T74P-6700-A)
 ST1668-A	Remover/Installer, Cylinder Head 303-572 (T97T-6000-A)
 ST2443-A	Lifting Bracket Set, Engine 303-DS086 (D93P-6001-A)
 ST1377-A	Modular Engine Lift Bracket 303-F047 (014-00073) or equivalent



Material

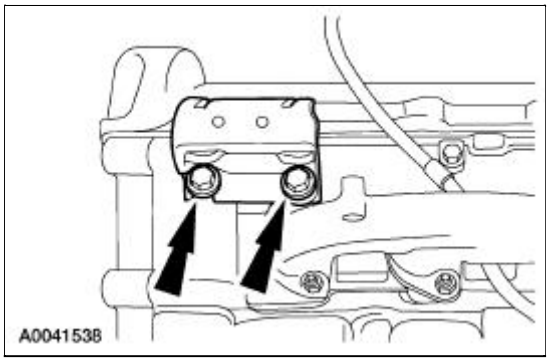
Item	Specification
Motorcraft Silicone Gasket Remover ZC-30	—
Motorcraft Metal Surface Prep ZC-31	—

Removal



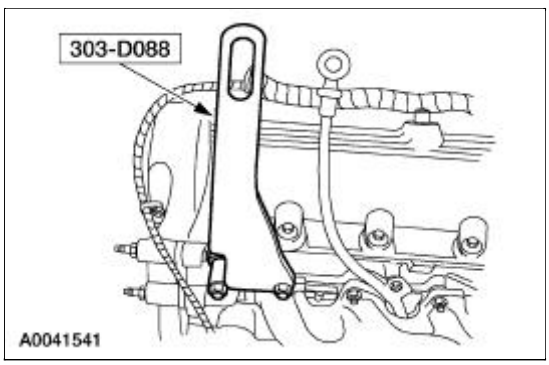
All cylinder heads

1. Remove the engine. For additional information, Engine in this section.
2. Remove the bolts and the flexplate or the flywheel.



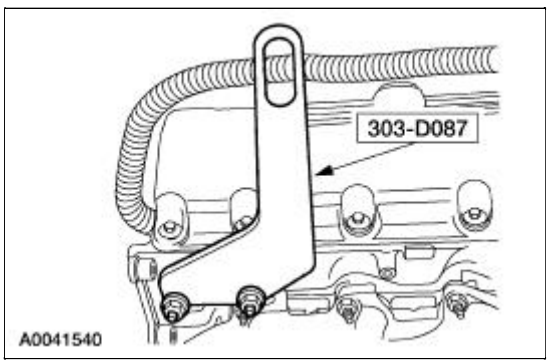
3. **CAUTION: To prevent damage to the oil pan, use care when lowering the engine.**

   Lower the engine onto wooden blocks.
4. Remove the special tool.

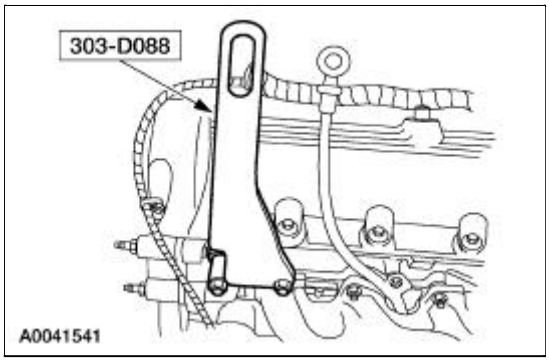


5. Remove the power steering reservoir lower mounting bracket.

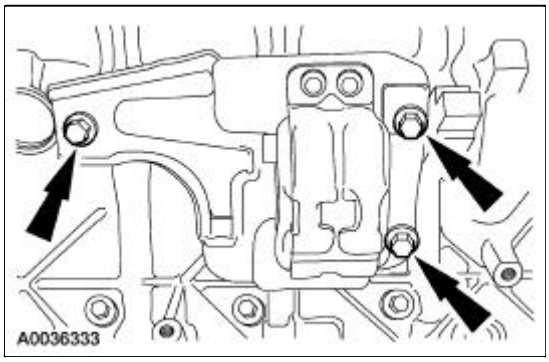
6. Install the special tool.



7. Install the special tool.

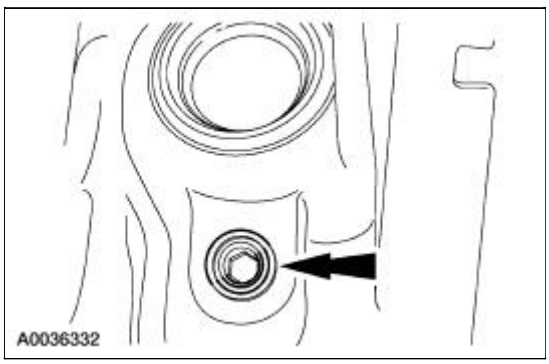


8. Mount the engine on a suitable work stand.

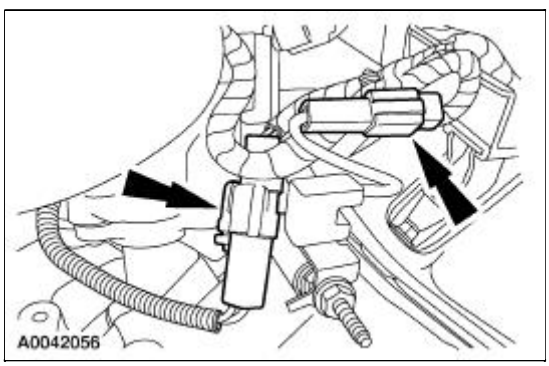


9. Remove the special tool.

10. Remove the special tool.

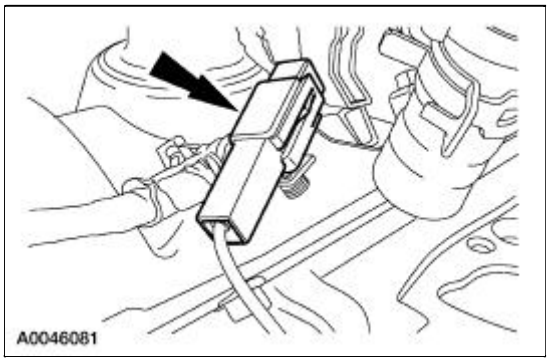


11. Remove the RH engine mount.

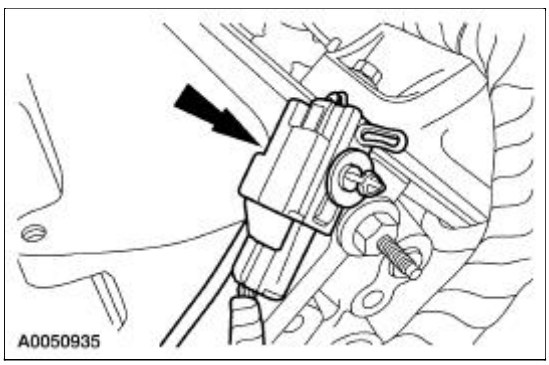


12. **NOTE:** LH shown, RH similar.

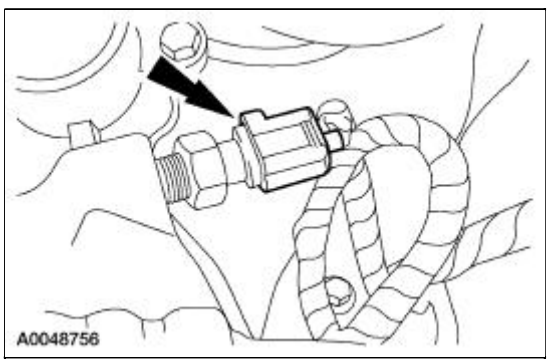
    Remove the cylinder block drain plugs, and drain the coolant in a suitable container.



13. Disconnect the LH radio frequency interference capacitor and cylinder head temperature (CHT) sensor electrical connectors.

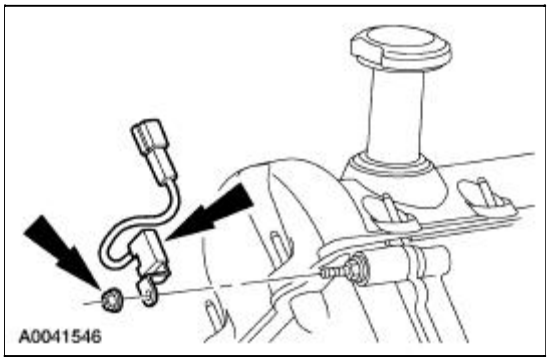


14. Disconnect the camshaft position (CMP) sensor electrical connector.

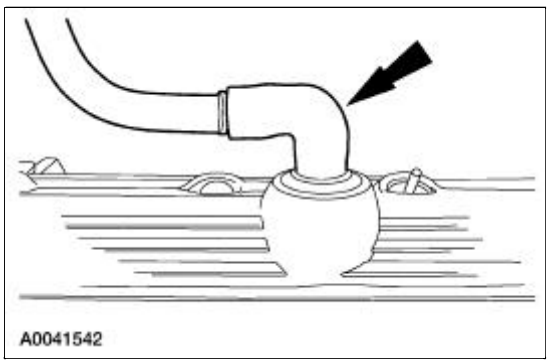


15. Disconnect the RH radio frequency interference capacitor electrical connector.

16. Disconnect the knock sensor electrical connector.



17. Disconnect the oil pressure switch electrical connector.

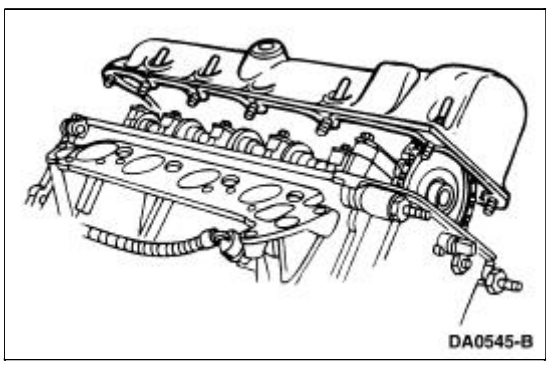


18. Detach all of the harness routing clips and connector retainers. Remove the engine control sensor wiring harness.

19. **NOTE:** RH shown, LH similar.

Remove the nuts, and the two radio interference capacitors.

20. Remove the crankcase ventilation tube from the LH valve cover.

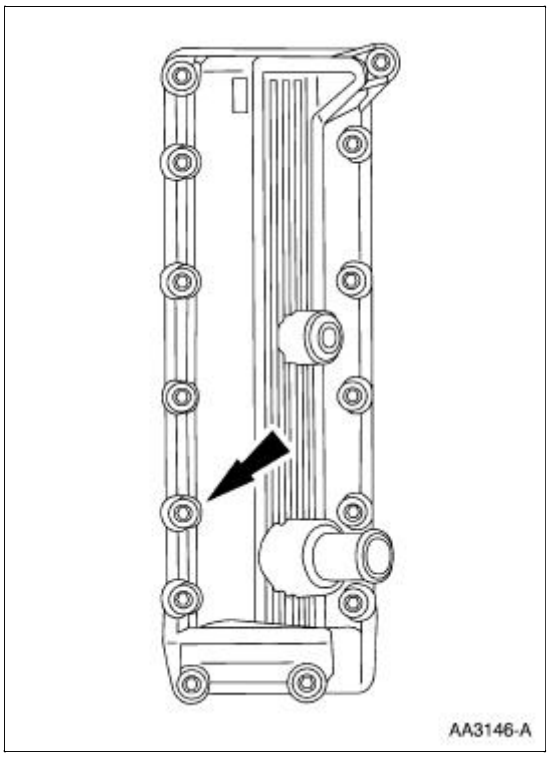


21. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

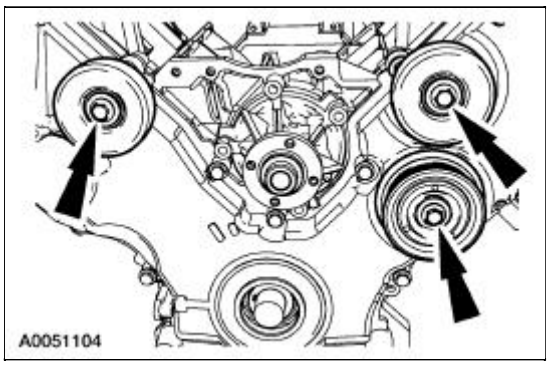
NOTE: The bolts are part of the valve cover and should not be removed.

Remove the LH valve cover.

- Fully loosen the bolts and remove the valve cover.
- Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
- Inspect the valve cover gasket. If the gasket is damaged, remove and discard the gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

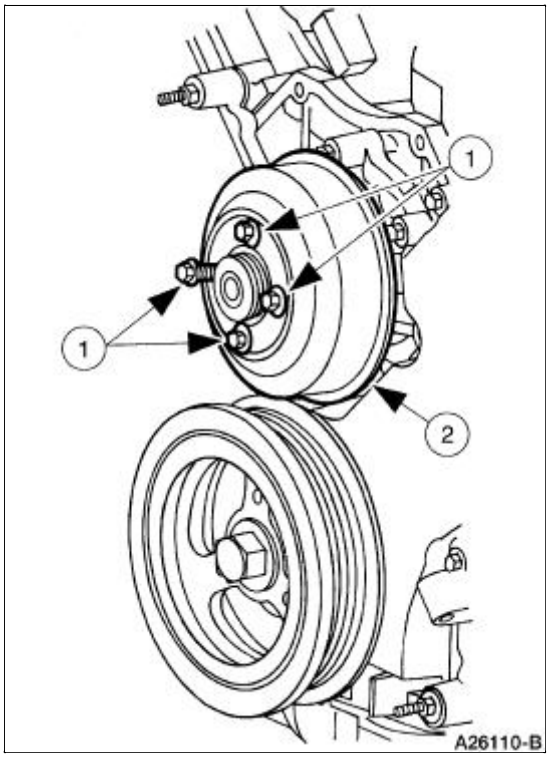


22. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

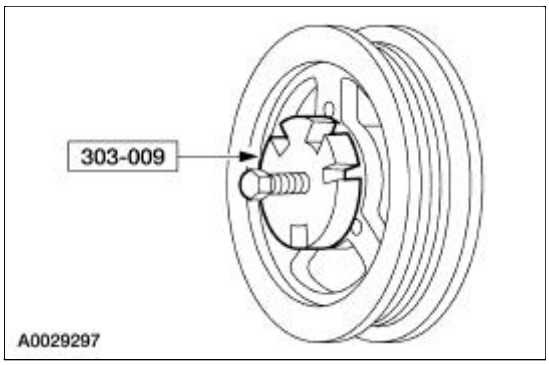


NOTE: The bolts are part of the valve cover and should not be removed.

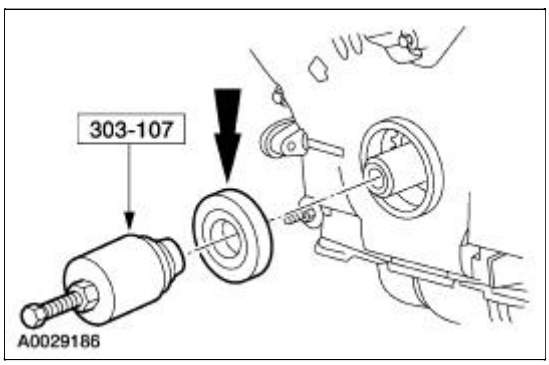
Remove the RH valve cover.



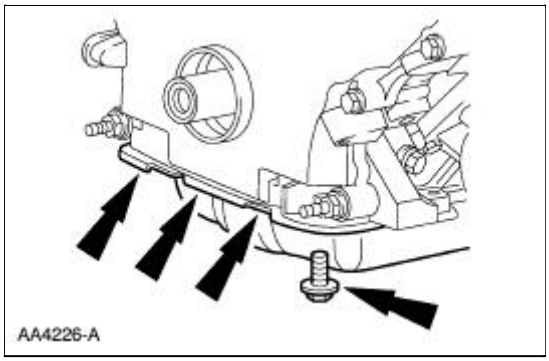
- Fully loosen the bolts and remove the valve cover.
- Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
- Inspect the valve cover gasket. If the gasket is damaged, remove and discard the gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.



23. Remove the bolts and the belt idler pulleys.

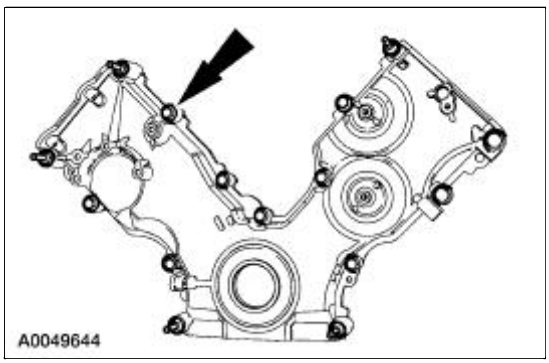


24. Remove the coolant pump pulley.
    1. Remove the bolts.
    2. Remove the coolant pump pulley.

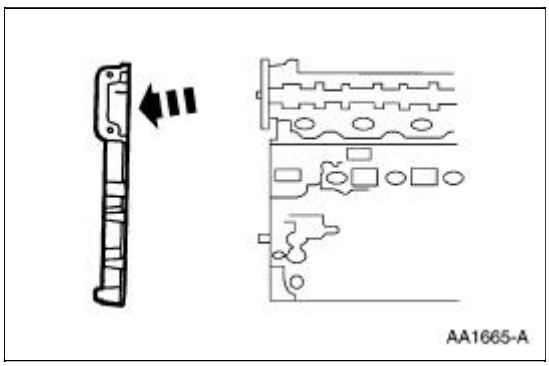


25. Remove and discard the crankshaft pulley bolt.
Use the special tool to remove the crankshaft pulley.

26. Use the special tool to remove the crankshaft front oil seal.



27. Remove the four bolts.

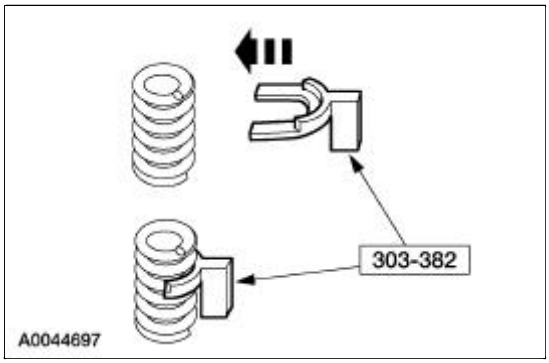


28. **NOTE:** Correct fastener location is essential for assembly procedure. Record fastener location.

    Remove the fasteners.

29. Remove the engine front cover from the cylinder block.

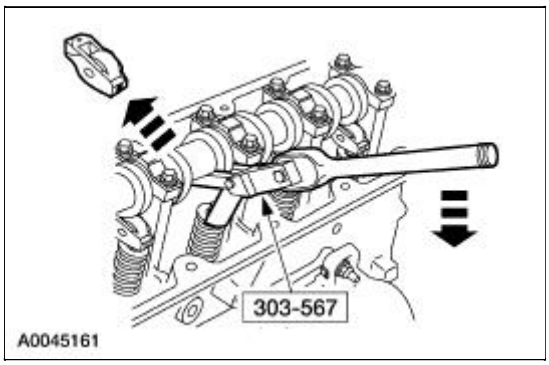
30. Remove the crankshaft sensor ring from the crankshaft.



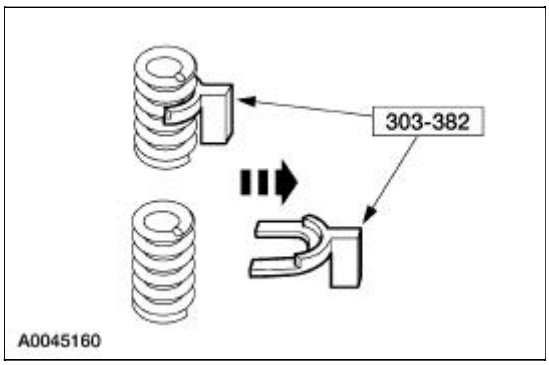
31. **CAUTION: Use care when removing the spark plugs.**

NOTE: Use compressed air to remove any foreign material from the spark plug well before removing the spark plugs.

Remove the eight spark plugs.

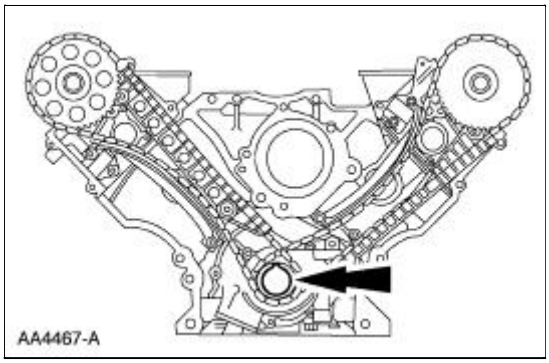


32. Install the special tool between the valve spring coils to prevent valve stem seal damage.

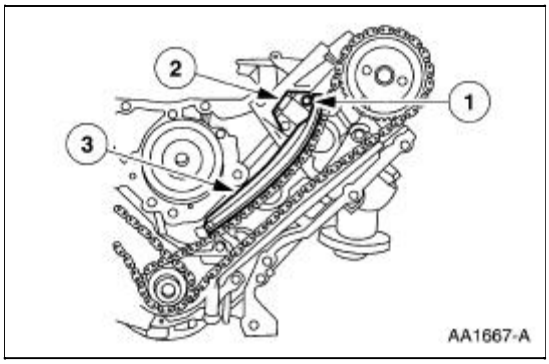


33. **NOTE:** The camshaft roller followers must be reinstalled in their original locations. Record the camshaft roller follower locations.

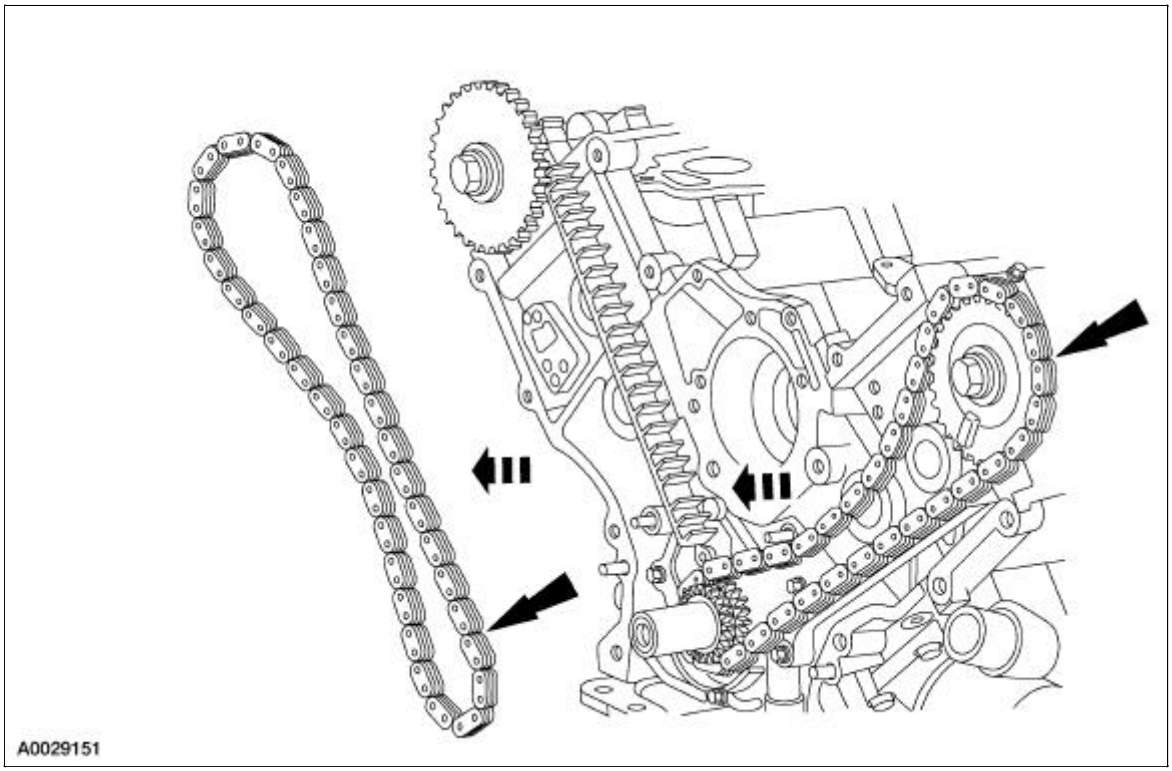
NOTE: Position the cam lobe away from the camshaft roller follower prior to removing each camshaft roller follower.



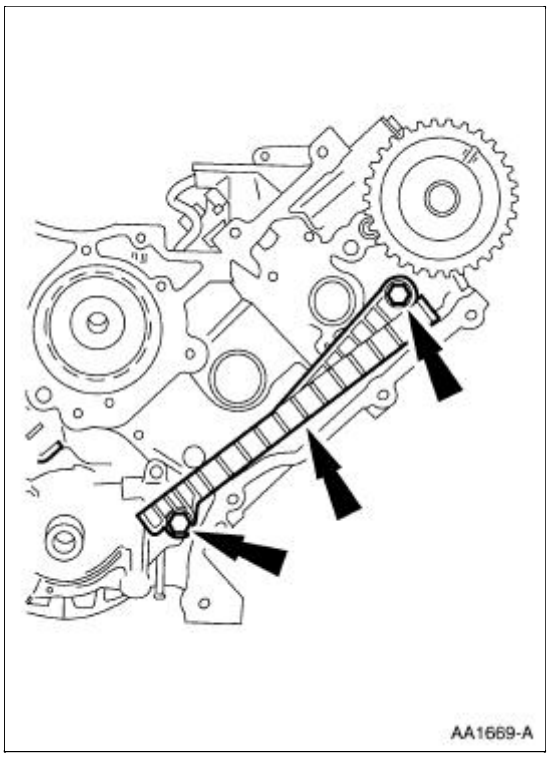
Use the special tool to compress the valve springs, and remove the camshaft roller followers.



34. Remove the special tool.

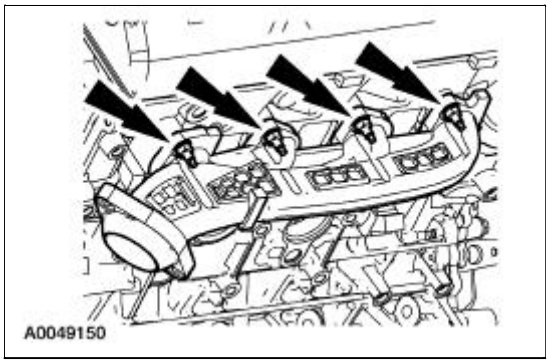


35. Position the crankshaft with the keyway at the 12 o'clock position.

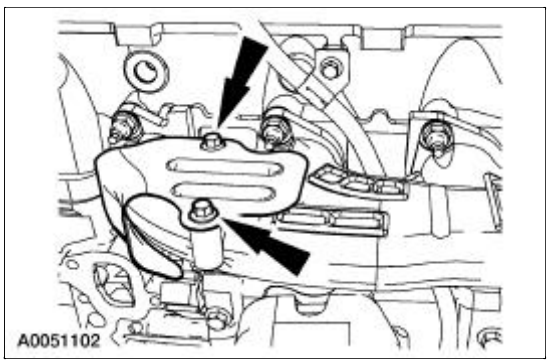


36. Remove the timing chain tensioning system from both timing chains.
    1. Remove the bolts.
    2. Remove the timing chain tensioners.
    3. Remove the timing chain tensioner arms.

37. Remove the RH and LH timing chains and the crankshaft sprocket.
    - Remove the RH timing chain from the camshaft sprocket.
    - Remove the RH timing chain from the crankshaft sprocket.
    - Remove the LH timing chain from the camshaft sprocket.
    - Remove the LH timing chain and crankshaft sprocket.

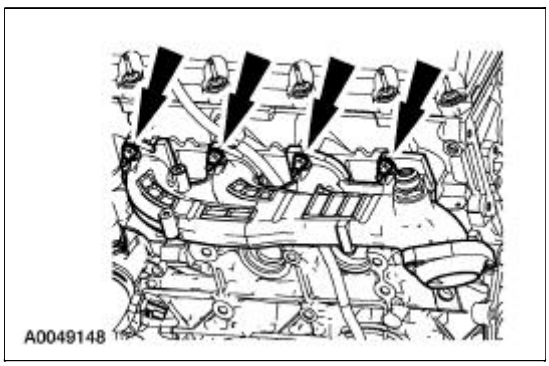


38. Remove both timing chain guides.
    - Remove the bolts.
    - Remove both timing chain guides.

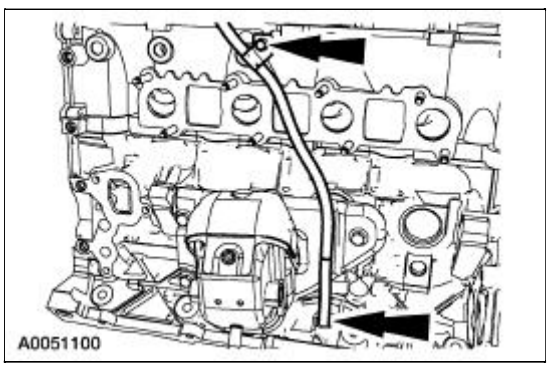


RH cylinder head

39. Remove the eight nuts, the RH exhaust manifold and the gasket.
    - Discard the RH exhaust manifold gasket.

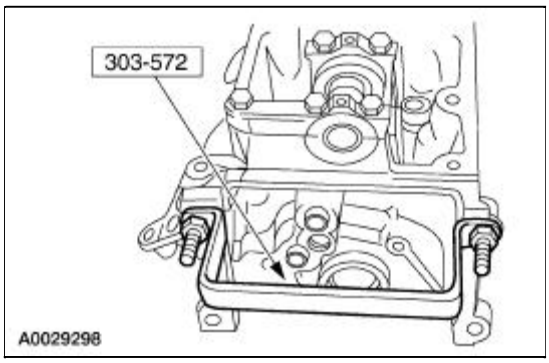


LH cylinder head



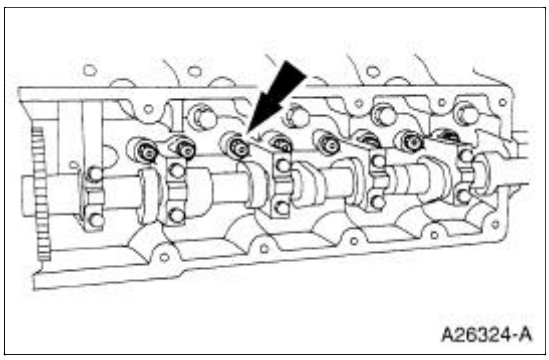
40. Remove the bolts and the heat shield.

41. Remove the eight nuts, the LH exhaust manifold and the gasket.
    - Discard the LH exhaust manifold gasket.



42. Remove the bolt and the oil level indicator tube.

All cylinder heads



43. Clean and inspect the exhaust manifolds. For additional information, refer to Section 303-00 .

44. Install the special tools on both ends of the cylinder head.

45. **NOTE:** The hydraulic lash adjusters must be reinstalled in their original locations. Record the hydraulic lash adjuster locations.

    Remove the hydraulic lash adjusters.

RH cylinder head

46. **CAUTION: The cylinder head must be cool before removing it from the engine. Cylinder head warpage can result if a warm or hot cylinder head is removed.**

    CAUTION: Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.

    CAUTION: The cylinder head bolts must be discarded and new bolts installed. They are tighten-to-yield designed and cannot be reused.

    CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

    CAUTION: Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.

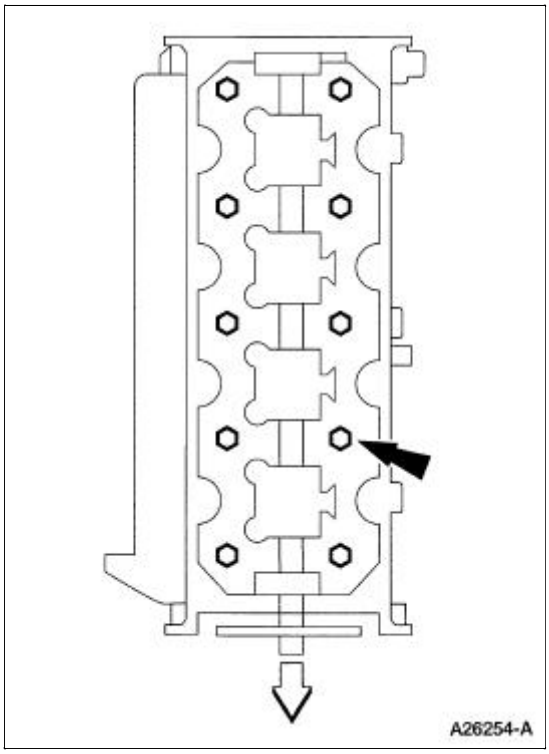
    Remove the bolts and the RH cylinder head.

    - Discard the cylinder head gasket.
    - Discard the cylinder head bolts.

LH cylinder head

47. **CAUTION: The cylinder head must be cool before removing it from the engine. Cylinder head warpage can result if a warm or hot cylinder head is removed.**

CAUTION: Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.



CAUTION: The cylinder head bolts must be discarded and new bolts installed. They are tighten-to-yield designed and cannot be reused.

CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

CAUTION: Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.

Remove the bolts and the LH cylinder head.

- Discard the cylinder head gasket.
- Discard the cylinder head bolts.

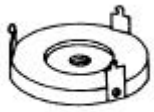
All cylinder heads

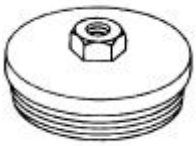
48. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    CAUTION: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

    Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the cylinder block.
    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant, and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.





49. **NOTE:** The straightedge used must be flat within 0.0051 mm (0.0002 in) per foot of tool length.

    Support the cylinder head on a bench with the head gasket side up. Inspect all areas of the deck face with a straightedge, paying particular attention to the oil pressure feed area. The cylinder head must not have depressions deeper than 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area, or scratches more than 0.0254 mm (0.001 in).

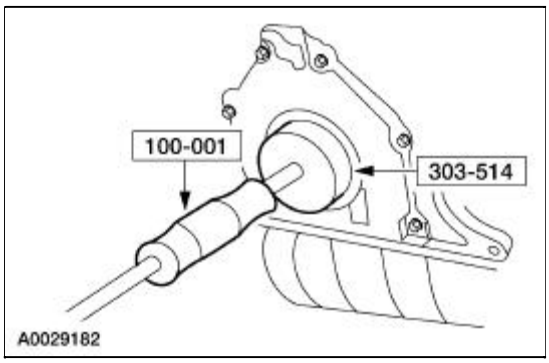
Disassembly

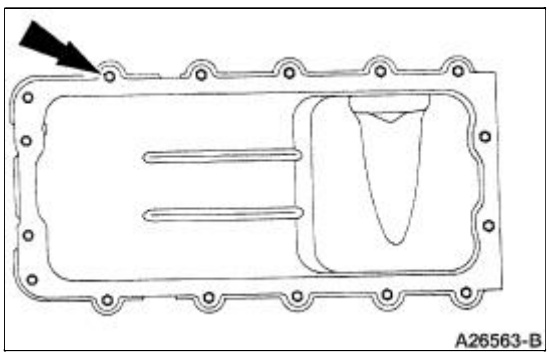
All vehicles



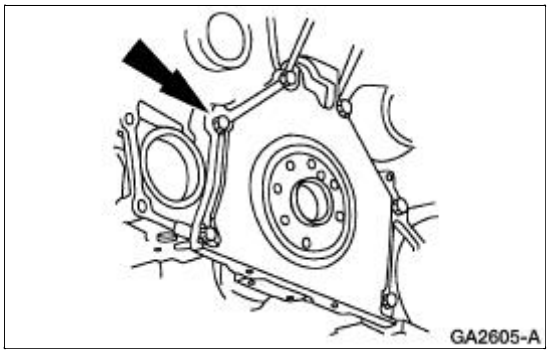
NOTE: The crankshaft rear oil seal, the oil seal slinger and the oil seal retainer plate must be removed before mounting the engine on the engine stand.

1. **NOTE:** 5.4L engine shown, 4.6L engine similar.

   Remove the bolts and the flexplate.

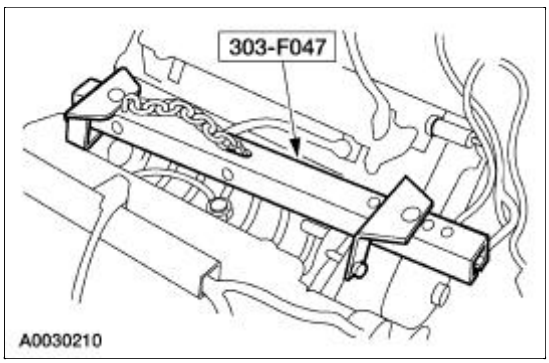


2. Using the special tools, remove the crankshaft rear oil slinger.

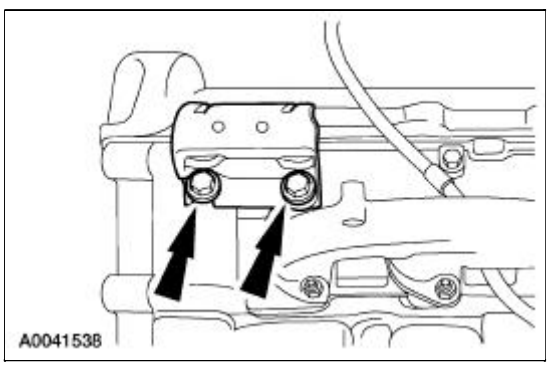


3. Using the special tools, remove the crankshaft rear oil seal.

4. Remove the bolts, oil pan and oil pan gasket.
    - Clean and inspect the sealing surfaces.

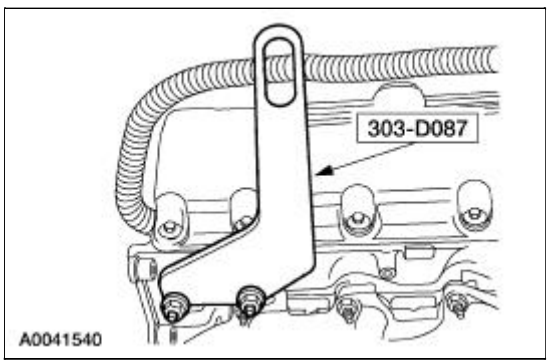


5. Remove the bolts and the crankshaft rear oil seal retainer plate.
    - Clean and inspect the sealing surfaces.

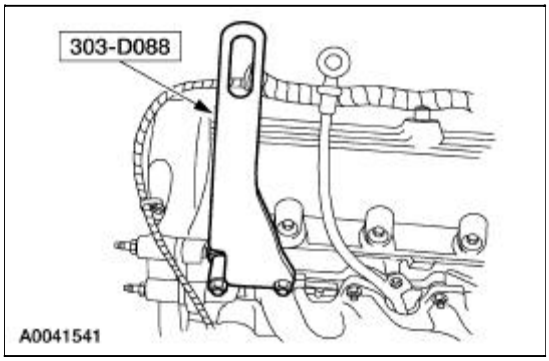


6. **CAUTION: Use care when lowering the engine, to prevent damage to the oil pump screen and pickup tube.**

   Lower the engine onto wooden blocks.

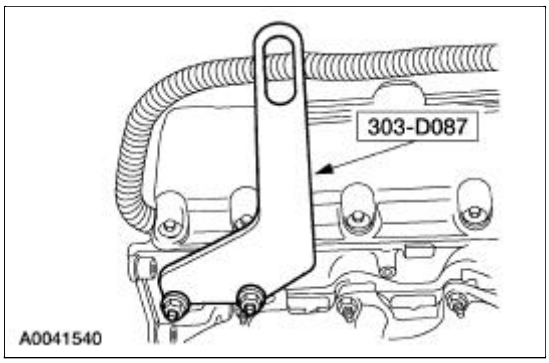


7. Remove the special tool.

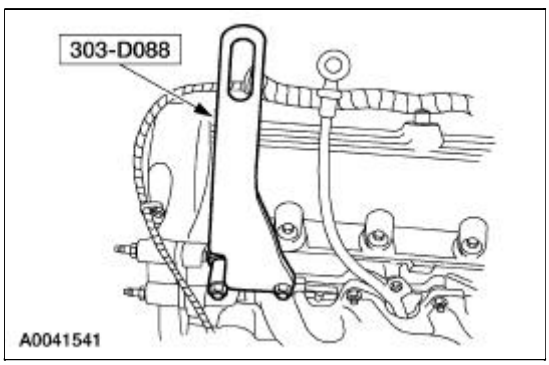


8. Remove the power steering reservoir lower mounting bracket.

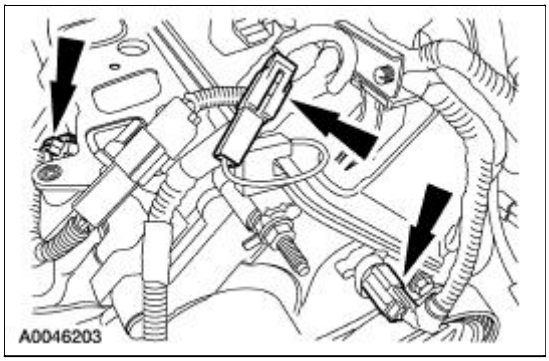
9. Install the special tool.



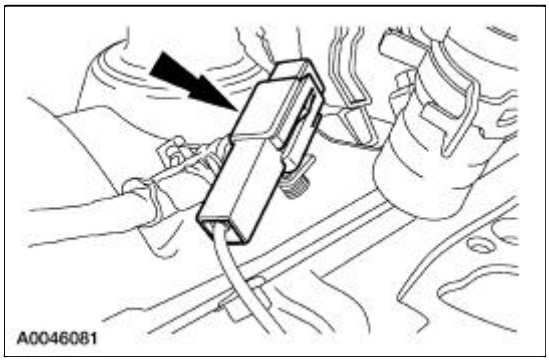
10. Install the special tool.



11. Mount the engine on a suitable work stand.

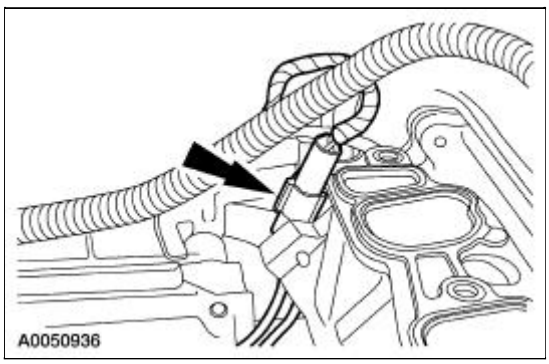


12. Remove the special tool.

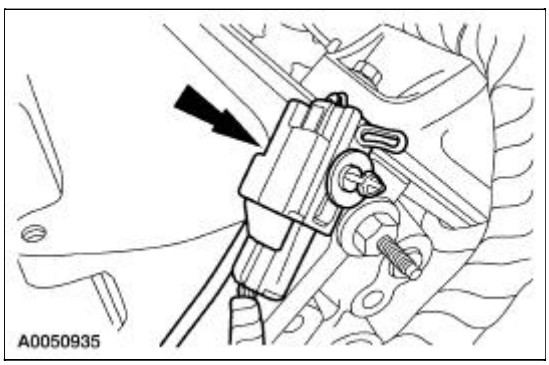


13. Remove the special tool.

14. Disconnect the following electrical connectors.
    - The camshaft position (CMP) sensor.
    - The LH radio interference capacitor.
    - The cylinder head temperature (CHT) sensor.

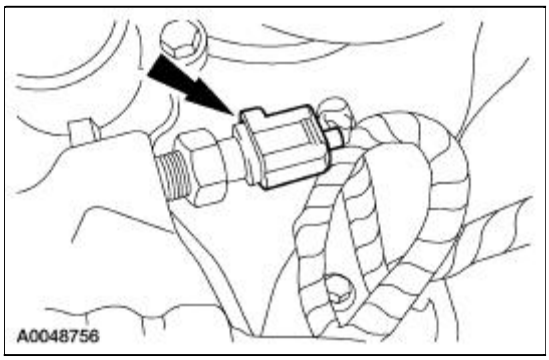


15. Disconnect the RH radio interference capacitor electrical connector.



4.6L engines

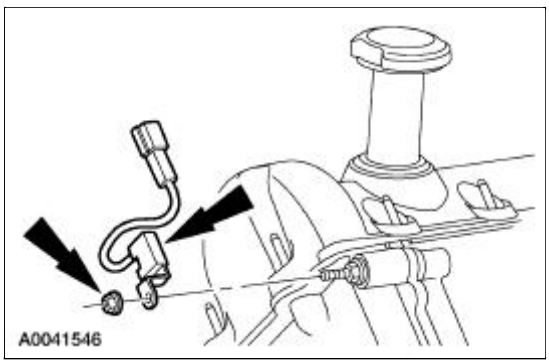
16. Disconnect the knock sensor electrical connector.



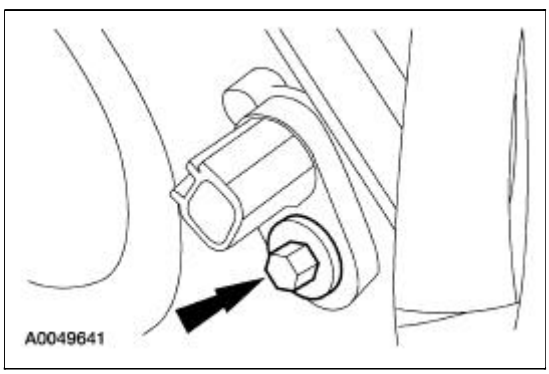
5.4L engines

17. Disconnect the knock sensor electrical connector.

All vehicles



18. Disconnect the oil pressure switch electrical connector.

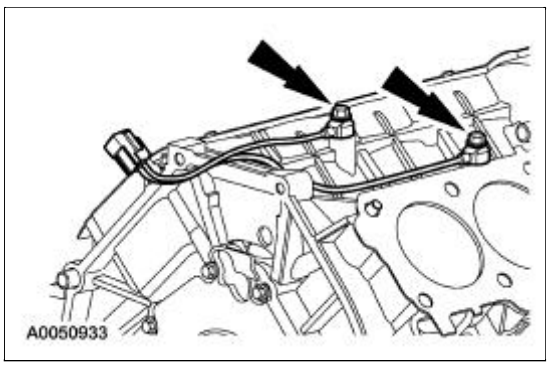


19. Detach all of the harness routing clips and connector retainers. Remove the engine control sensor wiring harness.

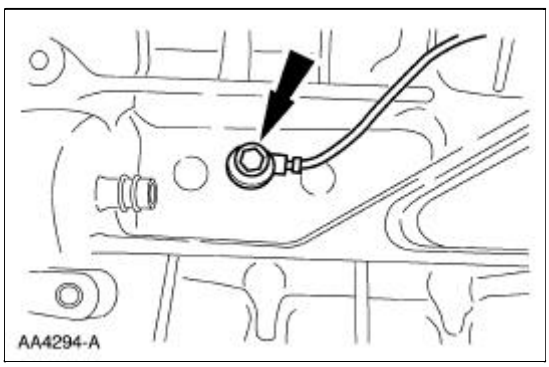
20. **NOTE:** RH shown, LH similar.

    Remove the nuts and the two radio interference capacitors.

21. Remove the bolt and the CMP sensor.

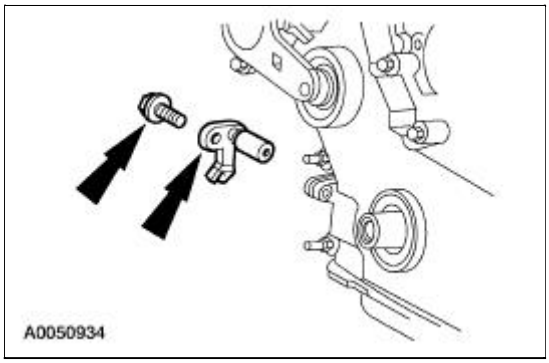


22. Remove the CHT sensor.



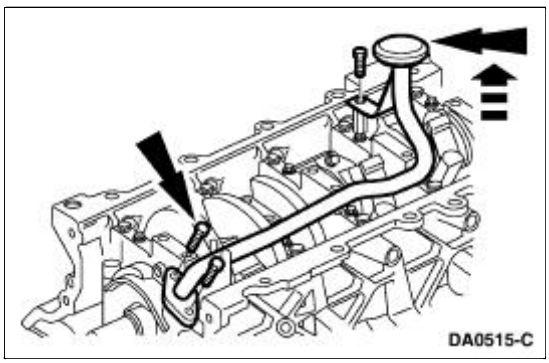
4.6L engines

23. Remove the bolts and the knock sensors.

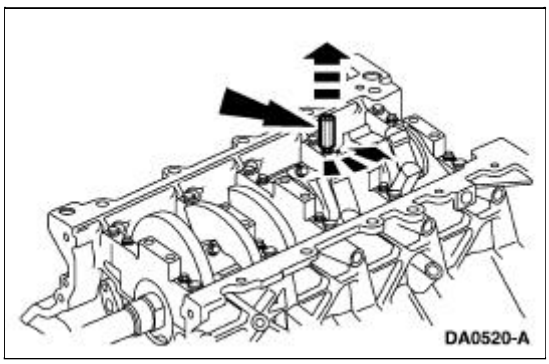


5.4L engines

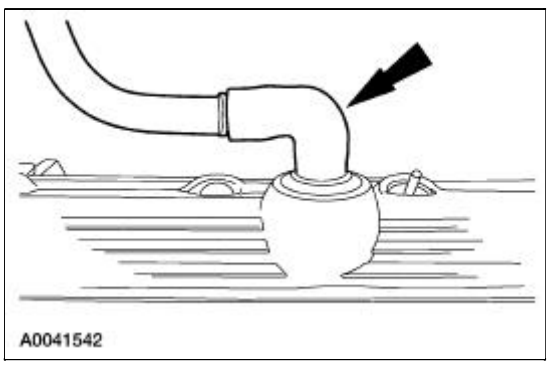
24. Remove the bolt and the knock sensor.



All vehicles



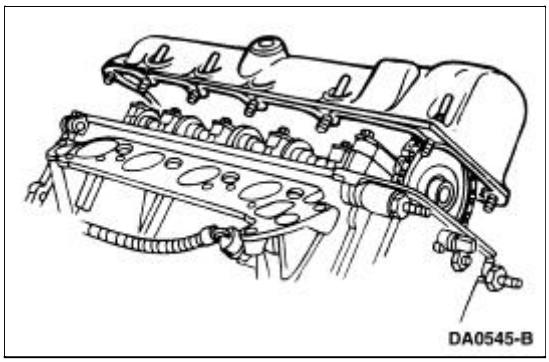
25. Remove the bolt and the crankshaft position (CKP) sensor.



26. Remove the bolts and the oil pump screen and pickup tube.

27. Remove the oil pump screen and pickup tube spacer.

28. Remove the crankcase ventilation tube from the LH valve cover.

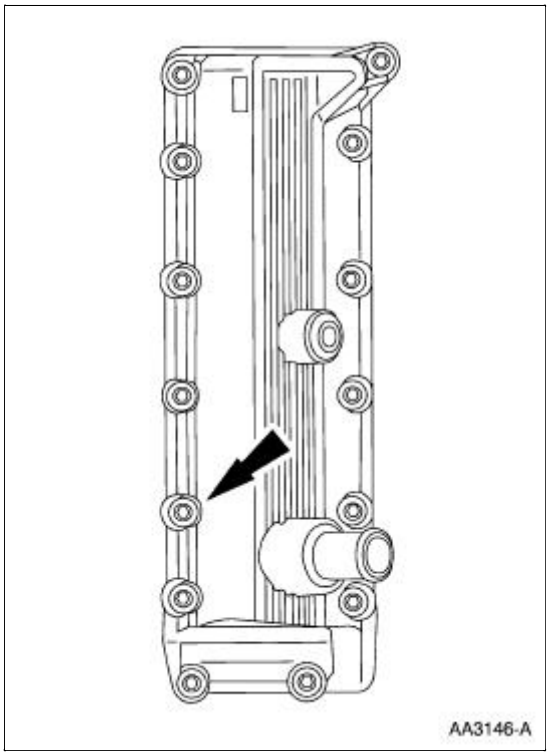


29. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

NOTE: The bolts are part of the valve cover and should not be removed.

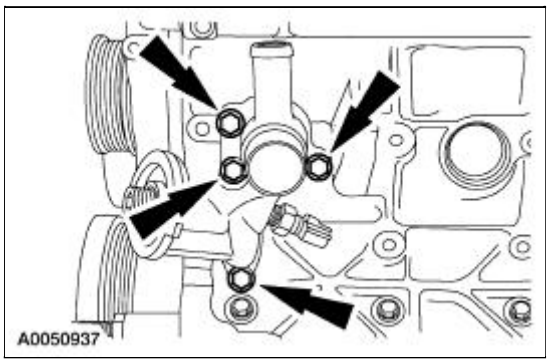
Remove the LH valve cover.

- Fully loosen the bolts and remove the valve cover.
- Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
- Inspect the valve cover gasket. If the gasket is damaged, remove and discard the gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.



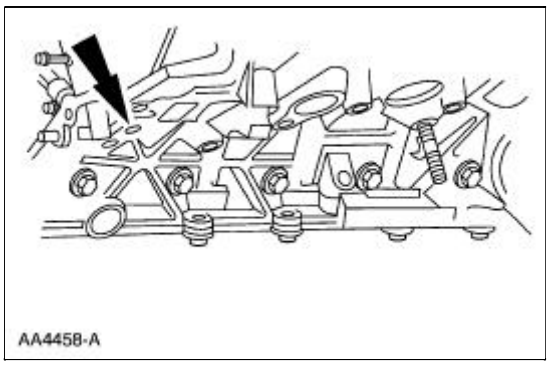
30. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

NOTE: The bolts are part of the valve cover and should not be removed.

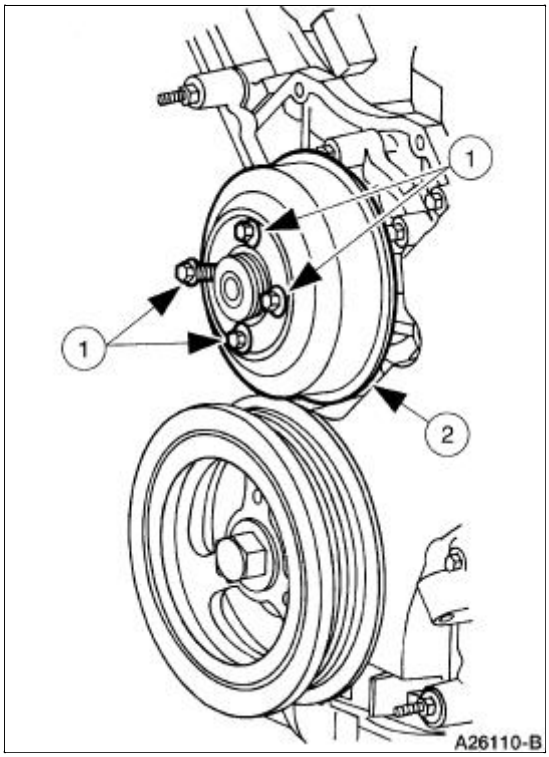


NOTE: Windsor engine shown; Romeo engine similar.

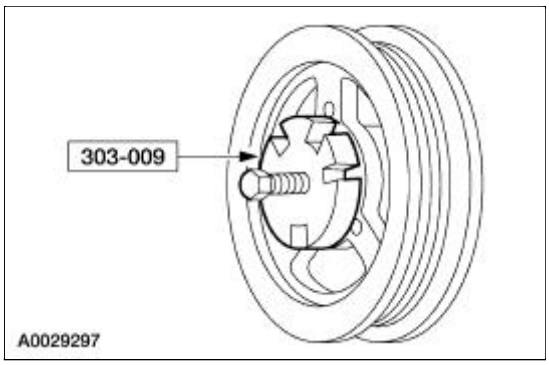
Remove the RH valve cover.



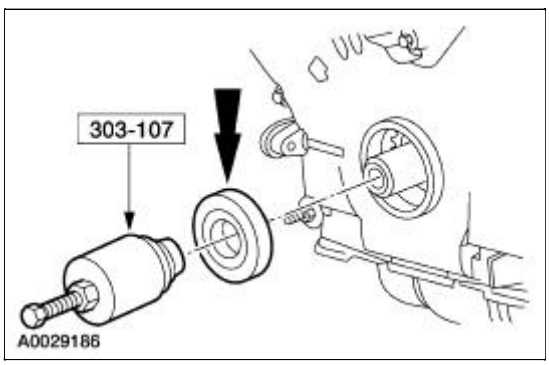
- Fully loosen the bolts and remove the valve cover.
- Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
- Inspect the valve cover gasket. If the gasket is damaged, remove and discard the gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.



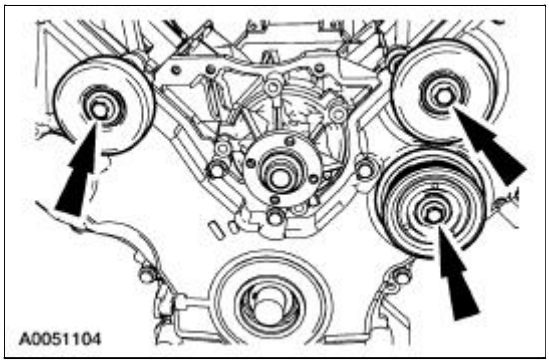
31. Remove the bolts, the oil filter adapter and the oil filter adapter gasket.



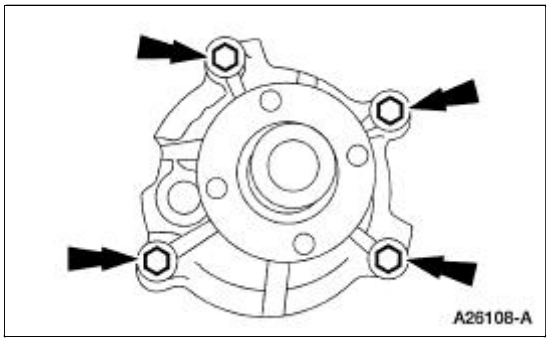
32. Clean the oil filter adapter gasket surface at the cylinder block.



33. Remove the coolant pump pulley.
    1. Remove the bolts.
    2. Remove the coolant pump pulley.

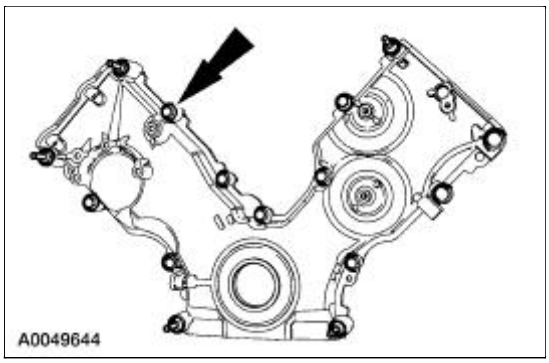


34. Remove and discard the crankshaft pulley bolt. Use the special tool to remove the crankshaft pulley.

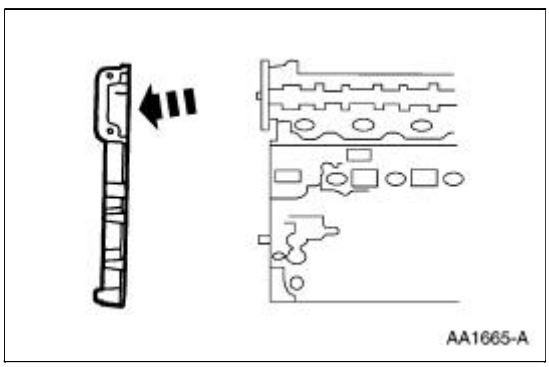


35. Use the special tool to remove the crankshaft front oil seal.

36. Remove the bolts and the belt idler pulleys.

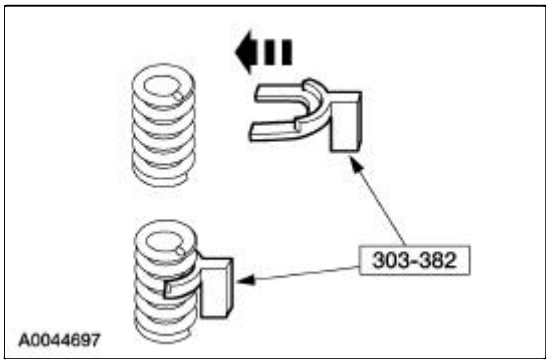


37. Remove the bolts and the coolant pump.



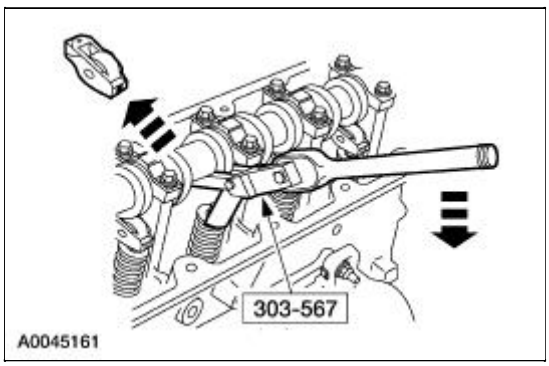
38. **NOTE:** Correct fastener location is essential for assembly procedure. Record fastener location.

    Remove the fasteners.

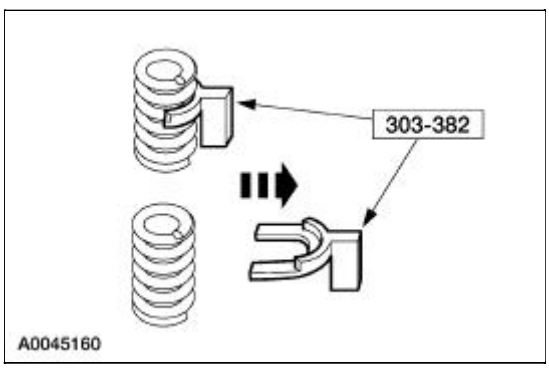


39. Remove the engine front cover from the cylinder block.

40. Remove the crankshaft sensor ring from the crankshaft.

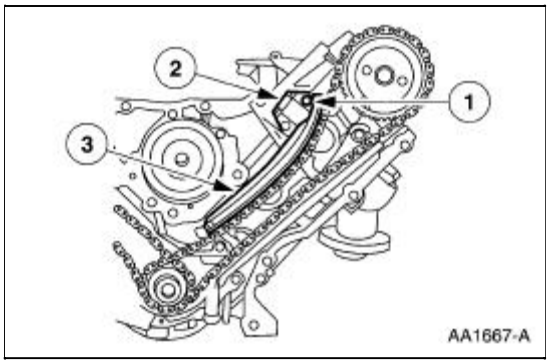


41. Install the special tool between the valve spring coils to prevent valve stem seal damage.



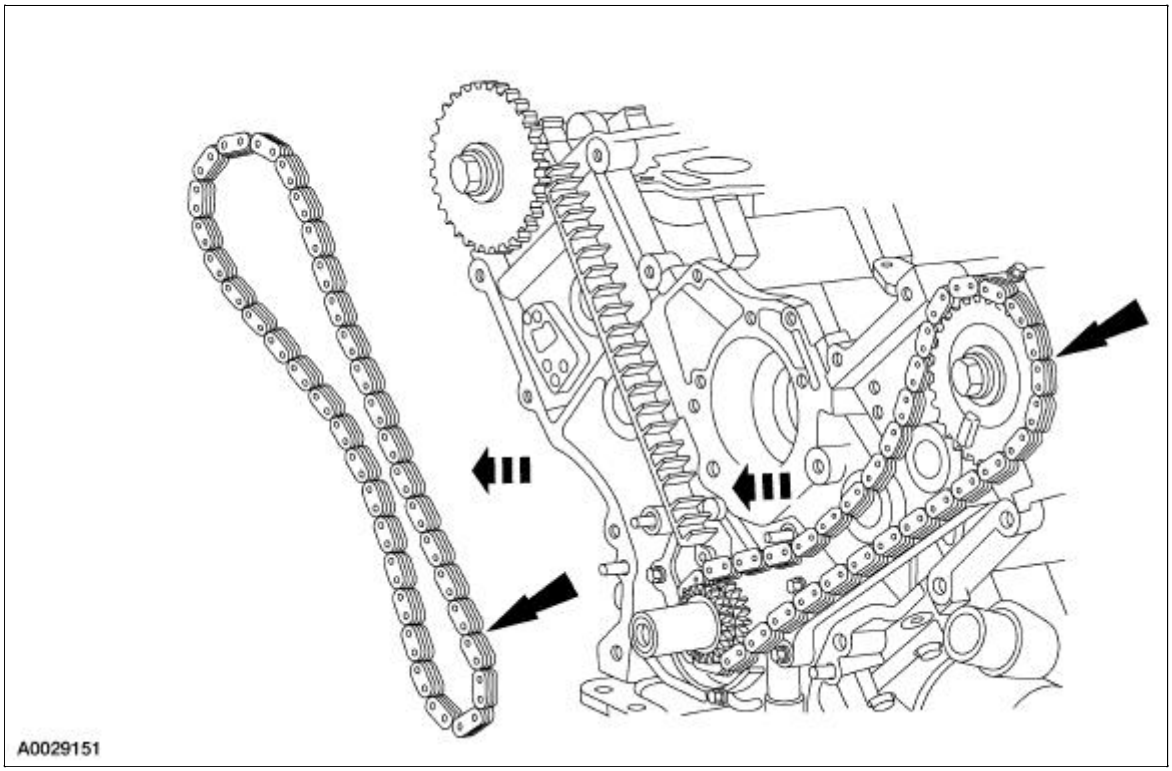
42. **NOTE:** The camshaft roller followers must be reinstalled in their original locations. Record the camshaft roller follower locations.

    Use the special tool to compress the valve springs, and remove the camshaft roller followers.

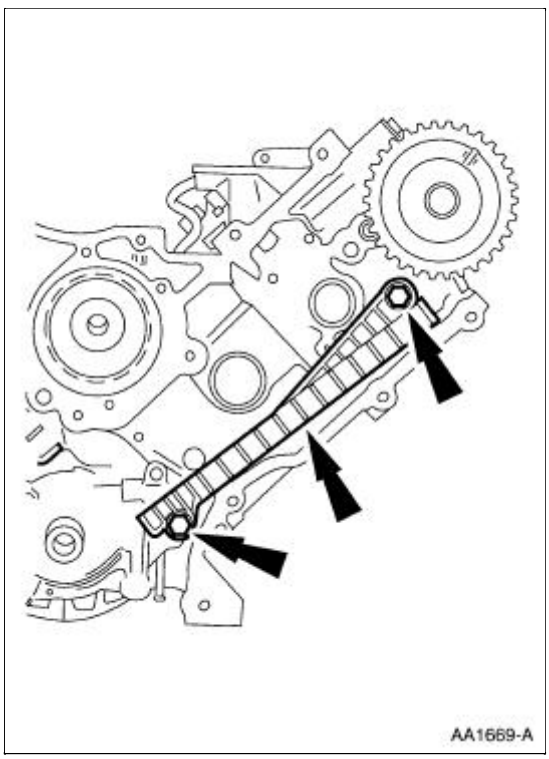


43. Remove the special tool.

44. Position the crankshaft with the keyway at the 12 o'clock position.



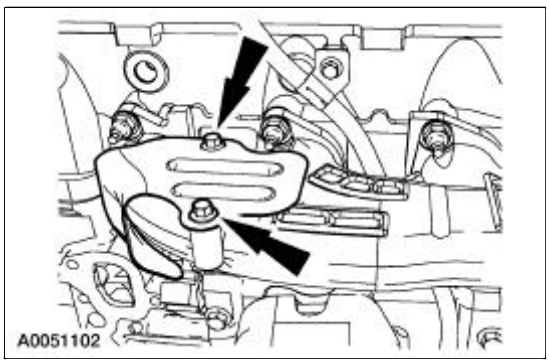
45. Remove the timing chain tensioning system from both timing chains.
    1. Remove the bolts.
    2. Remove the timing chain tensioners.
    3. Remove the timing chain tensioner arms.



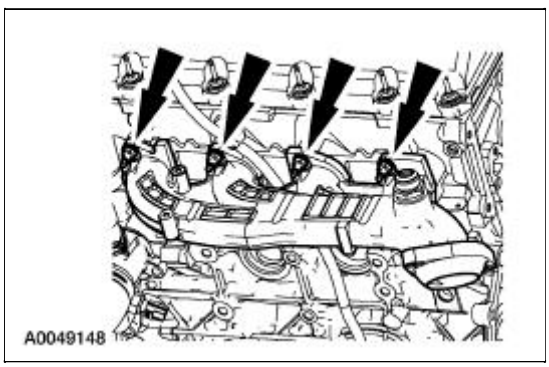
46. **CAUTION: Unless otherwise instructed, at no time when the timing chains are removed and the cylinders heads are installed is the crankshaft or camshaft to be rotated. Severe piston and valve damage will occur.**

    Remove the RH and LH timing chains and the crankshaft sprocket.

    - Remove the RH timing chain from the camshaft sprocket.
    - Remove the RH timing chain from the crankshaft sprocket.
    - Remove the LH timing chain from the camshaft sprocket.
    - Remove the LH timing chain and the crankshaft sprocket.

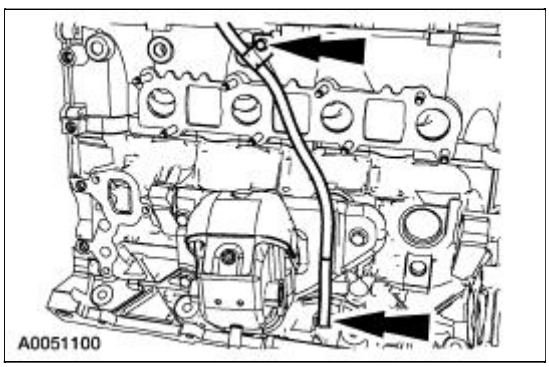


47. Remove both timing chain guides.
    - Remove the bolts.
    - Remove both timing chain guides.

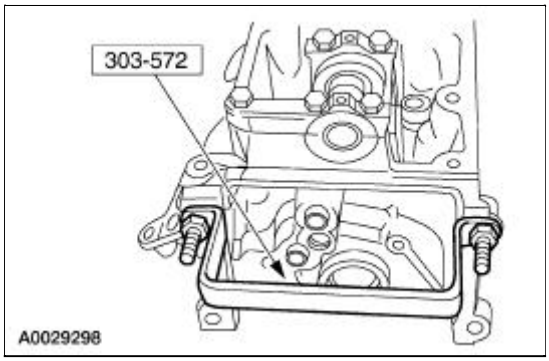


48. Remove the eight nuts, the RH exhaust manifold and the gasket.
    - Discard the RH exhaust manifold gasket.

49. Remove the bolts and the heat shield.



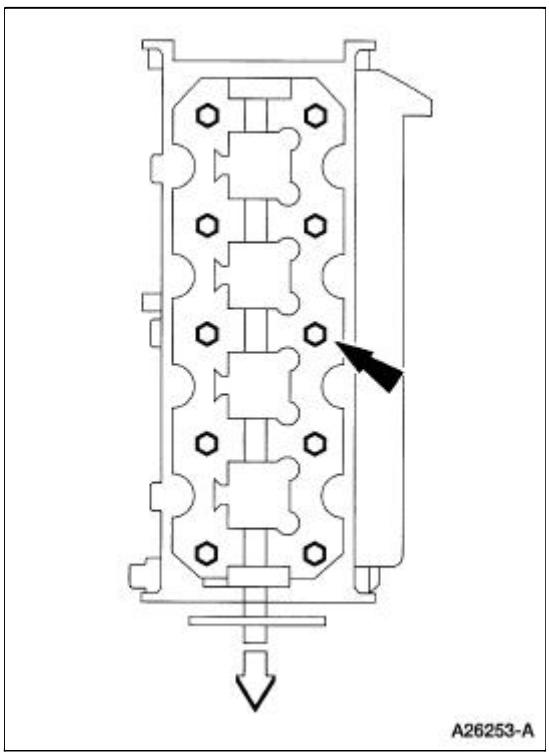
50. Remove eight nuts, the LH exhaust manifold and the gaskets.
    - Discard the LH exhaust manifold gaskets.



51. Clean and inspect the exhaust manifolds. For additional information, refer to Section 303-00 .

52. Remove the bolt and the oil level indicator tube.

53. Install the special tools on both ends of the cylinder head.



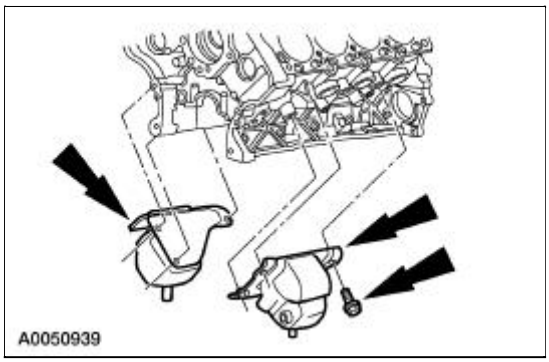
54. **CAUTION: New cylinder head bolts must be installed. They are tighten-to-yield designed and cannot be reused.**

CAUTION: Place cylinder head on a cardboard or wood surface to prevent damage to the joint face.

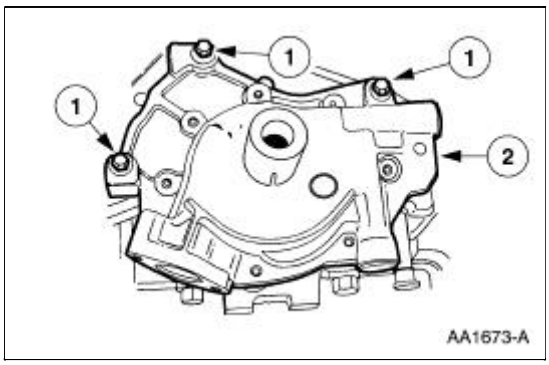
CAUTION: Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.

NOTE: RH is shown; LH is similar.

Remove the bolts and discard. Remove the cylinder heads.

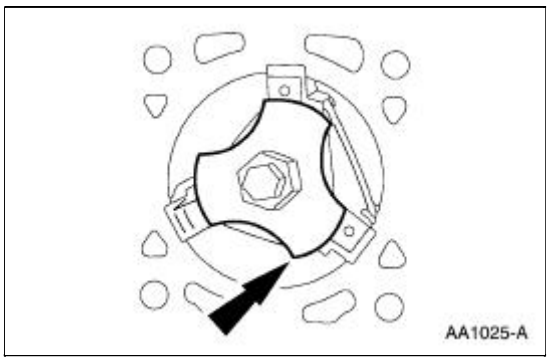


55. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraper to remove all traces of the head gasket.**



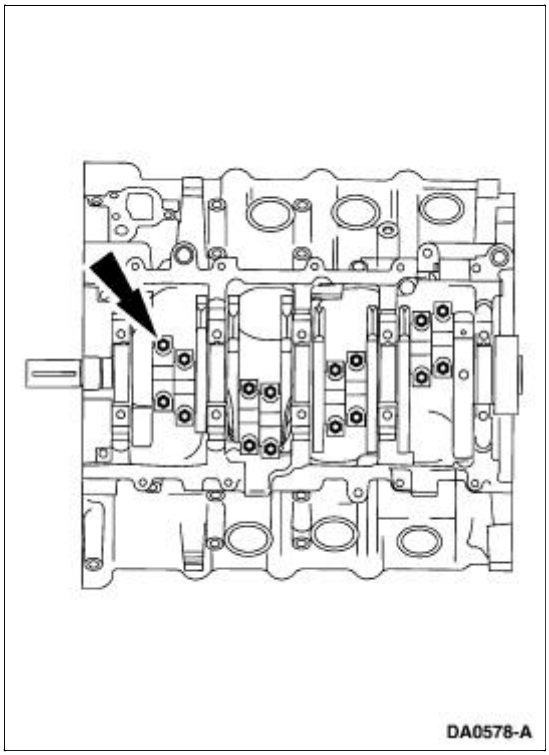
NOTE: If the cylinder head will be disassembled, it will be cleaned during that process.

Discard the cylinder head gaskets. Clean the sealing surfaces of the cylinder head and engine block with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

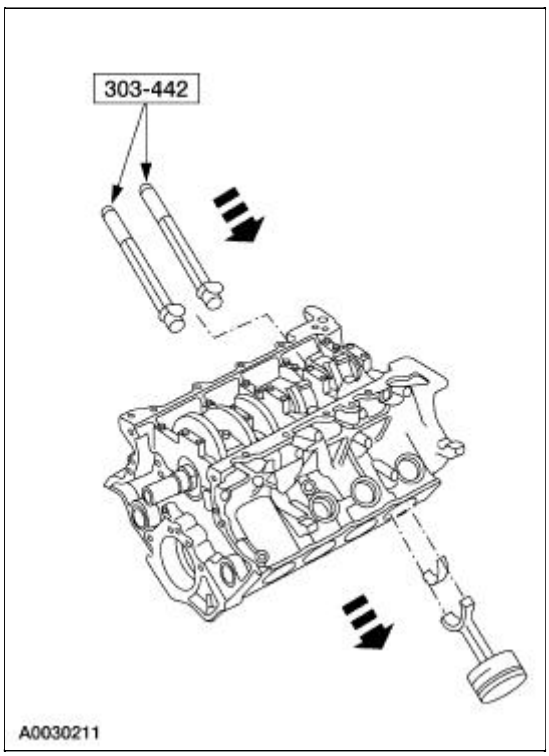


56. Remove the six bolts and the two engine mounts.

57. Remove the oil pump.
    1. Remove the bolts.
    2. Remove the oil pump.

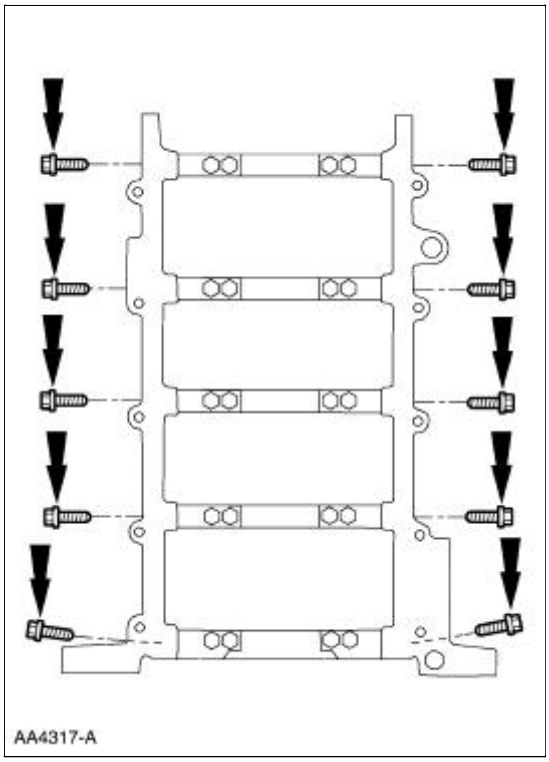


58. Before removing the pistons, inspect the top of the cylinder bores. If necessary, remove the ridge or carbon deposits from each cylinder using a cylinder ridge reamer. Follow the manufacturer's instructions.



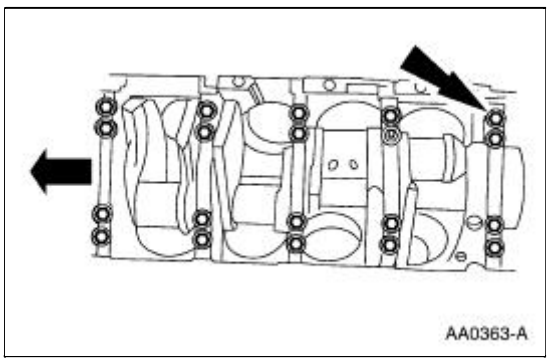
59. **CAUTION: Verify that the connecting rods and rod caps have orientation numbers cast into them. If not, number the connecting rods and rod caps for correct orientation.**

Remove the bolts and the connecting rod cap. Discard the bolts.



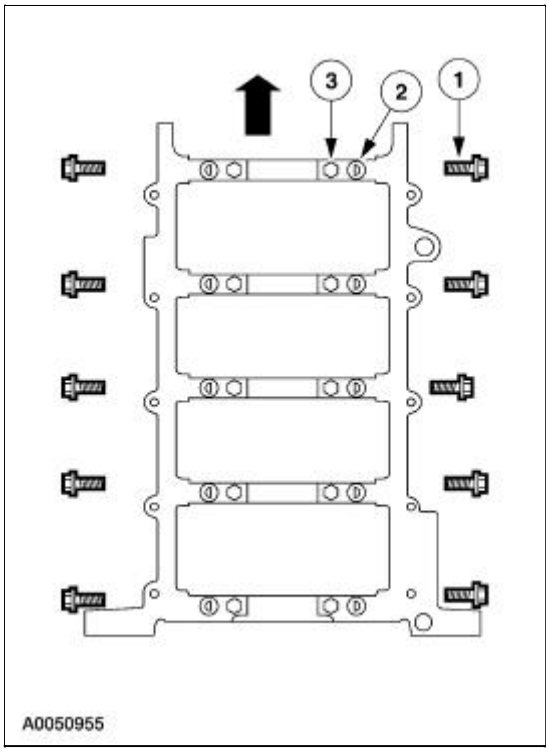
60. **CAUTION: Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

    Use the special tool to push the piston through the top of the cylinder block.

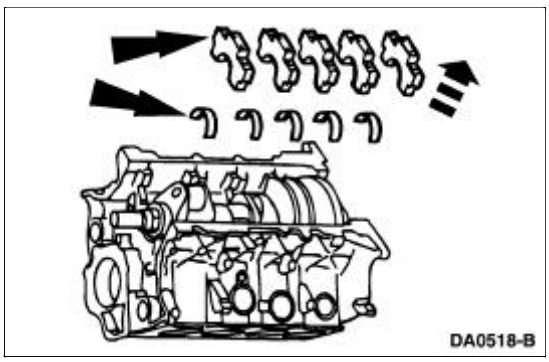


4.6L engines

61. Remove and discard the crankshaft bearing cap side bolts.

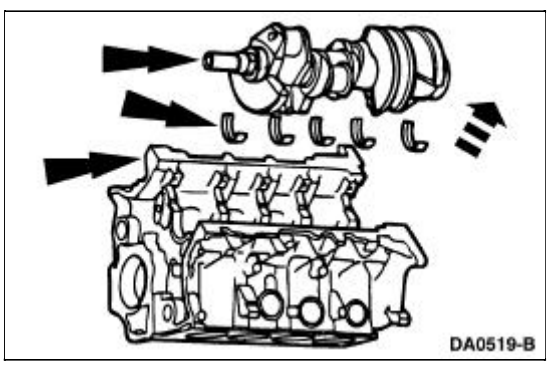


62. Remove and discard the crankshaft bearing cap bolts.



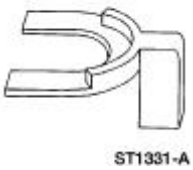
5.4L engines

63. Remove the fasteners.
    1. Remove and discard the crankshaft bearing cap side bolts.
    2. Remove the dowels.
    3. Remove and discard the crankshaft bearing cap bolts.



All vehicles

64. Remove the five main bearing caps, the lower crankshaft main bearings and, if equipped, the lower thrust washer.



65. Remove the crankshaft, the upper crankshaft main bearings and the upper thrust washer(s) from the cylinder block.

Cylinder Head

Special Tool(s)

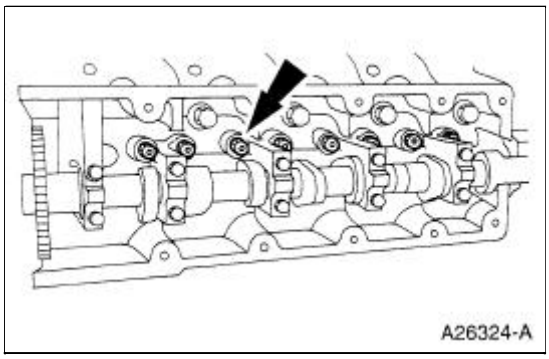
 ST1330-A	Compressor, Valve Spring 303-567 (T97P-6565-AH)
 ST1331-A	Compressor Spacer, Valve Spring 303-382 (T91P-6565-AH)
 ST1332-A	Installer, Valve Stem Oil Seal 303-383 (T91P-6571-A)
	Aligner, Camshaft Position 303-557 (T96T-6256-B)

Material

Item	Specification
Motorcraft Silicone Gasket Remover ZC-30	—
Motorcraft Metal Surface Prep ZC-31	—
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP	WSS-M2C153-H

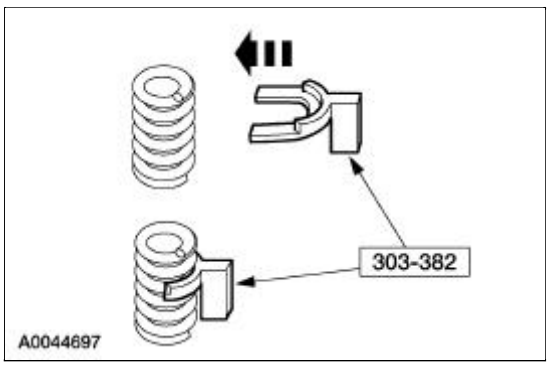
Disassembly

CAUTION: Cylinder head machining or milling is not authorized by the Ford Motor Company. Cylinder head flatness must be within 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area.



CAUTION: Place the cylinder head on a cardboard or wood surface to prevent damage to

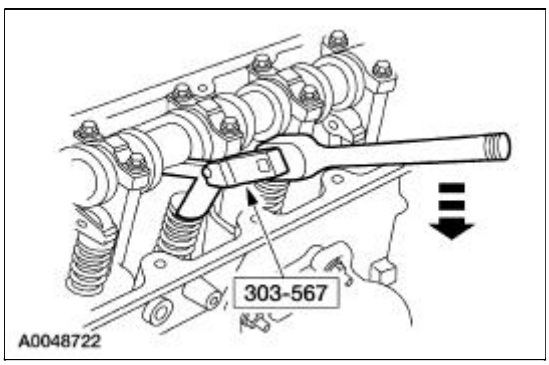
the joint face.



All cylinder heads

1. **NOTE:** The hydraulic lash adjusters must be reinstalled in their original locations. Record the hydraulic lash adjuster locations.

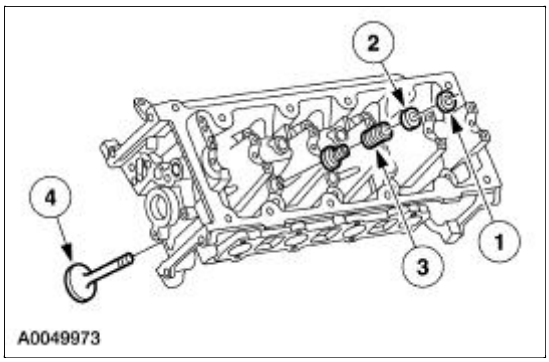
   Remove the hydraulic lash adjusters.



2. Install the special tool between the valve spring coils to prevent valve stem seal damage.

3. **NOTE:** Windsor engine shown; Romeo engine similar.

   Use the special tool to compress the valve springs.

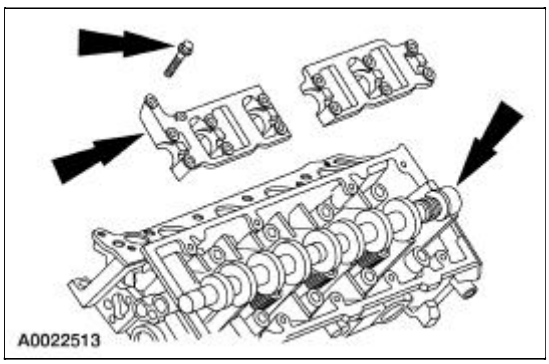


4. **CAUTION: Keep the valves and valve spring retainer keys in order so they can be reinstalled in their original locations.**

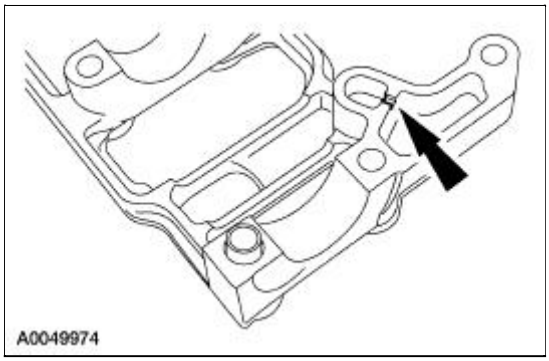
   NOTE: Shown without camshaft for clarity.

   Remove the valves.

1. Remove the valve spring retainer keys.
2. Remove the valve spring retainers.
3. Remove the valve springs.
4. Remove the valves.



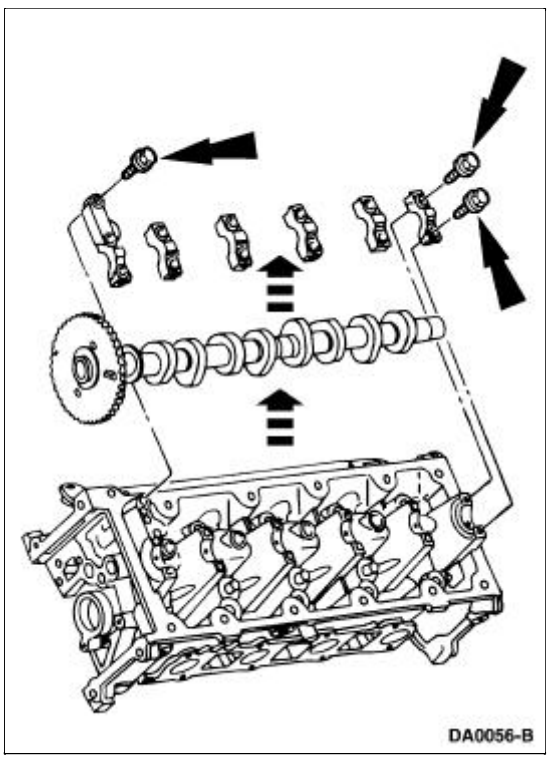
5. Remove the valve stem seals.



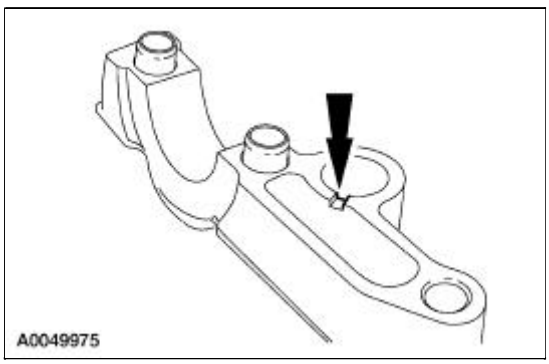
Romeo cylinder heads (4.6L)

6. **NOTE:** The camshaft bearing caps must be reinstalled in their original locations. Record the camshaft bearing cap locations.

   Remove the bolts, the bearing caps and the camshaft.



7. Clean and inspect the camshaft bearing caps.
   - One of the bearing caps contains an oil flow restriction groove. Make sure the groove is free of foreign material.



Windsor cylinder heads (5.4L)

8. **NOTE:** The camshaft bearing caps must be reinstalled in their original locations. Record the camshaft bearing cap locations.

   Remove the bolts, the bearing caps and the camshaft.

9. Clean and inspect the camshaft bearing caps.
   - One of the bearing caps contains an oil flow restriction groove. Make sure the groove is free of foreign material.

All cylinder heads

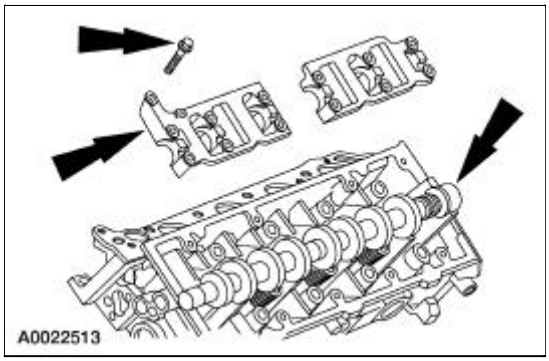
10. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    CAUTION: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

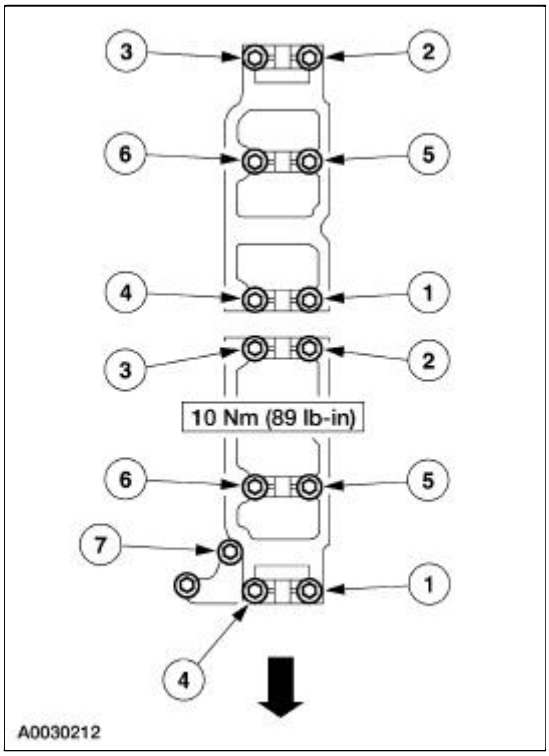
    Clean the cylinder head sealing surfaces.
    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant, and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

Assembly



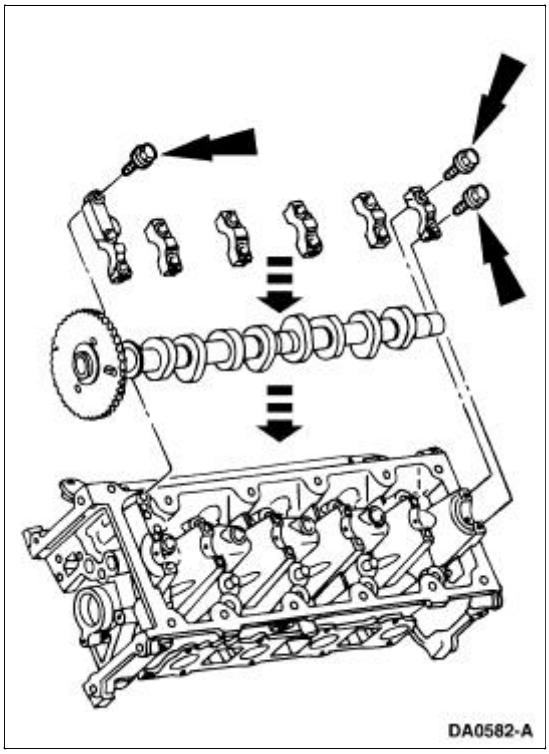
All cylinder heads

1. Lubricate the camshaft journals with clean engine oil.

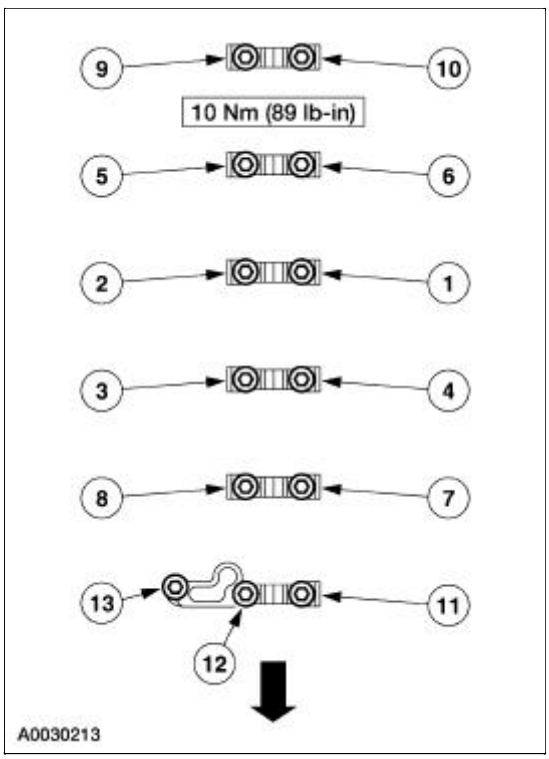


Romeo cylinder heads (4.6L)

2. Install the camshaft and the camshaft bearing caps in their original locations.
    - Lubricate the camshaft bearing caps with clean engine oil.
    - Position the camshaft bearing caps.
    - Install the bolts loosely.

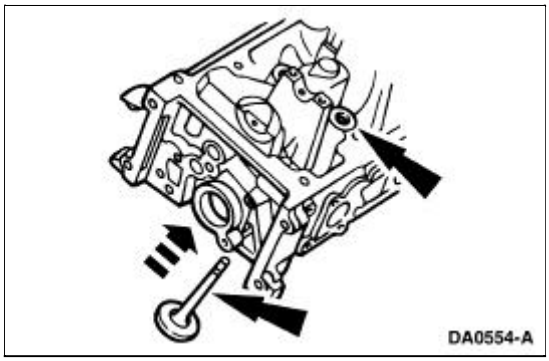


3. Tighten the bolts in the sequence shown.

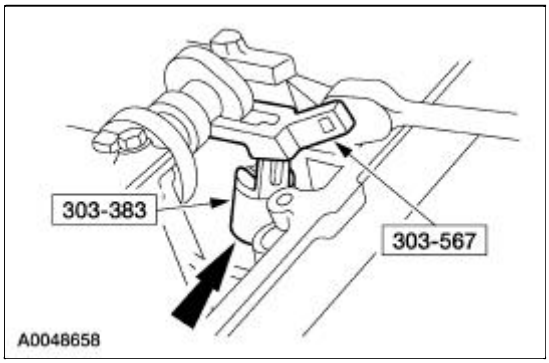


Windsor cylinder heads (5.4L)

4. Install the camshaft and the camshaft bearing caps in their original locations.
    - Lubricate the camshaft bearing caps with clean engine oil.
    - Position the camshaft bearing caps.
    - Install the bolts loosely.



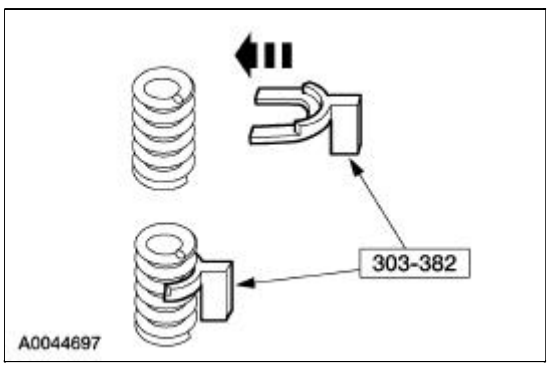
5. Tighten the bolts in the sequence shown.



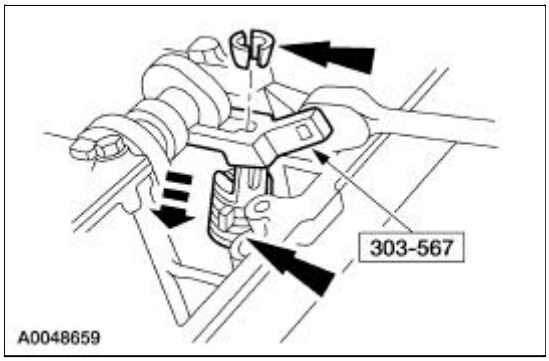
All cylinder heads

6. **NOTE:** Lubricate the valve stems using clean engine oil.

   Install the valves in the valve guides located in the cylinder head.

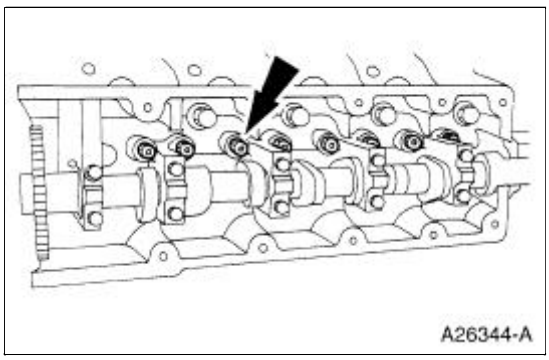


7. Use the special tools to install the valve stem seals.

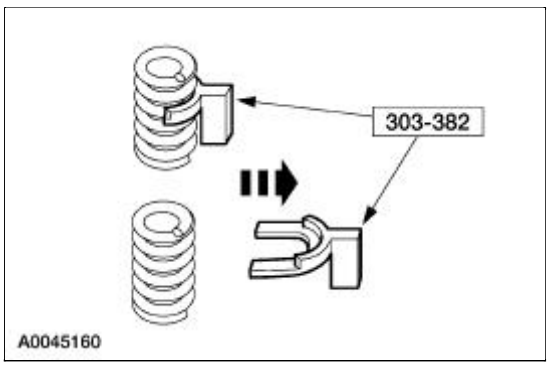


8. Install the valve springs and the valve spring retainers onto the valves.

9. Install the special tool between the valve spring coils to prevent valve stem seal damage.



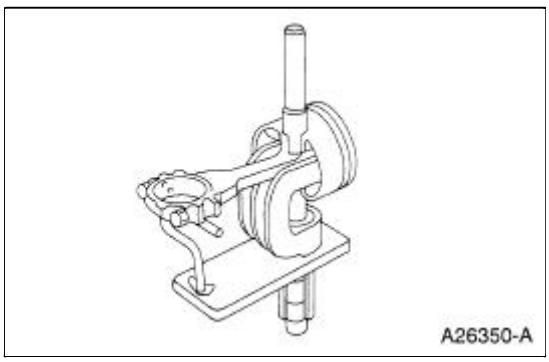
10. Use the special tool to compress the valve springs. Install the valve spring retainer keys.



11. **NOTE:** Lubricate the hydraulic lash adjusters using clean engine oil.

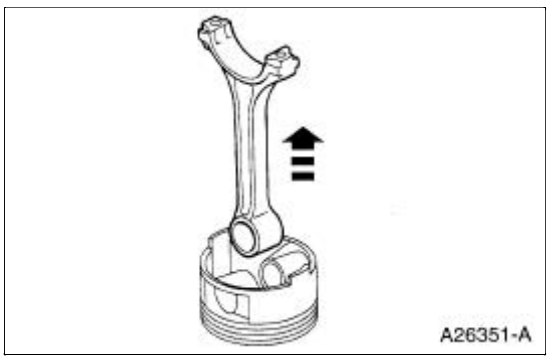
    Install the hydraulic lash adjusters in their original locations.

12. Remove the special tool, unless the cylinder head is to be installed in-vehicle.



Piston —Pin Connecting Rod, Press Fit

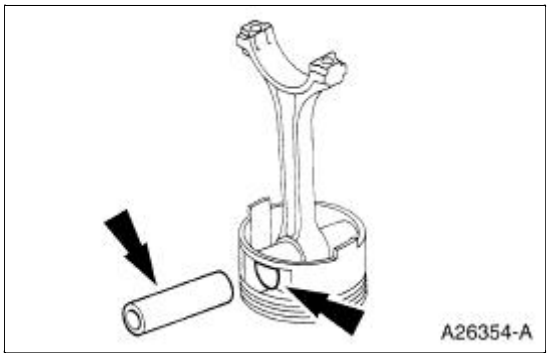
Material



Item	Specification
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP	WSS-M2C153-H

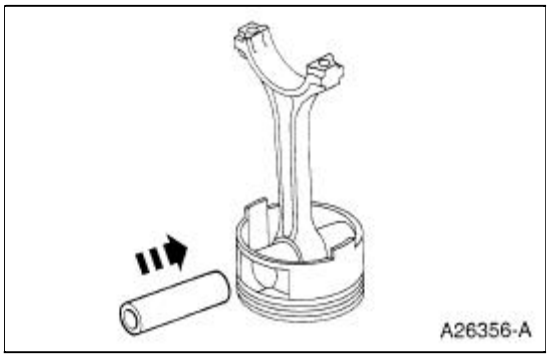
Disassembly

1. Press the piston pin out from the connecting rod and piston assembly.



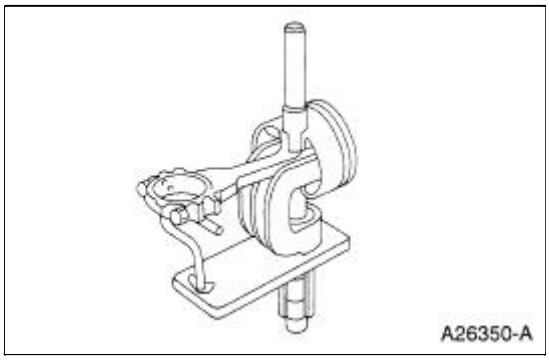
2. Remove the connecting rod (6200) from the piston (6108).

3. Clean and inspect the connecting rod and piston. For additional information, refer to Section 303-00 .



Assembly

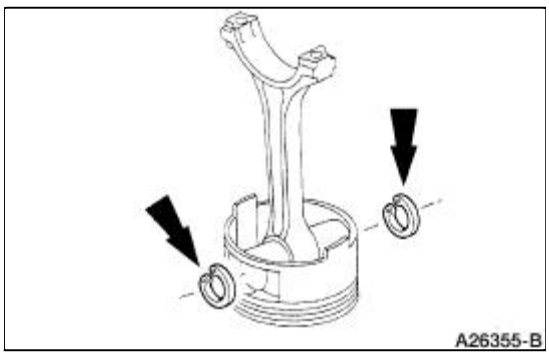
1. Lubricate the piston pin (6135) and piston pin bore with clean engine oil.



2. **NOTE:** The connecting rod can be installed in either direction.

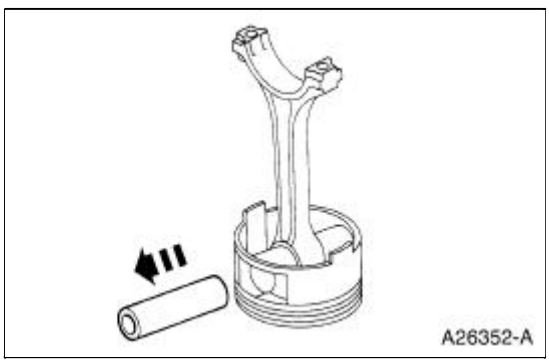
   Position the piston pin in the bore aligned with the connecting rod bore.

3. Press the piston pin into the piston and rod assembly.



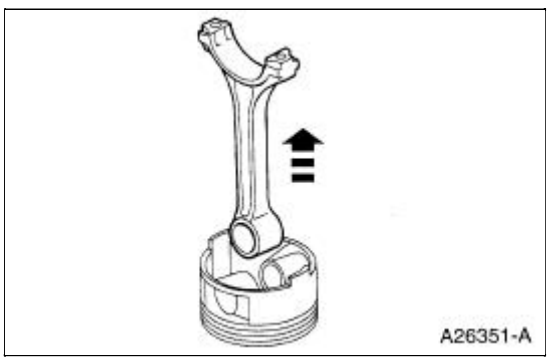
Piston —Pin Connecting Rod, Floating Pin

Material



Item	Specification
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP	WSS-M2C153-H

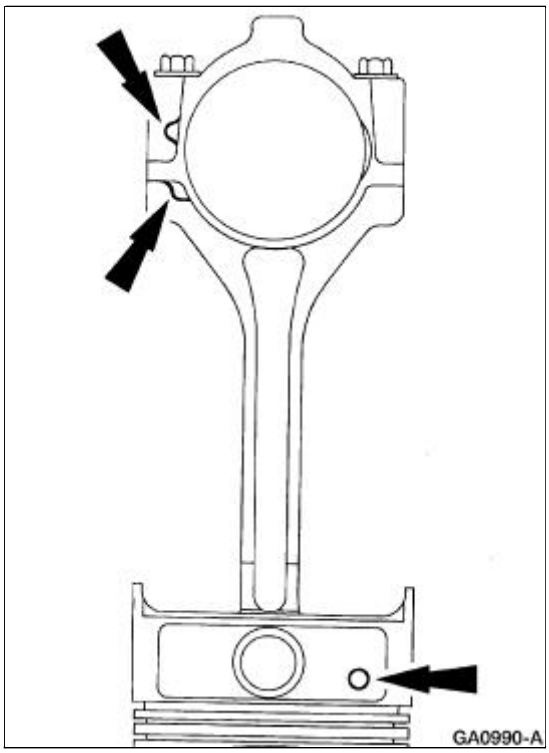
Disassembly



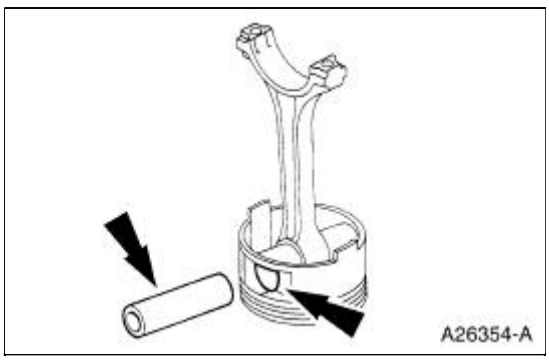
1. Remove the clips.

2. Remove the piston pin (6135) from the piston (6108) and connecting rod assembly.

3. Remove the connecting rod (6200) from the piston.



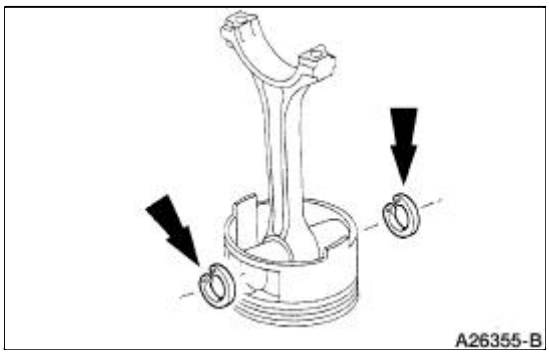
4. Clean and inspect the piston and connecting rod. For additional information, refer to Section 303-00 .



Assembly

1. **NOTE:** Connecting rod must be installed into piston with identification markings toward front.

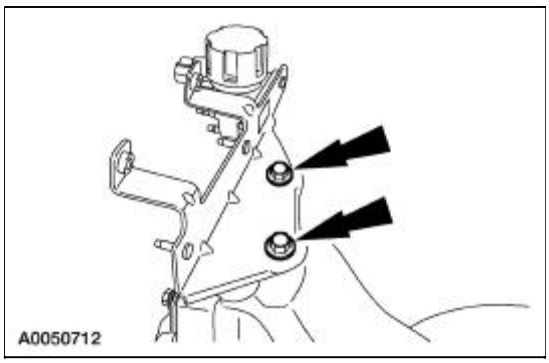
   Position the connecting rod in the piston.



2. Lubricate the piston pin and pin bore with clean engine oil.

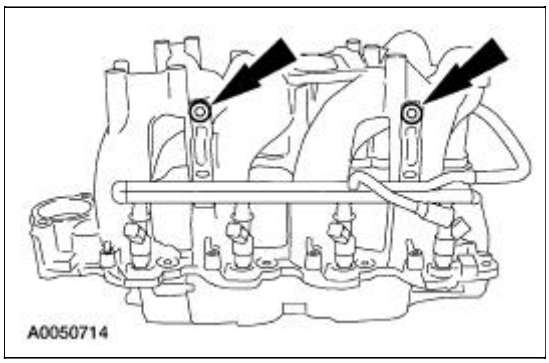
3. Install the piston pin in the piston and connecting rod assembly.

4. Install the piston pin retaining clips in the piston.



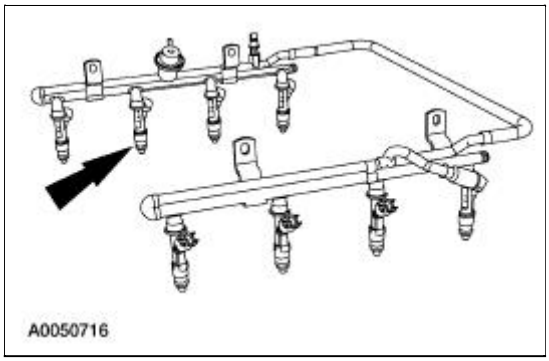
Intake Manifold Assembly —4.6L

Material

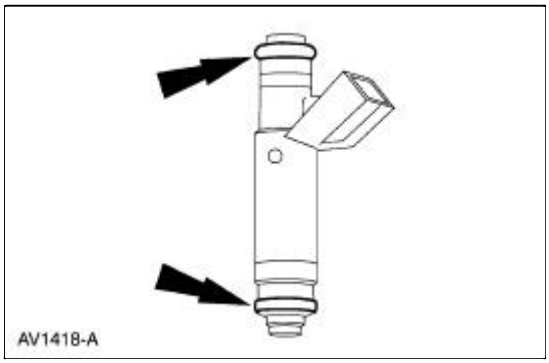


Item	Specification
Motorcraft Silicone Gasket Remover ZC-30	—
Motorcraft Metal Surface Prep ZC-31	—

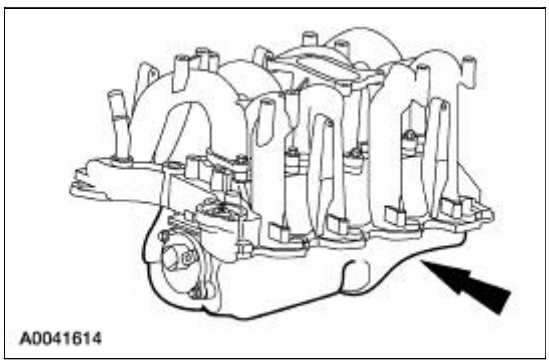
Disassembly



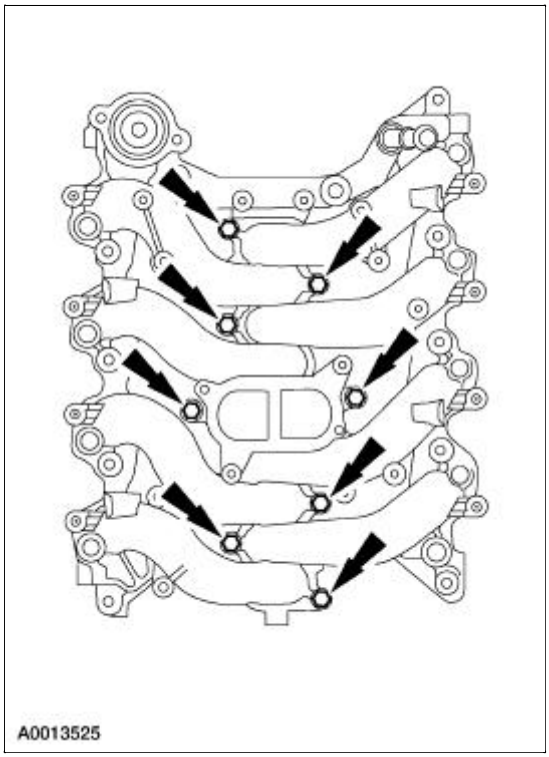
1. Remove the bolts and the exhaust gas recirculation (EGR) vacuum regulator solenoid bracket.



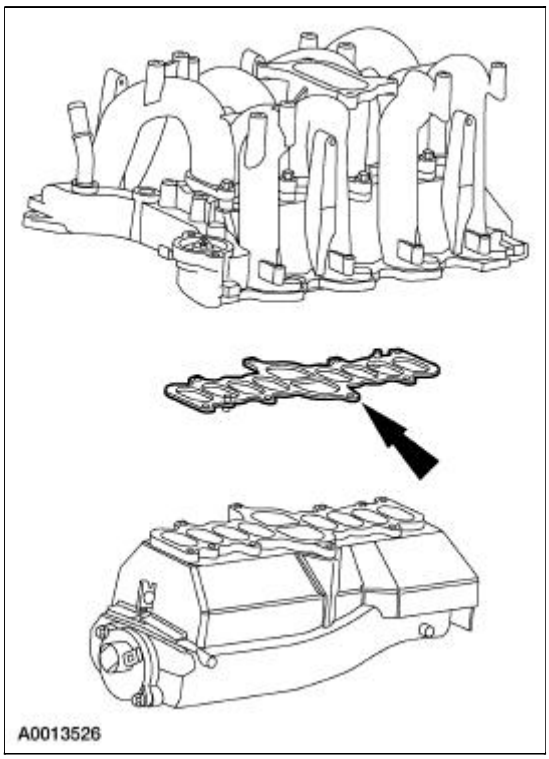
2. Remove the four bolts and the fuel injection supply manifold.



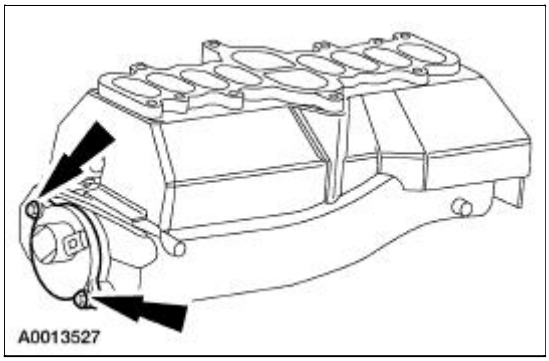
3. Remove the eight fuel injectors from the fuel injection supply manifold.



4. Inspect the two O-ring seals from each fuel injector. Install new O-ring seals as needed.



5. Remove the engine noise shield.



6. Remove the bolts.

7. Separate the upper and lower intake manifolds and discard the lower intake manifold gasket.

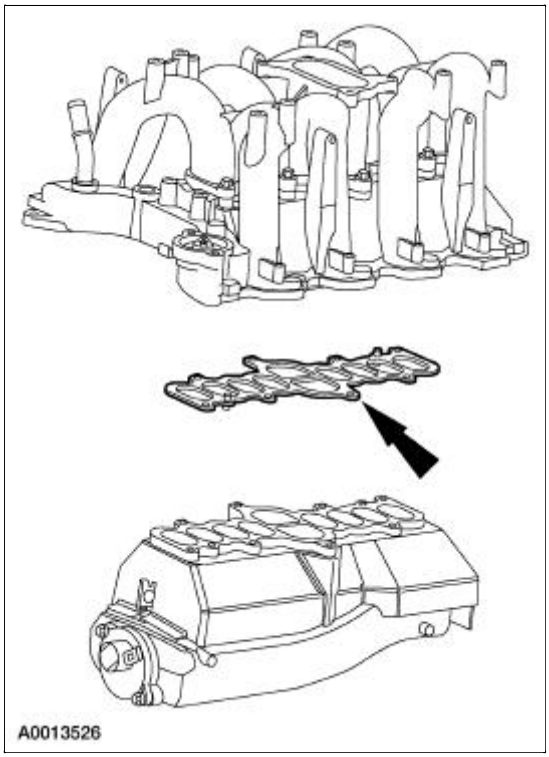
8. Remove the bolts and the intake manifold turning valve.

9. **CAUTION: If the engine has been internally damaged and metal or other foreign material has entered the manifold, it is recommended the manifold be discarded.**

   NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the sealing surfaces.

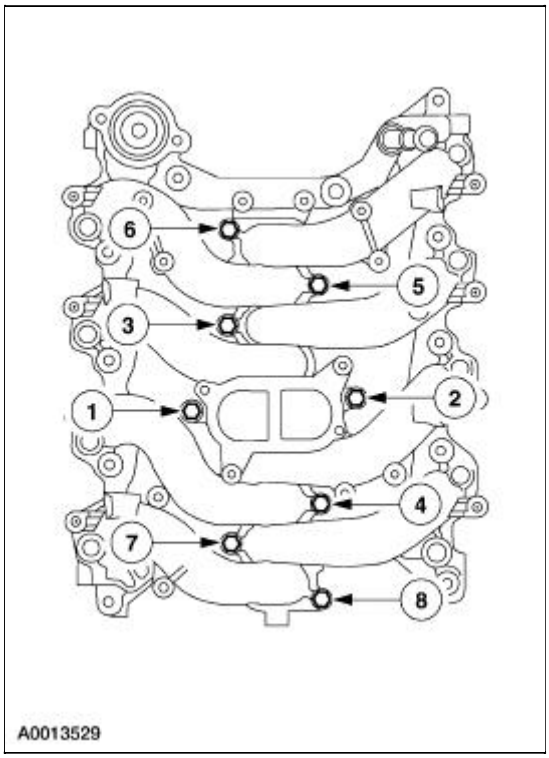
   Inspect all external and internal surfaces of the upper intake manifold.

   - Inspect for cracks or other damage.
   - Inspect for foreign material inside of the manifold.
   - Clean the upper intake manifold sealing surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

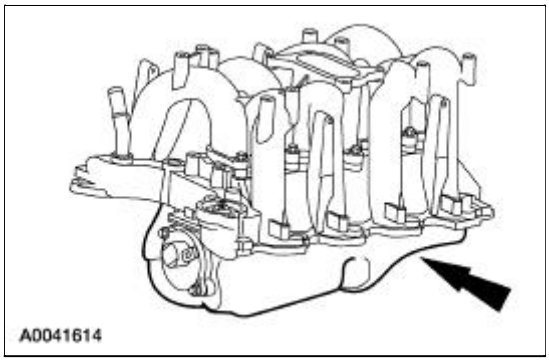


10. Allow the intake manifolds to dry completely.

Assembly

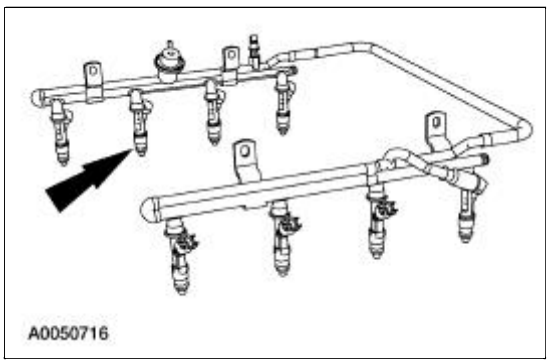


1. Position the intake manifold turning valve. Install the bolts.

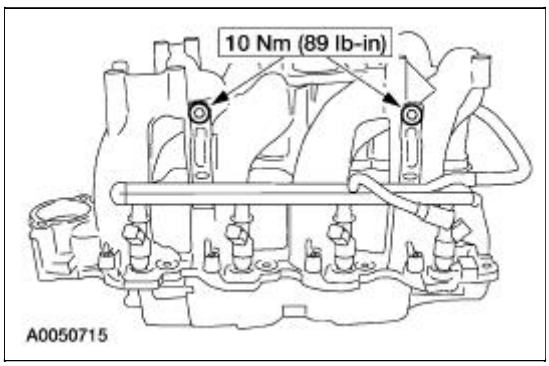


2. Position a new lower intake manifold gasket, and the upper intake manifold, on the lower intake manifold. Loosely install the bolts.

3. Tighten the bolts in two stages in the sequence shown.
    - Stage 1: tighten to 2 Nm (18 lb-in).
    - Stage 2: tighten to 10 Nm (89 lb-in).



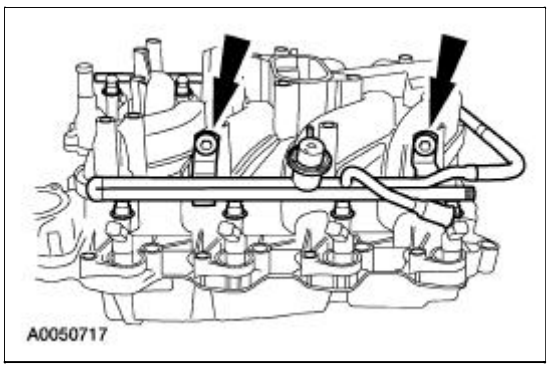
4. Install the engine noise shield.



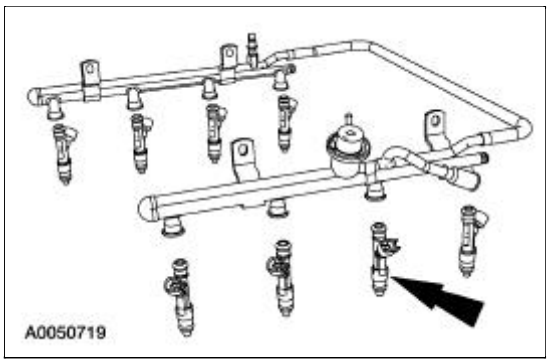
5. **NOTE:** Lubricate the O-ring seals with clean engine oil, to aid installation.

   Install the eight fuel injectors into the fuel injection supply manifold.

6. Position the fuel injection supply manifold. Install the four bolts.

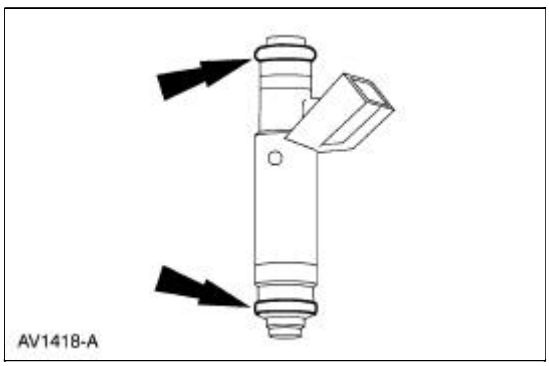


7. Position the EGR vacuum regulator solenoid bracket. Install the bolts.

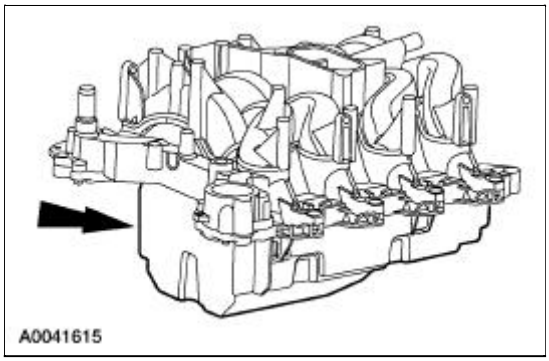


Intake Manifold Assembly —5.4L

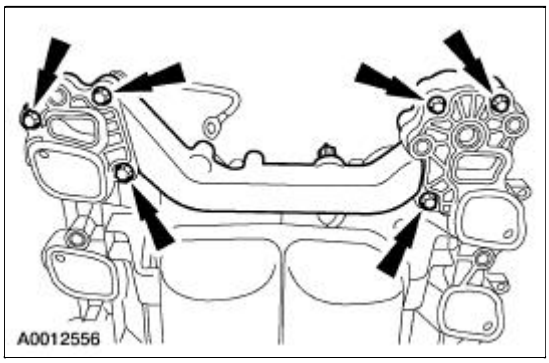
Disassembly



1. Remove the four bolts and the fuel injection supply manifold.



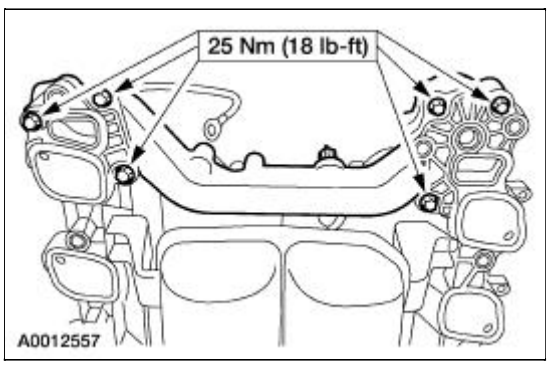
2. Remove the eight fuel injectors from the fuel injection supply manifold.



3. Inspect the two O-ring seals from each fuel injector. Install new O-ring seals as needed.

4. Remove the engine noise shield.

5. Remove the bolts and the water crossover tube.
    - Inspect and install new gaskets as necessary.

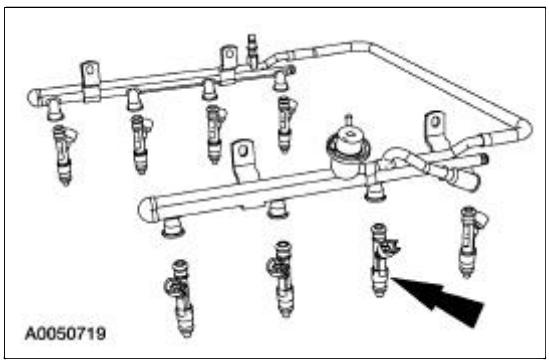


6. **CAUTION: If the engine has been internally damaged and metal or other foreign material has entered the manifold, it is recommended that the manifold be discarded.**

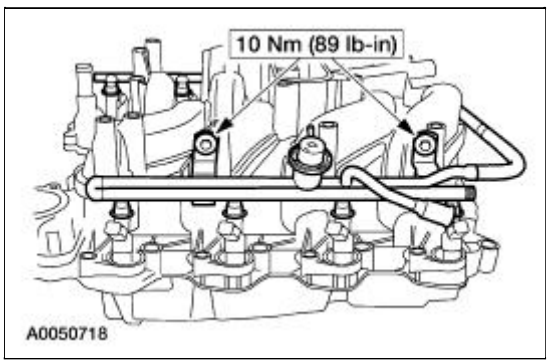
    Inspect all external and internal surfaces of the intake manifold.
    - Inspect for cracks or other damage.
    - Inspect for foreign material inside of the manifold.
    - Clean the intake manifold with a suitable cleaner.

Assembly

1. Position the water crossover tube. Install the bolts.

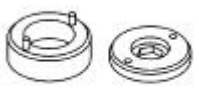


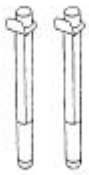
2. Install the engine noise shield.

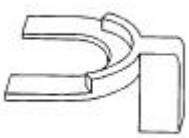


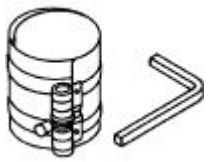
3. **NOTE:** Lubricate the O-ring seals with clean engine oil, to aid installation.

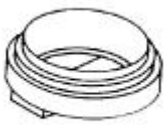
   Install the eight fuel injectors into the fuel injection supply manifold.











4. Position the fuel injection supply manifold. Install the four bolts.

Engine

Special Tool(s)

 ST2565-A	Alignment Set, Camshaft 303-S568 (T96T-6256-AR)
 ST1337-A	Installer, Connecting Rod 303-442 (T93P-6136-A)
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST2197-A	Installer, Crankshaft Front Oil Seal 303-635
 ST1328-A	Installer, Front Cover Oil Seal 303-335 (T88T-6701-A)
 ST1330-A	Compressor, Valve Spring 303-567 (T97P-6565-AH)

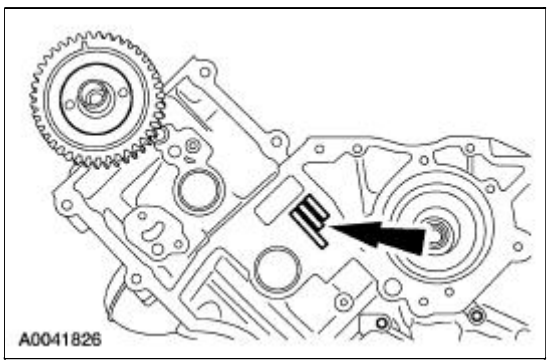
Material

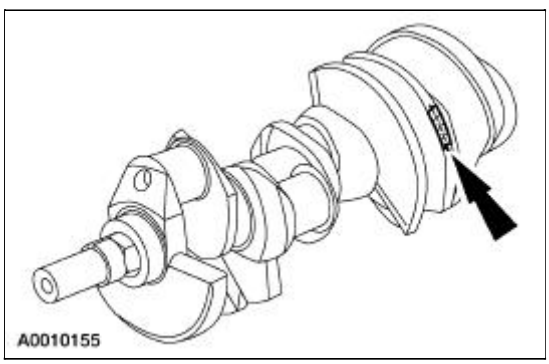
Item	Specification
Motorcraft Silicone Gasket Remover ZC-30	—
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket and Sealant	



F7AZ-19554-EA or equivalent	WSE-M4G323-A4
Instant Adhesive E8AZ-19554-A	WSK-M2G402-A4
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H
Motorcraft Premium Engine Coolant VC-4-A (in Canada CXC-10; in Oregon VC-5) or equivalent. Do not mix coolant types.	ESE-M97B44-A (Green in color)
Motorcraft Premium Gold Engine Coolant VC-7-A (in Oregon VC-7-B) or equivalent. Do not mix coolant types.	WSS-M97B51-A1 (Yellow in color)
Hydraulic Chain Tensioner Retaining Clip	1L3Z-6P250-AA

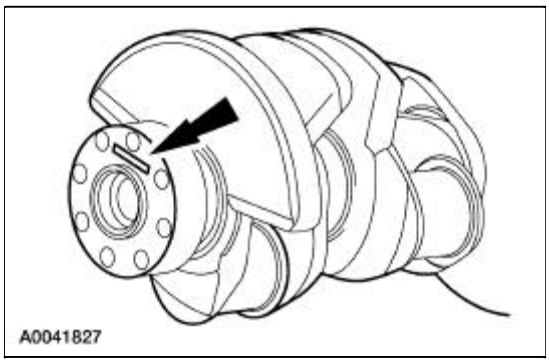
Assembly

All engines



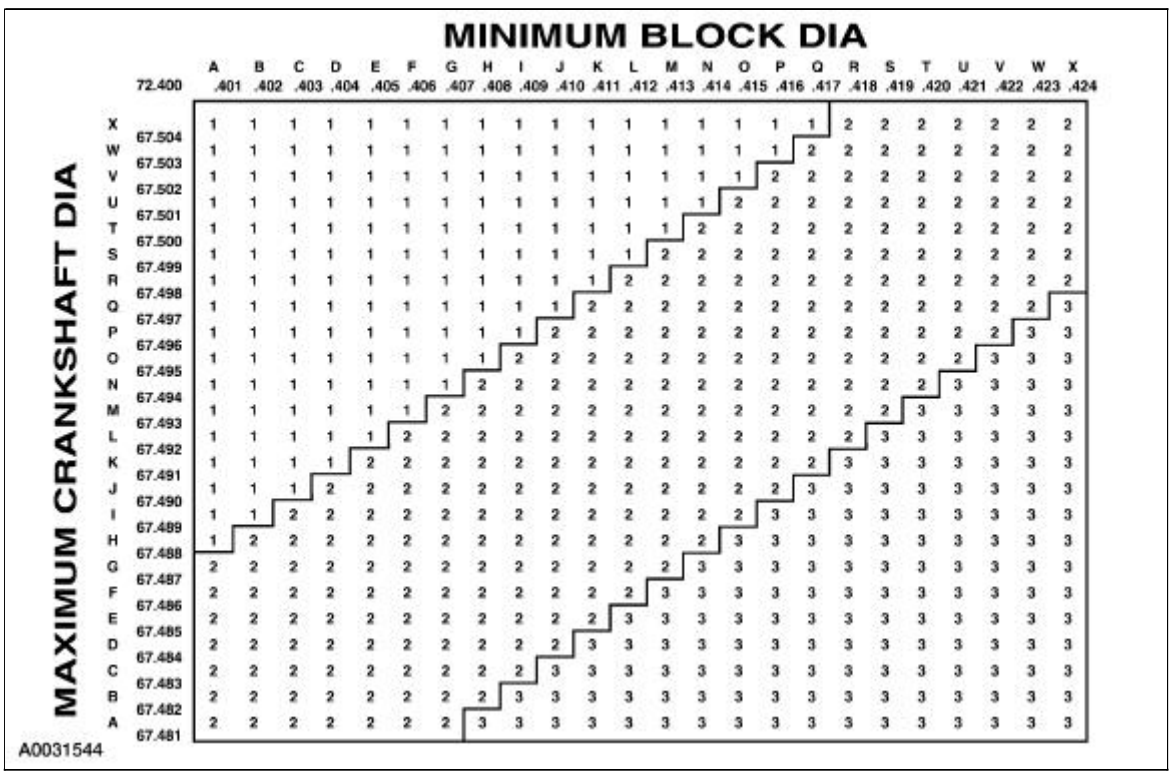
NOTE: During engine assembly it may become necessary to check bearing clearances, end play, etc. For additional information, refer to Section 303-00 .

1. Record the main bearing code found on the front of the engine block.



Romeo engine (4.6L)

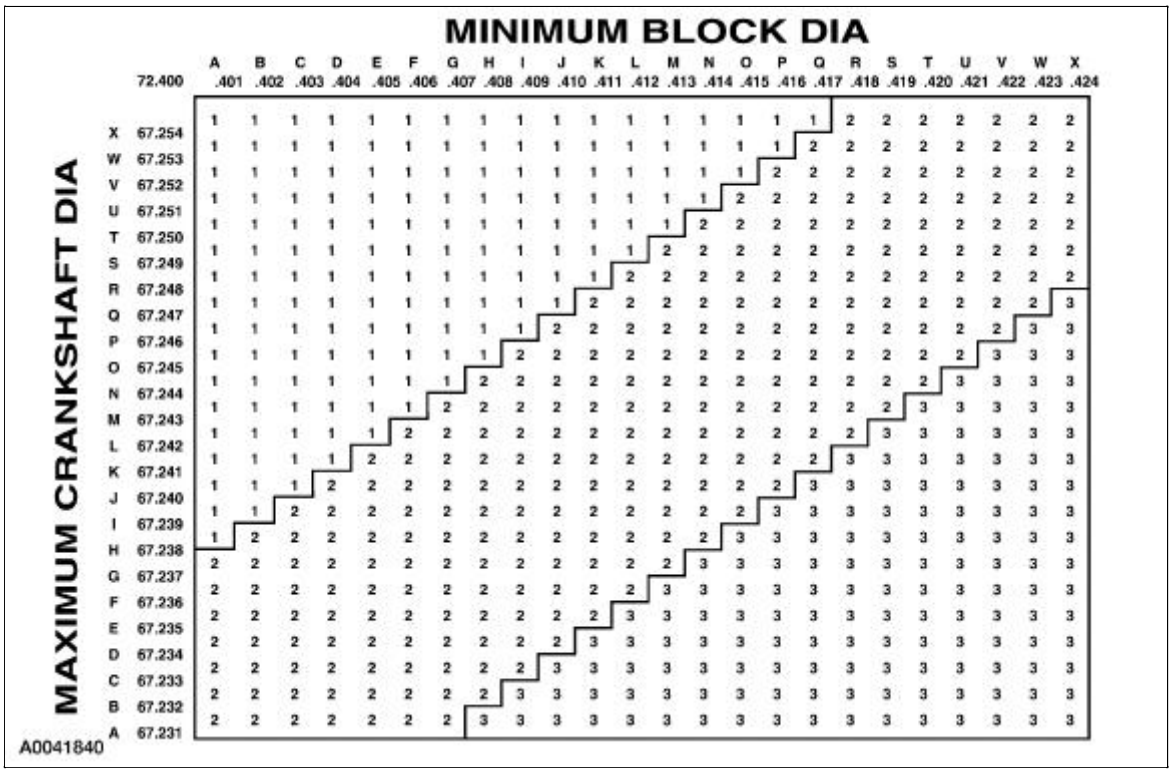
2. Record the main bearing code found on the crankshaft counterweight.



Windsor engine (5.4L)

3. Record the main bearing code found on the back of the crankshaft.

Bearing Select Fit Chart, Standard Bearings, All Engines



4. Using the data recorded earlier and the Bearing Select Fit Chart, Standard Bearings determine the required bearing grade for each main bearing.
    - Read the first letter of the engine block main bearing code and the first letter of the crankshaft main bearing code.
    - Read down the column below the engine block main bearing code letter, and across the row next to the crankshaft main bearing code letter, until the two intersect. This is the required bearing grade for the number one crankshaft main bearing.
    - As an example, if the engine block code letter is "F" and the crankshaft code letter is "D", the correct bearing grade for this main bearing is a "2".
    - Repeat this process for the remaining four main bearings.

Bearing Select Fit Chart, Oversize Bearings, All Engines

5. If oversize bearings are being used, use the procedure in the previous step and the Bearing

Select Fit Chart, Oversize Bearings to determine the required bearing grade for each main bearing.

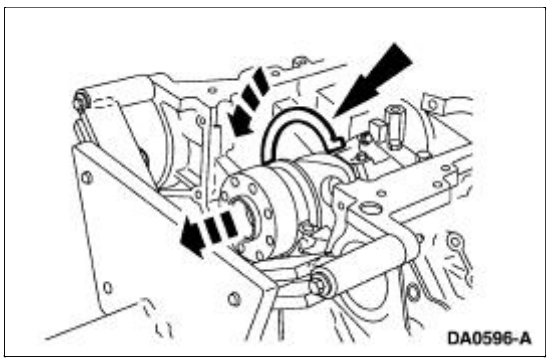
All engines

6. **NOTE:** Before assembling the cylinder block, all sealing surfaces must be free of chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

   Install the crankshaft main bearings.

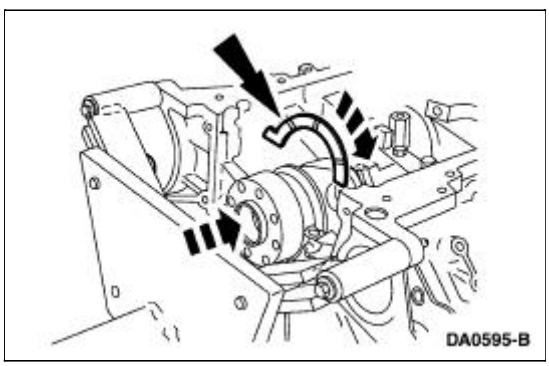
   - Install the crankshaft upper main bearings into the cylinder block.
   - Install the crankshaft lower main bearings into the bearing caps.
   - Make sure all oil passages are aligned.
   - Lubricate all main bearings with clean engine oil.

Windsor engine (5.4L)



7. **NOTE:** The upper thrust washers are shown for location purposes only. Do not install the upper thrust washers until the crankshaft is installed. Refer to the following two steps.

   Lubricate the crankshaft bearing journals with clean engine oil. Install the crankshaft onto the upper crankshaft main bearings.

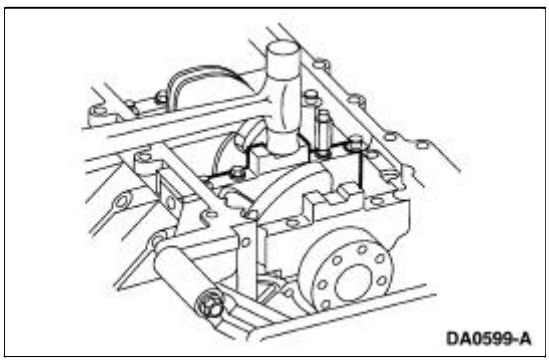


8. **NOTE:** The oil groove on the thrust washer must face toward the front of the engine (against the crankshaft thrust surface).

   Push the crankshaft rearward and install the rear crankshaft upper thrust washer at the back of the No. 5 main boss.

9. **NOTE:** The oil groove on the thrust washer must face toward the front of the engine (against the crankshaft surface).

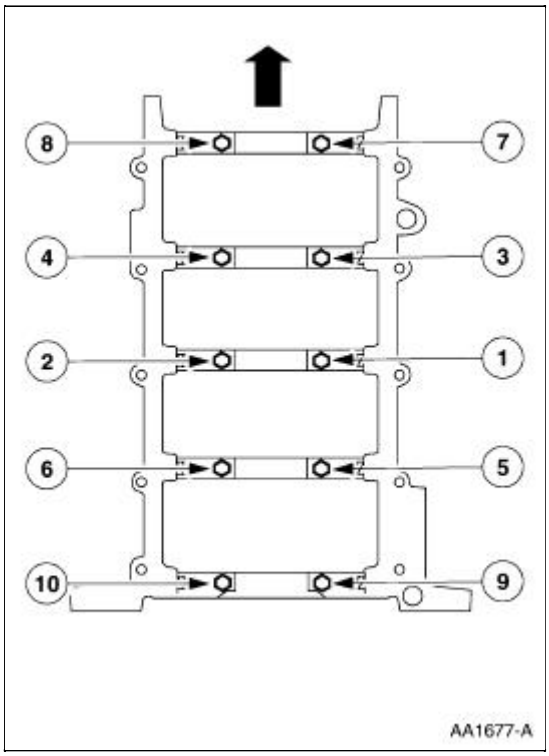
   Push the crankshaft forward and install the front crankshaft upper thrust washer at the front of the No. 5 main boss.



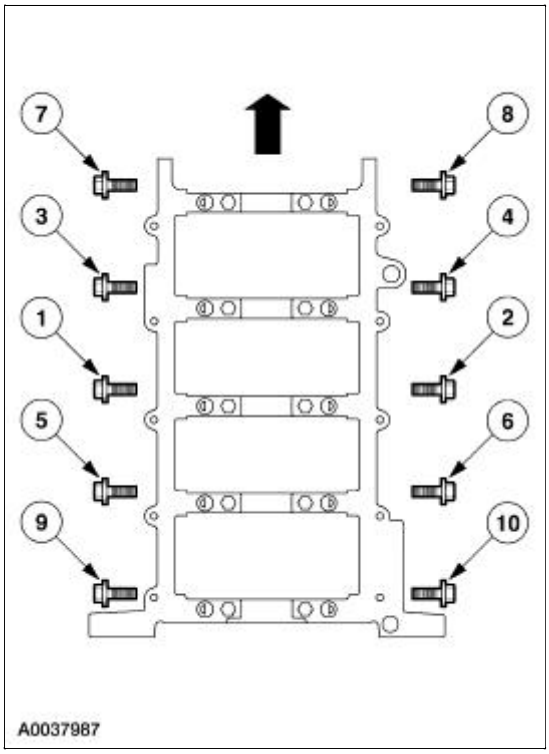
10. **NOTE:** To aid in assembly, apply petroleum jelly to the back of the crankshaft thrust washer.

    NOTE: The oil groove on the thrust washer must face toward the rear of the engine (crankshaft surface).

    Install the lower crankshaft thrust washer to the back side of the rear (No. 5) main bearing cap, with oil grooves facing the crankshaft surface. Install the rear (No. 5) main bearing cap.

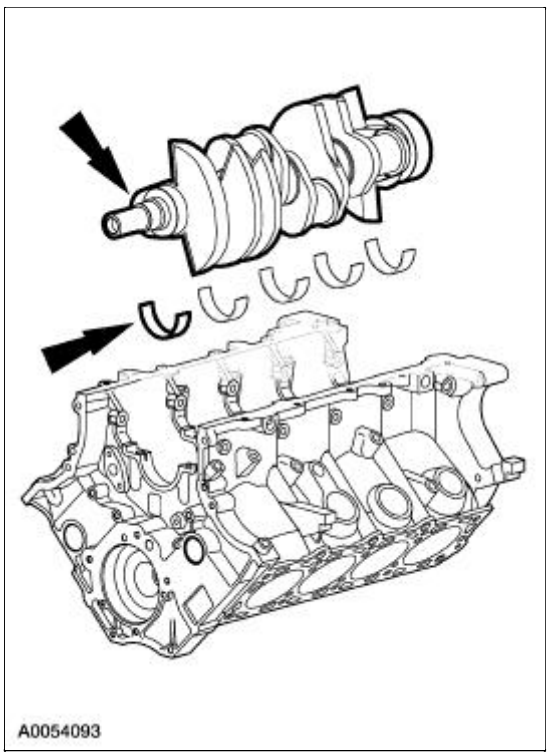


11. Locate the main bearing caps on the cylinder block and tap into place using a plastic or dead-blow hammer.

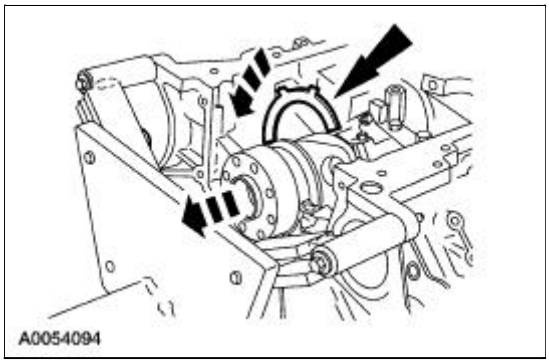


12. Install the dowel pins so the flat sides face the crankshaft, and are parallel to it.

13. Install the vertical main bearing cap fasteners and tighten in the sequence shown, in two stages.
    - Stage 1: tighten to 40 Nm (30 lb-ft).
    - Stage 2: tighten an additional 90 degrees.

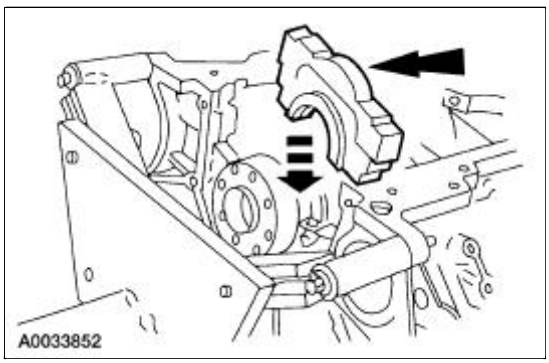


14. Install the side bolts and tighten in the sequence shown, in two stages.
    - Stage 1: tighten to 30 Nm (22 lb-ft).
    - Stage 2: tighten an additional 90 degrees.



Romeo engine (4.6L)

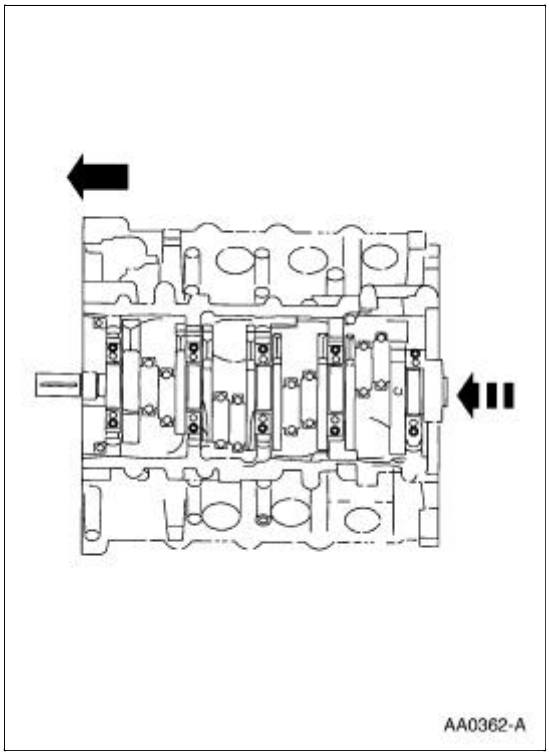
15. Lubricate the crankshaft bearing journals with clean engine oil. Install the crankshaft onto the upper crankshaft main bearings.



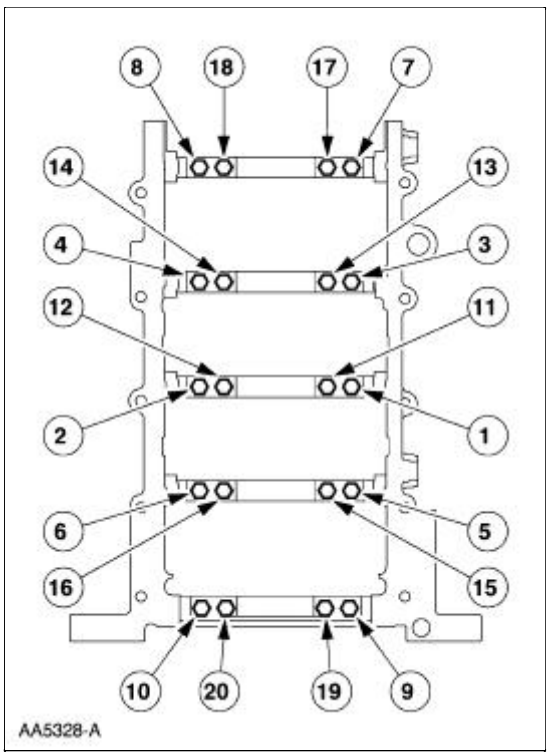
16. **NOTE:** The oil groove on the thrust washer must face toward the front of the engine (against the crankshaft thrust surface).

    Push the crankshaft rearward and install the crankshaft upper thrust washer at the back of the No. 5 upper main bearing.

17. Install the rear (No. 5) main bearing cap.

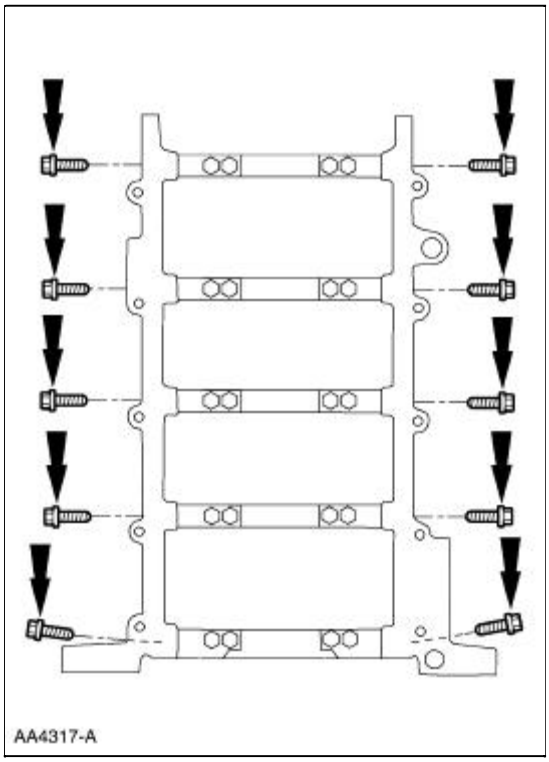


18. Locate the main bearing caps on the cylinder block and tap into place using a plastic or dead-blow hammer.



19. Loosely install all main bearing cap bolts.

20. Push the crankshaft forward to seat the crankshaft thrust washer. Hold the crankshaft in the forward position.



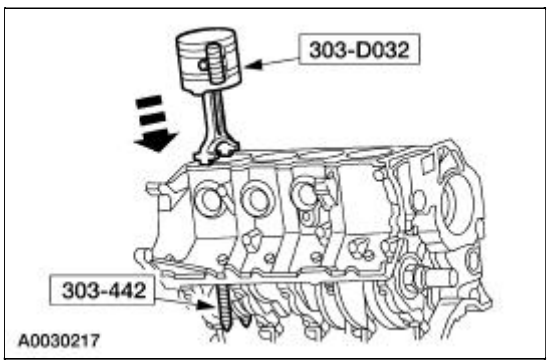
21. Tighten the vertical main bearing cap fasteners in the sequence shown, in four stages.
    - Stage 1: tighten to 10 Nm (89 lb-in).
    - Stage 2: tighten to 25 Nm (18 lb-ft).
    - Stage 3: tighten to 40 Nm (30 lb-ft).
    - Stage 4: tighten an additional 90 degrees.

22. Tighten the side bolts in the sequence shown, in two stages.
    - Stage 1: tighten to 40 Nm (30 lb-ft).

- Stage 2: tighten an additional 90 degrees.

All engines

23. Check the crankshaft end play. For additional information, refer to Section 303-00 .



24. Check that crankshaft torque-to-turn does not exceed 6 Nm (53 lb-in).

25. **CAUTION: Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

    NOTE: The next three steps are for all eight connecting rods, rod caps and pistons. Only one connecting rod, rod cap and piston is shown.

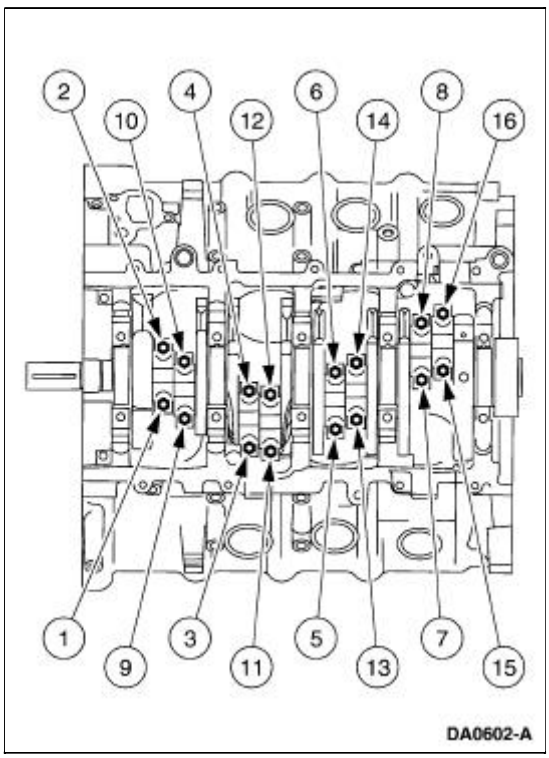
    NOTE: Make sure the identification marks on the piston and connecting rod face the front of the engine.

    Use the special tools to install the piston and connecting rod with the upper connecting rod bearing in place.

26. **CAUTION: Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

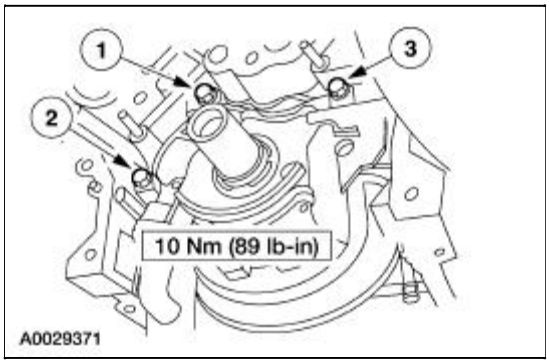
Once the connecting rod is seated on the crankshaft journal, remove the Connecting Rod Installer.

27. **CAUTION: The rod cap installation must keep the same orientation as marked during disassembly.**



NOTE: The connecting rod caps are of the "cracked" design and must mate with the connecting rod ends. Excessive bearing clearance will result if not mated correctly.

Position the lower bearing and connecting rod, and install the new bolts loosely.

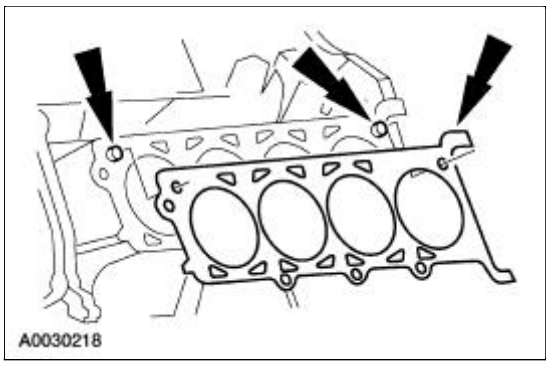


28. **NOTE:** Main bearing caps are removed for clarity.

Tighten the bolts in the sequence shown, in two stages.

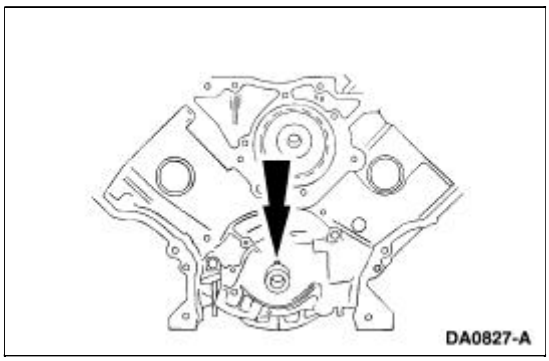
- Stage 1: tighten to 43 Nm (32 lb-ft).
- Stage 2: tighten an additional 90-120 degrees.

29. Position the oil pump and install the bolts loosely. Tighten the bolts in the sequence shown.



30. **CAUTION: Make sure all coolant residue and foreign material are cleaned from the block surface and cylinder bore.**

CAUTION: The use of sealing aids (aviation cement, copper spray and glue) is not permitted. The gasket must be installed dry.



CAUTION: The new gasket has a film coating which is crucial to the gasket's ability to seal correctly. Do not scratch the gasket.

NOTE: RH is shown; LH is similar.

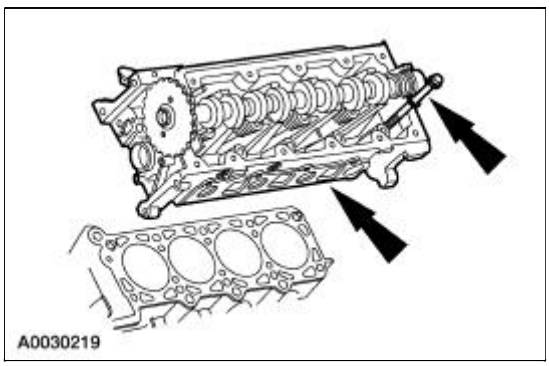
Position the head gasket over the dowel pins.

31. Rotate the crankshaft until the crankshaft keyway points toward the top of the engine (12 o'clock).

32. **CAUTION: The cylinder head bolts must be discarded and new bolts installed. They**

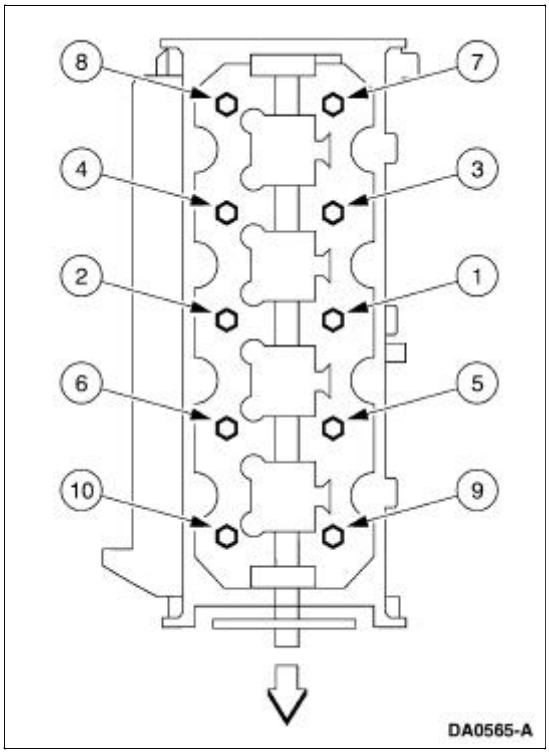
are tighten-to-yield designed and cannot be reused.

CAUTION: Cylinder head machining or milling is not authorized by the Ford Motor Company. Cylinder head flatness must be within 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area.



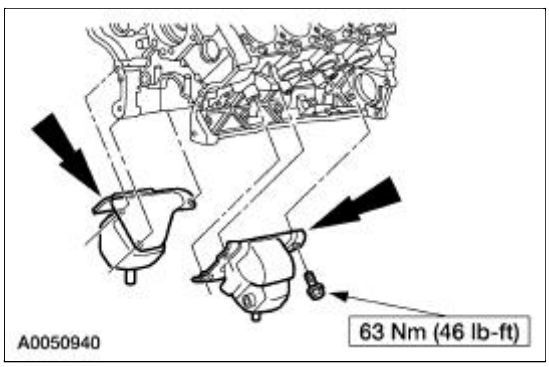
CAUTION: The use of sealing aids (aviation cement, copper spray, and glue) is not permitted. The gasket must be installed dry.

CAUTION: Do not allow the dowels to scratch the sealing surface of the cylinder head during cylinder head installation.

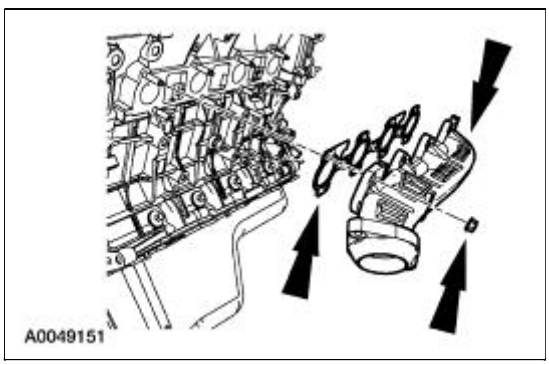


NOTE: The new cylinder head bolts must be lightly oiled with a rag, and allowed to drain for a few minutes prior to installation.

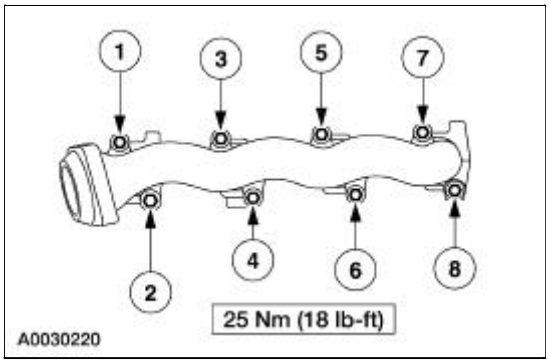
NOTE: RH is shown; LH is similar.



Position the cylinder head over the dowels and head gasket and install the new cylinder head bolts loosely.

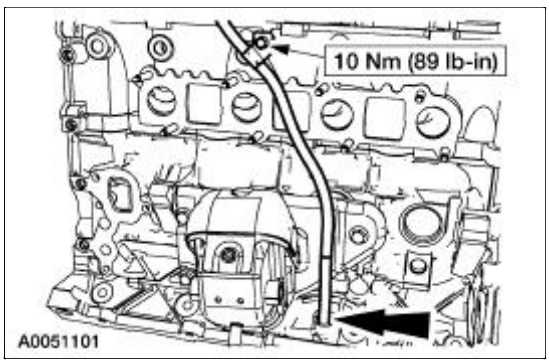


33. Tighten the bolts in the sequence shown, in three stages.
RH is shown; LH is similar.
    - Stage 1: tighten to 40 Nm (30 lb-ft).
    - Stage 2: tighten an additional 90 degrees.
    - Stage 3: tighten an additional 90 degrees.

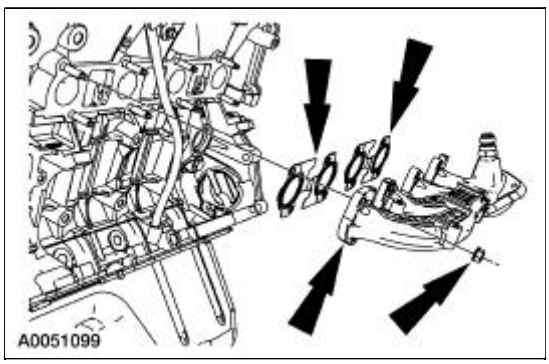


34. Position the engine mounts and install the six bolts.

35. Position the RH exhaust manifold gasket and the exhaust manifold. Loosely install the nuts.



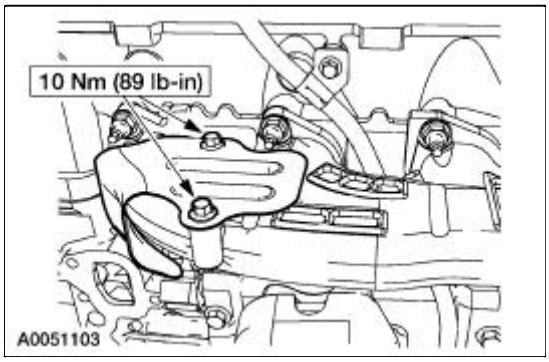
36. Tighten the RH exhaust manifold nuts in the sequence shown.



37. **NOTE:** Lubricate the O-ring seal with clean engine oil.

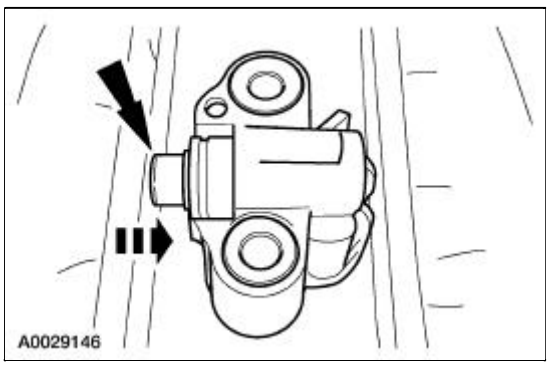
    Install the oil level indicator tube.

    - Install a new O-ring seal on the oil level indicator tube.
    - Install the oil level indicator tube.
    - Install the bolt.

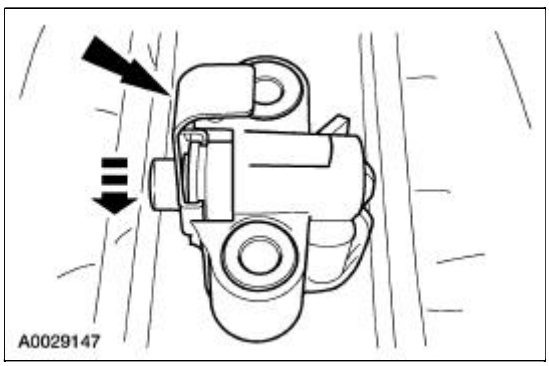


38. Position the LH exhaust manifold gaskets and the exhaust manifold. Loosely install the nuts.

39. Tighten the LH exhaust manifold nuts in the sequence shown.

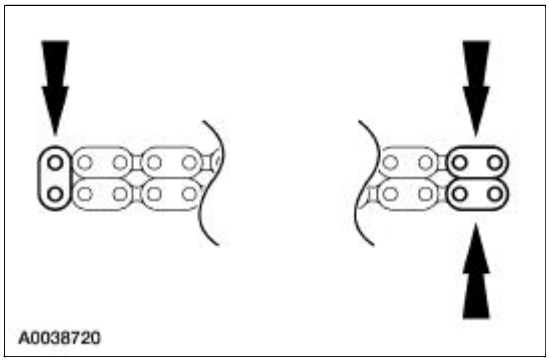


40. Install the heat shield and bolts.

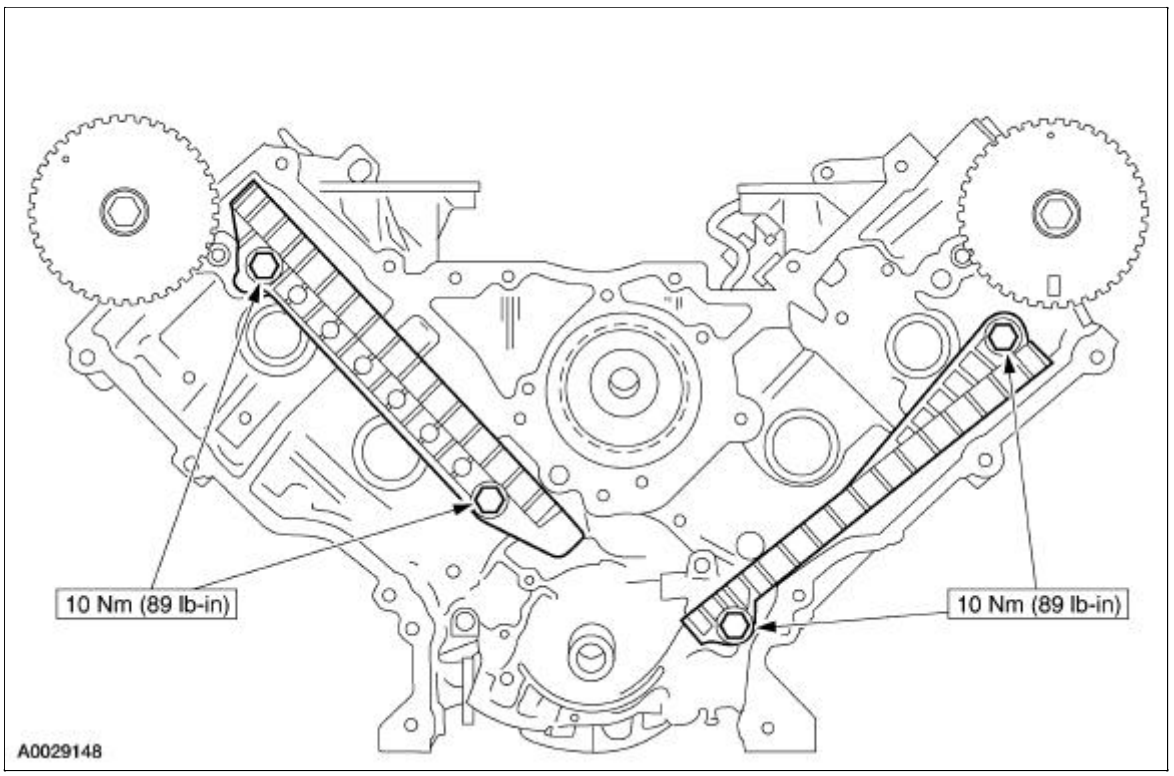


41. **CAUTION: Timing chain procedures must be followed exactly or damage to valves and pistons will result.**

    Compress the tensioner plunger, using a vise.



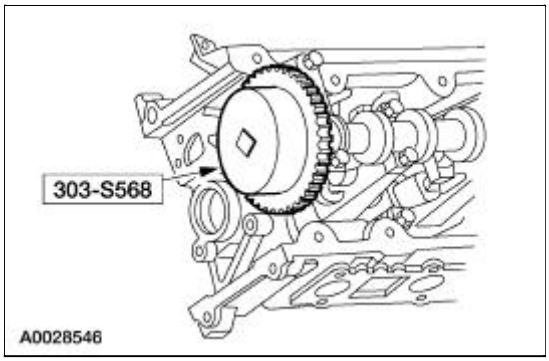
42. Install a retaining clip on the tensioner to hold the plunger in during installation.



43. Remove the tensioner from the vise.

Windsor engine (5.4L)

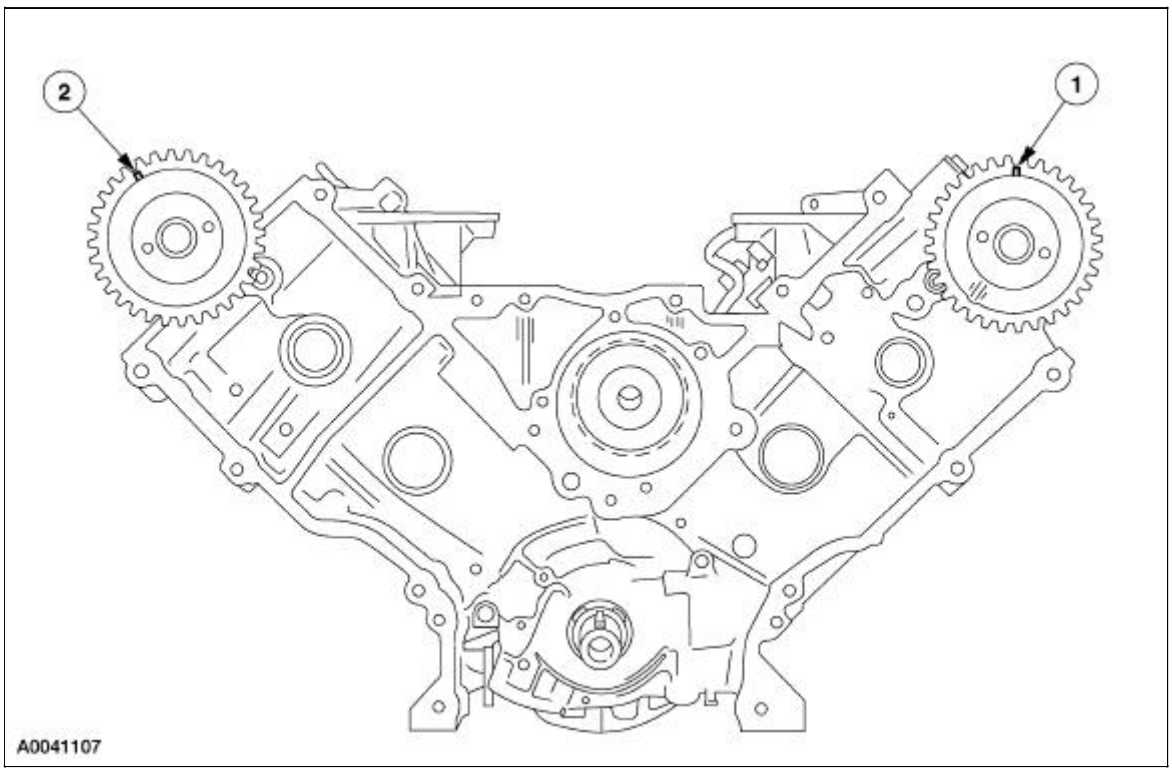
44. If the copper links are not visible, mark two links on one end and one link on the other end, and use as timing marks.



45. Install the timing chain guides.

46. **CAUTION: Do not turn the engine over with the Camshaft Positioning Tool or damage to the camshaft sprocket or the bolt can occur.**

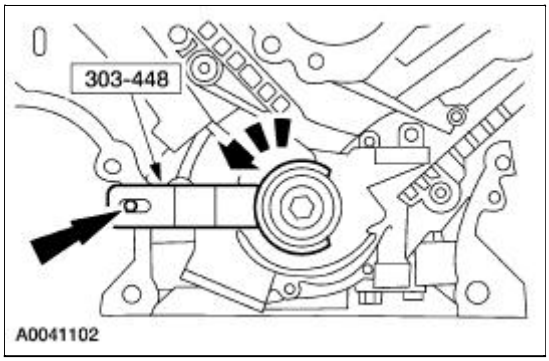
Install the special tool.



47. **NOTE:** Slightly loosen the Camshaft Holding Tool to allow slight camshaft movement.

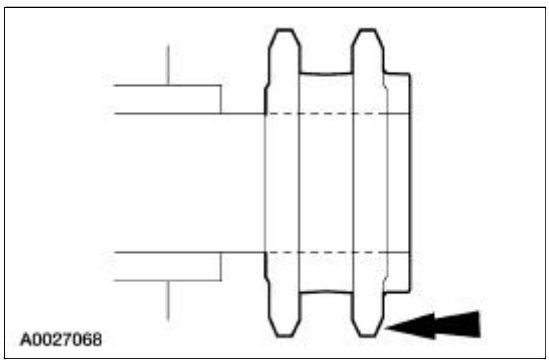
Pre-position the camshafts.

1. Rotate the LH camshaft with the Camshaft Positioning Tool until the timing mark is approximately at 12 o'clock.
2. Rotate the RH camshaft with the Camshaft Positioning Tool until the timing mark is approximately at 11 o'clock.



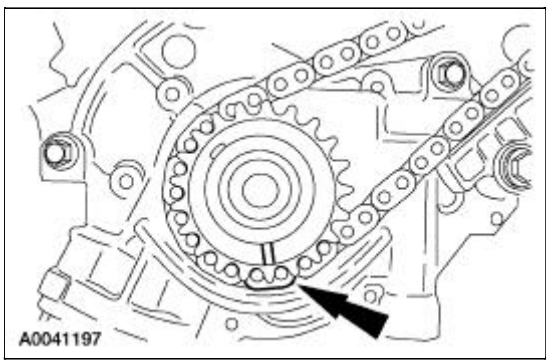
- Tighten the Camshaft Holding Tool to maintain camshaft pre-positioning.

48. **CAUTION: Rotate the crankshaft counterclockwise only. Do not rotate past position shown or severe piston and valve damage can occur.**



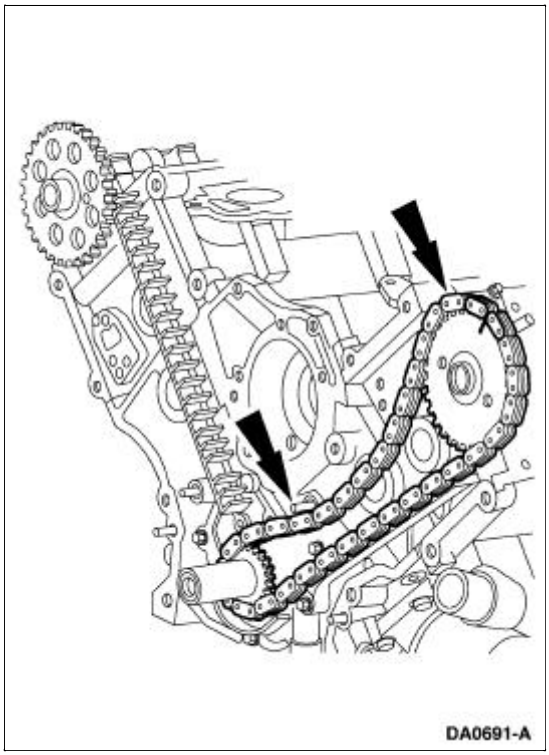
NOTE: When the stud on the engine block fits into the slot in the handle of the special tool, the number one piston is at top dead center (TDC).

Position the crankshaft so the number one cylinder is at TDC with the special tool.



49. Remove the special tool.

50. Install the crankshaft sprocket, making sure the flange faces forward.

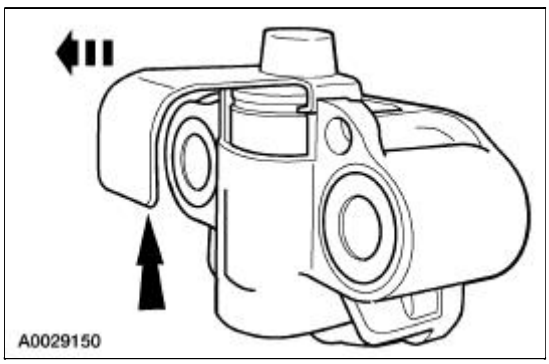


51. Position the lower end of the LH (inner) timing chain on the crankshaft sprocket, aligning the timing mark on the outer flange of the crankshaft sprocket with the single copper (marked) chain link.

52. **NOTE:** Make sure the upper half of the timing chain is below the tensioner arm dowel.

    NOTE: If necessary, use the Camshaft Positioning Tool to adjust the camshaft sprocket slightly to obtain timing mark alignment.

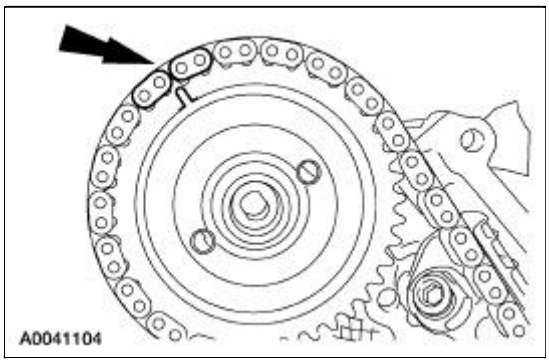
    Position the LH timing chain on the camshaft sprocket. Make sure the camshaft sprocket timing mark is positioned between the two copper (marked) chain links.



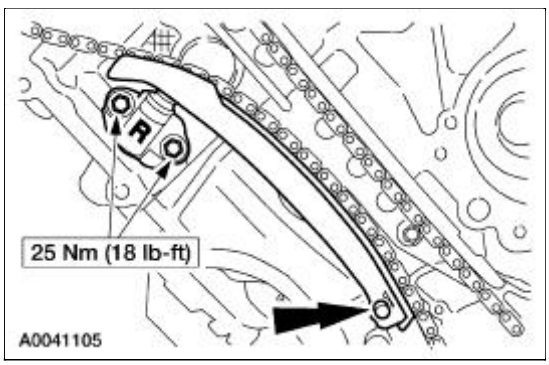
53. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole for identification.

    Position the LH timing chain tensioner arm on the dowel pin and install the LH timing chain tensioner.

54. Remove the retaining clip from the LH timing chain tensioner.



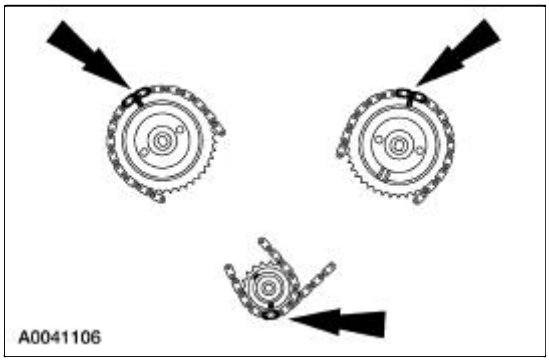
55. Position the lower end of the RH (outer) timing chain on the crankshaft sprocket, aligning the timing mark on the sprocket with the single copper (marked) chain link.



56. **NOTE:** The lower half of the timing chain must be positioned above the tensioner arm dowel.

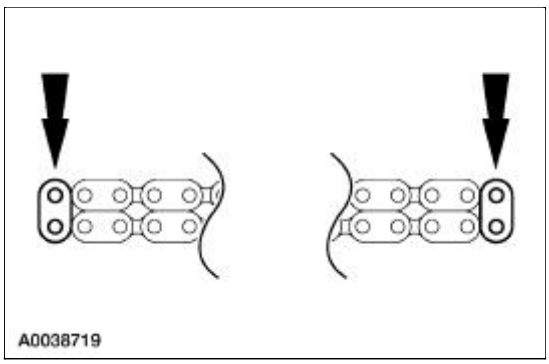
    NOTE: If necessary, use the Camshaft Positioning Tool to adjust the camshaft sprocket slightly to obtain timing mark alignment.

    Position the RH timing chain on the camshaft sprocket. Make sure the camshaft sprocket timing mark is positioned between the two copper (marked) chain links.

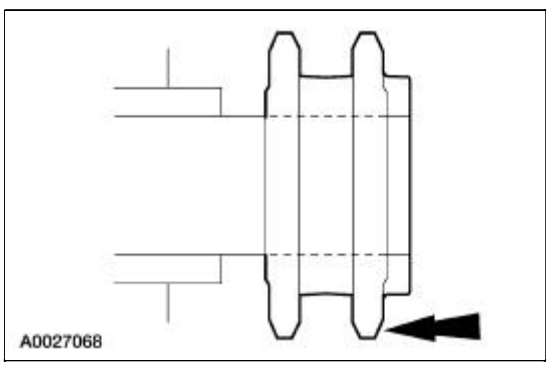


57. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner.

58. Remove the retaining clip from the RH timing chain tensioner.

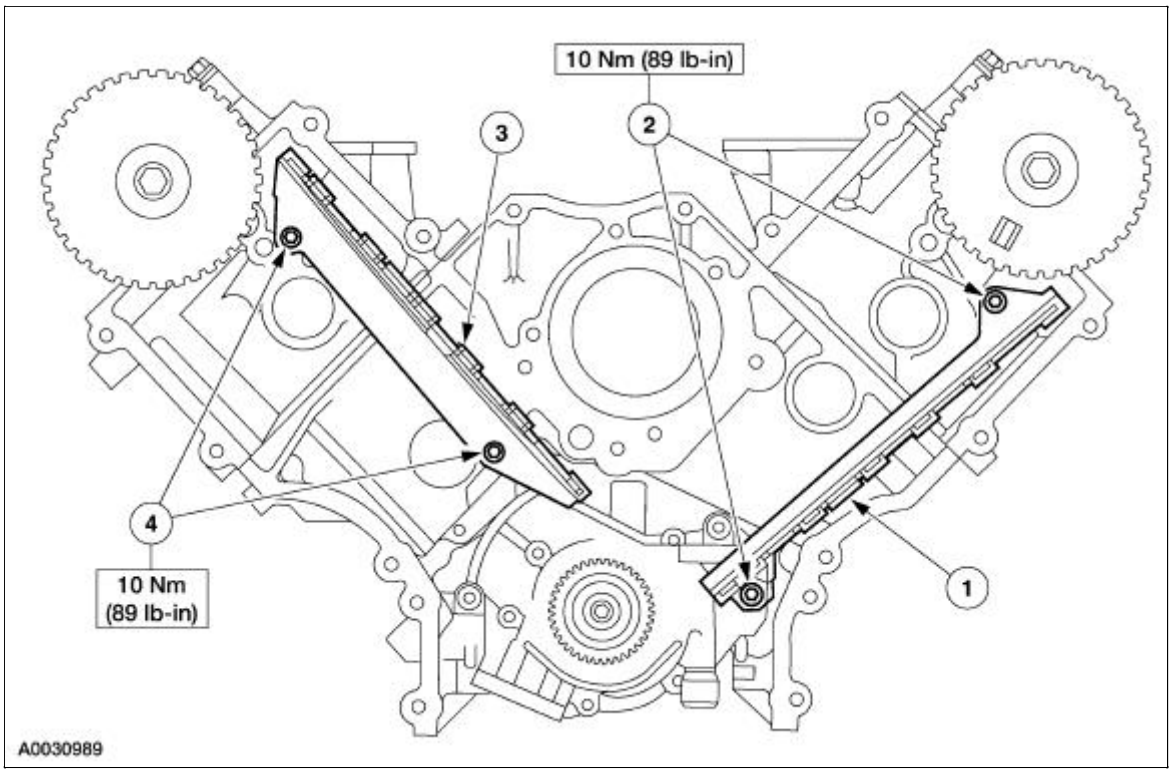


59. As a post-check, verify correct alignment of all timing marks.

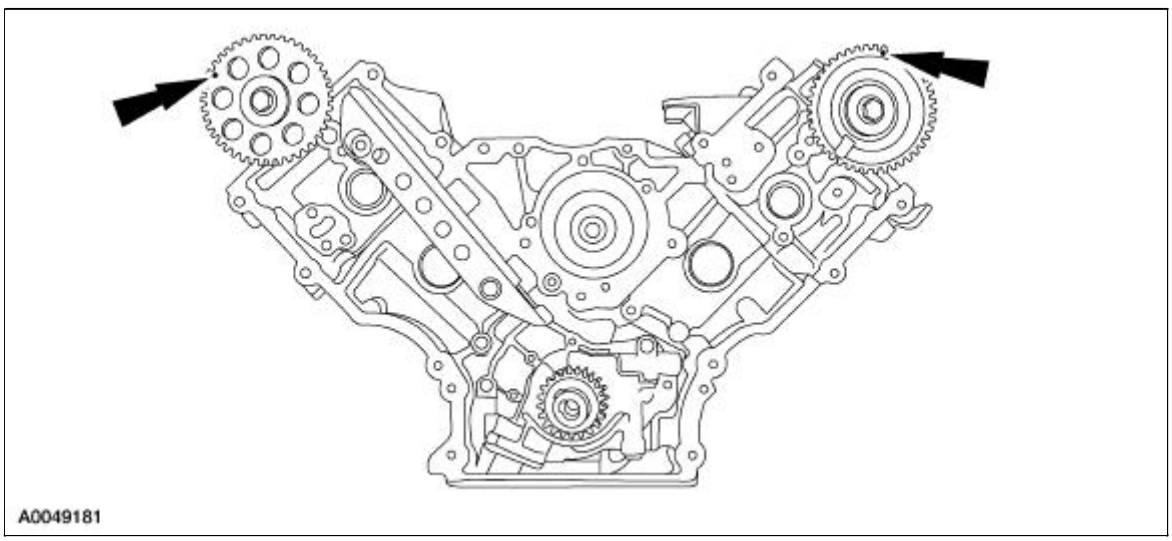


Romeo engine (4.6L)

60. If the copper links are not visible, mark one link on one end and one link on the other end, and use as timing marks.

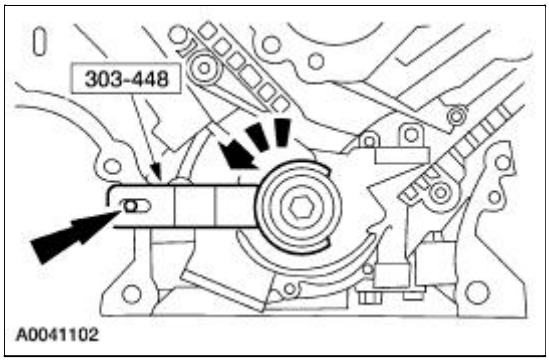


61. Install the crankshaft sprocket, making sure the flange faces forward.



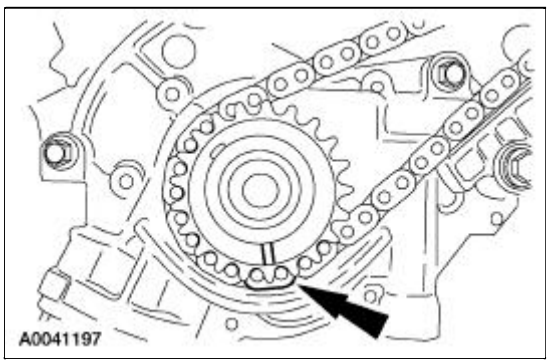
62. Install the timing chain guides.

1. Position the LH timing chain guide.
2. Install and tighten the LH bolts.
3. Position the RH timing chain guide.
4. Install and tighten the RH bolts.



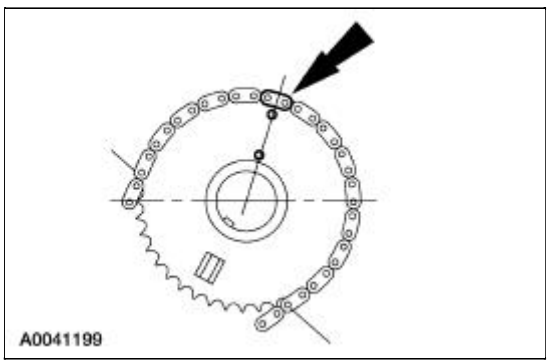
63. Rotate the RH camshaft sprocket until the timing mark is approximately at the 11 o'clock position. Rotate the LH camshaft sprocket until the timing mark is approximately at the 12 o'clock position.

64. **CAUTION: When instructed to do so, rotate the crankshaft counterclockwise only. Do not rotate past the position shown or severe piston and valve damage can occur.**



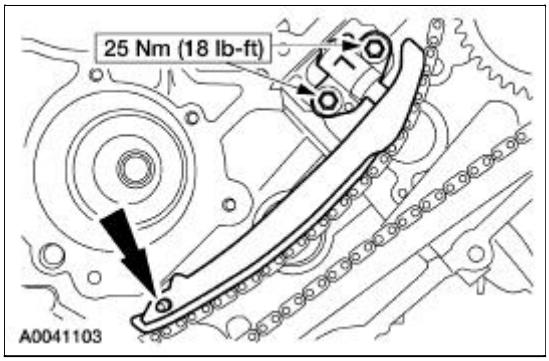
NOTE: When the stud on the engine block fits into the slot in the handle of the special tool, the number one cylinder is at top dead center (TDC).

Using the special tool, position the crankshaft so the number one cylinder is at TDC.

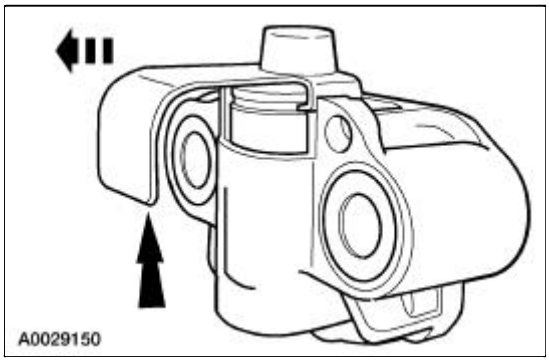


65. Remove the special tool.

66. Position the LH (inner) timing chain on the crankshaft sprocket, aligning the copper (marked) link with the timing mark on the sprocket.

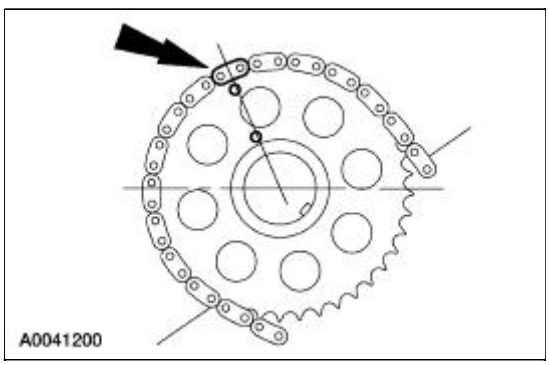


67. Install the LH timing chain on the camshaft sprocket, aligning the copper (marked) link with the timing marks on the sprocket.

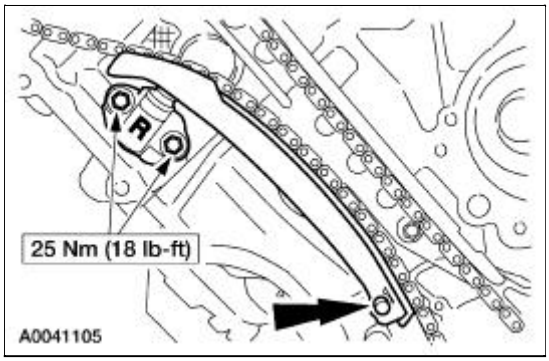


68. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole for identification.

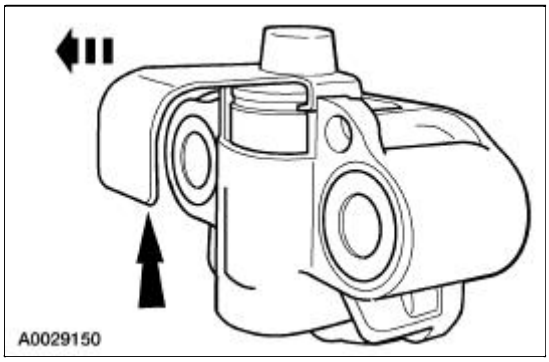
    Position the LH timing chain tensioner arm on the dowel pin and install the LH timing chain tensioner.



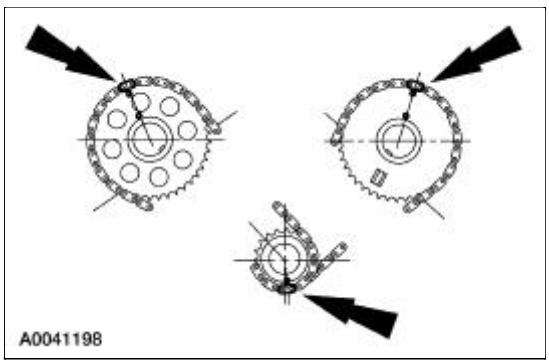
69. Remove the retaining clip from the LH timing chain tensioner.



70. Position the RH (outer) timing chain on the crankshaft sprocket, aligning the copper (marked) link with the timing mark on the sprocket.

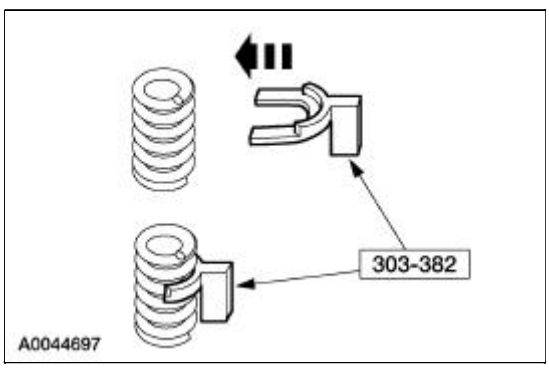


71. Install the RH timing chain on the camshaft sprocket, aligning the copper (marked) link with the timing marks on the sprocket.



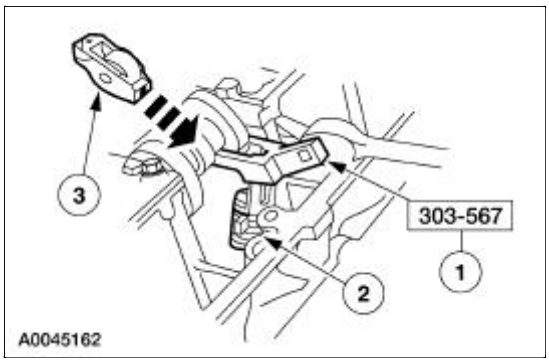
72. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner.

73. Remove the retaining clip from the RH timing chain tensioner.

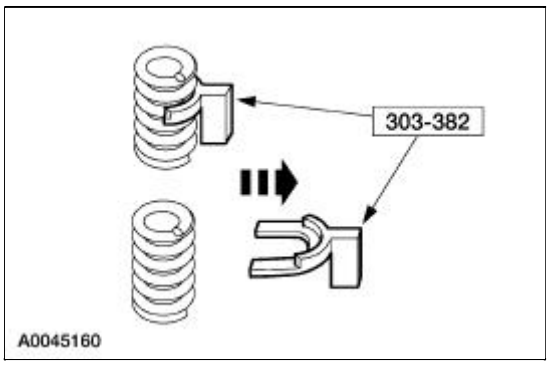


74. Make sure that the copper (marked) chain links are lined up with the dots on the crankshaft sprockets and the camshaft sprocket.

All engines

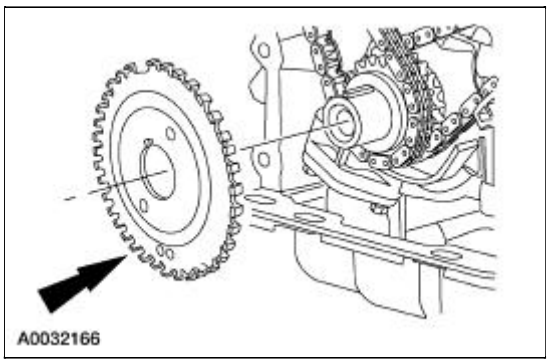


75. Install the special tool between the valve spring coils to prevent valve stem seal damage.

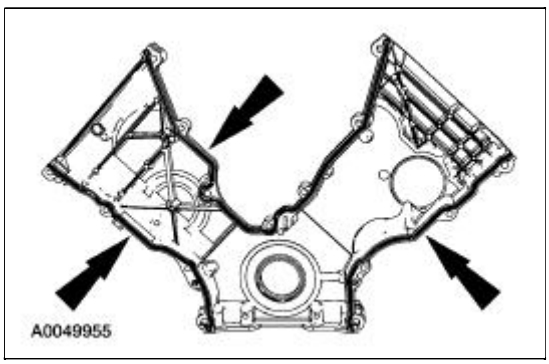


76. **NOTE:** Lubricate the camshaft roller followers using clean engine oil.

Install the camshaft roller followers.

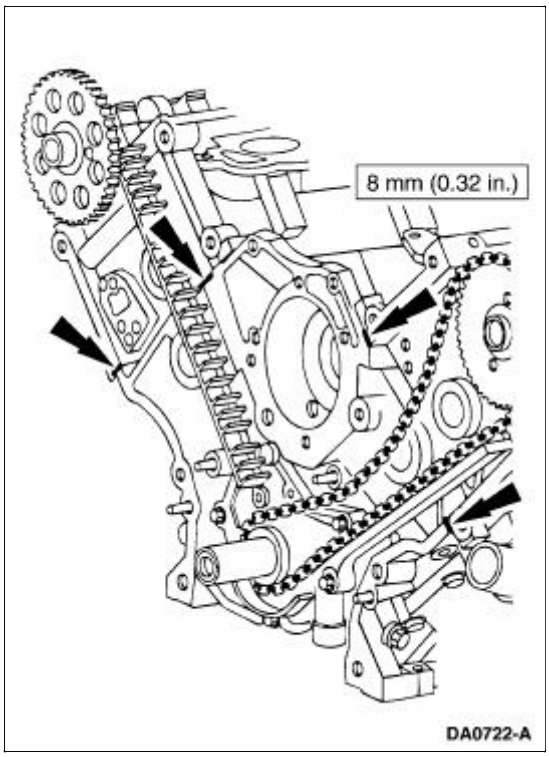


1. Install the special tool.
2. Compress the valve spring.
3. Install the camshaft roller followers in their original locations.

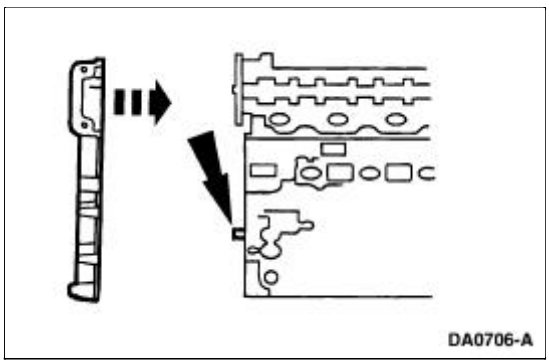


77. Remove the special tool.

78. Install the crankshaft sensor ring on the crankshaft.



79. Install new gaskets on the engine front cover.

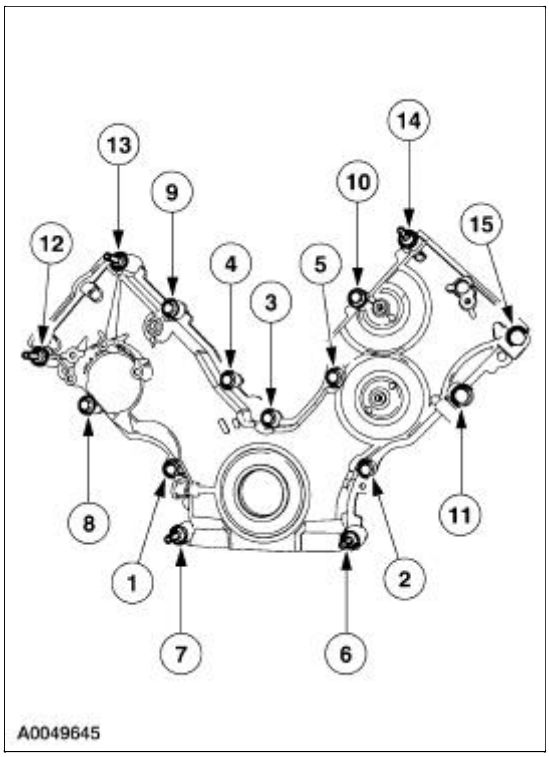


80. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply a bead of silicone gasket and sealant along the cylinder head-to-cylinder block surface at the locations shown.

81. **NOTE:** Make sure that the engine front cover gaskets are in place on the engine front cover before installation.

    Position the engine front cover on the front cover-to-cylinder block dowels. Install the fasteners finger-tight.



Romeo engine (4.6L)

82. Tighten the engine front cover fasteners in the sequence shown to 25 Nm (18 lb-ft).

Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 53

4	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
5	N806177	Bolts, Hex Flange Head Pilot, M8 x 53
6	N808586	Stud, Hex Shldr Pilot, M8 x 1.25 — M6 x 1 x 86.35
7	N808586	Stud, Hex Shldr Pilot, M8 x 1.25 — M6 x 1 x 86.35
8	N808586	Stud, Hex Shldr Pilot, M8 x 1.25 — M6 x 1 x 86.35

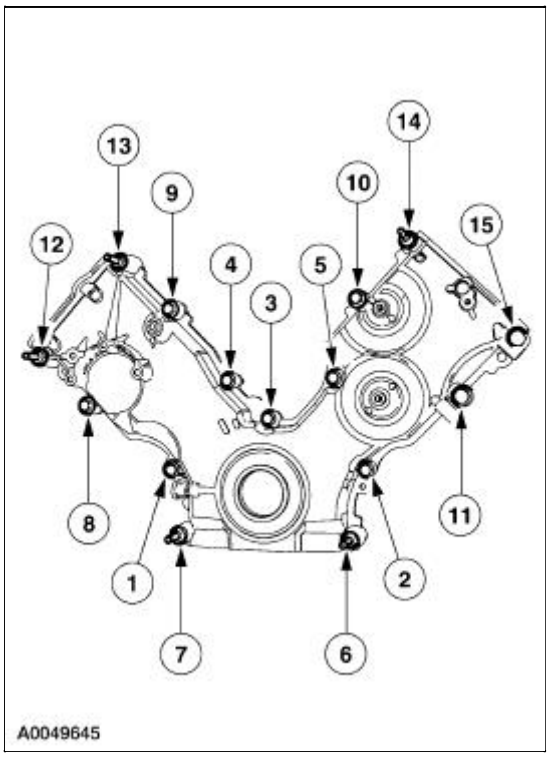
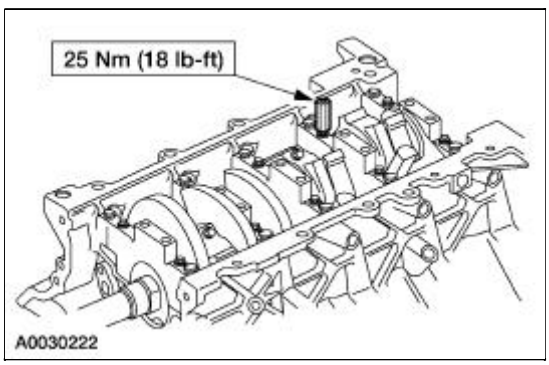
13	N806300	Stud, Hex Shldr Pilot, M8 x 1.25 x 1.25 x 91.1
14	N806300	Stud, Hex Shldr Pilot, M8 x 1.25 x 1.25 x 91.1
15	N806177	Bolt, Hex Flange Head Pilot, M8 x 53



Windsor engine (5.4L)

83. Tighten the engine front cover fasteners in the sequence shown in three stages.
Stage 1: tighten fasteners 1 through 5 to 25 Nm (18 lb-ft).
Stage 2: tighten fasteners 6 and 7 to 48 Nm (35 lb-ft).
Stage 3: tighten fasteners 8 through 15 to 48 Nm (35 lb-ft).



Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
4	N806177	Bolt, Hex Flange Head Pilot, M8 x 53
5	N806177	Bolts, Hex Flange Head Pilot, M8 x 53

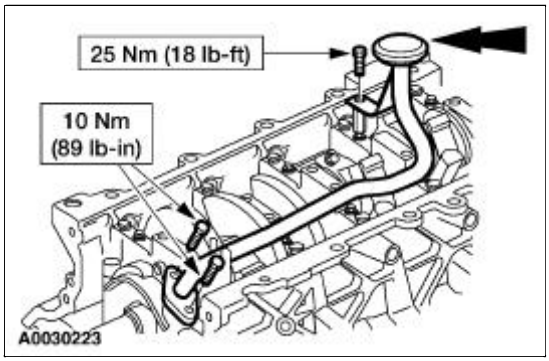
15	W706604	Bolt, Hex Flange Head, M10 x 65

All engines

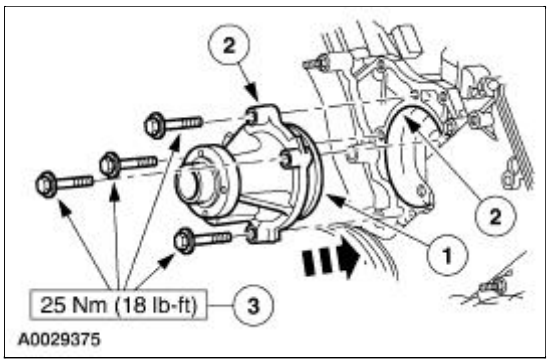
84. Install the oil pump screen and pickup tube spacer.



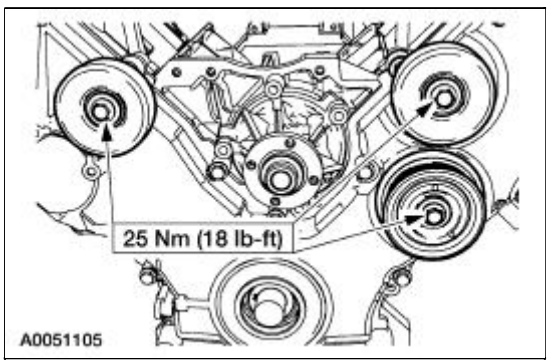
85. **CAUTION: Make sure the O-ring is in place and not damaged. A missing or damaged O-ring can cause foam in the lubrication system, low oil pressure and severe**

engine damage.

NOTE: Clean and inspect the mating surfaces and install a new O-ring. Lubricate with the O-ring with clean engine oil.

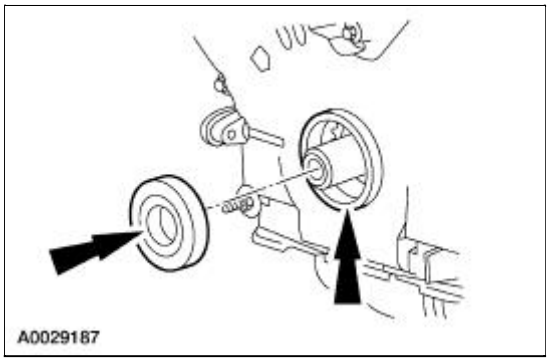


Position the oil pump screen and pickup tube and install the bolts.

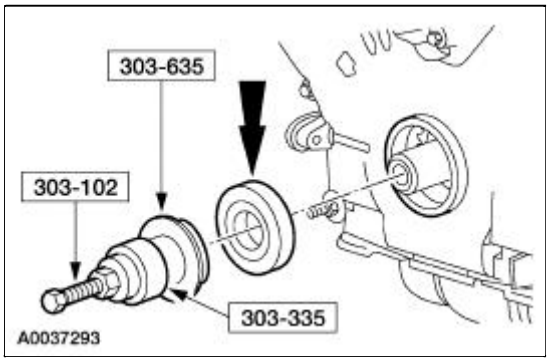


86. **CAUTION: Do not rotate the coolant pump housing once the coolant pump has been positioned in the cylinder block. Damage to the O-ring seal will occur.**

Install the coolant pump.

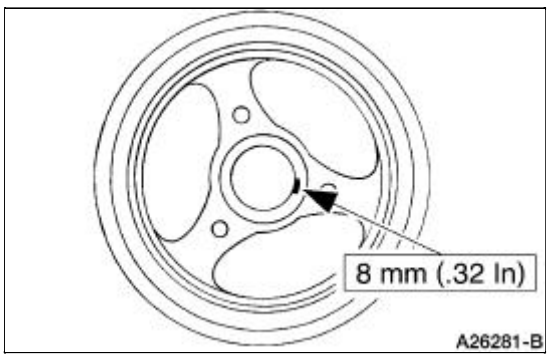


1. Lubricate the new O-ring seal using engine coolant and install the O-ring seal onto the coolant pump.
2. Position the coolant pump into the engine block.
3. Install the bolts.

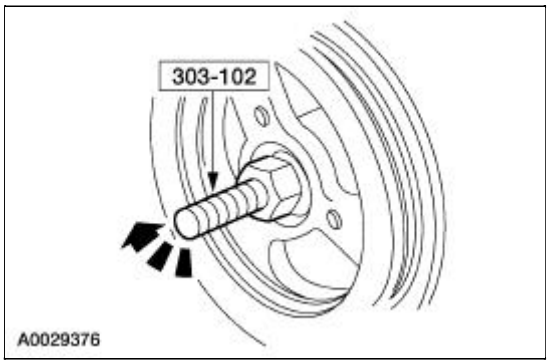


87. Position the belt idler pulleys and install the bolts.

88. Lubricate the engine front cover and the front oil seal inner lip with clean engine oil.

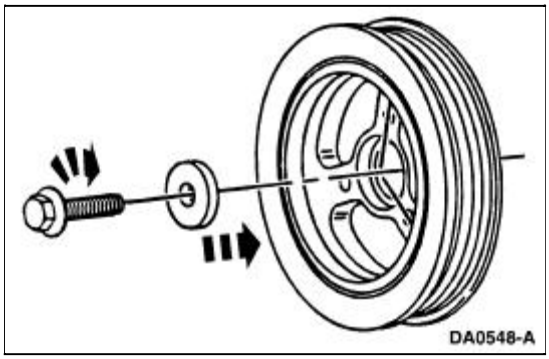


89. Use the special tools to install the crankshaft front oil seal into the engine front cover.

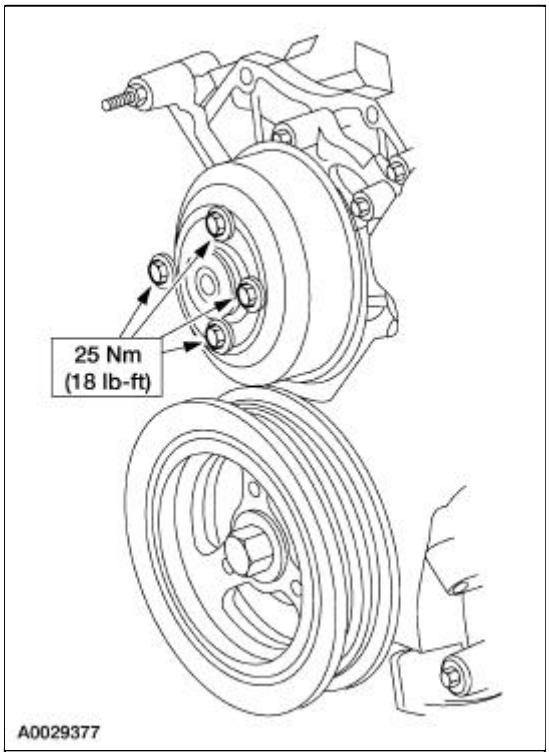


90. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant to the Woodruff key slot on the crankshaft pulley.

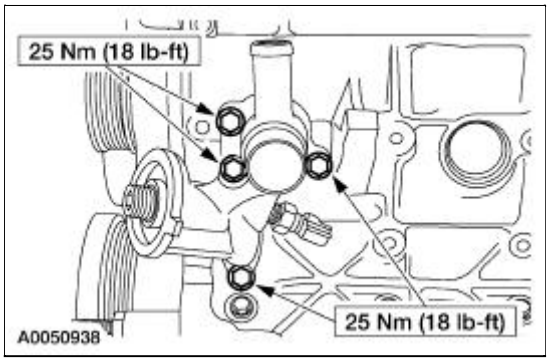


91. Use the special tool to install the crankshaft pulley.

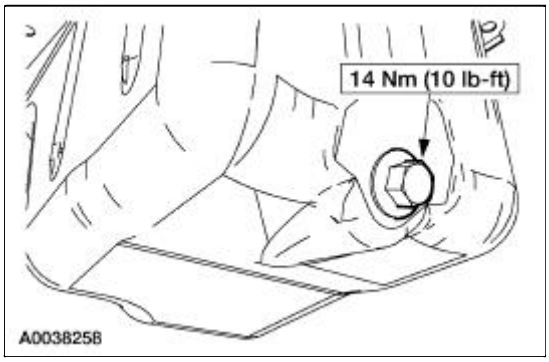


92. Tighten the new crankshaft pulley bolt in four stages.

- Stage 1: tighten to 90 Nm (66 lb-ft).
- Stage 2: loosen 360 degrees.
- Stage 3: tighten to 50 Nm (37 lb-ft).
- Stage 4: tighten an additional 90 degrees.



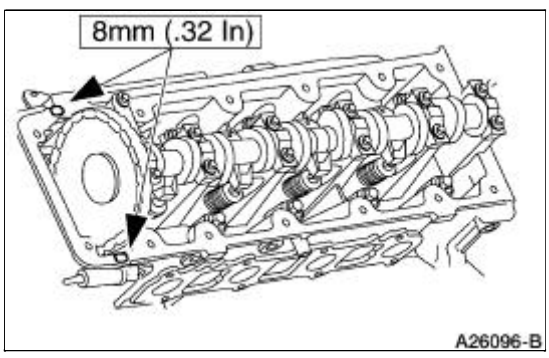
93. Position the coolant pump pulley on the coolant pump and install the bolts.



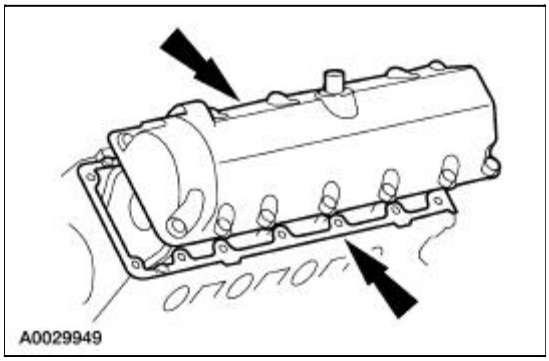
94. **NOTE:** Clean and inspect the mating surfaces, and install a new gasket.

    Position the oil filter adapter gasket and the oil filter adapter. Install the four bolts.

95. Install the oil drain plug.

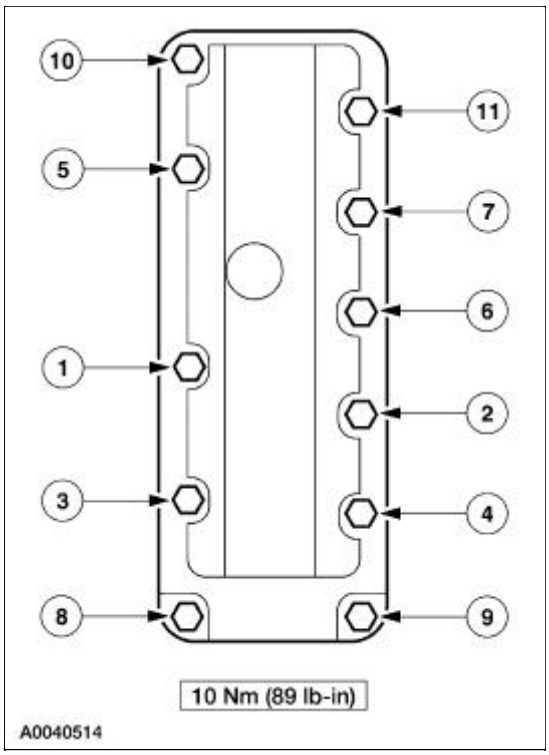


96. If a new gasket is being installed, apply instant adhesive completely around the gasket groove in the valve cover. Install the new LH valve cover gasket.

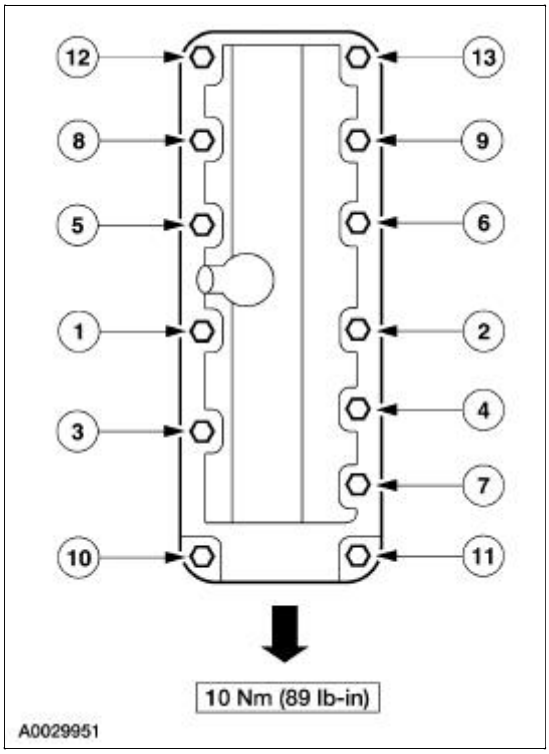


97. **NOTE:** If not secured within four minutes, sealant must be removed and the sealing area cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or four minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant in two places where the engine front cover meets the cylinder head.

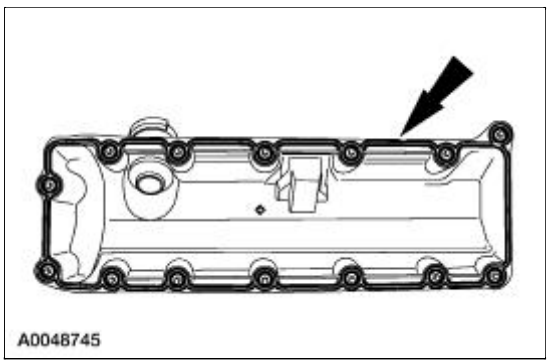


98. Position the LH valve cover and gasket on the cylinder head and install the bolts loosely.



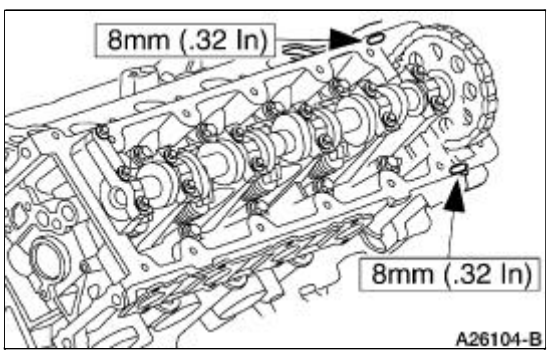
Romeo engine (4.6L)

99. Tighten the bolts in the sequence shown.



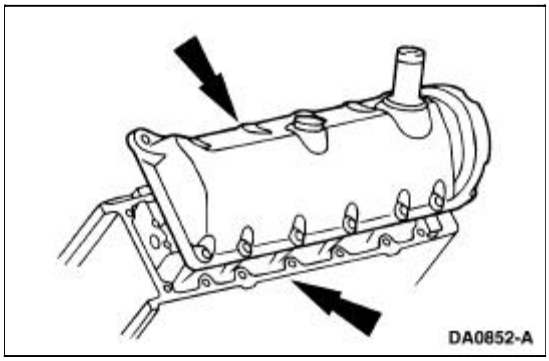
Windsor engine (5.4L)

100. Tighten the bolts in the sequence shown.



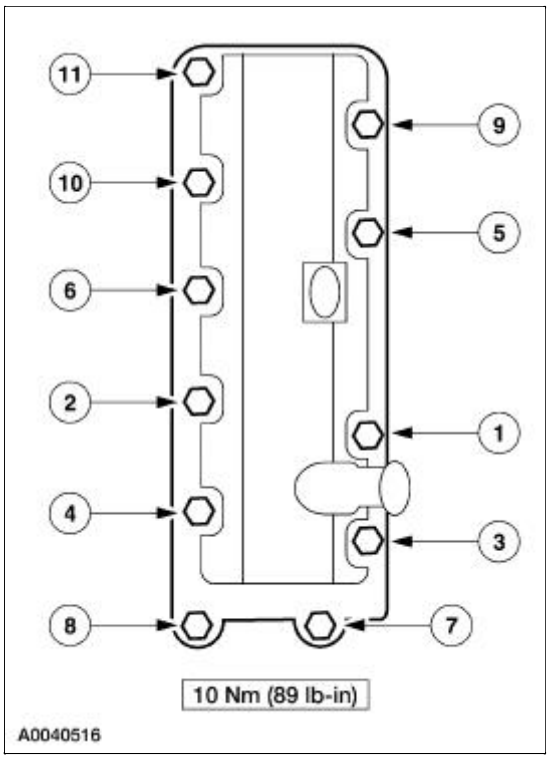
All engines

101. If a new gasket is being installed, apply instant adhesive completely around the gasket groove in the valve cover. Install the new RH valve cover gasket.

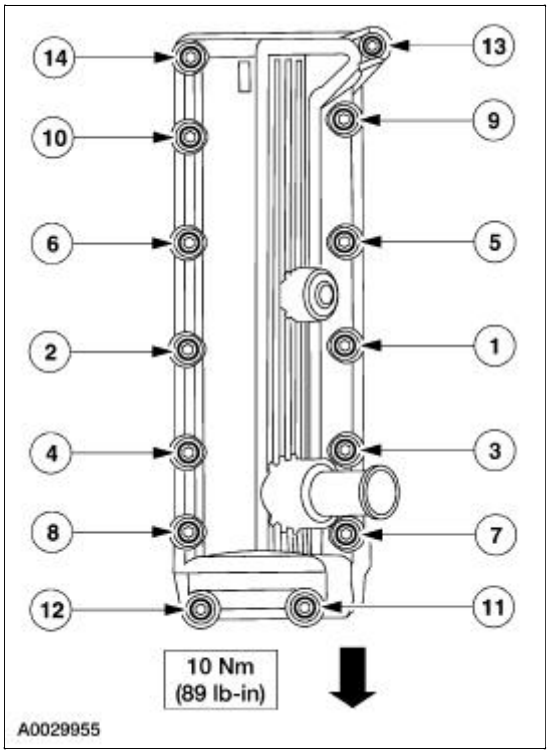


102. **NOTE:** If not secured within four minutes, sealant must be removed and the sealing area cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or four minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

Apply silicone gasket and sealant in two places where the engine front cover meets the cylinder head.

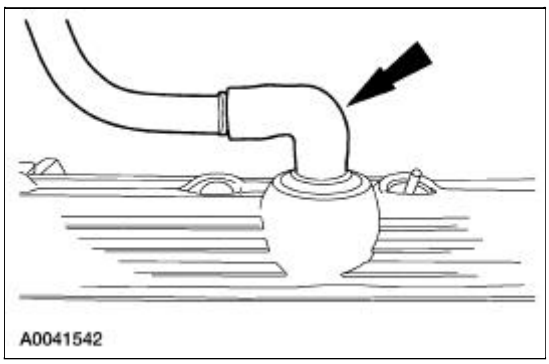


103. Position the RH valve cover and gasket on the cylinder head and install the bolts loosely.



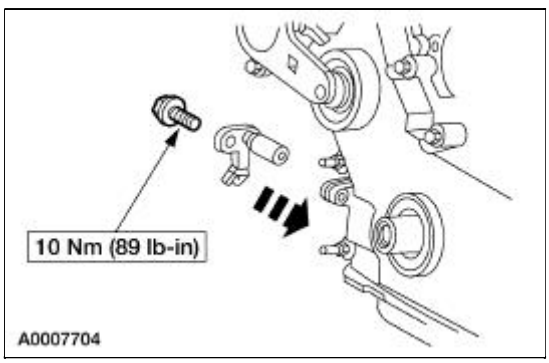
Romeo engine (4.6L)

104. Tighten the bolts in the sequence shown.



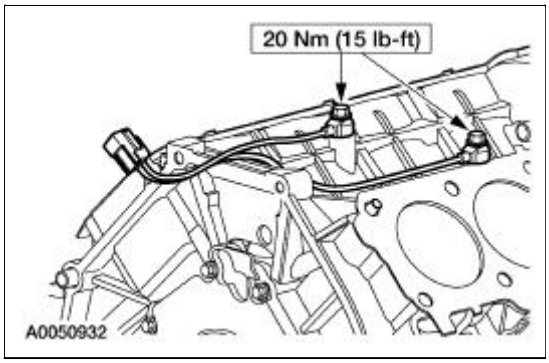
Windsor engine (5.4L)

105. Tighten the bolts in the sequence shown.

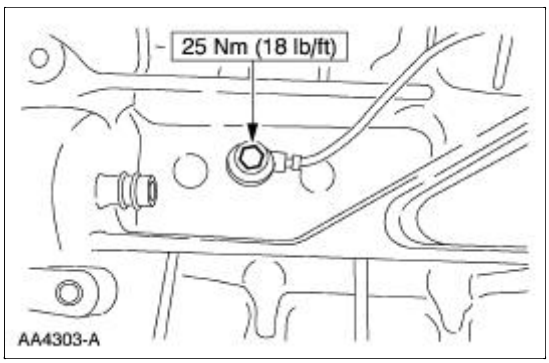


All engines

106. Install the crankcase ventilation tube on the LH valve cover.

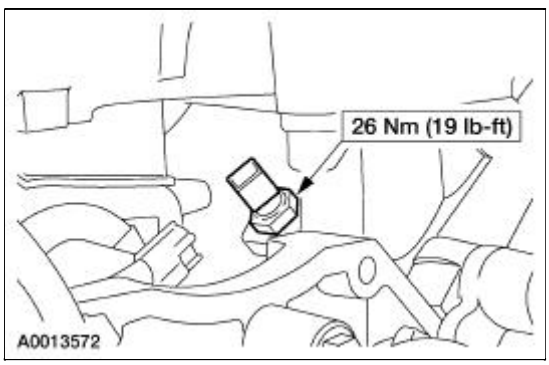


107. Insert the crankshaft position (CKP) sensor and install the bolt.



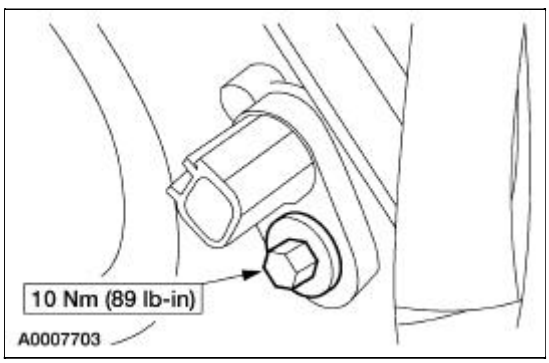
4.6L engines

108. Position the knock sensors and install the bolts.



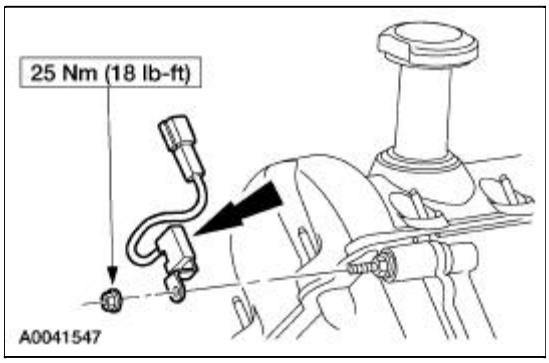
5.4L engines

109. Position the knock sensor and install the bolt.

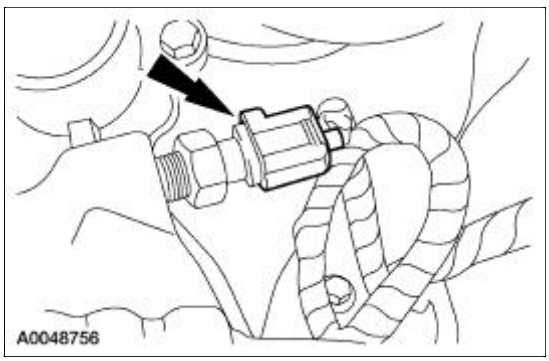


All engines

110. Install the cylinder head temperature (CHT) sensor.

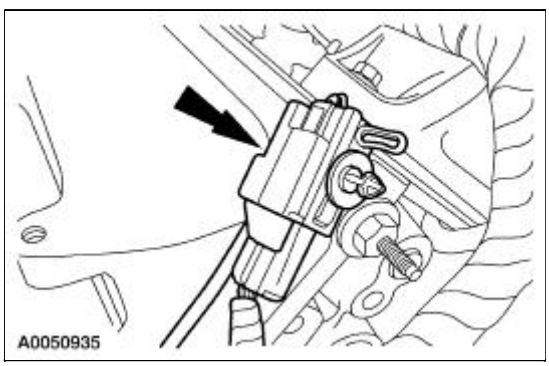


111. Install the camshaft position (CMP) sensor and bolt.



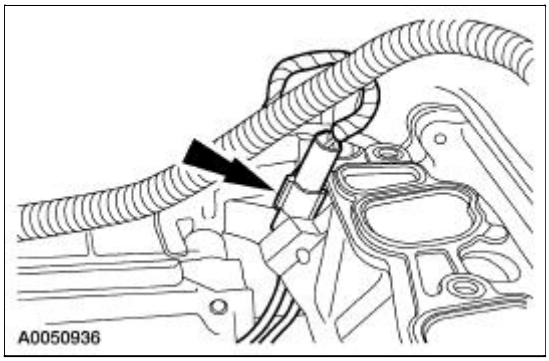
112. **NOTE:** RH shown; LH similar.

Install the radio frequency interference capacitors.



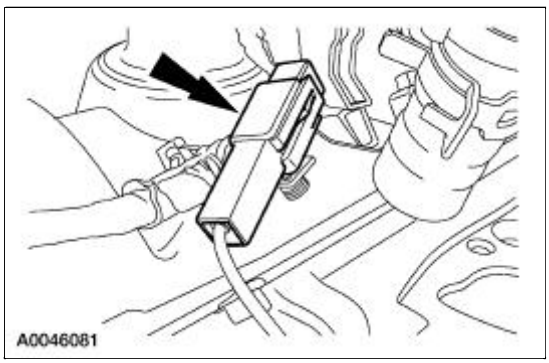
113. Roughly position the engine control sensor wiring harness. Attach the harness routing clips and connector retainers.

114. Connect the oil pressure switch electrical connector.



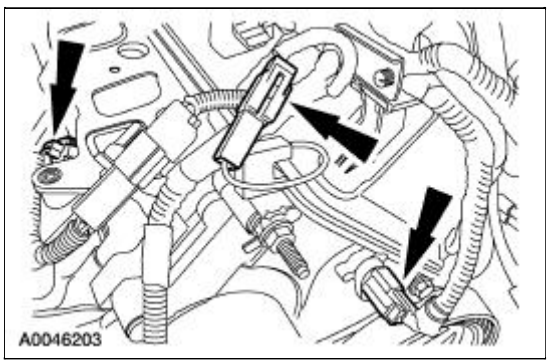
5.4L engines

115. Connect the knock sensor electrical connector.

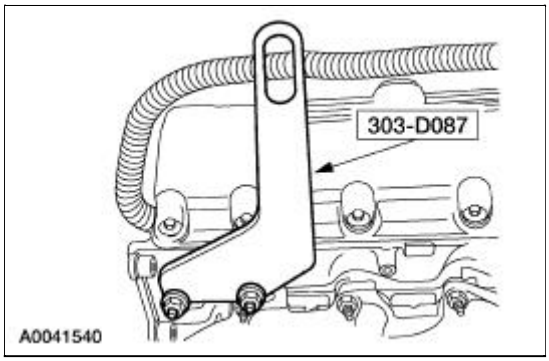


4.6L engines

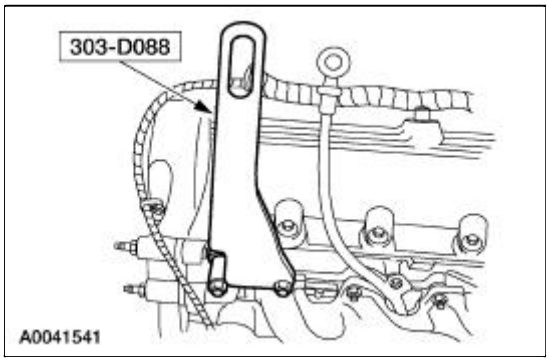
116. Connect the knock sensor electrical connector.



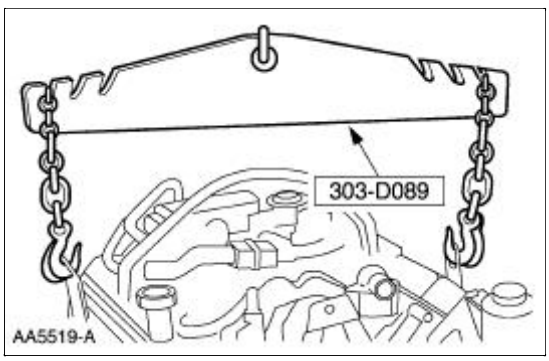
All engines



117. Connect the RH radio interference capacitor electrical connector.



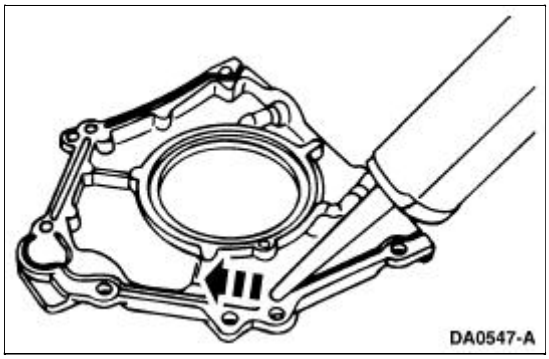
118. Connect the following electrical connectors.
    - The CHT sensor.
    - The LH radio interference capacitor.
    - The CMP sensor.



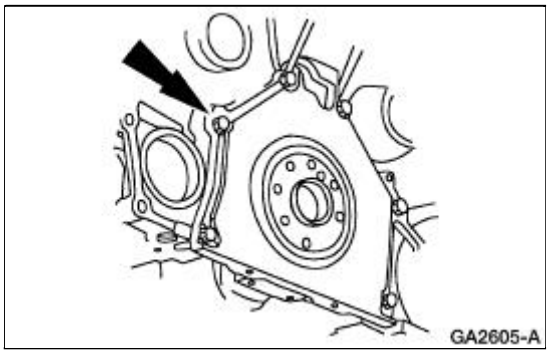
119. Install the special tool.

120. Install the special tool.

121. Install the special tool and remove the engine from the work stand.

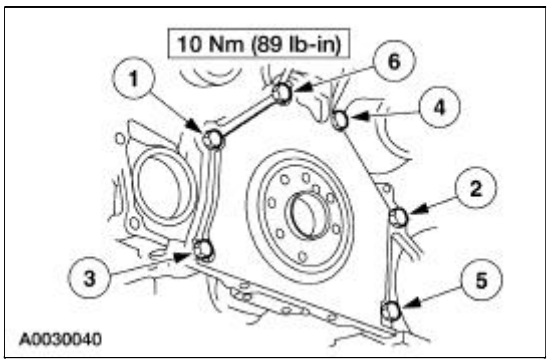


122. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the aluminum retainer plate. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**



Inspect the rear seal retainer plate. Clean the mating surface for the rear seal retainer plate with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

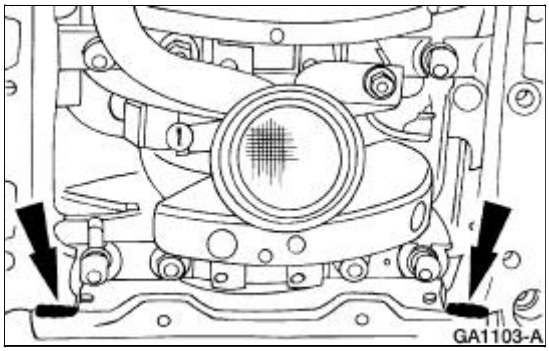
123. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.



Apply a 4 mm (0.16 in) bead of silicone gasket and sealant around the rear oil seal retainer sealing surface.

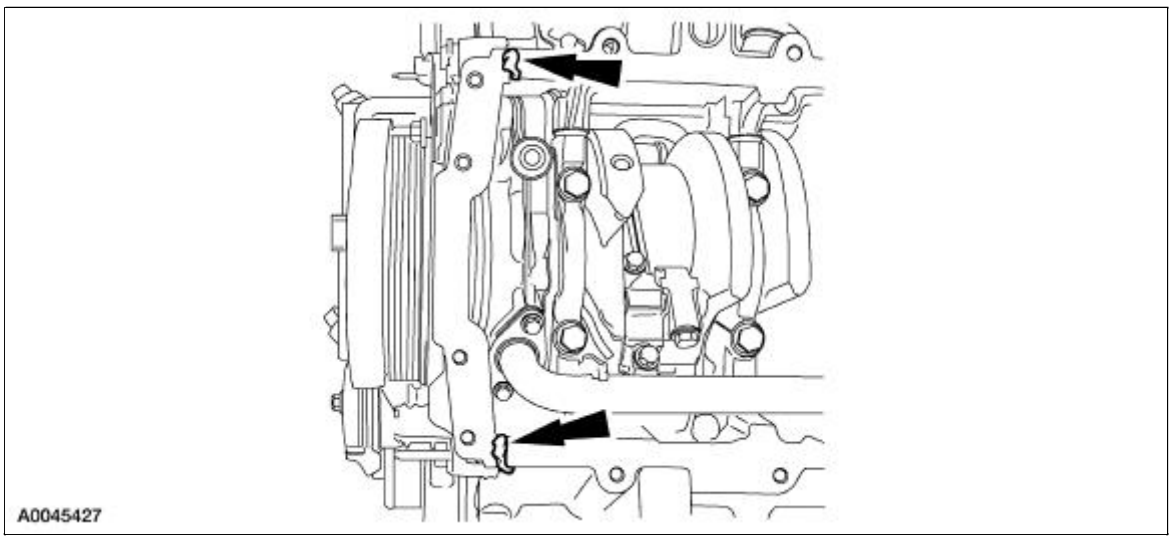
124. Install the rear oil seal retainer plate and loosely install the six bolts.

125. Tighten the bolts in the sequence shown.



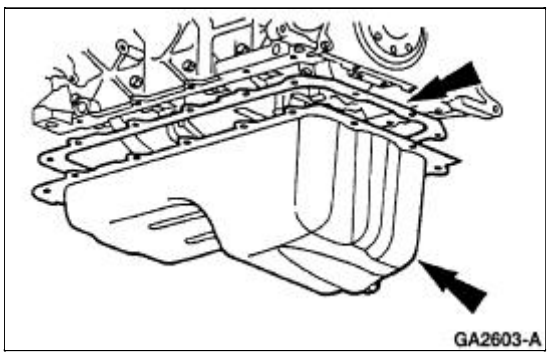
126. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

Inspect the oil pan. Clean the mating surface for the oil pan with silicone gasket remover and metal surface prep. Follow the directions on the packaging.



127. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

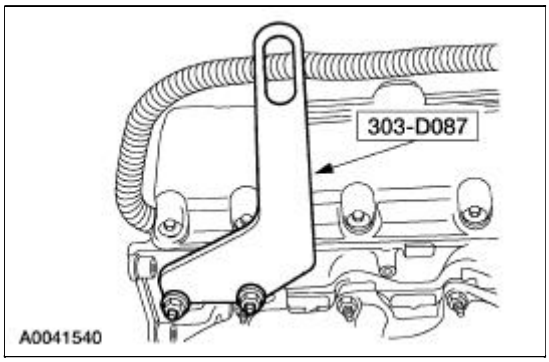
Apply silicone gasket and sealant at the rear oil seal retainer-to-cylinder block sealing surface.



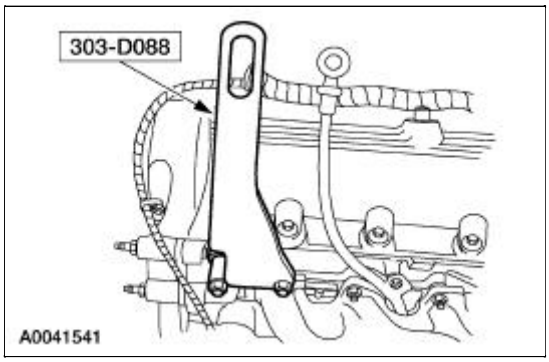
128. **NOTE:** If the oil pan is not secured within four minutes, the sealant must be removed and the sealing areas cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or four minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant at the engine front cover-to-cylinder block sealing surface.

129. Install the oil pan gasket and the oil pan, and loosely install the bolts.

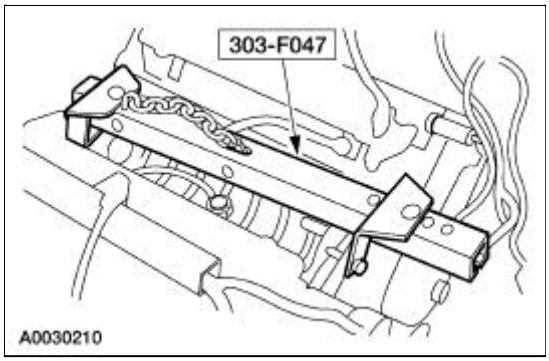


130. Tighten the bolts in the sequence shown, in three stages.
    - Stage 1: tighten to 2 Nm (18 lb-in).
    - Stage 2: tighten to 20 Nm (15 lb-ft).
    - Stage 3: tighten an additional 90 degrees.

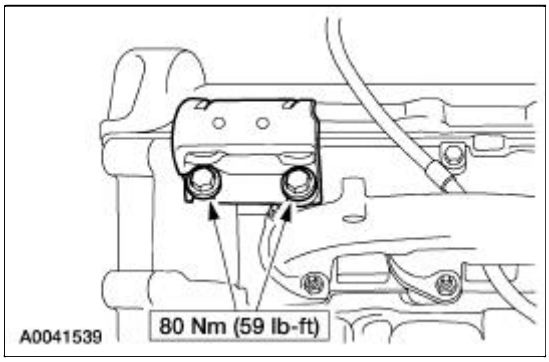


131. Lower the engine onto wooden blocks.

132. Remove the special tool.

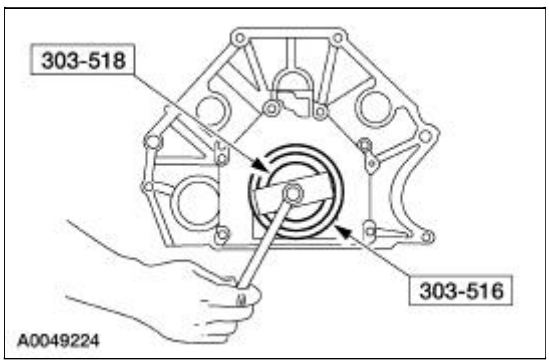


133. Remove the special tool.

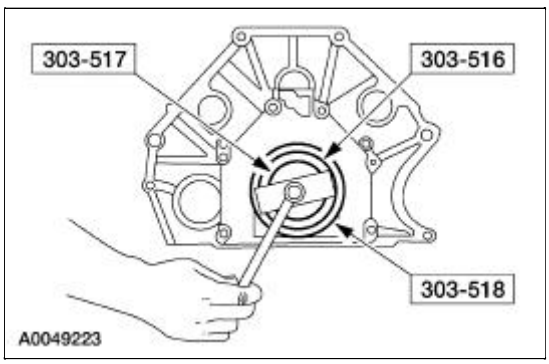


134. **NOTE:** On some engines it will be necessary to shim between the tool mounting brackets and the cylinder block.

    Install the special tool and raise the engine.

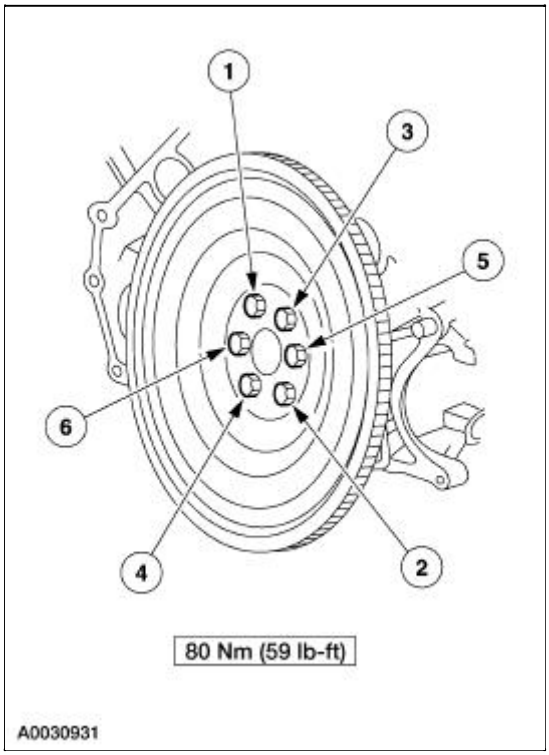


135. Install the power steering reservoir lower mounting bracket.

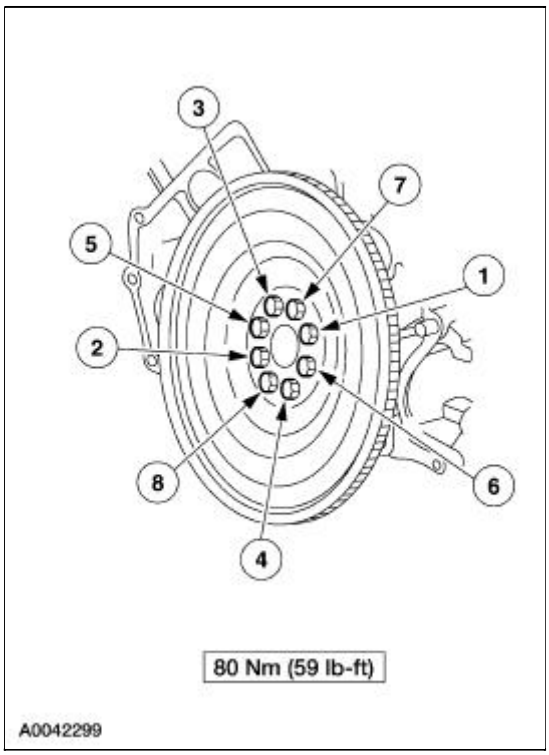


136. **NOTE:** Lubricate the inner lip of the crankshaft rear oil seal with clean engine oil.

Using the special tools, install a new crankshaft rear oil seal.

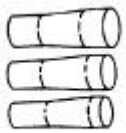


137. Using the special tools, install the crankshaft rear oil slinger.



Romeo engine (4.6L)

138. Install the flexplate and bolts. Tighten the bolts in the sequence shown.



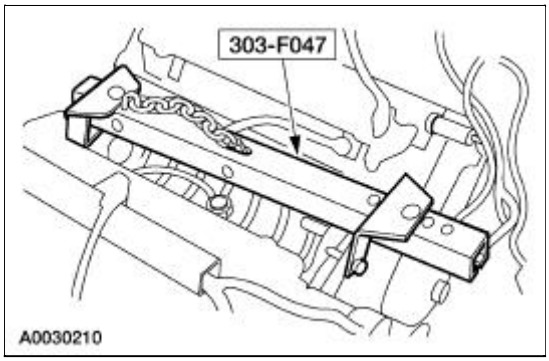
Windsor engine (5.4L)

139. Install the flexplate and bolts. Tighten the bolts in the sequence shown.

Engine

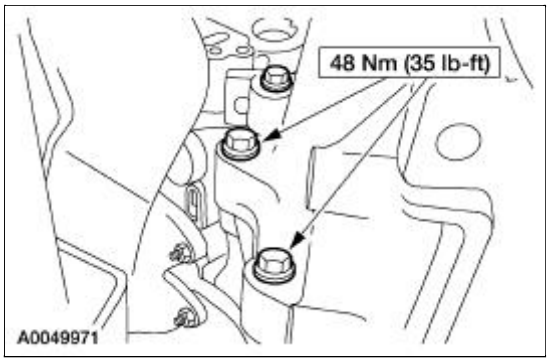
Special Tool(s)

 ST1377-A	Modular Engine Lift Bracket 303-F047 (014-00073) or equivalent
 ST1586-A	Installer, Power Steering Pump Pulley 211-185 (T91P-3A733-A)
 ST1444-A	Installer Set, Teflon Seal 211-D027 (D90P-3517-A) or equivalent



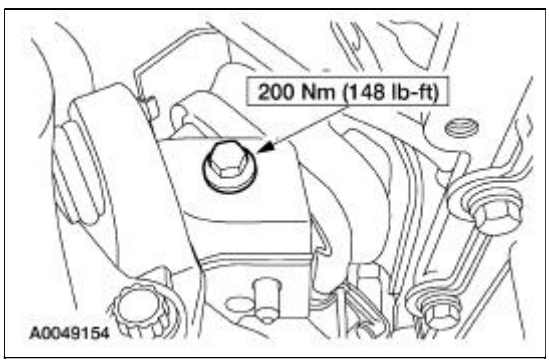
Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H
Motorcraft Premium Engine Coolant VC-4-A (in Canada CXC-10; in Oregon VC-5) or equivalent. Do not mix coolant types.	ESE-M97B44-A (Green in color)
Motorcraft Premium Gold Engine Coolant VC-7-A (in Oregon VC-7-B) or equivalent. Do not mix coolant types.	WSS-M97B51-A1 (Yellow in color)

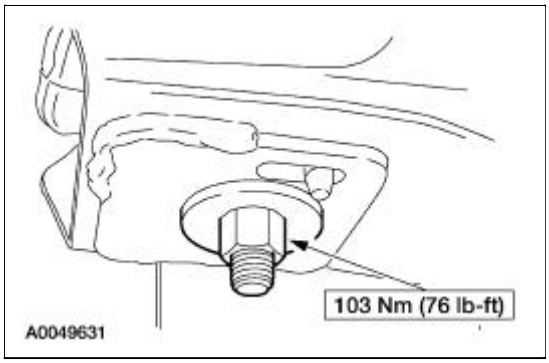


Installation

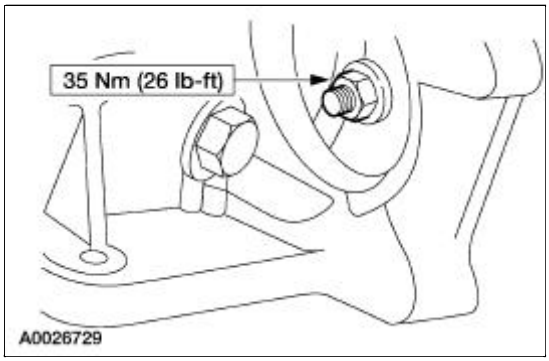
All engines



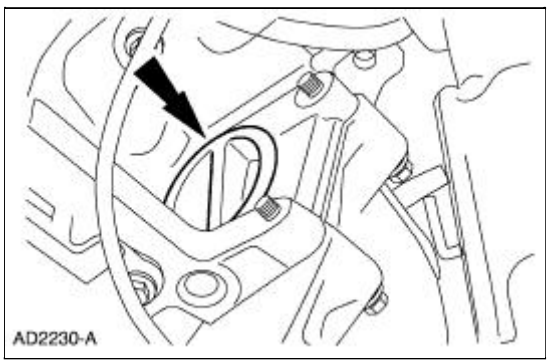
1. Position the engine in the vehicle.
2. Remove the special tool.



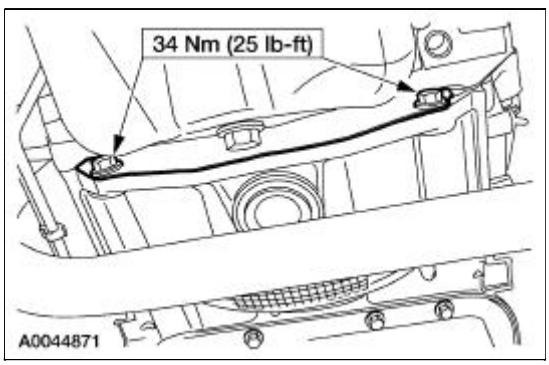
3. Remove the floor jack supporting the transmission.
4. Raise and support the vehicle. For additional information, refer to Section 100-02 .
5. Align the engine to the transmission.
6. Install the lower five transmission-to-engine bolts.



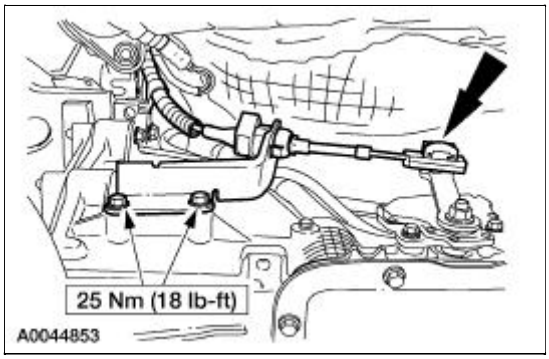
7. Install the LH engine mount bolt.



8. Install the RH engine mount nut.

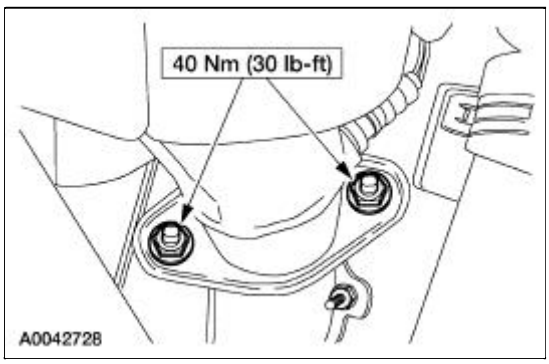


9. Install new torque converter-to-flexplate nuts.

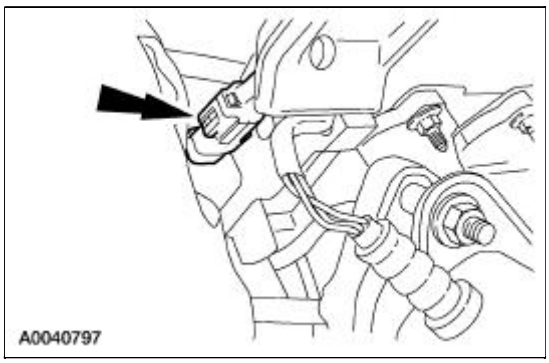


10. Install the cylinder block opening cover.

11. Install the flexplate inspection cover.

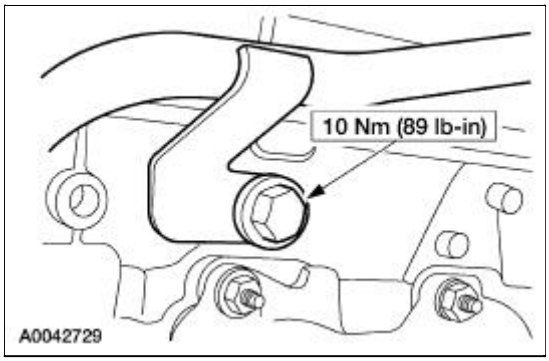


12. Install the shift cable end and the bracket.



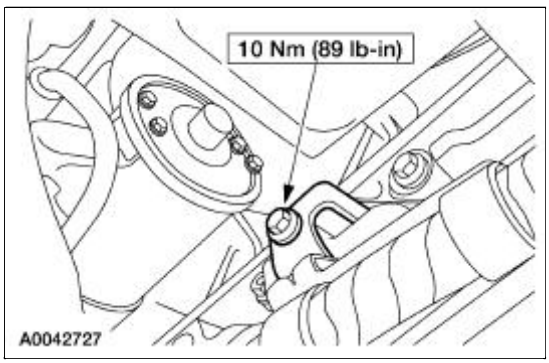
13. Install the RH exhaust manifold-to-dual converter Y-pipe studs.

14. Position the dual converter Y-pipe and install the four nuts.



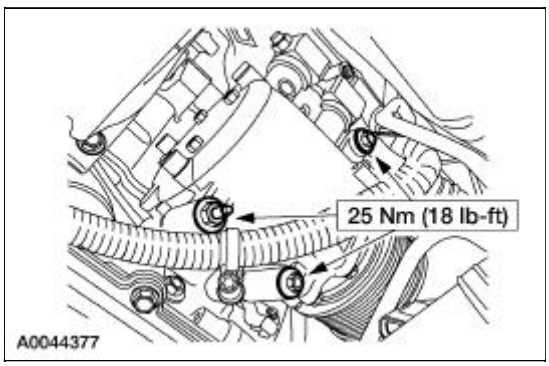
15. **NOTE:** RH is shown; LH is similar.

    Connect the two heated oxygen sensor (HO2S) electrical connectors.

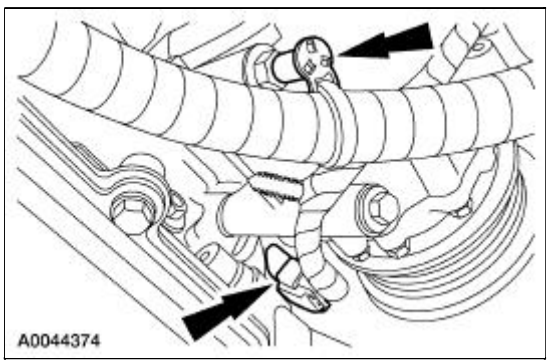


16. **NOTE:** The bolt is accessed through the RH fender well.

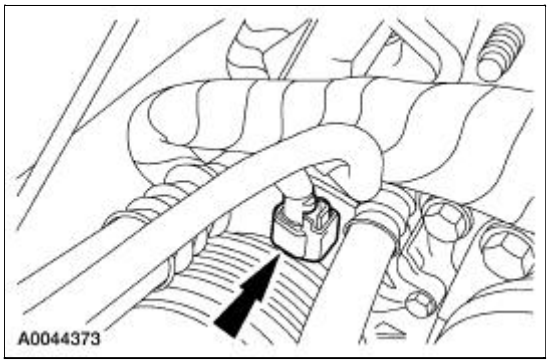
    Position the transmission fluid filler tube and install the bolt.



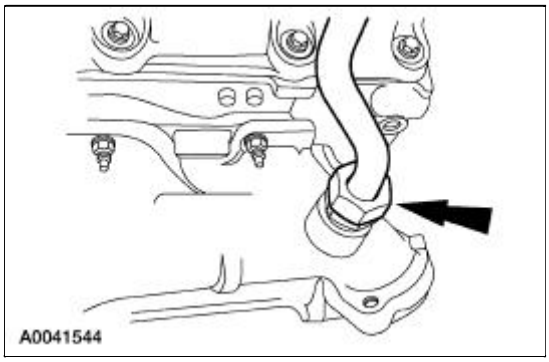
17. Install the starter motor. For additional information, refer to Section 303-06 .



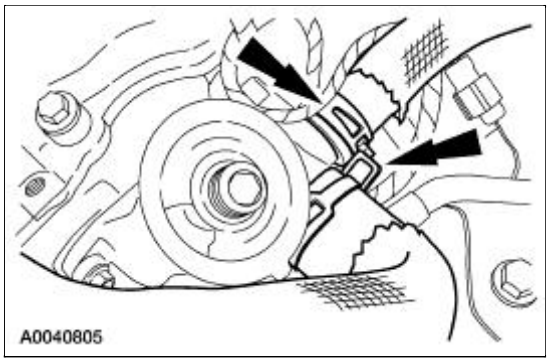
18. Position the wiring harness bracket and install the bolt.



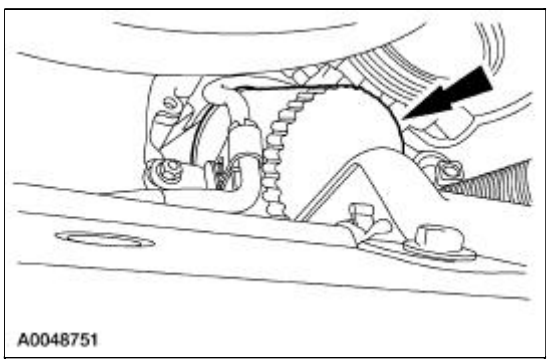
19. Position the A/C compressor and install the fasteners.



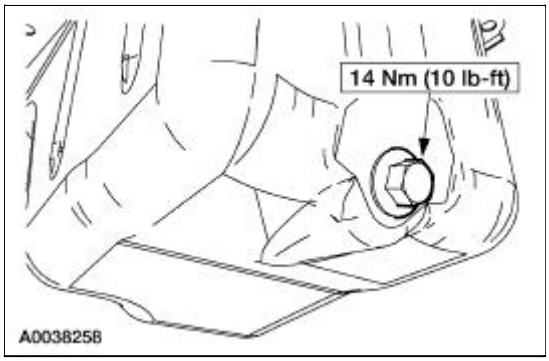
20. Attach the wiring harness retainer and connect the crankshaft position (CKP) sensor electrical connector.



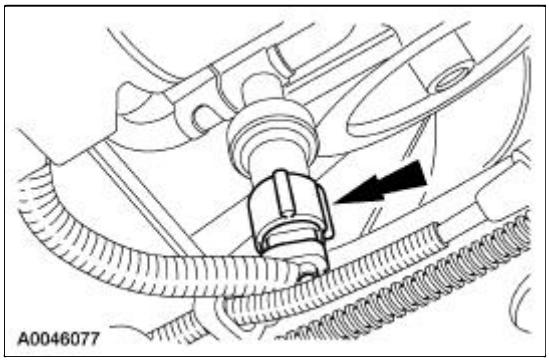
21. Connect the A/C compressor electrical connector.



22. Position the exhaust manifold-to-exhaust gas recirculation (EGR) valve tube and loosely install the lower fitting.

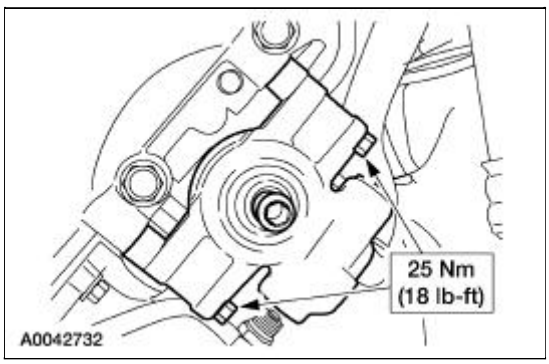


23. Connect the lower radiator hose and the degas bottle hose to the oil filter adapter.

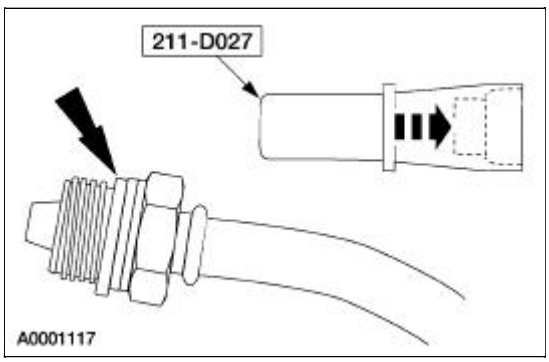


24. Install a new oil filter.

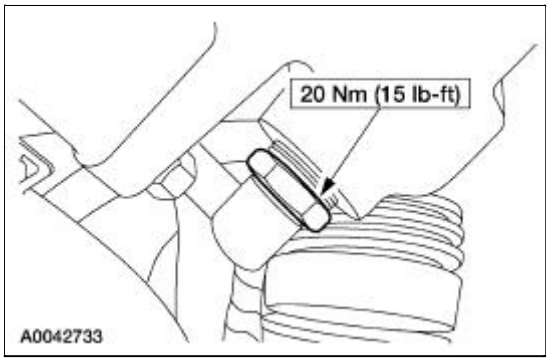
25. Install the drain plug.



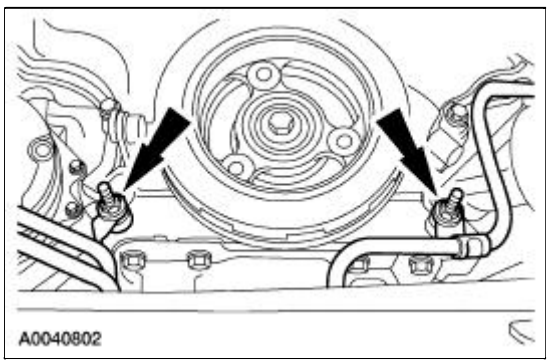
26. Connect the power steering pressure switch electrical connector.



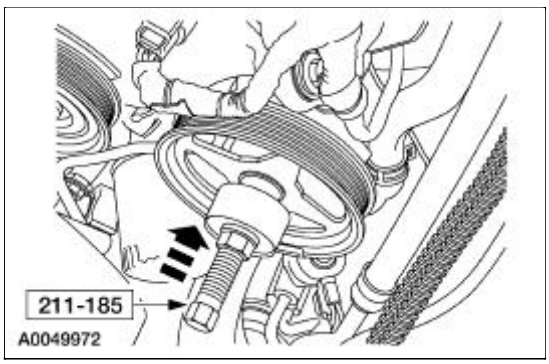
27. Lower the vehicle.



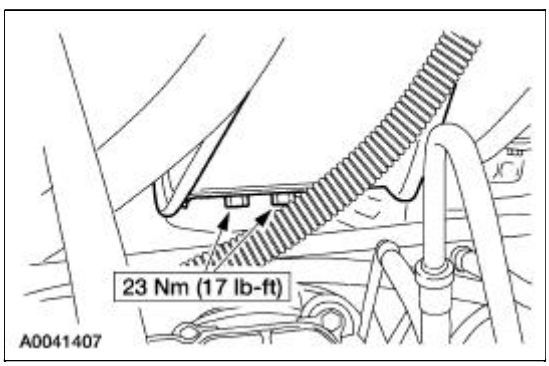
28. Position the power steering pump and install the three bolts.



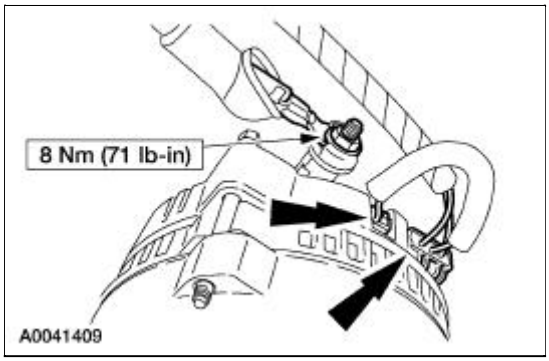
29. Using the special tool, install a new seal on the power steering pump pressure hose fitting.



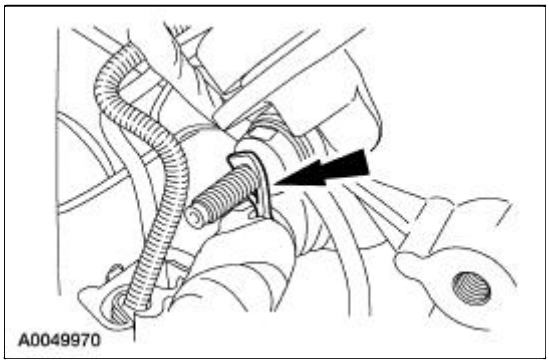
30. Connect the power steering pump pressure hose.



31. Position the transmission cooler tube and the power steering hose brackets. Install the nuts.
    - On 4.6L engine, tighten the nuts to 11 Nm (8 lb-ft).
    - On 5.4L engine, tighten the nuts to 40 Nm (30 lb-ft).

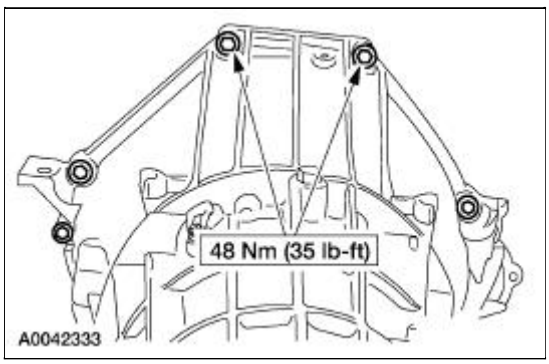


32. Using the special tool, install the power steering pump pulley.



33. Position the power steering reservoir and install the two lower bolts.

34. Connect the generator electrical connections and position the generator aside.



35. Install the wiring harness retainer on the front cover stud.

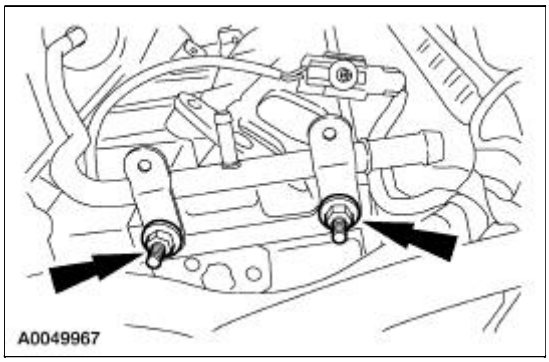
36. **NOTE:** On 4x4 vehicles, it may be necessary to reposition and secure the transfer case vent hose, after the transmission-to-engine bolts are installed.

    Install the wiring harness bracket and the upper two transmission-to-engine bolts.

37. **NOTE:** Do not reuse the O-ring seal.

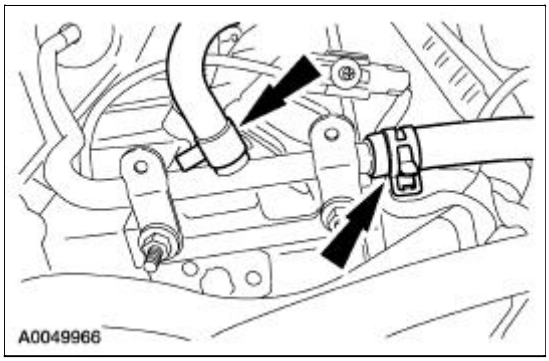
    Install the new O-ring seal and the heater outlet tube.

    - Lubricate the O-ring seal with engine coolant.



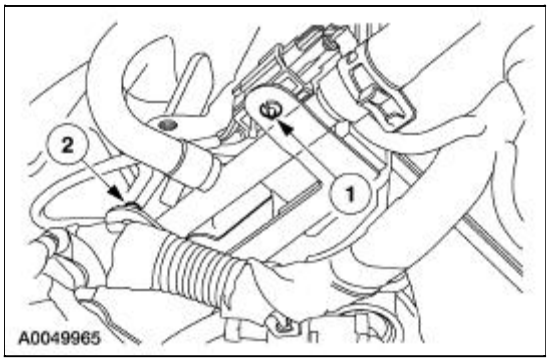
4.6L engines

38. Install the heater outlet tube upper and lower studs.
    - Tighten the studs to 25 Nm (18 lb-ft).



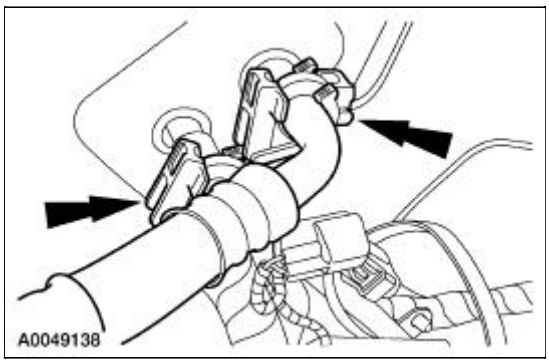
5.4L engines

39. Hand-tighten the heater outlet tube upper stud and install the lower stud.
    - Tighten the studs to 40 Nm (30 lb-ft).

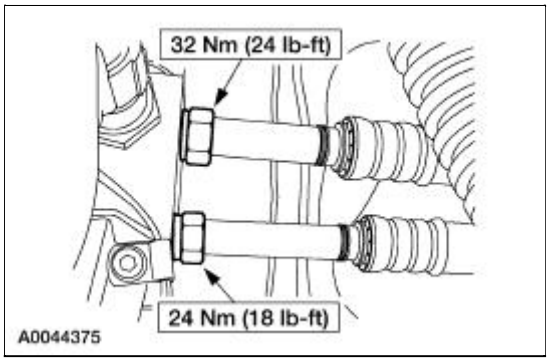


All engines

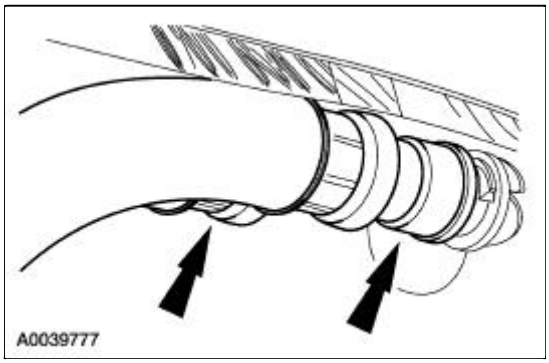
40. Connect the hoses to the heater outlet tube.



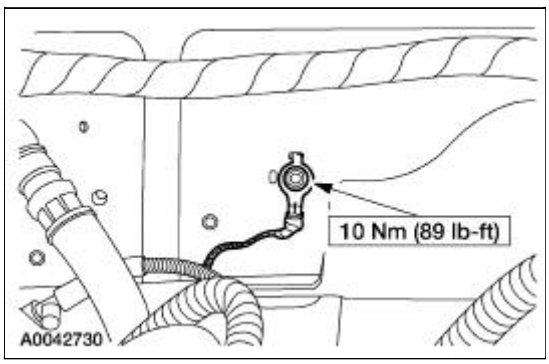
41. Install the wiring retainers on the heater outlet tube bracket.
    1. Install the knock sensor electrical connector retainer, 5.4L only.
    2. Install the engine harness routing clip.



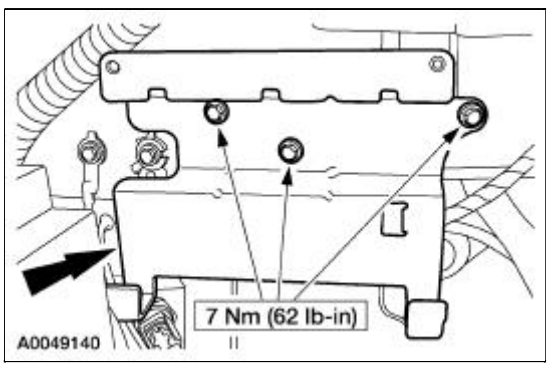
42. Install the cable routing bracket on the heater outlet tube mounting studs.
    - On 4.6L engine, tighten the nuts to 10 Nm (89 lb-in).
    - On 5.4L engine, tighten the nuts to 28 Nm (21 lb-ft).



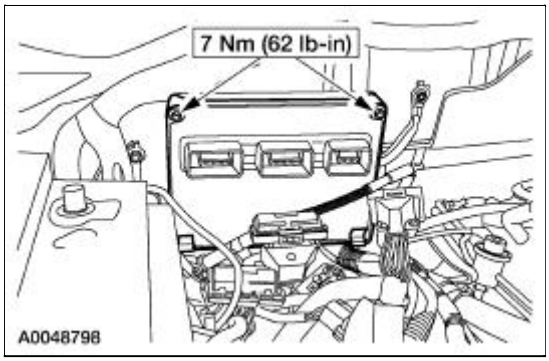
43. Connect the evaporator tubes to the evaporator.



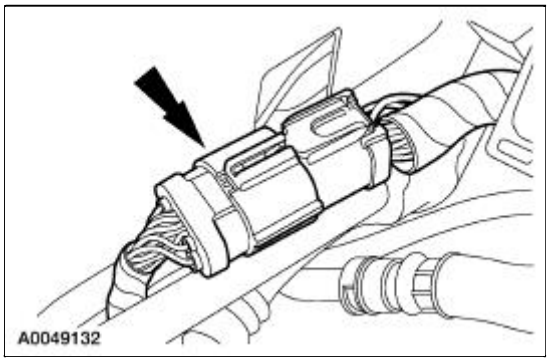
44. Connect the evaporator tubes to the manifold.



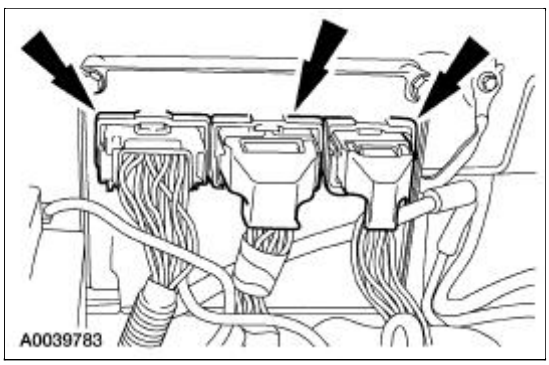
45. Connect the two heater hoses at the heater core.



46. Position the ground wire and install the bolt.

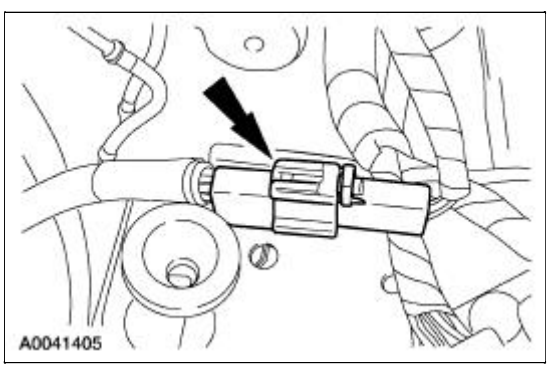


47. Position the powertrain control module (PCM) mounting bracket and install the bolts.

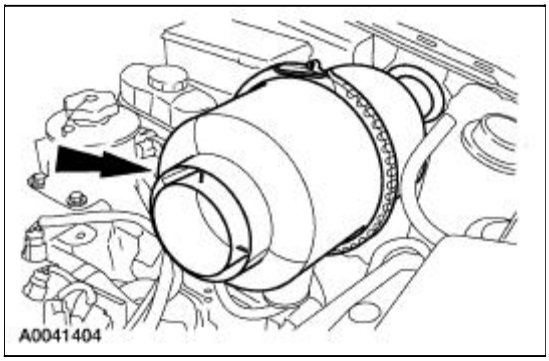


48. Position the PCM and install the bolts.

49. Connect the engine wiring harness electrical connector.

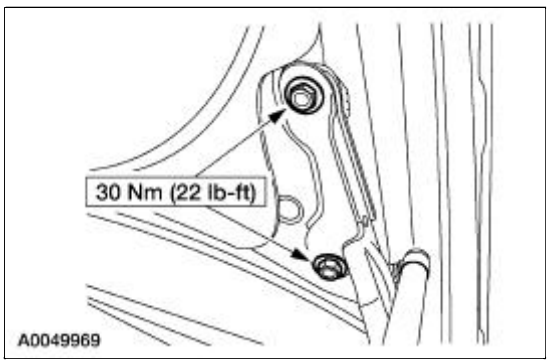


50. Connect the PCM electrical connectors.



51. Install the A/C condenser core. For additional information, refer to Section 412-03A .

52. Install the radiator. For additional information, refer to Section 303-03 .



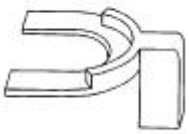
53. Position the engine air cleaner (ACL) in the vehicle and connect the mass air flow (MAF) sensor electrical connector.

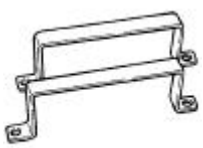
54. Install the ACL.

55. Install the hood.

56. Install the intake manifold. For additional information, refer to Intake Manifold—4.6L or Intake Manifold—5.4L .

57. Fill all fluids to the correct levels.





58. Start the engine and check for leaks. Stop the engine and recheck the fluid levels.

59. Recharge the A/C system. For additional information, refer to Section 412-00 .

60. If equipped, turn on the air suspension switch.

Cylinder Heads —4.6L

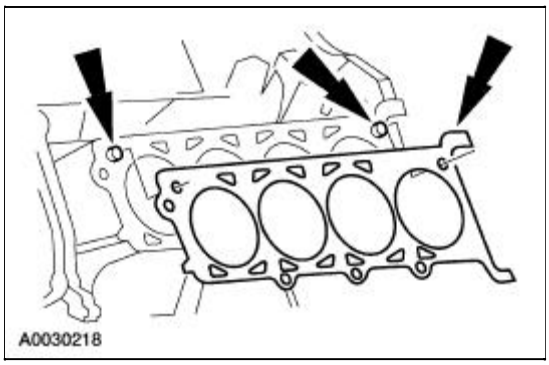
Hydraulic Chain Tensioner Retaining Clip	1L3Z-6P250-AA

Installation

All cylinder heads



1. **CAUTION: The gasket sealing surfaces on the cylinder head and cylinder block must be clean. For additional information, refer to Cylinder Heads—4.6L in the Removal portion of this section.**

   CAUTION: The use of sealing aids (aviation cement, copper spray, and glue) is not permitted. The gasket must be installed dry.

   CAUTION: The new gasket has a film coating which is crucial to the gasket's ability to seal correctly. Do not scratch the gasket.

   NOTE: The RH head gasket is shown; the LH head gasket is similar.

   Install the head gasket over the dowel pins.

2. **CAUTION: Cylinder head machining or milling is not authorized by the Ford Motor Company. Cylinder head flatness must be within 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area.**

   CAUTION: The gasket sealing surfaces on the cylinder head and cylinder block must be clean. For additional information, refer to Cylinder Heads—4.6L in the Removal portion of this section.

   CAUTION: The use of sealing aids (aviation cement, copper spray, and glue) is not permitted. The gasket must be installed dry.

   CAUTION: Do not allow the dowels to scratch the sealing surface of the cylinder head during cylinder head installation.

   NOTE: The new cylinder head bolts must be lightly oiled with a rag, and allowed to drain for a few minutes prior to installation.

   NOTE: The RH cylinder head is shown; the LH cylinder head is similar.

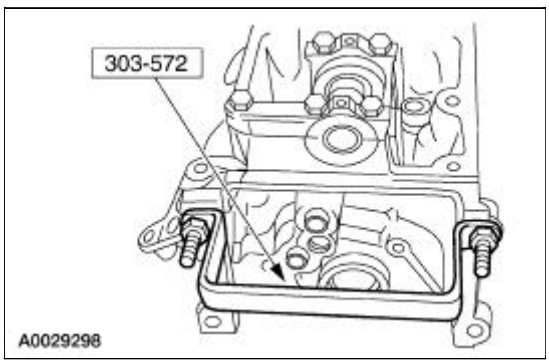
   Install the cylinder head on the dowels and the head gasket. Loosely install new bolts.

LH cylinder head

3. **NOTE:** Make sure to tighten the bolts in sequence in three stages.

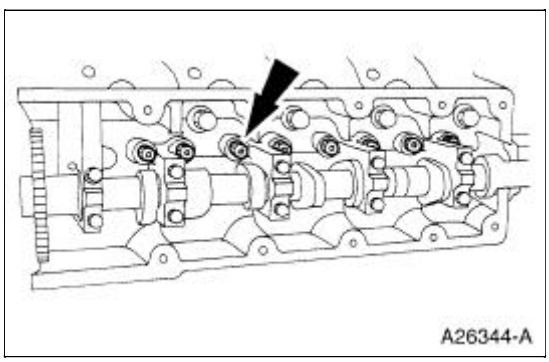
   Tighten the LH bolts in the sequence shown.
   - Stage 1: Tighten to 40 Nm (30 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.
   - Stage 3: Tighten an additional 90 degrees.

RH cylinder head



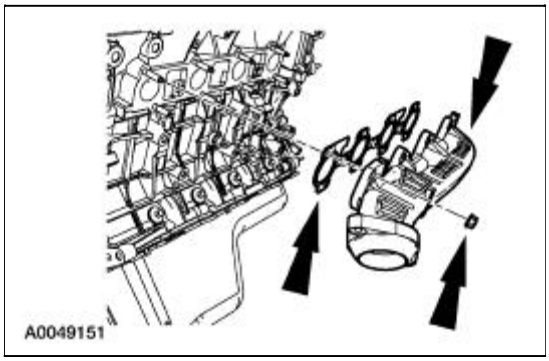
4. **NOTE:** Make sure to tighten the bolts in the following three stages.

   Tighten the RH bolts in the sequence shown.
   - Stage 1: Tighten to 40 Nm (30 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.
   - Stage 3: Tighten an additional 90 degrees.



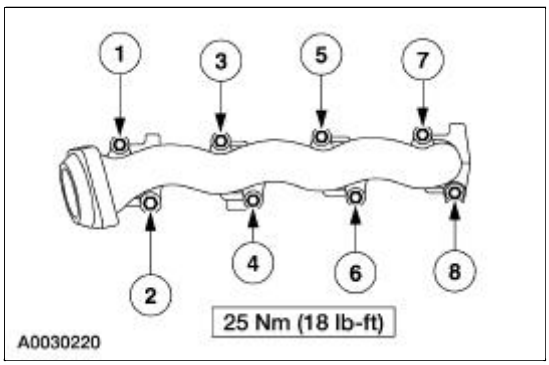
All cylinder heads

5. Remove the special tools from both ends of the cylinder head.



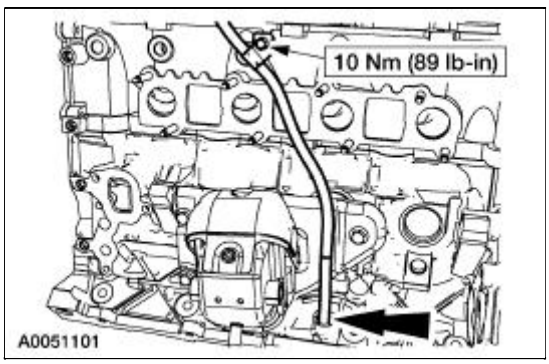
6. **NOTE:** Lubricate the hydraulic lash adjusters with clean engine oil.

   Install the hydraulic lash adjusters in their original locations.

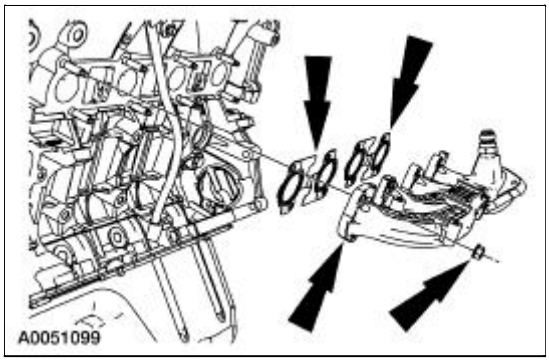


RH cylinder head

7. Position the RH exhaust manifold gasket and the exhaust manifold. Loosely install the nuts.



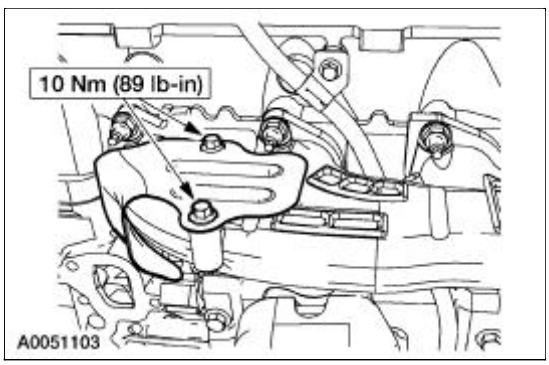
8. Tighten the RH exhaust manifold nuts in the sequence shown.



LH cylinder head

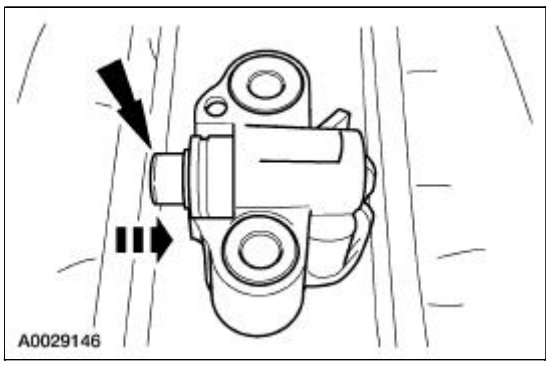
9. **NOTE:** Lubricate the O-ring seal with clean engine oil.

   Install the oil level indicator tube.
   - Install a new O-ring seal on the oil level indicator tube.
   - Install the oil level indicator tube.
   - Install the bolt.

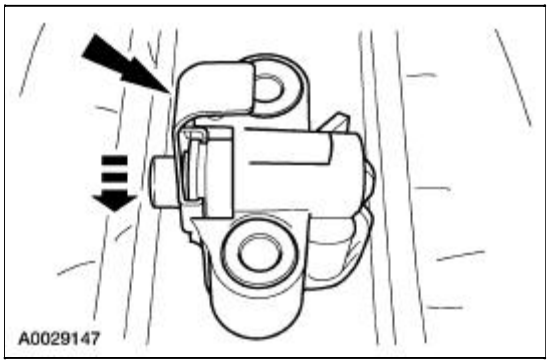


10. Position the LH exhaust manifold gaskets and the exhaust manifold. Loosely install the nuts.

11. Tighten the LH exhaust manifold nuts in the sequence shown.



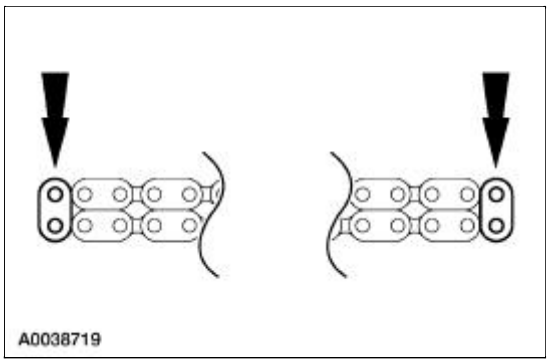
12. Install the heat shield and bolts.



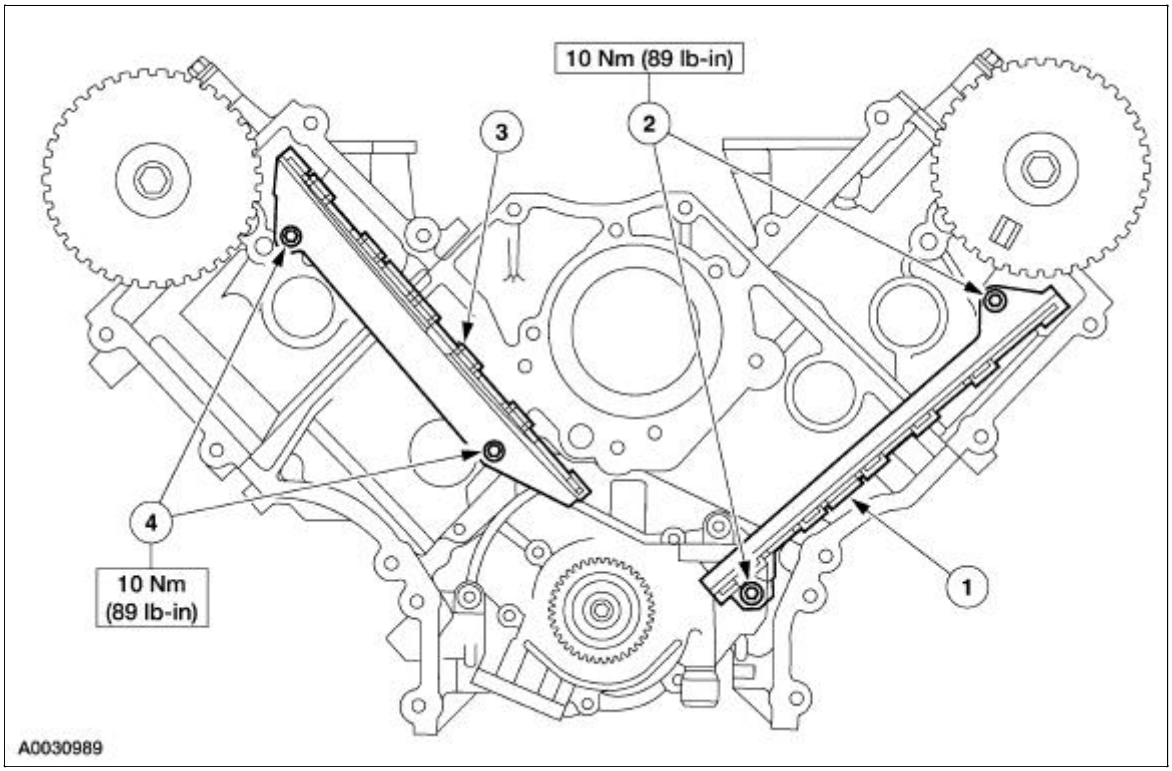
All cylinder heads

13. **CAUTION: Timing chain procedures must be followed exactly or damage to valves and pistons will result.**

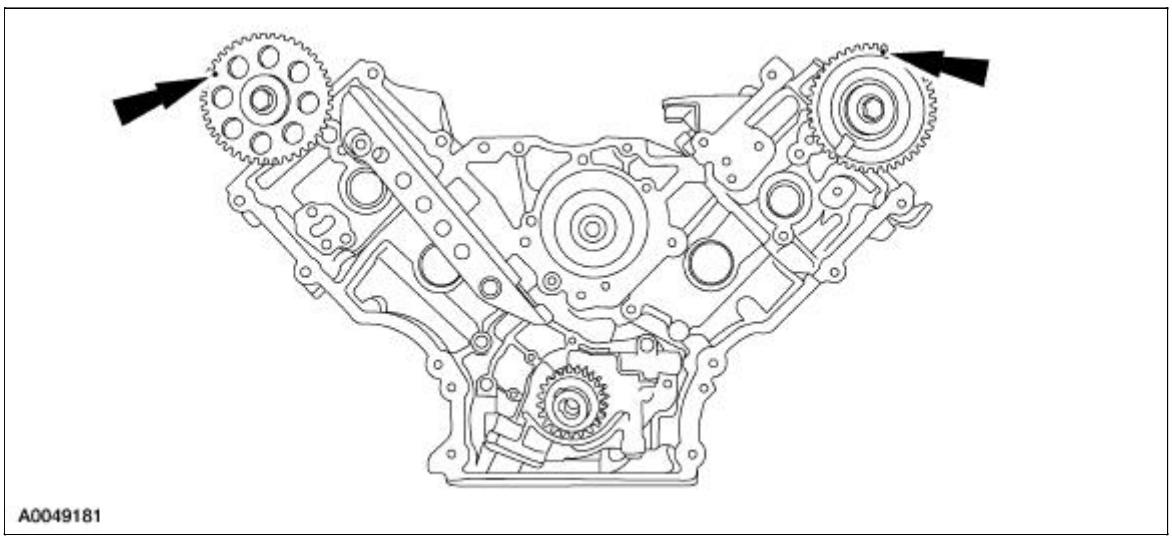
    Compress the tensioner plunger, using a vise.



14. Install a retaining clip on the tensioner to hold the plunger in during installation.

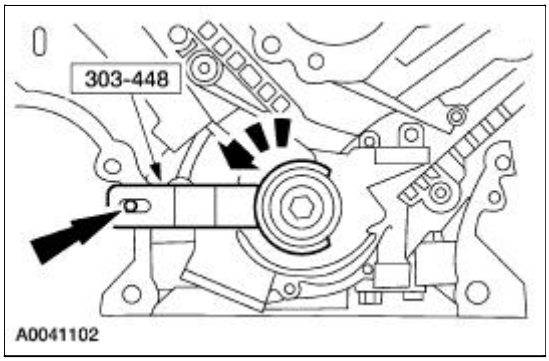


15. Remove the tensioner from the vise.



16. If the copper links are not visible, mark one link on one end and one link on the other end, and use as timing marks.

17. Install the timing chain guides.
    1. Position the LH timing chain guide.
    2. Install and tighten the LH bolts.
    3. Position the RH timing chain guide.
    4. Install and tighten the RH bolts.

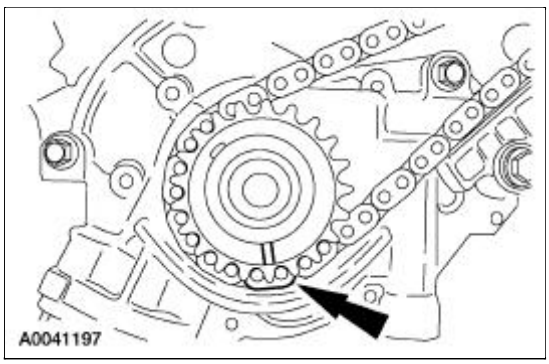


18. Rotate the RH camshaft sprocket until the timing mark is approximately at the 11 o'clock position. Rotate the LH camshaft sprocket until the timing mark is approximately at the 12 o'clock position.

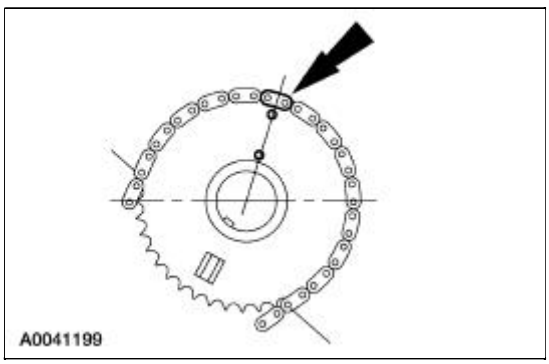
19. **CAUTION: Rotate the crankshaft counterclockwise only. Do not rotate past the position shown or severe piston and valve damage can occur.**

    NOTE: The number one cylinder is at top dead center (TDC) when the stud on the engine block fits into the slot in the handle of the special tool.

    Using the special tool, position the crankshaft so the number one cylinder is at TDC.

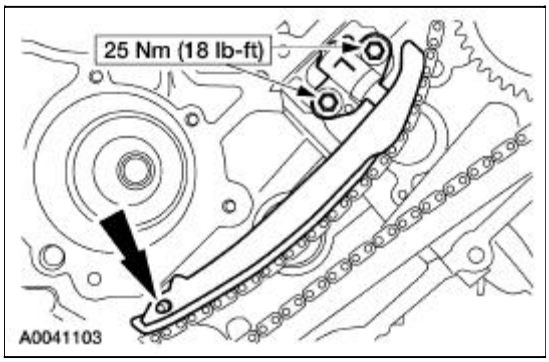


20. Remove the Crankshaft Holding Tool.

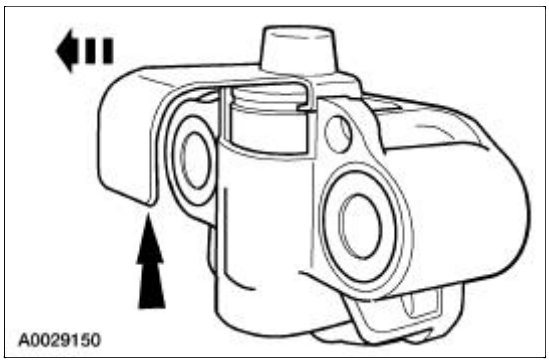


21. Install the crankshaft sprocket, making sure the flange faces forward.

22. Position the LH (inner) timing chain on the crankshaft sprocket, aligning the copper (marked) link with the timing mark on the sprocket.

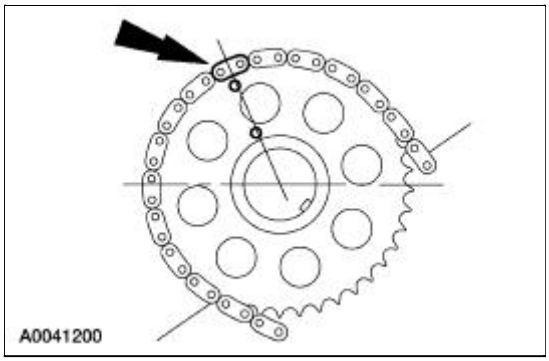


23. Install the LH timing chain on the camshaft sprocket, aligning the copper (marked) link with the timing marks on the sprocket.

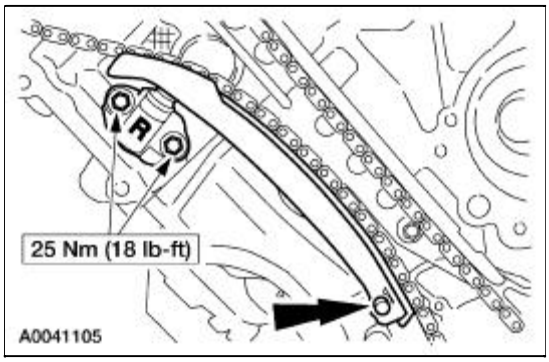


24. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole for identification.

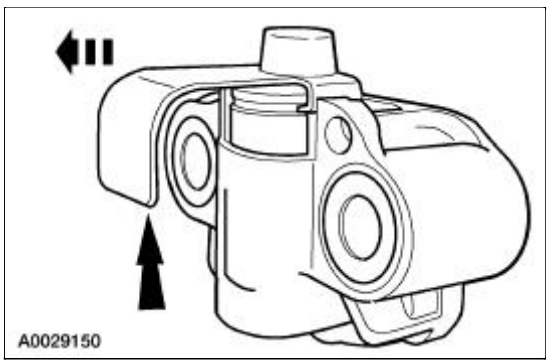
    Position the LH timing chain tensioner arm on the dowel pin and install the LH timing chain tensioner.



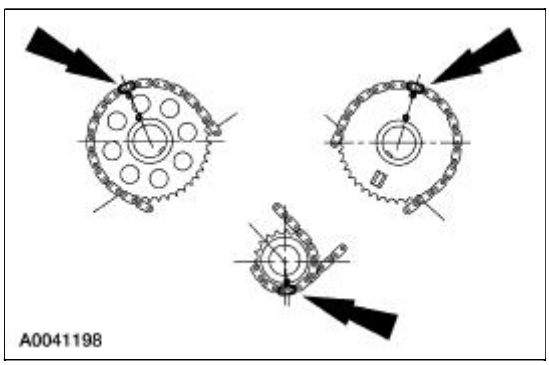
25. Remove the retaining clip from the LH timing chain tensioner.



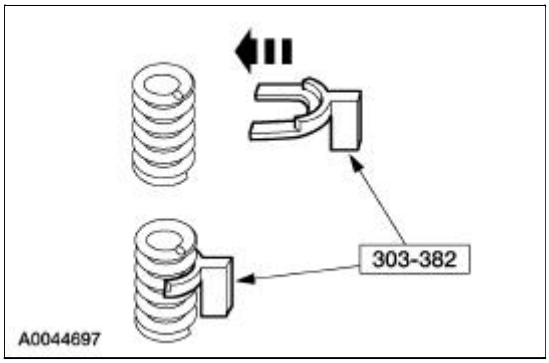
26. Position the RH (outer) timing chain on the crankshaft sprocket, aligning the copper (marked) link with the timing mark on the sprocket.



27. Install the RH timing chain on the camshaft sprocket, aligning the copper (marked) link with the timing marks on the sprocket.

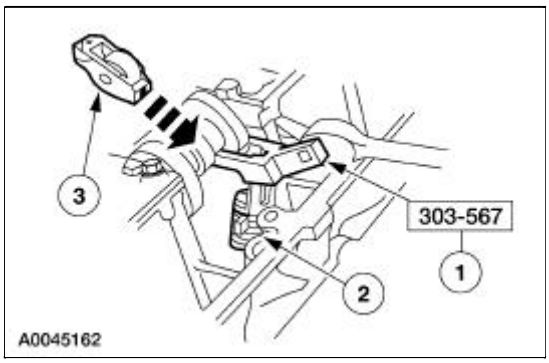


28. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner.

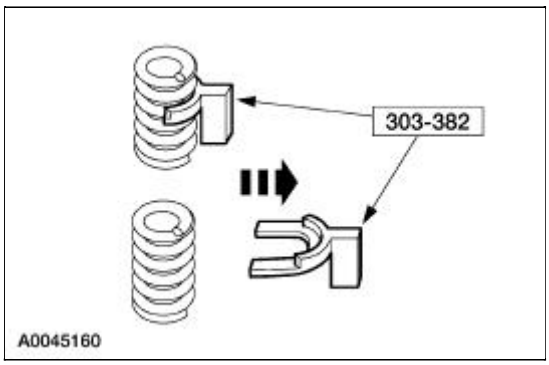


29. Remove the retaining clip from the RH timing chain tensioner.

30. Make sure that the copper (marked) chain links are lined up with the dots on the crankshaft sprockets and the camshaft sprocket.



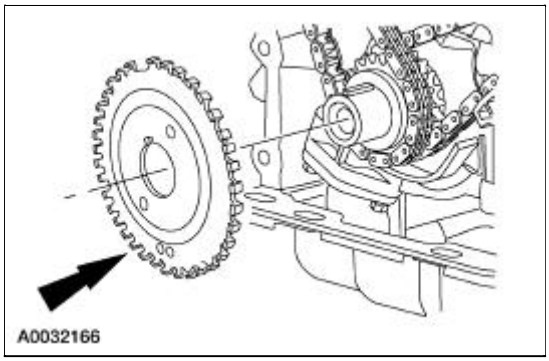
31. Install the special tool between the valve spring coils to prevent valve stem seal damage.



32. **NOTE:** Lubricate the camshaft roller followers using clean engine oil.

    NOTE: Position the cam lobe away from the camshaft roller follower location prior to installing each camshaft roller follower.

    Install the camshaft roller followers.
    1. Install the special tool.
    2. Compress the valve spring.
    3. Install the camshaft roller followers in their original locations.

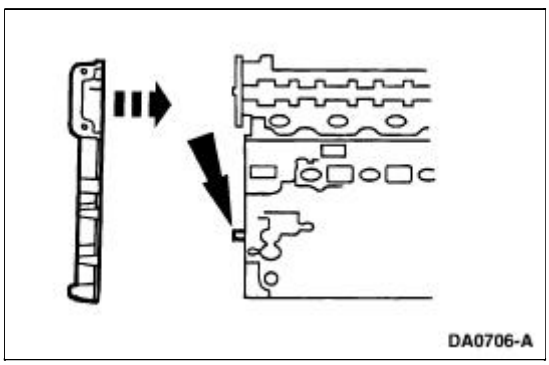


33. Remove the special tool.

34. **CAUTION: When installing the spark plugs, use care not to exceed the recommended torque.**

    Install the eight spark plugs.
    - Tighten the spark plugs to 18 Nm (13 lb-ft).

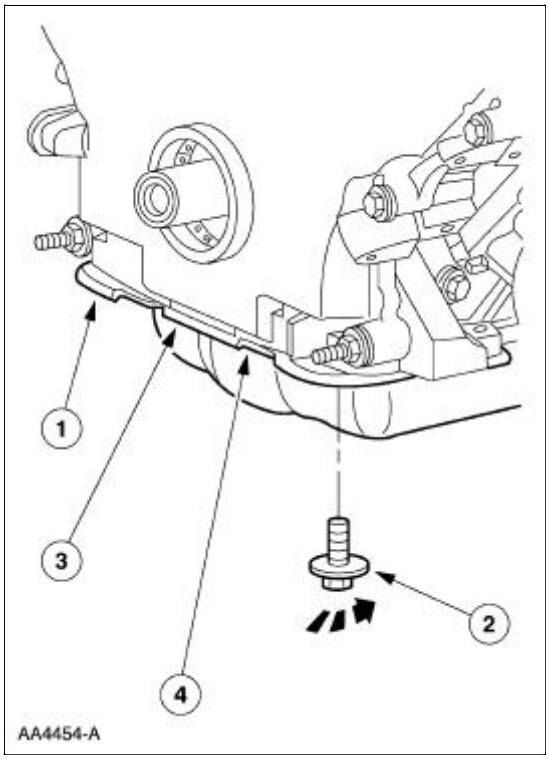
35. Install the crankshaft sensor ring on the crankshaft.



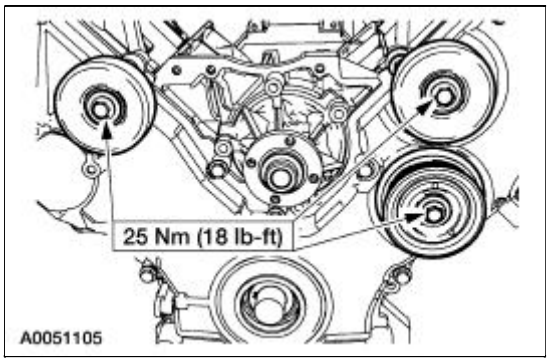
36. **NOTE:** If the front cover is not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply a bead of silicone gasket and sealant along the cylinder head-to-cylinder block surface and the oil pan-to-cylinder block surface, at the locations shown.

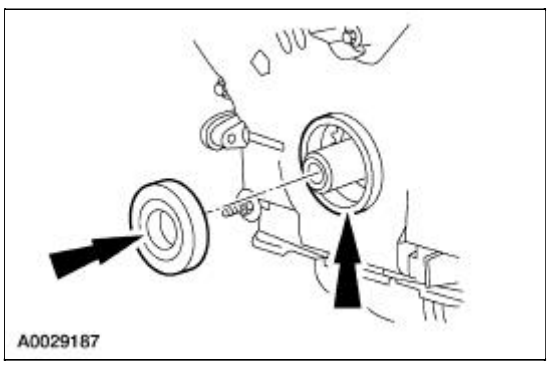
37. Install a new engine front cover gasket on the engine front cover. Position the engine front cover. Install the fasteners finger-tight.



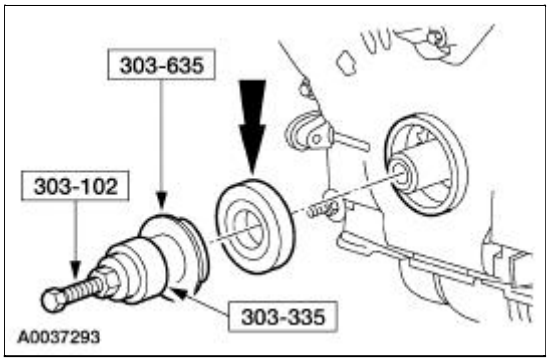
38. Tighten the front cover fasteners in the sequence shown to 25 Nm (18 lb-ft).



Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
4	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
5	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
6	W706508	Stud, Hex Shldr Pilot, M8 x 1.25 x 50 — M6 x 1 x 10
7	N808586	Stud and Washer, Hex Head Pilot, M8 x 1.25 x 60 — M6 x 1 x 26
8	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
9	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
10	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
11	N806300	Stud, Hex Shldr Pilot, M8 x 1.25 x 65 — M6 x 1.25 x 26
12	N806300	Stud, Hex Shldr Pilot, M8 x 1.25 x 65 — M6 x 1.25 x 26
13	N806300	Stud, Hex Shldr Pilot, M8 x 1.25 x 65 — M6 x 1.25 x 26
14	N806300	Stud, Hex Shldr Pilot, M8 x 1.25 x 65 — M6 x 1.25 x 26
15	N806300	Stud, Hex Shldr Pilot, M8 x 1.25 x 65 — M6 x 1.25 x 26

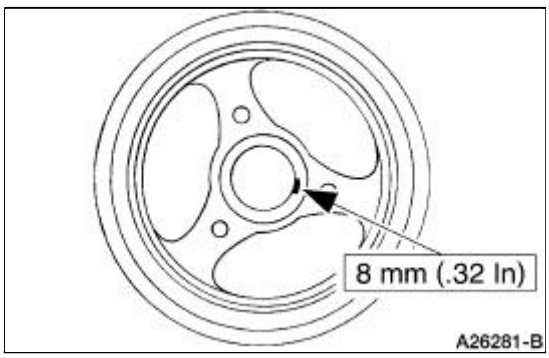


39. Loosely install the bolts, then tighten the bolts in two stages, in the sequence shown.
    - Stage 1: Tighten to 20 Nm (15 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

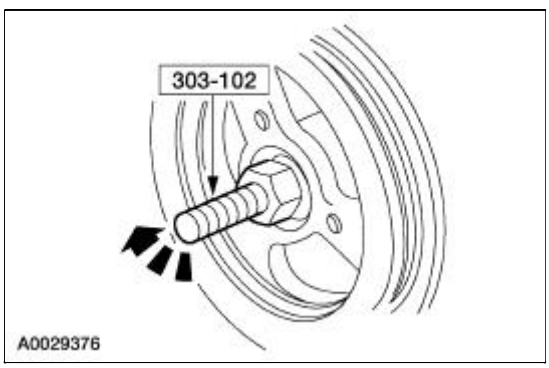


40. Position the belt idler pulleys and install the bolts.

41. Lubricate the engine front cover and the front oil seal inner lip with clean engine oil.

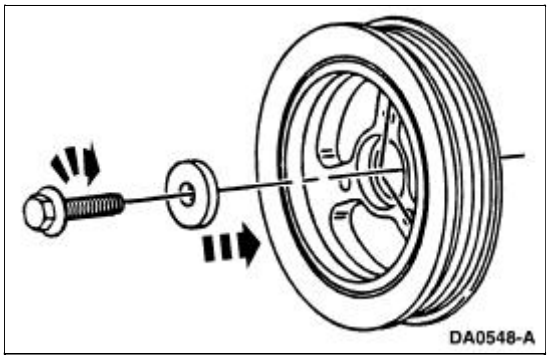


42. Use the special tools to install the crankshaft front oil seal into the engine front cover.

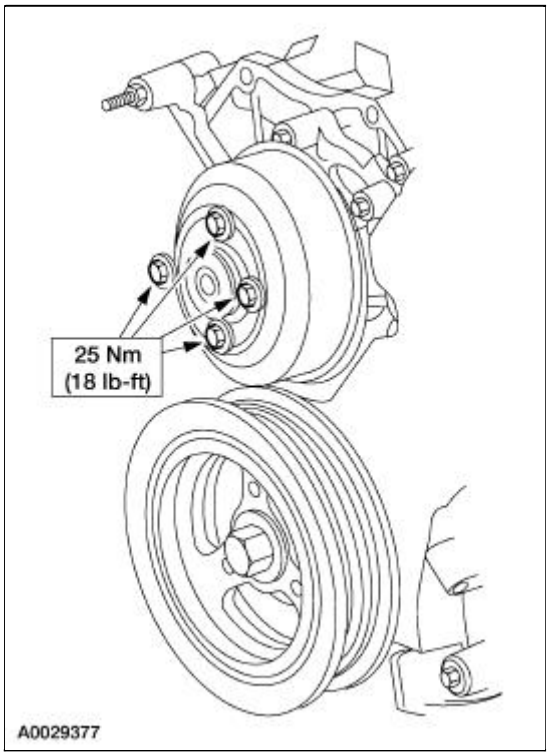


43. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant to the Woodruff key slot on the crankshaft pulley.



44. Use the special tool to install the crankshaft pulley.

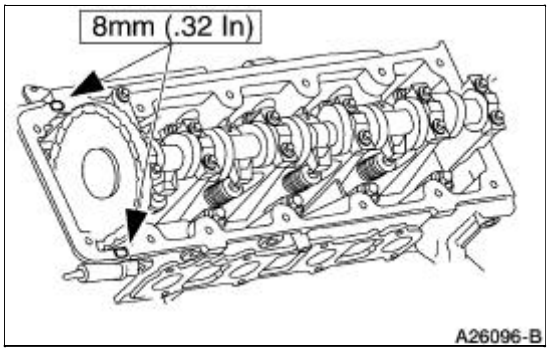


45. **NOTE:** Use a suitable strap wrench (303-D055) to hold the pulley while tightening the bolt.

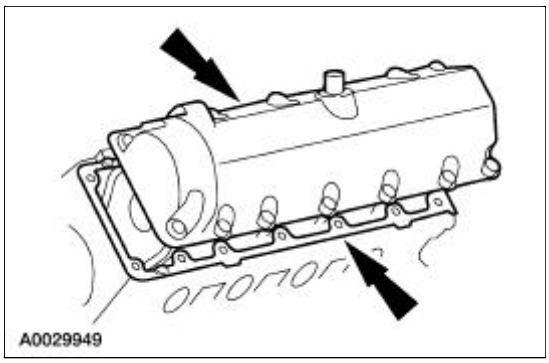
    Tighten the new crankshaft pulley bolt in four stages.

    - Stage 1: Tighten to 90 Nm (66 lb-ft).
    - Stage 2: Loosen 360 degrees.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

46. Position the coolant pump pulley on the coolant pump and install the bolts.

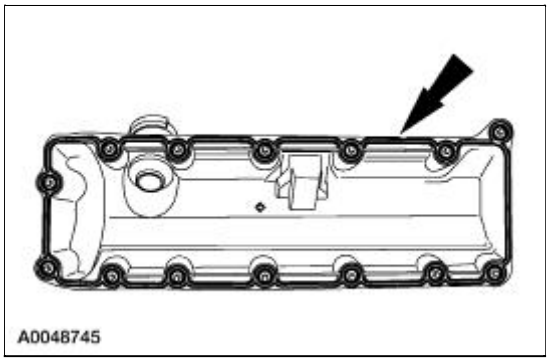


47. If a new gasket is being installed, apply instant adhesive completely around the gasket groove in the LH valve cover. Install the new valve cover gasket.



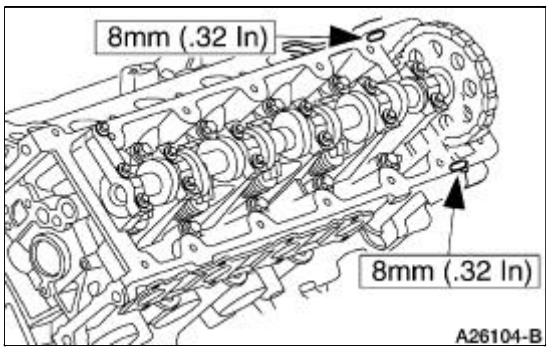
48. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant in two places where the engine front cover meets the cylinder head.

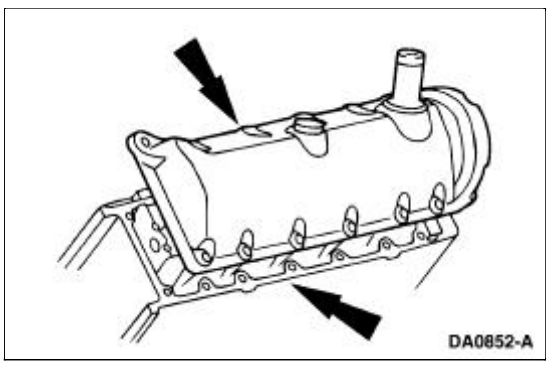


49. Position the LH valve cover and gasket on the cylinder head and install the bolts loosely.

50. Tighten the bolts in the sequence shown.

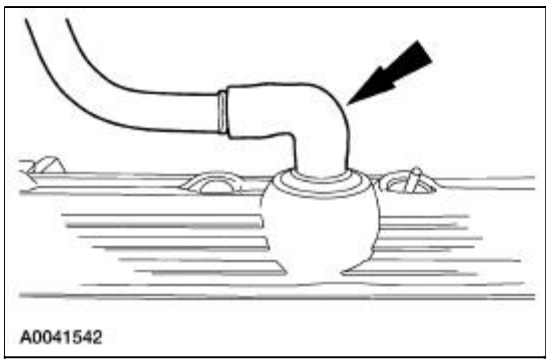


51. If a new gasket is being installed, apply instant adhesive completely around the gasket groove in the RH valve cover. Install the new valve cover gasket.



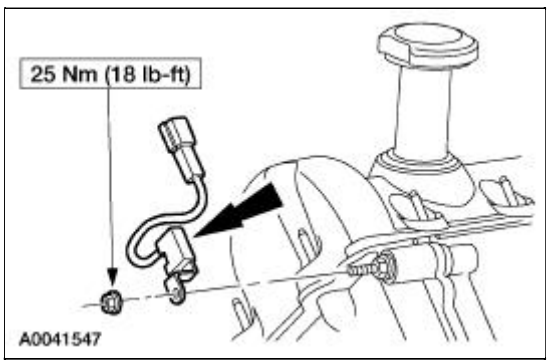
52. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant in two places where the engine front cover meets the cylinder head.

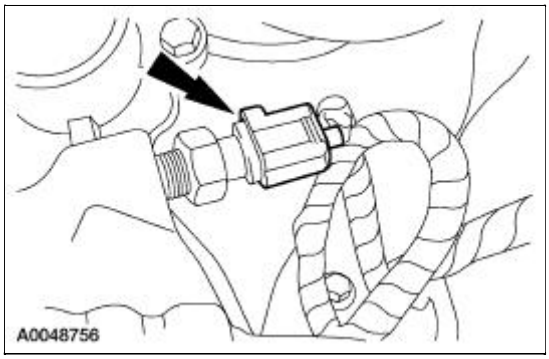


53. Position the RH valve cover and gasket on the cylinder head and install the bolts loosely.

54. Tighten the bolts in the sequence shown.

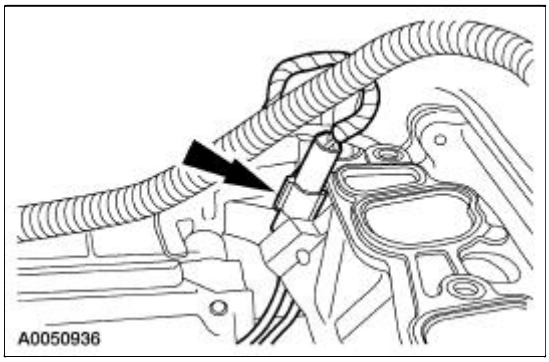


55. Install the crankcase ventilation tube on the LH valve cover.

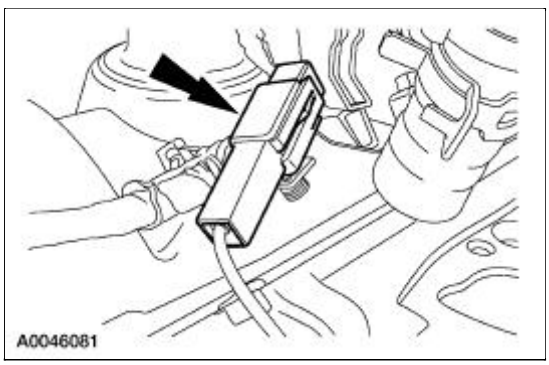


56. **NOTE:** RH shown, LH similar.

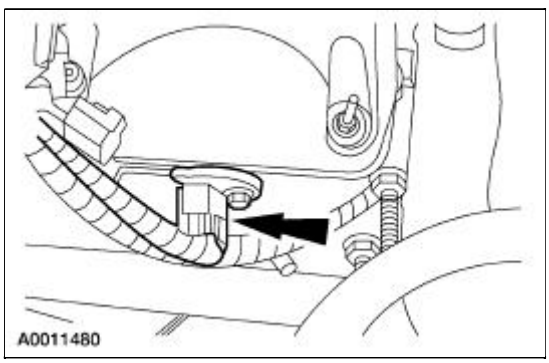
    Install the radio frequency interference capacitors and the engine appearance cover bracket.



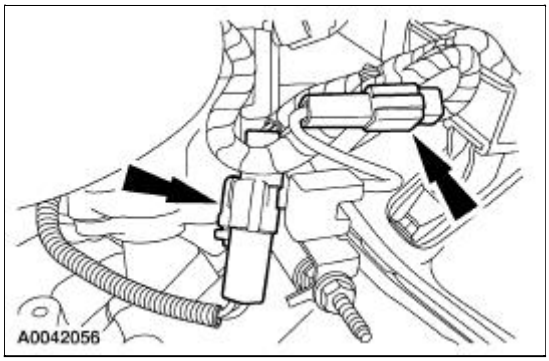
57. Roughly position the engine control sensor wiring harness and mount it on the valve cover studs.



58. Connect the oil pressure switch electrical connector.

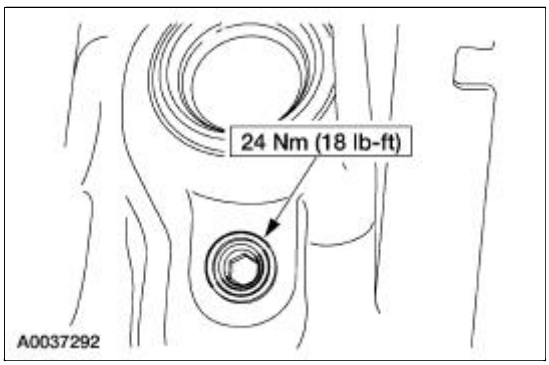


59. Connect the knock sensor electrical connector.

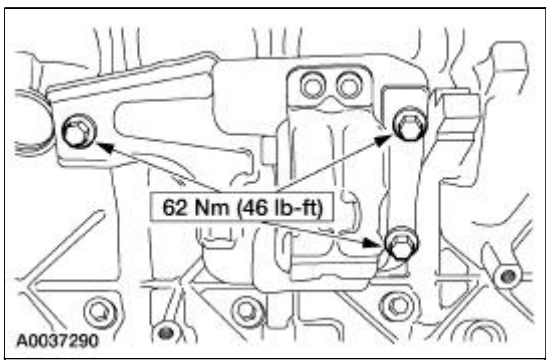


60. Connect the RH radio frequency interference capacitor electrical connector.

61. Connect the CMP sensor electrical connector.

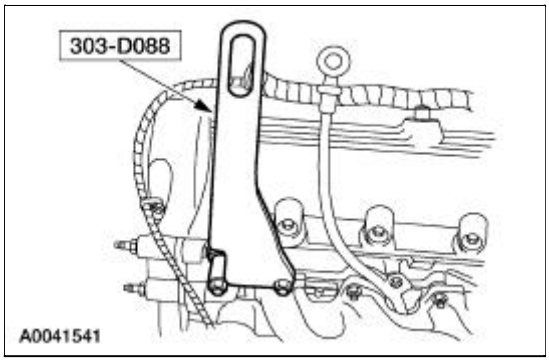


62. Connect the LH radio frequency interference capacitor and CHT sensor electrical connectors.

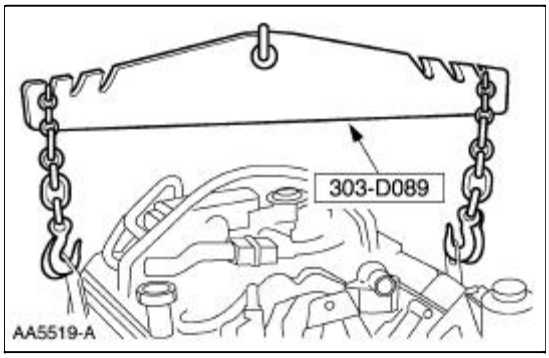


63. **NOTE:** LH shown, RH similar.

    Install the cylinder block drain plugs.

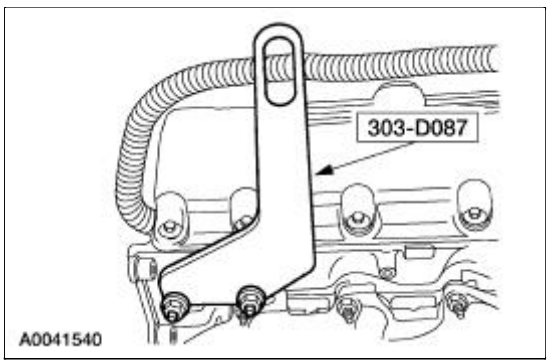


64. Install the RH engine mount.

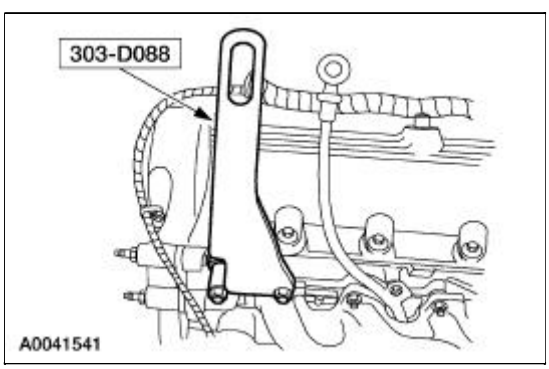


65. Install the special tool.

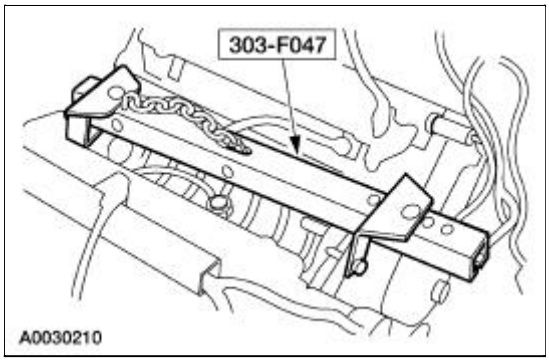
66. Install the special tool.



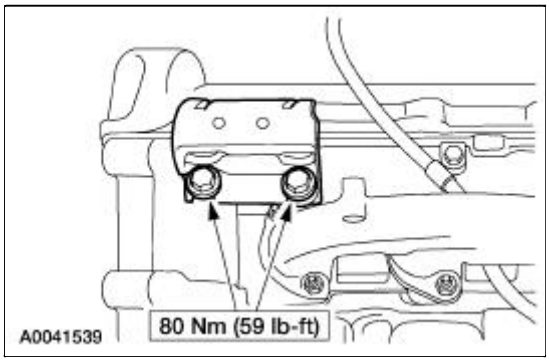
67. Install the special tool and remove the engine from the work stand.



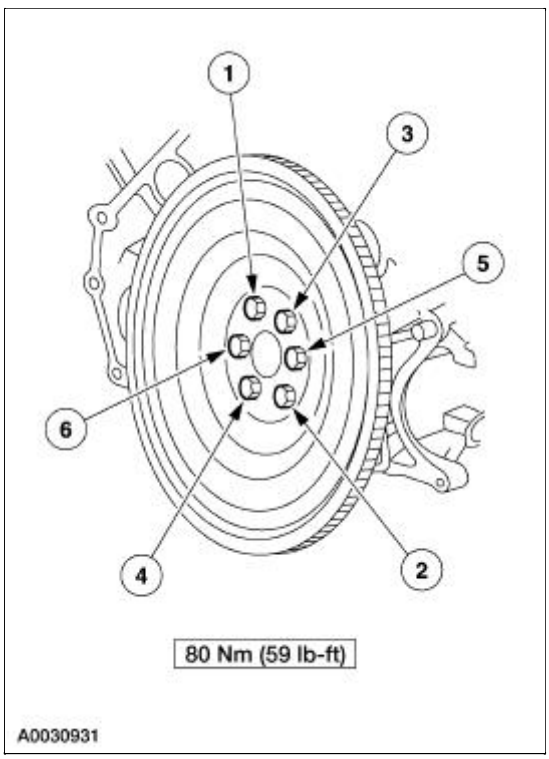
68. Lower the engine onto wooden blocks.



69. Remove the special tool.

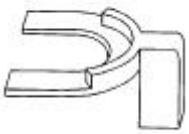


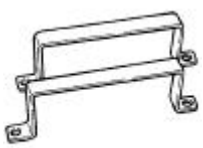
70. Remove the special tool.



71. Install the special tool and raise the engine.

72. Install the power steering reservoir lower mounting bracket.





73. Install the flexplate or the flywheel and bolts. Tighten the bolts in the sequence shown.

74. Install the engine. For additional information, refer to Engine in this section.

Cylinder Heads —5.4L

Special Tool(s)

 ST1330-A	Compressor, Valve Spring 303-567 (T97P-6565-AH)
 ST1331-A	Compressor Spacer, Valve Spring 303-382 (T91P-6565-AH)
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST2197-A	Installer, Crankshaft Front Oil Seal 303-635
 ST1328-A	Installer, Front Cover Oil Seal 303-335 (T88T-6701-A)
 ST1335-A	Holding Tool, Crankshaft 303-448 (T93P-6303-A)
 ST1668-A	Remover/Installer, Cylinder Head 303-572 (T97T-6000-A)
	Lifting Bracket Set, Engine 303-DS086 (D93P-6001-A)

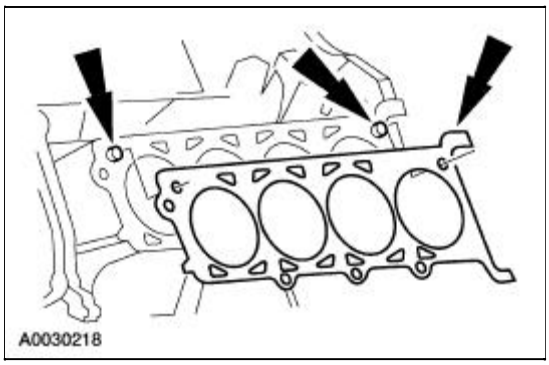
 ST2443-A	
 ST1377-A	Modular Engine Lift Bracket 303-F047 (014-00073) or equivalent
 ST1438-A	Strap Wrench 303-D055 (D85L-6000-A)

Material

Item	Specification
Motorcraft Silicone Gasket Remover ZC-30	—
Motorcraft Metal Surface Prep ZC-31	—
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4
Instant Adhesive E8AZ-19554-A	WSK-M2G402-A4
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H
Motorcraft Premium Engine Coolant VC-4-A (in Canada CXC-10; in Oregon VC-5) or equivalent. Do not mix coolant types.	ESE-M97B44-A (green in color)
Motorcraft Premium Gold Engine Coolant VC-7-A (in Oregon VC-7-B) or equivalent. Do not mix coolant types.	WSS-M97B51-A1 (yellow in color)
Hydraulic Chain Tensioner Retaining Clip	1L3Z-6P250-AA

Installation

All cylinder heads



1. **CAUTION: The gasket sealing surfaces on the cylinder head and cylinder block must be clean. For additional information, refer to Cylinder Heads—5.4L in the Removal portion of this section.**

   CAUTION: The use of sealing aids (aviation cement, copper spray, and glue) is not permitted. The gasket must be installed dry.

   CAUTION: The new gasket has a film coating which is crucial to the gasket's ability to seal correctly. Do not scratch the gasket.

   NOTE: The RH head gasket is shown; the LH head gasket is similar.

   Install the head gasket over the dowel pins.

2. **CAUTION: Cylinder head machining or milling is not authorized by the Ford Motor Company. Cylinder head flatness must be within 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area.**

   CAUTION: The gasket sealing surfaces on the cylinder head and cylinder block must be clean. For additional information, refer to Cylinder Heads—5.4L in the Removal portion of this section.

   CAUTION: The use of sealing aids (aviation cement, copper spray, and glue) is not permitted. The gasket must be installed dry.

   CAUTION: Do not allow the dowels to scratch the sealing surface of the cylinder head during cylinder head installation.

   NOTE: The new cylinder head bolts must be lightly oiled with a rag, and allowed to drain for a few minutes prior to installation.

   NOTE: The RH cylinder head is shown; the LH cylinder head is similar.

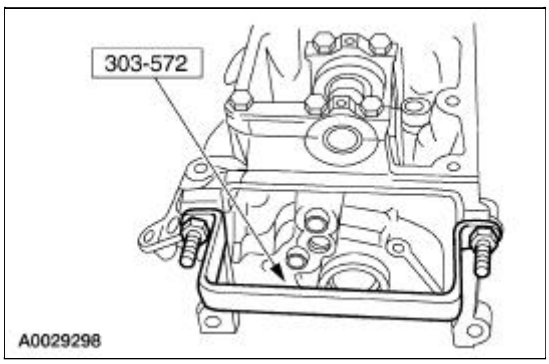
   Install the cylinder head on the dowels and the head gasket. Loosely install new bolts.

LH cylinder head

3. **NOTE:** Make sure to tighten the bolts in sequence in three stages.

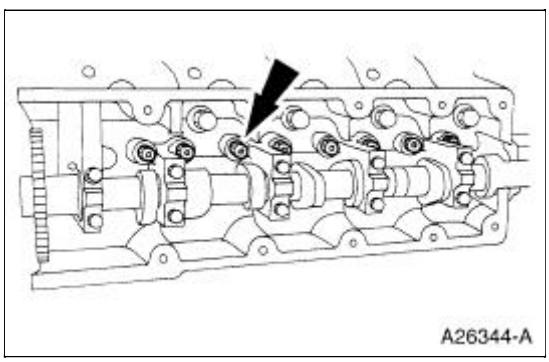
   Tighten the LH bolts in the sequence shown.
   - Stage 1: Tighten to 40 Nm (30 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.
   - Stage 3: Tighten an additional 90 degrees.

RH cylinder head



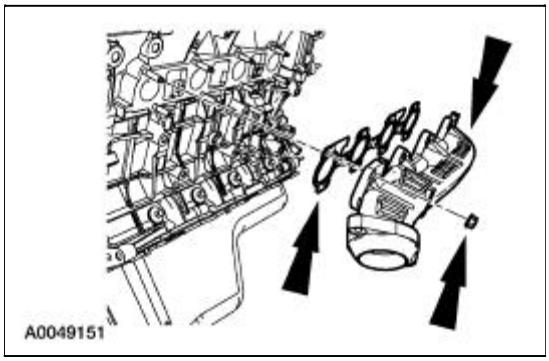
4. **NOTE:** Make sure to tighten the bolts in the following three stages.

   Tighten the RH bolts in the sequence shown.
   - Stage 1: Tighten to 40 Nm (30 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.
   - Stage 3: Tighten an additional 90 degrees.



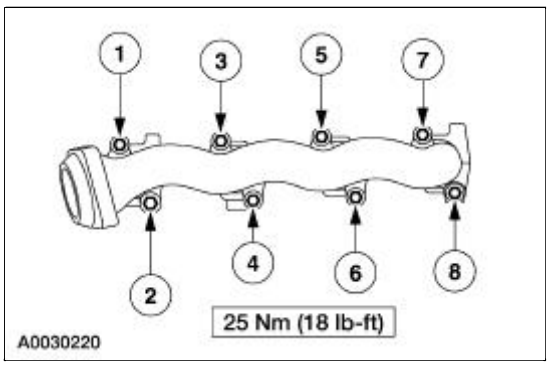
All cylinder heads

5. Remove the special tools from both ends of the cylinder head.



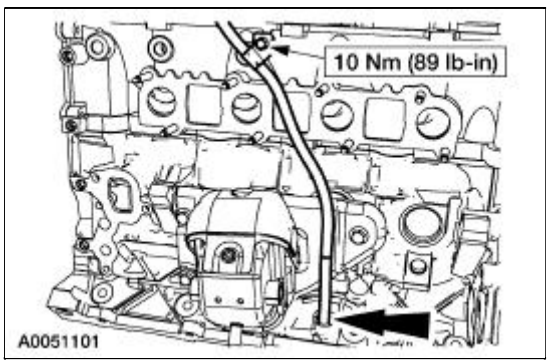
6. **NOTE:** Lubricate the hydraulic lash adjusters with clean engine oil.

   Install the hydraulic lash adjusters in their original locations.

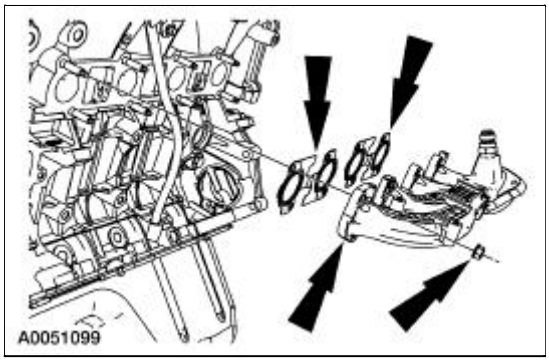


RH cylinder head

7. Position the RH exhaust manifold gasket and the exhaust manifold. Loosely install the nuts.



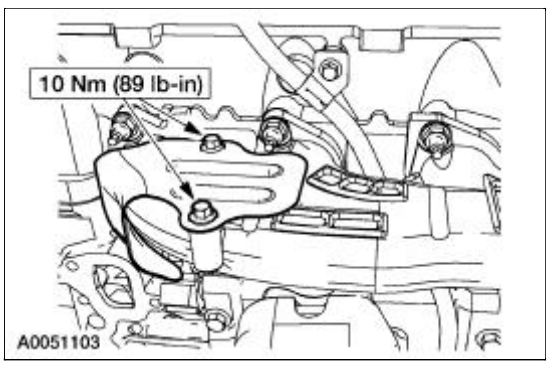
8. Tighten the RH exhaust manifold nuts in the sequence shown.



LH cylinder head

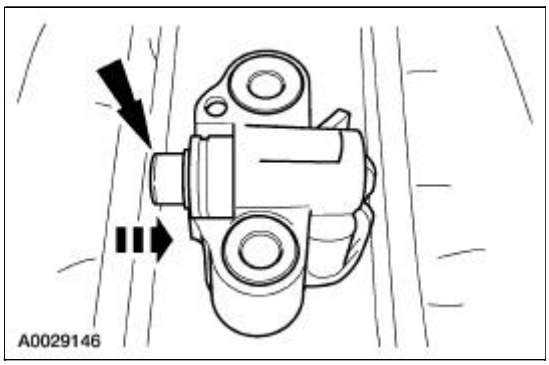
9. **NOTE:** Lubricate the O-ring seal with clean engine oil.

   Install the oil level indicator tube.
   - Install a new O-ring seal on the oil level indicator tube.
   - Install the oil level indicator tube.
   - Install the bolt.

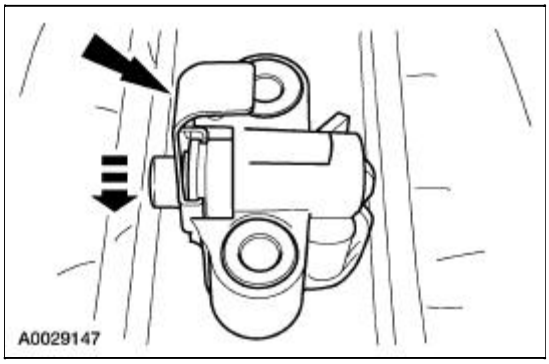


10. Position the LH exhaust manifold gaskets and the exhaust manifold. Loosely install the nuts.

11. Tighten the LH exhaust manifold nuts in the sequence shown.



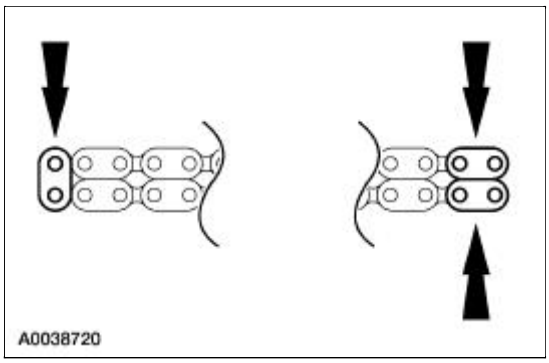
12. Install the heat shield and bolts.



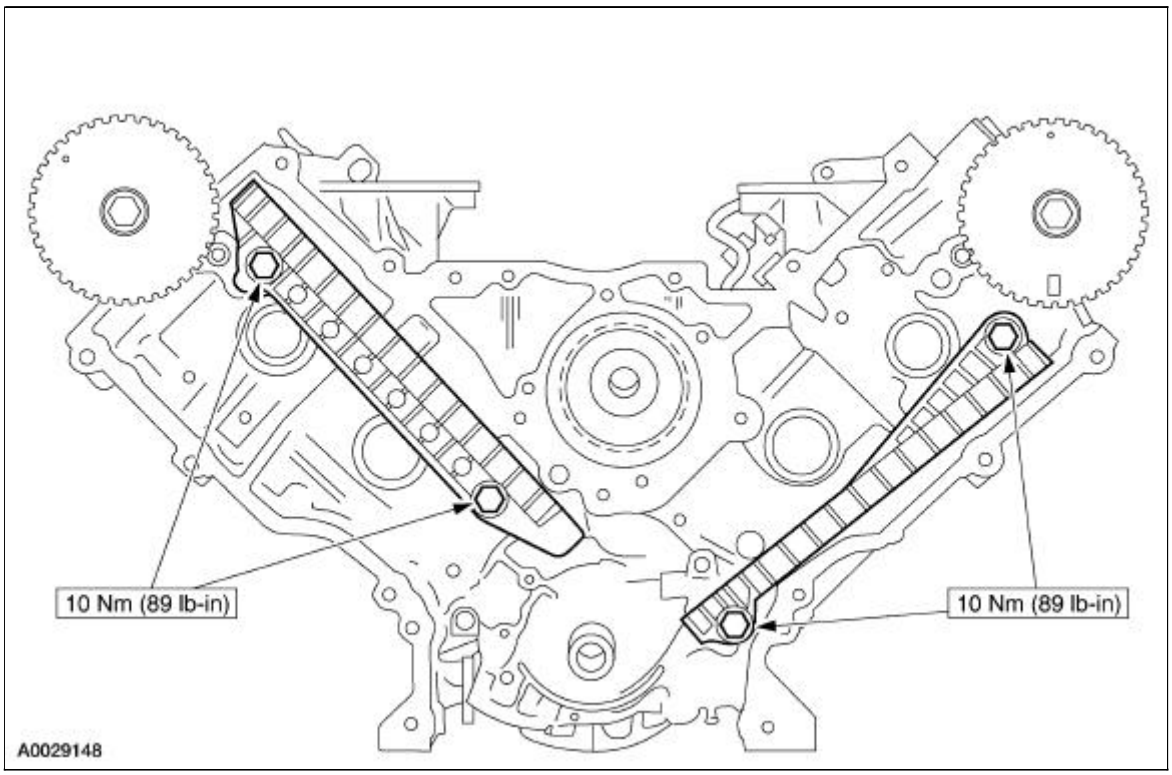
All cylinder heads

13. **CAUTION: Timing chain procedures must be followed exactly or damage to valves and pistons will result.**

    Compress the tensioner plunger, using a vise.

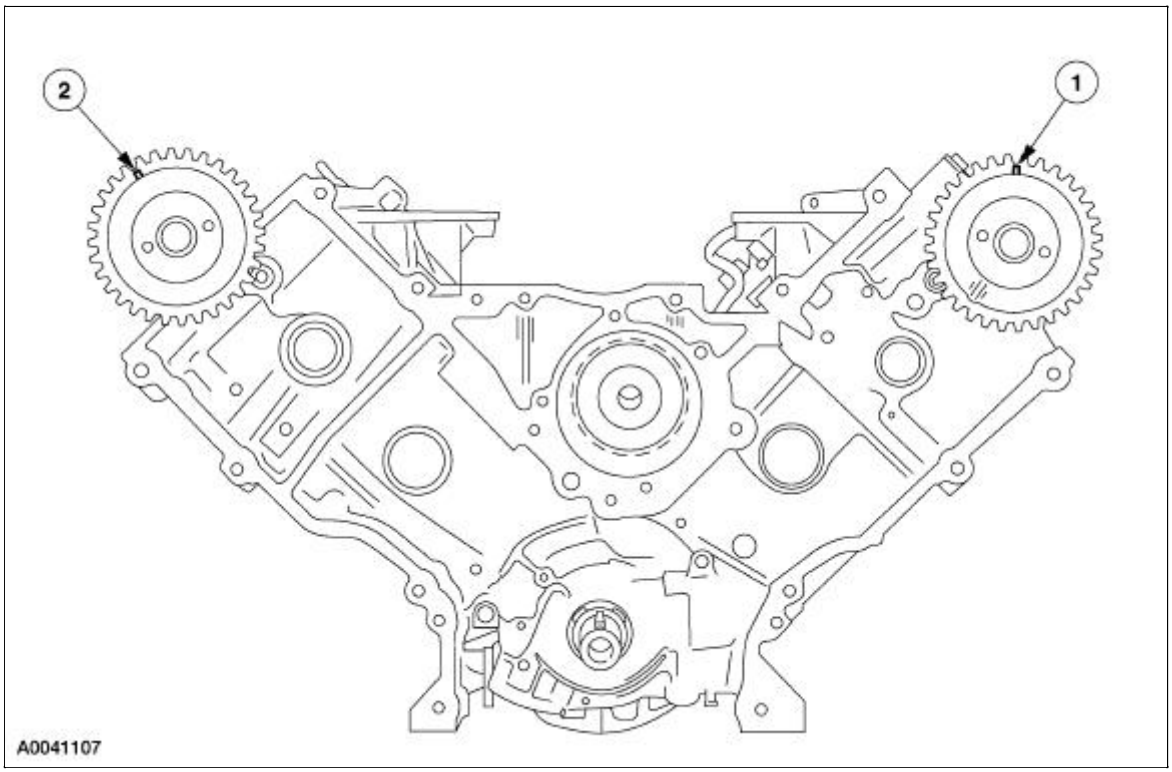


14. Install a retaining clip on the tensioner to hold the plunger in during installation.



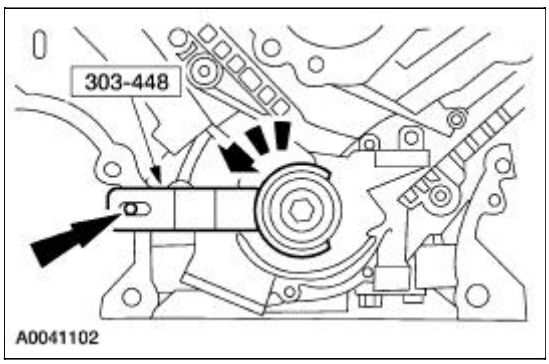
15. Remove the tensioner from the vise.

16. If the copper links are not visible, mark two links on one end and one link on the other end, and use as timing marks.



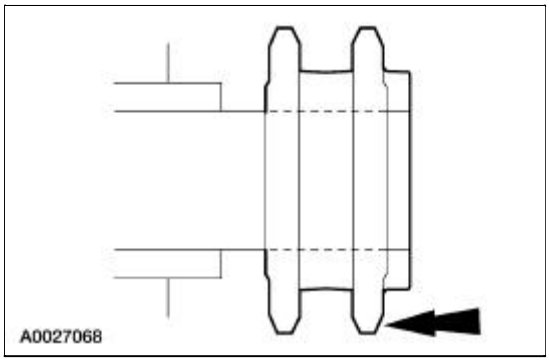
17. Install the timing chain guides.

18. Pre-position the camshafts.



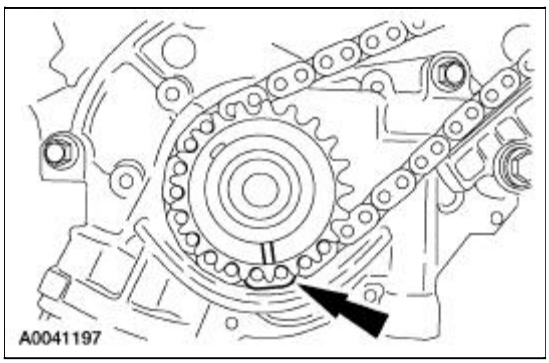
1. Rotate the LH camshaft until the timing mark is approximately at 12 o'clock.
2. Rotate the RH camshaft until the timing mark is approximately at 11 o'clock.

19. **CAUTION: Rotate the crankshaft counterclockwise only. Do not rotate past position shown or severe piston and valve damage can occur.**



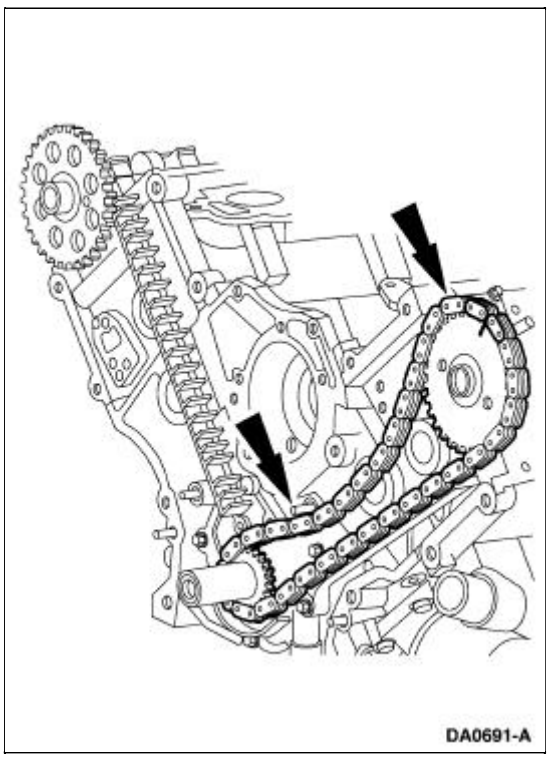
NOTE: The number one piston is at top dead center (TDC) when the stud on the engine block fits into the slot in the handle of the special tool.

Position the crankshaft so the number one cylinder is at TDC with the special tool.

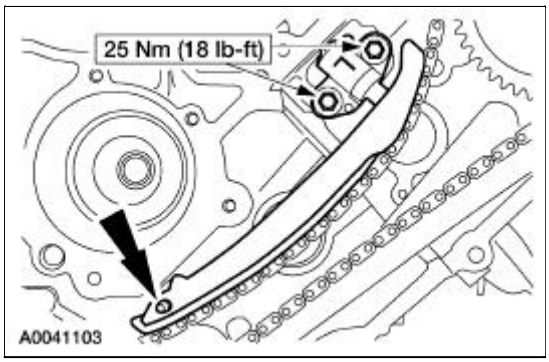


20. Remove the Crankshaft Holding Tool.

21. Install the crankshaft sprocket, making sure the flange faces forward.

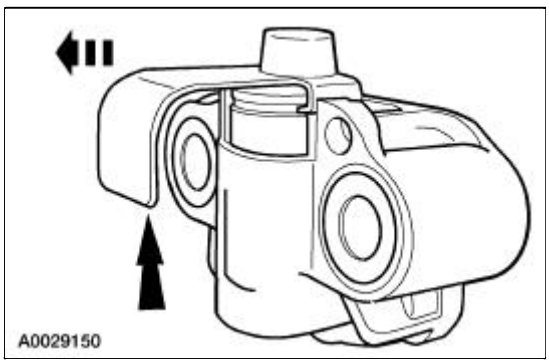


22. Position the lower end of the LH (inner) timing chain on the crankshaft sprocket, aligning the timing mark on the outer flange of the crankshaft sprocket with the single copper (marked) link on the chain.

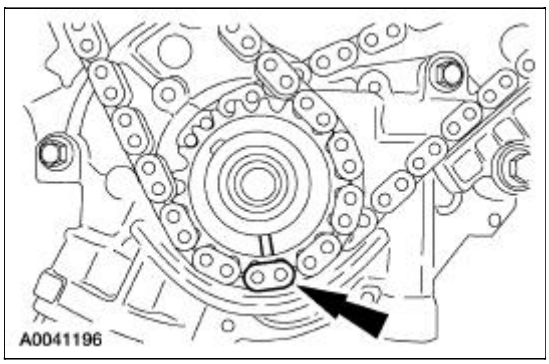


23. **NOTE:** Make sure the upper half of the timing chain is below the tensioner arm dowel.

    Position the timing chain on the camshaft sprocket with the camshaft sprocket timing mark positioned between the two copper (marked) chain links.

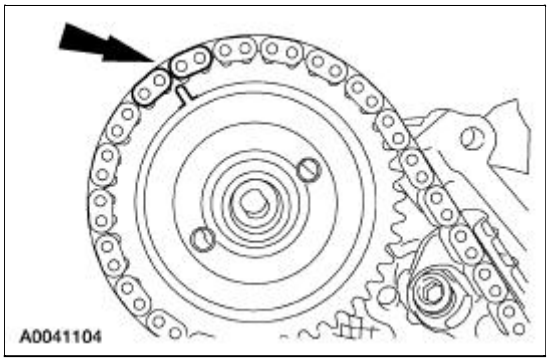


24. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole for identification.

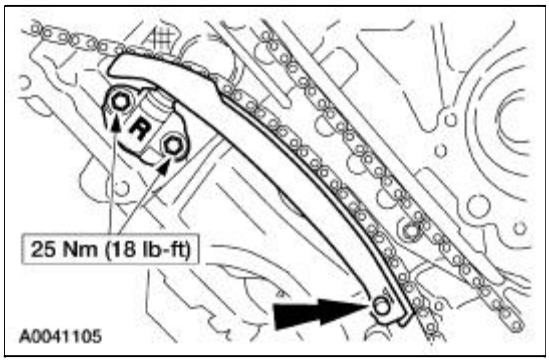


Position the LH timing chain tensioner arm on the dowel pin and install the LH timing chain tensioner.

25. Remove the retaining clip from the LH timing chain tensioner.

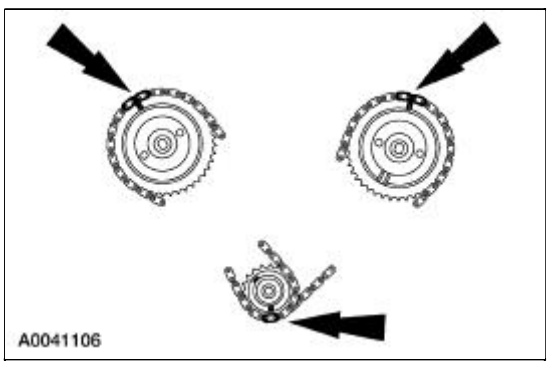


26. Position the lower end of the RH (outer) timing chain on the crankshaft sprocket, aligning the timing mark on the sprocket with the single copper (marked) chain link.

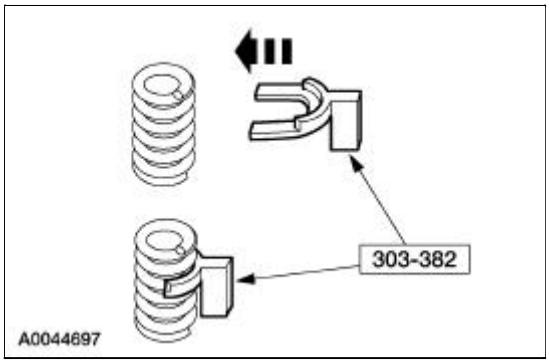


27. **NOTE:** The lower half of the timing chain must be positioned above the tensioner arm dowel.

    Position the RH timing chain on the camshaft sprocket. Make sure the camshaft sprocket timing mark is positioned between the two copper (marked) chain links.

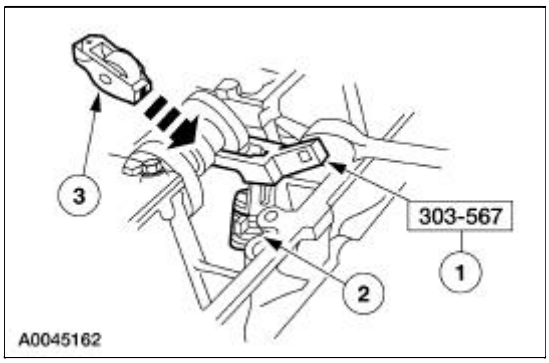


28. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner.

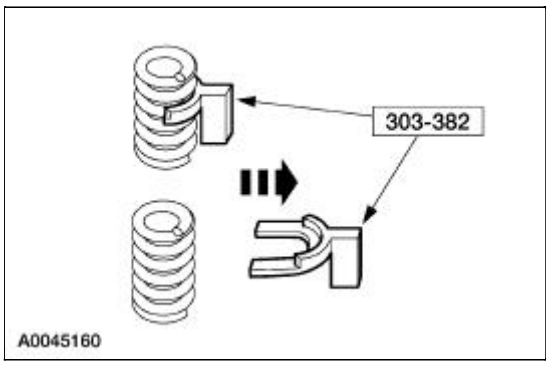


29. Remove the retaining clip from the RH timing chain tensioner.

30. As a post-check, verify correct alignment of all timing marks.



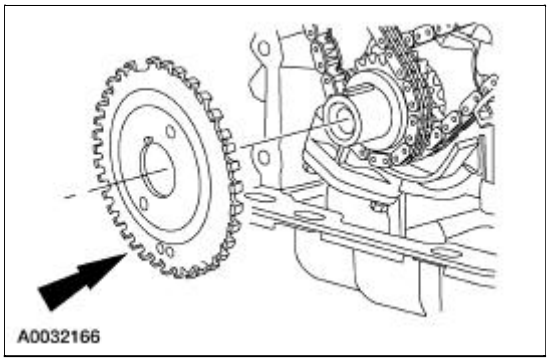
31. Install the special tool between the valve spring coils to prevent valve stem seal damage.



32. **NOTE:** Lubricate the camshaft roller followers using clean engine oil.

    NOTE: Position the cam lobe away from the camshaft roller follower location prior to installing each camshaft roller follower.

    Install the camshaft roller followers.
    1. Install the special tool.
    2. Compress the valve spring.
    3. Install the camshaft roller followers in their original locations.

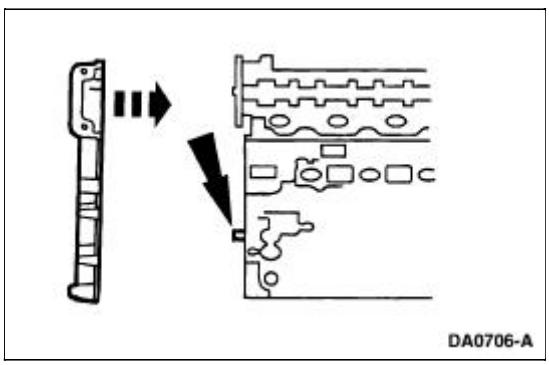


33. Remove the special tool.

34. **CAUTION: When installing the spark plugs, use care not to exceed the recommended torque.**

    Install the eight spark plugs.
    - Tighten the spark plugs to 18 Nm (13 lb-ft).

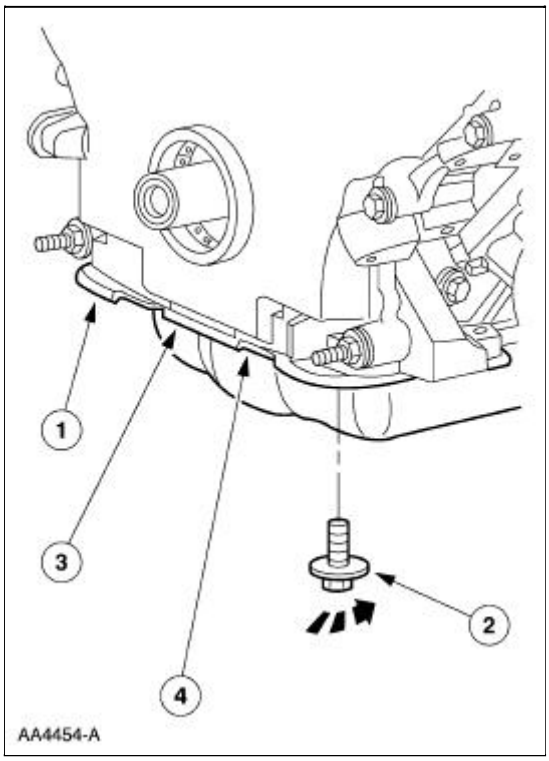
35. Install the crankshaft sensor ring on the crankshaft.



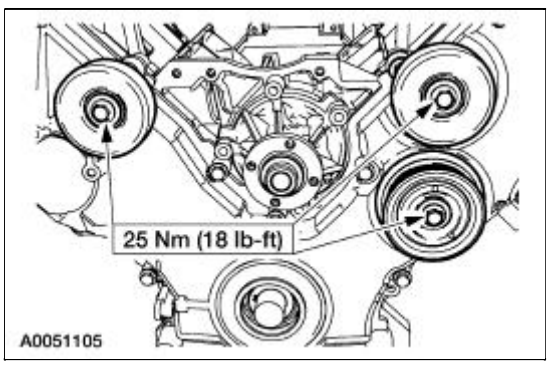
36. **NOTE:** If the front cover is not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply a bead of silicone gasket and sealant along the cylinder head-to-cylinder block surface and the oil pan-to-cylinder block surface, at the locations shown.

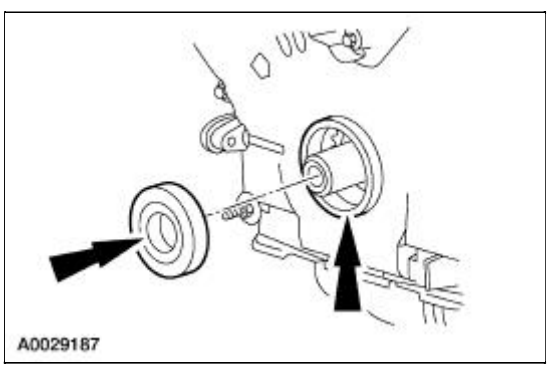
37. Install a new engine front cover gasket on the engine front cover. Position the engine front cover. Install the fasteners finger-tight.



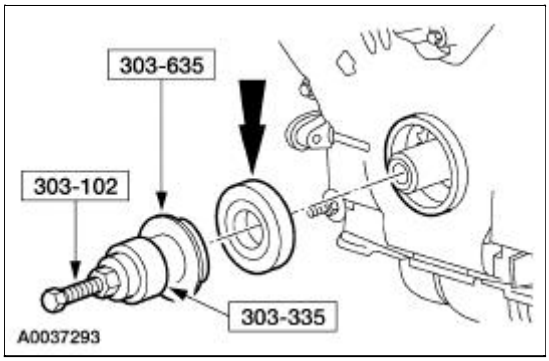
38. Tighten the engine front cover fasteners in sequence in three stages.
Stage 1: Tighten fasteners 1 through 5 to 25 Nm (18 lb-ft).
Stage 2: Tighten fasteners 6 and 7 to 48 Nm (35 lb-ft).
Stage 3: Tighten fasteners 8 through 15 to 48 Nm (35 lb-ft).



Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
4	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
5	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
6	N808529	Stud, Hex Head Pilot, M10 x 1.5 x 59 — M10 x 1.5 x 30
7	N808529	Stud, Hex Head Pilot, M10 x 1.5 x 59 — M10 x 1.5 x 30
8	N808142	Screw and Washer, Hex Pilot, M10 x 1.5 x 57.5
9	N808142	Screw and Washer, Hex Pilot, M10 x 1.5 x 57.5
10	N808142	Screw and Washer, Hex Pilot, M10 x 1.5 x 57.5
11	N808140	Stud and Washer, Hex Head Pilot, M10 x 1.5 x 68 — M8 x 1.25 x 27
12	N808140	Stud and Washer, Hex Head Pilot, M10 x 1.5 x 68 — M8 x 1.25 x 27
13	N808140	Stud and Washer, Hex Head Pilot, M10 x 1.5 x 68 — M8 x 1.25 x 27
14	N808140	Stud and Washer, Hex Head Pilot, M10 x 1.5 x 68 — M8 x 1.25 x 27
15	N808140	Stud and Washer, Hex Head Pilot, M10 x 1.5 x 68 — M8 x 1.25 x 27

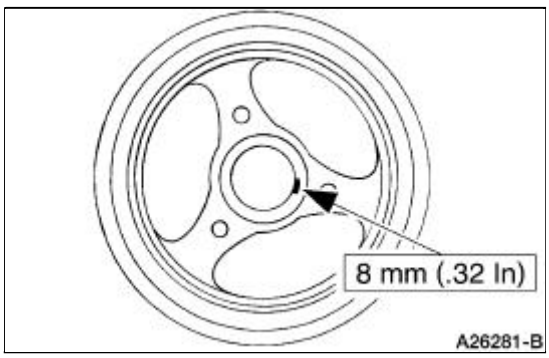


39. Loosely install the bolts, then tighten the bolts in two stages, in the sequence shown.
    - Stage 1: Tighten to 20 Nm (15 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

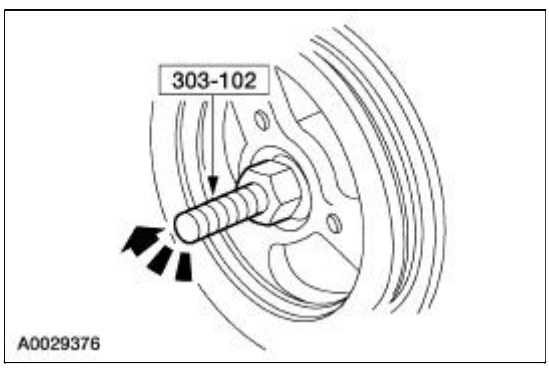


40. Position the belt idler pulleys and install the bolts.

41. Lubricate the engine front cover and the front oil seal inner lip with clean engine oil.

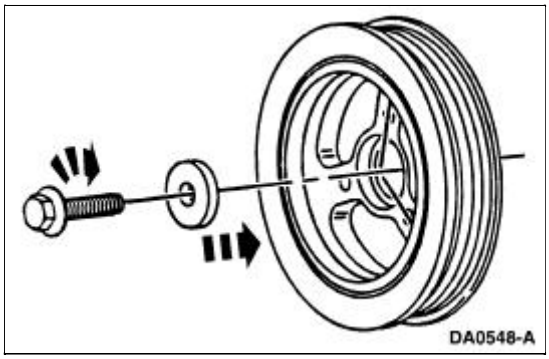


42. Use the special tools to install the crankshaft front oil seal into the engine front cover.

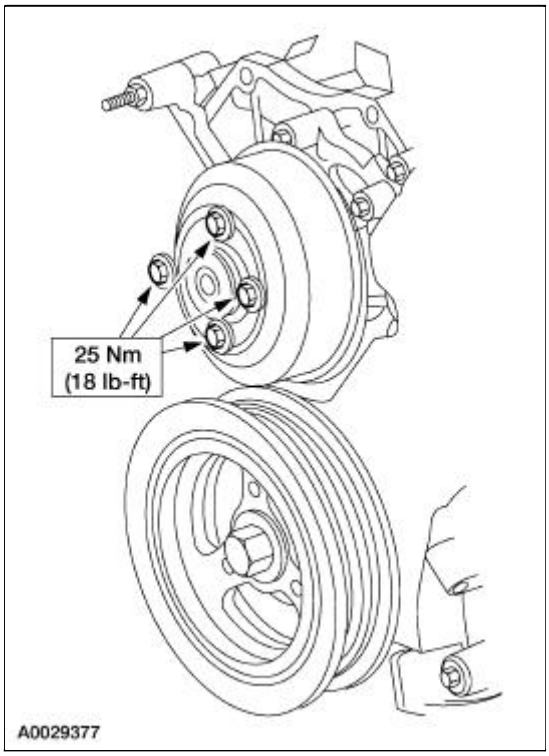


43. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant to the Woodruff key slot on the crankshaft pulley.



44. Use the special tool to install the crankshaft pulley.

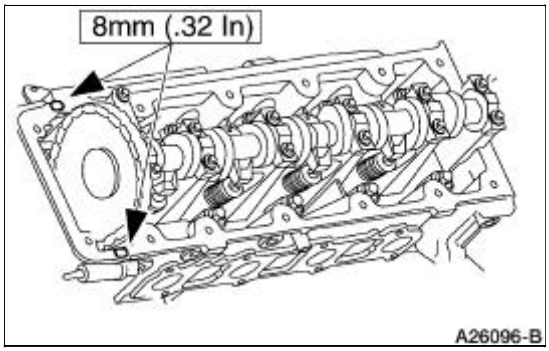


45. **NOTE:** Use a suitable strap wrench (303-D055) to hold the pulley while tightening the bolt.

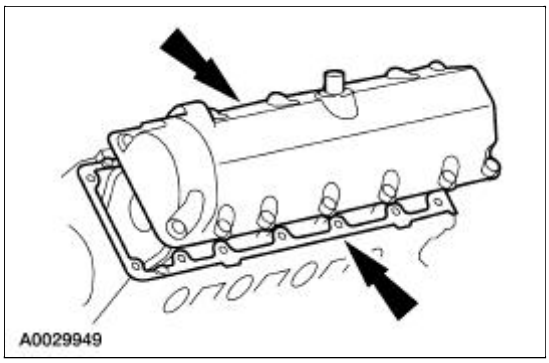
    Tighten the new crankshaft pulley bolt in four stages.

    - Stage 1: Tighten to 90 Nm (66 lb-ft).
    - Stage 2: Loosen 360 degrees.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

46. Position the coolant pump pulley on the coolant pump and install the bolts.

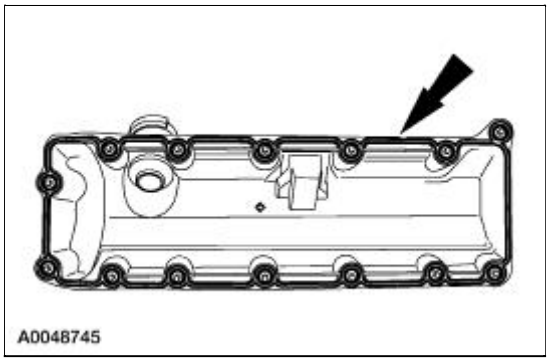


47. If a new gasket is being installed, apply instant adhesive completely around the gasket groove in the LH valve cover. Install the new valve cover gasket.



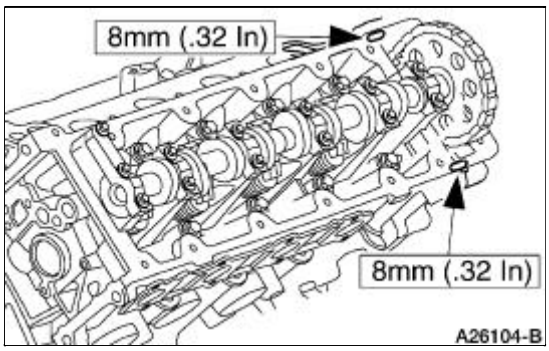
48. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant in two places where the engine front cover meets the cylinder head.

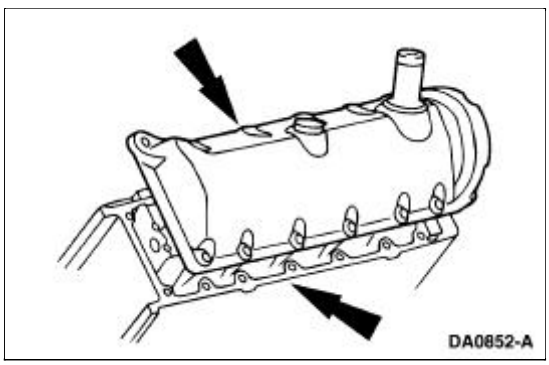


49. Position the LH valve cover and gasket on the cylinder head and install the bolts loosely.

50. Tighten the bolts in the sequence shown.

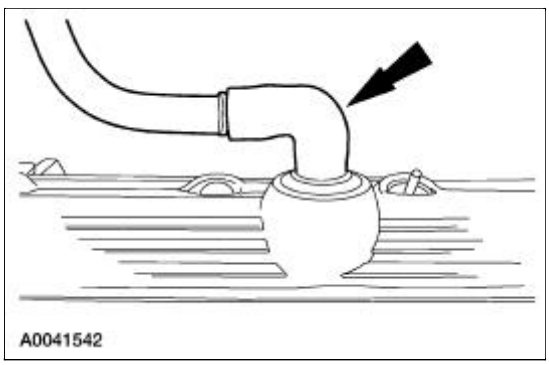


51. If a new gasket is being installed, apply instant adhesive completely around the gasket groove in the RH valve cover. Install the new valve cover gasket.



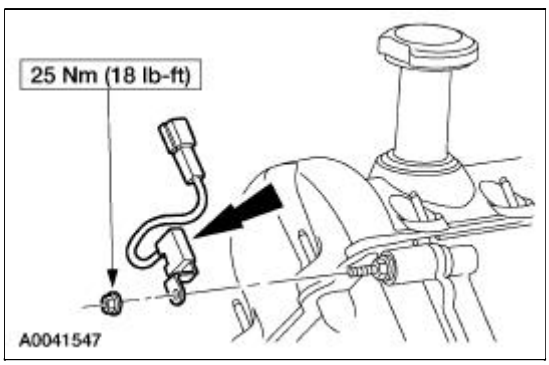
52. **NOTE:** If not secured within four minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant in two places where the engine front cover meets the cylinder head.

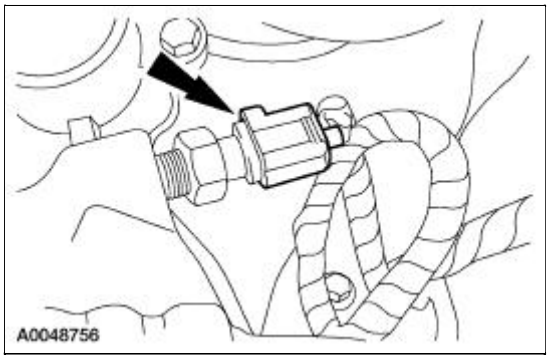


53. Position the RH valve cover and gasket on the cylinder head and install the bolts loosely.

54. Tighten the bolts in the sequence shown.

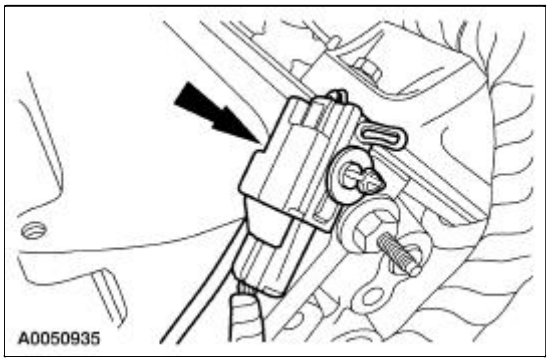


55. Install the crankcase ventilation tube on the LH valve cover.

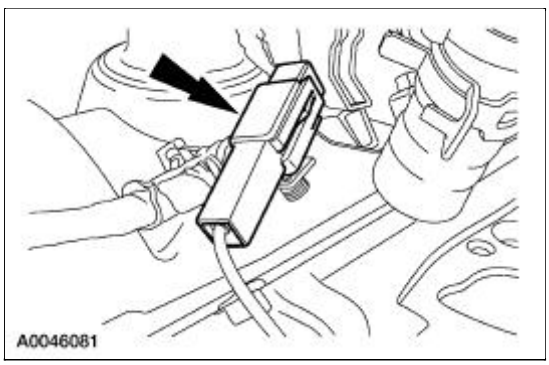


56. **NOTE:** RH shown, LH similar.

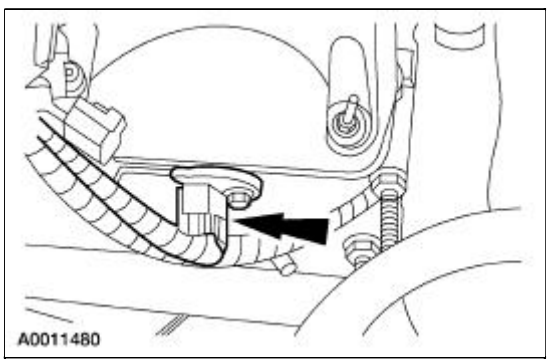
    Install the radio frequency interference capacitors.



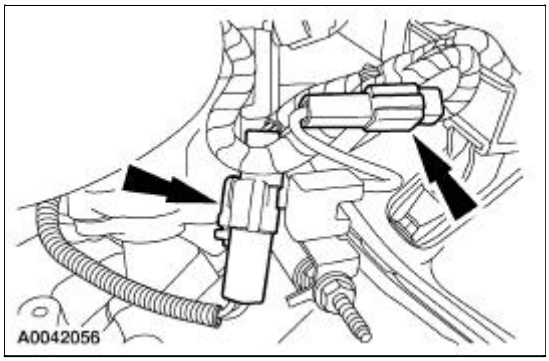
57. Roughly position the engine control sensor wiring harness and mount it on the valve cover studs.



58. Connect the oil pressure switch electrical connector.

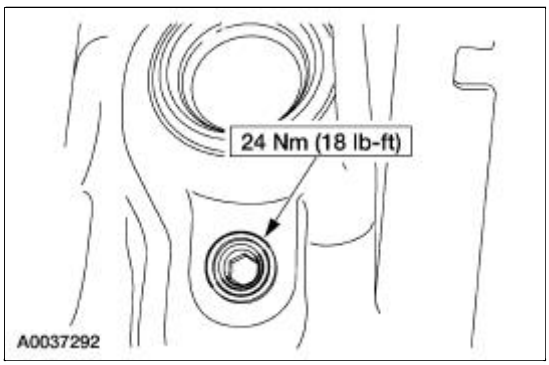


59. Connect the knock sensor electrical connector.

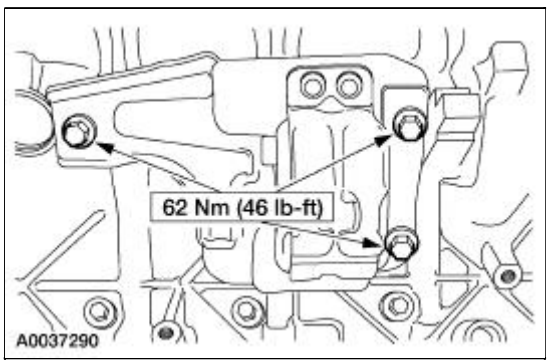


60. Connect the RH radio frequency interference capacitor electrical connector.

61. Connect the CMP sensor electrical connector.

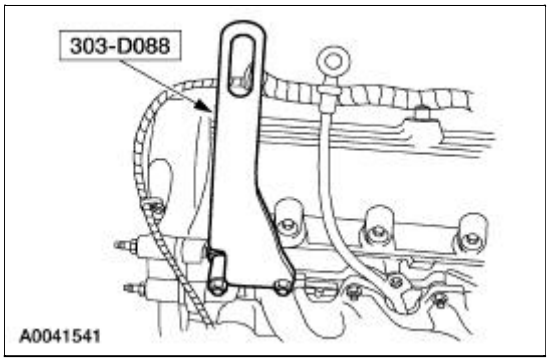


62. Connect the LH radio frequency interference capacitor and CHT sensor electrical connectors.

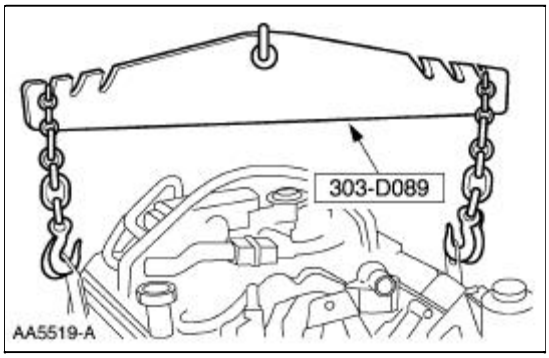


63. **NOTE:** LH shown, RH similar.

    Install the cylinder block drain plugs.

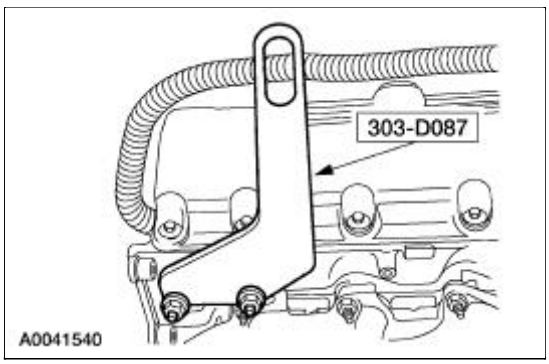


64. Install the RH engine mount.

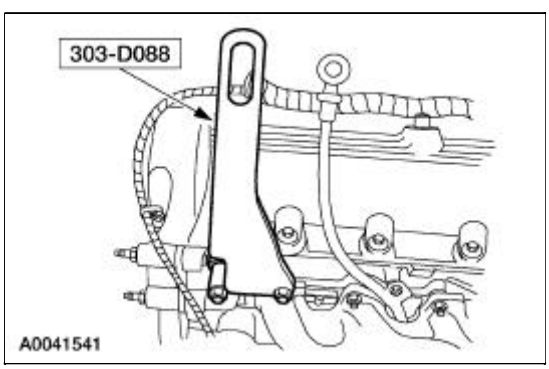


65. Install the special tool.

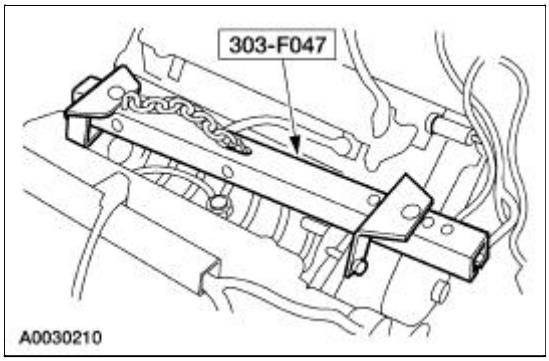
66. Install the special tool.



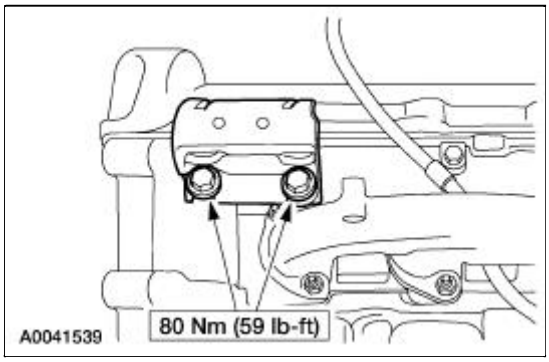
67. Install the special tool and remove the engine from the work stand.



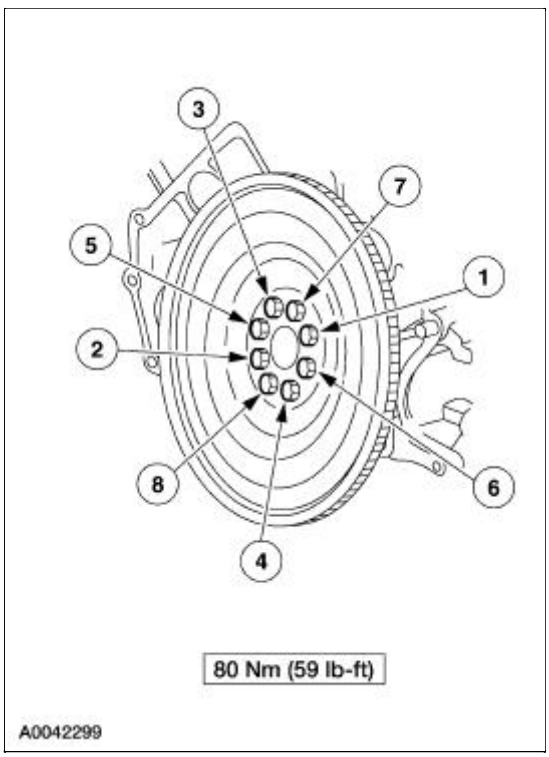
68. Lower the engine onto wooden blocks.



69. Remove the special tool.



70. Remove the special tool.



71. Install the special tool and raise the engine.

72. Install the power steering reservoir lower mounting bracket.

73. Install the flexplate or the flywheel and bolts. Tighten the bolts in the sequence shown.

74. Install the engine. For additional information, refer to Engine in this section.

General Specifications

Item	Specification
Lubricants and Sealants	
Silicone Gasket and Sealant F7AZ-19554-EA	WSE-M4G323-A4
Metal Surface Cleaner F4AZ-19A536-RA	WSE-M5B392-A
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP	WSS-M2C153-H
Motorcraft Premium Engine Coolant VC-4-A (in Oregon VC-5, in Canada CXC-10) or equivalent	ESE-M97B44-A
Motorcraft Premium Gold Engine Coolant VC-7-A or equivalent	WSS-M97B51-A1
Pipe Sealant with Teflon® XW7Z-19554-AA or equivalent	WSK-M2G350-A2 and ESR-M18P7-A
Engine	
Displacement	5.4L (4V)
Number of cylinders	8
Bore	90.215 (3.552)
Stroke	105.8 mm (4.23 in)
Firing order	1-3-7-2-6-5-4-8
Oil pressure	40-60 psi @ 2000 rpm
Oil capacity	6.62L (7 quarts)
Compression ratio	9.5:1
Cylinder Head and Valve Train	
Cylinder head gasket surface flatness	0.0254 mm (0.001 in) across any 38.1 mm (1.5 in) square area
Combustion chamber volume	53 ± 1.5cc (3.2342-0.0915 ci)
Valve arrangement (front to rear)	—
Valve guide bore diameter	7.044-7.015 mm (0.2773-0.2762 in)
Valve stem diameter — intake	6.995-6.975 mm (0.2754-0.2746 in)
Valve stem diameter — exhaust	6.970-6.949 mm (0.2744-0.2736 in)
Valve stem-to-guide clearance — intake	0.069-0.020 mm (0.0027-0.0008 in)
Valve stem-to-guide clearance — exhaust	0.095-0.045 mm (0.0037-0.0018 in)
Valve head diameter — intake	37.11-36.86 mm (1.461-1.4512 in)
Valve head diameter — exhaust	30.12-29.87 mm (1.1858-1.176 in)
Valve face runout	0.05 mm (0.0019 in)
Valve face angle	45.75-45.25 degrees
Valve seat width — intake	2.1-1.9 mm (0.0827-0.0748 in)
Valve seat width — exhaust	2.1-1.9 mm (0.0827-0.0748 in)
Valve seat runout	0.025 mm (0.001 in)

Valve seat angle	45.00-44.50 degrees
Valve spring free length — intake	50.2 mm (1.9764 in)
Valve spring free length — exhaust	50.2 mm (1.9764 in)
Valve spring squareness — intake	2.5 degrees
Valve spring squareness — exhaust	2.5 degrees
Valve spring compression pressure — intake	667.3 N @ 28.02 mm (1.1031 in)
Valve spring compression pressure — exhaust	667.3 N @ 28.02 mm (1.1031 in)
Valve spring installed height	42.56 mm (1.676 in)
Valve spring installed pressure — intake	289.1 N @ 40.01 mm (1.5752 in)
Valve spring installed pressure — exhaust	289.1 N @ 40.0 mm (1.5752 in)
Roller follower ratio	1.75:1
Hydraulic Lash Adjuster	
Diameter	16.000-15.9888 mm (0.6299-0.6295 in)
Clearance-to-bore	0.018-0.069 mm (0.0007-0.0027 in)
Service limit	0.016 mm (0.0006 in)
Hydraulic leakdown rate	5-25 seconds [a]
Collapsed lash adjuster gap	0.085-0.450 mm (0.0033-0.0177 in)
Camshaft	
Theoretical valve lift @ zero lash — intake	10.00 mm (0.3937 in)
Theoretical valve lift @ zero lash — exhaust	10.00 mm (0.3937 in)
Lobe lift — exhaust (LH)	6.5958 mm (0.2597 in)
Lobe lift — exhaust (RH)	6.5855 mm (0.2593 in)
Lobe lift — intake	6.58077 mm (0.250847 in)
Allowable lobe lift loss	0
Journal diameter	26.962-26.936 mm (1.0615-1.0605 in)
Journal bore inside diameter	27.012-26.987 mm (1.0635-1.0625 in)
Journal-to-bearing clearance	0.076-0.025 mm (0.0030-0.0010 in)
Runout	0.09 mm (0.0035 in) (4 places)
End play service limit	0.025-0.190 mm (0.0010-0.0075 in)
End play	0.027-0.190 mm (0.0011-0.0075 in)
Cylinder Block	
Cylinder bore diameter grade 1	90.200-90.210 mm (3.5511-3.5515 in)
Cylinder bore diameter grade 2	90.210-90.220 mm (3.5516-3.5521 in)
Cylinder bore diameter grade 3	90.220-90.230 mm (3.5519-3.5524 in)
Cylinder bore maximum taper	0.006 mm (0.0002 in)
Cylinder bore maximum out-of-round	0.020 mm (0.0008 in)
Main bearing bore inside diameter	72.401-72.422 mm (2.850-2.851 in)
Head gasket surface flatness	0.0254 mm (0.001 in) across any 38.1 mm (1.5 in) square area
Crankshaft	
Main bearing journal diameter	67.483-67.503 mm (2.6568-2.6576 in)
Main bearing journal maximum taper	0.004 mm (0.0002 in)

Main bearing journal maximum out-of-round	0.0075 mm (0.0003 in) between cross sections
Main bearing journal-to-cylinder block clearance	0.048-0.024 mm (0.001891-0.0009 in)
Connecting rod journal diameter	53.003-52.983 mm (2.0867-2.0859 in)
Connecting rod journal maximum taper	0.004 mm (0.0002 in)
Connecting rod journal maximum out-of-round	0.0075 mm (0.0003 in) between cross sections
Crankshaft maximum end play	0.075-0.377 mm (0.003-0.0148 in)
Piston and Connecting Rod	
Piston diameter	90.180 ± 0.005 mm (3.5504 ± 0.0002 in)
Piston to cylinder bore clearance	-0.005 to +0.025 mm (-0.0002 to 0.001 in)
Piston ring end gap — top	0.13-0.28 mm (0.0051-0.0111 in)
Piston ring end gap — intermediate	0.25-0.40 mm (0.0098-0.0157 in)
Piston ring gap — oil control	0.15-0.65 mm (0.0059-0.0256 in)
Piston ring groove width — top	1.53-1.55 mm (0.0602-0.061 in)
Piston ring groove width — intermediate	1.52-1.54 mm (0.0598-0.0606 in)
Piston ring groove width — oil control	3.030-3.050 mm (0.1193-0.1201 in)
Piston ring width	1.49-1.46 mm (0.0587-0.0575 in)
Piston ring-to-groove clearance — top	0.030-0.050 mm (0.0012-0.0020 in)
Piston ring-to-groove clearance — intermediate	0.030-0.080 mm (0.0012-0.0031 in)
Piston pin bore diameter	22.008-22.014 mm (0.8665-0.8667 in)
Piston pin diameter	22.0005-22.0030 mm (0.8662-0.8663 in)
Piston pin length	61.8 mm (2.433 in)
Piston pin-to-piston fit (clearance)	0.005-0.0135 mm (0.0002-0.0005 in)
Connecting rod-to-pin clearance	0.009-0.0235 mm (0.0004-0.0093 in)
Connecting rod pin bore diameter	22.012-22.024 mm (0.8666-0.8671 in)
Connecting rod length (centerline bore-to-bore)	169.1 mm (6.6575 in)
Connecting rod maximum allowed bend	± 0.038 mm (0.0015 in)
Connecting rod maximum allowed twist	± 0.05 mm (0.0021 in)
Connecting rod bearing bore diameter (with assembled liners)	53.049-53.027 mm (2.0885-2.0877 in)
Connecting rod bearing-to-crankshaft clearance	0.064-0.026 mm (0.0025-0.001 in)
Connecting rod side clearance (as assembled to crank) — standard play	0.300 ± 0.175 mm (0.0118 ± 0.0069 in)
Connecting rod side clearance (as assembled to crank) — max. play	0.475 mm (0.0187 in)

[a] Time required for the plunger to leak down 1.6 mm of travel with 222 N force and leak-down fluid in the lash adjuster.

Engine mount-to-cylinder block bolts	63	44	—
Engine mount RH nut	103	76	—

[a] Refer to the procedure in this section.

Engine

WARNING: Do not operate the engine with the hood open until the fan blade has been first examined for possible cracks and separation. Failure to follow these instructions may result in personal injury.

The 5.4L (4V) is a V-8 engine with the following features:

- dual overhead camshafts
- four valves per cylinder
- sequential multiport fuel injection (SFI)
- an aluminum intake manifold
- aluminum cylinder heads
- a cast iron, 90-degree V-cylinder block
- individually chain-driven camshafts with a hydraulic timing chain tensioner on each timing chain
- the electronic ignition system with eight ignition coils

Identification

Always refer to these labels when new parts are required or when checking engine calibrations. The engine parts often differ within a CID family. Verification of the identification codes will make sure that the correct parts are obtained. These codes contain all the pertinent information relating to the dates, optional equipment and revisions. The Ford Master Parts Catalog contains a complete listing of the codes and their application.

Code Information

The engine code information label, located on the side of the LH valve cover towards the rear, contains the following:

- engine build date
- engine plant code
- engine code

Exhaust Emission Control System

Operation and required maintenance of the exhaust emission control devices used on this engine is covered in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Induction System

The sequential multiport fuel injection (SFI) provides the fuel/air mixture needed for combustion in the cylinders. The eight solenoid-operated fuel injectors:

- are mounted in the fuel injection supply manifold and the intake manifold above the cylinder heads.
- meter fuel into the air intake stream in accordance with engine demand.

- are positioned so that their tips direct fuel just ahead of the engine intake valves.
- are connected in series with the fuel pressure regulator.
- supply fuel from the fuel tank by a fuel pump mounted in the fuel tank.

A constant fuel pressure drop is maintained across the fuel injectors by the fuel pressure regulator. The fuel pressure regulator:

- is positioned upstream from the fuel injectors on the fuel injection supply manifold.

Valve Train

The valve train operates as follows:

- Ball tip hydraulic lash adjusters provide automatic lash adjustment.
- Roller followers ride on the camshaft lobes, transferring the up-and-down motion of the camshafts to the valves in the cylinder heads.

Positive Crankcase Ventilation System

All engines are equipped with a closed-type positive crankcase ventilation system recycling the crankcase vapors to the upper intake manifold.

Lubrication System

The engine lubrication system operates as follows:

- Oil is drawn into the oil pump through the oil pump screen cover and tube in the sump of the oil pan.
- On two-wheel and four-wheel drive vehicles, oil is pumped through the oil bypass filter on the left front side of the cylinder block.
- Oil enters the main oil gallery where it is distributed to the crankshaft main journals and to both cylinder heads.
- From the main journals, the oil is routed through cross-drilled passages in the crankshaft to lubricate the connecting rod bearings. Controlled leakage through the crankshaft main bearings and connecting rod bearings is slung radially outward to cool and lubricate the cylinder walls as well as the entire connecting rod, piston and piston rings assembly.
- The left cylinder head is fed from a drilling into the supply passage feeding the main gallery at the front of the cylinder block. The right cylinder head is fed from a drilling into the rear of the main gallery. Main gallery pressure is reduced as it enters the cylinder head galleries through fixed serviceable orifices located at the upper part of the feed passages. It is this reduced pressure in the cylinder head galleries which feeds the camshaft journals, the hydraulic lash adjusters and the primary and secondary timing chain tensioners.
- The camshaft lobe and roller followers are lubricated by splash created through valve train operation.

Oil Pump

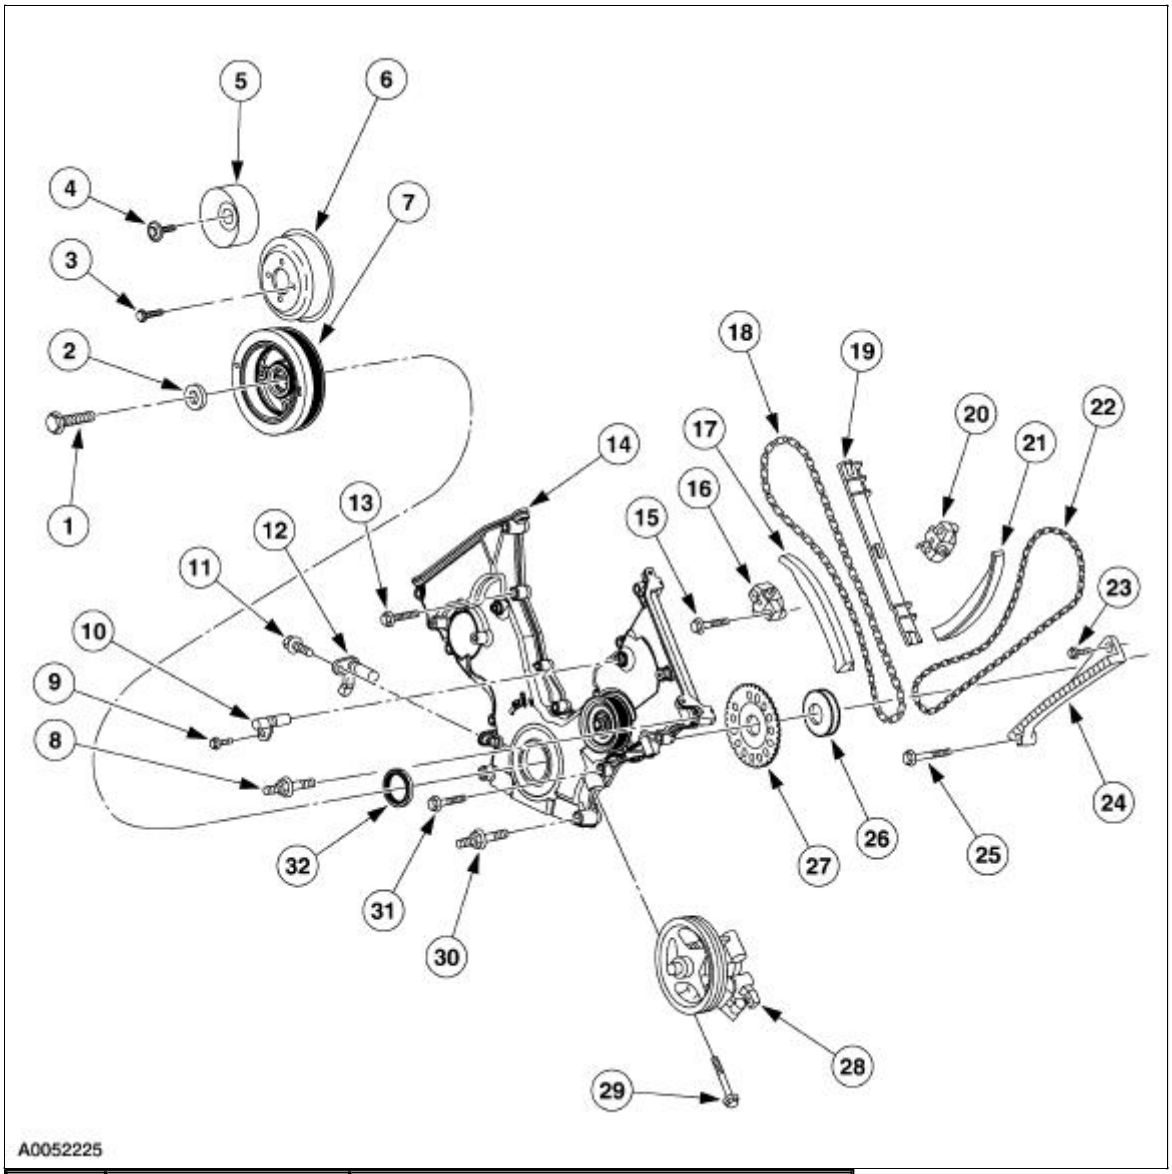
The lubrication system of the 5.4L (4V) engine is designed to provide optimum oil flow to critical components of the engine through its entire operating range. The heart of the system is a positive displacement internal gear oil pump using top seal rotors.

Generically this design is known as a gerotor pump, which operates as follows:

- The oil pump is mounted on the front face of the cylinder block.
- The inner rotor is piloted on the crankshaft post and is driven through flats on the crankshaft.
- System pressure is limited by an integral, internally-vented relief valve which directs the bypassed oil back to the inlet side of the oil pump.
- Oil pump displacement has been selected to provide adequate volume to ensure correct oil pressure both at hot idle and maximum speed.
- The relief valve calibration protects the system from excessive pressure during high viscosity conditions.
- The relief valve is designed to provide adequate connecting rod bearing lubrication under high-temperature and high-speed conditions.

Cooling System

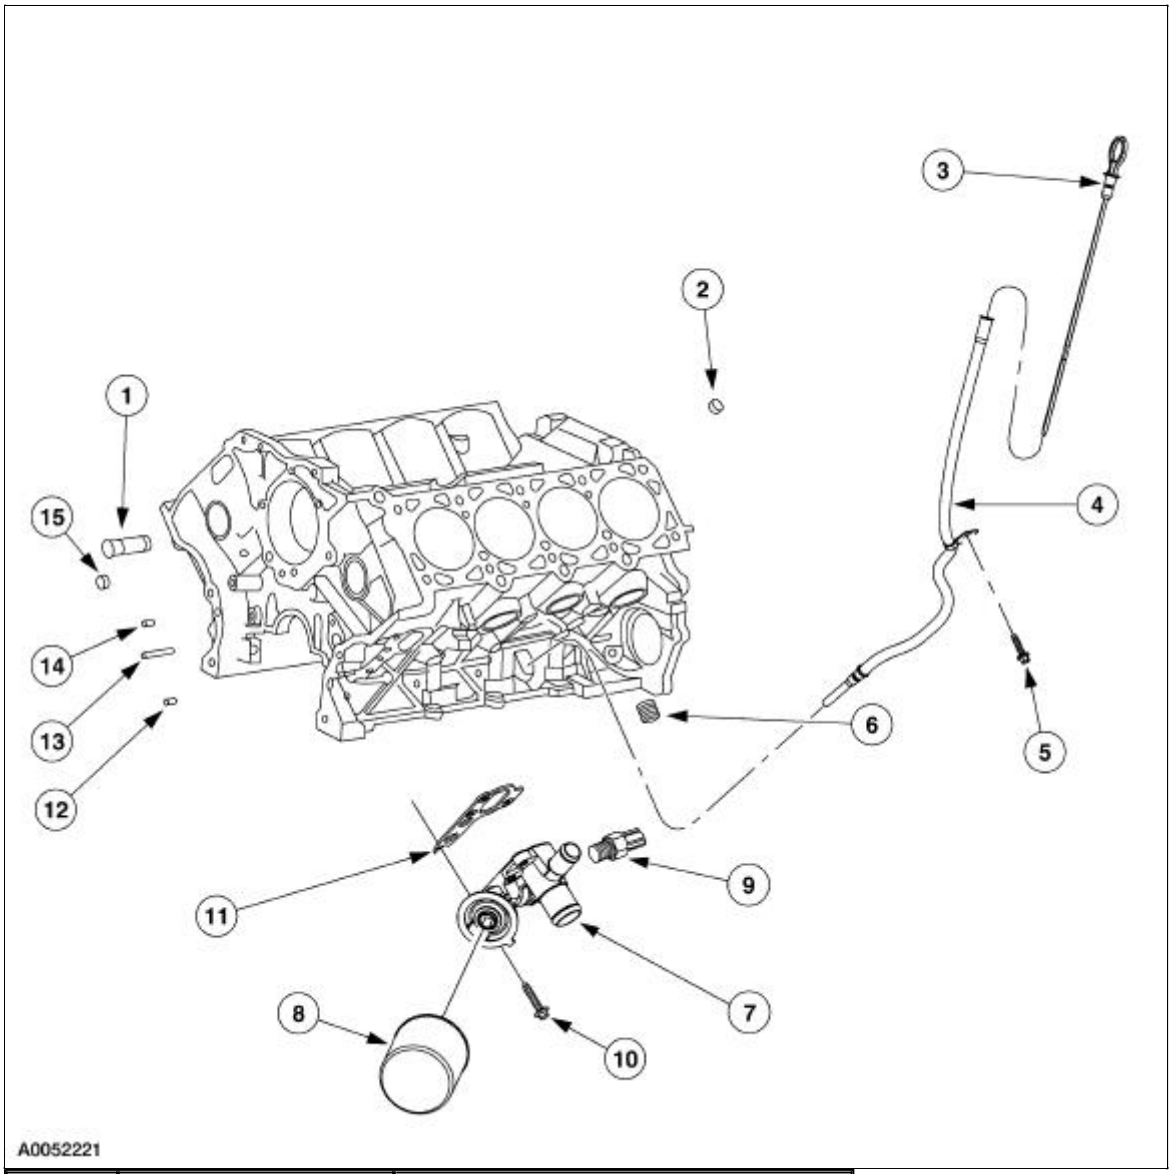
The engine cooling system includes the following:



- radiator
- water pump
- viscous fan clutch
- degas bottle (aids in maintaining the correct volume of engine coolant)
- water thermostat
- upper radiator hose
- lower radiator hose
- heater water hoses
- water bypass hose

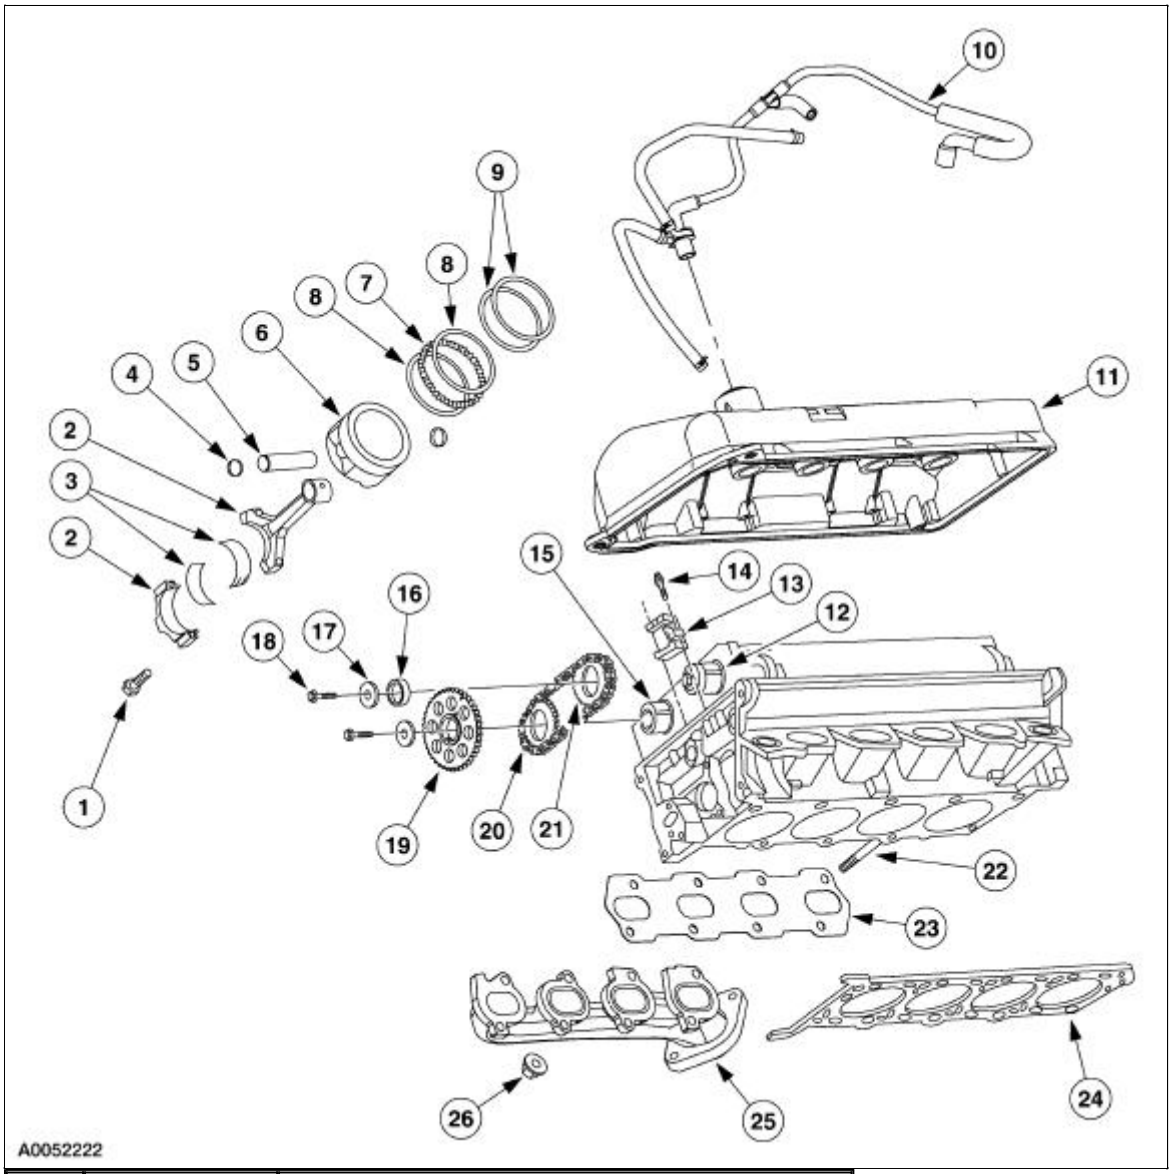
Drive Belt System

The 5.4L (4V) DOHC engine is equipped with a serpentine drive belt. To make sure of maximum life, a new drive belt should be of the same type as originally installed.



- The accessories mounted on the front of the engine are belt-driven by the crankshaft.
- The serpentine drive belt is routed over each accessory pulley, driven by the crankshaft pulley bolted to the crankshaft.

For service procedures, including tensioning, refer to Section 303-05.



Item	Part Number	Description
1	N806139	Bolt
2	N806165	Washer
3	N806282	Bolt (4 req'd)

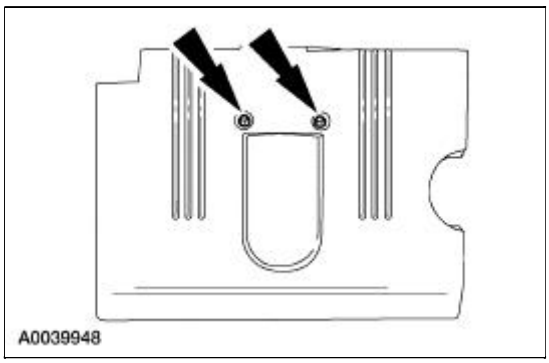
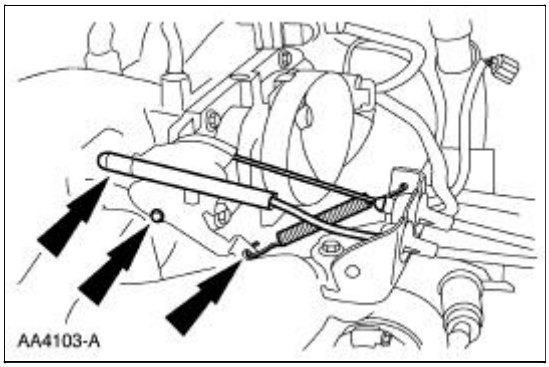
Engine

For basic engine mechanical concerns, refer to Section 303-00 . For driveability concerns, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

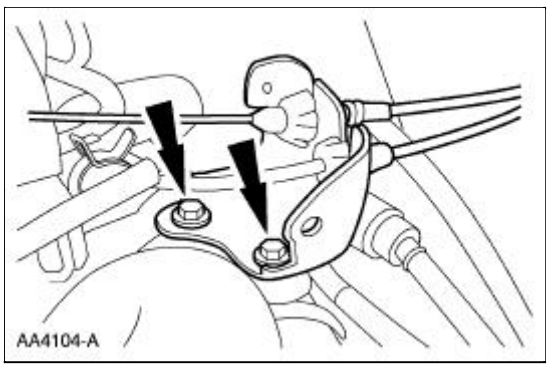


Upper Intake Manifold

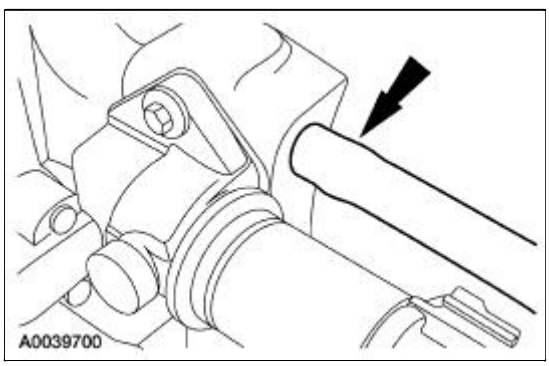
Removal



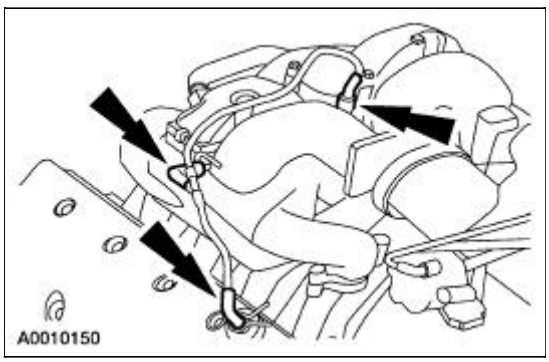
1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the cowl grille. For additional information, refer to Section 501-02 .
3. Remove the bolts and five clips and the wiring harness shield.



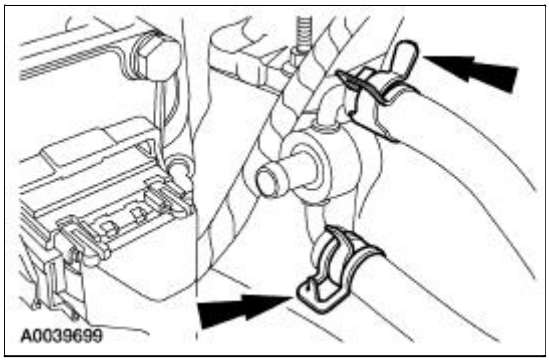
4. Remove the air cleaner outlet tube and the air cleaner assembly. For additional information, refer to Section 303-12 .
5. Partially drain the engine cooling system. For additional information, refer to Section 303-03 .
6. Remove the engine appearance cover.



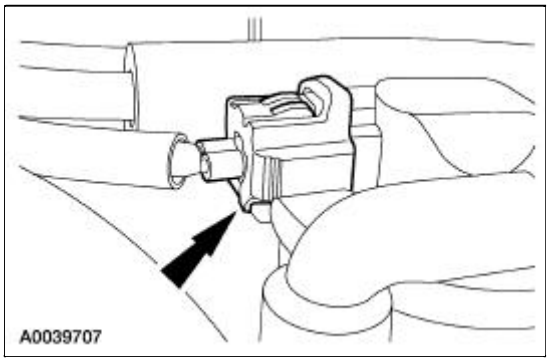
7. Disconnect the accelerator cable, speed control cable, and the return spring.



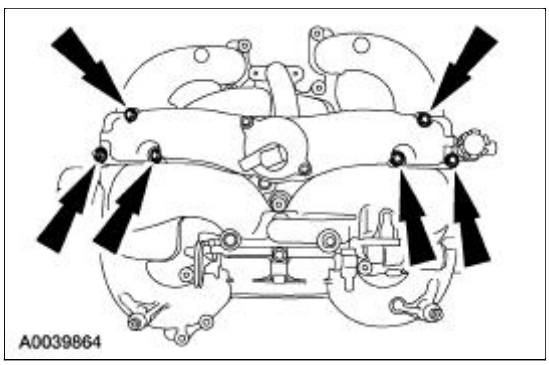
8. Remove the bolts and position the cables and bracket out of the way.



9. Disconnect the evaporative emission (EVAP) return hose.

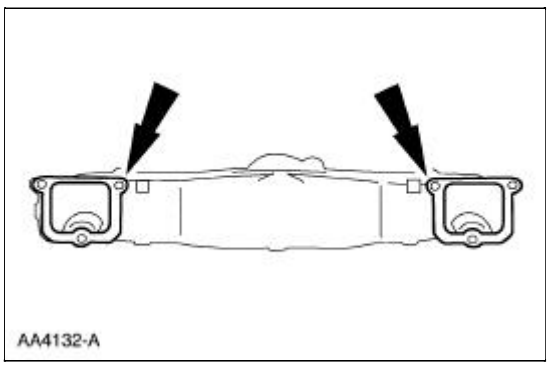


10. Disconnect and remove the positive crankcase ventilation (PCV) tube.

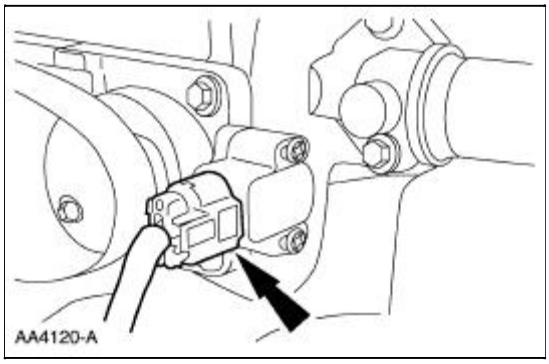


11. Disconnect the coolant hoses.

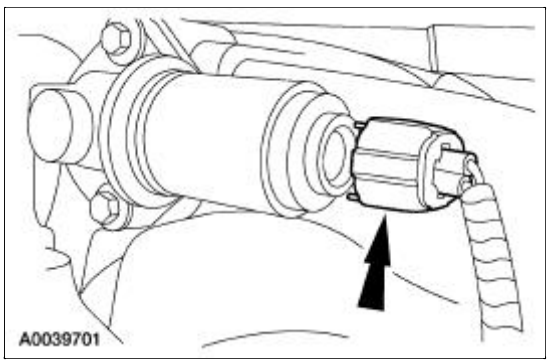
12. Disconnect the electrical connector from the intake tuning valve.



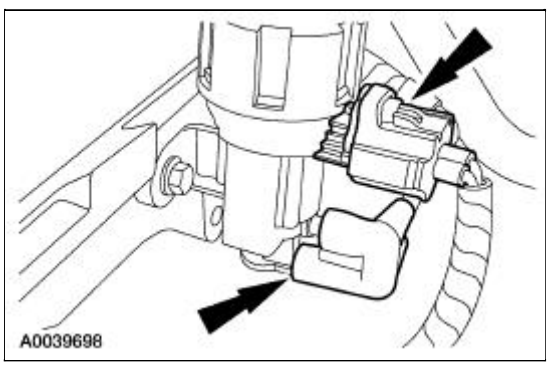
13. Remove the bolts, studs and the balance tube.



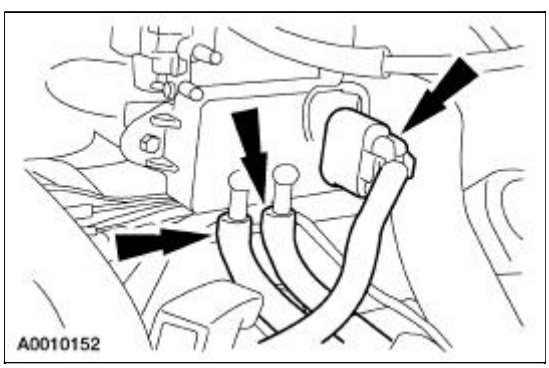
14. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**



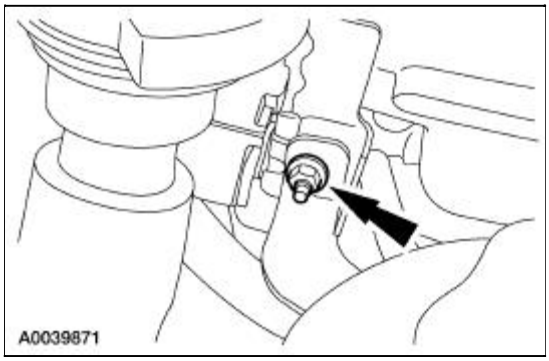
Remove and discard the gaskets and clean the sealing surfaces.



15. Disconnect the throttle position (TP) sensor electrical connector.

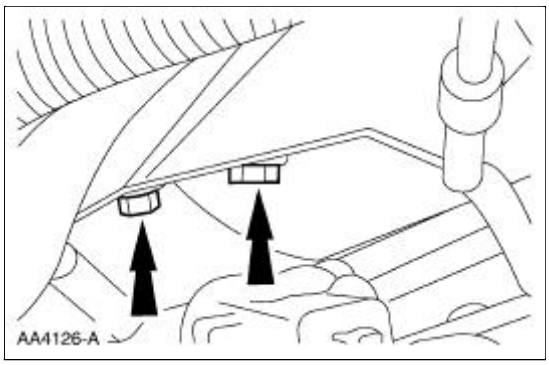


16. Disconnect the idle air control (IAC) valve electrical connector.

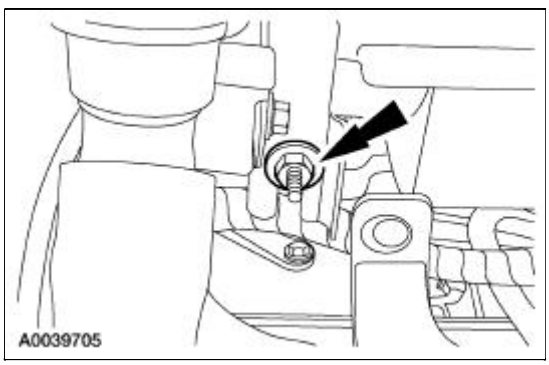


17. Disconnect the vacuum hoses and the electrical connector from the EGR vacuum regulator solenoid.

18. Disconnect the two hoses and the electrical connector from the differential pressure feedback EGR system.

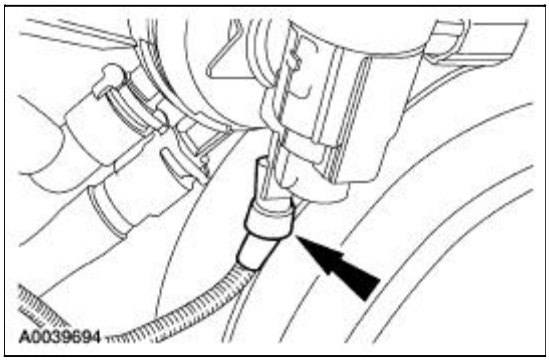


19. Remove the nut.

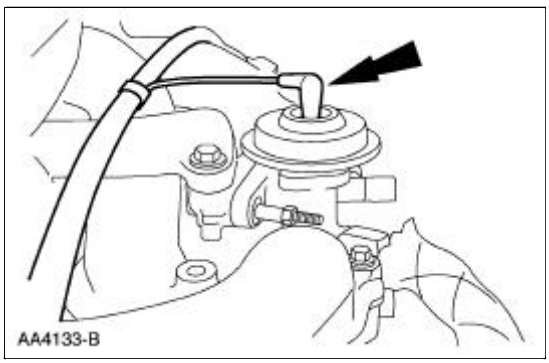


20. **NOTE:** The bolts are located at the front side of the LH cylinder head.

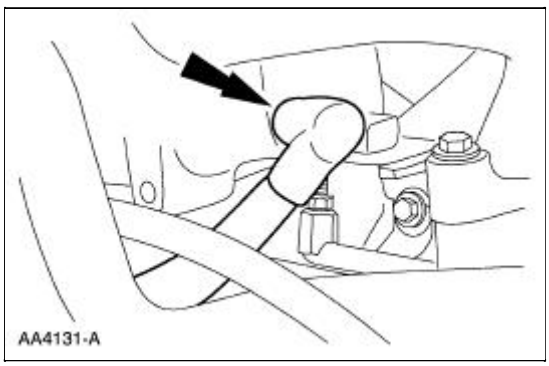
    Remove the bolts from the power steering reservoir bracket and position it aside.



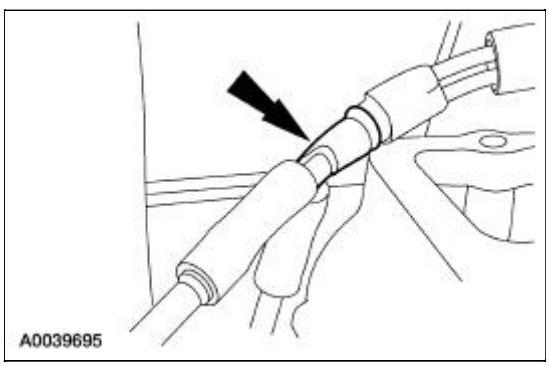
21. Remove the stud and position the oil fill tube aside.



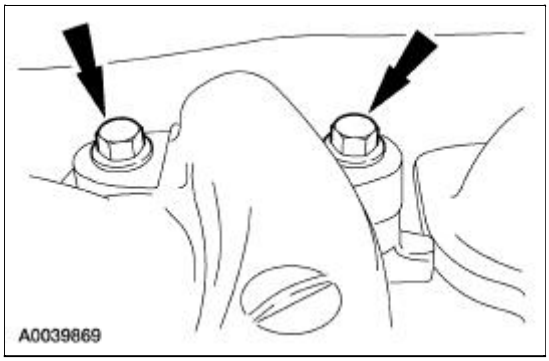
22. Disconnect the brake booster vacuum hose.



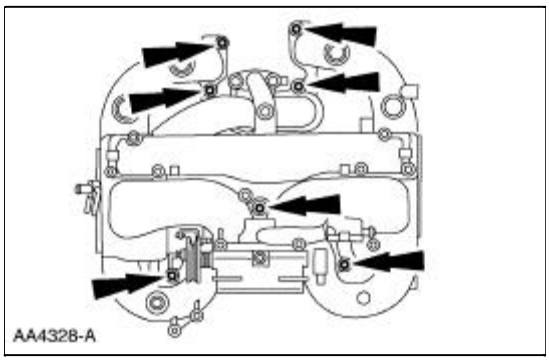
23. Disconnect the vacuum hose.



24. Disconnect the vacuum hose from the exhaust gas recirculation (EGR) valve.



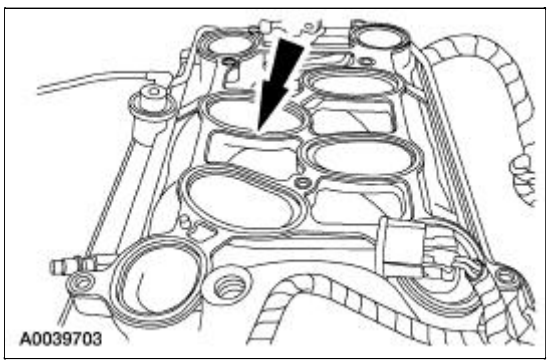
25. Disconnect the vacuum hose.



26. Disconnect the vacuum hose at the right rear of the intake manifold.

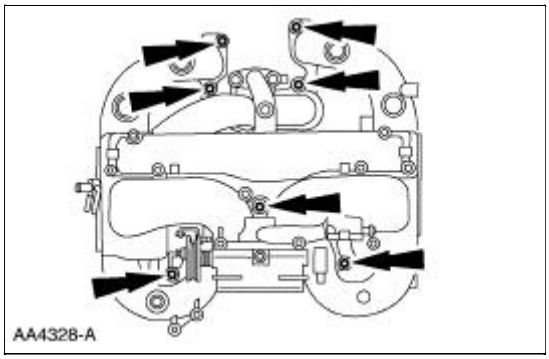
27. Remove the bolts from the EGR adapter.
    - Discard the gasket.

28. Remove the bolts and the upper intake manifold.
    - Discard the upper intake retaining bolts.



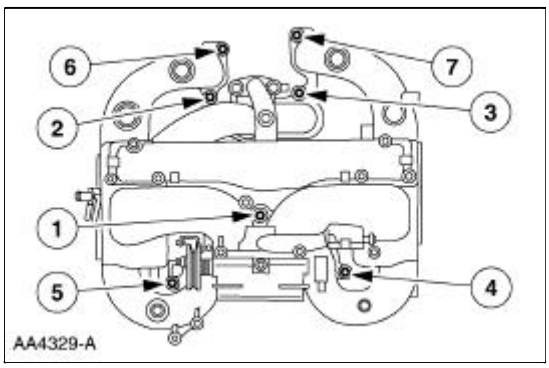
29. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Remove and inspect the intake gasket. Install a new gasket if necessary.
    - Clean and inspect the sealing surfaces.



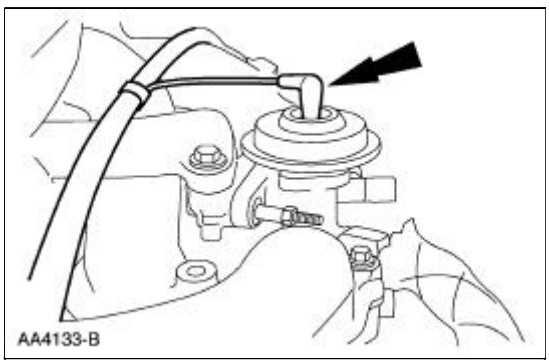
Installation

1. Install the upper intake manifold gasket.

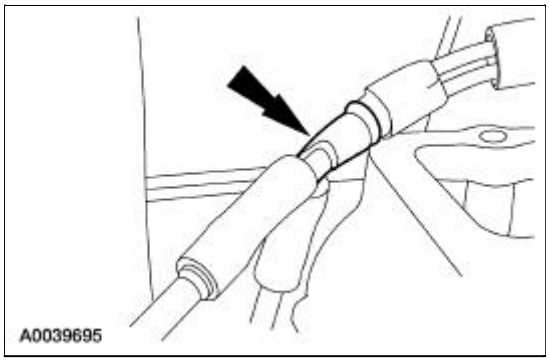


2. **NOTE:** Install new bolts.

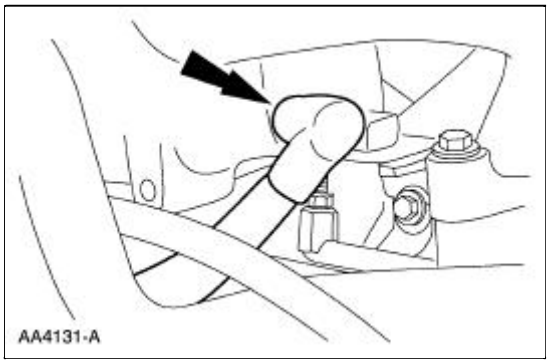
   Position the upper intake manifold and loosely install the new bolts.



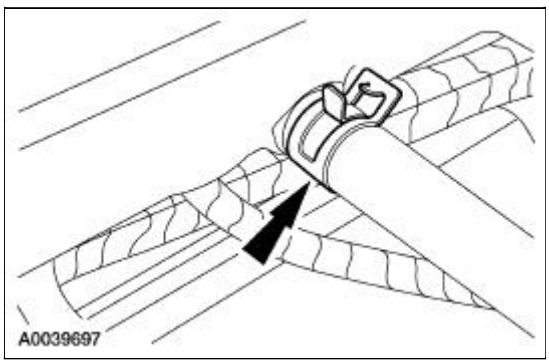
3. Tighten the bolts in the sequence shown in two stages.
    - Tighten to 10Nm (89 lb-in).
    - Tighten an additional 90 degrees.



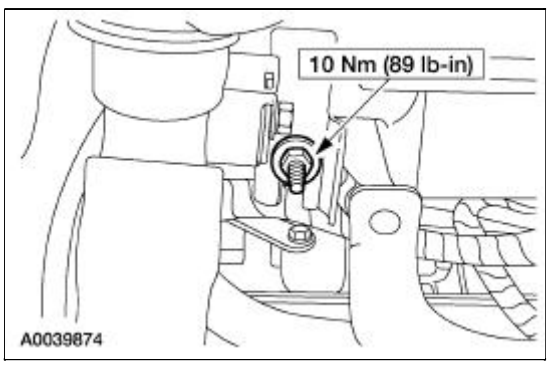
4. Install the EGR adapter using a new gasket.



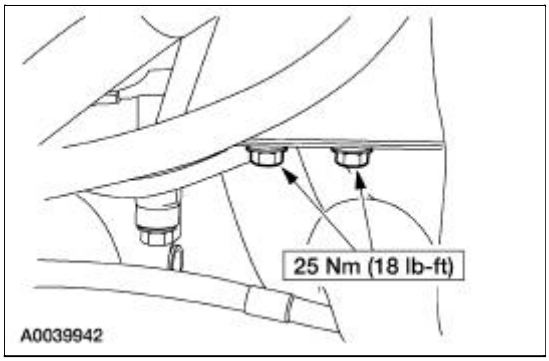
5. Connect the vacuum hose to the EGR valve.



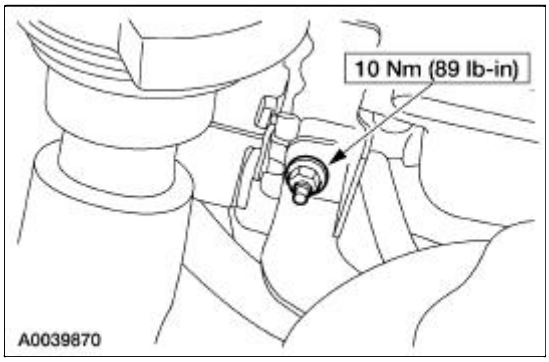
6. Connect the vacuum hose at the right rear of the intake manifold.



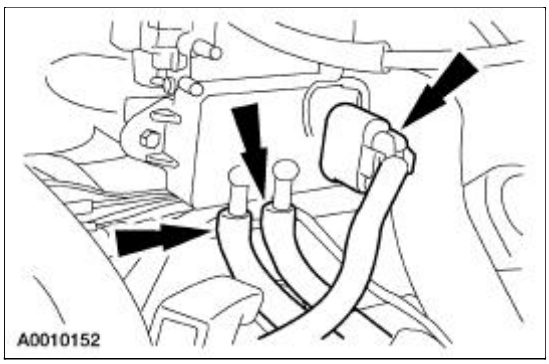
7. Connect the vacuum hose.



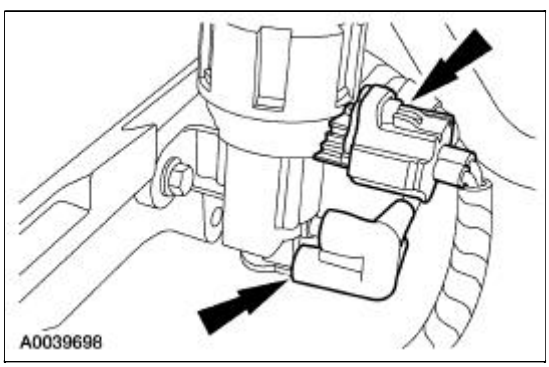
8. Connect the brake booster vacuum hose.



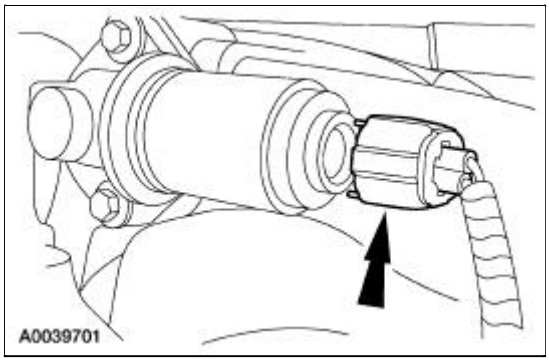
9. Position the oil fill tube and install the stud.



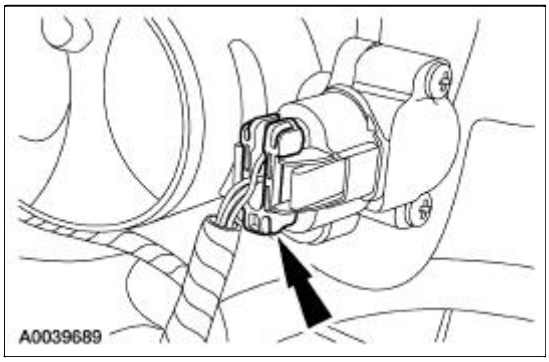
10. Position the power steering reservoir bracket and install the bolts.



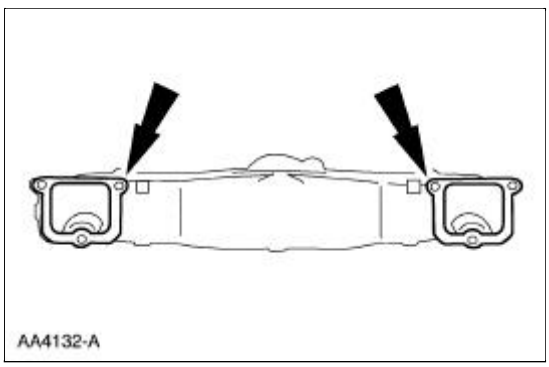
11. Install the nut.



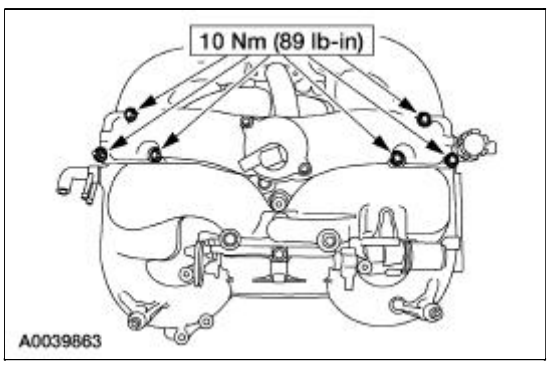
12. Connect the two vacuum hoses and the electrical connector to the differential pressure feedback EGR system.



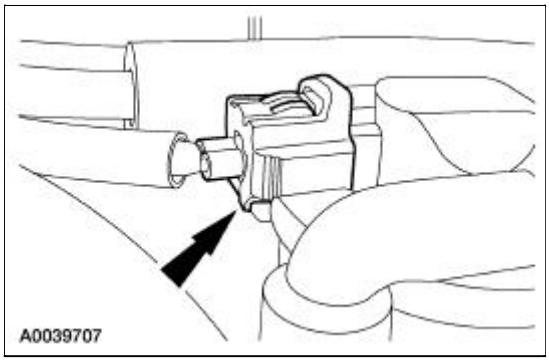
13. Connect the vacuum hoses and the electrical connector to the EGR vacuum regulator solenoid.



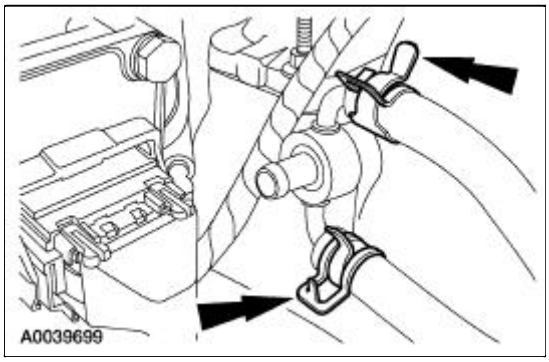
14. Connect the IAC valve electrical connector.



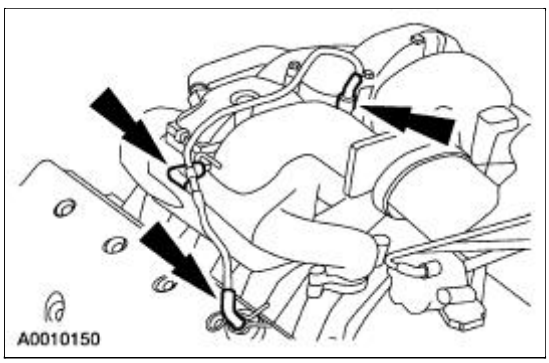
15. Connect the TP sensor electrical connector.



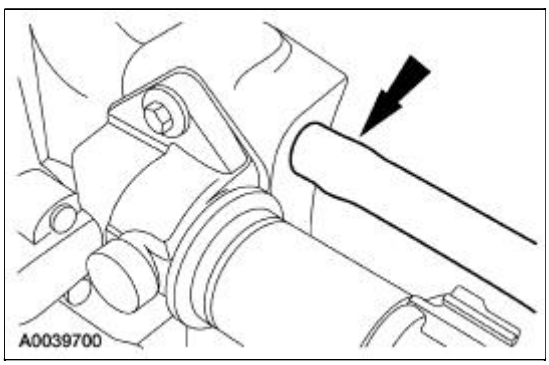
16. Install the balance tube gaskets.



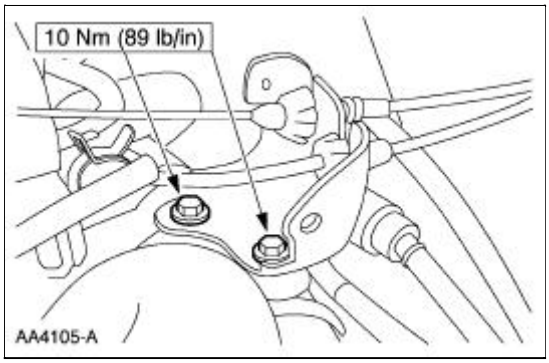
17. Install the balance tube, the bolts and the stud.



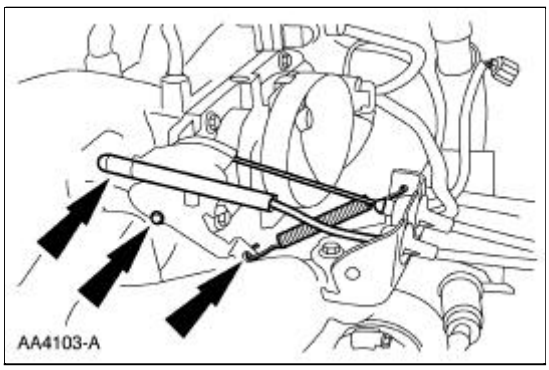
18. Connect the electrical connector to the intake manifold tuning valve.



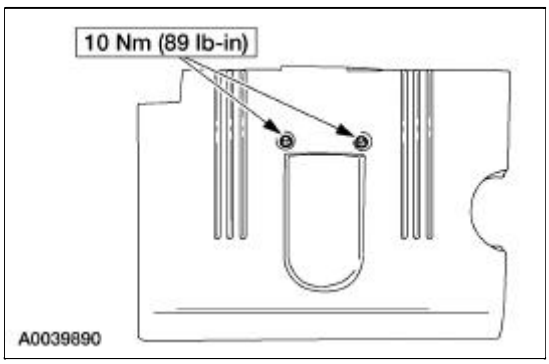
19. Connect the PCV heater coolant hoses.



20. Install the tube assembly and connect the PCV valve tube.

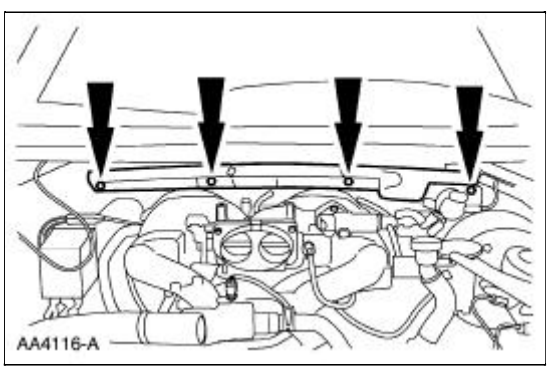


21. Connect the EVAP return hose.



22. Position the cables and bracket, and install the bolts.

23. Connect the accelerator cable, speed control cable and the return spring.

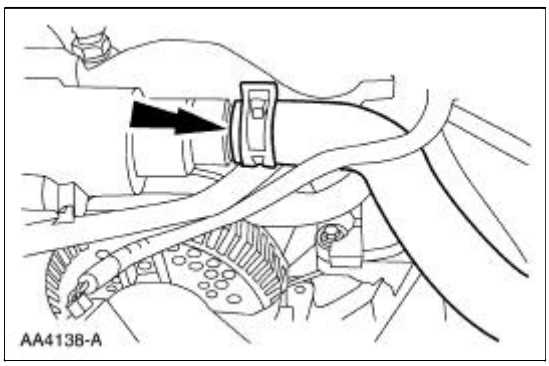


24. Install the engine appearance cover.

25. Install the engine air cleaner and outlet tube. For additional information, refer to Section 303-12 .

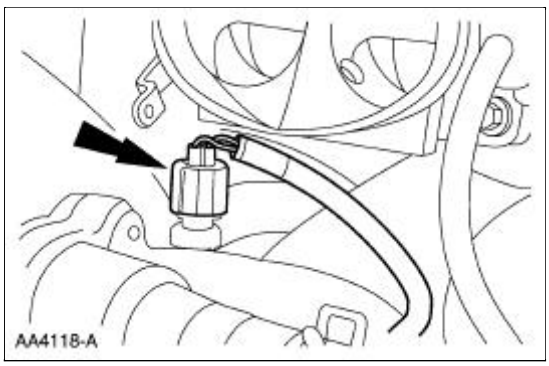
26. Install the wiring harness shield, the bolts and five clips.

27. Install the cowl grille. For additional information, refer to Section 501-02 .



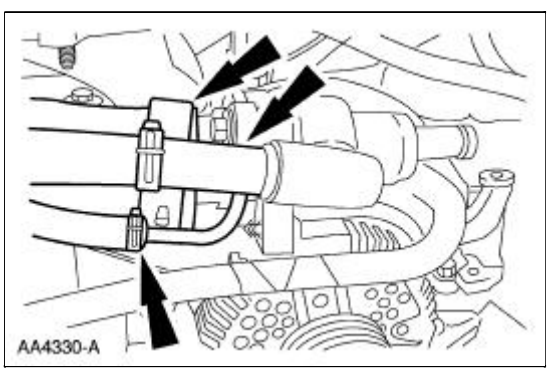
28. Connect the battery ground cable. For additional information, refer to Section 414-01 .

29. Fill the engine cooling system. For additional information, refer to Section 303-03 .

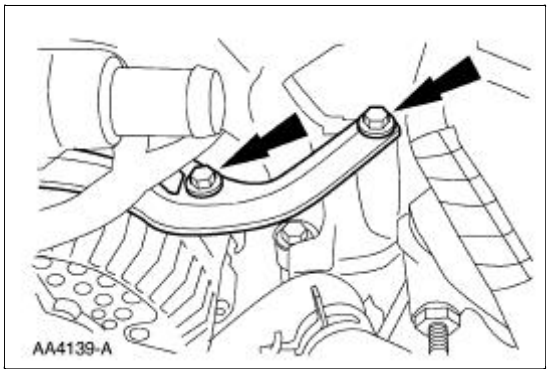


Lower Intake Manifold

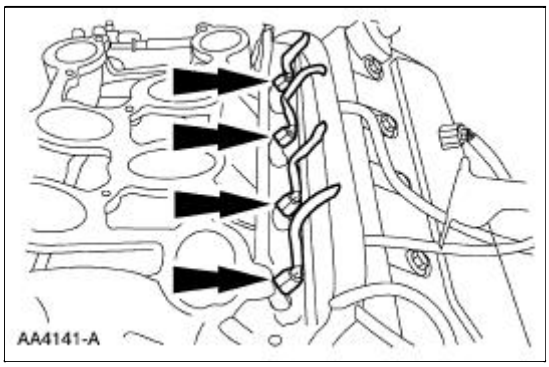
Removal



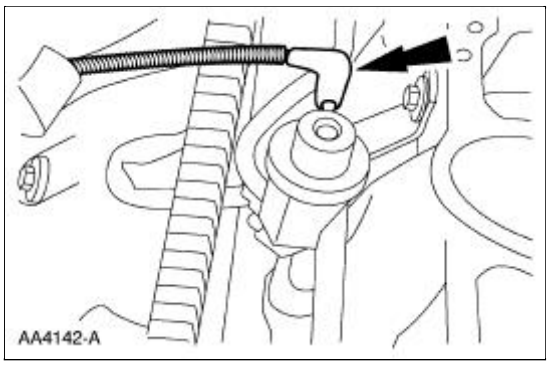
1. Remove the upper intake manifold. For additional information, refer to Upper Intake Manifold .
2. Disconnect the fuel hose spring lock couplings. For additional information, refer to Section 310-00 .
3. Disconnect the engine water bypass hose.



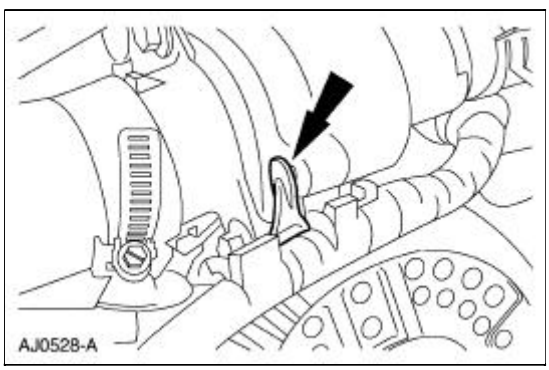
4. Disconnect the water temperature indicator sender electrical connector.



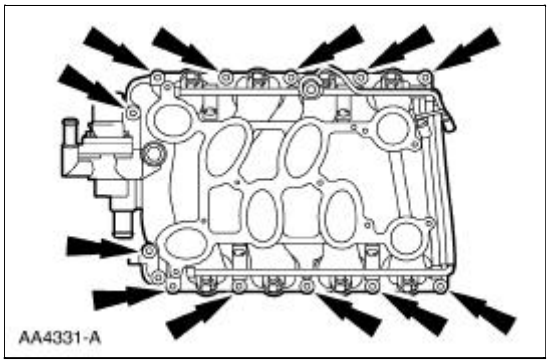
5. Disconnect the upper radiator hose, the heater water inlet hose and the heated positive crankcase ventilation (PCV) water heated fitting inlet hose.



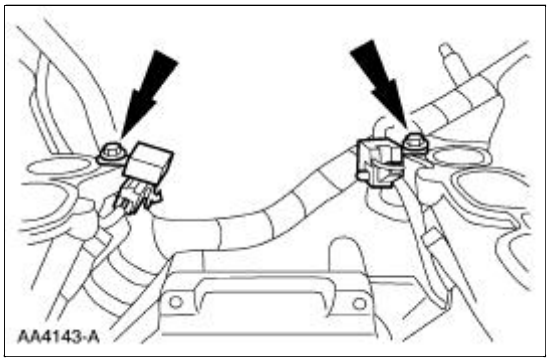
6. Remove the four bolts and the generator upper support bracket.



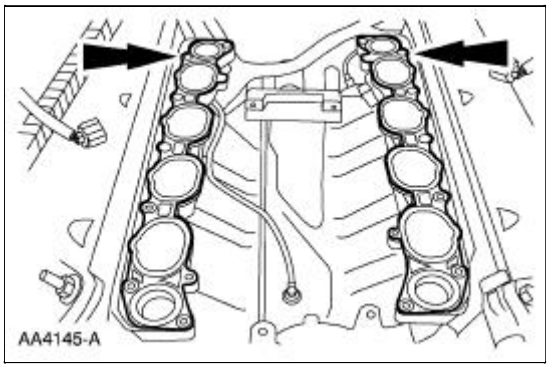
7. Disconnect the eight fuel injectors.



8. Disconnect the fuel injector pressure regulator vacuum hose and position out of the way.

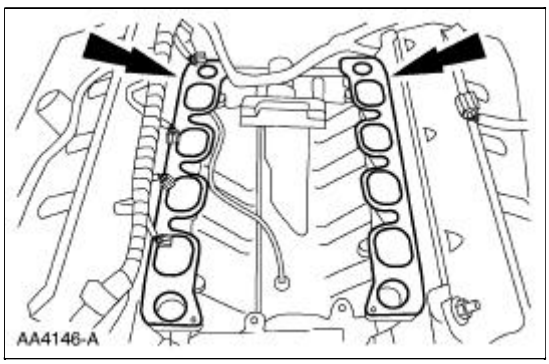


9. Disconnect the wire harness pin-type retainer.

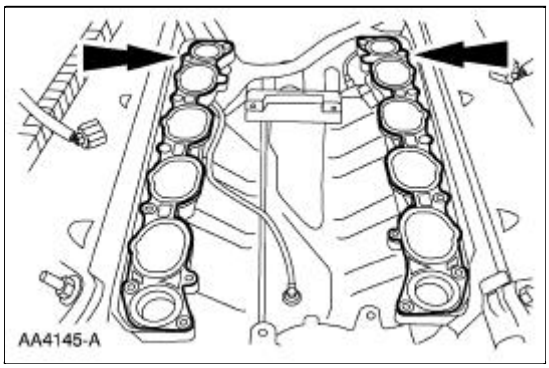


10. Remove the bolts and lower intake manifold.
    - Discard the bolts.

11. Remove the bolts and the radio ignition interference capacitors.

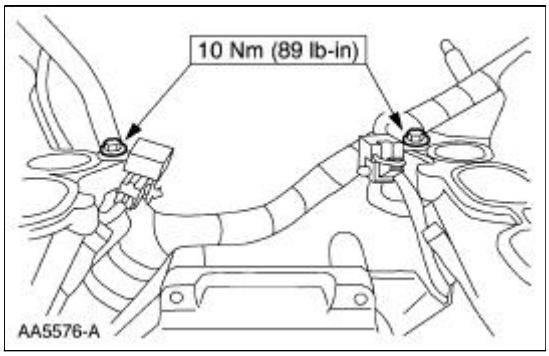


12. Remove and inspect the gaskets, and install new gaskets if necessary.



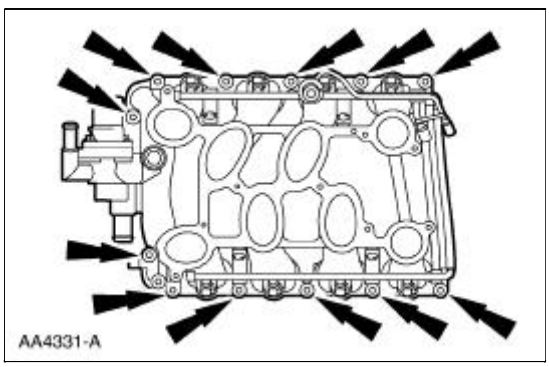
13. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Clean the sealing surfaces.

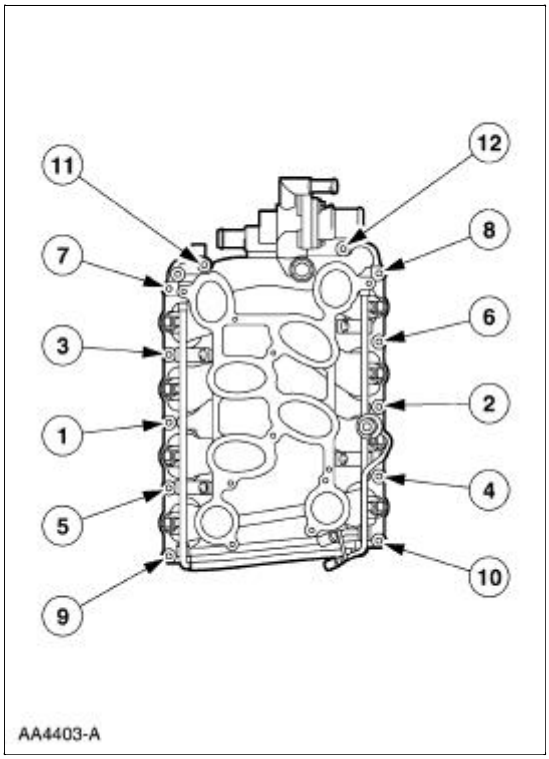


Installation

1. Install the lower intake gaskets.

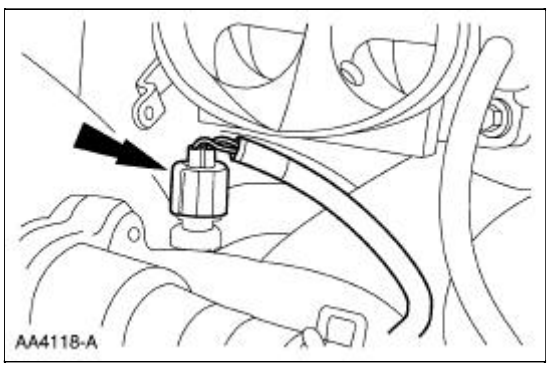


2. Install the radio ignition interference capacitors.

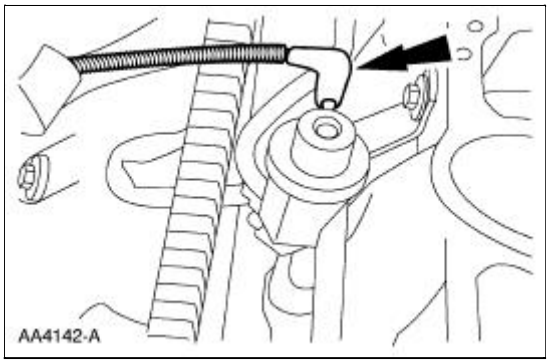


3. **NOTE:** Install new bolts.

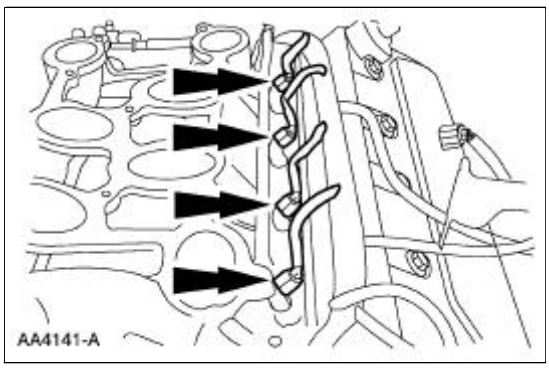
   Position the lower intake manifold. Loosely install the retaining bolts.



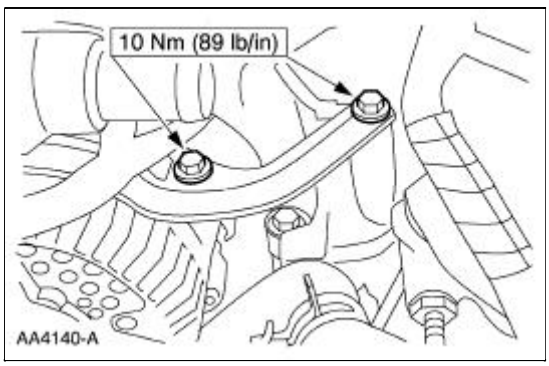
4. Tighten the retaining bolts in two stages. and then an additional 90 degrees in the sequence shown.
   - Tighten to 10 Nm (89 lb-in).
   - Tighten an additional 90 degrees.



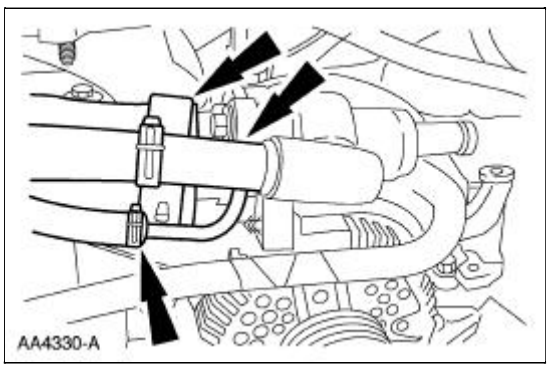
5. Connect the wire harness pin-type retainer.



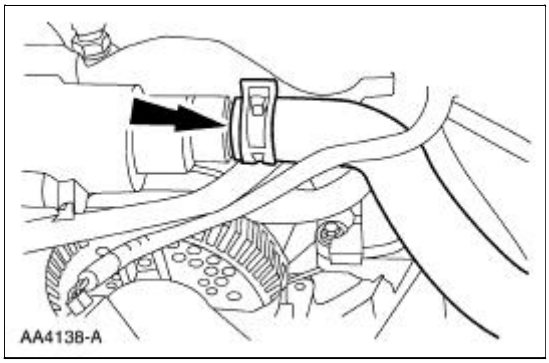
6. Connect the water temperature indicator sensor electrical connector.



7. Position the vacuum harness and connect the vacuum line to the fuel injector pressure regulator.



8. Connect the eight fuel injector electrical connectors.



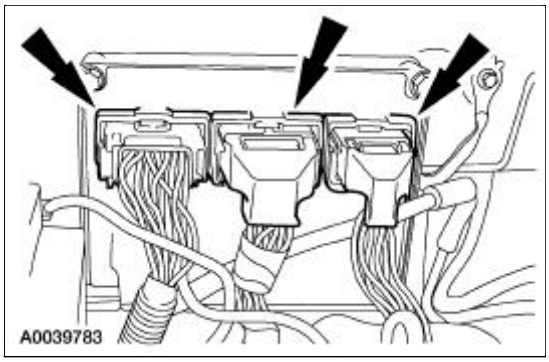
9. Install the upper generator support bracket and the four bolts.

10. Connect the heater water inlet hose, the upper radiator hose and the water heated fitting inlet hose.

11. Connect the engine water bypass return hose.

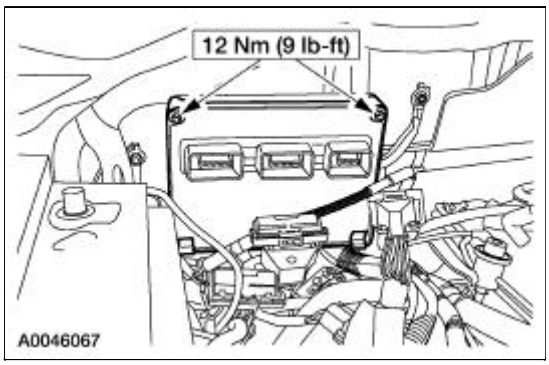
12. Connect the fuel hose spring lock couplings. For additional information, refer to Section 310-00 .

13. Install the upper intake manifold. For additional information, refer to Upper Intake Manifold in this section.



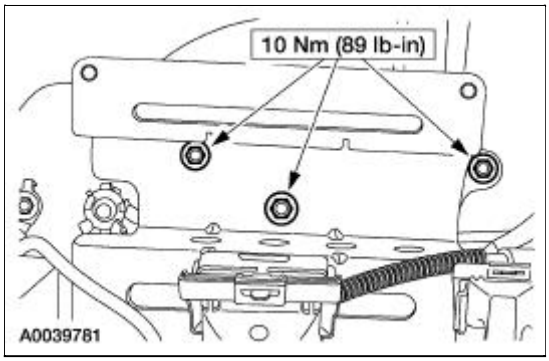
Valve Cover RH

Material

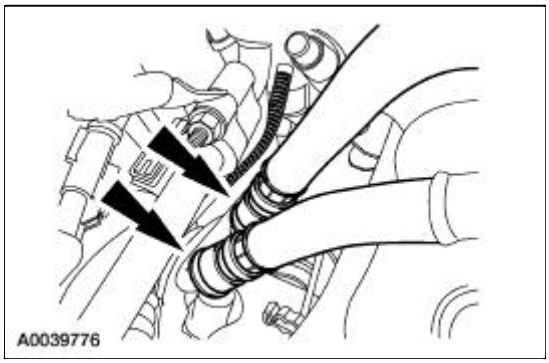


Item	Specification
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4

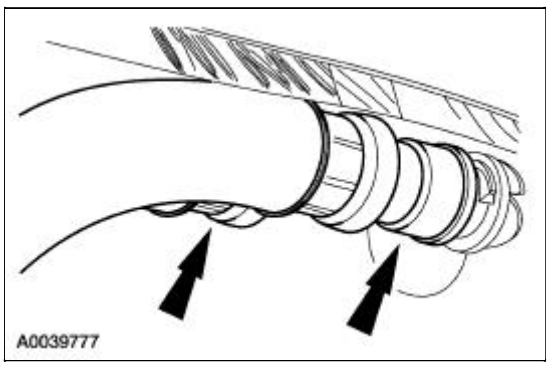
Removal and Installation



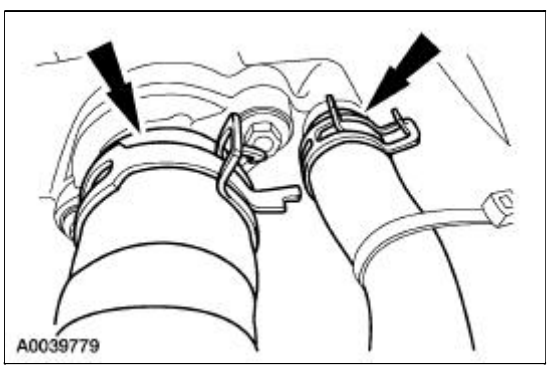
1. Remove the upper intake manifold. For additional information, refer to Upper Intake Manifold in this section.
2. Recover the A/C system refrigerant. For additional information, refer to Section 412-00 .
3. Disconnect the powertrain control module (PCM) electrical connectors.



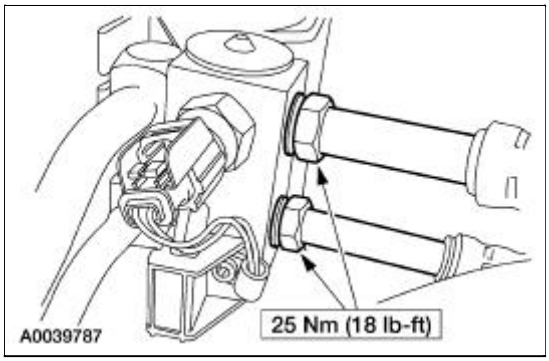
4. Remove the PCM mounting bolts and the PCM.



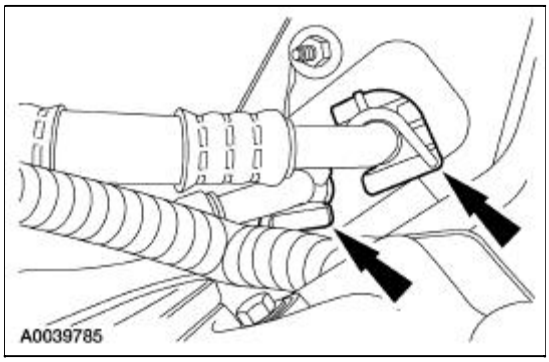
5. Remove the bolts and the PCM mounting bracket.



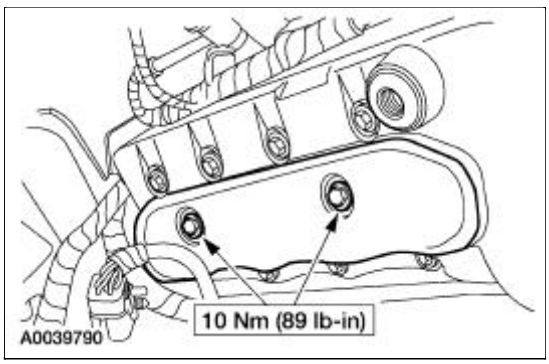
6. If equipped, disconnect the auxiliary heater hoses at the right-side valve cover.



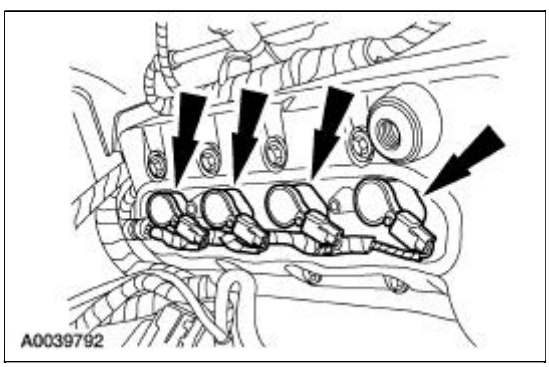
7. Disconnect the heater hoses at the heater core.



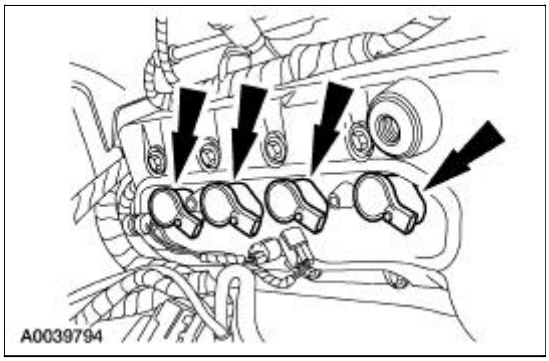
8. Disconnect the radiator upper hose and the heater hose at the lower intake manifold, and position them aside.



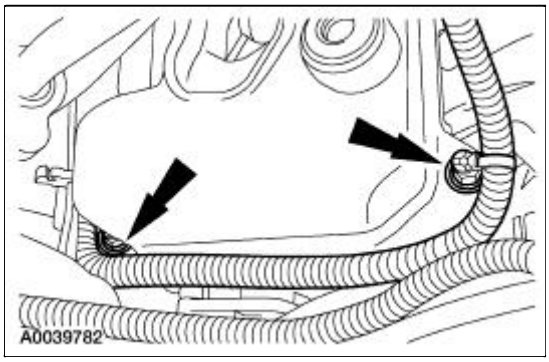
9. Disconnect the A/C hoses from the junction block.



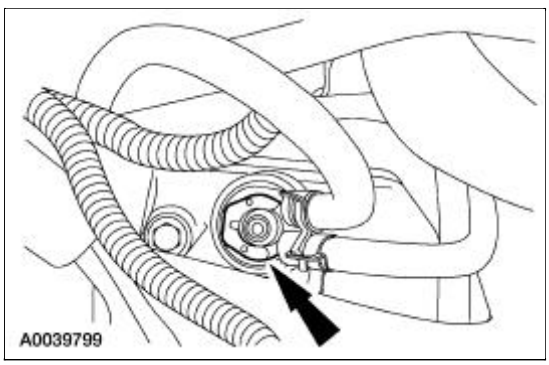
10. Remove the safety clips and disconnect the spring lock couplers at the evaporator core. For additional information, refer to Section 412-00 .



11. Remove the ignition coil cover.

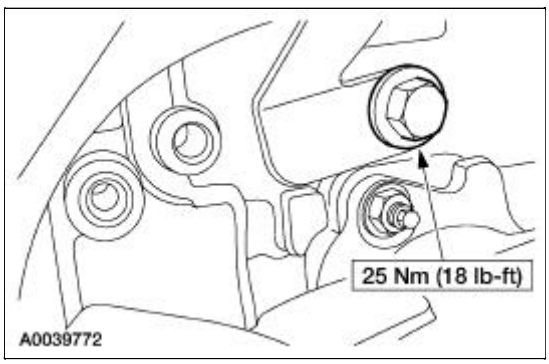


12. Disconnect the ignition coil electrical connectors.

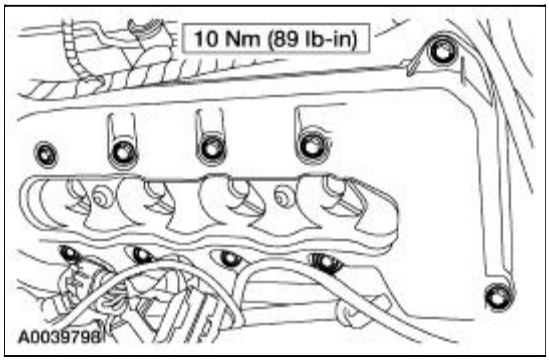


13. Remove the ignition coils.

14. Disconnect the wiring harness from the valve cover studs.



15. Remove the heated positive crankcase ventilation (PCV) valve from the valve cover.

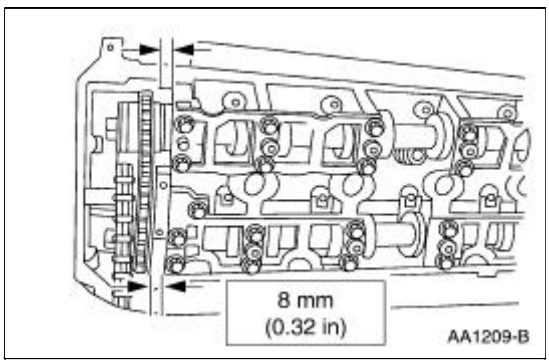


16. Raise the vehicle on a hoist. For additional information, refer to Section 100-02 .

17. Remove the transmission oil level indicator bolt and position the tube aside.

18. Lower the vehicle.

19. Remove the eight bolts, two studs, and the valve cover and gasket.



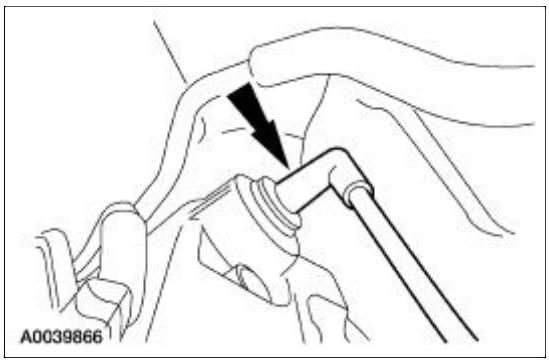
20. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

NOTE: The valve cover gasket is reusable. Inspect the gasket and install a new gasket as necessary.

NOTE: Clean the gasket sealing surfaces and apply gasket sealer in the locations shown.

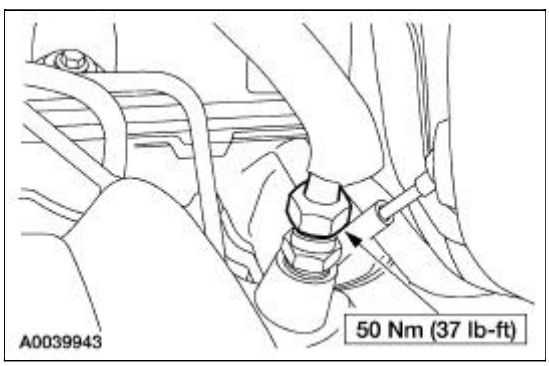
To install, reverse the removal procedure.

Valve Cover LH



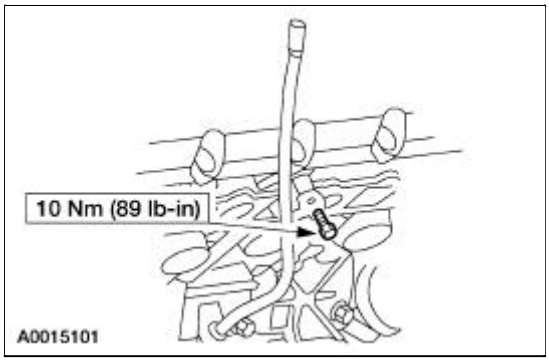
Material

Item	Specification
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4

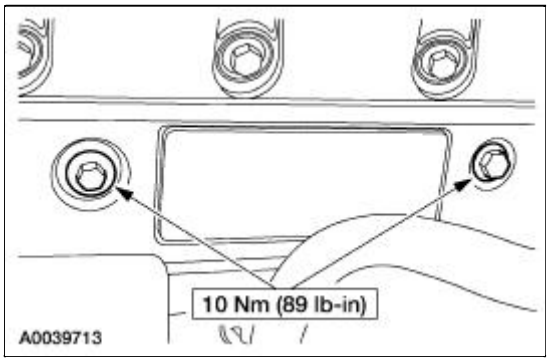


Removal and Installation

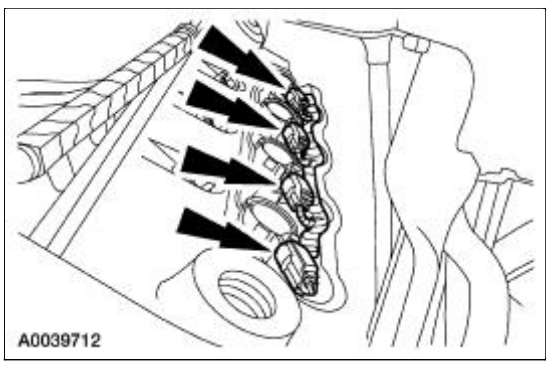
1. Remove the upper intake manifold. For additional information, refer to Upper Intake Manifold in this section.



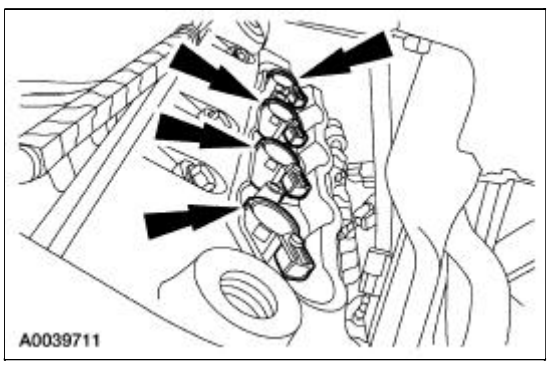
2. Remove the crankcase vent hose.



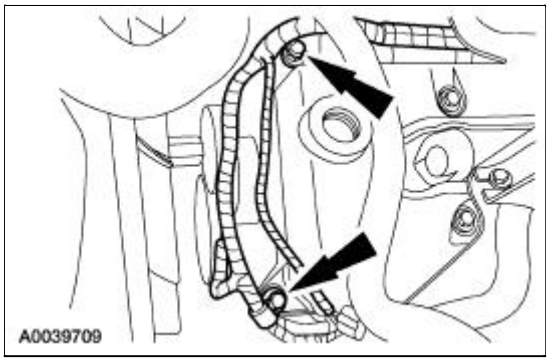
3. Disconnect the exhaust gas recirculation (EGR) tube from the exhaust manifold and remove the valve and tube as an assembly.



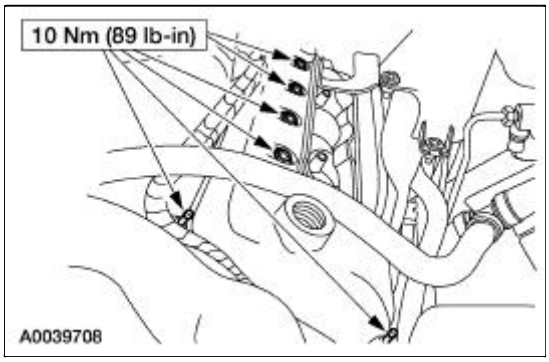
4. Remove the engine oil level indicator tube bracket bolt and position the tube aside.



5. Remove the bolts and the ignition coil cover.



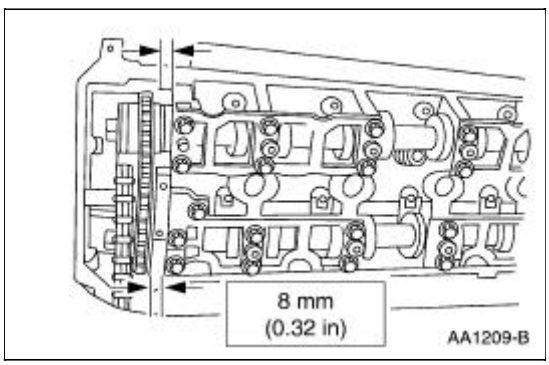
6. Disconnect the ignition coil electrical connectors.



7. Remove the ignition coils.

8. Separate the engine wiring harness from the valve cover studs.

9. Remove the bolts, studs and the left valve cover and gasket.



10. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    NOTE: The valve cover gasket is reusable. Inspect the gasket and replace as necessary.

    NOTE: Clean the gasket sealing surfaces and apply gasket sealer in the locations shown.

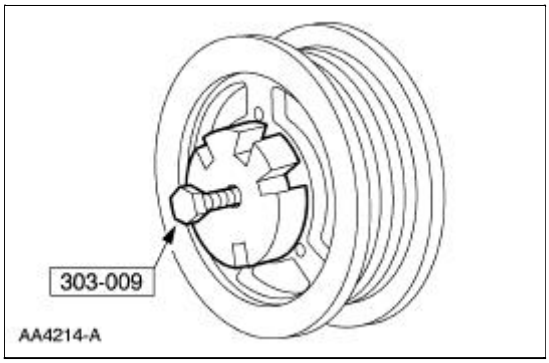
    To install, reverse the removal procedure.

Crankshaft Pulley

Special Tool(s)

 ST1286-A	Remover, Crankshaft Vibration Damper 303-009 (T58P-6316-D)
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)

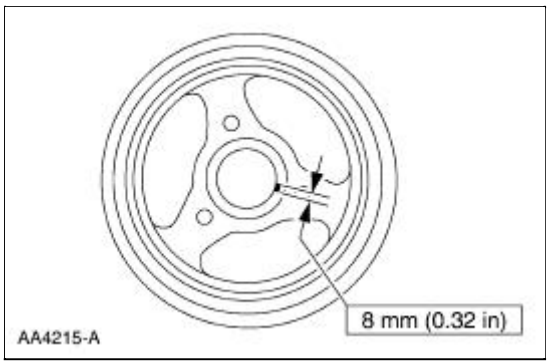
Material



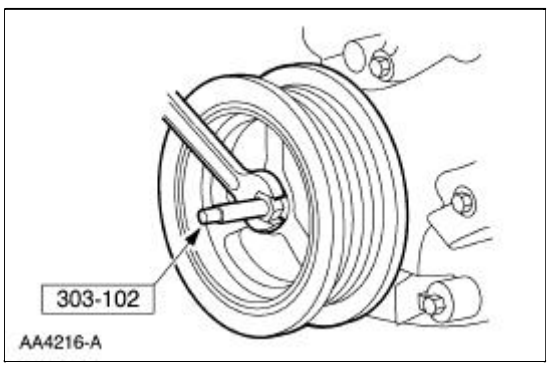
Item	Specification
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4

Removal

1. Remove the fan. For additional information, refer to Section 303-03 .
2. Remove the drive belt. For additional information, refer to Section 303-05 .
3. Raise and support the vehicle. For additional information, refer to Section 100-02 .
4. Remove the bolt.



5. Using the special tool, remove the crankshaft pulley.



Installation

1. **NOTE:** The crankshaft pulley must be installed within four minutes after applying the silicone.

   Apply silicone gasket and sealant to the Woodruff key slot on the crankshaft pulley.

2. Using the special tool, install the crankshaft pulley.

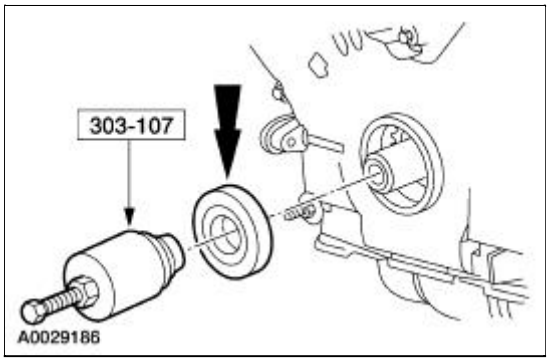
3. Install the bolt and washer. Tighten the bolt in four stages:
   - Stage 1: Tighten to 90 Nm (66 lb-ft).
   - Stage 2: Loosen one full turn.
   - Stage 3: Tighten to 50 Nm (37 lb-ft).
   - Stage 4: Tighten an additional 85-95 degrees.

4. Lower the vehicle.
5. Install the drive belt. For additional information, refer to Section 303-05 .
6. Install the fan. For additional information, refer to Section 303-03 .

Crankshaft Front Oil Seal

Special Tool(s)

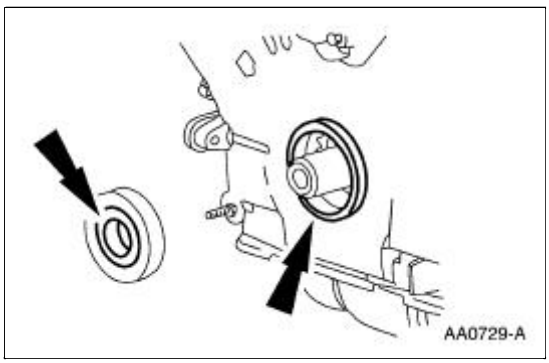
 ST2197-A	Installer, Crankshaft Front Oil Seal 303-635
 ST1328-A	Installer, Front Cover Oil Seal 303-335 (T88T-6701-A)
 ST1288-A	Remover, Crankshaft Front Oil Seal 303-107 (T74P-6700-A)
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)



Material

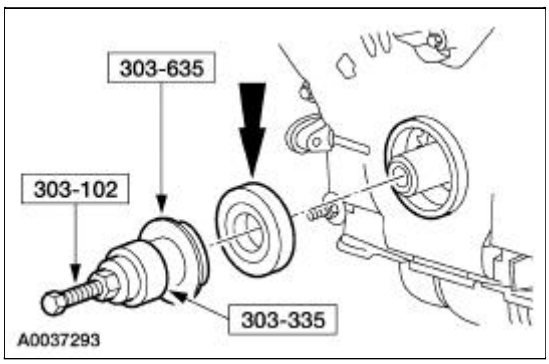
Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal



1. Remove the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.

2. Using the special tool, remove the crankshaft front oil seal.

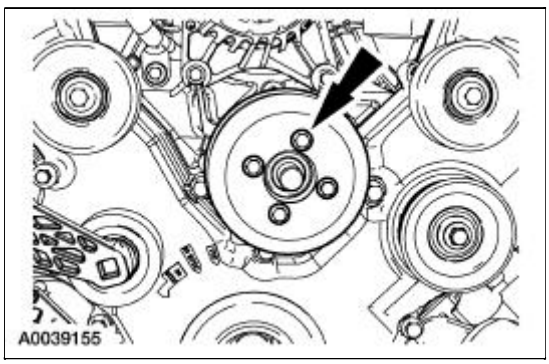


Installation

1. Lubricate the engine front cover and the crankshaft front oil seal inner lip with clean engine oil.

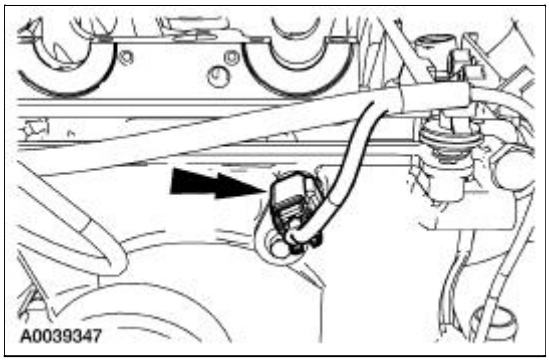
2. Using the special tools, install the crankshaft front oil seal into the engine front cover.

3. Install the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.



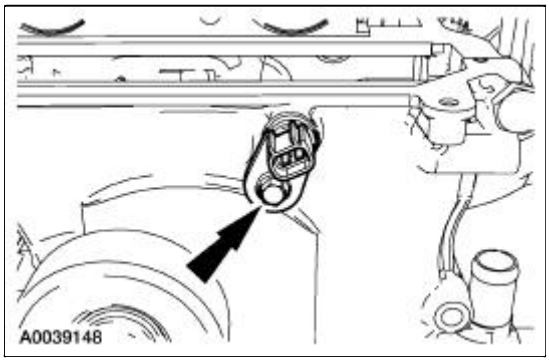
Engine Front Cover

Material

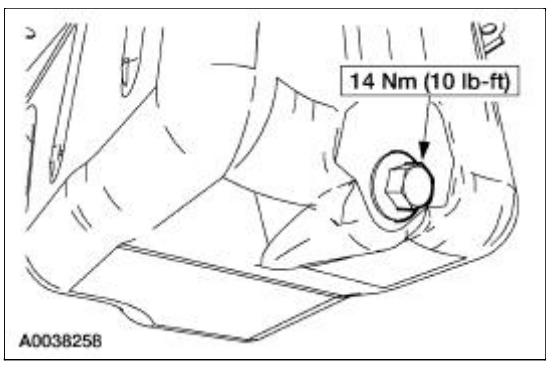


Item	Specification
Metal Surface Cleaner F4AZ-19A536-RA or equivalent	WSE-M5B392-A
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

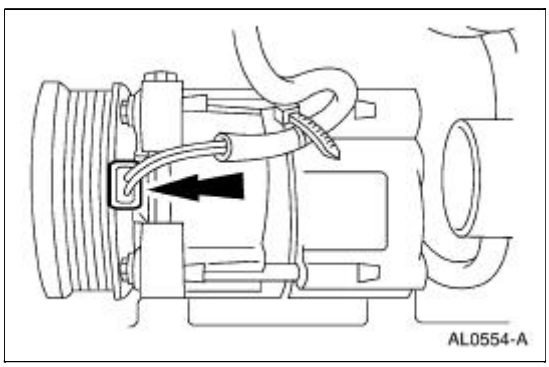
Removal



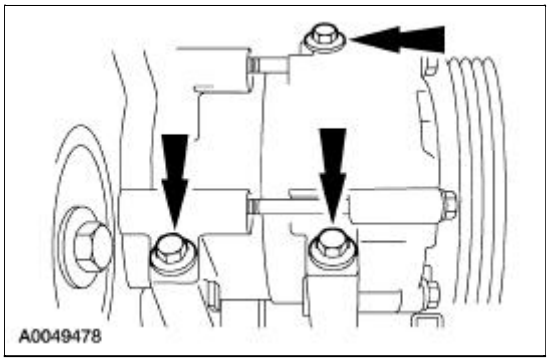
1. Remove the LH and RH valve covers. For additional information, refer to Valve Cover LH and Valve Cover RH in this section.
2. Remove the cooling fan and fan shroud. For additional information, refer to Section 303-03 .
3. Remove the bolts and the water pump pulley.



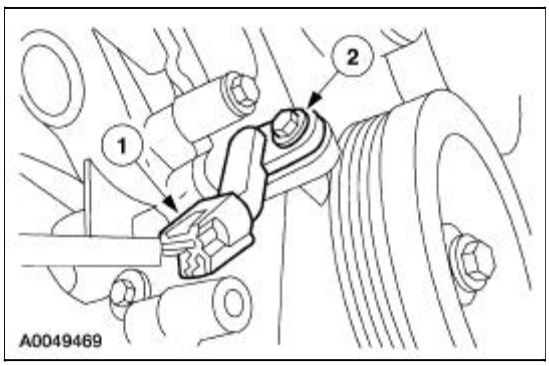
4. Remove the power steering pump. For additional information, refer to Section 211-02 .
5. Remove the crankshaft front oil seal. For additional information, refer to Crankshaft Front Oil Seal in this section.
6. Disconnect the camshaft position (CMP) sensor electrical connector.



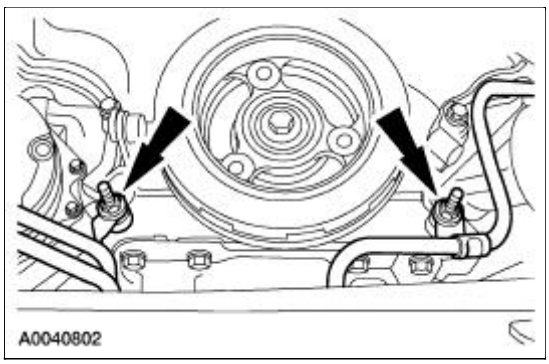
7. Remove the bolt and the CMP sensor.



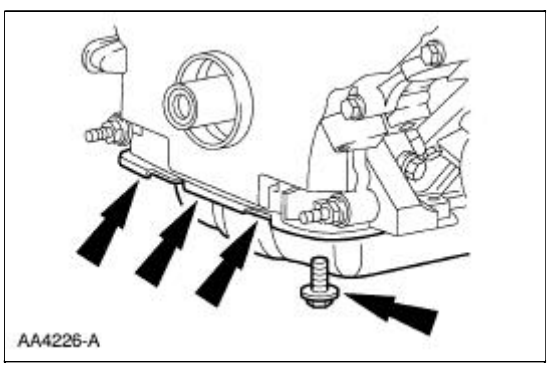
8. Remove the drain plug and drain the engine oil.
    - Install the drain plug after the oil has finished draining.



9. Disconnect the A/C compressor electrical connector.

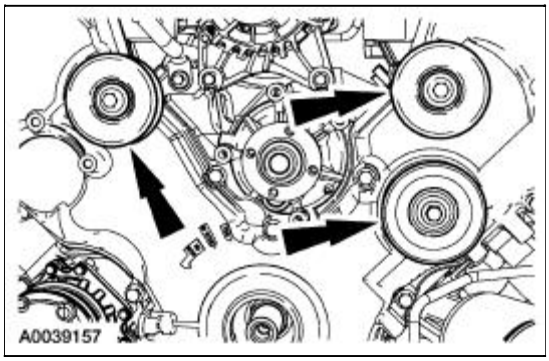


10. Remove the bolts and position the A/C compressor aside.

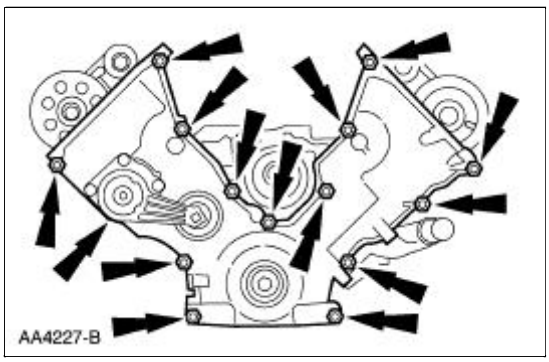


11. Remove the crankshaft position (CKP) sensor.
    1. Disconnect the electrical connector.
    2. Remove the bolt and the sensor.

12. Remove the nuts and detach the power steering and transmission cooler tube brackets.



13. Remove the bolts.



14. Lower the vehicle.

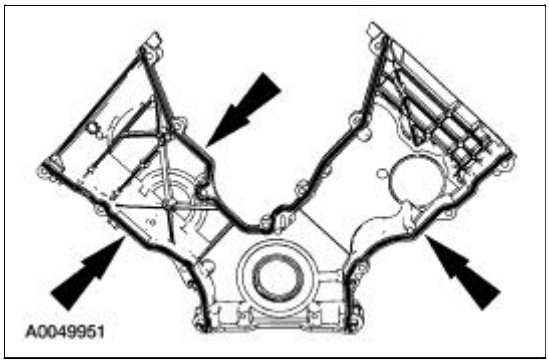
15. Remove and the drive belt idler pulleys.

16. Remove the bolts, the studbolts, the engine front cover and the gaskets.

17. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs, or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    CAUTION: Put shop towels into the oil pan opening to prevent debris from falling into the oil pan.

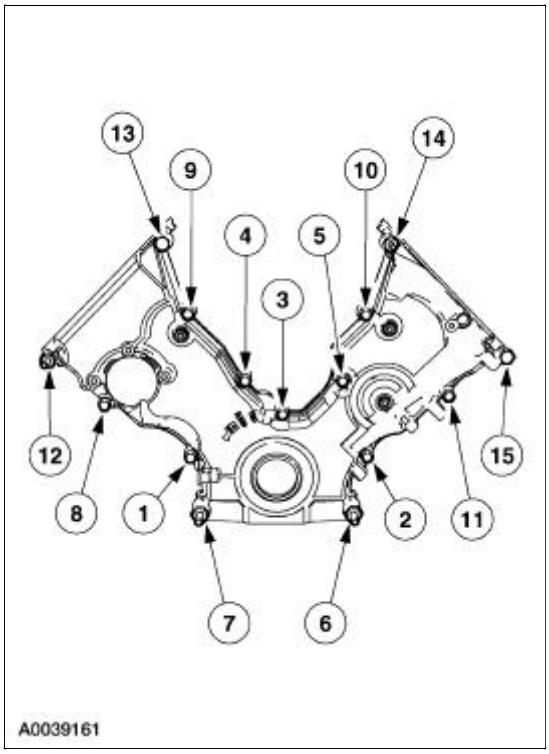
    Clean the gasket mating surfaces with metal surface cleaner.



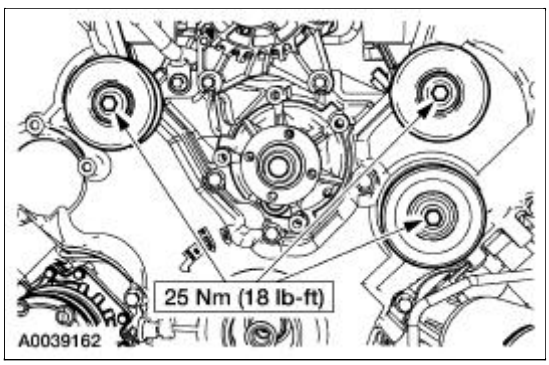
Installation

NOTE: If the front cover and gasket are not secured within four minutes, the sealant must be removed and the sealing surface cleaned with metal surface cleaner.

1. Apply an 8 mm (0.32 in) bead of sealant in the locations shown.

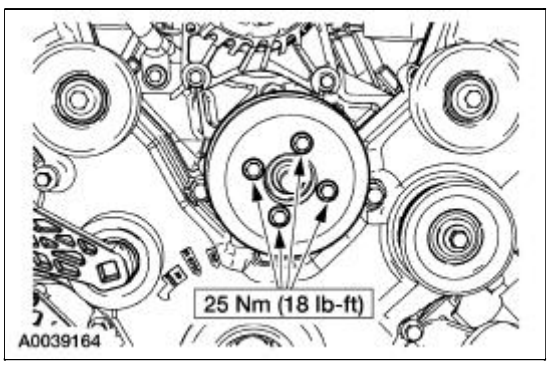


2. Position the gaskets.



3. Position the engine front cover and install the bolts and the studs in three stages:
   Stage 1: Tighten numbers one through five to 25 Nm (18 lb-ft).
   Stage 2: Tighten numbers six and seven to 50 Nm (37 lb-ft).
   Stage 3: Tighten numbers 11 through 15 to 25 Nm (18 lb-ft).

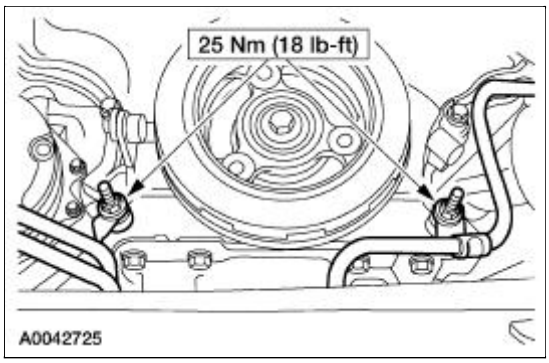
Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
4	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
5	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
6	N808529	Stud, Hex-Head Pilot, M10 x 1.5 x 30
7	N808529	Stud, Hex-Head Pilot, M10 x 1.5 x 30
8	N806177	Bolt, Hex-Head Flange, M8 x 1.25 x 50
9	N806177	Bolt, Hex-Head Flange, M8 x 1.25 x 50
10	N806177	Bolt, Hex-Head Flange, M8 x 1.25 x 50
11	N806300	Stud Hex Shoulder Pilot, M8 x 1.25 x 65 - M8 x 1.25 x 27
12	N806300	Stud Hex Shoulder Pilot, M8 x 1.25 x 65 - M8 x 1.25 x 27
13	W705386	Bolt Hex Shoulder Pilot, M8 x 1.25 x 65
14	N806300	Stud Hex Shoulder Pilot, M8 x 1.25 x 65 - M8 x 1.25 x 27
15	W705386	Bolt Hex Shoulder Pilot, M8 x 1.25 x 65



4. Install the drive belt idler pulleys and the bolts.

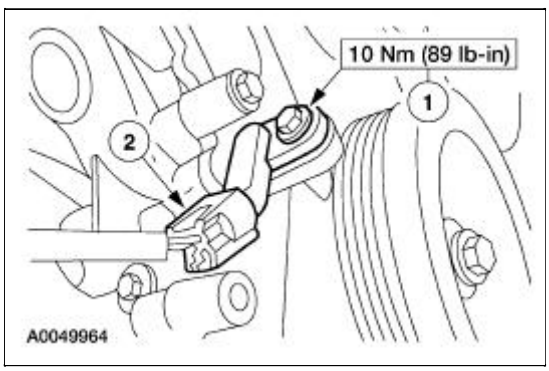
5. **NOTE:** Hold the water pump pulley with a suitable tool to prevent rotation.

   Install the water pump pulley and install the bolts.



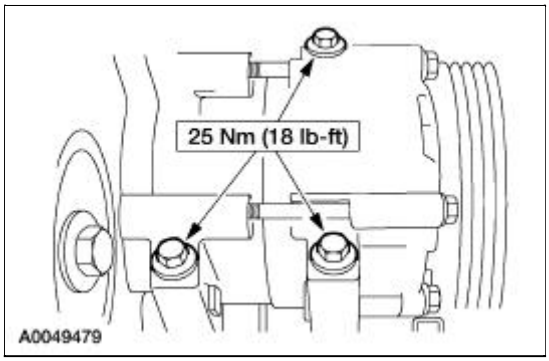
6. Raise the vehicle on a hoist.

7. Tighten the bolts in three stages in the sequence shown:
   - Stage 1: Tighten to 2 Nm (18 lb-in).

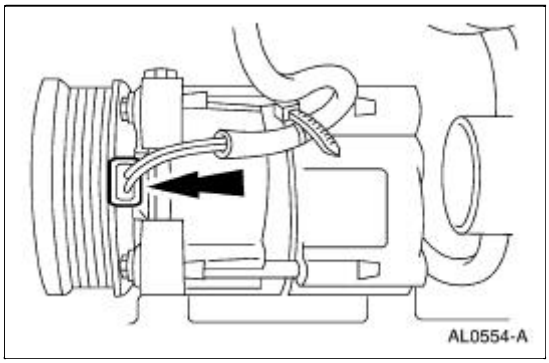


- Stage 2: Tighten to 20 Nm (15 lb-ft).
- Stage 3: Tighten an additional 90 degrees.

8. Position the transmission cooler tube and the power steering hose brackets, and install the nuts.



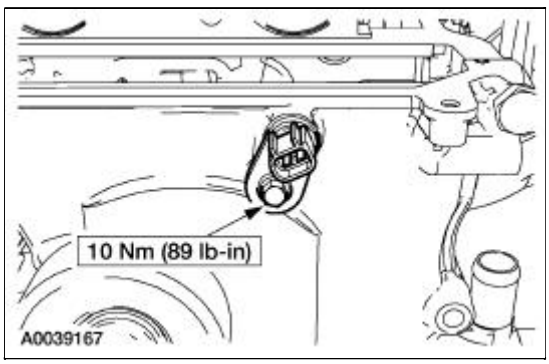
9. Install the CKP sensor.
    1. Install the sensor and the bolt.
    2. Connect the electrical connector.



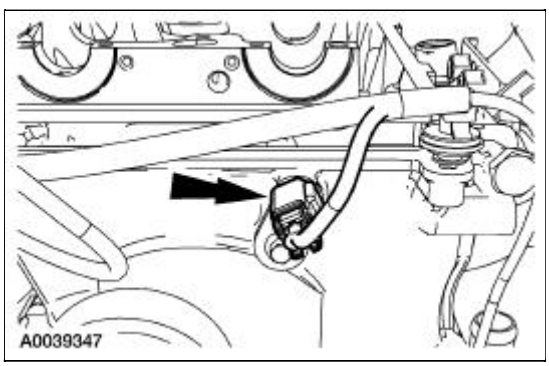
10. Install the crankshaft front oil seal. For additional information, refer to Crankshaft Front Oil Seal in this section.

11. Install the power steering pump. For additional information, refer to Section 211-02

12. Position the A/C compressor and the bolts.



13. Connect the A/C compressor electrical connector.



14. Install a new oil filter.

15. Install the CMP sensor and the bolt.

16. Connect the CMP sensor electrical connector.

17. Install the cooling fan and fan shroud. For additional information, refer to Section 303-03 .

18. Install the left and right valve cover. For additional information, refer to Valve Cover LH or Valve Cover RH in this section.

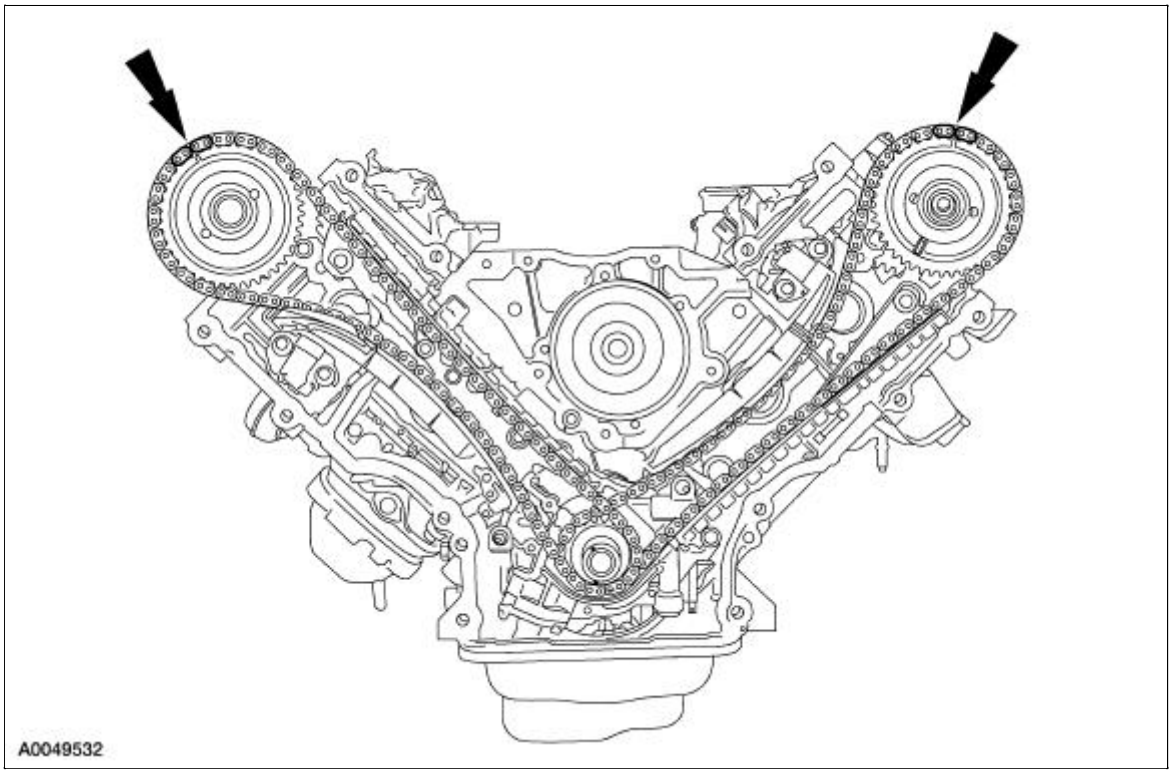
19. Fill the engine with clean engine oil.

Timing Drive Components

Special Tool(s)

 ST1681-A	Alignment Plate, Camshaft 303-445 (T93P-6256-A)
 ST1335-A	Holding Tool, Crankshaft 303-448 (T93P-6303-A)

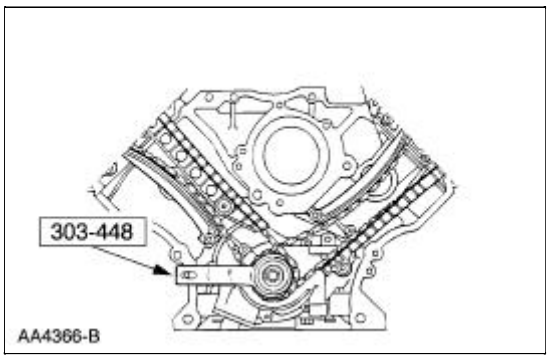
Removal



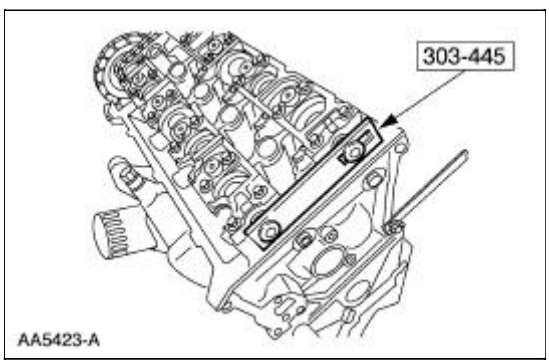
CAUTION: Since the engine is not free-wheeling, if the crankshaft or the camshafts are moved in any manner during removal and installation, the crankshaft and the camshafts must be re-synchronized.

1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.

2. Remove the crankshaft sensor ring from the crankshaft.

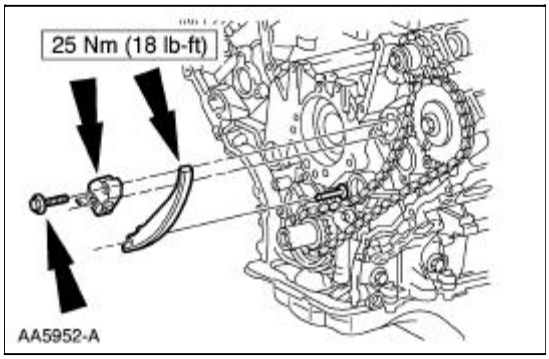


3. Rotate the crankshaft until the timing mark on the RH camshaft sprocket is approximately at the 11 o'clock position, and the timing mark on the LH camshaft sprocket is approximately at the 12 o'clock position.



4. **CAUTION: Unless otherwise instructed, at no time when the timing chains are removed and the cylinder heads are installed is the crankshaft or the camshaft to be rotated. Severe piston and valve damage will occur.**

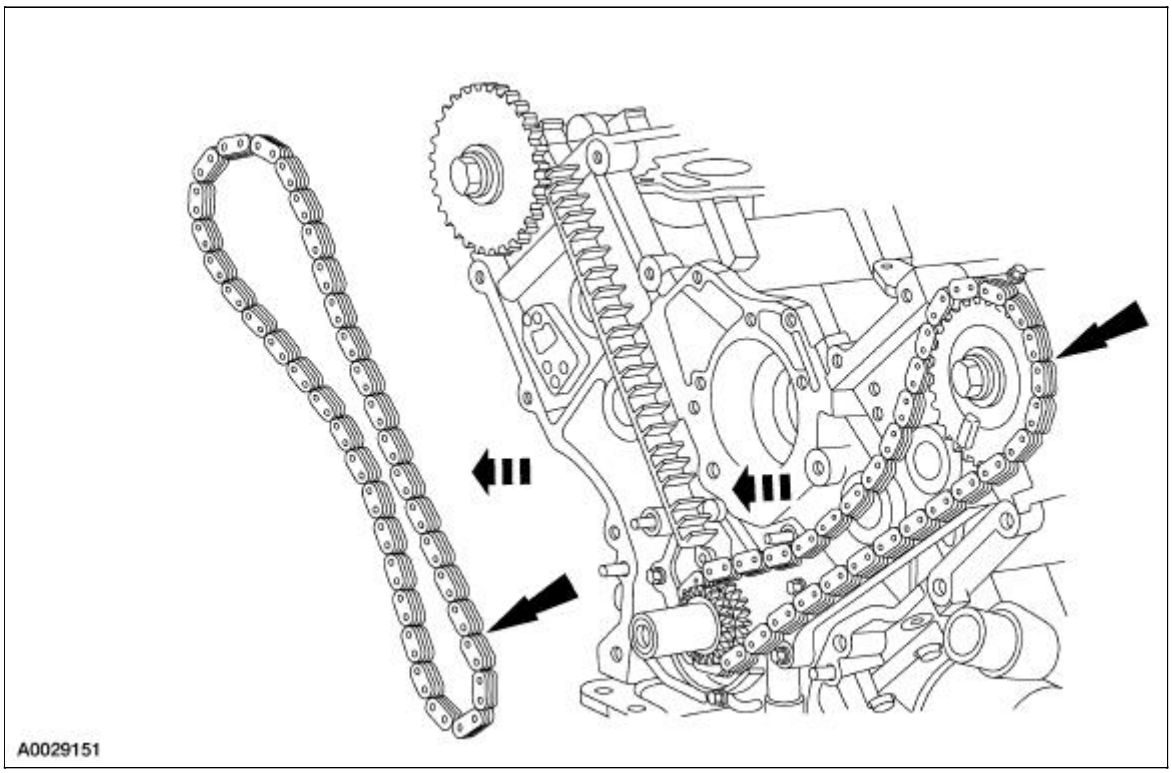
   Using the special tool, position the crankshaft as shown.



5. Install the special tool.

6. **NOTE:** LH shown; RH similar.

Remove the two bolts, the timing chain tensioner and tensioner arm.



7. **CAUTION: Unless otherwise instructed, at no time when the timing chains are removed and the cylinder heads are installed is the crankshaft or the camshaft to be rotated. Severe piston and valve damage will occur.**

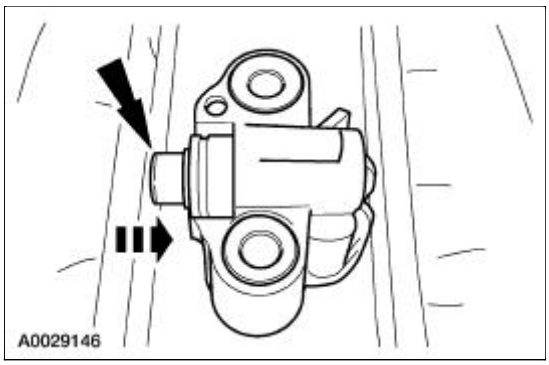
   CAUTION: Do not remove the special tool from the camshafts.

   Remove the LH and RH timing chains and the crankshaft sprockets.

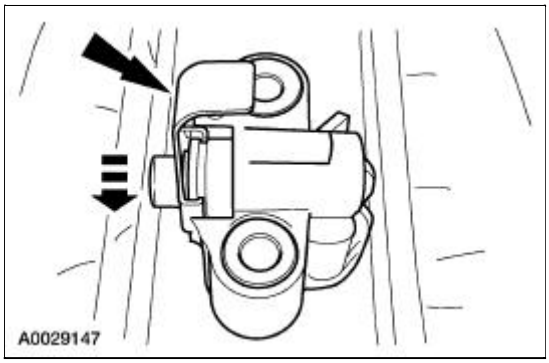
   - Remove the special tool from the crankshaft.
   - Remove the timing chains from the camshaft sprockets.
   - Remove the right and left timing chains and the crankshaft sprocket from the crankshaft.

8. **CAUTION: The bolts are different lengths and must be returned to their original location.**

   NOTE: LH shown; RH similar.



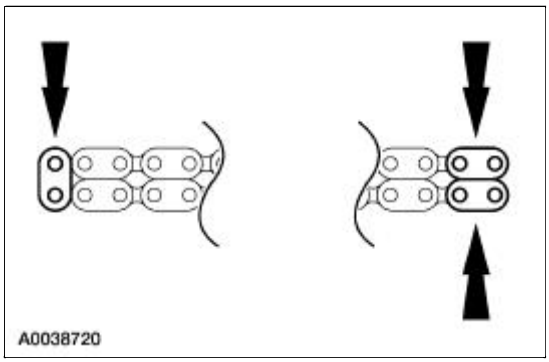
Remove the bolts and the timing chain guides.



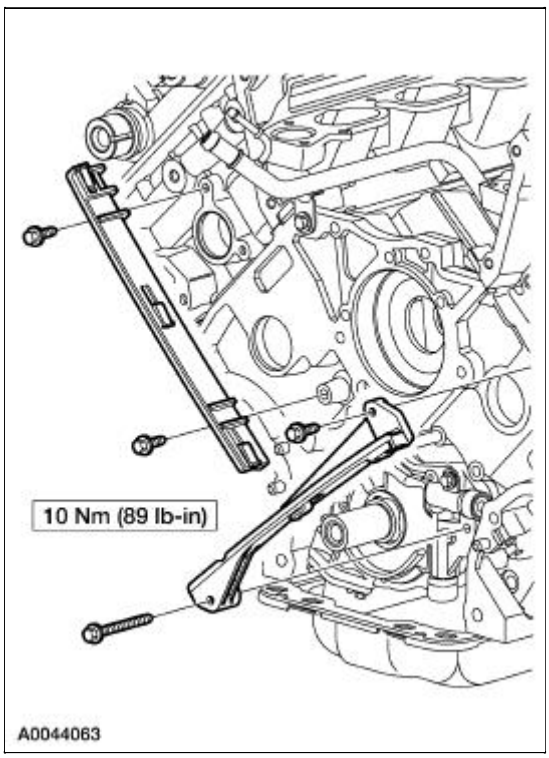
Installation

1. **CAUTION: Timing chain procedures must be followed exactly or damage to the pistons or valves will result.**

   Compress the tensioner plunger, using the edge of a soft-jawed vise.

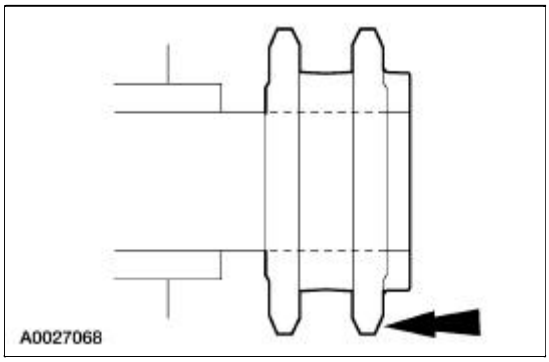


2. Install the tensioner retaining clip.
   - Remove the tensioner from the vise.

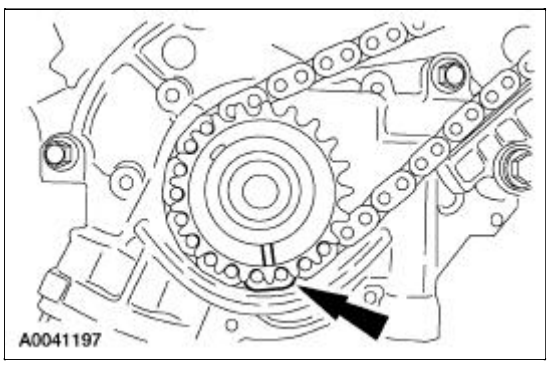


3. **NOTE:** There are 61 links in the timing chain.

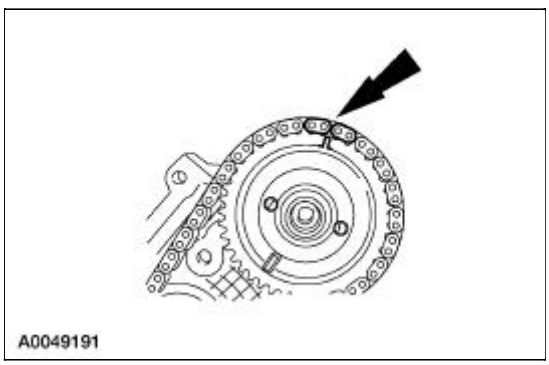
   If the copper links are not visible, mark two links on one end and one link on the other end, and use as timing marks.



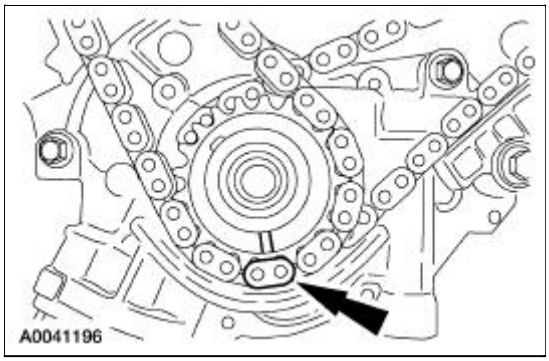
4. Install the timing chain guides.



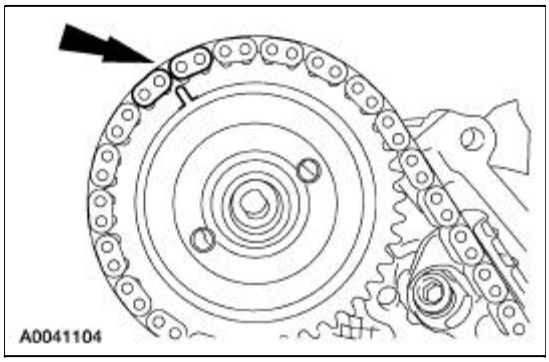
5. Remove the special tool.



6. Position the crankshaft sprocket with the long hub facing outward.

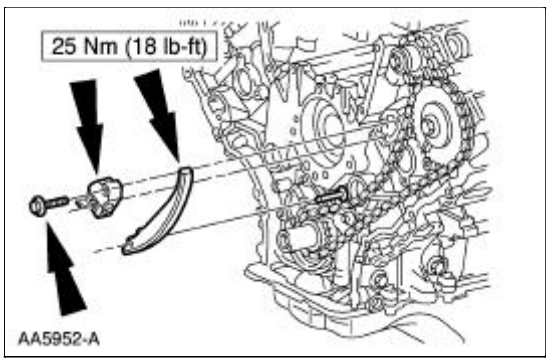


7. Install the LH timing chain onto the crankshaft sprocket, aligning the one copper (marked) link on the timing chain with the slot on the crankshaft sprocket.

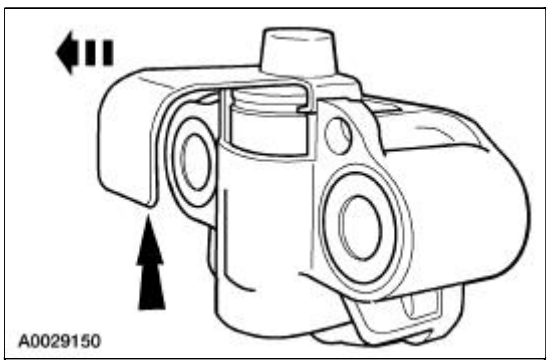


8. Position the LH timing chain on the camshaft sprocket with the two copper (marked) chain links and the camshaft sprocket timing mark aligned.

9. Position the RH (outer) timing chain on the crankshaft sprocket, aligning the copper (marked) link with the timing mark on the sprocket.



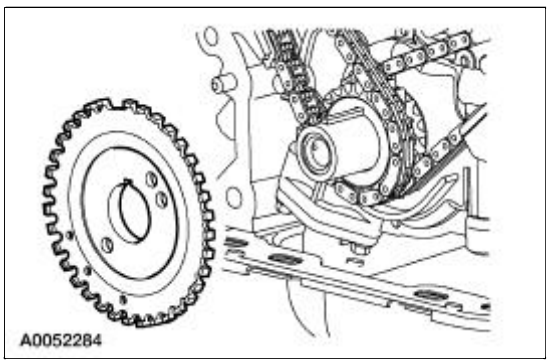
10. Position the RH timing chain on the camshaft sprocket. Make sure the two copper (marked) links align with the camshaft sprocket timing mark.



11. **NOTE:** LH shown; RH similar.

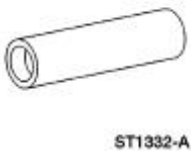
    Position the tensioner arms and tensioners, and install the bolts.

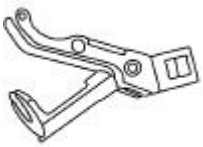
12. Remove the tensioner retaining clip.

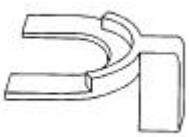


13. As a post-check, verify correct alignment of all timing marks.

14. Remove the special tool.



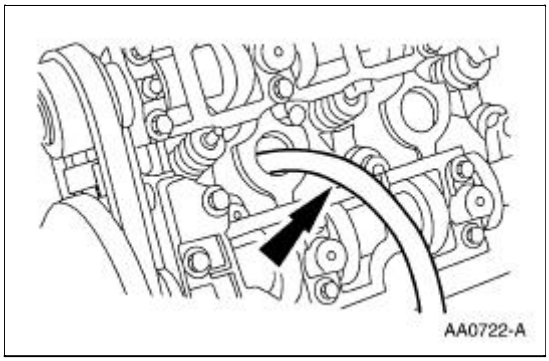




15. Position the crankshaft sensor ring on the crankshaft.

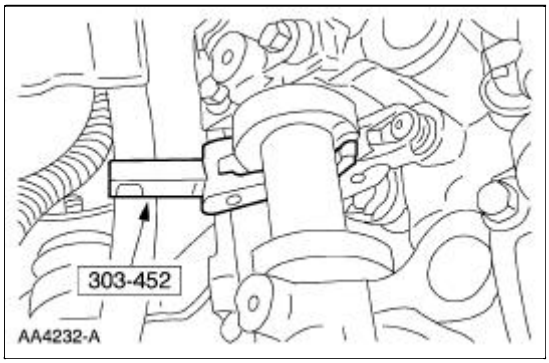
16. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

Valve Seals



Special Tool(s)

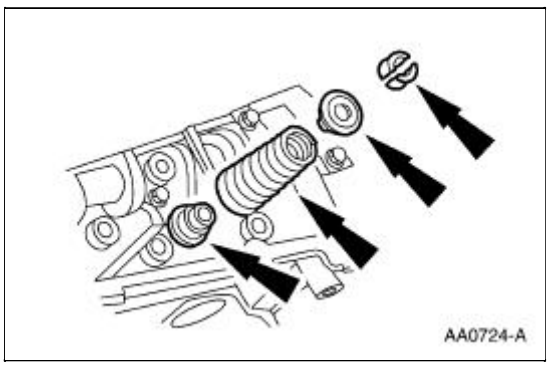
 ST1718-A	Compressor, Valve Spring 303-452 (T93P-6565-AR)
 ST1332-A	Installer, Valve Stem Oil Seal 303-383 (T91P-6571-A)
 ST1693-A	Compressor, Valve Spring 303-567 (T97P-6565-AH)
 ST1331-A	Compressor Spacer, Valve Spring 303-382 (T91P-6565-AH)



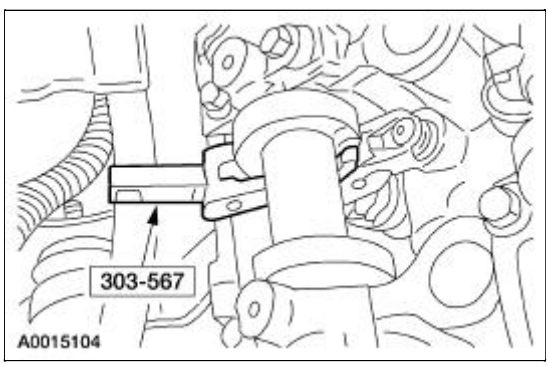
Removal

1. Remove the roller followers. For additional information, refer to Camshaft Roller Follower in this section.
2. Remove the spark plugs. For additional information, refer to Section 303-07B .
3. Position the piston of the cylinder being serviced at the bottom of the stroke.
4. **CAUTION: If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal.**

   Use compressed air in the cylinder to hold both valves in position.

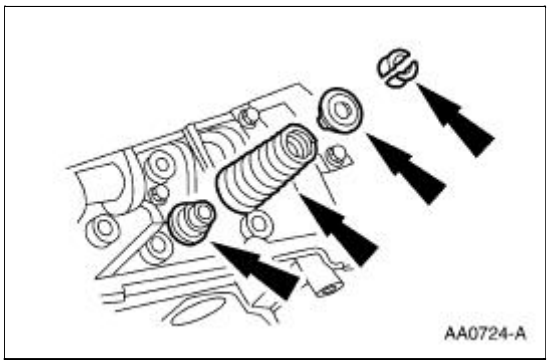


5. Using the special tool, compress the intake valve spring.

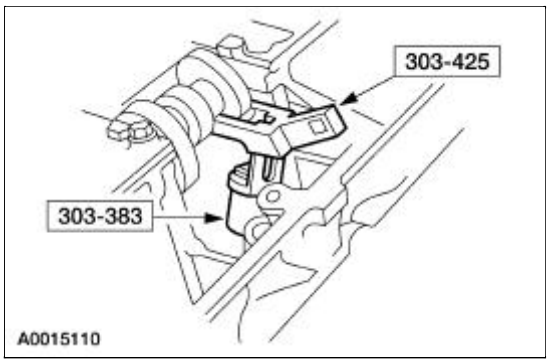


6. **NOTE:** Valve stem seals should be visually inspected if new seals are not installed.

   Remove the valve spring retainer keys, the valve spring retainer, the valve spring and the valve stem seal.

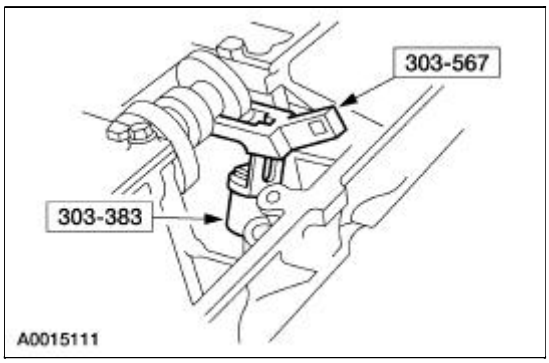


7. Using the special tool, compress the exhaust valve spring.

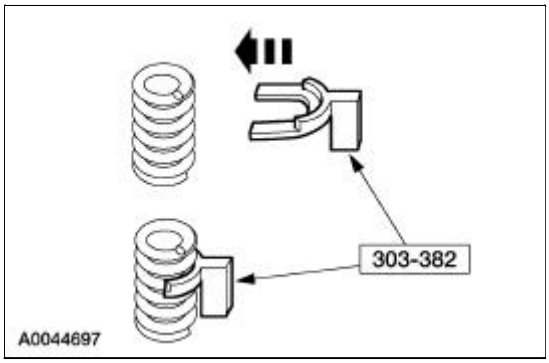


8. **NOTE:** Valve stem seals should be visually inspected if new seals are not installed.

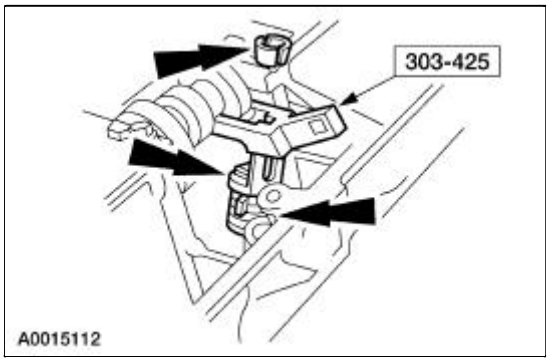
Remove the valve spring retainer keys, the valve spring retainer, the valve spring and the valve stem seal.



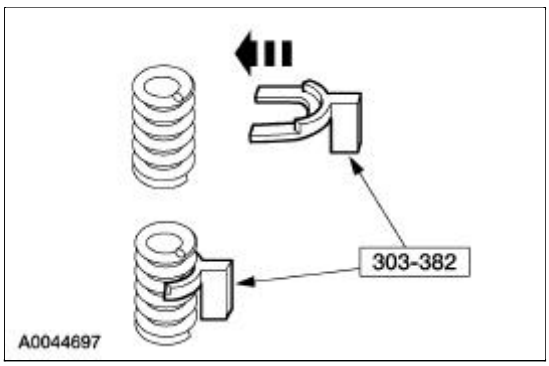
Installation



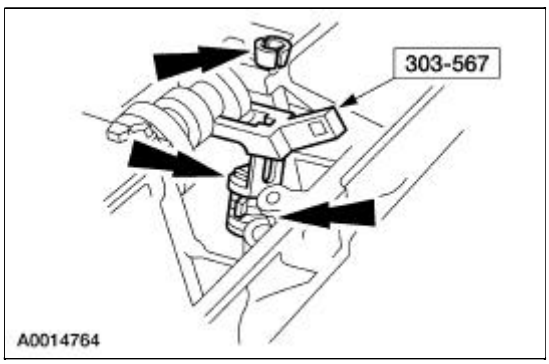
1. Using the special tools, install the new intake valve stem seals.



2. Using the special tools, install the new exhaust valve stem seals.



3. Install the special tool between the valve spring coils to protect the intake valve stem seal from damage.

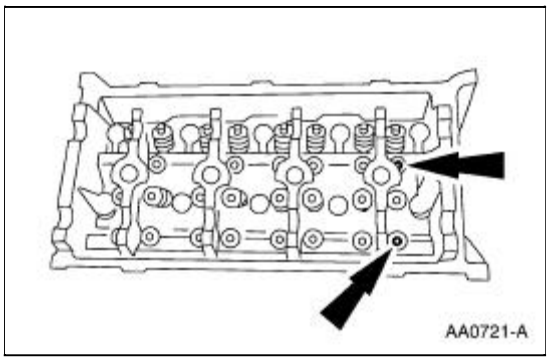


4. Using the special tool, install the intake valve spring, the spring retainer and the valve spring retainer keys.

5. Install the special tool between the valve spring coils to protect the intake valve stem seal from damage.

6. Using the special tool, install the exhaust valve spring, the spring retainer and the valve spring retainer keys.

7. Remove the compressed air hose from the cylinder.



8. Install the spark plugs. For additional information, refer to Section 303-07B .

9. Install the roller followers. For additional information, refer to Camshaft Roller Follower in this section.

Hydraulic Lash Adjusters

Removal and Installation

1. Remove the roller followers. For additional information, refer to Camshaft Roller Follower in this section.
2. Remove the 16 hydraulic lash adjusters.

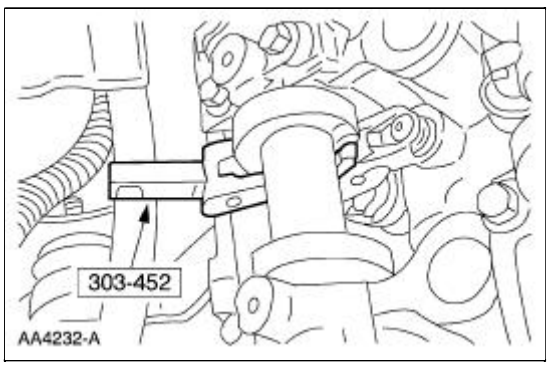
3. Inspect the roller followers. For additional information, refer to Section 303-00 .
4. To install, reverse the removal procedure.

Camshaft Roller Follower

Special Tool(s)

 ST1718-A	Compressor, Valve Spring 303-452 (T93P-6565-AR)

Removal and Installation

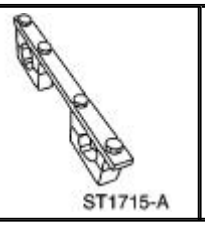


1. Remove the left and right valve cover (6582). For additional information, refer to Valve Cover RH and Valve Cover LH in this section.

2. Position the piston of the cylinder being repaired at the bottom of the stroke and camshaft lobe at base circle.

3. Using the special tool, compress the intake valve spring and remove the roller follower.

4. Using the special tool, compress the exhaust valve spring and remove the roller follower.



5. Repeat Steps 2, 3 and 4 to remove all the necessary roller followers. Inspect roller finger followers and camshafts. For additional information, refer to Section 303-00 .

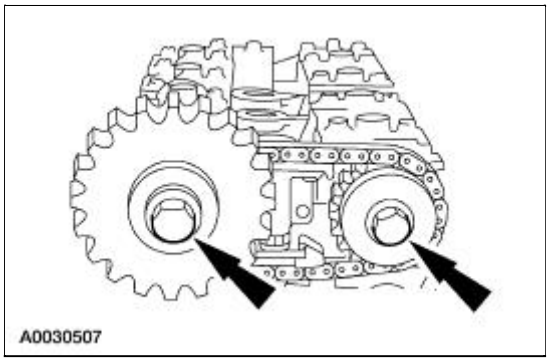
6. To install, reverse the removal procedure.

Camshaft

Special Tool(s)

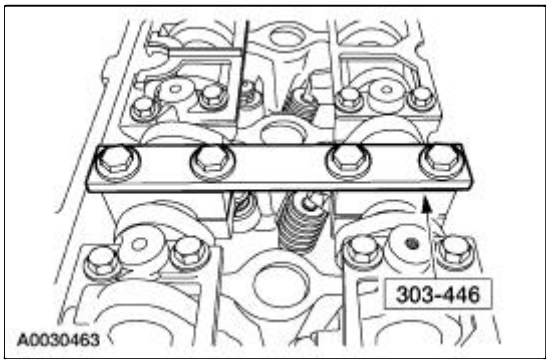
 ST1715-A	Holding Tool, Camshaft 303-446 (T93P-6256-AHR)

Material

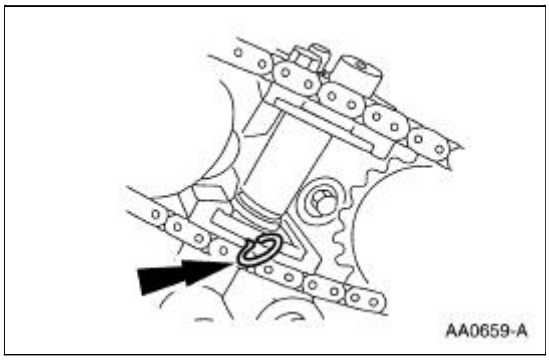


Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

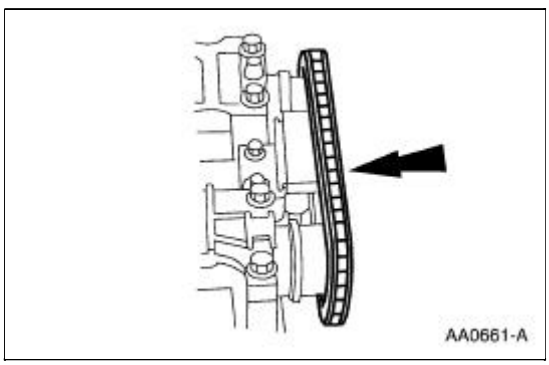
Removal



1. Remove the roller followers. For additional information, refer to Camshaft Roller Follower in this section.
2. Remove the LH timing chain for the LH side and both timing chains for the RH side. For additional information, refer to Timing Drive Components in this section.
3. Install the special tool.

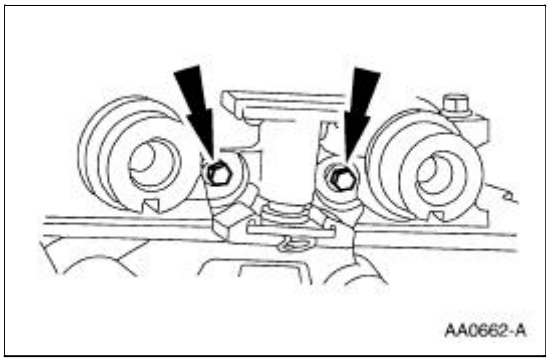


4. Remove the exhaust camshaft sprocket and the intake camshaft bolt, washer and spacer.



5. Remove the special tool.

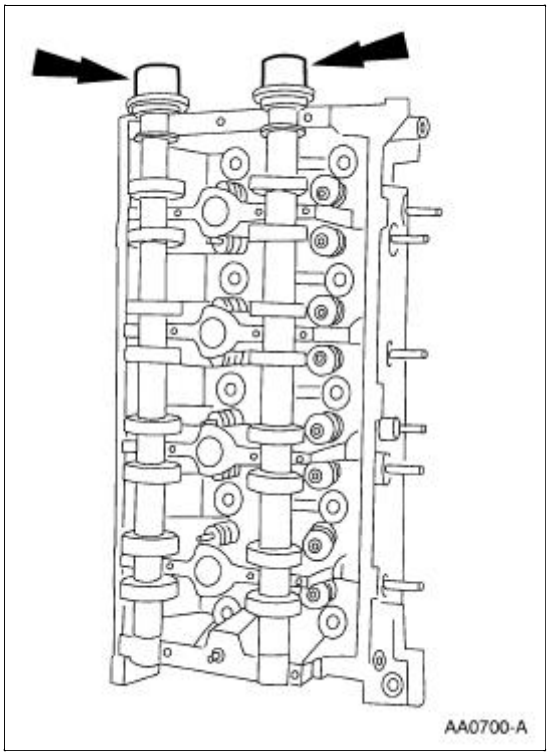
6. Compress the tensioner and install a lock pin.



7. Remove the timing chain, the sprocket, and intake camshaft sprocket spacer.

8. **NOTE:** LH shown; RH similar.

   Remove the bolts.

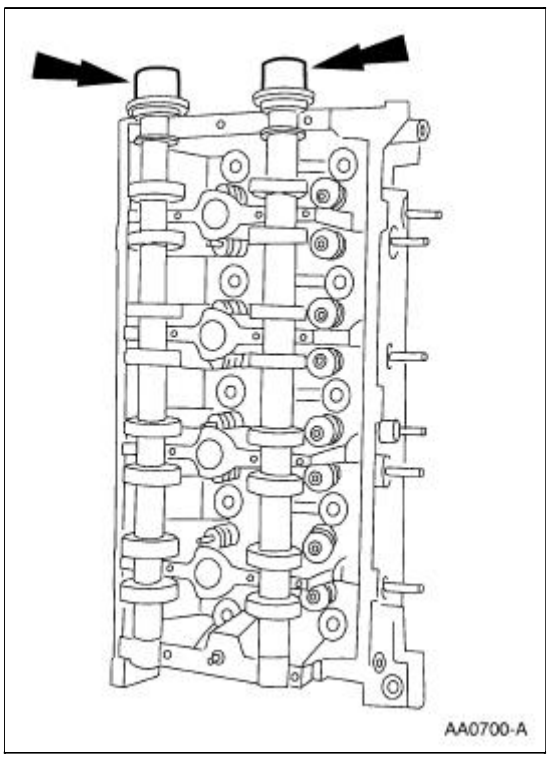


9. **CAUTION: The outer bolts on the outer cam bearing cap (exhaust) are longer and must be returned to the same location or engine damage may occur.**

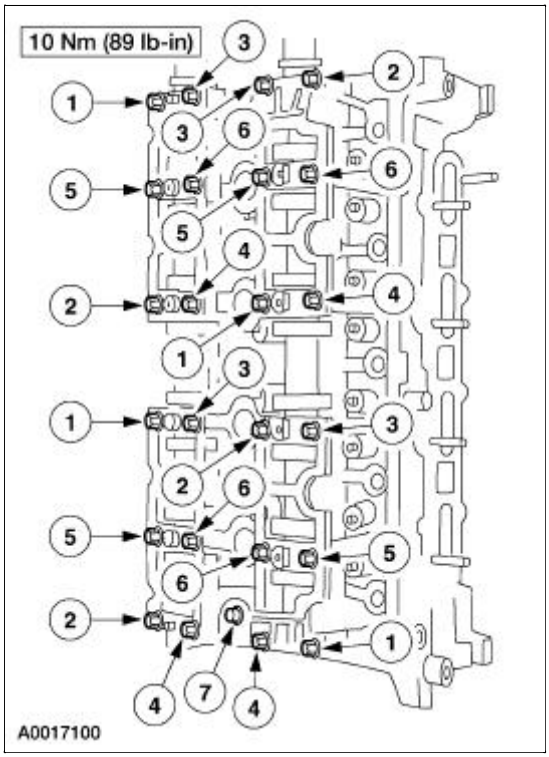
   NOTE: Identify the camshaft to cylinder head location. Caps are not interchangeable.

   Remove the bolts and the camshaft bearing cap assemblies.

10. Remove the camshafts (6250).



Installation

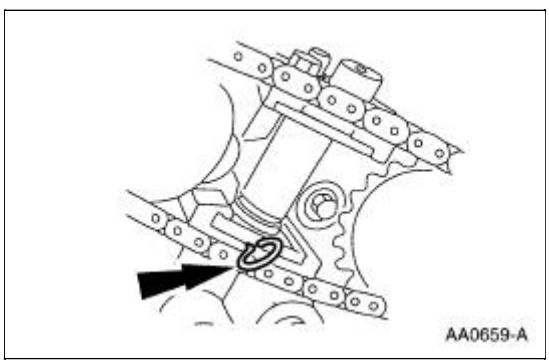


1. **NOTE:** LH shown; RH similar.

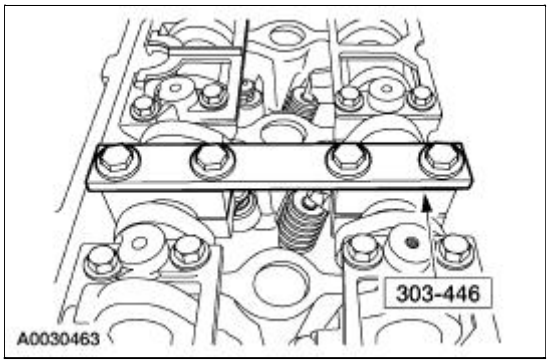
   Install the camshafts.

   - Lubricate the camshafts with clean engine oil.

2. Install the camshaft bearing cap assemblies.

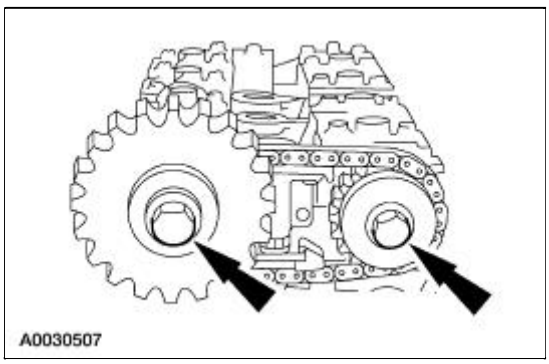


3. Install the bolts.



4. **CAUTION: Timing marks must be at 12 o'clock and indexed at 6 o'clock.**

   Install the camshaft sprockets and the chain as an assembly.



5. Remove the lockpin from the chain tensioner.

6. Install the special tool.

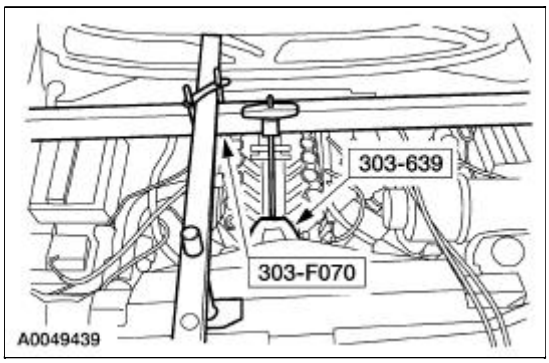
7. Tighten the exhaust camshaft sprocket and the intake camshaft bolt washer and spacer in two stages:
   - Stage 1: Tighten to 40 Nm (30 lb-ft).
   - Tighten an additional 90 degrees.

8. Remove the special tool.

9. Install the left timing chain for the left side or both timing chains for the right side. For additional information, refer to Timing Drive Components in this section.

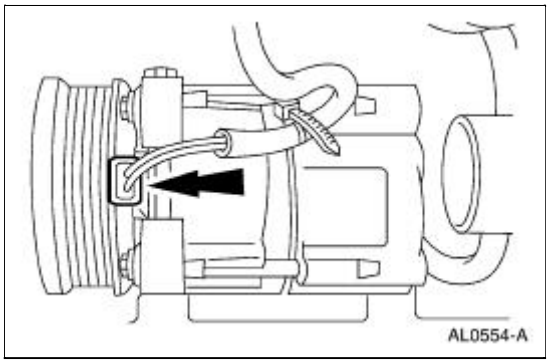
10. Install the roller followers. For additional information, refer to Camshaft Roller Follower in this section.

Exhaust Manifold RH



Special Tool(s)

 ST2176-A	3-Bar Engine Support 303-F070
 ST2592-A	Support Bracket, Engine 303-639

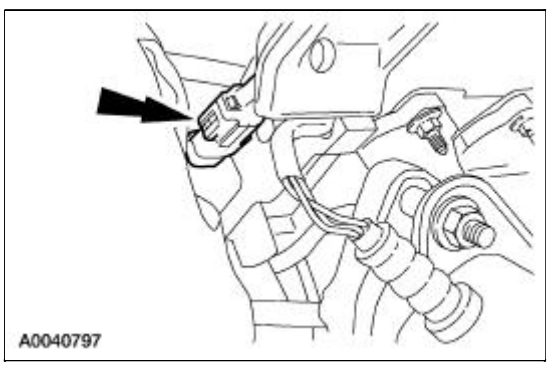


Removal and Installation

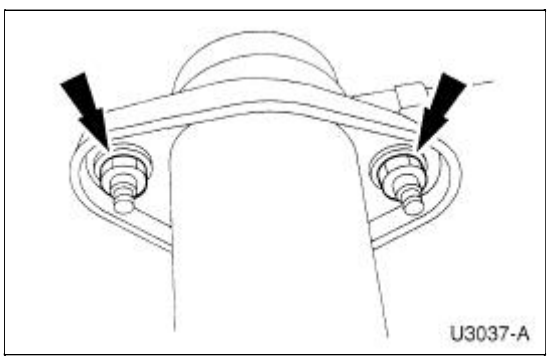
1. Remove the lower intake manifold. For additional information, refer to Section 303-01B .
2. **NOTE:** The alternator bolts may be used to attach the engine support bracket.

   Install the special tools and support the engine.

3. Remove the starter. For additional information, refer to Section 303-06 .
4. Remove the RH front wheel and tire assembly.
5. Remove the RH front fender splash shield.
6. Disconnect the A/C compressor electrical connector.



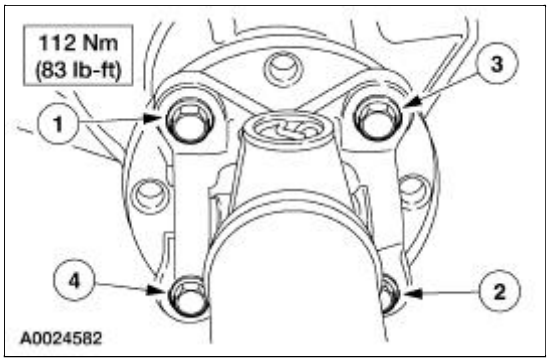
7. Remove the bolts and position the A/C compressor aside.



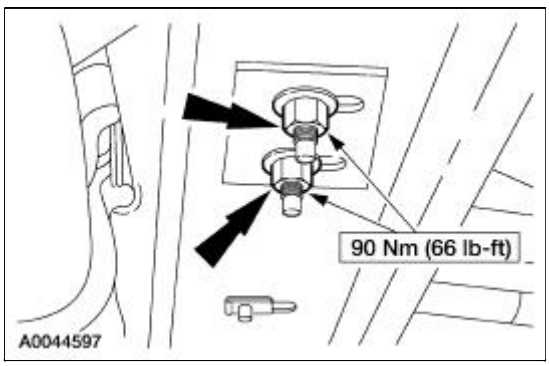
8. **NOTE:** Right side shown, left side similar.

   Disconnect the heated oxygen sensor (HO2S) electrical connectors.

9. Remove the two nuts from the RH and LH Y-pipes.

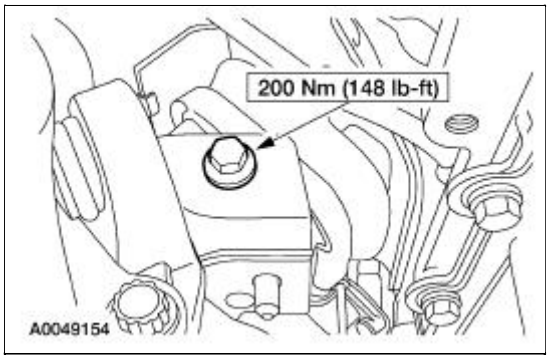


10. Index-mark the driveshaft flange yoke and the pinion flange.

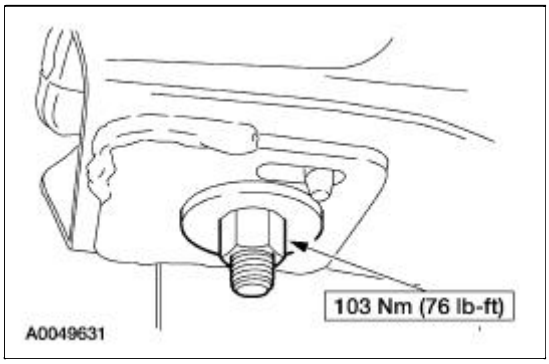


11. **CAUTION: Do not allow the driveshaft to hang unsupported. Support the driveshaft with mechanics wire.**

    Remove the four bolts.

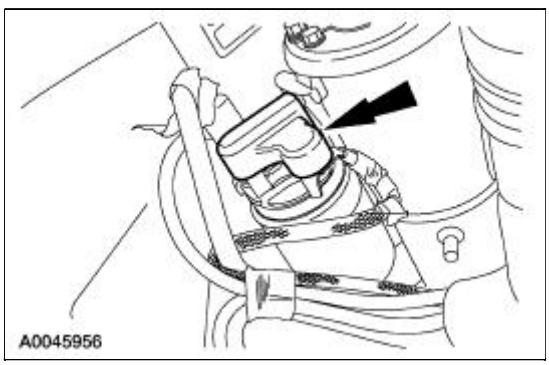


12. Remove the transmission mount-to-crossmember nuts.



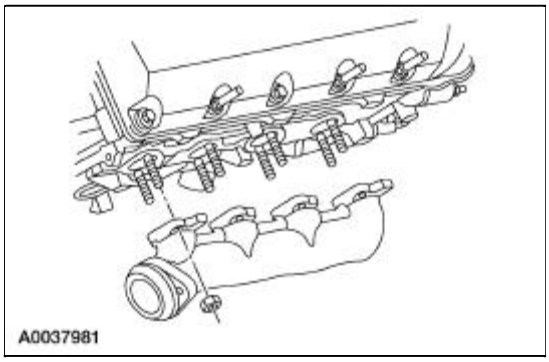
13. **NOTE:** The caged nut on the frame may break during bolt removal. If necessary, install a new nut.

    Remove the bolt from the LH motor mount.

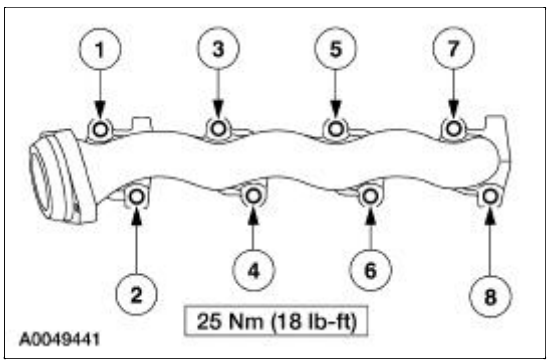


14. Remove the nut from the RH motor mount.

15. Remove the right motor mount bolts.



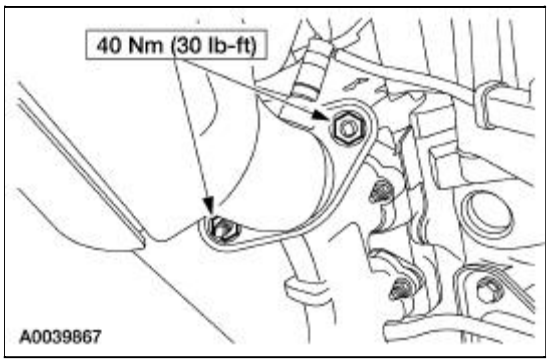
16. Remove the left motor mount bolts.



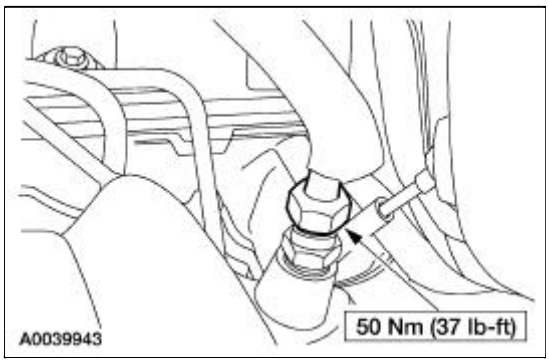
17. Lower the vehicle and raise the engine approximately 45 mm (1.8 in).

18. Remove the exhaust manifold.
    - Remove the eight nuts.

- Remove the exhaust manifold and gasket.

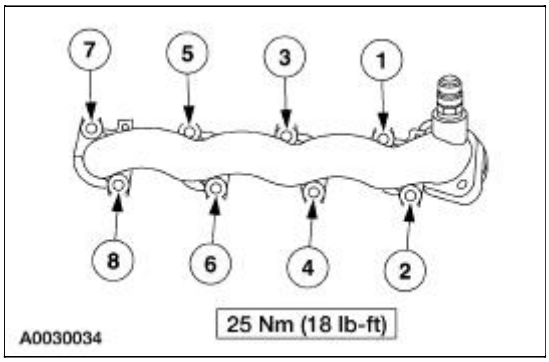


19. To install, reverse the removal procedure.
    - Install a new gasket.
    - Tighten the exhaust manifold in the sequence shown.



Exhaust Manifold LH

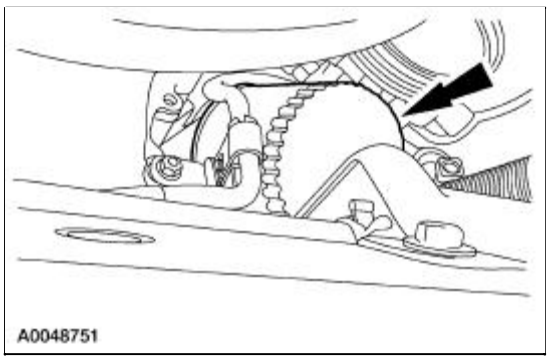
Removal and Installation



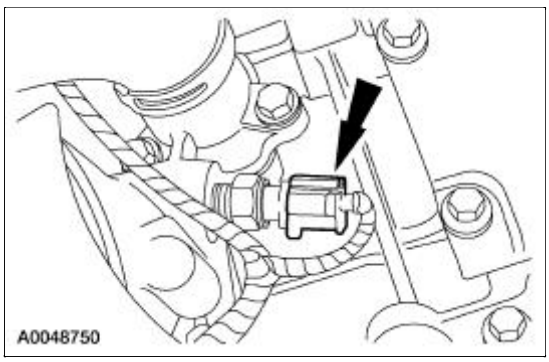
1. Raise and support the vehicle. For additional information, refer to Section 100-02 .
2. Remove the two nuts from the RH and LH catalytic converter assemblies and position the Y-pipe down.

3. Disconnect the EGR tube.

4. Remove the exhaust manifold.
   - Remove the eight nuts.
   - Remove the exhaust manifold and gaskets.

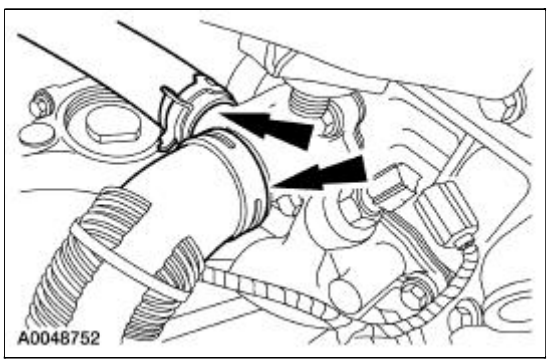


5. To install, reverse the removal procedure.



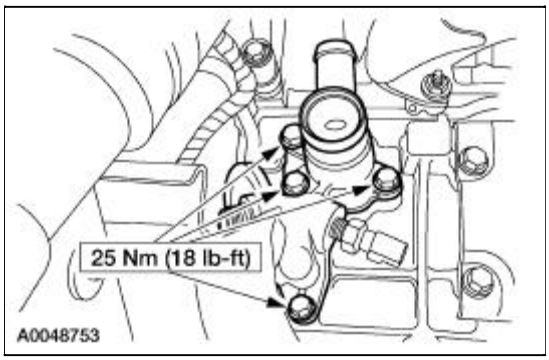
Oil Filter Adapter —4x2

Removal and Installation



1. Raise and support the vehicle. For additional information, refer to Section 100-02 .
2. Drain the cooling system. For additional information, refer to Section 303-03 .
3. Remove the oil filter.

4. Disconnect the oil pressure sensor electrical connector.



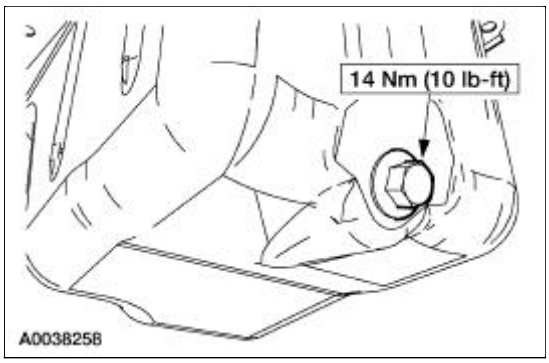
5. Slide back the clamps and disconnect the radiator lower hose and the degas hose.

6. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

Remove the four bolts and the filter adapter.

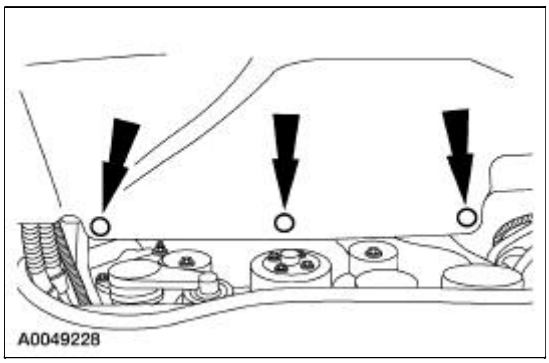
- Discard the gasket.
- Clean and inspect the mating surfaces.

7. To install, reverse the removal procedure.
    - Use a new gasket.



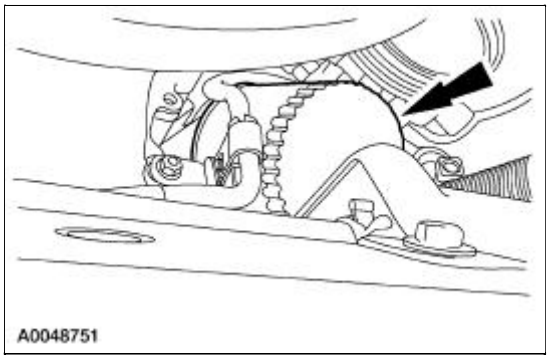
Oil Filter Adapter —4x4

Material

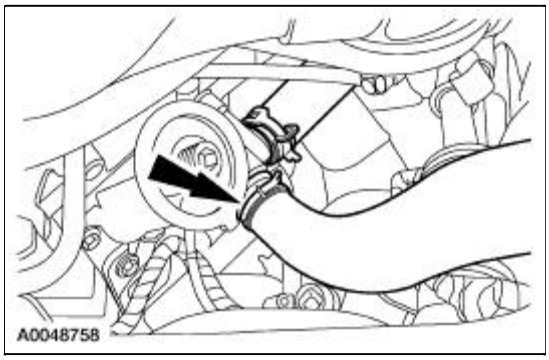


Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent)	WSS-M2C153-H

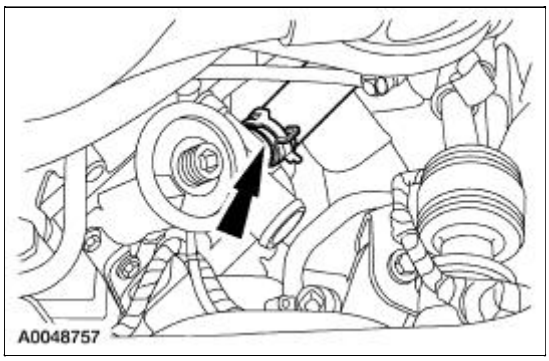
Removal



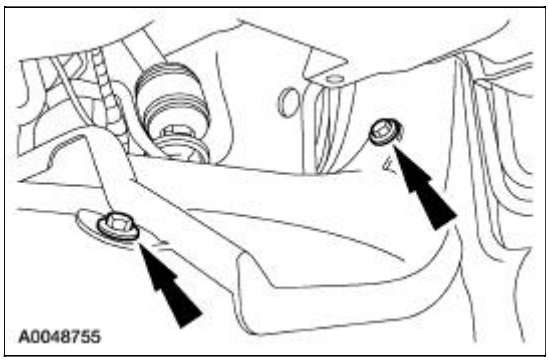
1. Raise and support the vehicle. For additional information, refer to Section 100-02 .
2. Drain the cooling system. For additional information, refer to Section 303-03 .
3. Remove the drain plug and drain the engine oil.
   - Install the drain plug after the oil has finished draining.



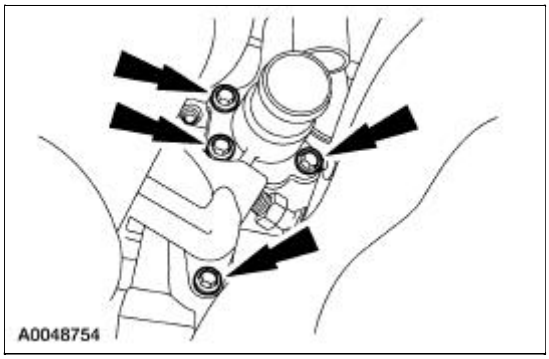
4. Remove the six pushpins and the lower radiator splash shield.



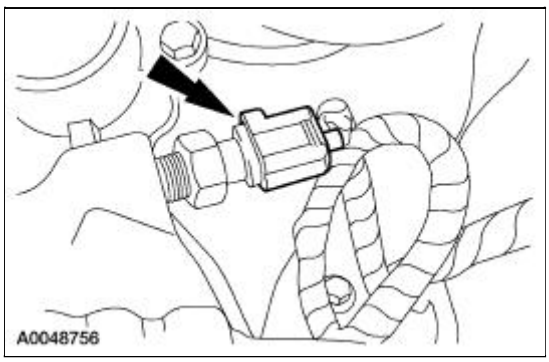
5. Remove the oil filter.



6. Slide back the hose clamp and disconnect the lower radiator hose from the oil filter adapter.



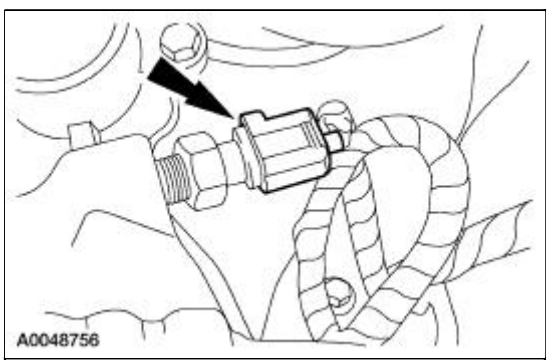
7. Slide back the hose clamp and disconnect the degas hose from the oil filter adapter.



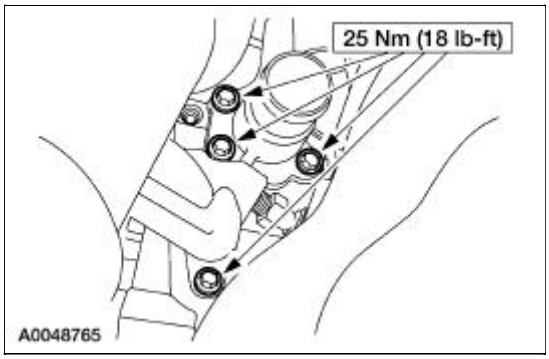
8. Remove the oil filter drip shield.

9. Remove the four bolts.

10. Remove the oil filter adapter.
    - Carefully lower the oil filter adapter and disconnect the oil pressure sender electrical connector.
    - Discard the gasket.

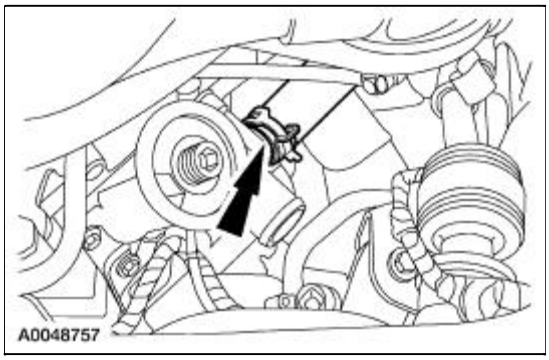


Installation

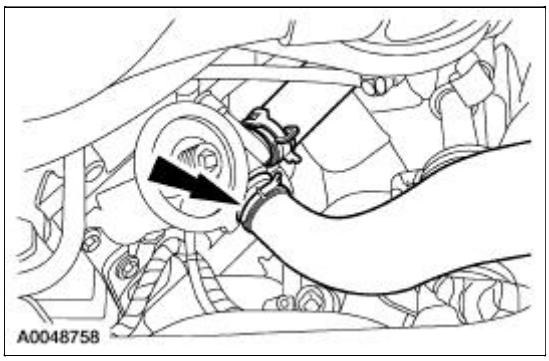


1. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

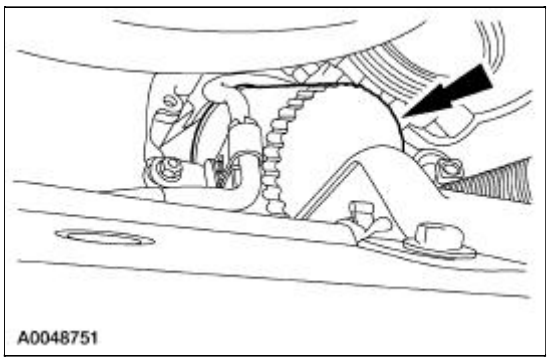
   Clean the gasket mating surfaces.



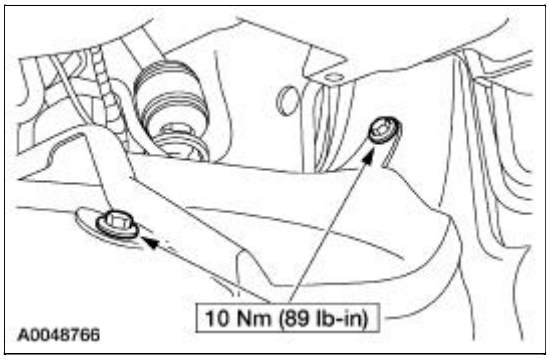
2. Position the oil filter adapter in the vehicle and connect the oil pressure switch electrical connector.



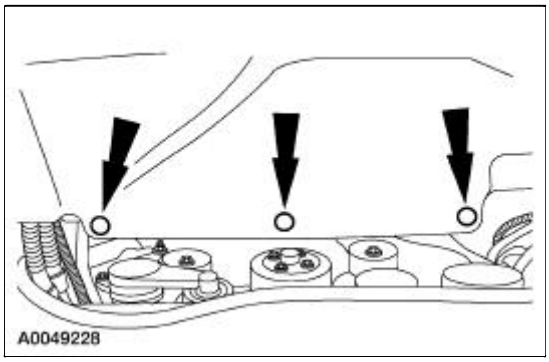
3. Install the oil filter adapter.
    - Install a new oil filter adapter gasket.
    - Position the oil filter adapter and install the four bolts.



4. Position the degas hose on the oil filter adapter and secure the hose clamp.



5. Position the radiator hose on the oil filter adapter and secure the hose clamp.

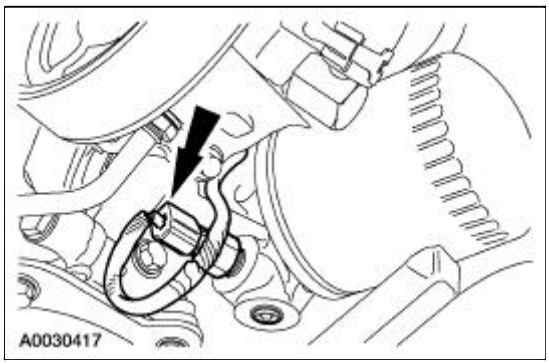


6. Install a new oil filter.

7. Install the oil filter drip shield.

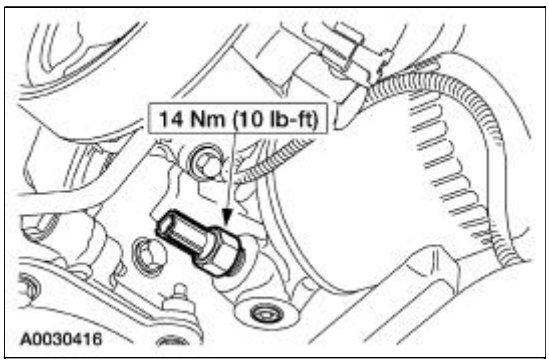
8. Install the lower radiator splash shield.

9. Lower the vehicle.
10. Fill the engine with clean engine oil.
11. Fill the engine cooling system. For additional information, refer to Section 303-03 .



Oil Pressure Sender

Material

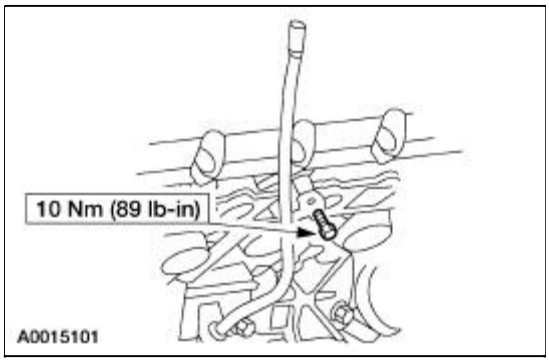


Item	Specification
Pipe Sealant with Teflon® XW7Z-19554-AA or equivalent	WSK-M2G350-A2 and ESR-M18P7-A

Removal and Installation

1. Raise and support the vehicle. For additional information, refer to Section 100-02 .
2. Disconnect the oil pressure sender electrical connector.

3. Remove the oil pressure sender.



4. **NOTE:** If reusing the sender, clean the threads and coat the oil pressure sensor threads with pipe sealant.

   To install, reverse the removal procedure.

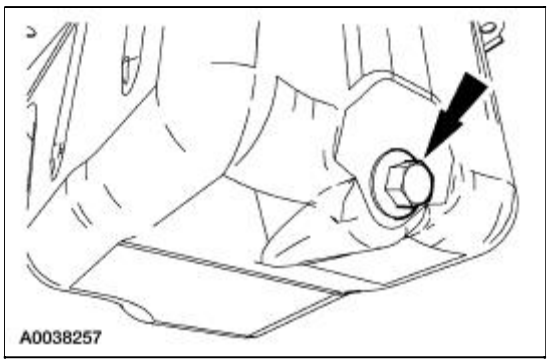
Oil Level Indicator and Tube

Removal and Installation

1. Remove LH exhaust manifold. For additional information, refer to Exhaust Manifold LH in this section.
2. Remove the oil level indicator.
3. Remove the bolt.

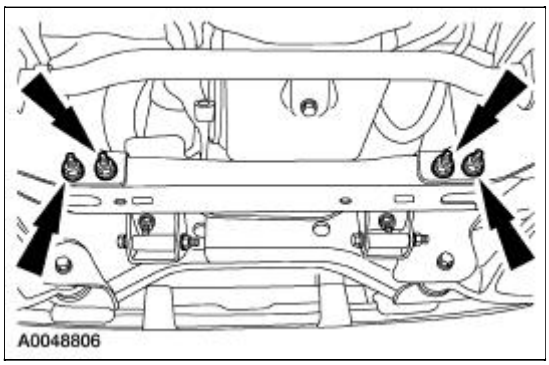
4. Remove the oil level indicator tube.
   - Install a new O-ring seal.

5. To install, reverse the removal procedure.



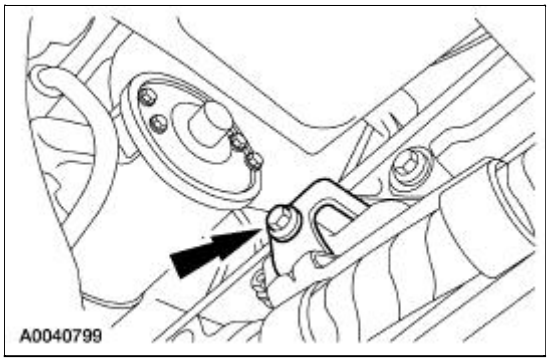
Oil Pan —4x2

Material

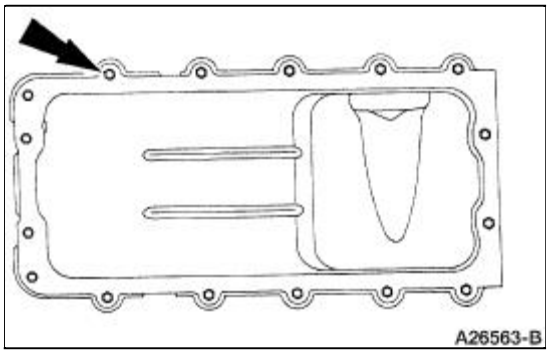


Item	Specification
Metal Surface Cleaner F4AZ-19A536-RA or equivalent	WSE-M5B392-A
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal



1. Raise the vehicle on the hoist. For additional information, refer to Section 100-02 .
2. Drain the engine oil.



3. Remove the bolts and nuts, and the frame crossmember.

4. Remove the bolt and detach the wire harness bracket.

5. Remove the bolts and the oil pan.

6. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs, or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

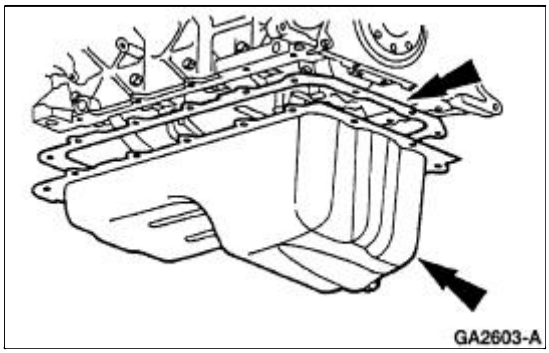
   Remove and discard the oil pan gasket. Clean the sealing surfaces.

   - Use metal surface cleaner. Allow the surfaces to dry for four minutes or until there is no sign of wetness, whichever is longest. Failure to do so can cause future oil leaks.

Installation

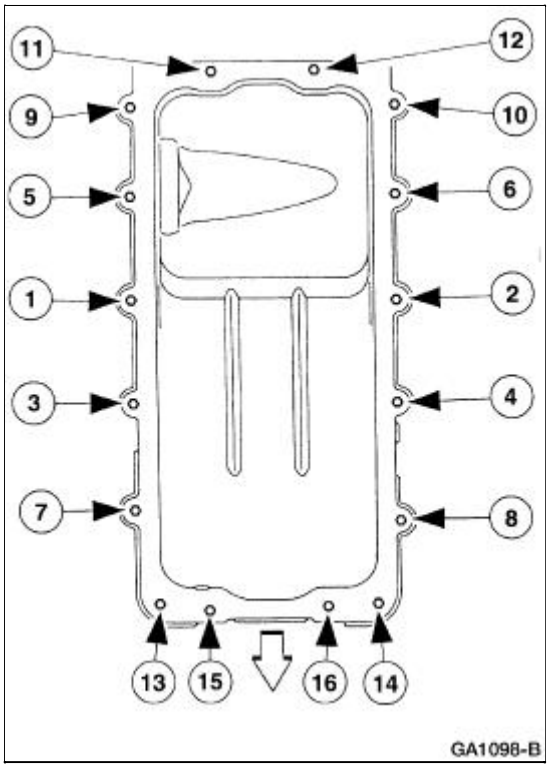
1. **NOTE:** If the oil pan is not secured within four minutes, the sealant must be removed and the sealing area cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or four minutes, whichever is longer. Failure to follow this procedure may result in future oil leakage.

   Apply silicone gasket and sealant at the engine front cover-to-cylinder block mating surface.

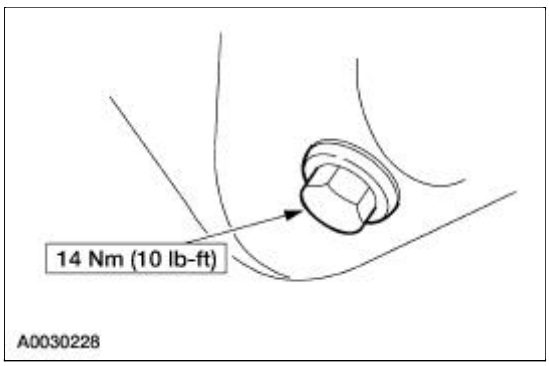


2. **NOTE:** If the oil pan is not secured within four minutes, the sealant must be removed and the sealing area cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or four minutes, whichever is longer. Failure to follow this procedure may result in future oil

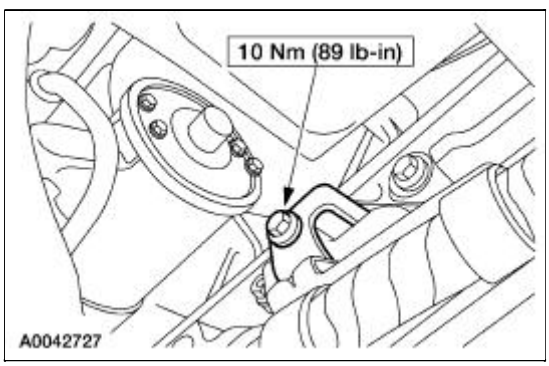
leakage.



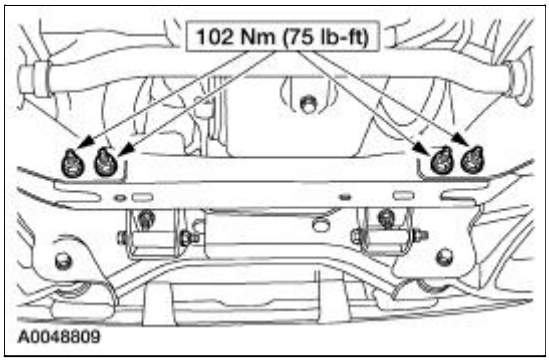
Apply silicone gasket and sealant at the rear seal retainer-to-cylinder block sealing surface.



3. Position the new oil pan gasket and the oil pan and loosely install the bolts.



4. Tighten the bolts in three stages, in the sequence shown.
    - Stage 1: Tighten to 2 Nm (18 lb-in).
    - Stage 2: Tighten to 20 Nm (15 lb-ft).
    - Stage 3: Tighten an additional 60 degrees.

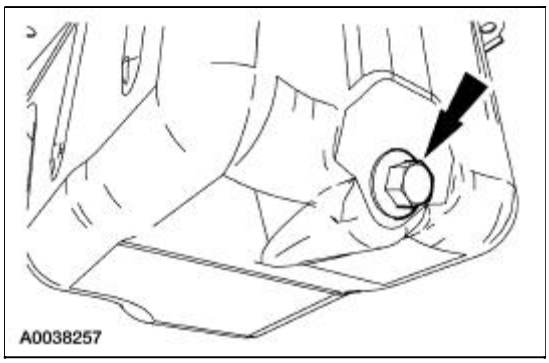


5. Install the drain plug.

6. Position the wire harness bracket and install the bolt.

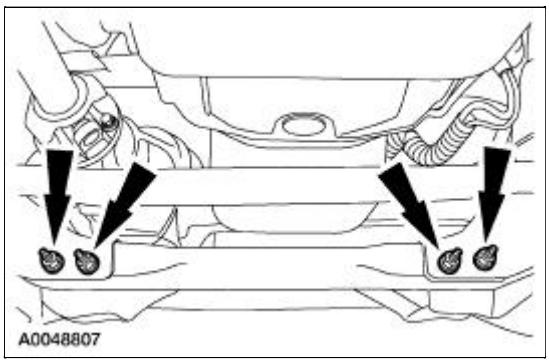
7. Install the frame crossmember.

8. Lower the vehicle.
9. Fill the engine with clean engine oil.
10. Start the engine and inspect for leaks.



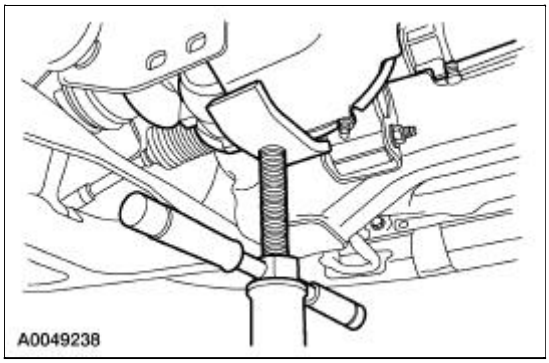
Oil Pan —4x4

Material



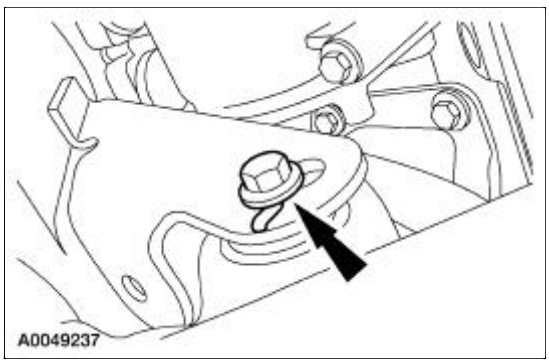
Item	Specification
Metal Surface Cleaner F4AZ-19A536-RA or equivalent	WSE-M5B392-A
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal

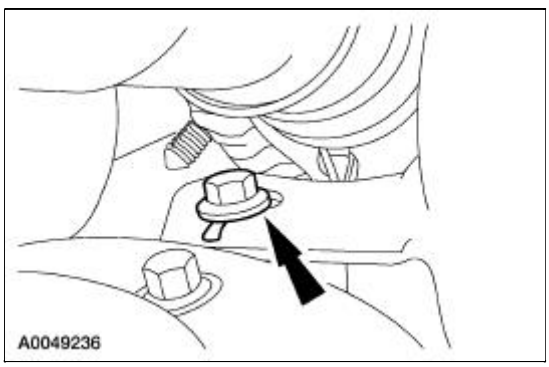


1. Raise the vehicle on the hoist. For additional information, refer to Section 100-02 .
2. Drain the engine oil.

3. Remove the frame crossmember.

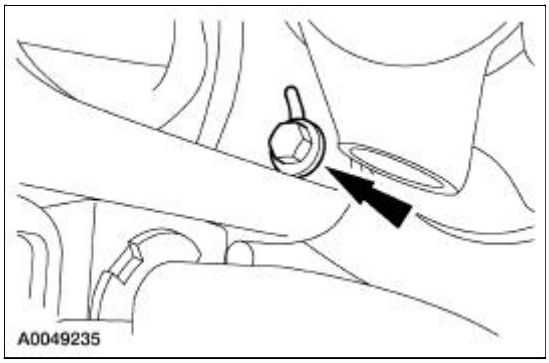


4. Support the front axle housing with a jack stand.



5. **NOTE:** Mark the bolt and bracket so that alignment can be maintained on installation.

   Remove front axle housing RH mounting bolt.



6. **NOTE:** Mark the bolt and bracket so that alignment can be maintained on installation.

   Remove front axle housing LH front mounting bolt.

7. **NOTE:** Mark the bolt and bracket so that alignment can be maintained on installation.

   Remove front axle housing LH rear mounting bolt.

8. **CAUTION: Use care when lowering the front axle housing, or the vacuum lines to the axle solenoid may become disconnected or damaged.**

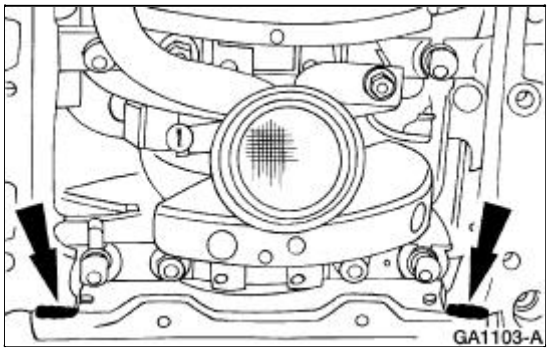
   Lower the axle to allow clearance for the oil pan to be removed.

9. Remove the bolts and the oil pan.

10. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs, or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

    Remove and discard the oil pan gasket. Clean the sealing surfaces.

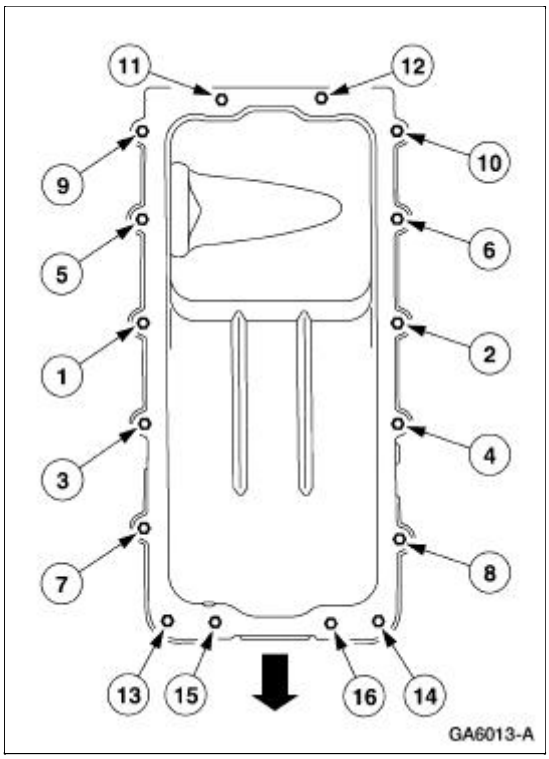
    - Use metal surface cleaner. Allow the surfaces to dry for four minutes or until there is no sign of wetness, whichever is longest. Failure to do so can cause future oil leaks.



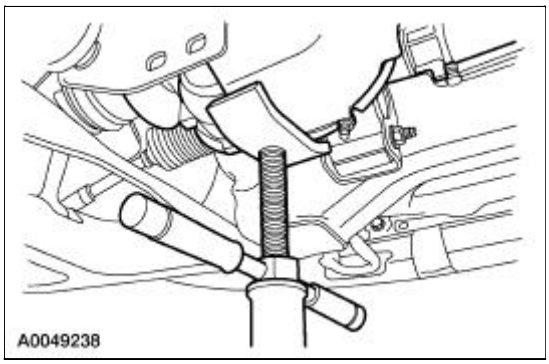
Installation

1. **NOTE:** If the oil pan and gasket are not secured within four minutes of sealer application, the sealant must be removed and the sealing surfaces cleaned with metal surface cleaner.

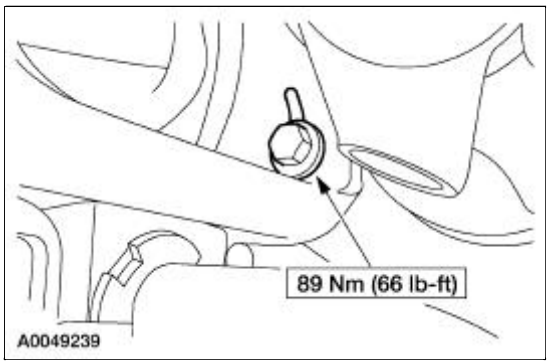
   Apply silicone gasket and sealant in at the front cover-to- cylinder block sealing surface.



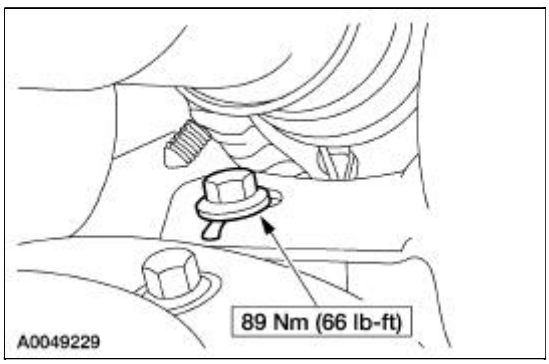
2. Apply silicone gasket and sealant in at the rear seal retainer-to-cylinder block sealing surface.



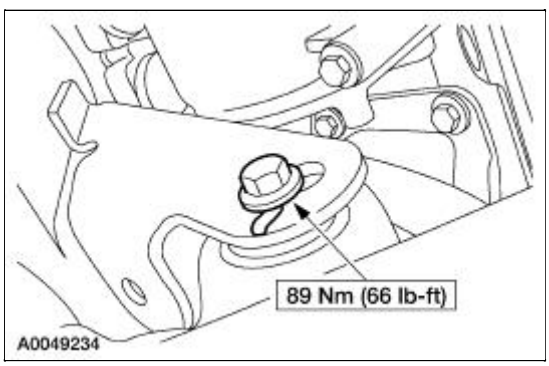
3. Position the new oil pan gasket and the oil pan and loosely install the bolts.



4. Tighten the bolts in three stages in the sequence shown.
    - Stage 1: Tighten to 2 Nm (18 lb-in).
    - Stage 2: Tighten to 20 Nm (15 lb-ft).
    - Stage 3: Tighten an additional 60 degrees.

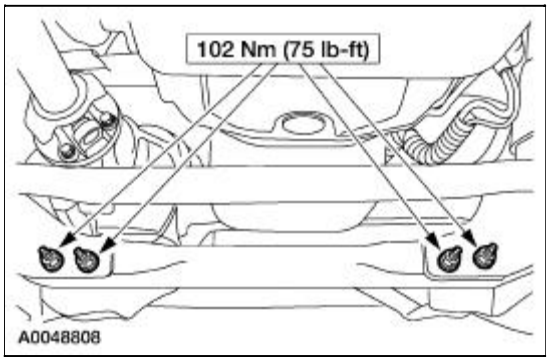


5. Position the front axle housing and loosely install the three bolts, aligning the bolt location marks made during removal.



6. Tighten the front axle housing LH rear mounting bolt.

7. Tighten the front axle housing LH front mounting bolt.



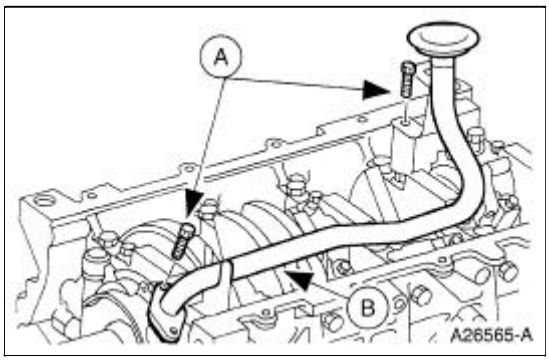
8. Tighten the front axle housing RH mounting bolt.

9. Remove the jack stand.

10. Install the frame crossmember.

11. Lower the vehicle.
12. Fill the engine with clean engine oil.
13. Start the engine and inspect for leaks.

Oil Pump Screen and Pickup Tube



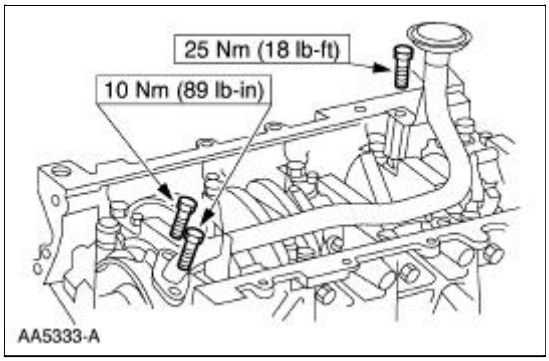
Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal

1. Remove the oil pan. For additional information, refer to Oil Pan—4x4 and Oil Pan—4x2 in this section.

2. Remove the three (A) bolts and the (B) oil pump screen cover and tube.



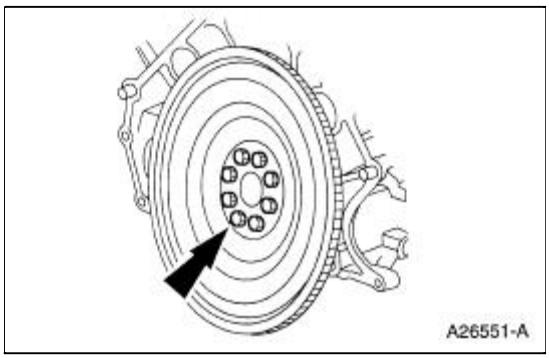
Installation

1. Clean and inspect the mating surfaces.
   - Inspect the O-ring seal.

2. **CAUTION: Make sure the O-ring is in place and not damaged. A missing or damaged O-ring can cause foam in the lubrication system, low oil pressure and severe engine damage.**

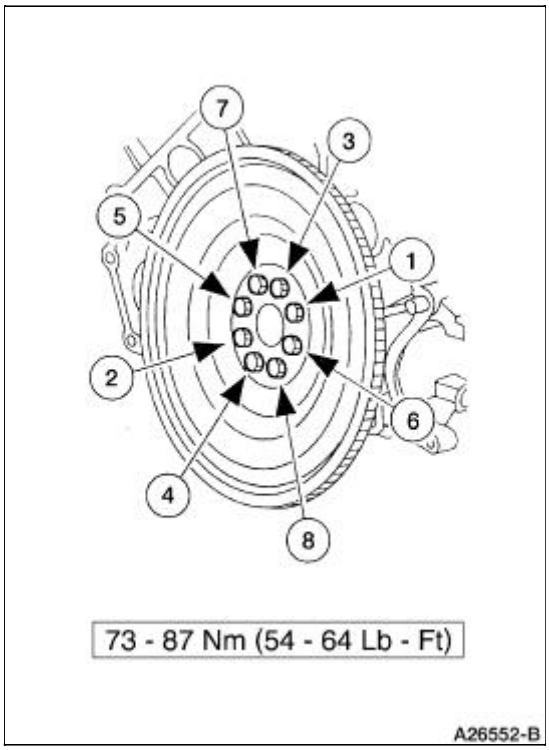
   NOTE: Clean and inspect the mating surfaces and install a new O-ring. Lubricate with clean engine oil.

   Install the oil pump screen cover and tube and install the bolts.



3. Install the oil pan. For additional information, refer to Oil Pan—4x4 and Oil Pan—4x2 in this section.

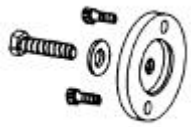
Flywheel

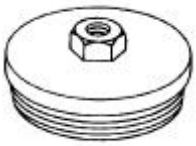


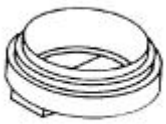
Removal

1. Remove the transmission. For additional information, refer to Section 307-01A .
2. Remove the bolts and the flywheel (6375).

Installation

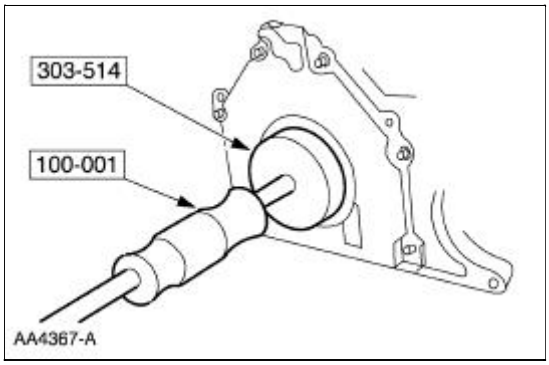






1. Position the flywheel and install the bolts in the sequence shown.

2. Install the transmission. For additional information, refer to Section 307-01A .



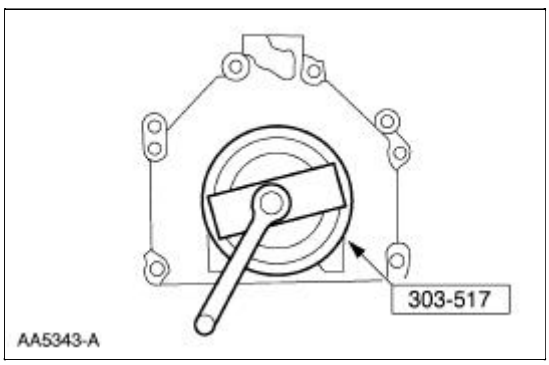
Crankshaft Rear Seal with Retainer Plate

Special Tool(s)

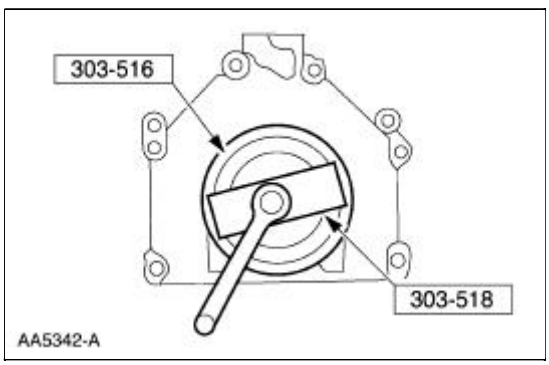
 ST1480-A	Installer, Crankshaft Rear Oil Seal 303-518 (T95P-6701-DH)
 ST1382-A	Remover, Crankshaft Rear Oil Seal 303-519 (T95P-6701-EH)
 ST1479-A	Installer, Crankshaft Rear Oil Seal 303-516 (T95P-6701-BH)
 ST1481-A	Remover, Crankshaft Rear Oil Slinger 303-514 (T95P-6701-AH)
 ST1482-A	Installer, Crankshaft Rear Oil Slinger 303-517 (T95P-6701-CH)
 ST1185-A	Impact Slide Hammer 100-001 (T50T-100-A)

Removal

1. Remove the flexplate. For additional information, refer to Flywheel in this section.
2. Using the special tools, remove the crankshaft oil slinger.



3. Using the special tools, remove the crankshaft rear oil seal.

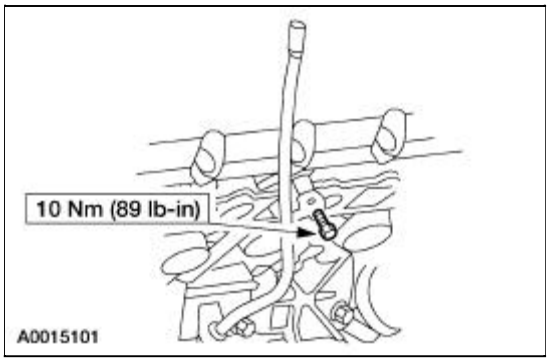


Installation

1. Using the special tool, install the crankshaft rear oil seal.

2. Using the special tools, install the crankshaft oil slinger.

3. Install the flexplate. For additional information, refer to Flywheel in this section.



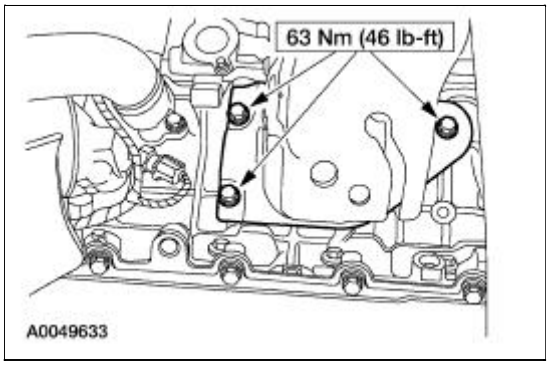
Engine Mount

Removal and Installation

1. Remove the RH exhaust manifold. For additional information, refer to Exhaust Manifold RH in this section.

2. Remove the left exhaust manifold. For additional information, refer to Exhaust Manifold LH in this section.

3. Remove the bolt.

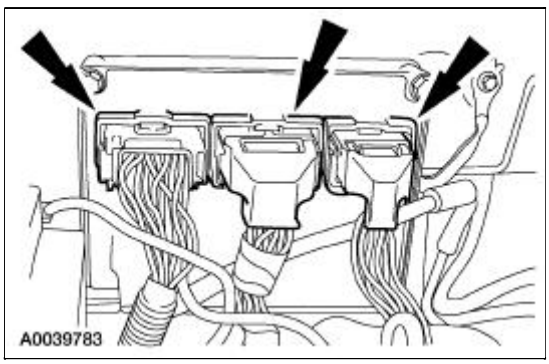


4. Remove the oil level indicator tube.
   - Install a new O-ring seal.

5. **NOTE:** LH shown, RH similar.

   Remove the RH or LH motor mount as needed.

6. To install, reverse the removal procedure.

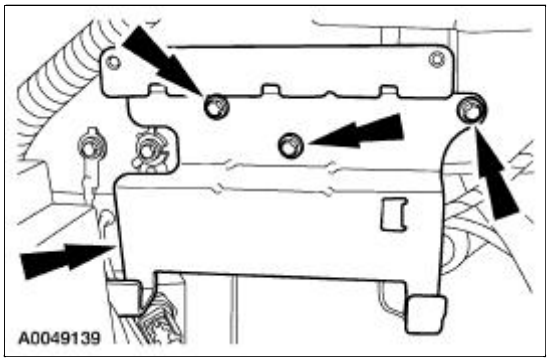


Engine

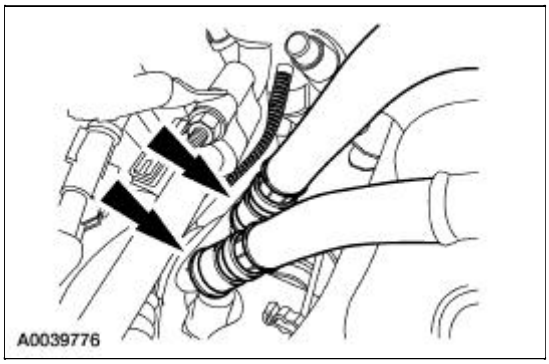
Special Tool(s)

 ST1377-A	Modular Engine Lifting Bar 303-F047 (014-00073)
 ST1290-B	Remover, Power Steering Pump Pulley 211-016 (T69L-10300-B)

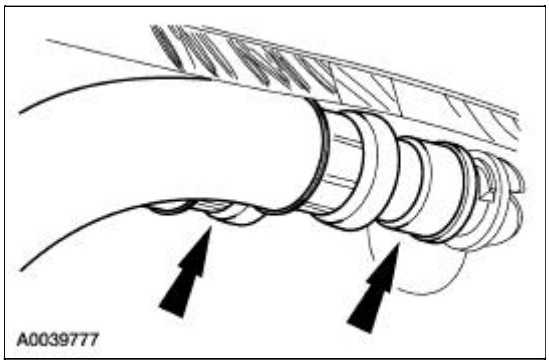
Removal



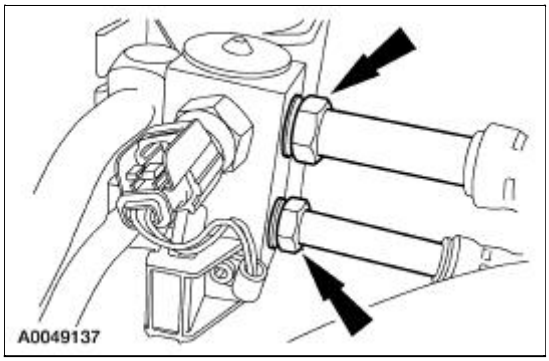
1. Remove the hood.
2. Remove the radiator. For additional information, refer to Section 303-03 .
3. Recover the A/C system refrigerant. For additional information, refer to Section 412-00 .
4. Remove the lower intake manifold. For additional information, refer to Lower Intake Manifold in this section.
5. Disconnect the powertrain control module (PCM) electrical connectors.



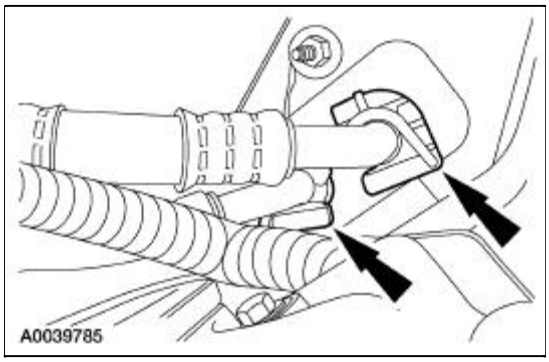
6. Remove the PCM mounting bolts and the PCM.



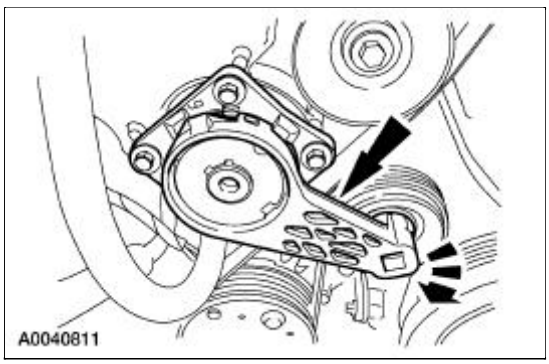
7. Remove the bolts and the PCM mounting bracket.



8. Disconnect the auxiliary heater hoses at the right side valve cover.

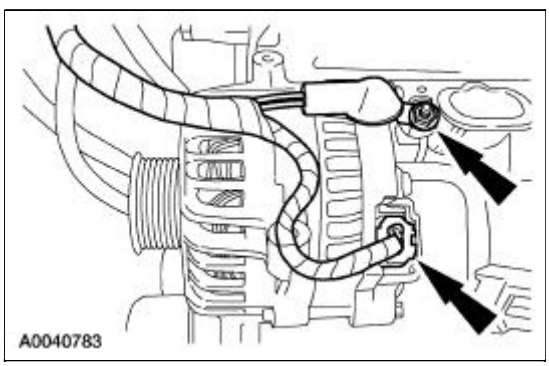


9. Disconnect the heater hoses at the heater core.

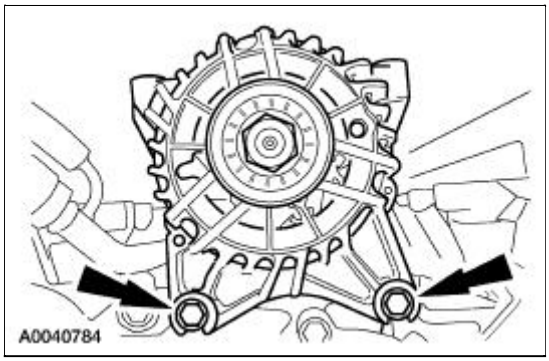


10. Disconnect the A/C hoses from the junction block.

11. Remove the safety clips and disconnect the spring lock couplers at the evaporator core. For additional information, refer to Section 412-00 .

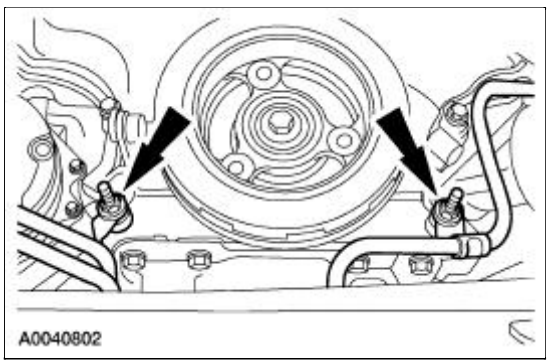


12. Rotate the belt tensioner counterclockwise and remove the drive belt.

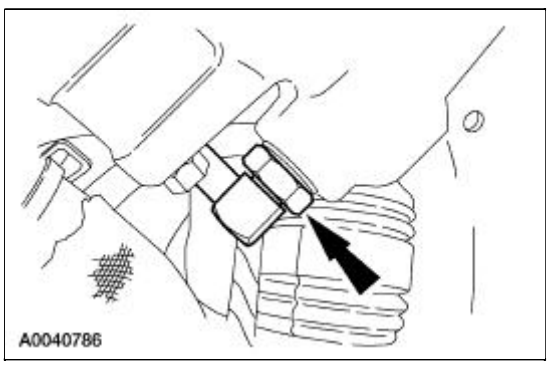


13. **NOTE:** Position the rubber boot aside to access the B+ cable.

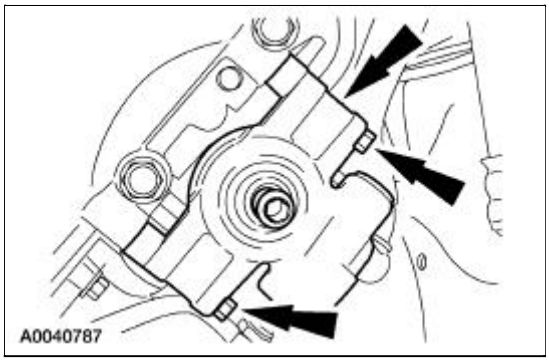
    Disconnect the generator electrical connectors.



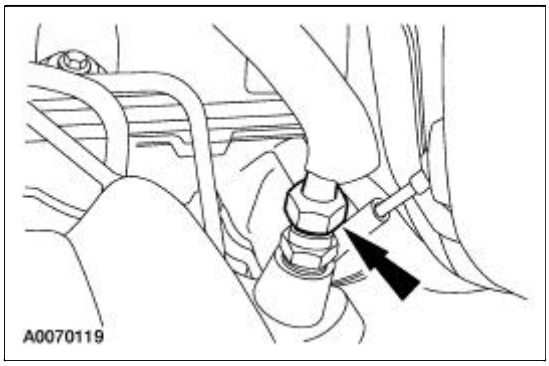
14. Remove the bolts and the generator.



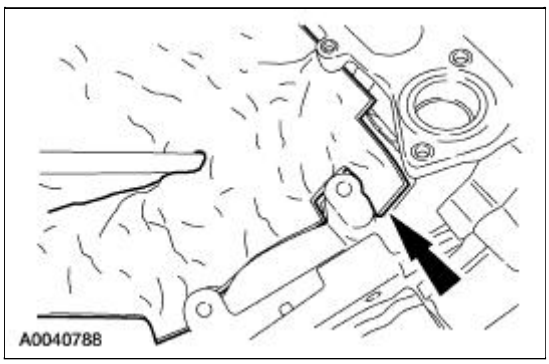
15. Using the special tool, remove the power steering pump pulley.



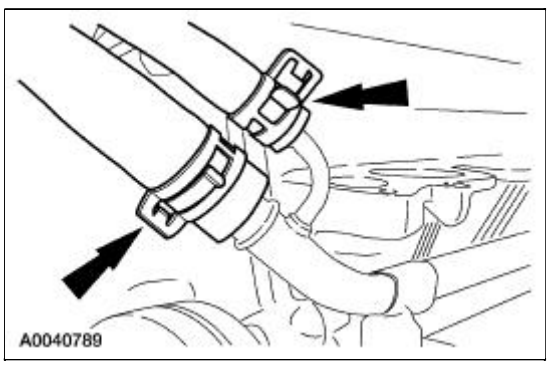
16. Remove the nuts and disconnect the transmission cooler tube and the power steering hose brackets.



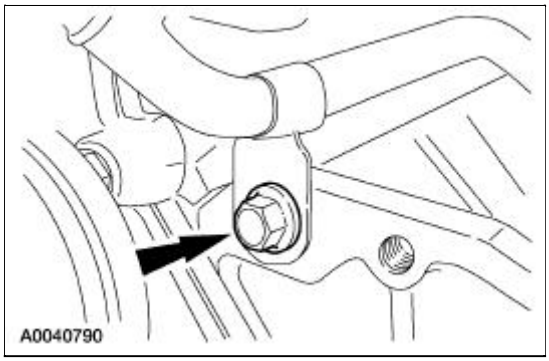
17. Disconnect the power steering pressure hose.
    - Drain the power steering fluid into a suitable container.



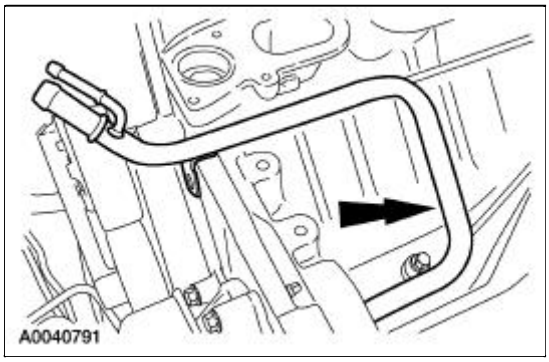
18. Remove the three bolts and position the power steering pump out of the way.



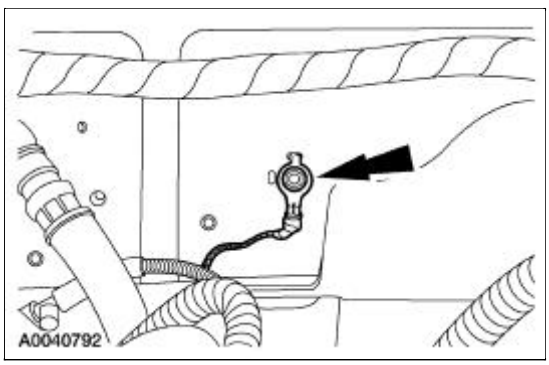
19. Disconnect the exhaust gas recirculation (EGR) valve tube nut from the LH exhaust manifold and remove the tube.



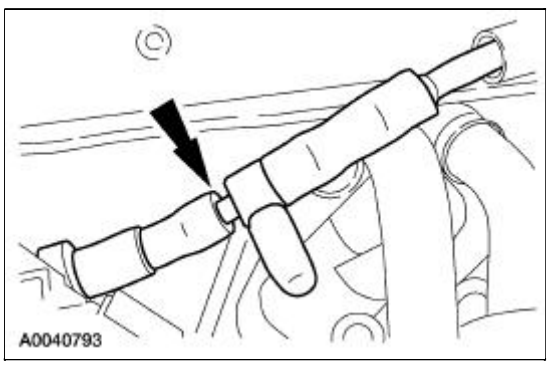
20. Remove the engine noise shield.



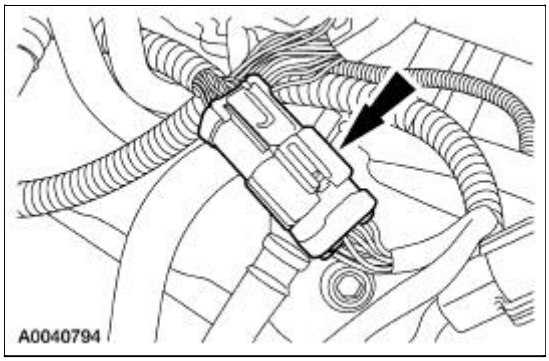
21. Squeeze the clamps and disconnect the hoses.
    - Remove the positive crankcase ventilation (PCV) valve and hose assembly from the vehicle.



22. Remove the bolt.



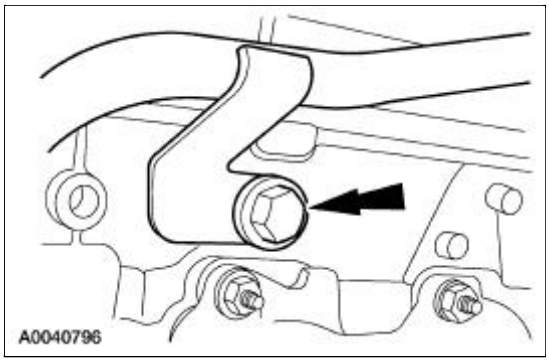
23. Remove the tube.



24. Remove the bolt and disconnect the ground wire.

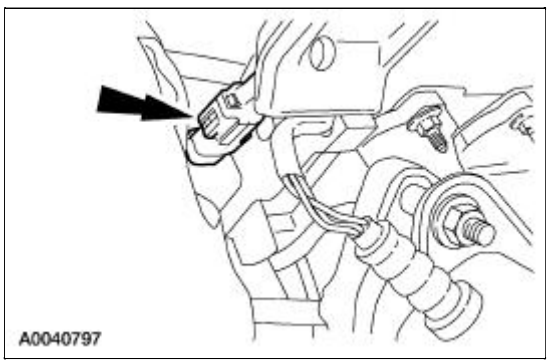
25. Disconnect the vacuum hose and remove the vacuum harness.

26. Disconnect the main engine harness electrical connector.



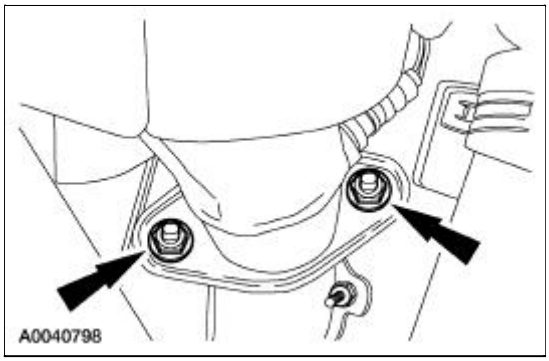
27. Raise the vehicle. For additional information, refer to Section 100-02 .

28. Remove the bolts and the skid plate, if equipped.



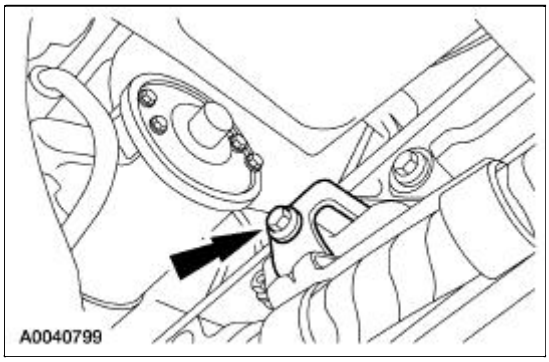
29. **NOTE:** The bolt is accessed through the RH fender well.

    Remove the transmission filler tube-to-engine block bolt.



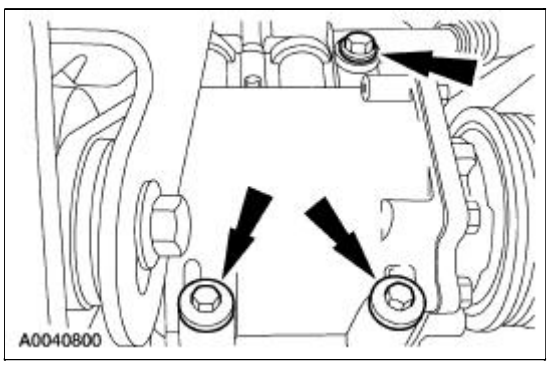
30. **NOTE:** Right side shown, left side similar.

    Disconnect the heated oxygen sensor (HO2S) electrical connectors.

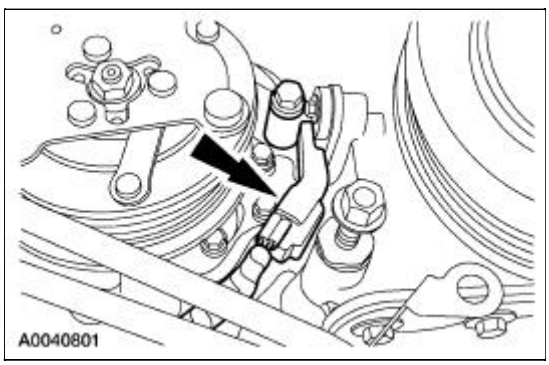


31. **NOTE:** Left side shown, right side similar.

    Remove the nuts and detach the dual converter Y-pipe.

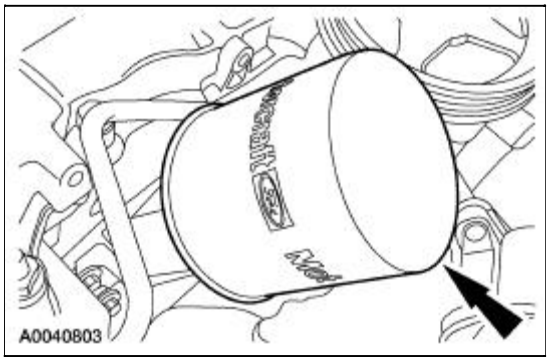


32. Remove the bolt and detach the wire harness bracket.

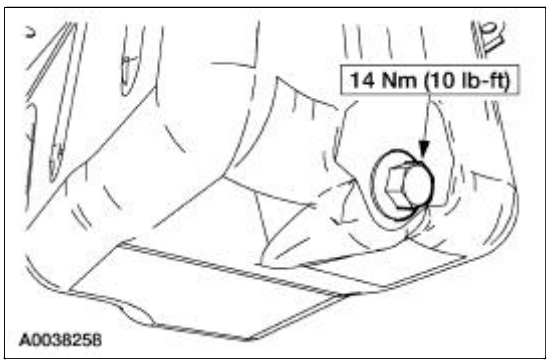


33. Remove the starter. For additional information, refer to Section 303-06 .

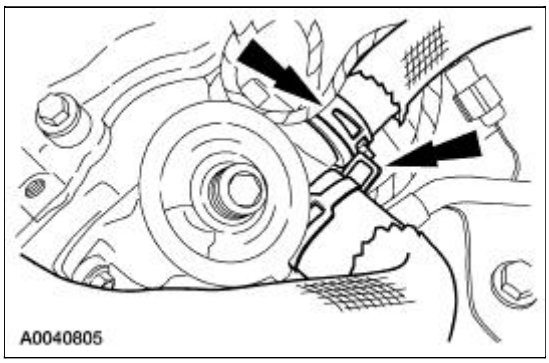
34. Disconnect the A/C clutch electrical connector.



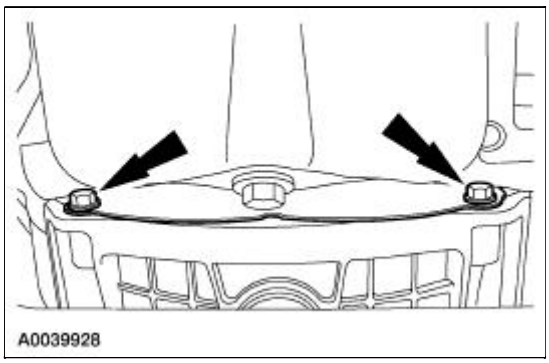
35. Remove the bolts and position the A/C compressor aside.



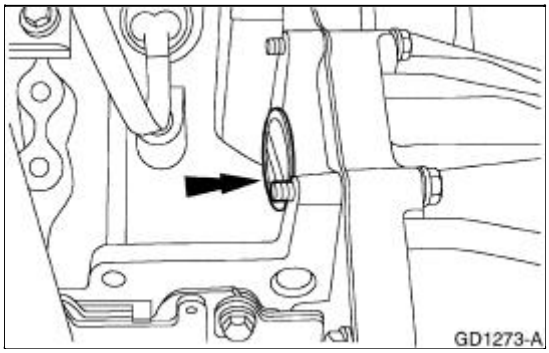
36. Disconnect the crankshaft position (CKP) sensor electrical connector.



37. Remove the oil filter.

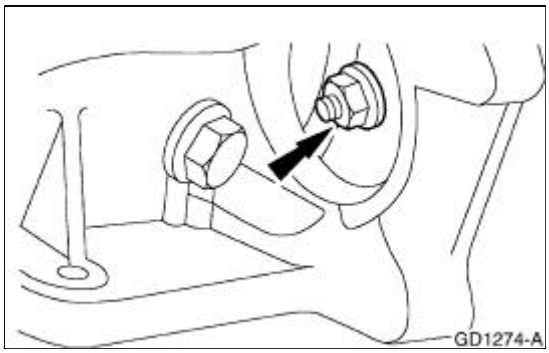


38. Remove the drain plug and drain the engine oil.
    - Install the drain plug when finished.

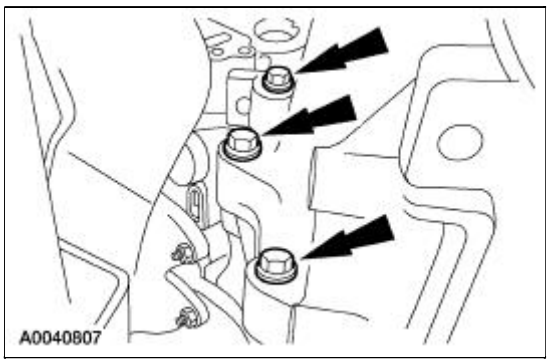


39. Squeeze the clamps and disconnect the hoses.
    - Remove the lower radiator hose.

40. Remove the inspection plate bolts and the inspection plate.



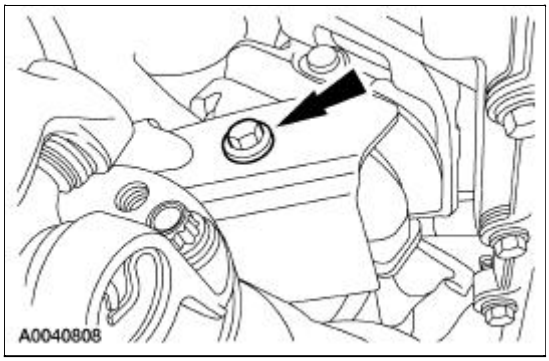
41. Remove the flexplate-to-torque converter nut access plug.



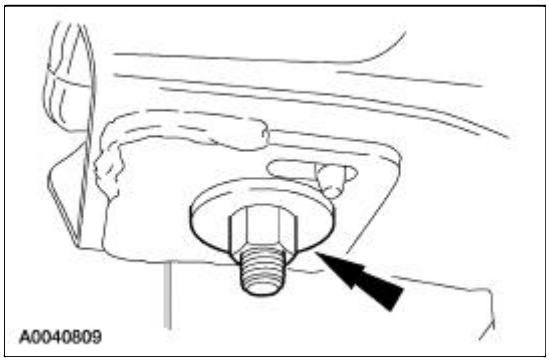
42. **NOTE:** Mark one stud and the flexplate for assembly reference.

    Remove the four torque converter nuts.

    - Rotate the crankshaft, using the crankshaft pulley bolt.



43. Remove the six lower transmission-to-engine bolts.

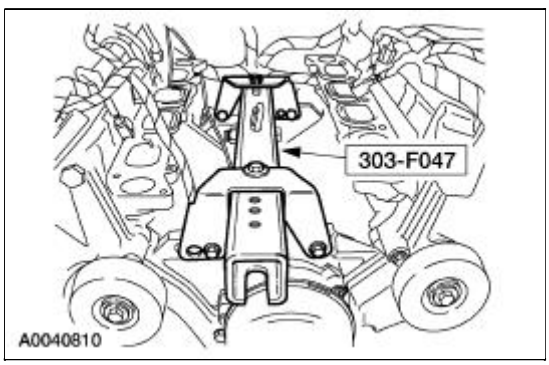


44. **NOTE:** The caged nut on the frame may break during bolt removal. If necessary, install a new nut.

    Remove the bolt from the LH motor mount.

45. Remove the nut from the RH motor mount.

46. Lower the vehicle.



47. Support the transmission, using a block of wood and a floor jack.

48. **NOTE:** On 4x4 vehicles, disconnect the transfer case vent hose from the bracket and position aside to gain access to the upper transmission-to-engine bolts.

    Remove the two upper transmission-to-engine bolts.

49. **NOTE:** The alternator bolts may be used to attach the special tool to the front of the engine. The two bolts used to attach the special tool to the rear of the engine must be shorter than the transmission-to-engine mounting bolts.

    Install the special tool.

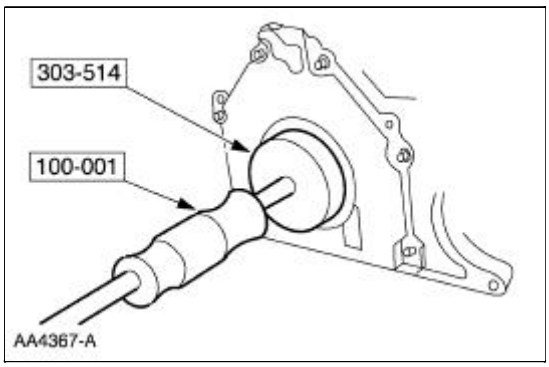
50. Using a floor crane, remove the engine from the vehicle.

Engine

Special Tool(s)

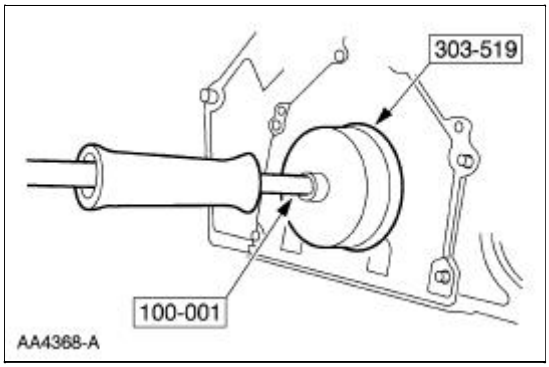
 ST1382-A	Remover, Crankshaft Rear Oil Seal 303-519 (T95P-6701-EH)
 ST1481-A	Remover, Crankshaft Rear Oil Slinger 303-514 (T95P-6701-AH)
 ST1185-A	Impact Slide Hammer 100-001 (T50T-100-A)
 ST2443-A	Lift Bracket Set, Engine 303-DS086 (D93P-6001-A)
 ST1286-A	Remover, Crankshaft Vibration Damper 303-009 (T58P-6316-D)
 ST1337-A	Installer, Connecting Rod 303-442 (T93P-6136-A)
 ST1730-A	Remover, Crankshaft Front Oil Seal 303-107 (T74P-6700-A)
	Compressor, Valve Spring (Exhaust Side)

 ST2373-A	303-567 (T97P-6565-AH)
 ST1718-A	Compressor, Valve Spring (Intake Side) 303-452 (T93P-6565-AR)
 ST1276-A	Cylinder Ridge Reamer 303-016 (T64L-6011-EA)



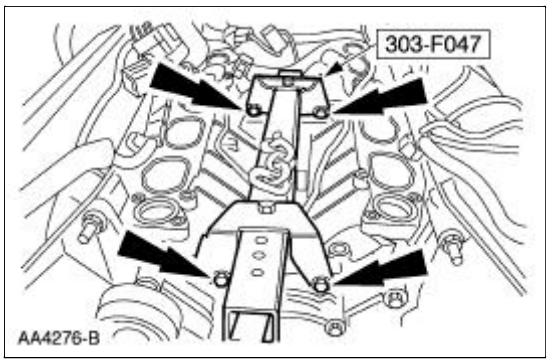
Disassembly

NOTE: The crankshaft rear oil seal slinger and the oil seal retainer plate must be removed before mounting the engine on the engine stand.

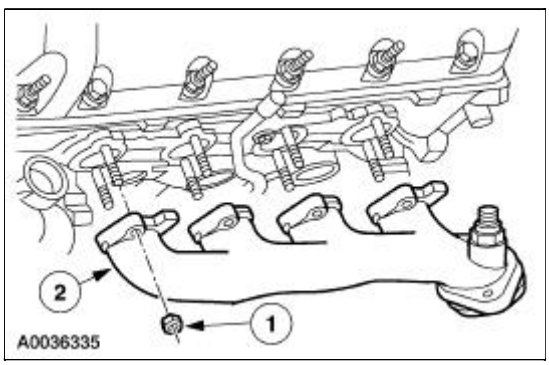


1. Remove the bolts and the flywheel.

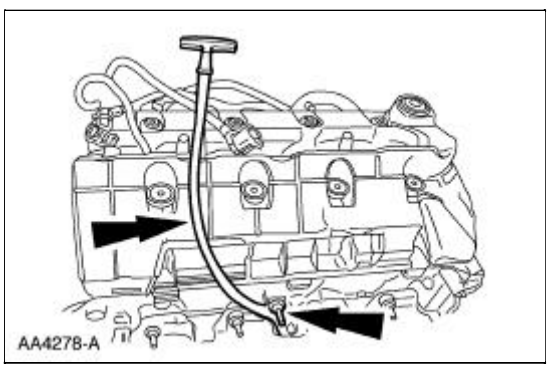
2. Using the special tools, remove the rear oil slinger.



3. Using the special tools, remove the rear main seal.

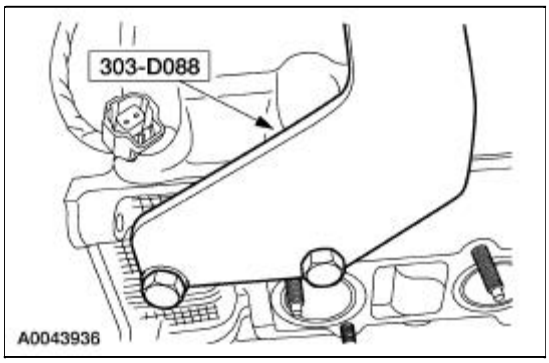


4. Lower the engine onto the wooden blocks.

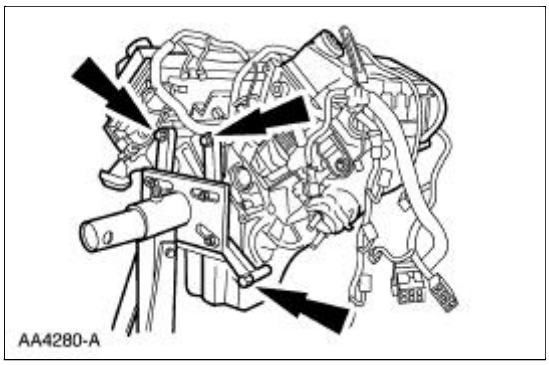


5. Remove the special tool.

6. Remove the LH exhaust manifold.
    1. Remove the eight nuts.
    2. Remove the manifold and discard the gasket.

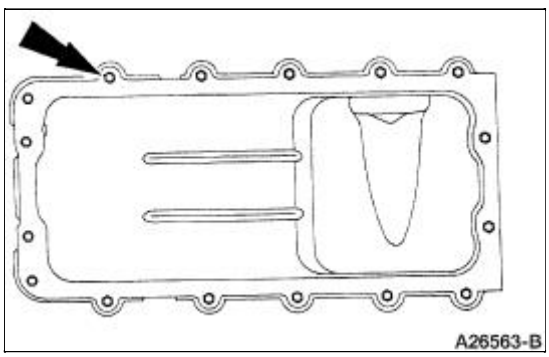


7. Remove the stud and the oil level indicator and tube.



8. **NOTE:** LH shown, RH similar.

   Install the special tools on the LH and RH sides of the engine.



9. Mount the engine on a work stand.

10. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

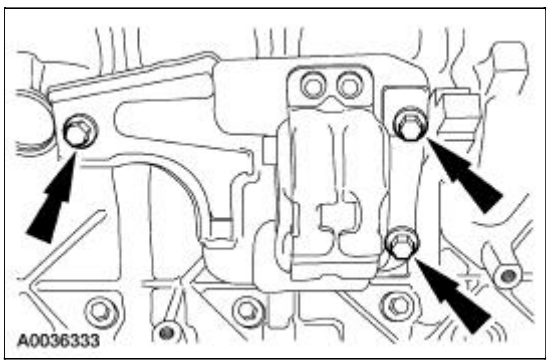
    Remove the bolts and the oil pan.

    - Clean and inspect the sealing surfaces.

11. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

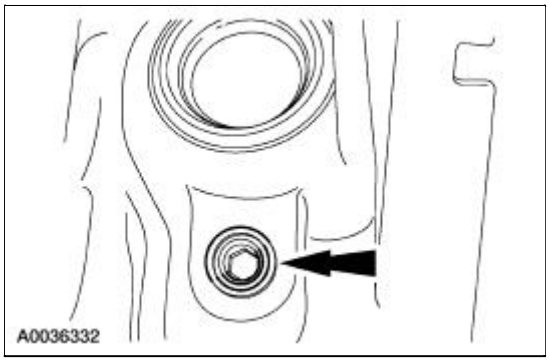
    Remove the bolts and the rear seal retainer plate.

    - Clean and inspect the sealing surfaces.



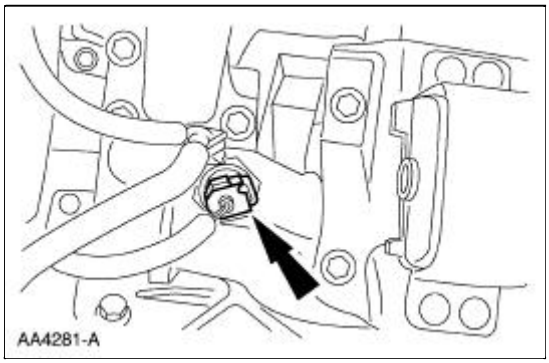
12. **NOTE:** LH shown, RH similar.

    Remove the special tools from the LH and RH sides of the engine.



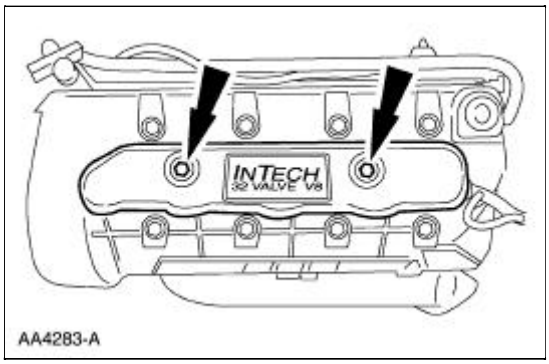
13. **NOTE:** LH shown, RH similar.

    Remove the RH and LH engine mounts.

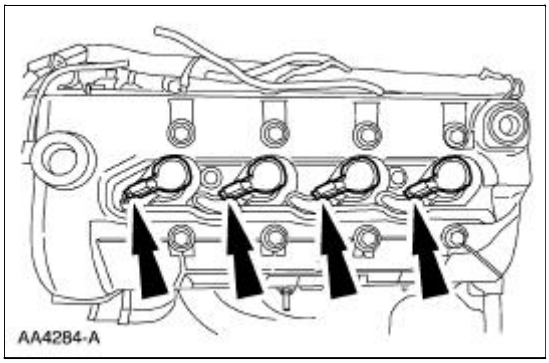


14. **NOTE:** LH shown, RH similar.

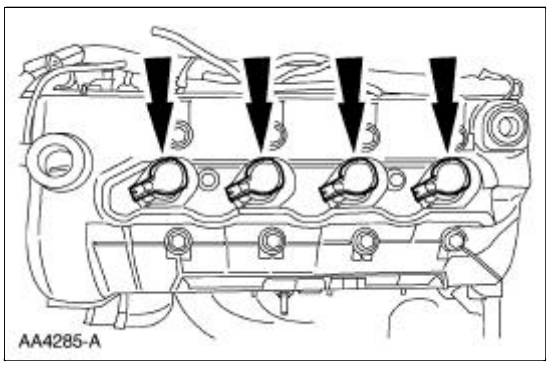
    Remove the cylinder block drain plugs, and drain the coolant in a suitable container.



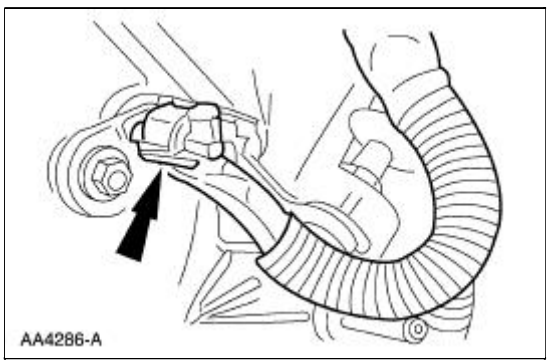
15. Disconnect the oil pressure sender.



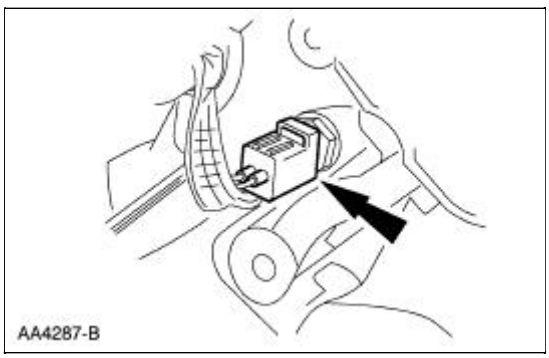
16. Remove the oil fill tube.



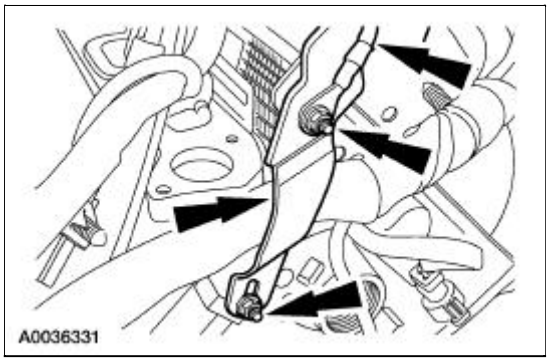
17. Remove the bolts and the LH ignition coil cover.



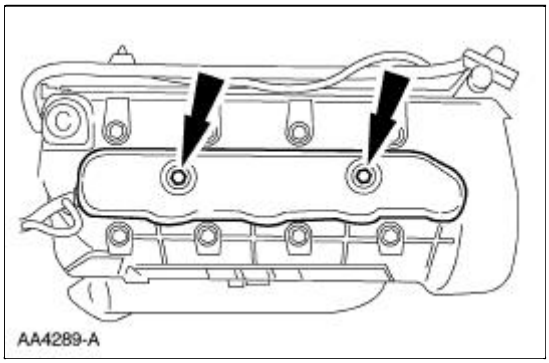
18. Disconnect the ignition coils.



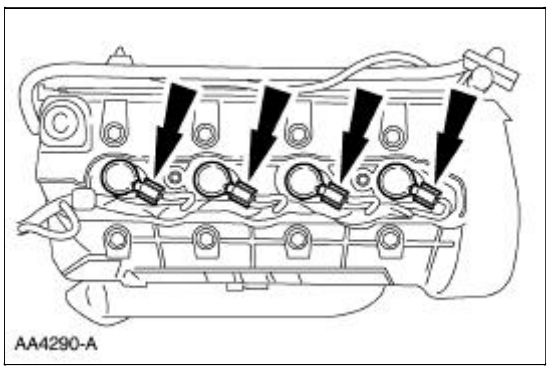
19. Remove the ignition coils.



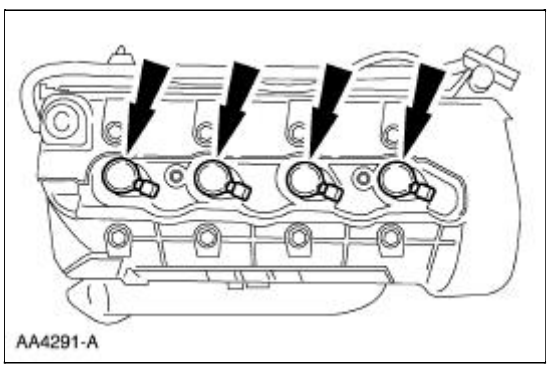
20. Disconnect the camshaft position (CMP) sensor.



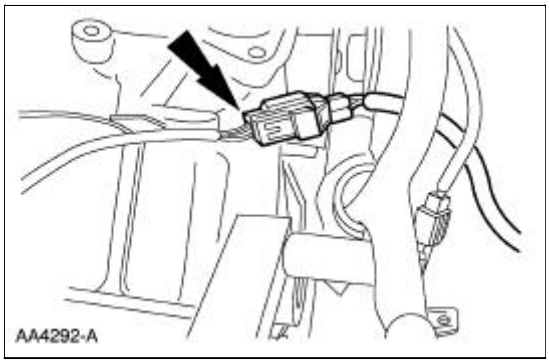
21. Disconnect the cylinder head temperature (CHT) sensor.



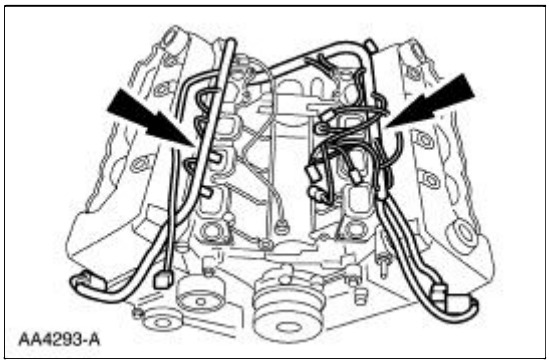
22. Remove the nuts, bracket and ground strap.



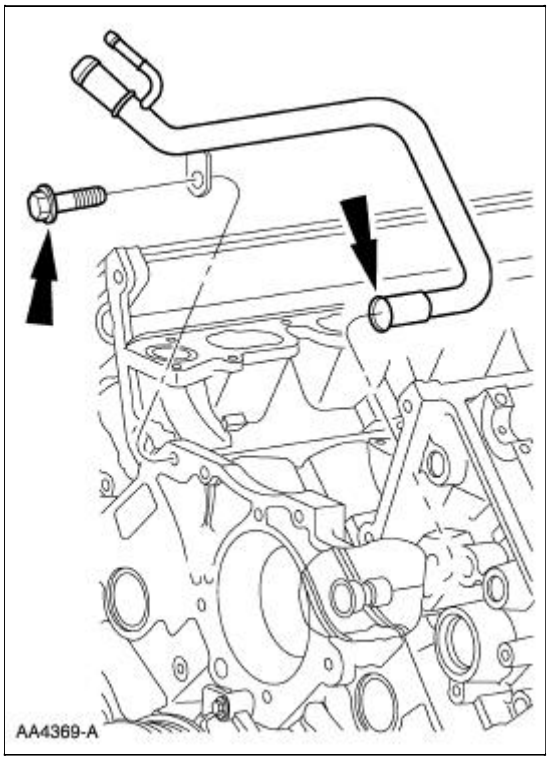
23. Remove the bolts and the RH ignition coil cover.



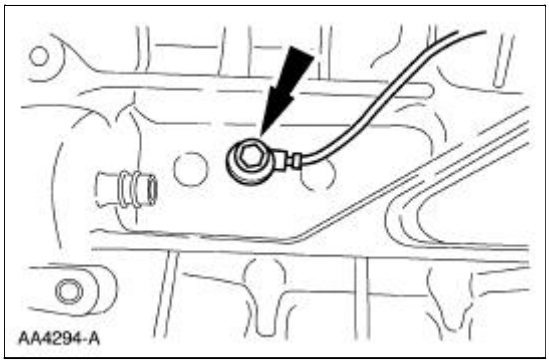
24. Disconnect the ignition coils.



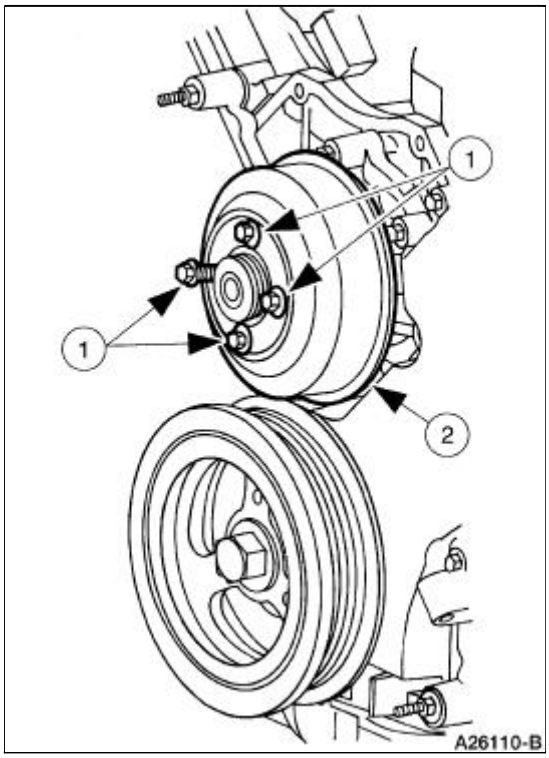
25. Remove the ignition coils.



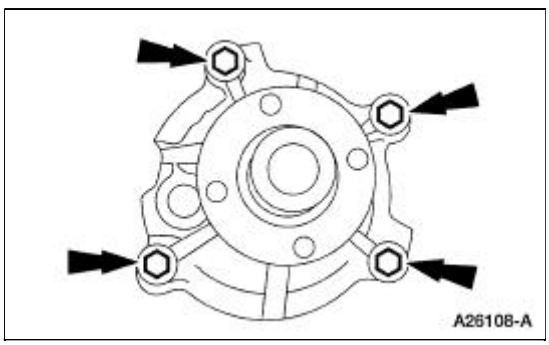
26. Disconnect the knock sensor (KS).



27. Separate the engine control sensor wiring from the engine at six locations and remove the wiring.

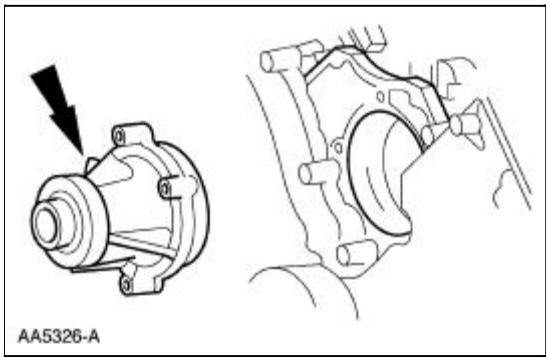


28. Remove the bolt and the heater return tube.

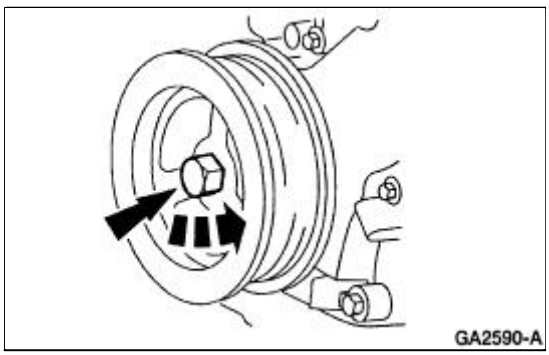


29. Remove the bolt and the knock sensor (KS).

30. Remove the water pump pulley.
    1. Remove the bolts.
    2. Remove the pulley.

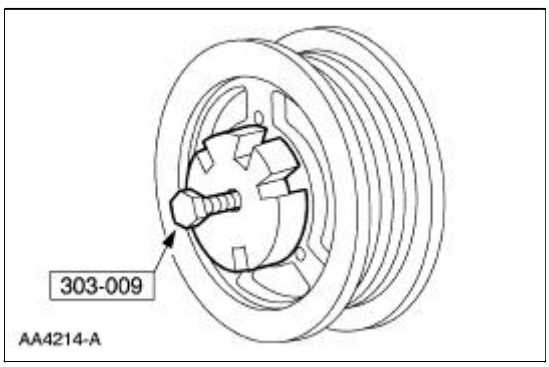


31. Remove the bolts.

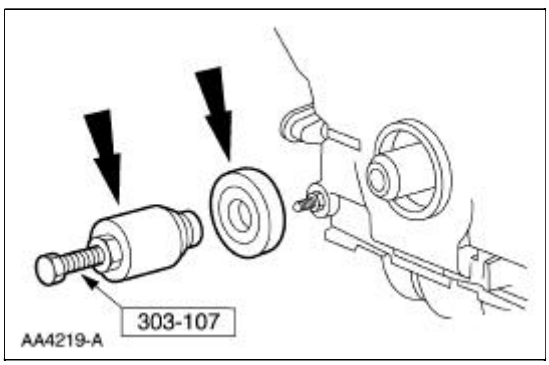


32. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

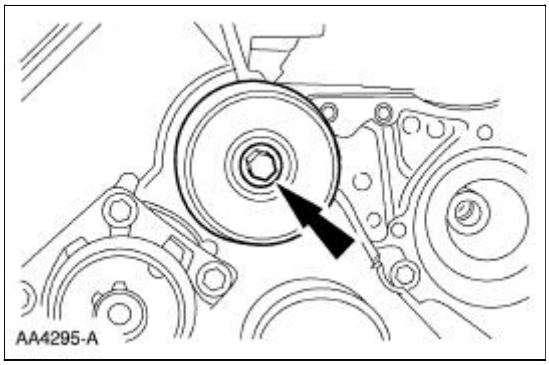
Remove the water pump.



- Clean and inspect the sealing surfaces.

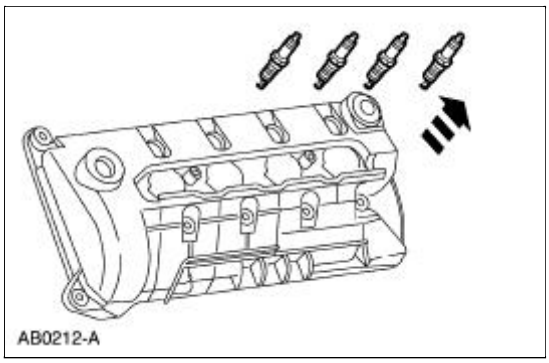


33. Remove the bolt.



34. Using the special tool, remove the crankshaft damper.

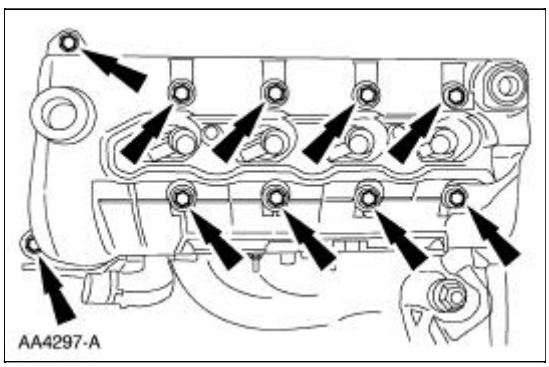
35. Using the special tool, remove the front crank seal.



36. Remove the bolt and the belt idler pulley.

37. **NOTE:** LH shown, RH similar.

    Remove the eight spark plugs.



38. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    NOTE: LH shown, RH similar.

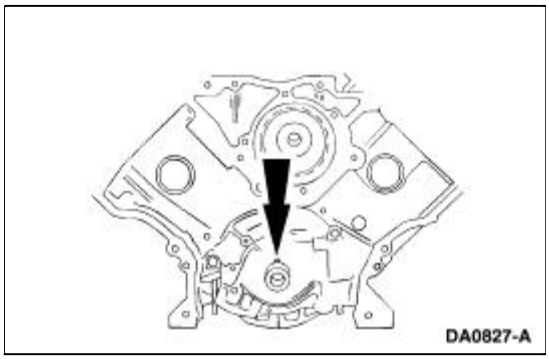
    Remove the bolts, studs and the valve covers.

    - Remove the gaskets. Clean and inspect the sealing surfaces.

39. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

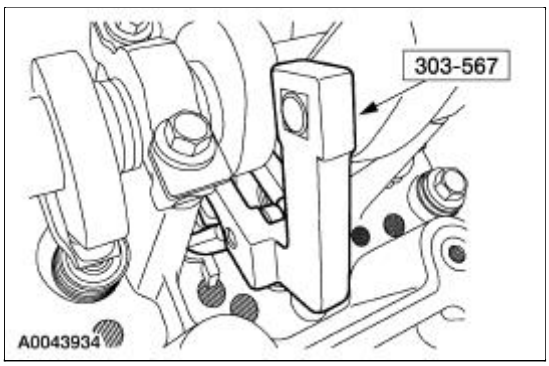
    Remove the studs, bolts, and the engine front cover.
    Remove the gaskets, clean and inspect the sealing surfaces.

Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
4	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
5	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
6	N808529	Stud, Hex-Head Pilot, M10 x 1.5 x 30
7	N808529	Stud, Hex-Head Pilot, M10 x 1.5 x 30
8	N806177	Bolt, Hex-Head Flange, M8 x 1.25 x 50
9	N806177	Bolt, Hex-Head Flange, M8 x 1.25 x 50
10	N806177	Bolt, Hex-Head Flange, M8 x 1.25 x 50
11	N806300	Stud Hex Shoulder Pilot, M8 x 1.25 x 65 - M8 x 1.25 x 27
12	N806300	Stud Hex Shoulder Pilot, M8 x 1.25 x 65 - M8 x 1.25 x 27
13	W705386	Bolt Hex Shoulder Pilot, M8 x 1.25 x 65
14	N806300	Stud Hex Shoulder Pilot, M8 x 1.25 x 65 - M8 x 1.25 x 27
15	W705386	Bolt Hex Shoulder Pilot, M8 x 1.25 x 65

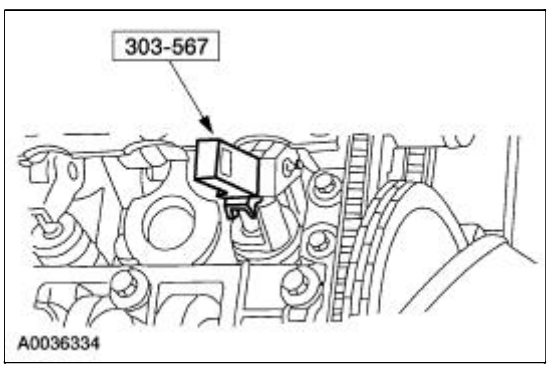


40. **CAUTION: Since the engine is not free-wheeling, if the crankshaft (6303) or the camshafts (6250) are moved in any manner during removal and installation, the crankshaft and the camshafts must be re-synchronized.**

Remove the crankshaft sensor ring from the crankshaft.

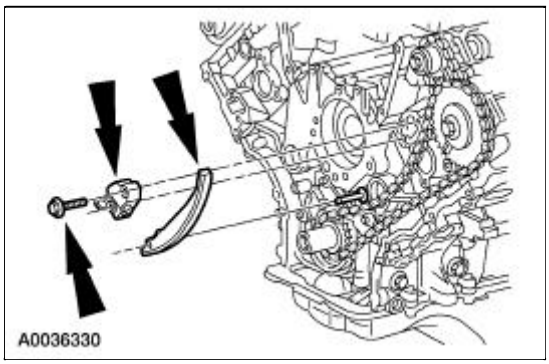


41. Rotate the crankshaft until the crankshaft keyway points towards the top of the engine (12 o'clock).



42. Position the camshaft lobes at the base circle.

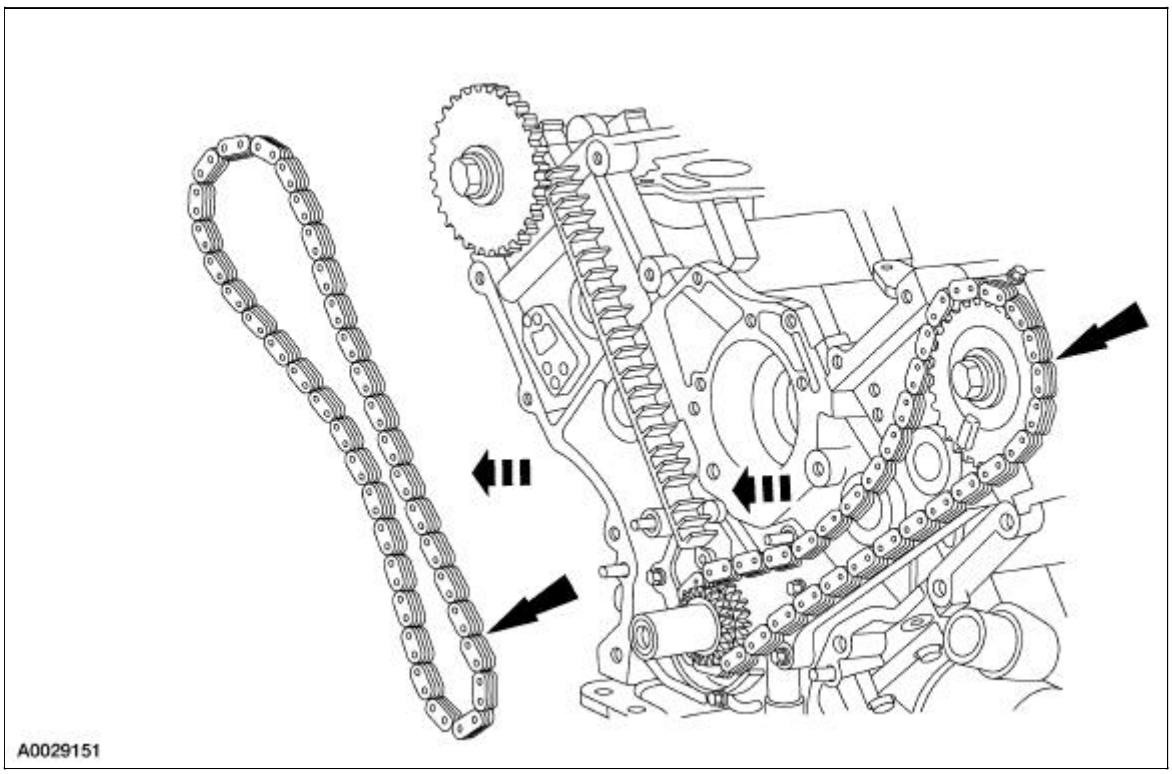
43. Using the special tool, compress the intake valve springs and remove the roller followers.



44. Using the special tool, compress the exhaust valve springs and remove the roller followers.

45. Repeat the previous steps to remove all roller followers.

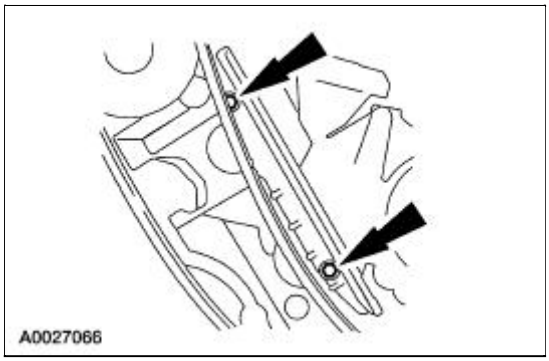
46. **NOTE:** LH shown, RH similar.



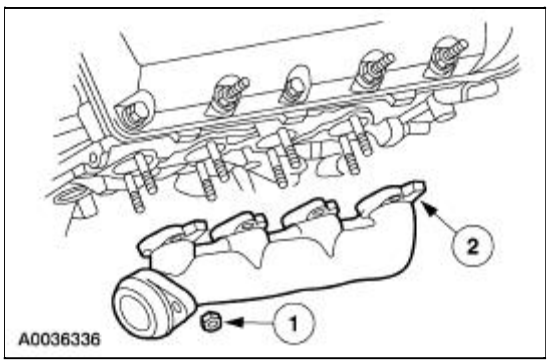
Remove the two bolts, the timing chain tensioner (6L266) and tensioner arm (6L253).

47. **NOTE:** LH shown, RH similar.

Remove the LH and RH timing chains and the crankshaft sprocket.

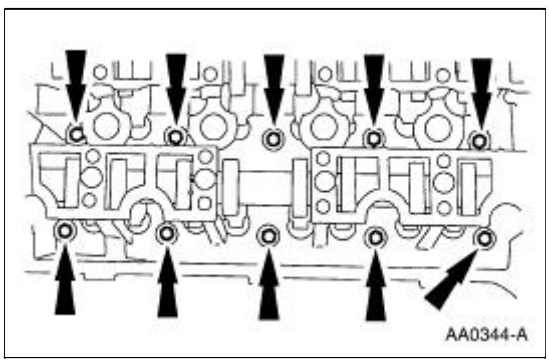


- Remove the timing chains from the camshaft sprockets.
- Remove the right and left timing chains and the crankshaft sprocket from the crankshaft.



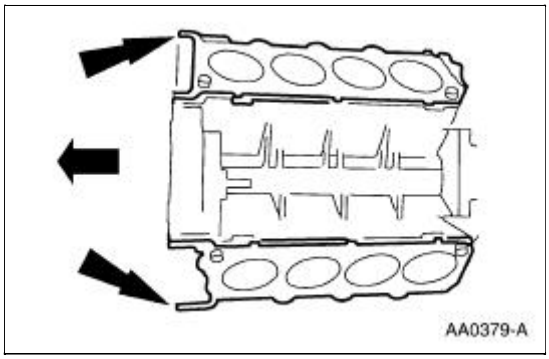
48. **CAUTION: The bolts are different lengths and must be returned to their original location.**

NOTE: RH shown, LH similar.

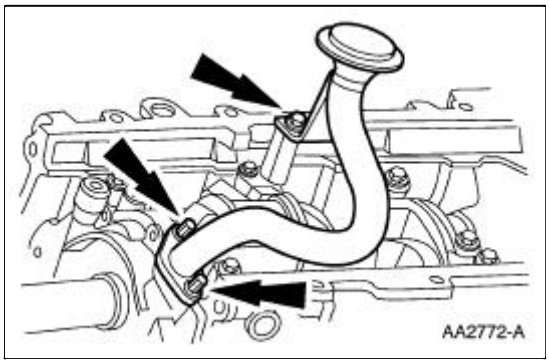


Remove the bolts and the timing chain guides.

49. Remove the RH exhaust manifold.
    1. Remove the eight nuts.
    2. Remove the exhaust manifold and gasket.

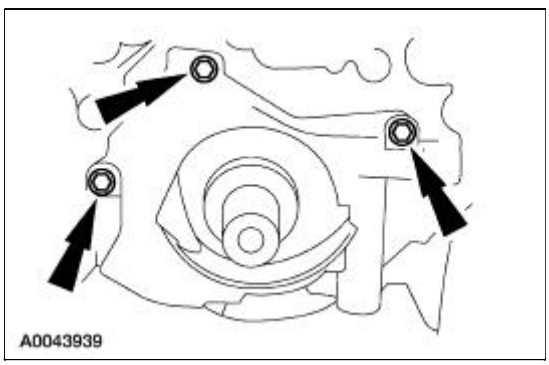


50. Remove the bolts from the RH and LH cylinder head and remove the cylinder heads.
    - Discard the bolts.

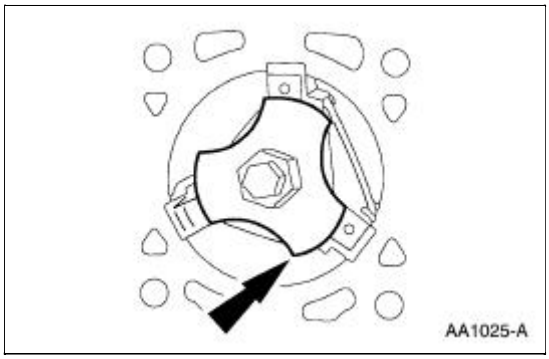


51. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Remove and discard head gaskets.
    - Clean and inspect the cylinder block and the head sealing surfaces.



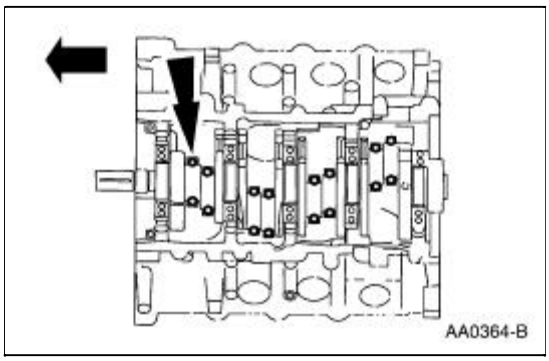
52. Remove the bolts and remove the oil pump screen cover and tube and the spacer.



53. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Remove the bolts and remove the oil pump.

    - Remove the gasket. Clean and inspect the sealing surfaces.

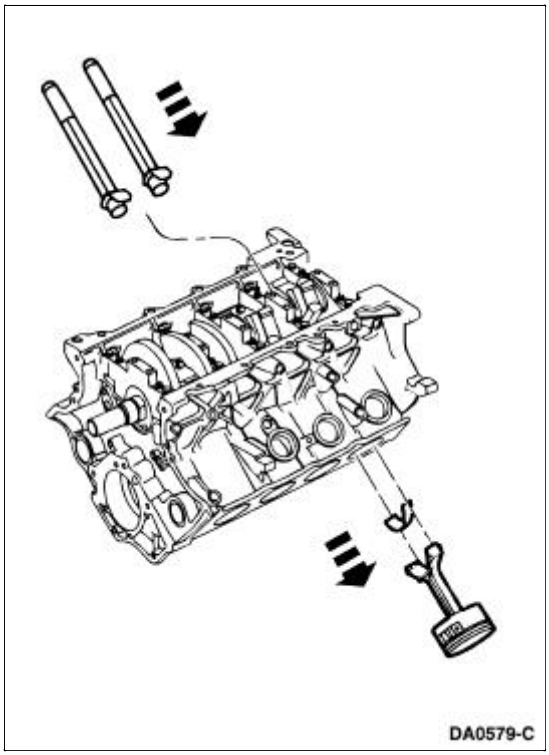


54. Before removing pistons, inspect the top of the cylinder bores. If necessary, remove the ridge or carbon deposits from each cylinder using a Cylinder Ridge Reamer, following manufacturer's instructions.

55. **CAUTION: Do not stamp the top of pistons. This may cause ring land damage.**

NOTE: Connecting rods and rod caps should be numbered to keep the correct orientation.

Remove the bolts and the connecting rod caps for pistons number 1 and 6.

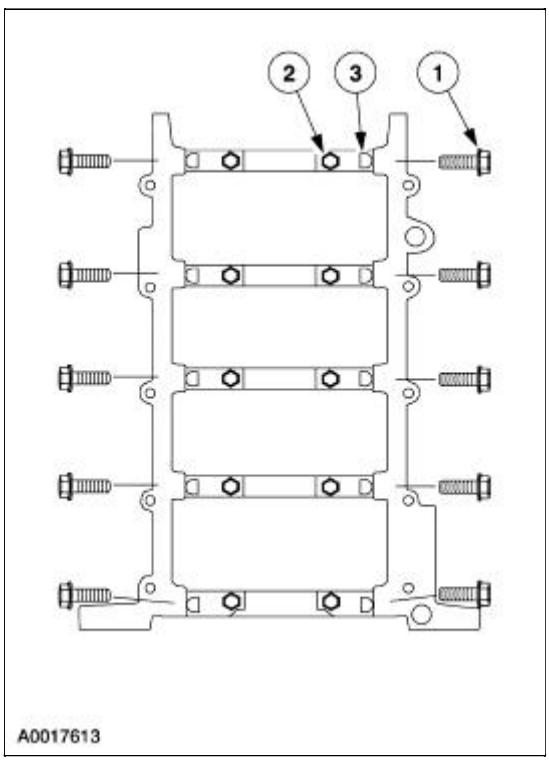


56. **NOTE:** Carefully tap connecting rod bolts out. Avoid damaging the rod cap.

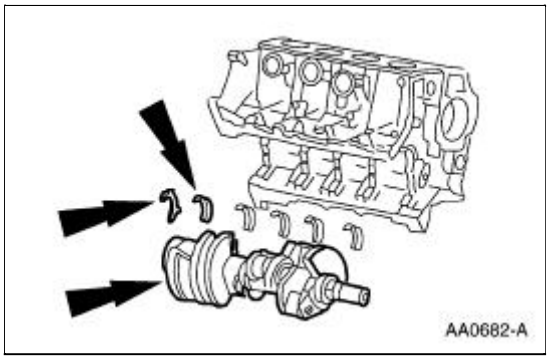
Discard the bolts.

57. **CAUTION: Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

NOTE: Connecting rod guides shown uninstalled for clarity.



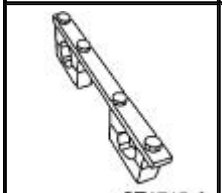
Install the Connecting Rod Guides and push the pistons number 1 and 6 through the top of the cylinder block (6010).



58. To remove pistons 3 and 5, 4 and 7, 2 and 8, turn crankshaft 90 degrees and repeat the previous steps.

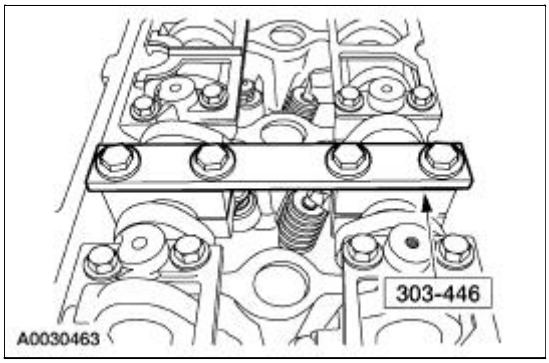
59. **NOTE:** Crankshaft not shown for clarity.

    Remove the crankshaft main bearing caps.
    1. Remove and discard the side bolts.
    2. Remove and discard the main bearing cap bolts.
    3. Remove the dowel pins.



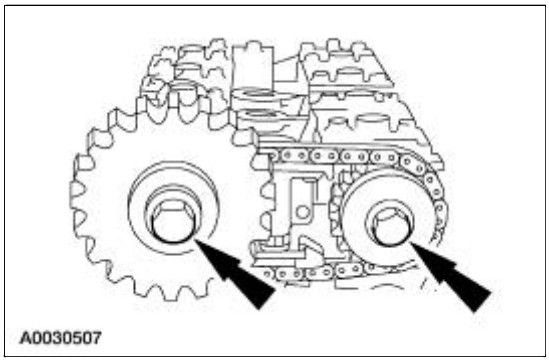
60. Remove the crankshaft (6303), the crankshaft thrust washer (6334), and the crankshaft upper main bearings from the cylinder block.

Cylinder Head



Special Tool(s)

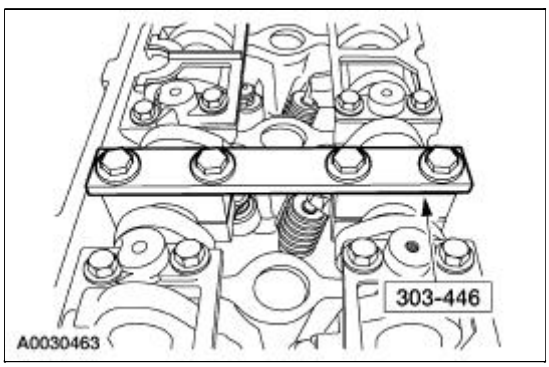
 ST2648-A	Compressor, Valve Spring 303-567 (T97P-6565-AH)
 ST1718-A	Compressor, Valve Spring 303-452 (T93P-6565-AR)
 ST1715-A	Holding Tool, Camshaft 303-446 (T93P-6256-AHR)
 ST1332-A	Installer, Valve Stem Oil Seal 303-383 (T91P-6571-A)
 ST1331-A	Compressor Spacer, Valve Spring 303-382 (T91P-6565-AH)



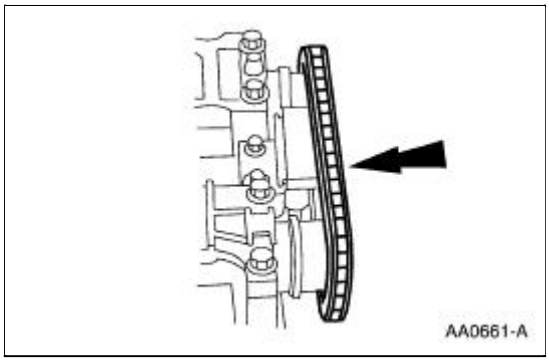
Disassembly

1. **CAUTION: Before disassembly begins, mark the valve position on the face of each valve being removed. The valves must be installed in their original positions.**

   Install the special tool.

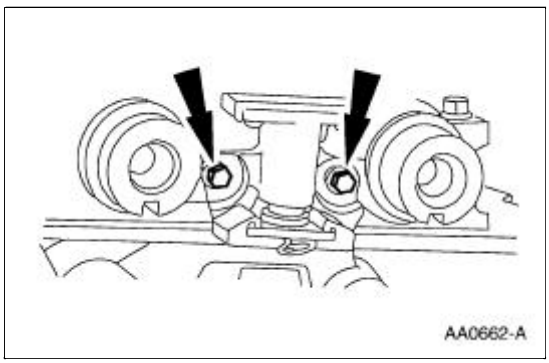


2. Remove the exhaust camshaft sprocket and the intake camshaft bolt, washer and spacer.

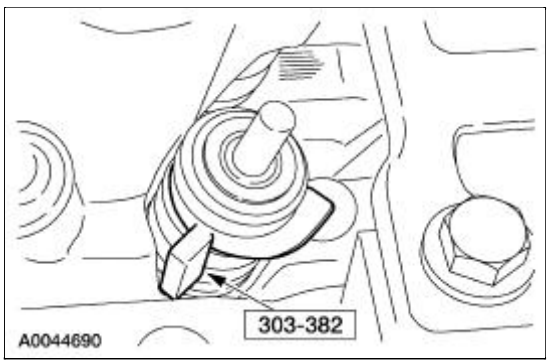


3. Compress the tensioner and install a lock pin.

4. Remove the special tool.



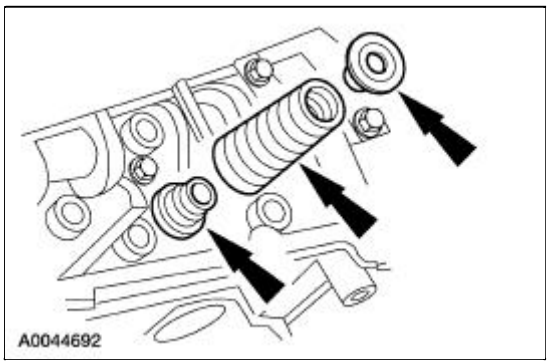
5. Remove the timing chain and the camshaft sprocket.



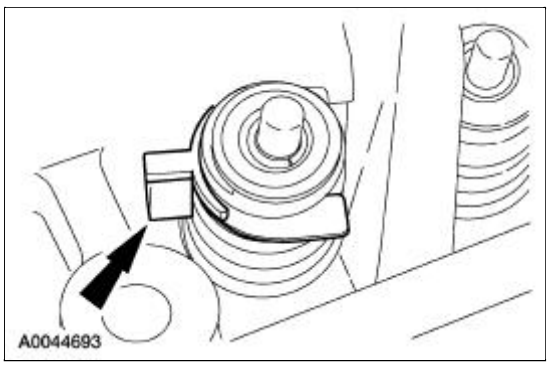
6. **NOTE:** LH tensioner shown, RH tensioner similar.

   Remove the tensioner.

7. Install the special tool between the valve spring coils to protect the intake valve stem seal from damage.

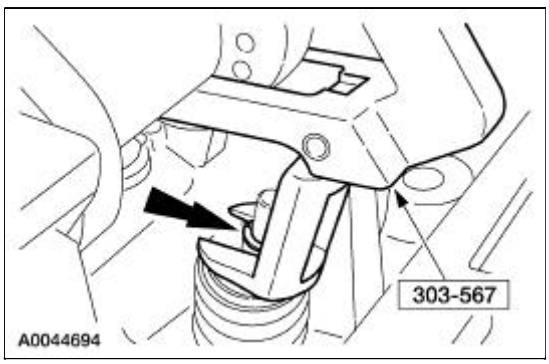


8. Using the special tool, compress the intake valve spring. Remove the intake valve spring retainer keys.



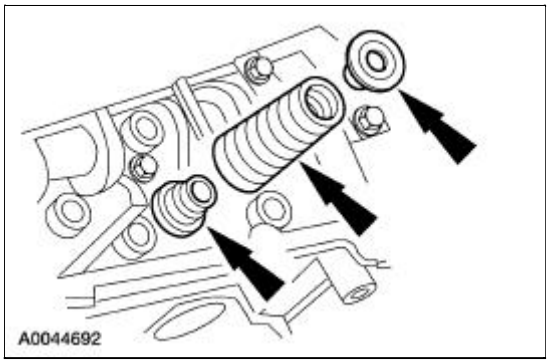
9. **NOTE:** Valve stem seals should be visually inspected if new seals are not installed.

   Remove the special tool, the valve spring retainer, the valve spring and the valve stem seal.



10. Repeat above three steps to remove all necessary intake valve spring assemblies.

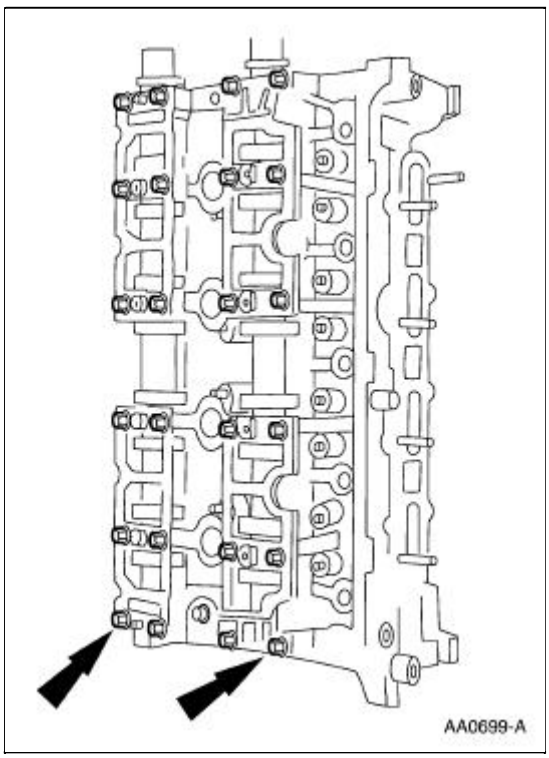
11. Install the special tool between the valve spring coils to protect the exhaust valve stem seal from damage.



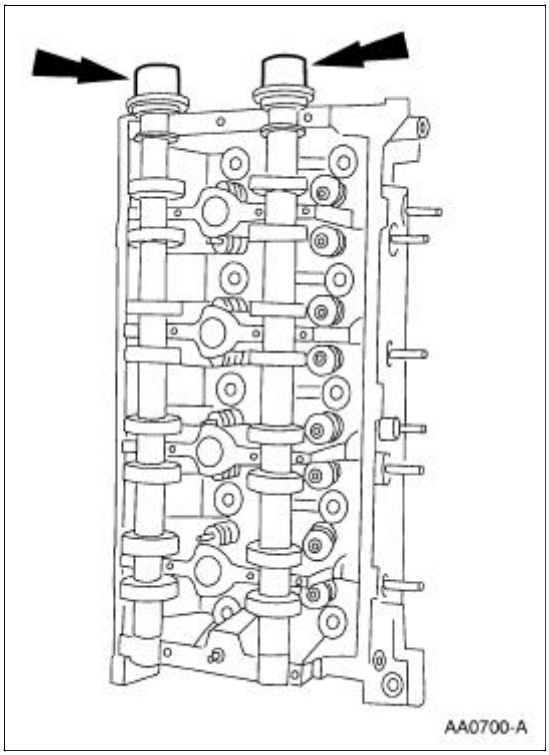
12. Using the special tool, compress the exhaust valve spring. Remove the exhaust valve spring retainer keys.

13. **NOTE:** Valve stem seals should be visually inspected if new seals are not installed.

    Remove the special tool, the valve spring retainer, the valve spring and the valve stem seal.



14. Repeat above three steps to remove all necessary exhaust valve spring assemblies.

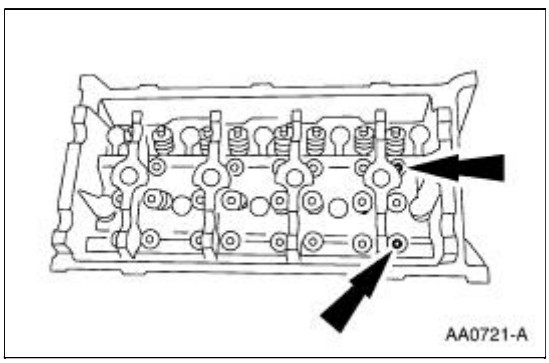


15. **CAUTION: The outer bolts on the outer cam bearing cap (exhaust) are longer and must be returned to the same location or engine damage can occur.**

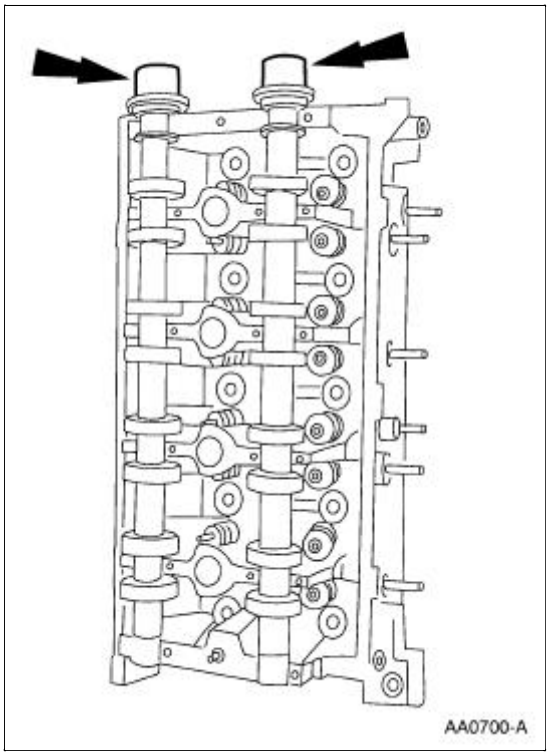
    NOTE: Identify the camshaft-to-cylinder head location. Caps are not interchangeable.

    Remove the bolts and the camshaft bearing cap assemblies.

16. Remove the camshafts.

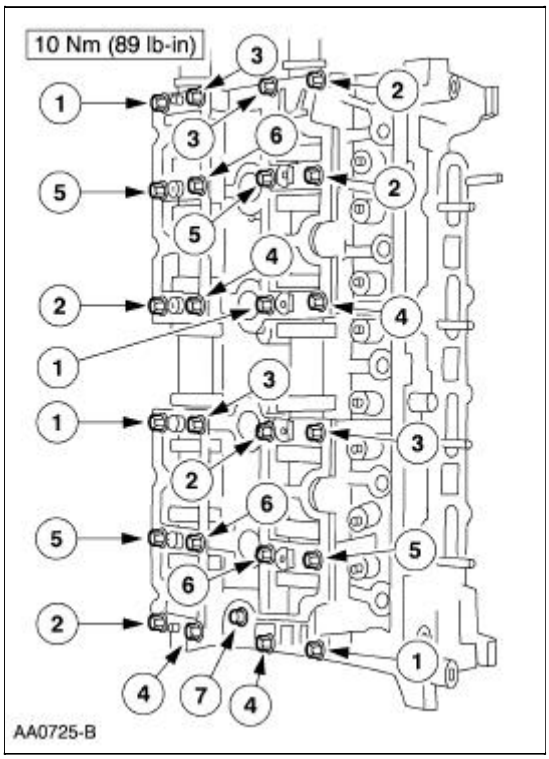


17. Remove the hydraulic lash adjusters.



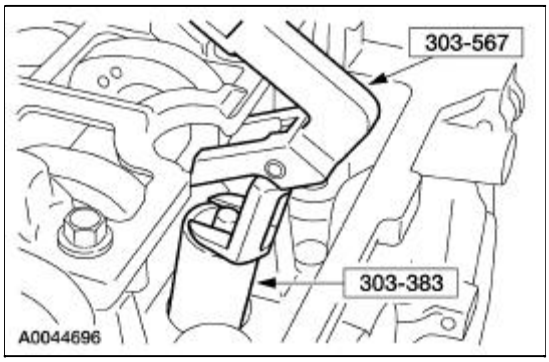
Assembly

1. Install the hydraulic lash adjusters.

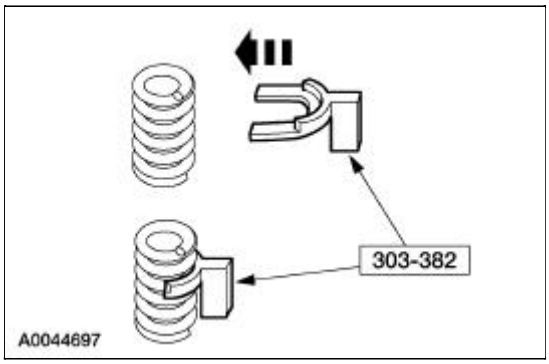


2. **NOTE:** LH shown, RH similar.

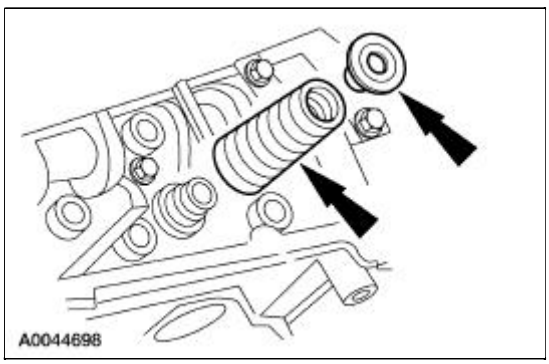
   Install the camshafts.



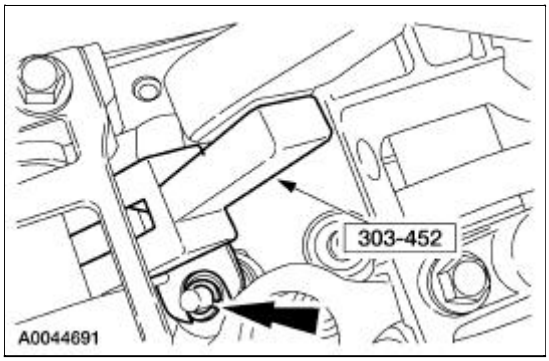
3. Install the camshaft bearing cap assemblies.



4. Using the special tools, install the new intake valve stem seals. Repeat this step to install all necessary intake valve stem seals.

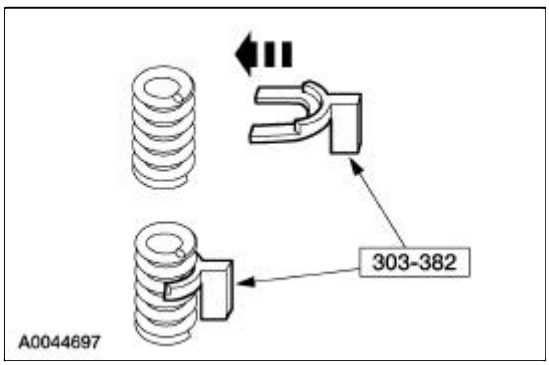


5. Using the special tools, install the new exhaust valve stem seals. Repeat this step to install all necessary exhaust valve stem seals.

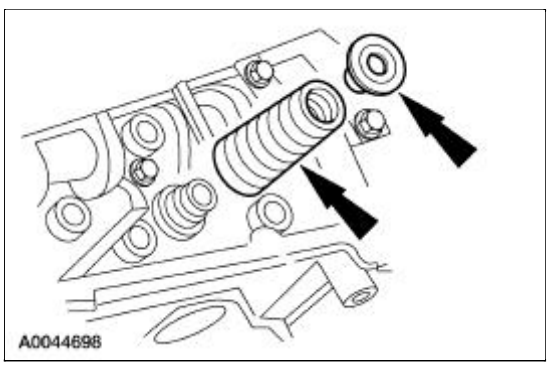


6. Install the special tool between the valve spring coils to protect the intake valve stem seal from damage.

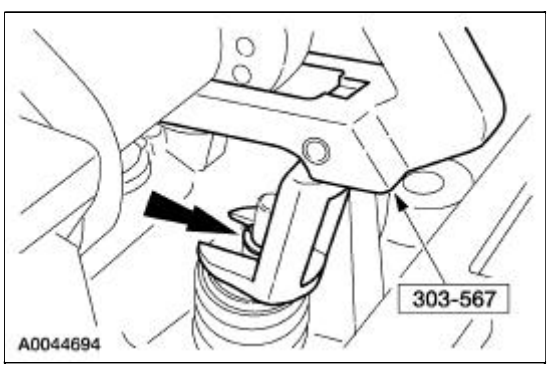
7. Position the intake valve spring and the spring retainer over the intake valve stem and the valve seal.



8. Using the special tool, compress the intake valve spring. Install the intake valve spring retainer keys.

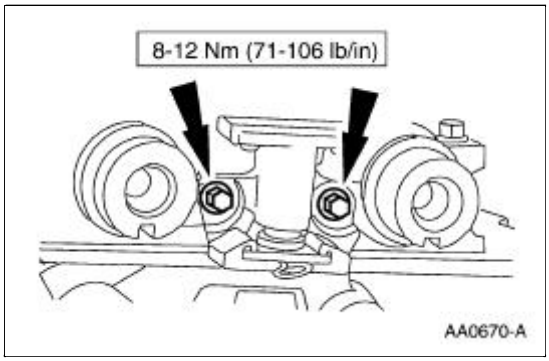


9. Repeat above three steps to install all necessary intake valve spring assemblies.



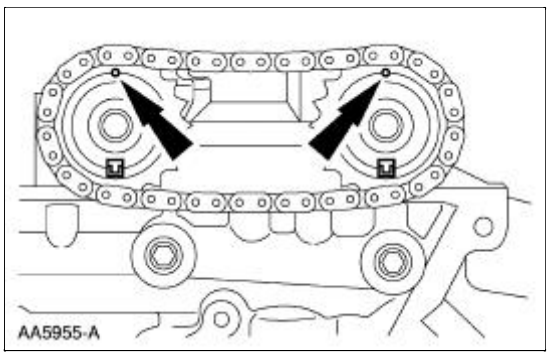
10. Install the special tool between the valve spring coil to protect the exhaust valve stem seal from damage.

11. Position the exhaust valve spring and the spring retainer over the exhaust valve stem and the valve seal.



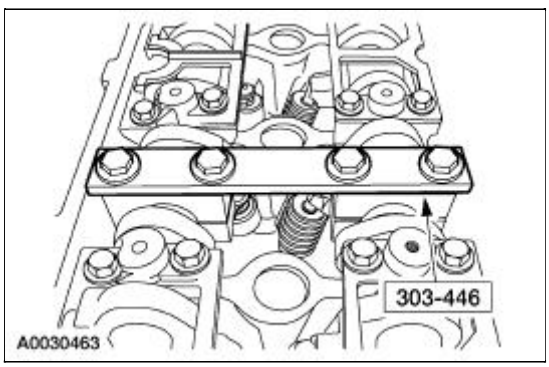
12. Using the special tool, compress the exhaust valve spring. Install the exhaust valve spring retainer keys.

13. Repeat above three steps to install all necessary exhaust valve spring assemblies.



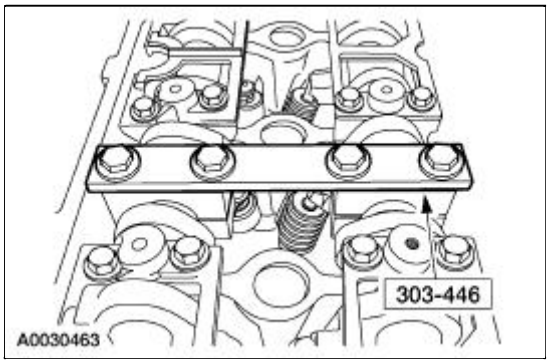
14. **NOTE:** LH tensioner shown, RH tensioner similar.

    Install the tensioner.



15. **CAUTION: Timing marks must be at 12 o'clock and indexed at 6 o'clock.**

    Install the camshaft sprockets and the chain as an assembly.

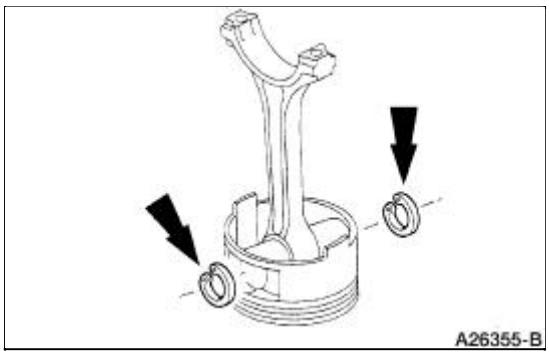


16. Install the special tool.

17. Tighten the exhaust camshaft sprocket and the intake camshaft bolt washer and spacer in two stages:
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

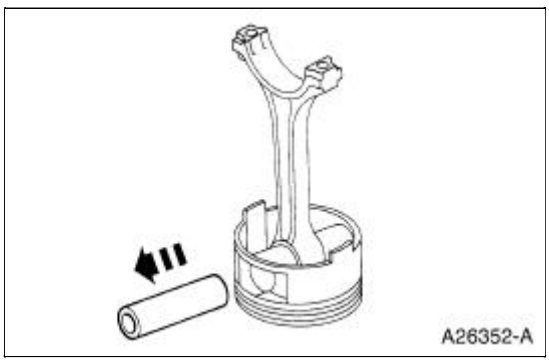
18. Remove the special tool.

Piston



Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H



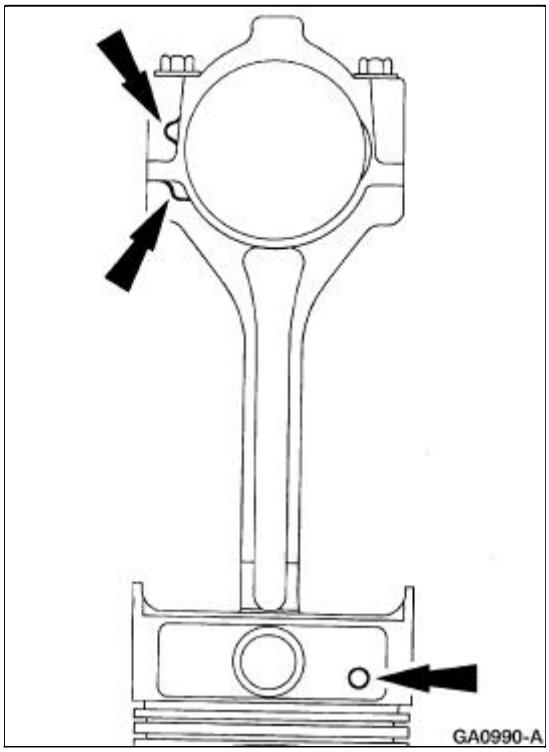
Disassembly

1. **NOTE:** Connecting rods and rod caps are a matched set and cannot be interchanged.

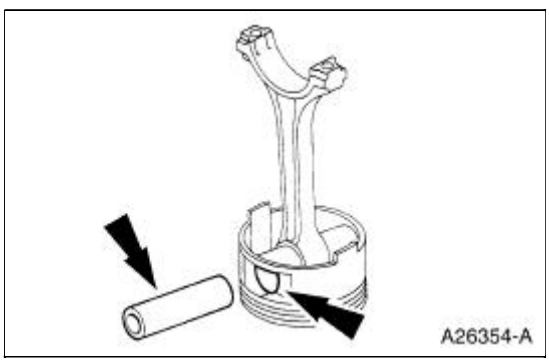
   Remove the clips.

2. Remove the piston pin (6135) from the piston (6108) and connecting rod assembly.

3. Remove the connecting rod (6200) from the piston.



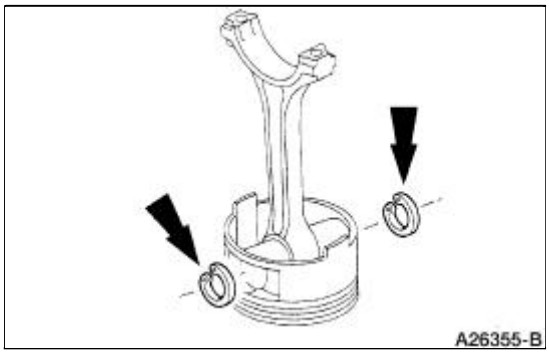
4. Clean and inspect the piston and connecting rod. For additional information, refer to Section 303-00 .



Assembly

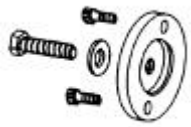
1. **NOTE:** Connecting rod must be installed into piston with identification markings toward front.

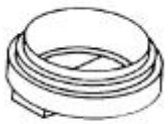
   Position the connecting rod in the piston.

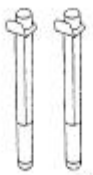


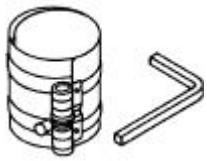
2. Lubricate the piston pin and pin bore with clean engine oil.

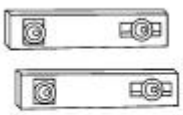
3. Install the piston pin in the piston and connecting rod assembly.











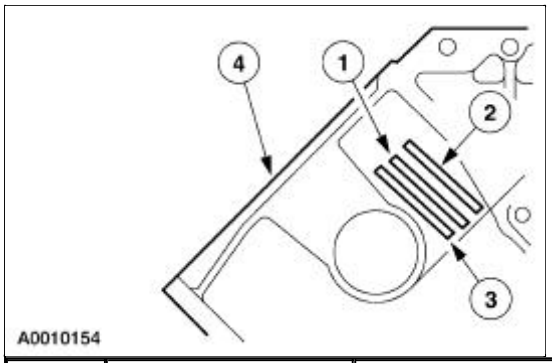
4. Install the piston pin retaining clips in the piston.

Engine

Special Tool(s)

 ST1480-A	Installer, Crankshaft Rear Oil Seal 303-518 (T95P-6701-DH)
 ST1479-A	Installer, Crankshaft Rear Oil Seal 303-516 (T95P-6701-BH)
 ST1482-A	Installer, Crankshaft Rear Oil Seal 303-517 (T95P-6701-CH)
 ST2443-A	Lifting Bracket Set, Engine 303-DS086 (D93P-6001-A)
 ST1337-A	Installer, Connecting Rod 303-442 (T93P-6136-A)
 ST2197-A	Installer, Crankshaft Front Oil Seal 303-635
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
	Installer, Front Cover Oil Seal 303-335 (T88T-6701-A)

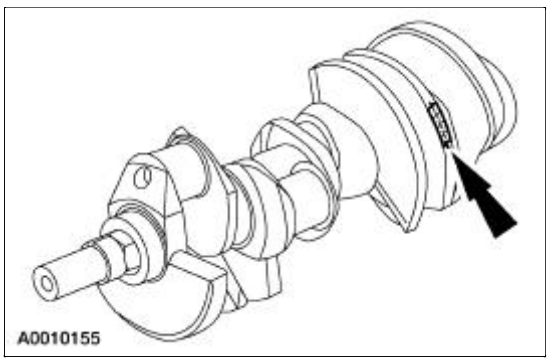
 ST1328-A	
	Compressor, Piston Ring 303-D032 (D81L-6002-C) or equivalent
 ST1377-A	Modular Engine Lift Bracket 303-F047 (014-00073) or equivalent
 ST2361-A	Alignment Plate, Camshaft 303-445 (T93P-6256-A)
 ST2373-A	Compressor, Valve Spring (Exhaust Side) 303-567 (T97P-6565-AH)
 ST1718-A	Compressor, Valve Spring (Intake Side) 303-452 (T93P-6565-AR)
 ST1335-A	Holding Tool, Crankshaft 303-448 (T93P-6303-A)



Material

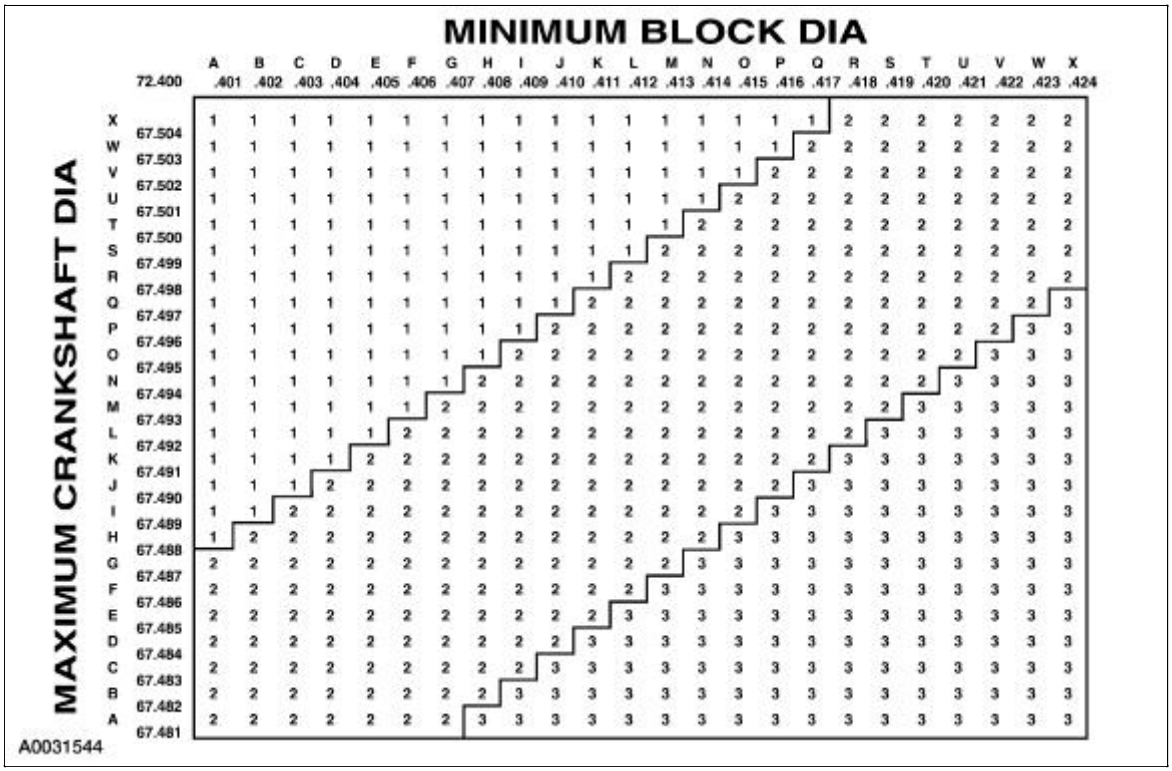
Item	Specification
Metal Surface Cleaner F4AZ-19A536-RA or equivalent	WSE-M5B392-A
Silicone Gasket and Sealant F7AZ-19554-EA or equivalent	WSE-M4G323-A4
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Assembly



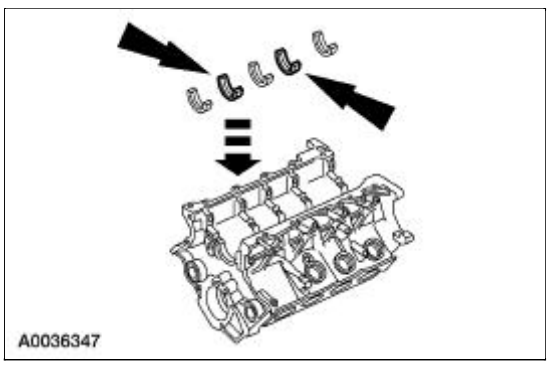
NOTE: During engine assembly it may become necessary to check bearing clearances, end play etc. For additional information, refer to Section 303-00 .

1. Read the first character code information on the cylinder block face (1) and record the information.

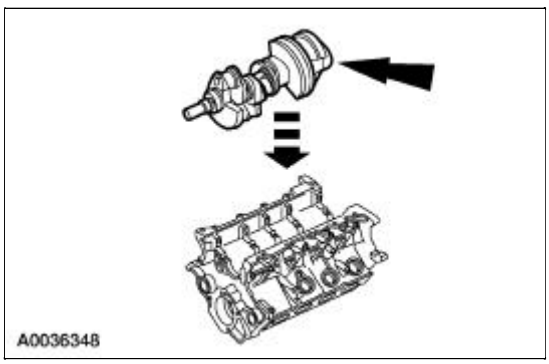


Item	Part Number	Description
1	—	Cylinder block identification
2	—	Cylinder bore grade
3	—	Cylinder block serial number
4	6010	Cylinder block front face

2. Read the first character on the No. 7 crankshaft counterweight and note it.

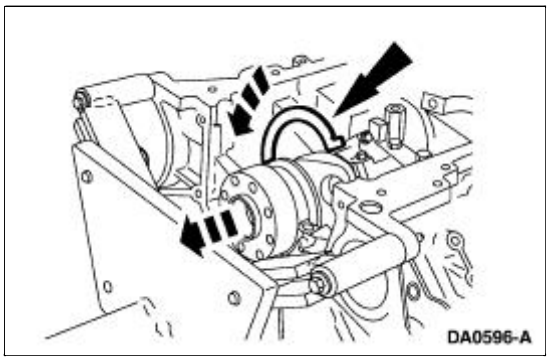


3. Using the data recorded in the previous two steps, cross-reference using the chart to obtain bearing grade.



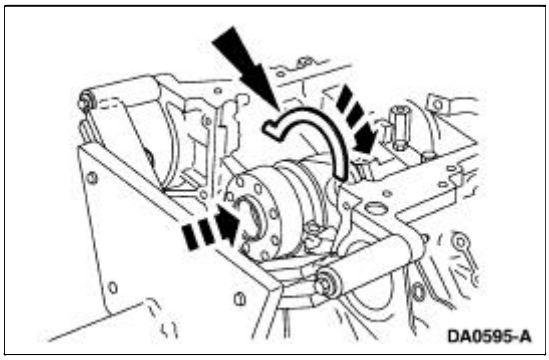
4. **NOTE:** Before assembling the cylinder block, all sealing surfaces must be free from chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

   Lubricate the crankshaft main bearings with clean engine oil and install into the cylinder block. Install the crankshaft main bearings into the main bearing caps.



5. **NOTE:** Do not install the upper thrust bearings until the crankshaft is installed.

   Install the crankshaft onto the upper main bearings.

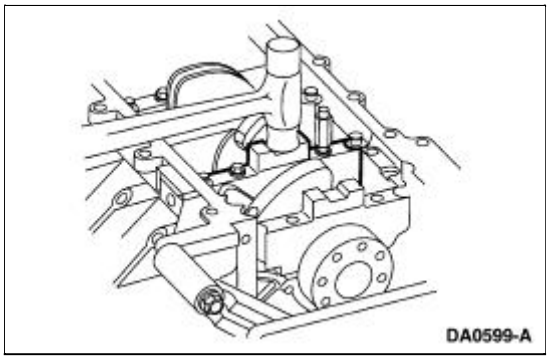


6. **CAUTION: Make sure the side of the thrust washer with three 5-mm wide oil grooves faces the crankshaft thrust surface.**

   Push the crankshaft rearward and install the crankshaft thrust washer at the back of the No. 5 main boss.

7. **CAUTION: Make sure the side of the thrust washer with three 5-mm wide oil grooves faces the crankshaft thrust surface.**

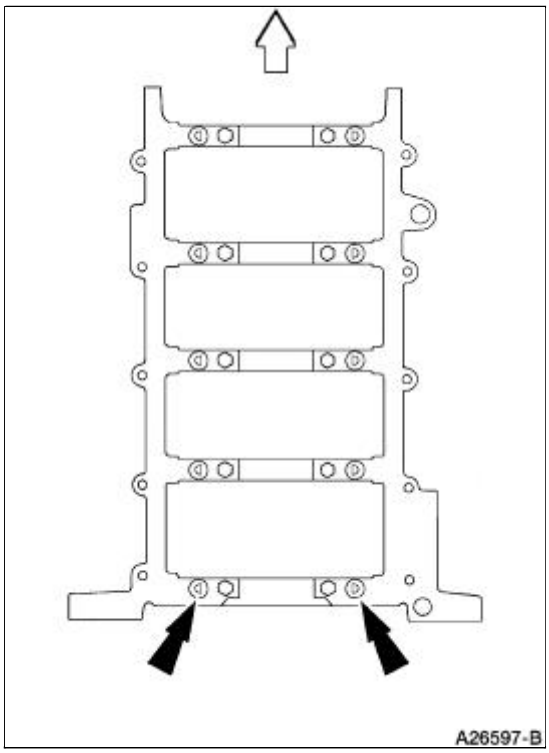
   Push the crankshaft forward and install the front crankshaft upper thrust washer at the front of the No. 5 main boss.



8. **CAUTION: Make sure the side of the thrust washer with three 5-mm wide oil grooves faces the rear of the engine.**

   NOTE: To aid in assembly apply petroleum jelly to the back of the crankshaft thrust washer.

   Install the lower crankshaft thrust washer to the back side of the No. 5 main bearing cap, with the oil grooves facing the crankshaft surface.



9. Install the crankshaft lower main bearings into the main bearing caps. Locate the main bearing cap on the cylinder block and tap into place using a plastic or deadblow hammer.

10. **NOTE:** Crankshaft not shown for clarity.

    Install the main bearing cap dowel pins so the flat sides face the crankshaft.

11. **NOTE:** Crankshaft not shown for clarity.

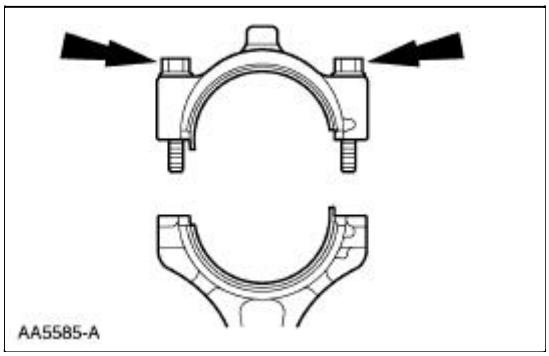
    Install and tighten the new bolts in two stages:

    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

12. **NOTE:** Crankshaft not shown for clarity.

    Install and tighten the new cross-mounted bolts in two stages:

    - Stage 1: Tighten to 30 Nm (22 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

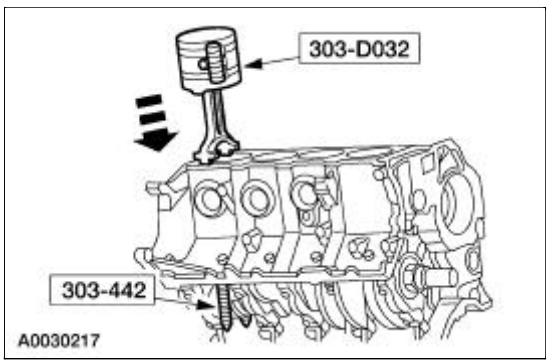


13. **NOTE:** Verify the connecting rods and rod caps for correct orientation.

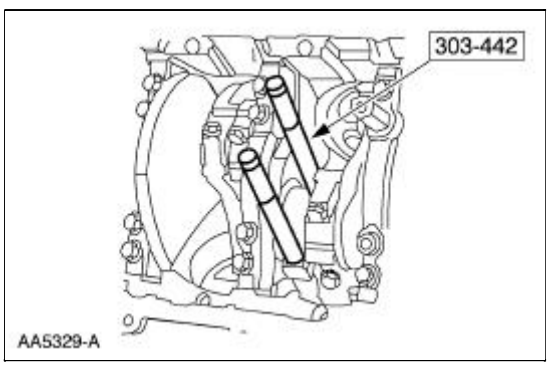
    NOTE: Carefully tap the connecting rod bolts in. Avoid damaging the connecting rod.

Prepare the connecting rod and caps.

- Insert the bolts in the rod cap.
- Insert the upper and lower rod bearings into the rod and cap.



14. **CAUTION: Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

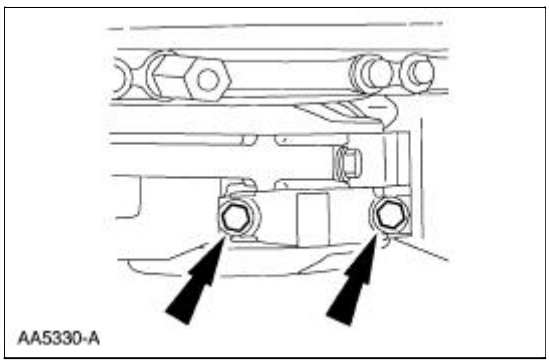


NOTE: Make sure the piston arrow is facing forward.

Using the special tools, install the No. 1 and No. 6 piston and connecting rod assemblies.

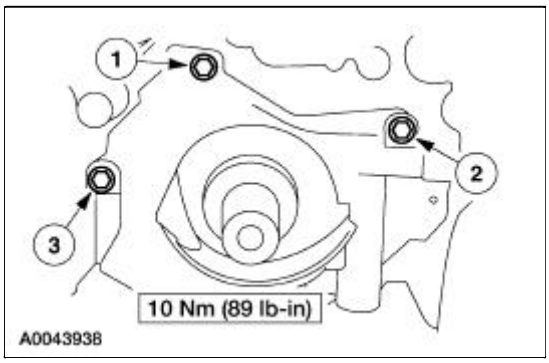
- Lubricate the piston and ring with clean engine oil.
- Lubricate the rod bearings with clean engine oil.

15. Seat the connecting rods on the crankshaft journals and remove the special tools.



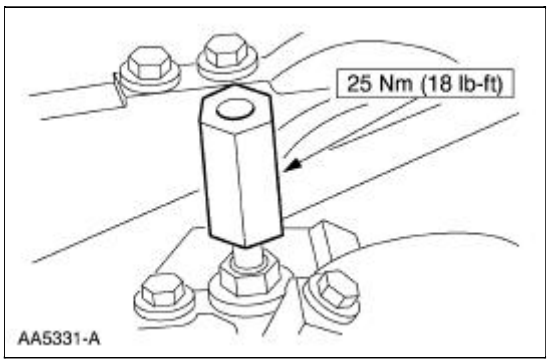
16. **CAUTION: The rod bearing caps must keep the same orientation as marked during disassembly.**

NOTE: The rod bearing cap bolts are torque-to-yield. Install new bolts each time repaired.



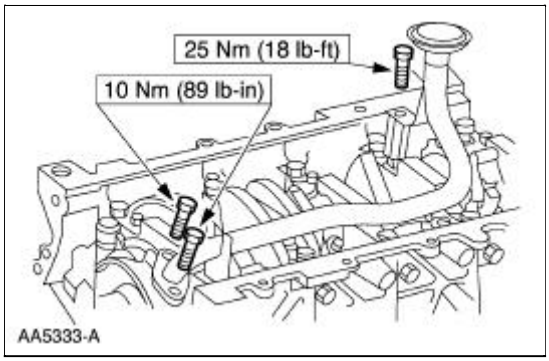
Install the rod bearing caps and tighten the bolts in three stages:

- Stage 1: Tighten to 25 Nm (18 lb-ft).
- Stage 2: Tighten to 45 Nm (30 lb-ft).
- Stage 3: Tighten an additional 90 degrees.

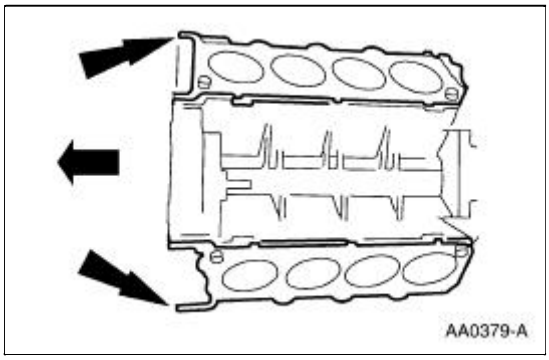


17. Install the piston connecting rod assemblies 3 and 5, 4 and 7, 2 and 8, by turning the crankshaft 90 degrees and repeating the previous steps.

18. Position the oil pump and gasket and install the bolts in the sequence shown.

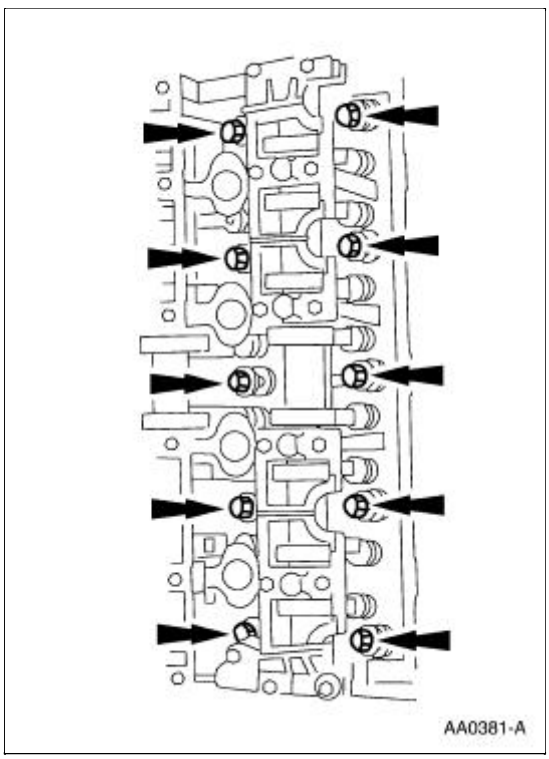


19. Install and tighten the oil pump screen and cover spacer.

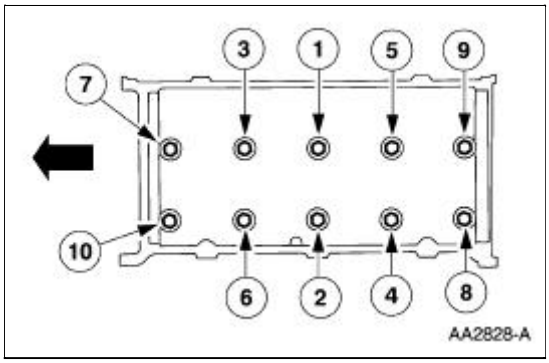


20. **CAUTION: Make sure the O-ring is in place and not damaged. A missing or damaged O-ring can cause foam in the lubrication system, low oil pressure and severe engine damage.**

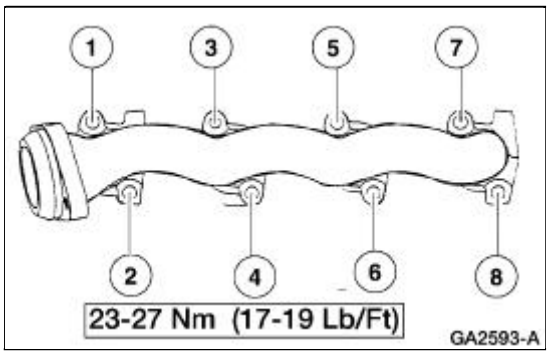
NOTE: Clean and inspect the mating surfaces and install a new O-ring. Lubricate with clean engine oil.



Install the oil pump screen cover and tube, and the bolts.

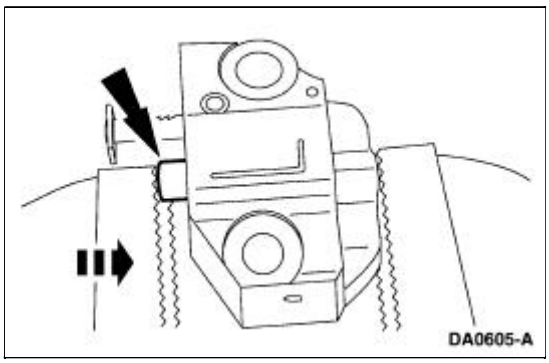


21. Install the cylinder head gaskets.

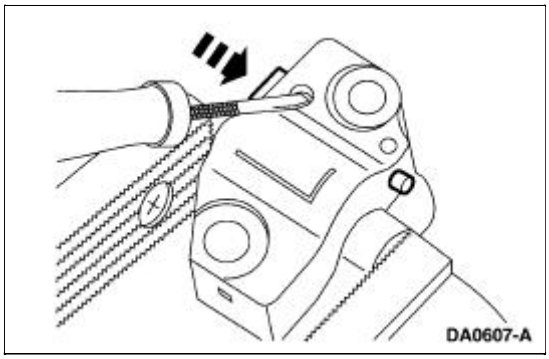


22. Install the LH and the RH cylinder heads. Loosely install the new bolts.

23. Tighten the LH and RH bolts in three stages, in the sequence shown.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.
    - Stage 3: Tighten an additional 90 degrees.

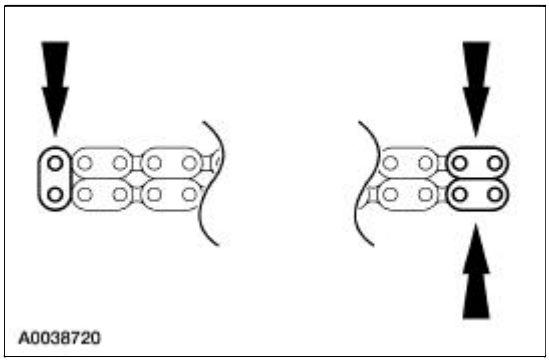


24. Install RH exhaust manifold gaskets and the exhaust manifold.
    - Tighten the nuts in the sequence shown.

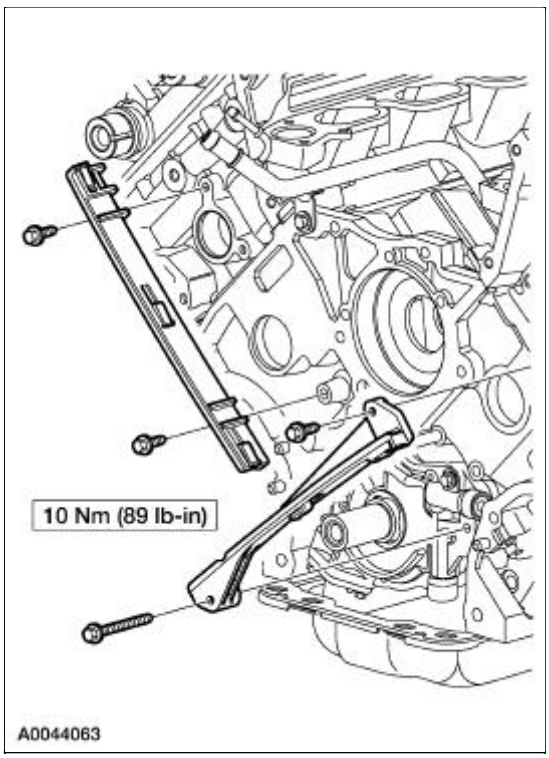


25. **CAUTION: Timing chain procedures must be followed exactly or damage to the pistons or valves can result.**

    Compress the tensioner plunger, using the edge of a soft-jawed vise.



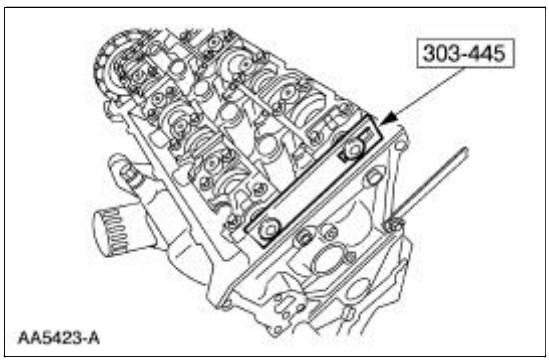
26. Install a paper clip into the hose in the tensioner housing to hold the ratchet assembly.
    - Remove the tensioner from the vise.



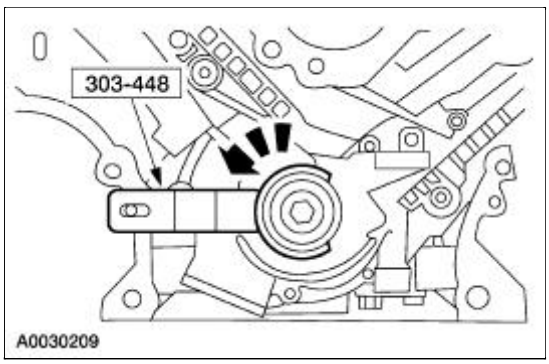
27. **NOTE:** There are 61 links in the timing chain.

    If the copper links are not visible, mark two links on one end and one link on the other end, and use as timing marks.

28. Install the timing chain guides.

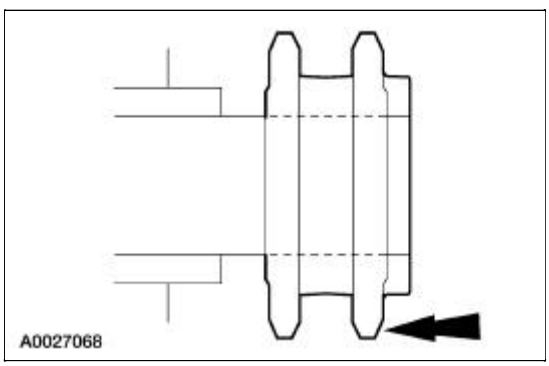


29. Rotate the LH camshaft sprocket until the timing mark is approximately at the 12 o'clock position. Rotate the RH camshaft timing sprocket until the timing mark is approximately in the 11 o'clock position.

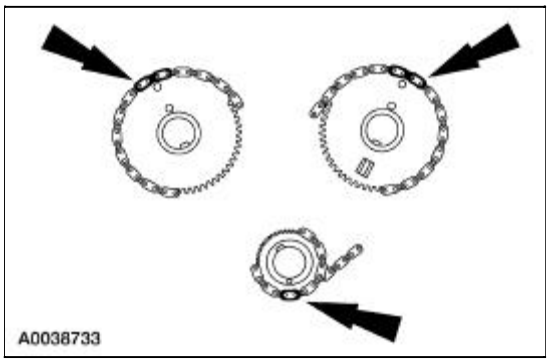


30. **NOTE:** LH shown, RH similar.

    Install the special tools on the LH and RH cylinder heads.

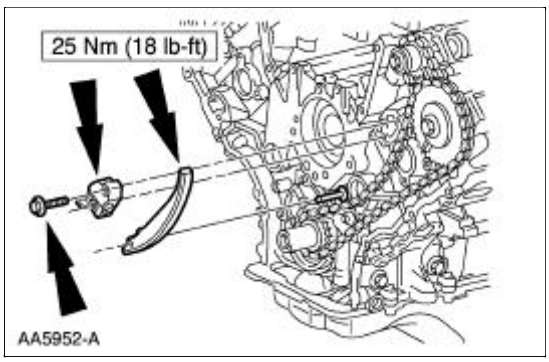


31. Using the special tool, position the crankshaft.

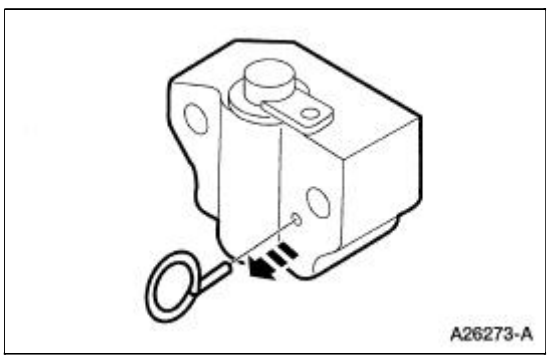


32. Remove the special tool.

33. Install the crankshaft sprocket with the timing mark facing outward.



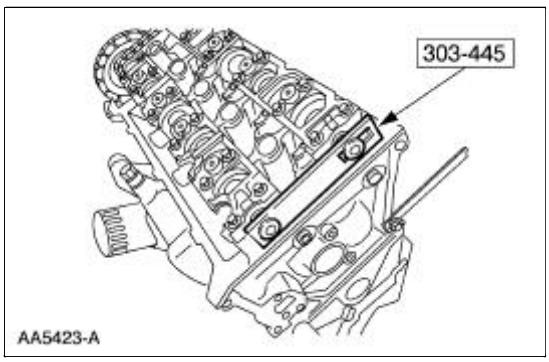
34. Install the LH and RH timing chain onto the crankshaft and camshaft sprockets.
    - Align the two copper (marked) links with the timing mark on the camshaft sprocket.
    - Align the one copper-colored link with the timing mark on the crankshaft sprocket.



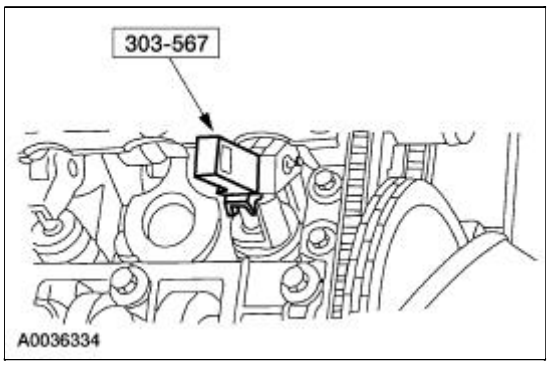
35. **NOTE:** LH shown, RH similar.

    Position the tensioner arms and tensioners, and install the bolts.

36. Remove the paper clip.

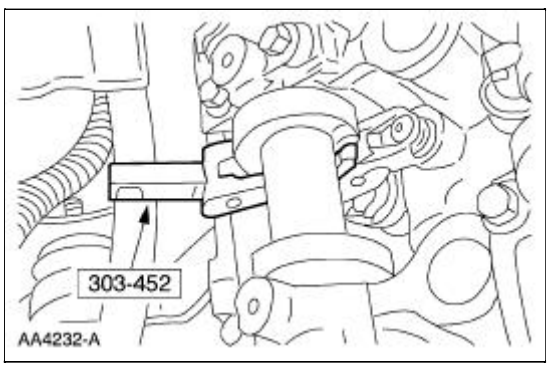


37. Verify the camshaft and crankshaft sprocket to copper link alignment.



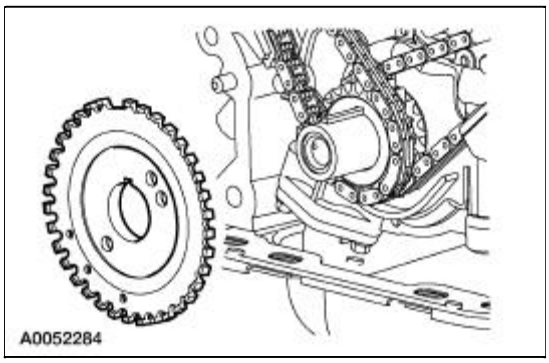
38. **NOTE:** LH shown, RH similar.

    Remove the special tools from the LH and RH cylinder heads.

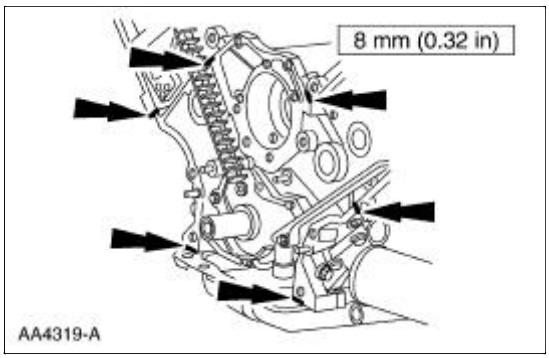


39. Position the camshaft lobes at the base circle.

40. Using the special tool, compress the exhaust valve springs and install the roller followers.

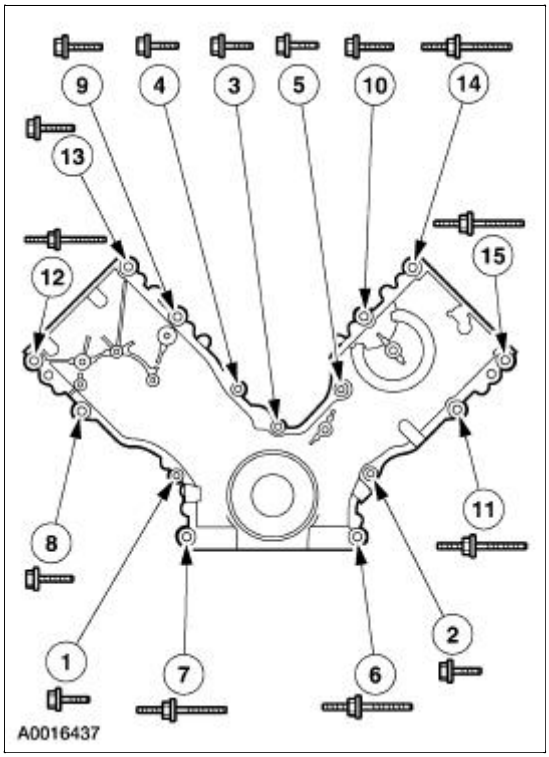


41. Using the special tool, compress the intake valve springs and install the roller followers.

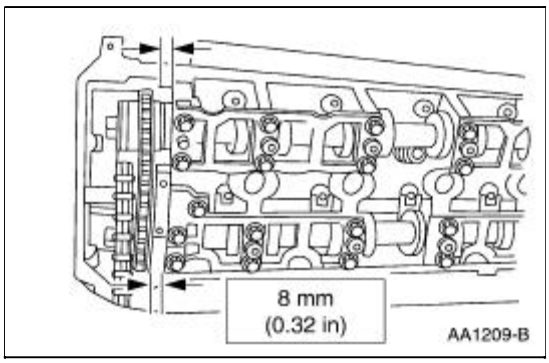


42. Repeat the previous steps to install all roller followers.

43. Position the crankshaft sensor ring on the crankshaft.

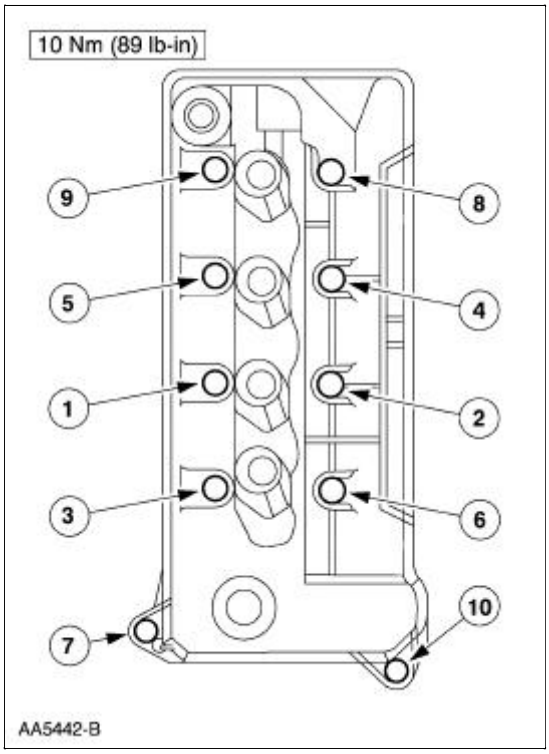


44. Apply silicone gasket sealant in the locations shown.



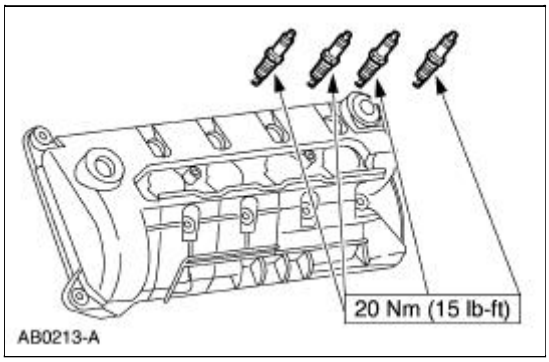
45. Position the engine front cover and install the bolts and the studs in three stages:
Stage 1: Tighten numbers one through five to 25 Nm (18 lb-ft).
Stage 2: Tighten numbers six and seven to 50 Nm (37 lb-ft).
Stage 3: Tighten numbers 11 through 15 to 25 Nm (18 lb-ft).

Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
4	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
5	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 50
6	N808529	Stud, Hex-Head Pilot, M10 x 1.5 x 30
7	N808529	Stud, Hex-Head Pilot, M10 x 1.5 x 30
8	N806177	Bolt, Hex-Head Flange, M8 x 1.25 x 50
9	N806177	Bolt, Hex-Head Flange, M8 x 1.25 x 50
10	N806177	Bolt, Hex-Head Flange, M8 x 1.25 x 50
11	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 65 - M8 x 1.25 x 27
12	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 65 - M8 x 1.25 x 27
13	W705386	Bolt, Hex Shoulder Pilot, M8 x 1.25 x 65
14	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 65 - M8 x 1.25 x 27
15	W705386	Bolt, Hex Shoulder Pilot, M8 x 1.25 x 65



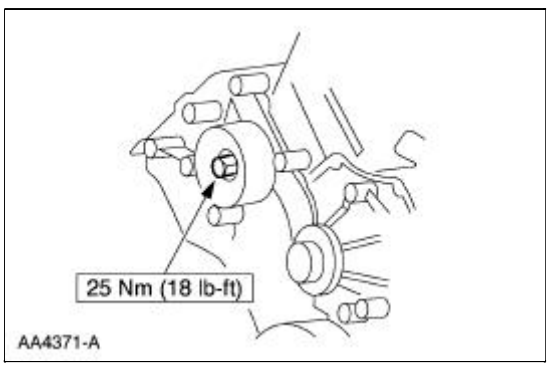
46. Apply silicone gasket sealant in the locations shown.

47. **NOTE:** LH shown, RH similar.



Install the valve covers, the bolts, and the studs.

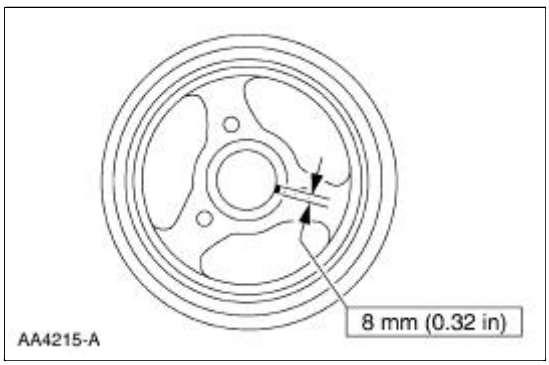
1. Install the gaskets.
2. Install the valve covers.



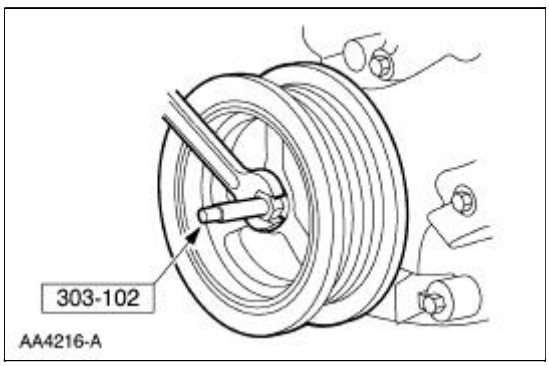
48. **NOTE:** LH shown, RH similar.

    Install the eight spark plugs.

49. Install the bolt and the belt idler pulley.

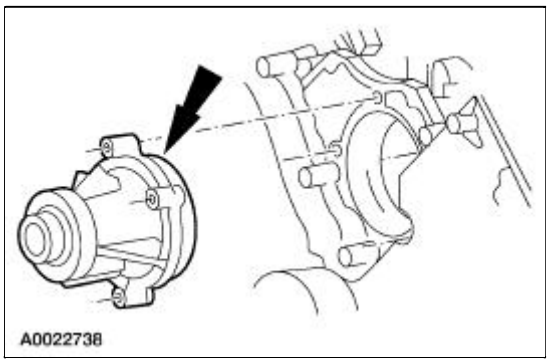


50. Using the special tools, install the front crank seal.

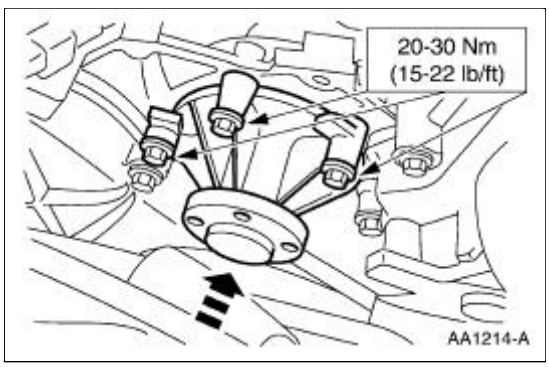


51. **NOTE:** The crankshaft pulley must be installed within four minutes after applying the silicone.

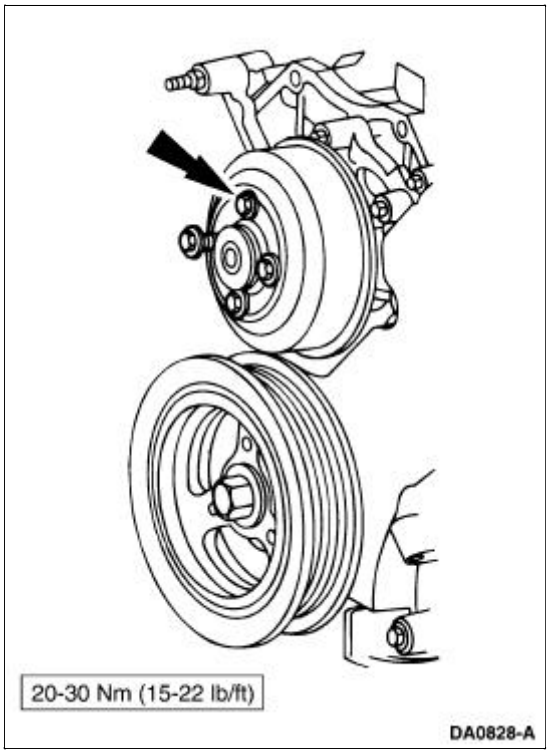
    Apply silicone gasket and sealant to the Woodruff key slot on the crankshaft pulley.



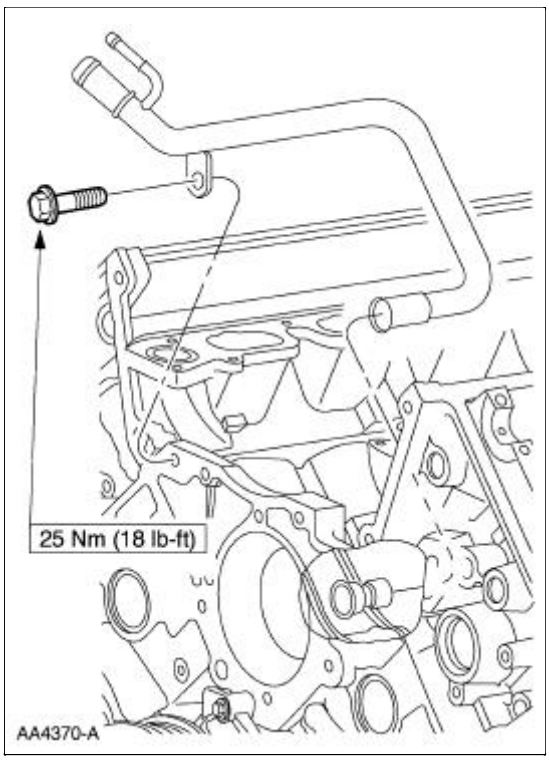
52. Using the special tool, install the crankshaft pulley.



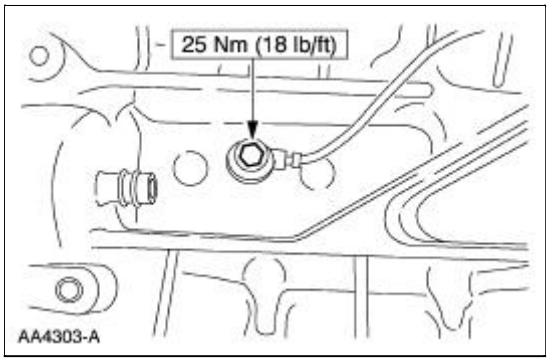
53. Install the bolt and washer. Tighten the bolt in four stages:
    - Stage 1: Tighten to 90 Nm (66 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.



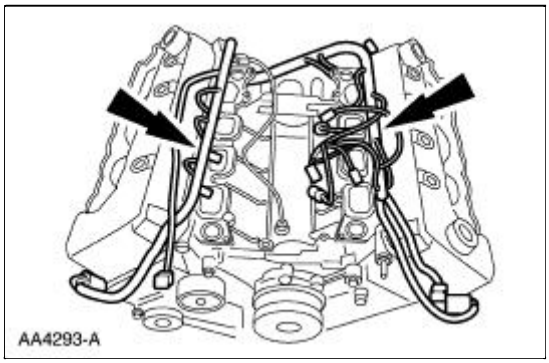
54. Install the water pump.
    - Inspect and lube the water pump O-ring seal before installation.



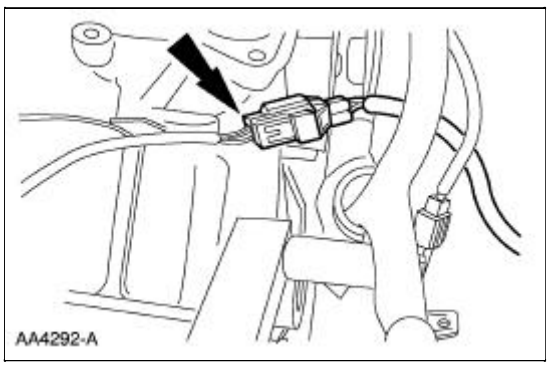
55. Install the four bolts.



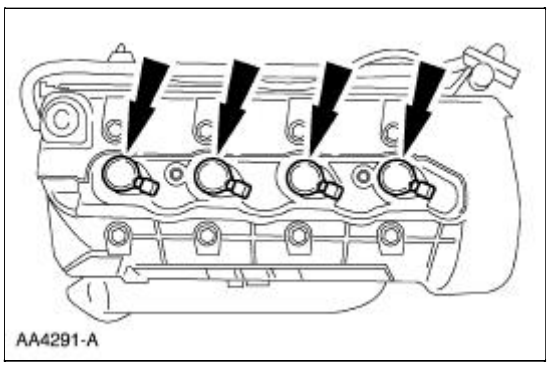
56. Install the water pump pulley and the bolts.



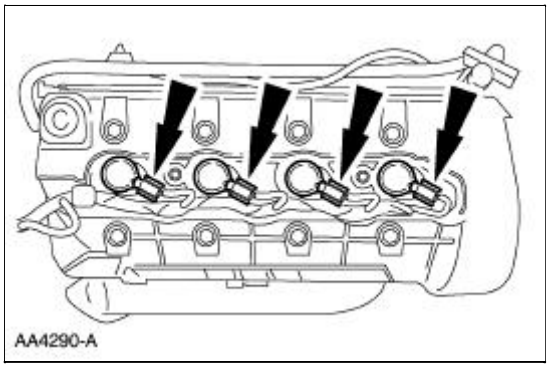
57. Install the heater return tube and the bolt.
    - Inspect and lube the O-ring seals.



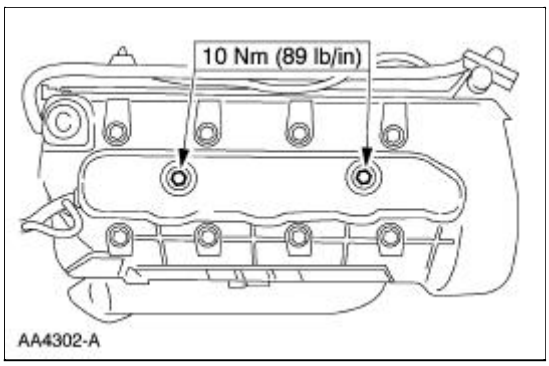
58. Install the knock sensor (KS).



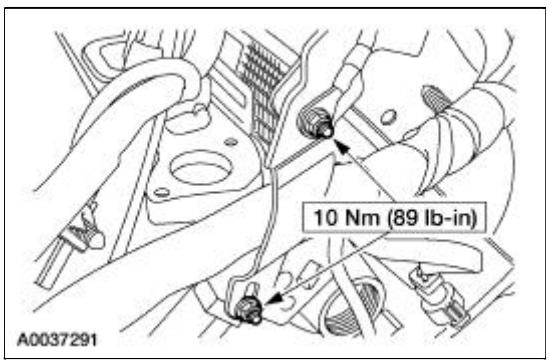
59. Install the wiring and connect to the engine at six locations.



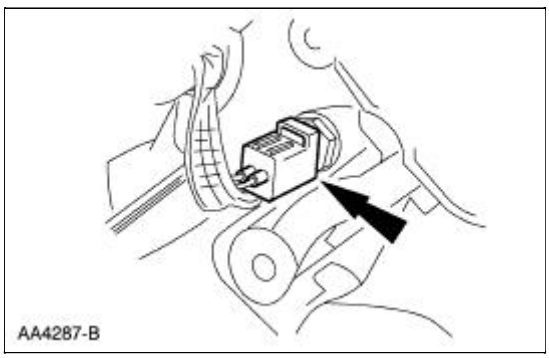
60. Connect the KS.



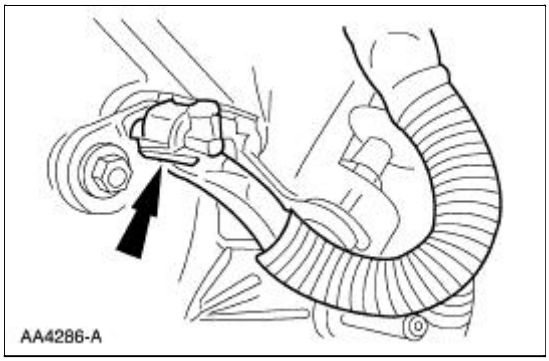
61. Install the RH ignition coils.



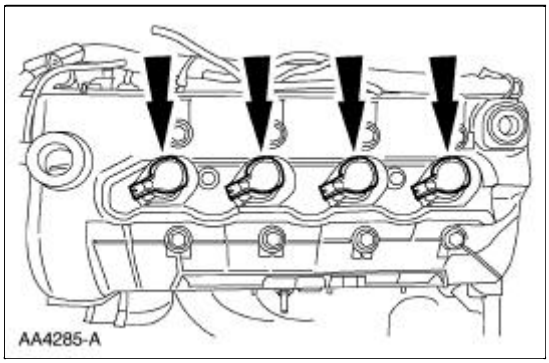
62. Connect the RH ignition coils.



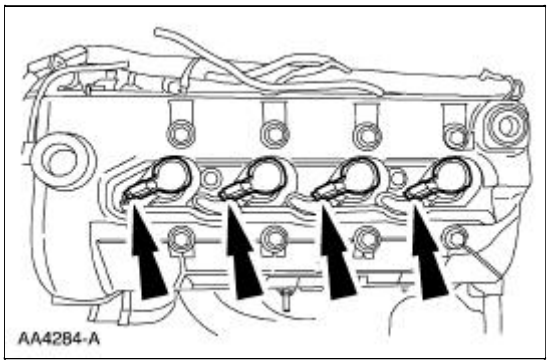
63. Install the RH ignition coil cover.



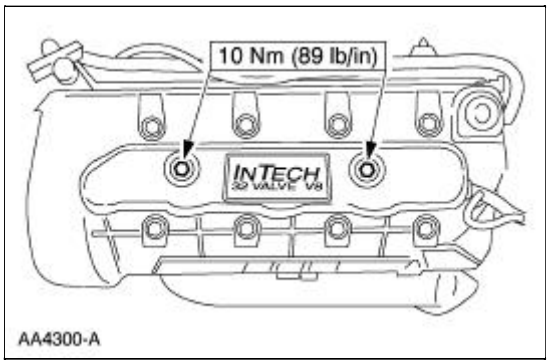
64. Position the bracket and the ground strap and install the nuts.



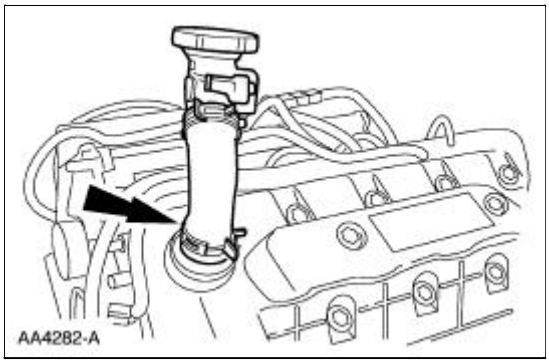
65. Connect the cylinder head temperature (CHT) sensor.



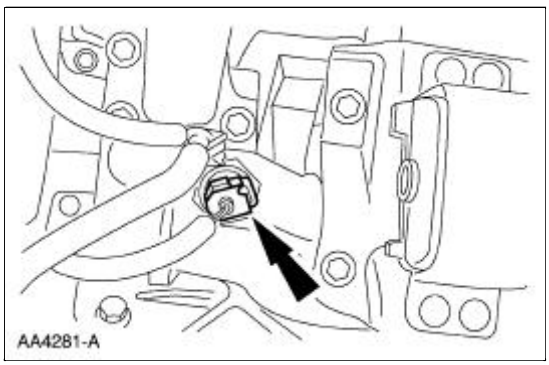
66. Connect the camshaft position (CMP) sensor.



67. Install the LH ignition coils.

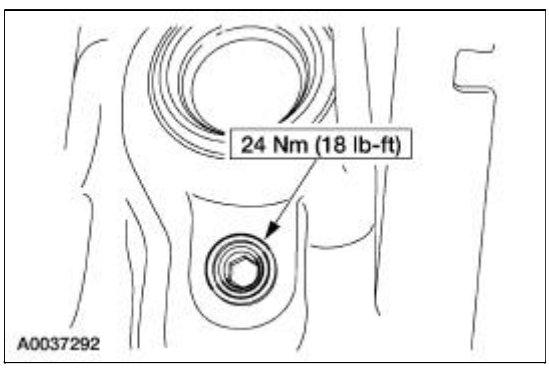


68. Connect the LH ignition coils.

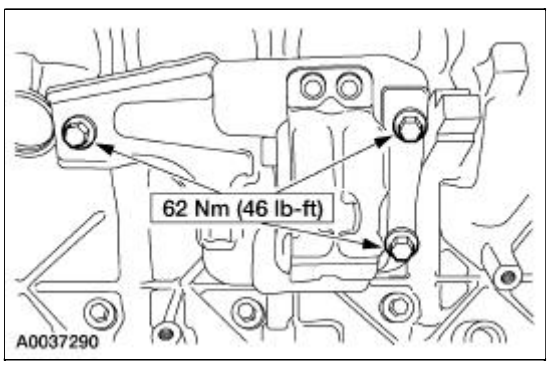


69. Install the bolts and the LH ignition coil cover.

70. Install the oil fill tube.

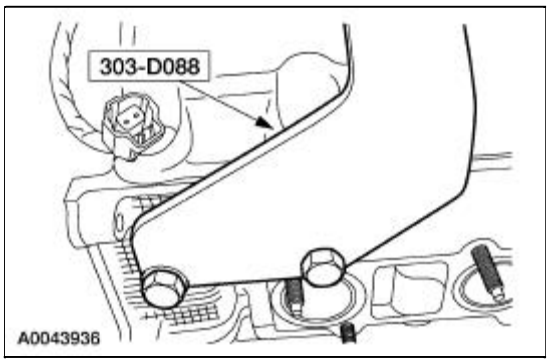


71. Connect the oil pressure sender.



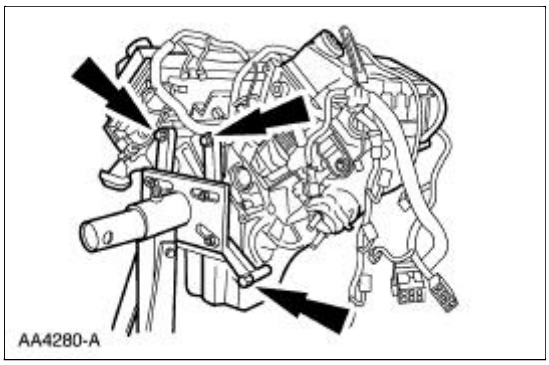
72. **NOTE:** LH shown, RH similar.

    Install the cylinder block drain plugs.



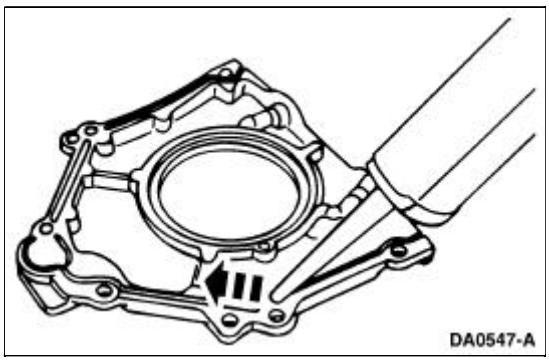
73. **NOTE:** RH shown, LH similar.

    Install the left and right engine mounts.

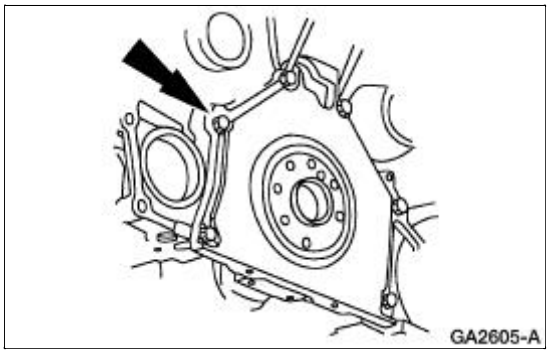


74. **NOTE:** LH shown, RH similar.

    Install the special tool.



75. Remove the engine from the work stand.

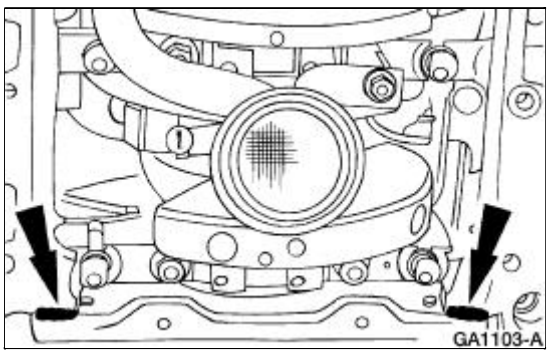


76. **NOTE:** If the rear crankshaft seal retaining plate is not secured within four minutes, the sealant must be removed and the sealing area cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or four minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

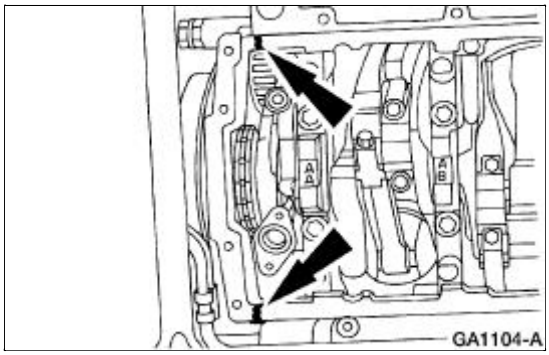
    NOTE: The silicone must be applied on the groove along the retainer plate.

    Apply a 4 mm (0.16 in) bead of silicone gasket and sealant around the rear oil seal retainer sealing surface.

77. Install the rear oil seal retainer and loosely install the six bolts.

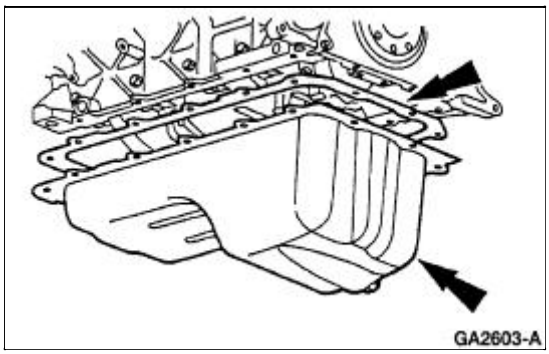


78. Tighten the bolts in the sequence shown.



79. **NOTE:** If the oil pan and the oil pan gasket are not secured within four minutes, the sealant must be removed and the sealing area cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or four minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

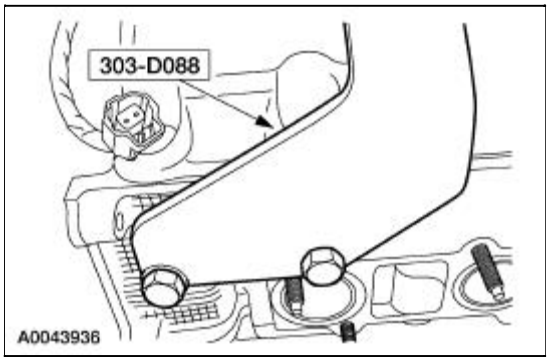
    Apply silicone gasket and sealant at the engine front cover-to-cylinder block sealing surface.



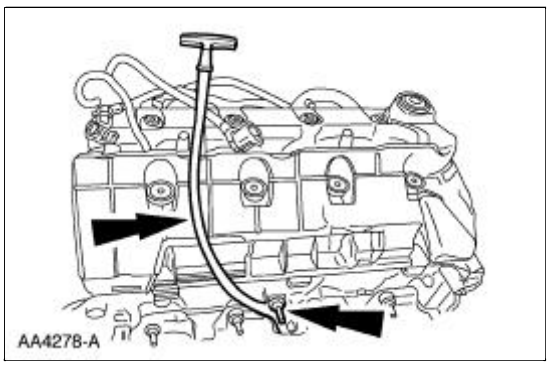
80. **NOTE:** If the oil pan and the oil pan gasket are not secured within four minutes, the sealant must be removed and the sealing area cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or four minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant at the engine front cover-to-cylinder block sealing surface.

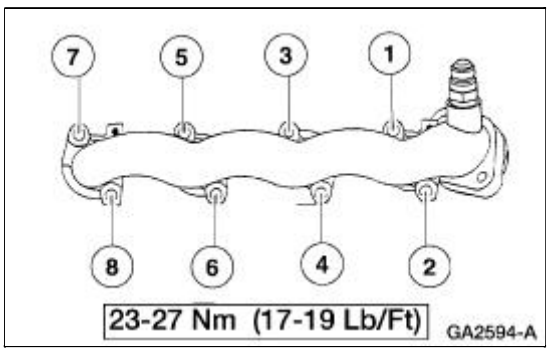
81. Install the oil pan gasket and the oil pan and loosely install the 16 bolts.



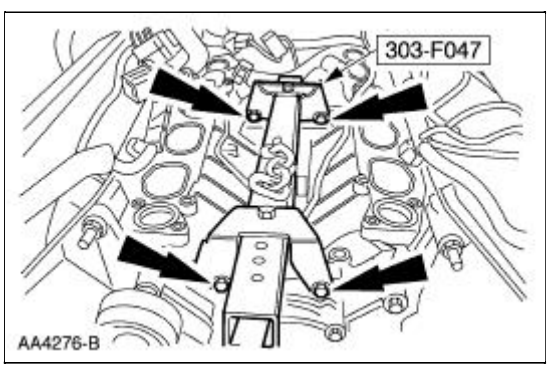
82. Tighten the bolts in three stages, in the sequence shown.
    - Stage 1: Tighten to 2 Nm (18 lb-in).
    - Stage 2: Tighten to 20 Nm (15 lb-ft).
    - Stage 3: Tighten an additional 60 degrees.



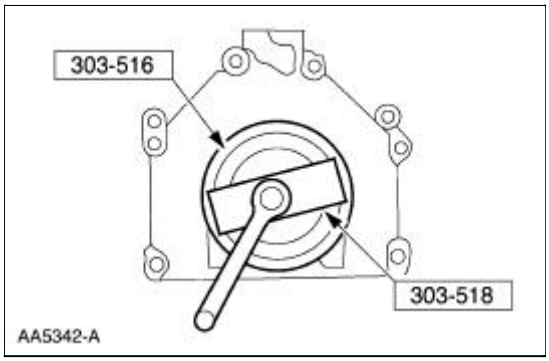
83. Lower the engine onto wooden blocks.



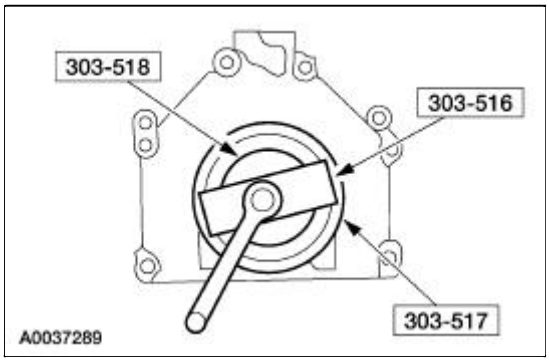
84. Remove the special tool.



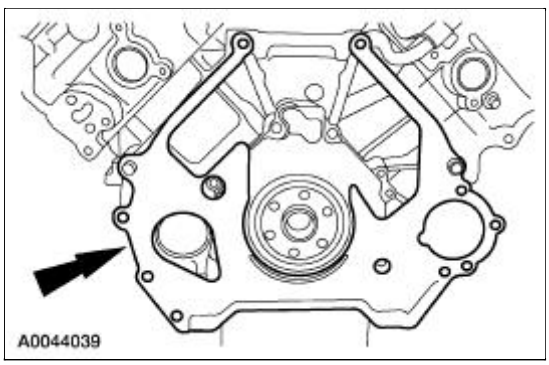
85. Install the oil level indicator and tube, and the stud.



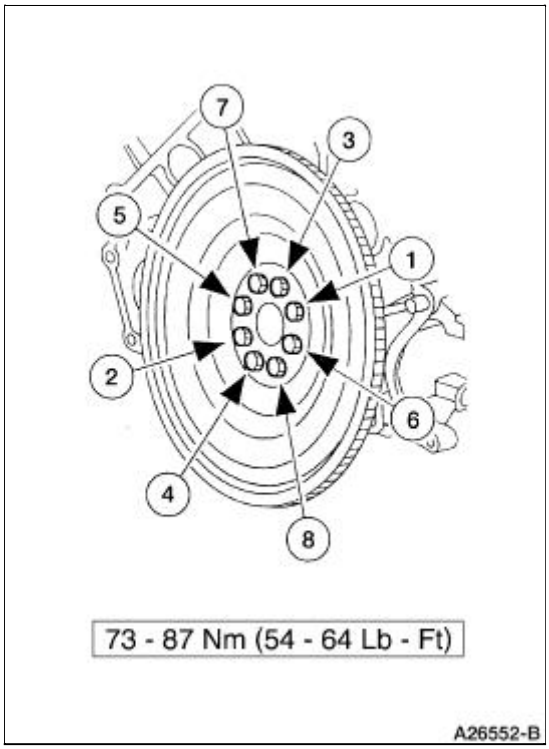
86. Install the LH exhaust manifold and gaskets.
    - Tighten the nuts in the sequence shown.



87. Install the special tool and raise the engine.

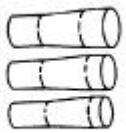


88. Using the special tool, install the crankshaft rear oil seal.



89. Using the special tool, install the crankshaft oil slinger.

90. Install the spacer plate.



91. Install the bolts and the flywheel.

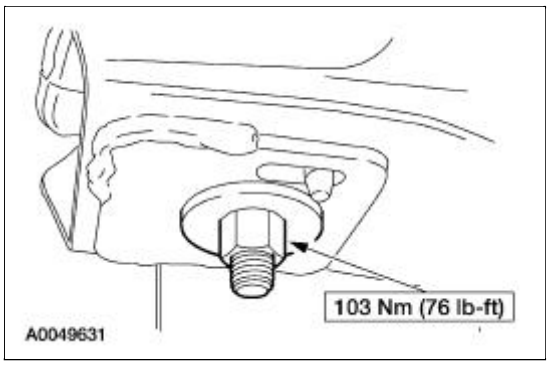
Engine

Special Tool(s)

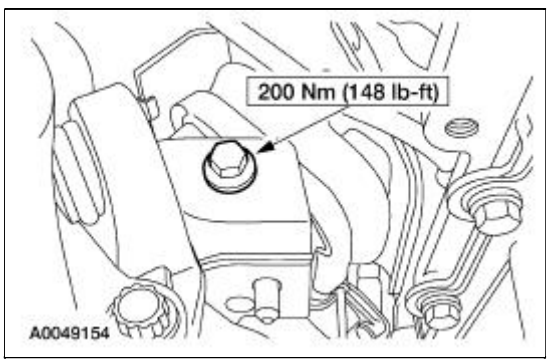
 ST1377-A	Modular Engine Lift Bracket 303-F047 (014-00073) or equivalent
 ST1586-A	Installer, Power Steering Pump Pulley 211-185 (T91P-3A733-A)
 ST1444-A	Installer Set, Teflon Seal 211-D027 (D90P-3517-A) or equivalent

Material

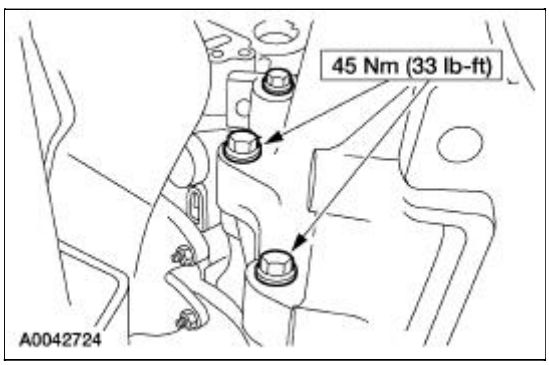


Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H
Motorcraft Premium Engine Coolant VC-4-A (in Oregon VC-5, in Canada CXC-10) or equivalent	ESE-M97B44-A
Motorcraft Premium Gold Engine Coolant VC-7-A or equivalent	WSS-M97B51-A1

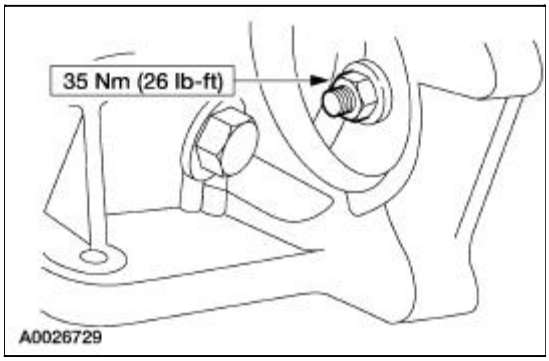
Installation



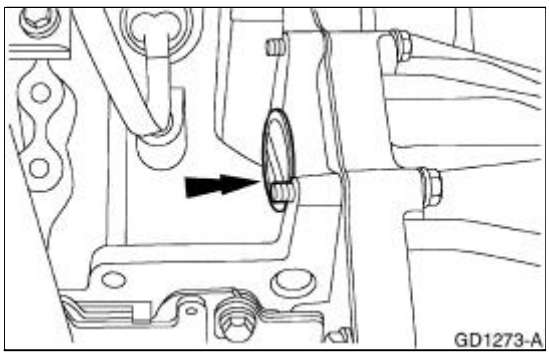
1. Using a floor crane, install the engine in the vehicle.
   - Make sure the marks on the flexplate and the torque converter stud made during removal are lined up.
2. Remove the special tool.



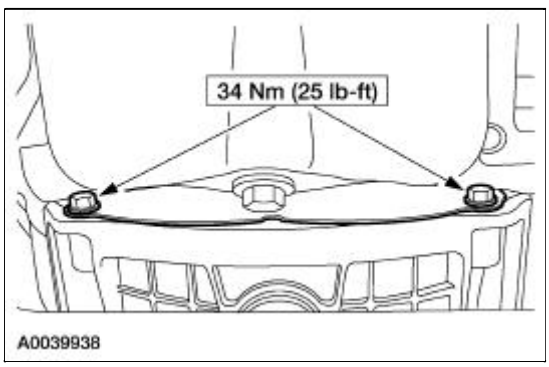
3. Remove the floor jack and wood block supporting the transmission.
4. Raise the vehicle. For additional information, refer to Section 100-02 .
5. Install the RH motor mount nut.



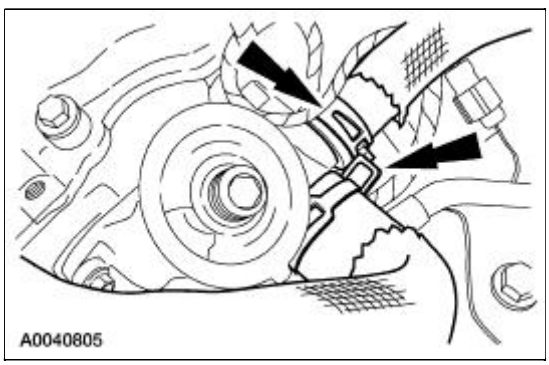
6. Install the LH motor mount bolt.



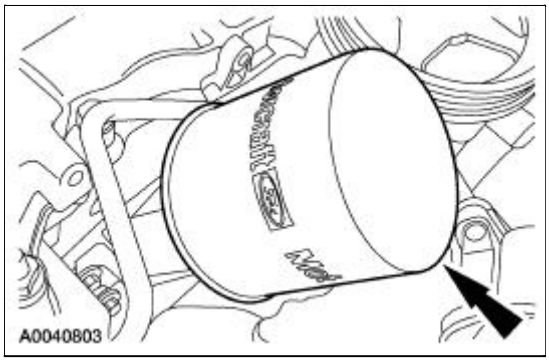
7. Align the transmission to the engine and install the six lower transmission-to-engine bolts.



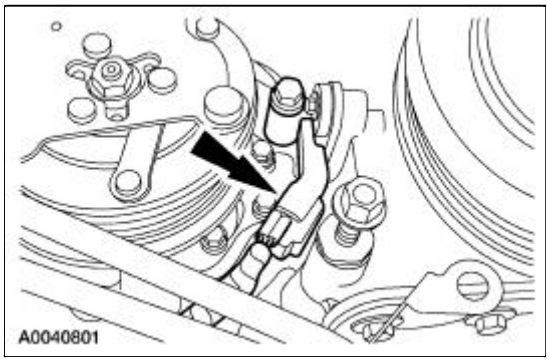
8. Install the four torque converter nuts.
    - Rotate the crankshaft, using the crankshaft pulley bolt.



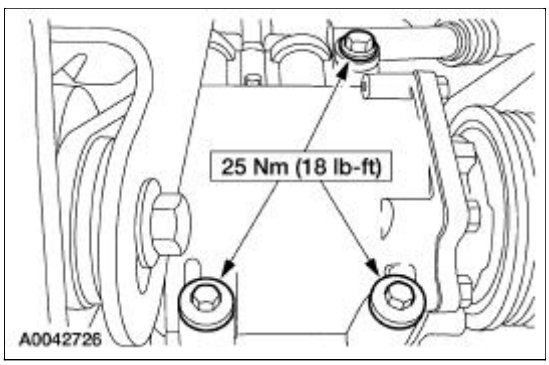
9. Install the flexplate-to-torque converter nut access plug.



10. Install the inspection plate.

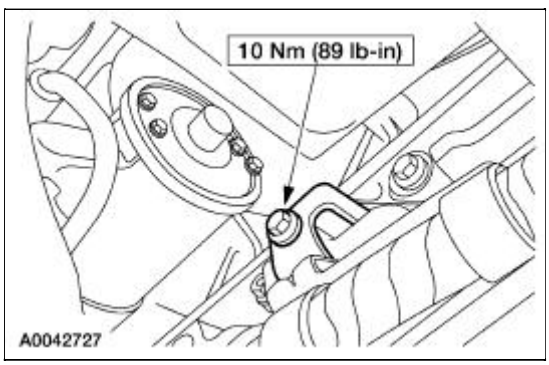


11. Position the hoses and install the clamps.

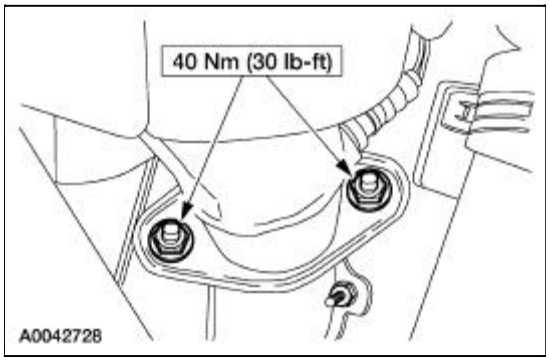


12. Install a new oil filter.

13. Connect the crankshaft position (CKP) sensor electrical connector.

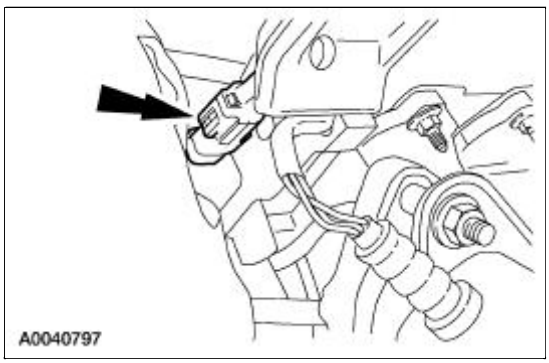


14. Position the A/C compressor and install the bolts.



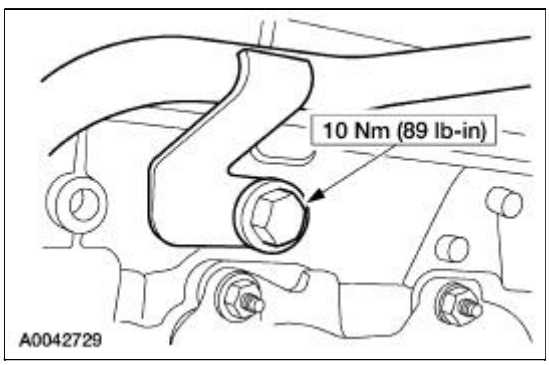
15. Connect the A/C clutch electrical connector.

16. Install the starter. For additional information, refer to Section 303-06 .



17. Position the wire harness bracket and install the nut.

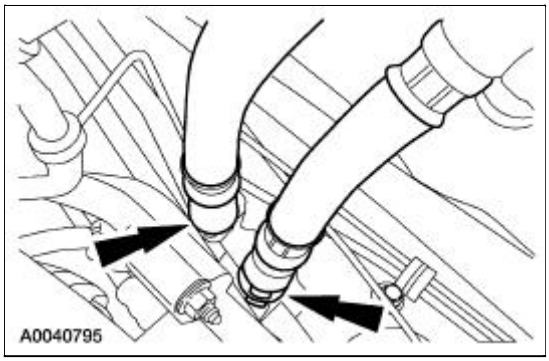
18. Position the dual converter Y-pipe and install the four nuts.



19. Connect the heated oxygen sensor (HO2S) electrical connectors.

20. **NOTE:** The bolt is accessed through the RH fender well.

    Position the transmission filler tube and install the bolt.

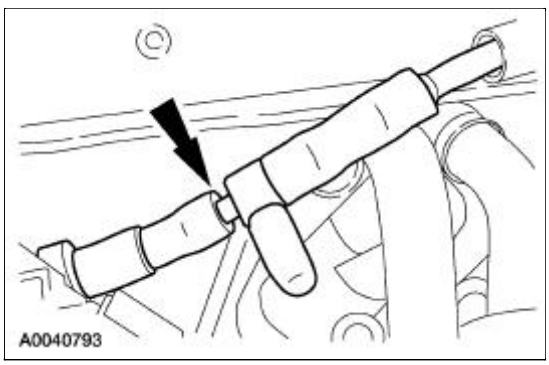


21. Install the skid plate and the bolts, if equipped.

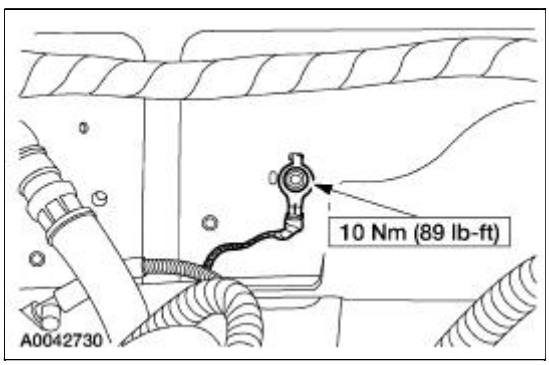
22. **NOTE:** On 4x4 vehicles, connect the transfer case vent hose to the bracket after installing the upper transmission-to-engine bolts.

    Install the two upper transmission-to-engine bolts.

23. Lower the vehicle.

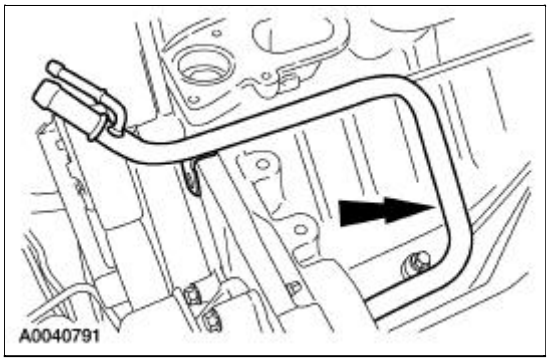


24. Connect the auxiliary heater hoses.

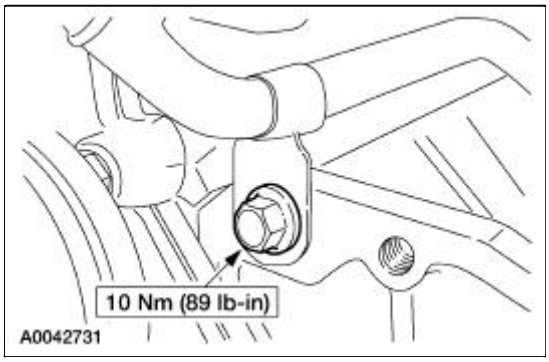


25. Connect the main engine harness electrical connector.

26. Position the vacuum harness and connect the hose.

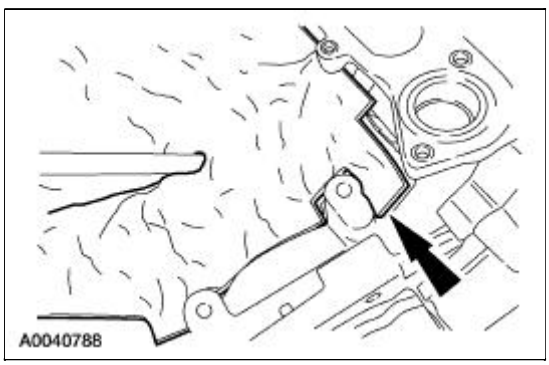


27. Position the ground cable and install the bolt.

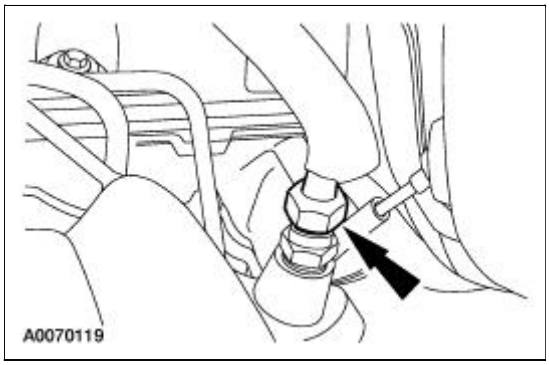


28. **NOTE:** Install a new O-ring. Lubricate the O-ring with clean engine coolant. Use the same coolant type that was drained from the engine.

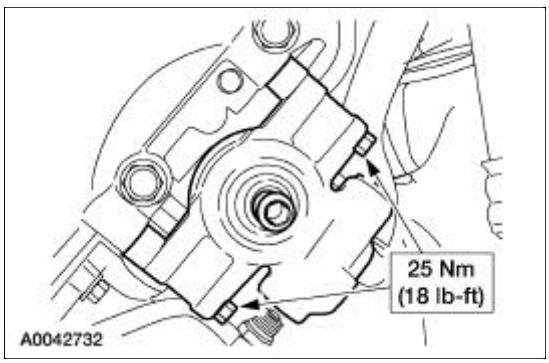
    Position the tube.



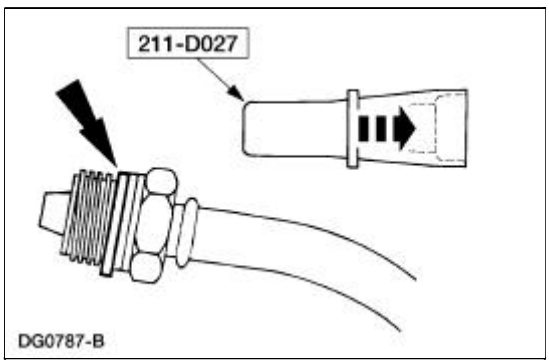
29. Install the bolt.



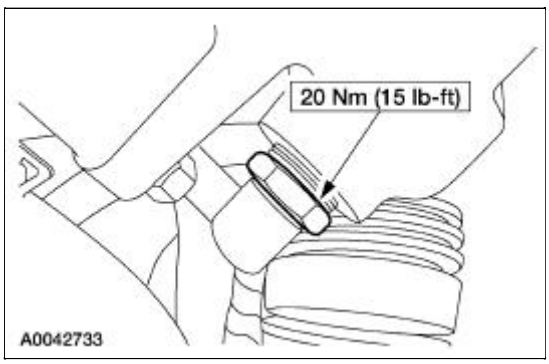
30. Position the hoses and install the clamps.



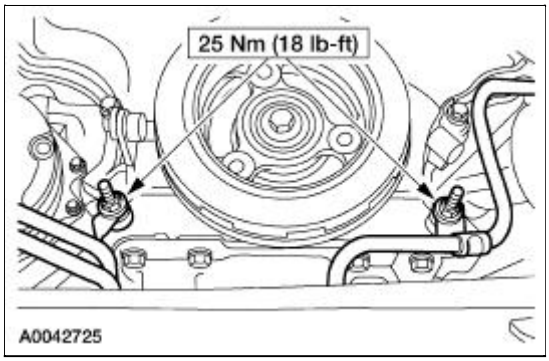
31. Install the engine noise shield.



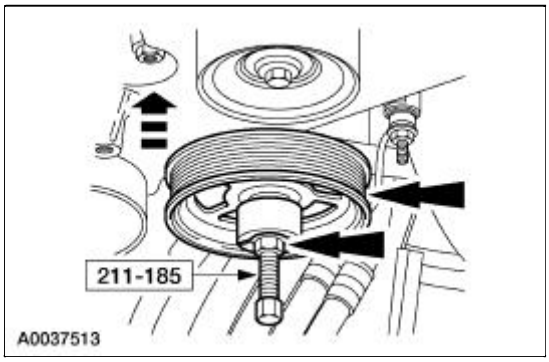
32. Connect the exhaust gas recirculation (EGR) valve tube nut to the LH exhaust manifold and hand-tighten.



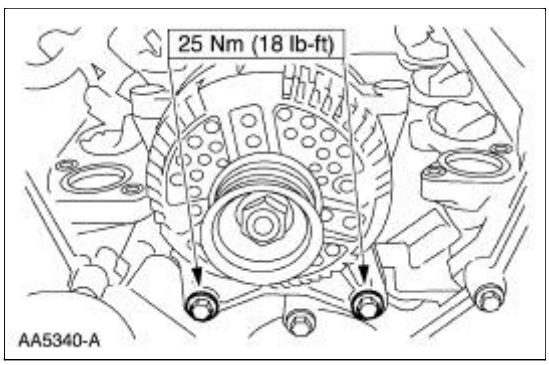
33. Position the power steering pump and install the three bolts.



34. Using the special tool, install a new O-ring seal on the power steering pressure hose fitting.

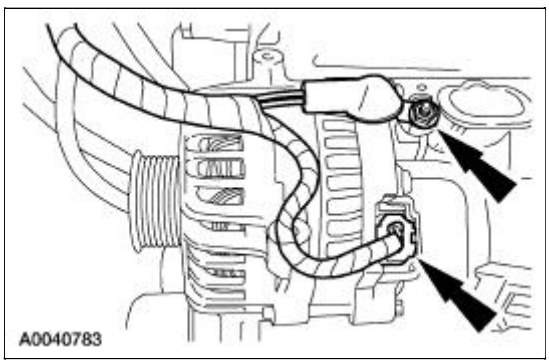


35. Connect the power steering pressure hose.

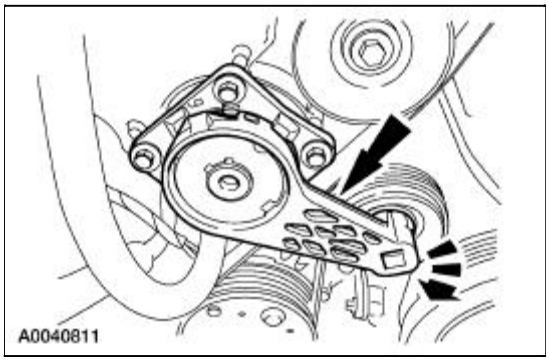


36. Position the transmission cooler tube and the power steering hose brackets and install the nuts.

37. Using the special tool, install the power steering pump pulley.

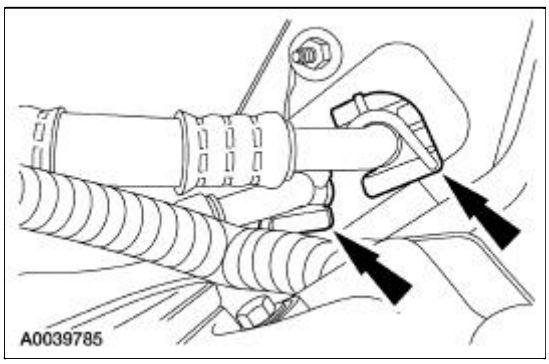


38. Position the generator and install the bolts.

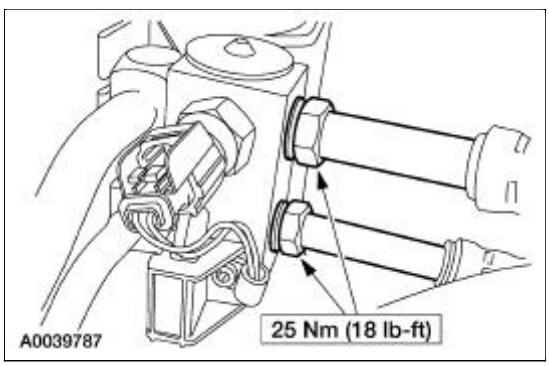


39. **NOTE:** Position the rubber boot on the B+ connector after tightening the nut.

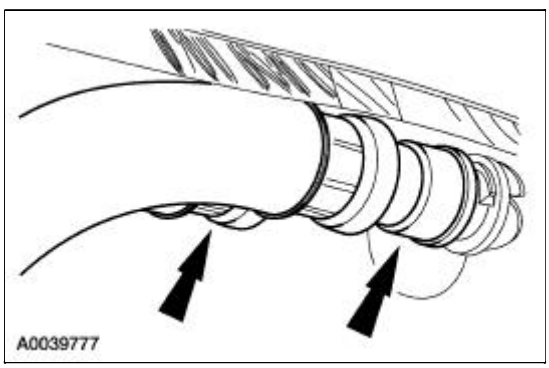
    Connect the generator electrical connectors.



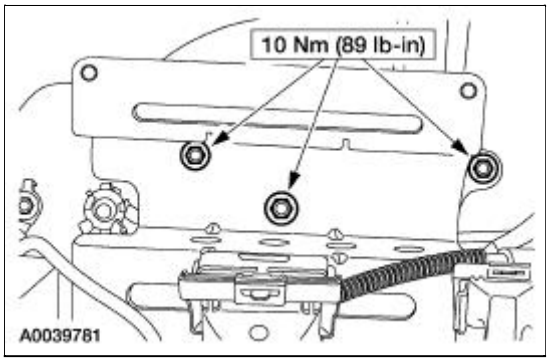
40. **NOTE:** For correct drive belt routing, refer to Section 303-05 .



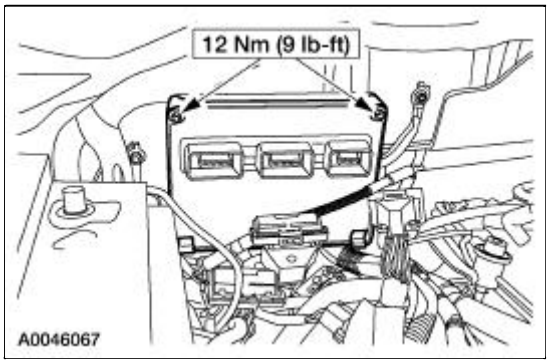
Rotate the belt tensioner counterclockwise and install the drive belt.



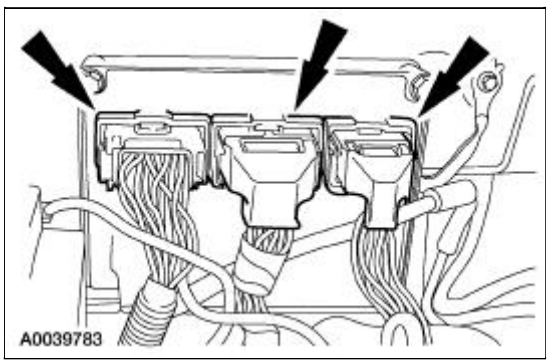
41. Connect the spring lock couplers and install the safety clips. For additional information, refer to Section 412-00 .



42. Connect the A/C hoses at the junction block.

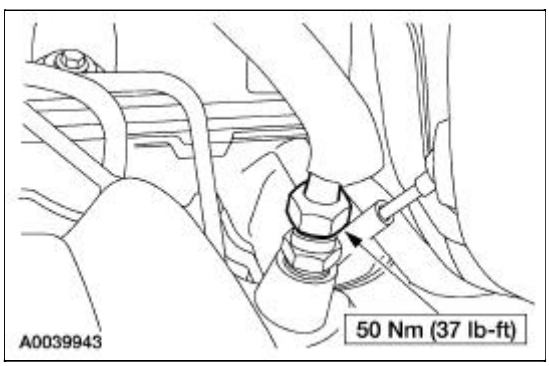


43. Connect the heater hoses to the heater core.



44. Install the power train control module (PCM) mounting bracket.

45. Install the PCM and the bolts.



46. Connect the PCM electrical connectors.

47. Install the lower intake manifold. For additional information, refer to Lower Intake Manifold .

48. Tighten the EGR valve tube nut.

49. Fill the engine with clean engine oil.

50. Connect the battery ground cable. For additional information, refer to Section 414-01 .
51. Install the radiator. For additional information, refer to Section 303-03 .
52. Recharge the A/C system. For additional information, refer to Section 412-00 .
53. Fill and bleed the power steering system. For additional information, refer to Section 211-02 .
54. Install the hood.

General Specifications

Item	Specification
Cooling System Capacity	
4.6L	19.0 L (20.1 quarts)
4.6L — with aux. rear heat	21.0 L (22.2 quarts)
5.4L	21.0 L (22.2 quarts)
5.4L — with aux. rear heat	23.0 L (24.3 quarts)
Coolant Type	
Motorcraft Premium Engine Coolant VC-4-A (in Oregon VC-5, in Canada CXC-10 or equivalent [a]	ESE-M97B44-A (Green color)
Motorcraft Premium Gold Engine Coolant VC-7-A (in Oregon VC-7-B) or equivalent [a b]	WSS-M97B51-A1 (Yellow color)
Other Chemicals	
Motorcraft Cooling System Flush VC-1	ESR-M14P7-A
Premium Long Life Grease XG-1-C	ESA-M1C75-B
Cooling System Stop Leak Pellets VC-6	ESE-M99B37-B5 except as noted in ES-F6SE-19A511-AA
Cooling System Pressure Test Specifications	
Radiator test pressure	152 kPa (22 psi)
Radiator Cap Pressure Test Specifications	
Pressure relief opening pressure	110 kPa (16 psi)
Thermostat Opening Temperatures	
Starts to open °C (°F)	87-91 (188-195)
Fully open °C (°F)	100 (212)

[a] Use the same type coolant that was drained from the cooling system. Do not mix coolant types.
[b] The addition of Motorcraft Cooling System Stop Leak Pellets, VC-6, darkens Motorcraft Premium Gold Engine Coolant from yellow to golden tan.

Torque Specifications

Description	Nm	lb-ft	lb-in
Cylinder block drain plug	20	15	—
Fan blade to fan clutch bolts	17	13	—
Fan blade and fan clutch to water pump pulley	55	41	—
Fan shroud screws	9	—	80
Degas bottle bolts	9	—	80
Radiator support bracket bolts	30	22	—
Water outlet connection bolts	25	18	—
Water temperature indicator sender unit	20	15	—
Water pump bolts	25	18	—

Water pump pulley bolts	25	18	—

Engine Cooling

CAUTION: Some vehicle cooling systems are filled with Motorcraft Premium Engine Coolant VC-4-A (in Oregon VC-5, in Canada CXC-10) or equivalent meeting Ford specification ESE-M97B44-A (green color). Others are filled with Motorcraft Premium Gold Engine Coolant VC-7-A (in Oregon VC-7-B) or equivalent meeting Ford specification WSS-M97B51-A1 (yellow color). Always fill the cooling system with the same coolant that is present in the system. Do not mix coolant types.

NOTE: The addition of Motorcraft Cooling System Stop Leak Pellets, VC-6, darkens Motorcraft Premium Gold Engine Coolant from yellow to golden tan.

The cooling system components are:

- block heater
- engine coolant temperature ECT sensor (5.4L [4V] only).
- fan blade
- fan clutch
- fan shroud
- radiator
- radiator cap
- degas bottle
- radiator draincock
- water temperature indicator sender unit
- water thermostat
- upper radiator hose
- lower radiator hose

The water pump circulates the coolant.

The water thermostat:

- controls coolant temperature.
- allows quicker engine warm-up.

The degas bottle:

- holds surplus coolant when hot.
- deaerates the system reducing engine hot spots.
- is the location for service fill.
- allows coolant expansion and system pressurization.
- provides a location for air separation during operation.
- replenishes coolant to the system.

The fan blade draws air through the radiator to help cool the system coolant.

The fan clutch is either a thermostatically-controlled or a electronically-controlled clutch that controls the fan drive.

The radiator allows excess heat to be transferred to the air.

- The radiator cannot be serviced. Install a new radiator.

The engine coolant flows:

- from the lower radiator hose to the water pump.
- from the water pump to the engine block and the cylinder heads.
    - Thermostat closed, the coolant returns to the water pump.
    - Thermostat open, the coolant flows back to the radiator.
- to the radiator for heat rejection then back to the lower radiator hose.

Engine coolant provides freeze protection, boil protection, cooling efficiency, and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the degas bottle.

When adding engine coolant, use a 50/50 mixture of engine coolant and clean, drinkable water.

To maintain the integrity of the coolant and the cooling system:

- Add Motorcraft Premium Engine Coolant VC-4-A (in Oregon VC-5, in Canada CXC-10) or equivalent meeting Ford specification ESE-M97B44-A (green color) or Motorcraft Premium Gold Engine Coolant VC-7-A (in Oregon VC-7-B) or equivalent meeting Ford specification WSS-M97B51-A1 (yellow color). Always fill the cooling system with the same coolant that is present in the system. Do not mix coolant types.
    - The addition of Motorcraft Cooling System Stop Leak Pellets, VC-6, darkens Motorcraft Premium Gold Engine Coolant from yellow to golden tan.
- Do not add/mix orange colored Motorcraft Specialty Orange Engine Coolant VC-2 or equivalent meeting Ford specification WSS-M97B44-D. Mixing coolants can degrade the coolants corrosion protection.
- Do not add alcohol, methanol, or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Do not mix with recycled coolant unless it meets the requirements of Ford specification ESE-M97B44-A or WSS- M97B51-A1. Not all coolant recycling processes meet these Ford specifications. Use of such coolants can harm the engine and cooling system components.

The block heater:

- is an optional electrical heating element installed in core plug opening.
- uses a standard 110 V electrical supply.
- keeps the engine coolant warm during cold weather.

Engine Cooling

Special Tool(s)

 ST1474-A	Radiator Pressure Tester 014-R1072 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool
 ST1720-A	Battery/Antifreeze Tester 014-R1060 or equivalent

Inspection and Verification

WARNING: To avoid personal injury, do not unscrew the coolant pressure relief cap while the engine is operating or hot. The coolant system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly.

CAUTION: Check the coolant level, engine oil and transmission fluid, top off the coolant if needed. If there is engine coolant in the engine oil or transmission fluid, the cause must be corrected and oil/fluid changed or major component damage can occur.

CAUTION: Some vehicle cooling systems are filled with Motorcraft Premium Engine Coolant VC-4-A (in Oregon VC-5, in Canada CXC-10) or equivalent meeting Ford specification ESE-M97B44-A (green color). Others are filled with Motorcraft Premium Gold Coolant VC-7-A (in Oregon VC-7-B) or equivalent meeting Ford specification WSS-M97B51-A1 (yellow color). Always fill the cooling system with the same coolant that is present in the system. Do not mix coolant types.

1. Verify the customer concern by operating the engine to duplicate the condition.

2. Inspect to determine if any of the following mechanical or electrical concerns apply.

Visual Inspection Chart

Mechanical	Electrical
● Leaks ● Damaged hoses ● Loose/damaged hose clamps ● Damaged water thermostat gasket ● Damaged head gaskets ● Damaged intake manifold gasket ● Damaged water pump ● Damaged radiator ● Damaged degas bottle ● Damaged heater core ● Damaged fan/fan clutch	● Damaged engine coolant temperature sensor ● Damaged wiring

3. If the inspection reveals an obvious concern that can be readily identified, repair as necessary.

4. Inspect the coolant condition.
    1. Inspect the coolant color.
        - If Motorcraft Premium Engine Coolant VC-4-A (in Oregon VC-5, in Canada CXC-10) or equivalent meeting Ford specification ESE-M97B44-A (green color) has a clear, light green or blue color, this indicates higher water content than required.
        - If Motorcraft Premium Gold Engine Coolant VC-7-A (in Oregon VC-7-B) or equivalent meeting Ford specification WSS-M97B51-A1 (yellow color) has a clear or pale yellow color, this indicates higher water content than required.
        - Dark brown could indicate unauthorized stop leak may have been used. Use Motorcraft Cooling System Stop Leak Pellets VC-6 or equivalent meeting Ford specification ESE-M99B37-B5 except as noted in ES-F6SE-19A511-AA only.
            - The addition of Motorcraft Cooling System Stop Leak Pellets, VC-6, darkens Motorcraft Premium Gold Engine Coolant from yellow to golden brown.
        - A light or reddish brown color indicates that rust may be present in the cooling system. Flush the system and refill with the correct mixture of water and Premium Engine Coolant or Premium Gold Engine Coolant. For additional information, refer to Engine and Radiator Flushing in this section.
        - An iridescent sheen on top of the coolant could indicate a trace of oil is entering the system. For additional information on engine diagnosis, refer to Section 303-00 .
        - A milky brown color may indicate that either engine oil or transmission fluid is entering the cooling system. If transmission fluid is suspected, the cause may be a leaky radiator. Pressure test the cooling system. For additional information, refer to component tests in this section. If engine oil is suspected, the cause of the leak may be internal to the engine. For additional information, refer to Section 303-00 .
        - If transmission fluid is contaminated with engine coolant, the cause may be a leaky radiator. Pressure test the system. For additional information, refer to the component tests in this section.
    2. If the engine coolant appearance is acceptable, test the engine coolant freezing point range with the Battery/Anti-Freeze Tester. The freezing point should be in the range -23° C to -46°C (-10°F to -50°F). If the vehicle is driven in cold climates less than -37°C (-34° F), it may be necessary to increase the coolant concentration to get adequate freeze protection.
        - Maximum coolant concentration is 60/40.
        - Minimum coolant concentration is 40/60.
    3. Adjust coolant range and level if necessary:
        - If the coolant is low, add specified coolant mixture only.

- If the engine coolant tests weak, add straight engine coolant until the readings are within acceptable levels.
- If the engine coolant tests strong, remove some of the engine coolant and add water until the readings are within acceptable levels.

5. If the concern remains after the inspection, determine the symptom(s) and go to the Symptom Chart.

Symptom Chart

SYMPTOM CHART

Condition	Possible Sources	Action
• Loss of coolant	• Radiator. • Water pump seal. • Radiator hoses. • Heater hoses/tubes. • Heater core. • Engine gaskets. • Degas bottle.	• Go To Pinpoint Test A .
• The engine overheats	• Water thermostat. • Water pump. • Internal engine coolant leak. • Radiator. • Heater core. • Cooling fan or visctronic fan clutch. • Pressure relief cap.	• Go To Pinpoint Test B .
• The engine does not reach normal operating temperature	• Water thermostat.	• Go To Pinpoint Test C .
• The block heater does not operate correctly	• Block heater power cable. • Block heater.	• CHECK for continuity in all three power cord circuits. INSTALL a new power cord, if necessary. • INSTALL a new block heater.

Pinpoint Tests

PINPOINT TEST A: LOSS OF COOLANT

Test Step	Result / Action to Take
A1 CHECK THE ENGINE COOLANT LEVEL	

WARNING: To avoid personal injury, do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. NOTE: Allow the engine to cool before checking the engine coolant level. • Key in OFF position. • Visually check the engine coolant level at the degas bottle. • **Is the engine coolant level within specification?**	**Yes** GO to A2 . **No** REFILL the engine coolant as necessary. GO to A6 .
A2 CHECK THE PRESSURE RELIEF CAP	
WARNING: To avoid personal injury, do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. • Carry out the pressure relief cap test. Refer to Component Tests, Cap—Pressure Relief in this section. • **Is pressure relief cap OK?**	**Yes** GO to A3 . **No** INSTALL a new pressure relief cap. TEST the system for normal operation.
A3 CHECK THE ENGINE COOLANT FOR INTERNAL LEAK	
WARNING: To avoid personal injury, do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. • Key in OFF position. • Inspect the engine coolant in the degas bottle for signs of transmission fluid or engine oil. • **Is oil or transmission fluid evident in coolant?**	**Yes** If engine oil is evident, GO to Section 303-00 . If transmission fluid is evident, REPAIR or INSTALL a new radiator as necessary. **No** GO to A4 .
A4 CHECK THE ENGINE AND THE TRANSMISSION FOR COOLANT	
• Remove the oil level dipsticks from the engine and the transmission. • **Is coolant evident in oil or transmission fluid?**	**Yes** If coolant is in engine, GO to Section 303-00 . If coolant is in transmission, INSTALL a new radiator as necessary. GO to Section 307-01A (4R100) or Section 307-01B (4R70W) to repair the automatic transmission. **No** GO to A5 .
A5 PRESSURE TEST THE ENGINE COOLING SYSTEM	
• Pressure test the engine cooling system. Refer to Component Tests, Pressure Test in this section. • **Does the engine cooling system leak?**	**Yes** REPAIR or INSTALL new components as necessary. TEST the system for normal operation. **No** The cooling system is operational. RETURN to the Symptom Chart.
A6 CHECK THE COOLANT RECOVERY SYSTEM	

WARNING: Never remove the pressure relief cap while the engine is operating or when the cooling system is hot. Failure to follow these instructions can result in damage to the cooling system or engine or personal injury. To avoid having scalding hot coolant or steam blow out of the degas bottle when removing the pressure relief cap, wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly. Step back while the pressure is released from the cooling system. When certain all pressure has been released, (still with a cloth) turn and remove the pressure relief cap. ● Remove the pressure relief cap. ● Inspect the pressure relief cap for foreign material between the sealing gasket and the diaphragm. ● **Is the pressure relief cap OK?**	**Yes** GO to A7 . **No** CLEAN or INSTALL a new pressure relief cap. TEST the system for normal operation. GO to A1 .
A7 CHECK THE DEGAS BOTTLE	
WARNING: To avoid personal injury, do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. ● **NOTE:** The engine must be cool when coolant is added to the degas bottle. ● Add coolant to the degas bottle until fluid is between the coolant fill level marks. ● **Does the degas bottle leak?**	**Yes** INSTALL a new degas bottle. TEST the system for normal operation. **No** CARRY OUT the cooling system pressure test. REFER to Component Tests, Pressure Test in this section. REPAIR as necessary. TEST the system for normal operation.

PINPOINT TEST B: THE ENGINE OVERHEATS

Test Step	Result / Action to Take
B1 CHECK THE ENGINE COOLANT LEVEL	
WARNING: Never remove the pressure relief cap under any conditions while the engine is operating. Failure to follow these instructions could result in damage to the cooling system or engine, or result in personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap from a hot degas bottle. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly one turn (counterclockwise). Step back while the pressure is released from the cooling system. When certain all the pressure has been released, remove the pressure relief cap (still with a cloth). **NOTE:** If the engine is hot, allow the engine to cool before proceeding. ● Key in OFF position. ● Check the engine coolant level at the degas bottle. ● **Is the engine coolant OK?**	**Yes** GO to B2 . **No** REFILL the engine coolant at the degas bottle. GO to Pinpoint Test A .
B2 CHECK THE COOLANT CONDITION	
● Check the coolant for dirt, rust or contamination. ● **Is the coolant condition OK?**	**Yes** GO to B3 .

	No FLUSH the engine cooling system. REFER to Engine and Radiator Flushing in this section. TEST the system for normal operation.
B3 CHECK FOR AN AIRFLOW OBSTRUCTION ● Inspect the A/C condenser core and radiator for obstructions such as leaves or dirt. ● **Is there an obstruction?**	**Yes** REMOVE the obstruction. CLEAN the A/C condenser core and radiator. TEST the system for normal operation. **No** GO to B4.
B4 CHECK THE HEATER CORE OPERATION ● Install the pressure relief cap. ● Key in START position. ● As the engine starts to heat up, feel the inlet and outlet heater water hoses. They should feel approximately the same after three or four minutes. ● **Is the outlet heater water hose approximately the same temperature as the inlet heater water hose?**	**Yes** GO to B5. **No** TURN the engine off. REPAIR or INSTALL a new heater core. REFER to Section 412-02. TEST the system for normal operation.
B5 CHECK THE WATER THERMOSTAT OPERATION ● Key in START position. ● Start the engine and allow the engine to run for 10 minutes. ● Feel the inlet and outlet heater water hoses and the underside of the upper radiator hose. ● **Are the upper radiator hose and the heater water hoses cold?**	**Yes** INSTALL a new water thermostat. TEST the system for normal operation. **No** GO to B6.
B6 CHECK THE COOLING FAN OPERATION ● Key in OFF position. ● Carry out the cooling fan clutch or visctronic fan clutch component tests. Refer to the Component Tests in this section. ● **Is the cooling operation OK?**	**Yes** GO to Section 303-00 for diagnosis and testing of the engine. **No** INSTALL a new cooling fan clutch. REFER to Cooling Fan in this section.

	TEST the system for normal operation.

PINPOINT TEST C: THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE

Test Step	Result / Action to Take
C1 CHECK THE ENGINE TEMPERATURE • Key in START position. • Start the engine and allow the engine to idle for 10 minutes. • Key in OFF position. • Feel the inlet and heater water hoses and the underside of the upper radiator hose. • **Are the upper radiator hose and the heater water hoses cold?**	**Yes** INSTALL a new water thermostat. REFER to Thermostat—4.6L and 5.4L (2V) and Thermostat—5.4L (4V) in this section. TEST the system for normal operation. **No** GO to Section 413-01 for diagnosis and testing of the engine coolant temperature gauge.

Component Tests

Pressure Test

1. Turn the engine OFF.

2. **WARNING: Never remove the pressure relief cap under any conditions while the engine is operating. Failure to follow these instructions could result in damage to the cooling system or engine, or result in personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, never remove the pressure relief cap from a hot degas bottle. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly one turn (counterclockwise). Step back while the pressure is released from the cooling system. When certain all the pressure has been released, remove the pressure relief cap (still with a cloth).**

   Check the engine coolant level. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

3. Connect Radiator Heater Core Pressure Tester to the degas bottle nipple and overflow hose. Install a pressure test pump to the quick-connect fitting of the test adapter.

4. **NOTE:** If the plunger of the pump is depressed too fast, an erroneous pressure reading will result.

   Slowly depress the plunger of the pressure test pump until the pressure gauge reading stops increasing and note the highest pressure reading obtained.

5. If the pressure relief cap does not hold pressure, remove and wash the pressure relief cap in clean water to dislodge all foreign particles from the gaskets. Check the sealing surface in the filler neck.

6. If 89 kPa (13 psi) cannot be reached, install a new pressure relief cap. If more than 124 kPa (18 psi) shows on the gauge, install a new pressure relief cap.

7. **CAUTION: If the pressure drops, check for leaks at the engine to heater core hoses, engine-to-radiator hoses, water valve hose (if applicable), oil cooler return tube gasket, radiator and heater core or other system components and connections. Any leaks which are found must be corrected and the system rechecked.**

   Pressurize the engine cooling system as described in Step 4 (using a pressure relief cap that operates within the specified upper and lower pressure limits). Observe the gauge reading for approximately two minutes. For additional information, refer to Specifications in this section. Pressure should not drop during this time.

8. Release the system pressure by loosening the pressure relief cap. Check the engine coolant level and replenish, if necessary, with the correct engine coolant mixture. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Cap—Pressure Relief

1. **WARNING: Never remove the pressure relief cap under any conditions while the engine is operating. Failure to follow these instructions could result in damage to the cooling system or engine or personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, never remove the pressure relief cap from a hot degas bottle. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly one turn (counterclockwise). Step back while the pressure is released from the cooling system. When certain all the pressure has been released, remove the pressure relief cap (still with a cloth).**

   Inspect the pressure relief cap and seals for damage or deterioration. Install a new pressure relief cap if necessary.

2. Fit the pressure relief cap to Radiator/Heater Core Pressure Tester Kit using the aftermarket adapter.

3. **NOTE:** If the plunger of the pressure tester is depressed too fast, an incorrect pressure reading will result.

   Slowly pump the pressure tester until the pressure gauge stops increasing and note the highest pressure reading. Release pressure and repeat the test. Install a new pressure relief cap if the pressure is not 99.3-121.4 kPa (14.4-17.6 psi).

Thermostat

A new water thermostat should be installed only after the following electrical and mechanical tests have been carried out.

Thermostat—Electrical Test — 5.4L (4V) Only

CAUTION: Always vent the exhaust to the outside when carrying out this test.

NOTE: The electrical thermostat test is most accurate if carried out indoors at less than 37.8°C (100°F) ambient air. This test may be carried out with or without the hood open and with the engine warm or cold.

1. Check the engine coolant level. Fill as needed.

2. With the key OFF, remove the engine coolant temperature (ECT) sensor harness connector and attach ECT Sensor "T" Cable as a jumper between the powertrain control module (PCM) and the ECT Sensor. Attach 73 Digital Multimeter to the ECT Sensor "T" Cable. Voltage values (0 to 5 V) can now be monitored while the sensor retains its connection to the wiring harness.

Use a scan tool to monitor the ECT sensor voltage.

3. **NOTE:** Running this test with the vehicle in gear or with the A/C compressor clutch engaged (running) will cause incorrect diagnosis.

   Place transmission in PARK (P) or NEUTRAL (N).

4. Start the engine and allow to idle throughout this test. Allow the engine to run for two minutes, then record the ECT voltage. Record the ECT voltage every 60 seconds. When the ECT voltage trend changes direction or only changes slightly (0.03 volt or less) from the previous reading, record this as the thermostat opening voltage. Use the voltage and corresponding coolant temperature chart listed below.

Coolant Temperature °C (°F)	ECT (Volts)
22 (71)	3.00
43 (109)	2.01
71 (159)	1.01
82 (180)	0.75
91 (195)	0.059
97 (206)	0.050
105 (221)	0.040

5. If the thermostat opening voltage is greater than 0.75 volt and less than 82°C (180°F), install a new water thermostat.

6. If the thermostat opening voltage is less than 0.75 volt and greater than 82°C (180°F), the water thermostat is good and a new thermostat should not be installed. For additional information, refer to the Symptom Chart.

Thermostat— Mechanical Test

1. Remove the water thermostat.

2. Check the water thermostat for seating. Hold the water thermostat up to a lighted background. Leakage of light around the thermostat valve at room temperature indicates that a new water thermostat should be installed. Some water thermostats have a small leakage notch at one location on the perimeter of the thermostat valve, which is considered normal.

3. Immerse it in a boiling antifreeze and water mixture.

4. For additional information, refer to Specifications for water thermostat opening temperature.

Radiator Leak Test, Removed From Vehicle

CAUTION: Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners may be present in the cleaning tank and they will damage aluminum radiators.

NOTE: Always install plugs in the oil cooler fittings before leak-testing or cleaning any radiator.

NOTE: Clean the radiator before leak-testing to avoid contamination of the tank.

Leak-test the radiator in clean water with 138 kPa (20 psi) air pressure.

Mechanical Fan Clutch Test

Spin the fan blade by hand. A light resistance should be felt. If there is no resistance or very high resistance, the minimum and maximum fan speeds must be checked as follows:

Minimum Speed Fan Clutch Requirement Test

1. Use a suitable marker to mark the water pump pulley, one of the fan blade bolts, and the crankshaft pulley.

2. Connect a tachometer to the engine.

3. Install a throttle adjusting tool.

4. Connect a digital photoelectric tachometer.

5.  **WARNING: To avoid the possibility of personal injury or damage to the vehicle, do not operate the engine until the fan blade has been first examined for possible cracks and separation. Failure to follow these instructions can result in personal injury.**

   Start the engine and run it at approximately 1,500 rpm until the normal operating temperature has been achieved.

6. Adjust the engine speed to 2,300 rpm.

7. Adjust the strobe light to 3,000 rpm and aim it at the water pump pulley. Adjust the engine speed until the light flash and the water pump pulley mark are synchronized.

8. Aim the strobe light at the fan blade retaining bolts. Adjust the strobe light until the light flash is synchronized with the marked fan blade retaining bolt (fan blade appears to stand still).

9. The fan blade speed must not be greater than 1,500 rpm at 3,000 water pump rpm.

10. Turn the engine off.

11. If the fan blade speed was greater than 1,500 rpm, install a new fan clutch.

Maximum Speed Fan Clutch Requirement Test

1. Carry out Steps 1 through 5 of the Minimum Speed Fan Clutch Requirement Test.

2. **NOTE:** The engine temperature should be above 96°C (205°F) for maximum fan speed.

   Block off areas on each side of the radiator in the engine compartment and the front of the radiator grille. This will raise the temperature of the air striking the fan clutch and should cause the fan to operate at maximum speed.

3. Place the climate control function selector switch in the MAX A/C position and the blower motor switch in the HI position.

4. Adjust the strobe light to 3,000 rpm.

5.  **WARNING: To avoid the possibility of personal injury or damage to the vehicle, do not operate the engine until the fan blade has been first examined for possible cracks and separation. Failure to follow these instructions can result in personal injury.**

Start the engine and adjust the engine speed until the strobe light flash and the water pump pulley mark are synchronized.

6. Aim the strobe light at the fan blade retaining bolts. Adjust the strobe light until the light flash is synchronized with the marked fan blade retaining bolt (fan blade appears to stand still).

7. If the fan blade speed is less than 2,300 rpm, install a new fan clutch.

Visctronic Fan Clutch Test

1. **WARNING: To avoid the possibility of personal injury or damage to the vehicle, do not operate the engine until the fan blade has been first examined for possible cracks and separation. Failure to follow these instructions can result in personal injury.**

   Start the engine.

2. Using the diagnostic tool, set the visctronic drive fan duty cycle PID to 100 percent.

3. If after several minutes the fan speed increases, the minimum and maximum fan speeds must be checked. Refer to minimum and maximum speed visctronic drive fan clutch requirement tests.

4. If sent here from the Powertrain Control/Emissions Diagnosis (PC/ED) manual, install a new visctronic drive fan clutch.

5. If after several minutes the fan speed does not increase, refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual for further diagnosis.

Minimum Speed Visctronic Fan Clutch Requirement Test

1. **WARNING: To avoid the possibility of personal injury or damage to the vehicle, do not operate the engine until the fan blade has been first examined for possible cracks and separation. Failure to follow these instructions can result in personal injury.**

   Start the engine.

2. Using the diagnostic tool, set the visctronic drive fan duty cycle PID to 0 percent.

3. Adjust the engine speed to 1,500 rpm until normal operating temperature is reached.

4. Increase the engine speed to 3,000 rpm for two minutes while reading the fan speed PID on the diagnostic tool.

5. If the fan speed is above 1,500 rpm, install a new visctronic drive fan clutch.

Maximum Speed Visctronic Fan Clutch Requirement Test

1. **WARNING: To avoid the possibility of personal injury or damage to the vehicle, do not operate the engine until the fan blade has been first examined for possible cracks and separation. Failure to follow these instructions can result in personal injury.**

   Start the engine.

2. Using the diagnostic tool, set the visctronic drive fan duty cycle PID to 100 percent.

3. Adjust the engine speed to 1,500 rpm until normal operating temperature is reached.

4. Increase the engine speed to 3,000 rpm for two minutes while reading the fan speed PID on the diagnostic tool.

5. If the fan speed is less than 2,300 rpm, install a new visctronic fan clutch.

6. If DTC P0480 or DTC P0528 are present, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Cooling System Draining, Filling and Bleeding

Material

Item	Specification
Motorcraft Premium Engine Coolant VC-4-A (in Oregon VC-5, in Canada CXC-10) or equivalent (green color)	ESE-M97B44-A
Motorcraft Premium Gold Engine Coolant VC-7-A (in Oregon VC-7-B) or equivalent (yellow color)	WSS-M97B51-A1

Draining

WARNING: Never remove the pressure relief cap under any conditions while the engine is operating. Failure to follow these instructions can result in damage to the cooling system or engine, or result in personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, never remove the pressure relief valve from a hot degas bottle. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly one turn (counterclockwise). Step back while the pressure is released from the cooling system. When certain all the pressure has been released, remove the pressure relief cap (still with a cloth).

CAUTION: The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated, it must be recycled or disposed of correctly and replaced.

CAUTION: Some vehicle cooling system are filled with Motorcraft Premium Engine Coolant VC-4-A (in Oregon VC-5, in Canada CXC-10) or equivalent meeting Ford specification ESE-M97B44-A (green color). Others are filled with Motorcraft Premium Gold Coolant VC-7-A (in Oregon VC-7-B) or equivalent meeting Ford specification WSS-M97B51-A1 (yellow color). Always fill the cooling system with the same coolant that is present in the system. Do not mix coolant types.

NOTE: The addition of Motorcraft Cooling System Stop Leak Pellets, VC-6, darkens Motorcraft Premium Gold Engine Coolant from yellow to golden tan.

NOTE: Less than 80% of coolant capacity can be recovered with the engine in the vehicle. Dirty, rusty or contaminated coolant requires replacement.

1. Release the pressure in the cooling system by slowly turning the pressure relief cap one half turn counterclockwise. When the pressure is released, remove the pressure relief cap.
2. Place a suitable container below the radiator draincock (8115). If equipped, disconnect the coolant return hose at the oil cooler.
3. Open the radiator draincock.
4. Close the radiator draincock when finished.

Filling

CAUTION: Engine coolant provides freeze protection, boil protection, cooling efficiency, and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the degas bottle.

When adding engine coolant, use a 50/50 mixture of engine coolant and clean, drinkable water.

To maintain the integrity of the coolant and the cooling system:

- **Add Motorcraft Premium Engine Coolant VC-4-A (in Oregon VC-5, in Canada CXC-10) or equivalent meeting Ford specification ESE-M97B44-A (green color), or Motorcraft Premium Gold Engine Coolant VC-7-A (in Oregon VC-7-B) or equivalent meeting Ford specification WSS-M97B51-A1 (yellow color). Use the same coolant that was drained from the cooling system. Do not mix coolant types.**
  - **The addition of Motorcraft Cooling System Stop Leak Pellets, VC-6, darkens Motorcraft Premium Gold Engine Coolant from yellow to golden tan.**
- **Do not add orange colored Motorcraft Specialty Orange Engine Coolant VC-2 or equivalent meeting Ford specification WSS-M97B44-D. Mixing coolants can degrade the coolants corrosion protection.**
- **Do not add alcohol, methanol, or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.**
- **Do not mix with recycled coolant unless it meets the requirements of Ford specification ESE-M97B44-A or WSS-M97B51-A1. Not all coolant recycling processes meet these Ford specifications. Use of such coolants can harm the engine and cooling system components.**

1. Add the correct engine coolant mixture to the degas bottle.
2. Move the temperature blend selector to the full warm position.
3. Run the engine until it reaches operating temperature.
4. Add the correct engine coolant mixture to the degas bottle until the coolant level is between the "COOLANT FILL LEVEL" marks.
5. Turn off the engine and allow the cooling system to cool.
6. Repeat Steps 1 through 5 until the degas bottle level is OK.

Bleeding

1. Select maximum heater temperature and blower motor speed settings. Position control to discharge air at A/C vents in the instrument panel (04320).
2. Start the engine and allow to idle. While the engine is idling, feel for hot air at A/C vents.
3. **CAUTION: If the air discharge remains cool and the engine coolant temperature gauge does not move, the engine coolant level is low in the engine and must be filled. Stop the engine, allow to cool and fill the cooling system as described.**

   Start the engine and allow to idle until normal operating temperature is reached. Hot air should discharge from the A/C vents. The engine coolant temperature gauge should maintain a stabilized reading in the middle of the NORMAL range and the upper radiator hose (8260) should feel hot to the touch.

4. Shut the engine off and allow it to cool.
5. Check the engine for coolant leaks.
6. Check the engine coolant level in the degas bottle and fill as necessary.

Engine and Radiator Flushing

Material

Item	Specification
Motorcraft Cooling System Flush VC-1 or equivalent	ESR-M14P7-A

1. **WARNING: Do not open the cooling system while it is hot or while the engine is running. Failure to follow these instructions can result in personal injury.**

   Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the water thermostat.

3. Install the water hose connection without the water thermostat.

4. **NOTE:** For additional information, refer to the cooling system flusher operating instructions for specific vehicle hook-up.

   Use an appropriate cooling system flusher to flush the engine and radiator.
   Use Motorcraft Cooling System Flush VC-1 or equivalent meeting Ford specification ESR-M14P7-A.

5. Install the water thermostat.

6. Backflush the heater core (18476). For additional information, refer to Heater Core Backflushing in this section.

7. Fill the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Heater Core Backflushing

Material

Item	Specification
Motorcraft Cooling System Flush VC-1 or equivalent	ESR-M14P7-A

1. **WARNING: Do not open the cooling system while it is hot or while the engine is running. Failure to follow these instructions can result in personal injury.**

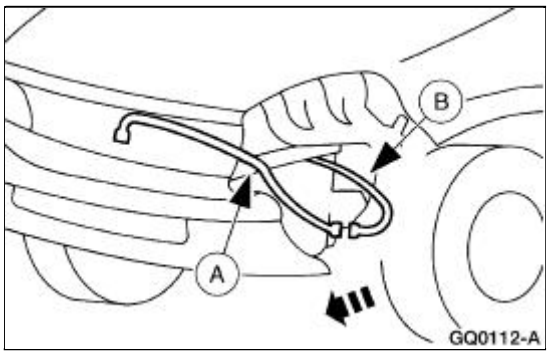
   Partially drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. **NOTE:** For additional information, refer to the cooling system flusher operating instructions for specific vehicle hook-up.

   Use an appropriate cooling system flusher to backflush the heater core. Use Motorcraft Cooling System Flush VC-1 or equivalent meeting Ford specification ESR-M14P7-A.

3. Fill the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Block Heater

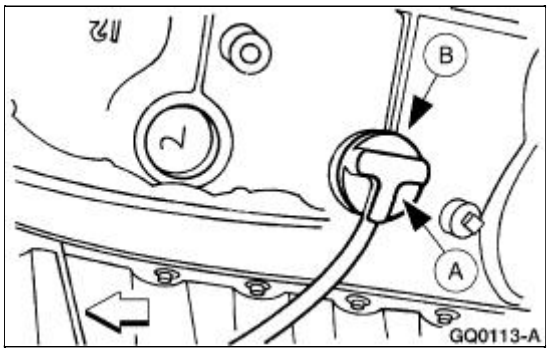


Material

Item	Specification
Premium Long Life Grease XG-1-C	ESA-M1C75-B

Removal and Installation

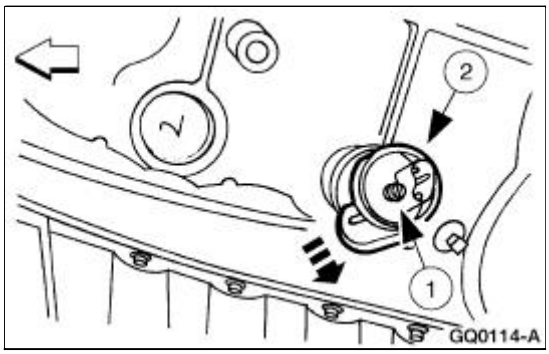
1. Drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.



2. Disconnect the (A) block heater wire extension (6B019) from the (B) block heater wiring (6B018) and remove.

3. **WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch located in the RH kick panel area. Failure to do so may result in unexpected inflation or deflation of the air springs which may result in shifting of the vehicle during these operations. Failure to follow these instructions may result in personal injury.**

   Raise and support the vehicle. For additional information, refer to Section 100-02 .



4. Disconnect the (A) block heater wiring from the (B) block heater (6A051).

5. Remove the block heater.

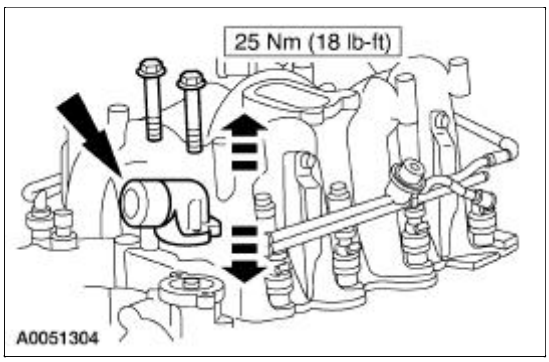
1. **CAUTION: Do not loosen the screw more than necessary for removal.**

   Loosen the screw.
2. Twist and slide the block heater to release the retainer clip and remove. Discard the retainer clip.

6. **NOTE:** To ease installation, coat the block heater seal and the cylinder block hole with grease.

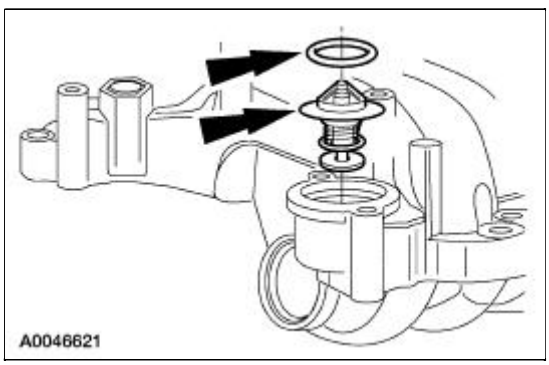
   NOTE: If equipped with air suspension, reactivate the system by turning on the air suspension switch.

   To install, reverse the removal procedure.



Thermostat —4.6L and 5.4L (2V)

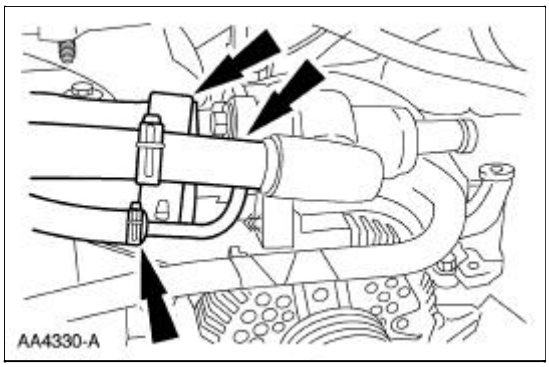
Removal and Installation



1. Partially drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
2. Disconnect the upper radiator hose from the water outlet adapter.
3. Remove the power steering reservoir upper mounting bracket.

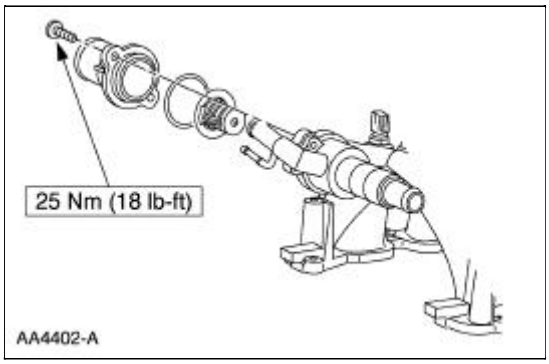
4. Remove the bolts and remove the water outlet adapter.

5. Remove the water thermostat and the O-ring seal.
   - Discard the O-ring seal.



6. To install, reverse the removal procedure.

Thermostat —5.4L (4V)



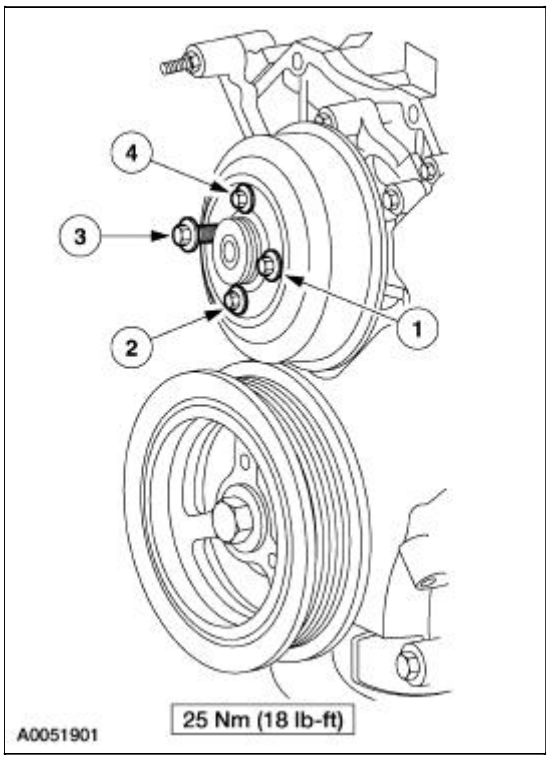
Removal and Installation

1. Partially drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Disconnect the upper radiator hose, the heater water inlet hose and the heated PCV inlet hose from the water outlet adapter.

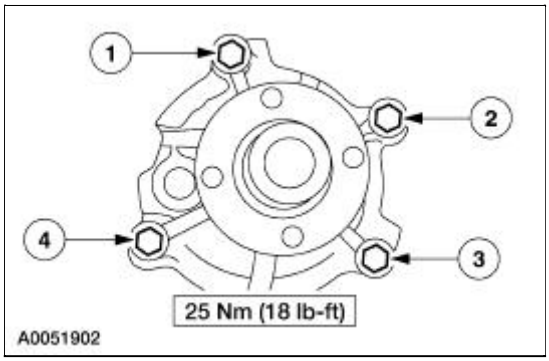
3. Remove the water hose connection (8592).

4. To install, reverse the removal procedure.



Water Pump

Material



Item	Specification
Motorcraft Premium Engine Coolant VC-4-A (in Oregon VC-5, in Canada CXC-10) (green color)	ESE-M97B44-A
Motorcraft Premium Gold Engine Coolant VC-7-A (in Oregon VC-7-B) (yellow color)	WSS-M97B51-A1

Removal and Installation

1. Remove the engine cooling fan (8K620) and fan shroud (8146). For additional information, refer to Cooling Fan in this section.
2. Remove the drive belt (8620). For additional information, refer to Section 303-05 .
3. Remove the bolts in the sequence shown, and the water pump pulley.

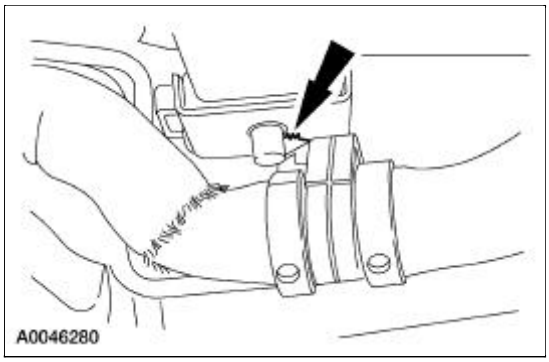
4. Remove the bolts in the sequence shown, and the water pump.

5. Wipe the water pump mounting surface with a soft cloth if necessary.

6. **CAUTION: Do not rotate the water pump housing once installed in the engine. Damage to the O-ring seal can occur, causing the water pump to leak.**

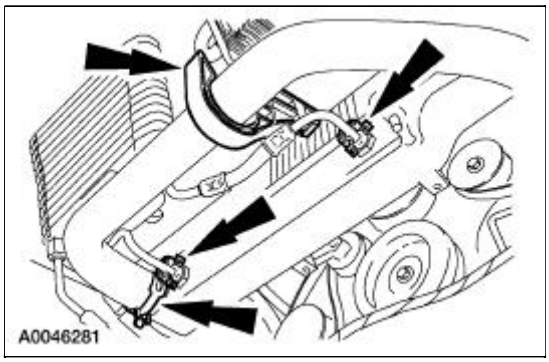
   NOTE: Install a new O-ring seal and lubricate with Motorcraft Premium Engine Coolant E2FZ-19549-AA, F5FZ-19549-CC in Oregon, CXC-10 in Canada or equivalent meeting Ford specification ESE-M97B44-A (green color) or Motorcraft Premium Gold Engine Coolant VC-7-A meeting Ford specification WSS-M97B51-A1 (yellow color). Use the same coolant that was drained from the engine.

   To install, reverse the removal procedure.



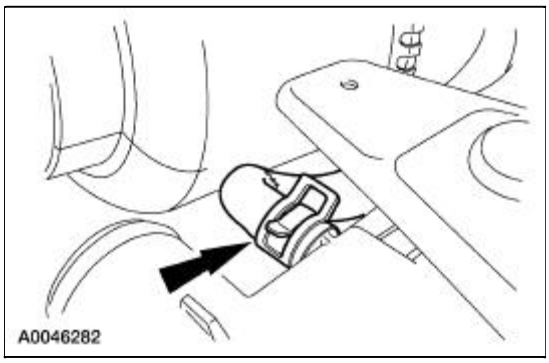
Radiator

Removal and Installation

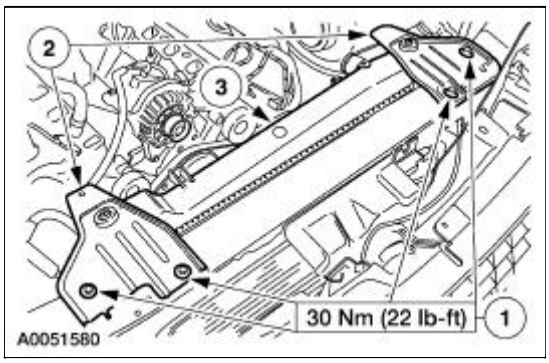


1. Remove the fan blade. For additional information, refer to Cooling Fan in this section.
2. Raise and support the vehicle. For additional information, refer to Section 100-02 .
3. Remove the splash shield.

4. Remove the pushpin securing the lower radiator hose to the radiator routing hook.



5. Disconnect the following:
   - Lower radiator hose from the radiator.
   - Lower radiator hose from the routing hook.
   - Transmission tubes from the radiator.



6. Lower the vehicle.

7. Disconnect the degas bottle hose from the radiator.

8. Remove the radiator.
    1. Remove the bolts.
    2. Remove the radiator upper support brackets.
    3. Remove the radiator.

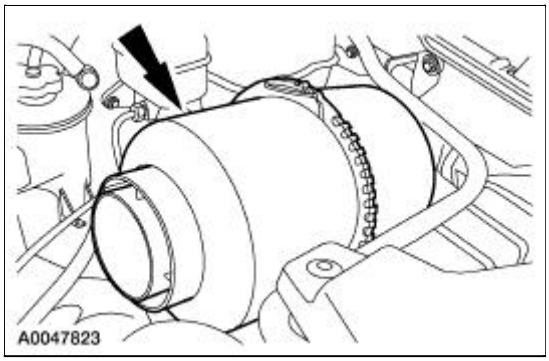
9. To install, reverse removal procedure.

Cooling Fan

Special Tool(s)

 ST1499-A	Holding Wrench, Fan Pulley 303-239 (T84T-6312-C)
 ST1828-A	Wrench, Fan Clutch Nut 303-240 (T84T-6312-D)

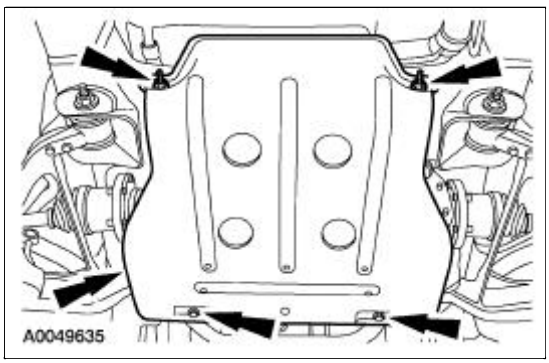
Removal



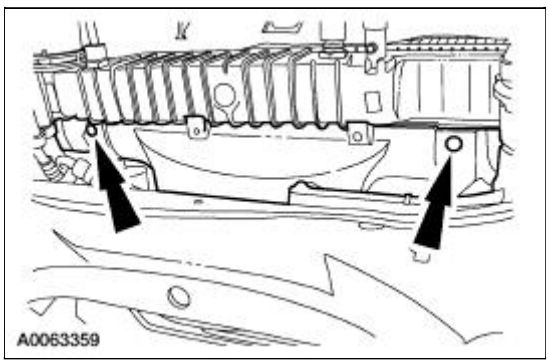
WARNING: Do not run the engine while the protective components are removed. Failure to follow these instructions can result in personal injury.

All vehicles

1. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
2. Disconnect the mass air flow (MAF) sensor electrical connector.

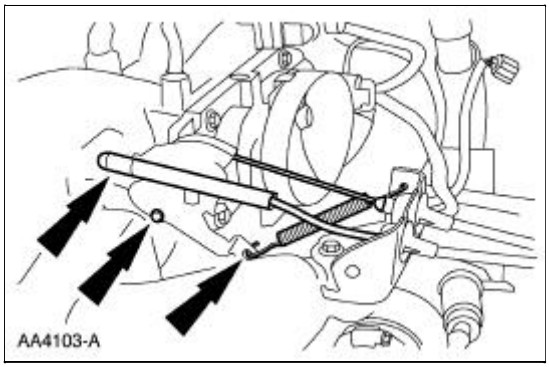


3. Remove the outlet side of the air cleaner.

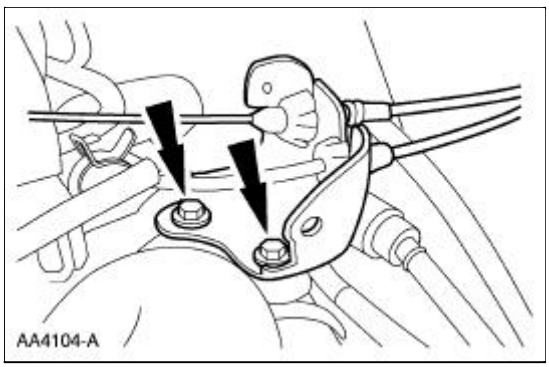


4. Raise and support the vehicle. For additional information, refer to Section 100-02 .

5. If equipped, remove the skidplate.



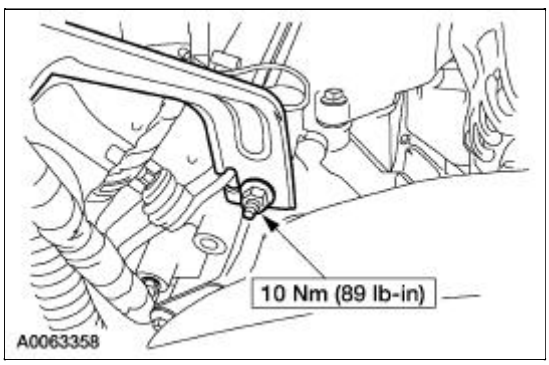
6. Remove the screws and the lower section of the cooling fan shroud.



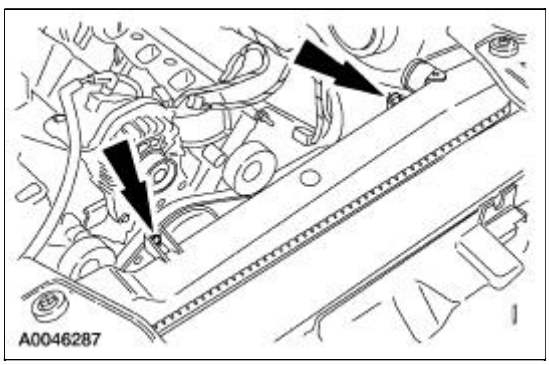
7. Lower the vehicle.

Vehicles equipped with 5.4L 4V engines

8. Disconnect the accelerator cable, speed control cable, and the return spring.

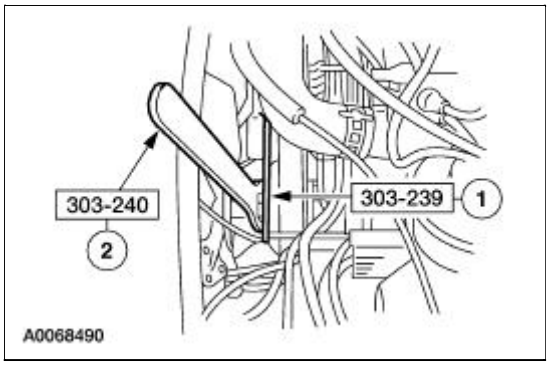


9. Remove the bolts and position the cable and brackets out of the way.



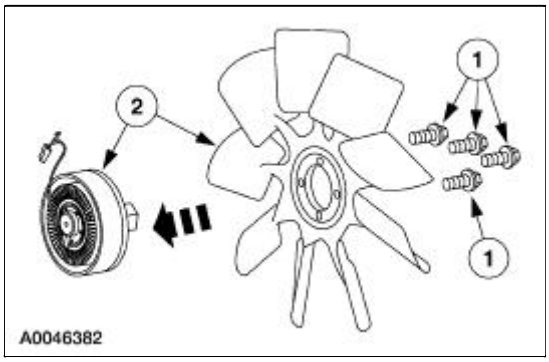
Vehicles equipped with 4.6L engines

10. Remove the nut and the engine appearance cover bracket.



All vehicles

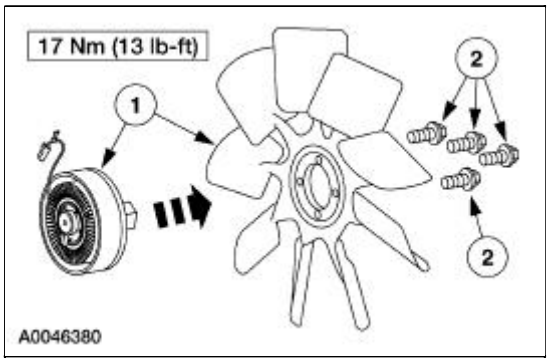
11. Remove the mounting bolts and the upper section of the cooling fan shroud.



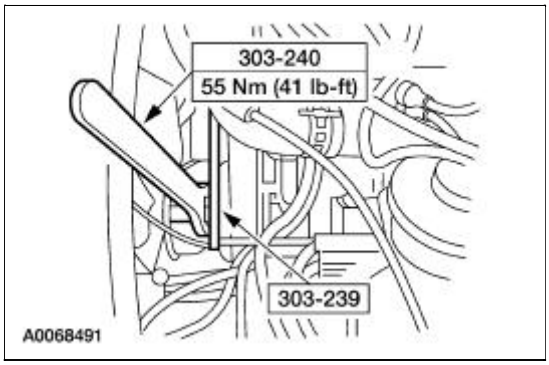
12. Remove the fan blade and the fan clutch.
    1. Using the special tool, hold the coolant pump pulley steady.
    2. Using the special tool, remove the cooling fan assembly locknut.

13. **NOTE:** Electronically-controlled fan clutch shown, thermostatically-controlled fan clutch similar.

    Separate the fan clutch from the fan blade.
    1. Remove the bolts.
    2. Separate the fan blade from the fan clutch.



Installation

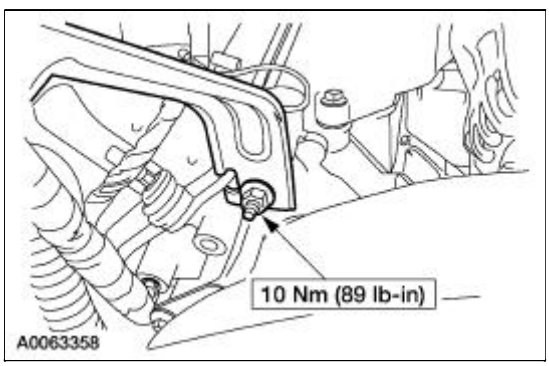


All vehicles

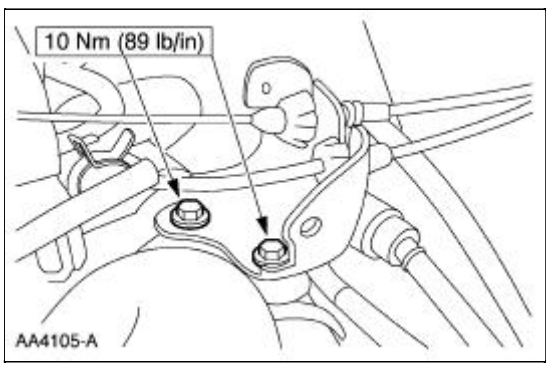
1. **NOTE:** Electronically-controlled fan clutch shown, thermostatically-controlled fan clutch similar.

   Assemble the fan clutch to the fan blade.
   1. Position the fan clutch on the fan blade.
   2. Install the bolts.

2. Using the special tools, install the cooling fan assembly.

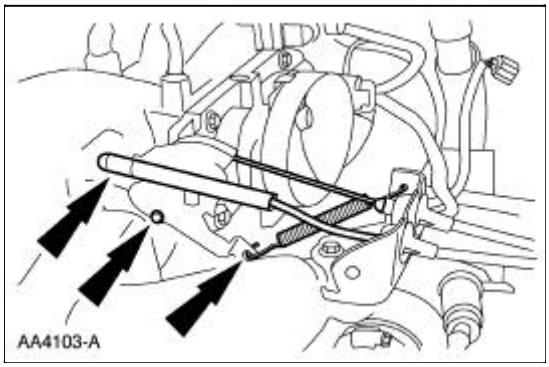


3. Install the upper section of the fan shroud and mounting bolts.



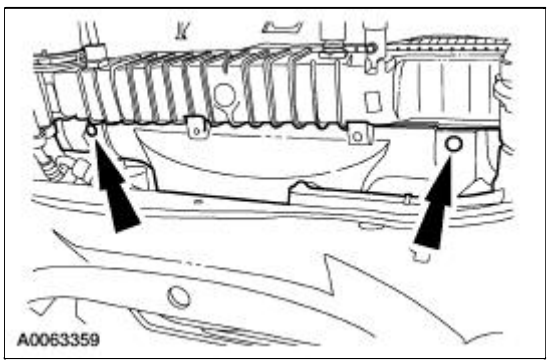
Vehicles equipped with 4.6L engines

4. Install the engine appearance cover bracket and nut.

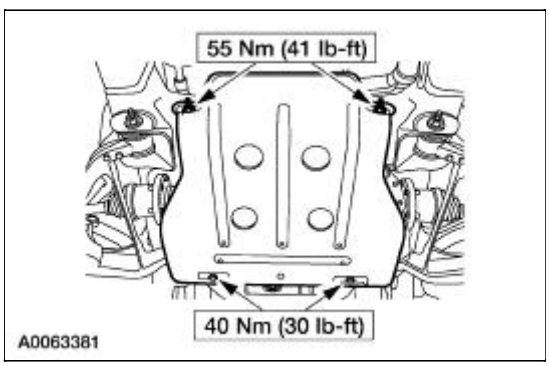


Vehicles equipped with 5.4L 4V engines

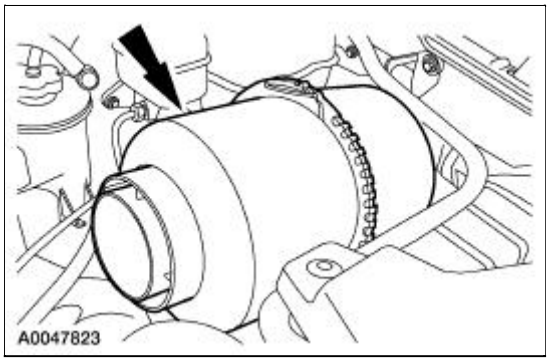
5. Position the cables and bracket, and install the bolts.



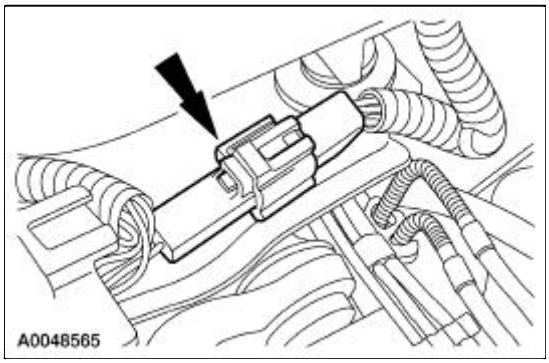
6. Connect the accelerator cable, speed control cable and the return spring.



All vehicles



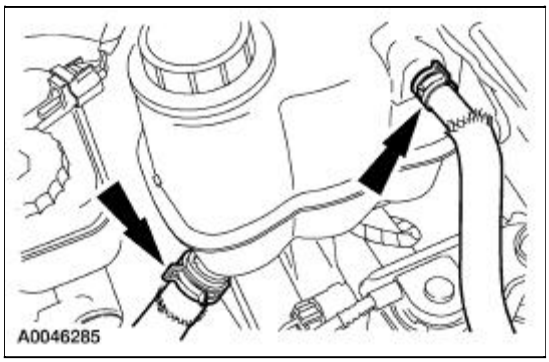
7. Raise the vehicle.
8. Install the screws and the lower section of the cooling fan shroud.



9. If equipped, install the skidplate.

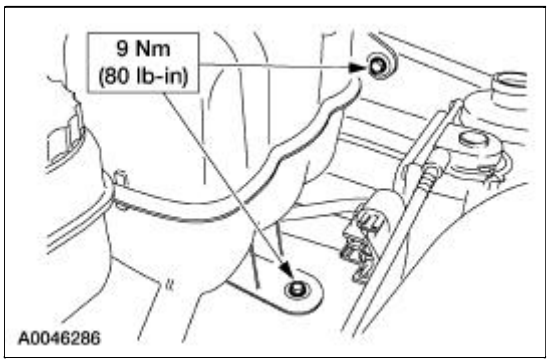
10. Lower the vehicle.
11. Install the outlet side of the air cleaner.

12. Connect the mass air flow (MAF) sensor electrical connector.



13. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

Degas Bottle



Removal and Installation

1. Partially drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Disconnect the coolant hoses.

3. Remove the mounting bolts.

4. Remove the degas bottle.

5. To install, reverse the removal procedure.

General Specifications

Item	Specification
Lubricants and Chemicals	
SAE 5W-20 Premium Synthetic Blend Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Torque Specifications

Description	Nm	lb-ft	lb-in
EGR vacuum regulator solenoid bracket bolt	10		89
Brake booster vacuum tube bolt	10	—	89
EGR tube fittings	40	30	—
Fuel injection supply manifold bolts	10	—	89
Throttle body bolts	9	—	80
Throttle body adapter bolts	10		89

Fuel Charging and Controls

The fuel injection supply manifold (9F792):

- delivers fuel to the individual fuel injectors (9F593).
- receives fuel from the fuel supply line.

The throttle body (9E926):

- controls air supply to the upper intake manifold (9424) by positioning the throttle plate.
- connects the accelerator cable (9A758) and, if equipped, the speed control actuator cable (9A825) to the throttle lever.
- is not adjustable.
- cannot be cleaned.

The fuel injectors:

- are electrically operated by the powertrain control module (PCM) (12A650).
- atomize the fuel as the fuel is delivered.
- are deposit-resistant.
- each have an internal solenoid that opens a needle valve to inject fuel into the lower intake manifold.

The fuel pressure relief valve (9H321) is used to inspect and relieve fuel pressure.

The fuel pressure regulator (9C968):

- maintains constant fuel pressure throughout the fuel system and to the fuel injectors.
- is spring-loaded and operated by intake manifold vacuum.

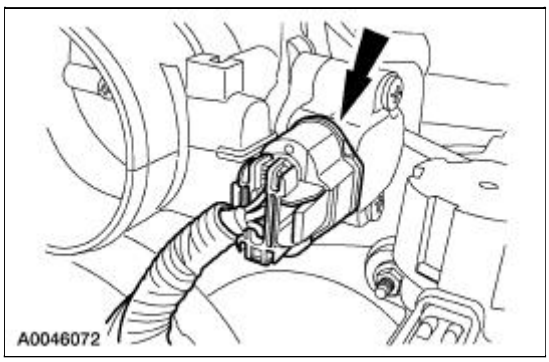
The A/C compressor clutch control relay (if A/C equipped):

- is controlled by the PCM.
- interrupts A/C clutch operation during engine start or manual transmission clutch engagement to reduce engine load.

The fuel pump relay engages the fuel pump when energized by the PCM.

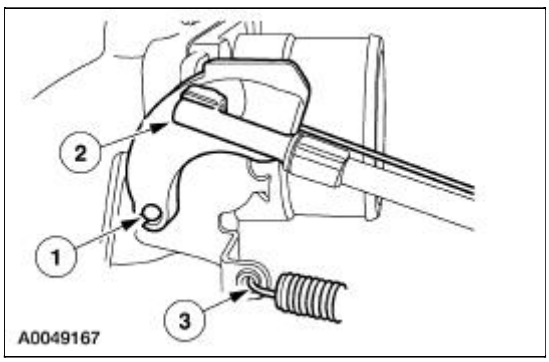
Fuel Charging and Controls

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.



Throttle Body

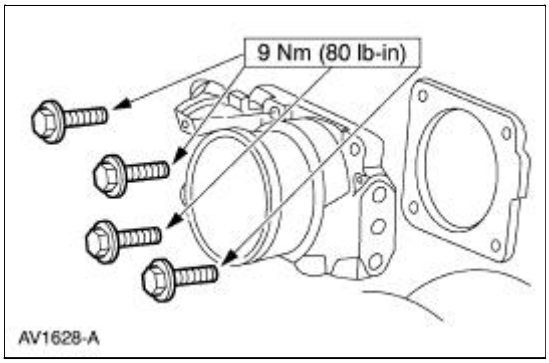
Removal and Installation



WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions can result in personal injury.

CAUTION: Throttle body bore and plate area have a special coating and cannot be cleaned.

1. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
2. Disconnect the throttle position (TP) sensor electrical connector.



3. Disconnect the accelerator controls.
    1. Disconnect the accelerator cable.
    2. Disconnect the speed control cable.
    3. Disconnect the return spring.

4. **NOTE:** Discard the throttle body gasket.

    Remove the bolts, the throttle body and the throttle body gasket.

5. To install, reverse the removal procedure.

Fuel Injectors

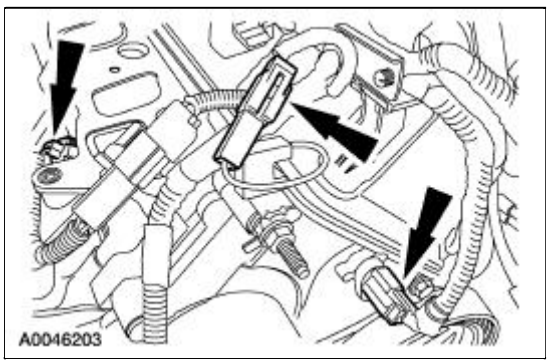
Removal and Installation

WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions can result in personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved. Failure to follow these instructions can result in personal injury.

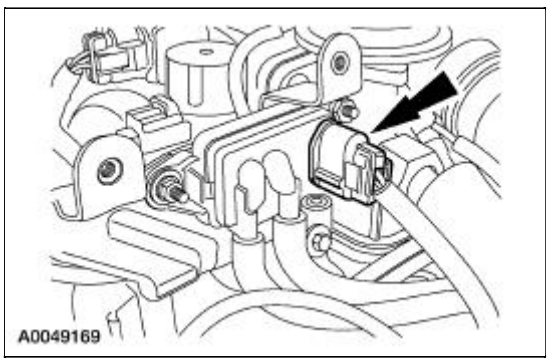
NOTE: In order to remove the fuel injectors, the fuel injection supply manifold must be removed.

1. Remove the fuel injection supply manifold. For additional information, refer to Fuel Injection Supply Manifold—4.6L or Fuel Injection Supply Manifold—5.4L in this section.



Fuel Charging Wiring Harness

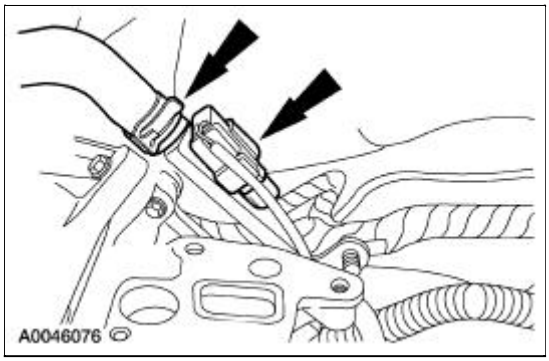
Removal and Installation



WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions can result in personal injury.

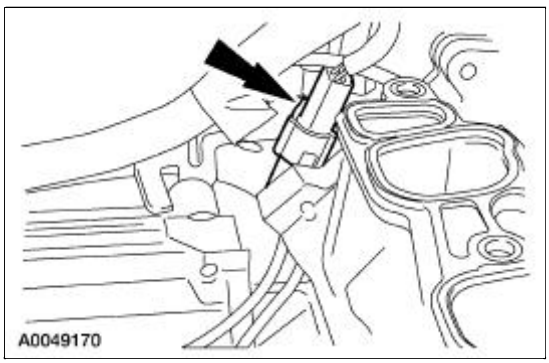
All vehicles

1. Remove the intake manifold. For additional information, refer to Section 303-01A .
2. Disconnect the following electrical connectors:
   - Camshaft position (CMP) sensor.
   - Left radio interference capacitor.
   - Cylinder head temperature sensor.



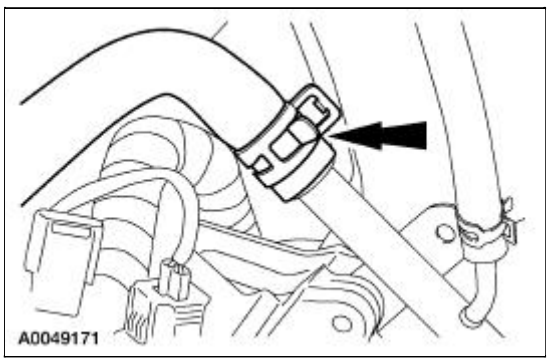
3. Disconnect the differential pressure feedback exhaust gas recirculation (EGR) system electrical connector.

4. Release the fuel charging wiring harness from the left valve cover.



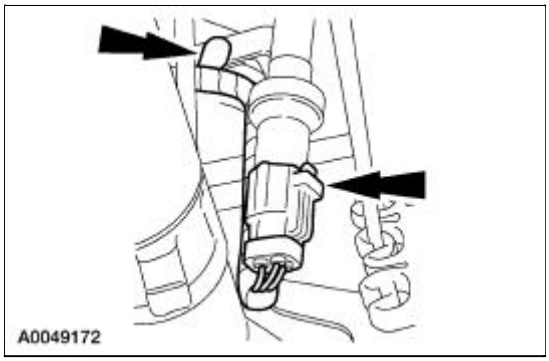
Vehicles with 5.4L engine

5. Remove the coolant hose from the water outlet tube and disconnect the knock sensor electrical connector.

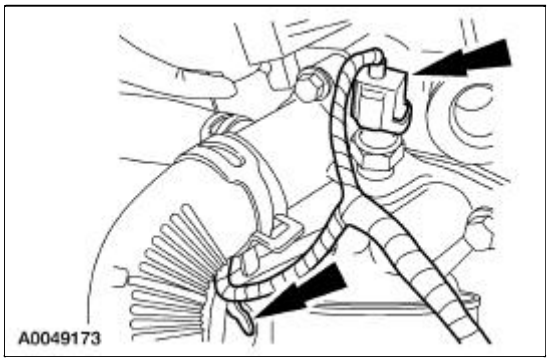


Vehicles with 4.6L engine

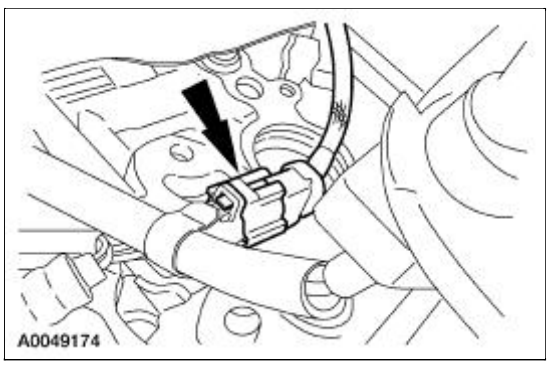
6. Disconnect the knock sensor electrical connector.



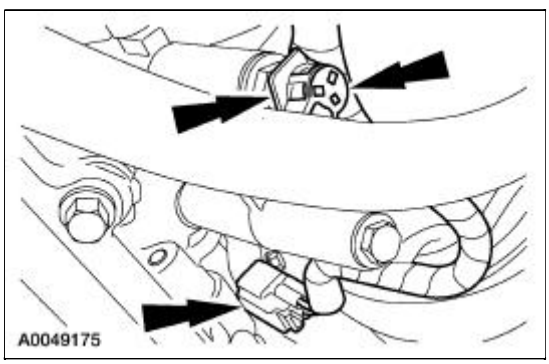
7. Remove the coolant hose from the water outlet tube.



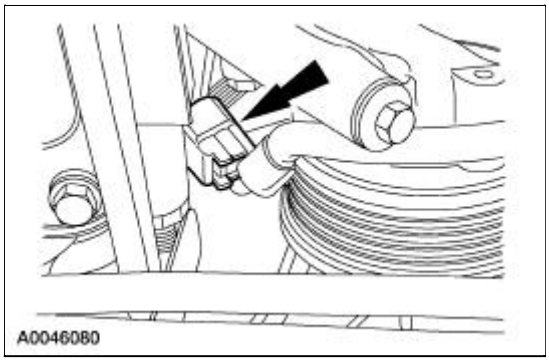
All vehicles



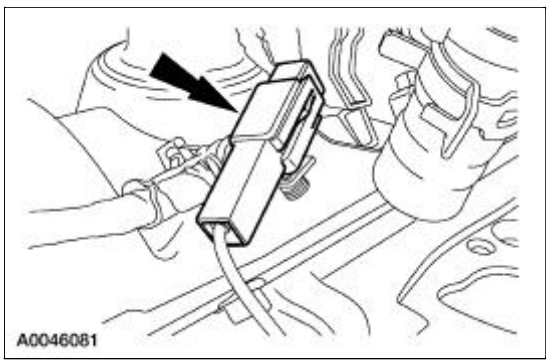
8. Raise and support the vehicle. For additional information, refer to Section 100-02 .
9. Disconnect the power steering pressure sensor electrical connector and wiring anchor.



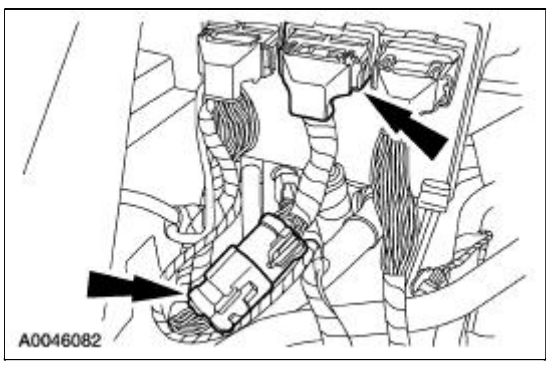
10. Disconnect the oil pressure sensor electrical connector and wiring anchor.



11. Disconnect the LH and RH oxygen sensor electrical connectors.



12. Disconnect the following:
    - Crankshaft position (CKP) sensor electrical connector.
    - Wiring harness anchors from the A/C compressor stud.



13. Disconnect the A/C compressor clutch electrical connector.

14. Lower the vehicle.
15. Remove the fuel charging wiring harness bracket from the water outlet tube brace.
16. Route all bottom-of-engine wiring into the engine compartment.
17. Disconnect the right radio interference capacitor electrical connector.

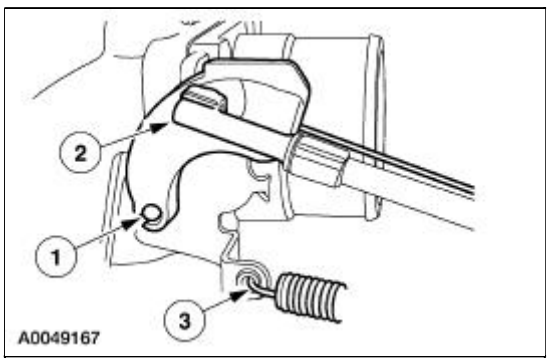
18. Disconnect the powertrain control module (PCM) electrical connectors.

19. Release the fuel charging wiring harness from the right valve cover.
20. Remove the fuel charging wiring harness.
21. To install, reverse the removal procedure.

Fuel Injection Supply Manifold —4.6L

Material

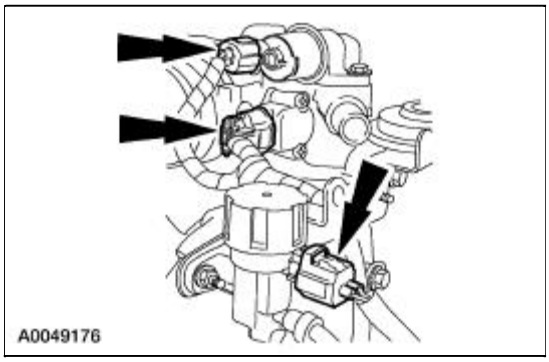
Item	Specification
Super Premium SAE 5W-20 Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H



Removal

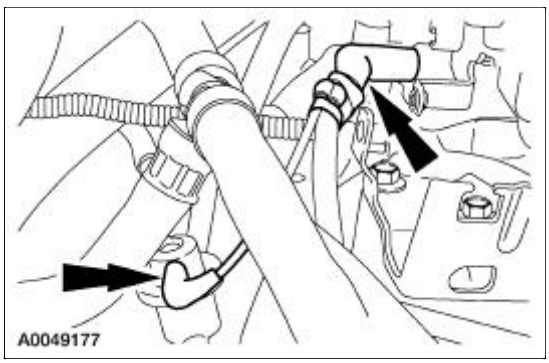
WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions can result in personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved. Failure to follow these instructions can result in personal injury.

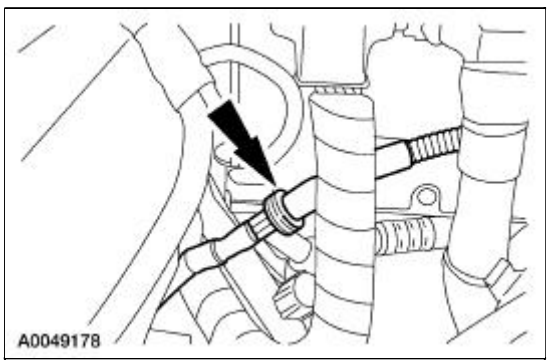


All vehicles

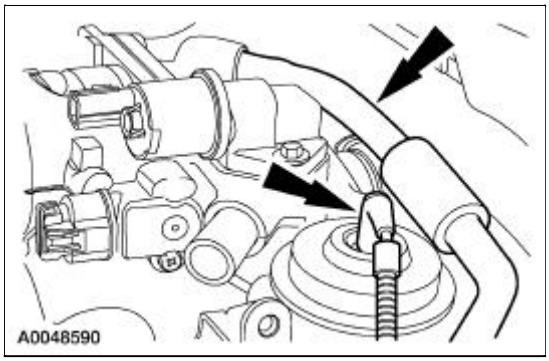
1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Partially drain the cooling system. For additional information, refer to Section 303-03 .
3. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
4. Disconnect the accelerator controls.
    1. Disconnect the accelerator cable.
    2. Disconnect the speed control cable.
    3. Disconnect the return spring.



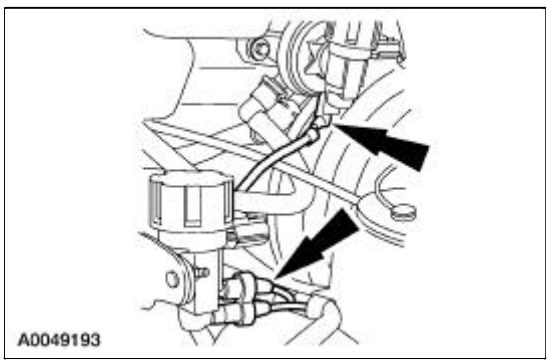
5. Disconnect the following electrical connectors:
    - Idle air control (IAC).
    - Throttle position (TP) sensor.



- Exhaust gas recirculation (EGR) vacuum regulator solenoid.

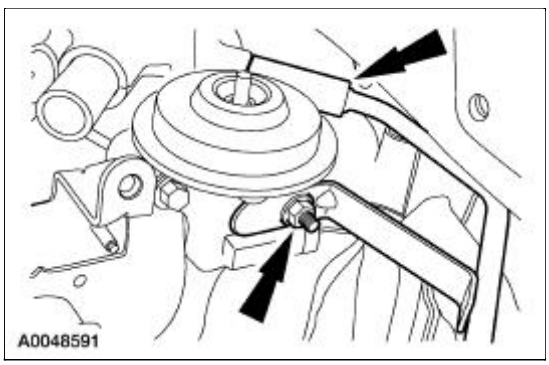


6. Disconnect the following vacuum connections:
   - Connection on the right side of the throttle body.
   - Fuel pressure regulator.

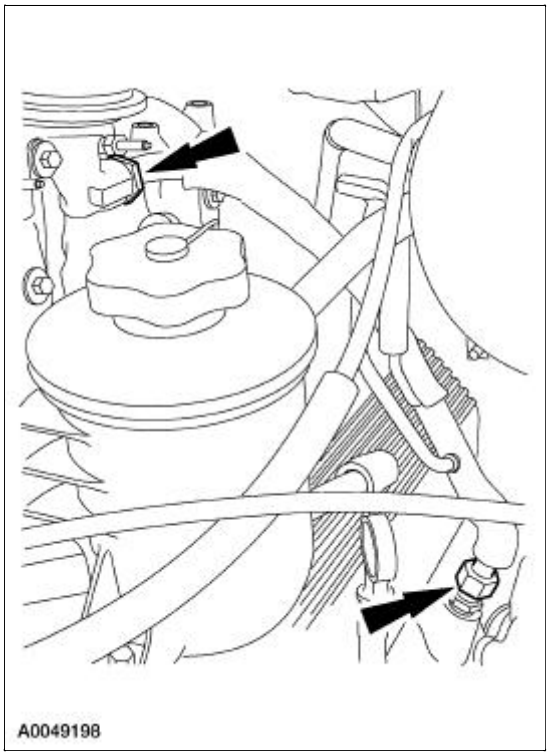


7. Disconnect the vacuum hose connection.

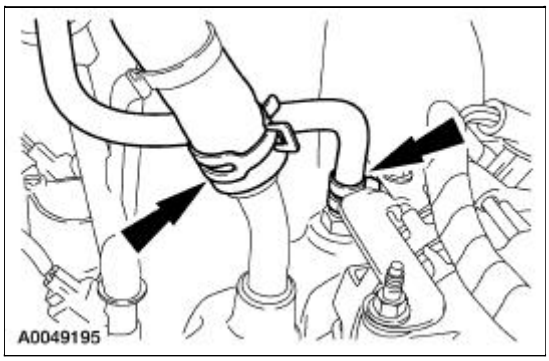
8. Disconnect the EGR valve vacuum hose and the evaporative emission (EVAP) hose at the throttle body.



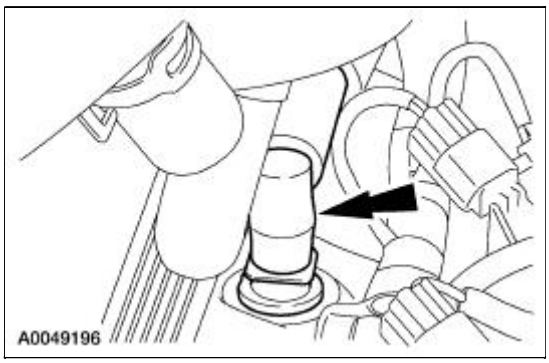
9. Disconnect the following vacuum connections:
    - EGR vacuum regulator solenoid.
    - EVAP canister purge solenoid.



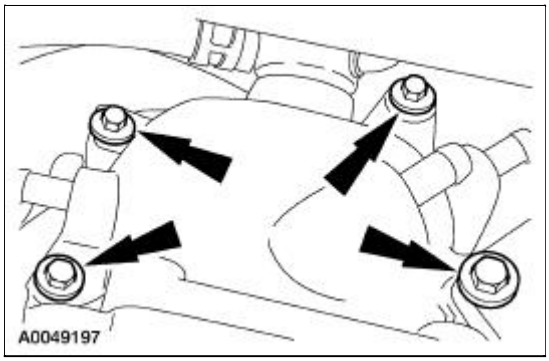
10. Position the vacuum harness aside.



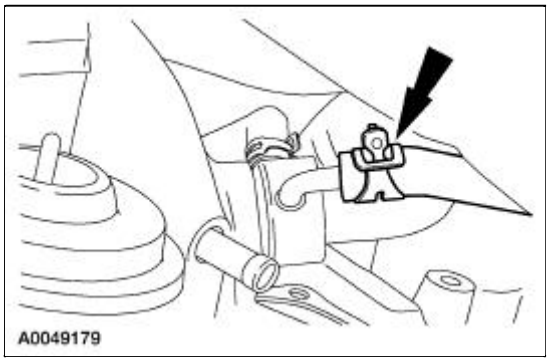
11. Remove the brake booster vacuum tube bracket nut. Disconnect and position the vacuum tube aside.



12. Disconnect the EGR tube upper fitting. Loosen the EGR tube lower fitting. Position the EGR tube aside.

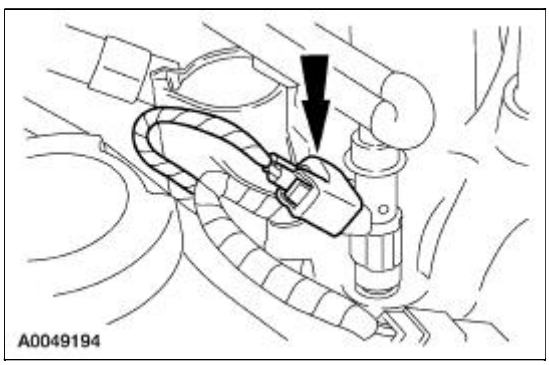


13. Remove the coolant hoses from the intake manifold.

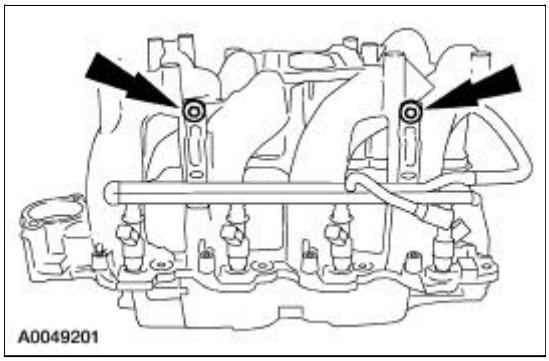


14. Remove the positive crankcase ventilation (PCV) valve from the valve cover.

15. Remove the throttle body adapter retaining bolts.



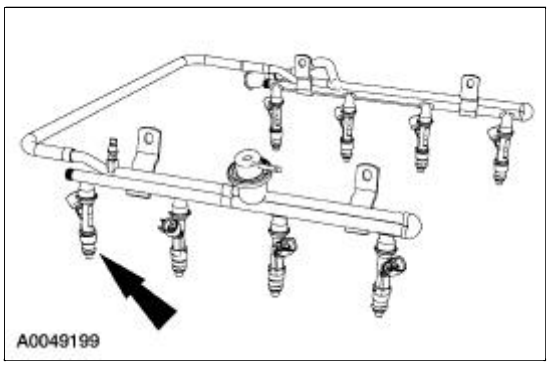
16. Position the throttle body adapter slightly forward and disconnect the PCV coolant hose.



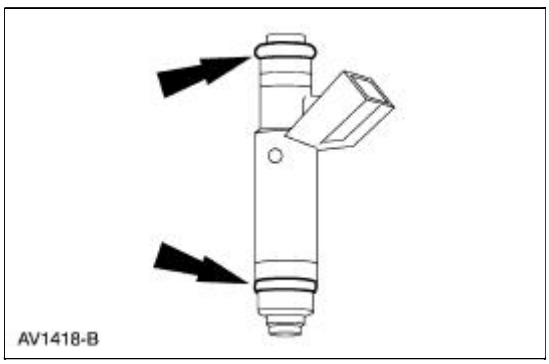
17. Remove the throttle body adapter assembly.

18. Disconnect the fuel tube spring lock coupling. For additional information, refer to Section 310-00 .

19. Disconnect the eight fuel injector electrical connectors.



20. Remove the four bolts and lift the fuel injection supply manifold and the injectors upward out of the intake manifold.

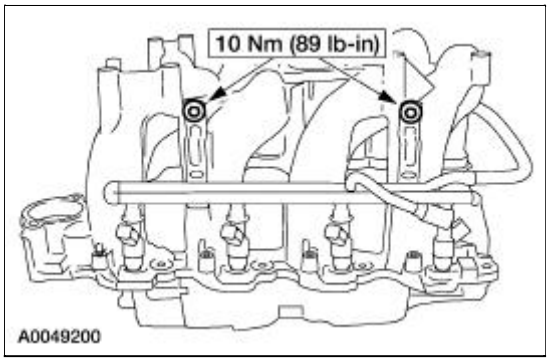


Vehicles requiring fuel injector service

21. Remove fuel injectors from the fuel injection supply manifold.

22. Inspect the O-ring seals from each fuel injector. Install new O-ring seals as needed.

Installation



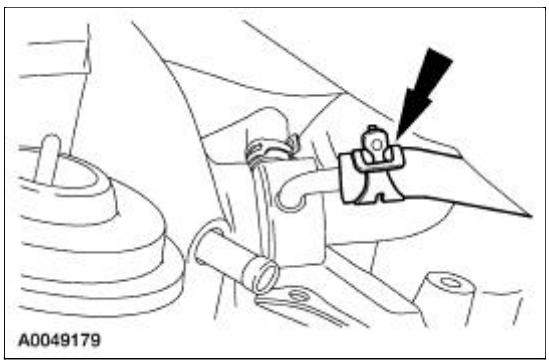
Vehicles requiring fuel injector service

1. **NOTE:** Lubricate the new O-ring seals with clean engine oil to aid installation.

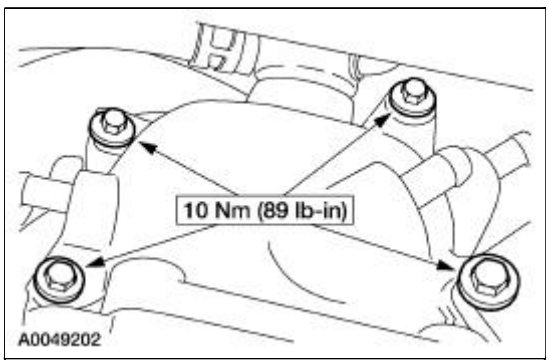
   Install the fuel injectors into the fuel injection supply manifold.

All vehicles

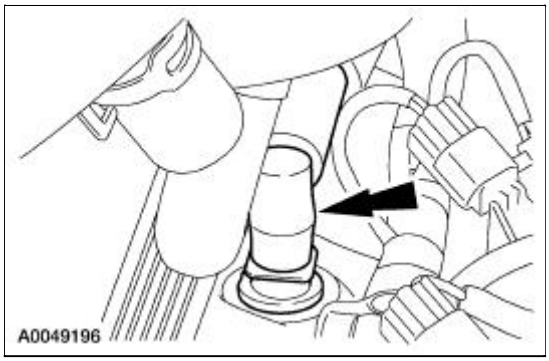
2. Install the fuel injection supply manifold.



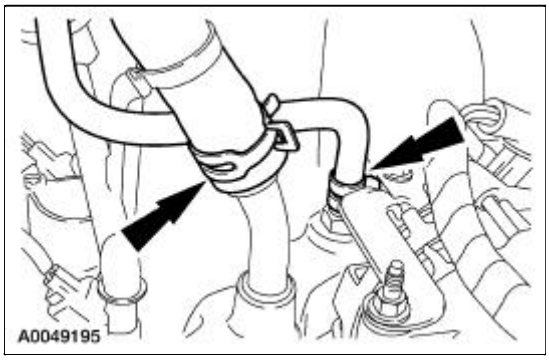
3. Connect the eight fuel injector electrical connectors.



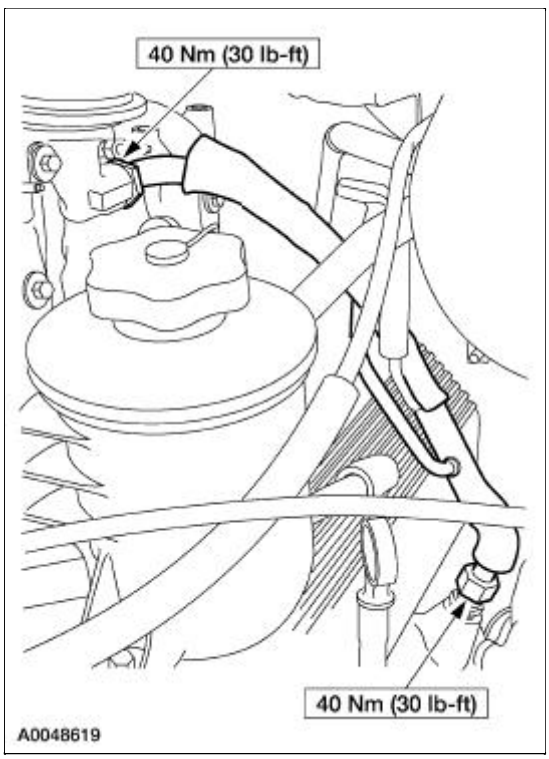
4. Connect the fuel tube spring lock coupling. For additional information, refer to Section 310-00 .



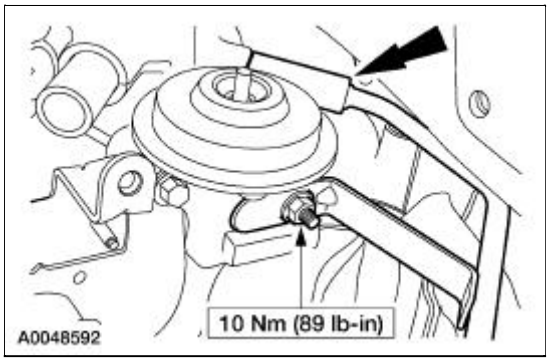
5. Position the throttle body adapter close to the installed position and connect the positive crankcase ventilation (PCV) coolant hose.



6. Install the throttle body adapter retaining bolts.

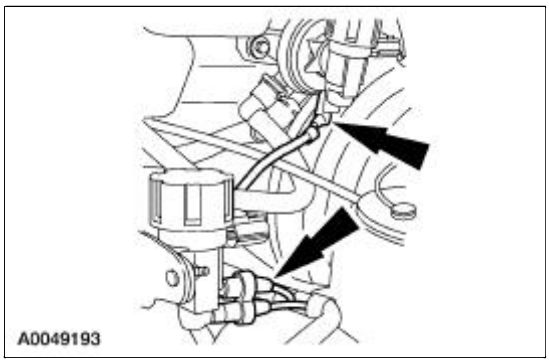


7. Install the PCV valve.

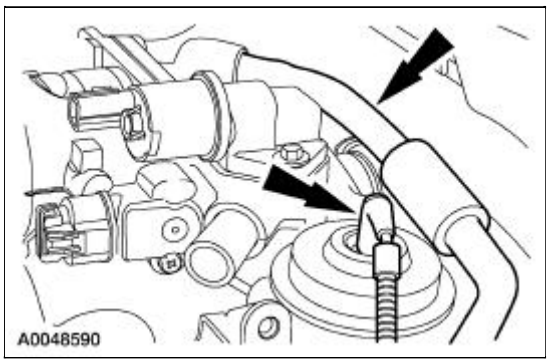


8. Connect the coolant hose to the intake manifold.

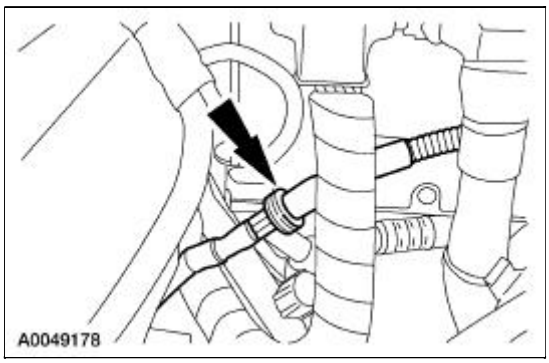
9. Install the exhaust gas recirculation (EGR) tube.



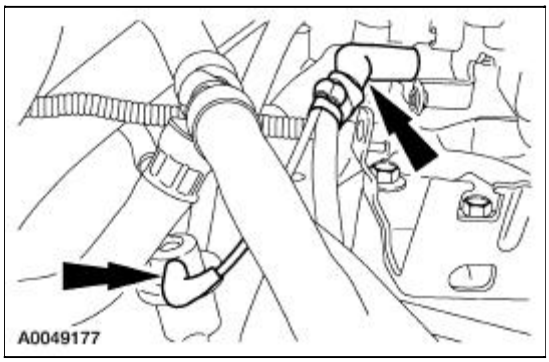
10. Connect the brake booster vacuum tube and install the bolt.



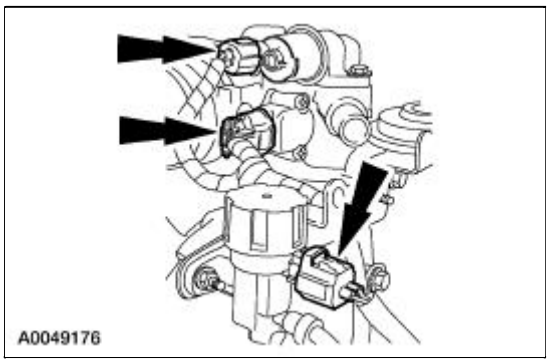
11. Position the vacuum harness across the engine.



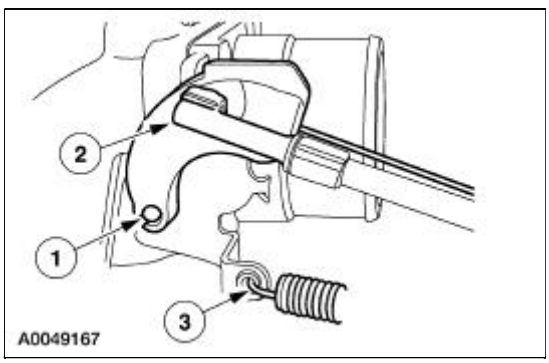
12. Connect the following vacuum connections:
    - EGR vacuum regulator solenoid.
    - Evaporative emission (EVAP) canister purge solenoid.



13. Connect the EGR vacuum hose and the EVAP hose to the throttle body.



14. Connect the vacuum hose connection.



15. Connect the following vacuum connections:
    - Connection on the right side of the throttle body.
    - Fuel pressure regulator.

16. Connect the following electrical connectors:
    - EGR vacuum regulator solenoid.
    - Throttle position (TP) sensor.
    - Idle air control (IAC).

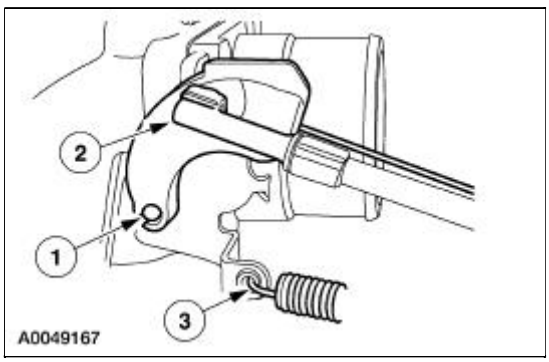
17. Connect the accelerator controls.
    1. Connect the accelerator cable.
    2. Connect the speed control cable.
    3. Connect the return spring.

18. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
19. Fill and bleed the cooling system. For additional information, refer to Section 303-03 .
20. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Fuel Injection Supply Manifold —5.4L

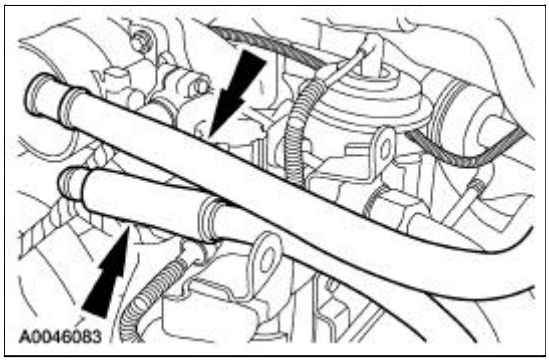
Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H



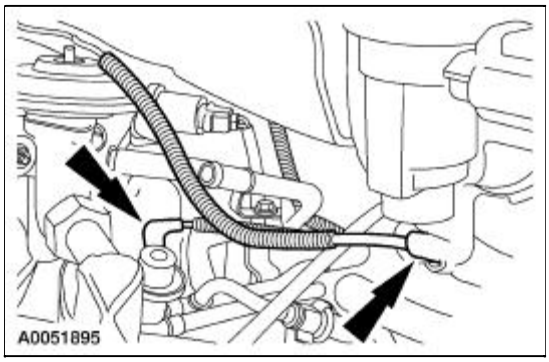
Removal

WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions can result in personal injury.

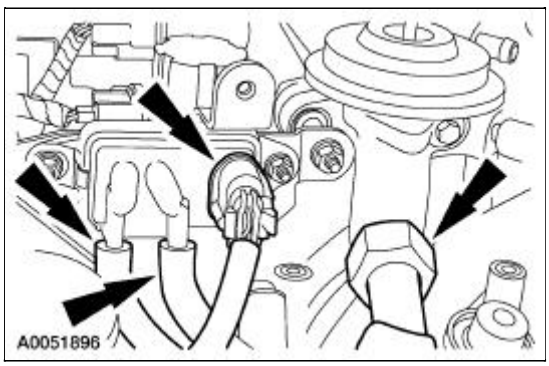


WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved. Failure to follow these instructions can result in personal injury.

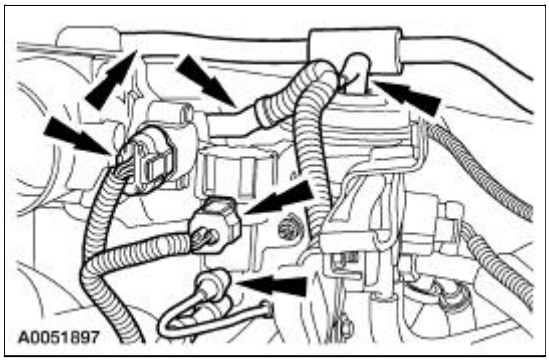
All vehicles



1. Partially drain the cooling system.
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove air cleaner outlet pipe. For additional information, refer to Section 303-12 .
4. Disconnect the accelerator controls.
    1. Disconnect the accelerator cable.
    2. Disconnect the speed control cable.
    3. Disconnect the return spring.

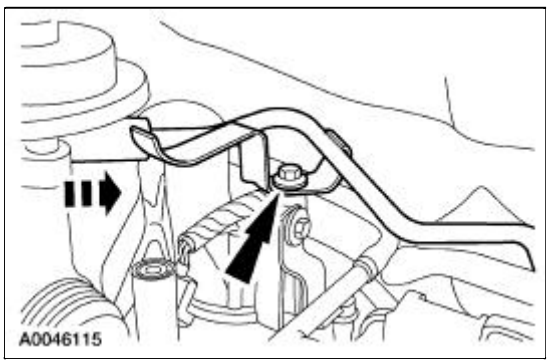


5. Remove the air tubes from the throttle body adapter and the valve cover.

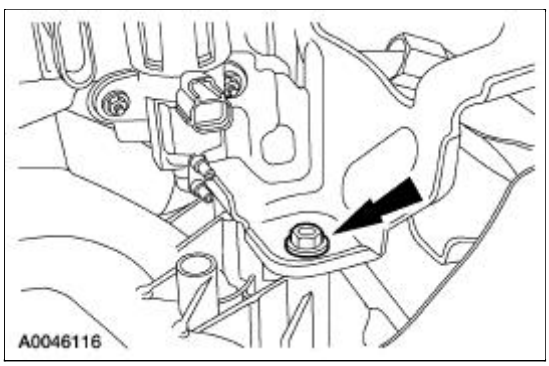


6. Disconnect the vacuum hoses from the evaporative emission (EVAP) canister purge solenoid and the fuel pressure regulator.

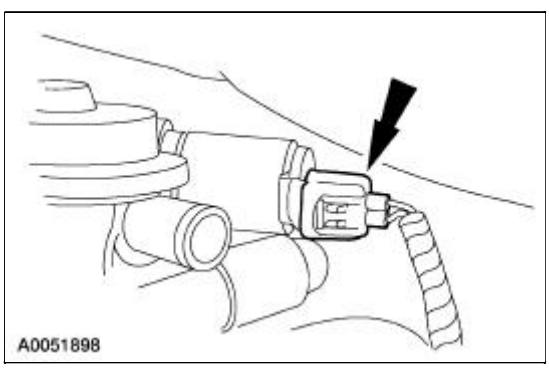
7. Disconnect the following:
    - Exhaust gas recirculation (EGR) tube from the EGR valve.
    - Differential pressure feedback EGR (DPFE) vacuum and electrical connections.



8. Disconnect the following:
    - Throttle position (TP) sensor electrical connector.
    - Exhaust gas recirculation (EGR) vacuum hose.
    - Evaporative emission (EVAP) canister purge solenoid vapor hose at the throttle body adapter.
    - EGR vacuum regulator solenoid electrical and vacuum connections.
    - Vacuum tap at throttle body adapter.

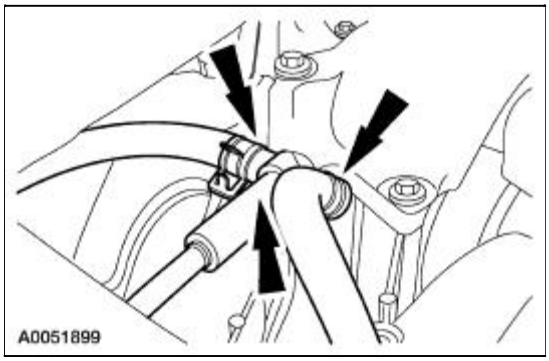


9. Position the vacuum harness aside.

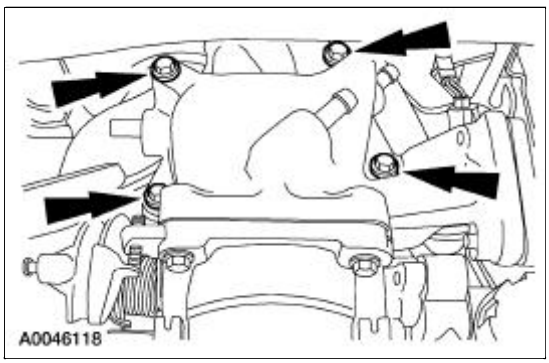


10. Remove the brake booster vacuum tube bracket nut. Disconnect and position the vacuum tube aside.

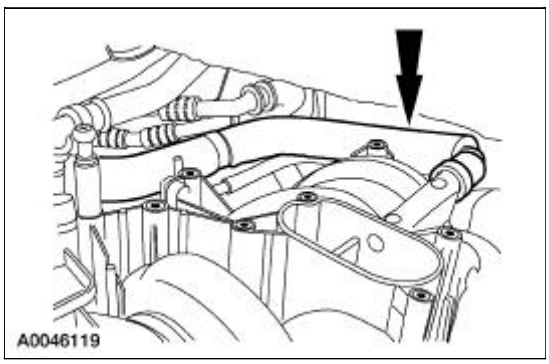
11. Remove the EGR vacuum regulator solenoid bracket bolt.



12. Disconnect the idle air control (IAC) electrical connector.

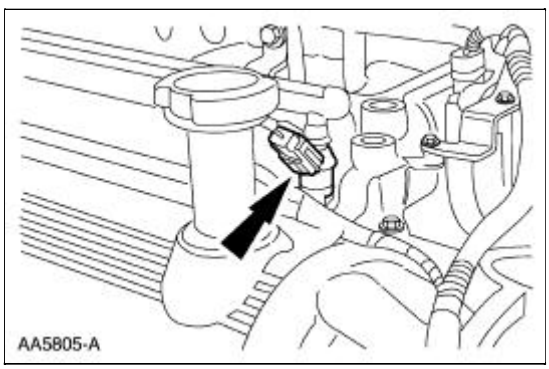


13. Disconnect the coolant hoses and the vacuum hose from the positive crankcase ventilation

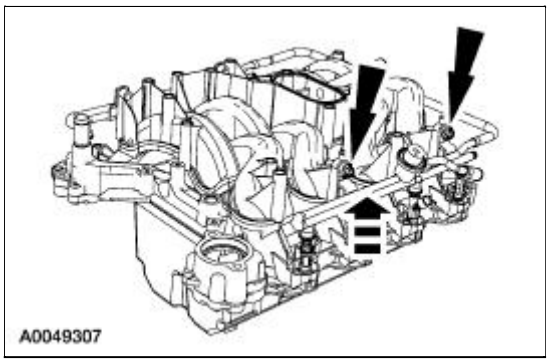


(PCV) heater fitting.

14. Remove the throttle body adapter assembly.

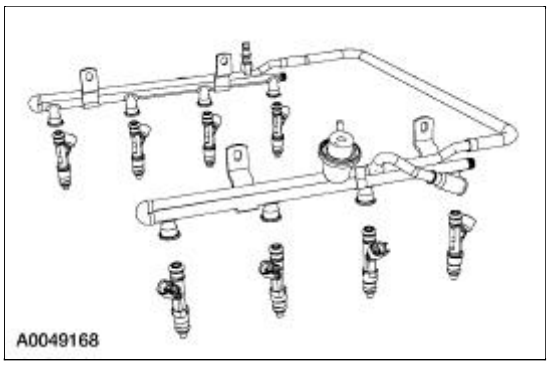


15. Remove the positive crankcase ventilation (PCV) valve and hose.

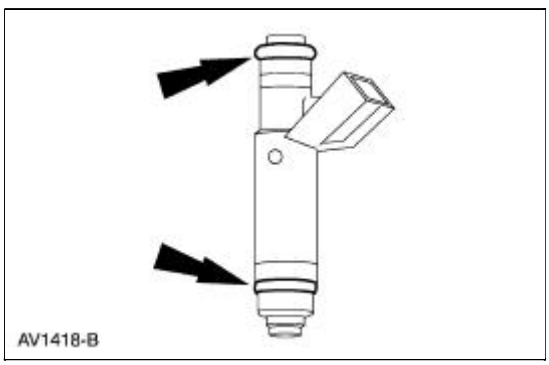


16. Disconnect the fuel tube spring lock coupling. For additional information, refer to Section 310-00 .

17. Disconnect the eight fuel injector electrical connectors.



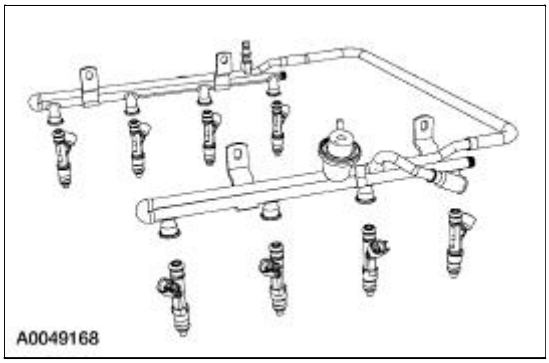
18. Remove the four bolts and lift the fuel injection supply manifold and the injectors upward out of the intake manifold.



Vehicles requiring fuel injector service

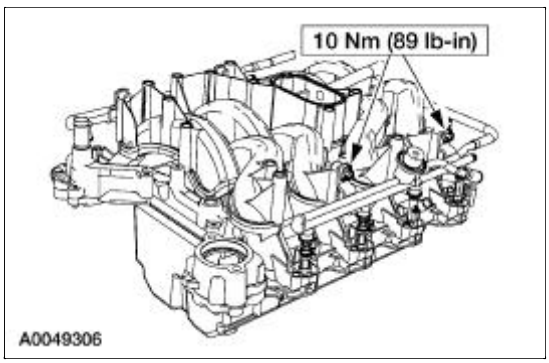
19. Remove the fuel injectors from the fuel injection supply manifold.

20. Inspect the O-ring seals from each fuel injector. Install new O-ring seals as needed.



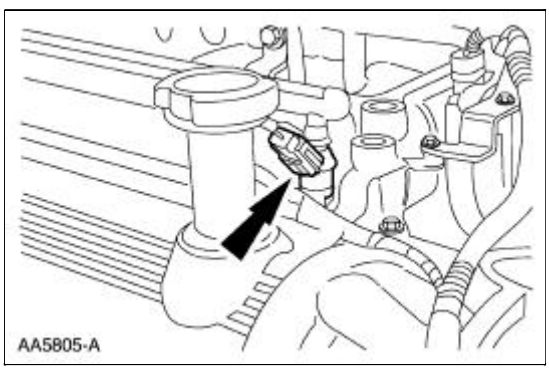
Installation

Vehicles requiring fuel injector service



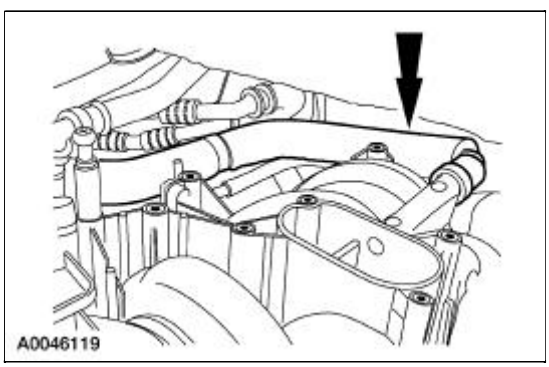
1. **NOTE:** Lubricate the new O-ring seals with clean engine oil to aid installation.

   Install the fuel injectors in the fuel injection supply manifold.

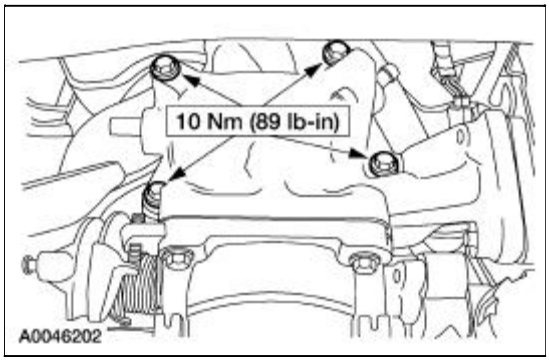


All vehicles

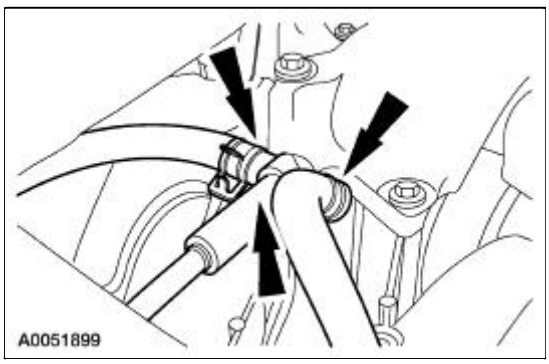
2. Install the fuel injection supply manifold.



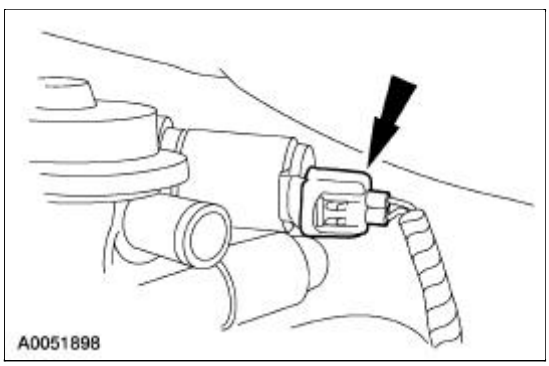
3. Connect the eight fuel injector electrical connectors.



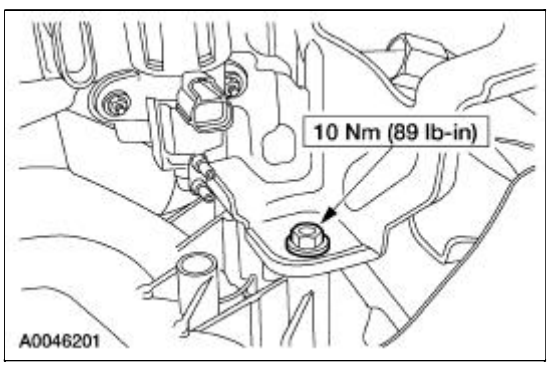
4. Connect the fuel tube spring lock coupling. For additional information, refer to Section 310-00 .



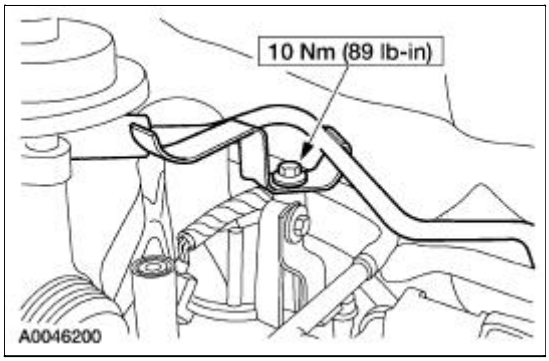
5. Install the positive crankcase ventilation (PCV) hose and valve.



6. Install the throttle body adapter assembly.

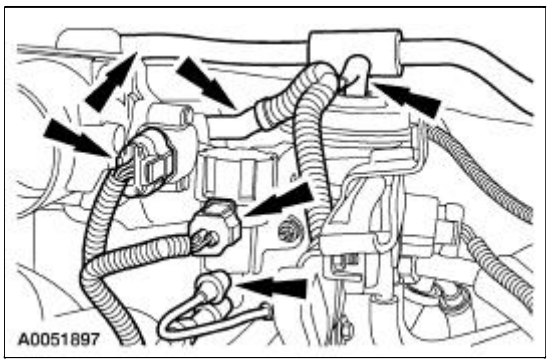


7. Connect the coolant hoses and the vacuum hose to the positive crankcase ventilation (PCV) heater fitting.

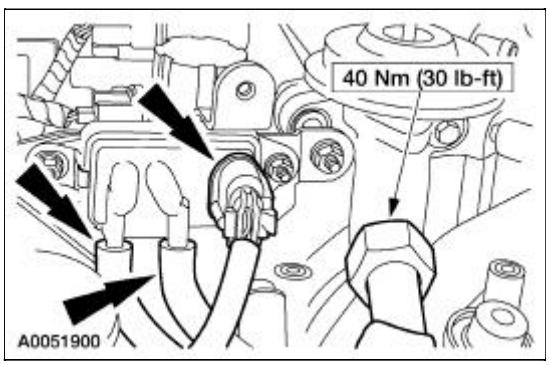


8. Connect the idle air control (IAC) electrical connector.

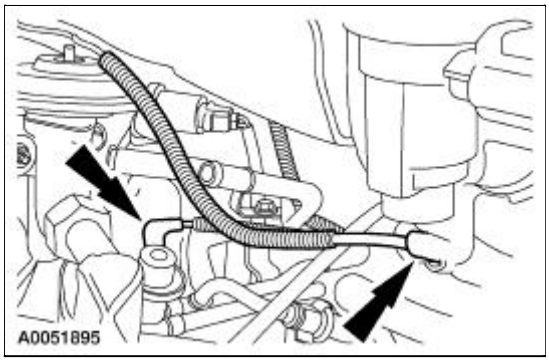
9. Install the exhaust gas recirculation (EGR) vacuum regulator solenoid bracket bolt.



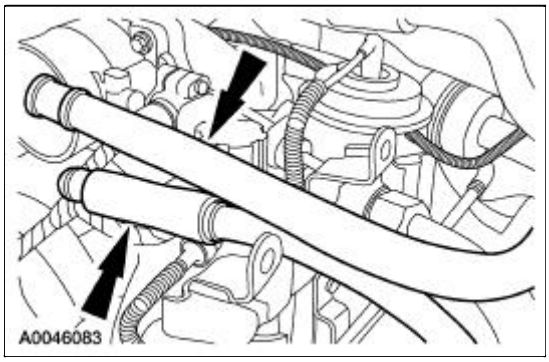
10. Connect the brake booster vacuum tube and install the bolt.



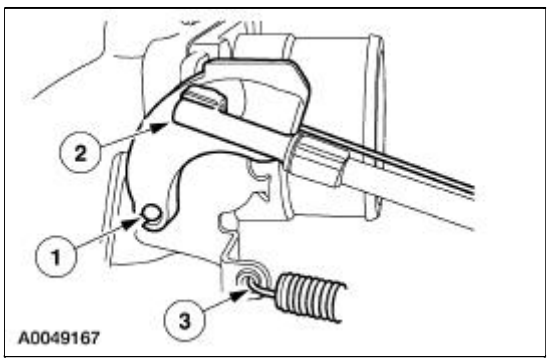
11. Position the vacuum harness across the engine.



12. Connect the following:
    - Vacuum tap at the throttle body adapter.
    - EGR vacuum regulator solenoid electrical and vacuum connections.
    - Evaporative emission (EVAP) canister purge solenoid vapor hose at the throttle body adapter.
    - EGR vacuum hose.
    - Throttle position (TP) sensor electrical connector.



13. Connect the following:
    - Differential pressure feedback EGR (DPFE) vacuum and electrical connections.
    - EGR tube to the EGR valve.



14. Connect the vacuum hoses to the evaporative emission (EVAP) canister purge solenoid and the fuel pressure regulator.

15. Install the air tubes to the throttle body adapter and the valve cover.

16. Connect the accelerator controls:
    1. Connect the accelerator cable.
    2. Connect the speed control cable.
    3. Connect the return spring.

17. Install the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

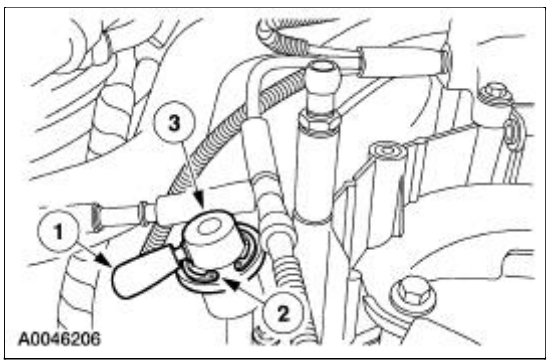
18. Connect the battery ground cable. For additional information, refer to Section 414-01 .

19. Fill and bleed the cooling system. For additional information, refer to Section 303-03 .

Fuel Pressure Regulator

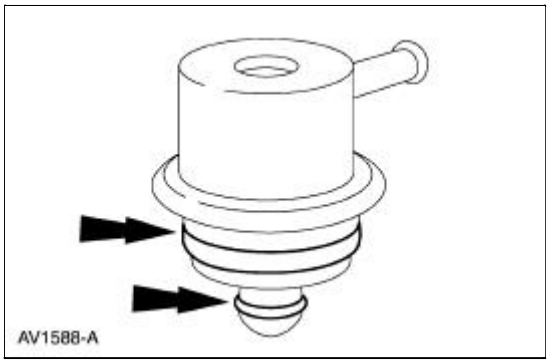
Material

Item	Specification
Super Premium SAE 5W-20 Engine Oil XO-5W20-QSP or equivalent	WSS-M2C153-H



Removal and Installation

WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions can result in personal injury.



WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved. Failure to follow these instructions can result in personal injury.

1. Relieve the fuel pressure. For additional information, refer to Section 310-00 .

2. Remove the fuel pressure regulator.
   1. Disconnect the vacuum hose.
   2. Remove the snap ring.
   3. Remove the fuel pressure regulator.

3. Remove and discard the fuel pressure regulator O-ring seals.

4. **CAUTION: Use O-ring seals that are made of special fuel resistant material. Use of ordinary O-ring seals can cause the fuel system to leak. Do not reuse the O-ring seals.**

   NOTE: Lubricate the new O-ring seals with clean engine oil to aid installation.

   To install, reverse the removal procedure.

General Specifications

Item	Specification
Lubricants and Chemicals	
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Torque Specifications

Description	Nm	lb-in
Fuel injection supply manifold bolts	10	89
Throttle body bolts	9	80
Pressure relief valve	8	71

Fuel Charging And Controls

The fuel charging and controls system consists of the:

- throttle body (9E926)
- fuel injectors (9F593)
- fuel charging wiring
- fuel injection supply manifold (9F792)
- fuel pressure regulator (9C968)
- fuel pressure relief valve (9H321)
- A/C compressor clutch relay
- fuel pump relay

The fuel charging and controls system is:

- a sequential multiport fuel injection (SFI) system.
- pulse width modulated.
- mass air flow controlled.

The fuel injection supply manifold:

- delivers fuel to the individual fuel injectors.
- receives fuel from the fuel supply line.
- returns unused fuel to the fuel tank (9002) through the fuel return line.

The throttle body:

- controls air supply to the upper intake manifold (9424) by positioning the throttle plate.
- connects the accelerator cable (9A758), and if equipped, speed control actuator cable (9A825) to the throttle lever.
- is not adjustable.
- cannot be cleaned.

The fuel injectors:

- are electrically operated by the powertrain control module (PCM) (12A650).
- each have an internal solenoid which opens a needle valve to inject fuel into the lower intake manifold.
- atomize the fuel as the fuel is delivered.
- are deposit-resistant.

The fuel pressure relief valve:

- is used to inspect and relieve fuel pressure.

The fuel pressure regulator:

- maintains a constant fuel pressure throughout the fuel system and to the fuel injectors.
- is spring loaded and operated by the intake manifold vacuum.

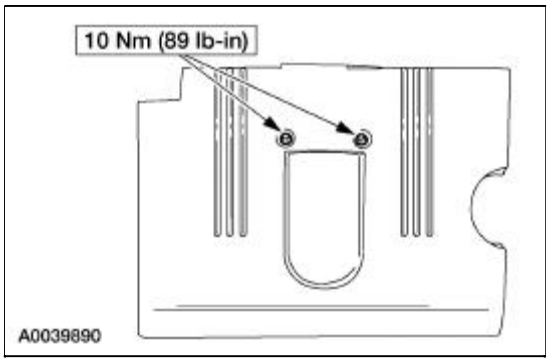
The A/C compressor clutch control relay (if A/C equipped):

- is controlled by the powertrain control module (PCM).
- interrupts A/C clutch operation during engine start or manual transmission clutch engagement to reduce engine load.

The fuel pump relay engages the fuel pump when energized by the PCM.

Fuel Charging And Controls

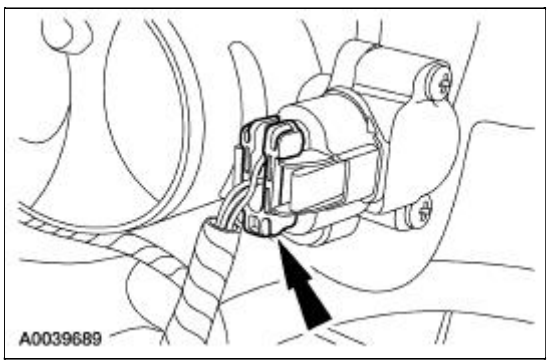
Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.



Throttle Body

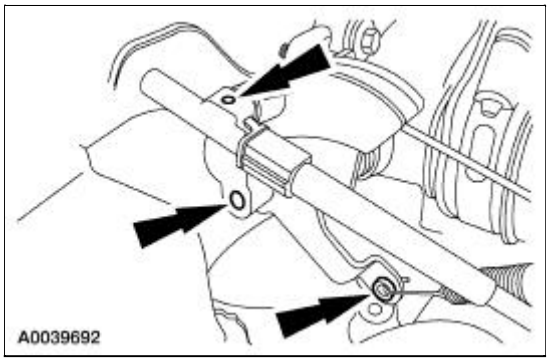
Removal and Installation

WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

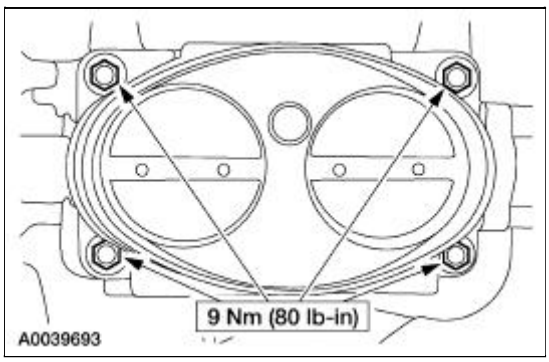


CAUTION: Throttle body bore and plate area have a special coating and cannot be cleaned.

1. Remove the engine appearance cover.



2. Remove the air cleaner resonator and outlet tube assembly. For additional information, refer to Section 303-12 .



3. Disconnect the throttle position (TP) sensor electrical connector.

4. Disconnect the accelerator cable, speed control cable and the return spring.

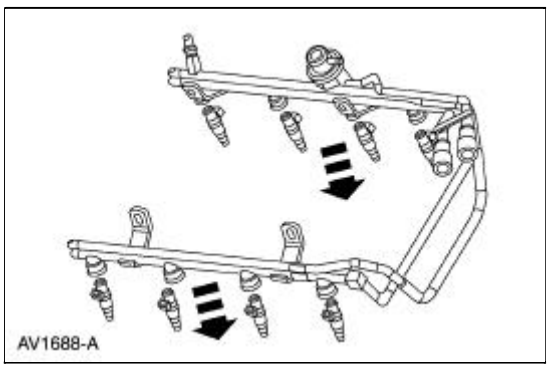
5. Remove the throttle body.
    1. Remove the bolts.
    2. Remove and discard the throttle body gasket.

6. To install, reverse the removal procedure.

Fuel Injectors

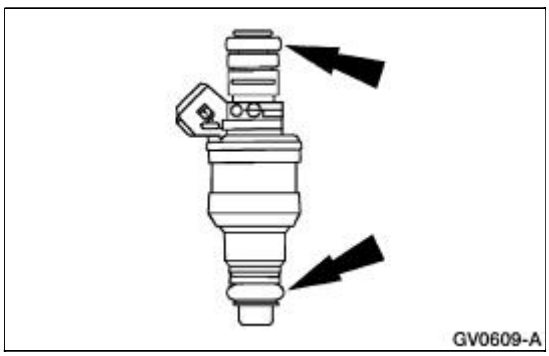
Material

Item	Specification
Super Premium SAE 5W-20 Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H



Removal and Installation

WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.



WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved. Failure to follow these instructions may result in personal injury.

1. Remove the fuel injection supply manifold (9F927). For additional information, refer to Fuel Injection Supply Manifold in this section.

2. Remove the fuel injectors (9F593) from the fuel injection supply manifold.

3. Inspect the two O-ring seals from each fuel injector. Install new O-ring seals as needed.

4. **NOTE:** Lubricate new O-ring seals with clean engine oil to aid installation.

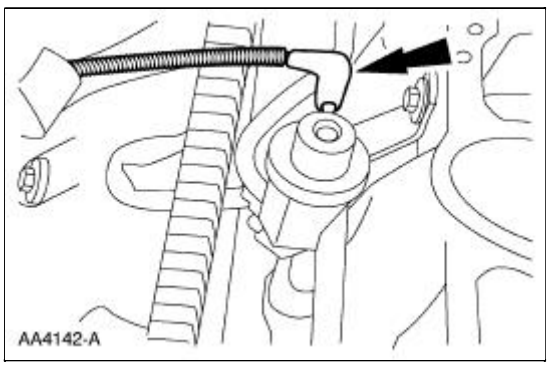
   To install, reverse the removal procedure.

Fuel Injection Supply Manifold

Material

Item	Specification
Super Premium SAE 5W-20 Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

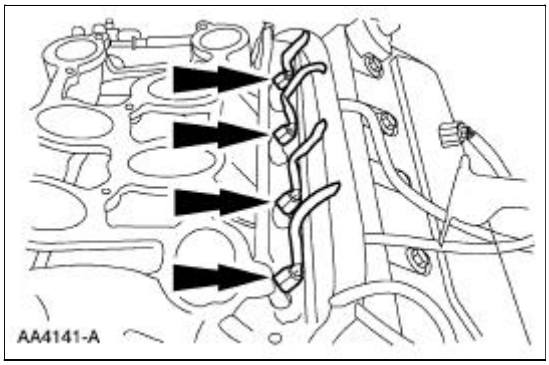
Removal and Installation



WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

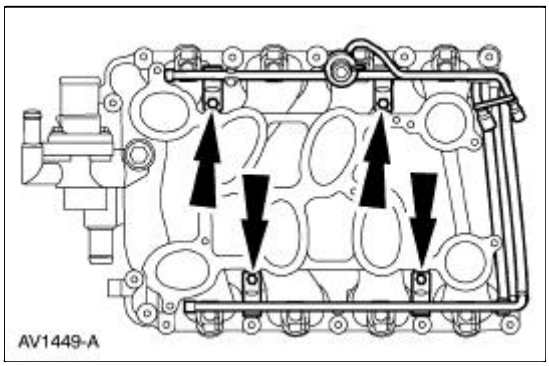
WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved. Failure to follow these instructions may result in personal injury.

1. Relieve the fuel pressure. For additional information, refer to Section 310-00 .
2. Remove the upper intake manifold. For additional information, refer to Section 303-01B .



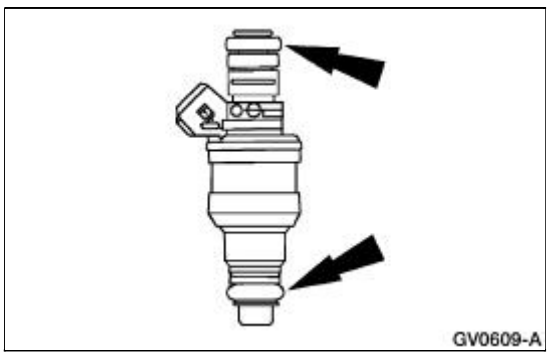
NOTE: After disconnecting, plug the fuel lines to prevent leakage.

3. Disconnect the fuel lines. For additional information, refer to Section 310-00 .
4. Disconnect the fuel pressure regulator (9C968) vacuum hose.

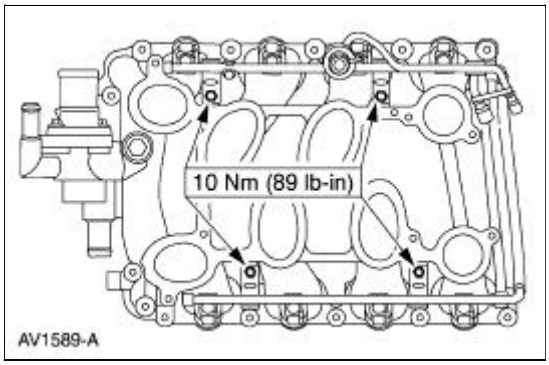


5. **NOTE:** The left side is shown, the right side is similar.

   Disconnect the eight fuel injector (9H321) electrical connectors.



6. Remove the fuel injection supply manifold (9F792).
    - Remove the bolts, then remove the fuel injection supply manifold with the fuel injectors attached.



7. Remove the fuel injectors from the fuel injection supply manifold (9F792).

8. Inspect the two O-ring seals from each fuel injector. Install new O-ring seals as needed.

9. **NOTE:** Lubricate the new O-rings with clean engine oil to aid installation.

    To install, reverse the removal procedure.

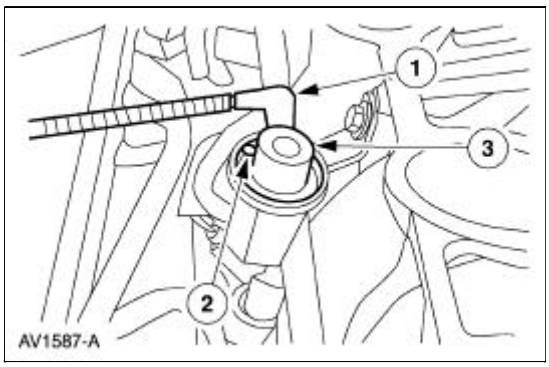
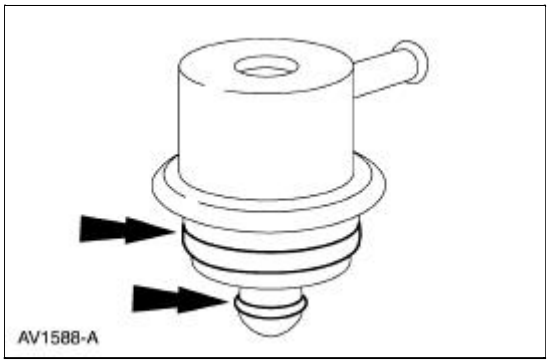
Fuel Pressure Regulator

Material



Item	Specification
Super Premium SAE 5W-20 Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153-H

Removal and Installation



WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved. Failure to follow these instructions may result in personal injury.

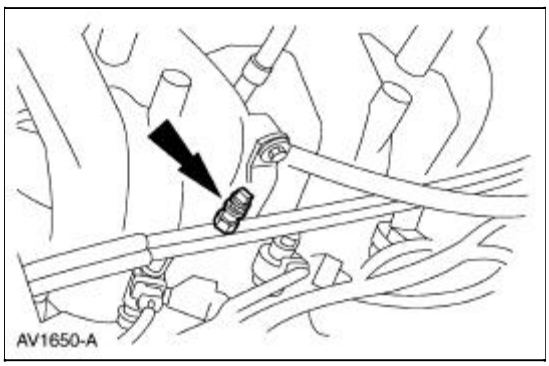
1. Relieve the fuel pressure. For additional information, refer to Section 310-00 .
2. Remove the upper intake manifold. For additional information, refer to Section 303-01B .
3. Remove the fuel pressure regulator (9C968).
    1. Disconnect the fuel pressure regulator vacuum hose.
    2. Remove the snap ring.
    3. Remove the fuel pressure regulator.

4. Remove and discard the fuel pressure regulator O-ring seals.

5. **CAUTION: Use O-ring seals that are made of special fuel resistant material. Use of ordinary O-ring seals can cause the fuel system to leak. Do not reuse O-ring seals.**

   NOTE: Lubricate the new O-ring seals with clean engine oil to aid installation.

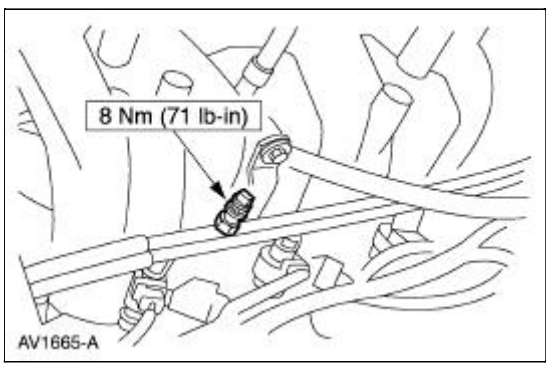
   To install, reverse the removal procedure.



Fuel Pressure Relief Valve

Removal

WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.



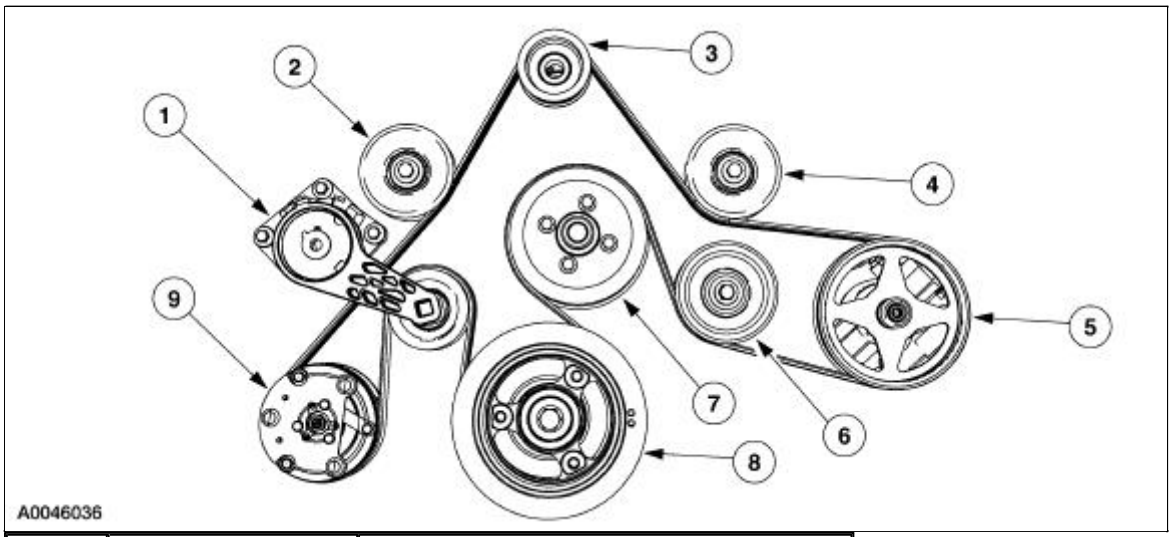
WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved. Failure to follow these instructions may result in personal injury.

1. Relieve the fuel pressure. For additional information, refer to Section 310-00 .
2. Remove the fuel pressure relief valve (9H321).

Installation

1. To install, reverse the removal procedure.

General Specifications



Item	Specification
Drive belt specification	6 rib

Torque Specifications

Description	Nm	lb-ft
Belt idler pulley bolt	25	18
Drive belt tensioner bolts	25	18

Accessory Drive

Component Locations — 4.6L, 5.4L(2V), 5.4L(4V)

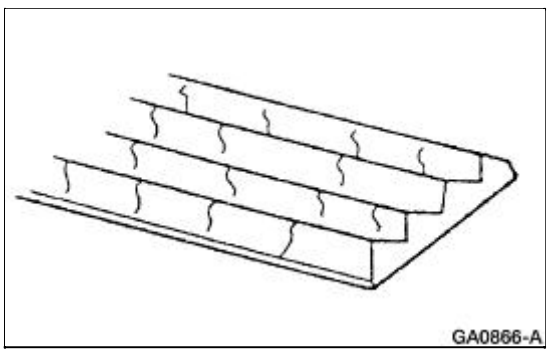
Item	Part Number	Description
1	6B209	Drive belt tensioner
2	8678	Belt idler pulley
3	10A352	Generator pulley
4	8678	Belt idler pulley
5	3A733	Power steering pump pulley
6	6C348	Belt idler pulley
7	8509	Water pump pulley
8	6312	Crankshaft pulley
9	2E884	A/C clutch pulley

The accessory drive consists of the:

- drive belt (8620)
- generator pulley
- power steering pump pulley
- crankshaft pulley
- A/C clutch pulley
- belt idler pulley
- drive belt tensioner
- water pump pulley

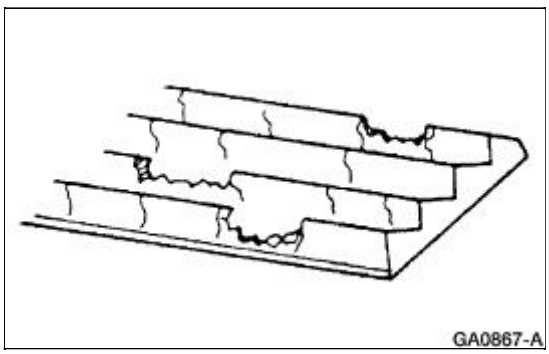
The accessory drive:

- has a single serpentine drive belt.
- has an automatic drive belt tensioner.
- does not require adjustment.



Accessory Drive

Inspection and Verification



1. Verify customer concern by running the engine.
2. Inspect the drive belt (8620) for chunking, fraying and wear.
3. Check the drive belt for correct routing.

Drive Belt Cracking/Chunking/Wear

V Ribbed Serpentine Drive Belt With Cracks Across Ribs

V Ribbed Belt With Chunks of Rib Missing

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Drive belt noise, chirping, flutter	• Defective/worn drive belt. • Misaligned pulley.	• REFER to Drive Belt Noise/Flutter diagnosis in this section.

	• Pulley runout. • Damaged accessories. • Fluid contamination of drive belt. • Damaged or worn drive belt tensioner (6B209).	• REFER to Belt Tensioner, Automatic diagnosis in this section.
• Premature drive belt wear	• Defective drive belt. • Misaligned pulley. • Pulley runout. • Damaged accessories. • Improperly installed drive belt.	• REFER to Drive Belt Noise/Flutter and Drive Belt Misalignment diagnosis in this section.

Component Tests

Drive Belt Noise/Flutter

NOTE: Tensioner is shown in free-state position against arm travel stops.

Drive Belt Tensioner/Belt Length Indicator

Item	Part Number	Description
1	—	Belt Length Indicator
2	—	Acceptable Belt Installation and Wear Range
3	—	Belt Replacement Range
4	—	Belt Tension Relief Point (Use 1/2 Inch Ratchet)

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged pulley or an incorrectly aligned pulley.

To correct, determine the area where the noise comes from. Check each of the pulleys in that area with a straightedge to the crankshaft pulley (6312), look for accessory pulleys out of position in the fore/aft direction or at an angle to the straightedge.

Drive belt squeal is an intermittent noise that occurs when the drive belt slips on a pulley during certain conditions, such as: engine start up, rapid engine acceleration, or A/C clutch engagement.

Drive belt squeal can occur under certain conditions:

- If the A/C discharge pressure goes above specifications:
  - the A/C system is overcharged.
  - the A/C condenser core airflow is blocked.
- If the A/C OFF equalized pressure (the common discharge and suction pressure that occurs after several minutes) exceeds specifications.
- If any of the accessories are damaged, have a worn or damaged bearing, internal torsional resistance above normal. All accessories should be rotatable by hand in the unloaded condition. If not, inspect the accessory.
- If fluid gets on the drive belt. This includes power steering fluid, engine coolant, engine oil or air conditioning system lubricant. If fluid does get on the drive belt during service, clean the drive belt with soap and water and thoroughly rinse with clean water. The drive belt does not have to be replaced if no apparent damage has occurred.
- **NOTE:** The drive belt tensioner arm should rotate freely without binding.

  If the drive belt is too long. A drive belt that is too long will allow the drive belt tensioner arm to go all the way to the arm travel stop under certain load conditions, which will release tension to the drive belt. If the drive belt tensioner indicator is outside the installation wear range window, replace the drive belt.
